```

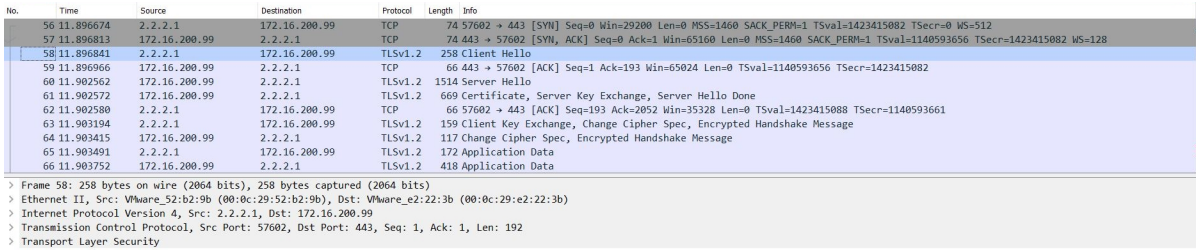
The ADC2 outgoing port capture shows that ADC2 forwards HTTPS traffic to the server:



SSH traffic file scanning

FortiGates can buffer, scan, log, or block files sent over SSH traffic (SCP and SFTP) depending on the file size, type, or contents (such as viruses or sensitive content).

This feature is supported in proxy-based inspection mode. It is currently not supported in flow-based inspection mode.

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 98 for more information.

You can configure the following SSH traffic settings in the CLI:

- Protocol options
- DLP profile
- Antivirus (profile and quarantine options)

To configure SSH protocol options:

```
config firewall profile-protocol-options
    edit <name>
        config ssh
           set options {oversize clientcomfort servercomfort}
           set comfort-interval <1 - 900>
           set comfort-amount <1 - 65535>
           set oversize-limit <1 - 798>
           set uncompressed-oversize-limit <0 - 798>
           set uncompressed-nest-limit <2 - 100>
           set scan-bzip2 {enable | disable}
        end
    next
end
```

To configure SCP block and log options:

```
config ssh-filter profile
    edit <name>
        set block scp
        set log scp
```

```
    next
end
```

To configure the DLP profile:

```
config dlp profile
    edit <name>
        set full-archive-proto ssh
        set summary-proto ssh
        config filter
            edit 1
                set proto ssh
            next
        end
    next
end
```

To configure the antivirus profile options:

```
config antivirus profile
    edit <name>
        config ssh
            set av-scan {disable | block | monitor}
            set outbreak-prevention {disable | block | monitor}
            set external-blocklist {disable | block | monitor}
            set fortindr {disable | block | monitor}
            set quarantine {enable | disable}
            set archive-block {encrypted corrupted partiallycorrupted multipart nested mailbomb
timeout unhandled}
            set archive-log {encrypted corrupted partiallycorrupted multipart nested mailbomb
timeout unhandled}
            set emulator {enable | disable}
        end
    next
end
```

To configure the antivirus quarantine options:

```
config antivirus quarantine
    set drop-infected ssh
    set store-infected ssh
    set drop-machine-learning ssh
    set store-machine-learning ssh
end
```

To configure SCP block and log options:

```
config ssh-filter profile
    edit <name>
```

```
        set block scp
        set log scp
    next
end
```

To apply the ssh-filter to a policy:

```
config firewall policy
    edit <id>
        set utm-status enable
        set inspection-mode proxy
        set ssh-filter-profile <ssh-filter profile>
    next
end
```

Redirect to WAD after handshake completion

In a proxy-based policy, the TCP connection is proxied by the FortiGate. A TCP three-way handshake can be established with the client even though the server did not complete the handshake.

This option uses IPS to handle the initial TCP three-way handshake. It rebuilds the sockets and redirects the session back to proxy only when the handshake with the server is established.

To enable proxy after a TCP handshake in an SSL/SSH profile:

```
config firewall ssl-ssh-profile
    edit "test"
        config https
            set ports 443
            set status certificate-inspection
            set proxy-after-tcp-handshake enable
        end
   next
end
```

To enable proxy after a TCP handshake in protocol options:

```
config firewall profile-protocol-options
    edit "test"
        config http
            set ports 80
            set proxy-after-tcp-handshake enable
            unset options
            unset post-lang
        end
   next
end
```

HTTP/2 support in proxy mode SSL inspection

Security profiles in proxy mode can perform SSL inspection on HTTP/2 traffic that is secured by TLS 1.2 or 1.3 using the Application-Layer Protocol Negotiation (ALPN) extension.

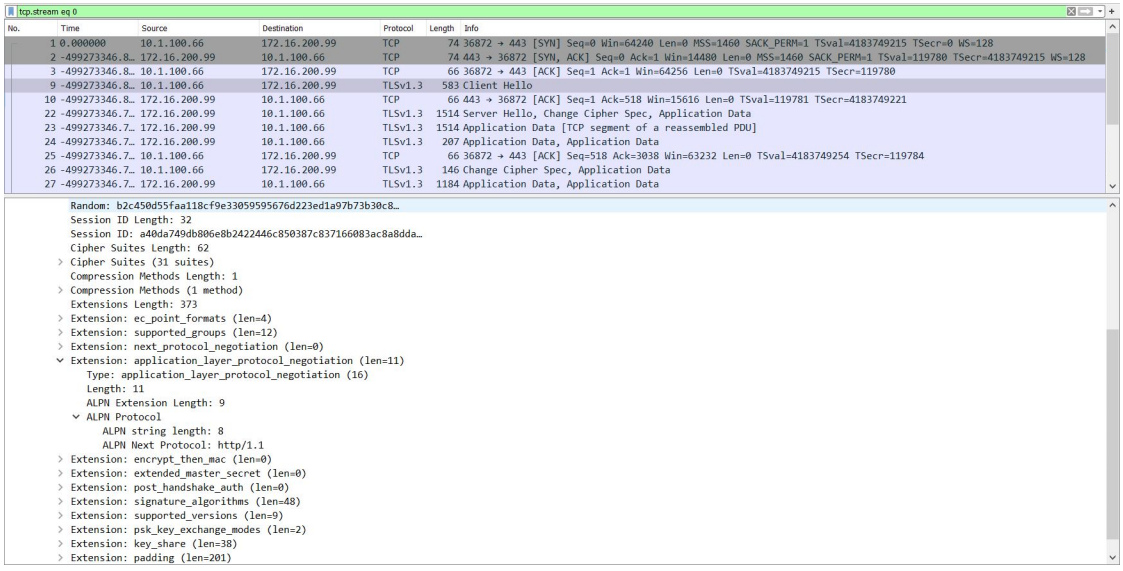
To set the ALPN support:

```
config firewall ssl-ssh-profile
    edit <profile>
        set supported-alpn {all | http1-1 | http2 | none}
    next
end
```

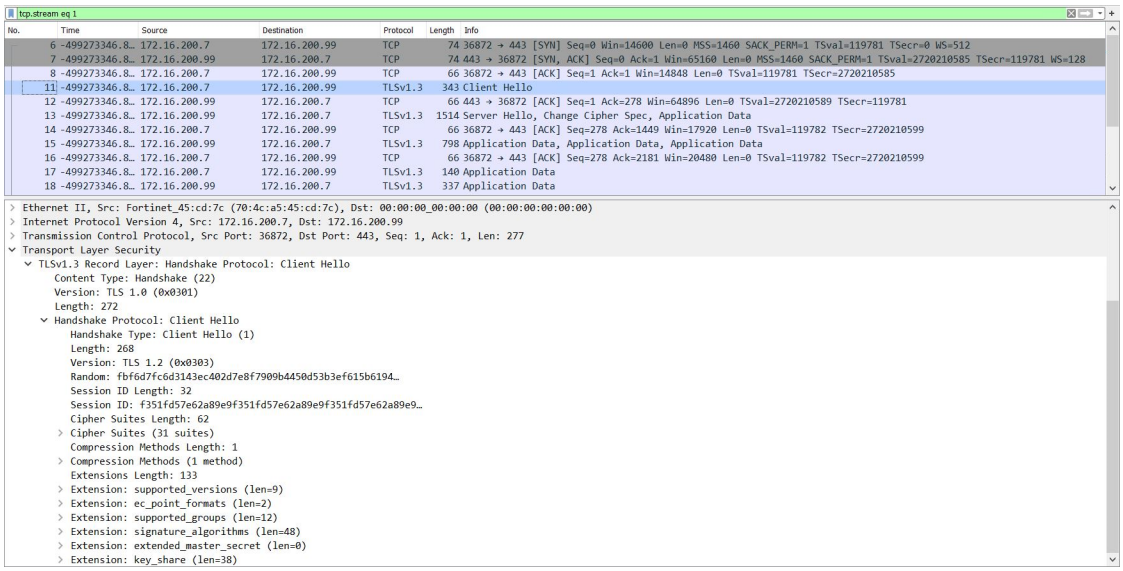
`all`	The FortiGate forwards all ALPN extensions, except SPDY. This is the default value.
`http1-1`	The FortiGate only forwards ALPN extensions that use HTTP/1.1. If the ALPN extension uses HTTP/2 or SPDY, then the FortiGate strips the ALPN header from the Client Hello.
`http2`	The FortiGate only forwards ALPN extensions that use HTTP/2. If the ALPN extension uses HTTP/1.1 or SPDY, then the FortiGate strips the ALPN header from the Client Hello.
`none`	The FortiGate always strips the ALPN header from the Client Hello when forwarding.

For example, if `supported-alpn` is set to `http2`, but the extension uses HTTP/1.1 or SPDY, the ALPN header is stripped from the Client Hello:

- Incoming packet capture:



- Outgoing packet capture:

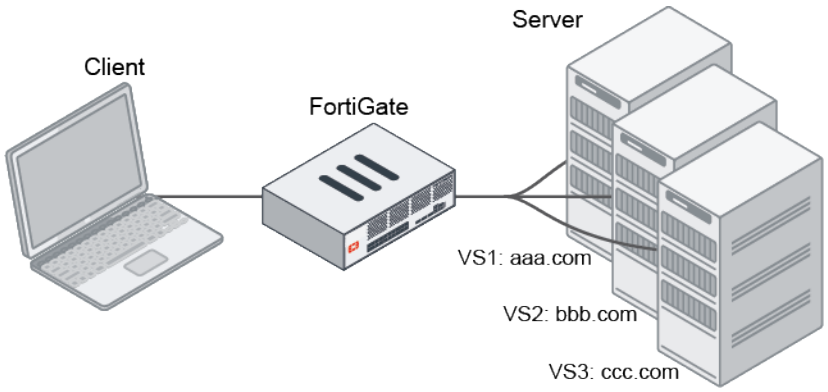


Define multiple certificates in an SSL profile in replace mode

Multiple certificates can be defined in an SSL inspection profile in replace mode (*Protecting SSL Server*). This allows multiple sites to be deployed on the same protected server IP address, and inspection based on matching the SNI in the certificate.

When the FortiGate receives the client and server hello messages, it will compare the server name identification (SNI) and the common name (CN) with the certificate list in the SSL profile, and use the matched certificate as a replacement. If there is no matched server certificate in the list, then the first server certificate in the list is used as a replacement.

Example



To configure an SSL profile in replace mode with multiple certificates:

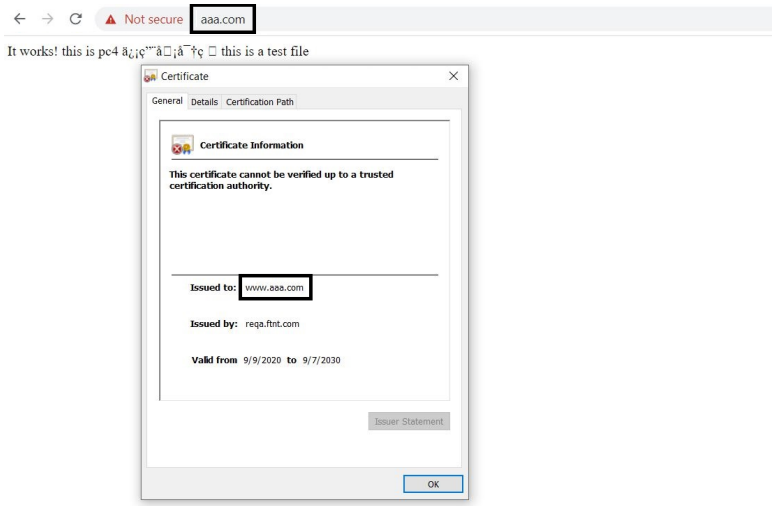
```
config firewall ssl-ssh-profile
    edit "multi-cert"
        set server-cert-mode replace
        set server-cert "bbb" "aaa"
    next
end
```

To configure a policy that uses the SSL profile:

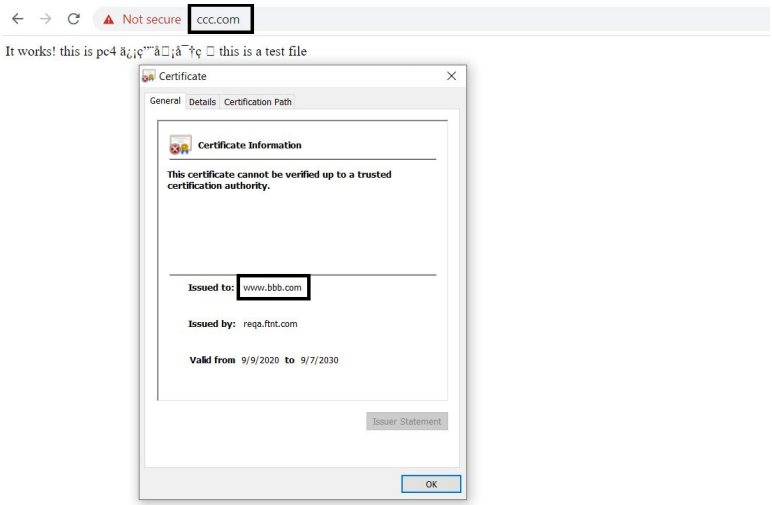
```
config firewall policy
    edit 1
        set name "multi-cert"
        set srcintf "port6"
        set dstintf "port11"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "multi-cert"
        set av-profile "default"
        set webfilter-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

Results

If the SNI matches the CN in the certificate list in the SSL profile, then the FortiGate uses the matched server certificate. In this example, when the client accesses *www.aaa.com*, the FortiGate will use the *aaa* certificate as a replacement.



If the SNI does not match the CN in the certificate list in the SSL profile, then the FortiGate uses the first server certificate in the list. In this example, when the client accesses *www.ccc.com*, because there is no certificate for *www.ccc.com*, the FortiGate will use the *bbb* certificate as a replacement.



Disabling the FortiGuard IP address rating

The FortiGuard IP address rating for SSL exemptions and proxy addresses can be disabled using the `ssl-exemption-ip-rating` and `address-ip-rating` options.

To disable using the FortiGuard IP address rating for SSL exemptions:

```
config firewall ssl-ssh-profile
    edit <name>
        set ssl-exemption-ip-rating {enable | disable}
    next
end
```

To disable using the FortiGuard IP address rating for proxy addresses:

```
config firewall profile-protocol-options
    edit <name>
        config http
            set address-ip-rating {enable | disable}
        end
    next
end
```

The `ssl-exemption-ip-rating` and `address-ip-rating` options are enabled by default, so when both a website domain and its IP address return different categories after being rated by FortiGuard, the IP address category takes precedence when evaluating SSL exemptions associated with the SSL inspection profile and proxy addresses associated with the proxy protocol options profile. SSL exemptions and the `ssl-exemption-ip-rating` option work in both inspection modes (proxy and flow).

When the categories associated with the website domain and IP address are different, disabling the FortiGuard IP rating ensures that the FortiGuard domain category takes precedence when evaluating the preceding objects. For most websites, the domain category is valid when its IP address is unrated by FortiGuard. Since being unrated is considered as not having a category, the FortiGate uses the domain category as the website category.

A website might have an IP category that differs from its domain category. If they are different, the FortiGate uses the rating weight of the IP address or domain name to determine the rating result and decision. The rating weight is hard-coded in the FortiGate and depending on the relative category weights, the FortiGate may use the IP category instead of the website category. If the `ssl-exemption-ip-rating` option is disabled in the SSL inspection profile, then the FortiGate uses the domain category as the website category, which ensures SSL exemption operation as intended.

The `address-ip-rating` option in a proxy protocol options profile functions the same way as the `ssl-exemption-ip-rating` option. If the `address-ip-rating` option is disabled in a profile that is used in an explicit proxy policy that also uses a web filter profile, for HTTP or HTTPS traffic to a website that has different IP and domain categories and that matches the policy, the FortiGate will use the domain category when it evaluates categories for the web filter.

Block or allow ECH TLS connections

Encrypted Client Hello (ECH) is an extension to TLS that allows TLS to effectively hide information that is exposed in the unencrypted TLS ClientHello message. The ClientHello is one of the first messages sent in a TLS handshake, containing information inside the Server Name Indication (SNI) field about the destination host. By encrypting the ClientHello, this information is not exposed in plaintext.

Using the ECH extension, the client queries DNS for the DNS record of the destination host containing the ECH configuration and public key for encrypting the ClientHello message. To prevent the identity from being exposed within the DNS query, clients usually use DoH or DoT to encrypt the DNS packets.

With the public key returned from the DNS server, the client can encrypt the ClientHello message, now called the inner ClientHello. An outer, unencrypted ClientHello must still be present to route to the server, often a CDN, that can unpack and reroute the traffic to the final destination.

Impact on the firewall

When a FortiGate does certificate inspection, for example for web category filtering, the FortiGate relies on the SNI field in the ClientHello to accurately determine the hostname of the server it is connecting to, and then performs category filtering based on this hostname. When ECH is used, this is equivalent to looking up the encrypted SNI field in the inner ClientHello. This means that applying ECH can break certificate inspection.

If the FortiGate is performing deep inspection, it always strips the ECH extension from an ECH, effectively forcing the client browser to use a non-ECH TLS connection.

Prevent ECH from affecting certificate inspection

By preventing the use of ECH, the destination hostname is not encrypted and certificate inspection can be performed accurately on the SNI on the unencrypted ClientHello. There are two ways to do this:

1. Blocking the ClientHello that uses ECH, allowing TLS to fallback to using a plaintext ClientHello.
2. Stripping the ECH response that is returned from the DNS server, preventing TLS from receiving the ECH encryption key to encrypt the ClientHello.

This feature is currently only supported in proxy inspection mode.

Configuration

To configure blocking/allowing ECH and filtering on the SNI string in the TLS connection in the CLI:

```
config firewall ssl-ssh-profile
    edit <name>
        config https
            set status certificate-inspection
            set encrypted-client-hello {block | allow}
        end
        config ech-outer-sni
            edit <name>
                set sni <string>
            next
        end
    next
end
```

`encrypted-client-hello {block | allow}`	Block/allow session based on existence of encrypted-client-hello.
`ech-outer-sni`	Filtering on the ClientHelloOuter Server Name Indications (SNIs) to be blocked.
`sni <string>`	ClientHelloOuter SNI to be blocked.

To configure stripping ECH information from DNS responses in the CLI:

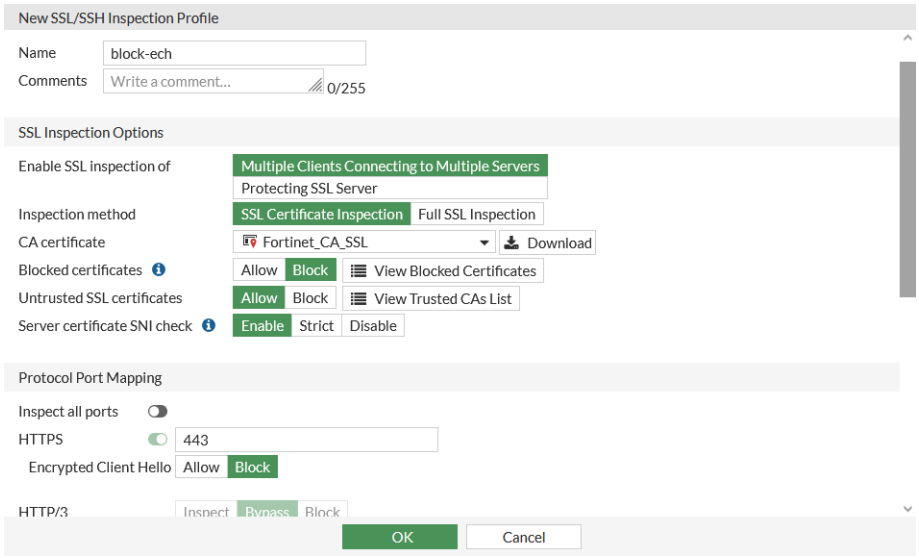
```
config dnsfilter profile
    edit <name>
        set strip-ech {enable | disable}
    next
end
```

`strip-ech {enable | disable}`	Enable/disable removal of the ECH service parameter from supporting DNS RRs.

To configure blocking/allowing ECH and filtering on the SNI string in the TLS connection GUI:

Blocking/allowing ECH is only configurable in an SSL/SSH inspection profile with *Inspection method* set to *SSL Certificate Inspection*.

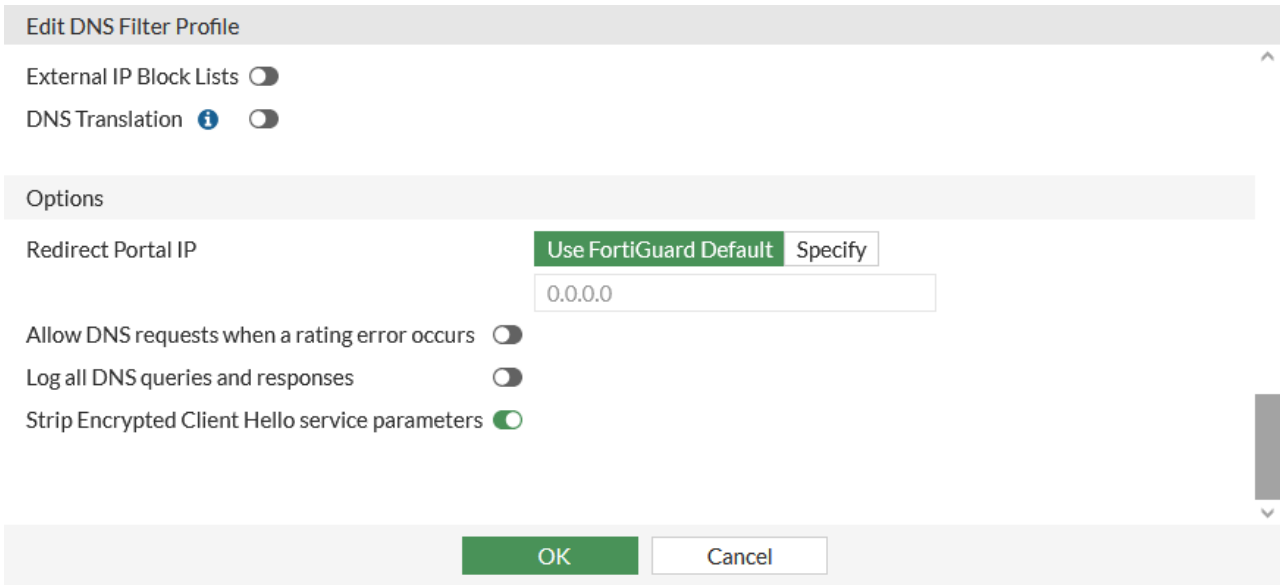
1. Go to *Security Profiles* > *SSL/SSH Inspection* and edit an existing profile or click *Create New*.
2. Set *Inspection method* to *SSL Certificate Inspection*.
3. Set *Encrypted Client Hello* to *Block*.



4. Click *OK*.
   SNIs cannot be configured in the GUI.

To configure stripping ECH information from DNS responses in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and edit an existing profile or click *Create New*.
2. Enable *Strip Encrypted Client Hello service parameters*.



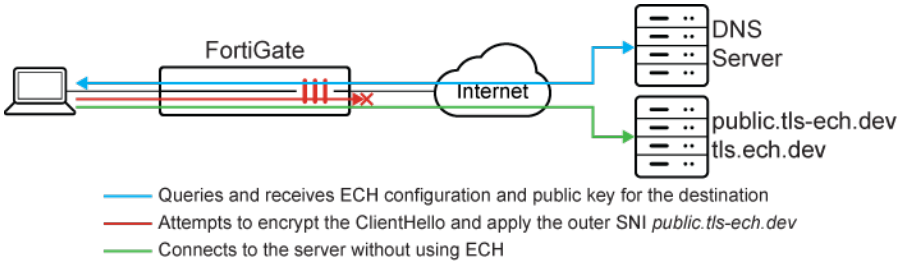
3. Click *OK*.

Examples

- Blocking TLS connections with certificate inspection when ECH is used in the TLS handshake through the FortiGate on page 2327
- Allowing TLS connections with certificate inspection when ECH is used in the TLS handshake through the FortiGate on page 2330
- Stripping ECH information from DoH responses on page 2331

Blocking TLS connections with certificate inspection when ECH is used in the TLS handshake through the FortiGate

In this example, an SSL/SSH inspection profile is configured to block TLS connections from some SNIs when ECH is used in the TLS handshake. Client messages with the outer SNI `public.tls-ech.dev` are blocked.



A webfilter block message will be shown when trying to connect directly to public.tls-ech.dev. Accessing the webpage tls-ech.dev, which uses public.tls-ech.dev in its outer SNI, will show that the client is not using ECH.

To configure blocking a TLS connection that uses ECH:

1. Configure an SSL/SSH inspection profile to block ECH and set the SNIs to match the outer SNI in the ECH message during the TLS handshake:

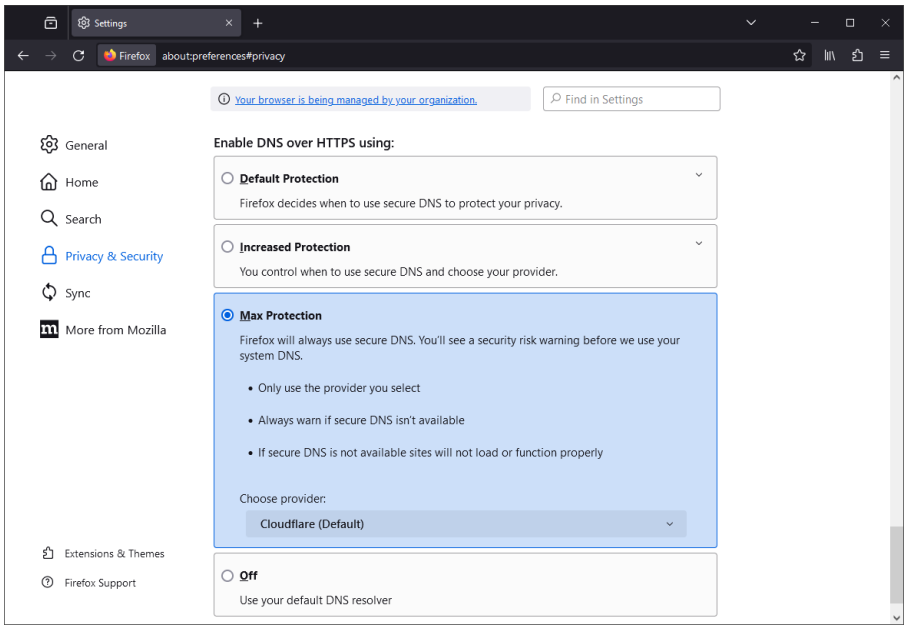
```
config firewall ssl-ssh-profile
    edit "block-ech"
        config https
            set status certificate-inspection
            set encrypted-client-hello block
        end
        config ech-outer-sni
            edit "cloudflare"
                set sni "cloudflare-ech.com"
            next
            edit "tls-ech"
                set sni "public.tls-ech.dev"
            next
            edit "defo.ie"
                set sni "cover.defo.ie"
            next
        end
    next
end
```

2. Apply the profile in a firewall policy:

```
config firewall policy
    edit 1
        set ssl-ssh-profile "block-ech"
    next
end
```

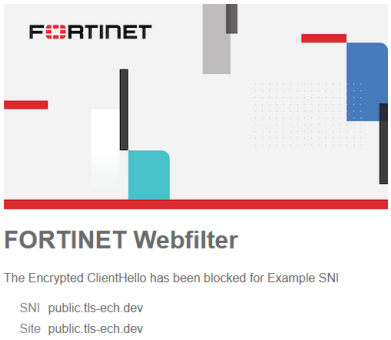
To check the results:

1. In a browser, enable DNS over HTTPS. For example, in Firefox go to *Settings* > *Privacy & Security* and under *DNS over HTTPS* enable *Max Protection*.



2. Visit a website, such as *https://public.tls-ech.dev*.

   Because ECH is blocked and the outer SNI matches one of the configured SNIs, the ECH initiated by the browser is blocked. In this case, the browser shows a replacement message:



3. An SSL log shows the blocked connection:

```
2: date=2024-04-24 time=11:35:12 eventtime=1713983712769767807 tz="-0700" logid="1702062101"

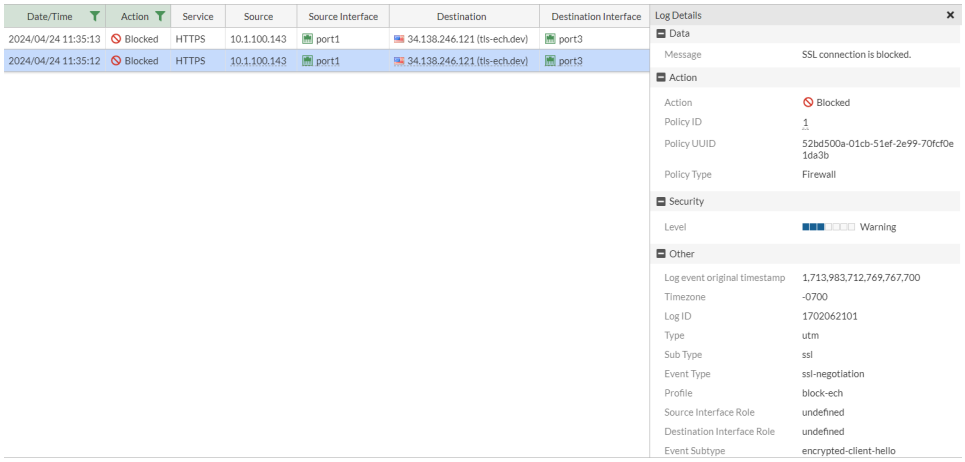
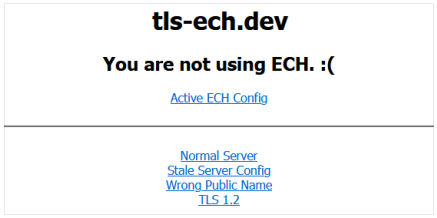
connection is blocked."
```



4. Try to visit a different website, such as *tls-ech.dev*, that does not match a default SNI to be blocked. The browser will initially try to establish an ECH-enabled TLS connection to *public.tls-ech.dev*, but that will be blocked, forcing the browser to connect to the actual website without ECH. In this case, the browser will load the actual website and not the replacement message:

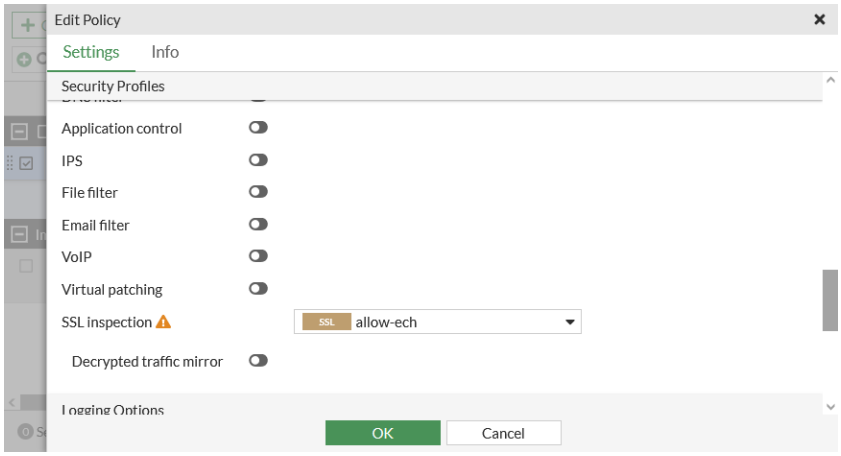


Allowing TLS connections with certificate inspection when ECH is used in the TLS handshake through the FortiGate

In this example, an SSL/SSH inspection profile is configured to allow TLS connections when ECH is used in the TLS handshake.

To configure allowing a TLS connection that uses ECH in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and edit an existing profile or click *Create New*.
2. Set *Inspection method* to *SSL Certificate Inspection*.
3. Set *Encrypted Client Hello* to *Allow*.
4. Click *OK*.
5. Go to *Policy & Objects* > *Firewall Policy* and edit an existing policy or click *Create New*.
6. Set *SSL inspection* to the SSL/SSH Inspection profile.



7. Click *OK*.

To configure allowing a TLS connection that uses ECH in the CLI:

1. Configure an SSL/SSH inspection profile to block ECH and set the SNIs to match the outer SNI in the ECH message during the TLS handshake:

```
config firewall ssl-ssh-profile
    edit "allow-ech"
        config https
            set status certificate-inspection
            set encrypted-client-hello allow
        end
    next
end
```

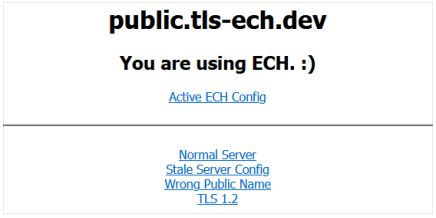
2. Apply the profile in a firewall policy:

```
config firewall policy
    edit 1
        set ssl-ssh-profile "allow-ech"
```

```
    next
end
```

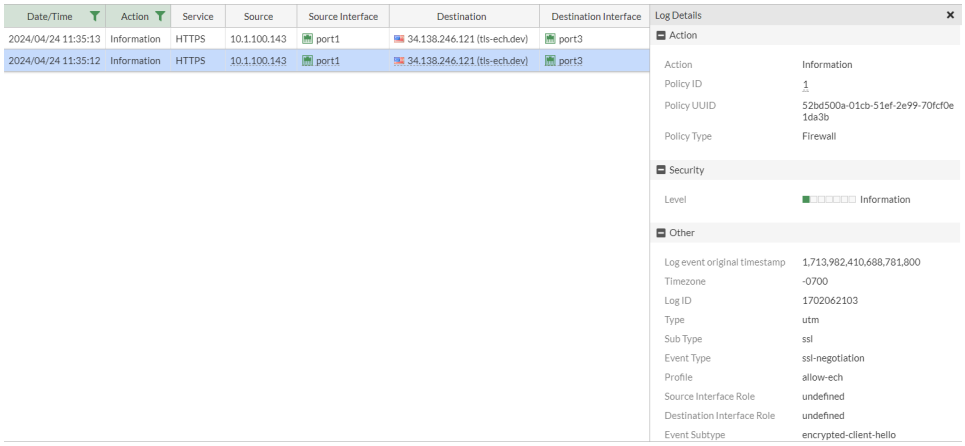
To check the results:

1. In a browser, enable DNS over HTTPS. For example, in Firefox go to *Settings* > *Privacy & Security* and under *DNS over HTTPS* enable *Max Protection*.
2. Visit a website, such as *https://public.tls-ech.dev*.
   The ECH-enabled TLS connection is allowed through the firewall policy and the website opens:



3. An SSL log shows the allowed connection:

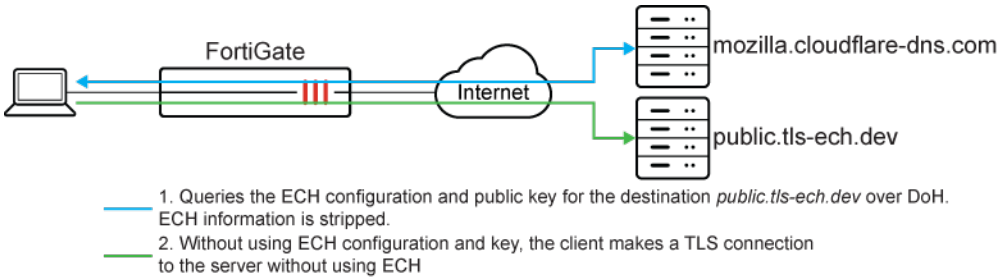
```
2: date=2024-04-24 time=11:13:31 eventtime=1713982410688781760 tz="-0700" logid="1702062103"
type="utm" subtype="ssl" eventtype="ssl-negotiation" level="information" vd="vdom1"
action="info" policyid=1 poluuid="52bd500a-01cb-51ef-2e99-70fcf0e1da3b" policytype="policy"
sessionid=118528 service="HTTPS" profile="allow-ech" srcip=10.1.100.143 srcport=63232
srccountry="Reserved" dstip=34.138.246.121 dstport=443 dstcountry="United States"
srcintf="port1" srcintfrole="undefined" dstintf="port3" dstintfrole="undefined"
srcuuid="fbd0def6-01ca-51ef-496f-08c90cb6b123" dstuuid="fbd0def6-01ca-51ef-496f-08c90cb6b123"
proto=6 eventsubtype="encrypted-client-hello" hostname="public.tls-ech.dev"
```



Stripping ECH information from DoH responses

DNS filters are used to strip ECH information from DNS responses, and force the browser to not use ECH for TLS connections. The browser relies on the ECH information from DNS over HTTPS (DoH) for ECH-enabled TLS connections.

In this example, a client sends a DoH query to a Cloudflare DNS server. The ECH information in the DNS response is stripped.



1. Policy 3 performs deep inspection on DoH traffic between the browser and the DoH server (mozilla.cloudflare-dns.com). A DNS filter profile is applied that strips the ECH information from the DoH response, forcing the browser to use a non-ECH TLS connection.
2. The browser then establishes a TLS connection through policy 1. Although policy 1 has an SSL/SSH inspection profile applied that allows ECH, ECH is not used because the ECH information from the DoH response was stripped by policy 3.

To configure and test stripping ECH information from DoH responses:

1. Configure the DNS filter profile that removes the ECH information:

```
config dnsfilter profile
    edit "strip-ech-enable"
        set strip-ech enable
    next
end
```

2. Configure a firewall address:

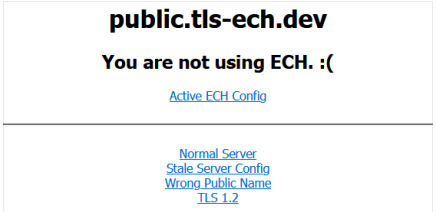
```
config firewall address
    edit "mozilla.cloudflare-dns.com"
        set type fqdn
        set fqdn "mozilla.cloudflare-dns.com."
    next
end
```

3. Configure the policies:

```
config firewall policy
    edit 3
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "mozilla.cloudflare-dns.com"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dnsfilter-profile "strip-ech-enable"
        set logtraffic all
        set nat enable
```

```
    next
    edit 1
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "allow-ech"
        set logtraffic all
        set nat enable
    next
end
```

4. In a browser, go to *https://public.tls-ech.dev* to see that ECH is not being used:

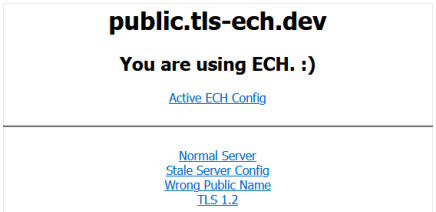


5. The debug log will show that the ECH service parameter was removed:

```
# diagnose debug application dnsproxy -1
...
[worker 0] dns_secure_filter_ech()-2166: Found ECH key=5
...
[worker 0] dns_secure_filter_ech()-2203: Removed ECH service parameter
```

6. If the DNS filter profile is changed to disable stripping the ECH information, then the website will show that ECH is being used:

```
config dnsfilter profile
    edit "strip-ech-enable"
        set strip-ech disable
    next
end
```



Custom signatures

You can create the following custom signatures and apply them to firewall policies:

- Application group
- Application signature
- IPS signature

The following topic provides information about custom signatures:

- Configuring custom signatures on page 2334
- Blocking applications with custom signatures on page 2335
- Filters for application control groups on page 2338
- Application groups in traffic shaping policies on page 2341

Configuring custom signatures

IPS signatures are the basis of signature-based intrusion prevention. Every attack can be reduced to a particular string of commands or a sequence of commands and variables. See Intrusion prevention on page 2113 for more information.

An IPS signature identifies characteristics of a packet that are unique to an attack, such as the protocol type, an option/value pair within the payload, other special aspects of the payload, or specific application options. Custom IPS signatures can be created to block, monitor, or quarantine specific traffic that is not covered by the IPS definitions list. To view the IPS definitions list:

- Go to *Security Profiles* > *IPS Signatures*.
- Go to *Security Profiles* > *Intrusion Prevention*, edit an existing IPS sensor, and click *View IPS Signatures* in the right-hand pane.
- Go to *System* > *FortiGuard*, in the *Subscriptions* > *Licensed* tab, expand *Intrusion Prevention System (IPS)*, and in the *IPS Signatures* row click *Actions* > *View List*.

An application signature identifies characteristics of a packet that is unique to an application. Custom application signatures can be used in application control profiles to block traffic from specific applications that are not covered by the application control signatures list. To view the application control signatures list:

- Go to *Security Profiles* > *Application Signatures* and select the *Signature* view.
- Go to *Security Profiles* > *Application Control*, edit an existing application sensor, and click *View Application Signatures* in the right-hand pane.
- Go to *System* > *FortiGuard*, in the *Subscriptions* > *Licensed* tab, expand *Firmware, VM, and base subscriptions*, and in the *Application Control Signatures* row click *Actions* > *View List*.

Application groups can be created by selecting individual application, or by filtering by application category. The groups can then be used in firewall policies.

For information about the syntax for building IPS and application control signatures, see the Custom IPS and Application Control Signature Syntax Guide.

To make the application signatures settings visible in the GUI:

1. Go to *System* > *Feature Visibility*
2. In the *Security Features* section, enable *Application Control*.
3. Click *Apply*.

To configure custom signatures:

1. Custom application and IPS signatures can be configured:
   - To configure custom application signatures, go to *Security Profiles* > *Application Signatures* and click *Create New* > *Custom Application Signature*. See Blocking applications with custom signatures on page 2335 for an example.
   - To configure custom IPS signatures, go to *Security Profiles* > *IPS Signatures* and click *Create New*.
2. Configure the following settings:

Name	Enter a unique name for the signature.
Comments	Enter a comment (optional).
Signature	Enter the signature.

3. Click *OK*.

To configure application groups:

1. Go to *Security Profiles* > *Application Signatures* and click *Create New* > *Application Group*.
2. Configure the following settings:

Group Name	Enter a unique name for the signature group.
Type	Set the application group type, either application ID or application filter. See Filters for application control groups on page 2338 for information about the available filters.
Members	Select the applications or filter to include in the group.
Comments	Enter a comment (optional).

3. Click *OK*.
   See Application groups in traffic shaping policies on page 2341 for more information.

Blocking applications with custom signatures

Custom signatures can be used in application control profiles to block web traffic from specific applications, such as out of support operating systems.

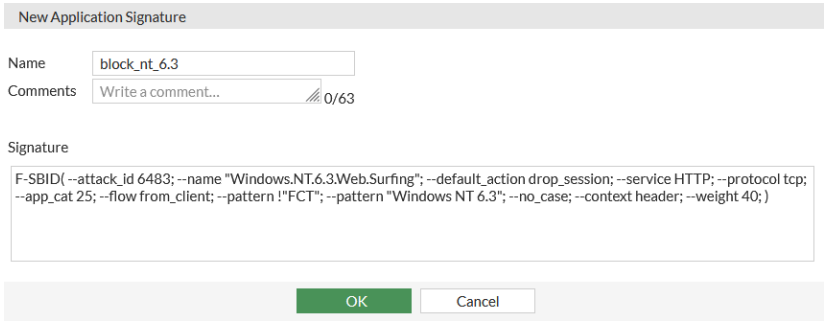
In this example, a custom signature is created to detect PCs running Windows NT 6.3 operating systems, including Windows 8.1. The signature is added to an application control profile and the action is set to block. The profile is then used in a firewall policy so that web traffic matching the signature is blocked. The logs generated by this example can be used to help identify other computers that need to be blocked.

To create the custom application signature:

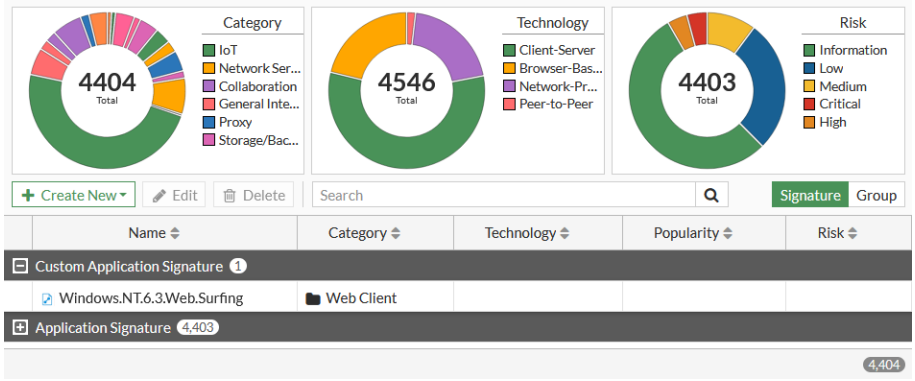
1. Go to *Security Profiles* > *Application Signatures* and click *Create New* > *Custom Application Signature*.
2. Enter a name for the custom signature, such as *block_nt_6.3*.
3. Enter the *Signature*. In this example:

```
F-SBID( --attack_id 6483; --name "Windows.NT.6.3.Web.Surfing"; --default_action drop_session;
--service HTTP; --protocol tcp; --app_cat 25; --flow from_client; --pattern !"FCT"; --pattern
"Windows NT 6.3"; --no_case; --context header; --weight 40; )
```

This signature scans HTTP and HTTPS traffic that matches the pattern *Windows NT 6.3* in its header. For blocking older versions of Windows, such as Windows XP, you would use the pattern *Windows NT 5.1*. An attack ID is automatically generated when the signature is created.

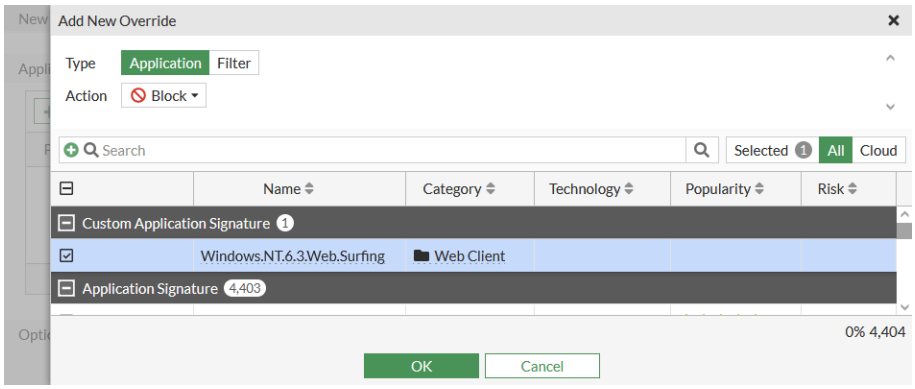


4. Click *OK*.
   The signature is included in the *Custom Application Signature* section of the signature list.



To use the signature in an application control profile:

1. Go to *Security Profiles* > *Application Control*.
2. Create a new profile, or edit an existing one.
3. In the *Application and Filter Overrides* table, click *Create New*.
4. Set *Type* to *Application* and *Action* to *Block*.
5. Select the custom signature from the list, using the search feature if required.



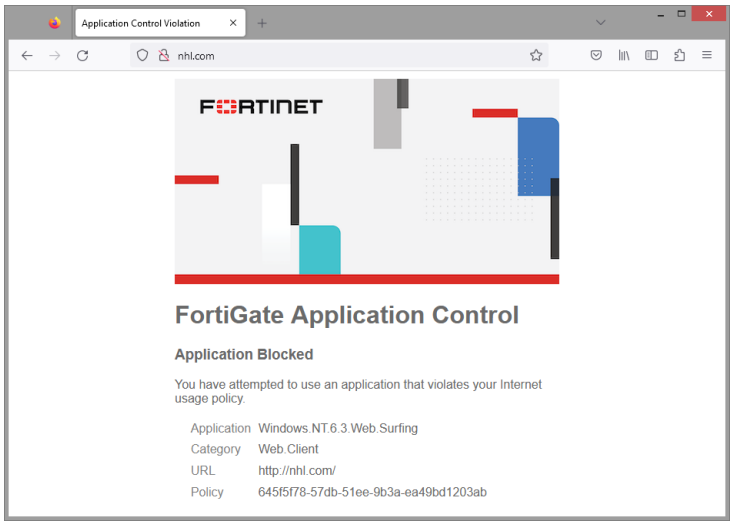
6. Click *OK*.
   The signature is added to the table.
7. Click *OK*.

To add the application control profile to a firewall policy:

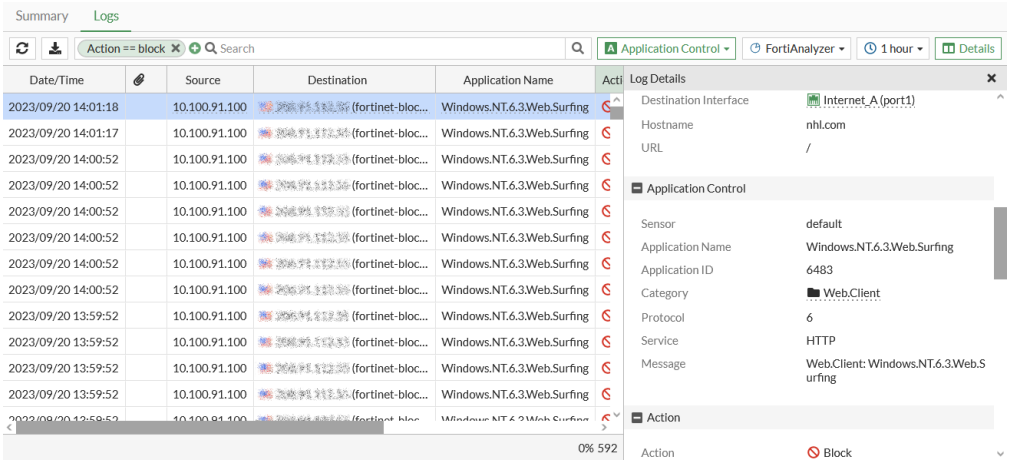
1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit the policy that currently allows a connection from the internal network to the internet.
3. In the *Security Profiles* section, enable *Application Control* and select the profile.
   If deep inspection is not enabled, then only HTTP traffic will be scanned. To scan HTTPS traffic, set SSL Inspection to a profile that includes deep inspection. See SSL & SSH Inspection on page 2303 for more information.
4. Click *OK*.

Results

When a PC running one of the affected operating systems tries to connect to the internet using a web browser, a replacement message is shown. For information on customizing replacement messages, see Replacement messages on page 3555.



Go to *Log & Report* > *Security Events* to view the web traffic that is logged for the PC that is blocked by the application signature in the *Application Control* card.



The raw logs can also be downloaded:

Filters for application control groups

When defining application groups in NGFW policy or profile mode, the following group filters are available: protocols, risk, vendor, technology, behavior, popularity, and category.

```
config application group
    edit <name>
        set type filter
        set protocols <integer>
        set risk <integer>
        set vendor <id>
        set technology <id>
        set behavior <id>
        set popularity <integer>
        set category <id>
    next
end
```

`protocols <integer>`	Application protocol filter (0 - 47, or all).
`risk <integer>`	Risk or impact of allowing traffic from this application to occur (1 - 5; low (1), elevated (2), medium (3), high (4), and critical (5)).
`vendor <id>`	Application vendor filter (0 - 25, or all).
`technology <id>`	Application technology filter: • all • 0 (network-protocol) • 1 (browser-based) • 2 (client-server) • 4 (peer-to-peer)
`behavior <id>`	Application behavior filter: • all • 2 (botnet) • 3 (evasive) • 5 (excessive bandwidth) • 6 (tunneling) • 9 (cloud)
`popularity <integer>`	Application popularity filter (1 - 5, from least to most popular).
`category <id>`	Application category filter: • 2 (P2P) • 3 (VoIP) • 5 (video/audio) • 6 (proxy) • 7 (remote access) • 8 (game) • 12 (general interest) • 15 (network service) • 17 (update) • 21 (email) • 22 (storage backup) • 23 (social media) • 25 (web client) • 26 (industrial) • 28 (collaboration) • 29 (business) • 30 (cloud IT) • 31 (mobile) • 32 (unknown applications)

Sample configurations

In this example, a single filter (risk level 1) is configured in the application group in NGFW policy mode, so only signatures matching this filter will match the security policy.

To configure the application group:

```
config application group
    edit "risk_1"
        set type filter
        set risk 1
    next
end
```

To configure the security policy:

```
config firewall security-policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set status enable
        set schedule "always"
        set enforce-default-app-port disable
        set service "ALL"
        set app-group risk_1
        set logtraffic all
    next
end
```

In this example, the application group is configured so that only signatures matching both filters, category 5 (video/audio) and technology 1 (browser-based), will match the security policy. The application group can also be configured in a traffic shaping policy.

To configure the application group:

```
config application group
    edit "two"
        set type filter
        set category 5
        set technology 1
    next
 end
```

To configure the security policy:

```
config firewall security-policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set status enable
        set schedule "always"
        set enforce-default-app-port disable
        set service "ALL"
        set app-group two
        set logtraffic all
    next
end
```

To configure the traffic shaping policy:

```
config firewall shaping-policy
    edit 1
        set ip-version 4
        set service "ALL"
        set app-group two
        set dstintf port1
        set traffic-shaper "max-100"
        set traffic-shaper-reverse "max-100"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Application groups in traffic shaping policies

Application groups can be configured in traffic shaping policies. In this example, there are two traffic shaping policies:

- Policy 1 is for traffic related to cloud applications and has high priority.
- Policy 2 is for other traffic and has low priority.

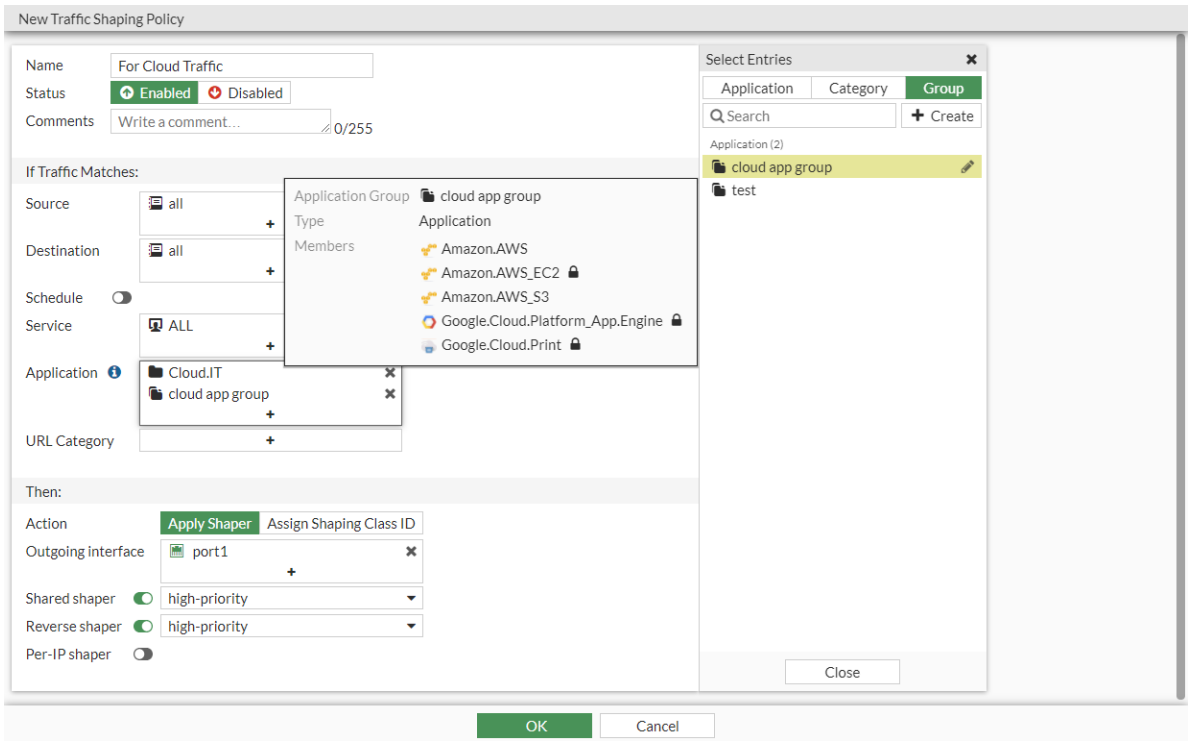
At least one firewall policy must have application control enabled for the applications to match any policy traffic.

To configure a traffic shaping policy to use an application group in the GUI:

1. Configure an application group for cloud applications:
   a. Go to *Security Profiles* > *Application Signatures*.
   b. Click *Create New* > *Application Group*. The *New Application Group* page opens.
   c. Enter a name for the group, and for *Type*, select *Application*.
   d. Click the + to add the group the members.

   e. Click *OK*.
2. Create the shaping policy for the high priority cloud application traffic:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
   b. Enter the following:

Name	For Cloud Traffic
Source	All
Destination	All
Service	All
Application	Add the *Cloud.IT* category and the *cloud app group* application group.
Outgoing interface	port1
Shared shaper	high-priority
Reverse shaper	high-priority

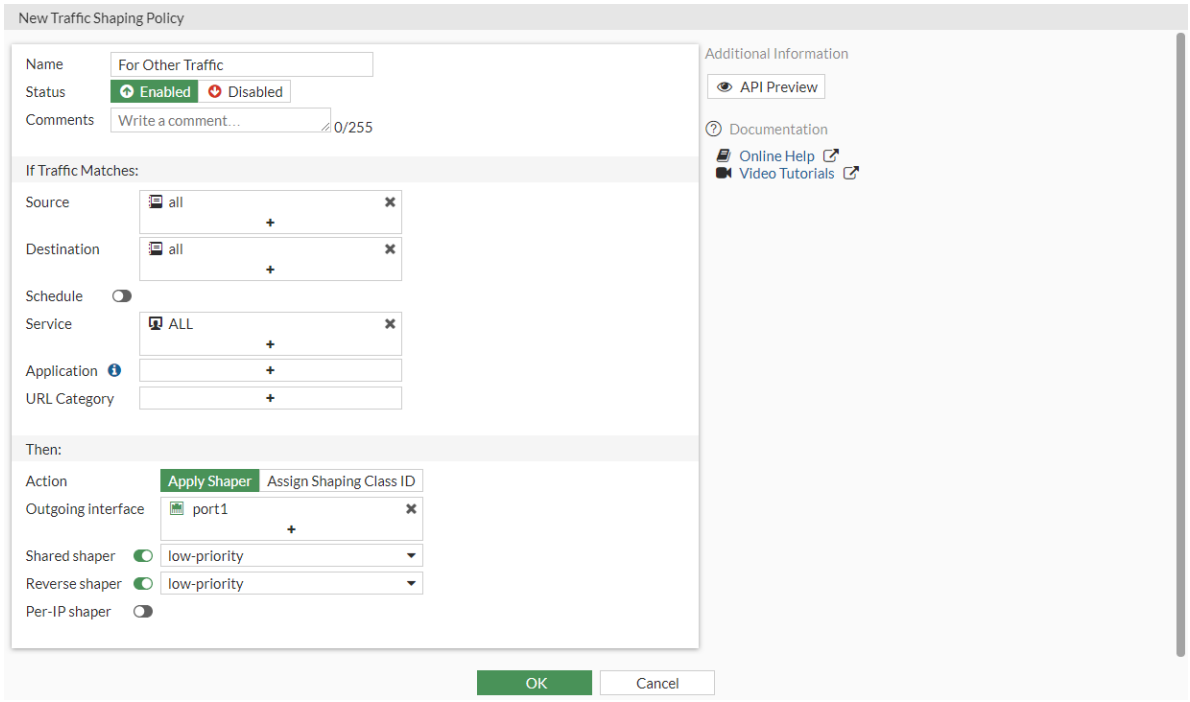


c. Click *OK*.

3. Create the shaping policy for the low priority other traffic:

a. Click *Create New* and enter the following:

Name	For Other Traffic
Source	All
Destination	All
Service	All
Outgoing interface	port1
Shared shaper	low-priority
Reverse shaper	low-priority



b. Click *OK*.

To configure a traffic shaping policy to use an application group in the CLI:

1. Configure an application group for cloud applications:

```
config application group
    edit "cloud app group"
        set application 27210 36740 35944 43296 33048
    next
end
```

2. Create the shaping policies for the high priority cloud application traffic and low priority other traffic:

```
config firewall shaping-policy
    edit 1
        set name "For Cloud Traffic"
```

```
        set service "ALL"
        set app-category 30
        set app-group "cloud app group"
        set dstintf "port1"
        set traffic-shaper "high-priority"
        set traffic-shaper-reverse "high-priority"
        set srcaddr "all"
        set dstaddr "all"
    next
    edit 2
        set name "For Other Traffic"
        set service "ALL"
        set dstintf "port1"
        set traffic-shaper "low-priority"
        set traffic-shaper-reverse "low-priority"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Overrides

Web filter configuration can be separated into profile configuration and profile overrides.

You can also override web filter behavior based on the FortiGuard website categorization:

- Use alternate categories (web rating overrides): this method manually assigns a specific website to a different Fortinet category or a locally-created category.
- Use alternate profiles: configured users or IP addresses can use an alternative web filter profile when attempting to access blocked websites.

Some features of this functionality require a subscription to FortiGuard Web Filtering.

The following topics provide information about web overrides:

- Web rating override on page 2345
- Using local and remote categories on page 2354
- Web profile override on page 2356

Web rating override

Web rating overrides allow you to apply a category override to a URL. This overrides the original FortiGuard category for the URL with either a different FortiGuard category, a custom local category, or an external feed remote category.

If a URL is in multiple active categories, the order of precedence is local categories, then remote categories, and then FortiGuard categories.

Web rating override requires a FortiGuard license.

This section includes information about override configurations and examples:

- Configuring the category override rule on page 2346
- Sub-category actions on page 2348
- Category override examples on page 2349

Configuring the category override rule

This topic includes information about configuring following category types:

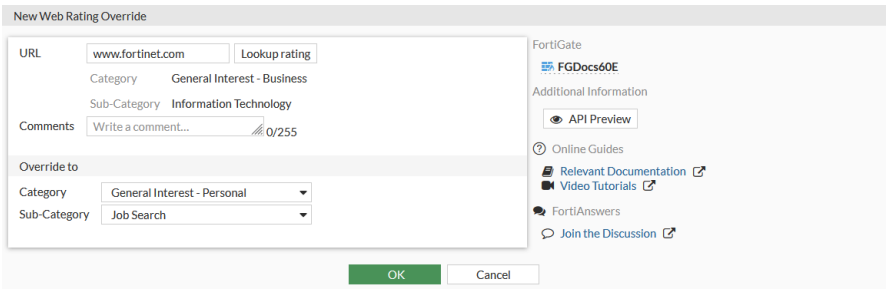
- FortiGuard category override
- Local category override
- Remote category override

Once you have configured the category override rules, ensure that the override category is active in a web filter profile. See Sub-category actions on page 2348 for more information.

To create a FortiGuard category override:

1. Go to *Security Profiles* > *Web Rating Overrides* and click *Create New*.
2. Configure the following settings:

URL		Enter the URL to override.
Lookup rating		Select to view any current *Category* and *Sub-Category* ratings.
Comments		Enter a comment (optional).
Override to		
	Category	Select a FortiGuard category, external feed remote category, or a *Custom Category*.
	Sub-Category	Select a sub-category to further define the rating. If *Custom Category* was selected for the *Category*, you can select from a list of categories you created.



3. Click *OK*.

See Example 1: Override a FortiGuard category with another FortiGuard category on page 2349 for a sample configuration.

To create a custom local category override:

1. Create a custom category :
   a. Go to *Security Profiles* > *Web Rating Overrides*.
   b. Click *Custom Categories*, then click *Create New*.
   c. Configure the following settings:

Name	Enter a unique name for the category.
Status	Enable/disable the status of the category.

   d. Click *OK*.
2. Create a web rating override:
   a. Go to *Security Profiles* > *Web Rating Overrides* and click *Create New*.
   b. Configure the following settings:

URL		Enter the URL to override.
Lookup rating		Select to view any current *Category* and *Sub-Category* ratings.
Comments		Enter a comment (optional).
Override to		
	Category	Select *Custom Category*.
	Sub-Category	Select the custom category that was just created.

   c. Click *OK*.

   See Example 3: Override a FortiGuard category with a custom local category on page 2353 for a sample configuration.

To create an external feed remote category override:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *External Feeds* section, click *FortiGuard Category*.
3. Enter a name for the external feed. This will also be the name of the remote category.

4. Enter the *URL of external resource* that contains the list of URLs that will be overridden in this remote category.
5. Configure the remaining settings as needed, then click *OK*.

See Example 2: Override a FortiGuard category with a remote category on page 2351for a sample configuration.

Sub-category actions

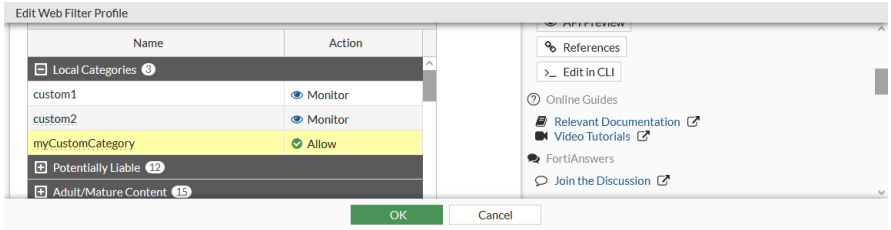
After configuring category override rules, an override category must be active in a web filter profile for it to take effect. Whether a category is active or not depends on the override method and action:

Override method	Active category actions	Inactive category actions
FortiGuard categories	Monitor, Block, Warning, or Authenticate	Allow
Local categories	Allow, Monitor, Block, Warning, or Authenticate	Disable*
Remote categories	Allow, Monitor, Block, Warning, or Authenticate	Disable*

*The *Disable* action is only available for local and remote categories by right clicking on the sub-category.

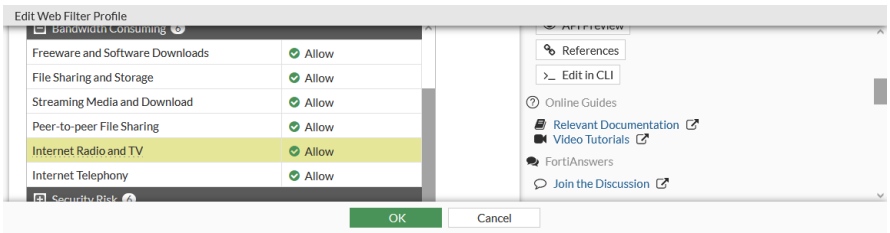
The *Allow* action in the GUI is different for FortiGuard categories compared to local and remote categories.

For local and remote categories, the *Allow* action in the GUI corresponds to the monitor action with logging disabled in the CLI:



```
config webfilter profile
    edit <profile>
        config ftgd-wf
            config filters
                edit 142
                    set category 142
                    set action monitor
                    set log disable
                next
            end
        end
    next
end
```

For FortiGuard categories, the *Allow* action in the GUI corresponds to no entry in the CLI:



The *Internet Radio and TV* sub-category has ID number 75.

```
config webfilter profile
    edit <profile>
        config ftgd-wf
            config filters
            end
        end
    next
end
```

This means that a FortiGuard category with the *Allow* action applied is effectively inactive, as there is no actual action specified in the CLI.

See Category override examples on page 2349 for sample configurations.

Category override examples

This topic includes examples that overrides the original FortiGuard category:

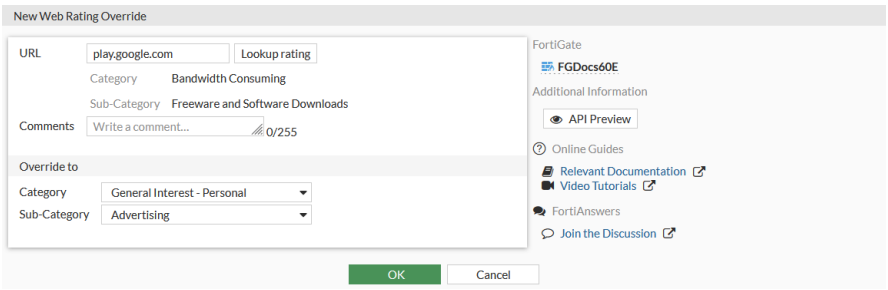
- Example 1: Override a FortiGuard category with another FortiGuard category on page 2349
- Example 2: Override a FortiGuard category with a remote category on page 2351
- Example 3: Override a FortiGuard category with a custom local category on page 2353

Example 1: Override a FortiGuard category with another FortiGuard category

In this example, play.google.com is overridden from its original category, Freeware and Software Download (19), to the Advertising category (17). In the web filter profile, the Advertising category is set to *Block* and the Freeware and Software Download category is set to *Allow*.

To configure a FortiGuard web rating override:

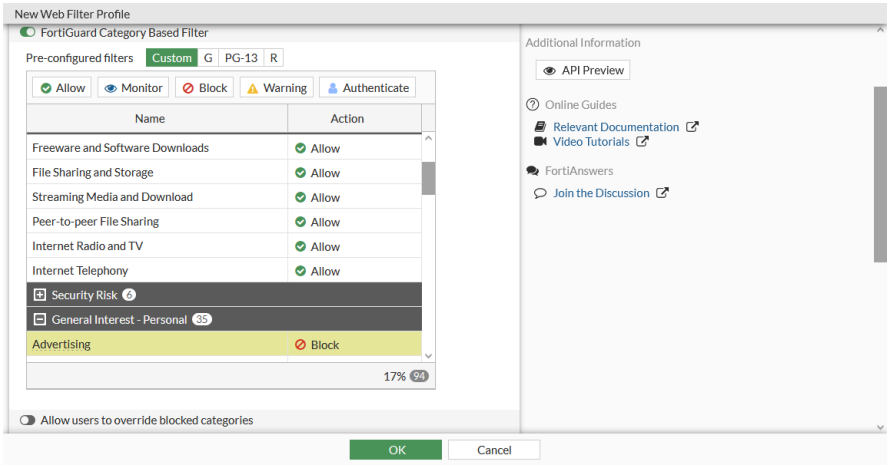
1. Go to *Security Profiles* > *Web Rating Overrides* and click *Create New*.
2. Enter the URL: play.google.com.
3. Optionally, click *Lookup rating* to see what its current rating is.
4. Set the *Category* and *Sub-Category* to an existing category that is different from the original category.



5. Click *OK*.

To apply the category in a web filter profile:

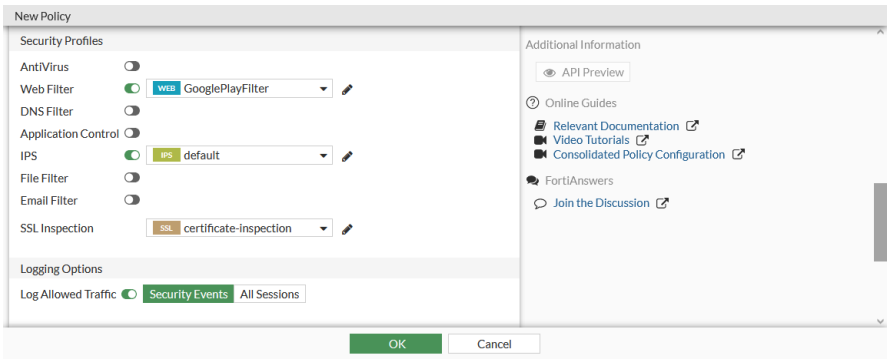
1. Go to *Security Profiles* > *Web Filter* and create or edit a web filter profile. See FortiGuard filter on page 1970 for more information.
2. Enable *FortiGuard category based filter*.
3. Set the action for the *Advertising* category in the *General Interest - Personal* group to *Block*.
4. Set the action for the *Freeware and Software Download* category in the *Bandwidth Consuming* group to *Allow*.



5. Configure the remaining settings required, then click *OK*.

To apply the category in firewall policy:

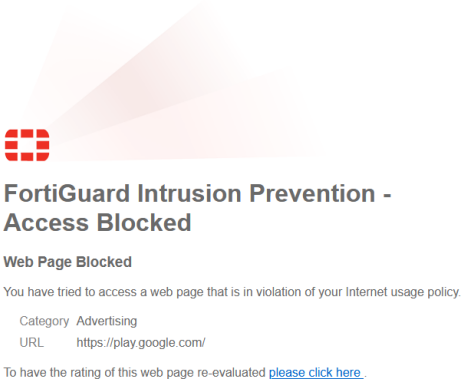
1. Go to *Policy & Objects* > *Firewall Policy* and create or edit a policy.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile that you just created.
4. Set *SSL Inspection* to *certificate-inspection* or *deep-inspection*.



5. Enable *Log Allowed Traffic*.
6. Click *OK*.

To test the filter:

1. From a Workstation behind the firewall, open a browser and browse to play.google.com. The page will be blocked by the category override.



2. Go to *Log & Report* > *Security Events* and select *Web Filter*.
3. View the log details in the GUI, or download the log file:

```
date=2022-09-21 time=16:43:31 eventtime=1663803811966781540 tz="-0700" logid="0316013056"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="root" policyid=2
sessionid=891040 srcip=192.168.2.8 srcport=50318 srcintf="port2" srcintfrole="undefined"
dstip=142.251.211.238 dstport=443 dstintf="port1" dstintfrole="undefined" proto=6
service="HTTPS" hostname="play.google.com" profile="FGD-Override-FGD-Flow" action="blocked"
reqtype="direct" url="https://play.google.com/" sentbyte=517 rcvdbyte=0 direction="outgoing"
msg="URL belongs to a denied category in policy" method="domain" cat=17 catdesc="Advertising"
```

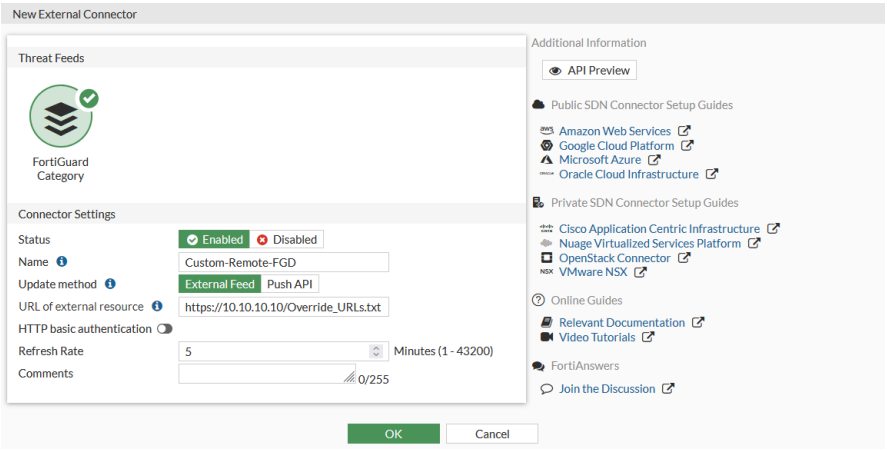
Example 2: Override a FortiGuard category with a remote category

In this example, play.google.com is added to an external URL category list and applied to an external feed. In the web filter profile, the remote category is set to *Allow*, and the original FortiGuard category (Freeware and Software Download) is set to *Block*. Remote categories take precedence over FortiGuard categories, so the override action for the remote category will apply.

Delete the web rating override entry from example 1 for play.google.com before configuring this example.

To configure a FortiGuard external feed for remote category override:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *External Feeds* section, click *FortiGuard Category*.
3. Enter a name for the external feed, such as *Custom-Remote-FGD*. This will be the name of the remote category.
4. Enter the *URL of external resource* that contains the list of URLs that will be overridden to this remote category. This list will contain one entry for play.google.com.



5. Configure the remaining settings as needed, then click *OK*.

To apply the category in a web filter profile:

1. Go to *Security Profiles* > *Web Filter* and create or edit a web filter profile. See FortiGuard filter on page 1970 for more information.
2. Enable *FortiGuard category based filter*.
3. Set the action for the *Custom-Remote-FGD* category in the *Remote Categories* group to *Allow*.
4. Set the action for the *Freeware and Software Download* category in the *Bandwidth Consuming* group to *Block*.
5. Configure the remaining settings are required, then click *OK*.

To apply the category in firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and create or edit a policy.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile that you just created.
4. Set *SSL Inspection* to *certificate-inspection* or *deep-inspection*.
5. Enable *Log Allowed Traffic*.
6. Click *OK*.

To test the filter:

1. From a Workstation behind the firewall, open a browser and browse to play.google.com. The page will be allowed by the remote category override.
2. No logs are recorded because the *Allow* action is selected.

Example 3: Override a FortiGuard category with a custom local category

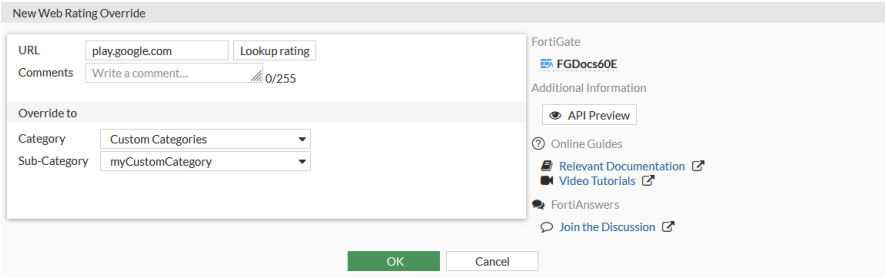
In this example, play.google.com is added to a custom local category. that is set to Monitor in the web filter profile. Local custom categories take precedence over both remote and FortiGuard categories, so the override action for the local category will apply.

To create a custom local category override:

1. Go to *Security Profiles* > *Web Rating Overrides*.
2. Click *Custom Categories*, then click *Create New*.
3. Enter a name for the category, such as *myCustomCategory*, and ensure the *Status* is set to *Enable*.
4. Click *OK*.

To create a web rating override for the custom local category:

1. Go to *Security Profiles* > *Web Rating Overrides* and click *Create New*.
2. Enter the URL to override.
3. For *Category*, select *Custom Categories* and for *Sub-Category* select *myCustomCategory*.



4. Click *OK*.

To apply the category in a web filter profile:

1. Go to *Security Profiles* > *Web Filter* and create or edit a web filter profile. See FortiGuard filter on page 1970 for more information.
2. Enable *FortiGuard category based filter*.
3. Set the action for the *myCustomCategory* category in the *LocalCategories* group to *Monitor*.
4. The other actions can be left as they were at the end of example 2, *Custom-Remote-FGD* set to *Allow* and *Freeware and Software Download* set to *Block*.
5. Configure the remaining settings are required, then click *OK*.

To apply the category in firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and create or edit a policy.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile that you just created.
4. Set *SSL Inspection* to *certificate-inspection* or *deep-inspection*.
5. Enable *Log Allowed Traffic*.
6. Click *OK*.

To test the filter:

1. From a Workstation behind the firewall, open a browser and browse to play.google.com. The page will be allowed by the local category override.
2. Go to *Log & Report* > *Security Events* and select *Web Filter*.
3. View the log details in the GUI, or download the log file:

```
date=2022-09-21 time=17:17:00 eventtime=1663805820486294353 tz="-0700" logid="0317013312"
type="utm" subtype="webfilter" eventtype="ftgd_allow" level="notice" vd="root" policyid=2
sessionid=893147 srcip=192.168.2.8 srcport=50417 srcintf="port2" srcintfrole="undefined"
dstip=142.251.211.238 dstport=443 dstintf="port1" dstintfrole="undefined" proto=6
service="HTTPS" hostname="play.google.com" profile="FGD-Override-FGD-Flow"
action="passthrough" reqtype="direct" url="https://play.google.com/" sentbyte=517 rcvdbyte=0
direction="outgoing" msg="URL belongs to an allowed category in policy" method="domain"
cat=142 catdesc="myCustomCategory"
```

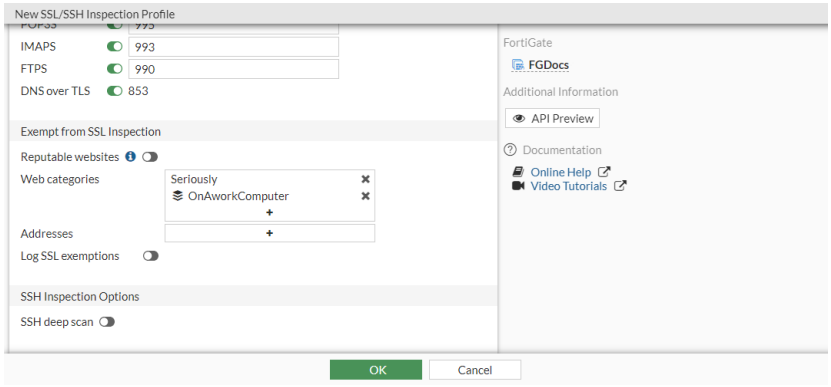
Using local and remote categories

For some functions, local and remote FortiGuard categories must be explicitly selected to apply. In SSL/SSH inspection profiles, custom categories must be explicitly selected to be exempt from SSL inspection. In Proxy addresses, custom categories must be explicitly selected as URL categories for them to apply. In both settings, if a URL is in multiple selected categories, the order of precedence is local categories, then remote categories, and then FortiGuard categories.

SSL/SSH inspection profiles

To use local and remote categories in an SSL/SSH inspection profile to exempt them from SSL inspection in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection*.
2. Create a new profile or edit an existing one.
3. Ensure that *Inspection method* is *Full SSL Inspection*.
4. In the *Exempt from SSL Inspection* section, add the local and remote categories to the *Web categories* list .



5. Configure the remaining settings as required, then click *OK*.

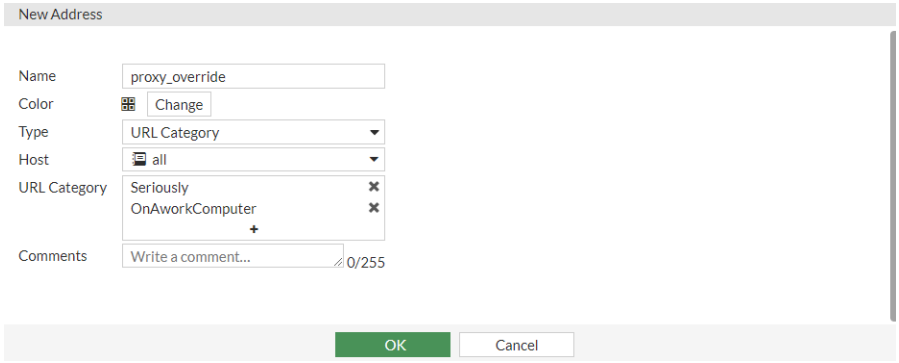
To use local and remote categories in an SSL/SSH inspection profile to exempt them from SSL inspection in the CLI:

```
config vdom
    edit root
        config firewall ssl-ssh-profile
            edit "SSL_Inspection"
                config https
                    set ports 443
                    set status deep-inspection
                end
                ...
                config ssl-exempt
                    edit 1
                        set fortiguard-category 140
                    next
                    edit 2
                        set fortiguard-category 192
                    next
                end
            next
        end
    next
end
```

Proxy addresses

To use local and remote categories in a proxy address in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Proxy* > *Address*.
2. Click *Create new* or edit an existing proxy address.
3. Set *Type* to *URL Category*.
4. In the *URL Category*, add the local and remote categories.



5. Configure the remaining settings as required, then click *OK*.

To use local and remote categories in a proxy address in the CLI:

```
config vdom
    edit root
        config firewall proxy-address
            edit "proxy_override"
                set type category
                set host "all"
                set category 140 192
                set color 23
            next
        end
    next
end
```

Web profile override

The following profile override methods are available:

- Administrative override
- Allow users to override blocked categories

Administrative override

Administrators can grant temporary access to sites that are otherwise blocked by a web filter profile. You can grant temporary access to a user, user group, or source IP address. You can set the time limit by selecting a date and time. The default is 15 minutes.

When the administrative web profile override is enabled, a blocked access page or replacement message does not appear, and authentication is not required.

Scope range

You can choose one of the following scope ranges:

- User: authentication for permission to override is based on whether or not the user is using a specific user account.
- User group: authentication for permission to override is based on whether or not the user account supplied as a credential is a member of the specified user group.
- Source IP: authentication for permission to override is based on the IP address of the computer that was used to authenticate. This would be used for computers that have multiple users. For example, if a user logs on to the computer, engages the override by using their credentials, and then logs off, anyone who logs on with an account on that computer would be using the alternate override web filter profile.

When you enter an IP address in the administrative override method, only individual IP addresses are allowed.

Differences between IP and identity-based scope

Using the IP scope does not require using an identity-based policy.

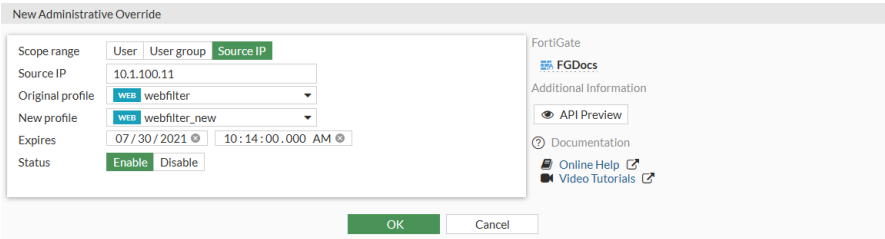
When using the administrative override method and IP scope, you might not see a warning message when you change from using the original web filter profile to using the alternate profile. There is no requirement for credentials from the user so, if allowed, the page will just appear in the browser.

Configuring a web profile administrative override

This example describes how to override the *webfilter* profile with the *webfilter_new* profile.

To configure web profile administrative override using the GUI:

1. Go to *Security Profiles* > *Web Profile Overrides* and click *Create New*.
2. Configure the administrative override:
   a. For *Scope Range*, click *Source IP*.
   b. In the *Source IP* field, enter the IP address for the client computer (*10.1.100.11* in this example).
   c. In the *Original profile* dropdown, select *webfilter*.
   d. In the *New profile* dropdown, select *webfilter_new*.
   In the *Expires* field, the default 15 minutes appears, which is the desired duration for this example.



3. Click *OK*.

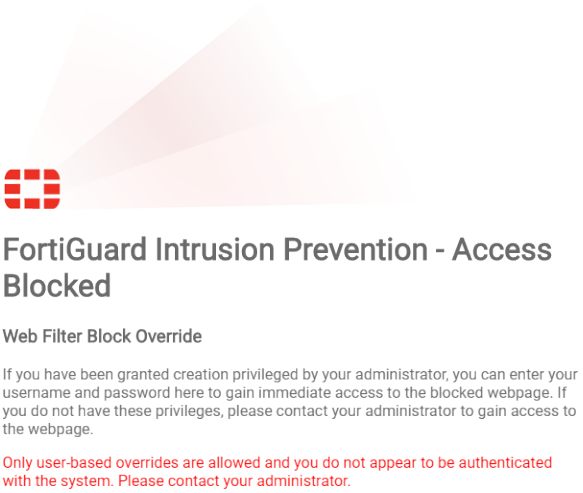
To configure web profile administrative override using the CLI:

```
config webfilter override
    edit 1
        set status enable
        set scope ip
        set old-profile "webfilter"
        set new-profile "webfilter_new"
        set expires 2021/07/30 10:14:00
        set initiator "admin"
        set ip 10.1.100.11
    next
end
```

Allow users to override blocked categories

For both override methods, the scope ranges (for specified users, user groups, or IP addresses) allow sites blocked by web filtering profiles to be overridden for a specified length of time.

But there is a difference between the override methods when the users or user group scope ranges are selected. In both cases, you would need to apply the user or user group as source in the firewall policy. With administrative override, if you do not apply the source in the firewall policy, the traffic will not match the override and will be blocked by the original profile. With the *Allow users to override blocked categories* setting, the traffic will also be blocked, but instead of displaying a blocking page, the following message appears:



When you choose the user group scope, once one user overrides, it will affect the other users in the group when they attempt to override. For example, user1 and user2 both belong to the local_user group. Once user1 successfully overrides, this will generate an override entry for the local_user group instead of one specific user. This means that if user2 logs in from another PC, they can override transparently.

Other features

Besides the scope, there are some other features in *Allow users to override blocked categories*.

Apply to user groups

Individual users can not be selected. You can select one or more of the user groups recognized by the FortiGate. They can be local to the system or from a third party authentication device, such as an AD server through FSSO.

Switch duration

Administrative override sets a specified time frame that is always used for that override. The available options are:

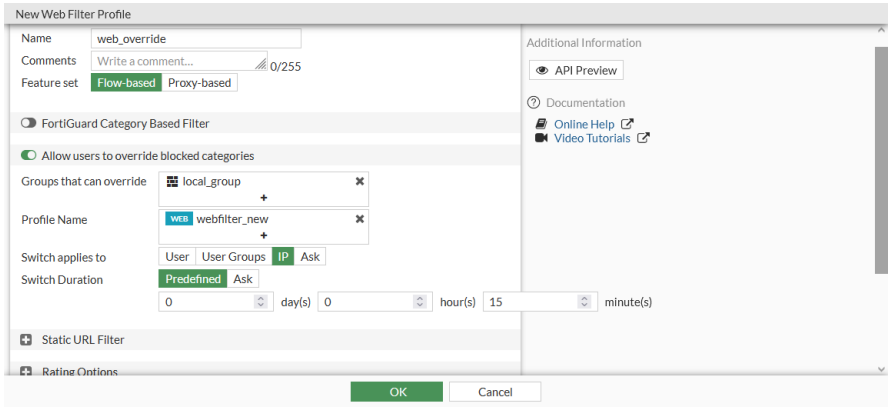
- *Predefined*: the value entered is the set duration (length of time in days, hours, or minutes) that the override will be in effect. If the duration variable is set to 15 minutes, the length of the override will always be 15 minutes. The option will be visible in the override message page, but the setting will be grayed out.
- *Ask*: the user has the option to set the override duration once it is engaged. The user can set the duration in terms of days, hours, or minutes.

Creating a web profile users override

This example describes how to allow users in the *local_group* to override the *webfilter_new* profile.

To allow users to override blocked categories using the GUI:

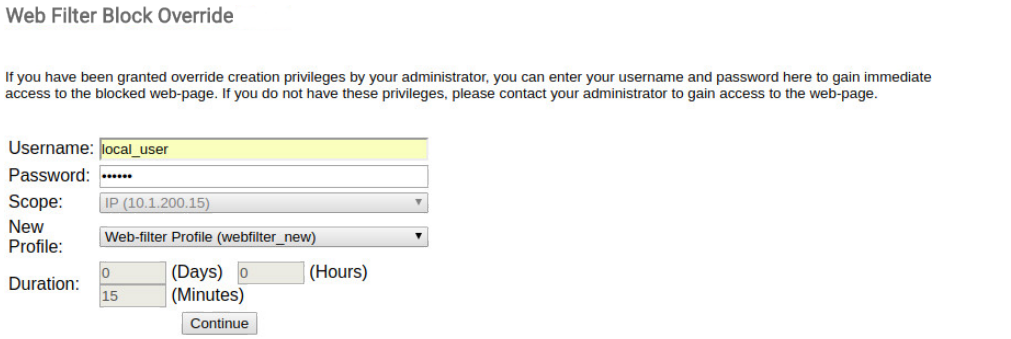
1. Go to *Security Profiles* > *Web Filter* and click *Create New*.
2. Enter a name for the profile.
3. Enable *Allow users to override blocked categories*.
4. Configure the web filter profile:
   a. Click the *Groups that can override* field, and select a group (*local_group* in this example).
   b. Click the *Profile Name* field, and select the *webfilter_new* profile.
   c. For the *Switch applies to* field, click *IP*.
   d. For the *Switch Duration* field, click *Predefined*. The default *15* minutes appears, which is the desired duration for this example.
   e. Configure the rest of the profile as needed.



5. Click *OK*.

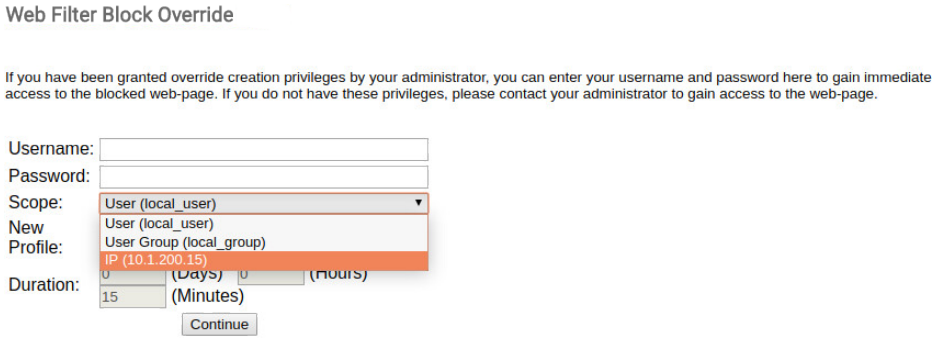
Using the ask feature

This option is only available in *Allow users to override blocked categories* is enabled. It configures the message page to have the user choose which scope they want to use. Normally on the message page, the scope options are grayed out and not editable. In the following example, the *Scope* is predefined with *IP*.



When the ask option is enabled (through the *Switch applies to* field in the GUI), the *Scope* dropdown is editable. Users can choose one of the following:

- User
- User group
- IP



User and *User Group* are only available when there is a user group in the firewall policy. You must specify a user group as a source in the firewall policy so the scope includes *User* and *User Group*; otherwise, only the IP option will be available.

IP ban

The FortiGate IP ban feature is a powerful tool for network security. It allows the system to block traffic originating from specific IP addresses that are deemed potentially harmful by the system administrator.

When an IP address is banned, any active connections originating from the banned IP address are immediately terminated. Any subsequent connection attempts are rejected by the Kernel's packet filter, further fortifying the network's security.

Checks for IP bans are carried out only if there is a corresponding firewall policy with an ACCEPT action. If a match is found, the action is then altered to DENY. In scenarios where there is no matching policy, the connection is refused due to the implicit deny rule that is in effect.

Several methods can be used to ban IP addresses:

- FortiView Source: This method allows you to ban an IP address directly from the *FortiView Sources* monitor. See To ban an IP address for more information.
- IP ban: Administrators can configure an automation stitch with the *IP Ban* action, using a trigger such as a *Compromised Host* or an *Incoming Webhook*. When the automation is triggered, the client PC is quarantined. See Actions on page 3914 and Incoming Webhook Quarantine stitch on page 3887 for more information. The Automation Stitch feature can also be used to configure IP bans from other fabric devices.
- Command line interface (CLI): For those who prefer using command line, IP ban can be added with the CLI. See IP ban using the CLI on page 2361 for more information.
- Security profiles: Most security profiles include a mechanism to ban a source IP address. See IP ban using security profiles on page 2362 for more information.

- DoS policy: A Denial of Service (DoS) policy can be used to block any further traffic from a source IP address that is considered a malicious actor. See DoS policy on page 1621 for more information.

Additionally, administrators can control whether the banned IP list remains intact through a power cycle. See Configuring the persistency for a banned IP list on page 2364 for more information.

IP ban using the CLI

Administrators can use the following command to manage the banned IP address list:

```
# diagnose user banned-ip {list | add | delete | clear | stat}
```

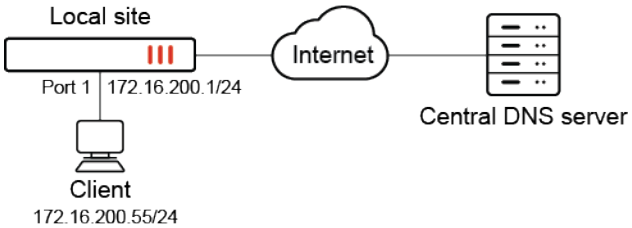
Option	Description
`list`	List banned IPs.
`add`	Add banned IP address.
`delete`	Delete banned IP address.
`clear`	Clear all banned IP addresses.
`stat`	Statistics

To add an IP address to the ban list:

```
# diagnose user banned-ip add <src4 | src6> <src-ipv4 | src-ipv6> <expiry> <admin | dlp | ips | av
| dos | app>
```

Setting the expiry time to `0` results in an indefinite expiry time. If this is combined with the `banned-ip-persistency` (either `permanent-only` or `all`), the ban becomes permanent.

Example



In this example, a client PC is configured with the IP address 172.16.200.55, and an administrator adds the IP address to the IP ban list.

To add an IP address to the ban list:

```
# diagnose user banned-ip add src4 172.16.200.55 2 admin
```

To view the banned IP list:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
172.16.200.55       Tue Jan 16 14:46:00 2024 Tue Jan 16 14:56:00 2024 Administrative
```

To verify that the banned IP list is working:

1. From the client with the banned IP address of 172.16.200.55, send a DNS query for a domain that is configured on the Central DNS server.
2. Go to *Log & Report > Forward Traffic*, and search for IP address *172.16.200.55*.
3. View the log details in the GUI, or download the log file.
   In the following log file example, action is deny for source IP 172.16.200.55.

```
date=2024-01-16 time=14:48:43 eventtime=1705445143824107713 tz="+1200" logid="0000000013"

```

IP ban using security profiles

Configure one or all of the security profiles to quarantine all traffic originating from the infected host's IP address for a configurable duration. The IP address of the attacker is also incorporated into the list of banned users. The address of the target remains unaffected.

The following types of security profiles can be used to ban IP addresses:

- Antivirus on page 2362
- Application control on page 2363
- DLP on page 2363
- IPS on page 2364

Antivirus

To ban IP addresses using an antivirus profile:

1. Configure an antivirus profile:

```
config antivirus profile
    edit <name>
    config nac-quar
```

```
    set infected quar-src-ip
    set expiry <duration>
 end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr       created                 expires                 cause
172.16.200.55       Wed Jan 17 13:06:05 2024 Wed Jan 17 13:08:05 2024 AV
```

Application control

Quarantine is available as one of the action types when the application matches this application control profile. See Basic category filters and overrides on page 2080 for more information.

To ban IP addresses using an application control profile:

1. Configure the application control profile:

```
config application list
    edit <name>
        config entries
            edit <id>
                set quarantine attacker
                set quarantine-expiry <duration>
            next
        end
    next
end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr       created                 expires                 cause     172.16.200.55
   Thu Jan 18 07:17:13 2024 Thu Jan 18 07:22:13 2024 APP
```

DLP

Quarantine is available as one of the action types when the content matches this DLP profile. See Basic DLP settings on page 2230 for more information

To ban IP addresses using a DLP profile:

1. Configure the DLP profile:

```
config dlp profile
    edit <name>
        config rule
```

```
            edit <id>
                set proto <protocols>
                set action quarantine-ip
                set expiry <duration>
            next
        end
    next
end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause     172.16.200.55
   Thu Jan 18 07:03:03 2024 Thu Jan 18 07:05:03 2024 DLP
```

IPS

Quarantine is available as one of the action types when the signature matches this IPS profile. A protocol must also be set. See Configuring an IPS sensor on page 2119 for more information.

To ban IP addresses using an IPS profile:

1. Configure the IPS profile:

```
config ips sensor
    edit <name>
        config entries
            edit <id>
                set quarantine attacker
                set quarantine-expiry <duration>
            next
        end
end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
172.16.200.55      Thu Jan 18 06:42:06 2024 Thu Jan 18 06:44:06 2024 IPS
```

Configuring the persistency for a banned IP list

The `banned-ip-persistency` option configures whether the banned IP list persists through a power cycle.

```
config firewall global
    set banned-ip-persistency {disabled | permanent-only | all}
end
```

`banned-ip-persistency {disabled | permanent-only | all}`	Set the persistency of banned IPs across power cycling: • `disabled`: no entries are kept across power cycling (default). • `permanent-only`: only permanent IP bans are kept across power cycling. • `all`: all IP bans are kept across power cycling.

The banned IP list is created from quarantining. For example, when quarantining is enabled for IPS, application control, and DDoS. Permanent quarantining can be added manually using `diagnose user banned-ip add src4`.

The `diagnose user quarantine <parameter>` command has changed to `diagnose user banned-ip <parameter>`.

Example 1: keep all banned IPs across power cycling

When `banned-ip-persistency` is set to `all`, all the banned IPs are saved after a reboot. In this example, an application control security profile with quarantining is already configured. After traffic is generated that triggers the quarantine rule, a quarantine list is generated.

To view the list of banned IPs:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
10.1.100.12       Tue Jul  5 18:01:05 2022 Tue Jul  5 18:21:05 2022 APP
```

After a reboot, the banned IP list is the same:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
10.1.100.12       Tue Jul  5 18:01:05 2022 Tue Jul  5 18:21:05 2022 APP
```

Example 2: keep only permanent banned IPs across power cycling

When `banned-ip-persistency` is set to `permanent-only`, only banned IPs with an indefinite expiry time are saved after a reboot. The permanent IP ban was already configured for 10.1.100.11 using `diagnose user banned-ip add src4 10.1.100.11 0 ips`.

To view the list of banned IPs:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
10.1.100.12       Tue Jul  5 18:01:05 2022 Tue Jul  5 18:21:05 2022 APP
10.1.100.11       Tue Jul  5 18:06:35 2022 indefinite               IPS
```

After a reboot, only 10.1.100.11 remains in the banned IP list:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
10.1.100.11       Tue Jul  5 18:06:35 2022 indefinite               IPS
```

Profile groups

Security profiles can be organized into groups. They are useful when there are multiple policies that use the same security profiles, helping save time and preventing missing profiles when configuring policies. When changes need to be made, only the group has to be changed and not the individual policies.

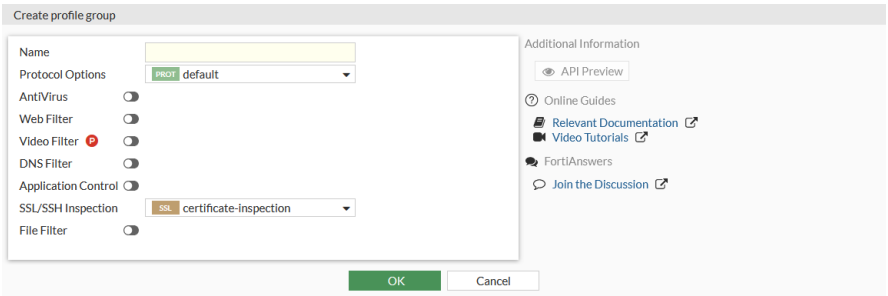
By default, *Security Profiles* > *Profile Groups* is not visible in the GUI. It can only be enabled using the CLI.

To show profile groups in the GUI:

```
config system settings
    set gui-security-profile-group enable
end
```

To configure a profile group in the GUI:

1. Go to *Security Profiles* > *Profile Groups* and click *Create New*.



2. Enter a name for the group.
3. Enable the required profile types and select the profile that will be included in the group.
   A *Protocol Option* must be selected.
4. Click *OK*.

To configure a profile group in the CLI:

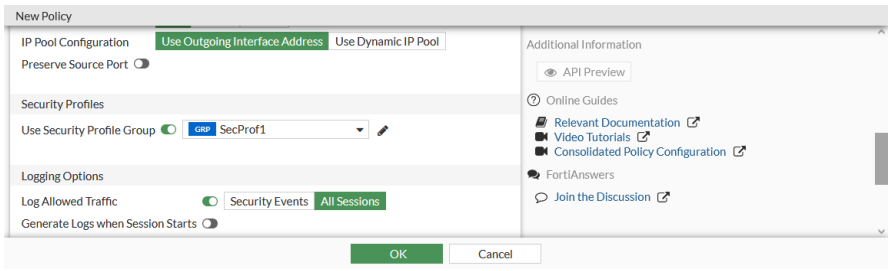
```
config firewall profile-group
    edit <name>
        set application-list <string>
        set av-profile <string>
        set casb-profile <string>
        set cifs-profile <string>
        set diameter-filter-profile <string>
        set dlp-profile <string>
        set dnsfilter-profile <string>
        set emailfilter-profile <string>
        set file-filter-profile <string>
        set icap-profile <string>
        set ips-sensor <string>
        set profile-protocol-options <string>
```

```
        set sctp-filter-profile <string>
        set ssh-filter-profile <string>
        set ssl-ssh-profile <string>
        set videofilter-profile <string>
        set virtual-patch-profile <string>
        set voip-profile <string>
        set waf-profile <string>
        set webfilter-profile <string>
    next
end
```

`application-list <string>`	Name of an existing application list.
`av-profile <string>`	Name of an existing antivirus profile.
`casb-profile <string>`	Name of an existing CASB profile.
`cifs-profile <string>`	Name of an existing CIFS profile.
`diameter-filter-profile <string>`	Name of an existing Diameter filter profile.
`dlp-profile <string>`	Name of an existing DLP profile.
`dnsfilter-profile <string>`	Name of an existing DNS filter profile.
`emailfilter-profile <string>`	Name of an existing email filter profile.
`file-filter-profile <string>`	Name of an existing file-filter profile.
`icap-profile <string>`	Name of an existing ICAP profile.
`ips-sensor <string>`	Name of an existing IPS sensor profile.
`profile-protocol-options <string>`	Name of an existing protocol options profile (default = `default`).
`sctp-filter-profile <string>`	Name of an existing SCTP filter profile.
`ssh-filter-profile <string>`	Name of an existing SSH filter profile.
`ssl-ssh-profile <string>`	Name of an existing SSL SSH profile (default = `certificate-inspection`).
`videofilter-profile <string>`	Name of an existing video filter profile.
`virtual-patch-profile <string>`	Name of an existing virtual-patch profile.
`voip-profile <string>`	Name of an existing VOIP profile.
`waf-profile <string>`	Name of an existing WAF profile.
`webfilter-profile <string>`	Name of an existing web filter profile.

To use the profile group in a policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and edit an existing policy or create a new one.
2. In the *Security Profiles* section, enable *Use Security Profile Group* and select a group.
   No individual profiles can be selected if using a profile group.



3. Click *OK*.

To use the profile group in a policy in the CLI:

```
config firewall policy
    edit <policyid>
        set name <string>
        set srcintf <interface(s)>
        set dstintf <interface(s)>
        set action {accept | deny | ipsec}
        set srcaddr <address(es)>
        set dstaddr <address(es)>
        set schedule <schedule>
        set service <service(s)>
        set utm-status enable
        set profile-type group
        set profile-group <group>
    next
end
```

IPsec VPN

Virtual Private Network (VPN) technology lets remote users connect to private computer networks to gain access to their resources in a secure way. For example, an employee traveling or working at home can use a VPN to securely access the office network through the internet.

Instead of remotely logging into a private network using an unencrypted and unsecured internet connection, using a VPN ensures that unauthorized parties cannot access the office network and cannot intercept information going between the employee and the office. Another common use of a VPN is to connect the private networks of multiple offices.

IPsec VPN uses the Internet Protocol Security (IPsec) protocol to create encrypted tunnels on the internet. The IPsec protocol operates at the network layer of the OS model and runs on top of the IP protocol, which routes packets. All transmitted data is protected by the IPsec tunnel.

The following sections provide instructions on configuring IPsec VPN connections in FortiOS 7.6.2.

- General IPsec VPN configuration on page 2369
- Site-to-site VPN on page 2414
- Remote access on page 2492
- Aggregate and redundant VPN on page 2578
- ADVPN on page 2623
- Fabric Overlay Orchestrator on page 2662
- Other VPN topics on page 2683
- VPN IPsec troubleshooting on page 2766

General IPsec VPN configuration

The following sections provide instructions on general IPsec VPN configurations:

- Network topologies on page 2370
- Phase 1 configuration on page 2370
- Phase 2 configuration on page 2396
- VPN security policies on page 2400
- Blocking unwanted IKE negotiations and ESP packets with a local-in policy on page 2403
- Configurable IKE port on page 2405
- IPsec VPN IP address assignments on page 2408
- Renaming IPsec tunnels on page 2411

Network topologies

The topology of your network will determine how remote peers and clients connect to the VPN and how VPN traffic is routed.

Topology	Description
Site-to-Site	Standard one-to-one VPN between two FortiGates. See Site-to-site VPN on page 2414.
Hub and spoke/ADVPN	One central FortiGate (hub) has multiple VPNs to other remote FortiGates (spokes). In ADVPN, shortcuts can be created between spokes for direct communication. See ADVPN on page 2623.
FortiClient dialup	Typically remote FortiClient dialup clients use dynamic IP addresses through NAT devices. The FortiGate acts as a dialup server allowing dialup VPN connections from multiple sources. See FortiClient as dialup client on page 2502.
FortiGate dialup	Similar to site-to-site except one end is a dialup server and the other end is a dialup client. This facilitates scenarios in which the remote dialup end has a dynamic address, or does not have a public IP, possibly because it is behind NAT. See FortiGate as dialup client on page 2492.
Aggregate VPN	Natively support aggregating multiple VPN tunnels to increase performance and provide redundancy over multiple links. See Packet distribution and redundancy for aggregate IPsec tunnels on page 2595.
Redundant VPN	Options for supporting redundant and partially redundant IPsec VPNs, using route-based approaches. See Redundant hub and spoke VPN on page 2618.
L2TP over IPsec	Configure VPN for Microsoft Windows dialup clients using the built in L2TP software. Users do not have to install any Fortinet software. See L2TP over IPsec on page 2527.
GRE over IPsec	Legacy support for routers requiring point-to-point GRE over IPsec for tunneling. See GRE over IPsec on page 2446.

Phase 1 configuration

Phase 1 configuration primarily defines the parameters used in IKE (Internet Key Exchange) negotiation between the ends of the IPsec tunnel. The local end is the FortiGate interface that initiates the IKE negotiations. The remote end is the remote gateway that responds and exchanges messages with the initiator. Hence, they are sometimes referred to as the initiator and responder. The purpose of phase 1 is to secure a tunnel with one bi-directional IKE SA (security association) for negotiating IKE phase 2 parameters.

The `auto-negotiate` and `negotiation-timeout` commands control how the IKE negotiation is processed when there is no traffic, and the length of time that the FortiGate waits for negotiations to occur.

IPsec tunnels can be configured in the GUI using the *VPN Wizard*. Go to *VPN > VPN Wizard*. The wizard includes several templates (site-to-site, hub and spoke, remote access), but a custom tunnel can be configured with the following settings.

The IPsec phase 1 interface type cannot be changed after it is configured. This is due to the tunnel ID parameter (`tun_id`), which is used to match routes to IPsec tunnels to forward traffic. If the IPsec phase 1 interface type needs to be changed, a new interface must be configured.

For FortiOS 7.4.0, SSL VPN web mode, explicit web proxy, and interface mode IPsec VPN features will not work with the following configuration:

1. An IP pool with ARP reply enabled is configured.
2. This IP pool is configured as the source IP address in a firewall policy for SSL VPN web mode, in a proxy policy for explicit web proxy, or as the local gateway in the Phase 1 settings for an interface mode IPsec VPN.
3. A matching blackhole route is configured for IP pool reply traffic.

Configuring an IP pool as the source NAT IP address in a regular firewall policy works as before.

For details, see Technical Tip: IP pool and virtual IP behaviour changes in FortiOS 6.4, 7.0, 7.2, and 7.4.

Name		Phase 1 definition name. The maximum length is 15 characters for an interface mode VPN and 35 characters for a policy-based VPN. For a policy-based VPN, the name normally reflects where the remote connection originates. For a route-based tunnel, the FortiGate also uses the name for the virtual IPsec interface that it creates automatically.
Network		
	IP Version	Protocol, either IPv4 or IPv6.
	Remote Gateway	Category of the remote connection: • *Static IP Address*: the remote peer has a static IP address. • *Dialup User*: one or more FortiClient or FortiGate dialup clients with dynamic IP addresses will connect to the FortiGate. • *Dynamic DNS*: a remote peer that has a domain name and subscribes to a dynamic DNS service will connect to the FortiGate.
	IP Address	The IP address of the remote peer. This option is only available when the *Remote Gateway* is *Static IP Address*.
	Dynamic DNS	The domain name of the remote peer. This option is only available when the *Remote Gateway* is *Dynamic DNS*.
	Interface	The interface through which remote peers or dialup clients connect to the FortiGate. This option is only available in NAT mode.

		By default, the local VPN gateway IP address is the IP address of the interface that was selected (*Primary IP* in the *Local Gateway* field).
	Local Gateway	IP address for the local end of the VPN tunnel (*Primary IP* is used by default): • *Secondary IP*: secondary address of the interface selected in the *Interface* field. • *Specify*: manually enter an address. Interface mode cannot be configured in a transparent mode VDOM.
	Mode Config	This option is only available when the *Remote Gateway* is *Dialup User*. Configure the client IP address range, subnet mask/prefix length, DNS server, and split tunnel capability to automate remote client addressing.
	NAT Traversal	This option is only available when the *Remote Gateway* is *Static IP Address* or *Dynamic DNS*. ESP (encapsulating security payload), the protocol for encrypting data in the VPN session, uses IP protocol 50 by default. However, it does not use any port numbers so when traversing a NAT device, the packets cannot be demultiplexed. Enabling NAT traversal encapsulates the ESP packet inside a UDP packet, thereby adding a unique source port to the packet. This allows the NAT device to map the packets to the correct session. • *Enable*: a NAT device exists between the local FortiGate and the VPN peer or client. Outbound encrypted packets are wrapped inside a UDP IP header that contains a port number. The local FortiGate and the VPN peer or client must have the same NAT traversal setting (both selected or both cleared) to connect reliably. When in doubt, enable NAT traversal. • *Disable*: disable the NAT traversal setting. • *Forced*: the FortiGate will use a port value of zero when constructing the NAT discovery hash for the peer. This causes the peer to think it is behind a NAT device, and it will use UDP encapsulation for IPsec, even if no NAT is present. This approach maintains interoperability with any IPsec implementation that supports the NAT-T RFC.
	Keepalive Frequency	Keepalive frequency setting. This option is only available when *NAT Traversal* is set to *Enable* or *Forced*. The NAT device between the VPN peers may remove the session when the VPN connection remains idle for too long. The value represents an interval in seconds where the connection will be maintained with periodic keepalive packets. The keepalive interval must be smaller than the session lifetime value used by the NAT device. The keepalive packet is a 138-byte ISAKMP exchange.

	Dead Peer Detection	Reestablishes VPN tunnels on idle connections and cleans up dead IKE peers if required. This feature minimizes the traffic required to check if a VPN peer is available or unavailable (dead). The available options are: • *Disable*: disable dead peer detection (DPD). • *On Idle*: triggers DPD when IPsec is idle. • *On Demand*: Passively sends DPD to reduce load on the firewall. Only triggers DPD when IPsec outbound packets are sent, but no reply is received from the peer. When there is no traffic and the last DPD-ACK has been received, IKE will not send DPDs periodically. Notifications are received whenever a tunnel goes up or down, or to keep the tunnel connection open when no traffic is being generated inside the tunnel. For example, in scenarios where a dialup client or dynamic DNS peer connects from an IP address that changes periodically, traffic may be suspended while the IP address changes. When *Dead Peer Detection* is selected, optionally specify a retry count and a retry interval using `dpd-retrycount` and `dpd-retryinterval`. See Dead peer detection on page 2379.
	Forward Error Correction	Enable on both ends of the tunnel to correct errors in data transmission by sending redundant data across the VPN.
	Device creation	Advanced option. When enabled, a dynamic interface (network device) is created for each dialup tunnel.
	Aggregate member	Advanced option. When enabled, the tunnel can be used as an aggregate member candidate.
Authentication		
	Method	Either *Pre-shared Key* or *Signature*.
	Pre-shared Key	The pre-shared key that the FortiGate will use to authenticate itself to the remote peer or dialup client during phase 1 negotiations. The same key must be defined at the remote peer or client. See Pre-shared key.
	Certificate Name	The server certificate that the FortiGate will use to authenticate itself to the remote peer or dialup client during phase 1 negotiations. See Digital certificates.
	IKE Version	Either *1* or *2*. See Choosing IKE version 1 and 2 on page 2380.
	Mode	This option is only available when IKEv1 is selected. The two available options are: • *Aggressive*: the phase 1 parameters are exchanged in a single message with unencrypted authentication information. • *Main (ID protection)*: the phase 1 parameters are exchanged in multiple rounds with encrypted authentication information. When the remote VPN peer has a dynamic IP address and is authenticated by a pre-shared key, you must select *Aggressive* mode if there is more than one dialup phase 1 configuration for the interface IP address.

		When the remote VPN peer has a dynamic IP address and is authenticated by a certificate, you must select *Aggressive* mode if there is more than one phase 1 configuration for the interface IP address and these phase 1 configurations use different proposals.
	Peer Options	Options to authenticate VPN peers or clients depending on the *Remote Gateway* and *Authentication Method* settings.
	Any peer ID	Accepts the local ID of any remote VPN peer or client. The FortiGate does not check identifiers (local IDs). *Mode* can be set to *Aggressive* or *Main*. This option can be used with digital certificate authentication, but for higher security, use *Peer certificate*.
	Specific peer ID	This option is only available when *Aggressive Mode* is enabled. Enter the identifier that is used to authenticate the remote peer. The identifier must match the local ID configured by the remote peer's administrator. If the remote peer is a FortiGate, the identifier is specified in the *Local ID* field of the *Phase 1 Proposal* settings. If the remote peer is a FortiClient user, the identifier is specified in the *Local ID* field. In circumstances where multiple remote dialup VPN tunnels exist, each tunnel must have a peer ID set.
	Peer certificate	Define the CA certificate used to authenticate the remote peer when the authentication mode is *Signature*. If the FortiGate will act as a VPN client, and you are using security certificates for authentication, set the *Local ID* to the distinguished name (DN) of the local server certificate that the FortiGate unit will use for authentication purposes.
	Peer ID from dialup group	Authenticate multiple FortiGate or FortiClient dialup clients that use unique identifiers and unique pre-shared keys (or unique pre-shared keys only) through the same VPN tunnel. You must create a dialup user group for authentication purposes. Select the group from the list next to the *Peer ID from dialup group* option. You must set *Mode* to *Aggressive* when the dialup clients use unique identifiers and unique pre-shared keys. If the dialup clients use unique pre-shared keys only, you can set *Mode* to *Main* if there is only one dialup Phase 1 configuration for this interface IP address.
Phase 1 Proposal		The encryption and authentication algorithms used to generate keys for the IKE SA. There must be a minimum of one combination. The remote peer or client must be configured to use at least one of the proposals that you define.
	Encryption	The following symmetric-key encryption algorithms are available:

		• *DES*: Digital Encryption Standard, a 64-bit block algorithm that uses a 56-bit key. • *3DES*: triple-DES; plain text is encrypted three times by three keys. • *AES128*: Advanced Encryption Standard, a 128-bit block algorithm that uses a 128-bit key. • *AES128GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 128-bit key. Only available for IKEv2. • *AES192*: a 128-bit block algorithm that uses a 192-bit key. • *AES256*: a 128-bit block algorithm that uses a 256-bit key. • *AES256GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 256-bit key. Only available for IKEv2. • *CHACHA20POLY1305*: a 128-bit block algorithm that uses a 128-bit key and a symmetric cipher. Only available for IKEv2. See also HMAC settings.
	Authentication	The following message digests that check the message authenticity during an encrypted session are available: • *MD5*: message digest 5. • *SHA1*: secure hash algorithm 1; a 160-bit message digest. • *SHA256*: a 256-bit message digest. • *SHA384*: a 384-bit message digest. • *SHA512*: a 512-bit message digest. In IKEv2, encryption algorithms include authentication, but a PRF (pseudo random function) is still required (*PRFSHA1*, *PRFSHA256*, *PRFSHA384*, *PRFSHA512*). See also HMAC settings.
	Diffie-Hellman Groups	Asymmetric key algorithms used for public key cryptography. Select one or more from groups 1, 2, 5, and 14 through 32. At least one of the *Diffie-Hellman Groups* (DH) settings on the remote peer or client must match one the selections on the FortiGate. Failure to match one or more DH groups will result in failed negotiations.
	Key Lifetime	The time (in seconds) that must pass before the IKE encryption key expires. When the key expires, a new key is generated without interrupting service. The keylife can be from 120 to 172 800 seconds.
	Local ID	Optional setting. This value must match the peer ID value given for the remote VPN peer's *Peer Options*. • If the FortiGate will act as a VPN client and you are using peer IDs for authentication purposes, enter the identifier that the FortiGate will supply to the VPN server during the phase 1 exchange. • If the FortiGate will act as a VPN client and you are using security certificates for authentication, select the distinguished name (DN) of the local server certificate that the FortiGate will use for authentication purposes.
XAUTH		This option supports the authentication of dialup clients. It is only available for IKE version 1.

	• *Disable*: do not use XAuth. • *Client*: available only if the *Remote Gateway* is set to *Static IP Address* or *Dynamic DNS*. If the FortiGate is a dialup client, enter the user name and password for the FortiGate to authenticate itself to the remote XAuth server. • *PAP Server*, *CHAP Server*, *Auto Server*: available only if *Remote Gateway* is set to *Dialup User*. Dialup clients authenticate as members of a dialup user group. A user group must be created first for the dialup clients that need access to the network behind the FortiGate. The FortiGate must be configured to forward authentication requests to an external RADIUS or LDAP authentication server. Select the server type based on the encryption method used between the FortiGate, the XAuth client, and the external authentication server. Then select the user group (*Inherit from policy* or *Choose*). See Using XAuth authentication on page 2384.
Username	User name used for authentication.
Password	Password used for authentication.

Additional CLI configurations

The following phase 1 settings can be configured in the CLI:

VXLAN over IPsec	Packets with a VXLAN header are encapsulated within IPsec tunnel mode.
	
	To configure VXLAN over IPsec:
	
	`config vpn ipsec phase1-interface/phase1`
	`edit ipsec`
	`set interface <name>`
	`set encapsulation vxlan/gre`
	`set encapsulation-address ike/ipv4/ipv6`
	`set encap-local-gw4 xxx.xxx.xxx.xxx`
	`set encap-remote-gw xxx.xxx.xxx.xxx`
	`next`
	`end`

IPsec tunnel idle timer	Define an idle timer for IPsec tunnels. When no traffic has passed through the tunnel for the configured `idle-timeout` value, the IPsec tunnel will be flushed.
	
	To configure IPsec tunnel idle timeout:
	
	`config vpn ipsec phase1-interface`
	`edit p1`

```
        set idle-timeout [enable | disable]
        set idle-timeoutinterval <integer> IPsec tunnel idle timeout
in minutes (10 - 43200).
    next
end
```

Monitor tunnel for failover

Monitor a site-to-site tunnel to guarantee operational continuity if the primary tunnel fails. Configure the secondary phase 1 interface to monitor the primary interface.

To configure the monitor:

```
config vpn ipsec phase1-interface
    edit <secondary phase1-interface>
        set monitor <primary phase1-interface>
    next
end
```

Passive mode

Passive mode turns one side of the tunnel to be a responder only. It does not initiate VPN tunnels either by auto-negotiation, rekey, or traffic initiated behind the FortiGate.

To configure passive mode:

```
config vpn ipsec phase1-interface
    edit <example>
        set rekey {enable | disable}
        set passive-mode {enable | disable}
        set passive-tunnel-interface {enable | disable}
    next
end
```

Network ID

The network ID is a Fortinet-proprietary attribute that is used to select the correct phase 1 between IPsec peers, so that multiple IKEv2 tunnels can be established between the same local/remote gateway pairs.

In a dial-up VPN, `network-id` is in the first initiator message of an IKEv2 phase 1 negotiation. The responder (Hub) uses the `network-id` to match a phase 1 configuration with a matching `network-id`. The Hub can then differentiate multiple dial-up phase 1s that are bound to the same underlay interface and IP address. Without a `network-id`, the Hub cannot have multiple phase 1 dialup tunnels on the same interface.

In static phase 1 configurations, `network-id` is used with the pair of gateway IPs to negotiate the correct tunnel with a matching `network-id`. This allows IPsec peers to use the same pair of underlay IPs to establish multiple IPsec tunnels. Without it, only a single tunnel can be established over the same pair of underlay IPs.

To configure the network ID:

```
config vpn ipsec phase1-interface
    edit <example>
        set ike-version 2
        set network-overlay enable
        set network-id <integer>
    next
end
```

Remote gateway matching

FortiOS supports source IP anchoring in dial-up IPsec tunnel connection. When a dial-up client first makes an IPsec connection to the FortiGate VPN gateway, the FortiGate will use the source IP to match the IPsec tunnel based on the IP subnet, address range or country defined for that IPsec tunnel. IPv4 and IPv6 are supported. This feature requires the dynamic (dial-up) tunnel to be defined in IKEv2. See Matching IPsec tunnel gateway based on address parameters on page 2386 for more information.

To configure remote gateway matching:

```
config vpn ipsec phase1-interface
    edit <name>
        set type dynamic
        set ike-version 2
        set remote-gw-match {any | ipmask | iprange | geography |
ztna}
    next
end
```

`any`	Match any connecting clients.
`ipmask`	Use `src-ip` of the connecting client to match IP subnet of remote VPN gateway. You can then define the IP subnet by setting `remote-gw-subnet`.
`iprange`	Use `src-ip` of the connecting client to match IP range of remote VPN gateway. You can then define the IP address range by setting `remote-gw-start-ip` and `remote-gw-end-ip`.
`geography`	Use `src-ip` of the connecting client to match the specified country of the VPN gateway. You can then define the country by setting `remote-gw-country`.
`ztna`	Use `ztna` of the connecting client to match against ZTNA security posture tags. You can then define the tags by setting `remote-gw-ztna-tags`.

Dead peer detection

By default, dead peer detection (DPD) sends probe messages every five seconds. If you are experiencing high network traffic, you can experiment with increasing the ping interval. However, longer intervals will require more traffic to detect dead peers, which will result in more traffic.

In a dynamic (dialup) connection, the *On Idle* option encourages dialup server configurations to more proactively delete tunnels if the peer is unavailable.

In the GUI, the dead peer detection option can be configured when defining phase 1 options. The following CLI commands support additional options for specifying a retry count and a retry interval.

For example, enter the following to configure DPD on the existing IPsec phase 1 configuration to use 15-second intervals and to wait for three missed attempts before declaring the peer dead and taking action.

To configure DPD:

```
config vpn ipsec phase1-interface
    edit <value>
        set dpd [disable | on-idle | on-demand]
        set dpd-retryinveral 15
        set dpd-retrycount 3
    next
end
```

DPD scalability

On a dialup server, if many VPN connections are idle, the increased DPD exchange could negatively impact the performance/load of the daemon. The `on-demand` option in the CLI triggers DPD when IPsec traffic is sent, but no reply is received from the peer.

When there is no traffic and the last DPD-ACK had been received, IKE will not send DPDs periodically. IKE will only send out DPDs if there are outgoing packets to send, but no inbound packets have since been received.

HMAC settings

The FortiGate uses the HMAC based on the authentication proposal that is chosen in phase 1 or phase 2 of the IPsec configuration. Each proposal consists of the encryption-hash pair (such as `3des-sha256`). The FortiGate matches the most secure proposal to negotiate with the peer.

To view the chosen proposal and the HMAC hash used:

```
# diagnose vpn ike gateway list

vd: root/0
name: MPLS
version: 1
```

```
interface: port1 3
addr: 192.168.2.5:500 -> 10.10.10.1:500
tun_id: 10.10.10.1

Choosing IKE version 1 and 2

If you create a route-based VPN, you have the option of selecting IKE version 2. Otherwise, IKE version 1 is used.

IKEv2, defined in RFC 4306, simplifies the negotiation process that creates the security association (SA).

If you select IKEv2:

- There is no choice in phase 1 of aggressive or main mode.
- Extended authentication (XAUTH) is not available.
- You can utilize EAP.

Repeated authentication in IKEv2

This feature provides the option to control whether a device requires its peer to re-authenticate or whether re-key is sufficient. It does not influence the re-authentication or re-key behavior of the device itself, which is controlled by the peer (the default being to re-key). This solution is in response to RFC 4478. As described by the IETF, "the purpose of this is to limit the time that security associations (SAs) can be used by a third party who has gained control of the IPsec peer".

To configure IKE SA re-authentication:

```
config vpn ipsec phase1-interface
    edit p1
        set reauth [enable | disable]
    next
end
```

IKEv2 quick crash detection

There is support for IKEv2 quick crash detection (QCD) as described in RFC 6290.

RFC 6290 describes a method in which an IKE peer can quickly detect that the gateway peer it has and established an IKE session with has rebooted, crashed, or otherwise lost IKE state. When the gateway receives

IKE messages or ESP packets with unknown IKE or IPsec SPIs, the IKEv2 protocol allows the gateway to send the peer an unprotected IKE message containing INVALID_IKE_SPI or INVALID_SPI notification payloads.

RFC 6290 introduces the concept of a QCD token, which is generated from the IKE SPIs and a private QCD secret, and exchanged between peers during the protected IKE AUTH exchange.

To configure QCD:

```
config system settings
    set ike-quick-crash-detect [enable | disable]
end
```

IKEv1 quick crash detection

Based on the IKEv2 QCD feature previously described, IKEv1 QCD is implemented using a new IKE vendor ID (Fortinet Quick Crash Detection) so both endpoints must be FortiGates. The QCD token is sent in the phase 1 exchange and must be encrypted, so this is only implemented for IKEv1 in main mode (aggressive mode is not supported as there is no available AUTH message to include the token). Otherwise, the feature works the same as in IKEv2 (RFC 6290).

IKEv1 fragmentation

UDP fragmentation can cause issues in IPsec when either the ISP or perimeter firewall(s) cannot pass or fragment the oversized UDP packets that occur when using a very large public security key (PSK). The result is that IPsec tunnels do not come up. The solution is IKE fragmentation.

For most configurations, enabling IKE fragmentation allows connections to automatically establish when they otherwise might have failed due to intermediate nodes dropping IKE messages containing large certificates, which typically push the packet size over 1500 bytes.

FortiOS will fragment a packet on sending if only all the following are true:

- Phase 1 contains `set fragmentation enable`.
- The packet is larger than the minimum MTU (576 for IPv4, 1280 for IPv6).
- The packet is being re-transmitted.

By default, IKE fragmentation is enabled.

To configure IKEv1 fragmentation:

```
config vpn ipsec phase1-interface
    edit 1
        set fragmentation [enable | disable]
    next
end
```

IKEv2 fragmentation

RFC 7383 requires each fragment to be individually encrypted and authenticated. With IKEv2, a copy of the unencrypted payloads around for each outgoing packet would need to be kept in case the original single packet

was never answered and would retry with fragments. With the following implementation, if the IKE payloads are greater than a configured threshold, the IKE packets are preemptively fragmented and encrypted.

To configure IKEv2 fragmentation:

```
config vpn ipsec phase1-interface
    edit ike
        set ike-version 2
        set fragmentation [enable|disable]
        set fragmentation-mtu <500-16000>
    next
end
```

IPsec global IKE embryonic limit

When trying to establish thousands of tunnels simultaneously, a situation can arise where new negotiations starve other SAs from progressing to an established state in IKEv2. The IKE daemon can prioritize established SAs, offload groups 20 and 21 to CP9, and optimize the default embryonic limits for mid- and high-end platforms. The IKE embryonic limit can be configured in the CLI.

```
config system ike
    set embryonic-limit <integer>
end
```

`embryonic-limit <integer>`	Set the maximum number of IPsec tunnels to negotiate simultaneously (50 - 20000, default = 1000).

To configure an IKE embryonic limit of 50:

```
config system ike
    set embryonic-limit 50
end
```

Pre-shared key vs digital certificates

A FortiGate can authenticate itself to remote peers or dialup clients using either a pre-shared key or a digital certificate.

Pre-shared key

Using a pre-shared key is less secure than using certificates, especially if it is used alone, without requiring peer IDs or extended authentication (XAuth). There also needs to be a secure way to distribute the pre-shared key to the peers.

If you use pre-shared key authentication alone, all remote peers and dialup clients must be configured with the same pre-shared key. Optionally, you can configure remote peers and dialup clients with unique pre-shared keys. On the FortiGate, these are configured in user accounts, not in the phase 1 settings.

The pre-shared key must contain at least six printable characters and should be known by network administrators. For optimum protection against currently known attacks, the key must consist of a minimum of 16 randomly chosen alphanumeric characters. The limit is 128 characters.

If you authenticate the FortiGate using a pre-shared key, you can require remote peers or dialup clients to authenticate using peer IDs, but not client certificates.

To authenticate the FortiGate using a pre-shared key:

1. Go to *VPN > IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network* section as needed.
3. Configure or edit the *Authentication* settings as follows:

Method	*Pre-shared Key*
Pre-shared Key	<string>
IKE Version	*1* or *2*
Mode	*Aggressive* or *Main*
Peer Options	Select an *Accept Type* and the corresponding peer. Options vary based on the *Remote Gateway* and *Authentication Method* settings in the *Network* section. *Peer Options* are only available in *Aggressive* mode.

4. For the *Phase 1 Proposal* section, keep the default settings unless changes are needed to meet your requirements.
5. Optionally, for authentication parameters for a dialup user group, define *XAUTH* parameters.
6. Click *OK*.

Digital certificates

To authenticate the FortiGate using digital certificates, you must have the required certificates installed on the remote peer and on the FortiGate. The signed server certificate on one peer is validated by the presence of the root certificate installed on the other peer. If you use certificates to authenticate the FortiGate, you can also require the remote peers or dialup clients to authenticate using certificates. See Basic site-to-site VPN with digital certificate on page 2423 for a detailed example.

To authenticate the FortiGate using a digital certificate:

1. Go to *VPN > IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network* section as needed.
3. Configure or edit the *Authentication* settings as follows:

Method	*Signature*
Certificate Name	Select the certificate used to identify this FortiGate. If there are no imported certificates, use *Fortinet_Factory*.
IKE Version	*1* or *2*

Mode	*Aggressive* is recommended.
Peer Options	For *Accept Type*, select *Peer certificate* and select the peer and the CA certificate used to authenticate the peer. If the other end is using the Fortinet_Factory certificate, then use the *Fortinet_CA* certificate here.

4. For the *Phase 1 Proposal* section, keep the default settings unless changes are needed to meet your requirements.
5. Optionally, for authentication parameters for a dialup user group, define *XAUTH* parameters.
6. Click *OK*.

Using XAuth authentication

Extended authentication (XAuth) increases security by requiring remote dialup client users to authenticate in a separate exchange at the end of phase 1. XAuth draws on existing FortiGate user group definitions and uses established authentication mechanisms such as PAP, CHAP, RADIUS, and LDAP to authenticate dialup clients. You can configure a FortiGate to function either as an XAuth server or client. If the server or client is attempting a connection using XAuth and the other end is not using XAuth, the failed connection attempts that are logged will not specify XAuth as the reason.

XAuth server

A FortiGate can act as an XAuth server for dialup clients. When the phase 1 negotiation completes, the FortiGate challenges the user for a user name and password. It then forwards the user's credentials to an external RADIUS or LDAP server for verification.

If the user records on the RADIUS server have suitably configured Framed-IP-Address fields, you can assign client virtual IP addresses by XAuth instead of from a DHCP address range.

The authentication protocol you use for XAuth depends on the capabilities of the authentication server and the XAuth client:

- Select *PAP Server* whenever possible.
- You must select *PAP Server* for all implementations of LDAP and some implementations of Microsoft RADIUS.
- Select *Auto Server* when the authentication server supports *CHAP Server* but the XAuth client does not. The FortiGate will use PAP to communicate with the XAuth client and CHAP to communicate with the authentication server. You can also use *Auto Server* to allow multiple source interfaces to be defined in an IPsec/IKE policy.

Before you begin, create user accounts and user groups to identify the dialup clients that need to access the network behind the FortiGate dialup server. If password protection will be provided through an external RADIUS or LDAP server, you must configure the FortiGate dialup server to forward authentication requests to the authentication server.

To configure XAuth to authenticate a dialup user group:

1. On the FortiGate dialup server, go to *VPN > IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network*, *Authentication*, and *Phase 1 Proposal* sections as needed.

3. In the *XAUTH* section, select the encryption method *Type* to use between the XAuth client, the FortiGate, and the authentication server.
4. For *User Group*:
   a. Click *Inherit from policy* for multiple user groups defined in the IPsec/IKE policy, or
   b. Click *Choose* and in the dropdown, select the user group that needs to access the private network behind the FortiGate.

   Only one user group may be defined for *Auto Server*.
5. Click *OK*.
6. Create as many policies as needed, specifying the source user(s) and destination address.

XAuth client

If the FortiGate acts as a dialup client, the remote peer, acting as an XAuth server, might require a username and password. You can configure the FortiGate as an XAuth client with its own username and password, which it provides when challenged.

To configure the FortiGate dialup client as an XAuth client:

1. On the FortiGate dialup client, go to *VPN > IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network*, *Authentication*, and *Phase 1 Proposal* sections as needed.
3. In the *XAUTH* section, for *Type*, select *Client*.
4. For *Username*, enter the FortiGate PAP, CHAP, RADIUS, or LDAP user name that the FortiGate XAuth server will compare to its records when the FortiGate XAuth client attempts to connect.
5. Enter the *Password* for the user name.
6. Click *OK*.

Dynamic IPsec route control

You can add a route to a peer destination selector by using the `add-route` option, which is available for all dynamic IPsec phases 1 and 2, for both policy-based and route-based IPsec VPNs.

The `add-route` option adds a route to the FortiGate routing information base when the dynamic tunnel is negotiated. You can use the distance and priority options to set the distance and priority of this route. If this results in a route with the lowest distance, it is added to the FortiGate forwarding information base.

You can also enable `add-route` in any policy-based or route-based phase 2 configuration that is associated with a dynamic (dialup) phase 1. In phase 2, `add-route` can be enabled, disabled, or set to use the same route as phase 1.

The `add-route` option is enabled by default.

To configure add-route in phase 1:

```
config vpn ipsec
    edit <name>
        set type dynamic
        set add-route {enable | disable}
    next
end
```

To configure add-route in phase 2:

```
config vpn ipsec {phase2 | phase2-interface}
    edit <name>
        set add-route {phase1 | enable | disable}
    next
end
```

Blocking IPsec SA negotiation

For interface-based IPsec, IPsec SA negotiation blocking can only be removed if the peer offers a wildcard selector. If a wildcard selector is offered, then the wildcard route will be added to the routing table with the distance/priority value configured in phase 1. If that is the route with the lowest distance, it will be installed into the forwarding information base.

In this scenario, it is important to ensure that the distance value configured for phase 1 is set appropriately.

Matching IPsec tunnel gateway based on address parameters

FortiOS supports source IP anchoring in dial-up IPsec tunnel connection. See Remote gateway matching on page 2378.

The following example uses the source IP address of the client to match the IPsec tunnel gateway based on the country parameters. The client, PC1, is behind a NAT'd device with address 160.106.x.x, which resolves to Canada. Two IPsec tunnels, `TestMatchA` and `TestMatchB`, will be configured on the phase1 interface to test remote gateway country matching. The tunnel that is assigned to Canada will match while the other will not.

This example only includes configurations related to the `remote-gw-match` feature. Other configurations, such as those for the phase2 interface, are omitted for brevity.

To match dialup IPsec tunnel gateway based on country:

1. On the phase1 interface, configure two IPsec tunnels on the FGT VPN Gateway, with `TestMatchA` set to the United States (US) and `TestMatchB` set to Canada (CA):

```
config vpn ipsec phase1-interface
    edit "TestMatchA"
        set type dynamic
        set ike-version 2
        set remote-gw-match geography
        set remote-gw-country "US"
    next
    edit "TestMatchB"
        set type dynamic
        set ike-version 2
        set remote-gw-match geography
        set remote-gw-country "CA"
    next
end
```

2. From PC2, initiate a dial-up VPN connection.
3. On the FortiGate, review the gateway list.

```
# diagnose vpn ike gateway list

vd: root/0
name: TestMatchB_0
version: 2
interface: port5 13
addr: 173.1.1.1:500 -> 160.106.x.x:500
tun_id: 160.106.x.x/::10.0.0.35
remote_location: 0.0.0.0
network-id: 0
created: 162s ago

```

Since the client IP address is anchored in Canada, `TestMatchB` matched.

4. Change the country assignments of the two IPsec tunnels so that `TestMatchA` is set to Canada (CA) and `TestMatchB` is set to China (CN):

```
config vpn ipsec phase1-interface
    edit "TestMatchA"
        set type dynamic
        set ike-version 2
        set remote-gw-match geography
        set remote-gw-country "CA"
    next
    edit "TestMatchB"
        set type dynamic
        set ike-version 2
        set remote-gw-match geography
        set remote-gw-country "CN"
    next
end
```

5. From PC2, initiate a dial-up VPN connection.
6. On the FortiGate, review the gateway list again.

```
# diagnose vpn ike gateway list

vd: root/0
name: TestMatchA_0
version: 2
interface: port5 13
addr: 173.1.1.1:500 -> 160.106.x.x:500

```

Since the client IP address is anchored in Canada, `TestMatchA` matched.

Enforcing security posture tag match before dial-up IPsec VPN connection

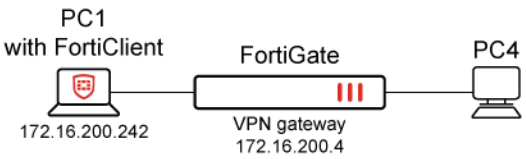
IPsec dial-up VPN configurations can enforce a ZTNA security posture tag match before clients can establish a VPN tunnel. When a tag is defined on an IKEv2 IPsec tunnel, only the client IP addresses resolved by the tag can establish connection to the tunnel. When multiple tags are used, tags are checked sequentially until a match is made. If no tags match, then the client cannot establish a VPN connection.

```
config vpn ipsec phase1-interface
    edit <name>
        set ike-version 2
        set remote-gw-match {any | ipmask | iprange | geography | ztna}
        set remote-gw-ztna-tags <IPv4 ZTNA posture tags>
    next
end
```

When `set remote-gw-match ztna` is enabled, `remote-gw-ztna-tags` can be configured.

Example

A PC (172.16.200.242) makes a connection to the dial-up VPN gateway (172.16.200.4). The following example configuration and outputs show a successful connection with a matching ZTNA security posture tag (`EMS1_ZTNA_all_registered_clients`) and an unsuccessful connection when a ZTNA security posture tag cannot be matched.



It is assumed that the following mandatory pre-configurations are complete before configuring VPN:

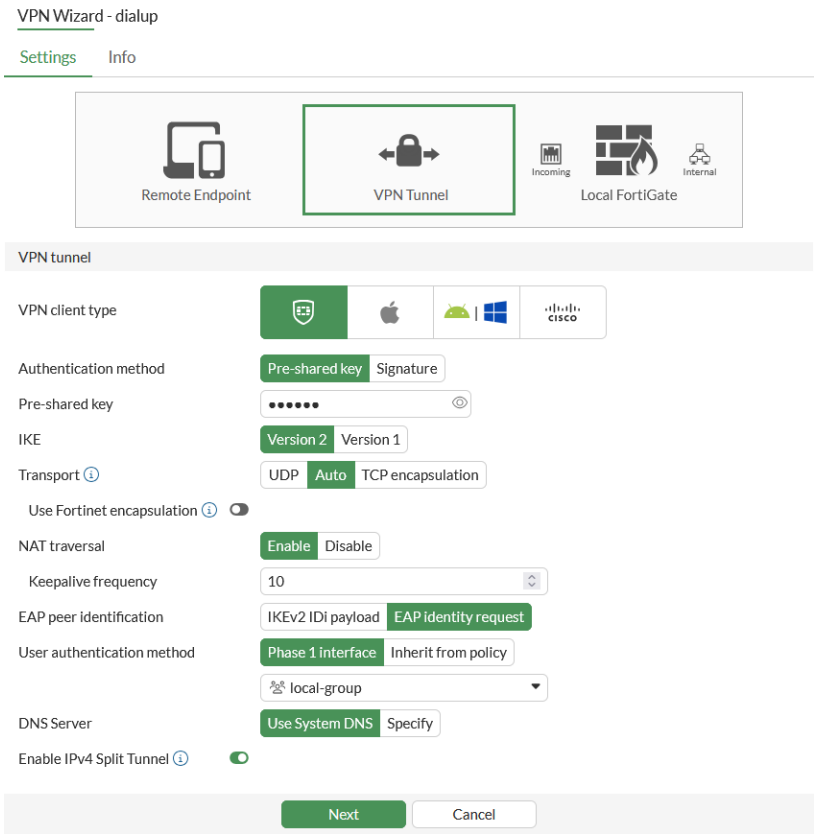
- FortiGate has established a connection with FortiClient EMS and has synchronized the ZTNA security posture tags, including the `EMS1_ZTNA_all_registered_clients` tag.
- FortiClient is registered to EMS and has the ZTNA security posture tag (`EMS1_ZTNA_all_registered_clients`).

In this example, the VPN Wizard is used in the GUI to configure the IPsec tunnel and use the ZTNA tag EMS1_ZTNA_all_registered_clients. This requires that IKEv2 is enabled. The example mostly uses the default settings in the wizard, but these can be modified as required by your use case.

To configure the VPN gateway with the GUI:

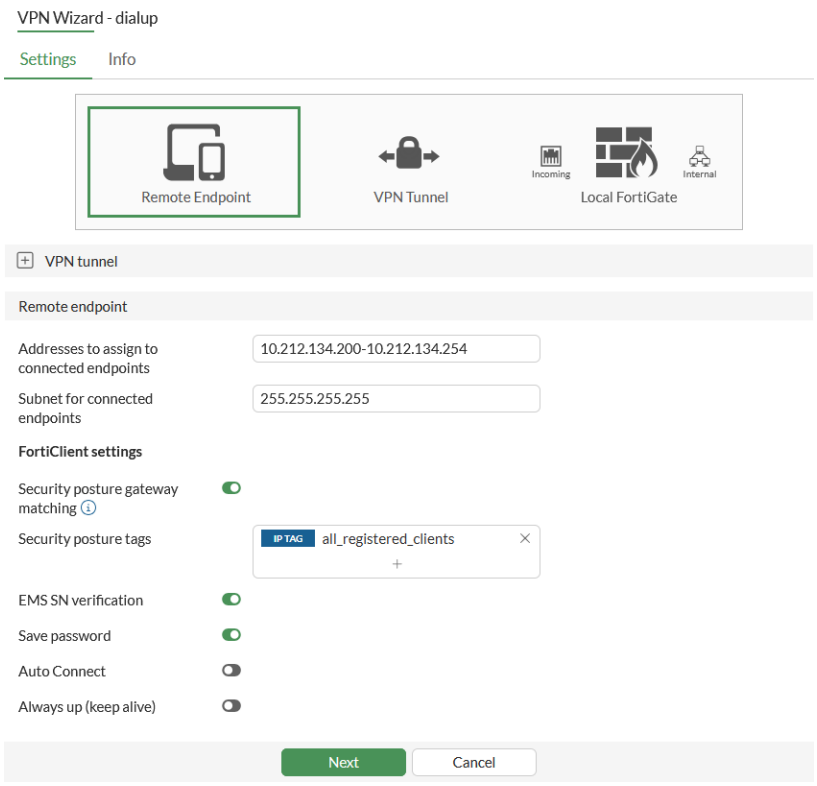
1. Go to *VPN > VPN Wizard*.
2. Enter the *Tunnel name*, such as *dialup*.

3. Set *Select a Template* to *Remote Access* then click *Begin*.
4. Configure the *VPN tunnel*:



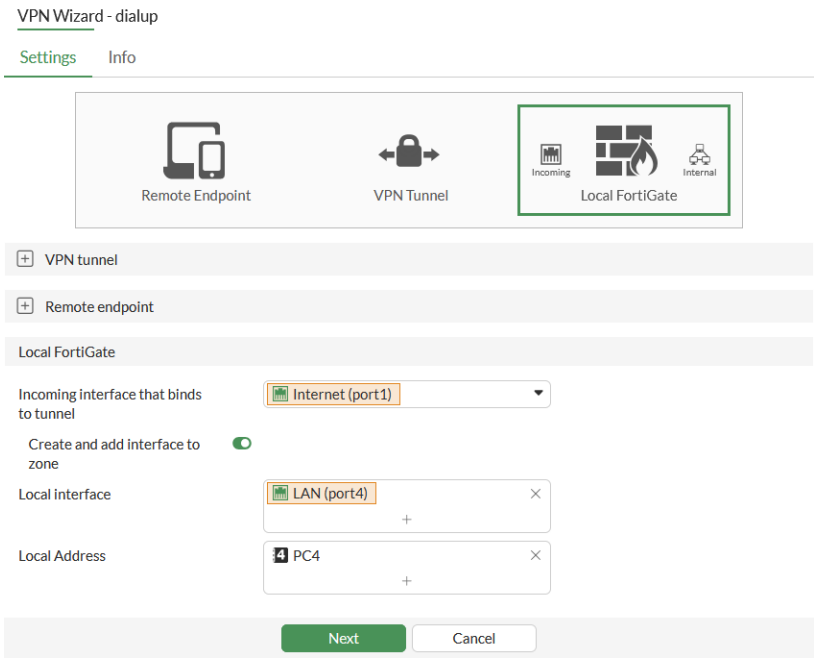
VPN client type	FortiClient
Authentication method	Pre-shared key
Pre-shared key	Enter the pre-shared key.
IKE	Version 2
Transport	Auto
NAT traversal	Enable
EAP peer identification	EAP identity request
User authentication method	Phase1 interface Select a user group for user authentication from the drop-down list.
DNS Server	Use System DNS
Enable IPv4 Split Tunnel	Enable

5. Click *Next*.
6. Configure the *Remote endpoint*:



Addresses to assign to connected endpoints	Enter the VPN IP address range that needs to be assigned to VPN endpoints: 10.212.134.200-10.212.134.254
Subnet for connected endpoints	255.255.255.255
Security posture gateway matching	Enable
Security posture tags	Add one or more ZTNA Tags, for example: IP TAG all_registered_clients
EMS SN verification	Enable
Save password	Enable
Auto Connect	Disable
Always up (keep alive)	Disable

7. Click *Next*.
8. Configure the *Local FortiGate*:



Incoming interface that binds to tunnel	Select the WAN Interface. In this example, that is the interface with IP address 172.16.200.4.
Create and add interface to zone	Enable
Local interface	Select the LAN interface. In this example, that is the interface that is connected to PC4.
Local Address	Select a local address to allow access from the VPN. In this example, that is the IP address of PC4.

9. Click *Next*.
10. Review the configuration. If everything looks correct, click *Submit*.

To configure the VPN gateway with the CLI:

```
config vpn ipsec phase1-interface
    edit "dialup"
        set type dynamic
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set eap enable
        set eap-identity send-request
        set authusrgrp "local-group"
```

```
        set ems-sn-check enable
        set transport auto
        set remote-gw-match ztna
        set ipv4-start-ip 10.1.1.1
        set ipv4-end-ip 10.1.1.254
        set dns-mode auto
        set ipv4-split-include "dialup_split"
        set save-password enable
        set psksecret xxxxxxxx
        set remote-gw-ztna-tags "EMS1_ZTNA_all_registered_clients"
    next
end
config vpn ipsec phase2-interface
    edit "DY"
        set phase1name "dialup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

Results

When a client (172.16.200.242) has the appropriate ZTNA security posture tag, it is synchronized to FortiClient EMS and FortiGate.

To view the IP address that is resolved to tag:

```
# diagnose firewall dynamic list EMS1_ZTNA_all_registered_clients

CMDB name: EMS1_ZTNA_all_registered_clients
TAG name: all_registered_clients
EMS1_ZTNA_all_registered_clients: ID(6)
        ADDR(172.16.200.242)
Total IP dynamic range blocks: 0.
Total IP dynamic addresses: 1.
```

The address resolves to the IP address that is configured on the client endpoint. It does not resolve to the NAT'd public IP address when the client is behind NAT. In other words, the address resolves to the `IP Address` in the following output, and not the `Public IP Address`:

```
# diagnose endpoint ec-shm list

Record #0:
                IP Address = 172.16.200.242
                MAC Address = **:**:**:**:67:74
                MAC list =
                VDOM = root (0)
                TOKEN VDOM =  (-1)
                EMS serial number: FCTEMS***********
                EMS tenant id: *************1EDB589FBC4626
                Client cert SN: *************60ACA9FE283DEEC3B
```

```
                Public IP address: *************

                Gateway Interface: port1
                FortiClient version: 7.2.4
                …
                Number of Routes: (1)
                        Gateway Route #0:
                                - IP:172.16.200.242, MAC: **:**:**:**:67:74, VPN: no
                                - Interface:port1, VDOM:root (0), SN: FG5H*************
```

From the PC1 client, establish a tunnel with the FortiGate VPN gateway. When enabled, the following debug information displays the output when the security posture tag is matched:

```
# diagnose debug application ike -1
…
ike V=root:0:DY:155: received FCT-UID : 6108A9179A5C40D7BD57504E15114C1F
ike V=root:0:DY:155: received EMS SN : FCTEMS***********
ike V=root:0:DY:155: received EMS tenant ID : *************1EDB589FBC4626
ike V=root:0:DY:155: peer identifier IPV4_ADDR 172.16.200.242
ike V=root:0:DY:155: re-validate gw ID
ike V=root:0:DY:155: gw validation OK
ike V=root:0:DY:155: responder preparing EAP identity request
…
```

The following tunnel output indicates a dial-up tunnel has been established:

```
# diagnose vpn ike gateway list

Phase 2 configuration

After phase 1 negotiations end successfully, phase 2 begins. In Phase 2, the VPN peer or client and the FortiGate exchange keys again to establish a secure communication channel. The phase 2 proposal parameters select the encryption and authentication algorithms needed to generate keys for protecting the implementation details of security associations (SAs). The keys are generated automatically using a Diffie-Hellman algorithm.

The basic phase 2 settings associate IPsec phase 2 parameters with the phase 1 configuration that specifies the remote end point of the VPN tunnel. In most cases, you need to configure only basic Phase 2 settings.

Some settings can be configured in the CLI. The following options are available in the *VPN Creation Wizard* after the tunnel is created:

New Phase 2		
	Name	Phase 2 definition name.
	Local Address	A value of `0.0.0.0/0` means all IP addresses behind the local VPN peer. Add a specific address or range to allow traffic from and to only this local address. See Quick mode selectors on page 2398.
	Remote Address	Enter the destination IP address that corresponds to the recipients or network behind the remote VPN peer. A value of `0.0.0.0/0` means all IP addresses behind the remote VPN peer. See Quick mode selectors on page 2398.
Advanced		Select the encryption and authentication algorithms that will be proposed to the remote VPN peer. To establish a VPN connection, at least one of the proposals specified must match the configuration on the remote peer.
	Encryption	The following symmetric-key encryption algorithms are available: • *NULL*: do not use an encryption algorithm. • *DES*: Digital Encryption Standard, a 64-bit block algorithm that uses a 56-bit key. • *3DES*: triple-DES; plain text is encrypted three times by three keys. • *AES128*: Advanced Encryption Standard, a 128-bit block algorithm that uses a 128-bit key. • *AES128GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 128-bit key. Only available for IKEv2. • *AES192*: a 128-bit block algorithm that uses a 192-bit key. • *AES256*: a 128-bit block algorithm that uses a 256-bit key.

	• *AES256GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 256-bit key. Only available for IKEv2. • *CHACHA20POLY1305*: a 128-bit block algorithm that uses a 128-bit key and a symmetric cipher. Only available for IKEv2. See ChaCha20 and Poly1305 AEAD cipher on page 2400, AES-GCM for IKEv2 phase 1 on page 2400, and HMAC settings.
Authentication	The following message digests that check the message authenticity during an encrypted session are available: • NULL: do not use a message digest. • *MD5*: message digest 5. • *SHA1*: secure hash algorithm 1; a 160-bit message digest. • *SHA256*: a 256-bit message digest. • *SHA384*: a 384-bit message digest. • *SHA512*: a 512-bit message digest. See also HMAC settings.
Enable Replay Detection	Replay attacks occur when an unauthorized party intercepts a series of IPsec packets and replays them back into the tunnel. Replay detection allows the FortiGate to check all IPsec packets to see if they have been received before. If any encrypted packets arrive out of order, the FortiGate discards them. Note that 64-bit extended sequence numbers (as described in RFC 4303, RFC 4304 as an addition to IKEv1, and RFC 5996 for IKEv2) are supported for IPsec when replay detection is enabled.
Enable Perfect Forward Secrecy (PFS)	Perfect forward secrecy (PFS) improves security by forcing a new Diffie-Hellman exchange whenever keylife expires.
Diffie-Hellman Group	Asymmetric key algorithms used for public key cryptography. Select one or more from groups 1, 2, 5, and 14 through 32. At least one of the *Diffie-Hellman Groups* (DH) settings on the remote peer or client must match one the selections on the FortiGate. Failure to match one or more DH groups will result in failed negotiations.
Local Port	Enter the port number that the local VPN peer uses to transport traffic related to the specified service (protocol number). The range is from 0 to 65535. To specify all ports, select *All*, or enter `0`.
Remote Port	Enter the port number that the remote VPN peer uses to transport traffic related to the specified service (protocol number). To specify all ports, select *All*, or enter `0`.
Protocol	Enter the IP protocol number of the service. To specify all services, select *All*, or enter `0`.
Auto-negotiate	Select this option for the tunnel to be automatically renegotiated when the it expires. See Auto-negotiate on page 2399.

	Autokey Keep Alive	Select this option for the tunnel to remain active when no data is being processed.
	Key Lifetime	Select the method for determining when the phase 2 key expires: • *Seconds* • *Kilobytes* • *Both* Enter a corresponding value for *Seconds* and/or *Kilobytes* in the text boxes. If *Both* is selected, the key expires when either the time has passed or the number of kilobytes have been processed.

Quick mode selectors

Quick mode selectors determine which IP addresses can perform IKE negotiations to establish a tunnel. By only allowing authorized IP addresses access to the VPN tunnel, the network is more secure.

The default settings are as broad as possible: any IP address or configured address object using any protocol on any port.

While the dropdown menus for specifying an address also show address groups, the use of address groups may not be supported on a remote endpoint device that is not a FortiGate.

When configuring a quick mode selector for *Local Address* and *Remote Address*, valid options include IPv4 and IPv6 single addresses, subnets, or ranges.

There are some configurations that require specific selectors:

- The VPN peer is a third-party device that uses specific phase2 selectors.
- The FortiGate connects as a dialup client to another FortiGate, in which case (usually) you must specify a local IP address, IP address range, or subnet. However, this is not required if you are using dynamic routing and `mode-cfg`.

With FortiOS VPNs, your network has multiple layers of security, with quick mode selectors being an important line of defense:

- Routes guide traffic from one IP address to another.
- Phase 1 and phase 2 connection settings ensure there is a valid remote end point for the VPN tunnel that agrees on the encryption and parameters.
- Quick mode selectors allow IKE negotiations only for allowed peers.
- Security policies control which IP addresses can connect to the VPN.
- Security policies also control what protocols are allowed over the VPN along with any bandwidth limiting.

If you are editing an existing phase 2 configuration, the local address and remote address fields are unavailable if the tunnel has been configured to use firewall addresses as selectors. This option exists only in the CLI.

Using the add-route option

Consider using the `add-route` option to add a route to a peer destination selector in phase 2 to automatically match the settings in phase 1.

To configure add-route:

```
config vpn ipsec {phase2 | phase2-interface}
    edit <name>
        set add-route {phase1 | enable | disable}
    next
end
```

Auto-negotiate

By default, the phase 2 security association (SA) is not negotiated until a peer attempts to send data. The triggering packet and some subsequent packets are dropped until the SA is established. Applications normally resend this data, so there is no loss, but there might be a noticeable delay in response to the user.

If the tunnel goes down, the auto-negotiate feature (when enabled) attempts to re-establish the tunnel. Auto-negotiate initiates the phase 2 SA negotiation automatically, repeating every five seconds until the SA is established.

Automatically establishing the SA can be important for a dialup peer. It ensures that the VPN tunnel is available for peers at the server end to initiate traffic to the dialup peer. Otherwise, the VPN tunnel does not exist until the dialup peer initiates traffic.

To configure auto-negotiate:

```
config vpn ipsec phase2
    edit <phase2_name>
        set auto-negotiate enable
    next
end
```

Installing dynamic selectors via auto-negotiate

The IPsec SA connect message generated is used to install dynamic selectors. These selectors can be installed via the auto-negotiate mechanism. When phase 2 has `auto-negotiate` enabled, and phase 1 has `mesh-selector-type` set to `subnet`, a new dynamic selector will be installed for each combination of source and destination subnets. Each dynamic selector will inherit the auto-negotiate option from the template selector and begin SA negotiation. Phase 2 selector sources from dialup clients will all establish SAs without traffic being initiated from the client subnets to the hub.

DHCP

The `dhcp-ipsec` option lets the FortiGate assign VIP addresses to FortiClient dialup clients through a DHCP server or relay. This option is only available if the remote gateway in the phase 1 configuration is set to dialup user, and it only works in policy-based VPNs.

With `dhcp-ipsec`, the FortiGate dialup server acts as a proxy for FortiClient dialup clients that have VIP addresses on the subnet of the private network behind the FortiGate. In this case, the FortiGate dialup server acts as a proxy on the local private network for the FortiClient dialup client. A host on the network behind the dialup server issues an ARP request, corresponding to the device MAC address of the FortiClient host (when a remote server sends an ARP to the local FortiClient dialup client). The FortiGate then answers the ARP request on behalf of the FortiClient host, and then forwards the associated traffic to the FortiClient host through the tunnel.

Acting as a proxy prevents the VIP address assigned to the FortiClient dialup client from causing possible ARP broadcast problems—the normal and VIP addresses can confuse some network switches when two addresses have the same MAC address.

ChaCha20 and Poly1305 AEAD cipher

In IKEv2 to support RFC 7634, the ChaCha20 and Poly1305 crypto algorithms can be used together as a combined mode AEAD cipher (like AES-GCM) in the `crypto_ftnt` cipher in `cipher_chacha20poly1305.c`:

```
config vpn ipsec phase2-interface
    edit <name>
        set phase1name <name>
        set proposal chacha20poly1305
    next
end
```

AES-GCM for IKEv2 phase 1

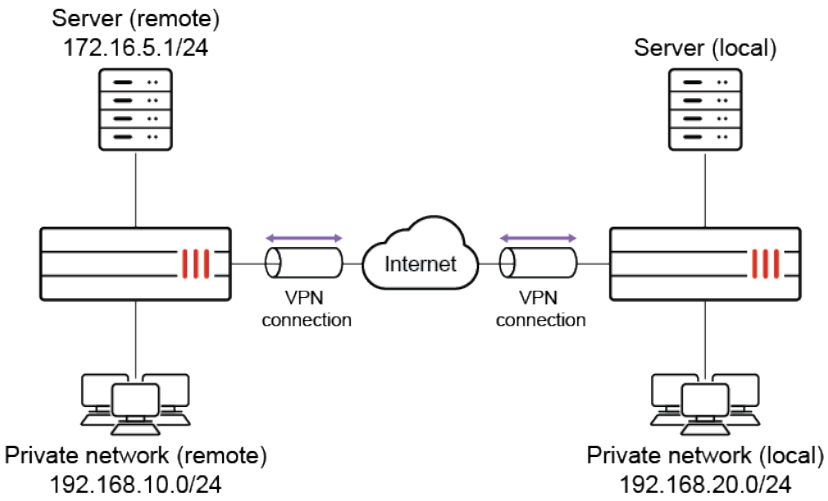
In IKEv2 to support RFC 5282, the AEAD algorithm AES-GCM supports 128- and 256-bit variants:

```
config vpn ipsec phase2-interface
    edit <name>
        set phase1name <name>
        set proposal [aes128gcm | aes256gcm]
    next
end
```

VPN security policies

This section explains how to specify the source and destination IP addresses of traffic transmitted through an IPsec VPN, and how to define appropriate security policies.

Topology



Defining policy addresses

In a gateway-to-gateway, hub-and-spoke, dynamic DNS, redundant tunnel, or transparent configuration, you need to define a policy address for the private IP address of the network behind the remote VPN peer (for example, `192.168.10.0/255.255.255.0` or `192.168.10.0/24`).

In a peer-to-peer configuration, you need to define a policy address for the private IP address of a server or host behind the remote VPN peer (for example, `172.16.5.1/255.255.255.255`, `172.16.5.1/32`, or `172.16.5.1`).

For a FortiGate dialup server in a dialup-client or internet-browsing configuration, the source IP should reflect the IP addresses of the dialup clients:

Defining security policies

Policy-based and route-based VPNs require different security policies.

- A policy-based VPN requires an IPsec policy. You specify the interface to the private network, the interface to the remote peer and the VPN tunnel. A single policy can enable traffic inbound, outbound, or in both directions.
- A route-based VPN requires an accept policy for each direction. For the source and destination interfaces, you specify the interface to the private network and the virtual IPsec interface (phase 1 configuration) of the VPN. The IPsec interface is the destination interface for the outbound policy and the source interface for the inbound policy. One security policy must be configured for each direction of each VPN interface.

If the policy that grants the VPN connection is limited to certain services, DHCP must be included, otherwise the client will not be able to retrieve a lease from the FortiGate's (IPsec) DHCP server because the DHCP request (coming out of the tunnel) will be blocked.

Policy-based VPN

An IPsec policy enables the transmission and reception of encrypted packets, specifies the permitted direction of VPN traffic, and selects the VPN tunnel. In most cases, a single policy is needed to control both inbound and outbound IP traffic through a VPN tunnel. For a detailed example, see Policy-based IPsec tunnel on page 2452. Be aware of the following before creating an IPsec policy.

Allow traffic to be initiated from the remote site

Policies specify which IP addresses can initiate a tunnel. By default, traffic from the local private network initiates the tunnel. When the *Allow traffic to be initiated from the remote site* option is selected, traffic from a dialup client, or a computer on a remote network, initiates the tunnel. Both can be enabled at the same time for bi-directional initiation of the tunnel.

Outbound and inbound NAT

When a FortiGate operates in NAT mode, you can enable inbound or outbound NAT. Outbound NAT may be performed on outbound encrypted packets or IP packets in order to change their source address before they are sent through the tunnel. Inbound NAT is performed to intercept and decrypt emerging IP packets from the tunnel.

By default, these options are not selected in security policies and can only be set through the CLI.

Defining multiple IPsec policies for the same tunnel

You must define at least one IPsec policy for each VPN tunnel. If the same remote server or client requires access to more than one network behind a local FortiGate, the FortiGate must be configured with an IPsec policy for each network. Multiple policies may be required to configure redundant connections to a remote destination or control access to different services at different times.

To ensure a secure connection, the FortiGate must evaluate policies with *Action* set to *IPsec* before *ACCEPT* and *DENY*. Because the FortiGate unit reads policies starting at the top of the list, you must move all IPsec policies to the top of the list, and be sure to reorder your multiple IPsec policies that apply to the tunnel so that specific constraints can be evaluated before general constraints. If you create two equivalent IPsec policies for two different tunnels, the system will select the correct policy based on the specified source and destination addresses.

Adding multiple IPsec policies for the same VPN tunnel can cause conflicts if the policies specify similar source and destination addresses, but have different settings for the same service. When policies overlap in this manner, the system may apply the wrong IPsec policy or the tunnel may fail.

Route-based VPN

When you define a route-based VPN, you create a virtual IPsec interface on the physical interface that connects to the remote peer. You create ordinary accept policies to enable traffic between the IPsec interface and the interface that connects to the private network. This makes configuration simpler than for policy-based VPNs.

To configure policies for a route-based VPN:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New* and define an *ACCEPT* policy to permit communication between the local private network and the private network behind the remote peer and enter these settings in particular:

Name	Enter a name for the security policy.
Incoming Interface	Select the interface that connects to the private network behind this FortiGate.
Outgoing Interface	Select the IPsec interface you configured.
Source	Select the address name you defined for the private network behind this FortiGate.
Destination	Select the address name you defined for the private network behind the remote peer.
Action	Select *ACCEPT*.
NAT	Disable *NAT*.

3. Click *OK*.
   To permit the remote client to initiate communication, you need to define a security policy for communication in that direction.
4. Click *Create New* and enter these settings in particular:

Name	Enter a name for the security policy.
Incoming Interface	Select the IPsec interface you configured.
Outgoing Interface	Select the interface that connects to the private network behind this FortiGate.
Source	Select the address name you defined for the private network behind the remote peer.
Destination	Select the address name you defined for the private network behind this FortiGate.
Action	Select *ACCEPT*.
NAT	Disable *NAT*.

5. Click *OK*.

Blocking unwanted IKE negotiations and ESP packets with a local-in policy

It is not unusual to receive IPsec connection attempts or malicious IKE packets from all over the internet. Malicious parties use these probes to try to establish an IPsec tunnel in order to gain access to your private network. A good way to prevent this is to use local-in policies to deny such traffic.

Sometimes there are malicious attempts using crafted invalid ESP packets. These invalid attempts are automatically blocked by the FOS IPsec local-in handler when it checks the SPI value against the SAs of existing tunnels. The IPsec local-in handler processes the packet instead of the firewall's local-in handler. So when these attempts are blocked, you will notice an `unknown SPI` message in your VPN logs instead of being silently blocked by your local-in policy. These log messages are rate limited.

Sample log and alert email

```
Message meets Alert condition
```

```
date=2020-08-11 time=09:28:40 devname=toSite1 devid=FGT60Fxxxxxxxxxx logid="0101037131"
type="event" subtype="vpn" level="error" vd="root" eventtime=1597163320747963100 tz="-0700"
logdesc="IPsec ESP" msg="IPsec ESP" action="error" remip=131.62.25.102 locip=192.157.116.88
remport=40601 locport=500 outintf="wan1" cookies="N/A" user="N/A" group="N/A" xauthuser="N/A"
xauthgroup="N/A" assignip=N/A vpntunnel="N/A" status="esp_error" error_num="Received ESP packet
with unknown SPI." spi="f6c9e2x1" seq="02000400"
```

The ESP packet handling process has the detection of unknown ESP packets enabled by default. You can disable the detection of unknown ESP packets using the `detect-unknown-esp` command.

To configure unknown ESP packet detection:

```
config system settings
    set detect-unknown-esp {enable | disable}
end
```

Note that invalid SPIs may not always indicate malicious activity. For example, the SPI may not match during rekey, or when one unit flushes its tunnel SAs. Administrators should collect as much information as possible before making a conclusion.

To block undesirable IPsec connection attempts and IKE packets using a local-in policy:

1. Configure an address group that excludes legitimate IPs:

```
config firewall addrgrp
    edit "All_exceptions"
        set member "all"
        set exclude enable
        set exclude-member "remote-vpn"
    next
end
```

2. Create a local-in policy that blocks IKE traffic from the address group:

```
config firewall local-in-policy
    edit 1
        set intf "wan1"
        set srcaddr "All_exceptions"
        set dstaddr "all"
        set service "IKE"
        set schedule "always"
```

```
    next
end
```

The default action is deny.

3. Verify the traffic blocked by the local-in policy:

```
# diagnose debug flow filter dport 500
# diagnose debug flow trace start 10
# diagnose debug enable

id=20085 trace_id=290 func=print_pkt_detail line=5588 msg="vd-root:0 received a packet
(proto=17, 10.10.10.13:500->10.10.10.1:500) from wan1. "
id=20085 trace_id=290 func=init_ip_session_common line=5760 msg="allocate a new session-
003442e7"
id=20085 trace_id=290 func=vf_ip_route_input_common line=2598 msg="find a route: flag=84000000
gw-10.10.10.1 via root"
id=20085 trace_id=290 func=fw_local_in_handler line=430 msg="iprope_in_check() check failed on
policy 1, drop"
```

Configurable IKE port

Some ISPs block UDP port 500 or UDP port 4500, preventing an IPsec VPN from being negotiated and established. To accommodate this, the IKE port can be changed.

To set the IKE port:

```
config system settings
    set ike-port <integer>
end
```

ike-port	UDP port for IKE/IPsec traffic (1024 - 65535, default = 500).

Example 1: site-to-site VPN without NAT

In this example, the IKE port is set to 6000 on the two site-to-site VPN gateways. There is no NAT between the VPN gateways, but the ISP has blocked UDP port 500. A site-to-site VPN is established using the defined IKE port.

To set the IKE port:

```
config system settings
    set ike-port 6000
end
```

To configure and check the site-to-site VPN:

1. Configure the phase1 and phase2 interfaces:

```
config vpn ipsec phase1-interface
    edit "s2s"
        set interface "port27"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set wizard-type static-fortigate
        set remote-gw 11.101.1.1
        set psksecret **********
    next
end
config vpn ipsec phase2-interface
    edit "s2s"
        set phase1name "s2s"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "s2s_local"
        set dst-name "s2s_remote"
    next
end
```

2. Check the IKE gateway list and confirm that the specified port is used:

```
# diagnose vpn ike gateway list

vd: root/0
name: s2s
version: 2
interface: port27 17
addr: 173.1.1.1:6000 -> 11.101.1.1:6000
tun_id: 11.101.1.1
remote_location: 0.0.0.0
created: 194s ago
PPK: no
IKE SA: created 1/2  established 1/2  time 0/4500/9000 ms
IPsec SA: created 1/2  established 1/2  time 0/4500/9000 ms
...
```

3. Check the VPN tunnel list:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=s2s ver=2 serial=1 173.1.1.1:6000->11.101.1.1:6000 tun_id=11.101.1.1 dst_mtu=1500 dpd-
link=on remote_location=0.0.0.0 weight=1
```

```
bound_if=17 lgwy=static/1 tun=tunnel/15 mode=auto/1 encap=none/520 options[0208]=npu frag-rfc
run_state=0 accept_traffic=1 overlay_id=0
...
```

Example 2: dialup VPN with NAT

In this example, the IKE port is set to 5000 on the VPN gateway and the dialup peer. The dialup peer is behind NAT, so NAT traversal (NAT-T) is used. The ISP blocks both UDP port 500 and UDP port 4500. The VPN connection is initiated on UDP port 5000 from the dialup VPN client and remains on port 5000 since NAT-T floating to 4500 is only required when the IKE port is 500.

To set the IKE port:

```
config system settings
    set ike-port 5000
end
```

To configure and check the dialup VPN with NAT:

1. Configure the phase1 and phase2 interfaces:

```
config vpn ipsec phase1-interface
    edit "server"
        set type dynamic
        set interface "port27"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dpd on-idle
        set wizard-type static-fortigate
        set psksecret **********
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "server"
        set phase1name "server"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "server_local"
        set dst-name "server_remote"
    next
end
```

2. Check the IKE gateway list and confirm that the specified port is used:

```
# diagnose vpn ike gateway list

vd: root/0
name: server_0
version: 2
interface: port27 17
addr: 173.1.1.1:5000 -> 173.1.1.2:65416
tun_id: 173.1.1.2
remote_location: 0.0.0.0
created: 90s ago
nat: peer
PPK: no
IKE SA: created 1/1  established 1/1  time 0/0/0 ms
IPsec SA: created 1/1  established 1/1  time 0/0/0 ms
...
```

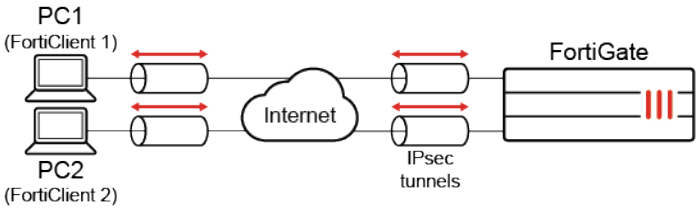
3. Check the VPN tunnel list:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=server_0 ver=2 serial=a 173.1.1.1:5000->173.1.1.2:65416 tun_id=173.1.1.2 dst_mtu=1500
dpd-link=on remote_location=0.0.0.0 weight=1
bound_if=17 lgwy=static/1 tun=tunnel/15 mode=dial_inst/3 encap=none/904 options[0388]=npu
rgwy-chg rport-chg frag-rfc  run_state=0 accept_traffic=1 overlay_id=0
...
```

IPsec VPN IP address assignments

When a user disconnects from a VPN tunnel, it is not always desirable for the released IP address to be used immediately. In IPsec VPN, IP addresses can held for the specified delay interval before being released back into the pool for assignment. The first-available address assignment method is still used.

Example



In this example, two PCs connect to the VPN. The IP address reuse delay interval is used to prevent a released address from being reused for at least four minutes. After the interval elapses, the IP address becomes available to clients again. Dual stack address assignment (both IPv4 and IPv6) is used.

To configure IPsec VPN with an IP address reuse delay interval:

1. Configure the IPsec phase1 interface, setting the IP address reuse delay interval to 240 seconds:

```
config vpn ipsec phase1-interface
    edit "FCT"
        set type dynamic
        set interface "port27"
        set mode aggressive
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set wizard-type dialup-forticlient
        set xauthtype auto
        set authusrgrp "local-group"
        set ipv4-start-ip 10.20.1.1
        set ipv4-end-ip 10.20.1.100
        set dns-mode auto
        set ipv4-split-include "FCT_split"
        set ipv6-start-ip 2001::1
        set ipv6-end-ip 2001::2
        set ip-delay-interval 240
        set save-password enable
        set psksecret **********
    next
end
```

2. Configure the IPsec phase2 interface:

```
config vpn ipsec phase2-interface
    edit "FCT"
        set phase1name "FCT"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
    edit "FCT6"
        set phase1name "FCT"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set src-addr-type subnet6
        set dst-addr-type subnet6
    next
end
```

To test the results:

1. Connect to the VPN with FortiClient 1 on PC1 then check the assigned IP address:

```
# diagnose vpn ike gateway list

vd: root/0
```

```
name: FCT_0
version: 1
interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:60417
tun_id: 173.1.1.2
remote_location: 0.0.0.0
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 14s ago
xauth-user: userc
2FA: no
FortiClient UID: 7C0897D80C8E4B6DAC775DD6B0F93BAA
assigned IPv4 address: 10.20.1.1/255.255.255.255
assigned IPv6 address: 2001::1/128
nat: peer
IKE SA: created 1/1  established 1/1  time 100/100/100 ms
IPsec SA: created 2/2  established 2/2  time 0/5/10 ms

  id/spi: 2 66140ba3e38b9b07/b64668f110ca4a48
  direction: responder
  status: established 14-14s ago = 100ms
  proposal: aes256-sha256
  key: 356637ee6e9a9cb5-fade432c09efb8aa-54be307fc1eeeab5-6e4b9ef19f98d5fa
  lifetime/rekey: 86400/86115
  DPD sent/recv: 00000000/00000394
```

2. Disconnect FortiClient 1 and connect with FortiClient 2. The IP address assigned to FortiClient 1 is not released to the pool, and a different IP address is assigned to FortiClient 2:

```
# diagnose vpn ike gateway list

vd: root/0
name: FCT_0
version: 1
interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:64916
tun_id: 173.1.1.2
remote_location: 0.0.0.0
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 6s ago
xauth-user: usera
2FA: no
FortiClient UID: EAF90E297393456AB546A041066C0720
assigned IPv4 address: 10.20.1.2/255.255.255.255
assigned IPv6 address: 2001::2/128
nat: peer
IKE SA: created 1/1  established 1/1  time 110/110/110 ms
IPsec SA: created 2/2  established 2/2  time 0/5/10 ms

  id/spi: 3 b25141d5a915e67e/b32decdb8cf98318
  direction: responder
  status: established 6-6s ago = 110ms
  proposal: aes256-sha256
```

```
  key: 374ab753f3207ea0-83496b5cb24b5a8d-c51da1fd505cf3a4-727884839897808a
  lifetime/rekey: 86400/86123
  DPD sent/recv: 00000000/00000453
```

3. Wait for 240 seconds, then disconnect and reconnect FortiClient 2. The IP address previously assigned to FortiClient 1 has been released back to the pool, and is assigned to FortiClient 2:

```
# diagnose vpn ike gateway list

vd: root/0
name: FCT_0
version: 1
interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:64916
tun_id: 173.1.1.2
remote_location: 0.0.0.0
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 20s ago
xauth-user: usera
2FA: no
FortiClient UID: EAF90E297393456AB546A041066C0720
assigned IPv4 address: 10.20.1.1/255.255.255.255
assigned IPv6 address: 2001::1/128
nat: peer
IKE SA: created 1/1  established 1/1  time 100/100/100 ms
IPsec SA: created 2/2  established 2/2  time 0/0/0 ms

  id/spi: 4 fb1fbad0c12f5476/aa06a2de76964f63
  direction: responder
  status: established 20-20s ago = 100ms
  proposal: aes256-sha256
  key: af43f1bb876dc79c-16448592fe608dc3-f251746d71b2c35d-c848e8c03bf738e9
  lifetime/rekey: 86400/86109
  DPD sent/recv: 00000000/000000a9
```

Instead of waiting for 240 seconds, you can instead use the `diagnose vpn ike gateway flush` command to release the previously used IP addresses back into the pool.

Renaming IPsec tunnels

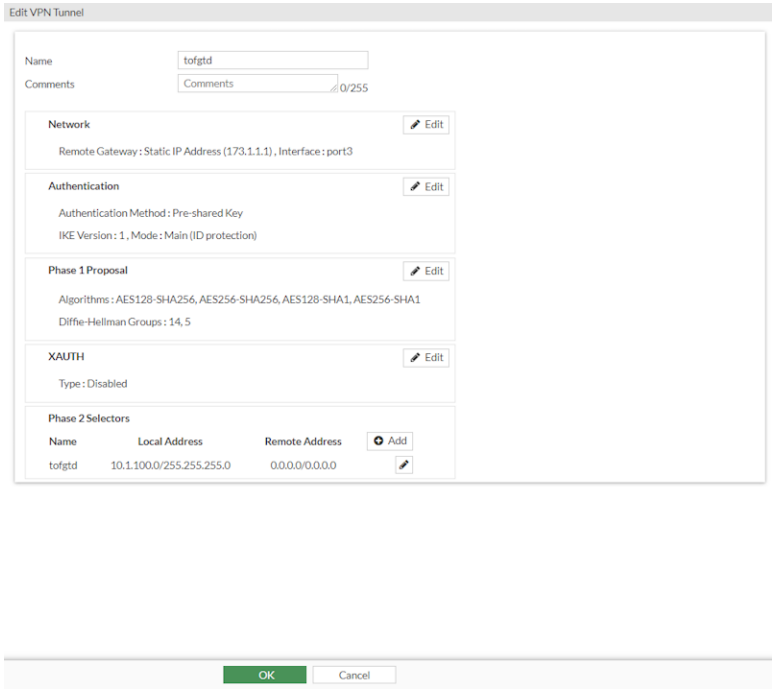
IPsec tunnels can be renamed. When you rename an IPsec tunnel, all references to the tunnel, such as routing and policies, are automatically updated to reflect the new name.

```
config vpn ipsec phase1-interface
    rename <string> to <string>
end
```

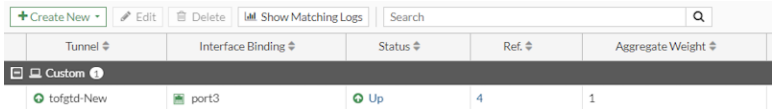
In this example, the IPsec tunnel named *tofgtd* is renamed to *tofgtd-New*, and all associated references are updated.

To rename an IPsec tunnel in the GUI:

1. Go to *VPN* > *IPsec Tunnels* and double-click an IPsec tunnel to open it for editing.
   In this example, the IPsec tunnel name is *tofgtd*.



2. In the *Name* box, type a new name, and click *OK*. The IPsec tunnel is renamed, and all associated references are updated.
   In this example, the IPsec tunnel is renamed to *tofgtd-New*.



3. Check the associated references:
   In this example, all associated references show the new IPsec tunnel name of *tofgtd-New*.
   - Go to *Network* > *Interfaces* to see that the interface references the new IPsec tunnel name.

   - Go to *Network* > *Static Routes* to see that the static route references the new IPsec tunnel name.

- Go to *Policy & Objects* > *Firewall Policy* to see that the policy references the new IPsec tunnel name

To rename an IPsec tunnel in the CLI:

1. Rename the IPsec tunnel.
   In this example, the IPsec tunnel named *tofgtd* is renamed to *tofgtd-New*:

```
config vpn ipsec phase1-interface
    rename tofgtd to tofgtd-New
end
```

2. Show the configuration to confirm that the IPsec tunnel was renamed.
   In this example, the IPsec tunnel was renamed to *tofgtd-New*:

```
show
config vpn ipsec phase1-interface
    edit "tofgtd-New"
        set interface "port3"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd disable
        set remote-gw 173.1.1.1
        ...
    next
end
```

3. Check the associated references.
   In this example, all associated references show the new IPsec tunnel name of *tofgtd-New*.
   - Confirm that the interfaces reference the new IPsec tunnel name:

```
config router static
show
config router static
    edit 3
        set dst 192.168.5.0 255.255.255.0
        set device "tofgtd-New"
    next
end
```

   - Confirm that the static route references the new IPsec tunnel name:

```
config system interface
show
    edit "tofgtd-New"
    ....
end
```

   - Confirm that the policies references the new IPsec tunnel name:

```
config firewall policy
show
config firewall policy
    edit 1
        set uuid 802c6c2e-8368-51ee-bf40-6c3c32da1024
        set srcintf "port2"
        set dstintf "tofgtd-New"
        set action accept
        ...
    next
    edit 2
        set uuid 80d136aa-8368-51ee-cc52-b0b06306fb80
        set srcintf "tofgtd-New"
        set dstintf "port2"
        set action accept
        ...
    next
end
```

Site-to-site VPN

A site-to-site VPN connection lets branch offices use the Internet to access the main office's intranet. A site-to-site VPN allows offices in multiple, fixed locations to establish secure connections with each other over a public network such as the Internet.

The following sections provide instructions for configuring site-to-site VPNs:

- FortiGate-to-FortiGate on page 2414
- FortiGate-to-third-party on page 2466

FortiGate-to-FortiGate

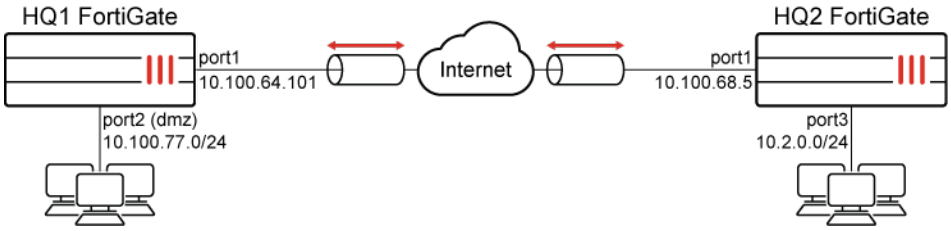
This section contains the following topics about FortiGate-to-FortiGate VPN configurations:

- Basic site-to-site VPN with pre-shared key on page 2414
- Basic site-to-site VPN with digital certificate on page 2423
- Site-to-site VPN with overlapping subnets on page 2434
- GRE over IPsec on page 2446
- Policy-based IPsec tunnel on page 2452
- Post-Quantum Cryptography for IPsec key exchange on page 2459

Basic site-to-site VPN with pre-shared key

This example shows how to configure a basic site-to-site IPsec tunnel between two FortiGates. This IKEv2 tunnel will use a pre-shared key to authenticate. Only traffic from the local subnets are permitted through the

tunnel.



Individual options may vary. However, in order for the tunnel to come up, options configured on one FortiGate should be identical to the other.

For more information on IPsec settings, see Phase 1 configuration and Phase 2 configuration.

To configure an IPsec VPN using the VPN Wizard in the GUI:

1. Configure the HQ1 FortiGate.
   a. Go to *VPN > VPN Wizard* and configure the following settings for VPN Setup:
      i. Enter a VPN name in the *Tunnel name* field. In this example, *HQ2B2*.
      ii. From the *Select a template* options, select *Site to Site*.
      iii. Click *Begin*.
   b. Configure the *Remote Site*:
      i. For *Remote site device type*, select *FortiGate*.
      ii. For *Remote site device*, select *Accessible and static*.
      iii. For the *IP address*, enter *10.100.68.5*.
      iv. For *Remote site subnets that can access VPN*, enter 10.2.0.0/24.
      v. Click *Next*.
   c. Configure the *VPN tunnel*:
      i. For *Authentication Method*, select *Pre-shared Key*.
      ii. In the *Pre-shared Key* field, enter your key.
      iii. For *IKE*, select *Version 2*.
      iv. For *Transport*, select *Auto*. Leave the *Use Fortinet encapsulation* option toggled off.
      v. For *NAT traversal*, select *Enable*.
      vi. For *Keepalive frequency*, enter *10*.
   d. Configure the *Local Site*:
      i. For *Outgoing interface that binds to tunnel*, select the WAN interface. In this example, *port1*. Disable the *Create and add interface to zone* toggle, if you do not want a zone created.
      ii. For *Local Interface*, select an interface from the *Select Entries* slide-out panel. In this example, *port2*.
      iii. The *Local subnets that can access VPN* field should automatically fill with the IP address related to the selected local interface (*10.100.77.0/24*).
      iv. Leave the *Allow remote site's internet traffic through this device* toggle disabled.
      v. Click *Next*.
   e. Review the configuration and click *Submit*.

2. Configure the HQ2 FortiGate
   a. Go to *VPN > VPN Wizard* and configure the following settings for VPN Setup:
      i. Enter a VPN name in the *Tunnel name* field. In this example, *B2toHQ*.
      ii. From the *Select a template* options, select *Site to Site*.
      iii. Click *Begin*.
   b. Configure the *Remote Site*:
      i. For *Remote site device type*, select *FortiGate*.
      ii. For *Remote site device*, select *Accessible and static*.
      iii. For the *IP address*, enter *10.100.64.101*.
      iv. For *Remote site subnets that can access VPN*, enter *10.100.77.0/24*.
      v. Click *Next*.
   c. Configure the *VPN tunnel*:
      i. For *Authentication Method*, select *Pre-shared Key*.
      ii. In the *Pre-shared Key* field, enter your key.
      iii. For *IKE*, select *Version 2*.
      iv. For *Transport*, select *Auto*. Leave the *Use Fortinet encapsulation* option toggled off.
      v. For *NAT traversal*, select *Enable*.
      vi. For *Keepalive frequency*, enter *10*.
   d. Configure the *Local Site*:
      i. For *Outgoing interface that binds to tunnel*, select the WAN interface. In this example, *port1*. Leave the *Create and add interface to zone* toggle enabled.
      ii. For *Local Interface*, select an interface from the *Select Entries* slide-out panel. In this example, *port3*.
      iii. The *Local subnets that can access VPN* field should automatically fill with the IP address related to the selected local interface (*10.2.0.0/24*).
      iv. Leave the *Allow remote site's internet traffic through this device* toggle disabled.
      v. Click *Next*.

Verify the VPN tunnel configurations created in the VPN Wizard

Verify the VPN tunnel configurations for HQ1 and HQ2 created in the *VPN Wizard* using the CLI.

Verify the HQ1 configuration

```
config firewall address
    edit "HQ2B2_local_subnet_0"
        set allow-routing enable
        set subnet 10.100.77.0 255.255.255.0
    next
    edit "HQ2B2_remote_subnet_0"
        set allow-routing enable
        set subnet 10.2.0.0 255.255.255.0
    next
end
```

```
config firewall addrgrp
    edit "HQ2B2_local"
        set allow-routing enable
        set member "HQ2B2_local_subnet_0"
        set comment "VPN: HQ2B2 -- Created by VPN wizard"
    next
    edit "HQ2B2_remote"
        set allow-routing enable
        set member "HQ2B2_remote_subnet_0"
        set comment "VPN: HQ2B2 -- Created by VPN wizard"
    next
end
```

```
config vpn ipsec phase1-interface
    edit "HQ2B2"
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set comments "VPN: HQ2B2 -- Created by VPN wizard"
        set wizard-type static-fortigate
        set remote-gw 10.100.68.5
        set psksecret ENC <encrypted key>
    next
end
```

```
config vpn ipsec phase2-interface
    edit "HQ2B2"
        set phase1name "HQ2B2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set comments "VPN: HQ2B2 -- Created by VPN wizard"
        set src-addr-type name
        set dst-addr-type name
        set src-name "HQ2B2_local"
        set dst-name "HQ2B2_remote"
    next
end
```

```
config router static
    edit 14
        set device "HQ2B2"
        set comment "VPN: HQ2B2 -- Created by VPN wizard"
        set dstaddr "HQ2B2_remote"

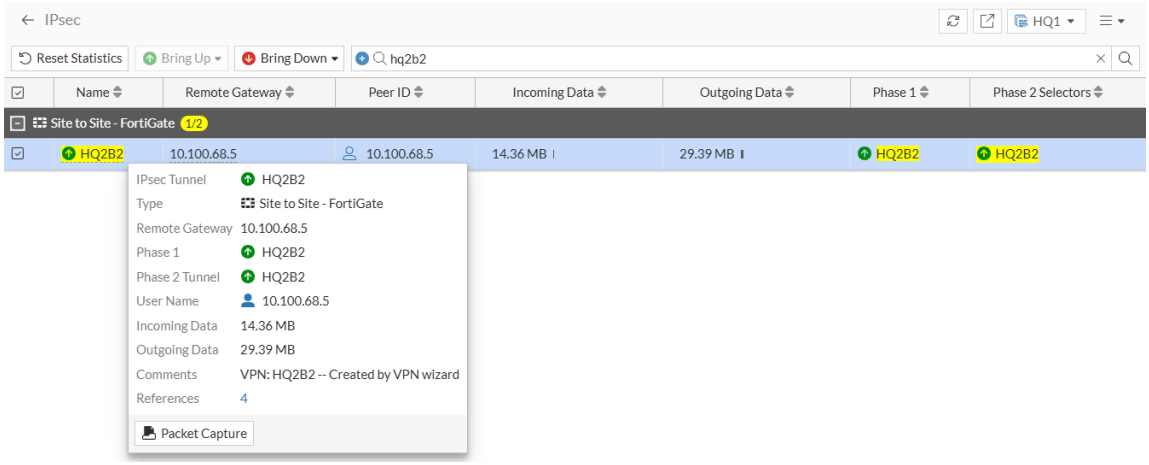
Testing the tunnel

To verify a tunnel is established, go to *Dashboard* > *Network* and open the *IPsec* widget. You can also use the following CLI command to verify the tunnel is established:

```
# diagnose vpn ike gateway list name <tunnel>
```

Verify the HQ1 tunnel

1. Go to *Dashboard* > *Network* and open the *IPsec* widget.
2. Look for the newly created tunnel, in this example, *HQ2B2*, and hover the cursor over the tunnel name and observe additional details.
3. From the CLI, run the `diagnose vpn ike gateway list name HQ2B2` command and observe the output:



```
vd: root/0
name: HQ2B2
version: 2
interface: port1 3
addr: 10.100.64.101:500 -> 10.100.68.5:500

```

HQ1 acted as the responder, and established the tunnel with remote peer *10.100.68.5* over UDP/500.

Verify the HQ2 tunnel

1. Go to *Dashboard > Network* and open the *IPsec* widget.
2. Look for the newly created tunnel, in this example, *B2toHQ*, and hover the cursor over the tunnel name and observe additional details.
3. From the CLI, run the `diagnose vpn ike gateway list name B2toHQ` command and observe the output:

```
vd: root/0
name: B2toHQ
version: 2
interface: port1 3
addr: 10.100.68.5:500 -> 10.100.64.101:500

peer-id: 10.100.64.101
```

HQ2 acted as the initiator, and established the tunnel with remote peer *10.100.64.101* over UDP/500.

Verifying traffic flow

Send traffic from *PC1 10.100.77.101* to the *10.2.0.0/24* network and verify traffic goes through.

Verify traffic on PC1 (10.100.77.101)

```
root@dmz-public-server:~# ping 10.2.0.7
PING 10.2.0.7 (10.2.0.7) 56(84) bytes of data.
64 bytes from 10.2.0.7: icmp_seq=1 ttl=62 time=9.84 ms
64 bytes from 10.2.0.7: icmp_seq=2 ttl=62 time=0.808 ms
```

Verify traffic on HQ1

In the CLI, run `diagnose sniffer packet any 'host 10.2.0.7' 4 0 l` and observe the output:

```
HQ1 # diag sniffer packet any 'host 10.2.0.7' 4 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.2.0.7]
2024-11-05 12:06:05.509027 port2 in 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.509074 HQ2B2 out 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.518607 HQ2B2 in 10.2.0.7 -> 10.100.77.101: icmp: echo reply
2024-11-05 12:06:05.518632 port2 out 10.2.0.7 -> 10.100.77.101: icmp: echo reply
```

The ICMP request is received on port2 and routed to the HQ2B2 tunnel. The ICMP reply is received on the HQ2B2 tunnel and routed back out port2.

Verify traffic on HQ2

In the CLI, run `diagnose sniffer packet any 'host 10.100.77.101' 4 0 l` and observe the output:

```
HQ2 # diag sniffer packet any 'host 10.100.77.101' 4 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.100.77.101]
2024-11-05 12:06:05.509711 B2toHQ in 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.509791 port3 out 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.518809 port3 in 10.2.0.7 -> 10.100.77.101: icmp: echo reply
2024-11-05 12:06:05.518899 B2toHQ out 10.2.0.7 -> 10.100.77.101: icmp: echo reply
```

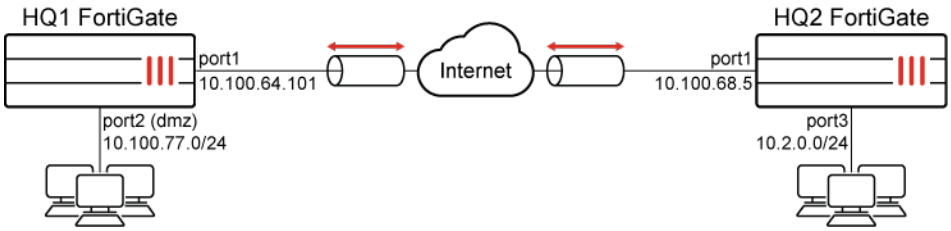
The ICMP request is received on the B2toHQ tunnel and routed to port3. The ICMP reply is received on port3 and routed back out the B2toHQ tunnel.

Basic site-to-site VPN with digital certificate

This is a sample configuration of IPsec VPN authenticating a remote FortiGate peer with a certificate. The certificate on one peer is validated by the presence of the CA certificate that is installed on the other peer.

The VPN Wizard is used to configure a site-to-site VPN tunnel.

It is assumed that the certificates have been configured and imported to the FortiGates. For information about configuring certificates using third party tools, such as XCA, see Creating certificates with XCA on page 3624. For information about importing a certificate, see Import a certificate on page 3604.



Individual settings can vary, but in order for the tunnel to come up, the configuration must be the same on both FortiGates.

For more information on IPsec settings, see Phase 1 configuration on page 2370 and Phase 2 configuration on page 2396.

To configure an IPsec VPN using the VPN Wizard on the HQ1 FortiGate:

1. Go to *VPN > VPN Wizard*.
2. Enter a name for the VPN in the *Tunnel name* field. In this example, *HQ2B2*
3. Set *Select a template* to *Site to Site*.
4. Click *Begin*.
5. Configure the *VPN tunnel* settings:

Field	Value
Authentication method	*Signature*
Certificate name	Select a certificate.
Peer certificate CA	Select a peer CA certificate.
IKE	*Version 2*
Transport	*Auto* Leave *Use Fortinet encapsulation* toggled off.
NAT traversal	*Enable* Set *Keepalive frequency* to *10*.

6. Click *Next*.
7. Configure the *Remote site* settings:

Field	Value
Remote site device type	*FortiGate*
Remote site device	*Accessible and static* Set *IP/FQDN* to *10.100.68.5*.
Route this device's internet traffic through the remote site.	Disabled
Remote site subnets that can access VPN	*10.2.0.0/24*

8. Click *Next*.
9. Configure the *Local site* settings:

Field	Value
Outgoing interface that binds to tunnel	*port1* (the WAN interface in this example) Disable *Create and add interface to zone* if you do not need a zone to be created.
Local interface	*port2* (in this example)
Local subnets that can access VPN	This field automatically uses the IP address related to the selected local interface. In this example, 10.100.77.0/24
Allow remote site's internet traffic through this device	Disabled

10. Click *Next*.
11. Review the configuration and, if everything is correct, click *Submit*.

To configure an IPsec VPN using the VPN Wizard on the HQ2 FortiGate:

1. Go to *VPN > VPN Wizard*.
2. Enter a name for the VPN in the *Tunnel name* field. In this example, *B2toHQ*
3. Set *Select a template* to *Site to Site*.
4. Click *Begin*.
5. Configure the *VPN tunnel* settings:

Field	Value
Authentication method	*Signature*
Certificate name	Select a certificate.
Peer certificate CA	Select a peer CA certificate.
IKE	*Version 2*
Transport	*Auto* Leave *Use Fortinet encapsulation* toggled off.
NAT traversal	*Enable* Set *Keepalive frequency* to *10*.

6. Click *Next*.
7. Configure the *Remote site* settings:

Field	Value
Remote site device type	*FortiGate*
Remote site device	*Accessible and static* Set *IP/FQDN* to *10.100.64.101*.
Route this device's internet traffic through the remote site.	Disabled
Remote site subnets that can access VPN	*10.100.77.0/24*

8. Click *Next*.
9. Configure the *Local site* settings:

Field	Value
Outgoing interface that binds to tunnel	*port1* (the WAN interface in this example) Enable *Create and add interface to zone*.
Local interface	*port3* (in this example)
Local subnets that can access VPN	This field automatically uses the IP address related to the selected local interface. In this example, 10.2.0.0/24

Field	Value
Allow remote site's internet traffic through this device	Disabled

10. Click *Next*.
11. Review the configuration and, if everything is correct, click *Submit*.

To configure HQ1 for IPsec VPN authenticating a remote FortiGate peer with a digital certificate using the CLI:

1. Configure the WAN interface and default route.

   The WAN interface is the interface connected to the ISP. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 10.100.64.101 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 10.100.64.102
        set device "port1"
    next
end
```

2. Configure address objects for internal protected networks.

```
config firewall address
    edit "10.2.0.0"
        set subnet 10.2.0.0 255.255.255.0
    next
    edit "10.100.77.0"
        set subnet 10.100.77.0 255.255.255.0
    next
end
```

3. Configure the internal (protected subnet) interface.

   The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.

```
config system interface
    edit "port2"
        set vdom "root"
        set ip 10.100.77.0 255.255.255.0
    next
end
```

4. Configure the import certificate and its CA certificate information.

The certificate and its CA certificate must be imported on the remote peer FortiGate and on the primary FortiGate before configuring IPsec VPN tunnels. If the built-in *Fortinet_Factory* certificate and the *Fortinet_CA* CA certificate are used for authentication, you can skip this step.

```
config vpn certificate local
    edit "test1"
        ...
        set range global
    next
end
config vpn certificate ca
    edit "CA_Cert_1"
        ...
        set range global
    next
end
```

5. Configure the peer user.

   The peer user is used in the IPsec VPN tunnel peer setting to authenticate the remote peer FortiGate.

   - If not using the built-in *Fortinet_Factory* certificate and *Fortinet_CA* CA certificate:

     ```
     config user peer
         edit "peer1"
             set ca "CA_Cert_1"
         next
     end
     ```

   - If the built-in *Fortinet_Factory* certificate and *Fortinet_CA* CA certificate are used for authentication, the peer user must be configured based on *Fortinet_CA*:

     ```
     config user peer
         edit "peer1"
             set ca "Fortinet_CA"
         next
     end
     ```

6. Configure the IPsec phase1-interface.

   ```
   config vpn ipsec phase1-interface
       edit "HQ2B2"
           set interface "port1"
           set ike-version 2
           set authmethod signature
           set net-device enable
           set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
           set remote-gw 10.100.68.5
           set certificate "test1"
           set peer "peer1"
       next
   end
   ```

7. Configure the IPsec phase2-interface.

```
config vpn ipsec phase2-interface
    edit "HQ2B2"
        set phase1name "HQ2B2 "
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set auto-negotiate enable
        set src-addr-type name
        set dst-addr-type name
        set src-name "10.100.77.0"
        set dst-name "10.2.0.0"
    next
end
```

8. Configure the static routes.

   Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.

```
config router static
    edit 2
        set dst 10.20.0.0 255.255.255.0
        set device "HQ2B2"
    next
    edit 3
        set dst 10.20.0.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end
```

9. Configure two firewall policies to allow bidirectional IPsec traffic flow over the IPsec VPN tunnel.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "HQ2B2"
        set dstintf "port2"
        set srcaddr "10.2.0.0"
        set dstaddr "10.100.77.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "port2"
        set dstintf "HQ2B2"
        set srcaddr "10.100.77.0"
        set dstaddr "10.2.0.0"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
    next
end
```

To configure HQ2 for IPsec VPN authenticating a remote FortiGate peer with a digital certificate using the CLI:

1. Configure the WAN interface and default route.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 10.100.68.5 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 10.100.68.2
        set device "port1"
    next
end
```

2. Configure address objects for internal protected networks.

```
config firewall address
    edit "10.2.0.0"
        set subnet 10.2.0.0 255.255.255.0
    next
end
config firewall address
    edit "10.100.77.0"
        set subnet 10.100.77.0 255.255.255.0
    next
end
```

3. Configure the internal (protected subnet) interface.

```
config system interface
    edit "port3"
        set vdom "root"
        set ip 10.2.0.0 255.255.255.0
    next
end
```

4. Configure the import certificate and its CA certificate information.

```
config vpn certificate local
    edit "test2"
        ...
        set range global
    next
end
config vpn certificate ca
```

```
    edit "CA_Cert_1"
        ...
        set range global
    next
end
```

5. Configure the peer user.
   - If not using the built-in *Fortinet_Factory* certificate and *Fortinet_CA* CA certificate:

     ```
     config user peer
         edit "peer2"
             set ca "CA_Cert_1"
         next
     end
     ```

   - If the built-in *Fortinet_Factory* certificate and *Fortinet_CA* CA certificate are used for authentication, the peer user must be configured based on *Fortinet_CA*:

     ```
     config user peer
         edit "peer2"
             set ca "Fortinet_CA"
         next
     end
     ```

6. Configure the IPsec phase1-interface.

```
config vpn ipsec phase1-interface
    edit "HQ2B2"
        set interface "port1"
        set ike-version 2
        set authmethod signature
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 10.100.68.5
        set certificate "test1"
        set peer "peer1"
    next
end
```

7. Configure the IPsec phase2-interface.

```
config vpn ipsec phase2-interface
    edit "B2toHQ"
        set phase1name "B2toHQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set auto-negotiate enable
        set src-addr-type name
        set dst-addr-type name
        set src-name "10.2.0.0"
        set dst-name "10.100.77.0"
```

```
   next
end
```

8. Configure the static routes.

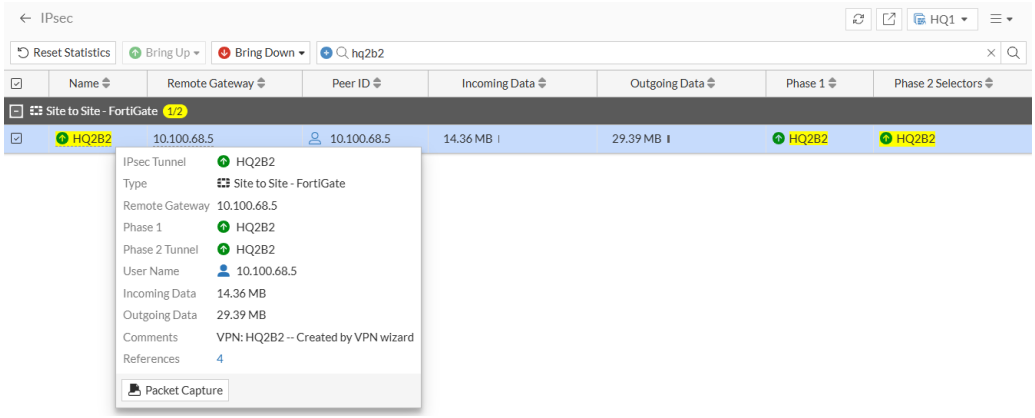
```
config router static
    edit 2
        set dst 10.100.77.0 255.255.255.0
        set device "B2toHQ"
    next
    edit 3
        set dst 10.100.77.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end
```

9. Configure two firewall policies to allow bidirectional IPsec traffic flow over the IPsec VPN tunnel.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "B2toHQ"
        set dstintf "port3"
        set srcaddr "10.100.77.0"
        set dstaddr "10.2.0.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "port3"
        set dstintf "B2toHQ"
        set srcaddr "10.2.0.0"
        set dstaddr "10.100.77.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To verify the tunnel status in the GUI:

1. On FortiGate HQ1, go to *Dashboard* > *Network* and expand the *IPsec* widget.
2. Find the new tunnel, *HQ2B2* in this example, and check that both *Phase 1* and *Phase 2 Tunnel* are up.



3. Verify the tunnel status on HQ2 in the same way.

To verify the tunnel status in the CLI:

1. On FortiGate HQ1, run the following command:

```
# diagnose vpn ike gateway list name HQ2B2
vd: root/0
name: HQ2B2
version: 2
interface: port1 3
addr: 10.100.64.101:500 -> 10.100.68.5:500
tun_id: 10.100.68.5/::10.100.68.5
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 852804s ago
peer-id: 10.100.68.5
peer-id-auth: no
pending-queue: 0
PPK: no
IKE SA: created 1/11  established 1/11  time 0/820/9010 ms
IPsec SA: created 1/21  established 1/21  time 0/433/9010 ms

id/spi: 8895 45e69522bd784183/69be2940ae314677
direction: responder
status: established 77898-77898s ago = 0ms
proposal: aes128-sha256
child: yes
SK_ei: 07446ef38bd406fa-18e45bec886a2bd3

lifetime/rekey: 86400/8231
DPD sent/recv: 00000000/00000000
peer-id: 10.100.68.5
```

Note that HQ1 acted as the *responder*, and established the tunnel with remote peer 10.100.68.5 over UDP/500.

2. On FortiGate HQ2, run the following command:

```
# diagnose vpn ike gateway list name B2toHQ
vd: root/0
name: B2toHQ
version: 2
interface: port1 3
addr: 10.100.68.5:500 -> 10.100.64.101:500
tun_id: 10.100.64.101/::10.100.64.101
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 853181s ago
peer-id: 10.100.64.101
peer-id-auth: no
pending-queue: 0
PPK: no
IKE SA: created 1/11  established 1/11  time 0/5/10 ms
IPsec SA: created 1/21  established 1/21  time 0/0/10 ms

id/spi: 5788 45e69522bd784183/69be2940ae314677
direction: initiator
status: established 78281-78281s ago = 10ms
proposal: aes128-sha256
child: yes
SK_ei: 07446ef38bd406fa-18e45bec886a2bd3
SK_er: b940f4338b27f369-7beaa308b7241a1b
SK_ai: 61eeb720d062c70b-e606340beab6f9d5-3a4da2966373ab15-e5766540cf6c7dd1
SK_ar: bbdd888b98dbda7b-669da7a726ce2148-3f08940f802f580c-52b6ef93f48672aa
message-id sent/recv: 1792/0
QKD: no
lifetime/rekey: 86400/7818
DPD sent/recv: 00001ed7/00001ed7
peer-id: 10.100.64.101
```

Note that HQ2 acted as the *initiator*, and established the tunnel with remote peer 10.100.64.101 over UDP/500.

To verify traffic through the IPsec tunnel:

1. On a PC connected behind the port2 interface of HQ1, initiate ICMP traffic to the 10.2.0.0/24 network and verify that traffic goes through:

```
root@dmz-public-server:~# ping 10.2.0.7
PING 10.2.0.7 (10.2.0.7) 56(84) bytes of data.
64 bytes from 10.2.0.7: icmp_seq=1 ttl=62 time=9.84 ms
64 bytes from 10.2.0.7: icmp_seq=2 ttl=62 time=0.808 ms
```

2. Verify the traffic on HQ1:

```
# diagnose sniffer packet any 'host 10.2.0.7' 4 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.2.0.7]
2024-11-05 12:06:05.509027 port2 in 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.509074 HQ2B2 out 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.518607 HQ2B2 in 10.2.0.7 -> 10.100.77.101: icmp: echo reply
2024-11-05 12:06:05.518632 port2 out 10.2.0.7 -> 10.100.77.101: icmp: echo reply
```

The ICMP request packets are received on port2 and routed to the HQ2B2 tunnel. ICMP reply packets are received on the HQ2B2 tunnel and routed back out port2.

3. Verify the traffic on HQ12:

```
# diagnose sniffer packet any 'host 10.100.77.101' 4 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.100.77.101]
2024-11-05 12:06:05.509711 B2toHQ in 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.509791 port3 out 10.100.77.101 -> 10.2.0.7: icmp: echo request
2024-11-05 12:06:05.518809 port3 in 10.2.0.7 -> 10.100.77.101: icmp: echo reply
2024-11-05 12:06:05.518899 B2toHQ out 10.2.0.7 -> 10.100.77.101: icmp: echo reply
```

The ICMP request is received on the B2toHQ tunnel and routed to port3. The ICMP reply is received on port3 and routed back out the B2toHQ.

4. Optionally, run real time IKE debug using appropriate filters for troubleshooting if the IPsec tunnel does not come up:

```
diagnose debug application ike -1
```

If the remote FortiGate certificate cannot be validated, the following error is shown in the debug output:

```
ike 0: to_HQ2:15314: certificate validation failed
```

Site-to-site VPN with overlapping subnets

Overlapping subnets in IPsec occur when two or more networks involved in a VPN tunnel use the same or overlapping IP address ranges. This creates a conflict, as IPsec relies on unique network subnets to route traffic securely between them. Overlapping subnets often occur when two networks with the same IP ranges need to communicate, such as in mergers or acquisitions.

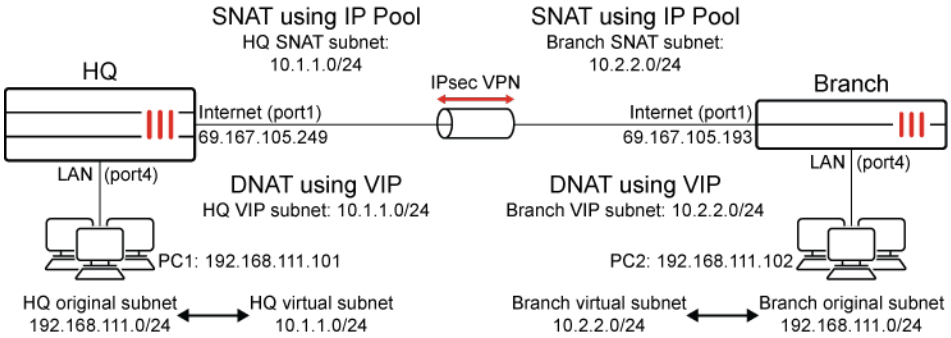
This example shows the configuration steps required to set up an IPsec VPN that enables communication between two overlapping networks located behind separate FortiGates using a route-based tunnel. Both source NAT (SNAT) and destination NAT (DNAT) are used to resolve IP conflicts.

Both the HQ and Branch FortiGates use the same overlapping internal subnet, 192.168.111.0/24. To establish communication between these networks over the IPsec tunnel, address translation is required to distinguish between the identical subnets. Without SNAT and DNAT, routing traffic between these overlapping networks would lead to conflicts, as networking devices cannot differentiate between identical IP addresses.

To resolve this issue, a unique and non-overlapping subnet is used on both FortiGates for address translation during transit.

- On the HQ FortiGate, the IP addresses of the HQ original subnet are logically one-to-one mapped to IP address in the HQ virtual subnet of 10.1.1.0/24.
- On the Branch FortiGate, the IP addresses of the Branch original subnet are logically one-to-one mapped to IP address in the Branch virtual subnet of 10.2.2.0/24.

The virtual subnets must be the same size as the overlapping subnet to cover the entire IP address range in the subnet and avoid network issues. The virtual subnets are used for SNAT using IP Pools and DNAT using virtual IP (VIP) configurations, ensuring that traffic originating from the overlapped subnets is translated according to the respective virtual subnets for communication.



After the configuration is complete, users that are in the HQ original subnet (192.168.111.0/24) are required to the Branch virtual subnet (10.2.2.0/24) to communicate with users that are behind the Branch. Users that are in the Branch original subnet (192.168.111.0/24) are required to use the HQ virtual subnet (10.1.1.0/24) to communicate with users that are behind the HQ.

Source	Destination	Used subnet
HQ	Branch	Branch virtual subnet (10.2.2.0/24)
Branch	HQ	HQ virtual subnet (10.1.1.0/24)

This ensures seamless communication across the IPsec tunnel while resolving the challenges posed by overlapping subnets.

HQ FortiGate configuration

To configure IPsec VPN:

1. Go to *VPN > VPN Tunnels* and click on *Create New > Custom IPsec tunnel*.
2. Set the *Name*, such as *HQtoBranchVPN*.
3. Configure the *Network* settings:

Field	Value
IP version	*IPv4*
Remote gateway	*Static IP address*
IP address	*69.167.105.193*
Interface	*Internet (port1)*
Transport	*UDP*

4. Leave the remaining *Network* settings as their default values.
5. Configure the *Authentication* settings:

Field	Value
Method	*Pre-shared Key*
Pre-shared key	Enter a suitable key. The same pre-shared key must be configured on the Branch FortiGate.

6. Leave the remaining *Authentication* settings as their default values.
7. Leave the *Phase 1 proposal* settings as their default values.
8. Configure the *Phase 2 selectors* settings:
   a. In the table, click *Create New*.
   b. Configure the new phase 2 selector:

Field	Value
Name	*HQtoBranchVPN*
Local address	*Subnet Address* *10.1.1.0/24*
Remote address	*Subnet Address* *10.2.2.0/24*
Auto-negotiate	(Optional) *Enable*

Only traffic matching the subnets specified in the *Local address* and *Remote address* fields in the Phase 2 configuration can pass through the IPsec tunnel.

- Outgoing traffic exiting through the IPsec tunnel is first matched against a firewall policy, then Source NAT (if configured) is applied, and finally, is checked against the traffic selectors in the IPsec tunnel settings.
- Incoming traffic on IPsec tunnel is first evaluated against the traffic selectors, then matched to a firewall policy, and finally, DNAT (if configured) is applied.

   c. Leave the remaining settings as their default values and click *OK*.
9. Click *OK*.

To configure static routes:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Configure the static route for the Branch virtual subnet:

Field	Value
Destination	*Subnet* *10.2.2.0/24*

Field	Value
Interface	*HQtoBranchVPN* (the IPsec tunnel interface)
Administrative Distance	*10*
Status	*Enabled*

3. Click *OK*.
4. Create a second static route with the same *Destination* that uses the blackhole interface.

   This is a best practice for route-based IPsec VPN tunnels because it ensures that traffic for the remote FortiGate's subnet is not sent using the default route in the event that the IPsec tunnel goes down and is instead sent to the blackhole.

Field	Value
Destination	*Subnet* *10.2.2.0/24*
Interface	*Blackhole*
Administrative Distance	*254*
Status	*Enable*

To configure the address objects:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new* and configure an address object for HQ original subnet:

Field	Value
Name	*HQ original subnet*
Interface	*Any*
Type	*Subnet*
IP/Netmask	*192.168.111.0/24*
Routing configuration	Disable

3. Click *OK*.
4. Click *Create new* again and configure an address object for Branch virtual subnet:

Field	Value
Name	*Branch virtual subnet*
Interface	*Any*
Type	*Subnet*
IP/Netmask	*10.2.2.0/24*
Routing configuration	Disable

5. Click *OK*

To configure the IP pool for SNAT:

1. Go to *Policy & Objects* > *IP Pools* and click *Create new*.
2. Configure the dynamic IP pool:

Field	Value
Name	*HQ SNAT subnet*
Type	*Fixed Port Range*
External IP Range	*10.1.1.1-10.1.1.254*
Internal IP Range	*192.168.111.1-192.168.111.254*

3. Leave the remaining settings as their default values and click *OK*.

To configure the VIP for DNAT:

1. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
2. Click *Create new*.
3. Configure the virtual IP:

Field	Value
Name	*HQ VIP subnet*
Type	*Static NAT*
External IP address/range	*10.1.1.1-10.1.1.254*
Map to IPv4 address/range	*192.168.111.1*

4. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the policy to allow traffic to flow from the HQ original subnet to the Branch virtual subnet and to perform SNAT:

Field	Value
Name	*HQ to Branch*
Incoming interface	*LAN (port4)*
Outgoing interface	*HQtoBranchVPN*
Source	*HQ original subnet*
Destination	*Branch virtual subnet*

Field	Value
Service	*ALL*
NAT	Enable
IP pool configuration	*Use Dynamic IP Pool* *HQ SNAT subnet IP*

3. Configure the remaining settings as needed, then click *OK*.
4. Click *Create New* again and configure the policy to allow traffic to flow from the Branch virtual subnet to the HQ original subnet and to perform DNAT:

Field	Value
Name	*Branch to HQ*
Incoming interface	*HQtoBranchVPN*
Outgoing interface	*LAN (port4)*
Source	*Branch virtual subnet*
Destination	*HQ VIP subnet* (the virtual IP/server to perform DNAT)
Service	*ALL*
NAT	Disable

5. Configure the remaining settings as needed, then click *OK*.

Branch FortiGate configuration

To configure IPsec VPN:

1. Go to *VPN* > *VPN Tunnels* and click on *Create New* > *Custom IPsec tunnel*.
2. Set the *Name*, such as *BranchtoHQVPN*.
3. Configure the *Network* settings:

Field	Value
IP version	*IPv4*
Remote gateway	*Static IP address*
IP address	*69.167.105.249*
Interface	*Internet (port1)*
Transport	*UDP*

4. Leave the remaining *Network* settings as their default values.
5. Configure the *Authentication* settings:

Field	Value
Method	*Pre-shared Key*
Pre-shared key	Enter a suitable key. The same pre-shared key must be configured on the HQ FortiGate.

6. Leave the remaining *Authentication* settings as their default values.
7. Leave the *Phase 1 proposal* settings as their default values.
8. Configure the *Phase 2 selectors* settings:
   a. In the table, click *Create New*.
   b. Configure the new phase 2 selector:

Field	Value
Name	*BranchtoHQVPN*
Local address	*Subnet Address* *10.2.2.0/24*
Remote address	*Subnet Address* *10.1.1.0/24*
Auto-negotiate	(Optional) *Enable*

Only traffic matching the subnets specified in the *Local address* and *Remote address* fields in the Phase 2 configuration can pass through the IPsec tunnel.

- Outgoing traffic exiting through the IPsec tunnel is first matched against a firewall policy, then Source NAT (if configured) is applied, and finally, is checked against the traffic selectors in the IPsec tunnel settings.
- Incoming traffic on IPsec tunnel is first evaluated against the traffic selectors, then matched to a firewall policy, and finally, DNAT (if configured) is applied.

   c. Leave the remaining settings as their default values and click *OK*.
9. Click *OK*.

To configure static routes:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Configure the static route for the Branch virtual subnet:

Field	Value
Destination	*Subnet* *10.1.1.0/24*
Interface	*BranchtoHQVPN* (the IPsec tunnel interface)
Administrative Distance	*10*
Status	*Enabled*

3. Click *OK*.
4. Create a second static route with the same *Destination* that uses the blackhole interface.

   This is a best practice for route-based IPsec VPN tunnels because it ensures that traffic for the remote FortiGate's subnet is not sent using the default route in the event that the IPsec tunnel goes down and is instead sent to the blackhole.

Field	Value
Destination	*Subnet* *10.1.1.0/24*
Interface	*Blackhole*
Administrative Distance	*254*
Status	*Enable*

To configure the address objects:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new* and configure an address object for HQ original subnet:

Field	Value
Name	*Branch original subnet*
Interface	*Any*
Type	*Subnet*
IP/Netmask	*192.168.111.0/24*
Routing configuration	Disable

3. Click *OK*.
4. Click *Create new* again and configure an address object for Branch virtual subnet:

Field	Value
Name	*HQ virtual subnet*
Interface	*Any*
Type	*Subnet*
IP/Netmask	*10.1.1.0/24*
Routing configuration	Disable

5. Click *OK*

To configure the IP pool for SNAT:

1. Go to *Policy & Objects* > *IP Pools* and click *Create new*.
2. Configure the dynamic IP pool:

Field	Value
Name	*Branch SNAT subnet*
Type	*Fixed Port Range*
External IP Range	*10.2.2.1-10.2.2.254*
Internal IP Range	*192.168.111.1-192.168.111.254*

3. Leave the remaining settings as their default values and click *OK*.

To configure the VIP for DNAT:

1. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
2. Click *Create new*.
3. Configure the virtual IP:

Field	Value
Name	*Branch VIP subnet*
Type	*Static NAT*
External IP address/range	*10.2.2.1-10.2.2.254*
Map to IPv4 address/range	*192.168.111.1*

4. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the policy to allow traffic to flow from the HQ original subnet to the Branch virtual subnet and to perform SNAT:

Field	Value
Name	*Branch to HQ*
Incoming interface	*LAN (port4)*
Outgoing interface	*BranchtoHQVPN*
Source	*Branch original subnet*
Destination	*HQ virtual subnet*
Service	*ALL*
NAT	Enable
IP pool configuration	*Use Dynamic IP Pool* *Branch SNAT subnet IP*

3. Configure the remaining settings as needed, then click *OK*.

4. Click *Create New* again and configure the policy to allow traffic to flow from the Branch virtual subnet to the HQ original subnet and to perform DNAT:

Field	Value
Name	*HQ to Branch*
Incoming interface	*BranchtoHQVPN*
Outgoing interface	*LAN (port4)*
Source	*HQ virtual subnet*
Destination	*Branch VIP subnet* (the virtual IP/server to perform DNAT)
Service	*ALL*
NAT	Disable

5. Configure the remaining settings as needed, then click *OK*.

Verification

To verify the status of IPsec tunnel in the GUI:

1. On either FortiGate, go to *Dashboard* > *Network* and expand the *IPsec* widget.
2. The tunnels should be up on both FortiGates. If you did not enable *Auto-negotiate* in the IPsec VPN settings, you may have to select the tunnel and click *Bring Up*.

To verify the status of IPsec tunnel in the CLI:

1. Verify the status of Phase 1:

```
Branch # diagnose vpn ike gateway list name BranchtoHQVPN
vd: root/0
name: BranchtoHQVPN
version: 2
interface: port1 3
addr: 10.100.66.99:4500 -> 69.167.105.249:4500
tun_id: 69.167.105.249/::69.167.105.249
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 58s ago
peer-id: 10.100.66.99
peer-id-auth: no
nat: me peer
pending-queue: 0
PPK: no
IKE SA: created 1/1  established 1/1  time 10/10/10 ms
IPsec SA: created 1/1  established 1/1  time 10/10/10 ms

  id/spi: 5 8d6f155741b90831/54940957144cdd82
  direction: initiator
```

```
  ...
  peer-id: 10.100.66.99
```

2. Verify the status of Phase 2:

```
Branch # diagnose vpn tunnel list name BranchtoHQVPN
list ipsec tunnel by names in vd 0
------------------------------------------------------
name=BranchtoHQVPN ver=2 serial=1 10.100.66.99:4500->69.167.105.249:4500 nexthop=10.100.66.1
tun_id=69.167.105.249 tun_id6=::69.167.105.249 status=up dst_mtu=1200 weight=1
bound_if=3 real_if=3 lgwy=static/1 tun=intf mode=auto/1 encap=none/552 options[0228]=npu frag-

```

Note that the protected subnet in the IPsec tunnel are the virtual subnets for Branch and HQ, respectively.

To verify the traffic flow from PC1 to PC2:

1. From a PC in the HQ network (PC1, 192.168.111.101), ping a PC in the Branch network (PC2, 192.168.111.102) using the virtual IP of PC2, 10.2.2.102.

   The ping should be successful.

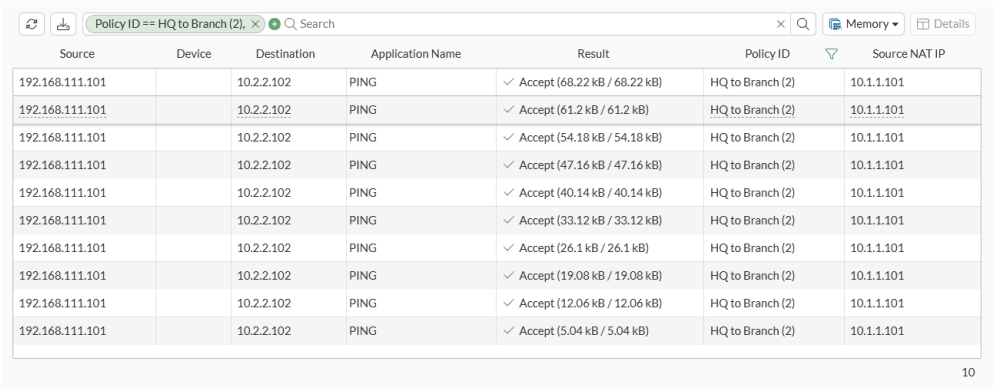
```
C:\>ping 10.2.2.102

Pinging 10.2.2.102 with 32 bytes of data:
Reply from 10.2.2.102: bytes=32 times=10ms TTL=126
Reply from 10.2.2.102: bytes=32 times=3ms TTL=126
Reply from 10.2.2.102: bytes=32 times=3ms TTL=126
Reply from 10.2.2.102: bytes=32 times=3ms TTL=126

Ping statistics for 10.2.2.102:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 3ms, Maximum = 10ms, Average = 4ms
```

To verify the traffic flow from PC1 to PC2 in the GUI:

1. On either FortiGate, go to *Log & Report* > *Forward Traffic*.
2. Filter the content using the search bar and add the required columns to see the logs.



Source	Device	Destination	Application Name	Result	Policy ID	Source NAT IP
192.168.111.101		10.2.2.102	PING	Accept (68.22 kB / 68.22 kB)	HQ to Branch (2)	10.1.1.101

192.168.111.101		10.2.2.102	PING	Accept (12.06 kB / 12.06 kB)	HQ to Branch (2)	10.1.1.101
192.168.111.101		10.2.2.102	PING	Accept (5.04 kB / 5.04 kB)	HQ to Branch (2)	10.1.1.101

10

To make sure that the logs are collected and shown under *Forward Traffic*, set *Log Allowed Traffic* to *All Sessions* in the corresponding firewall policy configured under *Policy & Objects* > *Firewall Policy*.

To verify the traffic flow from PC1 to PC2 in the CLI:

1. Verify the SNAT operation for traffic flowing from PC1 to PC2 on HQ:
   a. Using sniffer trace:

```
HQ # diagnose sniffer packet any 'icmp' 4 10
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
6.141932 port4 in 192.168.111.101 -> 10.2.2.102: icmp: echo request
6.144532 HQtoBranchVPN out 10.1.1.101 -> 10.2.2.102: icmp: echo request
6.149731 HQtoBranchVPN in 10.2.2.102 -> 10.1.1.101: icmp: echo reply
6.149770 port4 out 10.2.2.102 -> 192.168.111.101: icmp: echo reply
```

   b. Using session table:

```
HQ # diagnose sys session filter proto 1
HQ # diagnose sys session list
session info: proto=1 proto_state=00 duration=1 expire=58 timeout=0 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ tun_id=69.167.105.193/0.0.0.0 vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=60/1/1 reply=60/1/1 tuples=2
tx speed(Bps/kbps): 31/0 rx speed(Bps/kbps): 31/0

total session: 1
```

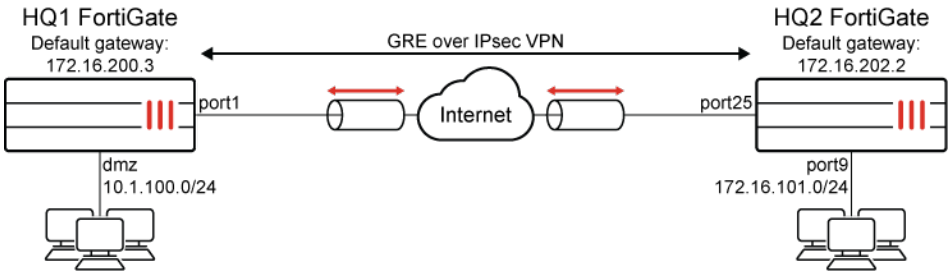
For more information on running sniffer trace, see Performing a sniffer trace or packet capture on page 4325.
For more information about using session table, see Using a session table on page 4335.

GRE over IPsec

This is an example of GRE over an IPsec tunnel using a static route over GRE tunnel and `tunnel-mode` in the `phase2-interface` settings.



To configure GRE over an IPsec tunnel:

1. Enable subnet overlapping at both HQ1 and HQ2.

```
config system settings
    set allow-subnet-overlap enable
end
```

2. Configure the WAN interface and static route.
   a. HQ1.

```
config system interface
    edit "port1"
        set ip 172.16.200.1 255.255.255.0
    next
    edit "dmz"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.3
        set device "port1"
    next
end
```

   b. HQ2.

```
config system interface
    edit "port25"
        set ip 172.16.202.1 255.255.255.0
    next
    edit "port9"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port25"
    next
end
```

3. Configure IPsec phase1-interface and phase2-interface.
   a. HQ1.

```
config vpn ipsec phase1-interface
    edit "greipsec"
        set interface "port1"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
        next
end
config vpn ipsec phase2-interface
    edit "greipsec"
        set phase1name "greipsec"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set protocol 47
    next
end
```

   b. HQ2.

```
config vpn ipsec phase1-interface
    edit "greipsec"
        set interface "port25"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set psksecret sample
        next
end
config vpn ipsec phase2-interface
    edit "greipsec"
        set phase1name "greipsec"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set protocol 47
    next
end
```

4. Configure IPsec tunnel interface IP address.
   a. HQ1.

```
config system interface
    edit "greipsec"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.2 255.255.255.255
    next
end
```

b. HQ2.

```
config system interface
    edit "greipsec"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.1 255.255.255.255
    next
end
```

5. Configure the GRE tunnel.
   a. HQ1.

```
config system gre-tunnel
    edit "gre_to_HQ2"
        set interface "greipsec"
        set remote-gw 10.10.10.2
        set local-gw 10.10.10.1
    next
end
```

   b. HQ2.

```
config system gre-tunnel
    edit "gre_to_HQ1"
        set interface "greipsec"
        set remote-gw 10.10.10.1
        set local-gw 10.10.10.2
    next
end
```

6. Configure the firewall policy.
   a. HQ1.

```
config firewall policy
    edit 1
        set srcintf "dmz"
        set dstintf "gre_to_HQ2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "gre_to_HQ2"
        set dstintf "dmz"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 3
```

```
        set srcintf "greipsec"
        set dstintf "greipsec"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

b. HQ2.

```
config firewall policy
    edit 1
        set srcintf "port9"
        set dstintf "gre_to_HQ1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "gre_to_HQ1"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 3
        set srcintf "greipsec"
        set dstintf "greipsec"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

7. Configure the static route.

a. HQ1.

```
config router static
    edit 2
        set dst 172.16.101.0 255.255.255.0
        set device "gre_to_HQ2"
    next
end
```

b. HQ2.

```
config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "gre_to_HQ1"
    next
end
```

To view the VPN tunnel list on HQ1:

```
diagnose vpn tunnel list
list all ipsec tunnel in vd 0
----

```

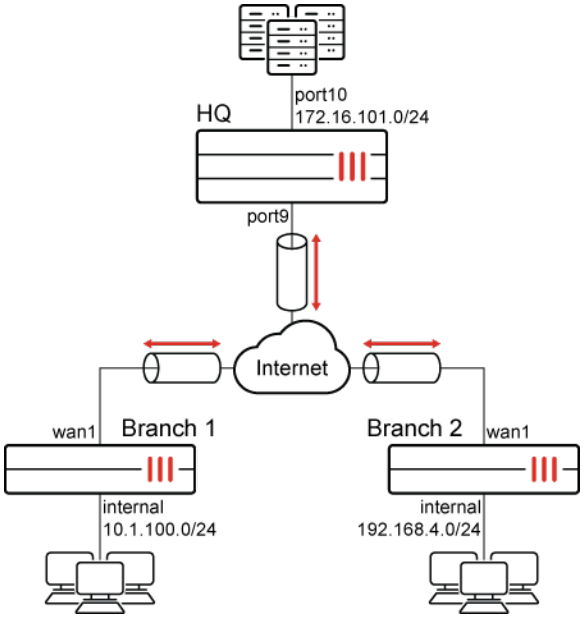
Policy-based IPsec tunnel

This is an example of policy-based IPsec tunnel using site-to-site VPN between branch and HQ. HQ is the IPsec concentrator.

Sample topology



Sample configuration

To configure a policy-based IPsec tunnel using the GUI:

- Configure the IPsec VPN at HQ.
- Configure the IPsec concentrator at HQ.
- Configure the firewall policy at HQ.
- Configure IPsec VPN at branch 1.
- Configure the firewall policy at branch 1.
- Configure IPsec VPN at branch 2.
- Configure the firewall policy at branch 2.

To configure the IPsec VPN at HQ:

1. Go to *VPN* > *IPsec Wizard* to set up branch 1.
   a. Enter a VPN *Name*. In this example, *to_branch1*.
   b. For *Template Type*, click *Custom*. Click *Next*.
   c. Uncheck *Enable IPsec Interface Mode*.
   d. For *Remote Gateway*, select *Static IP Address*.
   e. Enter IP address, in this example, *15.1.1.2*.
   f. For *Interface*, select *port9*.

   g. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
   h. Click *OK*.
2. Go to *VPN > IPsec Wizard* to set up branch 2.
   a. Enter a VPN *Name*. In this example, *to_branch2*.
   b. For *Template Type*, click *Custom*. Click *Next*.
   c. Uncheck *Enable IPsec Interface Mode*.
   d. For *Remote Gateway*, select *Static IP Address*.
   e. Enter IP address, in this example, *13.1.1.2*.
   f. For *Interface*, select *port9*.
   g. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
   h. Click *OK*.

To configure the IPsec concentrator at HQ:

1. Go to *VPN > IPsec Concentrator* and click *Create New*.
2. Enter a name. In this example, *branch*.
3. Add the *Members to_branch1* and *to_branch2*.
4. Click *OK*.

To configure the firewall policy at HQ:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. For *Incoming Interface*, select *port10*.
4. For *Outgoing Interface*, select *port9*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *Branch1/Branch2*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure IPsec VPN at branch 1:

1. Go to *VPN > IPsec Wizard* to set up branch 1.
2. Enter a VPN name. In this example, *to_HQ*.
3. For *Template Type*, click *Custom*. Click *Next*.
4. Uncheck *Enable IPsec Interface Mode*.
5. For *Remote Gateway*, select *Static IP Address*.
6. Enter IP address, in this example, *22.1.1.1*.
7. For *Interface*, select *wan1*.
8. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
9. Click *OK*.

To configure the firewall policy at branch 1:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. Choose the *Incoming Interface*, in this example, *internal*.
4. Choose the *Outgoing Interface*, in this example, *wan1*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *Branch1/Branch2*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure IPsec VPN at branch 2:

1. Go to *VPN > IPsec Wizard* to set up branch 1.
2. Enter a VPN name. In this example, *to_HQ*.
3. For *Template Type*, click *Custom*. Click *Next*.
4. Uncheck *Enable IPsec Interface Mode*.
5. For *Remote Gateway*, select *Static IP Address*.
6. Enter IP address, in this example, *22.1.1.1*.
7. For *Interface*, select *wan1*.
8. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
9. Click *OK*.

To configure the firewall policy at branch 2:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. Choose the *Incoming Interface*, in this example, *internal*.
4. Choose the *Outgoing Interface*, in this example, *wan1*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *to_HQ*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure a policy-based IPsec tunnel using the CLI:

1. Configure the HQ WAN interface and static route.

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
```

```
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the HQ IPsec phase1 and phase2.

```
config vpn ipsec phase1
    edit "to_branch1"
        set interface "port9"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 15.1.1.2
        set psksecret sample
        next
    edit "to_branch2"
        set interface "port9"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 13.1.1.2
        set psksecret sample
        next
end
config vpn ipsec phase2
    edit "to_branch1"
        set phase1name "to_branch1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
    edit "to_branch2"
        set phase1name "to_branch2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

3. Configure the firewall policy at HQ.

```
config firewall policy
    edit 1
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "10.1.100.0"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
```

```
        set vpntunnel "to_branch1"
    next
    edit 2
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "192.168.4.0"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_branch2"
    next
end
```

4. Configure the IPsec concentrator at HQ.

```
config vpn ipsec concentrator
    edit 1
        set name "branch"
        set member "to_branch1" "to_branch2"
    next
end
```

5. Configure the branch WAN interface and static route.
   a. For branch 1.

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

   b. For branch 2.

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
```

```
    next
end
config router static
    edit 1
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

6. Configure the branch IPsec phase1 and phase2.
   a. For branch 1.

```
config vpn ipsec phase1
    edit "to_HQ"
        set interface "wan1"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 22.1.1.1
        set psksecret sample
        next
end
config vpn ipsec phase2
    edit "to_HQ"
        set phase1name "to_HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

   b. For branch 2.

```
config vpn ipsec phase1
    edit "to_HQ"
        set interface "wan1"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 22.1.1.1
        set psksecret sample
        next
end
config vpn ipsec phase2
    edit "to_HQ"
        set phase1name "to_HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

7. Configure the branch firewall policy.
   a. For branch 1.

```
config firewall policy
    edit 1
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.1.100.0"
        set dstaddr "all"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_HQ"
    next
end
```

   b. For branch 2.

```
config firewall policy
    edit 1
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "192.168.4.0"
        set dstaddr "all"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_HQ"
    next
end
```

To view the IPsec VPN tunnel list at HQ:

```
# diagnose vpn tunnel list
```

```
list all ipsec tunnel in vd 0

Post-Quantum Cryptography for IPsec key exchange

IPsec key exchange supports Post-Quantum Cryptography (PQC) to enhance security with algorithms that protect against quantum computer attacks. This update ensures future-proof encryption and addresses vulnerabilities in traditional methods, aligning with upcoming security standards.

FortiOS allows users to specify various KE groups; however, only the following KE groups are standardized by NIST and are FIPS 203 compliant:

- ML-KEM-512
- ML-KEM-768
- ML-KEM-1024

FIPS 203, also known as the Module-Lattice-Based Key-Encapsulation Mechanism (ML-KEM) Standard, is a set of guidelines established by the National Institute of Standards and Technology (NIST). These guidelines specify the use of lattice-based cryptographic algorithms for key encapsulation mechanisms, which are crucial for secure communication in various applications.

The three parameter sets offer different levels of security and performance:

ML-KEM-512	Provides a balance between security and efficiency, suitable for environments where moderate security is sufficient.
ML-KEM-768	Offers a higher level of security compared to ML-KEM-512, making it suitable for more sensitive applications.
ML-KEM-1024	Delivers the highest level of security among the three, ideal for highly sensitive data and critical applications.

See FIPS203 and Module-Lattice-Based Key-Encapsulation Mechanism Standard for more information.

CLI configuration

The following commands can be used to enable and configure PQC:

```
config vpn ipsec phase1-interface
    edit <name>
        set addke1 <option1>, <option2>, <option3>
        set addke2 <option1>, <option2>, <option3>
        set addke3 <option1>, <option2>, <option3>
        set addke4 <option1>, <option2>, <option3>
        set addke5 <option1>, <option2>, <option3>
        set addke6 <option1>, <option2>, <option3>
        set addke7 <option1>, <option2>, <option3>
        set childless-ike enable
    next
end
config vpn ipsec phase2-interface
    edit <name>
        set addke1 <option1>, <option2>, <option3>
        set addke2 <option1>, <option2>, <option3>
        set addke3 <option1>, <option2>, <option3>
        set addke4 <option1>, <option2>, <option3>
        set addke5 <option1>, <option2>, <option3>
        set addke6 <option1>, <option2>, <option3>
        set addke7 <option1>, <option2>, <option3>
    next
end
```

Example

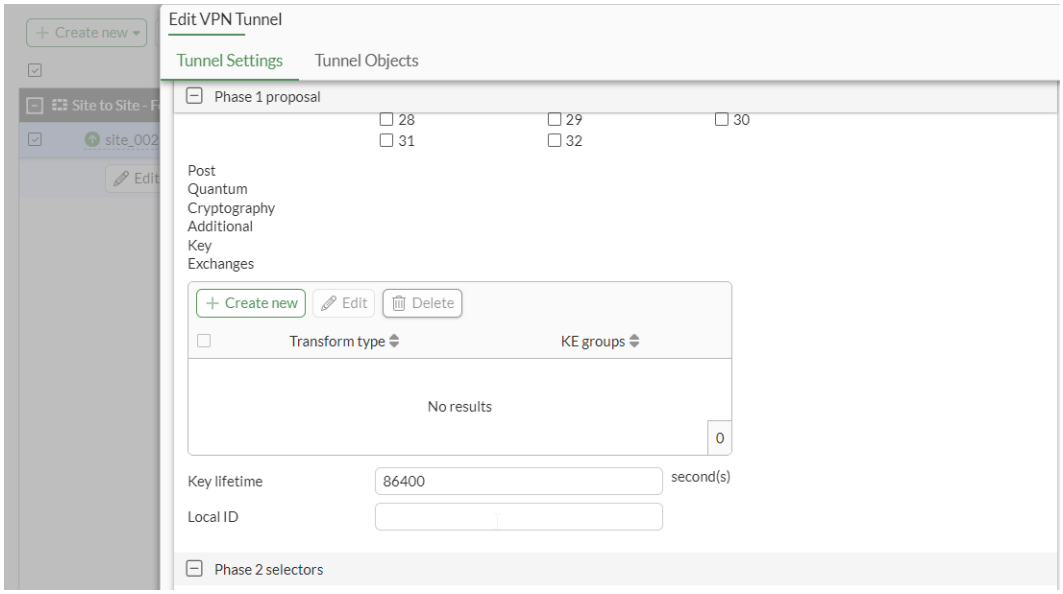
A financial institution uses IPsec VPN to move sensitive customer data, such as account numbers, social insurance numbers, and credit card information. The current encryption used is based on traditional algorithms, which could be vulnerable to attacks from quantum computers in the future. By implementing Post-Quantum Cryptography, the financial institution can ensure that their data remains secure even as technology advances, protecting themselves and their customers from potential breaches due to advancements in computing power. This ensures compliance with regulatory requirements and maintains customer trust.

To enable PQC in the GUI:

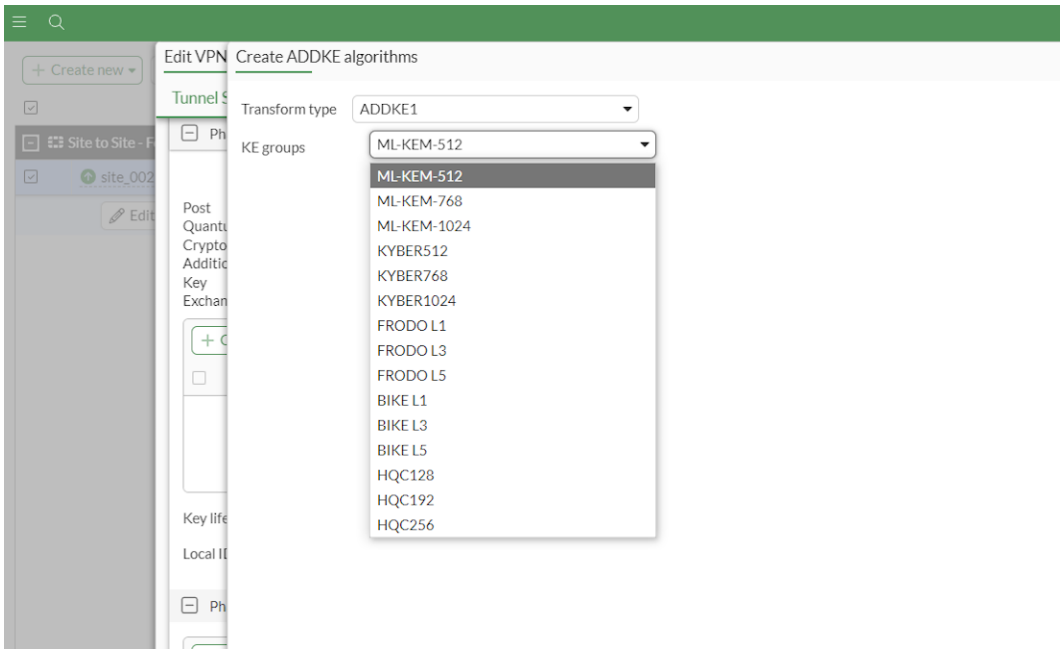
This is a site-to-site VPN setup. Only the new configuration is being demonstrated in the GUI for this example. For more information, see Basic site-to-site VPN with pre-shared key on page 2414.

1. Go to *VPN* > *VPN Tunnels*.

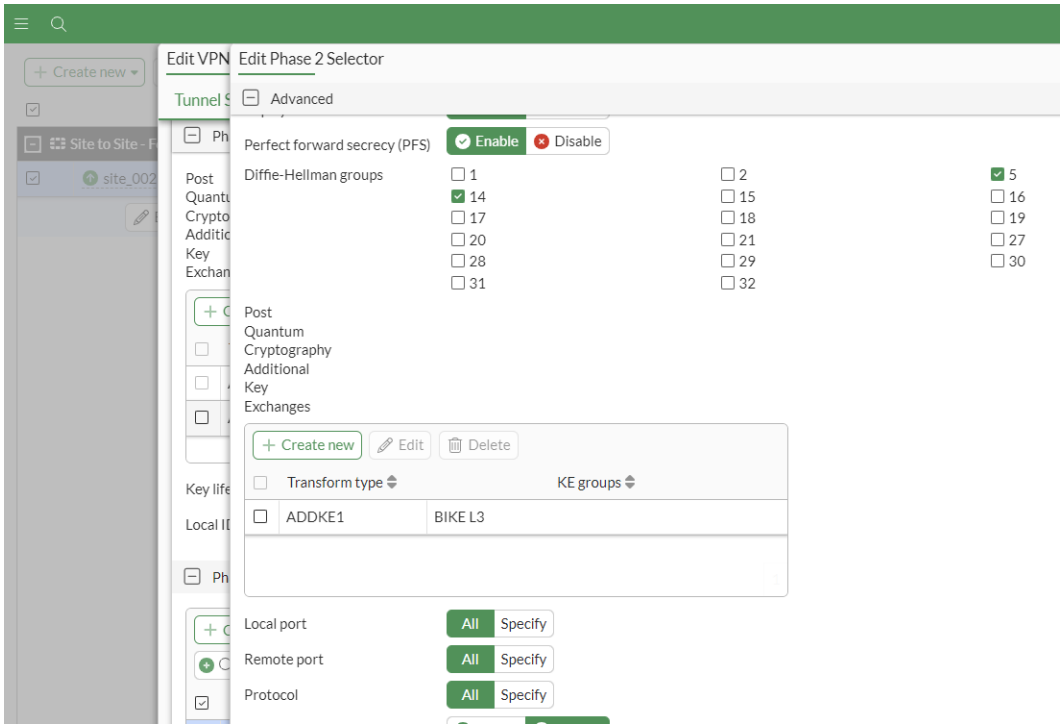
2. Double-click the VPN Tunnel to open it for editing.
3. Scroll down to *Post Quantum Cryptography Additional Key Exchanges*, and click *Create new*.



4. Set *Transform type*, select up to three *KE groups*, and click *OK*.



5. In *Phase 2 selectors*, click *Create new* and repeat the steps above.



6. Click *OK* to save the tunnel.

To enable PQC key exchange for an IPsec tunnel in the CLI:

1. Configure FGT-C:

```
config vpn ipsec phase1-interface
    edit "site_002"
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set addke1 35 36 37
        set addke2 1083
        set childless-ike enable
        set transport auto
        set remote-gw 172.16.200.9
        set psksecret XXXXXX
    next
end
config vpn ipsec phase2-interface
    edit "site_002"
        set phase1name "site_002"
        set addke1 1090
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

2. Configure FGT-D:

```
config vpn ipsec phase1-interface
    edit "site_001"
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set addke1 35 36 37
        set addke2 1083
        set childless-ike enable
        set transport auto
        set remote-gw 172.16.200.8
        set psksecret XXXXXX
    next
end
config vpn ipsec phase2-interface
    edit "site_001"
        set phase1name "site_001"
        set addke1 1090
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
```

```
    next
end
```

3. Verify the IPsec VPN tunnel state on FGT-D:

```
#diagnose vpn ike gateway list

vd: root/0
name: site_001PPPPPP1
version: 2
interface: port1 9
addr: 172.16.200.9:500 -> 172.16.200.8:500
tun_id: 172.16.200.8/::172.16.200.8
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 88s ago
peer-id: 172.16.200.8
peer-id-auth: no
pending-queue: 0
PPK: no
IKE SA: created 1/1  established 1/1  time 0/0/0 ms
IPsec SA: created 1/1  established 1/1  time 0/0/0 ms

  id/spi: 111 7316ebc639a46c4b/4be2fd15d7304333

FortiGate-to-third-party

This section contains the following topics about FortiGate-to-third-party VPN configurations:

- IKEv2 IPsec site-to-site VPN to an AWS VPN gateway on page 2467
- IPsec VPN to Azure with virtual network gateway on page 2473
- IPsec VPN to an Azure with virtual WAN on page 2481

- IPSec VPN between a FortiGate and a Cisco ASA with multiple subnets on page 2485
- Cisco GRE-over-IPsec VPN on page 2486

IKEv2 IPsec site-to-site VPN to an AWS VPN gateway

This is a sample configuration of an IPsec site-to-site VPN connection between an on-premise FortiGate and an AWS virtual private cloud (VPC).

AWS uses unique identifiers to manipulate a VPN connection's configuration. Each VPN connection is assigned an identifier and is associated with two other identifiers: the customer gateway ID for the FortiGate and virtual private gateway ID.

This example includes the following IDs:

- VPN connection ID: vpn-07e988ccc1d46f749
- Customer gateway ID: cgw-0440c1aebed2f418a
- Virtual private gateway ID

This example assumes that you have configured VPC-related settings in the AWS management portal as described in Create a Secure Connection using AWS VPC.

This example includes creating and configuring two tunnels. You must configure both tunnels on your FortiGate.

To configure IKEv2 IPsec site-to-site VPN to an AWS VPN gateway:

1. Configure the first VPN tunnel:
   a. Configure Internet Key Exchange (IKE).
   b. Configure IPsec.
   c. Configure the tunnel interface.
   d. Configure border gateway protocol (BGP).
   e. Configure firewall policies.
2. Configure the second VPN tunnel:
   a. Configure Internet Key Exchange (IKE).
   b. Configure IPsec.
   c. Configure the tunnel interface.
   d. Configure BGP.
   e. Configure firewall policies.

To configure IKE for the first VPN tunnel:

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman (DH), lifetime, and key parameters. These sample configurations fulfill the minimum requirements for AES128, SHA1, and DH Group 2. Category VPN connections in the GovCloud AWS region have a minimum requirement of AES128, SHA2, and DH Group 14. To take advantage of AES256, SHA256, or other DH groups such as 14-18, 22, 23, and 24, you must modify these sample configuration files. Higher parameters are only available for VPNs of category "VPN", not for "VPN-Classic".

Your FortiGate's external interface's address must be static. Your FortiGate may reside behind a device performing NAT. To ensure NAT traversal can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, it is recommended to disable NAT traversal.

Begin configuration in the root VDOM. The interface name must be shorter than 15 characters. It is best if the name is shorter than 12 characters. IPsec dead peer detection (DPD) causes periodic messages to be sent to ensure a security association remains operational.

```
config vpn ipsec phase1-interface
   edit vpn-07e988ccc1d46f749-0
      set interface "wan1"
      set dpd enable
      set local-gw 35.170.66.108
      set dhgrp 2
      set proposal aes128-sha1
      set keylife 28800
      set remote-gw 3.214.239.164
      set psksecret iCelks0UOob8z4SYMRM6zlx.rU2C3jth
      set dpd-retryinterval 10
   next
end
```

To configure IPsec for the first VPN tunnel:

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters.

```
config vpn ipsec phase2-interface
   edit "vpn-07e988ccc1d46f749-0"
      set phase1name "vpn-07e988ccc1d46f749-0"
      set proposal aes128-sha1
      set dhgrp 2
      set pfs enable
      set keylifeseconds 3600
   next
end
```

To configure the tunnel interface for the first VPN tunnel:

You must configure a tunnel interface as the logical interface associated with the tunnel. All traffic routed to the tunnel interface must be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

You must configure the interface's address with your FortiGate's address. If the address changes, you must recreate the FortiGate and VPN connection with Amazon VPC.

The `tcp-mss` option causes the router to reduce the TCP packets' maximum segment size to prevent packet fragmentation.

```
config system interface
   edit "vpn-07e988ccc1d46f749-0"
      set vdom "root"
      set ip 169.254.45.90 255.255.255.255
      set allowaccess ping
      set type tunnel
      set tcp-mss 1379
      set remote-ip 169.254.45.89
      set mtu 1427
      set interface "wan1"
   next
end
```

To configure BGP for the first VPN tunnel:

BGP is used within the tunnel to exchange prefixes between the virtual private gateway and your FortiGate. The virtual private gateway announces the prefix according to your VPC.

The local BGP autonomous system number (ASN) (65000) is configured as part of your FortiGate. If you must change the ASN, you must recreate the FortiGate and VPN connection with AWS.

Your FortiGate may announce a default route (0.0.0.0/0) to AWS. This is done using a prefix list and route map in FortiOS.

```
config router bgp
   set as 65000
   config neighbor
      edit 169.254.45.89
         set remote-as 64512
      end
   end
end
config router bgp
   config neighbor
      edit 169.254.45.89
         set capability-default-originate enable
      end
   end
end
config router prefix-list
   edit "default_route"
      config rule
         edit 1
            set prefix 0.0.0.0 0.0.0.0
         next
      end
   end
end
config router route-map
   edit "routemap1"
      config rule
         edit 1
            set match-ip-address "default_route"
         next
      end
   next
end
```

To advertise additional prefixes to the Amazon VPC, add these prefixes to the network statement and identify the prefix you want to advertise. Ensure that the prefix is present in the routing table of the device with a valid next-hop. If you want to advertise 192.168.0.0/16 to Amazon, you would do the following:

```
config router bgp
config network
   edit 1
      set prefix 192.168.0.0 255.255.0.0
   next
end
```

To configure firewall policies for the first VPN tunnel:

Create a firewall policy permitting traffic from your local subnet to the VPC subnet, and vice-versa.

This example policy permits all traffic from the local subnet to the VPC. First, view all existing policies using the `show firewall policy` command. Then, create a new firewall policy starting with the next available policy ID. In this example, running `show firewall policy` displayed policies 1, 2, 3, and 4, so you would proceed to create policy 5.

```
config firewall policy
   edit 5
      set srcintf "vpn-07e988ccc1d46f749-0"
      set dstintf internal
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
   next
end
config firewall policy
   edit 5
      set srcintf internal
      set dstintf "vpn-07e988ccc1d46f749-0"
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
   next
end
```

To configure IKE for the second VPN tunnel:

A policy is established for the supported ISAKMP encryption, authentication, DH, lifetime, and key parameters. These sample configurations fulfill the minimum requirements for AES128, SHA1, and DH Group 2. Category VPN connections in the GovCloud AWS region have a minimum requirement of AES128, SHA2, and DH Group 14. To take advantage of AES256, SHA256, or other DH groups such as 14-18, 22, 23, and 24, you must modify these sample configuration files. Higher parameters are only available for VPNs of category "VPN", not for "VPN-Classic".

Your FortiGate's external interface's address must be static. Your FortiGate may reside behind a device performing NAT. To ensure NAT traversal can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, it is recommended to disable NAT traversal.

Begin configuration in the root VDOM. The interface name must be shorter than 15 characters. It is best if the name is shorter than 12 characters. IPsec DPD causes periodic messages to be sent to ensure a security association remains operational.

```
config vpn ipsec phase1-interface
   edit vpn-07e988ccc1d46f749-1
      set interface "wan1"
      set dpd enable
      set local-gw 35.170.66.108
      set dhgrp 2
      set proposal aes128-sha1
      set keylife 28800
```

```
      set remote-gw 100.25.187.58
      set psksecret IjFzyDneUtDdAT4RNmQ85apUG3y4Akre
      set dpd-retryinterval 10
   next
end
```

To configure IPsec for the second VPN tunnel:

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters.

```
config vpn ipsec phase2-interface
   edit "vpn-07e988ccc1d46f749-1"
      set phase1name "vpn-07e988ccc1d46f749-1"
      set proposal aes128-sha1
      set dhgrp 2
      set pfs enable
      set keylifeseconds 3600
   next
end
```

To configure the tunnel interface for the second VPN tunnel:

You must configure a tunnel interface as the logical interface associated with the tunnel. All traffic routed to the tunnel interface must be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

You must configure the interface's address with your FortiGate's address. If the address changes, you must recreate the FortiGate and VPN connection with Amazon VPC.

The `tcp-mss` option causes the router to reduce the TCP packets' maximum segment size to prevent packet fragmentation.

```
config system interface
   edit "vpn-07e988ccc1d46f749-1"
      set vdom "root"
      set ip 169.254.44.162 255.255.255.255
      set allowaccess ping
      set type tunnel
      set tcp-mss 1379
      set remote-ip 169.254.44.161
      set mtu 1427
      set interface "wan1"
   next
end
```

To configure BGP for the second VPN tunnel:

BGP is used within the tunnel to exchange prefixes between the virtual private gateway and your FortiGate. The virtual private gateway announces the prefix according to your VPC.

The local BGP ASN (65000) is configured as part of your FortiGate. If you must change the ASN, you must recreate the FortiGate and VPN connection with AWS.

Your FortiGate may announce a default route (0.0.0.0/0) to AWS. This is done using a prefix list and route map in FortiOS.

```
config router bgp
   set as 65000
```

```
   config neighbor
      edit 169.254.44.161
         set remote-as 64512
      end
config router bgp
   config neighbor
      edit 169.254.44.161
         set capability-default-originate enable
      end
   end
config router prefix-list
   edit "default_route"
      config rule
         edit 1
            set prefix 0.0.0.0 0.0.0.0
         next
      end
   end
end
config router route-map
   edit "routemap1"
      config rule
         edit 1
            set match-ip-address "default_route"
         next
      end
   next
end
```

To advertise additional prefixes to the Amazon VPC, add these prefixes to the network statement and identify the prefix you want to advertise. Ensure that the prefix is present in the routing table of the device with a valid next-hop. If you want to advertise 192.168.0.0/16 to Amazon, you would do the following:

```
config router bgp
config network
   edit 1
      set prefix 192.168.0.0 255.255.0.0
   next
end
```

To configure firewall policies for the second VPN tunnel:

Create a firewall policy permitting traffic from your local subnet to the VPC subnet, and vice-versa.

This example policy permits all traffic from the local subnet to the VPC. First, view all existing policies using the `show firewall policy` command. Then, create a new firewall policy starting with the next available policy ID. In this example, running `show firewall policy` displayed policies 1, 2, 3, 4, and 5, so you would proceed to create policy 6.

```
config firewall policy
   edit 6
      set srcintf "vpn-07e988ccc1d46f749-1"
      set dstintf internal
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
```

```
    next
end
config firewall policy
    edit 6
          set srcintf internal
          set dstintf "vpn-07e988ccc1d46f749-1"
          set srcaddr all
          set dstaddr all
          set action accept
          set schedule always
          set service ANY
    next
end
```

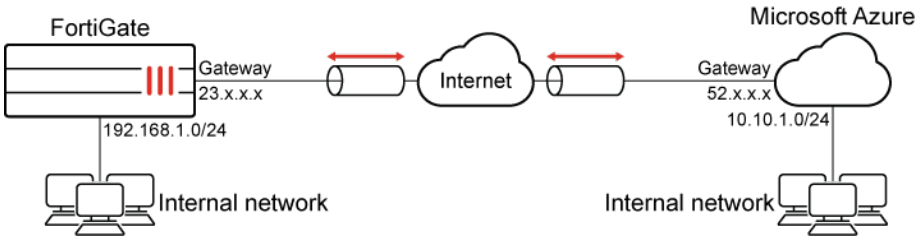
IPsec VPN to Azure with virtual network gateway

This example shows how to configure a site-to-site IPsec VPN tunnel to Microsoft Azure. It shows how to configure a tunnel between each site, avoiding overlapping subnets, so that a secure tunnel can be established.

Prerequisites

- A FortiGate with an Internet-facing IP address
- A valid Microsoft Azure account

Sample topology



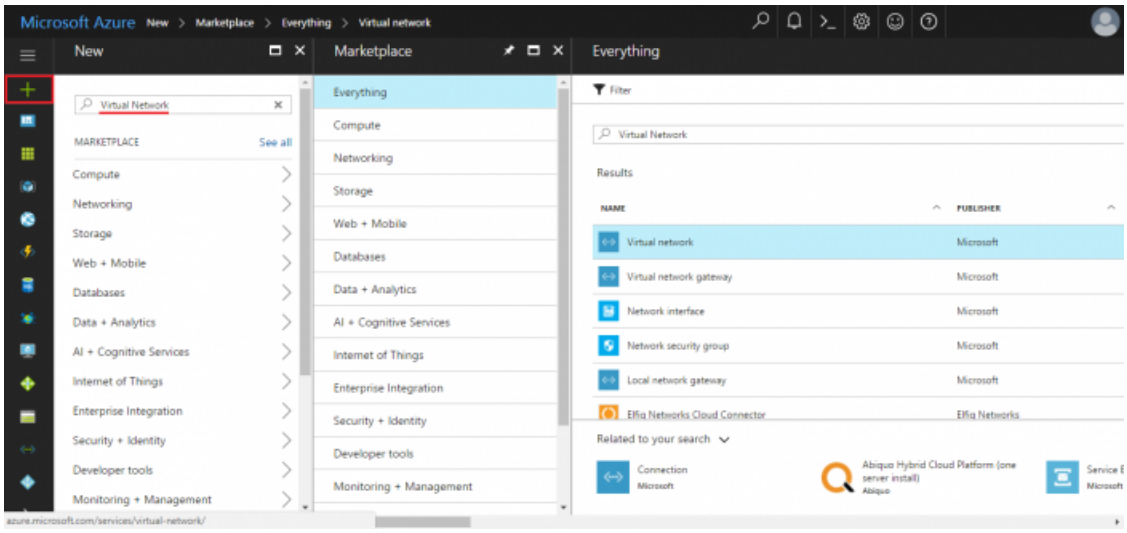
Sample configuration

This sample configuration shows how to:

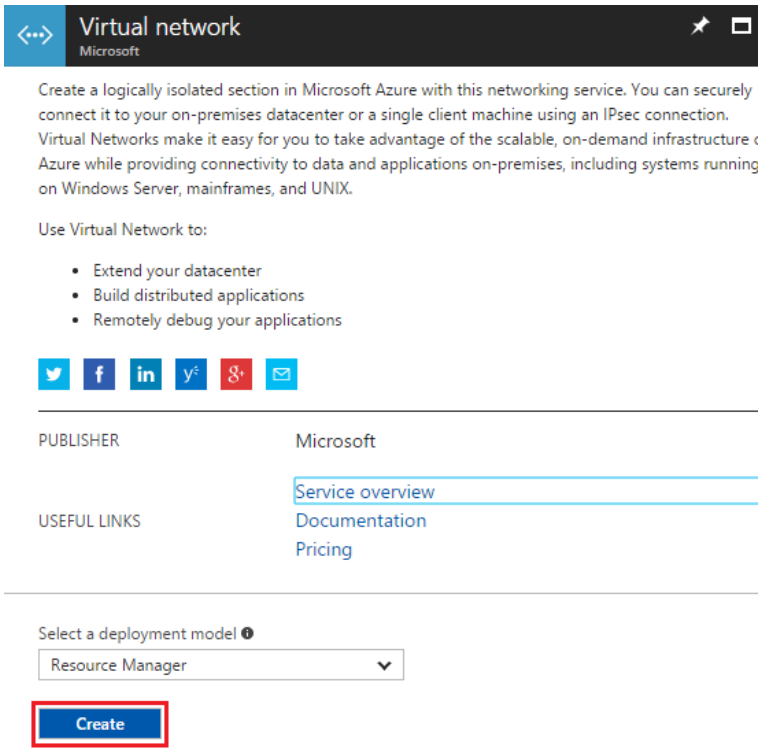
1. Configure an Azure virtual network
2. Specify the Azure DNS server
3. Configure the Azure virtual network gateway
4. Configure the Azure local network gateway
5. Configure the FortiGate tunnel
6. Create the Azure firewall object
7. Create the FortiGate firewall policies
8. Create the FortiGate static route
9. Create the Azure site-to-site VPN connection
10. Check the results

To configure an Azure virtual network:

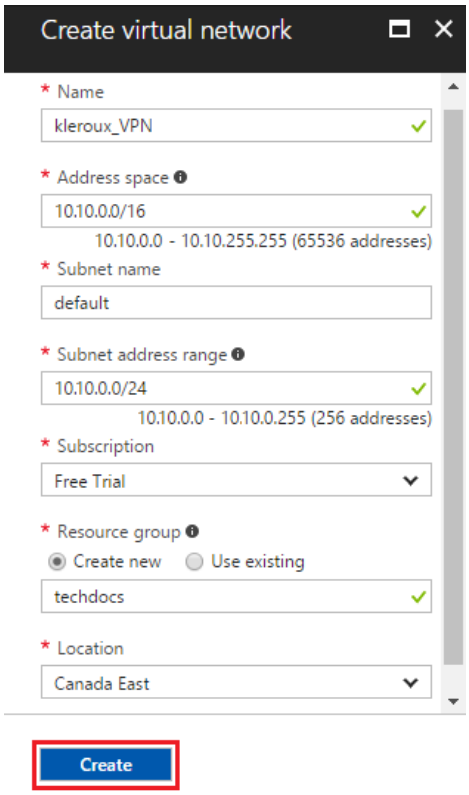
1. Log in to Azure and click *New*.
2. In *Search the Marketplace*, type *Virtual network*.
3. Click *Virtual network* to open the *Virtual network* pane.



4. At the bottom of the *Virtual network* pane, click the *Select a deployment model* dropdown list and select *Resource Manager*.
5. Click *Create*.

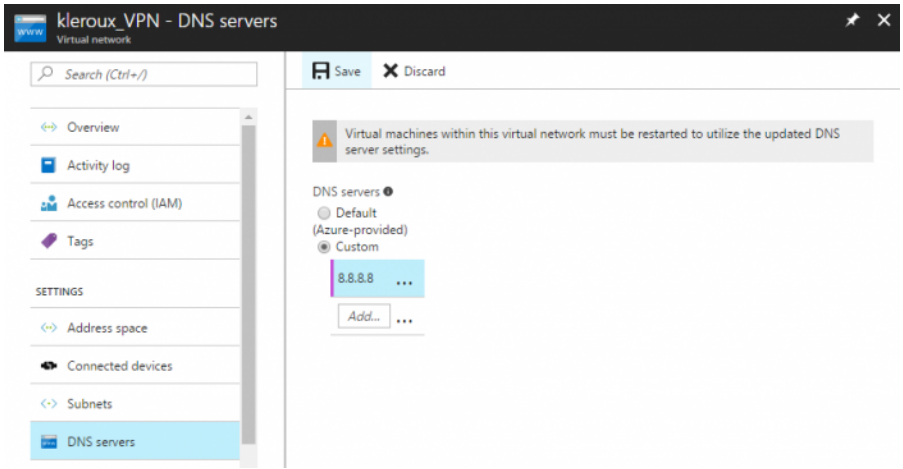


6. On the *Create virtual network* pane, enter you virtual network settings, and click *Create*.



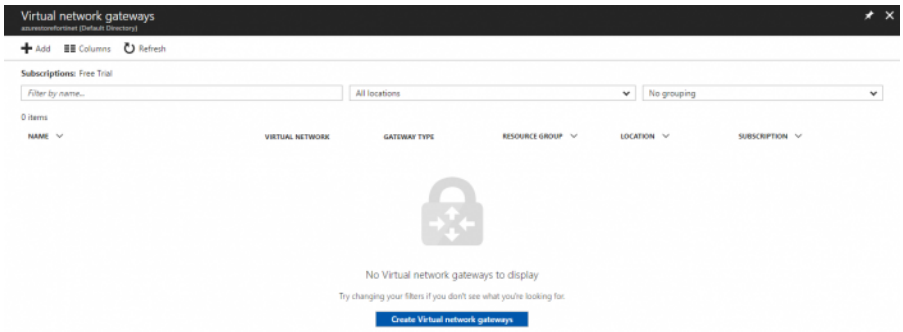
To specify the Azure DNS server:

1. Open the virtual network you just created.
2. Click *DNS servers* to open the *DNS servers* pane.
3. Enter the IP address of the DNS server and click *Save*.

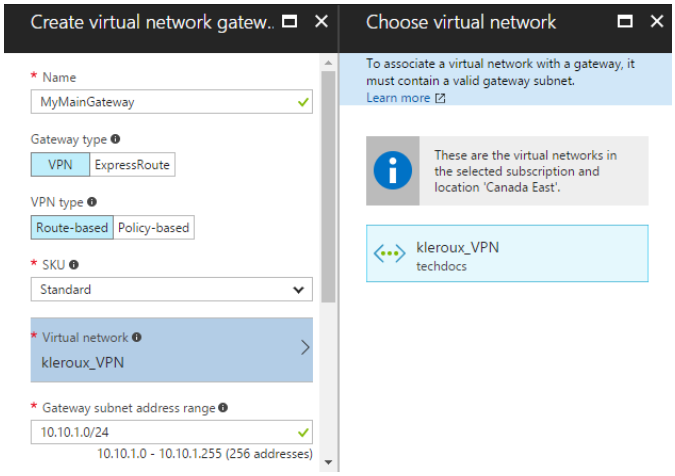


To configure the Azure virtual network gateway:

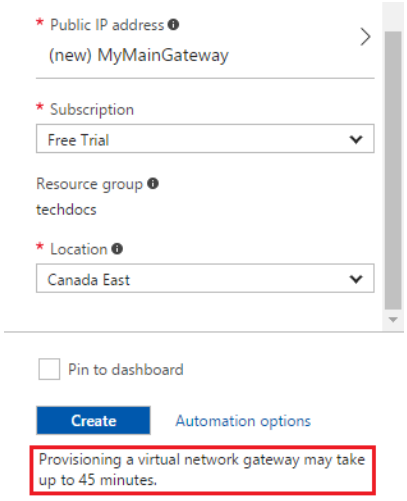
1. In the portal dashboard, go to *New*.
2. Search for *Virtual Network Gateway* and click it to open the *Virtual network gateway* pane.



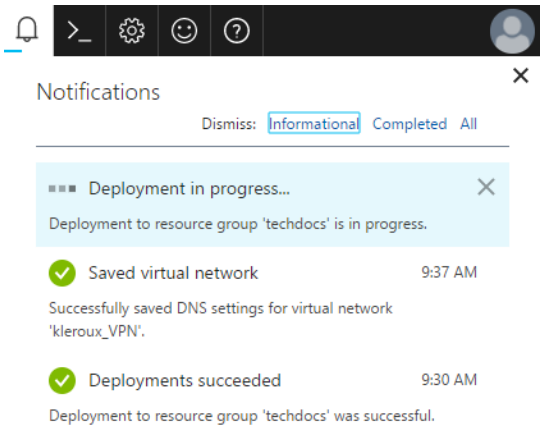
3. Click *Create Virtual network gateways* and enter the settings for your virtual network gateway.



4. If needed, create a Public IP address.

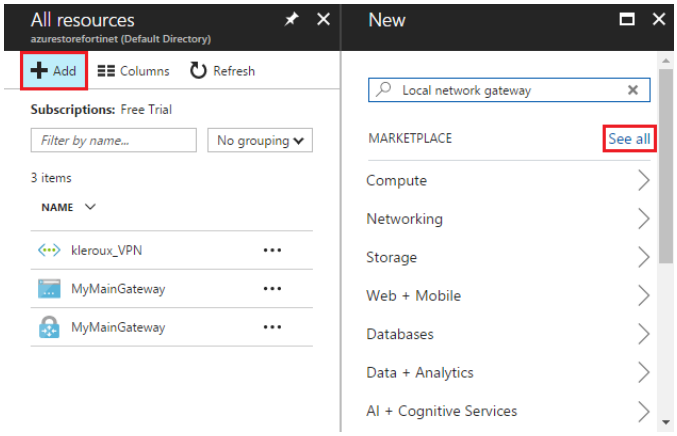


5. Click *Create*.
   Creating the virtual network gateway might take some time. When the provisioning is done, you'll receive a notification.

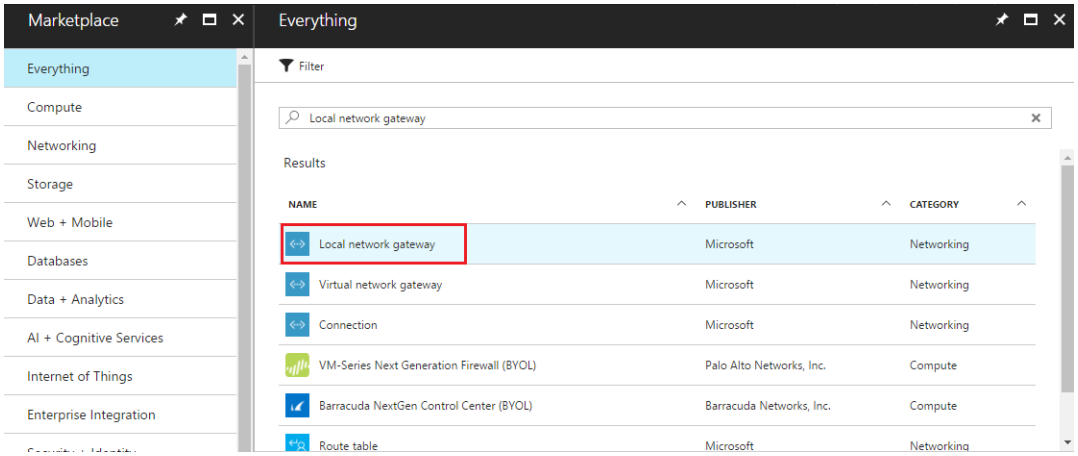


To configure the Azure local network gateway:

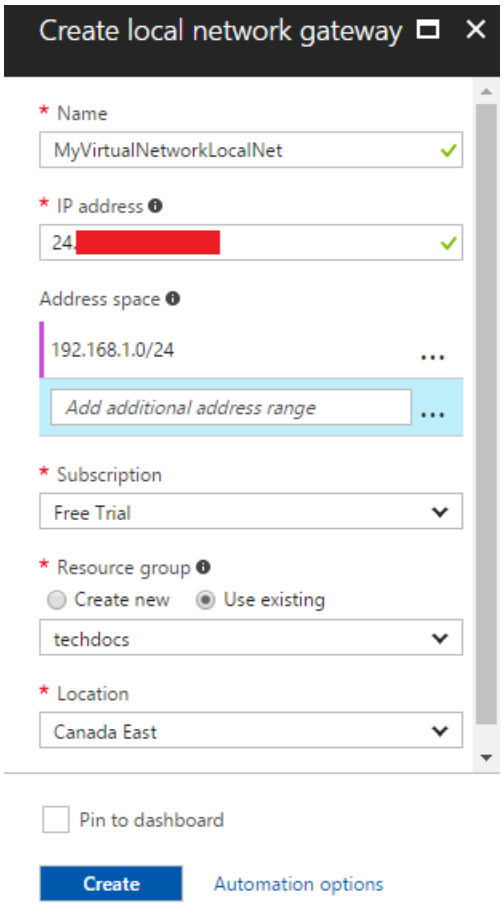
1. In the portal dashboard, click *All resources*.
2. Click *Add* and then click *See all*.



3. In the *Everything* pane, search for *Local network gateway* and then click *Create local network gateway*.



4. For the *IP address*, enter the local network gateway IP address, that is, the FortiGate's external IP address.



5. Set the remaining values for your local network gateway and click *Create*.

To configure the FortiGate tunnel:

1. In the FortiGate, go to *VPN > IP Wizard*.
2. Enter a *Name* for the tunnel, click *Custom*, and then click *Next*.
3. Configure the *Network* settings.
   a. For *Remote Gateway*, select *Static IP Address* and enter the IP address provided by Azure.
   b. For *Interface*, select *wan1*.
   c. For *NAT Traversal*, select *Disable*,
   d. For *Dead Peer Detection*, select *On Idle*.
   e. In the Authentication section, select
4. Configure the *Authentication* settings.
   a. For *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
   b. For *IKE*, select *2*.
5. Configure the *Phase 1 Proposal* settings.
   a. Set the Encryption and Authentication combination to the three supported encryption algorithm combinations accepted by Azure.

- AES256 and SHA1
- 3DES and SHA1
- AES256 and SHA256

b. For *Diffie-Hellman Groups*, select *2*.

c. Set *Key Lifetime (seconds)* to *28800*.

6. In *Phase 2 Selectors*, expand the *Advanced* section to configure the *Phase 2 Proposal* settings.
   a. Set the Encryption and Authentication combinations:
   - AES256 and SHA1
   - 3DES and SHA1
   - AES256 and SHA256

   b. Uncheck *Enable Perfect Forward Secrecy (PFS)*.
   c. Set *Key Lifetime (seconds)* to *27000*.
7. Click *OK*.

To create the Azure firewall object:

1. In the FortiGate, go to *Policy & Objects* > *Addresses*.
2. Create a firewall object for the Azure VPN tunnel.

To create the FortiGate firewall policies:

1. In the FortiGate, go to *Policy & Objects* > *Firewall Policy*.
2. Create a policy for the site-to-site connection that allows outgoing traffic.
   a. Set the *Source* address and *Destination* address using the firewall objects you just created.
   b. Disable *NAT*.
3. Create another policy that allows incoming traffic.
   a. For this policy, reverse the *Source* address and *Destination* address.
4. We recommend limiting the TCP maximum segment size (MSS) being sent and received so as to avoid packet drops and fragmentation.
   To do this, use the following CLI commands on both policies.

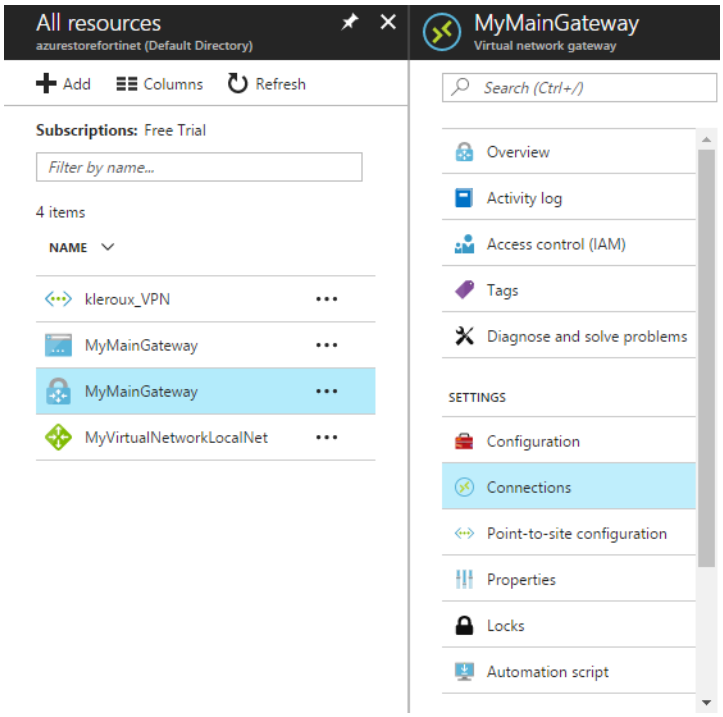
```
config firewall policy
   edit <policy-id>
      set tcp-mss-sender 1350
      set tcp-mss-receiver 1350
   next
end
```

To create the FortiGate static route:

1. In the FortiGate, go to *Network* > *Static Routes*.
2. Create an IPv4 Static Route that forces outgoing traffic going to Azure to go through the route-based tunnel.
3. Set the *Administrative Distance* to a value lower than the existing default route value.

To create the Azure site-to-site VPN connection:

1. In the Azure portal, locate and select your virtual network gateway.
2. In the *Settings* pane, click *Connections* and then click *Add*.



3. Enter the settings for your connection. Ensure the *Shared Key (PSK)* matches the *Pre-shared Key* for the FortiGate tunnel.

To check the results:

1. In the FortiGate, go to *Monitor* > *IPsec Monitor* and check that the tunnel is up. If the tunnel is down, right-click the tunnel and select *Bring Up*.
2. In the FortiGate, go to *Log & Report* > *System Events*.
   a. Select an event card to view more information and verify the connection.

3. In the Azure portal dashboard, click *All resources* and locate your virtual network gateway.
   a. In your virtual network gateway pane, click *Connections* to see the status of each connection.

   b. Click a connection to open the *Essentials* pane to view more information about that connection.
      - If the connection is successful, the *Status* shows *Connected*.
      - See the *ingress* and *egress* bytes to confirm traffic flowing through the tunnel.

IPsec VPN to an Azure with virtual WAN

This is a sample configuration of an IPsec site-to-site VPN connection between an on-premise FortiGate and an Azure virtual network (VNet). This example uses Azure virtual WAN (vWAN) to establish the VPN connection.

- Azure must use IPsec v2 for this configuration.
- Azure uses overlapped subnet IP addresses for the IPsec interfaces.

To configure IKEv2 IPsec site-to-site VPN to an Azure VPN gateway:

1. In the Azure management portal, configure vWAN-related settings as described in Tutorial: Create a Site-to-Site connection using Azure Virtual WAN.
   If a custom BGP IP address is configured on Azure's vWAN, such as 169.254.21.6 and 169.254.21.7, you must configure the FortiGate `remote-IP` to the corresponding *Custom BGP IP Address* value. If a custom BGP IP address is not configured, FortiGate `remote-IPs` should point to the *Default BGP IP Address* value.

2. Download the VPN configuration. The following shows an example VPN configuration:

```
[ {"configurationVersion":{"LastUpdatedTime":"2019-07-16T22:16:28.0409002Z","Version":"be5c5787-
      b903-43b1-a237-49eae1b373e4"},"vpnSiteConfiguration":
      {"Name":"toaws","IPAddress":"3.220.252.93","BgpSetting":
      {"Asn":7225,"BgpPeeringAddress":"169.254.24.25","PeerWeight":32768},"LinkName":"toaws"},"v
      pnSiteConnections":[{"hubConfiguration":{"AddressSpace":"10.1.0.0/16","Region":"West
      US","ConnectedSubnets":["10.2.0.0/16"]},"gatewayConfiguration":{"IpAddresses":
      {"Instance0":"52.180.90.47","Instance1":"52.180.89.94"},"BgpSetting":
      {"Asn":65515,"BgpPeeringAddresses":
      {"Instance0":"10.1.0.7","Instance1":"10.1.0.6"},"PeerWeight":0}},"connectionConfiguration":
      {"IsBgpEnabled":true,"PSK":"Fortinet123#","IPsecParameters":
      {"SADataSizeInKilobytes":102400000,"SALifeTimeInSeconds":3600}}}]} ]
```

3. Configure the following on the FortiGate. Note for `set proposal`, you can select from several proposals.

```
config vpn ipsec phase1-interface
   edit "toazure1"
      set interface "port1"
      set ike-version 2
      set keylife 28800
      set peertype any
      set proposal aes256-sha1
      set dhgrp 2
      set remote-gw 52.180.90.47
      set psksecret **********
   next
   edit "toazure2"
      set interface "port1"
      set ike-version 2
      set keylife 28800
      set peertype any
      set proposal aes256-sha1
      set dhgrp 2
      set remote-gw 52.180.89.94
      set psksecret **********
   next
end
config vpn ipsec phase2-interface
   edit "toazure1"
      set phase1name "toazure1"
      set proposal aes256-sha1
      set dhgrp 2
      set keylifeseconds 3600
   next
   edit "toazure2"
      set phase1name "toazure2"
      set proposal aes256-sha1
      set dhgrp 2
      set keylifeseconds 3600
   next
end
config system settings
   set allow-subnet-overlap enable
end
config system interface
   edit "toazure1"
      set vdom "root"
      set ip 169.254.24.25 255.255.255.255
      set type tunnel
```

```
      set remote-ip 10.1.0.7 255.255.255.255
      set snmp-index 4
      set interface "port1"
   next
   edit "toazure2"
      set vdom "root"
      set ip 169.254.24.25 255.255.255.255
      set type tunnel
      set remote-ip 10.1.0.6 255.255.255.255
      set snmp-index 5
      set interface "port1"
   next
end
config router bgp
   set as 7225
   set router-id 169.254.24.25
   config neighbor
      edit "10.1.0.7"
         set remote-as 65515
      next
      edit "10.1.0.6"
         set remote-as 65515
      next
   end
   config network
      edit 1
         set prefix 172.30.101.0 255.255.255.0
      next
   end
   config redistribute "connected"
      set status enable
   end
   config redistribute "rip"
   end
   config redistribute "ospf"
   end
   config redistribute "static"
   end
   config redistribute "isis"
   end
   config redistribute6 "connected"
   end
   config redistribute6 "rip"
   end
   config redistribute6 "ospf"
   end
   config redistribute6 "static"
   end
   config redistribute6 "isis"
   end
end
```

4. Run `diagnose vpn tunnel list`. If the configuration was successful, the output should resemble the following:

```
name=toazure1 ver=2 serial=3 172.30.1.83:4500->52.180.90.47:4500 tun_id=52.180.90.47

```

IPSec VPN between a FortiGate and a Cisco ASA with multiple subnets

When a Cisco ASA unit has multiple subnets configured, multiple phase 2 tunnels must be created on the FortiGate to allocate to each subnet (rather than having multiple subnets on one phase 2 tunnel).

The FortiGate uses the same SPI value to bring up the phase 2 negotiation for all of the subnets, while the Cisco ASA expects different SPI values for each of its configured subnets. Using multiple phase 2 tunnels on the FortiGate creates different SPI values for each subnet.

To configure multiple phase 2 interfaces in route-based mode:

```
config vpn ipsec phase2-interface
    edit "First subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.142.0.0 255.255.254.0
    next
    edit "Second subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.143.0.0 255.255.254.0
    next
end
```

To configure multiple phase 2 interfaces in policy-based mode:

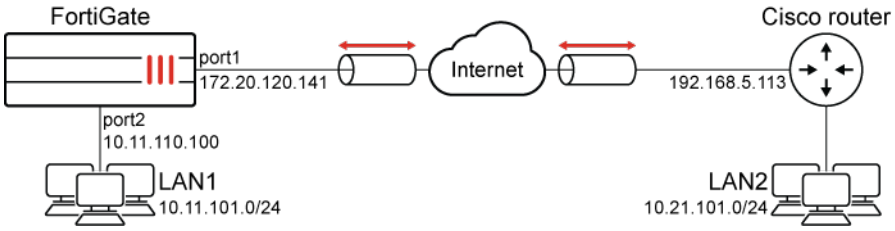
```
config vpn ipsec phase2
    edit "First subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.142.0.0 255.255.254.0
    next
    edit "Second subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.143.0.0 255.255.254.0
    next
end
```

Cisco GRE-over-IPsec VPN

This is a sample configuration of a FortiGate VPN that is compatible with Cisco-style VPNs that use GRE in an IPsec tunnel. Cisco products with VPN support often use the GRE protocol tunnel over IPsec encryption. Cisco VPNs can use either transport mode or tunnel mode IPsec.

Topology

In this example, LAN1 users are provided with access to LAN2.



Configuring the FortiGate

There are five steps to configure GRE-over-IPsec with a FortiGate and Cisco router:

1. Enable overlapping subnets.
2. Configure a route-based IPsec VPN on the external interface.
3. Configure a GRE tunnel on the virtual IPsec interface.
4. Configure security policies.
5. Configure the static route.

Enabling overlapping subnets

Overlapping subnets are required because the IPsec and GRE tunnels will use the same addresses. By default, each FortiGate network interface must be on a separate network. This configuration assigns an IPsec tunnel endpoint and the external interface to the same network.

To enable overlapping subnets:

```
config system settings
    set allow-subnet-overlap enable
    next
end
```

Configuring a route-based IPsec VPN

A route-based VPN that use encryption and authentication algorithms compatible with the Cisco router is required. Pre-shared key authentication is used in this configuration.

To configure route-based IPsec in the GUI:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. Enter the tunnel name (*tocisco*) and click *Next*.
3. Enter the following:

Remote Gateway	Static IP Address
IP Address	Cisco router public interface (192.168.5.113)
Interface	FortiGate public interface (172.20.120.141)
Authentication Method	Pre-shared Key
Pre-shared Key	Entry must match the pre-shared key on the Cisco router
Mode	Main (ID Protection)
Phase 1 Proposal	3DES-SHA1, AES128-SHA1 (at least one proposal must match the settings on the Cisco router)
Local Address	GRE local tunnel endpoint IP address (172.20.120.141)
Remote Address	GRE remote tunnel endpoint IP address (192.168.5.113)
Phase 2 Proposal	3DES-MD5 (at least one proposal must match the settings on the Cisco router)
Local Port	0
Remote Port	0
Protocol	47

4. Click *OK*.
5. If the Cisco router is configured to use transport mode IPsec, configure transport mode on the FortiGate:

```
config vpn phase2-interface
    edit tocisco_p2
        set encapsulation transport-mode
    next
end
```

To configure route-based IPsec in the CLI:

```
config vpn ipsec phase1-interface
    edit tocisco
        set interface port1
        set proposal 3des-sha1 aes128-sha1
        set remote-gw 192.168.5.113
        set psksecret xxxxxxxxxxxxxxx
    next
end
```

```
config vpn ipsec phase2-interface
    edit tocisco_p2
```

```
        set phase1name tocisco
        set proposal 3des-md5
        set encapsulation [tunnel-mode | transport-mode]
        set protocol 47
        set src-addr-type ip
        set dst-start-ip 192.168.5.113
        set src-start-ip 172.20.120.141
    next
end
```

To add the IPsec tunnel end addresses:

```
config system interface
    edit tocisco
        set ip 172.20.120.141 255.255.255.255
        set remote-ip 192.168.5.113
    next
end
```

Configuring the GRE tunnel

The local gateway and remote gateway addresses must match the local and remote gateways of the IPsec tunnel. The GRE tunnel runs between the virtual IPsec public interface on the FortiGate unit and the Cisco router.

To configure the GRE tunnel:

```
config system gre-tunnel
    edit gre1
        set interface tocisco
        set local-gw 172.20.120.141
        set remote-gw 192.168.5.113
        set keepalive-interval <integer>
        set keepalive-failtimes <integer>
    next
end
```

The Cisco router configuration requires an address for its end of the GRE tunnel, so you need to add the tunnel end addresses.

To add the tunnel end addresses:

```
config system interface
    edit gre1
        set ip 10.0.1.1 255.255.255.255
        set remote-ip 10.0.1.2
    next
end
```

Configuring the security policies

Two sets of security policies are required:

- Policies to allow traffic to pass in both directions between the GRE virtual interface and the IPsec virtual interface.
- Policies to allow traffic to pass in both directions between the protected network interface and the GRE virtual interface.

To configure security policies in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Enter the following to allow traffic between the protected network and the GRE tunnel:

Name	LANtoGRE
Incoming Interface	Interface that connects to the private network behind the FortiGate (port2)
Outgoing Interface	GRE tunnel virtual interface (gre1)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

3. Click *OK*.
4. Create a new policy and enter the following to allow traffic between the GRE tunnel and the protected network:

Name	GREtoLAN
Incoming Interface	GRE tunnel virtual interface (gre1)
Outgoing Interface	Interface that connects to the private network behind the FortiGate (port2)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

5. Click *OK*.
6. Create a new policy and enter the following to allow traffic between the GRE virtual interface and the IPsec virtual interface:

Name	GREtoIPsec
Incoming Interface	GRE tunnel virtual interface (gre1)

Outgoing Interface	Virtual IPsec interface (tocisco)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

7. Click *OK*.
8. Create a new policy and enter the following to allow traffic between the IPsec virtual interface and the GRE virtual interface:

Name	IPsectoGRE
Incoming Interface	Virtual IPsec interface (tocisco)
Outgoing Interface	GRE tunnel virtual interface (gre1)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

9. Click *OK*.

To configure security policies in the CLI:

```
config firewall policy
    edit 1
        set name LANtoGRE
        set srcintf port2
        set dstintf gre1
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 2
        set name GREtoLAN
        set srcintf gre1
        set dstintf port2
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 3
        set name GREtoIPsec
        set srcintf gre1
```

```
        set dstintf tocisco
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 4
        set name IPsectoGRE
        set srcintf tocisco
        set dstintf gre1
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
end
```

Configuring routing

to direct traffic destined for the network behind the Cisco router into the GRE-over-IPsec tunnelTraffic destined for the network behind the Cisco router must be routed to the GRE tunnel. To do this, create a static route

To create the static route in the GUI:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Enter the following:

Destination	IP and netmask for the network behind the Cisco router (10.21.101.0 255.255.255.0)
Interface	GRE tunnel virtual interface (gre1)
Administrative Distance	Leave the default setting

3. Click *OK*.

To create the static route in the CLI:

```
config router static
    edit 0
        set device gre1
        set dst 10.21.101.0 255.255.255.0
    next
end
```

Configuring the Cisco router

For more information, refer to Configuring and verifying a GRE over IPsec tunnel in the Fortinet Knowledge Base.

Remote access

Remote access lets users connect to the Internet using a dialup connection over traditional POTS or ISDN telephone lines. Virtual private network (VPN) protocols are used to secure these private connections.

The following topics provide instructions on configuring remote access:

- FortiGate as dialup client on page 2492
- FortiClient as dialup client on page 2502
- Add FortiToken multi-factor authentication on page 2509
- Add LDAP user authentication on page 2510
- iOS device as dialup client on page 2511
- IKE Mode Config clients on page 2518
- IPsec VPN with external DHCP service on page 2524
- L2TP over IPsec on page 2527
- Tunneled Internet browsing on page 2531
- Dialup IPsec VPN with certificate authentication on page 2538
- SAML-based authentication for FortiClient remote access dialup IPsec VPN clients on page 2547
- Restricting VPN access to rogue/non-compliant devices with Security Fabric
- Enhancing IPsec security using EMS SN verification on page 2567
- IPsec split DNS on page 2568
- Dialup IPsec VPN using custom TCP port on page 2568
- IPsec DNS suffix on page 2577

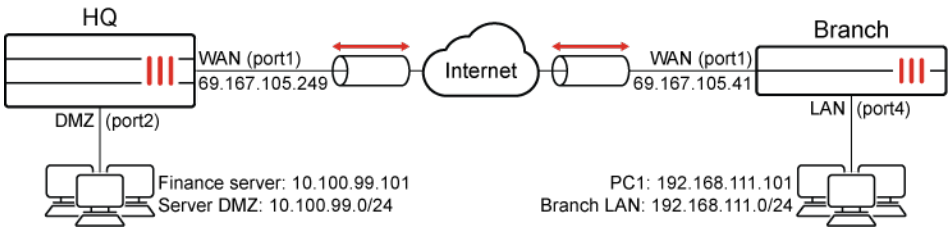
FortiGate as dialup client

A FortiGate configured as a dial-up client initiates an IPsec VPN connection to a remote IPsec VPN server or IPsec VPN hub (like another FortiGate or a third-party gateway) while using a dynamically assigned WAN IP address. Unlike traditional site-to-site VPNs that require static public IP addresses on both endpoints, the dial-up client relies on dynamic IP allocation, such as through DHCP, making it useful in networks with no static IP availability. It is also suitable for environments where the client FortiGate is located behind a NAT device.

The dial-up VPN significantly reduces configuration complexity and overhead when deploying new branches. Because the IPsec VPN server or IPsec VPN hub is preconfigured to accept dynamic IPsec connections, there is no need to reconfigure it for each new branch FortiGate deployment. This makes scaling easier, allowing organizations to add new sites without delays.

In this example, users in the Branch LAN subnet require connectivity with the HQ DMZ subnet to access servers with IPsec VPN. The IP address of the Branch's Internet (port1) interface is assigned dynamically using DHCP.

The Branch FortiGate is configured as a dialup VPN client to authenticate and connect to the HQ FortiGate. For mutual authentication, a pre-shared key is used.



After the IPsec VPN tunnel is successfully established, PC1 (192.168.111.101) can ping the Finance server (10.100.99.101).

To configure the HQ FortiGate as an IPsec VPN dialup server using the VPN Wizard:

1. Go to *VPN > VPN Wizard*.
2. Enter a name for the VPN in the *Tunnel name* field. In this example, *vpn-server*
3. Set *Select a template* to *Site to Site*.
4. Click *Begin*.
5. Configure the *VPN tunnel* settings:

Field	Value
Authentication method	*Pre-shared key*
Pre-shared key	Enter a suitable key. The same pre-shared key must be configured on the Branch FortiGate.
IKE	*Version 1*
NAT traversal	*Enable* Set *Keepalive frequency* to *10*.

6. Click *Next*.
7. Configure the *Remote site* settings:

Field	Value
Remote site device type	*FortiGate*
Remote site device	*Behind NAT or dynamic*
Remote site subnets that can access VPN	*192.168.111.0/24* (The Branch's LAN subnet)

8. Click *Next*.
9. Configure the *Local site* settings:

Field	Value
Outgoing interface that binds to tunnel	*WAN (port1)* Disable *Create and add interface to zone*.
Local interface	*DMZ (port2)*

Field	Value
Local subnets that can access VPN	This field automatically uses the IP address related to the selected local interface. In this example, 10.100.99.0/24
Allow remote site's internet traffic through this device	Disabled

10. Click *Next*.
11. Review the configuration and, if everything is correct, click *Submit*.
    The *vpn-server* IPsec tunnel is configured by the wizard and is visible under *VPN > VPN Tunnels*.

To configure Branch FortiGate as IPsec VPN dialup client using the VPN Wizard:

1. Go to *VPN > VPN Wizard*.
2. Enter a name for the VPN in the *Tunnel name* field. In this example, *vpn-client*
3. Set *Select a template* to *Site to Site*.
4. Click *Begin*.
5. Configure the *VPN tunnel* settings:

Field	Value
Authentication method	*Pre-shared key*
Pre-shared key	Enter a suitable key. The same pre-shared key must be configured on the HQ FortiGate.
IKE	*Version 1*
NAT traversal	*Enable* Set *Keepalive frequency* to *10*.

6. Click *Next*.
7. Configure the *Remote site* settings:

Field	Value
Remote site device type	*FortiGate*
Remote site device	*Accessible and static* Set *IP/FQDN* to *69.167.105.249*. The WAN interface IP address of the HQ FortiGate, or its FQDN (the FQDN must resolve to the WAN IP address).
Route this device's internet traffic through the remote site.	Disabled
Remote site subnets that can access VPN	*10.100.99.0/24* (The HQ's DMZ subnet).

8. Click *Next*.
9. Configure the *Local site* settings:

Field	Value
Outgoing interface that binds to tunnel	*WAN (port1)* Disable *Create and add interface to zone*.
Local interface	*LAN (port4)*
Local subnets that can access VPN	This field automatically uses the IP address related to the selected local interface. In this example, 192.168.11.0/24
Allow remote site's internet traffic through this device	Disabled

10. Click *Next*.
11. Review the configuration and, if everything is correct, click *Submit*.
    The *vpn-client* IPsec tunnel is configured by the wizard and is visible under *VPN > VPN Tunnels*.

To configure the HQ FortiGate as an IPsec VPN dialup server in the CLI:

1. Configure the WAN interface and default route.
   The WAN interface is the interface connected to the ISP and it is recommended to configure it with a static IP address to ensure that the IPsec VPN configuration on the Branch stays unchanged if the WAN IP changes on the HQ. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 69.167.105.249 255.255.255.0
        set alias "WAN"
    next
end
config router static
    edit 1
        set gateway 69.167.105.250
        set device "port1"
    next
end
```

2. Configure address objects for the HQ server DMZ subnet (10.100.99.0/24) and Branch LAN subnet (192.168.111.0/24):

```
config firewall address
    edit "HQ Server DMZ"
        set subnet 10.100.99.0 255.255.255.0
    next
    edit "Branch LAN"
        set subnet 192.168.111.0 255.255.255.0
    next
end
```

3. Configure the DMZ interface.

```
config system interface
    edit "port2"
        set vdom "root"
        set alias "DMZ"
        set ip 10.100.99.1 255.255.255.0
    next
end
```

4. Configure the IPsec phase1-interface.

```
config vpn ipsec phase1-interface
    edit "vpn-server"
        set type dynamic
        set interface "port1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set psksecret ****
    next
end
```

5. Configure the IPsec phase2-interface.

```
config vpn ipsec phase2-interface
    edit "vpn-server"
        set phase1name "vpn-server"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "HQ Server DMZ"
        set dst-name "Branch LAN"
    next
end
```

6. Configure two firewall policies to allow the Branch LAN users to access the HQ DMZ subnet over the IPsec tunnel and vice versa:

```
config firewall policy
    edit 1
        set name "HQ DMZ to Branch LAN"
        set srcintf "port2"
        set dstintf "vpn-server"
        set action accept
        set srcaddr "HQ Server DMZ"
        set dstaddr "Branch LAN"
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "Branch LAN to HQ DMZ"
        set srcintf "vpn-server"
```

```
        set dstintf "port2"
        set action accept
        set srcaddr "Branch LAN"
        set dstaddr "HQ Server DMZ"
        set schedule "always"
        set service "ALL"
    next
end
```

To configure Branch FortiGate as IPsec VPN dialup client in the CLI:

1. Configure the WAN interface and default route.

   The WAN interface is the interface connected to the ISP. It can work in static mode, DHCP (as in this example), or PPPoE. The IPsec tunnel is established over the WAN interface.

   ```
   config system interface
       edit "port1"
           set vdom "root"
           set mode dhcp
           set alias "WAN"
           set defaultgw enable
       next
   end
   ```

   Setting `defaultgw` to `enable` automatically injects a default route with an administrative distance (AD) of five, using the gateway IP address provided in DHCP Option 3 by the DHCP server. If the DHCP server does not supply this information, administrators will need to manually configure a default route.
2. Configure address objects for the HQ server DMZ subnet (10.100.99.0/24) and Branch LAN subnet (192.168.111.0/24):

   ```
   config firewall address
       edit "HQ Server DMZ"
           set allow-routing enable
           set subnet 10.100.99.0 255.255.255.0
       next
       edit "Branch LAN"
           set subnet 192.168.111.0 255.255.255.0
       next
   end
   ```

   Setting `allow-routing` to `enable` is optional. It allows address objects to be directly referenced when defining static routes. When this setting is disabled, administrators must manually specify subnets instead of using address objects for static route configuration. Enabling this option streamlines route management and ensures consistency by leveraging predefined address objects.
3. Configure the LAN interface.

   ```
   config system interface
       edit "port4"
           set vdom "root"
           set alias "LAN"
           set ip 192.168.111.0 255.255.255.0
   ```

```
    next
end
```

4. Configure the IPsec phase1-interface.

```
config vpn ipsec phase1-interface
    edit "vpn-client"
        set interface "port1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 69.167.105.249
        set psksecret ****
    next
end
```

5. Configure the IPsec phase2-interface.

```
config vpn ipsec phase2-interface
    edit "vpn-client"
        set phase1name "vpn-client"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "Branch LAN"
        set dst-name "HQ Server DMZ"
    next
end
```

6. Configure the static routes on the Branch to route traffic from the LAN subnet to the DMZ subnet.
   The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.

```
config router static
    edit 1
        set device "vpn-client"
        set dstaddr "HQ Server DMZ"
    next
    edit 2
        set distance 254
        set blackhole enable
        set dstaddr "HQ Server DMZ"
    next
end
```

7. Configure two firewall policies to allow the Branch LAN users to access the HQ DMZ subnet over the IPsec tunnel and vice versa:

```
config firewall policy
    edit 1
        set name "Branch LAN to HQ DMZ"
```

```
        set srcintf "port4"
        set dstintf "vpn-client"
        set action accept
        set srcaddr "Branch LAN"
        set dstaddr "HQ Server DMZ"
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "HQ DMZ to Branch LAN"
        set srcintf "vpn-client"
        set dstintf "port4"
        set action accept
        set srcaddr "HQ Server DMZ"
        set dstaddr "Branch LAN"
        set schedule "always"
        set service "ALL"
    next
end
```

To verify the tunnel status in the GUI:

1. On the Branch FortiGate, go to *Dashboard > Network* and expand the *IPsec* widget.
2. Find the new tunnel and check the statuses of the *Phase 1* and *Phase 2* selectors.
3. If the Phase 2 selector is not up, click on the tunnel, and select *Bring Up > All Phase 2 Selectors*.

To verify the tunnel status in the CLI:

1. Verify the IPsec Phase 1 tunnel status on either the Branch or HQ:

```
Branch # diagnose vpn ike gateway list name vpn-client
vd: root/0
name: vpn-client
version: 1
interface: port1 3
addr: 69.167.105.41:4500 -> 69.167.105.249:4500
tun_id: 69.167.105.249/::69.167.105.249
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 84005s ago
peer-id: 69.167.105.41
peer-id-auth: no
nat: peer
pending-queue: 0
IKE SA: created 1/1  established 1/1  time 10/10/10 ms
IPsec SA: created 1/3  established 1/3  time 10/13/20 ms

  id/spi: 0 1b29fe469e07695f/bb46729f1ce4b621
  direction: initiator
  status: established 84005-84005s ago = 10ms
```

```
  proposal: aes128-sha256
  key: 03b3a13938d3691d-b0b74a7a6e480f74
  QKD: no
  PQC-KEM (IKE): no
  PQC-KEM (all IPsec): no
  lifetime/rekey: 86400/2094
  DPD sent/recv: 00000000/00000000
  peer-id: 10.100.66.99
```

Note that the IPsec tunnel is established using port 4500 due to NAT Traversal (NAT-T) detection, and the Branch FortiGate acts as the initiator, thus functioning as IPsec VPN dialup client.

2. Verify the IPsec Phase 2 tunnel status on either the Branch or HQ:

```
Branch # diagnose vpn tunnel list name vpn-client
list all ipsec tunnel in vd 0
------------------------------------------------------
name=vpn-client ver=1 serial=1 69.167.105.41:4500->69.167.105.249:4500 nexthop=69.167.105.1
tun_id=69.167.105.249 tun_id6=::69.167.105.249 status=up dst_mtu=1200 weight=1

  dec:pkts/bytes=0/0, enc:pkts/bytes=0/0
  npu_flag=00 npu_rgwy=69.167.105.249 npu_lgwy=69.167.105.41 npu_selid=0 dec_npuid=0 enc_
npuid=0
```

Note the decryption, encryption, and authentication keys negotiated in Phase 2 to protect subnets under the `src` and `dst` fields.

To verify the traffic flow from PC1 to the Finance server:

1. From a PC1 (192.168.111.101), ping the Finance server (10.100.99.101).
   The ping should be successful.

```
C:\>ping 10.100.99.101

Pinging 10.100.99.101 with 32 bytes of data:
Reply from 10.100.99.101: bytes=32 time=5ms TTL=62
```

```
Reply from 10.100.99.101: bytes=32 time=2ms TTL=62
Reply from 10.100.99.101: bytes=32 time=9ms TTL=62
Reply from 10.100.99.101: bytes=32 time=2ms TTL=62

Ping statistics for 10.100.99.101:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 2ms, Maximum = 9ms, Average = 4ms
```

To verify the traffic flow on the Branch and HQ FortiGate in the GUI:

1. On either FortiGate, go to *Log & Report* > *Forward Traffic*.
2. Filter the content using the search bar based on the respective Policy ID.

To make sure that the logs are collected and shown under *Forward Traffic*, set *Log Allowed Traffic* to *All Sessions* in the corresponding firewall policy configured under *Policy & Objects* > *Firewall Policy*.

To verify the traffic flow on the Branch and HQ FortiGate in the CLI:

1. Verify traffic on the Branch:

```
Branch # diagnose sniffer packet any 'host 10.100.99.101 and icmp' 4 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.100.99.101 and icmp]
2025-01-16 08:37:22.515436 port4 in 192.168.111.101 -> 10.100.99.101: icmp: echo request
2025-01-16 08:37:22.515478 vpn-client out 192.168.111.101 -> 10.100.99.101: icmp: echo request
2025-01-16 08:37:22.520118 vpn-client in 10.100.99.101 -> 192.168.111.101: icmp: echo reply
2025-01-16 08:37:22.520141 port4 out 10.100.99.101 -> 192.168.111.101: icmp: echo reply
```

2. Verify traffic on the HQ:

```
HQ # diagnose sniffer packet any 'host 10.100.99.101 and icmp' 4 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.100.99.101 and icmp]
2025-01-16 08:37:22.518421 vpn-server in 192.168.111.101 -> 10.100.99.101: icmp: echo request
2025-01-16 08:37:22.518459 port2 out 192.168.111.101 -> 10.100.99.101: icmp: echo request
2025-01-16 08:37:22.518900 port2 in 10.100.99.101 -> 192.168.111.101: icmp: echo reply
2025-01-16 08:37:22.518914 vpn-server out 10.100.99.101 -> 192.168.111.101: icmp: echo reply
```

   For more information, see Performing a sniffer trace or packet capture on page 4325.
3. Optionally, run real time IKE debug using appropriate filters for troubleshooting if the IPsec tunnel does not come up:

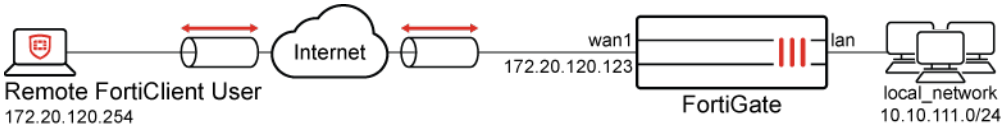
```
Branch # diagnose vpn ike log filter rem-addr4 69.167.105.249
Branch # diagnose debug application ike -1
Branch # diagnose debug enable
```

   For more information, see VPN IPsec troubleshooting on page 2766.

FortiClient as dialup client

When FortiGate is configured as a dial-up VPN server, remote FortiClient users with dynamic or unknown IP addresses can establish secure connections over the Internet to access private resources protected by FortiGate.

In this example, the FortiGate protects a local network (10.10.111.0/24) that a remote FortiClient user needs to securely access over the Internet using a VPN connection. The FortiGate is configured as a dialup VPN server on wan1, and the FortiClient is the dialup IPsec VPN client.



This example uses IKE version 1. For remote user authentication, a local user is configured to be a part of a local user group on the FortiGate. After completing the initial tunnel configuration using VPN Wizard, the VPN mode is switched to use Aggressive mode so that the FortiGate can utilize Peer IDs for selecting a specific IPsec tunnel when multiple dial-up IPsec tunnels are configured on the same WAN interface.

In IKE version 1 Aggressive mode, FortiGate utilizes peer IDs as unique identifiers to distinguish and manage multiple dialup tunnels configured on the same WAN interface. During the IPsec negotiation process, FortiClient transmits its configured Local ID, which FortiGate matches against the defined peer IDs to identify the appropriate tunnel. The local ID configured on FortiClient must align with the corresponding peer ID set on FortiGate to successfully establish an IPsec tunnel.

To configure IPsec VPN with FortiClient as the dialup client in the GUI:

1. Configure a local user:
   a. Go to *User & Authentication* > *User Definition* and click *Create New*.
   b. Set the *User Type* to *Local User*, then click *Next*.
   c. Set the *Login Credentials*, then click *Next*:
      - *Username*: *vpnuser1*
      - *Password*: Enter a suitable password
   d. Disable *Two-factor Authentication*, then click *Next*.
   e. Set *User Account Status* to *Enabled* and disable *User Group*, then click *Submit*.
2. Configure a local user group:
   a. Go to *User & Authentication* > *User Groups* and click *Create New*.
   b. Configure the following:

Field	Value
Name	*vpngroup*
Type	*Firewall*
Members	*vpnuser1*

c. Click *OK*.

For other types of authentication, such as LDAP, PKI, or SAML, see User & Authentication on page 2990.

3. Go to *VPN > VPN Wizard*.
4. Enter a name for the VPN in the *Tunnel name* field. In this example, *for_client*
5. Set *Select a template* to *Remote Access*.
6. Click *Begin*.
7. Configure the *VPN tunnel* settings:

Field	Value
VPN client type	*FortiClient*
Authentication method	*Pre-shared key*
Pre-shared key	Enter a suitable key. The same pre-shared key is used by the remote user on the FortiClient to connect to the dialup VPN.
IKE	*Version 1*
NAT traversal	*Enable* Set *Keepalive frequency* to *10*.
User authentication method	*Phase 1 interface* Select *vpngroup* from the drop-down list. Optionally, if you have multiple user groups configured, select *Inherit from policy* and then specify the groups.
DNS Server	*Use System DNS*
Enable IPv4 Split Tunnel	Enable

8. Click *Next*.
9. Configure the *Remote Endpoint* settings:

Field	Value
Addresses to assign to connected endpoints	*10.10.2.1-10.10.2.200*
Subnet for connected endpoints	*255.255.255.255*
Security posture gateway matching	Disable
EMS SN verification	Disable
Save password	Enable
Auto Connect	Disable
Always up (keep alive)	Disable

10. Click *Next*.
11. Configure the *Local FortiGate* settings:

Field	Value
Incoming interface that binds to tunnel	*wan1* Disable *Create and add interface to zone*.
Local interface	*lan*
Local address	*local_network* Click + to create a new address object with *Type* set to *Subnet* and *IP/Netmask* set to *10.10.111.0/24*, if not already configured.

12. Click *Next*.
13. Review the configuration and, if everything is correct, click *Submit*.
14. Go to *VPN* > *VPN Tunnels* and edit the *for_client* VPN.
15. On the *Tunnel Settings* tab, under *Authentication*, set *Accepted peer ID* to *Specific peer ID*.
16. Set *Peer ID* to *dialup1*.
17. Click *OK*.

The DNS suffix can be configured in the phase 1 configuration using the command `set domain <string>`.This feature is available only in IKE version 1 and requires enabling unity-support using in the Phase 1 configuration. See IPsec DNS suffix on page 2577 for more information.

To configure IPsec VPN with FortiClient as the dialup client in the CLI:

1. Configure a local user:

```
config user local
    edit "vpnuser1"
        set type password
        set passwd ******
    next
end
```

2. Configure a local user group:

```
config user group
    edit "vpngroup"
        set member "vpnuser1"
    next
end
```

3. Configure the internal interface.

   The LAN interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this FortiGate causes traffic to this network group to go through the IPsec tunnel.

```
config system interface
    edit "lan"
        set vdom "root"
```

```
        set ip 10.10.111.1 255.255.255.0
    next
end
```

```
config firewall address
    edit "local_subnet_1"
        set subnet 10.10.111.0 255.255.255.0
    next
end
```

```
config firewall addrgrp
    edit "local_network"
        set member "local_subnet_1"
    next
end
```

4. Configure the WAN interface.

   The WAN interface is the interface connected to the ISP. It can be configured in static mode (as shown here), DHCP, or PPPoE mode. It is recommended to configure it with a static IP address to ensure that the IPsec VPN configuration on the on the FortiClient stays unchanged if the WAN IP changes on the FortiGate. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

5. Configure the client address pool.

   You must create a firewall address to assign an IP address to a client from the address pool.

```
config firewall address
    edit "client_range"
        set type iprange
        set comment "VPN client range"
        set start-ip 10.10.2.1
        set end-ip 10.10.2.200
    next
end
```

6. Configure the IPsec phase1-interface.

   PSK is used as the authentication method in this example. Signature authentication is also an option.

```
config vpn ipsec phase1-interface
    edit "for_client"
        set type dynamic
        set interface "wan1"
        set mode aggressive
        set peertype one
        set peerid "dialup1"
```

```
        set net-device enable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-demand
        set dpd-retryinterval 20
        set xauthtype auto
        set authusrgrp "vpngroup"
        set assign-ip-from name
        set ipv4-name "client_range"
        set dns-mode auto
        set ipv4-split-include "local_network"
        set save-password enable
        set psksecret *****
    next
end
```

7. Configure the IPsec phase2-interface:

```
config vpn ipsec phase2-interface
    edit "for_client"
        set phase1name "for_client"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

8. Configure a firewall policy to allow client traffic flow over the IPsec VPN tunnel to the FortiGate's lan interface:

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "for_client"
        set dstintf "lan"
        set srcaddr "client_range"
        set dstaddr "local_network"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To configure FortiClient:

1. In FortiClient, go to *Remote Access* and click *Add a new connection*.
2. Set *VPN* to *IPsec VPN* and specify a *Connection Name*.
3. Set *Remote Gateway* to the FortiGate wan1 IP address.
4. Set *Authentication Method* to *Pre-Shared Key* and enter the key.
5. Expand *Advanced Settings* > *Phase 1* and set *Local ID* to *dialup1*.
6. Configure the remaining settings as needed, then click *Save*.
7. Go to the *Remote Access* tab, select the VPN, enter the username and password, then click*Connect*.

To establish an IPsec tunnel, the Phase 1 and Phase 2 configurations of the dial-up IPsec VPN on FortiGate must precisely match the corresponding settings on FortiClient.

To verify the tunnel status in the GUI:

1. On the FortiGate, go to *Dashboard* > *Network* and expand the *IPsec* widget.
2. Find the new tunnel, *for_client_0* in this example, and check the statuses of the *Phase 1* and *Phase 2* selectors.

Successfully established dialup IPsec VPN tunnels are displayed using a parent name followed by an index, creating a structured and organized association with the parent tunnel. For example, the parent name *for_client* results in tunnel names such as *for_client_0*, *for_client_1*, and so on.

3. Hover the cursor over the tunnel name to see additional details.

To verify the tunnel status in the CLI:

1. Verify the IPsec Phase 1 tunnel status on the FortiGate:

```
FortiGate# diagnose vpn ike gateway list name for_client_0

vd: root/0
name: for_client_0
version: 1
interface: wan1 15
addr: 172.20.120.123:4500 ->172.20.120.254:64916
created: 37s ago
xauth-user: vpnuser1
assigned IPv4 address: 10.10.2.1/255.255.255.255
nat: me peer
IKE SA: created 1/1 established 1/1 time 10/10/10 ms
IPsec SA: created 1/1 established 1/1 time 0/0/0 ms

  id/spi: 1 b40a32d878d5e262/8bba553563a498f4
  direction: responder
  status: established 37-37s ago = 10ms
  proposal: aes256-sha256
  key: f4ad7ec3a4fcfd09-787e2e9b7bceb9a7-0dfa183240d838ba-41539863e5378381
  lifetime/rekey: 86400/86092
  DPD sent/recv: 00000000/00000a0e
```

Note that FortiGate acts as the responder, establishes the IPsec tunnel with remote FortiClient user with IP 172.20.120.254 over UDP NAT-T port 4500 on its wan1 interface, and dynamically assigns a VPN IP of 10.10.2.1 to FortiClient endpoint. The authenticated username is also displayed in `xauth-user` field.

2. Verify the IPsec Phase 2 tunnel status on the FortiGate:

```
FortiGate # diagnose vpn tunnel list name for_client_0
list all ipsec tunnel in vd 0
```

```
----------------------------------------------------

```

Note the decryption, encryption, and authentication keys negotiated in Phase 2 to protect subnets under the `src` and `dst` fields. FortiOS also automatically adds the dynamically assigned VPN IP of 10.10.2.1 to its traffic selectors for dialup tunnel for_client_0.

To verify traffic through the IPsec tunnel:

1. On the remote FortiClient user with IP 172.20.120.254, initiate ICMP traffic to a machine in the 10.10.111.0/24 network and verify that traffic goes through:

```
# ping 10.10.111.3
PING 10.10.111.3 (10.10.111.3) 56(84) bytes of data.
64 bytes from 10.10.111.3: icmp_seq=1 ttl=62 time=9.84 ms
64 bytes from 10.10.111.3: icmp_seq=2 ttl=62 time=0.808 ms
```

2. On FortiGate, run a sniffer trace for ICMP packets destined to 10.10.111.3:

```
# diagnose sniffer packet any 'host 10.10.111.3’ 4 0 l
Using Original Sniffing Mode
```

```
interfaces=[any]
filters=[host 10.10.111.3]
2024-11-05 12:06:05.509711 for_client_0 in 10.10.2.1 -> 10.10.111.3: icmp: echo request
2024-11-05 12:06:05.509791 lan out 10.10.2.1 -> 10.10.111.3: icmp: echo request
2024-11-05 12:06:05.518809 lan in 10.10.111.3 -> 10.10.2.1: icmp: echo reply
2024-11-05 12:06:05.518899 for_client_0 out 10.10.111.3 -> 10.10.2.1: icmp: echo reply
```

The ICMP request packets are received on for_client_0 tunnel interface and routed to the lan interface. ICMP reply packets are received on the lan interface and routed back out on for_client_0 tunnel interface.

For more information, see Performing a sniffer trace or packet capture on page 4325.

3. Optionally, run real time IKE debug using appropriate filters for troubleshooting if the IPsec tunnel does not come up:

```
FortiGate # diagnose vpn ike log filter rem-addr4 172.20.120.254
FortiGate # diagnose debug application ike -1
FortiGate # diagnose debug enable
```

For more information, see VPN IPsec troubleshooting on page 2766.

Add FortiToken multi-factor authentication

This configuration adds multi-factor authentication (MFA) to the FortiClient dialup VPN configuration (FortiClient as dialup client on page 2502). It uses one of the two free mobile FortiTokens that is already installed on the FortiGate.

To configure MFA using the GUI:

1. Edit the user:
   a. Go to *User & Authentication* > *User Definition* and edit local user *vpnuser1*.
   b. Enable *Two-factor Authentication*.
   c. For *Authentication Type*, click *FortiToken* and select one mobile *Token* from the list.
   d. Enter the user's *Email Address*.
   e. Enable *Send Activation Code* and select *Email*.
   f. Click *Next* and click *Submit*.
2. Activate the mobile token.
   a. When a FortiToken is added to user *vpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

To configure MFA using the CLI:

1. Edit the user and user group:

```
config user local
    edit "vpnuser1"
        set type password
        set two-factor fortitoken
        set fortitoken <select mobile token for the option list>
```

```
        set email-to <user's email address>
        set passwd <user's password>
    next
end
```

2. Activate the mobile token.
   a. When a FortiToken is added to user *vpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

Add LDAP user authentication

This configuration adds LDAP user authentication to the FortiClient dialup VPN configuration (FortiClient as dialup client on page 2502). You must have already generated and exported a CA certificate from your AD server.

To configure LDAP user authentication using the GUI:

1. Import the CA certificate into FortiGate:
   a. Go to *System* > *Certificates*.
   If the *Certificates* option is not visible, enable it in *Feature Visibility*. See Feature visibility on page 3595 for details.
   b. Click *Import* > *CA Certificate*.
   c. Set *Type* to *File*.
   d. Click *Upload* then find and select the certificate file.
   e. Click *OK*.
   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
   f. Optionally, rename the system generated *CA_Cert_1* to something more descriptive:

   ```
   config vpn certificate ca
       rename CA_Cert_1 to LDAPS-CA
   end
   ```

2. Configure the LDAP user:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Set *Name* to *ldaps-server* and specify *Server IP/Name*.
   c. Specify *Common Name Identifier* and *Distinguished Name*.
   d. Set *Bind Type* to *Regular*.
   e. Specify *Username* and *Password*.
   f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.
   g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
   h. Click *OK*.
3. Add the LDAP user to the user group:
   a. Go to *User & Authentication* > *User Groups* and edit the *vpngroup* group.
   b. In *Remote Groups*, click *Add* to add the *ldaps-server* remote server.

c. Click *OK*.

To configure LDAP user authentication using the CLI:

1. Import the CA certificate using the GUI.
2. Configure the LDAP user:

```
config user ldap
    edit "ldaps-server"
        set server "172.20.120.161"
        set cnid "cn"
        set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
        set type regular
        set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
        set password **********
        set group-member-check group-object
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
    next
end
```

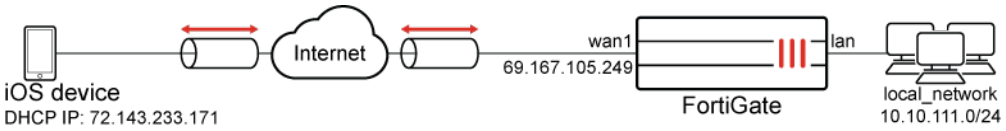
3. Add the LDAP user to the user group:

```
config user group
    edit "vpngroup"
        append member "ldaps-server"
    next
end
```

iOS device as dialup client

When FortiGate is configured as a dialup VPN server, Apple devices, such as iPhones or iPads, with dynamic or unknown IP addresses can establish secure connections over the Internet to access private resources protected by FortiGate.

In this example, the FortiGate protects a local network (10.10.111.0/24) that a remote user on an iOS device needs to securely access over the Internet using a VPN connection. The FortiGate is configured as a dialup VPN server on wan1, and the iOS device is the dial-up IPsec VPN client.



You can configure dialup IPsec VPN with an iOS device as the dialup client using the VPN Wizard in the GUI or the CLI.

To configure IPsec VPN with an iOS device as the dialup client in the GUI:

1. Configure a local user:
   a. Go to *User & Authentication > User Definition* and click *Create New*.
   b. Set the *User Type* to *Local User*, then click *Next*.
   c. Set the *Login Credentials*, then click *Next*:
      - *Username*: *vpnuser1*
      - *Password*: Enter a suitable password
   d. Disable *Two-factor Authentication*, then click *Next*.
   e. Set *User Account Status* to *Enabled* and disable *User Group*, then click *Submit*.
2. Configure a local user group:
   a. Go to *User & Authentication > User Groups* and click *Create New*.
   b. Configure the following:

Field	Value
Name	*vpngroup*
Type	*Firewall*
Members	*vpnuser1*

   c. Click *OK*.

   For other types of authentication, such as LDAP, PKI, or SAML, see User & Authentication on page 2990.
3. Go to *VPN > VPN Wizard*.
4. Enter a name for the VPN in the *Tunnel name* field. In this example, *ios_client*
5. Set *Select a template* to *Remote Access*.
6. Click *Begin*.
7. Configure the *VPN tunnel* settings:

Field	Value
VPN client type	*iOS*
Authentication method	*Pre-shared key*
Pre-shared key	Enter a suitable key. The same pre-shared key is used by the remote user on the iOS device to connect to the dialup VPN.
IKE	*Version 1*
NAT traversal	*Enable* Set *Keepalive frequency* to *10*.
User group	*vpngroup*
Require 'Group Name' on VPN client	Disable
DNS Server	*Use System DNS*
Enable IPv4 Split Tunnel	Enable

8. Click *Next*.
9. Configure the *Remote Endpoint* settings:

Field	Value
Addresses to assign to connected endpoints	*10.10.2.1-10.10.2.200*
Subnet for connected endpoints	*255.255.255.255*

10. Click *Next*.
11. Configure the *Local FortiGate* settings:

Field	Value
Incoming interface that binds to tunnel	*wan1* Disable *Create and add interface to zone*.
Local interface	*lan*
Local address	*local_network* Click + to create a new address object with *Type* set to *Subnet* and *IP/Netmask* set to *10.10.111.0/24*, if not already configured.

12. Click *Next*.
13. Review the configuration and, if everything is correct, click *Submit*.
    The IPsec VPN is configured and is visible on the *VPN > VPN Tunnels* page.

To configure IPsec VPN with an iOS device as the dialup client in the CLI:

1. Configure a local user:

```
config user local
    edit "vpnuser1"
        set type password
        set passwd ******
    next
end
```

2. Configure a local user group:

```
config user group
    edit "vpngroup"
        set member "vpnuser1"
    next
end
```

3. Configure the internal interface.
   The LAN interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this FortiGate causes traffic to this network group to go through the IPsec tunnel.

```
config system interface
    edit "lan"
        set vdom "root"
        set ip 10.10.111.1 255.255.255.0
    next
end
```

```
config firewall address
    edit "local_subnet_1"
        set subnet 10.10.111.0 255.255.255.0
    next
end
```

```
config firewall addrgrp
    edit "local_network"
        set member "local_subnet_1"
    next
end
```

4. Configure the WAN interface.

   The WAN interface is the interface connected to the ISP. It can be configured in static mode (as shown here), DHCP, or PPPoE mode. It is recommended to configure it with a static IP address to ensure that the IPsec VPN configuration on the on the iOS device stays unchanged if the WAN IP changes on the FortiGate. The IPsec tunnel is established over the WAN interface.

   ```
   config system interface
       edit "wan1"
           set vdom "root"
           set ip 172.20.120.123 255.255.255.0
       next
   end
   ```

5. Configure the client address pool.

   You must create a firewall address to assign an IP address to a client from the address pool.

   ```
   config firewall address
       edit "client_range"
           set type iprange
           set comment "VPN client range"
           set start-ip 10.10.2.1
           set end-ip 10.10.2.200
       next
   end
   ```

6. Configure the IPsec phase1-interface.

   PSK is used as the authentication method in this example. Signature authentication is also an option.

   ```
   config vpn ipsec phase1-interface
       edit "ios_client"
           set type dynamic
           set interface "wan1"
   ```

```
        set mode main
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-demand
        set dpd-retryinterval 20
        set xauthtype auto
        set authusrgrp "vpngroup"
        set assign-ip-from name
        set ipv4-name "client_range"
        set dns-mode auto
        set ipv4-split-include "local_network"
        set save-password enable
        set psksecret *****
    next
end
```

7. Configure the IPsec phase2-interface:

```
config vpn ipsec phase2-interface
    edit "ios_client"
        set phase1name "ios_client"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set pfs disable
    next
end
```

8. Configure a firewall policy to allow client traffic flow over the IPsec VPN tunnel to the FortiGate's lan interface:

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "ios_client"
        set dstintf "lan"
        set srcaddr "client_range"
        set dstaddr "local_network"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To configure the iOS device:

1. On the iOS device, go to *Settings* > *General* > *VPN & Device Management* > *VPN* and select *Add VPN Configuration*.
2. Configure the following details:

Field	Value
Type	*IPsec*
Description	Enter a suitable description.
Server	*69.167.105.249* (the wan1 IP address of the FortiGate the is configured as the IPsec VPN dialup server)
Account	*vpnuser1* (the local user configured on the FortiGate)
Password	Enter the password configured for the user.
Secret	Enter the pre-shared key that is configured on the FortiGate.

3. Leave the remaining settings as their default values and press *Done*.
4. Go to *Settings* > *General* > *VPN & Device Management* > *VPN*
5. Highlight the IPsec VPN configuration (indicated by a checkmark) and press the *Not Connected* toggle to enable the VPN.
6. If prompted, enter your user credentials.
7. The *VPN Status* changes to *Connected* and a VPN icon appears at the top of the screen.

To verify the tunnel status in the GUI:

1. On the FortiGate, go to *Dashboard* > *Network* and expand the *IPsec* widget.
2. Find the new tunnel, *ios_client_0* in this example, and check the statuses of the *Phase 1* and *Phase 2* selectors.

Successfully established dialup IPsec VPN tunnels are displayed using a parent name followed by an index, creating a structured and organized association with the parent tunnel. For example, the parent name *ios_client* results in tunnel names such as *ios_client_0*, *ios_client_1*, and so on.

3. Hover the cursor over the tunnel name to see additional details.

To verify the tunnel status in the CLI:

1. Verify the IPsec Phase 1 tunnel status on the FortiGate:

```
FortiGate # diagnose vpn ike gateway list name ios_client_0

vd: root/0
name: ios_client_0
version: 1
interface: wan1 3
addr: 69.167.105.249:4500 -> 72.143.233.171:40398
tun_id: 72.143.233.171/::10.0.0.8
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 22s ago
xauth-user: vpnuser1
```

```
2FA: no
peer-id: 0.0.0.0
peer-id-auth: no
assigned IPv4 address: 10.10.2.1/255.255.255.255
nat: me peer
pending-queue: 0
IKE SA: created 1/1  established 1/1  time 330/330/330 ms
IPsec SA: created 1/1  established 1/1  time 280/280/280 ms

  id/spi: 5 456ee87e1ccab0d5/a2d3d3f43d7c1147
  direction: responder
  status: established 22-22s ago = 330ms
  proposal: aes256-sha256
  key: c5b56bf00a715ad4-7332f707363766b5-9d7fc85b5003227c-18ab12ec2a8c4823
  QKD: no
  PQC-KEM (IKE): no
  PQC-KEM (all IPsec): no
  lifetime/rekey: 3600/3307
  DPD sent/recv: 00000000/00000000
  peer-id: 0.0.0.0
```

Note that FortiGate acts as the responder, establishes the IPsec tunnel with remote iOS device with IP 72.143.233.171 over UDP NAT-T port 4500 on its wan1 interface, and dynamically assigns a VPN IP of 10.10.2.1 to the iOS device. The authenticated username is also displayed in `xauth-user` field.

2. Verify the IPsec Phase 2 tunnel status on either the Branch or HQ:

```
FortiGate # diagnose vpn tunnel list name ios_client_0
list ipsec tunnel by names in vd 0
------------------------------------------------------
name=ios_client_0 ver=1 serial=a 69.167.105.249:4500->72.143.233.171:40398

npuid=0
```

Note the decryption, encryption, and authentication keys negotiated in Phase 2 to protect subnets under the `src` and `dst` fields. FortiOS also automatically adds the dynamically assigned VPN IP of 10.10.2.1 to its traffic selectors for dialup tunnel for_client_0.

To verify traffic through the IPsec tunnel:

1. On the iOS device with public IP 72.143.233.171 open an app that has the ping utility and initiate ICMP requests the a machine in the 10.10.111.0/24 network, then verify that traffic goes through:

```
# ping 10.10.111.3
PING 10.10.111.3 (10.10.111.3) 56(84) bytes of data.
64 bytes from 10.10.111.3: icmp_seq=1 ttl=62 time=9.82 ms
64 bytes from 10.10.111.3: icmp_seq=2 ttl=62 time=0.809 ms
```

2. On FortiGate, run a sniffer trace for ICMP packets destined to 10.10.111.3:

```
# diagnose sniffer packet any 'host 10.10.111.3’ 4 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.10.111.3]
2024-11-05 12:06:05.509711 ios_client_0 in 10.10.2.1 -> 10.10.111.3: icmp: echo request
2024-11-05 12:06:05.509791 lan out 10.10.2.1 -> 10.10.111.3: icmp: echo request
2024-11-05 12:06:05.518809 lan in 10.10.111.3 -> 10.10.2.1: icmp: echo reply
2024-11-05 12:06:05.518899 ios_client_0 out 10.10.111.3 -> 10.10.2.1: icmp: echo reply
```

The ICMP request packets are received on ios_client_0 tunnel interface and routed to the lan interface. ICMP reply packets are received on the lan interface and routed back out on ios_client_0 tunnel interface.

For more information, see Performing a sniffer trace or packet capture on page 4325.

3. Optionally, run real time IKE debug using appropriate filters for troubleshooting if the IPsec tunnel does not come up:

```
FortiGate # diagnose vpn ike log filter rem-addr4 72.143.233.171
FortiGate # diagnose debug application ike -1
FortiGate # diagnose debug enable
```

For more information, see VPN IPsec troubleshooting on page 2766.

IKE Mode Config clients

IKE Mode Config is an alternative to DHCP over IPsec. It allows dialup VPN clients to obtain virtual IP address, network, and DNS configurations amongst others from the VPN server. A FortiGate can be configured as either an IKE Mode Config server or client.

IKE Mode Config can configure the host IP address, domain, DNS addresses ,and WINS addresses. IPsec parameters such as gateway address, encryption, and authentication algorithms must be configured. Several network equipment vendors support IKE Mode Config.

An IKE Mode Config server or client is configured using `config vpn ipsec phase1-interface` and involves the following parameters:

Parameter	Description
ike-version {1 | 2}	IKE v1 is the default for FortiGate IPsec VPNs. IKE Mode Config is also compatible with IKE v2.
mode-cfg {enable | disable}	Enable/disable IKE Mode Config.
type {static | dynamic | ddns}	If you set `type` to `dynamic`, an IKE Mode Config server is created. The other settings create an IKE Mode Config client.
assign-ip {enable | disable}	Enable to request an IP address from the server. This configuration is for IKE Mode Config clients only.
interface <interface_name>	Specify the physical, aggregate, or VLAN interface to which the IPsec tunnel will be bound.
proposal <encryption_ combination>	The encryption and authentication settings that the client will accept.
ip-version {4 | 6}	By default, IPsec VPNs use IPv4 addressing.
ipv4-split-include <string> ipv6-split-include <string>	Mode Config server configuration. Applicable to IKEv1 and IKEv2. Specify the firewall address or address group that represents the subnets that the clients will have access to. This information is sent to the clients so that default traffic should not flow over the IPsec tunnel except for the specified subnets.
split-include-service <string>	Mode Config server configuration. Applicable to IKEv1 and IKEv2. Specify the service or service group that represents the services that the clients will have access to. This information is sent to the clients so that default traffic should not flow over the IPsec tunnel except for the specified services.
ipv4-split-exclude <string> ipv6-split-exclude <string>	Specify the subnets that should not be accessed over the IPsec tunnel. This information is sent to the clients so that all default traffic should flow over the IPsec tunnel except for the specified subnets. See Split-exclude in IKEv1.
domain <string>	Allows the configuration of a DNS suffix and is available only in IKE v1. To enable this feature, unity-support must be enabled using the `set unity-support enable` command in the phase 1 configuration. A maximum of one DNS suffix can be specified per IPsec tunnel.

Creating an IKE Mode Config client

In this example, the FortiGate connects to a VPN gateway with a static IP address that can be reached through port 1. Only the port, gateway, and proposal information needs to be configured. All other configuration information will come from the IKE Mode Config server.

To configure an IKE Mode Config client:

```
config vpn ipsec phase1-interface
    edit vpn1
        set ip-version 4
        set type static
        set remote-gw <gw_address>
        set interface port1
        set proposal 3des-sha1 aes128-sha1
        set mode-cfg enable
        set assign-ip enable
    next
end
```

Creating an IKE Mode Config server

To configure IKE Mode config settings, the following must be configured first :

```
config vpn ipsec phase1-interface
    edit "vpn-p1"
        set type dynamic
        set interface <interface_name>
        set ike-version {1 | 2}
        set mode-cfg enable
        set proposal <encryption_combination>
        set ip-version {4 | 6}
    next
end
```

In this example, the FortiGate assigns IKE Mode Config clients addresses in the range of 10.11.101.160 - 10.11.101.180. DNS and WINS server addresses are also provided. The public interface of the FortiGate unit is port1.

When IKE Mode-Configuration is enabled, multiple server IPs can be defined in IPsec phase 1.

The `ipv4-split-include` parameter specifies a firewall address (`OfficeLAN`), which represents the networks that the clients will have access to. This destination IP address information is sent to the clients.

To configure an IKE Mode Config server:

```
config vpn ipsec phase1-interface
    edit "vpn-p1"
        set type dynamic
```

```
        set interface "wan1"
        set xauthtype auto
        set mode aggressive
        set mode-cfg enable
        set proposal 3des-sha1 aes128-sha1
        set dpd disable
        set dhgrp 2
        set authusrgrp "FG-Group1"
        set ipv4-start-ip 10.10.10.10
        set ipv4-end-ip 10.10.10.20
        set ipv4-dns-server1 1.1.1.1
        set ipv4-dns-server2 2.2.2.2
        set ipv4-dns-server3 3.3.3.3
        set ipv4-wins-server1 4.4.4.4
        set ipv4-wins-server2 5.5.5.5
        set domain "fgt1c-domain"
        set banner "fgt111C-banner"
        set backup-gateway "100.100.100.1" "host1.com" "host2"
        set ipv4-split-include OfficeLAN
    next
end
```

Assigning IP addresses

Once the basic configuration is enabled, you can configure IP address assignment for clients, as well as DNS and WINS server assignments. Usually you will want to assign IP addresses to clients. The easiest way is to assign addresses from a specific range, similar to a DHCP server.

To assign an IP from an address range:

```
config vpn ipsec phase1-interface
    edit vpn1
        set ip-version 4
        set assign-ip enable
        set assign-ip-from range
        set ipv4-start-ip <range_start>
        set ipv4-end-ip <range_end>
        set ipv4-netmask <netmask>
    next
end
```

To assign an IP from a named firewall address or group:

```
config vpn ipsec phase1-interface
    edit vpn1
        set type dynamic
        set assign-ip-from name
        set ipv4-name <name>
        set ipv6-name <name>
```

```
    next
end
```

RADIUS server

If the client is authenticated by a RADIUS server, you can obtain the user's IP address assignment from the Framed-IP-Address attribute. The user must be authenticated using XAuth.

The users must be authenticated by a RADIUS server and assigned to the FortiGate user group `<grp_name>`. Since the IP address is not static, type is set to dynamic and `mode-cfg` is enabled. With IKE Mode Config, compatible clients can configure themselves with settings provided by the FortiGate.

To assign an IP from a RADIUS server:

```
config vpn ipsec phase1-interface
    edit vpn1
        set type dynamic
        set mode-cfg enable
        set assign-ip enable
        set assign-ip-from usrgrp
        set xauthtype auto
        set authusrgrp <grp_name>
    next
end
```

DHCP server

IKE Mode Config can use a remote DHCP server to assign the client IP addresses. Up to eight server addresses can be selected for either IPv4 or IPv6. The DHCP proxy must be enabled first.

To assign an IP from a DHCP server:

```
config system settings
    set dhcp-proxy enable
    set dhcp-server-ip <address>
    set dhcp6-server-ip <address>
end
```

```
config vpn ipsec phase1-interface
    edit vpn1
        set mode-cfg enable
        set assign-ip-from dhcp
    next
end
```

Certificate groups

IKE certificate groups consisting of up to four RSA certificates can be used in IKE phase 1. Since CA and local certificates are global, the IKE daemon loads them once for all VDOMs and indexes them into trees based on subject and public key hash (for CA certificates), or certificate name (for local certificates). Certificates are linked together based on the issuer, and certificate chains are built by traversing these links. This reduces the need to keep multiple copies of certificates that could exist in multiple chains.

To configure the IKE local ID:

```
config vpn certificate local
    edit <name>
        set ike-localid <string>
        set ike-localid-type {asnldn | fqdn}
    next
end
```

Split-exclude

The `split-exclude` setting specifies that default traffic flows over the IPsec tunnel except for specified subnets. This is the opposite of `split-include`, which specifies that default traffic should not flow over the IPsec tunnel except for specified subnets. The `split-include` and `split-exclude` settings can be specified at the same time.

To configure split-exclude:

```
config vpn ipsec phase1-interface
    edit <name>
        set ike-version {1 | 2}
        set type dynamic
        set mode-cfg enable
        set ipv4-split-exclude <string>
        set ipv6-split-exclude <string>
    next
end
```

DNS suffix

The DNS suffix enables DNS resolution of network resources using their hostnames, without requiring clients to specify their fully qualified domain names (FQDN). This feature is particularly useful in environments where users access internal resources over VPN connections. By appending a DNS suffix to unqualified domain names (such as hostnames), it enables end systems to generate FQDNs required for DNS resolution.

Currently, DNS suffix configuration is supported only for IKE version 1 and only one DNS suffix is configurable per IPsec tunnel.

The configuration of a DNS suffix on an IPsec tunnel requires enabling unity-support in the phase 1 configuration of the IPsec tunnel:

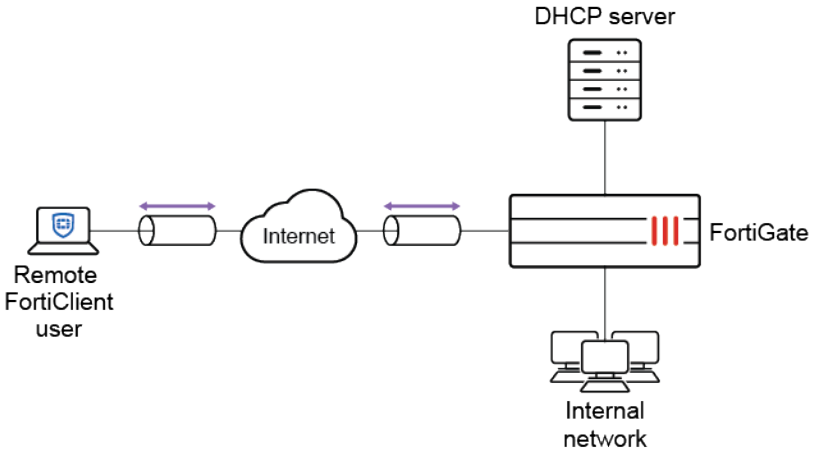
```
config vpn ipsec phase1-interface
    edit <name>
        set unity-support enable
        set domain <string>
    next
end
```

For more information, see IPsec DNS suffix on page 2577.

IPsec VPN with external DHCP service

You can use an external DHCP server to assign IP addresses to your IPsec VPN clients. This is a common scenario found in enterprises where all DHCP leases need to be managed centrally.

In this example, the DHCP server assigns IP addresses in the range of 172.16.6.100 to 172.16.6.120. The server is attached to internal2 on the FortiGate and has an IP address of 192.168.3.70.



To configure a DHCP server to assign IP addresses to IPsec VPN clients:

1. Create a user group for remote users:
   a. Go to *User & Authentication* > *User Definition* and click *Create New*.
   b. For *User Type*, select *Local User*.
   c. Complete the wizard, and click *Submit*.
   d. Go to *User & Authentication* > *User Groups* and click *Create New*..
   e. Create a *Firewall* user group for your remote users.
   f. For *Members*, add the user you just created.
   g. Click *OK*.
2. Add a firewall address for the local network and IPsec VPN client range:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Create a new *Subnet* address for the LAN, including the IP mask and local interface (*internal2*).
   c. Click *OK*.

d. Create a new *IP Range* address for the IPsec VPN client range (`172.16.6.100–172.16.6.120`).

e. Click *OK*.

3. Configure the IPsec VPN using a VPN tunnel in the CLI:

```
config vpn ipsec phase1-interface
    edit "dhcp_vpn"
        set type dynamic
        set interface "wan1"
        set mode aggressive
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set dhgrp 5
        set xauthtype auto
        set authusrgrp "ipsecvpn"
        set psksecret **********
        set dpd-retryinterval 60
    next
end

config vpn ipsec phase2-interface
    edit "toclient"
        set phase1name "dhcp_vpn"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set dhgrp 5
        set dhcp-ipsec enable
    next
end
```

4. Configure the IPsec VPN interface:

a. Go to *Network > Interfaces* and edit the newly created IPsec VPN interface.

b. Enable the *DHCP Server*.

c. Expand *Advanced* and change the *Mode* to *Relay*.

d. Enter the external DHCP server IP address (`192.168.3.70`).

e. Change the *Type* to *IPsec*.

f. Click *OK*.

5. Create a security policy for access to the local network:

a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.

b. Configure the following parameters:

i. Set the *Incoming Interface* to the tunnel interface created in step 3 (*dhcp_vpn*).

ii. Set the *Outgoing Interface* (*internal2*).

iii. Set the *Source* to the IPsec VPN client range defined in step 2 (*ipsecvpn_range*).

iv. Set the *Destination* to the subnet address defined in step 2 (*Local LAN*).

v. Set the *Service* to *ALL*.

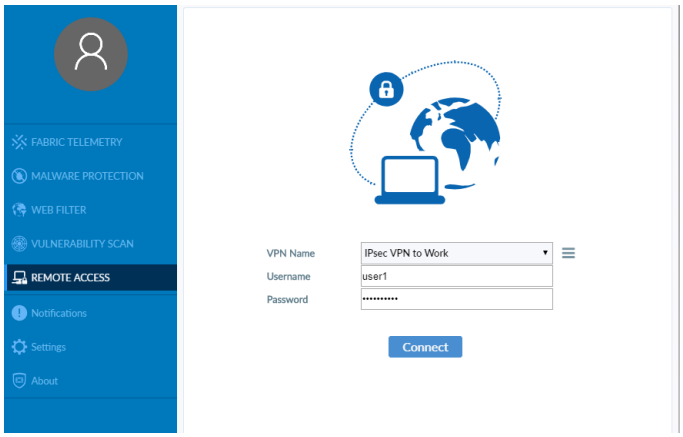
c. Click *OK*.

6. Configure FortiClient:
   a. In FortiClient, go to *REMOTE ACCESS* > *Add a new connection*.

   b. Configure the following parameters:
      i. Set the *VPN* type to *IPsec VPN*.
      ii. Enter a connection name.
      iii. Set the *Remote Gateway* to the FortiGate external IP address.
      iv. Set the *Authentication Method* to *Pre-shared key* and enter the key below.
      v. Expand the *Advanced Settings* > *VPN Settings* and for *Options*, select *DHCP over IPsec*.
      vi. Click *Save*.

   c. Select the new connection, and enter the user name and password.

d. Click *Connect*.



Once the connection is established, the external DHCP server assigns the user an IP address and FortiClient displays the connection status, including the IP address, connection duration, and bytes sent and received.

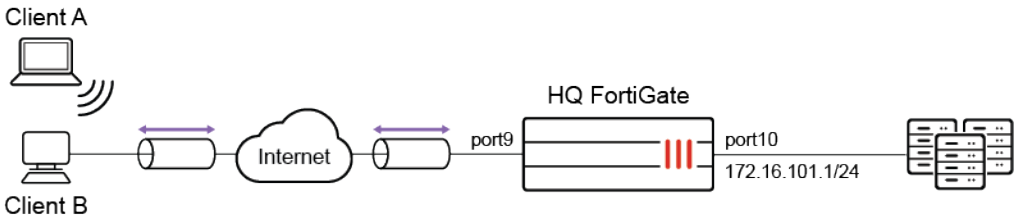
Verification

1. In FortiOS, go to *Monitor* > *IPsec Monitor* and verify that the tunnel *Status* is *Up*.
2. Go to *Log & Report* > *Forward Traffic* and verify the *Sent / Received* column displays the traffic flow through the tunnel.

L2TP over IPsec

This is an example of L2TP over IPsec.

This example uses a locally defined user for authentication, a Windows PC or Android tablet as the client, and `net-device` is set to `enable` in the `phase1-interface` settings. If `net-device` is set to `disable`, only one device can establish an L2TP over IPsec tunnel behind the same NAT device.



To configure L2TP over an IPsec tunnel using the GUI:

1. Go to *VPN* > *IPsec Wizard*.
2. Enter a VPN *Name*. In this example, *L2tpoIPsec*.
3. Configure the following settings for *VPN Setup*:
   a. For *Template Type*, select *Remote Access*.
   b. For *Remote Device Type*, select *Native* and *Windows Native*.
   c. Click *Next*.

4. Configure the following settings for *Authentication*:
   a. For *Incoming Interface*, select *port9*.
   b. For *Authentication Method*, select *Pre-shared Key*.
   c. In the *Pre-shared Key* field, enter *your-psk* as the key.
   d. For *User Group*, select *L2tpusergroup*
   e. Click *Next*.
5. Configure the following settings for *Policy & Routing*:
   a. From the *Local Interface* dropdown menu, select *port10*.
   b. Configure the *Local Address* as *172.16.101.0*.
   c. Configure the *Client Address Range* as *10.10.10.1-10.10.10.100*.
   d. Leave the *Subnet Mask* at its default value.
   e. Click *Create*.

To configure L2TP over an IPsec tunnel using the CLI:

1. Configure the WAN interface and static route on HQ.

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure IPsec phase1-interface and phase2-interface on HQ.

```
config vpn ipsec phase1-interface
    edit "L2tpoIPsec"
        set type dynamic
        set interface "port9"
        set peertype any
        set proposal aes256-md5 3des-sha1 aes192-sha1
        set dpd on-idle
        set dhgrp 2
        set net-device enable
        set psksecret sample
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
```

```
    edit "L2tpoIPsec"
        set phase1name "L2tpoIPsec"
        set proposal aes256-md5 3des-sha1 aes192-sha1
        set pfs disable
        set encapsulation transport-mode
        set l2tp enable
    next
end
```

3. Configure a user and user group on HQ.

```
config user local
    edit "usera"
        set type password
        set passwd usera
        next
end
config user group
    edit "L2tpusergroup"
        set member "usera"
    next
end
```

4. Configure L2TP on HQ.

```
config vpn l2tp
    set status enable
    set eip 10.10.10.100
    set sip 10.10.10.1
    set usrgrp "L2tpusergroup"
end
```

5. Configure a firewall address that is applied in L2TP settings to assign IP addresses to clients once the L2TP tunnel is established.

```
config firewall address
    edit "L2TPclients"
        set type iprange
        set start-ip 10.10.10.1
        set end-ip 10.10.10.100
    next
end
```

6. Configure a firewall policy.

```
config firewall policy
    edit 1
        set name "Bridge_IPsec_port9_for_l2tp negotiation"
        set srcintf "L2tpoIPsec"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
```

```
        set action accept
        set schedule "always"
        set service "L2TP"
    next
    edit 2
        set srcintf "L2tpoIPsec"
        set dstintf "port10"
        set srcaddr "L2TPclients"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To view the VPN tunnel list on HQ:

```
# diagnose vpn tunnel list

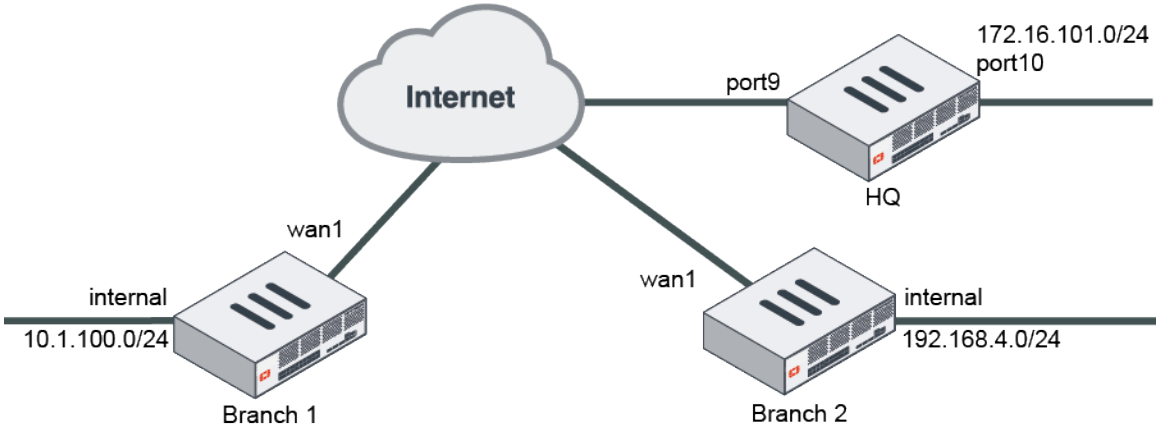
Tunneled Internet browsing

This is a sample configuration of tunneled internet browsing using a dialup VPN. To centralize network management and control, all branch office traffic is tunneled to HQ, including Internet browsing.



To configure a dialup VPN to tunnel Internet browsing using the GUI:

1. Configure the dialup VPN server FortiGate at HQ:
   a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name, in this example, *HQ*.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *The remote site is behind NAT*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Incoming Interface*, select *port9*.
      ii. For *Authentication Method*, select *Pre-shared Key*.
      iii. In the *Pre-shared Key* field, enter *sample* as the key.
      iv. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select *port10*.
      ii. Configure the *Local Subnets* as *172.16.101.0*.
      iii. Configure the *Remote Subnets* as *0.0.0.0/0*.
      iv. For *Internet Access*, select *Share Local*.
      v. For *Shared WAN*, select *port9*.
      vi. Click *Create*.
2. Configure the dialup VPN client FortiGate at a branch:
   a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name, in this example, *Branch1* or *Branch2*.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *The remote site is behind NAT*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *IP Address*, select *Remote Device* and enter *22.1.1.1*.
      ii. For *Outgoing Interface*, select *wan1*.

iii. For *Authentication Method*, select *Pre-shared Key*.
iv. In the *Pre-shared Key* field, enter *sample* as the key.
v. Click *Next*.

c. Configure the following settings for *Policy & Routing*:
i. From the *Local Interface* dropdown menu, select *internal*.
ii. Configure the *Local Subnets* as *10.1.100.0/192.1684.0*.
iii. Configure the *Remote Subnets* as *0.0.0.0/0*.
iv. For *Internet Access*, select *Use Remote*.
v. Configure the *Local Gateway* to *15.1.1.1/13.1.1.1*.
vi. Click *Create*.

To configure a dialup VPN to tunnel Internet browsing using the CLI:

1. Configure the WAN interface and static route on the FortiGate at HQ.

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure IPsec phase1-interface and phase2-interface configuration at HQ.

```
config vpn ipsec phase1-interface
    edit "HQ"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret sample
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "HQ"
        set phase1name "HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
```

```
chacha20poly1305
    next
end
```

3. Configure the firewall policy at HQ.

```
config firewall policy
    edit 1
        set srcintf "HQ"
        set dstintf "port9" "port10"
        set srcaddr "10.1.100.0" "192.168.4.0"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

4. Configure the WAN interface and static route on the FortiGate at the branches.
   a. Branch1.

```
config system interface
    edit "wan1"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

   b. Branch2.

```
config system interface
    edit "wan1"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 13.1.1.1
        set device "wan1"
```

```
   next
end
```

5. Configure IPsec phase1-interface and phase2-interface configuration at the branches.
   a. Branch1.

```
config vpn ipsec phase1-interface
    edit "branch1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "branch1"
        set phase1name "branch1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 10.1.100.0 255.255.255.0
    next
end
```

   b. Branch2.

```
config vpn ipsec phase1-interface
    edit "branch2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "branch2"
        set phase1name "branch2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 192.168.4.0 255.255.255.0
    next
end
```

6. Configure the firewall policy at the branches.
   a. Branch1.

```
config firewall policy
    edit 1
        set name "outbound"
        set srcintf "internal"
        set dstintf "branch1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound"
        set srcintf "branch1"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

   b. Branch2.

```
config firewall policy
    edit 1
        set name "outbound"
        set srcintf "internal"
        set dstintf "branch2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound"
        set srcintf "branch2"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

7. Configure the static routes at the branches.
   a. Branch1.

```
config router static
    edit 2
        set dst 22.1.1.1/32
        set gateway 15.1.1.1
        set device "wan1"
        set distance 1
    next
    edit 3
        set device "branch1"
        set distance 5
    next
end
```

   b. Branch2.

```
config router static
    edit 2
        set dst 22.1.1.1/32
        set gateway 13.1.1.1
        set device "wan1"
        set distance 1
    next
    edit 3
        set device "branch2"
        set distance 5
    next
end
```

8. Optionally, view the VPN tunnel list on a branch with the `diagnose vpn tunnel list` command:

```
list all ipsec tunnel in vd 0
----
name=branch1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1.1
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu create_dev
frag-rfc  accept_traffic=1

proxyid_num=1 child_num=1 refcnt=19 ilast=0 olast=0 ad=r/2
stat: rxp=1 txp=1661 rxb=65470 txb=167314

```

```
  dec:pkts/bytes=0/16348, enc:pkts/bytes=313/55962
  npu_flag=03 npu_rgwy=22.1.1.1 npu_lgwy=15.1.1.2 npu_selid=1 dec_npuid=1 enc_npuid=1
```

9. Optionally, view static routing table on a branch with the `get router info routing-table static` command:

```
Routing table for VRF=0
S*      0.0.0.0/0 [5/0] is directly connected, branch1
S*      22.1.1.1/32 [1/0] via 15.1.1.1, wan1
```

Dialup IPsec VPN with certificate authentication

In a dialup IPsec VPN setup, a company may choose to use X.509 certificates as their authentication solution for remote users. This method includes the option to verify the remote user using a user certificate, instead of a username and password. This method can be simpler for end users.

Administrators need to issue unique user certificates to each user for remote access management. The user certificate can be verified by the subject field, common name, or the subject identity in the Subject Alternative Name (SAN) field.

Subject field verification

This is the basic method that verifies the subject string defined in the PKI user setting matches a substring in the subject field of the user certificate. For example:

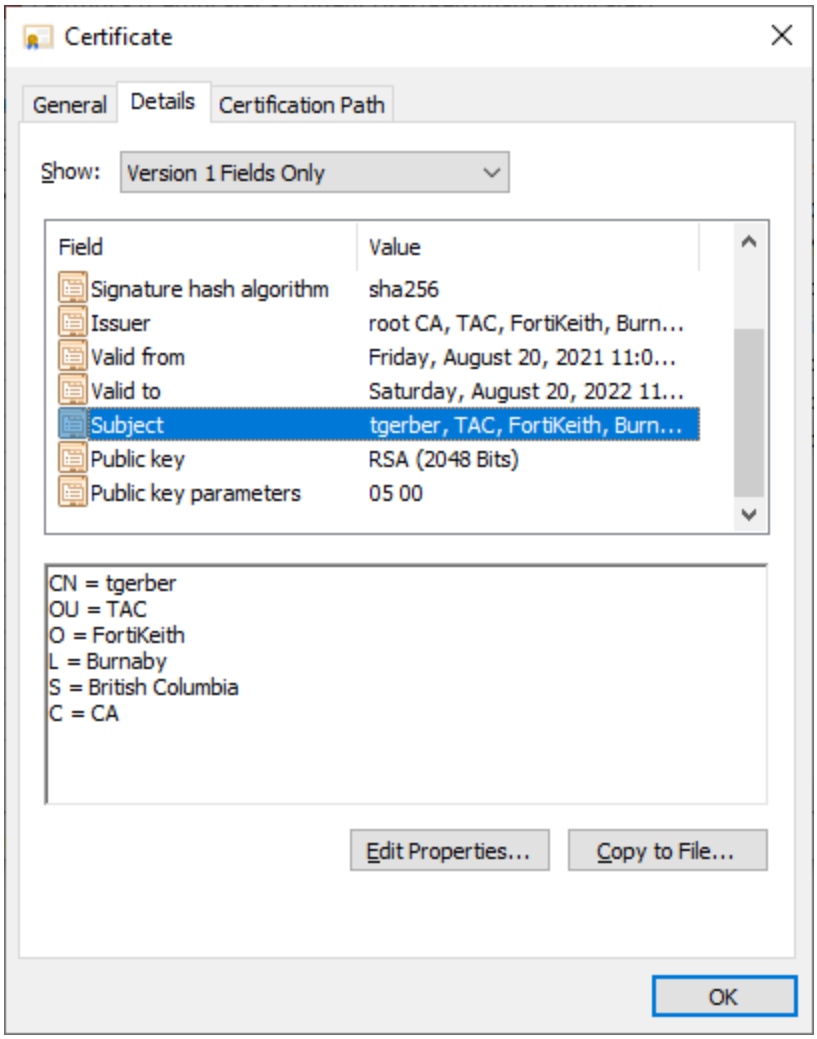
```
config user peer
    edit "tgerber"
        set ca "CA_Cert_2"
        set subject "CN=tgerber"
    next
end
```

Common name verification

In this method, administrators can define the CN string to match the common name (CN) in the subject field of the certificate. For example:

```
config user peer
    edit "tgerber"
        set ca "CA_Cert_2"
        set cn "tgerber"
    next
end
```

The matching certificate looks like the following:



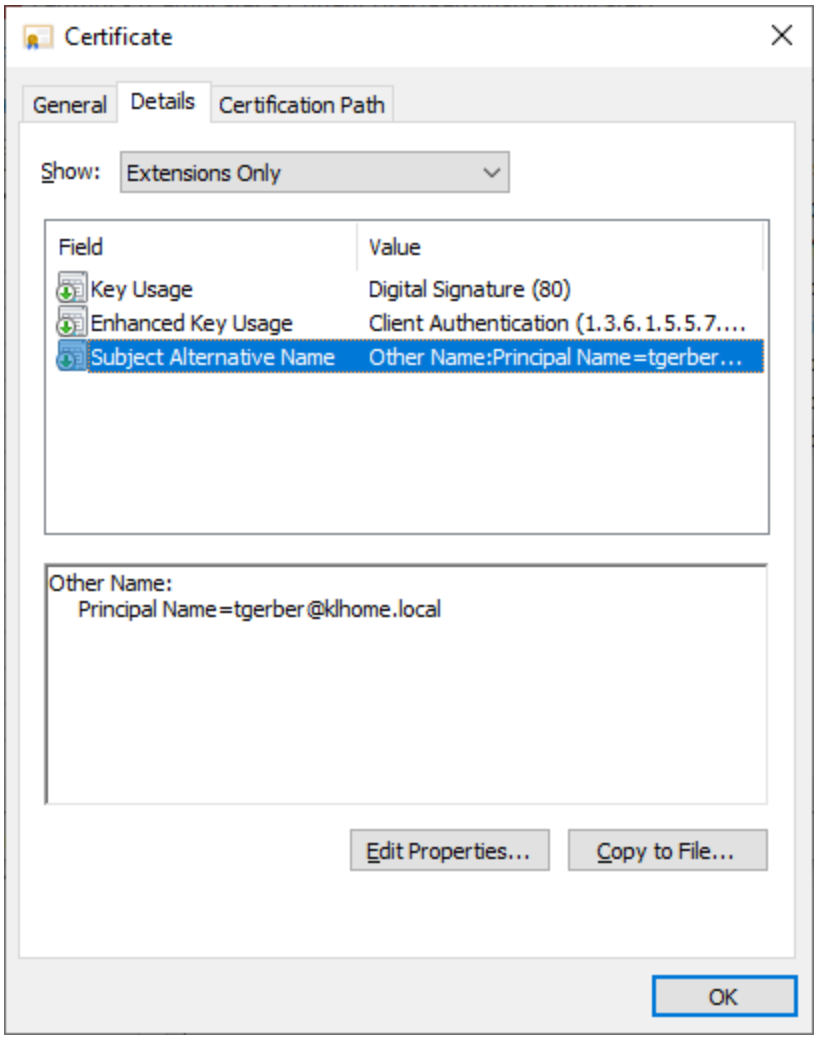
A PKI user must be created on the FortiGate for each remote user that connects to the VPN with a unique user certificate.

Principal name with LDAP integration

In this method, the PKI user setting references an LDAP server. When `mfa-mode` is set to `subject-identity`, the UPN in the user certificate's SAN field is used to look up the user in the LDAP directory. If a match is found, then authentication succeeds. For example:

```
config user peer
    edit "ldap-peer"
        set ca "CA_Cert_2"
        set mfa-server "WIN2K16-KLHOME-LDAPS"
        set mfa-mode subject-identity
    next
end
```

The matching certificate looks like the following:



This method is more scalable because only one PKI user needs to be created on the FortiGate. Remote users connect with their unique user certificate that are matched against users in the LDAP server.

Certificate management

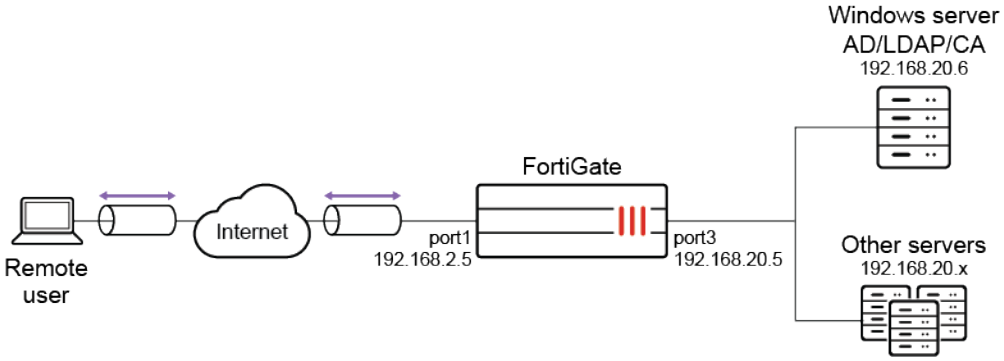
Dialup IPsec VPN with certificate authentication requires careful certificate management planning. Assuming that a company's private certificate authority (CA) is used to generate and sign all the certificates, the following certificates are needed:

Certificate type	Description
Server certificate	The server certificate is used to identify the FortiGate IPsec dialup gateway. A CSR can be generated on the FortiGate and signed by the CA, or the CA can generate the private and public keys and export the certificate package to the FortiGate.

Certificate type	Description
User certificate	The user certificate is generated and signed by the CA with unique CNs in the subject field and/or unique Principal Names in the SAN field. They are used to identify the user that is connecting to the VPN. User certificates must be installed on client machines.
CA certificate	The root CA certificate, and any subordinate CA that signed the actual user and server certificates, must be imported into the FortiGate and client machines. The CA certificate is used to verify the certificate chain of the server and user certificates.

Example

In this example, a dialup IPsec VPN tunnel is configured with certificate authentication using the subject field verification method and the LDAP integration method.



The company CA, named root CA, signs all the server and user certificates. The user, tgerber@klhome.local, has a user certificate signed by root CA installed on their endpoint. The corresponding user account is also present under the company's Active Directory.

There are five major steps to configure this example:

1. Importing the certificates
2. Configuring user authentication
3. Configuring the VPN
4. Configuring FortiClient and the endpoints
5. Testing and verifying the certificate authentication

Importing the certificates

The server certificate and CA certificate need to be imported into the FortiGate.

To import the server certificate:

1. Go to *System* > *Certificates* and select *Import* > *Local Certificate*.
2. For *Type*, select *PKCS #12 Certificate*.
3. Upload the key file exported from the CA and enter the password.

4. Click *OK*. The certificate now appears in the *Local Certificate* section.

To import the CA certificate:

1. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
2. For *Type*, select *File*.
3. Upload the CA certificate (usually a .CRT file). This certificate only contains the public key.
4. Click *OK*. The certificate now appears in the *Remote CA Certificate* section.

If any subordinate CA is involved in signing the certificates, you need to import its certificate.

Configuring user authentication

FortiGate PKI users do not appear in the GUI until at least one PKI user has been created in the CLI. The following instructions create the PKI users in the CLI.

To configure PKI users for subject field verification:

1. Create the PKI user and choose the CA certificate that was imported (if the certificate was signed by a subordinate CA, choose the subordinate CA's certificate):

```
config user peer
    edit "tgerber"
        set ca "CA_Cert_2"
        set subject "CN=tgerber"
    next
end
```

   For an example of CN field matching, see Common name verification.
2. Create additional users as needed.
3. Place the users into a peer group:

```
config user peergrp
    edit "pki-users"
        set member "tgerber" <user> ... <user>
    next
end
```

To configure PKI users for LDAP integration:

1. Configure the LDAP server that users connect to for authentication:

```
config user ldap
    edit "WIN2K16-KLHOME-LDAPS"
        set server "192.168.20.6"
        set cnid "sAMAccountName"
        set dn "dc=KLHOME,dc=local"
```

```
        set type regular
        set username "KLHOME\\Administrator"
        set password ************
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

2. Configure the PKI user to reference the LDAP server using the CA certificate that was imported:

```
config user peer
    edit "ldap-peer"
        set ca "CA_Cert_2"
        set mfa-server "WIN2K16-KLHOME-LDAPS"
        set mfa-mode subject-identity
    next
end
```

3. Place the user into a peer group:

```
config user peergrp
    edit "pki-ldap"
        set member "ldap-peer"
    next
end
```

Configuring the VPN

To configure the VPN, the address objects must be defined first so they can be used in the VPN and policy configurations. In this example, the VPN is configured in custom mode to define the authentication settings.

To configure the address objects:

1. Create the address range for the dialup clients:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. For *Name*, enter *remote-user-range*.
   d. For *Type*, select *IP Range* and enter *172.18.200.10-172.18.200.99* in the *IP Range* field.
   e. Click *OK*.
2. Create the address subnet for the destination 192.168.20.0/24:
   a. Click *Create new*.
   b. For *Name*, enter *192.168.20.0*.
   c. For *Type*, select *Subnet* and enter *192.168.20.0/24* in the *IP/Netmask* field.
   d. Click *OK*.

To configure the IPsec dialup tunnel:

1. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Tunnel*.
2. Enter a name for the tunnel, *Dialup-cert_0*.
3. For *Template type*, select *Custom* then click *Next*.
4. In the *Network* section, enter the following:

Remote Gateway	*Dialup User*
Interface	*port1*
Mode Config	Enable
Assign IP From	*Range*
IPv4 mode config > Client Address Range	*172.18.200.10-172.18.200.99*
Enable IPv4 Split Tunnel	Enable
Accessible Networks	*192.168.20.0*

5. In the *Authentication* section, enter the following:

Method	*Signature*
Certificate Name	Select the server certificate that was imported.
Mode	*Aggressive*
Peer Options > Accept Types	*Peer certificate group*
Peer Options > Peer certificate group	Select the group based on the preferred method: • For subject verification, select *pki-users*. • For LDAP integration, select *pki-ldap*.

When IKEv1 is used, aggressive mode should be selected so that the connecting endpoint will provide its peer ID in the first message of the IKE exchange. The peer identifier allows the FortiGate to match the correct tunnel when multiple dialup tunnels are defined.

6. For *Phase 2 Selectors*, leave the local and remote selectors as *0.0.0.0/0.0.0.0*.
7. Click *OK*.

To configure the firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the following:

Name	Enter a policy name.
Incoming interface	*Dialup-cert_0*
Outgoing Interface	*port3*
Source	*remote-user-range*

Destination	*192.168.20.0*
Schedule	*always*
Service	*ALL*
Action	*ACCEPT*

3. Configure the other settings as needed.
4. Click *OK*.

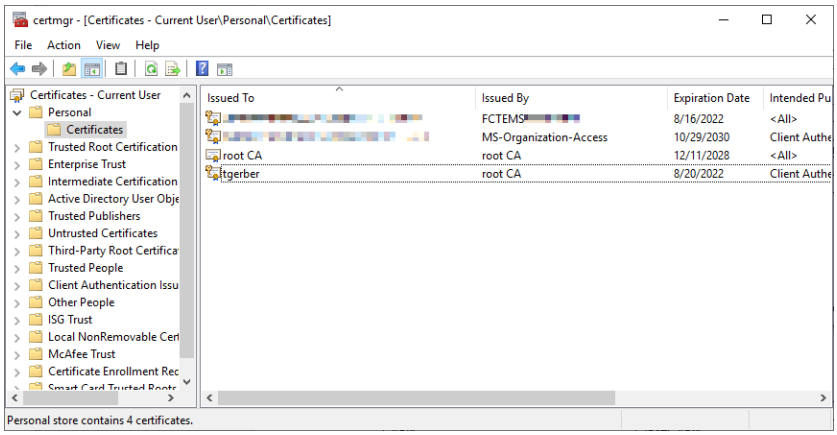
Configuring FortiClient and the endpoints

The following example is configured on a Windows PC with FortiClient 7.0.0. Other configurations may differ slightly.

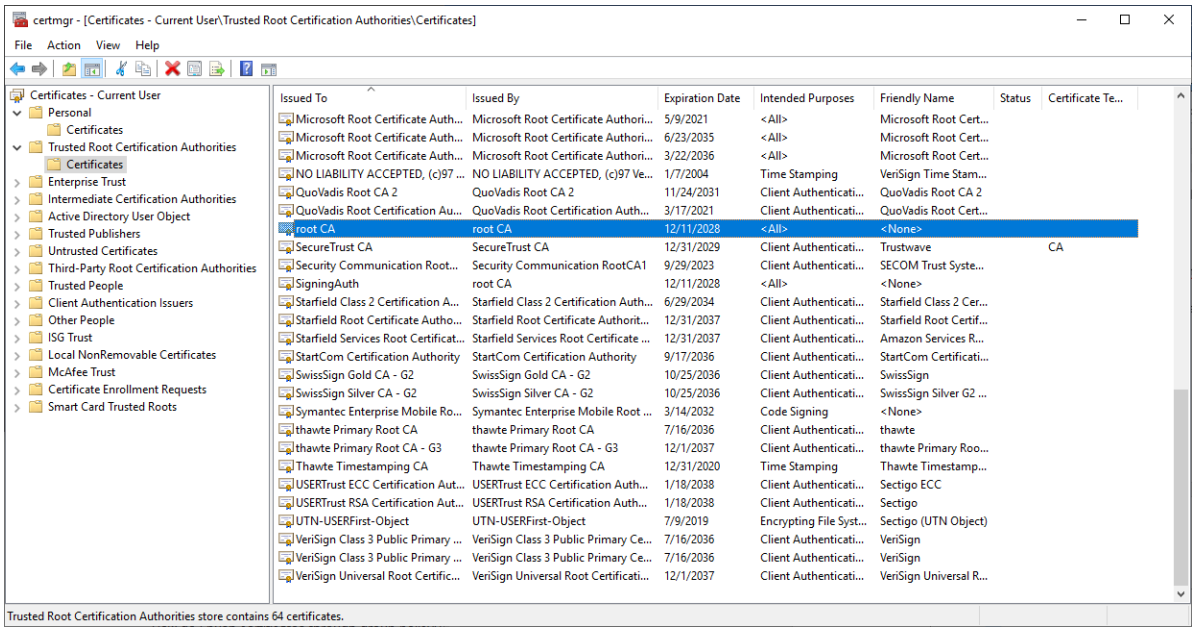
The user certificate and CA certificate must be installed on the endpoint device. They may be pushed by the administrator through group policies or another method. This example assumes that the user certificate and CA certificate are already installed on the endpoint.

To verify the user and CA certificates:

1. Open the Windows certificate manager (certmgr):
   a. In the Control Panel, type *Manage user certificate* in the search box.
   b. Click the result, *Manage user certificates*.
2. Go to *Personal* > *Certificate*. The user certificate should be listed.



3. Go to *Trusted Root Certification Authorities* > *Certificates*. The company CA certificate should be listed.



To configure the FortiClient endpoint settings:

1. In FortiClient, click the *Remote Access* tab and add a new connection:
   a. If there are no existing connections, click *Configure VPN*.
   b. If there are existing connections, click the menu icon and select *Add a new connection*.
2. Configure the following:

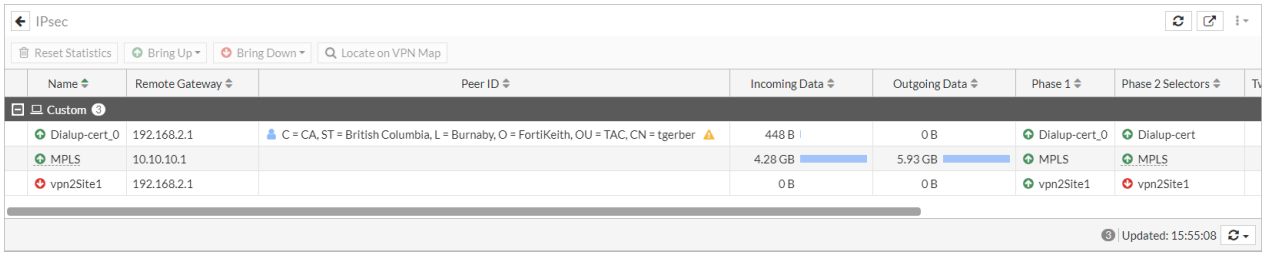
VPN	*IPsec VPN*
Connection Name	*Dialup-cert_0*
Remote Gateway	*192.168.2.5*
Authentication Method	*X.509 Certificate* Select the user certificate, *tgerber/root CA*, from the dropdown.
Authentication (XAuth)	*Disable*

3. Click *Save*.

Testing and verifying the certificate authentication

1. On the client PC, open FortiClient and click the *Remote Access* tab.
2. Select the VPN tunnel, *Dialup-cert_0*, and click *Connect*.
   If the connection is successful, a FortiClient pop-up will appear briefly indicating that the IKE negotiation succeeded. The *Remote Access* window now displays *VPN Connected* and the associated VPN tunnel details.
3. On the FortiGate, go to *Dashboard* > *Network* and locate the *IPsec* widget to view the VPN tunnel monitor. Click the widget to expand to full view.

The widget displays tunnel information, including the *Peer ID* containing the subject field of the user certificate.



4. Go to *Log & Report > System Events* and select the *VPN Events* card. Several tunnel related logs are recorded.
5. The same logs can be viewed in the CLI:

```
# execute log filter category 1
# execute log filter field subtype vpn
# execute log display
7: date=2021-08-23 time=15:53:08 eventtime=1629759188862005740 tz="-0700" logid="0101037138"
type="event" subtype="vpn" level="notice" vd="root" logdesc="IPsec connection status changed"
msg="IPsec connection status change" action="tunnel-up" remip=192.168.2.1 locip=192.168.2.5
remport=64916 locport=4500 outintf="port1" cookies="19f05ebc8c2f7a0d/7716190005538db5" user="C
= CA, ST = British Columbia, L = Burnaby, O = FortiKeith, OU = TAC, CN = tgerber" group="pki-
ldap" useralt="C = CA, ST = British Columbia, L = Burnaby, O = FortiKeith, OU = TAC, CN =
tgerber" xauthuser="N/A" xauthgroup="N/A" assignip=172.18.200.10 vpntunnel="Dialup-cert_0"
tunnelip=172.18.200.10 tunnelid=3418215253 tunneltype="ipsec" duration=0 sentbyte=0 rcvdbyte=0
nextstat=0
```

6. If any issues arise during the connection, run the following debug commands to troubleshoot the issue:

```
# diagnose debug application ike -1
# diagnose debug application fnbamd -1
# diagnose debug enable
```

SAML-based authentication for FortiClient remote access dialup IPsec VPN clients

SAML-based authentication for FortiClient remote access dialup IPsec VPN clients is now supported. This feature requires FortiClient 7.2.4 and FortiClient supports only using IKEv2. Two factor authentication using FortiToken push is also supported.

The FortiGate authd daemon has been enhanced to support SAML authentication and accepts local-in traffic from the FortiClient by the TCP port number configured in the `auth-ike-saml-port` setting (0 - 65535, default = 1001). This setting can be configured in the CLI:

```
config system global
    set auth-ike-saml-port <integer>
end
```

This allows the FortiGate to act as a SAML service provider (SP) for IKEv2 FortiClient remote access IPsec VPN clients by forwarding the FortiClient's SAML request to the configured SAML identity provider (IdP) for user authentication.

The `ike-saml-server` setting enables a configured SAML server to listen on a FortiGate interface for SAML authentication requests from FortiClient remote access IPsec VPN clients. It must be configured on the interface that is directly receiving the SAML authentication requests from FortiClient. This setting can be configured in the CLI:

```
config system interface
    edit <name>
        set ike-saml-server <saml_server>
    next
end
```

The `ike-saml-server` setting must be configured on the interface that is the first point of contact for FortiClient traffic.

For example, if FortiClient user SAML authentication traffic is always routed to the FortiGate on the WAN1 interface, then `ike-saml-server` must be configured for WAN1. If it is configured for WAN2, then the authentication traffic will not reach it on WAN1, even is the FortiGate allows traffic to flow from WAN1 to WAN2.

FortiClient will validate the certificate presented to it by FortiGate during its initial SAML connection. This certificate can be configured on the FortiGate from the GUI under *User & Authentication* > *Authentication Settings* > *Certificate* under *User Authentication Options*. To import the certificate on the FortiGate, see Import a certificate on page 3604.

This certificate can also be configured in the CLI:

```
config user setting
     set auth-cert <certificate>
end
```

To prevent an invalid server certificate prompt on FortiClient, the certificate's common name (CN) should match the IPsec VPN remote gateway's FQDN. If the certificate is signed by a custom Certificate Authority or one that is not well-known, the Certificate Authority's (CA) certificate should be imported in FortiClient endpoint's Trusted Root Certificate Authority store. For details on installing a CA certificate on the endpoint, see Installing certificates on the client.

Dialup IPsec VPN with SAML using an external browser for authentication is supported starting from FortiOS 7.6.1, FortiClient (Windows) and (macOS) 7.2.5 and 7.4.1 and FortiClient (Linux) 7.4.3.

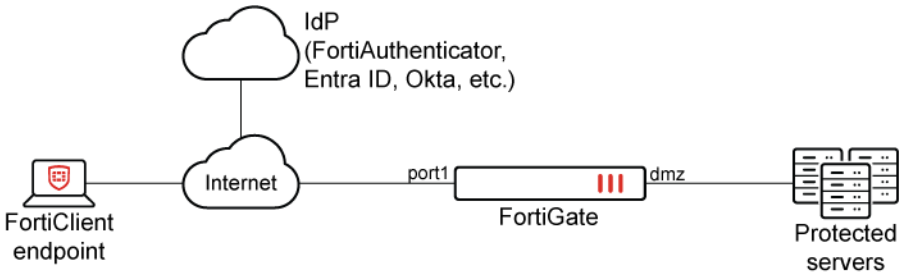
SAML authentication flow with IPsec

The SAML Authentication flow when using IPsec where FortiGate is the Service Provider (SP), FortiAuthenticator, Entra ID, Okta, or another SAML IdP is the Identity Provider (IdP) and FortiClient is the web-browser:

1. When the FortiClient user clicks on Connect on FortiClient to connect to IPsec VPN Gateway (i.e. FortiGate), FortiClient first initiates a connection to FortiGate on the `auth-ike-saml-port` configured on FortiGate.
2. The FortiGate sends a SAML Authentication Requests inside a redirect to FortiClient. The redirect consists of URLs to reach the IdP.
3. FortiClient uses these redirects to send SAML Authentication Request to the IdP after which the login page on the IdP opens up.
4. The user authenticates to the IdP using their SAML credentials configured on the IdP.
5. The IdP sends a SAML Authentication Response that contains the user and group information in form of SAML Assertions to FortiClient.
6. FortiClient sends a SAML Authentication Response to FortiGate.
7. The FortiGate consumes the SAML Authentication Response and SAML Assertions after verifying the IdP using its IdP's certificate and provides FortiClient with a temporary token ID.
8. FortiClient initiates IPsec tunnel and presents the token ID for authentication. Upon successful verification of token ID, IPsec tunnel establishes.

SAML configuration example with different IdPs

The following example shows configuring IPsec with SAML authentication using different IdPs on FortiGate and FortiClient.



The configuration steps on the FortiGate, different IdPs and FortiClient are as follows:

1. Configure IKE-SAML authentication port number on FortiGate.
2. Configure IPsec VPN certificate on FortiGate.
3. Configure SAML IdP and SAML SP.
4. Configure IPsec IKEv2 on FortiGate.
5. Configure firewall policies on FortiGate.
6. Configure IPsec VPN profile on FortiClient.
7. Verify the IPsec connection.

Only Configuring SAML IdP and SAML SP on page 2550 is unique to individual IdPs. All other steps listed above are the same on FortiGate and FortiClient when using different IdPs.

Configuring IKE-SAML authentication port number on FortiGate

Configure a suitable TCP port number for SAML authentication (`auth-ike-saml-port`) used by FortiGate. This example uses port 9443 and the setting is configurable using the CLI.

```
config system global
    set auth-ike-saml-port 9443
end
```

Configuring IPsec VPN certificate

In this step, using either the GUI or the CLI, configure the IPsec VPN certificate that is presented to FortiClient upon its initial connection.

To configure the IPsec VPN certificate in the GUI:

1. Go to *User & Authentication* > *Authentication Settings*.
2. Select the certificate from the *Certificate* dropdown menu. To import the certificate on FortiGate, see Import a certificate on page 3604.

To configure the IPsec VPN certificate in the CLI:

If the certificate *VPN_Certificate* has already been imported on the FortiGate, then use the following CLI commands:

```
config user setting
    set auth-cert "VPN_Certificate"
end
```

Configuring SAML IdP and SAML SP

The SAML configuration on SP (FortiGate) will vary based on selected IdPs from the list below. Select the preferred combination of SP and IdP as per your requirement from the following list.

1. Configure FortiAuthenticator as SAML IdP and FortiGate as SAML SP
2. Configure Microsoft Entra ID as SAML IdP and FortiGate as SAML SP

SAML IdPs other than FortiAuthenticator or Microsoft Entra ID can be used. Please refer to the documentation of the respective SAML IdP for details.

Configuring IPsec IKEv2 on FortiGate

Configuring Remote access VPN on FortiGate enables FortiClient to connect to the IPsec VPN gateway configured on FortiGate. FortiClient 7.2.4 GA and above supports only IKEv2 for SAML authentication. The

example discussed uses full-tunnel IPsec VPN. For split-tunnel configuration and other advanced configurations as per your requirement, see Remote access on page 2492.

To configure IPsec VPN on FortiGate with FortiClient as the dialup client:

1. Go to *VPN > IPsec Tunnels*.
2. Click *Create New > IPsec Tunnel*. The *VPN Creation Wizard* is displayed.
3. Enter the *Name* as *FCT_SAML*. This example does not use the VPN wizard for the IPsec tunnel configuration but rather configures a *Custom* IPsec tunnel.
4. Configure the *Template type* as *Custom*.
5. Click *Next*.
6. Configure the following options:

Name	*FCT_SAML*
Comments	(Optional)
Network	
IP Version	*IPv4*
Remote Gateway	*Dialup User*
Interface	*port1* Select the IPsec tunnel gateway interface.
Mode Config	*Enable*
Use system DNS in mode config	(Optional) Enable FortiClient to use the host's DNS server after it connects to VPN.
Assign IP From	*Enable* Select *Address/Address Group* from the dropdown list.
IPv4 mode config	
Client Address Range	*VPN_Client_IP_Range* *VPN_Client_IP_Range* is configured from *10.212.134.1* to *10.212.134.200*. If it is not already created, select *Create > Address* from the dropdown menu to create a new address object. See Subnet on page 1747 for more information.
Subnet Mask	*255.255.255.255*
DNS Server	*8.8.8.8*
Authentication	
Method	*Pre-shared key*
Pre-shared key	Enter the pre-shared key of at least six characters.
IKE	
Version	*2*
Peer Options	

Accept Types	*Any peer ID*
Phase 1 Proposal	
Encryption	*AES128*
Authentication	*SHA256* Select the desired Encryption and Authentication algorithms that should also match with Phase1 Proposals configured on FortiClient. See Configuring IPsec VPN profile on FortiClient on page 2553.

7. Keep other configurations as defaults.
8. Click *OK*. The newly created IPsec tunnel would be now visible under *VPN > IPsec Tunnels*.
9. As IKEv2 uses EAP for user authentication, enable EAP using the CLI inside the configured IPsec tunnel for user authentication, as follows:

```
config vpn ipsec phase1-interface
    edit "FCT_SAML"
        set eap enable
        set eap-identity send-request
    next
end
```

For other advanced custom configurations as per your requirement, see Remote access on page 2492.

The SAML group configured, `<group-name>`, must be either configured inside the IPsec Phase 1 setting, `set authusrgrp <group-name>`, or in the firewall policy, `set groups <group-name>`, to allow the traffic to flow through the IPsec tunnel. If the SAML group is configured in both IPsec Phase 1 and firewall policy, the traffic stops to flow through the IPsec tunnel. In the example discussed, it is configured it in the firewall policy.

Configuring firewall policies for IPsec tunnel

To configure firewall policies for IPsec tunnel:

1. Go to *Policy & Object > Firewall Policy*.
2. Click *Create New*.
3. Enter the following configuration:

Name	*IPsec to DMZ* Enter the desired name.
Incoming Interface	*FCT_SAML* Select the configured IPsec tunnel.
outgoing Interface	*DMZ* Select the interfaces that FortiClient needs access to when it connects to VPN.
Source	Under *Address*, select *VPN_Client_IP_Range*.

	Under *User*, select *SAML-FAC-Group* (or *SAML-ENTRA-ID-Group*). The group under *User* is the SAML user group configured in the earlier steps.
Destination	*DMZ subnet* Click *Create* if it is not already created. See Subnet on page 1747 for more information.
Service	*ALL*

4. Click *OK*.
5. As IPsec tunnel configured as full-tunnel, create another policy to allow traffic from *IPsec to Internet*, to allow FortiClient to access Internet through IPsec tunnel.

For additional custom settings as per your requirement, see Firewall policy on page 1563.

Configuring IPsec VPN profile on FortiClient

To configure an IPsec VPN profile on FortiClient:

1. In FortiClient, go to *Remote Access* > *Configure VPN* or *Add a new connection*.
2. Set the following settings to configure an IPsec IKEv2 profile on FortiClient:

Connection Name	*VPN-Tunnel*
Remote Gateway	*<VPN Gateway FQDN>* or *<VPN Gateway IP>*
Authentication Method	*Pre-shared key* with *Enable Single Sign On (SSO) for VPN Tunnel* enabled.
Customize port	*9443*
Advanced Settings > VPN Settings	
IKE	*Version 2*
Options	*Mode Config*

To explore additional custom options to configure IPsec VPN profile, see Configuring an IPsec VPN connection.

Verifying IPsec connection

To verify the IPsec connection in the GUI:

1. On the client PC, open FortiClient and select the *Remote Access* tab.
2. Select the VPN tunnel, *VPN-Tunnel*, and click *Connect*.
3. If the connection is successful, a FortiClient pop-up will appear briefly indicating that the IKE negotiation succeeded. The *Remote Access* window now displays *VPN Connected* and the associated VPN tunnel details.

4. In FortiOS, go to *Dashboard* > *Network* and locate the *IPsec* widget. Click the widget to expand to full view and view more details.

To verify the IPsec connection in the CLI:

The following debugs are from FortiGate when used with FortiAuthenticator as the IdP. The debugs should be similar for other IdPs depending on the SAML attributes supported and sent by the IdP.

1. Verify the IKE gateway list:

```
# diagnose vpn ike gateway list
vd: root/0
name: FCT_SAML_0
version: 2
interface: port1 3
addr: 10.100.66.99:4500 -> 208.91.115.30:64917

```

2. Verify the authd daemon debug output:

```
# diagnose debug application authd -1
...
[authd_http_on_method_post:5151]: src 10.1.100.253 flag 00008000
[authd_local_saml_auth:5602]: SAML login with UID '19E1FA565259468FB46EDAA9D595176F'.
[authd_http_prepare_javascript_redir:3852]: https://<VPN Gateway
FQDN>:9443/saml?0704048f9683e491
...
```

3. Verify the samld daemon debug output:

```
# diagnose debug application samld -1
...
</Session>
samld_send_common_reply [99]:     Attr: 17, 31, magic=040c07809dafc13e
samld_send_common_reply [99]:     Attr: 18, 29, 2024-03-19T21:42:21Z
samld_send_common_reply [95]:     Attr: 10, 26, 'username' 'testuser'
samld_send_common_reply [95]:     Attr: 10, 17, 'group' 'IT'
...
```

4. Verify the fnbamd daemon debug output:

```
# diagnose debug application fnbamd -1
...
[2426] handle_req-Rcvd auth cache message
[133] __saml_auth_cache_push-Auth cache created, user='19E1FA565259468FB46EDAA9D595176F',

```

Configuring FortiAuthenticator as SAML IdP and FortiGate as SAML SP

This topic discusses the configuration steps required on FortiAuthenticator to act as the Identity Provider (IdP) and FortiGate to act as Service Provider (SP) during SAML Authentication for IPsec connection, as a part of the overall configuration in SAML-based authentication for FortiClient remote access dialup IPsec VPN clients on page 2547.

In the example discussed, the following assumptions and configuration steps are used:

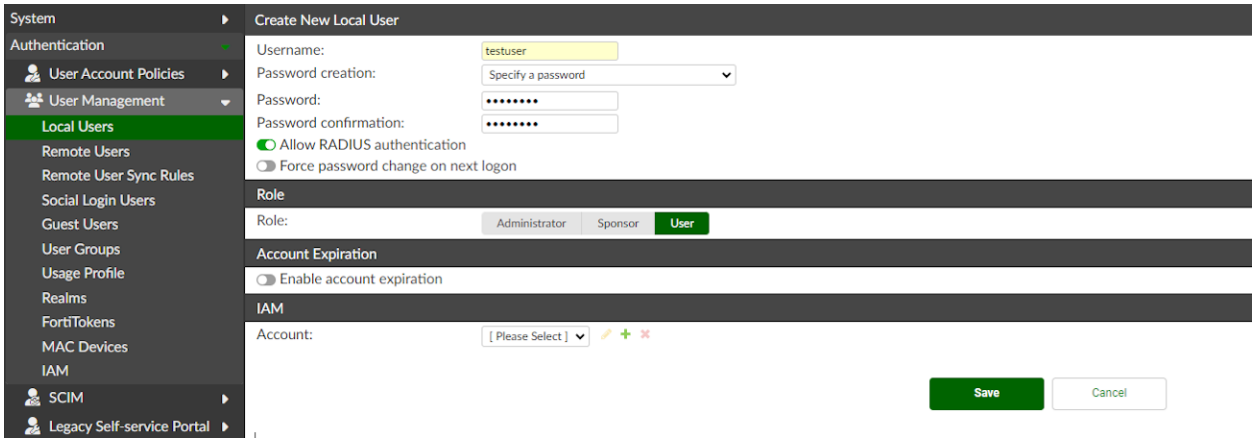
1. FortiAuthenticator is configured with local user (*testuser*) inside a User group (*IT*).
2. This user belongs to a unique realm (*samlrealm*).
3. FortiAuthenticator also requires a server certificate (also called as IdP certificate) for itself signed by a well-known CA or trusted by FortiClient endpoint and FortiGate.
4. The IdP certificate must be imported into FortiGate after which FortiAuthenticator can use the certificate to sign the SAML messages.
5. FortiAuthenticator must then be configured as SAML IdP and FortiGate as SAML SP.

To configure a local user on FortiAuthenticator:

1. Go to *Authentication > User Management > Local Users* and select *Create New*.
2. Enter the following details shown below and leave other settings as the defaults.

Username	*testuser*
Password creation	*Specify a password*
Password	Enter a desired password
Password confirmation	Re-enter the password

3. Click *Save*.



For more advanced and custom configuration options, see Local users.

To configure a user group on FortiAuthenticator:

1. Go to *Authentication > User Management > User Groups* and select *Create New*.
2. To create a user group with a local user:
   a. In the *Name* field, enter the group name as *IT*.
   b. Set the *Type* as *Local*.
   c. Under *Users*, from the *Available Users* table, select *testuser* and move it to the *Chosen Users* table.
3. Click *Save*.

For more advanced options, see User Groups.

To configure a user realm on FortiAuthenticator:

1. Go to *Authentication > User Management > Realms* and select *Create New*.
2. Name the realm as *samlrealm*.
3. In *User source*, from the dropdown, select *Local Users*.
4. Click *Save*.

For more advanced options, see Realms.

To import a server certificate on FortiAuthenticator:

1. Go to *Certificate Management > End Entities > Local Services* and select *Import*.
2. Depending on which file format your certificate is in, select the suitable *Type*.
3. Select *Upload a file* to locate the certificate file on your computer.
4. Click *Import*.

See End entities for more information on certificates on FortiAuthenticator.

To configure general SAML IdP settings on FortiAuthenticator for SAML:

1. Go to *Authentication > SAML IdP > General*, and select *Enable SAML Identity Provider portal*.
2. Configure the following settings:

Device FQDN	*<FortiAuthenticator FQDN>* To configure this setting, you must enter a *Device FQDN* in the *System Information* widget in the *Dashboard*.
Server address	*<FortiAuthenticator FQDN>* Enter the IP address or FQDN of the FortiAuthenticator device. This address must be accessible by the FortiClient endpoint.
Username input format	*username@realm*
Use default realm when user-provided realm is different from all configured realms	*Disabled*
Realms	*Realm*: *samlrealm*

	(Optional) *Groups* > *Filter*: *IT* Use *Groups* and *Filter* to add specific user groups. These user groups may be local users configured on the FortiAuthenticator itself or remote users populated from different remote authentication servers. See User Groups and Remote users for more information.
Legacy login sequence	*Disabled*
Default IdP certificate	*<IdP certificate>* This certificate is used by IdP to sign SAML messages before sending it to IdP. To import this certificate on FortiAuthenticator see Importing a server certificate. This certificate also needs to be imported on the SP (FortiGate) to be used in the SAML configuration. See Remote certificate on page 3610.

3. Select *Save* to apply any changes that you have made.

To configure service provider SAML settings on FortiAuthenticator for SAML:

1. Go to *SAML IdP* > *Service Providers*.
2. Click *Create New*.
3. Enter the following:

SP name	*FortiGate* Use any suitable SP name.
Server certificate	*<IdP certificate>* This certificate is used by IdP to sign SAML messages before sending it to IdP. To import this certificate on FortiAuthenticator, see Importing a server certificate. This certificate also needs to be imported on the SP (FortiGate) to be used in the SAML configuration. See Remote certificate on page 3610.
IdP Metadata	
Select an identifier to display IdP info	Click + to create a new IdP prefix. In the *IdP identifier* field, enter the prefix as *fac* and click *OK*. Fields such as *IdP entity id*, *IdP single sign-on URL*, and *IdP single logout URL* will populate automatically with this prefix information. These URLs must be accessible by FortiClient endpoints. Copy and paste this URL information in a separate notepad file as it will be used to configure IdP information on SP (FortiGate) later.
Authentication	
Authentication Method	*Password-only*
Assertion Attributes	Click + to expand it. Configure two SAML assertion attributes (*username* and *group*) as follows:
Assertion attribute	

	SAML attribute	*username*
	User attribute	*FortiAuthenticator > Username*
	Assertion attribute	
	SAML attribute	*group*
	User attribute	*FortiAuthenticator > Group*

4. Click *Save*.

To export SAML IdP server certificate and import it on FortiGate:

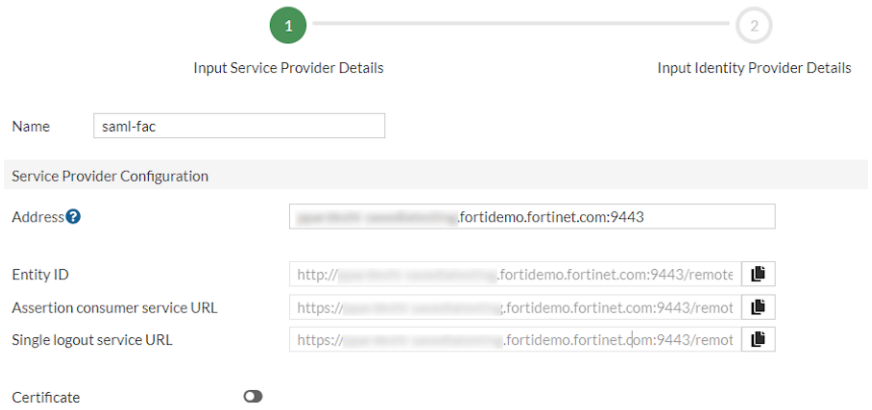
1. On FortiAuthenticator, go to *Certificate Management > End Entities > Local Services*.
2. Select the certificate, *<IdP certificate>*, by selecting the left checkbox for the certificate entry in the table and clicking *Export Certificate*.
3. Go to the file location on your local computer and click *Save*.
4. On FortiGate, go to *System > Certificates*, and from the *Create/Import* dropdown, select *Remote Certificate*.
5. Select *Upload* to locate and upload the .cer remote certificate from your computer.
6. Click *OK*.
   The new certificate is now visible in the *System > Certificates* page under *Remote Certificate*.

To configure SAML server on FortiGate:

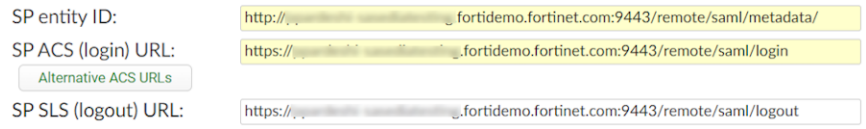
1. Go to *User & Authentication > Single Sign-On*.
2. Click *Create New*.
3. Enter the *Name* as *saml-fac*.
4. In the *Address* field, enter the FQDN/IP information in the following format:
   <ipsec-vpn-gateway-fqdn/ip-address>:<saml-ike-authentication-port>
   The *Address* field is used by FortiClient to initiate IPsec connection to FortiGate.
5. On the FortiGate, from *Service Provider Configuration*, copy the following URLs (*Entity ID*, *Assertion consumer service URL*, *Single logout service URL*). In FortiAuthenticator, enter it in *Authentication > SAML IdP > Service Providers > FortiGate*, inside the *SP Metadata* fields according to following mapping:

FortiGate settings	FortiAuthenticator settings
Entity ID	SP entity ID
Assertion consumer service URL	SP ACS (login) URL
Single logout service URL	SP SLS (logout) URL

The following demonstrates on the FortiGate:



The following demonstrates on FortiAuthenticator:

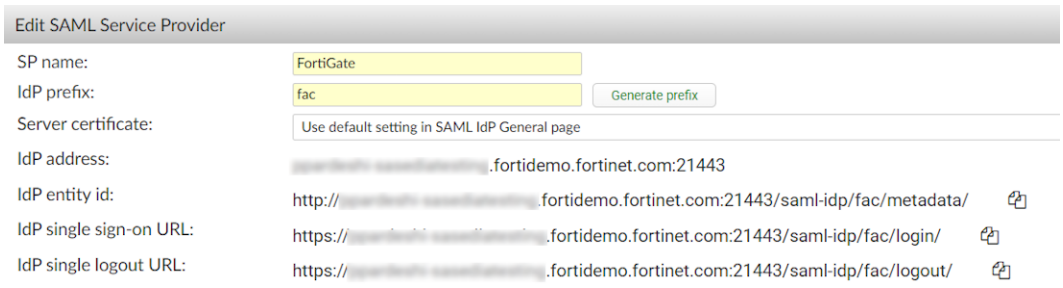


6. Click *Save* on FortiAuthenticator to save the SP URLs.
7. Return to FortiGate GUI, and click *Next*.

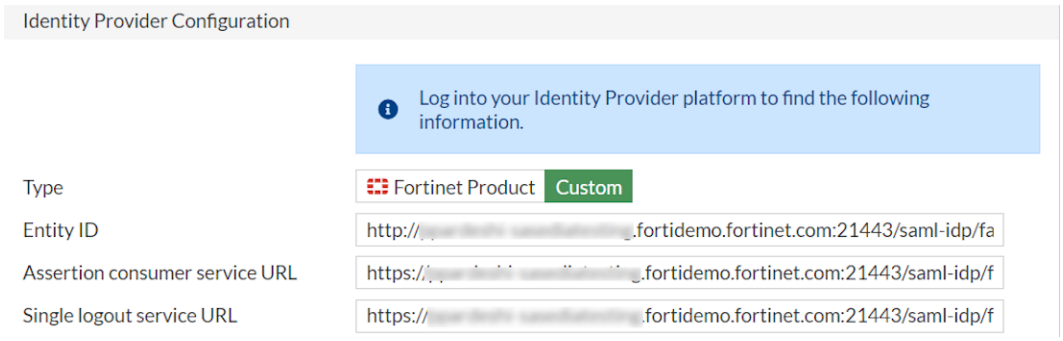
   Set the *Type* as *Custom*.The *Entity ID*, *Assertion consumer service URL*, and *Single logout service URL* fields required are available from FortiAuthenticator.
8. To copy the following URLs (*IdP entity id*, *IdP single sign-on URL*, *IdP single logout URL*) from FortiAuthenticator, go to *Authentication > SAML IdP > Service Providers > FortiGate* under *IdP Metadata*. Copy the URLs from FortiAuthenticator and paste it on FortiGate according to the following mapping:

FortiAuthenticator settings	FortiGate settings
IdP entity ID	Entity ID
IdP single sign-onURL	Assertion consumer service URL
IdP single logout URL	Single logout service URL

The following demonstrates on FortiAuthenticator:



The following demonstrates on the FortiGate:



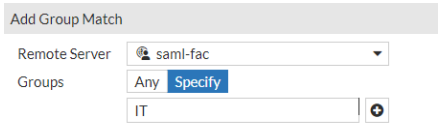
9. In the *Certificate* dropdown, select the IdP certificate that was imported on FortiGate.
10. Enter the following details in *Additional SAML Attributes*.

Attribute used to identify users	*username*
Attribute used to identify groups	*group*

11. Click *Submit* to save the changes.

To create SAML user group on FortiGate:

1. Go to *User & Authentication* > *User Groups* .
2. Click *Create New*.
3. Enter *Name* as *SAML-FAC-Group*.
4. In *Remote Groups*, click *Add*.
5. From the *Remote Server* dropdown, select *saml-fac* SAML server.
6. In the *Groups* field, click *Specify* and enter *IT*.



7. Click *OK*.
8. Click *OK*.

To associate SAML server with IPsec gateway interface:

Use FortiGate CLI to bind and associate the SAML server with the VPN gateway interface (port1) as follows:

```
config system interface
    edit "port1"
        set ike-saml-server "saml-fac"
    next
end
```

Configuring SAML on IdP and SP is now complete. The next step is to use SAML configuration inside IPsec configuration. To configure IPsec, see Configuring IPsec IKEv2 on FortiGate on page 2550.

Configuring Microsoft Entra ID as SAML IdP and FortiGate as SAML SP

This topic discusses the configurations steps required if your users are managed through Microsoft Entra ID (formerly Azure Active Directory), as a part of the overall configuration in SAML-based authentication for FortiClient remote access dialup IPsec VPN clients on page 2547. Microsoft Entra ID will be configured as Identity Provider (IdP) and FortiGate as Service Provider (SP) during SAML Authentication for IPsec connection.

To configure a user on Microsoft Entra ID:

1. Login to the Azure portal (portal.azure.com).
2. Search for *Microsoft Entra ID service* in the search bar and click on it.
3. In the left side menu, go to *Users*.
4. Select *New user > Create new user*.
5. In the *Basic* properties:
   a. In the *Display name* field, enter *testuser*.
   b. In the *User principal name* field, enter the username@companydomain.extension. For example, *testuser@<mydomain>.onmicrosoft.com*.
   c. Select *Show password* and then write down the value that's displayed in the *Password* box.
   d. Select *Review + create*.
6. Select *Create*.

To configure a Security group and add user to it on Microsoft Entra ID:

In this section, we create a security group named *IT* in Microsoft Entra ID for the *testuser*. FortiGate will use this security group to grant the user network access through the VPN.

1. In the Azure portal, navigate to *Microsoft Entra ID* service.
2. In the left side menu, go to *Groups*.
   a. Select *New Group*.
   b. In the *Group type* list, select *Security*.
   c. In the *Group name* field, enter *IT*.
   d. (Optional) In the *Group description* field, enter *Group for granting FortiGate VPN access*.
   e. For the *Microsoft Entra roles can be assigned to the group (Preview) settings*, select *No*.
   f. In the *Membership type* field, select *Assigned*.
   g. Under *Members*, select *No members selected*.
   h. In the *Users and groups* dialog field, select *testuser* from the *Users* list, and then click *Select*.
   i. Select *Create*.
3. Back in the *Groups* section in Microsoft Entra ID, find the *IT* group and note the *Object Id*. This will be needed later.

To configure Enterprise application on Azure portal:

1. Configure user and groups:
   a. In the Azure portal, search for *Enterprise applications service* in the search bar.
   b. Click on *New application* and search for *FortiGate SSL VPN*.

   The application is named for “SSL VPN” but should still work with the IPsec VPN configuration.

   c. Once the application is found, select it, change the *Name* to *FortiGate IPsec VPN*, and click *Create*. It may take a few seconds to create the application.
   d. Once the application is created, go to *Enterprise application > All applications > FortiGate IPsec VPN*.
   e. On the application's overview page, in the *Manage* section, select *Users and groups*.
   f. Select *Add user/group*, then select *Users* in the *Add Assignment* dialog.
   g. In the *Users and groups* dialog, select *testuser* in the *Users* list, and then click *Select*.
   h. (Optional) If you are expecting any role value in the SAML assertion, in the *Select Role* dialog, select the appropriate role for the user from the list. Click *Select*.
   i. In the *Add Assignment* dialog, select *Assign*.
2. Configure single sign-on:
   a. Browse to *Enterprise application > All applications > FortiGate IPsec VPN application*.
   b. In the *Manage* section, select *Single sign-on*.
   c. In the *Select a single sign-on method* page, select *SAML*.
   d. In the *Set up Single Sign-On with SAML* page, select *Edit* for *Basic SAML Configuration* to edit the settings:

      i. In *Identifier*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:<Custom SAML-IKE port>/remote/saml/metadata
      ii. In *Reply URL*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:<Custom SAML-IKE port>/remote/saml/login
      iii. In *Sign on URL*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:< Custom SAML-IKE port >/remote/saml/login
      iv. In *Logout URL*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:< Custom SAML-IKE port >/remote/saml/logout

These URLs can be retrieved and copied directly from the FortiGate. Go to To configure SAML server on FortiGate: on page 2559 to get these URLs.

e. Click *Save*.

f. The FortiGate IPsec VPN application expects SAML assertions in a specific format, which requires you to add custom attribute mappings to the configuration.

g. The claims required by FortiGate IPsec VPN are shown in the following table. Names are case-sensitive.

Name	Source attribute
username	user.userprincipalname
group	user.groups

To create these additional claims:

i. Next to *User Attributes & Claims*, select *Edit*.

ii. Select *Add new claim*.

iii. For *Name*, enter *username*.

iv. For *Source attribute*, select *user.userprincipalname*.

v. Select *Save*.

vi. Select *Add a group claim*.

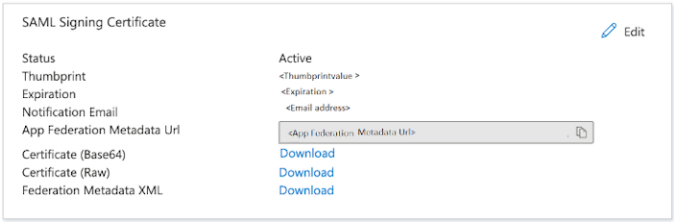
vii. Select *All groups*.

viii. Under *Advanced options*, select the *Customize the name of the group claim*.

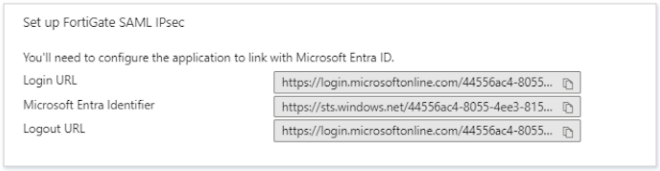
ix. For *Name*, enter *group*.

x. Select *Save*.

h. In the *Set up Single Sign-On with SAML* page, in the *SAML Signing Certificate* section, select *Download* next to *Certificate (Base64)* to download the certificate and save it on your computer. This will be needed in the step To export SAML IdP server certificate and import it on FortiGate: on page 2564



i. In the *Set up FortiGate SAML IPsec* section, copy the URLs (*Login URL*, *Microsoft Entra Identifier*, *Logout URL*) and paste it inside FortiGate's SAML server configuration, discussed in To configure SAML server on FortiGate: on page 2565.



To export SAML IdP server certificate and import it on FortiGate:

1. On FortiGate, go to *System* > *Certificates*, and from the *Create/Import* dropdown, select *Remote Certificate*.
2. Select *Upload* to locate and upload the .cer remote certificate from your computer.

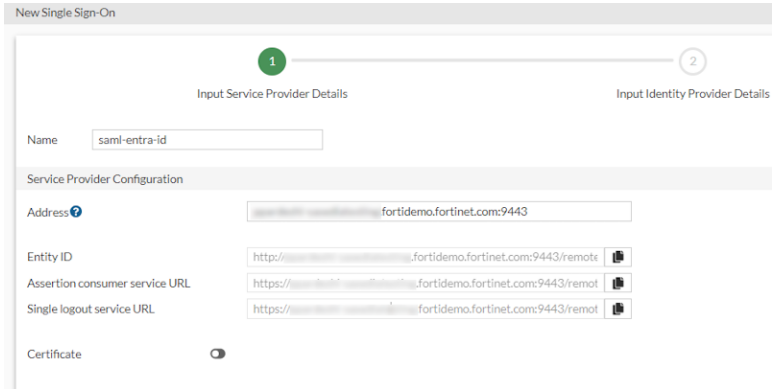
3. Click *OK*. The certificate will now be visible under *System > Certificates > Remote Certificate*.

To configure SAML server on FortiGate:

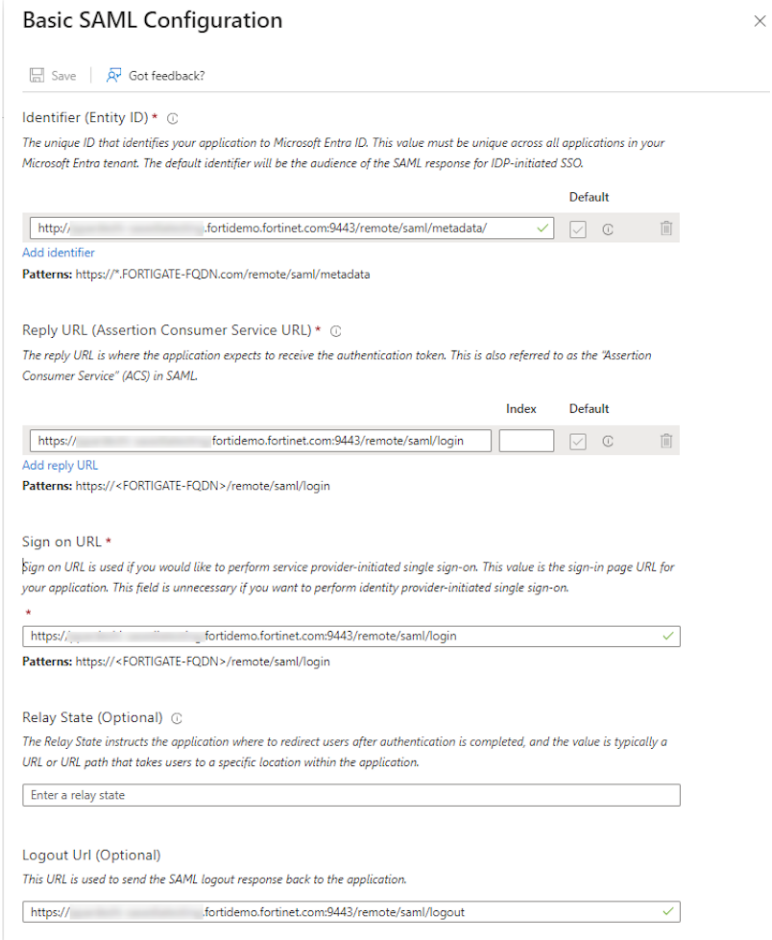
1. On the FortiGate, go to *User & Authentication > Single Sign-On > Create new*.
2. Enter the *Name* as *saml-entra-id*.
3. In the *Address* field, enter the FQDN/IP information in the following format:
   <ipsec-vpn-gateway-fqdn/ip-address>:<saml-ike-authentication-port>
   The *Address* field is used by FortiClient to initiate IPsec connection to FortiGate.
4. In *Service Provider Configuration*, copy the following URLs (*Entity ID*, *Assertion consumer service URL*, *Single logout service URL*) and use it in *Azure in Enterprise application > All applications > FortiGate IPsec VPN > Single sign-on page > Basic SAML Configuration*. Use the following mapping to copy the required values:

FortiGate settings	Microsoft Entra ID settings
Entity ID	Identifier (Entity ID)
Assertion consumer service URL	Reply URL (Assertion Consumer Service URL)
Assertion consumer service URL	Sign on URL
Single logout service URL	Logout URL (Optional)

The following demonstrates on the FortiGate:



The following demonstrates on Microsoft Entra ID:



5. On the FortiGate GUI, click *Next*.
6. In *Identity Provider Details*, set the *Type* as *Custom*.
7. Paste the URLs copied from last step of section To configure Enterprise application on Azure portal: on page 2563 according to the following mapping:

Microsoft Entra IDsettings	FortiGate settings
Login URL	Assertion consumer service URL
Microsoft Entra Identifier	Entity ID
Logout URL	Single logout service URL

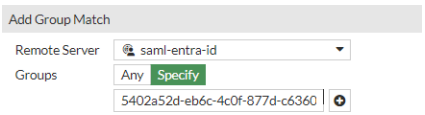
8. Select the *Certificate* from the dropdown. This certificate was imported into FortiGate in section To export SAML IdP server certificate and import it on FortiGate: on page 2564.
9. In the *Additional SAML Attributes* section, enter the following attributes:

Attribute used to identify users	*username*
Attribute used to identify groups	*group*

10. Click *Submit* to save the changes.

To configure SAML user group on FortiGate:

1. Go to *User & Authentication* > *User Groups* > *Create New*.
2. Enter *Name* as *SAML-ENTRA-ID-Group*.
3. In *Remote Groups*, click *Add*.
4. From the *Remote Server* dropdown, select *saml-entra-id SAML server*.
5. In *Groups*, click *Specify* and paste the Object ID copied in the section To configure a Security group and add user to it on Microsoft Entra ID: on page 2562.



6. Click *OK*.
7. Click *OK*.

To associate SAML server with IPsec gateway interface:

Use the FortiGate CLI to bind and associate the SAML server with the VPN gateway interface (port1) as follows:

```
config system interface
    edit "port1"
        set ike-saml-server "saml-entra-id"
    next
end
```

Configuring SAML on IdP and SP is now complete. The next step is to use SAML configuration inside IPsec configuration. To configure IPsec, see Configuring IPsec IKEv2 on FortiGate on page 2550.

Enhancing IPsec security using EMS SN verification

This feature ensures that only licensed FortiClient endpoints can establish an IPsec VPN connection with FortiGate. The FortiGate performs EMS SN verification, and for this feature to work, both the FortiGate and FortiClient endpoints must be connected to the same FortiClient EMS.

To enable the EMS SN verification in the CLI:

```
config vpn ipsec phase1-interface
    edit <name>
        set ems-sn-check {enable | disable}
    next
end
```

Command	Description
`set ems-sn-check`	Enable or disable EMS serial number verification.

IPsec split DNS

This functionality empowers clients to determine whether DNS traffic should utilize the tunnel's DNS or the local DNS server for query resolution. This is achieved by letting users specify a list of FQDNs. Only FQDNs that match the specified list are directed to the tunnel for resolution, while all other queries are handled by the local DNS server.

The `internal-domain-list` option is available on IKEv2 phase1 dialup gateways if `mode-cfg` is enabled.

To enable IPsec Split DNS in the CLI:

```
config vpn ipsec phase1-interface
    edit <name>
        set type dynamic
        set ike-version 2
        set mode-cfg enable
        set dns-mode {manual | auto}
        set internal-domain-list <domain name>
    next
end
```

Command	Description
`set internal-domain-list`	One or more internal domain names in quotes separated by spaces.

Two scenarios need attention:

1. When there is no split tunnel, or the split tunnel is set to address *all*, the user must manually select the *Enable Local LAN* checkbox in the FortiClient by navigating to *Advanced Settings* > *Phase 1*. If not, only the FQDN matching the `internal-domain-list` will be resolved, discarding other DNS queries. However, once this setting is enabled on FortiClient, any non-matching DNS query will be resolved through the local DNS server.
2. If the `dns-mode` is set to `manual`, but the *ipv4-dns-server1* is not configured, the VPN tunnel's DNS will default to 0.0.0.0 and all DNS queries will be routed through the local DNS server.

Dialup IPsec VPN using custom TCP port

Dialup IPsec VPN traditionally relies on UDP but can now operate over TCP. This enhancement enables VPN traffic from FortiClient to traverse restrictive firewalls that only permit TCP-based traffic. You can configure an IPsec VPN tunnel to exclusively use UDP or TCP, or you can configure the tunnel automatically switch to TCP mode when the firewall blocks UDP.

In high-latency or congested networks, UDP-based VPN connections may suffer from packet loss or performance degradation. TCP, with its built-in error correction and retransmission mechanisms, enhances the reliability and stability of VPN connections in such environments.

Dialup IPsec over TCP is particularly advantageous in mobile or dynamic settings such as public WiFi, hotel networks, or cellular data where network conditions and restrictions often vary. This feature ensures more seamless and dependable VPN connectivity across a broader range of scenarios.

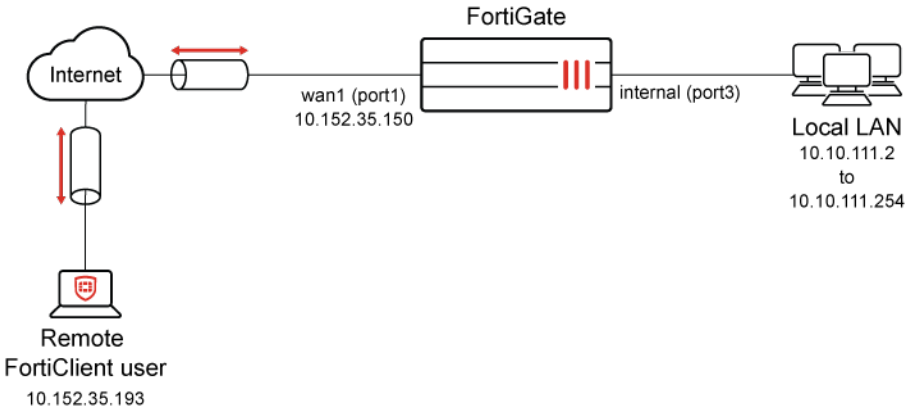
The custom TCP port functionality for IPsec is exclusively supported with IKE version 2 (IKEv2), and does not support NPU offloading.

Example

In this example, FortiGate is configured as a dialup IPsec server using IKE version 2 (IKEv2) and operating on a custom TCP port (5500). IKEv2 is configured to use EAP for user authentication. The initial setup leverages the VPN wizard to create the dialup IPsec tunnel. After the tunnel is created by the wizard, you use the CLI to customize the IKE settings and enable the use of TCP port 5500.

On the client side, FortiClient is managed by FortiClient EMS and configured to act as the dialup IPsec client. The client is configured to connect to the FortiGate server over the custom TCP port 5500. This feature requires FortiClient 7.4.1 or later.

For a detailed description of the steps to configure FortiClient EMS to use the custom TCP port 5500 for IPsec VPN connections, see IPsec VPN over TCP.



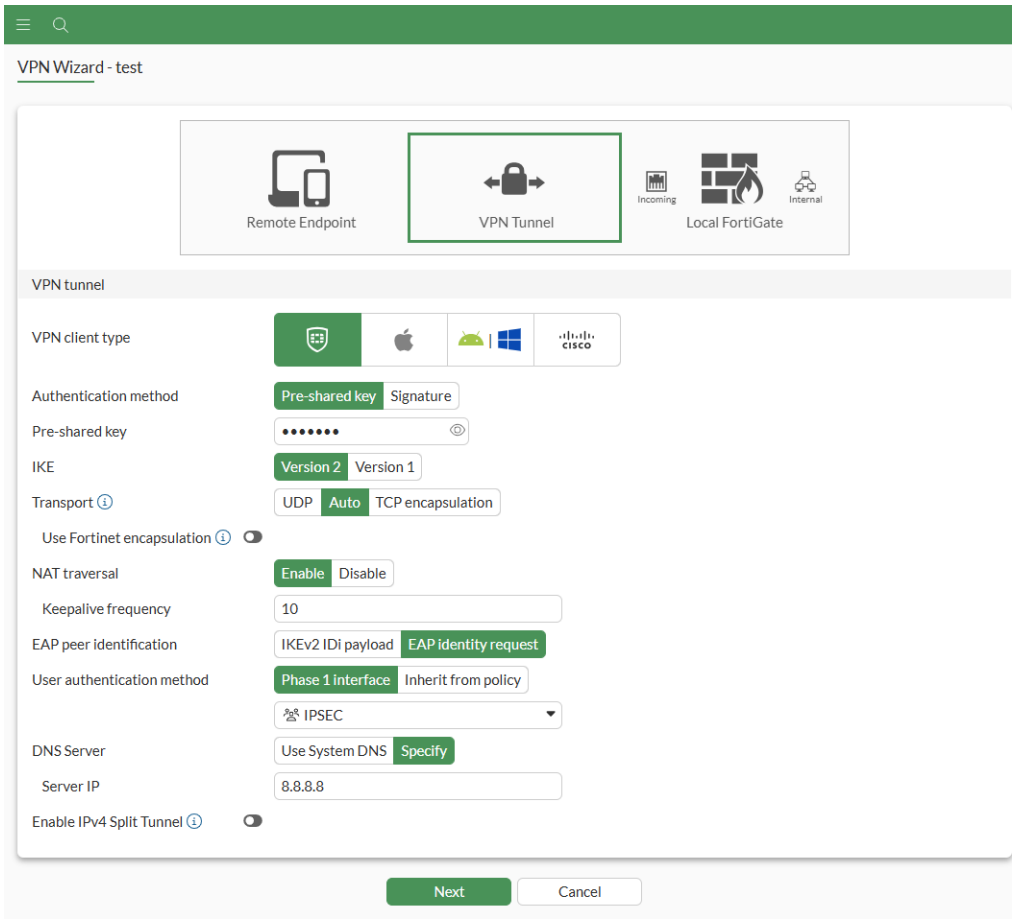
To configure FortiGate as IPsec dialup server using VPN Wizard:

1. Go to *VPN* > *VPN Wizard*, and enter the following:

Field	Value
Tunnel name	v2_psk-120
Select a template	Remote Access

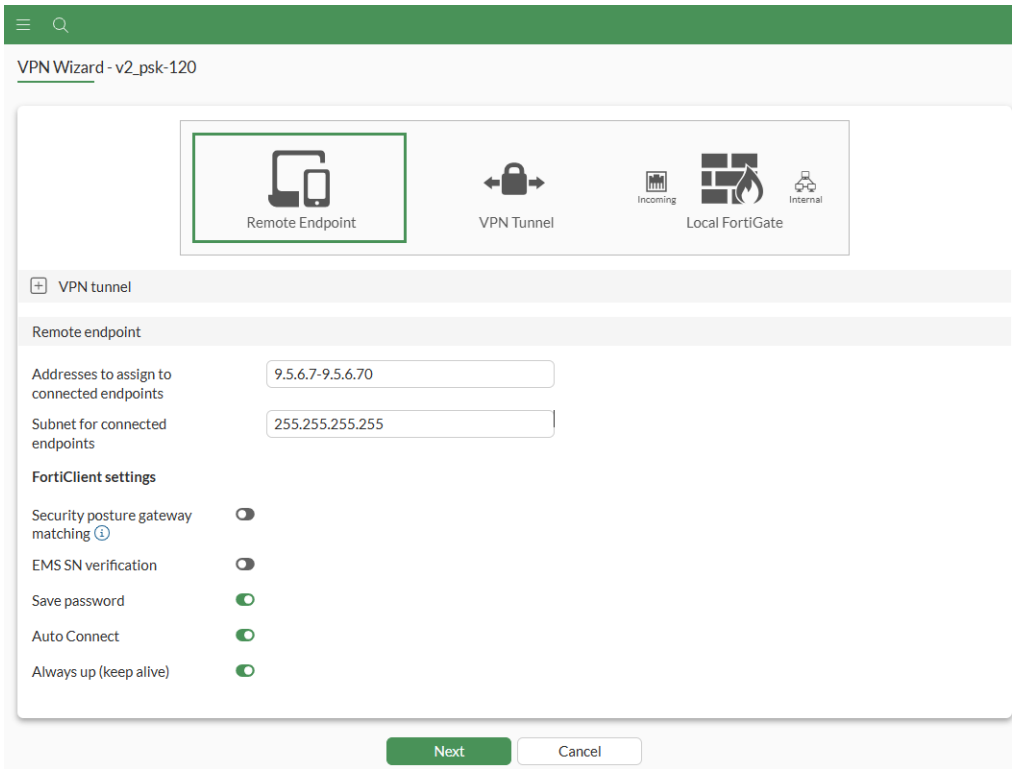
2. Click *Begin*.
3. Under *VPN Tunnel* section, enter the following:

Field	Value
VPN client type	FortiClient
Authentication method	Pre-shared key
Pre-shared key	Enter suitable key
IKE	Version 2
Transport	Auto
Use Fortinet encapsulation	Disable
NAT traversal	Enable
Keepalive frequency	10
EAP peer identification	EAP identity request
User authentication method	Phase 1 interface Use dropdown to select user group *IPSEC*. To configure user groups for authentication, see User groups on page 2993. (Optional) To use multiple user groups, select *Inherit from policy*.
DNS Server	Specify
Server IP	8.8.8.8
Enable IPv4 Split Tunnel	Disable



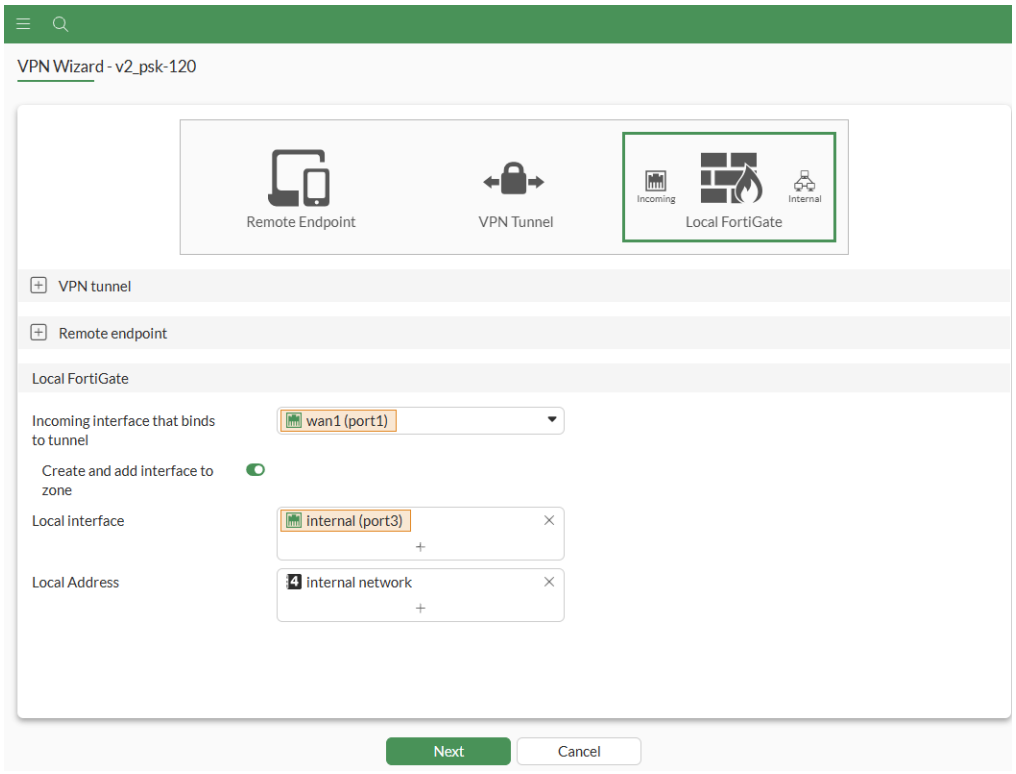
4. Click *Next*.
5. Under *Remote Endpoint* section, enter the following:

Field	Value
Address to assign to connected endpoints	9.5.6.7-9.5.6.70
Subnet for connected endpoints	255.255.255.255
FortiClient settings	
Security posture gateway matching	Disable
EMS SN verification	Disable
Save password	Enable
Auto Connect	Enable
Always up (keep alive)	Enable

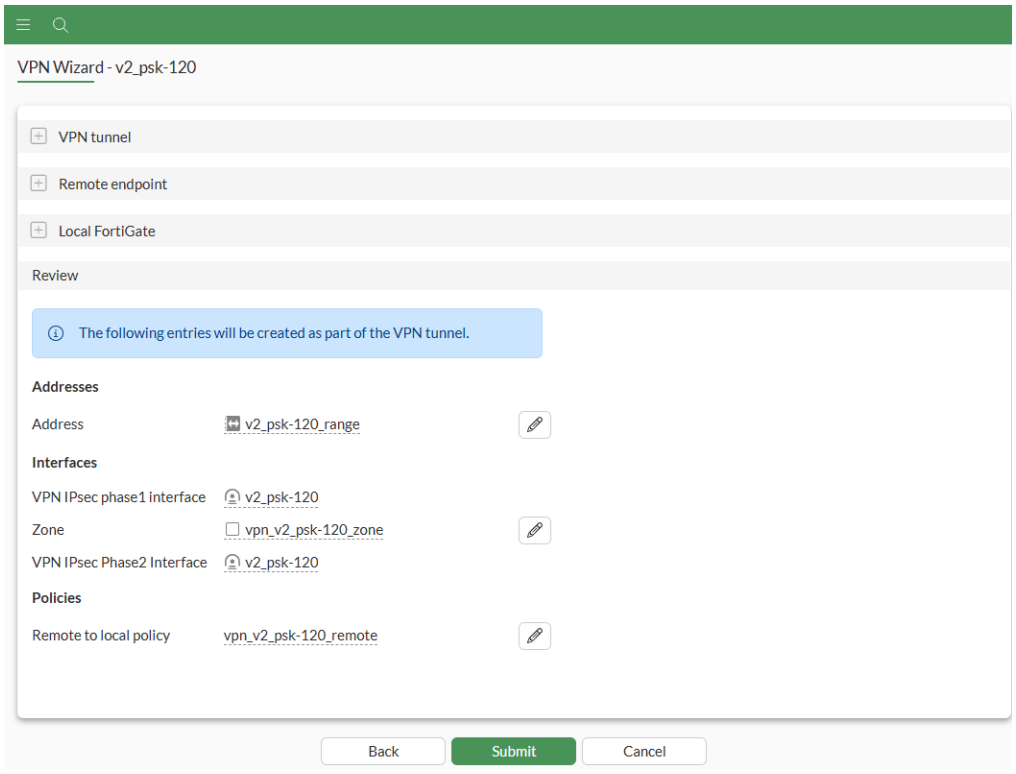


6. Click *Next*.
7. Under *Local FortiGate* section, enter the following:

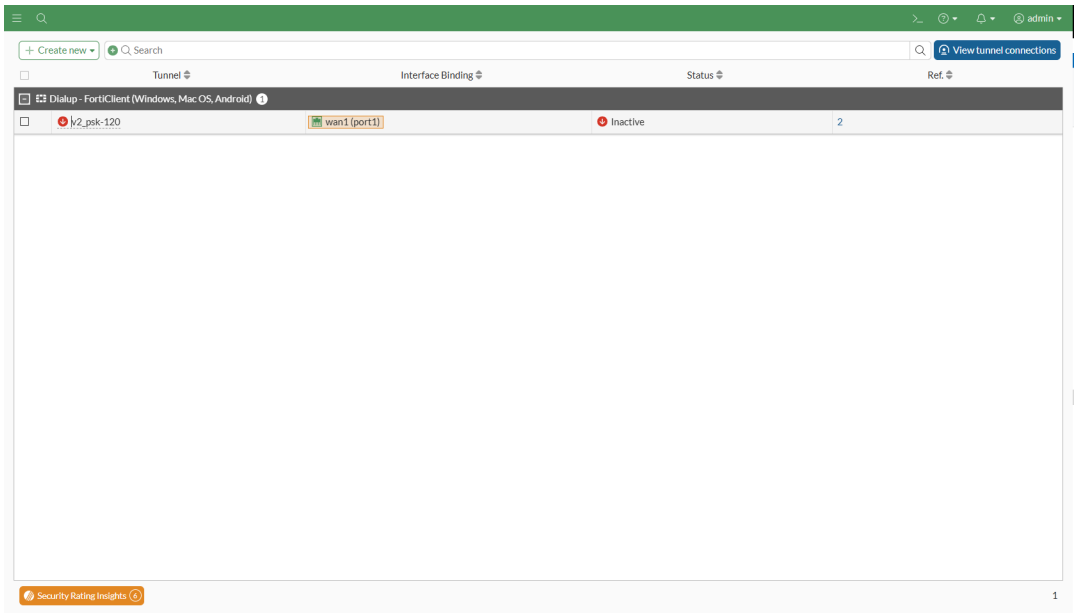
Field	Value
Incoming interface that binds to tunnel	wan1(port1)
Create and add interface to Zone	Enable
Local interface	internal (port3)
Local Address	internal network



8. Click *Next*.
9. Under *Review* section, review the configuration pending configuration by the wizard.

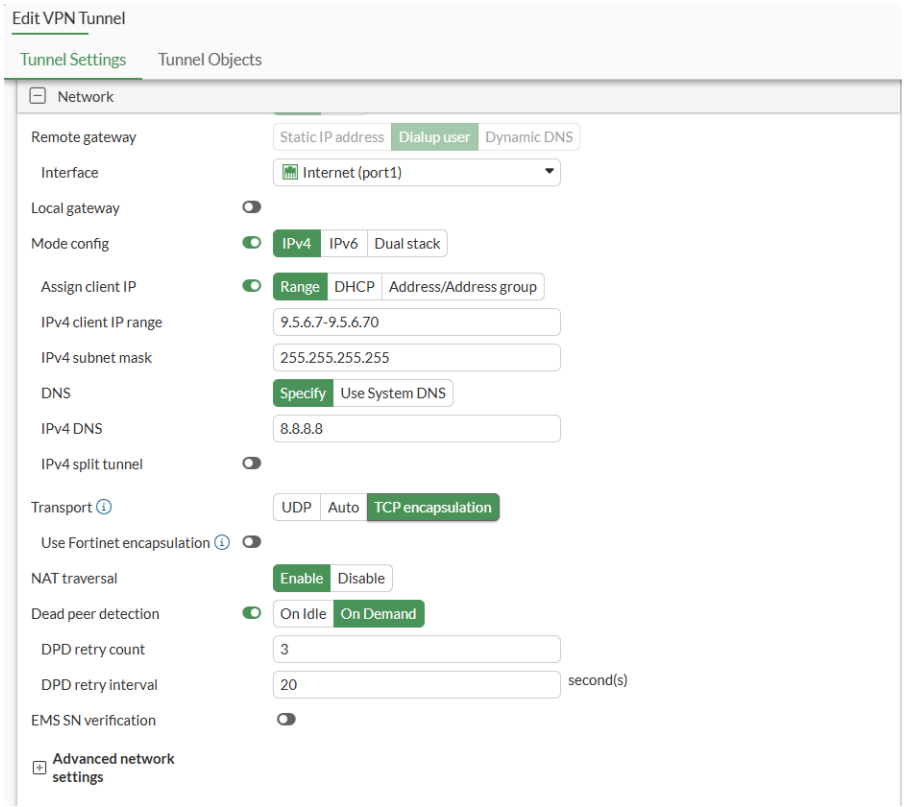


10. Click *Submit*.
    The tunnel is configured and visible under *VPN* > *VPN Tunnels*.



To configure the IPsec tunnel's method as TCP:

1. On FortiGate, go to *VPN > VPN Tunnels*, select the tunnel *v2_psk-120*, and click *Edit*.
2. In *Tunnel Settings* slide-in, under *Network* section, set *Transport* to *TCP encapsulation*.



3. Click *OK*.

To view and modify TCP port used by IKEv2 using CLI:

1. On the top-right corner of the FortiGate GUI, click the _> icon to open a CLI console.
   For other methods to connect to CLI, see Connecting to the CLI on page 59.
2. Enter the following command to see the default TCP IKE port used by FortiGate:

```
show full-configuration system settings | grep ike-tcp
    set ike-tcp-port 4500
```

3. Notice the setting `ike-tcp-port` set to `4500` by default.
4. Use the following commands to modify the default TCP port to use a custom port 5500:

```
config system settings
    set ike-tcp-port 5500
end
```

ike-tcp-port <port>	Set the TCP port for IKE/IPsec traffic (1 - 65535, default = 4500).

When using TCP port 443 for IKE/IPsec traffic, GUI access can be affected for interfaces that are bound to an IPsec tunnel when the GUI admin port is also using port 443. To ensure continued functionality, change either the IKE/IPsec port or the administrative access port.

To change the administrative access port:

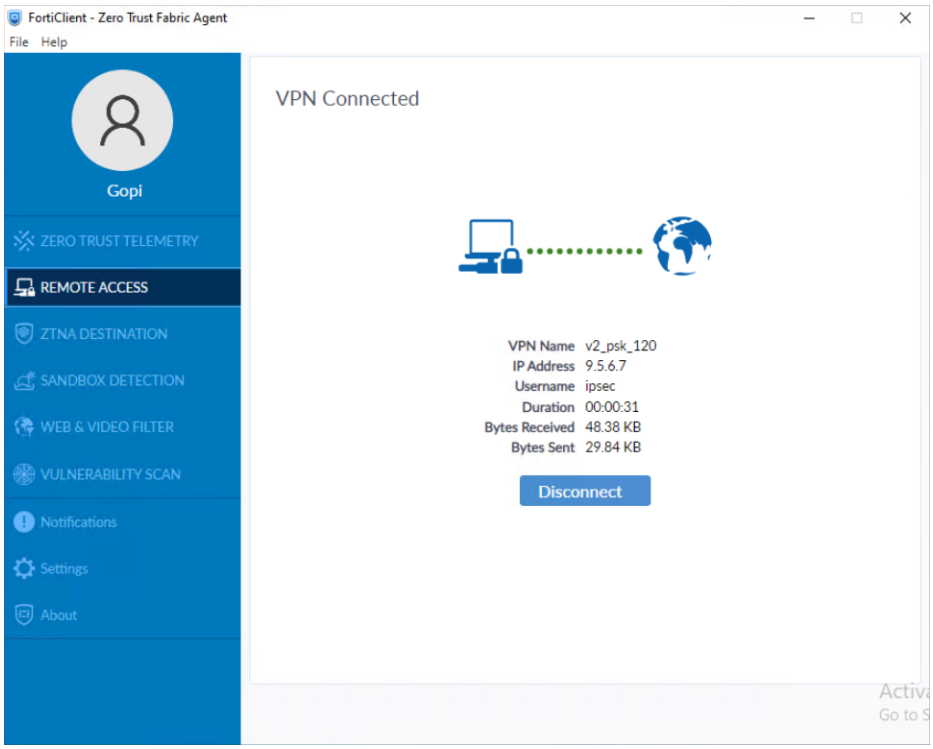
```
config system global
    set admin-sport <port>
end
```

admin-sport <port>	Set the administrative access port for HTTPS (1 - 65535, default = 443).

For port conflicts with ZTNA and SSL VPN, ZTNA and SSL VPN will take precedence. To avoid any port conflicts with other services, review the FortiOS Ports guide for other incoming ports used on the FortiGate.

To verify the VPN connection:

1. Using FortiClient, connect to the IPsec VPN gateway.



2. On FortiGate, run `diagnose vpn ike gateway list` to verify the IPsec VPN tunnel status. Note that `addr` shows the custom TCP port value, and `transport` shows `TCP`:

```
vd: root/0
name: v2_psk-120_0
version: 2
interface: port1 3
addr: 10.152.35.150:5500 -> 10.152.35.193:54854

```

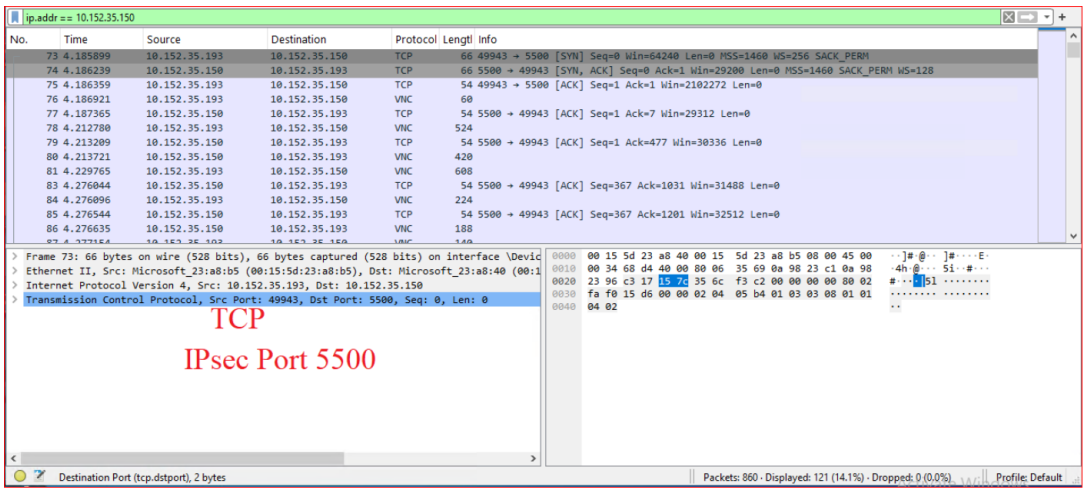
3. Run a packet capture using the packet capture tool on FortiGate GUI under *Network* > *Diagnostic* tab for wan1(port1) interface with TCP port number 5500.



For more information, see Using the packet capture tool on page 884.

4. (Optional) Run the packet capture using the following command:

```
diagnose sniffer packet wan1 “port 5500” 4 0 l.
```

For more information, see Performing a sniffer trace or packet capture on page 4325.

IPsec DNS suffix

The DNS suffix enables DNS resolution of network resources using their hostnames, without requiring clients to specify their fully qualified domain names (FQDN). This feature is particularly useful in environments where users access internal resources over VPN connections. By appending a DNS suffix to unqualified domain names (such as hostnames), it enables end systems to generate FQDNs required for DNS resolution.

When a DNS suffix is configured for an IPsec tunnel, the configuration is pushed to FortiClient during VPN negotiations and is added to the DNS suffix list for the VPN adapter on the endpoint machine. This setting

ensures accurate name resolution for unqualified domain names by appending the specified DNS suffix, which is essential for proper DNS resolution.

Currently, DNS suffix configuration is supported only for IKE version 1 and only one DNS suffix is configurable per IPsec tunnel.

If we assume that a DNS suffix named example.com is set for an IPsec tunnel, when a VPN client performs DNS query for server1 using only its hostname server1, the end system appends the DNS suffix it to make the FQDN server1.example.com. A DNS query is sent using this FQDN to the DNS servers configured for VPN clients.

Split Tunneling:

If split tunneling is enabled on the IPsec tunnel, ensure that the address object used for split tunneling includes the IP address of the DNS server used by VPN clients. This ensures that DNS traffic flows correctly through the VPN adapter. Without this configuration, the DNS suffix is not applied, as DNS queries will bypass the VPN adapter.

Unqualified domains:

The DNS suffix is only appended if VPN clients make DNS queries for unqualified domain names. The DNS suffix is not appended for DNS queries made for FQDNs (such as server1.example.com) or partially qualified domain names (such as server1.example).

The configuration of a DNS suffix on an IPsec tunnel requires enabling unity-support in the phase 1 configuration of the IPsec tunnel:

```
config vpn ipsec phase1-interface
    edit <name>
        set unity-support enable
        set domain <string>
    next
end
```

Command	Description
`unity-support enable`	Enables unity support to allow pushing DNS suffixes to VPN clients.
`domain <string>`	Specify the DNS suffix that is required to be pushed to VPN clients.

Aggregate and redundant VPN

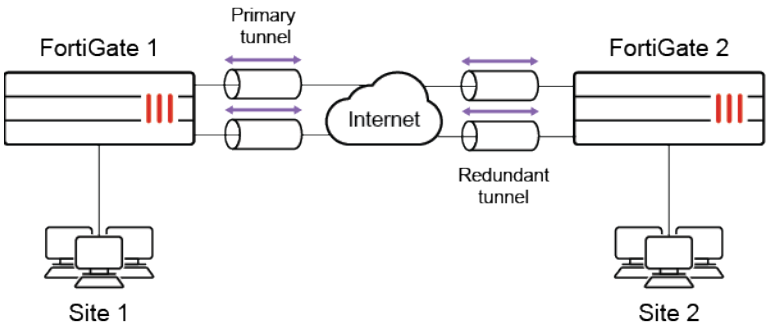
The following topics provide instructions on configuring aggregate and redundant VPNs:

- Manual redundant VPN configuration on page 2579
- OSPF with IPsec VPN for network redundancy on page 2582
- IPsec VPN in an HA environment on page 2589
- Packet distribution and redundancy for aggregate IPsec tunnels on page 2595
- Packet distribution for aggregate dial-up IPsec tunnels using location ID on page 2606
- Packet distribution for aggregate static IPsec tunnels in SD-WAN on page 2611
- Packet distribution for aggregate IPsec tunnels using weighted round robin on page 2616
- Redundant hub and spoke VPN on page 2618

Manual redundant VPN configuration

A FortiGate with two interfaces connected to the internet can be configured to support redundant VPNs to the same remote peer. Four distinct paths are possible for VPN traffic from end to end. If the primary connection fails, the FortiGate can establish a VPN using the other connection.

Topology



The redundant configuration in this example uses route-based VPNs. The FortiGates must operate in NAT mode and use auto-keying.

This example assumes the redundant VPNs are essentially equal in cost and capability. When the original VPN returns to service, traffic continues to use the replacement VPN until the replacement VPN fails. If the redundant VPN uses more expensive facilities, only use it as a backup while the main VPN is down.

A redundant configuration for each VPN peer includes:

- One phase 1 configuration for each path between the two peers with dead peer detection enabled
- One phase 2 definition for each phase 1 configuration
- One static route for each IPsec interface with different distance values to prioritize the routes
- Two firewall policies per IPsec interface, one for each direction of traffic

To configure the phase 1 and phase 2 VPN settings:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. Enter the tunnel name and click *Next*.

3. Enter the following phase 1 settings for path 1:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the primary interface of the remote peer.
Interface	Select the primary public interface of this peer.
Dead Peer Detection	On-Demand

4. Configure the remaining phase 1 and phase 2 settings as needed.
5. Click *OK*.
6. Repeat these steps for the remaining paths.
   a. Path 2:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the secondary interface of the remote peer.
Interface	Select the primary public interface of this peer.
Dead Peer Detection	On-Demand

   b. Path 3:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the primary interface of the remote peer.
Interface	Select the secondary public interface of this peer.
Dead Peer Detection	On-Demand

   c. Path 4:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the secondary interface of the remote peer.
Interface	Select the secondary public interface of this peer.
Dead Peer Detection	On-Demand

To configure the static routes:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. In the *Destination* field, enter the subnet of the private network.
3. For *Interface*, select one of the IPsec interfaces on the local peer.
4. Enter a value for *Administrative Distance*.
5. Click *OK*.
6. Repeat these steps for the three remaining paths, and enter different values for *Administrative Distance* to prioritize the paths.

To configure the firewall policies:

1. Create the policies for the local primary interface:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Enter the following:

Name	Enter a name for the policy.
Incoming Interface	Select the local interface to the internal (private) network.
Outgoing Interface	Select one of the virtual IPsec interfaces.
Source	All
Destination	All
Schedule	Always
Service	All
Action	ACCEPT

   c. Click *OK*.
   d. Click *Create New* and configure the policy for the other direction of traffic:

Name	Enter a name for the policy.
Incoming Interface	Select one of the virtual IPsec interfaces.
Outgoing Interface	Select the local interface to the internal (private) network.
Source	All
Destination	All
Schedule	Always
Service	All
Action	ACCEPT

   e. In the policy list, drag the VPN policies above any other policies with similar source and destination addresses.
2. Repeat these steps to create the policies for the three remaining paths.

Creating a backup IPsec interface

A route-based VPN can be configured to act as a backup IPsec interface when the main VPN is out of service. This can only be configured in the CLI.

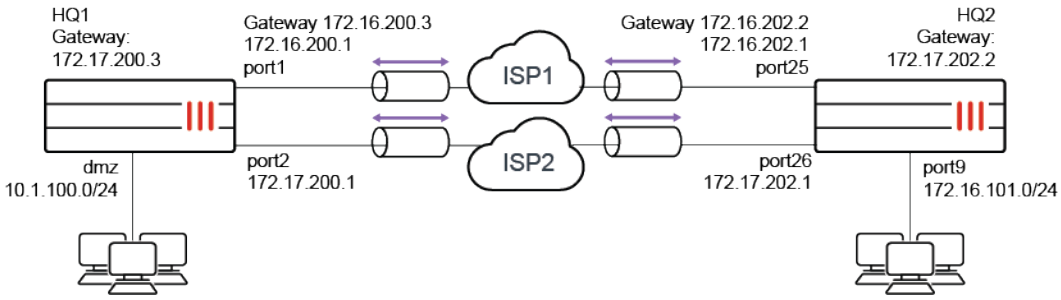
The backup feature works on interfaces with static addresses that have dead peer detection enabled. The `monitor` option creates a backup VPN for the specified phase 1 configuration.

To create a backup IPsec interface:

```
config vpn ipsec phase1-interface
    edit main_vpn
        set dpd on-demand
        set interface port1
        set nattraversal enable
        set psksecret ********
        set remote-gw 192.168.10.8
        set type static
    next
    edit backup_vpn
        set dpd on-demand
        set interface port2
        set monitor main_vpn
        set nattraversal enable
        set psksecret ********
        set remote-gw 192.168.10.8
        set type static
    next
end
```

OSPF with IPsec VPN for network redundancy

This is a sample configuration of using OSPF with IPsec VPN to set up network redundancy. Route selection is based on OSPF cost calculation. You can configure ECMP or primary/secondary routes by adjusting OSPF path cost.



Because the GUI can only complete part of the configuration, we recommend using the CLI.

To configure OSPF with IPsec VPN to achieve network redundancy using the CLI:

1. Configure the WAN interface and static route.
   Each FortiGate has two WAN interfaces connected to different ISPs. The ISP1 link is for the primary FortiGate and the IPS2 link is for the secondary FortiGate.
   a. Configure HQ1.
   ```
   config system interface
      edit "port1"
         set alias to_ISP1
         set ip 172.16.200.1 255.255.255.0
   ```

```
      next
      edit "port2"
         set alias to_ISP2
         set ip 172.17.200.1 255.255.255.0
      next
   end
   config router static
      edit 1
         set gateway 172.16.200.3
         set device "port1"
      next
      edit 2
         set gateway 172.17.200.3
         set device "port2"
         set priority 100
      next
   end
```

b. Configure HQ2.

```
config system interface
   edit "port25"
      set alias to_ISP1
      set ip 172.16.202.1 255.255.255.0
   next
   edit "port26"
      set alias to_ISP2
      set ip 172.17.202.1 255.255.255.0
   next
end
config router static
   edit 1
      set gateway 172.16.202.2
      set device "port25"
   next
   edit 2
      set gateway 172.17.202.2
      set device "port26"
      set priority 100
   next
end
```

2. Configure the internal (protected subnet) interface.

a. Configure HQ1.

```
config system interface
   edit "dmz"
      set ip 10.1.100.1 255.255.255.0
   next
end
```

b. Configure HQ2.

```
config system interface
   edit "port9"
      set ip 172.16.101.1 255.255.255.0
   next
end
```

3. Configure IPsec phase1-interface and phase-2 interface. On each FortiGate, configure two IPsec tunnels: a primary and a secondary.

a. Configure HQ1.

```
config vpn ipsec phase1-interface
   edit "pri_HQ2"
      set interface "port1"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set psksecret sample1
   next
   edit "sec_HQ2"
      set interface "port2"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.17.202.1
      set psksecret sample2
   next
   end
config vpn ipsec phase2-interface
   edit "pri_HQ2"
      set phase1name "pri_HQ2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
      set auto-negotiate enable
   next
   edit "sec_HQ2"
      set phase1name "sec_HQ2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
      set auto-negotiate enable
   next
end
```

b. Configure HQ2.

```
config vpn ipsec phase1-interface
   edit "pri_HQ1"
      set interface "port25"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.200.1
      set psksecret sample1
   next
   edit "sec_HQ1"
      set interface "port26"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.17.200.1
      set psksecret sample2
   next
end
config vpn ipsec phase2-interface
   edit "pri_HQ1"
      set phase1name "pri_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
```

```
      set auto-negotiate enable
    next
    edit "sec_HQ1"
      set phase1name "sec_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
          chacha20poly1305
      set auto-negotiate enable
    next
  end
```

4. Configure an inbound and outbound firewall policy for each IPsec tunnel.
   a. Configure HQ1.

```
config firewall policy
  edit 1
    set name "pri_inbound"
    set srcintf "pri_HQ2"
    set dstintf "dmz"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "pri_outbound"
    set srcintf "dmz"
    set dstintf "pri_HQ2"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 3
    set name "sec_inbound"
    set srcintf "sec_HQ2"
    set dstintf "dmz"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 4
    set name "sec_outbound"
    set srcintf "dmz"
    set dstintf "sec_HQ2"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end
```

   b. Configure HQ2.

```
config firewall policy
  edit 1
```

```
            set name "pri_inbound"
            set srcintf "pri_HQ1"
            set dstintf "port9"
            set srcaddr "10.1.100.0"
            set dstaddr "172.16.101.0"
            set action accept
            set schedule "always"
            set service "ALL"
        next
        edit 2
            set name "pri_outbound"
            set srcintf "port9"
            set dstintf "pri_HQ1"
            set srcaddr "10.1.100.0"
            set dstaddr "172.16.101.0"
            set action accept
            set schedule "always"
            set service "ALL"
        next
        edit 3
            set name "sec_inbound"
            set srcintf "sec_HQ1"
            set dstintf "port9"
            set srcaddr "10.1.100.0"
            set dstaddr "172.16.101.0"
            set action accept
            set schedule "always"
            set service "ALL"
        next
        edit 4
            set name "sec_outbound"
            set srcintf "port9"
            set dstintf "sec_HQ1"
            set srcaddr "172.16.101.0"
            set dstaddr "10.1.100.0"
            set action accept
            set schedule "always"
            set service "ALL"
        next
    end
```

5. Assign an IP address to the IPsec tunnel interface.
   a. Configure HQ1.

```
config system interface
    edit "pri_HQ2"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.2 255.255.255.255
    next
    edit "sec_HQ2"
        set ip 10.10.11.1 255.255.255.255
        set remote-ip 10.10.11.2 255.255.255.255
    next
end
```

   b. Configure HQ2.

```
config system interface
    edit "pri_HQ1"
        set ip 10.10.10.2 255.255.255.255
```

```
            set remote-ip 10.10.10.1 255.255.255.255
        next
        edit "sec_HQ1"
            set ip 10.10.11.2 255.255.255.255
            set remote-ip 10.10.11.1 255.255.255.255
        next
    end
```

6. Configure OSPF.
   a. Configure HQ1.

```
config router ospf
    set router-id 1.1.1.1
    config area
        edit 0.0.0.0
        next
    end
    config ospf-interface
        edit "pri_HQ2"
            set interface "pri_HQ2"
            set cost 10
            set network-type point-to-point
        next
        edit "sec_HQ2"
            set interface "sec_HQ2"
            set cost 20
            set network-type point-to-point
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.10.11.0 255.255.255.0
        next
        edit 3
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

   b. Configure HQ2.

```
config router ospf
    set router-id 2.2.2.2
    config area
        edit 0.0.0.0
        next
    end
    config ospf-interface
        edit "pri_HQ1"
            set interface "pri_HQ1"
            set cost 10
            set network-type point-to-point
        next
        edit "sec_HQ1"
            set interface "sec_HQ1"
            set cost 20
            set network-type point-to-point
```

```
            next
        end
        config network
            edit 1
                set prefix 10.10.10.0 255.255.255.0
            next
            edit 2
                set prefix 10.10.11.0 255.255.255.0
            next
            edit 3
                set prefix 172.16.101.0 255.255.255.0
            next
        end
    end
```

To check VPN and OSPF states using diagnose and get commands:

1. Run the `HQ1 # diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: pri_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500

   dec:pkts/bytes=1/68, enc:pkts/bytes=1/136
```

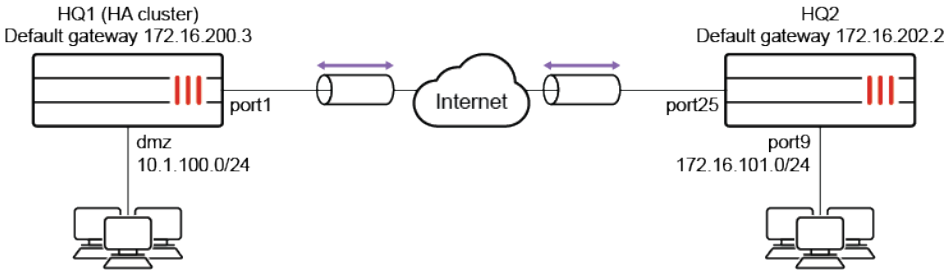
3. Run the `HQ1 # get router info ospf neighbor` command. The system should return the following:
   ```
   OSPF process 0, VRF 0:
   Neighbor ID Pri State Dead Time Address Interface
   2.2.2.2 1. Full/ - 00:00:37 10.10.10.2 pri_HQ2
   2.2.2.2 1. Full/ - 00:00:32 10.10.11.2 sec_HQ2
   ```
4. Run the `HQ1 # get router info routing-table ospf` command. The system should return the following:
   ```
   Routing table for VRF=0
   O 172.16.101.0/24 [110/20] via 10.10.10.2, pri_HQ2 , 00:03:21
   ```
   In case the primary tunnel is down after route convergence.
5. Run the `HQ1 # get router info routing-table ospf` command. The system should return the following:
   ```
   Routing table for VRF=0
   O 172.16.101.0/24 [110/110] via 10.10.11.2, sec_HQ2 , 00:00:01
   ```

IPsec VPN in an HA environment

This is a sample configuration of site-to-site IPsec VPN in an HA environment.

For this example, set up HA as described in the HA topics. When setting up HA, enable the following options to ensure IPsec VPN traffic is not interrupted during an HA failover:

- `session-pickup` under HA settings.
- `ha-sync-esp-seqno` under IPsec phase1-interface settings.



You can configure IPsec VPN in an HA environment using the GUI or CLI.

In this example, the VPN name for HQ1 is "to_HQ2", and the VPN name for HQ2 is "to_HQ1".

To configure IPsec VPN in an HA environment in the GUI:

1. Set up IPsec VPN on HQ1 (the HA cluster):
   a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, set *No NAT between sites*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Remote Device*, select *IP Address*.
      ii. In the *IP address* field, enter *172.16.202.1*.
      iii. For *Outgoing Interface*, select port1.
      iv. For *Authentication Method*, select *Pre-shared Key*.
      v. In the *Pre-shared Key* field, enter an example key.
      vi. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select the local interface.
      ii. Configure the *Local Subnets* as *10.1.100.0/24*.
      iii. Configure the *Remote Subnets* as *172.16.101.0/24*.
      iv. Click *Create*.
2. Set up IPsec VPN on HQ2:
   a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, set *No NAT between sites*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Remote Device*, select *IP Address*.
      ii. In the *IP address* field, enter 172.16.200.1.
      iii. For *Outgoing Interface*, select port13.
      iv. For *Authentication Method*, select *Pre-shared Key*.
      v. In the *Pre-shared Key* field, enter an example key.
      vi. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select the desired local interface. In this example, it is port9.
      ii. Configure the *Local Subnets* as 172.16.101.0.
      iii. Configure the *Remote Subnets* as 10.1.100.0
      iv. Click *Create*.

To configure IPsec VPN in an HA environment using the CLI:

1. Configure HA. In this example, two FortiGates work in active-passive mode. The HA heartbeat interfaces are WAN1 and WAN2:
```
config system ha
   set group-name "FGT-HA"
   set mode a-p
   set password sample
   set hbdev "wan1" 50 "wan2" 50
   set session-pickup enable
   set priority 200
   set override-wait-time 10
end
```
2. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.
   a. Configure HQ1:
```
config system interface
   edit "port1"
      set vdom "root"
      set ip 172.16.200.1 255.255.255.0
   next
end
config router static
   edit 1
      set gateway 172.16.200.3
      set device "port1"
   next
end
```
   b. Configure HQ2:
```
config system interface
   edit "port25"
      set vdom "root"
      set ip 172.16.202.1 255.255.255.0
   next
end
config router static
   edit 1
      set gateway 172.16.202.2
      set device "port25"
   next
end
```
3. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.
   a. Configure HQ1:
```
config system interface
   edit "dmz"
      set vdom "root"
      set ip 10.1.100.1 255.255.255.0
   next
end
```
   b. Configure HQ2:
```
config system interface
   edit "port9"
```

```
        set vdom "root"
        set ip 172.16.101.1 255.255.255.0
    next
end
```

4. Configure the IPsec phase1-interface. This example uses PSK as the authentication method. You can also use signature authentication.

   a. Configure HQ1:

```
config vpn ipsec phase1-interface
    edit "to_HQ2"
        set interface "port1"
        set peertype any
        set net-device enable
        set ha-sync-esp-seqno enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
    next
end
```

   b. Configure HQ2:

```
config vpn ipsec phase1-interface
    edit "to_HQ1"
        set interface "port25"
        set peertype any
        set net-device enable
        set ha-sync-esp-seqno enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set psksecret sample
    next
```

5. Configure the IPsec phase2-interface:

   a. Configure HQ1:

```
config vpn ipsec phase2-interface
    edit "to_HQ2"
        set phase1name "to_HQ2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
        set auto-negotiate enable
    next
end
```

   b. Configure HQ2:

```
config vpn ipsec phase2-interface
    edit "to_HQ1"
        set phase1name "to_HQ1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
        set auto-negotiate enable
    next
end
```

6. Configure static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure IPsec traffic does not match the default route when the IPsec tunnel is down.

   a. Configure HQ1:

```
config router static
    edit 2
        set dst 172.16.101.0 255.255.255.0
```

```
      set device "to_HQ2"
    next
    edit 3
      set dst 172.16.101.0 255.255.255.0
      set blackhole enable
      set distance 254
    next
  end
```

b. Configure HQ2:

```
config router static
  edit 2
    set dst 10.1.100.0 255.255.255.0
    set device "to_HQ1"
  next
  edit 3
    set dst 10.1.100.0 255.255.255.0
    set blackhole enable
    set distance 254
  next
end
```

7. Configure two firewall policies to allow bi-directional IPsec traffic flow over the IPsec tunnel:

a. Configure HQ1:

```
config firewall policy
  edit 1
    set name "inbound"
    set srcintf "to_HQ2"
    set dstintf "dmz"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "outbound"
    set srcintf "dmz"
    set dstintf "to_HQ2"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end
```

b. Configure HQ2:

```
config firewall policy
  edit 1
    set name "inbound"
    set srcintf "to_HQ1"
    set dstintf "port9"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
```

```
    edit 2
       set name "outbound"
       set srcintf "port9"
       set dstintf "to_HQ1"
       set srcaddr "172.16.101.0"
       set dstaddr "10.1.100.0"
       set action accept
       set schedule "always"
       set service "ALL"
    next
end
```

8. Use the following `diagnose` commands to check IPsec phase1/phase2 interface status including the sequence number on the secondary FortiGate. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.

   a. Run the `HQ1 # diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: to_HQ2
version: 1
interface: port1 11
 addr: 172.16.200.1:500 -> 172.16.202.1:500
created: 5s ago
IKE SA: created 1/1 established 1/1 time 0/0/0 ms
IPsec SA: created 2/2 established 2/2 time 0/0/0 ms
   id/spi: 12 6e8d0532e7fe8d84/3694ac323138a024 direction: responder status: established 5-
         5s ago = 0ms proposal: aes128-sha256 key: b3efb46d0d385aff-7bb9ee241362ee8d
         lifetime/rekey: 86400/86124 DPD sent/recv: 00000000/00000000
```

   b. Run the `HQ1 # diagnose vpn tunnel list` command. The system should return the following:

```
list all ipsec tunnel in vd 0

name=to_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1
bound_if=11 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/528 options[0210]=create_dev
      frag-rfc accept_traffic=1

    dec:pkts/bytes=0/0, enc:pkts/bytes=0/0
```

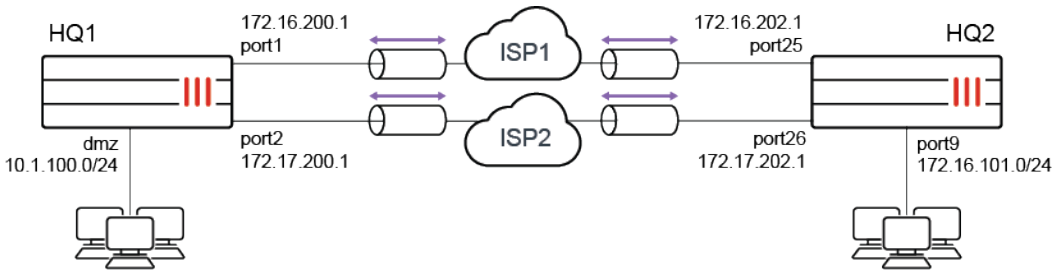
Packet distribution and redundancy for aggregate IPsec tunnels

This is a sample configuration of a multiple site-to-site IPsec VPN that uses an IPsec aggregate interface to set up redundancy and traffic load-balancing. The VPN tunnel interfaces must have `net-device` disabled in order to be members of the IPsec aggregate.

Each FortiGate has two WAN interfaces connected to different ISPs. OSPF runs over the IPsec aggregate in this configuration.

The supported load balancing algorithms are: L3, L4, round-robin (default), weighted round-robin, and redundant. The first four options allow traffic to be load-balanced, while the last option (redundant) uses the first tunnel that is up for all traffic.

Dynamic routing can run on the aggregate interface, and it can be a member interface in SD-WAN (not shown in this configuration).



Configuring the HQ1 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. Create the IPsec tunnels.
2. Create the IPsec aggregate.
3. Configure the firewall policies.
4. Configure the aggregate VPN interface IPs.

5. Configure OSPF.

To create the IPsec tunnels:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. For *Name*, enter pri_HQ2 and click *Next*.
3. Enter the following:

Phase 1	
IP Address	172.16.202.1
Interface	port1
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

4. Configure the other settings as needed.
5. Click *OK*.
6. Create another tunnel named sec_HQ2 with the following settings:

Phase 1	
IP Address	172.17.202.1
Interface	port2
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

To create the IPsec aggregate:

1. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Aggregate*.
2. For *Name*, enter agg_HQ2.
3. Select a load balancing algorithm.
4. From the *Tunnel* dropdown, select the tunnels that you created previously (*pri_HQ2* and *sec_HQ2*). If required, enter weights for each tunnel.
5. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects > Firewall Policy*.
2. Create an inbound traffic policy with the following settings:

Name	inbound
Incoming Interface	agg_HQ2
Outgoing Interface	dmz
Source	172.16.101.0
Destination	10.1.100.0
Schedule	always
Action	ACCEPT
Service	ALL

3. Click *OK*.
4. Create an outbound traffic policy with the following settings:

Name	outbound
Incoming Interface	dmz
Outgoing Interface	agg_HQ2
Source	10.1.100.0
Destination	172.16.101.0
Schedule	always
Action	ACCEPT
Service	ALL

To configure the aggregate VPN interface IPs:

1. Go to *Network > Interfaces* and edit agg_HQ2.
2. For *IP*, enter 10.10.10.1.
3. For *Remote IP/Netmask*, enter 10.10.10.2 255.255.255.255.
4. Click *OK*.

To configure OSPF:

1. Go to *Network* > *OSPF*.
2. For *Router ID*, enter 1.1.1.1.
3. In the *Areas* table, click *Create New*.
   a. For *Area ID*, enter 0.0.0.0.
   b. Click *OK*.
4. In the *Networks* table, click *Create New*.
   a. Set the *Area* to *0.0.0.0*.
   b. For *IP/Netmask*, enter 10.1.100.0/24.
   c. Click *OK*.
   d. Click *Create New*.
   e. For *IP/Netmask*, enter 10.10.10.0/24.
   f. Click *OK*.
5. Click *Apply*.

Configuring the HQ2 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. Create the IPsec tunnels.
2. Create the IPsec aggregate.
3. Configure the firewall policies.
4. Configure the aggregate VPN interface IPs.
5. Configure OSPF.

To create the IPsec tunnels:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. For *Name*, enter pri_HQ1 and click *Next*.
3. Enter the following:

Phase 1	
IP Address	172.16.200.1
Interface	port25
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID

Phase 2	
Auto-negotiate	Enable

4. Configure the other settings as needed.
5. Click *OK*.
6. Create another tunnel named sec_HQ1 with the following settings:

Phase 1	
IP Address	172.17.200.1
Interface	port26
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

To create the IPsec aggregate:

1. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Aggregate*.
2. For *Name*, enter agg_HQ1.
3. Select a load balancing algorithm.
4. From the *Tunnel* dropdown, select the tunnels that you created previously (*pri_HQ1* and *sec_HQ1*). If required, enter weights for each tunnel.
5. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects > Firewall Policy*.
2. Create an inbound traffic policy with the following settings:

Name	inbound
Incoming Interface	agg_HQ1
Outgoing Interface	port9
Source	10.1.100.0
Destination	172.16.101.0
Schedule	always

Action	ACCEPT
Service	ALL

3. Click *OK*.
4. Create an outbound traffic policy with the following settings:

Name	outbound
Incoming Interface	port9
Outgoing Interface	agg_HQ1
Source	172.16.101.0
Destination	10.1.100.0
Schedule	always
Action	ACCEPT
Service	ALL

To configure the aggregate VPN interface IPs:

1. Go to *Network > Interfaces* and edit agg_HQ1.
2. For *IP*, enter 10.10.10.2.
3. For *Remote IP/Netmask*, enter 10.10.10.1 255.255.255.255.
4. Click *OK*.

To configure OSPF:

1. Go to *Network > OSPF*.
2. For *Router ID*, enter 2.2.2.2.
3. In the *Areas* table, click *Create New*.
   a. For *Area ID*, enter 0.0.0.0.
   b. Click *OK*.
4. In the *Networks* table, click *Create New*.
   a. Set the *Area* to *0.0.0.0*.
   b. For *IP/Netmask*, enter 172.16.101.0/24.
   c. Click *OK*.
   d. Click *Create New*.
   e. For *IP/Netmask*, enter 10.10.10.0/24.
   f. Click *OK*.
5. Click *Apply*.

Monitoring the traffic in the GUI

To monitor the traffic:

1. Go to *Dashboard* > *Network* , hover over the *IPsec* widget, then click *Expand to Full Screen*.
2. Expand the aggregate tunnel in the table to view statistics for each aggregate member.

Configuring the HQ1 FortiGate in the CLI

There are six steps to configure the FortiGate:

1. Configure the interfaces.
2. Configure two IPsec phase 1 and phase 2 interfaces.
3. Configure the IPsec aggregate.
4. Configure the firewall policies.
5. Configure the aggregate VPN interface IPs.
6. Configure OSPF.

To configure the interfaces:

1. Configure port1, port2, and dmz as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```
config vpn ipsec phase1-interface
   edit "pri_HQ2"
      set interface "port1"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set psksecret sample1
   next
   edit "sec_HQ2"
      set interface "port2"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.17.202.1
      set psksecret sample2
   next
   end
config vpn ipsec phase2-interface
   edit "pri_HQ2"
      set phase1name "pri_HQ2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
      set auto-negotiate enable
   next
   edit "sec_HQ2"
```

```
      set phase1name "sec_HQ2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
           chacha20poly1305
      set auto-negotiate enable
   next
end
```

To configure the IPsec aggregate:

```
config system ipsec-aggregate
   edit "agg_HQ2"
      set member "pri_HQ2" "sec_HQ2"
   next
end
```

To configure the firewall policies:

```
config firewall policy
   edit 1
      set name "inbound"
      set srcintf "agg_HQ2"
      set dstintf "dmz"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "outbound"
      set srcintf "dmz"
      set dstintf "agg_HQ2"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```

To configure the aggregate VPN interface IPs:

```
config system interface
   edit "agg_HQ2"
      set ip 10.10.10.1 255.255.255.255
      set remote-ip 10.10.10.2 255.255.255.255
   next
end
```

To configure OSPF:

```
config router ospf
   set router-id 1.1.1.1
   config area
      edit 0.0.0.0
      next
```

```
    end
    config network
       edit 1
          set prefix 10.1.100.0 255.255.255.0
       next
       edit 2
          set prefix 10.10.10.0 255.255.255.0
       next
    end
end
```

Configuring the HQ2 FortiGate in the CLI

There are six steps to configure the FortiGate:

1. Configure the interfaces.
2. Configure two IPsec phase 1 and phase 2 interfaces.
3. Configure the IPsec aggregate.
4. Configure the firewall policies.
5. Configure the aggregate VPN interface IPs.
6. Configure OSPF.

To configure the interfaces:

1. Configure port25, port26, and port9 as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```
config vpn ipsec phase1-interface
   edit "pri_HQ1"
      set interface "port25"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.200.1
      set psksecret sample1
   next
   edit "sec_HQ1"
      set interface "port26"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.17.200.1
      set psksecret sample2
   next
end
config vpn ipsec phase2-interface
   edit "pri_HQ1"
      set phase1name "pri_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
```

```
      set auto-negotiate enable
   next
   edit "sec_HQ1"
      set phase1name "sec_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
           chacha20poly1305
      set auto-negotiate enable
   next
end
```

To configure the IPsec aggregate:

```
config system ipsec-aggregate
   edit "agg_HQ1"
      set member "pri_HQ1" "sec_HQ1"
   next
end
```

To configure the firewall policies:

```
config firewall policy
   edit 1
      set name "inbound"
      set srcintf "agg_HQ1"
      set dstintf "port9"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "outbound"
      set srcintf "port9"
      set dstintf "agg_HQ1"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```

To configure the aggregate VPN interface IPs:

```
config system interface
   edit "agg_HQ1"
      set ip 10.10.10.2 255.255.255.255
      set remote-ip 10.10.10.1 255.255.255.255
   next
end
```

To configure OSPF:

```
config router ospf
   set router-id 2.2.2.2
```

```
    config area
       edit 0.0.0.0
       next
    end
    config network
       edit 1
          set prefix 172.16.101.0 255.255.255.0
       next
       edit 2
          set prefix 10.10.10.0 255.255.255.0
       next
    end
end
```

Monitoring the traffic in the CLI

To view debugging information:

1. Verify the status of the phase 1 IKE SAs:

```
# diagnose vpn ike gateway list
vd: root/0
name: pri_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
 tun_id: 172.16.202.1
created: 1520s ago
IKE SA: created 1/2 established 1/1 time 10/10/10 ms
IPsec SA: created 2/2 established 1/1 time 0/0/0 ms
   id/spi: 173 dcdede154681579b/e32f4c48c4349fc0 direction: responder status: established 1498-
         1498s ago = 10ms proposal: aes128-sha256 key: d7230a68d7b83def-588b94495cfa9d38
         lifetime/rekey: 86400/84631 DPD sent/recv: 0000000d/00000006
vd: root/0
name: sec_HQ2
version: 1
interface: port2 12
addr: 172.17.200.1:500 -> 172.17.202.1:500
created: 1520s ago
IKE SA: created 1/2 established 1/1 time 10/10/10 ms
IPsec SA: created 2/2 established 1/1 time 0/0/0 ms
   id/spi: 174 a567bd7bf02a04b5/4251b6254660aee2 direction: responder status: established 1498-
         1498s ago = 10ms proposal: aes128-sha256 key: 9f44f500c28d8de6-febaae9d1e6a164c
         lifetime/rekey: 86400/84631 DPD sent/recv: 00000008/0000000c
```

2. Verify the phase 2 IPsec tunnel SAs:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
name=sec_HQ2 ver=1 serial=2 172.17.200.1:0->172.17.202.1:0 tun_id=172.17.202.1
bound_if=5 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/512 options[0200]=frag-rfc run_
      state=1 accept_traffic=1

           mtu=1438 expire=41231/0B replaywin=2048
         seqno=28 esn=0 replaywin_lastseq=00000027 itn=0
      life: type=01 bytes=0/0 timeout=42900/43200 dec: spi=1071b4f8 esp=aes key=16
           142cce377b3432ba41e64128ade6848c
         ah=sha1 key=20 20e64947e2397123f561584321adc0e7aa0c342d
      enc: spi=ec89b7ed esp=aes key=16 2ec13622fd60dacce3d28ebe5fe7ab14
         ah=sha1 key=20 c1787497508a87f40c73c0db0e835c70b3c3f42d
      dec:pkts/bytes=38/2568, enc:pkts/bytes=39/5432
```

3. Debug the IPsec aggregation list:

```
# diagnose sys ipsec-aggregate list
agg_HQ2 algo=RR member=2 run_tally=2
members:
   pri_HQ2
   sec_HQ2
```

4. Verify the OSPF neighbor information:

```
# get router info ospf neighbor
OSPF process 0, VRF 0:
Neighbor ID Pri State Dead Time Address Interface
2.2.2.2 1. Full/ - 00:00:34 10.10.10.2 agg1_HQ2
```

5. Verify the OSPF routing table:

```
# get router info routing-table ospf
Routing table for VRF=0
O 172.16.101.0/24 [110/20] via 10.10.10.2, agg1_HQ2 , 00:18:43
```

Packet distribution for aggregate dial-up IPsec tunnels using location ID

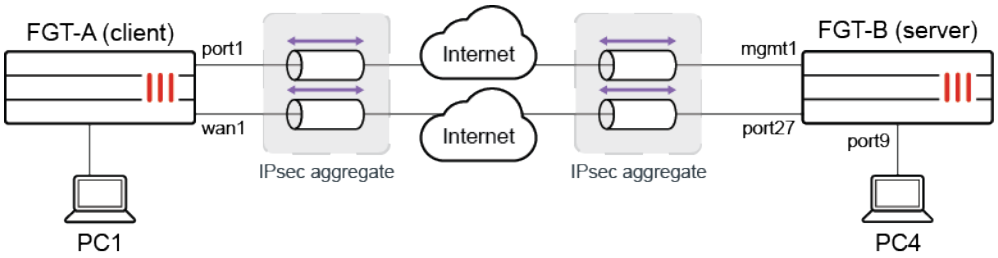
To support per-packet load balancing on aggregate dial-up IPsec tunnels between sites, each spoke must be configured with a location ID. On the hub, per-packet load balancing is performed on the tunnels in the IPsec aggregate that have the same location ID.

Multiple dial-up VPN tunnels from the same location can be aggregated on the VPN hub and load balanced based on the configured load balance algorithm.

IPsec traffic cannot be offloaded to the NPU.

Example

In this example, an IPsec aggregate tunnel is formed between two dial-up IPsec tunnels in order to support per-packet load balancing.



To configure the client FortiGate (FGT-A):

1. Configure the IPsec tunnels:

```
config vpn ipsec phase1-interface
    edit "client1"
        set interface "port1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.4
        set psksecret **********
    next
    edit "client2"
        set interface "wan1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 173.1.1.1
        set psksecret **********
    next
end
```

2. Configure an aggregate of the IPsec tunnels:

```
config system ipsec-aggregate
    edit "agg1"
        set member "client1" "client2"
    next
end
```

3. Configure the location ID:

```
config system settings
    set location-id 1.1.1.1
end
```

To configure the server FortiGate (FGT-B):

1. Configure the IPsec tunnels:

```
config vpn ipsec phase1-interface
    edit "server1"
        set type dynamic
        set interface "mgmt1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret ***********
        set dpd-retryinterval 60
    next
    edit "server2"
        set type dynamic
        set interface "port27"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret **********
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "server1"
        set phase1name "server1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
    edit "server2"
        set phase1name "server2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

2. Configure an aggregate of the IPsec tunnels:

```
config system ipsec-aggregate
    edit "server"
        set member "server1" "server2"
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 1
```

```
        set srcintf "server"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To check the IPsec tunnel and aggregate state:

1. List all of the VPN tunnels:

```
FGDocs # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=server1 ver=1 serial=1 172.16.200.4:500->0.0.0.0:500 tun_id=1.0.0.0 dst_mtu=0 dpd-link=on

```

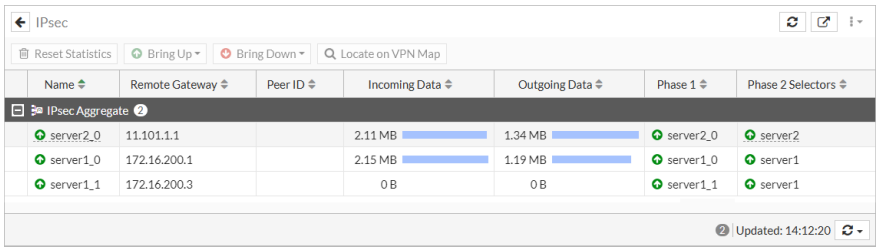
2. List the IPsec aggregate members:

```
# diagnose sys ipsec-aggregate list
server
members(3):
        server1_1
        server1_0
        server2_0
```

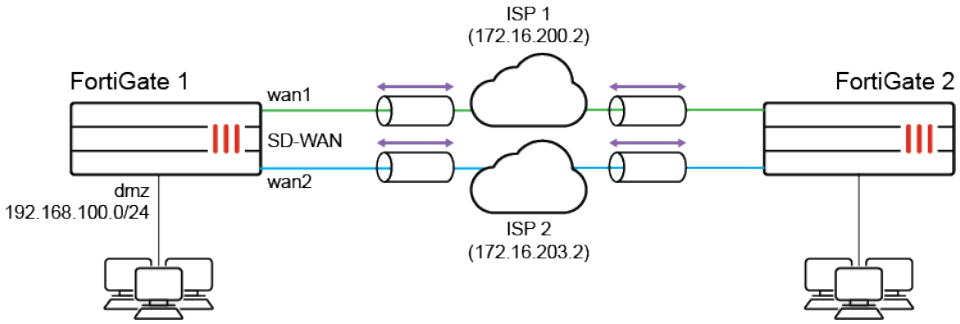
3. In the GUI, go to *Dashboard* > *Network* and expand the *IPsec* widget to review the traffic distributed over the aggregate members:



Packet distribution for aggregate static IPsec tunnels in SD-WAN

This is a sample configuration of aggregating IPsec tunnels by using per-packet load-balancing.

For example, a customer has two ISP connections, wan1 and wan2. On each FortiGate, two IPsec VPN interfaces are created. Next, an `ipsec-aggregate` interface is created and added as an SD-WAN member.



Configuring FortiGate 1

To create two IPsec VPN interfaces:

```
config vpn ipsec phase1-interface
    edit "vd1-p1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.201.2
        set psksecret ftnt1234
    next
    edit "vd1-p2"
        set interface "wan2"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.202.2
        set psksecret ftnt1234
    next
end
```

```
config vpn ipsec phase2-interface
    edit "vd1-p1"
        set phase1name "vd1-p1"
    next
    edit "vd1-p2"
        set phase1name "vd1-p2"
    next
end
```

To create an IPsec aggregate interface:

```
config system ipsec-aggregate
    edit "agg1"
        set member "vd1-p1" "vd1-p2"
        set algorithm L3
    next
end
```

```
config system interface
    edit "agg1"
        set vdom "root"
        set ip 172.16.11.1 255.255.255.255
        set allowaccess ping
```

```
        set remote-ip 172.16.11.2 255.255.255.255
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf ""virtual-wan-link""
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "agg1"
            set gateway 172.16.11.2
        next
    end
end
```

Configuring FortiGate 2

To create two IPsec VPN interfaces:

```
config vpn ipsec phase1-interface
    edit "vd2-p1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.200.1
        set psksecret ftnt1234
    next
    edit "vd2-p2"
        set interface "wan2"
        set peertype any
        set net-device disable
```

```
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.203.1
        set psksecret ftnt1234
    next
end
```

```
config vpn ipsec phase2-interface
    edit "vd2-p1"
        set phase1name "vd2-p1"
    next
    edit "vd2-p2"
        set phase1name "vd2-p2"
    next
end
```

To create an IPsec aggregate interface:

```
config system ipsec-aggregate
    edit "agg2"
        set member "vd2-p1" "vd2-p2"
        set algorithm L3
    next
end
```

```
config system interface
    edit "agg2"
        set vdom "root"
        set ip 172.16.11.2 255.255.255.255
        set allowaccess ping
        set remote-ip 172.16.11.1 255.255.255.255
    next
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf ""virtual-wan-link""
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "agg2"
            set gateway 172.16.11.1
        next
    end
end
```

Related diagnose commands

To display aggregate IPsec members:

```
# diagnose sys ipsec-aggregate list
agg1 algo=L3 member=2 run_tally=2
members:
        vd1-p1
        vd1-p2
```

To check the VPN status:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------

```

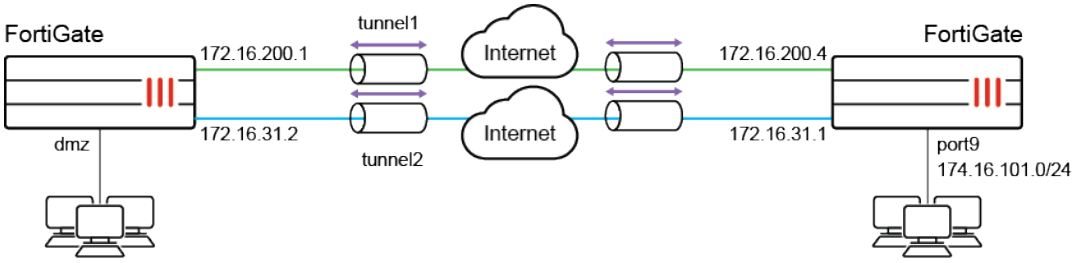
Packet distribution for aggregate IPsec tunnels using weighted round robin

A weighted round robin algorithm can be used for IPsec aggregate tunnels to distribute traffic by the weight of each member tunnel.

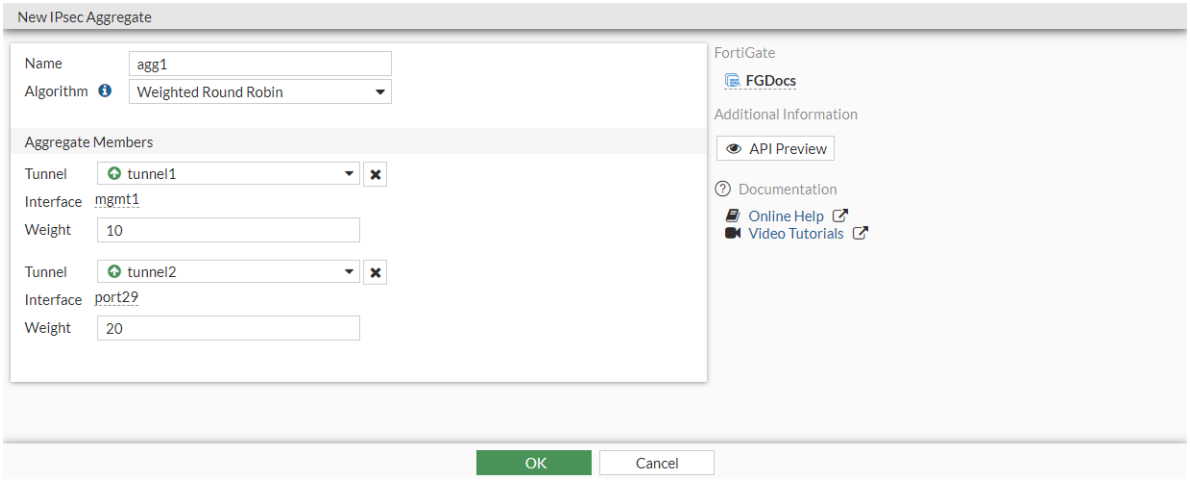
In this example, the FortiGate has two IPsec tunnels put into IPsec aggregate. Traffic is distributed among the members, with one third over *tunnel1*, and two thirds over *tunnel2*. To achieve this, the weighted round robin algorithm is selected, *tunnel1* is assigned a weight of 10, and *tunnel2* is assigned a weight of 20.



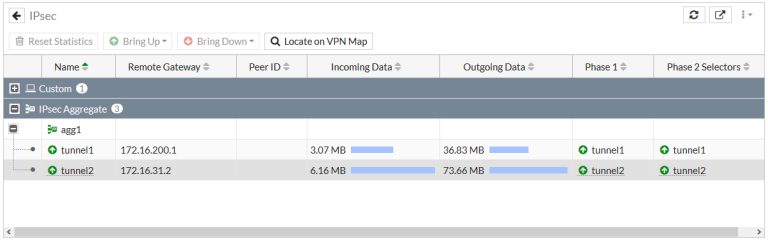
To create the IPsec aggregate in the GUI:

1. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Tunnel*.
2. Complete the wizard to create the *tunnel1* and *tunnel2* custom IPsec tunnels. Ensure that *Aggregate member* is *Enabled* for each tunnel under the *Network > Advanced* section.
3. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Aggregate*.
4. Enter a name for the aggregate, such as *agg1*, and ensure that *Algorithm* is *Weighted Round Robin*.
5. Add *tunnel1* as an aggregate members, and set *Weight* to *10*.

6. Add *tunnel2* as a second aggregate members, and set its *Weight* to *20*.



7. Click *OK*.
8. To view and monitor the aggregate tunnel statistics, go to the *IPsec* widget on the *Network* dashboard.



To create the IPsec aggregate in the CLI:

1. Create the *tunnel1* and *tunnel2* custom IPsec tunnels with aggregate-member enabled and aggregate-weight set for both tunnels:

```
config vpn ipsec phase1-interface
    edit "tunnel1"
        ...
        set aggregate-member enable
        set aggregate-weight 10
        ...
    next
    edit "tunnel2"
        ...
        set aggregate-member enable
        set aggregate-weight 20
        ...
    next
end
```

2. Create the IPsec aggregate:

```
config system ipsec-aggregate
    edit "agg1"
        set member "tunnel1" "tunnel2"
```

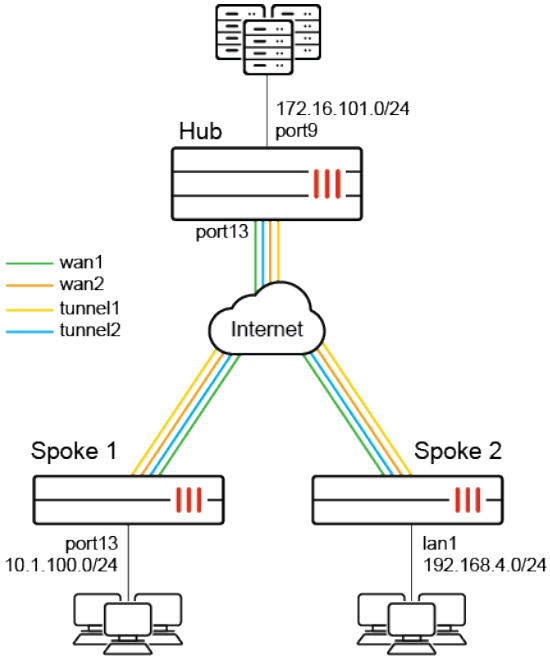
```
        set algorithm weighted-round-robin
    next
end
```

Redundant hub and spoke VPN

A redundant hub and spoke configuration allows VPN connections to radiate from a central FortiGate unit (the hub) to multiple remote peers (the spokes). Traffic can pass between private networks behind the hub and private networks behind the remote peers. Traffic can also pass between remote peer private networks through the hub.

This is a sample configuration of hub and spoke IPsec VPN. The following applies for this scenario:

- The spokes have two WAN interfaces and two IPsec VPN tunnels for redundancy.
- The secondary VPN tunnel is up only when the primary tunnel is down by dead peer detection.



Because the GUI can only complete part of the configuration, we recommend using the CLI.

To configure redundant hub and spoke VPN using the FortiOS CLI:

1. Configure the hub.
   a. Configure the WAN, internal interface, and static route.

```
config system interface
   edit "port13"
      set alias "WAN"
      set ip 172.16.202.1 255.255.255.0
   next
   edit "port9"
      set alias "Internal"
      set ip 172.16.101.1 255.255.255.0
```

```
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port13"
    next
end
```

b. Configure the IPsec phase1-interface and phase2-interface.

```
config vpn ipsec phase1-interface
    edit "hub"
        set type dynamic
        set interface "port13"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret sample
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "hub"
        set phase1name "hub"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
    next
end
```

c. Configure the firewall policy.

```
config firewall policy
    edit 1
        set name "spoke-hub"
        set srcintf "hub"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke-spoke"
        set srcintf "hub"
        set dstintf "hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

2. Configure the spokes.

a. Configure the WAN, internal interface, and static route.

i. Configure Spoke1.

```
config system interface
   edit "port1"
      set ip 172.16.200.1 255.255.255.0
   next
   edit "wan1"
      set mode dhcp
      set distance 10
      set priority 100
   next
   edit "dmz"
      set ip 10.1.100.1 255.255.255.0
   next
end
config router static
   edit 1
      set gateway 172.16.200.2
      set device "port1"
   next
end
```

ii. Configure Spoke2.

```
config system interface
   edit "wan1"
      set ip 172.16.200.3 255.255.255.0
   next
   edit "wan2"
      set mode dhcp
      set distance 10
      set priority 100
   next
   edit "lan1"
      set ip 192.168.4.1 255.255.255.0
   next
end
config router static
   edit 1
      set gateway 172.16.200.2
      set device "wan1"
   next
end
```

b. Configure IPsec phase1-interface and phase2-interface.

i. Configure Spoke1.

```
config vpn ipsec phase1-interface
   edit "primary"
      set interface "port1"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set psksecret sample
      next
   edit "secondary"
      set interface "wan1"
      set peertype any
```

```
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set monitor "primary"
      set psksecret sample
      next
end
config vpn ipsec phase2-interface
   edit "primary"
      set phase1name "primary"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
      set auto-negotiate enable
      set src-subnet 10.1.100.0 255.255.255.0
   next
   edit "secondary"
      set phase1name "secondary"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
      set auto-negotiate enable
      set src-subnet 10.1.100.0 255.255.255.0
   next
end
```

ii. Configure Spoke2.

```
config vpn ipsec phase1-interface
   edit "primary"
      set interface "wan1"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set psksecret sample
      next
   edit "secondary"
      set interface "wan2"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set monitor "primary"
      set psksecret sample
      next
end
config vpn ipsec phase2-interface
   edit "primary"
      set phase1name "primary"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
      set auto-negotiate enable
      set src-subnet 192.168.4.0 255.255.255.0
   next
   edit "secondary"
      set phase1name "secondary"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
      set auto-negotiate enable
```

```
            set src-subnet 192.168.4.0 255.255.255.0
        next
    end
```

c. Configure the firewall policy.

i. Configure Spoke1.

```
config firewall policy
    edit 1
        set srcintf "dmz"
        set dstintf "primary" "secondary"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2.

```
config firewall policy
    edit 1
        set srcintf "lan1"
        set dstintf "primary" "secondary"
        set srcaddr "192.168.4.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the static route.

i. Configure Spoke1.

```
config router static
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set distance 1
        set device "primary"
    next
    edit 4
        set dst 172.16.101.0 255.255.255.0
        set distance 3
        set device "secondary"
    next
end
```

ii. Configure Spoke2.

```
config router static
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set distance 1
        set device "primary"
    next
    edit 4
        set dst 172.16.101.0 255.255.255.0
        set distance 3
        set device "secondary"
    next
```

```
end
```

3. Run diagnose and get commands.
   a. Run the `Spoke1 # diagnose vpn tunnel list` command. The system should return the following:

```
name=primary ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1

```

   b. Run the `Spoke1 # get router info routing-table static` command. The system should return the following:

```
Routing table for VRF=0
.................
S 172.16.101.0/24 [1/0] is directly connected, primary
```

ADVPN

Auto-Discovery VPN (ADVPN) allows the central hub to dynamically inform spokes about a better path for traffic between two spokes.

The following topics provide instructions on configuring ADVPN:

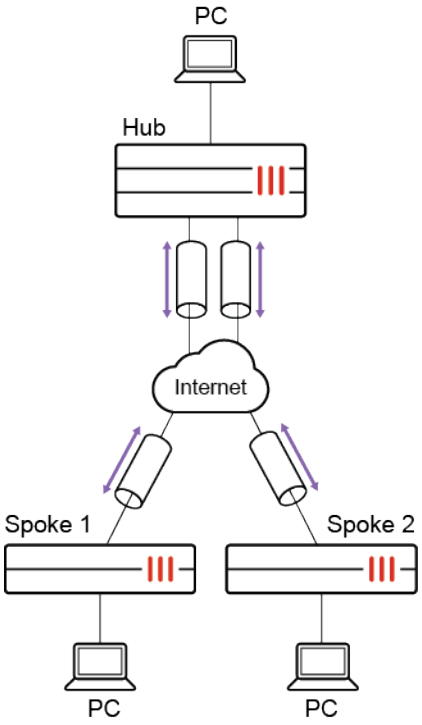
- IPsec VPN wizard hub-and-spoke ADVPN support on page 2624
- ADVPN with BGP as the routing protocol on page 2628
- ADVPN with OSPF as the routing protocol on page 2638
- ADVPN with RIP as the routing protocol on page 2648
- UDP hole punching for spokes behind NAT on page 2658

IPsec VPN wizard hub-and-spoke ADVPN support

When using the IPsec VPN wizard to create a hub and spoke VPN, multiple local interfaces can be selected. At the end of the wizard, changes can be reviewed, real-time updates can be made to the local address group and tunnel interface, and easy configuration keys can be copied for configuring the spokes.

When editing a VPN tunnel, the Hub & Spoke Topology section provides access to the easy configuration keys for the spokes, and allows you to add more spokes.

This example shows the configuration of a hub with two spokes.



To configure the hub:

1. Go to *VPN > IPsec Wizard*.
2. Go through the steps of the wizard:
   a. *VPN Setup*:

Name	hub
Template Type	Hub-and-Spoke
Role	Hub

   b. *Authentication*:

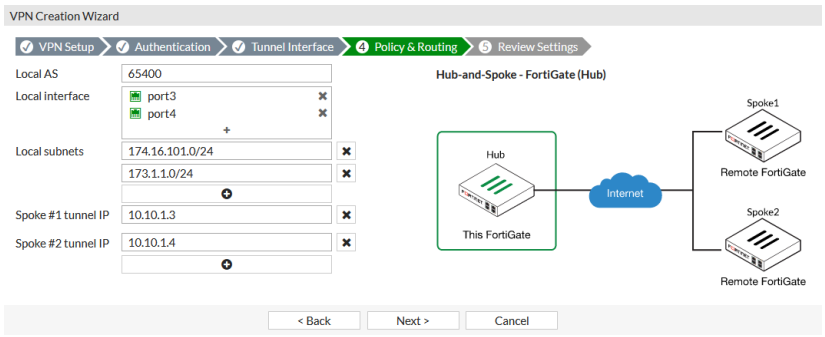
Incoming Interface	port1
Authentication method	Pre-shared Key
Pre-shared key	<key>

   c. *Tunnel Interface*:

Tunnel IP	10.10.1.1
Remote IP/netmask	10.10.1.2/24

   d. *Policy & Routing*:
   Multiple local interfaces and subnets can be configured.

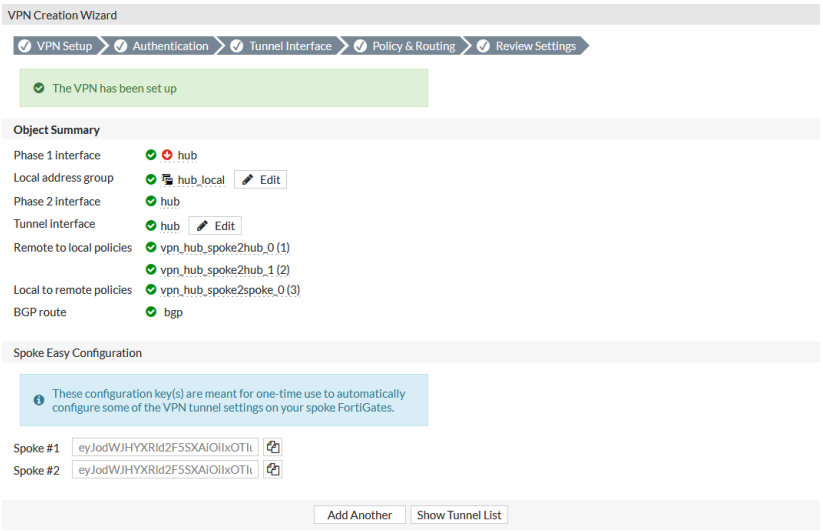
Local AS	65400
Local interface	port3 port4
Local subnets	174.16.101.0/24 173.1.1.0/24
Spoke #1 tunnel IP	10.10.1.3
Spoke #2 tunnel IP	10.10.1.4



e. *Review Settings*:
Confirm that the settings look correct, then click *Create*.

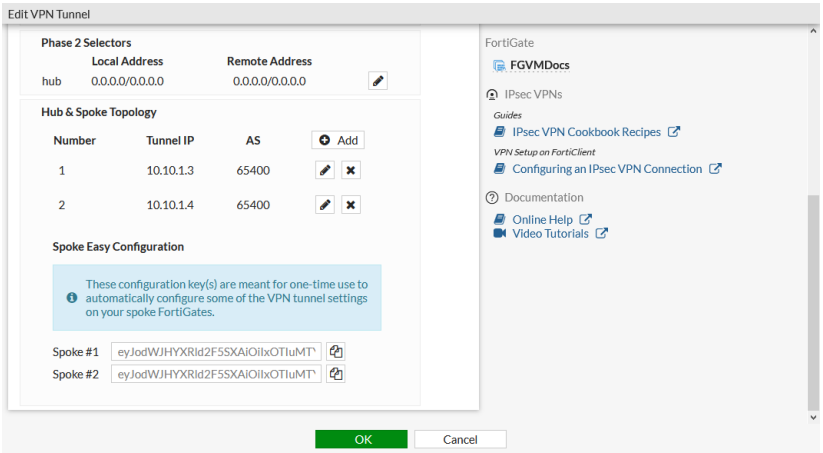
3. The summary shows details about the set up hub:

- The *Local address group* and *Tunnel interface* can be edited directly on this page.
- Spoke easy configuration keys can be used to quickly configure the spokes.



4. Click *Show Tunnel List* to go to *VPN* > *IPsec Tunnels*.

5. Edit the VPN tunnel to add more spokes and to copy the spokes' easy configuration keys.

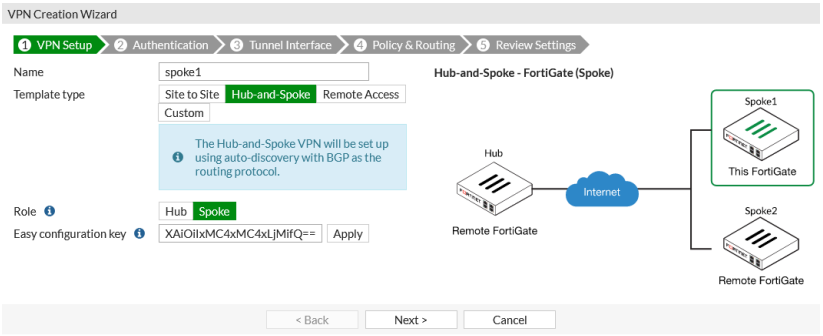


To configure the spokes:

1. Go to *VPN > IPsec Wizard*.
2. On the *VPN Setup* page of the wizard, enter the following:

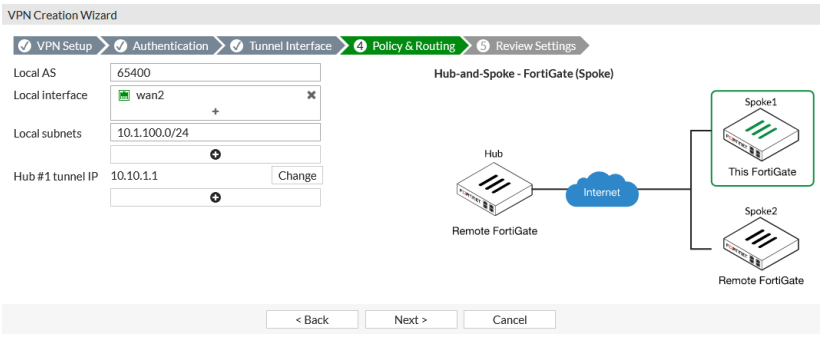
Name	spoke1
Template Type	Hub-and-Spoke
Role	Spoke

3. In the *Easy configuration key* field, paste the *Spoke #1* key from the hub FortiGate, click *Apply*, then click *Next*.



4. Adjust the *Authentication* settings as required, enter the *Pre-shared key*, then click *Next*.
5. Adjust the *Tunnel Interface* settings as required, then click *Next*.
6. Configure the *Policy & Routing* settings, then click *Next*:

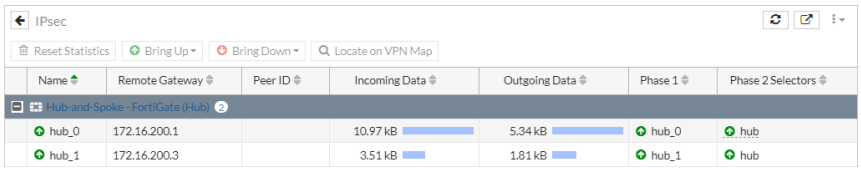
Local interface	wan2
Local subnets	10.1.100.0/24



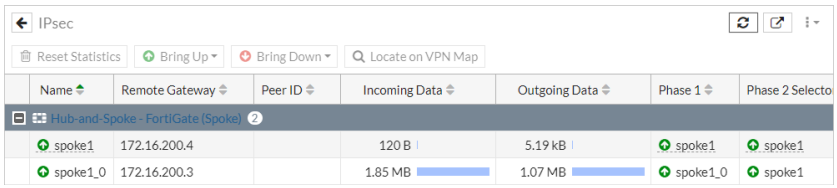
7. Review the settings, then click *Create*.
8. The summary shows details about the set up spoke. The *Local address group* and *Tunnel interface* can be edited directly on this page.
9. Follow the same steps to configure the second spoke.

To check that the tunnels are created and working:

1. On the hub FortiGate, go to *Dashboard > Network* and expand the IPsec widget.
   The tunnels to the spokes are established.



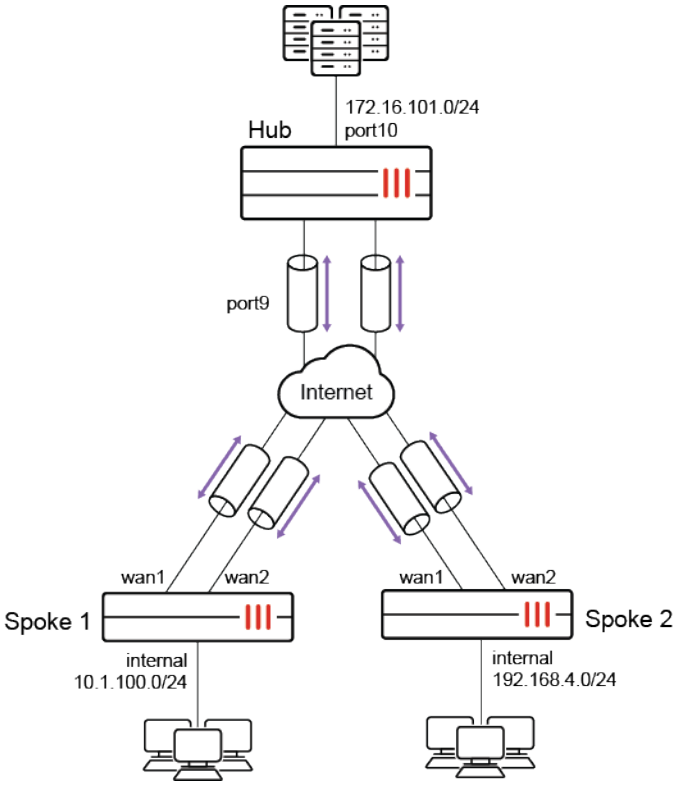
2. On a spoke, go to *Dashboard* > *Network* and expand the IPsec widget. The tunnel to the hub and the spoke to spoke shortcut are established.



ADVPN with BGP as the routing protocol

This is a sample configuration of ADVPN with BGP as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device disable` must be run.
- IBGP must be used between the hub and spoke FortiGates.
- `bgp neighbor-group/neighbor-range` must be reused.



To configure ADVPN with BGP as the routing protocol using the CLI:

1. Configure hub FortiGate WAN interface, internal interface, and a static route:

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the hub FortiGate:
   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-
sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-
sha256
    next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

   b. Configure the hub FortiGate firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end
```

d. Configure the hub FortiGate's BGP:

```
config router bgp
    set as 65412
    config neighbor-group
        edit "advpn"
            set link-down-failover enable
            set remote-as 65412
            set route-reflector-client enable
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.10.10.0 255.255.255.0
            set neighbor-group "advpn"
        next
    end
    config network
        edit 1
            set prefix 172.16.101.0 255.255.255.0
        next
```

```
    end
end
```

3. Configure the spoke FortiGates:
   a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:
      i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

      ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
```

```
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
```

```
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
```

```
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

e. Configure the spoke FortiGates' BGP:

i. Configure Spoke1:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.10.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65412
        next
    end
    config network
        edit 1
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

ii. Configure Spoke2:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.10.254"

            set link-down-failover enable
            set remote-as 65412
        next
    end
    config network
        edit 1
            set prefix 192.168.4.0 255.255.255.0
        next
```

```
    end
end
```

4. Run `diagnose` and `get` commands on Spoke1 to check VPN and BGP states:
   a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

```

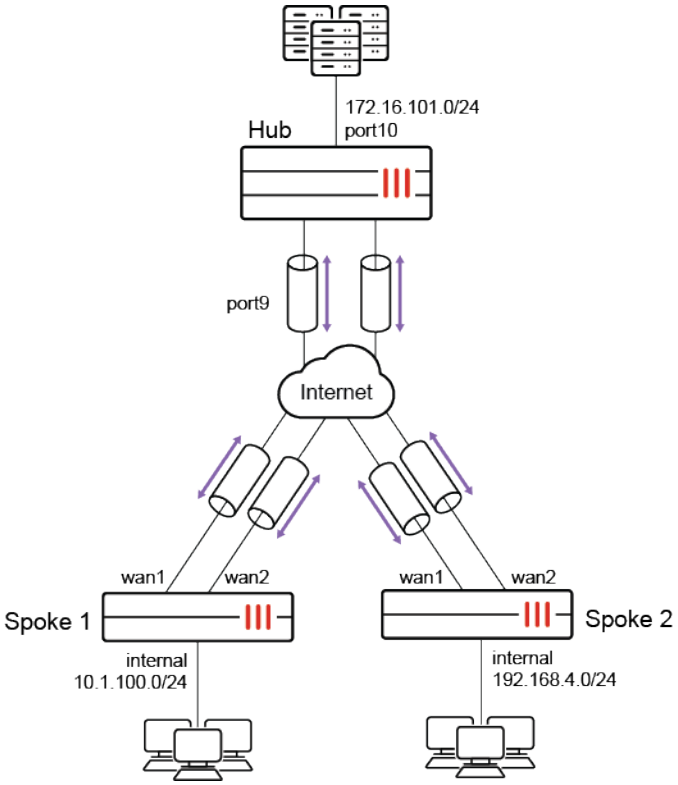
e. Run the `get router info routing-tale bgp` command. The system should return the following:

```
Routing table for VRF=0
B       172.16.101.0/24 [200/0] via 10.10.10.254, spoke1, 00:23:57
B       192.168.4.0/24 [200/0] via 10.10.10.3, spoke1_0 , 00:22:03
```

ADVPN with OSPF as the routing protocol

This is a sample configuration of ADVPN with OSPF as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device enable` must be run.
- OSPF must be used between the hub and spoke FortiGates.



To configure ADVPN with OSPF as the routing protocol using the CLI:

1. Configure hub FortiGate's WAN, internal interface, and static route:

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the hub FortiGate:
   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "advpn-hub"
```

```
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-
sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-
sha256
    next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end
```

d. Configure the hub FortiGate's OSPF:

```
config router ospf
    set router-id 1.1.1.1
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 172.16.101.0 255.255.255.0
        next
    end
end
```

3. Configure the spoke FortiGates:

a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:

i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
```

```
    next
end
```

ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
```

```
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
```

```
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
```

```
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

e. Configure the spoke FortiGates' OSPF:

i. Configure Spoke1:

```
config router ospf
    set router-id 7.7.7.7
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
```

```
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

ii. Configure Spoke2:

```
config router ospf
    set router-id 8.8.8.8
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end
```

4. Run `diagnose` and `get` commands on Spoke1 to check VPN and OSPF states:

a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu create_
dev frag-rfc  accept_traffic=1

proxyid_num=1 child_num=1 refcnt=19 ilast=5 olast=2 ad=r/2
stat: rxp=1 txp=263 rxb=16452 txb=32854

proxyid=spoke1_backup proto=0 sa=0 ref=2 serial=1 auto-negotiate adr
  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0
```

b. Run the `get router info ospf neighbor` command on Spoke1. The system should return the following:

```
OSPF process 0, VRF 0: Neighbor ID Pri State Dead Time Address Interface 8.8.8.8 1. Full/
- 00:00:35 10.10.10.254 spoke1 1.1.1.1 1. Full/ - 00:00:35 10.10.10.254 spoke1
```

c. Run the `get router info routing-table ospf` command on Spoke1. The system should return the following:

```
Routing table for VRF=0
O       172.16.101.0/24 [110/110] via 10.10.10.254, spoke1, 00:23:23
O       192.168.4.0/24   [110/110] via 10.10.10.254, spoke1, 00:22:35
```

d. Generate traffic between the spokes, then check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

  npu_flag=03 npu_rgwy=13.1.1.2 npu_lgwy=15.1.1.2 npu_selid=a dec_npuid=1 enc_npuid=1
```

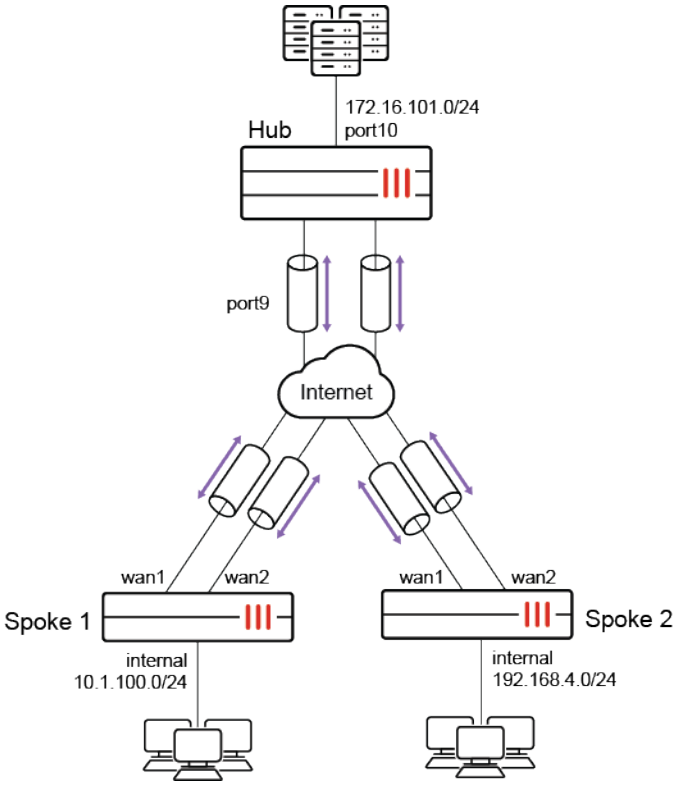
e. Run the `get router info routing-tale ospf` command. The system should return the following:

```
Routing table for VRF=0
O       172.16.101.0/24 [110/110] via 10.10.10.254, spoke1, 00:27:14
O       192.168.4.0/24  [110/110] via  10.10.10.3, spoke1_0, 00:26:26
```

ADVPN with RIP as the routing protocol

This is a sample configuration of ADVPN with RIP as routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device disable` must be run.
- RIP must be used between the hub and spoke FortiGates.
- `split-horizon-status enable` must be run on the hub FortiGate.



To configure ADVPN with RIP as the routing protocol using the CLI:

1. In the CLI, configure hub FortiGate's WAN, internal interface, and static route:

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the hub FortiGate:
   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "advpn-hub"
```

```
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-
sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-
sha256
    next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end
```

d. Configure the hub FortiGate's RIP:

```
config router rip
    set default-information-originate enable
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 172.16.101.0 255.255.255.0
        next
    end
    config interface
        edit "advpn-hub"
            set split-horizon-status disable
        next
    end
end
```

3. Configure the spoke FortiGates:

a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:

i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
```

```
        set device "wan1"
    next
end
```

ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
```

```
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
```

```
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
```

```
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

e. Configure the spoke FortiGates' RIP:

i. Configure Spoke1:

```
config router rip
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
```

```
        next
    end
end
```

ii. Configure Spoke2:

```
config router rip
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end
```

4. Run `diagnose` and `get` commands on Spoke1:

a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu create_

```

```
  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0
```

b. Run the `get router info rip database` command on Spoke1. The system should return the following:

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel,
       C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP

   Network            Next Hop         Metric From            If     Time
Rc 10.1.100.0/24                             1.                 internal
Rc 10.10.10.2/32                               1.                 spoke1
R  172.16.101.0/24    10.10.10.254             1. 10.10.10.254      spoke1 02:28
R  192.168.4.0/24      10.10.10.254              1. 10.10.10.254       spoke1 02:44
```

c. Run the `get router info routing-table rip` command on Spoke1. The system should return the following:

```
Routing table for VRF=0
R       172.16.101.0/24 [120/2] via 10.10.10.254, spoke1, 00:08:38
R       192.168.4.0/24 [120/3] via 10.10.10.254, spoke1, 00:08:38
```

d. Generate traffic between the spokes, then check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

```

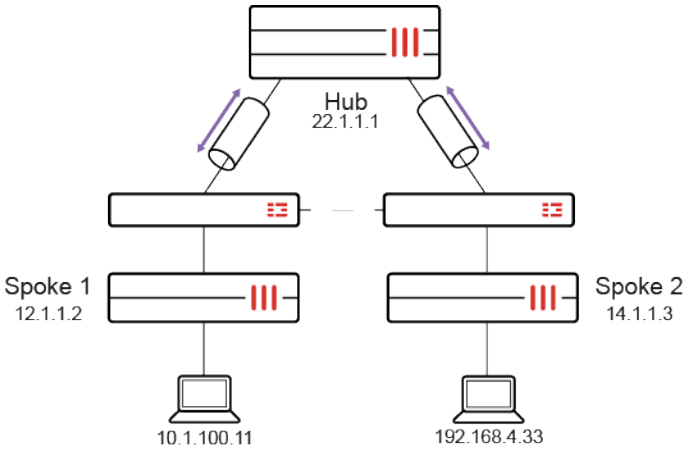
e. Run the `get router info routing-tale rip` command. The system should return the following:

```
Routing table for VRF=0
R       172.16.101.0/24 [120/2] via 10.10.10.254, spoke1, 00:09:04
R       192.168.4.0/24 [120/2] via 10.10.10.3, spoke1_0, 00:00:02
```

UDP hole punching for spokes behind NAT

UDP hole punching allows ADVPN shortcuts to be established through a UDP hole on a NAT device. The NAT device must support RFC 4787 Endpoint-Independent Mapping.

In the following example, device 10.1.100.11 behind Spoke1 needs to reach device 192.168.4.33 behind Spoke2. Spoke1 and Spoke2 are behind NAT devices and have established IPsec tunnels to the Hub. The hole punching creates a shortcut between Spoke1 and Spoke2 that bypasses the Hub.



To verify the ADVPN shortcut is established between both spokes behind NAT:

```
# diagnose debug enable
# diagnose debug application ike -1

Fabric Overlay Orchestrator

The Fabric Overlay Orchestrator feature is an easy-to-use GUI wizard that simplifies the process of configuring a self-orchestrated SD-WAN overlay within a single Security Fabric. This feature is self-orchestrated since no additional tool or device, aside from the FortiGates themselves, is required to orchestrate this configuration. An SD-WAN overlay configuration consists of IPsec and BGP configuration settings.

Currently, the Fabric Overlay Orchestrator supports a single hub architecture and builds upon an existing Security Fabric configuration. This feature configures the root FortiGate as the SD-WAN overlay hub and the downstream first-level FortiGates as the spokes.

After configuring the Fabric Overlay, you can complete the SD-WAN deployment by configuring SD-WAN rules.

If you cannot view the *VPN > Fabric Overlay Orchestrator* tree menu, configure the FortiGate as a root or a downstream device in the Security Fabric. See Configuring the root FortiGate and downstream FortiGates on page 3702 for more details.

The Fabric Overlay Orchestrator does not work when VDOM mode is enabled.

This section contains the following topics:

- Prerequisites on page 2662
- Network topology on page 2663
- Using the Fabric Overlay Orchestrator on page 2663
- SPA easy configuration key for FortiSASE on page 2681

Prerequisites

Create a single Fortinet Security Fabric with the following components:

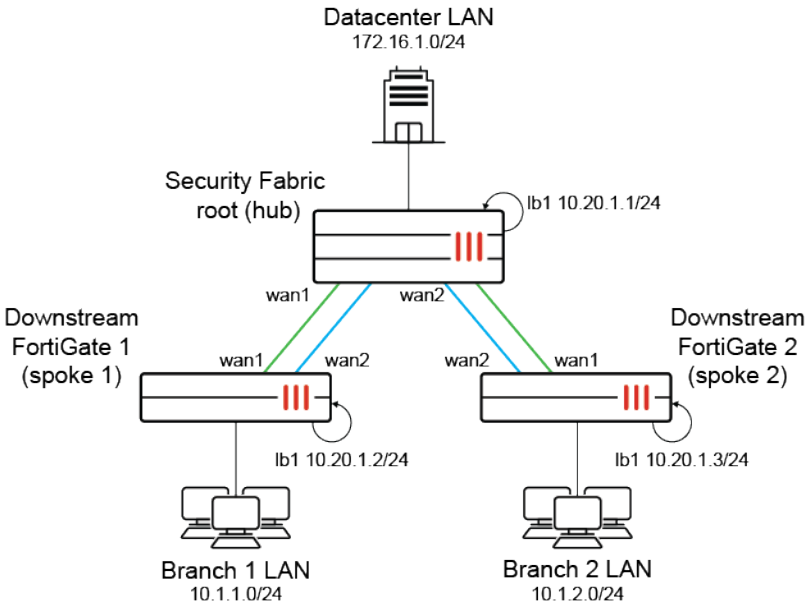
- A root FortiGate and one or more downstream FortiGates all running FortiOS 7.2.4 or later
- A FortiAnalyzer, or cloud logging using FortiAnalyzer Cloud or FortiGate Cloud
  - For FortiGate Cloud, all downstream devices must belong to the same FortiCloud account

  For more information about configuring these components, see Configuring the root FortiGate and downstream FortiGates on page 3702, Configuring FortiAnalyzer on page 3711, and Configuring cloud logging on page 3714 in the Security Fabric chapter.

The Fabric Overlay Orchestrator does not work when VDOM mode is enabled.

Network topology

The Fabric Overlay Orchestrator supports configuring an overlay for the following example hub and spoke topology using ADVPN and a single hub.



This topology corresponds to the single datacenter (active-passive gateway) design using the IPsec overlay design of one-to-one overlay mapping per underlay. For more details on these topics, see the SD-WAN Architectures for Enterprise guide.

In this topology, the datacenter FortiGate (Security Fabric root FortiGate) is the hub, and the branch FortiGates (Security Fabric downstream FortiGates) are the spokes. Each FortiGate has a distinctly defined LAN subnet and loopback interface (lb1) with an IP address within the 10.20.1.0/24 subnet.

The Fabric Overlay Orchestrator creates loopbacks to act as health check servers that are always up, and they can be accessed by adjacent Fabric devices. When configuring the policy creation option of either automatic or health check on the hub, the Fabric Overlay Orchestrator configures performance SLAs from the hub to the health check servers on 10.20.1.2 and 10.20.1.3 corresponding to the spoke 1 and spoke 2 FortiGates respectively. Likewise, when the Fabric Overlay Orchestrator runs on each spoke, it creates a performance SLA to the hub using its loopback address of 10.20.1.1.

Instead of using loopbacks, any business-critical applications and resources connected to the LAN of each device can be used as health check servers for performance SLAs.

Using the Fabric Overlay Orchestrator

If you cannot view the *VPN > Fabric Overlay Orchestrator* tree menu, configure the FortiGate as a root or a downstream device in the Security Fabric. See Configuring the root FortiGate and downstream FortiGates on page 3702 for more details.

The Fabric Overlay Orchestrator does not work when VDOM mode is enabled.

The following steps should be used to configure a self-orchestrated SD-WAN overlay within a single Security Fabric. These steps must be followed in order, and assume that the prerequisites and network topology are in place.

1. Configure the root FortiGate using the Fabric Overlay Orchestrator.
2. Configure one or more downstream FortiGates using the Fabric Overlay Orchestrator.
3. Configure an overlay on the spoke for an additional incoming interface on the hub (if applicable).
4. Verify the firewall policies on the hub FortiGate.
5. Verify the Fabric Overlay created by the Fabric Overlay Orchestrator:
   a. Verify the IPsec VPN tunnels on the hub FortiGate.
   b. Verify BGP routing on the hub FortiGate.
   c. Verify the performance SLAs on the hub FortiGate.
   d. Verify the firewall policies on a spoke FortiGate.
   e. Verify the IPsec VPN tunnels on a spoke FortiGate.
   f. Verify BGP routing on a spoke FortiGate.
   g. Verify the performance SLAs on a spoke FortiGate.
   h. Verify the spoke-to-spoke ADVPN communication.
6. Configure SD-WAN rules on the hub FortiGate.
7. Configure SD-WAN rules on the spoke FortiGates.

When configuring the root and downstream FortiGates, the Fabric Overlay Orchestrator configures the following settings in the background:

- IPsec overlay configuration (hub and spoke ADVPN tunnels)
- BGP configuration
- Policy routing
- SD-WAN zones
- SD-WAN performance SLAs

The FortiGate's role in the SD-WAN overlay is automatically determined by its role in the Security Fabric. The Fabric root will be the hub, and any first-level downstream devices from the Fabric root will be spokes.

After using the Fabric Overlay Orchestrator on all FortiGates and verifying the overlay settings, complete the SD-WAN deployment configuration using steps 3 (if applicable), and steps 6 and 7. See SD-WAN rules on page 1017 for more information.

Creating firewall policies

The Fabric Overlay Orchestrator can create firewall policies to allow all traffic through the SD-WAN overlay, or firewall policies to just allow health check traffic through it instead. When the Fabric Overlay Orchestrator is enabled on the root FortiGate, there are three *Policy creation* options:

- *Automatic*: automatically create policies for the loopback interface and tunnel overlays.
- *Health check*: automatically create a policy for the loopback interface so the SD-WAN health checks are functional.
- *Manual*: no policies are automatically created.

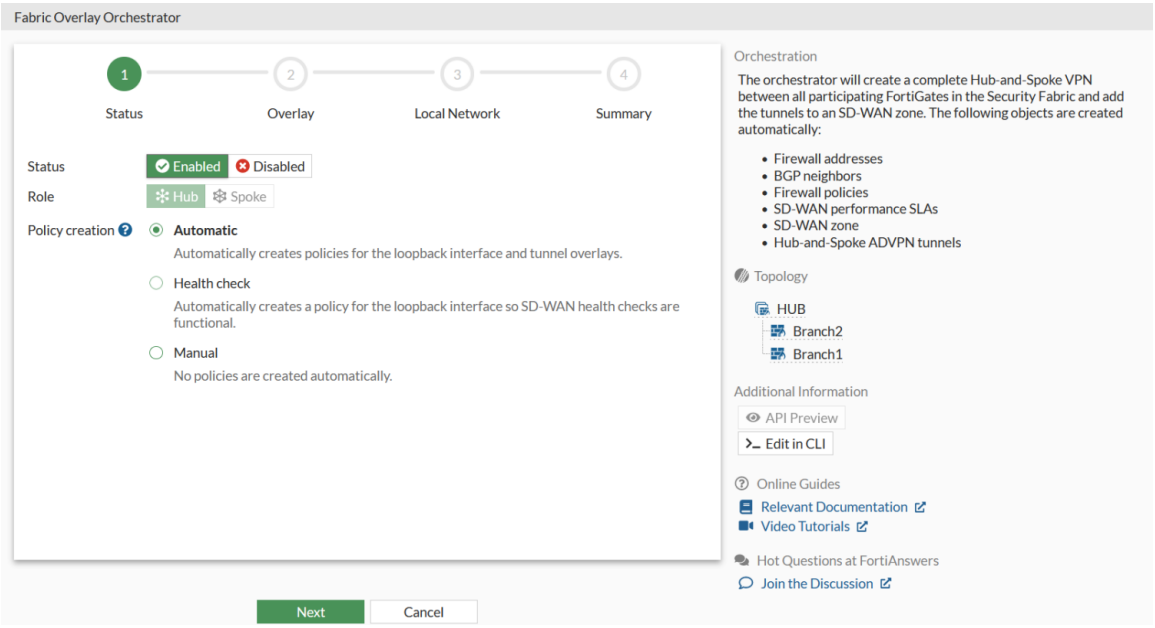
The *Automatic* policy creation option creates wildcard allow policies for the tunnel overlays. For some cases, these policies do not provide the necessary granularity to restrict overlay traffic to specific subnets or hosts.

When the Fabric Overlay Orchestrator is configured on a device, changing the policy creation rule will create new policies based on the rule, but it will not delete existing policies. Deleting existing policies must be performed manually.

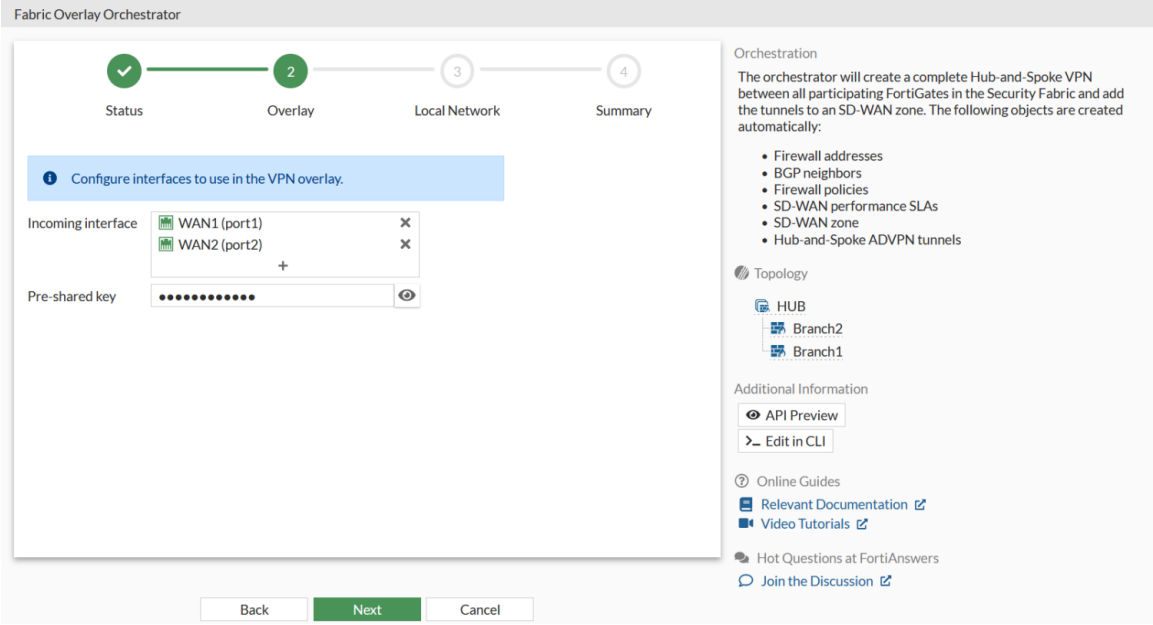
Configuring the root FortiGate using the Fabric Overlay Orchestrator

To configure the root FortiGate using the Fabric Overlay Orchestrator:

1. Go to *VPN* > *Fabric Overlay Orchestrator*.
2. Set the *Status* to *Enabled*. The *Role* is automatically selected based on the FortiGate's role in the Security Fabric. Ensure that *Hub* is selected. The Fabric root must always be the hub.
3. Set *Policy creation* to *Automatic*.

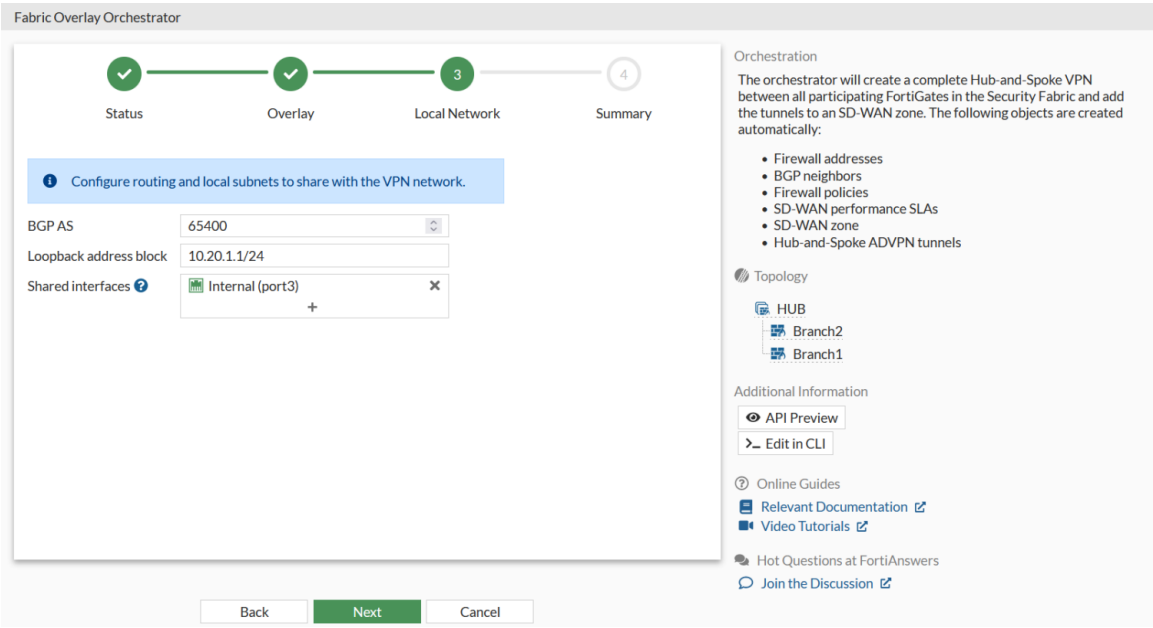


4. Click *Next*. The *Overlay* settings appear.
5. Select one or more interfaces as the *Incoming interface* or the underlay link over which the VPN overlay will be built (two incoming interfaces are selected in this example).
6. Enter the *Pre-shared key*.

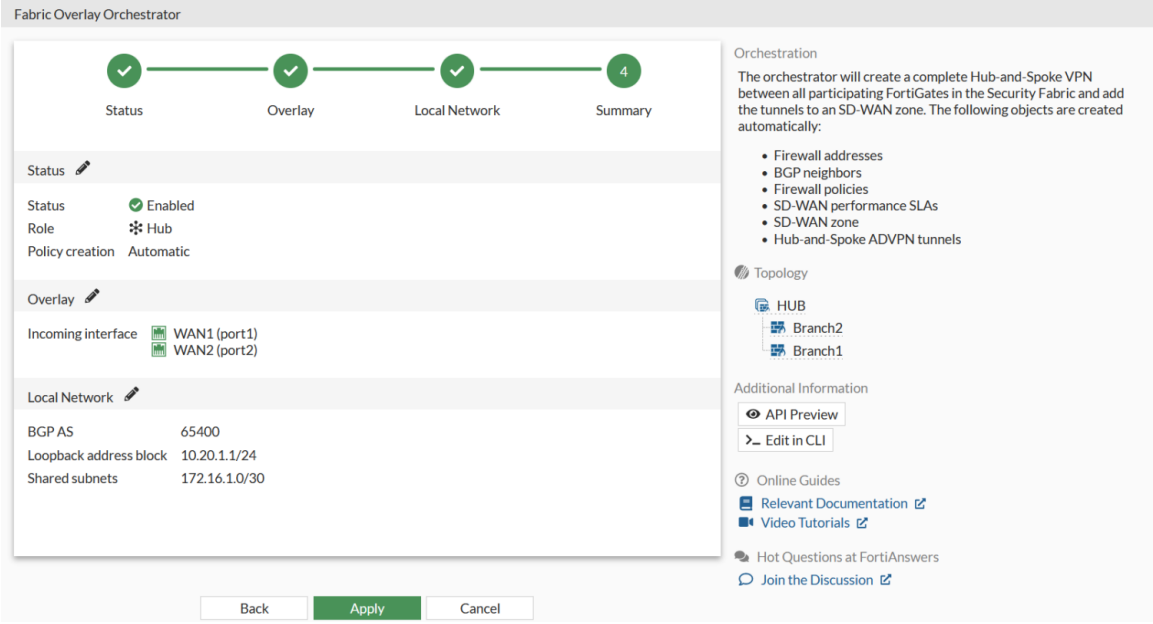


7. Click *Next*. The *Local Network* settings appear.
8. Configure routing and local subnets to share the following with the VPN network:

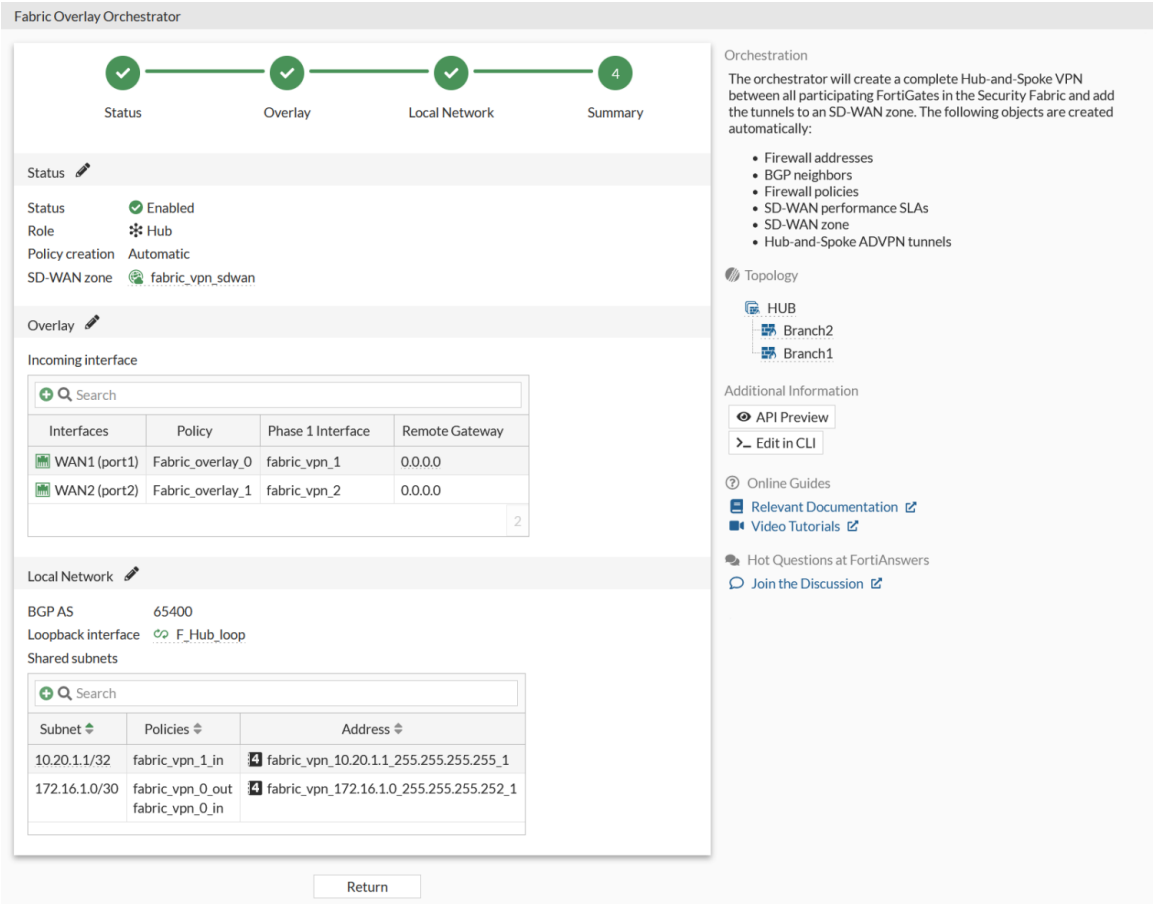
BGP AS	Optional setting to configure the BGP AS number. By default, this is set to *65400*.
Loopback address block	Optional setting to configure the loopback IP address. By default, this is set to *10.20.1.1/255.255.255.0*.
Shared interfaces	Select the interface of the local network to share with the VPN network.



9. Click *Next*. The *Summary* page appears.
10. Review the settings, then click *Apply*.



An updated *Summary* page appears with all the settings.



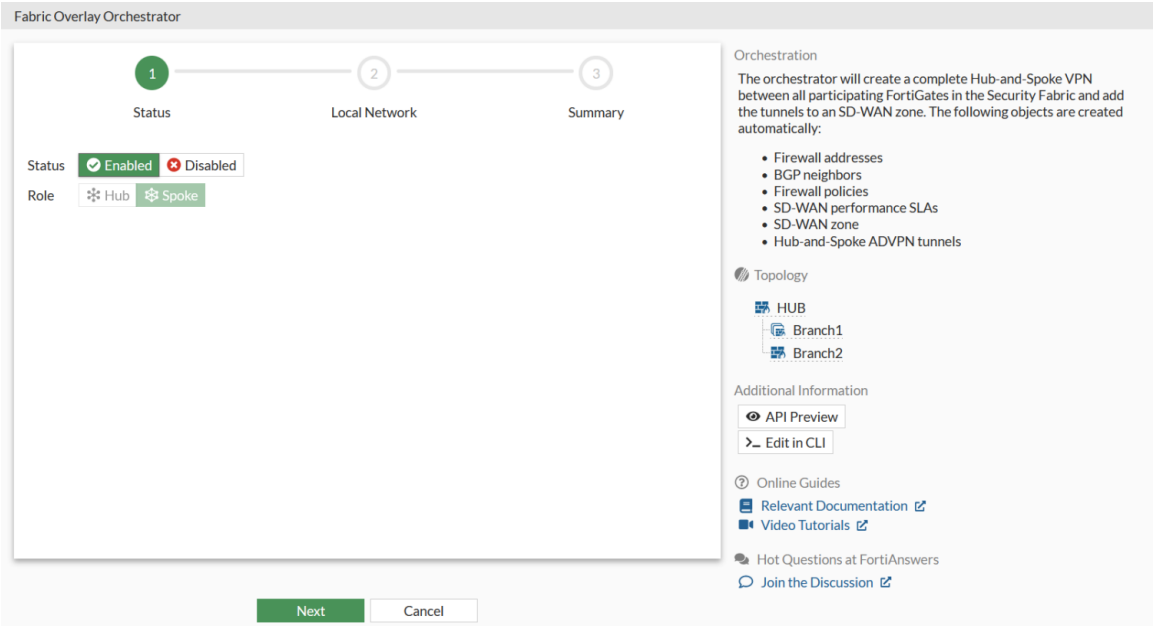
Note the following settings in this example:

SD-WAN zone	Located in the *Status* section: *fabric_vpn_sdwan*.
VPN tunnels	Located in the *Overlay* section in the *Incoming interface* table under the *Phase 1 Interface* column: *fabric_vpn1* and *fabric_vpn2*.
BGP	Located in the *Local Network* section. The *BGP AS* is *65400*. The *Shared subnets* are *10.20.1.1/32* and *172.16.1.0/30*.
Loopback interface	Located in the *Local Network* section: *F_Hub_loop*.
Firewall policies	Located in two sections: • *Overlay* section in the *Incoming interface* table under the *Policy* column: *Fabric_overlay_0* and *Fabric_overlay_1* • *Local Network* section in the *Shared subnets* table under the *Policies* column: *fabric_vpn_1_in*, *fabric_vpn_0_out*, and *fabric_vpn_0_in*

Configuring a downstream FortiGate using the Fabric Overlay Orchestrator

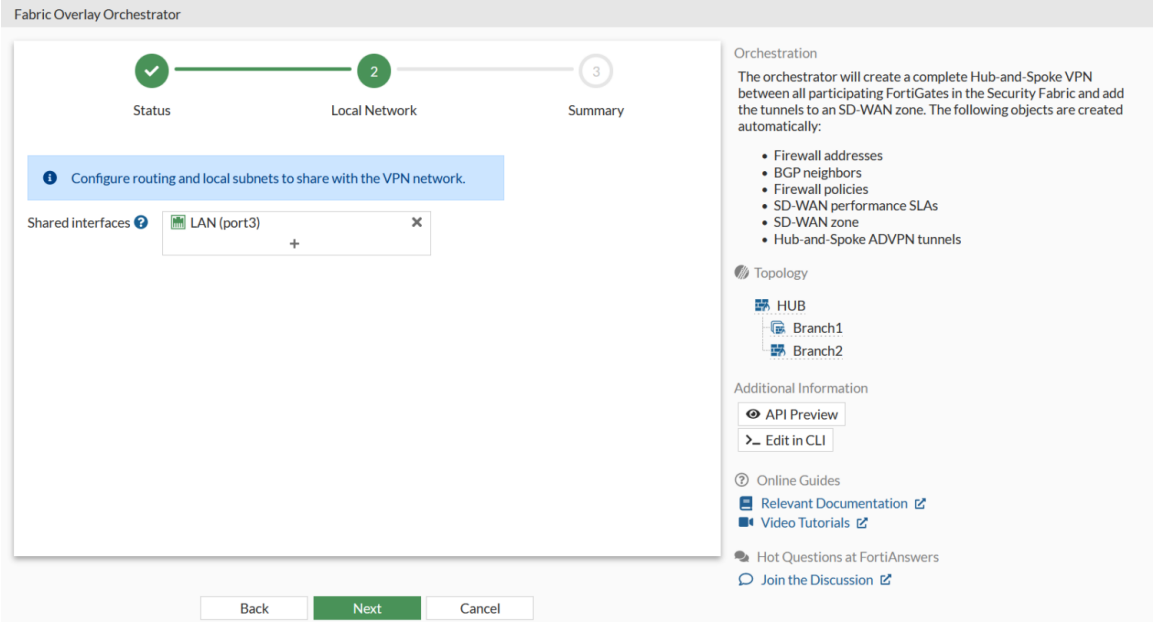
To configure a downstream FortiGate using the Fabric Overlay Orchestrator:

1. Go to *VPN* > *Fabric Overlay Orchestrator*.
2. Set the *Status* to *Enabled*. The *Role* is automatically selected based on the FortiGate's role in the Security Fabric. Ensure that *Spoke* is selected. Only downstream first-level FortiGates can be spokes.

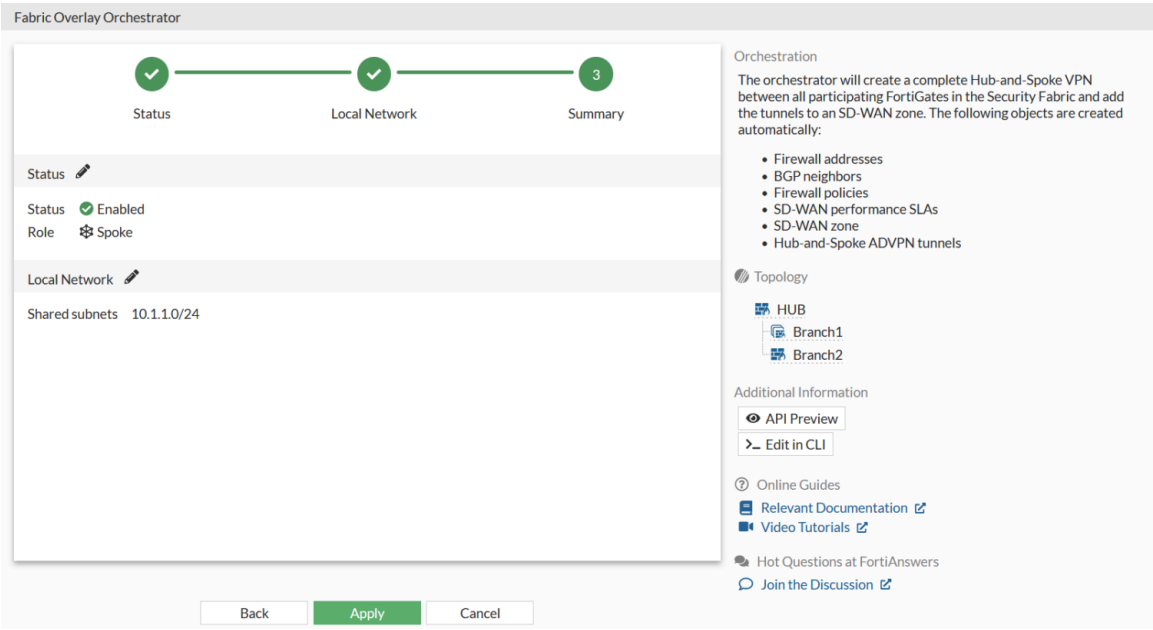


3. Click *Next*. The *Local Network* settings appear.
4. Configure the routing and local subnets to share with the VPN network in the following fields:

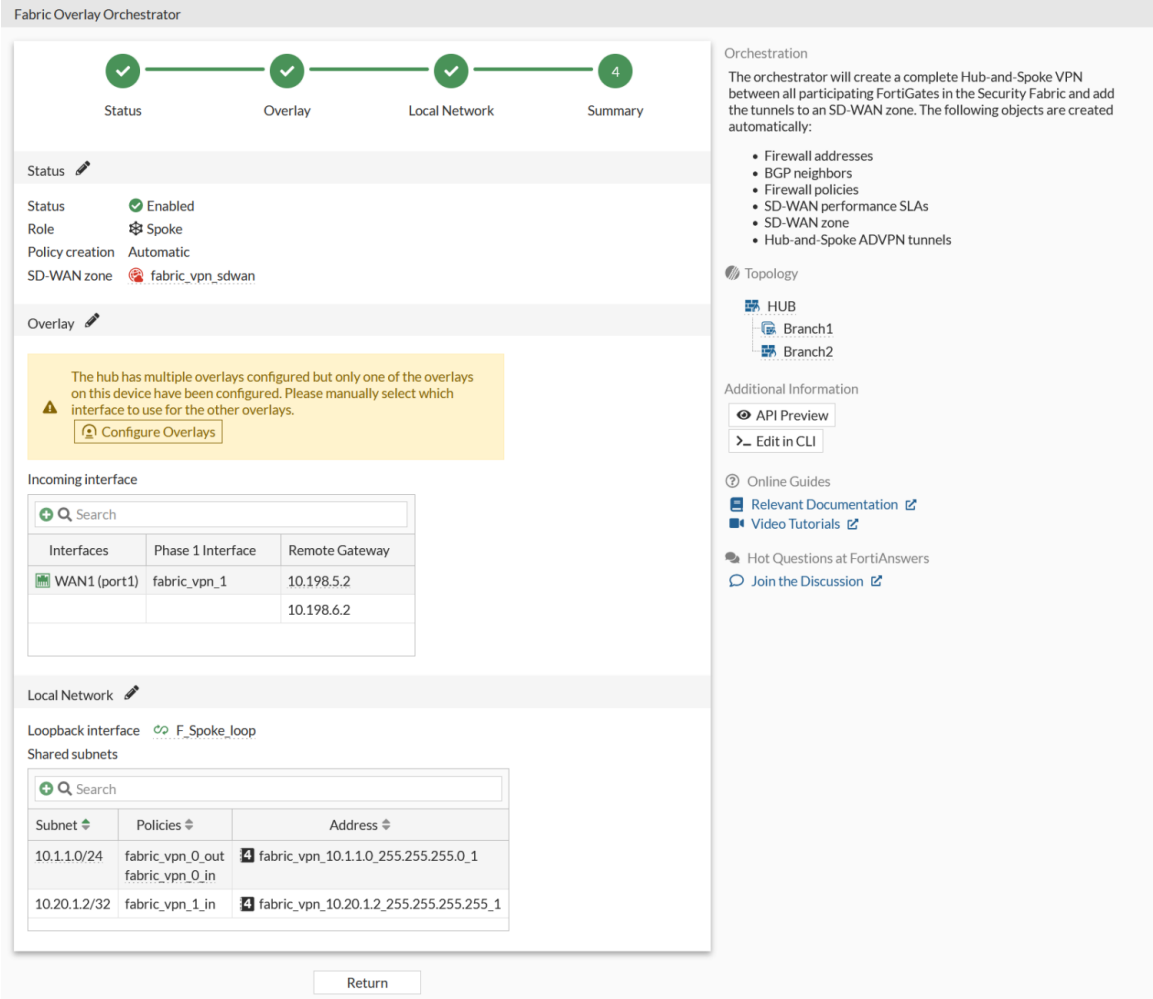
Shared interfaces	Select the interface of the local network to share with the VPN network.



5. Click *Next*. As the downstream FortiGate updates, a *Configuring spoke Fabric VPN from root FortiGate* message appears The *Summary* page appears once the update is complete.



6. Review the settings, then click *Apply*.
   An updated *Summary* page appears with all the settings.



Note the following settings in this example:

SD-WAN zone	Located in the *Status* section: *fabric_vpn_sdwan*.
VPN tunnels	Located in the *Overlay* section in the *Incoming interface* table under the *Phase 1 Interface* column: *fabric_vpn1*.
BGP	Located in the *Local Network* section. The *BGP AS* is *65400*. The *Shared subnets* are *10.1.1.0/24* and *10.20.1.2/32*.
Loopback interface	Located in the *Local Network* section: *F_Hub_loop*.
Firewall policies	Located in the *Local Network* section in the *Shared subnets* table under the *Policies* column: *fabric_vpn_0_out*, *fabric_vpn_0_in*, and *fabric_vpn_1_in*.

The loopback IP addresses for the branches are generated based on the index number of the trusted device in the root FortiGate's Security Fabric (HUB) configuration.

```
config system csf
    set status enable
    set group-name "fabric"
```

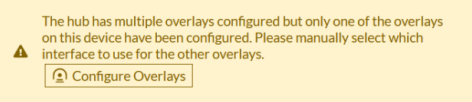
```
    config trusted-list
        edit "FGVM02TM22000001"
            set serial "FGVM02TM22000001"
            set index 1
        next
        edit "FGVM02TM22000002"
            set serial "FGVM02TM22000002"
            set index 2
        next
    end
end
```

For example, if Branch1 (index 1) is the first FortiGate and Branch2 (index 2) is the second FortiGate authorized on the root FortiGate, the loopback addresses are generated as follows:

- Branch1 loopback IP: 10.20.1.2
- Branch2 loopback IP: 10.20.1.3

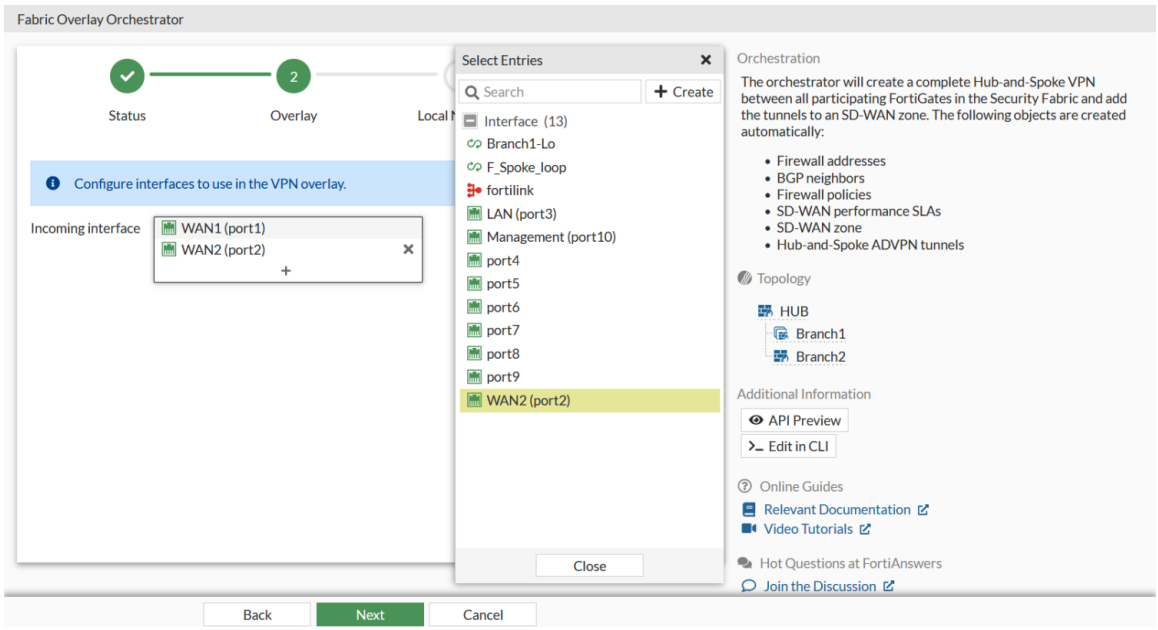
Configuring an overlay on the spoke for an additional incoming interface on the hub

A hub typically includes two incoming interfaces, but additional interfaces can be configured if needed. On downstream devices, the following warning is displayed on the *Fabric Overlay Orchestrator* page that *The hub has multiple overlays configured but only one of the overlays on this device have been configured. Please manually select which interface to use for the other overlays.*

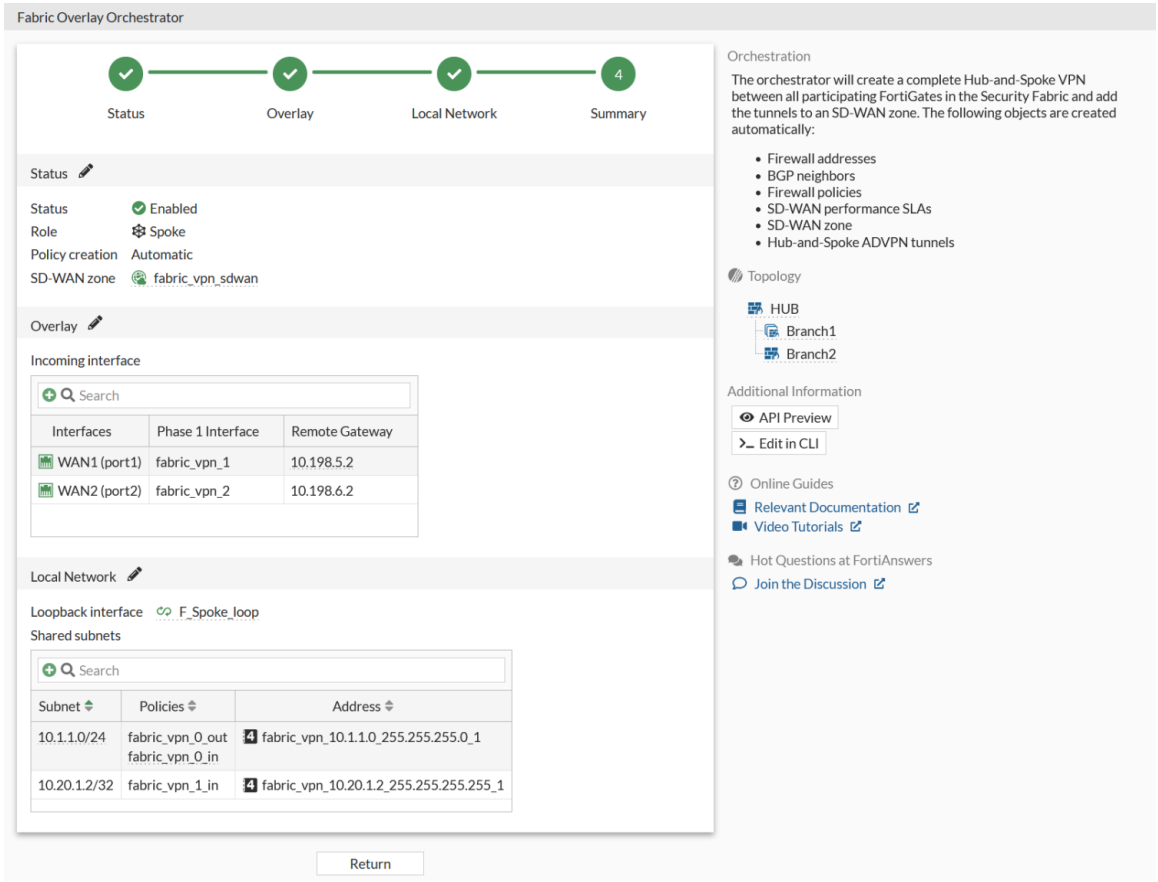


To configure an additional incoming interface on a spoke:

1. Go to *VPN > Fabric Overlay Orchestrator*.
2. Click *Configure Overlays* in the warning box.
3. Navigate to the *Overlay* section, click the *+* in the *Incoming interface* field, and select *WAN2 (port2)* to add it to the overlay.



4. Click *Next*, then complete the remaining steps in the GUI wizard. On the *Summary* page, the additional interface *WAN2 (port2)* appears in the *Incoming interfaces* table.

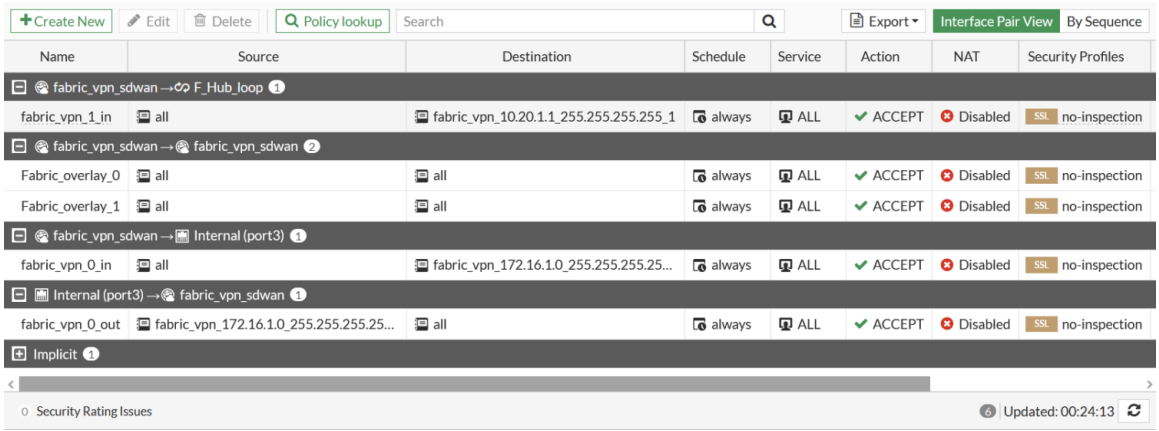


Verifying the firewall policies on the hub FortiGate

Different policies are created on the hub FortiGate based on the *Policy creation* setting in the Fabric Overlay Orchestrator configuration (*Automatic*, *Health check*, or *Manual*).

Automatic

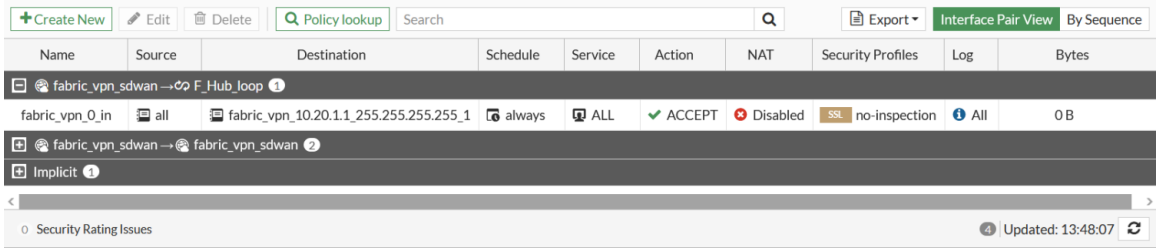
Go to *Policy & Objects* > *Firewall Policy* to verify that wildcard firewall policies have been configured on the hub FortiGate. This Fabric Overlay Orchestrator configuration example uses automatic policy creation, and the following firewall policies are configured:



The *Automatic* policy creation option creates wildcard allow policies for the tunnel overlays. For some cases, these policies do not provide the necessary granularity to restrict overlay traffic to specific subnets or hosts.

Health check

Go to *Policy & Objects* > *Firewall Policy* to verify that a single firewall policy allowing health check traffic to the hub's loopback has been configured on the hub FortiGate. For example:



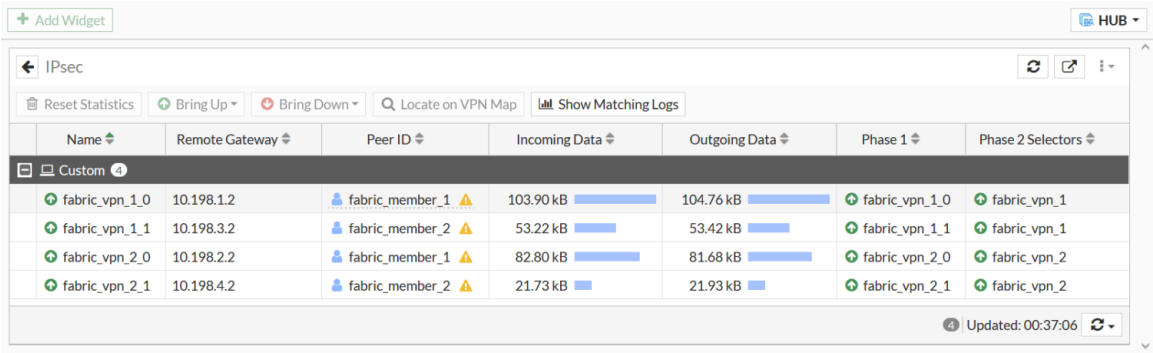
Manual

Go to *Policy & Objects* > *Firewall Policy* to verify that no firewall policies have been created by the Fabric Overlay Orchestrator. If desired, firewall policies must be manually configured on the hub FortiGate to allow traffic to the loopback interface for health checks and the overlays.

Verifying the Fabric Overlay created by the Fabric Overlay Orchestrator

To verify the IPsec VPN tunnels on the hub:

1. Go to *Dashboard* > *Network* and click the *IPsec* widget to expand it.
2. Verify that there are two tunnels established for each phase 1 interface.



The naming convention <tunnel_name>_<number> indicates the relative order in which the tunnels were established:

fabric_vpn_1_0	VPN tunnel listening on the hub's WAN1 incoming interface; established with spoke 1 using its WAN1 interface
fabric_vpn_1_1	VPN tunnel listening on the hub's WAN1 incoming interface; established with spoke 2 using its WAN1 interface
fabric_vpn_2_0	VPN tunnel listening on the hub's WAN2 incoming interface; established with spoke 1 using its WAN2 interface
fabric_vpn_2_1	VPN tunnel listening on the hub's WAN2 incoming interface; established with spoke 2 using its WAN2 interface

Verify the BGP routing on the hub:

1. In the CLI, check the BGP peering status:

```
HUB # get router info bgp summary

VRF 0 BGP router identifier 10.20.1.1, local AS number 65400
BGP table version is 11
1 BGP AS-PATH entries
0 BGP community entries
Next peer check timer due in 43 seconds

Neighbor    V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.10.10.1  4      65400      23      27       11    0    0 00:09:28        2
10.10.10.2  4      65400      16      16       11    0    0 00:06:36        2
10.10.11.1  4      65400      14      20       11    0    0 00:09:22        2
10.10.11.2  4      65400       7      11       11    0    0 00:03:22        2
```

```
Total number of neighbors 4
```

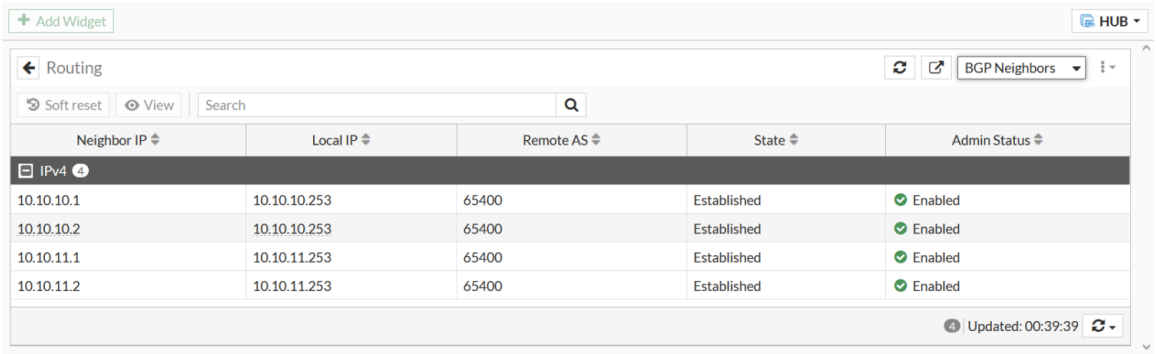
2. Check the BGP advertised routes:

```
HUB # get router info bgp neighbors 10.10.10.1 advertised-routes
VRF 0 BGP table version is 11, local router ID is 10.20.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          Next Hop            Metric     LocPrf Weight RouteTag Path
*>i10.1.1.0/24      10.10.11.1                       100      0        0 i <-/2>
*>i10.1.2.0/24      10.10.11.2                       100      0        0 i <-/2>
*>i10.1.2.0/24      10.10.10.2                       100      0        0 i <-/1>
*>i10.10.10.0/24    10.10.10.253                     100  32768        0 i <-/1>
*>i10.10.11.0/24    10.10.10.253                     100  32768        0 i <-/1>
*>i10.20.1.1/32     10.10.10.253                     100  32768        0 i <-/1>
*>i10.20.1.2/32     10.10.11.1                       100      0        0 i <-/2>
*>i10.20.1.3/32     10.10.11.2                       100      0        0 i <-/2>
*>i10.20.1.3/32     10.10.10.2                       100      0        0 i <-/1>
*>i172.16.1.0/30    10.10.10.253                     100  32768        0 i <-/1>

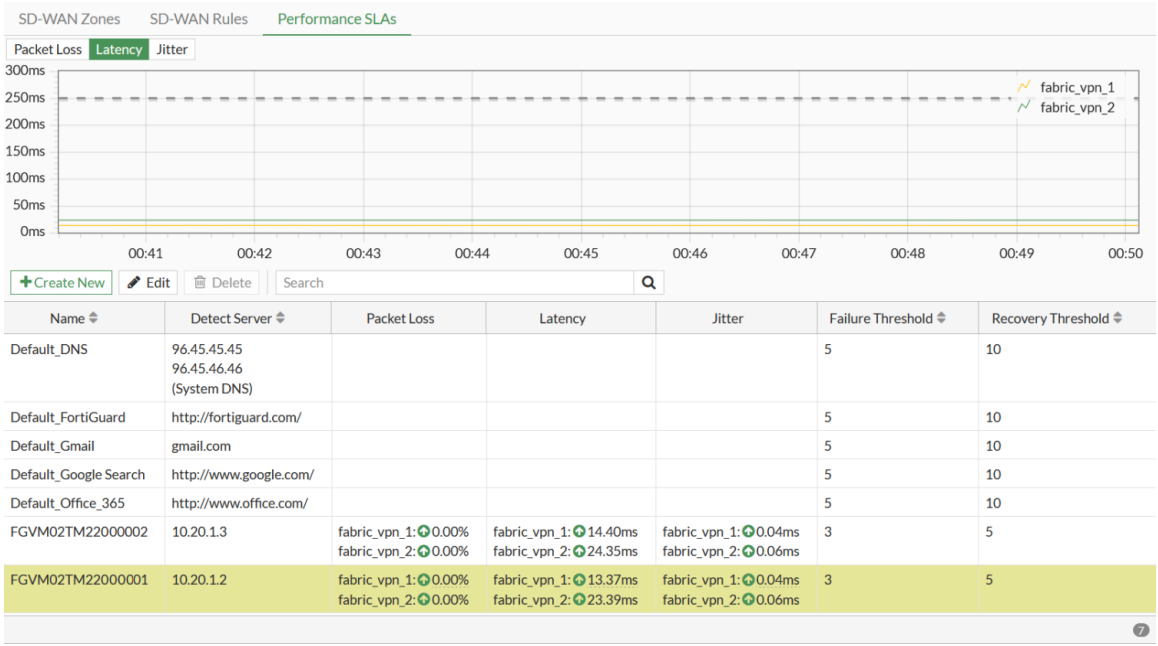
Total number of prefixes 10
```

3. In the GUI, go to *Dashboard* > *Network* and click the *Routing* widget to expand it.
4. In the dropdown, select *BGP Neighbors*.



To verify the performance SLAs on the hub:

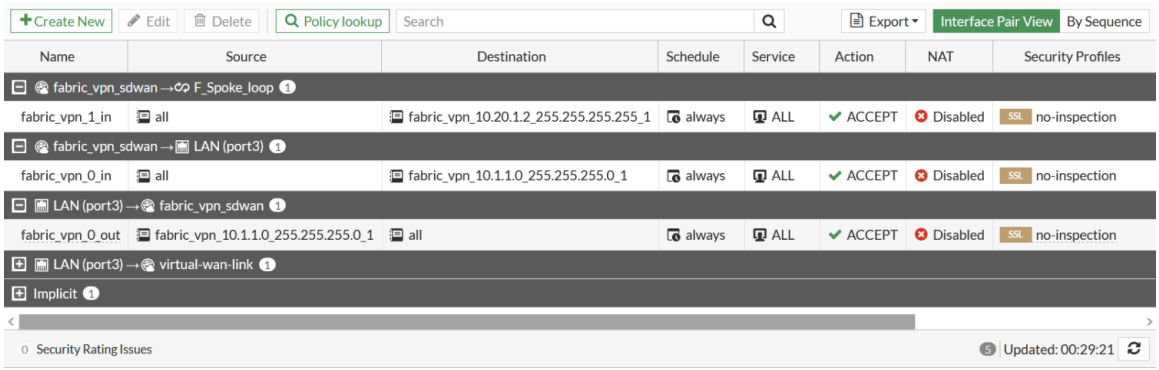
1. Go to *Network* > *SD-WAN* and select the *Performance SLAs* tab.
2. Verify that the performance SLAs are automatically created for each spoke. The performance SLA naming uses the serial number of the spoke FortiGate. There are two new entries.



To verify the firewall policies on a spoke FortiGate:

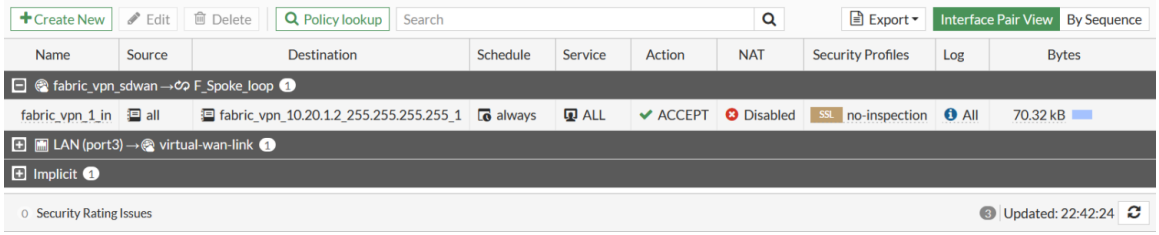
Different policies are created on the spoke FortiGates based on the hub's *Policy creation* setting in the Fabric Overlay Orchestrator configuration (*Automatic*, *Health check*, or *Manual*). The *Automatic* setting is used in this example.

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Verify that wildcard firewall policies have been configured.



The *Automatic* policy creation option creates wildcard allow policies for the tunnel overlays. For some cases, these policies do not provide the necessary granularity to restrict overlay traffic to specific subnets or hosts.

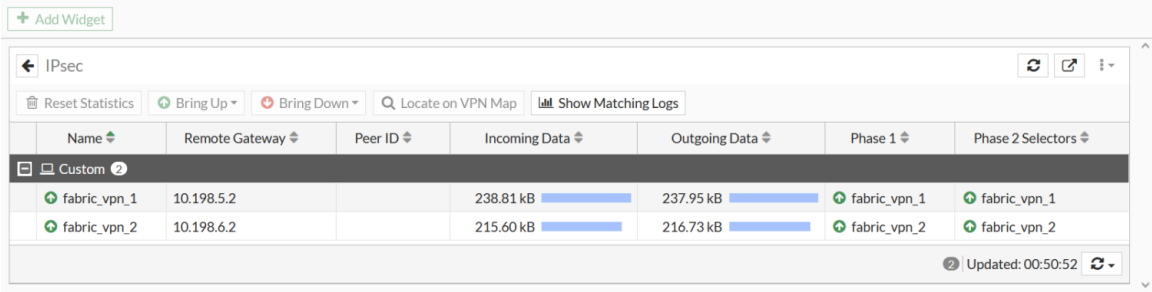
If the hub's *Policy creation*setting is *Health Check*, a single firewall policy that allows health check traffic to the spoke's loopback should be configured on the spoke FortiGates:



If the hub's *Policy creation*setting is *Manual*, there should be no new policies created by the Fabric Overlay Orchestrator. If desired, firewall policies must be manually configured on the spoke FortiGates to allow traffic to the loopback interface for health checks and the overlays.

To verify the IPsec VPN tunnels on a spoke:

1. Go to *Dashboard* > *Network* and click the *IPsec* widget to expand it.
2. Verify the IPsec tunnels that go back to the hub.



To verify BGP routing on a spoke:

1. In the CLI, check the BGP peering status:

```
Branch1 # get router info bgp summary

VRF 0 BGP router identifier 10.20.1.2, local AS number 65400
BGP table version is 5
1 BGP AS-PATH entries
0 BGP community entries

Neighbor     V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.10.10.253 4      65400      41      37        4    0    0 00:23:39        8
10.10.11.253 4      65400      38      34        4    0    0 00:23:33        8

Total number of neighbors 2
```

2. Check the BGP advertised routes:

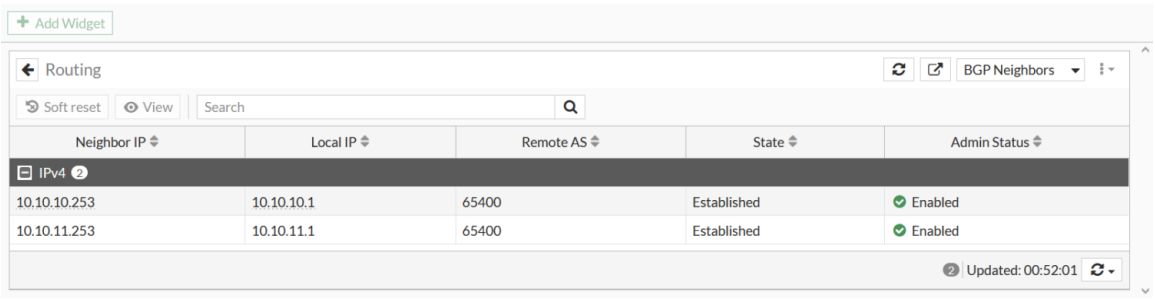
```
Branch1 # get router info bgp neighbors 10.10.10.253 advertised-routes
VRF 0 BGP table version is 5, local router ID is 10.20.1.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          Next Hop            Metric     LocPrf Weight RouteTag Path
```

```
*>i10.1.1.0/24      10.10.10.1                    100  32768        0 i <0/->
*>i10.20.1.2/32     10.10.10.1                    100  32768        0 i <0/->

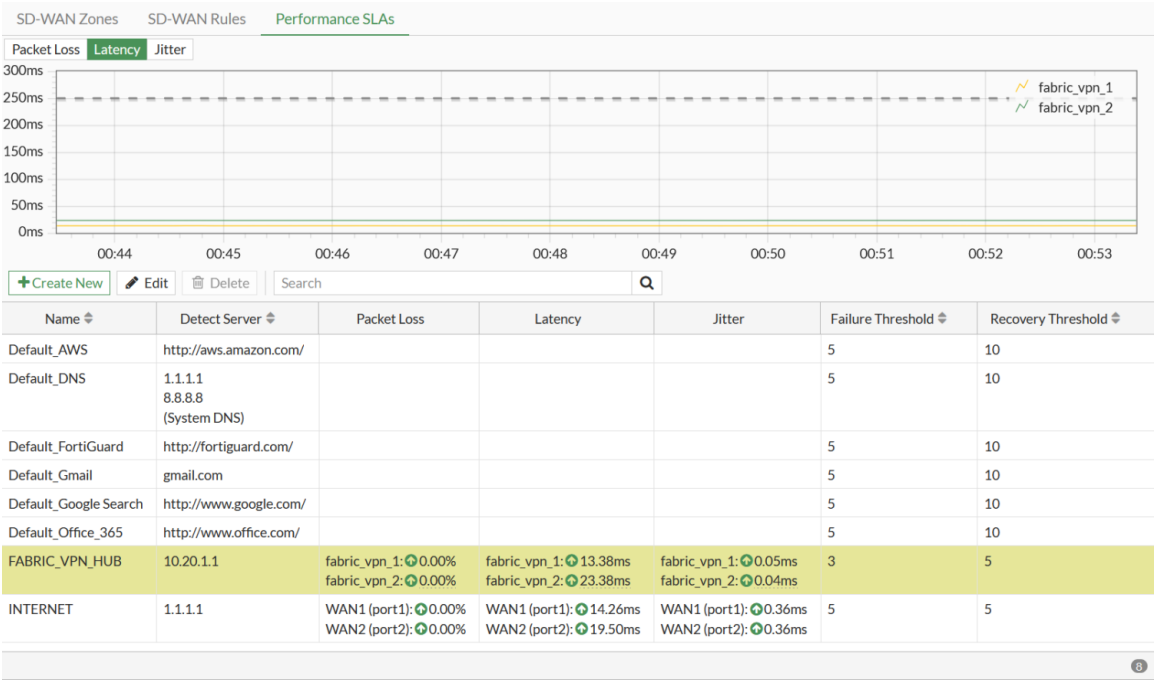
Total number of prefixes 2
```

3. In the GUI, go to *Dashboard* > *Network* and click the *Routing* widget to expand it.
4. In the dropdown, select *BGP Neighbors*.



To verify the performance SLAs on a spoke:

1. Go to *Network* > *SD-WAN* and select the *Performance SLAs* tab.
2. Verify that the performance SLA is automatically created for the hub FortiGate. There is a new entry (*FABRIC_VPN_HUB*).



To verify the spoke-to-spoke ADVPN communication:

1. From Branch1, ping Branch2 (10.20.1.3):

```
Branch1 # exec ping-options source 10.20.1.2
Branch1 # exec ping 10.20.1.3
```

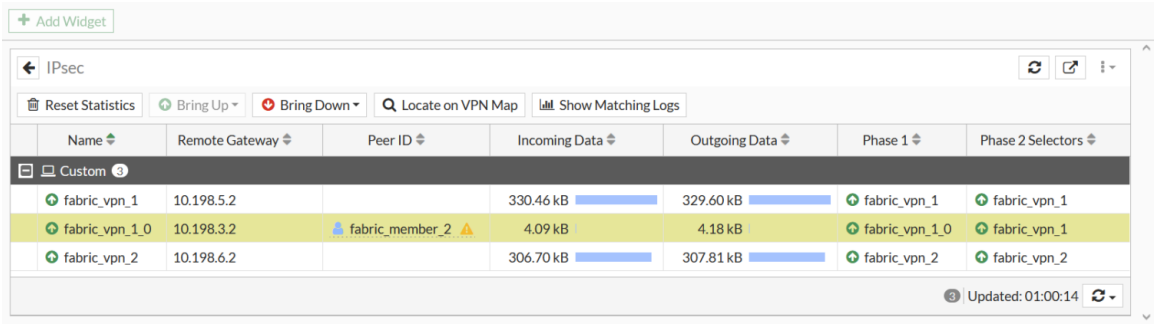
```
PING 10.20.1.3 (10.20.1.3): 56 data bytes
64 bytes from 10.20.1.3: icmp_seq=0 ttl=254 time=27.7 ms
64 bytes from 10.20.1.3: icmp_seq=2 ttl=255 time=17.4 ms
64 bytes from 10.20.1.3: icmp_seq=3 ttl=255 time=17.5 ms
64 bytes from 10.20.1.3: icmp_seq=4 ttl=255 time=17.4 ms

--- 10.20.1.3 ping statistics ---
5 packets transmitted, 4 packets received, 20% packet loss
round-trip min/avg/max = 17.4/20.0/27.7 ms
```

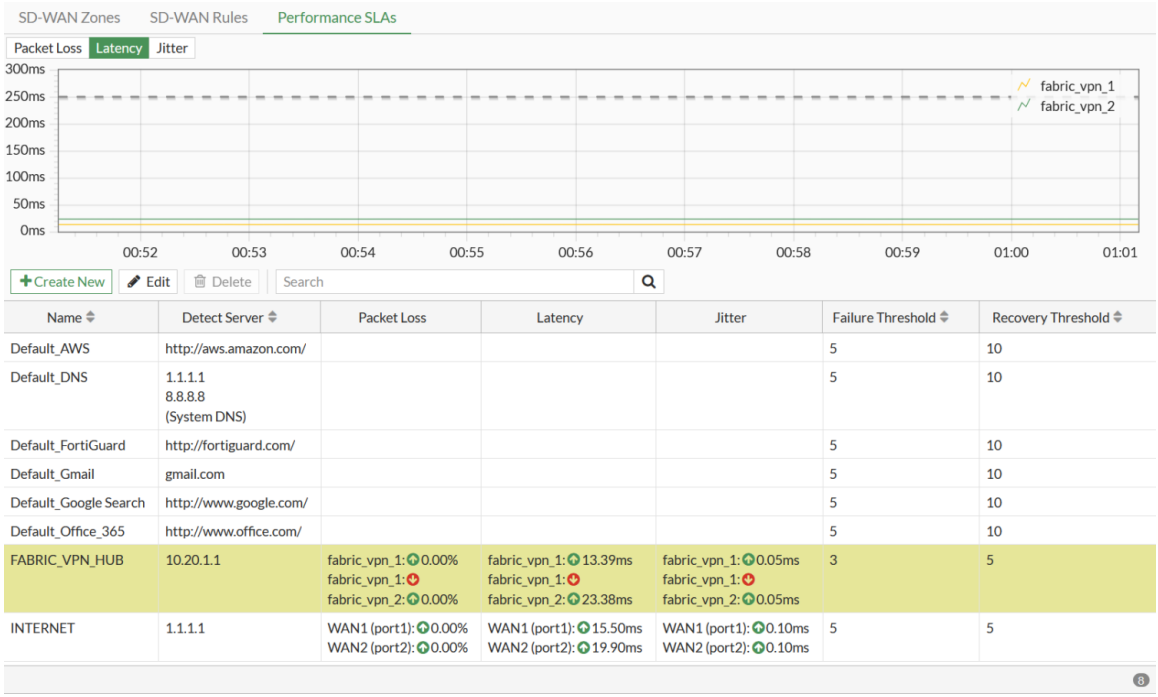
2. Verify the IPsec tunnel summary.
   - In the CLI, enter the following:

     ```
     Branch1 # get vpn ipsec tunnel summary
     'fabric_vpn_1_0' 10.198.3.2:0  selectors(total,up): 1/1  rx(pkt,err): 25/0  tx(pkt,err):
     26/2
     'fabric_vpn_1' 10.198.5.2:0  selectors(total,up): 1/1  rx(pkt,err): 8032/0  tx(pkt,err):
     8022/2
     'fabric_vpn_2' 10.198.6.2:0  selectors(total,up): 1/1  rx(pkt,err): 7462/0  tx(pkt,err):
     7478/1
     ```

     The `fabric_vpn_1_0` tunnel was created for spoke 1-to-spoke 2 communication.
   - In the GUI, go to *Dashboard* > *Network* and click the *IPsec* widget to expand it.



3. Verify that the performance SLA was updated. Go to *Network* > *SD-WAN* and select the *Performance SLAs* tab.



The first performance SLA, *fabric_vpn_1*, that corresponds to the spoke-to-hub VPN tunnel is shown as up. The second one, *fabric_vpn_1* that corresponds to the spoke-to-spoke VPN tunnel (*fabric_vpn_1_0*) is shown as down since 10.20.1.1 is the IP address corresponding to the hub's loopback interface that is not present on another spoke.

Configuring SD-WAN rules on the hub FortiGate

On the hub, the Fabric Overlay Orchestrator automatically creates a performance SLA that corresponds to each spoke FortiGate using the serial number as the name of the performance SLA. SD-WAN rules must be configured on the hub FortiGate to direct traffic to each of the spokes using these performance SLAs.

To configure SD-WAN rules on the hub FortiGate:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Enter a name (such as *Hub-To-Br1*).
3. In the *Source* section, set the *Address* to the local subnet of the hub.
4. Configure the following in the *Destination* section:
   a. Set the *Address* to the local subnet of the spoke. If an address object does not exist yet, click *Create* in the slide-out pane and configure the address.
   b. Set the *Protocol number* as needed (default = *ANY*).
5. Configure the following in the *Outgoing Interfaces* section:
   a. Set the *Interface selection strategy* to *Lowest cost (SLA)*.
   b. Set the *Interface preference* to the SD-WAN members.
   c. Set *Required SLA target* to the corresponding performance SLA created by the Fabric Overlay Orchestrator for this the spoke. The name is based on the spoke FortiGate's serial number (*FGVM0XXX00000000 #1*).

6. Click *OK*.
7. Repeat these steps for the other spoke. Ensure the *Name* is unique, and that the *Destination* address corresponds to the local subnet behind the spoke.

If you need to disable the Fabric Overlay Orchestrator on the hub FortiGate by setting the *Status* to *Disabled*, you must first delete any SD-WAN rules on the hub FortiGate created using this procedure to ensure the added configuration does not block the clean-up process.

Configuring SD-WAN rules on the spoke FortiGates

On each spoke, the Fabric Overlay Orchestrator automatically creates a performance SLA that corresponds to the hub FortiGate. An SD-WAN rule must be configured on the spoke FortiGates to direct traffic to the hub FortiGate using this performance SLA.

To configure an SD-WAN rule on a spoke FortiGate:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Enter a name (such as *LAN-to-HUB*).
3. In the *Source* section, set the *Address* to the local subnet of the spoke.
4. Configure the following in the *Destination* section:
   a. Set the *Address* to the local subnet of the hub. If an address object does not exist yet, click *Create* in the slide-out pane and configure the address.
   b. Set the *Protocol number* as needed (default = *ANY*).
5. Configure the following in the *Outgoing Interfaces* section:
   a. Set the *Interface selection strategy* to *Lowest cost (SLA)*.
   b. Set the *Interface preference* to the SD-WAN members.
   c. Set *Required SLA target* to the corresponding performance SLA created by the Fabric Overlay Orchestrator, which is named *FABRIC_VPN_HUB#1* by default.
6. Click *OK*.

If you need to disable the Fabric Overlay Orchestrator on a spoke FortiGate by setting the *Status* to *Disabled*, you must first delete any SD-WAN rules on the spoke FortiGate created using this procedure to ensure the added configuration does not block the clean-up process.

SPA easy configuration key for FortiSASE

A gutter section is available in the *Fabric Overlay Orchestrator* page if the FortiSASE SPA license is active. From this section, the user can open a pane that will generate a FortiSASE SPA easy configuration key based on the current Fabric Overlay Orchestrator configuration which can be used in the SPA setup of FortiSASE.

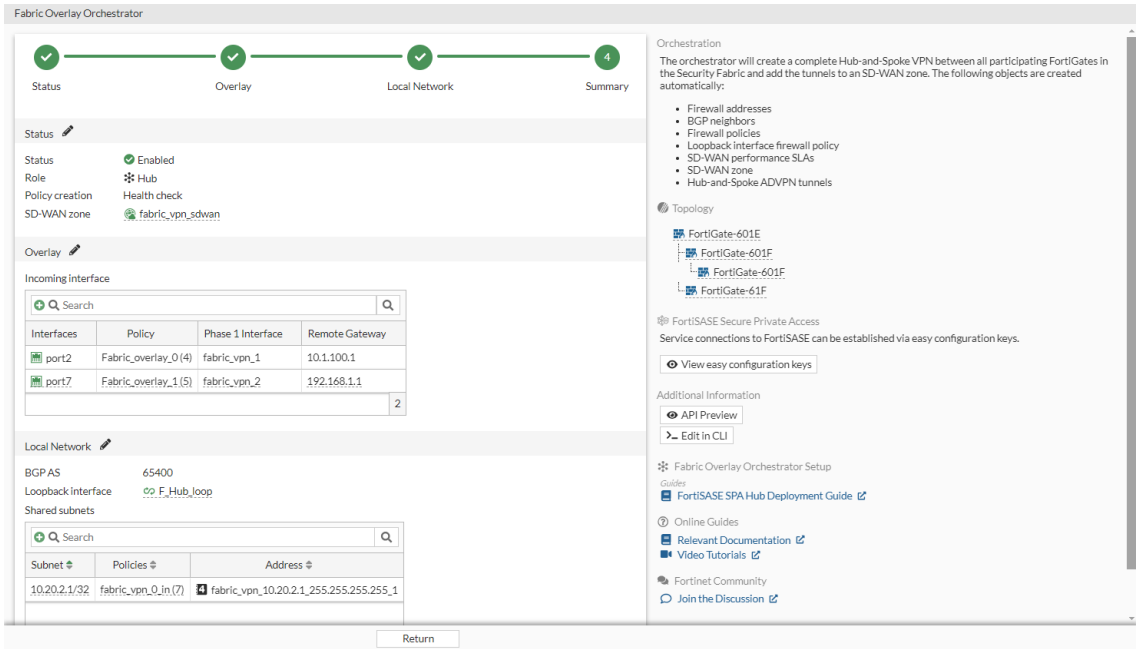
The easy configuration key is an encode of Base64 of a JSON object. It includes the FortiOS version, gateway, peer IP address, BGP Autonomous Systems (AS), BGP method, and the FortiSASE BGP router subnet.

To access the easy configuration key:

1. Prepare the two FortiGates:
   a. Go to *System* > *FortiGuard* and confirm that the FortiGates have a FortiSASE SPA license.

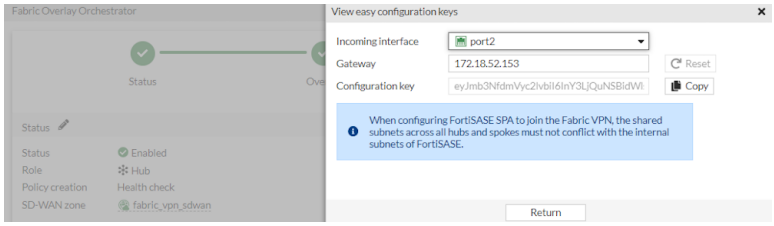
   b. Configure the Security Fabric in both FortiGates.
   c. Go to *VPN* > *Fabric Overlay Orchestrator* and enable it on both FortiGates. See Using the Fabric Overlay Orchestrator on page 2663.

   The *FortiSASE Secure Private Access* section will be included in the gutter.



2. Access the easy configuration key:

a. In *VPN* > *Fabric Overlay Orchestrator*, click *View easy configuration keys* in the gutter.
The *View easy configuration keys* pane is displayed.



b. Select the *Incoming interface*.

c. Enter the *Gateway*.

Shared subnets cannot conflict with FortiSASE's internal subnets.

d. Click *Copy* beside the *Configuration key*.
This easy configuration key can be pasted into FortiSASE when setting up SPA.

If the FortiOS administrator makes any changes to BGP or to their IPsec, the configuration key is auto-updated on FortiOS. However, the FortiSASE administrator needs to know to re-copy and paste the configuration into FortiSASE.

Currently, there is no way to detect the above and throw a warning on either FortiSASE nor FortiOS GUI.

Other VPN topics

The following topics provide instructions on configuring other VPN topics.

VPN and ASIC offload

This topic provides a brief introduction to VPN traffic offloading.

IPsec traffic processed by NPU

1. Check the device ASIC information. For example, a FortiGate 900D has an NP6 and a CP8.

```
# get hardware status
Model name: [[QualityAssurance62/FortiGate]]-900D
ASIC version: CP8
ASIC SRAM: 64M
CPU: Intel(R) Xeon(R) CPU E3-1225 v3 @ 3.20GHz
Number of CPUs: 4
RAM: 16065 MB
Compact Flash: 1925 MB /dev/sda
Hard disk: 244198 MB /dev/sdb
USB Flash: not available
Network Card chipset: [[QualityAssurance62/FortiASIC]] NP6 Adapter (rev.)
```

2. Check port to NPU mapping.

```
# diagnose npu np6 port-list
Chip   XAUI Ports            Max   Cross-chip
                             Speed offloading
----

        1.    port13           1G    Yes
        1.    port14           1G    Yes
        1.    portA            10G   Yes
        1.
----
```

3. Configure the option in IPsec phase1 settings to control NPU encrypt/decrypt IPsec packets (enabled by default).

```
config vpn ipsec phase1/phase1-interface
    edit "vpn_name"
        set npu-offload enable/disable
    next
end
```

4. Check NPU offloading. The NPU encrypted/decrypted counter should tick. The `npu_flag 03` flag means that the traffic processed by the NPU is bi-directional.

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0

```

2. Two options are used to control if the CP processes packets. If disabled, packets are processed by the CPU.

```
config system global
    set ipsec-asic-offload disable
    set ipsec-hmac-offload disable
end
```

IPsec traffic processed by CPU

IPsec traffic might be processed by the CPU for the following reasons:

- Some entry-level models do not have NPUs.
- NPU offloading and CP IPsec traffic processing manually disabled.
- Some types of proposals - SEED, ARIA, chacha20poly1305 - are not supported by the NPU or CP.
- NPU flag set to 00 and software encrypt/decrypt counter ticked.

```

Disable automatic ASIC offloading

When `auto-asic-offload` is set to `disable` in the firewall policy, traffic is not offloaded and the NPU hosting counter is ticked.

```

```

Encryption algorithms

This topic provides a brief introduction to IPsec phase 1 and phase 2 encryption algorithms and includes the following sections:

- IKEv1 phase 1 encryption algorithm
- IKEv1 phase 2 encryption algorithm
- IKEv2 phase 1 encryption algorithm
- IKEv2 phase 2 encryption algorithm
- HMAC settings

IKEv1 phase 1 encryption algorithm

The default encryption algorithm is:

```
aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
```

DES is a symmetric-key algorithm, which means the same key is used for encrypting and decrypting data. FortiOS supports:

- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

3DES applies the DES algorithm three times to each data. FortiOS supports:

- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

AES is a symmetric-key algorithm with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512

The ARIA algorithm is based on AES with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-md5

- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

SEED is a symmetric-key algorithm. FortiOS supports:

- seed128-md5
- seed128-sha1
- seed128-sha256
- seed128-sha384
- seed128-sha512

Suite-B is a set of AES encryption with ICV in GCM mode. IPsec traffic can be offloaded on NP6XLite and NP7 platforms. They cannot be offloaded on other NP6 processors and below. CP9 supports Suite-B offloading, otherwise packets are encrypted and decrypted by software. FortiOS supports:

- suite-b-gcm-128
- suite-b-gcm-256

See Network processors (NP6, NP6XLite, NP6Lite, and NP4) and CP9, CP9XLite, and CP9Lite capabilities in the Hardware Acceleration guide for more information.

IKEv1 phase 2 encryption algorithm

The default encryption algorithm is:

```
aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
```

With null encryption, IPsec traffic can offload NPU/CP. FortiOS supports:

- null-md5
- null-sha1
- null-sha256
- null-sha384
- null-sha512

With the DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- des-null
- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

With the 3DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- 3des-null
- 3des-md5
- 3des-sha1
- 3des-sha256

- 3des-sha384
- 3des-sha512

With the AES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- aes128-null
- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-null
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-null
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512

With the AESGCM encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aes128gcm
- aes256gcm

With the chacha20poly1305 encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- chacha20poly1305

With the ARIA encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aria128-null
- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-null
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-null
- aria256-md5

- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

With the SEED encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- seed-null
- seed-md5
- seed-sha1
- seed-sha256
- seed-sha384
- seed-sha512

IKEv2 phase 1 encryption algorithm

The default encryption algorithm is:

```
aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384 chacha20poly1305-prfsha256
```

DES is a symmetric-key algorithm, which means the same key is used for encrypting and decrypting data. FortiOS supports:

- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

3DES applies the DES algorithm three times to each data. FortiOS supports:

- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

AES is a symmetric-key algorithm with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes128gcm-prfsha1
- aes128gcm-prfsha256
- aes128gcm-prfsha384
- aes128gcm-prfsha512
- aes192-md5

- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512
- aes256gcm-prfsha1
- aes256gcm-prfsha256
- aes256gcm-prfsha384
- aes256gcm-prfsha512

The ARIA algorithm is based on AES with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

With the chacha20poly1305 encryption algorithm, FortiOS supports:

- chacha20poly1305-prfsha1
- chacha20poly1305-prfsha256
- chacha20poly1305-prfsha384
- chacha20poly1305-prfsha512

SEED is a symmetric-key algorithm. FortiOS supports:

- seed128-md5
- seed128-sha1
- seed128-sha256
- seed128-sha384
- seed128-sha512

Suite-B is a set of AES encryption with ICV in GCM mode. IPsec traffic can be offloaded on NP6XLite and NP7 platforms. They cannot be offloaded on other NP6 processors and below. CP9 supports Suite-B offloading, otherwise packets are encrypted and decrypted by software. FortiOS supports:

- suite-b-gcm-128
- suite-b-gcm-256

See Network processors (NP6, NP6XLite, NP6Lite, and NP4) and CP9, CP9XLite, and CP9Lite capabilities in the Hardware Acceleration guide for more information.

IKEv2 phase 2 encryption algorithm

The default encryption algorithm is:

```
aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
```

With null encryption, IPsec traffic can offload NPU/CP. FortiOS supports:

- null-md5
- null-sha1
- null-sha256
- null-sha384
- null-sha512

With the DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- des-null
- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

With the 3DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- 3des-null
- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

With the AES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- aes128-null
- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-null

- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-null
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512

NP7 and NP6XLite can offload the AESGCM encryption algorithm for IPsec traffic. CP9 supports AESGCM offloading. FortiOS supports:

- aes128gcm
- aes256gcm

With the chacha20poly1305 encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- chacha20poly1305

With the ARIA encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aria128-null
- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-null
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-null
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

With the SEED encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- seed-null
- seed-md5
- seed-sha1
- seed-sha256

- seed-sha384
- seed-sha512

HMAC settings

The FortiGate uses the HMAC based on the authentication proposal that is chosen in phase 1 or phase 2 of the IPsec configuration. Each proposal consists of the encryption-hash pair (such as 3des-sha256). The FortiGate matches the most secure proposal to negotiate with the peer.

To view the chosen proposal and the HMAC hash used:

```
# diagnose vpn ike gateway list

vd: root/0
name: MPLS
version: 1
interface: port1 3
addr: 192.168.2.5:500 -> 10.10.10.1:500
tun_id: 10.10.10.1
virtual-interface-addr: 172.31.0.2 -> 172.31.0.1
created: 1015820s ago
IKE SA: created 1/13 established 1/13 time 10/1626/21010 ms
IPsec SA: created 1/24 established 1/24 time 0/11/30 ms

  id/spi: 124 43b087dae99f7733/6a8473e58cd8990a

  lifetime/rekey: 86400/17436
  DPD sent/recv: 000001e1/00000000
```

Fragmenting IP packets before IPsec encapsulation

The `ip-fragmentation` command controls packet fragmentation before IPsec encapsulation, which can benefit packet loss in some environments.

The following options are available for the `ip-fragmentation` variable.

Option	Description
pre-encapsulation	Fragment before IPsec encapsulation.
post-encapsulation (default value)	Fragment after IPsec encapsulation (RFC compliant).

To configure packet fragmentation using the CLI:

```
config vpn ipsec phase1-interface
   edit "demo"
      set interface "port1"
```

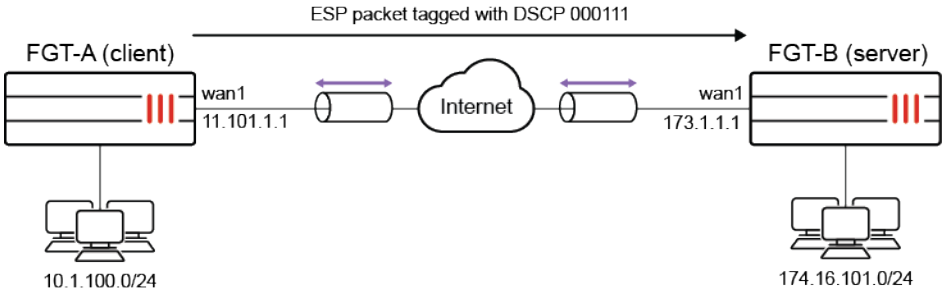
```
      set authmethod signature
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set ip-fragmentation pre-encapsulation
      set remote-gw 172.16.200.4
      set certificate "Fortinet_Factory"
   next
end
```

Configure DSCP for IPsec tunnels

Configuring the differentiated services (DiffServ) code in phase2 of an IPsec tunnel allows the tag to be applied to the Encapsulating Security Payload (ESP) packet.

- If `diffserv` is disabled in the IPsec phase2 configuration, then the ESP packets' DSCP value is copied from the inner IP packet DSCP.
- If `diffserv` is enabled in the IPsec phase2 configuration, then ESP packets' DSCP value is set to the configured value.

Offloading traffic to the NPU must be disabled for the tunnel.



In this example, NPU offloading is disabled, diffserv is enabled, and the diffserv code is set to 000111 on FGT-A. Only one side of the tunnel needs to have diffserv enabled.

To configure IPsec on FGT-A:

1. Configure the phase1-interface:

```
config vpn ipsec phase1-interface
    edit "s2s"
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set npu-offload disable
        set dhgrp 14 5
        set wizard-type static-fortigate
```

```
        set remote-gw 173.1.1.1
        set psksecret **********
    next
end
```

2. Configure the phase2-interface:

```
config vpn ipsec phase2-interface
    edit "s2s"
        set phase1name "s2s"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set dhgrp 14 5
        set diffserv enable
        set diffservcode 000111
        set src-addr-type name
        set dst-addr-type name
        set src-name "s2s_local"
        set dst-name "s2s_remote"
    next
end
```

3. Check the state of the IPsec tunnel:

```
FGT-A # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=s2s ver=1 serial=1 11.101.1.1:0->173.1.1.1:0 tun_id=173.1.1.1 dst_mtu=1500

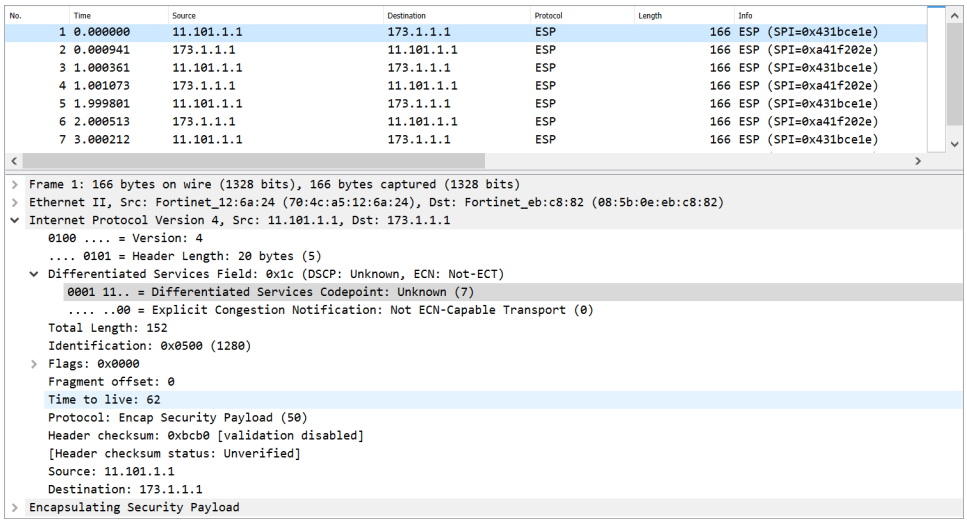
  dst: 0:174.16.101.0/255.255.255.0:0
  SA:  ref=3 options=110226 type=00 soft=0 mtu=1438 expire=39916/0B replaywin=2048
       seqno=5 esn=0 replaywin_lastseq=00000005 itn=0 qat=0 hash_search_len=1
  life: type=01 bytes=0/0 timeout=42899/43200
  dec: spi=a41f202e esp=aes key=16 8a02875b80b884d961af227fe8b5cdee
       ah=sha1 key=20 fc9760b79e79dbbeef630ec0c5dca74777976208
  enc: spi=431bce1e esp=aes key=16 851117af24212da89e466d8bea9632bb
       ah=sha1 key=20 0807cc0af2dc4ea049a6b1a4af410ccc71e2156d
  dec:pkts/bytes=4/336, enc:pkts/bytes=4/608
  npu_flag=00 npu_rgwy=173.1.1.1 npu_lgwy=11.101.1.1 npu_selid=1 dec_npuid=0 enc_npuid=0
run_tally=1
```

4. Use a packet analyzer, or sniffer, to check the ESP packets:

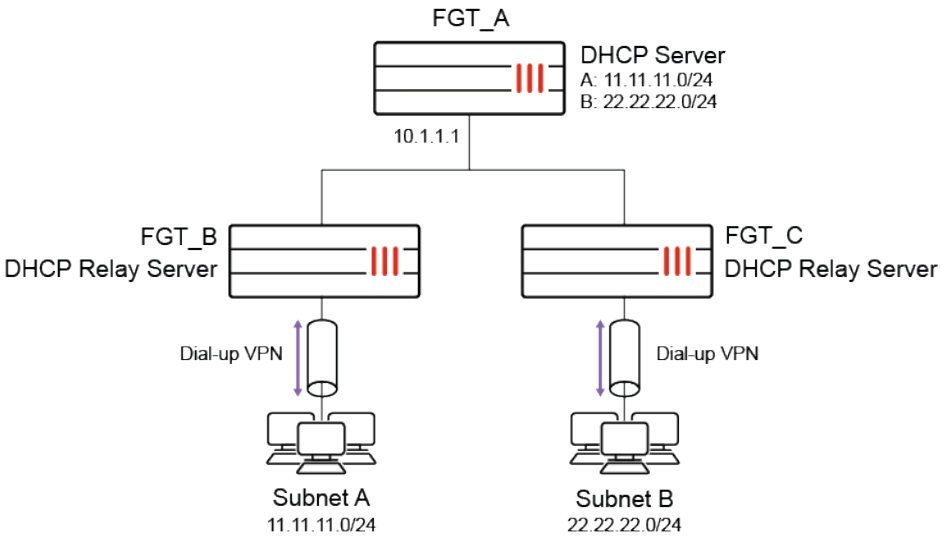


Defining gateway IP addresses in IPsec with mode-config and DHCP

For an IPsec tunnel, the gateway IP address (giaddr) can be defined on a DHCP relay agent. Both IPv4 and IPv6 addresses are supported. An IPsec tunnel with mode-config and DHCP relay cannot specify a DHCP subnet range to the DHCP server.

The DHCP server assigns an IP address based on the giaddr set on the IPSec phase1 interface and sends an offer to this subnet. The DHCP server must have a route to the specified subnet giaddr.

Example



To define the gateway IP address on the DHCP relay server:

1. Configure the VPN IPsec phase1 interface:

```
config vpn ipsec phase1-interface
    edit "ipv4"
        set type dynamic
        set interface "port2"
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal des-md5 des-sha1
        set dpd on-idle
        set dhgrp 5
        set assign-ip-from dhcp
        set dhcp-ra-giaddr 11.11.11.1
        set psksecret ***********
        set dpd-retryinterval 60
    next
end
```

   IPv6 could also be configured:

```
config vpn ipsec phase1-interface
    edit "ipv6"
        set type dynamic
        set interface "port2"
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal des-md5 des-sha1
        set dpd on-idle
        set dhgrp 5
        set assign-ip-from dhcp
        set dhcp6-ra-linkaddr 2000:11:11:11::1
        set psksecret **********
        set dpd-retryinterval 60
    next
end
```

2. Enable DHCP proxy and configure the DHCP server IP address:

```
config system settings
    set dhcp-proxy enable
    set dhcp-server-ip "10.1.1.1"
end
```

3. Repeat the above steps for FGT_C and subnet B.

FQDN support for remote gateways

FortiGate supports FQDN when defining an IPsec remote gateway with a dynamically assigned IPv6 address. When FortiGate attempts to connect to the IPv6 device, FQDN will resolve the IPv6 address even when the address changes.

Using FQDN to configure the remote gateway is useful when the remote end has a dynamic IPv6 address assigned by their ISP or DHCPv6 server.

To set the VPN to DDNS and configure FQDN:

```
config vpn ipsec phase1-interface
    edit "ddns6"
        set type ddns
        set interface "agg1"
        set ip-version 6
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dpd on-idle
        set remotegw-ddns "rgwa61.vpnlab.org"
        set psksecret **********
    next
end
```

```
config vpn ipsec phase2-interface
    edit "ddns6"
        set phase1name "ddns6"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set src-addr-type subnet6
        set dst-addr-type subnet6
        set src-subnet6 2003:1:1:1::/64
    next
end
```

FQDN resolves the IPv6 address

```
# diagnose test application dnsproxy 7

vfid=0, name=rgwa61.vpnlab.org, ttl=3600:3547:1747
         2003:33:1:1::22 (ttl=3600)
```

FortiGate uses FQDN to connect to the IPv6 device

```
# diagnose vpn tunnel list name ddns6
list ipsec tunnel by names in vd 0
```

```
----------------------------------------------------
name=ddns6 ver=2 serial=2 2003:33:1:1::1:0->2003:33:1:1::22:0 dst_mtu=1500

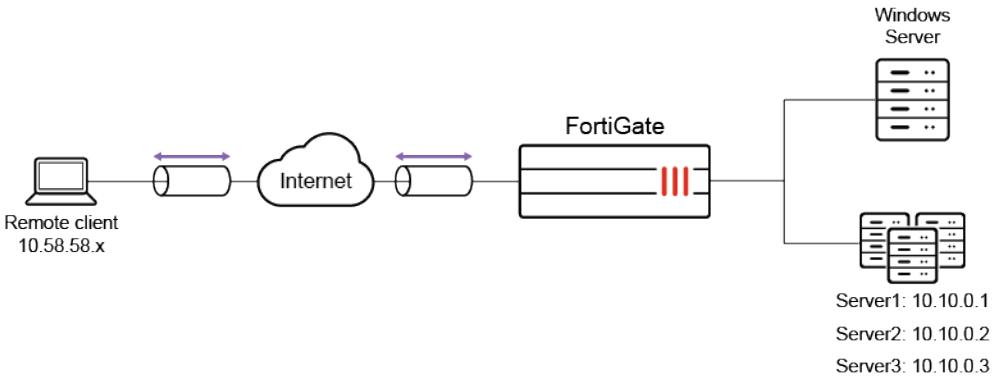
Windows IKEv2 native VPN with user certificate

In this example, IKEv2 with Extensible Authentication Protocol – Transport Layer Security (EAP-TLS) using mutual certificate authentication is configured. Mutual certificate authentication means that both the client and server use certificates to identify themselves. EAP uses RADIUS, which is handled by the Network Policy Server (NPS) on the Windows server. Certificates are generated and distributed through Active Directory Certificate Services (AD CS). An additional certificate is used to identify the IPsec gateway.

This example assumes that the following Windows server roles are installed and available:

- NPS (RADIUS)
- AD CS with a generated CA
- Group Policy Management
- DNS server

It is also assumed that a connection is established between the NPS and FortiGate, and a DNS entry exists for the NPS that the FortiGate can resolve.



Certificates

The following certificates are required:

- CA certificate for EAP-TLS to sign the client and server certificates.

  The CA certificate must be able to sign other certificates. It is created after AD CSs CA role installation. It is named lab-local-CA, as lab.local is the domain that is used in this example. The CA certificate is automatically installed on the server that is hosting the AD CS role. In this example, that server is also hosting the NPS and DNS server.

  The *Key Usage* specifies *Certificate Signing*.
- Client certificate for EAP-TLS used by the windows client.

The client certificate is stored in the personal user certificate store and is used to authenticate the user. The certificate has *Client Authentication* and a SAN of the user's FQDN, and is signed by the CA. The CA is stored in *Current User > Trusted Root Certification Authorities*.

- Server certificate for EAP-TLS used by the server providing RADIUS authentication.

  The NPS certificate must be in the hosting server's certificate store so that the NPS can access it. It has *Server Authentication* and a SAN DNS name to match the server's IP address. The user must use the FQDN to connect to the VPN. If the IP address that the name resolves to is used, the certificate will not be considered valid.
- VPN certificate used to identify the FortiGate dialup gateway.

  The VPN certificate and private key are installed to the FortiGate using a CSR generated by the FortiGate

Configure the Windows server

The Windows server includes AD-CS, a RADIUS server, and a DNS server.

After the AD CS role has been installed and configured, the CA is ready to sign certificates.

Users and groups are defined first. The groups are configured to automatically receive certificates and relay membership to the FortiGate for granular access control through group matching in policies.

RADIUS is used to authorize connecting users. The RADIUS server returns users' groups with the access-accept response, to indicate to the FortiGate what groups the users belong to.

To create security groups and users:

1. Open *Active Directory Users and Computers*.
2. Create two groups, *Group1* and *Group2*.
3. Create two users, *User1* and *User2*.
   a. To ensure that the automatic enrollment process succeeds in subsequent steps, ensure that each users has an email address configured in the *Email* field under *Properties > General*.
4. Add *User1* to *Group1* and *User2* to *Group2*.

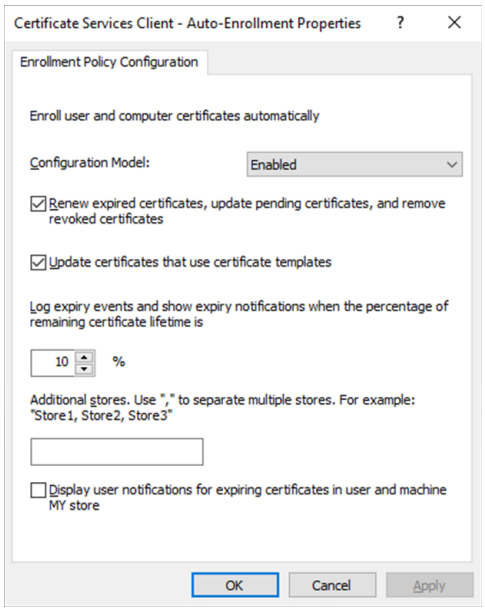
To create a certificate template to enable automatic enrollment for the user groups:

1. Open *Certification Authority*.
2. In the navigation pane, expand the new CA, right-click *Certificate Template* and click *Manage*.
3. Configure a new certificate template:
   a. Right-click the *User* template and click *Duplicate Template*.
   b. On the *General* tab, enter a *Template display name*, such as *User Auto Enroll*.
   c. Enable *Publish certificate in Active Directory* and *Do not automatically reenroll...*.

   d. Configure the remaining settings as required, then go to the *Request Handling* tab.
   e. Disable *Allow private key to be exported* and select *Enroll subject without requiring any user input*.
   f. On the *Security* tab, in *Group or user name*, click *Add*.
   g. Add *Group1* and *Group2*.
   h. Select each group and, under *Permissions*, enable *Read*, *Enroll*, and *Autoenroll*.
   i. On the *Extensions* tab, click *Application Policies* then click *Edit*.
   j. Remove all of the policies expect for *Client Authentication*.
   k. Click *OK* then close the *Certificate Templates* console.
4. In the navigation pane, right-click *Certificate Template* and click *New > Certificate Template to Issue*.
5. Select the new certificate template, *User Auto Enroll*, then click *OK*.

To create a group policy to enable automatic enrollment:

1. Open the *Group Policy Management* console.
2. In the navigation pane, go to *Forest:lab.local > Domains > lab.local*, and then click *Group Policy Objects*.
3. Click *Action*, and then click *New*.
4. Set a *Name* for the new GPO then click *OK*.
5. Right-click the new GPO and click *Edit*.
6. In the *Group Policy Management Editor* navigation pane, go to *User configuration > Policies > Windows Settings > Security Settings > Public Key Policies*.
7. In the content pane, double-click *Certificate Services Client - Auto-Enrollment*.
8. Set *Configuration Model* to *Enabled*.
9. Enable *Renew expired certificates...* and *Update certificates...*.



10. Click *OK*.

To verify that users are receiving certificates:

1. Log into an endpoint with a domain user.
2. On the server, open Certification Authority.
3. Expand the CA and select *Issued Certificates*.
4. Verify that the user logged into the endpoint is listed under *Requested Name*. You can also check the local user certificate store on the endpoint.

To generate and sign a CSR and import the signed certificate to the FortiGate:

1. On the FortiGate and go to *System* > *Certificates* and click *Create/Import* > *Generate CSR*.
2. Configure the CSR:

Certificate Name	vpn.lab.local
ID Type	Domain Name
Domain Name	vpn.lab.local
Subject Alternative Name	DNS:vpn.lab.local

3. Configure the remaining settings as required, then click *OK*.
4. Download the CSR to a location that is accessible to the CA server, in this example: C:\CSR\
5. Sign the CSR with the previously created CA:
   a. Open the command prompt as an administrator and enter the following:

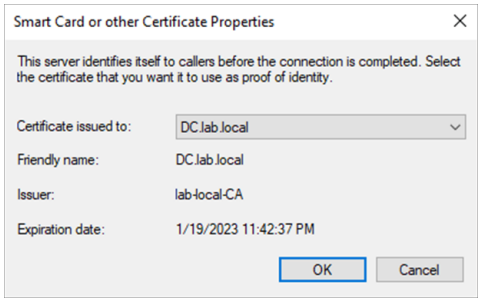
```
certreq -submit -attrib "CertificateTemplate:WebServer" C:\CSR\vpn.lab.local.csr
```

   The *Certification Authority List* window opens.
   b. Select the CA and click *OK*.

   c. Save the signed certificate with a .cer file extension to a location that is accessible from the FortiGate.
6. Import the signed certificate to the FortiGate:
   a. On the FortiGate, go to *System* > *Certificates* and click *Create/Import* > *Certificate*.
   b. Click *Import Certificate*.
   c. Set *Type* to *Local Certificate*.
   d. Click *Upload* and locate and select the signed certificate
   e. Click *Create* then click *OK*.

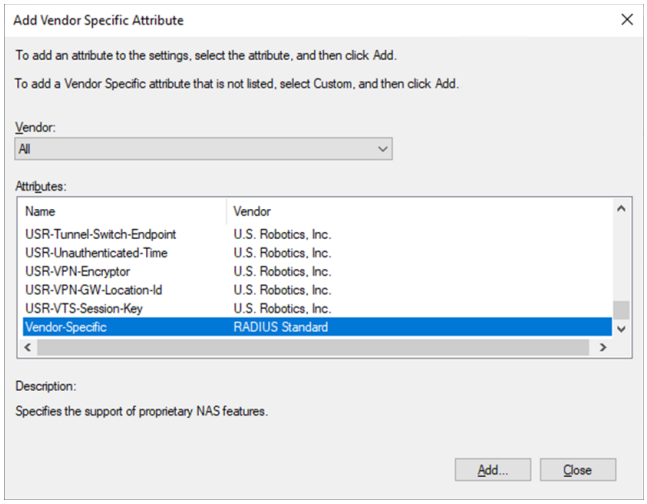
To configure network policies on the RADIUS server:

1. Open the *Network Policy Server* and, in the console tree, expand *Policies*.
2. Right-click on *Network Policies* and click *New*.
3. Enter a *Policy name*, such as *VPN-Group1*, then click *Next*.
4. Under *Condition description* click *Add*:
   a. Select *User Groups*, then click *Add*.
   b. Click *Add Groups*.
   c. Enter the group name, *Group1*, click *Check Names* to confirm the group.
   d. Click *OK* in both windows.
5. Click *Next*.
6. Make sure that *Access granted* is selected, then click *Next*.
7. On the *Configure Authentication Methods* page, click *Add* and add the EAP type *Microsoft: Smart Care or other certificate*.
8. Edit the EAP type, select the previously generated certificate, then click *OK*.



9. Deselect all of the *Less secure authentication methods* then click *Next*.
10. Configure constraints as needed, then click *Next*.
11. On the *Configure Settings* page, under *RADIUS Attributes*, select *Vendor Specific*, then click *Add*:

a. In the *Attributes* list, select *Vendor-Specific*, then click *Add*.

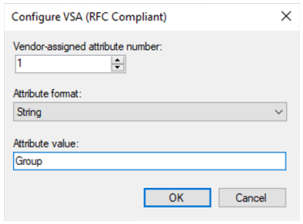


b. In the *Attribute Information* window, click *Add*.

c. In the *Vendor-Specific Attribute Information* window, enter the *Vendor Code*, *12356*, and select *Yes. It conforms*.

d. Click *Configure Attribute* and configure the following:

Vendor-assigned attribute number	1
Attribute format	String
Attribute value	Group



e. Click *OK* on all three windows and on the *Add Vendor Specific Attribute* window click *Close*.

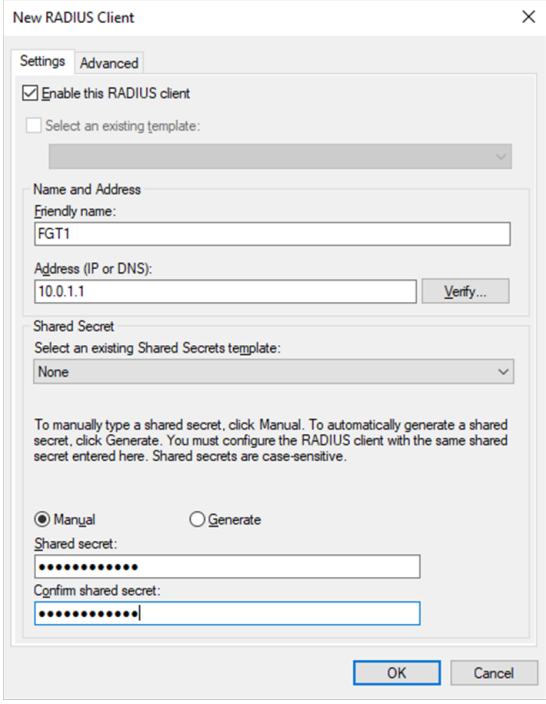
12. Click *Next*.
13. On the *Completing New Network Policy* page, review the configuration, then click *Finish*.
14. Duplicate the policy for *Group2*, and call the new policy *VPN-Group2*.
15. Reorder the policies so that *VPN-Group1* and *VPN-Group2* are one and two in the processing order.

To add the FortiGate as a RADIUS client:

1. Open the *Network Policy Server* and, in the console tree, expand *RADIUS Clients and Servers*.
2. Right-click on *RADIUS Clients* and click *New*.
3. Add the FortiGate as a RADIUS client:

Friendly name	FGT1

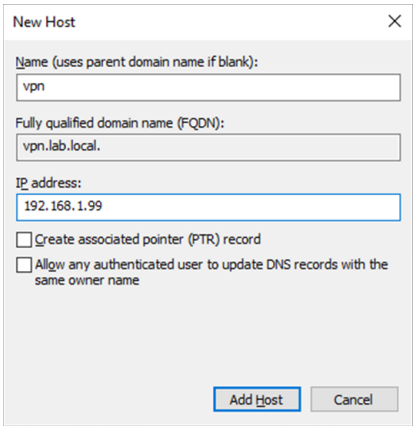
Address	10.0.1.1
Shared Secret	Manually enter the shared secret.



4. Click *OK*.

To create a DNS entry for the VPN connection:

1. Open the *DNS Manager*.
2. Go to *DC > Forward Lookup Zones* and select *lab.local*.
3. Right click in the content pane and select *New Host (A or AAAA)*.
4. Enter the VPN name. The FQDN should be auto-filled with *vpn.lab.local*.



5. Enter an IP address.
6. Click *Add Host*.

Configure the FortiGate

An IPsec VPN tunnel is configured to connect to the NPS (RADIUS) server for EAP authentication. For information about IPsec VPN, see IPsec VPN on page 2369.

A RADIUS server is added to relay VPN authentication requests to the NPS server. For information about RADIUS servers, see RADIUS servers on page 3032.

Three groups are created that point to the RADIUS server for authentication: one group each for user group *Group1*, user group *Group2*, and the remote server. For information about groups, see User groups on page 2993.

Three firewall policies are created to test the functionality of the three user groups (see Policies on page 1562):

- Policy 1 allows VPN clients to communicate with each other.
- Policy 2 allows VPN clients in the *Group1* user group to communicate with *Server1* and *Server3*.
- Policy 3 allows VPN clients in the *Group2* user group to communicate with *Server1* and *Server2*.

To configure IPsec VPN in the GUI:

1. Go to *VPN > IPsec Wizard*.
2. Enter a name for the VPN, such as *VPN1*.
3. Set *Template type* to *Custom*, then click *Next*.
4. In the *Network* section, configure the following:

Remote Gateway	Dialup User
Interface	port1
Mode Config	Enable
Assign IP From	Range
Client Address Range	10.58.58.1-10.58.58.10
DNS Server	192.168.1.100
Enable IPv4 Split Tunnel	Enable
Accessible Networks	Select the networks that VPN users will have access to.

5. In the *Authentication* section, configure the following:

Method	Signature
Certificate Name	vpn.lab.local
Version	2
Accept Types	Any peer ID

6. In the *Phase 1 Proposal* section, configure the following:

Encryption / Authentication	AES128 / SHA256
Encryption / Authentication	AES256 / SHA256

Encryption / Authentication	AES128 / SHA1
Diffie-Hellman Groups	14, 5, 2
Local ID	vpn.lab.local

7. In the *Phase 2 Selectors* section, configure the following:

Local Address	Named Address - all
Remote Address	Named Address - all
Encryption / Authentication	AES128 / SHA256
Encryption / Authentication	AES256 / SHA256
Encryption / Authentication	AES128 / SHA1
Enable Perfect Forward Secrecy (PFS)	Disable
Autokey Keep Alive	Enable

8. Enable EAP settings in the CLI:

```
config vpn ipsec phase1-interface
    edit VPN1
        set eap enable
        set eap-identity send-request
    next
end
```

To configure IPsec VPN in the CLI:

```
config vpn ipsec phase1-interface
    edit "VPN1"
        set type dynamic
        set interface "port1"
        set ike-version 2
        set authmethod signature
        set peertype any
        set net-device disable
        set mode-cfg enable
        set ipv4-dns-server1 192.168.1.100
        set proposal aes128-sha256 aes256-sha256 aes128-sha1
        set localid "vpn.lab.local"
        set dpd on-idle
        set dhgrp 14 5 2
        set eap enable
        set eap-identity send-request
        set certificate "vpn.lab.local"
        set ipv4-start-ip 10.58.58.1
        set ipv4-end-ip 10.58.58.10
        set ipv4-split-include "10/8_net"
        set dpd-retryinterval 60
```

```
    next
end
config vpn ipsec phase2-interface
    edit "VPN1"
        set phase1name "VPN1"
        set proposal aes128-sha256 aes256-sha256 aes128-sha1
        set pfs disable
        set keepalive enable
        set src-addr-type name
        set dst-addr-type name
        set src-name "all"
        set dst-name "all"
    next
end
```

To add the RADIUS server in the GUI:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Enter a name for the server, such as *NPS*.
3. Enter the *Primary Server IP/Name* and *Secret*.
   The *Test User Credentials* option will not work, as it does not use certificates for the test.
4. Click *OK*.

To add the RADIUS server in the CLI:

```
config user radius
    edit "NPS"
        set server <ip>
        set secret **********
    next
end
```

To configure the user groups in the GUI:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Enter a name for the group, such as *Group1*.
3. In the *Remote Groups* table, click *Add*:
   a. Set *Remote Server* to the just created RADIUS server, *NPS*.
   b. Set *Groups* to *Specify* and enter *Group1*.
   c. Click *OK*.
4. Click *OK*.
5. Create a second group called *Group2* with the same *Remote Server* and *Group Name* set to *Group2*.
6. Create a third group called RADIUS with the same *Remote Server* but no *Group Name*.

To configure the user groups in the CLI:

```
config user group
    edit "Group1"
        set member "NPS"
        config match
            edit 1
                set server-name "NPS"
                set group-name "Group1"
            next
        end
    next
    edit "Group2"
        set member "NPS"
        config match
            edit 1
                set server-name "NPS"
                set group-name "Group2"
            next
        end
    next
    edit "RADIUS"
        set member "NPS"
    next
end
```

To configure the policies in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure policy 1:

Name	VPN-VPN
Incoming Interface	VPN1
Outgoing Interface	VPN1
Source	all, RADIUS
Destination	all
Schedule	always
Service	ALL
NAT	Disable

3. Click *OK*.
4. Click *Create New* again and configure policy 2:

Name	VPN Group1
Incoming Interface	VPN1

Outgoing Interface	Server1, Server3
Source	all, Group1
Destination	10.10.0.1, 10.10.0.3
Schedule	always
Service	ALL
NAT	Disable

5. Click *OK*.
6. Click *Create New* again and configure policy 3:

Name	VPN Group2
Incoming Interface	VPN1
Outgoing Interface	Server1, Server2
Source	all, Group2
Destination	10.10.0.1, 10.10.0.2
Schedule	always
Service	ALL
NAT	Disable

7. Click *OK*.

To configure the policies in the CLI:

```
config firewall policy
    edit 1
        set name "VPN-VPN"
        set srcintf "VPN1"
        set dstintf "VPN1"
        set action accept
        set srcaddr "all" "RADIUS"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set nat disable
    next
    edit 2
        set name "VPN Group1"
        set srcintf "VPN1"
        set dstintf "Server1" "Server3"
        set action accept
        set srcaddr "all" "Group1"
        set dstaddr "10.10.0.1" "10.10.0.3"
        set schedule "always"
        set service "ALL"
```

```
        set nat disable
    next
    edit 3
        set name "VPN Group2"
        set srcintf "VPN1"
        set dstintf "Server1" "Server2"
        set action accept
        set srcaddr "all" "Group2"
        set dstaddr "10.10.0.1" "10.10.0.2"
        set schedule "always"
        set service "ALL"
        set nat disable
    next
end
```

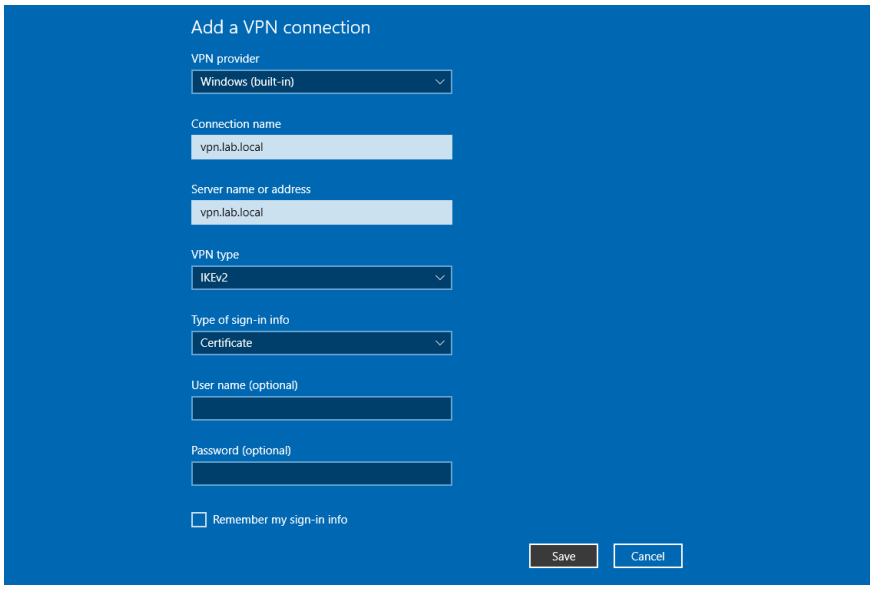
Configure the Windows client

The configuration is done on a Windows 10 Enterprise endpoint.

To add VPN connection and configure a VPN interface:

1. Open the *Settings* page and go to *Network & Internet > VPN*.
2. Click *Add a VPN connection*.
3. Configure the following:

VPN provider	Windows (built-in)
Connection name	vpn.lab.local
Server name or address	vpn.lab.local
VPN type	IKEv2
Type of sign-in info	Certificate



4. Click *Save*.
5. Go to *Network & Internet* > *Status* and, under *Advanced network settings*, click *Change adapter options*.
6. Select the VPN connection then click *Change settings of this connection*, or right-click on the connection and select *Properties*:
   a. Go to the *Security* tab and, in the *Authentication* section, click *Properties*.
   b. Select *Use a certificate on this computer* and enable *Use simple certification selection*.
   c. Enable *Verify the server's identity by validating the certificate*.
   d. Optionally, enable *Connect to these servers* and enter your NPS server's FQDN, in this case *DC.lab.local*.
   e. In the *Trusted Root Certificate Authorities* list, select the CA *lab-local-CA*.

   f. Click *OK*, then click *OK* again.

To test the connection:

1. Log in to the Windows endpoint as user1.
2. Open the network settings and connect to the *vpn.lab.local* VPN.
3. Ping each of the three servers to confirm that you can connect to server1 (10.10.0.1) and server3 (10.10.0.3), but not server2 (10.10.0.2).
4. Log out of the Windows endpoint, then log back in as user2.
5. Open the network settings and connect to the *vpn.lab.local* VPN.
6. Ping each of the three servers to confirm that you can connect to server1 (10.10.0.1) and server2 (10.10.0.2), but not server3 (10.10.0.3).

IPsec IKE load balancing based on FortiSASE account information

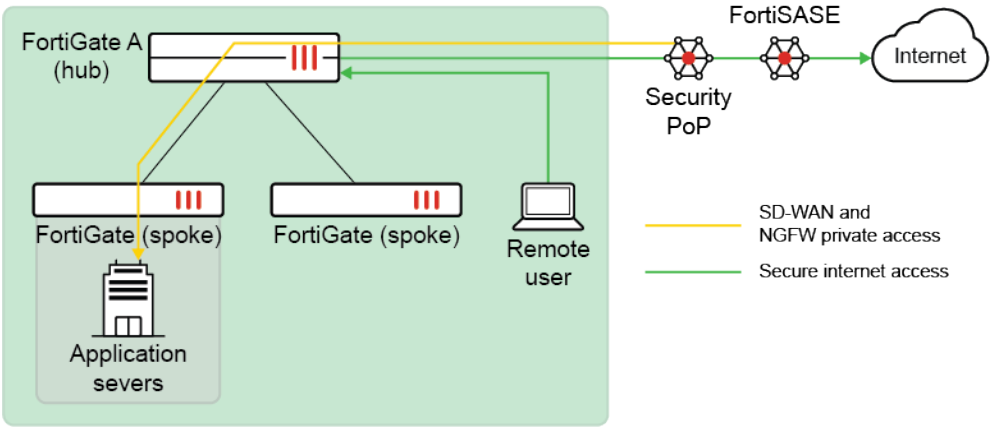
The FortiGate device ID is carried by the IKEv2 message NOTIFY payload when it is configured.

```
config vpn ipsec phase1-interface
    edit <name>
        set dev-id-notification enable
        set dev-id <string>
    next
end
```

This device ID configuration is required when the FortiGate is configured as a secure edge LAN extension for FortiSASE. It allows FortiSASE to distribute IKE/IPsec traffic according to the FortiGate device ID to achieve load balancing.

Example

In this example, a FortiGate SD-WAN is configured, which acts as a secure edge. FortiSASE ensures secure internet access for users in the local network behind the FortiGate and allows other FortiSASE remote users with secure private access to private resources behind the FortiGate.



To configure FortiGate A (FGT-A):

1. Configure the IPsec phase 1 settings:

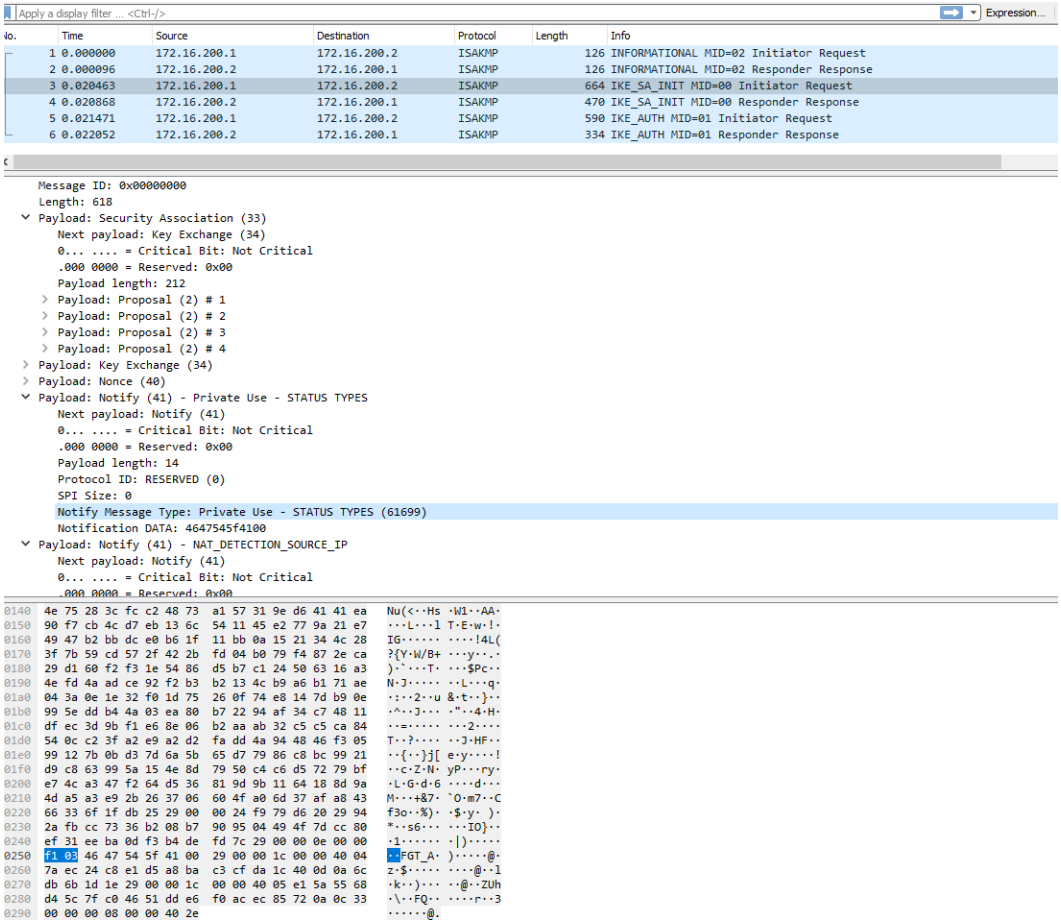
```
config vpn ipsec phase1-interface
    edit "ul-port1"
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set localid "peerid-UNshTWcLQ22UNWqk0UwYtCQNtVhujrxAdyMG0qRsGVkx9mM8ksdaRZOF"
        set dpd on-idle
        set comments "[FGCONN] Do NOT edit. Automatically generated by extension controller."
        set dev-id-notification enable
        set dev-id "FGT_A"
        set remote-gw 172.16.200.2
        set psksecret ********
    next
end
```

2. Verify that the IPsec tunnel is established:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 3
------------------------------------------------------
name=ul-port1 ver=2 serial=3 172.16.200.1:0->172.16.200.2:0 tun_id=172.16.200.2 tun_
id6=::172.16.200.2 dst_mtu=1500 dpd-link=on weight=1
bound_if=19 lgwy=static/1 tun=intf mode=auto/1 encap=none/552 options[0228]=npu frag-rfc  run_
state=0 role=primary accept_traffic=1 overlay_id=0

proxyid_num=1 child_num=0 refcnt=4 ilast=0 olast=0 ad=/0
stat: rxp=2689 txp=7115 rxb=278520 txb=617095
dpd: mode=on-idle on=1 idle=20000ms retry=3 count=0 seqno=1
natt: mode=none draft=0 interval=0 remote_port=0
fec: egress=0 ingress=0
proxyid=ul-port1 proto=0 sa=1 ref=3 serial=1
  src: 0:10.252.0.2-10.252.0.2:0
  dst: 0:10.252.0.1-10.252.0.1:0
  SA:  ref=6 options=10226 type=00 soft=0 mtu=1438 expire=41281/0B replaywin=2048
       seqno=1bca esn=0 replaywin_lastseq=00000a80 qat=0 rekey=0 hash_search_len=1
  life: type=01 bytes=0/0 timeout=42897/43200
  dec: spi=acf1f0fc esp=aes key=16 97d75ba10fbc904f14ce4a4caf8b4148
       ah=sha1 key=20 4ab706602068f9590314c4b16f53130a8011f410
  enc: spi=ca8de50b esp=aes key=16 8185ec9d2ecbb1d157663a6c199fc998
       ah=sha1 key=20 9430df55054152ab88e7372a322aad8f87688614
  dec:pkts/bytes=2690/278560, enc:pkts/bytes=14227/1632503
  npu_flag=03 npu_rgwy=172.16.200.2 npu_lgwy=172.16.200.1 npu_selid=2 dec_npuid=2 enc_npuid=2
run_tally=0
```

3. Perform a packet capture of IPsec traffic (Wireshark is used in this example) and locate the initiator request IKE packet's NOTIFY message (type 61699).



IPsec SA key retrieval from a KMS server using KMIP

In environments that require centralized management of cryptographic keys where no key derivations or algorithmic operations are allowed on edge devices (such as the FortiGate), they will deploy a Key Management Services (KMS) server cluster to generate and manage all cryptographic keys. Then, the Key Management Interoperability Protocol (KMIP) is used on the edge devices to locate the KMS server, create keys if they do not exist, and retrieve keys to be used for securing these edge devices.

FortiGates have a KMIP client that sends KMIP requests to locate the Key Management Services (KMS) server, creates keys if they do not exist on the KMS server, and retrieves keys from the KMS server to use as IPsec security association (SA) keys for IKEv2 only.

This feature allows the FortiGate to offload the task of generating IPsec SA keys to a KMS server, regardless of specific IPsec VPN topologies with a FortiGate, when the administrator has the requirement to centralize cryptographic keys management in a KMS server.

The FortiGate's integrated KMIP client also supports the following:

- If the KMS server is unavailable, then the FortiGate continues to use the previous keys to avoid a network blackout.
- ADVPN configurations for the hub and spoke, so that shortcuts between two spokes will use their own encryption keys retrieved from the KMS server.

- Multiple tunnels between the same tunnel endpoints using multiple VRFs.

To configure the KMIP server:

```
config vpn kmip-server
    edit <KMS_server_ID>
        config server-list
            edit <ID>
                set server <server_IP>
                set cert <string>
            next
        end
        set username <username_defined_on_KMS_server>
        set password <password>
    next
end
```

To apply the KMS server in the phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit <name>
        set kms <KMS_server_ID>
    next
end
```

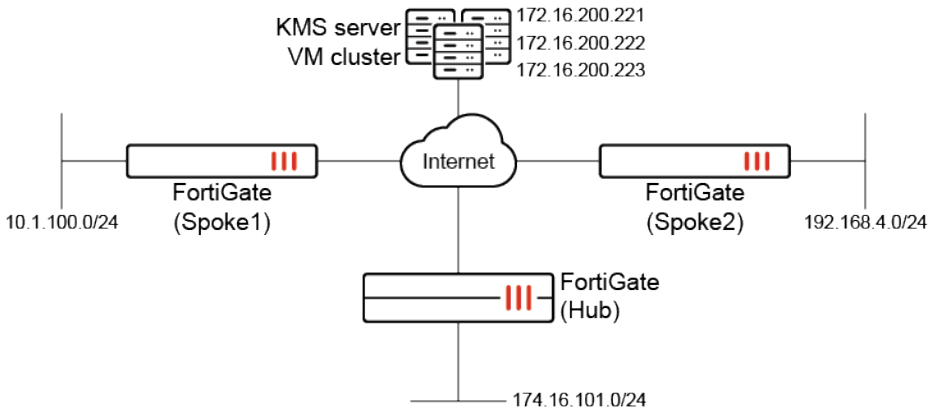
IPsec tunnels will not be established if a FortiGate VPN peer does not support KMS, or has not configured `kms <KMS_server_ID>` in `config vpn ipsec phase1-interface`.

The following diagnostic commands have been added:

- `get vpn ike kms-keys`
- `diagnose debug application kmipd -1`
- `execute kmip {create | destroy | get | locate | rekey} <parameter>`

Example

In this example, there is a topology with an ADVPN hub FortiGate and two spoke FortiGates. There is a cluster or three KMS server VMs (172.16.200.221, 172.16.200.222, and 172.16.200.223) that operates in round-robin mode. The `testuser1_Cert` certificate is issued by the KMS server, and the `testuser1` user is defined on the KMS server. Authentication to the KMS server by the KMIP client requires both a certificate and a password.



The Hub FortiGate acting as the responder will try to locate keys on the KMS server first. If they do not exist, the FortiGate requests to create new keys on KMS server. The responder sends the keys' names to the Spoke1 and Spoke2 FortiGates acting as the initiators using IKE messages, and these initiators locate and retrieve keys from KMS server using the keys' names. The `keylifeseconds` parameter in phase 2 defines how often the FortiGate will try to synchronize local keys to those on the KMS server.

The keys are retrieved from the KMS server and used as IPsec SA keys in IPsec tunnels. The key format used is: [IDi/r]-[IDr/i]-[phase2name]-ENC/AUTH-[keyalg]-[keylen].

First, this example focuses on the Hub FortiGate and the IPsec VPN connection between the Spoke1 and Hub FortiGate. Second, this example focuses on the spoke-to-spoke tunnel, also known as a shortcut tunnel or shortcut, which is established when traffic flows between the Spoke1 and Spoke2 FortiGates.

To configure IPsec SA key retrieval from a KMS server on the Hub FortiGate:

1. Configure the KMIP server:

```
config vpn kmip-server
    edit "KMS_server"
        config server-list
            edit 1
                set server "172.16.200.221"
                set cert "testuser1_Cert"
            next
            edit 2
                set server "172.16.200.222"
                set cert "testuser1_Cert"
            next
            edit 3
                set server "172.16.200.223"
                set cert "testuser1_Cert"
            next
        end
        set username "testuser1"
        set password **********
    next
end
```

2. Configure the IPsec VPN phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "hub"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set authmethod signature
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set kms "KMS_server"
        set certificate "Fortinet_Factory_Backup"
        set dpd-retryinterval 60
    next
end
```

This feature is only supported in IKEv2. The `localid` is required in the phase 1 settings when using the PSK authentication method.

3. Configure the IPsec VPN phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "hub"
        set phase1name "hub"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set keylifeseconds 7200
    next
end
```

To verify the IPsec configuration and tunnel between the Hub and Spoke1 FortiGates:

1. Verify the tunnel state on the Hub:

```
Hub # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=hub ver=2 serial=1 172.16.200.4:0->0.0.0.0:0 tun_id=10.0.0.1 tun_id6=::10.0.0.1 dst_mtu=0

```

2. Verify the KMS keys for the VPN tunnel between Spoke1 and Spoke2:

```
Spoke1 # get vpn ike kms-keys

vd: root/0
name: spoke1
addr: 172.16.200.1:500 -> 172.16.200.4:500

  phase2
  name: spoke1
  server: "KMS_server"
  spi: 628d1814
    enc
      keyname: "Spoke1-hub-hub-ENC-AES-16"
```

```
      key: 5dad0d8d3568eab7c3f259349dc64039
    auth
      keyname: "Spoke1-hub-hub-AUTH-SHA1-20"
      key: e660f491b80b2cfdcdb0d737942bea2e853dac8d
  spi: 471dfe2e
    enc
      keyname: "hub-Spoke1-hub-ENC-AES-16"
      key: 1de4b8e8accaa792e0934fbd9f933a6a
    auth
      keyname: "hub-Spoke1-hub-AUTH-SHA1-20"
      key: 1fa244d3971b4d4df59b8d7b3655a1b77f8e65af

vd: root/0
name: spoke1_0
addr: 172.16.200.1:500 -> 172.16.200.3:500

  phase2
  name: spoke1
  server: "KMS_server"
  spi: 8d568114
    enc
      keyname: "Spoke1-Spoke2-spoke2-ENC-AES-16"
      key: b01c534b11792b856c1b95c78c4cad91
    auth
      keyname: "Spoke1-Spoke2-spoke2-AUTH-SHA1-20"
      key: fe6a82177db6911b3203d1306969e5ddec8fd039
  spi: 471dfe2f
    enc
      keyname: "Spoke2-Spoke1-spoke2-ENC-AES-16"
      key: a6d6a25cd986860bcc502d58f32e99de
    auth
      keyname: "Spoke2-Spoke1-spoke2-AUTH-SHA1-20"
      key: 07d712156eaca28439fbe944e3a8c9af4c45166a
```

3. Verify the FortiGate (KMIP client) connection to the KMS server:

```
Spoke1 # execute kmip locate KMS_server hub-Spoke1-hub-AUTH-SHA1-20
Locating key 'hub-Spoke1-hub-AUTH-SHA1-20', jobid=1935521133
Ret=0, jobid=1935521133
        Key ID: 2ba130bff7174ba7a237d7ea53611121383b132cf18a4fd183890ca196296cb4
```

4. Verify the IKE and KMIP debug messages on Spoke1 to confirm that when the KMS server is down during IPsec rekey, IPsec tunnel does not go down:

```
Spoke1 # diagnose debug application ike -1
Spoke1 # diagnose debug application kmipd -1

ike 0:spoke1:543:580 rekey in progress for SPI 471dfe32

IPsec key retrieval with a QKD system using the ETSI standardized API

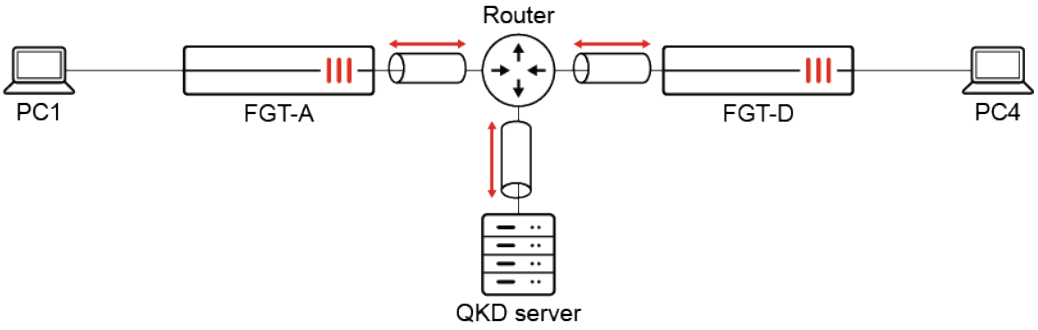
FortiGates support IPsec key retrieval with a quantum key distribution (QKD) system using the ETSI standardized API. This eliminates negotiation, simplifies the process, and enhances efficiency in IPsec key management.

```
config vpn qkd
    edit <name>
        set server <string>
        set port <integer>
        set id <string>
        set peer <string>
        set certificate <certificate_name>
    next
end
```

`server <string>`	Enter the IPv4, IPv6, or DNS address of the key management entity (KME).
`port <integer>`	Enter the port to connect to on the KME, 1 - 65535.
`id <string>`	Enter the quantum key distribution ID assigned by the KME.
`peer <string>`	Enter the peer or peer group to authenticate with the quantum key device's certificate.
`certificate <certificate_name>`	Enter the name of up to four certificates to offer to the KME.

Example

In this example, a quantum key distribution (QKD) system is deployed to perform central IPsec key management. The FortiGates installed as security gateways will terminate large amount of IPsec tunnels.



To configure IPsec key retrieval with a QKD system:

1. Configure FGT-A:
   a. Configure the QKD profile:

```
config vpn qkd
    edit "qkd_1"
        set server "172.16.200.83"
        set port 8989
        set id "FGT-A"
        set peer "qkd"
        set certificate "FGT_qkd1"
    next
end
```

   b. Configure the IPsec phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "site1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set qkd allow
        set qkd-profile "qkd_1"
        set remote-gw 173.1.1.1
        set psksecret **********
    next
end
```

   c. Configure the IPsec phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "site1"
        set phase1name "site1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

2. Configure FGT-D:
   a. Configure the QKD profile:

```
config vpn qkd
    edit "qkd_1"
        set server "172.16.200.83"
        set port 8989
        set id "FGT-D"
        set peer "qkd"
        set certificate "FGT_qkd3"
    next
end
```

b. Configure the IPsec phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "site2"
        set interface "port25"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set qkd require
        set qkd-profile "qkd_1"
        set remote-gw 11.101.1.1
        set psksecret **********
    next
end
```

c. Configure the IPsec phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "site2"
        set phase1name "site2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

To verify the configuration:

1. Generate traffic between PC1 and PC4.
2. Run diagnostics on FGT-A:
   a. Verify the IPsec phase 1 interface status:

```
# diagnose vpn ike gateway list

vd: root/0
name: site1
version: 1
interface: wan1 17
addr: 11.101.1.1:500 -> 173.1.1.1:500
tun_id: 172.16.200.4/::172.16.200.4
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 3s ago
peer-id: 173.1.1.1
peer-id-auth: no
IKE SA: created 1/1  established 1/1  time 0/0/0 ms
IPsec SA: created 1/1  established 1/1  time 30/30/30 ms

  id/spi: 21 ad7d995677250c7e/053f958ea7be66c8
  direction: initiator
  status: established 3-3s ago = 0ms
  proposal: aes128-sha256
```

```
  key: 5b198e1a431c20fb-c08135cf0c007704
  QKD: yes
  lifetime/rekey: 86400/86096
  DPD sent/recv: 00000000/00000000
  peer-id: 173.1.1.1
```

b. Verify the IPsec phase 2 tunnel status:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=site1 ver=1 serial=2 11.101.1.1:0->173.1.1.1:0 tun_id=172.16.200.4 tun_
id6=::172.16.200.4 dst_mtu=1500 dpd-link=on weight=1
bound_if=17 lgwy=static/1 tun=intf mode=auto/1 encap=none/552 options[0228]=npu frag-rfc
run_state=0 role=primary accept_traffic=1 overlay_id=0

proxyid_num=1 child_num=0 refcnt=4 ilast=12 olast=11 ad=/0
stat: rxp=1 txp=2 rxb=84 txb=168
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=0
natt: mode=none draft=0 interval=0 remote_port=0
fec: egress=0 ingress=0
proxyid=site1 proto=0 sa=1 ref=3 serial=2
  src: 0:0.0.0.0-255.255.255.255:0
  dst: 0:0.0.0.0-255.255.255.255:0
  SA:  ref=6 options=10226 type=00 soft=0 mtu=1438 expire=42883/0B replaywin=2048
       seqno=3 esn=0 replaywin_lastseq=00000002 qat=0 rekey=0 hash_search_len=1
  life: type=01 bytes=0/0 timeout=42897/43200
  dec: spi=b2af532f esp=aes key=16 c1d5d17e6bdecd5b145f672a5054cde1
       ah=sha1 key=20 084f1c0fee48994f59a125606f9c757838dc2421
  enc: spi=3d14392a esp=aes key=16 66277c8cf2bdbd2d12a9d829dde356ad
       ah=sha1 key=20 fdbaa42cca5c3a9bffb1cf0fc74ff29a643a2b9f
  dec:pkts/bytes=1/84, enc:pkts/bytes=2/304
  npu_flag=03 npu_rgwy=173.1.1.1 npu_lgwy=11.101.1.1 npu_selid=4 dec_npuid=2 enc_npuid=2
```

The IPsec tunnel is up and traffic passes through.

c. Verify the IKE debug messages:

```
# diagnose debug application ike -1
...
ike V=root:0:site1:site1: IPsec SA connect 17 11.101.1.1->173.1.1.1:0
ike V=root:0:site1:site1: using existing connection

```

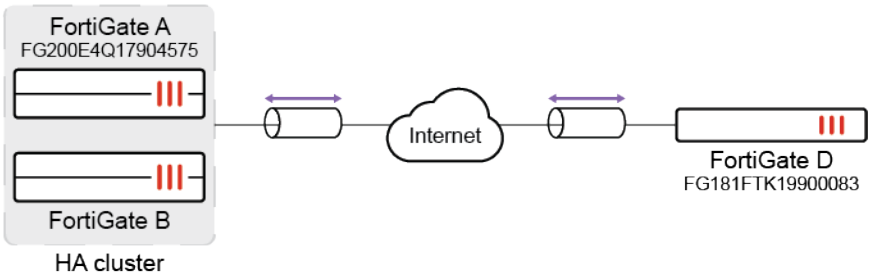
Securely exchange serial numbers between FortiGates connected with IPsec VPN

Serial numbers can be securely exchanged between FortiGates connected with IPsec VPN. This feature is supported in IKEv2, IKEv1 main mode, and IKEv1 aggressive mode. The exchange is only performed with participating FortiGates that have enabled the `exchange-fgt-device-id` setting under `config vpn ipsec phase1-interface`.

Example

In this example, FortiGates A and B are in an HA cluster, so the serial numbers will not exchange after failover. The cluster is connected to FortiGate D through IPsec VPN.



To securely exchange serial numbers between the FortiGates:

1. Configure the IPsec settings on FortiGate A.
   a. Configure the phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "to_FGTD"
        set interface "port1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set exchange-fgt-device-id enable
        set remote-gw 172.16.200.4
        set psksecret **********
    next
end
```

   b. Configure the phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "to_FGTD"
        set phase1name "to_FGTD"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
```

```
        set src-name "to_FGTD_local"
        set dst-name "to_FGTD_remote"
    next
end
```

2. Configure the IPsec settings on FortiGate D.
   a. Configure the phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "to_FGTA"
        set interface "port2"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set exchange-fgt-device-id enable
        set remote-gw 172.16.200.1
        set psksecret **********
    next
end
```

   b. Configure the phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "to_FGTA"
        set phase1name "to_FGTA"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "to_FGTA_local"
        set dst-name "to_FGTA_remote"
    next
end
```

3. Verify the peer serial numbers.
   a. On FortiGate A:

```
# diagnose vpn ike gateway list

vd: root/0
name: to_FGTD
version: 1
interface: port1 19
addr: 172.16.200.1:500 -> 172.16.200.4:500
tun_id: 172.16.200.4/::172.16.200.4
remote_location: 0.0.0.0
network-id: 0
created: 783s ago
peer-id: 172.16.200.4
peer-id-auth: no
peer-SN: FG181FTK19900083
IKE SA: created 1/1  established 1/1  time 0/0/0 ms
```

```
IPsec SA: created 1/1  established 1/1  time 0/0/0 ms

  id/spi: 2 a8b2df203ef134e8/955fafbd10a04fa0
  direction: initiator
  status: established 783-783s ago = 0ms
  proposal: aes128-sha256
  key: 644db099e1178d1f-119fee3141f1e2a6
  lifetime/rekey: 86400/85316
  DPD sent/recv: 00000000/00000000
  peer-id: 172.16.200.4
```

b. On FortiGate D:

```
# diagnose vpn ike gateway list

vd: root/0
name: to_FGTA
version: 1
interface: port2 10
addr: 172.16.200.4:500 -> 172.16.200.1:500
tun_id: 172.16.200.1/::172.16.200.1
remote_location: 0.0.0.0
network-id: 0
created: 723s ago
peer-id: 172.16.200.1
peer-id-auth: no
peer-SN: FG200E4Q17904575
IKE SA: created 1/1  established 1/1  time 10/10/10 ms
IPsec SA: created 0/0

  id/spi: 7 a8b2df203ef134e8/955fafbd10a04fa0
  direction: responder
  status: established 723-723s ago = 10ms
  proposal: aes128-sha256
  key: 644db099e1178d1f-119fee3141f1e2a6
  lifetime/rekey: 86400/85406
  DPD sent/recv: 00000000/00000000
  peer-id: 172.16.200.1
```

4. After an HA failover, verify that the peer serial numbers have not changed.

a. On FortiGate B:

```
# diagnose vpn ike gateway  list

vd: root/0
name: to_FGTD
version: 2
interface: port1 19
addr: 172.16.200.1:500 -> 172.16.200.4:500
tun_id: 172.16.200.4/::172.16.200.4
remote_location: 0.0.0.0
network-id: 0
```

```
created: 104s ago
peer-id: 172.16.200.4
peer-id-auth: no
peer-SN: FG181FTK19900083
PPK: no
IKE SA: created 1/2  established 1/2  time 0/0/0 ms

```

To retrieve the peer serial number in FortiManager:

1. Add and authorize FortiGate A (see Adding online devices using Discover mode for more details).
2. Go to *Device Manager* > *Device & Groups* and select the FortiGate A.
3. Add the *IPsec VPN* widget (see Customizing the dashboard for more details).
4. Open the developer tools in your browser and select the *Network* tab.
5. Refresh the *IPsec VPN* widget.
6. In the *Network* tab, there should be a JSON POST request that FortiManager will proxy request to the FortiGate for the IPsec API. The response should contain the peer serial number.

Multiple interface monitoring for IPsec

IPsec can monitor multiple interfaces per tunnel, and activate a backup link only when all of the primary links are down. This can be useful if you have multiple WAN links and want to optimize your WAN link selection and performance while limiting the use of more expensive and bandwidth intensive interfaces, like 5G or LTE.

In cases where multiple primary overlays are deployed and the backup overlay is on an LTE connection, avoiding IPsec keep alive messages, BGP hellos, and SD-WAN health checks on the backup connection is required when the primary overlays are working. The backup overlay can monitor all of the primary overlays, and is not activated until the number of unhealthy primary overlays equals or surpasses the predefined threshold.

```
config vpn ipsec phase1-interface
    edit <phase-1 name>
        set monitor <overlay> <overlay> ... <overlay>
        set monitor-min <integer>
    next
end
```

`monitor`	The IPsec interfaces to monitor.
`monitor-min`	The minimum number of monitored interfaces that must become degraded before this interface is activated (0 = all interfaces, default = 0).

In this example, four primary overlays are configured, T1 - T4, on fixed broadband connections and one backup overlay, T5, is configured on an LTE connection.

The backup overlay stays down as long as the primary overlays are working normally. When all four of the primary overlays go down, the backup overlay is activated and used to forward traffic. If any of the primary overlays recover, then the backup overlay goes down.

SD-WAN can also be configured to steer traffic.

To configure the overlays:

1. Configure the VPN remote gateways:

```
config vpn ipsec phase1-interface
    edit "T1"
        set interface "dmz"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256
        set remote-gw 172.16.208.2
        set psksecret **********
    next
    edit "T2"
        set interface "agg1"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256
        set remote-gw 172.16.203.2
        set psksecret **********
    next
    edit "T3"
        set interface "vlan100"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256
        set remote-gw 172.16.206.2
        set psksecret **********
    next
    edit "T4"
        set interface "port15"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256
        set remote-gw 172.16.209.2
        set psksecret **********
    next
    edit "T5"
        set interface "vlan200"
        set ike-version 2
        set peertype any
        set monitor "T1" "T2" "T3" "T4"
        set monitor-min 4
        set net-device disable
        set proposal aes128-sha256
        set remote-gw 172.16.210.2
        set psksecret **********
```

```
   next
end
```

2. Configure the VPN tunnels:

```
config vpn ipsec phase2-interface
    edit "T1_P2"
        set phase1name "T1"
        set proposal aes256-sha256
        set auto-negotiate enable
    next
    edit "T2_P2"
        set phase1name "T2"
        set proposal aes256-sha256
        set auto-negotiate enable
    next
    edit "T3_P2"
        set phase1name "T3"
        set proposal aes256-sha256
        set auto-negotiate enable
    next
    edit "T4_P2"
        set phase1name "T4"
        set proposal aes256-sha256
        set auto-negotiate enable
    next
    edit "T5_P2"
        set phase1name "T5"
        set proposal aes256-sha256
        set auto-negotiate enable
    next
end
```

3. Configure the interfaces:

```
config system interface
    edit "T1"
        set vdom "root"
        set ip 100.1.1.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 100.1.1.2 255.255.255.0
        set snmp-index 113
        set interface "dmz"
    next
    edit "T2"
        set vdom "root"
        set ip 100.1.2.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 100.1.2.2 255.255.255.0
        set snmp-index 114
```

```
        set interface "agg1"
    next
    edit "T3"
        set vdom "root"
        set ip 100.1.3.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 100.1.3.2 255.255.255.0
        set snmp-index 115
        set interface "vlan100"
    next
    edit "T4"
        set vdom "root"
        set ip 100.1.4.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 100.1.4.2 255.255.255.0
        set snmp-index 65
        set interface "port15"
    next
    edit "T5"
        set vdom "root"
        set ip 100.1.5.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 100.1.5.2 255.255.255.0
        set snmp-index 117
        set interface "vlan200"
    next
end
```

4. Check the IPsec tunnel summary:

```
# get vpn ipsec tunnel summary
'T2' 172.16.203.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T3' 172.16.206.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T4' 172.16.209.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T5' 172.16.210.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T1' 172.16.208.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
```

The backup overlay, T5, is down.

To configure steering traffic with SD-WAN:

1. Configure the SD-WAN:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
```

```
    config members
        edit 1
            set interface "T1"
        next
        edit 2
            set interface "T2"
        next
        edit 3
            set interface "T3"
        next
        edit 4
            set interface "T4"
        next
        edit 5
            set interface "T5"
        next
    end
    config service
        edit 1
            set name "1"
            set load-balance enable
            set dst "all"
            set src "172.16.205.0"
            set priority-members 1 2 3 4 5
        next
    end
end
```

2. Configure a static route:

```
config router static
    edit 5
        set dst 8.0.0.0 255.0.0.0
        set distance 1
        set sdwan-zone "virtual-wan-link"
    next
end
```

3. Check the routing table:

```
# get router info routing-table static
Routing table for VRF=0
S       8.0.0.0/8 [1/0] via T2 tunnel 172.16.203.2, [1/0]
                  [1/0] via T3 tunnel 172.16.206.2, [1/0]
                  [1/0] via T1 tunnel 172.16.208.2, [1/0]
                  [1/0] via T4 tunnel 172.16.209.2, [1/0]
```

Check the results:

- When both the T1 and T2 connections are down, T5 stays down as well, and traffic is load-balanced on T3 and T4 by the SD-WAN configuration:

```
 # get vpn ipsec tunnel summary
'T2' 172.16.203.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T3' 172.16.206.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T4' 172.16.209.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T5' 172.16.210.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T1' 172.16.208.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
```

```
# get router info routing-table static
Routing table for VRF=0
S       8.0.0.0/8 [1/0] via T3 tunnel 172.16.206.2, [1/0]
                  [1/0] via T4 tunnel 172.16.209.2, [1/0]
```

Traffic is load-balanced between the remaining tunnels:

```
# diagnose sniffer packet any 'host 8.8.8.8' 4
interfaces=[any]
filters=[host 8.8.8.8]
3.027055 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
3.027154 T4 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
3.031434 T4 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
3.031485 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
3.612818 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
3.612902 T3 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
3.617107 T3 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
3.617159 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
4.168845 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.168907 T4 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.173150 T4 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
4.173174 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
4.710907 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.710991 T3 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.715933 T3 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
4.715958 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
```

- When all of the primary overlays are down, T5 is activated and used for traffic

```
# get vpn ipsec tunnel summary
'T2' 172.16.203.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T3' 172.16.206.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T4' 172.16.209.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T5' 172.16.210.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T1' 172.16.208.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
```

```
# get router info routing-table static
Routing table for VRF=0
S       8.0.0.0/8 [1/0] via T5 tunnel 172.16.210.2, [1/0]
```

Traffic is using the backup overlay, T5:

```
# diagnose sniffer packet any 'host 8.8.8.8' 4
interfaces=[any]
filters=[host 8.8.8.8]
```

```
1.907944 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
1.908045 T5 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
1.912283 T5 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
1.912351 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
2.665921 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
2.665999 T5 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
2.670209 T5 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
2.670235 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
5.269997 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.270090 T5 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.274275 T5 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
5.274300 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
5.781848 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.781920 T5 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.786334 T5 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
5.786363 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
```

- If T4 recovers, T5 is deactivated and traffic switches to T4:

```
# get vpn ipsec tunnel summary
'T2' 172.16.203.2:0  selectors(total,up): 2/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T3' 172.16.206.2:0  selectors(total,up): 2/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T4' 172.16.209.2:0  selectors(total,up): 2/2  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T5' 172.16.210.2:0  selectors(total,up): 2/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T1' 172.16.208.2:0  selectors(total,up): 2/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
```

```
# get router info routing-table static
Routing table for VRF=0
S       8.0.0.0/8 [1/0] via T4 tunnel 172.16.209.2, [1/0]
```

The primary overlay T4 has recovered, and the backup overlay is down again:

```
# diagnose sniffer packet any 'host 8.8.8.8' 4
interfaces=[any]
filters=[host 8.8.8.8]
4.555685 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.555790 T4 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.560428 T4 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
4.560478 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
5.163223 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.163332 T4 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.167590 T4 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
5.167620 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
5.650089 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.650194 T4 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.654352 T4 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply

6.102263 T4 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
6.106411 T4 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
6.106445 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
```

Encapsulate ESP packets within TCP headers

FortiOS includes a proprietary solution to support the encapsulation of Encapsulating Security Payload (ESP) packets within Transmission Control Protocol (TCP) headers. This allows ESP packets to be assigned a port number, which enables them to traverse over carrier networks where direct IPsec traffic is blocked or impeded by carrier-grade NAT.

This feature only works with IKE version 2, and it does not support ADVPN or NPU offloading.

To configure the TCP port for IKE/IPsec traffic:

```
config system settings
    set ike-tcp-port <port>
end
```

`ike-tcp-port <port>`	Set the TCP port for IKE/IPsec traffic (1 - 65535, default = 443). By default, IKE listens on port 4500 when `ike-tcp-port` is configured as 4500. If `ike-tcp-port` is configured on any other port, the IKE daemon listens on port 4500 and port 11443 while traffic enters on the `ike-tcp-port` and redirects to port 11443.

When using TCP port 443 for IKE/IPsec traffic, GUI access can be affected for interfaces that are bound to an IPsec tunnel when the GUI admin port is also using port 443. To ensure continued functionality, change either the IKE/IPsec port or the administrative access port.

To change the administrative access port:

```
config system global
    set admin-sport <port>
end
```

`admin-sport <port>`	Set the administrative access port for HTTPS (1 - 65535, default = 443).

For port conflicts with ZTNA and SSL VPN, ZTNA and SSL VPN will take precedence. To avoid any port conflicts with other services, review the FortiOS Ports guide for other incoming ports used on the FortiGate.

To configure ESP encapsulation on the phase 1 interface:

```
config vpn ipsec phase1-interface
    edit <name>
        set ike-version 2
```

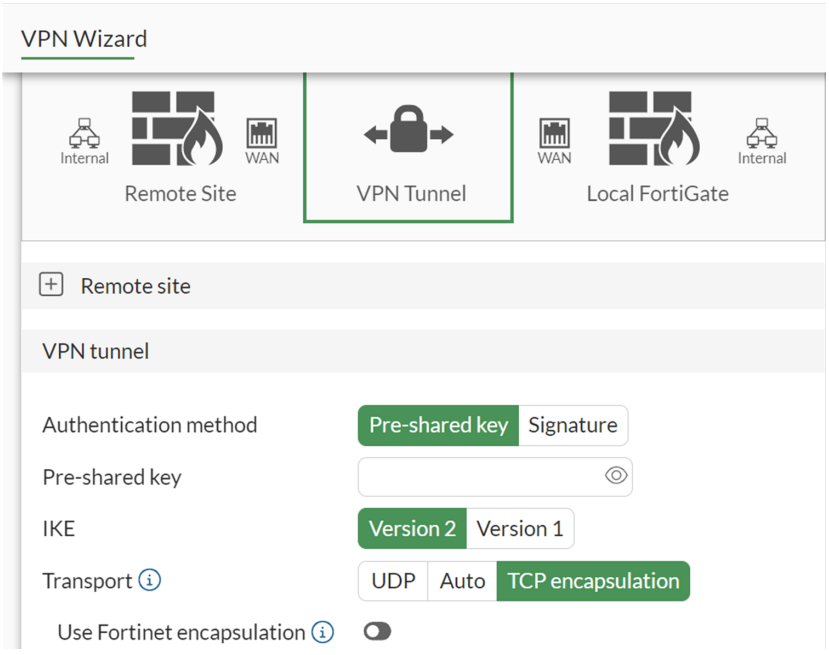
```
        set transport {auto | udp | tcp}
        set fortinet-esp {enable | disable}
        set auto-transport-threshold <integer>
    next
end
```

`transport {auto | udp | tcp}`	Set the IKE transport protocol. • `auto`: use UDP transport for IKE, with fallback to TCP transport. • `udp`: use UDP transport for IKE. • `tcp`: use TCP transport for IKE.
`fortinet-esp {enable | disable}`	Enable/disable ESP encapsulation.
`auto-transport-threshold <integer>`	Set the timeout before IKE/IPsec traffic falls back to TCP, in seconds (1 - 300, default = 15).

In the GUI, the *VPN Wizard* can be used to set the IKE transport protocol.

To set the IKE transport protocol in the GUI:

1. Go to *VPN* > *VPN Wizard*.
2. Enter a Tunnel name.
3. For *Select a template*, select *Site to Site*, and click *Begin*.
4. Configure the *Remote Site* settings as required, and click *Next*.
5. Under *VPN tunnel*, set the *Transport* protocol as needed.



The *Use Fortinet encapsulation* option displays only when *Transport* is set to *TCP encapsulation*. See Encapsulate ESP packets within TCP headers for more information.

When *Transport* is set to *Auto*, you can adjust the threshold for switching to TCP encapsulation by using the `set auto-transport-threshold` command.

6. Configure the remaining settings as needed.

TCP encapsulation of IKE and IPsec packets across multiple vendors

FortiOS supports TCP encapsulation of IKE and IPsec packets across multiple vendors. This cross-vendor interoperability ensures that you can maintain a secure and efficient network, while also having the flexibility to choose the hardware that aligns best with your requirements.

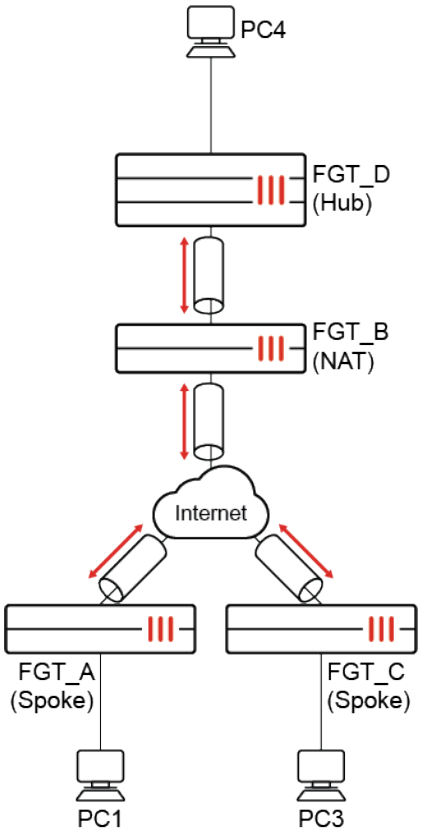
IKE and ESP will be encapsulated into TCP and ESP packets will be encapsulated into a real TCP header. This is because FortiOS ESP encapsulation is not enabled, and therefore anti-replay does not need to be disabled.

To configure ESP encapsulation for cross-vendor interoperability:

1. Configure the IKE TCP port setting.
2. Configure the IPsec phase 1 settings and do not set `fortinet-esp` to `enable`. This is disabled by default.
3. Configure the IPsec phase 2 settings.

Example

In this example, IPsec VPN crosses over a carrier network and UDP packets are not allowed.



To encapsulate ESP packets within TCP headers:

1. On each FortiGate, configure the IKE TCP port setting:

```
config system settings
    set ike-tcp-port 1443
end
```

2. Disable anti-replay in the global settings on the FGT_B (NAT) FortiGate (see step 7 for more information):

```
config system global
    set anti-replay disable
    set hostname "FGT-B"
end
```

3. Configure the FGT_A (spoke) FortiGate.
   a. Configure the IPsec phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "spoke"
        set interface "wan1"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
```

```
chacha20poly1305-prfsha256
        set transport tcp
        set fortinet-esp enable
        set remote-gw 173.1.1.1
        set psksecret **********
    next
end
```

b. Configure the IPsec phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "spoke"
        set phase1name "spoke"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-subnet 10.1.100.0 255.255.255.0
    next
end
```

IKE and ESP will be encapsulated into TCP, and ESP packets encapsulated into a fake TCP header.

4. Configure the FGT_C (spoke) FortiGate.

a. Configure the IPsec phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "Spoke"
        set interface "wan1"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set transport auto
        set fortinet-esp enable
        set auto-transport-threshold 10
        set remote-gw 173.1.1.1
        set psksecret **********
    next
end
```

b. Configure the IPsec phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "Spoke"
        set phase1name "Spoke"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-subnet 192.168.4.0 255.255.255.0
    next
end
```

IKE will use UDP encapsulation first. If it fails to establish in 10 seconds, it will fall back to TCP. ESP packets are encapsulated into a fake TCP header.

5. Configure the FGT_D (hub) FortiGate.
   a. Configure the IPsec phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "Hub"
        set type dynamic
        set interface "port25"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dpd on-idle
        set transport tcp
        set fortinet-esp enable
        set psksecret **********
        set dpd-retryinterval 60
    next
end
```

   b. Configure the IPsec phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "Hub"
        set phase1name "Hub"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

6. Verify the IPsec VPN tunnel state on FGT_D (hub):

```
# diagnose vpn ike gateway list

vd: root/0
name: Hub_0
version: 2
interface: port25 33
addr: 173.1.1.1:1443 -> 173.1.1.2:23496

In the packet capture, ESP packets are encapsulated into TCP ACK packets with the same sequence number. This is why anti-replay must be disabled on the NAT FortiGate.

Cross-validation for IPsec VPN

FortiOS supports a cross-validation mechanism for IPsec VPN, aimed at bolstering security and user authentication by mitigating the risk of unauthorized access and identity spoofing. This mechanism functions by cross-checking whether the username provided by the client matches the identity field specified in the peer certificate. The identity field, which could be an Othername, RFC 822 Name, or CN, serves as a unique identifier for the client.

```
config vpn ipsec phase1-interface
    edit <name>
        set cert-peer-username-validation {none | othername | rfc822name | cn}
        set cert-peer-username-strip {enable | disable}
    next
end
```

Validation can be enabled for IPsec VPN when the peer sends certificates for authentication and XAUTH, EAP, SAML, or `azure-ad-autoconnect` is used. Name matching is not case sensitive.

To configure cross-validation for IPsec VPN:

1. Configure IPsec VPN phase1:

```
config vpn ipsec phase1-interface
    edit "toclient"
        set type dynamic
        set interface "port8"
        set authmethod signature
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256
        set dpd on-idle
        set dhgrp 5
        set xauthtype auto
        set authusrgrp "vpnad01- ldap-group"
        set cert-peer-username-validation othername
        set cert-peer-username-strip enable
        set certificate "FTG-D"
```

```
    next
end
```

2. Configure IPsec VPN phase2:

```
config vpn ipsec phase2-interface
    edit "toclient"
        set phase1name "toclient"
        set proposal aes128-sha256 aes256-sha256
        set dhcp-ipsec enable
    next
end
```

3. In FortiClient, input a username that corresponds with the identity in the certificate, such as *tester2*.
4. Verify that the cross-validation succeeded and the tunnel is established:

```
# diagnose vpn ike gateway list

vd: root/0
name: toclient_0
version: 1
interface: port8 16
addr: 173.1.1.1:4500 -> 173.1.1.2:64917
tun_id: 173.1.1.2/::10.0.0.12
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 17s ago
xauth-user: tester2
2FA: no
peer-id: DC=com, DC=vpnfosqa, CN=Users, CN=tester2
peer-id-auth: yes
FortiClient UID: 43B7079E9D244365A91CB0F139EA470F
nat: peer
pending-queue: 0
IKE SA: created 1/1  established 1/1  time 20/20/20 ms
IPsec SA: created 1/2  established 1/2  time 0/95/190 ms

  id/spi: 26 df4fd267a4ba2093/a9161305effacd5a
  direction: responder
  status: established 17-17s ago = 20ms
  proposal: aes128-sha256
  key: 3cbdc74916c1b2aa-e00b39fda1b2e324
  QKD: no
  lifetime/rekey: 86400/86112
  DPD sent/recv: 00000000/00000002
  peer-id: DC=com, DC=vpnfosqa, CN=Users, CN=tester2
```

5. In FortiClient, input a username that does not correspond with the identity in the certificate, such as *tester1*.
6. Verify that the cross-validation failed:

```
# diagnose debug application fnbamd -1
# diagnose debug enable

ike V=root:0:toclient:23: received p1 notify type INITIAL-CONTACT
ike V=root:0:toclient:23: received peer identifier DER_ASN1_DN 'DC=com, DC=vpnfosqa, CN=Users,
CN=tester2'
ike V=root:0:toclient:23: re-validate gw ID
ike V=root:0:toclient:23: gw validation OK
ike V=root:0:toclient:23: Validating X.509 certificate

```

Resuming sessions for IPsec tunnel IKE version 2

FortiOS supports session resumptions for IPsec tunnel IKE version 2. This feature enhances the user experience by maintaining the tunnel in an idle state, which allows for uninterrupted usage even after a client resumes from sleep or when connectivity is restored after a disruption. Furthermore, it removes the necessity for re-authentication when reconnecting, making the process more efficient.

```
config vpn ipsec phase1-interface
    edit <phase 1 name>
        set client-resume enable
        set client-resume-interval {integer length of idle time}
```

```
    next
end
```

Example

In the following example, the client FortiGate will be configured to enable session resumption after returning from an idle state. The resume interval will be set as 120 seconds and the interface status will be tested when the client resumes within and past this interval.

This example uses a pre-shared key for authentication, although signature authentication can also be used.

To enable session resumption for IPsec tunnel IKE version 2:

1. Configure IPsec VPN for the dialup client FortiGate:
   a. Configure the IPsec phase 1 interface:

```
config vpn ipsec phase1-interface
    edit "toServer"
        set interface "port9"
        set ike-version 2
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dpd on-idle
        set remote-gw 173.1.1.1
        set psksecret ****************
        set dpd-retryinterval 60
    next
end
```

   b. Configure the IPsec phase 2 interface:

```
config vpn ipsec phase2-interface
    edit "toServer"
        set phase1name "toServer"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

   c. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "toServer"
```

```
        set action accept
        set srcaddr "10.1.100.0"
        set dstaddr "192.168.5.0"
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "toServer"
        set dstintf "port2"
        set action accept
        set srcaddr "192.168.5.0"
        set dstaddr "10.1.100.0"
        set schedule "always"
        set service "ALL"
   next
end
```

2. Configure IPsec VPN for the dialup server FortiGate:
   a. Configure the IPsec phase 1 interface:

```
config vpn ipsec phase1-interface
    edit "toClient"
        set type dynamic
        set interface "port8"
        set ike-version 2
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dpd on-idle
        set client-resume enable
        set client-resume-interval 120
        set psksecret ****************
        set dpd-retryinterval 60
    next
end
```

   b. Configure the IPsec phase 2 interface:

```
config vpn ipsec phase2-interface
    edit "toClient"
        set phase1name "toClient"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

   c. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
```

```
        set dstintf "toClient"
        set action accept
        set srcaddr "192.168.5.0"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "toClient"
        set dstintf "port2"
        set action accept
        set srcaddr "all"
        set dstaddr "192.168.5.0"
        set schedule "always"
        set service "ALL"
    next
end
```

3. Check the IPsec phase 1 and phase 2 interface status and the client resume messages:
   a. In the following scenario, the client becomes idle or has connectivity issues but resumes within the set 120 second interval:

```
# diagnose debug application ike -1
ike V=root:0:toClient_0: starting client-resume sleep period 120 sec (1)
ike V=root:0: comes 11.101.1.1:500->173.1.1.1:500,ifindex=16,vrf=0,len=632....
ike V=root:0: IKEv2 exchange=SA_INIT id=dfa40e0473d89550/0000000000000000 len=632
ike V=root:0:toClient_0: client has resumed (1)
ike 0:toClient_0:10: out
6749C602DDF25B141E24AC649641D2242E2025000000000200000050000000343F9A56C6D16E93E2F5D7BC7F66
DC7CBDB3E44EA75F0A87A3238DCC08EE0BF478817EC93DF72EB2B3E027D695FACECF4E
ike V=root:0:toClient_0:11:toClient:30: sending SNMP tunnel UP trap
ike V=root:0:toClient_0: tunnel up event
```

   b. In the following scenario, the client becomes idle or has connectivity issues but the set 120 second interval expires before it resumes. Therefore, the tunnel is not maintained:

```
# diagnose debug application ike -1
ike V=root:0:toClient_0:9: sent IKE msg (RETRANSMIT_INFORMATIONAL): 173.1.1.1:500-
>11.101.1.1:500, len=80, vrf=0, id=e50861aebc1e5b1a/6457ea1e8512148c, oif=16
ike V=root:0:toClient_0: link is idle 16 173.1.1.1->11.101.1.1:0 dpd=1 seqno=2 rr=0
ike V=root:0:toClient_0:9: send IKEv2 DPD probe, seqno 2

SSL VPN

Virtual Private Network (VPN) technology lets remote users connect to private computer networks to gain access to their resources in a secure way. For example, an employee traveling or working at home can use a VPN to securely access the office network through the internet.

Instead of remotely logging into a private network using an unencrypted and unsecured internet connection, using a VPN ensures that unauthorized parties cannot access the office network and cannot intercept information going between the employee and the office. Another common use of a VPN is to connect the private networks of multiple offices.

SSL VPN uses the Secure Socket Layer (SSL) protocol to create a secure tunnel from the host's web browser to a particular application (web mode) or to provide an SSL-secured tunnel between the client and the corporate network (tunnel mode). SSL VPN operates at the application layer of the OSI model and protects specific services or applications.

SSL VPN security restricts and validates the HTTP messages sent from clients to FortiGate using web mode and/or tunnel mode. With advanced checks and binary code verification, FortiGate now automatically detects and blocks certain HTTP methods that could be used for malicious access attempts. By implementing this proactive defense, FortiGate enhances the safety of its SSL VPN feature, ensuring a more secure environment for users.

The SSL VPN web and tunnel mode feature will not be available from the GUI or the CLI on the FortiGate 90G and 91G models. Settings will not be upgraded from previous versions.

Consider migrating to using IPsec Dialup VPN for remote access.

The following topics provide information about SSL VPN in FortiOS 7.6.2.

- SSL VPN to dial-up VPN migration on page 2776
- SSL VPN best practices on page 2776
- SSL VPN security best practices on page 2779
- SSL VPN quick start on page 2786
- SSL VPN tunnel mode on page 2794
- SSL VPN web mode on page 2819
- SSL VPN authentication on page 2842
- SSL VPN to IPsec VPN on page 2936
- SSL VPN protocols on page 2943
- Configuring OS and host check on page 2947
- FortiGate as SSL VPN Client on page 2954
- Dual stack IPv4 and IPv6 support for SSL VPN on page 2963
- Disable the clipboard in SSL VPN web mode RDP connections on page 2974
- SSL VPN IP address assignments on page 2979
- Using SSL VPN interfaces in zones on page 2982
- SSL VPN troubleshooting on page 2986

- Restricting VPN access to rogue/non-compliant devices with Security Fabric

SSL VPN to dial-up VPN migration

FortiOS 7.6.1 and later does not support the SSL VPN web and tunnel mode feature on some FortiGate models:

FortiGate models	Supports SSL VPN?	FortiOS upgrade impact on SSL VPN configuration
FortiGate models with 2GB of RAM or less	No	Deleted during upgrade to FortiOS 7.6.0 or later
FortiGate models with more than 2GB of RAM	Yes	Retained after upgrade to FortiOS 7.6.0 or later

See the FortiOS 7.6 Release Notes for information about affected models.

You may want to use IPsec VPN instead of SSL VPN. Depending on your needs and FortiGate model, you may want to migrate the VPN configuration before or after upgrade to FortiOS 7.6:

- For information about migrating before upgrade to FortiOS 7.6, see the FortiOS 7.4 SSL VPN to IPsec VPN Migration guide.
- For information about migrating after upgrade to FortiOS 7.6, see the FortiOS 7.6 SSL VPN to IPsec VPN Migration guide.

The migration guide covers:

- Background information, such as a security comparison between SSL VPN and IPsec VPN, the differences between IKEv1 and IKEv2, and information about TLS protocol for tunneling.
- Design differences between SSL VPN and IPsec VPN to consider, such as authentication methods, user groups, full tunneling versus split tunneling, client address assignments, policy configurations, FortiClient or endpoint configurations, and whether to migrate VPNs before or after FortiOS upgrade.
- Instructions for configuring IPsec tunnels using the FortiOS IPsec wizard.
- Instructions for migrating FortiClient endpoint configurations.

SSL VPN best practices

Securing remote access to network resources is a critical part of security operations. SSL VPN allows administrators to configure, administer, and deploy a remote access strategy for their remote workers. When not in use, SSL VPN can be disabled.

Choosing the correct mode of operation and applying the proper levels of security are integral to providing optimal performance and user experience, and keeping your user data safe.

- Tunnel mode: Establish an SSL VPN tunnel using FortiClient to support a wide range of applications and provide a transparent end user experience that is easy to configure and administer.

- Web mode: Provide clientless network access to a limited set of applications using an SSL VPN Web Portal that is accessed using a web browser over HTTPS.

The below guidelines outline selecting the correct SSL VPN mode for your deployment and employing best practices to ensure that your data are protected.

Information about SSL VPN throughput and maximum concurrent users is available on your device's datasheet; see Next-Generation Firewalls Models and Specifications.

By default, SSL VPN tunnel mode settings and the *VPN > SSL-VPN* menus are hidden from the GUI.

To enable SSL VPN feature visibility in the GUI, go to *System > Feature Visibility*, enable *SSL-VPN*, and click *Apply*.

To enable SSL VPN feature visibility in the CLI, enter:

```
config system settings
    set gui-sslvpn enable
end
```

By default, SSL VPN web mode settings are disabled and hidden from the GUI and the CLI.

To enable SSL VPN web mode, enter:

```
config system global
    set sslvpn-web-mode enable
end
```

If this setting is disabled, even though SSL VPN tunnel mode can be correctly configured, when trying to access SSL VPN web mode using the SSL VPN portal by navigating to the listening IP address, domain, and port using a web browser, an error message will appear.

Alternative remote access solutions in FortiOS are IPsec VPN and ZTNA.

Ensure you always upgrade your FortiGate to the latest FortiOS firmware version. This ensures you are running the latest SSL VPN security enhancements to protect your VPN deployment.

Tunnel mode

In tunnel mode, the SSL VPN client encrypts all traffic from the remote client computer and sends it to the FortiGate through an SSL VPN tunnel over the HTTPS link between the user and the FortiGate. SSL VPN tunnel mode provides an easy-to-use encrypted tunnel that will traverse almost any infrastructure.

The FortiGate establishes a tunnel with the client, and assigns an IP address to the client from a range of reserved addresses. While the underlying protocols are different, the outcome is very similar to an IPsec VPN tunnel. All client traffic is encrypted, allowing the users and networks to exchange a wide range of traffic, regardless of the application or protocols.

Use this mode if you require:

- A wide range of applications and protocols to be accessed by the remote client.
- No proxying is done by the FortiGate.
- Straightforward configuration and administration, as traffic is controlled by firewall policies.
- A transparent experience for the end user. For example, a user that needs to RDP to their server only requires a tunnel connection; they can then use the usual client application, like Windows Remote Desktop, to connect.

Full tunneling forces all traffic to pass through the FortiGate (see SSL VPN full tunnel for remote user on page 2794). Split tunneling only routes traffic to the designated network through the FortiGate (see SSL VPN split tunnel for remote user on page 2786).

Avoid setting *all* as the destination address in a firewall policy when the user or group associated with that policy is using a portal with *Split tunneling* enabled. Setting *all* as the destination address will cause portal to function as a full tunnel, potentially leading to misconfigurations and complicating troubleshooting efforts.

Limitations

Tunnel mode requires that the FortiClient VPN client be installed on the remote end. The standalone FortiClient VPN client is free to use, and can accommodate SSL VPN and IPsec VPN tunnels. For supported operating systems, see the FortiClient Technical Specifications.

SSL VPN encrypts traffic using TLS and uses TCP as the transport layer. Therefore, SSL VPN is subject to retransmission issues that can occur with TCP-in-TCP that result in lower VPN throughput. For optimal SSL VPN throughput, consider enabling DTLS support. See DTLS support on page 2944.

For the highest VPN throughput, consider configuring dialup IPsec VPN instead. See FortiClient as dialup client on page 2502.

Web mode

Web-only mode provides clientless network access using a web browser with built-in SSL encryption. Users authenticate to FortiGate's SSL VPN Web Portal, which provides access to network services and resources, including HTTP/HTTPS, Telnet, FTP, SMB/CIFS, VNC, RDP, and SSH. When a user starts a connection to a server from the web portal, FortiOS proxies this communication with the server. All communication between the FortiGate and the user continues to be over HTTPS, regardless of the service that is being accessed.

The clipboard can be disabled for SSL VPN web mode RDP/VNC connections, see Disable the clipboard in SSL VPN web mode RDP connections on page 2974.

Use this mode if you require:

- A clientless solution in which all remote services are access through a web portal.
- Tight control over the contents of the web portal.
- Limited services provided to the remote users.

Do not set the virtual IP addresses as the destination address in a firewall policy when using SSL VPN web mode, as it will result in no destination address being accessible. Please note that the FortiOS SSL VPN web mode does not support mapping the virtual IP to the actual one.

Limitations

- Multiple applications and protocols are not supported.
- VNC and RDP access might have limitations, such as certain shortcut keys not being supported.
- In some configurations RDP can consume a significant amount of memory and CPU time.
- Firewall performance might decrease as remote usage increases.
- Highly customized web pages might not render correctly.

Security best practices

See SSL VPN security best practices on page 2779 for more information.

SSL VPN security best practices

SSL VPN settings on page 2780

- Define your minimum supported TLS version and cipher suites on page 2780
- Limit log in attempts and block duration on page 2780
- Limit users to one SSL VPN session at a time on page 2780
- Use a custom listening port for SSL VPN on page 2781
- Disable SSL VPN on page 2781
- Disable SSL VPN web login page on page 2781

Authentication on page 2782

- Integrate with authentication servers on page 2782
- Use a non-factory SSL certificate for the SSL VPN portal on page 2782
- Use multi-factor authentication on page 2782
- Use multi-factor authentication with authentication servers on page 2783
- Disable case sensitivity for remote users using authentication servers and MFA on page 2783
- Deploy user certificates for remote SSL VPN users on page 2783

Authorization on page 2783

- Properly administer firewall policies and profiles against only the access level required for the remote user on page 2783
- Set the default portal to a custom SSL VPN with all modes disabled on page 2784
- Limit incoming access to specific hosts or geography based addresses on page 2784
- Limit incoming access using local-in policies with specific hosts, geography based addresses, or schedules on page 2785
- Limit incoming access using a virtual IP, loopback interface, and firewall policy with Internet Services or an external feed or schedule on page 2785

SSL VPN settings

Define your minimum supported TLS version and cipher suites

Minimum and maximum supported TLS version can be configured in the FortiGate CLI. The cipher algorithm can also be customized.

See How to control the SSL version and cipher suite for SSL VPN for more information.

Limit log in attempts and block duration

To prevent brute force attacks, limit log in attempts and configure the block duration:

```
config vpn ssl settings
   set login-attempt-limit 2
   set login-block-time 60
end
```

These values are the default values. The FortiGate will block attempts to connect to SSL VPN for 60 seconds after two unsuccessful log in attempts. These values can be configured as needed.

See How to limit SSL VPN login attempts and block duration for more information.

Limit users to one SSL VPN session at a time

To prevent attacks from a compromised user, you can limit a user to one SSL VPN session at a time by going to *VPN > SSL-VPN Portals*, editing a portal, and enabling *Limit Users to One SSL-VPN Connection at a Time*. This option can also be configured in the CLI:

```
config vpn ssl web portal
    edit < portal name >
        set limit-user-logins enable
    end
end
```

See Multiple sessions of SSL VPN users for more information.

Use a custom listening port for SSL VPN

To prevent external attacks targeting the default SSL VPN port 10443, use a custom listening port for SSL VPN other than port 10443.

The SSL VPN listening port can be configured from the GUI on the *VPN > SSL-VPN Settings* page by changing the *Listen on Port* field from the default 10443 to any other port. To change the listening port in the CLI:

```
config vpn ssl settings
    set port <port number>
end
```

After the SSL VPN listening port has been changed, the custom port must be communicated to end users that must use it for SSL VPN tunnel mode access using FortiClient, or for SSL VPN web portal access using a web browser, replacing 10443 in the web portal URL.

Disable SSL VPN

After the SSL VPN settings have been configured, SSL VPN can be disabled when not in use.

To disable SSL VPN in the GUI:

1. Go to *VPN > SSL-VPN Settings*.
2. Disable *Enable SSL-VPN*.
3. Click *Apply*.

If the FortiGate has VDOMs configured, then you can select the appropriate VDOM and repeat the steps to disable SSL VPN for that specific VDOM.

See How to disable SSL VPN functionality on FortiGate for more information.

Disable SSL VPN web login page

A best practice is to disable the SSL VPN web login page when SSL VPN is configured to only allow tunnel access and web access is disabled. This prevents the web login page from displaying in a browser when users access https://<FortiGate-ip>:<ssl-vpn-port-number>.

To disable SSL VPN web login page in the GUI:

1. Go to *System > Replacement Messages* and double-click *SSL-VPN Login Page* to open it for editing.
2. In the *Message Format: text/html* select from `<body>` to `</body>`, and press `Delete`.
3. Click *Save*.

To disable SSL VPN web login page in the CLI:

```
config system replacemsg sslvpn sslvpn-login
    set buffer " "
end
```

See How to prevent the SSL-VPN web login portal from displaying when SSL-VPN web mode is disabled for more information.

Authentication

Integrate with authentication servers

For networks with many users, integrate your user configuration with existing authentication servers through LDAP, RADIUS, or FortiAuthenticator. When integrating with existing authentication servers, these users are referred to as remote users.

By integrating with existing authentication servers, such as Windows AD, there is a lower chance of making mistakes when configuring remote users and remote user groups, reducing your administration effort. Also, credentials for remote users are kept on the authentication servers themselves and are not stored on the FortiGate, unlike credentials for local users.

See SSL VPN with LDAP user authentication on page 2842 and SSL VPN with RADIUS on Windows NPS on page 2891 for more information.

It is best practice to integrate with encrypted protocols on authentication servers such as LDAPS instead of LDAP, and RADSEC over TLS instead of RADIUS. See Configuring client certificate authentication on the LDAP server on page 3029 and Configuring a RADSEC client on page 3073 for more information.

Use a non-factory SSL certificate for the SSL VPN portal

Your certificate should identify your domain so that a remote user can recognize the identity of the server or portal that they are accessing through a trusted CA.

The default Fortinet factory self-signed certificates are provided to simplify initial installation and testing. If you use these certificates you are vulnerable to man-in-the-middle attacks, where an attacker spoofs your certificate, compromises your connection, and steals your personal information. It is highly recommended that you purchase a server certificate from a trusted CA to allow remote users to connect to SSL VPN with confidence. See Procuring and importing a signed SSL certificate on page 3616 for more information.

Enabling the *Do not Warn Invalid Server Certificate* option on the client disables the certificate warning message, potentially allowing users to accidentally connect to untrusted servers. Disabling invalid server certificate warnings is not recommended.

Use multi-factor authentication

Multi-factor authentication (MFA) ensures that the end-user is who they claim to be by requiring at least two factors - a piece of information that the user knows (password), and an asset that the user has (OTP). A third factor, something a user is (fingerprint or face), may be enabled as well. FortiToken Mobile is typically used for MFA.

FortiGate comes with two free FortiTokens, and more can be purchased from the FortiToken Mobile iOS app or through Fortinet partners.

See SSL VPN with FortiToken mobile push authentication on page 2872 for more information.

2FA, a subset of MFA, can also be set up with email tokens. See Email Two-Factor Authentication on FortiGate for information.

Use multi-factor authentication with authentication servers

Users configured with MFA, such as FortiToken Mobile tokens and email tokens on the FortiGate, are still essentially local users with user credentials stored on the FortiGate.

You should therefore consider using a combination of MFA and authentication servers for optimal security. See SSL VPN with LDAP-integrated certificate authentication on page 2858, SSL VPN with RADIUS and FortiToken mobile push on FortiAuthenticator on page 2882, and RADIUS integrated certificate authentication for SSL VPN on page 3077 for more information.

Disable case sensitivity for remote users using authentication servers and MFA

When using remote users with authentication servers and MFA, it is possible for MFA to be bypassed if the case of the entered username is not an exact match. To prevent this, ensure case sensitivity is disabled for each remote user that has been configured on the FortiGate with authentication server and MFA settings. See SSL VPN for remote users with MFA and user sensitivity on page 2864 for more information.

Deploy user certificates for remote SSL VPN users

This method of 2FA uses a user certificate as the second authentication factor. This is more secure, as it identifies the end user using a certificate. The configuration and administration of this solution is significantly more complicated, and requires administrators with advanced knowledge of the FortiGate and certificate deployment.

See SSL VPN with certificate authentication on page 2853 for more information.

Authorization

Properly administer firewall policies and profiles against only the access level required for the remote user

Users do not all require the same access. Access should only be granted after careful considerations. Typically, users are placed in groups, and each group is allowed access to limited resources.

Using SSL VPN realms simplifies defining the control structure for mapping users and groups to the appropriate resources.

See SSL VPN multi-realm on page 2921 for more information.

Set the default portal to a custom SSL VPN with all modes disabled

In the SSL VPN settings, it is mandatory in the *Authentication/Portal Mapping* section to configure a portal *for All Other Users/Groups* or what can be considered a default portal for other users who are not specifically mapped to access SSL VPN portals.

When the *Authentication/Portal Mapping* does not match users or groups that you have specifically mapped to access SSL VPN portals, you can create a custom SSL VPN portal with both tunnel and web modes disabled, and then set the default portal to that custom portal. This configuration is analogous to the implicit deny policy in firewall policies, in that this custom portal can deny all other users and groups.

Even with a default portal with all modes disabled, users deemed to be part of *All Other Users/Groups* will still be able to access the web portal. Once these users try to log into the web portal, access will be denied. Users deemed to be part of *All Other Users/Groups* should not be able to successfully establish tunnel mode connections in this case.

See How to disable SSL VPN Web Mode or Tunnel Mode in SSL VPN portal for more information.

Limit incoming access to specific hosts or geography based addresses

The simplest method for limiting incoming access is specifying source addresses in the SSL VPN settings.

- If you require schedules and geography based addresses, and are comfortable using the CLI, then consider configuring local-in policies as described in To limit incoming access to specific hosts based on their source IP addresses in the CLI.
- If you require Internet Services using ISDB or external feeds, or schedules and geography based addresses, and are more comfortable using the GUI, then consider configuring a VIP, loopback, and firewall policy as described in To limit incoming access to specific hosts based on their source IP addresses in the GUI.

To limit incoming access to specific hosts based on their source IP addresses in the GUI:

1. Create address objects or groups with the source IP addresses you need to allow access to SSL VPN modes.
2. In *VPN > SSL-VPN Settings* under *Restrict Access*, select *Limit access to specific hosts* and in the *Hosts* field select address objects or groups corresponding to specific source IP addresses for hosts that you need to allow.

You can block incoming access for specific hosts by following the same configuration steps with the address objects or groups being of hosts to block and instead selecting Negate Source. See How to block SSL VPN connection from a certain source IP Address for more information.

To limit incoming access to specific hosts based on their source IP addresses in the CLI:

```
config vpn ssl settings
    set source-address <source address 1> ... <source address n>
    set source-address-negate {disable | enable}
end
```

With this CLI, you can limit incoming access to hosts from specific countries by specifying geography based addresses as the source addresses. See Geography based addresses on page 1755 and Restricting SSL VPN connectivity from certain countries using firewall geography address for more information.

Limit incoming access using local-in policies with specific hosts, geography based addresses, or schedules

As an alternative to configuring source addresses in the SSL VPN settings, you can configure local-in policies to allow and deny specific source addresses.

The configuration workflow is:

1. Create a new custom service corresponding to the SSL VPN listening TCP port.
2. (Optional) Create new geography based addresses that can be specified as the source addresses for the allow and deny local-in policies that are created.
3. (Optional) Configure new schedules that can be specified as the schedule for the allow and deny local-in policies that are created.
4. Create a local-in policy using the SSL VPN custom service to allow specific source addresses.
5. Create a local-in policy using the SSL VPN custom service to deny specific source addresses. This is required since there is no implicit deny local-in policy defined by default.

Note that extra care should be taken when configuring a local-in policy, as an incorrect configuration could inadvertently deny traffic for IPsec VPN, dynamic routing protocols, HA, and other FortiGate features.

The source IP address objects that are used can be address objects or groups, or geography based address objects. New schedules can be created and applied to the local-in policies to impose schedule-based access restrictions.

You can also deny all access to SSL VPN by creating a deny local-in policy using source address `all` and SSL VPN custom service without creating a corresponding local-in policy to allow the SSL VPN custom service.

See Local-in policy on page 1605, Restricting/Allowing access to the FortiGate SSL-VPN from specific countries or IP addresses with local-in-policy, and Scheduled SSL-VPN connectivity via Local-in-Policy for more information.

Limit incoming access using a virtual IP, loopback interface, and firewall policy with Internet Services or an external feed or schedule

SSL VPN access can be moved to a secondary IP address or any other WAN IP address defined on a FortiGate interface by using a virtual IP (VIP), loopback interface, and WAN-to-loopback firewall policy.

The configuration workflow is as follows:

1. Configure the SSL VPN firewall policy from the `ssl.<VDOM>` interface to the internal interface or interfaces, ensuring that you specify the users and groups (required), and addresses or address groups (optional) in the policy's *Source* field. See SSL VPN split tunnel for remote user on page 2786.
2. Create a new loopback interface and specify an IP address that is not being used by any other interface on the FortiGate. This IP address can be a private IP address within the RFC 1918 range.
3. Create a new VIP with the following settings:

- *External IP address/range* configured as the secondary WAN IP address, or any other WAN IP address that is available for the WAN interface.
- *IPv4 address/range* configured as the IP address assigned to the loopback interface.
- *Port forwarding* enabled with *External service port* and *Map to IPv4 port* with the SSL VPN listening port.

4. Create a new WAN interface to loopback interface firewall policy with the VIP as the destination address.
5. In the SSL VPN settings set *Listen on Interface(s)* to the newly created loopback interface.
6. (Optional) Create a new deny firewall policy, configure Internet Services as source addresses in the new policy, and place it above the WAN-to-loopback firewall policy.
7. (Optional) Create a new deny firewall policy, configure an IP address external feed, configure the external feed as a source address in the new policy, and place it above the WAN-to-loopback firewall policy.
8. (Optional) Configure a new schedule and apply it to the WAN-to-loopback firewall policy.

This configuration gives you the option to deny access to SSL VPN from specified hosts. You can create a new deny firewall policy, apply Internet Services using the ISDB or external feed objects as source addresses and place the deny policy above the WAN-to-loopback firewall policy.

You also have the option of creating a new schedule and applying it to the WAN-to-loopback firewall policy to allow SSL VPN access during a specified time or days of the week.

Finally, you can disable all SSL VPN access by disabling the WAN-to-loopback firewall policy.

See Access SSL VPN from Secondary IP only, Using Internet Service in a policy on page 1868, IP address external feed on page 4084, and Firewall policy on page 1563 for more information.

See Prevent TOR IP addresses from accessing SSL-VPN with brute-force attacks on FortiGate and How to use a Threat Feed with SSL VPN for specific examples.

SSL VPN quick start

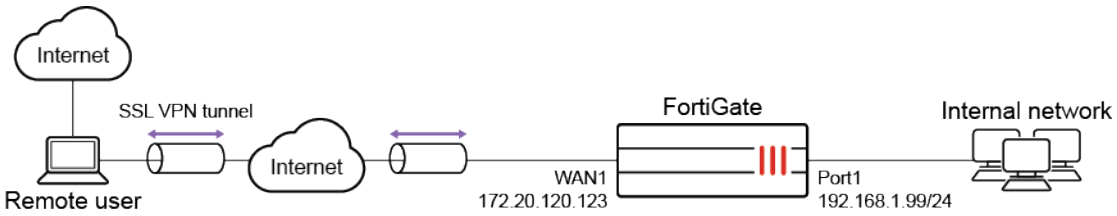
The following topics provide introductory instructions on configuring SSL VPN:

- SSL VPN split tunnel for remote user on page 2786
- Connecting from FortiClient VPN client on page 2790
- Set up FortiToken multi-factor authentication on page 2792
- Connecting from FortiClient with FortiToken on page 2793

SSL VPN split tunnel for remote user

This is a sample configuration of remote users accessing the corporate network and internet through an SSL VPN by tunnel mode using FortiClient but accessing the Internet without going through the SSL VPN tunnel.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface. Ensure that SSL VPN feature visibility is enabled before starting the configuration.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Enable SSL VPN feature visibility:
   a. Go to *System > Feature Visibility*.
   b. In the *Core Features* section, enable *SSL-VPN*.
   c. Click *Apply*.
2. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network > Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects > Address* and create an address for internal subnet *192.168.1.0*.
3. Configure user and user group.
   a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
   b. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
4. Configure SSL VPN web portal.
   a. Go to *VPN > SSL-VPN Portals* to create a tunnel mode only portal *my-split-tunnel-portal*.
   b. Enable *Tunnel Mode* and select one of the *Split tunneling* settings. See Split tunneling settings on page 2805 for more information.
   c. Select *Routing Address Override* to define the destination network (usually the corporate network) that will be routed through the tunnel.

Leave *Routing Address Override* undefined to use the destination in the respective firewall policies.

d. Select *Source IP Pools* for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.

5. Configure SSL VPN settings.
   a. Go to *VPN > SSL-VPN Settings*.
   b. For *Listen on Interface(s)*, select *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
   e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *tunnel-access*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-split-tunnel-portal*.
6. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn split tunnel access*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Choose an *Outgoing Interface*. In this example, *port1*.
   e. Set the *Source* to *all* and group to *sslvpngroup*.
   f. In this example, the *Destination* is the internal protected subnet 192.168.1.0.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Click *OK*.

Avoid setting *all* as the destination address in a firewall policy when the user or group associated with that policy is using a portal with *Split tunneling* enabled. Setting *all* as the destination address will cause portal to function as a full tunnel, potentially leading to misconfigurations and complicating troubleshooting efforts.

To configure SSL VPN using the CLI:

1. Enable SSL VPN feature visibility:

```
config system settings
    set gui-sslvpn enable
end
```

2. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

3. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

4. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "sslvpnuser1"
    next
end
```

5. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "my-split-tunnel-portal"
        set tunnel-mode enable
        set split-tunneling  enable
        set split-tunneling-routing-address "192.168.1.0"
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
    next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
```

```
            set groups "sslvpngroup"
            set portal "my-split-tunnel-portal"
        next
    next
end
```

7. Configure one SSL VPN firewall policy to allow the remote user to access the internal network. Traffic is dropped from internal to remote client.

```
config firewall policy
    edit 1
        set name "sslvpn split tunnel access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

Avoid setting *all* as the destination address in a firewall policy when the user or group associated with that policy is using a portal with *Split tunneling* enabled. Setting *all* as the destination address will cause portal to function as a full tunnel, potentially leading to misconfigurations and complicating troubleshooting efforts.

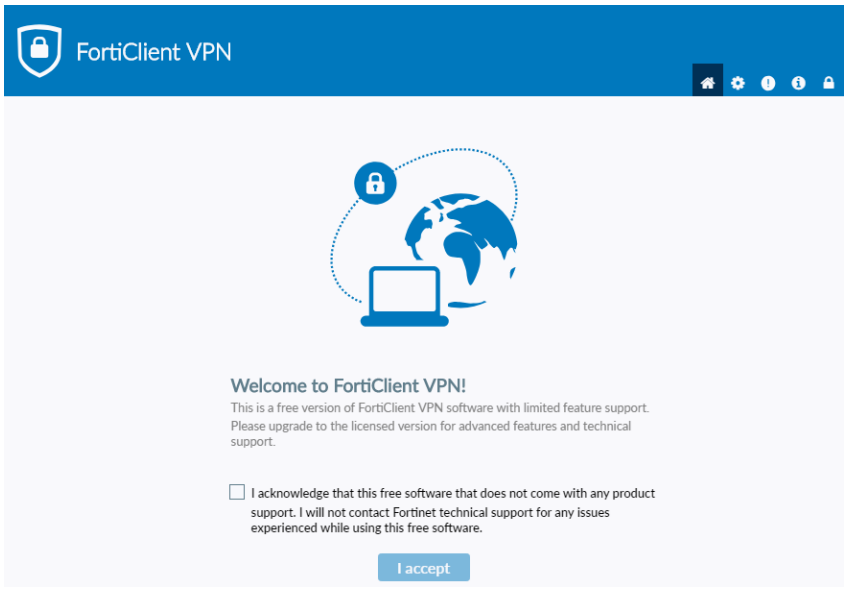
Connecting from FortiClient VPN client

For FortiGate administrators, a free version of FortiClient VPN is available which supports basic IPsec and SSL VPN and does not require registration with EMS. This version does not include central management, technical support, or some advanced features.

Downloading and installing the standalone FortiCient VPN client

You can download the free VPN client from FNDN or FortiClient.com.

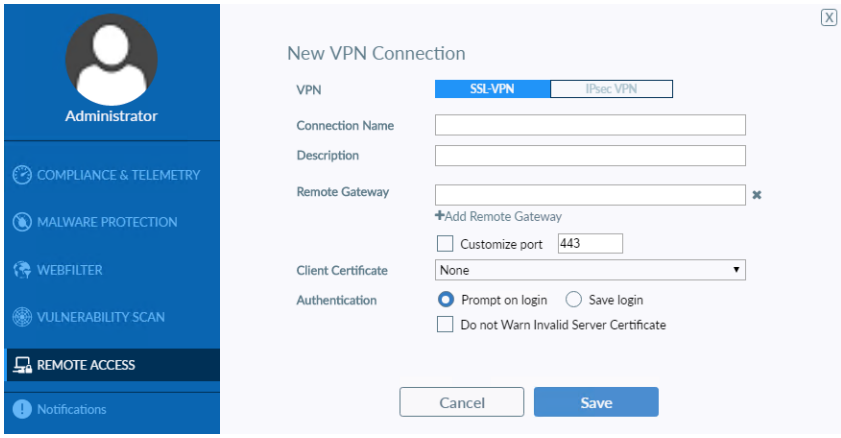
When the free VPN client is run for the first time, it displays a disclaimer. You cannot configure or create a VPN connection until you accept the disclaimer and click *I accept*:



Configuring an SSL VPN connection

To configure an SSL VPN connection:

1. On the *Remote Access* tab, click on the settings icon and then *Add a New Connection*.



2. Select *SSL-VPN*, then configure the following settings:

Connection Name	SSLVPNtoHQ
Description	(Optional)
Remote Gateway	172.20.120.123
Customize port	10443
Client Certificate	Select *Prompt on connect* or the certificate from the dropdown list.
Authentication	Select *Prompt on login* for a prompt on the connection screen

3. Click *Save* to save the VPN connection.

Connecting to SSL VPN

To connect to SSL VPN:

1. On the *Remote Access* tab, select the VPN connection from the dropdown list.
   Optionally, you can right-click the FortiTray icon in the system tray and select a VPN configuration to connect.
2. Enter your username and password.
3. Click the *Connect* button.
4. After connecting, you can now browse your remote network. Traffic to 192.168.1.0 goes through the tunnel, while other traffic goes through the local gateway. FortiClient displays the connection status, duration, and other relevant information.
5. Click the *Disconnect* button when you are ready to terminate the VPN session.

Checking the SSL VPN connection

To check the SSL VPN connection using the GUI:

1. On the FortiGate, go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
2. On the FortiGate, go to *Log & Report > Forward Traffic* to view the details of the SSL entry.

To check the tunnel log in using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type    Timeout   From           HTTP in/out  HTTPS in/out
 0       sslvpnuser1   1(1)         291       10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User          Source IP      Duration   I/O Bytes      Tunnel/Dest IP
 0       sslvpnuser1   10.1.100.254   9          22099/43228    10.212.134.200
```

Set up FortiToken multi-factor authentication

This configuration adds multi-factor authentication (MFA) to the split tunnel configuration (SSL VPN split tunnel for remote user on page 2786). It uses one of the two free mobile FortiTokens that is already installed on the FortiGate.

To configure MFA using the GUI:

1. Configure a user and user group:
   a. Go to *User & Authentication > User Definition* and edit local user *sslvpnuser1*.
   b. Enable *Two-factor Authentication*.
   c. For *Authentication Type*, click *FortiToken* and select one mobile *Token* from the list.
   d. Enter the user's *Email Address*.

e. Enable *Send Activation Code* and select *Email*.
f. Click *Next* and click *Submit*.

2. Activate the mobile token.
When a FortiToken is added to user *sslvpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

To configure MFA using the CLI:

1. Configure a user and user group:

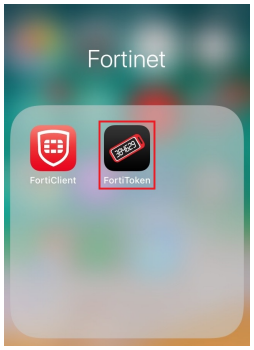
```
config user local
    edit "sslvpnuser1"
        set type password
        set two-factor fortitoken
        set fortitoken <select mobile token for the option list>
        set email-to <user's email address>
        set passwd <user's password>
    next
end
config user group
    edit "sslvpngroup"
        set member "sslvpnuser1"
    next
end
```

2. Activate the mobile token.
When a FortiToken is added to user *sslvpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

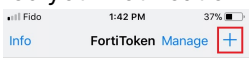
Connecting from FortiClient with FortiToken

To activate your FortiToken:

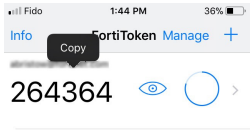
1. On your device, open FortiToken Mobile. If this is your first time opening the application, it may prompt you to create a PIN for secure access to the application and tokens.



2. You should have received your notification via email, select + and use the device camera to scan the token QR code in your email.



3. FortiToken Mobile provisions and activates your token and generates token codes immediately. To view the OTP's digits, select the eye icon. After you open the application, FortiToken Mobile generates a new six-digit OTP every 30 seconds.



To connect to SSL VPN:

1. On the *Remote Access* tab, select the VPN connection from the dropdown list.
   Optionally, you can right-click the FortiTray icon in the system tray and select a VPN configuration to connect.
2. Enter your username and password.
3. Click the *Connect* button.
4. A Token field will appear, prompting you for the FortiToken code. Enter the FortiToken code from your Mobile device.
5. After connecting, you can now browse your remote network. Traffic to 192.168.1.0 goes through the tunnel, while other traffic goes through the local gateway. FortiClient displays the connection status, duration, and other relevant information.
6. Click the *Disconnect* button when you are ready to terminate the VPN session.

SSL VPN tunnel mode

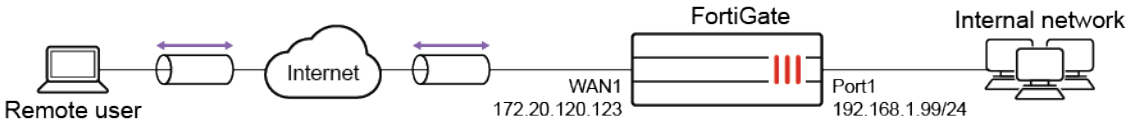
The following topics provide instructions on configuring SSL VPN tunnel mode:

- SSL VPN full tunnel for remote user
- SSL VPN tunnel mode host check
- SSL VPN split DNS on page 2802
- Split tunneling settings on page 2805
- Augmenting VPN security with ZTNA tags on page 2806
- Enhancing VPN security using EMS SN verification on page 2819

SSL VPN full tunnel for remote user

This is a sample configuration of remote users accessing the corporate network and internet through an SSL VPN by tunnel mode using FortiClient.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface. Ensure that SSL VPN feature visibility is enabled before starting the configuration.

To configure SSL VPN using the GUI:

1. Enable SSL VPN feature visibility:
   a. Go to *System* > *Feature Visibility*.
   b. In the *Core Features* section, enable *SSL-VPN*.
   c. Click *Apply*.
2. Configure the interface and firewall address:
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
3. Configure user and user group:
   a. Go to *User & Authentication* > *User Definition* to create a local user *sslvpnuser1*.
   b. Go to *User & Authentication* > *User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
4. Configure SSL VPN web portal:
   a. Go to *VPN* > *SSL-VPN Portals* to create a tunnel mode only portal *my-full-tunnel-portal*.
   b. Disable *Split Tunneling*.
5. Configure SSL VPN settings:
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. For *Listen on Interface(s)*, select *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
   e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *tunnel-access*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-full-tunnel-portal*.
6. Configure SSL VPN firewall policies to allow remote user to access the internal network:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set *Name* to *sslvpn tunnel mode access*.
   c. Set *Incoming Interface* to *SSL-VPN tunnel interface(ssl.root)*.
   d. Set *Outgoing Interface* to *port1*.
   e. Set the *Source* Address to *all* and User to *sslvpngroup*.

f. Set *Destination* to *all*, *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
g. Click *OK*.
h. Click *Create New*.
i. Set *Name* to *sslvpn tunnel mode outgoing*.
j. Configure the same settings as the previous policy, except set *Outgoing Interface* to *wan1*.
k. Click *OK*.

To configure SSL VPN using the CLI:

1. Enable SSL VPN feature visibility:

```
config system settings
    set gui-sslvpn enable
end
```

2. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

3. Configure the internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

4. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "sslvpnuser1"
    next
end
```

5. Configure SSL VPN web portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "my-full-tunnel-portal"
        set tunnel-mode enable
        set split-tunneling disable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
    next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "my-full-tunnel-portal"
        next
    end
end
```

7. Configure SSL VPN firewall policies to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

```
config firewall policy
    edit 1
        set name "sslvpn tunnel mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "sslvpn tunnel mode outgoing"
        set srcintf "ssl.root"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
    next
end
```

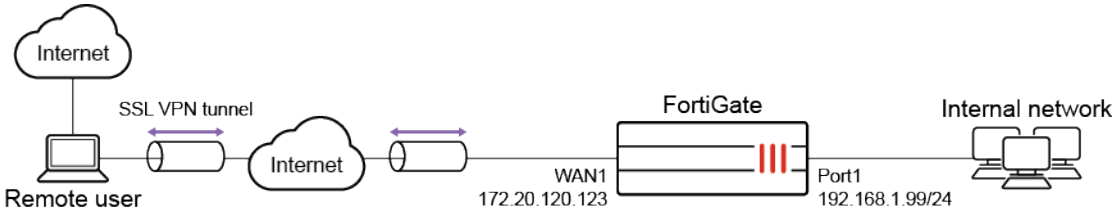
To see the results:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection:
   - Set *VPN Type* to *SSL VPN*.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Use the credentials you've set up to connect to the SSL VPN tunnel.
7. After connection, all traffic except the local subnet will go through the tunnel *FGT*.
8. Go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
9. On the FortiGate, go to *Log & Report > Forward Traffic* and view the details for the SSL entry.

SSL VPN tunnel mode host check

This is a sample configuration of remote users accessing the corporate network through an SSL VPN by tunnel mode using FortiClient with AV host check.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
   a. Go to *User & Authentication* > *User Definition* to create a local user *sslvpnuser1*.
   b. Go to *User & Authentication* > *User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
3. Configure SSL VPN web portal.
   a. Go to *VPN* > *SSL-VPN Portals* to create a tunnel mode only portal *my-split-tunnel-portal*.
   b. Enable *Tunnel Mode* and select one of the *Split tunneling* settings. See Split tunneling settings on page 2805 for more information.
   c. Select *Routing Address Override*.
   d. Select *Source IP Pools* for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.
4. Configure SSL VPN settings.
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. For *Listen on Interface(s)*, select *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Choose a certificate for *Server Certificate*.

   It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the SSL VPN best practices on page 2776 and learn how to Procuring and importing a signed SSL certificate on page 3616.

   e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *tunnel-access*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-split-tunnel-portal*.
5. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn tunnel access with av check*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Choose an *Outgoing Interface*. In this example, *port1*.
   e. Set the *Source* to *all* and group to *sslvpngroup*.
   f. In this example, the *Destination* is *all*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Click *OK*.
6. Use CLI to configure SSL VPN web portal to enable the host to check for compliant antivirus software on the user's computer.

```
config vpn ssl web portal
    edit my-split-tunnel-access
        set host-check av
    next
end
```

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "vpnuser1"
    next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "my-split-tunnel-portal"
        set tunnel-mode enable
```

```
        set split-tunneling  enable
        set split-tunneling-routing-address "192.168.1.0"
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
    next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "my-split-tunnel-portal"
        next
    end
end
```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

7. Configure SSL VPN web portal to enable the host to check for compliant antivirus software on the user’s computer:

```
config vpn ssl web portal
    edit my-split-tunnel-access
        set host-check av
    next
end
```

To see the results:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection:
   - Set *VPN Type* to *SSL VPN*.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Use the credentials you've set up to connect to the SSL VPN tunnel.
   If the user's computer has antivirus software, a connection is established; otherwise FortiClient shows a compliance warning.
7. After connection, traffic to *192.168.1.0* goes through the tunnel. Other traffic goes through local gateway.
8. On the FortiGate, go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
9. On the FortiGate, go to *Log & Report > Forward Traffic* and view the details for the SSL entry.

SSL VPN split DNS

SSL VPN clients in tunnel mode can enable the following settings to split DNS traffic:

- Resolve DNS requests for a specific domain, or suffix, using specific DNS servers.
- Resolve all other DNS requests using a DNS server configured in the SSL VPN settings. This DNS server can be the same as the client system DNS server, or another DNS server.

Administrators typically configure SSL VPN clients to use DNS servers that are behind the FortiGate on the internal network. This will require DNS traffic to traverse the SSL VPN tunnel.

Configuring SSL VPN DNS servers to use DNS suffixes

The `dns-suffix` setting under `config vpn ssl settings` is used to specify domains for SSL VPN DNS servers in the tunnel mode configuration. This setting can only be configured in the CLI.

The DNS servers and suffixes configured under `config vpn ssl settings` have a global scope, and apply only to SSL VPN portals that do not have their own DNS server configuration.

To configure DNS servers for all SSL VPN portals:

```
config vpn ssl settings
    set dns-suffix domain1.com
    set dns-server1 10.10.10.10
    set dns-server2 10.10.10.11
end
```

SSL VPN portals configured with their own DNS servers and suffixes under `config vpn ssl web portal` override the settings configured under `config vpn ssl settings`.

To configure DNS servers for a specific SSL VPN portal in split tunnel mode:

```
config vpn ssl web portal
    edit "full-access"
        set dns-suffix domain2.com
        set dns-server1 10.10.10.12
        set dns-server2 10.10.10.13
        set split-tunneling enable
    next
end
```

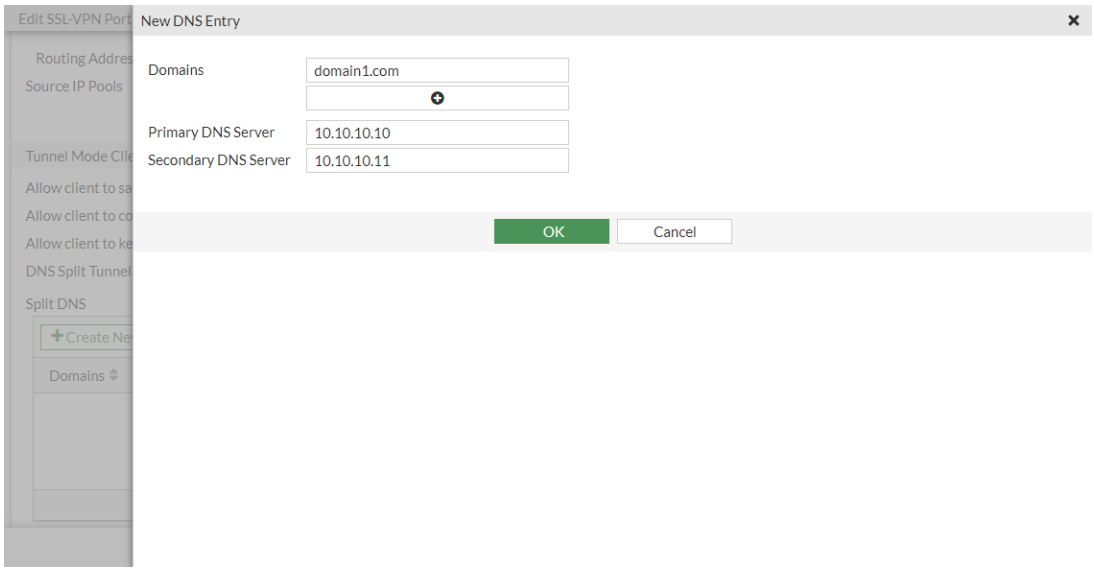
Only DNS requests that match DNS suffixes use the DNS servers configured in the VPN. Due to iOS limitations, the DNS suffixes are not used for searching as in Windows. Using short (non-FQDN) names may not be possible.

Configuring SSL VPN DNS servers for tunnel mode using DNS split tunneling

The DNS split tunneling setting can be used to configure domains that apply to a specific SSL VPN portal by specifying primary and secondary DNS servers to be used to resolve specific suffixes. This setting can be configured in the GUI and CLI. In the following example, DNS split tunneling is configured on the default tunnel-access portal with two DNS entries.

To configure DNS split tunneling in the GUI:

1. Go to *VPN > SSL-VPN Portals* and double-click *tunnel-access* to edit the portal.
2. In the *Tunnel Mode Client Options* section, enable *DNS Split Tunneling*.
3. In the *Split DNS* table, click *Create New*. The *New DNS Entry* pane opens.
4. Configure the first DNS entry:
   a. For *Domains*, enter *domain1.com*.
   b. Set the *Primary DNS Server* to *10.10.10.10*.
   c. Set the *Secondary DNS Server* to *10.10.10.11*.



d. Click *OK*.

5. Configure the second DNS entry:

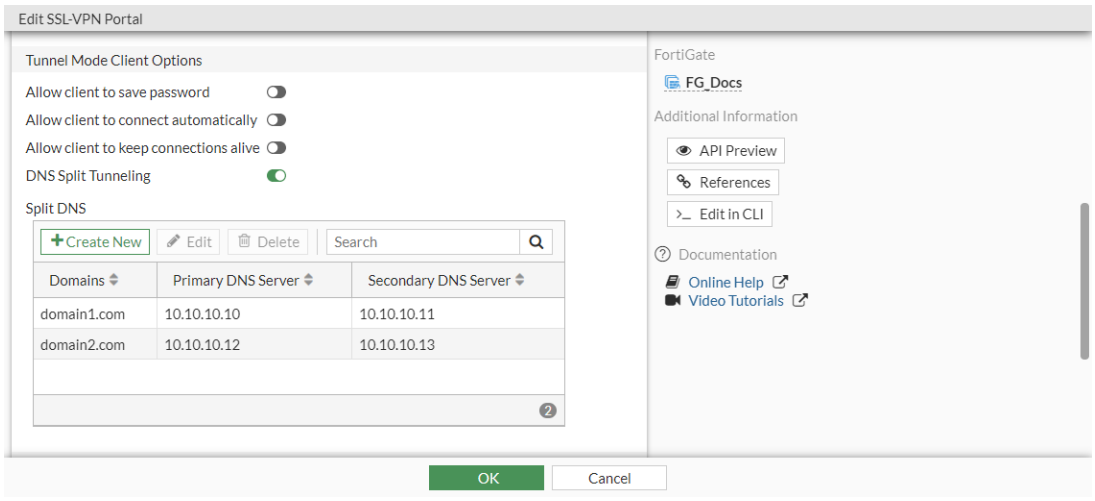
a. Click *Create New*.

b. For *Domains*, enter *domain2.com*.

c. Set the *Primary DNS Server* to *10.10.10.12*.

d. Set the *Secondary DNS Server* to *10.10.10.13*.

e. Click *OK*.



6. Click *OK* to save the portal settings.

To configure DNS split tunneling in the CLI:

```
config vpn ssl web portal
    edit "tunnel-access"
        set dns-suffix "domain0.com"
        set dns-server1 10.10.10.8
        set dns-server2 10.10.10.9
```

```
        set split-tunneling enable
        config split-dns
            edit 1
                set domains "domain1.com"
                set dns-server1 10.10.10.10
                set dns-server2 10.10.10.11
            next
            edit 2
                set domains "domain2.com"
                set dns-server1 10.10.10.12
                set dns-server2 10.10.10.13
            next
        end
    next
end
```

Split tunneling settings

SSL VPN clients in tunnel mode can choose between the following settings to split the traffic:

Option	Description
Tunnel mode	• *Disabled*: All client traffic will be directed over the SSL-VPN tunnel. • *Enabled Based on Policy Destination*: Only client traffic in which the destination matches the destination of the configured firewall polices will be directed over the SSL-VPN tunnel. • *Enabled for Trusted Destinations*: Only client traffic which does not match explicitly trusted destination will be directed over the SSL-VPN tunnel.

To configure split tunneling in the GUI:

1. Go to *VPN* > *SSL-VPN Portals*.
2. Click *Create New* or *Edit* an existing portal.
3. Enable *Tunnel Mode* and select one of the *Split tunneling* settings.
4. Select *Routing Address Override* to define the destination network (usually the corporate network) that will be routed through the tunnel.

   Leave *Routing Address Override* undefined to use the destination in the respective firewall policies.

5. Select *Source IP Pools* for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.
6. Configure other necessary parameters as required.
7. Click *OK*.

To configure split tunneling in the CLI:

```
config vpn ssl web portal
    edit "tunnel-access"
        set tunnel-mode enable
        set split-tunneling {enable | disable}
        set split-tunneling-routing-negate {enable | disable}
        set split-tunneling-routing-address <name1> <name2> …
        set ip-pools <name1> <name2> …
    next
end
```

The command `split-tunneling-routing-negate` is only available on the CLI after `split-tunneling` is enabled.

`split-tunneling-routing-negate` is disabled by default and corresponds to the *Enabled Based on Policy Destination* option on the GUI.

`split-tunneling-routing-negate enable` corresponds to the *Enabled for Trusted Destinations* option on the GUI.

Augmenting VPN security with ZTNA tags

FortiGate's integration of ZTNA tags into the VPN infrastructure offers a powerful solution to enhance VPN security. ZTNA tags are a feature exclusively offered with the licensed FortiClient versions (FortiClient EMS). ZTNA tags are objects that are assigned to the FortiClient endpoints in real-time. ZTNA tags are used in the firewall policies on the FortiGate to allow or deny access to the VPN and network resources based on the organization's security compliance regulations. These compliance regulations are enforced in real-time, thereby safeguarding the organization against constantly evolving security threats.

The following table compares features of the free VPN-only standalone FortiClient versus a licensed FortiClient managed by EMS for security compliance.

Feature	Free VPN-only standalone FortiClient	Licensed FortiClient
Basic VPN connection	Yes	Yes
Managed remote access profiles	No	Yes
Compliance using ZTNA tags: • Allow or block VPN connections based on ZTNA security posture • Per-firewall policy security posture checks using ZTNA tags	No	Yes

For more detailed information, see Feature comparison of FortiClient standalone and licensed versions in the FortiClient Administration Guide.

This topic contains the following sections:

- ZTNA tags on page 2807
- Security Fabric configuration on page 2807
- Creating ZTNA tags and ZTNA rules in FortiClient EMS
- Connecting FortiClient to FortiClient EMS using telemetry on page 2810
- Monitoring ZTNA tags on the FortiGate on page 2810
- Monitoring ZTNA tags in FortiClient and FortiClient EMS on page 2811
- Example: using ZTNA tags to augment VPN security on page 2812
  - Scenario 1: using ZTNA tags to restrict access to FortiClient endpoints connecting to the VPN on page 2813
  - Scenario 2: using ZTNA tags in firewall policies for role-based network access control on page 2815

ZTNA tags

ZTNA tags (formerly FortiClient EMS tags in FortiOS 6.4 and earlier) are tags synchronized from FortiClient EMS as dynamic address objects on the FortiGate. FortiClient EMS uses zero-trust tagging rules to automatically tag managed endpoints based on various attributes detected by the FortiClient. When the FortiGate establishes a connection with the FortiClient EMS server through the EMS Fabric connector, it pulls zero-trust tags containing device IP and MAC addresses and converts them to read-only dynamic address objects. It also establishes a persistent WebSocket connection to monitor for changes in zero-trust tags, which keeps the device information current. These zero-trust tags can then be used in SSL VPN firewall rules to perform security posture checks to restrict or allow access to network resources, enabling role-based access control.

Security Fabric configuration

The FortiGate needs to be connected to FortiClient EMS in order to retrieve the ZTNA tags so they can be used in firewall policies. This is done by configuring a FortiClient EMS Security Fabric connector on the FortiGate to connect to FortiClient EMS. See Configuring FortiClient EMS on page 3722 for more information.

Creating ZTNA tags and ZTNA rules in FortiClient EMS

You can create, edit, and delete zero-trust tagging rules for endpoints. You can also view and manage the tags used to dynamically group endpoints.

The following process occurs when using zero-trust tagging rules with EMS and FortiClient:

1. EMS sends zero-trust tagging rules to endpoints through telemetry communication.
2. FortiClient checks endpoints using the provided rules and sends the results to EMS.
3. EMS receives the results from FortiClient.
4. EMS dynamically groups endpoints together using the tag configured for each rule. The dynamic endpoint groups can be viewed on the *Zero Trust Tags > Zero Trust Tag Monitor* page. See Zero Trust Tag Monitor in the FortiClient EMS Administration Guide for more information.

In this topic, two zero-trust tagging rule sets are created:

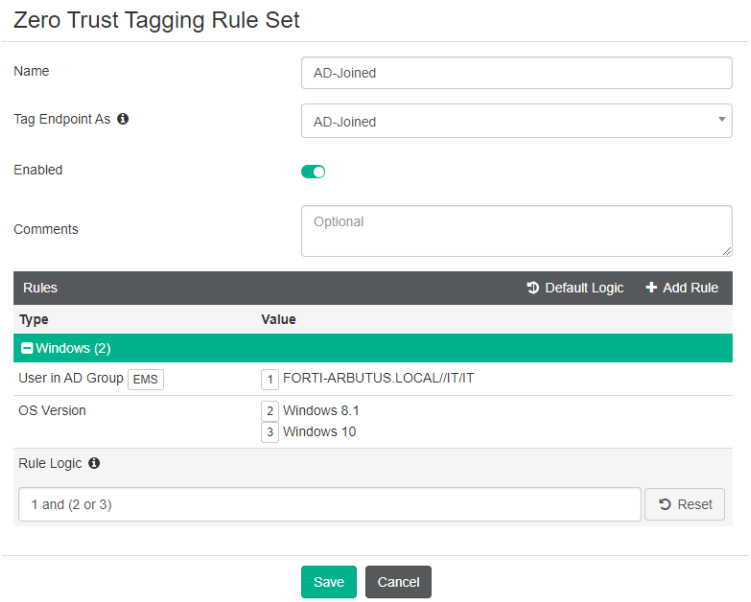
ZTNA tag	ZTNA tagging rule
AD-Joined	Apply if a remote user has OS version Windows 8.1 or Windows 10 and is a part of the AD group, FORTI-ARBUTUS.LOCAL/IT/IT.
Vulnerable	Apply if critical vulnerabilities are detected on a remote user.

These tags will be applied in two scenario examples (see Scenario 1 and Scenario 2). For more information about zero-trust tagging rule settings, see Adding a Zero Trust tagging rule set and Zero Trust tagging rule types in the FortiClient EMS Administration Guide.

To create a zero-trust tagging rule set in FortiClient EMS:

1. Go to *Zero Trust Tags* > *Zero Trust Tagging Rules*, and click *Add*.
2. Create the AD-Joined tagging rule set:
   a. In the *Name* field, enter *AD-Joined*.
   b. In the *Tag Endpoint As* dropdown list, enter *AD-Joined* and press `Enter`.
      EMS uses this tag to dynamically group together endpoints that satisfy the rule, as well as any other rules that are configured to use this tag.
   c. Toggle *Enabled* on to enable the rule.
   d. Configure the user in AD group rule:
      i. Click *Add Rule*.
      ii. Set *OS* to *Windows*.
      iii. Set the *Rule Type* to *User in AD Group*.
      iv. Set the *AD Group* to *FORTI-ARBUTUS.LOCAL/IT/IT*.
      v. Click *Save*.
   e. Configure the OS rule:
      i. Click *Add Rule*.
      ii. Set *OS* to *Windows*.
      iii. Set the *Rule Type* to *OS Version* and select *Windows 8.1*.
      iv. Click the *+* button and select *Windows 10*.
      v. Click *Save*.
   f. By default, an endpoint must satisfy all configured rules to be eligible for the rule set. You may want to apply the tag to endpoints that satisfy some, but not all, of the configured rules. In this example, you need to modify the rule set logic to apply the same tag to endpoints that fulfill one of the following criteria:
      - Running Windows 8.1 or 10
      - Is part of an AD group called FORTI-ARBUTUS.LOCAL/IT/IT

      With the default rule set logic, an endpoint would be eligible for the rule set if it is running Windows 8.1 or 10 and is part of an AD group called IT. To modify the rule set logic, do the following:
      i. Click *Edit Logic*.
      ii. Clicking *Edit Logic* assigns numerical values to each configured rule. You can use *and* and *or* to define the rule logic. You cannot use *not* when defining the rule logic. You can also use parentheses to group rules.
         In the *Rule Logic* field, enter *1 and (2 or 3)* to indicate that endpoints that satisfy that they are part of the AD IT group (rule 1) and Windows 8.1 (rule 2) or Windows 10 (rule 3) satisfy the rule set.



g. Click *Save*.

3. Create the Vulnerable tagging rule set:
   a. Click *Add*.
   b. In the *Name* field, enter *Vulnerable*.
   c. In the *Tag Endpoint As* dropdown list, enter *Vulnerable* and press `Enter`.
   d. Toggle *Enabled* on to enable the rule.
   e. Configure the vulnerable devices rule:
      i. Click *Add Rule*.
      ii. Set *OS* to *Windows*.
      iii. Set the *Rule Type* to *Vulnerable Devices*.
      iv. Set the *Security Level* to *Critical*.
      v. Click *Save*.

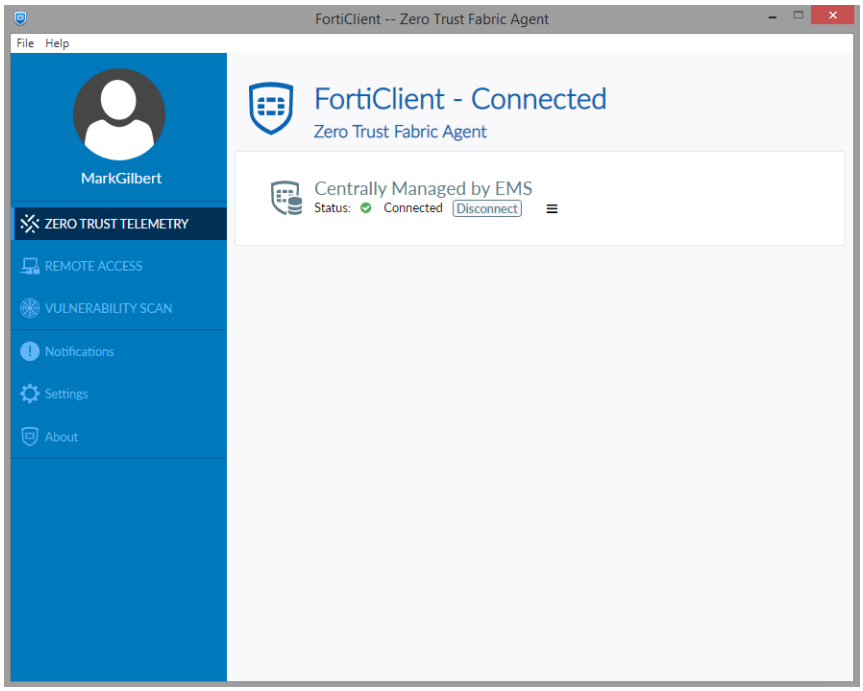
   f. Click *Save*.

For more information about editing, deleting, and importing ZTNA rules, see Zero Trust Tagging Rules in the FortiClient EMS Administration Guide.

Connecting FortiClient to FortiClient EMS using telemetry

After FortiClient software installation is complete on an endpoint, you can connect FortiClient to FortiClient EMS. Depending on the way the FortiClient installation is performed, you can either manually or automatically connect to FortiClient EMS, see Connecting FortiClient Telemetry after installation in the FortiClient Administration Guide for more details.

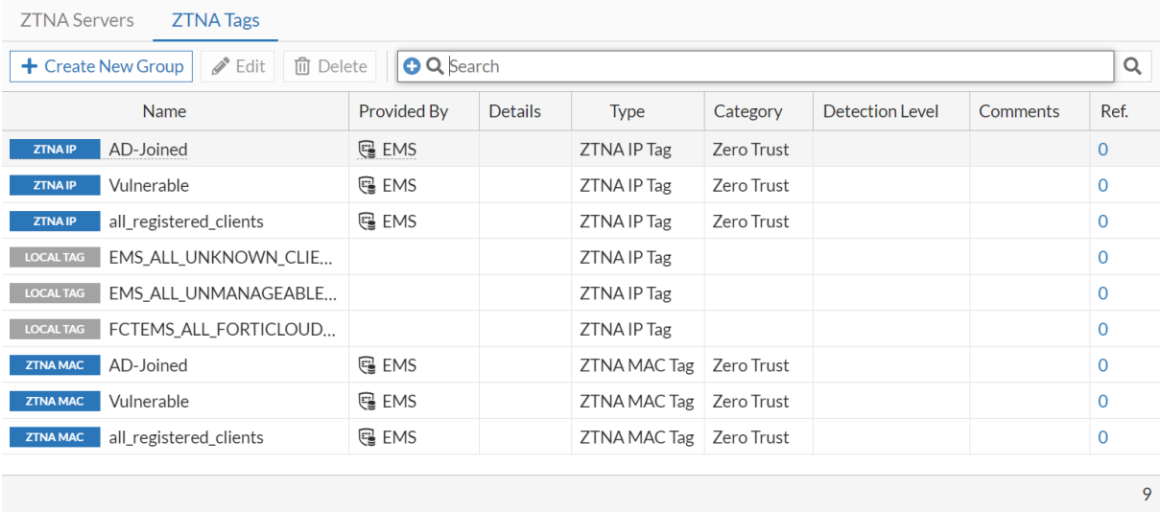
Once FortiClient connects to the FortiClient EMS, the *Status* shows up as *Connected* in the *Zero Trust Telemetry* tab.



After FortiClient telemetry connects to EMS, FortiClient endpoints receive the ZTNA tags if they satisfy any of the required ZTNA rules configured on the FortiClient EMS.

Monitoring ZTNA tags on the FortiGate

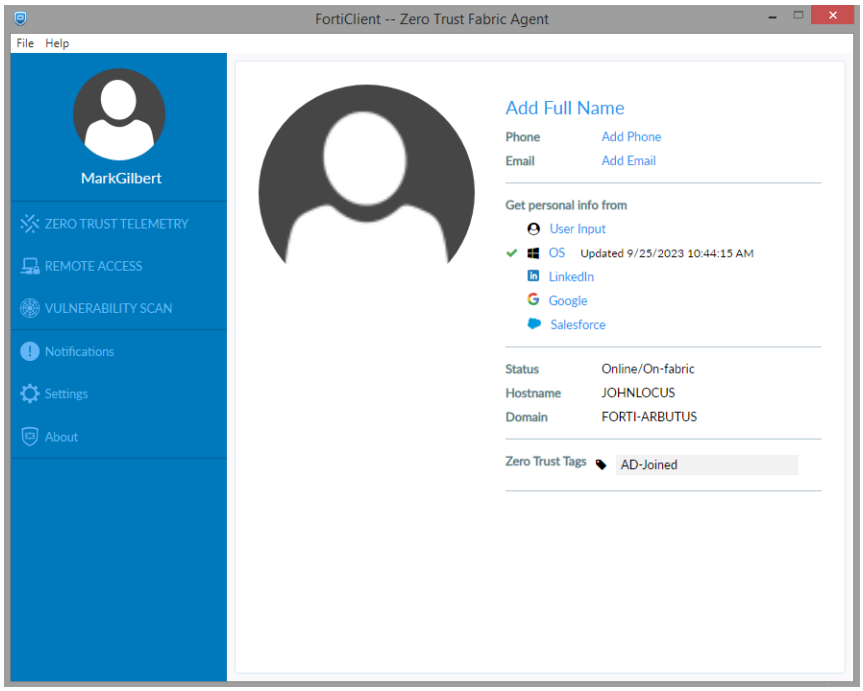
After the FortiGate is connected and authorized to and by FortiClient EMS, the ZTNA tags that were created in the zero-trust tagging rules are retrieved by the FortiGate. To view the tags on the FortiGate, go to *Policy & Objects* > *ZTNA* and select the *ZTNA Tags* tab.



If the tags are not visible on the FortiGate, ensure that the FortiClient EMS is configured to share tagging information with the FortiGate. See Configuring EMS to share tagging information with multiple FortiGates in the FortiClient EMS Administration Guide for more details.

Monitoring ZTNA tags in FortiClient and FortiClient EMS

To view the ZTNA tags assigned to the FortiClient endpoints by FortiClient EMS, click the user avatar and locate the *Zero Trust Tags* section. The following FortiClient endpoint is assigned the *AD-Joined* tag.

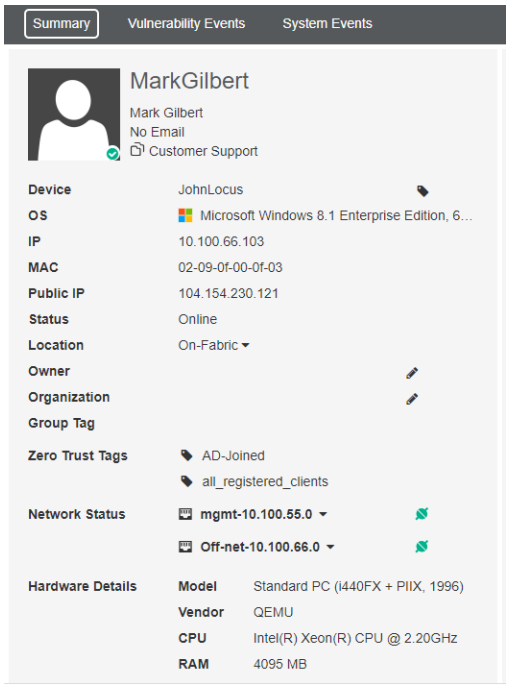


Ensure that the *Show Zero Trust Tag on FortiClient GUI* is enabled on FortiClient EMS (*Endpoint Profiles* > *System Settings* in the profile's *Advanced* view) so the tags are visible in FortiClient. See System Settings in the FortiClient EMS Administration Guide for more details.

ZTNA tags can also be monitored on FortiClient EMS from the endpoint's details in the *Endpoints* pane.

To view ZTNA tag information in the endpoint details:

1. Go to *Endpoints*, and select *All Endpoints*, a domain, or workgroup. The list of endpoints for the selected domain or workgroup displays.
2. Click an endpoint to display details about it in the content pane.
3. In the *Summary* pane, you can see the *Zero Trust Tags* associated with the endpoint. For example, this user has the *AD-Joined* and *all_registered_clients* tags.



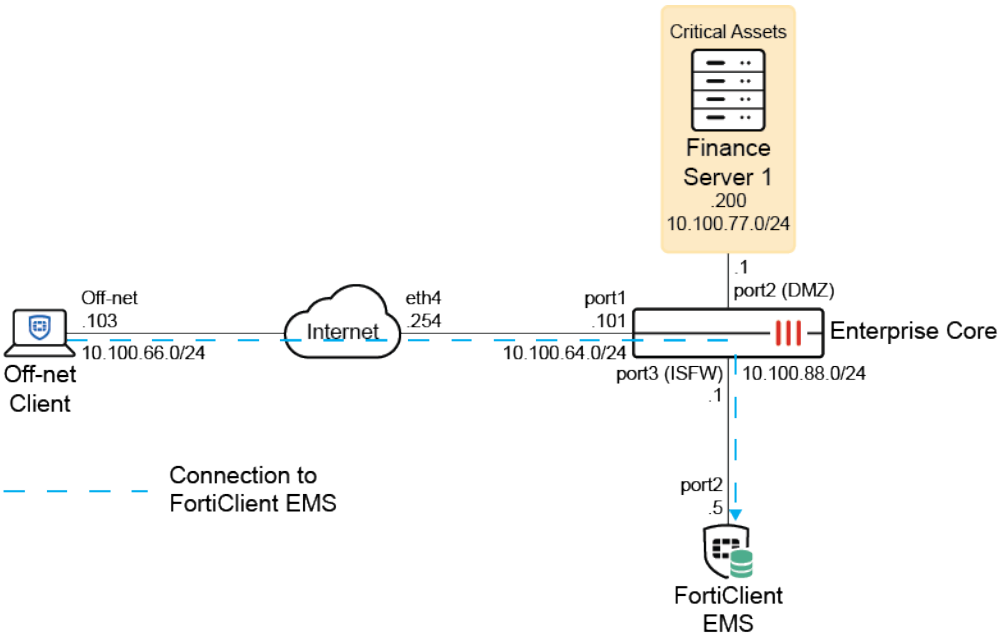
For detailed descriptions of the options in the *Endpoints* content pane, see Viewing the Endpoints pane in the FortiClient EMS Administration Guide.

Example: using ZTNA tags to augment VPN security

ZTNA tags can be used to augment VPN security using the following methods:

- Restrict an endpoint to connect to the VPN tunnel based on the ZTNA tag (see Scenario 1).
- Control access to network resources by allowing or denying traffic passing through the FortiGate using the *IP/MAC Based Access Control* field in the firewall policy (also known as ZTNA IP MAC based access control, see Scenario 2).

Both methods are demonstrated in the following example.



In this example, Off-net-Client is the FortiClient endpoint connected to and managed by FortiClient EMS. The telemetry traffic passes through the FortiGate using a virtual IP. The two ZTNA rule tagging sets configured previously (AD-Joined and Vulnerable) are applied.

Enterprise Core is the FortiGate that acts as the SSL VPN server. To configure SSL VPN, refer to SSL VPN on page 2775 and SSL VPN security best practices on page 2779. Critical Assets are network resources that the off-net user tries to access after connecting to the VPN. SSL VPN is used in this example, but a similar configuration also applies to dialup IPsec VPN where the FortiGate acts as a dialup server.

Scenario 1: using ZTNA tags to restrict access to FortiClient endpoints connecting to the VPN

FortiClient endpoint profiles can be configured to allow or block an endpoint from connecting to a VPN tunnel based on its applied zero-trust tag. This feature is only available for Windows endpoints.

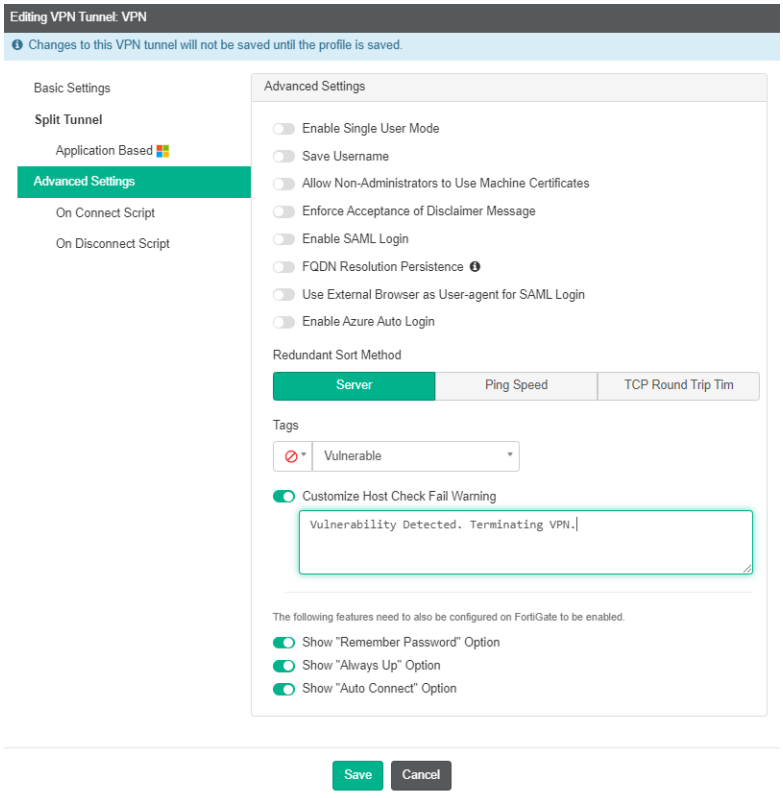
In this scenario, the endpoint profile is configured to prohibit the Off-net-Client (with a Windows OS) from connecting to the VPN if the endpoint has a Vulnerable ZTNA tag. The Vulnerable tag was configured previously (see Creating ZTNA tags and ZTNA rules in FortiClient EMS).

To configure the remote access profile in FortiClient EMS:

1. Go to *Endpoint Profiles > Remote Access*, and edit an existing profile or add a new one.
2. In the *General* section, enable *Enable Secure Remote Access*.
3. In the *VPN Tunnels* section, edit an existing VPN tunnel or add a new one.
4. Configure the following under *Advanced Settings*:
   a. For the *Tag* field, select *Prohibit* from the first dropdown.
   b. Select the *Vulnerable* tag from the second dropdown.
   c. Enable *Customize Host Check Fail Warning*.

d. Enter a message to display to users when their connection to the VPN tunnel is prohibited due to critical vulnerabilities on their device.

e. Configure the other VPN tunnel settings as needed.



f. Click *Save*.

5. Configure the other remote access profile settings as needed.
6. Click *Save*.

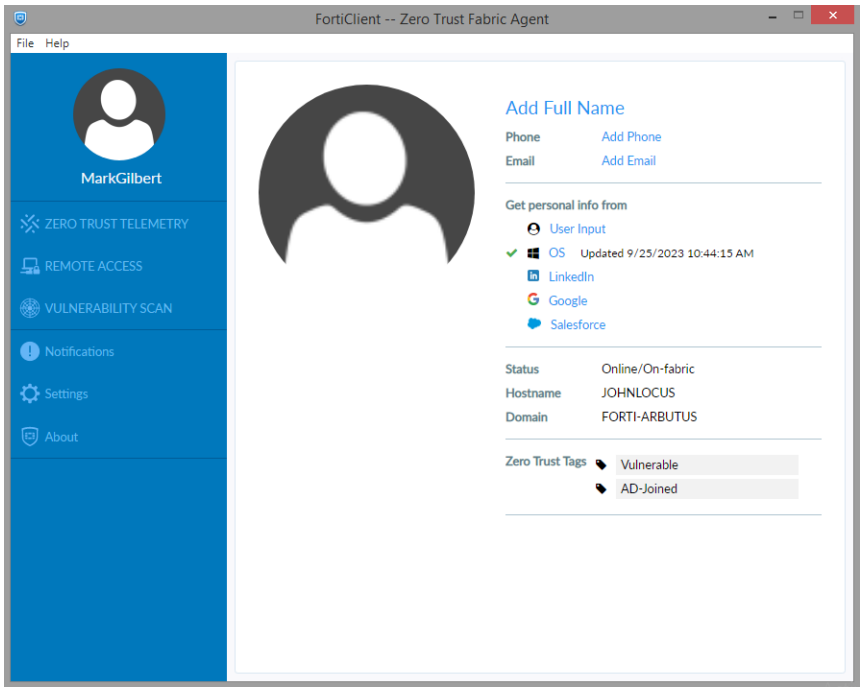
   After the next communication between FortiClient EMS and FortiClient, endpoints with this profile applied are unable to connect to this VPN tunnel if they have critical vulnerabilities.

To verify the configuration using a vulnerable endpoint:

1. On the Off-net-Client endpoint, open FortiClient.
2. Click *Vulnerability Scan*, then click *Scan Now* to initiate a manual scan.

   Vulnerability scans can also be scheduled. See Vulnerability Scan in the FortiClient EMS Administration Guide for more details.
3. Wait a few minutes for the scan to complete.
4. Click the user avatar and locate the *Zero Trust Tags* section.

   FortiClient discovered the vulnerability and added a *Vulnerable* ZTNA tag in addition to the existing *AD-Joined* tag.



5. Click *Remote Access* to try to connect to the VPN:
   a. Enter the *Username* and *Password*.
   b. Click *Connect*.

   Based on the remote access profile configuration, the endpoint's access is denied due to the assigned *Vulnerable* ZTNA tag. The message configured in the remote access profile appears as a notification above the FortiTray icon (in the Windows system tray).

   See FortiTray in the FortiClient Administration Guide for more details about this icon.

Scenario 2: using ZTNA tags in firewall policies for role-based network access control

ZTNA tags are used in firewall policies to control access to network resources with the *IP/MAC Based Access Control* field.

In this scenario, if the Off-net Client is tagged with a Vulnerable tag, then it is not allowed to access Finance Server 1 (10.100.77.200). If the Off-net Client is tagged with an AD-Joined tag and no Vulnerable tag, then it is allowed to access Finance Server 1. Two firewall policies are configured as follows.

- Deny Vulnerable Endpoints: use IP/MAC based access control with the Vulnerable ZTNA IP tag to deny access.
- SSL VPN to DMZ: use IP/MAC based access control with the AD-Joined ZTNA IP tag to allow access.

These polices use a source address and group that have already be configured for SSL VPN users and authentication. See User groups on page 2993 for more information.

To configure the Deny Vulnerable Endpoints policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the following settings:

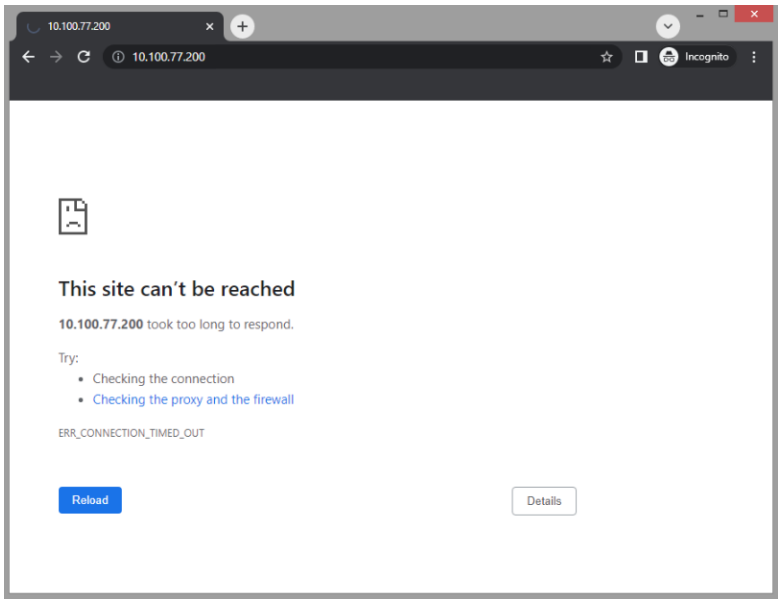
Name	*Deny Vulnerable Endpoints*
Type	*Standard*
Incoming Interface	*ssl.root*
Outgoing Interface	*port2*
Source	*SSLVPN_TUNNEL_ADDR1, AD-Joined VPN Users*
IP/MAC Based Access Control	*Vulnerable*
Destination	*DMZ Subnet*
Schedule	*always*
Service	*ALL*
Action	*DENY*
Log Violation Traffic	Enable this setting.
Enable this policy	Enable this setting.

3. Click *OK*.

To verify the configuration using an off-net client with a Vulnerable tag:

This verification assumes that a vulnerability scan was performed, the endpoint has a critical vulnerability, and the Vulnerable zero-trust tag was added.

1. On the endpoint, open FortiClient and click *Remote Access* to connect to the VPN:
   a. Enter the *Username* and *Password*.
   b. Click *Connect*.
2. Once the FortiClient endpoint is connected to the VPN, try to access Finance Server 1 using the web server. The connection times out because the traffic is denied by the firewall policy.



3. Verify the forward traffic log:
   a. In the GUI, go to *Log & Report > Forward Traffic*.
   b. In the CLI, enter the following:

```
# execute log filter category 0
# execute log filter field policyname "Deny Vulnerable Endpoints"
# execute log display

date=2023-10-24 time=17:04:19 eventtime=1698192258985043569 tz="-0700" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="root" srcip=10.212.134.200
srcport=53801 srcintf="ssl.root" srcintfrole="undefined" dstip=10.100.77.200 dstport=80
dstintf="port2" dstintfrole="dmz" srcuuid="697b0036-37db-51ee-162f-5fed6735b06e"

sessionid=25809 proto=6 action="deny" policyid=3 policytype="policy" poluuid="c715492c-
72aa-51ee-481d-09eef1adf713" policyname="Deny Vulnerable Endpoints" user="markgilbert"
service="HTTP" trandisp="noop" duration=0 sentbyte=0 rcvdbyte=0 sentpkt=0 rcvdpkt=0
appcat="unscanned" crscore=30 craction=131072 crlevel="high"
```

To configure the SSL VPN to DMZ policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the following settings:

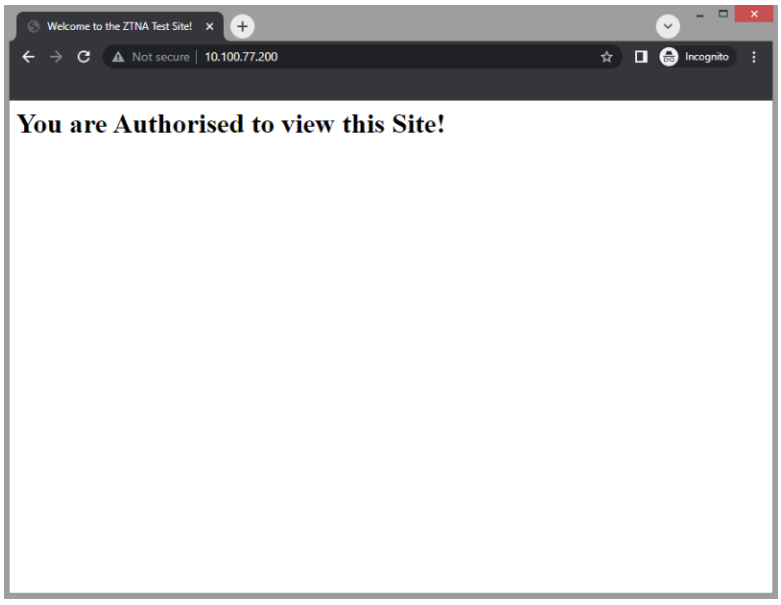
Name	*SSL VPN to DMZ*
Type	*Standard*
Incoming Interface	*ssl.root*
Outgoing Interface	*port2*
Source	*SSLVPN_TUNNEL_ADDR1, AD-Joined VPN Users*

IP/MAC Based Access Control	*AD-Joined*
Destination	*DMZ Subnet*
Schedule	*always*
Service	*ALL*
Action	*ACCEPT*
Log Allowed Traffic	Enable this setting and select *All Sessions*.
Enable this policy	Enable this setting.

3. Configure the other settings as needed.
4. Click *OK*.

To verify the configuration using an off-net client with an AD-Joined tag:

1. On the endpoint, open FortiClient, click *Remote Access* to connect to the VPN:
   a. Enter the *Username* and *Password*.
   b. Click *Connect*.
2. Once the FortiClient endpoint is connected to the VPN, try to access Finance Server 1 using the web server. The traffic is allowed by the firewall policy, and the server is accessible.



3. Verify the forward traffic log:
   a. In the GUI, go to *Log & Report* > *Forward Traffic*.
   b. In the CLI, enter the following:

```
# execute log  filter category 0
# execute log filter field policyname "SSL VPN to DMZ"
# execute log display
```

```
date=2023-10-24 time=14:07:05 eventtime=1698181625479969117 tz="-0700" logid="0000000020"

```

Enhancing VPN security using EMS SN verification

The EMS serial number (SN) verification feature restricts establishing a VPN connection to the FortiGate to only licensed FortiClient endpoints. The EMS SN verification is performed by the FortiGate and the feature requires that the FortiGate and FortiClient endpoints both must be connected to the same FortiClient EMS.

EMS SN verification is performed when a FortiClient user attempts to establish a VPN connection to the FortiGate. During the VPN establishment process:

- FortiClient sends the SN of the FortiClient EMS that manages it to the FortiGate.
- The FortiGate performs a check to confirm whether the EMS SN sent by the FortiClient corresponds to same FortiClient EMS to which the FortiGate itself is connected to.
- The FortiGate allows the user to connect to the VPN only if the EMS SN match.

This feature prevents the free VPN-only standalone FortiClient users from connecting to VPN, thus enhancing VPN security. This setting can only be enabled from the CLI.

To enable the EMS SN verification in the CLI:

```
config system global
    set vpn-ems-sn-check {enable | disable}
end
```

Command	Description
`set vpn-ems-sn-check {enable | disable}`	Enable/disable verification of EMS serial number in SSL-VPN connection.

SSL VPN web mode

By default, SSL VPN tunnel mode settings and the *VPN > SSL-VPN* menus are hidden from the GUI.

To enable SSL VPN feature visibility in the GUI:

1. Go to *System* > *Feature Visibility*.
2. In the *Core Features* section, enable *SSL-VPN*.
3. Click *Apply*.

To enable SSL VPN feature visibility in the CLI:

```
config system settings
    set gui-sslvpn enable
end
```

By default, SSL VPN web mode settings are disabled and hidden from the GUI and the CLI.

To enable SSL VPN web mode:

```
config system global
    set sslvpn-web-mode enable
end
```

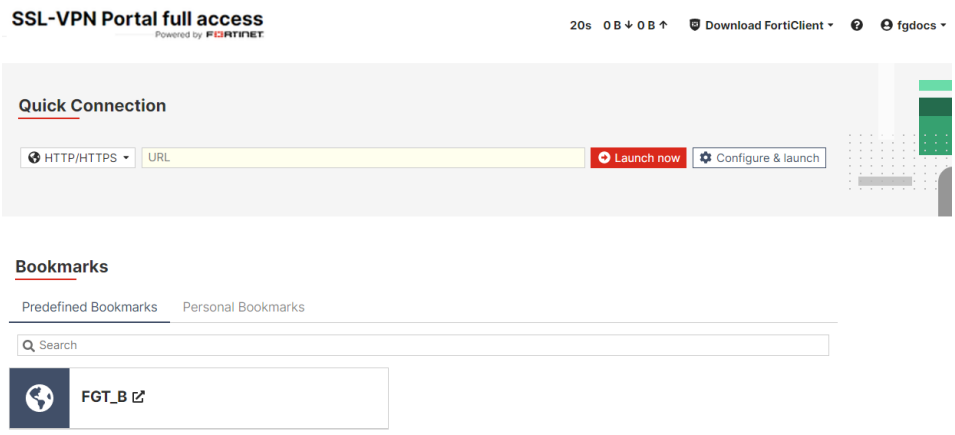
If this setting is disabled, even though SSL VPN tunnel mode can be correctly configured, when trying to access SSL VPN web mode using the SSL VPN portal by navigating to the listening IP address, domain, and port using a web browser, an error message will appear.

A user must have valid username and password credentials to log in to an SSL VPN web portal in addition to other multi-factor authentication components that may be configured, such as FortiTokens.

Web-only mode provides clientless network access using a web browser with built-in SSL encryption. Use this mode if you require:

- A clientless solution where all remote services are accessed through a web portal
- Tight control over the contents of the web portal
- Limited services provided to the remote users

After logging in, the web portal page appears:



A web portal includes the following features:

- The session information is displayed in the right corner of the top banner. This includes the elapsed time since logging in, and the volume of inbound and outbound HTTP and HTTPS traffic.
- The *Launch FortiClient* button appears if FortiClient is installed. Clicking the button opens the FortiClient *Remote Access* tab, but FortiClient does not automatically create a VPN connection based on the web mode connection information.
- The *Download FortiClient* button provides access to download the FortiClient application for various operating systems.
- The *Bookmarks* widget includes links to network resources (administrator-defined bookmarks), and users can create their own bookmarks.
- The *Quick Connection* dropdown menu enables a connection to network resources without using or creating a bookmark.

The following topics provide information about SSL VPN web mode:

- Web portal configurations on page 2821
- Quick Connection tool on page 2824
- SSL VPN bookmarks on page 2826
- SSL VPN web mode for remote user on page 2828
- Customizing the RDP display size on page 2832
- Showing the SSL VPN portal login page in the browser's language on page 2836
- SSL VPN custom landing page on page 2838

Web portal configurations

An SSL VPN web portal enables users to access network resources through a secure channel using a web browser. System administrators can configure log in privileges for users and which network resources are available to these users. The portal configuration determines what the user sees when they log in to the portal. Both system administrators and the users have the ability to customize the SSL VPN portal.

There are three predefined default web portal configurations available:

- full-access: connecting clients can either access protected resources through the SSL VPN web portal, or use FortiClient to connect through tunnel mode.
- tunnel-access: connecting clients can only access protected resources with FortiClient connecting through tunnel mode.
- web-access: connecting clients can only access protected resources through the SSL VPN web portal.

Custom web portals can also be configured.

To configure a custom web portal:

1. Go to *VPN* > *SSL-VPN Portals* and click *Create New*.
2. Configure the following settings as needed:

GUI option	Description
Name	Enter the portal name.

GUI option		Description
Limit Users to One SSL-VPN Connection at a Time		This option is disabled by default. When enabled, once a user logs in to the portal, they cannot go to another system and log in with the same credentials again.
Tunnel Mode		
	Split tunneling	There are three options: • *Disabled*: all client traffic will be directed over the SSL VPN tunnel. • *Enabled Based on Policy Destination*: only client traffic where the destination matches the destination of the configured firewall policies will be directed over the SSL VPN tunnel. • *Enabled for Trusted Destinations*: only client traffic that does not match explicitly trusted destinations will be directed over the SSL VPN tunnel.
	Routing Address Override	When *Split tunneling* is set to *Enabled Based on Policy Destination*, the IPv4 firewall address selected overrides the firewall policy destination addresses to control split tunnel access. When *Split tunneling* is set to *Enabled for Trusted Destinations*, the IPv4 firewall address selected becomes a trusted destination that will not be tunneled through SSL VPN. All other destinations will be tunneled through SSL VPN.
	Source IP Pools	Select an IP pool for users to acquire an IP address when connecting to the portal.
IPv6 Tunnel Mode		When enabled, these settings determine how tunnel mode clients are assigned IPv6 addresses.
	IPv6 split tunneling	The same three options are available as in *Tunnel Mode*.
	IPv6 Routing Address Override	When *Split tunneling* is set to *Enabled Based on Policy Destination*, the IPv6 firewall address selected overrides the firewall policy destination addresses to control split tunnel access. When *Split tunneling* is set to *Enabled for Trusted Destinations*, the IPv6 firewall address selected becomes a trusted destination that will not be tunneled through SSL VPN. All other destinations will be tunneled through SSL VPN.

GUI option		Description
	Source IPv6 Pools	Select an IP pool for users to acquire an IP address when connecting to the portal.
Tunnel Mode Client Options		The following options affect how FortiClient behaves when connected to the VPN tunnel.
	Allow client to save password	When enabled and if the user selects this option, their password is stored on the their computer and will automatically populate each time they connect to the VPN.
	Allow client to connect automatically	When enabled and if the user selects this option, when FortiClient launches (such as after a reboot or system start up), FortiClient will automatically attempt to connect to the VPN.
	Allow client to keep connections alive	When enabled and if the user selects this option, FortiClient will try to reconnect once it detects that the VPN connection is unexpectedly down (not manually disconnected by the user).
	DNS Split Tunneling	When enabled, the *Split DNS* table is visible, where new DNS entries can be created. See SSL VPN split DNS on page 2802 for more details.
Host Check		When enabled, the type of host checking performed on endpoints can be configured (see Configuring OS and host check on page 2947).
	Type	There are three options: • *Realtime AntiVirus*: check for antivirus software recognized by the Windows Security Center. • *Firewall*: check for firewall software recognized by the Windows Security Center. • *Enable both*: check for antivirus and firewall software recognized by the Windows Security Center.
Restrict to Specific OS Versions		When enabled, access to certain operating systems can be denied or forced to check for an update. By default, all operating systems in the table are allowed (see Configuring OS and host check on page 2947).
Web Mode		Enable this option to configure the web portal settings.
	Portal Message	Enter a message that appears at the top of the web portal screen (default = *SSL-VPN Portal*).

GUI option		Description
	Theme	Select a color theme from the dropdown.
	Show Session Information	Enable to display session information in the top banner of the web portal (username, amount of time logged in, and traffic statistics).
	Show Connection Launcher	Enable to display the *Quick Connection* button.
	Show Login History	Enable to display the user's login history (*History*).
	User Bookmarks	Enable to allow users to add their own bookmarks (*New Bookmark*).
	Rewrite Content IP/UI/	Enable contents rewrite for URIs containing `IP-address/ui/`.
	RDP/VNC clipboard	Enable to support RDP/VPC clipboard functionality.
	Predefined Bookmarks	Use the table to create and edit predefined bookmarks. See To create a predefined administrator bookmark in FortiOS: on page 2827 for more details.
FortiClient Download		Enable this option to display the *Download FortiClient* button.
	Download Method	Select either *Direct* or *SSL-VPN Proxy* as the method to download FortiClient.
	Customize Download Location	Enable to configure a custom download location for *Windows* or *Mac*.

3. Click *OK*.

By default, the browser's language preference is automatically detected and used by the SSL VPN portal login page. The system language can still be used by changing the settings on the *SSL-VPN Settings* page of the GUI, or disabling browser-language detection in the CLI. See Showing the SSL VPN portal login page in the browser's language on page 2836 for more details.

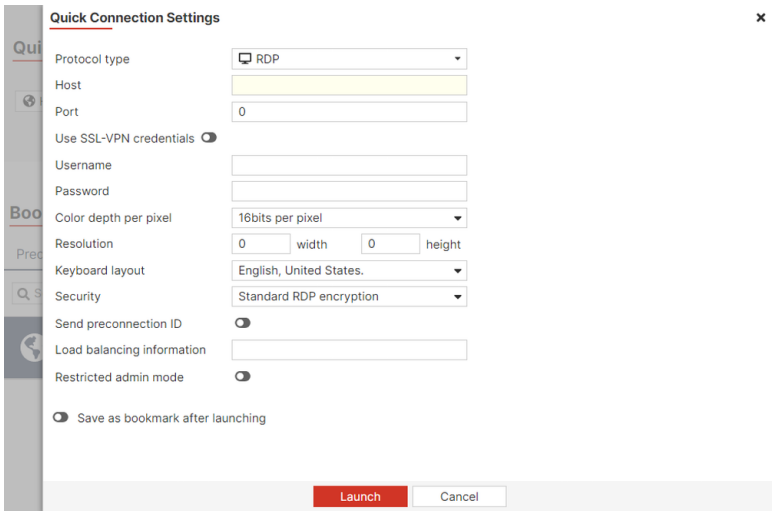
Quick Connection tool

The *Quick Connection* tool allows a user to connect to a resource when it is not a predefined bookmark. The tool allows the user to specify the type of server and the URL or IP address of the host.

To connect to a resource:

1. Select the connection type.
2. Enter the required information, such as the IP address or URL of the host.

3. Click *Configure & launch*.



In a VNC session, to send Ctrl+Alt+Del, press *F8* then select *Send Ctrl-Alt-Delete*.

RDP sessions

Some Windows servers require that a specific security be set for RDP sessions, as opposed to the standard RDP encryption security. For example, Windows 10 requires that TLS be used.

You can specify a location option if the remote computer does not use the same keyboard layout as your computer by appending it to the *Host* field using the following format: `<IP address> -m <locale>`

The available options are:

ar	Arabic	fr-be	Belgian French	no	Norwegian
da	Danish	fr-ca	Canadian French	pl	Polish
de	German	fr-ch	Swiss French	pt	Portuguese
de-ch	Swiss German	hr	Croatian	pt-br	Brazilian Portuguese
en-gb	British English	hu	Hungarian	ru	Russian
en-uk	UK English	it	Italian	sl	Slovenian
en-us	US English	ja	Japanese	sv	Sudanese
es	Spanish	lt	Lithuanian	tk	Turkmen
fi	Finnish	lv	Latvian	tr	Turkish
fr	French	mk	Macedonian		

SSL VPN bookmarks

The *Bookmarks* widget displays bookmarks configured by administrators and users. Administrator bookmarks cannot be edited, and they are configured in FortiOS. Users can add, edit, and delete their own bookmarks within the web portal.

The FortiGate forwards client requests to servers on the internet or internal network. To use the web portal applications, add the URL, IP address, or name of the server application to the *Bookmarks* list. Once a bookmark is created, click the bookmark icon to initiate a session.

To access a destination without adding a bookmark to the *Your Bookmarks* list, use the Quick Connection tool. See Quick Connection tool on page 2824 for more details.

Configuring bookmarks

The following table summarizes which options can be configured based on the bookmark type in the SSL VPN web portal:

Setting	HTTP/ HTTPS	FTP	SMB	SFTP	RDP	VNC	SSH	Telnet
URL	✓							
Folder		✓	✓	✓				
Host					✓	✓	✓	✓
Domain			✓					
Port					✓	✓		
Description	✓	✓	✓	✓	✓	✓	✓	✓
Password						✓		
SSO Credentials	✓	✓	✓	✓				
SSL-VPN Login	✓	✓	✓	✓				
SSO Form Data	✓							

Setting	HTTP/ HTTPS	FTP	SMB	SFTP	RDP	VNC	SSH	Telnet
Form Key	✓							
Form Value	✓							
Alternative	✓	✓	✓	✓				
Username	✓	✓	✓	✓				
Password	✓	✓	✓	✓				
Use SSL-VPN Credentials					✓			
Username					✓			
Password					✓			
*Color Depth Per Pixel**					✓			
*Screen Width**					✓			
*Screen Height**					✓			
Keyboard Layout					✓			
Security					✓			
Preconnection ID					✓			
Preconnection Blob					✓			
Load Balancing Information					✓			
Restricted Admin Mode					✓			

* = This setting can only be configured by an administrator.

To create a user bookmark in the web portal:

1. In the *Personal Bookmarks* section, click *Create new bookmark*.
2. Enter a *Name*.
3. Select a bookmark type and configure the type-based settings.
4. Click *Save*.

To create a predefined administrator bookmark in FortiOS:

1. Go to *VPN > SSL-VPN Portals* and double-click a portal to edit it.
2. In the *Predefined Bookmarks* table, click *Create New*. The *New Bookmark* pane appears.
3. Enter a *Name*.
4. Select a bookmark type and configure the type-based settings.
5. Click *OK* to save the bookmark settings.
6. Click *OK* to save the portal settings.

Configuring group-based SSL VPN bookmarks

Administrators can add bookmarks for users in the same user group. SSL VPN will only output the matched group name entry to the client. This setting can only be configured in the CLI.

To add bookmarks for users in the same user group:

1. Enable group bookmarks in the web portal settings:

```
config vpn ssl web portal
    edit <name>
        set user-group-bookmark enable
    next
end
```

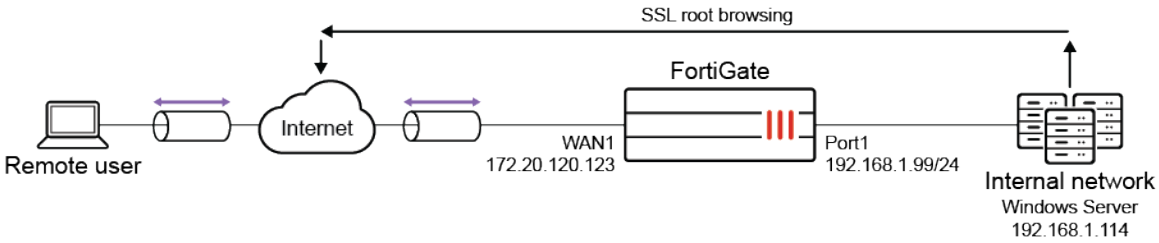
2. Configure the user group bookmark:

```
config vpn ssl web user-group-bookmark
    edit <name>
        config bookmarks
            edit <name>
                ...
            next
        end
    next
end
```

SSL VPN web mode for remote user

This is a sample configuration of remote users accessing the corporate network through an SSL VPN by web mode using a web browser.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface. Ensure that SSL VPN web mode

and SSL VPN feature visibility are enabled before starting the configuration.

For FortiOS 7.4.0, SSL VPN web mode, explicit web proxy, and interface mode IPsec VPN features will not work with the following configuration:

1. An IP pool with ARP reply enabled is configured.
2. This IP pool is configured as the source IP address in a firewall policy for SSL VPN web mode, in a proxy policy for explicit web proxy, or as the local gateway in the Phase 1 settings for an interface mode IPsec VPN.
3. A matching blackhole route is configured for IP pool reply traffic.

Configuring an IP pool as the source NAT IP address in a regular firewall policy works as before.

For details, see Technical Tip: IP pool and virtual IP behaviour changes in FortiOS 6.4, 7.0, 7.2, and 7.4.

To enable SSL VPN web mode and SSL VPN feature visibility in FortiOS:

1. Enable SSL VPN web mode:

```
config system global
    set sslvpn-web-mode enable
end
```

2. Enable SSL VPN feature visibility.
   a. In the GUI:
      i. Go to *System* > *Feature Visibility*.
      ii. In the *Core Features* section, enable *SSL-VPN*.
      iii. Click *Apply*.
   b. In the CLI:

```
config system settings
    set gui-sslvpn enable
end
```

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
   a. Go to *User & Authentication* > *User Definition* to create a local user *sslvpnuser1*.
   b. Go to *User & Authentication* > *User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.

3. Configure SSL VPN web portal.
   a. Go to *VPN > SSL-VPN Portals* to create a web mode only portal *my-web-portal*.
   b. Set *Predefined Bookmarks for Windows server* to type *RDP*.
4. Configure SSL VPN settings.
   a. Go to *VPN > SSL-VPN Settings*.
   b. For *Listen on Interface(s)*, select *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Choose a certificate for *Server Certificate*.

   It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the SSL VPN best practices on page 2776 and learn how to Procuring and importing a signed SSL certificate on page 3616.

   e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *web-access*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-Web-portal*.
5. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn web mode access*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Choose an *Outgoing Interface*. In this example, *port1*.
   e. Set the *Source* to *all* and group to *sslvpngroup*.
   f. In this example, the *Destination* is the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Click *OK*.

Do not set the virtual IP addresses as the destination address in a firewall policy when using SSL VPN web mode, as it will result in no destination address being accessible. Please note that the FortiOS SSL VPN web mode does not support mapping the virtual IP to the actual one.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure the internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
```

```
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "vpnuser1"
    next
end
```

4. Configure SSL VPN web portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "my-web-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
```

```
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "my-web-portal"
        next
    end
end
```

6. Configure one SSL VPN firewall policy to allow the remote user to access the internal network. Traffic is dropped from internal to remote client.

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

Do not set the virtual IP addresses as the destination address in a firewall policy when using SSL VPN web mode, as it will result in no destination address being accessible. Please note that the FortiOS SSL VPN web mode does not support mapping the virtual IP to the actual one.

To see the results:

1. In a web browser, log into the portal *https://172.20.120.123:10443* using the credentials you've set up.
2. In the portal with the predefined bookmark, select the bookmark to begin an RDP session. If there are no predefined bookmarks, the Quick Connection tool can be used; see Quick Connection tool on page 2824 for more information.
3. Go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
4. Go to *Log & Report > Forward Traffic* to view the details for the SSL entry.

Customizing the RDP display size

The RDP display size (width and height settings) can be customized for SSL VPN web mode when creating a new connection or bookmark. Administrators can also specify the display size when preconfiguring bookmarks.

To configure the default window dimensions in an RDP web portal:

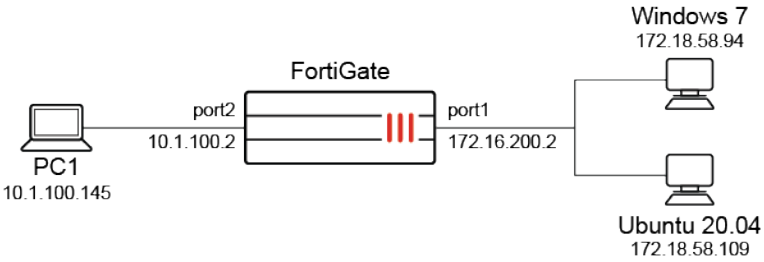
```
config vpn ssl web portal
    edit <name>
        set default-window-width <integer>
        set default-window-height <integer>
    next
end
```

`default-window-width <integer>`	Set the default RDP screen width, in pixels (0 - 65535, default = 1024).
`default-window-height <integer>`	Set the default RDP screen height, in pixels (0 - 65535, default = 768).

Example

In this example, a user has a monitor with a resolution of 1920 × 1080. The user creates two bookmarks for RDP servers with different resolutions:

- Windows 7: 1360 × 768
- Ubuntu 20.04: 800 × 600

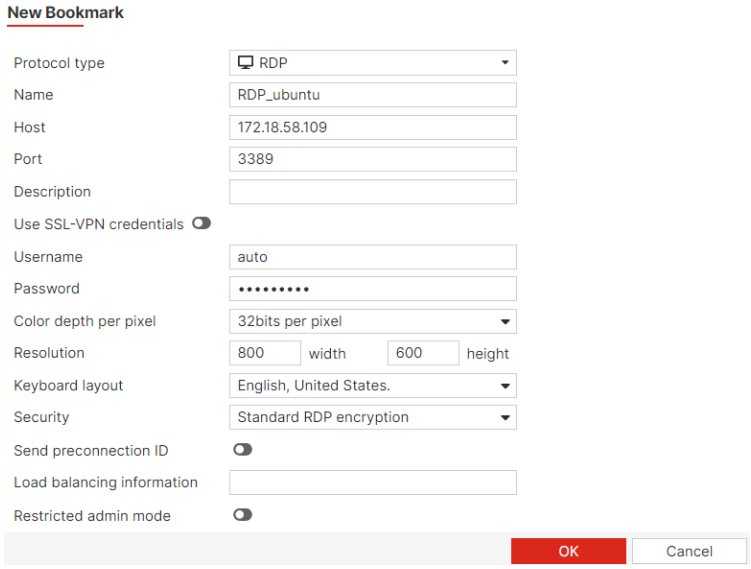


To customize the RDP bookmark display size:

1. Log in to the SSL VPN web portal.
2. Create a new personal RDP bookmark (*+ New Bookmark*), or hover over an existing bookmark and click the edit (pencil) icon.

3. Set the *Resolition width* and *height* fields as required.
   a. Windows 7: 1360 width and 768 height.

   b. Ubuntu 20.04: 800 width and 600 height.

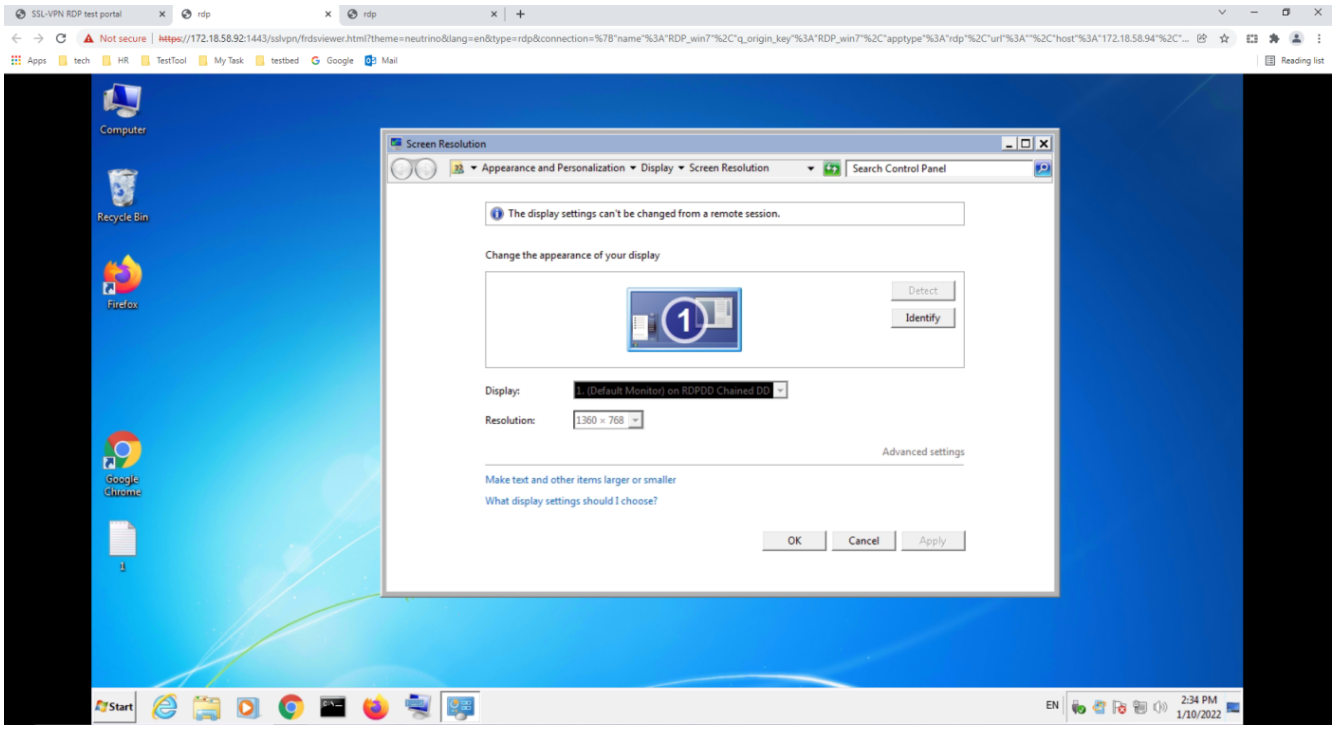


4. Click *Save*.

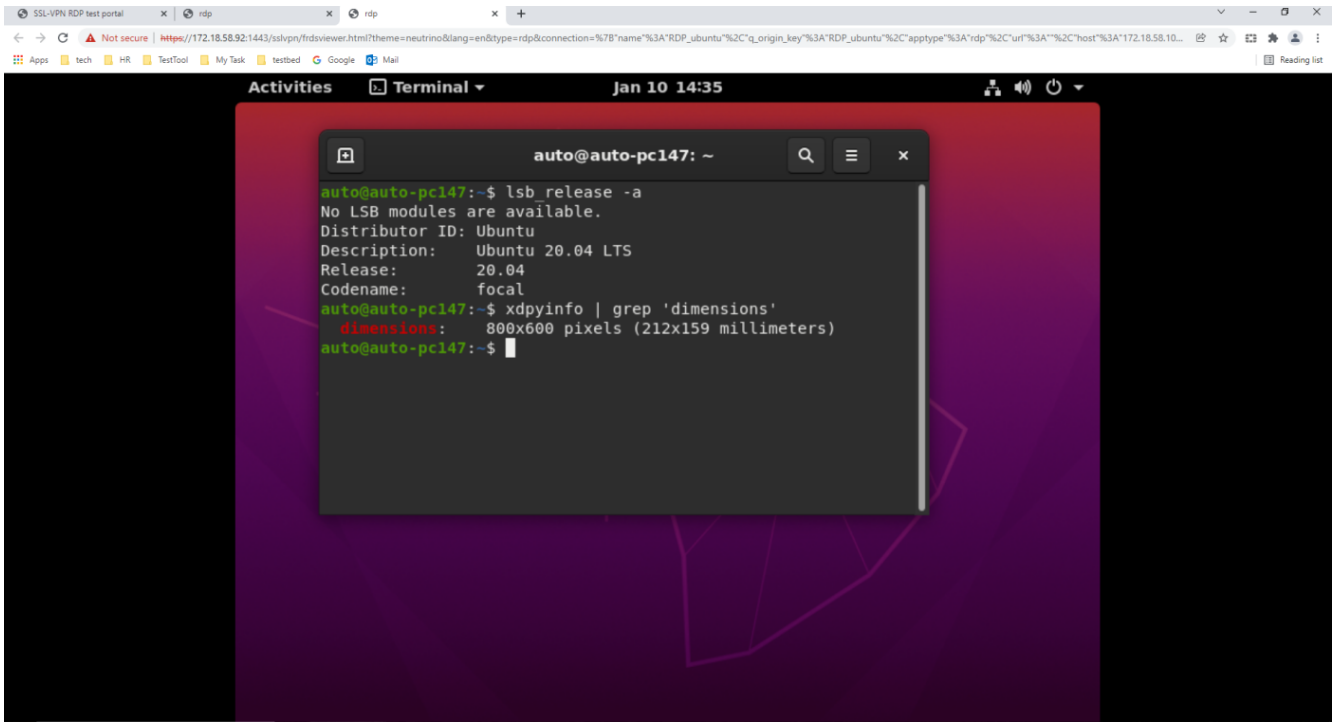
Verification:

When the user connects to the RDP servers using the bookmarks, the customized screen resolutions are applied regardless of the client PC's screen resolution (1920 × 1080).

Windows 7:



Ubuntu 20.04:



To view the bookmarks created by the user:

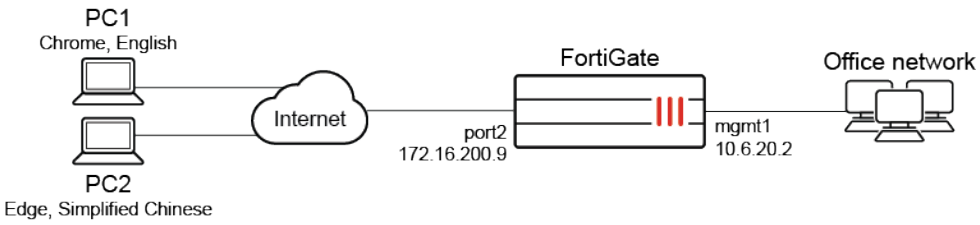
```
show vpn ssl web user-bookmark
config vpn ssl web user-bookmark
```

```
    edit "rdp_user#"
        config bookmarks
            edit "RDP_win7"
                set apptype rdp
                set host "172.18.58.94"
                set port 3389
                set logon-user "fosqa"
                set logon-password ********
                set color-depth 32
                set width 1360
                set height 768
            next
            edit "RDP_ubuntu"
                set apptype rdp
                set host "172.18.58.109"
                set port 3389
                set logon-user "auto"
                set logon-password ********
                set color-depth 32
                set width 800
                set height 600
            next
        end
    next
end
```

Showing the SSL VPN portal login page in the browser's language

By default, the browser's language preference is automatically detected and used by the SSL VPN portal login page. The system language can still be used by changing the settings on the *SSL-VPN Settings* page of the GUI, or disabling `browser-language-detection` in the CLI:

```
config vpn ssl settings
    set browser-language-detection disable
end
```



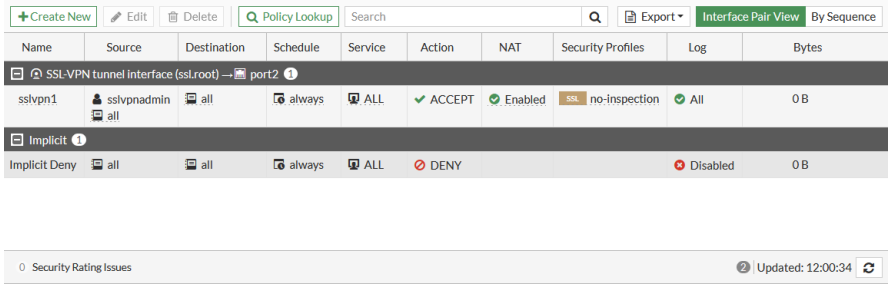
In this example, the *sslvpnadmin* user account is used for SSL VPN connections on the *testportal1* SSL VPN portal. The account is shared by users from different countries that use different browsers and different languages in their browsers. The user on PC1 uses Chrome in English, and the user on PC2 uses Edge in Simplified Chinese. When a user logs in to the SSL VPN web portal, all of the pages are shown in the same language as their browser.

To configure the SSL VPN portal to use the client's browser language:

1. Configure the SSL VPN portal:
   a. Go to *VPN > SSL-VPN Portals* and edit the SSL VPN portal.
   For information about configuring SSL VPN portals, see SSL VPN on page 2775.
   b. Enable *Web Mode*.

   c. Click *OK*.
2. Set the language preference:
   a. Go to *VPN > SSL-VPN Settings*.
   b. Under *Web Mode Settings*, set *Language* to *Browser Preference*.

   c. Click *Apply*.
3. Add the *sslvpnadmin* user to the policy used by the SSL VPN portal.



4. Confirm that the configuration works:
   - When the user on PC1 logs in to the SSL VPN portal using Chrome in English, all of the pages are shown in English.
   - When the user on PC2 logs in to the SSL VPN portal using Edge in Simplified Chinese, all of the pages are shown in Simplified Chinese.

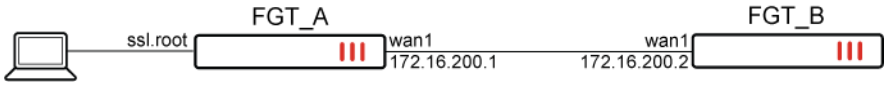
SSL VPN custom landing page

An SSL VPN web mode user can log in to the web portal and be redirected to a custom landing page. The custom landing page can be configured in *VPN > SSL-VPN Portals* by setting the portal *Landing page* to *Custom* or by using the command `config landing-page`.

The landing page can accept SSO credentials as well as SSO from form data. This allows administrators to streamline web application access for their users. The custom redirected portal has a logout button so that when users log out from the web application, they are also logged out from the SSL VPN web connection.

Example

In the following example, the SSL VPN web portal settings are configured so that the URL of the custom landing page of FGT_A is set to the FGT_B login page. Therefore, when a web user is logging into FGT_A's SSL VPN web portal, they will automatically be redirected to FGT_B, where the SSO username and password are passed into the username and password input fields. This allows for single sign on of the connecting user into FGT_B through the SSL VPN.



To configure a custom landing page from the CLI:

1. Configure the user and user group:

```
config user local
    edit "custom_landing_user"
        set type password
        set passwd ********
    next
end
config user group
    edit "ssl-web-group"
        set member "custom_landing_user"
    next
end
```

2. Configure the SSL VPN web portal:

```
config vpn ssl web portal
    edit "custom_landing"
        set web-mode enable
        set landing-page-mode enable
        config landing-page
            set url "https://172.16.200.2/login"
            set sso static
            config form-data
                edit "username"
                    set value "admin"
```

```
                next
                edit "secretkey"
                    set value "1"
                next
            end
            set sso-credential alternative
            set sso-username "admin"
            set sso-password ********
        end
    next
end
```

3. Configure the SSL VPN settings:

```
config vpn ssl settings
    set servercert "fgt_gui_automation"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set port 1443
    set source-interface "port1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 2
            set users "custom_landing_user"
            set portal "custom_landing"
        next
    end
    set encrypt-and-store-password enable
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "testpolicy"
        set srcintf "ssl.root"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set groups "ssl-web-group"
        set users "custom_landing_user"
    next
end
```

To configure a custom landing page from the GUI:

1. Configure the user and user group:
   a. Go to *User & Authentication > User Definition* to create the `custom_landing_user` user.
   b. Go to *User & Authentication > User Groups* to create the `ssl-web-group` user group with the member `custom_landing_user`.
2. Configure the SSL VPN web portal:
   a. Go to *VPN > SSL-VPN Portals*.
   b. Click *Create New*.
   c. Enter `custom_landing` as the *Name*.
   d. Enable custom *Web Mode* features:
      i. Enable *Web Mode*.
      ii. Set *Landing Page* to *Custom*.
      iii. Enter the FGT_B login page *URL*.
      iv. Enable *SSO Credentials* and select *Alternative*.
      v. Enable *SSO form data* and enter the form keys and values.

   e. Click *OK*.
3. Configure the SSL VPN settings:
   a. Go to *VPN > SSL-VPN Settings*.
   b. Set *Listen on Interface(s)* to *port1*.
   c. Set *Listen on Port* to *1443*.
   d. Set *Server Certificate* to *fgt_gui_automation*.
   e. Create a new *Authentication/Portal Mapping* for group *ssl-web-group* mapping the portal *custom-landing*.
   f. Click *Apply*.
4. Configure the firewall policy:
   a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
   b. Configure the following settings:

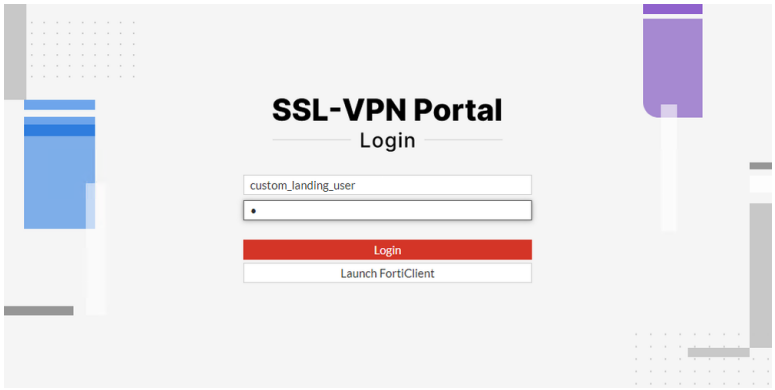
Name	testpolicy
Incoming Interface	ssl.root
Outgoing Interface	wan1
Source	all custom_landing_user ssl-web-group
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT

c. Enable *NAT*.
d. Enable *Log Allowed Traffic* and set it to *All Sessions*.
e. Click *OK*.

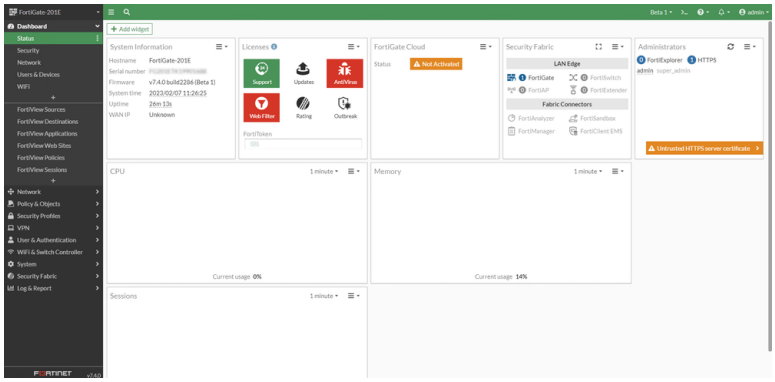
Once the SSL VPN web portal is configured, the connected user can access FGT_B through the FGT_A SSL VPN web portal.

To access FGT_B through the FGT_A SSL VPN web portal:

1. Enter your SSO credentials in the SSL VPN login fields.



The landing page is redirected to the FGT_B GUI automatically.



SSL VPN authentication

The following topics provide instructions on configuring SSL VPN authentication:

- SSL VPN with LDAP user authentication on page 2842
- SSL VPN with LDAP user password renew on page 2847

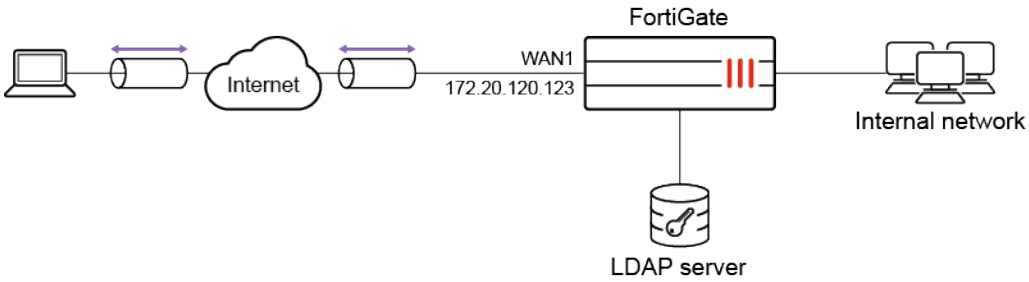
SSL VPN with LDAP user authentication

This is a sample configuration of SSL VPN for LDAP users. In this example, the LDAP server is a Windows 2012 AD server. A user *ldu1* is configured on Windows 2012 AD server.

You must have generated and exported a CA certificate from the AD server and then have imported it as an external CA certificate into the FortiGate.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network:
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Import CA certificate into FortiGate:
   a. Go to *System* > *Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Specify *Name* and *Server IP/Name*.
   c. Specify *Common Name Identifier* and *Distinguished Name*.
   d. Set *Bind Type* to *Regular*.
   e. Specify *Username* and *Password*.
   f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.
   g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
4. Configure user group:
   a. Go to *User & Authentication* > *User Groups* to create a user group.
   b. Enter a *Name*.
   c. In *Remote Groups*, click *Add* to add *ldaps-server*.
5. Configure SSL VPN web portal:
   a. Go to *VPN* > *SSL-VPN Portals* to edit the *full-access* portal.
   This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
6. Configure SSL VPN settings:
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.

   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *ldaps-group* mapping portal *full-access*.
7. Configure SSL VPN firewall policy:
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name, in this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *ldaps-group*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network, in this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Import CA certificate into FortiGate:
   a. Go to *System > Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System > Certificates* and select *Import > CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
   The CA certificate now appears in the list of *External CA Certificates*. In the example, it is called *CA_Cert_1*.

d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

4. Configure the LDAP server:

```
config user ldap
    edit "ldaps-server"
        set server "172.20.120.161"
        set cnid "cn"
        set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
        set type regular
        set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
        set password **********
        set group-member-check group-object
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
    next
end
```

5. Configure user group:

```
config user group
    edit "ldaps-group"
        set member "ldaps-server"
    next
end
```

6. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
     next
end
```

7. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
```

```
            set groups "ldaps-group"
            set portal "full-access"
        next
    end
end
```

8. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “ldaps-group”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Enter the *ldu1* user credentials, then click *Login*.
3. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
   c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the *ldu1* credentials.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report* > *System Events* and select the *VPN Events* card to view the details of the SSL VPN connection event log.
3. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       ldu1    1(1)         229        10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       ldu1    1(1)         291        10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User    Source IP      Duration    I/O Bytes      Tunnel/Dest IP
 0       ldu1    10.1.100.254   9           22099/43228    10.212.134.200
```

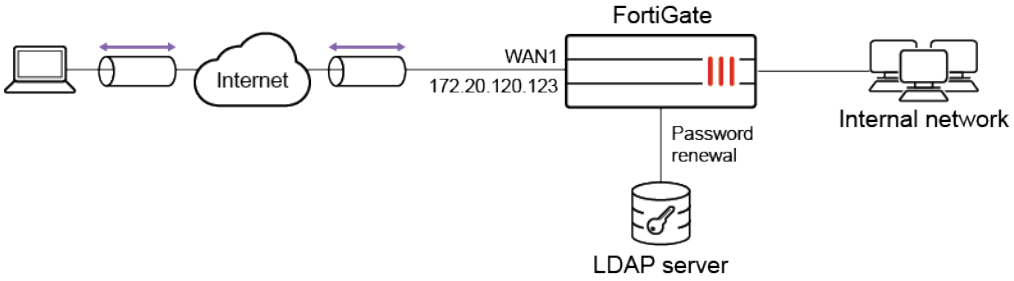
SSL VPN with LDAP user password renew

This is a sample configuration of SSL VPN for LDAP users with *Force Password Change on next logon*. In this example, the LDAP server is a Windows 2012 AD server. A user *ldu1* is configured on Windows 2012 AD server with *Force password change on next logon*.

The LDAP renewal method is designed to replace (reset) the user password, meaning that the Active Directory password policy will not be enforced. For example, users can reuse the same password or use old ones.

You must have generated and exported a CA certificate from the AD server and then have imported it as an external CA certificate into the FortiGate.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Import CA certificate into FortiGate:
   a. Go to *System* > *Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
      The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:

The LDAP user must either be an administrator, or have the proper permissions delegated to it, to be able to change passwords of other registered users on the LDAP server.

   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Specify *Name* and *Server IP/Name*.
   c. Specify *Common Name Identifier* and *Distinguished Name*.
   d. Set *Bind Type* to *Regular*.
   e. Specify *Username* and *Password*.
   f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.
   g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
   h. To enable the `password-renew` option, use these CLI commands.

```
config user ldap
    edit "ldaps-server"
        set password-expiry-warning enable
        set password-renewal enable
```

```
    next
end
```

4. Configure user group:
   a. Go to *User & Authentication > User Groups* to create a user group.
   b. Enter a *Name*.
   c. In *Remote Groups*, click *Add* to add *ldaps-server*.
5. Configure SSL VPN web portal:
   a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
6. Configure SSL VPN settings:
   a. Go to *VPN > SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *ldaps-group* mapping portal *full-access*.
7. Configure SSL VPN firewall policy:
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name, in this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *ldaps-group*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network, in this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
```

```
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Import CA certificate into FortiGate:
   a. Go to *System* > *Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
      The CA certificate now appears in the list of *External CA Certificates*. In the example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

      ```
      config vpn certificate ca
          rename CA_Cert_1 to LDAPS-CA
      end
      ```

4. Configure the LDAP server:

   The LDAP user must either be an administrator, or have the proper permissions delegated to it, to be able to change passwords of other registered users on the LDAP server.

```
config user ldap
    edit "ldaps-server"
        set server "172.20.120.161"
        set cnid "cn"
        set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
        set type regular
        set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
        set password **********
        set group-member-check group-object
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
        set password-expiry-warning enable
        set password-renewal enable
    next
end
```

5. Configure user group:

```
config user group
    edit "ldaps-group"
        set member "ldaps-server"
    next
end
```

6. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
     next
end
```

7. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "ldaps-group"
            set portal "full-access"
        next
    end
end
```

8. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “ldaps-group”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *ldu1* credentials.
   Use a user that is configured on FortiAuthenticator with *Force password change on next logon*.
3. Click *Login*. You are prompted to enter a new password. The prompt will timeout after 90 seconds.
4. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
   c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the *ldu1* credentials.
   You are prompted to enter a new password. The prompt will timeout after 90 seconds.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > System Events* and select the *VPN Events* card to view the details of the SSL VPN connection event log.
3. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       ldu1    1(1)         229        10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       ldu1    1(1)         291        10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User    Source IP      Duration    I/O Bytes      Tunnel/Dest IP
 0       ldu1    10.1.100.254   9           22099/43228    10.212.134.200
```

SSL VPN with certificate authentication

This is an example configuration of SSL VPN that requires users to authenticate using a client certificate. The client certificate is issued by the company Certificate Authority (CA). Each user is issued a certificate with their username in the subject.

There are two ways to configure certificate authentication:

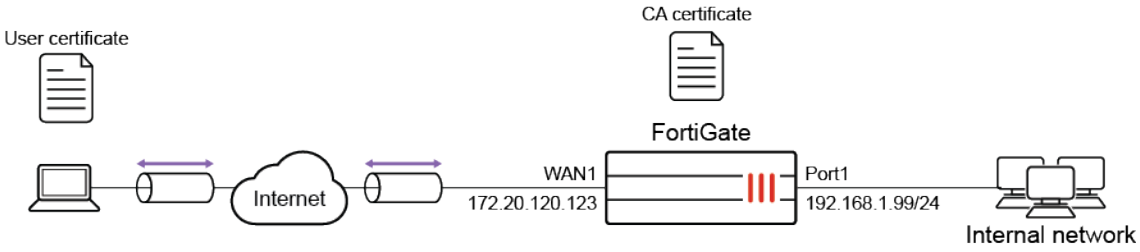
1. Using PKI users
2. Configuring the SSL VPN settings to require a client certificate

In this example, the server and client certificates are signed by the same Certificate Authority (CA).

Self-signed certificates are provided by default to simplify initial installation and testing. It is **HIGHLY** recommended that you acquire a signed certificate for your installation.

Continuing to use these certificates can result in your connection being compromised, allowing attackers to steal your information, such as credit card details.

For more information, please review the Use a non-factory SSL certificate for the SSL VPN portal on page 2782 and learn how to Procuring and importing a signed SSL certificate on page 3616.



Using PKI users

When using PKI users, the FortiGate authenticates the user based on there identity in the subject or the common name on the certificate. The certificate must be signed by a CA that is known by the FortiGate, either through the default CA certificates or through importing a CA certificate.

The user can either match a static subject or common name defined in the PKI user settings, or match an LDAP user in the LDAP server defined in the PKI user settings. Multi-factor authentication can also be enabled with the password as the second factor.

Configuring the SSL VPN settings to require a client certificate

Using this method, the user is authenticated based on their regular username and password, but SSL VPN will still require an additional certificate check. The client certificate only needs to be signed by a known CA in order to pass authentication.

This method can be configured by enabling *Require Client Certificate* (`reqclientcert`) in the SSL-VPN settings.

Configuration

In the following example, SSL VPN users are authenticated using the first method. A PKI user is configured with multi-factor authentication

Pre-requisites:

- The CA has already issued a client certificate to the user.
- The CA has issued a server certificate for the FortiGate's SSL VPN portal.
- The CA certificate is available to be imported on the FortiGate.

To configure SSL VPN in the GUI:

1. Install the server certificate. The server certificate allows the clients to authenticate the server and to encrypt the SSL VPN traffic.
   a. Go to *System* > *Feature Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *Local Certificate*.
      - Set *Type* to *Certificate*.
      - Choose the *Certificate file* and the *Key file* for your certificate, and enter the *Password*.
      - If required, you can change the *Certificate Name*.

   The server certificate now appears in the list of *Certificates*.
2. Install the CA certificate.
   The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users.
   a. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   b. Select *Local PC* and then select the certificate file.

   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
3. Configure PKI users and a user group.
   To use certificate authentication, use the CLI to create PKI users.

```
config user peer
    edit pki01
        set ca CA_Cert_1
        set subject "CN=User01"
    next
end
```

   Ensure that the subject matches the name of the user certificate. In this example, *User01*.
4. After you have create a PKI user, a new menu is added to the GUI:
   a. Go to *User & Authentication* > *PKI* to see the new user.
   b. Edit the user account.
   c. Enable *Two-factor authentication* and set a password for the account.
   d. Go to *User & Authentication* > *User Groups* and create a group called *sslvpngroup*.
   e. Add the PKI user *pki01* to the group.
5. Configure SSL VPN web portal.
   a. Go to *VPN* > *SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.

   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
6. Configure SSL VPN settings.
   a. Go to *VPN > SSL-VPN Settings* and enable SSL-VPN.
   b. Set the *Listen on Interface(s)* to *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the local certificate that was imported.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
7. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as needed.
   j. Click *OK*.

To configure SSL VPN in the CLI:

1. Configure the protected subnet:

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

2. Install the server certificate:

   The server certificate allows the clients to authenticate the server and to encrypt the SSL VPN traffic. While it is easier to install the server certificate in the GUI, the CLI can be used to import a p12 certificate from a TFTP server.

   To import a p12 certificate, put the certificate *server_certificate.p12* on your TFTP server, then run following command on the FortiGate:

```
execute vpn certificate local import tftp server_certificate.p12 <your tftp_server> p12 <your
password for PKCS12 file>
```

   To check that the server certificate is installed:

```
show vpn certificate local server_certificate
```

3. Install the CA certificate:

   The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users. While it is easier to install the CA certificate from GUI, the

CLI can be used to import a CA certificates from a TFTP server.

To import a CA certificate, put the CA certificate on your TFTP server, then run following command on the FortiGate:

```
execute vpn certificate ca import tftp <your CA certificate name> <your tftp server>
```

To check that a new CA certificate is installed:

```
show vpn certificate ca
```

4. Configure PKI users and a user group:

```
config user peer
    edit pki01
        set ca CA_Cert_1
        set subject "CN=User01"
        set two-factor enable
        set passwd **********
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "pki01"
    next
end
```

5. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
     next
end
```

6. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Installation

To use the user certificate, you must first install it on the user's PC. When the user tries to authenticate, the user certificate is checked against the CA certificate to verify that they match.

Every user should have a unique user certificate. This allows you to distinguish each user and revoke a specific user's certificate, such as if a user no longer has VPN access.

To install the user certificate on Windows 7, 8, and 10:

1. Double-click the certificate file to open the *Import Wizard*.
2. Use the *Import Wizard* to import the certificate into the *Personal store* of the current user.

To install the user certificate on Mac OS X:

1. Open the certificate file, to open *Keychain Access*.
2. Double-click the certificate.
3. Expand *Trust* and select *Always Trust*.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection.
   - Set *VPN Type* to *SSL VPN*.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Enable *Client Certificate* and select the authentication certificate.
6. Save your settings.
7. Use the credentials you've set up to connect to the SSL VPN tunnel.
   If the certificate is correct, you can connect.

To see the results of web portal:

1. In a web browser, log into the portal *http://172.20.120.123:10443*.
   A message requests a certificate for authentication.
2. Select the user certificate.
3. Enter your user credentials.
   If the certificate is correct, you can connect to the SSL VPN web portal.

To check the SSL VPN connection using the GUI:

1. Go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
2. Go to *Log & Report > System Events* and select the *VPN Events* card to view the details for the SSL connection log.

To check the SSL VPN connection using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type      Timeout         From     HTTP in/out    HTTPS in/out
 0       pki01,cn=User01          1(1)            229     10.1.100.254   0/0     0/0
 1       pki01,cn=User01          1(1)            291     10.1.100.254   0/0     0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       pki01,cn=User01          10.1.100.254    9       22099/43228    10.212.134.200
```

SSL VPN with LDAP-integrated certificate authentication

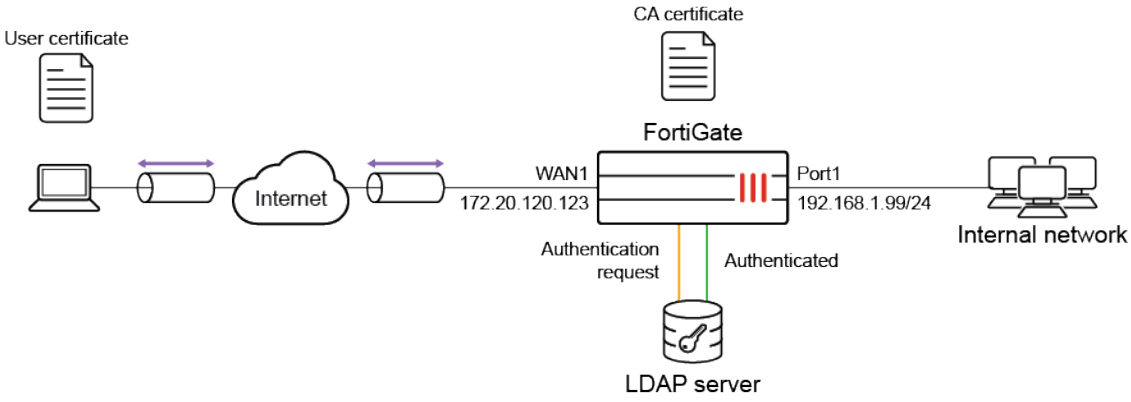
This is a sample configuration of SSL VPN that requires users to authenticate using a certificate with LDAP `UserPrincipalName` checking.

This sample uses Windows 2012R2 Active Directory acting as both the user certificate issuer, the certificate authority, and the LDAP server.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 3014 and Configuring client certificate authentication on the LDAP server on page 3029.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 3022.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

In this sample, the *User Principal Name* is included in the subject name of the issued certificate. This is the user field we use to search LDAP in the connection attempt.

To use the user certificate, you must first install it on the user's PC. When the user tries to authenticate, the user certificate is checked against the CA certificate to verify that they match.

Every user should have a unique user certificate. This allows you to distinguish each user and revoke a specific user's certificate, such as if a user no longer has VPN access.

To install the server certificate:

The server certificate is used for authentication and for encrypting SSL VPN traffic.

1. Go to *System* > *Feature Visibility* and ensure *Certificates* is enabled.
2. Go to *System* > *Certificates* and select *Import* > *Local Certificate*.
3. Set *Type* to *Certificate*.
4. Choose the *Certificate file* and the *Key file* for your certificate, and enter the *Password*.
5. If required, change the *Certificate Name*.
   The server certificate now appears in the list of *Certificates*.

To install the CA certificate:

The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users.

1. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
2. Select *Local PC* and then select the certificate file.
   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Configure the LDAP server:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Specify *Name* and *Server IP/Name*.
   c. Set *Distinguished Name* to *dc=fortinet-fsso,dc=com*.
   d. Set *Bind Type* to *Regular*.
   e. Set *Username* to *cn=admin,ou=testing,dc=fortinet-fsso,dc=com*.
   f. Set *Password*.
   g. Click *OK*.
3. Configure PKI users and a user group:
   To use certificate authentication, use the CLI to create PKI users.

```
config user peer
    edit user1
        set ca CA_Cert_1
        set mfa-server "ldap-AD"
        set mfa-mode subject-identity
    next
end
```

   When you have create a PKI user, a new menu is added to the GUI:
   a. Go to *User & Authentication* > *PKI* to see the new user.
   b. Go to *User & Authentication* > *User* > *User Groups* and create a group *sslvpn-group*.
   c. Add the PKI peer object you created as a local member of the group.
   d. Add a remote group on the LDAP server and select the group of interest.
      You need these users to be members using the LDAP browser window.
4. Configure SSL VPN web portal:
   a. Go to *VPN* > *SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
5. Configure SSL VPN settings:
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpn-group* mapping portal *full-access*.

6. Configure SSL VPN firewall policy:
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *sslvpn-group*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure the LDAP server:

```
config user ldap
    edit "ldap-AD"
        set server "172.18.60.206"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=admin,ou=testing,dc=fortinet-fsso,dc=com"
        set password ldap-server-password
```

```
   next
end
```

4. Configure PKI users and a user group:

```
config user peer
    edit user1
        set ca CA_Cert_1
        set mfa-server "ldap-AD"
        set mfa-mode subject-identity
    next
end
```

```
config user group
    edit "sslvpn-group"
        set member "ldap-AD" "user1"
        config match
            edit 1
                set server-name "ldap-AD"
                set group-name "CN=group3,OU=Testing,DC=Fortinet-FSSO,DC=COM"
            next
        end
    next
end
```

5. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

6. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpn-group"
            set portal "full-access"
        next
    end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpn-group”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection.
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
   c. Select *Customize Port* and set it to *10443*.
   d. Enable *Client Certificate* and select the authentication certificate.
4. Save your settings.
   Connecting to the VPN only requires the user's certificate. It does not require username or password.

To see the results of web portal:

1. In a web browser, log into the portal *http://172.20.120.123:10443*.
   A message requests a certificate for authentication.
2. Select the user certificate.
   You can connect to the SSL VPN web portal.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user’s connection.
2. Go to *Log & Report* > *VPN Events* to view the details of the SSL VPN connection event log.
3. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the SSL VPN connection using the CLI:

Below is a sample output of `diagnose debug application fnbamd -1` while the user connects. This is a shortened output sample of a few locations to show the important parts. This sample shows lookups to find the group memberships (three groups total) of the user and that the correct group being found results in a match.

```
[1148] fnbamd_ldap_recv-Response len: 16, svr: 172.18.60.206

[2091] fnbamd_auth_cert_check-Group 'sslvpn-group' matched
[2120] fnbamd_auth_cert_result-Result for ldap svr[0] 'ldap-AD' is SUCCESS
[2126] fnbamd_auth_cert_result-matched user 'test3', matched group 'sslvpn-group'
```

You can also use `diagnose firewall auth list` to validate that a firewall user entry exists for the SSL VPN user and is part of the right groups.

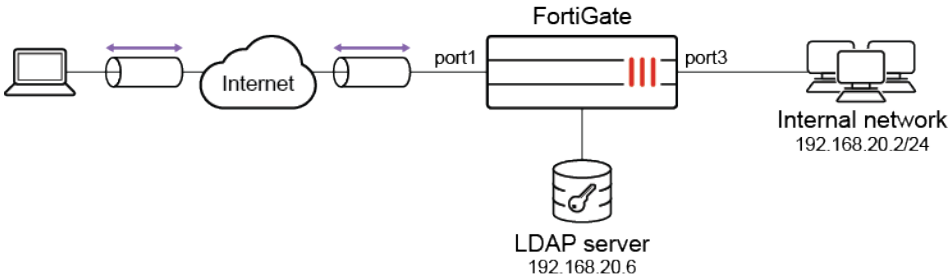
SSL VPN for remote users with MFA and user sensitivity

By default, remote LDAP and RADIUS user names are case sensitive. When a remote user object is applied to SSL VPN authentication, the user must type the exact case that is used in the user definition on the FortiGate.

Case sensitivity and accents can be ignored by disabling the `username-sensitivity` CLI command, allowing the remote user object to match any case or accents that the end user types in.

In this example, a remote user is configured with multi-factor authentication (MFA). The user group includes the LDAP user and server, and is applied to SSL VPN authentication and the policy.

Topology



Example configuration

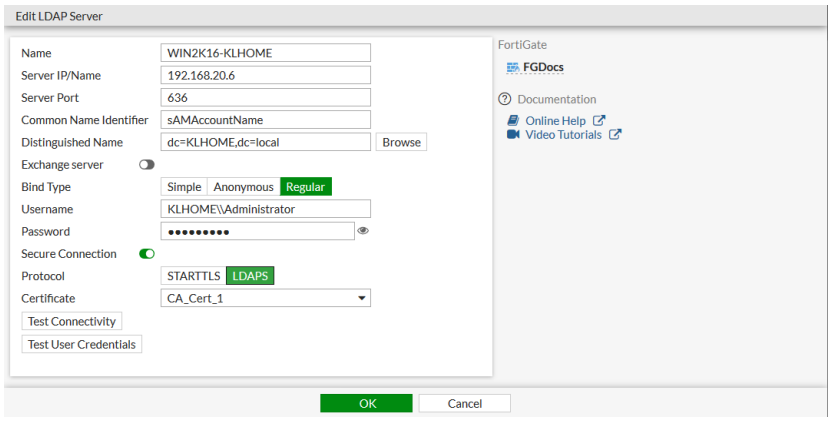
To configure the LDAP server:

1. Generate and export a CA certificate from the AD server .
2. Import the CA certificate into FortiGate:
   a. Go to *System* > *Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Configure the following options for this example:

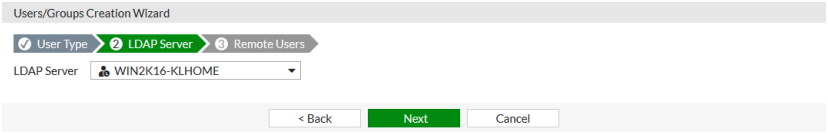
Name	WIN2K16-KLHOME
Server IP/Name	192.168.20.6
Server Port	636
Common Name Identifier	sAMAccountName
Distinguished Name	dc=KLHOME,dc=local
Bind Type	Regular
Username	KLHOME\\Administrator
Password	*********
Secure Connection	Enable
Protocol	LDAPS
Certificate	CA_Cert_1 This is the CA certificate that you imported in step 2.



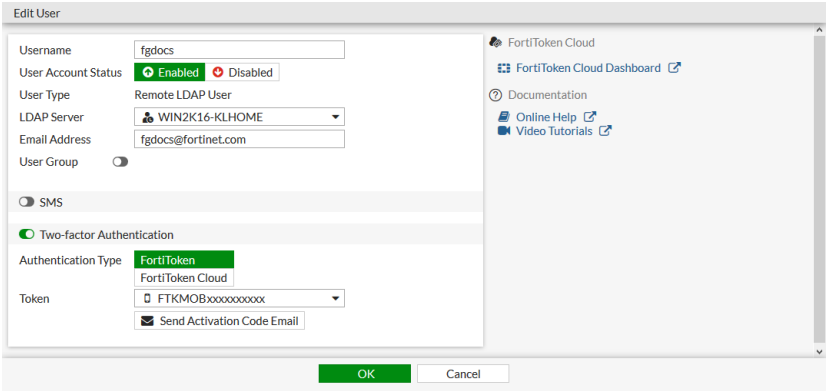
c. Click *OK*.

To configure an LDAP user with MFA:

1. Go to *User & Authentication* > *User Definition* and click *Create New*.
2. Select *Remote LDAP User*, then click *Next*.
3. Select the just created LDAP server, then click *Next*.



4. Right click to add the selected user, then click *Submit*.
5. Edit the user that you just created.
   The username will be pulled from the LDAP server with the same case as it has on the server.
6. Set the *Email Address* to the address that FortiGate will send the FortiToken to.
7. Enable *Two-factor Authentication*.
8. Set *Authentication Type* to *FortiToken*.
9. Set *Token* to a FortiToken device. See for more information.



10. Click *OK*.

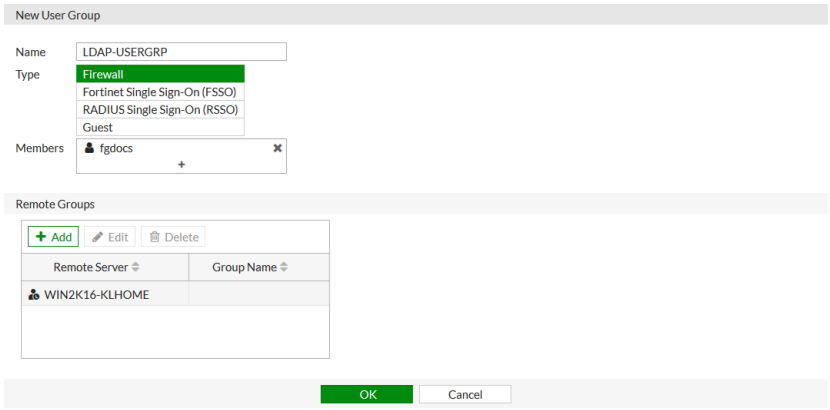
To disable case and accent sensitivity on the remote user:

This can only be configured in the CLI.

```
config user local
    edit "fgdocs"
        set type ldap
        set two-factor fortitoken
        set fortitoken "FTKMOBxxxxxxxxxx"
        set email-to "fgdocs@fortinet.com"
        set username-sensitivity disable
        set ldap-server "WIN2K16-KLHOME"
    next
end
```

To configure a user group with the remote user and the LDAP server:

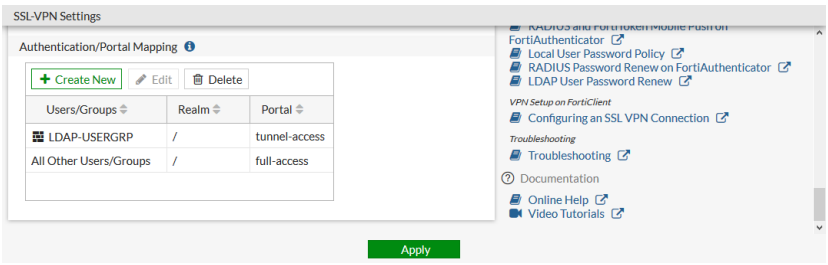
1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Set the *Name* to *LDAP-USERGRP*.
3. Set *Members* to the just created remote user.
4. In the *Remote Groups* table, click *Add*:
   a. Set *Remote Server* to the LDAP server.
   b. Set the group or groups that apply, and right click to add them.
   c. Click *OK*.



5. Click *OK*.

To apply the user group to the SSL VPN portal:

1. Go to *VPN* > *SSL-VPN Settings*.
2. In the *Authentication/Portal Mapping* table, click *Create New*.
   a. Set *Users/Groups* to the just created user group.
   b. Configure the remaining settings as required.
   c. Click *OK*.

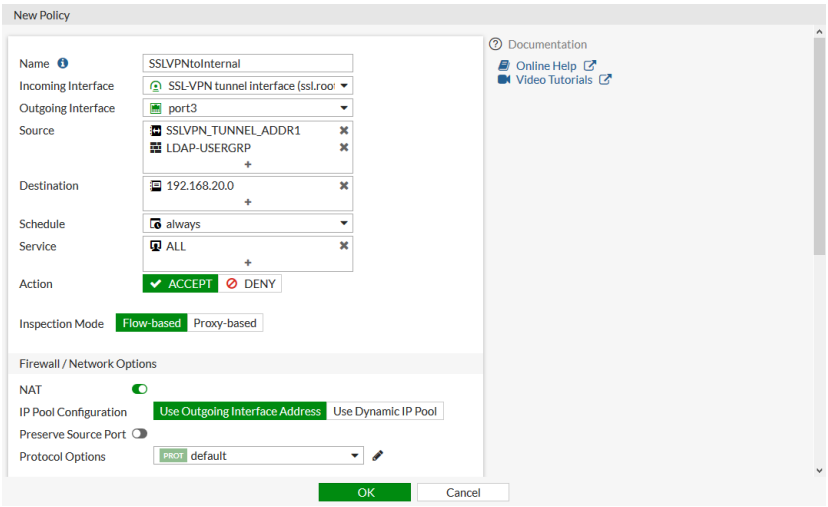


3. Click *Apply*.

To apply the user group to a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following:

Name	SSLVPNtoInteral
Incoming Interface	SSL-VPN tunnel interface (ssl.root)
Outgoing Interface	port3
Source	Address - SSLVPN_TUNNEL_ADDR1 User - LDAP-USERGRP
Destination	The address of the internal network. In this case: 192.168.20.0.
Schedule	always
Service	ALL
Action	ACCEPT
NAT	Enabled



3. Configuring the remaining settings as required.
4. Click *OK*.

To configure this example in the CLI:

1. Configure the LDAP server:

```
config user ldap
    edit "WIN2K16-KLHOME"
        set server "192.168.20.6"
        set cnid "sAMAccountName"
        set dn "dc=KLHOME,dc=local"
        set type regular
        set username "KLHOME\\Administrator"
        set password *********
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

2. Configure an LDAP user with MFA and disable case and accent sensitivity on the remote user:

```
config user local
    edit "fgdocs"
        set type ldap
        set two-factor fortitoken
        set fortitoken "FTKMOBxxxxxxxxxx"
        set email-to "fgdocs@fortinet.com"
        set username-sensitivity disable
        set ldap-server "WIN2K16-KLHOME"
    next
end
```

3. Configure a user group with the remote user and the LDAP server:

```
config user group
    edit "LDAP-USERGRP"
        set member "fgdocs" "WIN2K16-KLHOME"
    next
end
```

4. Apply the user group to the SSL VPN portal:

```
config vpn ssl settings
    set servercert <server certificate>
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "LDAP-USERGRP"
            set portal "full-access"
        next
```

```
    end
end
```

5. Apply the user group to a firewall policy:

```
config firewall policy
    edit 5
        set name "SSLVPNtoInternal"
        set srcintf "ssl.root"
        set dstintf "port3"
        set srcaddr "SSLVPN_TUNNEL_ADDR1"
        set dstaddr "192.168.20.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set groups "LDAP-USERGRP"
        set nat enable
    next
end
```

Verification

To setup the VPN connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface.
   c. If required, set the *Customize Port*.
4. Save your settings.

To test the connection with case sensitivity disabled:

1. Connect to the VPN:
   a. Log in to the tunnel with the username, using the same case that it is on the FortiGate.
   b. When prompted, enter your FortiToken code.
   You should now be connected.
2. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS in/out
 0       fgdocs          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0      0/0

SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       fgdocs          LDAP-USERGRP    192.168.2.202   45      99883/5572    10.212.134.200
```

3. Disconnect from the VPN connection.
4. Reconnect to the VPN:
   a. Log in to the tunnel with the username, using a different case than on the FortiGate.
   b. When prompted, enter your FortiToken code.
      You should now be connected.
5. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS in/out
 0       FGDOCS          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0      0/0

SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       FGDOCS          LDAP-USERGRP    192.168.2.202   45      99883/5572    10.212.134.200
```

In both cases, the remote user is matched against the remote LDAP user object and prompted for multi-factor authentication.

To test the connection with case and accent sensitivity enabled:

1. Enable case and accent sensitivity for the user:

```
config user local
    edit "fgdocs"
        set username-sensitivity enable
    next
end
```

2. Connect to the VPN
   a. Log in to the tunnel with the username, using the same case that it is on the FortiGate.
   b. When prompted, enter your FortiToken code.
      You should now be connected.
3. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS in/out
 0       fgdocs          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0      0/0

SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       fgdocs          LDAP-USERGRP    192.168.2.202   45      99883/5572    10.212.134.200
```

1. Disconnect from the VPN connection.
2. Reconnect to the VPN:
   a. Log in to the tunnel with the username, using a different case than on the FortiGate.
      You will not be prompted for your FortiToken code. You should now be connected.

3. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS in/out
 0       FGdocs          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0      0/0

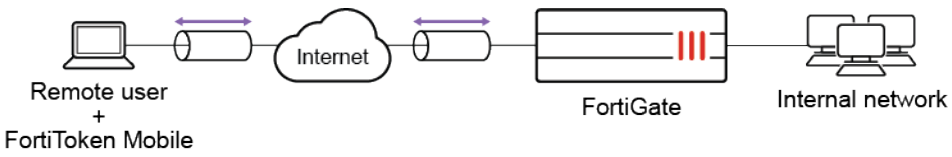
SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       FGdocs          LDAP-USERGRP    192.168.2.202   45      99883/5572    10.212.134.200
```

In this case, the user is allowed to log in without a FortiToken code because the entered user name did not match the name defined on the remote LDAP user object. Authentication continues to be evaluated against the LDAP server though, which is not case sensitive.

SSL VPN with FortiToken mobile push authentication

This is a sample configuration of SSL VPN that uses FortiToken mobile push two-factor authentication. If you enable push notifications, users can accept or deny the authentication request.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Register FortiGate for FortiCare Support:
   To add or download a mobile token on FortiGate, FortiGate must be registered for FortiCare Support. If your FortiGate is registered, skip this step.
   a. Go to *Dashboard* > *Licenses*.
   b. Hover the pointer on *Support* to check if FortiCare registered. If not, click it and select *Register*.

3. Add FortiToken mobile to FortiGate:
   If your FortiGate has FortiToken installed, skip this step.
   a. Go to *User & Authentication > FortiTokens* and click *Create New*.
   b. Select *Mobile Token* and type in *Activation Code*.
   c. Every FortiGate has two free mobile tokens. Go to *User & Authentication > FortiTokens* and click *Import Free Trial Tokens*.
4. Enable FortiToken mobile push:
   To use FTM-push authentication, use CLI to enable FTM-Push on the FortiGate.
   a. Ensure `server` is reachable from the Internet and enter the following CLI commands:

```
config system ftm-push
    set server 172.20.120.123
    set status enable
end
```

   b. Go to *Network > Interfaces*.
   c. Edit the *wan1* interface.
   d. Under *Administrative Access > IPv4*, select *FTM*.
   e. Click *OK*.
5. Configure user and user group:
   a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
   b. Enter the user's *Email Address*.
   c. Enable *Two-factor Authentication* and select one mobile *Token* from the list,
   d. Enable *Send Activation Code* and select *Email*.
   e. Click *Next* and click *Submit*.
   f. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
6. Activate the mobile token:
   a. When the user *sslvpnuser1* is created, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.
7. Configure SSL VPN web portal:
   a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
8. Configure SSL VPN settings:
   a. Go to *VPN > SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
9. Configure SSL VPN firewall policy:
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.

c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
h. Enable *NAT*.
i. Configure any remaining firewall and security options as desired.
j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Register FortiGate for FortiCare Support.
   To add or download a mobile token on FortiGate, FortiGate must be registered for FortiCare Support. If your FortiGate is registered, skip this step.

```
diagnose forticare direct-registration product-registration -a "your account@xxx.com" -p "your
password" -T "Your Country/Region" -R "Your Reseller" -e 1
```

4. Add FortiToken mobile to FortiGate:

```
execute fortitoken-mobile import <your FTM code>
```

   If your FortiGate has FortiToken installed, skip this step.
   Every FortiGate has two free mobile Tokens. You can download the free token.

```
execute fortitoken-mobile import 0000-0000-0000-0000-0000
```

5. Enable FortiToken mobile push:
   a. To use FTM-push authentication, ensure `server` is reachable from the Internet and enable FTM-push in the FortiGate:

```
config system ftm-push
    set server 172.20.120.123
    set status enable
end
```

   b. Enable FTM service on WAN interface:

```
config system interface
    edit "wan1"
        append allowaccess ftm
    next
end
```

6. Configure user and user group:

```
config user local
    edit "sslvpnuser1"
        set type password
        set two-factor fortitoken
        set fortitoken <select mobile token for the option list>
        set email-to <user's email address>
        set passwd <user's password>
    next
end
config user group
    edit "sslvpngroup"
        set member "sslvpnuser1"
    next
end
```

7. Activate the mobile token.

   When the user *sslvpnuser1* is created, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

8. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

9. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
```

```
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end
```

10. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *sslvpnuser1* credentials.
   The FortiGate pushes a login request notification through the FortiToken mobile application.
3. Check your mobile device and select *Approve*.
   When the authentication is approved, *sslvpnuser1* is logged into the SSL VPN portal.
4. On the FortiGate, go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
   c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the *sslvpnuser1* credentials and click *FTM Push*.

The FortiGate pushes a login request notification through the FortiToken mobile application.

6. Check your mobile device and select *Approve*.
   When the authentication is approved, *sslvpnuser1* is logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User           Auth Type    Timeout   From           HTTP in/out   HTTPS in/out
 0       sslvpnuser1    1(1)         229       10.1.100.254   0/0           0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

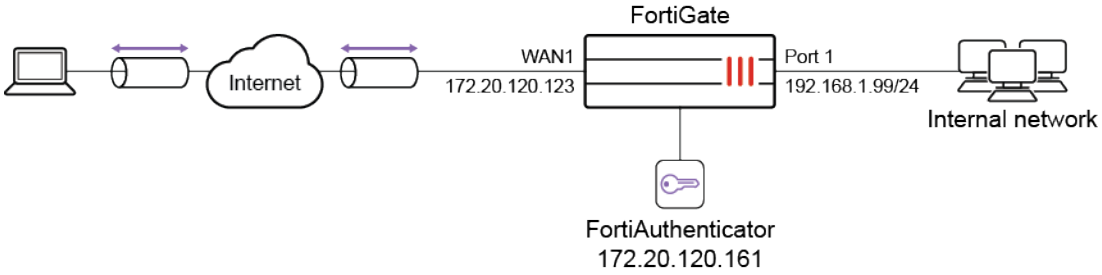
```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User           Auth Type    Timeout   From           HTTP in/out  HTTPS in/out
 0       sslvpnuser1    1(1)         291       10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User           Source IP      Duration   I/O Bytes      Tunnel/Dest IP
 0       sslvpnuser1    10.1.100.254   9          22099/43228    10.212.134.200
```

SSL VPN with RADIUS on FortiAuthenticator

This is a sample configuration of SSL VPN that uses FortiAuthenticator as a RADIUS authentication server.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure FortiAuthenticator using the GUI:

1. Create a user on the FortiAuthenticator.
   a. On the FortiAuthenticator, go to *Authentication* > *User Management* > *Local Users* to create a user *sslvpnuser1*.
   b. Enable *Allow RADIUS authentication* and click *OK* to access additional settings.
   c. Go to *Authentication* > *User Management* > *User Groups* to create a group *sslvpngroup*.
   d. Add *sslvpnuser1* to the group by moving the user from *Available users* to *Selected users*.
2. Create the RADIUS client (FortiGate) on the FortiAuthenticator.
   a. On the FortiAuthenticator, go to *Authentication* > *RADIUS Service* > *Clients* to add the FortiGate as a RADIUS client *OfficeServer*).
   b. Enter the FortiGate IP address and set a *Secret*.
   The secret is a pre-shared secure password that the FortiGate uses to authenticate to the FortiAuthenticator.
   c. Set *Realms* to *local | Local users*.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Addresses* and create an address for internal subnet *192.168.1.0*.
2. Create a RADIUS user and user group .
   a. On the FortiGate, go to *User & Authentication* > *RADIUS Servers* to create a user to connect to the RADIUS server (FortiAuthenticator).
   b. For *Name*, use *FAC-RADIUS*.
   c. Enter the IP address of the FortiAuthenticator, and enter the *Secret* created above.
   d. Click *Test Connectivity* to ensure you can connect to the RADIUS server.
   e. Select *Test User Credentials* and enter the credentials for *sslvpnuser1*.
   The FortiGate can now connect to the FortiAuthenticator as the RADIUS client.
   f. Go to *User & Authentication* > *User Groups* and click *Create New* to map authenticated remote users to a user group on the FortiGate.
   g. For *Name*, use *SSLVPNGroup*.
   h. In *Remote Groups*, click *Add*.
   i. In the *Remote Server* dropdown list, select *FAC-RADIUS*.
   j. Leave the *Groups* field blank.

3. Configure SSL VPN web portal.
   a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
4. Configure SSL VPN settings.
   a. Go to *VPN > SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
5. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. *Incoming Interface* must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example: *port1*.
   e. Set the *Source > Address* to *all* and *Source > User* to *sslvpngroup*.
   f. Set *Destination > Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure the remaining options as required.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
```

```
    next
end
```

3. Create a RADIUS user and user group.

```
config user radius
    edit "FAC-RADIUS"
        set server "172.20.120.161"
        set secret <FAC client secret>
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "FAC-RADIUS"
    next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end
```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
```

```
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *sslvpnuser1* credentials.
3. On the FortiGate, go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection.
   - Set the connection name.
   - Set *Remote Gateway* to *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Log in using the *sslvpnuser1* credentials and check that you are logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       sslvpnuser1   1(1)         229        10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
```

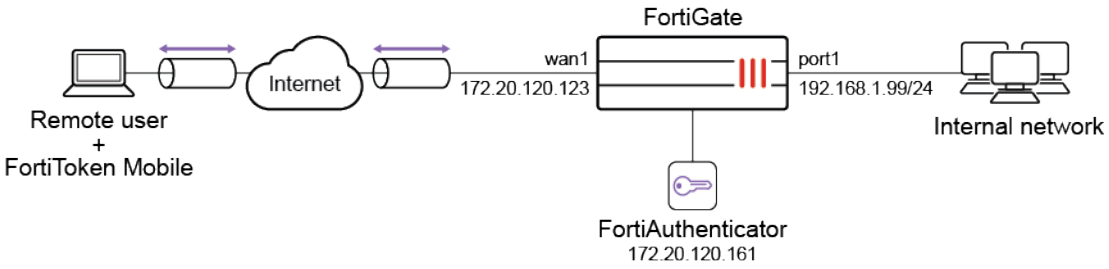
```
 Index   User          Auth Type   Timeout    From           HTTP in/out  HTTPS in/out
 0       sslvpnuser1   1(1)        291        10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User          Source IP      Duration     I/O Bytes      Tunnel/Dest IP
 0       sslvpnuser1   10.1.100.254   9            22099/43228    10.212.134.200
```

SSL VPN with RADIUS and FortiToken mobile push on FortiAuthenticator

This is a sample configuration of SSL VPN that uses FortiAuthenticator as a RADIUS authentication server and FortiToken mobile push two-factor authentication. If you enable push notifications, users can accept or deny the authentication request.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure FortiAuthenticator using the GUI:

1. On the FortiAuthenticator, go to *System > Administration > System Access* and configure a *Public IP/FQDN for FortiToken Mobile*. If the FortiAuthenticator is behind a firewall, the public IP/FQDN will be an IP/port forwarding rule directed to one of the FortiAuthenticator interfaces. The interface that receives the approve/deny FTM push responses must have the *FortiToken Mobile API* service enabled.
2. Add a FortiToken mobile license on the FortiAuthenticator:
   a. Go to *Authentication > User Management > FortiTokens*.
   b. Click *Create New*.
   c. Set *Token type* to *FortiToken Mobile* and enter the *FortiToken Activation codes*.

3. Create the RADIUS client (FortiGate) on the FortiAuthenticator:
   a. Go to *Authentication > RADIUS Service > Clients* to add the FortiGate as a RADIUS client *OfficeServer*).
   b. Enter the FortiGate IP address and set a *Secret*.
      The secret is a pre-shared secure password that the FortiGate uses to authenticate to the FortiAuthenticator.
   c. Set *Authentication method* to *Enforce two-factor authentication*.
   d. Select *Enable FortiToken Mobile push notifications authentication*.
   e. Set *Realms* to *local | Local users*.
4. Create a user and assign FortiToken mobile to the user on the FortiAuthenticator:
   a. Go to *Authentication > User Management > Local Users* to create a user *sslvpnuser1*.
   b. Enable *Allow RADIUS authentication* and click *OK* to access additional settings.
   c. Enable *Token-based authentication* and select to deliver the token code by *FortiToken*.
   d. Select the FortiToken added from the FortiToken Mobile dropdown menu.
   e. Set *Delivery method* to *Email* and fill in the *User Information* section.
   f. Go to *Authentication > User Management > User Groups* to create a group *sslvpngroup*.
   g. Add *sslvpnuser1* to the group by moving the user from *Available users* to *Selected users*.
5. Install the FortiToken mobile application on your Android or iOS smartphone.
   The FortiAuthenticator sends the FortiToken mobile activation to the user's email address.
6. Activate the FortiToken mobile through the FortiToken mobile application by entering the activation code or scanning the QR code.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network > Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Create a RADIUS user and user group:
   a. On the FortiGate, go to *User & Authentication > RADIUS Servers* to create a user to connect to the RADIUS server (FortiAuthenticator).
   b. For *Name*, use *FAC-RADIUS*.
   c. Enter the IP address of the FortiAuthenticator, and enter the *Secret* created above.
   d. Click *Test Connectivity* to ensure you can connect to the RADIUS server.
   e. Select *Test User Credentials* and enter the credentials for *sslvpnuser1*.
      The FortiGate can now connect to the FortiAuthenticator as the RADIUS client.
   f. Go to *User & Authentication > User Groups* and click *Create New* to map authenticated remote users to a user group on the FortiGate.
   g. For *Name*, use *SSLVPNGroup*.
   h. In *Remote Groups*, click *Add*.
   i. In the *Remote Server* dropdown list, select *FAC-RADIUS*.
   j. Leave the *Groups* field blank.
3. Configure SSL VPN web portal:

   a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
4. Configure SSL VPN settings:
   a. Go to *VPN > SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
5. Configure SSL VPN firewall policy:
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example: *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
```

```
   next
end
```

3. Create a RADIUS user and user group:

```
config user radius
    edit "FAC-RADIUS"
        set server "172.20.120.161"
        set secret <FAC client secret>
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "FAC-RADIUS"
    next
end
```

4. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
     next
end
```

5. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end
```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
```

```
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *sslvpnuser1* credentials.
   The FortiAuthenticator pushes a login request notification through the FortiToken Mobile application.
3. Check your mobile device and select *Approve*.
   When the authentication is approved, *sslvpnuser1* is logged into the SSL VPN portal.
4. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example: *172.20.120.123*.
   c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the *sslvpnuser1* credentials and click *FTM Push*.
   The FortiAuthenticator pushes a login request notification through the FortiToken Mobile application.
6. Check your mobile device and select *Approve*.
   When the authentication is approved, *sslvpnuser1* is logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type   Timeout   From          HTTP in/out   HTTPS in/out
 0       sslvpnuser1   1(1)        229       10.1.100.254  0/0           0/0
```

```
SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login on CLI:

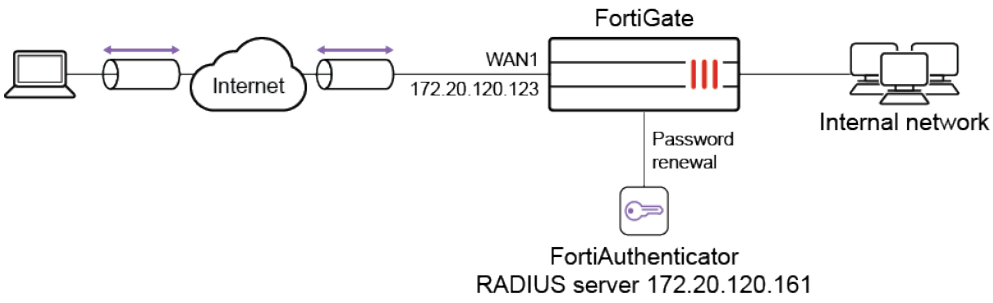
```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type    Timeout   From          HTTP in/out  HTTPS in/out
 0       sslvpnuser1   1(1)         291       10.1.100.254  0/0          0/0

SSL VPN sessions:
 Index   User          Source IP      Duration    I/O Bytes      Tunnel/Dest IP
 0       sslvpnuser1   10.1.100.254   9           22099/43228    10.212.134.200
```

SSL VPN with RADIUS password renew on FortiAuthenticator

This is a sample configuration of SSL VPN for RADIUS users with *Force Password Change on next logon*. In this example, the RADIUS server is a FortiAuthenticator. A user *test1* is configured on FortiAuthenticator with *Force password change on next logon*.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.

   d. Click *OK*.
   e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Create a RADIUS user.
   a. Go to *User & Authentication > RADIUS Servers* to create a user.
   b. Set *Authentication method* to *MS-CHAP-v2*.
   c. Enter the *IP/Name* and *Secret*.
   d. Click *Create*.
   Password renewal only works with the MS-CHAP-v2 authentication method.
   e. To enable the `password-renew` option, use these CLI commands.

```
config user radius
    edit "fac"
        set server "172.20.120.161"
        set secret <fac radius password>
        set auth-type ms_chap_v2
        set password-renewal enable
    next
end
```

3. Configure user group.
   a. Go to *User & Authentication > User Groups* to create a user group.
   b. For the *Name*, enter *fac-group*.
   c. In *Remote Groups*, click *Add* to add *Remote Server* you just created.
4. Configure SSL VPN web portal.
   a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
   This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
5. Configure SSL VPN settings.
   a. Go to *VPN > SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *fac-group* mapping portal *full-access*.
6. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name, in this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *fac-group*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network, in this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.

j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure the RADIUS server.

```
config user radius
    edit "fac"
        set server "172.18.58.107"
        set secret <fac radius password>
        set auth-type ms_chap_v2
        set password-renewal enable
    next
end
```

4. Configure user group.

```
config user group
    edit "fac-group"
        set member "fac"
    next
end
```

5. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
```

```
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "fac-group"
            set portal "full-access"
        next
    end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “fac-group”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *test1* credentials.
   Use a user which is configured on FortiAuthenticator with *Force password change on next logon*.
3. Click *Login*. You are prompted to enter a new password.
4. On the FortiGate, go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.

3. Add a new connection.
   - Set the connection name.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Log in using the *test1* credentials.
   You are prompted to enter a new password.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > System Events* and select the *VPN Events* card to view the details of the SSL VPN connection event log.
3. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out   HTTPS in/out
 0       test1   1(1)         229        10.1.100.254   0/0           0/0

SSL VPN sessions:

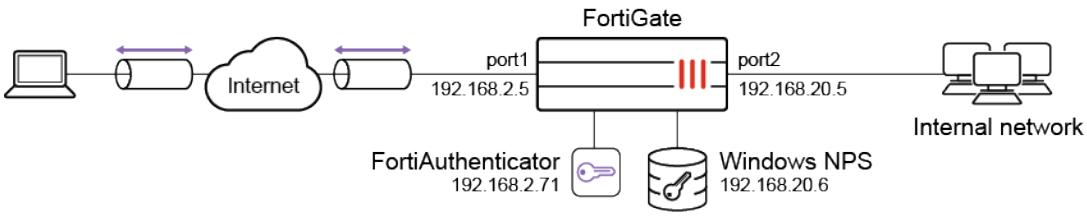
SSL VPN with RADIUS on Windows NPS

This is an example configuration of SSL VPN that uses Windows Network Policy Server (NPS) as a RADIUS authentication server.

The NPS must already be configured to accept the FortiGate as a RADIUS client and the choice of authentication method, such as MS-CHAPv2. A shared key must also have been created.

Example



The user is connecting from their PC to the FortiGate's port1 interface. RADIUS authentication occurs between the FortiGate and the Windows NPS, and the SSL-VPN connection is established once the authentication is successful.

Configure SSL-VPN with RADIUS on Windows NPS in the GUI

To configure the internal and external interfaces:

1. Go to *Network* > *Interfaces*
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.
3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

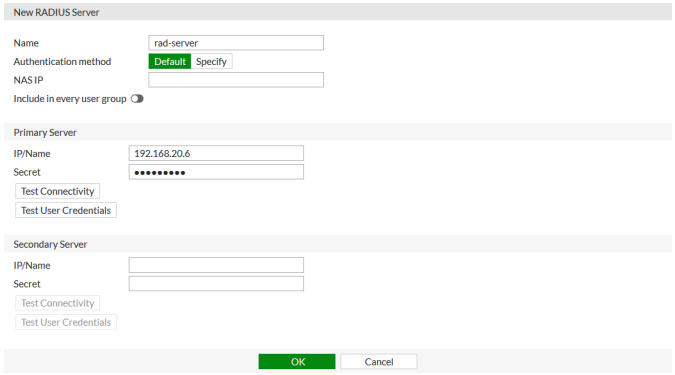
To create a firewall address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Set *Name* to *192.168.20.0*.
4. Leave *Type* as *Subnet*
5. Set *IP/Netmask* to *192.168.20.0/24*.
6. Click *OK*.

To add the RADIUS server:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Set *Name* to *rad-server*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.

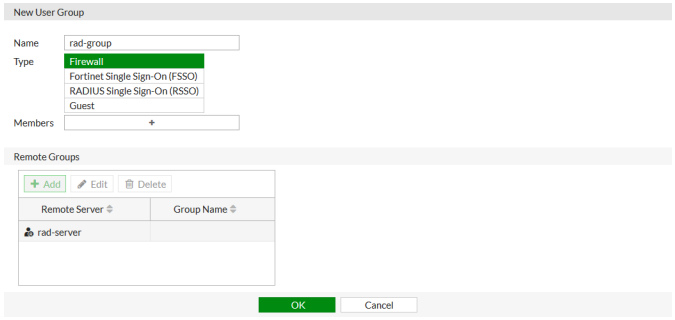
6. Optionally, click *Test User Credentials* to test user credentials. Testing from the GUI is limited to PAP.



7. Click *OK*.

To configure a user group:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Set *Name* to *rad-group*.
3. Under *Remote Groups*, click *Add* and add the *rad-server*.



4. Click *OK*.

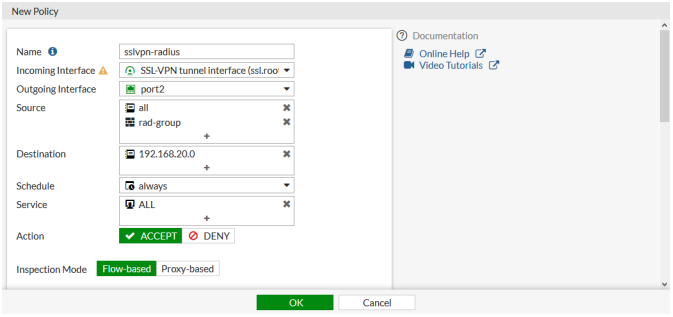
To configure SSL VPN settings:

1. Go to *VPN* > *SSL-VPN Settings*.
2. Select the *Listen on Interface(s)*, in this example, *port1*.
3. Set *Listen on Port* to *10443*.
4. If you have a server certificate, set *Server Certificate* to the authentication certificate.
5. Under *Authentication/Portal Mapping*:
   a. Edit *All Other Users/Groups* and set *Portal* to *web-access*.
   b. Click *Create New* and create a mapping for the *rad-group* user group with *Portal* set to *full-access*.

   c. Click *OK*.
6. Click *Apply*.

To configure an SSL VPN firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Set the policy name, in this example, *sslvpn-radius*.
3. Set *Incoming Interface* to *SSL-VPN tunnel interface(ssl.root)*.
4. Set *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port2*.
5. Set the *Source* > *Address* to *all* and *Source* > *User* to *rad-group*.
6. Set *Destination* > *Address* to the internal protected subnet *192.168.20.0*.
7. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
8. Enable *NAT*.



9. Configure the remaining options as required.
10. Click *OK*.

Configure SSL-VPN with RADIUS on Windows NPS in the CLI

To configure SSL VPN using the CLI:

1. Configure the internal and external interfaces:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.2.5 255.255.255.0
        set alias internal
    next
    edit "port2"
        set vdom "root"
        set ip 192.168.20.5 255.255.255.0
        set alias external
    next
end
```

2. Configure the firewall address:

```
config firewall address
    edit "192.168.20.0"
        set subnet 192.168.20.0 255.255.255.0
```

```
    next
end
```

3. Add the RADIUS server:

```
config user radius
    edit "rad-server"
        set server "192.168.20.6"
        set secret *********
    next
end
```

4. Create a user group and add the RADIUS server to it:.

```
config user group
    edit "rad-group"
        set member "rad-server"
    next
end
```

5. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "rad-group"
            set portal "full-access"
        next
    end
end
```

6. Configure an SSL VPN firewall policy to allow remote user to access the internal network.

```
config firewall policy
    edit 1
        set name "sslvpn-radius"
        set srcintf "ssl.root"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "192.168.20.0"
        set groups “rad-group”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Results

To connect with FortiClient in tunnel mode:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to *192.168.2.5*.
   c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the RADIUS user credentials.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report* > *System Events* and select the *VPN Events* card to view the details of the SSL VPN connection event log.
3. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out    HTTPS in/out
 0       radkeith        rad-group        2(1)            295     192.168.2.202  0/0     0/0

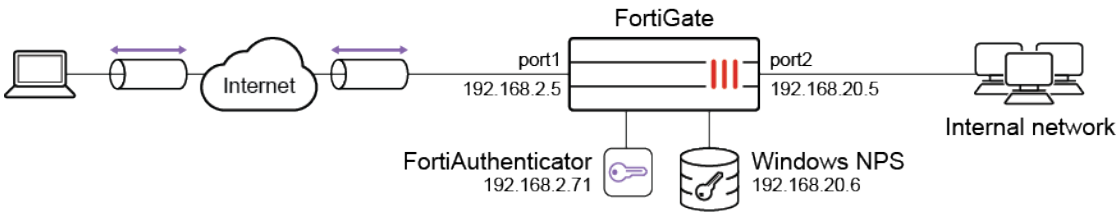
SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       radkeith        rad-group        192.168.2.202   18      28502/4966     10.212.134.200
```

SSL VPN with multiple RADIUS servers

When configuring two or more RADIUS servers, you can configure a Primary and Secondary server within the same RADIUS server configurations for backup purposes. You can also configure multiple RADIUS servers within the same User Group to service the access request at the same time.

A tertiary server can be configured in the CLI.

Sample topology



Sample configurations

- Configure a Primary and Secondary server for backup on page 2897
- Authenticating to two RADIUS servers concurrently on page 2901

Configure a Primary and Secondary server for backup

When you define a Primary and Secondary RADIUS server, the access request will always be sent to the Primary server first. If the request is denied with an Access-Reject, then the user authentication fails. However, if there is no response from the Primary server after another attempt, the access request will be sent to the Secondary server.

In this example, you will use a Windows NPS server as the Primary server and a FortiAuthenticator as the Secondary server. It is assumed that users are synchronized between the two servers.

To configure the internal and external interfaces:

1. Go to *Network* > *Interfaces*.
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.
3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Set *Name* to *192.168.20.0*.
4. Leave *Type* as *Subnet*
5. Set IP/*Netmask* to *192.168.20.0/24*.
6. Click *OK*.

To add the RADIUS servers:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Set *Name* to *PrimarySecondary*.

3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Under *Secondary Server*, set *IP/Name* to *192.168.2.71* and *Secret* to the shared secret configured on the RADIUS server.
7. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
8. *Click OK*.

To configure the user group:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. In the *Name* field, enter *PrimarySecondaryGroup*.
3. In the *Remote Groups* area, click *Add*, and from the *Remote Server* dropdown, select *PrimarySecondary*.
4. Click *OK*, and then click *OK* again.

To configure the SSL VPN settings:

1. Go to *VPN > SSL-VPN Settings*.
2. From the *Listen on Interface(s)* dropdown select *port1*.
3. In the *Listen on Port* field enter *10443*.
4. Optionally, from the *Server Certificate* dropdown, select the authentication certificate if you have one for this SSL VPN portal.
5. Under *Authentication/Portal Mapping*, set the default portal web-access.
   a. Select *All Other Users/Groups* and click *Edit*.
   b. From the *Portal* dropdown, select *web-access*.
   c. Click *OK*.
6. Create a web portal for *PrimarySecondaryGroup*.
   a. Under *Authentication/Portal Mapping*, click *Create New*.
   b. Click *Users/Groups* and select *PrimarySecondaryGroup*.
   c. From the *Portal* dropdown, select *full-access*.
   d. Click *OK*.

To configure SSL VPN firewall policy:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New* to create a new policy, or double-click an existing policy to edit it and configure the following settings:

Name	Enter a name for the policy.
Incoming Interface	*SSL-VPN tunnel interface (ssl.root)*

Outgoing interface	Set to the local network interface so that the remote user can access the internal network. For this example, select *port3*.
Source	In the *Address* tab, select *SSLVPN_TUNNEL_ADDR1* In the *User* tab, select *PrimarySecondaryGroup*
Destination	Select the internal protected subnet *192.168.20.0*.
Schedule	*always*
Service	*All*
Action	*Accept*
NAT	*Enable*

3. Configure any remaining firewall and security options as required.
4. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the internal interface and firewall address:
```
config system interface
   edit "port3"
      set vdom "root"
      set ip 192.168.20.5 255.255.255.0
      set alias "internal"
   next
end
config firewall address
   edit "192.168.20.0"
      set uuid cc41eec2-9645-51ea-d481-5c5317f865d0
      set subnet 192.168.20.0 255.255.255.0
   next
end
```
2. Configure the RADIUS server:
```
config user radius
   edit "PrimarySecondary"
      set server "192.168.20.6"
      set secret <secret>
      set secondary-server "192.168.2.71"
      set secondary-secret <secret>
   next
end
```
3. Add the RADIUS user to the user group:
```
config user group
   edit "PrimarySecondaryGroup"
      set member "PrimarySecondary "
   next
end
```
4. Configure SSL VPN settings:
```
config vpn ssl settings
   set servercert "server_certificate"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
```

```
      set source-interface "port1"
      set source-address "all"
      set default-portal "web-access"
      config authentication-rule
         edit 1
            set groups "PrimarySecondaryGroup "
            set portal "full-access"
         next
      end
   end
```

5. Configure one SSL VPN firewall policy to allow remote users to access the internal network:

```
config firewall policy
   edit 1
      set name "sslvpn-radius"
      set srcintf "ssl.root"
      set dstintf "port3"
      set srcaddr "all"
      set dstaddr "192.168.20.0"
      set groups “PrimarySecondaryGroup”
      set action accept
      set schedule "always"
      set service "ALL"
      set nat enable
   next
end
```

To verify the connection:

User *radkeith* is a member of both the NPS server and the FAC server.

When the Primary server is up, it will connect to the SSL VPN tunnel using FortiClient.

```
# diagnose sniffer packet any 'port 1812' 4 0 l
interfaces=[any]
filters=[port 1812]
2020-05-15 16:26:50.838453 port3 out 192.168.20.5.2374 -> 192.168.20.6.1812: udp 118
2020-05-15 16:26:50.883166 port3 in 192.168.20.6.1812 -> 192.168.20.5.2374: udp 20
2020-05-15 16:26:50.883374 port3 out 192.168.20.5.2374 -> 192.168.20.6.1812: udp 182
2020-05-15 16:26:50.884683 port3 in 192.168.20.6.1812 -> 192.168.20.5.2374: udp 228
```

The access request is sent to the Primary NPS server 192.168.20.6, and the connection is successful.

```
# get vpn ssl monitor
SSL VPN Login Users:
```

```
Index   User            Group                   Auth Type      Timeout         From     HTTP
in/out    HTTPS in/out
```

```
0       radkeith       PrimarySecondaryGroup   2(1)           285     192.168.2.202          0/0
   0/0
```

```
SSL VPN sessions:
```

```
Index   User       Group                   Source IP      Duration        I/O Bytes
Tunnel/Dest IP
```

```
0       radkeith   PrimarySecondaryGroup   192.168.2.202   62              132477/4966
10.212.134.200
```

When the Primary server is down, and the Secondary server is up, the connection is made to the SSLVPN tunnel again:

```
# diagnose sniffer packet any 'port 1812' 4 0 l
interfaces=[any]
filters=[port 1812]
2020-05-15 16:31:23.016875 port3 out 192.168.20.5.7989 -> 192.168.20.6.1812: udp 118
2020-05-15 16:31:28.019470 port3 out 192.168.20.5.7989 -> 192.168.20.6.1812: udp 118
2020-05-15 16:31:30.011874 port1 out 192.168.2.5.23848 -> 192.168.2.71.1812: udp 118
2020-05-15 16:31:30.087564 port1 in 192.168.2.71.1812 -> 192.168.2.5.23848: udp 20
```

Access request is sent to the Primary NPS server 192.168.20.6, but there was no response. RADIUS authentication falls through to the Secondary FortiAuthenticator 192.168.2.71, and the authentication was accepted. The VPN connection is established.

```
# get vpn ssl monitor
SSL VPN Login Users:
```

```

```

Authenticating to two RADIUS servers concurrently

There are times where users are located on separate RADIUS servers. This may be the case when migrating from an old server to a new one for example. In this scenario, a Windows NPS server and a FortiAuthenticator are configured in the same User Group. The access-request is sent to both servers concurrently. If FortiGate receives an access-accept from either server, authentication is successful.

To configure the internal and external interfaces:

1. Go to *Network* > *Interfaces*.
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.
3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects > Addresses* and select *Address*.
2. Click *Create new*.
3. Set *Name* to *192.168.20.0*.
4. Leave *Type* as *Subnet*
5. Set IP/*Netmask* to *192.168.20.0/24*.
6. Click *OK*.

To configure the first RADIUS server:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Set *Name* to *win2k16*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. *Click OK*.

To configure the second RADIUS server:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Set *Name* to *fac*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.2.71* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. *Click OK*.

To configure the user group:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. In the *Name* field, enter *dualPrimaryGroup.*.
3. In the *Remote Groups* area, click *Add*, and from the *Remote Server* dropdown, select *fac*.
4. Click *Add* again. From the *Remote Server* dropdown select *win2k16* and click *OK*.
5. Click *OK*, and then click *OK* again.

To configure the SSL VPN settings:

1. Go to *VPN > SSL-VPN Settings*.
2. From the *Listen on Interface(s)* dropdown select *port1*.
3. In the *Listen on Port* field enter *10443*.

4. Optionally, from the *Server Certificate* dropdown, select the authentication certificate if you have one for this SSL VPN portal.
5. Under *Authentication/Portal Mapping*, set the default portal web-access.
   a. Select *All Other Users/Groups* and click Edit.
   b. From the *Portal* dropdown, select *web-access*.
   c. Click *OK*.
6. Create a web portal for *PrimarySecondaryGroup*.
   a. Under *Authentication/Portal Mapping*, click *Create New*.
   b. Click *Users/Groups* and select *dualPrimaryGroup*.
   c. From the *Portal* dropdown, select *full-access*.
   d. Click *OK*.

To configure SSL VPN firewall policy:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New* to create a new policy, or double-click an existing policy to edit it.

Name	Enter a name for the policy.
Incoming Interface	*SSL-VPN tunnel interface (ssl.root)*
Outgoing interface	Set to the local network interface so that the remote user can access the internal network. For this example, select *port3*.
Source	In the *Address* tab, select *SSLVPN_TUNNEL_ADDR1* In the *User* tab, select *dualPrimaryGroup*
Destination	Select the internal protected subnet *192.168.20.0*.
Schedule	*always*
Service	*All*
Action	*Accept*
NAT	*Enable*

3. Configure any remaining firewall and security options as required.
4. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the internal interface and firewall address:

```
config system interface
   edit "port3"
      set vdom "root"
      set ip 192.168.20.5 255.255.255.0
      set alias "internal"
   next
end
config firewall address
   edit "192.168.20.0"
```

```
      set uuid cc41eec2-9645-51ea-d481-5c5317f865d0
      set subnet 192.168.20.0 255.255.255.0
   next
end
```

2. Configure the RADIUS server:

```
config user radius
   edit "win2k16"
      set server "192.168.20.6"
      set secret <secret>
   next
   edit "fac"
      set server "192.168.2.71"
      set secret <secret>
   next
end
```

3. Add the RADIUS user to the user group:

```
config user group
   edit "dualPrimaryGroup"
      set member "win2k16" “fac”
   next
end
```

4. Configure SSL VPN settings:

```
config vpn ssl settings
   set servercert "server_certificate"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
   set source-interface "port1"
   set source-address "all"
   set default-portal "web-access"
   config authentication-rule
      edit 1
         set groups "dualPrimaryGroup"
         set portal "full-access"
      next
   end
end
```

5. Configure one SSL VPN firewall policy to allow remote users to access the internal network:

```
config firewall policy
   edit 1
      set name "sslvpn-radius"
      set srcintf "ssl.root"
      set dstintf "port3"
      set srcaddr "all"
      set dstaddr "192.168.20.0"
      set groups “dualPrimaryGroup”
      set action accept
      set schedule "always"
      set service "ALL"
      set nat enable
   next
end
```

To verify the connection:

User *fackeith* is a member of the FortiAuthenticator server only.

User *radkeith* is a member of both the NPS server and the FortiAuthenticator server, but has different passwords on each server.

Case 1: Connect to the SSLVPN tunnel using FortiClient with user FacAdmin:

```
# diagnose sniffer packet any 'port 1812' 4 0 l
interfaces=[any]
filters=[port 1812]
2020-05-15 17:21:31.217985 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 118
2020-05-15 17:21:31.218091 port1 out 192.168.2.5.11490 -> 192.168.2.71.1812: udp 118
2020-05-15 17:21:31.219314 port3 in 192.168.20.6.1812 -> 192.168.20.5.11490: udp 20 <-- access-
      reject
2020-05-15 17:21:31.219519 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 182
2020-05-15 17:21:31.220219 port3 in 192.168.20.6.1812 -> 192.168.20.5.11490: udp 42
2020-05-15 17:21:31.220325 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 119
2020-05-15 17:21:31.220801 port3 in 192.168.20.6.1812 -> 192.168.20.5.11490: udp 20
2020-05-15 17:21:31.236009 port1 in 192.168.2.71.1812 -> 192.168.2.5.11490: udp 20 <--access-
      accept
```

Access is denied by the NPS server because the user does not exist. However, access is accepted by FortiAuthenticator. The end result is the authentication is successful.

```
# get vpn ssl monitor
SSL VPN Login Users:
```

```
Index   User       Group             Auth Type      Timeout         From       HTTP in/out
HTTPS in/out
```

```
0       fackeith  dualPrimaryGroup   2(1)            292        192.168.2.202      0/0
0/0
```

```
SSL VPN sessions:
```

```
Index   User       Group                 Source IP      Duration        I/O Bytes
Tunnel/Dest IP
```

```
0       fackeith  dualPrimaryGroup        192.168.2.202   149             70236/4966
10.212.134.200
```

Case 2: Connect to the SSLVPN tunnel using FortiClient with user radkeith:

```
# diagnose sniffer packet any 'port 1812' 4 0 l
interfaces=[any]
filters=[port 1812]
2020-05-15 17:26:07.335791 port1 out 192.168.2.5.17988 -> 192.168.2.71.1812: udp 118
2020-05-15 17:26:07.335911 port3 out 192.168.20.5.17988 -> 192.168.20.6.1812: udp 118
2020-05-15 17:26:07.337659 port3 in 192.168.20.6.1812 -> 192.168.20.5.17988: udp 20 <--access-
      accept
2020-05-15 17:26:07.337914 port3 out 192.168.20.5.17988 -> 192.168.20.6.1812: udp 182
2020-05-15 17:26:07.339451 port3 in 192.168.20.6.1812 -> 192.168.20.5.17988: udp 228
2020-05-15 17:26:08.352597 port1 in 192.168.2.71.1812 -> 192.168.2.5.17988: udp 20 <--access-
      reject
```

There is a password mismatch for this user on the Secondary RADIUS server. However, even though the authentication was rejected by FortiAuthenticator, it was accepted by Windows NPS. Therefore, the end result is authentication successful.

```
# get vpn ssl monitor
```

```
SSL VPN Login Users:

Index   User       Group            Auth Type      Timeout         From        HTTP in/out
HTTPS in/out

0       radkeith   dualPrimaryGroup   2(1)           290        192.168.2.202    0/0
0/0

SSL VPN sessions:

Index   User      Group              Source IP      Duration        I/O Bytes
Tunnel/Dest IP

0       radkeith dualPrimaryGroup   192.168.2.202   142             64875/4966
10.212.134.200
```

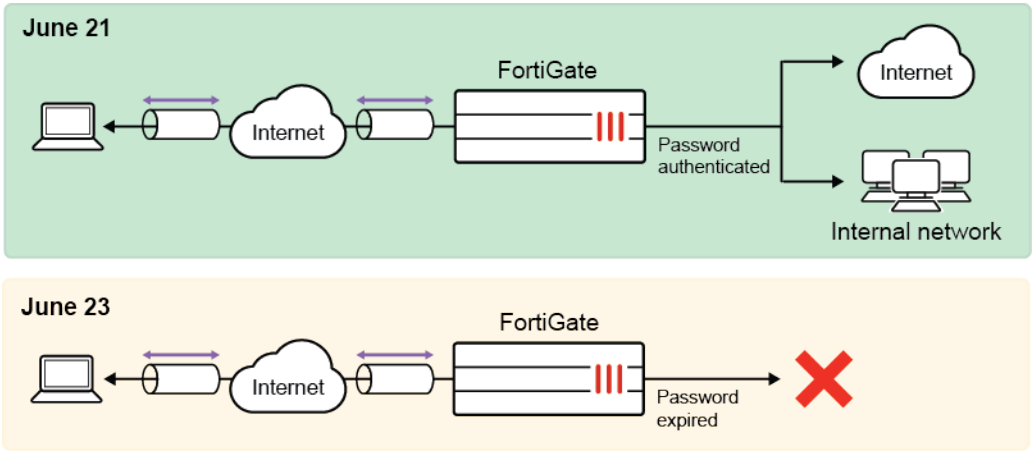
SSL VPN with local user password policy

This is a sample configuration of SSL VPN for users with passwords that expire after two days. Users are warned after one day about the password expiring. The password policy can be applied to any local user password. The password policy cannot be applied to a user group or a local remote user such as LDAP/RADIUS/TACACS+.

In FortiOS 6.2, users are warned after one day about the password expiring and have one day to renew it. If the password expires, the user cannot renew the password and must contact the administrator for assistance.

In FortiOS 6.0/5.6, users are warned after one day about the password expiring and have to renew it. If the password expires, the user can still renew the password.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
   a. Go to *User & Authentication* > *User Definition* to create a local user.
   b. Go to *User & Authentication* > *User Groups* to create a user group and add that local user to it.
3. Configure and assign the password policy using the CLI.
   a. Configure a password policy that includes an expiry date and warning time. The default start time for the password is the time the user was created.

```
config user password-policy
    edit "pwpolicy1"
        set expire-days 2
        set warn-days 1
    next
end
```

   b. Assign the password policy to the user you just created.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd-policy "pwpolicy1"
    next
end
```

4. Configure SSL VPN web portal.
   a. Go to *VPN* > *SSL-VPN Portals* to edit the *full-access* portal.
   This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
5. Configure SSL VPN settings.
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.

6. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "sslvpngroup"
        set member "vpnuser1"
```

```
    next
end
```

4. Configure and assign the password policy.
   a. Configure a password policy that includes an expiry date and warning time. The default start time for the password is the time the user was created.

```
config user password-policy
    edit "pwpolicy1"
        set expire-days 2
        set warn-days 1
    next
end
```

   b. Assign the password policy to the user you just created.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd-policy "pwpolicy1"
    next
end
```

5. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
     next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *sslvpnuser1* credentials.
   When the warning time is reached, the user is prompted to enter a new password.
   In FortiOS 6.2, when the password expires, the user cannot renew the password and must contact the administrator.
   In FortiOS 6.0/5.6, when the password expires, the user can still renew the password.
3. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
   - Set the connection name.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Log in using the *sslvpnuser1* credentials.
   When the warning time is reached, the user is prompted to enter a new password.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check that login failed due to password expired on GUI:

1. Go to *Log & Report > System Events* and select the *VPN Events* card to see the SSL VPN alert labeled `ssl-login-fail`.

2. Click *Details* to see the log details about the *Reason* `sslvpn_login_password_expired`.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User         Auth Type   Timeout    From           HTTP in/out   HTTPS in/out
 0       sslvpnuser1  1(1)        229        10.1.100.254   0/0           0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type   Timeout    From           HTTP in/out   HTTPS in/out
 0       sslvpnuser1   1(1)        291        10.1.100.254   0/0           0/0

SSL VPN sessions:
 Index   User          Source IP      Duration   I/O Bytes      Tunnel/Dest IP
 0       sslvpnuser1   10.1.100.254   9          22099/43228    10.212.134.200
```

To check the FortiOS 6.2 login password expired event log:

```
FG201E4Q17901354 # execute log  filter category event

FG201E4Q17901354 # execute log  filter field subtype vpn

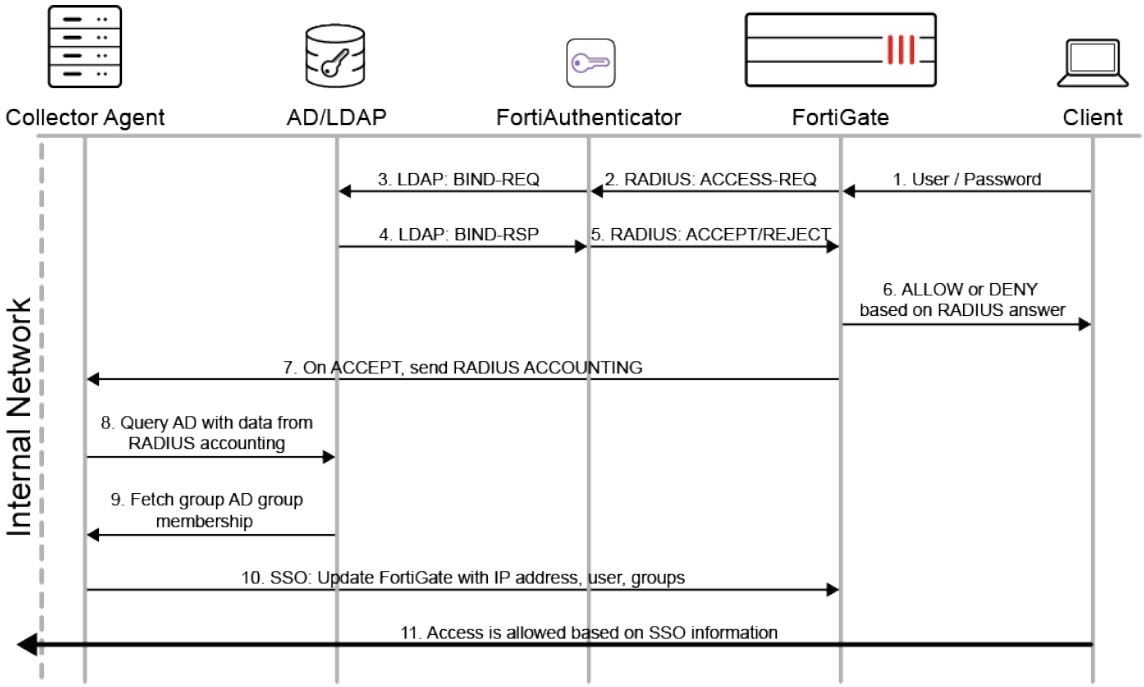
FG201E4Q17901354 # execute log  filter field action ssl-login-fail

FG201E4Q17901354 # execute log  display
1: date=2019-02-15 time=10:57:56 logid="0101039426" type="event" subtype="vpn" level="alert"
vd="root" eventtime=1550257076 logdesc="SSL VPN login fail" action="ssl-login-fail"
tunneltype="ssl-web" tunnelid=0 remip=10.1.100.254 user="u1" group="g1" dst_host="N/A"
reason="sslvpn_login_password_expired" msg="SSL user failed to logged in"
```

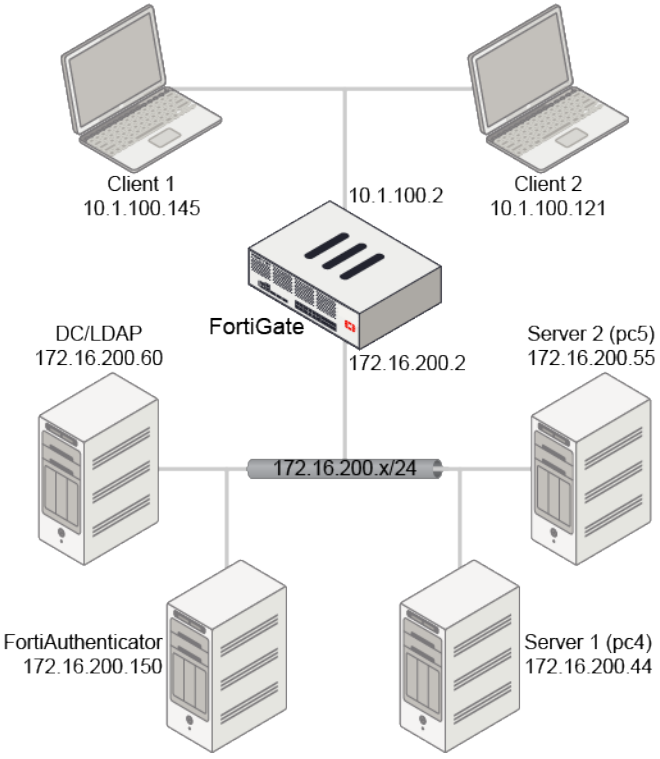
Dynamic address support for SSL VPN policies

Dynamic SSO user groups can be used in place of address objects when configuring SSL VPN policies. This allows dynamic IP addresses to be used in SSL VPN policies. A remote user group can be used for authentication while an FSSO group is separately used for authorization. Using a dummy policy for remote user authentication and a policy for FSSO group authorization, FSSO can be used with SSL VPN tunnels.

This image shows the authentication and authorization flow:



In this example, FortiAuthenticator is used as a RADIUS server. It uses a remote AD/LDAP server for authentication, then returns the authentication results to the FortiGate. This allows the client to have a dynamic IP address after successful authentication.

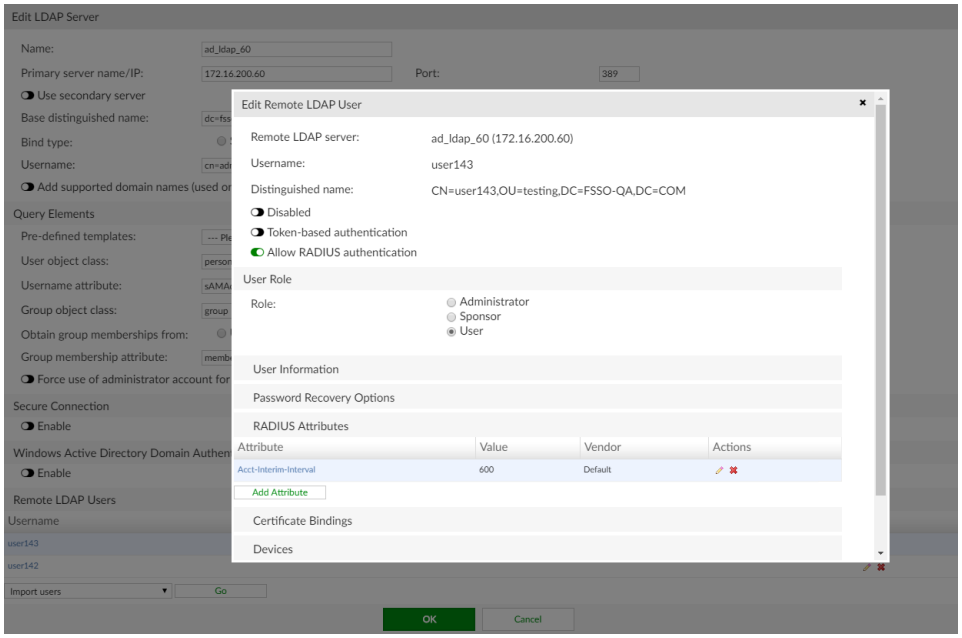


First, on the LDAP server, create two users each in their own group, *user142* in group *pc_group1*, and *user143* in group *pc_group2*.

Configure the FortiAuthenticator

To add a remote LDAP server and users on the FortiAuthenticator:

1. Go to *Authentication* > *Remote Auth. Servers* > *LDAP*.
2. Click *Create New*.
3. Set the following:
   - *Name*: *ad_ldap_60*
   - *Primary server name/IP*: *172.16.200.60*
   - *Base distinguished name*: *dc=fsso-qa,dc=com*
   - *Bind type*: Regular
   - *Username*: *cn=administrator,cn=User*
   - *Password*: <enter a password>
4. Click *OK*.
5. Edit the new LDAP server.
6. Import the remote LDAP users.
7. Edit each user to confirm that they have the RADIUS attribute *Acct-Interim-Interval*. This attribute is used by FortiGate to send interim update account messages to the RADIUS server.



To create a RADIUS client for FortiGate as a remote authentication server:

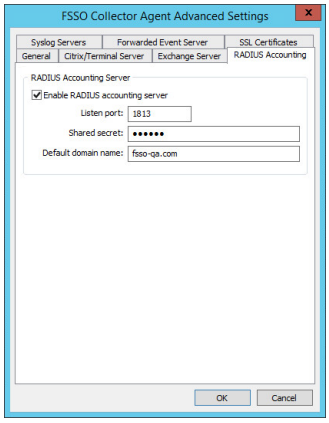
1. Go to *Authentication* > *RADIUS Service* > *Clients*.
2. Click *Create New*.
3. Set the following:
   - *Name*: *fsso_ldap*
   - *Client address*: *Range 172.16.200.1~172.16.200.10*
   - *Secret*: <enter a password>
4. In the *Realms* table, set the realm to the LDAP server that was just added: *ad_ldap_60*.

5. Click *OK*.
   FortiAuthenticator can now be used as a RADIUS server, and the authentication credentials all come from the DC/LDAP server.

Fortinet Single Sign-On Collector Agent

To configure the Fortinet Single Sign-On Collector Agent:

1. Select *Require authenticated connection from FortiGate* and enter a *Password*.
2. Click *Advanced Settings*.
3. Select the *RADIUS Accounting* tab.
4. Select *Enable RADIUS accounting server* and set the *Shared secret*.



5. Click *OK*, then click *Save&close*.
   The collector agent can now accept accounting requests from FortiGate, and retrieve the IP addresses and usernames of SSL VPN client from the FortiGate with accounting request messages.

Configure the FortiGate

To configure the FortiGate in the CLI:

1. Create a Fortinet Single Sign-On Agent fabric connector:

```
config user fsso
    edit "AD_CollectAgent"
        set server "172.16.200.60"
        set password 123456
    next
end
```

2. Add the RADIUS server:

```
config user radius
    edit "rad150"
        set server "172.16.200.150"
        set secret 123456
```

```
        set acct-interim-interval 600
        config accounting-server
            edit 1
                set status enable
                set server "172.16.200.60"
                set secret 123456
            next
        end
    next
end
```

3. Create a user group for the RADIUS server:

```
config user group
    edit "rad_group"
        set member "rad150"
    next
end
```

4. Create user groups for each of the FSSO groups:

```
config user group
    edit "fsso_group1"
        set group-type fsso-service
        set member "CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM"
    next
    edit "fsso_group2"
        set group-type fsso-service
        set member "CN=PC_GROUP2,OU=TESTING,DC=FSSO-QA,DC=COM"
    next
end
```

5. Create an SSL VPN portal and assign the RADIUS user group to it:

```
config vpn ssl web portal
    edit "testportal"
        set tunnel-mode enable
        set ipv6-tunnel-mode enable
        set web-mode enable
        ...
    next
end
config vpn ssl settings
    ...
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "rad_group"
            set portal "testportal"
        next
    end
end
```

6. Create firewall addresses:

```
config firewall address
    edit "none"
        set subnet 0.0.0.0 255.255.255.255
    next
    edit "pc4"
        set subnet 172.16.200.44 255.255.255.255
    next
    edit "pc5"
        set subnet 172.16.200.55 255.255.255.255
    next
end
```

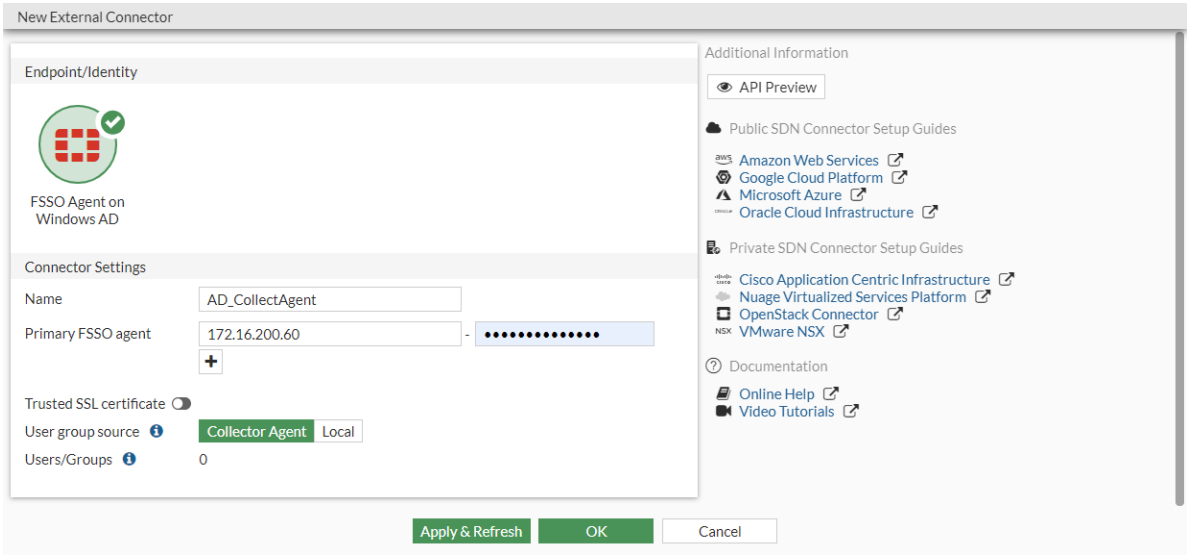
7. Create one dummy policy for authentication only, and two normal policies for authorization:

```
config firewall policy
    edit 1
        set name "sslvpn_authentication"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "none"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set groups "rad_group"
        set nat enable
    next
    edit 3
        set name "sslvpn_authorization1"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "pc4"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set groups "fsso_group1"
        set nat enable
    next
    edit 4
        set name "sslvpn_authorization2"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "pc5"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
```

```
        set groups "fsso_group2"
        set nat enable
    next
end
```

To create an FSSO agent fabric connector in the GUI:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.
3. Click *FSSO Agent on Windows AD*.
4. Enter the name and *Primary FSSO agent* information.

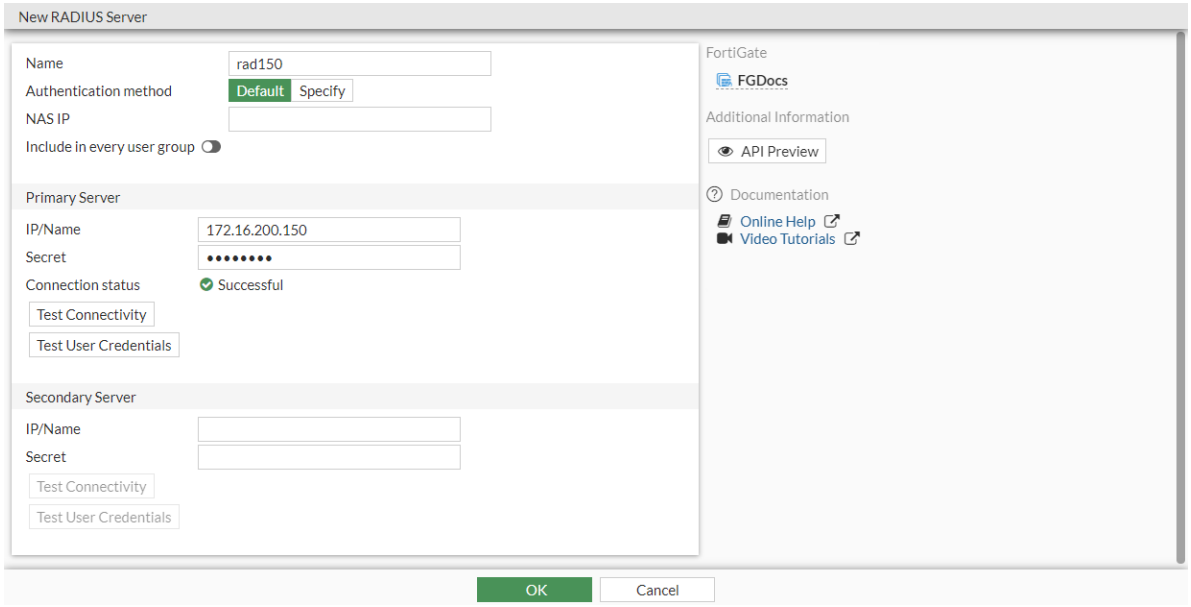


5. Click *Apply & Refresh*.
   The FSSO groups are retrieved from the collector agent.

To add the RADIUS server in the GUI:

1. Go to *User & Authentication* > *RADIUS Servers*.
2. Click *Create New*.
3. Enter a name for the server.
4. Enter the *IP/Name* and *Secret* for the primary server.

5. Click *Test Connectivity* to ensure that there is a successful connection.



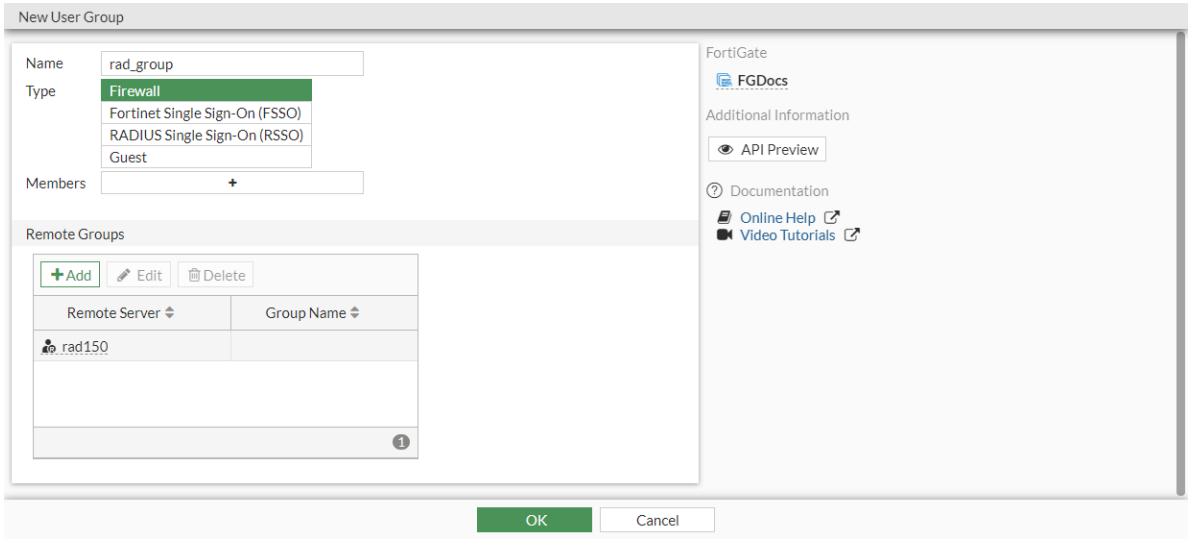
6. Click *OK*.
7. Configure an accounting server with the following CLI command:

```
config user radius
    edit rad150
        set acct-interim-interval 600
        config accounting-server
            edit 1
                set status enable
                set server 172.16.200.60
                set secret *********
            next
        end
    next
end
```

To create a user group for the RADIUS server in the GUI:

1. Go to *User & Authentication* > *User Groups*.
2. Click *Create New*.
3. Enter a name for the group and set the *Type* to *Firewall*.

4. Add the RADIUS server as a remote group.



5. Click *OK*.

To create user groups for each of the FSSO groups in the GUI:

1. Go to *User & Authentication* > *User Groups*.
2. Click *Create New*.
3. Enter a name for the group and set the *Type* to *Fortinet Single Sign-On (FSSO)*.
4. Add PC_GROUP1 as a member:
   `CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM`
5. Click *OK*.
6. Add a second user group with PC_GROUP2 as a member:
   `CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM`
7. Click *OK*.

To create an SSL VPN portal and assign the RADIUS user group to it in the GUI:

1. Go to *VPN* > *SSL VPN Portals*.
2. Click *Create New*.
3. Configure the portal, then click *OK*.
4. Go to *VPN* > *SSL VPN Settings*.
5. Configure the required settings.
6. Create an *Authentication/Portal Mapping* table entry:
   a. Click *Create New*.
   b. Set *User/Groups* to *rad_group*.
   c. Set *Portal* to *testportal*.
   d. Click *OK*.
7. Click *OK*.

To create policies for authentication and authorization in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Configure a dummy policy for authentication. Set the destination to *none* so that traffic is not allowed through the FortiGate, and add *rad_group* as a source.
3. Configure two authorization policies, with the FSSO groups as sources.

Confirmation

On *Client 1*, log in to FortiClient using *user142*. Traffic can go to *pc4* (172.16.200.44), but cannot go to *pc5* (172.16.200.55).

On *Client 2*, log in to FortiClient using *user143*. Traffic can go to *pc5* (172.16.200.55), but cannot go to *pc4* (172.16.200.44).

On the FortiGate, check the authenticated users list and the SSL VPN status:

```
# diagnose firewall auth list

10.212.134.200, USER142
        type: fsso, id: 0, duration: 173, idled: 173
        server: AD_CollectAgent

```

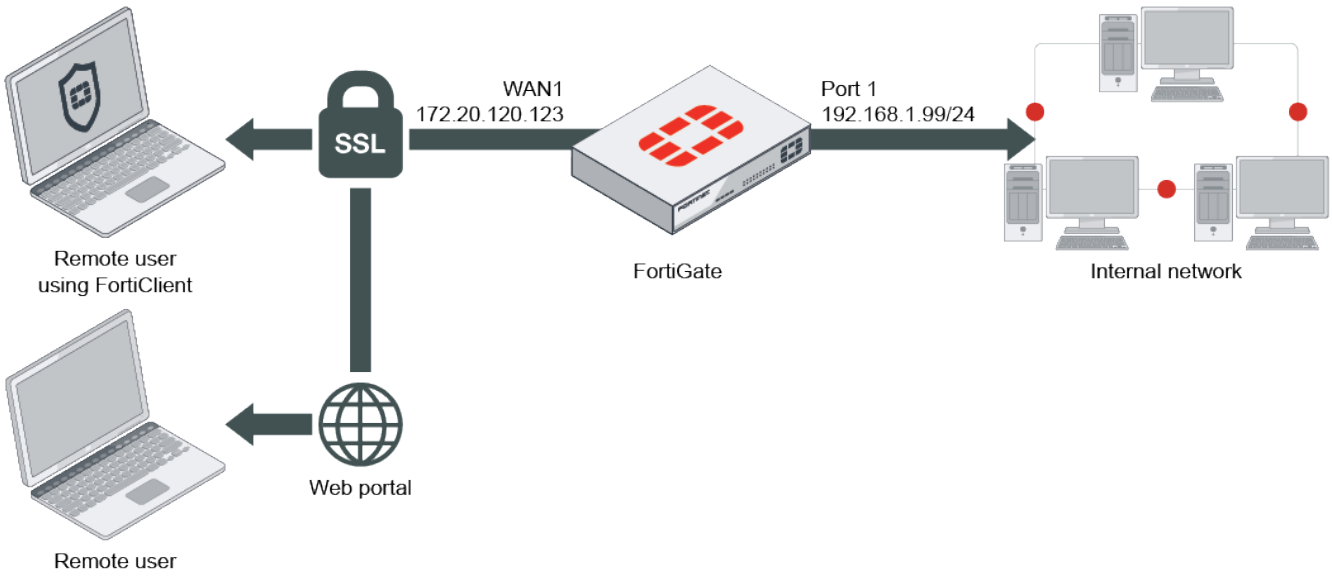
SSL VPN multi-realm

This sample shows how to create a multi-realm SSL VPN that provides different portals for different user groups.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network > Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects > Address* and create an address for internet *QA_subnet* with subnet *192.168.1.0/24* and *HR_subnet* with subnet *10.1.100.0/24*.
2. Configure user and user group.
   a. Go to *User & Authentication > User Definition* to create local users *qa-user1* and *hr-user1*.
   b. Go to *User & Authentication > User Groups* to create separate user groups for web-only and full-access portals:
      - *QA_group* with member *qa-user1*.
      - *HR_group* with the member *hr-user1*.
3. Configure SSL VPN web portal.
   a. Go to *VPN > SSL-VPN Portals* to create portal *qa-tunnel*.
   b. Enable *Tunnel Mode*.
   c. Create a portal *hr-web* with *Web Mode* enabled.
4. Configure SSL VPN realms.
   a. Go to *System > Feature Visibility* to enable *SSL-VPN Realms*.
   b. Go to *VPN > SSL-VPN Realms* to create realms for *qa* and *hr*.
   c. (Optional) To access each realm with FQDN instead of the default URLs *https://172.20.120.123:10443/hr* and *https://172.20.120.123:10443/qa*, you can configure a virtual-host for the realm in the CLI.

```
config vpn ssl web realm
   edit hr
      set virtual-host hr.mydomain.com
   next
   edit qa
      set virtual-host qa.mydomain.com
   next
end
```

   Where `mydomain.com` is the name of your domain. Ensure FQDN resolves to the FortiGate wan1 interface and that your certificate is a wildcard certificate.
5. Configure SSL VPN settings.
   a. Go to *VPN > SSL-VPN Settings*.
   b. For *Listen on Interface(s)*, select *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
   e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *web-access*.

f. Create new *Authentication/Portal Mapping* for group *QA_group* mapping portal *qa-tunnel*.
g. Specify the realm *qa*.
h. Add another entry for group *HR_group* mapping portal *hr-web*.
i. Specify the realm *hr*.

6. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Create a firewall policy for QA access.
   c. Fill in the firewall policy name. In this example, *QA sslvpn tunnel mode access*.
   d. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   e. Choose an *Outgoing Interface*. In this example, *port1*.
   f. Set the *Source* to *all* and group to *QA_group*.
   g. In this example, the *Destination* is the internal protected subnet *QA_subnet*.
   h. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   i. Click *OK*.
   j. Create a firewall policy for HR access.
   k. Fill in the firewall policy name. In this example, *HR sslvpn web mode access*.
   l. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   m. Choose an *Outgoing Interface*. In this example, *port1*.
   n. Set the *Source* to *all* and group to *HR_group*.
   o. In this example, the *Destination* is the internal protected subnet *HR_subnet*.
   p. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   q. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "QA_subnet"
        set subnet 192.168.1.0 255.255.255.0
    next
```

```
    edit "HR_subnet"
        set subnet 10.1.100.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "qa_user1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "QA_group"
        set member "qa_user1"
    next
end
```

```
config user local
    edit "hr_user1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "HR_group"
        set member "hr_user1"
    next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "qa-tunnel"
        set tunnel-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling enable
        set split-tunneling-routing-address "QA_subnet"
    next
end
```

```
config vpn ssl web portal
    edit "hr-web"
        set web-mode enable
    next
end
```

5. Configure SSL VPN realms.

```
config vpn ssl web realm
   edit hr
      set virtual-host hr.mydomain.com
   next
```

```
   edit qa
         set virtual-host qa.mydomain.com
   next
end
```

The `set virtual-host` setting is optional. For example:

```
config vpn ssl web realm
   edit hr
   next
   edit qa
   next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "QA_group"
            set portal "qa-tunnel"
            set realm qa
        next
        edit 2
            set groups "HR_group"
            set portal "hr-web"
            set realm hr
        next
    end
end
```

7. Configure two SSL VPN firewall policies to allow remote QA user to access internal QA network and HR user to access HR network.

```
config firewall policy
    edit 1
        set name "QA sslvnpn tunnel access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "QA_subnet"
        set groups “QA_group”
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "HR sslvpn web access"
        set srcintf "ssl.root"
```

```
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "HR_subnet"
        set groups “HR_group”
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To see the results for QA user:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection.
   - Set *VPN Type* to *SSL VPN*.
   - Set *Remote Gateway* to *https://172.20.120.123:10443/qa.*.
   - If a virtual-host is specified, use the FQDN defined for the realm (*qa.mydomain.com*).
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Use the credentials you've set up to connect to the SSL VPN tunnel.
   If the user's computer has antivirus software, a connection is established; otherwise FortiClient shows a compliance warning.
7. After connection, traffic to subnet *192.168.1.0* goes through the tunnel.
8. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the list of SSL users.
9. On the FortiGate, go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
10. On the FortiGate, go to *Log & Report > Forward Traffic* and view the details of the traffic.

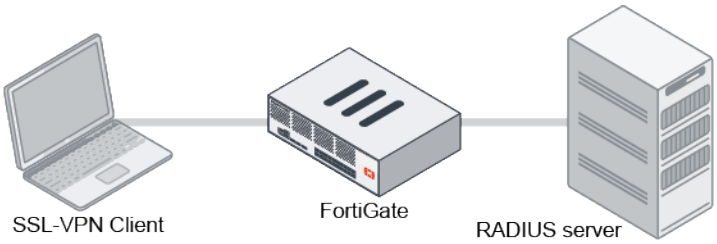
To see the results for HR user:

1. In a web browser, log into the portal *https://172.20.120.123:10443/hr* using the credentials you've set up.
2. Alternatively, if a virtual-host is specified, use the FQDN defined for the realm (*hr.mydomain.com*).
3. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the list of SSL users.
4. Go to *Log & Report > Forward Traffic* and view the details of the traffic.

NAS-IP support per SSL-VPN realm

For RADIUS authentication and authorization, the RADIUS client (the FortiGate) passes the username, password, and NAS-IP to the RADIUS server in its access request. The RADIUS server authenticates and authorizes based on this information. Each RADIUS server can be configured with multiple NAS-IPs for authenticating different groups and NAS clients.

On the FortiGate, configuring the NAS-IP in the realm settings overrides the RADIUS server setting, allowing multiple NAS-IPs to be mapped to the same RADIUS server.



In this example, the user wants to present one FortiGate VDOM with different NAS-IPs to a single RADIUS server based on specific rules.

To configure the SSL-VPN to use the NAS-IP in the realm settings:

1. Configure a RADIUS user and add it to a group:

```
config user radius
    edit "fac150"
        set server "172.16.200.150"
        set secret ********
        set nas-ip 172.16.200.2
        config accounting-server
            edit 1
                set status enable
                set server "172.16.200.150"
                set secret ********
            next
        end
    next
end
config user group
    edit "radgrp"
        set member "fac150"
    next
end
```

2. Configure a realm for the user with a different NAS-IP:

```
config vpn ssl web realm
    edit "realm1"
        set login-page '.......'
        set radius-server "fac150"
        set nas-ip 10.1.100.2
    next
end
```

3. Configure SSL-VPN with an authentication rule that includes the user group and the realm:

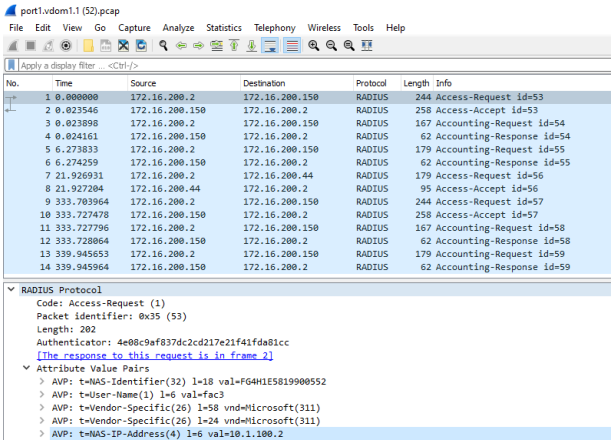
```
config vpn ssl settings
    ...
    config authentication-rule
        edit 1
            set groupd "radgrp"
```

```
            set portal "testportal1"
            set realm "realm1"
        next
    end
end
```

4. Create a firewall policy:

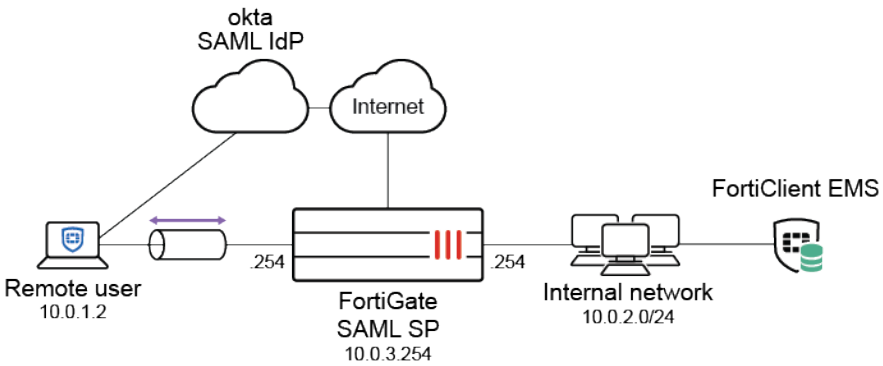
```
config firewall policy
    edit 1
        set name "sslvpn1"
        ...
        set srcintf "ssl.vdom1"
        set groups "radgrp"
    next
end
```

Because the RADIUS server and NAS-IP are specified in realm1, its NAS-IP is used for authentication.



SSL VPN with Okta as SAML IdP

In this configuration, the FortiGate acts as a SAML service provider (SP) requesting authentication from Okta, which acts as a SAML identity provider (IdP). The following shows the topology in this configuration:



The authentication process is as follows in this deployment:

1. The user initiates an SSL VPN request to the FortiGate.
2. The FortiGate sends the browser POST redirect to FortiClient.
3. FortiClient redirects the SAML authentication request to Okta.
4. The user authenticates with Okta using their credentials.
5. Okta sends a SAML assertion that contains the user and group authentication in a POST redirect to the SSL VPN login page.
6. FortiClient sends the redirected Okta request that contains the SAML assertion to the FortiGate.
7. The FortiGate consumes the assertion and provides the user with access to resources based on the defined firewall security policy.

The example assumes that you already have an Okta account. This example uses users locally defined within the Okta directory and does not include LDAP mapping. The instructions describe the steps that you take if using the free Okta developer edition.

The following certificates are used:

Certificate	Description

SP certificate	This is the certificate used to sign the SAML messages originating from the SP to the IdP. This is configured on the FortiGate by the following CLI setting:
	
	`config user saml`
	`edit <profile>`
	`set cert <local certificate>`
	`next`
	`end`
	
	The certificate will be used by the SAML IdP (Okta) to verify the SP connection, so the certificate must be uploaded into Okta.

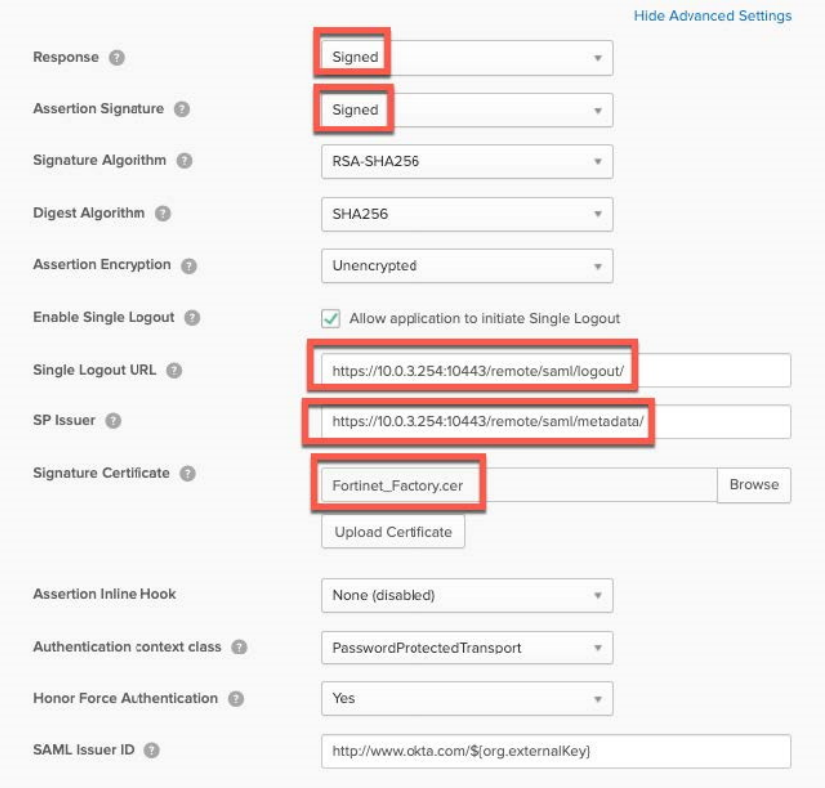
IdP certificate	This is the certificate used to sign the SAML response originating from the IdP. This must be trusted by the SP in order to verify the identity of the messages from the IdP.
	In this example, the certificate is provided by Okta. To upload this remote certificate into the FortiGate, follow the instructions in Remote certificate on page 3610.
	To use the certificate in your SAML SSO settings:
	
	`config user saml`
	`edit <profile>`
	`set idp-cert <Okta certificate>`
	`next`
	`end`

SSl VPN server certificate	This certificate identifies the SSL VPN portal when a SSL VPN client connects to the FortiGate. This is configured in the CLI as follows: `config vpn ssl settings`

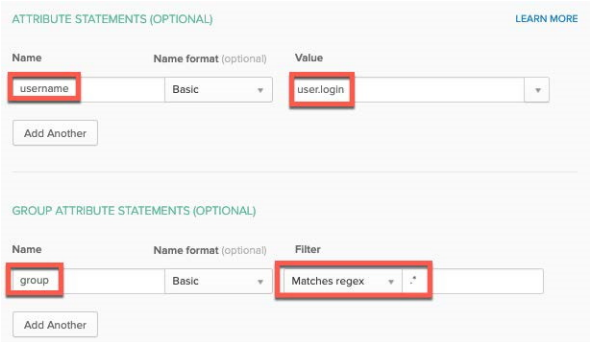
Certificate	Description
	``` set servercert <server certificate> end ``` When this is not specified, then the Fortinet factory self-signed certificate is used.

To configure Okta for SSL VPN with FortiOS:

1. Log in to the Okta portal as the registered admin user.
2. Add the FortiGate application:
   a. Go to *Applications*.
   b. Click *Applications*, then click *Create App Integration*.
   c. Click *SAML 2.0*, then *Next*.
   d. Configure SAML settings:
      i. Proceed through the application creation wizard. In the *Single sign on URL* field, enter https://<FortiGate IP address>:<port>/remote/saml/login/. In this example, it is https://10.0.3.254:10443/remote/saml/login/.
      ii. Enable *Use this for Recipient URL and Destination URL*.
      iii. In the *Audience URI (SP Entity ID)* field, enter the https://<FortiGate IP address>:<port>/remote/saml/metadata/. In this example, it is https://10.0.3.254:10443/remote/saml/metadata/.
      iv. Click *Download Okta Certificate* to download the Okta certificate to your machine. You will provide this certificate to the FortiGate.
      v. Click *Show Advanced Settings*. From the *Response* dropdown list, select *Signed*.
      vi. From the *Assertion Signature* dropdown list, select *Signed*.
      vii. In the *Single Logout URL* field, enter https://<FortiGate IP address>:<port>/remote/saml/logout/. In this example, it is https://10.0.3.254:10443/remote/saml/logout/.
      viii. In the *SP Issuer* field, enter https://<FortiGate IP address>:<port>/remote/saml/metadata/. In this example, it is https://10.0.3.254:10443/remote/saml/metadata/.
      ix. In the *Signature Certificate* field, first download the Fortinet_Factory certificate by logging into FortiOS, going to *System > Local Certificate*, then browsing to and uploading the FortiGate certificate. Okta uses this to authenticate the SAML SP.



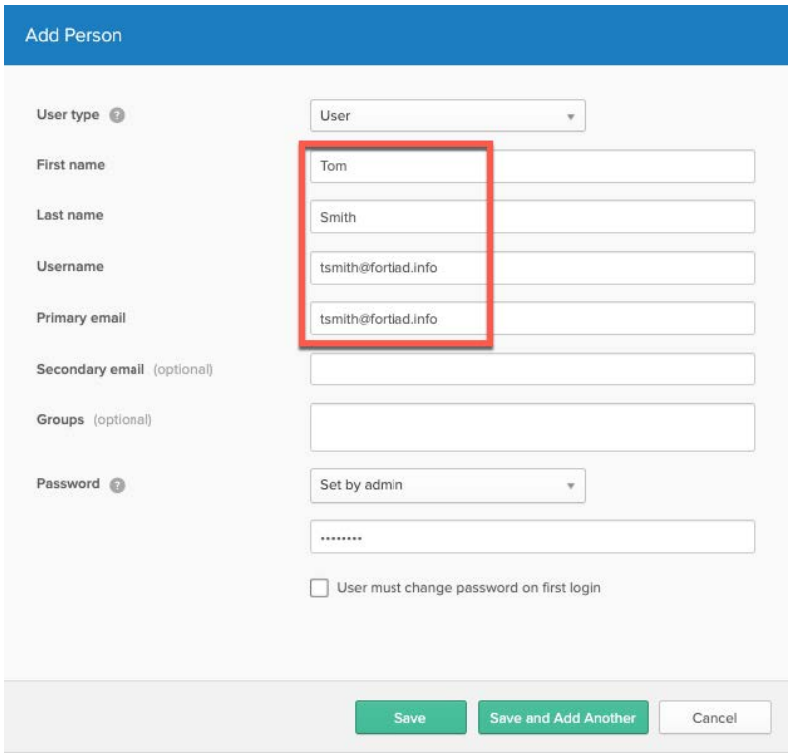
e. Under *ATTRIBUTE STATEMENTS* and *GROUP ATTRIBUTE STATEMENTS*, define attribute mappings for Okta to use in SAML assertion. In this example, the following is entered as a attribute statement and a group attribute statement, respectively:
   - username, with value user.login
   - group, with *Matches regex* filter



f. On the *Feedback* step, select *I'm an Okta customer adding an internal app*.
g. Select *This is an internal app that we have created*.
h. Click *Finish*.

3. Go to *Directory* > *People*.
4. Click *Add Person*.

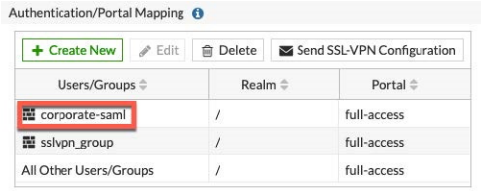
5. Enter the person's details as desired. Click *Save*.



6. Add a group:
   a. Go to *Directory* > *Groups*.
   b. Click *Add Group*.
   c. Enter the desired name, then click *Add Group*. In this example, the name is corporate-saml.
   d. Select the newly added group, then click *Assign People*.
   e. Add the person that you created as a member of the new group. Click *Save*.
7. Assign the group to the FortiGate application:
   a. Go to *Applications* > *FortiGate application* > *Assignments*.
   b. From the *Assign* dropdown list, select *Assign to Groups*.
   c. Assign the group that you created to the FortiGate application.
8. To view the SAML setup instructions, do the following:
   a. Click the newly created application's name.
   b. Click *Sign On*.
   c. Go to *View SAML Setup Instructions*. Note down the *Identity Provider Single Sign-On URL*, *Identity Provider Single Logout URL*, and *Identity Provider Issuer* values.
9. Download the Okta certificate and upload it to FortiOS:
   a. From *View SAML Setup Instructions*, download the certificate.
   b. In FortiOS, go to *System* > *Certificates*.
   c. From the *Create/Import* dropdown list, select *Remote Certificate*.
   d. Click *Upload* and upload the downloaded Okta certificate.

To configure the FortiGate:

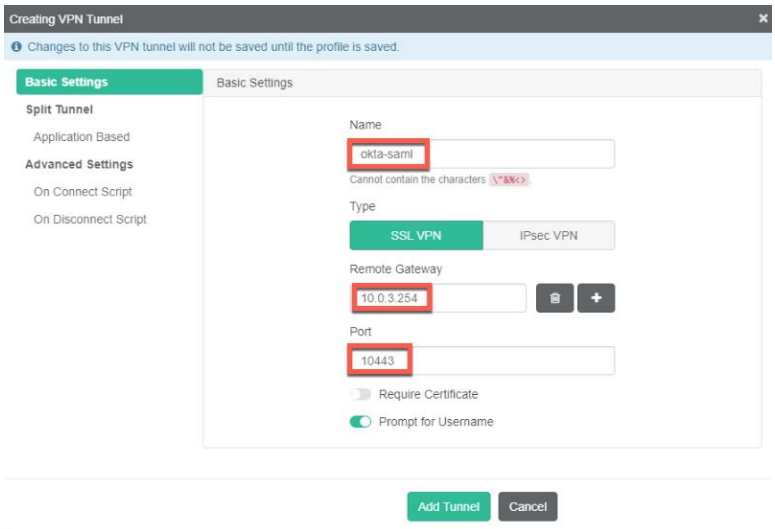
1. Configure the FortiGate SP to be a SAML user:
```
config user saml
   edit "okta-idp"
      set cert "Fortinet_Factory"
      set entity-id "https://10.0.3.254:10443/remote/saml/metadata/"
      set single-sign-on-url "https://10.0.3.254:10443/remote/saml/login"
      set single-logout-url "https://10.0.3.254:10443/remote/saml/logout"
      set idp-entity-id "http://www.okta.com/exk103foxaa8gk5qy4x7"
      set idp-single-sign-on-url "https://fortinet01.okta.com/app/fortinetorg878484_fortigate_
           1/exk103foxaa8gk5qy4x7/sso/saml"
      set idp-single-logout-url "https://fortinet01.okta.com/app/fortinetorg878484_fortigate_
           1/exk103foxaa8gk5qy4x7/slo/saml"
      set idp-cert "Okta-IDP_Certificate"
      set user-name "username"
      set group-name "group"
   next
end
```
2. Configure user group assertion on Okta as part of the SAML assertion attributes. It is important that the group attribute value received is locally matched with the `group-name` value:
```
config user group
   edit "corporate-saml"
      set member "okta-idp"
      config match
         edit 1
            set server-name "okta-idp"
            set group-name "corporate-saml"
         next
      end
   next
end
```
3. Go to *VPN* > *SSL-VPN Settings*. Configure VPN settings as desired. When testing the VPN solution, starting with a web-based configuration, then moving to a tunnel-based configuration is recommended. Web-based testing can help in troubleshooting.



4. Configure a local or RADIUS user as a backup. This setting also provides a login web user with a choice of local or SSO login.
5. Go to *Policy and Objects* > *Firewall Policies*. Configure a policy as desired.
6. Increase the global authentication timeout period to allow users to fill in their credentials in time. The default timeout is five seconds:
```
config system global
   set remoteauthtimeout 60
end
```

To configure EMS:

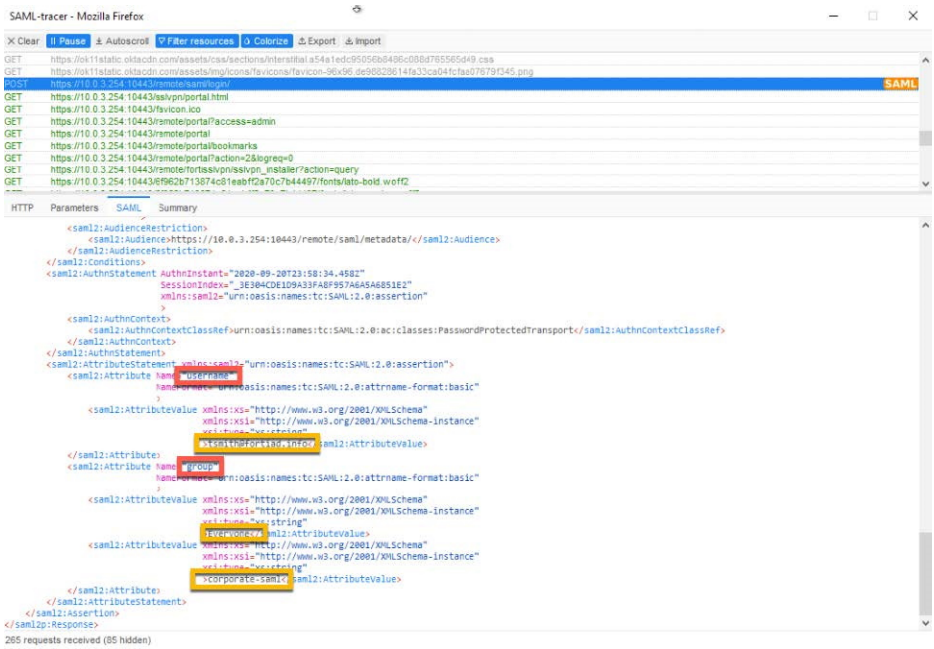
1. In EMS, go to *Endpoint Profiles* > *Manage Profiles*. Edit a VPN profile.
2. Under *VPN Tunnels*, click *Add Tunnel*.
3. In the *Remote Gateway* field, enter the FortiGate IP address. In this example, it is 10.0.3.254.
4. In the *Port* field, enter the port number. In this example, it is 10443.



5. In *Advanced Settings*, enable *Enable SAML Login*.
6. Click *Add Tunnel*.
7. Save the profile.
8. After the policy synchronizes to the endpoint, the *SAML Login* button is visible on the Remote Access tab in FortiClient.

To test the configuration:

1. You will first test web-based SSL VPN authentication using Firefox with the SAML tracer plugin enabled. Install the SAML-tracer plugin to Firefox.
2. In Firefox, go to the FortiOS SSL VPN login page. In this example, this is https://10.0.3.254:10443.
3. Open the SAML tracer.
4. The browser redirects to the Okta SAML login page. Enter the Okta credentials, then click *Sign in*.
5. Upon successful authentication, the browser redirects to the authenticated SSL VPN page. If authentication does not succeed, review the SAML tracer to confirm the SAML assertion attributes that are passed during the authentication session. Select the POST message with the SAML information. On the SAML tab, confirm the username and group attributes.

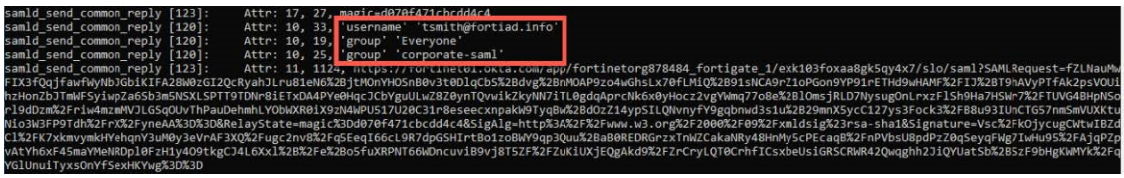


6. To test tunnel mode, go to the *Remote Access* tab in FortiClient. Click the *SAML Login* button.
7. A FortiAuthenticator web login page opens within FortiClient. Enter the Okta credentials, then log in to connect to the VPN tunnel.

To troubleshoot the configuration:

You can view FortiOS event logs in *Log & Report* > *Events* to verify successful authentication and user group allocation.

You can also run the `diagnose debug application samld -1` command to verify that the SAML IdP sent the correct information. The following shows example output for this scenario:



SSL VPN with Microsoft Entra SSO integration

You can use SAML single sign-on to authenticate against Microsoft Entra ID with SSL VPN SAML users who are using tunnel and web modes. See:

- Configuring SAML SSO login for SSL VPN with Entra ID acting as SAML IdP
- Tutorial: Microsoft Entra SSO integration with FortiGate SSL VPN

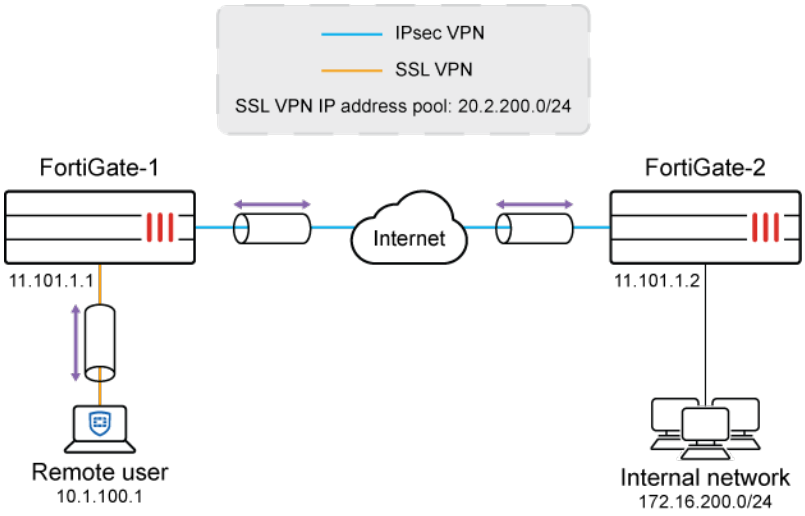
SSL VPN to IPsec VPN

This is a sample configuration of a remote endpoint connecting to FortiGate-1 over SSL VPN, and then connecting over site-to-site IPsec VPN to an internal network behind FortiGate-2.

This example uses a pre-existing user group, a tunnel mode SSL VPN with split tunneling, and a route-based IPsec VPN between two FortiGates. All sessions must start from the SSL VPN interface.

If you want sessions to start from the FGT_2 subnet, you need more policies. Also, if the remote subnet is beyond FGT_2 (if there are multiple hops), you need to include the SSL VPN subnet in those routers as well.

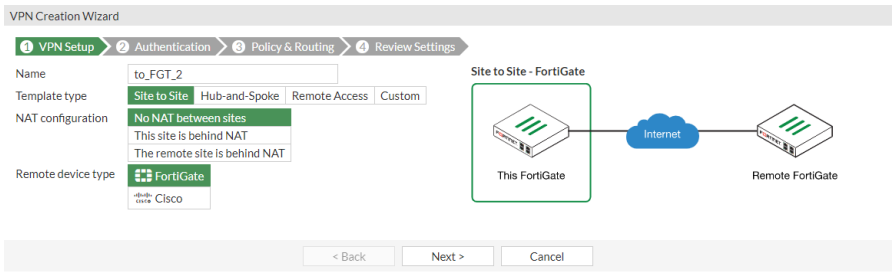
Sample topology



Sample configuration

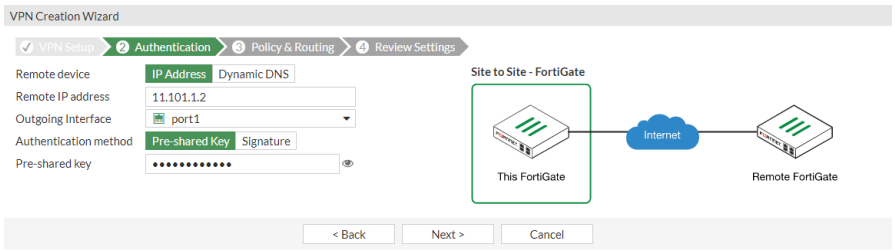
To configure the site-to-site IPsec VPN on FGT_1:

1. Go to *VPN* > *IPsec Wizard*.
2. In the *VPN Setup* pane:
   a. Specify the VPN connection *Name* as *to_FGT_2*.
   b. Select *Site to Site*.



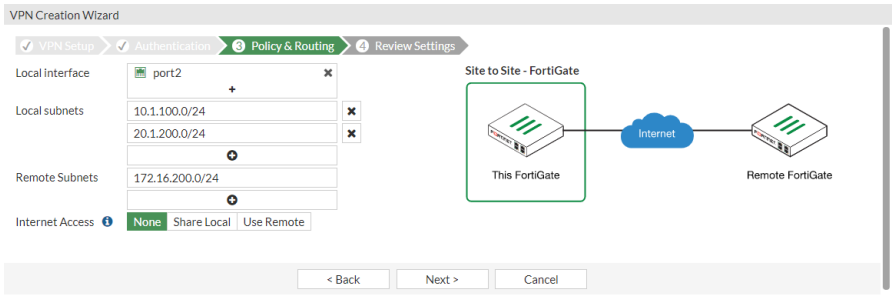
c. Click *Next*.

3. In the *Authentication* pane:
   a. Enter the *IP Address* to the Internet-facing interface.
   b. For *Authentication Method*, click *Pre-shared Key* and enter the *Pre-shared Key*.

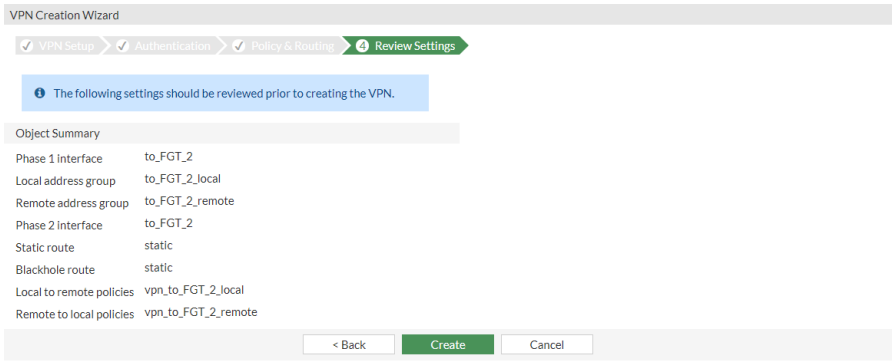


c. Click *Next*.

4. In the *Policy & Routing* pane:
   a. Set the *Local Interface* to the internal interface.
   b. Set the *Local Subnets* to include the internal and SSL VPN subnets for FGT_1.
   c. Set *Remote Subnets* to include the internal subnet for FGT_2.

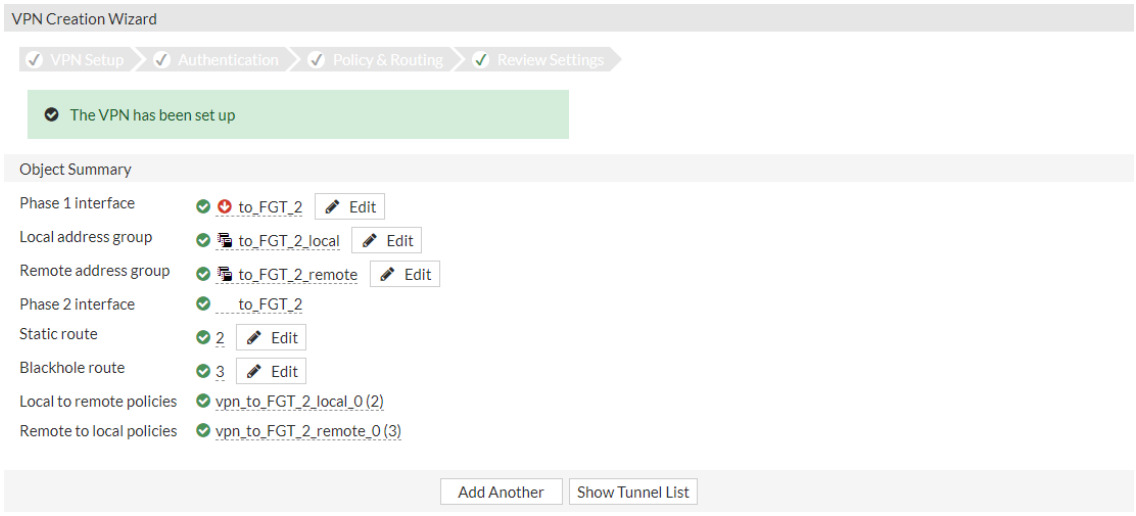


d. Click *Next*.



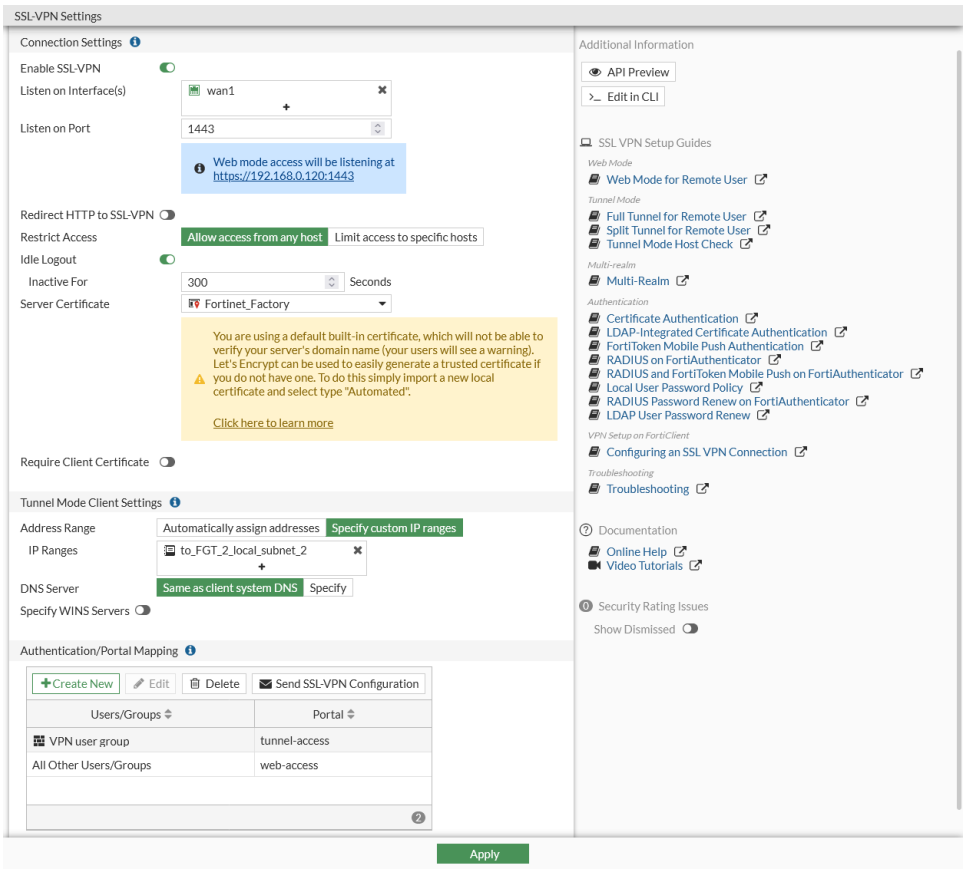
5. Review the VPN settings and click *Create*.

A confirmation screen shows a summary of the configuration including the firewall address groups for both the local and remote subnets, static routes, and security policies.



To configure SSL VPN settings:

1. Go to *VPN > SSL-VPN Settings*.
2. Set *Listen on Interface(s)* to *wan1*.
3. To avoid port conflicts, set *Listen on Port* to *10443*.
4. Set *Restrict Access* to *Allow access from any host*.
5. In the Tunnel Mode Client Settings section, select *Specify custom IP ranges* and include the SSL VPN subnet range created by the *IPsec Wizard*.
6. In the *Authentication/Portal Mapping* section, add the *VPN user group* to the *tunnel-access Portal*. Set *All Other Users/Groups* to the *web-access Portal*.

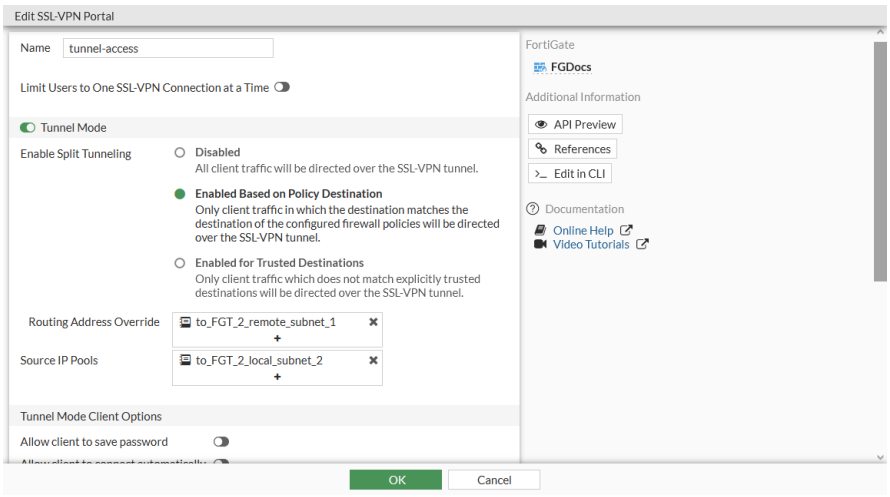


It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the SSL VPN best practices on page 2776 and learn how to Procuring and importing a signed SSL certificate on page 3616.

7. Click *Apply*.

To configure SSL VPN portal:

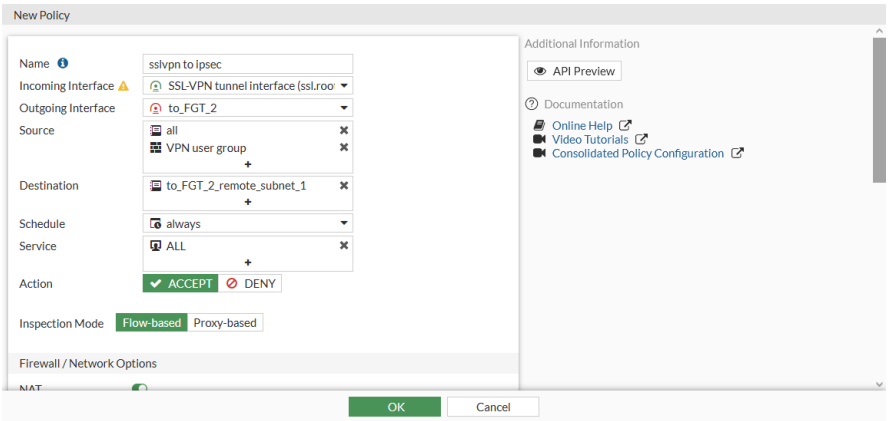
1. Go to *VPN* > *SSL-VPN Portals*.
2. Select *tunnel-access* and click *Edit*.
3. Turn on *Enable Split Tunneling* so that only traffic intended for the local or remote networks flow through FGT_1 and follows corporate security profiles.
4. For *Routing Address*, add the local and remote IPsec VPN subnets created by the *IPsec Wizard*.
5. For *Source IP Pools*, add the SSL VPN subnet range created by the *IPsec Wizard*.



6. Click *OK*.

To add policies to FGT_1:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New* to create a policy that allows SSL VPN users access to the IPsec VPN tunnel.
3. For *Incoming Interface*, select *ssl.root*.
4. For *Outgoing Interface*, select the IPsec tunnel interface *to_FGT_2*.
5. Set the *Source* to *all* and the *VPN user group*.
6. Set *Destination* to the remote IPsec VPN subnet.
7. Specify the *Schedule*.
8. Set the *Service* to *ALL*.
9. In the *Firewall/Network Options* section, disable *NAT*.



10. Click *OK*.

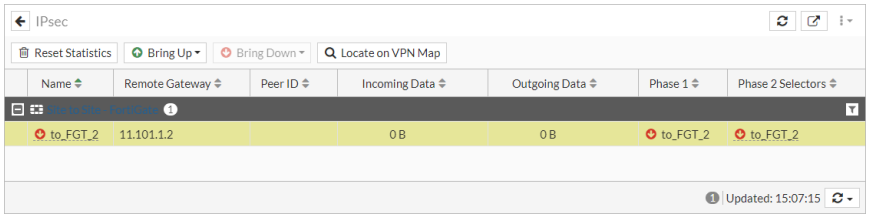
To configure the site-to-site IPsec VPN on FGT_2:

1. Go to *VPN > IPsec Wizard*.
2. In the *VPN Setup* pane:
   a. Specify the VPN connection *Name* as *to FGT_1*.
   b. Select *Site to Site*.
   c. Click *Next*.
3. In the *Authentication* pane:
   a. Enter the *IP Address* to the Internet-facing interface.
   b. For *Authentication Method*, click *Pre-shared Key* and enter the *Pre-shared Key* of the FGT_1.
   c. Click *Next*.
4. In the *Policy & Routing* pane:
   a. Set the *Local Interface* to the internal interface.
   b. Set the *Local Subnets* to include the internal and SSL VPN subnets for FGT_2.
   c. Set *Remote Subnets* to include the internal subnet for FGT_1.
   d. Click *Create*.

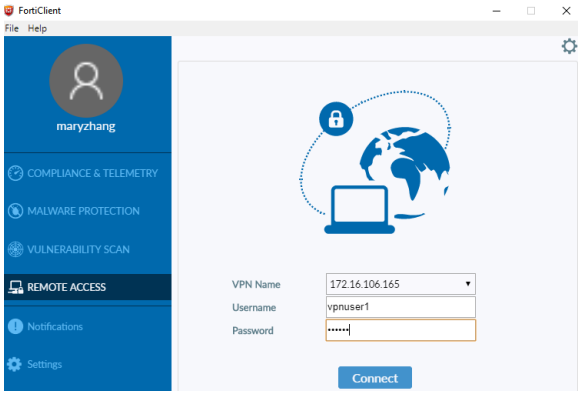
A confirmation screen shows a summary of the configuration including the firewall address groups for both the local and remote subnets, static routes, and security policies.

To check the results:

1. Go to *Dashboard > Network* and click the *IPsec* widget to expand to full screen view.
2. Select the tunnel and click *Bring Up*.



3. Verify that the *Status* changes to *Up*.
4. Configure the SSL VPN connection on the user's FortiClient and connect to the tunnel.



5. On the user's computer, send a ping though the tunnel to the remote endpoint to confirm access:

```
C:\>ping 172.16.200.55

Pinging 172.16.200.55 with 32 bytes of data:
Replay from 172.16.200.55: bytes=32 times=2ms TTL=62
Replay from 172.16.200.55: bytes=32 times=1ms TTL=62
Replay from 172.16.200.55: bytes=32 times=1ms TTL=62
Replay from 172.16.200.55: bytes=32 times=1ms TTL=62

Ping statistics for 172.16.200.55:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip time in milli-seconds:
    Minimum = 1ms, Maximum = 2ms, Average = 1ms
```

6. In FortiOS, go to the following pages for further verification:
   a. Go to *Dashboard* > *Network* and click the *Routing* widget to verify the IPsec and SSL VPNs are added.
   b. Go to *VPN* > *SSL-VPN Clients* to verify the connected users.
   c. Go to *VPN* > *VPN Location Map* to view the connection activity.
   d. Go to *Log & Report* > *System Events* and select the *VPN Events* card to view tunnel statistics.
   e. Go to *Dashboard* > *FortiView Policies* to view the policy usage.

Troubleshooting

To troubleshoot on FGT_1, use the following CLI commands:

```
diagnose debug reset
diagnose debug flow show function-name enable
diagnose debug flow show iprope enable
diagnose debug flow filter addr 172.16.200.55
diagnose debug flow filter proto 1
diagnose debug flow trace start 2
diagnose debug enable
```

To troubleshoot using ping:

1. Send a ping through the SSL VPN tunnel to 172.16.200.55 and analyze the output of the debug.
2. Disable the debug output with: `diagnose debug disable`.

If traffic is entering the correct VPN tunnel on FGT_1, then run the same commands on FGT_2 to check whether the traffic is reaching the correct tunnel. If it is reaching the correct tunnel, confirm that the SSL VPN tunnel range is configured in the remote side quick mode selectors.

To troubleshoot using a sniffer command:

```
diagnose sniff packet any "host 172.16.200.44 and icmp" 4
```

To troubleshoot IPsec VPN issues, use the following commands on either FortiGate:

```
diagnose debug reset
diagnose vpn ike gateway clear
diagnose debug application ike -1
diagnose debug enable
```

SSL VPN protocols

The following topics provide information about SSL VPN protocols:

- TLS 1.3 support on page 2943
- SMBv2 support on page 2944
- DTLS support on page 2944

TLS 1.3 support

FortiOS supports TLS 1.3 for SSL VPN.

TLS 1.3 support requires IPS engine 4.205 or later and endpoints running FortiClient 6.2.0 or later.

To establish a client SSL VPN connection with TLS 1.3 to the FortiGate:

1. Enable TLS 1.3 support using the CLI:
   ```
   config vpn ssl setting
      set ssl-max-proto-ver tls1-3
      set ssl-min-proto-ver tls1-3
   end
   ```
2. Configure the SSL VPN settings (see SSL VPN full tunnel for remote user on page 2794).
3. Configure the firewall policy (see Firewall policy on page 1563).
4. For Linux clients, ensure OpenSSL 1.1.1a is installed:
   a. Run the following commands in the Linux client terminal:
      ```
      root@PC1:~/tools# openssl
      OpenSSL> version
      ```
      If OpenSSL 1.1.1a is installed, the system displays a response like the following:
      ```
      OpenSSL 1.1.1a 20 Nov 2018
      ```
5. For Linux clients, use OpenSSL with the TLS 1.3 option to connect to SSL VPN:
   a. Run the following command in the Linux client terminal:
      ```
      #openssl s_client -connect 10.1.100.10:10443 -tls1_3
      ```
6. Ensure the SSL VPN connection is established with TLS 1.3 using the CLI:
   ```
   # diagnose debug application sslvpn -1
   # diagnose debug enable
   ```

The system displays a response like the following:

```
[207:root:1d]SSL established: TLSv1.3 TLS_AES_256_GCM_SHA384
```

Deep inspection (flow-based)

FortiOS supports TLS 1.3 for policies that have the following security profiles applied:

- Web filter profile with flow-based inspection mode enabled.
- Deep inspection SSL/SSH inspection profile.

For example, when a client attempts to access a website that supports TLS 1.3, FortiOS sends the traffic to the IPS engine. The IPS engine then decodes TLS 1.3 and the client is able to access the website.

SMBv2 support

On all FortiGate models, SMBv2 is enabled by default for SSL VPN. Client PCs can access the SMBv2 server using SSL VPN web-only mode.

To configure SMBv2:

1. Set the minimum and maximum SMB versions.

```
config vpn ssl web portal
    edit portal-name
       set smb-min-version smbv2
       set smb-max-version smbv3
    next
end
```

2. Configure the SSL VPN settings (see SSL VPN full tunnel for remote user on page 2794).
3. Configure the firewall policy (see Firewall policy on page 1563).
4. Connect to the SSL VPN web portal and create an SMB bookmark for the SMBv2 server.
5. Click the bookmark to connect to the SMBv2 server.
6. On the FortiGate, use package capture to verify that SMBv2 works:

DTLS support

FortiOS Datagram Transport Layer Security (DTLS) allows SSL VPN to encrypt traffic using TLS and uses UDP as the transport layer instead of TCP. This avoids retransmission problems that can occur with TCP-in-TCP.

To establish a client SSL VPN connection with DTLS to the FortiGate:

1. Enable the DTLS tunnel in the CLI:

```
config vpn ssl setting
    set dtls-tunnel enable
end
```

2. Configure the SSL VPN settings (see SSL VPN full tunnel for remote user on page 2794).
3. Configure the firewall policy (see Firewall policy on page 1563).
4. In FortiClient, use the *Preferred DTLS Tunnel* option to connect to SSL VPN with DTLS:
   a. Go to *Settings* and expand the *VPN Options* section.
   b. Enable *Preferred DTLS Tunnel*.

FortiClient 5.4.0 to 5.4.3 uses DTLS by default. FortiClient 5.4.4 and later uses normal TLS, regardless of the DTLS setting on the FortiGate.

   c. Click *Save*.
5. In FortiOS, run diagnostics to ensure the SSL VPN connection is established with DTLS:

```
# diagnose debug application sslvpn -1
# diagnose debug enable
```

The system displays a response like the following:

```
[304:vdom1:7]DTLS established: DTLSv1 ECDHE-RSA-AES256-GCM-SHA384
```

Configuring the DTLS heartbeat parameters

The DTLS heartbeat parameters for SSL VPN can be adjusted. This improves the success rate of establishing a DTLS tunnel in networks with congestion or jitter.

```
config vpn ssl settings
    set dtls-heartbeat-idle-timeout <integer>
    set dtls-heartbeat-interval <integer>
    set dtls-heartbeat-fail-count <integer>
end
```

`dtls-heartbeat-idle-timeout <integer>`	Set the idle timeout before the DTLS heartbeat is sent, in seconds (3 - 10, default = 3).
`dtls-heartbeat-interval <integer>`	Set the interval between DTLS heartbeats, in seconds (3 - 10, default = 3).
`dtls-heartbeat-fail-count <integer>`	Set the number of missing heartbeats before the connection is considered dropped, in seconds (3 - 10, default = 3).

To configure the DTLS heartbeat parameters:

```
config vpn ssl settings
    set dtls-heartbeat-idle-timeout 3
    set dtls-heartbeat-interval 3
    set dtls-heartbeat-fail-count 3
end
```

To verify the configuration:

1. Run diagnostics on the server side:

```
# diagnose debug console timestamp enable
# diagnose debug application sslvpn -1
# diagnose debug enable
```

```
2023-04-26 12:01:40 [304:vdom1:5]sslvpn_send_ctrl_msg:987 0x7f1f2743e800 message: heartbeat
 10.1.100.147
2023-04-26 12:01:41 [304:vdom1:5]sslvpn_dtls_handle_client_data:758 0x7f1f2743e800 got
heartbeat
2023-04-26 12:01:44 [304:vdom1:5]sslvpn_dtls_handle_client_data:758 0x7f1f2743e800 got
heartbeat
2023-04-26 12:01:46 [304:vdom1:5]sslvpn_send_ctrl_msg:987 0x7f1f2743e800 message: heartbeat
 10.1.100.147
2023-04-26 12:01:50 [304:vdom1:5]sslvpn_send_ctrl_msg:987 0x7f1f2743e800 message: heartbeat
 10.1.100.147
2023-04-26 12:01:54 [304:vdom1:5]sslvpn_send_ctrl_msg:987 0x7f1f2743e800 message: heartbeat
 10.1.100.147
2023-04-26 12:01:54 [304:vdom1:5]sslvpn_dtls_timeout_check:358 no heartbeat received for 9
seconds.
2023-04-26 12:01:54 [304:vdom1:5]fsv_disassociate_fd_to_ipaddr:2367 deassociate 10.11.12.1
from tun (ssl.vdom1:12)
2023-04-26 12:01:54 [304:vdom1:5]dtls_tun_link_down:1884 tunnel device (12) closed
2023-04-26 12:01:54 [304:vdom1:5]tunnel is down, wait for next connection.
2023-04-26 12:01:54 [304:vdom1:5]sslvpn_release_dynip:1597 free app session, idx[0]
2023-04-26 12:01:54 [304:vdom1:5]release dyip
2023-04-26 12:01:54 [304:vdom1:5]Destroy sconn 0x7f1f2743e800, connSize=0. (vdom1)
```

   The heartbeat starts being sent after the idle timeout, and the heartbeat is sent every three seconds.

   The tunnel is disconnected once the `dtls-heartbeat-fail-count` is reached.

2. Use a Linux traffic control (tc) utility to introduce packet loss of 30% on the interface connected to the FortiGate (ens192):

```
root@auto-pc147:~# tc qdisc add dev ens192 root netem loss 30%
```

3. Run a ping test. The results show that the network has jitter/congestion as 33% of packets are being lost:

```
root@auto-pc147:~# ping 10.1.100.2 -c 100
PING 10.1.100.2 (10.1.100.2) 56(84) bytes of data.
64 bytes from 10.1.100.2: icmp_seq=1 ttl=255 time=0.111 ms
64 bytes from 10.1.100.2: icmp_seq=2 ttl=255 time=0.106 ms
```

```
...
64 bytes from 10.1.100.2: icmp_seq=99 ttl=255 time=0.103 ms
64 bytes from 10.1.100.2: icmp_seq=100 ttl=255 time=0.097 ms

--- 10.1.100.2 ping statistics ---
100 packets transmitted, 67 received, 33% packet loss, time 101382ms
rtt min/avg/max/mdev = 0.088/0.104/0.141/0.009 ms
```

4. Run diagnostics again on the server side to verify that the DTLS tunnel is established:

```
# diagnose debug application sslvpn -1
# diagnose debug enable
```

```
[307:vdom1:9]form_ipv4_pol_split_tunnel_addr:113 Matched policy (id = 14) to add ipv4 split

```

Configuring OS and host check

Beyond the basics of setting up the SSL VPN, you can configure a number of other options that can help to ensure your internal network is secure and can limit the possibility of attacks and viruses entering the network

from an outside source. These include verifying OS and performing host checks on software running on the remote device.

Verifying remote user OS

To verify that remote users are using devices with up-to-date Operating Systems to connect to your network, you can configure a host check for Windows and Mac OS. You can configure an OS host check for specific OS versions, such as Windows 7, 8.1, 10, and 11.

To configure an OS host check for specific OS versions:

1. Go to *VPN* > *SSL-VPN*.
2. Click *Create New*.
3. Enable *Restrict to Specific OS Versions*.
4. Select an OS version and click *Edit* to change the action.
5. Select the action:
   - *Allow*: The selected OS version is allowed to connect. This is the default action.
   - *Deny*: The selected OS version is not allowed to connect.
   - *Check up to date*: Specify a *Tolerance* and *Latest patch level* that is allowed for the selected OS version.
6. Click *OK*.
7. Configure other parameters as needed.
8. Click *OK*.

Host check

Host check verifies whether the client device has AntiVirus, firewall, both, or other custom security software enabled on their Windows device. Admins may also define their own custom host check software, which supports Windows and Mac OS. See Creating a custom host check list on page 2950.

Host Check is only available for SSL VPN tunnel mode.

To configure host checking:

1. Go to *VPN* > *SSL-VPN Portal*.
2. Click *Create New*.
3. Enable *Host Check*.
4. Set the *Type*:
   - *Realtime AntiVirus*: Checks that AntiVirus software recognized by Windows Security Center is enabled.
   - *Firewall*: Checks that firewall software recognized by Windows Security Center is enabled.
   - *Enable both*: Checks that both *Realtime AntiVirus* and *Firewall* are enabled.

- Custom: Not configurable from the GUI. See CLI settings below.

5. Configure other parameters as needed.
6. Click *OK*.

You can configure the full-access portal to perform a custom host check for FortiClient Host Security AV and firewall software.

To configure custom host checking:

```
config vpn ssl web portal
    edit full-access
        set host-check custom
        set host-check-policy FortiClient-AV FortiClient-FW
    next
end
```

Many other security software can also be configured. Use `set host-check-policy ?` to see a list of software.

Replacing the host check error message

You can add your own host security check error message using either the GUI or the CLI. The default message reads:

```
Your PC does not meet the host checking requirements set by the firewall. Please try again in a
few minutes. If the issue persists check that your OS version meets the minimum requirements, that
your antivirus and firewall applications are installed and running properly, and that you have the
correct network interface.
```

To replace the host check error message in the GUI:

1. Go to *System* > *Replacement Messages*.
2. Select *Extended View* in the upper right corner.
3. Scroll down to *SSL-VPN* and select *Hostcheck Error Message*.
4. Click *Edit*. The *Hostcheck Error Message* pane opens.
5. Edit the text in the right-hand column.
6. Click *Save*.

If you are unhappy with the new message, you can restore the message to its default by selecting *Restore Defaults* instead of *Save*.

MAC address check

Aside from OS and Host check, FortiGate can also perform a MAC address check on the remote host.

To configure a MAC address check on the remote host in the CLI:

```
config vpn ssl web portal
    edit <portal_name>
        set mac-addr-check enable
        config mac-addr-check-rule
            edit <rule_name>
                set mac-addr-list <address> [address]
                set mac-addr-mask <mask between 1-48>
            next
        end
        set mac-addr-action {allow | deny}
    next
end
```

Creating a custom host check list

You can add your own software requirements to the host check list using the CLI. Host integrity checking is only possible with client computers running Microsoft Windows platforms.

To add software requirements to the host check list:

```
config vpn ssl web host-check-software
    edit <software_name>
        set os-type {windows | macos}
        set type {av | fw}
        set version <version_number>
        set guid <guid_value>
        config check-item-list
            edit <ID>
                set action {require | deny}
                set type {file | registry | process}
                set target <target string>
                set version <version string>
                set md5s <hext string>
            next
        end
    next
end
```

If known, enter the Globally Unique Identifier (GUID) for the host check application. Windows uses GUIDs to identify applications in the Windows Registry. The GUID can be found in the Windows registry in the `HKEY_CLASSES_ROOT` section.

To obtain the exact versioning, in Windows, right-click on the .EXE file of the application and select *Properties*, then select the *Version* tab.

Example: Tunnel Mode Host Check - Registry Key Check

The following example configuration checks if a required registry key is present on a Windows device.

```
config vpn ssl web host-check-software
    edit <computer_name>
        config check-item-list
            edit 1
                set target "HKEY_LOCAL_
MACHINE\\SYSTEM\\CurrentControlSet\\Control\\ComputerName\\ActiveComputerName:ComputerName=WINXP32
SP3B62"
                set type registry
            next
        end
    next
end
```

Example: Tunnel Mode Host Check - Application Running Check

The following example configuration checks if a required application is installed and/or running:

```
config vpn ssl web host-check-software
    edit "calc"
        config check-item-list
            edit 1
                set target "calc.exe"
                set type process
            next
        end
    next
end
```

Example: Mac OS host check and process check

The `os-type` option is available under `vpn ssl web host-check-software`; if `os-type` is `macos`, then `type`, `version` and `guid` are hidden. Furthermore, `type` in `check-item-list` can only be set to `file` or `process`.

```
config vpn ssl web portal
    edit <portal_name>
        set os-check enable
        config os-check-list macos-bigsur-11
            set action {allow | deny | check-up-to-date}
            set tolerance <value>
            set latest-patch-level <value>
        end
```

```
    next
end
config vpn ssl web host-check-software
    edit <name>
        set os-type macos
        config check-item-list
            edit <name>
                set type process
                set target <target process>
            next
        end
    next
end
```

Example: Configuring Windows OS Check with patch version

The Windows patch check enables you to define the minimum Windows version and patch level allowed when connecting to the SSL VPN portal. When the user attempts to connect to the web portal, FortiOS performs a query on the version of Windows the user has installed. If it does not match the minimum requirement, the connection is denied. The Windows patch check is configured in the CLI.

To specify the acceptable patch level, you set the `latest-patch-level` and the `tolerance`. The lowest acceptable patch level is `latest-patch-level` minus *tolerance*. In this case, *latest-patch-level* is three and *tolerance* is one, so two is the lowest acceptable patch level.

To configure OS check:

```
config vpn ssl web portal
    edit <portal_name>
        set os-check enable
        config os-check-list <windows OS version>
            set action {allow | check-up-to-date | deny}
            set latest-patch-level {disable | 0 - 65535}
            set tolerance <tolerance_num>
        end
    next
end
```

Example: Host check for Windows firewall

The Windows built-in firewall does not have a GUID in root\securitycenter or root\securitycenter2, but you can use a registry value to detect the firewall status.

If Windows firewall is on, the following registry value will be set to one:

- **KeyName**: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\FirewallPolicy\StandardProfile
- **ValueName**: EnableFirewall

In FortiOS, use the `registry-value-check` feature to define the Windows firewall software.

To define the Windows firewall software:

```
config vpn ssl web host-check-software
    edit "Microsoft-Windows-Firewall"
        set type fw
        config check-item-list
            edit 1
                set target
"HKLM\\SYSTEM\\CurrentControlSet\\Services\\SharedAccess\\Parameters\\FirewallPolicy\\StandardProf
ile:EnableFirewall==1"
                set type registry
            next
            edit 2
                set target
"HKLM\\SYSTEM\\CurrentControlSet\\Services\\SharedAccess\\Parameters\\FirewallPolicy\\PublicProfil
e:EnableFirewall==1"
                set type registry
            next
            edit 3
                set target
"HKLM\\SYSTEM\\CurrentControlSet\\Services\\SharedAccess\\Parameters\\FirewallPolicy\\DomainProfil
e:EnableFirewall==1"
                set type registry
            next
        end
    next
end
config vpn ssl web portal
    edit <portal_name>
        set host-check custom
        set host-check-policy Microsoft-Windows-Firewall
    next
end
```

Troubleshooting

To troubleshoot OS and host check, enable the following real-time debugs from the CLI:

```
# diagnose debug app sslvpn -1
```

```
# diagnose debug enable
```

From the remote client, connect to SSL VPN. Look for debug output similar to the following:

```
[263:root:3cca1]host check result:4 0100,10.0.19042,74:78:27:4d:81:93|84:1b:77:3a:95:84
```

To interpret the above output:

Field	Description
`host check result: 4`	This is the hex number of portal's host check value: • `0`: None • `1`: Check antivirus • `2`: Check firewall • `3`: Check antivirus and firewall • `4`: Custom check
`0100`	The 4 bytes shows the result of host check checking in the FortiGate Settings. Position counts from left to right, zero to three: • Position zero means result of third party firewall. • Position one means result of third party antivirus. • Position two means result of FortiClient firewall. • Position three means result of FortiClient antivirus. `0` means not in use. `1` means in use.
`10.0.19042`	This is the OS version.
`74:78:27:4d:81:93|84:1b:77:3a:95:84`	The MAC address of the client machine's network interface, that is used for the mac address check. Multiple MAC address are separately by '|'.

FortiGate as SSL VPN Client

The FortiGate can be configured as an SSL VPN client, using an *SSL-VPN Tunnel* interface type. When an SSL VPN client connection is established, the client dynamically adds a route to the subnets that are returned by the SSL VPN server. Policies can be defined to allow users that are behind the client to be tunneled through SSL VPN to destinations on the SSL VPN server.

FortiOS can be configured as an SSL VPN server that allows IP-level connectivity in tunnel mode, and can act as an SSL VPN client that uses the protocol used by the FortiOS SSL VPN server. This allows hub-and-spoke topologies to be configured with FortiGates as both the SSL VPN hub and spokes.

For an IP-level VPN between a device and a VPN server, this can be useful to avoid issues caused by intermediate devices, such as:

- ESP packets being blocked.
- UDP ports 500 or 4500 being blocked.
- Fragments being dropped, causing IKE negotiation that uses large certificates to fail if the peer does not support IKE fragmentation.

If the client specified destination is *all*, a default route is effectively dynamically created on the SSL VPN client, and the new default route is added to the existing default route in the form of ECMP. Some examples how to configure routing are:

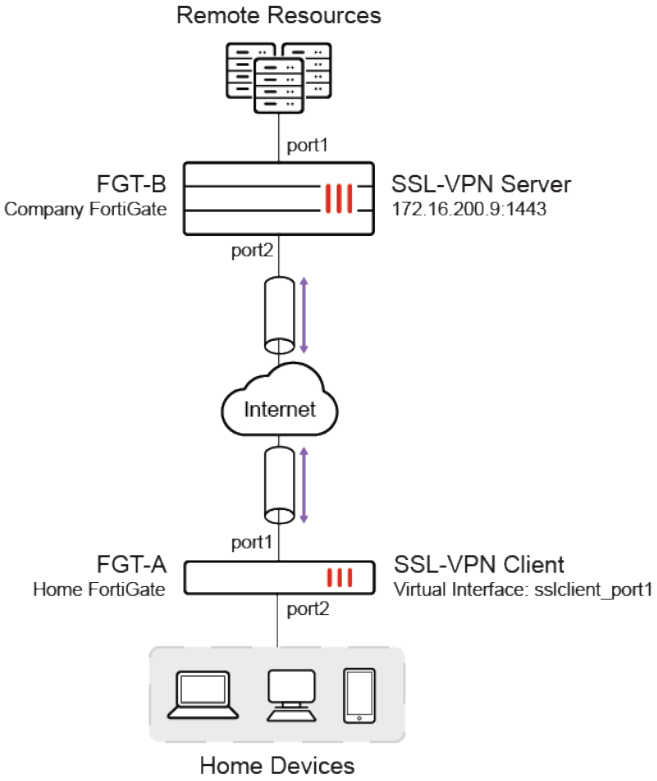
- To make all traffic default to the SSL VPN server and still have a route to the server's listening interface, on the SSL VPN client set a lower distance for the default route that is learned from the server.
- To include both default routes in the routing table, with the route learned from the SSL VPN server taking priority, on the SSL VPN client set a lower distance for the route learned from the server. If the distance is already zero, then increase the priority on the default route.
- To avoid a default being learned on the SSL VPN client, on the SSL VPN server define a specific destination.

Example

In this example, the home FortiGate (FGT-A) is configured as an SSL VPN client, and the company FortiGate (FGT-B) is configured as an SSL VPN server. After FGT-A connects to FGT-B, the devices that are connected to FGT-A can access the resources behind FGT-B.

The SSL VPN server has a custom server certificate defined, and the SSL VPN client user uses PSK and a PKI client certificate to authenticate. The FortiGates must have the proper CA certificate installed to verify the certificate chain to the root CA that signed the certificate.

Split tunneling is used so that only the destination addresses defined in the server's firewall policies are routed to the server, and all other traffic is connected directly to the internet.



Configure the SSL VPN server

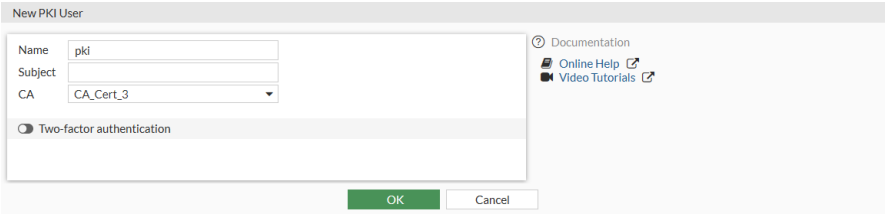
To create a local user in the GUI:

1. Go to *User & Authentication* > *User Definition* and click *Create New*.
2. Use the wizard to create a local user named *client2*.

To create a PKI user in the GUI:

The PKI menu is only available in the GUI after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.

1. Go to *User & Authentication* > *PKI* and click *Create New*.
2. Set the *Name* to *pki*.
3. Set *CA* to the CA certificate that is used to verify the client certificate.



4. Click *OK*.
5. In the CLI, specify the CN that must be matched. If no CN is specified, then any certificate that is signed by the CA will be valid and matched.

```
config user peer
    edit "pki"
        set cn "*.fos.automation.com"
    next
end
```

To create an SSL VPN portal in the GUI:

1. Go to *VPN* > *SSL-VPN Portals* and click *Create New*.
2. Set the *Name* to *testportal2*.
3. Set *Enable Split Tunneling* to *Enabled Based on Policy Destination*.
4. Set *Source IP Pools* to *SSLVPN_TUNNEL_ADDR1*.
5. Click *OK*.

To configure SSL VPN settings in the GUI:

1. Go to *VPN* > *SSL-VPN Settings* and enable *Enable SSL-VPN*.
2. Set *Listen on Interface(s)* to *port2*.
3. Set *Listen on Port* to *1443*.
4. Set *Server Certificate* to *fgt_gui_automation*.

5. In the *Authentication/Portal Mapping* table click *Create New*:
   a. Set *Users/Groups* to *client2*.
   b. Set *Portal* to *testportal2*.
   c. Click *OK*.
6. Click *OK*.
7. In the CLI, enable SSL VPN client certificate restrictive and set the user peer to *pki*:

```
config vpn ssl settings
    config authentication-rule
        edit 1
            set client-cert enable
            set user-peer "pki"
        next
    end
end
```

To create a firewall address in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. click *Create new*.
3. Set the *Name* to *bing.com*.
4. Set *Type* to *FQDN*.
5. Set *FQDN* to *www.bing.com*.
6. Click *OK*.

To create a firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the policy:

Name	*sslvpn2*
Incoming Interface	*SSL-VPN tunnel interface (ssl.root)*
Outgoing Interface	*port1*
Source	*Address*: *all* *User*: *client2*
Destination	*bing.com*: This FQDN resolves to 13.107.21.200 and 204.79.197.200. Traffic to these addresses is directed to the SSL VPN, while other traffic is routed to the remote devices' default adapters or interfaces. *mantis*
Schedule	*always*
Service	*ALL*
Action	*Accept*

3. Click *OK*.

To configure the SSL VPN server (FGT-B) in the CLI:

1. Create a local user:

```
config user local
    edit "client2"
        set passwd **********
    next
end
```

2. Create a PKI user:

```
config user peer
    edit "pki"
        set ca "CA_Cert_3"
        set cn "*.fos.automation.com"
    next
end
```

3. Create a new SSL VPN portal:

```
config vpn ssl web portal
    edit "testportal2"
        set tunnel-mode enable
        set ipv6-tunnel-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling enable
        set ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
        set ipv6-split-tunneling enable
        ....
    next
end
```

4. Configure SSL VPN settings, including the authentication rule for user mapping:

```
config vpn ssl settings
    set ssl-min-proto-ver tls1-1
    set servercert "fgt_gui_automation"
    set auth-timeout 0
    set login-attempt-limit 10
    set login-timeout 180
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set dns-suffix "sslvpn.com"
    set port 1443
    set source-interface "port2"
    set source-address "all"
    set source-address6 "all"
    set default-portal "testportal1"
    config authentication-rule
        edit 1
            set users "client2"
            set portal "testportal2"
```

```
            set client-cert enable
            set user-peer "pki"
        next
    end
end
```

5. Create a firewall address and policy. The destination addresses used in the policy are routed to the SSL VPN server.

```
config firewall address
    edit "bing.com"
        set type fqdn
        set fqdn "www.bing.com"
    next
end
```

```
config firewall policy
    edit 2
        set name "sslvpn2"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "mantis" "bing.com"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "client2"
    next
end
```

Configure the SSL VPN client

To create a PKI user in the GUI:

The PKI menu is only available in the GUI after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.

1. Go to *User & Authentication* > *PKI* and click *Create New*.
2. Set the *Name* to *fgt_gui_automation*.
3. Set *CA* to the CA certificate. The CA certificate allows the FortiGate to complete the certificate chain and verify the server 's certificate, and is assumed to already be installed on the FortiGate.
4. Click *OK*.
5. In the CLI, specify the CN of the certificate on the SSL VPN server:

```
config user peer
    edit "fgt_gui_automation"
```

```
        set cn "*.fos.automation.com"
    next
end
```

To create an SSL VPN client and virtual interface in the GUI:

1. Go to *VPN > SSL-VPN Clients* and click *Create New*.
2. Expand the *Interface* drop down and click *Create* to create a new virtual interface:
   a. Set the *Name* to *sslclient_port1*.
   b. Set *Interface* to *port1*.
   c. Under *Administrative Access*, select *HTTPS* and *PING*.

   d. Click *OK*.
3. Configure the SSL VPN client:

Name	*sslclientTo9*
Interface	*sslclient_port1*
Server	*172.16.200.9*
Port	*1443*
Username	*client2*
Pre-shared Key	**********
Client Certificate	*fgtb_gui_automation* This is the local certificate that is used to identify this client, and is assumed to already be installed on the FortiGate. The SSL VPN server requires it for authentication.
Peer	*fgt_gui_automation*
Administrative Distance	Configure as needed.
Priority	Configure as needed.
Status	Enabled

4. Click *OK*.

To create a firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the policy:

Name	*policy_to_sslvpn_tunnel*
Incoming Interface	*port2*
Outgoing Interface	*sslclient_port1*
Source	*all*
Destination	*all*
Schedule	*always*
Service	*ALL*
Action	*Accept*

3. Click *OK*.

To configure the SSL VPN client (FGT-A) in the CLI:

1. Create the PKI user. Use the CA that signed the certificate *fgt_gui_automation*, and the CN of that certificate on the SSL VPN server.

```
config user peer
    edit "fgt_gui_automation"
        set ca "GUI_CA"
        set cn "*.fos.automation.com"
    next
end
```

2. Create the SSL interface that is used for the SSL VPN connection:

```
config system interface
    edit "sslclient_port1"
        set vdom "vdom1"
        set allowaccess ping https
        set type ssl
        set role lan
        set snmp-index 46
        set interface "port1"
    next
end
```

3. Create the SSL VPN client to use the PKI user and the client certificate *fgtb_gui_automation*:

```
config vpn ssl client
    edit "sslclientTo9"
        set interface "sslclient_port1"
```

```
        set user "client2"
        set psk 123456
        set peer "fgt_gui_automation"
        set server "172.16.200.9"
        set port 1443
        set certificate "fgtb_gui_automation"
    next
end
```

4. Create a firewall policy:

```
config firewall policy
    edit 1
        set name "policy_to_sslvpn_tunnel"
        set srcintf "port2"
        set dstintf "sslclient_port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Verification

After the tunnel is established, the route to 13.107.21.200 and 204.79.197.200 on FGT-A connects through the SSL VPN virtual interface *sslclient_port1*.

To check the routing table details:

```
(vdom1) # get router info routing-table details
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default

Routing table for VRF=0
S*      0.0.0.0/0 [10/0] via 172.16.200.254, port1
C       10.0.1.0/24 is directly connected, link_11
C       10.1.100.0/24 is directly connected, port2
                      is directly connected, port2
C       10.212.134.200/32 is directly connected, sslclient_port1
S       13.107.21.200/32 [10/0] is directly connected, sslclient_port1
C       172.16.200.0/24 is directly connected, port1
S       192.168.100.126/32 [10/0] is directly connected, sslclient_port1
S       204.79.197.200/32 [10/0] is directly connected, sslclient_port1
```

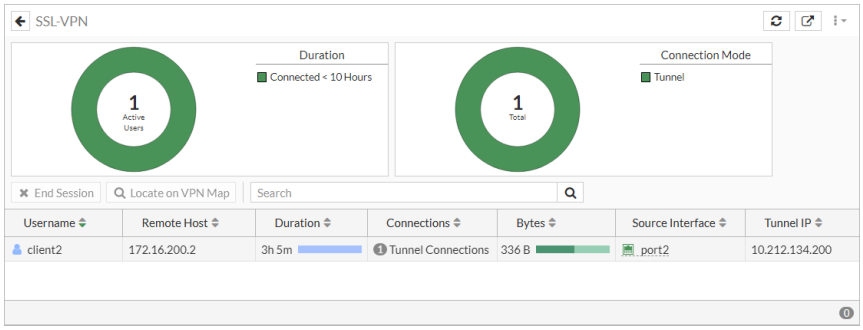
To check the added routing for an IPv6 tunnel:

```
(vdom1) # get router info6 routing-table database
IPv6 Routing Table
Codes: K - kernel route, C - connected, S - static, R - RIP, O - OSPF,
       IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, B - BGP
       > - selected route, * - FIB route, p - stale info
Timers: Uptime

S    *> ::/0 [10/0] via 2000:172:16:200::254, port1, 00:00:01, [1024/0]
     *>      [10/0] via ::, sslclient_port1, 00:00:01, [1024/0]
C    *> ::1/128 via ::, vdom1, 03:26:35
C    *> 2000:10:0:1::/64 via ::, link_11, 03:26:35
C    *> 2000:10:1:100::/64 via ::, port2, 03:26:35
C    *> 2000:172:16:200::/64 via ::, port1, 03:26:35
C    *> 2001:1::1:100/128 via ::, sslclient_port1, 00:00:01
C    *> fe80::/64 via ::, port2, 03:26:35
```

To check the connection in the GUI:

1. On the SSL VPN server FortiGate (FGT-B), go to *Dashboard* > *Network* and expand the *SSL-VPN* widget.



2. On the SSL VPN client FortiGate (FGT-A), go to *VPN* > *SSL-VPN Clients* to see the tunnel list.

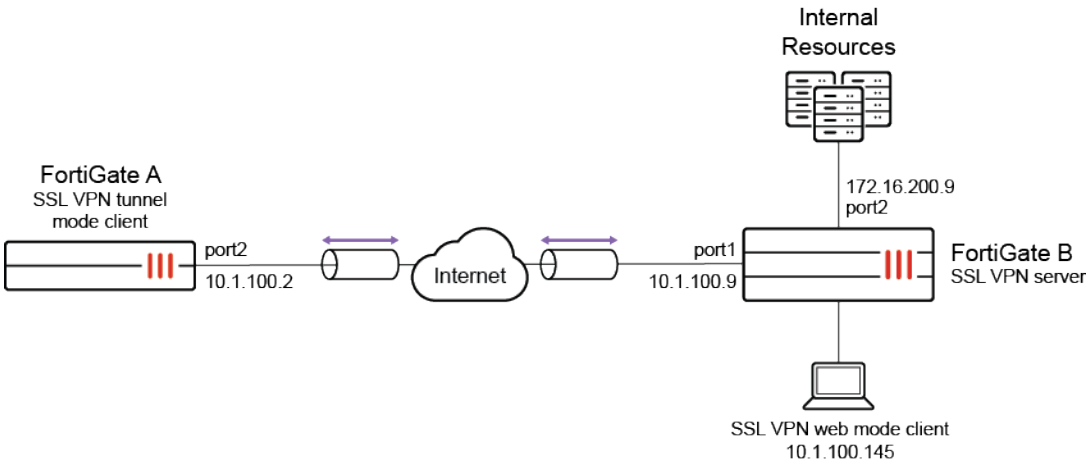
Dual stack IPv4 and IPv6 support for SSL VPN

Dual stack IPv4 and IPv6 support for SSL VPN servers and clients enables a client to establish a dual stack tunnel to allow both IPv4 and IPv6 traffic to pass through. FortiGate SSL VPN clients also support dual stack, which allows it to establish dual stack tunnels with other FortiGates.

Users connecting in web mode can connect to the web portal over IPv4 or IPv6. They can access bookmarks in either IPv4 or IPv6, depending on the preferred DNS setting of the web portal.

Example

In this example, FortiGate B works as an SSL VPN server with dual stack enabled. A test portal is configured to support tunnel mode and web mode SSL VPN.



FortiGate A is an SSL VPN client that connects to FortiGate B to establish an SSL VPN tunnel connection. It attempts to access www.bing.com and www.apple.com via separate IPv4 and IPv6 connections. Two addresses are configured on FortiGate B:

- *bing.com* uses IPv4 FQDN and resolves to 13.107.21.200 and 204.79.197.200.
- *apple_v6* uses IPv6 FQDN and resolves to 2600:140a:c000:385::1aca and 2600:140a:c000:398::1aca.

The server certificate used is fgt_gui_automation, and the CN is *.fos.automation.com.

A PC serves as a client to connect to FortiGate B in SSL VPN web mode. The PC can connect to the SSL VPN server over IPv4 or IPv6. Based on the preferred DNS setting, it will access the destination website over IPv4 or IPv6.

Dual stack tunnel mode support requires a supported client. In 7.0.0, a FortiGate in SSL VPN client mode can support dual stack tunnels. FortiClient 7.0.1 and later releases support dual stack.

To configure an SSL VPN server in tunnel and web mode with dual stack support in the GUI:

1. Create a local user:
   a. Go to *User & Authentication* > *User Definition* and click *Create New*. The *Users/Groups Creation Wizard* opens.
   b. Set the *User Type* to *Local User* and click *Next*.
   c. Enter the *Username* (*client2*) and password, then click *Next*.
   d. Optionally, configure the contact information and click *Next*.
   e. Click *Submit*.
2. Configure the addresses:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.

c. Enter the following for the IPv4 address:

Name	bing.com
Type	FQDN
FQDN	www.bing.com

d. Click *OK*.
e. Select *IPv6 Address*.
f. Click *Create new* and enter the following for the IPv6 address:

Name	apple_v6
Type	IPv6 FQDN
FQDN	www.apple.com

g. Click *OK*.

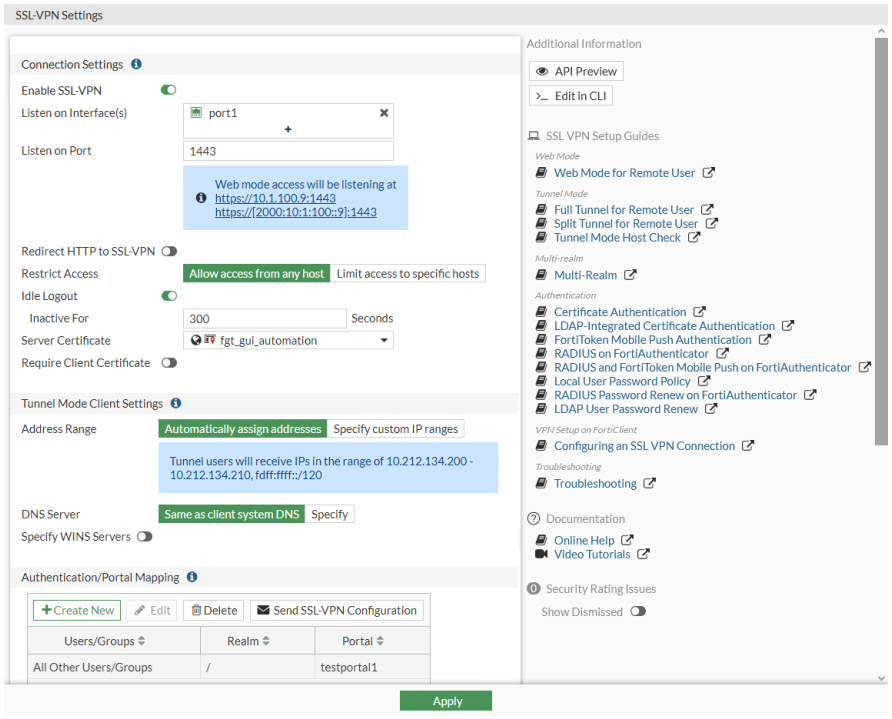
3. Configure the SSL VPN portal:
   a. Go to *VPN > SSL-VPN Portals* and click *Create New*.
   b. Enter a name (*testportal1*).
   c. Enable *Tunnel Mode* and for *Enable Split Tunneling*, select *Enable Based on Policy Destination*.
   d. For *Source IP Pools*, add *SSLVPN_TUNNEL_ADDR1*.
   e. Enable *IPv6 Tunnel Mode* and for *Enable Split Tunneling*, select *Enable Based on Policy Destination*.
   f. For *Source IP Pools*, add *SSLVPN_TUNNEL_IPv6_ADDR1*.
   g. Enable *Enable Web Mode*.

   h. Click *OK*.

4. Configure the SSL VPN settings:

a. Go to *VPN > SSL-VPN Settings* and configure the following:

Listen on Interface(s)	port1
Listen on Port	1443
Restrict Access	Allow access from any host
Server Certificate	fgt_gui_automation
Address Range	Automatically assign addresses
DNS Server	Same as client system DNS
Authentication/Portal Mapping	Edit the *All Other Users/Groups* entry to use *testportal1*.



b. Click *Apply*.

c. Enable dual stack in the CLI:

```
config vpn ssl settings
    set dual-stack-mode enable
end
```

5. Configure the firewall policy:

a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.

b. Enter the following:

Name	sslvpn
Incoming Interface	ssl.root

Outgoing Interface	port2
Source	all (IPv4), all (IPv6), client2
Destination	bing.com, apple_v6
Schedule	Always
Service	All
NAT	Enabled

c. Click *OK*.

To configure FortiGate A as an SSL VPN client in the GUI:

1. Create a peer to verify the server certificate:

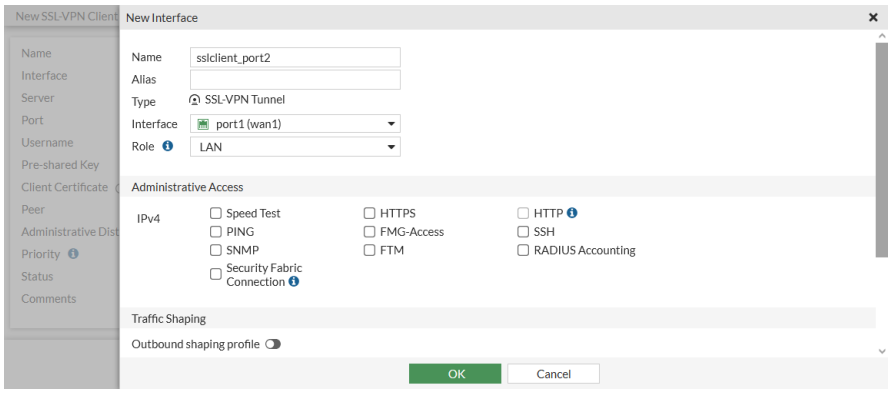
The PKI menu is only available in the GUI (*User & Authentication > PKI*) after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.

If the CA is not known or is public, import the CA that signed the server certificate.

   a. Go to *User & Authentication > PKI* and click *Create New*.
   b. Set the *Name* to *fgt_gui_automation*.
   c. Set *CA* to the CA certificate that is used to verify the server certificate.
   d. Click *OK*.
   e. In the CLI, specify the CN that must be matched:

```
config user peer
    edit "fgt_gui_automation"
        set ca "GUI_CA"
        set cn "*.fos.automation.com"
    next
end
```

2. Configure the SSL VPN client:
   a. Go to *VPN > SSL-VPN Clients* and click *Create New*.
   b. In the *Interface* dropdown, click *Create*.
      i. Enter a Name (*sslclient_port2*).
      ii. Set *Interface* to *port2*.
      iii. Set *Role* to *LAN*.



iv. Click *OK*.

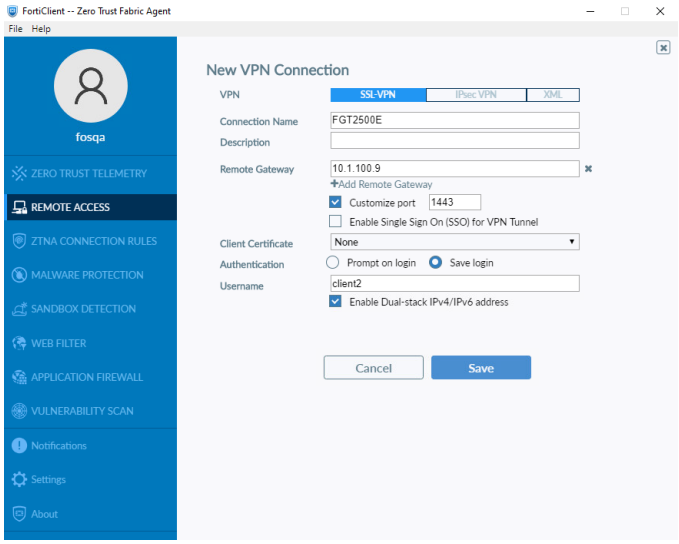
c. Configure the SSL VPN client:

Name	sslclientTo9
Interface	sslclient_port2
Server	Either IPv4 address *10.1.100.9* or IPv6 address *2000:10:1:100::9* can be used and will have the same results.
Port	1443
Username	client2
Pre-shared Key	******
Peer	fgt_gui_automation
Status	Enabled

d. Click *OK*.

To configure FortiClient and connect to the VPN:

1. On the *Remote Access* tab and click *Configure VPN*, or if other connections have already been configured, click the sandwich icon and select *Add a new connection*.
2. Set *Connection Name* to *FGT2500E*, and *Remote Gateway* to *10.1.100.9*.
3. Enable *Customize port* and enter the port number *1443*.
4. Set *Username* to *client2*.
5. Enable *Enable Dual-stack IPv6/IPv6 address*.



6. Click *Save*.
7. Enter the password, then click *Connect*.

To configure an SSL VPN server in tunnel and web mode with dual stack support in the CLI:

1. Create a local user:

```
config user local
    edit "client1"
        set type password
        set passwd ******
    next
end
```

2. Configure the addresses:

```
config firewall address
    edit "bing.com"
        set type fqdn
        set fqdn "www.bing.com"
    next
end
```

```
config firewall address6
    edit "apple_v6"
        set type fqdn
        set fqdn "www.apple.com"
    next
end
```

3. Configure the SSL VPN portal:

```
config vpn ssl web portal
    edit "testportal1"
        set tunnel-mode enable
```

```
        set ipv6-tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
        set split-tunneling enable
        set ipv6-split-tunneling enable
    next
end
```

4. Configure the SSL VPN settings:

```
config vpn ssl settings
    set servercert "fgt_gui_automation"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set port 1443
    set source-interface "port1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "testportal1"
    set dual-stack-mode enable
end
```

5. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "sslvpn"
        set srcintf "ssl.root"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "bing.com"
        set srcaddr6 "all"
        set dstaddr6 "apple_v6"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "client2"
    next
end
```

To configure FortiGate A as an SSL VPN client in the CLI:

1. Create a peer to verify the server certificate:

```
config user peer
    edit "fgt_gui_automation"
        set ca "GUI_CA"
        set cn "*.fos.automation.com"
    next
end
```

2. Configure the interface:

```
config system interface
    edit "sslclient_port2"
        set vdom "vdom1"
        set type ssl
        set role lan
        set snmp-index 46
        set interface "port2"
    next
end
```

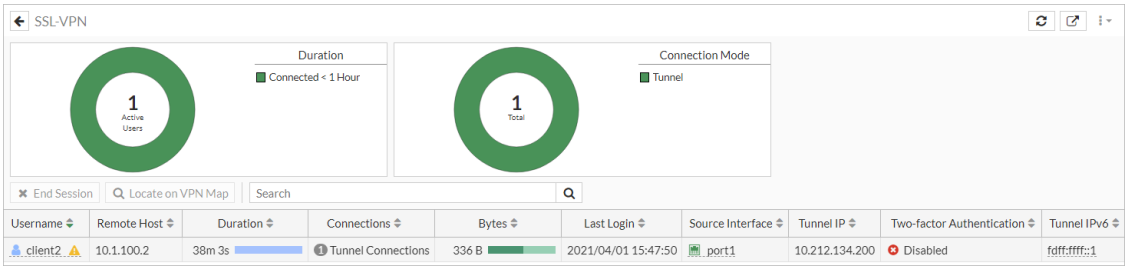
3. Configure the SSL VPN client. Either IPv4 address 10.1.100.9 or IPv6 address 2000:10:1:100::9 can be used and will have the same results:

```
config vpn ssl client
    edit "sslclientTo9"
        set interface "sslclient_port2"
        set user "client2"
        set psk ******
        set peer "fgt_gui_automation"
        set server {10.1.100.9 | 2000:10:1:100::9}
        set port 1443
    next
end
```

Testing dual stack with tunnel mode

To verify the SSL VPN tunnel connection in the GUI:

1. On FortiGate B, go to *Dashboard* > *Network*.
2. Expand the *SSL-VPN* widget.



To verify the SSL VPN tunnel connection in the CLI:

1. On FortiGate B, verify that the client is assigned with both IPv4 and IPv6 addresses:

```
(root) # get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
 HTTPS in/out    Two-factor Auth
 0       client2               1(1)             292    2147483647       10.1.100.2     0/0
```

```
 0/0     0

SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       client2                10.1.100.2       5427    1756/1772
10.212.134.200,fdff:ffff::1
```

2. On FortiGate A, verify the routing tables.
   a. IPv4 with resolved addresses for www.bing.com:

```
(vdom1) # get router info routing-table database
...
Routing table for VRF=0
S    *> 0.0.0.0/0 [10/0] via 172.16.200.254, port1
C    *> 10.0.1.0/24 is directly connected, link_11
C    *> 10.1.100.0/24 is directly connected, port2
C    *> 10.212.134.200/32 is directly connected, sslclient_port2
S    *> 13.107.21.200/32 [10/0] is directly connected, sslclient_port2
C    *> 172.16.200.0/24 is directly connected, port1
S    *> 204.79.197.200/32 [10/0] is directly connected, sslclient_port2
```

   b. IPv6 with resolved addresses for www.apple.com:

```
(vdom1) # get router info6 routing-table database
...
S    *> ::/0 [10/0] via 2000:172:16:200::254, port1, 01:57:23, [1024/0]
C    *> ::1/128 via ::, vdom1, 06:12:54
C    *> 2000:10:0:1::/64 via ::, link_11, 06:12:54
C    *> 2000:10:1:100::/64 via ::, port2, 06:12:54
C    *> 2000:172:16:200::/64 via ::, port1, 06:12:54
S    *> 2600:140a:c000:385::1aca/128 [10/0] via ::, sslclient_port2, 01:33:08, [1024/0]
S    *> 2600:140a:c000:398::1aca/128 [10/0] via ::, sslclient_port2, 01:33:08, [1024/0]
C    *> fdff:ffff::/120 via ::, sslclient_port2, 01:33:08
C    *> fe80::/64 via ::, port2, 06:12:54
```

To test the address connections using ping:

1. On FortiGate A, ping www.bing.com using IPv4 ping:

```
# execute ping www.bing.com
PING www-bing-com.dual-a-0001.a-msedge.net (13.107.21.200): 56 data bytes
64 bytes from 13.107.21.200: icmp_seq=0 ttl=117 time=1.8 ms
...
```

2. On FortiGate B, sniff for IPv4 ICMP packets and observe the results:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
9.675101 ssl.root in 10.212.134.200 -> 13.107.21.200: icmp: echo request
9.675219 port2 out 172.16.200.9 -> 13.107.21.200: icmp: echo request
9.676698 port2 in 13.107.21.200 -> 172.16.200.9: icmp: echo reply
```

```
9.676708 ssl.root out 13.107.21.200 -> 10.212.134.200: icmp: echo reply
...
```

3. On FortiGate A, ping www.apple.com using IPv6 ping:

```
# execute ping6 www.apple.com
PING www.apple.com (2600:140a:c000:385::1aca): 56 data bytes
64 bytes from 2600:140a:c000:385::1aca: icmp_seq=1 ttl=52 time=1.88 ms
...
```

4. On FortiGate B, sniff for IPv6 ICMP packets and observe the results:

```
# diagnose sniffer packet any icmp6 4
interfaces=[any]
filters=[icmp6]
3.564296 ssl.root in fdff:fff::1 -> 2600:140a:c000:385::1aca: icmp6: echo request seq 1
3.564435 port2 out 2000:172:16:200::9 -> 2600:140a:c000:385::1aca: icmp6: echo request seq 1
3.565929 port2 in 2600:140a:c000:385::1aca -> 2000:172:16:200::9: icmp6: echo reply seq 1
[flowlabel 0x1fdff]
3.565953 ssl.root out 2600:140a:c000:385::1aca -> fdff:fff::1: icmp6: echo reply seq 1
[flowlabel 0x1fdff]
...
```

Testing dual stack with web mode

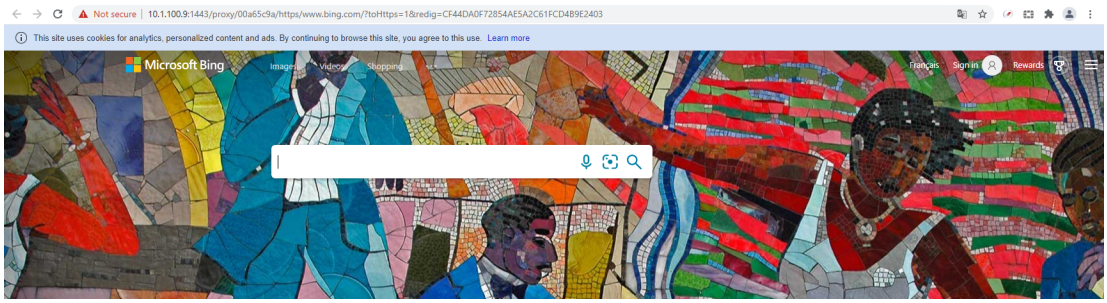
In SSL VPN web mode, users can access both IPv4 and IPv6 bookmarks in the portal. The attribute, `prefer-ipv6-dns` can be enabled to prefer querying IPv6 DNS first, or disabled to prefer querying IPv4.

To test an IPv4 connection to the web portal and access www.bing.com over IPv6:

1. On FortiGate B, prioritize resolving IPv6 addresses:

```
config vpn ssl web portal
    edit "testportal1"
        set prefer-ipv6-dns enable
    next
end
```

2. Log in to the web portal in the browser over the IPv4 address 10.1.100.9.
3. Create a new HTTP/HTTPS bookmark named *bing* for the URL www.bing.com.
4. Click the *bing* bookmark. The bing page will open over IPv6.

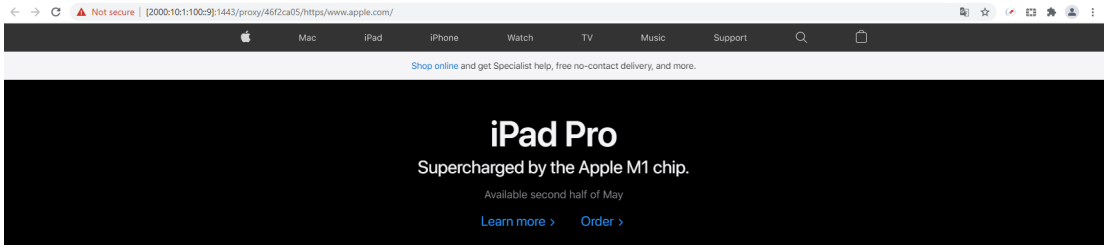


To test an IPv6 connection to the web portal and access www.apple.com over IPv4:

1. On FortiGate B, prioritize resolving IPv4 addresses:

```
config vpn ssl web portal
    edit "testportal1"
        set prefer-ipv6-dns disable
    next
end
```

2. Log in to the web portal in the browser over the IPv6 address [2000:10:1:100::9].
3. Create a new HTTP/HTTPS bookmark named *apple* for the URL www.apple.com.
4. Click the *apple* bookmark. The apple page will open over IPv4.

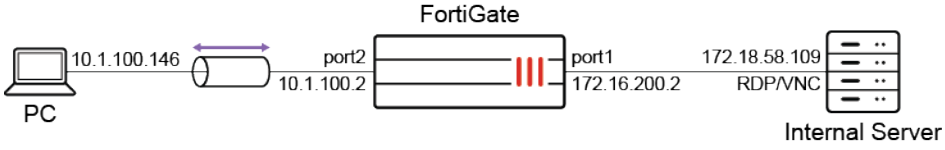


Disable the clipboard in SSL VPN web mode RDP connections

In web portal profiles, the clipboard can be disabled for SSL VPN web mode RDP/VNC connections. User will not be able to copy and paste content to or from the internal server.

Example

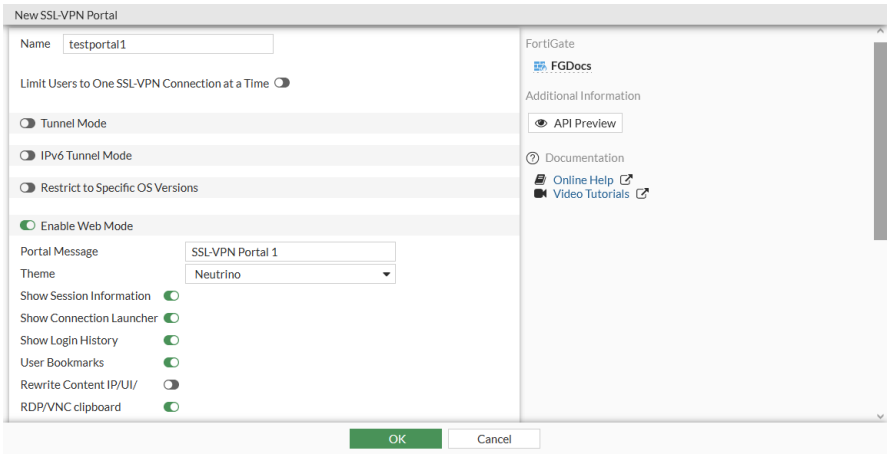
In this example, two groups of users are using SSL VPN web mode to access internal servers with RDP/VNC. One group is allowed to copy and paste content to and from the internal server using the clipboard, while the other is not.



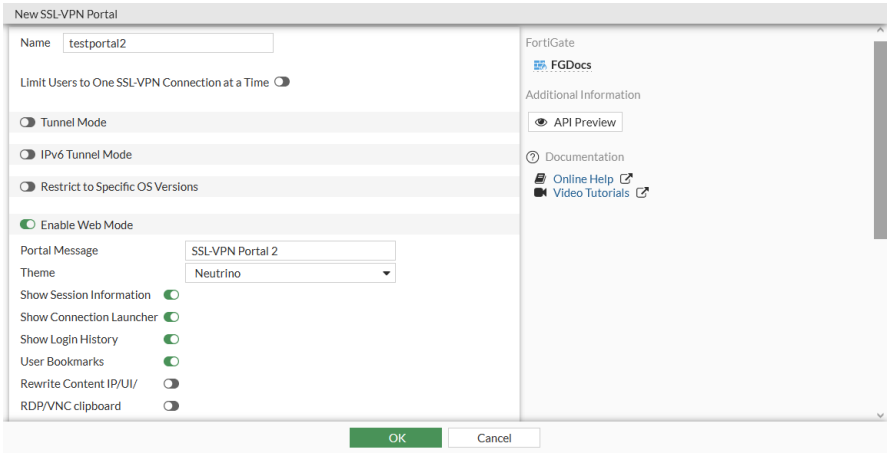
To configure the SSL VPN portals in the GUI:

1. Go to *VPN > SSL-VPN Portals* and click *Create New*.
2. Enter a name for the portal, such as *testportal1*.
3. Enable *Enable Web Mode* and enable *RDP/VNC clipboard* to allow copying and pasting.

4. Configure the remaining settings as needed.



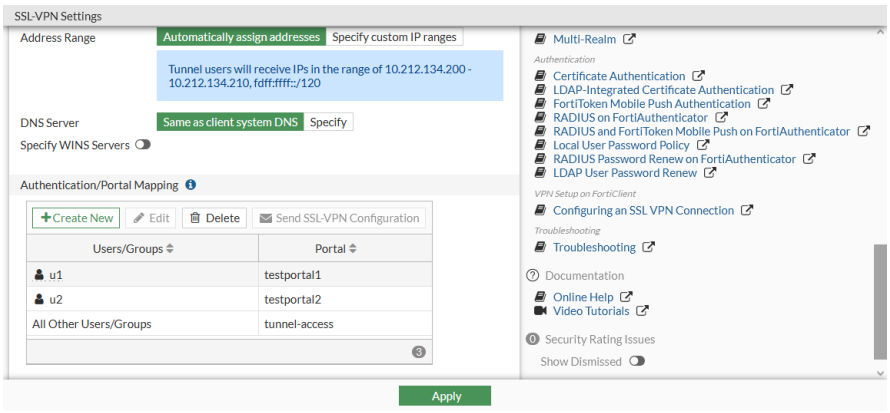
5. Click *OK*.
6. Click *Create New* again.
7. Enter a name for the portal, such as *testportal2*.
8. Enable *Enable Web Mode* and disable *RDP/VNC clipboard* to prevent copying and pasting.
9. Configure the remaining settings as needed.



10. Click *OK*.

To configure the SSL VPN settings in the GUI:

1. Go to *VPN > SSL-VPN Settings*.
2. Set *Listen on Interface* to port2.
3. In the *Authentication/Portal Mapping* table, add the users to each of the portals:
   a. Click *Create New*.
   b. Set *Users/Groups* to *u1* and *Portal* to *testportal1*.
   c. Click *OK*, then click *Create New* again.
   d. Set *Users/Groups* to *u2* and *Portal* to *testportal2*.
   e. Click *OK*.
4. Configure the remaining settings as needed.



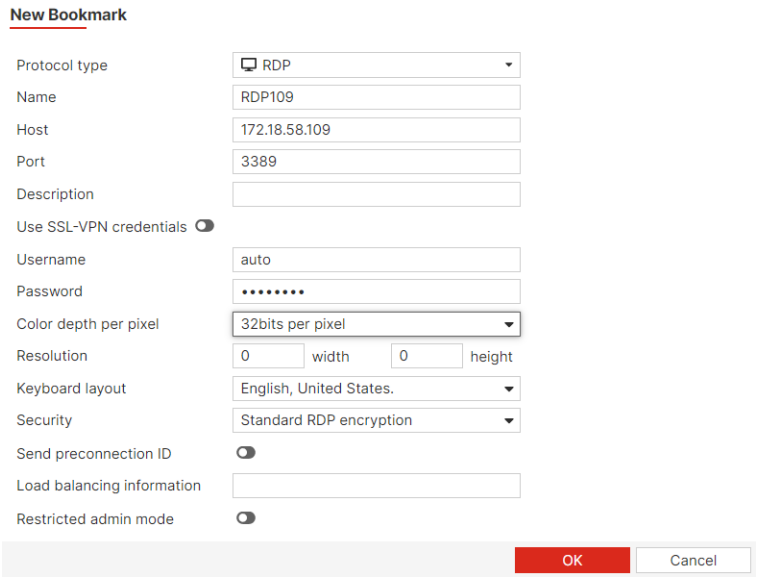
5. Click *Apply*.

To configure a firewall policy for SSL VPN in the GUI:

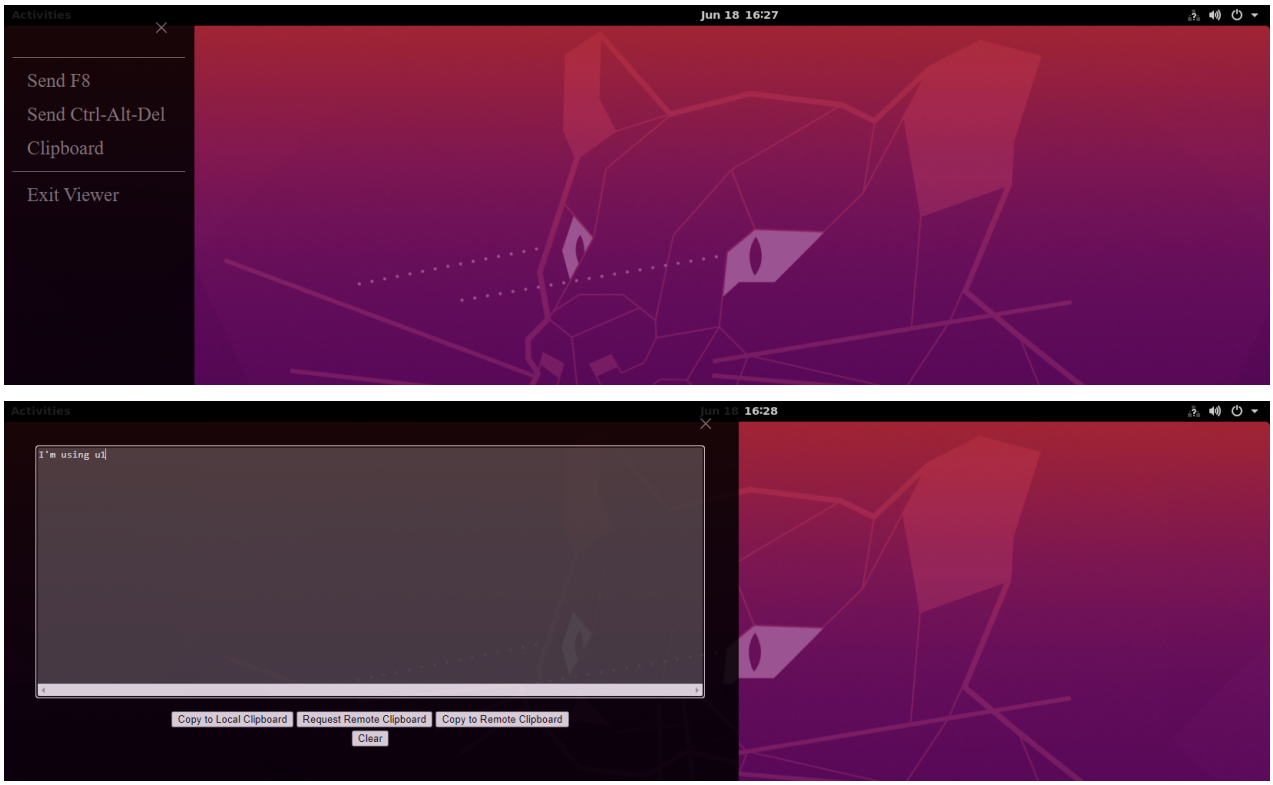
1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Set a name for the policy, such as *policy_to_sslvpn_tunnel*.
3. Set *Incoming Interface* to the SSL VPN tunnel interface and *Outgoing Interface* to port1.
4. Set *Source* to the users, *u1* and *u2*, and all addresses.
5. Set *Destination* to all addresses.
6. Set *Schedule* to *always*, *Service* to *All*, and *Action* to *Accept*.
7. Configure the remaining settings as needed.
8. Click *OK*.

To test the if the users can use the clipboard:

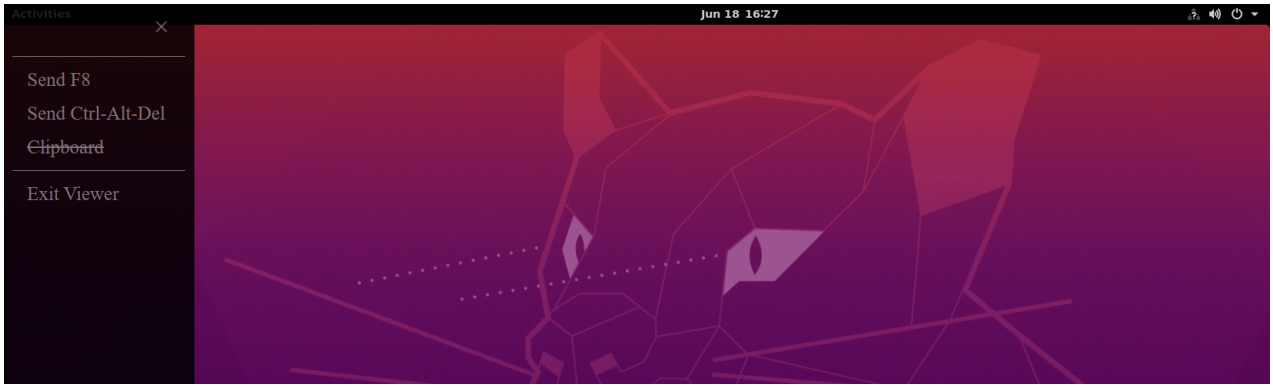
1. On the PC, open a web browser and log in to the web portal as user *u1*.
2. Access the internal server using RDP/VNC.



3. The clipboard is available and you can copy and paste content to and from the remote server.



4. Log out of the web portal, then log back in as user *u2* and access the internal server using RDP/VNC. The clipboard is disabled.



To configure the SSL-VPN portals and settings in the CLI:

1. Configure the SSL VPN portals:

```
config vpn ssl web portal
    edit "testportal1"
        set web-mode enable
        set clipboard enable
        ...
    next
    edit "testportal2"
        set web-mode enable
```

```
        set clipboard disable
        ...
    next
end
```

2. Configure the SSL VPN settings:

```
config vpn ssl settings
    set port 1443
    set source-interface "port2"
    set source-address "all"
    set source-address6 "all"
    set default-portal "tunnel-access"
    config authentication-rule
        edit 1
            set users "u1"
            set portal "testportal1"
        next
        edit 2
            set users "u2"
            set portal "testportal2"
        next
    end
end
```

3. Configure a firewall policy for SSL VPN:

```
config firewall policy
    edit 1
        set name "policy_to_sslvpn_tunnel"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "u1" "u2"
    next
end
```

4. On the PC, open a web browser, log in to the web portal as user *u1*, access the internal server using RDP/VNC, and use the clipboard.
5. Check the SSL VPN session monitor:

```
# get vpn ssl monitor
SSL-VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
 HTTPS in/out    Two-factor Auth
```

```
 0       u1             1(1)             N/A     10.1.100.146   0/0     0/364   0

SSL-VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       u1             10.1.100.146     64      0/700  RDP 172.18.58.109
```

6. On the PC, open a web browser, log in to the web portal as user *u2*, access the internal server using RDP/VNC, and note that the clipboard is not available.
7. Check the SSL VPN session monitor:

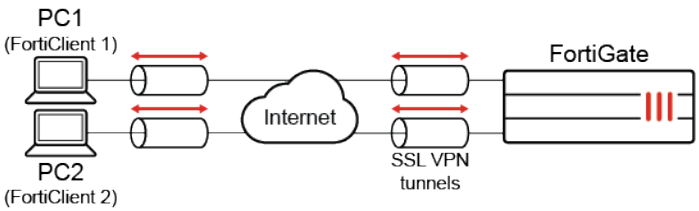
```
# get vpn ssl monitor
SSL-VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
 HTTPS in/out    Two-factor Auth
 0       u2             1(1)             N/A     10.1.100.146   0/0     0/2681  0

SSL-VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       u2             10.1.100.146     7       0/553  RDP 172.18.58.109
```

SSL VPN IP address assignments

When a user disconnects from a VPN tunnel, it is not always desirable for the released IP address to be used immediately. In SSL VPN, IP addresses can be assigned from the pool in a round robin fashion, instead of the default first-available address method.

Example



In this example, two PCs connect to the VPN. SSL VPN is configured to use round robin IP address assignment. Dual stack address assignment (both IPv4 and IPv6) is used.

After a tunnel is disconnected, freeing a low IP address, the next client that connects gets the next address in the round robin instead of the lowest address.

To configure SSL VPN with round robin and dual stack:

1. Create IPv4 and IPv6 address ranges:

```
config firewall address
    edit "sslvpn_ipv4_pool"
        set type iprange
        set start-ip 173.10.1.1
        set end-ip 173.10.1.3
    next
end
```

```
config firewall address6
    edit "sslvpn_ipv6_pool"
        set type iprange
        set start-ip 2000::ad0a:101
        set end-ip 2000::ad0a:103
    next
end
```

2. Set the address ranges as IP pools in the SSL VPN settings:

```
config vpn ssl settings
    set tunnel-ip-pools "sslvpn_ipv4_pool"
    set tunnel-ipv6-pools "sslvpn_ipv6_pool"
end
```

   When round-robin is used, any address pools defined in the web portal are ignored and the tunnel IPv4 and IPv6 pool addresses in the SSL VPN settings are used. Only one set of IP pool addresses can be applied.

3. Enable round-robin and dual stack in the SSL VPN settings:

```
config vpn ssl settings
    set dual-stack-mode enable
    set tunnel-addr-assigned-method round-robin
end
```

   By default, the IP pool assignment follows the first available rule.

4. Create two users and assign them to an SSL VPN policy:

```
config user local
    edit "u1"
        set type password
        set passwd **********
    next
    edit "u2"
        set type password
        set passwd **********
    next
end
```

```
config firewall policy
    edit 1
```

```
        set name "sslvpnd"
        set srcintf "ssl.vdom1"
        set dstintf "link_11" "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "u1" "u2"
    next
end
```

To test the results:

1. Log in to the SSL VPN on PC1 using user u1 and then check its assigned IP address:

```
# get vpn ssl monitor
SSL-VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
 HTTPS in/out    Two-factor Auth
 0       u1              1(1)             N/A     10.1.100.145   0/0     0/0     0

SSL-VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       u1              10.1.100.145     13      49935/35251    173.10.1.1,2000::ad0a:101
```

2. Log in to the SSL VPN on PC1 using user u2 and then check its assigned IP address:

```
# get vpn ssl monitor
SSL-VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
 HTTPS in/out    Two-factor Auth
 0       u1              1(1)             N/A     10.1.100.145   0/0     0/0     0
 1       u2              1(1)             N/A     10.1.100.254   0/0     0/0     0

SSL-VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       u1              10.1.100.145     44      90126/70405    173.10.1.1,2000::ad0a:101
 1       u2              10.1.100.254     10      10563/8158     173.10.1.2,2000::ad0a:102
```

3. Log user u1 off of PC1, then log them back in and check that the assigned IP address is not the same as was previously assigned:

```
# get vpn ssl monitor
SSL-VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
 HTTPS in/out    Two-factor Auth
 0       u1              1(1)             N/A     10.1.100.145   0/0     0/0     0
 1       u2              1(1)             N/A     10.1.100.254   0/0     0/0     0
```

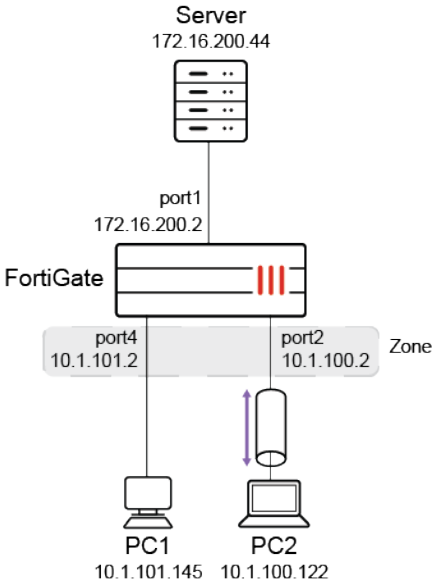
```
SSL-VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       u1              10.1.100.145     10      50992/41159    173.10.1.3,2000::ad0a:103
 1       u2              10.1.100.254     43      30374/21860    173.10.1.2,2000::ad0a:102
```

Using SSL VPN interfaces in zones

SSL VPN interfaces can be used in zones, simplifying firewall policy configuration in some scenarios.

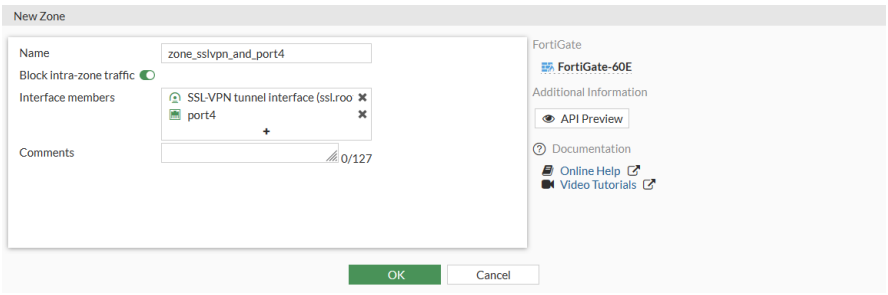
Example

In this example, a zone is created that includes a physical interface (port4) and an SSL VPN interface. The zone is used as the source interface in a firewall policy. PC1 is used for regular access with a firewall policy, and PC2 uses the SSL VPN for access.



To create a zone that includes the port4 and ssl.root interfaces in the GUI:

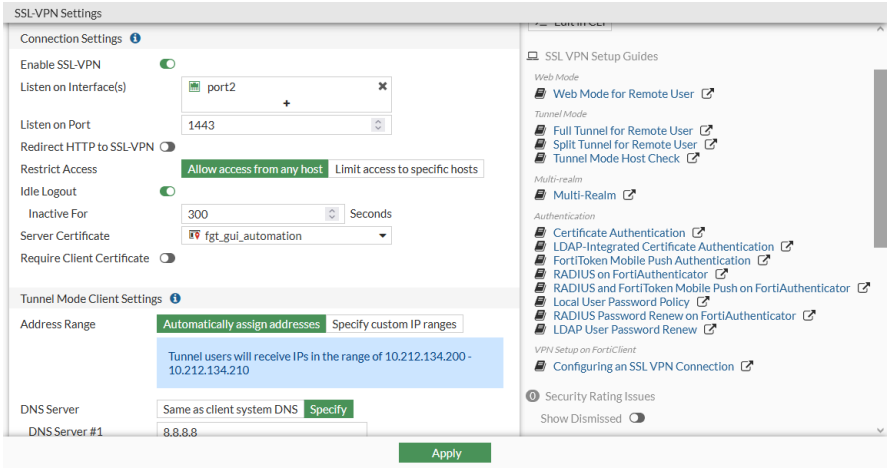
1. Go to *Network* > *Interfaces* and click *Create New* > *Zone*.
2. Set the name of the zone, such as *zone_sslvpn_and_port4*.
3. Add *port4* and *ssl.root* to the *Interface members*.



4. Click *OK*.

To configure SSL VPN settings in the GUI:

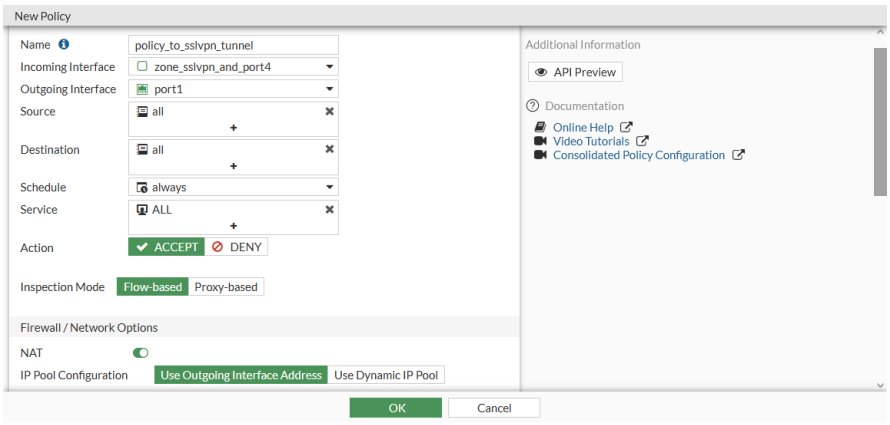
1. Go to *VPN* > *SSL-VPN Settings*.
2. Set *Listen on Interface(s)* to *port2*.
3. Set *Listen on Port* to *1443*.
4. Select a *Server Certificate* (*fgt_gui_automation* is used in this example).
5. Configure the remaining settings as required.



6. Click *Apply*.

To configure a firewall policy with the zone as the source interface in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Set the policy name, such as *policy_to_sslvpn_tunnel*.
3. Set *Incoming Interface* to *zone_sslvpn_and_port4*.
4. Set *Outgoing Interface* to *port1*.
5. Configure the remaining settings as required.



6. Click *OK*.

To configure the zone, SSL VPN, and policy in the CLI:

1. Create a zone that includes the port4 and ssl.root interfaces:

```
config system zone
    edit "zone_sslvpn_and_port4"
        set interface "port4" "ssl.root"
    next
end
```

2. Configure SSL VPN settings with port2 as the source interface:

```
config vpn ssl settings
    set servercert "fgt_gui_automation"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set dns-server1 8.8.8.8
    set dns-server2 8.8.4.4
    set port 1443
    set source-interface "port2"
    set source-address "all"
    set source-address6 "all"
    set default-portal "web-access"
end
```

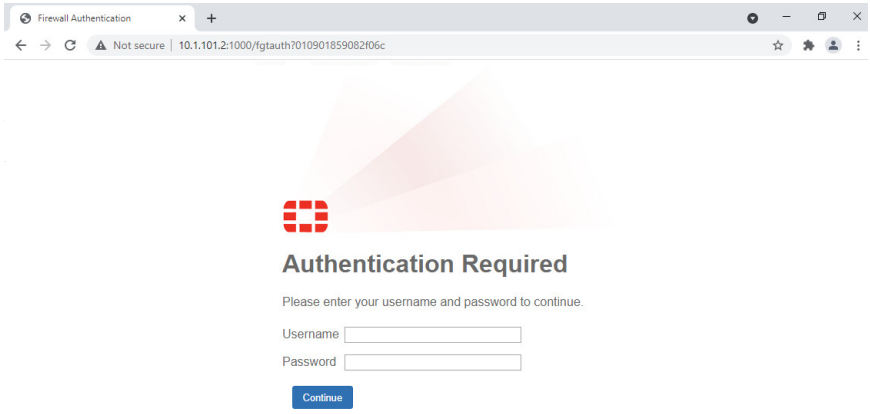
3. Configure a firewall policy with the zone as the source interface:

```
config firewall policy
    edit 2
        set name "policy_to_sslvpn_tunnel"
        set srcintf "zone_sslvpn_and_port4"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
```

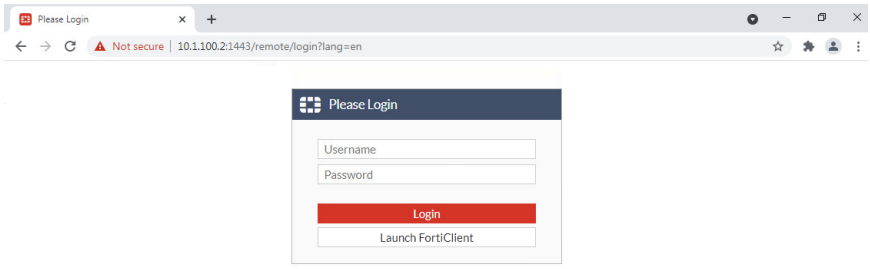
```
        set logtraffic all
        set nat enable
        set users "u1"
    next
end
```

To test the configuration:

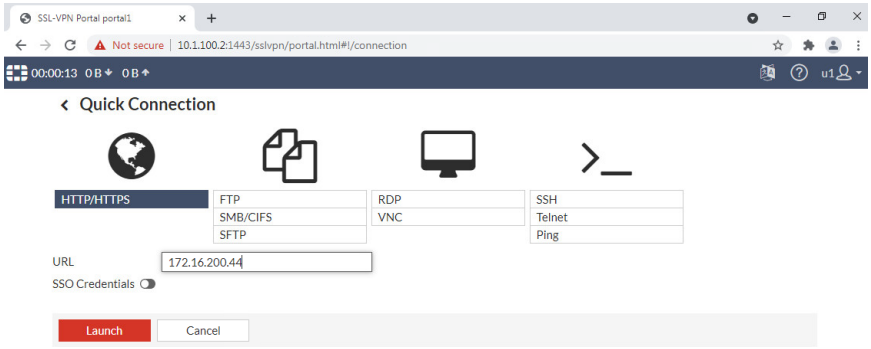
1. On PC1, open a browser and try to access the server at 172.16.200.44.
   You are redirected to the authentication page.



2. Enter the *Username* and *Password*, then click *Continue*.
   You are redirected back to the server.
3. On PC2, access the SSL VPN web portal.



4. Enter the *Username* and *Password*, then click *Login*.
5. Access the server using the bookmark.



SSL VPN troubleshooting

The following topics provide information about SSL VPN troubleshooting:

- Debug commands on page 2986
- Troubleshooting common issues on page 2987

Debug commands

SSL VPN debug command

Use the following diagnose commands to identify SSL VPN issues. These commands enable debugging of SSL VPN with a debug level of -1 for detailed results.

```
diagnose debug application sslvpn -1
diagnose debug enable
```

The CLI displays debug output similar to the following:

```
FGT60C3G10002814 # [282:root]SSL state:before/accept initialization (172.20.120.12)
[282:root]SSL state:SSLv3 read client hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write server hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write change cipher spec A (172.20.120.12)
[282:root]SSL state:SSLv3 write finished B (172.20.120.12)
[282:root]SSL state:SSLv3 flush data (172.20.120.12)
[282:root]SSL state:SSLv3 read finished A:system lib(172.20.120.12)
[282:root]SSL state:SSLv3 read finished A (172.20.120.12)
[282:root]SSL state:SSL negotiation finished successfully (172.20.120.12)
[282:root]SSL established: DHE-RSA-AES256-SHA SSLv3 Kx=DH Au=RSA Enc=AES(256) Mac=SHA1
```

To disable the debug:

```
diagnose debug disable
diagnose debug reset
```

Remote user authentication debug command

Use the following diagnose commands to identify remote user authentication issues.

```
diagnose debug application fnbamd -1
diagnose debug reset
```

Troubleshooting common issues

To troubleshoot no visible SSL VPN menus or tunnel mode options in the GUI:

Enable the feature visibility in the GUI or CLI.

In the GUI:

1. Go to *System* > *Feature Visibility*.
2. In the *Core Features* section, enable *SSL-VPN*.
3. Click *Apply*.

In the CLI:

```
config system settings
    set gui-sslvpn enable
end
```

To troubleshoot no visible SSL VPN web mode options in the GUI or CLI:

```
config system global
    set sslvpn-web-mode enable
end
```

To troubleshoot getting no response from the SSL VPN URL:

1. Go to *VPN* > *SSL-VPN Settings*.
   a. Confirm that SSL VPN is enabled.
   b. Check the SSL VPN port assignment.
   c. Check the *Restrict Access* setting to ensure the host you are connecting from is allowed.
2. Go to *Policy* > *Firewall Policy*.
   a. Check that the policy for SSL VPN traffic is configured correctly.
   b. Check the URL you are attempting to connect to. It should follow this pattern:

      ```
      https://<FortiGate IP>:<Port>
      ```

   c. Check that you are using the correct port number in the URL. Ensure FortiGate is reachable from the computer.

      ```
      ping <FortiGate IP>
      ```

   d. Check the browser has *TLS 1.1*, *TLS 1.2*, and *TLS 1.3* enabled.

To troubleshoot FortiGate connection issues:

1. Check the Release Notes to ensure that the FortiClient version is compatible with your version of FortiOS.
2. FortiClient uses IE security setting, In IE *Internet options* > *Advanced* > *Security*, check that *Use TLS 1.1* and *Use TLS 1.2* are enabled.

3. Check that SSL VPN *ip-pools* has free IPs to sign out. The default *ip-poolsSSLVPN_TUNNEL_ADDR1* has 10 IP addresses.
4. Export and check FortiClient debug logs.
   a. Go to *File > Settings*.
   b. In the *Logging* section, enable *Export logs*.
   c. Set the *Log Level* to *Debug* and select *Clear logs*.
   d. Try to connect to the VPN.
   e. When you get a connection error, select *Export logs*.

To troubleshoot SSL VPN hanging or disconnecting at 98%:

1. A new SSL VPN driver was added to FortiClient 5.6.0 and later to resolve SSL VPN connection issues. If your FortiOS version is compatible, upgrade to use one of these versions.
2. Latency or poor network connectivity can cause the login timeout on the FortiGate. In FortiOS 5.6.0 and later, use the following commands to allow a user to increase the SSL VPN login timeout setting.

```
config vpn ssl settings
  set login-timeout 180 (default is 30)
  set dtls-hello-timeout 60 (default is 10)
end
```

To troubleshoot tunnel mode connections shutting down after a few seconds:

This might occur if there are multiple interfaces connected to the Internet, for example, SD-WAN. This can cause the session to become “dirty”. To allow multiple interfaces to connect, use the following CLI commands.

If you are using a FortiOS 6.0.1 or later:

```
config system interface
  edit <name>
    set preserve-session-route enable
  next
end
```

If you are using a FortiOS 6.0.0 or earlier:

```
config vpn ssl settings
   set route-source-interface enable
end
```

To troubleshoot users being assigned to the wrong IP range:

1. Go to *VPN > SSL-VPN Portals* and *VPN > SSL-VPN Settings* and ensure the same *IP Pool* is used in both places.
   Using the same *IP Pool* prevents conflicts. If there is a conflict, the portal settings are used.

To troubleshoot slow SSL VPN throughput:

Many factors can contribute to slow throughput.

This recommendation tries to improve throughput by using the FortiOS Datagram Transport Layer Security (DTLS) tunnel option, available in FortiOS 5.4 and above.

DTLS allows SSL VPN to encrypt traffic using TLS and uses UDP as the transport layer instead of TCP. This avoids retransmission problems that can occur with TCP-in-TCP.

FortiClient 5.4.0 to 5.4.3 uses DTLS by default. FortiClient 5.4.4 and later uses normal TLS, regardless of the DTLS setting on the FortiGate.

To use DTLS with FortiClient:

1. Go to *File > Settings* and enable *Preferred DTLS Tunnel*.

To enable DTLS tunnel on FortiGate, use the following CLI commands:

```
config vpn ssl settings
  set dtls-tunnel enable
end
```

User & Authentication

In *User & Authentication*, you can control network access for different users and devices in your network. FortiGate authentication controls system access by user group. By assigning individual users to the appropriate user groups you can control each user's access to network resources. You can define local users and peer users on the FortiGate unit. You can also define user accounts on remote authentication servers and connect them to FortiOS.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 3014 and Configuring client certificate authentication on the LDAP server on page 3029.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 3022.

To secure RADIUS connections, consider using RADSEC over TLS instead. See Configuring a RADSEC client on page 3073.

You can control network access for different device types in your network by doing the following:

- Identifying and monitoring the types of devices connecting to your network
- Using MAC address based access control to allow or deny individual devices
- Using Telemetry data received from FortiClient endpoints to construct a policy to deny access to endpoints with known vulnerabilities or to quarantine compromised endpoints

The following sections provide information about users and devices:

- User definition, groups, and settings on page 2991
- Basic authentication with cached client certificates on page 3012
- LDAP servers on page 3014
- RADIUS servers on page 3032
- SAML on page 3080
- TACACS+ servers on page 3110
- SCIM servers on page 3112
- FortiTokens on page 3122
- PKI on page 3151
- FSSO on page 3159
- Include usernames in logs on page 3176

User definition, groups, and settings

FortiGate authentication controls system access by user groups. By assigning individual users to the appropriate user groups, this controls each user's access to network resources. The user groups members are user accounts, of which there are several types. Local and peer users are defined in FortiOS. User accounts can also be defined on remote authentication servers.

This section contains information about configuring the following:

- Users on page 2991
- User groups on page 2993
- Authentication settings on page 3000
- Retail environment guest access on page 3005
- Customizing complexity options for the local user password policy on page 3007

For information about configuring authentication servers, see the LDAP servers on page 3014, RADIUS servers on page 3032, TACACS+ servers on page 3110, and SAML on page 3080 sections.

Users

A user is a user account consisting of a username, password, and sometimes other information, that is configured in FortiOS or on an external authentication server. There are several types of user accounts with slightly different methods of authentication.

User type	Authentication method
Local	The username and password must match a user account stored in FortiOS. Authentication is done by a firewall policy.
Remote	Remote users consist of usernames defined in FortiOS that are authenticated by a remote server. For example, RADIUS, TACACS+, LDAP, or FortiNAC. The server must be configured in FortiOS before creating a user.
FSSO	Users on a Microsoft Windows, Citrix, or Novell network can use their network authentication to access resources through the FortiGate. Access is controlled through FSSO user groups, which contain Windows, Citrix, or Novell user groups as members. The FSSO agent must be configured in FortiOS before creating a user (see FSSO on page 3159).
PKI or peer	A PKI or peer user is a digital certificate holder that authenticates using a client certificate. No password is required, unless two-factor authentication is enabled. In the GUI, the *User & Authentication > PKI* menu is only available after a PKI user is configured in the CLI (see Configuring a PKI user on page 3151).

Some user types have an option to enable multi-factor authentication using FortiToken or FortiToken Cloud. In some cases, the user must be defined first, and then can be edited to add multi-factor authentication. See FortiTokens on page 3122 for more information.

To create a user:

1. Go to User Authentication > User Definition and click Create New. The *Users/Groups Creation Wizard* appears.
2. Select a *User Type* and click *Next*.
3. The remaining wizard steps depend on the user type:
   - *Local User*:
     i. Enter a *Username* and *Password*, then click *Next*.
     ii. Optionally, enable *Two-factor Authentication* and configure the following:

Authentication Type	Select *FortiToken Cloud* or *FortiToken*.
Token	If using FortiToken to authenticate, select a token.
Email Address	Enter an email address.
SMS	Enable to send an SMS message to activate the token.
Country Dial Code	Select the country code.
Phone Number	Enter a phone number.

     iii. Click *Next*, then click *Submit*.
   - *Remote LDAP User*:
     i. Select an *LDAP Server*, then click *Next*.
     ii. Select the users to add from the LDAP server. If the user ID matches an existing configured username, it cannot be added.

     iii. Click *Submit*.

- *Remote RADIUS User* and *Remote TACACS+ User*:
  i. Enter a *Username* and select the server.
  ii. Click *Next*.
  iii. Optionally, enable *Two-factor Authentication* and configure the settings as needed.
  iv. Click *Next*, then click *Submit*.
- *FSSO*:
  i. Select an *FSSO Agent*, click the *+* to add *AD Groups*, then click *Next*.
  ii. Select an FSSO group to add the *AD Groups* to. If an FSSO group already exists (see Configuring FSSO user groups on page 2998), click *Choose Existing* and select the group. Otherwise, click *Create New*, enter a name, and click *OK*.
  iii. Click *Submit*.

User groups

A user group is a list of user identities. A user identity can be a:

- Local user account (username/password) stored on the FortiGate
- Remote user account (password stored on a RADIUS, LDAP, or TACACS+ server)
- PKI user account with a digital client authentication certificate stored on the FortiGate
- RADIUS, LDAP, or TACACS+ server, optionally specifying particular user groups on that server
- User group defined on an FSSO server

User groups provide the ability to combine users that require the same permissions so they can be referenced at once, which enables consistency in configurations. User groups allow for remote servers to be referenced by leveraging the pre-existing user accounts, instead of redefining them on the FortiGate.

For example, when a new employee joins a department, they can be added to their respective group, whether in the remote authentication server or local group, and be subject to the same access as their colleagues in the same department. In FortiOS, user groups can be used when configuring firewall policies, traffic shaping policies, proxy policies, SSL VPN portals, IPsec VPN XAUTH, ZTNA, wireless networks (SSIDs), web filtering profiles, identity-based routing, and system administrators with remote authentication.

In most cases, the FortiGate authenticates users by requesting their username and password. The FortiGate checks local user accounts first. If a match is not found, the FortiGate checks the RADIUS, LDAP, or TACACS+ servers that belong to the user group. Authentication succeeds when a matching username and password are found. If the user belongs to multiple groups on a server, those groups will also be matched.

Four types of user groups can be configured:

- Firewall
- FSSO
- RSSO
- Guest

Configuring firewall user groups

Firewall user groups are used locally as part of authentication. For example, when a firewall policy allows access only to specified user groups, users must authenticate before matching the policy. If the user authenticates

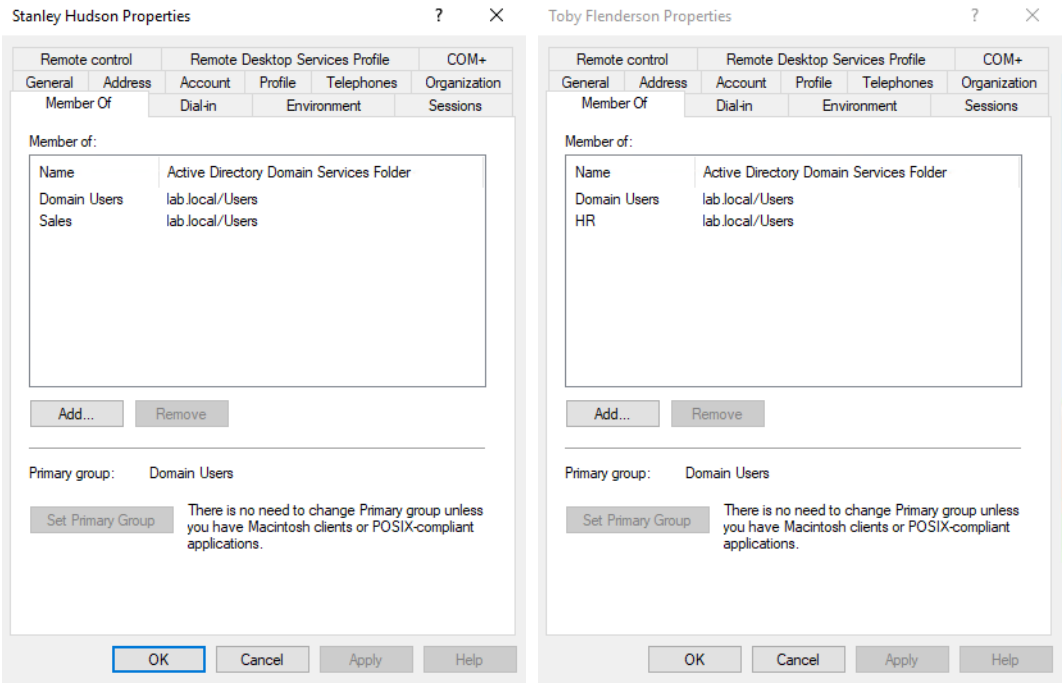
successfully and is a member of one of the permitted groups, the policy is applied to the user. A firewall user group may contain local users (defined locally or authenticated remotely), PKI users, or authentication servers.

There are two options to add users in a firewall group configuration: members or remote groups. Members are the individual users who have been defined in FortiOS. Remote groups are remote server that users may authenticate to. One or more user groups can be specified within that server to limit which users can authenticate to the firewall user group. Both options may be used at the same time. The FortiGate attempts to authenticate users in the members list first, and then the remote groups if the initial authentication does not succeed.

When adding remote groups to user groups, FortiTokens cannot be applied to the users. To use remote authentication servers and FortiToken for multi-factor authentication, a remote user type must be created and then added as a user group member.

The following user group configuration examples have local members and a remote authentication server user group. There are two LDAP users, but the principle applies to other remote authentication server types.

Both LDAP users (shudson and tflenderson) belong to the primary group, Domain Users. The user, shudson belongs to the Sales group; tflenderson belongs to the HR group.



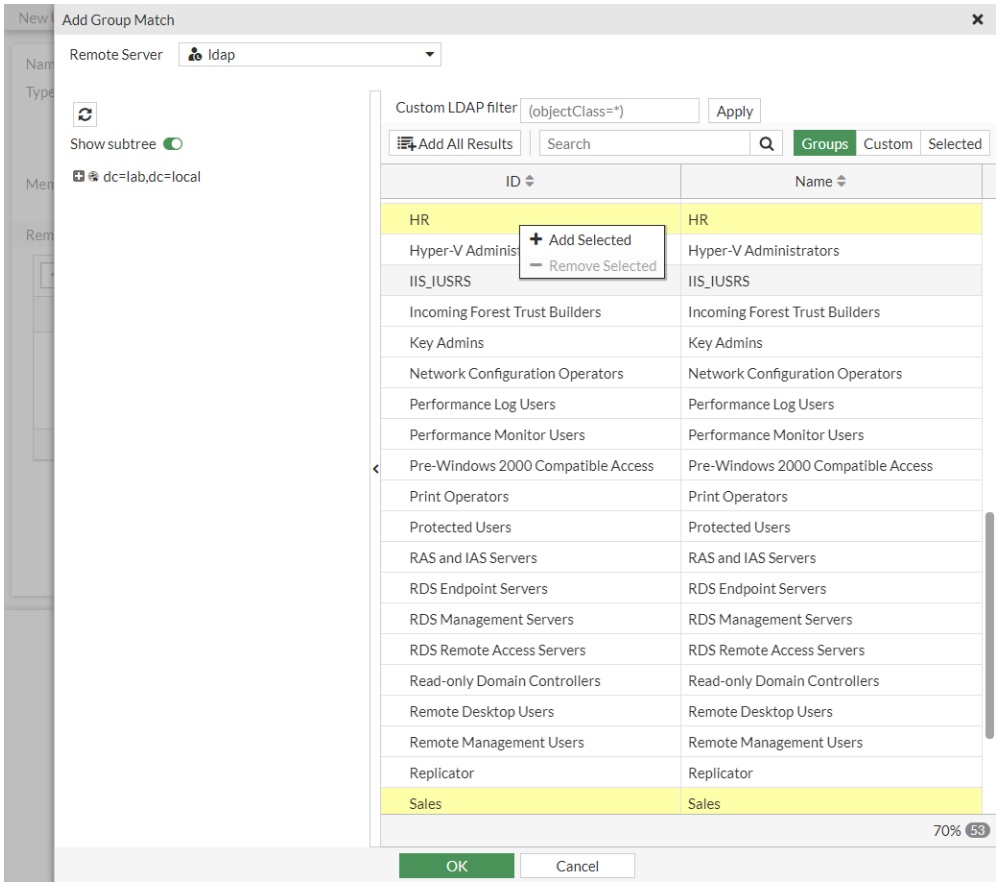
Example 1: Adding multiple remote groups to a user group

In this example, two remote groups (HR and Sales) are added to a firewall group called SSL_VPN_ACCESS.

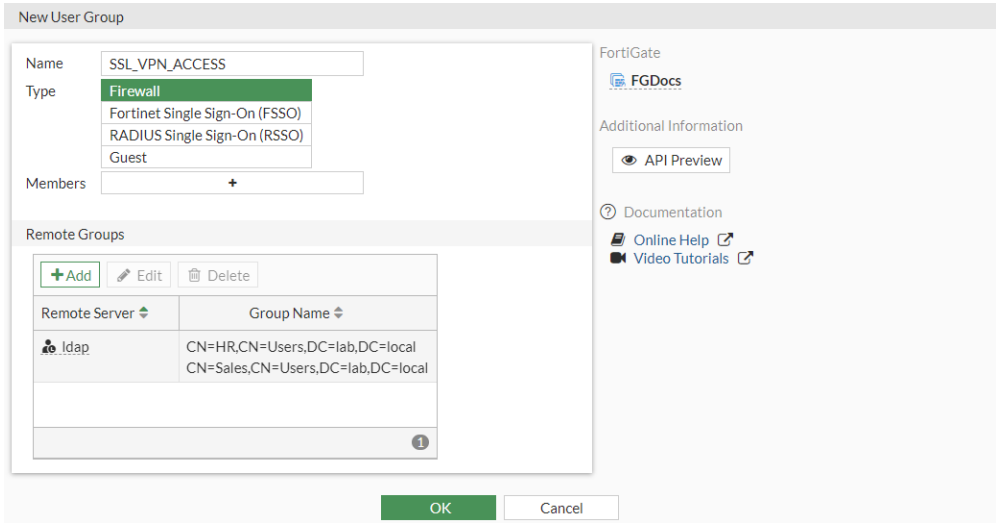
To add multiple remote groups to a user group:

1. Go to *User & Authentication* > *User Groups* and click *Create New*. *Firewall* is selected as the default *Type*.
2. Enter the group name, *SSL_VPN_ACCESS*.
3. In the *Remote Groups Section*, click *Add*.
4. Set *Remote Server* to the LDAP server (*ldap*).

5. In the *Groups* table, select *Sales*, then right-click and select *Add Selected*.
6. Select *HR*, then right-click and select *Add Selected*.



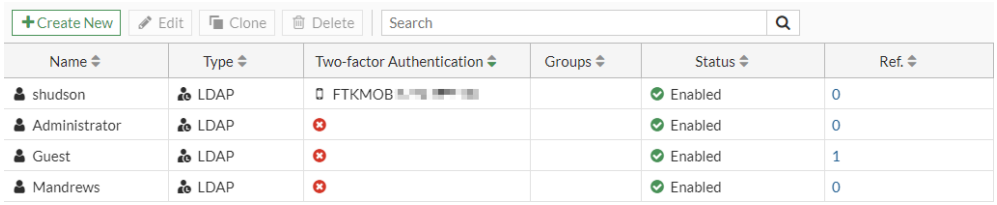
7. Click *OK*.
   Both user group paths are specified under the *Group Name*.



8. Click *OK*.
   In this configuration, shudson and tflenderson would be able to authenticate to this group.

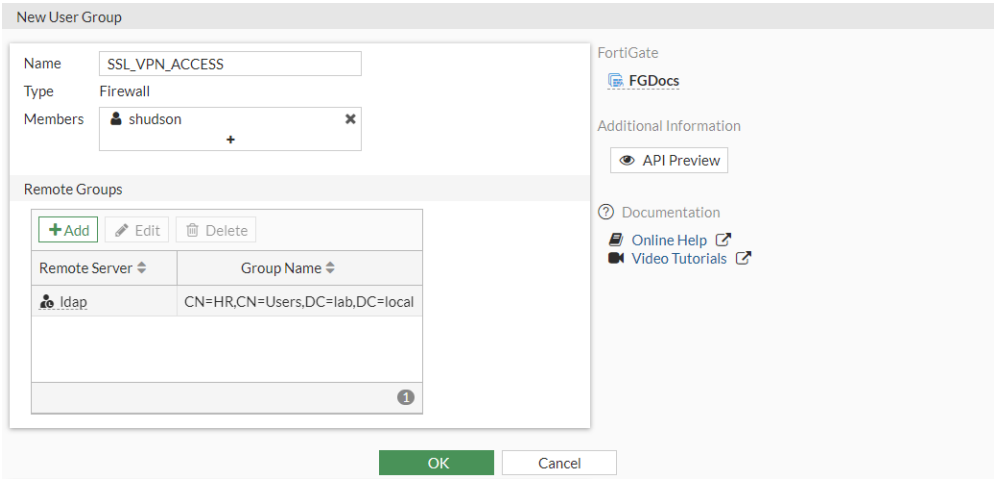
Example 2: combining remote groups and local users in a user group

In this example, the firewall group (SSL_VPN_ACCESS) is configured to contain the HR remote group and a local LDAP user (shudson) with multi-factor authentication.



To combine remote groups and local users in a user group:

1. Go to *User & Authentication > User Groups* and click *Create New*. *Firewall* is selected as the default *Type*.
2. Enter the group name, *SSL_VPN_ACCESS*.
3. In the *Remote Groups Section*, click *Add*.
4. Set *Remote Server* to the LDAP server (*ldap*).
5. In the *Groups* table, select *HR*, then right-click and select *Add Selected*.
6. Click *OK*.
7. In the *Members* field, click the *+* and add *shudson*.



8. Click *OK*.

   In this configuration, shudson, tflenderson, and any members of the HR LDAP group would be able to authenticate to the user group. Other users in the Sales group are not allowed.

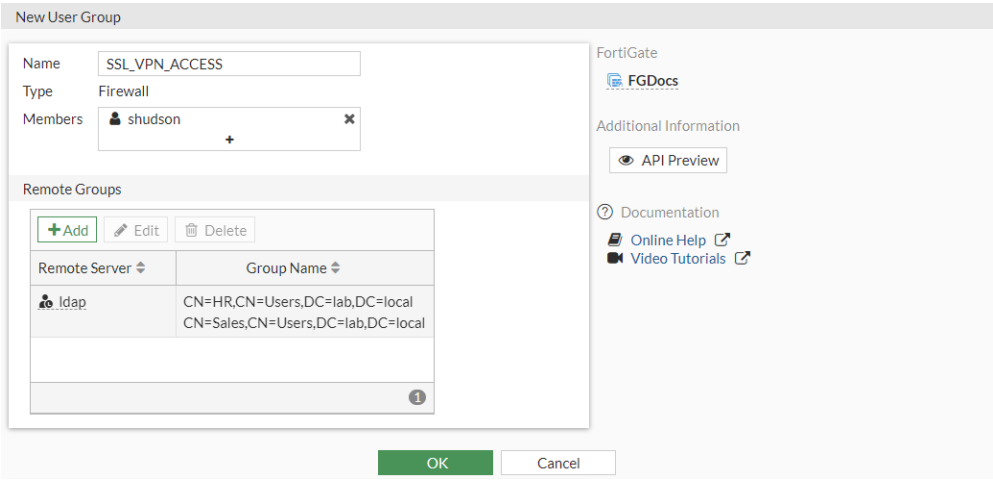
Example 3: adding a user as a member and their group as a remote groups

This example uses a combination of the previous examples. The HR and Sales groups are added as remote groups similar to example 1. The local LDAP user, shudson (using a FortiToken), from example 2 is added as a group member.

This example is for demonstration only. It may cause unwanted results, so this configuration is not advised.

To add a user as a member and their group as a remote groups:

1. Refer to example 1 to configure the two remote groups.
2. In the *Members* field, click the *+* and add *shudson*.



3. Click *OK*.

One unwanted scenario from this configuration is that a user might be able to bypass multi-factor authentication on LDAP by changing the username case (see the related PSIRT advisory). By default, the username of the remote LDAP user is case sensitive. This means the username has to match what is configured (shudson). If a user types `sHudson`, for example, this will not match the user shudson, so it falls through to remote group authentication. It will match the Sales group in this example. To prevent this, disable username case sensitivity (see SSL VPN for remote users with MFA and user sensitivity on page 2864 for more details).

To disable case sensitivity on the remote user:

```
config user local
    edit <name>
        set type ldap
        set two-factor fortitoken
        set fortitoken "FTKMOBxxxxxxxxxx"
        set email-to <email_address>
        set username-sensitivity disable
        set ldap-server <server_name>
    next
end
```

There is another unwanted scenario from this configuration than can occur to bypass multi-factor authentication. The LDAP server, ldap, has a user named shudson. Another LDAP server, ldap2, also has a user named shudson, but with a different password. If the ldap and ldap2 servers are added to the user group in addition to the remote shudson user, if a user tries to log in using `shudson` and the password on the ldap2 server, they would be able to bypass multi-factor authentication.

Configuring FSSO user groups

FSSO user groups contain only Windows, Citrix, and Novell network users. Information about these user groups and their member logon activities are provided by the corresponding FSSO connector. See the FSSO on page 3159 section for more information.

Configuring RSSO user groups

RADIUS single sign-on user groups leverage a RADIUS server to authenticate connecting users. This requires users to log in to their computer using their RADIUS account. The FortiGate does not interact with the remote RADIUS server. It only monitors RADIUS accounting records that the server forwards (originating from the RADIUS client). These records include the user IP address and user group. See RADIUS single sign-on agent on page 4061 for more information.

Configuring guest user groups

In some scenarios, an administrator might need to create temporary user accounts with a defined expiry time to access network resources. For example, if there is a large conference and may attendees require temporary network access for a few days. *Guest Management* can be used to combine many guest users into a group. Many guest accounts can be created at once using randomly-generated user IDs and passwords.

A guest group must be configured first. The guest user account user ID can be an email address, a randomly generated string, or an ID that the assigned by the administrator. The password can be assigned by the administrator or randomly generated. The guest group configuration determines the fields that are provided when creating guest user accounts in *Guest Management*.

To create a guest user group:

1. Go to *User & User & Authentication* > *User Groups* and click *Create New*.
2. Enter a name, and set the *Type* to *Guest*.
3. Configure the following:

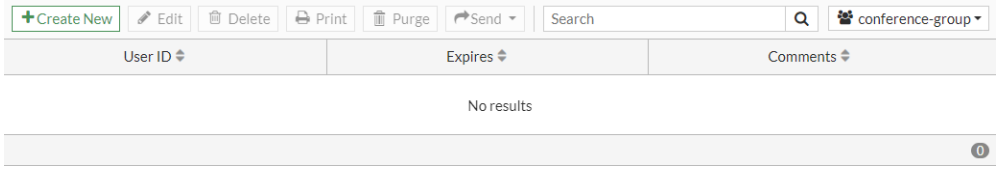
Batch Guest Account Creation	Create multiple accounts automatically. When enabled: • The user ID and password are automatically generated. • The accounts only have user ID, password, and expiration fields. The expiration field is editable in the GUI in the *Start Countdown* and *Time* settings. • An administrator can print the account information. • Users do not receive an email or SMS notification.
User ID	Select one of the following: • *Email*: use the user's email address • *Auto Generate*: FortiOS creates a random user ID • *Specify*: the administrator assigns a user ID
Maximum Accounts	Enable to set a maximum number of guest accounts that can be created for this group (disabled = unlimited).

Guest Details	
Enable Name	If enabled, the user form has a field to enter a name.
Enable Email	If enabled, the user is notified by email.
Enable SMS	If enabled, the user is notified by SMS.
Password	Select one of the following: • *Auto Generate*: FortiOS creates a random password • *Specify*: the administrator assigns a password If the setting is disabled, no password is used.
Sponsor	If enabled, the user form has a field to enter a sponsor (*Optional*). Select *Required* if the sponsor field is mandatory.
Company	If enabled, the user form has a field to enter a company (*Optional*). Select *Required* if the company field is mandatory.
Expiration	
Start Countdown	Select one of the following: • *On Account Creation*: the countdown starts from the time the account is created • *After First Login*: the countdown starts from the time the first time the user logs in
Time	Set the expiry time. There are fields to enter values for *Days*, *Hours*, *Minutes*, and *Seconds*.

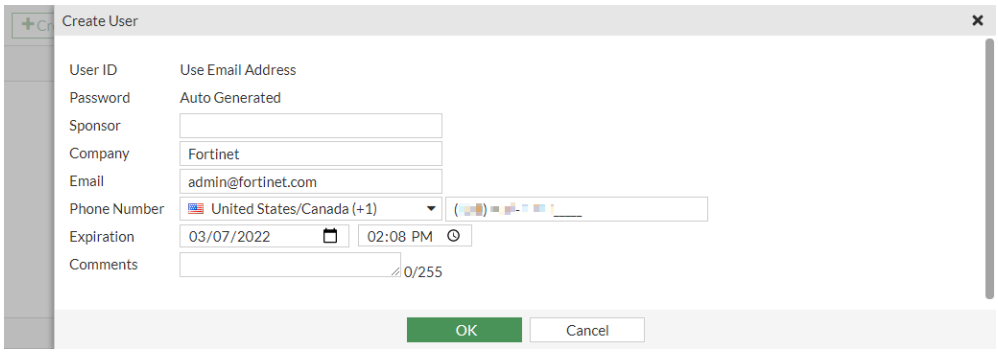
4. Click *OK*.

To manually create a guest user account:

1. Go to *User & User & Authentication* > *Guest Management*.
2. If more than one guest user group is configured, select the group from the dropdown beside the search box.



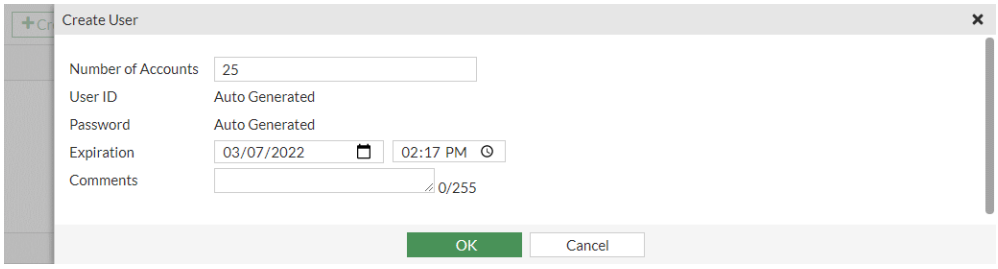
3. Click *Create New* and enter the information in the *Create User* pane. The fields are based on the guest group configuration. Optional fields can be left blank, such as *Sponsor* in this example.



4. Click *OK*.

To automatically create multiple guest user accounts:

1. Go to *User & User & Authentication* > *Guest Management*.
2. If more than one guest user group is configured, select the group from the dropdown beside the search box. The group must have *Batch Guest Account Creation* enabled.
3. Click *Create New* > *Multiple Users* and enter the *Number of Accounts*.
4. Optionally, edit the *Expiration* date and time.



5. Click *OK*.

Authentication settings

General authentication settings include:

- Timeout on page 3001
- Preserve authentication sessions after reboot on page 3002
- Protocols on page 3002
- Certificates on page 3003
- Lockouts on page 3003
- Authentication policy extensions on page 3004

Only some of the settings can be configured in the GUI.

To configure authentication settings in the GUI:

1. Go to *User & Authentication* > *Authentication Settings*.
2. Configure the following settings:

Setting	Description
Authentication Timeout	Enter the desired timeout, in minutes, from 1 to 1440 (24 hours). The default time is 5 minutes. Only idle timeout can be configured in the GUI.
Protocol support	Select the protocols to challenge during firewall user authentication.
HTTP redirect	Redirect HTTP challenge to a secure channel (HTTPS). This option is only available if *HTTP* is selected in the *Protocol Support* options.
Certificate	Select the local certificate to use for authentication.

3. Click *OK*.

Timeout

Authenticated users and user groups can have timeout values per user or group, in addition to FortiGate-wide timeouts. Three types of user timeouts can be configured:

Timeout type	Description
Idle	The idle timer starts when a user initiates a session. As long as data are transferred in this session, the timer continually resets. If the data flow stops, the timer is allowed to advance until it reaches its limit. When the user has been idle for too long, they must re-authenticate before traffic is allowed to continue in that session. This is the default setting. It can be configured in the GUI and CLI.
Hard	The hard timer starts when a user initiates a session. When the timeout is reached, all the sessions for that user must be re-authenticated. This timeout is not affected by any events. This setting can be configured in the CLI.
Session	The session timer starts when a user initiates a session. When the timeout is reached, existing sessions may continue. New sessions are not allowed until the user re-authenticates. This timeout is not affected by any events. This setting can be configured in the CLI.

The authentication timeout time is configured in minutes. The default is five minutes. If VDOMs are enabled, the global level `auth-timeout` user setting is the default that all VDOMs inherit. If the timeout time is set to zero,

To configure timeout for authenticated users:

```
config user setting
    set auth-timeout-type {idle-timeout | hard-timeout | new-session}
    set auth-timeout <integer>
end
```

To configure the authentication timeout for a user group:

```
config user group
    edit <name>
        set authtimeout <integer>
    next
end
```

If the group timeout time is zero (the default) or the user belongs to multiple RADIUS groups, then the user group timeout values are ignored and the global user timeout value is used.

Preserve authentication sessions after reboot

FortiGate models with a log disk can preserve authentication sessions a firewall reboot. This eliminates the need to reauthenticate after rebooting.

When session authentication backup is enabled, authenticated sessions are backed up at the configured interval. By default, session authentication backup is disabled.

```
config system global
    set auth-session-auto-backup {enable | disable}
    set auth-session-auto-backup-interval {1min | 5min | 15min | 30min | 1hr}
end
```

To configure authentication session backup:

1. Enable authentication backup and specify a backup interval.
   In this example, authentication backup runs every minute.

   ```
   config system global
       set auth-session-auto-backup enable
       set auth-session-auto-backup-interval 1min
   end
   ```

Protocols

When you enable user authentication within a security policy, the authentication challenge is normally issued for any of four protocols, depending on the connection protocol:

- HTTP (you can set this to redirect to HTTPS)
- HTTPS
- FTP
- Telnet

The selected protocols control which protocols support the authentication challenge. Users must connect with a supported protocol first so that they can subsequently connect with other protocols. If HTTPS is selected as a protocol support method, it allows the user to authenticate with a customized local certificate.

When you enable user authentication within a security policy, FortiOS challenges the security policy user to authenticate. For user ID and password authentication, the user must provide their username and password. For

certificate authentication (HTTPS, or HTTP redirected to HTTPS only), you can install customized certificates on the unit and the user can also install customized certificates on their browser. Otherwise, users see a warning message and must accept a default Fortinet certificate. The network user's web browser may deem the default certificate invalid.

Enable `auth-secure-http` to redirect HTTP challenges to a secure channel. Enable `auth-ssl-allow-renegotiation` to allow SSL re-negotiation for HTTPS authentication.

Enable `auth-http-basic` to use HTTP basic authentication for identity-based firewall policies. HTTP basic authentication usually causes a browser to display a pop-up authentication window instead of an authentication web page. Some basic web browsers, such as those on older mobile devices, may only support HTTP basic authentication.

FTP and Telnet authentication replacement messages cannot be customized.

To configure the protocols to challenge during firewall user authentication:

```
config user setting
    set auth-type {http https ftp telnet}
    set auth-secure-http {enable | disable}
    set auth-http-basic {enable | disable}
    set auth-ssl-allow-renegotiation  {enable | disable}
end
```

Certificates

Configure the HTTPS certificate and CA certificate to use for policy authentication.

To configure certificates for policy authentication:

```
config user setting
    set auth-cert <certificate>
    set auth-ca-cert <CA certificate>
end
```

Lockouts

Failed log in attempts can indicate malicious attempts to gain access to your network. To prevent this security risk, you can limit the number of failed log in attempts. After the configured maximum number of failed log in attempts is reached (1 - 10, default = 3), access to the account is blocked for the configured lockout duration (0 - 4294967295 seconds, default = 0)

To configure the maximum failed log in attempts and the lockout duration:

```
config user setting
    set auth-lockout-threshold <integer>
    set auth-lockout-duration <integer>
end
```

Authentication policy extensions

By default, unauthenticated traffic is permitted to fall to the next policy. This means that unauthenticated users are only forced to authenticate against a policy when there are no other matching policies. To avoid this, you can force authentication to always take place.

To set that authentication requirement:

```
config user setting
    set auth-on-demand {always | implicitly}
end
```

Where:

`always`	Always trigger firewall authentication on demand.
`implicitly`	Implicitly trigger firewall authentication on demand. This is the default setting (and the behavior in FortiOS 6.0 and earlier).

In the following example, authentication is required; traffic that would otherwise be allowed by the second policy is instead blocked by the first policy.

To use forced authentication:

```
config user setting
    set auth-on-demand always
end
```

```
config firewall policy
    edit 1
        set name "QA to Database"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "QA_subnet"
        set dstaddr "Database"
        set action accept
        set schedule "always"
        set service "ALL"
        set fsso disable
        set groups "qa_group"
        set nat enable
    next
    edit 2
        set name "QA to Internet"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "QA_subnet"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
        set fsso disable
        set nat enable
    next
end
```

Retail environment guest access

Businesses such as coffee shops provide free Internet access for customers. In this scenario, you do not need to configure guest management, as customers can access the WiFi access point without logon credentials.

However, consider that the business wants to contact customers with promotional offers to encourage future patronage. You can configure an email collection portal to collect customer email addresses for this purpose. You can configure a firewall policy to grant network access only to users who provide a valid email address. The first time a customer's device attempts WiFi connection, FortiOS requests an email address, which it validates. The customers' subsequent connections go directly to the Internet without interruption.

This configuration consists of the following steps:

1. Creating an email collection portal on page 3005
2. Creating a firewall policy on page 3006
3. Checking for collected emails on page 3006

Creating an email collection portal

The customer's first contact with your network is a captive portal that presents a webpage requesting an email address. When FortiOS has validated the email address, the customer's device MAC address is added to the collected emails device group.

This example modifies the freewifi WiFi interface to present an email collection captive portal.

To configure the freewifi SSID to use an email collection portal in the GUI:

1. Enable email collection:
   a. Go to *System* > *Feature Visibility*.
   b. In the *Additional Features* section, enable *Email Collection*.
   c. Click *Apply*.
2. Edit the freewifi SSID:
   a. Go to *WiFi & Switch Controller* > *SSIDs* and edit the *freewifi* SSID.
   b. In the *Security Mode Settings* section, set the *Security mode* to *Captive Portal*.
   c. Set the *Portal type* to *Email Collection*.
   d. Click *OK*.

To configure the freewifi SSID to use an email collection portal in the CLI:

```
config wireless-controller vap
    edit freewifi
        set security captive-portal
        set portal-type email-collect
```

```
    next
end
```

Creating a firewall policy

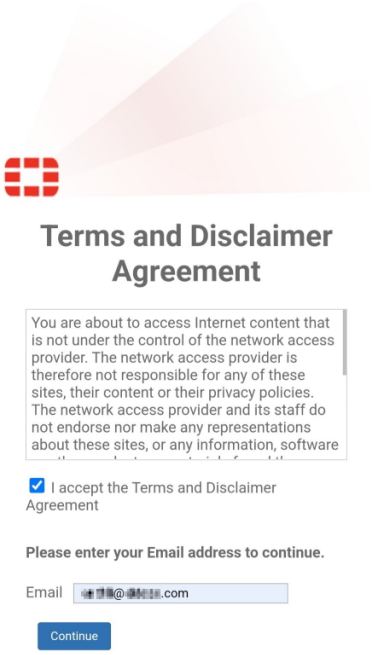
You must configure a firewall policy that allows traffic to flow from the WiFi SSID to the internet interface only for members of the collected emails device group. This policy must be listed first. Unknown devices are not members of the collected emails device group, so they do not match the policy.

To create a firewall policy:

```
config firewall policy
    edit 3
        set srcintf "freewifi"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set email-collect enable
    next
end
```

Checking for collected emails

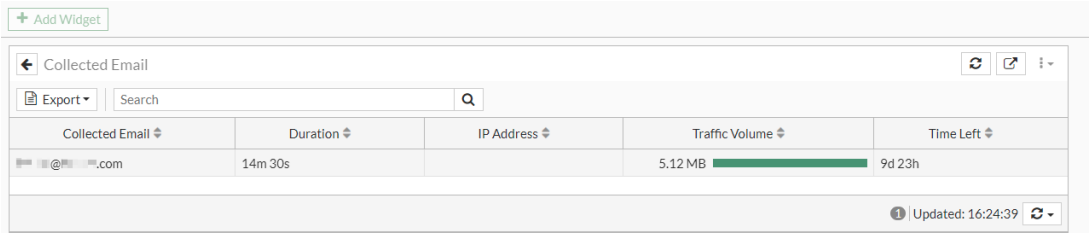
When a WiFi user connects to the freewifi SSID, they are presented with a captive portal to enter their email address.



Once the user enters their email and clicks *Continue*, they will have access to the Internet. The collected emails can be verified in FortiOS.

To check for collected emails in the GUI:

1. Go to *Dashboard* > *Assets & Identities* and click *Add Widget*.
2. In the *User & Authentication* section, select *Collected Email* and click *Add Widget*.
3. Click *Close*.
4. Click the *Collected Email* to expand to full view. The list of emails is displayed.



5. Optionally, click *Export* to export the data as a CSV or JSON file.

To check for collected emails in the CLI:

```
# diagnose firewall auth mac list

72:4d:e1:**:**:**, admin@fortinet.com
        type: email, id: 0, duration: 937, idled: 19
        expire: 863980, allow-idle: 864000
        flag(1000): src_idle
        packets: in 4753 out 4592, bytes: in 2662403 out 2458644

----- 1 listed, 0 filtered ------
```

Customizing complexity options for the local user password policy

The local firewall user password policy can be customized with various settings, such as minimum length, character types, and password reuse. These settings are similar to the ones available for the system administrator password policy, which offer more security and flexibility than the previous local user password policy.

```
config user password-policy
    edit <name>
        set minimum-length <integer>
        set min-lower-case-letter <integer>
        set min-upper-case-letter <integer>
        set min-non-alphanumeric <integer>
        set min-number <integer>
        set min-change-characters <integer>
        set expire-status {enable | disable}
```

```
        set reuse-password {enable | disable}
    next
end
```

`minimum-length <integer>`	Set the minimum password length (8 - 128, default = 8).
`min-lower-case-letter <integer>`	Set the minimum number of lowercase characters in the password (0 - 128, default = 0).
`min-upper-case-letter <integer>`	Set the minimum number of uppercase characters in the password (0 - 128, default = 0).
`min-non-alphanumeric <integer>`	Set the minimum number of non-alphanumeric in the password (0 - 128, default = 0).
`min-number <integer>`	Set the minimum number of numeric characters in the password (0 - 128, default = 0).
`min-change-characters <integer>`	Set the minimum number of unique characters in new password, which do not exist in the old password (0 - 128, default = 0). This attribute overrides `reuse-password` if both are enabled.
`set expire-status {enable | disable}`	Enable/disable password expiration (default = disable).
`set reuse-password {enable | disable}`	Enable/disable password reuse (default = enable. If both `reuse-password` and `min-change-characters` are enabled, `min-change-characters` overrides it.

After upgrading to 7.4.1 from 7.4.0, users must activate the user password policy using the CLI. The previous password policy settings will remain valid, but they will not be effective unless the password policy password expiration is enabled (`expire-status`). If the password policy password expiration is not enabled, the `expire-days <integer>` option will not force users to change their password after number of specified days.

Example

The following user password policy is configured before upgrading to 7.4.1:

```
config user password-policy
    edit "1"
        set expire-days 1
        set warn-days 1
        set expired-password-renewal enable
    next
end
```

To configure the user password policy options:

1. Check the user password policy settings after the upgrade:

```
config user password-policy
    edit 1
```

```
        get
            name                : 1
            expire-days         : 1
            warn-days           : 1
            expired-password-renewal: enable
            minimum-length      : 8
            min-lower-case-letter: 0
            min-upper-case-letter: 0
            min-non-alphanumeric: 0
            min-number          : 0
            min-change-characters: 0
            expire-status       : disable
            reuse-password      : enable
    next
end
```

2. Edit the user password policy settings, including enabling password expiration:

```
config user password-policy
    edit "1"
        set expire-days 1
        set warn-days 1
        set expired-password-renewal enable
        set min-lower-case-letter 1
        set min-upper-case-letter 1
        set min-non-alphanumeric 3
        set min-number 3
        set min-change-characters 2
        set expire-status enable
        set reuse-password disable
    next
end
```

3. Change a password for a local user.
   a. In the CLI when the password meets the criteria:

```
config user local
    edit pwd-test1
        set passwd CCbcset123!!!
    next
end
```

   b. In the CLI when the password does not meet the criteria (only two numbers, so an error message appears):

```
config user local
    edit pwd-test1
        set passwd CCbXsetp23!!!
New password must conform to the password policy enforced on this user:
Password must:
        Be a minimum length of 8
        Include at least 1 lower case letter(s) (a-z)
```

```
        Include at least 1 upper case letter(s) (A-Z)
        Include at least 3 non-alphanumeric character(s)
        Include at least 3 number(s) (0-9)
        Have at least 2 unique character(s) which don't exist in the old password
        Not be same as last two passwords

node_check_object fail! for passwd CCbXsetp23!!!

value parse error before 'CCbXsetp23!!!'
Command fail. Return code -49
```

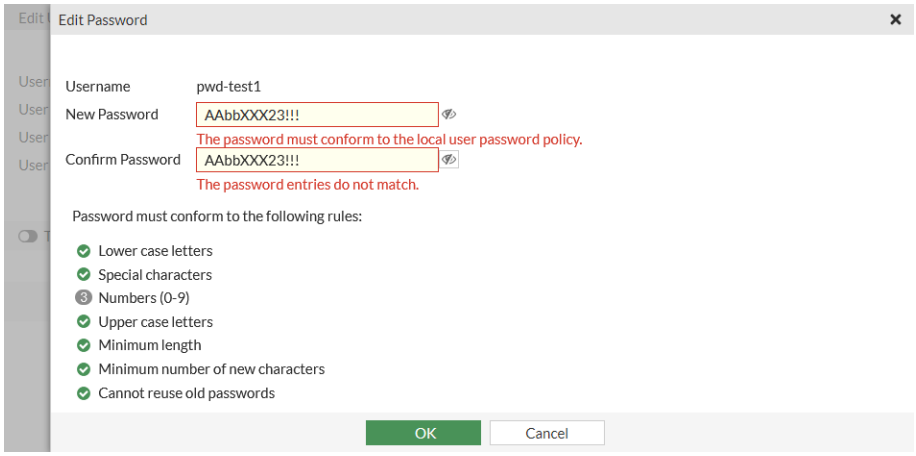
c. In the GUI:

i. Go to *User & Authentication* > *User Definition* and edit a local user.

ii. Click *Change Password*.

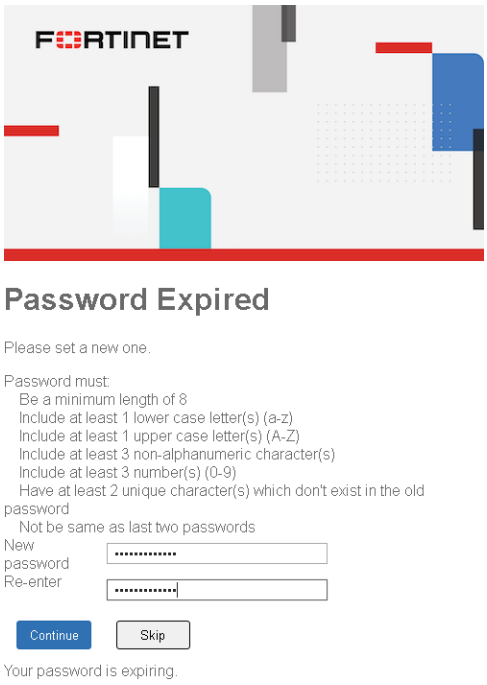
iii. Enter the *New Password*.

iv. Enter the password again (*Confirm Password*). A warning will appear when the password does not match the criteria and indicates which parameters must be fixed. In this example, there are less than three numbers used.

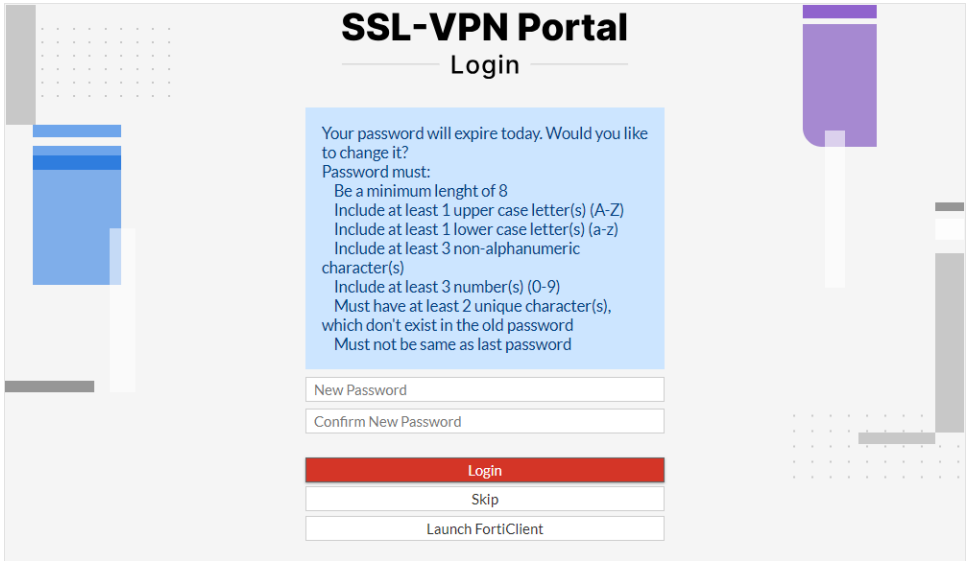


v. Click *OK*.

Sample prompt when a local user needs to update their password for firewall authentication:



Sample prompt when a local user needs to update their password for SSL VPN portal access:



Basic authentication with cached client certificates

With basic authentication, client certificates can be cached and used as authentication cookies, eliminating the need for repeated user authentication.

In this example, a CA signs a client certificate. The client certificate is installed on two endpoints, and the root CA certificate is imported to FortiGate.

During the authentication process, the client certificate from the endpoint is verified against the CA certificate. Once this verification is successful, the user is prompted to enter login credentials for user authentication. Once authenticated, the client certificate is stored as an authentication cookie so that subsequent access does not require any user authentication as long as the client certificate remains present on the endpoint.

To configure client certificates as authentication cookies:

1. Prepare the certificate:
   a. Use a CA to sign the client certificate.
   b. Import the root CA certificate that signed the client certificate to FortiGate.
   c. Install the client certificate on all endpoints.
2. In FortiOS, configure an authentication scheme to apply authentication against the local user database.

```
config authentication scheme
    edit "test"
        set method basic
        set user-database "local-user-db"
    next
end
```

3. Configure an authentication rule to enable the client certificate to be cached.

```
config authentication rule
    edit "test"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "test"
        set cert-auth-cookie enable
    next
end
```

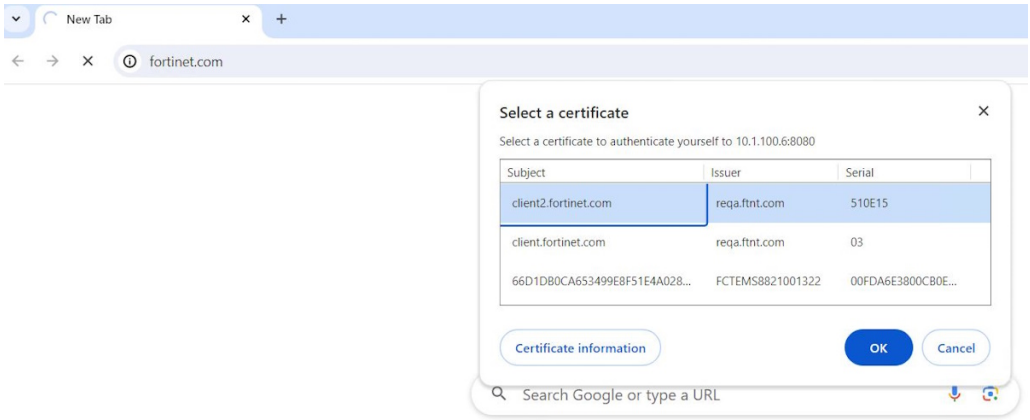
4. Configure verification of the client certificate with the root CA.

```
config authentication setting
    set user-cert-ca "root_ca"
end
```

When the user accesses a resource, such as a web site, for the first time:

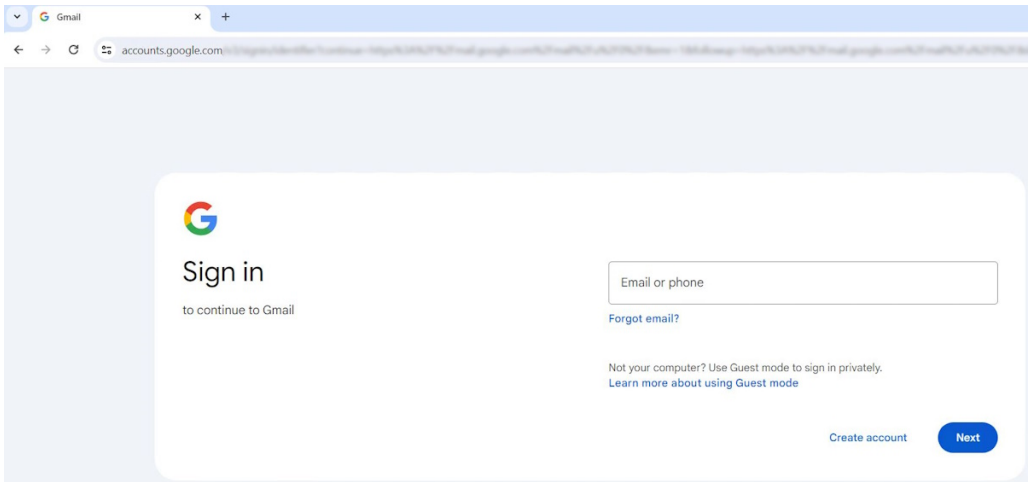
1. The browser prompts the user for a client certificate. The user selects the certificate (client2.fortinet.com), and clicks *OK*. Then the endpoint device (IP address 10.1.100.59) presents the client certificate to FortiGate

for verification.



2. Once the certificate verification passes, an authentication dialog box is displayed.

3. The user enters their username and password to authenticate with FortiGate and successfully access the web site.



FortiGate also logs the first access in the traffic log:

```
9: date=2024-04-24 time=12:28:51 eventtime=1713918531092354265 tz="+1200" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="vdom1" srcip=10.1.100.59 srcport=63615
srcintf="port2" srcintfrole="undefined" dstcountry="United States" srccountry="Reserved"
dstip=142.251.33.69 dstport=443 dstintf="port3" dstintfrole="undefined" sessionid=51442
service="web" proxyapptype="http" proto=6 action="accept" policyid=10 policytype="proxy-
```

```
policy" poluuid="e272fe7e-00d2-51ef-5fe0-09d157495e71" duration=73 user="localuser"
group="localgroup" authserver="localuser" gatewayid=1 realserverid=1 vip="ztna"
accessproxy="ztna" clientdevicemanageable="manageable" clientcert="yes" wanin=5734
rcvdbyte=5734 wanout=1505 lanin=3226 sentbyte=3226 lanout=42588 appcat="unscanned"
```

When the user accesses the resource from the same endpoint device for the second and subsequent times, FortiGate uses the cached authentication cookie to grant access, as long as the client certificate remains present on the endpoint.

When the user has multiple endpoint devices with the same certificate installed, the certificate will match the cached authentication cookie on the FortiGate, and the user can access resources without additional authentication.

This log shows a user accessing a website from a different PC (IP address 10.1.100.78) without needing to provide user credentials.

```
2: date=2024-04-24 time=12:30:42 eventtime=1713918642320943415 tz="+1200" logid="0005000024"

appcat="unscanned"
```

LDAP servers

The following topics provide information about LDAP servers:

- Configuring an LDAP server on page 3014
- Enabling Active Directory recursive search on page 3018
- Configuring LDAP dial-in using a member attribute on page 3019
- Configuring wildcard admin accounts on page 3020
- Configuring least privileges for LDAP admin account authentication in Active Directory on page 3022
- Tracking users in each Active Directory LDAP group on page 3023
- Tracking rolling historical records of LDAP user logins on page 3026
- Configuring client certificate authentication on the LDAP server on page 3029

Configuring an LDAP server

FortiOS can be configured to use an LDAP server for authentication.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See relevant LDAPS information in this topic and Configuring client certificate authentication on the LDAP server on page 3029.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 3022.

To configure an LDAP server on the FortiGate:

1. Go to *User & Authentication > LDAP Servers*.
2. Click *Create New*.
3. Configure the following:

Name	This connection name is for reference within the FortiGate only.
Server IP/Name	LDAP server IP address or FQDN resolvable by the FortiGate.
Server Port	By default, LDAP uses port 389 and LDAPS uses 636. Use this field to specify a custom port if necessary.
Common Name Identifier	Attribute field of the object in LDAP that the FortiGate uses to identify the connecting user. The identifier is case sensitive. Common attributes are: • *cn* (Common Name) • *sAMAccountName* (SAMAccountName) • *uid* (User ID)
Distinguished Name	Used to look up user account entries on the LDAP server. It reflects the hierarchy of LDAP database object classes above the CN identifier in which you are doing the lookup. Enter *dc=COMPANY,dc=com* to specify the root of the domain to include all objects. Enter *ou=VPN-Users,dc=COMPANY,dc=com* to look up users under a specific organization unit.
Exchange server	Enable to specify the exchange server connector to collect information about authenticated users from a corporate exchange server. See Exchange Server connector on page 4065 for more details.
Bind Type	Select one of the following options: • *Simple*: bind using simple password authentication using the client name. The LDAP server only looks up against the distinguished name (DN), but does not search on the subtree. • *Anonymous*: bind using an anonymous user, and search starting from the DN and recurse over the subtrees. Many LDAP servers do not allow this. • *Regular*: bind using the username and password provided, and

	search starting from the DN and recurse over the subtrees.
Username	If using regular bind, enter a username with sufficient privileges to access the LDAP server. The following formats are supported: • *username\administrator* • *administrator@domain* • *cn=administrator,cn=users,dc=domain,dc=com*
Password	If using regular bind, enter the password associated with the username.
Secure Connection	Enable to apply security to the LDAP connection through STARTTLS or LDAPS.
Protocol	If *Secure Connection* is enabled, select *STARTTLS* or *LDAPS*. Selecting *STARTTLS* changes the port to 389 and selecting *LDAPS* changes the port to 636.
Certificate	Enable and select the root CA certificate so that the FortiGate will only accept a certificate from the LDAP server that is signed by this CA. The root CA certificate should be in the Remote CA Certificate store on the FortiGate. If this setting is not enabled (meaning that no certificate is chosen), the server certificate validation will not be performed even if *Secure Connection* is enabled. If the wrong certificate is chosen, which is not the issuing CA for the server certificate, then the LDAP connection will fail.
Server identity check	This check verifies the server domain or IP address against the server certificate. This option is enabled by default when *Certificate* is chosen and it is recommended to leave it enabled for a secure configuration.

When specifying a secure connection, there are some considerations for the certificate used by LDAP to secure the connection. The FortiGate checks the certificate presented by the LDAP server for the IP address or FQDN as specified in the *Server IP/Name* field with the following logic:

- If there is a Subject Alternative Name (SAN), it will ignore any Common Name (CN) value and look for a match in any of the SAN fields.
- If there is no SAN, it will check the CN for a match.

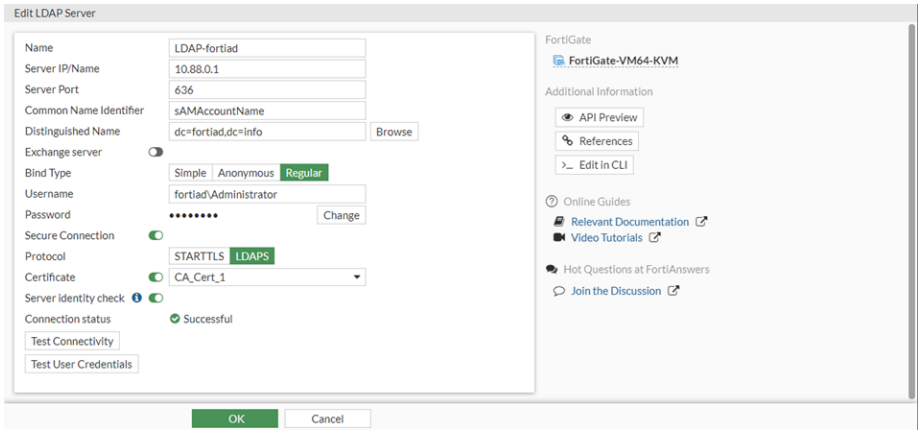
4. Optionally, click *Test User Credentials* to ensure that the account has sufficient access rights.
5. Click *OK*.
   The FortiGate checks the connection and updates the *Connection Status*.

To configure a secure connection to the LDAP server in the GUI:

1. Go to *User & Authentication > LDAP Servers*.
2. Click *Create New*.
3. Configure the following:

Name	LDAP-fortiad

Server IP/Name	10.88.0.1
Server Port	636
Common Name Identifier	sAMAccountName
Distinguished Name	dc=fortiad,dc=info
Exchange server	Disabled
Bind Type	Regular Enter the *Username* and *Password* for LDAP binding and lookup.
Secure Connection	Enabled • Set *Protocol* to *LDAPS*. • Enable *Certificate* and select the CA certificate to validate the server certificate.
Server identity check	Enable to verify the domain name or IP address against the server certificate.



4. Click *Test Connectivity* to verify the connection to the server.
5. Click *OK*.

To configure a secure connection to the LDAP server in the CLI:

```
config user ldap
    edit "LDAP-fortiad"
        set server "10.88.0.1"
        set cnid "sAMAccountName"
        set dn "dc=fortiad,dc=info"
        set type regular
        set username "fortiad\\Administrator"
        set password <password>
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

To account for dynamic IP address changes, such as those governed by SD-WAN rules, interface names can be used to define the source IP addresses in RADIUS, LDAP, and DNS configurations using the `source-ip-interface` command. See Implement the interface name as the source IP address in RADIUS, LDAP, and DNS configurations on page 309.

Enabling Active Directory recursive search

By default, nested groups (groups that are members or other groups) are not searched in Windows Active Directory (AD) LDAP servers because this can slow down the group membership search. There is an option in FortiOS to enable the searching of nested groups for user group memberships on AD LDAP servers.

This option is not available for other LDAP servers, such as OpenLDAP-based servers.

The default behavior does not include nested groups:

```
config user ldap
    edit "ldap-ad"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password XXXXXXXXXXXXXXXXXXXXXXXX
    next
end
```

The default search results only show groups that have the user as member, and no groups that have groups as members:

```
diagnose test authserver ldap ldap-ad nuser nuser
    authenticate 'nuser' against 'ldap-ad' succeeded!
    Group membership(s) - CN=nested3,OU=Testing,DC=Fortinet-FSSO,DC=COM
                          CN=Domain Users,CN=Users,DC=Fortinet-FSSO,DC=COM
```

To enable recursive search to include nested groups in the results:

```
config user ldap
    edit "ldap-ad"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password XXXXXXXXXXXXXXXXXXXXXXXX
```

```
        set search-type recursive
    next
end
```

The search results now include groups that have other groups as members:

```
diagnose test authserver ldap ldap-ad nuser nuser
    authenticate 'nuser' against 'ldap-ad' succeeded!
    Group membership(s) - CN=nested3,OU=Testing,DC=Fortinet-FSSO,DC=COM
                          CN=Domain Users,CN=Users,DC=Fortinet-FSSO,DC=COM
                          CN=nested2,OU=Testing,DC=Fortinet-FSSO,DC=COM
                          CN=nested1,OU=Testing,DC=Fortinet-FSSO,DC=COM
```

The group nested3 is a member of the group nested2, which is a member of the group nested1.

Configuring LDAP dial-in using a member attribute

In this configuration, users defined in Microsoft AD can set up a VPN connection based on an attribute that is set to `TRUE`, instead of their user group. You can activate the *Allow Dialin* property in AD user properties, which sets the `msNPAllowDialin` attribute to *TRUE*. You can use this procedure for other member attributes as your system requires.

This configuration consists of the following steps:

1. Ensure that the AD server has the `msNPAllowDialin` attribute set to *TRUE* for the desired users.
2. Configure user LDAP member attribute settings.
3. Configure LDAP group settings.
4. Ensure that you configured the settings correctly.

To configure user LDAP member attribute settings:

```
config user ldap
   edit "ldap_server"
      set server "192.168.201.3"
      set cnid "sAMAccountName"
      set dn "DC=fortilabanz,DC=com,DC=au"
      set type regular
      set username "fortigate@sample.com"
      set password ******
      set member-attr "msNPAllowDialin"
   next
end
```

To configure LDAP group settings:

```
config user group
   edit "ldap_grp"
      set member "ldap_server"
      config match
         edit 1
            set server-name "ldap_server"
            set group-name "TRUE"
```

```
        next
      end
    next
end
```

To ensure that you configured the settings correctly:

Users that are members of the `ldap_grp` user group should be able to authenticate. The following shows sample `diagnose debug` output when the `Allow Dial-in` attribute is set to `TRUE`:

```
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-val[0]='TRUE'
fnbamd_ldap_get_result-Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Passed group matching
```

If the attribute is not set to `TRUE` but is expected, you may see the following output:

```
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-val[0]='FALSE'
fnbamd_ldap_get_result-Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Failed group matching
```

The difference between the two outputs is the last line, which shows passed or failed depending on whether the member attribute is set to the expected value.

Configuring wildcard admin accounts

To avoid setting up individual admin accounts in FortiOS, you can configure an admin account with the wildcard option enabled, allowing multiple remote admin accounts to match one local admin account. This way, multiple LDAP admin accounts can use one FortiOS admin account.

Benefits include:

- Fast configuration of the FortiOS admin account to work with your LDAP network, saving effort and avoiding potential errors incurred when setting up multiple admin accounts
- Reduced ongoing maintenance. As long as LDAP users belong to the same group and you do not modify the wildcard admin account in FortiOS, you do not need to configure changes on the LDAP accounts. If you add or remove a user from the LDAP group, you do not need to perform changes in FortiOS.

Potential issues include:

- Multiple users may be logged in to the same account simultaneously. This may cause issues if both users make changes simultaneously.
- Security is reduced since multiple users have login access to the same account, as opposed to an account for each user.

Wildcard admin configuration also applies to RADIUS. If configuring for RADIUS, configure the RADIUS server and RADIUS user group instead of LDAP. When using the GUI, wildcard admin is the only remote admin account

that does not require you to enter a password on account creation. That password is normally used when the remote authentication server is unavailable during authentication.

This example uses default values where possible. If a specific value is not mentioned, the example sets it to its default value.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials. To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 3014 and Configuring client certificate authentication on the LDAP server on page 3029.

To secure RADIUS connections, consider using RADSEC over TLS. See Configuring a RADSEC client on page 3073.

You can configure an admin account in Active Directory for LDAP authentication to allow an admin to perform lookups and reset passwords without being a member of the Account Operators or Domain Administrators built-in groups. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 3022.

To configure the LDAP server:

The important parts of this configuration are the username and group lines. The username is the domain administrator account. The group binding allows only the GRP group access.

This example uses an example domain name. Configure as appropriate for your own network.

```
config user ldap
   edit "ldap_server"
      set server "192.168.201.3"
      set cnid "sAMAccountName"
      set dn "DC=example,DC=com,DC=au"
      set type regular
      set username "CN=Administrator,CN=Users,DC=example,DC=COM”
      set password *
      set group-member-check group-object
      set group-object-filter (&
            (objectcategory=group)member="CN=GRP,OU=training,DC=example,DC=COM"))
   next
end
```

To configure the user group and add the LDAP server:

```
config user group
   edit "ldap_grp"
      set member "ldap_server"
         config match
                  edit 1
                     set server-name "ldap_server"
                     set group-name "CN=GRP,OU=training,DC=example,DC=COM"
                  next
               end
            next
         end
      end
```

```
   end
end
```

To configure the wildcard admin account:

```
config system admin
   edit "test"
      set remote-auth enable
      set accprofile "super_admin"
      set wildcard enable
      set remote-group "ldap_grp"
   next
end
```

Configuring least privileges for LDAP admin account authentication in Active Directory

An administrator should only have sufficient privileges for their role. In the case of LDAP admin bind, you can configure an admin account in Active Directory for LDAP authentication to allow an admin to perform lookups and reset passwords without being a member of the Account Operators or Domain Administrators built-in groups.

For information about Active Directory, see the product documentation.

To configure account privileges for LDAP authentication in Active Directory:

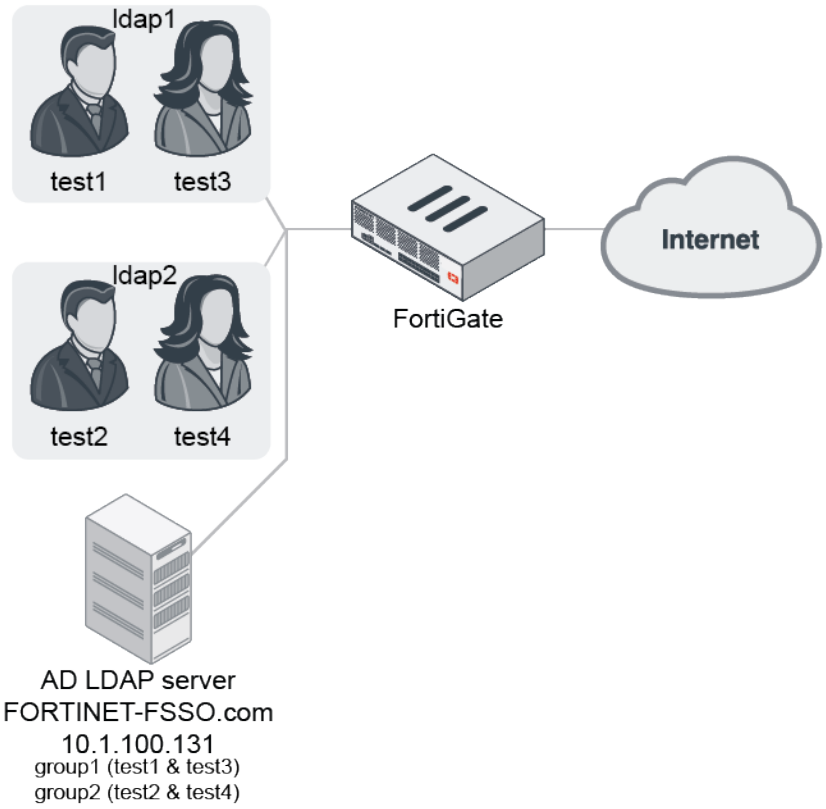
1. In the *Active Directory Users and Computers* administrative console, right-click the Organizational Unit (OU) or the top-level domain you want to configure and select *Delegate Control*.
2. In the *Delegation of Control Wizard* dialog, click *Next*.
3. In the *Users or Groups* dialog, click *Add...* and search Active Directory for the users or groups.
4. Click *OK* and then click *Next*.
5. In the *Tasks to Delegate* dialog, select *Create a custom task to delegate* and click *Next*.
6. Select *Only the following objects in the folder* and scroll to the bottom of the list. Select *User objects* and click *Next*.
7. In the *Permissions* dialog, select *General*.
8. From the *Permissions* list, select the following:
   - *Change password*
   - *Reset password*
9. Clear the *General* checkbox and select *Property-specific*.
10. From the *Permissions* list, select the following:
    - *Write lockoutTime*
    - *Read lockoutTime*
    - *Write pwdLastSet*
    - *Read pwdLastSet*
    - *Write UserAccountControl*
    - *Read UserAccountControl*

11. Click *Next* and click *Finish*.

Tracking users in each Active Directory LDAP group

When LDAP users log on through firewall authentication, the active users per Active Directory LDAP group is counted and displayed in the *Firewall Users* widget and the CLI.

Example



The Active Directory LDAP server, FORTINET-FSSO.com, is configured with two groups that contain two users each: group1 consists of users test1 and test3; group2 consists of users test2 and test4.

To configure AD LDAP user groups in the GUI:

1. Configure the Active Directory LDAP server, FORTINET-FSSO:
   a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
   b. Enter the following:

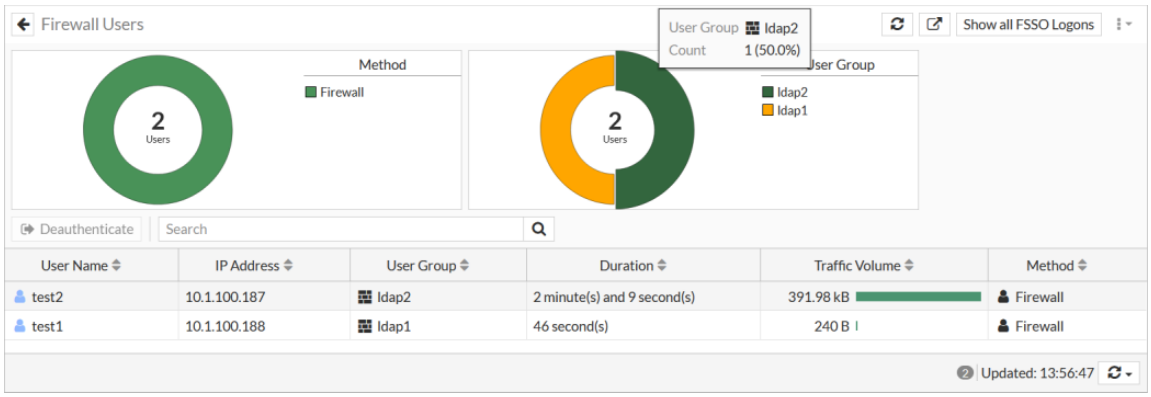
Name	*FORTINET-FSSO*
Server IP/Name	*10.1.100.131*

Distinguished Name	*dc=FORTINET-FSSO,dc=com*
Bind Type	*Regular*
Username	*cn=administrator,cn=users,dc=FORTINET-FSSO,dc=com*
Password	Enter the password.

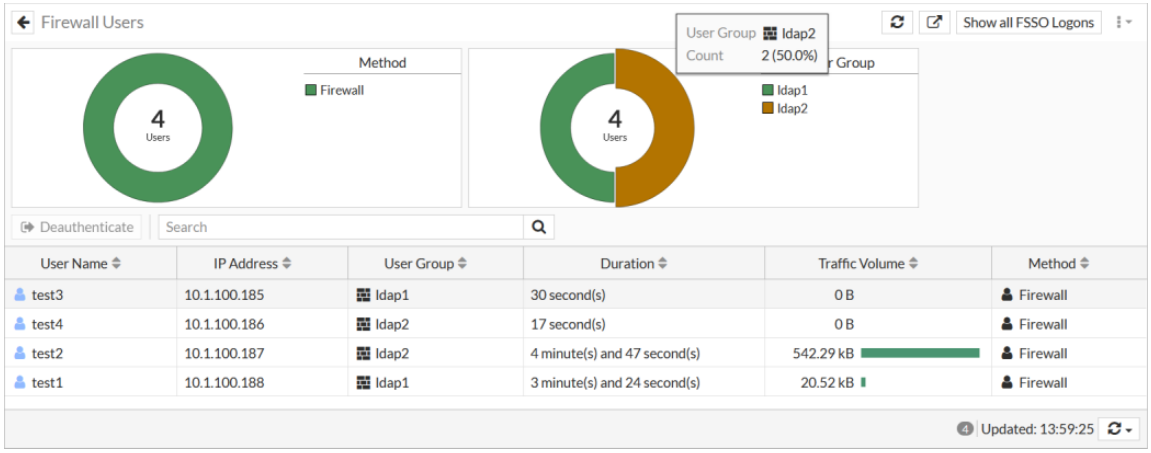
c. Click *OK*.

2. Configure the LDAP user groups:
   a. Go to *User & Authentication* > *User Groups* and click *Create New*.
   b. Enter the name, *ldap1*.
   c. In the *Remote Groups* table, click *Add*. The *Add Group Match* pane opens.
   d. For *Remote Server*, select *FORTINET-FSSO*.
   e. In the search box, enter *group1*, and select the result in the table.
   f. Click *OK*.

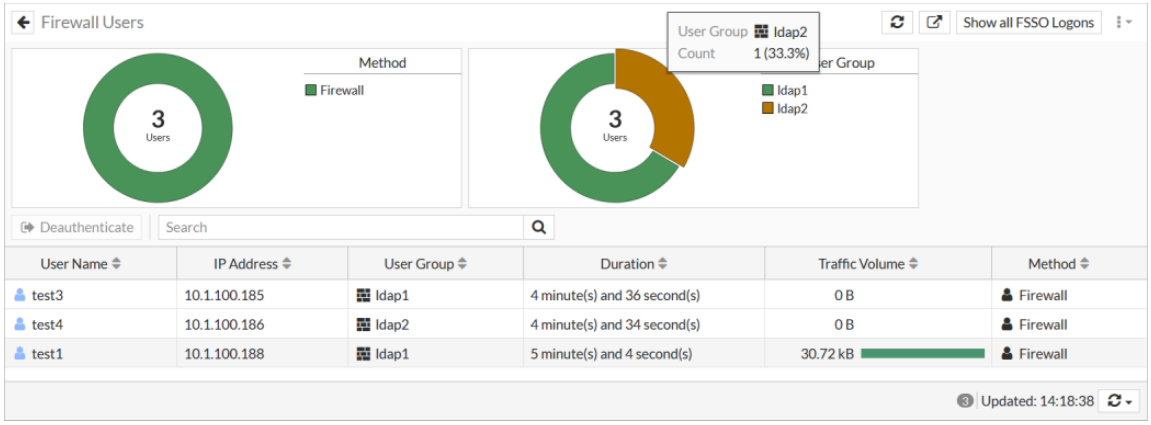
   g. Repeat these steps to configure *ldap2* with the FORTINET-FSSO *group2*.
   h. Click *OK*.
3. Configure a firewall policy with both LDAP groups:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. For *Source*, select *ldap1* and *ldap2*.
   c. Configure the other settings as needed.
   d. Click *OK*.
4. Get users test1 and test2 to log in.
5. In FortiOS, go to *Dashboard* > *Assets & Identities* and click the *Firewall Users* widget to expand to full screen view.
   Hover over a group in the *User Group* donut chart to view how many users are logged on from that group, and the number of users as a percentage of all logged on users. The chart shows that two users are logged in.



6. Get users test3 and test4 to log in, and refresh the *Firewall Users* widget. Each LDAP group has two users logged in, with a total of four active users.



7. Get user test2 to log out, and refresh the *Firewall Users* widget. There is a total of three active users, and the ldap2 group only has one user that is logged in.



To verify the user group count in the CLI:

```
# diagnose user-device-store user-count list <integer>
# diagnose user-device-store user-count query <FQDN of AD group>
```

Tracking rolling historical records of LDAP user logins

Authenticated LDAP users can be tracked by logging the users' group memberships, logon timestamps, and logout timestamps into local files on a log disk over a rolling four-week period. The historical records can be queried from the CLI. This feature is only enabled on FortiGate models with a log disk.

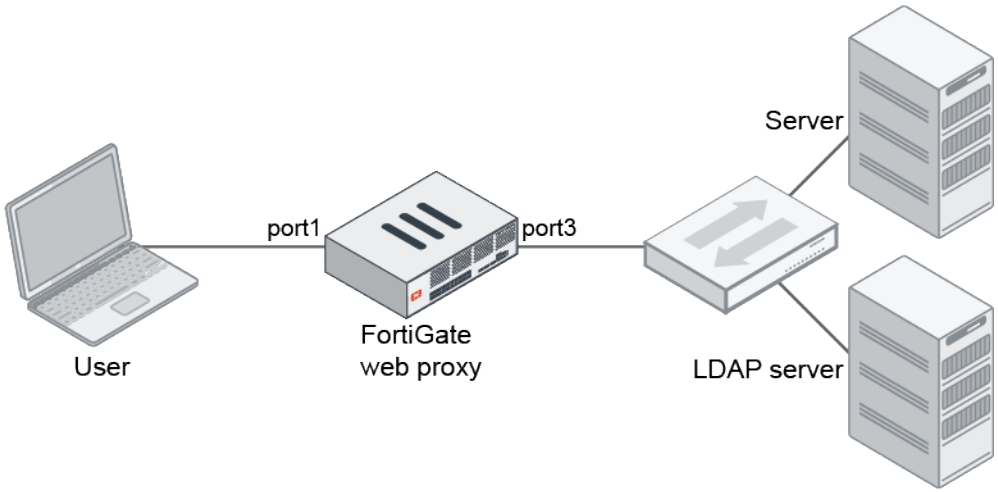
To view active user logged information:

```
# diagnose user-device-store user-stats query <yyyy-mm-dd> <range_in_days>
```

Example

In this example, the FortiGate is configured with an explicit web proxy and an LDAP server. When an LDAP user is authenticated by an IP-based authentication method in WAD, the WAD user is considered to be in an active logon status. This WAD user is listed in the `diagnose wad user list` output. If the user is removed from WAD as an authenticated, such as when the IP-based authentication expires, then the user is considered to become inactive (logout status). The user is no longer listed in the `diagnose wad user list` output.

The WAD user's group membership information and their logon and logout timestamps are written into local files on the FortiGate's disk. There is one log file for each day, and the FortiGate can maintain up to 28 log files over a rolling period of 28 days (four weeks). This means after 28 days with 28 files stored, on the 29th day, the first file will be removed and a new file will be created for the 29th day.



This feature works on other configurations such as firewall authentication, transparent web proxy, ZTNA, and SSL VPN where an LDAP server is used.

To configure the FortiGate:

1. Enable the explicit web proxy on port1:

```
config system interface
    edit "port1"
        set explicit-web-proxy enable
        set explicit-ftp-proxy enable
        set snmp-index 3
    next
end
```

2. Configure the LDAP server:

```
config user ldap
    edit "ldap-test"
        set server "172.16.200.98"
        set cnid "cn"
        set dn "dc=fortinetqa,dc=local"
        set type regular
        set username "CN=root,CN=Users,DC=fortinetqa,DC=local"
        set password **********
    next
end
```

3. Configure the authentication scheme:

```
config authentication scheme
    edit "basic-ldap"
        set method basic
        set user-database "ldap-test"
    next
end
```

4. Configure the authentication rule:

```
config authentication rule
    edit "basic-ldap"
        set srcaddr "all"
        set active-auth-method "basic-ldap"
        set web-portal disable
    next
end
```

5. Configure the user group:

```
config user group
    edit "ldap-group"
        set member "ldap" "ldap-test"
    next
end
```

6. Configure the proxy policy:

```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set service "web"
        set action accept
        set schedule "always"
        set groups "ldap-group"
        set utm-status enable
        set ssl-ssh-profile "deep-custom"
        set av-profile "av"
    next
end
```

When users pass through the explicit proxy and log in and out through LDAP, their login and logout records will be logged to the disk.

In this example, there are two LDAP users, test1 and test3, with the following activity:

1. test3 logs on at 22:30:22 on February 23, 2022, then logs out at 22:31:09 on the same day.
2. test1 logs on at 23:55:02 on February 23, 2022, then logs out at 00:05:02 on February 24, 2022.
3. test3 logs on at 16:29:44 on February 24, 2022, then logs out at 16:39:44 on the same day.

The logon and logout timestamp information, and the group membership information for users test1 and test3 will be logged into two local files on the log disk.

To view the active user logged information for two days back from February 24, 2022:

```
# diagnose user-device-store user-stats query 2022-02-24 2

Record #0:
        'username' = 'test3'
        'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
        'logon' = '2022-02-23 22:30:22'
        'logout' = '2022-02-23 22:31:09'

Record #1:
        'username' = 'test1'
        'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=mytest-grp,OU=QA,DC=FORTINETQA,DC=local'
        'logon' = '2022-02-23 23:55:02'

Record #2:
        'username' = 'test1'
        'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=mytest-grp,OU=QA,DC=FORTINETQA,DC=local'
```

```
        'logon' = '2022-02-23 23:55:02'
        'logout' = '2022-02-24 00:05:02'

Record #3:
        'username' = 'test3'
        'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
        'logon' = '2022-02-24 16:29:44'
        'logout' = '2022-02-24 16:39:44'

Returned 4 records.
```

There is one record (logon) for test1 on 2022-02-23 because they remained active after midnight (until 00:05:02). There is another record for 2022-02-24 with logon and logout timestamps for test1.

Configuring client certificate authentication on the LDAP server

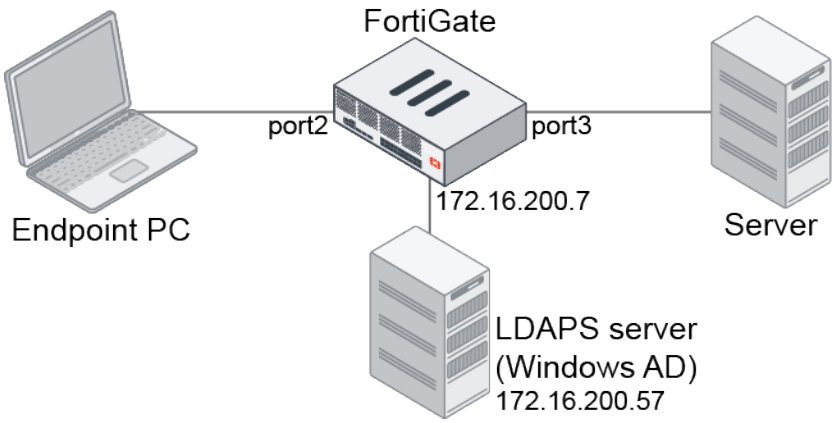
Administrators can configure a FortiGate client certificate in the LDAP server configuration when the FortiGate connects to an LDAPS server that requires client certificate authentication.

```
config user ldap
    edit <ldap_server>
        set client-cert-auth {enable | disable}
        set client-cert <source>
    next
end
```

Example

In this example, the FortiGate is configured as an explicit web proxy. It connects to the Windows AD server through LDAPS, where the Windows server requires a client certificate to connect. The client certificate is configured in the CLI.

The endpoint PC connecting to the web server will first need to authenticate to the explicit web proxy before accessing the server.



While this example demonstrates an LDAP client certificate for an explicit proxy configuration, LDAP client certificates can be used in firewall authentication, transparent proxy, ZTNA, and where ever LDAP configurations are used on the FortiGate.

To configure a client certificate on the LDAP server:

1. Enable the explicit web proxy on port2:

```
config system interface
    edit "port2"
        set explicit-web-proxy enable
    next
end
```

2. Upload the client certificate to the FortiGate:

```
config vpn certificate local
    edit "Zach"
        set password **********
        set private-key <private key>
        set certificate <certificate>
    next
end
```

3. Configure the LDAP server settings:

```
config user ldap
    edit "ldaps"
        set server "172.16.200.57"
        set server-identity-check disable
        set cnid "CN"
        set dn "CN=Users,DC=ftnt,DC=com"
        set secure ldaps
        set port 636
        set client-cert-auth enable
        set client-cert "Zach"
    next
end
```

To ensure the proper operation of LDAPS authentication, make sure that the CA that signed the server certificate for the LDAPS server, typically a private CA, is trusted by the FortiGate by uploading the private CA certificate. This is especially important for an existing configuration where this was not previously done to ensure proper operation after upgrades. See CA certificate on page 3609.

4. Configure the authentication scheme:

```
config authentication scheme
    edit "1"
        set method basic
        set user-database "ldaps"
    next
end
```

5. Configure the authentication rule:

```
config authentication rule
    edit "1"
        set srcintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set active-auth-method "1"
    next
end
```

6. Configure the user group:

```
config user group
    edit "test"
        set member "ldaps"
    next
end
```

7. Configure the proxy policy with the user group:

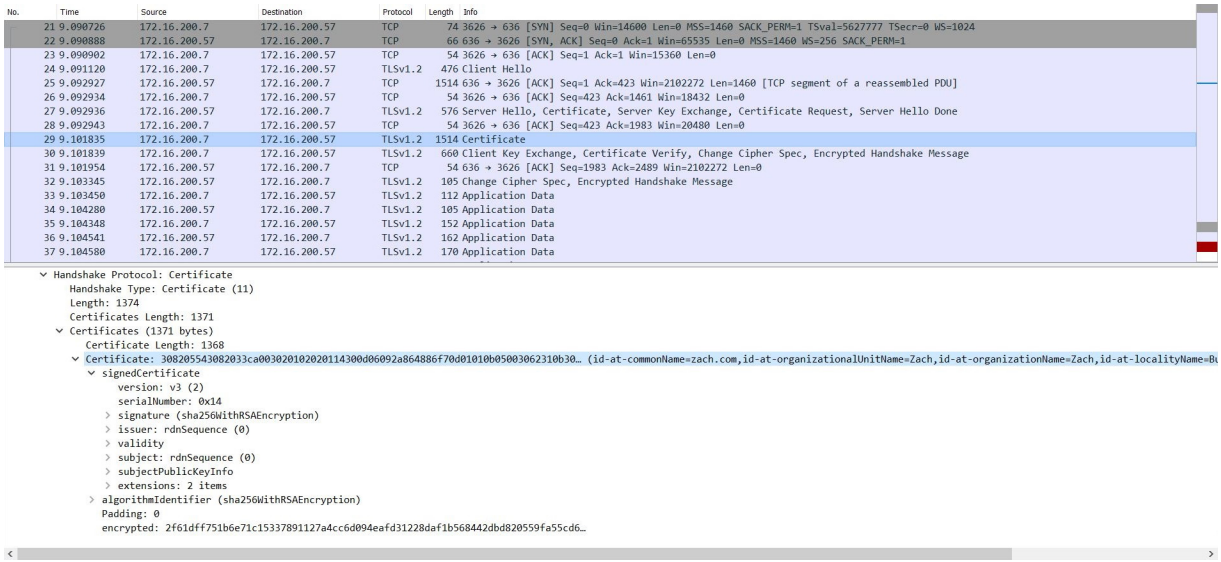
```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set groups "test"
        set utm-status enable
        set ssl-ssh-profile "deep-inspection-clone"
        set av-profile "av"
```

```
    next
end
```

Testing and verification

When traffic from the endpoint PC matches a policy and triggers authentication, the FortiGate starts the LDAPS TLS connection handshake with the Windows AD. The LDAPS server requests a client certificate to identify the FortiGate as a client. The FortiGate provides a configured client certificate, issued to zach.com, to the LDAPS server.

The following communication between the FortiGate and the LDAPS server shows the client certificate is sent by the FortiGate:



RADIUS servers

Remote Authentication and Dial-In User Service (RADIUS) is a broadly supported client-server protocol that provides centralized authentication, authorization, and accounting functions. RADIUS clients are built into gateways that allow access to networks such a VPN server, network access server (NAS), and a network switch or firewall that uses authentication.

RADIUS servers use UDP packets to communicate with the RADIUS clients on the network to authenticate users before allowing them access to the network, authorize access to resources by appropriate users, and account or bill for those resources that are used. RADIUS servers are currently defined by RFC 2865 (RADIUS) and RFC 2866 (RADIUS Accounting), and listen on either UDP ports 1812 (authentication) and 1813 (accounting), or ports 1645 (authentication) and 1646 (accounting) requests. RADIUS servers exist for all major operating systems.

The RADIUS server must be configured to accept the FortiGate as a client so it can use the authentication and accounting functions of the RADIUS server.

To secure RADIUS connections, consider using RADSEC over TLS. See Configuring a RADSEC client on page 3073.

RADIUS authentication with a FortiGate requires the following:

- Configuring one or more RADIUS server profiles on the FortiGate.
- Assigning the RADIUS server profile to a user or user group.
- Applying the user or user group to a firewall policy.

RADIUS authentication can be applied to many FortiGate functions, such as firewall authentication, SSL and IPsec VPNs, administrator profiles, ZTNA, explicit proxy, wireless, 802.1X, and more.

The RADIUS server uses a shared secret key with MD5 hashing to encrypt information passed between RADIUS servers and clients. Typically, only user credentials are encrypted. Additional security can be configured through IPsec tunnels by placing the RADIUS server behind another VPN gateway.

The following topics provide more information about RADIUS servers:

- Configuring a RADIUS server on page 3033
- Using multiple RADIUS servers on page 3036
- RADIUS AVPs and VSAs on page 3039
- RADIUS VSAs for captive portal redirects on page 3041
- Restricting RADIUS user groups to match selective users on the RADIUS server on page 3043

- RADIUS Termination-Action AVP in wired and wireless scenarios on page 3068
- Configuring a RADSEC client on page 3073
- RADIUS integrated certificate authentication for SSL VPN on page 3077

Configuring a RADIUS server

A RADIUS server can be configured in the GUI by going to *User & Authentication* > *RADIUS Servers*, or in the CLI under `config user radius`.

Basic configuration

The following table summarizes the common RADIUS settings that can be configured in the GUI and CLI.

GUI field	CLI setting	Description
Name	`edit <name>`	Define the RADIUS server object within FortiOS.

GUI field	CLI setting	Description
Authentication method	`set auth-type {auto | ms_chap_v2 | ms_chap | chap | pap}`	Specify the authentication method, or select *Default*/`auto` to negotiate PAP, MSCHAP_v2, and CHAP in that order.
NAS IP	`set nas-ip <IPv4_address>`	Optional setting, also known as Calling-Station-Id. Specify the IP address the FortiGate uses to communicate with the RADIUS server. If left unconfigured, the FortiGate will use the IP address of the interface that communicates with the RADIUS server.
Include in every user group	`set all-usergroup {enable | disable}`	Optional setting to add the RADIUS server to each user group. This allows each user group to try and authenticate users against the RADIUS server if local authentication fails.
Primary Server		
IP/Name	`set server <string>`	Enter the IP address or resolvable FQDN of the RADIUS server.
Secret	`set secret <password>`	Enter the password used to connect to the RADIUS server.

There is an option in the GUI to configure a second server, and a third server can be configured in the CLI (see Using multiple RADIUS servers on page 3036).

Advanced settings

Advanced settings for RADIUS servers can be configured in the CLI. The following are some commonly used settings.

To edit the port used to connect with the RADIUS server:

```
config system global
    set radius-port <integer>
end
```

To edit the default setting for password encoding and username case sensitivity:

```
config user radius
    edit <name>
        set password-encoding {auto | ISO-8859-1}
        set username-case-sensitive {enable | disable}
    next
end
```

`password-encoding {auto | ISO-8859-1}`	Set the password encoding to use the original encoding or ISO-8859-1 (default = auto). The `auth-type` must be `auto` or `pap` to change this setting.
`username-case-sensitive {enable | disable}`	Enable/disable case sensitive usernames (default = disable).

To configure different transport protocols:

```
config user radius
    edit <name>
        set transport-protocol {udp | tcp | tls}
    next
end
```

`transport-protocol {udp | tcp | tls}`	Set the type of transport protocol to use: • `udp`: use UDP (default) • `tcp`: use TCP, but no TLS security • `tls`: use TLS over TCP

To configure a RADSEC client with TLS:

```
config user radius
    edit <name>
        set transport-protocol tls
        set ca-cert <string>
        set client-cert <string>
        set tls-min-proto-version {default | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
        set server-identity-check {enable | disable}
    next
end
```

`ca-cert <string>`	Set the CA certificate of server to trust under TLS.
`client-cert <string>`	Set the client certificate to use under TLS.
`tls-min-proto-version {default | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}`	Set the minimum supported protocol version for TLS connections: • `default`: follow the system global setting • `SSLv3`: use SSLv3 • `TLSv1`: use TLSv1 • `TLSv1-1`: use TLSv1.1 • `TLSv1-2`: use TLSv1.2
`server-identity-check {enable | disable}`	Enable/disable RADIUS server identity check, which verifies the server domain name/IP address against the server certificate (default = enable).

For RADSEC over TLS example configuration, see Configuring a RADSEC client on page 3073.

It is best practice to enable RADSEC over TLS whenever the FortiGate and RADIUS connection must pass through unencrypted transport. When using TCP and UDP transport modes, it is recommended to ensure the FortiGate and RADIUS connection passes through a trusted network or the connection passes through an encrypted tunnel over untrusted networks.

To account for dynamic IP address changes, such as those governed by SD-WAN rules, interface names can be used to define the source IP addresses in RADIUS, LDAP, and DNS configurations using the `source-ip-interface` command. See Implement the interface name as the source IP address in RADIUS, LDAP, and DNS configurations on page 309.

RADIUS Connection

When using TCP or UDP as transport, it is possible for the RADIUS protocol to be compromised by the vulnerability described in CVE-2024-3596. In order to protect against this RADIUS vulnerability, as a RADIUS client, FortiGate will:

1. Force the validation of message authenticator.
2. Reject RADIUS response with unrecognized `proxy-state` attribute.

Message authenticator checking is made mandatory under UDP/TCP. It is not mandatory when using TLS.

Therefore, if FortiGate is using UDP/TCP mode without RADSEC, the RADIUS server should be patched to ensure the message authenticator attribute is used in its RADIUS messages. Check with your RADIUS server vendor for information about support for the message authenticator attribute.

It is best practice to enable RADSEC over TLS whenever the FortiGate and RADIUS connection must pass through unencrypted transport. When using TCP and UDP transport modes, it is recommended to ensure the FortiGate and RADIUS connection passes through a trusted network or the connection passes through an encrypted tunnel over untrusted networks.

Using multiple RADIUS servers

There are several ways to implement multiple RADIUS servers, and each has a different effect on user authentication. The three main options available are:

- Add a second (or third) RADIUS server in the same profile.
- Add a second RADIUS server profile, and add both to the same user group.
- Use two RADIUS server profiles for two user groups (one for each).

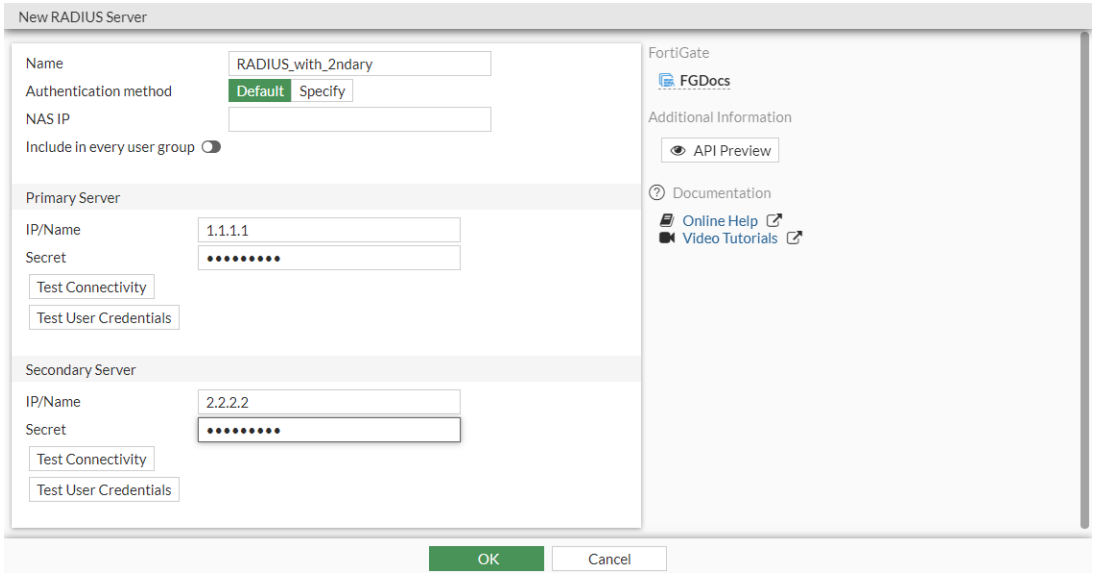
Adding a second server in a RADIUS profile

A second RADIUS server can be configured in the same RADIUS profile so in the event the first RADIUS server does not respond, the second server can be checked. If the first RADIUS server responds with an Access-Reject, no further servers are queried.

To add a second server in a RADIUS profile:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Enter the following:

Name	*RADIUS_with_2ndary*
Authentication method	*Default*
Primary Server	
IP/Name	*1.1.1.1*
Secret	Enter the password used to connect to the RADIUS server.
Secondary Server	
IP/Name	*2.2.2.2*
Secret	Enter the password used to connect to the RADIUS server.



3. Click *OK*.

Adding two RADIUS server profiles in the same user group

When two separate RADIUS profiles are added to a user group, the FortiGate sends an Access-Request simultaneously to both RADIUS servers, and authentication succeeds if either server sends back an Access-Accept. This example includes the settings from the previous example where one or more of the RADIUS server profiles has a secondary server configured.In this case, the secondary server in the *RADIUS_with_2ndary*

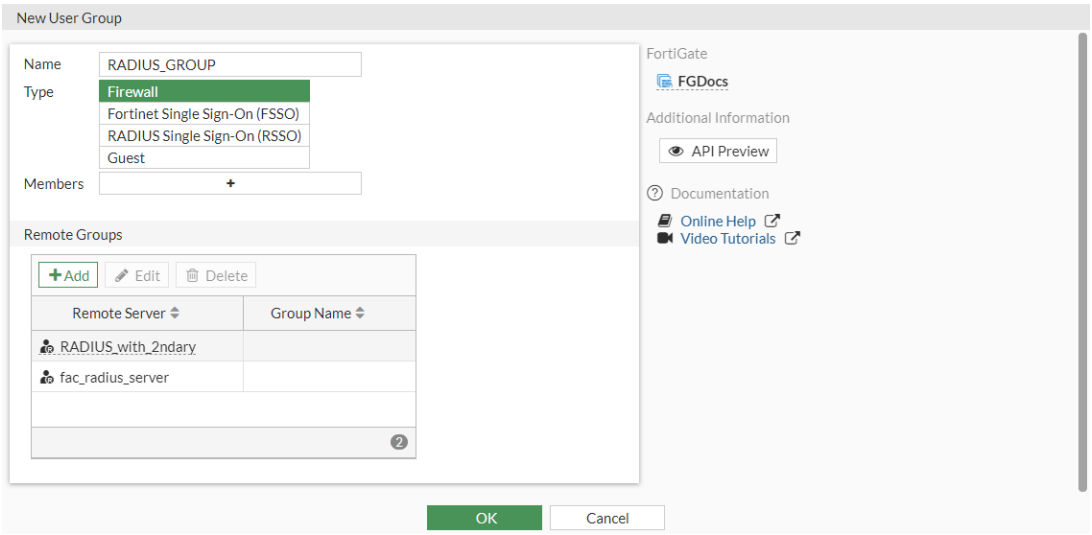
profile, 2.2.2.2, is only checked if the primary server of this profile times out and the *fac_radius_server* profile does not return an Access-Accept.

To add two RADIUS server profiles in the same user group:

1. Go to *User & Authentication* > *RADIUS Servers*, click *Create New*, and configure the RADIUS servers as needed (refer to the previous example).
2. Go to *User & Authentication* > *User Groups* and click *Create New*.
3. Enter the following:

Name	*RADIUS_GROUP*
Type	*Firewall*

4. In the *Remote Groups* table, click *Add*.
5. Select *RADIUS_with_2ndary* and click *OK*.
6. Click *Add*, select *fac_radius_server*, then click *OK*.



7. Click *OK*.

Using separate RADIUS server profiles for separate user groups

In this example, the FortiGate first evaluates if the user belongs to the first listed group (*radius_group*) in the policy. If the user fails to authenticate to this group, then the FortiGate checks if the user can successfully authenticate to the second user group (*radius_group_2*). Refer to the first and second examples for detailed instructions.

To use separate RADIUS server profiles for separate user groups:

1. Configure the RADIUS server profiles:
   a. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
   b. Configure two RADIUS servers, *fac_radius_server* and *RADIUS_with_2ndary*, as needed (refer to the previous example).

2. Configure the firewall groups:
   a. Go to *User & Authentication* > *User Groups* and click *Create New*.
   b. Configure two firewall groups, one named *radius_group* with remote server member *fac_radius_server*, and one named *radius_group_2* with remote server member *RADIUS_with_2ndary* (refer to the previous example).

Group Name	Group Type	Members	Ref.
radius_group	Firewall	fac_radius_server	1
radius_group_2	Firewall	RADIUS_with_2ndary	1

3. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. For *Source*, click *User* then select *radius_group* and *radius_group_2*. Click *Address* and select *LAN address*.
   c. Configure the other settings as needed.
   d. Click *OK*.

Name	From	To	Source	Destination	Schedule	Service	Action	NAT
LAN to WAN	LAN (LAN)	WAN	radius_group radius_group_2 LAN address	all	always	ALL	ACCEPT	Enabled

RADIUS AVPs and VSAs

This topic describes RADIUS Attribute Value Pairs (AVPs) and Vendor-Specific Attributes (VSAs).

AVPs

RADIUS packets include a set of AVPs to identify information about the user, their location, and other information. The IETF defined a set of 255 standard attributes, which are well known and come in the form of Type, Length, Value (for more details, refer to RFC 2865). Of the standard 255, the FortiGate sends the following RADIUS attributes:

RADIUS attribute number	Name	Description
1	User-Name	Name of the user being authenticated by the RADIUS server.
4	NAS-IP-Address	IP address of the network access server (NAS) that is requesting authentication. The NAS is the FortiGate.
8	Framed-IP-Address	IP address to be configured for the user, by sending the IP address of a user to the RADIUS server in the Access-Request packet.
25	Class	Used in accounting packets and requests for firewall, WiFi, and proxy authentication. The attribute is returned in the Access-Accept message and is added to all accounting packets.
26	Fortinet-VSA	See VSAs.

RADIUS attribute number	Name	Description
32	NAS-Identifier	Identifier or IP address of the NAS that is requesting authentication. The NAS is the FortiGate.
42	Acct-Input-Octets	Number of octets received from the port over the course of this service being provided. Used to charge the user for the amount of traffic they used.
43	Acct-Output-Octets	Number of octets sent to the port while delivering this service. Used to charge the user for the amount of traffic they used.
44	Acct-Session-Id	Unique number assigned to each start and stop record to make it easy to match them, and to eliminate duplicate records.
55	Event-Timestamp	Records the time that the event occurred on the NAS. The timestamp is measured in seconds since January 1, 1970 00:00 UTC. Before the Event-Timestamp attribute can be sent in a packet, make sure that the correct time is set on the FortiGate.

VSAs

Some vendors want or need to send attributes that do not match any of the defined IETF attributes. This can be accomplished by using RADIUS attribute type 26, which allows a vendor to encapsulate their own specific attributes in this standard AVP.

In order to support VSAs, the RADIUS server requires a dictionary to define the VSAs. This dictionary is typically supplied by the client or server vendor.

The Fortinet RADIUS vendor ID is 12356 and contains the following attributes:

Attribute name	Attribute number	Attribute value format
Fortinet-Group-Name	1	String
Fortinet-Client-IP-Address	2	IP address
Fortinet-Vdom-Name*	3	String
Fortinet-Client-IPv6-Address	4	Octets
Fortinet-Interface-Name	5	String
Fortinet-Access-Profile	6	String
Fortinet-SSID	7	String
Fortinet-AP-Name	8	String
Fortinet-FAC-Auth-Status	11	String
Fortinet-FAC-Token-ID	12	String
Fortinet-FAC-Challenge-Code	15	String

Attribute name	Attribute number	Attribute value format
Fortinet-Webfilter-Category-Allow	16	String
Fortinet-Webfilter-Category-Block	17	Octets
Fortinet-Webfilter-Category-Monitor	18	Octets
Fortinet-AppCtrl-Category-Allow	19	Octets
Fortinet-AppCtrl-Category-Block	20	Octets
Fortinet-AppCtrl-Risk-Allow	21	Octets
Fortinet-AppCtrl-Risk-Block	22	Octets
Fortinet-WirelessController-Device-MAC	23	Ether
Fortinet-WirelessController-WTP-ID	24	String
Fortinet-WirelessController-Assoc-Time	25	Date
Fortinet-FortiWAN-AVPair	26	String
Fortinet-Captive-Portal-URL	27	String
Fortinet-FDD-Access-Profile	30	String
Fortinet-FDD-Trusted-Hosts	31	String
Fortinet-FDD-SPP-Name	32	String
Fortinet-FDD-Is-System-Admin	33	String
Fortinet-FDD-Is-SPP-Admin	34	String
Fortinet-FDD-SPP-Policy-Group	35	String
Fortinet-FDD-Allow-API-Access	36	String
Fortinet-Fpc-User-Role	40	String
Fortinet-Tenant-Identification	41	String
Fortinet-Host-Port-AVPair	42	String

* For Fortinet-Vdom-Name, users can be tied to a specific VDOM on the FortiGate. Refer to the documentation provided by your RADIUS server for configuration details.

RADIUS VSAs for captive portal redirects

RADIUS Vendor-Specific Attributes (VSA) for captive portal redirects provide a smoother user experience during captive portal redirects, especially in environments where vendor-specific attributes are heavily used, such as corporate networks or public Wi-Fi hotspots.

To configure RADIUS VSA for captive portal redirects:

1. Configure a RADIUS user:

```
config user radius
    edit "pc05"
        set server "172.16.200.55"
        set secret ***************
    next
end
```

2. Add the user to a group:

```
config user group
    edit "radius-group"
        set member "pc05"
    next
end
```

3. Configure the interface to use captive portal authentication and the group:

```
config system interface
    edit "port2"
        set security-mode captive-portal
        set security-groups "radius-group"
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "port2"
        set dstintf "mgmt"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set logtraffic all
        set nat enable
    next
end
```

5. To check the configuration, on a client PC:
   a. Use a browser to access a web server.
   b. Authenticate using RADIUS.
   c. Browse the redirect to https://www.fortinet.com.
   d. Check the list of authenticated users:

```
# diagnose firewall auth list

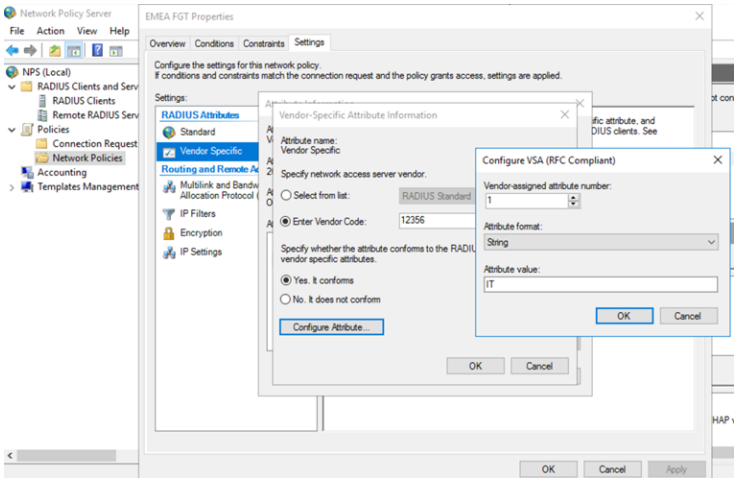
10.1.100.11, 962341
        src_mac: 00:0c:29:61:d4:13
        type: fw, id: 0, duration: 752, idled: 2
        expire: 298, allow-idle: 300
        flag(10): radius
        server: pc05
        packets: in 8531 out 7654, bytes: in 7972540 out 1104574
        group_id: 1
        group_name: radius-group

----- 1 listed, 0 filtered ------
```

Restricting RADIUS user groups to match selective users on the RADIUS server

When a user group is configured in FortiOS to authenticate against a RADIUS server, it will allow any valid user account on the RADIUS server to match that user group. Sometimes you might want to specify which users on the RADIUS server should match a particular user group on the FortiGate. This can be accomplished using the RADIUS attribute value pair (AVP) 26, known as a Vendor-Specific Attribute (VSA). This attribute allows the Fortinet-Group-Name VSA to be included in the RADIUS response. In FortiOS, the user group must be configured to specifically match this group.

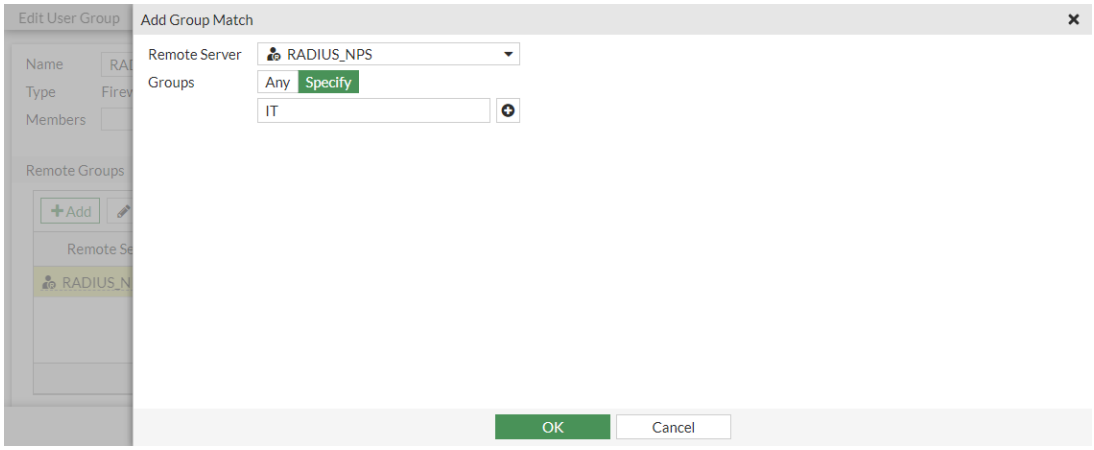
In the following example, a RADIUS Network Policy Server (NPS) has been configured to have the Fortinet-Group-Name be *IT*, and assumes that the user group, *RADIUS_IT* has been created, which authenticates to the *RADIUS_NPS* server.



To configure specific group matching in the GUI:

1. Go to *User & Authentication* > *User Groups* and edit the *RADIUS_IT* group.
2. In the *Remote Groups* table, select the *RADIUS_NPS* server and click *Edit*. The *Add Group Match* pane opens.

3. For *Groups*, select *Specify* and enter the group name configured on the RADIUS server (*IT*).
4. Click *OK*.



5. Click *OK*.

To configure specific group matching in the CLI:

```
config user group
    edit "RADIUS_IT"
        set member "RADIUS_NPS"
        config match
            edit 1
                set server-name "RADIUS_NPS"
                set group-name "IT"
            next
        end
    next
end
```

To change the matching back to any group, under `config match`, enter `delete 1`. Changing the `group-name` to `"Any"` will cause the FortiGate to match the Fortinet-Group-Name with the literal string, `Any`.

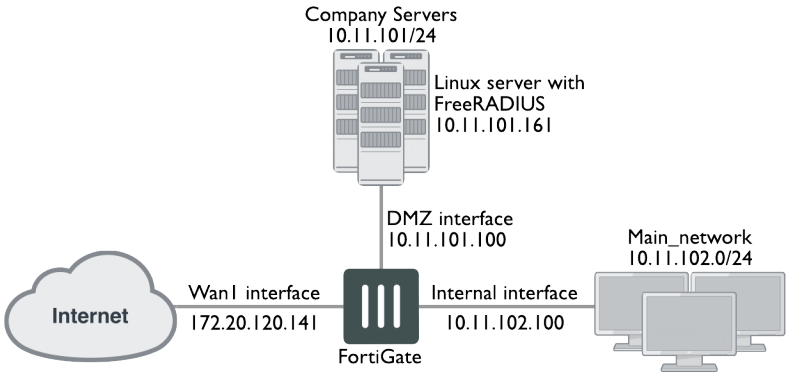
Configuring RADIUS SSO authentication

A common RADIUS SSO (RSSO) topology involves a medium-sized company network of users connecting to the Internet through the FortiGate and authenticating with a RADIUS server. The following describes how to configure FortiOS for this scenario. The example makes the following assumptions:

- VDOMs are not enabled.
- The super_admin account is used for all FortiGate configuration.
- A RADIUS server is installed on a server or FortiAuthenticator and uses default attributes.
- BGP is used for any dynamic routing.
- You have configured authentication event logging under *Log & Report*.

Example.com has an office with 20 users on the internal network who need access to the Internet. The office network is protected by a FortiGate-60C with access to the Internet through the wan1 interface, the user network on the internal interface, and all servers are on the DMZ interface. This includes an Ubuntu sever running FreeRADIUS. This example configures two users:

User	Account
Pat Lee	plee@example.com
Kelly Green	kgreen@example.com



Configuring this example consists of the following steps:

1. Configure RADIUS.
2. Configure FortiGate interfaces.
3. Configure a RSSO agent.
4. Create a RSSO user group.
5. Configure security policies.
6. Test the configuration.

To configure RADIUS:

Configuring RADIUS includes configuring a RADIUS server such as FreeRADIUS on user's computers and configuring users in the system. In this example, Pat and Kelly belong to the exampledotcom_employees group. After completing the configuration, you must start the RADIUS daemon. The users have a RADIUS client installed on their PCs that allow them to authenticate through the RADIUS server.

For any problems installing FreeRADIUS, see the FreeRADIUS documentation.

To configure FortiGate interfaces:

You must define a DHCP server for the internal network, as this network type typically uses DHCP. The wan1 and dmz interfaces are assigned static IP addresses and do not need a DHCP server. The following table shows the FortiGate interfaces used in this example:

Interface	Subnet	Act as DHCP server	Devices
wan1	172.20.120.141	No	Internet service provider

Interface	Subnet	Act as DHCP server	Devices
dmz	10.11.101.100	No	Servers including RADIUS server
internal	10.11.102.100	Yes: x.x.x.110-250	Internal user network

1. Go to *Network* > *Interfaces*.
2. Edit wan1:

Alias	Internet
Addressing Mode	Manual
IP/Network Mask	172.20.120.141/255.255.255.0
Administrative Access	HTTPS, SSH
Enable DHCP Server	Not selected
Comments	Internet
Administrative Status	Up

3. Click *OK*.
4. Edit dmz:

Alias	Servers
Addressing Mode	Manual
IP/Network Mask	10.11.101.100/255.255.255.0
Administrative Access	HTTPS, SSH, PING, SNMP
Enable DHCP Server	Not selected
Listen for RADIUS Accounting Messages	Select
Comments	Servers
Administrative Status	Up

5. Click *OK*.
6. Edit internal:

Alias	Internal network
Addressing Mode	Manual
IP/Network Mask	10.11.102.100/255.255.255.0
Administrative Access	HTTPS, SSH, PING
Enable DHCP Server	Select
Address Range	10.11.102.110 - 10.11.102.250

Netmask	255.255.255.0
Default Gateway	Same as Interface IP
Comments	Internal network
Administrative Status	Up

To create a RADIUS SSO agent:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.
3. Under *Endpoint/Identity*, select *RADIUS Single Sign-On Agent*.
4. Enable *Use RADIUS Shared Secret*. Enter the RADIUS server's shared secret.
5. Enable *Send RADIUS Responses*. Click *OK*.

To create a RADIUS SSO user group:

1. Go to *User & Authentication > User Groups*.
2. Click *Create New*.
3. For *Type*, select *RADIUS Single Sign-On (RSSO)*.
4. In *RADIUS Attribute Value*, enter the name of the RADIUS user group that this local user group represents.
5. Click *OK*.

Configuring security policies

The following security policies are required for RADIUS SSO:

Sequence Number	From	To	Type	Schedule	Description
1	internal	wan1	RADIUS SSO	Business hours	Authenticate outgoing user traffic
2	internal	wan1	Regular	Always	Allow essential network services and VoIP
3	dmz	wan1	Regular	Always	Allow servers to access the Internet
4	internal	dmz	Regular	Always	Allow users to access servers
5	any	any	Deny	Always	Implicit policy denying all traffic that has not been matched

You must place the RADIUS SSO policy at the top of the policy list so that it is matched first. The only exception to this is if you have a policy to deny access to a list of banned users. In this case, you must put that policy at the top so that the RADIUS SSO does not mistakenly match a banned user or IP address.

You must configure lists before creating security policies.

Schedule

You must configure a business_hours schedule. You can configure a standard Monday to Friday 8 AM to 5 PM schedule, or whatever days and hours covers standard work hours at the company.

Address groups

You must configure the following address groups:

Name	Interface	Address range included
internal_network	internal	10.11.102.110 to 10.11.102.250
company_servers	dmz	10.11.101.110 to 10.11.101.250

Service groups

You must configure the service groups. The services listed are suggestions and you may include more or less as required:

Name	Interface	Description of services to be included
essential_network_services	internal	Any network protocols required for normal network operation such as DNS, NTP, BGP
essential_server_services	dmz	All the protocols required by the company servers such as BGP, HTTP, HTTPS, FTP, IMAP, POP3, SMTP, IKE, SQL, MYSQL, NTP, TRACEROUTE, SOCKs, and SNMP
user_services	internal	Any protocols required by users such as HTTP, HTTPS, FTP

The following security policy configurations are basic and only include logging and default AV and IPS. These policies allow or deny access to non-RADIUS SSO traffic. These are essential as network services including DNS, NTP, and FortiGuard require access to the Internet.

To configure security policies:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Configure the policy as follows, then click *OK*:

Incoming Interface	Internal
Source Address	internal_network
Outgoing Interface	wan1

Destination Address	all
Schedule	always
Service	essential_network_services
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	ON
Comments	Essential network services

4. Click *Create New*, and configure the new policy as follows, then click *OK*:

Incoming Interface	dmz
Source Address	company_servers
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	essential_server_services
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	enable
Comments	Company servers accessing the Internet

5. Click *Create New*, and configure the new policy as follows, then click *OK*:

Incoming Interface	Internal
Source Address	internal_network
Outgoing Interface	dmz
Destination Address	company_servers
Schedule	always
Service	all
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	enable
Comments	Access company servers

6. Click *Create New*, and configure the RADIUS SSO policy as follows, then click *OK*. This policy allows access for members of specific RADIUS groups.

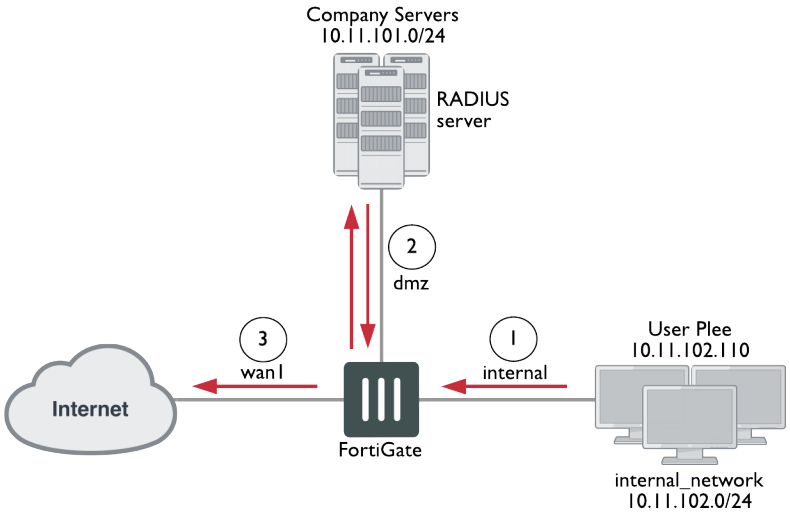
Incoming Interface	Internal
Source Address	internal_network
Source User(s)	Select the user groups that you created for RSSO.
Outgoing Interface	wan1
Destination Address	all
Schedule	business_hours
Service	ALL
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, Web Filter, IPS, and Email Filter. In each case, select the default profile.

7. Place the RSSO policy higher in the security policy list than more general policies for the same interfaces. Click *OK*.

To test the configuration:

Once configured, a user only needs to log in to their PC using their RADIUS account. After that, when they attempt to access the Internet, the FortiGate uses their session information to get their RADIUS information. Once the user is verified, they can access the website.

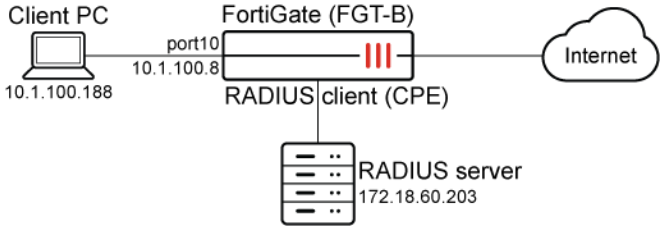
1. The user logs on to their PC and tries to access the Internet.
2. The FortiGate contacts the RADIUS server for the user's information. Once confirmed, the user can access the Internet. Each step generates logs that enable you to verify that each step succeeded.
3. If a step does not succeed, confirm that your configuration is correct.



Trigger RADIUS authentication with DNS and ICMP queries

DNS and ICMP queries can trigger RADIUS authentication. In some situations, a RADIUS client cannot trigger authentication with only HTTP, HTTPS, or Telnet traffic, such as VoIP gateways or servers. Without RADIUS authentication there is no RADIUS accounting, which can be required in some circumstances.

In this example, a Client PC is used as a VoIP gateway.



To configure FGT-B:

1. Configure a RADIUS user:

```
config user radius
    edit "FreeRADIUS"
        set server "172.18.60.203"
        set secret **********
        set acct-interim-interval 600
        set auth-type pap
        set password-renewal disable
        config accounting-server
            edit 1
                set status enable
                set server "172.18.60.203"
                set secret **********
            next
        end
    next
end
```

2. Find the MAC address on the interface. In the RADIUS accounting start message it will be the *Called-Station-Id*.

```
# get hardware nic port10 | grep HW
Current_HWaddr   80:80:2c:a3:50:f3
Permanent_HWaddr 80:80:2c:a3:50:f3
```

3. Add the RADIUS user to a group:

```
config user group
    edit "remote-radius"
        set member "FreeRADIUS"
    next
end
```

4. Configure the interface:

```
config system interface
    edit "port10"
        set vdom "root"
        set ip 10.1.100.8 255.255.255.0
        set allowaccess ping https ssh http telnet
        set type physical
        set security-mode captive-portal
        set security-ip-auth-bypass enable
        set security-groups "remote-radius"
        set device-identification enable
        set snmp-index 12
        config ipv6
            set ip6-address 2008::8/64
            set ip6-allowaccess ping https http
        end
    next
end
```

5. Configure a policy:

```
config firewall policy
    edit 1
        set name "pol1"
        set srcintf "port10"
        set dstintf "port9"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
        set av-profile "default"
        set logtraffic all
        set nat enable
        set groups "remote-radius"
        set radius-ip-auth-bypass enable
    next
end
```

To test the configuration:

1. Trigger RADIUS authentication on the Client PC using the `ip-auth-bypass` feature configured on the FortiGate. This can be done by either:
   - Pinging any external resource (ICMP query).
   - Connecting to an external webpage using an FQDN URL in a browser with an empty cache, which requires a new DNS query.

   The FortiGate will use the Client PC IP address as the credentials for authentication. If successful, this will be followed by a RADIUS accounting start message.
2. On FGT-B, check the local firewall authentication list.

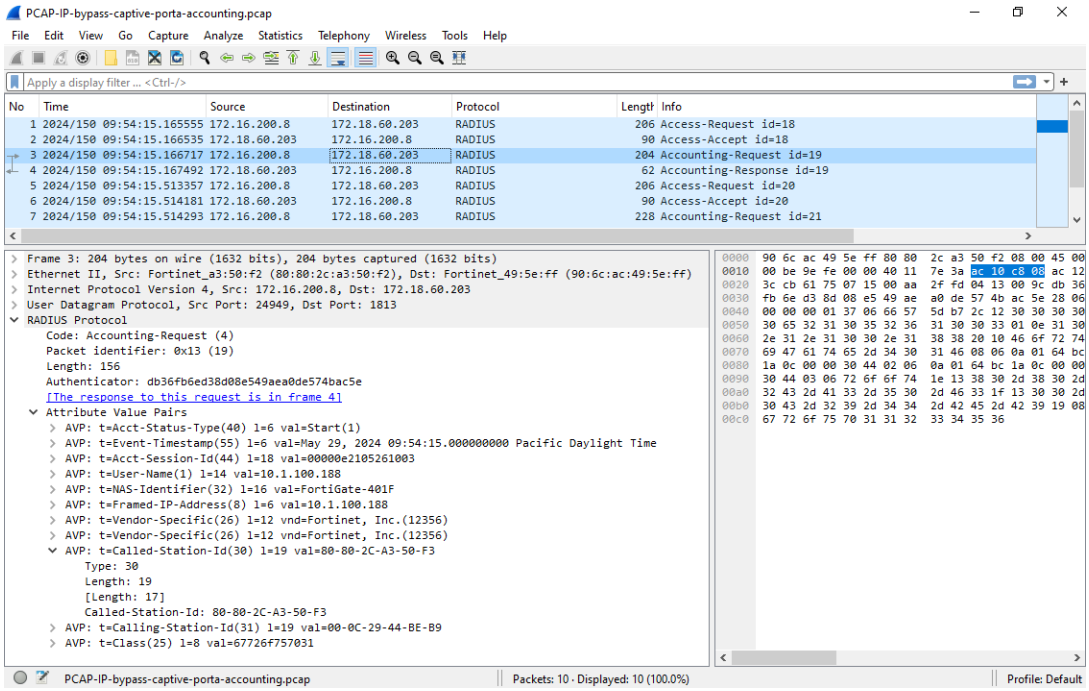
The RADIUS user that is used for `ip-auth-bypass` is the IP address of the Client PC. The source MAC address is the MAC address of the Client PC.

```
# diagnose firewall auth list

10.1.100.188, 10.1.100.188
        src_mac: 00:0c:29:44:be:b9
        type: fw, id: 0, duration: 16, idled: 10
        expire: 284, allow-idle: 300, max-life: 2384
        flag(14): hard radius
        server: FreeRADIUS
        packets: in 4 out 5, bytes: in 1105 out 1044
        group_id: 5
        group_name: remote-radius

----- 1 listed, 0 filtered ------
```

3. Check the RADIUS accounting start messages in the traffic between FGT-B and the RADIUS server. The MAC address of FGT-B is the *Called-Station-Id*, and the IP address of the Client PC is the *User-Name*.



RSA ACE (SecurID) servers

SecurID is a two-factor system produced by the company RSA that uses one-time password (OTP) authentication. This system consists of the following:

- Portable tokens that users carry
- RSA ACE/Server
- Agent host (the FortiGate)

When using SecurID, users carry a small device or "token" that generates and displays a pseudo-random password. According to RSA, each SecurID authenticator token has a unique 64-bit symmetric key that is combined with a powerful algorithm to generate a new code every 60 seconds. The token is time-synchronized with the SecurID RSA ACE/Server.

The RSA ACE/Server is the SecurID system's management component. It stores and validates the information about the SecurID tokens allowed on your network. Alternately, the server can be an RSA SecurID 130 appliance.

The agent host is the server on your network. In this case, this is the FortiGate, which intercepts user logon attempts. The agent host gathers the user ID and password entered from the SecurID token and sends the information to the RSA ACE/Server for validation. If valid, the RSA ACE/Server returns a reply indicating that it is a valid logon and FortiOS allows the user access to the network resources specified in the associated security policy.

Configuring SecurID with FortiOS consists of the following:

1. Configure the RSA and RADIUS servers to work with each other. See RSA server documentation.
2. Do one of the following:
   a. Configure the RSA SecurID 130 appliance.
   b. Configure the FortiGate as an agent host on the RSA ACE/Server.
3. Configure the RADIUS server in FortiOS.
4. Create a SecurID user group.
5. Create a SecurID user.
6. Configure authentication with SecurID.

The following instructions are based on RSA ACE/Server 5.1 and RSA SecurID 130 appliance. They assume that you have successfully completed all external RSA and RADIUS server configuration.

In this example, the RSA server is on the internal network and has an IP address of 192.168.100.102. The FortiOS internal interface address is 192.168.100.3. The RADIUS shared secret is fortinet123, and the RADIUS server is at IP address 192.168.100.202.

To configure the RSA SecurID 130 appliance:

1. Log on to the SecurID IMS console.
2. Go to *RADIUS* > *RADIUS clients*, then select *Add New*.

RADIUS Client Basics		
	Client Name	FortiGate
	Associated RSA Agent	FortiGate
RADIUS Client Settings		
	IP Address	Enter the FortiOS internal interface. In this example, it is 192.168.100.3.
	Make / Model	Select *Standard Radius*.
	Shared Secret	Enter the RADIUS shared secret. In this example, it is fortinet123.
	Accounting	Leave unselected.
	Client Status	Leave unselected.

3. Configure your FortiGate as a SecurID client:
4. Click *Save*.

To configure the FortiGate as an agent host on the RSA ACE/Server:

1. On the RSA ACE/Server, go to *Start > Programs > RSA ACE/Server*, then *Database Administration - Host Mode*.
2. From the *Agent Host* menu, select *Add Agent Host*.
3. Configure the following:

Name	FortiGate
Network Address	Enter the FortiOS internal interface. In this example, it is 192.168.100.3.
Secondary Nodes	You can optionally enter other IP addresses that resolve to the FortiGate.

For more information, see the RSA ACE/Server documentation.

To configure the RADIUS server in FortiOS:

1. Go to *User & Authentication > RADIUS Servers*, then click *Create New*.
2. Configure the following:

Name	RSA
Authentication method	Select *Default*.
Primary Server	
IP/Name	192.168.100.102. You can click *Test* to ensure the IP address is correct and that FortiOS can contact the RADIUS server.
Secret	fortinet123

3. Click *OK*.

To create a SecurID user group:

1. Go to *User & Authentication > User Groups*. Click *Create New*.
2. Configure the following:

Name	RSA_group
Type	Firewall

3. In *Remote Groups*, click *Add*, then select the RSA server.
4. Click *OK*.

To create a SecurID user:

1. Go to *User & Authentication > User Definition*. Click *Create New*.
2. Configure the following:

User Type	Remote RADIUS User
Type	wloman
RADIUS Server	RSA
Contact Info	(Optional) Enter email or SMS information.
User Group	RSA_group

3. Click *Create*.

You can test the configuration by entering the `diagnose test authserver radius RSA auto wloman 111111111` command. The series of 1s is the OTP that your RSA SecurID token generates that you enter for access.

Configuring authentication with SecurID

You can use the SecurID user group in several FortiOS features that authenticate by user group:

- Security policy on page 3056
- IPsec VPN XAuth on page 3057
- PPTP VPN on page 3057
- SSL VPN

Unless stated otherwise, the following examples use default values.

Security policy

The example creates a security policy that allows HTTP, FTP, and POP3 traffic from the internal interface to WAN1. If these interfaces are not available in FortiOS, substitute other similar interfaces.

To configure a security policy with SecurID authentication:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Configure the following:

Incoming Interface	internal
Source Address	all
Source User(s)	RSA_group
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	HTTP, FTP, POP3
Action	ACCEPT
NAT	On

Shared Shaper	If you want to limit traffic or guarantee minimum bandwidth for traffic that uses the SecurID security policy, enable and use the default shaper, guarantee-100kbps.
Log Allowed Traffic	Enable if you want to generate usage reports on traffic that this policy has authenticated.

4. Click *OK*.

IPsec VPN XAuth

In *VPN > IPsec Wizard*, select the SecurID user group on the *Authentication* page. The SecurID user group members must enter their SecurID code to authenticate.

PPTP VPN

When configuring PPTP in the CLI, set `usrgrp` to the SecurID user group.

SSL VPN

You must map the SecurID user group to the portal that will serve SecurID users and include the SecurID user group in the security policy's *Source User(s)* field.

To map the SecurID group to an SSL VPN portal:

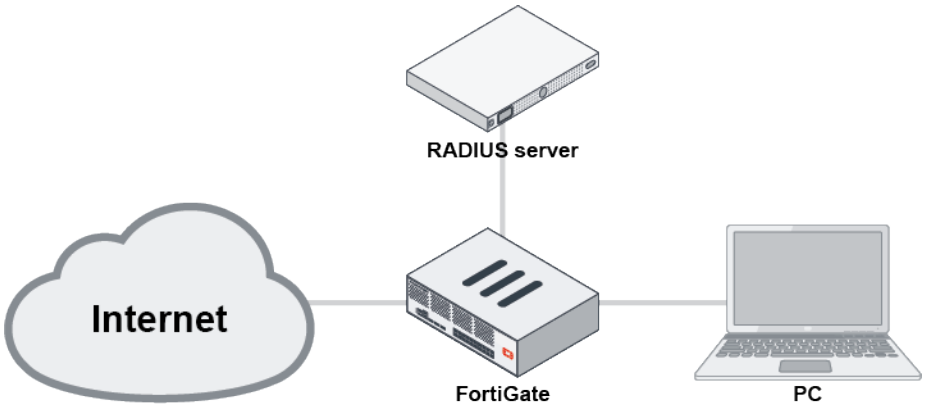
1. Go to *VPN > SSL-VPN Settings*.
2. Under *Authentication/Portal Mapping*, click *Create New*.
3. Configure the following:

Users/Groups	RSA_group
Portal	Select the desired portal.

4. Click *OK*.

Support for Okta RADIUS attributes filter-Id and class

RADIUS user group membership information can be returned in the filter-Id (11) and class (25) attributes in RADIUS Access-Accept messages. The group membership information can be used for group matching in FortiGate user groups in firewall policies and for FortiGate wildcard administrators with remote RADIUS authentication.



In this example, a FortiAuthenticator is used as the RADIUS server. A local RADIUS user on the FortiAuthenticator is configure with two groups in the filter-Id attribute: *okta-group1* and *okta-group2*.

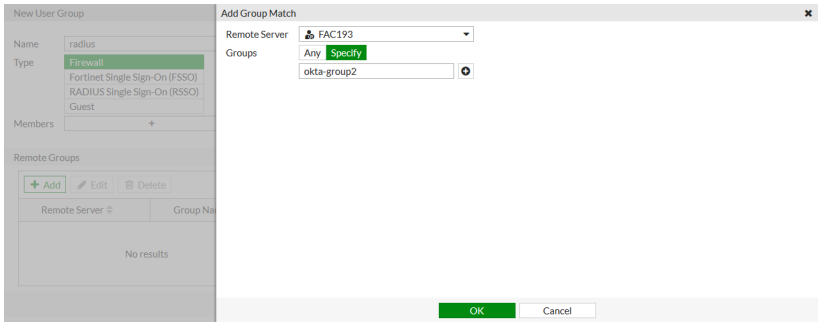
To create the RADIUS user and set the attribute type to override group information:

```
config user radius
    edit "FAC193"
        set server "10.1.100.189"
        set secret **********
        set group-override-attr-type filter-Id
    next
end
```

FortiOS will only use the configured filter-Id attribute, even if the RADIUS server sends group names in both class and filter-id attributes. To return group membership information from the class attribute instead, set `group-override-attr-type` to `class`.

To configure group match in the user group:

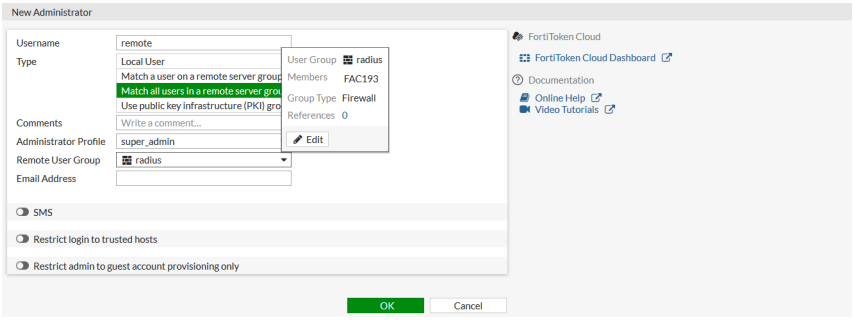
1. Go to *User & Authentication* > *User Groups*.
2. Click *Create New*.
3. Enter a name for the group, and set *Type* to *Firewall*.
4. In the *Remote Groups* table, click *Add*.
5. Set *Remote Server* to the just created RADIUS server, *FAC193*.
6. Set *Groups* to *Specify*, and enter the group name, `okta-group2`. The string must match the group name configured on the RADIUS server for the filter-Id attribute.



7. Click *OK*.
   The remote server is added to the *Remote Groups* table.
8. Click *OK*.
9. Add the new user group to a firewall policy and generate traffic on the client PC that requires firewall authentication, such as connecting to an external web server.
10. After authentication, on the FortiGate, verify that traffic is authorized in the traffic log:
    a. Go to *Log & Report* > *Forward Traffic*.
    b. Verify that the traffic was authorized.

To use the remote user group with group match in a system wildcard administrator configuration:

1. Go to *System* > *Administrators*.
2. Edit an existing administrator, or create a new one.
3. Set *Type* to *Match all users in a remote server group*.
4. Set *Remote User Group* to the remote server.



5. Configure the remaining settings as required.
6. Click *OK*.
7. Log in to the FortiGate using the remote user credentials on the RADIUS server.
   If the correct group name is returned in the filter-Id attribute, administrative access is allowed.

Sending multiple RADIUS attribute values in a single RADIUS Access-Request

A managed FortiSwitch can be configured to send multiple RADIUS attribute values in a single RADIUS Access-Request. This option is configured per RADIUS user, and is set to none by default.

The available service type options are:

login	User should be connected to a host.
framed	User use Framed Protocol.
callback-login	User disconnected and called back.
callback-framed	User disconnected and called back, then a Framed Protocol.
outbound	User granted access to outgoing devices.

administrative	User granted access to the administrative unsigned interface.
nas-prompt	User provided a command prompt on the NAS.
authenticate-only	Authentication requested, and no authentication information needs to be returned.
callback-nas-prompt	User disconnected and called back, then provided a command prompt.
call-check	Used by the NAS in an Access-Request packet, Access-Accept to answer the call.
callback-administrative	User disconnected and called back, granted access to the admin unsigned interface.

To configure a managed FortiSwitch to the RADIUS attributes login, framed, and authenticate-only all at the same time:

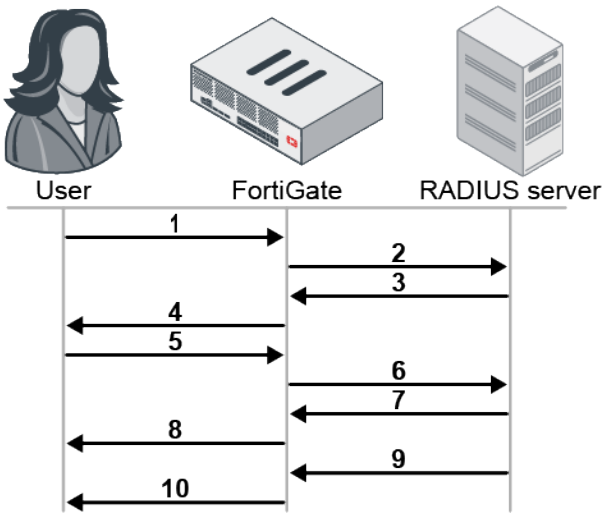
```
config user radius
    edit "Radius_Server"
        set switch-controller-service-type login framed authenticate-only
        ....
    next
end
```

Traffic shaping based on dynamic RADIUS VSAs

A FortiGate can use the WISPr-Bandwidth-Max-Down and WISPr-Bandwidth-Max-Up dynamic RADIUS VSAs (vendor-specific attributes) to control the traffic rates permitted for a certain device. The FortiGate can apply different traffic shaping to different users who authenticate with RADIUS based on the returned RADIUS VSA values. When the same user logs in from an additional device, the RADIUS server will send a CoA (change of authorization) message to update the bandwidth values to 1/*N* of the total values, where *N* is the number of logged in devices from the same user.

This feature is not supported on NP hardware. NP offloading is automatically disabled on the policy if this feature is enabled.

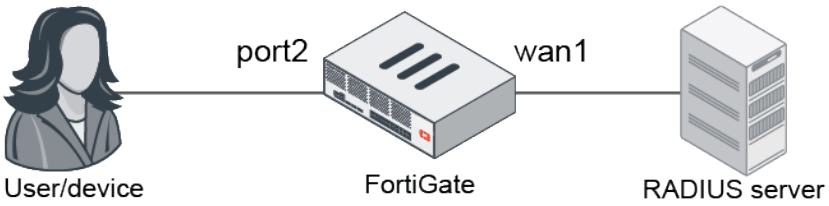
When a user logs in to two devices through RADIUS authentication. The authentication and authorization flow is as follows:



1. The user logs in to a device and the authentication is sent to the FortiGate.
2. The FortiGate sends the Access-Request message to the RADIUS server.
3. The RADIUS server sends the Access-Accept message to the FortiGate. The server also returns the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs.
4. Based on the VSA values, the FortiGate applies traffic shaping for the upload and download speeds based on its IP.
5. The user logs in to a second device and the authentication is sent to the FortiGate.
6. The FortiGate sends the Access-Request message to the RADIUS server.
7. The RADIUS server sends the Access-Accept message to the FortiGate. The server also returns the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs at half the value from the first device.
8. Based on the VSA values, the FortiGate applies traffic shaping for the upload and download speeds on the second device based on its IP.
9. The RADIUS server sends a CoA message and returns WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs for the first device at half the value.
10. Based on the VSA values, the FortiGate updates traffic shaping for the upload and download speeds on the first device based on its IP.

Example

In this example, the FortiGate is configured to dynamically shape user traffic based on the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs returned by the RADIUS server when the user logs in through firewall authentication.



To configure traffic shaping based on dynamic RADIUS VSAs:

1. Configure the RADIUS server users file to identify WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down:

The WISPr-Bandwidth is measured in bps, and the FortiOS dynamic shaper is measured in Bps.

```
WISPr-Bandwidth-Max-Up = 1004857,
WISPr-Bandwidth-Max-Down = 504857,
```

2. In FortiOS, configure the RADIUS server:

```
config user radius
    edit "rad1"
        set server "172.16.200.44"
        set secret ************
        set radius-coa enable
        set acct-all-servers enable
        config accounting-server
            edit 1
                set status enable
                set server "172.16.200.44"
                set secret ************
            next
        end
    next
end
```

3. Configure the RADIUS user group:

```
config user group
    edit "group_radius"
        set member "rad1"
    next
end
```

4. Configure the firewall policy with dynamic shaping and the RADIUS group:

```
config firewall policy
    edit 2
        set srcintf "port2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all6"
        set dstaddr6 "all6"
        set action accept
        set schedule "always"
        set service "ALL"
        set dynamic-shaping enable
```

```
        set groups "group_radius"
        set nat enable
    next
end
```

Verification

After a client PC is authenticated by the RADIUS server, dynamic shaping is applied to the client based on the IP address.

Use the following commands to monitor the dynamic shaper:

```
# diagnose firewall shaper dynamic-shaper stats
```

```
# diagnose firewall shaper dynamic-shaper list {ip | ipv6 | user} <address or username>
```

Use case 1

User1 is paying for rate plan A that limits their maximum bandwidth to 10 Mbps download and 5 Mbps upload. User2 is paying for rate plan B that limits their maximum bandwidth to 5 Mbps download and 5 Mbps upload. The speeds in both plans are provided by best effort, so there is no guaranteed minimum bandwidth.

User1 logs in to pc1 with RADIUS authentication and IP-based dynamic shaping is applied. User2 logs in to pc2 with RADIUS authentication and IP-based dynamic shaping is applied.

To verify the dynamic shaping:

1. On pc1, verify the bandwidth and transfer speed:

```
root@pc1:~# iperf -c 172.16.200.44 -u -t 25 -b 20M
------------------------------------------------------------
Client connecting to 172.16.200.44, UDP port 5001
Sending 1470 byte datagrams
UDP buffer size:  208 KByte (default)
------------------------------------------------------------
[  3] local 10.1.100.11 port 50510 connected with 172.16.200.44 port 5001
[ ID] Interval       Transfer     Bandwidth
[  3]  0.0-25.0 sec  59.6 MBytes  20.0 Mbits/sec
[  3] Sent 42518 datagrams
[  3] Server Report:
[  3]  0.0-25.3 sec  30.1 MBytes  9.99 Mbits/sec  15.651 ms 21058/42518 (50%)
```

2. On pc2, verify the bandwidth and transfer speed:

```
root@pc2:~# iperf -c 172.16.200.44 -u -t 25 -b 20M
------------------------------------------------------------
Client connecting to 172.16.200.44, UDP port 5001
Sending 1470 byte datagrams
UDP buffer size:  208 KByte (default)
------------------------------------------------------------
```

```
[  3] local 10.1.100.22 port 52814 connected with 172.16.200.44 port 5001
[ ID] Interval       Transfer     Bandwidth
[  3]  0.0-25.0 sec  59.6 MBytes  20.0 Mbits/sec
[  3] Sent 42518 datagrams
[  3] Server Report:
[  3]  0.0-25.3 sec  15.1 MBytes  5.03 Mbits/sec  15.652 ms 31710/42514 (75%)
```

3. In FortiOS, check the authentication list:

```
# diagnose firewall auth  list
10.1.100.11, test-shaper1
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 38, idled: 16
        expire: 562
        flag(814): hard radius no_idle
        server: rad1
        packets: in 8207 out 3999, bytes: in 12306164 out 226963
        group_id: 3
        group_name: group_radius
10.1.100.22, test-shaper2
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 24, idled: 24
        expire: 156, max-life: 35976
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 5, bytes: in 0 out 300
        group_id: 3
        group_name: group_radius
----- 2 listed, 0 filtered ------
```

4. Check the dynamic shaper list:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply): 1250000 Bps/625000 Bps
current bandwidth(original/reply): 1237072 Bps/0 Bps
allow packets(original/reply): 38524/14
allow bytes(original/reply): 55270378/11285
drop packets(original/reply): 10136/0
drop bytes(original/reply): 13516198/0
life: 441
idle: 0/40
idle time limit: 600 s

addr: 10.1.100.22
bandwidth(original/reply): 625000 Bps/625000 Bps
current bandwidth(original/reply): 622909 Bps/0 Bps
allow packets(original/reply): 3232/3
allow bytes(original/reply): 4841536/243
drop packets(original/reply): 2753/0
drop bytes(original/reply): 4123994/0
life: 10
```

```
idle: 0/10
idle time limit: 36000 s
```

5. Check the session list:

```
# diagnose sys session list
session info: proto=6 proto_state=05 duration=3 expire=116 timeout=3600 flags=00000004
socktype=4 sockport=10001 av_idx=0 use=4

```

Use case 2

A user logs in to a device (pc1, 10.1.100.11) and has a maximum bandwidth of 10 Mbps download and 5 Mbps upload. The same user logs in to a second device (pc2, 10.1.100.22) and the RADIUS server sends a CoA request with the WISPr-Bandwidth-Max to pc1. The maximum bandwidth on pc1 changes to 5 Mbps download and 2.5Mbps upload. On pc2, the maximum bandwidth is also 5 Mbps download and 2.5Mbps upload.

When the user logs out from pc1, the RADIUS server sends CoA request with the new WISPr-Bandwidth-Max for pc2. The FortiGate updates the authentication user list and dynamic shaper for pc2. The maximum bandwidth on pc2 changes to 10 Mbps download and 5 Mbps upload.

To verify the dynamic shaping:

1. Check the dynamic shaper list after the user logs in to pc1:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply): 1250000 Bps/625000 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/3
allow bytes(original/reply): 0/243
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 491
idle: 4/4
idle time limit: 86400 s
```

2. Check the dynamic shaper list after the user logs in to pc2:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply): 625000 Bps/312500 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/0
allow bytes(original/reply): 0/0
```

```
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 652
idle: 5/5
idle time limit: 600 s

addr: 10.1.100.22
bandwidth(original/reply): 625000 Bps/312500 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/3
allow bytes(original/reply): 0/243
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 3
idle: 3/3
idle time limit: 86400 s
```

3. Check the authentication list:

```
# diagnose firewall auth list
10.1.100.11, test
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 171, idled: 11
        expire: 589, max-life: 589
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 15
        group_name: group_radius
10.1.100.22, test
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 9, idled: 9
        expire: 86391
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 15
        group_name: group_radius
----- 2 listed, 0 filtered ------
```

4. Check the dynamic shaper list after the user logs out from pc1:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.22
bandwidth(original/reply): 1250000 Bps/625000 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/0
allow bytes(original/reply): 0/0
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 414
```

```
idle: 9/9
idle time limit: 600 s
```

5. Check the authentication list again:

```
# diagnose firewall auth  list
10.1.100.22, test
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 453, idled: 49
        expire: 551, max-life: 551
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 15
        group_name: group_radius
----- 1 listed, 0 filtered ------
```

RADIUS Termination-Action AVP in wired and wireless scenarios

When authenticating with RADIUS in a wired or wireless scenario, the FortiGate can support proper handling of the Termination-Action AVP.

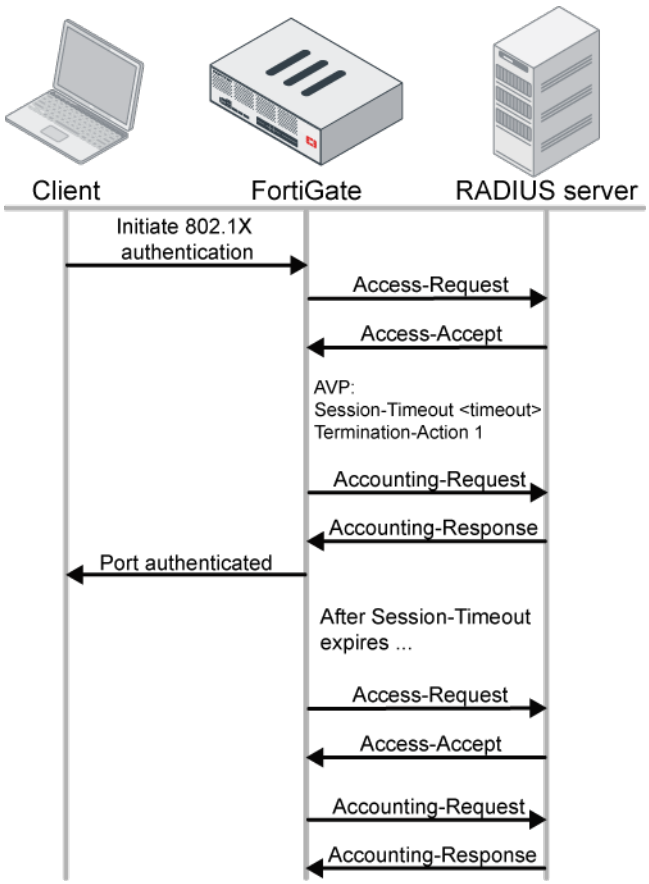
In a wired scenario, a hardware switch configured with 802.1X security authentication can read the Termination-Action attribute value from the RADIUS Access-Accept response. If the Termination-Action is 1, the FortiGate will initiate re-authentication when the session time has expired. During re-authentication, the port stays authorized. If the Termination-Action is 0, the session will be terminated.

In a wireless scenario, when a virtual AP is configured with WPA2-Enterprise security with RADIUS and has CoA enabled, it processes the RADIUS CoA request immediately upon receiving it and re-authenticates when the Termination-Action is 1.

Wired example

This example has a FortiGate configured with a hardware switch with two ports: port3 and port5. The hardware switch is enabled with 802.1X security and assigned to a RADIUS user group. Upon a successful authentication, the RADIUS server responds with an Access-Accept containing the authentication Session-Timeout and Termination-Action attributes. In this example, the Termination-Action value is 1, which informs the client to re-authenticate when the session time expires. During this time, the FortiGate keeps the client/port authorized while it initiates the re-authentication with the RADIUS server.

The message exchange is as follows:



To configure the RADIUS server and the FortiGate to handle the Termination-Action AVP:

1. On the RADIUS server, configure the Termination-Action AVP with the value `RADIUS-Request (1)` to indicate that re-authentication should occur upon expiration of the Session-Time.
2. On the FortiGate, configure the RADIUS server:

```
config user radius
    edit "rad1"
        set server "172.18.60.203"
        set secret ENC **********
        set radius-coa enable
        config accounting-server
            edit 1
                set status enable
                set server "172.18.60.203"
                set secret ENC **********
            next
        end
    next
end
```

3. Configure the RADIUS user group:

```
config user group
    edit "group_radius"
        set member "rad1"
    next
end
```

4. Configure the hardware switch with 802.1X enabled.
   a. Configure the virtual switch settings:

```
config system virtual-switch
    edit hw2
        set physical-switch "sw0"
        config port
            edit port3
            next
            edit port5
            next
        end
    next
end
```

   b. Configure the interface settings:

```
config system interface
    edit hw2
        set vdom vdom1
        set ip 6.6.6.1 255.255.255.0
        set allowaccess ping https ssh
        set stp enable
        set security-mode 802.1X
        set security-groups "group_radius"
    next
end

WARNING: Changing 802.1X could interrupt network connectivity on affected interfaces.
Do you want to continue? (y/n)y
```

5. On the client device, initiate 802.1X authentication, then verify that the switch port shows as authorized:

```
# diagnose sys 802-1x status
Virtual switch 'hw2' (default mode) 802.1x member status:
  port3: Link up, 802.1X state: unauthorized
  port5: Link up, 802.1X state: authorized
```

6. After successful authentication, wait for the session to timeout.
7. The FortiGate will keep the 802.1X port authenticated, and initiate re-authentication with the same Acct-Session-Id to the RADIUS server. The 802.1X status of the port remains unchanged:

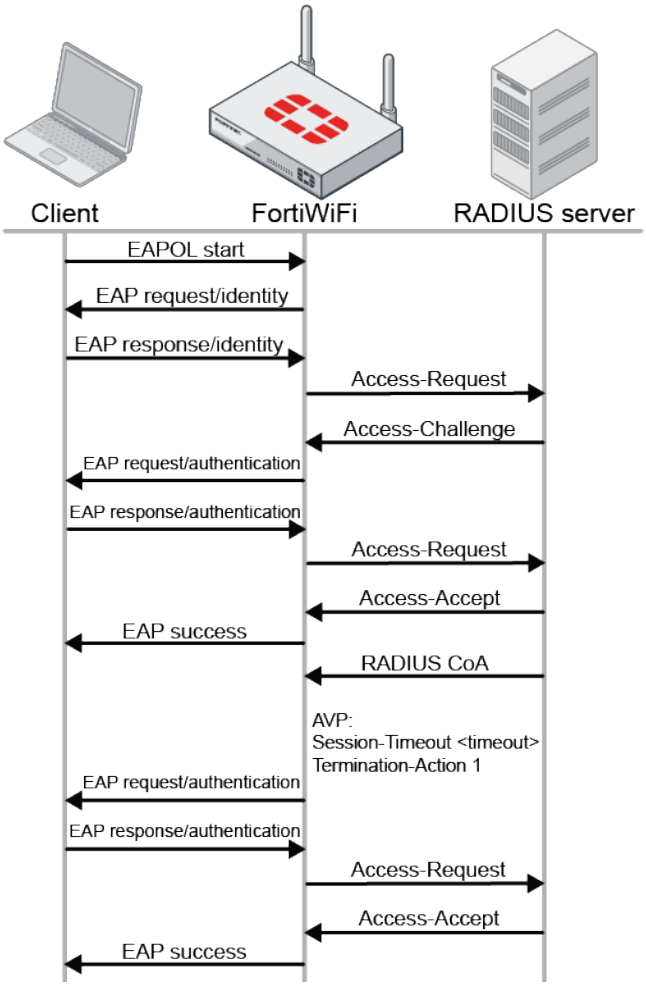
```
# diagnose sys 802-1x status
Virtual switch 'hw2' (default mode) 802.1x member status:
```

```
port3: Link up, 802.1X state: unauthorized
port5: Link up, 802.1X state: authorized
```

Wireless example

In this example, a virtual AP is configured with WPA2-Enterprise security with RADIUS and has CoA enabled. After a wireless user authenticates and connects to the wireless SSID, the RADIUS server triggers a CoA event with AVPs Session-timeout and a Termination-Action of 1. This signals the FortiGate to trigger re-authentication of the client, which the client immediately performs to stay connected to the wireless SSID.

The message exchange is as follows:



To configure the FortiGate to handle the Termination-Action AVP:

1. Configure the RADIUS server:

```
config user radius
    edit "peap"
        set server "172.16.200.55"
```

```
        set secret **********
        set radius-coa enable
    next
end
```

2. Configure the VAP:

```
config wireless-controller vap
    edit "wifi"
        set ssid "FWF-60F-coa"
        set security wpa2-only-enterprise
        set auth radius
        set radius-server "peap"
        set schedule "always"
    next
end
```

3. Verify that the wireless station connects to the SSID:

```
# diagnose wireless-controller wlac -d sta online
   vf=0 wtp=1 rId=1 wlan=wifi vlan_id=0 ip=10.10.80.2 ip6=:: mac=**:**:**:**:**:** vci=
host=wifi-qa-01 user=test1 group=group1 signal=-28 noise=-95 idle=1 bw=0 use=6 chan=149 radio_
type=11AC security=wpa2_only_enterprise mpsk= encrypt=aes cp_authed=no online=yes mimo=2
```

4. From the RADIUS server, manually trigger a RADIUS CoA event.
   a. RADIUS CoA sent to the FortiGate:

```
Sent CoA-Request Id 7 from 0.0.0.0:54158 to 172.16.200.201:3799 length 39
    User-Name = "test1"
    Session-Timeout = 120
    Termination-Action = RADIUS-Request
```

   b. RADIUS CoA-ACK received from the FortiGate:

```
Received CoA-ACK Id 7 from 172.16.200.201:3799 to 0.0.0.0:0 length 44
    Event-Timestamp = "Jan  5 2022 14:43:12 PST"
    Message-Authenticator = 0x3311ba3b763d68da653ab34351b0308
```

5. On the wireless station console, verify that the re-authentication happens immediately:

```
root@wifi-qa-01:/home/wpa-test# wlan1: CTRL-EVENT-EAP-STARTED EAP authentication started
wlan1: CTRL-EVENT-EAP-PROPOSED-METHOD vendor=0 method=25
wlan1: CTRL-EVENT-EAP-METHOD EAP vendor 0 method 25 (PEAP) selected
EAP-TLV: TLV Result - Success - EAP-TLV/Phase2 Completed
wlan1: CTRL-EVENT-EAP-SUCCESS EAP authentication completed successfully
wlan1: PMKSA-CACHE-REMOVED **:**:**:**:**:** 0
wlan1: PMKSA-CACHE-ADDED **:**:**:**:**:** 0
wlan1: WPA: Key negotiation completed with **:**:**:**:**:** [PTK=CCMP GTK=CCMP]
```

Configuring a RADSEC client

FortiOS supports RADSEC clients in order to secure the communication channel over TLS for all RADIUS traffic, including RADIUS authentication and RADIUS accounting over port 2083. A FortiGate acting as a TLS client can initiate the TLS handshake with a remote RADIUS server. Administrators can specify a client certificate, perform a server identity check (enabled by default), and verify against a particular trust anchor (CA certificate). During a TLS handshake, the SNI check will use the RADIUS server FQDN if configured.

TCP connections are also supported, which use port 1812 for authentication and port 1813 for accounting.

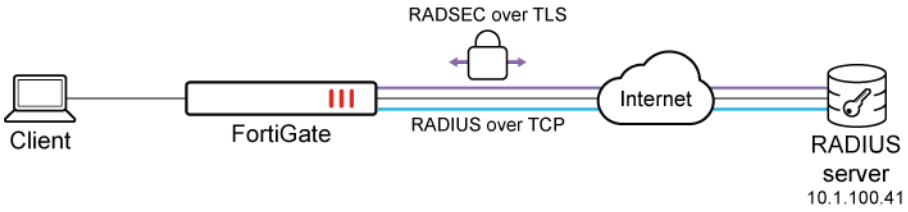
```
config user radius
    edit <name>
        set transport-protocol {udp | tcp | tls}
        set ca-cert <string>
        set client-cert <string>
        set tls-min-proto-version {default | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
        set server-identity-check {enable | disable}
    next
end
```

`transport-protocol {udp | tcp | tls}`	Set the type of transport protocol to use: • `udp`: use UDP (default) • `tcp`: use TCP, but no TLS security • `tls`: use TLS over TCP
`ca-cert <string>`	Set the CA certificate of server to trust under TLS.
`client-cert <string>`	Set the client certificate to use under TLS.
`tls-min-proto-version {default | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}`	Set the minimum supported protocol version for TLS connections: • `default`: follow the system global setting • `SSLv3`: use SSLv3 • `TLSv1`: use TLSv1 • `TLSv1-1`: use TLSv1.1 • `TLSv1-2`: use TLSv1.2
`server-identity-check {enable | disable}`	Enable/disable RADIUS server identity check, which verifies the server domain name/IP address against the server certificate (default = enable).

It is best practice to enable RADSEC over TLS whenever the FortiGate and RADIUS connection must pass through unencrypted transport. When using TCP and UDP transport modes, it is recommended to ensure the FortiGate and RADIUS connection passes through a trusted network or the connection passes through an encrypted tunnel over untrusted networks.

Examples

The following topology is used to demonstrate configurations using RADSEC over TLS and RADIUS over TCP.



Example 1: RADSEC over TLS

When using TLS, FortiOS uses port 2083 for RADIUS authentication and RADIUS accounting. There is no need to configure the RADIUS accounting separately.

Before configuring RADSEC over TLS, make sure that the CA certificate (which issues the remote RADIUS server certificate) is imported into the FortiGate trusted root store. If a customized local FortiGate client certificate is used, both the certificate and private key are imported into local FortiGate certificate store.

To configure RADSEC over TLS:

1. Configure the RADIUS server:

```
config user radius
    edit "radius-tls"
        set server "10.1.100.41"
        set secret ********
        set acct-interim-interval 600
        set radius-port 2083
        set auth-type pap
        set transport-protocol tls
        set ca-cert "CA_Cert_2"
        set client-cert "portal.fortinet-fsso"
        config accounting-server
            edit 1
                set status enable
                set server "10.1.100.41"
                set secret ********
            next
        end
    next
end
```

2. Enable fnbamd debug messages on the FortiGate to verify the RADIUS authentication triggered by client traffic requesting access to external networks, which requires user authentication by the firewall policy. Note the highlighted initial RADSEC TLS authentication, successfully completed TLS handshake, and RADIUS accounting using TLS over port 2083:

```
# diagnose debug application fnbamd -1
Debug messages will be on for 30 minutes.

# diagnose debug enable
...
```

```
[629] __fnbamd_cfg_add_radius_by_user-

(10.1.100.41:2083) code=4 id=33 len=123
[758] __rad_rxtx-Start rad conn timer.
...
```

Example 2: RADIUS over TCP

When using TCP, the default RADIUS ports remain same as with UDP: 1812 for authentication and 1813 for accounting.

To configure RADIUS over TCP:

1. Configure the RADIUS server:

```
config user radius
    edit "radius-tcp"
        set server "10.1.100.41"
        set secret ********
        set acct-interim-interval 600
        set transport-protocol tcp
        config accounting-server
            edit 1
                set status enable
                set server "10.1.100.41"
                set secret ********
            next
        end
    next
end
```

2. Enable fnbamd debug messages on the FortiGate to verify the RADIUS authentication triggered by client traffic requesting access to external networks, which requires user authentication by the firewall policy. Note the highlighted initial RADIUS authentication over TCP: 1812 and initial RADIUS accounting over TCP: 1813:

```
# diagnose debug application fnbamd -1
Debug messages will be on for 30 minutes.

# diagnose debug enable
...

[806] __fnbamd_rad_get_next_addr-Next available address of rad 'radius-tcp': 10.1.100.41:1812.
[981] __auth_ctx_start-Connection starts radius-tcp:10.1.100.41, addr 10.1.100.41:1812 proto:

[758] __rad_rxtx-Start rad conn timer.
...
```

RADIUS integrated certificate authentication for SSL VPN

Secure connections to SSL VPNs can be established using certificate-based authentication. Access can be granted to the user by using the content inside the Subject Alternative Name (SAN) of the user certificate to authenticate to the RADIUS server. An extra layer of security is added by ensuring that only users with valid certificates can access the VPN.

Certificate-based authentication with RADIUS supports UserPrincipalName (UPN), RFC822 Name (corporate email address) defined in the SAN extension of the certificate, the DNS defined in the user certificate as the unique identifier in the SAN field for peer user certificates, and the Subject Common Name (CN) defined in the certificate.

```
config user radius
    edit <name>
        set account-key-processing {same | strip}
        set account-key-cert-field {othername | rfc822name | dnsname | cn}
    next
end
```

`account-key-processing {same | strip}`	Account key processing operation. The FortiGate will keep either the whole domain or strip the domain from the subject identity. • `same`: Same as subject identity field (default). • `strip`: Strip domain string from subject identity field.
`account-key-cert-field {othername | rfc822name | dnsname}`	Define subject identity field in certificate for user access right checking. • `othername`: match to UPN in SAN (default). • `rfc822name`: match to RFC822 email address in SAN. • `dnsname`: match to DNS name in SAN. • `cn`: match to CN in subject.

The RADIUS server configurations are applied to the user peer configuration when the PKI user is configured.

```
config user peer
    edit <name>
        set ca <string>
        set subject <string>
        set cn <string>
        set mfa-mode subject-identity
```

```
        set mfa-server <string>
    next
end
```

When a user authenticates to FortiGate over SSL VPN, the user presents a user certificate signed by a trusted CA to FortiGate. This CA should also be trusted by the FortiGate. See CA certificate for more information about importing a CA certificate to FortiGate trusted CA store. The following sequence of events occurs as the FortiGate processes the certificate for authentication:

1. The FortiGate checks whether the certificate is issued by a trusted CA. If the CA is not a public CA, FortiGate ensures that the CA certificate is uploaded and trusted by the FortiGate, and applies it to the user peer configurations (`set ca <string>`).
2. The FortiGate verifies that the CN field of the certificate matches the CN specified in the user peer configurations (`set cn <string>`).
3. If the user peer configuration has `mfa-mode` set to `subject-identity` and the `mfa-server` is configured, then the FortiGate uses a unique identifier in the certificate to authenticate against the RADIUS server.
   - If `account-key-cert-field` is set to `othername` (the default setting), then the FortiGate uses the UPN in the certificate's SAN field to authenticate against RADIUS.
   - If `account-key-cert-field` is set to `rfc822name`, then the FortiGate uses the RFC822 Name in the certificate's SAN field to authenticate against RADIUS.
   - If `account-key-cert-field` is set to `dnsname`, then the FortiGate uses the DNS name in the certificate's SAN field to authenticate against RADIUS.
   - If `account-key-cert-field` is set to `cn`, then the FortiGate uses the CN in the certificate's subject to authenticate against RADIUS.

Some RADIUS servers do not require a password in an Access Request, while others need a valid password to return an ACCESS ACCEPT. If your RADIUS server requires a valid password to return an ACCESS ACCEPT, then you can configure an MFA password for each peer user using the `set mfa-password` command.

When you configure a user MFA password in a user peer, you must need to have a user peer configuration on the FortiGate for each user with `cn=USER`.

Example

In this example, a user certificate is issued to a user by a customer's CA. The certificate is used to authenticate the user to the SSL VPN web portal. The administrator uses the RFC822 Name in the SAN field to authenticate against their corporate RADIUS. The Active Directory mail attribute is used to check against the RFC822 Name field.

The configuration used in this example assumes the following:

- The CA certificate has already been uploaded to the FortiGate.
- SSL VPN has already been configured, pending the assignment of the PKI user group.

To configure the authentication settings:

1. Configure the RADIUS server:

```
config user radius
    edit "NPS-MFA"
        set server "172.18.60.214"
        set secret  XXXXXXXXXX
        set auth-type pap
        set password-encoding ISO-8859-1
        set account-key-processing strip
        set account-key-cert-field rfc822name
    next
end
```

2. Configure the local peer user:

```
config user peer
    edit "peer2"
        set ca "CA_Cert_1"
        set subject "L = Burnaby"
        set cn "test2"
        set mfa-mode subject-identity
        set mfa-server "NPS-MFA"
    next
end
```

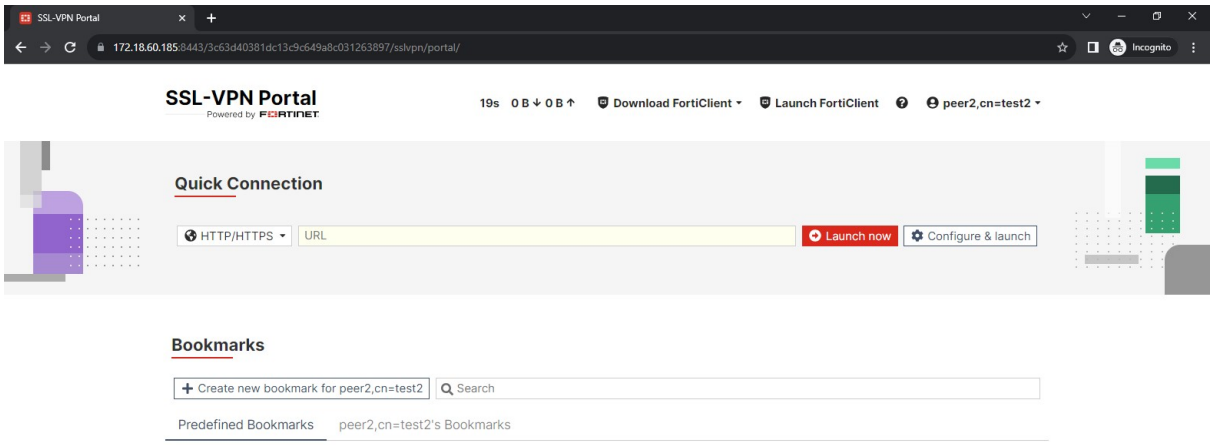
3. Configure the firewall user group for SSL VPN authentication:

```
config user group
    edit "sslvpn-mfa"
        set member  "peer2"
    next
end
```

4. Apply the user group to the SSL VPN configuration and firewall policy.

To verify the configuration:

When a user authenticates to Web mode SSL VPN using their browser, the FortiOS fnbamd daemon first validates the certificate supplied by the user. If the certificate check is successful, the information in the SAN field of the user certificate is used to find a matching user record on the RADIUS server. See SSL VPN web mode for information about configuring web mode SSL VPN.

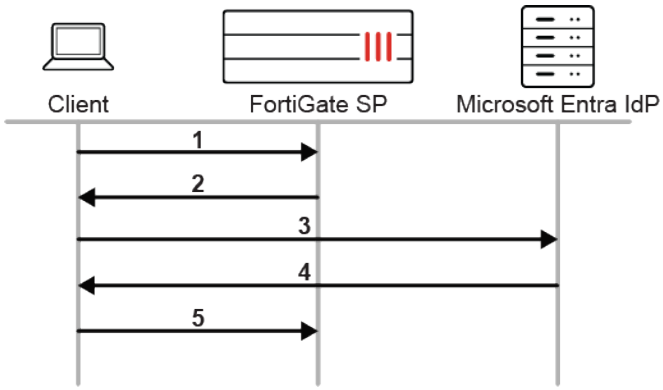


SAML

SAML authentication allows a user to complete authentication and authorization between a Service Provider (SP) and an Identity Provider (IdP). It enables Single Sign-On (SSO) by allowing users who have been authenticated against an IdP to be allowed access to different applications (the SPs providing a service such as a web application).

A FortiGate (SP) can provide a web service, such as an SSL VPN connection, that requires users to be authenticated through SAML. The user identities for the company can be stored remotely in an IdP, such as Microsoft Entra ID. Other applications might also require authentication from the same IdP, so after a user is authenticated once, the same SAML assertion carrying user and group information can be used to authorize the user access to the FortiGate SSL VPN, as well as other applications.

To illustrate the communication between the user or browser, SP, and IdP:



1. The user initiates an SSL VPN connection to the FortiGate.
2. The FortiGate SP redirects the user to the SAML IdP.
3. The user connects to the Microsoft log in page for the SAML authentication request.
4. The SAML IdP authenticates the user and sends the SAML assertion containing the user and group.

5. The browser forwards the SAML assertion to the FortiGate SP. If the user and group are allowed by the FortiGate, the user is allowed to access the application, in this case, connecting to SSL VPN.

Usage

There are many practical uses and applications for SAML authentication on the FortiGate. For example:

- Authentication for SSL VPN
- Authentication for IPsec VPN (with compatible FortiClient endpoint 7.2.4 and above)
- Firewall authentication for firewall policy access
- Authentication for ZTNA
- Authentication for Explicit Proxy
- Authentication for Administrative Access

Identity providers

FortiGate's SAML SSO configurations can be integrated with any common Identity providers, such as Microsoft Entra ID, Okta, Google Workspace, Onelogin, and others. You can also use FortiAuthenticator as an identity provider with local or remote user integration, or as an IdP Proxy to other IdP providers.

For more information on using FortiAuthenticator, see the FortiAuthenticator Administration Guide and FortiAuthenticator Examples Guide.

Configuring SAML SSO

SAML Single Sign-On (SSO) can be configured from the GUI or CLI. The configurations allow administrators to set up the FortiGate as a SAML Service Provider (SP) while inputting the necessary settings for the Identity Provider (IdP).

There are many use cases for applying SAML authentication, as explained in the SAML introduction. For each use case, the configuration steps vary slightly. In general, to successfully configure SAML authentication for an application, you will need to perform the following:

1. Obtain IdP configurations from the Identity Provider. This is outside the scope of the FortiGate.
2. Create a Single Sign-On object in *User & Authentication* > *Single Sign-On*.
3. Apply the FortiGate SP URLs to the IdP.
4. Install appropriate IdP and SP certificates.
5. Configure user group with the SSO object as member.

After these steps are completed, the user group object can be applied to whatever type of policy is applicable to the use case.

Common SAML SSO settings

Configuring the IdP is outside the scope of this topic, but to successfully configure SAML on the FortiGate the following information must be obtained from the Identity Provider:

From IdP	Description
Entity ID	The identifier URL for the IdP used to identify the issuer of the SAML response or assertion.
Assertion consumer service (ACS) URL	The ACS URL, sometimes called the Login URL, informs the SP and end user where to send the Login request to the IdP.
Single logout service URL	The Single logout service URL, sometimes called the Logout URL, informs the SP and end user where to send the Logout request to the IdP.
SAML Signing Certificate	The certificate used to sign the SAML response originating from the IdP. This must be trusted by the SP in order to verify the identity of the messages from the IdP. To upload a remote certificate from the IdP, follow the instructions in Remote certificate on page 3610.

At the same time, to complete the configurations on the IdP, it will require information about the SP from the FortiGate. The following describes the settings configured on the FortiGate, including the information needed for the IdP configuration.

To configure the FortiGate SP settings for SSO in the GUI:

1. Go to *User & Authentication* > *Single Sign-On* and click *Create new*.
2. Configure the SP settings:

Setting	Description
Name	Name of the SSO object.
Address	FQDN or IP address that clients will be connecting to. If this requires a non-standard port (eg. 443), specify the port in this format *<address>:<port>*.
Entity ID	The identifier URL for the SP used to identify the issuer of the SAML request. This URL must be provided to the IdP. Modifying the URL must be done in CLI.
Assertion consumer service URL	The ACS URL, sometimes referred to as the reply URL or the single sign-on URL, informs the IdP and end user the URL to send the SAML Assertion for login to. This URL must be provided to the IdP. Modifying the URL must be done in CLI.
Single logout service URL	The logout URL informs the IdP and end user the URL to send the request to logout to. This URL must be provided to the IdP. Modifying the URL must be done in CLI.

Setting	Description
Certificate	The certificate used to sign the SAML messages originating from the SP to the IdP. This is typically an optional configuration.

3. Click *Next*.
4. Configure the IdP settings:

Setting	Description
Type	• *Fortinet Product*: If the IdP is a FortiAuthenticator or FortiTrust-ID, IdP configurations are simplified. See FortiAuthenticator Admin Guide > Authentication > SAML IdP for more information • *Custom*: If the IdP is any other vendor, or you want to configure each field manually, select this option.
Fortinet Product setup	
Address	Enter the address of the FortiAuthenticator or FortiTrust-ID that users will access to authenticate to the IdP.
Prefix	Enter the prefix specified by the FortiAuthenticator or FortiTrust-ID.
Certificate	Select the SAML Signing certificate from the IdP. If this is not yet uploaded, use the *Import* option to import the remote certificate.
Custom setup	
Entity ID	Input the Entity ID URL from the IdP. See Entity ID on page 3082.
Assertion consumer service URL	Input the ACS URL from the IdP. See Assertion consumer service (ACS) URL on page 3082.
Single logout service URL	Input the Single logout service URL from the IdP. See Single logout service URL on page 3082.
Certificate	Select the SAML Signing certificate from the IdP. If this is not yet uploaded, use the *Import* option to import the remote certificate. See SAML Signing Certificate on page 3082.
Additional SAML Attributes	
AD FS claim	This setting is only available after the initial SSO object has been configured. Enable this setting to select the attribute names based on Active Directory Federated Services (AD FS) claim types.
User claim type	Select the AD FS claim type that will be used to match the user within the SAML assertion statement.
Group claim type	Select the AD FS claim type that will be used to match the group within the SAML assertion statement.
Attribute used to identify users	Specify the name of the attribute for a user within the SAML assertion statement. This value is case sensitive.

Setting	Description
	If AD FS claim is enabled, this field will be auto-populated to reflect the claim type.
Attribute used to identify groups	Specify the name of the attribute for a group within the SAML assertion statement. This value is case-sensitive. If AD FS claim is enabled, this field will be auto-populated to reflect the claim type.

5. Click *Submit*.

To configure the FortiGate SP settings for SSO in the CLI:

```
config user saml
    edit <name>
        set adfs-claim [enable|disable]
        set cert {string}
        set clock-tolerance {integer}
        set digest-method [sha1|sha256]
        set entity-id {string}
        set group-claim-type [email|given-name|...]
        set group-name {string}
        set idp-cert {string}
        set idp-entity-id {string}
        set idp-single-logout-url {string}
        set idp-single-sign-on-url {string}
        set limit-relaystate [enable|disable]
        set reauth [enable|disable]
        set single-logout-url {string}
        set single-sign-on-url {string}
        set user-claim-type [email|given-name|...]
        set user-name {string}
    next
end
```

Setting	Description
`adfs-claim`	See AD FS claim on page 3083.
`cert`	The SP certificate used to sign SAML messages.
`clock-tolerance`	A SAML assertion is only valid for a specific duration. When the FortiGate SP and the SAML IdP clocks are not in synchronization, use clock-tolerance to define the number of seconds that the skew in time is tolerated. The setting is only available in the CLI.
`digest-method`	The type of hash used to compute the hash value of the content of the SAML assertion. The setting is only available in the CLI.
`entity-id`	The SP Entity ID.

Setting	Description
group-claim-type	Specify the group claim type when adfs-claim is enabled.
group-name	The attribute used to identify a group within the SAML assertion statement.
idp-cert	The SAML Signing certificate from the IdP.
idp-entity-id	The Entity ID from the IdP.
idp-single-logout-url	The Single logout service URL from the IdP.
idp-single-sign-on-url	The ACS URL, sometimes called the Login URL, from the IdP.
limit-relaystate	Enable/disable limiting the relay-state parameter when it exceeds SAML 2.0 specification limits (80 bytes). The setting is only available in the CLI.
reauth	Enable/disable signaling the IdP to force user re-authentication. The SAML AuthnRequest is set to ForceAuthn="true". The setting is only available in the CLI.
single-logout-url	The Single logout service URL from the SP.
single-sign-on-url	The ACS URL, sometimes referred to as the reply URL or the single sign-on URL, from the SP.
user-claim-type	Specify the user claim type when adfs-claim is enabled.
user-name	The attribute used to identify a user within the SAML assertion statement.

Other SAML related global settings

Authentication port

By default, the FortiGate listens on port 1003 for incoming authentication requests when traffic matches an identity based firewall policy. As a SAML SP with an identity based firewall policy configured for the SAML user group, the FortiGate will use the same port to listen for SAML authentication requests and redirect them to the IdP.

To change the default port:

```
config system global
    set auth-https-port <port>
end
```

Configuring the user authentication setting

When the FortiGate receives an authentication request in an identity based firewall policy, the authentication daemon uses a local server certificate to secure the connection. The client making the authentication request must trust the certificate presented by the FortiGate that is acting as the TLS server.

In SAML authentication, when a user initiates traffic to the SP, the traffic matches the identity based firewall policy which triggers the authentication request to hit the authentication daemon. The server certificate used by the authentication daemon must be trusted by the user, otherwise they will receive a certificate warning. To avoid a certificate warning, use a custom certificate that the user trusts.

To configure a custom certificate in the GUI:

1. Go to *User & Authentication* > *Authentication Settings*.
2. Set *Certificate* to the custom certificate.
   If the certificate is not available, click *Create* to create or import a new custom certificate.
   The custom certificate's SAN field should have the FQDN or IP address from the SP URL.

To configure a custom certificate in the CLI:

```
config user setting
    set auth-cert <custom certificate name>
end
```

Alternatively, assigning a CA certificate allows the FortiGate to automatically generate and sign a certificate for the authentication daemon. This will override any assigned server certificate.

To assign a CA certificate:

1. Edit the user setting :

   ```
   config user setting
       set auth-ca-cert <CA certificate name>
   end
   ```

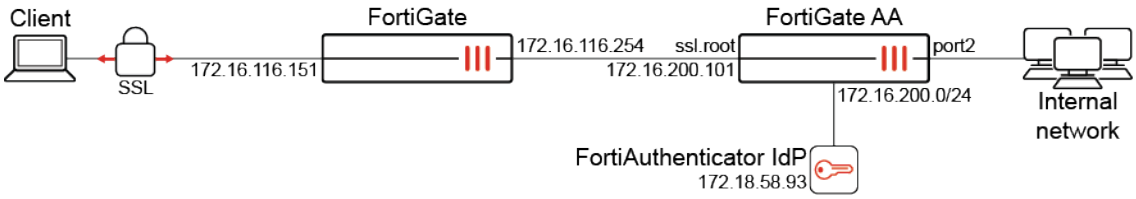
2. Go to *System* > *Certificates* and download the certificate.
3. Install the certificate into the client's certificate store.

SSL VPN with FortiAuthenticator as a SAML IdP

A FortiGate can act as a SAML service provider (SP) for SSL VPN that requests authentication from a a SAML identity provider (IdP), such as Entra ID, Okta, Fortinet's FortiAuthenticator, or others. The following example shows the use of FortiAuthenticator as the IdP.

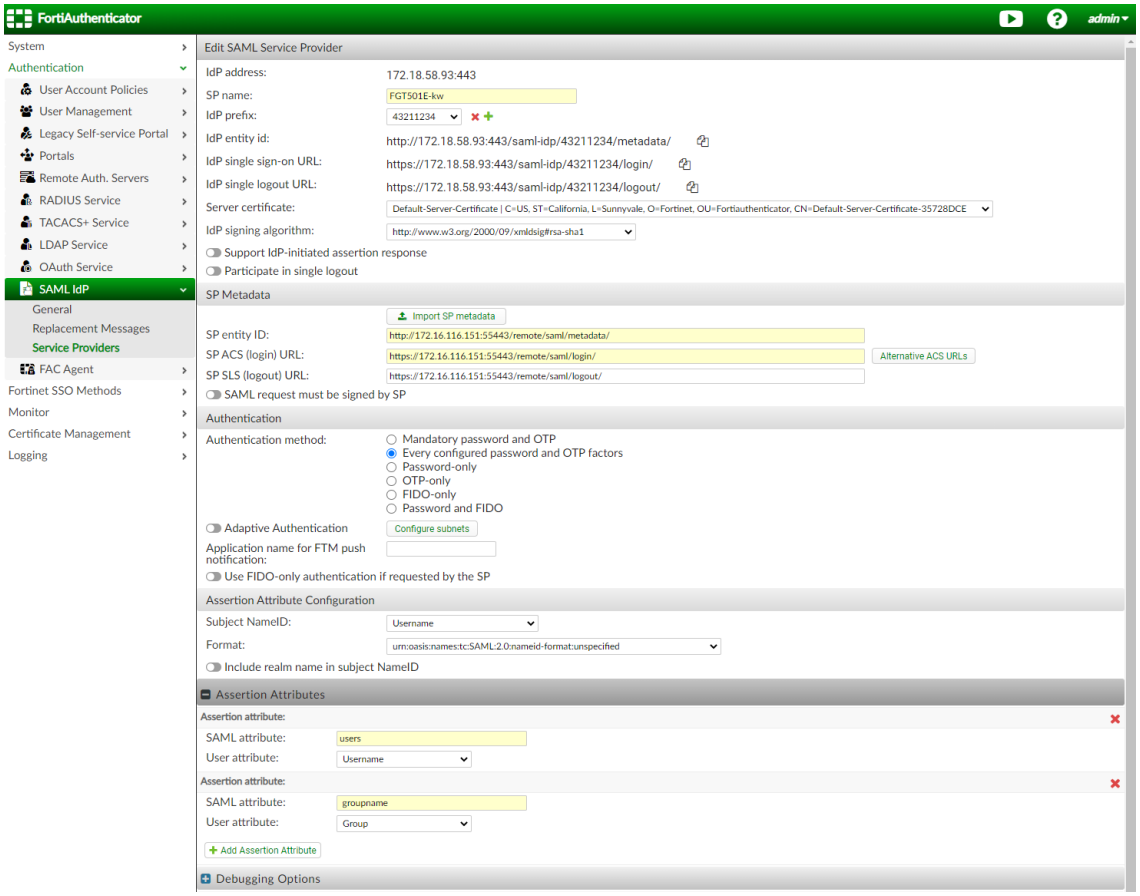
Using FortiAuthenticator as an IdP

In this example, FortiGate AA is the inside firewall (172.16.200.101). The other FortiGate is the outside firewall that only does port forwarding from 172.16.116.151:55443 to 172.16.200.101:443. FortiGate AA is configured to allow full SSL VPN access to the network in port2.



This SSL VPN portal allows users from the user group *saml_grp* and SAML server *saml_test* to log in. The FortiAuthenticator acts as the SAML identity provider (IdP), while the FortiGate is the SAML SP. External users are directed to the FortiAuthenticator IdP login URL to authenticate.

The FortiAuthenticator in this example has the following configuration:

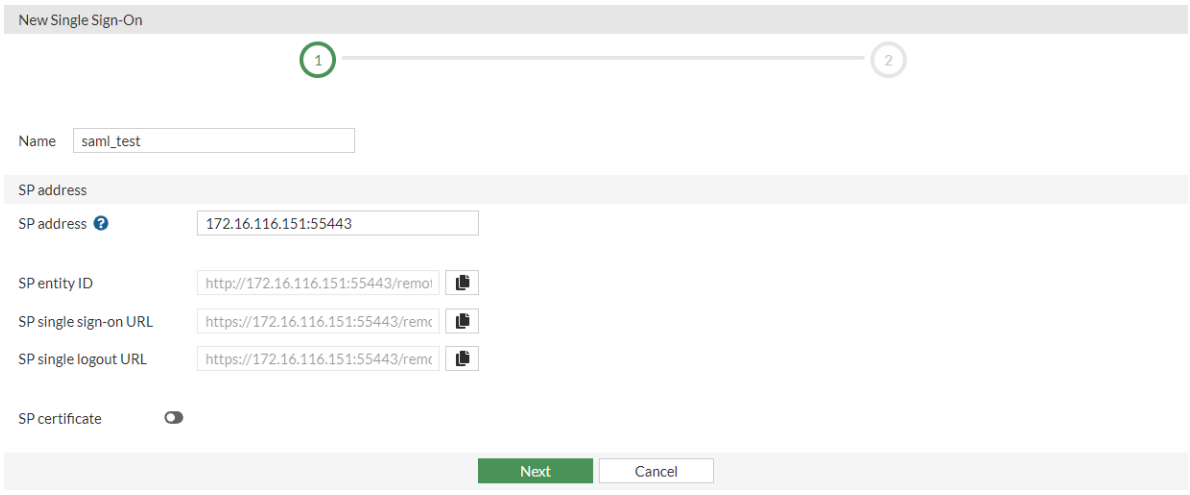


For a deep-dive into how to configure FortiAuthenticator as an IdP, including integration with Windows AD via LDAP for user authentication, see the FortiGate SSL VPN with FortiAuthenticator as SAML IdP section in the FortiAuthenticator Examples Guide.

This example also demonstrates using FortiAuthenticator to act as a root CA to sign certificates for the SP, IdP, and SSL VPN portal.

To configure FortiGate AA as an SP:

1. Create a new SAML server entry:
   a. Go to *User & Authentication > Single Sign-On* and click *Create New*. The single-sign on wizard opens.
   b. Enter a name (*saml_test*). The other fields will automatically populate based on the FortiGate's WAN IP and port.



Click the icon beside the *SP entity ID*, *SP single sign-on URL*, and *SP single logout URL* fields to copy the text.

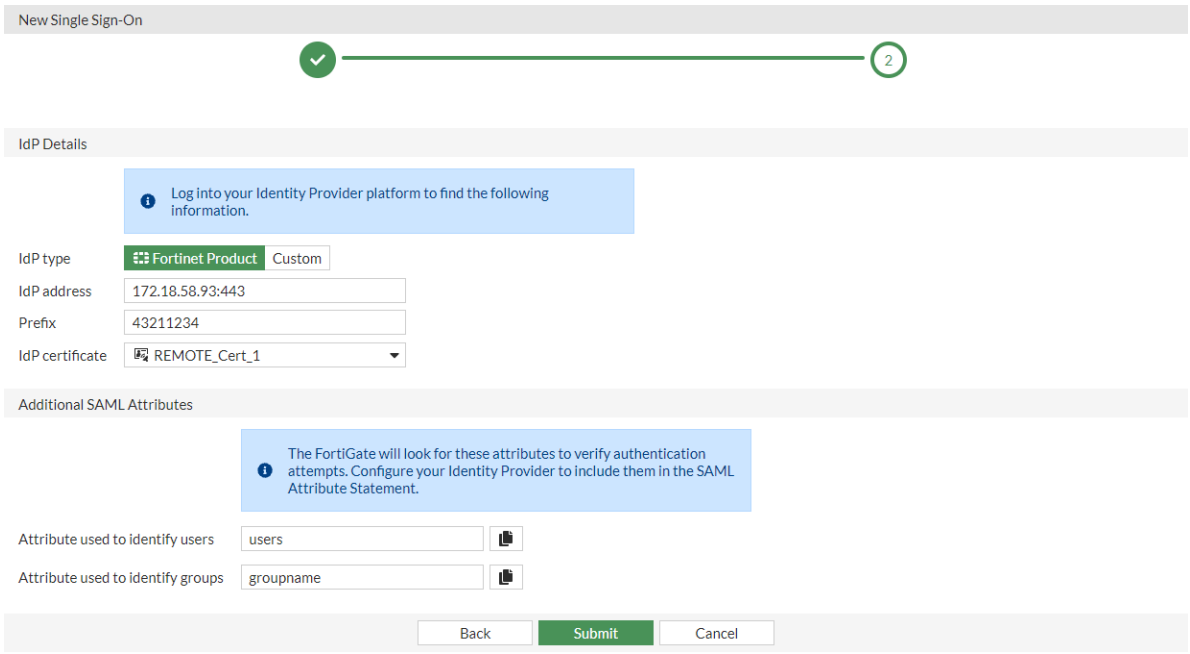
   c. Click *Next*.
   d. Enter the FortiAuthenticator IdP details:

IdP address	172.18.58.93:443
Prefix	43211234
IdP certificate	REMOTE_Cert_1

   e. Enter the additional SAML attributes that will be used to verify authentication attempts:

Attribute used to identify users	users
Attribute used to identify groups	groupname

The IdP must be configured to include these attributes in the SAML attribute statement. In FortiAuthenticator, this is configured in the *Assertion Attributes* section.



f. Click *Submit*.

The following is created in the backend:

```
config user saml
    edit "saml_test"
        set cert "fgt_gui_automation"
        set entity-id "http://172.16.116.151:55443/remote/saml/metadata/"
        set single-sign-on-url "https://172.16.116.151:55443/remote/saml/login/"
        set single-logout-url "https://172.16.116.151:55443/remote/saml/logout/"
        set idp-entity-id "http://172.18.58.93:443/saml-idp/43211234/metadata/"
        set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/43211234/login/"
        set idp-single-logout-url "https://172.18.58.93:443/saml-idp/43211234/logout/"
        set idp-cert "REMOTE_Cert_1"
        set user-name "users"
        set group-name "groupname"
        set digest-method sha1
    next
end
```

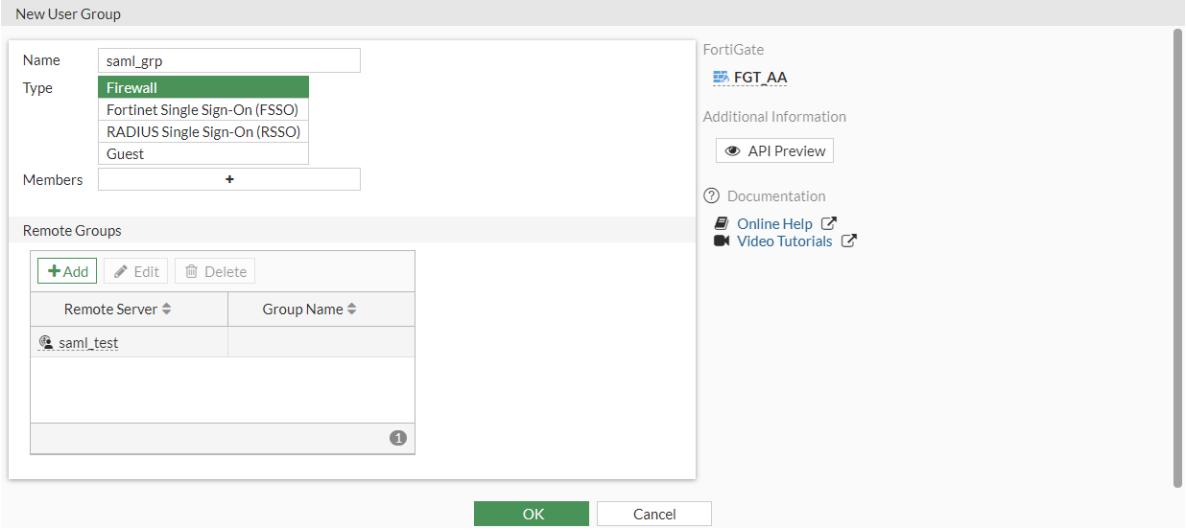
2. Create the SAML group:

a. Go to *User & Authentication* > *User Groups* and click *Create New*.

b. Enter a name, *saml_grp*.

c. In the *Remote Groups* table, click *Add*.

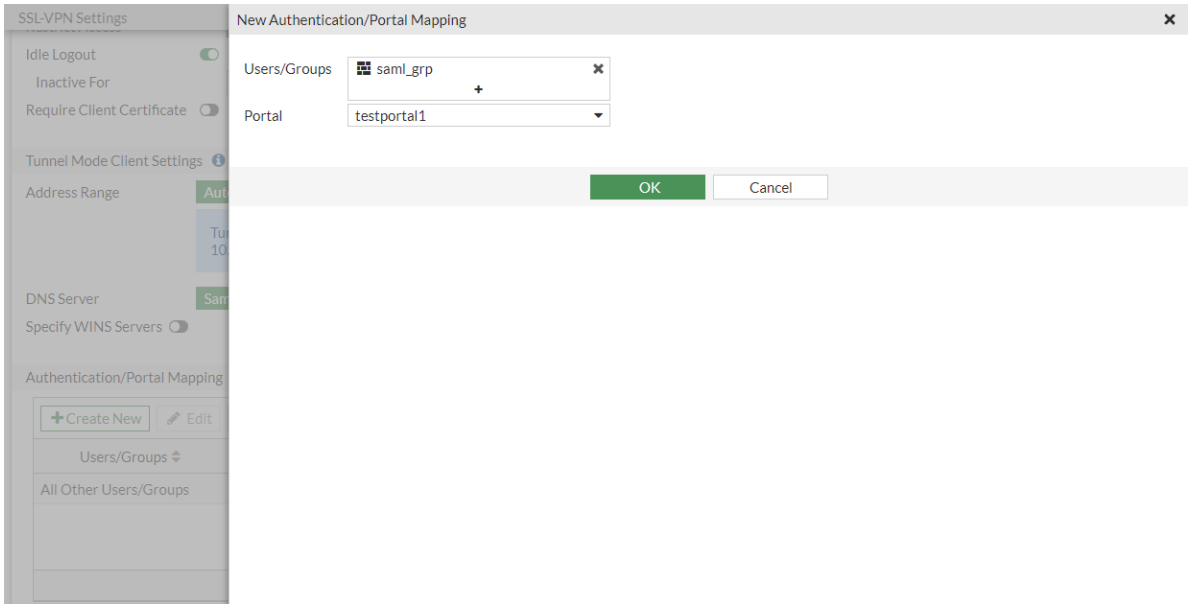
d. In the *Remote Server* dropdown, select *saml_test* and click *OK*.



e. Click *OK*.
The following is created in the backend:

```
config user group
    edit "saml_grp"
        set member "saml_test"
    next
end
```

3. Add the SAML group in the SSL VPN settings:
   a. Go to *VPN > SSL-VPN Settings*.
   b. In the *Authentication/Portal Mapping* table, click *Create New*.
   c. For *Users/Groups*, click the + and select *saml_grp*.
   d. Select the *Portal* (*testportal1*).
   e. Click *OK*.



f. Click *Apply*.

4. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Enter the following:

Incoming Interface	ssl.root
Outgoing Interface	port2
Source	all, saml_grp, saml_test

   c. Configure the other settings as needed.
   d. Click *OK*.
5. On the client, log in with SAML using the SSL VPN web portal.

If you are using FortiClient for tunnel mode access, enable *Enable Single Sign On (SSO) for VPN Tunnel* in the *SSL-VPN* connection settings to use the SAML log in. See Configuring an SSL VPN connection for more information.

6. In FortiOS, go to *Dashboard* > *Network* and click the *SSL-VPN* widget to expand to full view and verify the connection information.

Using a browser as an external user-agent for SAML authentication in an SSL VPN connection

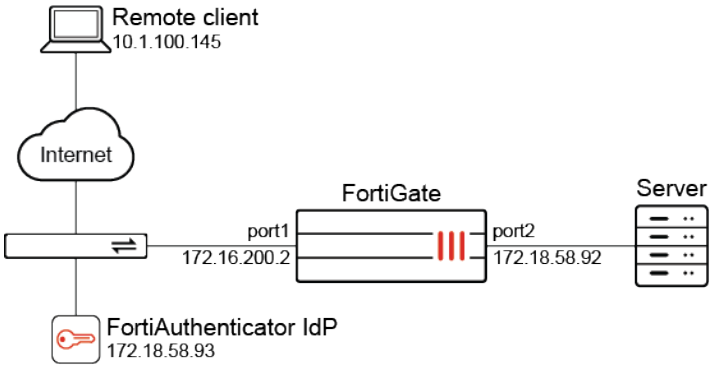
FortiClient can use a browser as an external user-agent to perform SAML authentication for SSL VPN tunnel mode, instead of the FortiClient embedded log in window. If a user has already done SAML authentication in the default browser, they do not need to authenticate again in the FortiClient built-in browser. FortiClient 7.0.1 and later is required.

The following CLI is used to set the SAML local redirect port on the FortiClient endpoint after successful SAML authentication:

```
config vpn ssl settings
    set saml-redirect-port <port>
end
```

Example

In this example, a user wants to use their default browser to connect to IdP for SAML authentication, without needing to separately authenticate in the FortiClient built-in browser. After authenticating in the browser, FortiClient obtains the authentication cookie directly from the browser.



The authentication process proceeds as follows:

1. The remote client uses FortiClient to connect to the FortiGate SSL VPN on 172.16.58.92:1443 with the *Use external browser as user-agent for saml user authentication* option enabled.
2. The SSL VPN redirects FortiClient to complete SAML authentication using the Identity Provider (IdP).
3. FortiClient opens the default browser to authenticate the IdP server.
4. After a successful authentication, the browser redirects to localhost:<port>, where the port is defined by the `saml-redirect-port` variable on the FortiGate.
5. FortiClient reads the authentication ID passed by the successful authentication, then requests that the SAML authentication process continues on the FortiGate with this ID.
6. The FortiGate continues with the remaining SSL-VPN host-check and other steps until it receives the authentication cookie. It then allow the SSL VPN user to connect using tunnel mode.

To configure the VPN:

1. Configure a SAML user:

```
config user saml
    edit "su1"
        set cert "fgt_gui_automation"
        set entity-id "http://172.18.58.92:1443/remote/saml/metadata/"
        set single-sign-on-url "https://172.18.58.92:1443/remote/saml/login/"
        set single-logout-url "https://172.18.58.92:1443/remote/saml/logout/"
        set idp-entity-id "http://172.18.58.93:443/saml-idp/222222/metadata/"
        set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/222222/login/"
        set idp-single-logout-url "https://172.18.58.93:443/saml-idp/222222/logout/"
        set idp-cert "REMOTE_Cert_1"
        set user-name "Username"
        set group-name "Groupname"
        set digest-method sha1
    next
end
```

2. Add the SAML user to a user group:

```
config user group
    edit "saml_grp"
        set member "su1"
```

```
   next
end
```

3. Create an SSL VPN web portal:

```
config vpn ssl web portal
    edit "testportal1"
        set tunnel-mode enable
        set ipv6-tunnel-mode enable
        set web-mode enable
        ...
    next
end
```

4. Configure the SSL VPN:

```
config vpn ssl settings
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set port 1443
    set source-interface "port2"
    set source-address "all"
    set source-address6 "all"
    set default-portal "testportal1"
    ...
end
```

5. Configure a firewall policy for the SSL VPN and assign the SAML group and a local user to it:

```
config firewall policy
    edit 1
        set name "policy_to_sslvpn_tunnel"
        set srcintf "ssl.root"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set groups "saml_grp"
        set users "u1"
    next
end
```

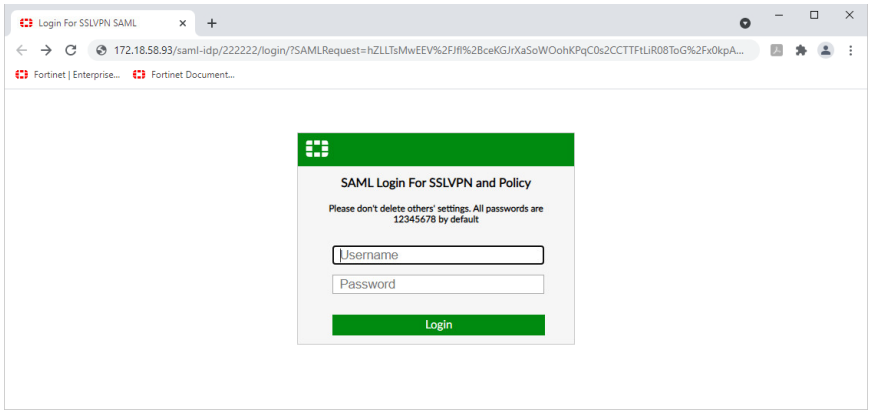
6. Enable the SAML redirect port:

```
config vpn ssl settings
    set saml-redirect-port 8020
end
```

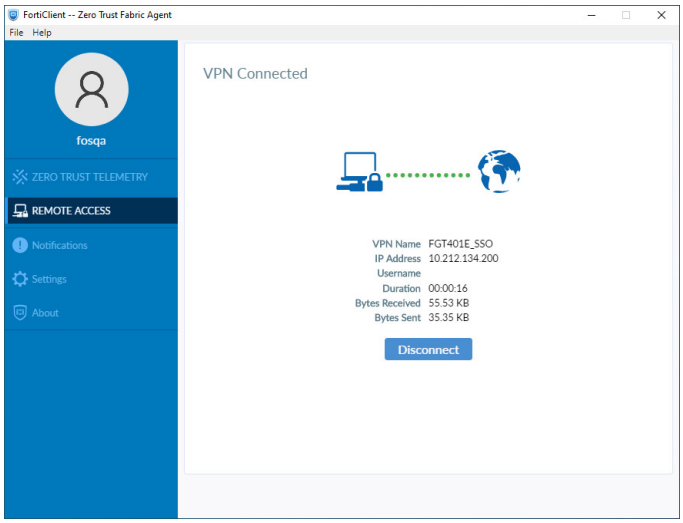
To connect to the VPN using FortiClient:

1. Configure the SSL VPN connection:
   a. Open FortiClient and go to the *Remote Access* tab and click *Configure VPN*.
   b. Enter a name for the connection.
   c. Set the *Remote Gateway* to the FortiGate port *172.18.58.92*.
   d. Enable *Customize port* and set the port to *1443*.
   e. Enable *Enable Single Sign On (SSO) for VPN Tunnel* and *Use external browser as user-agent for saml user authentication*.

   f. Click *Save*.
2. On the *Remote Access* tab select the *FGT401E_SSO* VPN connection from the dropdown list.
3. Click *SAML Login*.
   The default browser opens to the IdP authentication page.



4. Enter the username and password, then click *Login*.
   The authenticated result is sent back to FortiClient and the connection is established.



To check the connection on the FortiGate:

```
# get vpn ssl monitor
SSL-VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
HTTPS in/out    Two-factor Auth
 1       fac3    saml_grp       256(1)           N/A     10.1.100.254   0/0     0/0     0

SSL-VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       fac3    saml_grp       10.1.100.254     5       9990/8449
10.212.134.200,fdff:ffff::1
```

```
# diagnose firewall auth list

10.212.134.200, fac3
        type: fw, id: 0, duration: 6, idled: 0
        expire: 259199, allow-idle: 259200
        flag(80): sslvpn
        server: su1
        packets: in 28 out 28, bytes: in 23042 out 8561
        group_id: 5
        group_name: saml_grp
```

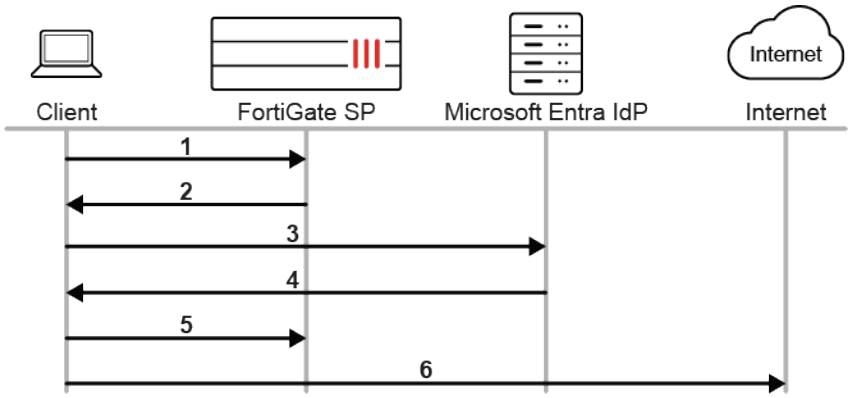
IPsec VPN with SAML IdP

For information about configuring IPsec VPN with SAML IdP, see SAML-based authentication for FortiClient remote access dialup IPsec VPN clients on page 2547.

Outbound firewall authentication with Microsoft Entra ID as a SAML IdP

In this example, users are managed through Microsoft Entra ID (formerly Azure Active Directory). The FortiGate is configured for SSO firewall authentication for outbound traffic, with authentication performed by the Microsoft Entra ID as a SAML identity provider (IdP).

The SAML interaction occurs as follows:

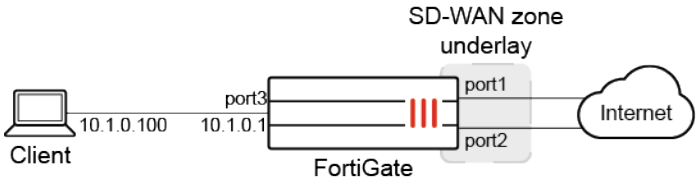


1. The user initiates web traffic to the internet.
2. The FortiGate redirects to the local captive portal port (default is 1003), then redirects the user to the SAML IdP.
3. The user connects to the Microsoft log in page for the SAML authentication request.
4. The SAML IdP sends the SAML assertion containing the user and group.
5. The browser forwards the SAML assertion to the SAML SP.
6. If the user and group are allowed by the FortiGate, the user is allowed to access the internet.

In this example environment, a user is added in the Microsoft Entra ID belonging to the security group called Firewall.

- Username: John Locus
- User login: jlocus@azure.kldocs.com
- Group: Firewall (ID 62b699ce-4f80-48c0-846e-c1dfde2dc667)

The goal is to allow users in the Firewall group to access the internet after passing firewall authentication.



Configuring the Microsoft Entra ID

The following Microsoft Entra ID configuration demonstrates how to add the FortiGate as an enterprise non-gallery application. This application provides SAML SSO connectivity to the Microsoft Entra IdP. Some steps are

performed concurrently on the FortiGate.

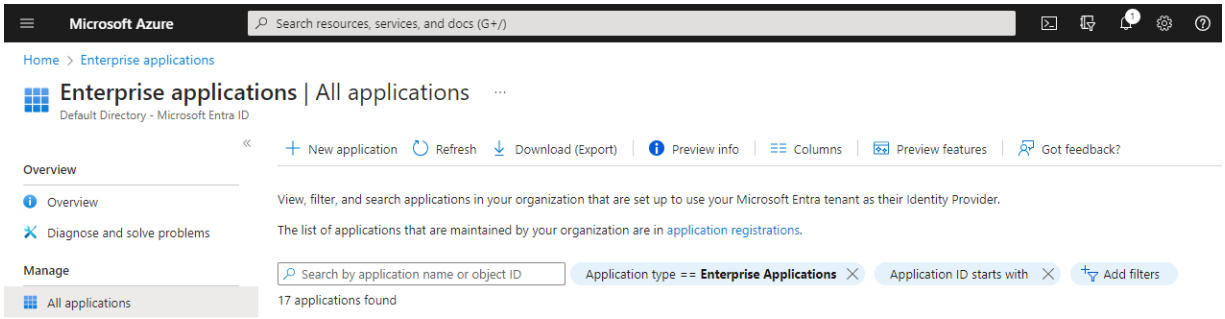
This example is configured with an Microsoft Entra ID free-tier directory. There may be limitations to managing users in Azure in this tier that are not limited in other tiers. Consult the Microsoft Entra ID documentation for more information.

There are three steps to configure the Microsoft Entra ID:

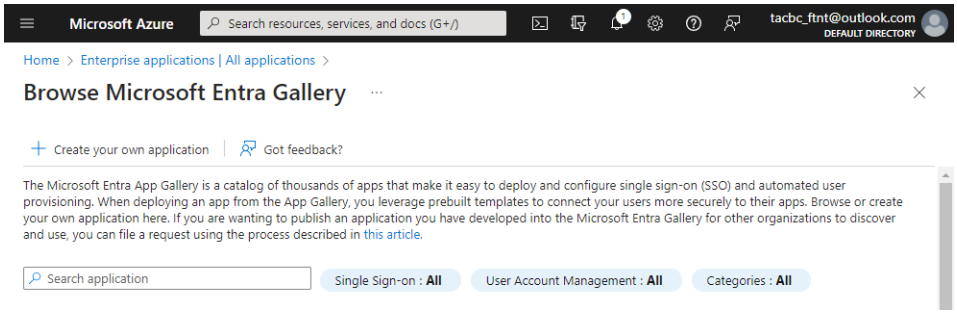
1. Create a new enterprise application.
2. Configure the SAML SSO settings on the application and FortiGate.
3. Assign Microsoft Entra ID users and groups to the application.

To create a new enterprise application:

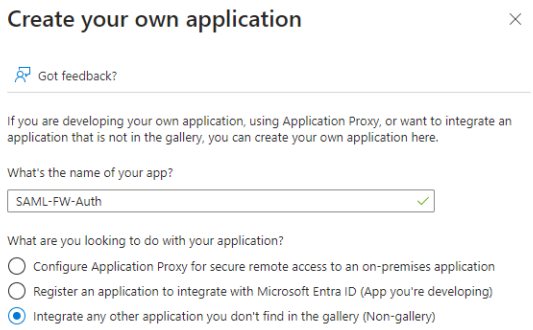
1. Log in to the Azure portal.
2. In the Azure portal menu, click *Microsoft Entra ID*.
3. In the left-side menu go *Manage > Enterprise applications*.
4. Click *New application*.



5. Click *Create your own application*.



6. Enter a name for the application (*SAML-FW-Auth*) and select *Integrate any other application you don't find in the gallery (Non-gallery)*.

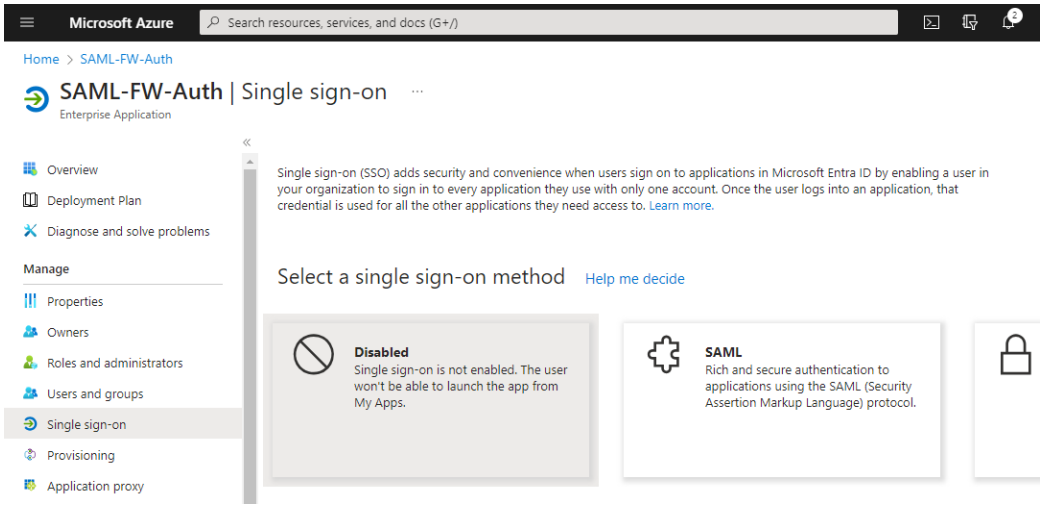


7. Click *Create*.

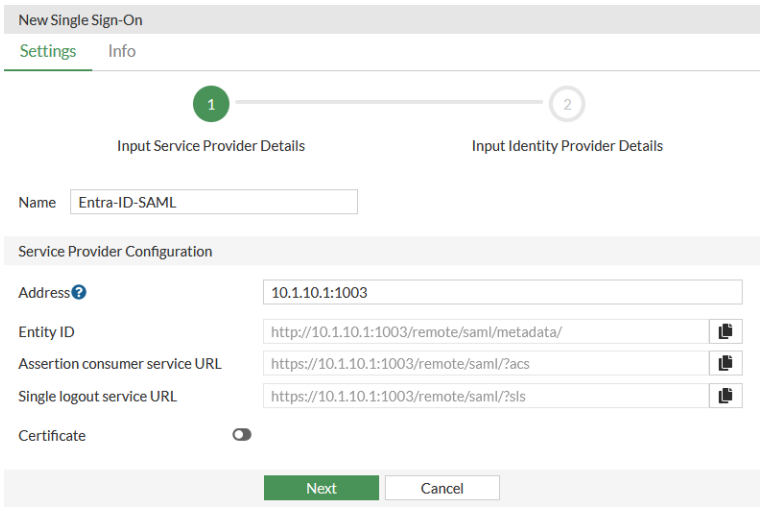
To configure the SAML SSO settings on the application and FortiGate:

This procedure requires going back and forth between Azure and the FortiGate GUI. Leave the FortiGate GUI open for the entire procedure.

1. On the *Overview* page for your new application, go to *Manage* > *Single sign-on* and select *SAML* as the single sign-on method.



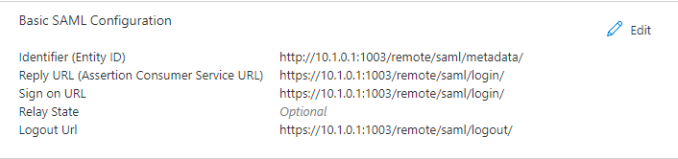
2. The *Basic SAML Configuration* section in Azure describes the SAML SP entity and links that Azure will reference. Configure these settings on the FortiGate by creating a new SAML server object and defining the SP address. The SP (IP or FQDN) address should be accessible by the user who is authenticating against the firewall. The port used should match the port used by the FortiGate firewall authentication captive portal. By default, this is port 1003 for HTTPS. A captive portal does not need to be configured separately.
   a. Go to *User & Authentication* > *Single Sign-On* and click *Create New*.
   b. Enter a *Name* for the SAML object, *Entra-ID-SAML*.
   c. Enter the *SP address*, *10.1.0.1:1003*. The three SP URLs are automatically populated.



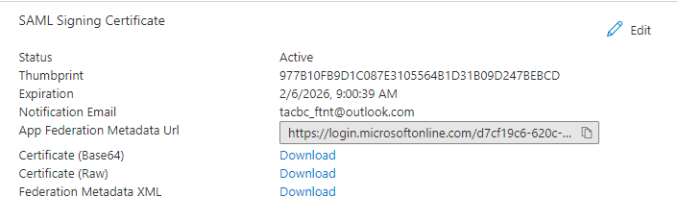
3. In Azure on the *Set up Single Sign-On with SAML* page, copy the following URLs from the FortiGate to the *Basic SAML Configuration* section:

From FortiGate	To Azure field
Entity ID (http://10.1.0.1:1003/remote/saml/metadata/)	*Identifier (Entity ID)*, set to *Default*
Assertion consumer service URL (https://10.1.0.1:1003/remote/saml/login/)	*Reply URL* and *Sign on URL*
Single logout service URL (https://10.1.0.1:1003/remote/saml/logout/)	*Logout URL*

4. Click *Save*.



5. Under the *SAML Signing Certificate* section, download the Base64 certificate.



6. Import the certificate from Azure on the FortiGate as the IdP certificate:
   a. Go to *System* > *Certificates* and click *Create/Import* > *Remote Certificate*.
   b. Upload the certificate from Azure and click *OK*. The new certificate appears under the *Remote Certificate* section with the name *REMOTE_Cert_(N)*.
   c. Optionally, rename the certificate in the CLI to give it a more recognizable name:

```
config vpn certificate remote
    rename REMOTE_Cert_3 to ENTRA_ID_SAML_FW
end
```

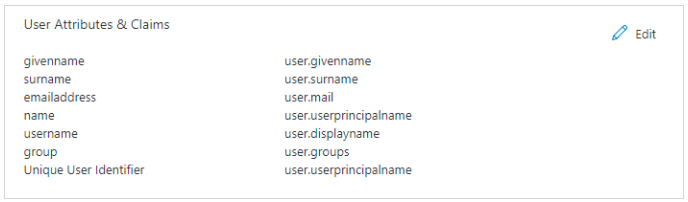
7. In the *Set up <application name>* section, copy the URLs from Azure to the FortiGate in the *IdP Details* section:

   a. On the FortiGate, click *Next*.
   b. For *IdP type*, select *Custom* and copy the following from Azure to the corresponding field:

From Azure	To FortiGate field
Microsoft Entra Identifier	*Entity ID*
Login URL	*Assertion consumer service URL*
Logout URL	*Single logout service URL*

   c. For *Certificate*, select the remote certificate imported earlier.
8. In Azure, edit the *User Attributes & Claims* section. The attributes are returned in the SAML assertion, which the FortiGate uses to verify the user and group. Configuring group matching is optional.
   a. Click *Add new claim*, name it *username*, and set the *Source attribute* to *user.displayname*. The source attribute can be any of the related username fields. The value of the username returned to the FortiGate will be used in logs and monitors to identify the user.
   b. Click *Save*.
   c. Click *Add a group claim* and in the *Group Claims* pane, select *All groups*.
   d. In *Advanced Options*, select *Customize the name of the group claim*. Set the name to *group*.

   e. Click *Save*. The *User Attributes & Claims* section displays the update settings.

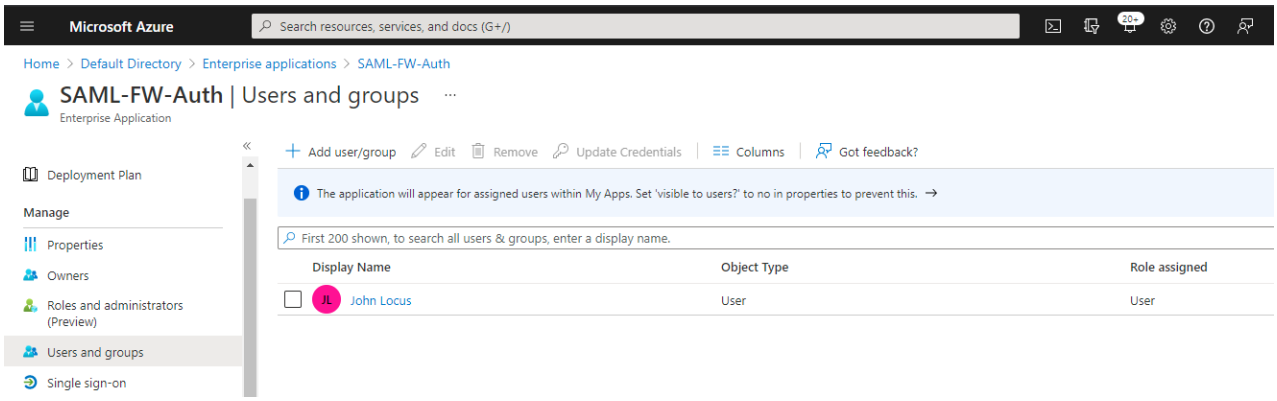


9. On the FortiGate, update the *Additional SAML Attributes* section with the username and group created in Azure:
   a. For *Attribute used to identify users*, enter *username*.
   b. For *Attribute used to identify groups*, enter *group*.

   c. Click *Submit*.

To assign Microsoft Entra users and groups to the application:

1. In Azure, go to the application's *Overview* page.
2. Go to *Manage* > *Users and groups* and click *Add user/group*.
3. Click *Users* to select the users or groups (*John Locus* is selected in this example).
4. Click *Assign* to add the assignment.



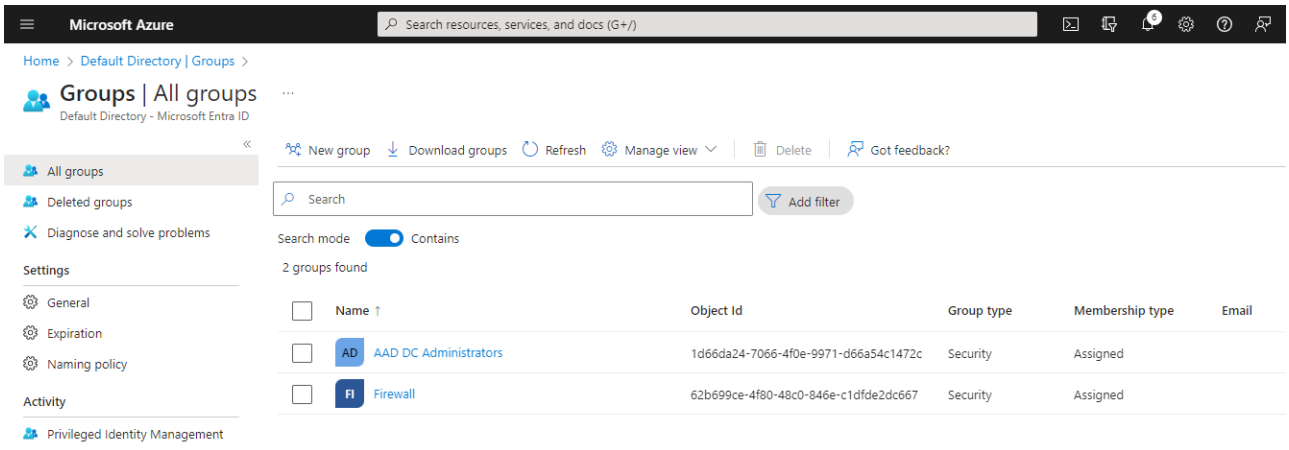
Configuring the FortiGate

The user group, user authentication settings, and firewall policies must be configured on the FortiGate.

Configuring the user group

A user group named *Azure-FW-Auth* is created with the member *Entra-ID-SAML*.

Configuring group matching is optional, and the *Object ID* from Azure is needed for the `config match` settings. In the Azure default directory, go to *Manage* > *Groups* and locate the *Object ID* for the *Firewall* group.



To configure the user group:

```
config user group
    edit "Azure-FW-Auth"
        set member "Entra-ID-SAML"
        config match
            edit 1
                set server-name "Entra-ID-SAML"
                set group-name "62b699ce-4f80-48c0-846e-c1dfde2dc667"
            next
        end
```

```
    next
end
```

Configuring the user authentication setting

When a user initiates traffic, the FortiGate will redirect the user to the firewall authentication captive portal before redirecting them to the SAML IdP portal. After the SAML IdP responds with the SAML assertion, the user is again redirected to the firewall authentication captive portal. If the firewall portal's certificate is not trusted by the user, they will receive a certificate warning. Use a custom certificate that the user trusts to avoid the certificate warning.

To configure a custom certificate:

1. Go to *User & Authentication* > *Authentication Settings*.
2. For *Certificate*, select the custom certificate. The custom certificate's SAN field should have the FQDN or IP from the SP URL.

Alternatively, assigning a CA certificate allows the FortiGate to automatically generate and sign a certificate for the portal page. This will override any assigned server certificate. In this example, the built-in Fortinet_CA_SSL is used.

To assign a CA certificate:

1. Edit the user setting:

```
config user setting
    set auth-ca-cert "Fortinet_CA_SSL"
end
```

2. Go to *System* > *Certificates* and download the certificate.
3. Install the certificate into the client's certificate store.

Configuring the firewall policies

Firewall policies must be configured to apply user authentication and still allow users behind the FortiGate to access the Microsoft log in portal without authentication.

To configure the firewall policies:

1. Configure a policy to allow traffic to the Microsoft Azure internet service:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Enter the following:

Name	*LAN-to-AuthPortal*
Incoming Interface	*port3*
Outgoing Interface	*Underlay*
Source	*all*

Destination	*Microsoft-Azure* (under *Internet Service*)
Schedule	*always*
Service	*ALL*
Action	*ACCEPT*
NAT	Enable and select *NAT*.
Log Allowed Traffic	Enable and select *All Sessions*.

c. Configure the other settings as needed.
d. Click *OK*.

2. Configure a policy to apply user authentication:
   a. Click *Create New* and enter the following:

Name	*LAN-auth-policy*
Incoming Interface	*port3*
Outgoing Interface	*Underlay*
Source	*all*, *Azure-FW-Auth*
Destination	*all*
Schedule	*always*
Service	*ALL*
Action	*ACCEPT*
NAT	Enable and select *NAT*.
Log Allowed Traffic	Enable and select *All Sessions*.

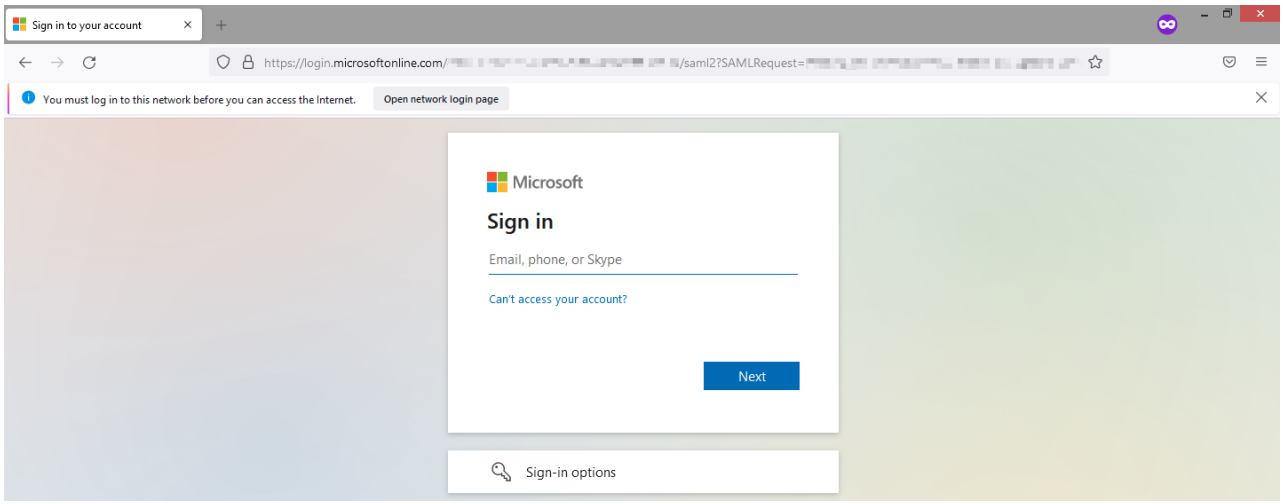
   b. Configure the other settings as needed.
   c. Click *OK*.

Connecting from the client

When the client connects to the internet from a browser, they will be redirected to the Microsoft log in page to authenticate against the Microsoft Entra ID. The FortiGate's authentication portal certificate should be installed on the client.

To connect from the client:

1. On the client, open a browser (such as Firefox) and go to a website. The user is redirected to the Microsoft log in page.
2. Enter the user credentials.



3. If the log in attempt is successful, the user is allowed to access the internet

Viewing logs and diagnostics

To verify user logins, go to the *Dashboard* > *Assets & Identities* and expand the *Firewall Users* widget, or enter the following in the CLI:

```
# diagnose firewall auth list
10.1.0.100, John Locus
        src_mac: 02:09:0f:00:03:03
        type: fw, id: 0, duration: 152, idled: 7
        expire: 292, allow-idle: 300
        server: Entra-ID-SAML
        packets: in 2097 out 932, bytes: in 2208241 out 143741
        group_id: 2
        group_name: Azure-FW-Auth
----- 1 listed, 0 filtered ------
```

To verify user login logs, go to *Log & Report* > *System Events* and select the *User Events* card, or enter the following in the CLI:

```
# execute log filter category event
# execute log filter field subtype user
# execute log display
17 logs found.
10 logs returned.
7: date=2021-09-30 time=09:49:25 eventtime=1633020565577584390 tz="-0700" logid="0102043039"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication logon"
srcip=10.1.0.100 user="John Locus" authserver="Entra-ID-SAML" action="auth-logon" status="logon"
msg="User John Locus added to auth logon"

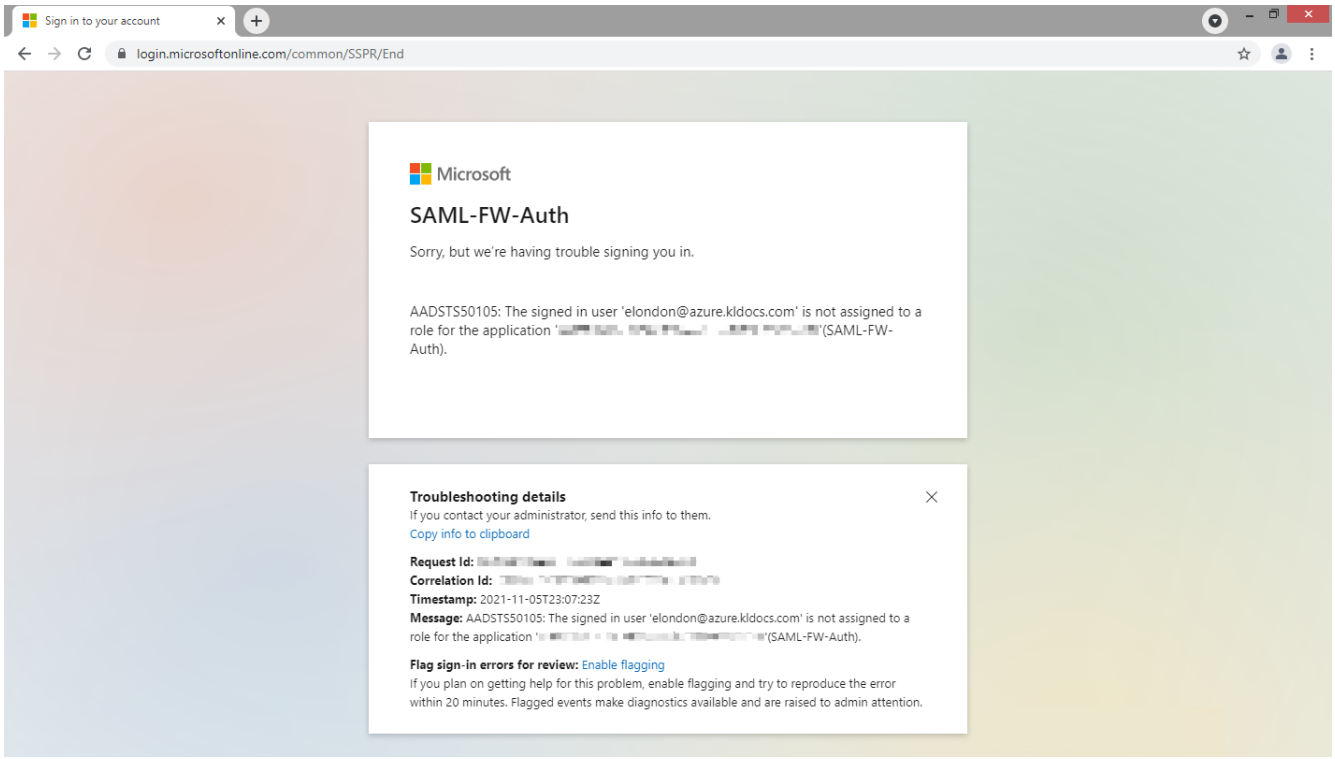
8: date=2021-09-30 time=09:49:25 eventtime=1633020565577075629 tz="-0700" logid="0102043008"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication success"
srcip=10.1.0.100 dstip=10.1.0.1 policyid=11 interface="port3" user="John Locus" group="Azure-FW-
```

```
Auth" authproto="HTTPS(10.1.0.100)" action="authentication" status="success" reason="N/A"
msg="User John Locus succeeded in authentication"
```

If user authentication is successful in Microsoft Entra ID, but their group does not match the one defined in the FortiGate user group, the user will receive a *Firewall Authentication Failed* message in the browser. A log is also recorded:

```
# execute log filter category event
# execute log filter field subtype user
# execute log display
1: date=2021-09-30 time=10:39:35 eventtime=1633023575381139214 tz="-0700" logid="0102043009"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication failed"
srcip=10.1.0.100 dstip=10.1.0.1 policyid=11 interface="port3" user="Adam Thompson" group="N/A"
authproto="HTTPS(10.1.0.100)" action="authentication" status="failure" reason="No matched SAML
user or group name in auth resp" msg="User Adam Thompson failed in authentication"
```

If a user receives the following error message, this means the user is not assigned to the enterprise application *SAML-FW-Auth* in Azure.



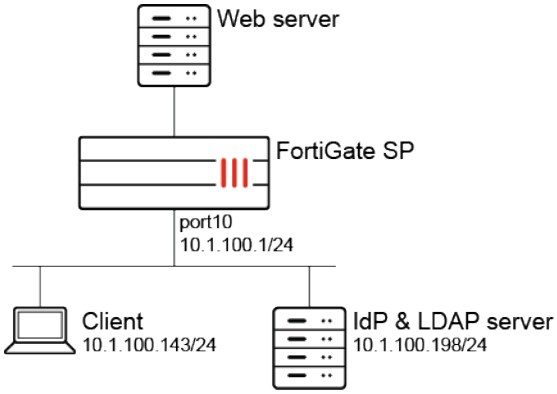
To troubleshoot SAML issues:

```
# diagnose debug application samld -1
# diagnose debug enable
```

SAML authentication in a proxy policy

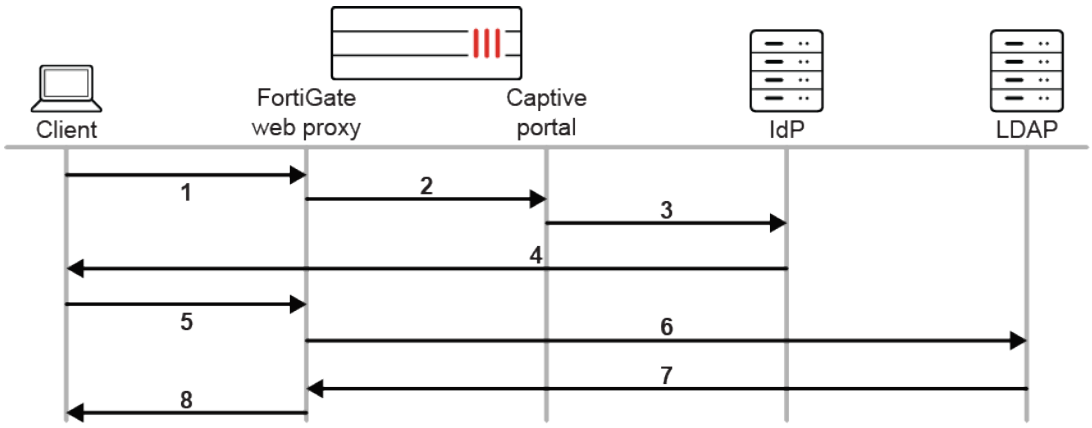
SAML user authentication can be used in explicit web proxies and transparent web proxies with the FortiGate acting as a SAML SP. SAML can be used as an authentication method for an authentication scheme that requires using a captive portal.

Topology



In this configuration, SAML authentication is used with an explicit web proxy. The IdP is a Windows 2016 server configured with ADFS. The LDAP and IdP servers are on the same server. The LDAP server is used as the user backend for the IdP to perform authentication; however, they are not required to be on the same server.

The authentication and authorization flow is as follows:



1. The client opens a browser and visits https://www.google.com.
2. The browser is redirected by the web proxy the captive portal.
3. The request is redirected to the IdP's sign-in page.
4. If the user signs in, the IdP authenticates the user and sends back a SAML assertion message to the user's browser with the user group information.
5. The browser forwards the SAML assertion response as a HTTP POST to the FortiGate SAML assertion consumer service URL (https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/login/).
6. If the FortiGate authentication scheme has a user database configured, the FortiGate will query the LDAP server for the user group information and ignore the user group information from the SAML message.

7. The user group information is returned. The FortiGate matches the user group information against the LDAP group in the proxy policy group settings. If there is a match, the request is authorized and the proxy policy is matched.
8. If all policy criteria match successfully, then the webpage is returned to the client.

To configure SAML authentication with an explicit web proxy:

1. Enable the web proxy:

```
config web-proxy explicit
    set status enable
    set http-incoming-port 8080
end
```

2. Enable the proxy captive portal:

```
config system interface
    edit "port10"
        set vdom "vdom1"
        set ip 10.1.100.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
        set type physical
        set explicit-web-proxy enable
        set explicit-ftp-proxy enable
        set proxy-captive-portal enable
        set snmp-index 12
    next
end
```

3. Configure the LDAP server:

```
config user ldap
    edit "ldap-10.1.100.198"
        set server "10.1.100.198"
        set cnid "cn"
        set dn "dc=myqalab,dc=local"
        set type regular
        set username "cn=fosqa1,cn=users,dc=myqalab,dc=local"
        set password ************
        set group-search-base "dc=myqalab,dc=local"
    next
end
```

4. Configure the user group:

```
config user group
    edit "ldap-group-saml"
        set member "ldap-10.1.100.198"
    next
end
```

5. Configure SAML:

```
config user saml
    edit "saml_user"
        set cert "Fortinet_CA_SSL"
        set entity-id "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/metadata/"
        set single-sign-on-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/login/"
        set single-logout-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/logout/"
        set idp-entity-id "http://MYQALAB.LOCAL/adfs/services/trust"
        set idp-single-sign-on-url "https://myqalab.local/adfs/ls"
        set idp-single-logout-url "https://myqalab.local/adfs/ls"
        set idp-cert "REMOTE_Cert_4"
        set digest-method sha256
        set adfs-claim enable
        set user-claim-type name
        set group-claim-type group
    next
end
```

6. Configure the authentication scheme, rule, and setting:

```
config authentication scheme
    edit "saml"
        set method saml
        set saml-server "saml_user"
        set user-database "ldap-10.1.100.198"
    next
end
```

```
config authentication rule
    edit "saml"
        set srcaddr "all"
        set active-auth-method "saml"
    next
end
```

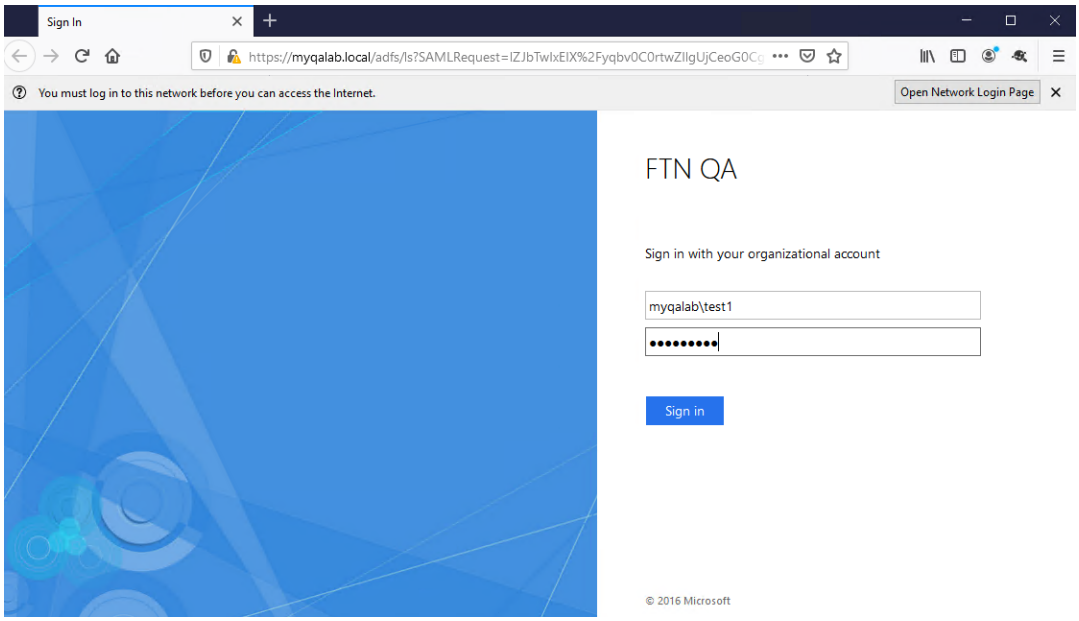
```
config authentication setting
    set captive-portal "fgt9.myqalab.local"
end
```

7. Configure the proxy policy:

```
config firewall proxy-policy
    edit 3
        set proxy explicit-web
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
        set logtraffic all
```

```
        set groups "ldap-group-saml"
        set utm-status enable
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "deep-custom"
        set av-profile "av"
    next
end
```

When a user goes to www.google.com in a browser that is configured to use the FortiGate as a proxy, the IdP sign-in page appears.



Sample log

```

```

TACACS+ servers

TACACS+ is a remote authentication protocol that provides access control for routers, network access servers, and other network devices through one or more centralized servers.

FortiOS sends the following proprietary TACACS+ attributes to the TACACS+ server during authorization requests:

Attribute	Description
`service=<name>`	User must be authorized to access the specified service.
`memberof`	Group that the user belongs to.
`admin_prof`	Administrator profile (admin access only).

Only `memberof` and `admin_prof` attributes are parsed in authentication replies.

You can configure up to ten remote TACACS+ servers in FortiOS. You must configure at least one server before you can configure remote users.

A TACACS+ server must first be added in the CLI to make the option visible in the GUI.

To configure TACACS+ authentication in the CLI:

1. Configure the TACACS+ server entry:

```
config user tacacs+
    edit "TACACS-SERVER"
        set server <IP address>
        set key <string>
        set authen-type ascii
        set source-ip <IP address>
    next
end
```

2. Configure the remote user group:

```
config user group
    edit "TACACS-GROUP"
        set group-type firewall
        set member "TACACS-SERVER"
    next
end
```

3. Configure the remote user:

```
config system admin
    edit TACACS-USER
        set remote-auth enable
        set accprofile "super_admin"
        set vdom "root"
```

```
        set wildcard enable
        set remote-group "TACACS-GROUP"
    next
end
```

To configure a TACACS+ server in the GUI:

1. Go to *User & Authentication* > *TACACS+ Servers*.
2. Click *Create New*.
3. Configure the following settings:

Name	Enter the TACACS+ server name.
Authentication Type	Select the authentication type used for the TACACS+ server. Selecting *Auto* tries PAP, MSCHAP, and CHAP, in that order.
Server IP/Name	Enter the domain name or IP address for the primary server.
Server Secret	Enter the key to access the primary server.

4. Click *OK*.

SCIM servers

System for Cross-domain Identity Management (SCIM) is an open-standard protocol that facilitates the exchange of identity data between platforms. See the following RFCs for more information:

- See RFC 7642 for information about definitions, overview, concepts, and requirements.
- See RFC 7643 for information about the core schema.
- See RFC 7644 for information about the protocol.

SCIM is based on a client-server model where the client is usually an identity provider (IdP) that maintains a directory of user identities, and the server is typically a service provider (SP). The client sends user and group information to the server, enabling automatic provisioning of users and groups between the SP and IdP.

With SCIM servers, FortiGate can communicate with an Identity Provider (IdP) using the SCIM 2.0 protocol, which facilitates the automatic provisioning of users and groups on FortiGate. Once users and groups are provisioned on FortiGate, they can be used with SAML to provide user authentication.

The *config system global* command includes SCIM settings:

```
config system global
    set scim-http-port <integer>
    set scim-https-port <integer>
    set scim-server-cert <string>
end
```

`scim-http-port <integer>`	Specify the port on which the SCIM server will listen for HTTP requests (default = 44558).
`scim-https-port <integer>`	Specify the port on which the SCIM server will listen for HTTPS requests (default = 44559).
`scim-server-cert <string>`	Specify the certificate that will be used if the HTTPS protocol is being used to communicate with the SCIM client. The certificate used by FortiGate must be trusted by the SCIM client.

To allow SCIM access in the GUI:

1. Go to *Network* > *Interfaces*.
2. Create or edit an interface.
3. In the *Administrative Access* section, select *SCIM*.
4. Click *OK*.

To allow SCIM access in the CLI:

```
config system interface
    edit <name>
        append allowaccess scim
    next
end
```

To specify the SCIM server certificate and HTTP(S) port in the GUI:

1. Go to *System* > *Settings*.
2. In the *SCIM Settings* section, configure the *HTTP port*, *HTTPS port*, and *Server certificate* as required.
3. Click *Apply*.

To specify the SCIM server certificate and HTTP(S) port in the CLI:

```
config system global
    set scim-http-port <port>
    set scim-https-port <port>
    set scim-server-cert <certificate>
end
```

To configure SCIM clients in the GUI:

1. Go to *User & Authentication* > *SCIM Clients*, and click *Create New*.
2. Set *Status* to *Enabled*, enter a *Name*, then configure the remaining settings as needed.
3. Click *OK*.

To configure SCIM clients in the CLI:

```
config user scim
    edit <name>
        set status {enable| disable}
        set base-url <string>
        set authe-method {token | base}
        set token-certificate <name>
        set secret <passwd>
        set certificate <name>
        set client-identity-check {enable| disable}
    next
end
```

`status {enable| disable}`	Enable/disable System for Cross-domain Identity Management (SCIM).
`base-url <string>`	Server URL to receive SCIM create, read, update, delete (CRUD) requests.
`auth-method {token | base}`	TLS client authentication methods (default = bearer token).
`token-certificate <name>`	Certificate for token verification.
`secret <passwd>`	Secret for token verification or base authentication.
`certificate <name>`	Certificate for client verification during TLS handshake.
`client-identity-check {enable| disable}`	Enable/disable client identity check.

To add a SCIM client to SAML server configuration in the GUI:

1. Go to *User & Authentication* > *Single Sign-On* and edit an existing entry or click *Create New* to create a new single sign-on.
2. In the *Additional SAML Attributes* section, enable *SCIM client* and select a SCIM client.
3. Click *OK*.

To add a SCIM client to SAML server configuration in the CLI:

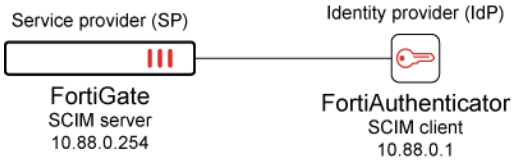
```
config user saml
    edit <name>
        set scim-client <name>
    next
end
```

Example

In this example, FortiGate is configured as the SCIM server (SP), and FortiAuthenticator is configured as the SCIM client (IdP). Two groups are configured on FortiAuthenticator: `IT` and `Pochiya clan`. The groups contain the following users:

- The `IT` group contains three users: `admin`, `sk`, and `sy`.
- The `Pochiya clan` group contains two users: `naynay` and `kiki`.

Upon successful configuration, users and groups are provisioned on FortiGate. This setup can leverage SAML to provide access to authenticated users.

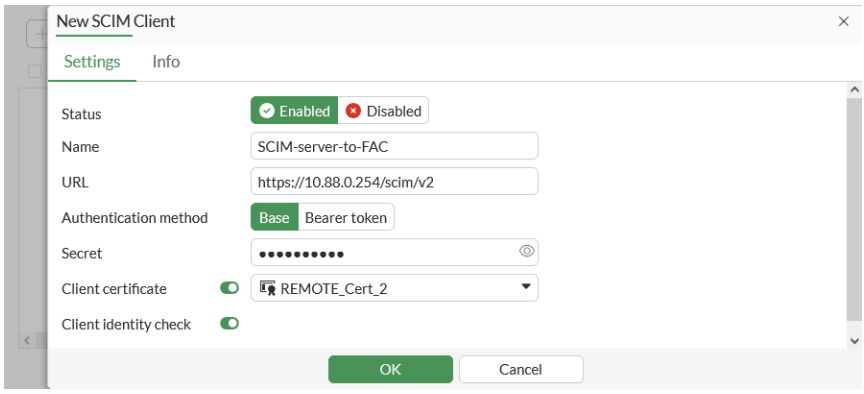


To configure FortiGate as an SCIM server in the GUI:

1. Allow SCIM access on an interface:
   a. Go to *Network* > *Interfaces* and edit the interface.
   b. In the *Administrative Access* section, select *SCIM*.

   c. Click *OK*.
2. Specify the SCIM server certificate:
   a. Go to *System* > *Settings*.
   b. In the *SCIM Settings* section, set *Server certificate*.

   c. Click *Apply*.
3. Configure SCIM client entries:
   a. Go to *User & Authentication* > *SCIM Clients*, and click *Create New*.
   b. Set *Status* to *Enabled*, enter a *Name*, then configure the remaining settings as needed.



c. Click *OK*.

To configure FortiGate as an SCIM server in the CLI:

1. Allow SCIM access on an interface:

```
config system interface
    edit port2
        append allowaccess scim
    next
end
```

2. Specify the SCIM server certificate:

```
config system global
    set scim-server-cert SCIM-Demo-CA-SSL
end
```

3. Configure SCIM client entries:

```
config user scim
    edit "SCIM-server-to-FAC"
        set status enable
        set base-url https://10.88.0.254/scim/v2
        set auth-method base
        set secret **********
        set certificate REMOTE_Cert_2
        set client-identity-check enable
    next
end
```

To configure FortiAuthenticator as an SCIM client:

1. On FortiAuthenticator, use your admin account to log in.
2. Click *Authentication > SCIM > Service Provider*.
3. Click *Create New*, and configure the following settings:

Name	Test-SCIM

SCIM endpoint	https://10.88.0.254:44559/scim/v2
Access token	**********

4. Configure the remaining settings as required, and click *Save*.
5. Once the setting is saved, double-click the newly created entry to open the settings pane, and click *Sync* to automatically add existing users to the SCIM server.

See Service providers for more information

The SCIM endpoint and access token must match the `base-url` and `secret` respectively, as configured on the FortiGate.

Furthermore, an initial synchronization is necessary to commence provisioning for the first time. However, when alterations to identities occur in the IdP, including creation, updating, and deletion, these changes are automatically synchronized with SP in accordance with the SCIM protocol.

To verify whether users and groups are provisioned on FortiGate:

```
# diagnose test scim list-clients
There are 1 clients in vdom.
id:1 name:SCIM-server-to-FAC

# diagnose test scim list-groups SCIM-server-to-FAC

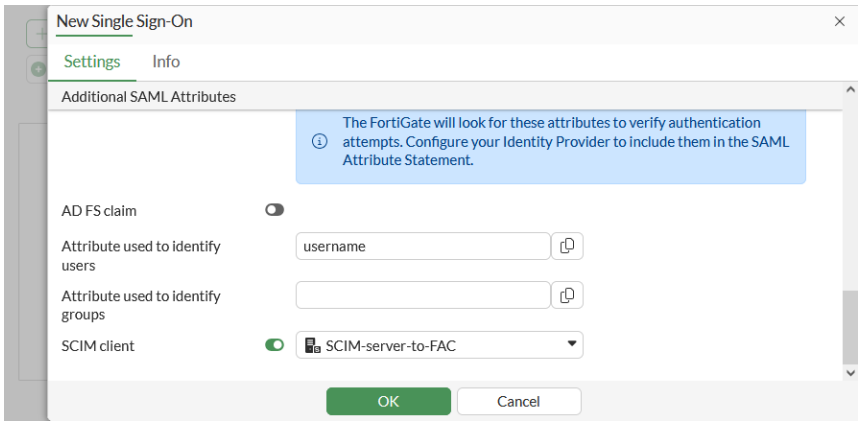
IT
pochiya clan
total:2

# diagnose test scim list-users SCIM-server-to-FAC

admin
kiki
naynay
sk
sy
```

To add a SCIM client to SAML server configuration in the GUI:

1. Go to *User & Authentication* > *Single Sign-On* and edit an existing entry or click *Create New* to create a new single sign-on.
2. In the *Additional SAML Attributes* section, enable *SCIM client* and select the SCIM client.



3. Click *OK*.

To add the SCIM group to a SAML server configuration in the CLI:

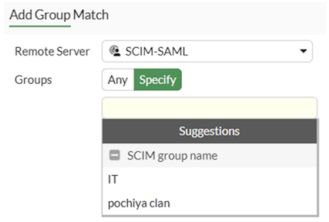
```
config user saml
    edit "SCIM-SAML"
        set scim-client "SCIM-server-to-FAC"
    next
end
```

Modify the SAML user group used in the firewall policy

The configuration in this topic incorporates all the SCIM groups configured on FortiAuthenticator and enables all users to authenticate. However, if you want to limit authentication to users who belong to specific groups, such as the IT group, the following additional configuration is necessary:

To modify the SAML user group used in the firewall policy in the GUI:

1. Go to *User & Authentication* > *User Groups* and click *Create New*. *Firewall* is selected as the default *Type*.
2. Enter the group name, such as *saml-scim*.
3. In the *Remote Groups* section, click *Add*.
4. Set *Remote Server* to the SAML user, *SCIM-SAML*.
5. For the *Groups*, select *Specify*, then click the text box to see the groups pulled from SCIM client as *Suggestions*.



6. Select the required group then click *OK*.

To modify the SAML user group used in the firewall policy in the CLI:

```
config user group
    edit saml-scim
        set member "SCIM-SAML"
        config match
            edit 1
                set server-name "SCIM-SAML"
                set group-name "IT"
            next
        end
    next
end
```

For brevity, only the commands relevant to this enhancement are included. See SAML for more information about configuring SP and IdP.

Bearer token authentication for SCIM servers

Bearer token authentication can be used for SCIM to improve security between the SCIM server and client. Bearer tokens generated by FortiOS can be temporary or long lived, and the SCIM client can verify the token.

Use the `execute gen-token` command to generate bearer tokens. The command is available for each VDOM.

```
execute gen-token <type> <string> <algorithm> <expire>
```

`<type>`	Type for token generation: • `cert`: certificate • `key`: pre-shared key
`<string>`	Name of the certificate or pre-shared key for token generation.
`<algorithm>`	Algorithm for token generation. Ensure that the signing algorithm supports the type. Available algorithms: • When the type is `cert`: `RS256`, `RS384`, `RS512`, `ES256`, `ES384`, or `ES512`. • When the type is `key`: `HS256`, `HS384`, or `HS512`.
`<expire>`	Expire interval, in hours (1 - 32767, 0 = long lived). When the token expires, administrators must manually generate another token on FortiGate and copy it to the SCIM client.

Use the `config user scim` command to configure token verification.

Example

This example explains how to generate a certificate type of bearer token and configure verification of the bearer token.

When generating a bearer token on FortiGate, remember:

- You can use any of the built-in or custom certificates available in the local certificate store.
- You must select a signing algorithm that supports the certificates.
- When the bearer token expires, the administrator must manually generate a new bearer token on FortiGate and copy the token to the SCIM client.

To generate a bearer token:

1. Enter `execute gen-token cert` to display the list of certificates available in the local certificate store:
   Custom and built-in certificates are displayed, and either can be used to generate tokens. In this example, `FGT401E-II-SAN-all` is a custom certificate, and `Fortinet_CA_SSL` is a built-in certificate.

```
# execute gen-token cert
<string>    Certificate or preshared-key for token generation.
Available certificates:
FGT401E-II-SAN-all      local
Fortinet_CA_SSL     local
Fortinet_CA_Untrusted   local           "
Fortinet_Factory        local           "
Fortinet_Factory_Backup local
Fortinet_GUI_Server     local           "
Fortinet_SSL    local
Fortinet_SSL_DSA1024    local
Fortinet_SSL_DSA2048    local
Fortinet_SSL_ECDSA256   local
Fortinet_SSL_ECDSA384   local
Fortinet_SSL_ECDSA521   local
Fortinet_SSL_ED448      local
Fortinet_SSL_ED25519    local
Fortinet_SSL_RSA1024    local
Fortinet_SSL_RSA2048    local
Fortinet_SSL_RSA4096    local
```

2. Enter `?` to display additional information:

```
# execute gen-token cert
Please specify <certificate or preshared-key> <algorithm> <expire>.
```

3. Enter the certificate name and `?` to display additional information:
   In this example, the `FGT401E-II-SAN-all` certificate is specified.

```
# execute gen-token cert FGT401E-II-SAN-all
<Algorithm>    Algorithm for token generation.
Please ensure that the signing algorithm matches the type of certificate and its corresponding
private key.
```

```
Available Algorithms:
RS256, RS384, RS512, ES256, ES384, ES512 for cert.
HS256, HS384, HS512 for key.
```

4. Enter the algorithm and `?` to display additional information:
   In this example, the `RS256` algorithm is specified.

```
# execute gen-token cert FGT401E-II-SAN-all RS256
<Expire>    Expire interval in hours, 0 for long live token.
```

5. Enter the expiration value:
   In this example, no expiration time (`0`) is specified.

```
# execute gen-token cert FGT401E-II-SAN-all RS256 0
```

   The following values display after successful token generation:

```
Added key:iat val:1732547333
Generated token:eyAidHlwIjogIkpXVCIsICJhbGciOXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
```

6. Copy the `Generated token` to your SCIM client.

```
Generated token:eyAidHlwIjogIkpXVCIsICJhbGciOXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
```

   - On FortiAuthenticator, the generated token is called an *access token*.
   - For Azure, the generated token is called a *secret token*.

To configure verification of the bearer token:

1. Configure the certificate name or pre-shared key to use for verification of the bearer token.
   In this example, a certificate (`cert`) type of bearer token is configured. You must specify the same certificate used to generate the bearer token:

```
config user scim
    edit "SCIM-server-to-FAC"
        set id 1
        set status enable
        set base-url "https://10.1.100.7/SCIM-server-to-FAC/scim/v2/"
        set auth-method token
        set token-certificate "FGT401E-II-SAN-all"
        set certificate "REMOTE_Cert_1"
        set client-identity-check disable
    next
end
```

   When using a pre-shared key (`key`), you must specify the same value used to generate the bearer token, for example:

```
config user scim
    edit "SCIM-server-to-FAC"
        set id 1
        set status enable
```

```
        set base-url "https://10.1.100.8/SCIM-server-to-FAC/scim/v2/"
        set auth-method token
        set secret ENC mSoyZXvQ/tM1v1VOuS31DOrCZRNQ383JiXXXXXXXXXXXXXXXXXXXXX"
        set certificate "REMOTE_Cert_2"
        set client-identity-check disable
    next
end
```

FortiTokens

FortiTokens are security tokens used as part of a multi-factor authentication (MFA) system on FortiGate and FortiAuthenticator. A security token is a 6-digit or 8-digit (configurable) one-time password (OTP) that is used to authenticate one's identity electronically as a prerequisite for accessing network resources. FortiToken is available as either a mobile or a physical (hard) token. Mobile tokens can be purchased as a license, or consumed with points as part of the FortiToken Cloud service.

FortiToken Mobile and physical FortiTokens store their encryption seeds on the cloud. FortiToken Mobile seeds are generated dynamically when the token is provisioned. They are always encrypted whether in motion or at rest.

You can only register FortiTokens to a single FortiGate or FortiAuthenticator for security purposes. This prevents malicious third parties from making fraudulent requests to hijack your FortiTokens by registering them on another FortiGate or FortiAuthenticator. If re-registering a FortiToken Mobile or Hard Token on another FortiGate is required, you must contact Fortinet Customer Support.

To migrate FortiToken Mobile tokens from FortiAuthenticator to FortiToken Cloud, see Migrate FTM tokens from FortiGate in the latest FortiToken Cloud Admin Guide.

Common usage for FortiTokens includes:

- Applying MFA to a VPN dialup user connecting to the corporate network
- Applying MFA to FortiGate administrators
- Applying MFA to firewall authentication and captive portal authentication

The MFA process commonly involves:

- **Something you know**: User password
- **Something you have**: The FortiToken OTP

A third factor of authentication is added to the authentication process:

- **Something you are**: Your fingerprint or face

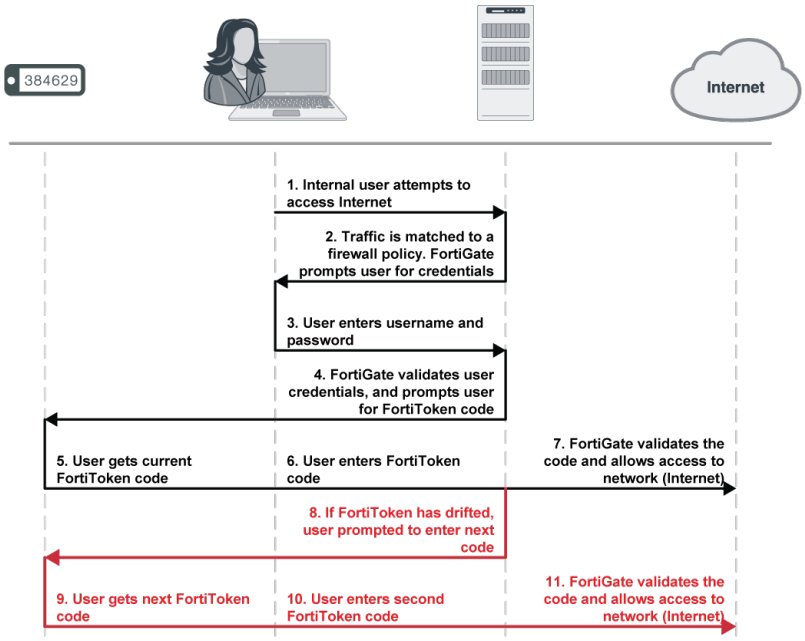
To enable the third factor, refer to the Activating FortiToken Mobile on a mobile phone on page 3127 section.

The following illustrates the FortiToken MFA process:

1. The user attempts to access a network resource.
2. FortiOS matches the traffic to an authentication security policy and prompts the user for their username and password.
3. The user enters their username and password.
4. FortiOS verifies their credentials. If valid, it prompts the user for the FortiToken code.
5. The user views the current code on their FortiToken. They enter the code at the prompt.
6. FortiOS verifies the FortiToken code. If valid, it allows the user access to network resources.

If the FortiToken has drifted, the following must take place for the FortiToken to resynchronize with FortiOS:

1. FortiOS prompts the user to enter a second code to confirm.
2. The user gets the next code from the FortiToken. They enter the code at the prompt.
3. FortiOS uses both codes to update its clock to match the FortiToken.



This section includes the following topics to quickly get started with FortiTokens:

- FortiToken Mobile quick start on page 3124
- FortiToken Cloud on page 3131
- Registering hard tokens on page 3131
- Managing FortiTokens on page 3134
- FortiToken Mobile Push on page 3136
- Synchronizing LDAP Active Directory users to FortiToken Cloud using the two-factor filter on page 3138
- Enable the FortiToken Cloud free trial directly from the FortiGate on page 3142
- FortiGuard distribution of updated Apple certificates for push notifications on page 3146
- Troubleshooting and diagnosis on page 3148

FortiToken Mobile quick start

FortiToken Mobile is an OATH compliant, event- and time-based one-time password (OTP) generator for mobile devices. It provides an easy and flexible way to deploy and provision FortiTokens to your end users through mobile devices. FortiToken Mobile produces its OTP codes in an application that you can download onto your Android or iOS mobile device without the need for a physical token.

You can download the free FortiToken Mobile application for Android from the Google Play Store, and for iOS from the Apple App Store.

This section focuses on quickly getting started and setting up FortiToken Mobile for use on a FortiGate:

- Registering FortiToken Mobile on page 3124
- Provisioning FortiToken Mobile on page 3125
- Activating FortiToken Mobile on a mobile phone on page 3127
- Applying multi-factor authentication on page 3131

Registering FortiToken Mobile

To deploy FortiToken Mobile for your end users, you must first register the tokens on your FortiGate. After registering the tokens, you can assign them to your end users.

Each FortiGate comes with two free FortiToken Mobile tokens. These tokens should appear under *User & Authentication > FortiTokens*. If no tokens appear, you may import them. Ensure that your FortiGate is registered and has internet access to connect to the FortiToken servers to import the tokens.

To import FortiTokens from the FortiGate GUI:

1. Go to *User & Authentication > FortiTokens*.
2. Click the *Import Free Trial Tokens* icon at the top. The two free tokens are imported.

To import FortiTokens from the FortiGate CLI:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
# show user fortitoken
```

If only one free token appears, you can first delete that token and then follow the procedure to import the two free tokens from either the GUI or the CLI.

If you have the FortiToken Mobile redemption certificate, you can register FortiToken Mobile on a FortiGate.

To register FortiToken Mobile from the FortiGate GUI:

1. Go to *User & Authentication > FortiTokens* and click *Create New*. The *New FortiToken* dialog appears.
2. For the *Type* field, select *Mobile Token*.
3. Locate the 20-digit code on the redemption certificate and type it in the *Activation Code* field.
4. Click *OK*. The token is successfully registered.

If you attempt to add invalid FortiToken serial numbers, there is no error message. FortiOS does not add invalid serial numbers to the list.

To register FortiToken Mobile from the FortiGate CLI:

```
# execute fortitoken-mobile import <20-digit activation code>
# show user fortitoken
```

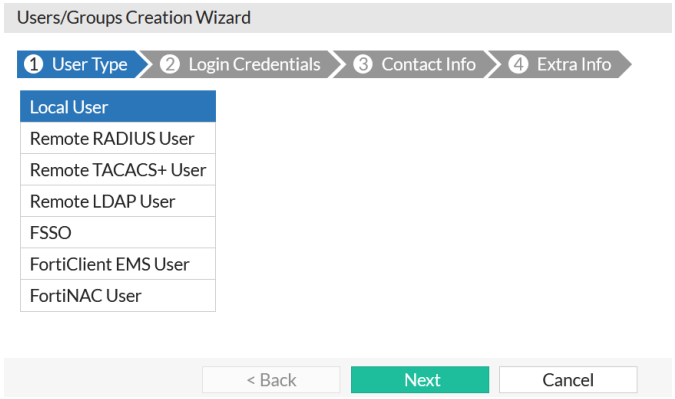
FortiToken Mobile stores its encryption seeds on the cloud. You can only register it to a single FortiGate or FortiAuthenticator.

Provisioning FortiToken Mobile

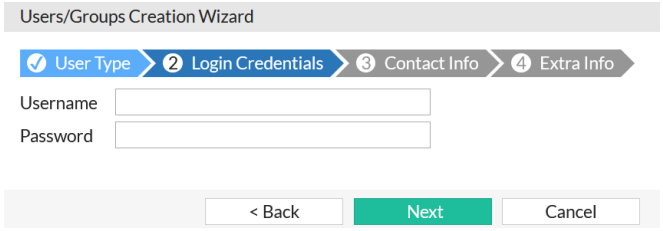
Once registered, FortiTokens need to be provisioned for users before they can be activated. In this example, you will provision a mobile token for a local user. Similar steps can be taken to assign FortiTokens to other types of users.

To create a local user and assign a FortiToken in the FortiGate GUI:

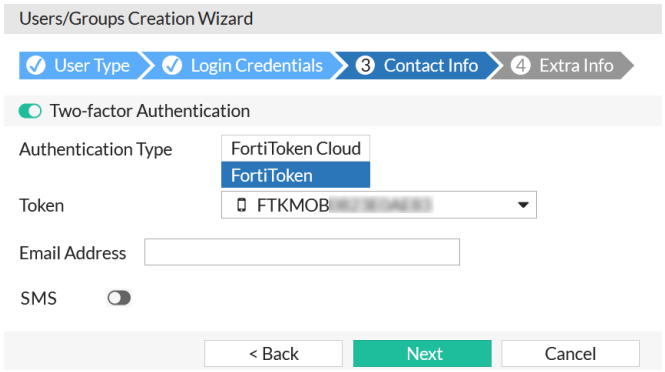
1. Go to *User & Authentication* > *User Definition*, and click *Create New*. The *Users/Groups Creation Wizard* appears.
2. In the *User Type* tab, select *Local User*, and click *Next*.



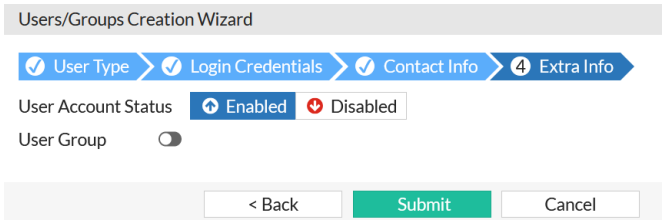
3. In the *Login Credentials* tab, enter a *Username* and *Password* for the user, and click *Next*.



4. In the *Contact Info* tab:
   a. Enable the *Two-factor Authentication* toggle.
   b. Select *FortiToken* for *Authentication Type*.
   c. Select a *Token* to assign to the user from the drop-down list.
   d. Enter the user's email address in the *Email Address* field. This is the email where the user will receive the QR code for activation of the FortiToken.
   e. Click *Next*.



5. In the *Extra Info* tab, make sure the *User Account Status* field is set to Enabled. You can also optionally assign the user to a user group by enabling the *User Group* toggle.



6. Click *Submit*. An activation code should be sent to the created user by email or SMS, depending upon the delivery method configured above.

FortiGate has the *Email Service* setting configured using the server *notifications.fortinet.net* by default. To see configuration, go to *System* > *Settings* > *Email Service*.

The activation code expires if not activated within the 3-day time period by default. However, the expiry time period is configurable.

To configure the time period (in hours) for FortiToken Mobile, using the CLI:

```
config system global
   set two-factor-ftm-expiry <1-168>
end
```

To resend the email or SMS with the activation code, refer to the Managing FortiTokens on page 3134 section.

Activating FortiToken Mobile on a mobile phone

After your system administrator provisions your token, you receive a notification with an activation code and expiry date via SMS or email. If you do not activate your token by the expiry date, you must contact your system administrator so that they can reassign your token for activation.

Platforms that support FortiToken Mobile:

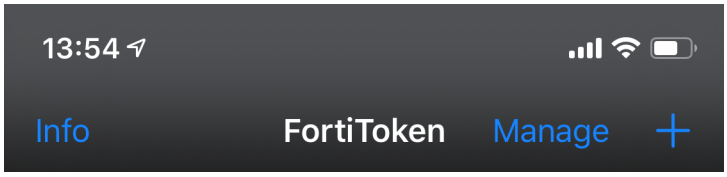
Platform	Device and firmware support
iOS	iPhone, iPad, and iPod Touch with iOS 6.0 and later.
Android	Phones and tablets with Android Jellybean 4.1 and later.
Windows	Windows 10 (desktop and mobile), Windows Phone 8.1, and Windows Phone 8. FortiToken is a Windows Universal Platform (UWP) application. To download FortiToken for Windows 10 desktop and mobile platforms, see FortiToken for Windows on the Microsoft Store.

The following instructions describe procedures when using FortiToken Mobile for iOS on an iPhone. Procedures may vary depending on your device and firmware.

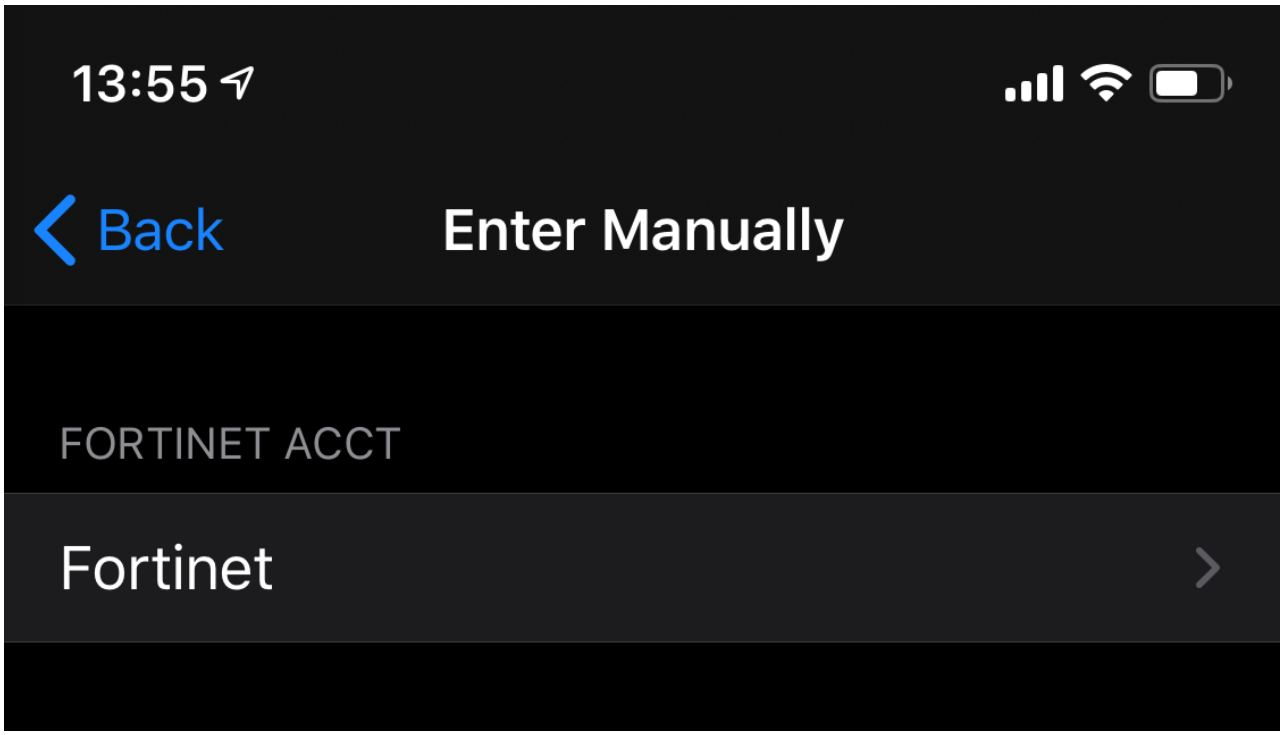
To activate FortiToken Mobile on iOS:

1. On your iOS device, tap on the FortiToken application icon to open the application. If this is your first time opening the application, it may prompt you to create a PIN for secure access to the application and tokens.

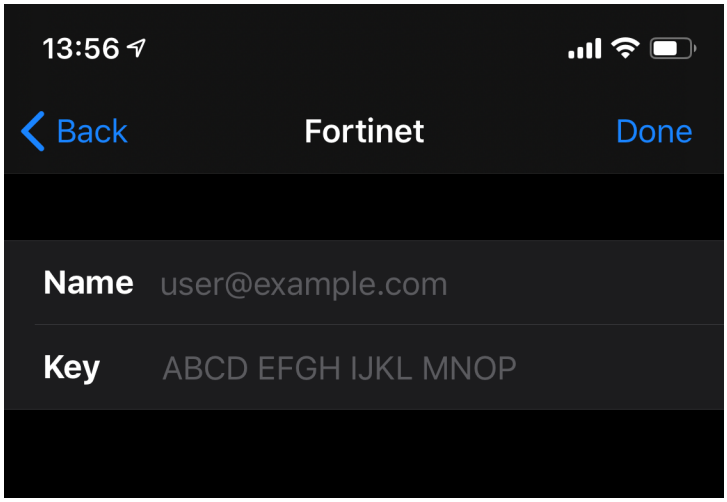
2. Tap on the + icon. The *Scan Barcode* screen appears.



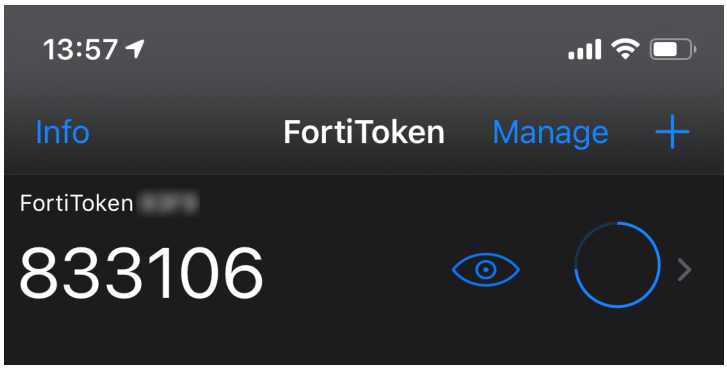
3. If you received the QR code via email, locate and scan the QR code in your email.
OR
If you received the activation key via SMS, tap on *Enter Manually* at the bottom of the screen, and tap on *Fortinet*.



Enter your email address in the *Name* field, the activation key in the *Key* field, and tap *Done*.



4. FortiToken Mobile activates your token, and starts generating OTP digits immediately. To view or hide the OTP digits, tap the eye icon.

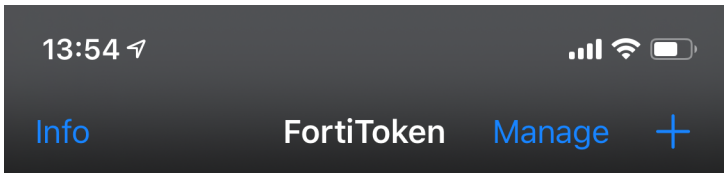


After you open the application, FortiToken Mobile generates a new 6-digit OTP every 30 seconds. All configured tokens display on the application homescreen.

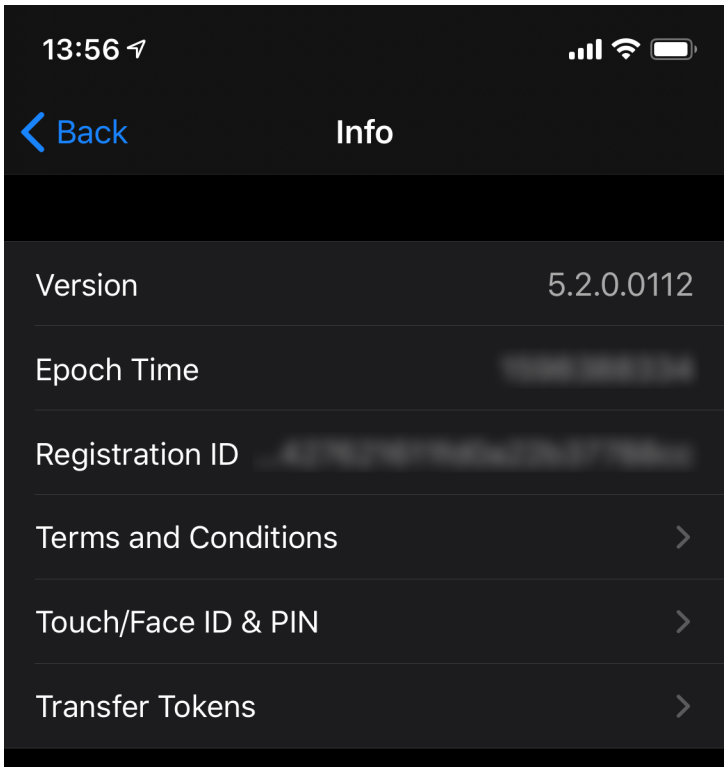
The FortiToken Mobile activation process described above caters to the MFA process that involves two factors (password and OTP) of the authentication process. A third factor (fingerprint or face) can be enabled as well.

To enable *Touch/Face ID* on iOS for FortiToken Mobile:

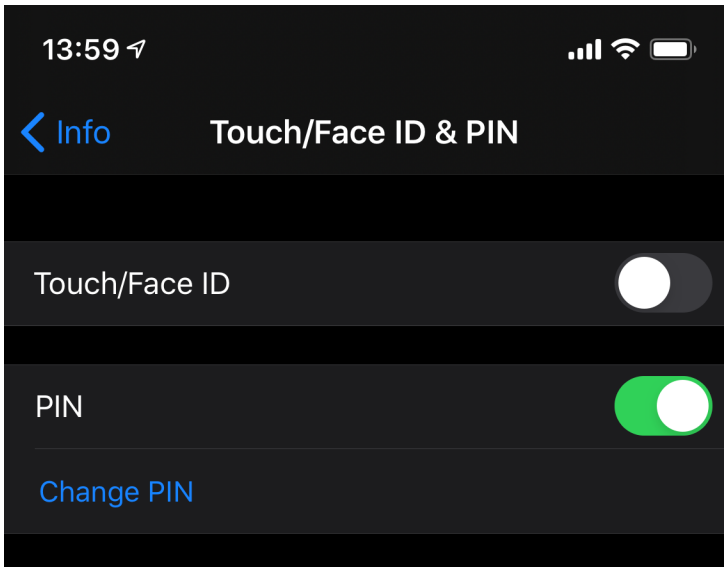
1. Open the FortiToken application and tap on *Info*.



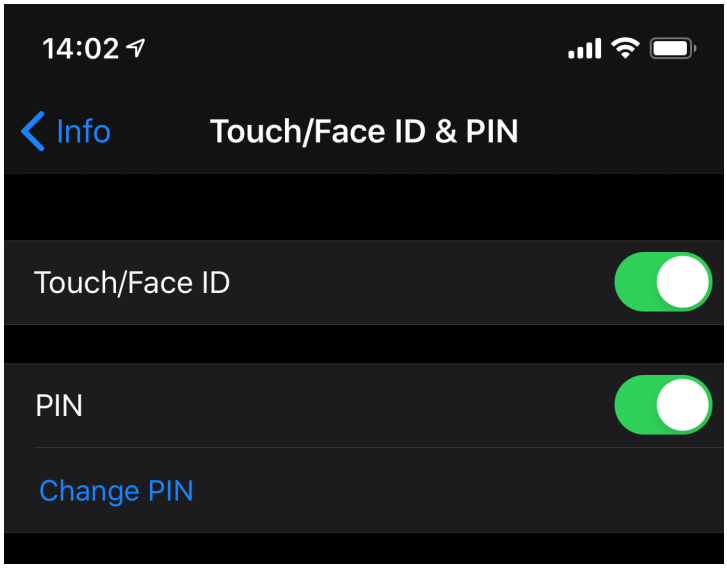
2. Tap on *Touch/Face ID & PIN*.



3. Enable and set up a 4-digit *PIN* for the application. The *PIN* is required to be enabled before you can enable *Touch/Face ID*.

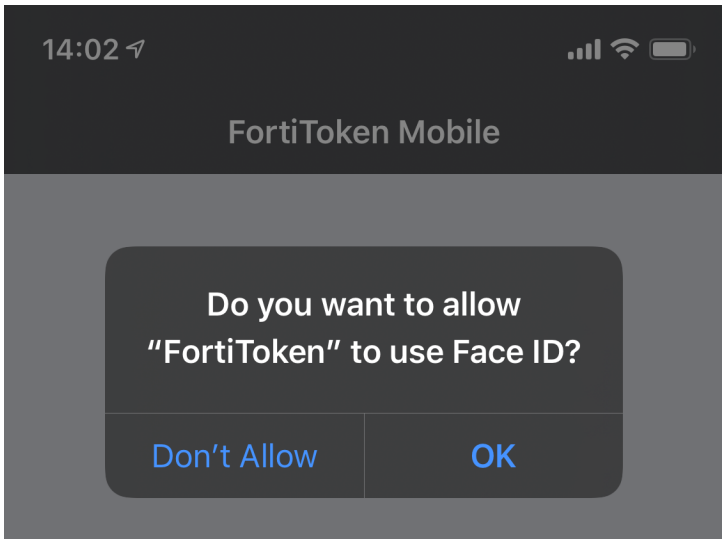


4. Enable *Touch/Face ID*.



You cannot enable *Touch/Face ID* for FortiToken if *Touch/Face ID* is not set up and enabled for device unlock (*iPhone Unlock* in this case) on iOS. You must first set up and enable *Touch/Face ID* from *Settings* on your iOS device.

5. When prompted by iOS, allow the FortiToken application to use *Touch/Face ID* by tapping on *OK* in the prompt.



Applying multi-factor authentication

Multi-factor authentication (MFA) may also be set up for SSL VPN users, administrators, firewall policy, wireless users, and so on. The following topics explain more about how you may use the newly created user in such scenarios:

- MFA for SSL VPN: Set up FortiToken multi-factor authentication on page 2792
- MFA for IPsec VPN: Add FortiToken multi-factor authentication on page 2509
- MFA for Administrators: Administrator account options on page 3193
- MFA with Captive Portal
- MFA for wireless users via Captive Portal
- Configuring FSSO firewall authentication on page 3169

FortiToken Cloud

FortiToken Cloud is an Identity and Access Management as a Service (IDaaS) cloud service offering by Fortinet. It enables FortiGate and FortiAuthenticator customers to add MFA for their respective users, through the use of Mobile tokens or Hard tokens. It protects local and remote administrators as well as firewall and VPN users.

For information, see Getting started—FGT-FTC users in the FortiToken Cloud Administration Guide.

Registering hard tokens

Registering FortiTokens consists of the following steps:

1. Adding FortiTokens to FortiOS.
2. Activating FortiTokens.
3. Associating FortiTokens with user accounts.

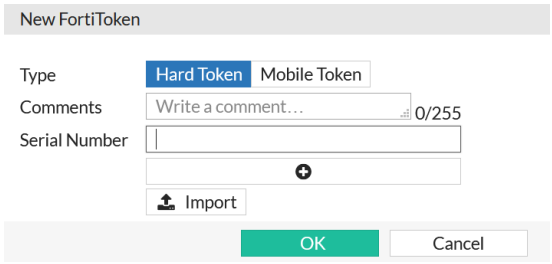
Adding FortiTokens to FortiOS

You can add FortiTokens to FortiOS in the following ways:

- Add FortiToken serial numbers using the GUI
- Add FortiToken serial numbers using the CLI
- Import FortiTokens using a serial number or seed file using the GUI

To manually add single hard token to FortiOS using the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Click *Create New*.
3. For *Type*, select *Hard Token*.
4. In the *Serial Number* field, enter one or more FortiToken serial numbers.
5. Click *OK*.

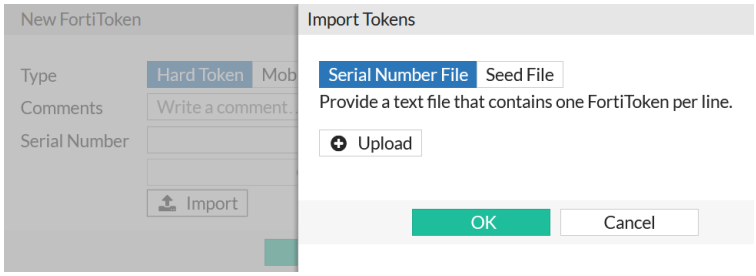


To add multiple FortiTokens to FortiOS using the CLI:

```
config user fortitoken
   edit <serial_number>
   next
   edit <serial_number2>
   next
end
```

To import multiple FortiTokens to FortiOS using the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Click *Create New*.
3. For *Type*, select *Hard Token*.
4. Click *Import*. The *Import Tokens* section slides in on the screen.



5. Select *Serial Number File*.

Seed files are only used with FortiToken-200CD. These are special hardware tokens that come with FortiToken seeds on a CD. See the FortiToken Comprehensive Guide for details.

6. Click *Upload*.
7. Browse to the file's location on your local machine, select the file, then click *OK*.
8. Click *OK*.

Activating FortiTokens

You must activate the FortiTokens before starting to use them. FortiOS requires connection to FortiGuard servers for FortiToken activation. During activation, FortiOS queries FortiGuard servers about each token's validity. Each token can only be used on a single FortiGate or FortiAuthenticator. If tokens are already registered, they are deemed invalid for re-activation on another device. FortiOS encrypts the serial number and information before sending for added security.

To activate a FortiToken using the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Select the desired FortiTokens that have an *Available* status.
3. Click *Activate* from the menu above.
4. Click *Refresh*. The selected FortiTokens are activated.

To activate a FortiToken using the CLI:

```
config user fortitoken
   edit <token_serial_num>
      set status activate
   next
end
```

Associating FortiTokens with user accounts

You can associate FortiTokens with local user or administrator accounts.

To associate a FortiToken to a local user account using the GUI:

1. Ensure that you have successfully added your FortiToken serial number to FortiOS and that its status is *Available*.
2. Go to *User & Authentication* > *User Definition*. Edit the desired user account.
3. Enable *Two-factor Authentication*.
4. From the *Token* dropdown list, select the desired FortiToken serial number.
5. In the *Email Address* field, enter the user's email address.
6. Click *OK*.

To associate a FortiToken to a local user account using the CLI:

```
config user local
   edit <username>
      set type password
      set passwd "myPassword"
      set two-factor fortitoken
      set fortitoken <serial_number>
      set email-to "username@example.com"
      set status enable
   next
end
```

Before you can use a new FortiToken, you may need to synchronize it due to clock drift.

To associate a FortiToken to an administrator account, refer to the Administrator account options on page 3193 section.

Managing FortiTokens

This section focuses on the following:

- Resending an activation email on page 3134
- Locking/unlocking FortiTokens on page 3134
- Managing FortiTokens drift on page 3135
- Deactivating FortiTokens on page 3135
- Moving FortiTokens to another device on page 3135

Resending an activation email

To resend an activation email/SMS for a mobile token on a FortiGate:

1. Go to *User & Authentication* > *User Definition* and edit the user.
2. Click *Send Activation Code Email* from the *Two-factor Authentication* section.

Locking/unlocking FortiTokens

To change FortiToken status to active or to lock:

```
config user fortitoken
   edit <token_serial_num>
      set status <active | lock>
   next
end
```

A user attempting to log in using a locked FortiToken cannot successfully authenticate.

Managing FortiTokens drift

If the FortiToken has drifted, the following must take place for the FortiToken to resynchronize with FortiOS:

1. FortiOS prompts the user to enter a second code to confirm.
2. The user gets the next code from the FortiToken. They enter the code at the prompt.
3. FortiOS uses both codes to update its clock to match the FortiToken.

If you still experience clock drift, it may be the result of incorrect time settings on your mobile device. If so, make sure that the mobile device clock is accurate by confirming the network time and the correct timezone.

If the device clock is set correctly, the issue could be the result of the FortiGate and FortiTokens being initialized prior to setting an NTP server. This will result in a time difference that is too large to correct with the synchronize function. To avoid this, selected Tokens can be manually drift adjusted.

To show current drift and status for each FortiToken:

```
diagnose fortitoken info
FORTITOKEN DRIFT STATUS
FTK200XXXXXXXXXC 0 token already activated, and seed won't be returned
FTK200XXXXXXXXXE 0 token already activated, and seed won't be returned
FTKMOBXXXXXXXXXA 0 provisioned
FTKMOBXXXXXXXXX4 0 new
Total activated token: 0
Total global activated token: 0
Token server status: reachable
```

This command lists the serial number and drift for each configured FortiToken. You can check if it is necessary to synchronize the FortiGate and any particular FortiTokens.

To adjust Mobile FortiToken for drift:

```
# execute fortitoken sync <FortiToken_ID> <token_code1> <next_token_code2>
```

Deactivating FortiTokens

To deactivate FortiToken on a FortiGate:

1. Go to *User & Authentication* > *User Definition*.
2. Select and edit the user for which you want to deactivate the token.
3. Disable the *Two-factor Authentication* toggle.
4. Click *OK*. The token will be removed from the user's *Two-factor Authentication* column. The user will also be removed from the token's *User* column under *User & Authentication* > *FortiTokens*.

Moving FortiTokens to another device

FortiTokens can only be activated on a single FortiGate or FortiAuthenticator. To move FortiTokens to another device, you would first have to reset the registered FortiTokens on a device and then reactivate them on another device.

To reset Hard tokens registered to a FortiGate appliance (non-VM model), you can reset all hardware FTK200 tokens from the Support Portal, or during RMA transfer. See the Migrating users and FortiTokens to another FortiGate KB article, for more information.

The above process will reset all Hard tokens and you cannot select individual tokens to reset.

To reset FortiToken Mobile, a single Hard token, a Hard token registered to a VM, and so on, an administrator must contact Customer Support and/or open a ticket on the Support Portal.

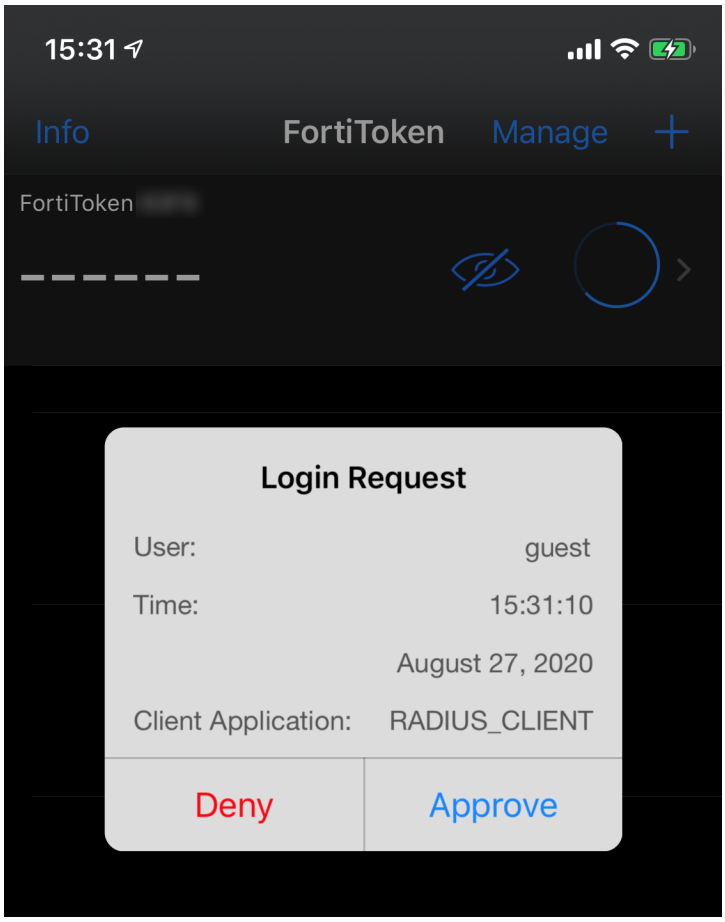
Once reset, the FortiTokens can be activated on another FortiGate or FortiAuthenticator.

FortiToken Mobile Push

FortiToken Mobile Push allows authentication requests to be sent as push notifications to the end user's FortiToken Mobile application.

The FortiToken Mobile push service operates as follows:

1. FortiGate sends a DNS query to the FortiToken Mobile Push proxy server (*push.fortinet.com*).
2. FortiGate connects to the proxy server via an encrypted connection over TCP/443.
3. The proxy server handles the notification request by making a TLS connection with either Apple (for iOS) or Google (for Android) notification servers. Notification data may include the recipient, session, FortiGate callback IP and port, and so on.
4. The notification service from either Apple or Google notifies the user's mobile device of the push request.
5. The FortiToken Mobile application on the user's mobile displays a prompt for the user to either *Approve* or *Deny* the request.



To configure FortiToken Mobile push services using the CLI:

```
config system ftm-push
    set proxy {enable | disable}
    set server-port [1-65535]
    set server <ip-address>
    set status enable
end
```

The default server port is 4433.

The server IP address is the public IP address of the FortiOS interface that FortiToken Mobile calls back to. FortiOS uses this IP address for incoming FortiToken Mobile calls.

If an SSL VPN user authenticates with their token, then logs out and attempts to reauthenticate within a minute, a *Please wait x seconds to login again* message displays. This replaces a previous error/permission denied message. The x value depends on the calculation of how much time is left in the current time step.

```
config system interface
    edit "guest"
        set allowaccess ftm
    next
end
```

FortiOS supports FortiAuthenticator-initiated FortiToken Mobile Push notifications for users attempting to authenticate through an SSL VPN and/or RADIUS server (with FortiAuthenticator as the RADIUS server).

Synchronizing LDAP Active Directory users to FortiToken Cloud using the two-factor filter

To synchronize Active Directory users and apply two-factor authentication using FortiToken Cloud, two-factor authentication can be enabled in the `user ldap` object definition in FortiOS. By default, FortiOS retrieves all Active Directory users in the LDAP server with a valid email or mobile number (`mail` and `mobile` attributes), and synchronizes the users to FortiToken Cloud. Users are then created on FortiToken Cloud and activation is sent out using email or SMS.

Two-factor filters can be used to reduce the number of the Active Directory users returned, and only synchronize the users who meet the filter criteria.

```
config user ldap
    edit <name>
        set dn <string>
        set two-factor {disable | fortitoken-cloud}
        set two-factor-filter <string>
    next
end
```

`dn <string>`	Set the distinguished name used to look up entries on the LDAP server. The search for users and groups starts here based on what is defined.
`two-factor {disable | fortitoken-cloud}`	Enable/disable two-factor authentication: • `disable`: disable two-factor authentication • `fortitoken-cloud`: use the FortiToken Cloud service
`two-factor-filter <string>`	Set the filter used to synchronize users to FortiToken Cloud.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 3014 and Configuring client certificate authentication on the LDAP server on page 3029.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 3022.

Two-factor filter examples

In the following examples, a `user ldap` object is defined to connect to an Active Directory on a Windows server. The search will begin in the root of the fortinet-fsso.com directory.

To configure a default LDAP server configuration without a two-factor filter:

```
config user ldap
    edit "ad-ldap-auth"
        set server <ip_address>
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set two-factor fortitoken-cloud
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password **********
    next
end
```

When a two-factor filter is not used, all users in the Active Directory with a valid email or mobile number will be retrieved.

Example 1: specific users and email address with wildcard

With this `two-factor-filter`, users under fortinet-fsso.com that have oliver* in their username and *fortinet* in their email will be matched.

```
config user ldap
    edit "ad-ldap-auth"
        set two-factor-filter "(&(SAMAccountName=oliver*)(mail=*fortinet*))"
    next
end
```

Example 2: all users with matching email

With this `two-factor-filter`, all users under fortinet-fsso.com with *fortinet* in their email will be matched.

```
config user ldap
    edit "ad-ldap-auth"
        set two-factor-filter "(&(SAMAccountName=*)(mail=*fortinet*))"
    next
end
```

Example 3: all users in a group

With this `two-factor-filter`, all users within the group fortinet-fsso.com > Testing > ftc-users will be matched.

```
config user ldap
    edit "ad-ldap-auth"
        set two-factor-filter "(&(objectCategory=Person)(sAMAccountName=*)( memberOf=cn=ftc-
```

```
users,ou=Testing,dc=fortinet-fsso,DC=com))"
    next
end
```

Example configuration

In this example, Active Directory users are configured to be synchronized to FortiToken Cloud. The same two-factor filter is used from example 1 and searches the Active Directory for users named oliver* with email *fortinet*.

Before configuring the FortiGate:

1. Gather the information to connect to the Active Directory server through LDAP. Include all necessary fields, such as the server IP, port, CN name identifier, DN for the start of the search, bind type, and username associated with a regular bind.
2. Consider the users or groups that require two-factor authentication and should be synchronized. If necessary, group the users under the same group in the Active Directory.
3. If using a two-factor filter, formulate the `two-factor-filter` string to limit the match. For this example, `(&(SAMAccountName=oliver*)(mail=*fortinet*))`.
4. Test the filter by using the FortiOS CLI to perform a quick LDAP search:

```
# diagnose test authserver ldap-search <server_ip> 389 "ou=Testing,dc=fortinet-fsso,DC=com" cn
Administrator@fortinet-fsso.com PASSWORD 0 '(&(SAMAccountName=oliver*)(mail=*fortinet*))' 2

searching 'ou=Testing,dc=fortinet-fsso,DC=com, cn=cn' on 10.1.100.131:389 for
(Administrator@fortinet-fsso.com, PASSWORD), secure(0), filter((&(SAMAccountName=oliver*)
(mail=*fortinet*))), flag(0x2), page_no(0)...
CN=oliver2022,OU=Testing,DC=Fortinet-FSSO,DC=COM (oliver2022, 0 entries)
```

   The user, `oliver2022`, was found.
5. Estimate how many users will be retrieved, and ensure that the FortiToken Cloud account has enough user licenses to support the number of users.

To configure Active Directory users to be synchronized to FortiToken Cloud:

1. Configure the user LDAP settings:

```
config user ldap
    edit "ad-ldap-auth"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set two-factor fortitoken-cloud
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password **********
        set two-factor-filter "(&(SAMAccountName=oliver*)(mail=*fortinet*))"
    next
end
```

2. In the background, the FortiGate FAS daemon scans the LDAP server for users to be synchronized based on the two-factor filter pattern, but will not send them to the FortiToken Cloud server yet. Optionally, verify the users that are retrieved from the Active Directory based on the filter:

```
# diagnose fortitoken-cloud debug enable
# diagnose debug enable
# diagnose fortitoken-cloud sync
...
fas_sync_ftc[2788]: Sending packet to FTC server: "IP-of-FTC-server" Port: 8686(length:444)
fas_sync_ftc[2792]: FTC User Sync Packet(length:444):
POST /api/v1/user_sync HTTP/1.1
Host: ftc.fortinet.com
Connection: keep-alive
User-Agent: FortiGate-401E v7.0.6,build****
Content-Type: application/json
Content-Length: 246
{"users":[{"username":"oliver2022","vdom":"vdom1","email":"o****@fortinet.com","mobile_
number":"XXXXXXXXXXX","user_data":1,"action":"create"}],"sn":"FG4H1E5819900000","cluster_
members":[ "FG4H1E5819900000" ],"group_name":"FGT400D","group_id":"0"}
Reminder: User sync packet not actually sent out because of diagnose purpose!
```

   As expected, only the user that matches the current filter is returned.

3. Manually trigger the synchronization process with FortiToken Cloud:

```
# execute fortitoken-cloud sync
```

   The user is added to FortiToken Cloud, and an activation email or SMS message is sent to the user.

4. In FortiToken Cloud, go to *Users* to verify that the user was added.

   If the activation email was sent, but user has not downloaded and activated the mobile token yet, a pending symbol appears in the *Status* column (such as for the *admin*, *test6*, and *test3* users).

5. In FortiOS, add the `ad-ldap-auth` object in a user group. The user group can be used for VPN, firewall authentication, and so on.

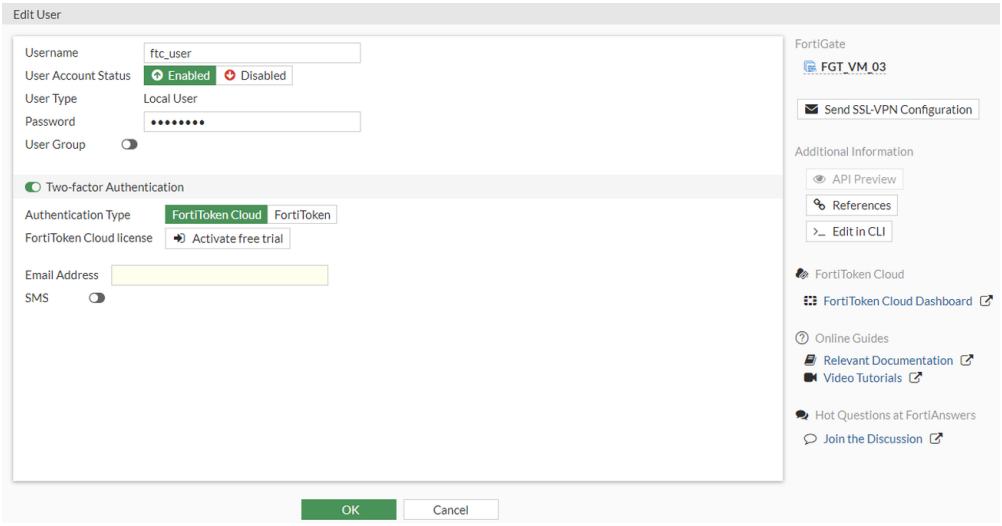
The `ldap user` object should not be used in remote LDAP user groups that require group matching because it is not supported.

Enable the FortiToken Cloud free trial directly from the FortiGate

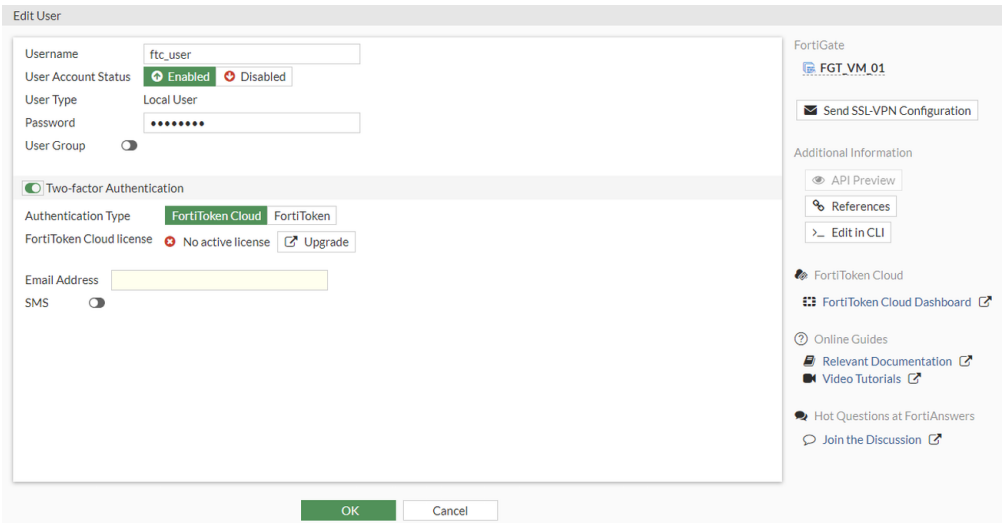
Administrators can activate a free one-month trial of FortiToken Cloud directly from the FortiGate instead of logging into the FortiCare Support Portal. This can be performed while enabling two-factor authentication within a user or administrator configuration, or from the *System* > *FortiGuard* page.

The FortiToken Cloud free trial can only be activated once and can only be activated if there is a registered FortiCare account. It cannot be activated if there is another FortiToken Cloud license or trial associated with the FortiGate device or the registered FortiCare accounts.

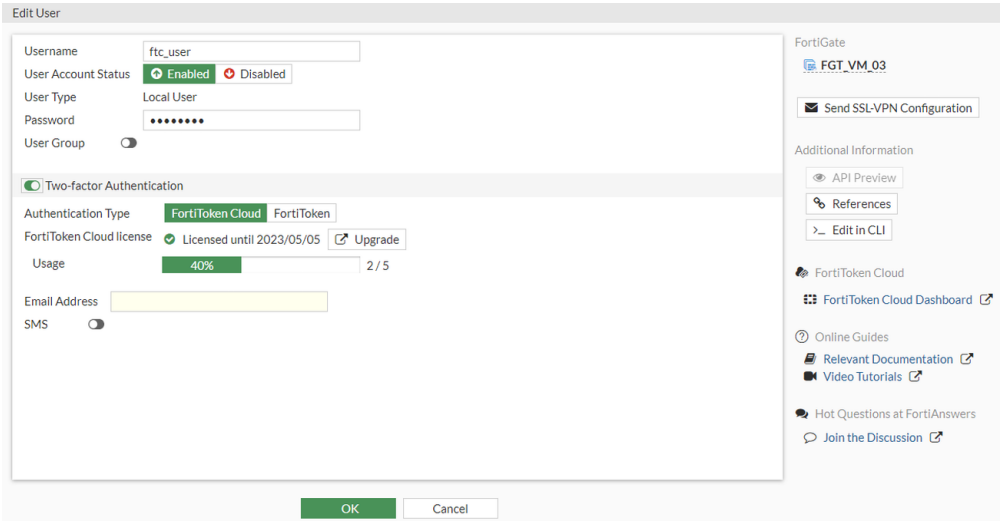
If the free trial has not been activated, the *Activate free trial* button will be available.



If the FortiToken Cloud license or free trial period is expired, the status will be displayed as *No active license*.

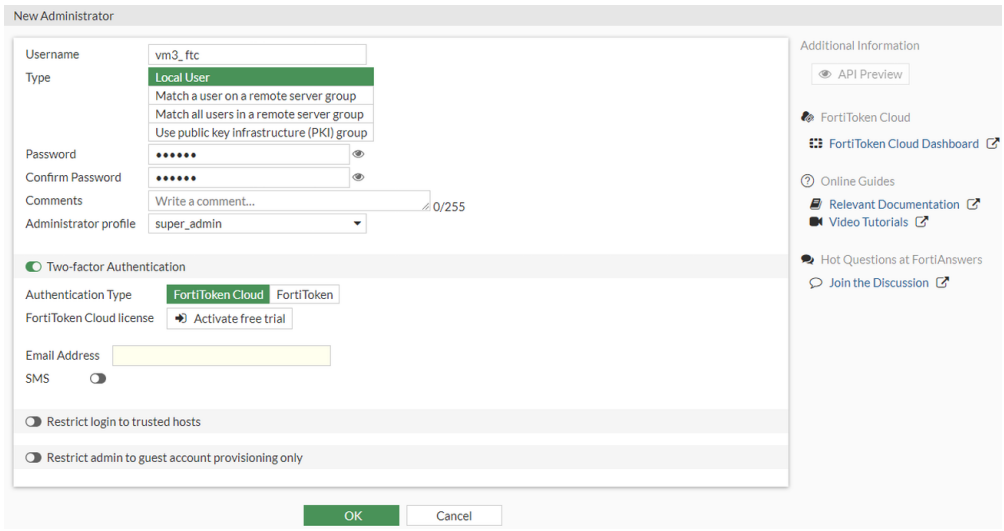


After activation, license information will be displayed and a *Usage* field will display how many of the available licenses have been assigned. Detailed usage information can be found using the CLI.

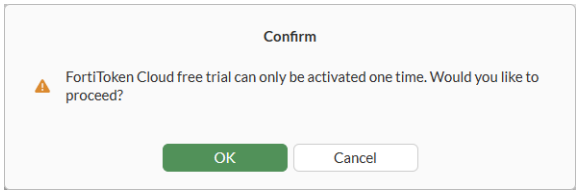


To enable the FortiToken Cloud free trial for an Administrator:

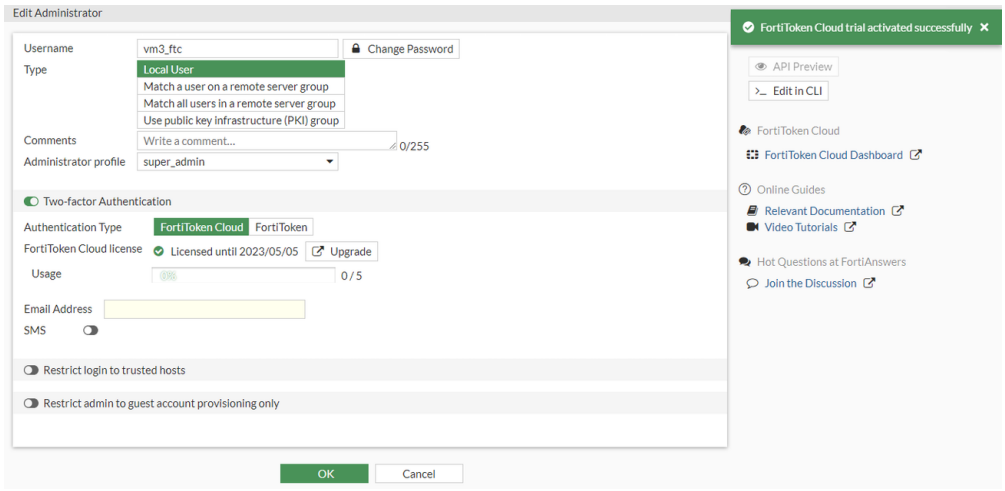
1. Go to *System* > *Administrators*.
2. Click *Create new* > *Administrator*.
3. Enable *Two-factor Authentication*.
4. Set *Authentication Type* to *FortiToken Cloud*.



5. Select *Activate free trial*. A confirmation message is displayed.



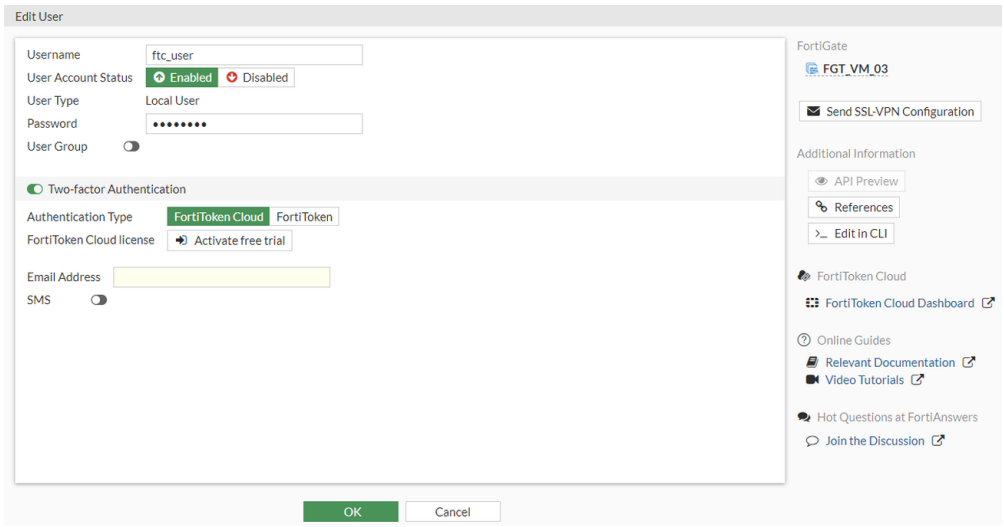
6. Click *OK*. The license information is displayed.



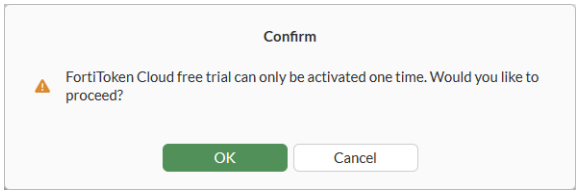
7. Click *OK*.

To enable the FortiToken Cloud free trial for a Local User:

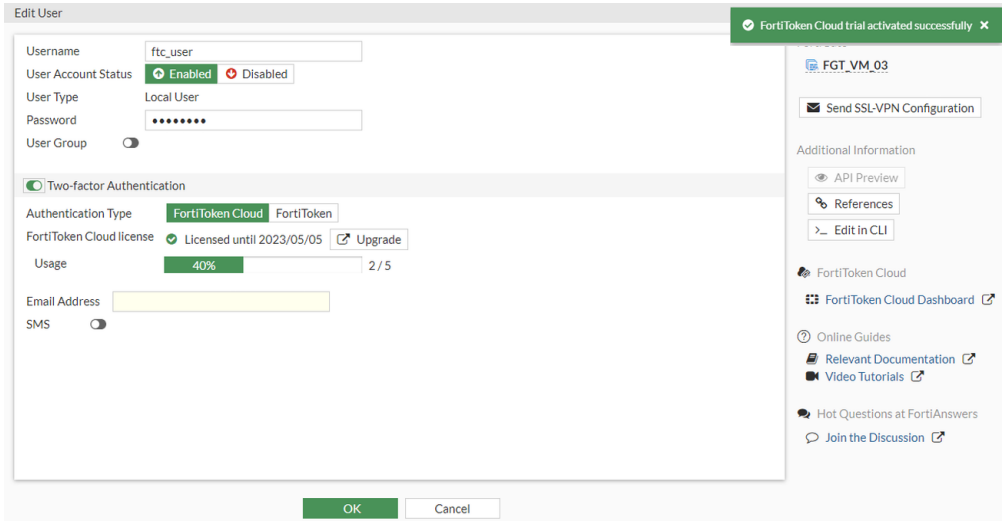
1. Go to *User & Authentication* > *User Definition*.
2. Click *Create new*.
3. Configure settings as needed.
4. Enable *Two-factor Authentication*.
5. Set *Authentication Type* to *FortiToken Cloud*.



6. Select *Activate free trial*. A confirmation message is displayed.



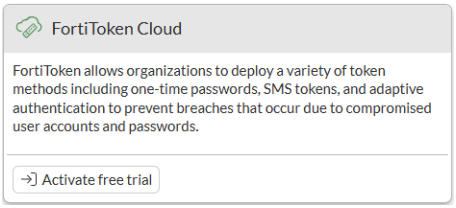
7. Click *OK*. The license information is displayed.



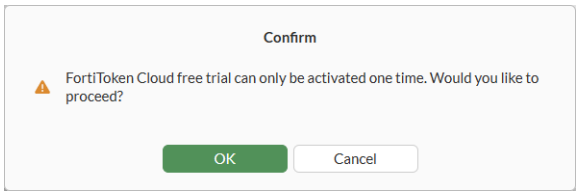
8. Click *OK*.

To enable the FortiToken Cloud free trial for FortiGuard:

1. Go to *System* > *FortiGuard*.
2. In the *Subscriptions* tab, click *Available for purchase* and locate the *FortiToken Cloud* widget.



3. Select *Activate free trial* for *FortiToken Cloud*. A confirmation message is displayed.



4. Click *OK*. The license information is displayed in the *Licensed* content.
5. Click *Apply*.

To enable the FortiToken Cloud free trial in the CLI:

1. Activate the FortiToken Cloud trial:

```
# execute fortitoken-cloud trial
FortiToken Cloud free trial activated!
```

2. Review the status of the free trial:

```
# diagnose fortitoken-cloud show service
FortiToken Cloud service status: free trial.
Service balance: 0.00 users. Expiration date: 2022-07-06. Customer ID: 139XXXX.

# execute fortitoken-cloud show
FortiToken Cloud service status: free trial.
Service balance: 0.00 users. Expiration date: 2022-07-06. Customer ID: 139XXXX.
```

3. View users associated with FortiToken Cloud:

```
# diagnose fortitoken-cloud show users
Number of users in fortitoken cloud: 2
 1: username:vm3_ftc vdom:#FOS_Administrator email:fos@fortinet.com phone:
realm:FGTABCDXXXXXXXXX-#FOS_Administrator userdata:0
 2: username:ftc_user vdom:root email:fos@fortinet.com phone: realm:FGTABCDXXXXXXXXX-root
userdata:0
```

FortiGuard distribution of updated Apple certificates for push notifications

Push notifications for iPhone (for the purpose of two-factor authentication) require a TLS server certificate to authenticate to Apple. As this certificate is only valid for one year, a service extension allows FortiGuard to distribute updated TLS server certificates to FortiGate when needed.

FortiGuard update service updates local Apple push notification TLS server certificates when the local certificate is expired. FortiGuard update service also reinstalls certificates when the certificates are lost.

You can verify that the feature is working on the FortiGate by using the CLI shell.

To verify certificate updates:

1. Using FortiOS CLI shell, verify that all certificates are installed:

```
/data/etc/apns # ls -al
drwxr-xr-x    2 0        0       Tue Jan 15 08:42:39 2019         1024 .
drwxr-xr-x   12 0        0       Tue Jan 15 08:45:00 2019         2048 ..
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019         2377 apn-dev-cert.pem
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019         1859 apn-dev-key.pem
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019         8964 apn-dis-cert.pem
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019         4482 apn-dis-key.pem
```

2. Rename all current Apple certificates.
   Apple push notification no longer works after you rename the certificates.

```
/data/etc/apns # mv apn-dis-cert.pem apn-dis-cert.pem.save
/data/etc/apns # mv apn-dev-key.pem apn-dev-key.pem.save
/data/etc/apns # mv apn-dev-cert.pem apn-dev-cert.pem.save
/data/etc/apns # mv apn-dis-key.pem apn-dis-key.pem.save
/data/etc/apns # ls -al
drwxr-xr-x   2 0  0   Tue Jan 15 08:51:15 2019   1024 .
drwxr-xr-x  12 0  0   Tue Jan 15 08:45:00 2019   2048 ..
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   2377 apn-dev-cert.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   1859 apn-dev-key.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   8964 apn-dis-cert.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   4482 apn-dis-key.pem.save
```

3. Run a FortiGuard update, and verify that all certificates are installed again:

```
/data/etc/apns # ls -al
drwxr-xr-x   2 0  0   Tue Jan 15 08:56:20 2019   1024 .
drwxr-xr-x  12 0  0   Tue Jan 15 08:56:15 2019   2048 ..
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   2377 apn-dev-cert.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   1859 apn-dev-key.pem.save
-rw-r--r--   1 0  0   Tue Jan 15 08:56:20 2019   2167 apn-dis-cert.pem  <-- downloaded from
FortiGuard
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   8964 apn-dis-cert.pem.save
-rw-r--r--   1 0  0   Tue Jan 15 08:56:20 2019   1704 apn-dis-key.pem   <-- downloaded from
FortiGuard
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   4482 apn-dis-key.pem.save
-rw-r--r--   1 0  0   Tue Jan 15 08:56:20 2019     41 apn-version.dat   <-- downloaded from
FortiGuard
/data/etc/apns #
```

Troubleshooting and diagnosis

This section contains some common scenarios for FortiTokens troubleshooting and diagnosis:

- FortiToken Statuses on page 3148
- Recovering trial FortiTokens on page 3149
- Recovering lost Administrator FortiTokens on page 3149
- SSL VPN with multi-factor authentication expiry timers on page 3150

FortiToken Statuses

When troubleshooting FortiToken issues, it is important to understand different FortiToken statuses. FortiToken status may be retrieved either from the CLI or the GUI, with a slightly different naming convention.

Before you begin, verify that the FortiGate has Internet connectivity and is also connected to both the FortiGuard and registration servers:

```
# execute ping fds1.fortinet.com
# execute ping directregistration.fortinet.com
# execute ping globalftm.fortinet.net
```

The `globalftm.fortinet.net` server is the Fortinet Anycast server added in FortiOS 6.4.2.

If there are connectivity issues, retrieving FortiToken statuses or performing FortiToken activation could fail. Therefore, troubleshoot connectivity issues before continuing.

To retrieve FortiToken statuses:

- In the CLI:
  `# diagnose fortitoken info`
- In the GUI:
  Go to *User & Authentication* > *FortiTokens*.

Various FortiToken statuses in either the CLI or the GUI may be described as follows:

CLI	GUI	Description
`new`	*Available*	Newly added, not pending, not activated, not yet assigned.
`active`	*Assigned*	Assigned to a user, hardware token.
`provisioning`	*Pending*	Assigned to a user and waiting for activation on the FortiToken Mobile app.
`provisioned`	*Assigned*	Assigned to user and activated on the FortiToken Mobile app.
`provision timeout`		Token provided to user but not activated on the FortiToken Mobile app. To fix, the token needs to be re-provisioned and activated in time.

CLI	GUI	Description
`token already activated, and seed won't be returned`	*Error*	Token is locked by FortiGuard FDS. The hardware token was already activated on another device and locked by FDS.
`locked`		Either manually locked by an Administrator (`set status lock`), or locked automatically, for example, when the token is unassigned and the FortiCare FTM provisioning server was unreachable to process that change.

Recovering trial FortiTokens

You can recover trial FortiTokens if deleted from a FortiGate, or if stuck in a state where it is not possible to provision to a user.

When a token is stuck in an unusual state or with errors, delete the FortiTokens from the unit and proceed to recover trial FortiTokens.

To recover trial tokens via the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Click the *Import Free Trial Tokens* button at the top. The two free trial tokens are recovered.

To recover trial tokens via the CLI:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
```

- Before attempting to recover the trial tokens, both the tokens should be deleted from the unit first.
- If VDOMs are enabled, trial tokens are in the management VDOM (`root` by default).

Following error codes might come up in the CLI:

- If the device is not registered:
  ```
  # execute fortitoken-mobile import 0000-0000-0000-0000-0000
  import fortitoken license error: -7571
  ```
- If the serial number format is incorrect:
  ```
  # execute fortitoken-mobile import 0000-0000-0000-0000-00
  import fortitoken license error: -7566
  ```

Recovering lost Administrator FortiTokens

If an Administrator loses their FortiToken or the FortiToken is not working, they will not be able to log into the admin console through the GUI or the CLI. If there is another Administrator that can log into the device, they may be able to reset the two-factor settings configured for the first Administrator, or create a new Admin user for them. Note that a *super_admin* user will be able to edit other admin user settings, but a *prof_admin* user will not be able to edit *super_admin* settings.

In the case where there are no other administrators configured, the only option is to flash format the device and reload a backup config file. You must have console access to the device in order to format and flash the device. It is recommended to be physically on site to perform this operation.

Before formatting the device, verify that you have a backup config file. You may or may not have the latest config file backed up, though you should consider using a backed up config file, and reconfigure the rest of the recent changes manually. Otherwise, you may need to configure your device starting from the default factory settings.

To recover lost Administrator FortiTokens:

1. If you have a backed up config file:
   a. Open the config file and search for the specific admin user. For representational purposes we will use `Test` in our example.
   ```
   # edit "Test"
      set accprofile "super_admin"
      set vdom "root"
      set two-factor fortitoken
      set fortitoken "FTKXXXXXXXXXX"
      set email-to "admin@email.com"
      set password *********
      next
   end
   ```
   b. Once you find the settings for the `Test` user, delete the `fortitoken`-related settings:
   ```
   # edit "Test"
      set accprofile "super_admin"
      set vdom "root"
      set password *********
      next
   end
   ```
2. Format the boot device during a maintenance window and reload the firmware image using instructions in the Formatting and loading FortiGate firmware image using TFTP KB article.
3. Once the reload is complete, log into the admin console from the GUI using the default admin user credentials, and go to *Configuration* > *Restore* from the top right corner to reload your config file created in Step 1 above.
4. Once the FortiGate reboots and your configuration is restored, you can log in with your admin user credentials.

SSL VPN with multi-factor authentication expiry timers

When SSL VPN is configured with multi-factor authentication (MFA), sometimes you may require a longer token expiry time than the default 60 seconds.

To configure token expiry timers using the CLI:

```
config system global
    set two-factor-ftk-expiry <number of seconds>
    set two-factor-ftm-expiry <number of seconds>
    set two-factor-sms-expiry <number of seconds>
    set two-factor-fac-expiry <number of seconds>
```

```
    set two-factor-email-expiry <number of seconds>
end
```

These timers apply to the tokens themselves and remain valid for as long as configured above. However, SSL VPN does not necessarily accept tokens for the entire duration they are valid. To ensure SSLVPN accepts the token for longer durations, you need to configure the remote authentication timeout setting accordingly.

To configure the remote authentication timeout:

```
config system global
    set remoteauthtimeout <1-300 seconds>
end
```

SSL VPN waits for a maximum of five minutes for a valid token code to be provided before closing down the connection, even if the token code is valid for longer.

The `remoteauthtimout` setting shows how long SSL VPN waits not only for a valid token to be provided before closing down the connection, but also for other remote authentication like LDAP, RADIUS, and so on.

PKI

The following topics include information about public key infrastructure (PKI):

- Configuring a PKI user on page 3151
- Using the SAN field for LDAP-integrated certificate authentication on page 3155
- SSL VPN with certificate authentication on page 2853
- SSL VPN with LDAP-integrated certificate authentication on page 2858

Configuring a PKI user

PKI users are users who are identified by a digital certificate they hold. Defining a PKI user in FortiOS specifies:

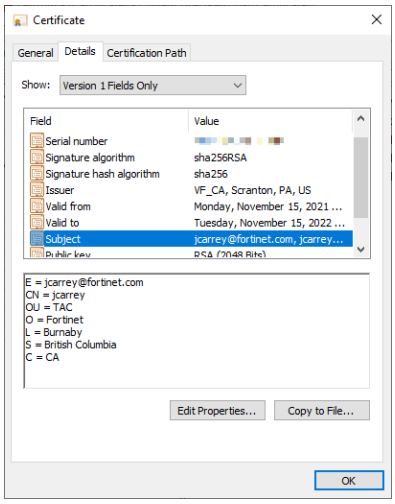
- Which CA certificate to use to validate the user's certificate
- The field and value of the user's certificate that FortiOS will check to verify a user

These peer users can then be used in a FortiGate user group, or as a peer certificate group used for IPsec VPN configurations that accept RSA certificate authentication.

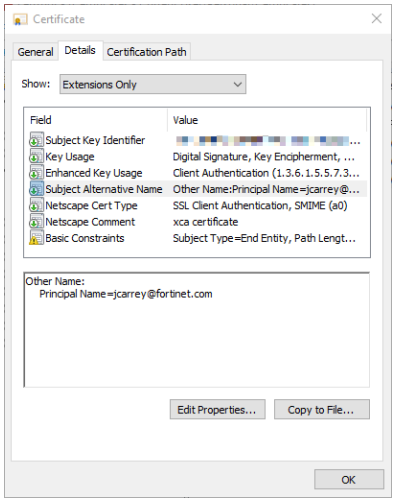
Example X.509 certificate

The following certificate demonstrates which FortiGate settings can be used to match on different fields.

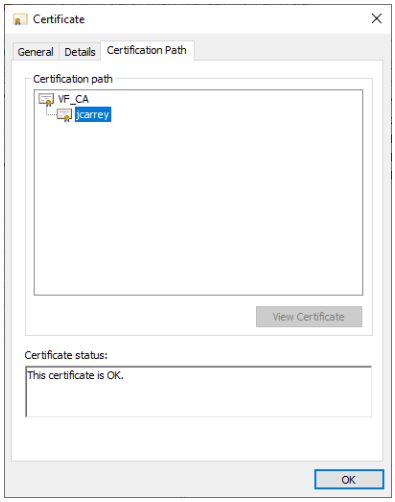
Subject:



Subject Alternative Name:



Certification path:



To configure a PKI user:

```
config user peer
    edit <name>
        set ca <string>
        set mandatory-ca-verify {enable | disable}
        set subject <string>
        set cn <string>
        set cn-type {string | email | FQDN | ipv4 | ipv6}
        set mfa-server <string>
        set mfa-username <string>
        set mfa-password <string>
        set mfa-mode {none | password | subject-identity}
    next
end
```

`ca <string>`	Specify which certificate on the FortiGate is used to validate the client's certificate. This can be any CA in the client's certificate chain. You may need to upload a CA certificate to the FortiGate specifically to identify PKI peer users (see CA certificate on page 3609).
`mandatory-ca-verify {enable | disable}`	Control the action if the CA certificate used to sign the client's certificate is not installed on the FortiGate (default = enable). Disabling this setting makes the FortiGate consider any certificate presented by the peer as valid. In the example certificate, the certification path shows that VF_CA signed jcarrey's certificate.
`subject <string>`	Enter the peer certificate name constraints.
`cn <string>`	Enter the peer certificate common name.
`cn-type {string | email | FQDN | ipv4 | ipv6}`	Set the peer certificate common name type: string, email, FQDN, IPv4 address, or IPv6 address. See CN on page 3154 for more details.
`mfa-server <string>`	Enter the name of a multi-factor authentication server defined under `config user ldap` for performing client access rights checks. See LDAP servers on page 3014 for more details.
`mfa-mode {none | password | subject-identity}`	Set the mode for remote peer authentication, either by password or subject identity extracted from certificate. See LDAP on page 3155 for more details.
`mfa-username <string>`	Enter the username for the remote multi-factor authentication server bind when the MFA mode is password.
`mfa-password <string>`	Enter the password for the multi-factor authentication server bind when the MFA mode is password.

Identifying users based on their client certificate

When the client's certificate is valid, or `mandatory-ca-verify` is disabled, the FortiGate can then inspect the certificate to check specific fields for matching values. There are three ways of specifying which certificate field to verify: by subject, CN, or LDAP. All string comparisons are case sensitive.

Subject

This basic method verifies that the subject string defined in the PKI user setting matches a value or substring in the subject field of the user certificate. Further matching is controlled in the following VPN certificate settings.

```
config vpn certificate setting
    set subject-match {substring | value}
    set subject-set {superset | subset}
    set cn-match {substring | value}
    set cn-allow-multi {enable | disable}
end
```

`subject-match {substring | value}`	Control how to do relative distinguished name (RDN) value matching with the certificate subject name: • substring: find a match if any string in the certificate subject name matches the name being searched for (such as `set subject jcarrey`). • value: find a match if any attribute value string in a certificate subject name is an exact match with the name being searched for (such as `set subject "OU=TAC"` or `set subject "C=CA, CN=jcarrey, OU=TAC"`).
`set subject-set {superset | subset}`	Control how to do RDN value matching with the certificate subject name: • superset: a certificate only passes verification if it contains all the RDNs defined in the subject settings (such as `set subject "E = jcarrey@fortinet.com, CN = jcarrey, OU = TAC, O = Fortinet, L = Burnaby, S = British Columbia, C = CA"`). • subset: a certificate passes verification if the RDN is a subset of the certificate subject (such as `set subject "CN = jcarrey, OU = TAC"`).
`cn-match {substring | value}`	Control how to do CN value matching with the certificate subject name: • substring: find a match if any string in the certificate subject name matches the name being searched for. • value: find a match if any attribute value string in a certificate subject name is an exact match with the name being searched for.
`cn-allow-multi {enable | disable}`	Enable/disable allowing multiple CN entries with the certificate subject name (default = enable).

CN

Common name (CN) certificate verification compares the CN in the subject field with the configured string (such as `set cn "jcarrey"`. The following logic is used when configuring different CN types:

Type	Action
`string`	Based on the `cn-match` setting, perform a substring or exact match in the certificate subject.
`email`	Look for a match in the certificate subject.
`FQDN`	Look for a match in the certificate subject, then compare the mapped IP and client IP. The FQDN is only retrieved from the CN.

Type	Action
ipv4	Look for a match in the certificate subject, then compare the IP.
ipv6	Look for a match in the certificate subject, then compare the IP.

The CN type also controls the format checking of the CN string. In this example, if the CN type is set to email, the CN must be in email format (`set cn "jcarrey@fortinet.com"`).

LDAP

LDAP-integrated user authentication allows the FortiGate to check the connecting user against an LDAP server in two ways: through a username and password, or the certificate's principal name. The `password` method requires the username and password of each authenticating user to be entered, so it is not recommended when configuring PKI users. The `subject-identity` method is recommended.

The UPN in the user certificate's Subject Alternative Name (SAN) field is used to look up the user in the LDAP directory. The SAN in the certificate for UPN matching can the UPN on the AD LDAP server (default), RFC 822 Name (corporate email address), or DNS name. If a match is found, then authentication succeeds. This type of configuration scales well since only one PKI user needs to be created on the FortiGate. Connecting clients use their unique user certificate to match within the configured LDAP server. See Using the SAN field for LDAP-integrated certificate authentication on page 3155 for an example.

Using the SAN field for LDAP-integrated certificate authentication

Certificate-based authentication against Active Directory LDAP (AD LDAP) supports the UserPrincipalName (UPN), RFC822 Name (corporate email address) defined in the Subject Alternative Name (SAN) extension of the certificate, the DNS defined in the user certificate as the unique identifier in the SAN field for peer user certificates, and the Subject Common Name (CN) defined in the certificate.

```
config user ldap
    edit <name>
        set account-key-cert-field {othername | rfc822name | dnsname | cn}
    next
end
```

`account-key-cert-field {othername | rfc822name | dnsname | cn}`	Define subject identity field in certificate for user access right checking: • `othername`: match to UPN in SAN (default). • `rfc822name`: match to RFC822 email address in SAN. • `dnsname`: match to DNS name in SAN. • `cn`: match to CN in subject.

The LDAP server configurations are applied to the user peer configuration when the PKI user is configured.

```
config user peer
    edit <name>
        set ca <string>
```

```
        set cn <string>
        set mfa-server <string>
        set mfa-mode subject-identity
    next
end
```

When a user authenticates to the FortiGate for an administrative log in, SSL VPN, IPsec dialup, or firewall authentication using a user certificate, it presents a signed certificate issued by a trusted CA to the FortiGate. The following sequence of events occurs as the FortiGate processes the certificate for authentication:

1. The FortiGate verifies if the certificate is issued by a trusted CA. If the CA is not a public CA, ensure that the CA certificate is uploaded and trusted by the FortiGate, and is applied to the user peer configurations (`set ca <string>`).
2. The FortiGate verifies that the CN field of the certificate matches the CN specified in the user peer configurations (`set cn <string>`).
3. If the `user peer` configuration has `mfa-server` configured and the `mfa-mode` is set to `subject-identity`, the FortiGate uses the unique identifier in the certificate to authenticate against the LDAP server.
   - If `set account-key-cert-field othername` is configured (the default setting), the FortiGate uses the UPN in the certificate's SAN field to authenticate against LDAP.
   - If `set account-key-cert-field rfc822name` is configured, the FortiGate uses the RFC822 Name in the certificate's SAN field to authenticate against LDAP.
   - If `set account-key-cert-field dnsname` is configured, the FortiGate uses the DNS name in the certificate's SAN field to authenticate against LDAP.
   - If `account-key-cert-field` is set to `cn`, then the FortiGate uses the CN in the certificate's subject to authenticate against LDAP.
4. By default, the FortiGate tries to match the UPN attribute on the AD LDAP. If this needs to be changed to another field, configure the `account-key-filter` setting on the LDAP configuration:

```
config user ldap
    edit <name>
        set account-key-filter <string>
    next
end
```

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

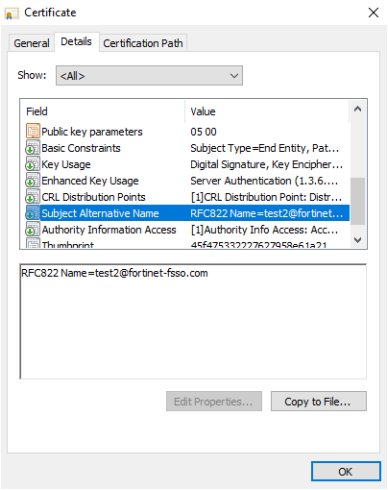
- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 3014 and Configuring client certificate authentication on the LDAP server on page 3029.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 3022.

Example

In this example, a user certificate is issued by a customer's CA to a user. The user uses this certificate to authenticate to the SSL VPN web portal. The administrator decides to use the RFC822 Name in the SAN field to

authenticate against their corporate AD LDAP. The Active Directory attribute to check against the RFC822 Name field is the mail attribute.

User certificate information:



The configuration used in this example assumes the following:

- The CA certificate has already been uploaded to the FortiGate.
- The SSL VPN configurations have already been configured, pending the assignment of the PKI user group.

To configure the authentication settings:

1. Configure the LDAP server:

```
config user ldap
    edit "ad-ldap-peer-user"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password ENC XXXXXXXXXXXXXXXX
        set password-renewal enable
        set account-key-cert-field rfc822name
        set account-key-filter "(&(mail=%s)(!(UserAccountControl:1.2.840.113556.1.4.803:=2)))"
    next
end
```

   By default, the `account-key-filter` filters on the UPN attribute uses the following string: (&(**userPrincipalName=%s**)(!(UserAccountControl:1.2.840.113556.1.4.803:=2))).
   - (userPrincipalName=%s) matches the UPN attribute on the AD LDAP.
   - (!(UserAccountControl:1.2.840.113556.1.4.803:=2)) filters out inactive and locked AD accounts.
2. Configure the local peer user:

```
config user peer
    edit "peer-RFC822-name"
        set ca "CA_Cert_2"
```

```
        set cn "test2"
        set mfa-server "ad-ldap-peer-user"
        set mfa-mode subject-identity
    next
end
```

3. Configure the firewall user group for SSL VPN authentication:

```
config user group
    edit "vpn-group"
        set member "peer-RFC822-name"
    next
end
```

4. Apply the user group to the SSL VPN configuration and firewall policy.

Verification

When the SSL VPN user authenticates in a browser, the FortiOS fnbamd daemon first validates the certificate supplied by the user. If the certificate check is successful, the information in the SAN field of the user certificate is used to find a matching user record on the AD LDAP.

To verify the configuration:

```
# diagnose debug app fnbamd -1
# diagnose debug enable
```

The output includes the following information.

- Validate the certificate:

```
...
    __check_crl-***CERTIFICATE IS GOOD***
[567] fnbamd_cert_verify-Issuer found: CA_Cert_2 (SSL_DPI opt 1)
[500] fnbamd_cert_verify-Following cert chain depth 1
[675] fnbamd_cert_check_group_list-checking group with name 'vpn-group'
[490] __check_add_peer-check 'peer-RFC822-name'
[366] peer_subject_cn_check-Cert subject 'C = CA, ST = BC, L = Burnaby, CN = test2'
[294] __RDN_match-Checking 'CN' val 'test2' -- match.
[404] peer_subject_cn_check-CN is good.
```

- Bind to LDAP and try to match the content of the SAN in the user certificate with the user record in the AD LDAP:

```
...
_cert_ldap_query-LDAP query, idx 0
[448] __cert_ldap_query-UPN = 'test2@fortinet-fsso.com'
[1717] fnbamd_ldap_init-search filter is: (&(mail=test2@fortinet-fsso.com)(!
(UserAccountControl:1.2.840.113556.1.4.803:=2)))
```

- Confirm the successful match:

```
...
     __cert_ldap_query_cb-LDAP ret=0, server='ad-ldap-peer-user', req_id=269178889
[388] __cert_ldap_query_cb-Matched peer 'peer-RFC822-name'
...
[1066] fnbamd_cert_auth_copy_cert_status-req_id=269178889
[1074] fnbamd_cert_auth_copy_cert_status-Matched peer user 'peer-RFC822-name'
[833] fnbamd_cert_check_matched_groups-checking group with name 'vpn-group'
[895] fnbamd_cert_check_matched_groups-matched
[1193] fnbamd_cert_auth_copy_cert_status-Cert st 290, req_id=269178889
[209] fnbamd_comm_send_result-Sending result 0 (nid 672) for req 269178889, len=2155
```

FSSO

FortiOS can provide single sign-on capabilities to Windows AD, Citrix, VMware Horizon, Novell eDirectory, and Microsoft Exchange users with the help of agent software installed on these networks. The agent software sends information about user logons to the FortiGate unit. With user information such as IP address and user group memberships from the network, FortiGate security policies can allow authenticated network access to users who belong to the appropriate user groups without requesting their credentials again.

Fortinet Single Sign-On (FSSO), through agents installed on the network, monitors user logons and passes that information to the FortiGate unit. When a user logs on at a workstation in a monitored domain, FSSO:

- Detects the logon event and records the workstation name, domain, and user,
- Resolves the workstation name to an IP address,
- Determines which user groups the user belongs to,
- Sends the user logon information, including IP address and groups list, to the FortiGate unit, and
- Creates one or more log entries on the FortiGate unit for this logon event as appropriate.

When the user tries to access network resources, the FortiGate unit selects the appropriate security policy for the destination. If the user belongs to one of the permitted user groups associated with that policy then the connection is allowed, otherwise the connection is denied.

Agent-based FSSO

Several different FSSO agents can be used in an FSSO implementation:

- Domain Controller (DC) agent
- eDirectory agent
- Citrix/Terminal Server (TS) agent
- Collector Agent

Consult the latest FortiOS Release Notes for operating system compatibility information.

Domain Controller agent

The Domain Controller (DC) agent must be installed on every domain controller when you use DC Agent mode. The DC agents monitor user logon events and pass the information to the Collector agent, which stores the

information and sends it to the FortiGate unit.

eDirectory agent

The eDirectory agent is installed on a Novell network to monitor user logons and send the required information to the FortiGate unit. It functions much like the Collector agent on a Windows AD domain controller. The agent can obtain information from the Novell eDirectory using either the Novell API or LDAP.

Terminal Server agent

The Terminal Server (TS) agent can be installed on a Citrix, VMware Horizon 7.4, or Windows Terminal Server to monitor user logons in real time. It functions much like the DC Agent on a Windows AD domain controller.

Collector agent

The Collector Agent (CA) is installed as a service on a server in the Windows AD network to monitor user logons and send the required information to the FortiGate unit. The Collector agent can collect information from a DC agent (Windows AD) and TS agent (Citrix or VMware Horizon Terminal Server).

In a Windows AD network, the Collector agent can optionally obtain logon information by polling the AD domain controllers. In this case, DC agents are not needed.

The CA is responsible for DNS lookups, group verification, workstation checks, and updating FortiGates on logon records. The FSSO CA sends Domain Local Security Group and Global Security Group information to FortiGate units. The CA communicates with the FortiGate over TCP port 8000 and it listens on UDP port 8002 for updates from the DC agents.

The FortiGate device can have up to five CAs configured for redundancy. If the first CA on the list is unreachable, the next is attempted, and so on down the list until one is contacted.

All DC agents must point to the correct CA port number and IP address on domains with multiple DCs.

A FortiAuthenticator device can act much like a CA, collecting Windows AD user logon information and sending it to the FortiGate device. It is particularly useful in large installations with several FortiGate units. For more information, see the FortiAuthenticator Administration Guide.

Agentless FSSO

For Windows AD networks, FortiGate devices can also provide SSO capability by directly polling Windows Security Event log entries on Windows DC for user log in information. This configuration does not require a CA or DC agent.

FortiGate configuration

To configure FSSO on a FortiGate, go to *Security Fabric > External Connectors*.

When creating a new connector, several options for connectors are available under Endpoint/Identity:

- Fortinet single sign-on agent on page 4052

  For most FSSO Agent-based deployments, this connector option will be used. Specify either Collector Agent or Local as User Group Source to collect user groups from the Collector Agent, or to match users to user groups from a LDAP server.
- Poll Active Directory server on page 4053

  This connection option directly polls Windows Security Event log entries on Windows DC for user log in information.
- RADIUS single sign-on agent on page 4061

  FortiGate can authenticate users who have authenticated on a remote RADIUS server by monitoring the RADIUS accounting records forwarded by the RADIUS server to the FortiGate.
- Exchange Server connector on page 4065

  FortiGate collects information about authenticated users from corporate Microsoft Exchange Servers.
- Symantec endpoint connector on page 4054

  This connector uses client IP information from Symantec Endpoint Protection Manager (SEPM) to assign dynamic IP addresses on FortiOS.

  Since FSSO is commonly associated with Agent-based FSSO and Agentless FSSO, this chapter will primarily focus on the first two Security Fabric External Connector options.

FSSO polling connector agent installation

This topic gives an example of configuring a local FSSO agent on the FortiGate. The agent actively polls Windows Security Event log entries on Windows Domain Controller (DC) for user login information. The FSSO user groups can then be used in a firewall policy.

This method does not require any additional software components, and all the configuration can be done on the FortiGate.

To configure a local FSSO agent on the FortiGate:

1. Configure an LDAP server on the FortiGate on page 3161
2. Configure a local FSSO polling connector on page 3161
3. Add the FSSO groups to a policy on page 3162

Configure an LDAP server on the FortiGate

Refer to Configuring an LDAP server on page 3014. The connection must be successful before configuring the FSSO polling connector.

Configure a local FSSO polling connector

To configure a local FSSO polling connector:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Endpoint/Identity* section, select *Poll Active Directory Server*.

3. Fill in the required information.
4. For *LDAP Server*, select the server you just created.
5. Configure the group settings:
   a. For *Users/Groups*, click *Edit*. The structure of the LDAP tree is shown in the *Users/Groups* window.
   b. Click the *Groups* tab.
   c. Select the required groups, right-click on them, and select *Add Selected*. Multiple groups can be selected at one time by holding the CTRL or SHIFT keys. The groups list can be filtered or searched to limit the number of groups that are displayed.
   d. Click the *Selected* tab and verify that the required groups are listed. To remove a group, right-click and select *Remove Selected*.
   e. Click *OK* to save the group settings.
6. Click *OK* to save the connector settings.
7. Go back to *Security Fabric* > *External Connectors*.
8. There should be two new connectors:

   - The *Local FSSO Agent* is the backend process that is automatically created when the first FSSO polling connector is created.
   - The *Active Directory Connector* is the front end connector that can be configured by FortiGate administrators.

   To verify the configuration, hover the cursor over the top right corner of the connector; a popup window will show the currently selected groups. A successful connection is also shown by a green up arrow in the lower right corner of the connector.

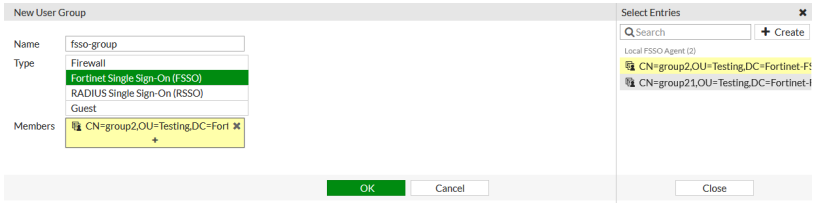
   If you need to get log in information from multiple DCs, then you must configure other Active Directory connectors for each additional DC to be monitored.

Add the FSSO groups to a policy

FSSO groups can be used in a policy by either adding them to the policy directly, or by adding them to a local user group and then adding the group to a policy.

To add the FSSO groups to a local user group:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Enter a name for the group in the *Name* field.
3. Set the *Type* to *Fortinet Single Sign-On (FSSO)*.
4. In the *Members* field, click the + and add the FSSO groups.



5. Click *OK*.
6. Add the local FSSO group to a policy.

To add the FSSO groups directly to a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. In the *Source* field, click the *+*. In the *Select Entries* pane, select the *User* tab.
3. Select the FSSO groups.
4. Configure the remaining settings as required.
5. Click *OK*.

Troubleshooting

If an authenticated AD user cannot access the internet or pass the firewall policy, verify the local FSSO user list:

```
# diagnose debug authd fsso list
----FSSO logons----
IP: 10.1.100.188 User: test2 Groups: CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM Workstation:
MemberOf: CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM
Total number of logons listed: 1, filtered: 0
----end of FSSO logons----
```

1. Check that the group in *MemberOf* is allowed by the policy.
2. If the expected AD user is not in list, but other users are, it means that either:
   - The FortiGate missed the log in event, which can happen if many users log in at the same time, or
   - The user's workstation is unable to connect to the DC, and is currently logged in with cached credentials, so there is no entry in the DC security event log.
3. If there are no users in the local FSSO user list:
   a. Ensure that the local FSSO agent is working correctly:

      ```
      # diagnose debug enable
      # diagnose debug authd fsso server-status

      Server Name                         Connection Status    Version            Address
      -----------                         -----------------    -------            -------
      FGT_A (vdom1) # Local FSSO Agent    connected            FSAE server 1.1    127.0.0.1
      ```

      The connection status must be `connected`.

   b. Verify the Active Directory connection status:

      ```
      # diagnose debug fsso-polling detail 1
      AD Server Status (connected):
      ID=1, name(10.1.100.131),ip=10.1.100.131,source(security),users(0)
      port=auto username=Administrator
      read log eof=1, latest logon timestamp: Fri Jul 26 10:36:20 2019

      polling frequency: every 10 second(s) success(274), fail(0)
      ```

```
LDAP query: success(0), fail(0)
LDAP max group query period(seconds): 0
LDAP status: connected

Group Filter: CN=group2,OU=Testing,DC=Fortinet-
FSSO,DC=com+CN=group21,OU=Testing,DC=Fortinet-FSSO,DC=COM
```

If the polling frequency shows successes and failures, that indicates sporadic network problems or a very busy DC. If it indicates no successes or failures, then incorrect credentials could be the issue.

If the LDAP status is connected, then the FortiGate can access the configured LDAP server. This is required for AD group membership lookup of authenticated users because the Windows Security Event log does not include group membership information. The FortiGate sends an LDAP search for group membership of authenticated users to the configure LDAP server.

FortiGate adds authenticated users to the local FSSO user list only if the group membership is one of the groups in `Group Filter`.

4. If necessary, capture the output of the local FortiGate daemon that polls Windows Security Event logs:

```
# diagnose debug application fssod -1
```

This output contains a lot of detailed information which can be captured to a text file.

Limitations

- NTLM based authentication is not supported.
- If there are a large number of user log ins at the same time, the FSSO daemon may miss some. Consider using FSSO agent mode if this will be an issue. See Public and private SDN connectors on page 3981 for information.
- The FSSO daemon does not support all of the security log events that are supported by other FSSO scenarios. For example, only Kerberos log in events 4768 and 4769 are supported.

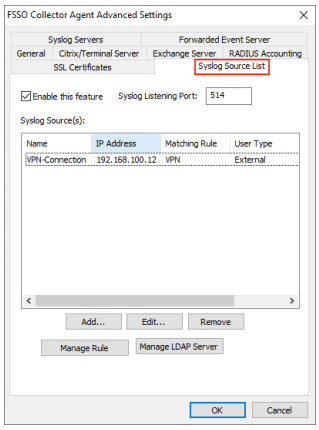
FSSO using Syslog as source

This example describes how to configure Fortinet Single Sign-On (FSSO) agent on Windows using syslog as the source and a custom syslog matching rule.

The FSSO collector agent must be build 0291 or later, and in advanced mode (see How to switch FSSO operation mode from Standard Mode to Advanced Mode).

To configure the FSSO agent on Windows:

1. Open the FSSO agent on Windows.
2. Click *Advanced Settings*.
3. Go to the *Syslog Source List* tab.
4. Select *Enable this feature*.
5. Set *Syslog Listening Port*, or use the default port.

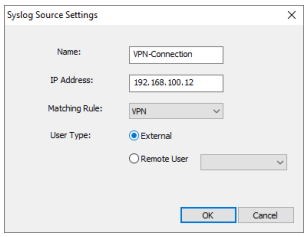


6. Click *Manage Rule*.
7. Create a new syslog rule:
   a. Click *Add*.
   b. Configure the rule:

Trigger	*722051*
Logon	*assigned to session*
Username Field	*User <{{:username}}>*
Client IPv4 Field	*IPv4 Address <{{:client_ip}}>*
Client IPv6 Field	*IPv6 Address <{{:client_ipv6}}>*
Group Field	*Group <{{:group}}>*
Groups List Separator	,

   c. To test the rule, enter a sample log line, then click *Test*.
   d. Click *OK*.
8. Create a new syslog source:
   a. On the *Advanced Settings* window, click *Add*.
   b. Configure the source:

Name	*VPN-Connection*
IP Address	*192.168.100.12*
Matching Rule	*VPN*
User Type	*External*: Users are not defined on the CA and user groups come from the source. *Remote User*: Users are defined on a remote LDAP server and user groups are retrieved from the specified LDAP server. Any group from the syslog messages are ignored. See Connect to a remote LDAP server on page 3166.



c. Click *OK*.

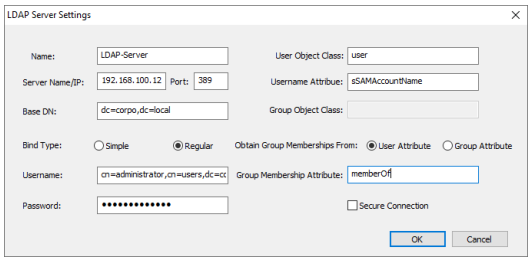
9. Click *OK*.

Connect to a remote LDAP server

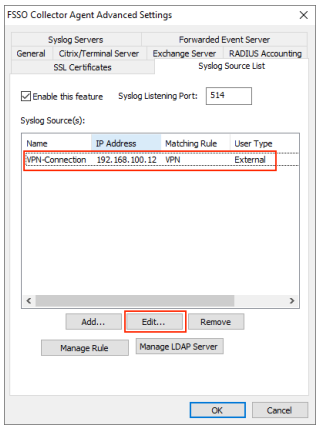
This section describes how to connect to a remote LDAP server to match the user identity from the syslog server with an LDAP server.

To connect to a remote LDAP server:

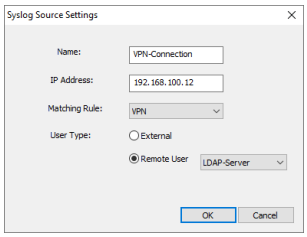
1. Open the FSSO agent on Windows.
2. Click *Advanced Settings*.
3. Go to the *Syslog Source List* tab.
4. Click *Manage LDAP Server*.
5. Click *Add* and configure the LDAP server settings:



6. Click *OK*.
7. Select the syslog source and click *Edit*.



8. Set *User Type* to *Remote User*, and select the LDAP server from the drop-down list.



9. Click *OK*.

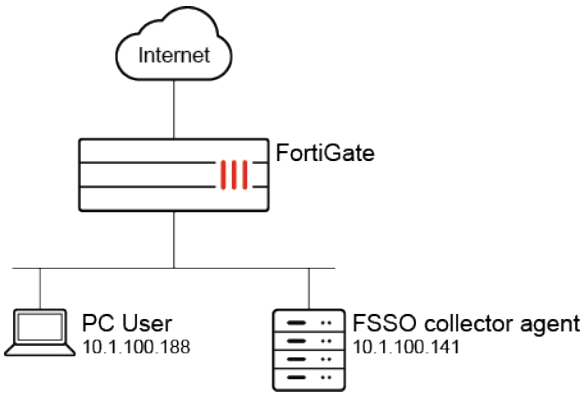
Configuring the FSSO timeout when the collector agent connection fails

The `logon-timeout` option is used to manage how long authenticated FSSO users on the FortiGate will remain on the list of authenticated FSSO users when a network connection to the collector agent is lost.

```
config user fsso
    edit <name>
        set server <string>
        set password <string>
        set logon-timeout <integer>
    next
end
```

`logon-timeout <integer>`	Enter the interval to keep logons after the FSSO server is down, in minutes (1 - 2880, default = 5).

Example



In this example, the logon timeout is set for four minutes.

To configure the FSSO logon timeout:

1. Set the timeout value:

```
config user fsso
    edit "ad"
        set server "10.1.100.141"
        set password ********
        set logon-timeout 4
    next
end
```

2. Log on to a PC with a valid FSSO user account.
3. Enable real-time debugging and check for authd polling collector agent information. During this time, the connection to the collector agent is lost:

```
# diagnose debug enable
# diagnose debug application authd -1
# diagnose debug application fssod -1
021-06-10 16:20:41 authd_timer_run: 2 expired

```

4. After about three minutes, check that the FSSO user is still in the list of authenticated users and can connect to the internet:

```
# diagnose firewall auth l
10.1.100.188, TEST1
        type: fsso, id: 0, duration: 229, idled: 229
        server: ad
        packets: in 0 out 0, bytes: in 0 out 0
        user_id: 16777219
        group_id: 3 33554433
        group_name: ad CN=GROUP1,OU=TESTING,DC=FORTINET-FSSO,DC=COM

----- 1 listed, 0 filtered ------
```

5. After four minutes, check the debugs again. Note that the FSSO users are cleared:

```
...
2021-06-10 16:24:57 authd_timer_run: 3 expired
2021-06-10 16:24:57 authd_epoll_work: timeout 60000

```
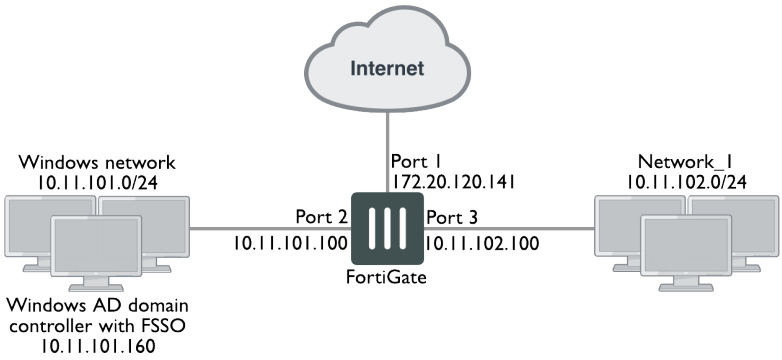
# diagnose firewall auth l

----- 0 listed, 0 filtered ------
```

After the connection to the collector agent is restored, all users remain in the list of authenticated users and are synchronized to the FortiGate. The users do not need to log in again for authentication.

Configuring FSSO firewall authentication

In this example, a Windows network is connected to the FortiGate on port 2, and another LAN, Network_1, is connected on port 3.



All Windows network users authenticate when they log on to their network. Engineering and Sales groups members can access the Internet without reentering their authentication credentials. The example assumes that you have already installed and configured FSSO on the domain controller.

LAN users who belong to the Internet_users group can access the Internet after entering their username and password. The example shows two users: User1, authenticated by a password stored in FortiOS; and User 2, authenticated on an external authentication server. Both users are local users since you create the user accounts in FortiOS.

1. Create a locally authenticated user account
2. Create a RADIUS-authenticated user account
3. Create an FSSO user group
4. Create a firewall user group
5. Define policy addresses
6. Create security policies

Creating a locally authenticated user account

User1 is authenticated by a password stored in FortiOS.

To create a locally authenticated user account in the GUI:

1. Go to *User & Authentication* > *User Definition* and click *Create New*.
2. Configure the following settings:

User Type	Local User
User Name	User1
Password	hardtoguess1@@1
User Account Status	Enabled

3. Click *Submit*.

To create a locally authenticated user account in the CLI:

```
config user local
   edit user1
      set type password
      set passwd hardtoguess1@@1
   next
end
```

Creating a RADIUS-authenticated user account

You must first configure FortiOS to access the external authentication server, then create the user account.

To create a RADIUS-authenticated user account in the GUI:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Configure the following settings:

Name	OurRADIUSsrv
Authentication method	Default
Primary Server	
IP/Name	10.11.101.15
Secret	OurSecret

3. Click *OK*.
4. Go to *User & Authentication* > *User Definition* and click *Create New*.
5. Configure the following settings:

User Type	Remote RADIUS User
User Name	User2
RADIUS Server	OurRADIUSsrv
User Account Status	Enabled

6. Click *Submit*.

To create a RADIUS-authenticated user account in the CLI:

```
   config user radius
   edit OurRADIUSsrv
      set server 10.11.102.15
      set secret OurSecret
      set auth-type auto
   next
end
config user local
   edit User2
      set name User2
      set type radius
      set radius-server OurRADIUSsrv
   next
end
```

Creating an FSSO user group

This example assumes that you have already set up FSSO on the Windows network and that it used advanced mode, meaning that it uses LDAP to access user group information. You must do the following:

- Configure LDAP access to the Windows AD global catalog
- Specify the collector agent that sends user log in information to FortiOS
- Select Windows user groups to monitor
- Select and add the Engineering and Sales groups to an FSSO user group

To create an FSSO user group in the GUI:

1. Configure LDAP for FSSO:
   a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
   b. Configure the following settings:

Name	ADserver
Server Name / IP	10.11.101.160
Distinguished Name	dc=office,dc=example,dc=com
Bind Type	Regular
Username	cn=FSSO_Admin,cn=users,dc=office,dc=example,dc=com
Password	Enter a secure password.

   c. Leave other fields as-is. Click *OK*.
2. Specify the collector agent for FSSO;
   a. Go to *Security Fabric > External Connectors* and click *Create New*.
   b. Under *Endpoint/Identity*, select *FSSO Agent on Windows AD*.
   c. Configure the following settings:

Name	Enter the Windows AD server name. This name appears in the Windows AD server list when you create user groups. In this example, the name is WinGroups.
Server IP/Name	Enter the IP address or name of the server where the agent is installed. The maximum name length is 63 characters. In this example, the IP address is 10.11.101.160.
Password	Enter the password of the server where the agent is installed. You only need to enter a password for the collector agent if you configured the agent to require authenticated access. If the TCP port used for FSSO is not the default, 8000, you can run the `config user fsso` command to change the setting in the CLI.
Collector Agent AD access mode	Advanced
LDAP Server	Select the previously configured LDAP server. In this example, it is ADserver.
User/Groups/Organization Units	Select the users, groups, and OUs to monitor.

   d. Click *OK*.
3. Create the FSSO_Internet_users user group:
   a. Go to *User & Authentication > User Groups* and click *Create New*.
   b. Configure the following settings:

Name	FSSO_Internet_users

Type	Fortinet Single Sign-On (FSSO)
Members	Engineering, Sales

c. Click *OK*.

To create an FSSO user group in the CLI:

```
config user ldap
   edit "ADserver"
      set server "10.11.101.160"
      set dn "cn=users,dc=office,dc=example,dc=com"
      set type regular
      set username "cn=administrator,cn=users,dc=office,dc=example,dc=com"
      set password set_a_secure_password
   next
end
config user fsso
   edit "WinGroups"
      set ldap-server "ADserver"
      set password ********
      set server "10.11.101.160"
   next
end
config user group
   edit FSSO_Internet_users
      set group-type fsso-service
      set member CN=Engineering,cn=users,dc=office,dc=example,dc=com
            CN=Sales,cn=users,dc=office,dc=example,dc=com
   next
end
```

Creating a firewall user group

This example shows a firewall user group with only two users. You can add additional members.

To create a firewall user group in the GUI:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Configure the following settings:

Name	Internet_users
Type	Firewall
Members	User1, User2

3. Click *OK*.

To create a firewall user group in the CLI:

```
config user group
   edit Internet_users
         set group-type firewall
```

```
        set member User1 User2
    next
end
```

Defining policy addresses

To define policy addresses:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create New*.
3. Configure the following settings:

Name	Internal_net
Type	Subnet
IP/Netmask	10.11.102.0/24
Interface	Port 3

4. Click *OK*.
5. Create another new address by repeating steps 2-4 using the following settings:

Name	Windows_net
Type	Subnet
IP/Netmask	10.11.101.0/24
Interface	Port 2

Creating security policies

You must create two security policies: one for the firewall group connecting through port 3, and one for the FSSO group connecting through port 2.

To create security policies using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Configure the following settings:

Incoming Interface	Port2
Source Address	Windows_net
Source User(s)	FSSO_Internet_users
Outgoing Interface	Port1
Destination Address	all

Schedule	always
Service	ALL
NAT	Enabled.
Security Profiles	You can enable security profiles as desired.

4. Click *OK*.
5. Create another new policy by repeating steps 2-4 using the following settings:

Incoming Interface	Port3
Source Address	Internal_net
Source User(s)	Internet_users
Outgoing Interface	Port1
Destination Address	all
Schedule	always
Service	ALL
NAT	Enabled.
Security Profiles	You can enable security profiles as desired.

6. Click *OK*.

To create security policies using the CLI:

```
config firewall policy
    edit 0
        set srcintf port2
        set dstintf port1
        set srcaddr Windows_net
        set dstaddr all
        set action accept
        set groups FSSO_Internet_users
        set schedule always
        set service ANY
        set nat enable
    next
    edit 1
        set srcintf port3
        set dstintf port1
        set srcaddr internal_net
        set dstaddr all
        set action accept
        set schedule always
        set groups Internet_users
        set service ANY
        set nat enable
```

```
    next
end
```

Include usernames in logs

Usernames can be included in logs, instead of just IP addresses. The benefits of doing this include:

- FortiOS monitors and FortiAnalyzer reports display usernames instead of IP addresses, allowing you to quickly determine who the information pertains to. Without the usernames, it is difficult to correlate the IP addresses with specific users.
- User activity can be correlated across multiple IP addresses.

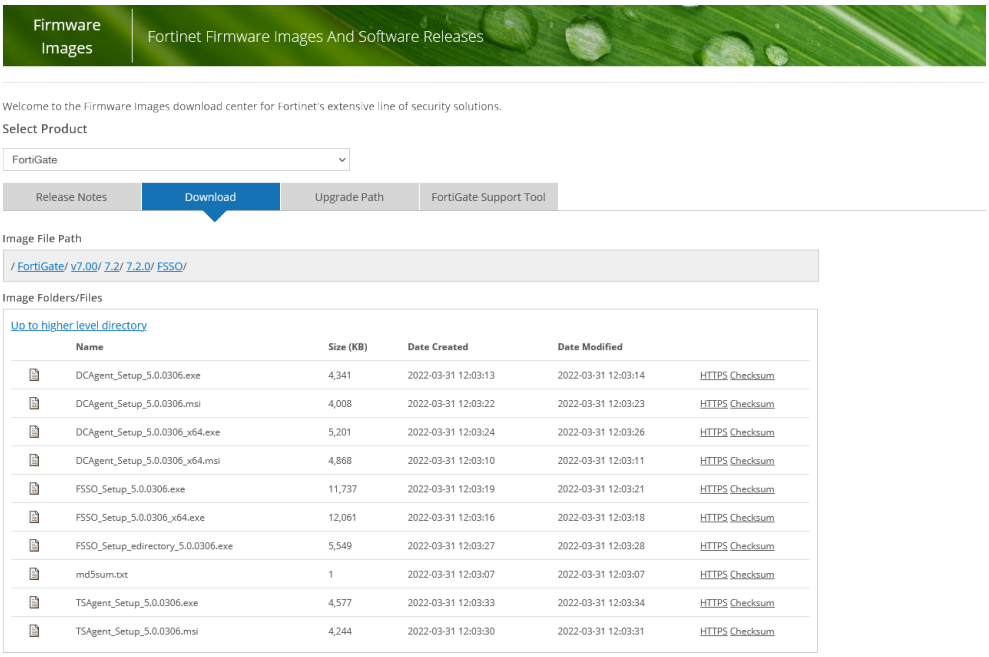
  For example, if DHCP is used a user might receive different IP addresses every day, making it difficult to track a specific user by specifying an IP address as the match criterion.

In this example, a collector agent (CA) is installed on a Windows machine to poll a domain controller (DC) agent (seeFSSO on page 3159 for more information). On the FortiGate, an external connector to the CA is configured to receives user groups from the DC agent. The received group or groups are used in a policy, and some examples of the usernames in logs, monitors, and reports are shown.

Install and configure FSSO Agent

To download the FSSO agent:

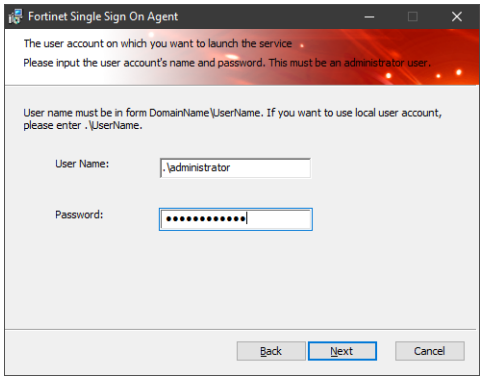
1. Sign in to your FortiCloud account.
2. Go to *Support* > *Firmware Download* and select the *Download* tab.
3. Browse to the appropriate directory for the version of the FSSO agent that you need to download.



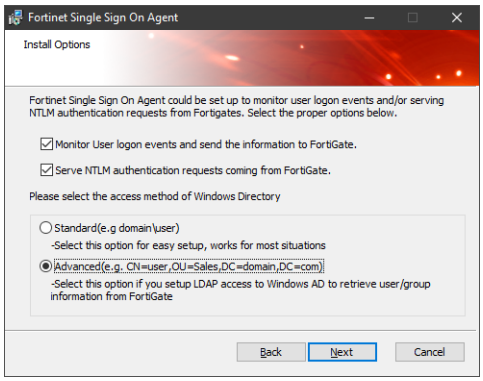
4. Click *HTTPS* to download the appropriate *FSSO_Setup* file.

To install the FSSO agent:

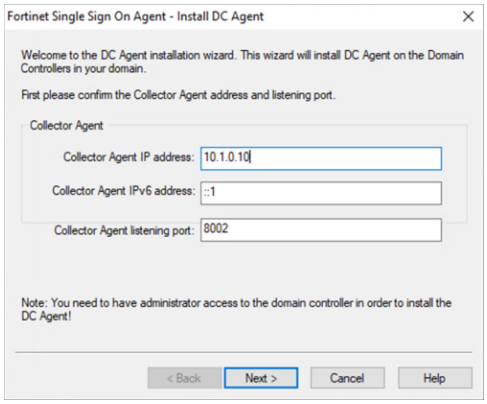
1. Run the *FSSO_Setup* file with administrator privileges.
2. Click *Next*, accept the terms of the license agreement, and click *Next* again.
3. Select the installation directory, or use the default location, then click *Next*.
4. Enter the User Name and Password, then click *Next*.



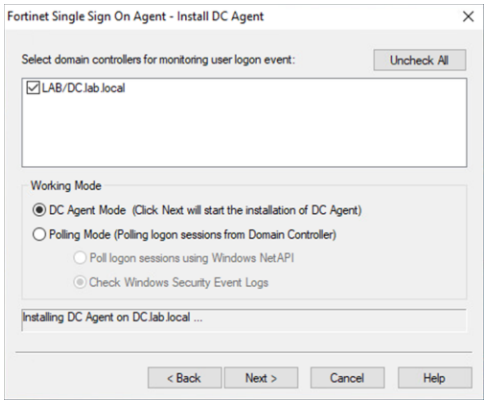
5. On the *Install Options*, select *Advanced*, then click *Next*.



6. Click *Install*.
7. After the FSSO Agent installs, run *Install DC Agent*.
8. Update the Collector Agent IP address and listening port as needed, then click *Next*.



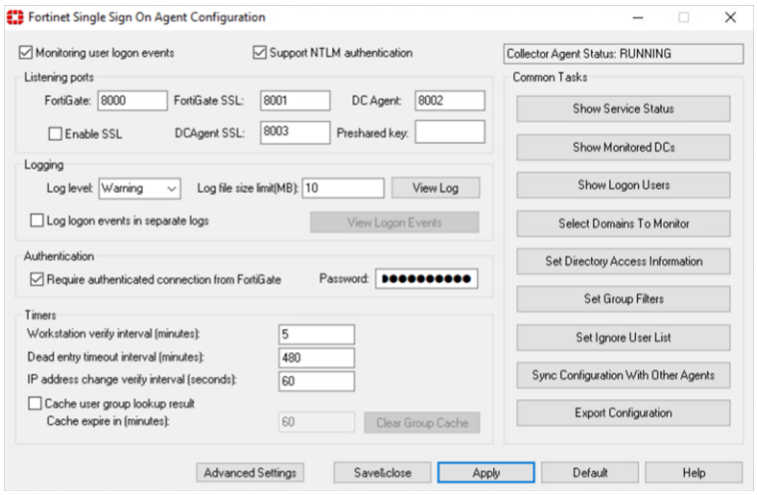
9. Select the domain, in this example *LAB:lab.local*, then click *Next*.
10. Set the *Working Mode* to *DC Agent Mode*, then click *Next* to install the agent.



11. After the DC agent mode installation finishes, Reboot the DC to complete the setup.

To configure the FSSO agent:

1. Open the FSSO agent.
2. Enable *Require authentication from FortiGate* and enter a password for FortiGate authentication.



3. Click *Set Group Filters*, and create a default group filter to limit the groups that are sent to the FortiGate.
4. Click *Save&close*.

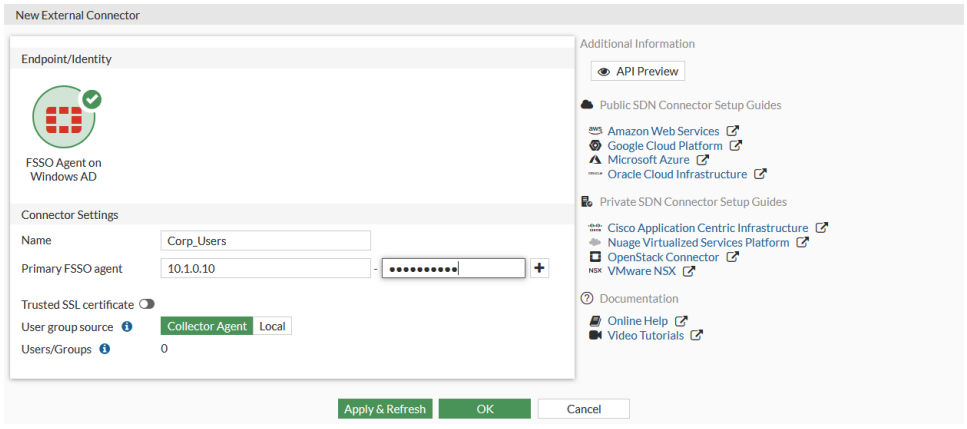
Configure the FortiGate

Create an external connector to the FSSO agent to receive the AD user groups. Add the user group or groups as the source in a firewall policy to include usernames in traffic logs. Enable security profiles, such as web filter or antivirus, in the policy to include the usernames in UTM logs.

Event logs include usernames when the log is created for a user action or interaction, such as logging in or an SSL VPN connection.

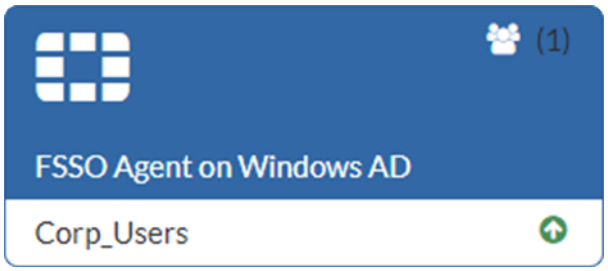
To create an external connector:

1. On the FortiGate, go to *Security Fabric > External Connectors*.
2. Click *Create New* and select *FSSO Agent on Windows AD*.
3. Set the *Primary FSSO agent* to the previously configured *Collector Agent IP address* and authentication password.



4. Click *OK*

The connector shows a green arrow when the connection is established, and a number in the top right indicating the number of AD groups received from the DC agent. Edit the connector to view the user groups.



To configure a policy with an imported user group and web filter in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit an existing policy, or create a new one. See Firewall policy on page 1563 for information.
3. Add the FSSO groups or groups as sources:
   a. Click in the *Source* field.
   b. Select the *User* tab.
   c. Select the group or groups.

   d. Click *Close*.
4. Under *Security Profiles*, enable *Web Filter* and select a profile that monitors or blocks traffic, such as the *monitor-all* profile. See Web filter on page 1965 for information.
5. Click *OK*.

To configure a policy with an imported user group and web filter in the CLI:

```
config firewall policy
    edit 0
        set name "LAN to WAN"
        set srcintf "port5"
        set dstintf "port1"
        set action accept
        set srcaddr "LAN"
        set dstaddr "all"
        set schedule "always"
```

```
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set webfilter-profile "monitor-all"
        set logtraffic all
        set nat enable
        set fsso-groups "CN=USERS,DC=LAB,DC=LOCAL"
    next
end
```

Log, monitor, and report examples

For more information about logs, see the FortiOS Log Message Reference.

Traffic logs:

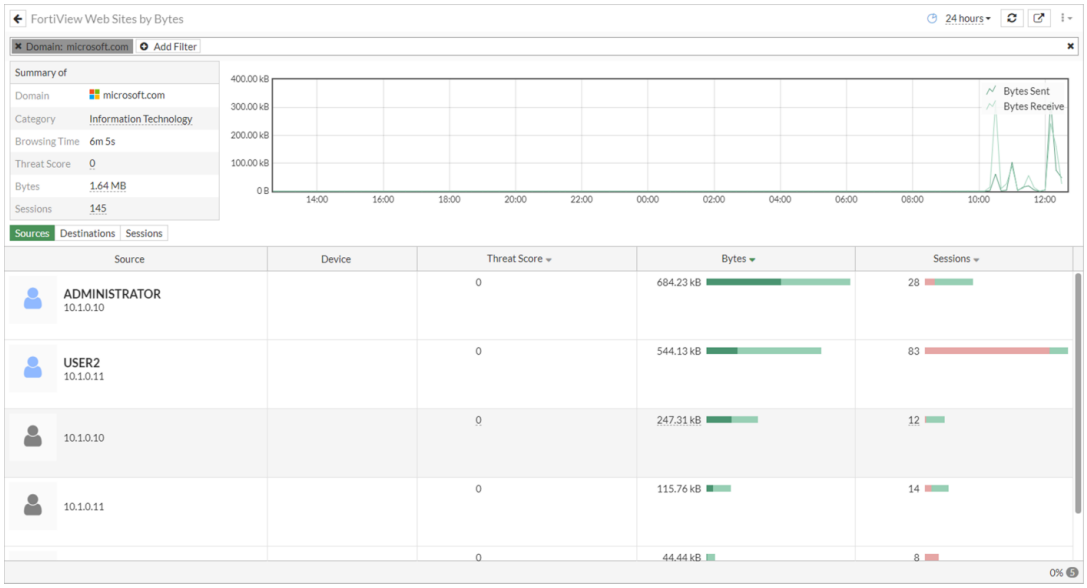
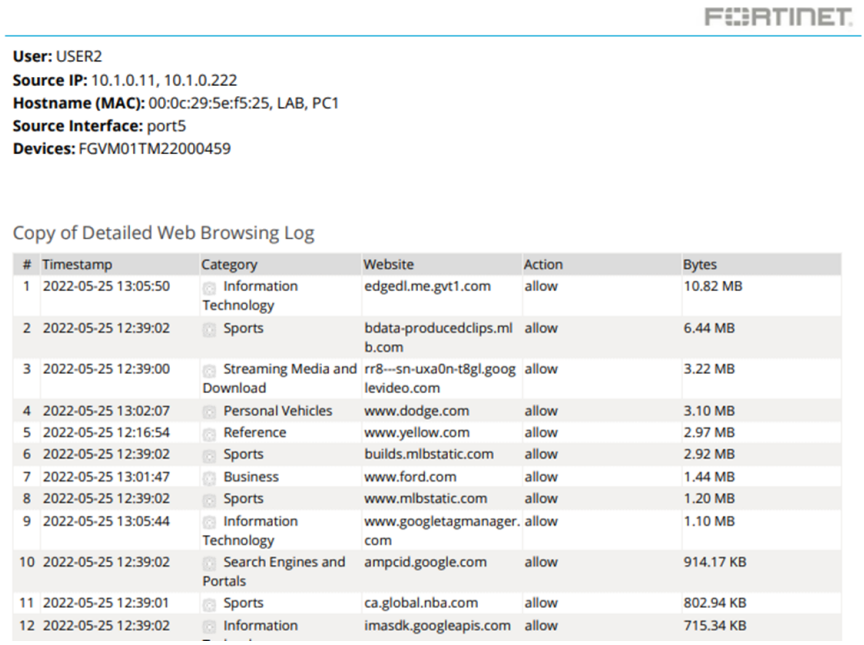
FortiOS monitors:

The *FortiView Web Sites by Bytes* monitor shows a list of visited websites. Double click a specific domain (or manually create a filter), such as *microsoft.com*, to see a breakdown of the usernames and IP addresses that visited that domain. See Monitors on page 141 for more information.



FortiAnalyzer reports:

The *User Detailed Browsing Log* report require a username or IP address to run. If a username is used, the report includes logs related to that user regardless of their IP address. For example, the following report show two source IP addresses:



User: USER2
Source IP: 10.1.0.11, 10.1.0.222
Hostname (MAC): 00:0c:29:5e:f5:25, LAB, PC1
Source Interface: port5
Devices: FGVM01TM22000459

See Reports in the FortiAnalyzer Administration guide for more information.

Wireless configuration

See the FortiWiFi and FortiAP Configuration Guide.

Switch Controller

Use the Switch Controller function, also known as FortiLink, to remotely manage FortiSwitch units. In the commonly-used layer 2 scenario, the FortiGate that is acting as a switch controller is connected to distribution FortiSwitch units. The distribution FortiSwitch units are in the top tier of stacks of FortiSwitch units and connected downwards with Convergent or Access layer FortiSwitch units. To leverage CAPWAP and the Fortinet proprietary FortiLink protocol, set up data and control planes between the FortiGate and FortiSwitch units.

FortiLink allows administrators to create and manage different VLANs, and apply the full-fledged security functions of FortiOS to them, such as 802.1X authentication and firewall policies. Most of the security control capabilities on the FortiGate are extended to the edge of the entire network, combining FortiGate, FortiSwitch, and FortiAP devices, and providing secure, seamless, and unified access control to users.

FortiLink is not supported if there is a 3rd party switch in between the FortiGate and FortiSwitch in a layer 2 network. However, FortiLink is supported over a layer 3 network. See FortiLink mode over a layer-3 network in the FortiLink Guide.

See FortiSwitch devices managed by FortiOS.

System

This topic contains information about FortiGate administration and system configuration that you can do after installing the FortiGate in your network.

Basic system settings

Administrators

By default, FortiGate has an administrator account with the username *admin* and no password. See Administrators on page 3189 for more information.

Administrator profiles

An administrator profile defines what the administrator can see and do on the FortiGate. See Administrator profiles on page 3218 for more information.

Password policy

Set up a password policy to enforce password criteria and change frequency. See Password policy on page 3204 for more information.

Interfaces

Physical and virtual interface allow traffic to flow between internal networks, and between the internet and internal networks. See Interfaces on page 170 for more information.

Advanced system settings

SNMP

The simple network management protocol (SNMP) allows you to monitor hardware on your network. See SNMP on page 3533 for more information.

DHCP server

You can configure one or more DHCP servers on any FortiGate interface. See DHCP servers and relays on page 445 for more information.

VDOM

You can use virtual domains (VDOMs) to divide a FortiGate into multiple virtual devices that function independently. See Virtual Domains on page 3298 for more information.

High availability

You can configure multiple FortiGate devices, including private and public cloud VMs, in HA mode. See High Availability on page 3340 for more information.

Certificates

You can manage certificates on the FortiGate. See Certificates on page 3596 for more information.

Operating modes

A FortiGate or VDOM (in multi-vdom mode) can operate in either NAT/route mode or transparent mode.

NAT/route mode

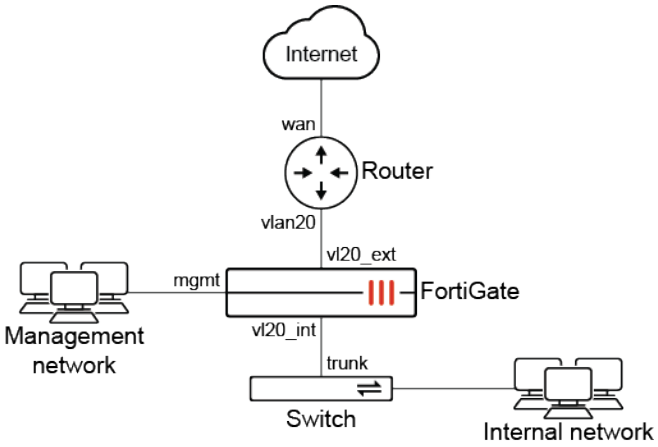
The FortiGate or VDOM is installed as a gateway or router between multiple networks, such as a private network and the internet. One function of NAT/route mode is to allow the FortiGate to hide the IP addresses on the private network using NAT. NAT/route mode can also be used to connect to multiple ISPs in an SD-WAN setup, and to route traffic between different networks. .

By default, new VDOMs are set to NAT/route operation mode.

Transparent mode

The FortiGate or VDOM operates in layer 2 to forward traffic between network devices such as routers, firewalls, and switches. For example. it can be installed inline between a router and a switch to perform security scanning without changing the network topology or modifying the IP addresses. When you add a FortiGate that is in transparent mode to a network, it only needs to be provided with a management IP address in order to access the device. It is recommended that a dedicated interface is used to connect to the management network in transparent mode.

The following topology is an example of a transparent mode FortiGate inserted inline between a router and a switch:



Using transparent mode VDOMs is recommended when multiple VLANs pass through the FortiGate. Otherwise, they must be separated into different forwarding domains within the same VDOM.

Changing modes

The following is a sample configuration for changing from NAT/route operation mode to transparent operation mode in the CLI:

```
config system settings
    set opmode transparent
    set manageip <IP_address>
    set gateway <gateway_address>
end
```

The gateway setting is optional. However, once the operation mode is changed from NAT/route to transparent, the gateway configuration is found under the static router settings:

```
config router static
    edit <seq-num>
        set gateway <IP_address>
    next
end
```

The following is a sample configuration for changing from transparent operation to NAT/route operation mode in the CLI:

```
config system settings
    set opmode nat
    set ip <IP_address>
    set device <interface>
    set gateway <gateway_address>
end
```

The IP and device settings are mandatory. Once the operation mode is changed from transparent to NAT/route, the IP address configuration is found under the corresponding interface settings:

```
config system interface
    edit <interface>
        set ip <IP_address>
    next
end
```

The gateway setting is optional. However, once the operation mode is changed, the gateway configuration is found under the static router settings:

```
config router static
    edit <seq-num>
        set gateway <IP_address>
        device <interface>
    next
end
```

Administrators

By default, FortiGate has an administrator account with the username *admin* and no password. To prevent unauthorized access to the FortiGate, this account must be protected with a password. Additional administrators can be added for various functions, each with a unique username, password, and set of access privileges.

The following topics provide information about administrators:

- Local authentication on page 3190
- Remote authentication for administrators on page 3190
- Administrator account options on page 3193
- REST API administrator on page 3196
- SSO administrators on page 3198
- FortiCloud SSO on page 3198
- Allowing the FortiGate to override FortiCloud SSO administrator user permissions on page 3199
- Password policy on page 3204
- Public key SSH access on page 3208
- Separating the SSHD host key from the administration server certificate on page 3210
- Restricting SSH and Telnet jump host capabilities on page 3211
- Restricting local administrator logins through the console on page 3212
- Remote administrators with TACACS+ VSA attributes on page 3214

Local authentication

By default, FortiGate has one super admin named `admin`. You can create more administrator accounts with different privileges.

To create an administrator account in the GUI:

1. Go to *System* > *Administrators*.
2. Select *Create New* > *Administrator*.
3. Specify the *Username*.

- Usernames can include lower and upper case letters (a-z, A-Z), numbers (0-9), underscores (_), and dashes (-)
- Usernames cannot start with a dash (-)
- Usernames can end with dollar symbol ($)
- Usernames must not use the following characters: `< > ( ) # " '`. Using these characters in an administrator username might have a cross site scripting (XSS) vulnerability.

4. Set *Type* to *Local User*.
5. Set the password and other fields.
6. Click *OK*.

To create an administrator account in the CLI:

```
config system admin
    edit <admin_name>
        set accprofile <profile_name>
        set vdom <vdom_name>
        set password <password for this admin>
    next
end
```

Remote authentication for administrators

Administrators can use remote authentication, such as LDAP, RADIUS, and TACACS+ to connect to the FortiGate.

Configuring remote authentication with an LDAP server is shown. For more information about configuring LDAP, see Configuring an LDAP server on page 3014.

For information about configuring RADIUS or TACACS+ servers, see Configuring a RADIUS server on page 3033 and TACACS+ servers on page 3110. To use a RADIUS or TACACS+ server for remote authentication, configure the server, and then add it to the user group instead of the LDAP server.

Local logins can also be restricted when remote authentication servers are available, see Restricting logins from local administrator accounts when remote servers are available on page 3193.

Configuring remote authentication for administrators using LDAP includes the following steps:

1. Configuring the LDAP server on page 3191
2. Adding the LDAP server to a user group on page 3191
3. Configuring the administrator account on page 3192

Configuring the LDAP server

To configure the LDAP server in the GUI:

1. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
2. Enter the server *Name* and *Server IP/Name*.
3. Enter the *Common Name Identifier* and *Distinguished Name*.
4. Set the *Bind Type* to *Regular* and enter the *Username* and *Password*.
5. Click *OK*.

To configure the LDAP server in the CLI:

```
config user ldap
    edit <name>
        set server <server_ip>
        set cnid "cn"
        set dn "dc=XYZ,dc=fortinet,dc=COM"
        set type regular
        set username "cn=Administrator,dc=XYA, dc=COM"
        set password <password>
    next
end
```

Adding the LDAP server to a user group

After configuring the LDAP server, create a user group that includes that LDAP server.

To create a user group in the GUI:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Enter a *Name* for the group.
3. In the *Remote groups* section, select *Create New*.
4. Select the *Remote Server* from the dropdown list.
5. Click *OK*.

To create a user group in the CLI:

```
config user group
    edit <name>
        set member <ldap_server_name>
```

```
    next
end
```

Configuring the administrator account

After configuring the LDAP server and adding it to a user group, create a new administrator. For this administrator, instead of entering a password, use the new user group for authentication.

A remote authentication server can allow authentication of either a single user or any user from a specified group.

Public key infrastructure (PKI) administrator authentication requires a PKI user instead of a remote server. For information about creating a PKI user, see Configuring a PKI user on page 3151.

To create an administrator to match a single user in the GUI:

1. Go to *System* > *Administrators* and click *Create New* > *Administrator*.
2. Specify the *Username*.
   This username is used when the administrator logs in, and is what FortiOS sends to the remote authentication server for authorization.
3. Set *Type* to *Match a user on a remote server group*.
4. In *Remote User Group*, select the user group that you created.
5. Select an *Administrator Profile*.
6. Enter a *Backup Password*, to be used if the remote authentication server is unreachable.
7. Click *OK*.

To create an administrator match a single user in the CLI:

```
config system admin
    edit <name>
        set remote-auth enable
        set accprofile super_admin
        set remote-group <ldap_group_name>
        set password **********
    next
end
```

To create an administrator to match all users in a remote server group in the GUI:

1. Go to *System* > *Administrators* and click *Create New* > *Administrator*.
2. Specify the *Username*.
   This username is only used to identify this administrator group. Administrators can log in with any username in the remote user group.
3. Set *Type* to *Match all users in a remote server group*.
4. In *Remote User Group*, select the user group that you created.
5. Select an *Administrator Profile*.
6. Click *OK*.

To create an administrator to match all users in a remote server group in the CLI:

```
config system admin
    edit <name>
        set remote-auth enable
        set accprofile super_admin
        set wildcard enable
        set remote-group <ldap_group_name>
    next
end
```

To create an administrator that uses a PKI group in the GUI:

1. Go to *System* > *Administrators* and click *Create New* > *Administrator*.
2. Specify the *Username*.
3. Set *Type* to *Use public key infrastructure (PKI) group*.
4. In *Remote User Group*, select the user group that you created.
5. Select an *Administrator Profile*.
6. Click *OK*.

To create an administrator that uses a PKI group in the CLI:

```
config system admin
    edit <name>
        set remote-auth enable
        set accprofile super_admin
        set peer-group <pki_group_name>
    next
end
```

Restricting logins from local administrator accounts when remote servers are available

Logins from local administrator accounts can be restricted when remote servers are available. When enabled, FortiOS will check if all of the remote servers used by administrators are down before allowing a local administrator to log in. This option is applied globally, and is disabled by default.

To restrict local administrator authentication when a remote authentication server available:

```
config system global
    set admin-restrict-local enable
end
```

Administrator account options

Options to further define the access and abilities of an administrator account include:

- Multi-factor authentication on page 3194
- Restricting logins to trusted hosts on page 3195
- Restricting administrators to guest account provisioning on page 3196
- Global and VDOM administrators on page 3196

Multi-factor authentication

Multi-factor authentication (MFA) requires authenticating administrators to supply more than one factor to identify themselves in addition to their password, such as a FortiToken.

Before enabling MFA, it is recommended that you create second administrator account that is configured to guarantee administrator access to the FortiGate if you are unable to authenticate on the main account for any reason.

Multi-factor authentication options include:

- FortiToken
- FortiToken Cloud
- Email
- SMS

FortiToken

To associate a FortiToken to an administrator account using the GUI:

1. Ensure that you have successfully added your FortiToken serial number to FortiOS and that its status is *Available*.
2. Go to *System* > *Administrators*. Edit the admin account. This example assumes that the account is fully configured except forMFA.
3. Enable *Two-factor Authentication* and for *Authentication Type*, select *FortiToken*.
4. From the *Token* dropdown list, select the FortiToken serial number.
5. In the *Email Address* field, enter the administrator's email address.
6. Click *OK*.

For a mobile token, click *Send Activation Code* to send the activation code to the configured email address. The admin uses this code to activate their mobile token. You must have configured an email service in *System* > *Settings* to send the activation code.

To associate a FortiToken to an administrator account using the CLI:

```
config system admin
   edit <username>
      set password "myPassword"
      set two-factor fortitoken
      set fortitoken <serial_number>
      set email-to "username@example.com"
```

```
    next
end
```

The `fortitoken` keyword is not visible until you select `fortitoken` for the `two-factor` option.

Before you can use a new FortiToken, you may need to synchronize it due to clock drift.

FortiToken Cloud

FortiToken Cloud is an Identity and Access Management as a Service (IDaaS) cloud service provided by Fortinet. It enables FortiGate and FortiAuthenticator customers to add MFA for their users using Mobile or Hard tokens.

For more information, see Getting started—FGT-FTC users in the FortiToken Cloud Administration Guide.

Email

Enter an email address to send an MFA code to that address.

SMS

Enable *SMS* then select the *Country Dial Code* and enter the *Phone Number* (`sms-phone` in the CLI) to send an MFA code to.

SMS messages can also be sent to the FortiGuard SMS server or a custom server.

```
config system admin
    edit "admin"
        ...
        set sms-server {fortiguard | custom}
        set sms-server-custom <string>
        ...
    next
end
```

Restricting logins to trusted hosts

Administrator accounts can be configured to only be accessible to a user using a trusted host. You can set a specific IP address for the trusted host, or use a subnet. Up to ten trusted hosts can be specified for an administrator.

When trusted hosts are defined for all of the administrators on the FortiGate, the administrative access on each interface will be restricted to the trusted hosts that are defined for the administrator, except for ping. If ping is enabled on an interface, it works regardless of the trusted hosts.

Restricting administrators to guest account provisioning

To simplify guest account creation, an administrator account can be created exclusively for guest user management. This allows new accounts to be created without requiring full administrative access to FortiOS.

When enabling this option, a guest group must be specified for the administrator to provision new accounts to. See Configuring guest user groups on page 2998 for information about creating such a group.

Global and VDOM administrators

When a FortiGate is in multi-VDOM mode, it can be managed by either global or per-VDOM administrators. Each type of administrator will have a different view of the GUI that corresponds to their role. For more information, see Administrator roles and views on page 3300.

For information about configuring per-VDOM administrators, see Create per-VDOM administrators on page 3306.

REST API administrator

REST API administrator accounts are used for automated configuration, backup creation, and monitoring of the FortiGate.

For more information about the REST API, see the Fortinet Development Network (FNDN). Note that an account is required to access the FNDN.

Only an administrator with the *super_admin* profile can create a REST API administrator by using the GUI or CLI.

To create a REST API administrator in the GUI:

1. Go to *System* > *Administrators*.
2. Select *Create New* > *REST API Admin*.
3. Configure the administrator:

Username	The username of the administrator. Do not use the characters < > ( ) # " ' in the administrator username. Using these characters in an administrator username might have a cross site scripting (XSS) vulnerability.
Administrator Profile	Where permissions for the REST API administrator are defined. A REST API administrator should have the minimum permissions required to complete the request.
PKI Group	Certificate matching is supported as an extra layer of security. Both the client certificate and token must match to be granted access to the API.

CORS Allow Origin	Cross Origin Resource Sharing (CORS) allows third-party web apps to make API requests to the FortiGate using the token.
Trusted Hosts	The following can be used to restrict access to FortiGate API: • Multiple trusted hosts/subnets can be configured • IPv6 hosts are supported • Allow all (0.0.0.0/0) is not allowed You need your *Source Address* to create the trusted host.

4. Click *OK*.
   An API token is generated. Make note of the token, as it is only shown once.

To create a REST API administrator in the CLI:

1. Create the REST API administrator:

```
config system api-user
    edit "api-admin"
        set comments <string>
        set api-key ************
        set accprofile "API profile"
        set vdom "root"
        set peer-auth enable
        set peer-group <group>
        config trusthost
            edit 1
                set ipv4-trusthost <class_ip&net_netmask>
            next
            ...
        end
    next
end
```

2. Generate the API token:

```
# execute api-user generate-key <API username>
```

   Make note of the token, as it is only shown once.

It is highly recommended to apply the principle of least privilege to the REST API administrator account and avoid using the generic *super_admin* profile for permissions. The profiles *admin_no_access* or *super_admin_readonly* can be used for generic read-only access. However, consider defining a new administrator profile with the required permissions for the account. For example, you could use a specific API user to query the FortiGate for just their own status. In that case, the profile would be configured as read-only.

SSO administrators

SSO administrators are automatically created when the FortiGate acts as a SAML service provider (SP) with *SAML Single Sign-On* enabled in the Security Fabric settings.

On the system login page, an administrator can log in with their username and password against the root FortiGate acting as the identity provider (IdP) in the Security Fabric. After the first successful log in, this user is added to the administrators table (*System > Administrators* under *Single Sign-On Administrator*). The default profile selected is based on the SP settings (*Default admin profile*). See Configuring a downstream FortiGate as an SP on page 3845 for more information.

SSO administrators can be manually configured in FortiOS.

To manually configure an SSO administrator in the GUI:

1. Go to *System > Administrators* and click *Create New > SSO Admin*.
2. Enter the username.
3. Select an administrator profile.
4. Click *OK*.

To manually configure an SSO administrator in the CLI:

```
config system sso-admin
    edit <name>
        set accprofile <profile>
        set vdom <vdom>
    next
end
```

FortiCloud SSO

FortiGate can be configured to allow administrators to log in using FortiCloud single sign-on. Both IAM and non-IAM users on the FortiCloud support portal are supported. Non-IAM users must be the FortiCloud account that the FortiGate is registered to.

To configure an IAM user in FortiCloud:

1. Log in to your FortiCloud account at support.fortinet.com.
2. Select *Services > IAM*.
3. See the FortiCloud Identity & Access Management (IAM) guide for more information.

To manually enable FortiCloud single sign-on in the GUI:

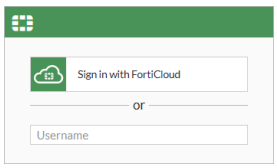
1. Log in to the FortiGate and go to *System > Settings*.
2. In the *Administration Settings* section, enable *Allow administrative login using FortiCloud SSO*.
3. Click *Apply*.

To manually enable FortiCloud single sign-on in the CLI:

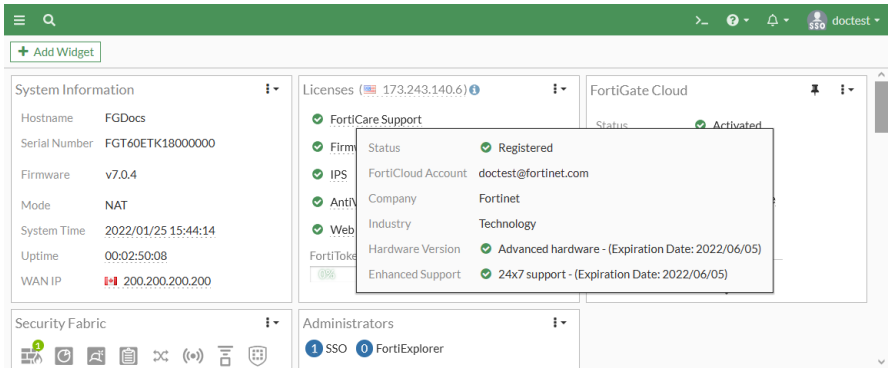
```
config system global
    set admin-forticloud-sso-login {enable | disable}
end
```

To log in to the FortiGate with the FortiCloud user:

1. Go to the FortiGate log in screen.



2. Click *Sign in with FortiCloud*. The FortiCloud log in page opens.
3. Enter the FortiCloud account credentials and click *Login*.
   You are logged in to the FortiOS GUI. The SSO username is shown in the top right corner of the GUI.

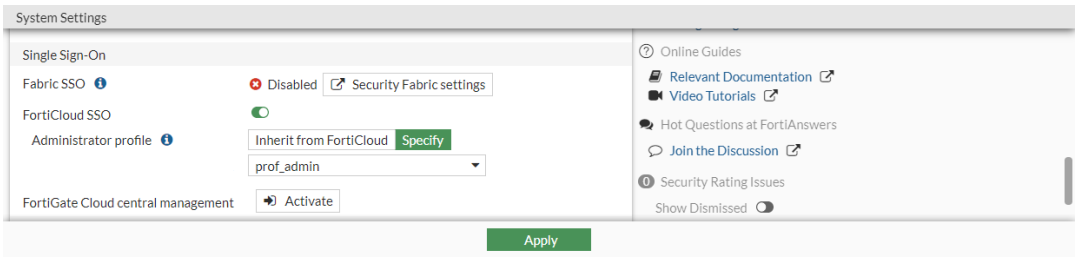


Allowing the FortiGate to override FortiCloud SSO administrator user permissions

The FortiGate can allow single sign-on (SSO) from FortiCloud and FortiCloud IAM users with administrator profiles inherited from FortiCloud or overridden locally by the FortiGate. Similarly, users accessing the FortiGate remotely from FortiGate Cloud can have their permissions inherited or overridden by the FortiGate.

To enable FortiCloud SSO in the GUI:

1. Go to *System* > *Settings*.
2. In the *Single Sign-On* section, enable *FortiCloud SSO*.
3. Set the default *Administrator profile* to assign: *Inherit from FortiCloud*, or *Specify* and select a profile from the dropdown.



4. Click *Apply*.

To enable FortiCloud SSO in the CLI:

```
config system global
    set admin-forticloud-sso-login enable
    set admin-forticloud-sso-default-profile <profile>
end
```

The following administrator profiles are assigned based on the inherited or overwritten permissions:

User type	Inherited from FortiCloud/FortiGate Cloud	Specify
FortiCloud	Uses the super_admin profile.	Local user profile
FortiCloud IAM	Is based on the IAM permission profile's FortiOS SSO portal settings: • If *Access* is disabled = no access • If *Access* is enabled and the *Access Type* is set to *SuperAdmin* = super_admin profile • If *Access* is enabled and the *Access Type* is set to *Read Only*= super_admin_readonly profile	Local user profile
FortiGate Cloud subscription tier	Uses the super_admin profile.	Local user profile
FortiGate Cloud free tier	Has read-only access.	Cannot override

This topic includes four use case examples:

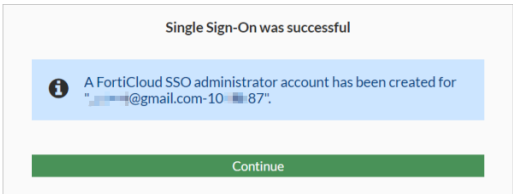
- Example 1: specifying permissions for a FortiCloud SSO user
- Example 2: inheriting FortiCloud permissions for a FortiCloud SSO user
- Example 3: specifying a local user profile for a FortiCloud IAM user
- Example 4: accessing a FortiGate remotely from FortiGate Cloud

Example 1: specifying permissions for a FortiCloud SSO user

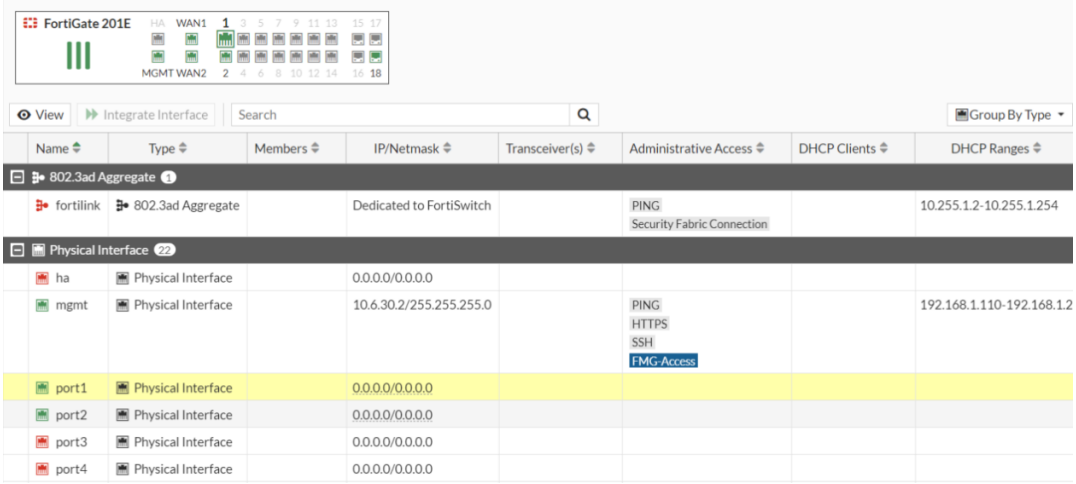
In this example, a FortiCloud SSO user is configured to override permissions and use the prof_admin profile, which is a local read-only profile.

To configure the FortiCloud SSO user:

1. Go to *System > Settings*.
2. In the *Single Sign-On* section, enable *FortiCloud SSO*.
3. Set *Administrator profile* to *Specify*, and select *prof_admin*. The FortiCloud SSO user will be created upon the first login.
4. Get the user to log in to the FortiGate:
   a. On the FortiOS login screen, click *Sign in with FortiCloud*. The FortiCloud log in page opens.
   b. Click *Email Login*.
   c. Enter the FortiCloud account credentials and click *Log In*.
   The new SSO user is created.



Since the profile has read-only access, the SSO user can only view items (such as interfaces) and cannot edit them.

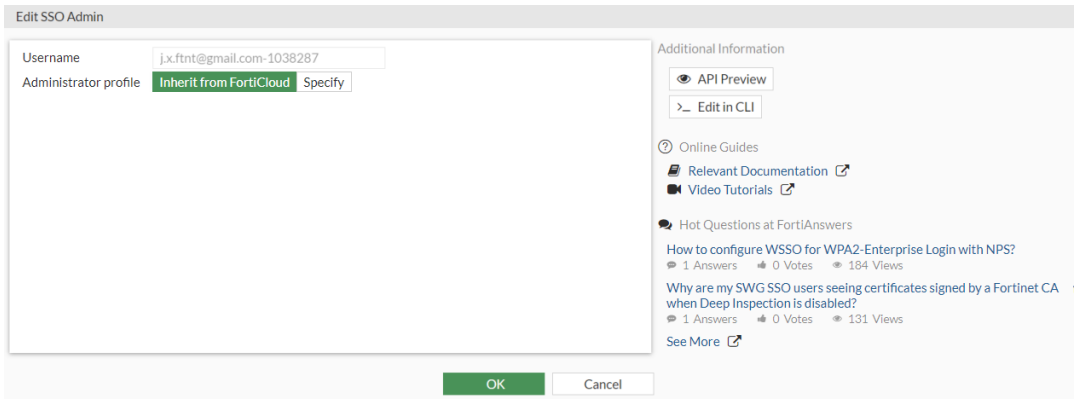


Example 2: inheriting FortiCloud permissions for a FortiCloud SSO user

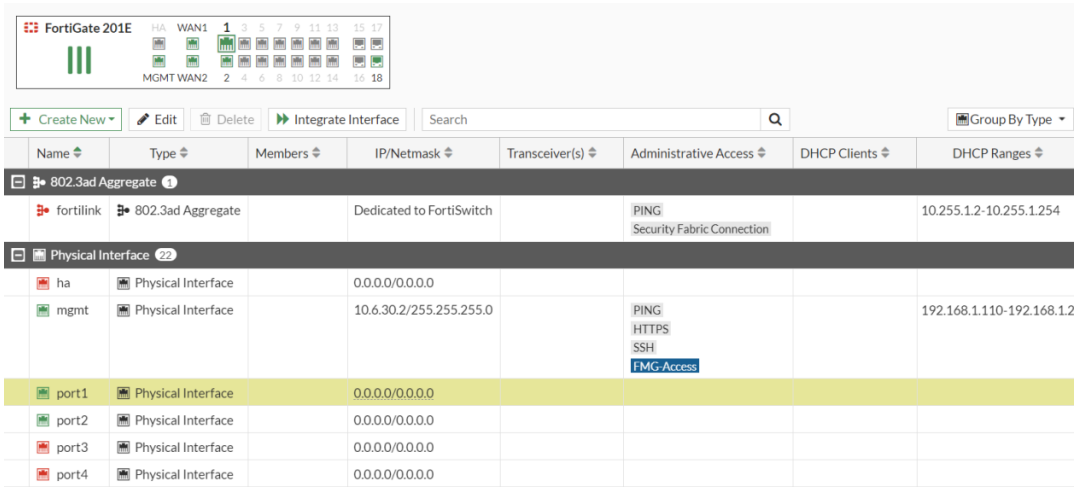
In this example, a local administrator changes the permissions of an existing FortiCloud SSO user (created in the previous example) to *Inherit from FortiCloud*, which means the super_admin profile will be used.

To configure the existing SSO user:

1. Go to *System > Administrators* and edit the user in the *FortiCloud SSO Administrator* section (*********@gmail.com*).
2. Set *Administrator profile* to *Inherit from FortiCloud*.



3. Click *OK*.
4. Get the user to log in to the FortiGate. Since the profile changed to super_admin, they can modify items (such as interfaces).



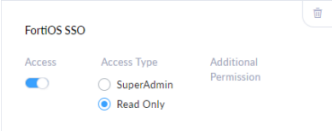
Example 3: specifying a local user profile for a FortiCloud IAM user

In this example, a FortiCloud IAM user is configured to have read-only SSO access based on the settings in the FortiOS SSO portal. Once the FortiCloud IAM user logs in, an administrator with super_admin access changes the permission of the IAM user to have super_admin access.

This example assumes the *FortiOS SSO* portal has already been added to the IAM permission profile. See Creating a permission profile and Managing permission profiles in the Identity & Access Management (IAM) Guide for more information about configuring permission profiles in FortiCloud.

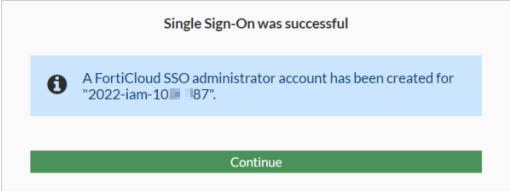
To configure the FortiCloud IAM user:

1. In FortiCloud, configure the permission profile:
   a. Go to *Services* > *IAM*, then click *Permission Profiles*.
   b. Select a profile and click *Edit*.
   c. In the *FortiOS SSO* portal, enable *Access*. Set the *Access Type* to *Read Only*.



d. Click *Update*.

2. Get the user to log in to the FortiGate:
   a. On the FortiOS login screen, click *Sign in with FortiCloud*. The FortiCloud log in page opens.
   b. Click *IAM Login*.
   c. Enter the IAM account credentials and click *Log In*.
   The new SSO user is created with a super_admin_readonly profile.



3. Update the IAM user permission to have super_admin access:
   a. Log in to the FortiGate with a super_admin administrator account.
   b. Go to *System* > *Administrators* and edit the IAM user (*2022*).
   c. Set *Administrator profile* to *Specify* and select *super_admin*.
   d. Click *OK*.
4. Get the user to log in to the FortiGate again. Since the profile changed to super_admin, they can modify items.

Example 4: accessing a FortiGate remotely from FortiGate Cloud

In this example, a FortiGate Cloud user with a paid subscription accesses the FortiGate remotely from FortiGate Cloud. When the user logs in with SSO, the profile has super_admin access. After the FortiGate Cloud user logs in, an administrator with super_admin access changes the permission of the FortiGate Cloud user to have prof_admin (read-only) access.

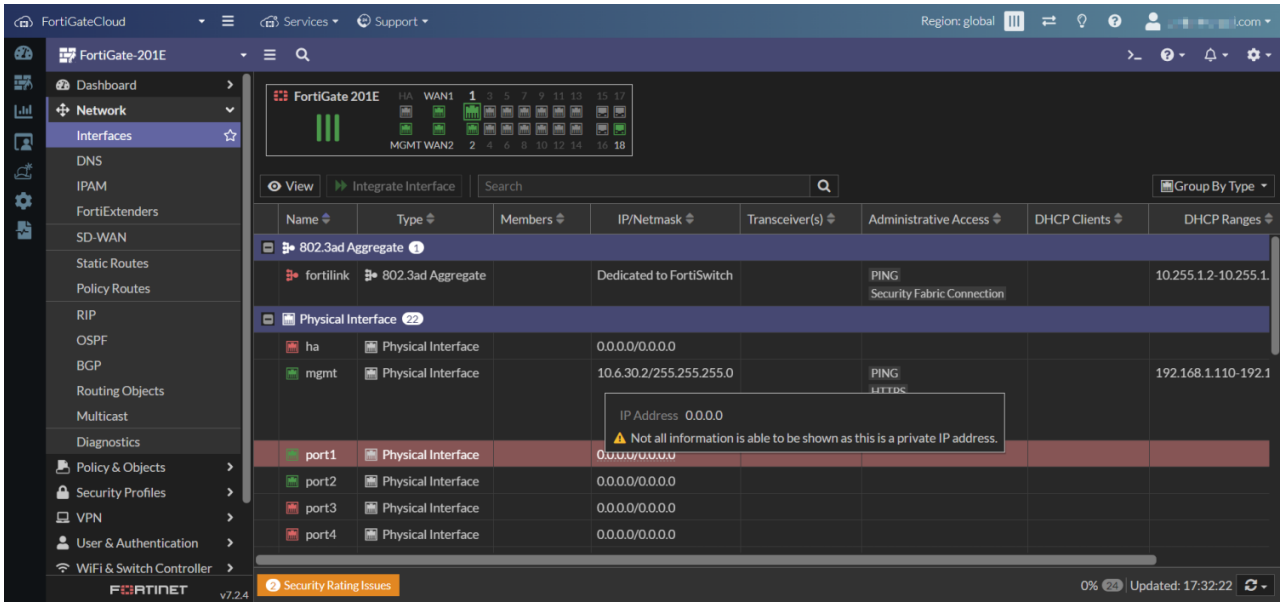
FortiGate Cloud must be accessed from a FortiGate Cloud 2.0 portal (also called FortiGate Cloud Premium) in order to have remote access using the FortiGate Cloud proxy. See Getting started with FortiGate Cloud 2.0 for more details.

To access a FortiGate remotely from FortiGate Cloud:

1. Log in to the FortiGate Cloud 2.0 portal.
2. Go to *Inventory* > *Asset List*. Select the desired FortiGate, then click *Remote Access*.
   FortiGate Cloud accesses the FortiGate using the FortiGate Cloud proxy and creates a super_admin user. The FortiOS interface is displayed in the current browser window.
3. Log out of FortiGate Cloud.
4. Update the FortiGate Cloud user permission to have prof_admin access:

a. Log in to the FortiGate with a super_admin administrator account.
b. Go to *System* > *Administrators* and edit the user in the *FortiGate Cloud SSO Administrator* section (********@gmail.com).
c. Set *Administrator profile* to *Specify* and select *prof_admin*.
d. Click *OK*.

5. Log in to the FortiGate Cloud 2.0 portal and access the FortiGate remotely again. Since the profile changed to prof_admin, they can only view items (such as interfaces).



Password policy

Brute force password software can launch more than just dictionary attacks. It can discover common passwords where a letter is replaced by a number. For example, if `p4ssw0rd` is used as a password, it can be cracked.

Using secure passwords is vital for preventing unauthorized access to your FortiGate. When changing the password, consider the following to ensure better security:

- Do not use passwords that are obvious, such as the company name, administrator names, or other obvious words or phrases.
- Use numbers in place of letters, for example: `passw0rd`.
- Administrator passwords can be up to 64 characters.
- Include a mixture of numbers, symbols, and upper and lower case letters.
- Use multiple words together, or possibly even a sentence, for example: `correcthorsebatterystaple`.
- Use a password generator.
- Change the password regularly and always make the new password unique and not a variation of the existing password. For example, do not change from `password` to `password1`.
- Limit the number of passwords that can be reused.
- Make note of the password and store it in a safe place away from the management computer, in case you forget it; or ensure at least two people know the password in the event one person becomes unavailable.

Alternatively, have two different admin logins.

FortiGate allows you to create a password policy for administrators and IPsec pre-shared keys. With this policy, you can enforce regular changes and specific criteria for a password policy.

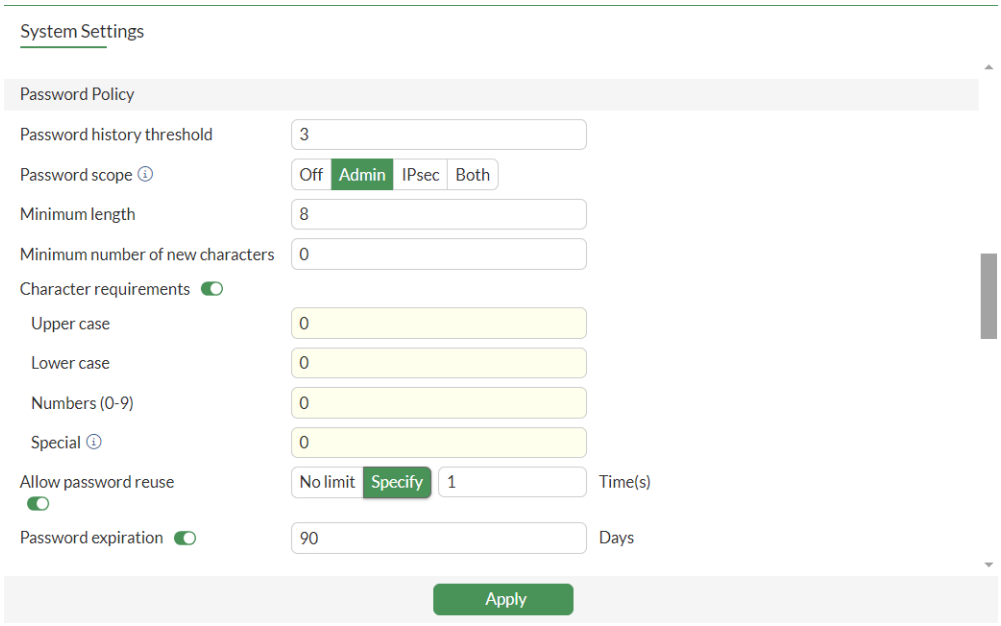
If you add a password policy or change the requirements on an existing policy, the next time that administrator logs in to the FortiGate, the administrator is prompted to update the password to meet the new requirements before proceeding to log in.

For information about setting passwords, see Default administrator password on page 3269.

To create a system password policy the GUI:

1. Go to *System* > *Settings*.
2. In the *Password Policy* section, configure the options:

Password history threshold	Global maximum number of previous passwords saved for each local user and system administrator.
Password scope	Where the password policy applies: • *Off* - Password policy is disabled. • *Admin* - Password policy applies to administrators. • *IPsec* - Password policy applies to IPsec pre-shared keys. • *Both* - Password policy applies to both administrators and IPsec pre-shared keys.
Minimum length	The minimum length, between 8 and 128 characters.
Minimum number of new characters.	The number of new characters required.
Character requirements	Enable to specify character requirements for the password: • *Upper case* - If the password must contain uppercase (A, B, C) characters. • *Lower case* - If the password must contain lowercase (a, b, c) characters. • *Numbers (0 - 9)* - If the password must contain numbers (1, 2, 3). • *Special* - If the password must contain special or non-alphanumeric characters: !, @, #, $, %, ^, &, *, (, and)
Allow password reuse	Applies only to administrators. Available when *Password scope* set to *Admin* or *Both*. Disable for unlimited password reuse. Enable to specify the number of passwords that can be reused. Choose from: • *No limit* - Allow unlimited password reuse. • *Specify* - Specify how many times a password can be reused. Must be lower than the *Password history threshold*. Password history is visible in the backup configuration.
Password expiration	The duration of the password before a new one must be specified.



3. Click *Apply*.

To create a system password policy the CLI:

The password policy applies to all administrator accounts when enabled, including the built-in admin account named *admin*. If an existing system administrator account fails to comply with the enabled password policy, the administrator is forced to change passwords on next login.

1. Configure a global history password limit.
   In this example, the global policy is to save three passwords for each local user and system administrator.

```
config system global
    set user-history-password-threshold 3
end
```

2. Configure a password policy for system administrators:
   a. Enable the password policy.

```
config system password-policy
    set status enable
end
```

   b. Enable password expiration:

```
config system password-policy
    set expire-status enable
end
```

   c. Set the number of days after which passwords expire, the password criteria, and password reuse limit.
   In this example, the `reuse-password-limit` is set to `1`, which means one of the globally-set three saved passwords can be reused.

```
config system password-policy
    set apply-to {admin-password | ipsec-preshared-key}
    set minimum-length <8-128>
    set min-lower-case-letter <0-128>
    set min-upper-case-letter <0-128>
    set min-non-alphanumeric <0-128>
    set min-number <0-128>
    set min-change-characters <0-128>
    set expire-day 90
    set reuse-password enable
    set reuse-password-limit 1
end
```

To create a password policy for a local user in the CLI:

Multiple password policies can be created and applied to different local user accounts.

1. Configure a global password history limit.
   In this example, the global policy is to save three passwords for each local user and system administrator.

```
config system global
    set user-history-password-threshold 3
end
```

2. Configure a password policy for local users:
   a. Before you can configure the password limit, enable `expire-status` and `reuse-password`.

```
config user password-policy
    edit 1
        set expire-status enable
        set reuse-password enable
    next
end
```

   b. Specify the maximum number of times a user can reuse a password.
      In this example, the `reuse-password-limit` is set to `1`, which means one of the globally-set three saved passwords can be reused.

```
config user password-policy
    edit 1
        set reuse-password-limit 1
    next
end
```

3. Assign the password policy to a local user.
   In this example, password policy `1` is assigned to local user `local2`.

```
config user local
    edit "local2"
        set type password
        set passwd-policy "1"
        set passwd ********
```

```
    next
end
```

4. Add the local user to a firewall policy, an SSL VPN policy, or to FortiGate user groups used in policies.

Before the password for the local user expires, the FortiOS GUI provides the option to change the password during login or skip the password change.

If the password for the local user has expired, the FortiOS GUI provides the option to change the password during login. When the local user enters a password that adheres to the policy, the login continues. If the new password has been used too many times before, a warning message is displayed.

Public key SSH access

Public-private key pairs can be used to authenticate administrators connecting to the CLI using an SSH client. These keys can be RSA, ECDSA, or EdDSA.

Weigh the pros and cons of using key-pair authentication, versus passwords, when considering their use:

	Key-pair	Password
Pros	More secure (higher complexity)	Easy to remember
	Restricts logon to hosts that have the private key	Easy to update
	Never sent to the FortiGate	Can log in from any system
	Can add a password in addition to the key	
Cons	More complex to implement	Might be guessable or brute forced
	The private key is only as secure as the system storing it	Could be reused and compromised on another system
	More complicated to train users and administrators to use keys	Might be stored in plain text on an authenticating device (This does not apply to FortiGates)
		Can be phished or observed if written down

Key-pair authentication is often implemented when connecting to the FortiGate without any human interaction, such as when using a script. The script can leverage existing mechanisms to secure private keys, instead of trying to develop a way to securely store a username and password.

Generating the key pair

Key pairs can be generated and added in multiple different ways. This example shows generating a key pair using *PuTTY Key Generator* and adding the private key to the endpoint using *PuTTY Pageant*.

To create the key pair using PuTTY:

1. Download and install PuTTY.
2. Run *PuTTYgen.exe*.
3. Set *Type of key to generate* to *RSA*, *ECDSA*, or *EdDSA*.
4. Click *Generate*, then move the mouse cursor around in the blank space to generate randomness while the keys are generated.
5. Save both the public and private keys. Optionally, a key passphrase can be entered to protect the private key.

To add the public key to the FortiGate:

1. Delete the *Key comment*, then copy the public key from the *PuTTY Key Generator*.
   Conversely, you can also open the saved public key in Notepad, remove the line breaks from the key, then remove extraneous lines:

   ```
   ---- BEGIN SSH2 PUBLIC KEY ----
   Comment: "rsa-key-2022XXXX"
   ```

   ```
   ---- END SSH2 PUBLIC KEY ----
   ```

2. Add the key to the FortiGate:

   ```
   config system admin
       edit <admin>
           set ssh-public-key1 "<key_type> <key_value>"
       next
   end
   ```

   Where <key_value> is the copied key, and <key_type> depends on the type of key that was generated:

RSA	ssh-rsa
ECDSA	ecdsa-sha2-nistp256 ecdsa-sha2-nistp384 ecdsa-sha2-nistp521
EdDSA	ssh-ed25519

To add the private key to the endpoint:

1. Open *PuTTY Pageant*.
2. Click *Add Key* or *Add Key (encrypted)* and select the previously saved private key.
3. Click *Close*.

You can now log in to the FortiGate on an SSH connection without using a password.

If using PuTTY, the username can be entered under *Connection > Data* in the *Auto-login username* field.

The generated keys can also be used in a certificate to authenticate with the FortiGate. See Administrative access using certificates on page 3624 for information about generating and using certificates for administrative authentication.

Separating the SSHD host key from the administration server certificate

Separating the SSHD host key from the administration server certificate addresses the issue where the administration server key tends to overwrite one of the key files, which can lead to complications. This resolves the problem where the SSH module regenerates the host key files after a factory reset. This action previously prompted a warning message when an older SSH client attempted to log in to the FortiGate using SSH.

```
config system global
    set ssh-hostkey-override {enable | disable}
    set ssh-hostkey-password <password>
    set ssh-hostkey <encrypted_private_key>
end
```

The `ssh-hostkey-algo` option under `config system global` supports ECDSA 384 and ECDSA 256, allowing the SSHD to accommodate the most commonly used host key algorithms.

To configure SSH host key override in SSHD:

1. Using the ssh-keygen tool, generate the host key (ecdsa-sha2-nistp384 is used in this example).
2. Configure the SSH host key override settings:

```
config system global
    set ssh-hostkey-override enable
    set ssh-hostkey-algo ecdsa-sha2-nistp384
    set ssh-hostkey-password **********
    set ssh-hostkey <encrypted_private_key>
end
```

3. On a PC, attempt to log in to the FortiGate with the defined ecdsa-sha2-nistp384 algorithm:

```
root@PC05:~# ssh admin@172.16.200.1
The authenticity of host '172.16.200.1 (172.16.200.1)' can't be established.
ECDSA key fingerprint is SHA256:mcrMXSjtN/YjY3zQgZpxk77ezxPVGGGOL/GUOG8Oijs.
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added '172.16.200.1' (ECDSA) to the list of known hosts.
```

4. Verify the server host key algorithms:

```
root@PC05:~# nmap -sV --script ssh2-enum-algos 172.16.200.1
Starting Nmap 7.01 ( https://nmap.org ) at 2023-11-07 15:47 PST
Nmap scan report for FGT_A (172.16.200.1)
Host is up (0.00013s latency).
Not shown: 995 filtered ports
```

```
PORT    STATE  SERVICE      VERSION
22/tcp  open   ssh          (protocol 2.0)
| ssh2-enum-algos:
|   kex_algorithms: (8)
|       diffie-hellman-group14-sha256
|       diffie-hellman-group16-sha512
|       diffie-hellman-group18-sha512
|       diffie-hellman-group-exchange-sha256
|       curve25519-sha256@libssh.org
|       ecdh-sha2-nistp256
|       ecdh-sha2-nistp384
|       ecdh-sha2-nistp521
|   server_host_key_algorithms: (1)
|       ecdsa-sha2-nistp384
|   encryption_algorithms: (3)
```

Restricting SSH and Telnet jump host capabilities

Jump hosts are used to access devices in separate security zones, such as the internet and an internal network. Administrator access profiles can be configured to prevent administrators from using the FortiGate as a jump host for SSH and Telnet connections.

To configure permission to execute SSH or Telnet commands in an access profile:

```
config system accprofile
    edit <name>
        set system-execute-ssh {enable | disable}
        set system-execute-telnet {enable | disable}
    next
end
```

To block SSH and Telnet connections for an administrator:

1. Disable permission to execute SSH or Telnet commands in an administrator access profile:

```
config system accprofile
    edit "test_accprofile"
        set system-execute-ssh disable
        set system-execute-telnet disable
    next
end
```

2. Configure an administrator in the profile:

```
config system admin
    edit "admin1"
        set accprofile "test_accprofile"
        set vdom "root"
        set password **********
```

```
    next
end
```

3. Log in as the new administrator, and attempt to connect to another host using SSH or Telnet:

```
# execute ssh root@172.16.200.55
You are not entitled to run the command.
Command fail. Return code -37
```

```
# execute ssh6 root@2000:172:16:200::55
You are not entitled to run the command.
Command fail. Return code -37
```

```
# execute telnet 172.16.200.55
You are not entitled to run the command.
Command fail. Return code -37
```

Restricting local administrator logins through the console

FortiOS can now restrict local administrator logins using the console when FortiGate can reach the remote authentication server. This enhancement provides more control over local administrator logins to improve system security.

```
config system global
    set admin-restrict-local {all | non-console-only | disable}
end
```

`set admin-restrict-local {all | non-console-only | disable}`	Restrict local administrator logins when the remote authentication server is reachable. • `all`: Enable local administrator authentication restriction, including the console. • `non-console-only`: Enable local administrator authentication restriction, excluding the console. • `disable`: Disable local administrator authentication restriction.

Example 1

In this example, the local administrator restriction is set to `non-console-only`. As a result, local administrators cannot use non-console methods, such as SSH, to log in to FortiGate when the remote authentication server is reachable. However, local administrators can use the console to log in to FortiGate.

To exclude the console from local administrator login restrictions:

1. In FortiOS, set the administrator restriction to `non-console-only`:

```
config system global
    set admin-restrict-local non-console-only
end
```

2. Using SSH and the local administrator account, log in to FortiOS.
   Login is denied:

```
ssh admin@<ip address>
admin@<ip address>'s password:
Permission denied, please try again.
```

   The login failure is captured in the logs:

```
1: date=2024-04-01 time=15:42:08 eventtime=1712011328452918375 tz="-0700" logid="0100032002"
type="event" subtype="system" level="alert" vd="root" logdesc="Admin login failed" sn="0"
user="admin" ui="ssh(172.16.200.100)" method="ssh" srcip=172.16.200.100 dstip=172.16.200.1
action="login" status="failed" reason="none" msg="Administrator admin login failed from ssh
(172.16.200.100)"
```

3. Using the FortiGate console and the local administrator account, log in to FortiOS.
   Login is allowed:

```
FGT login: admin
Password:
Welcome!
```

   The successful login is captured in the logs:

```
1: date=2024-04-01 time=15:43:36 eventtime=1712011415358013250 tz="-0700" logid="0100032001"
type="event" subtype="system" level="information" vd="root" logdesc="Admin login successful"
sn="1712011415" user="admin" ui="console" method="console" srcip=0.0.0.0 dstip=0.0.0.0
action="login" status="success" reason="none" profile="super_admin" msg="Administrator admin
logged in successfully from console"
```

Example 2

In this example, the local administrator restriction is set to `all`. As a result, local administrators cannot use any method to log in to FortiGate when the remote authentication server is reachable.

To restrict all local administrator logins:

1. In FortiOS, set the local administrator restriction to `all`:

```
config system global
    set admin-restrict-local all
end
```

2. Using SSH and the local administrator account, log in to FortiOS.

Login is denied and the failure is captured in the logs.

3. Using the FortiGate console and the local administrator account, log in to FortiOS.
   Login is denied, and the failure is captured in the logs:

```
2: date=2024-04-01 time=16:26:56 eventtime=1712014017124846849 tz="-0700" logid="0100032002"
type="event" subtype="system" level="alert" vd="root" logdesc="Admin login failed" sn="0"
user="admin" ui="console" method="console" srcip=0.0.0.0 dstip=0.0.0.0 action="login"
status="failed" reason="none" msg="Administrator admin login failed from console"
```

Remote administrators with TACACS+ VSA attributes

Vendor-Specific Attributes (VSAs) can be used with TACACS+ authentication and authorization in wildcard system administrator access to FortiGates from browsers and SSH. The `memberof` VSA can be used in remote TACACS+ user group for group matching. The `vdom` VSA returned from TACACS+ can be used to overwrite the VDOM in the `system admin` settings. The `admin_prof` VSA returned from TACACS+ can be used to overwrite the `accprofile` in the `system admin` settings.

Example

In this example, a FortiGate is configured with multiple VDOMs, and the root acts as the management VDOM. Administrators attempt to log in with SSH or HTTPS through each VDOM.

Using the VSA values for the `vdom` and `admin_prof` attributes returned from the TACACS+ server, the FortiGate can allow access only to the VDOMs returned with the permissions from the corresponding administrator profile. If no VSA values are returned from TACACS+ , then the FortiGate uses the default values under the `config system admin` settings.

The TACACS+ server settings are configured as follows:

```
user = admin-all-vdom {
    default service = permit
    member = sys_admin_all_vdom
    …
}
user = admin-vdom1 {
    default service = permit
    member = sys_admin_vdom1
    …
}
group = sys_admin_all_vdom {
default service = permit
    service = fortigate {
        memberof = group3
        admin_prof = admin_all_vdom
    }
}
group = sys_admin_vdom1 {
default service = permit
    service = fortigate {
```

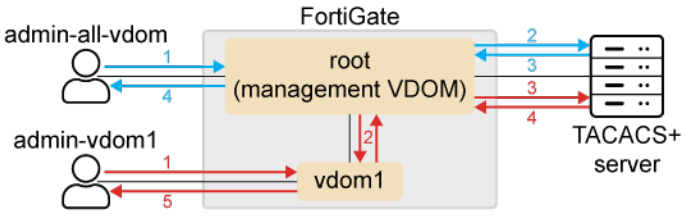
```
        memberof = group3
        admin_prof = admin_vdom1
        vdom = vdom1
    }
}
```

For multiple VDOMs, each VDOM must be specified in a separate field. For example, for access to vdom1 and vdom2:

```
vdom = vdom1
vdom = vdom2
```

Some TACACS+ servers, such as Linux TACACS+ servers, may only return the last VDOM specified.

The authentication process is as follows:



Authentication for admin-all-vdom:

1. The administrator attempts to log in to the FortiGate over the remote TACACS+ user group, `remote-tacacs`.
2. The FortiGate sends an authorization request to the TACACS+ server.
3. TACACS+ authenticates the admin-all-vdom user. The user matches the `sys_admin_all_vdom` TACACS+ group. TACACS+ returns following VSA values:
   - `memberof = group3`
   - `admin_prof = admin_all_vdom`
4. The FortiGate authenticates and authorizes the user based on the returned `memberof` group. The admin_prof value overwrites the `accprofile` setting configured under `system admin`. Since no other VDOM VSA is returned, the FortiGate matches the user to the default VDOM configured under `system admin`, which is `admin_no_access`.

Authentication for admin-vdom1:

1. The administrator attempts to log in to the FortiGate over the remote TACACS+ user group, `remote-tacacs`.
2. vdom1 forwards the request to the management VDOM, which is the root.
3. The FortiGate sends an authorization request to the TACACS+ server through the management VDOM.
4. TACACS+ authenticates the admin-vdom1 user. The user matches the `sys_admin_vdom1` TACACS+ group. TACACS+ returns following VSA values:
   - `memberof = group3`
   - `admin_prof = admin_vdom1`
   - `vdom = vdom1`

5. The FortiGate authenticates and authorizes the user based on the returned `memberof` group. The other VSA values overwrite the `accprofile` and VDOM settings configured under `system admin`. The user is only allowed to access vdom1 with the administrative permissions allowed for admin_vdom1.

To configure the FortiGate:

1. Create two system administrator profiles.
   a. Configure admin_vdom1 who has read-write access to vdom1 (except for firewall policies) and is redistricted from using diagnose commands in the CLI:

```
config system accprofile
    edit "admin_vdom1"
        set secfabgrp read-write
        set ftviewgrp read-write
        set authgrp read-write
        set fwgrp custom
        set cli-diagnose disable
        config fwgrp-permission
            set policy read
            set address read
            set service read
            set schedule read
            set others read
        end
    next
end
```

   b. Configure admin_all_vdom who has read-write access to all VDOMs, but not with super_admin permissions:

```
config system accprofile
    edit "admin_all_vdom"
        set secfabgrp read-write
        set ftviewgrp read-write
        set authgrp read-write
        set sysgrp read
        set netgrp read-write
        set loggrp read-write
        set fwgrp read-write
        set vpngrp read
        set utmgrp read
        set wanoptgrp read
        set wifi read
    next
end
```

2. Configure the TACACS+ server:

```
config user tacacs+
    edit "tac1"
        set server "10.1.100.34"
        set key XXXXXXXXXXXX
```

```
        set authorization enable
    next
end
```

3. Configure the remote TACACS+ group with group matching:

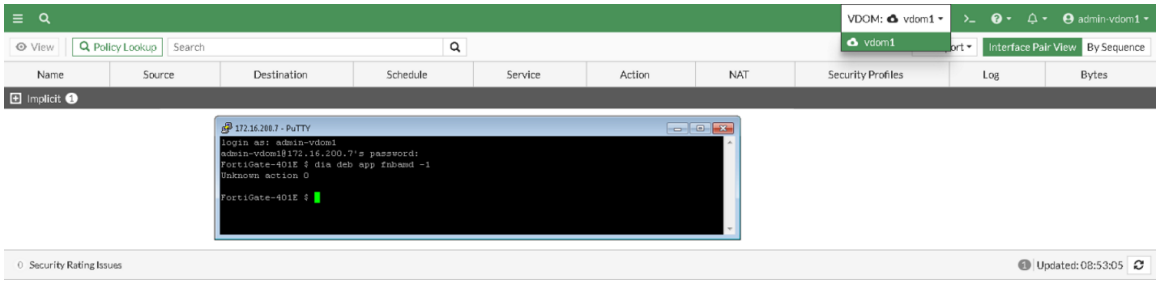
```
config user group
    edit "remote-tacacs"
        set member "tac1"
        config match
            edit 1
                set server-name "tac1"
                set group-name "group3"
            next
        end
    next
end
```

4. Configure the wildcard administrative user assigned to the remote TACACS+ group:

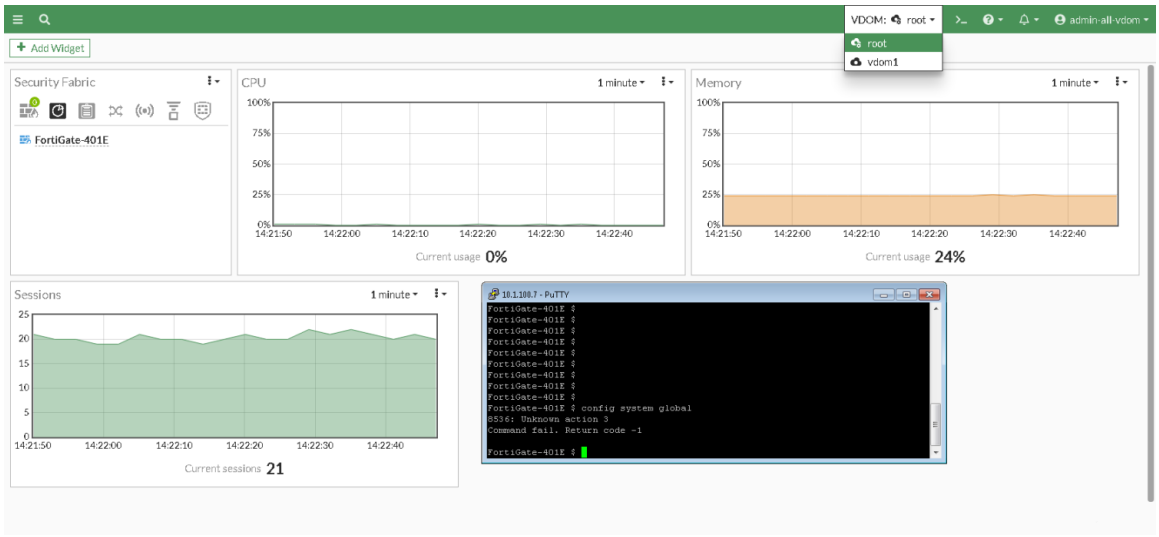
```
config system admin
    edit "remote-admin"
        set remote-auth enable
        set accprofile "admin_no_access"
        set vdom "root" "vdom1"
        set wildcard enable
        set remote-group "remote-tacacs"
        set accprofile-override enable
        set vdom-override enable
    next
end
```

To verify the configuration:

1. Log in as admin-vdom1 using a browser and SSH. The following behavior is expected:
   - The user can only access vdom1 (returned by TACACS+ in the `vdom` VSA).
   - The user can view firewall policies, but they cannot not create new policies.
   - The user cannot run `diagnose debug application` commands in the PuTTY SSH session.



2. Log in as admin_all_vdom using a browser and SSH. The following behavior is expected:
   - The user has no VSA VDOM configured on the TACACS+ server, so the default setting in the `system admin` configuration should apply. The user can access the root and vdom1 VDOMs.
   - The user has no access to `system global` in the CLI, and the prompt symbol is a `$` instead of a `#`.



Administrator profiles

Administrator profiles define what the administrator can do when logged into the FortiGate. When you set up an administrator account, you also assign an administrator profile which dictates what the administrator sees. Depending on the nature of the administrator's work, access level or seniority, you can allow them to view and configure as much or as little as is required. Access to CLI diagnose commands can also be disabled for global and VDOM level administrators.

By default, the FortiGate has an *admin* administrator account that uses the *super_admin* profile.

super_admin profile

This profile has access to all components of FortiOS, including the ability to add and remove other system administrators. For certain administrative functions, such as backing up and restoring the configuration, super_admin access is required. To ensure that there is always a method to administer the FortiGate, the super_admin profile cannot be deleted or modified.

Lower level administrator profiles cannot backup or restore the FortiOS configuration.

The super_admin profile is used by the default admin account. It is recommended that you add a password and rename this account once you have set up your FortiGate. In order to rename the default account, a second admin account is required.

Creating customized profiles

To create a profile in the GUI:

1. Go to *System* > *Admin Profiles* and click *Create New*.
2. Configure the following settings:
   - Name
   - Access permissions
   - Usage of CLI commands
   - Override idle timeout
3. Click *OK*.

To create a profile in the CLI:

```
config system accprofile
    edit <name>
        set secfabgrp {none | read | read-write}
        set ftviewgrp {none | read | read-write}
        set authgrp {none | read | read-write}
        set sysgrp {none | read | read-write | custom}
        set netgrp {none | read | read-write | custom}
        set loggrp {none | read | read-write | custom}
        set fwgrp {none | read | read-write | custom}
        set vpngrp {none | read | read-write}
        set utmgrp {none | read | read-write | custom}
        set wanoptgrp {none | read | read-write}
        set wifi {none | read | read-write}
        set admintimeout-override {enable | disable}
        set cli-diagnose {enable | disable}
        set cli-get {enable | disable}
        set cli-show {enable | disable}
        set cli-exec {enable | disable}
        set cli-config {enable | disable}
    next
end
```

The CLI profile configuration includes additional options to allow usage of the `get`, `show`, `execute`, and `config` CLI commands.

Many diagnostic commands have privileged access. As a result, using them could unintentionally grant unexpected access or cause serious problems, so understanding the risks involved is crucial.

Controlling CLI system permissions

Administrator profiles can control administrator access to CLI commands based on role, access level, or seniority.

To configure CLI command access in administrative profiles:

```
config system accprofile
    edit <name>
        set cli-diagnose {enable | disable}
        set cli-get {enable | disable}
        set cli-show {enable | disable}
        set cli-exec {enable | disable}
        set cli-config {enable | disable}
    next
end
```

This command allows the administrator to configure the administrator profiles by enabling specific CLI commands as needed. The default setting for all the CLI command options is `disable`.

Displaying execute commands for custom system permissions

A custom access profile can have customized system permissions. In this example, a profile is created for maintenance read access, and the profile is applied to a new system administrator account. Once the administrator logs in, they can view the available execute commands by entering `execute ?` in the CLI.

To create the profile:

1. Configure the access profile:

```
config system accprofile
    edit "mnt test"
        set sysgrp custom
        config sysgrp-permission
            set mnt read
        end
    next
end
```

2. Configure the system administrator account:

```
config system admin
    edit "mnt"
        set accprofile "mnt test"
        set vdom "root"
        set password ********
    next
end
```

To display the list of the execute commands:

```
$ execute ?
backup                backup
fctems                fctems
ping                  PING command.
ping-options          ping-options
ping6                 PINGv6 command. [Take 0-100 arg(s)]
ping6-options         ping6-options
ssh-options           SSH options.
ssh6-options          IPv6 SSH options.
telnet-options        telnet-options
traceroute            Traceroute {IP|hostname}.
traceroute-options    traceroute-options
tracert6              Traceroute for IPv6. [Take 0-32 arg(s)]
usb-device            usb-device
usb-disk              usb-disk
vm-license-options    VM license options.
```

The output will vary based on the FortiGate model. A FortiGate VM is used in this example. For more information about using the CLI, see CLI basics on page 62.

Editing profiles

To edit a profile in the GUI:

1. Go to *System* > *Admin Profiles*.
2. Select the profile to be edited and click *Edit*.
3. Make the required changes.
4. Click *OK* to save any changes.

To edit a profile in the CLI:

```
config system accprofile
    edit "sample"
        set secfabgrp read
    next
end
```

Deleting profiles

To delete a profile in the GUI:

1. Go to *System* > *Admin Profiles*.
2. Select the profile to be deleted and click *Delete*.
3. Click *OK*.

To delete a profile in the CLI:

```
config system accprofile
    delete "sample"
end
```

Firmware & Registration

The *Firmware & Registration* page allows administrators to manage the firmware running on all supported devices, including FortiGate, FortiAP, FortiSwitch, and FortiExtender devices. You can upgrade individual devices or all devices. Supports Security Fabric and non-Security Fabric devices.

From the *Firmware & Registration* page, administrators can also authorize, deauthorize, and register devices.

The *Firmware & Registration* page displays a summary of devices that includes:

- Total number of devices and how many devices of each type
- Upgrade status of all devices
- Device name
- Device status
- Registration status
- Firmware version and maturity level
- Upgrade status

Please note a valid *Firmware & General Updates* (FMWR) license is a prerequisite for upgrading to a major or minor firmware release in FortiGate. See How the FortiGate firmware license works on page 3265 for more information.

From the *Firmware & Registration* page, you can:

Upgrade all	Click *Upgrade all* and choose whether to upgrade all devices, extension devices, FortiAPs, FortiSwitches, or FortiExtenders. Available for Security Fabric and non-Security Fabric devices. See Upgrading all devices on page 3234.

Upgrade	Select one or more FortiGate, FortiAP, FortiSwitch, or FortiExtender devices to display and click the *Upgrade* button. Available for Security Fabric and non-Security Fabric devices. See Upgrading individual devices on page 3231.
Register	Select one or more devices to display and click the *Register* button. Use to register selected devices to FortiCare. See Registering devices on page 3238. The FortiGate, and then its service contract, must be registered to have full access to Fortinet Customer Service and Support, and FortiGuard services. The FortiGate can be registered in either the FortiGate GUI or the FortiCloud support portal. The service contract can be registered from the FortiCloud support portal. See also Registering FortiGate on page 38.
Authorization	Select one or more devices to display and click the *Authorization* or *Deauthorize* buttons. Use to authorize, deauthorize, or reject selected devices. See Authorizing devices on page 3251.
Reports	After a successful upgrade, view the firmware upgrade report. It compares statistics and configurations before and after a firewall upgrade. See Viewing firmware upgrade reports on page 3246.

Before upgrading FortiGate firmware, it is recommended to learn about firmware updates, firmware maturity levels, Special Technical Support (STS) firmware, and selected availability (SA) versions. See About firmware installations on page 3223 and Firmware labels on page 3224.

This section also includes the following topics:

- Enabling automatic firmware upgrades on page 3239
- Firmware upgrade notifications on page 3252
- Downloading a firmware image on page 3253
- Testing a firmware version on page 3254
- Installing firmware from system reboot on page 3255
- Restoring from a USB drive on page 3258
- Using controlled upgrades on page 3258
- Downgrading individual device firmware on page 3259
- Downloading the EOS support package for supported Fabric devices on page 3261
- How the FortiGate firmware license works on page 3265

About firmware installations

Fortinet periodically releases new FortiGate firmware to include new features and resolve important issues. After successful registration of your FortiGate unit, firmware updates are available from FortiGuard and from the Fortinet Customer Service & Support website. See Registering FortiGate on page 38 for more information.

A valid *Firmware & General Updates* (FMWR) license is a prerequisite for upgrading to a major or minor firmware release in FortiGate. See How the FortiGate firmware license works on page 3265 for more information.

Installing a new firmware image replaces the current antivirus and attack definitions, along with the definitions included with the firmware release that is being installing. After you install new firmware, make sure that the antivirus and attack definitions are up to date.

It is recommended to back up your configuration before making any firmware changes. You will be prompted to back up your configuration as part of the upgrade process. See also Configuration backups and reset on page 3686.

Before you install any new firmware, follow the below steps:

1. Understand the maturity level of the current and target firmware releases to help you determine whether to upgrade. See Firmware maturity levels on page 3225. See also Selected availability (SA) versions on page 3229.
2. Review the Release Notes for a new firmware release.
3. Review the Supported Upgrade Paths.
4. Download a copy of the currently installed firmware, in case you need to revert to it. See Downloading a firmware image on page 3253 and Downgrading individual device firmware on page 3259 for details.
5. Have a plan in place in case there is a critical failure, such as the FortiGate not coming back online after the update.

   This could include having console access to the device (Connecting to the CLI on page 59), ensuring that your TFTP server is working (Installing firmware from system reboot on page 3255), and preparing a USB drive (Restoring from a USB drive on page 3258).
6. Back up the current configuration, including local certificates. The upgrade process prompts you to back up the current configuration. See also Configuration backups and reset on page 3686 for details.
7. Test the new firmware until you are satisfied that it applies to your configuration. See Testing a firmware version on page 3254 and Using controlled upgrades on page 3258 for details.

Installing new firmware without reviewing release notes or testing the firmware may result in changes to settings and unexpected issues.

Only FortiGate admin users and administrators whose access profiles contain system read and write privileges can change the FortiGate firmware.

Firmware labels

Fortinet uses the following labels to communicate important information about the version of FortiOS firmware running on FortiGate:

Maturity level	Identifies whether the firmware includes new, major features in addition to bug fixes and vulnerability patches. See Firmware maturity levels on page 3225.
Special Technical Support	Identifies a non-GA build of firmware issued by Fortinet support. See Special Technical Support firmware on page 3227.
Selected Availability	Identifies a special build of firmware issued by Fortinet to use for a long time. See Selected availability (SA) versions on page 3229.

Firmware maturity levels

Starting with FortiOS 7.2.0, released FortiOS firmware images use tags to indicate the following maturity levels:

- The *Feature* tag indicates that the firmware release includes new features. It can also include bug fixes and vulnerability patches where applicable.
- The *Mature* tag indicates that the firmware release includes no new, major features. Mature firmware will contain bug fixes and vulnerability patches where applicable.

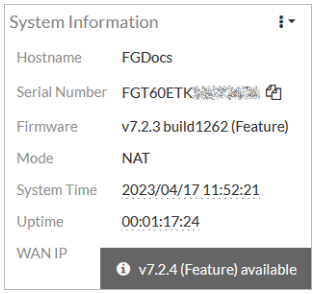
Administrators can use the tags to identify the maturity level of the current firmware in the GUI or CLI.

Administrators can view the maturity level of each firmware image that is available for upgrade on the *Firmware & Registration* page. When upgrading from mature firmware to feature firmware, a warning message is displayed.

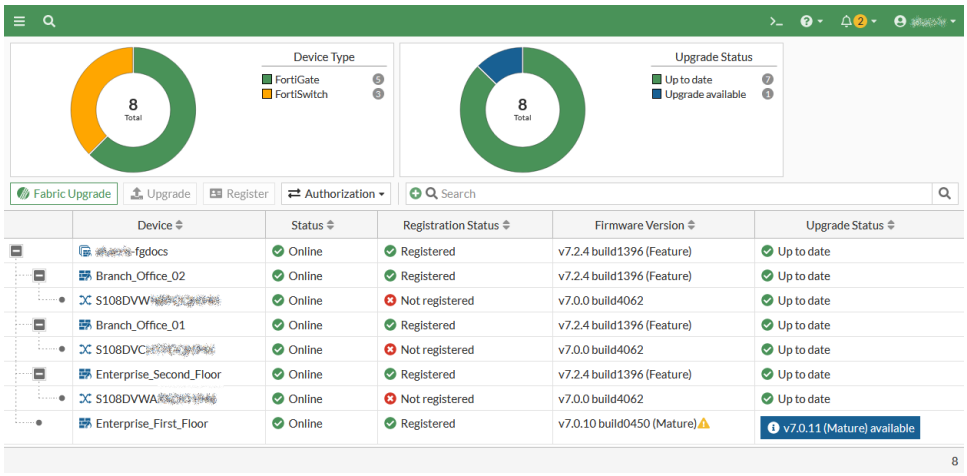
To view maturity levels for firmware in the GUI:

1. Go to *Dashboard > Status*. The *Firmware* field in the *System Information* widget displays the version with build number and either *(Mature)* or *(Feature)*.
   The following is an example of firmware with the *(Mature)* tag:

   The following is an example of firmware with the *(Feature)* tag:



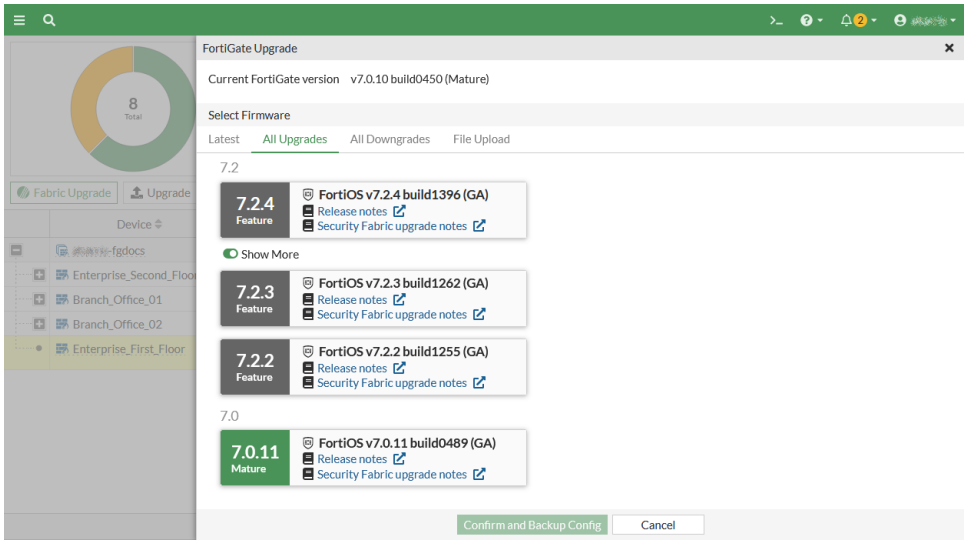
2. Go to *System > Firmware & Registration*. The *Firmware Version* column displays the version with build number and either *(Mature)* or *(Feature)*.



3. Select a device and click *Upgrade*. The *FortiGate Upgrade* pane is displayed.
   - Click the *Latest* tab to view the latest available firmware version with its maturity level.

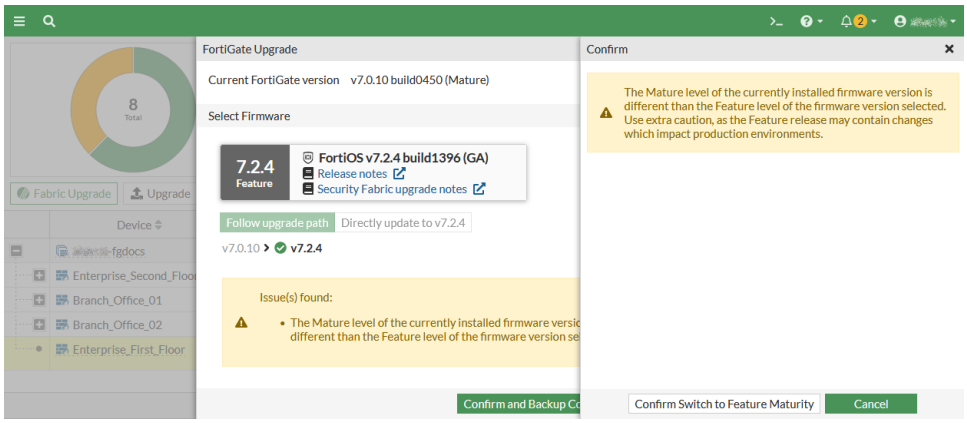
   - Click the *All Upgrades* tab to view all available firmware versions and their maturity levels.

     A gray box around the version number and the label *Feature* identifies feature firmware version. A green box around the version with the label *Mature* identifies a mature firmware version.



4. Select a version and click *Confirm and Backup Config*.

When the firmware version is a feature release, a warning is displayed; click *Confirm Switch to Feature Maturity*.



To view maturity levels for firmware in the CLI:

In this example, the `Version` field includes `.F` to indicate that the maturity level is feature:

```
# get system status
Version: FortiWiFi-81F-2R-POE v7.2.4,build1396,230131 (GA.F)
...
```

In this example, the `Version` field includes `.M` to indicate that the maturity level is mature:

```
# get system status
Version: FortiWiFi-81F-2R-POE v7.0.10,build0450,230221 (GA.M)
...
```

Special Technical Support firmware

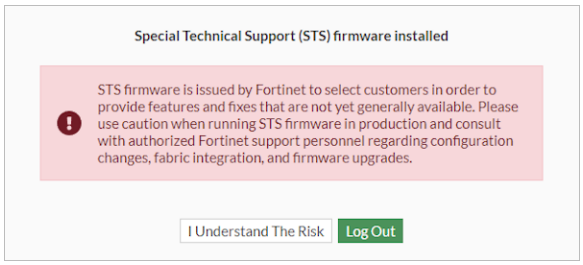
Special Technical Support firmware was formerly known as Top3 builds. When Special Technical Support (STS) firmware is running on FortiGate instead of General Availability (GA) firmware, it is labeled as STS in the FortiOS GUI and CLI, and warning messages about the risks are displayed. STS builds are signed by Fortinet.

This example shows how to use the FortiOS GUI and CLI to identify when FortiGate is running an STS build of firmware.

See also BIOS-level signature and file integrity checking on page 3644.

To view an STS build in the GUI:

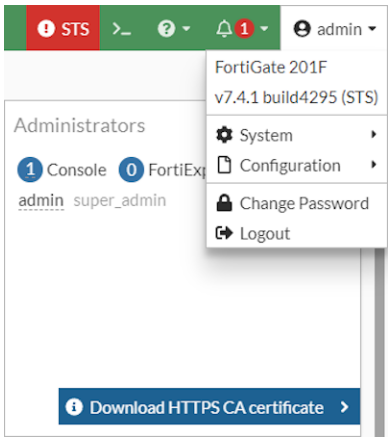
1. Log in to FortiOS. A warning message is displayed.



2. Click *I Understand The Risk* to acknowledge the warning and complete the login process.
3. View the STS build label and warnings:
   - Go to *Dashboard > Status > System Information* widget to view the red (STS) label in the *Firmware* field, for example, *7.4.1 build4291 (STS)*.

   - Hover over the FortiGate name on the left corner of the banner to display a tooltip. The *Version* fields displays *(STS)*, for example, *7.4.1 build4295 (STS)*.

   - Click *admin* on the top-right of the banner to display a menu. The *(STS)* label appears at the end of the version, for example, *7.4.1 build4295 (STS)*.



- Hover over the exclamation mark beside *STS* on the top-right of the banner. A *Special Technical Support (STS) firmware installed* warning is displayed.

To view an STS build in the CLI:

1. Log in to the CLI. The console prints the following warning message:

```
Login: admin
Password
******WARNING: This is a Special Technical Support (STS) firmware.******
STS firmware is issued by Fortinet to select customers in order to provide features and fixes
that are not yet generally available. Plesae use caution when running STS firmware in
production and consult with authorized Fortinet support personnel regarding configuration
changes, fabric integration, and firmware upgrades.

Welcome!
```

2. Get the system status.
   In this example, the STS build is identified by (STS) and a certified firmware signature.

```
# get system status
Version: FortiGate-201F v7.4.1,build4295,230817 (STS)
Security Level: 2
Firmware Signature: certified
...
```

Selected availability (SA) versions

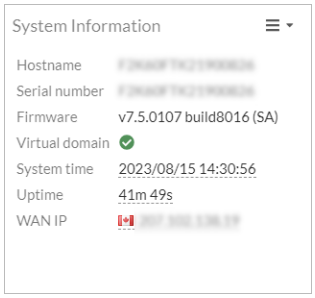
A selected availability (SA) version and label identifies special builds that are provided to customers to use for a long time. The SA version uses an odd number as the minor version and a four digit number for the patch version. The SA version and label are visible in the GUI and CLI.

SA builds are dual-signed by the Fortinet CA and a third-party CA.

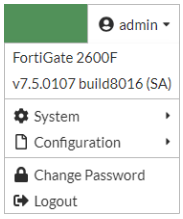
In the following example, special build 0107 is based on FortiOS 7.4.0 build 8016 and is labeled *v7.5.0107 build8016 (SA)*.

To view the SA version and label in the GUI:

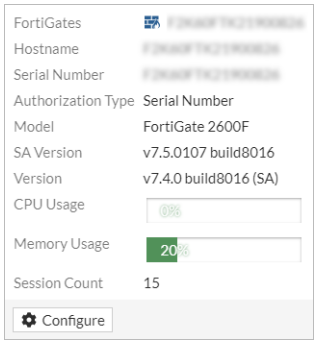
1. Go to *Dashboard* > *Status* > *System Information*. The *Firmware* option displays the SA version and label of *v7.5.0107 build8016 (SA)*.



2. On the top-right of the banner, click *<administrator name>*, such as *admin*. The SA version and label is displayed.



3. On the top-left corner of the banner, click the FortiGate name. A tooltip displays the SA version and label.



To view the SA version and label in the CLI:

```
# get system  status
Version: FortiGate-2600F v7.4.0,build8016,230711 (SA)
SA Version: v7.5.0107,build8016
Security Level: 0
Firmware Signature: certified
...
```

The `SA Version` is displayed as `v7.5.0107, build8016`.

Upgrading individual devices

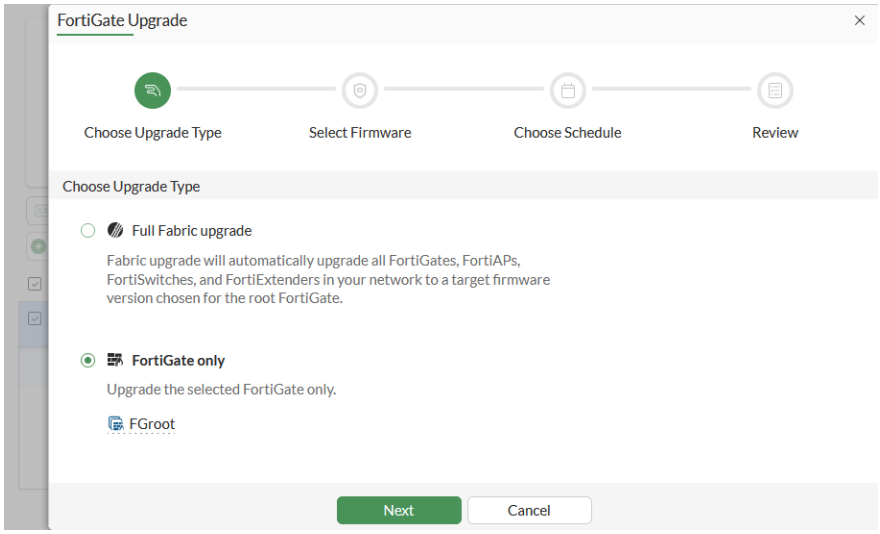
On the *System > Firmware & Registration* page, select one or more supported devices to display the *Upgrade* button. Supported devices include FortiGate, FortiAP, FortiExtender, or FortiSwitch. Click the *Upgrade* button to open the *FortiGate Upgrade* wizard and complete the following steps:

- Choose Upgrade Type
- Select Firmware
- Choose Schedule
- Review

To upgrade individual device firmware in the GUI:

1. Log in to the FortiGate GUI as an administrative user.
2. Go to *System > Firmware & Registration*.
3. Select one or more devices, and click *Upgrade* to open the *FortiGate Upgrade* wizard.
   The following devices and scenarios are supported:
   - Select one or more FortiGate devices.
   - Select one or more FortiAP devices.
   - Select one or more FortiExtender devices.
   - Select one or more FortiSwitch devices.
   - Select a mix of FortiAP, FortiExtender, and/or FortiSwitch devices.

   When upgrading non-FortiGate devices, the wizard opens at the *Select Firmware* step.
4. If the *Choose Upgrade Type* step is displayed, select *FortiGate only* then click *Next*.



5. For the *Select Firmware* step:

a. Select firmware from one of the following tabs:

Recommended	Displays the recommended firmware from FortiGuard. When FortiGate is running the latest firmware from FortiGuard, the following message is displayed: *The firmware is up to date*.
All Upgrades	Displays all available firmware from FortiGuard. When FortiGate is running the latest firmware from FortiGuard, the following message is displayed: *No upgrades available*.
All Downgrades	Displays all available firmware downgrades from FortiGuard. Downgrading the firmware is not recommended. See Downgrading individual device firmware on page 3259.
File Upload	Upload a firmware file that you previously downloaded from the Fortinet Customer Service & Support website. See Downloading a firmware image on page 3253.

b. If the selected firmware version spans multiple builds in the upgrade path, choose one of the following options:

Follow upgrade path	Automatically upgrade FortiGate to each firmware in the upgrade path before upgrading to the selected version. Recommended. FortiGate automatically completes the upgrades, including any required reboots, by downloading the chosen firmware directly from FortiGuard.
Directly update to v<version and build number>	Bypass the upgrade path to immediately upgrade FortiGate to the selected firmware. A warning message is displayed: *Upgrading to FortiOS v<version and build number> directly may result in the loss of configuration*.

Information about the selected firmware is displayed for you to consider. For example, when upgrading from mature firmware to feature firmware, a warning message appears about the maturity level of the selected firmware for the upgrade. See Firmware maturity levels on page 3225 for more information.

c. Click *Next*.

6. For the *Choose Schedule* step:

a. Choose a schedule:

Immediate	Select to start the upgrade immediately after completing the *FortiGate Upgrade* wizard.
Specify	Select to schedule a date and time to start the upgrade after completing the *FortiGate Upgrade* wizard.

Scheduling an upgrade using a manually uploaded file is only available for FortiGate devices that have physical disk storage.

- If the FortiGate has a disk, *File Upload* upgrades can be scheduled for it and its extension units both in the GUI and using the Security Fabric.
- If the FortiGate does not have a disk, *File Upload* upgrades cannot be scheduled for it or its extension units.

b. Click *Next* to proceed to the *Review* step.

7. For the *Review* step, review the upgrade plan, and click *Confirm and Backup Config* to proceed. The *Confirm* dialog box is displayed.
8. Click *Yes* to start the upgrade. The *Important* dialog box is displayed.
9. Read the information and click *Close*.
10. Use the *Firmware Upgrade* tray to monitor upgrade progress.

    The FortiGate unit backs up the current configuration to the management computer, uploads the firmware image file, upgrades to the new firmware version, and restarts. This process takes a few minutes.

To upgrade individual device firmware in the CLI:

1. Make sure that the TFTP server is running.
2. Copy the new firmware image file to the root directory of the TFTP server.
3. Log in to the CLI.
4. Ping the TFTP server to ensure that the FortiGate can connect to it:

```
# execute ping <tftp_ipv4>
```

5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:

```
# execute restore image tftp <filename> <tftp_ipv4>
```

   The FortiGate unit responds with the message:

```
This operation will replace the current firmware version!
Do you want to continue? (y/n)
```

6. Type y. The FortiGate unit uploads the firmware image file, verifies the signature of the firmware image, and determines the firmware maturity level.

   When you are upgrading to a feature firmware image, you are asked to confirm whether to continue with the upgrade.

   When you proceed with the upgrade, the upgrade image is installed and FortiGate restarts. This process takes a few minutes.

```
Please wait...
Connect to tftp server 172.16.200.55 ...
#################################################################################
Get image from tftp server OK.
Verifying the signature of the firmware image.

Warning: Upgrading to an image with Feature maturity notation.
Image file uploaded is marked as a Feature image, are you sure you want to upgrade?
Do you want to continue? (y/n)y
Please confirm again. Are you sure you want to upgrade using uploaded file?
Do you want to continue? (y/n)y
Checking new firmware integrity ... pass
Please wait for system to restart.
Firmware upgrade in progress ...
Done.
The system is going down NOW !!
```

7. Reconnect to the CLI.
8. Update the antivirus and attack definitions:

```
# execute update-now
```

Upgrading all devices

On the *System > Firmware & Registration* page, use the *Upgrade all* button to upgrade firmware on all supported devices. Supported devices include FortiGate, FortiAP, FortiExtender, and FortiSwitch, and the option is available for Security Fabric and non-Security Fabric devices.

Click the *Upgrade all* button and choose what device types to upgrade. The *FortiGate Upgrade* wizard opens to help you complete the following steps:

- Choose Upgrade Type
- Select Firmware
- Choose Schedule
- Review

During a full Fabric upgrade, FortiGate upgrades devices by groups in the following order:

1. PoE PD (Power over Ethernet Powered Devices)
2. PoE PSE (Power Source Equipment) and non-PoE devices
3. FortiGate itself

Group 2 (PoE PSE and non-POE devices) waits until group 1 (PoE PD) finishes upgrading to new firmware before starting its upgrade.

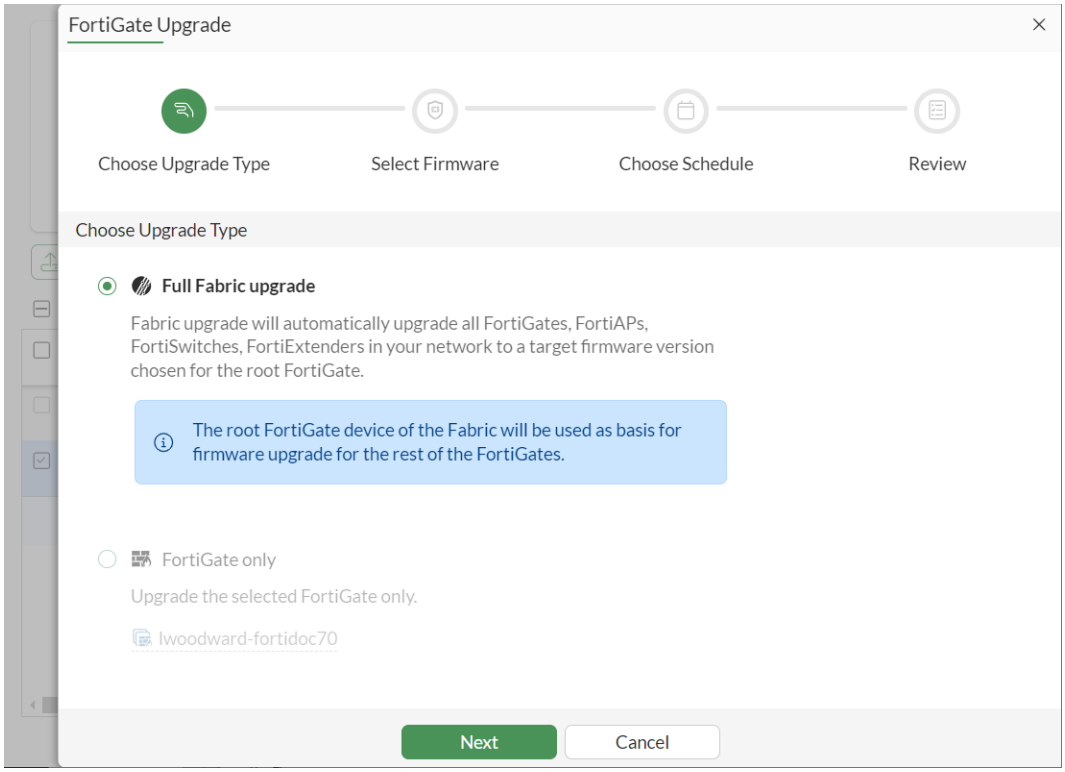
Once all upgrades are complete, and the FortiGate is back up, it verifies that all devices are using the new firmware version before labeling the upgrade as done.

To upgrade all device firmware in the GUI:

1. Log in to the FortiGate GUI as an administrative user.
   When you are upgrading the Security Fabric, you must log in to the root FortiGate.
2. Go to *System > Firmware & Registration*, click *Upgrade all*, and select one of the following options:

Upgrade all > Devices	Upgrades all devices, including FortiGate, FortiAP, FortiSwitch, and FortiExtender devices.
Upgrade all > Extension devices	Upgrades all FortiAP, FortiSwitch, and FortiExtender devices.
Upgrade all > FortiAPs	Upgrades all FortiAP devices.
Upgrade all > FortiExtenders	Upgrades all FortiExtender devices.
Upgrade all > FortiSwitches	Upgrades all FortiSwitch devices.

   The *FortiGate Upgrade* wizard opens to the *Choose Upgrade Type* step.



3. On the *Choose Upgrade Type* step, select *Full Fabric upgrade*, and click *Next* to proceed to the *Select Firmware* step.
4. For the *Select Firmware* step:

a. Select firmware from one of the following tabs:

Recommended	Displays the recommended firmware from FortiGuard. When the devices are running the latest firmware from FortiGuard, the following message is displayed: *The firmware is up to date*.
All Upgrades	Displays all available firmware from FortiGuard. When the devices are running the latest firmware from FortiGuard, the following message is displayed: *No upgrades available*.
All Downgrades	Displays all available firmware downgrades from FortiGuard. Downgrading the firmware is not recommended. See Downgrading individual device firmware on page 3259.

On managed FortiAP, FortiExtender, and FortiSwitch devices, the upgrade adheres to the respective compatibility matrix information maintained on the FortiGuard Distribution Network (FDN).

b. If the selected firmware version spans multiple builds in the upgrade path, choose one of the following options:

Follow upgrade path	Automatically upgrade to each firmware in the upgrade path before upgrading to the selected version. Recommended. FortiGate automatically completes the upgrades, including any required reboots, by downloading the chosen firmware directly from FortiGuard.
Directly update to v<version and build number>	Bypass the upgrade path to immediately upgrade FortiGate to the selected firmware. A warning message is displayed: *Upgrading to v<version and build number> directly may result in the loss of configuration*.

Information about the selected firmware is displayed for you to consider. For example, when upgrading from mature firmware to feature firmware, a warning message appears about the maturity level of the selected firmware for the upgrade. See Firmware maturity levels on page 3225 for more information.

c. Click *Next* to proceed to the *Choose Schedule* step.

5. For the *Choose Schedule* step:

a. Choose a schedule:

Immediate	Select to start the upgrade immediately after completing the *FortiGate Upgrade* wizard.
Specify	Select to schedule a date and time to start the upgrade after completing the *FortiGate Upgrade* wizard.

The configuration is backed up when the upgrade is scheduled, not when the upgrade occurs.

If configuration changes are made after the upgrade is scheduled but before the upgrade occurs, those changes will not be saved in the configuration backup.

Scheduling an upgrade using a manually uploaded file is only available for FortiGate devices that have physical disk storage.

- If the FortiGate has a disk, *File Upload* upgrades can be scheduled for it and its extension units both in the GUI and using the Security Fabric.
- If the FortiGate does not have a disk, *File Upload* upgrades cannot be scheduled for it or its extension units.

b. Click *Next* to proceed to the *Review* step.

6. For the *Review* step, review the upgrade plan, and click *Confirm and Backup Config* to proceed. The *Confirm* dialog box is displayed.
7. Click *Yes* to start the upgrade. The *Important* dialog box is displayed.
8. Read the information and click *Close*.
9. Use the *Firmware Upgrade* tray to monitor upgrade progress.

   The FortiGate unit backs up the current configuration to the management computer, uploads the firmware image file, upgrades to the new firmware version, and restarts. This process takes a few minutes.

To upgrade all device firmware in the CLI:

The following options are available in `execute federated-upgrade <option>`:

Option	Description
`cancel`	Cancel the currently configured upgrade.
`initialize`	Set up a federated upgrade.
`status`	Show the current status of a federated upgrade.
`restart`	Restart the currently configured federated upgrade.

The `config system federated-upgrade` command is read-only. Attempting to configure federated upgrade using the `config` command will show the following error message:

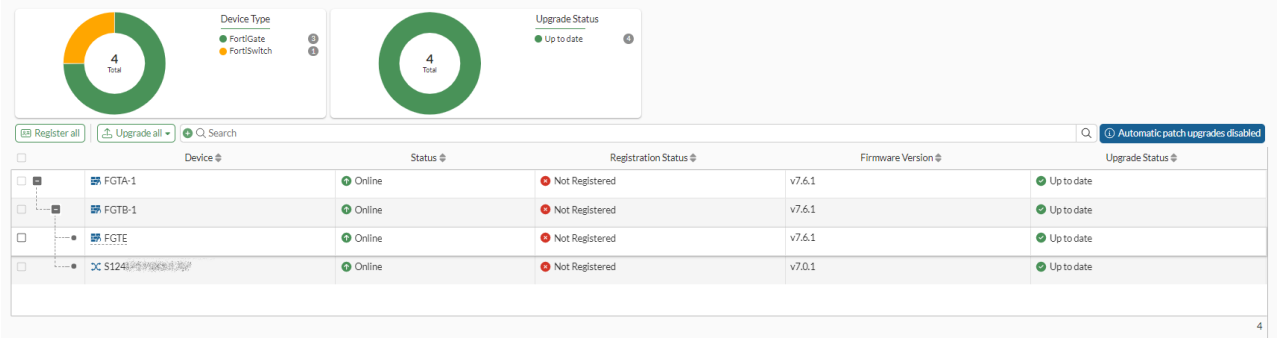
```
Federated upgrade cannot be configured directly.
Please use 'execute federated-upgrade ...' to configure.
```

Registering devices

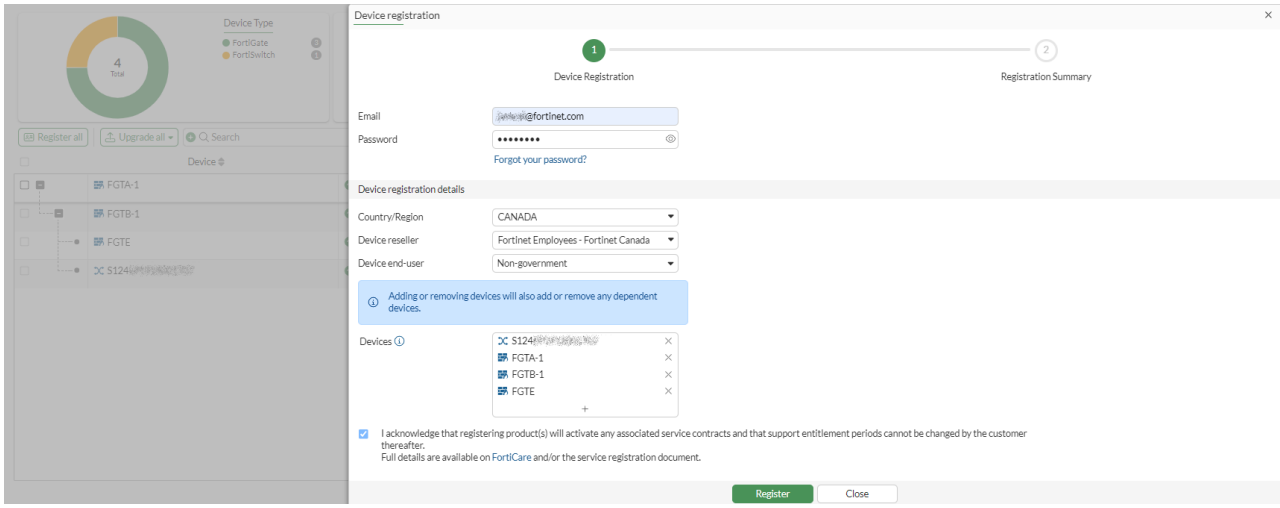
All Fortinet devices (FortiGates, FortiAPs, and FortiSwitches) that are in the same Security Fabric can be registered to the same FortiCare account at the same time, as opposed to having to register each device individually.

To register devices from the Firmware & Registration page:

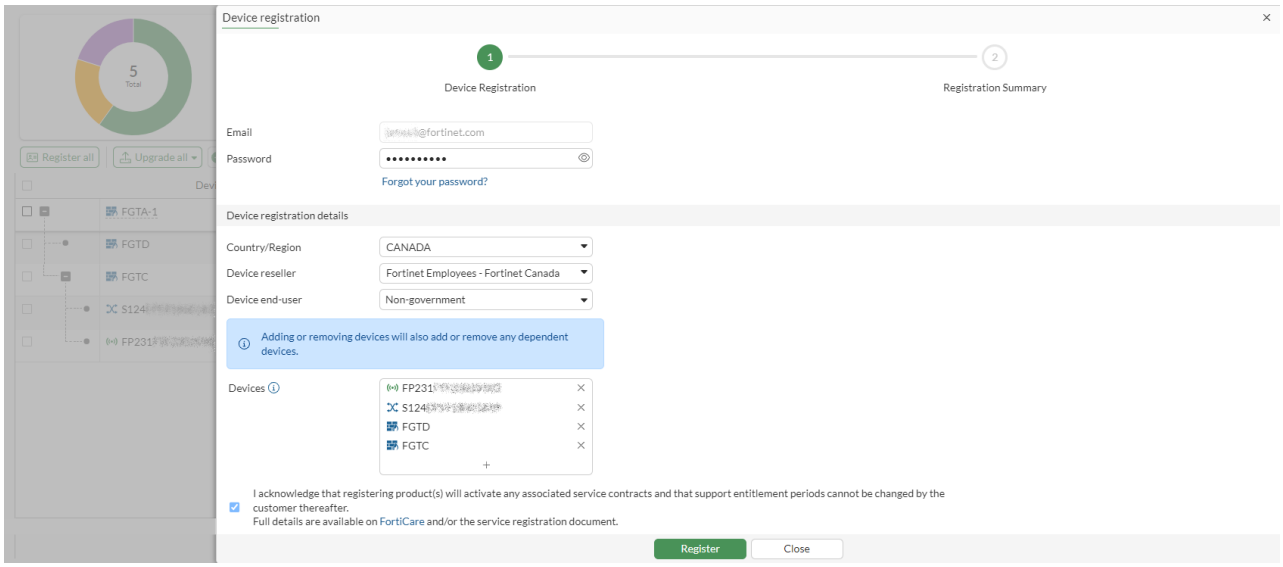
1. On the Fabric root FortiGate, go to *System* > *Firmware & Registration*. The *Registration Status* column shows whether or not a device has been registered to FortiCare.



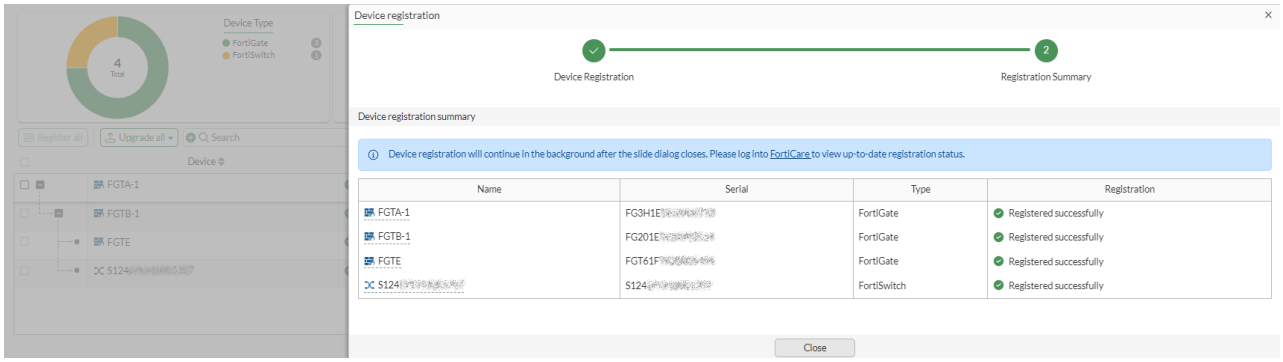
2. Click *Register All*.
3. Fill in the *Device registration* pane, adding all of the unregistered devices in the *Devices* field.



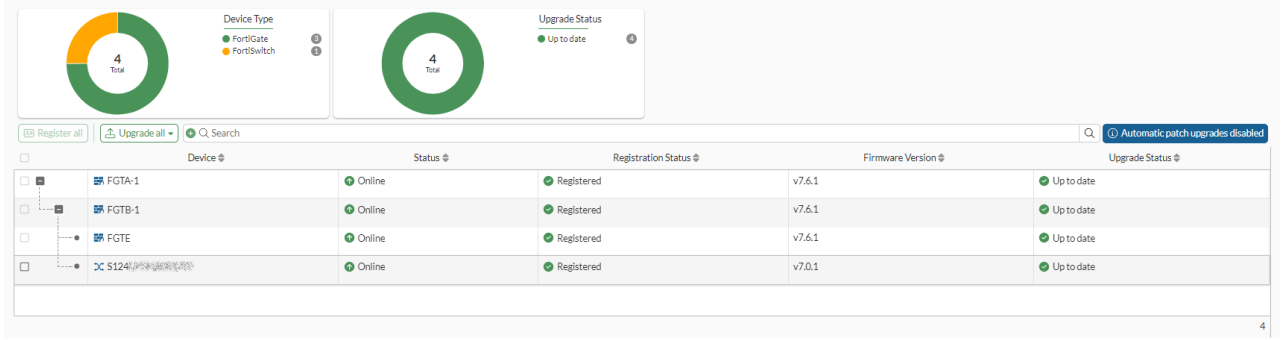
If the root FortiGate device is already registered, the *Email* address will already be set.



4. Click *Register*. A registration request for all of the selected devices is sent to FortiCare and the *Device registration summary* table is shown.



5. Click *Close*. The *Firmware & Registration* page shows the updated registration statuses.



Enabling automatic firmware upgrades

Automatic firmware upgrades can be enabled so that the FortiGate automatically upgrades when a new FortiOS patch release is available, for increased device security.

When enabled, FortiGates use the FortiGuard upgrade path to check FortiGuard for firmware updates within the same minor release. Checks are performed within a specified time period. When a new patch release is available, a firmware upgrade is scheduled.

After the patch release is successfully installed, an email is sent to the FortiCloud account that the FortiGate is registered to.

- Automatic firmware upgrade cannot be enabled for FortiGates belonging to a Security Fabric, FortiGates under management by a FortiManager, or a secondary HA FortiGate. However, HA groups will still have automatic firmware upgrades based on the primary FortiGate.
- Automatic upgrades will only upgrade to a newer patch within that minor version. For example, a FortiOS version 7.2.x image will only auto-upgrade to another 7.2.x image. It will not upgrade to a 7.4.x image.

Starting with FortiOS 7.6.1, automatic firmware upgrades are enabled by default on all FortiGate models, including FortiGate VMs. Automatic firmware upgrades can be configured from the *FortiGate Setup* wizard, the *System > Firmware & Registration* pane, or in the CLI with the following commands:

```
config system fortiguard
    set auto-firmware-upgrade {enable | disable}
    set auto-firmware-upgrade-day {sunday monday tuesday wednesday thursday friday saturday}
    set auto-firmware-upgrade-delay <integer>
    set auto-firmware-upgrade-start-hour <integer>
    set auto-firmware-upgrade-end-hour <integer>
end
```

`auto-firmware-upgrade {enable | disable}`	Enable/disable automatic patch-level firmware upgrades from FortiGuard.
`auto-firmware-upgrade-day {sunday monday tuesday wednesday thursday friday saturday}`	Enter the allowed day or days of the week to start the automatic patch-level firmware upgrade from FortiGuard.
`auto-firmware-upgrade-delay <integer>`	Enter the number of days to wait before automatically installing the automatic patch-level firmware upgrade from FortiGuard (default = 3).
`auto-firmware-upgrade-start-hour <integer>`	Set the start time of the designated time window for the automatic patch-level firmware upgrade from FortiGuard (in hours, 0 - 23, default = 2). The actual upgrade time is randomly selected in the time window. See Reviewing upgrade status on page 3241 for more information on confirming the scheduled upgrade time.
`auto-firmware-upgrade-end-hour <integer>`	Set the end time of the designated time window for the automatic patch-level firmware upgrade from FortiGuard (in hours, 0 - 23, default = 4). When this value it is smaller than the start time, it will be treated as the same time in the next day. The actual upgrade time is randomly selected in the time window. See Reviewing upgrade status on page 3241 for more information on confirming the scheduled upgrade time.

The `auto-firmware-upgrade-delay` and `auto-firmware-upgrade-day` commands are mutually exclusive. The `auto-firmware-upgrade-delay` command overrides the `auto-firmware-upgrade-day` command. Disable `auto-firmware-upgrade-delay` by setting it to zero if you would rather use the `auto-firmware-upgrade-day` command to select a day of the week for automatic installation, regardless of when the patch release is detected.

For FortiGates managed by FortiGate Cloud, automatic firmware patch may be enabled depending on the FortiGate Cloud version and portal in use. See the Administration Guide for the applicable FortiGate Cloud version and portal:

- Standard Portal Administration Guide
- 25.1.a Portal (Beta) Administration Guide
- Premium Portal Administration Guide

Reviewing upgrade status

The following commands can be used to review the status of the automatic upgrade.

The `diagnose test application forticldd 13` command lists when the most recent firmware image upgrade check occurred as well as when the next check is scheduled.

If the FortiGate is part of a Fabric or managed by FortiManager, the `Automatic image upgrade` option will be set to `disabled`.

```
# diagnose test application forticldd 13
...
Automatic image upgrade: disabled.
```

If a newer, valid firmware patch is detected, the `show sys federated-upgrade` command will list when the firmware upgrade will occur. The firmware upgrade schedule will depend on the configured automatic upgrade settings. If the settings are changed before the upgrade occurs, the image installation will be rescheduled to respect the new requirements.

The `show sys federated-upgrade` command also lists previous firmware upgrades.

The following debug commands are available for troubleshooting:

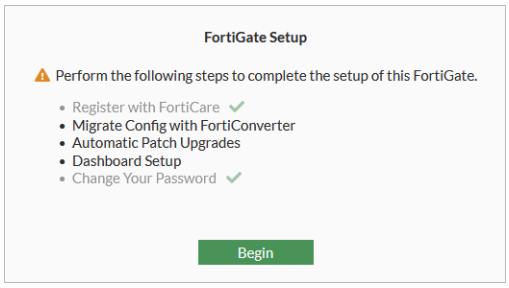
```
# diagnose debug en
# diagnose debug application forticldd -1
# diagnose debug application sfupgraded -1
```

Example

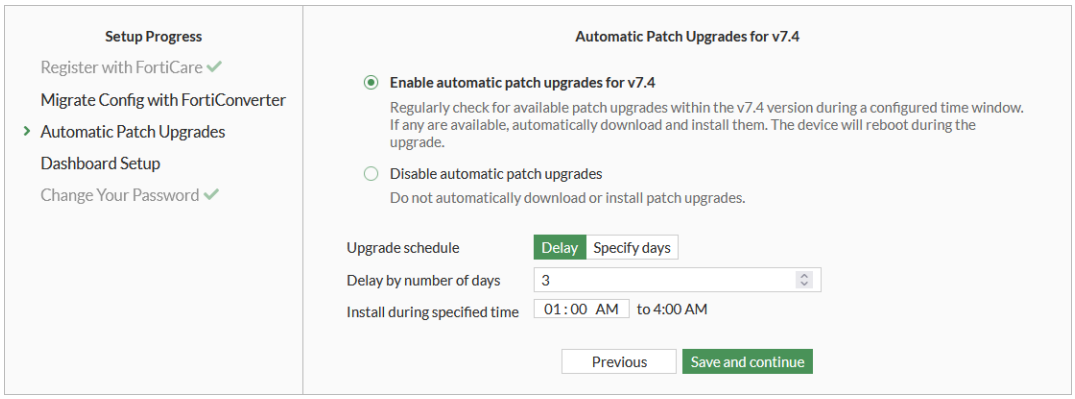
The following example demonstrates setting automatic firmware upgrades after a delay of three days.

To configure automatic firmware upgrades in the GUI:

1. Log in to the FortiGate GUI and click *Begin*.

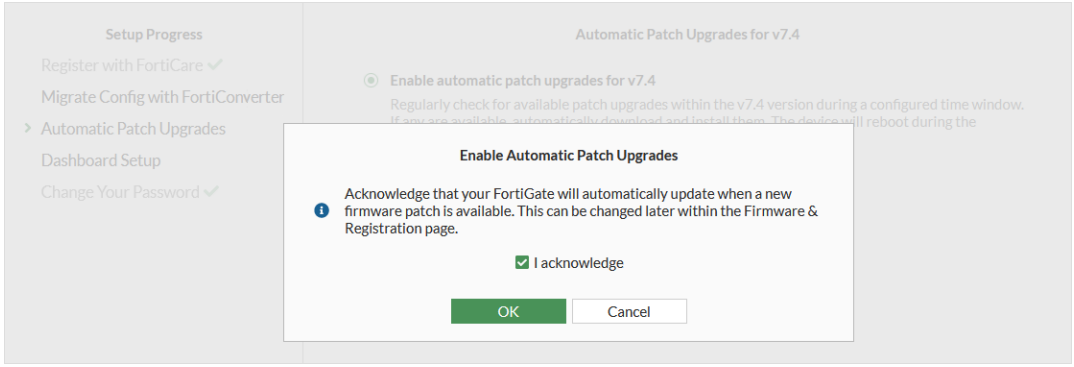


2. Select *Enable automatic patch upgrades for v7.4* (default setting).
3. Edit the upgrade and installation settings as needed (*Upgrade schedule*, *Delay by number of days*, *Install during specified time*), then click *Save and continue*.



If *Disable automatic patch upgrades* is selected, this can be changed later from the *System > Firmware & Registration* page by clicking the *Disable automatic patch upgrades* notification.

4. The *Enable Automatic Patch Upgrades* dialog opens. Select *I acknowledge* and click *OK* to proceed.



The FortiGate will be updated based on the configured schedule when a new patch is available.

5. An email is sent to alert the administrator that the firmware upgrade schedule has changed.

Sample email after configuring automatic firmware upgrades:

```
From: DoNotReply@fortinet-notifications.com <DoNotReply@fortinet-notifications.com>
Sent: Tuesday, July 25, 2023 11:08 AM
To: ********** <*****@fortinet.com>
Subject: Automatic firmware upgrade schedule changed

date=2023-07-25 time=11:07:34 devid="FG81EPTK19000000" devname="FortiGate-81E-POE"
eventtime=1690308454221334719 tz="-0700" logid="0100032263" type="event" subtype="system"
level="notice" vd="root" logdesc="Automatic firmware upgrade schedule changed" user="system"
msg="System patch-level auto-upgrade regular check enabled."
```

6. Once a patch is detected, an email is sent to alert the administrator that a new image installation is scheduled.

   Sample email after a new image installation is scheduled:

```
From: DoNotReply@fortinet-notifications.com <DoNotReply@fortinet-notifications.com>
Sent: Friday, July 21, 2023 1:17 PM
To: ********** <*****@fortinet.com>
Subject: Automatic firmware upgrade schedule changed

date=2023-07-21 time=13:16:50 devid="FG81EPTK19000000" devname="FortiGate-81E-POE"
eventtime=1689970609076391174 tz="-0700" logid="0100032263" type="event" subtype="system"
level="notice" vd="root" logdesc="Automatic firmware upgrade schedule changed" user="system"
msg="System patch-level auto-upgrade new image installation scheduled between local time Sat
Jul 22 13:03:56 2023 and local time Sat Jul 22 14:00:00 2023."
```

7. After the image installation is completed, an email is sent to alert the administrator that the federated upgrade is complete.

   Sample email after the federated upgrade is complete:

```
From: DoNotReply@fortinet-notifications.com <DoNotReply@fortinet-notifications.com>
Sent: Friday, July 22, 2023 2:00 PM
To: ********** <*****@fortinet.com>
Subject: A federated upgrade was completed by the root FortiGate

date=2023-07-22 time=14:00:09 devid="FG81EPTK19000000" devname="FortiGate-81E-POE"
eventtime=1689973183346851869 tz="-0700" logid="0100022094" type="event" subtype="system"
level="information" vd="root" logdesc="A federated upgrade was completed by the root
FortiGate" msg="Federated upgrade complete" version="7.4.2"
```

To configure automatic firmware upgrades in the CLI:

1. Configure the automatic firmware upgrade schedule:

```
config system fortiguard
    set auto-firmware-upgrade enable
    set auto-firmware-upgrade-delay 3
    set auto-firmware-upgrade-start-hour 2
    set auto-firmware-upgrade-end-hour 4
end
```

   The FortiGate will perform a check between the start and end hours set for the firmware upgrade to review if there is an upgrade available.

2. Review the firmware upgrade check schedule:

```
# diagnose test application forticldd 13
Scheduled push image upgrade: no
Scheduled Config Restore: no
Scheduled Script Restore: no
Automatic image upgrade: Enabled.
        Next upgrade check scheduled at (local time) Thu Mar 29 03:10:56 2023
```

When an available patch upgrade is detected, the automatic firmware update will be scheduled based on the set upgrade delay.

Sample event log after a new patch upgrade is detected:

```
date=2023-03-29 time=03:10:56 eventtime=1679336380720695924 tz="-0700"
logid="0100032263" type="event" subtype="system" level="notice" vd="vdom1"
logdesc="Automatic firmware upgrade schedule changed" user="system"
msg="System patch-level auto-upgrade new image installation scheduled
     between local time Sat Apr 01 03:10:56 2023 and local time Sat Apr 01 04:00:00 2023."
```

3. Review the installation window of the new patch release:

```
# diagnose test application forticldd 13
Scheduled push image upgrade: no
Scheduled Config Restore: no
Scheduled Script Restore: no
Automatic image upgrade: Enabled.
        Next upgrade check scheduled at (local time) Mon Mar 30 03:10:56 2023
        New image 7.4.1b2305(07004000FIMG0021204001) installation is scheduled to
                start at Sat Apr 01 03:10:56:21 2023
                end by Sat Apr 01 04:00:00 2023
```

Once the firmware patch is successfully installed, an event log is created to track the change and an email is sent to the FortiCloud account under which the FortiGate is registered.

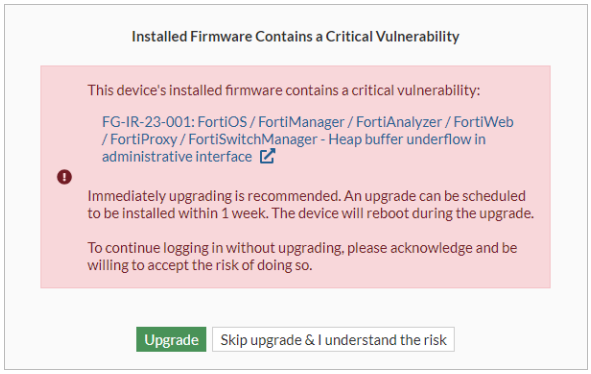
Sample event log after successfully updating firmware:

```
date=2023-04-01 time=03:13:04 devid="FG3H1E5819904039" devname="D"
eventtime=1679590383750408029 tz="-0700"
logid="0100022094" type="event" subtype="system" level="information" vd="vdom1"
logdesc="A federated upgrade was completed by the root FortiGate"
msg="Federated upgrade complete" version="7.4.1"
```

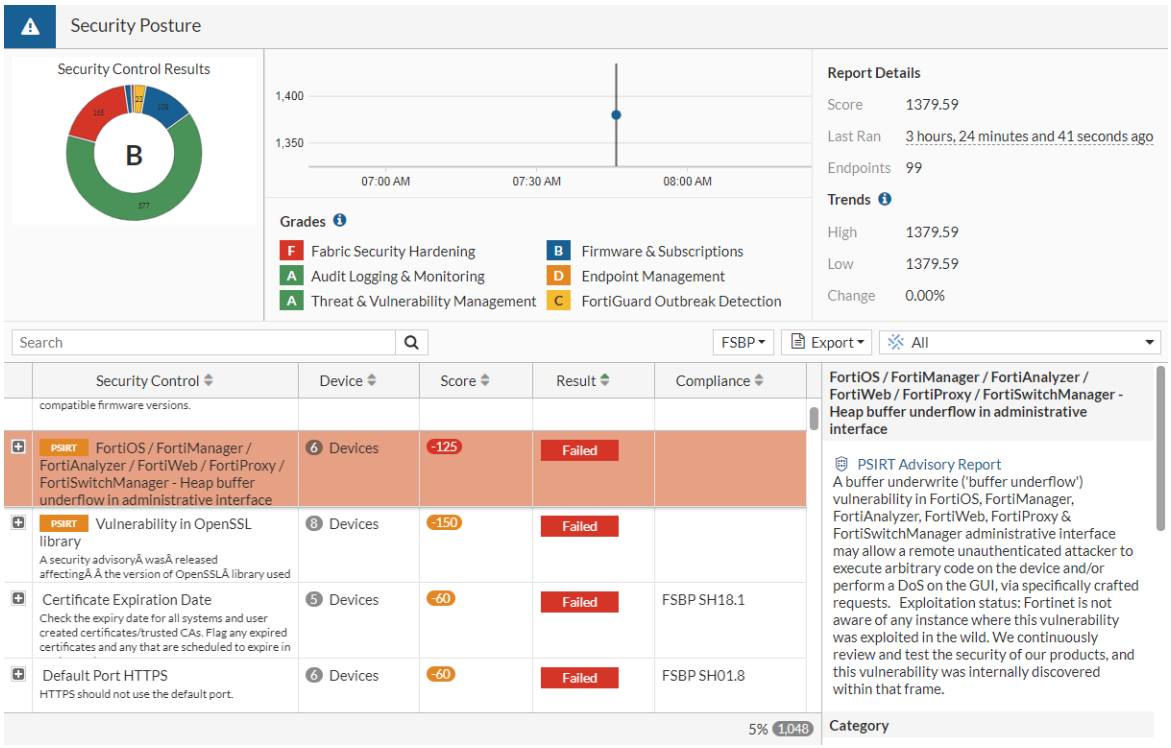
Upgrade prompt when a critical vulnerability is detected upon login

When FortiOS detects a critical vulnerability, an upgrade prompt is shown after logging into the FortiGate. A warning message is displayed in the GUI about the critical vulnerability and allows the administrator to either

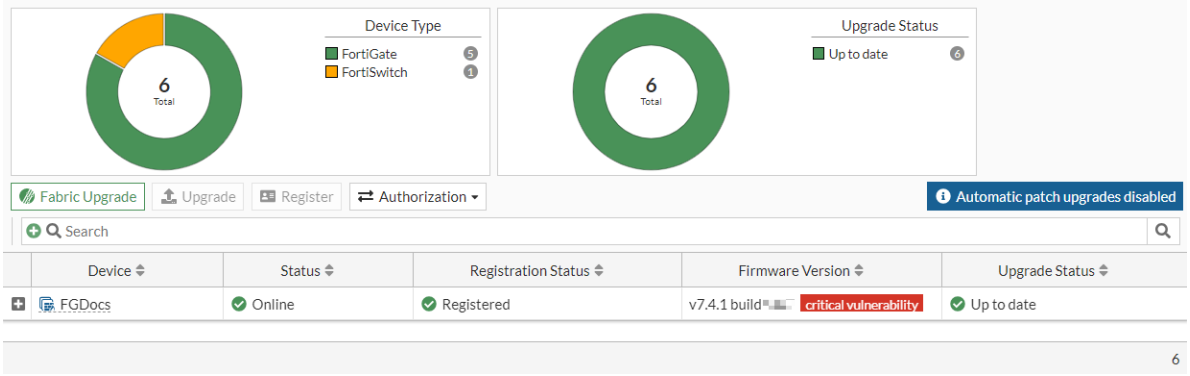
upgrade or skip it. This ensures that the administrator is aware of any potential security risks and can take immediate action to address them.



Clicking the hyperlinked vulnerability name opens the *Security Fabric* > *Security Rating* page, which displays more information about the vulnerability. See PSIRT-related notifications on page 3864 for more information.



Clicking the *Upgrade* button opens the *System* > *Firmware & Registration* page where the administrator can upgrade the device. See Firmware & Registration on page 3222 for more information.



Clicking the *Skip upgrade & I understand the risk* button continues the log in process as usual.

Diagnostics

To view vulnerability results after performing security rating scan:

```
# diagnose report-runner vuln-read
Index: 0
Name: FG-IR-23-001: FortiOS / FortiManager / FortiAnalyzer / FortiWeb / FortiProxy /
FortiSwitchManager - Heap buffer underflow in administrative interface
FortiGate Serial: FGVM02TM23000000
```

To clear the vulnerability result:

```
# diagnose report-runner vuln-clean
Deleted temporary critical vulnerability file
```

Viewing firmware upgrade reports

FortiOS now includes a firmware upgrade report that compares statistics and configurations before and after a firewall upgrade. Automatic generation of the report is enabled by default, and the report enhances the upgrade process by providing detailed assurance of successful upgrades.

The `config system global` command includes a new option:

```
config system global
    set upgrade-report {enable | disable}
end
```

`set upgrade-report {enable | disable}`	Enable/disable automatic generation of an upgrade report when upgrading firmware (default = enable).

The `diagnose` command includes new options:

```
# diagnose sys upgrade-report
current     Display the stats currently.
on-disk     Display the stats saved on disk.
generate    Generate upgrade report and replace the one on disk.
```

`diagnose sys upgrade-report current`	Display the current statistics.
`diagnose sys upgrade-report on-disk`	Display the upgrade report saved on disk.
`diagnose sys upgrade-report generate`	Generate an upgrade report and replace the report saved on disk.

For FortiGates without disks, the report is stored on flash memory. All FortiGate models are equipped with flash memory.

Example

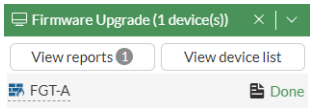
The firmware upgrade report is available after a successful FortiOS upgrade.

You can disable automatic generation of the firmware upgrade report in the CLI.

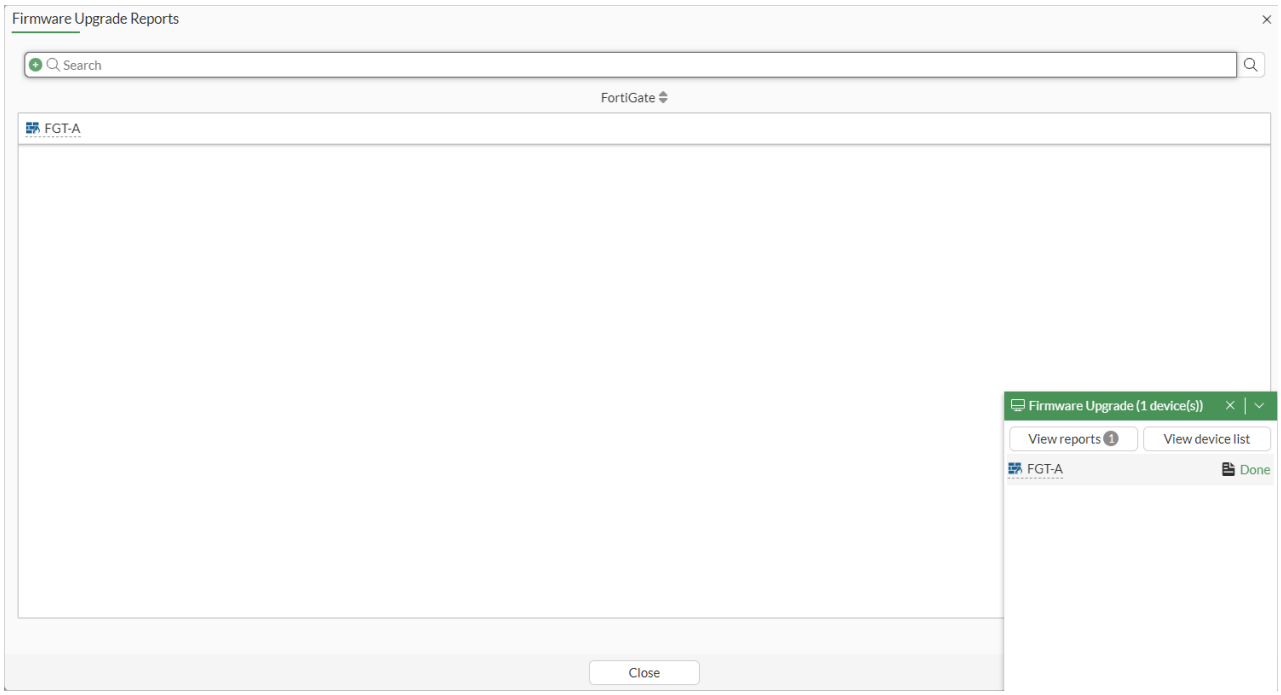
To view the firmware upgrade report in the GUI:

1. After a successful upgrade, log in to the GUI, and view the *Firmware Upgrade* monitor in the bottom-right corner. The following buttons are available:
   - *View reports <number>*

     The <number> indicates how many FortiGates have an available firmware upgrade report.
   - *View device list*



2. Click the *View reports <number>* button or the document icon beside *Done*. A *Firmware Upgrade Reports* pane opens to show the list of FortiGates with an available firmware upgrade report:



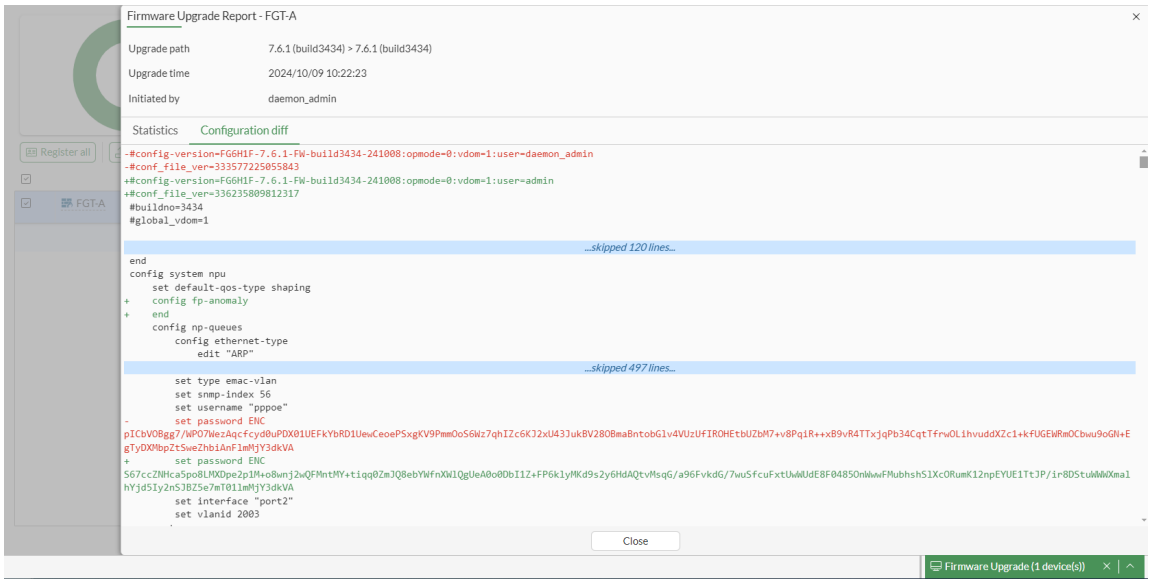
3. Double-click a FortiGate to display its firmware upgrade report. The firmware upgrade report contains the following tabs: *Statistics* and *Configuration diff*.
   - The *Statistics* tab displays general information at the top about *Upgrade path*, *Upgrade time*, and *Initiated by*.

     Below the general section are categories of information from before and after the upgrade. The categories of information depend on whether the FortiGate is part of a Security Fabric.

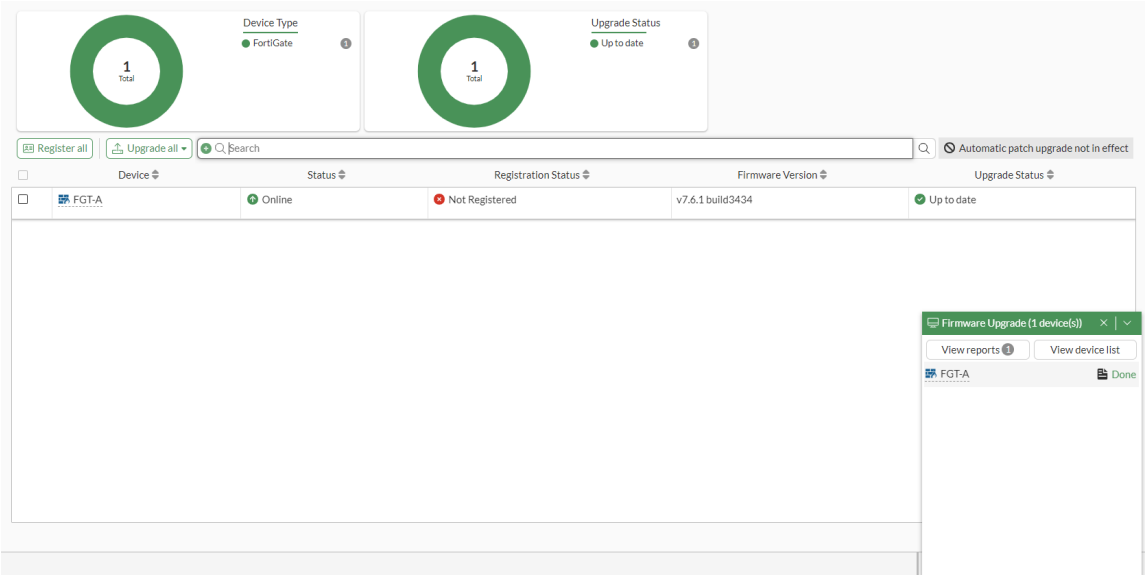
     In this example, the FortiGate is not part of a Security Fabric, and the following categories of information are displayed: *FortiAPs*, *FortiSwitches*, *FortiExtenders*, *Endpoint Devices*, *Routing*, *Traffic*, *Connectivity*, and *Resources*.

   - Click *Refresh* to retrieve the latest current statistics.

- Click the *Configuration diff* tab to display a comparison of the current (green) and previous (red) configurations.



4. In the *Firmware Upgrade* monitor, click *View device list* to display the *Firmware & Registration* pane.



To display the firmware upgrade report in the CLI:

1. After a successful firmware upgrade, display the firmware upgrade report:

```
# diagnose sys upgrade-report on-disk
```

To regenerate the firmware upgrade report in the CLI:

1. Regenerate the firmware upgrade report:

```
# diagnose sys upgrade-report generate
This act will delete the upgrade report on disk and create a new one.
Do you want to continue? (y/n)
```

2. Display the firmware upgrade report:

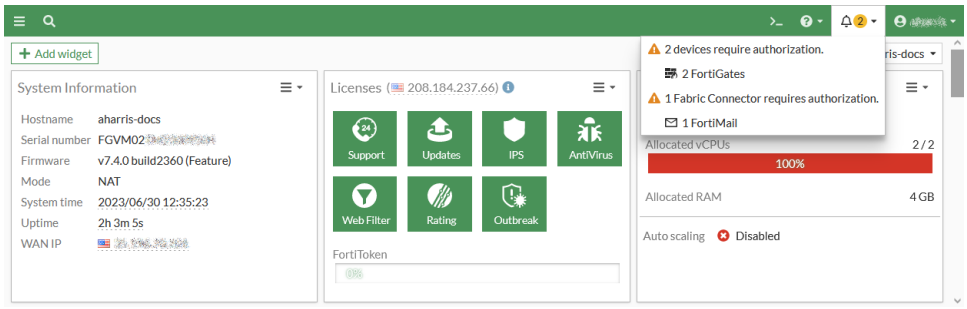
```
# diagnose sys upgrade-report on-disk
```

To view current statistics in the CLI:

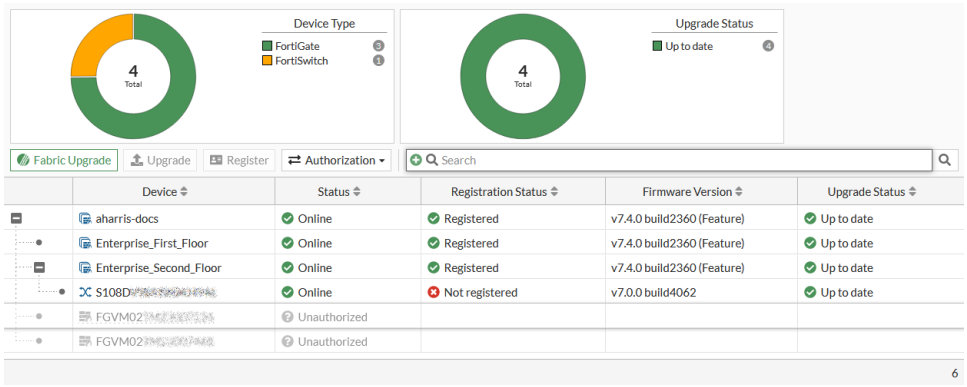
```
# diagnose sys upgrade-report current
IPv4 session count = 24
IPv6 session count = 0
SSLVPN tunnel count = 0
IPSEC tunnel count = 6
CPU usage = 0%
Memory usage = 36%
Total routes = 18
Total OSPF routes = 0
Total BGP routes = 5
Total FortiGates = 1
  Online = 1
  Unauthorized = 0
Total FortiAPs = 0
  Online = 0
  Offline = 0
  Unauthorized = 0
  Rejected = 0
Total FortiSwitches = 0
  Online = 0
  Offline = 0
  Unauthorized = 0
  Rejected = 0
Total FortiExtenders = 0
  Online = 0
  Offline = 0
  Unauthorized = 0
  Rejected = 0
Total Endpoints = 0
  Online = 0
  Offline = 0
  Quarantined = 0
```

Authorizing devices

If there are any notifications in the top banner dropdown for unauthorized devices or devices that require authorization, clicking the notification redirects the user to the *System* > *Firmware & Registration* page. In this example, two devices require authorization.

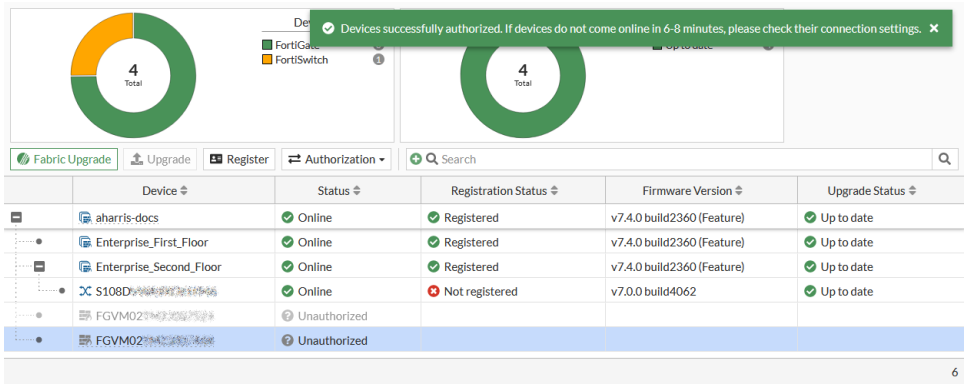


On the *Firmware & Registration* page, the unauthorized devices are grayed out, and their status is *Unauthorized*.

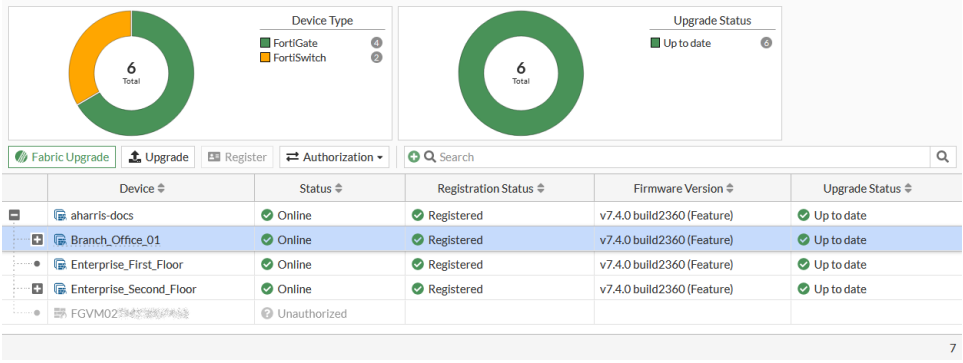


To authorize a Security Fabric device from the Firmware & Registration page:

1. Go to *System* > *Firmware & Registration*, and select an unauthorized device.
2. Click *Authorization* > *Authorize* (below the donut charts), or right-click and select *Authorization* > *Authorize*.
   A notification appears when the device is authorized.

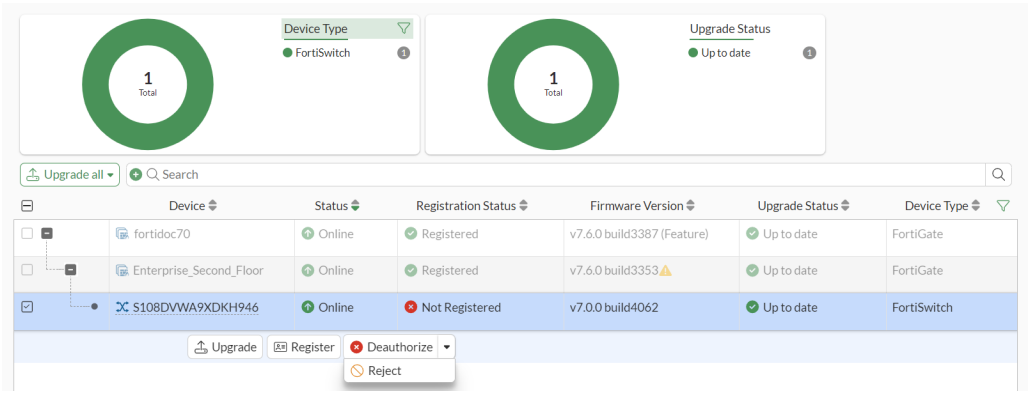


3. Refresh the page. The device's status should now be *Online*.



To deauthorize a Security Fabric device from the Firmware & Registration page:

1. Go to the *System* > *Firmware & Registration* page, and select a device.
2. Click *Deauthorize*.



3. Refresh the page to see that the device has been deauthorized.

Firmware upgrade notifications

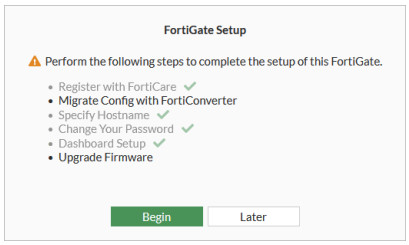
FortiGates with a firmware upgrade license that are connected to FortiGuard display upgrade notifications in the setup window, banner, and FortiGuard menu. The firmware notifications are enabled by default.

To configure firmware notifications in the CLI:

```
config system global
    set gui-firmware-upgrade-warning {enable | disable}
end
```

To use the firmware upgrade notifications in the GUI:

1. When you log in to FortiGate, the *FortiGate Setup* window includes an *Upgrade firmware* step. Click *Begin*.



2. Follow the steps in the *Setup Progress*, then click *Review Firmware Upgrade*.

   The *System* > *Firmware & Registration* page opens.
3. Notifications appear below the *Notification* icon in the banner, and beside *Firmware & Registration* in the tree menu.

Downloading a firmware image

Firmware images for all FortiGate units are available on the Fortinet Customer Service & Support website.

To download firmware:

1. Log into the support site with your user name and password.
2. Go to *Support* > *Firmware Download*.

   A list of Release Notes is shown. If you have not already done so, download and review the Release Notes for the firmware version that you are upgrading your FortiGate unit to.
3. Select the *Download* tab.
4. Navigate to the folder for the firmware version that you are upgrading to.
5. Find your device model on the list. FortiWiFi devices have file names that start with *FWF*.
6. Click *HTTPS* in the far right column to download the firmware image to your computer.

Firmware can also be downloaded using FTP, but as FTP is not an encrypted file transferring protocol, HTTPS downloading is recommended.

Security levels are pre-configured on the BIOS. See BIOS-level signature and file integrity checking on page 3644 and Real-time file system integrity checking on page 3648 for more information.

Testing a firmware version

The integrity of firmware images downloaded from Fortinet's support portal can be verified using a file checksum. A file checksum that does not match the expected value indicates a corrupt file. The corruption could be caused by errors in transfer or by file modification. A list of expected checksum values for each build of released code is available on Fortinet's support portal.

Image integrity is also verified when the FortiGate is booting up. This integrity check is done through a cyclic redundancy check (CRC). If the CRC fails, the FortiGate unit will encounter an error during the boot process.

Firmware images are signed and the signature is attached to the code as it is built. When upgrading an image, the running OS will generate a signature and compare it with the signature attached to the image. If the signatures do not match, the new OS will not load.

Testing before installation

FortiOS lets you test a new firmware image by installing the firmware image from a system reboot and saving it to system memory. After completing this procedure, the FortiGate unit operates using the new firmware image with the current configuration. The new firmware image is not permanently installed. The next time the FortiGate unit restarts, it operates with the originally installed firmware image using the current configuration. If the new firmware image operates successfully, you can install it permanently using the procedure explained in Upgrading individual devices.

For this procedure, you must install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

To test the new firmware version:

1. Connect to the CLI using an RJ-45 to USB (or DB-9) or null modem cable.
2. Ensure that the TFTP server is running.
3. Copy the new firmware image file to the root directory on the TFTP server.
4. Ensure that the FortiGate unit can connect to the TFTP server using the `execute ping` command.
5. Restart the FortiGate unit: `execute reboot`. The following message is shown:
   ```
   This operation will reboot the system!
   Do you want to continue? (y/n)
   ```
6. Type `y`. As the FortiGate unit starts, a series of system startup messages appears.
7. When the following messages appears:
   ```
   Press any key to display configuration menu.....
   ```
   Immediately press any key to interrupt the system startup.

   You have only three seconds to press any key. If you do not press a key during this time, the FortiGate will reboot, and you will have to log in and repeat the `execute reboot` command.

   If you successfully interrupt the startup process, the following messages appears:
   ```
   [G]: Get firmware image from TFTP server.
   [F]: Format boot device.
   [B]: Boot with backup firmware and set as default
   [C]: Configuration and information
   [Q]: Quit menu and continue to boot with default firmware.
   [H]: Display this list of options.
   Enter G, F, Q, or H:
   ```

8. Type *G* to get the new firmware image from the TFTP server. The following message appears: `Enter TFTP server address [192.168.1.168]:`
9. Type the address of the TFTP server, then press *Enter*. The following message appears: `Enter Local Address [192.168.1.188]:`
10. Type the IP address of the FortiGate unit to connect to the TFTP server.

The IP address must be on the same network as the TFTP server.
Make sure that you do not enter the IP address of another device on this network.

The following message appears:

```
Enter File Name [image.out]:
```

11. Enter the firmware image file name then press *Enter*. The TFTP server uploads the firmware image file to the FortiGate unit and the following message appears:

```
Save as Default firmware/Backup firmware/Run image without saving: [D/B/R]
```

12. Type *R*. The FortiGate image is installed to system memory and the FortiGate unit starts running the new firmware image, but with its current configuration.

Test the new firmware image as required. When done testing, reboot the FortiGate unit, and the it will resume using the firmware that was running before you installed the test firmware.

Installing firmware from system reboot

In the event that the firmware upgrade does not load properly and the FortiGate unit will not boot, or continuously reboots, it is best to perform a fresh install of the firmware from a reboot using the CLI. If configured, the firmware can also be automatically installed from a USB drive; see Restoring from a USB drive on page 3258 for details.

This procedure installs a firmware image and resets the FortiGate unit to factory default settings. You can use this procedure to upgrade to a new firmware version, revert to an older firmware version, or re-install the current firmware.

To use this procedure, you must connect to the CLI using the FortiGate console port and a RJ-45 to USB (or DB-9), or null modem cable. You must also install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

Before beginning this procedure, ensure that you backup the FortiGate unit configuration. See Configuration backups and reset on page 3686 for details. If you are reverting to a previous FortiOS version, you might not be able to restore the previous configuration from the backup configuration file.

Installing firmware replaces your current antivirus and attack definitions, along with the definitions included with the firmware release you are installing. After you install new firmware, make sure that antivirus and attack definitions are up to date.

To install firmware from a system reboot:

1. Connect to the CLI using the RJ-45 to USB (or DB-9) or null modem cable.
2. Ensure that the TFTP server is running.
3. Copy the new firmware image file to the root directory of the TFTP server.

4. Ensure that the FortiGate unit can connect to the TFTP server using the `execute ping` command.
5. Restart the FortiGate unit: `execute reboot`. The following message is shown:
   ```
   This operation will reboot the system!
   Do you want to continue? (y/n)
   ```
6. Type `y`. As the FortiGate unit starts, a series of system startup messages appears.
7. When the following messages appears:
   ```
   Press any key to display configuration menu.....
   ```
   Immediately press any key to interrupt the system startup.

   You have only three seconds to press any key. If you do not press a key during this time, the FortiGate will reboot, and you will have to log in and repeat the `execute reboot` command.

   If you successfully interrupt the startup process, the following messages appears:

   ```
   [C]: Configure TFTP parameters.
   [R]: Review TFTP parameters.
   [T]: Initiate TFTP firmware transfer.
   [F]: Format boot device.
   [I]: System information.
   [B]: Boot with backup firmware and set as default.
   [Q]: Quit menu and continue to boot.
   [H]: Display this list of options.

   Enter C,R,T,F,I,B,Q,or H:
   ```
8. If necessary, type `C` to configure the TFTP parameters, then type `Q` to return to the previous menu:

   ```
   [P]: Set firmware download port.
   [D]: Set DHCP mode.
   [I]: Set local IP address.
   [S]: Set local subnet mask.
   [G]: Set local gateway.
   [V]: Set local VLAN ID.
   [T]: Set remote TFTP server IP address.
   [F]: Set firmware file name.
   [E]: Reset TFTP parameters to factory defaults.
   [R]: Review TFTP parameters.
   [N]: Diagnose networking(ping).
   [Q]: Quit this menu.
   [H]: Display this list of options.

   Enter P,D,I,S,G,V,T,F,E,R,N,Q,or H:
   ```

The IP address must be on the same network as the TFTP server.

Make sure that you do not enter the IP address of another device on this network.

9. Type `T` get the new firmware image from the TFTP server.

   The FortiGate unit loads the firmware.
10. Save the firmware as the default (`D`) or backup (`B`) firmware image, or run the image without saving it (`R`).

    The FortiGate unit installs the new firmware image and restarts. The installation might take a few minutes to complete.

Factory resetting the FortiGate when the password is lost

For security reasons, users who lose their password must have physical access to the FortiGate and perform a TFTP restore of the firmware in order to regain access to the FortiGate. They will not have access to the current running configurations through the FortiGate. Configurations will be reset to the factory default once the firmware is reloaded. This process requires a connection to the TFTP server where the firmware image is stored.

To restore the FortiGate:

This procedure may vary depending on whether the FortiGate is a physical appliance or a VM.

1. Connect to the console port.
2. Ensure you can see the FortiGate prompt from the console terminal.
3. Physically power off the device, then power on the device.
4. Boot into the boot menu by pressing a key when prompted.
5. Follow the steps in the previous procedure to reload the firmware. Configurations will be reset to the factory default once the firmware is installed.
6. Once the firmware reload is complete, log in to the FortiGate to reconfigure the settings.

It is recommended to preform regular configuration backups and to store the backup on a secure server (see Configuration changes in the FortiOS Best Practices for more details). In the event that a password is lost, the configuration backup can be used to restore a configuration after the user completes the firmware installation process. This assumes the user knows the password from the previous backed up configuration. If the user does not know the password, they can still reload the configuration if it is not encrypted.

The following procedure describes how to edit an unencrypted backup configuration file so that the administrator password can be replaced before restoring the file.

To edit the configuration file when a password is lost:

1. Locate the line in the configuration file where `config system admin` is defined.
2. Edit an administrator account with an `accprofile` set to `super_admin`. This will ensure you can log in and perform any operations afterward.
3. Locate the line with `set password ENC xxxxxx`, and edit it to set a temporary new password in clear text (such as `set password cleartextpassword`).
4. Reload the configuration file.
5. Log in to the console using the temporary password, and then change the password.

The configuration backup allows the administrator to confirm the firmware that the FortiGate is running, so the same firmware can be restored. This information is listed in the first line of the configuration: `config-version=FGT61F-7.2.4-FW-build1396-230131:opmode=0:vdom=0:user=admin`.

Restoring from a USB drive

The FortiGate firmware can be manually restored from a USB drive, or installed automatically from a USB drive after a reboot.

To restore the firmware from a USB drive:

1. Copy the firmware file to the root directory on the USB drive.
2. Connect the USB drive to the USB port of the FortiGate device.
3. Connect to the FortiGate CLI using the RJ-45 to USB (or DB-9) or null modem cable.
4. Enter the following command:
   ```
   execute restore image usb <filename>
   ```
   The FortiGate unit responds with the following message:
   ```
   This operation will replace the current firmware version! Do you want to continue? (y/n)
   ```
5. Type y. The FortiGate unit restores the firmware and restarts. This process takes a few minutes.
6. Update the antivirus and attack definitions:
   ```
   execute update-now
   ```

To install firmware automatically from a USB drive:

1. Go to *System* > *Settings*.
2. In the *Start Up Settings* section, enable *Detect firmware* and enter the name of the firmware file.
3. Copy the firmware file to the root directory on the USB drive.
4. Connect the USB drive to the USB port of the FortiGate device.
5. Reboot the FortiGate device.

Using controlled upgrades

Using a controlled upgrade, you can upload a new version of the FortiOS firmware to a separate partition in the FortiGate memory for later upgrade. The FortiGate unit can be configured so that when it is rebooted, it will automatically load the new firmware. Using this option, you can stage multiple FortiGate units to upgrade simultaneously using FortiManager or a script.

To load the firmware for later installation:

```
execute restore secondary-image {ftp | tftp | usb} <filename_str>
```

To set the FortiGate unit so that when it reboots, the new firmware is loaded:

```
execute set-next-reboot {primary | secondary}
```

where `{primary | secondary}` is the partition with the preloaded firmware.

Downgrading individual device firmware

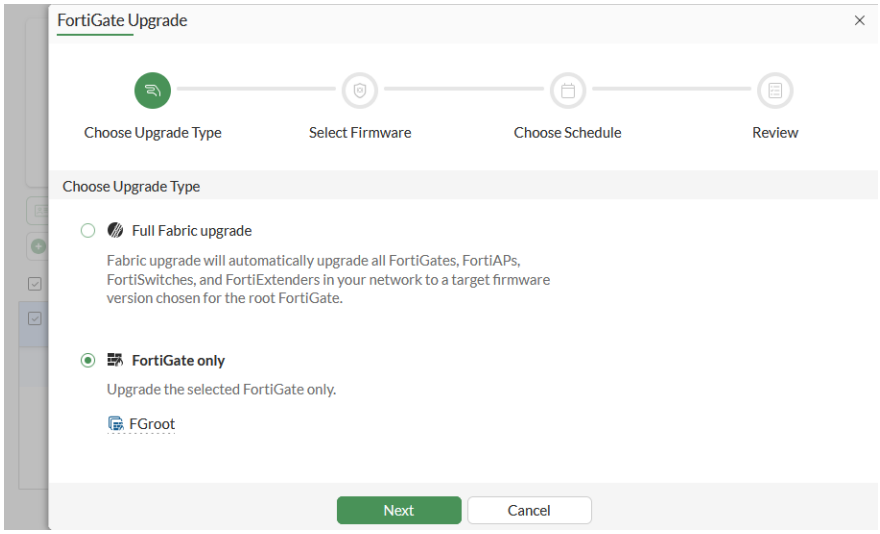
Downgrading the firmware is not recommended.

Downgrading FortiGates in an HA cluster causes all cluster members to be downgraded simultaneously. This process, also known as an interrupted downgrade, leads to a temporary interruption in the cluster's communication.

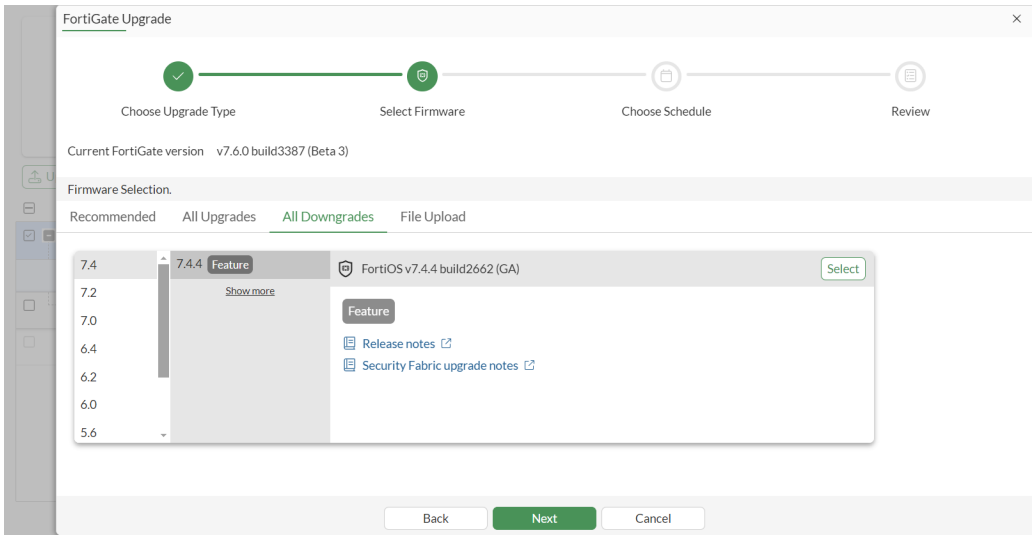
This procedure downgrades the FortiGate to a previous firmware version. After downgrading, you may be unable to restore the backup configuration.

To downgrade to a previous firmware version in the GUI:

1. Log into the FortiGate GUI as the admin administrative user.
2. Go to *System > Firmware & Registration*. The *Firmware Version* column displays the version and either *(Feature)* or *(Mature)*.
3. Select the FortiGate, and click *Upgrade*. The *FortiGate Upgrade* pane opens.



4. Select *FortiGate* only, and click *Next* to proceed to the *Select Firmware* step.
5. For the *Select Firmware* step:

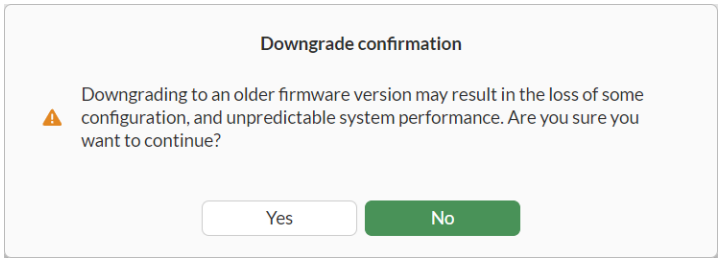


a. On the *All Downgrades* tab, select a firmware version, and click *Select*.

You can also click the *File Upload* tab to upload a firmware file that you previously downloaded from the Fortinet Customer Service & Support website.

See Downloading a firmware image on page 3253.

b. Click *Next*. A *Downgrade confirmation* message is displayed



c. Click *Yes* to proceed to the *Choose Schedule* step.

6. For the *Choose Schedule* step:

a. Choose a schedule:

Immediate	Select to start the upgrade immediately after completing the *FortiGate Upgrade* wizard.
Specify	Select to schedule a date and time to start the upgrade after completing the *FortiGate Upgrade* wizard.

b. Click *Next* to proceed to the *Review* step.

7. For the *Review* step, review the downgrade plan, and click *Confirm and Backup Config* to proceed. The *Confirm* dialog box is displayed.

8. Click *Yes* to continue with the downgrade.

The FortiGate unit backs up the current configuration to the management computer, uploads the firmware image file, downgrades to the firmware version, and restarts. This process takes a few minutes.

To downgrade to a previous firmware version in the CLI:

1. Make sure that the TFTP server is running.
2. Copy the new firmware image file to the root directory of the TFTP server.
3. Log into the CLI.
4. Ping the TFTP server to ensure that the FortiGate can connect to it:

```
execute ping <tftp_ipv4>
```

5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:

```
execute restore image tftp <filename> <tftp_ipv4>
```

   The FortiGate unit responds with the message:

```
This operation will replace the current firmware version!
Do you want to continue? (y/n)
```

6. Type y. The FortiGate unit uploads the firmware image file, then a message similar to the following is shown:

```
Get image from tftp server OK.
Check image OK.
This operation will downgrade the current firmware version!
Do you want to continue? (y/n)
```

7. Type y. The FortiGate unit downgrades to the old firmware version and restarts. This process takes a few minutes.
8. Reconnect to the CLI.
9. Update the antivirus and attack definitions:

```
execute update-now
```

Downloading the EOS support package for supported Fabric devices

FortiGates, FortiSwitches, FortiAPs, and FortiExtenders can download an EOS (end of support) package automatically from FortiGuard during the bootup process or by using manual commands. Based on the downloaded EOS package files, when a device passes the EOS date, a warning message is displayed in the device's tooltip. The device is also highlighted in the following GUI locations:

- *System > Firmware & Registration* page
- *Security Fabric > Physical Topology* and *Logical Topology* pages
- *Dashboard > Status > System Information* widget

FortiGuard updates

The EOS packages can be downloaded automatically from FortiGuard, but they can also be downloaded manually.

To manually download the EOS package from the FortiGuard server:

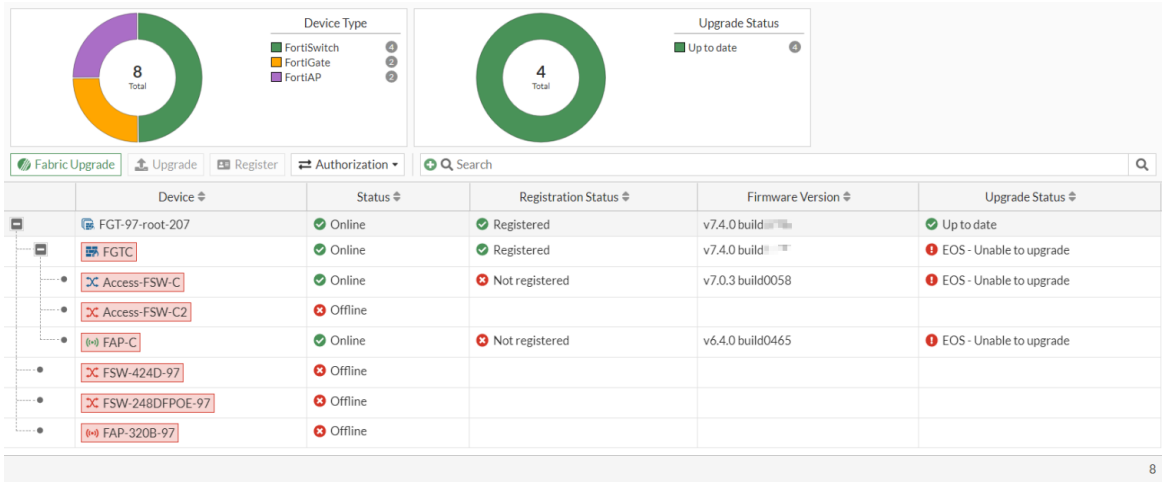
```
# diagnose fortiguard-resources update <product>-end-of-support
```

Product	Description
`fortigate-end-of-support`	FortiGate product life cycle information.
`fortiswitch-end-of-support`	FortiSwitch product life cycle information.
`fortiap-end-of-support`	FortiAP product life cycle information.
`fortiextender-end-of-support`	FortiExtender product life cycle information.

In the event the EOS package files are not downloaded due to a connection issue, use `diagnose fortiguard-resources update <product>-end-of-support` to download the package files.

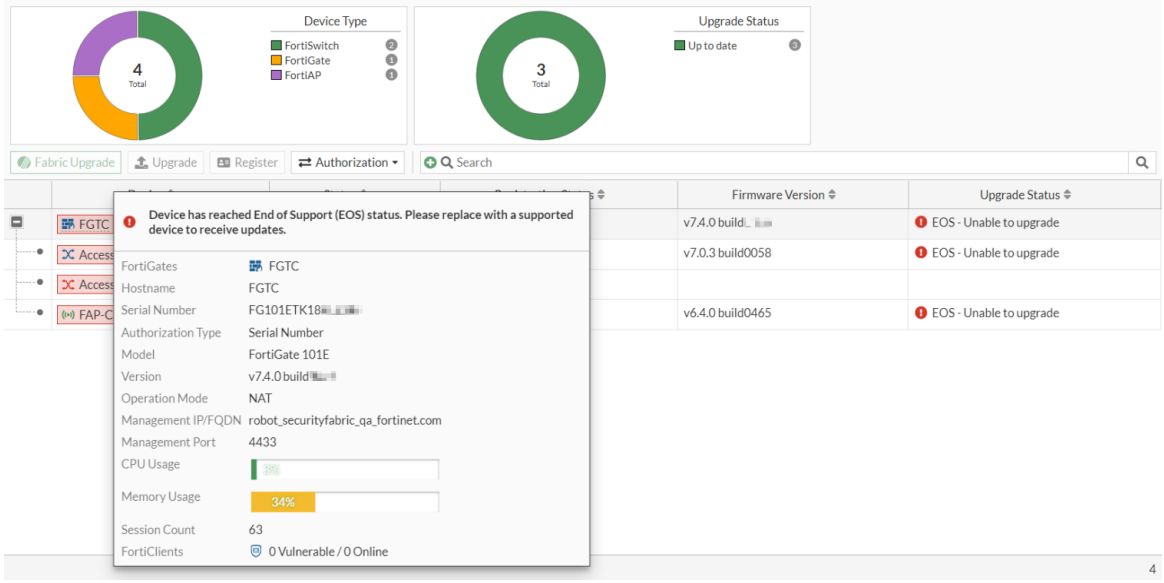
GUI warnings

On the *System* > *Firmware & Registration* page, devices that have reached EOS are highlighted in red, and their *Status* is *EOS - Unable to upgrade*.

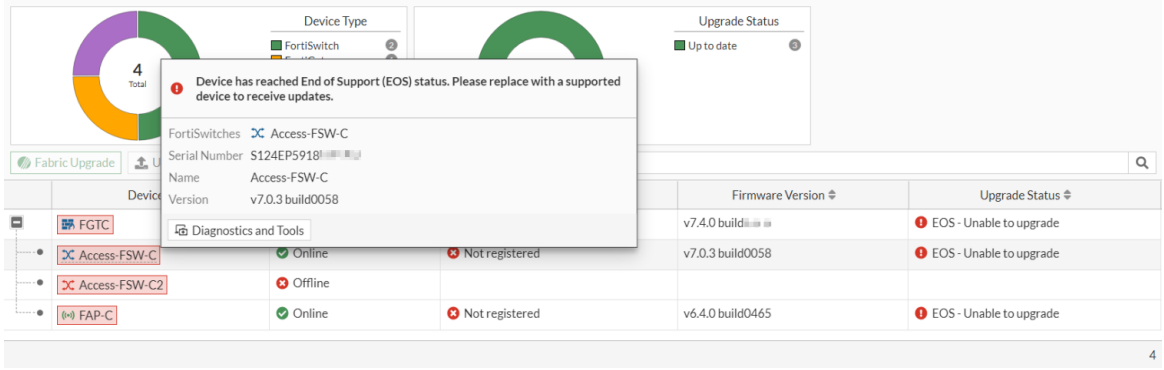


Hover over a device name to view the tooltip, which includes an EOS warning.

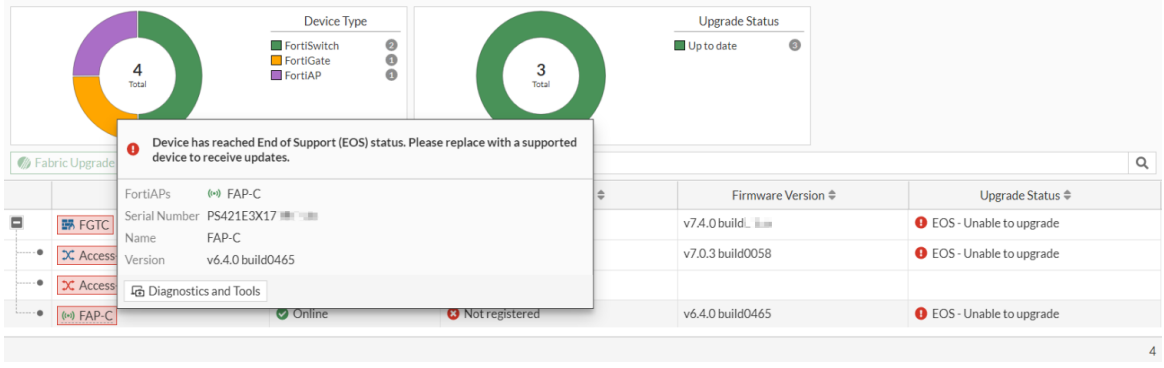
- Sample FortiGate tooltip:



- Sample FortiSwitch tooltip:

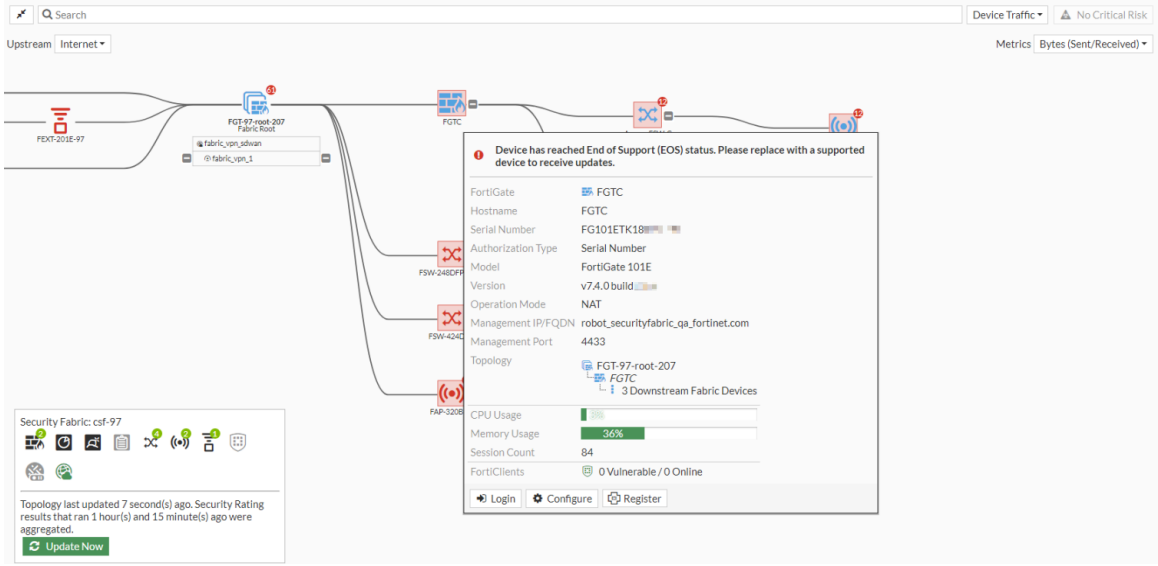


- Sample FortiAP tooltip:

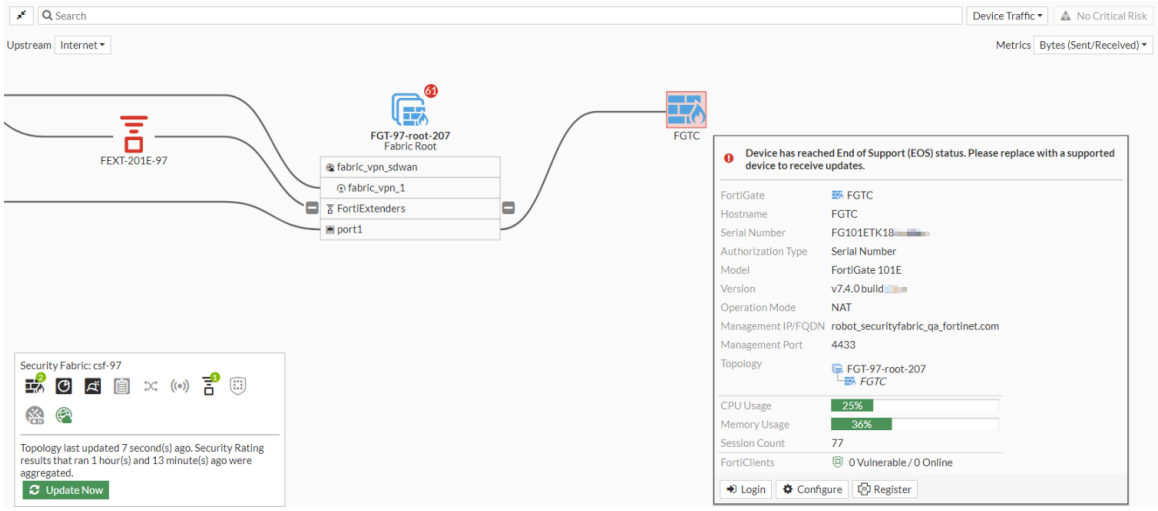


On the *Security Fabric > Physical Topology* and *Logical Topology* pages, devices that have reached EOS are highlighted in red. The device tooltips also include an EOS warning.

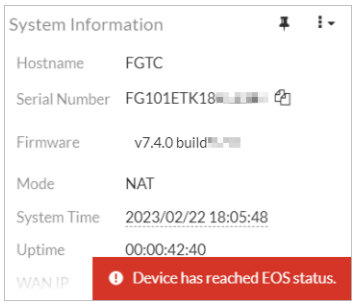
- Sample *Security Fabric > Physical Topology* page with tooltip:



- Sample *Security Fabric > Logical Topology* page with tooltip:



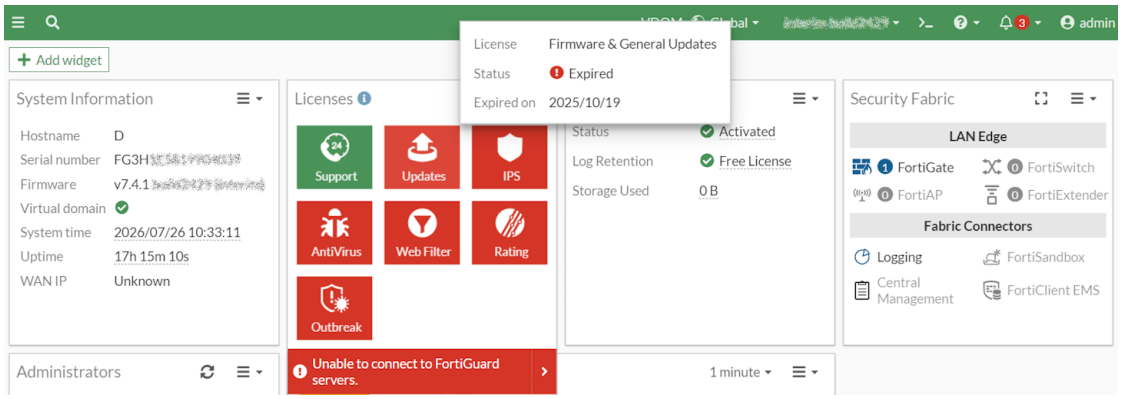
The *Dashboard > Status > System Information* widget includes a warning at the bottom of the widget that the *Device has reached EOS status*.



How the FortiGate firmware license works

Firmware upgrades are performed in the *System > Firmware & Registration* page or in the CLI. To demonstrate the functionality of this feature, the following explanations and examples use FortiGates that are running and upgrading to fictitious build numbers with fictitious release dates. For more information on performing an upgrade, see Upgrading individual devices on page 3231.

You can confirm the *Firmware & General Updates* (FMWR) contract expiry date in the *System > FortiGuard* page, by using the `diagnose test update info contract | grep FMWR` command, or by hovering your mouse over the *Updates* tile in the *Licenses* widget in *Dashboard > Status*.



Maintaining an active support contract for your FortiGate allows you to access the latest firmware upgrades and downgrades including:

- Updates between major versions, such as upgrading from FortiOS 7.0 to 8.0
- Updates between minor versions, such as upgrading from FortiOS 7.4 to 7.6
- Updates between patch versions, such as upgrading from FortiOS 7.6.1 to 7.6.2

In FortiOS 7.4.2 and above, enforcement of an active FortiGate firmware license to allow firmware upgrades and downgrades has been improved. Enforcement is based on the expiry date of the current firmware license compared to the release date of the first GA release of a major version. For example, for FortiOS 7.4.x firmware upgrades, enforcement is based on the expiry date of the current support contract compared to the release date of FortiOS 7.4.0 GA.

Therefore, upgrades and downgrades between major, minor, and patch versions are only allowed if the firmware license is valid relative to the release date of the first GA release of a major version. If the firmware license expiry date is earlier than the firmware first GA major release date, then the firmware update to that version will not be allowed.

For example, the release dates of major versions are as follows:

- 7.4.0 GA release on May 8, 2023
- 7.6.0 GA release on March 31, 2024
- 7.8.0 GA release on March 31, 2025

This example is using fictitious GA release dates of future versions for illustrative purposes only. These dates do not indicate the official FortiOS release schedule.

Firmware license expiry date	Is a FortiGate firmware upgrade allowed to the target version?		
	7.4.x	7.6.x	7.8.x
March 31, 2025 or later	Yes	Yes	Yes
March 25, 2025	Yes	Yes	No
March 25, 2024	Yes	No	No
May 2, 2023	No	No	No

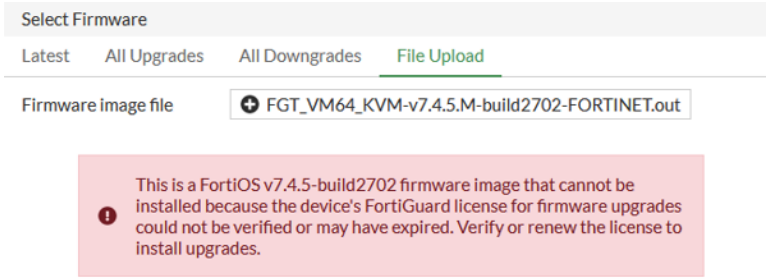
Downgrades from one major version to another are not blocked because the FortiGate should have had a firmware expiry date that is later than the release date of the older firmware major version.

For example, if the firmware license expiry date was March 25, 2024, the FortiGate is currently running 7.4.2 and you wanted to downgrade to 7.2.7, since the release date of 7.2.0 GA was March 31, 2022 then this firmware downgrade would be allowed. The firmware license expiry date is later than the release date of the older firmware major version, 7.2.0 GA.

Upgrading firmware in the GUI through file upload

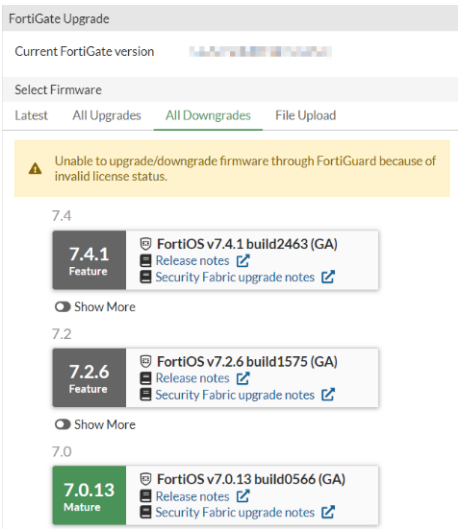
If the contract is expired relative to the major firmware GA .0 version release date, the following upgrade attempt will be blocked in the GUI *System* > *Firmware & Registration* page.

If the contract expiry date is earlier than the release date for the GA .0 version of a higher major, minor, or patch version of firmware that is being uploaded, then the upgrade is denied and an error is displayed.



Upgrading firmware in the GUI through FortiGuard

Until the support contract is renewed, FortiGuard upgrades will be unavailable, namely, the *Confirm and Backup Config* button will be grayed out. However, you will be able to view the FortiGate firmware images available on FortiGuard using *Latest*, *All Upgrades*, and *All Downgrades* tabs and this functionality will be restored upon support contract renewal.



Upgrading firmware in the CLI

The following example demonstrates what occurs when upgrading the firmware to a patch build and to a higher version with a license expiry date that is earlier than the major GA .0 version release date in the CLI. The major upgrade attempts and fails to upgrade the firmware from FortiOS 7.4.0 to 7.6.3.

This behavior is also observed for minor and patch upgrades with a license expiry date that is earlier than the major GA .0 version release date of the minor or patch firmware targeted for the upgrade.

To upgrade the firmware to a higher major version:

1. Confirm the current firmware version:

```
# get system status
Version: FortiGate-301E v7.4.0,build2303,230307 (interim)
```

2. Upgrade the firmware:

```
# execute restore image tftp  v763-B1505-GA-F_B234847_FGT_301E.out 172.16.200.55
......
Firmware update licence is expired! Please update to a valid licence.
Command fail. Return code -180
```

If your firmware support contract has expired, please contact your Fortinet Sales/Partner for details on renewing it.

Troubleshooting

To verify the presence of the FMWR license:

```
# diagnose test update info contract
…
System contracts:
    ENHN,Thu May  1 2025
    COMP,Thu May  1 2025
    FMWR,Thu May  1 2025
…
Support contract: pending_registration=255 got_contract_info=1
    account_id=[xxxxxxxx@fortinet.com] company=[Fortinet] industry=[Technology]

SerialNumber=FGVMxxxxxxxxxx|Contract=AVDB-1-06-20250503:0:1:1:0*AVEN-1-06-20250503:0:1:1:0*NIDS-1-
06-20250503:0:1:1:0*SPRT-1-20-202
50503:0:1:1:0*ZHVO-1-06-20250503:0:1:1:0*SWNO-1-06-20250503:0:1:1:0*SWNM-1-06-
20250503:0:1:1:0*SWNC-1-06-20250503:0:1:1:0*FGSA-1-06-2
0250503:0:1:1:0*SPAM-1-06-20250503:0:1:1:0*ISSS-1-06-20250503:0:1:1:0*IPMC-1-06-
20250503:0:1:1:0*IOTH-1-06-20250503:0:1:1:0*FURL-1-06
-20250503:0:1:1:0*FRVS-1-06-20250503:0:1:1:0*FMWR-1-06-20250503:0:1:1:0*FMGC-1-06-
20250503:0:1:1:0*FCSS-1-10-20250503:0:1:1:0*FAZC-1-
06-20250503:0:1:1:0*DLDB-1-06-20250516:0:1:1:0*ENHN-1-20-20250503:0:1:1:0*COMP-1-20-
20250503:0:1:1:0|
…
```

In the special scenario where the FMWR license information is missing, the FortiGate will not be allowed to upgrade. This scenario may occur when running on an EVAL license, where FMWR license is not supported.

Settings

The default administrator password should be configured immediately after the FortiGate is installed, see Default administrator password on page 3269.

After that, there are several system settings that should also be configured in *System* > *Settings*:

- Changing the host name on page 3270
- Setting the system time on page 3271
- Configuring ports on page 3275
- Setting the idle timeout time on page 3276
- Setting the password policy on page 3276
- Changing the view settings on page 3276
- Setting the administrator password retries and lockout time on page 3277
- TLS configuration on page 3278
- Controlling return path with auxiliary session on page 3279

- Email alerts on page 3283
- Using configuration save mode on page 3287
- Trusted platform module support on page 3289
- Using the default certificate for HTTPS administrative access on page 3292
- Configure TCP NPU session delay globally on page 3296

Default administrator password

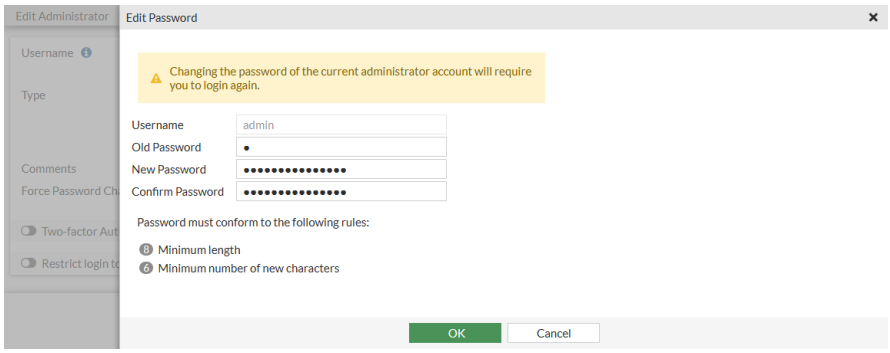
By default, your FortiGate has an administrator account set up with the username `admin` and no password. In order to prevent unauthorized access to the FortiGate, it is highly recommended that you add a password to this account.

Adding a password to the *admin* administrator is mandatory. You will be prompted to configured it the first time you log in to the FortiGate using that account, after a factory reset, and after a new image installation.

To change the default password in the GUI:

1. Go to *System* > *Administrators*.
2. Edit the *admin* account.
3. Click *Change Password*.
4. If applicable, enter the current password in the *Old Password* field.
5. Enter a password in the *New Password* field, then enter it again in the *Confirm Password* field.
   If the password does not conform to the password policy, an error is shown:

   If the password conforms to the password policy, no error message is shown:



6. Click *OK*.

To change the default password in the CLI:

```
config system admin
    edit admin
        set password <old password> <old password>
New password must conform to the password policy enforced on this device:
minimum-length=8; the new password must have at least 1 unique character(s) which don't exist in
the old password.; must not be same as last two passwords

node_check_object fail! for password *

value parse error before '*'
Command fail. Return code -49

        set password <new password> <old password>
    next
end
```

It is also recommended that you change the user name of this account; however, since you cannot change the user name of an account that is currently in use, a second administrator account must be created in order to do this.

Changing the host name

The FortiGate host name is shown in the *Hostname* field in the *System Information* widget on a dashboard, as the command prompt in the CLI, as the SNMP system name, as the device name on FortiGate Cloud, and other places. If the FortiGate is in an HA cluster, use a unique host name to distinguish it from the other devices in the cluster.

An administrator requires *System* > *Configuration* read/write access to edit the host name. See Administrator profiles on page 3218 for details.

To change the host name in the GUI:

1. Go to *System* > *Settings*.
2. In the *Host name* field, enter a new name.

3. Click *Apply*.

To change the host name in the CLI:

```
config system global
    set hostname <hostname>
end
```

Setting the system time

You can either manually set the FortiOS system time, or configure the device to automatically keep its system time correct by synchronizing with a Network Time Protocol (NTP) or Precision Time Protocol (PTP) server.

For many features to work, including scheduling, logging, and SSL-dependent features, the FortiOS system time must be accurate.

To configure the date and time in the GUI:

1. Go to *System* > *Settings*.
2. In the *System Time* section, configure the following settings to either manually set the time or use an NTP server:

Time Zone	Select a time zone from the list. This should be the time zone that the FortiGate is in.
Set Time	Select either *NTP*, *PTP*, or *Manual settings*.
NTP	To use an NTP server other than FortiGuard, the CLI must be used. In the *Sync interval* field, enter how often, in minutes, that the device synchronizes its time with the NTP server.
PTP	• Set the *Mode* to *Multicast* or *Hybrid*. • Select the *Delay mechanism*: *E2E* or *P2P*. • Set the *Request interval*, in seconds. • Select the *Interface*.
Manual settings	Manually enter the *Date*, and *Time*.
Setup device as local NTP server	Enable to configure the FortiGate as a local NTP server. This option is not available if *Set Time* is *PTP*. In the *Listen on Interfaces* field, set the interface or interfaces that the FortiGate will listen for NTP requests on.

3. Click *Apply*.

To configure the date and time in the CLI:

1. Configure the timezone:

```
config system global
    set timezone <integer>
end
```

2. Either manually configure the date and time, or configure an NTP or PTP server:
   - Manual:

```
execute date <yyyy-mm-dd>
execute time <hh:mm:ss>
```

   - NTP server:

```
config system ntp
    set ntpsync enable
    set type {fortiguard | custom}
    set syncinterval <integer>
    set source-ip <ip_address>
    set source-ip6 <ip6_address>
    set server-mode {enable | disable}
    set interface <interface>
    set authentication {enable | disable}
    set key-type {MD5 | SHA1}
    set key <password>
    set key-id <integer>
    config ntpserver
        edit <server_id>
            set server <ip_address or hostname>
            set ntpv3 {enable | disable}
            set authentication {enable | disable}
            set interface-select-method {auto | sdwan | specify}
            set key <password>
            set key-id <integer>
        next
    end
end
```

   - PTP server:

```
config system ptp
    set status enable
    set mode {multicast | hybrid}
    set delay-mechanism {E2E | P2P}
    set request-interval <integer>
    set interface <string>
end
```

SHA-1 authentication support (for NTPv4)

SHA-1 authentication support allows the NTP client to verify that severs are known and trusted and not intruders masquerading (accidentally or intentionally) as legitimate servers. In cryptography, SHA-1 is a cryptographic hash algorithmic function.

SHA-1 authentication support is only available for NTP clients, not NTP servers.

To configure authentication on a FortiGate NTP client:

```
config system ntp
    set ntpsync enable
    set type custom
    set syncinterval 1
    config ntpserver
        edit "883502"
            set server "10.1.100.11"
            set authentication enable
            set key **********
            set key-id 1
        next
    end
end
```

Command	Description
`authentication <enable | disable>`	Enable/disable MD5/SHA1 authentication (default = disable).
`key <passwd>`	Key for MD5/SHA1 authentication. Enter a password value.
`key-id <integer>`	Key ID for authentication. Enter an integer value from 0 to 4294967295.

To confirm that NTP authentication is set up correctly:

```
# diagnose sys ntp status
synchronized: yes, ntpsync: enabled, server-mode: disabled
ipv4 server(10.1.100.11) 10.1.100.11 -- reachable(0xff) S:4 T:6 selected
server-version=4, stratum=3
```

If NTP authentication is set up correctly, the server version is equal to 4.

PTPv2

The Precision Time Protocol (PTP) is used to synchronize network clocks. It is best suited to situations where time accuracy is of the utmost importance, as it supports accuracy in the sub-microsecond range. Conversely, NTP accuracy is in the range of milliseconds or tens of milliseconds.

Before configuring the PTP settings, ensure that NTP synchronization is disabled. Otherwise, the `config system ptp` command is not available.

```
config system ntp
    set ntpsync disable
end
```

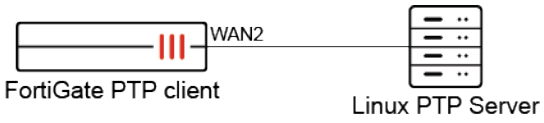
The following CLI commands are available:

```
config system ptp
    set status {enable | disable}
    set mode {multicast | hybrid}
    set delay-mechanism {E2E | P2P}
    set request-interval <integer>
    set interface <interface>
end
```

Command	Description
`status {enable | disable}`	Enable or disable the FortiGate system time by synchronizing with a PTP server (default = disable).
`mode {multicast | hybrid}`	Use multicast or hybrid transmission (default = multicast).
`delay-mechanism {E2E | P2P}`	Use end-to-end (E2E) or peer-to-peer (P2P) delay detection (default = E2E).
`request-interval <integer>`	The logarithmic mean interval between the delay request messages sent by the client to the server in seconds (default = 1).
`interface <interface>`	The interface that the PTP client will reply through.

Sample configuration

This example uses the following topology:



To configure a FortiGate to act as a PTP client that synchronizes itself with a Linux PTP server:

1. Enable debug messages:

   ```
   # diagnose debug application ptpd -1
   ```

   This command will provide details to debug the PTP communication with the server.
2. Check the system date:

   ```
   # execute date
   current date is: 2021-04-01
   ```

3. Configure PTP in global mode:

```
config system ptp
    set status enable
    set interface wan2
end
```

4. Check the system date again after synchronization with the PTP server:

```
# execute date
current date is: 2021-04-27
```

Configuring ports

To improve security, the default ports for administrative connections to the FortiGate can be changed. Port numbers must be unique. If a conflict exists with a particular port, a warning message is shown.

When connecting to the FortiGate after a port has been changed, the port number be included, for example: `https://192.168.1.99:100`.

Be aware of port conflicts with the IKE/IPsec TCP port. In 7.6.1 and later, the default IKE/IPsec TCP port is 443. If IPsec and GUI Management access are configured on the same interface, then IPsec access will take precedence.

To configure the ports in the GUI:

1. Go to *System* > *Settings*.
2. In the *Administration Settings* section, set the HTTP, HTTPS, SSH, and Telnet ports.
3. Enable *Redirect to HTTPS* to prevent HTTP from being used by administrators.
4. Click *Apply*.

To configure the ports in the CLI:

```
config system global
    set admin-port <port>
    set admin-sport <port>
    set admin-https-redirect {enable | disable}
    set admin-ssh-port <port>
    set admin-telnet-port <port>
end
```

Custom default service port range

The default service port range can be customized using the following CLI command:

```
config system global
    set default-service-source-port <port range>
end
```

Where `<port range>` is the new default service port range, that can have a minimum value of 0 and a maximum value up to 65535. The default value is 1 to 65535.

This change effects the TCP/UDP protocol.

Setting the idle timeout time

The idle timeout period is the amount of time that an administrator will stay logged in to the GUI without any activity. This is to prevent someone from accessing the FortiGate if the management PC is left unattended. By default, it is set to five minutes.

A setting of higher than 15 minutes will have a negative effect on a security rating score. See Security rating on page 3859 for more information.

To change the idle timeout in the GUI:

1. Go to *System* > *Settings*.
2. In the *Administration Settings* section, set the *Idle timeout* to up to 480 minutes.
3. Click *Apply*.

To change the idle timeout in the CLI:

```
config system global
    set admintimeout <1-480>
end
```

Setting the password policy

A password policy can be created for administrators and IPsec pre-shared keys. See Password policy on page 3204 for information.

Changing the view settings

The view settings change the look and language of the FortiOS GUI.

To change the view settings in the GUI:

1. Go to *System* > *Settings*.
2. In the *View Settings* section, configure the following settings:

Language	Set the GUI language: *English*, *French*, *Spanish*, *Portuguese*, *Japanese*, *Traditional Chinese*, *Simplifies Chinese*, *Korean*.
Theme	Set the theme color: *Jade*, *Neutrino*, *Mariner*, *Graphite*, *Melongene*, *Retro*, *Dark Matter*, *Onyx*, or *Eclipse*.
Date/Time Display	Set the date and time to display using the FortiGate's or the browser's timezone.
NGFW Mode	Set the NGFW mode to either *Profile-based* (default) or *Policy-based*.
Central SNAT	Optionally, enable central SNAT. This option is only available in *Profile-based* mode.

3. Click *Apply*.

To change the view settings in the CLI:

```
config system global
    set language {english | french | spanish | portuguese | japanese | trach | simch | korean}
    set gui-theme {jade | neutrino | mariner | graphite | melongene | retro | dark-matter | onyx |
eclipse}
    set gui-date-time-source {system | browser}
end
```

```
config system settings
    set ngfw-mode {profile-based | policy-based}
    set central-nat {enable | disable}
end
```

Setting the administrator password retries and lockout time

By default, the number password retry attempts is set to three, allowing the administrator a maximum of three attempts at logging in to their account before they are locked out for a set amount of time (by default, 60 seconds).

The number of attempts and the default wait time before the administrator can try to enter a password again can be configured using the CLI.

A maximum of ten retry attempts can be configured, and the lockout period can be 1 to 2147483647 seconds (over 68 years). The higher the retry attempts, the higher the risk that someone might be able to guess the password.

To configure the lockout options:

```
config system global
    set admin-lockout-threshold <failed_attempts>
    set admin-lockout-duration <seconds>
end
```

For example, to set the number of retry attempts to 1, and the lockout time to 5 minutes:

```
config system global
    set admin-lockout-threshold 1
    set admin-lockout-duration 300
end
```

If the time span between the first failed log in attempt and the lockout threshold failed attempt is less than lockout time, the lockout will be triggered.

TLS configuration

The minimum TLS version that is used for local out connections from the FortiGate can be configured in the CLI:

```
config system global
    set ssl-min-proto-version {SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2 | TLSv1-3}
end
```

By default, the minimum version is TLSv1.2. The FortiGate will try to negotiate a connection using the configured version or higher. If the server that FortiGate is connecting to does not support the version, then the connection will not be made. Some FortiCloud and FortiGuard services do not support TLSv1.3.

Minimum SSL/TLS versions can also be configured individually for the following settings, not all of which support TLSv1.3:

Setting	CLI
Email server	`config system email-server`
Certificate	`config vpn certificate setting`
FortiSandbox	`config system fortisandbox`
FortiGuard	`config log fortiguard setting`
FortiAnalyzer	`config log fortianalyzer setting`
Syslog	`config log syslogd setting`
User Authentication	`config user setting`
LDAP server	`config user ldap`
POP3 server	`config user pop3`

Setting	CLI
Exchange server	`config user exchange`

A minimum (`ssl-min-proto-ver`) and a maximum (`ssl-max-proto-ver`) version can be configured for SSL VPN. See TLS 1.3 support on page 2943

Controlling return path with auxiliary session

When multiple incoming or outgoing interfaces are used in ECMP or for load balancing, changes to routing, incoming, or return traffic interfaces impacts how an existing sessions handles the traffic. Auxiliary sessions can be used to handle these changes to traffic patterns.

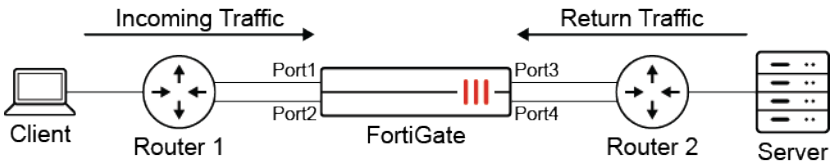
- In FortiOS 6.0 and earlier, the auxiliary session feature is not supported.
- In FortiOS 6.2.0 to 6.2.2, the auxiliary session feature is permanently enabled.
- In FortiOS 6.2.3 and later, the auxiliary session feature is disabled by default, and can be enabled if required.

To enable or disable the auxiliary session feature:

```
config system settings
    set auxiliary-session {enable | disable*}
end
```

When enabling auxiliary sessions, consider the impact of routing in both traffic directions. In topologies such as SD-WAN hub and spoke or ADVPN deployments, the symmetry of the return traffic is important for maintaining the stability of the session. It is expected that the spoke selects the outbound interface and path, and the other nodes obey and reply symmetrically. It is recommended to disable auxiliary in these scenarios, and others where incoming and return traffic symmetry is expected.

Scenarios



Incoming traffic is from the client to the server. Return traffic is from the server to the client.

Scenario 1 - Return traffic returns on the original outgoing interface

In this scenario, a session is established between port1 and port3. When the return traffic hits port3:

Auxiliary sessions disabled:

The reply to the client egresses on the original incoming interface, port1. If policy routes or SD-WAN rules are configured, the next hop gateway is applied if the output device is the same as the original incoming interface.

Auxiliary sessions enabled:

The reply to the client egresses on the best route in the routing table:

- If the best route is port1, then it will egress on port1.
- If the best route is port2, then it will egress on port2.

If policy routes or SD-WAN rules are configured, they must be matched to determine the egress interface. If both are configured, policy routes have higher priority.

Scenario 2 - Return traffic returns on an interfaces other than the original outgoing interfaces

In this scenario, a session is established between port1 and port3. When the return traffic hits port4:

Auxiliary sessions disabled:

- The session is dirtied and then gets refreshed, and interfaces on the session are updated. This continuous state change to dirty prevents the session from being offloaded.
- If there is a high traffic volume or flapping between the interfaces, the CPU usage increases.

Auxiliary sessions enabled:

An auxiliary session is created for the existing session, and traffic returns to the client as normal on the auxiliary session.

Scenario 3 - Incoming traffic enters on an interfaces other than the original incoming interfaces

In this scenario, a session is established between port1 and port3. When the incoming traffic hits port2:

Auxiliary sessions disabled:

The session is dirtied and then gets refreshed, and interfaces on the session are updated. This continuous state change to dirty prevents the session from being offloaded.

Auxiliary sessions enabled:

An auxiliary session is created for the existing session, and traffic is forwarded to the server as normal on the auxiliary session.

Scenario 4 - the routing table is changed

In this scenario, a session has been established between port1 and port3, when a new route on port4 is updated as the route to the server.

Auxiliary sessions disabled:

As long as there is a route to the destination, the session will not be dirtied or refreshed. Even though there is a better route, traffic continues on the original path between port1 and port3.

Auxiliary sessions enabled:

The session is dirtied and then gets refreshed, and interfaces on the session are updated. This continuous state change to dirty prevents the session from being offloaded.

Effect on NPU offloading sessions

When the auxiliary session feature is disabled, there is always one session. If the incoming or return interface changes, the FortiGate marks the session as dirty and updates the session's interfaces. This cannot be done by the NPU, so the session is not offloaded to the NPU, and is processed by the CPU instead. If Equal-Cost Multi-Path (ECMP) causes the interface to keep changing, then it will use significant CPU resources.

When the auxiliary session feature is enabled and the incoming or return interface changes, it creates an auxiliary session, and all traffic can continue to be processed by the NPU.

Verification

When an auxiliary, or reflect, session is created, it will appear as a reflect session below the existing session:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=111 expire=175 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=4

```

Email alerts

Alert emails are used to notify administrators about events on the FortiGate device, allowing a quick response to any issues.

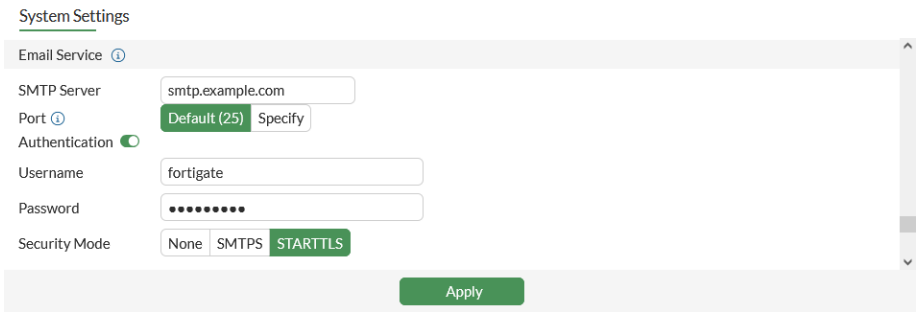
There are two methods that can be used to configure email alerts:

- Automation stitches on page 3284
- Alert emails on page 3287

The FortiGate has a default SMTP server, *fortinet-notifications.com*, that provides secure mail service with SMTPS. It is used for all emails that are sent by the FortiGate, including alert emails, automation stitch emails, and FortiToken Mobile activations. You can also configure a custom email service.

To configure a custom email service in the GUI:

1. Go to *System* > *Settings*.
2. In the *Email Service* section, enable *Use custom settings*.
3. Configure the following settings:



SMTP Server	If required, change the address or name of the SMTP server, such as *smtp.example.com*.
Port	If required, select *Specify* and enter a specific port number. The default is port depends on the selected security mode: *None* and *STARTTLS* default to port 25 and *SMTPS* defaults to 465.
Authentication	If required by the email server, enable authentication. If enabled, enter the *Username* and *Password*.
Security Mode	Set the security mode: *None*, *SMTPS*, or *STARTTLS*.

4. Click *Apply*.

To configure a custom email service in the CLI:

```
config system email-server
    set server "smtp.example.com"
    set port 465
    set authenticate enable
    set username "fortigate"
    set password *********
    set security smtps
end
```

The reply-to address for the source email is automatically set to *DoNotReply@fortinet-notifications.com* for all servers, including custom servers. For custom servers, if a username is configured, then MAIL FROM is set to the username, but if no username is configured, then MAIL FROM is the same as MAIL TO. You cannot customize the address when configuring a custom email server in the GUI or CLI.

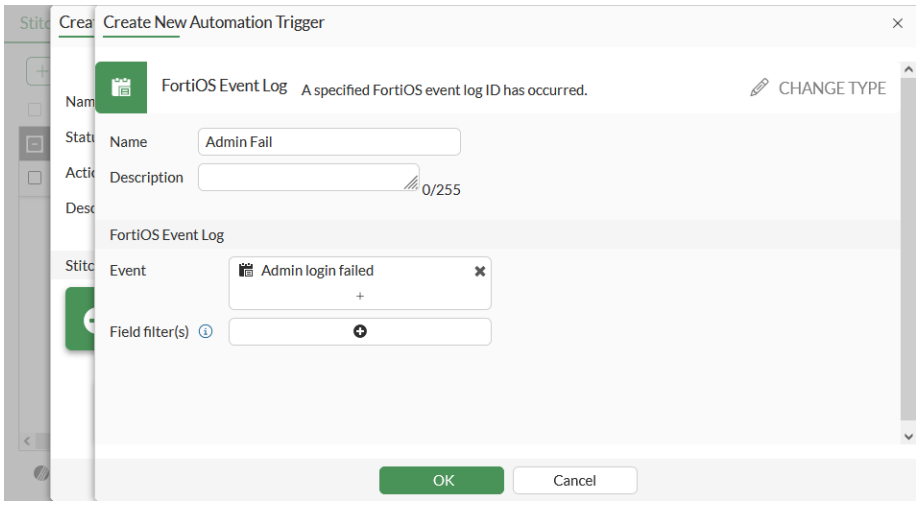
Automation stitches

Automation stitches can be configured to send emails based on a variety of triggers, giving you control over the events that cause an alert, and who gets alerted. For more information, see Automation stitches on page 3874.

In this example, the default mail service sends an email to two recipients when an Admin login failed event occurs or there is a configuration change.

To configure the automation stitch in the GUI:

1. On the root FortiGate, go to *Security Fabric > Automation* and, on the *Stitch* tab, click *Create New*.
2. Enter a name for the stitch, such as *Admin Fail*.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *FortiOS Event Log*.
   c. Enter a name for the trigger, such as *Admin Fail*.
   d. Click in the *Event* field, and in the slide out pane, search for and select *Admin login failed*.



e. Click *OK*.

f. Select the trigger in the list and click *Apply*.

4. Configure the action:

a. Click *Add Action*.

b. Click *Create* and select *Email*.

c. Configure the following settings:

Name	Enter a name for the action, such as *Admin Fail_email*.
To	Enter the two email recipients' addresses, such as *admin@example.com* and *manager@example.com*.
Subject	Enter an subject, such as *Admin log in failed*.
Body	Edit as required. By default, the email body will include all the fields from the log event that triggered the stitch.

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Click *OK*.
6. Create a second stitch with *Configuration Change* as the trigger, and an email action with a different subject line (such as *Configuration Change Detected*).

To configure the automation stitch in the CLI:

1. Create the automation triggers:

```
config system automation-trigger
    edit "Admin Fail"
        set event-type event-log
        set logid 32002
    next
    edit "Config Change"
        set event-type config-change
    next
end
```

2. Create automation actions to send the email messages:

```
config system automation-action
    edit "Admin Fail_email"
        set action-type email
        set email-to "admin@example.com" "manager@example.com"
        set email-subject "Admin log in failed"
    next
    edit "Config Change_email"
        set action-type email
        set email-to "admin@example.com" "manager@example.com"
        set email-subject "Configuration Change Detected"
    next
end
```

3. Create the automation stitches:

```
config system automation-stitch
    edit "Admin Fail"
        set trigger "Admin Fail"
        config actions
            edit 1
                set action "Admin Fail_email"
                set required enable
            next
        end
    next
    edit "Config Change"
        set trigger "Config Change"
        config actions
            edit 1
                set action "Config Change_email"
```

```
                set required enable
            next
        end
    next
end
```

Alert emails

When configuring an alert email, you can define the threshold when an issue becomes critical and requires attention. When the threshold is reached, an email is sent to up to three recipients on the configured schedule to notify them of the issue.

Alert email messages can be configured in the CLI. For more information on the available CLI commands, see Configure alert email settings.

Alert email messages (under `config alertemail setting`) cannot monitor and notify users of the current logging status or the status of the miglogd daemon. In the event that the miglogd daemon is unresponsive, alert email messages cannot be triggered.

IPS, SSH, violation traffic, antivirus, and web filter logs are supported as triggers in automation stitches. For more information, see Event log category triggers on page 3905.

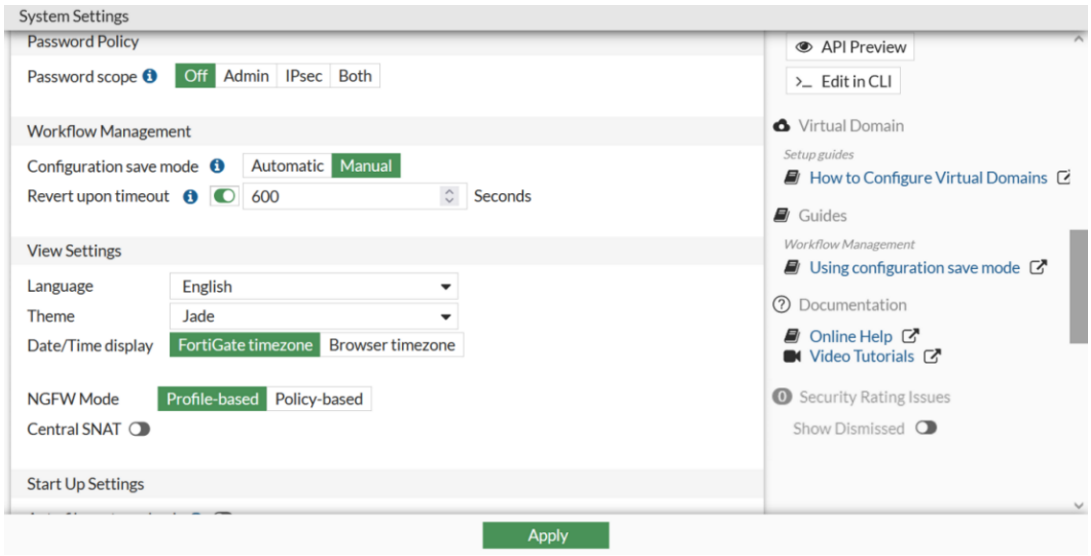
In this example, the FortiGate is configured to send email messages to two addresses, admin@example.com and manager@example.com, every two minutes when multiple intrusions, administrator log in or out events, or configuration changes occur.

To configure an alert email:

```
config alertemail setting
    set username fortigate@example.com
    set mailto1 admin@example.com
    set mailto2 manager@example.com
    set filter-mode category
    set email-interval 2
    set IPS-logs enable
    set configuration-changes-logs enable
    set admin-login-logs enable
end
```

Using configuration save mode

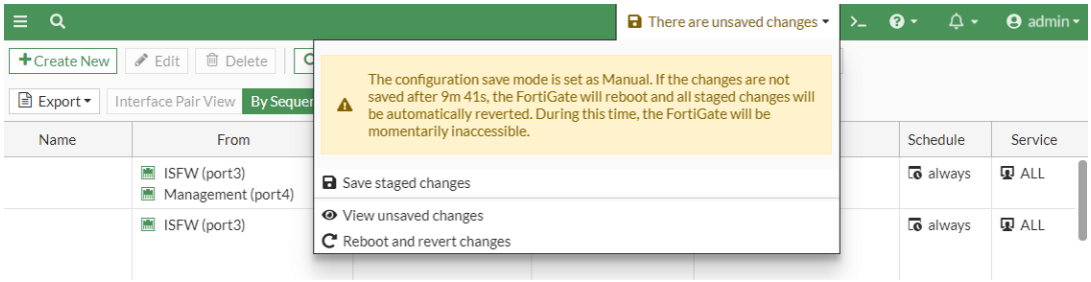
Administrators can use configuration save mode set to *Manual* to implement strict change control by requiring changes to be manually committed to the flash. To configure the setting in the GUI, go to *System* > *Settings*.



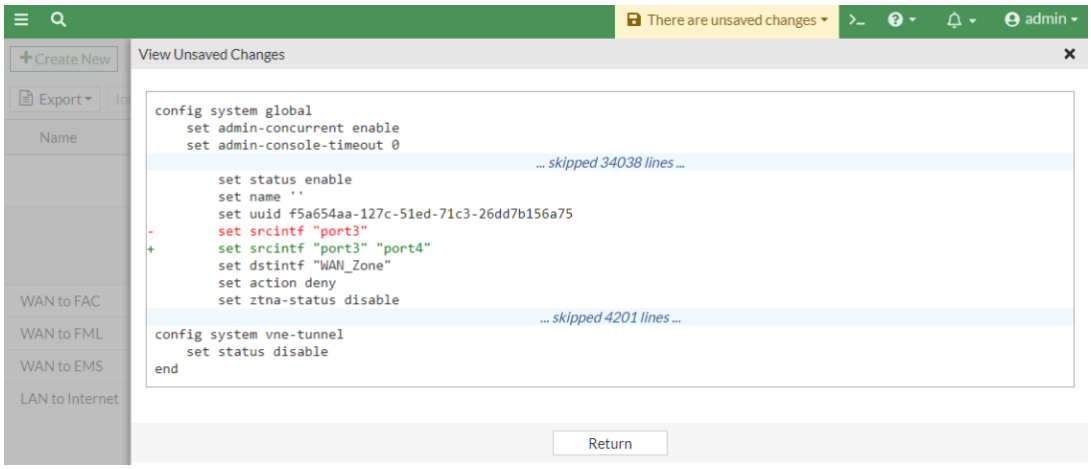
When *Configuration save mode* is set to *Automatic* (default), configuration changes are automatically saved to both memory and flash.

When *Configuration save mode* is set to *Manual*, configuration changes are saved to memory, but not to flash. The changes take effect immediately, but must be manually saved to flash. Unsaved changes are reverted when the device is rebooted. If *Revert upon timeout* is enabled, the system might be unresponsive for a short time after the configured timeout while it reverts the changes back to the previous save point. Prior to the timeout expiring, a pop-up warning gives you the option to postpone reverting the configuration by one minute, revert the configuration immediately, or save the configuration changes.

In *Manual* mode, a warning is shown in the banner when there are unsaved changes. Click the warning to save, view, or revert the changes. When *Reboot and revert changes* is clicked, the system might be unresponsive for a short time while it reverts the changes back to the previous save point.



Clicking *View Unsaved Changes* opens a pane highlighting the changes that have not been committed.



This feature is also available in the CLI:

```
config system global
    set cfg-save {automatic | manual | revert}
    set cfg-revert-timeout <integer>
end
```

```
# execute cfg {reload | save}
```

Trusted platform module support

On supported FortiGate hardware devices, the Trusted Platform Module (TPM) can be used to protect your password and key against malicious software and phishing attacks. The dedicated module hardens the FortiGate by generating, storing, and authenticating cryptographic keys. To help prevent tampering, the chip is soldered on the motherboard to reduce the risk of data transaction interceptions from attackers.

By default, the TPM is disabled. When enabling private data encryption, the FortiGate will generate a random master-encryption-password that encrypts sensitive data on the FortiGate using AES128-CBC. With the password, TPM generates a 2048-bit primary key to secure the master-encryption-password through RSA-2048 encryption. The master-encryption-password protects the data. The primary key protects the master-encryption-password.

The TPM module does not encrypt the disk drive of eligible FortiGates.

The primary key binds the encrypted configuration file to a specific FortiGate unit and never leaves the TPM. When backing up the configuration, the TPM uses the primary key to encrypt the master-encryption-password in the configuration file. When restoring a configuration that includes a TPM protected master-encryption-password:

- If TPM is disabled, then the configuration cannot be restored.
- If TPM is enabled but has a different master-encryption-password than the configuration file, then the configuration cannot be restored.

- If TPM is enabled and the master-encryption-password is the same in the configuration file, then the configuration can be restored.

For information on backing up and restoring the configuration, see Configuration backups and reset on page 3686.

Passwords and keys that can be encrypted by the master-encryption-key include:

- Alert email user's password
- BGP and other routing related configurations
- External resource
- FortiGuard proxy password
- FortiToken/FortiToken Mobile's seed
- HA password
- IPsec pre-shared key
- Link Monitor, server side password
- Local certificate's private key
- Local, LDAP. RADIUS, FSSO, and other user category related passwords
- Modem/PPPoE
- NST password
- NTP Password
- SDN connector, server side password
- SNMP
- Wireless Security related password

To check if your FortiGate device has a TPM:

Verify all the following commands exist. Otherwise, the platform does not support it.

```
# diagnose hardware test info
List of test cases:
    bios: sysid
    bios: checksum
    bios: license
    bios: detect

# diagnose hardware deviceinfo tpm
TPM capability information of fixed properties:
============================================================
TPM_PT_FAMILY_INDICATOR: 2.0
TPM_PT_LEVEL: 0
TPM_PT_REVISION: 138
TPM_PT_DAY_OF_YEAR: 8
TPM_PT_YEAR: 2018
TPM_PT_MANUFACTURER: NTC
# diagnose hardware test tpm
=========== Fortinet Hardware Test Report ===================
TPM
TPM Device Detection..................................... PASS
================ Fortinet Hardware Test PASSED ==============
```

```
# diagnose tpm
get-property Get TPM properties. [Take 0-1 arg(s)]
get-var-property Get TPM var properties.
read-clock Read TPM internal clock.
shutdown-prepare Prepare for TPM power cycle.
selftest Perform self tests.
generate-random-number Generate a 4-byte random number
SHA-1 HASH a sequence of num with SHA-1 algo
SHA-256 HASH a sequence of num with SHA-256 algo
```

To enable TPM and input the master-encryption-password:

```
config system global
    set private-data-encryption enable
end
This operation will generate a random private data encryption key!
Previous config files encrypted with the system default key cannot be restored after this
operation!
Do you want to continue? (y/n)y
Private data encryption key generation succeeded!
```

When enabling private-data-encryption the FortiGate will generate a random password itself. This increases security as the master-encryption-password is not known and cannot be stolen or leaked.

As such, a configuration that is backed up while private-data-encryption is enabled cannot be restored when private-data-encryption is disabled or when private-data-encryption is re-enabled with a different random key.

For FortiGates managed by FortiManager, refer to Verifying devices with private data encryption enabled in the FortiManager Administration Guide for steps on managing the FortiGate.

HA behavior

HA will form when both units have the basic matching HA required settings, including the HA group and HA password, regardless of whether private-data-encryption is enabled on both units before or after forming HA.

If private-data-encryption is enabled separately before forming HA, the FortiGates will first form HA and then synchronize the private-data-encryption key after. Once both devices have the same private-data-encryption key, configurations are synchronized from the primary to the secondary.

If private-data-encryption is enabled after the HA cluster is formed, then the primary unit will generate the random master-encryption-password. The password is synchronized from the primary to the secondary immediately after it is created.

Using the default certificate for HTTPS administrative access

By default, the FortiGate uses the certificate named Fortinet_GUI_Server for HTTPS administrative access. This certificate is generated and signed by the built-in Fortinet_CA_SSL certificate, which dynamically updates the SAN field of the Fortinet_GUI_Server certificate with the IP addresses of all interfaces enabled for HTTPS. After installing the Fortinet_CA_SSL CA certificate on a PC, administrators can access the FortiGate GUI through a browser without any warnings.

How the certificate works

The Fortinet_GUI_Server certificate is generated by the built-in certificate authority (CA) with the Fortinet_CA_SSL certificate, which is unique to each FortiGate. This CA certificate is also used in SSL deep inspection. When the Fortinet_GUI_Server certificate is generated, the SAN (Subject Alternative Name) extension field is populated with the IP addresses of all physical and logical (VLAN, loopback, and so on) interfaces enabled for HTTPS. It is also populated with the management IP address whenever this field is an IP address and not an FQDN. If there are any changes to the IP addresses on the interface or management IP, the Fortinet_GUI_Server certificate is updated and regenerated with the new IP. If the Fortinet_CA_SSL certificate itself is updated, the Fortinet_GUI_Server certificate is regenerated.

Because the root CA is not a public CA, the Fortinet_CA_SSL CA certificate must be installed in the trusted certificate store on the client PC in order for the trusted certificate chain to be recognized by a browser. This certificate can be downloaded from the FortiGate in several ways.

The Fortinet_GUI_Server certificate can only be used for HTTPS administrative access. It cannot be used anywhere else.

Example

The HTTPS server certificate can be configured in the GUI or CLI.

To configure the HTTPS server certificate in the GUI:

1. On an administrative PC, log in to the FortiGate GUI and go to *System > Settings*.
2. In the *Administration Settings* section, set the *HTTPS server certificate* to *Fortinet_GUI_Server*.
3. Download the Fortinet_CA_SSL certificate using one of the following methods:
   - On the *System > Settings* page, click *Download HTTPS CA certificate* (below the *HTTPS server certificate* option).
   - Go to *System > Certificates*. In the *Local CA Certificate* section, select *Fortinet_CA_SSL*, and click *Download*.
   - Go to *Dashboard > Status*. In the *Administrator* widget, click *Download HTTPS CA certificate*.
4. Install the certificate in the PC's trusted certificate store. Refer to your OS documentation if needed.
5. Reload the FortiGate GUI. The browser now trusts the certificate and does not display a certificate warning.

6. If you are connecting to the FortiGate over DNAT or port forwarding, the certificate needs to add the NATed management IP into the SAN field so that the browser does not display a warning about an invalid CN. Configure the management IP in the global settings:

```
config system global
    set management-ip <IP_address>
end
```

To configure the HTTPS server certificate in the CLI:

1. Configure the HTTPS server certificate:

```
config system global
    set admin-server-cert Fortinet_GUI_Server
end
```

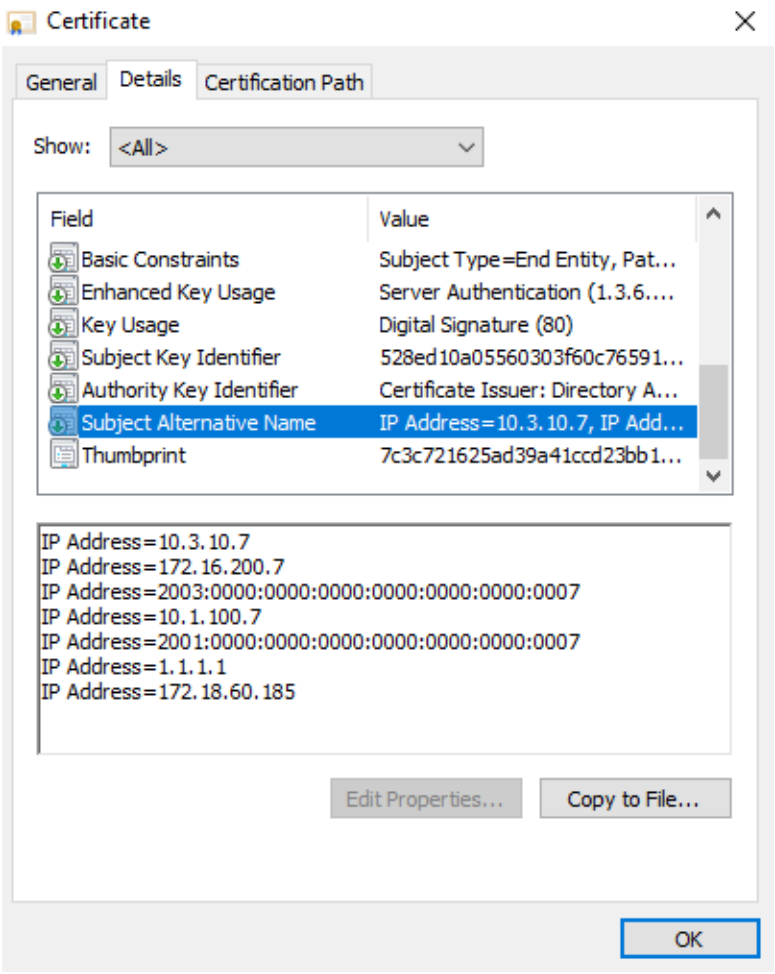
2. Download the Fortinet_CA_SSL certificate on the administrative PC through TFTP:

```
# execute vpn certificate local export tftp Fortinet_CA_SSL cer <file_name> <server_IP>

Done.
```

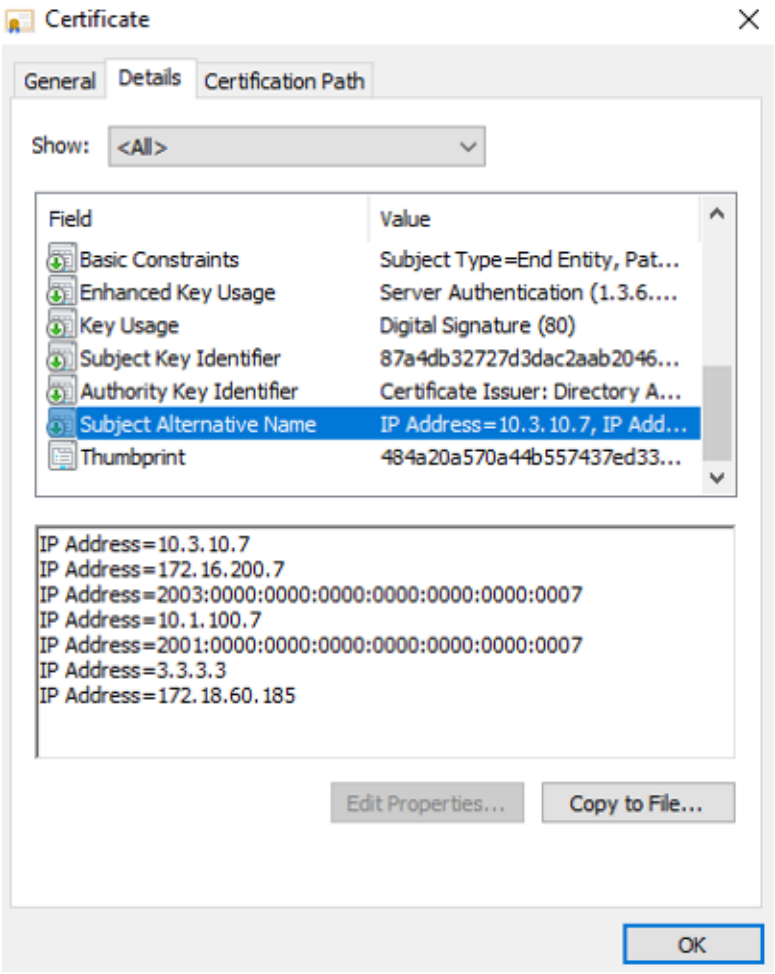
To verify the connection:

1. Access the FortiGate from a browser and verify the certificate information. For example, in Chrome:
   a. In the left side of the address bar, click the icon to view the site information.
   b. Click *Certificate*.
   c. Click the *Details* tab.
   d. Locate the *Subject Alternative Name* (SAN) field, and note the IP addresses that are listed (*1.1.1.1*).



e. Click *OK*.

2. In FortiOS, change one of the interface addresses. In this example, the port11 address is changed from 1.1.1.1 to 3.3.3.3.
3. Reload the browser and review the certificate information again. The IP 1.1.1.1 in the SAN field is updated to *3.3.3.3*.



4. In FortiOS, go to *System > Certificates* and double-click *Fortinet_GUI_Server* to view the *Certificate Details*.
5. At the bottom of the pane, the *X509v3 Subject Alternative Name* field displays the IP addresses from the certificate.
6. Verify the logs when the certificate is regenerated:

```
# execute log filter category 1
# execute log display
12 logs found.
10 logs returned.
```

```
1: date=2022-06-23 time=09:11:44 eventtime=1656000704674434910 tz="-0700" logid="0100022205"
type="event" subtype="system" level="information" vd="root" logdesc="Certificate succeed to
auto-generate" user="system" action="certificate-generate" status="successful" name="Fortinet_
GUI_Server" msg="Successfully generated GUI management cert"
```

```

Configure TCP NPU session delay globally

The TCP NPU session delay can be applied globally, eliminating the need to set this command for each firewall policy.

```
config system global
    set delay-tcp-npu-session {enable | disable}
end
```

This global setting is disabled by default. When it is disabled, if the host interface is busy, it is possible that the third TCP session establishment ACK received from the client is transmitted to the server after the data packets. When it is enabled, the packet order of the three-way handshake is guaranteed.

A sniffer trace will display the following when the setting is disabled:

```
# diagnose sniffer packet port1 'tcp' 6 0 a
interfaces=[port1]
filters=[tcp]

Virtual Domains

Virtual Domains (VDOMs) are used to divide a FortiGate into two or more virtual units that function independently. VDOMs can provide separate security policies and, in NAT mode, completely separate configurations for routing and VPN services for each connected network.

Multiple VDOMs can be created and managed as independent units in multi-VDOM mode.

The number of FortiGate units is dependent on the FortiGate series and many FortiGate models support purchasing a license key to increase the maximum number. For example, 200 to 400 series FortiGates support 25 VDOMs while 500 to 900 series FortiGates support 50 VDOMs. Some exceptions may apply.

The following topics provide an overview of VDOM concepts, topologies, best practices, and the general configurations involved when working with multi-VDOM mode:

- VDOM overview on page 3298
- General configurations on page 3303
- Configuring global profiles on page 3311
- Backing up and restoring configurations in multi-VDOM mode on page 3312

The following topics provide examples of configuring VDOMs:

- Inter-VDOM routing configuration example: Internet access on page 3316
- Inter-VDOM routing configuration example: Partial-mesh VDOMs on page 3326

VDOM overview

The following sections provide conceptual information on VDOMs:

- Multi-VDOM mode on page 3298
- Global settings on page 3299
- Global and per-VDOM resources on page 3299
- Management VDOM on page 3299
- VDOM types on page 3299
- Administrator roles and views on page 3300
- Inter-VDOM routing on page 3300

The following sections provide information on methods of VDOM configuration:

- Topologies on page 3300
- Best practices on page 3302

Multi-VDOM mode

In multi-VDOM mode, the FortiGate can have multiple VDOMs that function as independent units. When multi-VDOM mode is first enabled, all VDOM configurations will move to the root VDOM by default. The root VDOM cannot be deleted, and remains in the configuration even if it is not processing any traffic. New VDOMs can be created, up to the VDOM limit allowable on your device.

Global settings

Global settings are configured outside of a VDOM. They effect the entire FortiGate, and include settings such as interfaces, firmware, DNS, some logging and sandboxing options, and so on. Global settings should only be changed by top level administrators.

Global and per-VDOM resources

Global and per-VDOM resources can be configured when the FortiGate is in multi-VDOM mode. Global resources apply to resources that are shared by the whole FortiGate, while per-VDOM resources are specific to each VDOM.

By default, all per-VDOM resource settings are set to have no limits. This means that any single VDOM can use all of the FortiGate device's resources. This could deprive other VDOMs of the resources that they require, to the point that could be unable to function. We recommend setting maximum values on the resources that are vital to you.

Management VDOM

The management VDOM refers to the specific role that must be designated to one of the VDOMs. By default, the root VDOM is the management VDOM, and management-related services such as FortiGuard updates and other local out (self-originating) traffic such as logs to remote servers originate from the management VDOM. The management VDOM cannot be deleted. See Management VDOM on page 3304 for configuration details.

VDOM types

When a FortiGate is in multi-VDOM mode, a VDOM can be configured as an *Admin*, *Traffic*, or LAN extension type VDOM.

When the VDOM type is set to *Admin*, the VDOM is used to administer and manage the FortiGate. Usually, the *Admin* VDOM resides in a management network which is only accessible by administrators. Global and VDOM administrators can log in to the FortiGate using SSH, HTTPS, and so on but traffic cannot pass through this *Admin* VDOM. A FortiGate does not need to have an *Admin* VDOM and, at most, there can only be one *Admin* VDOM per FortiGate.

When VDOM type is set to *Traffic*, the VDOM can pass traffic like a regular firewall. Most VDOMs will be *Traffic* type VDOMs. Network interfaces on a *Traffic* VDOM can also enable SSH, HTTPS, and so on for administrative and management purposes.

In general, an *Admin* VDOM has a subset of a *Traffic* VDOM's capabilities. See Configure an administrative VDOM type on page 3307 for configuration details.

A LAN extension mode VDOM allows a remote FortiGate to provide remote connectivity to a local FortiGate over a backhaul connection. It can only be configured in the CLI. See FortiGate LAN extension on page 854 for details.

FortiGate-VM supports having at least two VDOMs; one that supports an administrative VDOM and another that supports a traffic VDOM.

Administrator roles and views

When a FortiGate has been configured in multi-VDOM mode, the device can be managed by global administrators and per-VDOM administrators. Each type of administrator will have a different view of the GUI in multi-VDOM mode which corresponds to their role.

Global administrators

Global administrators have complete visibility and access because the scope of their role is to manage the entire physical FortiGate device. An example of a global administrator is an administrator working for a managed security services provider (MSSP) providing the FortiGate as a multi-tenant environment to its clients.

When global administrators log into the GUI, from the *VDOM: Global* view they will see all pages for global settings shared between VDOMs, and VDOM-specific settings.

To create a global administrator that has access to all VDOMs and access to global settings, it must be created at the global level and must use the *super_admin* administrator profile.

See Administrator profiles on page 3218 and Local authentication on page 3190 for configuration details.

VDOM administrators

VDOM administrators will be unable to view global settings or VDOMs not assigned to them because the scope of their role is restricted to managing specific VDOMs only. An example of a VDOM administrator is the administrator working for a company which is a client, or tenant, of an MSSP's multi-tenant FortiGate.

When VDOM administrators log into the GUI, from the *VDOM:<VDOM>* view they will see pages for settings specific to the VDOM they have been configured to administer such as interfaces, routes, firewall policies, and security profiles.

See Create per-VDOM administrators on page 3306 for configuration details.

Inter-VDOM routing

VDOM links are virtual interfaces that allow VDOMs to communicate internally without using additional physical interfaces. A VDOM link contains a pair of interfaces, each one connected to a VDOM to form each end of the inter-VDOM connection. Inter-VDOM routing can be configured in order to communicate between one VDOM to another.

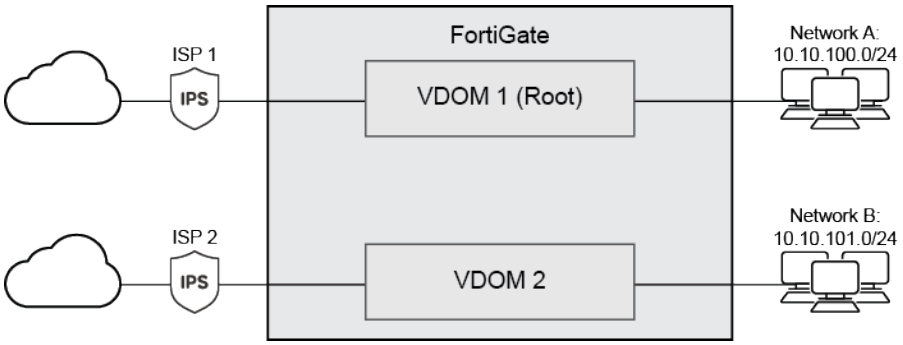
When VDOMs are configured on your FortiGate unit, configuring inter-VDOM routing and VDOM links is similar to creating a VLAN interface. VDOM links can be managed in either the CLI or in the network interface list in the GUI.

See Inter-VDOM routing configuration example: Internet access on page 3316 for more information.

Topologies

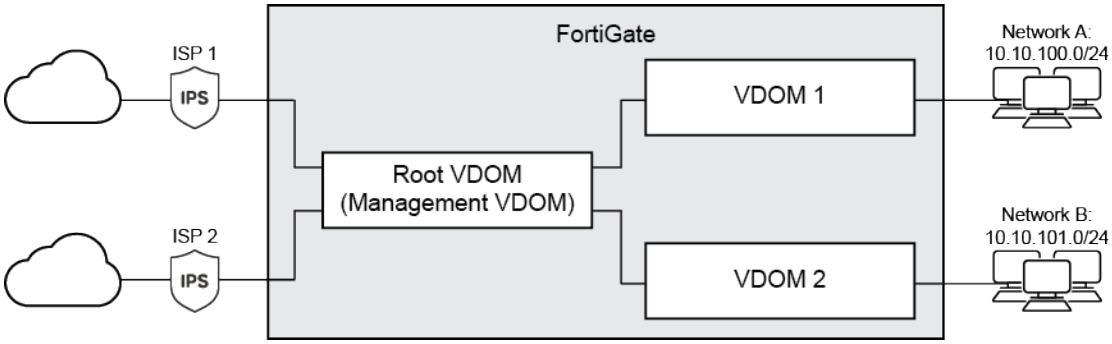
These are the main configuration types in multi-VDOM mode:

Independent VDOMs



Multiple, completely separate VDOMs are created. Any VDOM can be the management VDOM, as long as it has Internet access to connect to FortiGuard services and other management resources. There are no inter-VDOM links, and each VDOM is independently managed.

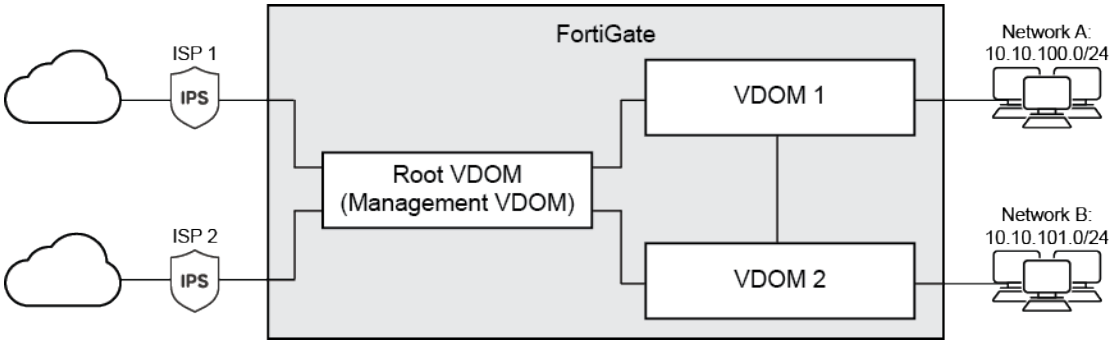
Internet access VDOM



In the Internet access VDOM configuration, Internet access is provided primarily by a single VDOM; for example, the management VDOM (depicted as root VDOM in the preceding diagram). Each tenant connects to the management VDOM via an inter-VDOM link. The management VDOM has complete control over Internet access, including the types of traffic that are allowed in both directions. This can improve security, as there is only one point of ingress and egress.

There is no communication between the other VDOMs.

Meshed VDOMs

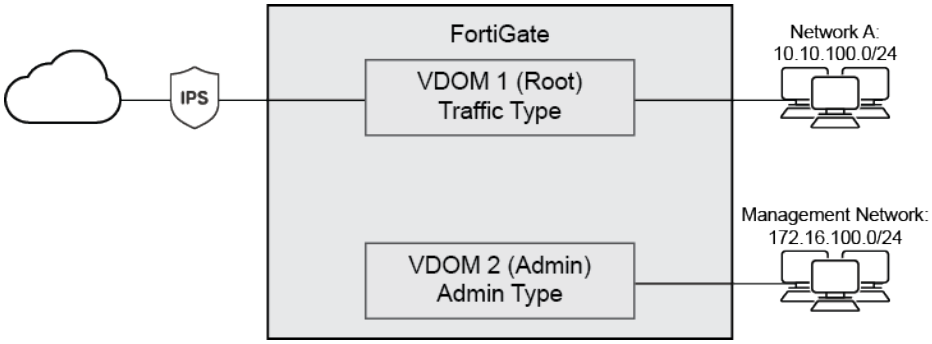


VDOMs can communicate with inter-VDOM links. In full-mesh configurations, all the VDOMs are interconnected. In partial-mesh configurations, only some of the VDOMs are interconnected.

In this configuration, inter-vdom links between tenants are created by the global administrator, but each tenant controls the firewall policies to allow access to other tenants.

See Inter-VDOM routing on page 3308 and Inter-VDOM routing configuration example: Internet access on page 3316 for configuration details.

Administrative VDOM on a management network



The administrative VDOM type can be used to limit administrative access to the FortiGate using SSH, HTTPS and so on to administrators working from a management network. Administrators may be limited to management settings or may have global privileges to access other VDOMs. The user or tenant network (depicted as Network A in the diagram) uses a traffic type VDOM, which allows traffic to pass through it like a regular firewall and allows configuration of firewall-related settings. This configuration can improve security if the management network is a closed network and administrative access is not enabled on any interfaces on the traffic VDOM.

Best practices

VDOMs can provide separate firewall policies and, in NAT mode, completely separate configurations for routing and VPN services for each connected network or organization. This section provides a list of best practices for configuring VDOMs.

Per-VDOM resource setting

All per-VDOM resource settings are set to no limit by default. To ensure proper functionality of all VDOMs, it is recommended that you set some maximum values for the most vital resources. See Global and per-VDOM resources on page 3305 for configuration details.

Virtual domains in NAT mode

Once the virtual domains have been enabled and one or more VDOMs have been created, they must be configured. The following steps provide a general overview of the configuration process.

To configure VDOMs:

1. Change the management virtual domain.
2. Configure FortiGate interfaces for your VDOMs in NAT mode.
3. Configure VDOM routing.
4. Configure security policies for VDOMs in NAT mode.
5. Configure UTM profiles for VDOMs in NAT mode.
6. Test the configuration.

While you may not require all of the steps for your network topology, it is recommended that you perform them in the order given.

See General configurations on page 3303 for configuration details.

Virtual clustering

Virtual clustering is an extension of FGCP HA that provides failover protection between two instances of one or more VDOMs operating on two FortiGates that are in a virtual cluster. A standard virtual cluster consists of FortiGates that are operating in active-passive HA mode with multiple VDOMs enabled. See HA virtual cluster setup on page 3368 for more details.

Typically, virtual clustering is configured with override enabled and uses device priorities to distribute traffic between the primary and secondary FortiGates.

If you decide to disable override for clustering, as a result of persistent renegotiating, you should disable it for both cluster units.

General configurations

VDOMs can be configured in the GUI and the CLI. To ensure that no VDOMs are accidentally configured in the CLI, prompts can be enabled. These prompts will display to ask for confirmation that the VDOM is meant to be configured in the CLI.

To configure confirmation prompts:

```
config system global
    set edit-vdom-prompt enable
end
```

The following topics provide information on general VDOM configurations:

- Enable multi-VDOM mode on page 3304
- Management VDOM on page 3304
- Global and per-VDOM resources on page 3305
- Create per-VDOM administrators on page 3306
- Configure an administrative VDOM type on page 3307
- Assign interfaces to a VDOM on page 3308

- Inter-VDOM routing on page 3308
- Allow FortiGuard services and updates to initiate from a traffic VDOM on page 3310

Enable multi-VDOM mode

Enable multi-VDOM mode and create the VDOMs in the GUI and CLI.

On FortiGate 90 series models and lower, VDOMs can only be enabled using the CLI.

To enable VDOMs in the GUI:

1. Go to *System* > *Settings*.
2. In the *System Operation Settings* sections, enable *Virtual Domains*.
3. Click *OK*.

To enable VDOMs in the CLI:

```
config system global
    set vdom-mode multi-vdom
end
```

You will be logged out of the device when the VDOM mode is enabled.

Management VDOM

By default, the management VDOM is *root*. The management VDOM can be manually assigned from the GUI or the CLI.

To assign the management VDOM in the GUI:

1. In the *Global* VDOM, go to *System* > *VDOM*.
2. Select the VDOM you want to assign as the management VDOM.
3. Click *Switch Management*.
4. Click *OK*.

To assign the management VDOM in the CLI:

```
config global
    config system global
        set management-vdom <vdom>
    end
end
```

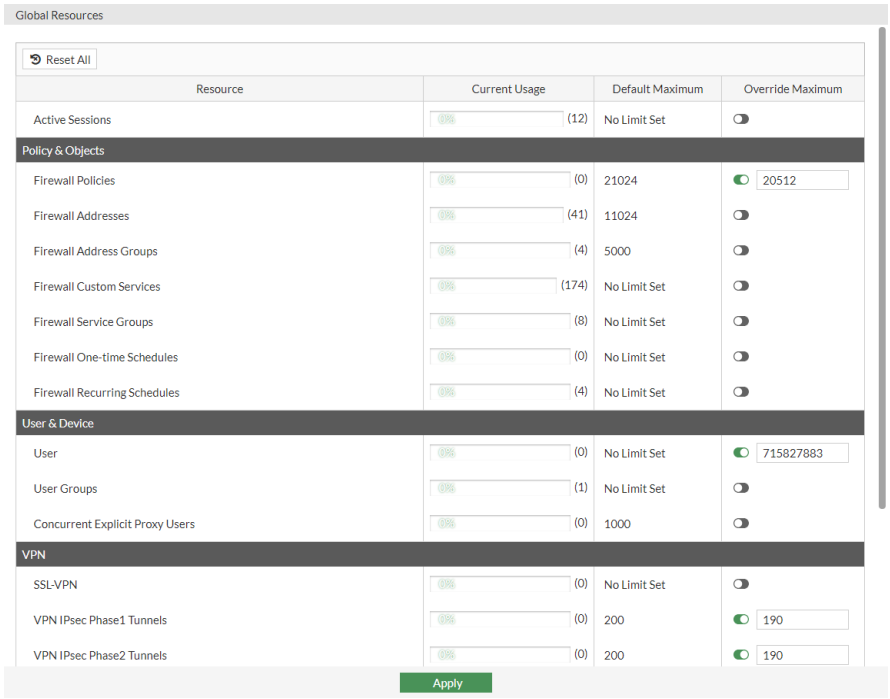
Only one management VDOM can exist at a time. It is strongly recommended that the management VDOM have Internet access otherwise management-related services, such as FortiGuard updates and queries, will not work.

Global and per-VDOM resources

Global resources apply to resources that are shared by the whole FortiGate, while per-VDOM resources are specific to each VDOM.

To configure global resources:

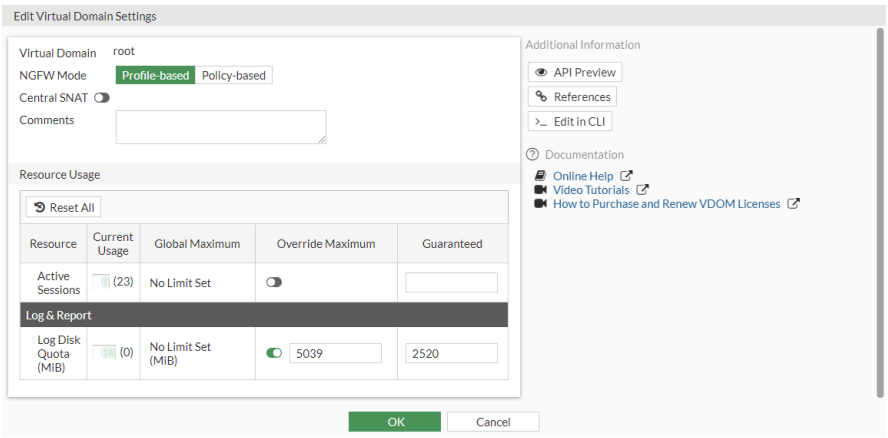
1. In the *Global* VDOM, go to *System > Global Resources*.
2. Enable the resource's override in the *Override Maximum* column, then enter the override value.



3. Click *Apply*.
   To reset all of the override values, click *Reset All*.

To configure per-VDOM resources:

1. In the *Global* VDOM, go to *System > VDOM*.
2. Select the VDOM whose resources need to be configured and click *Edit*.
3. Enable the resource's override in the *Override Maximum* column, then enter the override value.
4. Optionally, enter a value in the *Guaranteed* column.



5. Click *OK*.
   To reset all of the override values, click *Reset All*.

Create per-VDOM administrators

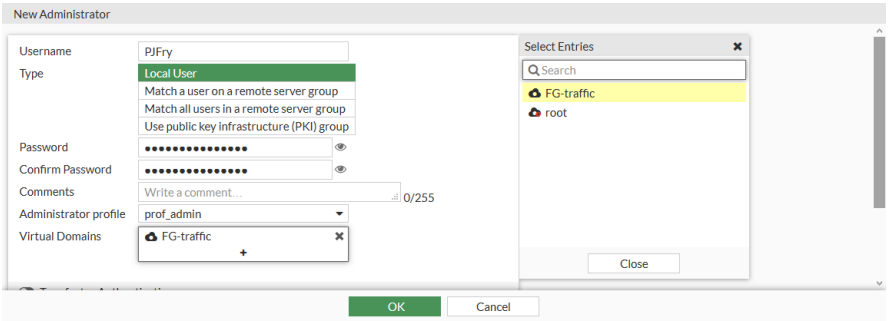
Per-VDOM administrators can be created that can access only the administrative or traffic VDOM. These administrators must use either the *prof_admin* administrator profile, or a custom profile.

A per-VDOM administrator can only access the FortiGate through a network interface that is assigned to the VDOM that they are assigned to. The interface must also be configured to allow management access. They can also connect to the FortiGate using the console port.

To assign an administrator to multiple VDOMs, they must be created at the global level. When creating an administrator at the VDOM level, the *super_admin* administrator profile cannot be used.

To create a per-VDOM administrator in the GUI:

1. On the FortiGate, connect to the *Global* VDOM.
2. Go to *System* > *Administrators* and click *Create New* > *Administrator*.
3. Fill in the required information, setting the *Type* as *Local User*.
4. In the *Virtual Domains* field, add the VDOM that the administrator will be assigned to, and if necessary, remove the other VDOM from the list.



5. Click *OK*.

To create a per-VDOM administrator using the CLI:

```
config global
    config system admin
        edit <name>
            set vdom <VDOM_name>
            set password <password>
            set accprofile <admin_profile>
            ...
        next
    end
end
```

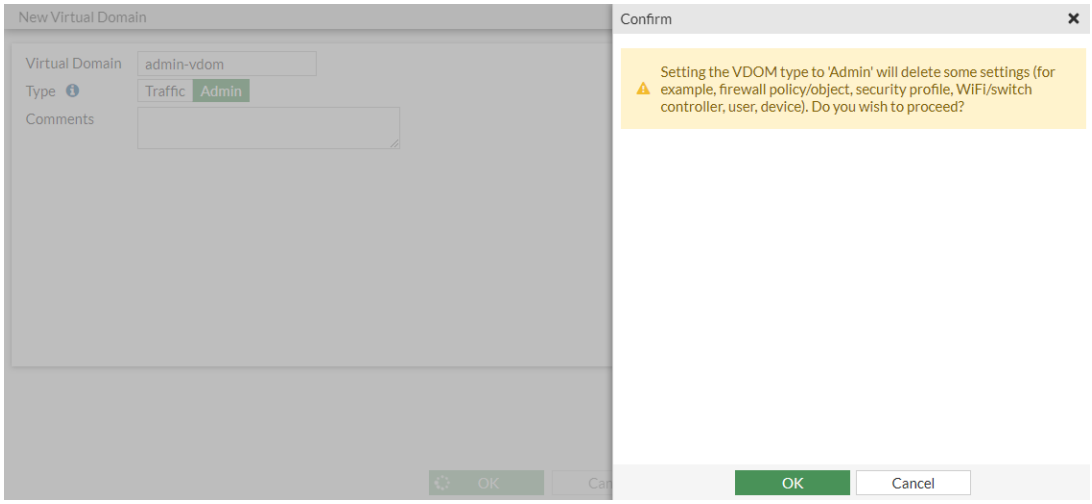
Configure an administrative VDOM type

Individual VDOMs can be configured as an administrative type in multi-VDOM mode.

Only one administrative VDOM can exist at a time and cannot be set on a FortiWifi. A VDOM cannot be an administrative type and in transparent mode at the same time.

To configure an administrative VDOM in the GUI:

1. Go to *System* > *VDOM*.
2. Click *Create New*.
3. Enter a *Virtual Domain* name and set the *Type* to *Admin*.
4. Click *OK*.



5. Click *OK* in the confirmation pane. The administrative VDOM is created.

To configure the VDOM type in the CLI:

```
config system settings
    set vdom-type {traffic | admin}
end
```

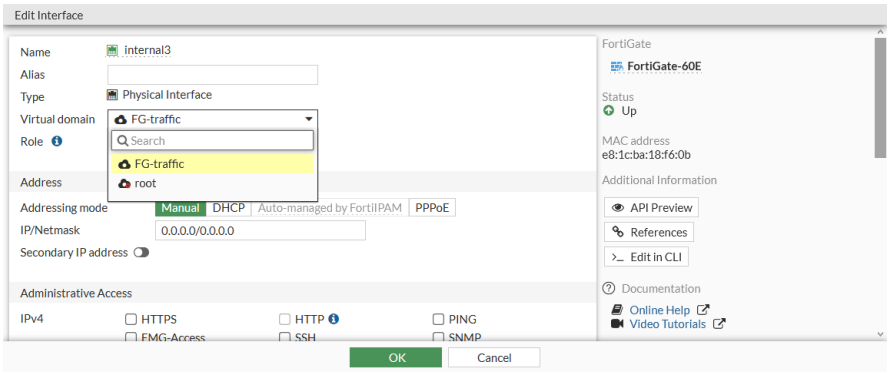
Assign interfaces to a VDOM

An interface can only be assigned to one of the VDOMs. An interface cannot be moved if it is referenced in an existing configuration.

In the GUI, the interface list *Ref.* column shows if the interface is referenced in an existing configuration, and allows you to quickly access and edit those references.

To assign an interface to a VDOM in the GUI:

1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Select the interface that will be assigned to a VDOM and click *Edit*.
3. Select the VDOM that the interface will be assigned to from the *Virtual Domain* list.



4. Click *OK*.

To assign an interface to a VDOM using the CLI:

```
config global
    config system interface
        edit <interface>
            set vdom <VDOM_name>
        next
    end
end
```

Inter-VDOM routing

VDOM links allow VDOMs to communicate internally without using additional physical interfaces.

A VDOM link cannot share the same name as a VDOM.

VDOM link does not support traffic offload. If you want to use traffic offload, use NPU-VDOM-LINK. See Configuring inter-VDOM link acceleration with NP6 processors in the Hardware Acceleration guide for details.

To configure a VDOM link in the GUI:

1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Click *Create New* > *VDOM Link*.
3. Configure the fields, including the *Name*, *Virtual Domain*, IP information, *Administrative Access*, and so on, then click *OK*.

By default, VDOM links are created as point-to-point (ppp) links. If required, the link type can be changed in the CLI.

For example, when running OSPF in IPv6, a link-local address is required in order to communicate with OSPF neighbors. For a VDOM link to obtain a link-local address, its type must be set to `ethernet`.

To configure a VDOM link in the CLI:

```
config global
    config system vdom-link
        edit "<vdom-link-name>"
            set type {ppp | ethernet}
        next
    end
    config system interface
        edit "<vdom-link-name0>"
            set vdom "<VDOM Name>"
            set type vdom-link
        next
        edit "<vdom-link-name1>"
            set vdom "<VDOM Name>"
            set type vdom-link
        next
    end
end
```

To delete a VDOM link in the GUI:

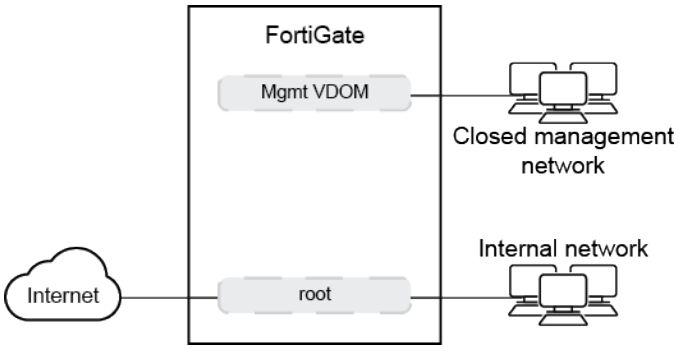
1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Select a *VDOM Link* and click *Delete*.

To delete a VDOM link in the CLI:

```
config global
    config system vdom-link
        delete <VDOM-LINK-Name>
    end
end
```

Allow FortiGuard services and updates to initiate from a traffic VDOM

In multi-VDOM mode, users can choose from which VDOM FortiGuard services and updates are initiated from, instead of being locked to the management VDOM. This allows deployment scenarios where the management VDOM resides in a closed management network.



When the management VDOM resides in a closed network, it does not have internet access. FortiGuard services (FortiGuard updates, web filters, DNS proxy, DDNS, and so on) must be configured in a VDOM with Internet access in order to work. Therefore, in the example above, change the FortiGuard settings to initiate from the root VDOM.

To configure FortiGuard services on a traffic VDOM:

1. Set up a traffic VDOM for FortiGuard services:

```
config global
    config system fortiguard
        set vdom "root"
    end
end
```

2. Ensure the traffic VDOM has the correct gateway to reach the internet:

```
config vdom
    edit root
        config router static
            edit 1
                set gateway 172.16.200.254
                set device "wan1"
            next
```

```
        end
    next
end
```

3. Configure the DNS servers to ensure the FortiGuard services can resolve the server name through the traffic VDOM:

```
config vdom
    edit root
        config system vdom-dns
            set vdom-dns enable
            set primary 208.91.112.53
            set secondary 208.91.112.52
        end
    next
end
```

Configuring global profiles

Global profiles can be configured globally across multiple VDOMs, even when multi-VDOM mode is disabled. When used in multi-VDOM mode, some or all profiles may be commonly-shared across VDOMs. Global profiles are available as read-only for VDOM-level administrators and can only be edited or deleted from within the global settings. The name for any global profile must begin with *g-* for identification. Each security feature has at least one default global profile, available for all VDOMs to use.

Some security profile features, such as URL filters under web-filter, are not available for use in a global profile.

External feeds also support global profile setting by specifying the *g-* prefix. When the FortiGate is in multi-VDOM mode, a global external feed will connect to the feed through one of the management VDOM's interfaces. A per-VDOM external feed will connect to the feed through the specific VDOM's interfaces.

In a non-VDOM setup, a profile with a *g-* prefix is accepted and, when created, is applied in the root VDOM. If the FortiGate is changed to multi-VDOM mode, the *g-* profile will automatically be moved to the global VDOM.

The following examples demonstrate configuring and editing Web Filter global security profiles. Similarly, you can view, edit, and configure other global security profiles for Antivirus, Application Control, Intrusion Prevention, and File Filter.

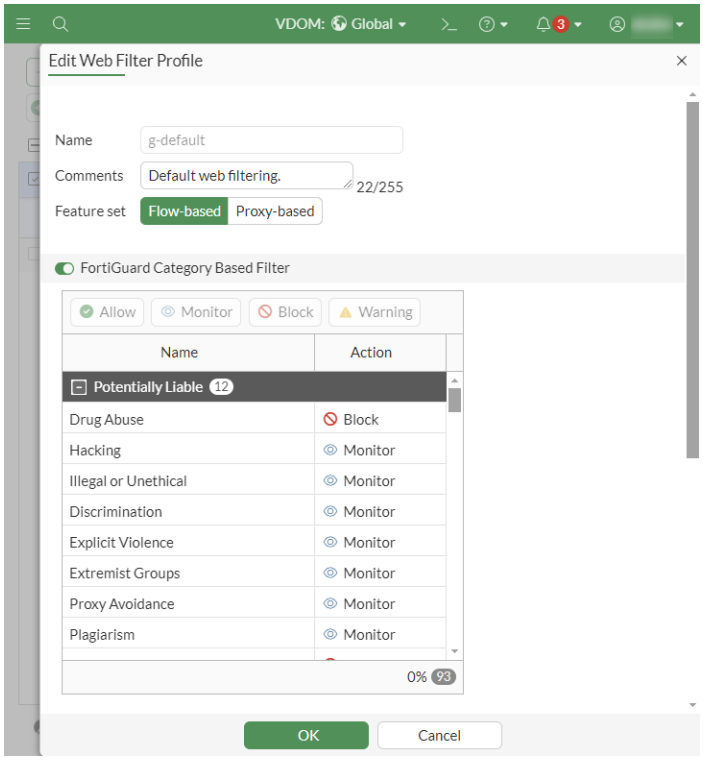
To configure a global security profile:

1. Go to *Security Profile* > *Web Filter*.
2. Click *Create new*.
3. Enter any suitable name that begins with *g-* and configure the web-filter settings required.
4. Click *OK*. This global web-filter is now available to be used in different VDOMs as required.

To view and edit a global security profile:

1. In the Global VDOM, go to *Security Profiles* > *Web Filter*. The names of the global web-filter security profile begins with *g-* for identification.
2. Select the default global web-filter profile named *g-default* and click *Edit*.

3. Under *FortiGuard Category Based Filter* select *Drug Abuse* and set the *Action* to *Block*.



4. Click *OK*.

Backing up and restoring configurations in multi-VDOM mode

When a FortiGate is in multi-VDOM mode, the configuration can be backed up or restored using the GUI or the CLI. Back up and restoration permissions depend on the VDOM administrator when in multi-VDOM mode:

- A global *super_admin* can back up and restore the global configuration or the configuration of a specific VDOM.
- A VDOM administrator of one VDOM can only back up and restore the configuration of the current VDOM.
- A VDOM administrator of multiple VDOMs can back up and restore the configuration of multiple VDOMs.

To back up the configuration using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration* > *Backup*.
2. Select *VDOM* for the *Scope*. The *VDOM* dropdown menu is displayed.
3. Select the VDOM you want to back up.
4. Direct the backup to your *Local PC* or to a *USB Disk*.

5. Enable *Encryption*.

This is recommended to secure your backup configurations and prevent unauthorized parties from reloading your configuration.

6. Enter a password, and enter it again to confirm it. This password will be required to restore the configuration.
7. Click *OK*.
8. When prompted, select a location on the PC or USB disk to save the configuration file. The configuration file will have a .conf extension.

To restore the FortiGate configuration using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration* > *Restore*.
2. Select *VDOM* for the *Scope*. The *VDOM* dropdown menu is displayed.
3. Select the VDOM that you want to restore the configuration for.
4. Identify the source of the configuration file to be restored: your *Local PC* or a *USB Disk*.
   The *USB Disk* option will not be available if no USB drive is inserted in the USB port. You can restore from the FortiManager using the CLI.
5. Click *Upload*, locate the configuration file, and click *Open*.

Confirm that the configuration file you are uploading is for the same VDOM selected from the dropdown menu.

6. Enter the password if required.
7. Click *OK*.

Backing up configurations in the CLI

Configuration backups can be performed in the CLI using the `execute backup` commands. If you are backing up a VDOM configuration instead of the global configuration, first enter the commands:

```
config vdom
    edit <vdom_name>
```

Configurations can be backed up in FortiOS and YAML format.

Configuration files can be backed up to various locations depending on the command:

- `flash`: Backup the configuration file to the flash drive.
- `ftp`: Backup the configuration file to an FTP server.
- `sftp`: Backup the configuration file to a SFTP server.
- `tftp`: Backup the configuration file to a TFTP server.
- `usb`: Backup the configuration file to an external USB drive.

Command	Description
`# execute backup config`	Back up the configuration in FortiOS format. Backup your configuration file to: • `flash` • `ftp` • `sftp` • `tftp` • `usb`
`# execute backup full-config`	Backup the configuration, including backups of default configuration settings. Backup your configuration file to: • `ftp` • `sftp` • `tftp` • `usb`
`# execute backup yaml-config`	Backup the configuration in YAML format. Backup your configuration file to: • `ftp` • `tftp`

To back up the configuration in FortiOS format using the CLI:

For FTP, note that port number and username are optional depending on the FTP site:

```
config vdom
    edit <vdom_name>
        execute backup config ftp <backup_filename> <ftp_server>[<:ftp_port>] [<user_name>]
[<password>] [<backup_password>]
```

or for TFTP:

```
config vdom
    edit <vdom_name>
        execute backup config tftp <backup_filename> <tftp_servers> [<backup_password>]
```

or for SFTP:

```
config vdom
    edit <vdom_name>
        execute backup config sftp <backup_filename> <sftp_server>[<:sftp_port>] <user> <password>
[<backup_password>]
```

or for an external USB:

```
config vdom
    edit <vdom_name>
        execute backup config usb <backup_filename> [<backup_password>]
```

To back up the configuration in YAML format using the CLI:

For FTP:

```
config vdom
    edit <vdom_name>
        execute backup yaml-config ftp <file_path> <ftp_server>[<:port>] [<user_name>] [<FTP
password>]
```

or for TFTP:

```
config vdom
    edit <vdom_name>
        execute backup yaml-config tftp <file_path> <tftp_server>
```

Restoring configurations in the CLI

Restoring configurations can be performed in the CLI using the `execute restore` command. If you are restoring a VDOM configuration instead of the global configuration, first enter the commands:

```
config vdom
    edit <vdom_name>
```

When restoring a VDOM configuration, ensure that the configuration file is for the correct VDOM specified.

Command	Description
`# execute restore config`	Restore a configuration that is in FortiOS or YAML format. Configurations can be loaded from: • `dhcp`: Load the configuration though DHCP. • `flash`: Load the configuration file from flash to firewall. • `ftp`: Load the configuration file from an FTP server. • `tftp`: Load the configuration from a TFTP server. • `usb`: Load the configuration file from an external USB disk to firewall.

To restore the FortiGate configuration in FortiOS or YAML format using the CLI:

For FTP, note that port number and username are optional depending on the FTP site:

```
config vdom
    edit <vdom_name>
        execute restore config ftp <file_path> <ftp_server>[<:port>] [<user_name>] [<FTP
password>] [<password>]
```

or for TFTP:

```
config vdom
    edit <vdom_name>
        execute restore config tftp <file_name> <tftp_server> [<password>]
```

or for DHCP:

```
config vdom
    edit <vdom_name>
        execute restore config dhcp <port> [<VLAN_ID>]
```

or for flash:

```
config vdom
    edit <vdom_name>
        execute restore config flash <revision_ID>
```

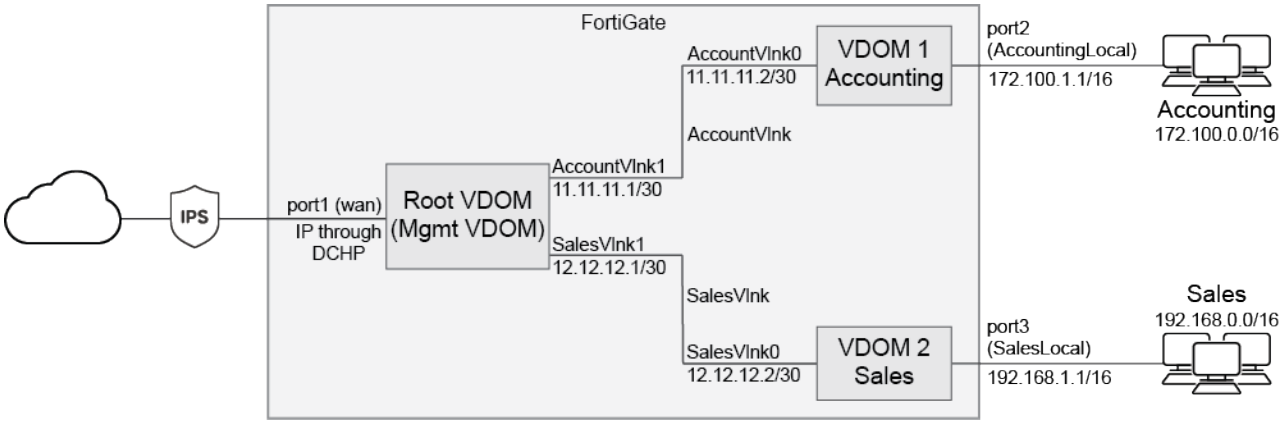
or for an external USB:

```
config vdom
    edit <vdom_name>
        execute restore config usb <file_name> [<password>]
```

Inter-VDOM routing configuration example: Internet access

This example shows how to configure a FortiGate unit to use inter-VDOM routing to route outgoing traffic from individual VDOMs to a root VDOM with Internet access. See Inter-VDOM routing on page 3308 for more information.

Two departments of a company, Accounting and Sales, are connected to one FortiGate. The company uses a single ISP to connect to the Internet. This is an example of the Internet access configuration. See Topologies on page 3300 for details.



This example assumes that the interfaces of the FortiGate have already been configured with the IP addresses depicted in the preceding diagram.

General steps for this example

This example includes the following general steps. We recommend following the steps in the order below:

1. Enable multi-VDOM mode and create the VDOMs on page 3317
2. Assign interfaces to VDOMs on page 3318
3. Configure the VDOM links on page 3318
4. Configure inter-VDOM routing on page 3319
5. Configure the firewall policies on page 3320
6. Test the configuration on page 3322

This example demonstrates how to configure these steps first using the GUI and then, at the end of the section, using the CLI. See Configuration with the CLI on page 3322 for details.

Enable multi-VDOM mode and create the VDOMs

Create the Accounting and Sales VDOMs.

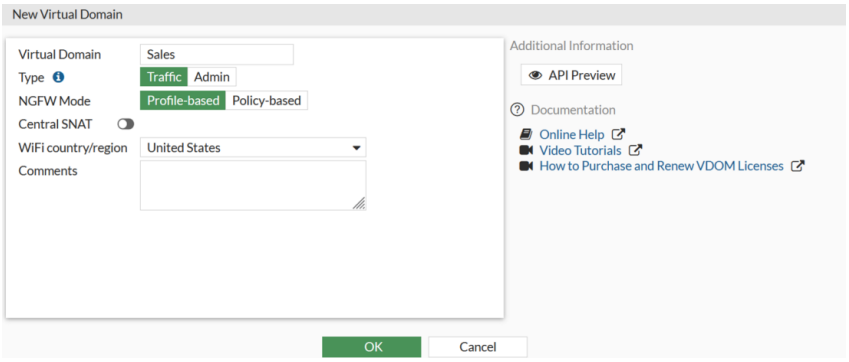
To enable VDOMs in the GUI:

1. Go to *System* > *Settings*.
2. In the *System Operation Settings* section, enable *Virtual Domains*.
3. Click *OK*.

On FortiGate 90 series models and lower, VDOMs can only be enabled using the CLI.

To create the Sales and Accounting VDOMs in the GUI:

1. In the *Global* VDOM, go to *System* > *VDOM*.
2. Click *Create New*.
3. In the *Virtual Domain* field, enter *Sales*.



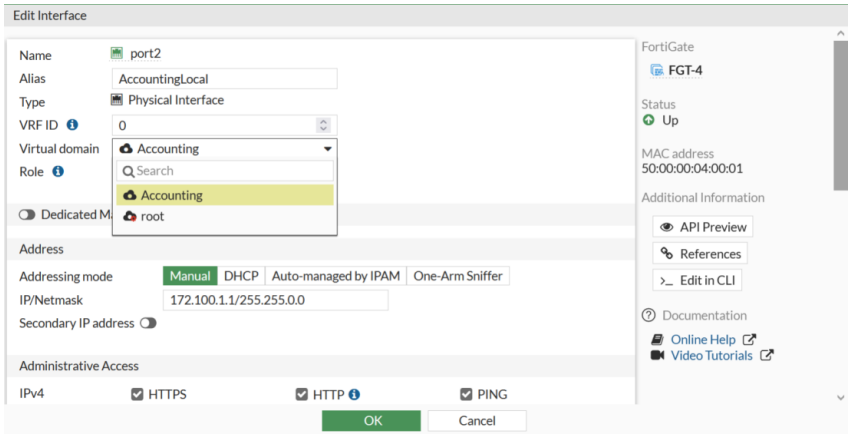
4. If required, set the *NGFW Mode*. If the *NGFW Mode* is *Profile-based*, *Central SNAT* can be enabled.
5. Click *OK* to create the VDOM.
6. Repeat the above steps for *Accounting*.

Assign interfaces to VDOMs

This example uses three interfaces on the FortiGate unit: port2 (AccountingLocal), port3 (SalesLocal), and port1 (WAN). Port2 and port3 interfaces each have a department's network connected. Port1 is for all traffic to and from the Internet and uses DHCP to configure its IP address, which is common with many ISPs.

To assign interfaces to VDOMs in the GUI:

1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Select *port2* and click *Edit*.
3. From the *Virtual domain* list, select *Accounting*.



4. Click *OK*.
5. Repeat the preceding steps to assign *port3* to the *Sales* VDOM.
6. Repeat the preceding steps to assign *port1* to the *root* VDOM.

Configure the VDOM links

To complete the connection between each VDOM and the management VDOM, add the two VDOM links. One pair is the Accounting – management link and the other is the Sales – management link. Each side of these links will be assigned IP addresses since they will be handy in configuring inter-VDOM routing in the next step.

To configure the Accounting and management VDOM link in the GUI:

1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Select *Create New* > *VDOM Link*.
3. Enter the following information:

Name	AccountVlnk
Interface 0	
Virtual Domain	Accounting
IP/Netmask	11.11.11.2/255.255.255.252

	Administrative Access	HTTPS, PING, SSH
	Comment	Accounting side of the VDOM link
Interface 1		
	Virtual Domain	root
	IP/Netmask	11.11.11.1/255.255.255.252
	Administrative Access	HTTPS, PING, SSH
	Comment	Management side of the VDOM link

4. Click *OK*.

To configure the Sales and management VDOM link in the GUI:

1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Select *Create New* > *VDOM link*.
3. Enter the following information:

Name		SalesVlnk
Interface 0		
	Virtual Domain	Sales
	IP/Netmask	12.12.12.2/255.255.255.252
	Administrative Access	HTTPS, PING, SSH
	Comment	Accounting side of the VDOM link
Interface 1		
	Virtual Domain	root
	IP/Netmask	12.12.12.1/255.255.255.252
	Administrative Access	HTTPS, PING, SSH
	Comment	Management side of the VDOM link

4. Click *OK*.

Configure inter-VDOM routing

A default static route can be configured on each VDOM to provide Internet access. In other words, this static route would provide inter-VDOM routing between each department VDOM and the root VDOM.

For this static route, these settings are used:

- Default Gateway: IP address of the management side of the VDOM link
  - Accounting VDOM: 11.11.11.1
  - Sales VDOM: 12.12.12.1
- Interface: Interface on the department VDOM side of the VDOM link
  - Accounting VDOM: AccountVlnk0
  - Sales VDOM: SalesVlnk0
- IP address: 0.0.0.0/0.0.0.0 (default)

To configure the default static route to the Internet in the Accounting VDOM:

1. In the *Accounting* VDOM, go to *Network* > *Static Routes*.
2. Click on *Create New* and select the version you need.
3. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	11.11.11.1
Interface	AccountVlink0
Administrative Distance	10

4. Click *OK*.

To configure the default static route to the Internet in the Sales VDOM:

1. In the *Sales* VDOM, go to *Network* > *Static Routes*.
2. Click on *Create New* and select the version you need.
3. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	12.12.12.1
Interface	SalesVlink0
Administrative Distance	10

4. Click *OK*.

Configure the firewall policies

With the VDOMs, physical interfaces, VDOM links, and static routes configured, the firewall must now be configured to allow the proper traffic. Firewalls are configured per-VDOM, and firewall objects and routes must be created for each VDOM separately.

To configure the firewall policies from AccountingLocal to Internet in the GUI:

1. In the *Accounting* VDOM, go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	Account-Local-to-Management
Incoming Interface	port2
Outgoing Interface	AccountVlnk0
Source	All
Destination	All
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

4. Click *OK*.
5. In the *root* VDOM, go to *Policy & Objects* > *Firewall Policy*.
6. Click *Create New*.
7. Enter the following information:

Name	Account-VDOM-to-Internet
Incoming Interface	AccountVlnk1
Outgoing Interface	port1
Source	All
Destination	All
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

8. Click *OK*.

To configure the firewall policies from SalesLocal to Internet in the GUI:

1. In the *Sales* VDOM, go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	Sales-Local-to-Management

Incoming Interface	port3
Outgoing Interface	SalesVlnk0
Source	All
Destination	All
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

4. Click *OK*.
5. In the *root* VDOM, go to *Policy & Objects* > *Firewall Policy*.
6. Click *Create New*.
7. Enter the following information:

Name	Sales-VDOM-to-Internet
Incoming Interface	SalesVlnk1
Outgoing Interface	port1
Source	All
Destination	All
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

8. Click *OK*.

Test the configuration

When the inter-VDOM routing has been configured, test the configuration to confirm proper operation. Testing connectivity ensures that physical networking connections, FortiGate unit interface configurations, and firewall policies are properly configured.

The easiest way to test connectivity is to use the `ping` and `traceroute` commands on hosts in the Accounting and Sales networks, respectively, to confirm the connectivity of different routes on the network. Test connectivity with hosts connected to port2 (AccountingLocal) in the Accounting VDOM to the internet and hosts connected to port3 (SalesLocal) in the Sales VDOM to the internet.

Configuration with the CLI

The example can also be configured in the CLI.

To configure inter-VDOM routing in the CLI:

1. Enable multi-VDOM mode:

```
config system global
    set vdom-mode multi-vdom
end
```

   You will be logged out of the device when VDOM mode is enabled.

2. Create the Sales and Accounting VDOMs:

```
config vdom
    edit Accounting
    next
    edit Sales
    next
end
```

3. Assign interfaces to the VDOMs:

```
config global
    config system interface
        edit port2
            set vdom Accounting
        next
        edit port3
            set vdom Sales
        next
        edit port1
            set vdom root
        next
    end
end
```

4. Configure the Accounting and management VDOM link:

```
config global
    config system vdom-link
        edit AccountVlnk
        next
    end
    config system interface
        edit AccountVlnk0
            set vdom Accounting
            set ip 11.11.11.2 255.255.255.252
            set allowaccess https ping ssh
            set description "Accounting side of the VDOM link"
        next
        edit AccountVlnk1
            set vdom root
            set ip 11.11.11.1 255.255.255.252
            set allowaccess https ping ssh
            set description "Management side of the VDOM link"
```

```
        next
    end
end
```

5. Configure the Sales and management VDOM link:

```
config global
    config system vdom-link
        edit SalesVlnk
        next
    end
    config system interface
        edit SalesVlnk0
            set vdom Sales
            set ip 12.12.12.2 255.255.255.252
            set allowaccess https ping ssh
            set description "Sales side of the VDOM link"
        next
        edit SalesVlnk1
            set vdom root
            set ip 12.12.12.1 255.255.255.252
            set allowaccess https ping ssh
            set description "Management side of the VDOM link"
        next
    end
end
```

6. Configure the default static route to the Internet in the Accounting VDOM:

```
config vdom
    edit Accounting
    config router static
        edit 1
            set gateway 11.11.11.1
            set device "AccountVlnk0"
        next
    end
end
```

7. Configure the default statis route to the Internet in the Sales VDOM:

```
config vdom
    edit Sales
    config router static
        edit 1
            set gateway 12.12.12.1
            set device "SalesVlnk0"
        next
    end
end
```

8. Configure the firewall policies from AccountingLocal to the Internet:

```
config vdom
    edit Accounting
        config firewall policy
            edit 1
                set name "Accounting-Local-to-Management"
                set srcintf port2
                set dstintf AccountVlnk0
                set srcaddr all
                set dstaddr all
                set action accept
                set schedule always
                set service ALL
                set nat enable
            next
        end
    next
    edit root
        config firewall policy
            edit 2
                set name "Accounting-VDOM-to-Internet"
                set srcintf AccountVlnk1
                set dstintf port1
                set srcaddr all
                set dstaddr all
                set action accept
                set schedule always
                set service ALL
                set nat enable
            next
        end
    next
end
```

9. Configure the firewall policies from SalesLocal to the Internet:

```
config vdom
    edit Sales
        config firewall policy
            edit 3
                set name "Sales-local-to-Management"
                set srcintf port3
                set dstintf SalesVlnk0
                set srcaddr all
                set dstaddr all
                set action accept
                set schedule always
                set service ALL
                set nat enable
            next
        end
    next
    edit root
```

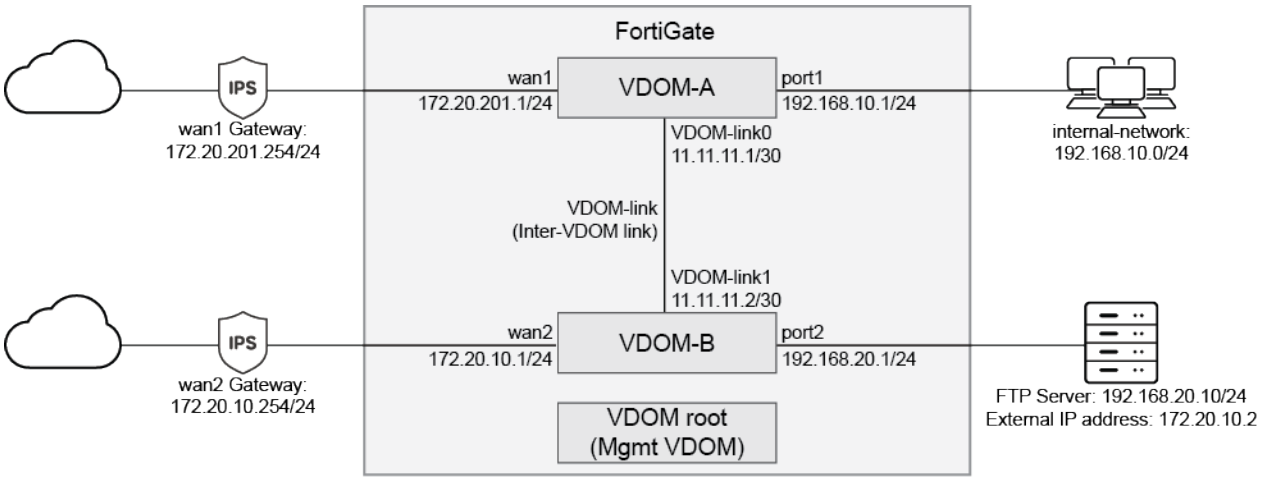
```
        config firewall policy
            edit 4
                set name "Sales-VDOM-to-Internet"
                set srcintf SalesVlnk1
                set dstintf port1
                set srcaddr all
                set dstaddr all
                set action accept
                set schedule always
                set service ALL
                set nat enable
            next
        end
    next
end
```

Inter-VDOM routing configuration example: Partial-mesh VDOMs

This example shows how to configure a FortiGate unit to use inter-VDOM routing to route traffic between an internal network and FTP server that are each behind separate VDOMs. See Inter-VDOM routing on page 3308 for more information.

The following example shows how to configure per-VDOM settings, such as operation mode, routing, and firewall policies, in a network that includes the following VDOMs:

- VDOM-A: allows the internal network to access the Internet.
- VDOM-B: allows external connections to an FTP server.
- root: the management VDOM.



You can use VDOMs in either NAT or transparent mode on the same FortiGate. By default, VDOMs operate in NAT mode. In this example, both VDOM-A and VDOM-B use NAT mode. An inter-VDOM link is created and inter-VDOM routes configured to allow users on the internal network to access the FTP server.

This is an example of the partial-mesh VDOMs configuration since only VDOM-A is connected to VDOM-B but neither of those VDOMs are connected to the root VDOM. See Topologies on page 3300 for details.

This example assumes that the interfaces of the FortiGate have already been configured with the IP addresses depicted in the preceding diagram.

General steps for this example

This configuration requires the following general steps:

1. Enable Multi-VDOM mode and create the VDOMs on page 3327
2. Assign interfaces to VDOMs on page 3328
3. Configure VDOM-A on page 3328
4. Configure VDOM-B on page 3330
5. Configure the VDOM link on page 3331
6. Configure inter-VDOM routing on page 3332
7. Configure firewall policies using the VDOM link on page 3333

This example demonstrates how to configure these steps first using the GUI and then, at the end of the section, using the CLI. See Configuration with the CLI on page 3334 for details.

Enable Multi-VDOM mode and create the VDOMs

Multi-VDOM mode can be enabled in the GUI or CLI. Enabling it does not require a reboot, but does log you out of the device. The current configuration is assigned to the root VDOM.

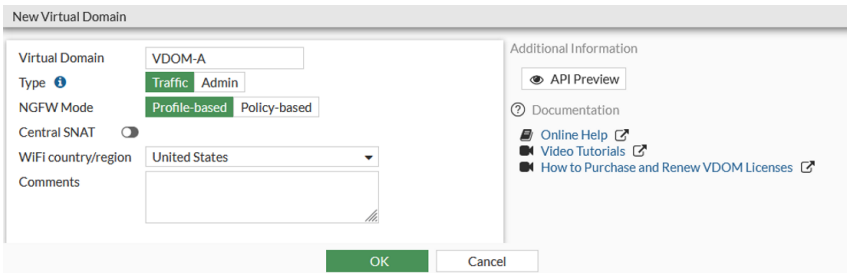
On FortiGate 90 series models and lower, VDOMs can only be enabled using the CLI.

To enable multi-VDOM mode in the GUI:

1. On the FortiGate, go to *System* > *Settings*.
2. In the *System Operation Settings* section, enable *Virtual Domains*.
3. Click *OK*.

To create the VDOMs in the GUI:

1. In the *Global* VDOM, go to *System* > *VDOM*.
   Click *Create New*.
2. In the *Virtual Domain* field, enter *VDOM-A*.



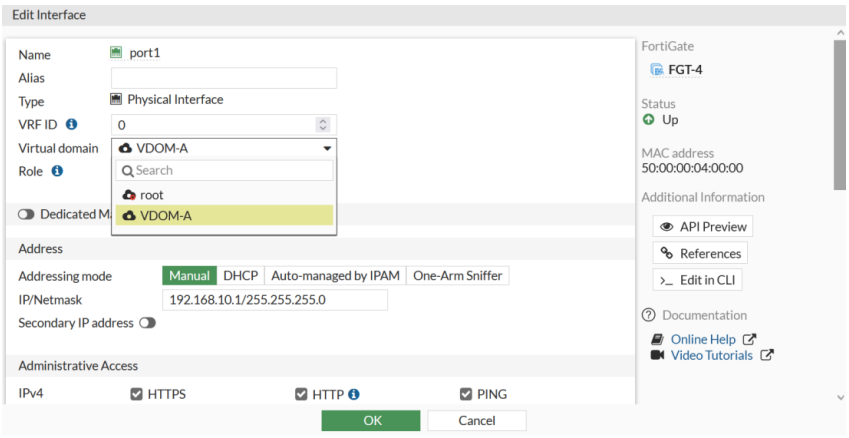
3. If required, set the *NGFW Mode*. If the *NGFW Mode* is *Profile-based*, *Central SNAT* can be enabled.
4. Click *OK* to create the VDOM.
5. Repeat the above steps for *VDOM-B*.

Assign interfaces to VDOMs

This example uses three interfaces on the FortiGate unit: port1 (internal network), port2 (FTP server), wan1 (WAN link for VDOM-A), and wan2 (WAN link for VDOM-B). The port1 and port2 interfaces are connected to the internal network and FTP server, respectively. The wan1 and wan2 interfaces are static assigned with IP addresses and default gateways provided by the ISPs for those WAN links.

To assign interfaces to VDOMs in the GUI:

1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Select *port1* and click *Edit*.
3. From the *Virtual domain* list, select *VDOM-A*.



4. Click *OK*.
5. Repeat the preceding steps to assign *port2* to *VDOM-B*.
6. Repeat the preceding steps to assign *wan1* to *VDOM-A*.
7. Repeat the preceding steps to assign *wan2* to *VDOM-B*.

Configure VDOM-A

VDOM-A allows connections from devices on the internal network to the Internet. WAN1 and port1 are assigned to this VDOM.

The per-VDOM configuration for VDOM-A includes the following:

- A firewall address for the internal network
- A static route to the ISP gateway
- A firewall policy allowing the internal network to access the Internet

All procedures in this section require you to connect to VDOM-A, either using a global or per-VDOM administrator account.

To add the firewall addresses in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Enter the following information:

Name	internal-network
Type	Subnet
IP/Netmask	192.168.10.0/255.255.255.0
Interface	port1

4. Click *OK*.

To add a default route in the GUI:

1. Go to *Network* > *Static Routes* and create a new route.
2. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	172.20.201.254
Interface	wan1
Administrative Distance	10

3. Click *OK*.

To add the firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	VDOM-A-Internet
Incoming Interface	port1
Outgoing Interface	wan1
Source	internal-network

Destination	all
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

4. Click *OK*.

Configure VDOM-B

VDOM-B allows external connections to reach an internal FTP server. WAN2 and port2 are assigned to this VDOM.

The per-VDOM configuration for VDOM-B includes the following:

- A firewall address for the FTP server
- A virtual IP address for the FTP server
- A static route to the ISP gateway
- A firewall policy allowing external traffic to reach the FTP server

The procedures described above require you to connect to VDOM-B, either using a global or per-VDOM administrator account.

To add the firewall addresses in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Enter the following information:

Name	FTP-server
Type	Subnet
IP/Netmask	192.168.20.10/255.255.255.255
Interface	port2

4. Click *OK*.

To add the virtual IP address in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs* and navigate to the *Virtual IP* tab.
2. Click *Create new*.
3. Enter the following information:

Name	FTP-server-VIP
Interface	wan2
External IP address/range	172.20.10.2

Map To	192.168.20.10

4. Click *OK*.

To add a default route in the GUI:

1. Go to *Network* > *Static Routes* and create a new route.
2. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	172.20.201.254
Interface	wan2
Administrative Distance	10

3. Click *OK*.

To add the firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	Access-server
Incoming Interface	wan2
Outgoing Interface	port2
Source	all
Destination	FTP-server-VIP
Schedule	always
Service	FTP
Action	ACCEPT
NAT	enabled

4. Click *OK*.

Configure the VDOM link

The VDOM link allows connections from VDOM-A to VDOM-B. The VDOM link interface configured in this step will be used for inter-VDOM routing.

This step requires you to connect to the global VDOM using a global administrator account.

To add the VDOM link in the GUI:

1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Create *New* > *VDOM link*.
3. Enter the following information:

Name	VDOM-link
Interface 0	
Virtual Domain	VDOM-A
IP/Netmask	11.11.11.1/255.255.255.252
Interface 1	
Virtual Domain	VDOM-B
IP/Netmask	11.11.11.2/255.255.255.252

4. Click *OK*.

Configure inter-VDOM routing

Inter-VDOM routing allows users on the internal network to route traffic to the FTP server through the FortiGate.

The configuration of inter-VDOM routing includes the following:

- Firewall addresses for the FTP server on VDOM-A and for the internal network on VDOM-B
- Inter-VDOM routing using static routes for the FTP server on VDOM-A and for the internal network on VDOM-B
- Policies allowing traffic using the VDOM link

The procedures described above require you to connect to both VDOM-A and VDOM-B, either using a global or per-VDOM administrator account.

To add the firewall address on VDOM-A in the GUI:

1. In the *VDOM-A* VDOM, go to *Policy & Objects* > *Addresses* and select Address.
2. Click *Create new*.
3. Enter the following information:

Name	FTP-server
Type	Subnet
IP/Netmask	192.168.20.10/32
Interface	VDOM-link2
Static route configuration	enabled

4. Click *OK*.

To add the static route on VDOM-A in the GUI:

1. Connect to *VDOM-A*.
2. Go to *Network* > *Static Routes* and create a new route.
3. Enter the following information:

Destination	Named Address
Named Address	FTP-server
Gateway	11.11.11.2
Interface	VDOM-link0

4. Click *OK*.

To add the firewall address on VDOM-B in the GUI:

1. In the *VDOM-B* VDOM, go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Enter the following information:

Name	internal-network
Type	Subnet
IP/Netmask	192.168.10.0/24
Interface	VDOM-link1
Static route configuration	enabled

4. Click *OK*.

To add the static route on VDOM-B in the GUI:

1. In the *VDOM-B* VDOM, go to *Network* > *Static Routes* and create a new route.
2. Enter the following information:

Destination	Named Address
Named Address	internal-network
Gateway	11.11.11.1
Interface	VDOM-link1

3. Click *OK*.

Configure firewall policies using the VDOM link

Firewall policies using the VDOM link allows users on the internal network to access the FTP server through the FortiGate.

Configuring policies allowing traffic using the VDOM link require you to connect to both VDOM-A and VDOM-B, respectively, either using a global or per-VDOM administrator account.

To add the firewall policy on VDOM-A in the GUI:

1. In the *VDOM-A* VDOM, go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	Access-FTP-server
Incoming Interface	port1
Outgoing Interface	VDOM-link0
Source	internal-network
Destination	FTP-server
Schedule	always
Service	FTP
Action	ACCEPT
NAT	disabled

4. Click *OK*.

To add the firewall policy on VDOM-B in the GUI:

1. In the *VDOM-B* VDOM, go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	Internal-server-access
Incoming Interface	VDOM-link1
Outgoing Interface	port2
Source	internal-network
Destination	FTP-server
Schedule	always
Service	FTP
Action	ACCEPT
NAT	disabled

4. Click *OK*.

Configuration with the CLI

The example can also be configured in the CLI.

To configure the two VDOMs:

1. Enable multi-VDOM mode:

```
config system global
    set vdom-mode multi-vdom
end
```

   You will be logged out of the device when VDOM mode is enabled.

2. Create the VDOMs:

```
config vdom
    edit VDOM-A
    next
    edit VDOM-B
    next
end
```

3. Assign interfaces to the VDOMs:

```
config global
    config system interface
        edit port1
            set vdom VDOM-A
        next
        edit port2
            set vdom VDOM-B
        next
        edit wan1
            set vdom VDOM-A
        next
        edit wan2
            set vdom VDOM-B
        next
    end
end
```

4. Add the firewall addresses to VDOM-A:

```
config vdom
    edit VDOM-A
        config firewall address
            edit internal-network
                set associated-interface port1
                set subnet 192.168.10.0 255.255.255.0
            next
        end
    next
end
```

5. Add a default route to VDOM-A:

```
config vdom
    edit VDOM-A
        config router static
            edit 0
                set gateway 172.20.201.254
                set device wan1
            next
        end
    next
end
```

6. Add the firewall policy to VDOM-A:

```
config vdom
    edit VDOM-A
        config firewall policy
            edit 1
                set name "VDOM-A-Internet"
                set srcintf "port1"
                set dstintf "wan1"
                set srcaddr "internal-network"
                set dstaddr "all"
                set action accept
                set schedule "always"
                set service "ALL"
                set nat enable
            next
        end
    next
end
```

7. Add the firewall addresses to VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall address
            edit FTP-server
                set associated-interface port2
                set subnet 192.168.20.10 255.255.255.255
            next
        end
    next
end
```

8. Add the virtual IP address to VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall vip
            edit FTP-server-VIP
                set extip 172.20.10.2
                set extintf wan2
```

```
                set mappedip 192.168.20.10
            next
        end
    next
end
```

9. Add a default route to VDOM-B:

```
config vdom
    edit VDOM-B
        config router static
            edit 0
                set gateway 172.20.10.254
                set device wan2
            next
        end
    next
end
```

10. Add the firewall policy to VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall policy
            edit 1
                set name "Access-server"
                set srcintf "wan2"
                set dstintf "port2"
                set srcaddr "all"
                set dstaddr "FTP-server-VIP"
                set action accept
                set schedule "always"
                set service "FTP"
                set nat enable
            next
        end
    next
end
```

To configure the VDOM link:

1. Configure the VDOM link:

```
config global
    config system vdom-link
        edit "VDOM-link"
        next
    end
    config system interface
        edit VDOM-link0
            set vdom VDOM-A
            set ip 11.11.11.1 255.255.255.252
```

```
            set allowaccess https ping ssh
            set description "VDOM-A side of the VDOM link"
        next
        edit VDOM-link1
            set vdom VDOM-B
            set ip 11.11.11.2 255.255.255.252
            set allowaccess https ping ssh
            set description "VDOM-A side of the VDOM link"
        next
    end
end
```

2. Configure the firewall addresses on VDOM-A:

```
config vdom
    edit VDOM-A
        config firewall address
            edit "FTP-server"
                set associated-interface "VDOM-link0"
                set allow-routing enable
                set subnet 192.168.20.10 255.255.255.255
            next
        end
    next
end
```

3. Add the firewall policy to VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall policy
            edit 1
                set name "Access-server"
                set srcintf "wan2"
                set dstintf "port2"
                set srcaddr "all"
                set dstaddr "FTP-server-VIP"
                set action accept
                set schedule "always"
                set service "FTP"
                set nat enable
            next
        end
    next
end
```

4. Add the static route on VDOM-A:

```
config vdom
    edit VDOM-A
        config router static
            edit 0
```

```
                set device VDOM-link0
                set dstaddr FTP-server
                set gateway 11.11.11.2
            next
        end
    next
end
```

5. Configure the firewall addresses on VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall address
            edit internal-network
                set associated-interface VDOM-link1
                set allow-routing enable
                set subnet 192.168.10.0 255.255.255.0
            next
        end
    next
end
```

6. Add the static route on VDOM-B:

```
config vdom
    edit VDOM-B
        config router static
            edit 0
                set device VDOM-link1
                set dstaddr internal-network
                set gateway 11.11.11.1
            next
        end
    next
end
```

7. Add the security policy on VDOM-A:

```
config vdom
    edit VDOM-A
        config firewall policy
            edit 0
                set name Access-FTP-server
                set srcintf port1
                set dstintf VDOM-link0
                set srcaddr internal-network
                set dstaddr FTP-server
                set action accept
                set schedule always
                set service FTP
            next
        end
```

```
    next
end
```

8. Add the firewall policy on VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall policy
            edit 0
                set name Internal-server-access
                set srcintf VDOM-link1
                set dstintf port2
                set srcaddr internal-network
                set dstaddr FTP-server
                set action accept
                set schedule always
                set service FTP
            next
        end
    next
end
```

High Availability

Whether your FortiGate is used as a security gateway, an internal segmentation firewall, in the cloud, or in an MSSP environment, as long as there is critical traffic passing through it, there is risk of it being a single point of failure. Physical outages can occur due to power failures, physical link failures, transceiver failures, or power supply failures. Non-physical outages can be caused by routing, resource issues, or kernel panic.

Network outages cause disruptions to business operations, downtime, and frustration for users and in some situations may have financial setbacks. In designing your network and architecture, it is important to weigh the risks and consequences associated with unexpected outages.

There are many ways to build redundancy and resiliency. In a switching network, you can accomplish this by adding redundant links and switches in partial or full mesh topologies. Using redundant and aggregate links, you can avoid a single link failure causing a network to go down. Using SD-WAN, you can build redundant and intelligent WAN load balancing and failover architectures.

FortiGate HA offers several solutions for adding redundancy in the case where a failure occurs on the FortiGate, or is detected by the FortiGate through monitored links, routes, and other health checks. These solutions support fast failover to avoid lengthy network outages and disruptions to your traffic.

FortiGate Clustering Protocol (FGCP)

FGCP provides a solution for two key requirements of critical enterprise networking components: enhanced reliability and increased performance. Enhanced reliability is achieved through device failover protection, link failover protection, and remote link failover protection. Session failover protection for most IPv4 and IPv6

sessions also contributes to enhanced reliability. Increased performance is achieved though active-active HA load balancing.

FortiGate Session Life Support Protocol (FGSP)

In a network that already includes load balancing (either with load balancers or routers) for traffic redundancy, two entities (either standalone FortiGates or FGCP clusters) can be integrated into the load balancing configuration using the FortiGate Session Life Support Protocol (FGSP). The external load balancers or routers can distribute sessions among the FortiGates and the FGSP performs session synchronization of IPv4 and IPv6 TCP, SCTP, UDP, ICMP, expectation, and NAT sessions to keep the session tables of both entities synchronized. In the event of a failure, the load balancer can detect the failed unit and failover the sessions to other active members to continue processing the traffic.

VRRP

FortiGates can function as primary or backup Virtual Router Redundancy Protocol (VRRP) routers. The FortiGates can quickly and easily integrate into a network that has already deployed VRRP. A FortiGate can be integrated into a VRRP group with any third-party VRRP devices, and VRRP can provide redundancy between multiple FortiGates. FortiOS supports VRRP version 2 and 3.

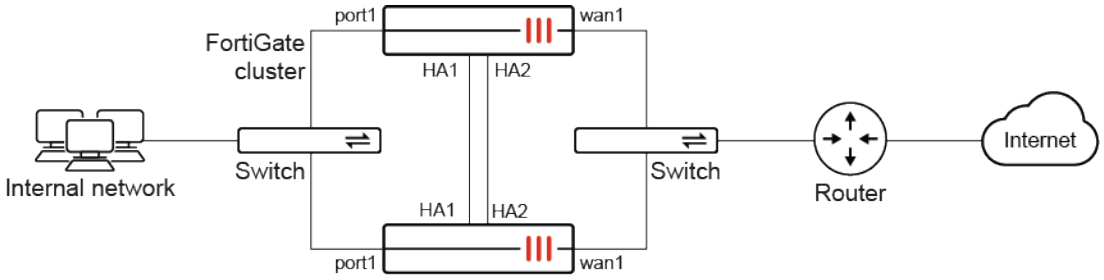
The following topics provide more information about each HA solution and other HA related topics:

- FGCP on page 3341
- FGSP on page 3446
- Standalone configuration synchronization on page 3506
- VRRP on page 3511
- Session failover on page 3526

FGCP

High availability (HA) is usually required in a system where there is high demand for little downtime. There are usually hot-swaps, backup routes, or standby backup units and as soon as the active entity fails, backup entities will start functioning. This results in minimal interruption for the users.

The FortiGate Clustering Protocol (FGCP) is a proprietary HA solution whereby FortiGates can find other member FortiGates to negotiate and create a cluster. A FortiGate HA cluster consists of at least two FortiGates (members) configured for HA operation. All FortiGates in the cluster must be the same model and have the same firmware installed. Cluster members must also have the same hardware configuration (such as the same number of hard disks). All cluster members share the same configurations except for their host name and priority in the HA settings. The cluster works like a device but always has a hot backup device.



All FortiGates that are in the same HA cluster must be registered under the same FortiCare account. Registering cluster members to different FortiCare accounts will result in licensing issues and potential downtime.

Critical cluster components

The following are critical components in an HA cluster:

- Identical heartbeat connections and interfaces: members will use this to communicate with each other. In general, a two-member cluster is most common. We recommend double back-to-back heartbeat connections (as demonstrated in the topology).
- Identical connections for internal and external interfaces: we recommend similar connections from each member to the switches for the cluster to function properly (as demonstrated in the topology).

The HA heartbeat interface communicates with each unit in the cluster using the same heartbeat interface for each member.

For example, if port1 and port2 are the heartbeat interfaces for the HA cluster, then in a cluster consisting of two members:

- port1 of the primary FortiGate should be connected to port1 of the secondary FortiGate.
- port2 of the primary FortiGate should be connected to port2 of the secondary FortiGate.

General operation

The following are best practices for general cluster operation:

- Ensure that heartbeat communication is present (see HA heartbeat interface on page 3346).
- Enable the session synchronization option in daily operation (see FGSP basic peer setup on page 3449).
- Monitor traffic flowing in and out of the interfaces.

Failover

FGCP provides failover protection in the following scenarios:

- The active device loses power.
- A monitored interface loses a connection.

After failover occurs, the user will not notice any difference, except that the active device has changed. See Failover protection on page 3344 for more information.

Synchronizing the configuration

FGCP uses a combination of incremental and periodic synchronization to make sure that the configuration of all cluster units is synchronized to that of the primary unit.

The following settings are not synchronized between cluster units:

- The FortiGate host name
- GUI Dashboard widgets
- HA override
- HA device priority
- The virtual cluster priority
- The HA priority setting for a ping server (or dead gateway detection) configuration
- The system interface settings of the HA reserved management interface
- The HA default route for the reserved management interface, set using the `ha-mgmt-interface-gateway` option of the `config system ha` command

Most subscriptions and licenses are not synchronized, as each FortiGate must be licensed individually. FortiToken Mobile is an exception; they are registered to the primary unit and synchronized to the secondary units.

The primary unit synchronizes all other configuration settings, including the other HA configuration settings.

All synchronization activity takes place over the HA heartbeat link using TCP/703 and UDP/703 packets.

Failover protection

The FortiGate Clustering Protocol (FGCP) provides failover protection, meaning that a cluster can provide FortiGate services even when one of the devices in the cluster encounters a problem that would result in the complete loss of connectivity for a stand-alone FortiGate unit. Failover protection provides a backup mechanism that can be used to reduce the risk of unexpected downtime, especially in mission-critical environments.

FGCP supports failover protection in four ways:

1. If a link fails.
2. If a device loses power.
3. If an SSD fails.
4. If memory utilization exceeds the threshold for a specified amount of time.

When session-pickup is enabled in the HA settings, existing TCP session are kept, and users on the network are not impacted by downtime as the traffic can be passed without reestablishing the sessions.

When and how the failover happens

1. Link fails

Before triggering a failover when a link fails, the administrator must ensure that monitor interfaces are configured. Normally, the internal interface that connects to the internal network, and an outgoing interface for traffic to the internet or outside the network, should be monitored. Any of those links going down will trigger a failover.

2. Loss of power for active unit

When an active (primary) unit loses power, a backup (secondary) unit automatically becomes the active, and the impact on traffic is minimal. There are no settings for this kind of fail over.

3. SSD failure

An HA failover can be triggered by an SSD failure.

To enable an SSD failure triggering HA fail over:

```
config system ha
    set ssd-failover enable
end
```

4. Memory utilization

An HA failover can be triggered when memory utilization exceeds the threshold for a specific amount of time.

Memory utilization is checked at the configured sample rate (`memory-failover-sample-rate`). If the utilization is above the threshold (`memory-failover-threshold`) every time that it is sampled for the entire monitor period (`memory-failover-monitor-period`), then a failover is triggered.

If the FortiGate meets the memory utilization conditions to cause failover, but the last memory triggered failover happened within the timeout period (`memory-failover-flip-timeout`), then the failover does not occur. Other HA cluster members can still trigger memory based failovers if they meet the criteria and have not already failed within the timeout period.

After a memory based failover from FortiGate A to FortiGate B, if the memory usage on FortiGate A goes down below the threshold but the memory usage on FortiGate B is still below the threshold, then a failover is triggered, and FortiGate A becomes the primary device.

When you disable memory based failover, a new HA primary selection occurs to determine the primary device.

To configure memory based HA failover:

```
config system ha
    set memory-based-failover {enable | disable}
    set memory-failover-threshold <integer>
    set memory-failover-monitor-period <integer>
    set memory-failover-sample-rate <integer>
    set memory-failover-flip-timeout <integer>
end
```

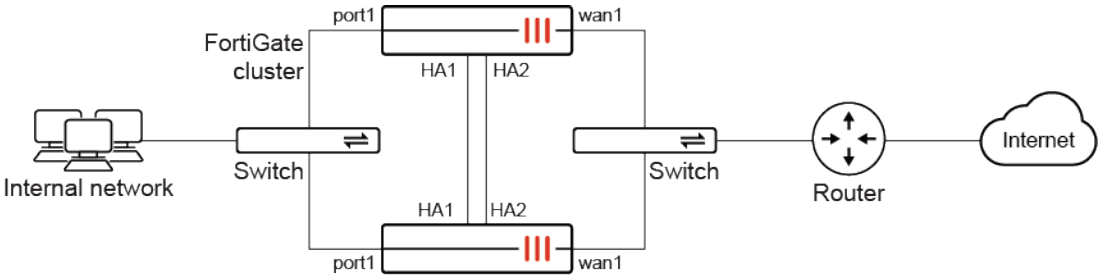
`memory-based-failover {enable | disable}`	Enable/disable memory based failover (default = disable).
`memory-failover-threshold <integer>`	The memory usage threshold to trigger a memory based failover, in percentage (0 - 95, 0 = use the conserve mode threshold, default = 0).
`memory-failover-monitor-period <integer>`	The duration of the high memory usage before a memory based failover is triggered, in seconds (1 - 300, default = 60).
`memory-failover-sample-rate <integer>`	The rate at which memory usage is sampled in order to measure memory usage, in seconds (1 - 60, default = 1).
`memory-failover-flip-timeout <integer>`	The time to wait between subsequent memory based failovers, in minutes (6 - 2147483647, default = 6).

Configuring HA failover time

On supported models, the HA heartbeat interval unit can be changed from the 100ms default to 10ms. This allows for a failover time of less than 50ms, depending on the configuration and the network.

```
config system ha
    set hb-interval-in-milliseconds {100ms | 10ms}
end
```

In this example, the HA heartbeat interval unit is changed from 100ms to 10ms. As the default heartbeat interval is two, this means that a heartbeat is sent every 20ms. The number of lost heartbeats that signal a failure is also changed to two. So, after two consecutive heartbeats are lost, a failover will be detected in 40ms.



To configure the HA failover time:

```
config system ha
    set group-id 240
    set group-name "300D"
    set mode a-p
    set password **********
    set hbdev "port3" 50 "port5" 100
    set hb-interval 2
    set hb-interval-in-milliseconds 10ms
    set hb-lost-threshold 2
    set override enable
    set priority 200
end
```

HA heartbeat interface

The HA heartbeat allows cluster units to communicate with each other. The heartbeat consists of hello packets that are sent at regular intervals by the heartbeat interface of all cluster units. The hello packets describe the state of the cluster unit (including communication sessions) and are used by other cluster units to keep the cluster synchronized. While the cluster is operating, the HA heartbeat confirms that all cluster units are functioning normally.

HA heartbeat packets are Layer 2 Ethernet frames that use EtherType values of 0x8890 and 0x8891 rather than 0x0800 for normal 802.3 IP packets. The default time interval between HA heartbeats is 200 ms.

As a best practice, it is recommended to isolate the heartbeat devices from the user networks by connecting the heartbeat devices to a dedicated switch that is not connected to any network. The heartbeat packets contain sensitive information about the cluster configuration and may use a considerable amount of network

bandwidth. If the cluster consists of two FortiGates, connect the heartbeat device interfaces back-to back using a crossover cable. If there are more than two FortiGates, each heartbeat interface should be connected to a dedicated switch. For example, in a four-member HA cluster with two heartbeat interfaces, there would be two switches (one switch dedicated to each interface).

Upon starting up, a FortiGate configured for HA broadcasts HA heartbeat hello packets from its HA heartbeat interface to find other FortiGates configured to operate in HA mode. If two or more FortiGates operating in HA mode connect with each other, they compare HA configurations (mode, password, and group ID). If the HA configurations match, then the units negotiate to form a cluster.

The HA heartbeat interface communicates with each unit in the cluster using the same heartbeat interface for each member.

For example, if port1 and port2 are the heartbeat interfaces for the HA cluster, then in a cluster consisting of two members:

- port1 of the primary FortiGate should be connected to port1 of the secondary FortiGate.
- port2 of the primary FortiGate should be connected to port2 of the secondary FortiGate.

Configuring an HA heartbeat interface

A heartbeat interface is an Ethernet network interface in a cluster that is used by the FGCP for HA heartbeat communications between cluster units.

By default, two interfaces are configured to be heartbeat interfaces on most FortiGate models. The heartbeat interface configuration can be changed to select an additional or different heartbeat interface. It is possible to select only one heartbeat interface; however, this is not a recommended configuration (see Split brain scenario on page 3348).

Another important setting in the HA configuration is the heartbeat interface priority. In all cases, the heartbeat interface with the highest priority is used for all HA heartbeat communication. If the interface fails or becomes disconnected, then the selected heartbeat interface with the next highest priority handles all HA heartbeat communication.

If more than one heartbeat interface has the same priority, the heartbeat interface with the highest priority that is also highest in the heartbeat interface list is used for all HA heartbeat communication. If this interface fails or becomes disconnected, then the selected heartbeat interface with the highest priority that is next highest in the list handles all heartbeat communication (see Selecting heartbeat packets and interfaces on page 3349).

The default heartbeat interface configuration sets the priority of both heartbeat interfaces to 50, and the range is 0 to 512. When selecting a new heartbeat interface, the default priority is 0. The higher the number, the higher the priority.

In most cases, the default heartbeat interface configuration can be maintained as long the heartbeat interfaces are connected. Configuring HA heartbeat interfaces is the same for virtual clustering and for standard HA clustering. Up to eight heartbeat interface can be selected. This limit only applies to FortiGates with more than eight physical interfaces.

Heartbeat communications can be enabled on physical interfaces, but not on switch ports, VLAN subinterfaces, IPsec VPN interfaces, redundant interfaces, or 802.3ad aggregate interfaces.

To change the heartbeat interfaces in the GUI:

1. Go to *System* > *HA* and select a *Mode*.
2. Click the *+* in the *Heartbeat interfaces* field to select an interface.
3. Click *OK*.

To configure two interfaces as heartbeat interfaces with the same priority in the CLI:

```
config system ha
    set hbdev port4 150 port5 150
end
```

In this example, port4 and port5 are configured as the HA heartbeat interfaces and they both have a priority of 150.

To configure two interfaces as heartbeat interfaces with different priorities in the CLI:

```
config system ha
    set hbdev port4 100 port1 50
end
```

In this example, port4 and port1 are configured as the HA heartbeat interfaces. The priority for port4 is higher (100) than port1 (50), so port4 is the preferred HA heartbeat interface.

Split brain scenario

At least one heartbeat interface must be selected for the HA cluster to function correctly. This interface must be connected to all the units in the cluster. If heartbeat communication is interrupted and cannot fail over to a second heartbeat interface, then the cluster units will not be able to communicate with each other and more than one cluster unit may become a primary unit. As a result, the cluster stops functioning normally because multiple devices on the network may be operating as primary units with the same IP and MAC addresses creating a split brain scenario. See Split brain scenario: on page 3445 for more information.

A backup heartbeat interface is available to help prevent split-brain scenarios.

The backup heartbeat can be configured in the GUI on the *System* > *HA* page, or in the CLI:

```
config system ha
    set backup-hbdev <interface(s)>
end
```

The backup heartbeat is a dedicated interface that is automatically used when a secondary unit detects no heartbeats from the primary unit through the heartbeat interface(s). The backup heartbeat interface is no longer used when the secondary unit detects a heartbeat again.

Consider the following when using a backup heartbeat interface:

- A split-brain happens specifically when the secondary unit cannot detect heartbeats from the primary unit, and it promotes itself to primary. Therefore, the `backup-hbdev` is used only when the secondary unit cannot detect heartbeats. When the `backup-hbdev` is in use, the setting cannot be changed.
- The backup heartbeat interface does not bind to the virtual `port_ha` interface. Its main purpose is to operate efficiently to maintain the HA cluster and continue the flow of traffic. Therefore, some functions are

not available by design.
- Configuration changes are not synchronized to the secondary member in the HA cluster while the backup heartbeat interface is in use.
- Without using `session-sync-dev`, the `session-sync` and `session-pickup` events will not occur.

Sharing heartbeat interfaces with traffic ports

HA heartbeat and data traffic is supported on the same cluster interface. In NAT mode, if the heartbeat interfaces are used for processing network traffic, then the interface can be assigned any IP address. The IP address does not affect HA heartbeat traffic.

In transparent mode, the heartbeat interface can be connected to the network with management access enabled on the same interface. A management connection would then be established to the interface using the transparent mode management IP address. This configuration does not affect HA heartbeat traffic.

While these configurations are allowable, they are not recommended. When possible, use dedicated interfaces for heartbeat traffic.

Selecting heartbeat packets and interfaces

HA heartbeat hello packets are sent constantly by all of the enabled heartbeat interfaces. Using these hello packets, each cluster unit confirms that the other cluster units are still operating. The FGCP selects one of the heartbeat interfaces to be used for communication between the cluster units. This interface is used for heartbeat communication and is based on the linkfail states of the heartbeat interfaces, the heartbeat interface priority, and the interface index. The connected heartbeat interface with the highest priority is selected for heartbeat communication.

If more than one connected heartbeat interface has the highest priority, then the FGCP selects the heartbeat interface with the lowest interface index. The interface index order is visible in the CLI by running the `diagnose netlink interface list` command.

If the interface that is processing heartbeat traffic fails or becomes disconnected, the FGCP uses the same criteria to select another heartbeat interface for heartbeat communication. If the original heartbeat interface is fixed or reconnected, the FGCP selects this interface again for heartbeat communication.

The HA heartbeat interface communicates cluster session information, synchronizes the cluster configuration, synchronizes the cluster kernel routing table, and reports individual cluster member statuses. The HA heartbeat constantly communicates HA status information to make sure that the cluster is operating properly.

Modifying heartbeat timing

The heartbeat interval and heartbeat lost threshold are two variables that dictate the length of time one cluster unit will wait before determining a peer is dead.

```
config system ha
    set hb-interval <integer>
    set hb-interval-in-milliseconds {100 | 10}
    set hb-lost-threshold <integer>
end
```

`hb-interval <integer>`	Set the time between sending heartbeat packets; increase to reduce false positives (1 - 20, default = 2).
`hb-interval-in-milliseconds {100 | 10}`	Set the number of milliseconds for each heartbeat interval (100 or 10, default = 100).
`hb-lost-threshold <integer>`	Set the number of lost heartbeats to signal a failure; increase to reduce false positives (1 - 60, default = 20).

Heartbeats are sent out every 2 × 100 ms, and it takes 20 consecutive lost heartbeats for a cluster member to be detected as dead. Therefore, it takes by default 2 × 100 ms × 20 = 4000 ms, or 4 seconds, for a failure to be detected.

Sub-second heartbeat failure detection can be achieved by lowering the interval and threshold or lowering the heartbeat interval unit of measurement from 100 ms to 10 ms.

If the primary unit does not receive a heartbeat packet from a subordinate unit before the heartbeat threshold expires, the primary unit assumes that the subordinate unit has failed.

If a subordinate unit does not receive a heartbeat packet from the primary unit before the heartbeat threshold expires, the subordinate unit assumes that the primary unit has failed. The subordinate unit then begins negotiating to become the new primary unit.

The HA heartbeat packets consume more bandwidth if the heartbeat interval is short. But if the heartbeat interval is very long, the cluster is not as sensitive to topology and other network changes. Therefore, gauge your settings based on the amount of traffic and CPU usage sustainable by the cluster units versus the tolerance for an outage when the primary unit fails. Avoid using the heartbeat interfaces as traffic ports to prevent congesting the interfaces.

Changing the time to wait in the hello state

The hello state hold down time is the number of seconds that a cluster unit waits before changing from hello state to work state. After a failure or when starting up, cluster units operate in the hello state to send and receive heartbeat packets so that all the cluster units can find each other and form a cluster. A cluster unit should change from the hello state to work state after it finds all the other FortiGates to form a cluster with.

If all cluster units cannot find each other during the hello state, then some cluster units may join the cluster after it has formed. This can cause disruptions to the cluster and affect how it operates. A delay could occur if the cluster units are located at different sites or if communication is delayed between the heartbeat interfaces. If delays occur, increase the cluster units wait time in the hello state.

```
config system ha
    set hello-holddown <integer>
end
```

`hello-holddown <integer>`	Set the time to wait before changing from hello to work state, in seconds (5 - 300, default = 20).

Configuring HA heartbeat encryption and authentication

HA heartbeat encryption and authentication to encrypt and authenticate HA heartbeat packets can be enabled. HA heartbeat packets should be encrypted and authenticated if the cluster interfaces that send HA heartbeat

packets are also connected to the networks. HA heartbeat encryption and authentication are disabled by default. Note that enabling these settings could reduce cluster performance.

```
config system ha
    set authentication {enable | disable}
    set encryption {enable | disable}
end
```

If HA heartbeat packets are not encrypted, the cluster password and changes to the cluster configuration could be exposed. An attacker may be able to sniff HA packets to get cluster information. Enabling HA heartbeat message authentication prevents an attacker from creating false HA heartbeat messages. False HA heartbeat messages could affect the stability of the cluster.

HA authentication and encryption uses AES-128 for encryption and SHA1 for authentication. Heartbeat messages are encrypted and encapsulated in ESP packets for transfer in an IPsec tunnel between the cluster members.

Heartbeat bandwidth requirements

The majority of the traffic processed by the HA heartbeat interface is session synchronization traffic. Other heartbeat interface traffic required to synchronize IPsec states, IPsec keys, routing tables, configuration changes, and so on is usually negligible.

The amount of traffic required for session synchronization depends on the connections per second (CPS) that the cluster is processing, since only new sessions (and session table updates) need to be synchronized.

Another factor to consider is that if session pickup is enabled, the traffic on the heartbeat interface surges during a failover or when a unit joins or re-joins the cluster. When one of these events occurs, the entire session table needs to be synchronized. Lower throughput HA heartbeat interfaces may increase failover time if they cannot handle the higher demand during these events.

The amount of heartbeat traffic can also be reduced by:

- Turning off session pickup if it is not needed
- Enabling `session-pickup-delay` to reduce the number of sessions that are synchronized
- Using the `session-sync-dev` option to move session synchronization traffic off of the heartbeat link

Heartbeat packet EtherTypes

Normal 802.3 IP packets have an EtherType field value of 0x0800. EtherType values other than 0x0800 are understood as Layer 2 frames rather than IP packets.

HA heartbeat packets use the following EtherTypes:

Field value	Function	Description
0x8890	Heartbeat	Heartbeat packets are used by cluster units to find other cluster units, and to verify the status of other cluster units while the cluster is operating. Use the `ha-eth-type` option to change the EtherType.

Field value	Function	Description
0x8891	Traffic redistribution from primary to subordinate	These are used when the HA primary needs to redistribute traffic packets and the corresponding session information to the subordinate units in A-A mode. Use the `hc-eth-type` option to change the EtherType.
0x8892	Session synchronization	Session synchronization uses the heartbeat interfaces for communication, unless session synchronization devices are specified. See Session synchronization on page 3352 for more information.
0x8893	HA Telnet sessions (configuration synchronization)	The Telnet sessions are used to synchronize the cluster configurations, and to connect from one cluster unit's CLI to another when an administrator uses the `execute ha manage` command. Use the `l2ep-eth-type` option to change the EtherType.

Session synchronization

Since large amounts of session synchronization traffic can increase network congestion, it is recommended to keep this traffic off of the network and separate from the HA heartbeat interfaces by using dedicated connections for it. The interfaces are configured in the `session-sync-dev` setting.

The session synchronization device interfaces must be connected together by directly using the appropriate cable or using switches. If one of the interfaces becomes disconnected, then the cluster uses the remaining interfaces for session synchronization. If all the session synchronization interfaces become disconnected, then session synchronization reverts to using the HA heartbeat link.

All session synchronization traffic is between the primary unit and each subordinate unit. Session synchronization always uses UDP/708, but this will be encapsulated differently depending on the `session-sync-dev` setting. If `session-sync-dev` is specified, the packets will use 0x8892 and will exit over the mentioned port. If `session-sync-dev` is not specified, the packets will use 0x8893 and will exit the heartbeat port.

Session synchronization packets are typically processed by a single CPU core because all source and destination MAC addresses of the L2 frames are the same. Hashing based on the L2 addresses maps the processing of the frames to the same core. When large amounts of session synchronization traffic must be processed, enable the `sync-packet-balance` setting to distribute the processing to more cores. This effectively uses a larger set of MAC addresses for the hashing to map to multiple cores.

Troubleshooting heartbeat packets

Understanding the different types of heartbeat packets will ease troubleshooting. Heartbeat packets are recognized as Layer 2 frames. The switches and routers on the heartbeat network that connect to heartbeat interfaces must be configured to allow them to pass through. If Layer 2 frames are dropped by these network devices, then the heartbeat traffic will not be allowed between the cluster units.

For example, some third-party network equipment may not allow EtherType 0x8893. The unit can still be found in the HA cluster, but you would be unable to run `execute ha manage` to manage the other unit. Use the

following settings to change the EtherTypes of the HA heartbeat packets, if they require changing them for the traffic to be forwarded on the connected switch.

```
config system ha
    set ha-eth-type <hex_value>
    set hc-eth-type <hex_value>
    set l2ep-eth-type <hex_value>
end
```

To change the EtherType values of the heartbeat and HA Telnet session packets:

```
config system ha
    set ha-eth-type 8895
    set l2ep-eth-type 889f
end
```

For troubleshooting issues with packets sent or received on the HA heartbeat ports, use the following diagnostic command to sniff the traffic by EtherType.

```
# diagnose sniffer packet any 'ether proto <EtherType_in_hex>' 6 0 1
```

To sniff the traffic on EtherType 0x8890:

```
# diagnose sniffer packet any 'ether proto 0x8890' 6 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[ether proto 0x8890]
2022-10-19 16:22:26.512813 port5 out Ether type 0x8890 printer hasn't been added to sniffer.

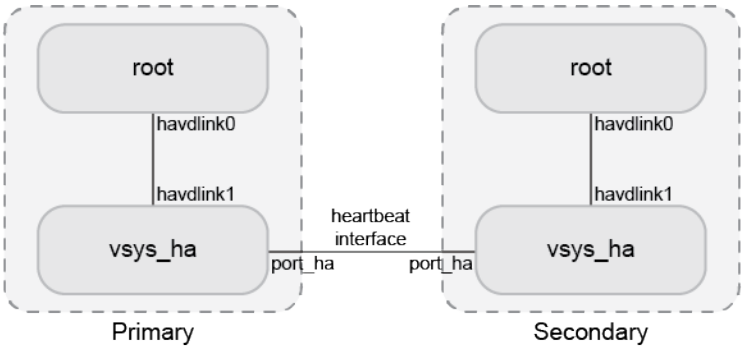
Interface IP addresses

An FGCP cluster communicates heartbeat packets using Layer 2 frames over the physical heartbeat interface, but it also communicates other synchronization traffic, logs, and locally generated traffic from subordinate devices over Layer 3 IP packets. Additional virtual interfaces are created in the hidden vsys_ha VDOM, which need to be addressed with IPv4 addresses.



The FGCP uses link-local IPv4 addresses (see RFC 3927) in the 169.254.0.x range for the virtual HA heartbeat interface (port_ha) and for the inter-VDOM link interfaces between the vsys_ha and management VDOM. When members join an HA cluster, each member's heartbeat interface (port_ha) is assigned an IP address from the range of 169.254.0.1 to 169.254.0.63/26. HA inter-VDOM link interfaces (havdlink0 and havdlink1) are assigned IP address from the range of 169.254.0.65 to 169.254.0.66/26.

The IP address that is assigned to a virtual heartbeat interface depends on the serial number priority of the member. Higher serial numbers have a higher priority, and therefore a lower `serialno_prio` number, for example:

```
# diagnose sys ha status
...
FGVM08TM20002002:    Secondary, serialno_prio=0, usr_priority=128, hostname=FGVM08TM20002002
FGVM08TM19003001:      Primary, serialno_prio=1, usr_priority=128, hostname=FGVM08TM19003001
```

The member with `serialno_prio=0` is assigned IP address 169.254.0.1, `serialno_prio=1` is assigned 169.254.0.2, and so forth.

To view the HA heartbeat interface IP address of the primary unit:

```
# get system ha status
...
vcluster 1: work 169.254.0.2
...
```

To view all the assigned IP addresses of a device:

```
# diagnose ip address list
IP=172.16.151.84->172.16.151.84/255.255.255.0 index=3 devname=port1
IP=192.168.2.204->192.168.2.204/255.255.255.0 index=6 devname=port2
IP=10.10.10.1->10.10.10.1/255.255.255.0 index=9 devname=port3
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=13 devname=root
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=16 devname=vsys_ha
IP=169.254.0.2->169.254.0.2/255.255.255.192 index=17 devname=port_ha
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=18 devname=vsys_fgfm
IP=169.254.0.65->169.254.0.65/255.255.255.192 index=19 devname=havdlink0
IP=169.254.0.66->169.254.0.66/255.255.255.192 index=20 devname=havdlink1
```

When generating traffic from a subordinate unit, traffic will be routed to the primary unit's port_ha virtual heartbeat interface. From there, if traffic is destined to another network, the traffic is routed from the vsys_ha VDOM to the management VDOM by the havdlink interfaces.

Use the `execute traceroute` command on the subordinate unit to display HA heartbeat IP addresses and the HA inter-VDOM link IP addresses.

To trace the route to an IP address on a subordinate unit:

```
# execute ha manage 1
# execute traceroute 172.20.20.10
traceroute to 172.20.20.10 (172.20.20.10), 32 hops max, 72 byte packets
1 169.254.0.1 0 ms 0 ms 0 ms
2 169.254.0.66 0 ms 0 ms 0 ms
3 172.20.20.10 0 ms 0 ms 0 ms
```

To run a sniffer trace on the primary unit to view the traffic flow:

```
# diagnose sniffer packet any 'net 169.254.0.0/24' 4 0 l
```

Unicast HA heartbeat

In virtual machine (VM) and cloud environments that do not support heartbeat communication with Layer 2 Ethernet frames (see HA heartbeat interface on page 3346), you can set up a Layer 3 unicast HA heartbeat when configuring HA. This consists of enabling the feature and adding a peer IP address. The peer IP address is the IP address of the HA heartbeat interface of the other FortiGate VM in the HA cluster.

Unicast HA is only supported between two FortiGate VMs in active-passive (A-P) mode. The heartbeat interfaces must be connected to the same network, and the IP addresses must be added to these interfaces.

In the following example, unicast HA heartbeat is enabled over the port3 interface.

To enable unicast HA heartbeat in the GUI:

1. Go to *System* > *HA*.
2. Enable *Unicast Heartbeat* and enter the *Peer IP*, such as *172.30.3.12*.
3. Click *OK*.

To enable unicast HA heartbeat in the CLI:

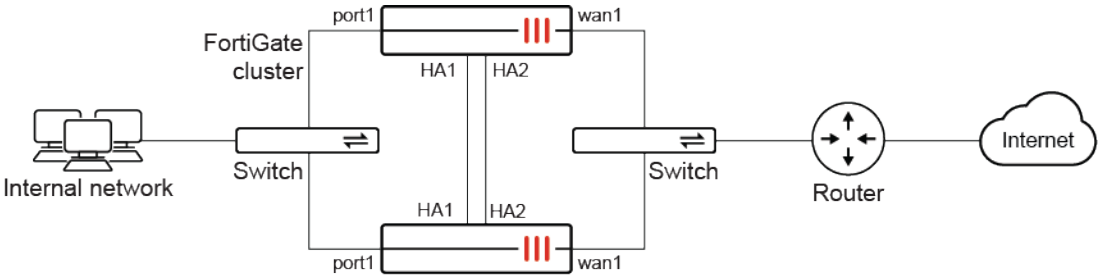
```
config system ha
    set hbdev port3 50
    set unicast-hb enable
    set unicast-hb-peerip 172.30.3.12
end
```

HA active-passive cluster setup

An HA Active-Passive (A-P) cluster can be set up using the GUI or CLI.

FortiGate A-P HA cluster supports sharing a single FortiGuard service license for both cluster units. See Single FortiGuard license for FortiGate A-P HA cluster on page 3359.

This example uses the following network topology:

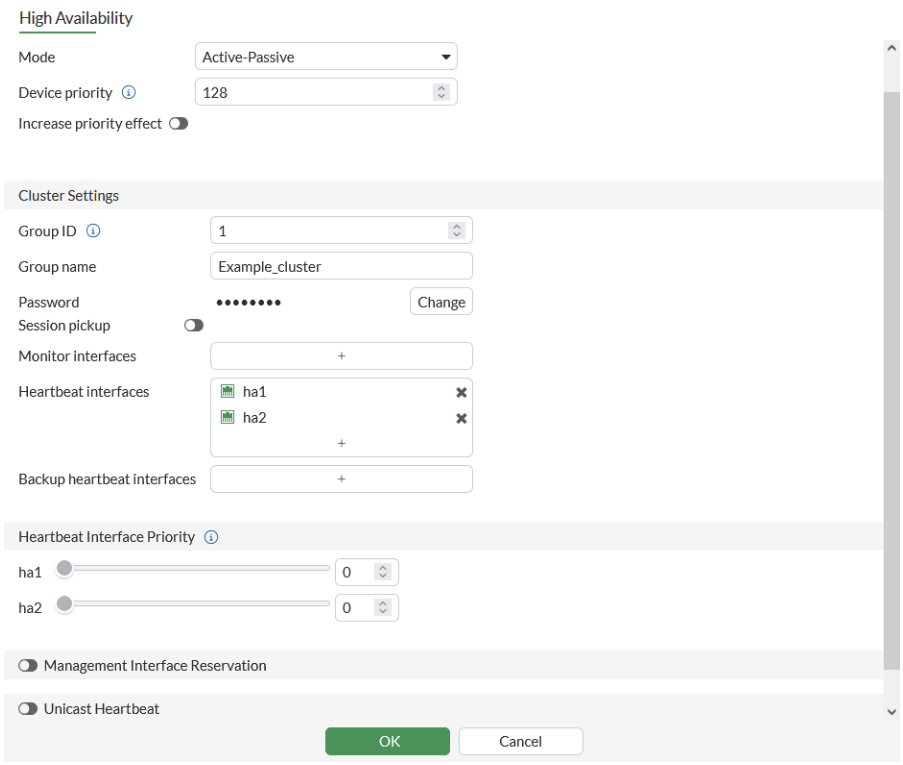


To set up an HA A-P cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Go to *System* > *HA* and set the following options:

Mode	Active-Passive
Device priority	128 or higher
Group ID	1 The group ID must be the same in all HA members in order to form a cluster. The group ID can impact the definition of the virtual MAC addresses of interfaces. See Determining VMAC addresses for more details.
Group name	Example_cluster
Password	********
Heartbeat interfaces	ha1 and ha2

Except for the device priority, these settings must be the same on all FortiGates in the cluster.



4. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
5. Click *OK*.
   The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate's interfaces.
6. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat steps 1 to 5, omitting setting the device priority, to join the cluster.

To set up an HA A-P cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Change the hostname of the FortiGate:

```
config system global
    set hostname Example1_host
end
```

   Changing the host name makes it easier to identify individual cluster units in the cluster operations.
4. Enable HA:

```
config system ha
    set mode a-p
    set group-id 1
    set group-name Example_cluster
    set password ********
```

```
    set hbdev ha1 10 ha2 20
end
```

5. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
6. Repeat steps 1 to 5 on the other FortiGate devices to join the cluster, giving each device a unique hostname.

Single FortiGuard license for FortiGate A-P HA cluster

FortiGate A-P HA cluster supports sharing a single FortiGuard service license for both cluster units for the following models:

- 40F and variants
- 60F and variants
- 70F and variants
- 80F and variants
- 100F and variants

When a customer purchases two units with the HA SKU (such as 2 x FG-40F-HA), they can further purchase a single order of the following subscriptions:

- Enterprise Protection
- Unified Threat Protection (UTP)
- Advanced Threat Protection (ATP)

The two FortiGate serial numbers will be associated together on FortiCare to create one virtual serial number (vSN). If multiple pairs of devices are ordered, each pair will be together in its own box to help identify the associated devices. The aforementioned services will then be registered to the vSN. A la carte SKUs are not supported, and cannot be registered to the vSN.

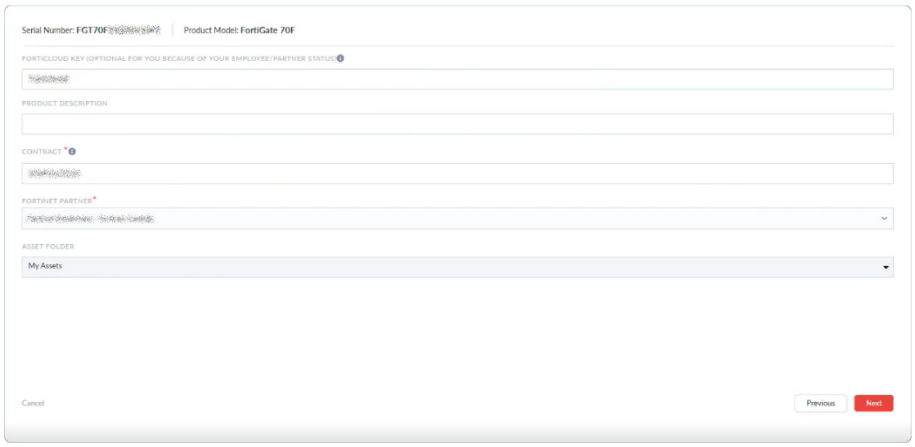
Deploying the FortiGates in HA to support vSN requires two steps:

1. Register the FortiGate and associated service contract
2. Provision the FortiGate HA configurations either through FortiGate Cloud or manually

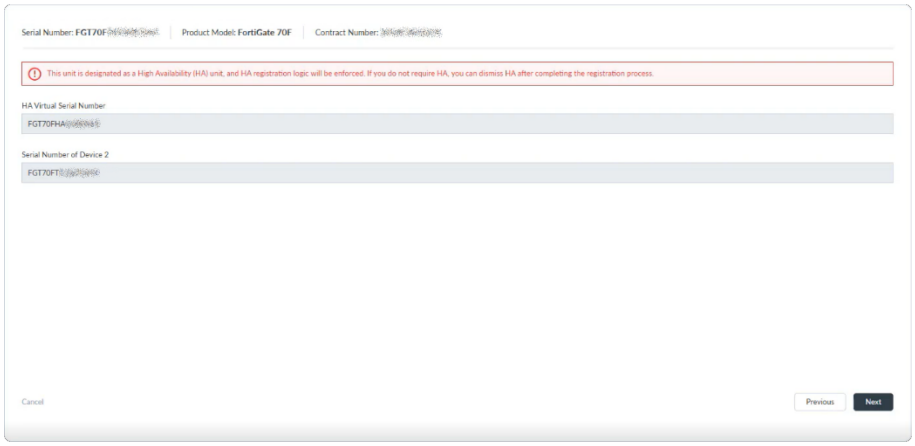
For information about RMAing the HA cluster, see RMA the FortiGate virtual HA on page 3363.

To register the FortiGates and associated contract:

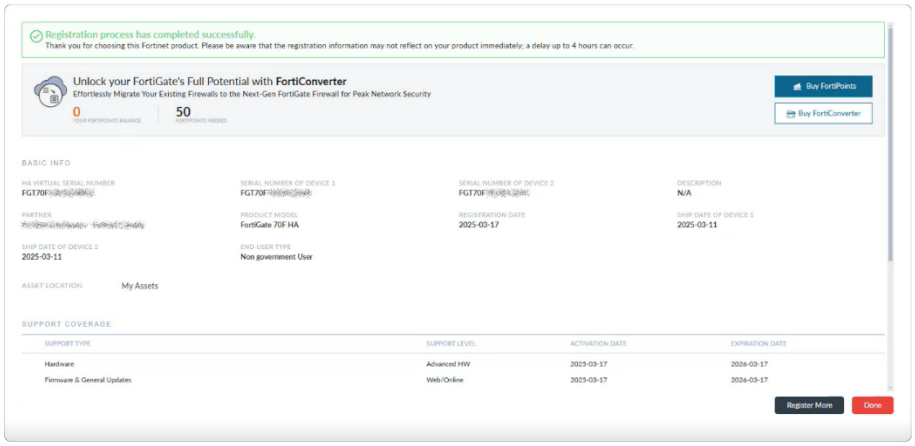
1. Log in to the FortiCloud support portal.
2. In the *Dashboard*, click *Register Now* to register a device and contract.
3. In the *Registration* field, enter the one of the FortiGate's serial numbers. Do not enter the service contract registration code, license certificate number, or asset transfer token.
4. Set the end user type, then click *Next*.
5. Enter the FortiCloud key from the FortiGate in the *FortiCloud Key* field, and the Registration Code from the service entitlement document in the *Contract* field.



6. Configure the remaining settings as needed then click *Next*.



7. Check the HA vSN and the serial number of the second device, then click *Next*.
8. Review the configuration, then click *Done* to complete the registration.



The vSN is registered in *Asset Management* with service entitlement. The individual FortiGates cannot be managed.

To configure the FortiGates in HA using FortiGate Cloud:

1. In the FortiGate Cloud portal, provision the FortiGate:
   a. In the FortiCloud support portal, go to *Services > FortiGate Cloud* to open the portal.
   b. Go to *Assets > Asset list* and click *Add FortiGate*.
   c. Select the FortiGate vSN from the inventory table and click *Provision > Provision to FortiGate Cloud*.
2. Unpack the boxes and connect the HA interfaces back to back using the highest physical port number that is not a fabric port (portA and portB) as indicated:

Model	HA interface
FortiGate 40F series	port3
FortiGate 60F series	port5
FortiGate 70F series	port4 and/or 5
FortiGate 80F series	port5 and/or 6
FortiGate 100F series	ha1 and/or ha2

   Some models have 2 HA interfaces. In these cases, both interfaces will be provisioned by FortiGate Cloud as heartbeat interfaces, but one or both of the interfaces can be connected. It is recommended to connect 2 heartbeat interfaces whenever possible for redundancy.
3. Connect the WAN interface to an upstream gateway that is providing DHCP service.
4. Connect internal interfaces to an internal switch as required.
5. Power on both FortiGates.
   Shortly after, the boxes will receive the vSN and their HA configuration from FortiGate Cloud, as follows:

```
config system ha
    set group-id <id>
    set group-name <group-name>
    set mode a-p
    set password ********
    set hbdev <HA interface 1> <priority 1> [HA interface 2] [priority 2]
    set override disable
    set logical-sn enable
end
```

To configure the FortiGates in HA manually using the CLI:

1. Unpack the two boxes, and connect to each unit through the CLI or the default management interface.
2. Configure the following basic HA settings on each unit:

```
config system ha
    set mode a-p
    set group-id <id>
    set group-name <group-name>
    set password ********
    set hbdev <HA interface 1> <priority 1> [HA interface 2] [priority 2]
    set logical-sn enable
end
```

3. Connect the HA interfaces back to back using your preferred interfaces.
4. Power on both FortiGates.
   Shortly after, the boxes will receive the vSN.

To verify the HA status and vSN (or Logical Serial) after the HA cluster registration is complete:

1. In the GUI, go to the *System > HA* page.
2. In the CLI use these commands:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-80F
Mode: HA A-P
Group Name: Branch1-HA
Group ID: 100
Debug: 0
Cluster Uptime: 0 days 2h:33m:2s
Cluster state change time: 2024-11-19 13:57:31
Primary selected using:
    <2024/11/19 13:57:31> vcluster-1: FGT80FTK22023xxx is selected as the primary because its
override priority is larger than peer member FGT80FTK20000xxx.
    <2024/11/19 11:26:06> vcluster-1: FGT80FTK22023xxx is selected as the primary because it's
the only member in the cluster.
ses_pickup: enable, ses_pickup_delay=disable
override: enable
Configuration Status:
    FGT80FTK22023xxx(updated 1 seconds ago): in-sync

Logical Serial Number: FGT80FHA24090xxx
```

```
# diagnose system ha dump-by debug-zone
            HA information.
is_manage_primary=1,manage_vd=root,ip=169.254.0.1,num=2,nvcluster=1,jiffies=938038.
logical serial number is FGT80FHA24090xxx,
local serial number is FGT80FTK22023xxx,
member's serial number is FGT80FTK20000xxx
```

3. Furthermore, the service contract will be associated with the vSN and can be viewed on the *System* > *FortiGuard* page.

Do not change the HA mode from A-P to A-A when `logical-sn` is enabled. This will result in the FortiGate losing its vSN. Disabling `logical-sn` will also result in losing the vSN. As a result, service entitlements will no longer be registered to the HA cluster.

RMA the FortiGate virtual HA

In the event that one of the FortiGate HA units requires an RMA, the RMA transfer can be completed from the FortiCloud support portal.

To RMA a FortiGate HA unit:

1. Go to the *Products* > *Product List* and click the HA vSN.
2. In the *Registration* widget click RMA Transfer.
3. Continue the RMA process as needed.

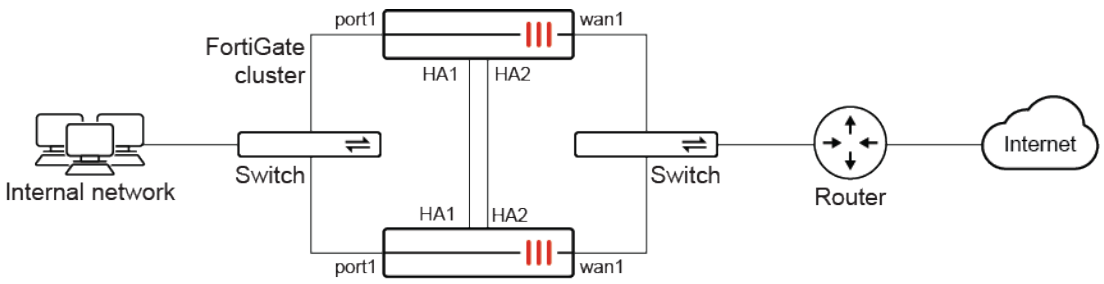
HA active-active cluster setup

An HA Active-Active (A-A) cluster can be set up using the GUI or CLI.

An A-A cluster supports interfaces in DHCP mode, but not interfaces in PPPoE mode. If an interface is in PPPoE mode, then the Active-Active option will not appear in the *Mode* selection.

FGCP in Active-Active mode cannot load balance any sessions that traverse NPU VDOM links or regular VDOM links. If Active-Active session load balancing between VDOMs is required, use an external router to handle the inter-VDOM routing.

This example uses the following network topology:

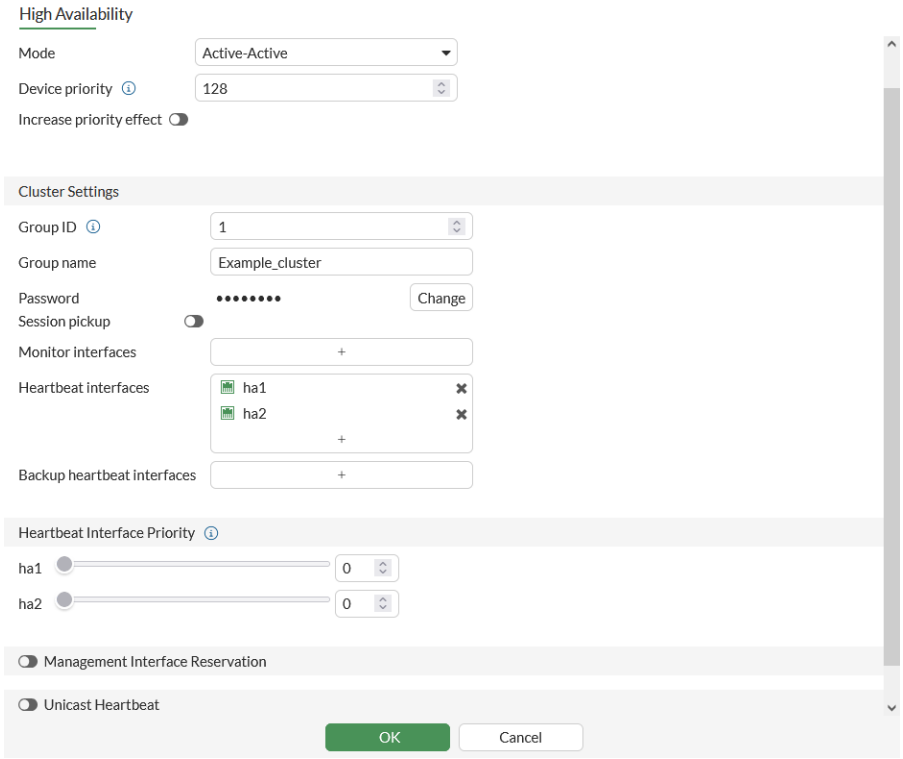


To set up an HA A-A cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Go to *System* > *HA* and set the following options:

Mode	Active-Active
Device priority	128 or higher
Group ID	1 The group ID must be the same in all HA members in order to form a cluster. The group ID can impact the definition of the virtual MAC addresses of interfaces. See Determining VMAC addresses for more details.
Group name	Example_cluster
Password	********
Heartbeat interfaces	ha1 and ha2

Except for the device priority, these settings must be the same on all FortiGates in the cluster.



4. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
5. Click *OK*.
   The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate's interfaces.

6. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat steps 1 to 5, omitting setting the device priority, to join the cluster.

To set up an HA A-A cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Change the hostname of the FortiGate:

```
config system global
    set hostname Example1_host
end
```

   Changing the host name makes it easier to identify individual cluster units in the cluster operations.
4. Enable HA:

```
config system ha
    set mode a-a
    set group-id 1
    set group-name Example_cluster
    set password ********
    set hbdev ha1 10 ha2 20
end
```

5. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
6. Repeat steps 1 to 5 on the other FortiGate devices to join the cluster.

HA and load balancing

FGCP active-active HA uses a technique similar to unicast load balancing where the primary unit is associated with the cluster HA virtual MAC addresses and cluster IP addresses. The primary unit is the only cluster unit that receives packets sent to the cluster. The primary unit uses a load balancing schedule to distribute sessions to all cluster units (including the primary unit). Subordinate unit interfaces retain their actual MAC addresses, and the primary unit communicates with the subordinate units using these MAC addresses. Packets exiting the subordinate units proceed directly to their destination and do not pass through the primary unit.

By default, active-active HA load balancing distributes proxy-based security profile processing to all cluster units. Proxy-based security profile processing is CPU and memory-intensive, so FGCP load balancing may result in higher throughput because resource-intensive processing is distributed among all cluster units.

The following proxy-based security profile processing is load balanced:

- Virus scanning
- Web filtering
- Email filtering
- Data Loss prevention (DLP) of HTTP, FTP, IMAP, IMAPS, POP3, POP3S, SMTP, SMTPS, IM, and NNTP sessions accepted by firewall policies

Other features enabled in firewall policies such as endpoint security, traffic shaping, and authentication have no effect on active-active load balancing.

Active-active HA load balancing does not support software switches. See Software switch on page 230.

The `load-balance-all` option can be enabled to have the primary unit load balance all TCP sessions. Load balancing TCP sessions increases overhead and may actually reduce performance. This setting is disabled by default.

To configure TCP session load balancing:

```
config system ha
    set load-balance-all {enable | disable}
end
```

NP6 and NP7 processors can offload and accelerate load balancing. See NP session offloading in HA active-active configuration for more information.

During active-active HA load balancing, the primary unit uses the configured load balancing schedule to determine which cluster unit will process a session. The primary unit stores the load balancing information for each load balanced session in the cluster load balancing session table. Using the information in this table, the primary unit can then forward all of the remaining packets in each session to the appropriate cluster unit. The load balancing session table is synchronized among all cluster units.

ICMP, multicast, and broadcast sessions are never load balanced and are always processed by the primary unit. The following sessions are only processed by the primary unit:

- IPS
- Application control
- Flow-based virus scanning
- Flow-based web filtering
- Flow-based DLP
- Flow-based email filtering
- VoIP
- IM
- P2P
- IPsec VPN
- SSL VPN
- HTTP multiplexing
- SSL offloading
- WAN optimization
- Explicit web proxy
- WCCP

In addition to load balancing, active-active HA provides the same session, device, and link failover protection as active-passive HA. If the primary unit fails, a subordinate unit becomes the primary unit and resumes operating the cluster. Active-active HA maintains as many load balanced sessions as possible after a failover by

continuing to process the load balanced sessions that were being processed by the cluster units that are still operating.

Load balancing schedules

The load balancing schedule controls how the primary unit distributes packets to all cluster units.

To configure the load balancing schedule:

```
config system ha
    set schedule {none | leastconnection | round-robin | weight-round-robin | random | ip |
ipport}
end
```

The following table outlines the load balancing schedule options.

Schedule	Description
None	Use no load balancing. Select this option when the cluster interfaces are connected to load balancing switches. The primary unit does not load balance traffic, and the subordinate units process incoming traffic that does not come from the primary unit. For all other load balancing schedules, all traffic is received first by the primary unit and then forwarded to the subordinate units. The subordinate units only receive and process packets sent from the primary unit.
Least connection	Distribute network traffic to the cluster unit currently processing the fewest connections.
Round robin	Distribute network traffic to the next available cluster unit.
Weighted round robin	This is similar to round robin, but weighted values are assigned to each cluster unit based on their capacity and how many connections they are currently processing. For example, the primary unit should have a lower weighted value because it handles scheduling and forwards traffic. Weighted round robin distributes traffic more evenly because units that are not processing traffic will be more likely to receive new connections than units that are very busy.
Random	Randomly distribute traffic to cluster units.
IP	Distribute traffic to cluster units based on the source and destination IP of the packet.
IP port	Distribute traffic to cluster units based on based on the source IP, source port, destination IP, and destination port of the packet.

Once a packet has been propagated to a subordinate unit, all packets are part of that same communication session are propagated to that same subordinate unit. Traffic is distributed according to the communication session, not just an individual packet.

Any subordinate unit that receives a forwarded packet processes it without applying load balancing. Note that subordinate units are still considered to be active because they perform routing, virus scanning, and other tasks

on their share of the traffic. Active subordinate units share their session and link status information with all cluster units. Active subordinate units do not make load balancing decisions.

The primary unit is responsible for the load balancing process, and still performs other FortiGate tasks. Depending on the load balancing schedule used, the primary unit may assign itself a smaller share of the total load.

Active-active failover

If a subordinate unit fails, the primary unit redistributes the sessions that the subordinate was processing among the remaining active cluster members. If the primary unit fails, the subordinate units negotiate to select a new primary unit. The new primary unit continues to distribute packets among the remaining active cluster units.

Failover works in a similar way if the cluster consists of only two units. If the primary unit fails, the subordinate unit negotiates and becomes the new primary unit. If the subordinate unit fails, the primary unit processes all traffic. In both cases, the single remaining unit continues to function as a primary unit, maintaining the HA virtual MAC address for all of its interfaces.

HTTPS sessions and active-active load balancing

In proxy inspection mode, active-active HA does not load balance HTTPS sessions that have SSL deep packet scanning or certificate inspection enabled. For example, when proxy inspection is triggered for HTTPS traffic in web or AV filtering, the traffic must be processed by the primary HA unti in proxy inspection mode.

FortiGate identifies HTTPS sessions as all sessions received on the HTTPS TCP port. The default HTTPS port is 443. If the HTTPS port is changed in the SSL/SSH inspection profile applied in the firewall policy, FGCP stops load balancing all sessions that use the custom HTTPS port.

HTTPS traffic passing through a firewall policy that does not meet the proxy inspection mode criteria can still be load balanced when `load-balance-all` is enabled. HTTPS traffic passing through flow-based inspection does not have this limitation.

HA virtual cluster setup

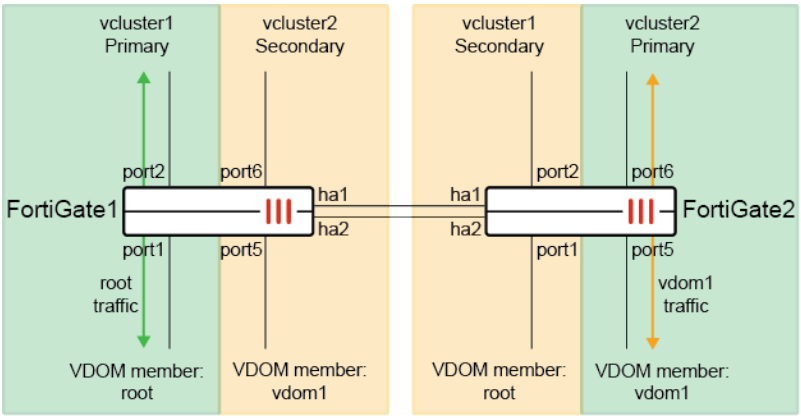
Virtual clustering is an extension of FGCP HA to allow multiple clusters to be formed between your HA members. In effect, each cluster consists of the same HA members, with the option to prioritize different members as the primary unit. Each cluster operates as its on active-passive FGCP HA cluster, with different virtual domains residing in the virtual cluster. The following custom settings can be configured per cluster:

```
config system ha
    set vcluster-status enable
    config vcluster
        edit <id>
            set override {enable | disable}
            set priority <integer>
            set vdom <vdom_1>, ... [vdom_n]
            set monitor <interface_1>, ... [interface_n]
            set pingserver-monitor-interface <interface_1>, ... [interface_n]
        next
    end
end
```

`override {enable | disable}`	Enable/disable override and increase the priority of the unit that should always be the primary.
`priority <integer>`	Increase the priority to select the primary unit (0 - 255, default = 128).
`vdom <vdom_1>, ... [vdom_n]`	Set the virtual domains in the virtual cluster.
`monitor <interface_1>, ... [interface_n]`	Set the interfaces to check for port monitoring (or link failure).
`pingserver-monitor-interface <interface_1>, ... [interface_n]`	Set the interfaces to check for remote IP monitoring.

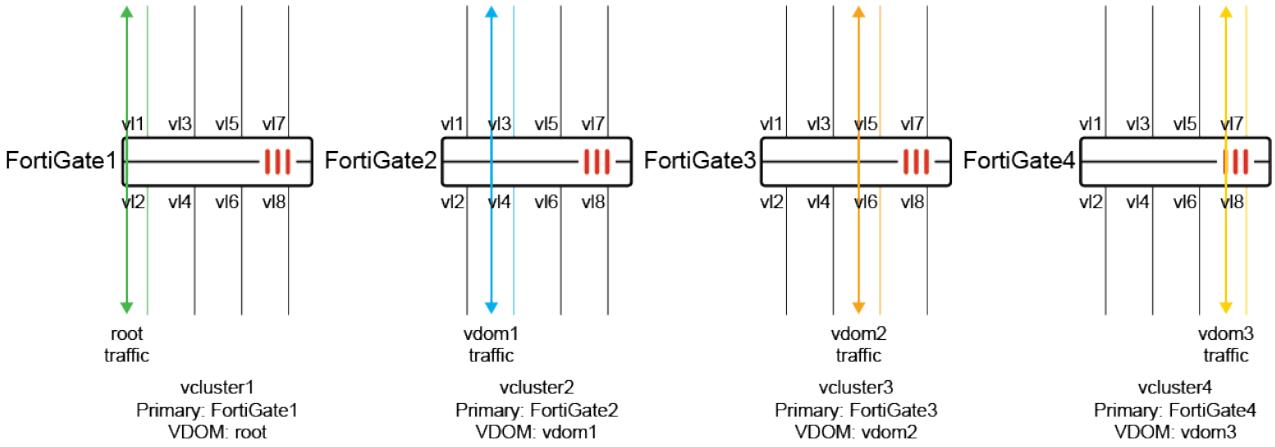
Active-passive virtual clustering uses VDOM partitioning to send traffic for some VDOMs to the primary FortiGate and traffic for other VDOMs to the secondary FortiGates. Traffic distribution between FortiGates can potentially improve throughput. If a failure occurs and only one FortiGate continues to operate, all traffic fails over to that FortiGate, similar to normal HA. If the failed FortiGates rejoin the cluster, the configured traffic distribution is restored.

In an active-passive virtual cluster of two FortiGates, the first and second FortiGates share traffic processing according to the VDOM partitioning configuration. The following is an example of two virtual clusters, with each member acting as primary for different vclusters.



If you add a third or fourth FortiGate, the first and second FortiGates process all traffic and the other one or two FortiGates operate in standby mode. If the first or second FortiGate fails, one of the other FortiGates becomes the new primary or secondary FortiGate and begins processing traffic.

For better load balancing, it is recommended to have as many vclusters as there are HA members. This way, each HA member can be a primary unit for each cluster, thereby processing traffic while standing by for the other vcluster as secondary. The following is an example of four FortiGates in an FGCP cluster, with four vclusters and four VDOMs. Each FortiGate is the primary unit for a vcluster and actively processes traffic as the primary member.



Virtual clustering and heartbeat interfaces

The HA heartbeat provides the same HA services in a virtual clustering configuration as in a standard HA configuration. One set of HA heartbeat interfaces provides HA heartbeat services for all of the VDOMs in the cluster. You do not have to add a heartbeat interface for each VDOM.

Special considerations for NPU-based VLANs in a virtual cluster

In an FGCP cluster, the primary FortiGate uses virtual MAC addresses when forwarding traffic, and the secondary uses the physical MAC addresses when forwarding traffic. In a virtual cluster, packets are sent with the cluster's virtual MAC addresses. However, in the case of NPU offloading on a non-root VDOM, traffic that leaves an NPU-based VLAN will use the physical MAC address of its parent interface rather than the virtual MAC address. If this behavior is not desired, disable `auto-asic-offload` in the firewall policy where the VLAN interface is used.

Support up to 30 virtual clusters

FortiOS supports up to 30 virtual clusters, which allows more VDOMs to be spread across different virtual clusters without overlapping. Each virtual cluster supports its own failover conditions. Prior to 7.2.0, only two virtual clusters were supported.

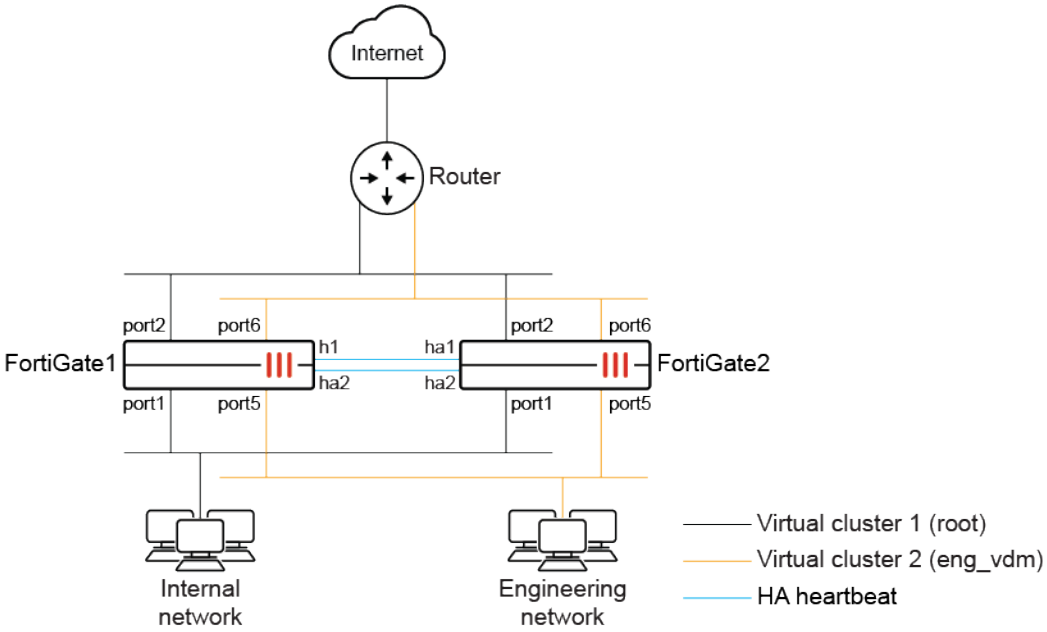
When configuring virtual clusters, the `group-id` is limited to a value from 0 to 7. If the HA `group-id` is greater than 7, use the command line first to change the `group-id` before enabling virtual clusters.

```
config system ha
    set group-id <integer>
end
```

When upgrading from 7.0 or earlier, old virtual clusters will be lost if the `group-id` is larger than 7.

Basic configuration

This example shows a virtual cluster configuration consisting of two FortiGates. The virtual cluster has two VDOMs, root and eng_vdm.



The root VDOM can only be associated with virtual cluster 1.

The VDOM that is assigned as the management VDOM can also only be associated with virtual cluster 1.

To set up an HA virtual cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Configure a regular A-P cluster:
   a. Log in to one of the FortiGates.
   b. Go to *System* > *HA* and set the following options:

Mode	Active-Passive
Device priority	128 or higher
Group name	Example_cluster
Heartbeat interfaces	ha1 and ha2

   Except for the device priority, these settings must be the same on all FortiGates in the cluster.
   c. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
   d. Click *OK*.
   The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate's

interfaces.

e. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat step 2 (omitting setting the device priority) to join the cluster.

3. On the primary FortiGate, go to *System* > *Settings* and enable *Virtual Domains*.
4. Click *Apply*. You will be logged out of the FortiGate.
5. Log back in to the FortiGate, and ensure that you are in the global VDOM.
6. Create the eng_vdm VDOM:
   a. Go to *System* > *VDOM* and click *Create New*. The *New Virtual Domain* pane opens.
   b. Enter the name in the *Virtual Domain* field, then click *OK*.
7. Implement a virtual cluster by moving the new VDOM to virtual cluster 2:
   a. Go to *System* > *HA* and enable *VDOM Partitioning*.
   b. In the table, click *Create New*. The *New Virtual Cluster* pane opens.
   c. Click the *+* and add the *eng_vdm* VDOM.
   d. Click *OK* to save the virtual cluster.

   e. Click *OK* to save the HA configuration.

To set up an HA virtual cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Configure a regular A-P cluster. See HA active-passive cluster setup on page 3357.
3. Enable VDOMs:

```
config system global
    set vdom-mode multi-vdom
end
```

You will be logged out of the FortiGate.

4. Create the eng_vdm VDOM:

```
config vdom
    edit eng_vdm
    next
end
```

5. Reconfigure the HA settings to be a virtual cluster:

```
config system ha
    set vcluster-status enable
    config vcluster
        edit 1
            set vdom root
            set override disable
        next
        edit 2
            set vdom eng_vdm
            set override disable
        next
    end
end
```

Configuration with 30 virtual clusters

In this example, there are 30 customers managed by an MSSP on an HA cluster, and each customer VDOM needs to failover independently of other customer VDOMs. Each customer is assigned to a different virtual cluster with its own virtual cluster configurations. This may include different monitored interfaces, ping servers, and priority for the primary and secondary cluster members. Each virtual cluster will fail over according to their own virtual cluster configurations.

This example assumes an A-P cluster and VDOMs have already been configured. See HA active-passive cluster setup on page 3357 and Virtual Domains on page 3298 for more information.

For each virtual cluster, this example assumes that unit 1 has an HA priority of 200, while unit 2 has an HA priority of 100. By default, unit 1 will be the primary cluster member of all the virtual clusters.

To configure multiple virtual clusters in the GUI:

1. Go to *System* > *HA* and enable *VDOM Partitioning*.
2. Create a virtual cluster:
   a. In the table, click *Create New*. The *New Virtual Cluster* pane opens.
   b. Set the *Device priority* to *200*.
   c. Click the *+* and add the *Virtual domains*.
   d. Optionally, click the *+* and add the *Monitor interfaces*.
   e. Click *OK*.
3. Repeat step 2 to create the remaining virtual clusters.
4. Click *OK* to save the HA configuration. The *HA* page summary displays the multiple virtual clusters, each with a *Primary* and *Secondary* HA member.
5. Edit the priority settings for the secondary members to be 100:

   a. Select the *Secondary* member in the table, and click *Edit*.
   b. Set the *Priority* to *100*.
   c. Click *OK*.
6. Repeat step 5 for the remaining secondary members.

To configure multiple virtual clusters in the CLI:

1. Configure the primary FortiGate:

```
config system ha
    set vcluster-status enable
    config vcluster
        edit 1
            set override disable
            set priority 200
            set vdom "vdom1"
        next
        edit 2
            set override disable
            set priority 200
            set vdom "vdom2"
        next
        ...
        edit 30
            set override disable
            set priority 200
            set vdom "vdom30"
        next
    end
end
```

2. Configure the secondary FortiGate:

```
config system ha
    set vcluster-status enable
    config vcluster
        edit 1
            set override disable
            set priority 100
            set vdom "vdom1"
        next
        edit 2
            set override disable
            set priority 100
            set vdom "vdom2"
        next
        ...
        edit 30
            set override disable
            set priority 100
            set vdom "vdom30"
        next
```

```
    end
end
```

HA primary unit selection criteria

In a FGCP HA setup, cluster members must negotiate to determine who will become the primary unit upon connecting to the HA cluster. Once a primary unit is identified, all other members become subordinate (or secondary) members.

When does primary unit selection occur?

Primary unit selection occurs whenever a new unit joins the HA cluster or the primary unit leaves the HA cluster. It also occurs whenever a monitored interface status changes.

This can occur when:

- Two or more units initially form a new HA cluster.
- A new unit joins an existing HA cluster.
- A device failover takes place, where the primary unit fails due to a device failure.
- A link failover takes place, where a monitored interface on any unit either fails or is restored.

Relevant configurations

Configurations that can impact the HA primary unit section are listed below:

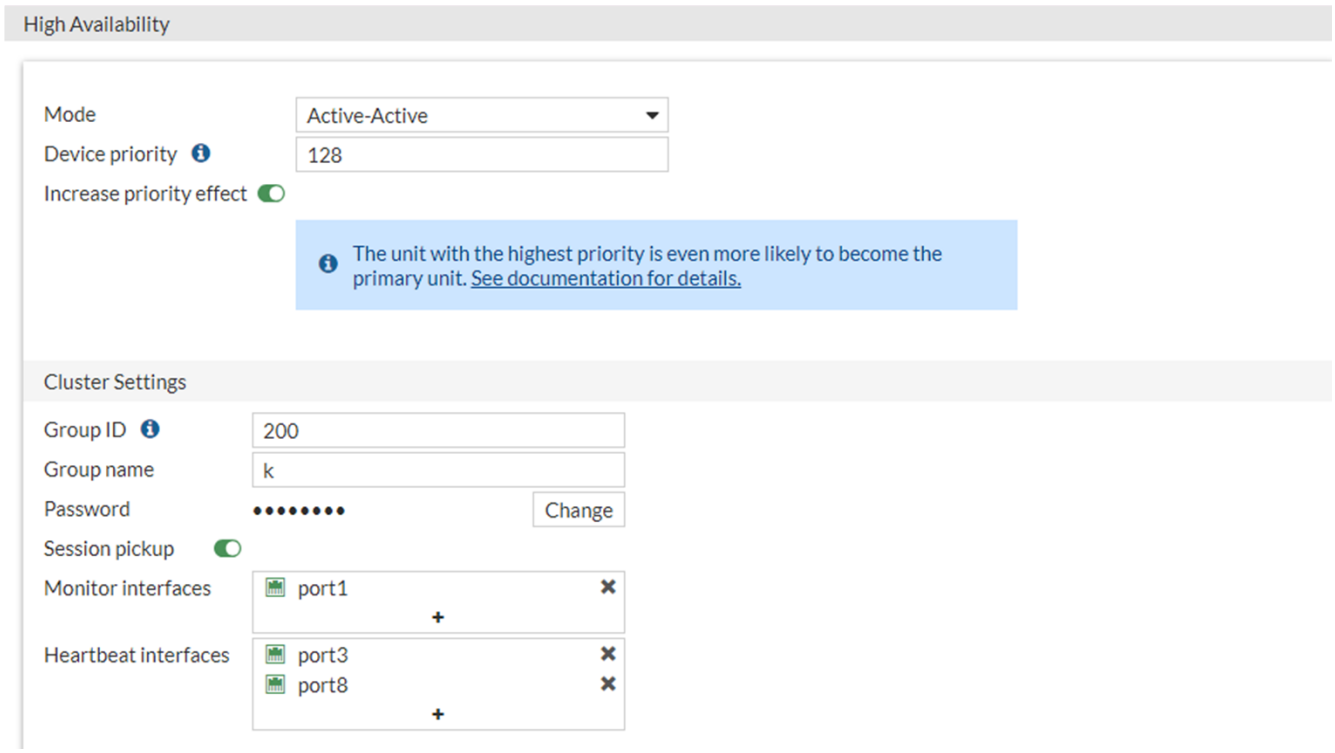
Priority	A value between 0-255 assigned to this unit. A higher number indicates higher priority. By default, priority is 128. Priority value does not get synchronized to other HA members.
Monitor	Interface(s) to check for a physical link failure.
Override	Enable to prioritize priority value over uptime in HA primary unit selection. Disable to prioritize uptime over priority value. This setting is disabled by default.

From CLI:

```
config system ha
    set priority <integer>
    set monitor <interface list>
    set override {enable | disable}
end
```

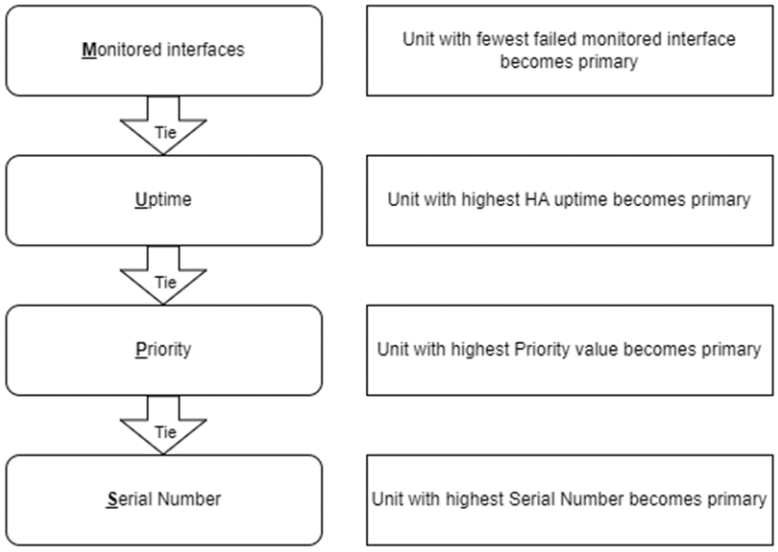
From GUI:

On the *System* > *HA* page:

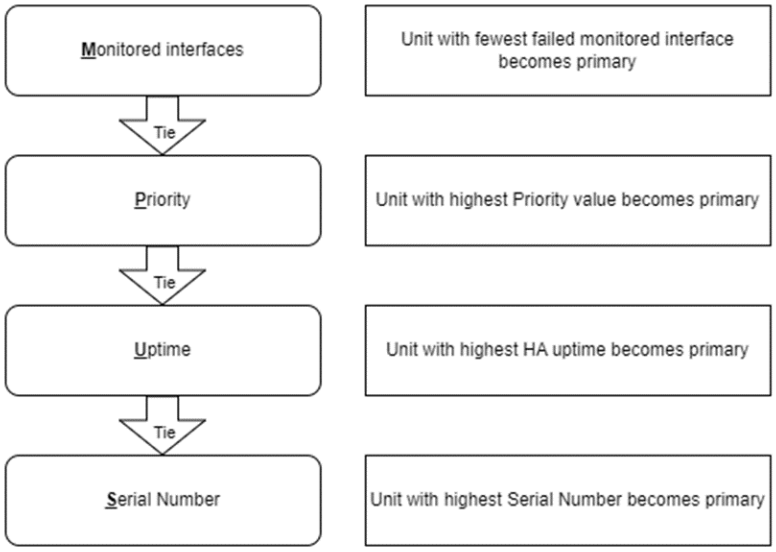


Primary unit selection criteria

If the HA override setting is *disabled* on all cluster members, the primary unit will be selected based on the following order:



If the HA override setting is *enabled* on all cluster members, the primary unit will be selected based on the following order:



For each criteria, if the value is the same, then it is considered a tie, and the next criteria is evaluated.

For the HA uptime criteria:

- If the difference between HA uptime is more than five (5) minutes (300 seconds), the cluster unit that is operating longer becomes the primary unit.
- If the difference between HA uptime is less than five (5) minutes (300 seconds), then the criteria is considered a tie.
- If a monitored interface fails on a HA unit, its HA uptime is reset to zero (0).
- If a cluster member restarts, the HA uptime is reset to zero (0).

In some documents, the terms MUPS and MPUS, which are based on the first letters of each criteria, are used to describe the order in which the criteria are considered during the HA primary unit selection process.

Viewing the role of the unit

After HA primary unit selection has completed, you can view the HA role of each unit in various ways.

- In the GUI, go to *System > HA* to view the members in the cluster and the role for each member.
- From the CLI, run `get system ha status`. The role of each unit is displayed:

```
# get system ha status
…
Primary: FG101FTK19xxxxx7, HA operating index = 0
Secondary: FG101FTK19xxxxx8, HA operating index = 1
```

- Similarly, from the CLI, run `diagnose sys ha status`. The role of each unit is displayed.

Viewing how the primary unit was selected

You can use the `get system ha status` command to see how the primary unit was selected. The output of this command contains a section called `Primary selected using` that shows a history of how the primary unit was selected.

```
# get system ha status
HA Health Status:
    WARNING: FG101FTK19xxxxx7 has hbdev down;
    WARNING: FG101FTK19xxxxx8 has hbdev down;
Model: FortiGate-101F
Mode: HA A-A
Group Name: FGT_HA
Group ID: 0
Debug: 0
Cluster Uptime: 5 days 8h:30m:57s
Cluster state change time: 2024-04-12 02:25:05
Primary selected using:
    <2024/04/12 02:25:05> vcluster-1: FG101FTK19xxxxx7 is selected as the primary because its
override priority is larger than peer member FG101FTK19xxxxx8.
    <2024/04/12 02:25:04> vcluster-1: FG101FTK19xxxxx7 is selected as the primary because it's the
only member in the cluster.
    <2024/04/12 02:13:34> vcluster-1: FG101FTK19xxxxx7 is selected as the primary because its
override priority is larger than peer member FG101FTK19xxxxx8.
    <2024/04/12 02:09:28> vcluster-1: FG101FTK19xxxxx7 is selected as the primary because it's the
only member in the cluster.
```

Comparing the HA uptime between cluster members

You can use the CLI command `diagnose sys ha dump-by group` to display the age difference of the units in a cluster. This command also displays information about a number of HA related parameters for each cluster unit.

For example, consider a cluster of two FortiGate units. Entering the `diagnose sys ha dump-by group` command from the primary unit CLI displays information similar to the following:

```
# diagnose sys ha dump-by group
...
vcluster_nr=1
vcluster-1: start_time=1712913904(2024-04-12 02:25:04), state/o/chg_time=2(work)/2
(work)/1712913904(2024-04-12 02:25:04)
        pingsvr_flip_timeout/expire=3600s/0s
        'FG101FTK19xxxxx8': ha_prio/o=1/1, link_failure=0, pingsvr_failure=0, flag=0x00000000,
mem_failover=0, uptime/reset_cnt=0/2
        'FG101FTK19xxxxx7': ha_prio/o=0/0, link_failure=0, pingsvr_failure=0, flag=0x00000001,
mem_failover=0, uptime/reset_cnt=189/2
```

The last two lines of the output display status information about each cluster unit including the `uptime`. The `uptime` is the age difference in seconds between the two units in the cluster.

In the example, the age of the subordinate unit is 189 seconds more than the age of the primary unit. The age difference is less than five (5) minutes (less than 300 seconds), so age has no effect on primary unit selection.

Changing the cluster age difference margin

You can change the cluster age difference margin using the following command:

```
config system ha
    set ha-uptime-diff-margin <margin>
end
```

Where the `<margin>` can be from 1 to 65535 seconds (default = 300).

Resetting the uptime of a unit

For debugging purpose, you may want to reset the HA member's uptime without restarting the unit or changing the status of a monitored interface.

To manually change the uptime:

```
# diagnose sys ha reset-uptime
```

The command resets the HA age internally and does not affect the up time displayed for cluster units using the `diagnose sys ha dump-by all-vcluster` or `diagnose sys ha dump-by all-vcluster` command. It also does not affect the time displayed on the Dashboard or cluster members list.

Check HA synchronization status

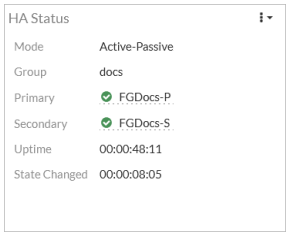
The HA synchronization status can be viewed in the GUI through either a widget on the *Dashboard* or on the *System > HA* page. It can also be confirmed through the CLI. When a cluster is out of synchronization, administrators should correct the issue as soon as possible as it affects the configuration integrity and can cause issues to occur.

When units are out of synchronization in an HA cluster, the GUI will compare the HA checksums and display the tables that caused HA to be out of synchronization. This can be visualized on the HA monitor page and in the HA status widget.

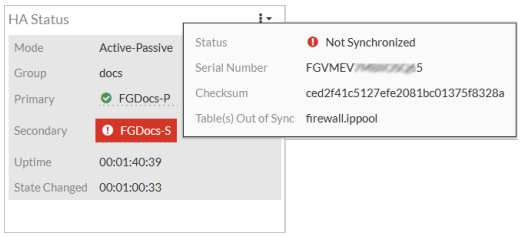
HA synchronization status in the GUI

Following HA setup, the *HA Status* widget can be added to the *Dashboard* that shows the HA synchronization statuses of the members.

A green checkmark is shown next to each member that is in synchronization.

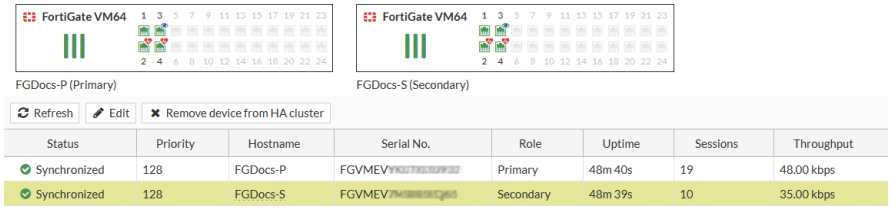


A member that is out of synchronization is highlighted in red. Hover the cursor over the unsynchronized device to see the tables that are out of synchronization and the checksum values.

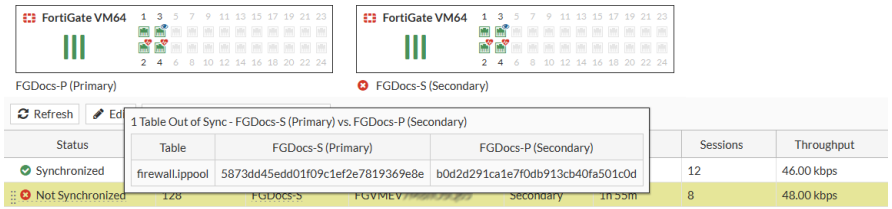


You can also go to *System* > *HA* to see the synchronization statuses of the members. A member that is out of synchronization will have a red icon next to its name. Hover the cursor over the unsynchronized device to see the tables that are out of synchronization and the checksum values.

Synchronized:



Unsynchronized:



HA synchronization status in the CLI

In the CLI, run the `get system ha status` command to see if the cluster is in synchronization . The synchronization status is reported under *Configuration Status*.

When both members are in synchronization:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-VM64
Mode: HA A-P
Group Name: docs
Group ID: 0
Debug: 0
Cluster Uptime: 0 days 0:52:39
Cluster state change time: 2021-04-29 13:17:03
Primary selected using:
    <2021/04/29 13:17:03> FGVMEV0000000002 is selected as the primary because its uptime is larger
than peer member FGVMEV7000000005.
    <2021/04/29 12:37:17> FGVMEV0000000002 is selected as the primary because it's the only member
in the cluster.
ses_pickup: disable
override: disable
```

```
Configuration Status:

Filtering the synchronization status by virtual cluster ID

The HA status information can be filtered for a specific virtual cluster in the CLI. The following example HA configuration has 10 virtual clusters, and the status information is filtered for virtual cluster 8.

To view the HA synchronization status of the entire cluster:

```
# get system ha status
HA Health Status:
    WARNING: FG101FTK19000007 has hbdev down;
    WARNING: FG101FTK19000009 has hbdev down;
Model: FortiGate-101F
Mode: HA A-P
Group Name: FGDocs
Group ID: 5
Debug: 0
Cluster Uptime: 0 days 0:8:29
Cluster state change time: 2023-05-24 15:00:56
Primary selected using:
  virtual cluster 1:
<2023/05/24 14:53:11> vcluster-1: FG101FTK19000007 is selected as the primary because its override
priority is larger than peer member FG101FTK19000009.
  virtual cluster 2:
<2023/05/24 14:58:49> vcluster-2: FG101FTK19000007 is selected as the primary because its override
```

```
priority is larger than peer member FG101FTK19000009.
  virtual cluster 3:
<2023/05/24 14:58:49> vcluster-3: FG101FTK19000007 is selected as the primary because its override
priority is larger than peer member FG101FTK19000009.
  ...

Out-of-band management with reserved management interfaces

As part of an HA configuration, you can reserve up to four management interfaces to provide direct management access to all cluster units. For each reserved management interface, you can configure a different

IP address, administrative access, and other interface settings, for each cluster unit. By connecting these interfaces to your network, you can separately manage each cluster unit from different IP addresses.

- Reserved management interfaces provide direct management access to each cluster unit, and give each cluster unit a different identity on your network. This simplifies using external services, such as SNMP, to monitor separate cluster units.
- Reserved management interfaces are not assigned HA virtual MAC addresses. They retain the permanent hardware address of the physical interface, unless you manually change it using the `config system interface` command.
- Reserved management interfaces and their IP addresses should not be used for managing a cluster using FortiManager. To manage a FortiGate HA cluster with FortiManager, use the IP address of one of the cluster unit interfaces.
- Configuration changes to a reserved management interface are not synchronized to other cluster units. Other configuration changes are automatically synchronized to all cluster units.

You can configure an in-band management interface for a cluster unit. See In-band management on page 3391 for information. In-band management does not reserve the interface exclusively for HA management.

Management interface

Enable HTTPS or HTTP administrative access on the reserved management interfaces to connect to the GUI of each cluster unit. On secondary units, the GUI has the same features as the primary unit, except for unit specific information, for example:

- The System Information widget on the Status dashboard shows the secondary unit's serial number.
- In the cluster members list at *System* > *HA*, you can change the HA configuration of the unit that you are logged into. You can only change the host name and device priority of the primary and other secondary units.
- The system events logs show logs for the device that you are logged into. Use the HA device drop down to view the log messages for other cluster units, including the primary unit.

Enable SSH administrative access on the reserved management interfaces to connect to the CLI of each cluster unit. The CLI prompt includes the host of the cluster unit that you are connected to. Use the `execute ha manage` command to connect to other cluster unit CLIs.

Enable SNMP administrative access on a reserved management interface to use SNMP to monitor each cluster unit using the interface's IP address. Direct management of cluster members must also be enabled, see Configuration examples on page 3386.

Reserved management interfaces are available in both NAT and transparent mode, and when the cluster is operating with multiple VDOMs.

FortiCloud, FortiSandbox, and other management services

By default, management services such as FortiCloud, FortiSandbox, SNMP, remote logging, and remote authentication, use a cluster interface. This means that communication from each cluster unit will come from a cluster interface of the primary unit, and not from the individual cluster unit's interface.

You can configure HA reserved management interfaces to be used for communication with management services by enabling the `ha-direct` option. This separates management traffic for each cluster unit, and allows

each unit to be individually managed. This is especially useful when cluster units are in different physical locations.

The following management features will then use the HA reserved management interface:

- SSH, HTTP, HTTPS administration
- Remote logging, including syslog, FortiAnalyzer, and FortiCloud
- SNMP queries and traps
- Remote authentication and certificate verification using LDAP, RADIUS, and TACACS+
- Communication with FortiSandbox
- NetFlow and sflow, see Routing NetFlow data over the HA management interface on page 3407 for information.

Any other management function not explicitly listed above is not supported, such as Security Fabric connectivity and new device registration.

Syntax for HA reserved management interfaces is as follows:

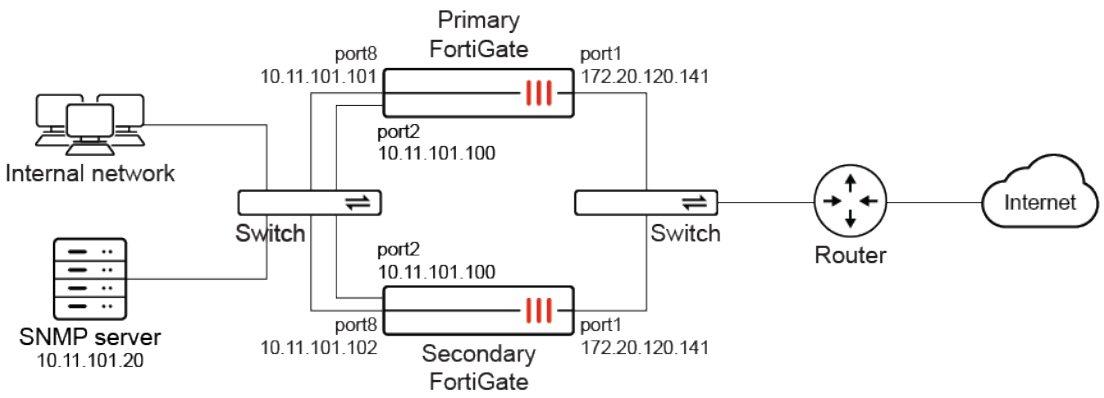
```
config system ha
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface <interface>
            set dst <destination IP>
            set gateway <IPv4 gateway>
            set gateway6 <IPv6 gateway>
        next
    end
    set ha-direct enable
end
```

The `ha-direct` option is a pre-requisite for allowing communication on each HA reserved management interface for various management services listed above. Once enabled, all `source-ip` settings will be unset from log related, netflow and sflow management services.

SNMP requires `ha-direct` to be configured under SNMP settings only. See below for more configuration options.

Configuration examples

The configuration examples below will use the following topology:



Two FortiGate units are already operating in a cluster. On each unit, port8 is connected to the internal network through a switch and configured as an out-of-band reserved management interface.

Configuration changes to the reserved management interface are not synchronized to other cluster units.

Administrative access and default route for HA management interface

To configure the primary unit's reserved management interface, configure an IP address and management access on port8. Then, configure the necessary HA settings to enable the HA reserved management interface and its route. To configure the secondary unit's reserved management interface, access the unit's CLI through the primary unit, and configure an IP address, management access on port8, and the necessary HA settings. Configuration changes to the reserved management interface are not synchronized to other cluster units.

To configure the primary unit reserved management interface to allow HTTPS, SSH, and ICMP access:

1. From a computer on the internal network, connect to the CLI at 10.11.101.100 on port2.
2. Change the port8 IP address and management access:

```
config system interface
    edit port8
        set ip 10.11.101.101/24
        set allowaccess https ping ssh
    next
end
```

3. Configure the HA settings for the HA reserved management interface by defining a default route to route to the gateway 10.11.101.2:

```
config system ha
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface port8
            set gateway 10.11.101.2
```

```
        next
    end
end
```

You can now log into the primary unit's GUI by browsing to https://10.11.101.101. You can also log into the primary unit's CLI by using an SSH client to connect to 10.11.101.101.

To configure secondary unit reserved management interfaces to allow HTTPS, SSH, and ICMP access:

1. From a computer on the internal network, connect to the primary unit's CLI.
2. Connect to the secondary unit with the following command:

```
execute ha manage <unit id> <username> <password>
```

3. Change the port8 IP address and management access:

```
config system interface
    edit port8
        set ip 10.11.101.102/24
        set allowaccess https ping ssh
    next
end
```

```
exit
```

4. Configure the HA settings for the HA reserved management interface by defining a default route to route to the gateway 10.11.101.2:

```
config system ha
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface port8
            set gateway 10.11.101.2
        next
    end
end
```

You can now log into the secondary unit's GUI by browsing to https://10.11.101.102. You can also log into the secondary unit's CLI by using an SSH client to connect to 10.11.101.102.

SNMP monitoring

The SNMP server can get status information from the cluster members. To use the reserved management interfaces, you must add at least one HA direct management host to an SNMP community. If the SNMP configuration includes SNMP users with user names and passwords, HA direct management must be enabled for the users.

To configure the cluster for SNMP management using the reserved management interfaces in the CLI:

1. Allow SNMP on port8 on both primary and secondary units:

```
config system interface
    edit port8
        append allowaccess snmp
    next
end
```

2. Add an SNMP community with a host for the reserved management interface of each cluster member. The host includes the IP address of the SNMP server.

```
config system snmp community
    edit 1
        set name "Community"
        config hosts
            edit 1
                set ip 10.11.101.20 255.255.255.255
                set ha-direct enable
            next
        end
    next
end
```

Enabling `ha-direct` in a non-HA environment will make SNMP unusable.

3. Add an SNMP user for the reserved management interface:

```
config system snmp user
    edit "1"
        set notify-hosts 10.11.101.20
        set ha-direct enable
    next
end
```

The SNMP configuration is synchronized to all cluster units.

To get CPU, memory, and network usage information from the SNMP manager for each cluster unit using the reserved management IP addresses:

1. Connect to the SNMP manager CLI.
2. Get resource usage information for the primary unit using the MIB fields:

```
snmpget -v2c -c Community 10.11.101.101 fgHaStatsCpuUsage
snmpget -v2c -c Community 10.11.101.101 fgHaStatsMemUsage
snmpget -v2c -c Community 10.11.101.101 fgHaStatsNetUsage
```

3. Get resource usage information for the primary unit using the OIDs:

```
snmpget -v2c -c Community 10.11.101.101 1.3.6.1.4.1.12356.101.13.2.1.1.3.1
snmpget -v2c -c Community 10.11.101.101 1.3.6.1.4.1.12356.101.13.2.1.1.4.1
snmpget -v2c -c Community 10.11.101.101 1.3.6.1.4.1.12356.101.13.2.1.1.5.1
```

4. Get resource usage information for the secondary unit using the MIB fields:

```
snmpget -v2c -c Community 10.11.101.102 fgHaStatsCpuUsage
snmpget -v2c -c Community 10.11.101.102 fgHaStatsMemUsage
snmpget -v2c -c Community 10.11.101.102 fgHaStatsNetUsage
```

5. Get resource usage information for the primary unit using the OIDs:

```
snmpget -v2c -c Community 10.11.101.102 1.3.6.1.4.1.12356.101.13.2.1.1.3.1
snmpget -v2c -c Community 10.11.101.102 1.3.6.1.4.1.12356.101.13.2.1.1.4.1
snmpget -v2c -c Community 10.11.101.102 1.3.6.1.4.1.12356.101.13.2.1.1.5.1
```

Firewall local-in policies for the reserved management interface

Enabling `ha-mgmt-intf-only` applies the local-in policy only to the VDOM that contains the reserved management interface. The incoming interface is set to match any interface in the VDOM.

To add local-in policies for the reserved management interface:

```
config firewall local-in-policy
    edit 0
        set ha-mgmt-intf-only enable
        set intf any
        set srcaddr internal-net
        set dstaddr mgmt-int
        set action accept
        set service HTTPS
        set schedule weekdays
    next
end
```

NTP over reserved management interfaces

When NTP is enabled in an HA cluster, the primary unit will always be the unit to contact the NTP server and synchronize system time to the secondary units over the HA heartbeat interface. However, in the event that the primary should contact the NTP server over the HA reserved management interface, then the `ha-direct` option should be enabled under the `config system ha` settings.

```
config system interface
    edit port5
        set ip 172.16.79.46 255.255.255.0
```

```
    next
end
```

```
config system ha
    set group-name FGT-HA
    set mode a-p
    set password **********
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface port5
            set gateway 172.16.79.1
        next
    end
    set ha-direct enable
end
```

```
config system ntp
    set ntpsync enable
    set syncinterval 5
end
```

In-band management

In-band management IP addresses are an alternative to reserved HA management interfaces, and do not require reserving an interface exclusively for management access. They can be added to multiple interfaces on each cluster unit.

The in-band management IP address is accessible from the network that the cluster interface is connected to. It should be in the same subnet as the interface that you are adding it to. It cannot be in the same subnet as other interface IP addresses.

In-band management interfaces support ping, HTTP, HTTPS, and SNMP administrative access options.

Primary and secondary units can respond on the management IP to traffic from different networks by using the routing table. The secondary unit uses the kernel routing table synchronized from the primary to route the traffic.

In-band management IP address configuration is not synchronized to other cluster units.

To add an in-band management IP address to port23 with HTTPS, SSH, and SNMP access:

```
config system interface
    edit port23
        set management-ip 172.25.12.5/24
        set allowaccess https ssh snmp
```

```
    next
end
```

Upgrading FortiGates in an HA cluster

You can upgrade the firmware on an HA cluster in the same way as on a standalone FortiGate. During a firmware upgrade, the cluster upgrades the primary unit and all of the subordinate units to the new firmware image.

Before upgrading a cluster, back up your configuration (Configuration backups and reset on page 3686), schedule a maintenance window, and make sure that you are using a supported upgrade path (https://docs.fortinet.com/upgrade-tool).

Uninterrupted upgrade

An uninterrupted upgrade occurs without interrupting communication in the physical or virtual cluster.

To upgrade the cluster firmware without interrupting communication, use the following steps. These steps are transparent to the user and the network, and might result in the cluster selecting a new primary unit.

1. The administrator uploads a new firmware image using the GUI or CLI. See Upgrading individual devices on page 3231 for details.
2. The firmware is upgraded on all of the subordinate units.
3. A new primary unit is selected from the upgraded subordinates.
4. The firmware is upgraded on the former primary unit.
5. Primary unit selection occurs, according to the standard primary unit selection process.

If all of the subordinate units crash or otherwise stop responding during the upgrade process, the primary unit will continue to operate normally, and will not be upgraded until at least one subordinate rejoins the cluster.

Uninterrupted upgrade does not guarantee that reboots will stagger after changes to CLI settings that require a reboot. Changing settings in the CLI that require a reboot will typically display a warning, such as:

```
The configuration will take effect after system reboot.
Do you want to continue? (y/n)
```

This can result in all of the cluster units rebooting at the same time.

Interrupted upgrade

An interrupted upgrade upgrades all cluster members at the same time. This takes less time than an uninterrupted upgrade, but it interrupts communication in the cluster. Interrupted upgrade is disabled by default.

To enable interrupted upgrade:

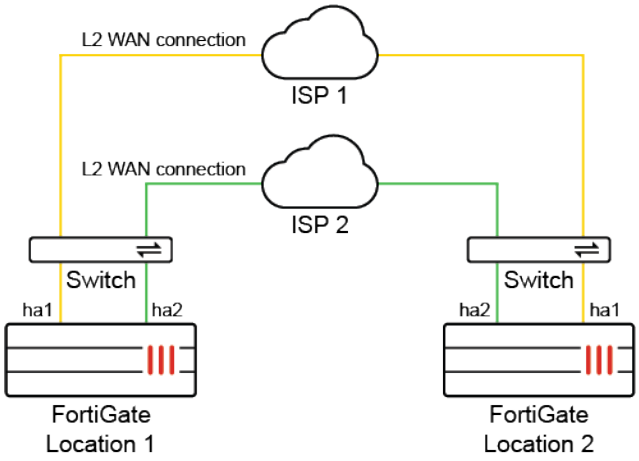
```
config system ha
    set upgrade-mode simultaneous
end
```

Distributed HA clusters

FGCP HA supports cluster units installed in different physical locations to achieve geo-redundancy. This may be desirable in large enterprises that deploy multiple data centers and network infrastructure to prevent interruptions caused by downtime in one location or region. Distributed clusters (or geographically distributed clusters) can have cluster units in different rooms in the same building, different buildings in the same location, or different geographical regions (cities, countries, or continents). When disruption is detected in one location, traffic can be routed to another location and failed over to the HA unit in the same cluster to prevent major downtime.

Just like any FGCP HA cluster, distributed clusters require heartbeat communication between cluster units over a Layer 2 network. In a distributed cluster, this heartbeat communication can take place over a dedicated lease-line, MPLS, or other L2 WAN solutions. Most Data Center Interconnect (DCI) or MPLS-based solutions that support Layer 2 extensions between the remote data centers should also support HA heartbeat communication between the FortiGates in the distributed locations.

For more information about FGCP HA heartbeats, see HA heartbeat interface on page 3346.



Because of the possible distance between the cluster members, it may take longer for heartbeat packets to be transmitted between cluster units. If the time it takes and the possible latency and packet losses cause the configured heartbeat lost threshold to be exceeded, then a split brain scenario can occur (see Split brain scenario).

To avoid this, you can increase the heartbeat interval (the time between the sending of heartbeat packets) so that the cluster expects extra time between heartbeat packets. A general rule is to configure the failover time to be longer than the maximum latency. You could also increase the `hb-lost-threshold`, which is the number of lost heartbeats to signal a failure, in order to tolerate losing more heartbeat packets if the network connection is less reliable.

To configure the heartbeat interval and lost threshold:

```
config system ha
    set hb-interval <integer>
    set hb-lost-threshold <integer>
end
```

A longer interval and threshold can lead to slower failover time, and a shorter interval and threshold may lead to false positives. Therefore, these settings should be fine-tuned based on individual network scenarios. Additional options include:

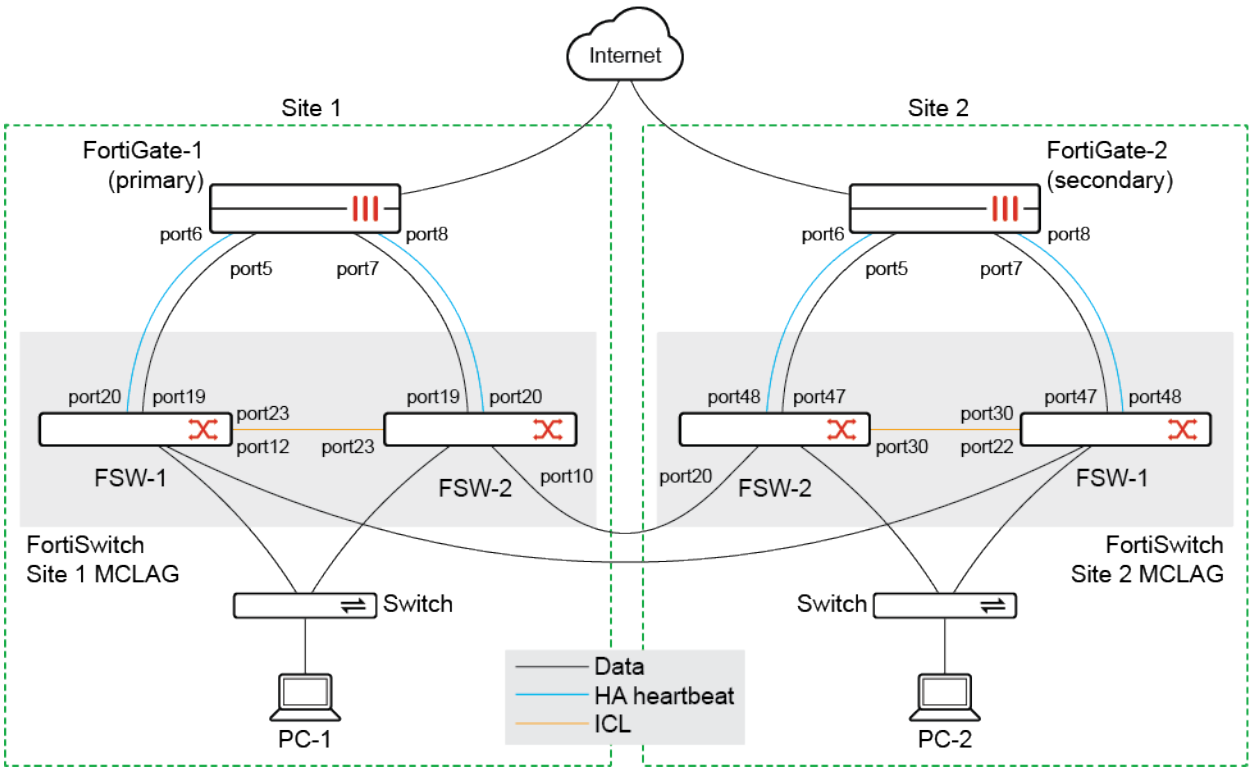
- Using multiple heartbeat interfaces and different link paths for heartbeat packets to optimize HA heartbeat communication.
- Configuring QoS on the links used for HA heartbeat traffic to make sure heartbeat communication has the highest priority.

For information about changing the heartbeat interval and other heartbeat related settings, see Modifying heartbeat timing.

HA between remote sites over managed FortiSwitches

In a multi-site FortiGate HA topology that uses managed FortiSwitches in a multi-chassis link aggregation group (MCLAG) to connect between sites, HA heartbeat signals can be sent through the switch layer of the FortiSwitches, instead of through back-to-back links between the heartbeat interfaces. This means that two fiber connections can be used, instead of four (two back-to-back heartbeat fiber connections and two connections for the FortiSwitches). The FortiSwitches can be different models, but must all support MCLAG and be running version 6.4.2 or later.

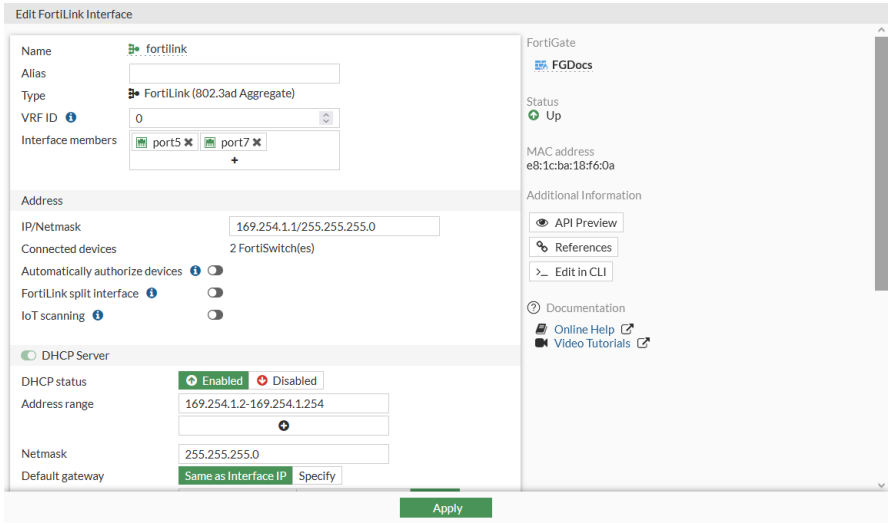
This example shows how to configure heartbeat VLANs to assign to the access ports that the heartbeat interfaces connect to, passing over the trunk between the FortiSwitches on the two sites.



FortiGate HA is with two FortiGates in separate locations and the switch layer connection between the FortiSwitches is used for the heartbeat signal.

To configure the example:

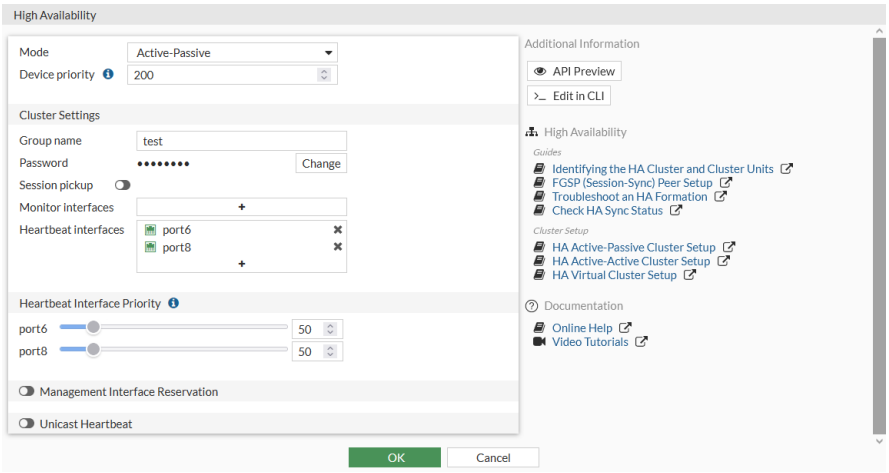
1. Disconnect the physical connections between Site 1 and Site 2:
   - Disconnect the cable on Site 1 FSW-1 port 12.
   - Disconnect the cable on Site 1 FSW-2 port 10.
2. Configure Site 1:
   a. On the FortiGate, go to *WiFi & Switch Controller* > *FortiLink Interface* and configure FortiLink:



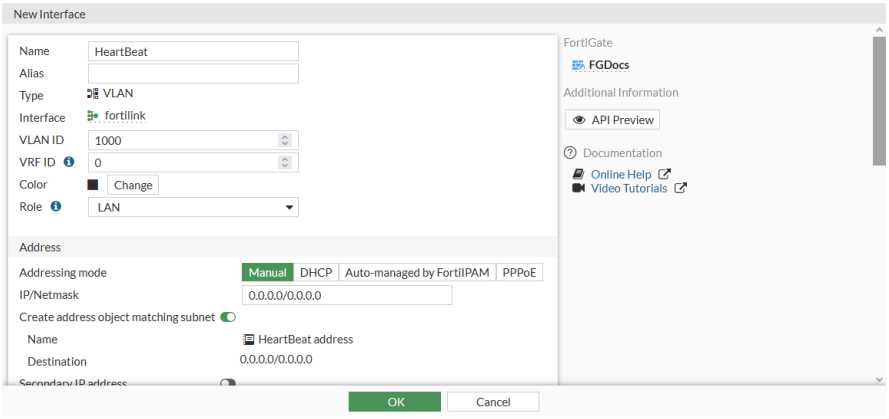
b. Go to *System* > *HA* and configure HA:

i. Set the heartbeat ports to the ports that are connected to FortiSwitch.

ii. Adjust the priority and enable override so that this FortiGate becomes the primary.



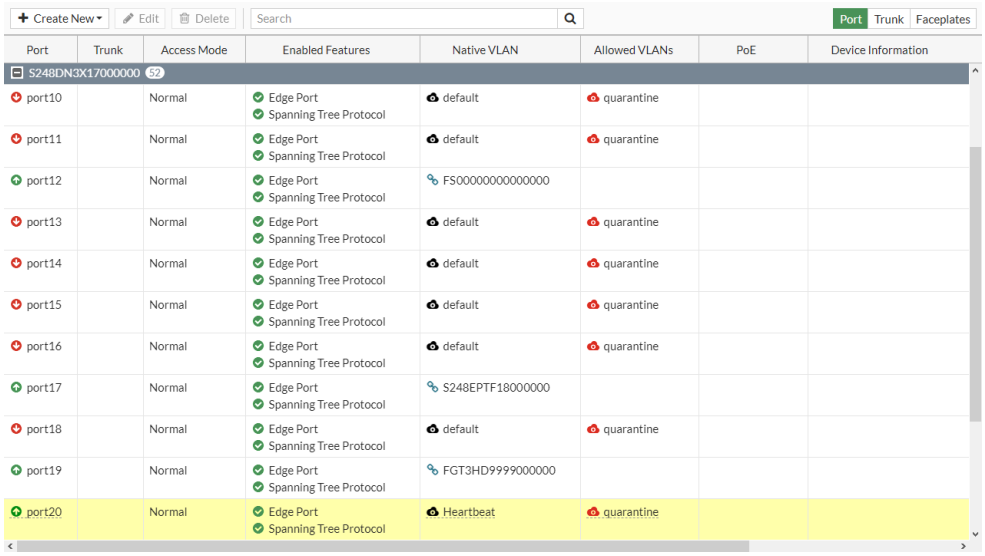
c. Go to *WiFi & Switch Controller* > *FortiSwitch VLANs* and create switch VLANs that are dedicated to each FortiGate HA heartbeat interface between the two FortiGates: Heartbeat VLAN 1000 and Heartbeat VLAN 1100.



d. Assign the native VLAN of the switch ports that are connected to the heartbeat ports to the created VLAN. Each HA heartbeat should be in its own VLAN.

i. Go to *WiFi & Switch Controller* > *FortiSwitch Ports*.

ii. In the *Native VLAN* column for the heartbeat port that is connected to FSW-1, click the edit icon and select the *Heartbeat* VLAN.



iii. In the *Native VLAN* column for the heartbeat port that is connected to FSW-2, click the edit icon and select the *Heartbeat2* VLAN.

e. On each FortiSwitch, enable MCLAG-ICL on the trunk port:

```
config switch trunk
    edit D243Z17000032-0
        set mclag-icl enable
    next
end
```

3. Configure Site 2 the same as Site 1, except set the HA priority so that the FortiGate becomes the secondary.
4. Disconnect the physical connections for FortiGate HA and FortiLink interfaces on Site 2:
   - Disconnect the cable on Site 2 FSW-1 ports 47 and 48.
   - Disconnect the cable on Site 2 FSW-2 ports 47 and 48.
5. Connect cables between the FortiSwitch MCLAG in Site 1 and Site 2:
   - Connect a cable from Site 1 FSW-1 port 12 to Site 2 FSW-1 port 22.
   - Connect a cable from Site 1 FSW-2 port 10 to Site 2 FSW-2 port 20.
6. On all of the FortiSwitches, configure the `auto-isl-port-group`. The group must match on both sides.

a. Site 1 FSW-1:

Set `members` to the port that is connected to Site 2 FSW-1:

```
config switch auto-isl-port-group
    edit 1
        set members port12
    next
end
```

b. Site 1 FSW-2:

Set `members` to the port that is connected to Site 1 FSW-1:

```
config switch auto-isl-port-group
    edit 1
```

```
        set members port22
    next
end
```

c. Site 2 FSW-1:

Set `members` to the port that is connected to Site 2 FSW-2:

```
config switch auto-isl-port-group
    edit 1
        set members port10
    next
end
```

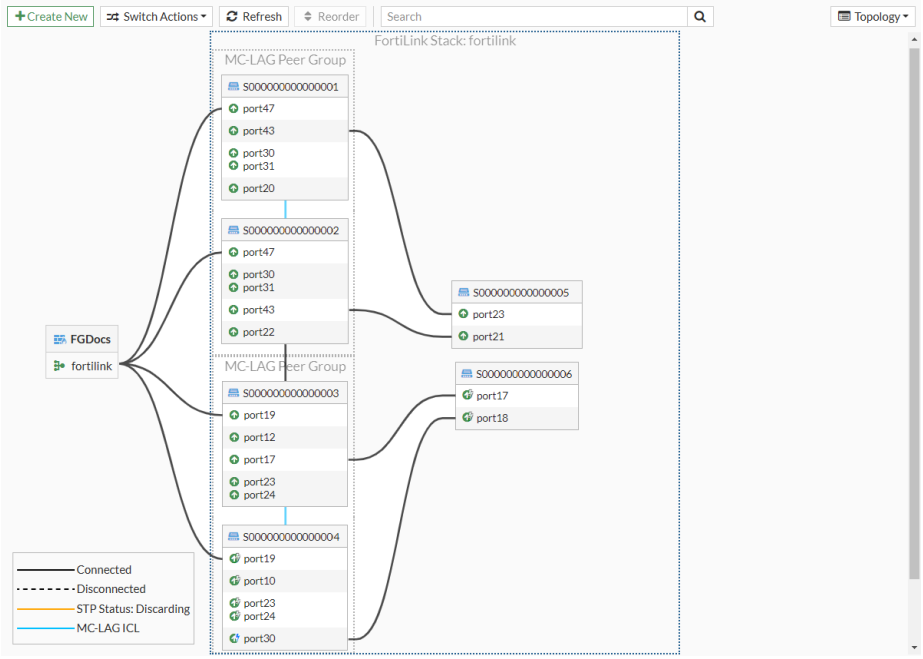
d. Site 2 FSW-2:

Set `members` to the port that is connected to Site 1 FSW-2:

```
config switch auto-isl-port-group
    edit 1
        set members port20
    next
end
```

7. Connect the FortiGate HA and FortiLink interface connections on Site 2.
8. Configure a firewall policy and route for traffic so that the client can reach the internet.
9. Wait for HA to finish synchronizing and for all of the FortiSwitches to come online, then on FortiGate-1, go to *WiFi & Switch Controller* > *Managed FortiSwitches* and select the Topology view from the drop-down on the right.

   The page should look similar to the following:



To test the configuration to confirm what happens when there is a failover:

1. On both PC-1 and PC-2, access the internet and monitor traffic. The traffic should be going through the primary FortiGate.
2. Perform a continuous ping to an outside IP address, then reboot any one of the FortiSwitches.
   Traffic from both Site 1 and Site 2 to the internet should be recovered in approximately five seconds.
3. Perform a continuous ping to an outside IP address, then force an HA failover (see Force HA failover for testing and demonstrations on page 3409).
   Traffic from both Site 1 and Site 2 to the internet should be recovered in approximately five seconds.
4. After an HA failover, on the new primary FortiGate, go to *WiFi & Switch Controller* > *Managed FortiSwitch*.
   The switch layer tiering will be changed so that the directly connected FortiSwitches are at the top of the topology.

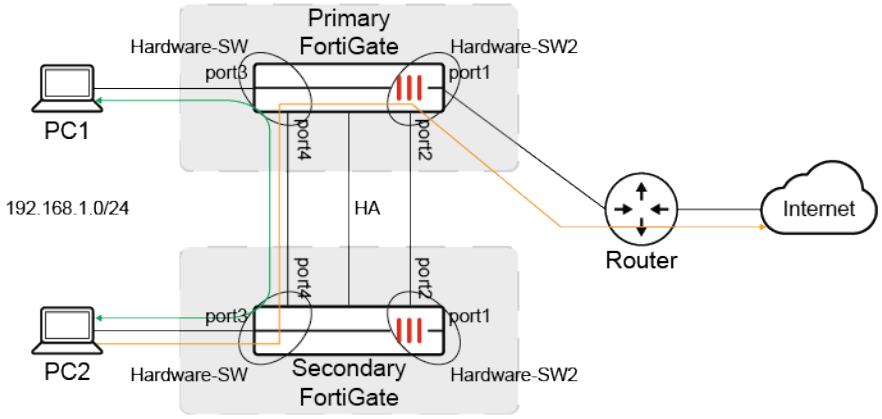
HA using a hardware switch to replace a physical switch

An HA cluster can be deployed without physical switches connecting the traffic interfaces on the primary and secondary members. This setup may be desirable in certain environments where the network infrastructure must be kept to a bare minimum.

Generally, using a hardware switch to replace a physical switch is not recommended, as it offers no redundancy or interface monitoring. If one FortiGate loses power, all of the clients connected to that FortiGate device cannot go to another device until that FortiGate recovers. A hardware switch cannot be used as a monitor interface in HA. Any incoming or outgoing link failures on hardware member interfaces will not trigger failover; this can affect traffic. Therefore, assess your environment thoroughly before applying this solution.

Examples

The examples use the following topology:



Traffic between hardware switches

When using Hardware switch in HA environment, a client device connected to the hardware switch on the primary FortiGate can communicate with client devices connected to the hardware switch on secondary FortiGates as long as there is a direct connection between the two switches.

To configure the FortiGate devices:

1. Connect the LAN side of the FortiGate cluster as shown in the topology diagram.
2. On each FortiGate, configure HA:

```
config system ha
    set mode a-a
    set group-name Example_cluster
    set password **********
    set hbdev ha1 10 ha2 20
end
```

3. On the primary FortiGate, configure the hardware switch:

```
config system virtual-switch
    edit Hardware-SW
        set physical-switch sw0
        config port
            edit port3
            next
            edit port4
            next
        end
    next
end
```

4. On each FortiGate, configure the IP addresses on the hardware switches:

```
config system interface
    edit Hardware-SW
        set ip 192.168.10.1 255.255.255.0
        set allowaccess ping ssh http https
    next
end
```

After configuring the hardware switches, PC1 and PC2 can now communicate with each other.

Traffic passes through FortiGate

If client device needs to send traffic through the FortiGate, additional firewall configuration on the FortiGate is required.

All traffic from the hardware switches on either the primary or secondary FortiGate reaches the primary FortiGate first. The traffic is then directed according to the HA mode and firewall configuration.

On the WAN side, in order for both HA members to reach the upstream router without connecting to a switch, a hardware switch must be configured with a direct connection between the cluster members.

To configure the FortiGate devices:

1. Connect the WAN side of the FortiGate cluster as shown in the topology diagram.
2. On the primary FortiGate, configure another hardware switch for the WAN connection:

```
config system virtual-switch
    edit Hardware-SW2
        set physical-switch sw0
        config port
            edit port1
            next
            edit port2
            next
        end
    next
end
```

3. On each FortiGate, configure the IP addresses on the hardware switch:

```
config system interface
    edit Hardware-SW2
        set ip 172.16.200.1 255.255.255.0
        set allowaccess ping ssh http https
    next
end
```

4. On each FortiGate, configure a firewall policy:

```
config firewall policy
    edit 1
        set srcintf Hardware-SW
        set dstintf Hardware-SW2
        set srcaddr all
        set dstaddr all
        set service ALL
        set action accept
        set schedule always
        set nat enable
    next
end
```

5. On each FortiGate, configure a static route:

```
config router static
    edit 1
        set device Hardware-SW2
        set gateway 172.16.200.254
    next
end
```

Traffic from PC1 and PC2 can now reach destinations outside of the FortiGate cluster.

VDOM exceptions

VDOM exceptions are settings that can be selected for specific VDOMs or all VDOMs that are not synchronized to other HA members. This can be required when cluster members are not in the same physical location, subnets, or availability zones in a cloud environment.

Some examples of possible use cases include:

- You use different source IP addresses for FortiAnalyzer logging from each cluster member. See Override FortiAnalyzer and syslog server settings on page 3403 for more information.
- You need to keep management interfaces that have specific VIPs or local subnets that cannot transfer from being synchronized.
- In a unicast HA cluster in the cloud, you use NAT with different IP pools in different subnets, so IP pools must be exempt.
- In a unicast HA cluster in the cloud, when HA members have different interface IPs, the local gateway (`local-gw`) used to define the local end of the VPN tunnel may need to be specified individually for IPsec tunnel failover to occur.

When a VDOM exception is configured, the object will not be synchronized between the primary and secondary devices when the HA forms. Different options can be configured for every object.

When VDOM mode is disabled, the configured object is excluded for the entire device. To define a scope, VDOM mode must be enabled and the object must be configurable in a VDOM.

VDOM exceptions are synchronized to other HA cluster members.

To configure VDOM exceptions:

```
config global
    config system vdom-exception
        edit 1
            set object <object name>
            set scope {all* | inclusive | exclusive}
            set vdom <vdom name>
        next
    end
end
```

`object`	The name of the configuration object that can be configured independently for some or all of the VDOMs. See Objects on page 3402 for a list of available settings and resources.
`scope`	Determine if the specified object is configured independently for all VDOMs or a subset of VDOMs. • `all`: Configure the object independently on all VDOMs. • `inclusive`: Configure the object independently only on the specified VDOMs. • `exclusive`: Configure the object independently on all of the VDOMs that are not specified.
`vdom`	The names of the VDOMs that are included or excluded.

Objects

The following settings and resources can be exempt from synchronization in an HA cluster:

log.fortianalyzer.setting	user.radius

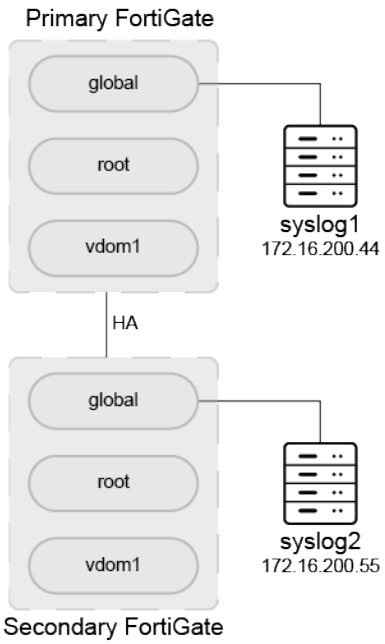
log.fortianalyzer.override-setting	system.interface*
log.fortianalyzer2.setting	vpn.ipsec.phase1-interface*
log.fortianalyzer2.override-setting	vpn.ipsec.phase2-interface*
log.fortianalyzer3.setting	router.bgp*
log.fortianalyzer3.override-setting	router.route-map*
log.fortianalyzer-cloud.setting	router.prefix-list*
log.fortianalyzer-cloud.override-setting	firewall.ippool*
log.syslogd.setting	firewall.ippool6*
log.syslogd.override-setting	router.static*
log.syslogd2.setting	router.static6*
log.syslogd2.override-setting	firewall.vip*
log.syslogd3.setting	firewall.vip6*
log.syslogd3.override-setting	system.sdwan*
log.syslogd4.setting	system.saml*
log.syslogd4.override-setting	router.policy*
system.central-management	router.policy6*
system.csf	

* This setting can only be configured on cloud VMs.

Override FortiAnalyzer and syslog server settings

In an HA cluster, secondary devices can be configured to use different FortiAnalyzer devices and syslog servers than the primary device. VDOMs can also override global syslog server settings.

Configure a different syslog server on a secondary HA device



To configure the primary HA device:

1. Configure a global syslog server:

```
config global
    config log syslog setting
        set status enable
        set server 172.16.200.44
        set facility local6
        set format default
    end
end
```

2. Set up a VDOM exception to enable setting the global syslog server on the secondary HA device:

```
config global
    config system vdom-exception
        edit 1
            set object log.syslogd.setting
        next
    end
end
```

To configure the secondary HA device:

1. Configure a global syslog server:

```
config global
    config log syslogd setting
        set status enable
        set server 172.16.200.55
        set facility local5
    end
end
```

2. After the primary and secondary device synchronize, generate logs on the secondary device.

To confirm that logs are been sent to the syslog server configured on the secondary device:

1. On the primary device, retrieve the following packet capture from the secondary device's syslog server:

```
# diagnose sniffer packet any "host 172.16.200.55" 6
interfaces=[any]
filters=[host 172.16.200.55]

266.859494 port2 out 172.16.200.2.7434 -> 172.16.200.55.514: udp 278
0x0000   0000 0000 0000 0009 0f09 0004 0800 4500        ..............E.
0x0010   0132 f3c7 0000 4011 9d98 ac10 c802 ac10        .2....@.........

```

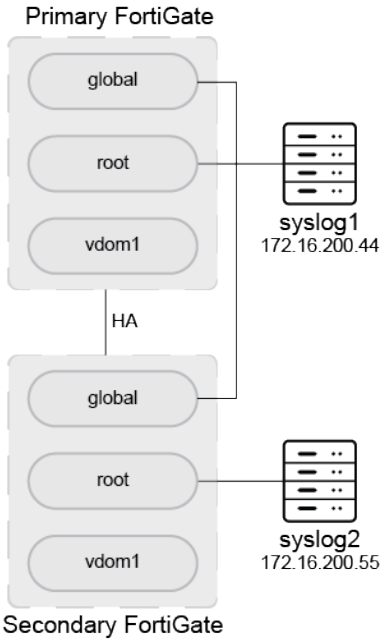
Configure a different syslog server in the root VDOM on a secondary HA device



To configure the primary HA device:

1. Configure a global syslog server:

```
config global
    config log syslog setting
        set status enable
        set server 172.16.200.44
        set facility local6
        set format default
    end
end
```

2. Set up a VDOM exception to enable `syslog-override` in the secondary HA device root VDOM:

```
config global
    config system vdom-exception
        edit 1
            set object log.syslogd.override-setting
            set scope inclusive
            set vdom root
        next
    end
end
```

3. In the VDOM, enable `syslog-override` in the log settings, and set up the override syslog server:

```
config root
    config log setting
        set syslog-override enable
    end
    config log syslog override-setting
        set status enable
        set server 172.16.200.44
        set facility local6
        set format default
    end
end
```

After `syslog-override` is enabled, an override syslog server must be configured, as logs will not be sent to the global syslog server.

To configure the secondary HA device:

1. Configure an override syslog server in the root VDOM:

```
config root
    config log syslogd override-setting
        set status enable
        set server 172.16.200.55
        set facility local5
        set format default
    end
end
```

2. After the primary and secondary device synchronize, generate logs in the root VDOM on the secondary device.

To confirm that logs are been sent to the syslog server configured for the root VDOM on the secondary device:

1. On the primary device, retrieve the following packet capture from the syslog server configured in the root VDOM on the secondary device:

```
# diagnose sniffer packet any "host 172.16.200.55" 6
interfaces=[any]
filters=[host 172.16.200.55]
```

```
156.759696 port2 out 172.16.200.2.1165 -> 172.16.200.55.514: udp 277
0x0000   0000 0000 0000 0009 0f09 0004 0800 4500        ..............E.
0x0010   0131 f398 0000 4011 9dc8 ac10 c802 ac10        .1....@.........

Routing NetFlow data over the HA management interface

In an HA environment, the `ha-direct` option allows data from services such as syslog, FortiAnalyzer, SNMP, and NetFlow to be routed over the outgoing interface.

The following example shows how NetFlow data can be routed over the HA management interface mgmt1.

To route NetFlow data over the HA management interface:

1. On the primary unit (FortiGate A), configure the HA and mgmt1 interface settings:

```
(global) # config system ha
    set group-name "test-ha"
    set mode a-p
    set password *********
    set hbdev "port6" 50
    set hb-interval 4
    set hb-lost-threshold 10
    set session-pickup enable
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface "mgmt1"
        next
    end
    set override enable
    set priority 200
```

```
   set ha-direct enable
end
```

```
(global) # config system interface
    edit "mgmt1"
        set ip 10.6.30.111 255.255.255.0
        set allowaccess ping https ssh http telnet fgfm
        set type physical
        set dedicated-to management
        set role lan
        set snmp-index 1
    next
end
```

2. On the secondary unit (FortiGate B), configure the HA and mgmt1 interface settings:

```
(global) # config system ha
    set group-name "test-ha"
    set mode a-p
    set password *********
    set hbdev "port6" 50
    set hb-interval 4
    set hb-lost-threshold 10
    set session-pickup enable
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface "mgmt1"
        next
    end
    set override enable
    set priority 100
    set ha-direct enable
end
```

```
(global) # config system interface
    edit "mgmt1"
        set ip 10.6.30.112 255.255.255.0
        set allowaccess ping https ssh http telnet fgfm
        set type physical
        set dedicated-to management
        set role lan
        set snmp-index 1
    next
end
```

3. On the primary unit (FortiGate A), configure the NetFlow setting:

```
(global) # config system netflow
    set collector-ip 10.6.30.59
end
```

4. Verify that NetFlow uses the mgmt1 IP:

```
(global) # diagnose test application sflowd 3
```

5. Verify that the NetFlow packets are being sent by the mgmt1 IP:

```
(vdom1) # diagnose sniffer packet any 'udp and port 2055' 4
interfaces=[any]
filters=[udp and port 2055]
8.397265 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 60
23.392175 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 188
23.392189 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 60
...
3 packets received by filter
0 packets dropped by kernel
```

6. On the secondary device (FortiGate B), change the priority so that it becomes the primary:

```
(global) # config system ha
    set priority 250
end
```

7. Verify the NetFlow status on FortiGate A, which is using the new primary's mgmt1 IP:

```
(global) # diagnose test application sflowd 3
```

8. Verify that the NetFlow packets use the new source IP on FortiGate B:

```
(vdom1) # diagnose sniffer packet any 'udp and port 2055' 4
interfaces=[any]
filters=[udp and port 2055]
7.579574 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 60
22.581830 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 60
29.038336 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 1140
^C
3 packets received by filter
0 packets dropped by kernel
```

Force HA failover for testing and demonstrations

This command should only be used for testing, troubleshooting, maintenance, and demonstrations.

Do not use it in a live production environment outside of an active maintenance window.

HA failover can be forced on an HA primary device. The device will stay in a failover state (secondary) regardless of the conditions. The only way to remove the failover status is by manually turning it off.

Syntax

```
execute ha failover set <cluster_id>
execute ha failover unset <cluster_id>
```

Variable	Description
<cluster_id>	The cluster ID is 1 for any cluster that is not in virtual cluster mode, and can be 1 or 2 if virtual cluster mode is enabled.

Example

To manually force an HA failover:

```
# execute ha failover set 1
Caution: This command will trigger an HA failover.
It is intended for testing purposes.
Do you want to continue? (y/n)y
```

To view the failover status:

```
# execute ha failover status
failover status: set
```

To view the system status of a device in forced HA failover:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-300D
Group Name:
Group ID: 240
Debug: 0
Cluster Uptime: 0 days 2:11:46
Cluster state change time: 2020-03-12 17:38:04
Primary selected using:
    <2020/03/12 17:38:04> FGT3HD3914800153 is selected as the primary because EXE_FAIL_OVER flag
is set on peer member FGT3HD3914800069.
    <2020/03/12 15:27:26> FGT3HD3914800069 is selected as the primary because it has the largest
value of override priority.

```

Disabling stateful SCTP inspection

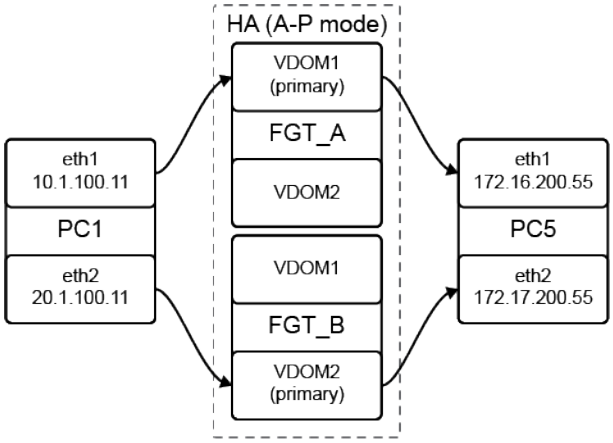
There is an option in FortiOS to disable stateful SCTP inspection. This option is useful when FortiGates are deployed in a high availability (HA) cluster that uses the FortiGate Clustering Protocol (FGCP) and virtual clustering in a multihoming topology. In this configuration, the primary stream control transmission protocol (SCTP) path traverses the primary FortiGate node by using its active VDOM (for example, VDOM1), and the backup SCTP path traverses the other passive FortiGate node by using its active VDOM (for example, VDOM2).

When stateful SCTP inspection is enabled, SCTP heartbeat traffic fails by means of the backup path because the primary path goes through a different platform and VDOM. Since there is no state sharing between VDOMs, the passive FortiGate is unaware of the original SCTP session and drops the heartbeats because of no associated sessions. When stateful SCTP inspection is disabled, the passive node permits the SCTP heartbeats to pass.

When set to `enable`, SCTP session creation without SCTP INIT is enabled. When set to `disable`, SCTP session creation without SCTP INIT is disabled (this is the default setting):

```
config system settings
    set sctp-session-without-init {enable | disable}
end
```

The following is an example topology and scenario:



In this example, FGT_A and FGT_B are in HA a-p mode with two virtual clusters. Two primaries exist on different FortiGate units. PC1 eth1 can access PC5 eth1 through VDOM1, and PC1 eth2 can access PC5 eth2 through VDOM2.

On PC5, to listen for an SCTP connection:

```
sctp_darn -H 172.16.200.55  -B 172.17.200.55 -P 2500 -l
```

On PC1, to start an SCTP connection:

```
sctp_darn -H 10.1.100.11 -B 20.1.100.11 -P 2600 -c 172.16.200.55 -c 172.17.200.55 -p 2500 -s
```

An SCTP four-way handshake is on one VDOM, and a session is created on that VDOM. With the default configuration, there is no session on any other VDOM, and the heartbeat on another path (another VDOM) is dropped. After enabling `sctp-session-without-init`, the other VDOM creates the session when it receives the heartbeat, and the heartbeat is forwarded:

```
config system settings
  set sctp-session-without-init enable
end
```

Resume IPS scanning of ICCP traffic after HA failover

After HA failover occurs, the IPS engine will resume processing ICCP sessions and keep the traffic going on the new primary unit. `session-pickup` must be enabled in an active-passive cluster to pick up the ICCP sessions.

Example

The following example uses an active-passive cluster. See HA active-passive cluster setup on page 3357 for more information.

To configure HA:

```
config system ha
    set group-name "HA-APP"
    set mode a-p
    set password ************
    set hbdev "port3" 100
    set session-pickup enable
    set override enable
end
```

Session states before failover

When HA is working, the ICCP session information is stored in the HA session cache on the secondary FortiGate.

To verify the HA session cache on the secondary FortiGate:

```
# diagnose ips share list
 HA Session Cache
  client=10.1.100.178:57218 server=172.16.200.177:102
    service=39, ignore_app_after=0, last_app=76919, buffer_len=32
    stock tags: nr=981, hash=e68dc8120970448
    custom tags: nr=0, hash=1a49b996b6a42aa2
    tags [count=2]: s-737, s-828,
```

The ICCP session information can be found in the IPS session list and the session table on the primary FortiGate.

To verify the IPS session information on the primary FortiGate:

```
# diagnose ips session list
SESSION id:1 serial:35487 proto:6 group:6 age:134 idle:1 flag:0x800012a6
        feature:0x4 encap:0 ignore:0,0 ignore_after:204800,0

Session states after failover

After HA failover, the IPS engine on the new primary picks up the related ICCP sessions and continues passing the traffic. The HA session cache disappears on the new primary. The ICCP session now appears on the IPS session list and session table on the new primary.

To verify the IPS session information on the new primary FortiGate:

```
# diagnose ips session list
SESSION id:1 serial:35487 proto:6 group:6 age:90 idle:2 flag:0x820012a3
        feature:0x4 encap:0 ignore:1,0 ignore_after:204800,0
        tunnel:0 children:0 flag:....-....-..i.
  C-10.1.100.178:57218, S-172.16.200.177:102
  state: C-ESTABLISHED/9114/0/0/0/0, S-ESTABLISHED/0/0/0/0/0 pause:0, paws:0
  expire: 28
  app: unknown:0 last:44684 unknown-size:0
```

The server and client IPs, ports, and protocols remain the same.

To verify the system information on the primary FortiGate:

```
# diagnose sys session list
session info: proto=6 proto_state=11 duration=569 expire=3577 timeout=3600 flags=00000000

Querying autoscale clusters for FortiGate VM

When a FortiGate VM secondary device is added to a cluster, the new secondary member can query the cluster about its autoscale environment. FortiManager can then run this query on the new secondary member to update its autoscale record.

To view cluster information from a secondary member:

```
# diagnose sys ha checksum autoscale-cluster
```

Cluster information sample

Sample cloud topology:

```
FGT_BYOL; primary; 10.0.0.6; FGVM04TM00000066
FGT_BYOL; secondary; 10.0.0.7; FGVM00000000056
FGT_PAYG; secondary; 10.0.0.4; FGTAZ000000000CD
FGT_PAYG; secondary; 10.0.0.5; FGTAZ0000000003D
```

From the secondary device, you can see cluster checksums and the primary device:

```
  # diagnose sys ha checksum autoscale-cluster
================== FGTAZ000000000CD ==================
is_autoscale_master()=0
```

```

To get ha sync information from the secondary device:

```
# get test hasync 50
autoscale_count=69. current_jiffies=41235125
    10.0.0.6, timeo=31430, serial_no=FGVM04TM19001766
    10.0.0.7, timeo=31430, serial_no=FGVM04TM19008156
    10.0.0.5, timeo=31430, serial_no=FGTAZR7UZRKKNR3D
```

Cluster virtual MAC addresses

In a cluster, each primary device interface requires a virtual MAC (VMAC) address. HA uses VMAC addresses during failover. If a failover occurs, the new primary device interfaces will have the same VMAC addresses and IP addresses as the failed primary device. As a result, most network equipment will identify the new primary device as the same device as the failed primary device and continue to communicate with the cluster.

The following methods are available to assign VMAC addresses to interfaces:

- Manual assignment
- Automatic assignment based on MAC address
- Automatic assignment based on vcluster ID, group ID, and physical index

See Determining VMAC addresses on page 3419 for more information.

If a cluster is operating in NAT mode with an automatic VMAC assignment method, FGCP assigns a different VMAC address to each primary device interface. VLAN subinterfaces are assigned the same VMAC address as the physical interface that the VLAN subinterface is added to. Redundant or 802.3ad aggregate interfaces are assigned the VMAC address of the first interface in the redundant or aggregate list.

If a cluster is operating in transparent mode with an automatic VMAC assignment method, FGCP assigns a VMAC address to the primary device's management IP address. Since you can connect to the management IP address from any interface, all FortiGate interfaces appear to have the same VMAC address.

The MAC address of a reserved management interface does not change to a VMAC address; it keeps its original MAC address.

Subordinate device MAC addresses do not change. Use `diagnose hardware deviceinfo nic <interface>` on the subordinate device to display the MAC addresses of each interface.

A MAC address conflict can occur when two clusters are operating on the same network using the same group ID (see Diagnosing packet loss). It is recommended that each cluster in the same network and broadcast domain uses a unique group

Failover

When the new primary device is selected after a failover, the primary device sends gratuitous ARP packets to update the devices connected to the cluster interfaces (usually layer 2 switches) with the VMAC addresses. This is sometimes called using gratuitous ARP packets (or GARP packets) to train the network. The gratuitous ARP packets sent from the primary unit are intended to make sure that the layer 2 switch forwarding databases (FDBs) are updated as quickly as possible.

Sending gratuitous ARP packets is not a requirement because connected devices will eventually learn of the new ports to forward the packets to. However, many network switches will update their FDBs more quickly after a failover if the new primary device sends gratuitous ARP packets.

Configuring ARP packet settings

The following settings can be configured.

```
config system ha
    set arps <integer>
    set arps-interval <integer>
    set gratuitous-arps {enable | disable}
    set link-failed-signal {enable | disable}
end
```

`arps <integer>`	Set the number of gratuitous ARPs; lower the value to reduce traffic, and increase the value to reduce failover time (1 - 60, default = 5).
`arps-interval <integer>`	Set the time between gratuitous ARPs; lower the value to reduce failover time, and increase the value to reduce traffic, in seconds (1 - 20, default = 8).
`gratuitous-arps {enable | disable}`	Enable/disable gratuitous ARPs (default = enable).
`link-failed-signal {enable | disable}`	Enable/disable shutting down all interfaces for one second after a failover. Use if gratuitous ARPs do not update the network (default = disable).

If you disable sending gratuitous ARP packets, it is recommended to enable the `link-failed-signal` setting. The `linked-fail-signal` alerts the connected switches of a failed link, which triggers them to react immediately to the changes.

For more information about gratuitous ARP packets see RFC 826 and RFC 3927.

Determining VMAC addresses

The following methods are available to assign virtual MAC addresses to interfaces, and they are listed in order of highest to lowest priority:

- Manual VMAC assignment on page 3419
- Automatic VMAC assignment based on hardware MAC address on page 3420
- Automatic VMAC assignment based on vcluster ID, group ID, and physical index on page 3420

Manual VMAC assignment

You can manually assign virtual MAC addresses to each interface, including physical, EMAC, or FortiExtender interfaces. Manual virtual MAC assignments override other virtual MAC address assignments on the interface.

```
config system interface
    edit <interface>
        set virtual-mac <mac_address>
    next
end
```

To manually assign a virtual MAC address to an interface:

```
config system interface
    edit "wan1"
        set ip 172.16.200.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
```

```
        set virtual-mac 06:d5:90:04:f8:9c
        set type physical
        set snmp-index 3
        config ipv6
            set ip6-address 2000:172:16:200::1/64
            set ip6-allowaccess ping https ssh snmp http telnet
        end
    next
end
```

Automatic VMAC assignment based on hardware MAC address

FGCP can automatically assign virtual MAC addresses to physical interfaces based on hardware MAC address of the primary device with the locally administered bit (U/L bit) changed to `1`. For example, `00:xx:xx:xx:xx:xx` becomes `02:xx:xx:xx:xx:xx`. You must use `set auto-virtual-mac-interface` to the interfaces to use this feature.

```
config system ha
    set auto-virtual-mac-interface <interface> [interface(s)]
end
```

In a 48-bit MAC address, the U/L bit refers to the second least significant bit in the first octet of the hexadecimal MAC address. When this bit is 0, it indicates that the MAC address is Universal, meaning that it is assigned by a central authority. When this bit is 1, it indicates that the MAC address is Local, meaning that it is assigned locally.

For example, the first octet of 00 represented in binary is 00000000, where the U/L bit is 0. Whereas the first octet of 02 represented in binary is 00000010, where the U/L bit is set to 1.

To configure automatic virtual MAC address assignment:

```
config system ha
    set group-id 20
    set group-name "MMMMM"
    set mode a-p
    set password **********
    set hbdev "ha1" 50 "ha2" 100
    set auto-virtual-mac-interface "wan1" "port1" "port2" "ha1" "ha2" "port3" "port4" "port5"
"port6" "port7" "port8" "dmz"
    set upgrade-mode simultaneous
    set override enable
    set priority 200
end
```

Automatic VMAC assignment based on vcluster ID, group ID, and physical index

FGCP can automatically assign virtual MAC addresses to each primary device interface based on vcluster ID, group ID, and physical index. This automatic VMAC assignment method is used when the `set auto-virtual-mac-interface` option is disabled.

With this method, specific logic and variables determine VMAC addresses. The variables are:

- **Virtual cluster (vcluster) ID**: What is the vcluster ID that the interface belongs to?

The vcluster ID used in the following logic is the number configured in the FortiGate minus 1. In this example the cluster ID is 0:

```
config vcluster
    edit 1
```

- **Group ID**: What is the group ID that the interface belongs to?
- **Physical index**: What is the value of the physical index receiving the VMAC?
  The following command can be used to locate the physical index number:

```
# diagnose sys ha dump-by debug-zone
(…)
<hatalk>              mgmt    ifindex=4       phyindex=0              mac=04.d5…
<hatalk>              ha      ifindex=3       phyindex=1              mac=04.d5…
<hatalk>              wan1    ifindex=17      phyindex=2              mac=04.d5…
<hatalk>              wan2    ifindex=18      phyindex=3              mac=04.d5…
```

The physical indexes used in this document are examples and may not match your interface indexes.

The logic uses the vcluster ID, group ID, and physical index variables to determine VMAC addresses as summarized in the following table:

Logic	Vcluster ID	Group ID	Physical index
Logic 1	0 or 1	Greater than 255	Less than 128
Logic 2	0 or 1	Less than 256	Less than 128
Logic 3	0 or 1	Less than 256	Greater than 127
Logic 4	Greater than 1	0-7	Less than 1024

Logic 1: vcluster ID 0 or 1, group ID > 255, and physical index < 128

The start of the VMAC address is always `e0:23:ff:--:--:--` with the last 24 bits defined as follows:

Preset bits	Group ID	Vcluster ID	Physical index
1 1 1 1 1 1	- - : - - - - - - - - :	-	- - - - - - -

This example uses group ID = 500 and vcluster ID = 0:

- Group ID
  - 500 – 256 = 244
  - $244_{10} = 011110100_2$

    - Group ID = 0011110100
- Vcluster ID
    - $0_{10} = 0_2$
    - Vcluster ID = 0
- Physical index
    - port7 physical index = 10
        - $10_{10} = 0001010_2$
    - port8 physical index = 12
        - $12_{10} = 0001100_2$
    - port9 physical index = 14
        - $14_{10} = 0001110_2$

Resulting in these VMAC addresses:

Interface	VMAC binary (last 24 bits)				VMAC hex (full)
	Preset bits	Group ID	Vcluster ID	Physical index	
port1	1 1 1 1 1 1	0 0 1 1 1 1 0 1 0 0	0	0 0 0 1 0 1 0	e0:23:ff:fc:f4:0a
port2	1 1 1 1 1 1	0 0 1 1 1 1 0 1 0 0	0	0 0 0 1 1 0 0	e0:23:ff:fc:f4:0c
port3	1 1 1 1 1 1	0 0 1 1 1 1 0 1 0 0	0	0 0 0 1 1 1 0	e0:23:ff:fc:f4:0e

Logic 2: vcluster ID 0 & 1, group ID < 256, and physical index < 128

The start of the VMAC address is always `00:09:0f:09:--:--` with the last 16 bits defined as follows:

Group ID	Vcluster ID	Physical index
- - - - - - - - : -	-	- - - - - - -

This example uses group ID = 200, vcluster ID = 1, and interfaces with physical indexes less than 128:

- Group ID:
    - $200_{10} = 11001000_2$
    - Group ID = 11001000
- Vcluster ID:
    - $1_{10} = 1_2$
    - Vcluster ID = 1
- Interfaces:
    - port25 physical index = 100
        - $100_{10} = 1100100_2$
    - port31 physical index = 120
        - $120_{10} = 1111000_2$
    - port38 physical index = 127
        - $127_{10} = 1111111_2$

Resulting in these VMAC addresses:

Interface	VMAC binary (last 16 bits)			VMAC hex (full)
	Group ID	Vcluster ID	Physical index	
port1	1 1 0 0 1 0 0 0	1	1 1 0 0 1 0 0	00:09:0f:09:c8:e4
port2	1 1 0 0 1 0 0 0	1	1 1 1 1 0 0 0	00:09:0f:09:c8:f8
port3	1 1 0 0 1 0 0 0	1	1 1 1 1 1 1 1	00:09:0f:09:c8:ff

Logic 3: vcluster ID 0 & 1, group ID < 256, and physical index > 127

The start of the VMAC address is always `70:4c:a5:--:--:--` with the last 24 bits defined as follows:

Physical index	Vcluster ID	Group ID
- - - - - - - - : - - - - - - - -	- :	- - - - - - - -

This example uses group ID = 25, vcluster ID = 1, and interfaces with physical indexes above 127:

- Group ID:
  - $25_{10} = 11001_2$
  - Group ID = 00011001
- Vcluster ID:
  - $1_{10} = 1_2$
  - Vcluster ID = 1
- Interfaces:
  - port40 physical index = 230
    - 230 – 128 = 102
    - $102_{10} = 1100110_2$
  - port45 physical index = 240
    - 240 – 128 = 112
    - $112_{10} = 1110000_2$
  - port50 physical index = 250
    - 250 – 128 = 122
    - $122_{10} = 1111010_2$

Resulting in these VMAC addresses:

Interface	VMAC binary (last 24 bits)			VMAC hex (full)
	Physical index	Vcluster ID	Group ID	
port1	0 0 0 0 0 0 0 0 1 1 0 0 1 1 0	1	0 0 0 1 1 0 0 1	70:4c:a5:00:cd:19
port2	0 0 0 0 0 0 0 0 1 1 1 0 0 0 0	1	0 0 0 1 1 0 0 1	70:4c:a5:00:e1:19
port3	0 0 0 0 0 0 0 0 1 1 1 1 0 1 0	1	0 0 0 1 1 0 0 1	70:4c:a5:00:f5:19

Logic 4: vcluster ID >= 2

When the vcluster ID is 2 or greater, the group ID must be between 0 and 7.

The start of the VMAC address is always `e0:23:ff:--:--:--` with the last 24 bits defined as follows:

Preset bits	Physical index	Vcluster ID	Group ID
1 1 1 1 1 1	- - : - - - - - - - - :	- - - - -	- - -

This example uses group ID = 6 and vcluster ID = 9:

- Group ID
  - $6_{10} = 110_2$
  - Group ID = 110
- Vcluster ID
  - $9_{10} = 1001_2$
  - Vcluster ID = 01001
- Interfaces
  - port1 physical index = 3_{10}
    - $3_{10} = 0000000011_2$
  - port2 physical index = 6_{10}
    - $6_{10} = 0000000110_2$
  - port3 physical index = 9_{10}
    - $9_{10} = 0000001001_2$

Resulting in these VMAC addresses:

Interface	VMAC binary (last 24 bits)				VMAC hex (full)
	Preset bits	Physical index	Vcluster ID	Group ID	
port1	1 1 1 1 1 1	0 0 0 0 0 0 0 0 1 1	0 1 0 0 1	1 1 0	e0:23:ff:fc:03:4e
port2	1 1 1 1 1 1	0 0 0 0 0 0 0 1 1 0	0 1 0 0 1	1 1 0	e0:23:ff:fc:06:4e
port3	1 1 1 1 1 1	0 0 0 0 0 0 1 0 0 1	0 1 0 0 1	1 1 0	e0:23:ff:fc:09:4e

Displaying VMAC addresses

Each FortiGate physical interface has two MAC addresses: the permanent and current hardware addresses. The permanent hardware address cannot be changed, as it is the actual MAC address of the interface hardware. The current hardware address can be changed, as it is the address seen by the network.

To change the current hardware address on a FortiGate not operating in HA:

```
config system interface
    edit <name>
        set macaddr <address>
```

```
    next
end
```

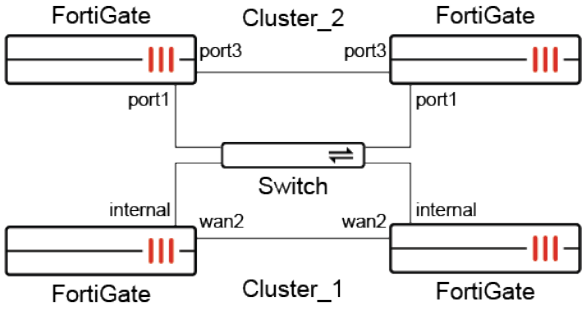
In an operating cluster, the current hardware address of each cluster device interface is changed to the HA virtual MAC address by the FGCP. The `macaddr` option is not available for a functioning cluster.

To display MAC addresses on a FortiGate operating in HA:

```
# diagnose hardware deviceinfo nic port1
...
Current_HWaddr 00:09:0f:09:ff:02
Permanent_HWaddr 08:5b:0e:72:3b:b2
```

Diagnosing packet loss

A network can experience packet loss when two FortiGate HA clusters are deployed in the same broadcast domain due to MAC address conflicts. You can resolve the MAC address conflict by changing the HA group ID (or cluster ID) configuration of the two clusters.



You can diagnose packet loss by pinging from one cluster to the other, or by pinging both of the clusters from a device within the broadcast domain.

To check for a MAC address conflict in a HA cluster:

1. On Cluster_1 and Cluster_2, check the VMAC address (`Current_HWaddr`) used in an interface on the primary device:

   ```
   # diagnose hardware deviceinfo nic <interface>
   ```

   If the group prefix and group hexadecimal ID are identical, there will be MAC address conflicts.
2. Change one of the clusters to use a different group ID:

   ```
   config system ha
       set group-id <integer>
   end
   ```

Abbreviated TLS handshake after HA failover

TLS sessions that pass through an HA A-A or A-P cluster can use an abbreviated TLS handshake instead of a full TLS handshake upon failover from a primary HA unit to a secondary HA unit. This reduces session pickup delays by reducing the time needed to renegotiate the TLS session, given that the TLS session ticket can be re-used.

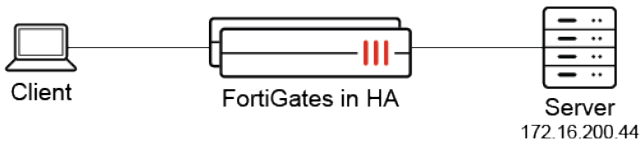
To accomplish this, FortiOS uses the web proxy global `ssl-ca-cert` to generate the key used in the TLS session ticket:

```
config web-proxy global
    set ssl-ca-cert "Fortinet_CA_SSL"
end
```

The certificate can be synchronized to the secondary HA unit, which allows the secondary unit to generate the same session key for a TLS session. When a TLS session reconnects after HA failover using the same session ticket as the first session, the new primary unit is able to generate the same key matching that session ticket and allow an abbreviated handshake.

Example

In this example, OpenSSL is used to create a TLS session between the client and the server through the primary FortiGate. The session ticket is outputted and saved. Upon failover, the same session ticket is reused to create a TLS session through the new primary unit. Because the new primary unit uses the same certificate to generate the key for the TLS session ticket, it allows the connection to be made using an abbreviated TLS handshake.



This example is for demonstration purposes only. In a normal failover, TLS sessions from clients will automatically be able to re-establish using an abbreviated handshake through the new primary unit.

To verify if an abbreviated TLS handshake is used after HA failover:

1. On the client using OpenSSL, open a new session to 172.16.200.44:443 and output the session ticket to a file called aaa.txt. This session will pass through the current HA primary unit:

   ```
   # openssl s_client -connect 172.16.200.44:443 -sess_out aaa.txt
   ```

2. Fail over the primary unit to the secondary unit. The HA secondary unit starts handling the traffic.
3. On the client, try connecting to 172.16.200.44:443 using the same saved session ticket as before (aaa.txt):

   ```
   # openssl s_client -connect 172.16.200.44:443 -sess_in aaa.txt
   ```

4. Verify whether the session succeeds in using the original session ticket:

```
Reused, TLSv1.3, Cipher is TLS_AES_256_GCM_SHA384
Server public key is 4096 bit
Secure Renegotiation IS NOT supported
Compression: NONE
Expansion: NONE
No ALPN negotiated
Early data was not sent
Verify return code: 19 (self signed certificate in certificate chain)
...
```

If the session is established using the same ticket, `Reused, TLSv1.3, Cipher is <name>` is displayed. If session is established using a new ticket, `New, TLSv1.3, Cipher is <name>` is displayed.

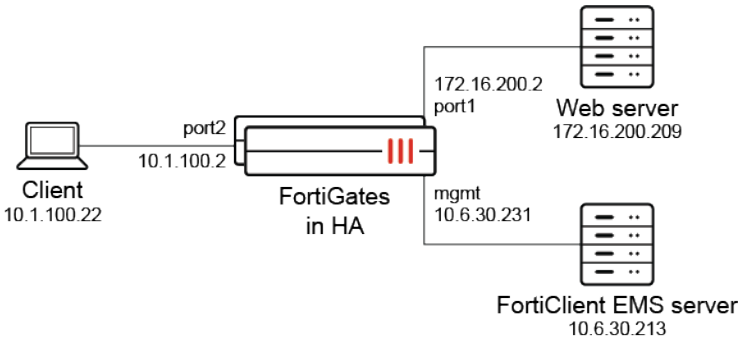
The new primary is able to use the web proxy global `ssl-ca-cert` to generate the same key as the old primary that was used in the session ticket. So, the second TLS connection that reuses the TLS session ticket from the first session can complete an abbreviated TLS handshake.

Session synchronization during HA failover for ZTNA proxy sessions

User information and TLS sessions are synchronized between HA members for ZTNA proxy sessions. When a failover occurs, the new primary unit will continue allowing sessions from the logged in users without asking for the client certificate and re-authentication again.

Example

In this example, a FortiGate HA pair is acting as a ZTNA access proxy. Clients that are trying to access the web server on qa.test.com are proxied by the ZTNA access proxy. Remote clients must be registered to the EMS server, and pass a client certificate check and user authentication in order to connect. Upon HA member failure, a failover occurs and the new primary unit will continue to allow connections without requesting client certificate check and user authentication for existing users and devices.



This example assumes ZTNA and EMS server settings are already configured.

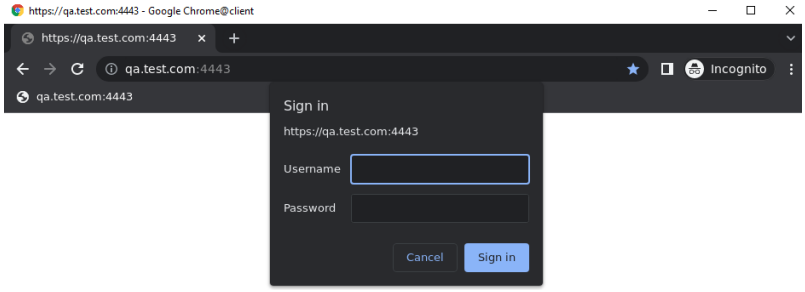
To configure the HA settings:

```
config system ha
    set group-name "501E"
    set mode a-p
```

```
    set password **********
    set hbdev "ha" 0
    set session-pickup enable
    set override disable
    set monitor "port1" "port2"
end
```

To verify that the proxy sessions are synchronized between HA members:

1. On the client, access the web server. The ZTNA access proxy challenges the user for a client certificate and user authentication.



2. On the primary FortiGate, verify that the user information and TLS sessions are synchronized between HA members.
   a. Verify the list of proxy users:

```
501E-primary # diagnose wad user list
ID: 1, VDOM: root, IPv4: 10.1.100.22
  user name   : localuser1
  worker      : 0
  duration    : 8
  auth_type   : IP
  auth_method : Basic
  pol_id      : 1
  g_id        : 0
  user_based  : 1
  expire      : 597
  LAN:
    bytes_in=2093 bytes_out=5753
  WAN:
    bytes_in=2024 bytes_out=1235
```

   b. Apply a filter to WAD debug to diagnose the wad informer process:

```
501E-primary # diagnose test application wad 2400
Set diagnosis process: type=informer index=0 pid=305
```

   c. Show the user cache from the WAD informer. Verify that the localuser1 entry exists:

```
501E-primary # diagnose test application wad 110
users:
[1]     localuser1@10.1.100.22:0 upn_domain= from:worker worker:6 vf:0 ref:1 stale=0
ntlm:0, has_fsae:0, guest:0
```

```
                user_node:(0x7fe18dcf0048) user:1[max=65536](0x7fe18dd08048) ip:1
(0x7fe18dd00048) scheme:0 outofsync:0(0) id:1
...
```

d. Verify using WAD real-time debugs on the secondary FortiGate. The user information is synchronized to the secondary FortiGate:

```
501E-secondary # diagnose wad debug enable category all
501E-secondary # diagnose wad debug enable level verbose
501E-secondary # diagnose debug enable
[I][p:296]              wad_proc_informer_ha_dgram_on_read:2811  Got HA msg: type=0,
sizeof(msg)=8, dlen=80, sz=88
[I][p:296]              wad_proc_informer_on_ha_user_add  :1493  reader:
ip=10.1.100.22:45852 vf=0 seq=0 grp_type=0 scheme=0 is_ntlm=0 has_fsae=0 concur_user=65536
domain=''
[I][p:296]              wad_informer_update_user_ext      :782   ip=10.1.100.22:45852
name=localuser1 from=worker
[I][p:296]              wad_informer_find_user_ip_entries :621   find=false(1) vf=0
ip=10.1.100.22:45852 pr=(nil)
mapping user_node:0x7fc1c84dd048, user_ip:0x7fc1c84ed048(0), user:0x7fc1c84f5048(0).
```

3. Verify the user cache from the WAD informer:

```
501E-secondary # diagnose test application wad 110
users:
[1]     localuser1@10.1.100.22:0 upn_domain= from:worker worker:-126 vf:0 ref:1 stale=0
ntlm:0, has_fsae:0, guest:0
               user_node:(0x7fa3eb07d048) user:1[max=65536](0x7fa3eb095048) ip:1
(0x7fa3eb08d048) scheme:0 outofsync:0(0) id:7
...
```

If the client tries to access the web server again after failover occurs, the client certificate check and authentication prompt does not appear. ZTNA allows the traffic to pass.

The ZTNA logs for both FortiGates contain the same user information.

Primary FortiGate log:

```

```

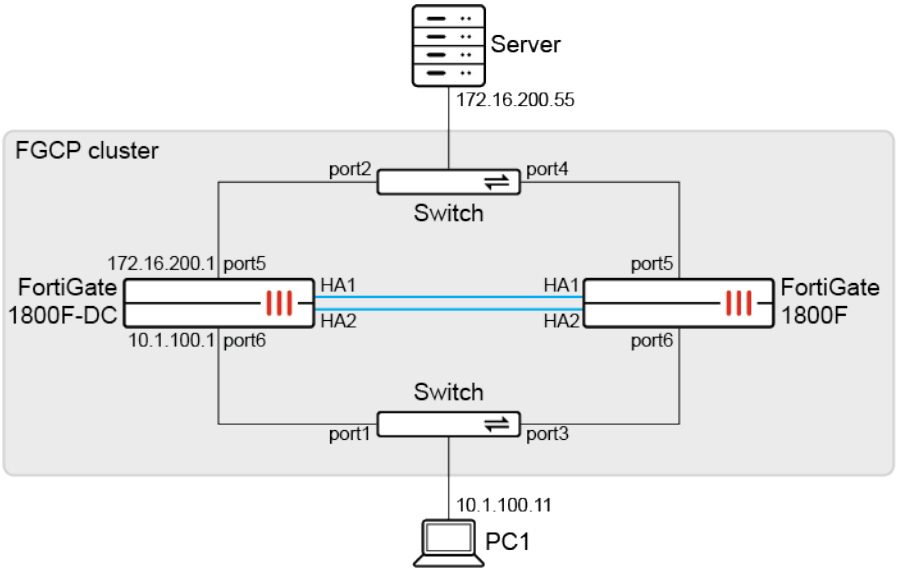
FGCP HA between FortiGates of the same model with different AC and DC PSUs

To improve power redundancy, FGCP HA clusters can support forming HA between units of the same model but with different AC PSU and DC PSU power supplies. This enables redundancy in a situation where power is completely lost on the AC grid, but traffic can fail over to a cluster member running on an independent DC grid.

The cluster members must be the same model with the same firmware installed, and must have the same hardware configuration other than the PSU.

In the following examples, there is an FGCP cluster with AC and DC PSU members: a FortiGate 1800F-DC (primary) and FortiGate 1800F (secondary).



Basic configuration

To configure the FGCP cluster in the GUI:

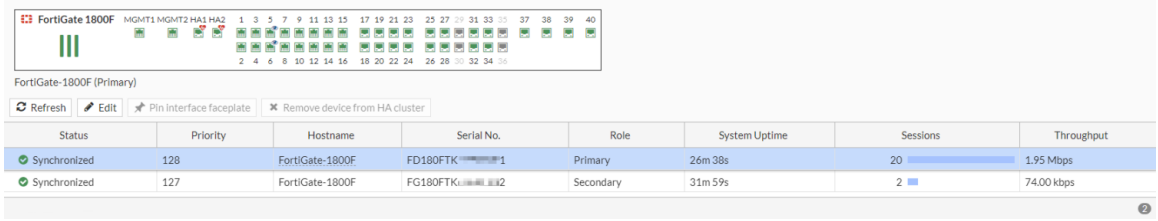
1. On the primary FortiGate (FG-1800F-DC), go to *System* > *HA*.
2. Configure the following settings:

Mode	*Active-Passive*
Device priority	*128*
Group ID	*0*
Group name	*Example_cluster*
Password	Enter a password.
Session pickup	Enable this setting.
Monitor interfaces	Click the + to add *port5* and *port6*.
Heartbeat interfaces	Click the + to add *ha1* and *ha2*.

3. Click *OK*.
4. On the secondary FortiGate (FG-1800F), go to *System* > *HA*.
5. Configure the following settings:

Mode	*Active-Passive*
Device priority	*127*
Group ID	*0*
Group name	*Example_cluster*
Password	Enter a password.
Session pickup	Enable this setting.
Monitor interfaces	Click the + to add *port5* and *port6*.
Heartbeat interfaces	Click the + to add *ha1* and *ha2*.

6. Click *OK*.
7. Verify that the cluster status is *Synchronized*.



To configure the FGCP cluster in the CLI:

1. Configure the primary FortiGate (FG-1800F-DC):

```
config system ha
    set group-name "Example_cluster"
    set mode a-p
    set password **********
    set hbdev "ha2" 0 "ha1" 0
    set session-pickup enable
    set override disable
    set monitor "port5" "port6"
end
```

2. Configure the secondary FortiGate (FG-1800F):

```
config system ha
    set group-name "Example_cluster"
    set mode a-p
    set password **********
    set hbdev "ha2" 0 "ha1" 0
    set session-pickup enable
    set override disable
    set priority 127
    set monitor "port5" "port6"
end
```

3. Verify the cluster status on the primary FortiGate:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-1800F
Mode: HA A-P
Group Name: Example_cluster
Group ID: 0
Debug: 0
Cluster Uptime: 0 days 0:56:11
Cluster state change time: 2023-05-29 19:11:14
Primary selected using:

...
Secondary   : FortiGate-1800F , FG180FTK*******2, HA cluster index = 0
Primary     : FortiGate-1800F , FG180FTK*******1, HA cluster index = 1
number of vcluster: 1
vcluster 1: standby 169.254.0.2
Secondary: FG180FTK*******2, HA operating index = 1
Primary: FG180FTK*******1, HA operating index = 0
```

Testing synchronization in the cluster

Based on the preceding example, the interface and firewall policy configurations are changed on the primary FortiGate. These configuration changes and sessions are synchronized to the secondary FortiGate. If the switch interface connected to the primary's port5 is down (port2), this triggers the monitor interface to be down, and the PC1 traffic will fail over to the secondary FortiGate.

To test configuration synchronization in the FGCP cluster:

1. Modify configurations on the primary FortiGate (FG-1800F-DC).
   a. Edit the interface settings:

```
config system interface
    edit "port5"
        set ip 10.1.100.1 255.255.255.0
        set allowaccess ping https ssh http telnet
        set alias "To_Client_PC"
        config ipv6
            set ip6-address 2000:10:1:100::1/64
            set ip6-allowaccess ping https ssh http
        end
    next
    edit "port6"
        set ip 172.16.200.1 255.255.255.0
        set allowaccess ping https ssh http fgfm
        set alias "To_Server"
        config ipv6
            set ip6-address 2000:172:16:200::1/64
            set ip6-allowaccess ping https ssh http
        end
    next
end
```

   b. Edit the firewall policy settings:

```
config firewall policy
    edit 1
        set name "to_server_policy"
        set srcintf "port5"
        set dstintf "port6"
```

```
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set logtraffic-start enable
    next
end
```

2. On the secondary FortiGate (FG-1800F), verify that the settings were synchronized.
   a. Verify the interface settings:

```
show system interface
    config system interface
        ...
        edit "port5"
            set vdom "root"
            set ip 10.1.100.1 255.255.255.0
            set allowaccess ping https ssh http telnet
            set type physical
            set alias "To_Client_PC"
            set snmp-index 9
            config ipv6
                set ip6-address 2000:10:1:100::1/64
                set ip6-allowaccess ping https ssh http
            end
        next
        edit "port6"
            set vdom "root"
            set ip 172.16.200.1 255.255.255.0
            set allowaccess ping https ssh http fgfm
            set type physical
            set alias "To_Server"
            set snmp-index 10
            config ipv6
                set ip6-address 2000:172:16:200::1/64
                set ip6-allowaccess ping https ssh http
            end
        next
    end
```

   b. Verify the firewall policy settings:

```
show firewall policy
    config firewall policy
            edit 1
            set name "to_server_policy"
            set uuid 82a05e78-fe90-51ed-eb16-ee7bdea60de0
            set srcintf "port5"
            set dstintf "port6"
            set action accept
            set srcaddr "all"
```

```
            set dstaddr "all"
            set schedule "always"
            set service "ALL"
            set logtraffic-start enable
        next
    end
```

c. Verify the HA checksum:

```
# diagnose sys ha checksum show
is_manage_primary()=0, is_root_primary()=0
debugzone
global: 4e 15 af c3 c6 87 32 f5 69 5c b7 33 b1 8b 27 12
root: 4a 52 e4 f1 6a 2b eb 7d 84 7d f1 48 50 93 fe d9
all: 95 4e 92 c3 39 75 8e 0e db 83 8d b7 b2 b1 9f 04

checksum
global: 4e 15 af c3 c6 87 32 f5 69 5c b7 33 b1 8b 27 12
root: 4a 52 e4 f1 6a 2b eb 7d 84 7d f1 48 50 93 fe d9
all: 95 4e 92 c3 39 75 8e 0e db 83 8d b7 b2 b1 9f 04
```

To test session synchronization in the FGCP cluster:

1. On PC1, verify the IP address and gateway:

```
root@pc1:~# ifconfig eth1
eth1      Link encap:Ethernet  HWaddr 00:0c:29:a0:60:d6
          inet addr:10.1.100.11  Bcast:10.1.100.255  Mask:255.255.255.0
          ...

root@pc1:~# route -n
Kernel IP routing table
Destination     Gateway         Genmask         Flags Metric Ref    Use Iface
0.0.0.0         10.1.100.1      0.0.0.0         UG    0      0        0 eth1
10.1.100.0      0.0.0.0         255.255.255.0   U     0      0        0 eth1
10.6.30.0       0.0.0.0         255.255.255.0   U     0      0        0 eth0
169.254.0.0     0.0.0.0         255.255.0.0     U     1000   0        0 eth0
```

2. Using Wget, initiate a large file download with HTTP that will maintain a long session:

```
root@pc1:~# wget http://172.16.200.55/big100MB.html   --keep-session-cookies --limit-rate=128k
--progress=dot -S -r --delete-after
--2023-05-29 14:55:33--  http://172.16.200.55/big100MB.html
Connecting to 172.16.200.55:80... connected.

no_ofld_reason:
total session: 1
```

To test failover in the FGCP cluster:

1. On the switch connected to port5 of the primary FortiGate, change port2's status to be down:

```
config switch physical-port
    edit port2
        set status down
    next
end
```

2. Check the HA status on the primary FortiGate (FG-1800F-DC), which now becomes the secondary device:

```
# get system ha status
HA Health Status:
    WARNING: FG180FTK*******1 has mondev down;
Model: FortiGate-1800F
Mode: HA A-P
Group Name: Example_cluster
Group ID: 0
Debug: 0
Cluster Uptime: 0 days 1:16:13
Cluster state change time: 2023-05-29 20:08:56
Primary selected using:
    <2023/05/29 20:08:56> vcluster-1: FG180FTK*******2 is selected as the primary because the
value 0 of link-failure + pingsvr-failure is less than peer member FG180FTK*******1.
    <2023/05/29 19:11:14> vcluster-1: FG180FTK*******1 is selected as the primary because its
uptime is larger than peer member FG180FTK*******2.
    <2023/05/29 18:59:45> vcluster-1: FG180FTK*******2 is selected as the primary because its
uptime is larger than peer member FG180FTK*******1.
    <2023/05/29 18:59:45> vcluster-1: FG180FTK*******1 is selected as the primary because its
override priority is larger than peer member FG180FTK*******2.
ses_pickup: enable, ses_pickup_delay=disable
override: disable
...
Secondary   : FortiGate-1800F , FG180FTK*******1, HA cluster index = 1
Primary     : FortiGate-1800F , FG180FTK*******2, HA cluster index = 0
```

```
number of vcluster: 1
vcluster 1: standby 169.254.0.1
Secondary: FG180FTK*******1, HA operating index = 1
Primary: FG180FTK*******2, HA operating index = 0
```

3. Check the HA status on the new primary FortiGate (FG-1800F):

```
# get system ha status
HA Health Status:
    WARNING: FG180FTK*******1 has mondev down;
Model: FortiGate-1800F
Mode: HA A-P
Group Name: Example_cluster
Group ID: 0
Debug: 0
Cluster Uptime: 0 days 1:19:9
Cluster state change time: 2023-05-29 20:08:56
Primary selected using:
    <2023/05/29 20:08:56> vcluster-1: FG180FTK*******2 is selected as the primary because the
value 0 of link-failure + pingsvr-failure is less than peer member FG180FTK*******1.
    <2023/05/29 19:11:14> vcluster-1: FG180FTK*******1 is selected as the primary because its
uptime is larger than peer member FG180FTK*******2.
    <2023/05/29 18:59:45> vcluster-1: FG180FTK*******2 is selected as the primary because its
uptime is larger than peer member FG180FTK*******1.
    <2023/05/29 18:55:03> vcluster-1: FG180FTK*******2 is selected as the primary because it's
the only member in the cluster.
ses_pickup: enable, ses_pickup_delay=disable
override: disable
...
Primary     : FortiGate-1800F , FG180FTK*******2, HA cluster index = 0
Secondary   : FortiGate-1800F , FG180FTK*******1, HA cluster index = 1
number of vcluster: 1
vcluster 1: work 169.254.0.1
Primary: FG180FTK*******2, HA operating index = 0
Secondary: FG180FTK*******1, HA operating index = 1
```

4. On PC1, verify that the HTTP traffic remains uninterrupted:

```
 ...
 74700K .......... .......... .......... .......... .......... 75%  100K 3m13s
 74750K .......... .......... .......... .......... .......... 75%  200K 3m13s
 74800K .......... .......... .......... .......... .......... 75%  100K 3m12s
 74850K .......... .......... .......... .......... .......... 75%  200K 3m12s
 74900K .......... .......... .......... .......... .......... 75%  100K 3m12s
 74950K .......... .......... .......... .......... .......... 75%  100K 3m11s
 75000K .......... .......... .......... .......... .......... 75%  200K 3m11s
 75050K .......... .......... .......... .......... .......... 75%  100K 3m10s
 75100K .......... .......... .......... .......... .......... 75%  200K 3m10s
 75150K .......... .......... .......... .......... .......... 75%  100K 3m10s
```

FGCP multi-version cluster upgrade

The FGCP multi-version cluster (MVC) upgrade mode allows manual control over the cluster member that is being upgraded. HA members can temporarily run in an MVC while administrators perform tests to confirm traffic can pass through the upgraded member smoothly.

The syntax of the existing upgrade mode has been updated starting in 7.4.1:

```
config system ha
    set upgrade-mode {simultaneous | uninterruptible | local-only | secondary-only}
end
```

`upgrade-mode {simultaneous | uninterruptible | local-only | secondary-only}`	Set the mode to upgrade a cluster. • `simultaneous`: all HA members upgrade at the same time (`set uninterruptible-upgrade disable` in 7.4.0 and earlier). • `uninterruptible`: secondary HA members are upgraded first, followed by the primary member (`set uninterruptible-upgrade enable` in 7.4.0 and earlier). • `local-only`: only upgrade the local member in which the firmware is uploaded. • `secondary-only`: only upgrade the secondary members.

The `local-only` and `secondary-only` upgrade options are advanced configurations that should only be used to temporarily put the HA cluster in MVC operation mode. While in this operation, states and sessions (such as the session table and routing table) are synchronized, but configuration changes are not synchronized between cluster members in different builds. If more than two members are in the cluster, the configurations between members in the same builds will be synchronized. The configurations for the entire cluster will be synchronized once the upgrade process has completed.

How it works

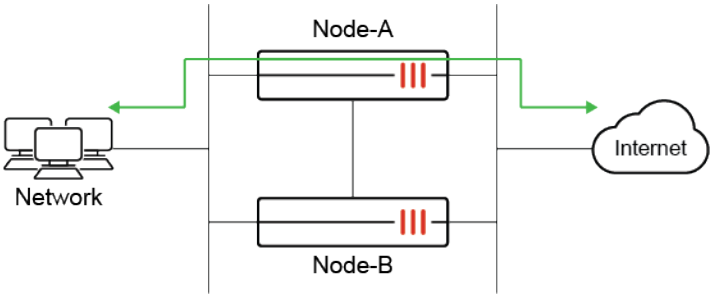
In `local-only` and `secondary-only` modes, the specific cluster member is upgraded and sessions are synchronized to it. The following tables show which members are upgraded based on the mode and where the upgrade is initiated.

local-only		
Upgrade method	**Outcome**	**Recommendation**
Initiate the upload or upgrade on the primary.	The primary member is upgraded.	Not recommended.
Initiate the upload or upgrade on the secondary member.	The secondary member where the image is uploaded is upgraded.	Recommended when selecting a specific HA member to upgrade.

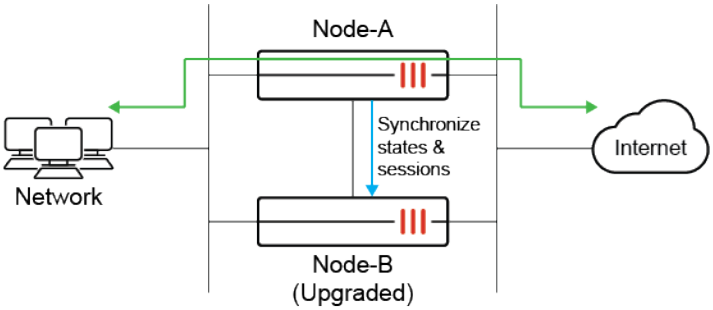
secondary-only		
Upgrade method	**Outcome**	**Recommendation**
Initiate the upload or upgrade on the primary.	All non-primary members are upgraded.	Recommended for scenarios where there is more than one secondary HA member.
Initiate the upload or upgrade on the secondary member.	The secondary member where the image is uploaded is upgraded.	Same result as initiating an upgrade on a secondary member in `local-only` mode.

This can apply to any HA clusters with two or more members. Administrators can initiate an upgrade on a secondary member by using its CLI console or accessing the device's GUI from its HA management interface.

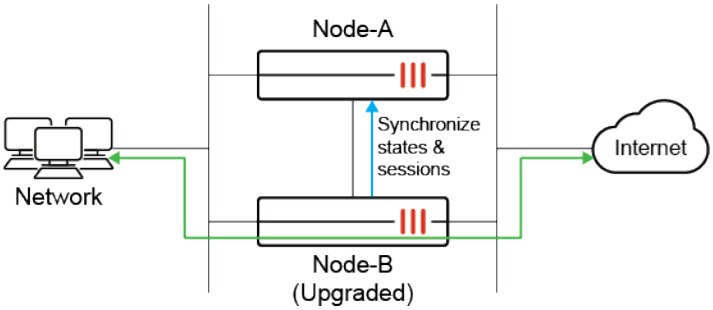
Initially, when you prepare an HA cluster in A-P mode for upgrade, traffic passes through the primary unit (Node-A) as the secondary unit (Node-B) sits on standby.



After the upgrade is completed on a secondary unit, states and sessions are synchronized. The members are now operating in MVC mode; however, traffic continues to pass through Node-A.



Administrators can manually trigger failover to make Node-B the new primary when ready. This can be done by resetting the HA uptime or changing device priorities, whichever method is desired. Traffic now passes through Node-B.

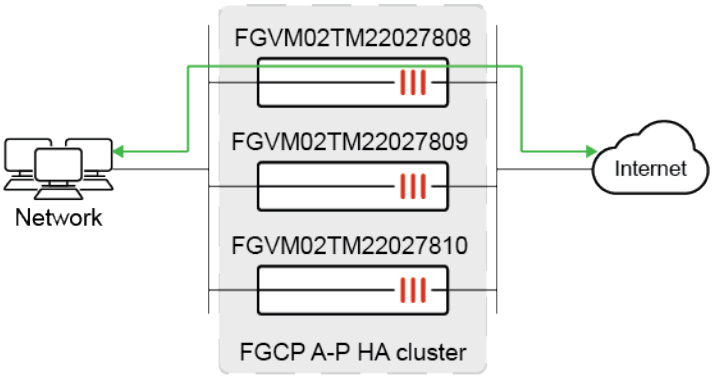


The upgraded system (Node-B) can be tested to verify that traffic can pass smoothly. If verification fails, administrators can trigger a failover to fail back to Node-A to avoid any downtime.

If verification is successful, administrators can manually trigger an upgrade on Node-A to bring the HA member up to the same version as Node-B to complete the HA upgrade procedure. This can be performed by accessing Node-A's GUI from its HA management interface or using its CLI console.

Example 1: upgrade a single secondary member using the local-only upgrade option

In this example, three HA members are running in an FGCP A-P HA cluster.



The member FGVM02TM22027808 is acting as the primary and forwarding traffic. The member FGVM02TM22027810 is chosen for upgrade.

The cluster is originally running build 2456. The secondary unit is upgraded to build 2461. Fictitious build numbers are used in this example to demonstrate functionality of the feature.

To configure the HA cluster:

```
config system ha
    set group-id 260
    set group-name "hagroup"
    set mode a-p
    set password **********
    set hbdev "port3" 0
    set session-pickup enable
    set upgrade-mode local-only
end
```

To perform the upgrade:

1. On the secondary member (FGVM02TM22027810), log in to the CLI console.
2. Execute a TFTP upgrade:

```
FGVM02TM22027810 # execute restore image tftp /home/Images/FortiOS/v7.00/images/build2461/FGT_
VM64-v7-build2461-FORTINET.out 172.16.100.71
This operation will replace the current firmware version!
Do you want to continue? (y/n)y
```

```
Please wait...

Connect to ftp server 172.16.100.71 ...
Get image from ftp server OK.
Verifying the signature of the firmware image.

Please wait for system to restart.
```

3. After the upgrade is complete, verify the version running on the secondary member:

```
FGVM02TM22027810 # get system status
Version: FortiGate-VM64 v7.4.1,build2461,230828 (interim)
…
```

4. On the primary unit, verify that HA is still formed between the three members:

```
FGVM02TM22027808 # diagnose sys ha dump-by group
<hatalk> vcluster_1: ha_prio=0(primary), state/chg_time/now=2(work)/1692750721/1693262149
            HA information.
group-id=260, group-name='hagroup'
has_no_aes128_gcm_sha256_member=0

gmember_nr=3
'FGVM02TM22027808': ha_ip_idx=2, hb_packet_version=10, last_hb_jiffies=0, linkfails=0,
weight/o=0/0, support_aes128_gcm_sha256=1
'FGVM02TM22027809': ha_ip_idx=1, hb_packet_version=12, last_hb_jiffies=51142842, linkfails=3,
weight/o=0/0, support_aes128_gcm_sha256=1
        hbdev_nr=1: port3(mac=000c..de, last_hb_jiffies=51142842, hb_lost=0),
'FGVM02TM22027810': ha_ip_idx=0, hb_packet_version=4, last_hb_jiffies=51142858, linkfails=3,
weight/o=0/0, support_aes128_gcm_sha256=1
        hbdev_nr=1: port3(mac=000c..1a, last_hb_jiffies=51142858, hb_lost=0),

vcluster_nr=1
vcluster-1: start_time=1692750718(2023-08-22 17:31:58), state/o/chg_time=2(work)/2
(work)/1692750721(2023-08-22 17:32:01)
        pingsvr_flip_timeout/expire=3600s/0s
        mondev: port1(prio=50,is_aggr=0,status=1) port7(prio=50,is_aggr=0,status=1) port8
(prio=50,is_aggr=0,status=1)
        'FGVM02TM22027808': ha_prio/o=0/0, link_failure=0, pingsvr_failure=0, flag=0x00000001,
mem_failover=0, uptime/reset_cnt=510868/0
        'FGVM02TM22027809': ha_prio/o=1/1, link_failure=0, pingsvr_failure=0, flag=0x00000000,
mem_failover=0, uptime/reset_cnt=510857/0
        'FGVM02TM22027810': ha_prio/o=2/2, link_failure=0, pingsvr_failure=0, flag=0x00000000,
mem_failover=0, uptime/reset_cnt=0/0
```

5. Fail over the HA cluster so that the secondary member, FGVM02TM22027810, becomes the primary. Since override is not enabled and the HA primary is determined by uptime, you can reset the HA uptime on the units that were not upgraded:

```
# diagnose sys ha reset-uptime
```

6. Once verification on the upgraded member is successful, repeat step 2 to perform upgrades on the remaining units.

Example 2: upgrade multiple secondary members using the secondary-only upgrade option

Using the same topology as example 1, the three HA cluster members are originally running build 2456. Both secondary units are upgraded using the `secondary-only` upgrade option. Fictitious build numbers are used in this example to demonstrate functionality of the feature.

To configure the HA cluster:

```
config system ha
    set group-id 260
    set group-name "hagroup"
    set mode a-p
    set password **********
    set hbdev "port3" 0
    set session-pickup enable
    set upgrade-mode secondary-only
end
```

To perform the upgrade:

1. On the primary unit (FGVM02TM22027808), log in to the CLI console.
2. Execute a TFTP upgrade:

   ```
   FGVM02TM22027808 # execute restore image tftp /home/Images/FortiOS/v7.00/images/build2461/FGT_
   VM64-v7-build2461-FORTINET.out 172.16.100.71
   ```

3. After the upgrade is complete, verify the version running on the secondary members.
   a. Member 1:

      ```
      FGVM02TM22027809 # get system status
      Version: FortiGate-VM64 v7.4.1,build2461,230828 (interim)
      …
      ```

   b. Member 2:

      ```
      FGVM02TM22027810 # get system status
      Version: FortiGate-VM64 v7.4.1,build2461,230828 (interim)
      …
      ```

4. On the primary unit, verify that HA is still formed between the three members:

   ```
   FGVM02TM22027808 # diagnose sys ha dump-by group
               HA information.
   group-id=260, group-name='hagroup'
   has_no_aes128_gcm_sha256_member=0

   gmember_nr=3
   'FGVM02TM22027808': ha_ip_idx=2, hb_packet_version=19, last_hb_jiffies=0, linkfails=0,
   weight/o=0/0, support_aes128_gcm_sha256=1
   'FGVM02TM22027809': ha_ip_idx=1, hb_packet_version=4, last_hb_jiffies=51358055, linkfails=3,
   ```

```
weight/o=0/0, support_aes128_gcm_sha256=1
        hbdev_nr=1: port3(mac=000c..de, last_hb_jiffies=51358055, hb_lost=0),
'FGVM02TM22027810': ha_ip_idx=0, hb_packet_version=5, last_hb_jiffies=51358057, linkfails=3,
weight/o=0/0, support_aes128_gcm_sha256=1
        hbdev_nr=1: port3(mac=000c..1a, last_hb_jiffies=51358057, hb_lost=0),

vcluster_nr=1
vcluster-1: start_time=1692750718(2023-08-22 17:31:58), state/o/chg_time=2(work)/2

        pingsvr_flip_timeout/expire=3600s/0s
        mondev: port1(prio=50,is_aggr=0,status=1) port7(prio=50,is_aggr=0,status=1) port8
(prio=50,is_aggr=0,status=1)
        'FGVM02TM22027808': ha_prio/o=0/0, link_failure=0, pingsvr_failure=0, flag=0x00000001,
mem_failover=0, uptime/reset_cnt=512775/0
        'FGVM02TM22027809': ha_prio/o=2/2, link_failure=0, pingsvr_failure=0, flag=0x00000000,
mem_failover=0, uptime/reset_cnt=0/0
        'FGVM02TM22027810': ha_prio/o=1/1, link_failure=0, pingsvr_failure=0, flag=0x00000000,
mem_failover=0, uptime/reset_cnt=1/0
```

Troubleshoot an HA formation

The following are requirements for setting up an HA cluster or FGSP peers.

Cluster members must have:

- The same model.
- The same hardware configuration.
- The same connections.
- The same generation.

The requirement to have the same generation is done as a best practice as it avoids issues that can occur later on. If you are unsure if the FortiGates are from the same generation, please contact customer service.

Troubleshooting common HA formation errors

One member keeps shutting down during HA setup (hard drive failure):

If one member has a hard drive failure but the other does not, the one with the hard drive failure will be shut down during HA setup. In this case, RMA the member to resolve the issue.

Split brain scenario:

A split brain scenario occurs when two or more members of a cluster cannot communicate with each other on the heartbeat interface, causing each member to think it is the primary. As a result, each member assumes the primary HA role and applies the same IP and virtual MAC addresses on its interfaces. This causes IP and MAC conflicts on the network, and causes flapping on L2 devices when they learn the same MAC address on ports connected to different FortiGates.

A split brain scenario is usually caused by a complete lost of the heartbeat link or links. This can be a physical connectivity issue, or less commonly, something blocking the heartbeat packets between the HA members. Another cause is congestion and latency in the heartbeat links that exceeds the heartbeat lost intervals and thresholds.

The following are common symptoms of a split brain scenario:

- The connections to the FortiGates in the cluster work intermittently when trying to connect with administrative access.
- Sessions cannot be established through the FortiGate, and the traffic drops.
- When logging in to the FortiGates using the console, `get system ha status` shows each FortiGate as the primary.

To resolve a split brain scenario:

- Be physically on-site with the FortiGates (recommended). If this is not possible, connect to the FortiGates using console access.
- Identify the heartbeat ports, and verify that they are physically connected and up.
- Verify that heartbeat packets are being sent and received on the heartbeat ports.
- Verify that the HA configurations match between the HA members. The HA `mode`, `group-name`, `group-id`, and `password` settings should be the same. Different `group-id` values will result in different virtual MAC addresses, which might not cause a MAC conflict. However, an IP conflict can still occur.
- If everything seems to be in working order, run `get system ha status` to verify that HA has formed successfully.

To avoid a split brain scenario:

- In a two-member HA configuration, use back-to-back links for heartbeat interface instead of connecting through a switch.
- Use redundant HA heartbeat interfaces.
- In a configuration where members are in different locations, ensure the heartbeat lost intervals and thresholds are longer than the possible latency in the links.

FGSP

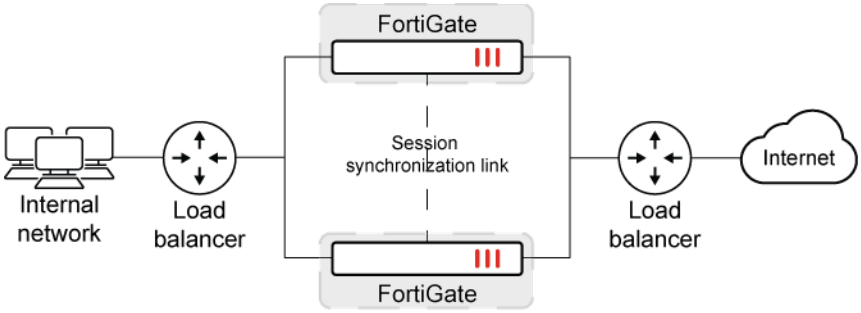
Standalone FortiGates or FGCP clusters can be integrated into the load balancing configuration using the FortiGate Session Life Support Protocol (FGSP) in a network where traffic is load balanced by an upstream load balancer and scanned by downstream FortiGates. FGSP can perform session synchronization of IPv4 and IPv6 TCP, SCTP, UDP, ICMP, expectation, RSSO authenticated user logon information, and NAT sessions to keep the session tables synchronized on all entities. If one of the FortiGates fails, the upstream load balancer should detect the failed member and stop distributing sessions to it. Session failover occurs and active sessions fail over to the peers that are still operating. Traffic continues to flow on the new peer without data loss because the sessions are synchronized.

The FortiGates in FGSP operate as peers that process traffic and synchronize sessions. An FGSP deployment can include two to 16 standalone FortiGates, or two to 16 FortiGate FGCP clusters of two members each. Adding more FortiGates increases the CPU and memory required to keep all of the FortiGates synchronized, and it increases network synchronization traffic. Exceeding the numbers of members is not recommended and may reduce overall performance. By default, FGSP synchronizes all IPv4 and IPv6 TCP sessions, and IPsec tunnels.

You can optionally add filters to control which sessions are synchronized, such as synchronizing packets from specific source and destination addresses, source and destination interfaces, or services.

FGSP is also compatible with FortiGate VRRP.

FGSP is primarily used instead of FGCP when external load balancers are part of the topology, and they are responsible for distributing traffic amongst the downstream FortiGates. FGSP provides the means to synchronize sessions between the FortiGate peers without needing a primary member to distribute the sessions like in FGCP active-active mode. If the external load balancers direct all sessions to one peer, the effect is similar to active-passive FGCP HA. If external load balancers balance traffic to both peers, the effect is similar to active-active FGCP HA. The load balancers should be configured so that all packets for any given session are processed by the same peer, including return packets whenever possible.



Session pickup

Session pickup is an optional setting that can be enabled to synchronize connectionless (UDP and ICMP) sessions, expectation sessions, and NAT sessions. If session pickup is not enabled, the FGSP does not share session tables for the particular session type, and sessions do not resume after a failover. All sessions are interrupted by the failover and must be re-established at the application level. Many protocols can successfully restart sessions with little, or no, loss of data. Others may not recover as easily. Enable session pickup for sessions that may be difficult to reestablish. Since session pickup requires FortiGate memory and CPU resources, only enable this feature for sessions that need to synchronize.

Session synchronization link

The session synchronization link is an optional configuration that allows peers to synchronize sessions over a dedicated interface instead of the interface in which the peer IP is routed. In this configuration, communications occur over L2 instead of L3. Configuring session synchronization links is recommended when you want to minimize traffic over the peering interface when there are many sessions that need to be synchronized.

Expectation sessions

FortiOS session helpers keep track of the communication of layer 7 protocols, such as FTP and SIP, that have control sessions and expectation sessions. The control sessions establish the link between the server and

client, and negotiate the ports and protocols that will be used for data communications. The session helpers then create expectation sessions through the FortiGate for the ports and protocols negotiated by the control session.

The expectation sessions are the sessions that actually communicate data. For FTP, the expectation sessions transmit files being uploaded or downloaded. For SIP, the expectation sessions transmit voice and video data. Expectation sessions usually have a timeout value of 30 seconds. If the communication from the server is not initiated within 30 seconds, the expectation session times out and traffic will be denied.

By default, FGSP does not synchronize expectation sessions; if a failover occurs, the sessions will have to be restarted.

To synchronize expectation sessions so they continue after a failover:

```
config system ha
    set session-pickup enable
    set session-pickup-expectation enable
end
```

NAT session synchronization

NAT sessions are not synchronized by default. You can enable NAT session synchronization by entering the following command:

```
config system ha
    set session-pickup enable
    set session-pickup-nat enable
end
```

When deploying FGCP over FGSP, the `session-pickup-nat` setting is hidden and enabled by default. It cannot be modified. See FGCP over FGSP per-tunnel failover for IPsec on page 3490 for more information.

After a failover with this configuration, all sessions that include the IP addresses of interfaces on the failed FortiGate unit will have nowhere to go since the IP addresses of the failed FortiGate unit will no longer be on the network. If you want NAT sessions to resume after a failover you should not configure NAT to use the destination interface IP address, since the FGSP FortiGate units have different IP addresses. To avoid this issue, you should use IP pools with the type set to overload (which is the default IP pool type), as shown in this example:

```
config firewall ippool
    edit FGSP-pool
        set type overload
        set startip 172.20.120.10
        set endip 172.20.120.20
    next
end
```

In NAT mode, only sessions for route mode security policies are synchronized. FGSP is also available for FortiGate units or virtual domains operating in transparent mode. Only sessions for normal transparent mode policies are synchronized.

FGSP basic peer setup

The FortiGate Session Life Support Protocol (FGSP) is a proprietary HA solution for only sharing sessions between entities based on peer-to-peer communications. The entities could be standalone FortiGates or an FGCP cluster. Sessions are load balanced by an upstream load balancer. Each peer will synchronize its sessions with the other peers so that if a failure occurs, sessions will continue to flow as the load balancer redirects the traffic to the other peers.

Basic requirements and limitations

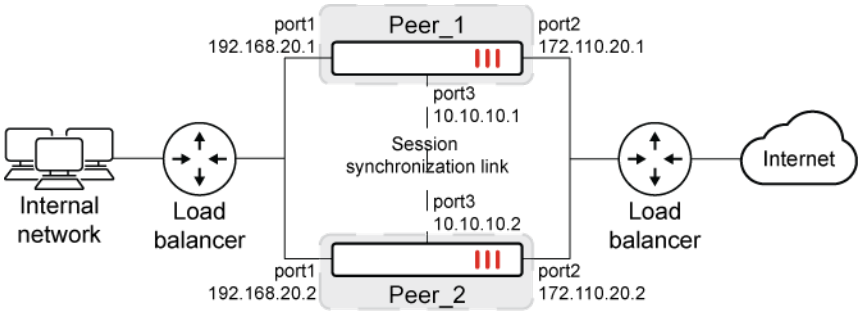
In most production environments, the following requirements should be met:

- The peers are FortiGates of the same model.
- The peers are running the same firmware version.
- There are 2 to 16 standalone FortiGates, or 2 to 16 FortiGate FGCP clusters of two members each.
- The configurations related to session tables should match. For example, the logical names used in firewall policies, IPsec interface names, VDOM names, firewall policy tables, and so on.

Two FortiGates must have similar capabilities so that data structures used in session synchronization will match, and are capable of delivering similar performance. Therefore, the same model and firmware version is highly recommended for most production deployments. The limitation on the number of FortiGates in FGSP also ensures that session synchronization will occur smoothly.

Example

This example uses two peer FortiGates. The load balancer is configured to send all sessions to Peer_1, and if Peer_1 fails, all traffic is sent to Peer_2.



To configure a basic FGSP peer setup:

These instructions assume that all FortiGates have been factory reset.

1. Make all the necessary connections as shown in the topology diagram.
2. On Peer_1, configure the peer IP in which this device will peer with:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.10.10.2
        next
    end
    set standalone-group-id 1
    set group-member-id 1
end
```

   If there are multiple peer IPs from the same peer, enter them as separate entries. If there are multiple peers, enter the IP of each peer in separate entries. See Optimizing FGSP session synchronization and redundancy on page 3467 for an example.

   Sessions by default will be synchronized over layer 3 on the interface in which the current unit connects to the peer's IP.
3. On Peer_2, configure session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.10.10.1
        next
    end
    set standalone-group-id 1
    set group-member-id 2
end
```

4. Configure identical firewall policies on each peer, such as for traffic going from the same incoming interface (port1) to the outgoing interface (port2).

To test the FGSP peer setup:

1. Initiate TCP traffic (like HTTP access) to go through Peer_1.
2. Check the session information:

```
# diagnose sys session filter src <IP_address>
```

```
# diagnose sys session list
```

3. Enter the same commands on Peer_2 to verify if the same session information appears.

Optional filters

Filters can be added to synchronize certain types of sessions that meet the filter criteria.

To add filters for session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit <id>
            config session-sync-filter
                set srcintf <interface>
                set dstintf <interface>
                set srcaddr <IPv4_address>
                set dstaddr <IPv4_address>
                set srcaddr6 <IPv6_address>
                set dstaddr6 <IPv6_address>
            end
        next
    end
end
```

Filter examples

To synchronize only sessions with a particular source subnet:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            config session-sync-filter
                set srcaddr 192.168.20.0/24
            end
        next
    end
end
```

To synchronize only sessions with a particular source address range:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            config session-sync-filter
                set srcaddr 192.168.20.10 192.168.20.20
            end
        next
    end
end
```

To synchronize only sessions with a particular destination address range:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            config session-sync-filter
                set dstaddr6 2001:db8:0:2::/64
            end
        next
    end
end
```

Session pickup

You can enable this setting to synchronize connectionless (UDP and ICMP) sessions, expectation sessions, and NAT sessions. If session pickup is not enabled, the FGSP does not share session tables for the particular session type, and sessions do not resume after a failover.

To enable UDP and ICMP session synchronization:

```
config system ha
    set session-pickup enable
    set session-pickup-connectionless enable
end
```

Session synchronization

You can specify interfaces used to synchronize sessions in L2 instead of L3 using the `session-sync-dev` setting. For more information about using session synchronization, see Session synchronization interfaces in FGSP on page 3455.

To configure session synchronization over redundant L2 connections:

```
config system standalone-cluster
    set session-sync-dev <interface 1> [<interface 2>] ... [<interface n>]
end
```

VDOM synchronization

When multi-VDOM mode is enabled, you can specify the peer VDOM and the synchronized VDOMs. The peer VDOM contains the session synchronization link interface on the peer unit. The synchronized VDOMs' sessions are synchronized using this session synchronization configuration.

To synchronize between VDOMs:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip <IP address>
            set peervd <vdom>
            set syncvd <vdom 1> [<vdom 2>] ... [<vdom n>]
        next
    end
end
```

Configuring unique group and member ID

FGSP can function between standalone FortiGates or between FGCP clusters. In either case, the `standalone-group-id` must match between FGSP members, and the `group-member-id` must be unique for each FGCP cluster. This allows each member to actively process traffic without any conflict.

To configure FGSP peering between standalone FortiGates, follow the steps under To configure a basic FGSP peer setup.

To configure FGSP peering between different FGCP clusters:

These instructions assume Peer_1 and Peer_2 are in cluster 1, and Peer_3 and Peer_4 are in cluster 2.

1. On Peer_1, configure the first group ID:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
end
```

2. On Peer_2, configure the same group ID but a different member ID:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 2
end
```

3. On Peer_3, configure the second group ID:

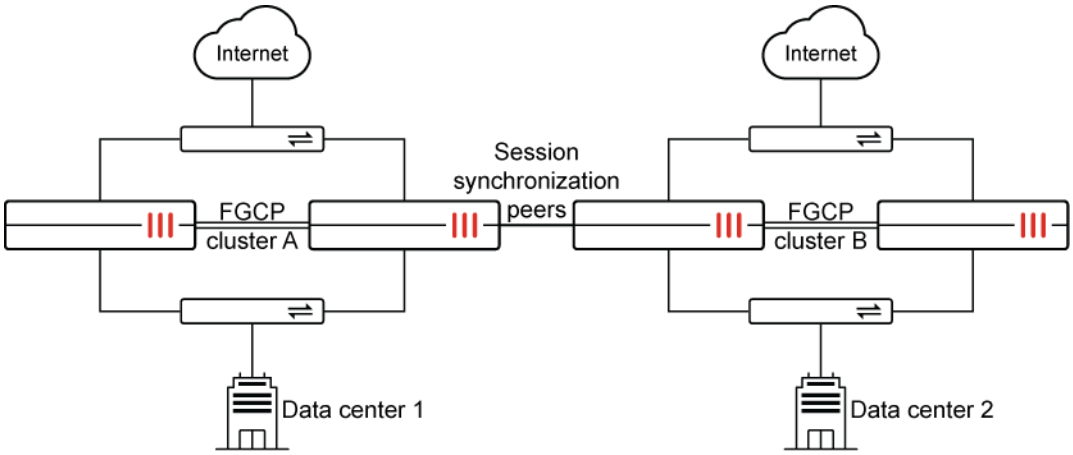
```
config system standalone-cluster
    set standalone-group-id 2
    set group-member-id 1
end
```

4. On Peer_4, configure the same group ID but a different member ID:

```
config system standalone-cluster
    set standalone-group-id 2
    set group-member-id 2
end
```

Synchronizing sessions between FGCP clusters

Synchronizing sessions between FGCP clusters is useful when data centers in different locations are used for load balancing, and traffic must be shared and flow freely based on demand.



There are some limitations when synchronizing sessions between FGCP clusters:

- All FortiGates must have the same model and generation, hardware configuration, and FortiOS version.
- A total of 16 clusters can share sessions.
- The configurations related to session tables should match. For example, the logical names used in firewall policies, IPsec interface names, VDOM names, firewall policy tables, and so on.

To configure session synchronization between two clusters:

1. Configure the two clusters (see HA active-passive cluster setup on page 3357 or HA active-active cluster setup on page 3363).
2. On cluster A, configure the peer IP for the interface:

```
config system interface
    edit "port5"
        set vdom "root"
        set ip 10.10.10.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
    next
end
```

   In this example, cluster A uses port5 and its IP address, 10.10.10.1, is reachable from another cluster.
3. On cluster A, configure FGSP, including cluster and session synchronization:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 0
    set session-sync-dev <interface>
    config cluster-peer
        edit 1
            set peerip 10.10.10.2
        next
    end
end
```

The `standalone-group-id` must match between FGSP members. The `group-member-id` is unique for each FGCP cluster. `session-sync-dev` is an optional command to specify the interfaces to sync sessions.

4. On cluster B, configure the peer IP for the interface:

```
config system interface
    edit "port5"
        set vdom "root"
        set ip 10.10.10.2 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
    next
end
```

In this example, cluster B uses port5 and its IP address, 10.10.10.2, is reachable from another cluster.

5. On cluster B, configure FGSP, including cluster and session synchronization:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    set session-sync-dev <interface>
    config cluster-peer
        edit 1
            set peerip 10.10.10.1
        next
    end
end
```

Session synchronization interfaces in FGSP

When peering over FGSP, by default, the FortiGates or FGCP clusters share information over L3 between the interfaces that are configured with Peer IP addresses. When a session synchronization interface is configured and FGSP peers are directly connected on this interface, then session synchronization is done over L2, only falling back to L3 if the session synchronization interface becomes unavailable.

When FGSP peers are formed between standalone FortiGates, the session synchronization process is performed by the kernel with UDP encapsulation. When using a FGSP session synchronization interface, the synchronization process is also offloaded to the kernel, albeit more efficiently without the UDP encapsulation. Therefore, a fast, dedicated, and stable L2 connection is recommended for the session synchronization interface between the FGSP peers. For redundancy, multiple synchronization interfaces can be configured. The session synchronization interface or interfaces should always be the same on each FGSP peer.

The configurations related to session tables should match. For example, the logical names used in firewall policies, IPsec interface names, VDOM names, firewall policy tables, and so on.

To configure session-sync interfaces:

```
config system standalone-cluster
    set session-sync-dev <interface 1> [<interface 2>] ... [<interface n>]
    set layer2-connection {available | unavailable}
    set encryption {enable | disable}
end
```

The `layer2-connection` setting is for forwarded traffic between FGSP peers. Set it to `available` if the peer interface user for traffic forwarding is directly connected and supports L2 forwarding. See UTM inspection on asymmetric traffic in FGSP on page 3458 for more information.

Session synchronization in FGCP over FGSP

To provide full redundancy, FGCP clusters can be used in FGSP peering. This is called FGCP over FGSP. In these complex environments, as well as in high performance, low latency data centers, using the FGCP session synchronization interface is recommended, as it offloads the session synchronization process to the kernel. If FGCP uses session synchronization interfaces, FGSP must also be configured to use the same session synchronization interfaces.

To offload the session synchronization process to the kernel and synchronize sessions using connected interfaces directly:

```
config system ha
    set session-sync-dev <interface 1> [<interface 2>] ... [<interface n>]
end
```

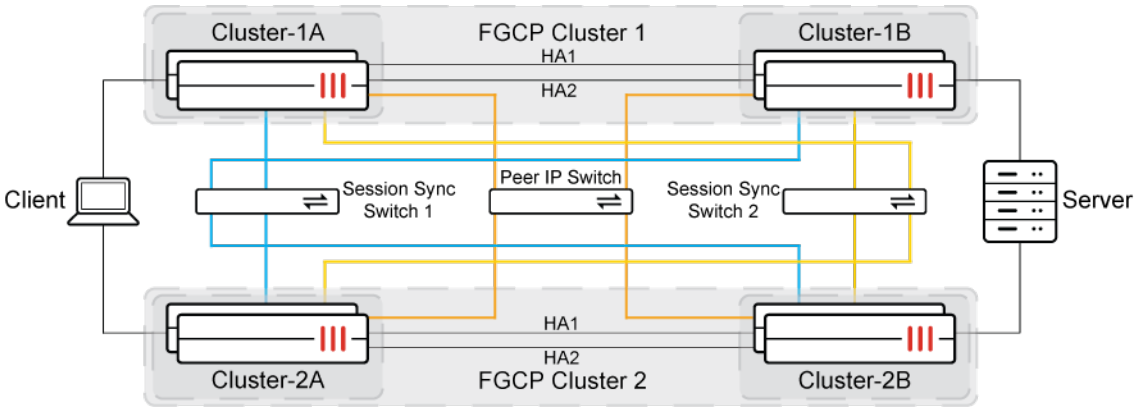
This is optimal when any of the following conditions apply:

- The session rate is high.
- Low network latency is required.
- There is a complex environment with FGCP clusters synchronizing over FGSP using L3 only in the presence of asymmetric traffic.

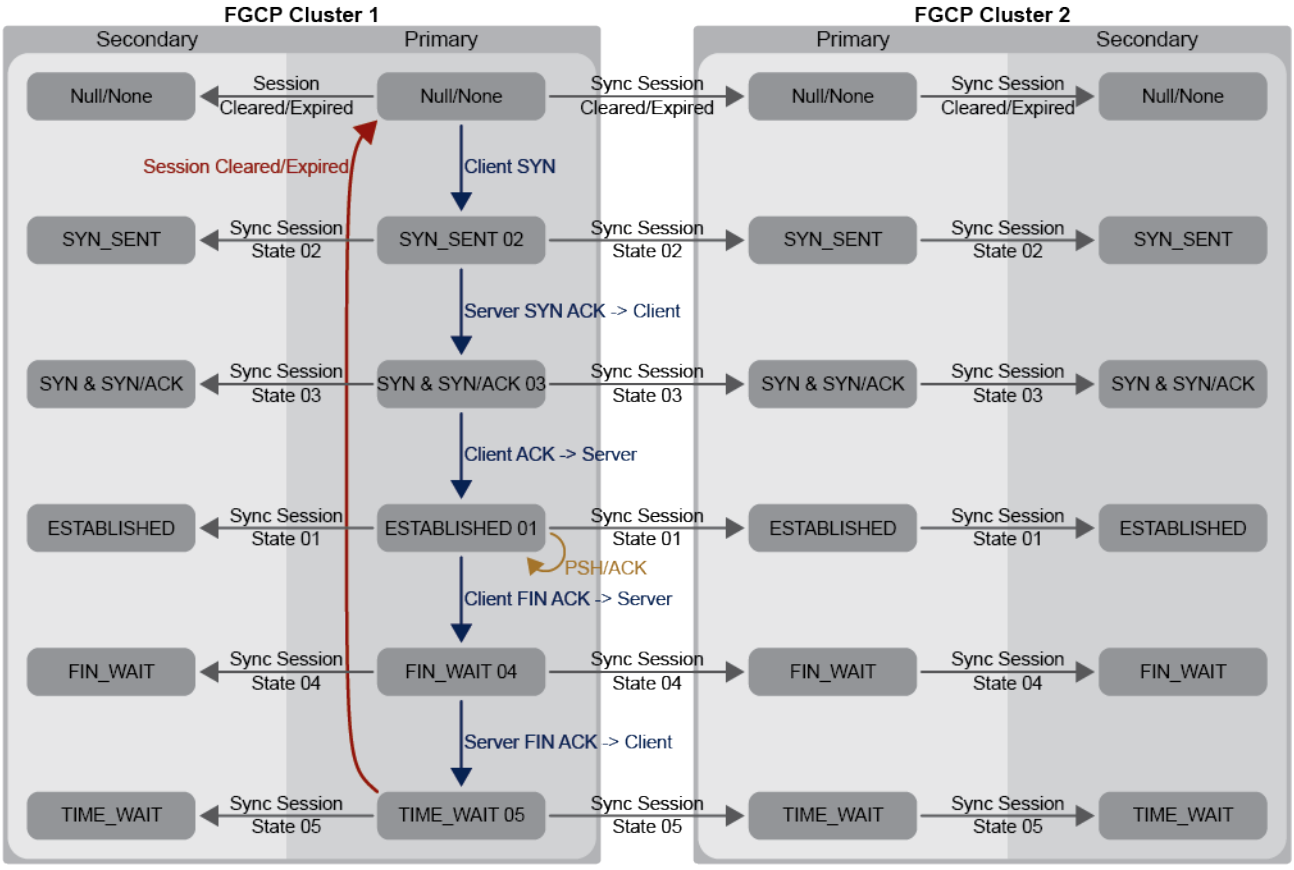
Configuring the FGCP `session-sync-dev` effectively offloads the session synchronization from the sessionsync daemon into the kernel and reduces the session synchronization latency.

When configuring both `system.standalone-cluster.session-sync-dev` and `system.ha.session-sync-dev` in FGCP over FGSP mode, the interfaces configured should be the same.

The following topology uses multiple session synchronization interfaces with a full mesh backbone to prevent any single point of failure.



The state diagram summarizes the session synchronization of a TCP session. It assumes that the session is connected over FGCP Cluster 1 and processed entirely by the primary unit, Cluster-1A.



1. The session starts with the Client SYN packet.
2. As the session is established, Cluster-1A synchronizes the session with Cluster-1B over the heartbeat interface, and with Cluster-2A over the session synchronization interface.
3. Cluster-2A then synchronizes the session with Cluster-2B over its heartbeat interface.
4. The process then repeats as it transitions to different states.

Session synchronization if links fail

In the previous topology, if any single session synchronization link fails on the primary member of each cluster, session synchronization will continue on the second link from the pair of session of session synchronization interfaces.

If the second link on the primary member of the same cluster then fails, L2 session synchronization over the session synchronization interface stops, and synchronization fails over to L3 between the peer IP links.

If the Peer IP link then fails, the FGSP peers are effectively disconnected, and no session synchronization will occur.

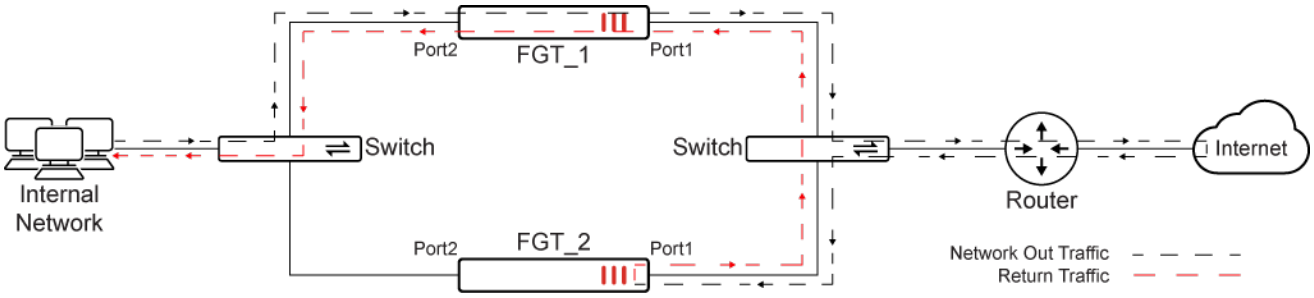
UTM inspection on asymmetric traffic in FGSP

When traffic passes asymmetrically through FGSP peers, UTM inspection can be supported by always forwarding traffic back to the session owner for processing. The session owner is the FortiGate that receives the first packet of the session.

In this example, traffic from the internal network first hits FGT_1, but the return traffic is routed to FGT_2. Consequently, traffic bounces from FGT_2 port1 to FGT_1 port1 using FGT_1's MAC address. Traffic is then inspected by FGT_1.

This example requires the following settings:

- The internal and outgoing interfaces of both FortiGates in the FGSP pair are in the same subnet.
- Both peers have layer 2 access with each other.



Due to the bouncing of traffic back to the session owner, performance degradation is expected.

To configure FGT_1:

1. Configure FGSP cluster attributes, including setting the peer IP to the IP address of FGT_2:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 0
    set layer2-connection available
    unset session-sync-dev
    config cluster-peer
```

```
        edit 1
            set peerip 10.2.2.2
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

To configure FGT_2:

1. Configure FGSP cluster attributes, including setting the peer IP to the IP address of FGT_1:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    set layer2-connection available
    unset session-sync-dev
    config cluster-peer
        edit 1
            set peerip 10.2.2.1
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
```

```
        set av-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

Results

Capture packets on FGT_2 to see that traffic bounced from FGT_2 to FGT_1 over the traffic interface.

```
FGT_2 # diagnose sniffer packet any 'host 10.1.100.15 and host 172.6.200.55' 4
interfaces=[any]
filters=[host 10.1.100.15 and host 172.16.200.55]
91.803816 port1 in 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
92.800480 port1 in 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
92.800486 port1 out 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
92.800816 port1 in 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
92.800818 port1 out 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
```

When defining a logical interface such as a Link Aggregate interface, all FGSP peers must define the interface in the same configuration order. If the configuration order does not match, the `phyindex` used by the HA module may not match, causing asymmetric traffic destined for an interface to be dropped.

To view the `phyindex` number for an interface, use the following command:

```
# diagnose system ha standalone-peers
```

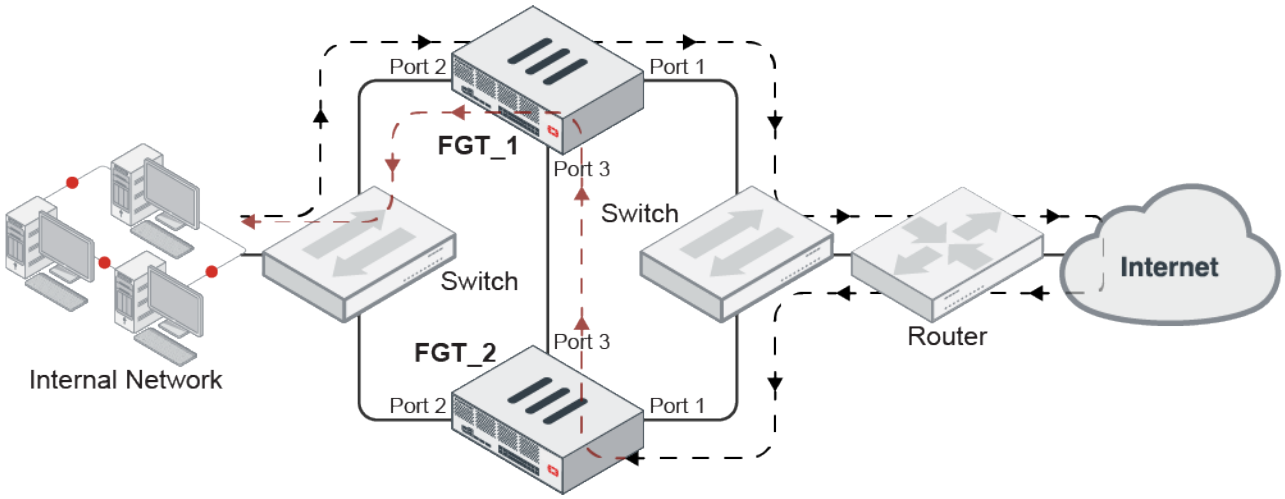
UTM inspection on asymmetric traffic on L3

When traffic passes asymmetrically through FGSP peers, UTM inspection can be supported by always forwarding traffic back to the session owner for processing. The session owner is the FortiGate that receives the first packet of the session.

For networks where L2 connectivity is not available, such as cloud environments, traffic bound for the session owner are forwarded through the peer interface using a UDP connection.

In this example, traffic from the internal network first hits FGT_1, but the return traffic is routed to FGT_2. Consequently, return traffic is packed and sent from FGT_2 to FGT_1 using UDP encapsulation between two peer interfaces (port 3). Traffic is then inspected by FGT_1.

Both of the FortiGates in this example are peering on interfaces in the same subnet, but the solution does not require the FortiGate peers to be on the same subnet or connected back-to-back.



Due to the bouncing of traffic back to the session owner, performance degradation is expected.

To configure FGT_1:

1. Configure FGSP cluster attributes, including setting the peer IP to the IP address of FGT_2:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 0
    set layer2-connection unavailable
    unset session-sync-dev
    config cluster-peer
        edit 1
            set peerip 10.2.2.2
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set logtraffic all
        set nat enable
```

```
    next
end
```

To configure FGT_2:

1. Configure FGSP cluster attributes, including setting the peer IP to the IP address of FGT_1:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    set layer2-connection unavailable
    unset session-sync-dev
    config cluster-peer
        edit 1
            set peerip 10.2.2.1
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

FGSP support for failover with asymmetric traffic and UTM

FortiGate can continue sessions on the active FGSP peers if the original FGSP peer, which initially received the session's first packet, becomes unavailable or unhealthy. It may go into this state due to:

- Device shutdown or reboot
- A monitored interface is down
- A ping-server monitor goes down

When the original peer for a session is unavailable or unhealthy and other peers receive the asymmetric traffic, this traffic does not bounce back to the original peer. Instead, it gets handled by the active FGSP peer. In the case of an unhealthy peer due to failed monitored interface or ping-server monitor, it will share its not-ready status over FGSP heartbeats so other peers will know not to bounce traffic back to it.

In the case of an unavailable peer, once the original FGSP peer is back online, it will perform session sync. While it is syncing, it will share a not-ready status over FGSP so peers will not bounce traffic back to it. Once session sync is complete, it will share a ready status and accept sessions to fail back to it.

UTM inspection will not occur during failover since the traffic must be scanned by the original peer only. Furthermore, during failback of the session to the original FGSP peer, the session will only be scanned if the policy is using flow-based inspection.

This ensures continuity and reliability of the network sessions, even if a device does not function as expected.

There are two options available in the `config system standalone-cluster` command on the CLI:

```
config system standalone-cluster
    set monitor-interface <interface name>
    set pingsvr-monitor-interface <interface name>
end
```

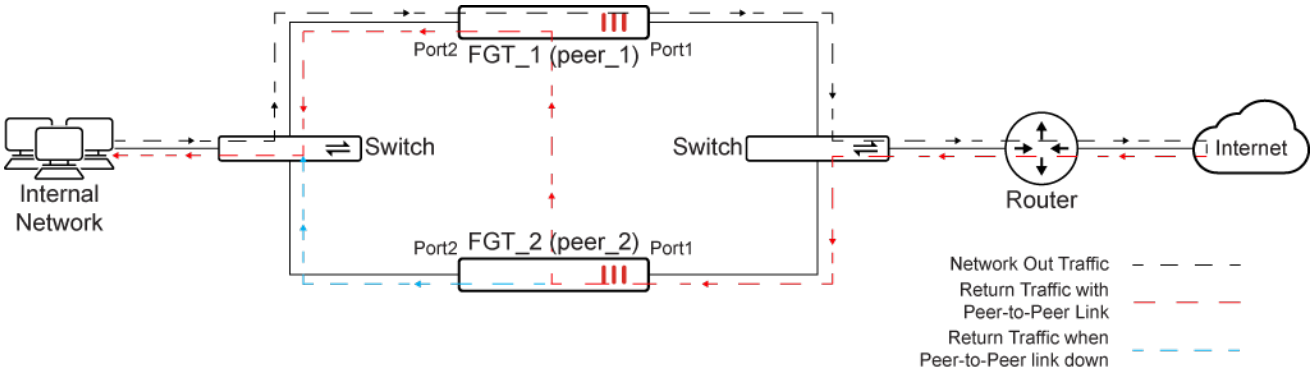
Example

In the following configurations, two peers are configured in FGSP, and a monitored interface and ping server monitor are configured.

```
config system link-monitor
    edit "1"
        set srcintf "wan1"
        set server "172.16.200.254"
    next
end
config system standalone-cluster
    set standalone-group-id 22
    set group-member-id 2
    config cluster-peer
        edit 1
            set peerip 10.2.2.2
            set hb-interval 20
            set hb-lost-threshold 60
        next
    end
    set monitor-interface "wan2"
    set pingsvr-monitor-interface "wan1"
end
```

Traffic originally passes through UTM inspection over *peer_1*. The return traffic is routed to *peer_2*, where it will bounce to *peer_1*, the original FGSP peer for inspection.

If *peer_1* becomes unavailable or unhealthy, traffic no longer bounces back to *peer_1*. Instead, it is failed over to *peer_2* for processing.



Monitor routing prefix for FGSP session failover

FGSP now supports another method for determining a FGSP peer as unhealthy, by monitoring the health of a routing prefix from RIP, OSPF or BGP. Using this method, FortiGate can prevent network isolation and blackholing by recognizing a critical data path is down. For instance, when peer 1's path to a certain network no longer exists in the routing table, it will share a not-ready status over FGSP heartbeats so other peers will know not to bounce traffic back to it.

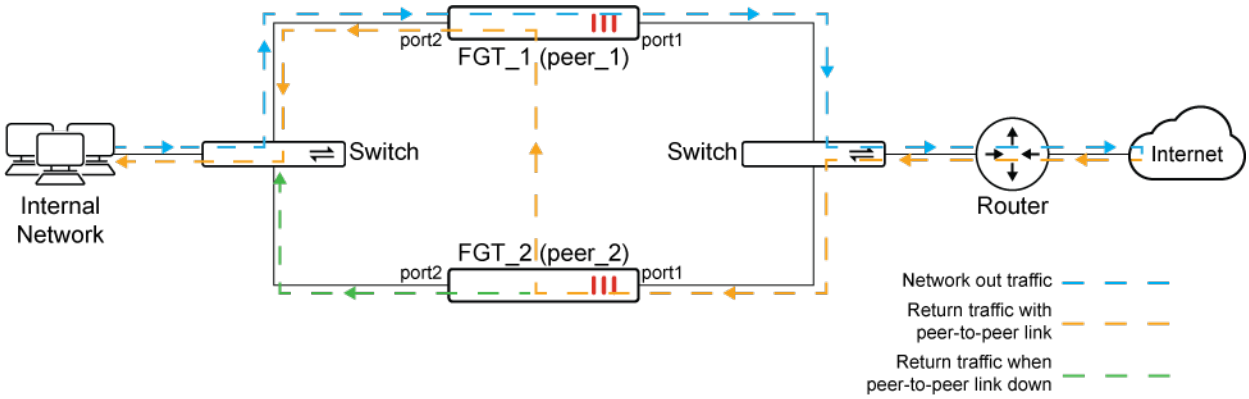
Multiple prefixes can be monitored. However, a bad health status on a prefix will trigger the entire peer as not-ready, not only the specific path. Furthermore, if traffic is failed over to the peer that is not the original owner of the session, then UTM inspection will not apply.

Route monitoring to FGSP peers can be configured in the CLI:

```
config system standalone-cluster
    config monitor-prefix
        edit <ID>
            set vdom <VDOM name>
            set vrf <VRF ID>
            set prefix <ip address and netmask>
        next
    end
end
```

Example

In the following configurations, two peers are configured in FGSP. Two routing prefixes are monitored. In the diagram below, traffic travels asymmetrically, but is eventually bounced back to the peer (FGT_1) where the traffic was initiated. This allows the traffic to continue its UTM inspection through the peer.



In the scenario that one of the peers (FGT_1) no longer sees a route to a prefix, disrupting the flow of traffic, instead of causing network isolation and blackholing by bouncing the traffic back to the peer (FGT_1), traffic instead continues through the healthy peer (FGT_2).

Note that in this case, traffic does not get scanned by UTM on the healthy peer (FGT_2).

To configure routing prefix monitoring to FGSP:

1. Configure two peers in FGSP:

```
config system standalone-cluster
    set standalone-group-id 1
    config cluster-peer
        edit 1
            set peerip 10.2.2.2
        next
    end
    config monitor-prefix
        edit 1
            set vdom "root"
            set prefix 192.168.2.0 255.255.255.0
        next
        edit 2
            set vdom "root"
            set prefix 20.1.1.0 255.255.255.0
        next
    end
end
```

2. Verification:
   a. FGT_1 and FGT_2 both learn the network prefix of 20.1.1.0/24 over RIP from the upstream router.

```
FGT_1 #  get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       V - BGP VPNv4
```

```
       * - candidate default

Routing table for VRF=0
S*      0.0.0.0/0 [10/0] via 172.16.200.254, wan1, [1/0]
C       10.1.100.0/24 is directly connected, port1
C       10.2.2.0/24 is directly connected, ha1
R       20.1.1.0/24 [120/2] via 172.16.200.3, wan1, 00:01:46, [1/0]
C       172.16.200.0/24 is directly connected, wan1
C       192.168.2.0/24 is directly connected, mgmt
```

b. As such, the health status on *peer_1* for both prefixes display healthy=1:

```
FGT_1 # diagnose test application sessionsync 1
HA is not enabled
sync context:
        sync-enabled=0, sync-tcp=1, sync-nat=0
        sync-other=1, sync-exp=1, standalone-sync=1, mtu=0
        ipsec-tun-sync=1, encrypt-enabled=0
fgsp-peers-num=1, kernel-filters-num=1
fgsp-peers:
        vdom=0, ip/port=10.2.2.2:708
fgsp_route_health=1
        mon_prefix: vdom=root vrf=0, prefix=192.168.2.0(255.255.255.0) healthy=1
        mon_prefix: vdom=root vrf=0, prefix=20.1.1.0(255.255.255.0) healthy=1
```

c. On *peer_2*, it sees the health status of *peer_1* as ready:

```
FGT_2 # diagnose sys ha standalone-peers
Group=1, ID=2
Detected-peers=1
Peer ready bitmap=0000000100000000
Kernel standalone-peers: num=1.
peer0: vfid=0, peerip:port = 10.2.2.1:708, standalone_id=0, ready=1
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
…
```

d. Traffic originally passes through UTM inspection over *peer_1*. The return traffic is routed to *peer_2*, where it will bounce to *peer_1*, the original FGSP peer for inspection.

e. In the event that the network prefix 20.1.1.0/24 becomes unavailable from *peer_1*:

```
FGT_1 # get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       V - BGP VPNv4
       * - candidate default
Routing table for VRF=0
S*      0.0.0.0/0 [10/0] via 172.16.200.254, wan1, [1/0]
C       10.1.100.0/24 is directly connected, port1
C       10.2.2.0/24 is directly connected, ha1
```

```
C       172.16.200.0/24 is directly connected, wan1
C       192.168.2.0/24 is directly connected, mgmt
```

f. Its health status immediately changes to unhealthy (`healthy=0`).

```
# diagnose test application sessionsync 1
HA is not enabled
sync context:
        sync-enabled=0, sync-tcp=1, sync-nat=0
        sync-other=1, sync-exp=1, standalone-sync=1, mtu=0
        ipsec-tun-sync=1, encrypt-enabled=0
fgsp-peers-num=1, kernel-filters-num=1
fgsp-peers:
        vdom=0, ip/port=10.2.2.2:708
fgsp_route_health=0
        mon_prefix: vdom=root vrf=0, prefix=192.168.2.0(255.255.255.0) healthy=1
        mon_prefix: vdom=root vrf=0, prefix=20.1.1.0(255.255.255.0) healthy=0
```

g. *peer_2* also detects the not-ready status over the heartbeat packets (`ready=0`):

```
FGT_2 (Interim)# diagnose sys ha standalone-peers
Group=1, ID=2
Detected-peers=1
Peer ready bitmap=0000000000000000
Kernel standalone-peers: num=1.
peer0: vfid=0, peerip:port = 10.2.2.1:708, standalone_id=0, ready=0
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
```

h. Upon *peer_1* becoming unavailable or unhealthy, traffic no longer bounces back to *peer_1*. Instead, it is failed over to *peer_2* for processing.

Encryption for L3 on asymmetric traffic in FGSP

In scenarios where asymmetric routing between FGSP members occurs, the return traffic can be encrypted and routed back to the session owner on Layer 3 (L3).

To encrypt L3 traffic in FGSP:

1. Run the following on both FortiGates:

```
config system standalone-cluster
    set encryption enable
    set psksecret xxxxxxxxx
end
```

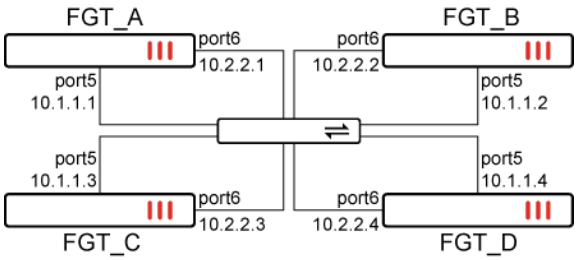
Optimizing FGSP session synchronization and redundancy

In this example where standalone FortiGates are peered in FGSP, using `session-sync-dev` optimizes session synchronization as it eliminates UDP encapsulation and offloads session synchronization processing to the

kernel. FGSP session synchronization can be supported to handle heavy loads.

For more information about session synchronization, see Session synchronization interfaces in FGSP on page 3455.

Topology



In this topology, there are three FGSP peer groups for each FortiGate. Sessions are synchronized between each FortiGate and its peer groups. Redundancy is achieved by using two dedicated session sync device links for each peer setup. There are a total of six peer IPs for each session synchronization device link in each FGSP peer. When one link is fails, session synchronization is not affected.

For optimization, `sync-packet-balance` is enabled to distribute synchronization packets processing to multiple CPUs. The session synchronization process is offloaded to the kernel, and sessions are synchronized over layer 2 over the connected interfaces (`set session-sync-dev "port5" "port6"`). Jumbo frame MTU 9216 is configured on each session synchronization device link to reduce the number of packets; however, setting MTU to 9216 is entirely optional.

To configure FGT_A:

1. Configure HA:

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.1/24
        set mtu-override enable
        set mtu 9216
    next
    edit port6
        set ip 10.2.2.1/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.1.1.2
        next
        edit 2
            set peerip 10.2.2.2
        next
        edit 3
            set peerip 10.1.1.3
        next
        edit 4
            set peerip 10.2.2.3
        next
        edit 5
            set peerip 10.1.1.4
        next
        edit 6
            set peerip 10.2.2.4
        next
    end
end
```

To configure FGT_B:

1. Configure HA:

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.2/24
        set mtu-override enable
        set mtu 9216
    next
    edit port6
        set ip 10.2.2.2/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.1.1.1
        next
        edit 2
            set peerip 10.2.2.1
        next
        edit 3
            set peerip 10.1.1.3
        next
        edit 4
            set peerip 10.2.2.3
        next
        edit 5
            set peerip 10.1.1.4
        next
        edit 6
            set peerip 10.2.2.4
        next
    end
end
```

To configure FGT_C:

1. Configure HA:

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.3/24
        set mtu-override enable
    set mtu 9216
    next
    edit port6
        set ip 10.2.2.3/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.1.1.1
        next
        edit 2
            set peerip 10.2.2.1
        next
        edit 3
            set peerip 10.1.1.2
        next
        edit 4
```

```
            set peerip 10.2.2.2
        next
        edit 5
            set peerip 10.1.1.4
        next
        edit 6
            set peerip 10.2.2.4
        next
    end
end
```

To configure FGT_D:

1. Configure HA:

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.4/24
        set mtu-override enable
        set mtu 9216
    next
    edit port6
        set ip 10.2.2.4/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.1.1.1
        next
        edit 2
            set peerip 10.2.2.1
        next
        edit 3
            set peerip 10.1.1.2
        next
        edit 4
            set peerip 10.2.2.2
        next
        edit 5
            set peerip 10.1.1.3
        next
        edit 6
            set peerip 10.2.2.3
        next
    end
end
```

Firmware upgrades in FGSP

FGSP supports cluster members using different firmware versions with some limitations. This allows for cluster members to be upgraded without needing to remove them from the cluster or network. You can find details on the requirements to support different firmware versions in the cluster in Different FortiGate models on page 3474.

If your cluster's current and target firmware are supported, you may upgrade each member one by one without any need to disconnect the member.

Otherwise, the following steps are recommended to upgrade the firmware of FortiGates in an FGSP deployment. Follow these steps whether or not you have enabled standalone configuration synchronization.

This example FGSP deployment has two FortiGates, FGT-1 and FGT-2.

To upgrade the firmware in an FGSP deployment:

1. Switch all traffic to FGT-1:
   a. Configure the load balancer or router that distributes traffic between the FortiGates to send all traffic to FGT-1.
2. Disconnect FGT-2 from the network.
   Make sure to also disconnect the interfaces that allow heartbeat and synchronization communication with FGT-1. This is to prevent FGT-2 from communicating with FGT-1.
3. Upgrade the firmware on FGT-2.
4. Reconnect the traffic interfaces on FGT-2, but not the interfaces used for heartbeat and synchronization communication with FGT-1.
5. Switch all traffic to the newly upgraded FGT-2:

   a. Configure the load balancer or router that distributes traffic between the FortiGates to send all traffic to FGT-2.
6. Upgrade the firmware on FGT-1 (while heartbeat and synchronization communication with FGT-2 remains disconnected).
7. Reconnect the FGT-2 interfaces that allow heartbeat and synchronization communication between FGT-1 and FGT-2.
8. Restore the original traffic distribution between FGT-1 and FGT-2:
   a. Configure the load balancer or router to distribute traffic to both FortiGates in the FGSP deployment.

FGSP session synchronization between different FortiGate models or firmware versions

FGSP HA deployments are generally meant for interoperating between FortiGates with the same model and firmware version. However, situations may arise where individual members or FGCP clusters running over FGSP use different models or firmware versions. For example, to avoid downtime while upgrading the members, some FGSP members or clusters may be upgraded first and then re-join the FGSP peers after a successful upgrade. Or while performing maintenance, sessions may need to be offloaded to a temporary member or FGCP cluster of a different model.

Being able to perform FGSP session synchronization between members of different models or firmware versions is helpful to transition the traffic smoothly and causes minimal disruptions. This topic outlines requirements to be aware of before assessing whether FGSP session synchronization may work between members with different models or firmware versions.

Different FortiGate models

The general guideline is to only use FortiGate models in a similar tier and family. Vastly different models have different performance and capabilities, which may not be compatible. The goal is for two models to have similar capabilities so that data structures used in session synchronization will match, and are capable of delivering similar performance.

When considering FGSP session synchronization between two FortiGates, ensure that:

- The FortiGates use the same 32-bit kernel or 64-bit kernel.
- The FortiGates use the same type of CPU (such as ARM or x86).
- For network interfaces:
  - The same type of physical interface should be used on each member.
  - The physical interfaces should be capable of the same speeds.
- The device memory should be similar in size. If the FortiGates have vastly different memory sizes, their performance may be different if one device supports more sessions than the other.
- The configurations related to session tables should match. For example, the logical names used in firewall policies, IPsec interface names, VDOM names, firewall policy tables, and so on.

Different firmware versions

When operating in FGSP, the firmware needs to have compatible data structures and session synchronization packet headers. The firmware is generally able to handle different data structures between old and new FortiOS sessions. Session synchronization packets are typically the same between versions.

Note the following exceptions and guidelines when assessing FGSP session synchronization compatibility between different firmware versions:

- FortiOS 7.0.2 added support for widening the HA virtual MAC address range. This change updated the session synchronization packet header structure.
  - FortiGates running 7.0.2 or later, and FortiGates running 7.0.1 or earlier will not accept session synchronization packets from each other.
- If the traffic uses a new feature only available in a newer FortiOS version, it may not work when synchronized to an older FortiOS version.
  - For example, PFCP (Packet Forwarding Control Protocol) support was added in 7.0.1, and a PFCP profile name was added to the sessions. When the sessions are synchronized to an older firmware version, the PFCP profile name will be lost and the sessions will not be able to handle the traffic as they would in 7.0.1.
- FortiOS 7.2.1 added `group-id` into the protocol header. This means that FortiGates running 7.2.1 and later cannot perform session synchronization with FortiGates running earlier versions.

Session synchronization interfaces

Session synchronization between FGSP members uses an L3 connection over the peer IP by default.

Session synchronization between FGSP members uses an L2 connection when a session synchronization interface (`session-sync-dev`) is used. The synchronization process is also offloaded to the kernel.

FGSP is also compatible with FortiGate VRRP.

Applying the session synchronization filter only between FGSP peers in an FGCP over FGSP topology

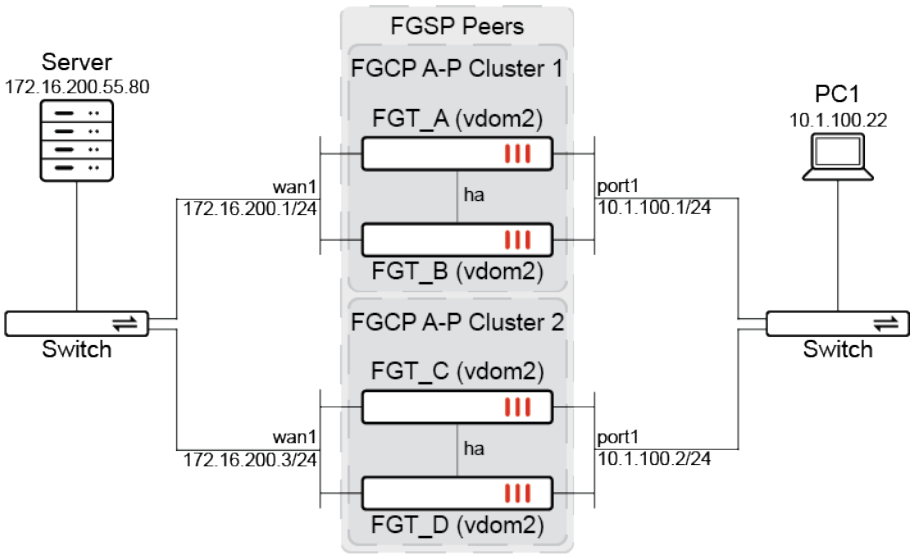
When the session synchronization filter is applied on FGSP, the filter will only affect sessions synchronized between the FGSP peers. When virtual clustering is used, sessions synchronized between each virtual cluster can also be synchronized to FGSP peers. All peers' `syncvd` must be in the same HA virtual cluster.

Example

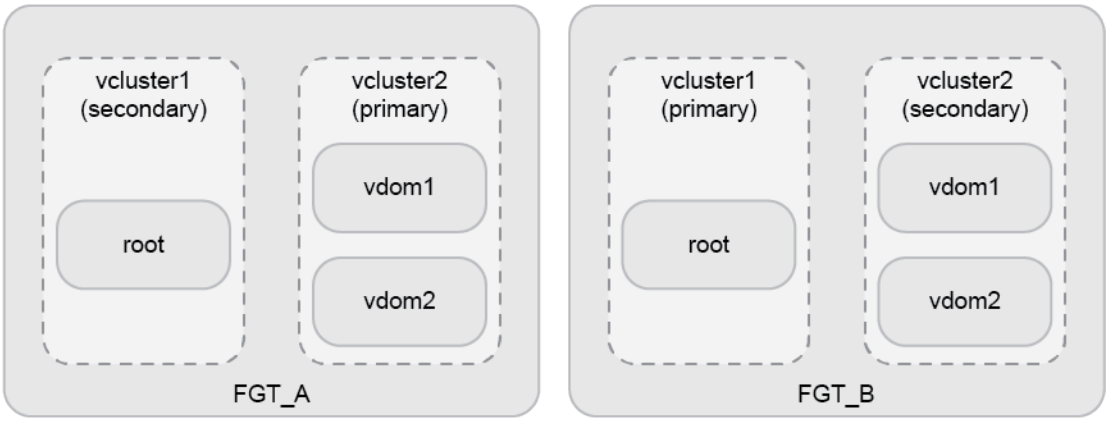
In this example, there is a simplified configuration where there is no router or load balancer performing balancing between the FGSP peers, but it demonstrates the following:

- When sessions pass through FGCP A-P Cluster 1, all sessions are synchronized between the FGT_A and FGT_B regardless of the session synchronization filter.
- Session synchronization between the FGSP peers (FGCP A-P Cluster 1 and 2) only occurs for the service specified in the filter, which is HTTP/80.
- The preceding behavior is applicable when virtual clustering is configured. This example focuses on vdom2, which belongs to vcluster2. FGT_A is the primary for vcluster2.

Each FGSP A-P cluster is connected on ha as the FGCP cluster heartbeat device. The FGSP peers are connected on mgmt over 10.1.1.1-2/24.



Virtual clustering between FGT_A and FGT_B:



Interface	FGT_A	FGT_B	FGT_C	FGT_D
wan1	172.16.200.1/24	172.16.200.1/24	172.16.200.3/24	172.16.200.3/24
port1	10.1.100.1/24	10.1.100.1/24	10.1.100.2/24	10.1.100.2/24
mgmt	10.1.1.1/24	10.1.1.1/24	10.1.1.2/24	10.1.1.2/24
ha	FGCP cluster heartbeat device		FGCP cluster heartbeat device	

To configure the HA clusters:

1. Configure FGCP A-P Cluster 1 (use the same configuration for FGT_A and FGT_B):

```
config system ha
    set group-id 146
    set group-name "FGT_HA1"
    set mode a-p
    set password **********
```

```
    set hbdev "wan2" 100 "ha" 50
    set session-pickup enable
    set session-pickup-nat enable
    set vcluster-status enable
    config vcluster
        edit 1
            set override enable
            set priority 25
            set monitor "wan1" "port1"
            set vdom "root"
        next
        edit 2
            set override disable
            set priority 150
            set monitor "wan1"
            set vdom "vdom2" "vdom1"
        next
    end
end
```

2. Configure FGCP A-P Cluster 2 (use the same configuration for FGT_C and FGT_D):

```
config system ha
    set group-id 200
    set group-name "FGT_HA2"
    set mode a-p
    set password **********
    set hbdev "wan2" 100 "ha" 50
    set session-pickup enable
    set session-pickup-nat enable
    set vcluster-status enable
    config vcluster
        edit 1
            set override enable
            set priority 120
            set monitor "wan1" "port1"
            set vdom "root"
        next
        edit 2
            set override disable
            set priority 150
            set monitor "wan1"
            set vdom "vdom2" "vdom1"
        next
    end
end
```

To configure the FGSP peers:

1. Configure FGT_A:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    config cluster-peer
        edit 1
            set peervd "vdom2"
            set peerip 10.1.1.2
            set syncvd "vdom2"
            config session-sync-filter
                config custom-service
                    edit 1
                        set dst-port-range 80-80
                    next
                end
            end
        next
    end
end
```

   The configuration is automatically synchronized to FGT_B.

2. Configure FGT_C:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 2
    config cluster-peer
        edit 1
            set peervd "vdom2"
            set peerip 10.1.1.1
            set syncvd "vdom2"
            config session-sync-filter
                config custom-service
                    edit 1
                        set dst-port-range 80-80
                    next
                end
            end
        next
    end
end
```

   The configuration is automatically synchronized to FGT_D.

To verify the configuration:

1. Verify the FGSP peer information on Cluster 1:

```
FGT_A (global) # diagnose sys ha fgsp-zone
Local standalone-member-id: 1
FGSP peer_num = 1
        peer[1]: standalone-member-id=2, IP=10.1.1.2, vd=vdom2, prio=1
```

2. Verify the FGSP peer information on Cluster 2:

```
FGT_C (global) # diagnose sys ha fgsp-zone
Local standalone-member-id: 1
FGSP peer_num = 1
        peer[1]: standalone-member-id=1, IP=10.1.1.1, vd=vdom2, prio=1
```

3. Initiate two sessions, HTTP and SSH.
4. Verify that the HTTP session is synchronized from Cluster 1 to Cluster 2.
   a. Verify the session list of vdom2 on FGT_A:

```
FGT_A (vdom2) # diagnose sys session list

session info: proto=6 proto_state=01 duration=693 expire=3593 timeout=3600 flags=00000000

no_ofld_reason:
total session 1
```

Session synchronization filters are designed to be configured symmetrically on all of the FGSP peers. In cases where the filters are configured asymmetrically, note the following differences:

- In an FGCP over FGSP topology, session filtering will be applied on the FGSP peer that has the filtering configured and is receiving the session synchronization.
- In an FGSP topology between standalone peers, the filtering will be applied on the FGSP peer that has the filtering configured and is sending out the session synchronization.

FGSP static site-to-site IPsec VPN setup

When configuring static site-to-site IPsec VPN between FGSP FortiGates and a remote gateway, the FGSP peers must have the `passive-mode` setting enabled in the `vpn ipsec phase1-interface` configuration to function as an IPsec responder. This is a required configuration in this setup. If the FGSP peers act as initiators for tunnel setup when `passive-mode` is disabled and both FGSP peers initiate the tunnel with the same gateway IP, the remote IPsec gateway will be unable to process this, and the tunnel negotiation will fail. Likewise, when a failover occurs in FGSP and a new peer begins to initiate tunnel traffic, the remote IPsec gateway will be unable to handle the traffic initiated from the new peer.

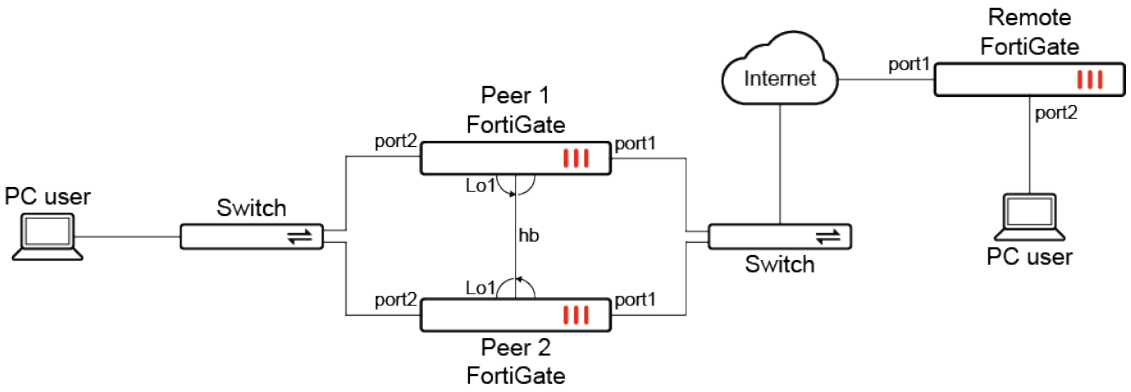
Enabling `passive-mode` ensures the FGSP peers only respond to tunnel initiations from the remote IPsec gateway and do not initiate tunnel negotiations. This way, the preceding situations will not occur.

For dynamic tunnel configuration examples on FGSP peers, see the following topics:

- FGSP per-tunnel failover for IPsec on page 3484
- FGCP over FGSP per-tunnel failover for IPsec on page 3490
- Allow IPsec DPD in FGSP members to support failovers on page 3500

Example

In this example, the FGSP peer has a loopback interface (Lo1) configured with the same IP address (192.168.202.31/32). All other interface IP addresses are different between the peers.



To configure IPsec on the FGSP peer FortiGates:

1. Configure the phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "IPsec"
        set type static
        set interface "port1"
        set ike-version 2
        set local-gw 192.168.202.31
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set passive-mode enable
        set remote-gw 10.10.100.100
    next
end
```

2. Configure the phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "IPSec"
        set phase1name "IPsec"
        set proposal aes256-sha256
        set dhgrp 14
    next
end
```

To configure IPsec on the remote FortiGate:

1. Configure the phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "IPsec"
        set type static
        set interface "port1"
        set ike-version 2
        set net-device disable
        set proposal aes256-sha256
```

```
        set dhgrp 14
        set remote-gw 192.168.202.31
    next
end
```

2. Configure the phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "IPSec"
        set phase1name "IPsec"
        set proposal aes256-sha256
        set dhgrp 14
    next
end
```

FGSP per-tunnel failover for IPsec
