In this scenario, PC1 connected to Spoke 1 initiates an ICMP ping destined for PC1 connected to Spoke 2. Therefore, this user traffic matches SD-WAN rule 1 and triggers shortcut path selection and establishment.

On Spoke 1, in the IKE debug (diagnose debug application ike -1), debug messages indicate that multiple direct shortcut-query packets are being sent to Spoke 2:

```
ike :VWL_ADVPN_MSG_T_TRIGGER
ike V=root:0 looking up shortcut by addr 172.31.80.2, resp-name:H1_T11, name H1_T22, peer-addr
172.31.3.101:0
ike V=root:0:H1_T22: send shortcut-query
...
ike :VWL_ADVPN_MSG_T_TRIGGER
ike V=root:0 looking up shortcut by addr 172.31.81.2, resp-name:H1_T22, name H1_T22, peer-addr
172.31.3.105:0
ike V=root:0:H1_T22: send shortcut-query
...
ike :VWL_ADVPN_MSG_T_TRIGGER
ike V=root:0 looking up shortcut by addr 172.31.82.2, resp-name:H1_T33, name H1_T33, peer-addr
172.31.4.101:0
ike V=root:0:H1_T33: send shortcut-query
...
```

From the diagnostic command on Spoke 1, observe that multiple shortcuts are triggered in **bold** based on the ADVPN 2.0 path management calculation where in-SLA overlays within the same transport group were selected.

```

  Src address(1):
        10.0.0.0-10.255.255.255
  Dst address(1):
        10.0.0.0-10.255.255.255
```

Example SD-WAN overlay placeholders using ADVPN 2.0

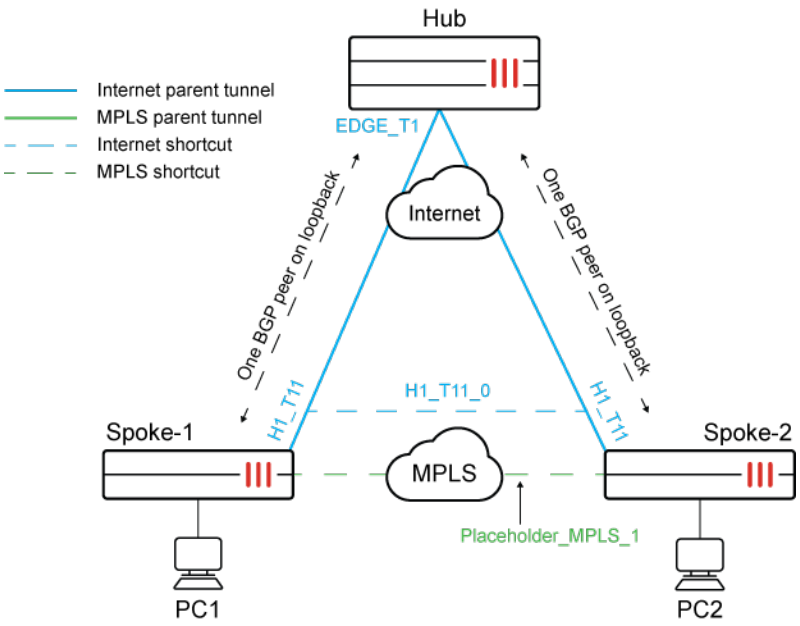
In a typical hub and spoke SD-WAN configuration, the hub uses the same underlay transports as the spokes. However, in unique circumstances, spokes may use different transports than the hub. For example, spokes may have direct MPLS connections that are not connected to the hub. Hubs are not necessarily connected to all the same underlay transports as spokes. In these instances, ADVPN 2.0 can use overlay placeholders to trigger shortcuts between spokes over transports to which hubs are not connected. As long as the path is in-SLA and is the best quality, ADVPN 2.0 uses the overlay placeholders to establish a shortcut tunnel.

In this SD-WAN example, the Hub, Spoke-1, and Spoke-2 all have broadband WAN connections. However, Spoke-1 and Spoke-2 have an additional MPLS connection between them. With ADVPN 2.0 enabled, Spoke-1 and Spoke-2 have regular parent tunnels (H1_T11) to the Hub. Spoke-1 and Spoke-2 also have placeholder parent tunnels configured (Placeholder_MPLS_1), where `auto-discovery-dialup-placeholder` is enabled

and `remote-gateway` isn't statically specified. As a placeholder tunnel, no connection is established between the spoke and the hub. Instead, the tunnel interface is utilized in the SD-WAN configurations as if it were a regular overlay because shortcuts can be established between spokes in a placeholder overlay.

Traffic is sent from PC-1 to PC-2, and the first bit of traffic goes through the Hub and triggers `SHORTCUT_QUERY/SHORTCUT_REPLY` exchange with the Hub. When Spoke-1 receives `SHORTCUT_REPLY` message, which includes SD-WAN information about Spoke-2, Spoke-1 calculates and creates the shortcut between regular parent tunnels and triggers a shortcut between the placeholder parent tunnels too.

Health-checks, which are automatically running on the regular shortcut and the placeholder shortcut, help decide which interface to use for forwarding the remaining traffic.



Settings on the spoke relevant to the example:

```
config vpn ipsec phase1-interface
    edit <placeholder_phase1_interface_name>
        set type dynamic
        ...
        set net-device enable
        ...
        set auto-discovery-dialup-placeholder enable
    next
end
```

To enable overlay placeholder tunnels on Spoke-1 and Spoke-2:

1. Configure key components on Spoke-1:
   a. Configure a parent tunnel and a placeholder tunnel:
      Tunnel H1_T11 is the parent tunnel, and tunnel Placeholder_MPLS_1 is the placeholder tunnel:

```
config vpn ipsec phase1-interface
    edit "H1_T11"
        set interface "port1"
        set ike-version 2
        set keylife 28800
        set peertype any
        set net-device enable
        set exchange-ip-addr4 172.31.0.65
        set proposal aes256gcm-prfsha384
        set add-route disable
        set dpd on-idle
        set idle-timeout enable
        set idle-timeoutinterval 5
        set auto-discovery-receiver enable
        set encapsulation vpn-id-ipip
        set network-overlay enable
        set network-id 11
        set transport udp
        set remote-gw 172.31.1.1
        set psksecret ENC

        set dpd-retryinterval 60
    next
```

```
end
```

b. Configure SD-WAN:

Enable ADVPN 2.0 and health-checks for the overlay. Configure the SD-WAN members and their transport groups.

```
config system sdwan
    set status enable
    config zone
        edit "overlay"
            set advpn-select enable
            set advpn-health-check "HUB"
        next
    end
    config members
        edit 4
            set interface "H1_T11"
            set zone "overlay"
            set source 172.31.0.65
            set priority 10
            set transport-group 1
        next
        edit 13
            set interface "Placeholder_MPLS_1"
            set zone "overlay"
            set source 172.31.0.65
            set priority 10
            set transport-group 2
        next
    end
    config health-check
        edit "HUB"
            set server "172.31.100.100"
            set members 4 13
            config sla
                edit 1
                    set link-cost-factor latency
                    set latency-threshold 100
                next
            end
        next
    end
    config service
        edit 1
            set name "1"
            set mode sla
            set dst "spoke-2_LAN-1"
            set src "spoke-1_LAN-1"
            config sla
                edit "HUB"
                    set id 1
                next
```

```
            end
            set priority-members 4 13
        next
    end
end
```

2. Configure key components on Spoke-2:
   a. Configure a parent tunnel and a placeholder tunnel:
   Tunnel H1_T11 is the parent tunnel, and tunnel Placeholder_MPLS_1 is the placeholder tunnel:

```
   config vpn ipsec phase1-interface
   edit "H1_T11"
        set interface "port1"
        set ike-version 2
        set keylife 28800
        set peertype any
        set net-device enable
        set exchange-ip-addr4 172.31.0.66
        set proposal aes256gcm-prfsha384
        set add-route disable
        set dpd on-idle
        set idle-timeout enable
        set idle-timeoutinterval 5
        set auto-discovery-receiver enable
        set encapsulation vpn-id-ipip
        set network-overlay enable
        set network-id 11
        set transport udp
        set remote-gw 172.31.1.1
        set psksecret ENC
7tP6FktH3z3nIpiGoANS/PbxfMOeLf0KCp65MbG2/yBmeAZz0XXcF9XMbnfBtaWhZhoTnGx086ST1aRmLDxCfVu/BM
6S+j1XOUSxSZb6xgwRoaQsFTFaXq/8PYjUzJK7SdPZiJDsCrGaslMR/mTLzFTasA4y9YGteJM+tELW5K0C6Ntrwlq8
UnAtrdFMGN/3BrLNyllmMjY3dkVA
        set dpd-retryinterval 5
    next
    edit "Placeholder_MPLS_1"
        set type dynamic
        set interface "port3"
        set ike-version 2
        set keylife 28800
        set peertype any
        set net-device enable
        set exchange-ip-addr4 172.31.0.66
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set idle-timeout enable
        set idle-timeoutinterval 5
        set auto-discovery-receiver enable
        set auto-discovery-dialup-placeholder enable
```

```
        set encapsulation vpn-id-ipip
        set network-overlay enable
        set network-id 250
        set transport udp
        set psksecret ENC
Un++iggqXo1wU8fAArjS9JY5rsAcd8+Xw3WR7MtRVLU0BpXT56bAwrP6wQ4gpMt32ABTQ/mAddlq1Mq5LxCV0X+lYa
xj2vVIulTb1n71Wn1WeTbDXjiTzDbrMnp4fM9+1uBKwy+RJ+u782IpI9WRhCWE/H4LNgZhYzUmyluTCouNoBpJyzdJ
rekAXOtSvxLJfju/7FlmMjY3dkVA
        set dpd-retryinterval 60
    next
end
```

b. Configure SD-WAN:

Enable ADVPN 2.0 and health-checks for the overlay. Configure the SD-WAN members and their transport groups. The internet overlay (H1_T11) is added to transport group 1, and the MPLS overlay (Placeholder_MPLS_1) is added to transport group 2.

```
config system sdwan
    set status enable
    config zone
        edit "overlay"
            set advpn-select enable
            set advpn-health-check "HUB"
        next
    end
    config members
        edit 4
            set interface "H1_T11"
            set zone "overlay"
            set source 172.31.0.66
            set priority 10
            set transport-group 1
        next
        edit 13
            set interface "Placeholder_MPLS_1"
            set zone "overlay"
            set source 172.31.0.66
            set priority 10
            set transport-group 2
        next
    end
    config health-check
        edit "HUB"
            set server "172.31.100.100"
            set members 4 13
            config sla
                edit 1
                    set link-cost-factor latency
                    set latency-threshold 100
                next
            end
        next
```

```
    end
end
```

To check the health status and traffic:

1. Check the health status on Spoke-1 and Spoke-2, and check the SD-WAN status of Spoke-1:
   a. Check the health of Spoke-1:
      The placeholder tunnel (Placeholder_MPLS_1) is dead.

```
# diagnose sys sdwan  health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%), latency(0.235), jitter(0.011), mos
(4.404), bandwidth-up(999998), bandwidth-dw(999998), bandwidth-bi(1999996), sla_map=0x1
Seq(13 Placeholder_MPLS_1): state(dead), packet-loss(100.000%), sla_map=0x0
```

   b. Check the health of Spoke-2:
      The placeholder tunnel (Placeholder_MPLS_1) is dead.

```
# diagnose sys sdwan  health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%), latency(0.250), jitter(0.041), mos
(4.404), bandwidth-up(999998), bandwidth-dw(999998), bandwidth-bi(1999996), sla_map=0x1
Seq(13 Placeholder_MPLS_1): state(dead), packet-loss(100.000%), sla_map=0x0
```

   c. Check the SD-WAN status of Spoke-1:

```
# diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x4200 use-shortcut-sla use-shortcut
 Tie break: cfg
 Shortcut priority: 3
  Gen(21), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-
order
  Members(2):
    1: Seq_num(4 H1_T11 overlay), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    2: Seq_num(13 Placeholder_MPLS_1 overlay), dead, sla(0x0), gid(0), cfg_order(1), local
cost(0)
  Src address(1):
        10.0.3.0-10.0.3.255
  Dst address(1):
        10.0.4.0-10.0.4.255
```

2. Send traffic from PC-1 to PC-2:
   When Spoke-1 receives `SHORTCUT_REPLY` message, which includes SD-WAN information about Spoke-2, Spoke-1 calculates and creates the shortcut between regular parent tunnels, and it triggers a shortcut between the placeholder tunnels too.
   a. Check the health of Spoke-1:
      The health-check is automatically running on the regular shortcut (H1_T11_0) and on the placeholder shortcut (Placeholder_MPLS_1_0).

```
# diagnose sys sdwan  health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%), latency(0.239), jitter(0.017), mos
(4.404), bandwidth-up(999998), bandwidth-dw(999998), bandwidth-bi(1999996), sla_map=0x1
Seq(4 H1_T11_0): state(alive), packet-loss(0.000%), latency(0.260), jitter(0.010), mos
(4.404), bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998), sla_map=0x1

Seq(13 Placeholder_MPLS_1): state(dead), packet-loss(100.000%), sla_map=0x0
Seq(13 Placeholder_MPLS_1_0): state(alive), packet-loss(0.000%), latency(0.139), jitter
(0.006), mos(4.404), bandwidth-up(1000000), bandwidth-dw(1000000), bandwidth-bi(2000000),
sla_map=0x1
```

b. Check the health of Spoke-2:

The health-check is automatically running on the regular shortcut (H1_T11_0) and on the placeholder shortcut (Placeholder_MPLS_1_0).

```
# diagnose sys sdwan  health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%), latency(0.214), jitter(0.012), mos
(4.404), bandwidth-up(999998), bandwidth-dw(999997), bandwidth-bi(1999995), sla_map=0x1
Seq(4 H1_T11_0): state(alive), packet-loss(0.000%), latency(0.296), jitter(0.030), mos
(4.404), bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997), sla_map=0x1

Seq(13 Placeholder_MPLS_1): state(dead), packet-loss(100.000%), sla_map=0x0
Seq(13 Placeholder_MPLS_1_0): state(alive), packet-loss(0.000%), latency(0.159), jitter
(0.023), mos(4.404), bandwidth-up(1000000), bandwidth-dw(1000000), bandwidth-bi(2000000),
sla_map=0x1
```

c. Check the SD-WAN status of Spoke-1:

The regular shortcut (H1_T11_0 overlay) is preferred.

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x4200 use-shortcut-sla use-shortcut
 Tie break: cfg
 Shortcut priority: 3
  Gen(33), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-
order
  Member sub interface(4):
    3: seq_num(4), interface(H1_T11):
       1: H1_T11_0(1152)
    4: seq_num(13), interface(dummy_MPLS_1):
       1: dummy_MPLS_1_0(1153)
  Members(4):
    1: Seq_num(4 H1_T11_0 overlay), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    2: Seq_num(13 Placeholder_MPLS_1_0 overlay), alive, sla(0x1), gid(0), cfg_order(1),
local cost(0), selected
    3: Seq_num(4 H1_T11 overlay), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    4: Seq_num(13 Placeholder_MPLS_1 overlay), dead, sla(0x0), gid(0), cfg_order(1), local
cost(0)
```

```
  Src address(1):
        10.0.3.0-10.0.3.255
  Dst address(1):
        10.0.4.0-10.0.4.255
```

3. Diagnose the sniffer packet:

   The first few packets travel over the regular parent tunnel (H1_T11), and then the packets switch to the regular shortcut tunnel (H1_T11_0).

```
# diagnose sniffer packet any 'host 10.0.4.2' 4
interfaces=[any]
filters=[host 10.0.4.2]
4.967575 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
4.967976 H1_T11 out 10.0.3.2 -> 10.0.4.2: icmp: echo request
4.969587 H1_T11 in 10.0.4.2 -> 10.0.3.2: icmp: echo reply
4.969629 port4 out 10.0.4.2 -> 10.0.3.2: icmp: echo reply
5.968744 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
5.968838 H1_T11 out 10.0.3.2 -> 10.0.4.2: icmp: echo request
5.969785 H1_T11 in 10.0.4.2 -> 10.0.3.2: icmp: echo reply
5.969842 port4 out 10.0.4.2 -> 10.0.3.2: icmp: echo reply
6.969970 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
6.970187 H1_T11 out 10.0.3.2 -> 10.0.4.2: icmp: echo request
9.969251 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
9.969366 H1_T11_0 out 10.0.3.2 -> 10.0.4.2: icmp: echo request
9.970229 H1_T11_0 in 10.0.4.2 -> 10.0.3.2: icmp: echo reply
9.970278 port4 out 10.0.4.2 -> 10.0.3.2: icmp: echo reply
10.969982 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
10.970199 H1_T11_0 out 10.0.3.2 -> 10.0.4.2: icmp: echo request
```

4. When the regular shortcut tunnel (H1_T11_0) is out of SLA, traffic switches to the placeholder shortcut tunnel (Placeholder_MPLS_1).

   a. Diagnose the SD-WAN service:

      The placeholder shortcut tunnel (Placeholder_MPLS_1) is preferred, and the regular shortcut tunnel (H1_T11_0 overlay) is out of SLA.

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x4200 use-shortcut-sla use-shortcut
 Tie break: cfg
 Shortcut priority: 3
  Gen(87), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-
order
  Member sub interface(4):
    2: seq_num(4), interface(H1_T11):
       1: H1_T11_0(1167)
    4: seq_num(13), interface(Placeholder_MPLS_1):
       1: Placeholder_MPLS_1_0(1168)
  Members(4):
    1: Seq_num(13 Placeholder_MPLS_1_0 overlay), alive, sla(0x1), gid(0), cfg_order(1),
local cost(0), selected
    2: Seq_num(4 H1_T11 overlay), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
```

```
selected
    3: Seq_num(4 H1_T11_0 overlay), alive, sla(0x0), gid(0), cfg_order(0), local cost(0),
selected
    4: Seq_num(13 Placeholder_MPLS_1 overlay), dead, sla(0x0), gid(0), cfg_order(1), local
cost(0)
  Src address(1):
        10.0.3.0-10.0.3.255
  Dst address(1):
        10.0.4.0-10.0.4.255
```

b. Sniff the packet to see the traffic switch to the placeholder shortcut tunnel (Placeholder_MPLS_1_0):

```
# diagnose sniffer packet any 'host 10.0.4.2' 4
interfaces=[any]
filters=[host 10.0.4.2]

17.356165 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
17.356261 Placeholder_MPLS_1_0 out 10.0.3.2 -> 10.0.4.2: icmp: echo request
17.356857 Placeholder_MPLS_1_0 in 10.0.4.2 -> 10.0.3.2: icmp: echo reply
17.356913 port4 out 10.0.4.2 -> 10.0.3.2: icmp: echo reply
18.361038 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
18.361247 Placeholder_MPLS_1_0 out 10.0.3.2 -> 10.0.4.2: icmp: echo request
```

ADVPN and shortcut paths

This topic provides an example of how to use SD-WAN and ADVPN together.

ADVPN (Auto Discovery VPN) is an IPsec technology that allows a traditional hub-and-spoke VPN's spokes to establish dynamic, on-demand, direct tunnels between each other to avoid routing through the topology's hub device. The primary advantage is that it provides full meshing capabilities to a standard hub-and-spoke topology. This greatly reduces the provisioning effort for full spoke-to-spoke low delay reachability, and addresses the scalability issues associated with very large fully meshed VPN networks.

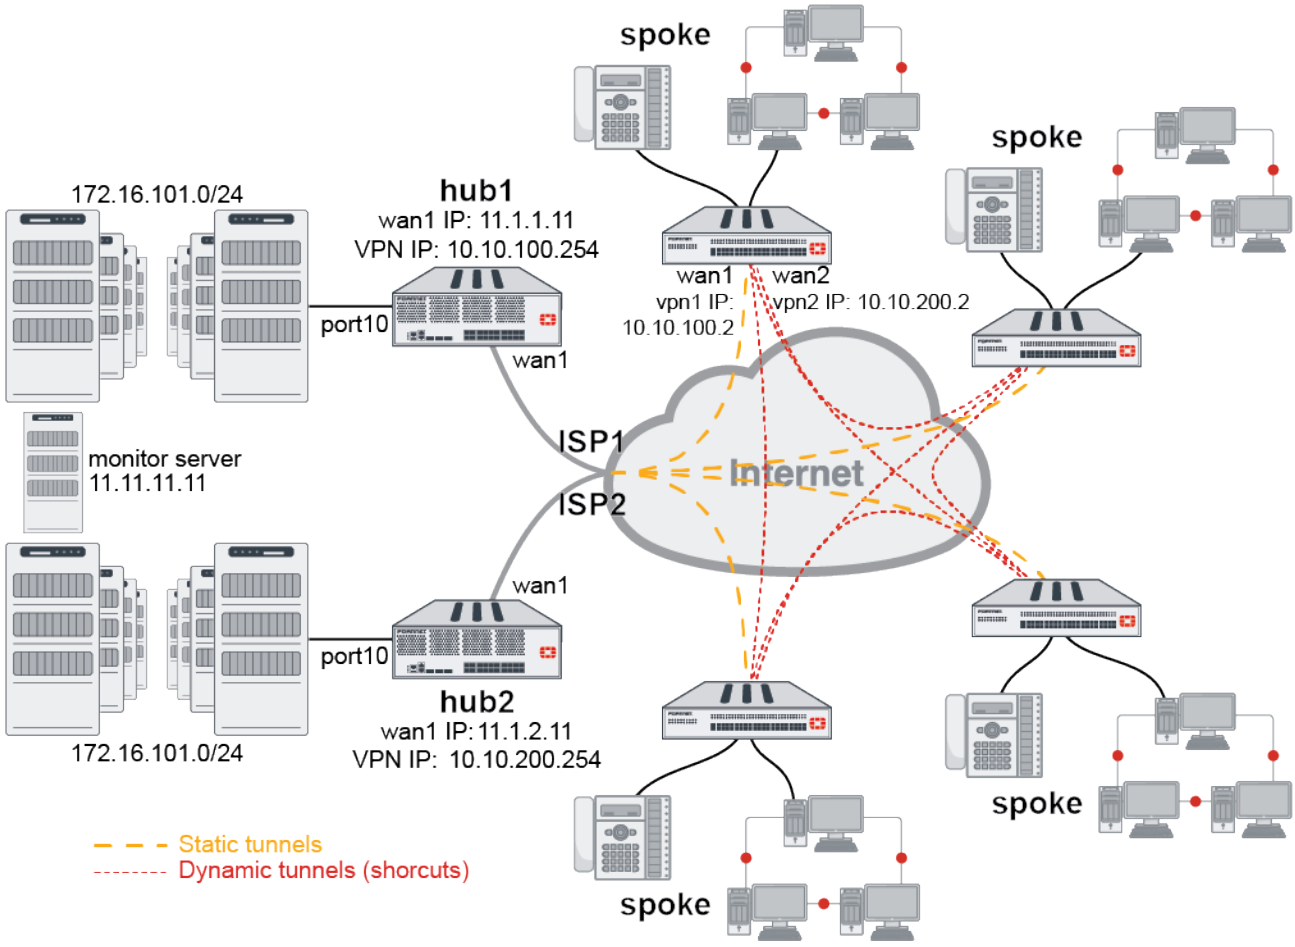
If a customer's head office and branch offices all have two or more internet connections, they can build a dual-hub ADVPN network. Combined with SD-WAN technology, the customer can load-balance traffic to other offices on multiple dynamic tunnels, control specific traffic using specific connections, or choose better performance connections dynamically.

SD-WAN load-balance mode rules (or services) do not support ADVPN members. Other modes' rules, such as SLA and priority, support ADVPN members.

This topic covers three parts:

1. Configure dual-hub ADVPN with multiple branches.
2. Configure BGP to exchange routing information among hubs and spokes.
3. Configure SD-WAN on spoke to do load-balancing and control traffic.

Configuration example



A typical ADVPN configuration with SD-WAN usually has two hubs, and each spoke connects to two ISPs and establishes VPN tunnels with both hubs.

This example shows a hub-and-spoke configuration using two hubs and one spoke:

- Hub1 and Hub2 both use wan1 to connect to the ISPs and port10 to connect to internal network.
- Spoke1 uses wan1 to connect to ISP1 and wan2 to connect to ISP2.
- wan1 sets up VPN to hub1.
- wan2 sets up VPN to hub2.

The SD-WAN is configured on the spoke. It uses the two VPN interfaces as members and two rules to control traffic to headquarters or other spokes using ADVPN VPN interfaces. You can create more rules if required.

For this example:

- Use SD-WAN member 1 (via ISP1) and its dynamic shortcuts for financial department traffic if member 1 meets SLA requirements. If it doesn't meet SLA requirements, it will use SD-WAN member 2 (via ISP2).
- Use SD-WAN member 2 (via ISP2) and its dynamic shortcuts for engineering department traffic.
- Load balance other traffic going to hubs and other spokes between these two members.
- Set up all other traffic to go with their original ISP connection. All other traffic does not go through SD-WAN.
- Set up basic network configuration to let all hubs and spokes connect to their ISPs and the Internet.

Hub internal network	172.16.101.0/24
Spoke1 internal network	10.1.100.0/24
ADVPN 1 network	10.10.100.0/24
ADVPN 2 network	10.10.200.0/24
Hub1 wan1 IP	11.1.1.11
Hub2 wan1 IP	11.1.2.11
Hub1 VPN IP	10.10.100.254
Hub2 VPN IP	10.10.200.254
Spoke1 to hub1 VPN IP	10.10.100.2
Spoke1 to hub2 VPN IP	10.10.200.2
Ping server in Headquarters	11.11.11.11
Internal subnet of spoke1	22.1.1.0/24
Internal subnet of spoke2	33.1.1.0/24
Firewall addresses	Configure hub_subnets and spoke_subnets before using in policies. These can be customized.

The GUI does not support some ADVPN related options, such as auto-discovery-sender, auto-discovery-receiver, auto-discovery-forwarder, and IBGP neighbor-group setting, so this example only provides CLI configuration commands.

Hub1 sample configuration

To configure the IPsec phase1 and phase2 interface:

```
config vpn ipsec phase1-interface
    edit "hub-phase1"
        set type dynamic
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "hub-phase2"
        set phase1name "hub-phase1"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-sha256
```

```
    next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

To configure the VPN interface and BGP:

```
config system interface
    edit "hub-phase1"
        set ip 10.10.100.254 255.255.255.255
        set remote-ip 10.10.100.253 255.255.255.0
    next
end
config router bgp
    set as 65505
    config neighbor-group
        edit "advpn"
            set link-down-failover enable
            set remote-as 65505
            set route-reflector-client enable
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.10.100.0 255.255.255.0
            set neighbor-group "advpn"
        next
    end
    config network
        edit 1
            set prefix 172.16.101.0 255.255.255.0
        next
        edit 2
            set prefix 11.11.11.0 255.255.255.0
         next
    end
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "hub-phase1"
        set dstintf "port10"
        set srcaddr "spoke_subnets"
        set dstaddr "hub_subnets"
```

```
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from spokes to headquarter"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "hub-phase1"
        set dstintf "hub-phase1"
        set srcaddr "spoke_subnets"
        set dstaddr "spoke_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from spokes to spokes"
    next
    edit 3
        set name "internal2spoke"
        set srcintf "port10"
        set dstintf "hub-phase1"
        set srcaddr "hub_subnets"
        set dstaddr "spoke_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from headquarter to spokes"
    next
end
```

Hub2 sample configuration

Hub2 configuration is the same as hub1 except the wan1 IP address, VPN interface IP address, and BGP neighbor-range prefix.

To configure the IPsec phase1 and phase2 interface:

```
config vpn ipsec phase1-interface
    edit "hub-phase1"
        set type dynamic
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
```

```
    edit "hub-phase2"
        set phase1name "hub-phase1"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-sha256
    next
end
```

To configure the VPN interface and BGP:

```
config system interface
    edit "hub-phase1"
        set ip 10.10.200.254 255.255.255.255
        set remote-ip 10.10.200.253 255.255.255.0
    next
end
config router bgp
    set as 65505
    config neighbor-group
        edit "advpn"
            set link-down-failover enable
            set remote-as 65505
            set route-reflector-client enable
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.10.200.0 255.255.255.0
            set neighbor-group "advpn"
        next
    end
    config network
        edit 1
            set prefix 172.16.101.0 255.255.255.0
        next
        edit 2
            set prefix 11.11.11.0 255.255.255.0
         next
    end
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "hub-phase1"
        set dstintf "port10"
        set srcaddr "spoke_subnets"
        set dstaddr "hub_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
        set comments "allow traffic from spokes to headquarter"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "hub-phase1"
        set dstintf "hub-phase1"
        set srcaddr "spoke_subnets"
        set dstaddr "spoke_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from spokes to spokes"
    next
    edit 3
        set name "internal2spoke"
        set srcintf "port10"
        set dstintf "hub-phase1"
        set srcaddr "hub_subnets"
        set dstaddr "spoke_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from headquarter to spokes"
    next
end
```

Spoke1 sample configuration

To configure the IPsec phase1 and phase2 interface:

```
config vpn ipsec phase1-interface
    edit "spoke1-phase1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 11.1.1.11
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1-2-phase1"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
```

```
        set remote-gw 11.1.2.11
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1-phase2"
        set phase1name "spoke1-phase1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1-2-phase2"
        set phase1name "spoke1-2-phase1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set auto-negotiate enable
    next
end
```

To configure the VPN interface and BGP:

```
config system interface
    edit "spoke1-phase1"
        set ip 10.10.100.2 255.255.255.255
        set remote-ip 10.10.100.254 255.255.255.0
    next
    edit "spoke1-2-phase1"
        set ip 10.10.200.2 255.255.255.255
        set remote-ip 10.10.200.254 255.255.255.0
    next
end
config router bgp
    set as 65505
    config neighbor
        edit "10.10.100.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65505
        next
        edit "10.10.200.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65505
        next
    end
    config network
        edit 1
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "spoke1-phase1"
        next
        edit 2
            set interface "spoke1-2-phase1"
        next
    end
    config health-check
        edit "ping"
            set server "11.11.11.11"
            set members 1 2
            config sla
                edit 1
                    set latency-threshold 200
                    set jitter-threshold 50
                    set packetloss-threshold 5
                next
            end
        next
    end
    config service
        edit 1
            set mode sla
            set dst "financial-department"
            config sla
                edit "ping"
                    set id 1
                next
            end
            set priority-members 1 2
        next
        edit 2
            set priority-members 2
            set dst "engineering-department"
        next
    end
end
```

If no SD-WAN zone is specified, members are added to the default *virtual-wan-link* zone.

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "virtual-wan-link"
        set srcaddr "spoke_subnets"
        set dstaddr "spoke_subnets" "hub_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow internal traffic going out to headquarter and other spokes"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "virtual-wan-link"
        set dstintf "internal"
        set srcaddr "spoke_subnets" "hub_subnets"
        set dstaddr "spoke_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow headquarter and other spokes traffic coming in"
    next
end
```

Troubleshooting ADVPN and shortcut paths

Before spoke vs spoke shortcut VPN is established

Use the following CLI commands to check status before spoke vs spoke shortcut VPN is established.

```
# get router info bgp summary
BGP router identifier 2.2.2.2, local AS number 65505
BGP table version is 13
3 BGP AS-PATH entries
0 BGP community entries

Neighbor        V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.10.100.254   4      65505    3286    3270       11    0    0 00:02:15        5
10.10.200.254   4      65505    3365    3319       12    0    0 00:02:14        5

Active dynamic BGP neighbor triggered by ADVPN shortcut

When a customer using SD-WAN with ADVPN has numerous IPv4 and IPv6 routes per spoke and there are many spokes in the topology, using ADVPN with a route reflector-based design poses the following challenges:

- The hub FortiGate will experience high CPU usage due to the amount of processing required to reflect the routes to the spoke FortiGates.
- Spoke FortiGates will learn many unnecessary routes.

For such cases, it is more suitable to deploy an IPv4- and IPv6-supported solution without a route-reflector that involves an active dynamic BGP neighbor triggered by an ADVPN shortcut. This solution allows a spoke FortiGate to form a BGP neighbor with another spoke FortiGate only after the shortcut tunnel between them has been established. As a result, the spoke only learns routes from its BGP neighbors.

How this solution differs from typical SD-WAN with ADVPN

In a topology where the Spoke 1 and Spoke 2 FortiGates are connected directly to the Hub FortiGate, route reflection will not be enabled. The Hub FortiGate is only configured with each spoke's summary route. An ADVPN shortcut tunnel is established between the Spoke 1 and Spoke 2 FortiGates. The valid routing between the Spoke 1 and Spoke 2 FortiGate is still through the Hub FortiGate at this point.

When a host behind Spoke 1 tries to connect to a host behind Spoke 2, Spoke 1 first reaches the Hub based on the valid routing table. The Hub determines that the destination is reachable, and the ADVPN shortcut tunnel between the spokes is established. Then, Spoke 1 and Spoke 2 will actively initiate a BGP connection to each other over the shortcut. Once established, they will exchange their routing information using BGP. On both spokes, BGP will resolve those routes on the shortcut and update the routing table accordingly.

For this solution, the following IPv4/IPv6 BGP configuration settings are required:

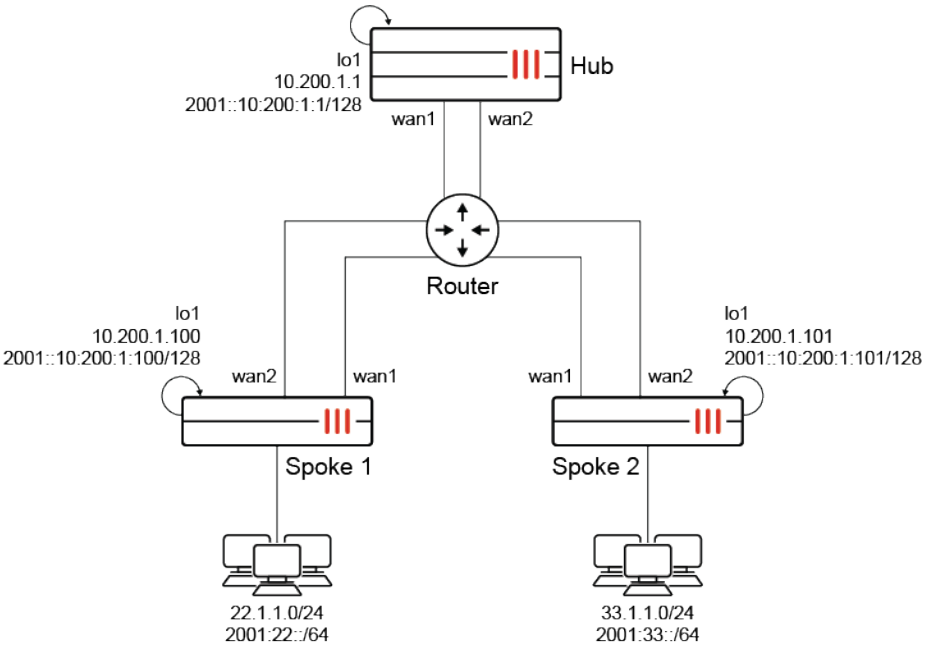
- The hub FortiGate should be configured with `neighbor-group` and `neighbor-range/neighbor-range6`.
- Each spoke FortiGate should be configured with `neighbor-group` and `neighbor-range/neighbor-range6` like the hub. More importantly, each spoke should be configured with `set passive disable` to ensure spokes are able to initiate dynamic BGP connections between each other.
- The hub FortiGate should have route reflection disabled (by default) where each `neighbor-group` setting should have `set route-reflector-client disable`.

In the configuration, each of the spokes will form a BGP neighbor relationship with the hub. This is unchanged from the typical SD-WAN with ADVPN configuration.

Example

This example configuration contains the following structure:

- Use SD-WAN member 1 (via ISP1) and its dynamic shortcuts for Financial Department traffic.
- Use SD-WAN member 2 (via ISP2) and its dynamic shortcuts for Engineering Department traffic.
- Internal subnets of Spoke 1:
  - IPv4: 22.1.1.0/24
  - IPv6: 2001:22::/64
- Internal subnets of Spoke 2:
  - IPv4: 33.1.1.0/24
    - Financial Department: 33.1.1.1 to 33.1.1.100
    - Engineering Department: 33.1.1.101 to 33.1.1.200
  - IPv6: 2001:33::/64
    - Financial Department: 2001:33::1 to 2001:33::100
    - Engineering Department: 2001:33::101 to 2001:33::200



To configure the Hub FortiGate:

1. Configure the BGP settings (neighbor group and ranges):

```
config router bgp
    set as 65100
    set router-id 10.200.1.1
    set ibgp-multipath enable
    config neighbor-group
        edit "EDGE"
            set activate6 disable
            set remote-as 65100
            set update-source "lo1"
            set route-reflector-client disable
        next
        edit "EDGEv6"
            set activate disable
            set remote-as 65100
            set update-source "lo1"
            set route-reflector-client disable
        next
    end
    config neighbor-range
        edit 2
            set prefix 10.200.1.0 255.255.255.0
            set neighbor-group "EDGE"
        next
    end
    config neighbor-range6
        edit 2
            set prefix6 2001::10:200:1:0/112
            set neighbor-group "EDGEv6"
        next
    end
    config network
        edit 2
            set prefix 10.200.1.0 255.255.255.0
        next
        edit 4
            set prefix 33.0.0.0 255.0.0.0
        next
        edit 5
            set prefix 22.0.0.0 255.0.0.0
        next
    end
    config network6
        edit 4
            set prefix6 2001:33::/32
        next
        edit 2
            set prefix6 2001:22::/32
        next
```

```
    end
end
```

2. Configure the static routes.
   a. For IPv4:

```
config router static
    edit 33
        set dst 33.0.0.0 255.0.0.0
        set blackhole enable
        set vrf 0
    next
    edit 22
        set dst 22.0.0.0 255.0.0.0
        set blackhole enable
        set vrf 0
    next
end
```

   b. For IPv6:

```
config router static6
    edit 33
        set dst 2001:33::/32
        set blackhole enable
        set vrf 0
    next
    edit 22
        set dst 2001:22::/32
        set blackhole enable
        set vrf 0
    next
end
```

The following IPv4 summary routes are advertised:

- 33.0.0.0/8
- 22.0.0.0/8

The following IPv6 summary routes are advertised:

- 2001:33::/32
- 2001:22::/32

Because route reflection has been disabled in this example, initially, Spoke 1 will not know the local subnet of Spoke 2, and Spoke 2 will not know the local subnet of Spoke 1. Therefore, for traffic routing, summary routes are configured on the hub as blackhole routes and then advertised to the spokes using BGP.

For example, for traffic from the local subnet of Spoke 2 destined for the local subnet of Spoke 1:

- For the IPv4 case, the summary route 22.0.0.0/8, which includes the local subnet of Spoke 1 (22.1.1.0/24), is advertised to Spoke 2. When Spoke 2 sends traffic destined for 22.1.1.0/24 to the Hub, the Hub forwards this traffic to Spoke 1 since they are BGP neighbors.

- For the IPv6 case, the summary route 2001:22::/32, which includes the local subnet of Spoke 1 (2001:22::/64), is advertised to Spoke 2. When Spoke 2 sends traffic destined for 2001:22::/64 to the Hub, the Hub forwards this traffic to Spoke 1 since they are BGP neighbors.

Although traffic from spoke-to-spoke goes through the hub first, it is expected that the spoke will eventually go through the shortcut tunnel.

To configure the Spoke 1 FortiGate:

1. Configure the SD-WAN settings:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "spoke1-1"
            set cost 10
        next
        edit 2
            set interface "spoke-2"
            set cost 20
        next
    end
    config health-check
        edit "ping"
            set server "11.11.11.11"
            set source 10.200.1.100
            set members 1 2
            config sla
                edit 1
                    set latency-threshold 200
                    set jitter-threshold 50
                next
            end
        next
    end
    config service
        edit 1
            set dst "financial-department"
            set priority-members 1
        next
        edit 2
            set dst "engineering-department"
            set priority-members 2
        next
        edit 61
            set addr-mode ipv6
            set priority-members 1
```

```
            set dst6 "financial-department-IPv6"
        next
        edit 62
            set addr-mode ipv6
            set priority-members 2
            set dst6 "engineering-department-IPv6"
        next
    end
end
```

2. Configure the BGP settings (neighbor group and ranges):

```
config router bgp
    set as 65100
    set router-id 10.200.1.100
    set ibgp-multipath enable
    config neighbor
        edit "10.200.1.1"
            set activate6 disable
            set remote-as 65100
            set connect-timer 10
            set update-source "lo1"
        next
        edit "2001::10:200:1:1"
            set advertisement-interval 1
            set activate disable
            set remote-as 65100
            set update-source "lo1"
        next
    end
    config neighbor-group
        edit "spokes"
            set activate6 disable
            set passive disable
            set remote-as 65100
            set update-source "lo1"
        next
        edit "spokesv6"
            set activate disable
            set passive disable
            set remote-as 65100
            set update-source "lo1"
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.200.1.0 255.255.255.0
            set neighbor-group "spokes"
        next
    end
    config neighbor-range6
        edit 1
```

```
            set prefix6 2001::10:200:1:0/112
            set neighbor-group "spokesv6"
        next
    end
    config network
        edit 3
            set prefix 22.1.1.0 255.255.255.0
        next
    end
    config network6
        edit 1
            set prefix6 2001:22::/64
        next
    end
end
```

Verifying the configuration before a spoke-to-spoke shortcut VPN is established

IPv4 use case

To verify the status on Spoke 1:

1. Verify the BGP status:

```
# get router info bgp summary
VRF 0 BGP router identifier 10.200.1.100, local AS number 65100
BGP table version is 5
1 BGP AS-PATH entries
0 BGP community entries
Neighbor   V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.200.1.1 4      65100     222     225        3    0    0 00:15:14        3
Total number of neighbors 1
```

2. Verify the BGP routing table:

```
# get router info routing-table bgp
Routing table for VRF=0
B       11.11.11.11/32 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11),
00:15:19
                                              (recursive via spoke1-2 tunnel 111.1.1.11),
00:15:19, [1/0]
B       22.0.0.0/8 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11), 00:15:19
                                          (recursive via spoke1-2 tunnel 111.1.1.11),
00:15:19, [1/0]
B       33.0.0.0/8 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11), 00:15:19
                                          (recursive via spoke1-2 tunnel 111.1.1.11),
00:15:19, [1/0]
```

IPv6 use case

To verify the status on Spoke 1:

1. Verify the BGP status:

```
# get router info6 bgp summary
VRF 0 BGP router identifier 10.200.1.100, local AS number 65100
BGP table version is 6
1 BGP AS-PATH entries
0 BGP community entries
Neighbor         V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
2001::10:200:1:1 4      65100     223     224        4    0    0 00:15:21        3
Total number of neighbors 1
```

2. Verify the BGP routing table:

```
# get router info6 routing-table bgp
Routing table for VRF=0
B       2001::11:11:11:11/128 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel
::11.1.1.11), 00:15:29
                                                           (recursive via spoke1-2 tunnel
::111.1.1.11), 00:15:29, [1024/0]
B       2001:22::/32 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel ::11.1.1.11),
00:15:29
                                                  (recursive via spoke1-2 tunnel
::111.1.1.11), 00:15:29, [1024/0]
B       2001:33::/32 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel ::11.1.1.11),
00:15:29
                                                  (recursive via spoke1-2 tunnel
::111.1.1.11), 00:15:29, [1024/0]
```

Verifying the configuration after a single spoke-to-spoke shortcut VPN is established

IPv4 use case

To trigger a single spoke-to-spoke shortcut VPN, on host 22.1.1.22, ping the host 33.1.1.33 in the Financial Department. Because of the SD-WAN rule, use SD-WAN member 1 (via ISP1) and its dynamic shortcuts to reach hosts in the Financial Department.

To verify the status on Spoke 1:

1. Verify the BGP status:

```
# get router info bgp summary
VRF 0 BGP router identifier 10.200.1.100, local AS number 65100
BGP table version is 6
1 BGP AS-PATH entries
0 BGP community entries
Neighbor     V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
```

```
10.200.1.1   4      65100     252     254        3    0    0 00:17:22        3
10.200.1.101 4      65100       6       6        5    0    0 00:00:14        1
Total number of neighbors 2
```

Spoke 1 has as its BGP neighbors:

- Hub FortiGate at 10.200.1.1
- Spoke 2 FortiGate at 10.200.1.101

2. Verify the BGP routing table:

```
# get router info routing-table bgp
Routing table for VRF=0
B       11.11.11.11/32 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11),
00:17:26
                                              (recursive via spoke1-2 tunnel 111.1.1.11),
00:17:26, [1/0]
B       22.0.0.0/8 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11), 00:17:26
                                          (recursive via spoke1-2 tunnel 111.1.1.11),
00:17:26, [1/0]
B       33.0.0.0/8 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11), 00:17:26
                                          (recursive via spoke1-2 tunnel 111.1.1.11),
00:17:26, [1/0]
B       33.1.1.0/24 [200/0] via 10.200.1.101 (recursive via spoke1-1_0 tunnel 13.1.1.3),
00:00:18, [1/0]
```

The remote route learned from Spoke 2 through the spoke1_1_0 tunnel and using BGP is 33.1.1.0/24.

IPv6 use case

To trigger a single spoke-to-spoke shortcut VPN over IPv6, on host 2001:22::22/64, ping the host 2001:33::33/64 in the Financial Department. Because of the SD-WAN rule, use SD-WAN member 1 (via ISP1) and its dynamic shortcuts to reach hosts in the Financial Department.

To verify the status on Spoke 1:

1. Verify the BGP status:

```
# get router info6 bgp summary
VRF 0 BGP router identifier 10.200.1.100, local AS number 65100
BGP table version is 7
1 BGP AS-PATH entries
0 BGP community entries
Neighbor           V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
2001::10:200:1:1   4      65100     253     254        4    0    0 00:17:28        3
2001::10:200:1:101 4      65100       7       7        6    0    0 00:00:21        1
Total number of neighbors 2
```

Spoke 1 has as its BGP neighbors:

- Hub FortiGate at 2001::10:200:1:1
- Spoke 2 FortiGate at 2001::10:200:1:101

2. Verify the BGP routing table:

```
# get router info6 routing-table bgp
Routing table for VRF=0
B       2001::11:11:11:11/128 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel
::11.1.1.11), 00:17:30
                                                           (recursive via spoke1-2 tunnel
::111.1.1.11), 00:17:30, [1024/0]
B       2001:22::/32 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel ::11.1.1.11),
00:17:30
                                                  (recursive via spoke1-2 tunnel
::111.1.1.11), 00:17:30, [1024/0]
B       2001:33::/32 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel ::11.1.1.11),
00:17:30
                                                  (recursive via spoke1-2 tunnel
::111.1.1.11), 00:17:30, [1024/0]
B       2001:33::/64 [200/0] via 2001::10:200:1:101 (recursive via spoke1-1_0 tunnel
::13.1.1.3), 00:00:24, [1024/0]
```

The remote route learned from Spoke 2 through the spoke1-1_0 tunnel and using BGP is 2001:33::/64.

Verifying the configuration after a second spoke-to-spoke shortcut VPN is established

IPv4 use case

To trigger a second spoke-to-spoke shortcut VPN, on host 22.1.1.22, ping the host 33.1.1.133 in the Engineering Department. Because of the SD-WAN rule, use SD-WAN member 2 (via ISP2) and its dynamic shortcuts to reach hosts in the Engineering Department.

To verify the status on Spoke 1:

1. Verify the BGP status:

```
# get router info bgp summary
VRF 0 BGP router identifier 10.200.1.100, local AS number 65100
BGP table version is 6
1 BGP AS-PATH entries
0 BGP community entries
Neighbor     V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.200.1.1   4      65100     263     265        3    0    0 00:18:12        3
10.200.1.101 4      65100      17      17        5    0    0 00:01:04        1
Total number of neighbors
```

Spoke 1 continues to have its BGP neighbors:

- Hub FortiGate at 10.200.1.1
- Spoke 2 FortiGate at 10.200.1.101

2. Verify the BGP routing table:

```
# get router info routing-table bgp
Routing table for VRF=0
B       11.11.11.11/32 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11),
```

```
00:18:17
                                              (recursive via spoke1-2 tunnel 111.1.1.11),
00:18:17, [1/0]
B       22.0.0.0/8 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11), 00:18:17
                                            (recursive via spoke1-2 tunnel 111.1.1.11),
00:18:17, [1/0]
B       33.0.0.0/8 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11), 00:18:17
                                            (recursive via spoke1-2 tunnel 111.1.1.11),
00:18:17, [1/0]
B       33.1.1.0/24 [200/0] via 10.200.1.101 (recursive via spoke1-1_0 tunnel 13.1.1.3),
00:01:09
                                           (recursive via spoke1-2_0 tunnel 113.1.1.3),
00:01:09, [1/0]
```

The remote route learned from Spoke 2 through the spoke1-2_0 tunnel and using BGP is 33.1.1.0/24.

IPv6 use case

To trigger a second spoke-to-spoke shortcut VPN over IPv6, on host 2001:22::22/64, ping the host 2001:33::133/64 in the Engineering Department. Because of the SD-WAN rule, use SD-WAN member 2 (via ISP2) and its dynamic shortcuts to reach hosts in the Engineering Department.

To verify the status on Spoke 1:

1. Verify the BGP status:

```
# get router info6 bgp summary
VRF 0 BGP router identifier 10.200.1.100, local AS number 65100
BGP table version is 7
1 BGP AS-PATH entries
0 BGP community entries
Neighbor           V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
2001::10:200:1:1   4      65100     264     265        4    0    0 00:18:18        3
2001::10:200:1:101 4      65100      19      19        6    0    0 00:01:11        1
Total number of neighbors 2
```

Spoke 1 continues to have its BGP neighbors:

- Hub FortiGate at 2001::10:200:1:1
- Spoke 2 FortiGate at 2001::10:200:1:101

2. Verify the BGP routing table:

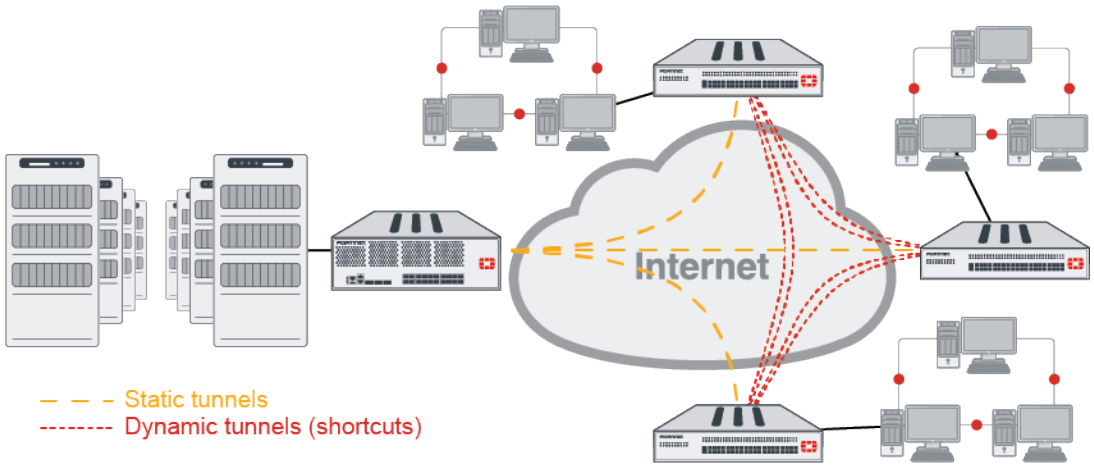
```
# get router info6 routing-table bgp
Routing table for VRF=0
B       2001::11:11:11:11/128 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel
::11.1.1.11), 00:18:20
                                                           (recursive via spoke1-2 tunnel
::111.1.1.11), 00:18:20, [1024/0]
B       2001:22::/32 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel ::11.1.1.11),
00:18:20
                                                  (recursive via spoke1-2 tunnel
::111.1.1.11), 00:18:20, [1024/0]
```

```
B       2001:33::/32 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel ::11.1.1.11),
00:18:20
                                                  (recursive via spoke1-2 tunnel
::111.1.1.11), 00:18:20, [1024/0]
B       2001:33::/64 [200/0] via 2001::10:200:1:101 (recursive via spoke1-1_0 tunnel
::13.1.1.3), 00:01:14
                                                    (recursive via spoke1-2_0 tunnel
::113.1.1.3), 00:01:14, [1024/0]
```

The remote route learned from Spoke 2 through the spoke1-2_0 tunnel and using BGP is 2001:33::/64.

SD-WAN monitor on ADVPN shortcuts

SD-WAN monitors ADVPN shortcut link quality by dynamically creating link monitors for each ADVPN link. The dynamic link monitor on the spoke will use ICMP probes and the IP address of the gateway as the monitored server. These ICMP probes will not be counted as actual user traffic that keeps the spoke-to-spoke tunnel alive.



- When no shortcut is established:

```
# diagnose sys sdwan health-check
Health Check(ping):
Seq(1 tunnel-1): state(alive), packet-loss(0.000%) latency(0.038), jitter(0.006) sla_map=0x3
Seq(2 tunnel-2): state(alive), packet-loss(0.000%) latency(0.035), jitter(0.004) sla_map=0x3
```

- When one shortcut is established:

```
# diagnose sys sdwan health-check
Health Check(ping):
Seq(1 tunnel-1): state(alive), packet-loss(0.000%) latency(0.039), jitter(0.003) sla_map=0x3
Seq(1 tunnel-1_0): state(alive), packet-loss(0.000%) latency(0.060), jitter(0.023) sla_map=0x3
Seq(2 tunnel-2): state(alive), packet-loss(0.000%) latency(0.035), jitter(0.002) sla_map=0x3
```

- When more than one shortcut is established:

```
# diagnose sys sdwan health-check
Health Check(ping):
```

```
Seq(1 tunnel-1): state(alive), packet-loss(0.000%) latency(0.036), jitter(0.004) sla_map=0x3
Seq(1 tunnel-1_0): state(alive), packet-loss(0.000%) latency(0.041), jitter(0.009) sla_map=0x3
Seq(2 tunnel-2): state(alive), packet-loss(0.000%) latency(0.030), jitter(0.005) sla_map=0x3
Seq(2 tunnel-2_0): state(alive), packet-loss(0.000%) latency(0.031), jitter(0.004) sla_map=0x3
```

Hold down time to support SD-WAN service strategies

In a hub and spoke SD-WAN topology with shortcuts created over ADVPN, a downed or recovered shortcut can affect which member is selected by an SD-WAN service strategy. When a downed shortcut tunnel recovers and the shortcut is added back into the service strategy, the shortcut is held at a low priority until the hold down time has elapsed.

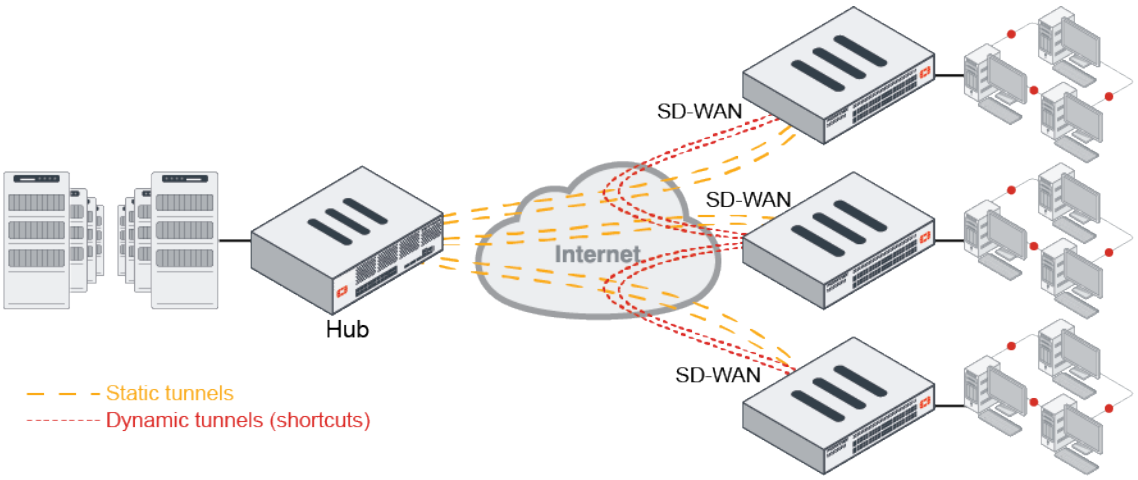
By default, the hold down time is zero seconds. It can be set to 0 - 10000000 seconds.

To configure the hold down time:

```
config system sdwan
    config service
        edit 1
            set hold-down-time <integer>
        next
    end
end
```

Example

In this example, the hold down time is set to 15 seconds, and then the SD-WAN service is looked at before and after the hold down elapses after a downed shortcut recovers.



To configure the hold down time:

```
config system sdwan
    config service
        edit 1
            set hold-down-time 15
        next
    end
end
```

To view which SD-WAN member is selected before and after the hold down time elapses:

Before the hold down time has elapsed:

```
# diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x200
  Gen(34), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(priority), link-cost-factor(packet-loss),
link-cost-threshold(0), heath-check(ping)
Hold down time(15) seconds, Hold start at 2003 second, now 2010
  Member sub interface(4):
    1: seq_num(1), interface(vd2-1):
       1: vd2-1_0(86)
    3: seq_num(2), interface(vd2-2):
       1: vd2-2_0(88)

  Members(4):
    1: Seq_num(1 vd2-1), alive, packet loss: 27.000%, selected
    2: Seq_num(2 vd2-2_0), alive, packet loss: 0.000%, selected
    3: Seq_num(2 vd2-2), alive, packet loss: 0.000%, selected
    4: Seq_num(1 vd2-1_0), alive, packet loss: 61.000%, selected
  Dst address(1):
        33.1.1.101-33.1.1.200
```

After the hold down time has elapsed:

```
# diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x200
  Gen(35), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(priority), link-cost-factor(packet-loss),
link-cost-threshold(0), heath-check(ping)
Hold down time(15) seconds, Hold start at 2018 second, now 2019
  Member sub interface(4):

    2: seq_num(2), interface(vd2-2):
       1: vd2-2_0(88)
    3: seq_num(1), interface(vd2-1):
       1: vd2-1_0(86)
  Members(4):
    1: Seq_num(2 vd2-2_0), alive, packet loss: 0.000%, selected
    2: Seq_num(2 vd2-2), alive, packet loss: 0.000%, selected
    3: Seq_num(1 vd2-1), alive, packet loss: 24.000%, selected
    4: Seq_num(1 vd2-1_0), alive, packet loss: 44.000%, selected
```

```
Dst address(1):
      33.1.1.101-33.1.1.200\
```

Adaptive Forward Error Correction

Forward Error Correction (FEC) is used to control and correct errors in data transmission by sending redundant data across the VPN in anticipation of dropped packets occurring during transit. The mechanism sends out *x* number of redundant packets for every *y* number of base packets.

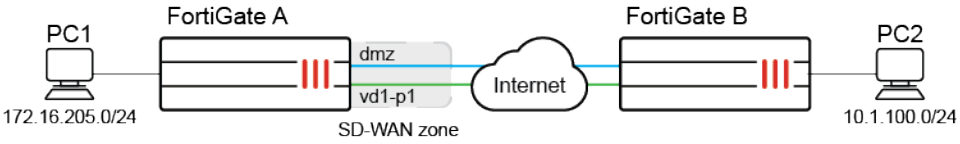
Adaptive FEC considers link conditions and dynamically adjusts the FEC packet ratio:

- The FEC base and redundant packet relationship is dynamically adjusted based on changes to the network SLA metrics defined in the SD-WAN SLA health checks. For example, when there is no or low packet loss in the network, FEC can work on a low redundant level sending only one redundant packet for every 10 base packets. As packet loss increases, the number of redundant packets sent can rise accordingly.
- FEC can be applied only to streams that are sensitive to packet loss. For Example, policies that allow the UDP based VoIP protocol can enable FEC, while TCP based traffic policies do not. This reduces unnecessary bandwidth consumption by FEC.
- Because FEC does not support NPU offloading, the ability to specify streams and policies that do not require FEC allows those traffic to be offloaded. This means that not all traffic suffers a performance impact.

NPU offload and anti-replay should not be used at the same time when FEC is enabled.

In this example, an IPsec tunnel is configured between two FortiGates that have FEC enabled and supporting configuration to protect traffic that egresses FortiGate A and ingresses FortiGate B. The tunnel is an SD-WAN zone, and an SLA health-check is used to monitor the quality of the VPN overlay. The intention is to apply FEC to UDP traffic that is passing through the VPN overlay, while allowing all other traffic to pass through without FEC. An FEC profile is configured to adaptively increase redundant levels if the link quality exceeds a 10% packet loss threshold, or the bandwidth exceeds 950 Mbps.

The DMZ interface and IPsec tunnel vd1-p1 are SD-WAN members. FEC is enabled on vd1-p1, and health-check works on vd1-p1.



To configure the FortiGates:

1. On FortiGate A, enable FEC for egress traffic and NPU offloading on the IPsec tunnel vd1-p1:

```
config vpn ipsec phase1-interface
    edit "vd1-p1"
        set npu-offload enable
        set fec-egress enable
```

```
    next
end
```

2. On FortiGate B, enable FEC for ingress traffic and NPU offloading on the IPsec tunnel vd1-p1:

```
config vpn ipsec phase1-interface
    edit "vd1-p1"
        set npu-offload enable
        set fec-ingress enable
    next
end
```

3. On FortiGate A, configure SD-WAN:
   The VPN overlay member (vd1-p1) must be included in the health-check and configured as the higher priority member in the SD-WAN rule.

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "dmz"
            set gateway 172.16.208.2
        next
        edit 2
            set interface "vd1-p1"
        next
    end
    config health-check
        edit "1"
            set server "2.2.2.2"
            set members 2
            config sla
                edit 1
                next
            end
        next
    end
    config service
        edit 1
            set name "1"
            set dst "all"
            set src "172.16.205.0"
            set priority-members 2 1
        next
    end
end
```

4. On FortiGate A, create a policy to specify performing FEC on UDP traffic, and a policy for other traffic:

```
config firewall policy
    edit 1
        set srcintf "port5"
        set dstintf "virtual-wan-link"
        set action accept
        set srcaddr "172.16.205.0"
        set dstaddr "all"
        set schedule "always"
        set service "ALL_UDP"
        set fec enable
    next
    edit 2
        set srcintf "any"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
    next
end
```

5. On FortiGate A, configure FEC mapping to bind network SLA metrics and FEC base and redundant packets:

```
config vpn ipsec fec
    edit "m1"
        config mappings
            edit 1
                set base 8
                set redundant 2
                set packet-loss-threshold 10
            next
            edit 2
                set base 9
                set redundant 3
                set bandwidth-up-threshold 950000
            next
        end
    next
end
```

   The mappings are matched from top to bottom: packet loss greater than 10% with eight base and two redundant packets, and then uploading bandwidth greater than 950 Mbps with nine base and three redundant packets.

6. On FortiGate A, apply the FEC mappings on vd1-p1:

```
config vpn ipsec phase1-interface
    edit "vd1-p1"
        set fec-health-check "1"
        set fec-mapping-profile "m1"
        set fec-base 10
        set fec-redundant 1
```

```
    next
end
```

The FEC base and redundant values are used when the link quality has not exceeded the limits specified in the FEC profile mapping. If `fec-codec` is set to `xor` the base and redundant packet values will not be updated.

To verify the results:

1. Send TCP and UDP traffic from PC1 to PC2, then check the sessions on FortiGate A:

```
# diagnose sys session list

session info: proto=6 proto_state=01 duration=12 expire=3587 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3

npu_state=0x5040000
no_ofld_reason:  non-npu-intf
```

Non-FEC protected TCP traffic is offloaded, while FEC protected UDP traffic is not offloaded

2. On FortiGate A, check the health-check result and the corresponding FEC base and redundant packets:

```
# diagnose sys sdwan health-check
Health Check(1):
Seq(2 vd1-p1): state(alive), packet-loss(0.000%) latency(0.168), jitter(0.021), bandwidth-up
(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x1
```

Because bandwidth-up is more than 950000kbps, base and redundant are set to 9 and 3:

```
# diagnose vpn tunnel fec vd1-p1
egress:
    enabled=1 base=9 redundant=3 codec=0 timeout=10(ms)
    encode=6621 encode_timeout=6621 encode_fail=0
    tx_data=6880 tx_parity=18601
ingress:
    enabled=0 timeout=0(ms)
    fasm_cnt=0 fasm_full=0
    ipsec_fec_chk_fail=0 complete=0
    rx_data=0 rx_parity=0
    recover=0 recover_timeout=0 recover_fail=0
    rx=0 rx_fail=0
```

3. Make packet loss more than 10%, then check the health-check result and the corresponding FEC base and redundant packets again on FortiGate A:

```
# diagnose sys sdwan  health-check
Health Check(1):
Seq(2 vd1-p1): state(alive), packet-loss(15.000%) latency(0.168), jitter(0.017), bandwidth-up
(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x0
```

Because packet loss is more than 10%, entry one in FEC mapping is first matched, and base and redundant are set to 8 and 2:

```
# diagnose vpn tunnel fec  vd1-p1
egress:
    enabled=1 base=8 redundant=2 codec=0 timeout=10(ms)
    encode=6670 encode_timeout=6670 encode_fail=0
    tx_data=6976 tx_parity=18748
ingress:
    enabled=0 timeout=0(ms)
    fasm_cnt=0 fasm_full=0
    ipsec_fec_chk_fail=0 complete=0
    rx_data=0 rx_parity=0
    recover=0 recover_timeout=0 recover_fail=0
    rx=0 rx_fail=0
```

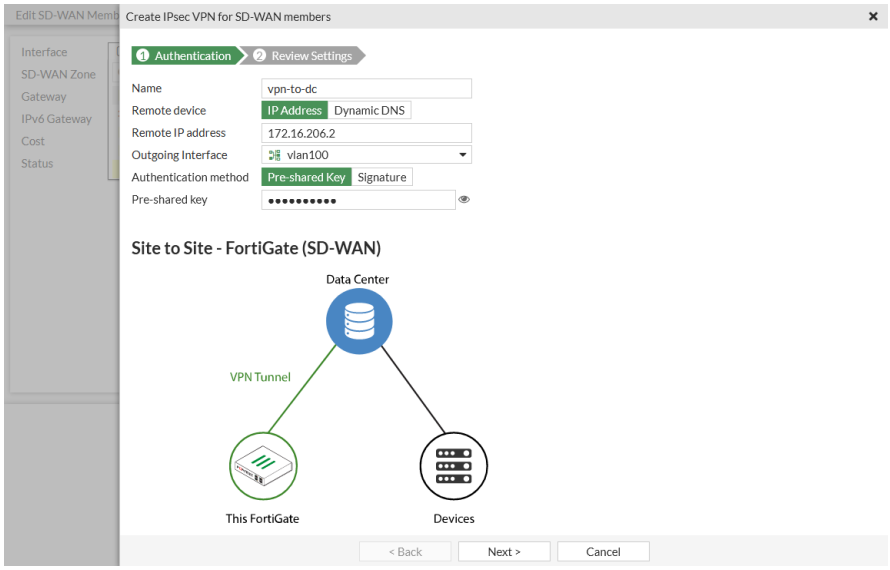
Dual VPN tunnel wizard

This wizard is used to automatically set up multiple VPN tunnels to the same destination over multiple outgoing interfaces. This includes automatically configuring IPsec, routing, and firewall settings, avoiding cumbersome

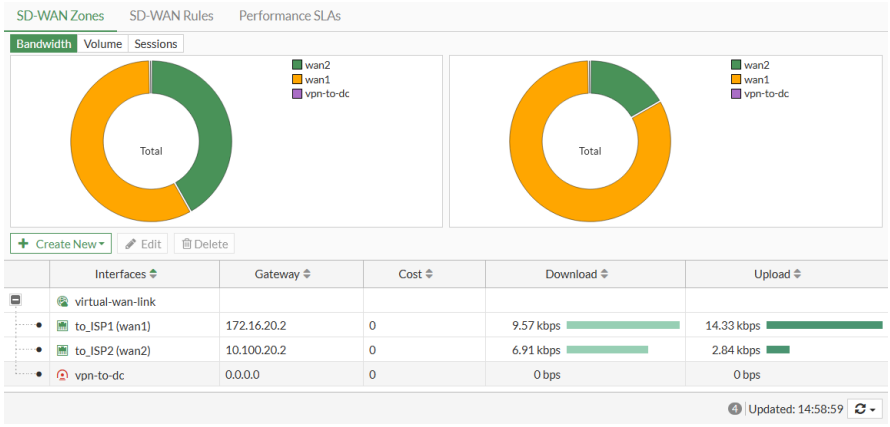
and error-prone configuration steps.

To create a new SD-WAN VPN interface using the tunnel wizard:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New* > *SD-WAN Member*.
2. In the *Interface* drop-down, click *+VPN*. The *Create IPsec VPN for SD-WAN members* pane opens.



3. Enter the required information, then click *Next*.
4. Review the settings then click *Create*.
5. Click *Close* to return to the SD-WAN page.
   The newly created VPN interface will be highlighted in the *Interface* drop-down list.
6. Select the VPN interface to add it as an SD-WAN member, then click *OK*.



Duplicate packets on other zone members

When duplication rules are used, packets are duplicated on other good links within the SD-WAN zone and de-duplicated on the destination FortiGate. Use `force` mode to force duplication on other links within the SD-WAN zone, or use `on-demand` mode to trigger duplication only when SLA fails on the selected member.

The duplication rule is configured in the CLI by using the `config duplication` command. The following options can be configured:

Parameter	Description
srcaddr	Source address or address group names.
dstaddr	Destination address or address group names.
srcaddr6	Source IPv6 address or IPv6 address group names.
dstaddr6	Destination IPv6 address or IPv6 address group names.
srcintf	Incoming (ingress) interfaces or zones.
dstintf	Outgoing (egress) interfaces or zones.
service	Service and service group names.
packet-duplication	Configure packet duplication method. • disable: Disable packet duplication (default). • force: Duplicate packets across all interface members of the SD-WAN zone. • on-demand: Duplicate packets across all interface members of the SD-WAN zone based on the link quality.
packet-de-duplication	Enable/disable discarding of packets that have been duplicated (default = disable).

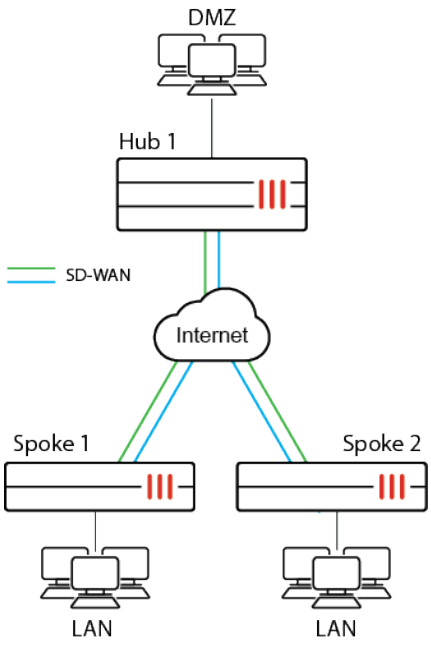
Additional settings under `config system sdwan`

The `duplication-max-num <integer>` option under `config system sdwan` is the maximum number of interface members that a packet is duplicated on in the SD-WAN zone (2 - 4, default = 2). If this value is set to 3, the original packet plus two more copies are created. If there are three member interfaces in the SD-WAN zone and the `duplication-max-num` is set to 2, the packet duplication follows the configuration order, so the packets are duplicated on the second member.

The `duplication-max-discrepancy <latency>` option under `config system sdwan` is configured to be 250ms by default and accepts a value from 250-1000ms. This latency setting defines the interval in which a duplicate packet received will be dropped when `packet-de-duplication` is enabled. It is recommended to keep this value at 250ms to minimize the packets cached in memory. However, if the discrepancy in latency between members is high, such as when one transport is through a satellite link, then this value can be adjusted upwards.

Example

The packet duplication feature works best in a spoke-spoke or hub-and-spoke topology. In this example, a hub-and-spoke ADVPN topology is used. Before shortcuts are established, Hub 1 forwards the duplicate packets from Spoke 1 to Spoke 2. Once shortcuts are established, Hub 1 is transparent, and duplicate packets are exchanged directly between the spokes.



To configure packet duplication between Spoke 1 and Spoke 2:

1. Configure Spoke 1:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
        edit "sdwanzone_v4"
        next
    end
    config members
        edit 1
            set interface "t1"
            set zone "sdwanzone_v4"
        next
        edit 4
            set interface "t21"
            set zone "sdwanzone_v4"
        next
        edit 2
            set interface "t2"
            set zone "sdwanzone_v4"
        next
    end
    config health-check
        edit "h1"
            set server "10.34.1.1"
            set interval 1000
            set failtime 10
```

```
            set members 1 2
            config sla
                edit 1
                    set packetloss-threshold 40
                next
            end
        next
    end
    config duplication
        edit 1
            set srcaddr "all"
            set dstaddr "all"
            set srcintf "port1"
            set dstintf "sdwanzone_v4"
            set service "ALL"
            set packet-duplication force
            set packet-de-duplication enable
        next
    end
end
```

2. Configure Spoke 2 with similar settings.

Duplicate packets based on SD-WAN rules

SD-WAN duplication rules can specify SD-WAN service rules to trigger packet duplication. This allows the duplication to occur based on an SD-WAN rule instead of the source, destination, and service parameters in the duplication rule.

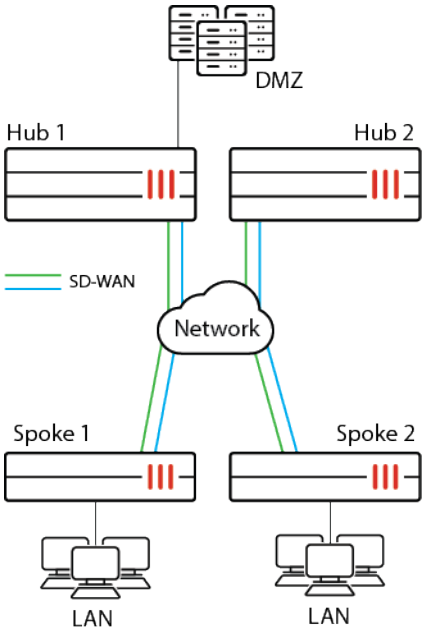
1. Packets can be forced to duplicate to all members of the same SD-WAN zone. See Duplicate packets on other zone members on page 1222 for details.

   For example, in Spoke 1 set `packet-duplication` to `force` so that when a client sends a packet to the server, it is duplicated to all members of the same zone as long as its health check is alive. If a members health check is dead, then the member is removed from the SD-WAN duplication zone.
2. Packets can be duplicated to other members of the SD-WAN zone on-demand only when the condition of the link is not good enough.

   Set `packet-duplication` to `on-demand`. If `sla-match-service` is disabled, when all the SLAs of the member exceed threshold (sla_map=0), the packet is duplicated. But when the SLAs are within threshold (sla_map!=0), the packet is not duplicated.

   If `sla-match-service` is enabled, then only the SLA health checks and targets used in the service rule need to exceed threshold in order to trigger packet duplication.
3. Packets can be duplicated to all members of the same SD-WAN zone when the traffic matches one or more regular SD-WAN service rules.

The following example shows the third type of packet duplication.



In this example, SD-WAN is configured with three members: vpn1, vpn2, and vpn3. Service rule 1 controls all traffic from 10.100.20.0/24 to 172.16.100.0/24 using member 1.

To send a duplicate of the traffic that matches service rule 1 using member 2, members 1 and 2 are added to the same SD-WAN zone, and a duplication rule is configured with service-id set to 1.

To send a duplicate of the traffic that matches service rule 1 using member 2:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
        edit "zone2"
        next
    end
    config members
        edit 1
            set interface "vpn1"
        next
        edit 2
            set interface "vpn2"
        next
        edit 3
            set interface "vpn3"
            set zone "zone2"
        next
    end
    config service
        edit 1
            set dst "172.16.100.0"
            set src "10.100.20.0"
```

```
            set priority-members 1
        next
    end
    config duplication
        edit 1
            set service-id 1
            set packet-duplication force
        next
    end
end
```

Interface based QoS on individual child tunnels based on speed test results

In a hub and spoke SD-WAN topology that uses dial-up VPN overlays, QoS can be applied on individual tunnels based on the measured bandwidth between the hub and spokes. The FortiGate can use the built in speed test to dynamically populate the egress bandwidth to individual dial-up tunnels from the hub.

A bandwidth limit, derived from the speed test, and a traffic shaping profile can be applied on the dial-up IPsec tunnel interface on the hub. A class ID and percentage based QoS settings can be applied to individual child tunnels using a traffic shaping policy and profile.

CLI commands

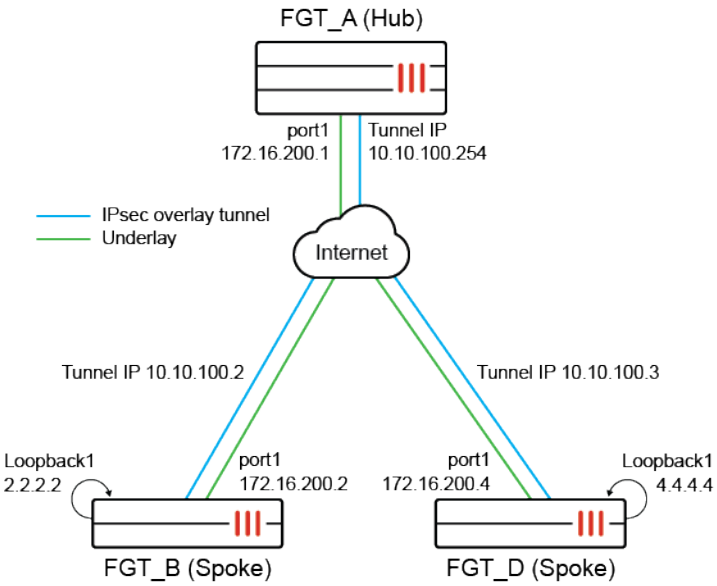
If the interface is an IPsec dial-up server, then egress shaping profile type can only be set to `policing`; it cannot be set to `queuing`:

```
config firewall shaping-profile
    edit <profile-name>
        set type policing
    next
end
```

The outbandwidth value is dynamically obtained from the speed test results for each individual child tunnel, and should not be set manually:

```
config system interface
    edit <dialup-server-phase1-name>
        set egress-shaping-profile <profile-name>
        set outbandwidth <bandwidth>
    next
end
```

Example



In this example, the hub is configured as a VPN dial-up server and both of the spokes are connected to the hub. It is assumed that the VPN configuration is already done, with a dynamic gateway type and kernel device creation (`net-device`) disabled. Only one SD-WAN interface is used, so there is only one VPN overlay member in the SD-WAN zone. Multiple WAN interfaces and VPN overlays could be used.

The VPN interfaces and IP addresses are:

FortiGate	Interface	IP Address
FGT_A (Hub)	hub-phase1	10.10.100.254
FGT_B (Spoke)	spoke11-p1	10.10.100.2
FGT_D (Spoke)	spoke21-p1	10.10.100.3

The hub VPN has two child tunnels, one to each spoke.

The speed test configuration is shown in Running speed tests from the hub to the spokes in dial-up IPsec tunnels on page 1363. This example shows applying a shaping profile to the hub's tunnel interface in order to apply interface based traffic shaping to the child tunnels.

A traffic shaping policy is used to match and assign traffic to the classes in the shaping profile.

To configure the hub FortiGate (FGT_A) and check the results:

1. Configure the hub FortiGate (FGT_A) as in Running speed tests from the hub to the spokes in dial-up IPsec tunnels on page 1363.
2. Configure the shaping profile:

```
config firewall shaping-profile
    edit "profile_1"
        config shaping-entries
```

```
            edit 1
                set class-id 2
                set priority low
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 10
            next
            edit 2
                set class-id 3
                set priority medium
                set guaranteed-bandwidth-percentage 30
                set maximum-bandwidth-percentage 40
            next
            edit 3
                set class-id 4
                set priority high
                set guaranteed-bandwidth-percentage 20
                set maximum-bandwidth-percentage 60
            next
        end
        set default-class-id 2
    next
end
```

3. Configure a traffic shaping policy:

```
config firewall shaping-policy
    edit 2
        set service "ALL"
        set schedule "always"
        set dstintf "hub-phase1"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

In this example, all traffic through the hub-phase1 interface is put into class ID 3. Class IDs an be assigned based on your traffic requirements.

4. At the schedules time, the speed test will start for the hub-phase1 interface from the hub to the spokes. The speed test results can then be dynamically applied on individual child tunnels as egress traffic shaping, and the class ID percentage based QoS settings is applicable on them as templates.

```
# diagnose vpn tunnel list
------------------------------------------------------
name=hub-phase1_0 ver=2 serial=c 172.16.200.1:0->172.16.200.4:0 tun_id=172.16.200.4 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
...
egress traffic control:
        bandwidth=737210(kbps) lock_hit=0 default_class=2 n_active_class=3
        class-id=2      allocated-bandwidth=73720(kbps)         guaranteed-bandwidth=73720
(kbps)
                        max-bandwidth=73720(kbps)       current-bandwidth=0(kbps)
```

```
                        priority=low    forwarded_bytes=52
                        dropped_packets=0       dropped_bytes=0

(kbps)
                        max-bandwidth=294883(kbps)      current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=4      allocated-bandwidth=442325(kbps)        guaranteed-bandwidth=147441
(kbps)
                        max-bandwidth=442325(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
---------------------------------------------------
name=hub-phase1_1 ver=2 serial=d 172.16.200.1:0->172.16.200.2:0 tun_id=172.16.200.2 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
...
egress traffic control:
        bandwidth=726813(kbps) lock_hit=0 default_class=2 n_active_class=3
        class-id=2      allocated-bandwidth=72681(kbps)         guaranteed-bandwidth=72681
(kbps)
                        max-bandwidth=72681(kbps)       current-bandwidth=0(kbps)
                        priority=low    forwarded_bytes=123
                        dropped_packets=0       dropped_bytes=0
        class-id=3      allocated-bandwidth=218044(kbps)        guaranteed-bandwidth=218043
(kbps)
                        max-bandwidth=290725(kbps)      current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=4      allocated-bandwidth=436087(kbps)        guaranteed-bandwidth=145362
(kbps)
                        max-bandwidth=436087(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
```

The guaranteed and maximum bandwidths equal 10% of the speed test result, as expected.

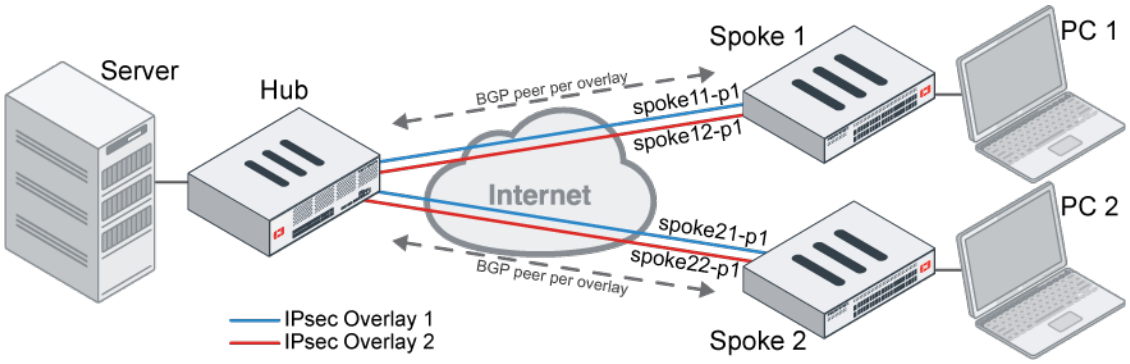
SD-WAN in large scale deployments

Phase 2 selectors can be used to inject IKE routes on the ADVPN shortcut tunnel. When configuration method (`mode-cfg`) is enabled in IPsec phase 1 configuration, enabling `mode-cfg-allow-client-selector` allows custom phase 2 selectors to be configured. By also enabling the addition of a route to the peer destination selector (`add-route`) in the phase 1 configuration, IKE routes based on the phase 2 selectors can be injected. This means that routes do not need to be reflected on the hub to propagate them between spokes, avoiding possible BGP daemon process load issues and improving network scalability in a large-scale ADVPN network.

Route map rules can apply priorities to BGP routes. On the hub, priorities can be set in a route map's rules, and the route map can be applied on BGP routes. This allows the hub to mark the preferred path learned from the spokes with a priority value (lower priority is preferred), instead of using multiple SD-WAN policy routes on the hub. When a preferred outbound route map (`route-map-out-preferable`) is also configured in an SD-WAN

neighbor on the spoke, deploying SD-WAN rules on the hub to steer traffic from the hub to a spoke is unnecessary.

SD-WAN members' local cost can be exchanged on the ADVPN shortcut tunnel so that spokes can use the remote cost as tiebreak to select a preferred shortcut. If multiple shortcuts originate from the same member to different members on the same remote spoke, then the remote cost on the shortcuts is used as the tiebreak to decide which shortcut is preferred.



In this example, SD-WAN is configured on an ADVPN network with a BGP neighbor per overlay.

Instead of reflecting BGP routes with the route-reflector on the hub, when the shortcuts are triggered, IKE routes on the shortcuts are directly injected based on the configured phase 2 selectors to allow routes to be exchanged between spokes.

Routes between the hub and the spokes are exchanged by BGP, and the spokes use the default route to send spoke-to-spoke traffic to the hub and trigger the shortcuts.

Instead of configuring SD-WAN rules on the hub, different priorities are configured on the BGP routes by matching different BGP communities to steer traffic from the hub to the spokes.

To configure Spoke 1:

1. Configure phase 1:

```
config vpn ipsec phase1-interface
    edit "spoke11-p1"
        ...
        set ike-version 2
        set net-device enable
        set add-route enable
        set mode-cfg enable
        set auto-discovery-receiver enable
        set mode-cfg-allow-client-selector enable
        set link-cost 11
        ...
    next
    edit "spoke12-p1"
       ...
        set ike-version 2
        set net-device enable
        set add-route enable
        set mode-cfg enable
```

```
        set auto-discovery-receiver enable
        set mode-cfg-allow-client-selector enable
        set link-cost 21
    next
end
```

2. Configure phase 2:

```
config vpn ipsec phase2-interface
    edit "spoke11-p2"
        ...
        set src-name "LAN_Net"
        set dst-name "all"
    next
    edit "spoke12-p2"
        ...
        set src-name "LAN_Net"
        set dst-name "all"
    next
end
```

3. Configure an address group:
   Spoke 1 uses LAN subnet 10.1-3.100.0/24.

```
config firewall addrgrp
    edit "LAN_Net"
        set member "10.1.100.0" "10.2.100.0" "10.3.100.0"
    next
end
```

4. Configure route maps:
   - If overlay 1 to the hub is in SLA, attach "65000:1" to the BGP routes advertised to the hub over overlay 1.
   - If overlay 2 to the hub is in SLA, attach "65000:2" to the BGP routes advertised to the hub over overlay 2.
   - If any overlay to the hub is out of SLA, attach "65000:9999" to the BGP routes advertised to the hub over any overlay.

```
config router route-map
    edit "HUB_CARRIER1"
        config rule
            edit 1
                set set-community "65000:1"
                ...
            next
        end
        ...
    next
    edit "HUB_CARRIER2"
        config rule
            edit 1
```

```
                set set-community "65000:2"
                ...
            next
        end
        ...
    next
    edit "HUB_BAD"
        config rule
            edit 1
                set set-community "65000:9999"
                ...
            next
        end
        ...
    next
end
```

5. Configure BGP and SD-WAN members and neighbors:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.15.253"
            set remote-as 65412
            set route-map-out "HUB_BAD"
            set route-map-out-preferable "HUB_CARRIER1"
            ...
        next
        edit "10.10.16.253"
            set remote-as 65412
            set route-map-out "HUB_BAD"
            set route-map-out-preferable "HUB_CARRIER2"
            ...
        next
    end
end
```

```
config system sdwan
    config members
        edit 1
            set interface "spoke11-p1"
            set cost 10
        next
        edit 2
            set interface "spoke12-p1"
            set cost 20
        next
    end
    config neighbor
        edit "10.10.15.253"
            set member 1
            set health-check "1"
```

```
            set sla-id 1
        next
        edit "10.10.16.253"
            set member 2
            set health-check "11"
            set sla-id 1
        next
    end
end
```

To configure Spoke 2:

1. Configure phase 1:

```
config vpn ipsec phase1-interface
    edit "spoke21-p1"
        ...
        set ike-version 2
        set net-device enable
        set add-route enable
        set mode-cfg enable
        set auto-discovery-receiver enable
        set mode-cfg-allow-client-selector enable
        set link-cost 101
        ...
    next
    edit "spoke22-p1"
       ...
        set ike-version 2
        set net-device enable
        set add-route enable
        set mode-cfg enable
        set auto-discovery-receiver enable
        set mode-cfg-allow-client-selector enable
        set link-cost 201
    next
end
```

2. Configure phase 2:

```
config vpn ipsec phase2-interface
    edit "spoke21-p2"
        ...
        set src-name "LAN_Net"
        set dst-name "all"
    next
    edit "spoke22-p2"
        ...
        set src-name "LAN_Net"
        set dst-name "all"
    next
end
```

3. Configure an address group:
   Spoke 2 uses LAN subnet 192.168.5-7.0/24.

```
config firewall addrgrp
    edit "LAN_Net"
        set member "192.168.5.0" "192.168.6.0" "192.168.7.0"
    next
end
```

4. Configure route maps:
   - If overlay 1 to the hub is in SLA, attach "65000:1" to the BGP routes advertised to the hub over overlay 1.
   - If overlay 2 to the hub is in SLA, attach "65000:2" to the BGP routes advertised to the hub over overlay 2.
   - If any overlay to the hub is out of SLA, attach "65000:9999" to the BGP routes advertised to the hub over any overlay.

```
config router route-map
    edit "HUB_CARRIER1"
        config rule
            edit 1
                set set-community "65000:1"
                ...
            next
        end
        ...
    next
    edit "HUB_CARRIER2"
        config rule
            edit 1
                set set-community "65000:2"
                ...
            next
        end
        ...
    next
    edit "HUB_BAD"
        config rule
            edit 1
                set set-community "65000:9999"
                ...
            next
        end
        ...
    next
end
```

5. Configure BGP and SD-WAN members and neighbors:

```
config router bgp
    set as 65412
    config neighbor
```

```
        edit "10.10.15.253"
            set remote-as 65412
            set route-map-out "HUB_BAD"
            set route-map-out-preferable "HUB_CARRIER1"
            ...
        next
        edit "10.10.16.253"
            set remote-as 65412
            set route-map-out "HUB_BAD"
            set route-map-out-preferable "HUB_CARRIER2"
            ...
        next
    end
end
```

```
config system sdwan
    config members
        edit 1
            set interface "spoke21-p1"
            set cost 10
        next
        edit 2
            set interface "spoke22-p1"
            set cost 20
        next
    end
    config neighbor
        edit "10.10.15.253"
            set member 1
            set health-check "1"
            set sla-id 1
        next
        edit "10.10.16.253"
            set member 2
            set health-check "11"
            set sla-id 1
        next
    end
end
```

To configure the hub:

1. Configure the route maps:
   - Set the priority to 100 for routes with community 65000:1, indicating that they are in SLA for overlay 1.
   - Set the priority to 200 for routes with community 65000:2, indicating that they are in SLA for overlay 2.
   - Set the priority to 9999 for routes with community 65000:9999, indicating that they are out of SLA for any overlay.

```
config router route-map
     edit "Set_Pri"
        config rule
```

```
            edit 1
                set match-community "comm_65000:1"
                set set-priority 100
            next
            edit 2
                set match-community "comm_65000:2"
                set set-priority 200
            next
            edit 3
                set match-community "comm_65000:9999"
                set set-priority 9999
            next
        end
    next
end
```

2. Configure BGP:

```
config router bgp
    set as 65412
    config neighbor-group
        edit "advpn"
            set remote-as 65412
            set route-map-in "Set_Pri"
            ...
        next
        edit "advpn2"
            set remote-as 65412
            set route-map-in "Set_Pri"
            ...
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.10.15.0 255.255.255.0
            set neighbor-group "advpn"
        next
        edit 2
            set prefix 10.10.16.0 255.255.255.0
            set neighbor-group "advpn2"
        next
    end
end
```

To test the configuration:

1. Check the routing tables on the spokes:
   Spoke 1:

```
spoke-1 (root) # get router info routing-table all
B*      0.0.0.0/0 [200/0] via 10.10.15.253 (recursive is directly connected, spoke11-p1),
```

```
00:01:17, [1/0]         // default route to hub
                         [200/0] via 10.10.16.253 (recursive is directly connected, spoke12-
p1), 00:01:17, [1/0]
B       9.0.0.0/24 [200/0] via 10.10.15.253 (recursive is directly connected, spoke11-p1),
00:01:17, [1/0]        // route to the server behind hub
                          [200/0] via 10.10.16.253 (recursive is directly connected, spoke12-
p1), 00:01:17, [1/0]
C       10.1.100.0/24 is directly connected, port2             // route to PC 1
C       10.10.15.0/24 is directly connected, spoke11-p1        // overlay 1
C       10.10.15.1/32 is directly connected, spoke11-p1
C       10.10.16.0/24 is directly connected, spoke12-p1        // overlay 2
C       10.10.16.1/32 is directly connected, spoke12-p1
```

Spoke 2:

```
spoke-2 (root) # get router info routing-table all
B*      0.0.0.0/0 [200/0] via 10.10.15.253 (recursive is directly connected, spoke21-p1),
00:46:14, [1/0]         // default route to hub
                         [200/0] via 10.10.16.253 (recursive is directly connected, spoke22-
p1), 00:46:14, [1/0]
B       9.0.0.0/24 [200/0] via 10.10.15.253 (recursive is directly connected, spoke21-p1),
00:46:18, [1/0]        // route to the server behind hub
                          [200/0] via 10.10.16.253 (recursive is directly connected, spoke22-
p1), 00:46:18, [1/0]
C       10.10.15.0/24 is directly connected, spoke21-p1        // overlay 1
C       10.10.15.2/32 is directly connected, spoke21-p1
C       10.10.16.0/24 is directly connected, spoke22-p1        // overlay 2
C       10.10.16.2/32 is directly connected, spoke22-p1
C       192.168.5.0/24 is directly connected, port2            // route to PC 2
```

2. Send traffic from PC 1 to PC 2 and trigger the shortcut:

   The IKE routes on the shortcut are directly injected based on the phase 2 selectors, and spoke-to-spoke traffic then goes directly through the shortcut instead of going through the hub.

   Spoke 1:

```
spoke-1 (root) # get router info routing-table static
S       192.168.5.0/24 [15/0] via spoke11-p1_0 tunnel 172.16.200.4 vrf 0, [1/0]
S       192.168.6.0/24 [15/0] via spoke11-p1_0 tunnel 172.16.200.4 vrf 0, [1/0]
S       192.168.7.0/24 [15/0] via spoke11-p1_0 tunnel 172.16.200.4 vrf 0, [1/0]
```

```
spoke-1 (root) # diagnose sniffer packet any 'host 192.168.5.44' 4
interfaces=[any]
filters=[host 192.168.5.44]
1.446306 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
1.446327 spoke11-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
1.446521 spoke11-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
1.446536 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
```

   Spoke 2:

```
spoke-2 (root) # get router info routing-table static
S       10.1.100.0/24 [15/0] via spoke21-p1_0 tunnel 10.10.15.1 vrf 0, [1/0]
```

```
S       10.2.100.0/24 [15/0] via spoke21-p1_0 tunnel 10.10.15.1 vrf 0, [1/0]
S       10.3.100.0/24 [15/0] via spoke21-p1_0 tunnel 10.10.15.1 vrf 0, [1/0]
```

3. Confirm that the overlays are in SLA on the spokes:

   Spoke 1:

```
spoke-1 (root) # diagnose sys sdwan  neighbor
Neighbor(10.10.15.253): member(1)role(standalone)
        Health-check(1:1)  sla-pass selected alive
Neighbor(10.10.16.253): member(2)role(standalone)
        Health-check(11:1)  sla-pass selected alive
```

   Spoke 2:

```
spoke-2 (root) # diagnose sys sdwan neighbor
Neighbor(10.10.15.253): member(1)role(standalone)
        Health-check(1:1)  sla-pass selected alive
Neighbor(10.10.16.253): member(2)role(standalone)
        Health-check(11:1)  sla-pass selected alive
```

4. On the hub, check that the routes received from the spokes have the expected priorities:

```
hub (root) # diagnose ip route list | grep proto=11
tab=254 vf=0 scope=0 type=1 proto=11 prio=100 0.0.0.0/0.0.0.0/0->10.1.100.0/24 pref=0.0.0.0
gwy=10.10.15.1 dev=101(hub-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=200 0.0.0.0/0.0.0.0/0->10.1.100.0/24 pref=0.0.0.0
gwy=10.10.16.1 dev=102(hub2-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=100 0.0.0.0/0.0.0.0/0->192.168.5.0/24 pref=0.0.0.0
gwy=10.10.15.2 dev=101(hub-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=200 0.0.0.0/0.0.0.0/0->192.168.5.0/24 pref=0.0.0.0
gwy=10.10.16.2 dev=102(hub2-phase1)
```

   The priority set by the hub's route map is based on the community string received from the spoke. The route with a lower priority value is selected, so traffic to Spoke 1 goes out on the hub-phase1 tunnel:

```
hub (root) # diagnose sniffer packet any 'host 9.0.0.2' 4
interfaces=[any]
filters=[host 9.0.0.2]
2.735456 R190 in 9.0.0.2 -> 10.1.100.22: icmp: echo request
2.735508 hub-phase1 out 9.0.0.2 -> 10.1.100.22: icmp: echo request
2.735813 hub-phase1 in 10.1.100.22 -> 9.0.0.2: icmp: echo reply
2.735854 R190 out 10.1.100.22 -> 9.0.0.2: icmp: echo reply
```

5. If overlay 1 goes out of SLA, the priorities of the routes on the hub are updated and traffic from the hub to Spoke 1 goes through overlay 2:

   Spoke 1:

```
spoke-1 (root) # diagnose sys sdwan  neighbor
Neighbor(10.10.15.253): member(1)role(standalone)
        Health-check(1:1)  sla-fail alive
Neighbor(10.10.16.253): member(2)role(standalone)
        Health-check(11:1)  sla-pass selected alive
```

Spoke 2:

```
spoke-2 (root) # diagnose sys sdwan neighbor
Neighbor(10.10.15.253): member(1)role(standalone)
        Health-check(1:1)  sla-fail alive
Neighbor(10.10.16.253): member(2)role(standalone)
        Health-check(11:1)  sla-pass selected alive
```

Hub:

```
hub (root) # diagnose ip route list | grep proto=11
tab=254 vf=0 scope=0 type=1 proto=11 prio=200 0.0.0.0/0.0.0.0/0->10.1.100.0/24 pref=0.0.0.0
gwy=10.10.16.1 dev=102(hub2-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=9999 0.0.0.0/0.0.0.0/0->10.1.100.0/24 pref=0.0.0.0

```

6. Verify the service diagnostics on Spoke 1:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x200 use-shortcut-sla
 Tie break: cfg
  Gen(4), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Members(2):
    1: Seq_num(1 spoke11-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(10), selected
    2: Seq_num(2 spoke12-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(20), selected
  Src address(1):
        10.1.100.0-10.1.100.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

7. Verify the service diagnostics on Spoke 2:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x200 use-shortcut-sla
 Tie break: cfg
  Gen(2), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Members(2):
    1: Seq_num(1 spoke21-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(10), selected
```

```
    2: Seq_num(2 spoke22-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(20), selected
  Src address(1):
        192.168.5.0-192.168.5.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

8. Trigger shortcuts between Spoke 1 and Spoke 2:
   - Shortcuts spoke11-p1_1 and spoke11-p1_0 originate from spoke11-p1.
   - spoke11-p1_1 corresponds to spoke21-p1_0 on Spoke 2.
   - spoke11-p1_0 corresponds to spoke22-p1_0 on Spoke 2.

   Spoke 1:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x200 use-shortcut-sla
 Tie break: cfg
  Gen(11), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Member sub interface(4):
    3: seq_num(1), interface(spoke11-p1):
       1: spoke11-p1_0(80)
       2: spoke11-p1_1(81)
  Members(4):
    1: Seq_num(1 spoke11-p1_1), alive, sla(0x1), gid(0), remote cost(101), cfg_order(0), local
cost(10), selected
    2: Seq_num(1 spoke11-p1_0), alive, sla(0x1), gid(0), remote cost(201), cfg_order(0), local
cost(10), selected
    3: Seq_num(1 spoke11-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(10), selected
    4: Seq_num(2 spoke12-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(20), selected
  Src address(1):
        10.1.100.0-10.1.100.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

   Spoke 2:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x200 use-shortcut-sla
 Tie break: cfg
  Gen(15), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Member sub interface(4):
    2: seq_num(1), interface(spoke21-p1):
       1: spoke21-p1_0(75)
    4: seq_num(2), interface(spoke22-p1):
       1: spoke22-p1_0(74)
  Members(4):
    1: Seq_num(1 spoke21-p1_0), alive, sla(0x1), gid(0), remote cost(11), cfg_order(0), local
cost(10), selected
    2: Seq_num(1 spoke21-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(10), selected
```

```
    3: Seq_num(2 spoke22-p1_0), alive, sla(0x1), gid(0), remote cost(11), cfg_order(1), local
cost(20), selected
    4: Seq_num(2 spoke22-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(20), selected
  Src address(1):
        192.168.5.0-192.168.5.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

The spoke11-p1_1 shortcut on Spoke 1 is preferred over spoke11-p1_0 due to the lower remote link cost of 101 when they have the same local SD-WAN member cost of 10.

9. Verify the policy route list on Spoke 1:

```
# diagnose firewall proute list
list route policy info(vf=root):

id=2131755009(0x7f100001) vwl_service=1(1) vwl_mbr_seq=1 1 1 2 dscp_tag=0xfc 0xfc flags=0x0
tos=0x00 tos_mask=0x00 protocol=0 sport=0-65535 iif=0(any) dport=1-65535 path(4) oif=81
(spoke11-p1_1) oif=80(spoke11-p1_0) oif=54(spoke11-p1) oif=55(spoke12-p1)
source(1): 10.1.100.0-10.1.100.255
destination(1): 0.0.0.0-255.255.255.255
hit_count=176 last_used=2022-07-12 11:56:08
```

Keeping sessions in established ADVPN shortcuts while they remain in SLA

In an SD-WAN hub and spoke configuration where ADVPN is used, when a primary shortcut goes out of SLA, traffic switches to the backup shortcut. During idle timeout, sessions will prefer using the primary parent tunnel and try to establish a new primary shortcut. However, because it is out of SLA, traffic switches back to the backup shortcut, which causes unnecessary traffic interruption.

The `sla-stickiness` option keeps existing sessions on the established ADVPN shortcuts while they remain in SLA instead of switching to a new link every idle timeout. New sessions will be routed through the primary shortcut if it is in SLA.

```
config system sdwan
    config service
        edit <id>
            set mode sla
            set sla-stickiness {enable | disable}
        next
    end
end
```

The `sla-stickiness` option can be applied in the following use cases.

Use case 1:

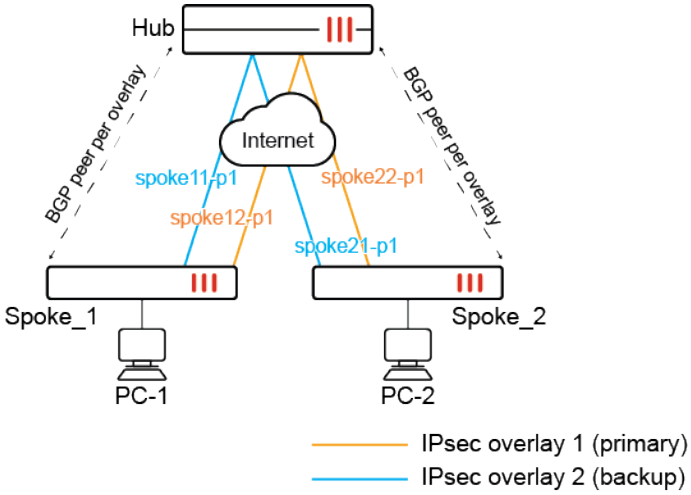
1. The sessions will switch over to the backup shortcut due to the primary shortcut being out of SLA.
2. After an idle timeout, the primary shortcut is torn down, and the routes will be reinstalled on the primary parent tunnel.
3. When `sla-stickiness` is enabled, even though the primary parent tunnel is preferred, established ADVPN sessions will remain on the backup shortcut (stickiness) instead of switching to the primary parent tunnel.
4. New sessions will be routed to the primary parent tunnel and trigger the primary shortcut, then traffic switches to the primary shortcut if it is in SLA.

Use case 2:

1. The sessions will switch over to the backup shortcut due to the primary shortcut being out of SLA.
2. After some time, the primary shortcut becomes in SLA.
3. When `sla-stickiness` is enabled, even though primary shortcut is preferred, established ADVPN sessions will remain on the backup shortcut (stickiness) instead of switching to the primary shortcut.
4. New sessions will be routed through the primary shortcut.

Example configuration

The following example demonstrates using the `sla-stickiness` option in use case 1.



After an idle timeout occurs, existing sessions remain on the spoke12-p1_0 backup shortcut tunnel. New sessions will try to create a shortcut over spoke11-p1, but will fall back to spoke12-p1_0 when it detects spoke11-p1 is out of SLA.

To configure shortcut stickiness for ADVPN shortcuts:

1. Configure SD-WAN on the Spoke_1 FortiGate:

```
config system sdwan
    set status enable
    config zone
```

```
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "spoke11-p1"
        next
        edit 2
            set interface "spoke12-p1"
        next
    end
    config health-check
        edit "1"
            set server "9.0.0.1"
            set members 1 2
            config sla
                edit 1
                next
            end
        next
    end
    config service
        edit 1
            set name "1"
            set mode sla
            set sla-stickiness enable
            set dst "all"
            set src "10.1.100.0"
            config sla
                edit "1"
                    set id 1
                next
            end
            set priority-members 1 2
        next
    end
end
```

2. Verify the SD-WAN configuration.
   a. Verify the health check status:

```
# diagnose sys sdwan health-check
Health Check(1):
Seq(1 spoke11-p1): state(alive), packet-loss(0.000%) latency(0.368), jitter(0.051), mos
(4.404), bandwidth-up(999999), bandwidth-dw(1000000), bandwidth-bi(1999999) sla_map=0x1
Seq(2 spoke12-p1): state(alive), packet-loss(0.000%) latency(0.211), jitter(0.019), mos
(4.404), bandwidth-up(999999), bandwidth-dw(999979), bandwidth-bi(1999978) sla_map=0x1
```

   b. Verify the service status:

```
# diagnose sys sdwan service4
```

```
Service(1): Address Mode(IPV4) flags=0x2200 use-shortcut-sla sla-stickiness
 Tie break: cfg
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Members(2):
    1: Seq_num(1 spoke11-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    2: Seq_num(2 spoke12-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
  Src address(1):
        10.1.100.0-10.1.100.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

The SD-WAN service rule prefers the primary parent tunnel (spoke11-p1) over the backup parent tunnel (spoke12-p1) before shortcuts are established.

3. Send traffic from PC-1 to PC-2 to trigger the primary shortcut. Verify the diagnostics.
   a. Run a sniffer trace:

```
# diagnose sniffer packet any 'host 192.168.5.44' 4
interfaces=[any]
filters=[host 192.168.5.44]
14.878761 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
14.878905 spoke11-p1 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
14.879842 spoke11-p1 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
14.880082 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
15.879761 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
15.879882 spoke11-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
15.880433 spoke11-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
15.880496 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
```

The SD-WAN service rule sends traffic to the parent tunnel (spoke11-p1) initially, and then switches to the primary shortcut tunnel (spoke11-p1_0) once it is established.

   b. Verify the service status:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x2200 use-shortcut-sla sla-stickiness
 Tie break: cfg
  Gen(2), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Member sub interface(3):
    2: seq_num(1), interface(spoke11-p1):
       1: spoke11-p1_0(57)
  Members(3):
    1: Seq_num(1 spoke11-p1_0), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    2: Seq_num(1 spoke11-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    3: Seq_num(2 spoke12-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
  Src address(1):
```

```
        10.1.100.0-10.1.100.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

The SD-WAN service rule prefers the primary shortcut tunnel (spoke11-p1_0) over other tunnels.

4. Make the primary shortcut be out of SLA. The traffic will switch to the backup parent tunnel and trigger the backup shortcut. Verify the diagnostics.
   a. Run a sniffer trace:

```
# diagnose sniffer packet any 'host 192.168.5.44' 4
interfaces=[any]
filters=[host 192.168.5.44]
20.588046 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
20.588157 spoke12-p1 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
20.588791 spoke12-p1 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
20.588876 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
21.589079 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
21.589190 spoke12-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
21.589661 spoke12-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
21.589733 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
```

When the primary shortcut tunnel goes out of SLA (spoke11-p1_0, alive, sla(0x0)), traffic reroutes to the backup parent tunnel (spoke12-p1) and then to the backup shortcut tunnel (spoke12-p1_0) once established.

   b. Verify the service status:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x2200 use-shortcut-sla sla-stickiness
 Tie break: cfg
  Gen(23), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Member sub interface(4):
    1: seq_num(1), interface(spoke11-p1):
       1: spoke11-p1_0(62)
    3: seq_num(2), interface(spoke12-p1):
       1: spoke12-p1_0(63)
  Members(4):
    1: Seq_num(1 spoke11-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    2: Seq_num(2 spoke12-p1_0), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
    3: Seq_num(2 spoke12-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
    4: Seq_num(1 spoke11-p1_0), alive, sla(0x0), gid(0), cfg_order(0), local cost(0),
selected
  Src address(1):
        10.1.100.0-10.1.100.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

The backup shortcut tunnel (spoke12-p1_0) is now preferred.

5. After an idle timeout, the primary shortcut is torn down. The primary parent tunnel is now preferred, but traffic is still kept on the backup shortcut due to `sla-stickiness` being enabled. Verify the diagnostics.
   a. Verify the service status:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x2200 use-shortcut-sla sla-stickiness
 Tie break: cfg
  Gen(24), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Member sub interface(3):
    3: seq_num(2), interface(spoke12-p1):
       1: spoke12-p1_0(63)
  Members(3):
    1: Seq_num(1 spoke11-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    2: Seq_num(2 spoke12-p1_0), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
    3: Seq_num(2 spoke12-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
  Src address(1):
        10.1.100.0-10.1.100.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

   b. Run a sniffer trace:

```
# diagnose sniffer packet any 'host 192.168.5.44' 4
interfaces=[any]
filters=[host 192.168.5.44]
1.065143 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
1.065218 spoke12-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
1.065471 spoke12-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
1.065508 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
2.066155 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
2.066198 spoke12-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
2.066442 spoke12-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
2.066480 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
3.067201 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
3.067255 spoke12-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
3.067507 spoke12-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
3.067544 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
```

6. Send new traffic from PC1 to PC2. The traffic is routed to the primary parent tunnel and triggers the primary shortcut, then traffic will switch to the primary shortcut if it is in SLA. Verify the connection.
   a. Run a sniffer trace:

```
# diagnose sniffer packet any 'host 192.168.5.4' 4
interfaces=[any]
filters=[host 192.168.5.4]
17.120310 port2 in 10.1.100.22 -> 192.168.5.4: icmp: echo request
17.120475 spoke11-p1 out 10.1.100.22 -> 192.168.5.4: icmp: echo request
```

```
17.121096 spoke11-p1 in 192.168.5.4 -> 10.1.100.22: icmp: echo reply
17.121151 port2 out 192.168.5.4 -> 10.1.100.22: icmp: echo reply
18.121331 port2 in 10.1.100.22 -> 192.168.5.4: icmp: echo request
18.121480 spoke11-p1_0 out 10.1.100.22 -> 192.168.5.4: icmp: echo request
18.121954 spoke11-p1_0 in 192.168.5.4 -> 10.1.100.22: icmp: echo reply
18.122007 port2 out 192.168.5.4 -> 10.1.100.22: icmp: echo reply
...
```

At first, traffic tries to go to the primary parent tunnel so that it can trigger the primary shortcut to establish. The primary shortcut (spoke11-p1_0) is in SLA and new traffic flows through it.

```
...
14.194066 port2 in 10.1.100.22 -> 192.168.5.4: icmp: echo request
14.194247 spoke12-p1_0 out 10.1.100.22 -> 192.168.5.4: icmp: echo request
14.194499 spoke12-p1_0 in 192.168.5.4 -> 10.1.100.22: icmp: echo reply
14.194565 port2 out 192.168.5.4 -> 10.1.100.22: icmp: echo reply
15.195093 port2 in 10.1.100.22 -> 192.168.5.4: icmp: echo request
15.195174 spoke12-p1_0 out 10.1.100.22 -> 192.168.5.4: icmp: echo request
15.195326 spoke12-p1_0 in 192.168.5.4 -> 10.1.100.22: icmp: echo reply
15.195361 port2 out 192.168.5.4 -> 10.1.100.22: icmp: echo reply
```

After the primary shortcut goes out of SLA, the traffic switches to the backup shortcut (spoke12-p1_0).

b. Verify the service status:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x2200 use-shortcut-sla sla-stickiness
 Tie break: cfg
  Gen(36), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Member sub interface(4):
    1: seq_num(1), interface(spoke11-p1):
       1: spoke11-p1_0(67)
    3: seq_num(2), interface(spoke12-p1):
       1: spoke12-p1_0(66)
  Members(4):
    1: Seq_num(1 spoke11-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    2: Seq_num(2 spoke12-p1_0), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
    3: Seq_num(2 spoke12-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
    4: Seq_num(1 spoke11-p1_0), alive, sla(0x0), gid(0), cfg_order(0), local cost(0),
selected
  Src address(1):
        10.1.100.0-10.1.100.255

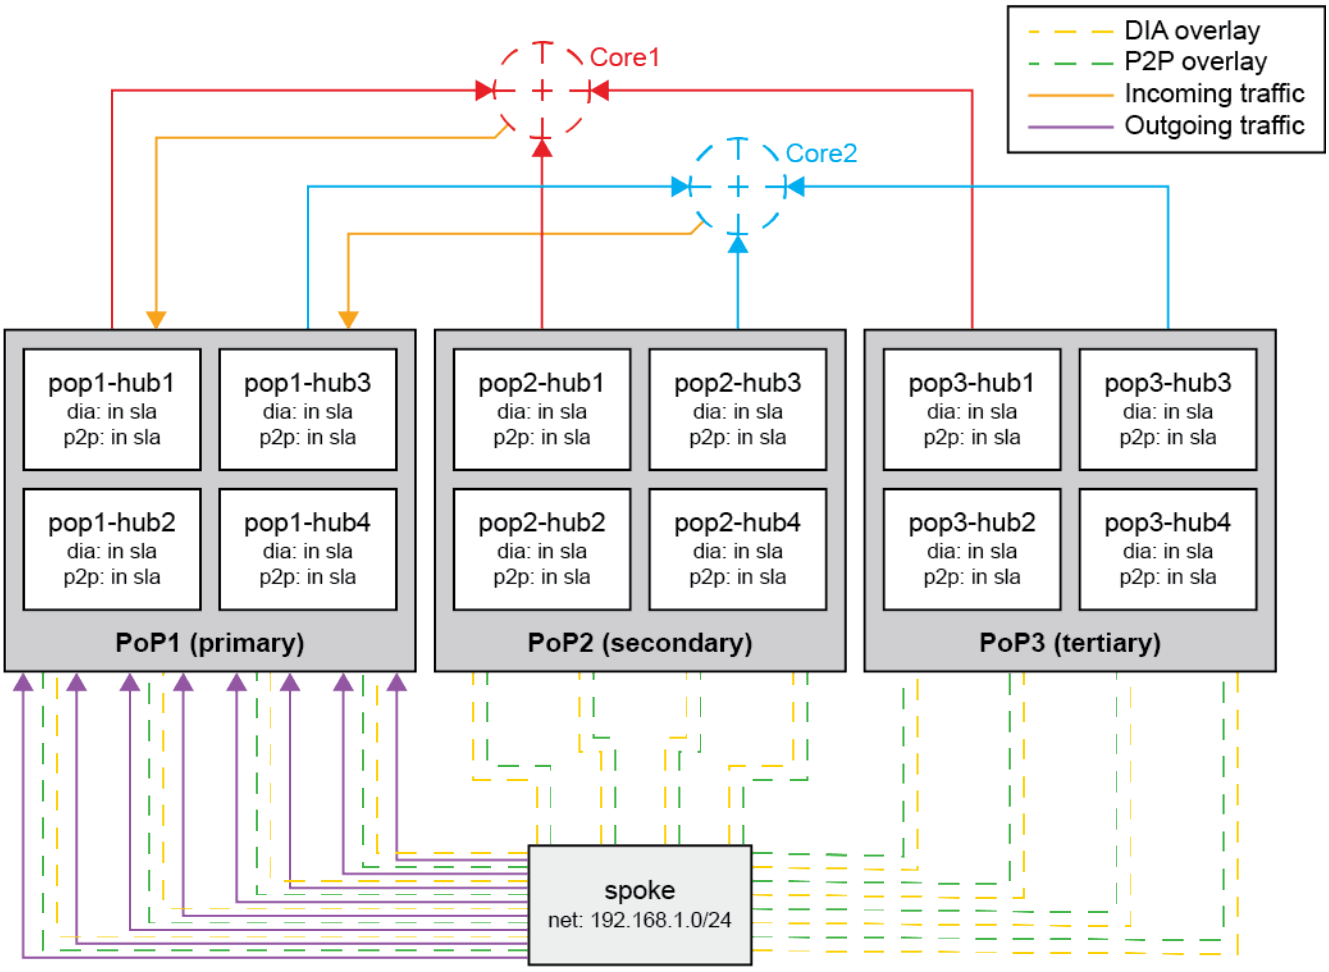
  Dst address(1):
        0.0.0.0-255.255.255.255
```

New traffic switches back to the backup shortcut while the primary shortcut is still out of SLA.

SD-WAN multi-PoP multi-hub large scale design and failover

FortiOS 7.2.0 introduced a feature to define the minimum number of SD-WAN interface members that must meet SLA in order for the spoke to select a hub to process its SD-WAN traffic. This design is suitable for a single-PoP multi-hub architecture in order to achieve hub-to-hub failover. See Using multiple members per SD-WAN neighbor configuration on page 1152.

In FortiOS 7.4.1 and later, the design is enhanced to support a multi-PoP multi-hub architecture in which incoming and outgoing traffic failover between PoPs is supported.



Based on the preceding diagram, incoming and outgoing traffic to the spoke is preferred over PoP1. If a single hub within PoP1 goes out of SLA, traffic will continue to flow through the PoP. If the minimum number of members to meet SLA in the PoP cannot be met, then traffic will fail over to PoP2.

The following enhancements have been made to support the multi-PoP failover scenario.

- Add `minimum-sla-meet-members` setting in the SD-WAN zone configurations and `zone-mode` setting in the SD-WAN service configurations:

```
config system sdwan
    config zone
        edit <name>
            set minimum-sla-meet-members <integer>
        next
    end
    config service
        edit <id>
            set mode sla
            set zone-mode {enable | disable}
        next
    end
end
```

When `zone-mode` is enabled on a SD-WAN service rule, the traffic is steered based on the status of the zone.

The state of the health check referenced in the SD-WAN service can be defined as follows:

- If the number of in SLA members in a zone is less than the `minimum-sla-meet-members`, then the zone's state is out of SLA; otherwise, it is in SLA.
- If a zone's state is out of SLA, then all members in the zone are out of SLA.
- If a zone's state is in SLA, then the health check's state of individual members in the zone is determined by its own state.

- Add `service-id` setting in the SD-WAN neighbor configurations:

```
config system sdwan
    config neighbor
        edit <bgp_neighbor_ip>
            set member <member_id>
            set service-id <id>
        next
    end
end
```

The SD-WAN neighbor's behavior can be determined by SD-WAN service and naturally synchronizes with SD-WAN service.

- The SD-WAN service defines priority zones, whose SLA state determines the advertised community preferable string.
- The SD-WAN service defines the `hold-down-time`, which determines how long an advertised community preferable string can be kept when it is expected to be changed.

- Add `sla-stickness` setting in the SD-WAN service configurations:

```
config system sdwan
    config service
        edit <id>
            set mode sla
            set sla-stickiness {enable | disable}
        next
    end
end
```

The switch-over of an existing session is determined as follows:

  - If the outgoing interface of the session is in SLA, then the session can keep its outgoing interface.
  - Otherwise, the session switches to a preferable path if one exists.
- Allow the neighbor group to be configured in the SD-WAN neighbor configurations:

```
config system sdwan
    config neighbor
        edit <bgp_neighbor_group>
            set member <member_id>
            set health-check <name>
            set sla-id <id>
        next
    end
end
```

Outgoing path control

The outgoing path from spoke to hub operates as follows:

1. Overlays to the primary and secondary PoP are assigned separately into an SD-WAN primary and secondary zone on the spoke.
2. One SD-WAN service rule is defined to include these zones as SD-WAN members.
3. When the primary zone is in SLA (`minimum-sla-meet-members` is met), the SD-WAN service rule steers traffic to the in SLA overlay members.
4. When the primary zone is out of SLA (`minimum-sla-meet-members` is not met), the SD-WAN service rule steers traffic to the in SLA overlay members in the secondary zone.
5. When the primary zone SLA is recovered:
   a. If `sla-stickness` is disabled on the SD-WAN service rule, then traffic will wait the duration of the `hold-down-time` before switching back to in SLA overlays in the primary zone.
   b. If `sla-stickness` is enabled on the SD-WAN service rule, then existing traffic will be kept on the in SLA overlays on the secondary zone, but new traffic will be steered to in SLA overlays in the primary zone.

Incoming path control

The incoming traffic from the core/external peers, to PoP, to spoke operates as follows:

1. When the primary zone is in SLA, the spoke uses the preferable route map to advertise local routes with the in SLA community to hubs in the primary and secondary PoPs.
   a. Hubs in the primary PoP translate the in SLA community into a short AS path and advertise it to external peers to attract incoming traffic.
   b. Hubs in the secondary PoP translate the in SLA community into a longer AS path and advertise it to external peers to deflect incoming traffic.
2. If the number of in SLA overlays in the primary zone is less than the `minimum-sla-meet-members`, then the spoke will use the default route map to advertise routes instead of with an out of SLA community to hubs in the primary PoP.
   a. Hubs in the primary PoP translate the out of SLA community into a longest AS path, and advertise it to external peers to deflect incoming traffic.
   b. As a result, inbound traffic is routed to hubs in the secondary PoP.

3. When the primary zone SLA is recovered:
   a. The spoke will wait the duration of the predefined `hold-down-time` in the SD-WAN service rule to use the preferable route map again to advertise routes with the in SLA community to hubs in the primary PoP.
   b. As a result, inbound traffic will be routed back to hubs in the primary PoP.

Neighbor group configuration

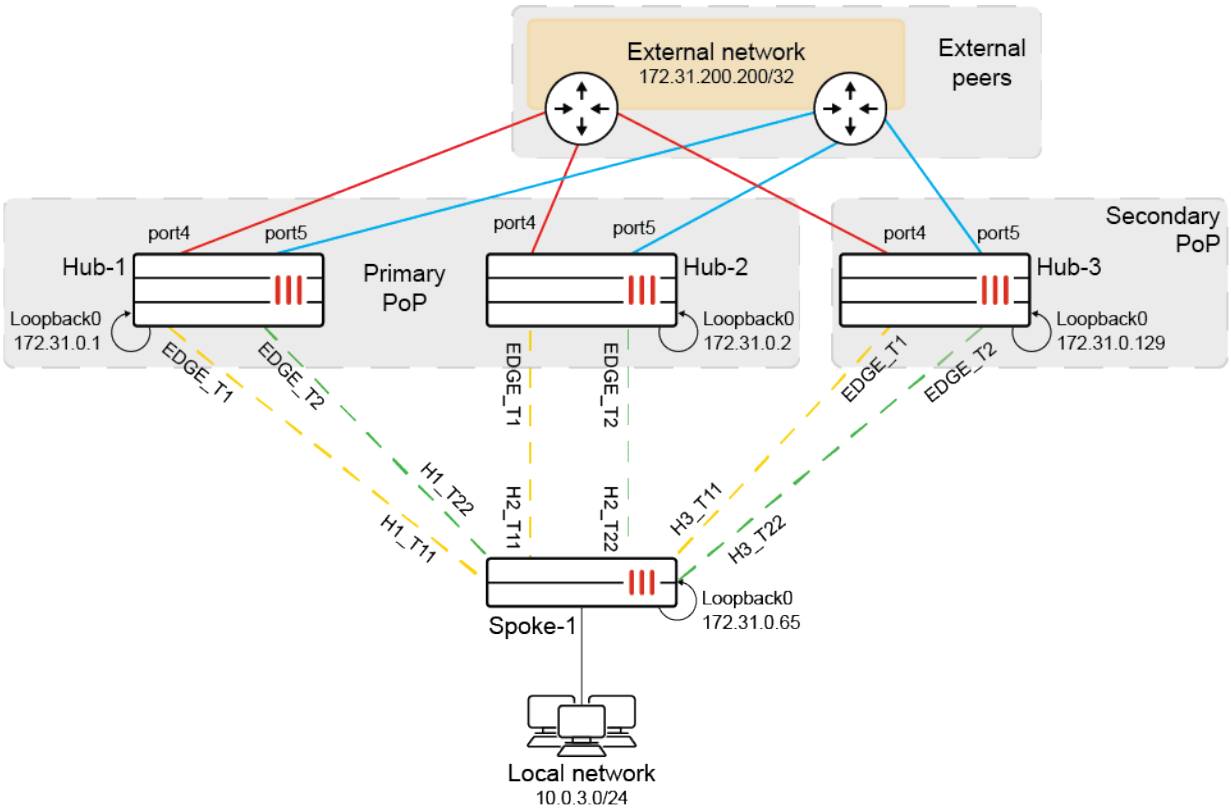
By configuring the neighbor group for spokes under the hub's SD-WAN neighbor configuration, if all paths from the hub to external peers are detected as out of SLA, then the hub will use the default route map to deny external routes to spokes that belong to this neighbor group defined on the hub. As a result, spokes will skip that specific hub and connect to external peers from other hubs.

This allows spokes to only measure overlay quality to each hub, and hubs to manage health checks to services by external peers. This significantly decreases the number of health check probes directly from the spoke to services and decreases the overall complexity. The complexity is further simplified by using multiple VRFs or segmentation where each spoke needs to send health check probes.

Example

This example configuration contains the following components:

- Two PoPs:
  - The primary PoP has two hubs (Hub-1 and Hub-2).
  - The secondary PoP has one hub (Hub-3).
- Spoke-1 has six overlays, with two overlay connections to each hub.
- Spoke-1 has three BGP neighbors, with one BGP neighbor for each hub.
  - All BGP neighbors are established on loopback IPs.
- Each hub has two paths to external peers.



Normally, outbound and inbound traffic go through hubs in the primary PoP. If the number of in SLA overlays to the primary PoP is less than the `minimum-sla-meet-members` (set to 2 in this example), bi-directional traffic needs to be switched to hubs in the secondary PoP. But when the primary PoP recovers and the `minimum-sla-meet-members` is met again, bi-directional traffic is forced back to hubs in the primary PoP after the predefined `hold-down-time` duration.

The hubs do not require SD-WAN configurations to the spokes. However, they use SD-WAN for connections to external peer routers.

Configuring the FortiGates

The following configurations highlight important routing and SD-WAN settings that must be configured on the spoke and the hubs. It is assumed that other configurations such as underlays, IPsec VPN overlays, loopbacks, static routes, and so on are already configured.

To configure Spoke-1:

1. Create the primary (PoP1) and secondary (PoP2) zones, and set the `minimum-sla-meet-members` to 2 on PoP1:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
        edit "PoP1"
```

```
            set minimum-sla-meet-members 2
        next
        edit "PoP2"
        next
    end
end
```

2. Add the overlay members to each zone. Four overlays are defined for PoP1, and two overlays are defined for PoP2:

```
config system sdwan
    config members
        edit 1
            set interface "H1_T11"
            set zone "PoP1"
        next
        edit 2
            set interface "H1_T22"
            set zone "PoP1"
        next
        edit 3
            set interface "H2_T11"
            set zone "PoP1"
        next
        edit 4
            set interface "H2_T22"
            set zone "PoP1"
        next
        edit 5
            set interface "H3_T11"
            set zone "PoP2"
        next
        edit 6
            set interface "H3_T22"
            set zone "PoP2"
        next
    end
end
```

3. Configure a performance SLA health check to a probe server behind the three hubs:

```
config system sdwan
    config health-check
        edit "Hubs"
            set server "172.31.100.100"
            set source 172.31.0.65
            set members 0
            config sla
                edit 1
                    set link-cost-factor latency
                    set latency-threshold 200
                next
```

```
            end
        next
    end
end
```

4. Configure the service rule with the following settings: use SLA mode, enable zone mode to steer traffic based on the zone statuses, enable `sla-stickiness`, and use a 30-second hold down so that upon a recovery, existing sessions will remain on the secondary PoP while new sessions will switch back to the primary PoP once the 30-second duration ends:

```
config system sdwan
    config service
        edit 1
            set mode sla
            set zone-mode enable
            set dst "all"
            set src "CORP_LAN"
            set hold-down-time 30
            set sla-stickiness enable
            config sla
                edit "Hubs"
                    set id 1
                next
            end
            set priority-zone "PoP1" "PoP2"
        next
    end
end
```

Since the PoP1 zone is specified before PoP2, PoP1 is regarded as the primary and preferred over the PoP2 zone.

5. Configure the in_sla and out_sla route maps that define the communities that are advertised to the hub when the zones are in and out of SLA.
   a. Configure the access list:

```
config router access-list
    edit "net10"
        config rule
            edit 1
                set prefix 10.0.3.0 255.255.255.0
            next
        end
    next
end
```

   b. Configure the route maps:

```
config router route-map
    edit "in_sla"
        config rule
            edit 1
```

```
                set match-ip-address "net10"
                set set-community "10:1"
            next
        end
    next
    edit "out_sla"
        config rule
            edit 1
                set match-ip-address "net10"
                set set-community "10:2"
            next
        end
    next
end
```

6. Configure the default route map for out of SLA scenarios, preferable route map for in SLA scenarios, and the local network to be advertised:

```
config router bgp
    config neighbor
        edit "172.31.0.1"
            ...
            set route-map-out "out_sla"
            set route-map-out-preferable "in_sla"
            ...
        next
        edit "172.31.0.2"
            ...
            set route-map-out "out_sla"
            set route-map-out-preferable "in_sla"
            ...
        next
        edit "172.31.0.129"
            ...
            set route-map-out "out_sla"
            set route-map-out-preferable "in_sla"
            ...
        next
    end
    config network
        edit 1
            set prefix 10.0.3.0 255.255.255.0
        next
    end
    ...
end
```

7. Define SD-WAN neighbors for each hub. The `minimum-sla-meet-members` is configured for the Hub-1 neighbor so that bi-directional traffic goes through Hub-1 as long as the in SLA overlays to Hub-1 are no less than 1. Associate the previously defined service rule to each SD-WAN neighbor:

```
config system sdwan
    config neighbor
        edit "172.31.0.1"
            set member 1 2
            set minimum-sla-meet-members 1
            set service-id 1
        next
        edit "172.31.0.2"
            set member 3 4
            set service-id 1
        next
        edit "172.31.0.129"
            set member 5 6
            set service-id 1
        next
    end
end
```

To configure the hubs:

1. Configure the SD-WAN zone, members, and health check for the external connections to peer routers. Performance SLA health checks are sent to external servers in order to measure the health of the external connections:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "port4"
        next
        edit 2
            set interface "port5"
        next
    end
    config health-check
        edit "external_peers"
            set server "10.0.1.2"
            set members 1 2
            config sla
                edit 1
                    set link-cost-factor latency
                    set latency-threshold 200
                next
            end
        next
    end
end
```

2. Configure the route maps for in and out of SLA scenarios. When out of SLA (one of the external connections is down), external routes are denied to be advertised to the spokes that are part of the neighbor group.
   a. Configure the access list:

```
config router access-list
    edit "net_Lo"
        config rule
            edit 1
                set prefix 172.31.200.200 255.255.255.255
            next
        end
    next
end
```

   b. Configure the route maps:

```
config router route-map
    edit "in_sla"
        config rule
            edit 1
                set match-ip-address "net_Lo"
            next
        end
    next
    edit "out_sla"
        config rule
            edit 1
                set action deny routes
                set match-ip-address "net_Lo"
            next
        end
    next
end
```

3. In the BGP settings, configure the external network prefix to advertise. Then configure the neighbor group and neighbor range for the spokes. Configure the preferable and default route maps to define the behavior when the external connections are in and out of SLA:

```
config router bgp
    ...
    config network
        edit 1
            set prefix 172.31.200.200 255.255.255.255
        next
    end
    config neighbor-group
        edit "EDGE"
            ...
            set route-map-out "out_sla"
            set route-map-out-preferable "in_sla"
            ...
        next
```

```
    end
    config neighbor-range
        edit 1
            set prefix 172.31.0.64 255.255.255.192
            set neighbor-group "EDGE"
        next
    end
    ...
end
```

4. Configure the SD-WAN neighbor to match the neighbor group that includes spokes as members. Specify that at least one of the external peer connections needs to be up to be considered in SLA:

```
config system sdwan
    config neighbor
        edit "EDGE"
            set member 1 2
            set minimum-sla-meet-members 1
            set health-check "external_peers"
            set sla-id 1
        next
    end
end
```

Testing and verification

The following tests use diagnostic commands on various FortiGates to verify the connections in the SD-WAN configuration.

Test case 1: the primary PoP and Hub-1 are in SLA

To verify the configuration:

1. Verify the SD-WAN service rules status on Spoke-1. When all six overlays are in SLA on Spoke-1, the primary PoP and primary zone PoP1 are preferred. In particular, the overlay H1_T11 over PoP1 is preferred:

```
Spoke-1 (root) # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x1c200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
  Gen(1), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-order
Hold down time(30) seconds, Hold start at 362646 second, now 362646
  Service role: standalone
  Members(6):
    1: Seq_num(1 H1_T11 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    2: Seq_num(2 H1_T22 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    3: Seq_num(3 H2_T11 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    4: Seq_num(4 H2_T22 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    5: Seq_num(5 H3_T11 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    6: Seq_num(6 H3_T22 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
  Src address(1):
        10.0.0.0-10.255.255.255
```

```
  Dst address(1):
        0.0.0.0-255.255.255.255
```

2. Verify the BGP learned routes on Hub-1. The local route with in SLA community 10:1 is advertised to all hubs. Though, the AS paths on Hub-1 and Hub-2 are shorter than Hub-3:

```
PoP1-Hub1 (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:1
      Last update: Mon Jul 17 15:16:57 2023
```

3. Send traffic from a host behind Spoke-1 to 172.31.200.200.
4. Run a sniffer trace on Spoke-1. Traffic leaves and returns on the H1_T11 overlay :

```
Spoke-1 (root) # diagnose sniffer packet any 'host 172.31.200.200' 4
interfaces=[any]
filters=[host 172.31.200.200]
5.098248 port4 in 10.0.3.2 -> 172.31.200.200: icmp: echo request
5.098339 H1_T11 out 10.0.3.2 -> 172.31.200.200: icmp: echo request
5.098618 H1_T11 in 172.31.200.200 -> 10.0.3.2: icmp: echo reply
5.098750 port4 out 172.31.200.200 -> 10.0.3.2: icmp: echo reply
```

Test case 2: a single SD-WAN member on Hub-1 is out of SLA

Hub-1 and PoP1 are still preferred in this scenario.

To verify the configuration:

1. Verify the health check status on Spoke-1. The H1_T11 overlay on Hub-1/PoP1 is out of SLA:

```
Spoke-1 (root) # diagnose sys sdwan health-check
Health Check(Hubs):
Seq(1 H1_T11): state(alive), packet-loss(0.000%) latency(220.214), jitter(0.015), mos(4.104),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x0
Seq(2 H1_T22): state(alive), packet-loss(0.000%) latency(0.196), jitter(0.014), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
Seq(3 H2_T11): state(alive), packet-loss(0.000%) latency(0.173), jitter(0.008), mos(4.404),
bandwidth-up(999998), bandwidth-dw(999997), bandwidth-bi(1999995) sla_map=0x1
…
```

2. Verify the SD-WAN neighbor status. The SD-WAN neighbor still displays Hub-1's zone status as pass/alive:

```
Spoke-1 (root) # diagnose sys sdwan neighbor
SD-WAN neighbor status: hold-down(disable), hold-down-time(0), hold_boot_time(0)
        Selected role(standalone) last_secondary_select_time/current_time in seconds 0/436439
Neighbor(172.31.0.1): member(1 2)role(standalone)
```

```
        Health-check(:0)  sla-pass selected alive
Neighbor(172.31.0.2): member(3 4)role(standalone)
        Health-check(:0)  sla-pass selected alive
Neighbor(172.31.0.129): member(5 6)role(standalone)
        Health-check(:0)  sla-pass selected alive
```

3. Verify the SD-WAN service rules status. Spoke-1 steers traffic to the H1_T22 overlay through Hub-1:

```
Spoke-1 (root) # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x1c200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
  Gen(2), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-order
Hold down time(30) seconds, Hold start at 364162 second, now 364162
  Service role: standalone
  Members(6):
    1: Seq_num(2 H1_T22 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    2: Seq_num(3 H2_T11 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    3: Seq_num(4 H2_T22 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    4: Seq_num(5 H3_T11 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    5: Seq_num(6 H3_T22 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    6: Seq_num(1 H1_T11 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
  Src address(1):
        10.0.0.0-10.255.255.255
  Dst address(1):
        0.0.0.0-255.255.255.255
```

4. Verify the BGP learned routes on Hub-1. The hubs continue to receive community 10:1 from the spoke and continue to route incoming traffic through Hub-1:

```
PoP1-Hub1 (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:1
      Last update: Mon Jul 17 15:16:57 2023
```

5. Send traffic from a host behind Spoke-1 to 172.31.200.200.
6. Run a sniffer trace on Spoke-1. Traffic leaves and returns on the H1_T22 overlay:

```
Spoke-1 (root) # diagnose sniffer packet any 'host 172.31.200.200' 4
interfaces=[any]
filters=[host 172.31.200.200]
25.299006 port4 in 10.0.3.2 -> 172.31.200.200: icmp: echo request
25.299080 H1_T22 out 10.0.3.2 -> 172.31.200.200: icmp: echo request
25.299323 H1_T22 in 172.31.200.200 -> 10.0.3.2: icmp: echo reply
25.299349 port4 out 172.31.200.200 -> 10.0.3.2: icmp: echo reply
```

Test case 3: both SD-WAN members on Hub-1 are out of SLA

Other in SLA overlays in zone PoP1 though Hub-2 are still preferred over PoP2 in this scenario.

To verify the configuration:

1. Verify the health check status on Spoke-1. Both H1_T11 and H1_T22 overlays on Hub-1/PoP1 are out of SLA:

```
Spoke-1 (root) # diagnose sys sdwan health-check
Health Check(Hubs):
Seq(1 H1_T11): state(alive), packet-loss(0.000%) latency(220.220), jitter(0.018), mos(4.103),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x0
Seq(2 H1_T22): state(alive), packet-loss(0.000%) latency(220.174), jitter(0.007), mos(4.104),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x0
Seq(3 H2_T11): state(alive), packet-loss(0.000%) latency(0.184), jitter(0.015), mos(4.404),
bandwidth-up(999998), bandwidth-dw(999997), bandwidth-bi(1999995) sla_map=0x1
Seq(4 H2_T22): state(alive), packet-loss(0.000%) latency(0.171), jitter(0.008), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
Seq(5 H3_T11): state(alive), packet-loss(0.000%) latency(0.173), jitter(0.011), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
Seq(6 H3_T22): state(alive), packet-loss(0.000%) latency(0.179), jitter(0.011), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x1
```

2. Verify the SD-WAN neighbor status. The SD-WAN neighbor displays Hub-1's zone status as failed. However, SD-WAN Hub-2 is pass/alive:

```
Spoke-1 (root) # diagnose sys sdwan neighbor
SD-WAN neighbor status: hold-down(disable), hold-down-time(0), hold_boot_time(0)
        Selected role(standalone) last_secondary_select_time/current_time in seconds 0/436535
Neighbor(172.31.0.1): member(1 2)role(standalone)
        Health-check(:0)  sla-fail alive
Neighbor(172.31.0.2): member(3 4)role(standalone)
        Health-check(:0)  sla-pass selected alive
Neighbor(172.31.0.129): member(5 6)role(standalone)
        Health-check(:0)  sla-pass selected alive
```

3. Verify the SD-WAN service rules status. Spoke-1 steers traffic to the H2_T11 overlay through Hub-2:

```
Spoke-1 (root) # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x1c200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
  Gen(3), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-order
Hold down time(30) seconds, Hold start at 364489 second, now 364490
  Service role: standalone
  Members(6):
    1: Seq_num(3 H2_T11 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    2: Seq_num(4 H2_T22 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    3: Seq_num(5 H3_T11 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    4: Seq_num(6 H3_T22 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    5: Seq_num(1 H1_T11 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
    6: Seq_num(2 H1_T22 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
  Src address(1):
        10.0.0.0-10.255.255.255
```

```
  Dst address(1):
        0.0.0.0-255.255.255.255
```

4. Verify the BGP learned routes on Hub-1 and Hub-2. Hub-2 and Hub-3 continue to receive community 10:1 from Spoke-1, but Hub-1 receives the out of SLA community of 10:2.
   a. On Hub-1:

```
PoP1-Hub1 (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:2
      Last update: Mon Jul 17 18:08:58 2023
```

   b. On Hub-2:

```
PoP1-Hub2 (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:1
      Last update: Mon Jul 17 15:31:43 2023
```

5. Send traffic from a host behind Spoke-1 to 172.31.200.200.
6. Run a sniffer trace on Spoke-1. Traffic leaves and returns on the H2_T11 overlay:

```
Spoke-1 (root) # diagnose sniffer packet any 'host 172.31.200.200' 4
interfaces=[any]
filters=[host 172.31.200.200]
13.726009 port4 in 10.0.3.2 -> 172.31.200.200: icmp: echo request
13.726075 H2_T11 out 10.0.3.2 -> 172.31.200.200: icmp: echo request

13.726354 H2_T11 in 172.31.200.200 -> 10.0.3.2: icmp: echo reply
13.726382 port4 out 172.31.200.200 -> 10.0.3.2: icmp: echo reply
```

Test case 4: three SD-WAN members on PoP1 are out of SLA

The number of in SLA overlays in zone PoP1 is less than the `minimum-sla-meet-members` in zone PoP1. The SD-WAN service rule for Hub-2 is forcibly marked as `sla(0x0)` or out of SLA.

To verify the configuration:

1. Verify the health check status on Spoke-1. All three H1_T11, H1_T22, and H2_T11 overlays on PoP1 are out of SLA:

```
Spoke-1 (root) # diagnose sys sdwan health-check
Health Check(Hubs):
Seq(1 H1_T11): state(alive), packet-loss(0.000%) latency(220.219), jitter(0.019), mos(4.103),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x0
Seq(2 H1_T22): state(alive), packet-loss(0.000%) latency(220.184), jitter(0.008), mos(4.104),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x0
Seq(3 H2_T11): state(alive), packet-loss(0.000%) latency(220.171), jitter(0.009), mos(4.104),
bandwidth-up(999998), bandwidth-dw(999997), bandwidth-bi(1999995) sla_map=0x0
Seq(4 H2_T22): state(alive), packet-loss(0.000%) latency(0.180), jitter(0.013), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
Seq(5 H3_T11): state(alive), packet-loss(0.000%) latency(0.174), jitter(0.014), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
Seq(6 H3_T22): state(alive), packet-loss(0.000%) latency(0.179), jitter(0.015), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x1
```

2. Verify the SD-WAN neighbor status. The SD-WAN neighbor displays Hub-1 and Hub-2's zone status as failed:

```
Spoke-1 (root) # diagnose sys sdwan neighbor
SD-WAN neighbor status: hold-down(disable), hold-down-time(0), hold_boot_time(0)
        Selected role(standalone) last_secondary_select_time/current_time in seconds 0/436605
Neighbor(172.31.0.1): member(1 2)role(standalone)
        Health-check(:0)  sla-fail alive
Neighbor(172.31.0.2): member(3 4)role(standalone)
        Health-check(:0)  sla-fail alive
Neighbor(172.31.0.129): member(5 6)role(standalone)
        Health-check(:0)  sla-pass selected alive
```

3. Verify the SD-WAN service rules status. Since the minimum SLA members is not met for the primary zone (PoP1), the remaining overlay in PoP1 associated with the SD-WAN service rule is forcibly set to out of SLA. Spoke-1 steers traffic to the H3_T11 overlay through Hub-3:

```
Spoke-1 (root) # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x1c200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
  Gen(6), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-order
Hold down time(30) seconds, Hold start at 365341 second, now 365341
  Service role: standalone
  Members(6):
    1: Seq_num(5 H3_T11 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    2: Seq_num(6 H3_T22 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    3: Seq_num(1 H1_T11 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
    4: Seq_num(2 H1_T22 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected

    5: Seq_num(3 H2_T11 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
    6: Seq_num(4 H2_T22 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
  Src address(1):
        10.0.0.0-10.255.255.255
  Dst address(1):
        0.0.0.0-255.255.255.255
```

4. Verify the BGP learned routes on each hub. Hub-3 continues to receive community 10:1 from Spoke-1, but Hub-1 and Hub-2 receive the out of SLA community of 10:2.
   a. On Hub-1:

```
PoP1-Hub1 (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:2
      Last update: Mon Jul 17 18:22:14 2023
```

   b. On Hub-2:

```
PoP1-Hub2 (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:2
      Last update: Mon Jul 17 18:37:53 2023
```

   c. On Hub-3:

```
PoP2-Hub3 (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:1
      Last update: Mon Jul 17 14:39:04 2023
```

5. Send traffic from a host behind Spoke-1 to 172.31.200.200.
6. Run a sniffer trace on Spoke-1. Traffic leaves and returns on the H3_T11 overlay:

```
Spoke-1 (root) # diagnose sniffer packet any 'host 172.31.200.200' 4
interfaces=[any]
filters=[host 172.31.200.200]
38.501449 port4 in 10.0.3.2 -> 172.31.200.200: icmp: echo request
38.501519 H3_T11 out 10.0.3.2 -> 172.31.200.200: icmp: echo request
38.501818 H3_T11 in 172.31.200.200 -> 10.0.3.2: icmp: echo reply
38.501845 port4 out 172.31.200.200 -> 10.0.3.2: icmp: echo reply
```

Test case 5: an SD-WAN member on PoP1 recovers

SD-WAN member H2_T11 recovers and brings the number of overlays in SLA back to being above the `minimum-sla-meet-members` threshold in PoP1. After the hold down time duration (30 seconds), in SLA overlays in zone PoP1 are preferred over PoP2 again. With `sla-stickiness` enabled, existing traffic is kept on H3_T11, but new traffic is steered to H2_T11.

To verify the configuration:

1. Verify the SD-WAN service rules status on Spoke-1. The hold down timer has not yet passed, so H2_T11 is not yet preferred—even though the SLA status is pass/alive:

```
Spoke-1 (root) # diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x1c200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
  Gen(16), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-
order
Hold down time(30) seconds, Hold start at 431972 second, now 432000
  Service role: standalone
  Members(6):
    1: Seq_num(5 H3_T11 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    2: Seq_num(6 H3_T22 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    3: Seq_num(1 H1_T11 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
    4: Seq_num(2 H1_T22 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
    5: Seq_num(3 H2_T11 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    6: Seq_num(4 H2_T22 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
```

2. Verify the SD-WAN service rules status again after the hold down timer passes. H2_T11 and H2_T22 from PoP1 are now preferred:

```
Spoke-1 (root) # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x1c200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
  Gen(17), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-
order
Hold down time(30) seconds, Hold start at 432003 second, now 432003
  Service role: standalone
  Members(6):
    1: Seq_num(3 H2_T11 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    2: Seq_num(4 H2_T22 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    3: Seq_num(5 H3_T11 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    4: Seq_num(6 H3_T22 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    5: Seq_num(1 H1_T11 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
    6: Seq_num(2 H1_T22 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
```

3. Verify the BGP learned routes on Hub-2, which now receives community 10:1 from Spoke-1:

```
PoP1-Hub2 (root) #  get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
```

```
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:1
      Last update: Tue Jul 18 14:41:32 2023
```

4. Send traffic from a host behind Spoke-1 to 172.31.200.200.
5. Run a sniffer trace on Spoke-1. Because of `sla-stickiness`, the existing traffic is kept on H3_T11:

```
Spoke-1 (root) # diagnose sniffer packet any 'host 172.31.200.200' 4
interfaces=[any]
filters=[host 172.31.200.200]

0.202708 port4 in 10.0.3.2 -> 172.31.200.200: icmp: echo request
0.202724 H3_T11 out 10.0.3.2 -> 172.31.200.200: icmp: echo request
0.202911 H3_T11 in 172.31.200.200 -> 10.0.3.2: icmp: echo reply
0.202934 port4 out 172.31.200.200 -> 10.0.3.2: icmp: echo reply
```

Test case 6: Hub-1 has an in SLA path to external peers

Since Hub-1 has an in SLA path to external peers, it will advertise the external route with destination 172.31.200.200/32 to Spoke-1.

To verify the configuration:

1. Verify the health check status on Hub-1. Note that port4 meets SLA, but port5 does not:

```
PoP1-Hub1 (root) # diagnose sys sdwan health-check
Health Check(external_peers):
Seq(1 port4): state(alive), packet-loss(0.000%) latency(0.161), jitter(0.009), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
Seq(2 port5): state(dead), packet-loss(100.000%) sla_map=0x0
```

2. Verify the SD-WAN neighbor status. The `minimum-sla-meet-members` threshold of 1 is still met:

```
PoP1-Hub1 (root) # diagnose sys sdwan neighbor
Neighbor(EDGE): member(1 2)role(standalone)
        Health-check(external_peers:1)  sla-pass selected alive
```

3. Verify the BGP learned routes. Hub-1 still advertises the external route to the Spoke-1 BGP neighbor:

```
PoP1-Hub1 (root) # get router info bgp neighbors 172.31.0.65 advertised-routes
VRF 0 BGP table version is 13, local router ID is 172.31.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network                Next Hop      Metric     LocPrf  Weight  RouteTag Path
*>i172.31.200.200/32     172.31.0.1     100        32768        0          i <-/->
Total number of prefixes 1
```

Test case 7: all external peers on Hub-1 are out of SLA

In this case, Hub-1 will now advertise the default route map, which denies the advertisement of the external route. Spoke-1 will now route traffic to the next hub.

To verify the configuration:

1. Verify the health check status on Hub-1. Note that port4 and port5 do not meet SLA:

```
PoP1-Hub1 (root) # diagnose sys sdwan health-check
Health Check(external_peers):
Seq(1 port4): state(dead), packet-loss(100.000%) sla_map=0x0
Seq(2 port5): state(dead), packet-loss(100.000%) sla_map=0x0
```

2. Verify the SD-WAN neighbor status. The `minimum-sla-meet-members` threshold of 1 is not met:

```
PoP1-Hub1 (root) # diagnose sys sdwan neighbor
Neighbor(EDGE): member(1 2)role(standalone)
        Health-check(external_peers:1)  sla-fail dead
```

3. Verify the BGP learned routes. Hub-1 does not advertise any external routes to the Spoke-1 BGP neighbor:

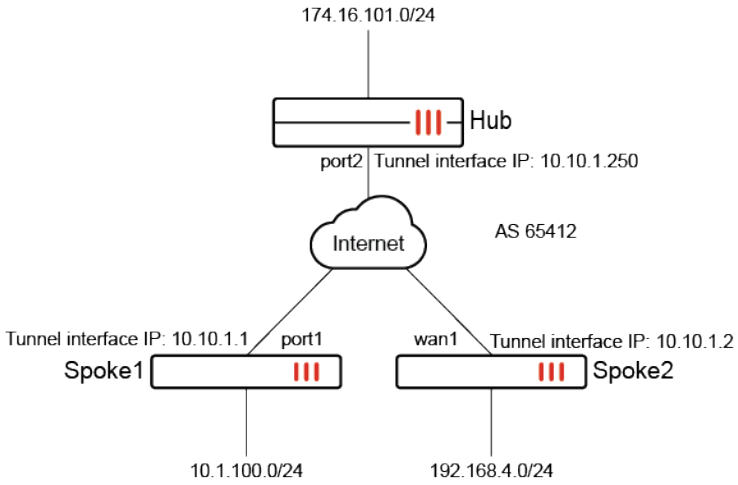
```
PoP1-Hub1 (root) # get router info bgp neighbors 172.31.0.65 advertised-routes
% No prefix for neighbor 172.31.0.65
```

Using a single IKE elector in ADVPN to match all SD-WAN control plane traffic

In the SD-WAN with ADVPN use case, two spokes can communicate with each other on the control plane by an ADVPN shortcut. In order to separate the control traffic from data traffic, the IKE creates a dynamic selector for health check packets sent between the spokes. BGP traffic is also matched by this dynamic IKE selector. Therefore, when spokes establish BGP peering with other spokes, the BGP traffic does not count towards the data traffic and will not impact IPsec idle timeout and shortcut tunnel tear down.

Example

In this example, SD-WAN with ADVPN is configured. The IPsec ADVPN shortcut tunnel is required to tear down when it is idle. SD-WAN health checks are configured, and BGP neighbors established between the spokes is required.



To configure the Hub FortiGate:

1. Configure the phase 1 interface:

```
config vpn ipsec phase1-interface
    edit "Hub"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret ************
        set dpd-retryinterval 60
    next
end
```

2. Configure the phase 2 interface:

```
config vpn ipsec phase2-interface
    edit "Hub"
        set phase1name "Hub"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

3. Configure the VPN interface:

```
config system interface
    edit "Hub"
        set vdom "root"
```

```
        set ip 10.10.1.250 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 10.10.1.254 255.255.255.0
        set snmp-index 50
        set interface "port2"
    next
end
```

4. Configure the BGP settings:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.1.1"
            set advertisement-interval 0
            set remote-as 65412
            set route-reflector-client enable
        next
        edit "10.10.1.2"
            set advertisement-interval 0
            set remote-as 65412
            set route-reflector-client enable
        next
    end
    config network
        edit 1
            set prefix 174.16.101.0 255.255.255.0
        next
    end
end
```

To configure the Spoke1 FortiGate:

1. Configure the phase 1 interface:

```
config vpn ipsec phase1-interface
    edit "Spoke1"
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set npu-offload disable
        set idle-timeout enable
        set idle-timeoutinterval 5
        set auto-discovery-receiver enable
        set remote-gw 172.16.200.4
        set psksecret ************
```

```
   next
end
```

2. Configure the phase 2 interface:

```
config vpn ipsec phase2-interface
    edit "Spoke1"
        set phase1name "Spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

3. Configure the VPN interface:

```
config system interface
    edit "Spoke1"
        set vdom "root"
        set ip 10.10.1.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 10.10.1.254 255.255.255.0
        set snmp-index 28
        set interface "port1"
    next
end
```

4. Configure the BGP settings:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.1.250"
            set advertisement-interval 0
            set remote-as 65412
        next
        edit "10.10.1.2"
            set remote-as 65412
        next
    end
    config network
        edit 1
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

5. Configure the SD-WAN settings:

```
config system sdwan
    set status enable
    config zone
```

```
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "Spoke1"
        next
    end
    config health-check
        edit "1"
            set server "174.16.101.44"
            set members 0
        next
    end
end
```

To configure the Spoke2 FortiGate:

1. Configure the phase 1 interface:

```
config vpn ipsec phase1-interface
    edit "Spoke2"
        set interface "wan1"
        set ike-version 2
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set npu-offload disable
        set idle-timeout enable
        set idle-timeoutinterval 5
        set auto-discovery-receiver enable
        set remote-gw 172.16.200.4
        set psksecret ************
    next
end
```

2. Configure the phase 2 interface:

```
config vpn ipsec phase2-interface
    edit "Spoke2"
        set phase1name "Spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

3. Configure the VPN interface:

```
config system interface
    edit "Spoke2"
```

```
        set vdom "root"
        set ip 10.10.1.2 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 10.10.1.254 255.255.255.0
        set snmp-index 15
        set interface "wan1"
    next
end
```

4. Configure the BGP settings:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.1.250"
            set advertisement-interval 0
            set remote-as 65412
        next
        edit "10.10.1.1"
            set remote-as 65412
        next
    end
    config network
        edit 1
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end
```

5. Configure the SD-WAN settings:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "Spoke2"
        next
    end
    config health-check
        edit "1"
            set server "174.16.101.44"
            set members 0
        next
    end
end
```

To verify the configuration:

1. Send traffic between the spokes to establish the ADVPN shortcut.
2. Verify the IPsec tunnel state on the Spoke1 FortiGate:

```
Spoke1 # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=Spoke1_0 ver=2 serial=7 172.16.200.1:0->172.16.200.3:0 tun_id=10.10.1.2 tun_

```

The dynamic selector is created (highlighted) for SD-WAN control traffic, SD-WAN health checks, and BGP between spokes traffic.

3. Verify the BGP neighbors and check the routing table:

```
Spoke1 # get router info bgp summary

VRF 0 BGP router identifier 172.16.200.1, local AS number 65412
BGP table version is 8
1 BGP AS-PATH entries
0 BGP community entries

Neighbor    V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.10.1.2   4      65412      52      76        7    0    0 00:06:27        1
10.10.1.250 4      65412      70      69        1    0    0 00:58:44        2

Total number of neighbors 2
```

4. Stop sending traffic between the spokes, and wait for a few minutes (idle timeout).
5. Verify the IPsec tunnel state on the Spoke1 FortiGate:

```
Spoke1 # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=Spoke1 ver=2 serial=1 172.16.200.1:0->172.16.200.4:0 tun_id=172.16.200.4 tun_
id6=::172.16.200.4 dst_mtu=1500 dpd-link=on weight=1
bound_if=19 lgwy=static/1 tun=intf mode=auto/1 encap=none/560 options[0230]=create_dev frag-
rfc  role=primary accept_traffic=1 overlay_id=0

proxyid_num=1 child_num=0 refcnt=4 ilast=0 olast=0 ad=r/2
stat: rxp=1467 txp=1469 rxb=60190 txb=60214
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=0

```

The shortcut tunnel between the spokes has been torn down. When data traffic is idle, the BGP traffic does not get sent on the data traffic selector, so the tunnel is not kept alive. This behavior is the expected, which consequently allows the shortcut tunnel to be torn down when idle.

6. Verify the IKE debugs messages to confirm the ADVPN shortcut was torn down:

```
Spoke1 # diagnose debug enable
Spoke1 # diagnose debug application ike -1
...
ike 0:Spoke1_0: connection idle time-out

```

SD-WAN Overlay-as-a-Service

The FortiCloud Overlay-as-a-Service portal and the FortiGate Cloud Advanced license support SD-WAN overlay.

SD-WAN overlay is supported through an Overlay-as-a-Service (OaaS) license displayed as *SD-WAN Overlay as a Service* on the *System > FortiGuard* page. Each FortiGate used by the FortiCloud Overlay-as-a-Service or FortiGate Cloud portal for SD-WAN overlay must have this license applied to it.

See the Overlay-as-a-Service Administration Guide and SD-WAN Overlay in the FortiGate Cloud Administration Guide for more information on SD-WAN overlay.

To view the status of the OaaS license in the GUI:

1. Go to *System* > *FortiGuard*.
2. Expand *License Information*. The *SD-WAN Overlay as a Service* license status is listed as:
   - *Licensed*: OaaS is currently licensed and will expire on the provided date.
   - *Expires Soon*: OaaS is currently licensed but will expire soon on the provided date.
   - *Expired*: The OaaS license has already expired on the provided date.
   - *Not Licensed*: OaaS has not been licensed.

To view the status of the OaaS license in the CLI:

1. Verify that the entitlement can be updated:

The SD-WAN Overlay-as-a-Service license is listed as SWOS in the CLI.

```
# diagnose test update info

System contracts:
    FMWR,Wed Dec 20 16:00:00 2023
    SPAM,Wed Dec 20 16:00:00 2023
    SBCL,Wed Dec 20 16:00:00 2023
    SWNO,Wed Dec 20 16:00:00 2023
    SWNM,Wed Sep 27 17:00:00 2023
    SWOS,Mon Aug 14 17:00:00 2023
    SPRT,Wed Dec 20 16:00:00 2023
    SDWN,Sun Dec 10 16:00:00 2023
    SBCL,Wed Dec 20 16:00:00 2023
    SBEN,Wed Dec 20 16:00:00 2023
```

2. Verify that the expiration date log can be generated:

```
# execute log display

1: date=2023-08-10 time=00:00:01 eventtime=1691650800645347120 tz="-0700" logid="0100020138"
type="event" subtype="system" level="warning" vd="root" logdesc="FortiGuard SD-WAN Overlay as
a Service license expiring" msg="FortiGuard SD-WAN Overlay Service license will expire in 4
day(s)"
```

To ensure FortiGate spoke traffic remains uninterrupted when configuration is orchestrated from SD-WAN Overlay-as-a-Service (OaaS) or FortiGate Cloud, support for an OaaS agent on the FortiGate is available. The OaaS agent communicates with the OaaS controller in FortiCloud, validates and compares the FortiOS configuration, and applies the FortiOS configuration to the FortiGate as a transaction when it has been orchestrated from the OaaS or FortiGate Cloud portal. Secure communication between the OaaS agent and the OaaS controller is achieved using the FGFM management tunnel.

If any configuration change fails to be applied, then the OaaS agent rolls back all configuration changes that were orchestrated. The OaaS status can be acquired using `get oaas status`.

To determine the status of OaaS:

```
# get oaas status
Account ID: 78992
Account: admin@domain.com
Site: site1
Configuration version: 4
Configuration sync status: SUCCESS
    Target version: 4
    Task ID: xxxxxxxxx
    Error:
```

Advanced configuration

The following topics provide instructions on SD-WAN advanced configuration:

- SD-WAN with FGCP HA on page 1278
- Configuring SD-WAN in an HA cluster using internal hardware switches on page 1289
- SD-WAN configuration portability on page 1293
- SD-WAN segmentation over a single overlay on page 1299
- SD-WAN segmentation over a single overlay using IPv6 on page 1315
- Matching BGP extended community route targets in route maps on page 1323
- Copying the DSCP value from the session original direction to its reply direction on page 1328

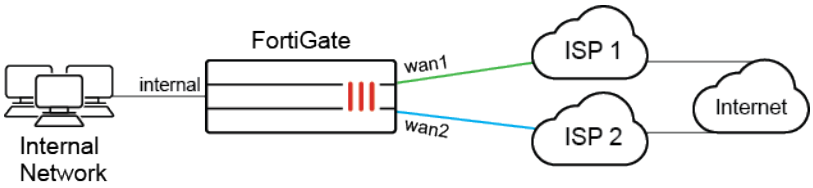
See also Packet distribution for aggregate static IPsec tunnels in SD-WAN on page 2611.

SD-WAN with FGCP HA

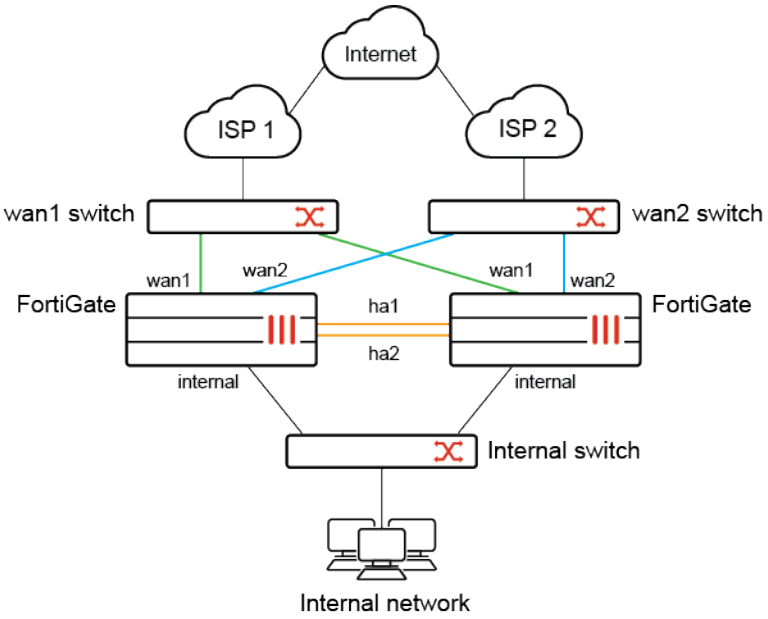
This example shows how to convert a standalone FortiGate SD-WAN solution to a FGCP HA cluster with full-mesh WAN set up. This configuration allows you to load balance your internet traffic between multiple ISP links. It also provides redundancy for your internet connection if your primary ISP in unavailable, or if one of the FortiGates in the HA cluster fails.

This example assumes that a standalone FortiGate has already been configured for SD-WAN by following the SD-WAN quick start on page 897.

Standalone FortiGate:



FGCP HA cluster:



The following devices are required to convert the topology to HA:

- A second FortiGate that is the same model running the same firmware version.
- Two switches for connecting each FortiGate's WAN interface to the corresponding ISP modem.

Before you begin:

- Ensure that the licenses and subscriptions on both HA members match.
- Ensure that there are one or more ports reserved for HA heartbeat.
- Ensure you have physical access to both HA members.

Enabling HA and re-cabling the WAN interfaces will cause network interruptions. This procedure should be performed during a maintenance window.

Configuring the standalone FortiGate for HA

After running the following commands, the FortiGate negotiates to establish an HA cluster. You might temporarily lose connectivity with the FortiGate as FGCP negotiations take place and the MAC addresses of the FortiGate interfaces are changed to HA virtual MAC addresses.

This configurations sets the HA mode to active-passive.

The ha1 and ha2 interfaces are configured as the heartbeat interfaces, with priorities set to 200 and 100 respectively. Setting different priorities for the heartbeat interfaces is a best practice, but is not required.

If you have more than one cluster on the same network, each cluster should have a different group ID. Changing the group ID changes the cluster interface's virtual MAC addresses. If the group IP causes a MAC address conflict on your network, select a different group ID.

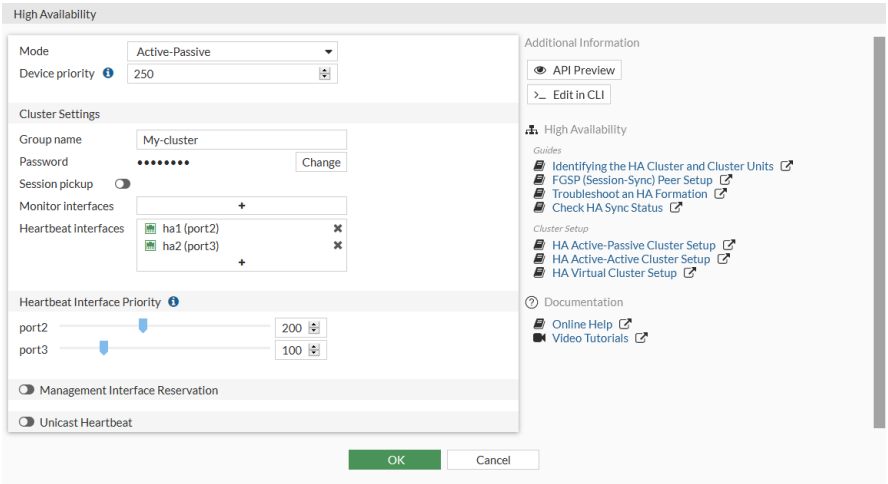
Enabling override and increasing the device priority means that this FortiGate always becomes the primary unit.

To configure the standalone FortiGate for HA in the GUI:

1. Go to *System* > *Settings* and change the *Host name* so that the FortiGate can be easily identified as the primary unit.
2. Go to *System* > *HA* and configure the following options:

Mode	Active-Passive
Device priority	250
Group name	My-cluster
Password	<password>
Heartbeat interfaces	ha1 and ha2
Heartbeat Interface Priority	**port2** (ha1): 200 **port3** (ha2): 100

Override and the group ID can only be configured from the CLI.



3. Click *OK*.
   Connectivity with the FortiGate will temporarily be lost.

To configure the standalone FortiGate for HA in the CLI:

1. Change the host name so that the FortiGate can be easily identified:

```
config system global
    set hostname primary_FG
end
```

2. Configure HA:

```
config system ha
    set mode a-p
    set group-id 100
    set group-name My-cluster
    set password <password>
    set priority 250
    set override enable
    set hbdev ha1 200 ha2 100
end
```

If HA mode does not start after running the above steps, ensure that none of the FortiGate's interfaces use DHCP or PPPoE addressing.

Configuring the secondary FortiGate for HA

The secondary FortiGate must be the same model and running the same firmware version as the primary FortiGate. The HA settings are the same as the for the primary unit, except the secondary device has a lower priority and override is not enabled.

It is best practice to reset the FortiGate to factory default settings prior to configuring HA. This reduces the chance of synchronization problems.

```
# execute factoryreset
This operation will reset the system to factory default!
Do you want to continue? (y/n) y
```

This is unnecessary if the device is new from the factory.

To configure the secondary FortiGate for HA in the GUI:

1. Go to *System > Settings* and change the *Host name* so that the FortiGate can be easily identified as the backup unit.
2. Go to *System > HA* and configure the options the same as for the primary FortiGate, except with a lower priority:

Mode	Active-Passive

Device priority	128
Group name	My-cluster
Password	<password>
Heartbeat interfaces	ha1 and ha2
Heartbeat Interface Priority	**port2** (ha1): 200 **port3** (ha2): 100

3. Click *OK*.

To configure the secondary FortiGate for HA in the CLI:

1. Change the host name so that the secondary FortiGate can be easily identified:

```
config system global
    set hostname secondary_FG
end
```

2. Configure HA:

```
config system ha
    set mode a-p
    set group-id 100
    set group-name My-cluster
    set password <password>
    set priority 128
    set hbdev ha1 200 ha2 100
end
```

Connecting the heartbeat interfaces between the FortiGates

To connect and check the heartbeat interfaces:

1. Connect the heartbeat interfaces ha1 and ha2 between the primary and secondary FortiGate.
   a. An HA primary device is selected. Because the primary FortiGate has a higher priority and override enabled, it assumes the role of HA primary.
   b. The secondary FortiGate synchronizes its configuration from the primary device.
2. Verify that the checksums match between the primary and secondary FortiGates:

```
# diagnose sys ha checksum cluster

================== FG5H0XXXXXXXXX0 ==================

is_manage_primary()=1, is_root_primary()=1
debugzone
global: 2b e9 81 38 c2 9d 4f db b7 0e 1f 49 42 c6 1e fb
root: af a6 48 c5 c2 9a 8b 81 a5 53 fb 27 e9 ae 01 6a
all: 89 1f 63 77 48 8a 30 ee 57 06 ca eb 71 e6 8e ad
```

```
checksum
global: 2b e9 81 38 c2 9d 4f db b7 0e 1f 49 42 c6 1e fb
root: af a6 48 c5 c2 9a 8b 81 a5 53 fb 27 e9 ae 01 6a
all: 89 1f 63 77 48 8a 30 ee 57 06 ca eb 71 e6 8e ad

================== FG5H0XXXXXXXXX1 ==================

is_manage_primary()=0, is_root_primary()=0
debugzone
global: 2b e9 81 38 c2 9d 4f db b7 0e 1f 49 42 c6 1e fb
root: af a6 48 c5 c2 9a 8b 81 a5 53 fb 27 e9 ae 01 6a
all: 89 1f 63 77 48 8a 30 ee 57 06 ca eb 71 e6 8e ad

checksum
global: 2b e9 81 38 c2 9d 4f db b7 0e 1f 49 42 c6 1e fb
root: af a6 48 c5 c2 9a 8b 81 a5 53 fb 27 e9 ae 01 6a
all: 89 1f 63 77 48 8a 30 ee 57 06 ca eb 71 e6 8e ad
```

If all of the cluster members have identical checksums, then their configurations are synchronized. If the checksums are not the same, wait for a few minutes, then repeat the command. Some parts of the configuration might take a significant amount of time to synchronize (tens of minutes).

Connecting other traffic interfaces

After the device configurations are synchronized, you can connect the rest of the traffic interfaces. Making these connections will disrupt traffic as cables are disconnected and reconnected.

Switches must be used between the cluster and the ISPs, and between the cluster and the internal network, as shown in the topology diagram.

Checking cluster operations

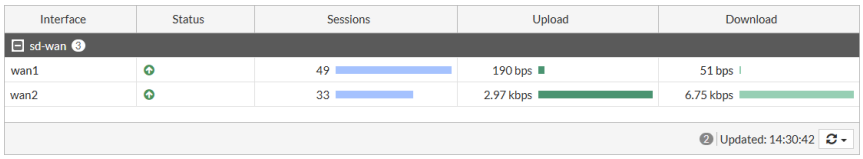
The *HA Status* dashboard widget shows the synchronization status. Hover over the host names of each FortiGate in the widget to verify that they are synchronized and have the same checksum.

To view more information about the cluster status, including the number of sessions passing through the cluster members, go to *System* > *HA*.

See Check HA synchronization status on page 3379 for more information.

Results

1. Browse the internet on a computer in the internal network.
2. Go to *Network* > *SD-WAN* and select the *SD-WAN Zones* tab to see the bandwidth, volume, and sessions for traffic on the SD-WAN interfaces. See Results on page 902 for details.
3. Go to *Dashboard* > *Network*, and expand the *SD-WAN* widget to see information about each interface, such as the number of sessions and the bit rate.



Testing HA failover

All traffic should currently be flowing through the primary FortiGate. If it becomes unavailable, traffic fails over to the secondary FortiGate. When the primary FortiGate rejoins the cluster, the secondary FortiGate continues to operate as the primary FortiGate.

To test this, ping a reliable IP address from a computer in the internal network, and then power off the primary FortiGate.

There will be a momentary pause in the ping results until traffic diverts to the backup FortiGate, allowing the ping traffic to continue:

```
64 bytes from 184.25.76.114: icmp_seq=69 ttl=52 time=8.719 ms\
64 bytes from 184.25.76.114: icmp_seq=70 ttl=52 time=8.822 ms\
64 bytes from 184.25.76.114: icmp_seq=74 ttl=52 time=8.901 ms\
Request timeout for icmp_seq 75\
64 bytes from 184.25.76.114: icmp_seq=76 ttl=52 time=8.860 ms\
64 bytes from 184.25.76.114: icmp_seq=77 ttl=52 time=9.174 ms\
64 bytes from 184.25.76.114: icmp_seq=83 ttl=52 time=8.639 ms}
```

If you are using port monitoring, you can also unplug the primary FortiGate's internet facing interface to test failover.

After the secondary FortiGate becomes the primary, you can log into the cluster using the same IP address as before the fail over. If the primary FortiGate is powered off, you will be logged into the backup FortiGate. Check the host name to verify what device you have logged into. The FortiGate continues to operate in HA mode, and if you restart the primary FortiGate, it will rejoin the cluster and act as the backup FortiGate. Traffic is not disrupted when the restarted FortiGate rejoins the cluster.

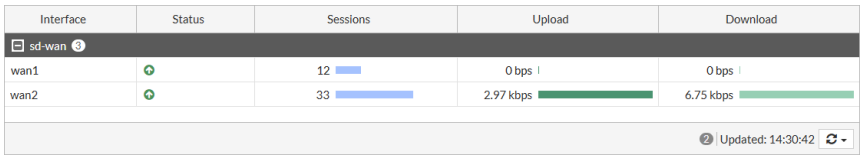
You can also use the CLI to force an HA failover. See Force HA failover for testing and demonstrations on page 3409 for information.

Testing ISP failover

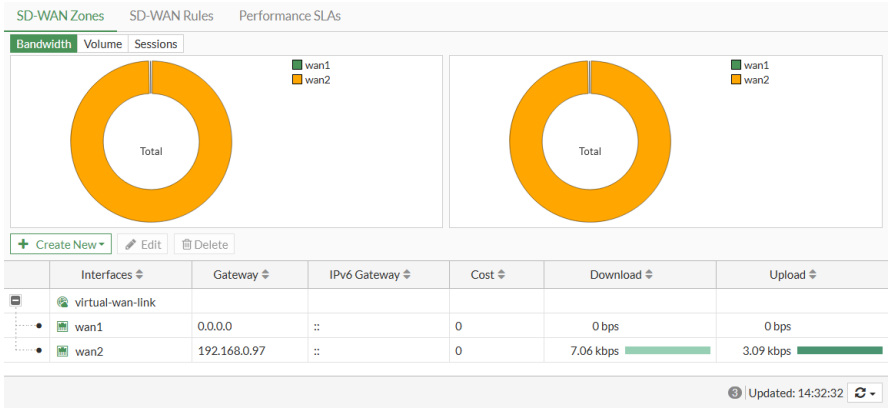
To test a failover of the redundant internet configuration, you need to simulate a failed internet connection to one of the ports. You can do this by disconnecting power from the wan1 switch, or by disconnecting the wan1 interfaces of both FortiGates from ISP1.

After disconnecting, verify that users still have internet access

- Go to *Dashboard* > *Network*, and expand the *SD-WAN* widget. The *Upload* and *Download* columns for wan1 show that traffic is not going through that interface.



- Go to *Network* > *SD-WAN* and select the *SD-WAN Zones* tab. The *Bandwidth*, *Volume*, and *Sessions* tabs show that traffic is entirely diverted to wan2.



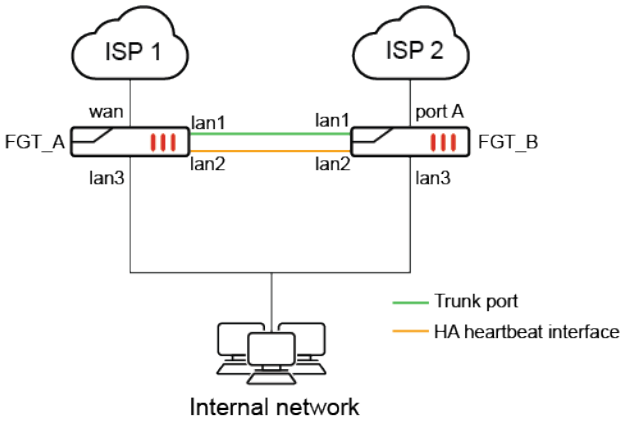
Users on the network should not notice the wan1 failure. If you are using the wan1 gateway IP address to connect to the administrator dashboard, it will appear as though you are still connecting through wan1.

After verifying a successful failover, reestablish the connection to ISP1.

Configuring SD-WAN in an HA cluster using virtual VLAN switch

In this SD-WAN configuration, two FortiGates in an active-passive (A-P) HA pair are used to provide hardware redundancy. Instead of using external switches to provide a mesh network connection to the ISP routers, each FortiGate connects to an ISP and uses a virtual VLAN switch to connect to each other. Virtual VLAN switch mode allows 802.1Q VLANs to be assigned to it, and the configuration of one interface as a trunk port.

Only FortiGate models that support the virtual VLAN switch feature can be used for this solution. See Virtual VLAN switch on page 210 for details.



In this topology:

- An HA cluster of two FortiGate 40Fs is used as an example
- The lan interface is broken up into lan1, lan2 and lan3
- lan1 is connected between FGT_A and FGT_B and designated as a virtual VLAN switch trunk port
- lan2 is used for HA heartbeat, connecting the two FortiGates in HA
- lan3 is connected to the internal network
- wan is connected to ISP1 on FGT_A
- port A is connected to ISP on FGT_B

Two VLANs are created (VLAN 10 and VLAN 20), and assigned to two VLAN switches. Each VLAN switch has the WAN interfaces (wan and port A) as its member.

When FGT_A is the primary device, it reaches ISP1 directly via the local wan interface and reaches ISP2 via the trunk port towards FGT_B. Packets are tagged/untagged as VLAN 10 as it passes through the trunk before egressing on port A on FGT_B.

When FGT_B is the primary device, it reaches ISP2 directly via the local port A interface and reaches ISP1 via the trunk port towards FGT_A. Packets are tagged/untagged as VLAN 20 as it passes through the trunk before egressing on the wan interface on FGT_A.

Using virtual VLAN switches for an SD-WAN HA configuration, as described in this example, requires fewer interfaces than the hardware switch configuration described in Configuring SD-WAN in an HA cluster using internal hardware switches on page 1289

A virtual VLAN switch configuration with 2 WAN connections requires 5 interfaces. With 3 WAN connections, a total of 6 interfaces are required.

For the internal hardware switch solution, each WAN connection requires a corresponding hardware switch interface. With 2 WAN connections, a total of 6 interfaces are needed. With 3 WAN connections, a total of 8 interfaces are needed.

HA failover

This is not a standard HA configuration with external switches. In the case of a device failure, one of the ISPs will no longer be available because the switch that is connected to it will be down.

For example, if FGT_A loses power, HA failover will occur and FGT_B will become the primary unit. Its connection to VLAN 10 over the trunk port will be down, so it will be unable to connect to ISP 1. Its SD-WAN SLAs will be broken, and traffic will only be routed through ISP 2.

SD-WAN SLA health checks should be used to monitor the health of each ISP. HA link monitoring will not be possible, since at least one of the WAN interfaces will be down on each FortiGate at all times.

Configuration

In the configuration example, it is assumed HA A-P mode is already configured and FGT_A and FGT_B are in sync.

To configure the virtual VLAN switch, VLANs and interface settings in the GUI:

1. Enable Virtual VLAN switch from the GUI under the *System > Settings* page. In the View Settings section, enable VLAN switch mode. Click *Apply*.
2. Create a new VLAN switch and assign the wan interface in the GUI.
   a. Go to *Network > Interfaces* and click *Create New > Interface*.
   b. Enter the name *ISP1*
   c. Set the *Type* to *VLAN Switch*.
   d. Enter the *VLAN ID 10*.
   e. Click the + and add the Interface Members. Select the interface *wan*.
   f. Configure the *Address* (192.168.10.99/24) and *Administrative Access* settings as needed.
   g. Click *OK*.
3. Repeat the same steps for a new VLAN switch and assign the port A interface in the GUI.
   a. Go to *Network > Interfaces* and click *Create New > Interface*.
   b. Enter the name ISP2
   c. Set the Type to VLAN Switch.
   d. Enter the VLAN ID 20.
   e. Click the + and add the Interface Members. Select the interface ‘a’.
   f. Configure the Address (192.168.20.99/24) and Administrative Access settings as needed.
   g. Click OK
4. Designate an interface as the trunk port from the CLI:

```
config system interface
   edit lan1
      set trunk enable
   next
end
```

To configure the virtual VLAN switch, VLANs and interface settings in the CLI:

```
config system global
   set virtual-switch-vlan enable
end
config system virtual-switch
   edit "ISP1"
```

```
      set physical-switch "sw0"
      set vlan 10
      config port
         edit "wan"
         next
      end
   next
   edit "ISP2"
      set physical-switch "sw0"
      set vlan 20
      config port
         edit "a"
         next
      end
   next
end
config system interface
   edit "ISP1"
      set vdom "root"
      set ip 192.168.10.99 255.255.255.0
      set allowaccess ping
      set type hard-switch
   next
   edit "ISP2"
      set vdom "root"
      set ip 192.168.20.99 255.255.255.0
      set allowaccess ping
      set type hard-switch
   next
end
config system interface
   edit lan1
      set trunk enable
   next
end
```

To configure SD-WAN in the GUI:

1. On the FortiGate, go to *Network > SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New > SD-WAN Member*.
2. In the *Interface* dropdown, select *ISP1*.
3. Leave *SD-WAN Zone* set to *virtual-wan-link*.
4. Enter the *Gateway* address *192.168.10.1*.
5. Click *OK*.
6. Repeat these steps to add the second interface (*ISP2*) with the gateway *192.168.20.1*.
7. Click *Apply*.
8. Create a health check:
   a. Go to *Network > SD-WAN*, select the *Performance SLA* tab, and click *Create New*.
   b. Set *Name* to *GW_HC*.
   c. Set *Protocol* to *Ping* and *Servers* to *8.8.8.8*.
   d. Set *Participants* to *All SD-WAN Members*.
   e. Enable *SLA Target* and leave the default values.

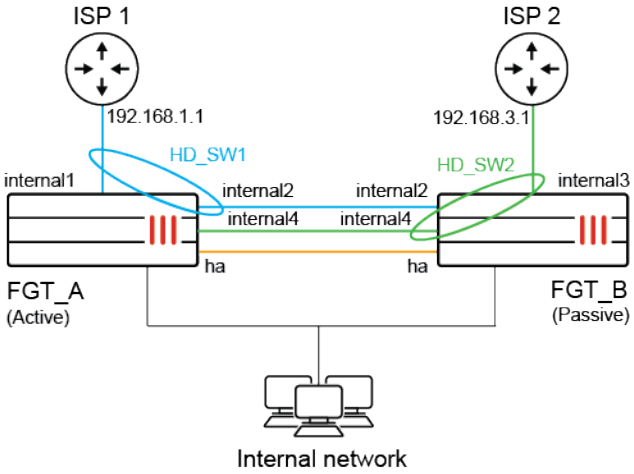
f. Click *OK*.

9. Create SD-WAN rules as needed. The SLA health check can be used to determine when the ISP connections are in or out of SLA, and to failover accordingly.
10. Configure your firewall policy as needed for the virtual-wan-link SD-WAN zone.

Configuring SD-WAN in an HA cluster using internal hardware switches

In this SD-WAN configuration, two FortiGates in an active-passive (A-P) HA pair are used to provide hardware redundancy. Instead of using external switches to provide a mesh network connection to the ISP routers, the FortiGates use their built-in hardware switches to connect to the ISP routers.

Only FortiGate models that have hardware switches can be used for this solution. Ports in a software switch are not in a forwarding state when a FortiGate is acting as a secondary device in a A-P cluster.



In this topology:

- Two hardware switches are created, HD_SW1 and HD_SW2.
- HD_SW1 is used to connect to ISP 1 Router and includes the internal1 and internal2 ports.
- HD_SW2 is used to connect to ISP 2 Router and includes the internal3 and internal4 ports.
- Another interface on each device is used as the HA heartbeat interface, connecting the two FortiGates in HA.

The FortiGates create two hardware switches to connect to ISP 1 and ISP2. When FGT_A is the primary device, it reaches ISP 1 on internal1 in HD_SW1 and ISP 2 on internal4 in HD_SW2. When FGT_B is the primary device, it reaches ISP 1 on internal2 in HD_SW1 and ISP 2 on internal3 on HD_SW2.

HA failover

This is not a standard HA configuration with external switches. In the case of a device failure, one of the ISPs will no longer be available because the switch that is connected to it will be down.

For example, If FGT_A loses power, HA failover will occur and FGT_B will become the primary unit. Its connection to internal2 on HD_SW1 will also be down, so it will be unable to connect to ISP 1. Its SD-WAN SLAs will be broken, and traffic will only be routed through ISP 2.

A link on a hardware switch cannot be monitored in HA monitor, so it is impossible to perform link failure when a port in either of the hardware switches fails. Performing a link failure is unnecessary in this configuration though, because any link failure on the hardware switch will be experienced by both cluster members. SD-WAN SLA health checks should be used to monitor the health of each ISP.

Failure on a hardware switch or ISP router

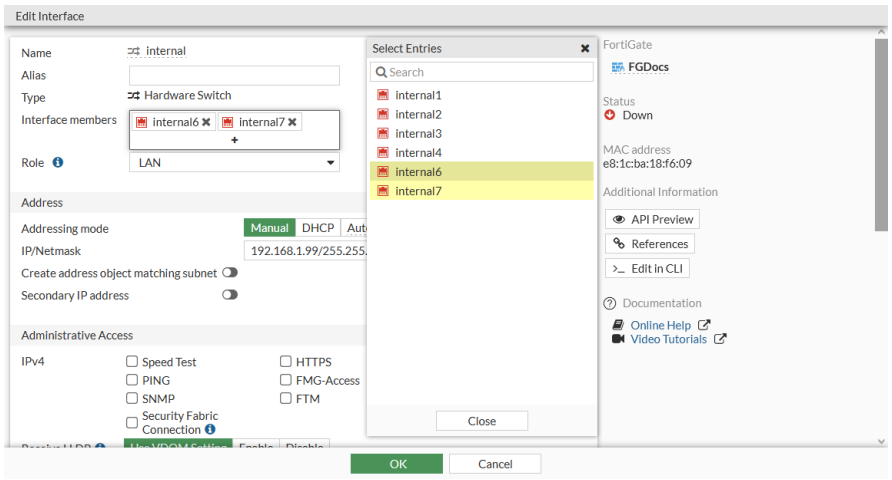
If a hardware switch or switch interface is down, or the ISP router is down, the SD-WAN can detect the broken SLA and continue routing to the other ISP.

For example, if FGT_A is the primary unit, and ISP 2 Router becomes unreachable, the SLA health checks on SD-WAN will detect the broken SLA and cause traffic to stop routing to ISP 2.

Configuration

To configure the HA A-P cluster with internal hardware switches:

1. Configure two FortiGates with internal switches in an A-P HA cluster (follow the steps in HA active-passive cluster setup on page 3357), starting by connecting the heartbeat interface.
2. When the HA cluster is up, connect to the primary FortiGate's GUI.
3. Remove the existing interface members from the default hardware switch:
   a. Go to *Network* > *Interfaces*.
   b. In the *LAN* section, double-click the *internal* interface to edit it.
   c. In *Interface Members*, remove all of the interfaces



d. Click *OK*.

4. Configure the hardware switch interfaces for the two ISPs:

a. Go to *Network* > *Interfaces* and click *Create New* > *Interface*.

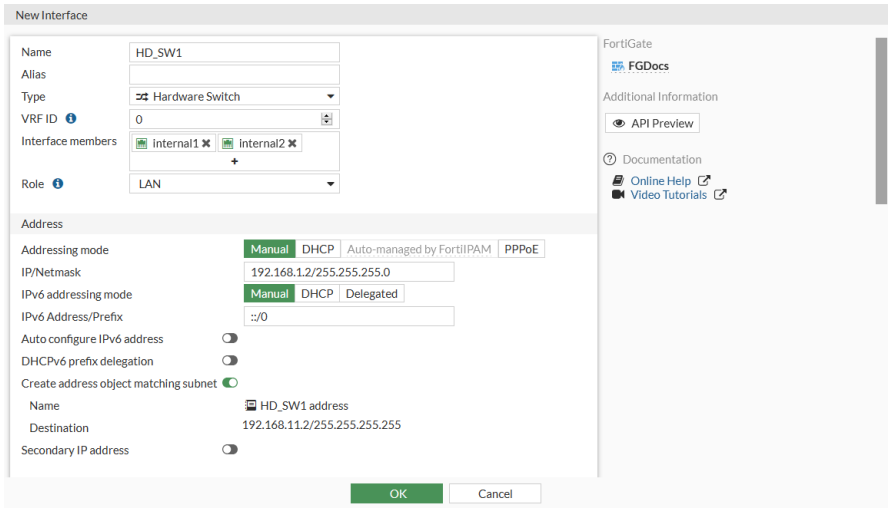
b. Enter a name (*HD_SW1*).

c. Set *Type* to *Hardware Switch*.

d. In *Interface Members*, add two interfaces (*internal1* and *internal2*).

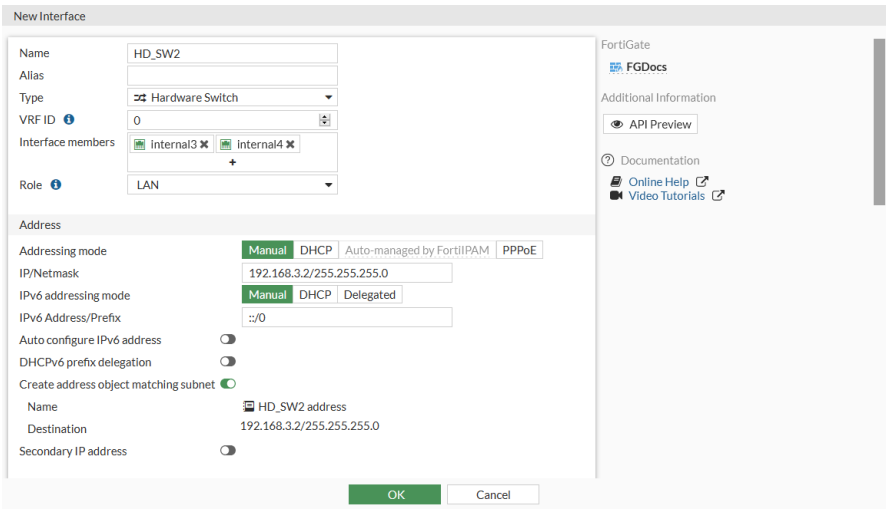
e. Set *IP/Netmask* to 192.168.1.2/24.

f. Configure the remaining settings as needed.



g. Click *OK*.

h. Repeat these steps to create a second hardware switch interface (*HD_SW2*) with two interface members (*internal3* and *internal4*) and *IP/Netmask* set to *192.168.3.2/24*.



To connect the devices as shown in the topology:

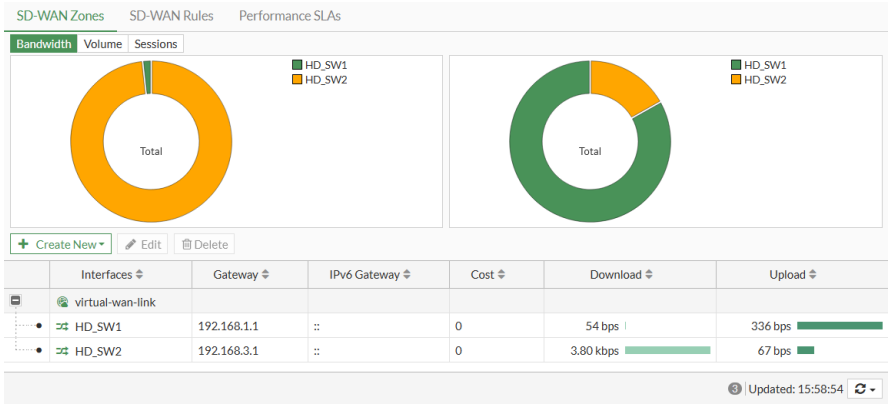
1. Connect the incoming interface to the internal switch on both FortiGates.
2. On FGT_A, connect internal1 of HD_SW1 to ISP 1 Router.
3. On FGT_B, connect internal3 of HD_SW2 to ISP 2 Router.
4. For HD_SW1, connect FGT_A internal2 directly to FGT_B internal2.
5. For HD_SW2, connect FGT_A internal4 directly to FGT_B internal4.

To configure SD-WAN:

The primary FortiGate makes all the SD-WAN decisions.

---

1. On the primary FortiGate, go to *Network* > *SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New* > *SD-WAN Member*.
2. In the *Interface* dropdown, select *HD_SW1*.
3. Leave *SD-WAN Zone* set to *virtual-wan-link*.
4. Enter the *Gateway* address *192.168.1.1*.
5. Click *OK*.
6. Repeat these steps to add the second interface (*HD_SW2*) with the gateway *192.168.3.1*.
7. Click *Apply*.



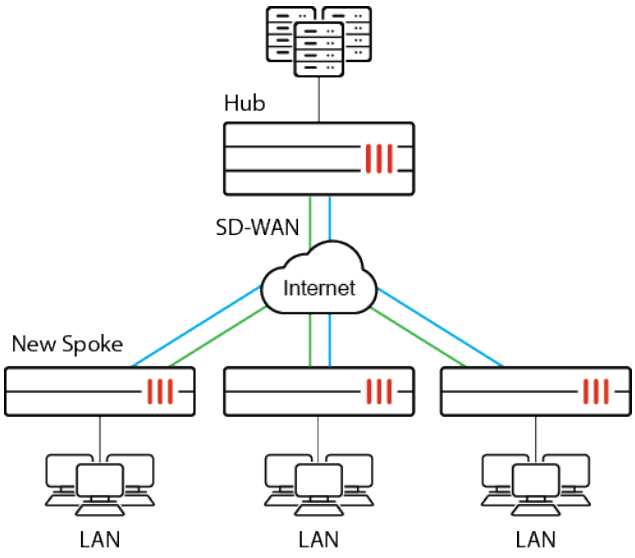
8. Create a health check:
   a. Go to *Network* > *SD-WAN*, select the *Performance SLA* tab, and click *Create New*.
   b. Set *Name* to *GW_HC*.
   c. Set *Protocol* to *Ping* and *Servers* to *8.8.8.8*.
   d. Set *Participants* to *All SD-WAN Members*.
   e. Enable *SLA Target* and leave the default values.
   f. Click *OK*.
9. Create SD-WAN rules as needed. The SLA health check can be used to determine when the ISP connections are in or out of SLA, and to failover accordingly.

SD-WAN configuration portability

When configuring SD-WAN, adding interfaces to members is optional.

This allows the SD-WAN to be configured without associating any interfaces to SD-WAN members. It also allows a configuration to be copied directly from one device to another, without requiring the devices to have interfaces with the same names.

After the configuration is created, add interfaces to the members make it functional.

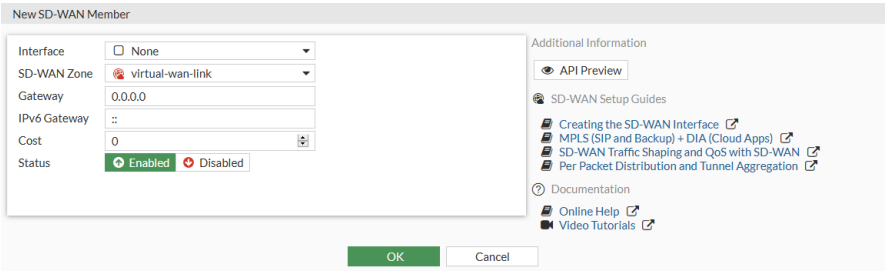


Example 1

In this example, we create a template with two SD-WAN members configured without assigned interfaces that are used in a performance SLA and SD-WAN rule. The template can be used to configure new devices, as in Example 2 on page 1297. Interfaces are then assigned to the members, and the configuration becomes active.

To create the SD-WAN members in the GUI:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New* > *SD-WAN Member*.
2. Leave all the settings set to their default values and click *OK*.



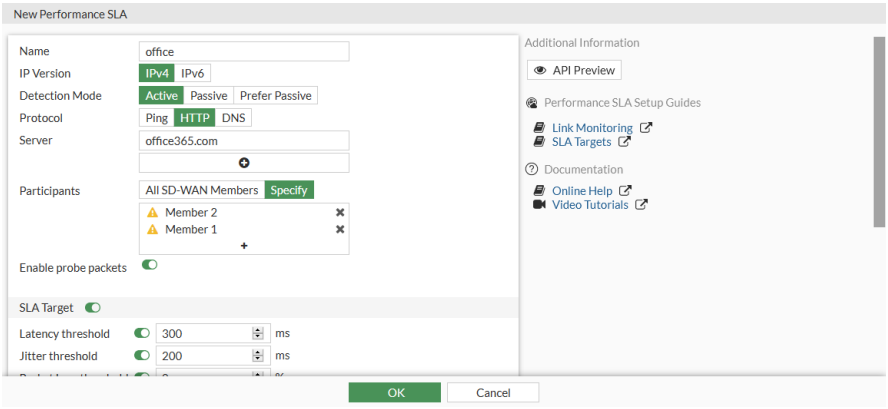
3. Repeat the above steps to create a second member.
   The empty members are listed on the *SD-WAN Zones* tab.

   The members are disabled until interfaces are configured, but can still be used in performance SLAs and SD-WAN rules.

To create a performance SLA in the GUI:

1. Go to *Network* > *SD-WAN* and select the *Performance SLAs* tab.
2. Click *Create New*.

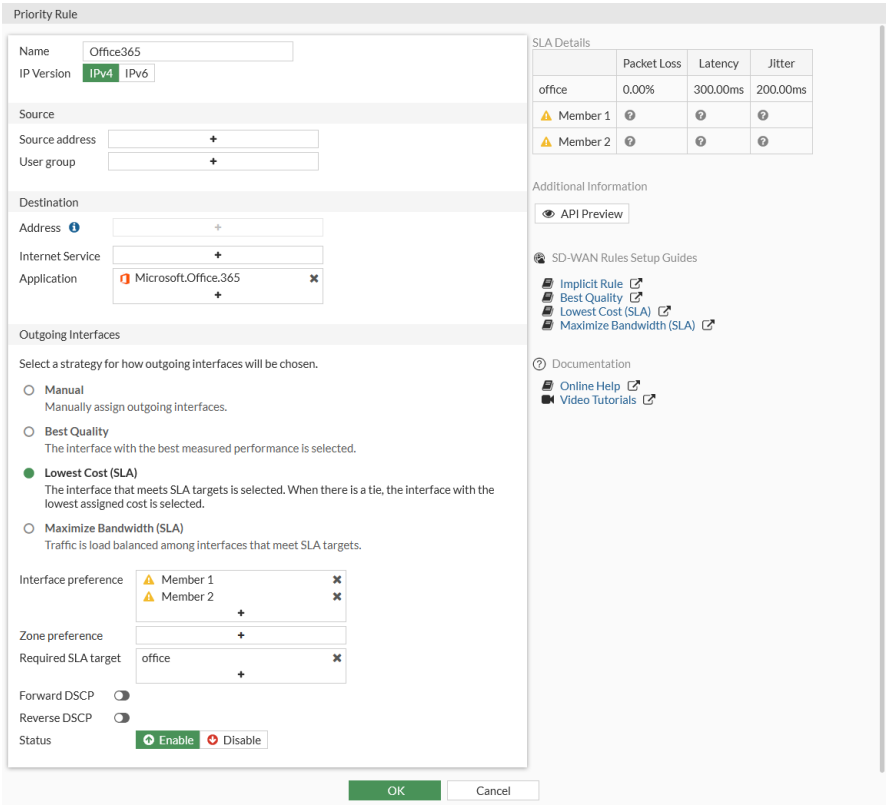
3. Configure the performance SLA, specifying the empty members as participants.



4. Click *OK*.

To create an SD-WAN rule in the GUI:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Configure the rule, adding both members to the *Interface preference* field:

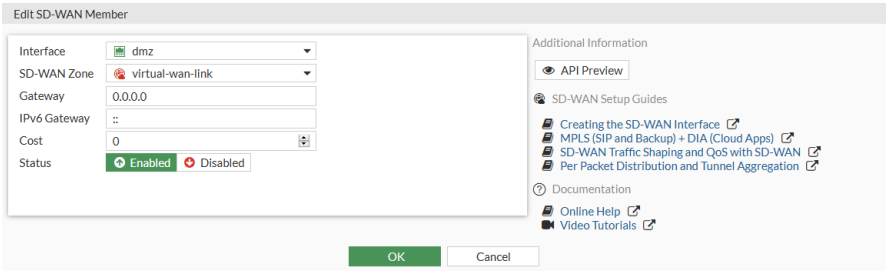


3. Click *OK*.

To assign interfaces to the SD-WAN members in the GUI:

1. Go to *Network* > *SD-WAN* and select the *SD-WAN Zones* tab.
2. Edit the first member

3. Set *Interface* to an actual interface.



4. Click *OK*.
5. Repeat the above steps to assign an interface to the second member.

To configure the SD-WAN in the CLI:

1. Create SD-WAN members:

```
config system sdwan
    set status enable
    config members
        edit 1
        next
        edit 2
        next
    end
end
```

2. Create a health check (performance SLA):

```
config system sdwan
    config health-check
        edit "office"
            set server "office365.com"
            set protocol http
            set sla-fail-log-period 300
            set sla-pass-log-period 300
            set members 2 1
            config sla
                edit 1
                    set latency-threshold 300
                    set jitter-threshold 200
                next
                edit 2
                    set link-cost-factor latency
                    set latency-threshold 20
                next
            end
        next
    end
end
```

3. Create a service (rule):

```
config system sdwan
    config service
        edit 3
            set name "Office365"
            set mode sla
            set internet-service enable
            set internet-service-app-ctrl 33182
            config sla
                edit "office"
                    set id 2
                next
            end
            set priority-members 1 2
        next
    end
end
```

The SD-WAN configuration can now be used in as a template for new spokes, as in Example 2 on page 1297.

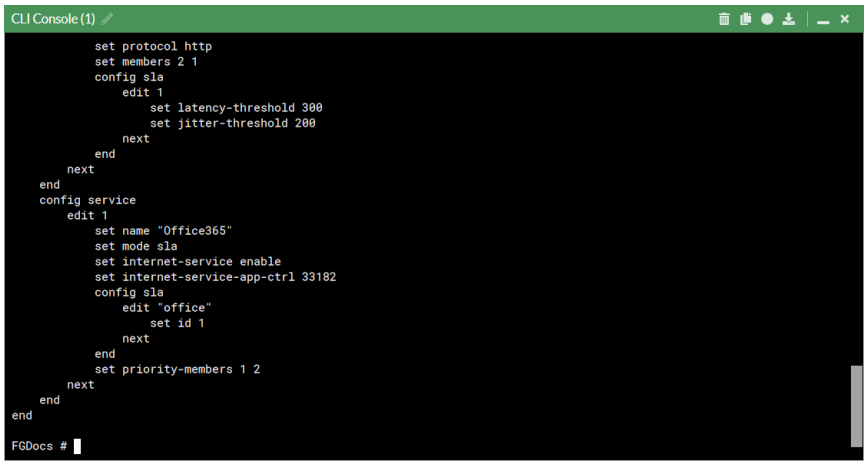
Example 2

In this example, the configuration from Example 1 is copied onto a new FortiGate.

Using the CLI console and the GUI

To copy the SD-WAN configuration from the original FortiGate:

1. Optionally, change the console screen paging setting. See Screen paging on page 67 for details.
2. Open the CLI console.
3. If necessary, click *Clear console* to empty the console.
4. Enter the following command:
   `show system sdwan`
5. Either click *Download* and open the file in a text editor, or click *Copy to clipboard* and paste the content into a text editor.



6. Edit the CLI configuration as necessary. For example, the first line that shows the `show` command should be deleted, and the default health checks can be removed.
7. If required, save the CLI configuration as a text file.

To paste the SD-WAN configuration onto a new FortiGate:

1. Copy the SD-WAN configuration from the text editor.
2. On the new FortiGate, open the CLI console.
3. Press *Ctrl + v* to paste the CLI commands.
4. In necessary, press *Enter* to apply the last `end` command.
   The SD-WAN configuration is copied to the new FortiGate.
   If the interfaces do not exist, the SD-WAN members are created without interfaces, and are disabled until interfaces are configured.

To assign interfaces to the SD-WAN members:

1. Go to *Network* > *SD-WAN* and select the *SD-WAN Zones* tab.
2. Edit the first member
3. Set *Interface* to an actual interface.
4. Click *OK*.
5. Repeat the above steps to assign an interface to the second member.

Using a terminal emulator

The following instructions use PuTTy. The steps may vary in other terminal emulators.

To copy the SD-WAN configuration from the original FortiGate:

1. Connect to the FortiGate. See Connecting to the CLI on page 59 for details.
2. Enter the following command:
   ```
   show system sdwan
   ```
3. Select the output, press *Ctrl + c* to copy it, and then paste it into a text editor.
4. Edit the CLI configuration as necessary. For example, the default health checks can be removed.
5. If required, save the CLI configuration as a text file.

To paste the SD-WAN configuration onto a new FortiGate:

1. Connect to the new FortiGate. See Connecting to the CLI on page 59 for details.
2. Copy the SD-WAN configuration from the text editor.
3. Right-click to paste the SD-WAN configuration.
4. In necessary, press *Enter* to apply the last `end` command.
   The SD-WAN configuration is copied to the new FortiGate.
   If the interfaces do not exist, the SD-WAN members are created without interfaces, and are disabled until interfaces are configured.

SD-WAN segmentation over a single overlay

SD-WAN, VPN, and BGP configurations support L3 VPN segmentation over a single overlay. In these configurations, a hub and spoke SD-WAN deployment requires that branch sites, or spokes, are able to accommodate multiple companies or departments, and each company's subnet is separated by a different VRF. A subnet on one VRF cannot communicate with a subnet on another VRF between different branches, but can communicate with the same VRF.

SD-WAN options

VRF-aware SD-WAN health checks

SD-WAN on the originating spoke can tag the health check probes with the correct VRF when transmitting to a multi-VRF tunnel. The hub can then forward the probes to the correct health check server in the same VRF as the hub. The IP version (`addr-mode`) can be either IPv4 or IPv6.

```
config system sdwan
   config health-check
       edit <name>
           set vrf <vrf id>
           set source <address>
       next
   end
end
```

`vrf <vrf id>`	Virtual Routing Forwarding ID.
`source <address>`	Source IP address used in the health-check packet to the server.

Overlay stickiness

When a hub has multiple overlays, traffic received on one overlay should egress on the same overlay when possible. The `service-sla-tie-break` option ensures overlay stickiness. In SD-WAN service rules, options are available to ensure that traffic received in a zone stays in that zone.

```
config system sdwan
    config zone
```

```
        edit <name>
            set service-sla-tie-break input-device
        next
    end
    config service
        edit <id>
            set input-zone <zone>
            set tie-break input-device
        next
    end
end
```

`service-sla-tie-break input-device`	Members that meet the SLA are selected by matching the input device.
`input-zone <zone>`	Source input-zone name.
`tie-break input-device`	Members that meet the SLA are selected by matching the input device.

IPsec options

Configurable rate limit for shortcut offers sent by the hub

By default, the hub sends a shortcut offer to a spoke every five seconds. If the hub continues to send offers that keep failing, and there are a large number of spokes, this can cause a high load on the hub. This setting makes the interval between shortcut offers configurable.

```
config vpn ipsec phase1-interface
    edit <name>
        set auto-discovery-offer-interval <interval>
    next
end
```

`auto-discovery-offer-interval <interval>`	Interval between shortcut offer messages, in seconds (1 - 300, default = 5).

Segmentation over a single overlay

Segmentation requires that VRF info is encapsulated within the IPsec VPN tunnel. This setting enables multi-VRF IPSEC tunnels. It is only applicable for forwarding traffic, and cannot be used for local-out traffic.

```
config vpn ipsec phase1-interface
    edit <name>
        set encapsulation vpn-id-ipip
    next
end
```

`encapsulation vpn-id-ipip`	VPN ID with IPIP encapsulation.

VPN configuration for BGP

The role of a VRF can be specified, along with other VRF details. Up to 252 VRFs can be configured per VDOM for any device.

```
config router bgp
    config vrf
        edit <vrf>
            set role {standalone | ce | pe}
            set rd <string>
            set export-rt <route_target>
            set import-rt <route_target>
            set import-route-map <route_map>
            config leak-target
                edit <vrf>
                    set route-map <route-map>
                    set interface <interface>
                next
            end
        next
    end
end
```

`role {standalone | ce | pe}`	VRF role: standalone, customer edge (CE), or provider edge (PE).
`rd <string>`	Route Distinguisher: AA|AA:NN. This option is only available when the role is CE.
`export-rt <route_target>`	List of export route target. This option is only available when the role is CE.
`import-rt <route_target>`	List of import route target. This option is only available when the role is CE.
`import-route-map <route_map>`	Import route map. This option is only available when the role is CE.
`route-map <route-map>`	Route map of VRF leaking.
`interface <interface>`	Interface that is used to leak routes to the target VRF.

In FortiOS 7.0, `config vrf` was `config vrf-leak`, and `config leak-target` was `config target`.

Display BGP routes by VRF and neighbor

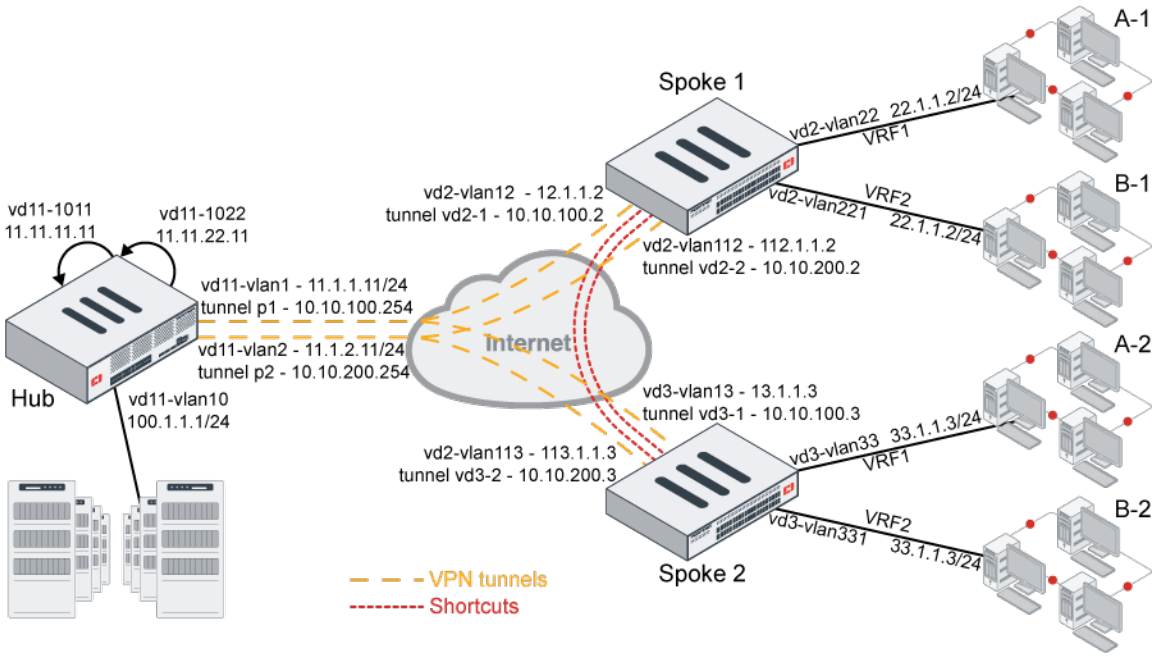
```
# diagnose ip router bgp set-filter vrf <vrf>
# diagnose ip router bgp set-filter neighbor <neighbor address>
# diagnose ip router bgp set-filter reset
# execute router clear bgp vpnv4 unicast soft {in | out}
# get router info filter show
# get router info filter vrf {vrf | all}
```

Examples

In example 1, multiple companies (or departments of a company) share the ADVPN. Company A and company B each have two branches in two different locations. Company A's branches (A-1 and A-2) can talk to each other using the VPN shortcut, but not to company B's branches (B-1 and B-2). Likewise, company B's branches can talk to each other using the VPN shortcut, but not to company A's branches. Traffic can share the tunnels and shortcuts, but cannot be mixed up.

Example 2 shows that performance SLA health checks can be sent from a spoke's VRF to the loopback on the hub that is in the same VRF.

Example 3 shows that when traffic is ingress on the hub on one overlay, it will preferably egress on the same overlay.



Example 1

In this example, two spokes each have two tunnels to the hub.

- Each spoke has two VRFs behind it that can use the same IP address or subnets.
- The computers in VRF1 behind spoke 1 can talk to the computers in VRF1 behind spoke 2, but not to any of the computers in the VRF2s behind either spoke.
- The computers in VRF2 behind spoke 1 can talk to the computers in VRF2 behind spoke 2, but not to any of the computers in the VRF1s behind either spoke.

To configure the hub:

```
config router bgp
    set as 65505
    set router-id 11.11.11.11
    set ibgp-multipath enable
```

```
    set additional-path enable
    set additional-path-vpnv4 enable
    set cluster-id 11.12.13.14
    set additional-path-select 3
    config neighbor-group
        edit "gr1"
            set capability-graceful-restart enable
            set capability-default-originate enable
            set next-hop-self-rr enable
            set soft-reconfiguration-vpnv4 enable
            set remote-as 65505
            set additional-path both
            set additional-path-vpnv4 both
            set adv-additional-path 3
            set route-reflector-client enable
            set route-reflector-client-vpnv4 enable
        next
        edit "gr2"
            set capability-graceful-restart enable
            set capability-default-originate enable
            set next-hop-self-rr enable
            set soft-reconfiguration-vpnv4 enable
            set remote-as 65505
            set additional-path both
            set additional-path-vpnv4 both
            set adv-additional-path 3
            set route-reflector-client enable
            set route-reflector-client-vpnv4 enable
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.10.100.0 255.255.255.0
            set neighbor-group "gr1"
        next
        edit 2
            set prefix 10.10.200.0 255.255.255.0
            set neighbor-group "gr2"
        next
    end
    config network
        edit 12
            set prefix 11.11.11.11 255.255.255.255
        next
        edit 22
            set prefix 11.11.22.11 255.255.255.255
        next
        edit 10
            set prefix 100.1.1.0 255.255.255.0
        next
        edit 33
            set prefix 11.1.1.0 255.255.255.0
```

```
        next
    end
    config vrf
        edit "0"
            set role pe
        next
        edit "1"
            set role ce
            set rd "1:1"
            set export-rt "1:1"
            set import-rt "1:1"
        next
        edit "2"
            set role ce
            set rd "2:1"
            set export-rt "2:1"
            set import-rt "2:1"
        next
    end
end
```

```
config vpn ipsec phase1-interface
    edit "p1"
        set type dynamic
        set interface "vd11-vlan1"
        set peertype any
        set net-device disable
        set proposal aes128-sha1
        set add-route disable
        set dpd on-idle
        set dhgrp 5
        set auto-discovery-sender enable
        set auto-discovery-offer-interval 10
        set encapsulation vpn-id-ipip
        set psksecret **********
        set dpd-retryinterval 60
    next
    edit "p2"
        set type dynamic
        set interface "vd11-vlan2"
        set peertype any
        set net-device disable
        set proposal aes128-sha1
        set add-route disable
        set dpd on-idle
        set dhgrp 5
        set auto-discovery-sender enable
        set auto-discovery-offer-interval 10
        set encapsulation vpn-id-ipip
        set psksecret **********
        set dpd-retryinterval 60
```

```
   next
end
```

```
config vpn ipsec phase2-interface
    edit "p1"
        set phase1name "p1"
        set proposal aes128-sha1
        set dhgrp 5
    next
    edit "p2"
        set phase1name "p2"
        set proposal aes128-sha1
        set dhgrp 5
    next
end
```

To configure a spoke:

```
config router bgp
    set as 65505
    set router-id 2.2.2.2
    set ebgp-multipath enable
    set ibgp-multipath enable
    set network-import-check disable
    set additional-path enable
    set additional-path6 enable
    set additional-path-vpnv4 enable
    set recursive-next-hop enable
    set graceful-restart enable
    set additional-path-select 4
    config neighbor
        edit "10.10.100.254"
            set capability-dynamic enable
            set capability-graceful-restart-vpnv4 enable
            set soft-reconfiguration enable
            set soft-reconfiguration-vpnv4 enable
            set remote-as 65505
            set additional-path both
            set additional-path-vpnv4 both
            set adv-additional-path 3
        next
        edit "10.10.200.254"
            set capability-dynamic enable
            set capability-graceful-restart-vpnv4 enable
            set soft-reconfiguration enable
            set soft-reconfiguration-vpnv4 enable
            set remote-as 65505
            set additional-path both
            set additional-path-vpnv4 both
            set adv-additional-path 3
        next
```

```
    end
    config network
        edit 3
            set prefix 22.1.1.0 255.255.255.0
        next
        edit 4
            set prefix 12.12.12.0 255.255.255.0
        next
    end
    config vrf
        edit "0"
            set role pe
        next

04:44:11, [1/0]
```

To test the configuration on shortcut 1:

1. From VRF1 of spoke 1 ping VRF1 of spoke 2 and from VRF2 of spoke 1 ping VRF2 spoke 2. Both VRF1 and VRF2 source and destination IP addresses are the same, so you can see how the traffic is isolated
2. Check sessions on spoke 1:

   The output `vd=<vdom ID>:<VRF ID>` indicates that sessions are created in and stay in the corresponding VRFs.

   - User at 22.1.1.22 in VRF1 on spoke 1 pings 33.1.1.33 in VRF1 on spoke2.

     ```
     # diagnose sys session list
     session info: proto=1 proto_state=00 duration=21 expire=42 timeout=0 flags=00000000
     socktype=0 sockport=0 av_idx=0 use=3

no_ofld_reason:  disabled-by-policy
```

Example 2

In this example, SLA health checks are sent from a spoke's VRF to the loopback on the hub that is in the same VRF.

To configure the health check:

```
config system sdwan
    config health-check
        edit "1"
            set server "11.11.22.11"
            set vrf 1
            set source 22.1.1.2
            set members 1 2
            config sla
                edit 1
                    set latency-threshold 200
                    set jitter-threshold 50
                next
```

```
            end
        next
    end
end
```

To check the health check status:

```
# diagnose sys sdwan health-check status  1
Health Check(1):
Seq(1 vd2-1): state(alive), packet-loss(0.000%) latency(0.023), jitter(0.002), mos(4.404),
bandwidth-up(0), bandwidth-dw(0), bandwidth-bi(0) sla_map=0x1
Seq(2 vd2-2): state(alive), packet-loss(0.000%) latency(0.022), jitter(0.002), mos(4.404),
bandwidth-up(0), bandwidth-dw(0), bandwidth-bi(0) sla_map=0x1
```

Example 3

In this example, when traffic from spoke 1 arrives at the hub on tunnel 1, it will egress the hub on tunnel 1 to go to other spokes. If traffic arrives on tunnel 2, it will egress on tunnel 2, and not tunnel 1.

To configure SD-WAN on the hub:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
            set service-sla-tie-break input-device
        next
    end
    config members
        edit 1
            set interface "p1"
        next
        edit 2
            set interface "p2"
        next
    end
    config health-check
        edit "1"
            set server "22.1.1.2"
            set members 1 2
            config sla
                edit 1
                next
            end
        next
    end
    config service
        edit 1
            set mode sla
            set dst "all"
```

```
            config sla
                edit "1"
                    set id 1
                next
            end
            set priority-members 1 2
            set tie-break input-device
        next
    end
end
```

To verify that traffic stays in the same overlay on ingress and egress on the hub:

1. Confirm that the SD-WAN service rule has `Tie break` set to `input-device` so that, when SLAs are met on all of the members, traffic prefers to egress on the same member as the input device:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x200 use-shortcut-sla
 Tie break: input-device
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Members(2):
    1: Seq_num(1 p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    2: Seq_num(2 p2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
  Dst address(1):
        0.0.0.0-255.255.255.255
```

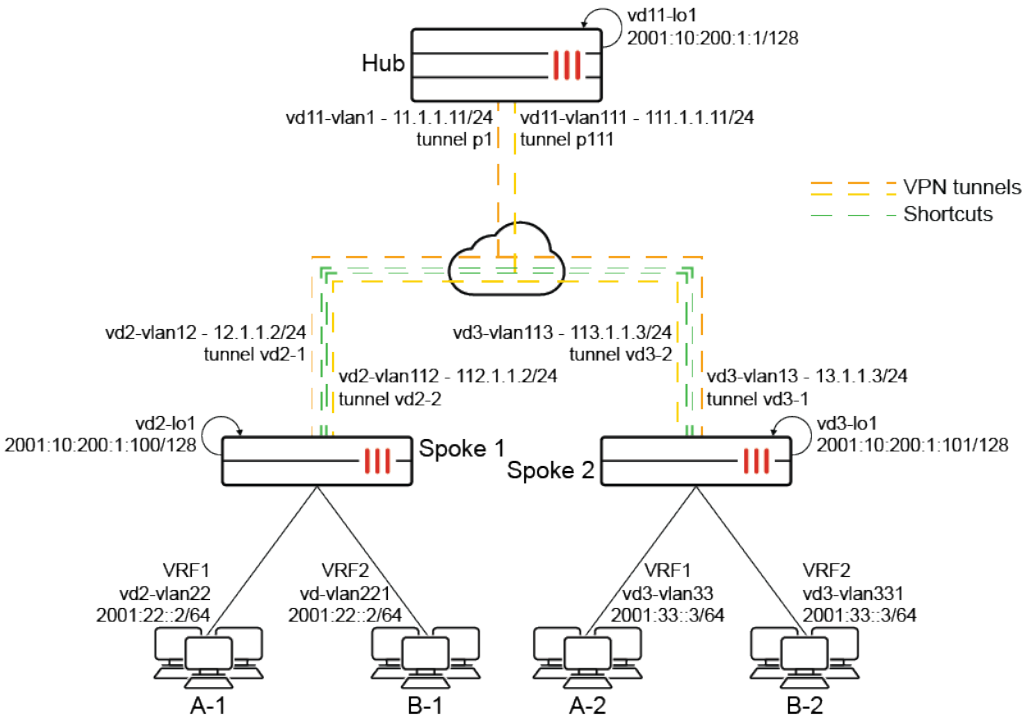
2. Use `diagnose sniffer packet` commands to verify that traffic ingress and egress are on the same overlay.

SD-WAN segmentation over a single overlay using IPv6

IPv6 is supported for SD-WAN segmentation over a single overlay. This allows seamless communication between IPv6 devices within virtual routing and forwarding (VRF) overlay networks, benefiting organizations transitioning to IPv6 or operating in a dual-stack environment.

Example

In this example, multiple companies (or departments of a company) share the ADVPN. Company A and company B each have two branches in two different locations. Company A's branches (A-1 and A-2) can talk to each other using the VPN shortcut, but not to company B's branches (B-1 and B-2). Likewise, company B's branches can talk to each other using the VPN shortcut, but not to company A's branches. Traffic can share the tunnels and shortcuts, but cannot be mixed up.



In this example, two spokes each have two tunnels to the hub.

- Each spoke has two VRFs behind it that can use the same IP address or subnets.
- The computers in VRF1 behind spoke 1 can talk to the computers in VRF1 behind spoke 2, but not to any of the computers in the VRF2s behind either spoke.
- The computers in VRF2 behind spoke 1 can talk to the computers in VRF2 behind spoke 2, but not to any of the computers in the VRF1s behind either spoke.
- Loopback addresses are used for communication between the spokes and the hub instead of tunnel IP address.

The `exchange-ip-addr6` option allows a loopback IPv6 address to be exchanged between the spokes and the hub in a network. This means that instead of using the tunnel IP address, which is typically used for communication, the loopback IPv6 address is used.

See config router bgp and config router route-map in the CLI Reference for a comprehensive list of commands.

To configure the hub:

1. Configure the BGP settings:

```
config router bgp
    set as 65100
    set router-id 10.200.1.1
    set keepalive-timer 5
    set holdtime-timer 15
    set ibgp-multipath enable
    set network-import-check disable
```

```
    set additional-path6 enable
    set additional-path-vpnv6 enable
    set additional-path-select6 4
    config neighbor-group
        edit "EDGEv6"
            set advertisement-interval 1
            set activate disable
            set activate-vpnv4 disable
            set capability-graceful-restart enable
            set next-hop-self-rr6 enable
            set soft-reconfiguration6 enable
            set remote-as 65100
            set update-source "vd11-lo1"
            set additional-path6 both
            set adv-additional-path6 4
            set route-reflector-client6 enable
            set route-reflector-client-vpnv6 enable
        next
    end
    config neighbor-range6
        edit 2
            set prefix6 2001::10:200:1:0/112
            set neighbor-group "EDGEv6"
        next
    end
    config network6
        edit 1
            set prefix6 2001::10:200:1:0/112
        next
    end
    config vrf6
        edit "0"
            set role pe
        next
        edit "1"
            set role ce
            set rd "1:1"
            set export-rt "1:1"
            set import-rt "1:1"
        next
        edit "2"
            set role ce
            set rd "2:1"
            set export-rt "2:1"
            set import-rt "2:1"
        next
    end
end
```

2. Configure the IPsec phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "p1"
        set type dynamic
        set interface "vd11-vlan1"
        set ike-version 2
        set peertype any
        set net-device disable
        set exchange-ip-addr6 2001::10:200:1:1
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set npu-offload disable
        set dhgrp 5
        set auto-discovery-sender enable
        set encapsulation vpn-id-ipip
        set psksecret **********
        set dpd-retryinterval 60
    next
    edit "p111"
        set type dynamic
        set interface "vd11-vlan111"
        set ike-version 2
        set peertype any
        set net-device disable
        set exchange-ip-addr6 2001::10:200:1:1
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set npu-offload disable
        set dhgrp 5
        set auto-discovery-sender enable
        set encapsulation vpn-id-ipip
        set psksecret **********
        set dpd-retryinterval 60
    next
end
```

3. Configure the IPsec phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "p1-v6"
        set phase1name "p1"
        set proposal aes128-sha1
        set replay disable
        set src-addr-type subnet6
        set dst-addr-type subnet6
    next
    edit "p111-v6"
        set phase1name "p111"
        set proposal aes128-sha1
```

```
        set replay disable
        set src-addr-type subnet6
        set dst-addr-type subnet6
    next
end
```

To configure a spoke:

1. Configure the BGP settings:

```
config router bgp
    set as 65100
    set router-id 10.200.1.100
    set keepalive-timer 5
    set holdtime-timer 15
    set ibgp-multipath enable
    set additional-path6 enable
    set additional-path-vpnv6 enable
    set recursive-next-hop enable
    set tag-resolve-mode merge
    set graceful-restart enable
    set additional-path-select6 4
    config neighbor
        edit "2001::10:200:1:1"
            set advertisement-interval 1
            set activate disable
            set activate-vpnv4 disable
            set capability-dynamic enable
            set capability-graceful-restart6 enable
            set capability-graceful-restart-vpnv6 enable
            set soft-reconfiguration6 enable
            set remote-as 65100
            set route-map-in6 "tag"
            set route-map-in-vpnv6 "tag"
            set connect-timer 10
            set update-source "vd2-lo1"
            set additional-path6 both
            set additional-path-vpnv6 both
        next
    end
    config network6
        edit 1
            set prefix6 2001:22::/64
        next
        edit 2
            set prefix6 2001::10:200:1:100/128
        next
    end
    config vrf6
        edit "0"
            set role pe
        next
```

```
        edit "1"
            set role ce
            set rd "1:1"
            set export-rt "1:1"
            set import-rt "1:1"
        next
        edit "2"
            set role ce
            set rd "2:1"
            set export-rt "2:1"
            set import-rt "2:1"
        next
    end
end
```

2. Configure the IPsec phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "vd2-1"
        set interface "vd2-vlan12"
        set ike-version 2
        set peertype any
        set net-device enable
        set exchange-ip-addr6 2001::10:200:1:100
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set npu-offload disable
        set dhgrp 5
        set auto-discovery-receiver enable
        set encapsulation vpn-id-ipip
        set remote-gw 11.1.1.11
        set psksecret **********
    next
    edit "vd2-2"
        set interface "vd2-vlan112"
        set ike-version 2
        set peertype any
        set net-device enable
        set exchange-ip-addr6 2001::10:200:1:100
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set npu-offload disable
        set dhgrp 5
        set auto-discovery-receiver enable
        set encapsulation vpn-id-ipip
        set remote-gw 111.1.1.11
        set psksecret **********
    next
end
```

3. Configure the IPsec phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "vd2-1-6"
        set phase1name "vd2-1"
        set proposal aes128-sha1
        set dhgrp 5
        set replay disable
        set auto-negotiate enable
        set src-addr-type subnet6
        set dst-addr-type subnet6
    next
    edit "vd2-2-6"
        set phase1name "vd2-2"
        set proposal aes128-sha1
        set dhgrp 5
        set replay disable
        set auto-negotiate enable
        set src-addr-type subnet6
        set dst-addr-type subnet6
    next
end
```

4. Configure the SD-WAN settings:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "vd2-1"
            set cost 10
        next
        edit 2
            set interface "vd2-2"
            set cost 20
        next
    end
    config health-check
        edit "ping6"
            set addr-mode ipv6
            set server "2001::10:200:1:1"
            set source6 2001::10:200:1:100
            set members 1 2
            config sla
                edit 1
                next
            end
        next
    end
    config service
```

```
        edit 61
            set addr-mode ipv6
            set priority-members 1
            set dst6 "6001-100"
        next
        edit 62
            set addr-mode ipv6
            set priority-members 2
            set dst6 "6100-200"
        next
    end
end
```

To check the spoke 1 routes:

```
# get router info6 routing-table bgp
Routing table for VRF=0
B       2001::10:200:1:0/112 [200/0] via 2001::10:200:1:1 tag 100 (recursive via vd2-1 tunnel
::11.1.1.11), 1d15h41m
(recursive via vd2-2 tunnel ::111.1.1.11), 1d15h41m, [1024/0]
B       2001::10:200:1:101/128 [200/0] via 2001::10:200:1:1 tag 100 (recursive via vd2-1 tunnel
::11.1.1.11), 1d15h41m
(recursive via vd2-2 tunnel ::111.1.1.11), 1d15h41m, [1024/0]

Routing table for VRF=1
B V     2001:33::/64 [200/0] via 2001::10:200:1:101 tag 100 (recursive via vd2-1 tunnel
::11.1.1.11), 1d15h41m
(recursive via vd2-2 tunnel ::111.1.1.11), 1d15h41m, [1024/0]

Routing table for VRF=2
B V     2001:33::/64 [200/0] via 2001::10:200:1:101 tag 100 (recursive via vd2-1 tunnel
::11.1.1.11), 1d15h41m
(recursive via vd2-2 tunnel ::111.1.1.11), 1d15h41m, [1024/0]
```

To test the configuration on shortcut 1:

1. From VRF1 of spoke 1, ping VRF1 of spoke 2.
2. From VRF2 of spoke 1, ping VRF2 spoke 2. Both VRF1 and VRF2 source and destination IP addresses are the same, so you can see how the traffic is isolated.
3. Verify the session list:

```
# diagnose sys session6 list
session6 info: proto=58 proto_state=00 duration=3 expire=59 timeout=0 refresh_dir=both
flags=00000000 sockport=0 socktype=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=may_dirty
statistic(bytes/packets/allow_err): org=416/4/0 reply=416/4/0 tuples=2
```

```
tx speed(Bps/kbps): 136/1 rx speed(Bps/kbps): 136/1
orgin->sink: org pre->post, reply pre->post dev=100->223/223->100
hook=pre dir=org act=noop 2001:22::55:398->2001:33::44:128(:::0)
hook=post dir=reply act=noop 2001:33::44:398->2001:22::55:129(:::0)
src_mac=02:4c:a5:fc:77:6f
misc=0 policy_id=1 pol_uuid_idx=1070 auth_info=0 chk_client_info=0 vd=3:2
serial=0001104d tos=ff/ff ips_view=0 app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=61
rpdb_link_id=ff00003d ngfwid=n/a
npu_state=0x1040001 no_offload
no_ofld_reason:  disabled-by-policy non-npu-intf
total session6: 1
```

In the output, `vd=<vdom_ID>:<VRF_ID>` indicates that sessions are created in and stay in the corresponding VRFs.

Matching BGP extended community route targets in route maps

BGP extended community route targets can be matched in route maps. This can be applied in a scenario where the BGP route reflector receives routes from many VRFs, and instead of reflecting all routes from all VRFs, users only want to reflect routes based on a specific extended community route target.

To configure the extended community list:

```
config router extcommunity-list
    edit <name>
        set type {standard | expanded}
        config rule
            edit <id>
                set action {deny | permit}
                set type {rt | soo}
                set match <extended_community_specifications>
                set regexp <ordered_list_of_attributes>
            next
        end
    next
end
```

`type {standard | expanded}`	Set the extended community list type (standard or expanded).
`action {deny | permit}`	Deny or permit route-based operations based on the route's extended community attribute.
`type {rt | soo}`	Set the extended community type: • rt: route target • soo: site of origin

`match <extended_community_specifications>`	Set the extended community specifications for matching a reserved extended community (community number in AA:NN format; use quotation marks complex expressions, `"123:234 345:456"`).
`regexp <ordered_list_of_attributes>`	Set the ordered list of extended community attributes as a regular expression.

To configure the BGP extended community list in the route map:

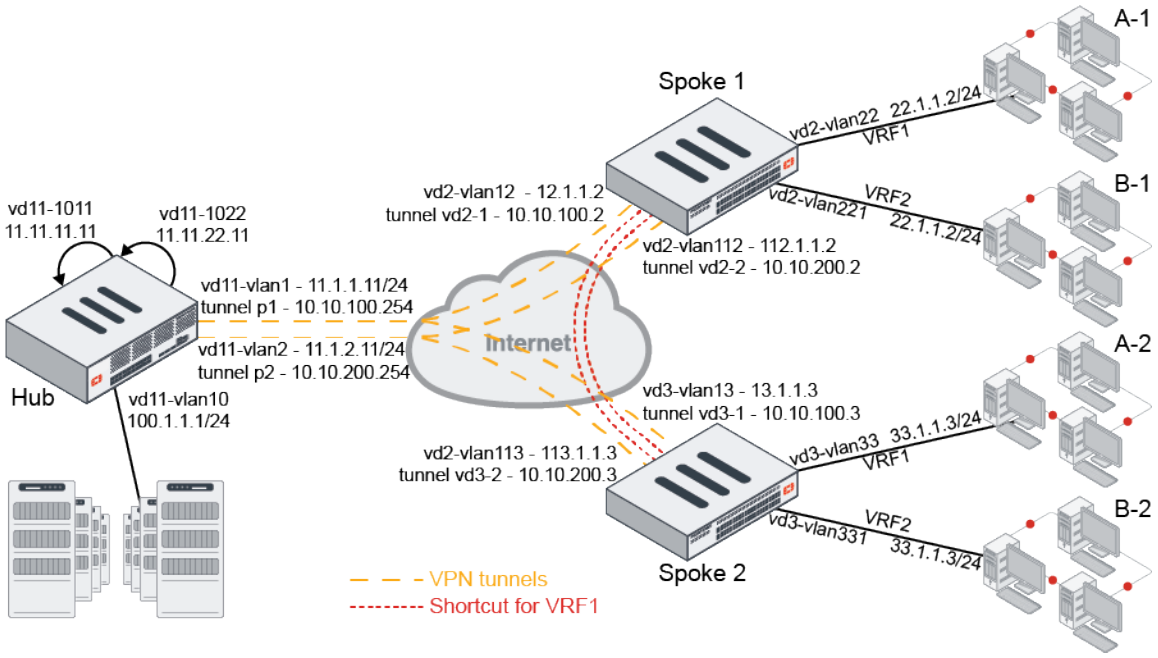
```
config router route-map
    edit <name>
        config rule
            edit <id>
                set match-extcommunity <list>
                set match-extcommunity-exact {enable | disable}
            next
        end
    next
end
```

`match-extcommunity <list>`	Set the BGP extended community list to match to.
`match-extcommunity-exact {enable | disable}`	Enable/disable exact matching of extended communities.

Example

In this example, multiple companies (or departments of a company) share the same hub and spoke VPN infrastructure. Company A and company B each have two branches in two different locations. The goal is for company A's branches (A-1 and A-2) to be able to communicate only with each other over VPN but not with company B's branches. Likewise, company B's branches (B-1 and B-2) can only communicate with each other over VPN but not with company A's. This is accomplished by placing each branch VLAN into their respective VRFs (VRF1 and VRF2), and encapsulating the VRF information within the VPN tunnel. The hub forms BGP peering with its neighbors, spoke 1 and spoke 2, over each IPsec overlay. The hub's BGP route reflector reflects the routes to the corresponding VRFs, allowing each spoke to form ADVPN shortcuts with the other spoke for each VRF.

However, in this scenario, we want A-1 and A-2 to use an ADVPN shortcut, but we do not want B-1 and B-2 to use ADVPN. A route map is configured on the hub to match the desired extended community route target number where only this route target is permitted, and others are denied. This allows the hub's BGP route reflector to only reflect routes associated with VRF1, allowing the spokes to form an ADVPN shortcut for VRF1. Routes associated with VRF2 are not reflected, and each spoke must route traffic through the hub to reach VRF2 on the other spoke.



Configure the topology by following the instructions of Example 1 in SD-WAN segmentation over a single overlay on page 1299. Note that when checking the spoke 1 routes in example 1, there is a VRF2 route:

```
Spoke 1 # get router info routing-table bgp
…
Routing table for VRF=2
B V     33.1.1.0/24 [200/0] via 10.10.100.3 [2] (recursive via vd2-1 tunnel 11.1.1.11), 00:00:20,
[1/0]
                    [200/0] via 10.10.200.3 [2] (recursive via vd2-2 tunnel 11.1.2.11), 00:00:20,
[1/0]
```

The following procedure applies a route map on the hub's BGP configurations to limit route reflection to only routes matching the external community target of 1:1. This external community target corresponds to BGP paths for VRF1 learned from spoke 1 and spoke 2. The external community target of 2:1 corresponds to BGP paths for VRF2. By not explicitly permitting this target (2:1) in the community list and denying everything other than the permitted target (1:1) in the route map, the VRF2 BGP paths are essentially omitted from being reflected to the spokes.

To configure BGP filtering for an extended community route target on the hub:

1. Identify the external community target of VRF1 to be permitted:

```
# get router info bgp network 33.1.1.0/24
VRF 0 BGP routing table entry for 33.1.1.0/24
Paths: (2 available, best #2, table Default-IP-Routing-Table)
  Advertised to non peer-group peers:
   11.1.1.1
  Advertised to peer-groups:
  gr1 gr2
…
VRF 1 BGP routing table entry for 33.1.1.0/24
```

```
Paths: (2 available, best #2, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0 external duplicated
  Local, (Received from a RR-client)
    0.0.0.0 from 10.10.100.3 (3.3.3.3)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Extended Community: RT:1:1
      Receive Path ID: 1
      Advertised Path ID: 1
       Last update: Wed Aug 17 10:31:02 2022
  Original VRF 0 external duplicated
  Local, (Received from a RR-client)
    0.0.0.0 from 10.10.200.3 (3.3.3.3)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Extended Community: RT:1:1
      Receive Path ID: 1

       Last update: Wed Aug 17 10:31:02 2022
VRF 2 BGP routing table entry for 33.1.1.0/24
Paths: (2 available, best #2, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0 external duplicated
  Local, (Received from a RR-client)
    0.0.0.0 from 10.10.100.3 (3.3.3.3)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Extended Community: RT:2:1
      Receive Path ID: 1
      Advertised Path ID: 1
       Last update: Wed Aug 17 10:31:02 2022
  Original VRF 0 external duplicated
  Local, (Received from a RR-client)
    0.0.0.0 from 10.10.200.3 (3.3.3.3)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Extended Community: RT:2:1
      Receive Path ID: 1
      Advertised Path ID: 2
       Last update: Wed Aug 17 10:31:02 2022
```

2. Configure the extended community list:

```
config router extcommunity-list
    edit "extcomm1"
        config rule
            edit 1
                set action permit
                set match "1:1"
                set type rt
            next
        end
    next
end
```

3. Apply the extended community list to the route map:

```
config router route-map
    edit "rmp11"
        config rule
            edit 1
                set match-extcommunity "extcomm1"
            next
            edit 2
                set action deny
            next
        end
    next
end
```

4. Update the related BGP neighbor group settings:

```
config router bgp
    config neighbor-group
        edit "gr1"
            set route-map-out-vpnv4 "rmp11"
        next
        edit "gr2"
            set route-map-out-vpnv4 "rmp11"
        next
    end
end
```

5. Refresh the routes:

```
# execute router clear bgp all vpnv4 unicast out
```

6. Check the spoke 1 routes. Since the extended community route target is applied, the VFR2 route does not appear in the BGP routing table:

```
# get router info routing-table bgp
Routing table for VRF=0

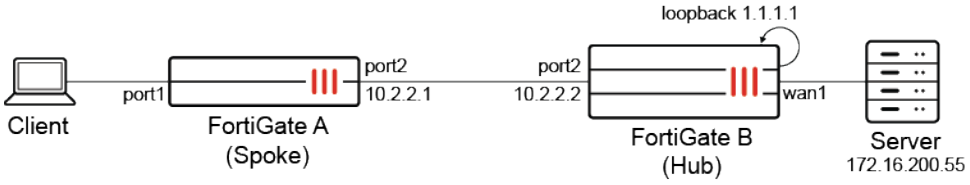
Copying the DSCP value from the session original direction to its reply direction

In an SD-WAN scenario when DSCP tags are used to mark traffic from the spoke to the hub, it is sometimes desirable for the hub to mark the reply traffic with the same DSSP tags. The `diffserv-copy` setting in firewall policy configurations allows the DSCP tag to be copied to the reply direction.

```
config firewall policy
    edit <id>
        set diffserv-copy {enable | disable}
    next
end
```

Example

The use cases in this example are for a hub and spoke SD-WAN deployment. Traffic from the spoke (either real traffic or SLA health check probes) can be marked with a certain DSCP tag when leaving the spoke. QoS may be applied by an upstream device based on the DSCP tag. When the traffic arrives on the hub, the hub may also want to mark the reply traffic to the spoke with the same DSCP tag. This would allow QoS to be applied to the traffic in the reply direction as well, which is traffic in the hub to spoke direction associated with the same session in the spoke to hub direction.



While this topology simplifies the SD-WAN deployment into a single hub and spoke, this feature applies to the following configurations:

- Multiple spokes (branch sites)
- One or more hubs (data center sites)
- Multiple overlays connecting spokes to hubs

- SD-WAN configured on spokes to pick the best overlay

Use case 1: typical forwarding traffic

Traffic originates from the spoke and is destined for a server behind the hub. The spoke marks the traffic with a DSCP tag of 101010. This is done by enabling `diffserv-foward` on the spoke firewall policy. It can also be accomplished by enabling `dscp-forward` in an SD-WAN rule.

The hub allows the traffic in through a firewall policy. By enabling `diffserv-copy` on the firewall policy, it will mark the reply traffic on the corresponding sessions with the same DSCP tag in which it came.

To configure the FortiGates:

1. Configure the firewall policy on the spoke (FortiGate A):

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "virtual-wan-link"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all6"
        set dstaddr6 "all6"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set diffserv-forward enable
        set diffservcode-forward 101010
    next
end
```

2. Configure the firewall policy on the hub (FortiGate B):

```
config firewall policy
    edit 3
        set srcintf "virtual-wan-link"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
        set diffserv-copy enable
    next
end
```

To test the configuration:

1. Generate some forwarding traffic.
2. Verify that the session's tos value from the original direction is applied to the reply direction:

```
# diagnose sys session filter policy 3
# diagnose sys session filter dst 172.16.200.55
# diagnose sys session list

session info: proto=1 proto_state=00 duration=35 expire=59 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=3024/36/1 reply=3024/36/1 tuples=2
tx speed(Bps/kbps): 82/0 rx speed(Bps/kbps): 82/0
orgin->sink: org pre->post, reply pre->post dev=20->17/17->20 gwy=172.16.200.55/10.2.2.1
hook=post dir=org act=snat 10.2.2.1:25290->172.16.200.55:8(172.16.200.2:25290)
hook=pre dir=reply act=dnat 172.16.200.55:25290->172.16.200.2:0(10.2.2.1:25290)
misc=0 policy_id=3 pol_uuid_idx=1097 auth_info=0 chk_client_info=0 vd=3
serial=0000a018 tos=6a/6a app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000001 no_offload
no_ofld_reason:  disabled-by-policy
total session 1
```

Use case 2: local-in traffic destined to a loopback interface

SLA health checks from the spoke are destined for a loopback interface on the hub. The health check is marked with a DSCP tag of 000001 by the spoke. When the hub receives the probes to its loopback, it will mark the replies with the same DSCP tags in which it came.

To configure the FortiGates:

1. Configure the health check on the spoke (FortiGate A):

```
config system sdwan
    config health-check
        edit "ping"
            set server "1.1.1.1"
            set diffservcode 000001
        set members 0
    next
end
```

2. Configure the loopback interface on the hub (FortiGate B):

```
config system interface
    edit "loopback"
```

```
        set vdom "vdom1"
        set ip 1.1.1.1 255.255.255.255
        set allowaccess ping https ssh  http telnet
        set type loopback
        set role lan
        set snmp-index 35
    next
end
```

3. Configure the firewall policy on the hub:

```
config firewall policy
    edit 1
        set srcintf "virtual-wan-link"
        set dstintf "loopback"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
        set diffserv-copy enable
    next
end
```

To test the configuration:

1. Generate some local-in traffic.
2. Verify that the session's `tos` value from the original direction is applied to the reply direction:

```
# diagnose sys session list

session info: proto=1 proto_state=00 duration=1 expire=59 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log local may_dirty
statistic(bytes/packets/allow_err): org=80/2/1 reply=80/2/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->in, reply out->post dev=20->42/42->20 gwy=1.1.1.1/0.0.0.0
hook=pre dir=org act=noop 10.2.2.1:15->1.1.1.1:8(0.0.0.0:0)
hook=post dir=reply act=noop 1.1.1.1:15->10.2.2.1:0(0.0.0.0:0)
misc=0 policy_id=1 pol_uuid_idx=0 auth_info=0 chk_client_info=0 vd=3
serial=0001a846 tos=41/41 app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
```

```
no_ofld_reason:  local disabled-by-policy
total session 1
```

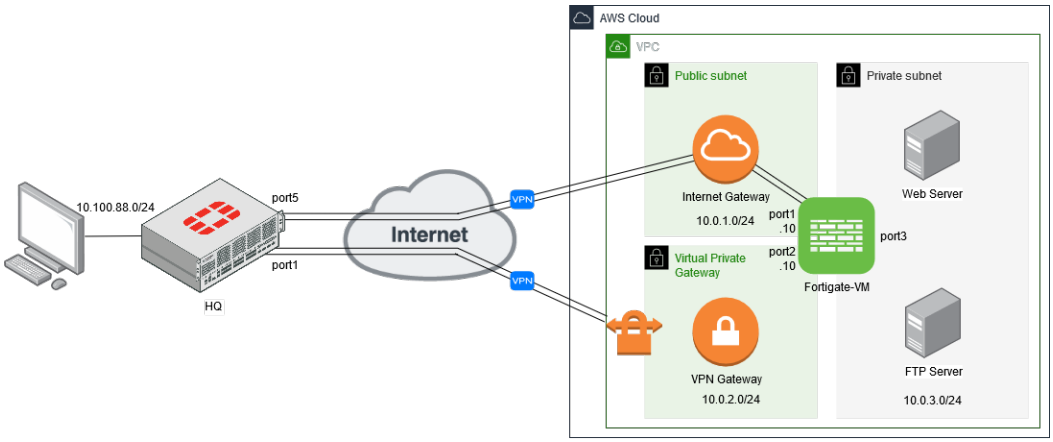
Capture packets can also be used verify that the DSCP value from the original direction is applied to the reply direction.

SD-WAN cloud on-ramp

In this example, you configure a connection to a new cloud deployment that has some remote servers. SD-WAN is used to steer traffic through the required overlay tunnel.

The on-premise FortiGate has two internet connections, each with a single VPN connection. The two VPN gateways are configured on the cloud for redundancy, one terminating at the FortiGate-VM, and the other at the native AWS VPN Gateway.

This example uses AWS as the Infrastructure as a Service (IaaS) provider, but the same configuration can also apply to other services. A full mesh VPN setup is not shown, but can be added later if required.



To connect to the servers that are behind the cloud FortiGate-VM, virtual IP addresses (VIPs) are configured on port2 to map to the servers:

- VPN traffic terminating on port1 is routed to the VIP on port2 to access the web servers.
- VPN traffic terminating on the VPN gateway accesses the VIPs on port2 directly.

There are four major steps to configure this setup:

1. Configuring the VPN overlay between the HQ FortiGate and cloud FortiGate-VM on page 1333
2. Configuring the VPN overlay between the HQ FortiGate and AWS native VPN gateway on page 1337
3. Configuring the VIP to access the remote servers on page 1341
4. Configuring the SD-WAN to steer traffic between the overlays on page 1344

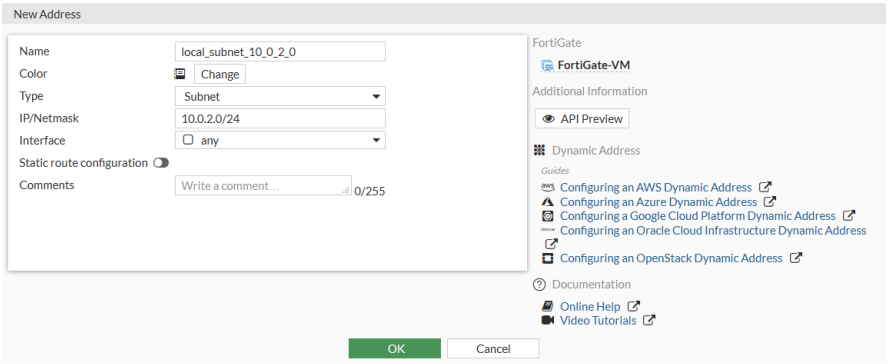
After the configuration is complete, verify the traffic to ensure that the configuration is working as expected, see Verifying the traffic on page 1348.

Configuring the VPN overlay between the HQ FortiGate and cloud FortiGate-VM

Configure the cloud FortiGate-VM

To create an address for the VPN gateway:

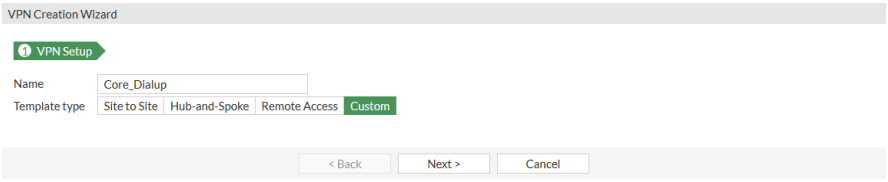
1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Set *Name* to *local_subnet_10_0_2_0*.
4. Set *IP/Netmask* to *10.0.2.0/24*.



5. Click *OK*.

To configure a custom IPsec VPN:

1. Go to *VPN* > *IPsec Wizard*.
2. Set *Name* to *Core_Dialup*.
3. Set *Template type* to *Custom*.



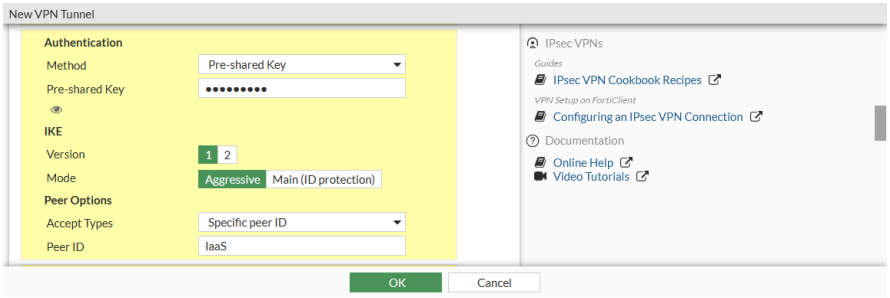
4. Click *Next*.
5. Configure *Network* settings:

Remote Gateway	Dialup User
Interface	port1
NAT Traversal	Enable

6. Configure *Authentication* settings:

Method	Pre-shared Key

Pre-shared Key	Enter the pre-shared key.
Version	1
Mode	Aggressive This setting allows the peer ID to be specified.
Accept Types	Specific peer ID
Peer ID	IaaS The other end of the tunnel needs to have its local ID set to IaaS.



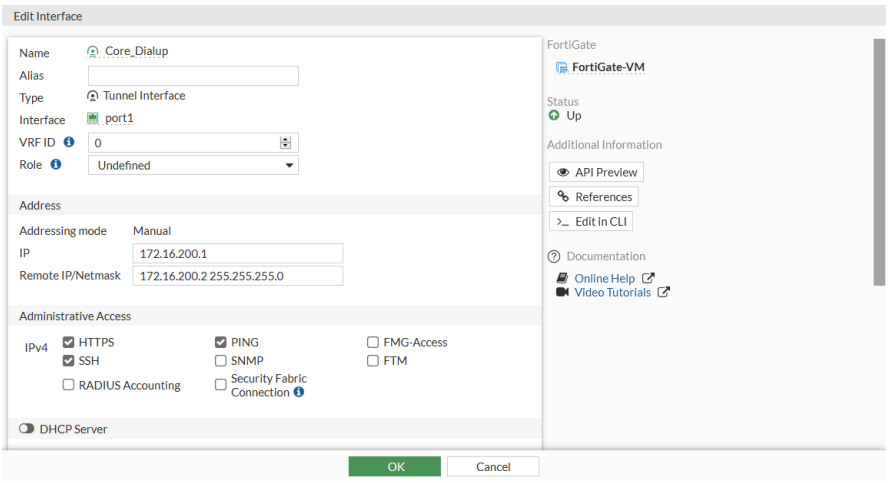
7. Leave the default *Phase 1 Proposal* settings and disable *XAUTH*.
8. Configure the *Phase 2 Selector* settings:

Name	Ent_Core
Local Address	Named Address - *local_subnet_10_0_2_0*
Remote Address	Named Address - *all* This setting allows traffic originating from both the remote subnet 10.100.88.0 and the health checks from the VPN interface on the remote FortiGate. For increased security, each subnet can be specified individually.

9. Click *OK*.

To configure remote and local tunnel IP addresses:

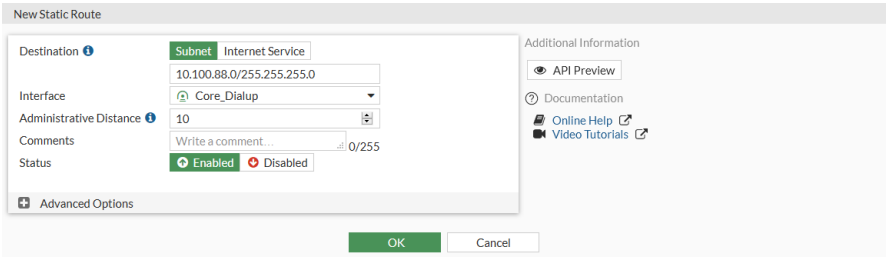
1. Go to *Network* > *Interfaces* and edit the *Core_Dialup* interface under *port1*.
2. Set *IP* to *172.16.200.1*.
3. Set *Remote IP/Netmask* to *172.16.200.2 255.255.255.0*. This is where remote health check traffic will come from.
4. Enable *Administrative access* for *HTTPS*, *PING*, and *SSH*.



5. Click *OK*.

To configure a route to the remote subnet through the tunnel:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Set *Destination* to *Subnet* and enter the IP address and netmask: *10.100.88.0/255.255.255.0*.
3. Set *Interface* to *Core_Dialup*.

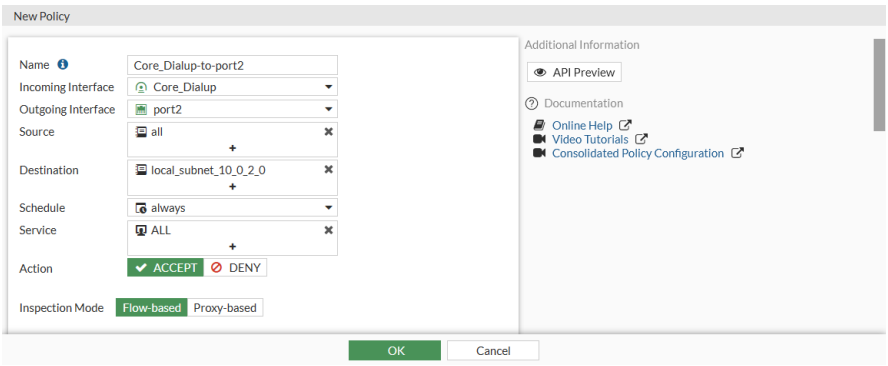


4. Click *OK*.

To configure a firewall policy to allow traffic from the tunnel to port2:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following:

Name	Core_Dialup-to-port2
Incoming Interface	Core_Dialup
Outgoing Interface	port2
Source	all
Destination	local_subnet_10_0_2_0
Schedule	always
Service	ALL
Action	ACCEPT



3. Configure the remaining settings as required.
4. Click *OK*.

Configure the HQ FortiGate

To create an address for the VPN gateway:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Set *Name* to *remote_subnet_10_0_2_0*.
4. Set *IP/Netmask* to *10.0.2.0/24*.
5. Click *OK*.

To configure a custom IPsec VPN:

1. Go to *VPN* > *IPsec Wizard*.
2. Set *Name* to *FGT_AWS_Tun*.
3. Set *Template type* to *Custom*.
4. Click *Next*.
5. Configure *Network* settings:

Remote Gateway	Static IP Address
IP Address	100.21.29.17
Interface	port5
NAT Traversal	Enable

6. Configure *Authentication* settings:

Method	Pre-shared Key
Pre-shared Key	Enter the pre-shared key.
Version	1
Mode	Aggressive This setting allows the peer ID to be specified.

Accept Types	Any peer ID

7. Leave the default *Phase 1 Proposal* settings, except set *Local ID* to *IaaS*.
8. Disable *XAUTH*.
9. Configure the *Phase 2 Selector* settings:

Name	FGT_AWS_Tun
Local Address	Named Address - *all* This setting allows traffic originating from both the local subnet 10.100.88.0 and the health checks from the VPN interface. For increased security, each subnet can be specified individually.
Remote Address	Named Address - *remote_subnet_10_0_2_0*

10. Click *OK*.

To configure local and remote tunnel IP addresses:

1. Go to *Network* > *Interfaces* and edit the *FGT_AWS_Tun* interface under *port5*.
2. Set *IP* to *172.16.200.2*.
3. Set *Remote IP/Netmask* to *172.16.200.1 255.255.255.0*.
4. Enable *Administrative access* for *HTTPS*, *PING*, and *SSH*.
5. Click *OK*.

Routing is defined when creating the SD-WAN interface. The firewall policy is created after the SD-WAN interface is defined.

Configuring the VPN overlay between the HQ FortiGate and AWS native VPN gateway

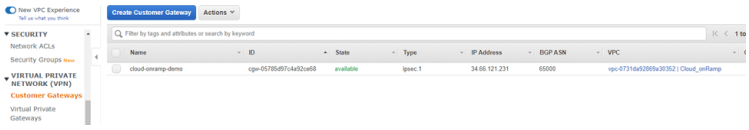
This example uses static routing. It is assumed that the AWS VPN Gateway is already configured, and that proper routing is applied on the corresponding subnet.

Verify the AWS configuration

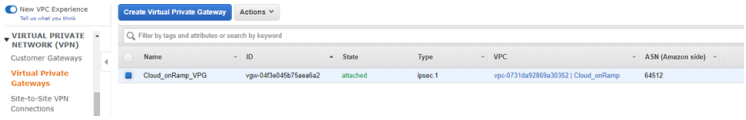
See Creating routing tables and associate subnets in the AWS Administration Guide for configuration details.

To check the AWS configuration:

1. Go to *Virtual Private Network (VPN)* > *Customer Gateways* to confirm that the customer gateway defines the FortiGate IP address as its Gateway IP address, in this case *34.66.121.231*.



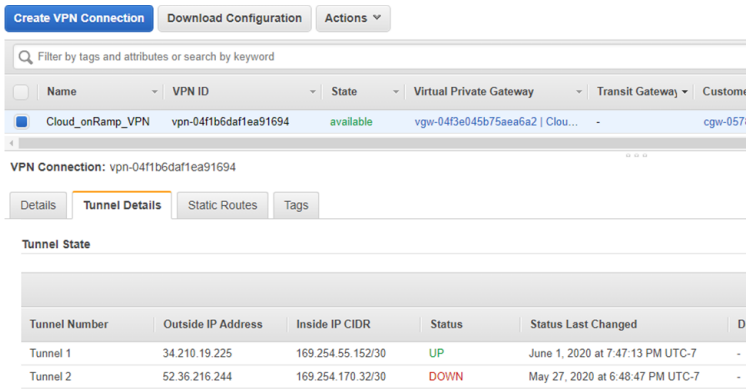
2. Go to *Virtual Private Network (VPN) > Virtual Private Gateways* to confirm that a virtual private gateway (VPG) has been created. In this case it is attached to the *Cloud_onRamp* VPC that contains the FortiGate and servers.



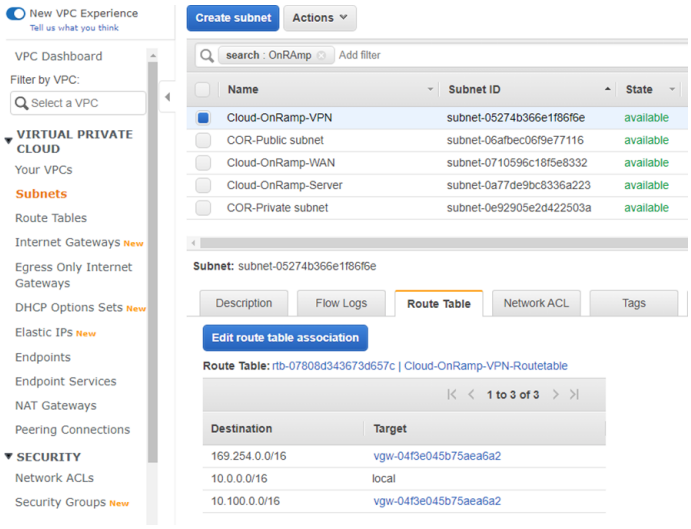
3. Go to *Virtual Private Network (VPN) > Site-to-Site VPN Connections* to confirm that site-to-site VPN connections have been created and attached to the customer gateway and virtual private gateway.

   If *Routing Options* is *Static*, the IP prefix of the remote subnet on the HQ FortiGate (10.100.88.0) is entered here.

   AWS site-to-site VPN always creates two VPN tunnels for redundancy. In this example, only Tunnel 1 is used.



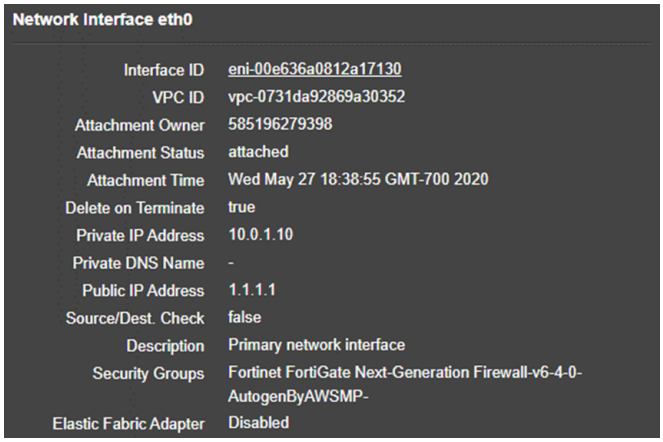
4. Click *Download Configuration* to download the FortiGate's tunnel configurations. The configuration can be referred to when configuring the FortiGate VPN.
5. The new VPG is attached to your VPC, but to successfully route traffic to the VPG, proper routing must be defined. Go to *Virtual Private Cloud > Subnets*, select the *Cloud-OnRamp-VPN*, and select the *Route Table* tab to verify that there are at least two routes to send traffic over the VPG.



- *169.254.0.0/24* defines the tunnel IP address. Health check traffic originating from the FortiGate will come from this IP range.
- *10.100.0.0/16* defines the remote subnet from the HQ FortiGate.
- Both routes point to the just created VPG *vgw-04xxxx*.

6. On the cloud FortiGate-VM EC2 instances, ensure that port1 and port2 both have *Source/Dest. Check* set to *false*. This allows the FortiGate to accept and route traffic to and from a different network.

   If you launched the instance from the AWS marketplace, this setting defaults to *true*.



Configure routing to the VPG on the cloud FortiGate-VM

To configure routing to the VPG on the cloud FortiGate-VM:

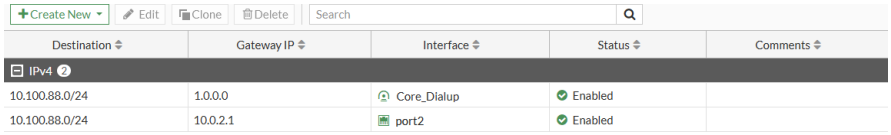
1. Go to *Network* > *Static Routes* and click *Create New*.
2. Set *Destination* to *Subnet* and enter the IP address and netmask: *10.100.88.0/255.255.255.0*.
3. Set *Gateway Address* to *Specify* and enter *10.0.2.1*.
4. Set *Interface* to *port2*.

   The new route must have the same *Administrative Distance* as the route that was created for traffic through the *Core_Dialup* tunnel to ensure that both routes are added to the routing table (see To configure a route

to the remote subnet through the tunnel).

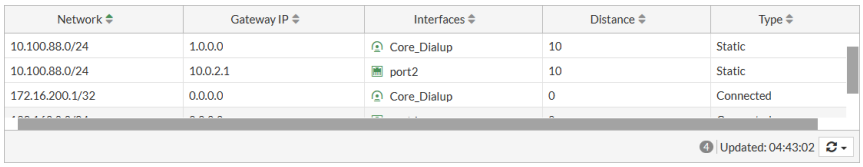
The *Gateway Address* is arbitrarily set to 10.0.2.1. The VPG does not have an IP address, but the address defined here allows the FortiGate to route traffic out of port2, while AWS routes the traffic based on its routing table.

5. Click *OK*.
6. Go to *Network* > *Static Routes* to view the configured static routes:



7. If *Optimal* dashboards is selected, go to *Dashboard* > *Network* and expand the Routing widget to view the routing table.

   If *Comprehensive* dashboards is selected, go to *Dashboard* > *Routing Monitor* and select *Static & Dynamic* in the widget toolbar to view the routing table:



Configure IPsec VPN on the HQ FortiGate

To configure a custom IPsec VPN:

1. Go to *VPN* > *IPsec Wizard*.
2. Set *Name* to *AWS_VPG*.
3. Set *Template type* to *Custom*.
4. Click *Next*.
5. Configure *Network* settings:

Remote Gateway	Static IP Address
IP Address	34.210.19.225 This address is taken from the downloaded AWS configuration file.
Interface	port1
NAT Traversal	Enable

6. Configure *Authentication* settings:

Method	Pre-shared Key
Pre-shared Key	Enter the pre-shared key.
Version	1
Mode	Main

7. Configure the *Phase 1 Proposal* settings using information from the downloaded AWS configuration file.
8. Disable *XAUTH*.

9. Configure the *Phase 2 Selector* settings:

Name	AWS_VPG
Local Address	Named Address - *all* This setting allows traffic originating from both the local subnet 10.100.88.0 and the health checks from the VPN interface. For increased security, each subnet can be specified individually.
Remote Address	Named Address - *remote_subnet_10_0_2_0*

10. Click *OK*.

To configure local and remote tunnel IP addresses:

1. Go to *Network* > *Interfaces* and edit the *AWS_VPG* interface under *port1*.
2. Set *IP* to *169.254.55.154*.
3. Set *Remote IP/Netmask* to *169.254.55.153 255.255.255.0*.
4. Enable *Administrative access* for *HTTPS* and *PING*.
5. Click *OK*.

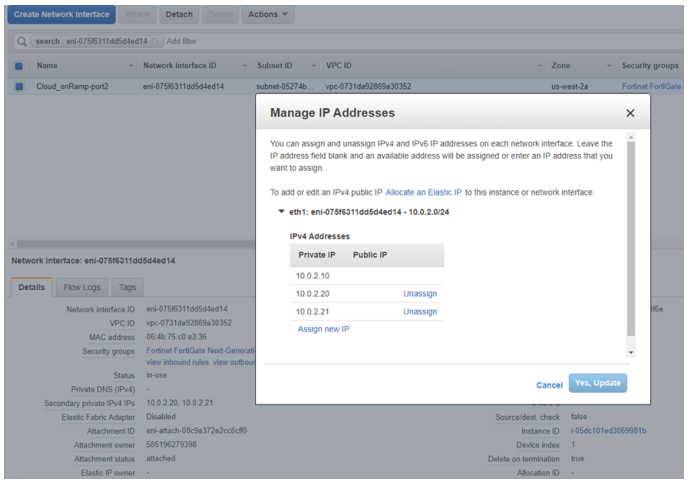
Routing is defined when creating the SD-WAN interface. The firewall policy is created after the SD-WAN interface is defined.

Configuring the VIP to access the remote servers

VIPs, interface IP addresses, and policies are created on the cloud FortiGate-VM to allow access to the remote servers.

To configure additional private IPs on AWS for the FortiGate VIP:

1. On the FortiGate EC2 instance, edit the *Elastic Network Interface* that corresponds to *port2*. In this example, Network Interface *eth1*.
2. Go to *Actions* > *Manage IP Addresses*.
3. Add two private IP address in the 10.0.2.0/24 subnet.
   These address will be used in the VIPs on the FortiGate. This ensures that traffic to these IP addresses is routed to the FortiGate by AWS.

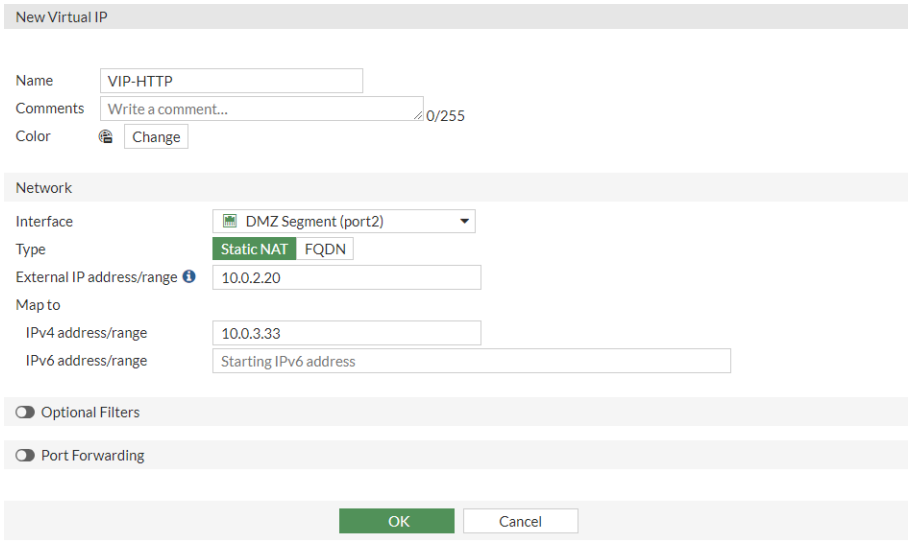


4. Click *Yes, Update*.

To configure VIPs on the cloud FortiGate-VM:

1. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
2. Click *Create new*.
3. Configure the following:

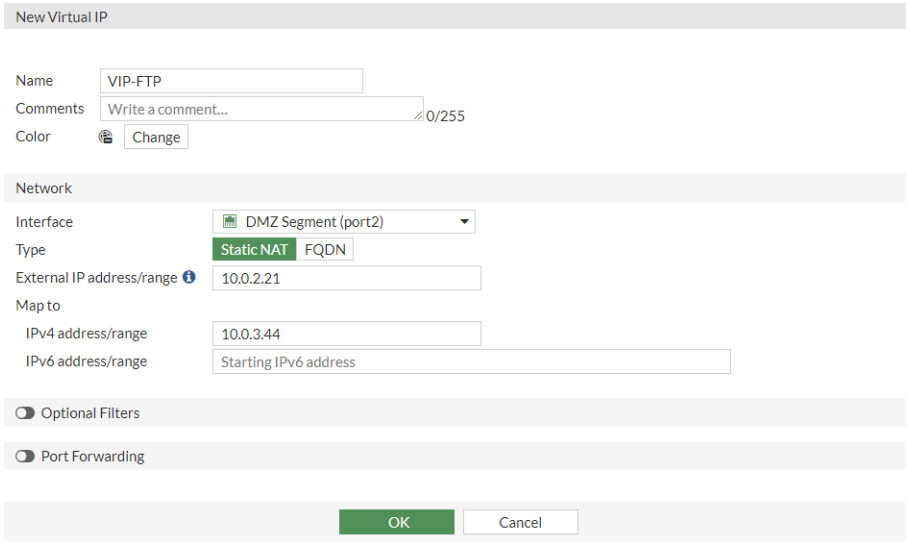
Name	VIP-HTTP
Interface	port2
External IP address/range	10.0.2.20
Map to IPv4 address/range	10.0.3.33



4. Click *OK*.
5. Create a second VIP for the FTP server with the following settings:

Name	VIP-FTP

Interface	port2
External IP address/range	10.0.2.21
Map to IPv4 address/range	10.0.3.44



To configure firewall policies to allow traffic from port2 to port3:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following:

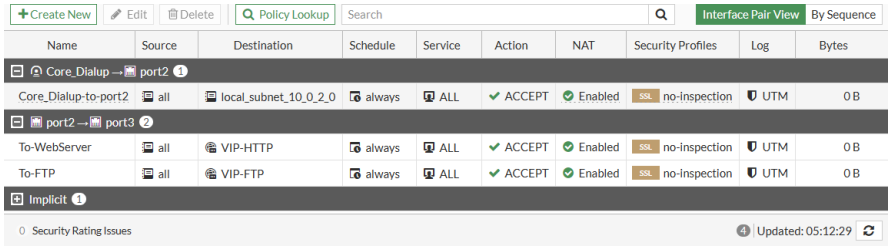
Name	To-WebServer
Incoming Interface	port2
Outgoing Interface	port3
Source	all
Destination	VIP-HTTP
Schedule	always
Service	ALL
Action	ACCEPT
NAT	Enabled

3. Configure the remaining settings as required.
4. Click *OK*.
5. Create a second policy for the FTP VIP with the following settings:

Name	To-FTP
Incoming Interface	port2

Outgoing Interface	port3
Source	all
Destination	VIP-FTP
Schedule	always
Service	ALL
Action	ACCEPT
NAT	Enabled

6. Click *OK*.



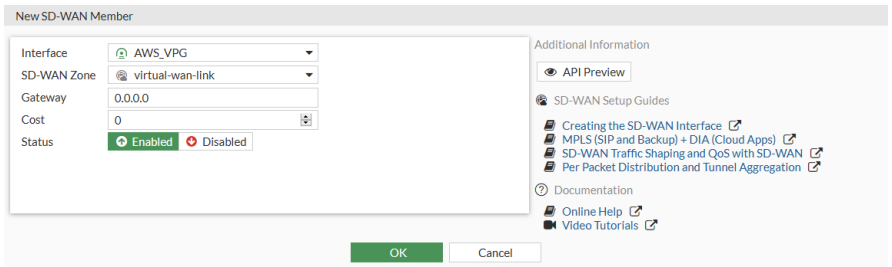
Configuring the SD-WAN to steer traffic between the overlays

Configure the HQ FortiGate to use two overlay tunnels for SD-WAN, steering HTTPS and HTTP traffic through the FGT_AWS_Tun tunnel, and SSH and FTP throguh the AWS_VPG tunnel.

1. Add SD-WAN member interfaces
2. Configure a route to the remote network
3. Configure firewall policies
4. Configure a health check
5. Configure SD-WAN rules

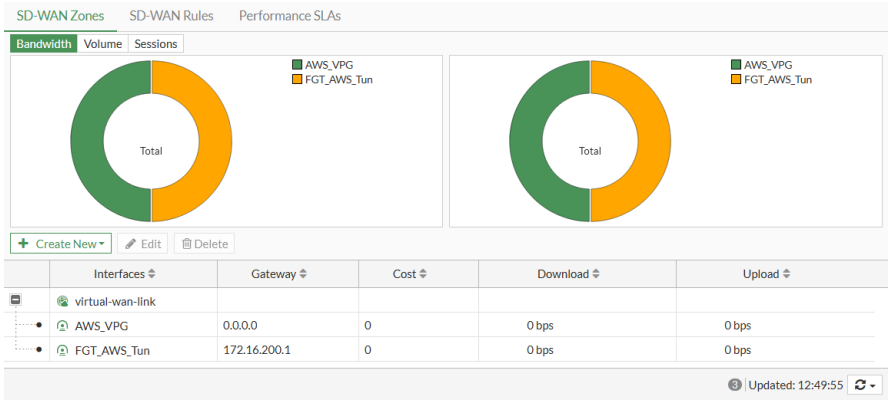
To add SD-WAN member interfaces:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New* > *SD-WAN Member*.
2. Set *Interface* to *AWS_VPG* then click *OK*.



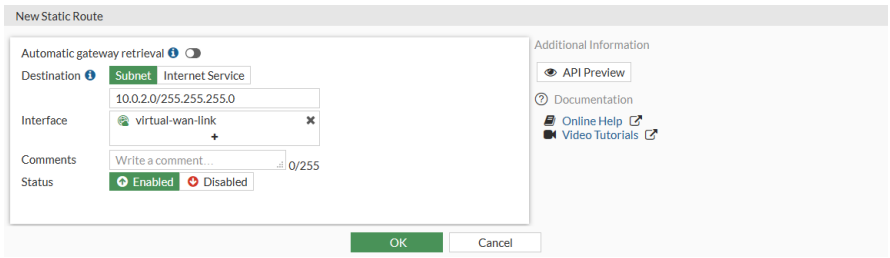
3. Click *Create New* > *SD-WAN Member* again.
4. Set *Interface* to *FGT_AWS_Tun*.

5. Set *Gateway* to *172.16.200.1*.
6. Click *OK*.

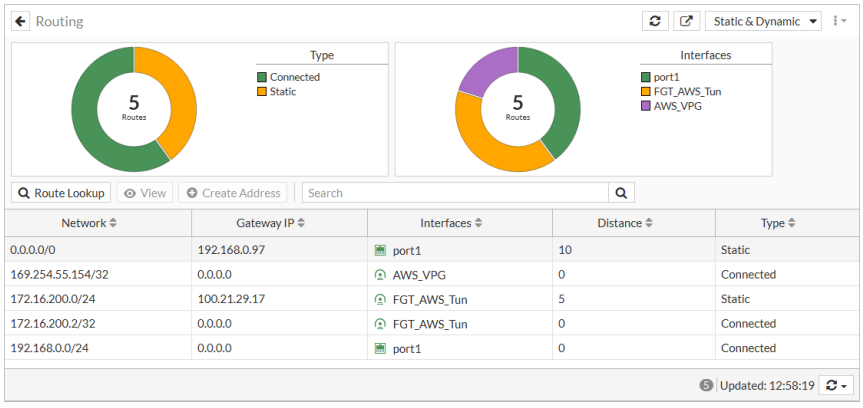


To configure a route to the remote network 10.0.2.0/24:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Set *Destination* to *Subnet* and enter the IP address and netmask: *10.0.2.0/255.255.255.0*.
3. Set *Interface* to *virtual-wan-link*.



4. Click *OK*.
   Individual routes to each tunnel are automatically added to the routing table with the same distance:



To configure firewall policies to allow traffic from the internal subnet to SD-WAN:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following:

Name	ISFW-to-IaaS
Incoming Interface	port3
Outgoing Interface	virtual-wan-link
Source	all
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT
NAT	Enabled

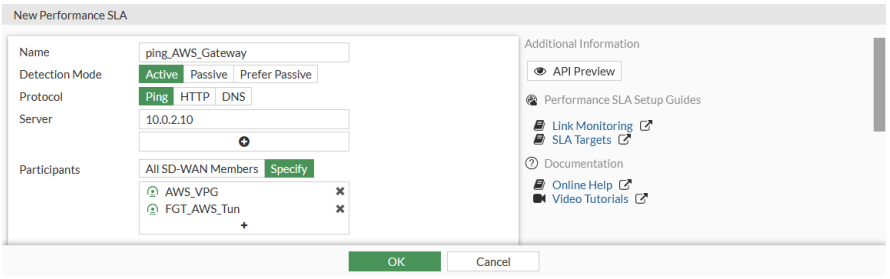
3. Configure the remaining settings as required.
4. Click *OK*.
   Once the firewall policies are configured, the VPN tunnels should come up when there is traffic.

To configure a health check to monitor the status of the tunnels:

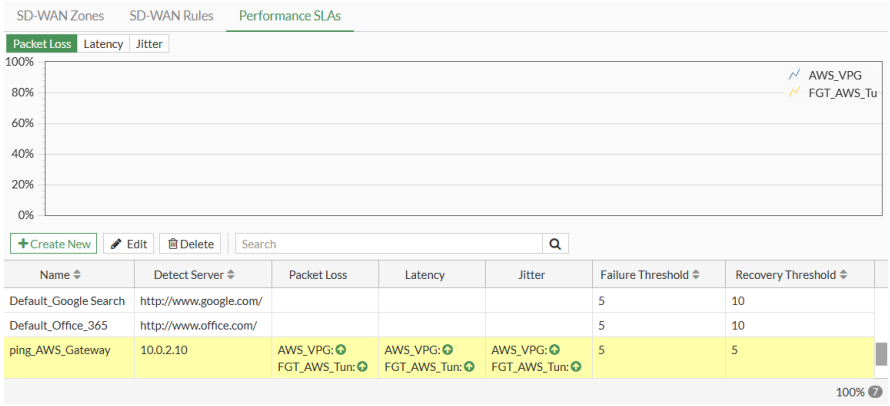
As you are accessing the servers on the 10.0.2.0/24 subnet, it is preferable to use the FortiGate port2 interface as the ping server for detection. This ensures that, if the gateway is not reachable in either tunnel, its routes are brought down and traffic continues on the other tunnel.

1. Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, and click *Create New*.
2. Configure the following:

Name	ping_AWS_Gateway
Protocol	Ping
Server	10.0.2.10
Participants	Specify Add AWS_VPG and FGT_AWS_Tun as participants.



3. Click *OK*.



Health check probes originate from the VPN interface's IP address. This is why the phase2 selectors are configured with *Local Address* set to *all*.

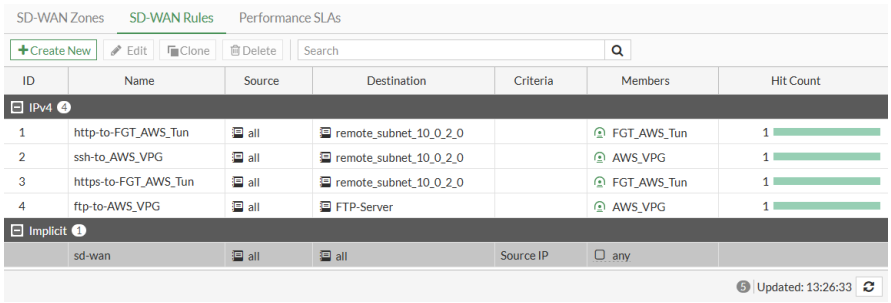
To configure SD-WAN rules to steer traffic:

HTTPS and HTTP traffic is steered to the FGT_AWS_Tun tunnel, and SSH and FTP traffic is steered to the AWS_VPG tunnel. The Manual algorithm is used in this example.

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Configure the following:

Name	http-to-FGT_AWS_Tun
Source Address	all
Address	remote_subnet_10_0_2_0
Protocol	TCP
Port range	80 - 80
Outgoing Interfaces	Manual
Interface preference	FGT_AWS_Tun

3. Click *OK*.
4. Create other SD-WAN rules as required:



Verifying the traffic

To verify that pings are sent across the IPsec VPN tunnels

- On the HQ FortiGate, run the following CLI command:

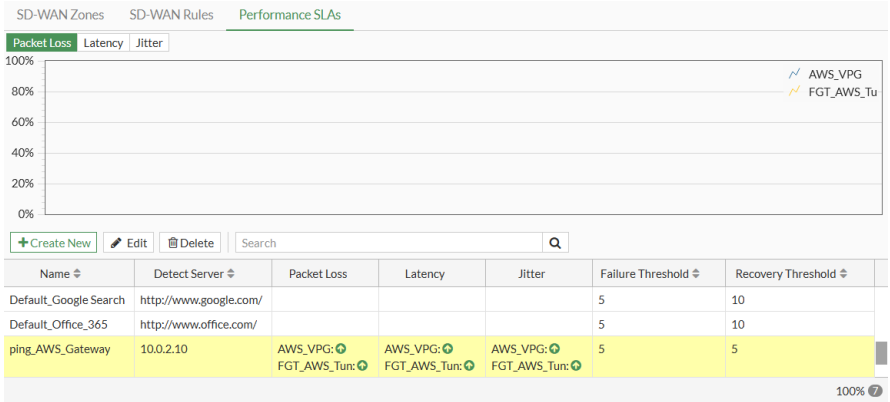
```
# diagnose sniffer packet any 'host 10.0.2.10' 4 0 1 interfaces=[any]
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.0.2.10]
pcap_snapshot: snaplen raised from 0 to 262144
2021-06-05 11:35:14.822600 AWS_VPG out 169.254.55.154 -> 10.0.2.10: icmp: echo request
2021-06-05 11:35:14.822789 FGT_AWS_Tun out 172.16.200.2 -> 10.0.2.10: icmp: echo request
2021-06-05 11:35:14.877862 FGT_AWS_Tun in 10.0.2.10 -> 172.16.200.2: icmp: echo reply
2021-06-05 11:35:14.878887 AWS_VPG in 10.0.2.10 -> 169.254.55.154: icmp: echo reply
```

- On the cloud FortiGate-VM, run the following CLI command:

```
# diagnose sniffer packet any 'host 10.0.2.10' 4 0 1 interfaces=[any]
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.0.2.10]
pcap_snapshot: snaplen raised from 0 to 262144
2021-06-05 11:37:57.176329 port2 in 169.254.55.154 -> 10.0.2.10: icmp: echo request
2021-06-05 11:37:57.176363 port2 out 10.0.2.10 -> 169.254.55.154: icmp: echo reply
2021-06-05 11:37:57.176505 Core_Dialup in 172.16.200.2 -> 10.0.2.10: icmp: echo request
2021-06-05 11:37:57.176514 Core_Dialup out 10.0.2.10 -> 172.16.200.2: icmp: echo reply
```

To verify the SLA health checks on the HQ FortiGate:

1. Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, select *Packet Loss*, and click the *ping_AWS_Gateway* SLA:



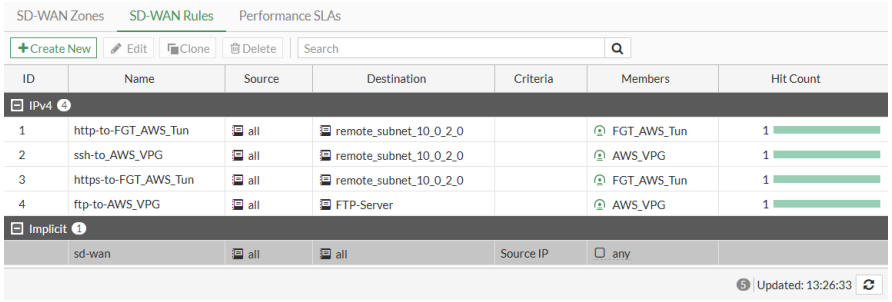
2. Run the following CLI command:

```
# diagnose sys sdwan health-check
…
Seq(1 AWS_VPG): state(alive), packet-loss(0.000%) latency(56.221), jitter(0.290) sla_map=0x0
```

```
Seq(2 FGT_AWS_Tun): state(alive), packet-loss(0.000%) latency(55.039), jitter(0.223) sla_
map=0x0
```

To verify service rules:

1. Go to *Network* > *SD-WAN* and select the *SD-WAN Rules* tab:



2. Run the following CLI command:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x0
  Gen(1), TOS(0x0/0x0), Protocol(6: 80->80), Mode(manual)
  Members:
    1: Seq_num(2 FGT_AWS_Tun), alive, selected
  Src address:
        0.0.0.0-255.255.255.255
  Dst address:
        10.0.2.0-10.0.2.255

Service(2): Address Mode(IPV4) flags=0x0

```

To verify that sessions are going to the correct tunnel:

1. Run the following CLI command to verify that HTTPS and HTTP traffic destined for the Web server at 10.0.2.20 uses FGT_AWS_Tun:

```
# diagnose sys session filter dst 10.0.2.20
# diagnose sys session list

session info: proto=6 proto_state=11 duration=2 expire=3597 timeout=3600 flags=00000000

```

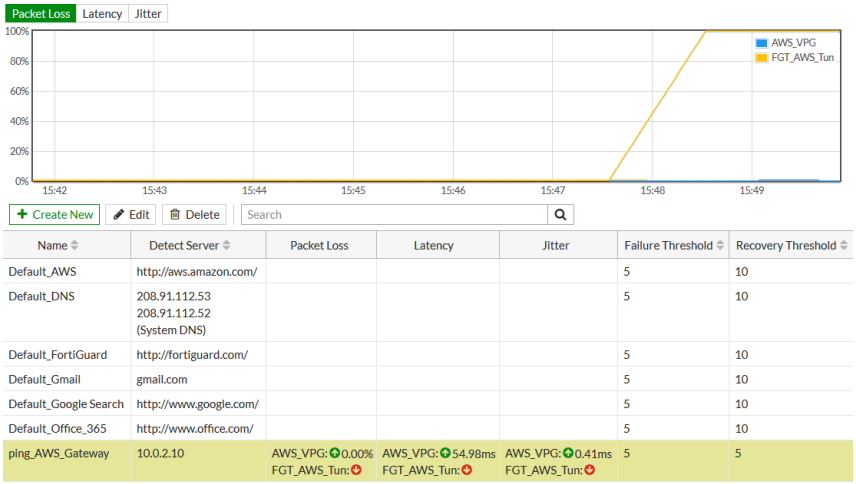
To simulate an issue on an overlay VPN tunnel:

On the cloud FortiGate-VM, disable the firewall policy allowing Core_Dialup to port2.

1. Health-checks through the FGT_AWS_Tun tunnel fail:
   a. Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, select *Packet Loss*, and click the *ping_AWS_Gateway* SLA:

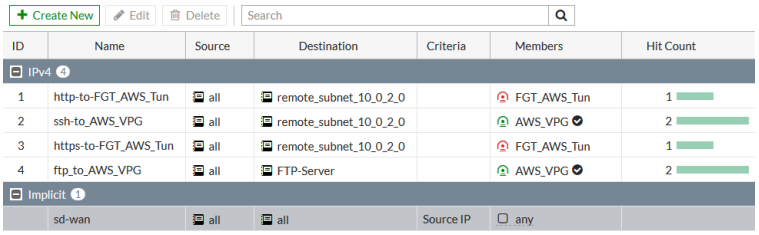


Name	Detect Server	Packet Loss	Latency	Jitter	Failure Threshold	Recovery Threshold
Default_AWS	http://aws.amazon.com/				5	10
Default_DNS	208.91.112.53 208.91.112.52 (System DNS)				5	10
Default_FortiGuard	http://fortiguard.com/				5	10
Default_Gmail	gmail.com				5	10
Default_Google Search	http://www.google.com/				5	10
Default_Office_365	http://www.office.com/				5	10
ping_AWS_Gateway	10.0.2.10	AWS_VPG: 0.00% FGT_AWS_Tun:	AWS_VPG: 54.98ms FGT_AWS_Tun:	AWS_VPG: 0.41ms FGT_AWS_Tun:	5	5

   b. Run the following CLI command:

```
# diagnose sys sdwan health-check
…
Seq(1 AWS_VPG): state(alive), packet-loss(0.000%) latency(52.746), jitter(0.713) sla_
map=0x0
Seq(2 FGT_AWS_Tun): state(dead), packet-loss(19.000%) sla_map=0x0
```

2. Service rules show that the member is down:
   a. Go to *Network* > *SD-WAN* and select the *SD-WAN Rules* tab:



ID	Name	Source	Destination	Criteria	Members	Hit Count
IPv4 4						
1	http-to-FGT_AWS_Tun	all	remote_subnet_10_0_2_0		FGT_AWS_Tun	1
2	ssh-to_AWS_VPG	all	remote_subnet_10_0_2_0		AWS_VPG	2
3	https-to-FGT_AWS_Tun	all	remote_subnet_10_0_2_0		FGT_AWS_Tun	1
4	ftp_to_AWS_VPG	all	FTP-Server		AWS_VPG	2
Implicit 1						
	sd-wan	all	all	Source IP	any	

   b. Run the following CLI command:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x0
  Gen(2), TOS(0x0/0x0), Protocol(6: 80->80), Mode(manual)
  Members:
    1: Seq_num(2 FGT_AWS_Tun), dead
  Src address:
        0.0.0.0-255.255.255.255
  Dst address:
        10.0.2.0-10.0.2.255
```

```
Service(2): Address Mode(IPV4) flags=0x0

4. Routes to the *FGT_AWS_Tun* tunnel are removed:
   a. If *Optimal* dashboards is selected, go to *Dashboard > Network* and expand the Routing widget to view the routing table.

      If *Comprehensive* dashboards is selected, go to *Dashboard > Routing Monitor* and select *Static & Dynamic* in the widget toolbar to view the routing table:

Network	Gateway IP	Interfaces	Distance	IP Version	Type
IPv4 40					
0.0.0.0/0	10.100.64.254	Internet_A (port1)	1	IPv4	Static
0.0.0.0/0	10.100.65.254	Internet_B (port5)	1	IPv4	Static
10.0.2.0/24	169.254.55.153	AWS_VPG	1	IPv4	Static
10.0.10.0/24	0.0.0.0	VPN_A_Tunnel (Branch-HQ-A)	0	IPv4	Connected
10.0.10.1/32	0.0.0.0	VPN_A_Tunnel (Branch-HQ-A)	0	IPv4	Connected

   b. Run the following CLI command:

```
# get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default

Routing table for VRF=0
S*      0.0.0.0/0 [1/0] via 10.100.64.254, port1
                  [1/0] via 10.100.65.254, port5
```

```
S       10.0.2.0/24 [1/0] via 169.254.55.153, AWS_VPG
C       10.0.10.0/24 is directly connected, Branch-HQ-A
C       10.0.10.1/32 is directly connected, Branch-HQ-A
…
```

SD-WAN Network Monitor service

The SD-WAN Network Monitor service is a tool designed to determine upload and download speeds. Speed tests can be conducted either on-demand or according to a predetermined schedule, measuring upload and download speeds of up to 1 Gbps. The results of the tests can be used as reference for various applications, including the following:

- Configuring the estimated bandwidth of an interface, which can be employed in conjunction with various WAN intelligence strategies. See Using speed test results with SD-WAN for more information.
- Configuring the inbandwidth and outbandwidth of an interface for use in traffic shaping. See Using speed test results with traffic shaping for more information.
- Applying the speed test to dialup VPN tunnels in a hub and spoke deployment to conduct traffic shaping.

FortiOS offers a variety of methods for testing SD-WAN speed. The following table provides a brief overview of each method and guidance on when it might be most advantageous to use one method over the others.

Service	Overview	License
CLI speed test	• Provides the most flexibility and options, which enables the speed test to operate with user-defined parameters. • Results can be used as reference to manually add to the interface's estimated bandwidth, or inbandwidth and outbandwidth. • Server is on the cloud, which is maintained by Fortinet.	Requires a valid SD-WAN Network Monitor license.
GUI speed test	• Downloads the speed test server list automatically. • Results can be added to the interface's estimated bandwidth with one click. • Results are automatically updated in the interface `measured-upstream-bandwidth` and `measured-downstream-bandwidth` fields. • Results can be used as a reference to manually configure an interface's inbandwidth and outbandwidth. • Easier to use. • Server is on the cloud, which is maintained by Fortinet.	Requires a valid SD-WAN Network Monitor license.

Service	Overview	License
Scheduled interface speed test	• Speed tests can be scheduled to run automatically. • Results are automatically updated in the interface `measured-upstream-bandwidth` and `measured-downstream-bandwidth` fields. • Results can be used as a reference to manually configure an interface's inbandwidth and outbandwidth. • Possible to temporarily bypass the bandwidth limits set on the interface and configure custom maximum bandwidth limits. • Server is on the cloud, which is maintained by Fortinet.	Requires a valid SD-WAN Network Monitor license.
Speed test from hub to spoke	• Server is the spoke. • Tests initiated from the hub. • Results are cached for future use. • Results can be dynamically applied to the dialup tunnel for egress traffic shaping. • Results can be used as a reference to manually configure an interface's inbandwidth and outbandwidth.	License not required.
Speed test from spokes to hub	• Server is the hub. • Tests initiated from spokes, even when a spoke is behind a NAT device. • Results are cached on the spoke for future use and sent to the hub. • Results can be dynamically applied to the dialup tunnel for egress traffic shaping. • Results can be used as a reference to manually configure an interface's inbandwidth and outbandwidth.	License not required.

CLI speed test

The speed test tool is compatible with iPerf3.6 with SSL support. It can test the upload bandwidth to the FortiGate Cloud speed test service. It can initiate the server connection and send download requests to the server. The tool can be run up to 10 times a day.

The FortiGate downloads the speed test server list. The list expires after 24 hours. One of the speed test servers is selected based on user input.

To configure the speed test settings:

```
config system speed-test-setting
    set latency-threshold <integer>
```

```
    set multiple-tcp-stream <integer>
end
```

`latency-threshold <integer>`	Set the speed test threshold for the auto mode, in milliseconds (0 - 2000, default = 60). If the latency exceeds this threshold, the speed test will use the UDP protocol; otherwise, it will use the TCP protocol.
`multiple-tcp-stream <integer>`	Set the number of parallel client streams for the TCP protocol to run during the speed test (1 - 64, default = 4).

To download the server list of speed tests:

1. Download the server list from FortiCloud:

```
# execute speed-test-server download
Download completed.
```

2. Verify the list:

```
# execute speed-test-server list
...
FTNT_CA_Toronto valid
        Host: 154.52.23.67 5200 fortinet
        ...
FTNT_CA_Vancouver valid
        Host: 154.52.20.6 5200 fortinet
        ...
FTNT_Global valid
        Host: 154.52.6.95 5203 fortinet
        ...
```

To run the speed test:

A speed test can be run with or without specifying a server. The system will automatically choose one server from the list and run the speed test. The test results are shown in the command terminal.

```
# execute speed-test <interface> <server> {Auto | TCP | UDP}
```

```
# diagnose netlink interface speed-test <interface> <server> {Auto | TCP | UDP}
```

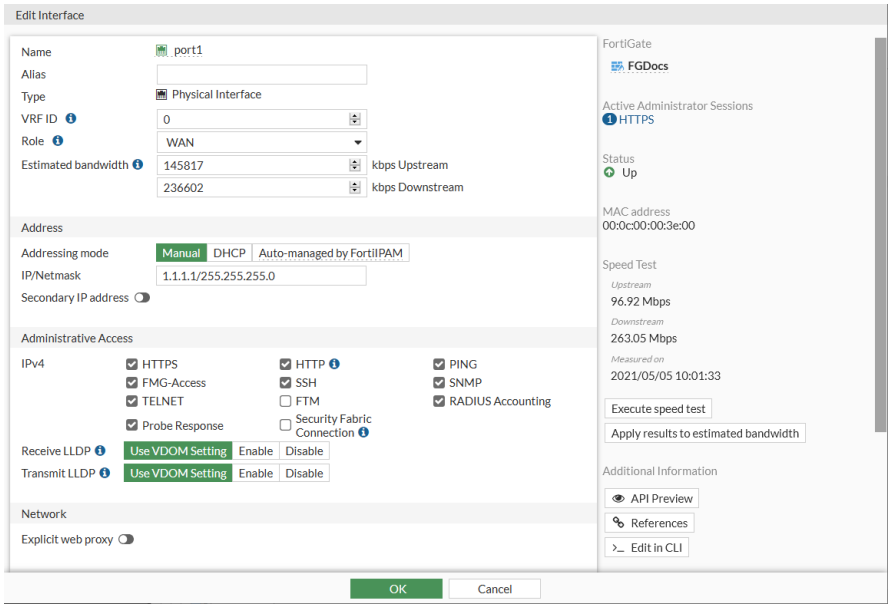
See Speed test examples on page 1380 for a sample configurations.

GUI speed test

An interface speed test can be manually performed on WAN interfaces in the GUI. The results of the test can be added to the interface's *Estimated bandwidth*. The estimated upstream and downstream bandwidths can be used in SD-WAN service rules to determine the best link to use when either load balancing or best quality strategies are selected.

To run an interface speed test on a WAN interface:

1. Go to *Network* > *Interfaces*.
2. Edit a WAN interface. The interfaces can be grouped by role using the grouping dropdown on the right side of the toolbar.
3. Click *Execute speed test* in the right pane.



The CLI equivalent to running a speed test in the GUI is `execute speed-test <interface>`.

4. When the test completes, click *OK* in the *Confirm* pane to apply the results to the estimated bandwidth. The results can also be applied later by clicking *Apply results to estimated bandwidth*.

   The speed test results are used to populate the *Estimated bandwidth* fields.
5. Click *OK*.

The FortiGate must be connected to FortiGuard, and able to reach either the AWS or Google speed test servers.

Scheduled interface speed test

The SD-WAN Network Monitor service supports running a speed test based on a schedule. The test results are automatically updated in the interface `measured-upstream-bandwidth` and `measured-downstream-bandwidth` fields. These fields do not impact the interface inbound bandwidth, outbound bandwidth, estimated upstream bandwidth, or estimated downstream bandwidth settings.

When the scheduled speed tests run, it is possible to temporarily bypass the bandwidth limits set on the interface and configure custom maximum or minimum bandwidth limits. These configurations are optional.

```
config system speed-test-schedule
    edit <interface>
        set mode {Auto | TCP | UDP}
```

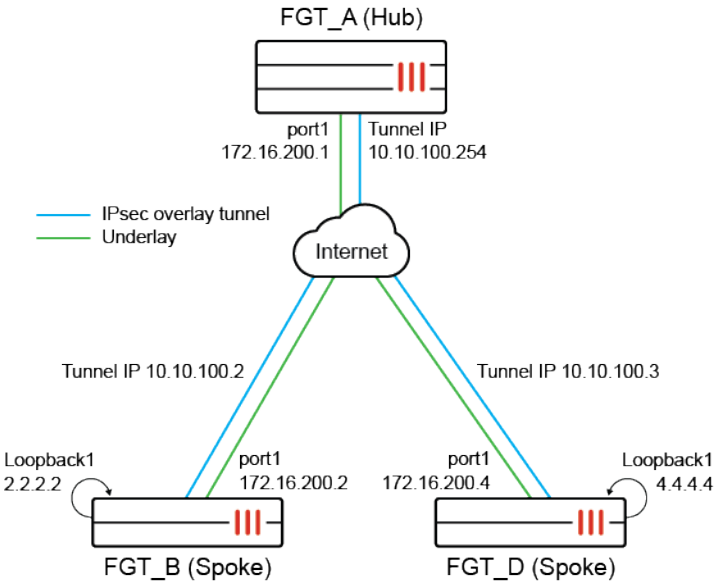
```
        set schedules <schedule> ...
        set update-inbandwidth enable {enable | disable}
        set update-outbandwidth enable {enable | disable}
        set update-inbandwidth-maximum <integer>
        set update-outbandwidth-maximum <integer>
    next
end
```

`mode {Auto | TCP | UDP}`	Set the protocol used for the speed test: • `Auto` (default): dynamically select TCP or UDP based on the speed test setting. • `UDP`: use UDP. • `TCP`: use TCP.
`update-inbandwidth enable {enable | disable}`	Enable/disable bypassing the interface's inbound bandwidth setting.
`update-outbandwidth enable {enable | disable}`	Enable/disable bypassing the interface's outbound bandwidth setting.
`update-inbandwidth-maximum <integer>`	Set the maximum downloading bandwidth to be used in a speed test, in Kbps (0 - 16776000).
`update-outbandwidth-maximum <integer>`	Set the maximum uploading bandwidth to be used in a speed test, in Kbps (0 - 16776000).

See Example 4 for a sample configuration.

Hub and spoke speed tests

In an SD-WAN hub and spoke topology, connections between sites are typically made through VPN overlays. The hub usually acts as the VPN gateway with spokes connecting as dial-up VPN clients. In order to estimate the speed of the connection to each spoke, speed tests can be performed between the hub and each spoke. The results of the speed test can be used for egress traffic shaping on the VPN overlay tunnel.



A speed test server can be enabled on the hub or spoke with custom speed-test listening ports. The test measures the speeds of the link to each spoke so that QoS can be applied on the hub to the egress traffic shaping profile assigned to the IPsec overlay tunnel interface and the respective tunnel. An egress-shaping profile can be applied to local, remote, or both local and remote IPsec tunnels or no IPsec tunnels. Tests can be in upload or download direction and support both TCP and UDP protocols.

Speed test results are cached for future use. When speed tests are initiated from the hub, the results are cached on the hub. When speed tests are initiated from the spoke, the results are cached on the spoke, but sent to the hub.

When a speed-test server is enabled on a hub or spoke, two speed test daemons are started and listen on different ports for different purposes:

- The controller speed test daemon listens on the IPsec overlay interfaces to assign an access token to each incoming speed test for authentication.
- The speed test daemon listens on the IPsec underlay interfaces to handle the speed tests.

Each incoming speed test request must present the obtained access token to prevent random, unauthorized requests. Otherwise, the connection is closed immediately. As such, speed test access must be enabled on both the underlay and the IPsec overlay tunnel interfaces.

```
config system interface
    edit <interface>
        set allowaccess speed-test [other access] ...
    next
end
```

If the IPsec tunnel has a configured `exchange-ip`, speed test access must also be configured on the associated interface, such as the loopback interface.

The speed test client can be a hub or a spoke and must have `system speed-test-schedule` configured and the `dynamic-server` setting enabled. The speed-test schedule initiates the test.

On the speed test client, specify whether and how to apply the test results in a shaping profile. The shaping profile must be configured in the phase1 interface before it can be used with a speed test.

```
config system speed-test-schedule
    edit <interface>
        set server-port <integer>
        set ctrl-port <integer>
        set update-shaper {disable | local | remote | both}
    next
end
```

`set server-port <integer>`	Specify the port number for the speed-test server used for speed tests (1 - 65535, default = 5201).
`set ctrl-port <integer>`	Specify the port number for the controller on the speed-test server used for authentication (1 - 65535, default = 5200).
`set update-shaper {disable | local | remote | both}`	Set the egress shaper to use the speed test results: • `disable`: Disable updating the egress shaper (default). • `local`: Update the speed-test client egress shaper. • `remote`: Update the speed-test server egress shaper. • `both`: Update both the local and remote egress shapers.

CLI commands

Enable the speed-test server:

```
config system global
    set speedtest-server {enable | disable}
    set speedtestd-server-port <integer>
    set speedtestd-ctrl-port <integer>
end
```

`speedtest-server {enable | disable}`	Enable/disable the speed test server on the hub or spoke (default = disable).This enables iPerf in server mode, which listens on the default iPerf TCP port 5201.
`set speedtestd-server-port <integer>`	Specify a custom port number (1024 - 65535, default = 5201) for the speed test daemon. The port is used to perform the speed test.
`set speedtestd-ctrl-port <integer>`	Specify a custom port number (1024 - 65535. default = 5200) for the controller speed test daemon. The port is used to assign access tokens for authentication prior to performing the speed test.

Enable the speed test client:

```
config system speed-test-schedule
    edit <interface>
       set dynamic-server {enable | disable}
```

```
        set ctrl-port <integer>
        set server-port <integer>
        set update-shaper {disable | local | remote | both}
    next
end
```

`<interface>`	The dial-up IPsec tunnel interface on the speed test client. The speed test client can be the hub or the spokes.
`dynamic-server {enable | disable}`	Enable/disable the dynamic speed test server (default = disable).
`Ctrl-port <integer>`	Specify the port number for the controller on the speed-test server used for authentication (1 - 65535, default = 5200).
`Server-port <integer>`	Specify the port number for the speed-test server used for speed tests (1 - 65535, default = 5201).
`Update-shaper {disable | local | remote | both}`	Set the egress shaper to use the speed test results: • `disable`: Disable updating the egress shaper (default). • `local`: Update the speed-test client egress shaper. • `remote`: Update the speed-test server egress shaper. • `both`: Update both the local and remote egress shapers.

To limit the maximum bandwidth used in the speed test, enable `set update-inbandwidth` and `set update-outbandwidth`. See Scheduled interface speed test on page 1358 for more information.

Enable speed test access on both the underlay and the IPsec overlay tunnel interfaces on the speed test server:

```
config system interface
    edit <interface>
        set allowaccess speed-test [other access] ...
    next
end
```

`<interface>`	The dial-up IPsec tunnel interface on the speed test server.
`set allowaccess {speed-test | [other access]}`	Enable speed-test access on the underlay and IPsec overlay interfaces.

Allow an SD-WAN member on the spoke to switch routes when on speed test from the hub to spokes:

```
config system sdwan
    set speedtest-bypass-routing {enable | disable}
    config neighbor
        edit <bgp neighbor>
            set mode speedtest
```

```
        next
    end
end
```

`speedtest-bypass-routing {enable | disable}`	Enable/disable bypass routing when doing a speed test on an SD-WAN member (default = disable).
`set mode speedtest`	Use the speed test to select the neighbor.

Manually run uploading speed test on the physical interfaces of each tunnel of a dial-up IPsec interface:

```
execute speed-test-dynamic <interface> <tunnel_name> <'y'/'n'> <max-out> <min-out>
```

`<interface>`	IPsec phase1 interface name.
`<tunnel_name>`	The tunnel name, or `all` for all tunnels.
`<'y'/'n'>`	Apply the result to the tunnels' shaper or not.
`<max-out>`	The maximum speed used in a speed test, in kbps.
`<min-out>`	The minimum speed used in a speed test, in kbps.

Manually run a non-blocking uploading speed test:

```
diagnose netlink interface speed-test-tunnel <interface> <tunnel_name>
```

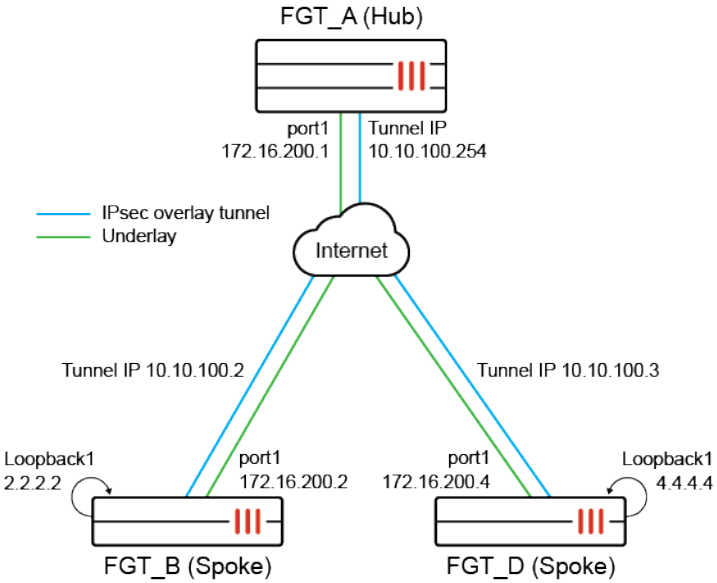
Debug and test commands:

`diagnose debug application speedtest <int>`	Enable debug of the speed test module in the forticron daemon.
`diagnose debug application speedtestd <int>`	Enable debug of the speed test server daemon.
`diagnose test application forticron 9`	List the scheduled speed tests.
`diagnose test application forticron 10`	Show the cached speed test results.
`diagnose test application forticron 11`	Write the cached speed test results to disk.
`diagnose test application forticron 12`	Load the speed test results from disk.
`diagnose test application forticron 99`	Cancel all pending speed tests.

Running speed tests from the hub to the spokes in dial-up IPsec tunnels

In this example, the hub is configured as a VPN dial-up server and both of the spokes are connected to the hub. It is assumed that the VPN configuration is already done, with a dynamic gateway type and kernel device

creation (`net-device`) disabled. Only one SD-WAN interface is used, so there is only one VPN overlay member in the SD-WAN zone. Multiple WAN interfaces and VPN overlays could be used.



The VPN interfaces and IP addresses are:

FortiGate	Interface	IP Address
FGT_A (Hub)	hub-phase1	10.10.100.254
FGT_B (Spoke)	spoke11-p1	10.10.100.2
FGT_D (Spoke)	spoke21-p1	10.10.100.3

A recurring speed test is configured that runs on the hub over the dial-up interfaces. The speed tests are performed over the underlay interface from the hub to the spoke. Each spoke is configured to operate as a speed test server and to allow the speed test to run on its underlay interface. The spokes establish BGP peering with the hub over the VPN interface, and advertises its loopback network to the hub. The specific configuration is only shown for FGT_B.

When the speed test is running, routing through the VPN overlay can be bypassed, and route maps are used to filter the routes that are advertised to peers. The spoke's route map does not advertise any routes to the peer, forcing the hub to use others paths to reach the spoke's network.

When no speed tests are running, the spoke's route map allows its network to be advertised on the hub.

When the speed test is complete, the measured egress bandwidth is dynamically applied to the VPN tunnel on the hub, and the result is cached for future use, in case the tunnel is disconnected and reconnected again.

To configure the hub FortiGate (FGT_A) as the speed-test client:

1. Configure a shaping profile:

```
config firewall shaping-profile
    edit "profile_1"
        config shaping-entries
```

```
            edit 1
                set class-id 2
                set priority low
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 10
            next
        end
        set default-class-id 2
    next
end
```

Three classes are used in the profile for low, medium, and high priority traffic. Each class is assigned a guaranteed and maximum bandwidth as a percentage of the measured bandwidth from the speed test.

2. Configure a shaping policy to assign certain traffic as a class ID:

   In this example, all traffic destined to the dialup tunnels are assigned class 3.

```
config firewall shaping-policy
    edit 2
        set service "ALL"
        set schedule "always"
        set dstintf "hub-phase1"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

3. Use the shaping profile in the interface:

```
config system interface
    edit "hub-phase1"
        set egress-shaping-profile "profile_1"
    next
end
```

4. Configure a schedule to use for the speed tests:

```
config firewall schedule recurring
    edit "speedtest_recurring"
        set start 01:00
        set end 23:00
        set day monday tuesday wednesday thursday friday saturday
    next
end
```

5. Configure the speed test schedule:

   The custom controller port used for authentication is set to 6000, and the custom port used to run the speed tests is set to 7000. The shaping profile is set to local.

```
config system speed-test-schedule
    edit "hub-phase1"
        set schedules "speedtest_recurring"
```

```
        set dynamic-server enable
        set ctrl-port 6000
        set server-port 7000
        set update-shaper remote
    next
end
```

To configure the spoke FortiGates (FGT_B) as a speed test server:

1. Enable a speed test server with custom speed-test listening ports:

   A speed test server is enabled on the hub. Port 7000 will run speed tests, and port 6000 will be the controller used to issue access tokens for speed test authentication.

```
config system global
     set speedtest-server enable
     set speedtestd-ctrl-port 6000
     set speedtestd-server-port 7000
end
```

2. Allow speed tests on the underlay:

```
config system interface
    edit "port1"
        append allowaccess speed-test
    next
end
```

3. Allow speed tests on the overlay:

```
config system interface
    edit "hub-spoke11-p1"
        set allowaccess ping speed-test
        ...
        set interface "port1"
    next
end
```

4. Configure SD-WAN with bypass routing enabled for speed tests on member *spoke11-p1*:

```
config system sdwan
    set speedtest-bypass-routing enable
    config members
        edit 1
            set interface "spoke11-p1"
        next
    end
    config neighbor
        edit "10.10.100.254"
            set member 1
            set mode speedtest
        next
```

```
    end
end
```

5. Configure BGP routing:

```
config router route-map
    edit "No_Speed-Test"
        config rule
            edit 1
                set action permit
            next
        end
    next
    edit "Start_Speed-Test"
        config rule
            edit 1
                set action deny
            next
        end
    next
end
config router bgp
    set as 65412
    config neighbor
        edit "10.10.100.254"
            set advertisement-interval 1
            set remote-as 65412
            set route-map-out "Start_Speed-Test"
            set route-map-out-preferable "No_Speed-Test"
        next
    end
    config network
        edit 1
            set prefix 2.2.2.2 255.255.255.255
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

Results

1. Before the speed test starts, FGT_A can receive the route from FGT_B by BGP:

```
# get router info routing-table bgp
Routing table for VRF=0
B       2.2.2.2/32 [200/0] via 10.10.100.2 (recursive via 172.16.200.2, hub-phase1), 00:00:10
B       10.1.100.0/24 [200/0] via 10.10.100.2 (recursive via 172.16.200.2, hub-phase1),
00:00:10
```

2. At the scheduled time, the speed test starts for the hub-phase1 interface from hub to spoke:

```
# diagnose test application forticron 9
Speed test schedules:
    Interface     Server     Update    Up/Down-limit (kbps)               Days        H:M
TOS     Schedule
-------------------------------------------------------------------------------------------
----------------------------
    hub-phase1    dynamic                                                1111111    14:41
0x00    speedtest_recurring
Active schedules:
        64002f: hub-phase1(port1) 172.16.200.2     hub-phase1_1
        64002e: hub-phase1(port1) 172.16.200.4     hub-phase1_0
```

The `diagnose debug application speedtest -1` command can be used on both the hub and spokes to check the speed test execution.

3. While the speed test is running, FGT_A does not receive the route from FGT_B by BGP:

```
#  get router info routing-table bgp
Routing table for VRF=0
```

4. Speed tests results can be dynamically applied to the dial-up tunnel for egress traffic shaping:

```
# diagnose vpn tunnel list
------------------------------------------------------
name=hub-phase1_0 ver=2 serial=c 172.16.200.1:0->172.16.200.4:0 tun_id=172.16.200.4 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
...
egress traffic control:
        bandwidth=737210(kbps) lock_hit=0 default_class=2 n_active_class=3
        class-id=2      allocated-bandwidth=73720(kbps)         guaranteed-bandwidth=73720
(kbps)
                        max-bandwidth=73720(kbps)       current-bandwidth=0(kbps)
                        priority=low    forwarded_bytes=52
                        dropped_packets=0       dropped_bytes=0
        class-id=3      allocated-bandwidth=221163(kbps)        guaranteed-bandwidth=221162
(kbps)
                        max-bandwidth=294883(kbps)      current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=4      allocated-bandwidth=442325(kbps)        guaranteed-bandwidth=147441
(kbps)
                        max-bandwidth=442325(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
------------------------------------------------------
name=hub-phase1_1 ver=2 serial=d 172.16.200.1:0->172.16.200.2:0 tun_id=172.16.200.2 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
...
egress traffic control:
        bandwidth=726813(kbps) lock_hit=0 default_class=2 n_active_class=3
        class-id=2      allocated-bandwidth=72681(kbps)         guaranteed-bandwidth=72681
(kbps)
                        max-bandwidth=72681(kbps)       current-bandwidth=0(kbps)
```

```
                        priority=low    forwarded_bytes=123
                        dropped_packets=0       dropped_bytes=0
        class-id=3      allocated-bandwidth=218044(kbps)        guaranteed-bandwidth=218043
(kbps)
                        max-bandwidth=290725(kbps)      current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=4      allocated-bandwidth=436087(kbps)        guaranteed-bandwidth=145362
(kbps)
                        max-bandwidth=436087(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
```

5. Speed test results can be cached, indexed, and written to disk:

```
# diagnose test application forticron 10
Speed test results:
1: vdom=root, phase1intf=hub-phase1, peer-id='spoke11-p1', bandwidth=737210, last_
log=1624226603
2: vdom=root, phase1intf=hub-phase1, peer-id='spoke21-p1', bandwidth=726813, last_
log=1624226614
```

```
# diagnose test application forticron 11
Write 2 logs to disk.
```

```
# diagnose test application forticron 12
load 2 results.
```

Disable then reenable the IPsec VPN tunnel and the cached speed test results can be applied to the tunnel again:

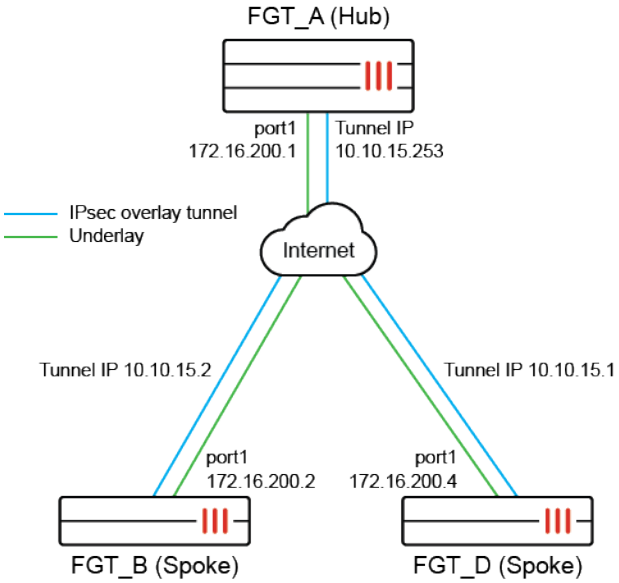
```
# diagnose vpn tunnel list
------------------------------------------------------
name=hub-phase1_0 ver=2 serial=c 172.16.200.1:0->172.16.200.4:0 tun_id=172.16.200.4 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
...
egress traffic control:
        bandwidth=737210(kbps) lock_hit=0 default_class=2 n_active_class=3
------------------------------------------------------
name=hub-phase1_1 ver=2 serial=d 172.16.200.1:0->172.16.200.2:0 tun_id=172.16.200.2 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
...
egress traffic control:
        bandwidth=726813(kbps) lock_hit=0 default_class=2 n_active_class=3
```

Running speed tests from spokes to the hub in dial-up IPsec tunnels

In this hub and spoke example, the hub is configured as an IPsec VPN dial-up server with two IPsec tunnels, and each tunnel is connected to a spoke. The VPN interfaces and IP addresses are:

FortiGate	Interface	IP Address
FGT_A (Hub)	hub-phase1	10.10.15.253
FGT_B (Spoke)	spoke11-p1	10.10.15.2
FGT_D (Spoke)	spoke21-p1	10.10.15.1

The hub (FGT_A) is configured as a speed-test server to listen on custom ports (6000 and 7000), and the spokes (FGT_B and FGT_D) are configured as speed-test clients. This setup allows speed tests to successfully perform when spokes are behind NAT devices. The results of the speed test will be applied to the hub-phase1 overlay tunnel(s) as specified by the speed-test clients.



The spokes are configured to initiate speed tests on a schedule on UDP. After the speed test completes, the results are sent to the hub, and the hub applies the results on its IPsec tunnels as egress traffic shaping. The results are also cached and can be used if an IPsec tunnel is disconnected and reconnected again.

To configure the hub FortiGate (FGT_A) as the speed test server:

1. Configure a shaping profile:
   In this example, the shaping profile is named profile_1.

```
config firewall shaping-profile
    edit "profile_1"
        set default-class-id 2
        config shaping-entries
```

```
            edit 1
                set class-id 2
                set priority low
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 10
            next
            edit 2
                set class-id 3
                set priority medium
                set guaranteed-bandwidth-percentage 30
                set maximum-bandwidth-percentage 40
            next
            edit 3
                set class-id 4
                set guaranteed-bandwidth-percentage 20
                set maximum-bandwidth-percentage 60
            next
        end
    end
end
```

Three classes are used in the profile for low, medium, and high priority traffic. Each class is assigned a guaranteed and maximum bandwidth as a percentage of the measured bandwidth from the speed test.

2. Configure a shaping policy to assign certain traffic as a class ID:

   In this example, all traffic destined to the dialup tunnels are assigned class 3.

```
config firewall shaping-policy
    edit 2
        set service "ALL"
        set schedule "always"
        set dstintf "hub-phase1" "hub2-phase1"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

3. Enable a speed test server with custom speed-test listening ports:

   A speed test server is enabled on the hub. Port 7000 will run speed tests, and port 6000 will be the controller used to issue access tokens for speed test authentication.

```
config system global
    ...
    set speedtest-server enable
    set speedtestd-ctrl-port 6000
    set speedtestd-server-port 7000
end
```

4. Allow the speed test on the underlay:

```
config system interface
    edit "port1"
        set ip 172.16.200.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet fgfm radius-acct probe-response fabric
speed-test
        ...
    next
end
```

5. Allow the speed test on the overlay and use the shaping profile in the interface:
   In this example, speed tests are allowed on the overlay, and the shaping profile (profile_1) is used on the hub phase1 interface (port1).

```
config system interface
    edit "hub-phase1"
        set ip 10.10.15.253 255.255.255.255
        set allowaccess ping speed-test
        set egress-shaping-profile "profile_1"
        ...
        set interface "port1"
    next
end
```

To configure the first spoke FortiGate (FGT_B) as a speed test client:

1. Configure `system speed-test-schedule`:
   The protocol mode is set to UDP. The custom controller port used for authentication is set to 6000, and the custom port used to run the speed tests is set to 7000. The shaping profile is set to remote.

```
config system speed-test-schedule
    edit "spoke11-p1"
        set mode UDP
        set schedules "1"
        set dynamic-server enable
        set ctrl-port 6000
        set server-port 7000
        set update-shaper remote
    next
end
```

2. Configure a recurring schedule for the speed tests:
   Schedule 1 is set to start at 08:37 every day of the week.

```
config firewall schedule recurring
    edit "1"
        set start 08:37
        set day sunday monday tuesday wednesday thursday friday saturday
    next
end
```

To configure the second spoke FortiGate (FGT_D) as a speed test client:

1. Configure a speed test schedule:
   The protocol mode is set to UDP. The custom controller port used for authentication is set to 6000, and the custom port used to run the speed tests is set to 7000. The shaping profile is set to remote.

```
config system speed-test-schedule
    edit "spoke21-p1"
        set mode UDP
        set schedules "1"
        set dynamic-server enable
        set ctrl-port 6000
        set server-port 7000
        set update-shaper remote
    next
end
```

2. Configure a recurring schedule for the speed tests:
   Schedule 1 is set to start at 08:37 every day of the week.

```
config firewall schedule recurring
    edit "1"
        set start 08:37
        set day sunday monday tuesday wednesday thursday friday saturday
    next
end
```

To view the speed test results:

1. After the speed test schedule runs, view the result on spoke FGT_B:
   On spoke FGT_B, authentication succeeds through port 6000, and the test runs on port 7000. UDP mode is used, and the test is successful.

```
# diagnose debug application speedtest -1

......

```

```
fcron_speedtest_sync_results()-1172: Sync cached results to secondary devices.
```

3. After the speed test schedule runs, view the result on the hub (FGT_A):

The server side uses `speedtestd`, while the client side uses `speedtest`.

The speed test results are applied on hub-phase1_0 and hub_phase1_1 as egress traffic shaping.

```
# diagnose debug application speedtestd -1

......
[speedtest(2771)] [  7] local 172.16.200.1 port 7000 connected to 172.16.200.2 port 17553
......
[speedtest(2771)] [  7] local 172.16.200.1 port 7000 connected to 172.16.200.2 port 7998
......
[sptestd::ctrl(0377):root] set shaper: if=hub-phase1, tun=hub-phase1_0, sp=profile_1,
bw=459745
......
[speedtest(2771)] [  7] local 172.16.200.1 port 7000 connected to 172.16.200.4 port 15349
......
[speedtest(2771)] [  7] local 172.16.200.1 port 7000 connected to 172.16.200.4 port 19586
......
[sptestd::ctrl(0377):root] set shaper: if=hub-phase1, tun=hub-phase1_1, sp=profile_1,
bw=470855
......
```

4. Verify the result is cached on the spokes.
   - On FGT_B, the speed test results are cached:

     ```
     #  diagnose test application forticron 10
     Speed test results:
     1: vdom=root, phase1intf=spoke11-p1, peer-id='172.16.200.1', up=454043, dw=459694,
     time=12/13 12:32:19
     ```

   - On FGT_D, the speed test results are cached:

     ```
     #   diagnose test application forticron 10
     Speed test results:
     1: vdom=root, phase1intf=spoke21-p1, peer-id='172.16.200.1', up=454398, dw=470794,
     time=12/12 16:33:18
     ```

5. On the hub (FGT_A), verify the speed test results are applied to the hub's IPsec tunnels as egress traffic shaping:

   On hub-phase1_0 and hub-phase1_1, the correct traffic control is displayed.

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
......
-----------------------------------------------------
```

```

                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
```

Speed test usage

Using speed test results with SD-WAN

The interface speed test can be used to populate the bandwidth values based on the results.

To manually configure the upstream and downstream interface bandwidth values in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit a WAN interface.
3. Input the results from the speed test in the *Estimated bandwidth* section, specifically into the appropriate *kbps Upstream* or *kbps Downstream* fields.
4. Click *OK*.

Alternatively, use the GUI speed test on page 1357 to add the speed test results to the interface's estimated bandwidth with one click.

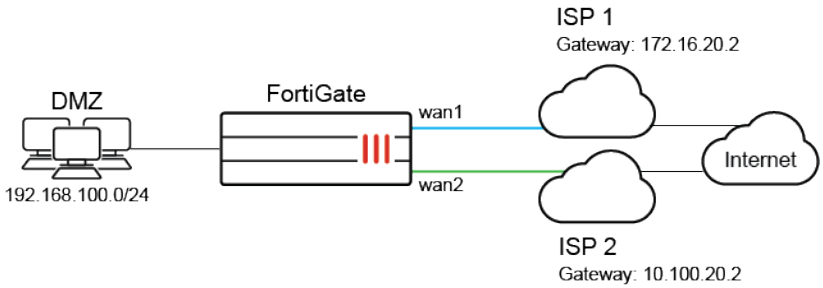
To manually configure the upstream and downstream interface bandwidth values in the CLI:

```
config system interface
    edit <interface>
        set estimated-upstream-bandwidth <speed in kbps>
        set estimated-downstream-bandwidth <speed in kbps>
    next
end
```

The populated bandwidth values can be employed in conjunction with various WAN intelligence strategies such as load balancing without SLA targets, load balancing with SLA targets, and best quality. These strategies are used to select an SD-WAN interface in SD-WAN service rules.

Example

In this example, SD-WAN interfaces, wan1 and wan2, are connected to two different internet service providers (ISPs), both providing access to the public internet. The preference is for Gmail services to use the link with the highest bandwidth.



To apply speed test results to a best quality SD-WAN rule:

1. Run theGUI speed test on page 1357 on wan1 and wan2:
   a. When the test is complete, click *OK* in the *Confirm* pane to apply the results to the estimated bandwidth.
2. Add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 897 for more information.
3. Configure the health check:
   a. Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, and click *Create New*.
   b. Enter a name for the performance SLA, such as *google*, and set the *Server* to *google.com*. See Health checks for more information.
   c. Click *OK*.
4. Configure an SD-WAN rule to use best quality with bandwidth set as the quality criteria:
   a. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
   b. Enter a name for the rule, such as *gmail*.
   c. Configure the following settings:

Internet service	*Google-Gmail*
Interface selection strategy	*Best quality*
Interface preference	*wan1* and *wan2*
Measured SLA	*google*
Quality criteria	*Bandwidth*

   d. Click *OK*.
5. Verify that the *Estimated bandwidth* values are used to select an SD-WAN interface in SD-WAN service rules.
   a. Verify the health check status:

```
# diagnose sys sdwan health-check status
Health Check(google):
Seq(1 wan1): state(alive), packet-loss(0.000%) latency(4.996), jitter(0.824), mos(4.401),
bandwidth-up(414400), bandwidth-dw(405115), bandwidth-bi(819515) sla_map=0x0
Seq(2 wan2): state(alive), packet-loss(0.000%) latency(4.634), jitter(0.340), mos(4.402),
bandwidth-up(443975), bandwidth-dw(699264), bandwidth-bi(1143239) sla_map=0x0
```

   b. Verify the service rule 1 diagnostics:

```
# diagnose sys sdwan service4 1

Service(1): Address Mode(IPV4) flags=0x4200 use-shortcut-sla use-shortcut
 Tie break: cfg
  Gen(1), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(priority), link-
cost-factor(bibandwidth), link-cost-threshold(10), heath-check(google)
  Members(2):
```

```
    1: Seq_num(2 wan2 virtual-wan-link), alive, bibandwidth: 1143239Kbps, selected
    2: Seq_num(1 wan1 virtual-wan-link), alive, bibandwidth: 819506Kbps, selected
  Internet Service(1): Google-Gmail(65646,0,0,0,0)
```

Since wan2 has superior bandwidth, SD-WAN will prioritize Seq_num(2) over Seq_num(1), and wan2 will be utilized to route Gmail traffic. The bandwidth is automatically determined by the *Estimated bandwidth* values, which were populated by running a speed test in the GUI.

Using speed test results with traffic shaping

The interface speed test can be used to populate the bandwidth values based on the results.

To configure the outbandwidth value in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit an interface.
3. In the *Traffic Shaping* section, enable *Outbound bandwidth* and enter the result obtained from the speed test's uploading mode.
4. Click *OK*.

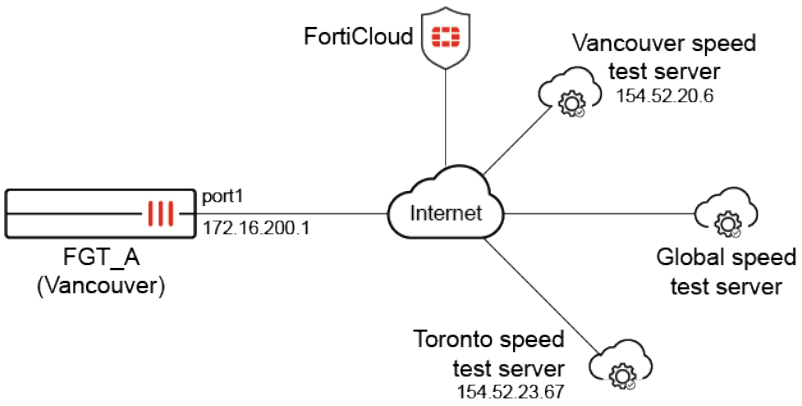
To configure the outbandwidth and inbandwidth values in the CLI:

```
config system interface
    edit <interface>
        set outbandwidth <speed_in_kbps>
        set inbandwidth <speed_in_kbps>
    next
end
```

The populated bandwidth values can be used in conjunction with either an egress or ingress traffic shaping profile.

Speed test examples

This topic includes examples that show various tests based on different modes (auto, TCP, UDP), latency thresholds, and test servers. Some test protocols and servers are manually configured, while others are chosen by the FortiGate.



These examples assume the FortiGate is connected to the internet, has a valid SD-WAN Network Monitor license, and has downloaded the server list of speed tests from FortiCloud. See CLI speed test on page 1356 for more information.

- Example 1: executing a speed test without specifying the interface, server, and mode
- Example 2: executing a speed test with a lower latency threshold setting
- Example 3: executing the speed test with diagnose netlink interface speed-test
- Example 4: executing the speed test according to the schedule
- Example 5: executing multiple speed tests with TCP and UDP connections

Example 1: executing a speed test without specifying the interface, server, and mode

Geographically, the Vancouver server (154.52.20.6) has the smallest latency (around 7 ms) to FGT_A, so it will be automatically selected for the speed test because the latency 7 ms to 154.52.20.6 is less than the default `latency-threshold` of 60 ms. Meanwhile, four TCP connections will be initiated to perform the test since the default `multiple-tcp-stream` is 4.

To execute the speed test without specifying parameters:

1. Configure the speed test settings:

```
config system speed-test-setting
    set latency-threshold 60
    set multiple-tcp-stream 4
end
```

2. Execute a ping to the closest test server, 154.52.20.6, to learn the latency for the connection:

```
# execute ping 154.52.20.6
PING 154.52.20.6 (154.52.20.6): 56 data bytes
64 bytes from 154.52.20.6: icmp_seq=0 ttl=50 time=7.5 ms
64 bytes from 154.52.20.6: icmp_seq=1 ttl=50 time=7.2 ms
64 bytes from 154.52.20.6: icmp_seq=2 ttl=50 time=7.1 ms
64 bytes from 154.52.20.6: icmp_seq=3 ttl=50 time=7.1 ms
64 bytes from 154.52.20.6: icmp_seq=4 ttl=50 time=9.1 ms
```

```
--- 154.52.20.6 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 7.1/7.6/9.1 ms
```

3. Run the speed test with no parameters:

```
# execute speed-test
Initializing speed test.
current vdom=root
Run in uploading mode.
Connecting to host 154.52.20.6, port 5203
[  7] local 172.16.200.1 port 21219 connected to 154.52.20.6 port 5203
[  9] local 172.16.200.1 port 21220 connected to 154.52.20.6 port 5203
[ 11] local 172.16.200.1 port 21221 connected to 154.52.20.6 port 5203
[ 13] local 172.16.200.1 port 21222 connected to 154.52.20.6 port 5203
[ ID] Interval           Transfer     Bitrate         Retr  Cwnd
[  7]   0.00-1.00   sec  22.4 MBytes   188 Mbits/sec   17    140 KBytes
[  9]   0.00-1.00   sec  9.71 MBytes  81.4 Mbits/sec    6   73.5 KBytes
[ 11]   0.00-1.00   sec  18.5 MBytes   155 Mbits/sec   12    117 KBytes
...
[SUM]   0.00-5.02   sec   321 MBytes   536 Mbits/sec                  receiver

speed test Done.
Run in reverse downloading mode.
Connecting to host 154.52.20.6, port 5203
Reverse mode, remote host 154.52.20.6 is sending
[  7] local 172.16.200.1 port 21228 connected to 154.52.20.6 port 5203
[ 11] local 172.16.200.1 port 21229 connected to 154.52.20.6 port 5203
...
[SUM]   0.00-5.00   sec   331 MBytes   555 Mbits/sec                  receiver

speed test Done.
```

The tested upload/download speed for port1 is 536 Mbps/555 Mbps when connecting to the closest server with four TCP connections.

Example 2: executing a speed test with a lower latency threshold setting

The `latency-threshold` setting is changed to 5 ms, which is less than the latency 7 ms to 154.52.20.6. When executing the speed test, one UDP connection will be initiated as expected.

To execute the speed test with a lower latency threshold setting:

1. Edit the speed test settings:

```
config system speed-test-setting
    set latency-threshold 5
end
```

2. Run the speed test:

```
# execute speed-test
Speed test quota for 7/19 is 4
current vdom=root
Run in uploading mode.
Connecting to host 154.52.20.6, port 5202
[  7] local 172.16.200.1 port 5315 connected to 154.52.20.6 port 5202

[SUM]  0.0- 5.0 sec  2 datagrams received out-of-order
[  7]   0.00-5.00   sec   355 MBytes   595 Mbits/sec  0.014 ms  295028/552025 (53%)  receiver

speed test Done.
```

The tested upload/download speed for port1 is 917 Mbps/595 Mbps when connecting to the closest server with one UDP connection.

Example 3: executing the speed test with diagnose netlink interface speed-test

After running this diagnose command, the results are recorded in the interface settings for reference as `measured-upstream-bandwidth` and `measured-downstream-bandwidth`.

To execute the speed test:

```
# diagnose netlink interface speed-test port1 FTNT_CA_Vancouver TCP
speed-test test ID is b0066
...
```

To view the interface settings:

```
show system interface port1
config system interface
    edit "port1"
        ...
        set measured-upstream-bandwidth 735682
        set measured-downstream-bandwidth 746573
        set bandwidth-measure-time 1689811319
        ...
    next
end
```

Example 4: executing the speed test according to the schedule

After running the speed test, the results are recorded in the interface settings for reference as `measured-upstream-bandwidth` and `measured-downstream-bandwidth`.

To execute the speed test according to the schedule:

1. Configure the recurring schedule:

   ```
   config firewall schedule recurring
       edit "speedtest_recurring"
           set start 17:07
           set day sunday monday tuesday wednesday thursday friday saturday
       next
   end
   ```

2. Configure the speed test schedule:

   ```
   config system speed-test-schedule
       edit "port1"
           set mode TCP
           set schedules "speedtest_recurring"
       next
   end
   ```

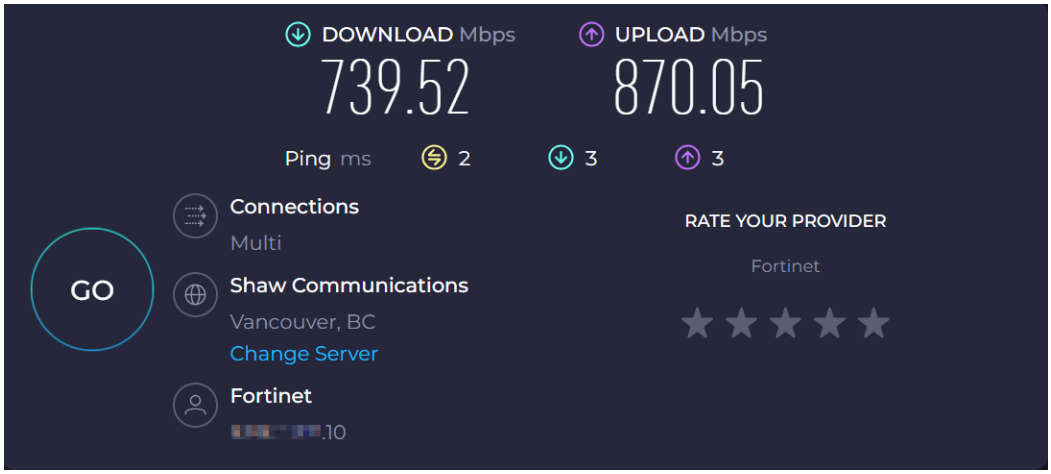
   The speed test will be initiated at 17:07 based on 10 TCP connections. The results will be recorded in port1's interface settings.

3. Verify the speed test results:

```
show system interface port1
config system interface
    edit "port1"
        ...
        set measured-upstream-bandwidth 715636
        set measured-downstream-bandwidth 819682
        set bandwidth-measure-time 1689811759
        ...
    next
end
```

Example 5: executing multiple speed tests with TCP and UDP connections

A speed test is executed to the closest server using 64 TCP connections and another speed test is executed using one UDP connection. The results can be checked with a third-party platform (such as Ookla), which returns comparable results.



To execute multiple speed tests with TCP and UDP connections:

1. Edit the speed test settings:

```
config system speed-test-setting
    set multiple-tcp-stream 64
end
```

2. Run the TCP speed test:

```
# execute speed-test port1 FTNT_CA_Vancouver TCP
...
Run in uploading mode.
...
[SUM]   0.00-5.00   sec   559 MBytes   938 Mbits/sec  2165             sender
[SUM]   0.00-5.01   sec   558 MBytes   933 Mbits/sec                  receiver
```

```
speed test Done.
Run in reverse downloading mode.
...
[SUM]   0.00-5.01   sec   505 MBytes   846 Mbits/sec  9329             sender
[SUM]   0.00-5.00   sec   491 MBytes   823 Mbits/sec                  receiver
```

3. Run the UDP speed test:

```
# execute speed-test port1 FTNT_CA_Vancouver UDP
...
Run in uploading mode.
...
[  7]   0.00-5.00   sec   556 MBytes   933 Mbits/sec  0.000 ms  0/402727 (0%)  sender
[  7]   0.00-5.04   sec   556 MBytes   925 Mbits/sec  0.020 ms  393/402717 (0.098%)  receiver
...
Run in reverse downloading mode.
...

Troubleshooting SD-WAN

The following topics provide instructions on SD-WAN troubleshooting:

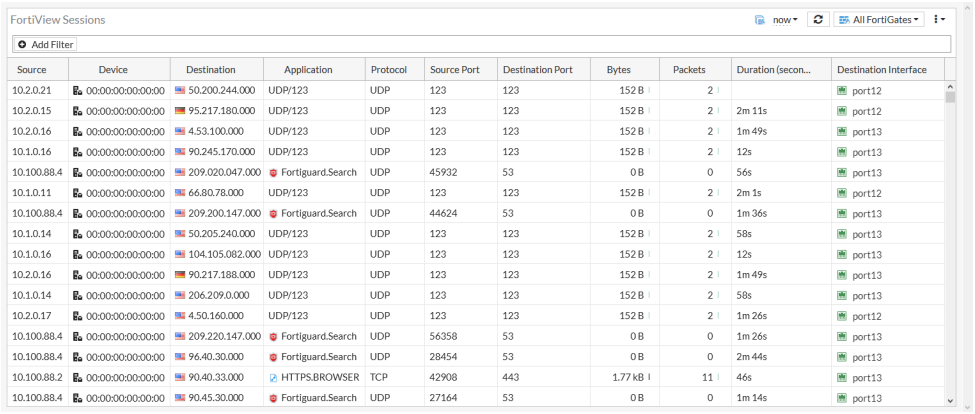
- Tracking SD-WAN sessions on page 1386
- Understanding SD-WAN related logs on page 1387
- SD-WAN related diagnose commands on page 1390
- Using SNMP to monitor health check on page 1395

Tracking SD-WAN sessions

You can check the destination interface in *Dashboard* > *FortiView Sessions* in order to see which port the traffic is being forwarded to.

The example below demonstrates a source-based load-balance between two SD-WAN members:

- If the source IP address is an *even* number, it will go to *port13*.
- If the source IP address is an *odd* number, it will go to *port12*.



Source	Device	Destination	Application	Protocol	Source Port	Destination Port	Bytes	Packets	Duration (secon...	Destination Interface
10.2.0.21	00:00:00:00:00:00	50.200.244.000	UDP/123	UDP	123	123	152 B	2		port12
10.2.0.15	00:00:00:00:00:00	95.217.180.000	UDP/123	UDP	123	123	152 B	2	2m 11s	port12
10.2.0.16	00:00:00:00:00:00	4.53.100.000	UDP/123	UDP	123	123	152 B	2	1m 49s	port13
10.1.0.16	00:00:00:00:00:00	90.245.170.000	UDP/123	UDP	123	123	152 B	2	12s	port13
10.100.88.4	00:00:00:00:00:00	209.020.047.000	Fortiguard.Search	UDP	45932	53	0 B	0	56s	port13
10.1.0.11	00:00:00:00:00:00	66.80.78.000	UDP/123	UDP	123	123	152 B	2	2m 1s	port12
10.100.88.4	00:00:00:00:00:00	209.200.147.000	Fortiguard.Search	UDP	44624	53	0 B	0	1m 36s	port13
10.1.0.14	00:00:00:00:00:00	50.205.240.000	UDP/123	UDP	123	123	152 B	2	58s	port13
10.1.0.16	00:00:00:00:00:00	104.105.082.000	UDP/123	UDP	123	123	152 B	2	12s	port13

Understanding SD-WAN related logs

This topic lists the SD-WAN related logs and explains when the logs will be triggered.

Health-check detects a failure:

- When health-check detects a failure, it will record a log:

```
1: date=2021-04-20 time=17:06:31 eventtime=1618963591590008160 tz="-0700" logid="0100022921"
type="event" subtype="system" level="critical" vd="root" logdesc="Routing information changed"
name="test" interface="R150" status="down" msg="Static route on interface R150 may be removed
by health-check test. Route:  (10.100.1.2->10.100.2.22 ping-down)"
```

- When health-check detects a recovery, it will record a log:

```
2: date=2021-04-20 time=17:11:46 eventtime=1618963906950174240 tz="-0700" logid="0100022921"
type="event" subtype="system" level="critical" vd="root" logdesc="Routing information changed"
name="test" interface="R150" status="up" msg="Static route on interface R150 may be added by
health-check test. Route:  (10.100.1.2->10.100.2.22 ping-up)"
```

Health-check has an SLA target and detects SLA qualification changes:

- When health-check has an SLA target and detects SLA changes, and changes to fail:

```
1: date=2021-04-20 time=21:32:33 eventtime=1618979553388763760 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status" eventtype="Health
Check" healthcheck="test" slatargetid=1 oldvalue="2" newvalue="1" msg="Number of pass member
changed."
```

```
2: date=2021-04-20 time=21:32:33 eventtime=1618979553388751880 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status" eventtype="Health
Check" healthcheck="test" slatargetid=1 member="1" msg="Member status changed. Member out-of-
sla."
```

- When health-check has an SLA target and detects SLA changes, and changes to pass:

```
1: date=2021-04-20 time=21:38:49 eventtime=1618979929908765200 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status" eventtype="Health
Check" healthcheck="test" slatargetid=1 oldvalue="1" newvalue="2" msg="Number of pass member
changed."
```

```
2: date=2021-04-20 time=21:38:49 eventtime=1618979929908754060 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="information" vd="root" logdesc="SDWAN status"
eventtype="Health Check" healthcheck="test" slatargetid=1 member="1" msg="Member status
changed. Member in sla."
```

SD-WAN calculates a link's session/bandwidth over/under its ratio and stops/resumes traffic:

- When SD-WAN calculates a link's session/bandwidth over its configured ratio and stops forwarding traffic:

```
1: date=2021-04-20 time=21:55:14 eventtime=1618980914728863220 tz="-0700" logid="0113022924"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN volume status"
eventtype="Volume" interface="R160" member="2" msg="Member enters into conservative status
with limited ablity to receive new sessions for too much traffic."
```

- When SD-WAN calculates a link's session/bandwidth according to its ratio and resumes forwarding traffic:

```
2: date=2021-04-20 time=22:12:52 eventtime=1618981972698753360 tz="-0700" logid="0113022924"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN volume status"
eventtype="Volume" interface="R160" member="2" msg="Member resume normal status to receive new
sessions for internal adjustment"
```

The SLA mode service rule's SLA qualified member changes:

- When the SLA mode service rule's SLA qualified member changes. In this example R150 fails the SLA check, but is still alive:

```
1: date=2021-04-20 time=22:40:46 eventtime=1618983646428803040 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" serviceid=1 service="test" seq="2,1" msg="Service prioritized by SLA will
be redirected in sequence order."
```

- When the SLA mode service rule's SLA qualified member changes. In this example R150 changes from fail to pass:

```
2: date=2021-04-20 time=22:41:51 eventtime=1618983711678827920 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" serviceid=1 service="test" seq="1,2" msg="Service prioritized by SLA will
be redirected in sequence order."
```

The priority mode service rule member's link status changes:

- When priority mode service rule member's link status changes. In this example R150 changes to better than R160, and both are still alive:

```
1: date=2021-04-20 time=22:56:55 eventtime=1618984615708804760 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" serviceid=1 service="test" metric="packet-loss" seq="2,1" msg="Service
prioritized by performance metric will be redirected in sequence order."
```

- When priority mode service rule member's link status changes. In this example R160 changes to better than R150, and both are still alive:

```
2: date=2021-04-20 time=22:56:58 eventtime=1618984618278852140 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" serviceid=1 service="test" metric="packet-loss" seq="1,2" msg="Service
prioritized by performance metric will be redirected in sequence order."
```

SD-WAN member is used in service and it fails the health-check:

- When SD-WAN member fails the health-check, it will stop forwarding traffic:

```
1: date=2021-04-20 time=23:04:32 eventtime=1618985072898756700 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" interface="R150" member="1" serviceid=1 service="test" gateway=10.100.1.1
msg="Member link is unreachable or miss threshold. Stop forwarding traffic. "
```

- When SD-WAN member passes the health-check again, it will resume forwarding logs:

```
2: date=2021-04-20 time=23:06:08 eventtime=1618985168018789600 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" interface="R150" member="1" serviceid=1 service="test" gateway=10.100.1.1
msg="Member link is available. Start forwarding traffic. "
```

Load-balance mode service rule's SLA qualified member changes:

- When load-balance mode service rule's SLA qualified member changes. In this example R150 changes to not meet SLA:

```
1: date=2021-04-20 time=23:10:24 eventtime=1618985425048820800 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" serviceid=1 service="test" member="2(R160)" msg="Service will be load
balanced among members with available routing."
```

- When load-balance mode service rule's SLA qualified member changes. In this example R150 changes to meet SLA:

```
2: date=2021-04-20 time=23:11:34 eventtime=1618985494478807100 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" serviceid=1 service="test" member="2(R160),1(R150)" msg="Service will be
load balanced among members with available routing."
```

SLA link status logs, generated with interval sla-fail-log-period or sla-pass-log-period:

- When SLA fails, SLA link status logs will be generated with interval sla-fail-log-period:

```
1: date=2021-04-20 time=23:18:10 eventtime=1618985890469018260 tz="-0700" logid="0113022925"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN SLA information"
eventtype="SLA" healthcheck="test" slatargetid=1 interface="R150" status="up" latency="0.061"
jitter="0.004" packetloss="2.000%" inbandwidthavailable="0kbps"
outbandwidthavailable="200.00Mbps" bibandwidthavailable="200.00Mbps" inbandwidthused="1kbps"
outbandwidthused="1kbps" bibandwidthused="2kbps" slamap="0x0" metric="packetloss" msg="Health
Check SLA status. SLA failed due to being over the performance metric threshold."
```

- When SLA passes, SLA link status logs will be generated with interval sla-pass-log-period:

```
2: date=2021-04-20 time=23:18:12 eventtime=1618985892509027220 tz="-0700" logid="0113022925"
type="event" subtype="sdwan" level="information" vd="root" logdesc="SDWAN SLA information"
eventtype="SLA" healthcheck="test" slatargetid=1 interface="R150" status="up" latency="0.060"
jitter="0.003" packetloss="0.000%" inbandwidthavailable="0kbps"
outbandwidthavailable="200.00Mbps" bibandwidthavailable="200.00Mbps" inbandwidthused="1kbps"
outbandwidthused="1kbps" bibandwidthused="2kbps" slamap="0x1" msg="Health Check SLA status."
```

SD-WAN related diagnose commands

This topic lists the SD-WAN related diagnose commands and related output.

To check SD-WAN health-check status:

```
FGT # diagnose sys sdwan health-check
Health Check(server):
Seq(1 R150): state(alive), packet-loss(0.000%) latency(0.110), jitter(0.024) sla_map=0x0
Seq(2 R160): state(alive), packet-loss(0.000%) latency(0.068), jitter(0.009) sla_map=0x0
```

```
FGT # diagnose sys sdwan health-check
Health Check(ping):
Seq(1 R150): state(alive), packet-loss(0.000%) latency(0.100), jitter(0.017) sla_map=0x0
Seq(2 R160): state(dead), packet-loss(100.000%) sla_map=0x0
```

```
FGT # diagnose sys sdwan health-check google
Health Check(google):
Seq(1 R150): state(alive), packet-loss(0.000%) latency(0.081), jitter(0.019) sla_map=0x0
Seq(2 R160): state(alive), packet-loss(0.000%) latency(0.060), jitter(0.004) sla_map=0x0
```

To check SD-WAN member status:

- When SD-WAN load-balance mode is *source-ip-based*/*source-dest-ip-based*.

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024, weight: 0
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024, weight: 0
```

- When SD-WAN load-balance mode is *weight-based*.

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024, weight: 33
  Session count: 15
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024, weight: 66
  Session count: 1
```

- When SD-WAN load-balance mode is *measured-volume-based*.
  - Both members are under volume and still have room:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 33
  Config volume ratio: 33, last reading: 218067B, volume room 33MB
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 66
  Config volume ratio: 66, last reading: 202317B, volume room 66MB
```

  - Some members are overloaded and some still have room:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 0
  Config volume ratio: 33, last reading: 1287767633B, overload volume 517MB
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 63
  Config volume ratio: 66, last reading: 1686997898B, volume room 63MB
```

- When SD-WAN load balance mode is *usage-based*/*spillover*.
  - When no spillover occurs:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 255
  Egress-spillover-threshold: 400kbit/s, ingress-spillover-threshold: 300kbit/s
  Egress-overbps=0, ingress-overbps=0
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 254
  Egress-spillover-threshold: 0kbit/s, ingress-spillover-threshold: 0kbit/s
  Egress-overbps=0, ingress-overbps=0
```

  - When member has reached limit and spillover occurs:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 255
  Egress-spillover-threshold: 400kbit/s, ingress-spillover-threshold: 300kbit/s
  Egress-overbps=1, ingress-overbps=0
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 254
```

```
Egress-spillover-threshold: 0kbit/s, ingress-spillover-threshold: 0kbit/s
Egress-overbps=0, ingress-overbps=0
```

- You can also use the `diagnose netlink dstmac list` command to check if you are over the limit.

```
FGT # diagnose netlink dstmac list R150
dev=R150 mac=00:00:00:00:00:00 vwl rx_tcp_mss=0 tx_tcp_mss=0 egress_overspill_
threshold=50000 egress_bytes=100982 egress_over_bps=1 ingress_overspill_threshold=37500
ingress_bytes=40 ingress_over_bps=0 sampler_rate=0 vwl_zone_id=1 intf_qua=0
```

To check SD-WAN service rules status:

- *Manual mode* service rules.

```
FGT # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
  Members(2):
    1: Seq_num(1 R150), alive, selected
    2: Seq_num(2 R160), alive, selected
  Dst address(1):
        10.100.21.0-10.100.21.255
```

- *Auto mode* service rules.

```
FGT # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(auto), link-cost-factor(latency), link-
cost-threshold(10), heath-check(ping)
  Members(2):
    1: Seq_num(2 R160), alive, latency: 0.066, selected
    2: Seq_num(1 R150), alive, latency: 0.093
  Dst address(1):
        10.100.21.0-10.100.21.255
```

- *Priority mode* service rules.

```
FGT # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(priority), link-cost-factor(latency),
link-cost-threshold(10), heath-check(ping)
  Members(2):
    1: Seq_num(2 R160), alive, latency: 0.059, selected
    2: Seq_num(1 R150), alive, latency: 0.077, selected
  Dst address(1):
        10.100.21.0-10.100.21.255
```

- *Load-balance* mode service rules.

```
FGT # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(load-balance hash-mode=round-robin)
```

```
  Members(2):
    1: Seq_num(1 R150), alive, sla(0x1), gid(2), num of pass(1), selected
    2: Seq_num(2 R160), alive, sla(0x1), gid(2), num of pass(1), selected
  Dst address(1):
        10.100.21.0-10.100.21.255
```

- *SLA mode* service rules.

```
FGT # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Members(2):
    1: Seq_num(1 R150), alive, sla(0x1), gid(0), cfg_order(0), cost(0), selected
    2: Seq_num(2 R160), alive, sla(0x1), gid(0), cfg_order(1), cost(0), selected
  Dst address(1):
        10.100.21.0-10.100.21.255
```

To check interface logs from the past 15 minutes:

```
FGT (root) # diagnose sys sdwan intf-sla-log R150
Timestamp: Wed Apr 21 16:58:27 2021, used inbandwidth: 655bps, used outbandwidth: 81655306bps,
used bibandwidth: 81655961bps, tx bys: 3413479982bytes, rx bytes: 207769bytes.
Timestamp: Wed Apr 21 16:58:37 2021, used inbandwidth: 649bps, used outbandwidth: 81655540bps,

To check the dynamic tunnel status:

```
# diagnose sys link-monitor interface <name> <name>_0
```

For example:

```
# diagnose sys link-monitor interface vd2-2
Interface(vd2-2): state(up, since Tue Jun 15 12:31:28 2021), bandwidth(up:1299bps, down:0bps),
session count(IPv4:2, IPv6:0), tx(2409919 bytes), rx(5292290 bytes), latency(0.03), jitter(0.00),
packet-loss(0.00).

# diagnose sys link-monitor interface vd2-2 vd2-2_0
Interface(vd2-2_0): state(up, since Tue Jun 15 15:21:52 2021), bandwidth(up:640bps, down:0bps),
session count(IPv4:0, IPv6:0), tx(102242 bytes), rx(16388 bytes), latency(0.03), jitter(0.00),
packet-loss(0.00).
```

To check BGP learned routes and determine if they are used in SD-WAN service:

```
FGT # get router info bgp network 10.100.11.0/24
VRF 0 BGP routing table entry for 10.100.11.0/24
Paths: (2 available, best #2, table Default-IP-Routing-Table)

Using SNMP to monitor health check

You can monitor SD-WAN health check related statistics using SNMP. The MIB file can be downloaded by going to *System* > *SNMP* and clicking *Download FortiGate MIB File*.

The following OIDs can be monitored:

Name	OID	Description
fgVWLHealthCheckLinkNumber	.1.3.6.1.4.1.12356.101.4.9.1	The number of health check links in fgVWLHealthCheckLinkTable
fgVWLHealthCheckLinkTable	.1.3.6.1.4.1.12356.101.4.9.2	SD-WAN health check statistics table.

Name	OID	Description
		This table has a dependent expansion relationship with fgVdTable.Only health checks with a configured member link are present in this table.
fgVWLHealthCheckLinkTableEntry	.1.3.6.1.4.1.12356.101.4.9.2.1	SD-WAN health check statistics on a virtual domain.
fgVWLHealthCheckLinkID	.1.3.6.1.4.1.12356.101.4.9.2.1.1	SD-WAN health check link ID. Only health checks with configured member link are present in this table. Virtual-wan-link health check link IDs are only unique within a virtual domain.
fgVWLHealthCheckLinkName	.1.3.6.1.4.1.12356.101.4.9.2.1.2	Health check name.
fgVWLHealthCheckLinkSeq	.1.3.6.1.4.1.12356.101.4.9.2.1.3	SD-WAN member link sequence.
fgVWLHealthCheckLinkState	.1.3.6.1.4.1.12356.101.4.9.2.1.4	Health check state on a specific member link.
fgVWLHealthCheckLinkLatency	.1.3.6.1.4.1.12356.101.4.9.2.1.5	The average latency of a health check on a specific member link within last 30 probes, in float number.
fgVWLHealthCheckLinkJitter	.1.3.6.1.4.1.12356.101.4.9.2.1.6	The average jitter of a health check on a specific member link within last 30 probes, in float number.
fgVWLHealthCheckLinkPacketSend	.1.3.6.1.4.1.12356.101.4.9.2.1.7	The total number of packets sent by a health check on a specific member link.
fgVWLHealthCheckLinkPacketRecv	.1.3.6.1.4.1.12356.101.4.9.2.1.8	The total number of packets received by a health check on a specific member link.
fgVWLHealthCheckLinkPacketLoss	.1.3.6.1.4.1.12356.101.4.9.2.1.9	The packet loss percentage of a health check on a specific member link within last 30 probes, in float number.
fgVWLHealthCheckLinkVdom	.1.3.6.1.4.1.12356.101.4.9.2.1.10	The VDOM that the link monitor entry exists in.

Name	OID	Description
		This name corresponds to the fgVdEntName used in fgVdTable.
fgVWLHealthCheckLinkBandwidthIn	.1.3.6.1.4.1.12356.101.4.9.2.1.11	The available bandwidth of incoming traffic detected by a health check on a specific member link, in Mbps,
fgVWLHealthCheckLinkBandwidthOut	.1.3.6.1.4.1.12356.101.4.9.2.1.12	The available bandwidth of outgoing traffic detected by a health check on a specific member link, in Mbps.
fgVWLHealthCheckLinkBandwidthBi	.1.3.6.1.4.1.12356.101.4.9.2.1.13	The available bandwidth of bi-direction traffic detected by a health check on a specific member link, in Mbps.
fgVWLHealthCheckLinkIfName	.1.3.6.1.4.1.12356.101.4.9.2.1.14	SD-WAN member interface name.

Example

This example shows a SD-WAN health check configuration and its collected statistics.

To configure the SD-WAN health check:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "port1"
            set gateway 192.168.2.1
        next
        edit 2
            set interface "MPLS"
            set zone "SD-Zone2"
            set cost 20
        next
        edit 3
            set interface "port2"
        next
    end
    config health-check
```

```
        edit "pingserver"
            set server "8.8.8.8"
            set sla-fail-log-period 10
            set sla-pass-log-period 20
            set members 2 1 3
            config sla
                edit 1
                    set link-cost-factor jitter packet-loss
                    set packetloss-threshold 2
                next
            end
        next
    end
end
```

The collected statistics:

fgVWLHealthCheckLinkID	.1.3.6.1.4.1.12356.101.4.9.2.1.1	1	2	3
fgVWLHealthCheckLinkName	.1.3.6.1.4.1.12356.101.4.9.2.1.2	pingserver	pingserver	pingserver
fgVWLHealthCheckLinkSeq	.1.3.6.1.4.1.12356.101.4.9.2.1.3	2	1	3
fgVWLHealthCheckLinkState	.1.3.6.1.4.1.12356.101.4.9.2.1.4	0	0	0
fgVWLHealthCheckLinkLatency	.1.3.6.1.4.1.12356.101.4.9.2.1.5	39.302	43.124	44.348
fgVWLHealthCheckLinkJitter	.1.3.6.1.4.1.12356.101.4.9.2.1.6	4.346	3.951	5.05
fgVWLHealthCheckLinkPacketSend	.1.3.6.1.4.1.12356.101.4.9.2.1.7	3657689	3657689	3657689
fgVWLHealthCheckLinkPacketRecv	.1.3.6.1.4.1.12356.101.4.9.2.1.8	3196258	3220258	3219466
fgVWLHealthCheckLinkPacketLoss	.1.3.6.1.4.1.12356.101.4.9.2.1.9	0	0	0

Zero Trust Network Access

This section includes information about ZTNA related features:

- Zero Trust Network Access introduction on page 1400
  - Basic ZTNA configuration on page 1403
  - Establish device identity and trust context with FortiClient EMS on page 1415
    - ZTNA scalability support for concurrent endpoints on page 1421
  - SSL certificate based authentication on page 1424
  - Full versus simple ZTNA policies on page 1426
- ZTNA advanced configurations on page 1437
- ZTNA configuration examples on page 1460
- ZTNA troubleshooting and debugging commands on page 1551
- ZTNA troubleshooting scenarios on page 1556

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 98 for more information.

Zero Trust Network Access introduction

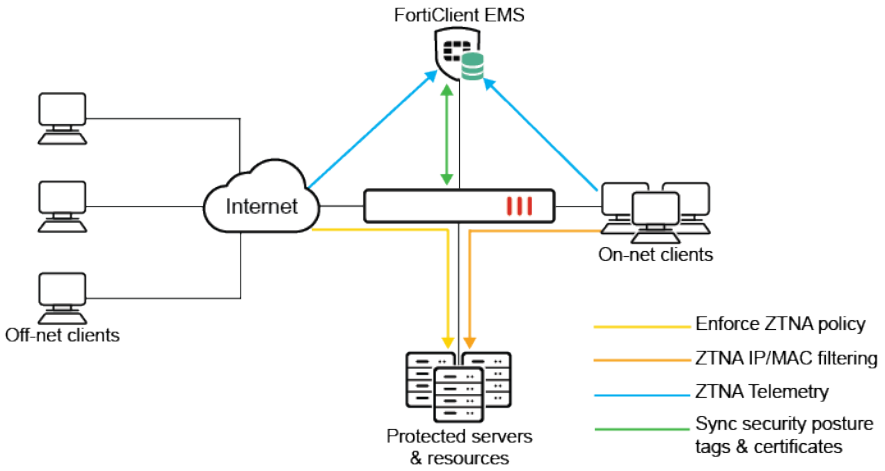
Zero Trust Network Access (ZTNA) is an access control method that uses client device identification, authentication, and security posture tags (formerly ZTNA tags) to provide role-based application access. It gives administrators the flexibility to manage network access for On-net local users and Off-net remote users. Access to applications is granted only after device verification, authenticating the user's identity, authorizing the user, and then performing context based posture checks using security posture tags.

Traditionally, a user and a device have different sets of rules for on-net access and off-net VPN access to company resources. With a distributed workforce and access that spans company networks, data centers, and cloud, managing the rules can become complex. User experience is also affected when multiple VPNs are needed to get to various resources. ZTNA can improve this experience.

ZTNA application gateway and IP/MAC based access control

- ZTNA application gateway allows users to securely access resources through an SSL encrypted access proxy. This simplifies remote access by eliminating the use of VPNs.
- IP/MAC based access control combines IP/MAC with security posture tags for identification and security posture check to implement role-based zero trust access.

ZTNA telemetry, tags, and policy enforcement

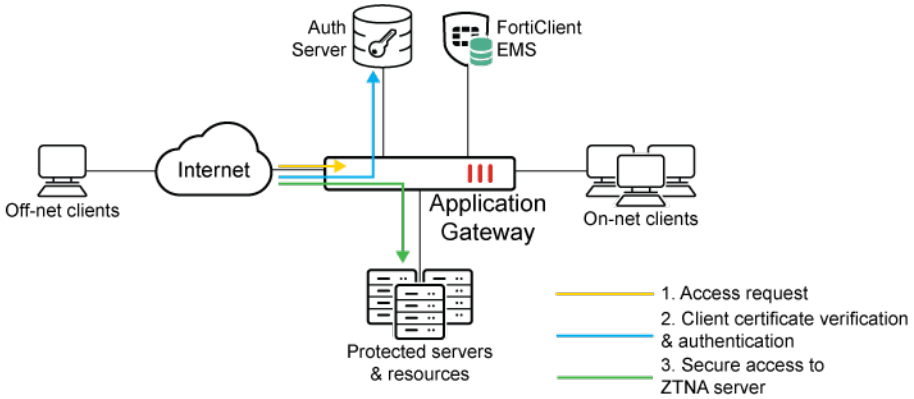


When On-net and Off-net FortiClient endpoints register to FortiClient EMS, device information, log on user information, and security posture are all shared over ZTNA telemetry with the EMS server. Clients also make a certificate signing request to obtain a client certificate from the EMS that is acting as the ZTNA Certificate Authority (CA).

Based on the client information, EMS applies matching Zero Trust tagging rules to tag the clients. These tags, and the client certificate information, are synchronized with the FortiGate in real-time. This allows the FortiGate to verify the client's identity using the client certificate, and grant access based on the security posture tags applied in the ZTNA policy.

For more information, see Establish device identity and trust context with FortiClient EMS on page 1415.

Application gateway



The FortiGate application gateway can proxy HTTP, SSH, RDP, SMB, FTP, and other TCP traffic over secure connections with the client. This enables seamless access from the client to the protected servers, without needing to form IPsec or SSL VPN tunnels.

HTTPS access proxy

The FortiGate HTTPS access proxy works as a reverse proxy for the HTTP server. When a client connects to a webpage hosted by the protected server, the address resolves to the FortiGate's access proxy VIP. The FortiGate proxies the connection and takes steps to authenticate the user. It prompts the user for their certificate on the browser, and verifies this against the ZTNA endpoint record that is synchronized from the EMS. If an authentication scheme, such as SAML authentication, is configured, the client is redirected to a captive portal for sign-on. If this passes, traffic is allowed based on ZTNA policies, and the FortiGate returns the webpage to the client.

For example configurations, see ZTNA HTTPS access proxy example on page 1461, ZTNA HTTPS access proxy with basic authentication example on page 1472, and ZTNA application gateway with SAML authentication example on page 1497.

TCP forwarding access proxy (TFAP)

The TCP forwarding access proxy works as a special type of HTTPS reverse proxy. Instead of proxying traffic to a web server, TCP traffic is tunneled between the client and the access proxy over HTTPS, and forwarded to the protected resource. The FortiClient on the remote endpoint intercepts traffic destined for the protected resources and routes them to the FortiGate proxy gateway. An HTTPS connection is made to the FortiGate's access proxy VIP, where the client certificate is verified and access is granted based on the ZTNA policies. TCP traffic is forwarded from the FortiGate to the protected resource, and an end to end connection is established. To reduce overhead, you can disable access proxy encryption on the client, as some TCP protocols, like RDP, are already secure. The TCP forwarding access proxy supports UTM scanning and deep inspection for HTTP, HTTPS, SMTP, SMTPS, IMAP, IMAPS, POP3, POP3S, SMB, and CIFS.

For an example configuration, see ZTNA TCP forwarding access proxy example on page 1480.

SSH access proxy

The SSH access proxy provides some benefits to proxying SSH connections over TFAP, including allowing SSH deep inspection, performing optional SSH host-key validation, and allowing one-time user authentication to authenticate the ZTNA SSH access proxy connection and SSH server connection.

For an example configuration, see ZTNA SSH access proxy example on page 1490.

Basic ZTNA configuration components

The basic components required to configure ZTNA application gateway on the FortiGate are:

1. FortiClient EMS fabric connector and security posture tags.
2. FortiClient EMS running version 7.0.0 or later or FortiClient EMS Cloud.
3. FortiClient running 7.0.0 or later.
4. ZTNA server
5. ZTNA policy
6. (Optional) User authentication
7. (Optional) HA configurations

For configuration details, see Basic ZTNA configuration on page 1403.

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 98 for more information.

Basic ZTNA configuration

To deploy a ZTNA application gateway, configure the following components on the FortiGate:

1. Configure a FortiClient EMS connector on page 1403
2. Configure a ZTNA server on page 1405
3. Configure a ZTNA policy on page 1409
4. Optional authentication on page 1412
5. Optional HA configurations on page 1415

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 98 for more information.

To configure ZTNA in the GUI, go to *System* > *Feature Visibility* and enable *Zero Trust Network Access*.

Configure a FortiClient EMS connector

To add an on-premise FortiClient EMS server in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiClient EMS* card.
2. Set the *Status* to *Enabled*.
3. Enter a name for the connector and the IP address or FQDN of the EMS.
4. Click *OK*.
5. A window appears to verify the EMS server certificate. Click *Accept*.
   See FortiClient EMS for more information.

To add an on-premise FortiClient EMS server in the CLI:

```
config endpoint-control fctems
    edit <ems-id>
        set server <server IP or domain>
    next
end
```

To add FortiClient EMS Cloud in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiClient EMS* card.
2. Set the *Status* to *Enabled*.
3. Set the *Type* to *FortiClient EMS Cloud*.

4. Enter a name for the connector.
5. Click *OK*. A window appears to verify the EMS server certificate.
6. Click *Accept*.
   See FortiClient EMS for more information.

To add FortiClient EMS Cloud in the CLI:

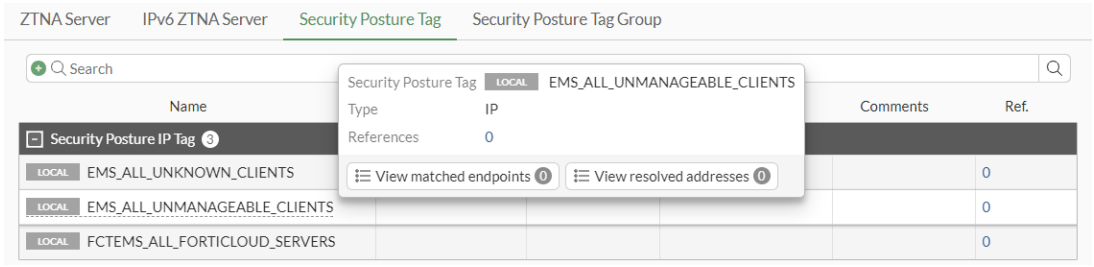
```
config endpoint-control fctems
    edit <ems-id>
        set fortinetone-cloud-authentication enable
        set certificate <string>
    next
end
```

Security posture tags

After the FortiGate connects to the FortiClient EMS, it automatically synchronizes security posture tags (formerly ZTNA tags). Security posture tags are generated from tagging rules configured on the FortiClient EMS. These tagging rules are based on various posture checks that can be applied on the endpoints. See Endpoint Posture Check Reference.

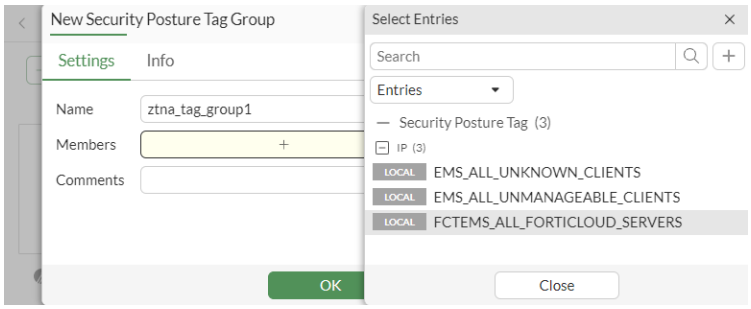
To view the synchronized security posture tags in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *Security Posture Tag* tab.
2. Hover the cursor over a tag name to view more information about the tag, such as its resolved addresses.



To create a security posture tag group in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *Security Posture Tag Group* tab.
2. Click *Create New*.
3. Enter a name for the group and select the group members.



4. Click *OK*.

To view the synchronized security posture tags in the CLI:

```
# diagnose firewall dynamic address
# diagnose firewall dynamic list
```

To create a security posture tag group in the CLI:

```
config firewall addrgrp
    edit <group name>
        set category ztna-ems-tag
        set member <members>
    next
end
```

Configure a ZTNA server

To configure a ZTNA server, define the access proxy VIP and the real servers that clients will connect to. The access proxy VIP is the FortiGate ZTNA gateway that clients make HTTPS connections to. The service/server mappings define the virtual host matching rules and the real server mappings of the HTTPS requests.

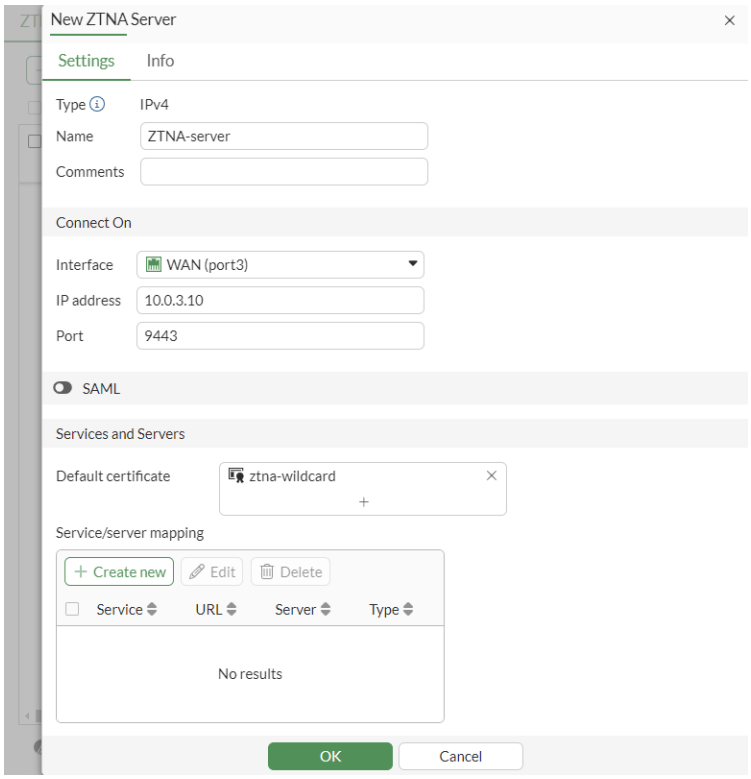
To create a ZTNA server for HTTPS access proxy in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Server* tab.
2. Click *Create New*.
3. Enter a name for the server.
4. Select an *Interface*. The *IP address* and *Port* fields are automatically filled in based on the interface selection.

Verify that the IP address and port do not conflict with management access to the interface. Otherwise, change the IP address to another address on that subnet.

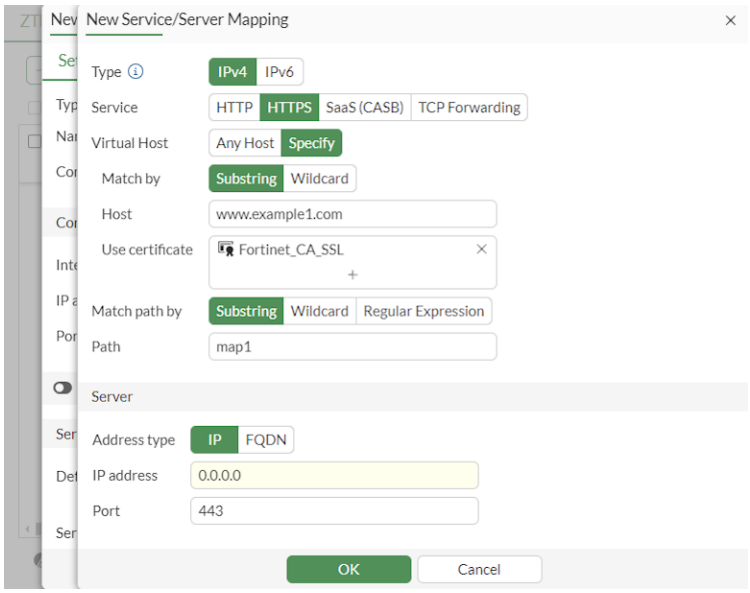
You may specify the IP address as 0.0.0.0 if an interface other than Any is selected. The ZTNA Application Gateway IP address will dynamically use the primary and secondary IPv4 address of the interface as its external IP address.

5. Select the *Default certificate*. Clients will be presented with this certificate when they connect to the access proxy VIP.



6. Add a server mapping:
   a. In the *Service/server mapping* table, click *Create New*.
   b. Set *Service* to *HTTPS*.
   c. Set *Virtual Host* to *Any Host* or *Specify*.
      - *Any Host*: Any request that resolves to the access proxy VIP will be mapped to your real servers. For example, if both www.example1.com and www.example2.com resolve to the VIP, then both requests are mapped to your real servers.
      - *Specify*: Enter the name or IP address of the host that the request must match. For example, if www.example1.com is entered as the host, then only requests to www.example1.com will match.
   d. Configure the path as needed.

      The path can be matched by substring, wildcard, or regular expression. For example, if the virtual host is specified as www.example1.com, and the path substring is map1, then www.example1.com/map1 will be matched.



e. In the *Server* section, enter the server IP address and port number.

f. Click *OK*.

7. Click *OK*.
8. Use the CLI to add additional servers and mappings to the ZTNA server.
   After additional servers and mappings are added, the *Load balancing* option is visible in the GUI.

```
config firewall access-proxy
    edit "ZTNA-Server"
        config api-gateway
            edit 1
                config realservers
                    edit 0
                        set ip <real server 2 address>
                        set port <real server 2 port>
                    next
                end
            next
        end
    next
end
```

To create a ZTNA server and access proxy VIP in the CLI:

1. Configure an access proxy VIP:

```
config firewall vip
    edit <name>
        set type access-proxy
        set extip <external IP>
        set extintf <external interface>
        set server-type {https | ssh}
        set extport <external port>
```

```
        set empty-cert-action {accept | block | accept-unmanageable}
        set user-agent-detect {enable | disable}
        set client-cert {enable | disable}
        set ssl-certificate <certificate>
    next
end
```

2. If the virtual host is specified, configure the virtual host:

```
config firewall access-proxy-virtual-host
    edit <auto generated when configured from GUI>
        set ssl-certificate <certificate>
        set host <host name or IP>
        set host-type {sub-string | wildcard}
    next
end
```

3. Configure the server and path mapping:

```
config firewall access-proxy
    edit <name>
        set vip <vip name>
        set client-cert {enable | disable}
        set log-blocked-traffic {enable | disable}
        config api-gateway
            edit 1
                set url-map <mapped path>
                set service {http | https | tcp-forwarding | samlsp}
                set virtual-host <name of virtual-host if specified>
                set url-map-type {sub-string | wildcard | regex}
                config realservers
                    edit 1
                        set addr-type ip
                        set ip <ip of real server>
                        set port <port>
                        set status {active | standby | disable}
                        set health-check {enable | disable}
                        set translate-host {enable | disable}
                    next
                end
                set ldb-method static
                set persistence none
                set ssl-dh-bits 2048
                set ssl-algorithm high
                set ssl-min-version tls-1.1
                set ssl-max-version tls-1.3
            next
        end
    next
end
```

Configure a ZTNA policy

A ZTNA policy is used to enforce zero trust role based access control by using security posture tags or tag groups to verify a device's security posture. A ZTNA policy can also utilize security profiles to protect this traffic.

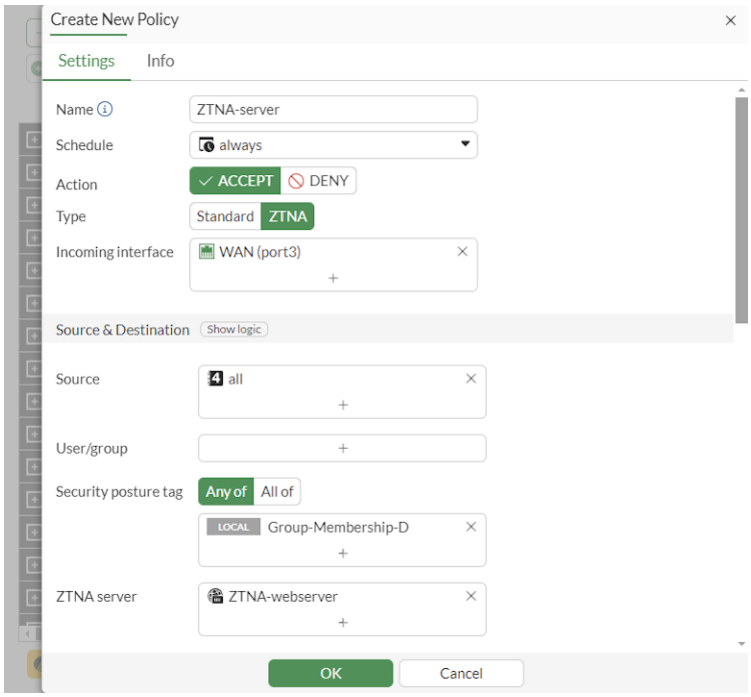
In earlier versions, ZTNA rules were special proxy policies that controlled access to the ZTNA servers, and they could be configured from the *Policy & Objects > ZTNA > ZTNA Rules* tab. However, on this version and above, these special proxy policies are now configured from *Policy & Objects > Proxy Policy* page.

There are two ways to configure ZTNA rules in the GUI by using a full or simple ZTNA policy:

- Full ZTNA policy: The legacy method for configuring access-proxy policies.
- Simple ZTNA policy: A simplified method for configuring a ZTNA policy using firewall policies. This method covers most functionality of a Full ZTNA policy, except it cannot control access based on destination interface or real server's destination address.

To configure a simple ZTNA policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Enter a name for the ZTNA policy.
4. Select the *Action*.
5. Set *Type* to *ZTNA*.
6. Select an *Incoming Interface* and *Source*.
7. Add the security posture tags or tag groups that are allowed access. If multiple tags are included, the matching method is set to *Any* by default.
8. Select the *ZTNA server*.



9. Configure the remaining options as needed.
10. Click OK.

To configure a simple ZTNA policy in the CLI:

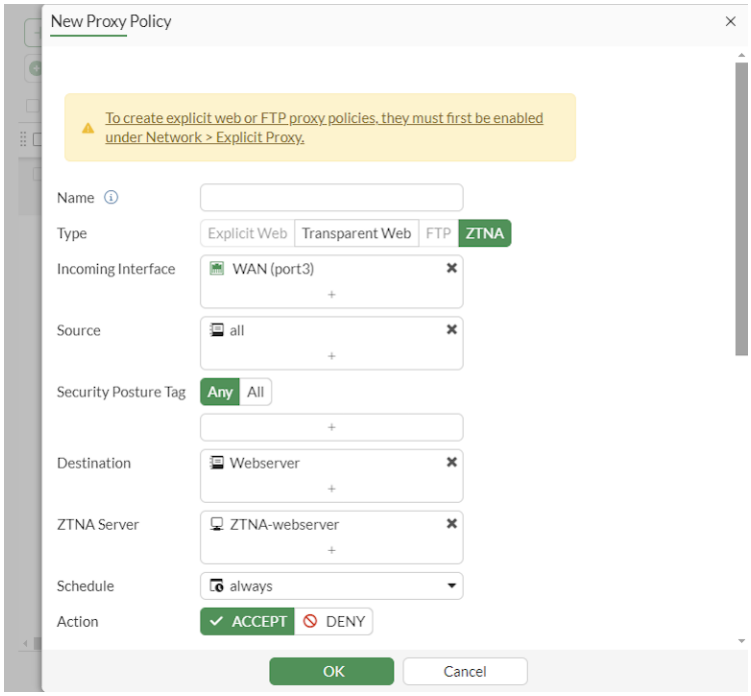
```
config firewall policy
    edit 1
        set name <ZTNA policy name>
        set srcintf <interface>
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr <access proxy vip>
        set ztna-ems-tag <security posture tags>
        set schedule "always"
        set nat enable
    next
end
```

The `dstintf` command cannot be modified.

To configure a full ZTNA policy in the GUI:

1. Go to *System* > *Feature Visibility*.
2. Under *Security Features*, enable *Explicit Proxy*.
3. Click *Apply*.

4. Go to *Policy & Objects* > *Proxy Policy*.
5. Click *Create New*.
6. Enter a name for the rule.
7. Select an *Incoming Interface* and *Source*.
8. Add the security posture tags or tag groups that are allowed access. If multiple tags are included, the matching method is set to *Any* by default.
9. Select the *Destination*.
10. Select the *ZTNA Server*.
11. Select the *Action*.



12. Configure the remaining options as needed.
13. Click *OK*.

To configure a full ZTNA policy in the CLI:

```
config firewall proxy-policy
    edit 1
        set name <ZTNA policy name>
        set proxy access-proxy
        set access-proxy <access proxy>
        set srcintf <interface>
        set srcaddr "all"
        set transparent {enable | disable}
        set dstaddr "all"
        set ztna-ems-tag <security posture tag(s)>
        set ztna-ems-tag-negate {enable | disable}
        set ztna-tags-match-logic {or | and}
        set action accept
        set schedule "always"
```

```
        set logtraffic all
        set poolname <ip_pool>
        set utm-status enable
        set ssl-ssh-profile <inspection profile>
    next
end
```

The `transparent` and `poolname` settings cannot be enabled at the same time. Use one setting at a time when configuring ZTNA policies.

Optional authentication

To configure authentication to the access proxy, you must configure an authentication scheme and authentication rule in the GUI or CLI. They are used to authenticate proxy-based policies, similar to configuring authentication for explicit and transparent proxy.

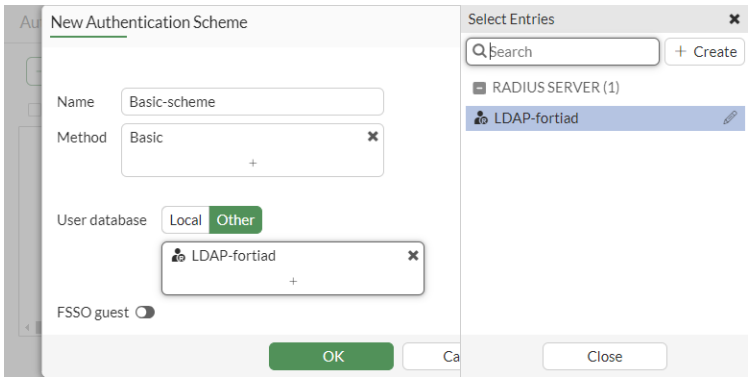
The authentication scheme defines the method of authentication that is applied. For ZTNA, basic HTTP and SAML methods are supported. Each method has additional settings to define the data source to check against. For example, with basic HTTP authentication, a user database can reference an LDAP server, RADIUS server, local database, or other supported authentication servers that the user is authenticated against.

The authentication rule defines the proxy sources and destinations that require authentication, and which authentication scheme to apply. For ZTNA, active authentication method is supported. The active authentication method references a scheme where users are actively prompted for authentication, like with basic authentication.

After the authentication rule triggers the method to authenticate the user, a successful authentication returns the groups that the user belongs to. In the ZTNA policy you can define a user or user group as the allowed source. Only users that match that user or group are allowed through the proxy policy.

To configure a basic authentication scheme in the GUI:

1. Go to *Policy & Objects* > *Authentication Rules*.
2. Go to the *Authentication Schemes* tab.
3. Click *Create New*.
4. Enter a name for the scheme.
5. Set the *Method* as *Basic*.
6. Select the *User database* as required.



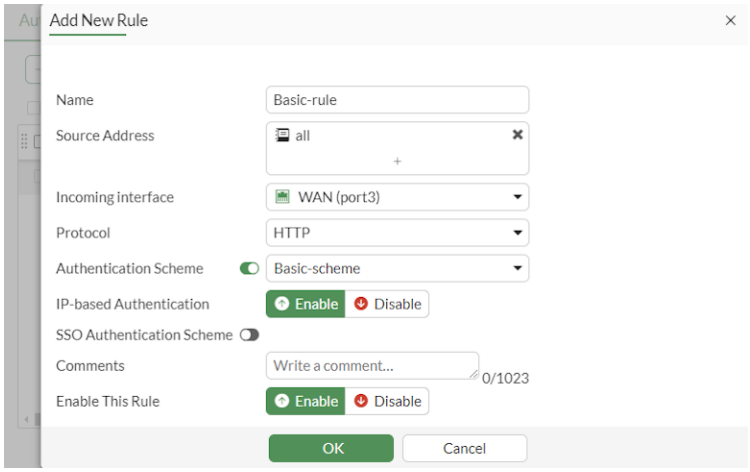
7. Click *OK*.

To configure a basic authentication scheme in the CLI:

```
config authentication scheme
    edit <name>
        set method basic
        set user-database <auth server>
    next
end
```

To configure an authentication rule in the GUI:

1. Go to *Policy & Objects* > *Authentication Rules*.
2. Click *Create New*.
3. Enter a name for the rule.
4. Select the *Source Address*.
5. Select the *Incoming interface*.
6. Select the *Authentication Scheme*.



7. Click *OK*.

To configure an authentication rule in the CLI:

```
config authentication rule
    edit <name>
        set status enable
        set protocol http
        set srcintf <interface>
        set srcaddr <address>
        set dstaddr <address>
        set ip-based enable
        set active-auth-method <active auth scheme>
    next
end
```

To apply a user group to a full ZTNA policy in the GUI:

1. Go to *Policy & Objects* > *Proxy Policy*.
2. Edit an existing rule, or click *Create New* to create a new rule.
3. Click in the *Source* field, select the *User* tab, and select the users and user groups that will be allowed access.
4. Configure the remaining settings as required.
5. Click *OK*.

To apply a user group to a full ZTNA policy in the CLI:

```
config firewall proxy-policy
    edit <policy ID>
        set name <ZTNA policy name>
        set proxy access-proxy
        set access-proxy <access proxy>
        set srcintf <interface>
        set srcaddr "all"
        set dstaddr "all"
        set ztna-ems-tag <security posture tags>
        set ztna-ems-tag-negate {enable | disable}
        set ztna-tags-match-logic {or | and}
        set action accept
        set schedule "always"
        set logtraffic all
        set groups <user group>
        set utm-status enable
        set ssl-ssh-profile <inspection profile>
    next
end
```

The authentication rule and scheme defines the method used to authenticate users. With basic HTTP authentication, a sign in prompt is shown after the client certificate prompt. After the authentication passes, the returned groups that the user is a member of are checked against the user groups that are defined in the ZTNA policy. If a group matches, then the user is allowed access after passing a posture check.

For basic setup information, see ZTNA HTTPS access proxy with basic authentication example on page 1472.

For advanced setup information, see ZTNA application gateway with SAML authentication example on page 1497 and ZTNA application gateway with SAML and MFA using FortiAuthenticator example on page 1502.

Optional HA configurations

User information and TLS sessions are synchronized between HA members for ZTNA proxy sessions. When a failover occurs, the new primary unit will continue allowing sessions from the logged in users without asking for the client certificate and re-authentication again.

There are no special configurations for HA. Refer to HA active-passive cluster setup on page 3357 and HA active-active cluster setup on page 3363 to configure your HA cluster.

HTTP access proxy vs TCP forwarding access proxy

In an HTTP access proxy connection, there is no configurations needed on the client endpoint. Users can simply access the HTTP website on a browser by entering its URL. For TCP forwarding access proxy, a ZTNA rule must be configured on the FortiClient endpoint. This rule instructs FortiClient to listen to traffic to the destination address and port, and redirects the traffic to the FortiGate access proxy over HTTPS.

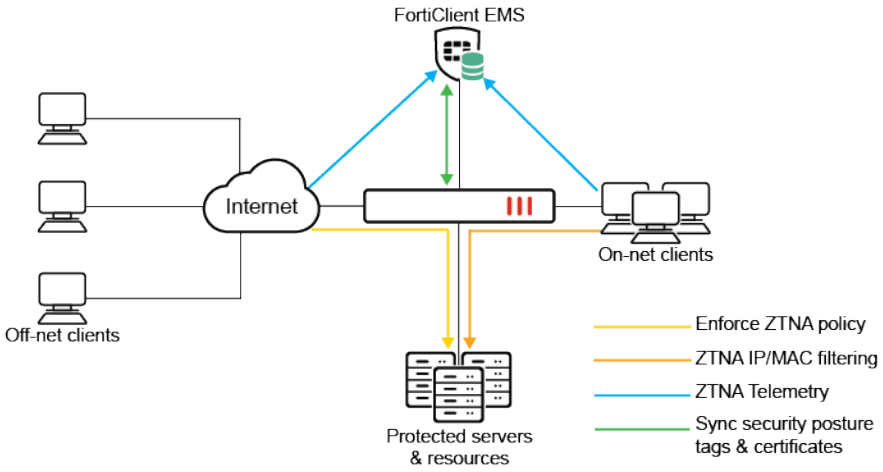
When deciding between using HTTP access proxy or TFAP for accessing web applications, consider the following.

- Use HTTP access proxy when the protected web application address can be resolved by the remote users publicly.
- Use TFAP when the protected application address can only be resolved on the internal network. TCP forwarding rules allow the FortiClient to intercept the request to the destination address and forward them to the application gateway.

For more information, see ZTNA TCP forwarding access proxy example on page 1480.

Establish device identity and trust context with FortiClient EMS

How device identity is established through client certificates, and how device trust context is established between FortiClient, FortiClient EMS, and the FortiGate, are integral to ZTNA.



Device roles

FortiClient

FortiClient endpoints provide the following information to FortiClient EMS when they register to the EMS:

- Device information (network details, operating system, model, and others)
- Logged on user information
- Security posture (On-net/Off-net, antivirus software, vulnerability status, and others)

It also requests and obtains a client device certificate from the EMS ZTNA Certificate Authority (CA) when it registers to FortiClient EMS. The client uses this certificate to identify itself to the FortiGate.

FortiClient EMS

FortiClient EMS issues and signs the client certificate with the FortiClient UID, certificate serial number, and EMS serial number. The certificate is then synchronized to the FortiGate. EMS also shares its EMS ZTNA CA certificate with the FortiGate, so that the FortiGate can use it to authenticate the clients.

FortiClient EMS uses zero trust tagging rules to tag endpoints based on the information that it has on each endpoint. The tags are also shared with the FortiGate. See Endpoint Posture Check Reference for a list of the endpoint posture checks that EMS can perform.

Each security posture tag creates two firewall addresses in all VDOMs on a FortiGate. One firewall address is the IP address, and the other firewall address is the MAC address. Because each FortiGate model has a global limit and a per-VDOM limit for the maximum number of supported firewall addresses, the FortiGate model determines the maximum number of security posture tags allowable by that unit, which is the maximum number of firewall address divided by two. For each FortiGate model's limit, see the Maximum Values table.

FortiGate

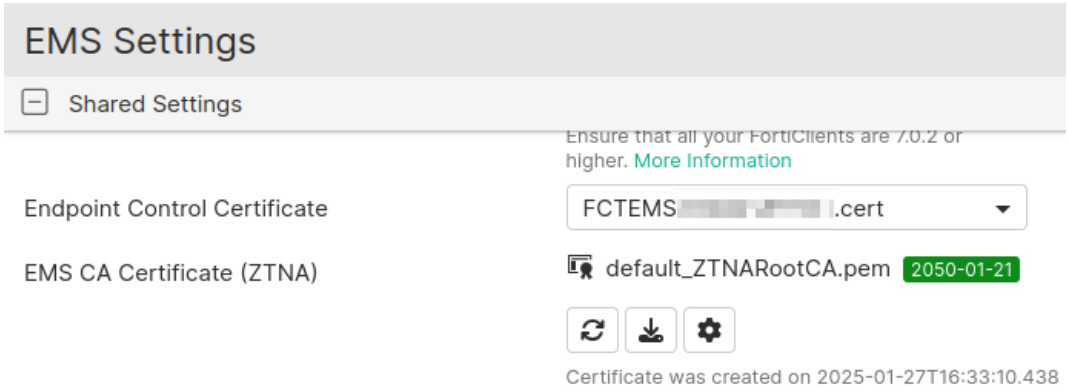
The FortiGate maintains a continuous connection to the EMS server to synchronize endpoint device information, including primarily:

- FortiClient UID
- Client certificate SN
- EMS SN
- Device credentials (user/domain)
- Network details (IP and MAC address and routing to the FortiGate)

When a device's information changes, such as when a client moves from on-net to off-net, or their security posture changes, EMS is updated with the new device information and then updates the FortiGate. The FortiGate's WAD daemon can use this information when processing ZTNA traffic. If an endpoint's security posture change causes it to no longer match the ZTNA policy criteria on an existing session, then the session is terminated.

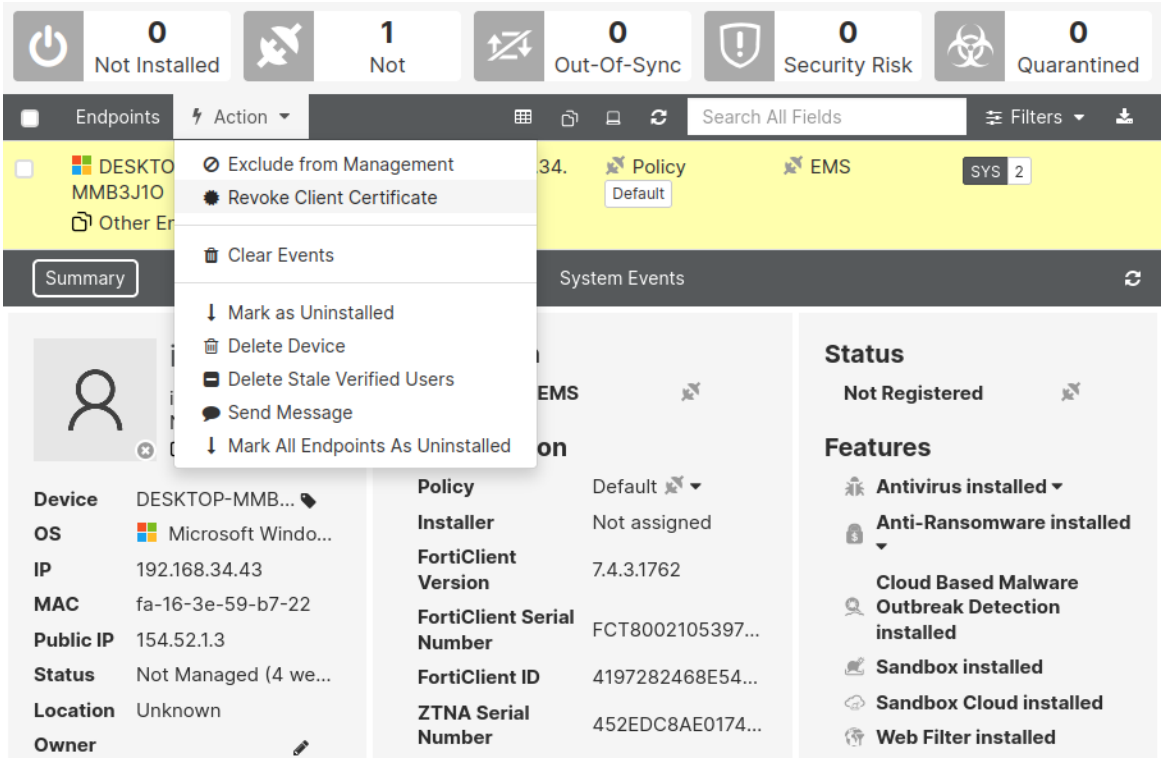
Certificate management on FortiClient EMS

FortiClient EMS has a *default_ZTNARootCA* certificate generated by default that the ZTNA CA uses to sign CSRs from the FortiClient endpoints. Clicking the refresh button revokes and updates the root CA, forcing updates to the FortiGate and FortiClient endpoints by generating new certificates for each client. Starting with FortiClient EMS 7.4.3, a custom root certificate and key can be uploaded to replace the default certificate.



Do not confuse the EMS CA certificate (ZTNA) with the SSL certificate. The latter is the server certificate that is used by EMS for HTTPS access and fabric connectivity to the EMS server.

EMS can also manage individual client certificates. To revoke the current client certificate that is used by the endpoint: go to *Endpoint > All Endpoints*, select the client, and click *Action > Revoke Client Certificate*.



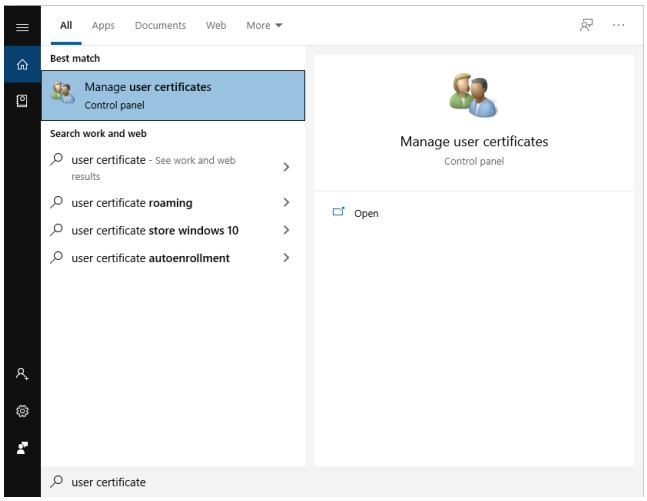
Locating and viewing the client certificate on an endpoint

In Windows, FortiClient automatically installs certificates into the certificate store. The certificate information in the store, such as certificate UID and SN, should match the information on EMS and the FortiGate.

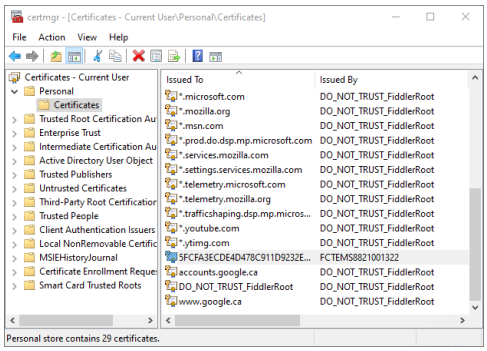
To locate certificates on other operating systems, consult the vendor documentation.

To locate the client certificate and EMS ZTNA CA certificate on a Windows PC:

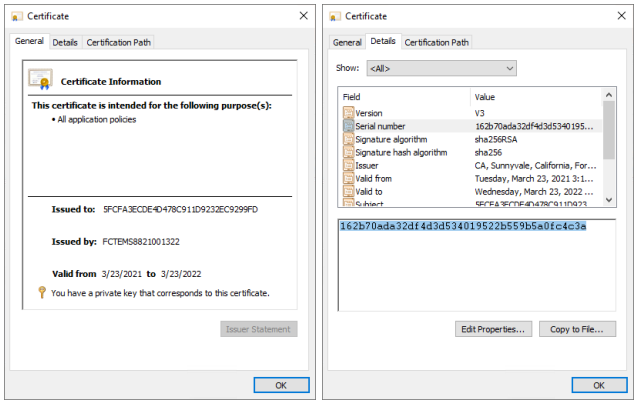
1. In the Windows search box, enter *user certificate* and click *Manage user certificates* from the results.



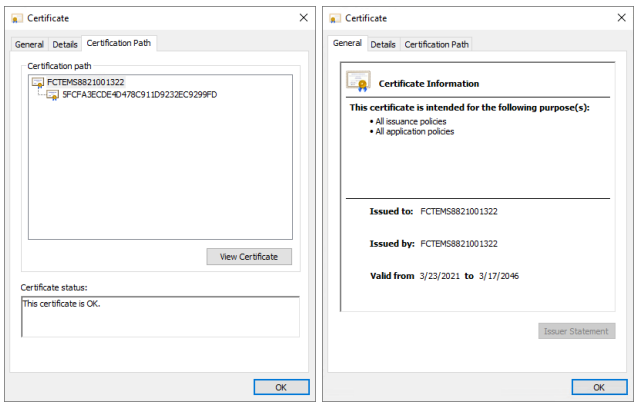
2. In the certificate manager, go to *Certificates - Current User* > *Personal* > *Certificates* and find the certificate that is issued by the FortiClient EMS.



3. Right-click on it and select Properties.
4. The *General* tab shows the client certificate UID and the issue and expiry dates. The *Details* tab show the certificate SN.



5. Go to the *Certificate Path* tab to see the full certificate chain.
6. Select the root CA and click *View Certificate* to view the details about the EMS ZTNA CA certificate.



Verifying that the client information is synchronized to the FortiGate

The following diagnose commands help to verify the presence of matching endpoint record, and information such as the client UID, client certificate SN, and EMS certificate SN on the FortiGate. If any of the information is

missing or incomplete, client certificate authentication might fail because the corresponding endpoint entry is not found. More in-depth diagnosis would be needed to determine the reason for the missing records.

Command	Description
`# diagnose endpoint ec-shm list <ip> <mac> <EMS_serial_number> <EMS_tenant_id>`	Show the endpoint record list. Optionally, add filters.
`# diagnose wad dev query-by uid <uid> <ems sn> <ems tenant id>`	Query from WAD diagnose command by UID.
`# diagnose wad dev query-by ipv4 <ip>`	Query from WAD diagnose command by IP address.
`# diagnose test application fcnacd 7` `# diagnose test application fcnacd 8`	Check the FortiClient NAC daemon ZTNA and route cache.
`#diagnose test application fcnacd 5`	Force a sync with the FortiClient EMS server.

To check the endpoint record list for IP address 10.0.3.2:

```
# diagnose endpoint ec-shm list 10.0.3.2
Record 0:
                IP Address = 10.0.3.2
                MAC Address = 02:09:0f:00:03:03
                MAC list =
                VDOM =  (-1)
                EMS serial number: FCTEMS8822001975
                EMS tenant id: 00000000000000000000000000000000
                Client cert SN: 2B8D4FF0E71FE7E064288FE1B4F87E25232092D0
                Public IP address: 34.23.223.220
                Quarantined: no
                Online status: online
                Registration status: registered
                On-net status: on-net
                Gateway Interface:
                FortiClient version: 7.2.0
                AVDB version: 1.0
                FortiClient app signature version: 23.544
                FortiClient vulnerability scan engine version: 2.34
                FortiClient UID: 9A016B5A6E914B42AD4168C066EB04CA

ZTNA scalability support for concurrent endpoints

ZTNA scalability supports up to 50 thousand concurrent endpoints. Communication between FortiOS and FortiClient EMS has efficient queries that request incremental updates. Retrieved device information can be

written to the FortiClient NAC daemon cache.

FortiOS can receive tag information from the EMS common tags API. This feature requires FortiClient EMS 7.0.3 or later.

The APIs `api/v1/report/fct/uid_tags` and `api/v1/report/fct/tags` replace the API `api/v1/report/fct/host_tags`.

To use the common tags API capability:

1. Enable the common tags API when connecting the EMS:

```
config endpoint-control fctems
    edit 1
        set status enable
        set name "local.ems"
        set server "10.6.30.213"
        set capabilities fabric-auth silent-approval websocket websocket-malware push-ca-certs
common-tags-api
    next
end
```

2. The FortiGate uses the new APIs to obtain device information from the EMS:

```
[ec_ems_context_submit_work:414] Call submitted successfully.
    obj-id: 11, desc: REST API to get updates of tag endpoints., entry:
api/v1/report/fct/tags.
[ec_ems_context_submit_work:414] Call submitted successfully.
    obj-id: 12, desc: REST API to get updates of tags associated with FCT UID., entry:
api/v1/report/fct/uid_tags.
[ec_ez_worker_process:334] Processing call for obj-id: 11, entry: "api/v1/report/fct/tags"
[dynamic_addr_ha_act:215] called (EMS SN N/A).
[dynamic_addr_ha_act:215] called (EMS SN N/A).
[ec_ez_worker_process:441] Call completed successfully.
    obj-id: 11, desc: "REST API to get updates of tag endpoints.", entry:
"api/v1/report/fct/tags".
[ec_ez_worker_process:334] Processing call for obj-id: 12, entry: "api/v1/report/fct/uid_tags"
[ec_record_sync_tags_info_store:1419] Received 1 tags for 3D86DF70B85E16CBAD67908A897B4494
with sn FCTEMS8888888888
[ec_record_sync_tags_info_store:1419] Received 1 tags for DA12930442F13F84D2441F03FCB6A10E
with sn FCTEMS8888888888
[ec_record_sync_tags_info_store:1419] Received 1 tags for 25C59C275F257F4C5FBC7F6F5F56788E
with sn FCTEMS8888888888
[ec_ez_worker_process:441] Call completed successfully.
    obj-id: 12, desc: "REST API to get updates of tags associated with FCT UID.", entry:
"api/v1/report/fct/uid_tags".
[ec_ems_context_submit_work:414] Call submitted successfully.
    obj-id: 7, desc: REST API to get updates about system info., entry:
api/v1/report/fct/sysinfo.
[ec_ems_context_submit_work:414] Call submitted successfully.
    obj-id: 11, desc: REST API to get updates of tag endpoints., entry:
api/v1/report/fct/tags.
[ec_ez_worker_process:334] Processing call for obj-id: 11, entry: "api/v1/report/fct/tags"
```

```
[ec_ez_worker_process:441] Call completed successfully.
    obj-id: 11, desc: "REST API to get updates of tag endpoints.", entry:
"api/v1/report/fct/tags".
(......)
```

3. Confirm that the device information from the EMS is written to the FortiClient NAC daemon cache:

```
# diagnose endpoint ec-shm list
    ...
          Avatar source: OS
            Phone number:
            Number of Routes: (1)
                    Gateway Route #0:
                            - IP:10.1.91.6, MAC: 4f:8d:c2:73:dd:fe, Indirect: no
                            - Interface:port2, VFID:1, SN: FG5H1E5999999999
online records: 37174; offline records: 0; quarantined records: 0; out-of-sync records: 0
```

4. Use the tags that are pulled from the EMS in a firewall address:

```
config firewall address
    edit "FCTEMS8888888888_ZT_AD_MGMT"
        set type dynamic
        set sub-type ems-tag
        set obj-tag "ZT_AD_MGMT"
        set tag-type "zero_trust"
    next
end
```

5. Check the tags' resolved IP and MAC addresses:

```
# diagnose firewall fqdn getinfo-ip FCTEMS8888888888_ZT_AD_MGMT
getinfo FCTEMS8888888888_ZT_AD_MGMT id:114 generation:106 count:187 data_len:6160 flag 0
```

```
# diagnose firewall fqdn getinfo-mac MAC_FCTEMS8888888888_ZT_AD_MGMT
getinfo MAC_FCTEMS8888888888_ZT_AD_MGMT id:163 generation:105 count:371 data_len:2226 flag 0
```

```
# diagnose firewall dynamic address  FCTEMS8888888888_ZT_AD_MGMT
CMDB name: FCTEMS8888888888_ZT_AD_MGMT
TAG name: ZT_AD_MGMT
FCTEMS8888888888_ZT_AD_MGMT: ID(114)
        ADDR(10.1.10.4)
(......)
        ADDR(10.1.99.195)
Total IP dynamic range blocks: 190.
Total IP dynamic addresses: 281.
```

```
# diagnose firewall dynamic address MAC_FCTEMS8888888888_ZT_AD_MGMT
CMDB name: MAC_FCTEMS8888888888_ZT_AD_MGMT
TAG name: ZT_AD_MGMT
MAC_FCTEMS8888888888_ZT_AD_MGMT: ID(163)
        MAC(52:f1:9d:06:1c:db)
        MAC(4b:77:2b:db:82:15)
```

```
        MAC(df:6e:9e:d9:04:1e)
Total MAC dynamic addresses: 393.
```

SSL certificate based authentication

A client certificate is obtained when an endpoint registers to EMS. FortiClient automatically submits a CSR request and the FortiClient EMS signs and returns the client certificate. This certificate is stored in the operating system's certificate store for subsequent connections. The endpoint information is synchronized between the FortiGate and FortiClient EMS. When an endpoint disconnects or is unregistered from EMS, its certificate is removed from the certificate store and revoked on EMS. The endpoint obtains a certificate again when it reconnects to EMS.

By default, client certificate authentication is enabled on the access proxy, so when the HTTPS request is received the FortiGate's WAD process challenges the client to identify itself with its certificate. The FortiGate makes a decision based on the following possibilities:

1. If the client responds with the correct certificate that the client UID and certificate SN can be extracted from:
   - If the client UID and certificate SN match the record on the FortiGate, the client is allowed to continue with the ZTNA proxy rule processing.
   - If the client UID and certificate SN do not match the record on the FortiGate, the client is blocked from further ZTNA proxy rule processing.
2. If the client cancels and responds with an empty client certificate:
   - If `empty-cert-action` is set to `accept`, the client is allowed to continue with ZTNA proxy rule processing.
   - If `empty-cert-action` is set to `block`, the client is blocked from further ZTNA proxy rule processing.

To configure the client certificate actions:

```
config firewall access-proxy
    edit <name>
        set client-cert {enable | disable}
        set empty-cert-action {accept | block | accept-unmanageable}
        set client-cert {enable | disable}
    next
end
```

To override these settings on a virtual host:

```
config firewall access-proy-virtual-host
    edit <host>
        set empty-cert-action {accept | block | accept-unmanageable}
        set client-cert {enable | disable}
    next
end
```

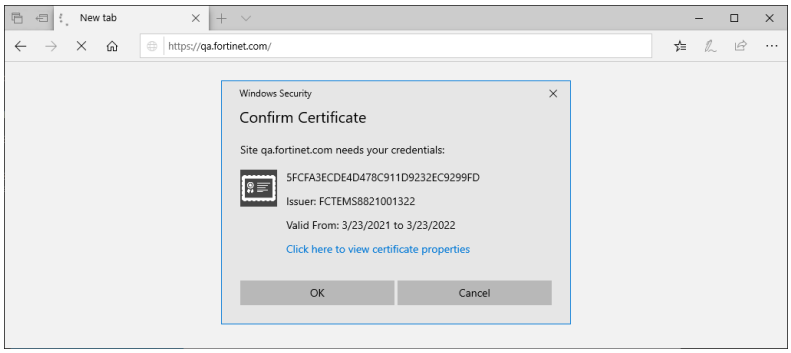
Example

In this example, a client connects to *qa.fortinet.com* and is prompted for a client certificate.

- `client-cert` is set to `enable`, and `empty-cert-action` is set to `block`.
- The ZTNA server is configured, and a ZTNA policy is set to allow this client.
- The domain resolves to the FortiGate access proxy VIP.

Scenario 1:

When prompted for the client certificate, the client clicks *OK* and provides a valid certificate that is verified by the FortiGate.

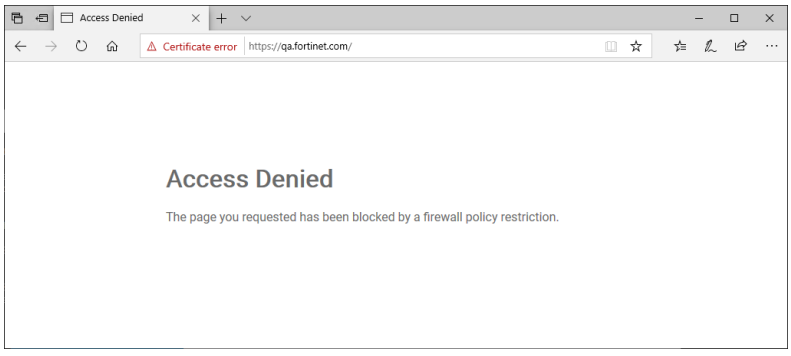


Result:

The client passes SSL certificate authentication and is allowed to access the website.

Scenario 2:

When prompted for the client certificate, the client clicks *Cancel*, resulting in an empty certificate response to the access proxy.



Result:

Because the certificate response is empty and `empty-cert-action` is set to `block`, the WAD daemon blocks the connection.

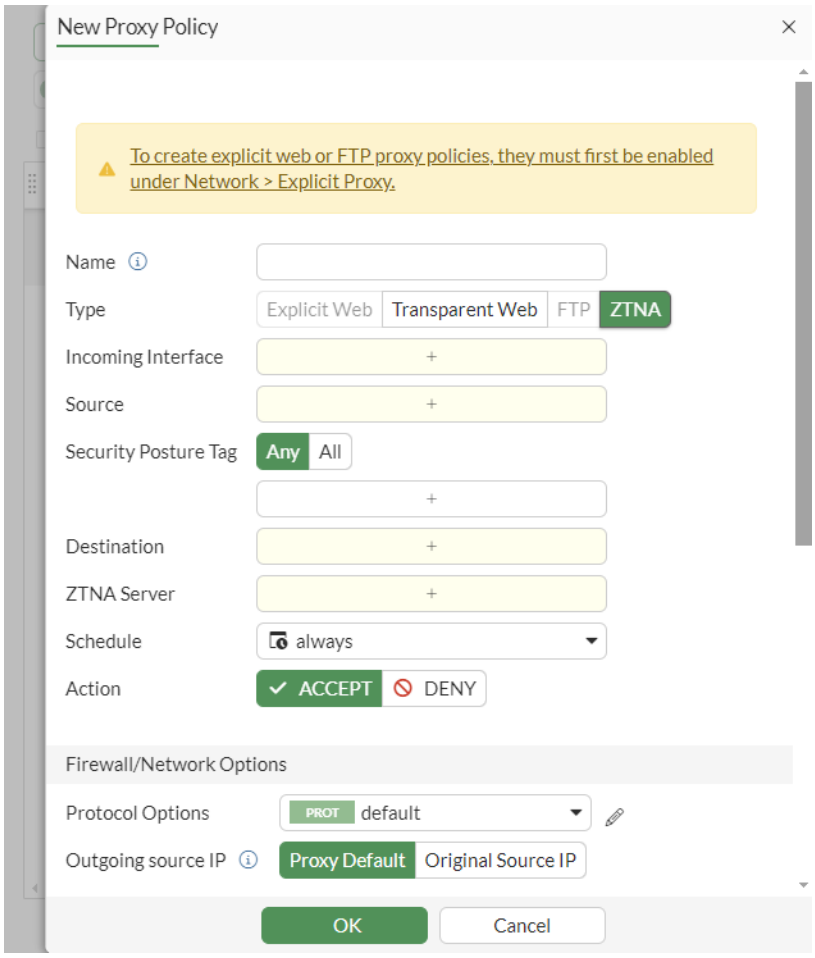
Currently, the Microsoft Edge, Google Chrome, and Safari browsers are supported by ZTNA.

Full versus simple ZTNA policies

There are two ways to configure ZTNA rules in the GUI by using a full or simple ZTNA policy.

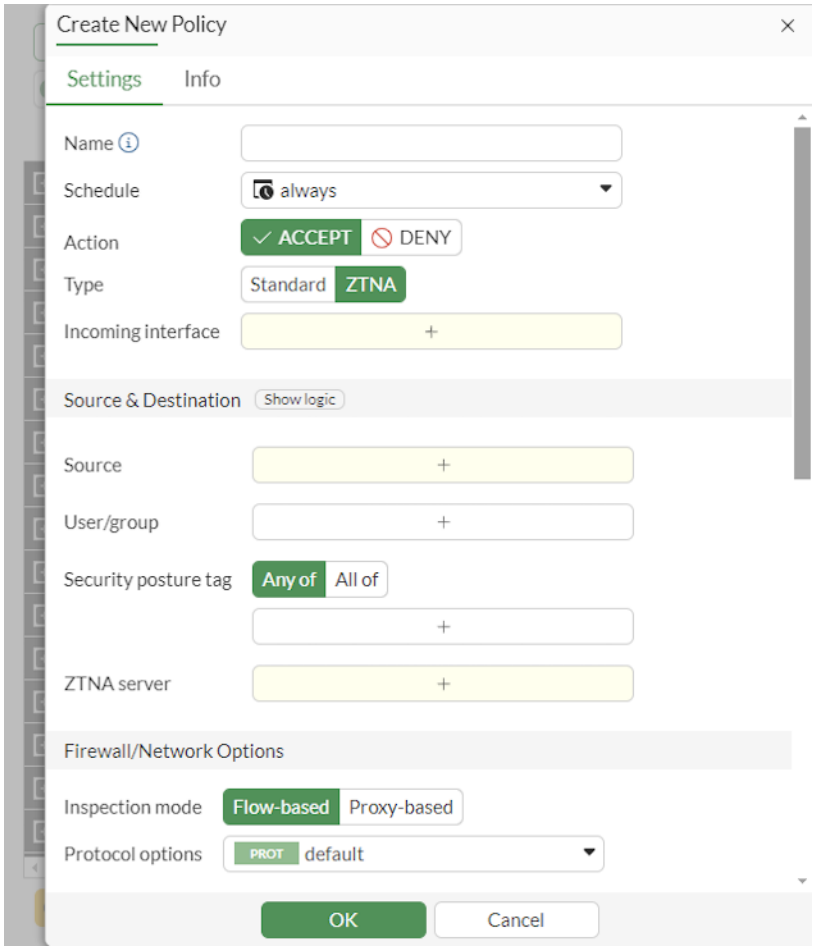
Full ZTNA policy

In a full ZTNA policy, the CLI configuration remains the same as previous versions. Administrators can configure ZTNA policies from the *Policy & Objects* > *Proxy Policy* page, and by setting the *Type* to *ZTNA*.



Simple ZTNA policy

In a simple ZTNA policy, a regular firewall policy is used for policy management. When creating a new firewall policy, administrators can configure a ZTNA policy by setting the *Type* to *ZTNA*.



A simple ZTNA policy cannot control access based on the destination interface or the real server's destination address. See the Examples on page 1428 section for detailed configurations.

Authentication for ZTNA policies

Authentication remains largely the same between both ZTNA policy configuration modes. You can specify user groups under *Source* to define the groups in which the access control applies to. However, the underlying authentication schemes and rules must still be in place to direct the traffic to the ZTNA application gateway.

Authentication for regular firewall policies

Authentication for regular firewall policies is traditionally handled by authd, which does not require an authentication scheme and rules to be configured in order to function. This enhancement allows authentication for regular firewall policies to be handled by WAD so that the authentication scheme and rules are used to determine the type of authentication and the traffic that requires authentication. This option is disabled by default, but can be enabled as follows:

```
config firewall auth-portal
    set proxy-auth {enable | disable}
end
```

Redirecting a simple ZTNA policy to a full ZTNA policy

An option is added so that after matching a simple ZTNA policy, the traffic can be redirected for a full ZTNA policy match. This setting can only be configured from the CLI, and it is disabled by default.

```
config firewall policy
    edit <id>
        set ztna-policy-redirect {enable | disable}
    next
end
```

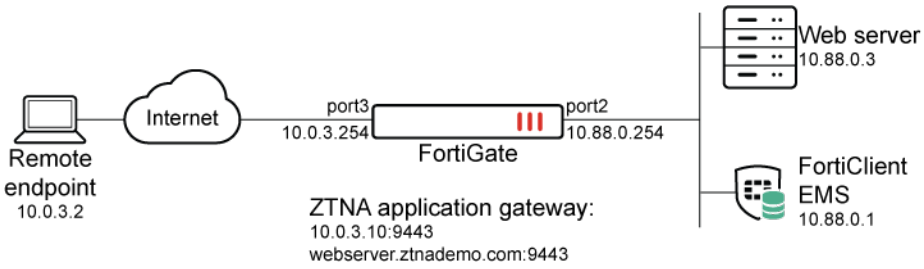
For example, a client has both tag A and tag B. In the simple ZTNA policy, the client matches a policy that requires tag A for a posture check. If they are using the `ztna-policy-redirect` option, then it will also require a full ZTNA policy match.

If a full ZTNA policy allows either tag A or tag B or all traffic in general, then the traffic is allowed. Otherwise, if a full ZTNA policy explicitly denies one of the tags, the traffic will be denied.

If no full ZTNA policy is matched, then the traffic is implicitly denied.

Examples

The following examples demonstrate how to configure a ZTNA policy using the full and simple ZTNA policy modes.



It is assumed that the following settings are already configured:

- EMS connection and EMS tags (Malicious-File-Detected and FortiAD.Info)
- ZTNA server configuration (ZTNA-webserver)

- Authentication scheme and rule

Configuring a full ZTNA policy

To configure a full ZTNA policy in the GUI:

1. Go to *Policy & Objects* > *Proxy Policy* and click *Create New*.
2. Configure the following settings:

Name	*ZTNA-webserver*
Type	*ZTNA*
Incoming Interface	*port3*
Source	*all*
Destination	*Webserver1* (10.88.0.3/32)
ZTNA Server	*ZTNA-webserver*
Schedule	*always*
Action	*ACCEPT*

3. Click *OK*.

To configure a full ZTNA policy in the CLI:

```
config firewall proxy-policy
    edit 1
        set name "ZTNA-webserver"
        set proxy access-proxy
        set access-proxy "ZTNA-webserver"
        set srcintf "port3"
        set srcaddr "all"
        set dstaddr "Webserver1"
        set action accept
        set schedule "always"
    next
end
```

When traffic is allowed, the ZTNA logs show traffic passing through policy 1 on a policy called `ZTNA-webserver`, which is a proxy policy.

To verify the traffic logs:

```
# execute log filter category traffic
# execute log filter field subtype ztna
# execute log display
9 logs found.
9 logs returned.
1: date=2023-03-06 time=20:16:11 eventtime=1678162572109525759 tz="-0800" logid="0005000024"
```

```
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=28597
srcintf="port3" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved" dstip=10.88.0.3
dstport=9443 dstintf="port2" dstintfrole="dmz" sessionid=20140 srcuuid="b458a65a-f759-51ea-d7df-
ef2e750026d1" service="tcp/9443" proxyapptype="http" proto=6 action="accept" policyid=1
policytype="proxy-policy" poluuid="1c0a04b8-bc85-51ed-48ba-7d43279fb899" policyname="ZTNA-
webserver" duration=3604 gatewayid=1 vip="ZTNA-webserver" accessproxy="ZTNA-webserver"
clientdevicemanageable="manageable" wanin=303150 rcvdbyte=303150 wanout=3755 lanin=2813
sentbyte=2813 lanout=304697 appcat="unscanned"
```

Configuring a simple ZTNA policy

To configure a simple ZTNA policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following settings:

Name	*ZTNA-webserver-fp*
Schedule	*always*
Action	*ACCEPT*
Type	*ZTNA*
Incoming Interface	*port3*
Source	*all*
ZTNA server	*ZTNA-webserver*

3. Click *OK*.

To configure a simple ZTNA policy in the CLI:

```
config firewall policy
    edit 9
        set name "ZTNA-webserver-fp"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "ZTNA-webserver"
        set schedule "always"
        set service "ALL"
    next
end
```

When traffic is allowed, the ZTNA logs show traffic passing through policy 9 on a policy called `ZTNA-webserver-fp`, which is a firewall policy.

To verify the traffic logs:

```
# execute log filter category traffic
# execute log filter field subtype ztna
# execute log display
14 logs found.
10 logs returned.

1: date=2023-03-06 time=23:01:55 eventtime=1678172515724776640 tz="-0800" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=31687
srcintf="port3" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved" dstip=10.88.0.3
dstport=9443 dstintf="port2" dstintfrole="dmz" sessionid=28076 srcuuid="b458a65a-f759-51ea-d7df-
ef2e750026d1" service="tcp/9443" proxyapptype="http" proto=6 action="accept" policyid=9
policytype="proxy-policy" poluuid="1f1d5036-bcaa-51ed-1d28-687edafe9439" policyname="ZTNA-
webserver-fp" duration=75 gatewayid=1 vip="ZTNA-webserver" accessproxy="ZTNA-webserver"
clientdevicemanageable="manageable" wanin=3445 rcvdbyte=3445 wanout=1189 lanin=2358 sentbyte=2358
lanout=4759 appcat="unscanned"
```

Configuring a ZTNA simple policy with security posture tags and authentication

In this example, a simple ZTNA policy uses the FortiAD.Info tag for a posture check and authentication against a pre-configured Active Directory server where the user tsmith resides. The authentication scheme and rule have already been configured as follows:

```
config authentication scheme
    edit "ZTNA-Auth-scheme"
        set method basic
        set user-database "LDAP-fortiad"
    next
end
```

```
config authentication rule
    edit "ZTNA-Auth-rule"
        set srcintf "port3"
        set srcaddr "all"
        set active-auth-method "ZTNA-Auth-scheme"
    next
end
```

To append security posture tag and authentication settings to the simple ZTNA policy:

1. Go to *Policy & Objects* > *Firewall Policy* and edit the *ZTNA-webserver-fp* policy.
2. For the *Source* field, click the *+* and add the user group named *LDAP-Remote-Allowed-Group*.
3. For the *Security Posture Tag* field, click the *+* and add the *FortiAD.Info tag*.
4. Click *OK*.

To verify the configuration:

1. Connect to the web server from a client.
2. After selecting the client certificate, the browser will prompt for a username and password. Enter the username (tsmith) and their password.

   Upon a successful authentication, the user can access the web server.
3. On the FortiGate, verify that the logs for the allowed traffic show the user tsmith and the tag EMS1_ZTNA_FortiAD.Info:

```
# execute log filter field subtype ztna
# execute log display
18 logs found.
10 logs returned.
1: date=2023-03-06 time=23:25:23 eventtime=1678173923745891128 tz="-0800" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=32017
srcintf="port3" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved" dstip=10.88.0.3
dstport=9443 dstintf="port2" dstintfrole="dmz" sessionid=29615 srcuuid="b458a65a-f759-51ea-
d7df-ef2e750026d1" service="tcp/9443" proxyapptype="http" proto=6 action="accept" policyid=9
policytype="proxy-policy" poluuid="1f1d5036-bcaa-51ed-1d28-687edafe9439" policyname="ZTNA-
webserver-fp" duration=106 user="tsmith" group="LDAP-Remote-Allowed-Group" authserver="LDAP-
fortiad" gatewayid=1 vip="ZTNA-webserver" accessproxy="ZTNA-webserver"
clientdeviceid="9A016B5A6E914B42AD4168C066EB04CA" clientdevicemanageable="manageable"
clientdevicetags="MAC_EMS1_ZTNA_all_registered_clients/EMS1_ZTNA_all_registered_clients/MAC_
EMS1_ZTNA_FortiAD.Info/EMS1_ZTNA_FortiAD.Info" emsconnection="online" wanin=301793
rcvdbyte=301793 wanout=3331 lanin=2877 sentbyte=2877 lanout=333000
fctuid="9A016B5A6E914B42AD4168C066EB04CA" appcat="unscanned"
```

Types of security posture tags

Security posture tags are tags retrieved from FortiClient EMS once a FortiGate is connected to an EMS through the security fabric connector. FortiGate can retrieve different categories of tags from EMS:

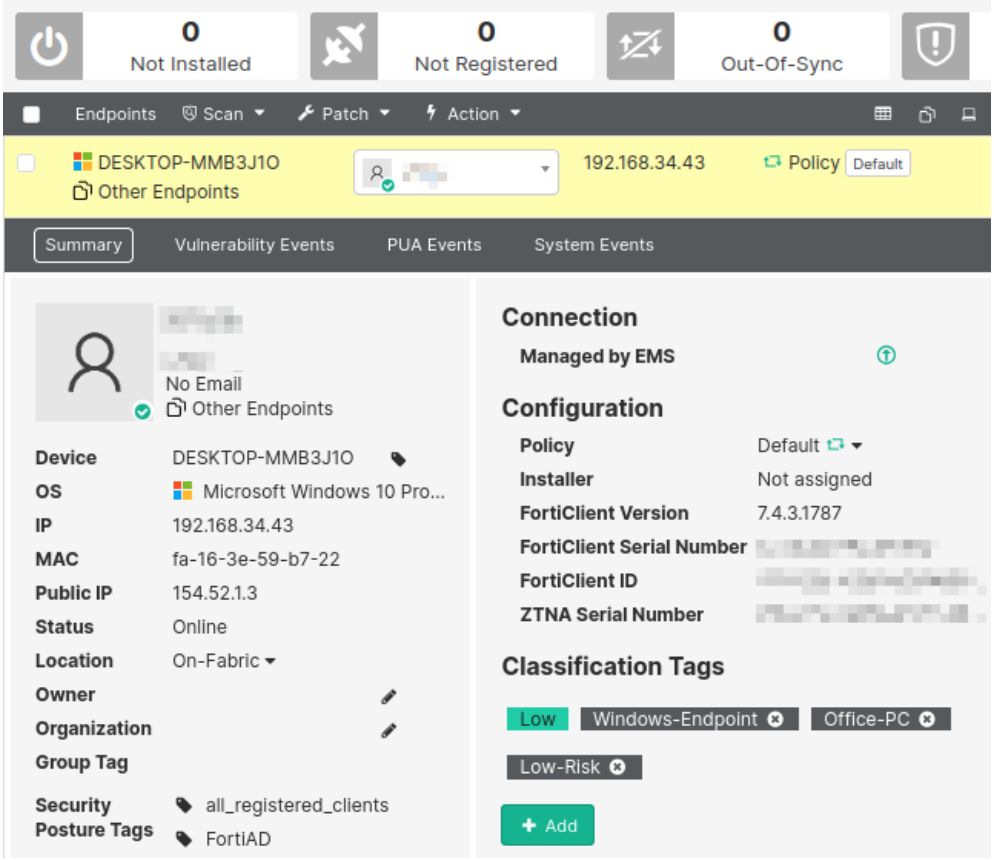
Category	Description
Security posture tags (Zero trust tags in earlier EMS versions)	Generated from tagging rules configured on FortiClient EMS. Tags are based on various posture checks that can be applied to the endpoints. Tags are synchronized from EMS to FortiGate by default.
Classification tags	Custom tags manually assigned by the EMS administrator to endpoints.
FortiGuard outbreak alert tags	Outbreak alerts inform EMS about vulnerabilities on an application or endpoint that is part of a recent outbreak. See FortiGuard Outbreak Alerts.
Fabric tags	Fabric tags are retrieved from FortiAnalyzer to EMS when endpoint logs trigger indicators of compromise (IOC) on a specific endpoint.

For more information about each type of tag on FortiClient EMS, see Fabric Devices.

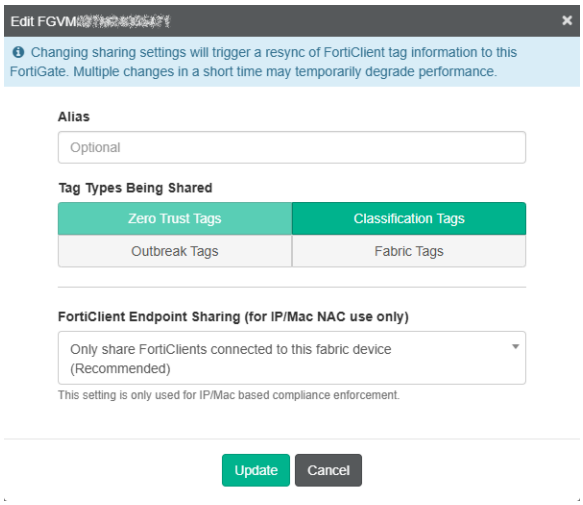
By default, only security posture tags/zero trust tags are synchronized from EMS to FortiGate. On EMS, you can enable other tags to be synchronized.

To synchronize classification tags from EMS:

1. From FortiClient EMS, go to *Endpoints* > *All Endpoints*.
2. Select an endpoint to view its summary.
3. Under *Classification Tags*, click *Add* to add a new custom tag.

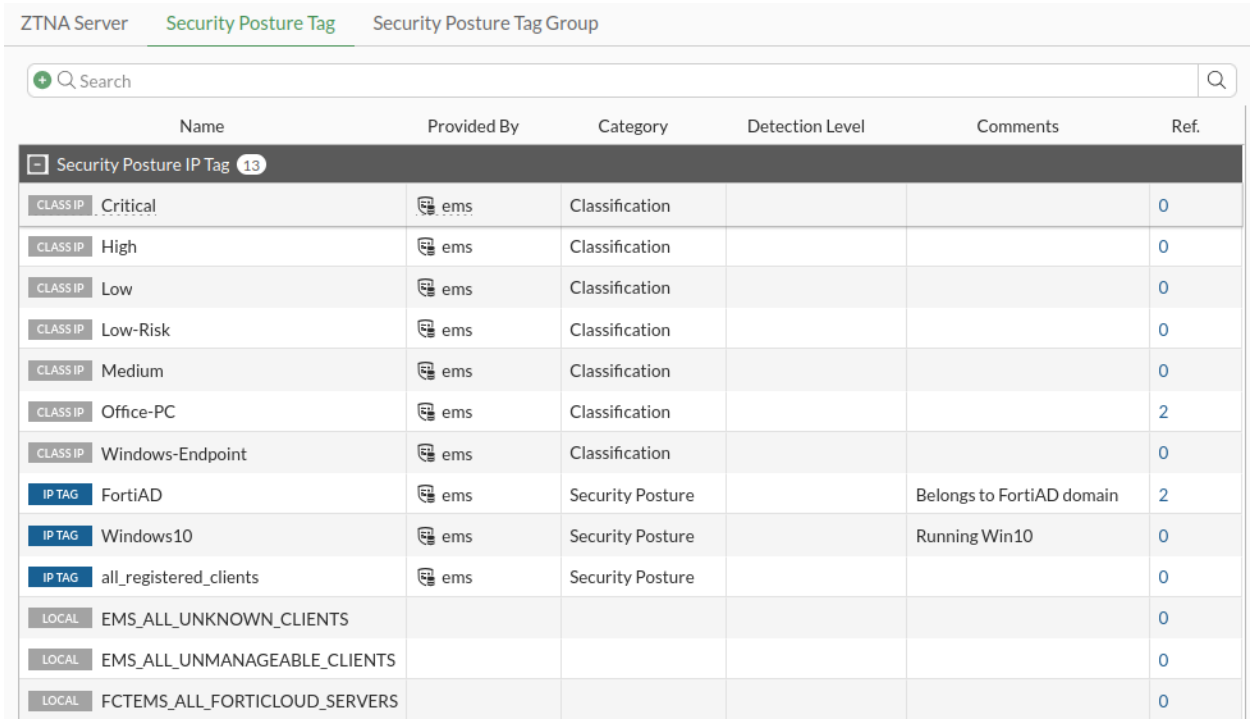


4. From *Fabric & Connectors* > *Fabric Devices*, find the FortiGate that requires the use of these tags.
5. Click *Edit* to update its synchronization settings.
6. Under *Tag Types Being Shared*, select all types that apply. In this example, *Classification Tags* is selected in addition to the default *Zero Trust Tags*.



7. Click *Update* to save.
8. On the FortiGate, go to *Policy & Objects* > *ZTNA*. Switch to the *Security Posture Tags* tab.

   Aside from the Security Posture type tags generated from tagging rules, Classification type tags are also retrieved.



Name	Provided By	Category	Detection Level	Comments	Ref.
Security Posture IP Tag 13					
CLASS IP Critical	ems	Classification			0
CLASS IP High	ems	Classification			0

IP TAG all_registered_clients	ems	Security Posture			0
LOCAL EMS_ALL_UNKNOWN_CLIENTS					0
LOCAL EMS_ALL_UNMANAGEABLE_CLIENTS					0
LOCAL FCTEMS_ALL_FORTICLOUD_SERVERS					0

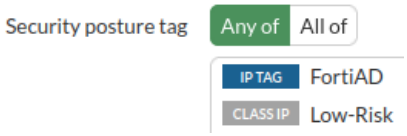
Using any versus all tags inside a ZTNA policy

When configuring the ZTNA policy to control access, the *Security posture tags* option can be set to *Any* or *All*:

- When set to *Any*, an endpoint must satisfy only one of the defined security posture tags to pass this check.
- When set to *All*, an endpoint must satisfy all of the defined security posture tags to pass this check.

Example 1: Using the Any of tag

1. A simple ZTNA policy is configured where the *Security posture tag* is set to *Any of*, with the tags *FortiAD* and *Low-Risk*.

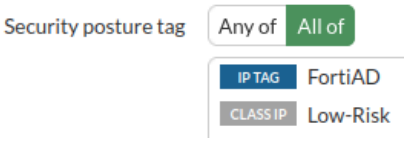


2. An endpoint with only the FortiAD tag connects.
3. The endpoint can connect to the server.
4. From the CLI, ZTNA logs indicate that the traffic was allowed.

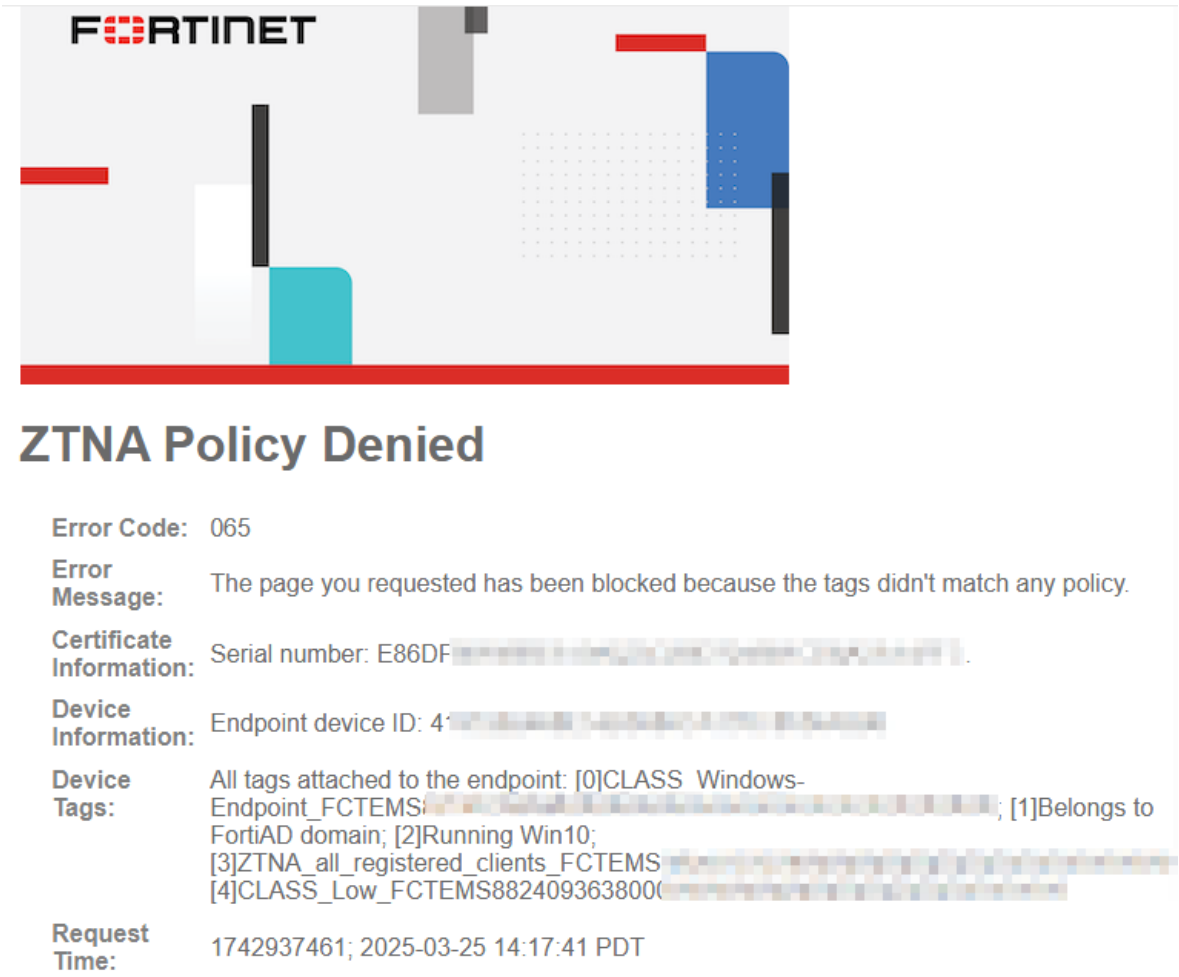
```
# execute log filter field subtype ztna
# execute log display
…
2: date=2025-01-07 time=10:57:00 eventtime=1736276220378088305 tz="-0800" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=17322
srcintf="port3" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved" dstip=10.0.3.10
dstport=9043 dstintf="root" dstintfrole="undefined" sessionid=8876 srcuuid="b458a65a-f759-
51ea-d7df-ef2e750026d1" service="tcp/9043" proxyapptype="http" proto=6 action="accept"
policyid=17 policytype="policy" poluuid="8065fc36-cd28-51ef-cd5a-84f5ae253c13"
policyname="ZTNA-webserver-allow" appcat="unscanned" duration=0 vip="ZTNA-webserver"
accessproxy="ZTNA-webserver" clientdevicemanageable="unknown" clientcert="no" wanin=0
rcvdbyte=0 wanout=0 lanin=1764 sentbyte=1764 lanout=3049
```

Example 2: Using the All of tag

1. A simple ZTNA policy is configured where the *Security posture tag* is set to *All of*, with the tags *FortiAD* and *Low-Risk*.



2. An endpoint with the following tags connects:
   - Low (this is a different tag than Low-Risk, the tag configured in the policy)
   - Windows-Endpoint
   - FortiAD
   - Windows10
   - all_registered_clients
3. It is unable to connect to the server, and a denied message appears.



4. From the CLI, ZTNA logs indicate that the implicit policy denied traffic. Tags are logged under `clientdevicetags`, and it indicates the tags registered to the endpoint. *Low-Risk* is not associated with this endpoint.

```
# execute log filter field subtype ztna
# execute log display
5 logs found.
5 logs returned.

7: date=2025-03-25 time=14:17:42 eventtime=1742937461544682088 tz="-0700" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=192.168.34.43 srcport=56662

ZTNA advanced configurations

This section includes the following ZTNA advanced configurations:

- Access control of unmanageable and unknown devices on page 1437
- HTTP2 connection coalescing and concurrent multiplexing for ZTNA on page 1443
- Fabric integration with FortiGSLB on page 1446
- ZTNA agentless web-based application access on page 1450

Access control of unmanageable and unknown devices

The ZTNA application gateway can determine whether a client device that does not have FortiClient installed is a mobile device that is considered unmanageable, or is not a mobile device that is considered unknown. The ZTNA application gateway tags the device as either `EMS_ALL_UNMANAGEABLE_CLIENTS` or `EMS_ALL_UNKNOWN_CLIENTS` respectively. The FortiGate WAD process achieves this by either matching device TLS fingerprints against a library or learning information from the HTTP User-Agent header if the `set user-agent-detect` setting is enabled.

Configuring the ZTNA access proxy and proxy policy

The `EMS_ALL_UNMANAGEABLE_CLIENTS` and `EMS_ALL_UNKNOWN_CLIENTS` tags allow for ZTNA access control of unmanageable and unknown devices using a proxy policy. The `accept-unmanageable` option for the `empty-cert-action` setting allows unmanageable clients to continue ZTNA proxy rule processing.

```
config firewall vip
    edit <name>
        set type access-proxy
        set client-cert enable
        set user-agent-detect {enable | disable}
        set empty-cert-action {accept | block | accept-unmanageable}
    next
end
```

`type access-proxy`	Configure an access proxy.
`client-cert enable`	Enable requesting client certificate.
`user-agent-detect {enable | disable}`	Enable/disable detecting the device type by HTTP User-Agent if no client certificate is provided (default = enable).
`empty-cert-action {accept | block | accept-unmanageable}`	Set the action for an empty client certificate: • `accept`: accept the SSL handshake if the client certificate is empty. • `block`: block the SSL handshake if the client certificate is empty. • `accept-unmanageable`: accept the SSL handshake only if the end point is unmanageable.

The `user-agent-detect` and `empty-cert-action` settings can only be configured in the CLI.

```
config firewall proxy-policy
    edit <id>
        set ztna-ems-tag {EMS_ALL_UNMANAGEABLE_CLIENTS | EMS_ALL_UNKNOWN_CLIENTS}
    next
end
```

`ztna-ems-tag {EMS_ALL_UNMANAGEABLE_CLIENTS | EMS_ALL_UNKNOWN_CLIENTS}`	Set the EMS tag names: • `EMS_ALL_UNMANAGEABLE_CLIENTS`: match any device that is unmanageable. • `EMS_ALL_UNKNOWN_CLIENTS`: match any device that is not recognized.

Consider the following use cases.

- Case 1: if a client device sends a TLS client hello in a mobile pattern, then WAD will try to match its TLS fingerprint with a WAD original library and mark it with an `EMS_ALL_UNMANAGEABLE_CLIENTS` tag.
- Case 2: if WAD cannot match the TLS fingerprint with an original library but `user-agent-detect` is enabled (under `config firewall access-proxy`), WAD will try to learn the device type from client request's User-Agent header. If it matches a mobile device, then it is still marked with an `EMS_ALL_UNMANAGEABLE_CLIENTS` tag.
- Case 3: if WAD cannot match the TLS fingerprint with an existing original or temporary library, or cannot learn it from User-Agent header, or `user-agent-detect` is disabled, then it will mark the device as `EMS_ALL_UNKNOWN_CLIENTS`.

In the access proxy settings, if `empty-cert-action` is set to `accept-unmanageable`, then only case 1 and 2 would go through the proxy policy. Case 3 would be denied, and a replacement message page would appear.

To configure ZTNA policy access control of unmanageable devices:

1. Configure the client certificate actions:

```
config firewall access-proxy
    edit "zt1"
        set vip "zt1"
        set client-cert enable
        set user-agent-detect enable
        set auth-portal disable
        set empty-cert-action accept
        set log-blocked-traffic disable
        set add-vhost-domain-to-dnsdb disable
        set decrypted-traffic-mirror ''
    next
end
```

2. Configure the proxy policy with the ZTNA EMS tag to control device access:

```
config firewall proxy-policy
    edit 1
        set proxy access-proxy
        set access-proxy "zt1"
        set srcintf "port2" "ag2"
        set srcaddr "all"
```

```
        set dstaddr "all"
        set ztna-ems-tag "EMS_ALL_UNMANAGEABLE_CLIENTS"
    next
end
```

Configuring dynamic address local tags

Like other security posture tags,`EMS_ALL_UNMANAGEABLE_CLIENTS` and `EMS_ALL_UNKNOWN_CLIENTS` are dynamic addresses on the FortiGate. The following diagnostic commands can be used to view local tag information:

- `diagnose firewall dynamic address`: a list of unmanageable and unknown clients' IP addresses associated with the `EMS_ALL_MANAGEABLE_CLIENTS` and `EMS_ALL_UNKNOWN_CLIENTS` dynamic addresses, respectively, is displayed.
- `diagnose user-device-store device memory list`: when device detection is enabled on a FortiGate interface that has a layer 2 connection to unmanageable and unknown device clients, then a client's device information is displayed.

To verify the list of dynamic firewall addresses in the CLI:

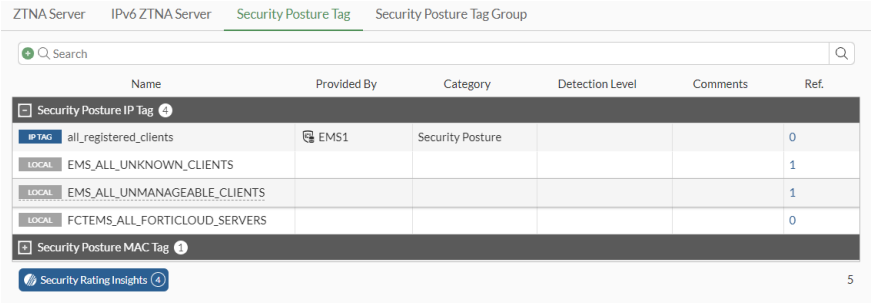
```
(vdom1) # diagnose firewall dynamic address
List all dynamic addresses:
IP dynamic addresses in VDOM vdom1(vfid: 1):
...
CMDB name: EMS_ALL_UNMANAGEABLE_CLIENTS
EMS_ALL_UNMANAGEABLE_CLIENTS: ID(101)
        ADDR(10.1.100.22)
Total IP dynamic range blocks: 1.
Total IP dynamic addresses: 1.
CMDB name: EMS_ALL_UNKNOWN_CLIENTS
EMS_ALL_UNKNOWN_CLIENTS: ID(154)
Total IP dynamic range blocks: 0.
Total IP dynamic addresses: 0.
...
```

To verify the client device information in the CLI:

```
(vdom1) # diagnose user-device-store device memory list
Record #1:
         ...
        device_info
                ...
                'is_online' = 'true'
                'is_ems_registered' = 'false'
                'active_start_time' = '1668811449'
                'is_fortiguard_src' = 'false'
                'tags' = 'EMS_ALL_UNMANAGEABLE_CLIENTS'
                ...
        interface_info
        ...
```

To view the local tag information in the GUI:

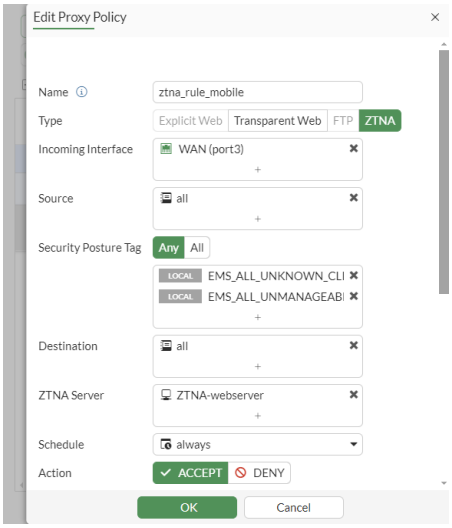
1. Go to *Policy & Objects* > *ZTNA* and select the *Security Posture Tag* tab.



2. Hover over a tag to view the tooltip, which displays matched endpoints and resolved addresses.

To apply a local tag in a full ZTNA policy:

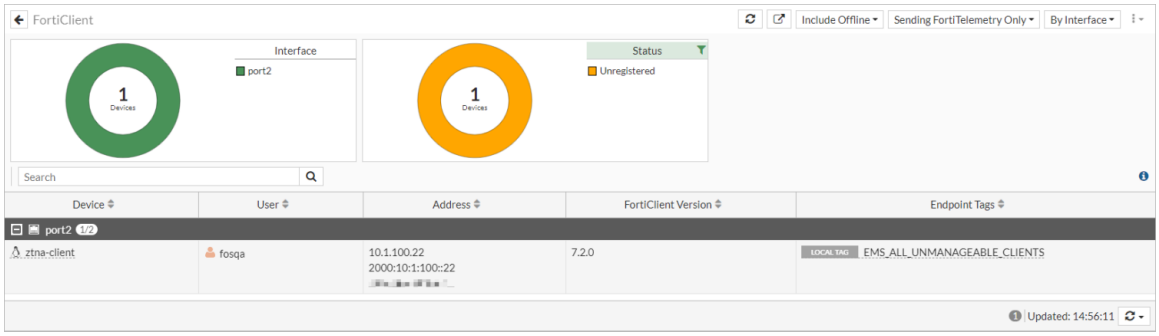
1. Go to *Policy & Objects* > *Proxy Policy*.
2. Click *Create New*, or select and edit an existing entry.
3. In the *Security Posture Tag* field, click the *+* to add tags. The local tags appear in the *IP* section.
4. Configure the other settings as needed.



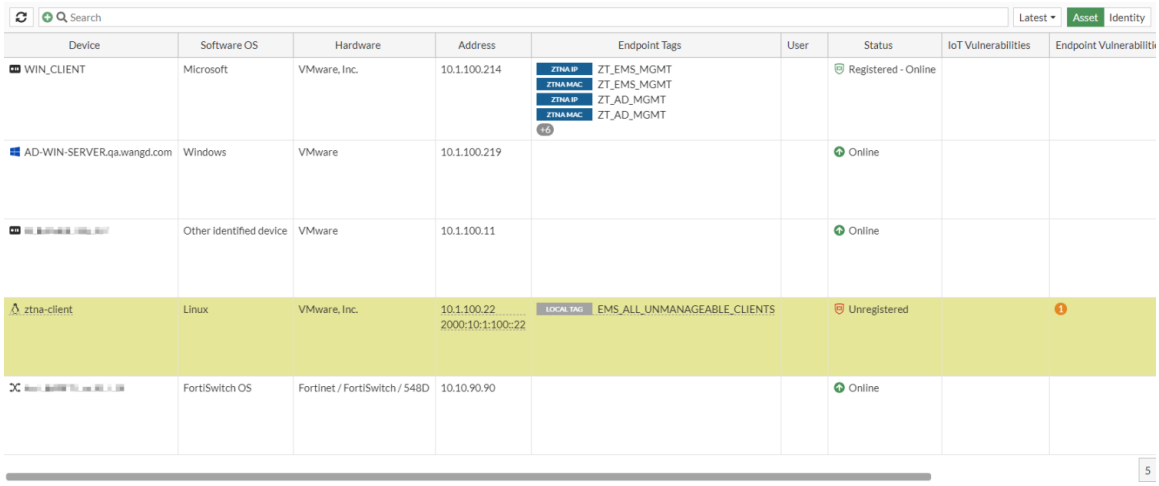
5. Click *OK*.

Local tag information is also available in the following GUI widgets and pages:

- *Dashboard* > *FortiClient* widget



- *Security Fabric* > *Asset Identity Center* page



Viewing ZTNA traffic logs

ZTNA traffic logs include the following fields related to unmanageable and unknown devices.

- Client connection status with EMS server with possible values of unknown, offline, or online:
  - CLI = `emsconnection`
  - GUI = *EMS Connection*
- Device manageability status with possible values of unknown, manageable, or unmanageable:
  - CLI = `clientdevicemanageable`
  - GUI = *Client Device Manageable*

The device manageability status can have one of the following values:

- Unknown: traffic from a client with an unknown TLS fingerprint and where the user agent information is not available for learning.
- Manageable: traffic from a non-mobile device (platform or operating system), with a known TLS fingerprint, or where the user agent information is available for learning.
- Unmanageable: traffic from a mobile device with a known mobile TLS fingerprint or user agent information is available for learning.

To view the ZTNA traffic logs in the CLI:

```
(vdom1)# execute log filter category 0
(vdom1)# execute log filter field subtype ztna
(vdom1)# execute log display

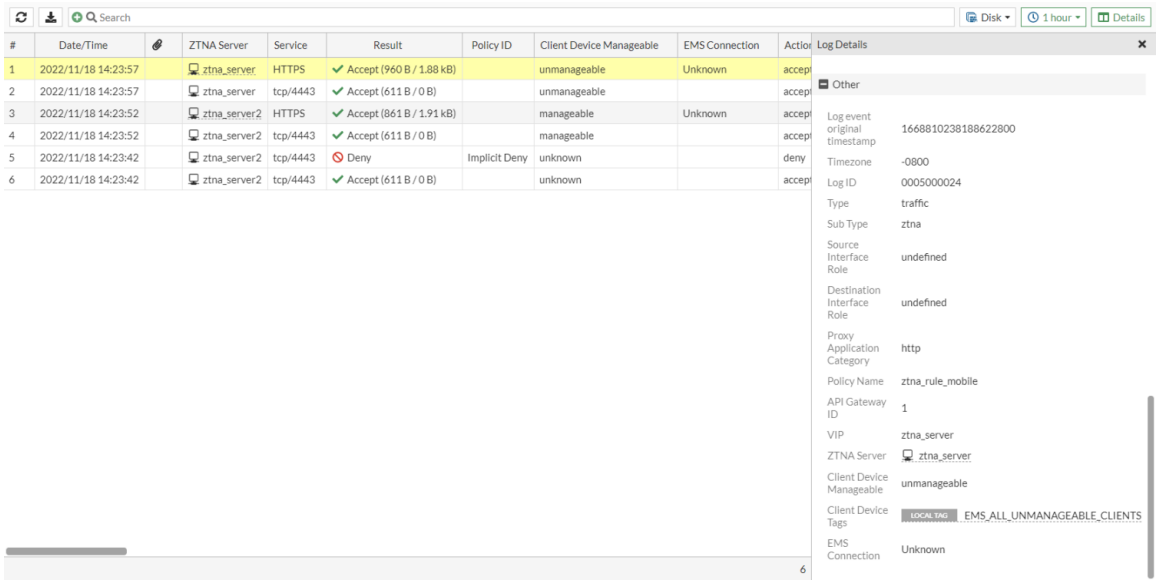
```

To view the ZTNA traffic logs in the GUI:

1. Go to *Log & Report > ZTNA Traffic*.
2. Select an entry and click *Details*.
3. Check the *Client Device Manageable* and *EMS Connection* fields.



HTTP2 connection coalescing and concurrent multiplexing for ZTNA

HTTP2 connection coalescing and concurrent multiplexing allows multiple HTTP2 requests to share the same TLS connection when the destination IP is the same, and the host names are compatible in the certificate. In ZTNA scenarios, the FortiGate application gateway may accept multiple HTTP2 requests to the same ZTNA server destined to different virtual hosts on the same real server. These HTTP2 requests can share the same TLS connection between the FortiGate and the real server so that the handshake does not need to be performed multiple times for multiple connections.

In order for the FortiGate to match the SNI (Server Name Indication), this SNI value must appear under the SAN extension on the server certificate. Configuring the SNI value under the CN alone will not work.

To configure the ZTNA access proxy:

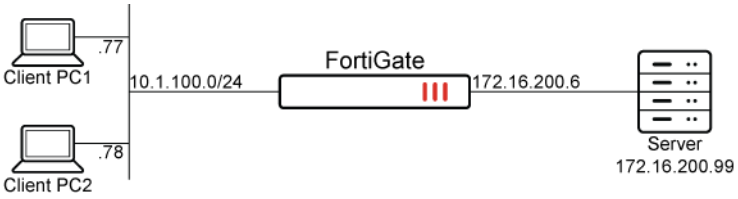
```
config firewall access-proxy
    edit <name>
        set http-supported-max-version {http1 | http2}
        set svr-pool-multiplex {enable | disable}
        set svr-pool-ttl <integer>
        set svr-pool-server-max-request <integer>
    next
end
```

`http-supported-max-version {http1 | http2}`	Set the maximum supported HTTP version: • http1: support HTTP 1.1 and HTTP1.

	• http2: support HTTP2, HTTP 1.1, and HTTP1 (default).
`svr-pool-multiplex {enable | disable}`	Enable/disable server pool multiplexing. When enabled, share the connected server in HTTP, HTTPS, and web portal API gateway.
`svr-pool-ttl <integer>`	Set the time-to-live in the server pool for idle connections to servers (in seconds, 0 - 2147483647, default = 15).
`svr-pool-server-max-request <integer>`	Set the maximum number of requests that servers in server pool handle before disconnecting (0 - 2147483647, default = 0).

Example

In this example, multiple clients submit requests in HTTP2. The requests hit the VIP address, and then FortiGate opens a session between itself (172.16.200.6) and the server (172.16.200.99). The coalescing occurs in this session as the multiple streams share the same TLS session to connect to the same destination server.



To configure connection coalescing and concurrent multiplexing with ZTNA:

1. Configure the VIP:

```
config firewall vip
    edit "vip-ztna"
        set type access-proxy
        set extip 10.1.100.223
        set extintf "port2"
        set server-type https
        set extport 443
        set ssl-certificate "Fortinet_SSL"
    next
end
```

2. Configure the ZTNA server and path mapping:

```
config firewall access-proxy
    edit "ztna"
        set vip "vip-ztna"
        set client-cert disable
        set svr-pool-multiplex enable
        set http-supported-max-version http2
        config api-gateway
            edit 1
                set url-map "/a"
                set virtual-host "a.ftnt.com"
```

```
                config realservers
                    edit 1
                        set ip 172.16.200.99
                    next
                end
            next
            edit 2
                set url-map "/b"
                set virtual-host "b.ftnt.com"
                config realservers
                    edit 1
                        set ip 172.16.200.99
                    next
                end
            next
        end
    next
end
```

3. Configure the ZTNA policy:

```
config firewall proxy-policy
    edit 3
        set proxy access-proxy
        set access-proxy "ztna"
        set srcintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set logtraffic all
        set utm-status enable
        set ssl-ssh-profile "deep-inspection-clone"
        set av-profile "av"
    next
end
```

4. Get the clients to access a.ftnt.com and b.ftnt.com. The clients share access with the same real server and certificate (CN=*.ftnt.com). The FortiGate shares the first TLS connection with second TLS connection.
5. Verify the sniffer packet capture on the FortiGate server side. There is one client hello.

No.	Time	Source	Destination	Protocol	Length	Info
1	0.000000	172.16.200.6	172.16.200.99	TCP	74	7688 → 443 [SYN] Seq=0 Win=65535 Len=0 MSS=1460 SACK_PERM=1 TSval=806055 TSecr=0 WS=4096

15	0.022509	172.16.200.6	172.16.200.99	TCP	66	7688 → 443 [ACK] Seq=473 Ack=2316 Win=176128 Len=0 TSval=806057 TSecr=834657466
16	0.022582	172.16.200.6	172.16.200.99	TLSv1.2	177	Application Data
17	0.022590	172.16.200.6	172.16.200.99	TLSv1.2	145	Application Data
18	0.022686	172.16.200.99	172.16.200.6	TCP	66	443 → 7688 [ACK] Seq=2316 Ack=663 Win=64640 Len=0 TSval=834657471 TSecr=806057
19	0.022935	172.16.200.99	172.16.200.6	TLSv1.2	122	Application Data
20	0.022987	172.16.200.99	172.16.200.6	TLSv1.2	260	Application Data
21	0.022993	172.16.200.6	172.16.200.99	TCP	66	7688 → 443 [ACK] Seq=663 Ack=2566 Win=176128 Len=0 TSval=806057 TSecr=834657471
22	0.023285	172.16.200.6	172.16.200.99	TLSv1.2	108	Application Data
23	0.065172	172.16.200.99	172.16.200.6	TCP	66	443 → 7688 [ACK] Seq=2566 Ack=705 Win=64640 Len=0 TSval=834657513 TSecr=806057

6. Disable server pool multiplexing:

```
config firewall access-proxy
    edit "ztna"
        set vip "vip-ztna"
        set svr-pool-multiplex disable
    next
end
```

7. Verify the sniffer packet capture. This time, the FortiGate does not coalesce the TLS connection, so there are two client hellos.

No.	Time	Source	Destination	Protocol	Length	Info

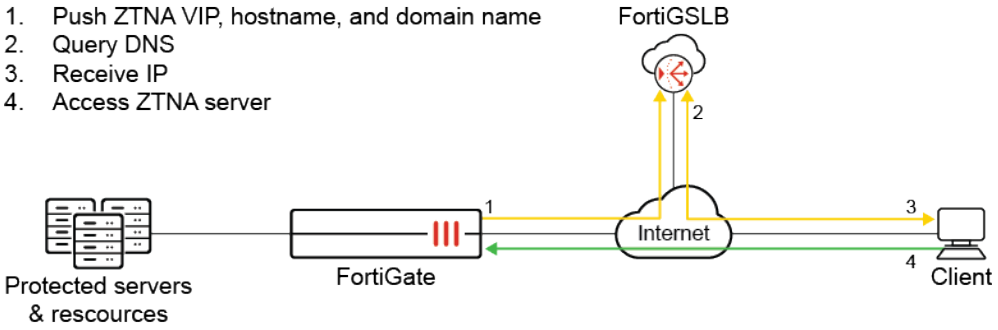
Fabric integration with FortiGSLB

Fabric integration between the FortiGate and FortiGSLB allows a FortiGate to publish custom host and domain names directly to FortiGSLB. This enables external IPs on VIPs used in ZTNA server objects to be published with the host and domain names directly to FortiGSLB, where its DNS service can provide nameserver lookups for the FQDNs.

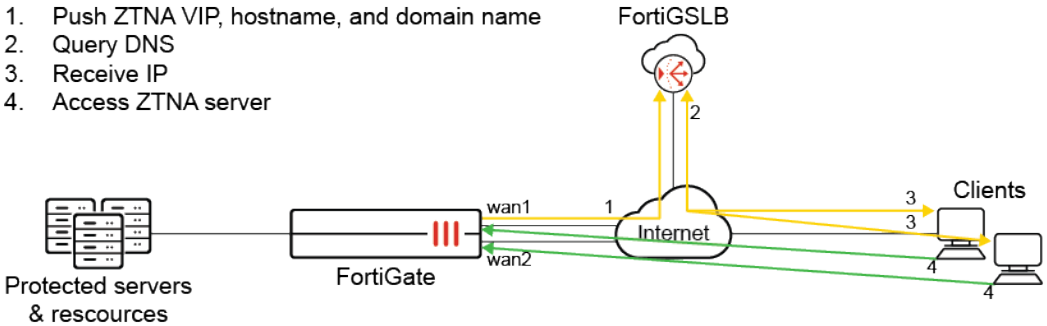
In a basic use case, the hostname, domain name, and external IP of a ZTNA server can be published, and any subsequent updates to the address are immediately pushed to FortiGSLB.

1. Push ZTNA VIP, hostname, and domain name
2. Query DNS
3. Receive IP
4. Access ZTNA server



In more advanced setup, an FQDN may map to different external IPs, which can be load balanced by FortiGSLB.

1. Push ZTNA VIP, hostname, and domain name
2. Query DNS
3. Receive IP
4. Access ZTNA server



In addition, FortiGSLB can perform health checks on the external IPs, and then return the link with the better metrics. See How to add FortiGate SD-WAN Inbound Load Balancing to FortiGSLB in the FortiGSLB Handbook for more information.

This feature requires a valid FortiGSLB account contract (FGCS). If no valid FGCS contract is found, the CLI will return a warning message during configurations:

```
No license detected for FortiGSLB.
GSLB configuration and statistics will not be reported unless the account is
licensed.
```

To enable VIP and ZTNA server integration with the FortiGSLB Cloud service:

```
config system global
    set fortigslb-integration {enable | disable}
end
```

To configure the FortiGSLB setting in the VIP:

```
config firewall vip
    edit <name>
        set one-click-gslb-server {enable | disable}
        set gslb-hostname <string>
        set gslb-domain-name <string>
        config gslb-public-ips
            edit <id>
                set ip <IP_address>
            next
        end
    next
end
```

`one-click-gslb-server {enable | disable}`	Enable/disable integration with FortiGSLB.
`gslb-hostname <string>`	Enter the hostname portion of the FQDN that will be used within the configured FortiGSLB domain.
`gslb-domain-name <string>`	Enter the domain name of the FQDN that will be used within the configured FortiGSLB domain.
`ip <IP_address>`	Enter the custom publicly accessible IP address that overrides the external IP address (`extip`). This setting is optional.

Example

In this example, a FortiGate has three WAN interfaces, each configured with different VIPs that are used in ZTNA server objects that point to the same real server. These VIPs are configured with the same GSLB hostname and domain name. As a result, the hostname and domain name are mapped to three different addresses and sent to

FortiGSLB. FortiGSLB's default setting will perform load balancing and respond to DNS queries by returning the addresses in a round-robin fashion.

To configure FortiGSLB integration:

1. Enable integration with FortiGSLB in the global settings:

```
config system global
    set fortigslb-integration enable
end
```

2. Enable integration with FortiGSLB on each firewall VIP:

```
config firewall vip
    edit "ztna_vip1"
        set type access-proxy
        set server-type https
        set extip 172.18.62.66
        set extintf "port2"
        set one-click-gslb-server enable
        set gslb-hostname "qa.test"
        set gslb-domain-name "wangd.com"
        set extport 4443
        set ssl-certificate "default.test.com"
    next
    edit "ztna_vip2"
        set type access-proxy
        set server-type https
        set extip 172.18.62.67
        set extintf "port3"
        set one-click-gslb-server enable
        set gslb-hostname "qa.test"
        set gslb-domain-name "wangd.com"
        set extport 4443
        set ssl-certificate "default.test.com"
    next
    edit "ztna_vip3"
        set type access-proxy
        set server-type https
        set extip 172.18.62.68
        set extintf "port4"
        set one-click-gslb-server enable
        set gslb-hostname "qa.test"
        set gslb-domain-name "wangd.com"
        config gslb-public-ips
            edit 1
                set ip 172.18.62.69
            next
        end
        set extport 4443
        set ssl-certificate "default.test.com"
```

```
    next
end
```

3. Enable debugs:

```
# diagnose debug application cloudapid -1
# diagnose debug enable
```

A successful connection will produce output similar to the following:

```
<4234> 10 cloudapi_curl_debug()-19: CURL HEADER OUT: POST /api/v1.0/one-click-glb-
fgt/modifyconfig HTTP/2
Host: 1clickfgt.fortigslb-cloud.com
Accept: application/json
Content-Type: application/json
Content-Length: 553

<4234> 10 cloudapi_curl_debug()-19: CURL DATA OUT: {"members":[{"vdom_name":"vdom1","name_
key":"ztna_vip1","type":"ztna","ip_list":
["172.18.62.66"],"host":"qa.test","domain":"wangd.com"},{"vdom_name":"vdom1","name_key":"ztna_
vip2","type":"ztna","ip_list":["172.18.62.67"],"host":"qa.test","domain":"wangd.com"},{"vdom_
name":"vdom1","name_key":"ztna_vip3","type":"ztna","ip_list":
["172.18.62.69”],"host":"qa.test","domain":"wangd.com"}],"ha_cluster":
[{"sn":"FG181FTK22902632","host_name":"FGT1801F-ZTNA"},{"sn":"FG181FTK22902625","host_
name":"FGT1801F-ZTNA"}],"timestamp":"2023-11-23 00:28:43"}
```

Verification

Upon successfully passing the hostname, domain name, and IP address mappings to FortiGSLB, clients that are using FortiGSLB's DNS for DNS resolution can now get responses to their queries. Results on consecutive queries return the IP addresses in a round-robin fashion.

First query:

```
fosqa@ztna-client4:~/ztna_pytest$ dig @15.197.150.26 qa.test.wangd.com
; <<>> DiG 9.16.1-Ubuntu <<>> @15.197.150.26 qa.test.wangd.com

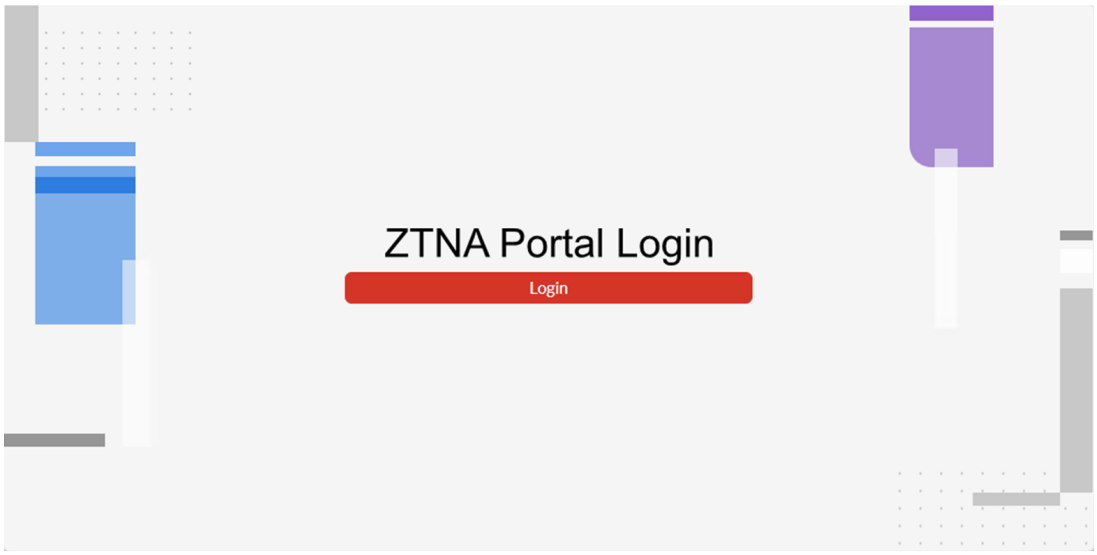
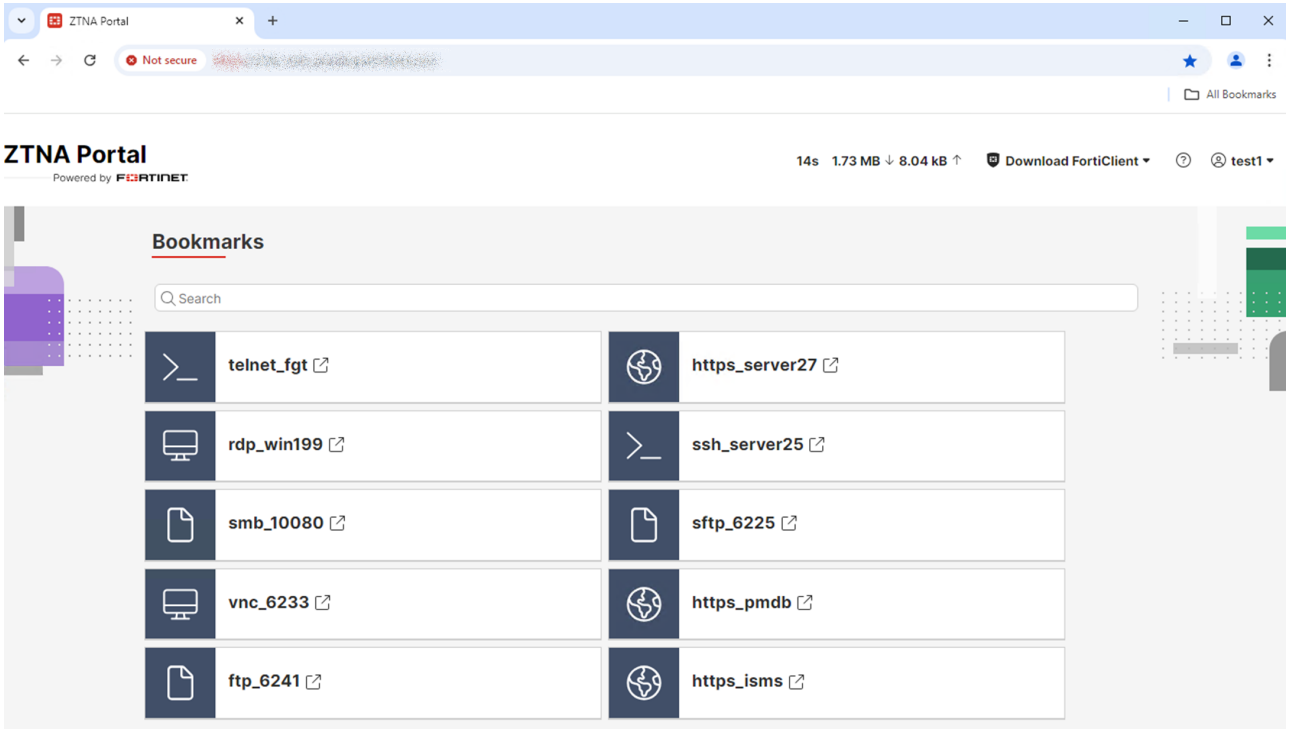
ZTNA agentless web-based application access

A ZTNA web portal is available to provide end-user access to applications without FortiClient or client certificate checks. The ZTNA portal handles authentication and authorization of traffic destined for the protected resources. It is implemented entirely in WAD.

When end-users connect to the ZTNA web portal, they are directed to a login page:



Once logged in, end-users can access bookmarks defined by the administrator:



For web applications, the client must resolve the FQDN to the ZTNA portal VIP. In addition, when accessing the web application, end users are presented with the certificate configured on the ZTNA portal VIP instead of the certificate on the end web server. Hence, the certificate requires the correct Subject Alternate Name(s) to avoid browser certificate errors.

CLI syntax

Configure an access-proxy type of VIP. Disable `client-cert` so that it is not checked when an agentless client connects.

```
config firewall vip
    edit <name>
        set type access-proxy
        set server-type https
        set extip <ip address>
        set extintf <interface>
        set client-cert disable
        set extport <port>
        set ssl-certificate <certificate>
    next
end
```

Configure an access-proxy virtual host. End-users will connect to this destination to access the ZTNA web portal. Disable `client-cert` for this virtual host.

```
config firewall access-proxy-virtual-host
    edit "ztna-web-portal-fqdn"
        set host < web portal host name or ip >
        set client-cert disable
    next
end
```

Configure an authentication scheme. Then configure an authentication rule with `ztna-portal`.

```
config authentication rule
    edit <rule>
        set protocol ztna-portal
        set active-auth-method < auth scheme >
    next
end
```

Configure the ZTNA web portal:

```
config ztna web-portal
    edit <name>
       set vip <vip name>
        set host <virtual host name>
        set auth-portal {enable | disable}
        set vip6 <virtual IPv6 name>
        set auth-rule <rule>
    next
end
```

`set vip <vip name>`	The access-proxy VIP associated with this portal.

`set host <virtual host name>`	The access-proxy virtual host object and FQDN defined for accessing this portal. This virtual host object should not conflict with other virtual host objects used in TCP forwarding and HTTP web services or with the SAML SP host.
`set auth-portal {enable | disable}`	Enable/disable the authentication portal.
`set vip6 <virtual IPv6 name>`	The access-proxy VIP6 associated with the ZTNA server and applications that this portal is allowing.

Create the web portal bookmarks:

```
config ztna web-portal-bookmark
    edit <name>
        set users <users>
        set groups <groups>
            config bookmarks
               edit <name>
               set apptype {ftp | rdp | sftp | smb | ssh | telnet | vnc | web}
               set url <string>
                set host <name or IP>
                set description <description>
                set port <remote port>
                set sso {enable | disable}
            next
       end
    next
end
```

`set users <users>`	The user(s) allowed to access the web-portal.
`set groups <groups>`	The group(s) allowed to access the web-portal.
`set apptype {ftp | rdp | sftp | smb | ssh | telnet | vnc | web}`	Supported types of bookmarks: ftp, rdp, sftp, smb, ssh, telnet, vnc, web.
`set url <url>`	For different types of applications, the URL used to define the destination.
`set host <name or ip>`	For different types of applications, the host name or IP used to define the destination.
`set port <remote port>`	Where applicable, define the port for the service.
`set sso {enable | disable}`	Enable/disable the SSO user login and credentials to connect to the application, where applicable.

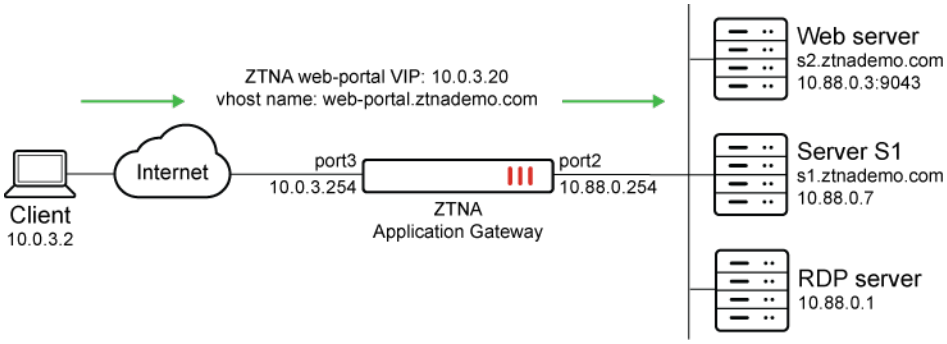
Not all options are listed. Some options are available only for certain types of applications.

Configure your proxy-policy to map to your web-portal.

```
config firewall proxy-policy
    edit <id>
        set proxy ztna-proxy
        set active-auth-method <authentication rule>
        set ztna-proxy <web-portal>
        …
    next
end
```

Example

This example demonstrates connecting to a ZTNA web portal to gain access to protected resources. Authentication is performed with LDAP.



Prerequisites:

- The Client can resolve:
  - The hostname web-portal.ztnademo.com to the VIP address 10.0.3.20
  - The server s1.ztnademo.com to the VIP address 10.0.3.20
  - The server s2.ztnademo.com to the VIP address 10.0.3.20
- The FortiGate resolves:
  - s1.ztnademo.com to the real server IP of 10.88.0.7
  - s2.ztnademo.com to the real server IP of 10.88.0.3
- The FortiGate has an LDAP connection and user group already created.

To configure from the CLI:

1. Configure a firewall VIP with external IP 10.0.3.20:

```
config firewall vip
    edit "ZTNA-web-proxy"
        set type access-proxy
        set server-type https
        set extip 10.0.3.20
        set extintf "port3"
        set client-cert disable
        set extport 443
```

```
        set ssl-certificate "ztna-wildcard"
    next
end
```

2. Configure an access-proxy virtual host:
   The configuration here defines the virtual host used to access the ZTNA web portal, as well as the server certificate for the portal. It overrides the settings in the VIP. Ensure that `client-cert` is disabled.

```
config firewall access-proxy-virtual-host
    edit "ztna-web-portal-fqdn"
        set host "web-portal.ztnademo.com"
        set client-cert disable
    next
end
```

3. Configure the authentication scheme and rule:

```
config authentication scheme
    edit "ztna-web-portal-ldap"
        set method basic
        set user-database "LDAP-fortiad"
    next
end
config authentication rule
    edit "ztna-web-portal-rule"
        set protocol ztna-portal
        set ip-based disable
        set active-auth-method "ztna-web-portal-ldap"
        set web-auth-cookie enable
    next
end
```

4. Configure the ZTNA web-portal:
   Map the portal to the VIP, virtual host, and authentication rule that were previously created.

```
config ztna web-portal
    edit "ztna-web-portal-ldap"
        set vip "ZTNA-web-proxy"
        set host "ztna-web-portal-fqdn"
        set auth-rule "ztna-web-portal-rule"
    next
end
```

5. Create web-portal bookmarks that will point to your internal resources:
   The `groups` setting defines the user group allowed access to the portal.

```
config ztna web-portal-bookmark
    edit "bookmark"
        set groups "LDAP-Remote-Allowed-Group"
        config bookmarks
            edit "Webserver"
                set url "https://s2.ztnademo.com:9043"
```

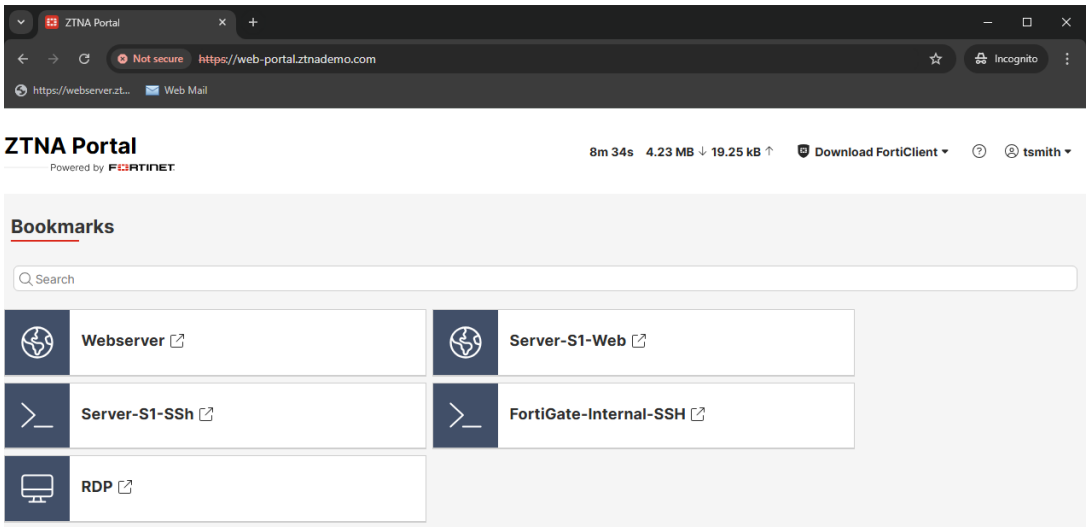
```
            next
            edit "Server-S1-Web"
                set sso enable
                set url "https://s1.ztnademo.com"
            next
            edit "Server-S1-SSh"
                set apptype ssh
                set sso enabled
                set host "10.88.0.7"
                set logon-user "admin"
                set logon-password <password>
            next
            edit "FortiGate-Internal-SSH"
                set apptype ssh
                set host "10.88.0.254"
            next
            edit "RDP"
                set apptype rdp
                set host "10.88.0.1"
                set port 3389
            next
        end
    next
end
```

6. Create a full ZTNA policy (`proxy-policy`) to allow access to the new VIP:

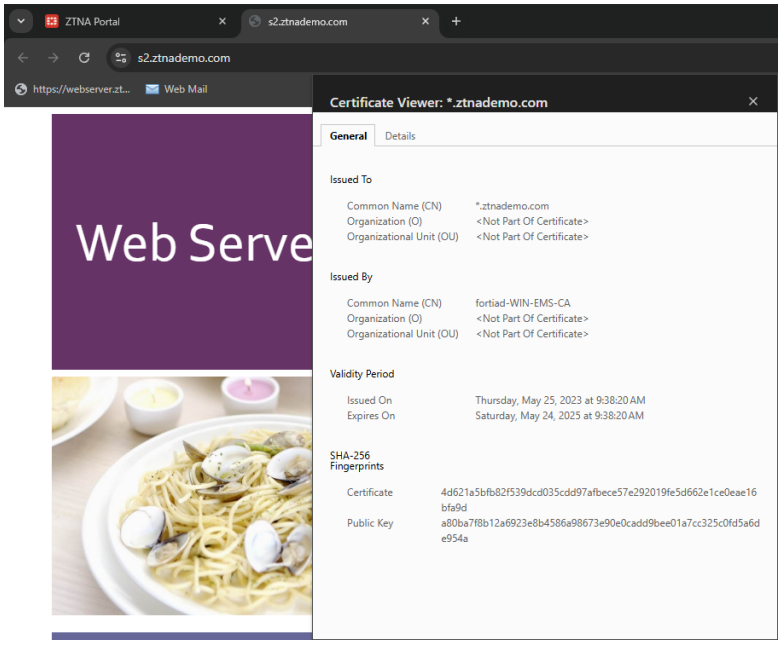
```
config firewall proxy-policy
    edit 0
        set name "ZTNA-web-portal"
        set proxy ztna-proxy
        set ztna-proxy "ztna-web-portal-ldap"
        set srcintf "any"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set logtraffic all
    next
end
```

Verification:

1. On the Client 10.0.3.2, access the portal on https://web-portal.ztnademo.com.
2. When prompted, enter the LDAP user credentials.
3. Once logged into the ZTNA Portal, choose the application bookmark to connect to.



4. Click *Webserver* to access *s2.ztnademo.com*. A new tab opens up to the web page.
5. Check the certificate to confirm it is signed by the CA certificate used in the VIP configurations.



6. On the FortiGate, go to *Log & Report* > *ZTNA Traffic* to view the latest traffic log. Alternatively, use these commands to view the logs from CLI:

```
# execute log filter field subtype ztna

# execute log display
32 logs found.
10 logs returned.

1: date=2024-12-03 time=13:04:33 eventtime=1733259873399494172 tz="-0800" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=1629

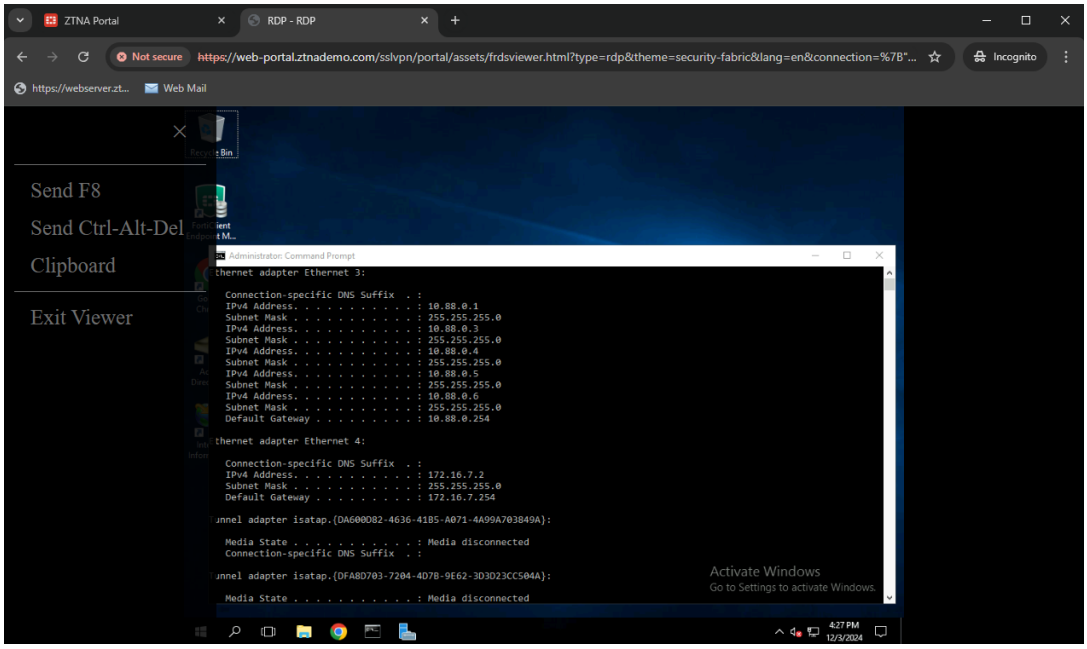
rcvdbyte=303011 wanout=5460 lanin=3202 sentbyte=3202 lanout=306669
```

7. On the ZTNA Portal, connect to RDP. When prompted enter the credentials.
8. Once successfully connected, users can press F8 for additional controls.



9. Review the logs:

```
# execute log filter field subtype ztna

# execute log display
35 logs found.
10 logs returned.

1: date=2024-12-03 time=16:24:50 eventtime=1733271890886450548 tz="-0800" logid="0005000024"

rcvdbyte=0 wanout=0 lanin=3242 sentbyte=3242 lanout=1726
```

Additional troubleshooting and debugs:

If an issue occurs, you can troubleshoot by running these commands:

```
# diagnose wad debug enable category all
# diagnose wad debug enable level verbose
# diagnose debug enable
```

A working connection will output the debugs indicating the web-portal matched the proper gateway. Then accessing the bookmark will output debugs for matching the bookmark.

ZTNA configuration examples

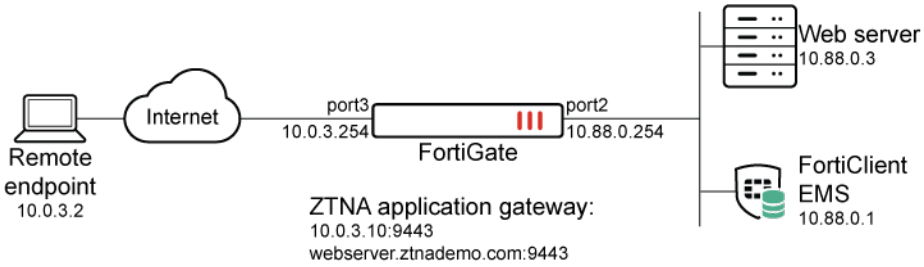
This section includes the following ZTNA configuration examples:

- ZTNA HTTPS access proxy example on page 1461
- ZTNA HTTPS access proxy with basic authentication example on page 1472
- ZTNA TCP forwarding access proxy example on page 1480
- ZTNA TCP forwarding access proxy with FQDN example on page 1487
- ZTNA SSH access proxy example on page 1490
- ZTNA application gateway with SAML authentication example on page 1497
- ZTNA application gateway with SAML and MFA using FortiAuthenticator example on page 1502
- Secure LDAP connection from FortiAuthenticator with zero trust tunnel example on page 1519
- ZTNA IP MAC based access control example on page 1520
- ZTNA IPv6 examples on page 1528

- ZTNA Zero Trust application gateway example on page 1534
- ZTNA SaaS application access control with Inline CASB on page 1535
- ZTNA application gateway with KDC to access shared drives on page 1542
- Custom replacement message for ZTNA virtual hosts on page 1548

ZTNA HTTPS access proxy example

In this example, an HTTPS access proxy is configured to demonstrate its function as a reverse proxy on behalf of the web server it is protecting. It verifies user identity, device identity, and trust context, before granting access to the protected source.



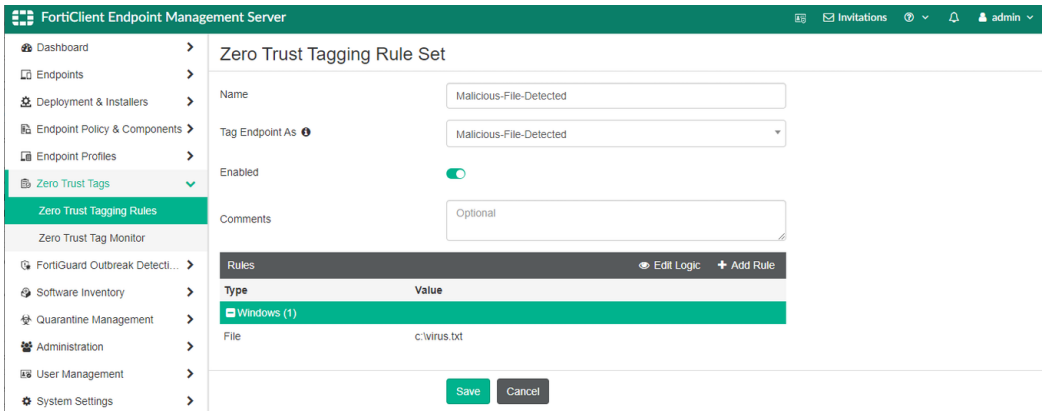
This example shows access control that allows or denies traffic based on security posture tags. Traffic is allowed when the FortiClient endpoint is tagged as *Low Importance* using Classification tags, and denied when the endpoint is tagged with *Malicious-File-Detected*.

This example assumes that the FortiGate EMS fabric connector is already successfully connected.

To configure ZTNA in the GUI, go to *System* > *Feature Visibility* and enable *Zero Trust Network Access*.

To configure a Zero Trust tagging rule on the FortiClient EMS:

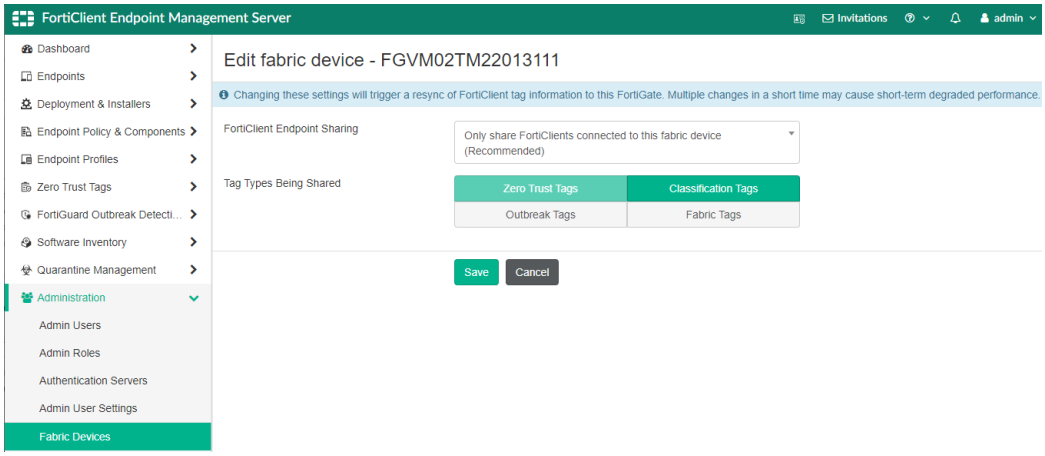
1. Log in to the FortiClient EMS.
2. Go to *Zero Trust Tags* > *Zero Trust Tagging Rules*, and click *Add*.
3. In the *Name* field, enter *Malicious-File-Detected*.
4. In the *Tag Endpoint As* dropdown list, select *Malicious-File-Detected*.
   EMS uses this tag to dynamically group together endpoints that satisfy the rule, as well as any other rules that are configured to use this tag.
5. Click *Add Rule* then configure the rule:
   a. For *OS*, select *Windows*.
   b. From the *Rule Type* dropdown list, select *File* and click the + button.
   c. Enter a file name, such as *C:\virus.txt*.
   d. Click *Save*.



6. Click *Save*.

To configure FortiClient EMS to share classification tags:

1. Go to *Administration* > *Fabric Devices*.
2. Select the FortiGate device.
3. Click *Edit*.
4. Under *Tag Types Being Shared*, add *Classification Tags*.



5. Click *Save*.

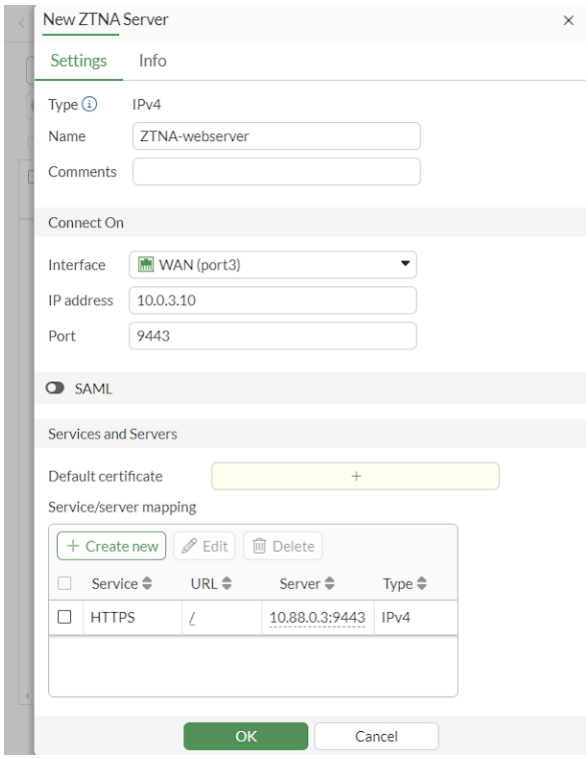
To configure a ZTNA server for HTTPS access proxy in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Server* tab.
2. Click *Create New*.
3. Set *Name* to *ZTNA-webserver*.
4. Set *Interface* to *port3*. The *IP address* and *Port* fields are automatically set to the IP of the selected interface and the default port of 443.
   a. Set *External IP* to *10.0.3.10*.
   b. Set *External port* to *9443*.

Verify that the IP address and port do not conflict with management access to the interface. Otherwise, change the IP address to another address on that subnet.

5. Select the *Default certificate*. Clients will be presented with this certificate when they connect to the access proxy VIP.
6. Add server mapping:
   a. In the *Service/server mapping* table, click *Create New*.
   b. Set *Service* to *HTTPS*.
   c. Set *Virtual Host* to *Any Host*.
   d. Configure the path as needed. For example, to map to *webserver.ztnademo.com/fortigate*, enter */fortigate*.
   e. In the *Server* section, set *Address type* to *IP*.
   f. Set *IP address* to *10.88.0.3*.
   g. Set *Port* to *9443*.

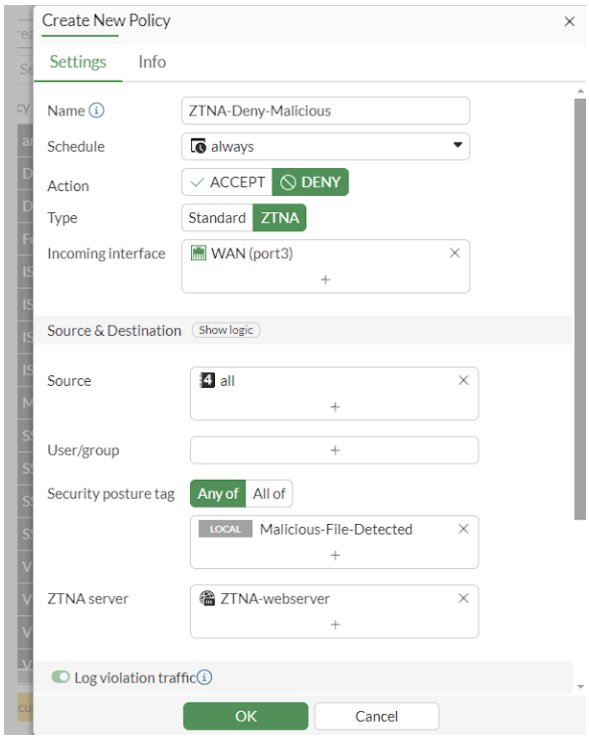
   h. Click *OK*. The server mapping is displayed.



7. Click *OK*.

To configure simple ZTNA policies to allow and deny traffic based on security posture tags in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a rule to deny traffic:
   a. Click *Create New*.
   b. Set *Name* to *ZTNA-Deny-malicious*.
   c. Set *Action* to *DENY*.
   d. Set *Type* to *ZTNA*.
   e. Set *Incoming Interface* to *port3*.
   f. Set *Source* to *all*.
   g. Add the security posture tag *Malicious-File-Detected*.
      This tag is dynamically retrieved from EMS when you first created the Zero Trust Tagging Rule.
   h. Select the ZTNA server *ZTNA-webserver*.
   i. Enable *Log Violation Traffic*.



j. Click *OK*.

3. Create a rule to allow traffic:
   a. Click *Create New*.
   b. Set *Name* to *ZTNA-Allow-Simple*.
   c. Set *Type* to *ZTNA*.
   d. Set *Incoming Interface* to *port3*.
   e. Set *Source* to *all*. This can also be set to specific IP addresses to only allow those addresses to connect to this HTTPS access proxy.
   f. Add the *Class* tag *Low*.
   g. Select the ZTNA server *ZTNA-webserver*.
   h. Configure the remaining options as needed.
   i. Click *OK*.
4. On the firewall policy list, make sure that the deny rule (*ZTNA-Deny-malicious*) is above the allow rule (*ZTNA-Allow-Simple*).

To configure HTTPS access in the CLI:

1. Configure the access proxy VIP:

```
config firewall vip
    edit "ZTNA-webserver"
        set type access-proxy
        set extip 10.0.3.10
        set extintf "port3"
        set server-type https
        set extport 9443
```

```
        set ssl-certificate "ztna-wildcard"
    next
end
```

2. Configure the server and path mapping:

```
config firewall access-proxy
    edit "ZTNA-webserver"
        set vip "ZTNA-webserver"
        set log-blocked-traffic enable
        config api-gateway
            edit 1
                config realservers
                    edit 1
                        set ip 10.88.0.3
                        set port 9443
                    next
                end
            next
        end
    next
end
```

3. Configure ZTNA policies:

```
config firewall policy
     edit 9
        set name "ZTNA-Deny-Malicious"
        set srcintf "port3"
        set dstintf "any"
        set srcaddr "all"
        set dstaddr "ZTNA-webserver"
        set ztna-ems-tag "EMS1_ZTNA_Malicious-File-Detected"
        set schedule "always"
        set logtraffic all
    next
    edit 10
        set name "ZTNA-Allow-Simple"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "ZTNA-webserver"
        set ztna-ems-tag "EMS1_CLASS_Low"
        set schedule "always"
        set logtraffic all
        set nat enable
    next
end
```

For configuration examples using full ZTNA policy, see Configure a ZTNA policy on page 1409.

Testing the remote access to the HTTPS access proxy

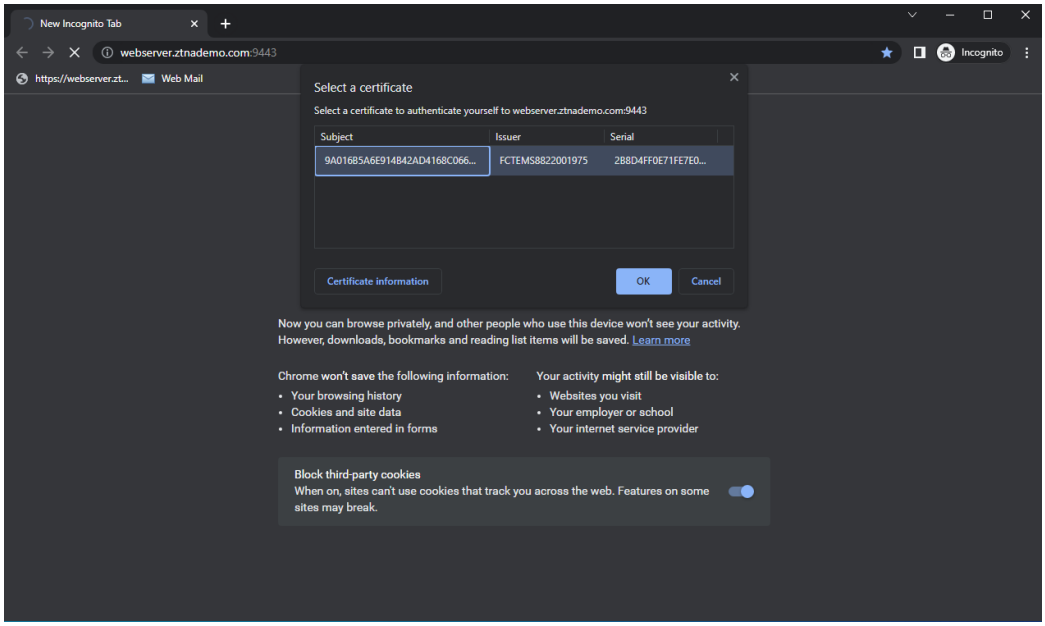
After FortiClient EMS and FortiGate are configured, the HTTPS access proxy remote connection can be tested.

Access allowed:

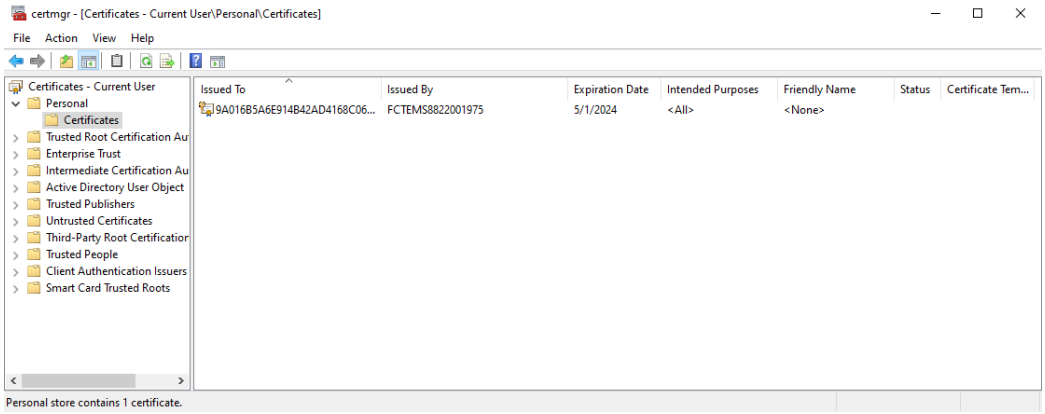
1. On the remote Windows PC, open FortiClient.
2. On the *Zero Trust Telemetry* tab, make sure that you are connected to the EMS server.

It is not necessary to configure a *ZTNA Destination* on FortiClient for the HTTPS access proxy use case. In fact, configuring a *ZTNA Destination* rule for the website may interfere with its operation.

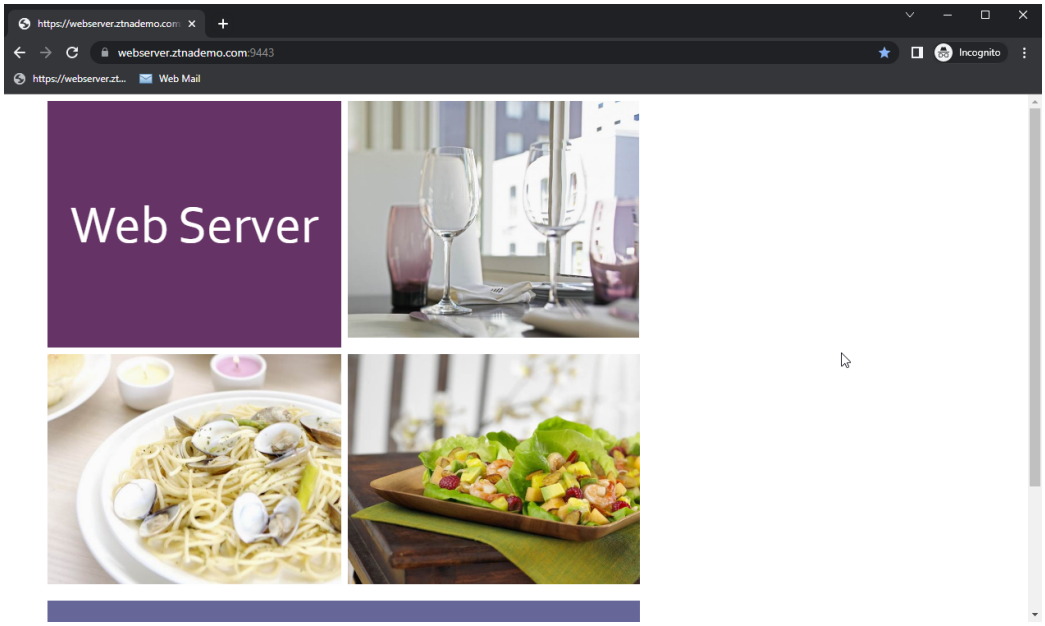
3. Open a browser and enter the address of the server and the access port. When entering the FQDN, make sure that the DNS can resolve the address to the IP address of the FortiGate. In this example, webserver.ztnademo.com resolves to 10.0.3.10.
4. The browser prompts for the client certificate to use. Select the EMS signed certificate, then click *OK*.



The certificate is in the *User Configuration* store, under *Personal* > *Certificates*. The details show the SN of the certificate, which matches the record on the FortiClient EMS and the FortiGate.

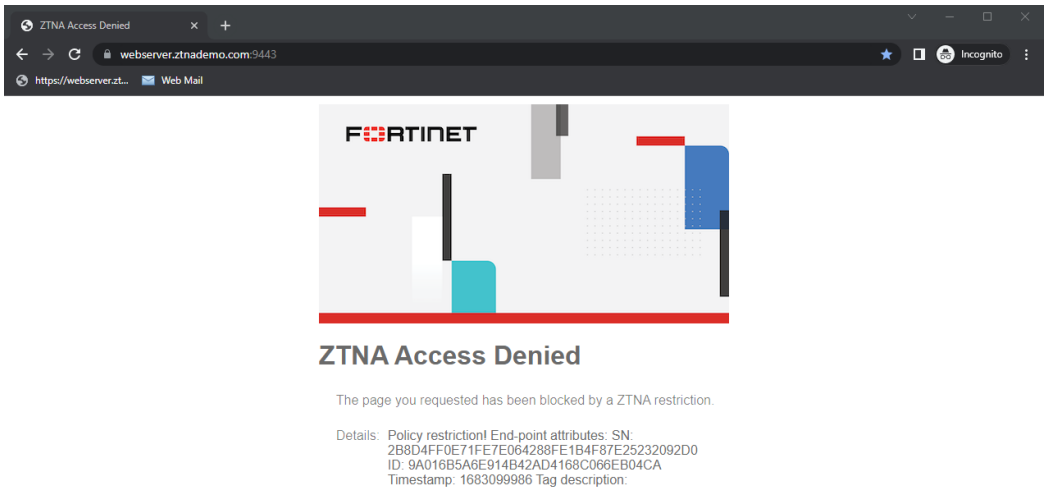


5. The client is verified by the FortiGate to authenticate your identity.
6. The FortiGate matches your security posture by verifying your security posture tag and matching the corresponding ZTNA rule, and you are allowed access to the web server.



Access denied:

1. On the remote Windows PC, trigger the Zero Trust Tagging Rule by creating the file in C:\virus.txt.
2. Open a browser and enter the address http://webserver.ztnademo.com:9443.
3. The client is verified by the FortiGate to authenticate your identity.
4. FortiGate checks your security posture. Because EMS has tagged the PC with the *Malicious-File-Detected* tag, it matches the *ZTNA-Deny-malicious* rule.
5. You are denied access to the web server.



Logs and debugs

Access allowed:

```

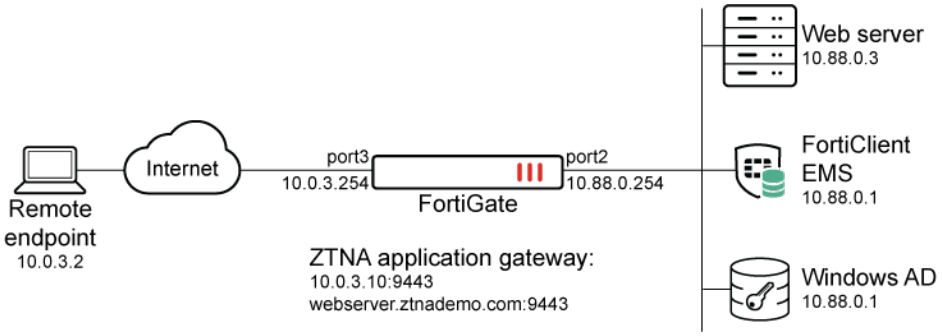
ZTNA HTTPS access proxy with basic authentication example

This example expands on the previous example (ZTNA HTTPS access proxy example on page 1461), adding LDAP authentication to the ZTNA rule. Users are allowed based on passing the client certificate authentication check, user authentication, and security posture check.

Users that are in the AD security group *ALLOWED-VPN* are allowed access to the access proxy. Users that are not part of this security group are not allowed access.



This example assumes that the FortiGate EMS fabric connector is already successfully connected.

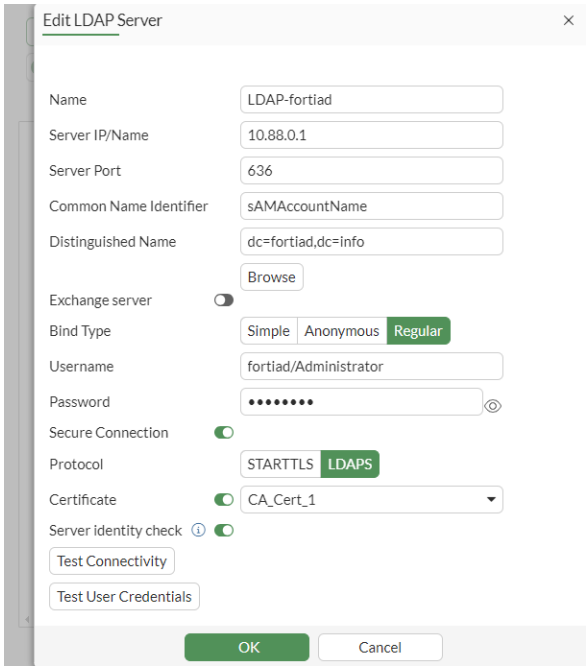
LDAP/Active Directory Users and Groups:

- Domain: fortiad.info
- Users (Groups):
  - tsmith (Domain Users, Remote-Allowed)
  - lhansen (Domain Users)

To configure a secure connection to the LDAP server in the GUI:

1. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
2. Configure the following settings:

Name	LDAP-fortiad
Server IP/Name	10.88.0.1
Server Port	636
Common Name Identifier	sAMAccountName
Distinguished Name	dc=fortiad,dc=info
Exchange server	Disabled
Bind Type	Regular Enter the *Username* and *Password* for LDAP binding and lookup.
Secure Connection	Enabled • Set *Protocol* to *LDAPS* • Enable *Certificate* and select the CA certificate to validate the server certificate.
Server identity check	Optionally, enable to verify the domain name or IP address against the server certificate.



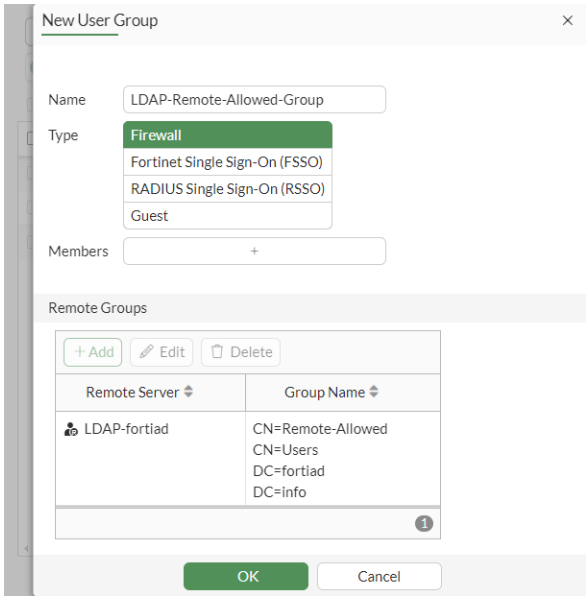
3. Click *Test Connectivity* to verify the connection to the server.
4. Click *OK*.

To configure a secure connection to the LDAP server in the CLI:

```
config user ldap
    edit "LDAP-fortiad"
        set server "10.88.0.1"
        set cnid "sAMAccountName"
        set dn "dc=fortiad,dc=info"
        set type regular
        set username "fortiad\\Administrator"
        set password <password>
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

To configure a remote user group from the LDAP server in the GUI:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Set the name to *LDAP-Remote-Allowed-Group*.
3. Set *Type* to *Firewall*.
4. In the *Remote Groups* table click *Add*:
   a. Set *Remote Server* to *LDAP-fortiad*.
   b. Locate the *Remote-Allowed* group, right-click on it, and click *Add Selected*.
   c. Click *OK*.



5. Click *OK*.

To configure a remote user group from the LDAP server in the CLI:

```
config user group
    edit "LDAP-Remote-Allowed-Group"
```

```
        set member "LDAP-fortiad"
        config match
            edit 1
                set server-name "LDAP-fortiad"
                set group-name "CN=Remote-Allowed,CN=Users,DC=fortiad,DC=info"
            next
        end
    next
end
```

Authentication scheme and rules

After the LDAP server and user group have been configured, an authentication scheme and rule must be configured.

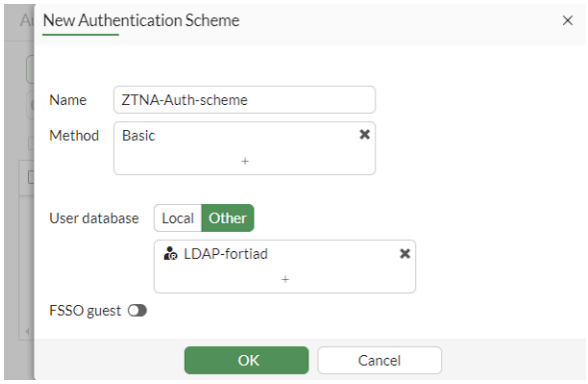
To configure authentication schemes and rules in the GUI, go to *System* > *Feature Visibility* and enable *Explicit Proxy*.

Authentication scheme

The authentication scheme defines the method of authentication that is applied. In this example, basic HTTP authentication is used so that users are prompted for a username and password the first time that they connect to a website through the HTTPS access proxy.

To configure an authentication scheme in the GUI:

1. Go to *Policy & Objects* > *Authentication Rules* and select the *Authentication Schemes* tab.
2. Click *Create New*.
3. Set the name to *ZTNA-Auth-scheme*.
4. Set *Method* to *Basic*.
5. Set *User database* to *Other* and select *LDAP-fortiad* as the LDAP server.



6. Click *OK*.

To configure an authentication scheme in the CLI:

```
config authentication scheme
    edit "ZTNA-Auth-scheme"
        set method basic
        set user-database "LDAP-fortiad"
    next
end
```

Authentication rule

The authentication rule defines the proxy sources and destination that require authentication, and what authentication scheme is applied. In this example, active authentication through the basic HTTP prompt is used and applied to all sources.

To configure an authentication rule in the GUI:

1. Go to *Policy & Objects* > *Authentication Rules* and click *Create New*.
2. Set the name to *ZTNA-Auth-rule*.
3. Set *Source Address* to *all*.
4. Set *Protocol* to *HTTP*.
5. Enable *Authentication Scheme* and select *ZTNA-Auth-scheme*.
6. Click *OK*.

To configure an authentication rule in the CLI:

```
config authentication rule
    edit "ZTNA-Auth-rule"
        set srcaddr "all"
        set active-auth-method "ZTNA-Auth-scheme"
    next
end
```

Applying the user group to a ZTNA policy

A user or user group must be applied to the ZTNA policy that you need to control user access to. The authenticated user from the authentication scheme and rule must match the user or user group in the ZTNA policy.

In this example, the user group is applied to the two simple ZTNA policies that were configured in ZTNA HTTPS access proxy example on page 1461.

To apply a user group to the simple ZTNA policies in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit the *ZTNA-Deny-malicious* rule.
3. Click in the *Source* field, select the *User* tab, select the *LDAP-Remote-Allowed-Group* group, then click *Close*.

4. Click *OK*.
5. Edit the *ZTNA-Allow-Simple* rule.
6. Click in the *Source* field, select the *User* tab, select the *LDAP-Remote-ALlowed-Group* group, then click *Close*.
7. Click *OK*.

To apply a user group to the simple ZTNA policies in the CLI:

```
config firewall policy
     edit 9
        set name "ZTNA-Deny-Malicious"
        set srcintf "port3"
        set dstintf "any"
        set srcaddr "all"
        set dstaddr "ZTNA-webserver"
        set ztna-ems-tag "EMS1_ZTNA_Malicious-File-Detected"
        set schedule "always"
        set logtraffic all
        set groups "LDAP-Remote-Allowed-Group"
    next
    edit 10
        set name "ZTNA-Allow-Simple"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "ZTNA-webserver"
        set ztna-ems-tag "EMS1_CLASS_Low"
        set schedule "always"
        set logtraffic all
        set nat enable
        set groups "LDAP-Remote-Allowed-Group"
    next
end
```

For configuration examples using full ZTNA policy, see Configure a ZTNA policy on page 1409.

Testing remote access to the HTTPS access proxy with user authentication

Scenario 1: access allowed - user tsmith

1. On a remote Windows PC, open the FortiClient app, select the *Zero Trust Telemetry* tab, and confirm that you are connected to the EMS server.

It is not necessary to configure a *ZTNA Destination* on the FortiClient for the HTTPS access proxy use case. In fact, configuring a *ZTNA Destination* rule for the website may interfere with its operation.

2. In a browser, enter the address of the server and the access port.
   If entering an FQDN, make sure that DNS can resolve the address to the IP address of the FortiGate. In this example, *webserver.ztnademo.com* resolves to 10.0.3.10.
3. When the browser asks for the client certificate to use, select the EMS signed certificate, then click *OK*.
   The client certificate is verified by the FortiGate to authenticate your identity.
4. When prompted, enter the username *tsmith* and the password, and click *Sign in*.
   As *tsmith* is a member of the *Remote-Allowed-Group* group in Active Directory, it will match the *LDAP-Remote-Allowed-Group* user group. After the user authentication passes, the FortiGate performs a posture check on the ZTNA group. When that passes, you are allowed access to the website.

Verifying the results

```
#  diagnose firewall auth list

10.0.3.2, tsmith
        type: fw, id: 0, duration: 12, idled: 12
        expire: 288, allow-idle: 300
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 3
        group_name: LDAP-Remote-Allowed-Group
```

```
# diagnose test app fcnacd 7
Entry #1:
 - UID: 9A016B5A6E914B42AD4168C066EB04CA

```

Scenario 2: access denied – user lhansen

1. If scenario 1 has just been tested, log in to the FortiGate and deauthenticate the user:
   a. Go to *Dashboard > Assets & Identities* and expand the *Firewall Users* widget.
   b. Right-click on the user *tsmith* and select deauthenticate.
2. On a remote Windows PC, open the FortiClient app, select the *Zero Trust Telemetry* tab, and confirm that you are connected to the EMS server.
3. In a browser, enter the address *webserver.ztnademo.com*.
4. When the browser asks for the client certificate to use, select the EMS signed certificate, then click *OK*. This option might not appear if you have already selected the certificate when testing scenario 1.

   The client certificate is verified by the FortiGate to authenticate your identity.
5. When prompted, enter the username *lhansen* and the password, and click *Sign in*.

   As *lhansen* is not a member of the *Remote-Allowed* group in Active Directory, it will not match the *LDAP-Remote-Allowed-Group* user group. Because no other policies are matched, this user is implicitly denied

Verifying the results

Go to *Dashboard > Assets & Identities*, expand the *Firewall Users* widget, and confirm that user *lhansen* is listed, but no applicable user group is returned.

```
# execute log display

ZTNA TCP forwarding access proxy example

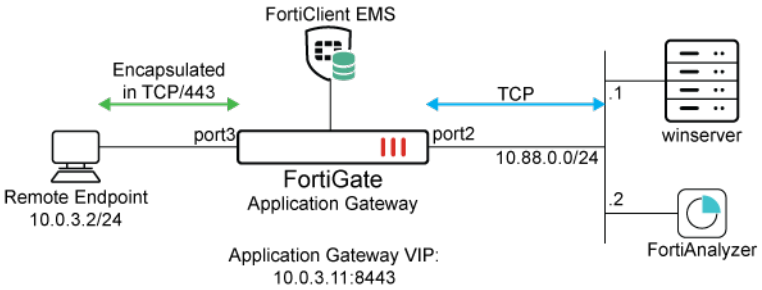
In this example, a TCP forwarding access proxy (TFAP) is configured to demonstrate an HTTPS reverse proxy that forwards TCP traffic to the designated resource. The access proxy tunnels TCP traffic between the client and the FortiGate over HTTPS, and forwards the TCP traffic to the protected resource. It verifies user identity, device identity, and trust context, before granting access to the protected source.

TCP forwarding access proxy supports communication between the client and the access proxy without SSL/TLS encryption. The connection still begins with a TLS handshake. The client uses the HTTP 101 response to switch protocols and remove the HTTPS stack. Further end to end communication between the client and server are encapsulated in the specified TCP port, but not encrypted by the access proxy. This improves performance by reducing the overhead of encrypting an already secured underlying protocol, such as RDP, SSH, or FTPS. Users should still enable the encryption option for end to end protocols that are insecure.

In this example, RDP (Remote Desktop Protocol) and SMB (Server Message Block) protocol access are configured to one server, and SSH access to the other server. Encryption is disabled for RDP and SSH, and enabled for SMB.

FortiClient (Windows) must be running 7.0.3 or later to detect SMB.

You cannot use ZTNA connection rules and TCP forwarding on a Windows 7 endpoint.



This example assumes that the FortiGate EMS fabric connector is already successfully connected.

To configure the ZTNA server for TCP access proxy in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Server* tab.
2. Click *Create New*.
3. Set *Name* to *ZTNA-tcp-server*.

4. Set *Interface* to *port3*. The *IP address* and *Port* fields are automatically set to the IP address of the selected interface and the default port 443.
   a. Set *External IP* to *10.0.3.11*.
   b. Set *External port* to *8443*.

Verify that the IP address and port do not conflict with management access to the interface. Otherwise, change the IP address to another address on that subnet.

5. Select the *Default certificate*. Clients will be presented with this certificate when they connect to the access proxy VIP.
6. Add server mapping:
   a. In the *Service/server mapping* table, click *Create New*.
   b. Set *Service* to *TCP Forwarding*.
   c. In the *Server* section, click *Address* and create a new address for the FortiAnalyzer server at 10.88.0.2.
   d. Set *Ports* to *22*.
   e. Click *OK*.
7. Click *OK*.
8. Use the CLI to add another server for the winserver server at 10.88.0.1 with ports 445 and 3389 to correspond to SMB and RDP:

```
config firewall access-proxy
    edit "ZTNA-tcp-server"
        config api-gateway
            edit 1
                config realservers
                    edit 0
           set address "winserver"
           set mappedport 445 3389
                    next
                end
            next
        end
    next
end
```

9. In the GUI, edit the ZTNA server named *ZTNA-tcp-server*, and verify the server mapping for winserver.

To configure a simple ZTNA policy to allow traffic to the TCP access proxy in the GUI:

1. Go to *Policy & Objects > Firewall Policy*, and click *Create New*.
2. Set *Name* to *ZTNA_remote*.
3. Set *Type* to *ZTNA*.
4. Set *Incoming Interface* to *port3*.
5. Set *Source* to *all*.
6. Select the ZTNA server *ZTNA-tcp-server*.
7. Configure the remaining options as needed.
8. Click *OK*.

To configure the access proxy VIP in the CLI:

```
config firewall vip
    edit "ZTNA-tcp-server"
        set type access-proxy
        set extip 10.0.3.11
        set extintf "port3"
        set server-type https
        set extport 8443
        set ssl-certificate "Fortinet_SSL"
    next
end
```

To configure the server addresses in the CLI:

```
config firewall address
    edit "FAZ"
        set subnet 10.88.0.2 255.255.255.255
    next
    edit "winserver"
        set subnet 10.88.0.1 255.255.255.255
    next
end
```

To configure access proxy server mappings in the CLI:

```
config firewall access-proxy
    edit "ZTNA-tcp-server"
        set vip "ZTNA-tcp-server"
        config api-gateway
            edit 1
                set url-map "/tcp"
                set service tcp-forwarding
                config realservers
                    edit 1
                        set address "FAZ"
                        set mappedport 22
                    next
                    edit 2
                        set address "winserver"
                        set mappedport 445 3389
                    next
                end
            next
        end
    next
end
```

The mapped port (`mappedport`) restricts the mapping to the specified port or port range. If `mappedport` is not specified, then any port will be matched.

To configure a ZTNA rule (proxy policy) in the CLI:

```
config firewall policy
    edit 11
        set name "ZTNA_remote"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "ZTNA-tcp-server"
        set schedule "always"
        set logtraffic all
        set nat enable
    next
end
```

For configuration examples using full ZTNA policy, see Configure a ZTNA policy on page 1409.

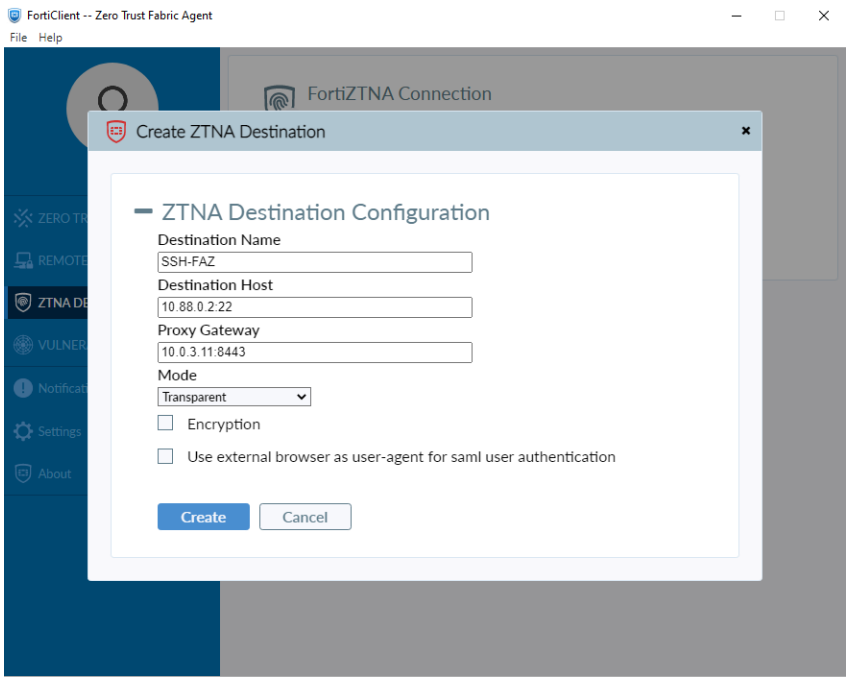
Test the connection to the access proxy

Before connecting, users must have a ZTNA connection rule in FortiClient.

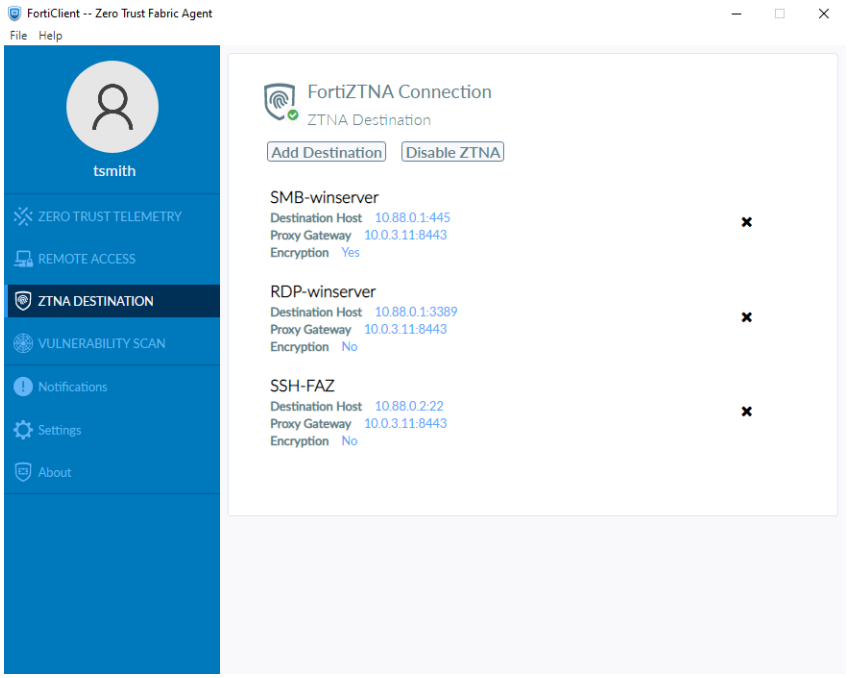
ZTNA TCP forwarding rules can be provisioned from the EMS server. See Provisioning ZTNA TCP forwarding rules via EMS for details.

To create a ZTNA Destination in FortiClient:

1. On the *ZTNA Destination* tab, click *Add Destination*.
2. Set *Destination Name* to *SSH-FAZ*.
3. Set *Destination Host* to *10.88.0.2:22*. This is the real IP address and port of the server.
4. Set *Proxy Gateway* to *10.0.3.11:8443*. This is the access proxy address and port that are configured on the FortiGate.
5. Leave *Encryption* disabled. This option determines whether or not the Client to FortiGate access proxy connection is encrypted in HTTPS.



6. Click *Create*.
7. Create a second rule with the following settings:
   - *Rule Name*: *RDP-winserver*
   - *Destination Host*: *10.88.0.1:3389*
   - *Proxy Gateway*: *10.0.3.11:8443*
   - *Encryption*: Disabled
8. Create a third rule with the following settings:
   - *Rule Name*: *SMB-winserver*
   - *Destination Host*: *10.88.0.1:445*
   - *Proxy Gateway*: *10.0.3.11:8443*
   - *Encryption*: Enabled



After creating the ZTNA connection rules, you can SSH, RDP, and SMB directly to the server IP address and port.

ZTNA TCP forwarding access proxy with FQDN example

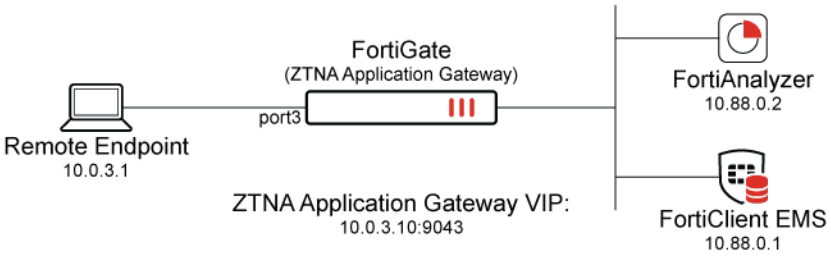
When defining ZTNA connection rules on FortiClient for TCP forwarding, it is sometimes desirable to configure the destination host address as an FQDN address instead of an IP address. Since the real servers are often servers in the corporate network, this layer of obfuscation prevents internal IPs from easily leaking to the public, and also makes the destination more easily recognizable by the end users.

One obstacle to overcome is getting remote hosts to resolve an internal FQDN that is typically only resolvable by an internal DNS in the corporate network. This can be solved with the following:

1. When an FQDN address is added in FortiClient's ZTNA Destination, FortiClient will intercept connections destined for the FQDN address and replace the destination with a special IP address (such as 10.235.0.1).
2. FortiClient listens to any traffic destined for the FQDN and its port and forwards the traffic using the TCP forwarding URL with FQDN to the ZTNA application gateway.
3. The ZTNA application gateway will resolve the FQDN, matching the traffic to the ZTNA real server configuration with the same domain and address.
4. If a valid ZTNA real server entry is found, traffic is forwarded to the real server.

Example

In this example, a FortiAnalyzer in the internal network is added to the FortiGate access proxy for TCP forwarding. A ZTNA Destination is configured on the FortiClient, with the destination host field pointing to the FQDN addresses of the internal servers. The FQDN address is also resolvable by the FortiGate and the same FQDN is used in the real server mapping.



This example assumes that the FortiGate EMS Fabric connector is already successfully connected.

This features requires a minimum FortiClient and FortiClient EMS version of 7.0.3.

To configure the TCP forwarding access proxy:

1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Server* tab.
2. Click *Create new*.
3. Set *Name* to *ZTNA-webserver*.
4. Configure the network settings:
   a. Set *Interface* to *WAN (port3)*.
   b. Set *IP address* to *10.0.3.10*.
   c. Set *Port* to *9043*.
5. Select the *Default certificate*. Clients will be presented with this certificate when they connect to the application gateway VIP.
6. Add server mapping:
   a. In the *Service/server mapping* table, click *Create new*.
   b. For *Service*, select *TCP Forwarding*.
   c. Under *Server*:
      i. For *Address*, create a new FQDN address called *FAZ-FQDN* for the FortiAnalyzer at fortianalyzer.ztnademo.com, then click *OK*.
      ii. Apply the new address object as the address for the new server.
      iii. Set *Ports* to *22*.
      iv. Click *OK*.
7. Click *OK* to complete.

To configure the ZTNA rule:

1. Go to *Policy & Objects* > *Proxy Policy*.
2. Click *Create new*.
3. Set *Name* to *ZTNA-Admin-Access*.
4. Set *Incoming Interface* to *WAN (port3)*.

5. Set *Source* to *all*.
6. Set *Destination* to the same *FAZ-FQDN* address created before.
7. Select the ZTNA server *ZTNA-webserver*.
8. Configure the remaining options as needed.
9. Click *OK*.

Testing the connection to the TCP forwarding access proxy

Before connecting, users must have a ZTNA Destination in FortiClient.

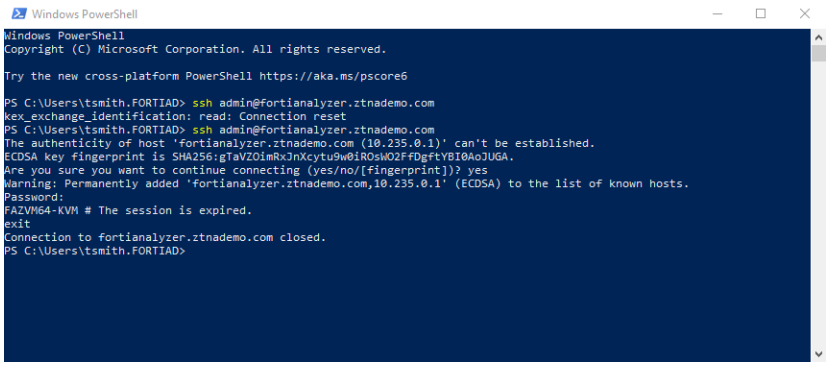
ZTNA TCP forwarding rules can be provisioned from the EMS server. See FQDN-based ZTNA TCP forwarding services for more details.

To create the ZTNA rules in FortiClient and connect:

1. From the *ZTNA Destination* tab, click *Add Destination*.
2. Create a rule for the FortiAnalyzer:
   a. Set *Destination Name* to *SSH*.
   b. Set *Destination Host* to *fortianalyzer.ztnademo.com:22*.
   c. Set *Proxy Gateway* to *10.0.3.10*.
   d. Click *Create*.
3. Upon creating the ZTNA rules, FortiClient now resolves fortianalyzer.ztnademo.com to a special address, overriding any DNS resolution for this host. From the Windows command prompt:

```
> ping fortianalyzer.ztnademo.com
Pinging fortianalyzer.ztnademo.com [10.235.0.1] with 32 bytes of data:
```

   Note that the ping will not be successful.
4. FortiClient will listen to the traffic to this FQDN and forward them to the TCP forwarding access proxy.
5. Have the remote user connect to fortianalyzer.ztnademo.com from Powershell. The connection will be successful.



From the FortiGate, go to *Log & Report > ZTNA Traffic* to view the logs. Alternatively, use the CLI to display the most recent ZTNA logs:

```
# execute log filter category 0
# execute log filter field subtype ztna
# execute log display

1: date=2024-09-16 time=12:02:24 eventtime=1726513343785273146 tz="-0700" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=17805
srcintf="port3" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved" dstip=10.88.0.2
dstport=22 dstintf="port2" dstintfrole="dmz" sessionid=56690 srcuuid="b458a65a-f759-51ea-d7df-

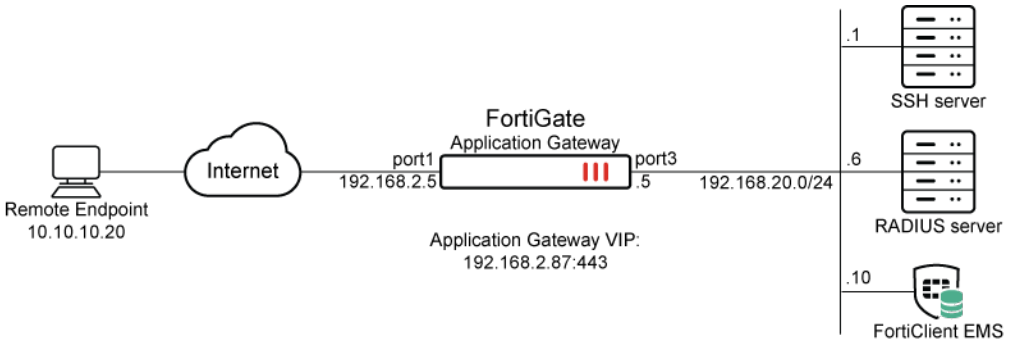
```

ZTNA SSH access proxy example

ZTNA can be configured with SSH access proxy to provide a seamless SSH connection to the server.

Advantages of using an SSH access proxy instead of a TCP forwarding access proxy include:

- Establishing device trust context with user identity and device identity checks.
- Applying SSH deep inspection to the traffic through the SSH related profile.
- Performing optional SSH host-key validation of the server.
- Using one-time user authentication to authenticate the ZTNA SSH access proxy connection and the SSH server connection.



Perform SSH host-key validation of the server

To act as a reverse proxy for the SSH server, the FortiGate must perform SSH host-key validation to verify the identity of the SSH server. The FortiGate does this by storing the public key of the SSH server in its SSH host-key configurations. When a connection is made to the SSH server, if the public key matches one that is used by the server, then the connection is established. If there is no match, then the connection fails.

One-time user authentication

SSH access proxy allows user authentication to occur between the client and the access proxy, while using the same user credentials to authenticate with the SSH server. The following illustrates how this works:

1. The remote endpoint registers to FortiClient EMS and receives the client certificate.
2. The remote endpoint tries to connect to the SSH access proxy. It must use the same username that is later used for access proxy authentication.
3. The FortiGate challenges the endpoint with device identity validation.
4. The remote endpoint provides the EMS issued certificate for device identification.
5. The FortiGate challenges the endpoint with user authentication. For example, this could be done with basic or SAML authentication.
6. The users enters their credentials on the remote endpoint.
7. The FortiGate authenticates the user and collects the username.
8. Using the FortiGate's CA or the customer's CA certificate, the FortiGate signs an SSH certificate and embeds the username in its principal.
9. The FortiGate attempts to connect to the SSH server using the certificate authentication.
10. The SSH server verifies the authenticity of the certificate, and matches the username principal against its authorized_keys file.
11. If the username matches a record in the file, then the SSH connection is established. If no match is found, then the SSH connection fails.

Example

In this example, an SSH connection is established using SSH access proxy with host-key validation and one-time authentication.

- The SSH server is a Linux based server that uses sshd to provide remote access
- For SSH host-key validation, the public key of the SSH server has been imported into the FortiGate.
- For one-time authentication using certificate authentication:
  - The SSH server must allow certificate authentication.
  - The SSH server must have the proper entry in its authorized_keys file that contains the user principal and the FortiGate CA's public key.
  - The entry is present in the user directory corresponding to the user that is trying to log in.

To pre-configure the Linux SSH server:

1. Retrieve the public key used for host-key validation:
   a. Locate the public key files in the SSH server:

```
$ ls -la /etc/ssh/*.pub
-rw-r--r-- 1 root root 186 Mar 29  2020 /etc/ssh/ssh_host_ecdsa_key.pub
-rw-r--r-- 1 root root 106 Mar 29  2020 /etc/ssh/ssh_host_ed25519_key.pub
-rw-r--r-- 1 root root 406 Mar 29  2020 /etc/ssh/ssh_host_rsa_key.pub2
```

   b. Choose the public key file based on the hash type (in this case, ECDSA), and show it's content:

```
$ cat /etc/ssh/ssh_host_ecdsa_key.pub
ecdsa-sha2-nistp256 AAAAE2*********IpEik=
```

   This key will be used when configuring the FortiGate.
2. Retrieve the FortiGate CA's public key from the FortiGate:

```
# show full firewall ssh local-ca Fortinet_SSH_CA
config firewall ssh local-ca
    edit "Fortinet_SSH_CA"
        set password ENC <hidden password>
        set private-key "-----BEGIN OPENSSH PRIVATE KEY-----
<hidden private key>
-----END OPENSSH PRIVATE KEY-----"
        set public-key "ssh-rsa AAAAB3**********JLXlxj3”
        set source built-in
    next
end
```

3. On the Linux server, enable the SSH service to use the authorized_keys file:
   a. Locate and edit the */etc/ssh/sshd_config* file.
   b. Ensure that the *AuthorizedKeysFile* line is uncommented, for example:

```
AuthorizedKeysFile      .ssh/authorized_keys .ssh/authorized_keys2
```

4. Allow remote SSH log in with certificate authentication and principal name:
   a. Log in to the SSH server using the account that will be granted remote SSH access (in this example: *radCurtis*):
   b. Locate the account's authorized_keys file in the *~/.ssh* directory:

```
$ ls -la ~/.ssh
total 12
drwxrwxr-x 2 radCurtis radCurtis 4096 Aug 10 19:14 .
drwxr-xr-x 5 radCurtis radCurtis 4096 Aug 10 19:13 ..
-rw-rw-r-- 1 radCurtis radCurtis  419 Aug 10 19:14 authorized_keys
```

   c. If the directory and file do not exist, create the directory:

```
$ mkdir ~/.ssh
```

   d. Create an entry containing the following keywords and add them to the authorized_keys file:

```
echo 'cert-authority,principals="radCurtis" ssh-rsa AAAAB3**********JLXlxj3' >>
authorized_keys
```

Where:

- `cert-authority` - indicates that this entry is used in certificate authentication by validating the certificate using the public key provided in this entry.
- `principals="radCurtis"` - indicates the user that must match with the username embedded in the SSH certificate.
- `ssh-rsa AAAAB3**********JLXlxj3` - indicates the FortiGate CA's public key that is used to validate the SSH certificate.

5. Restart the sshd service:

```
$ sudo systemctl stop sshd
$ sudo systemctl start sshd
```

The SSH server can now accept SSH connection from *radCurtis@<server IP>*, where the SSH certificate used by the FortiGate to log in contains radCurtis embedded as a principal.

When a user connects from a SSH client using *<username>@<server IP>*, sshd will locate the authorized_keys file in the directory */home/<username>/.ssh/authorized_keys*. If the authorized_keys is not in that directory, authentication will fail on the SSH server side.

If you suspect that authentication is failing on the SSH server, use the following commands to manually start sshd in debug mode to troubleshoot:

```
$ sudo systemctl stop sshd

$ /usr/sbin/sshd -ddd -p 22
```

To configure the FortiGate :

1. Configure a new VIP to allow access to the SSH access proxy over 192.168.2.87:443:

```
config firewall vip
    edit "ZTNA_SSH"
        set type access-proxy
        set extip 192.168.2.87
        set extintf "any"
        set server-type https
        set extport 443
        set ssl-certificate "Fortinet_SSL"
    next
end
```

2. Configure the address object for the SSH server:

```
config firewall address
    edit "SSH_server"
        set subnet 192.168.20.1 255.255.255.255
```

```
    next
end
```

3. Configure the host-key that will be used to authenticate the SSH server. The public-key was retrieved when pre-configure the Linux SSH server (step 1b).

```
config firewall ssh host-key
    edit "ed25519"
        set type ECDSA
        set usage access-proxy
        set public-key "AAAAE2**********IpEik="
    next
end
```

4. Configure the access proxy SSH client certificate:

   A CA certificate is assigned to sign the SSH certificate that will be used in the SSH authentication. The SSH certificate will have the username embedded in the certificate principal.

```
config firewall access-proxy-ssh-client-cert
    edit "ssh-access-proxy"
        set source-address enable
        set auth-ca "Fortinet_SSH_CA"
    next
end
```

5. Configure the access-proxy server setting:

```
config firewall access-proxy
    edit "ZTNA_SSH"
        set vip "ZTNA_SSH"
        config api-gateway
            edit 1
                set url-map "tcp"
                set service tcp-forwarding
                config realservers
                    edit 1
                        set address "SSH_server"
                        set type ssh
                        set ssh-client-cert "ssh-access-proxy"
                        set ssh-host-key-validation enable
                        set ssh-host-key "ed25519"
                    next
                end
            next
        end
    next
end
```

6. Configure the RADIUS setting, user setting, and user group to apply user authentication to the access proxy connection using RADIUS:

```
config user radius
    edit "Win2k16-Radius"
        set server "192.168.20.6"
        set secret ENC <secret>
    next
end
config user local
    edit "radCurtis"
        set type radius
        set radius-server "Win2k16-Radius"
    next
end
config user group
        edit "radius_group"
        set member "radCurtis" "Win2k16-Radius"
    next
end
```

7. Create the authentication scheme and rule to perform the authentication:

```
config authentication scheme
    edit "basic_auth"
        set method basic
        set user-database "Win2k16-Radius"
    next
end
config authentication rule
    edit "ztna-basic"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "basic_auth"
        set web-auth-cookie enable
    next
end
```

8. Configure the full ZTNA policy to allow traffic to the SSH server, and apply user authentication, posture check, and a security profile where necessary:

```
config firewall proxy-policy
    edit 5
        set name "SSH-proxy"
        set proxy access-proxy
        set access-proxy "ZTNA_SSH"
        set srcintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set ztna-ems-tag "FCTEMS8821001056_ems138_av_tag"
        set action accept
        set schedule "always"
        set groups "radius_group"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
```

```
    next
end
```

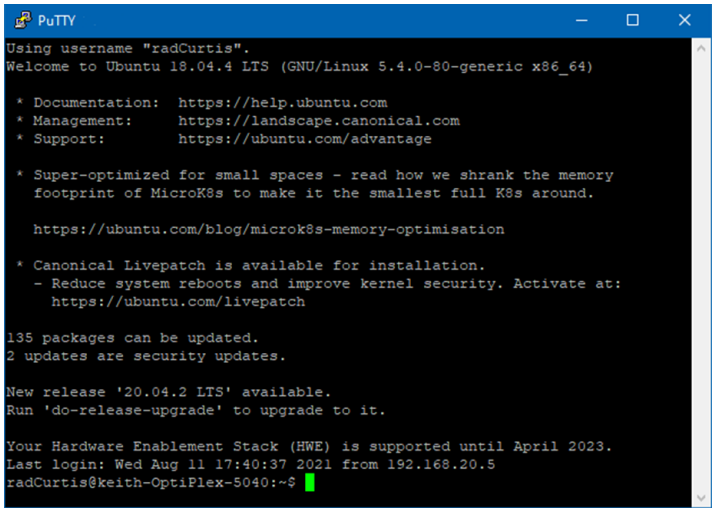
To check the results:

1. On the remote client, open FortiClient, go to the *Zero Trust Telemetry* tab, and make sure that it is connected to the EMS server.
2. Go to the *ZTNA Destination* tab and click *Add Destination*.
3. Configure the Destination, then click *Create*:

Rule Name	SSH-Linux
Destination Host	192.168.20.1:22
Proxy Gateway	192.168.2.87:443
Mode	Transparent
Encryption	Disabled (recommended)

   When Encryption is disabled, the connection between the client and FortiGate application gateway is not encapsulated in HTTPS after the client and FortiGate connection is established. This allows for less overhead, because SSH is already a secure connection.
4. Open an SSH client, such as PuTTy, and make an SSH connection to *radCurtis@192.168.20.1* on port *22*.
5. After device authentication is performed and passes in the background, FortiClient prompts the user to sign in. Enter the username, *radCurtis*, and password, then click *Sign in*.

   After successful user authentication, the SSH connection is established without an additional log in.



6. On the FortiGate, check the logged in user:

a. Go to *Dashboard* > *Assets & Identities* and expand the *Firewall Users* widget.
b. Check the WAD proxy user list:

```
# diagnose wad user list
ID: 2, VDOM: root, IPv4: 10.10.10.25
  user name   : radCurtis
  worker      : 0
  duration    : 614
  auth_type   : Session
  auth_method : Basic
  pol_id      : 5
  g_id        : 12
  user_based  : 0
  expire      : 53
  LAN:
    bytes_in=3403 bytes_out=5699
  WAN:
    bytes_in=3681 bytes_out=3132
```

7. The successful connection is logged in the forward traffic logs after the SSH connection has disconnected:

```
# execute log display
25 logs found.
10 logs returned.

1: date=2021-08-11 time=17:59:56 eventtime=1628729996110159120 tz="-0700" logid="0000000024"

ZTNA application gateway with SAML authentication example

SAML can be used with ZTNA as an authentication method. This allows user credentials to be stored remotely on an Identity Provider (IdP), with the FortiGate acting as the Service Provider (SP) to redirect users to the IdP for authentication. Once authenticated, the FortiGate as the trust broker can perform policy enforcement and authorization based on the SAML assertion that is returned.

For a basic configuration:

1. Configure a SAML SSO object on the FortiGate.
2. Apply the SAML SSO object to an authentication scheme.
3. Apply SAML to the ZTNA server object.
4. Create a user group that uses the SAML SSO object as its remote authentication server.
5. Apply the user group to a ZTNA policy.

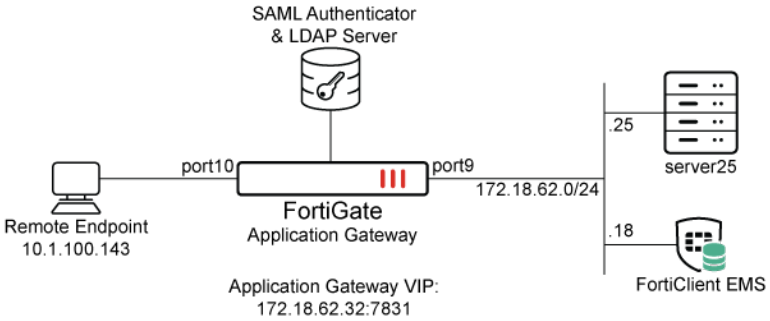
For a more advanced configuration, the group attribute returned from the SAML assertion from the IdP can be ignored and instead, the authenticated user can be queried using a different method, such as LDAP, to acquire its user group. The returned user group is then used for authorization on the ZTNA policy.

In this example, the configuration steps are:

1. Configure a SAML SSO object on the FortiGate.
2. Configure an LDAP server object on the FortiGate.
3. Apply the SAML SSO object to an authentication scheme, with the user-database configured to the LDAP server object.
4. Apply SAML to the ZTNA server object.
5. Create a user group that uses the LDAP server object as its remote authentication server.
6. Apply the user group to a ZTNA policy.

Example

In this example, an HTTPS access proxy is configured, and SAML authentication is applied to authenticate the client. The FortiGate acts as the SAML SP and a SAML authenticator serves as the IdP. In addition to verifying the user and device identity with the client certificate, the user is also authorized based on user credentials to establish a trust context before granting access to the protected resource. The user group returned from the SAML assertion is overridden by the group returned from querying the LDAP server directly.



This example assumes that the FortiGate EMS fabric connector is already successfully connected.

To configure the access proxy VIP:

```
config firewall vip
    edit "ZTNA_server01"
        set type access-proxy
        set extip 172.18.62.32
        set extintf "any"
        set server-type https
        set extport 7831
        set ssl-certificate "Fortinet_SSL"
    next
end
```

To configure access proxy server mappings:

```
config firewall access-proxy
    edit "ZTNA_server01"
        set vip "ZTNA_server01"
        config api-gateway
            edit 1
                set service https
                config realservers
                    edit 1
                        set ip 172.18.62.25
                        set port 443
                    next
                end
            next
        end
    next
end
```

To configure a SAML server:

```
config user saml
    edit "saml_ztna"
        set cert "Fortinet_CA_SSL"
        set entity-id "https://fgt9.myqalab.local:7831/samlap"
        set single-sign-on-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/login/"
        set single-logout-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/logout/"
        set idp-entity-id "http://MYQALAB.LOCAL/adfs/services/trust"
        set idp-single-sign-on-url "https://myqalab.local/adfs/ls"
        set idp-single-logout-url "https://myqalab.local/adfs/ls"
        set idp-cert "REMOTE_Cert_4"
        set digest-method sha256
        set adfs-claim enable
        set user-claim-type upn
        set group-claim-type group-sid
    next
end
```

To map the SAML server into an access proxy configuration:

```
config firewall access-proxy
    edit "ZTNA_server01"
        config api-gateway
             edit 3
                set service samlsp
                set saml-server "saml_ztna"
            next
        end
    next
end
```

To configure an LDAP server and an LDAP server group to verify user groups:

```
config user ldap
    edit "ldap-10.1.100.198"
        set server "10.1.100.198"
        set cnid "cn"
        set dn "dc=myqalab,dc=local"
        set type regular
        set username "cn=fosqa1,cn=users,dc=myqalab,dc=local"
        set password **********
        set group-search-base "dc=myqalab,dc=local"
    next
end
```

```
config user group
    edit "ldap-group-saml"
        set member "ldap-10.1.100.198"
    next
end
```

To configure the authentication rule and scheme to match the new SAML server:

```
config authentication rule
    edit "saml_ztna"
        set srcintf "port10"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "saml_ztna"
        set web-auth-cookie enable
    next
end
```

```
config authentication scheme
    edit "saml_ztna"
        set method saml
        set saml-server "saml_ztna"
        set saml-timeout 30
        set user-database "ldap-10.1.100.198"
    next
end
```

To enable user group authentication in an access-proxy type firewall proxy-policy:

```
config firewall proxy-policy
    edit 6
        set name "ZTNA_remote"
        set proxy access-proxy
        set access-proxy "ZTNA_server01"
        set srcintf "any"
        set srcaddr "all"
```

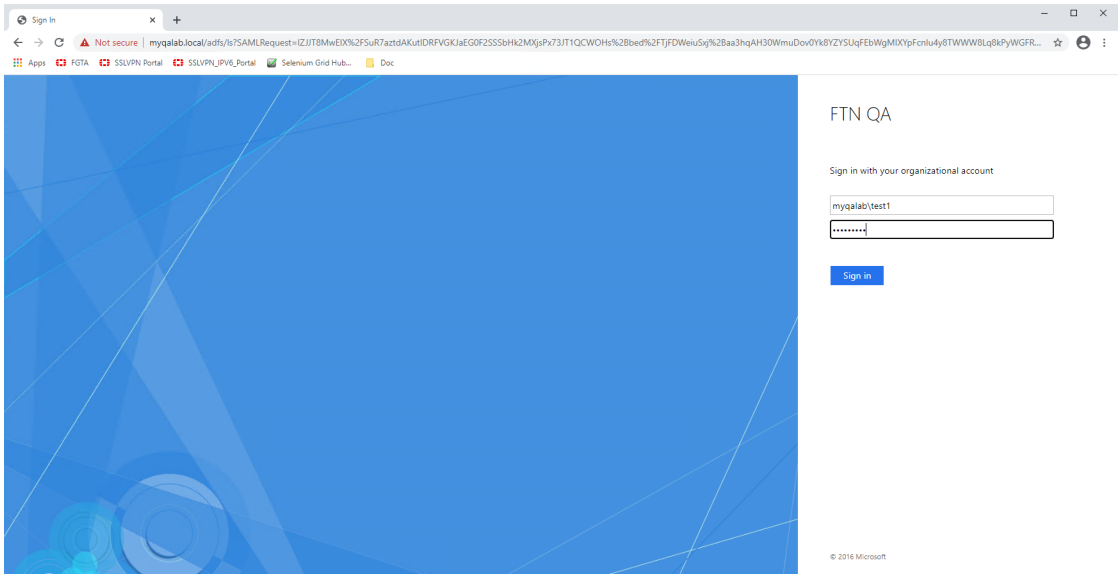
```
        set dstaddr "all"
        set action accept
        set schedule "always"
        set groups "ldap-group-saml"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
    next
end
```

Testing the connection

To test the connection:

It is not necessary to configure a *ZTNA Destination* on the FortiClient for the HTTPS access proxy use case. In fact, configuring a *ZTNA Destination* rule for the website may interfere with its operation.

1. On a client PC, try to access the webpage through the HTTPS access proxy. For example, go to http://172.18.62.32:7831 in a browser.
2. The client PC is prompted for a client certificate. After the certificate is validated, you are redirected to a SAML log in portal.



3. Enter your user credentials. The SAML server authenticates and sends a SAML assertion response message to the FortiGate.
4. The FortiGate queries the LDAP server for the user group, and then verifies the user group against the groups or groups defined in the proxy policy.
5. The user is proxied to the webpage on the real web server.

Logs and debugs

Use the following command to check the user information after the user has been authenticated:

```
# diagnose wad user list
ID: 7, VDOM: vdom1, IPv4: 10.1.100.143
  user name    : test1@MYQALAB.local
  worker       : 0
  duration     : 124
  auth_type    : Session
  auth_method : SAML
  pol_id       : 6
  g_id         : 13
  user_based   : 0
  expire       : no
  LAN:
    bytes_in=25953 bytes_out=14158
  WAN:
    bytes_in=8828 bytes_out=6830
```

Event log:

```
1: date=2021-03-24 time=19:02:21 eventtime=1616637742066893182 tz="-0700" logid="0102043025"
type="event" subtype="user" level="notice" vd="vdom1" logdesc="Explicit proxy authentication
successful" srcip=10.1.100.143 dstip=172.18.62.32 authid="saml" user="test1@MYQALAB.local"
group="N/A" authproto="HTTP(10.1.100.143)" action="authentication" status="success"
reason="Authentication succeeded" msg="User test1@MYQALAB.local succeeded in authentication"
```

Traffic log:

```
1: date=2021-03-24 time=19:09:06 eventtime=1616638146541253587 tz="-0700" logid="0000000010"

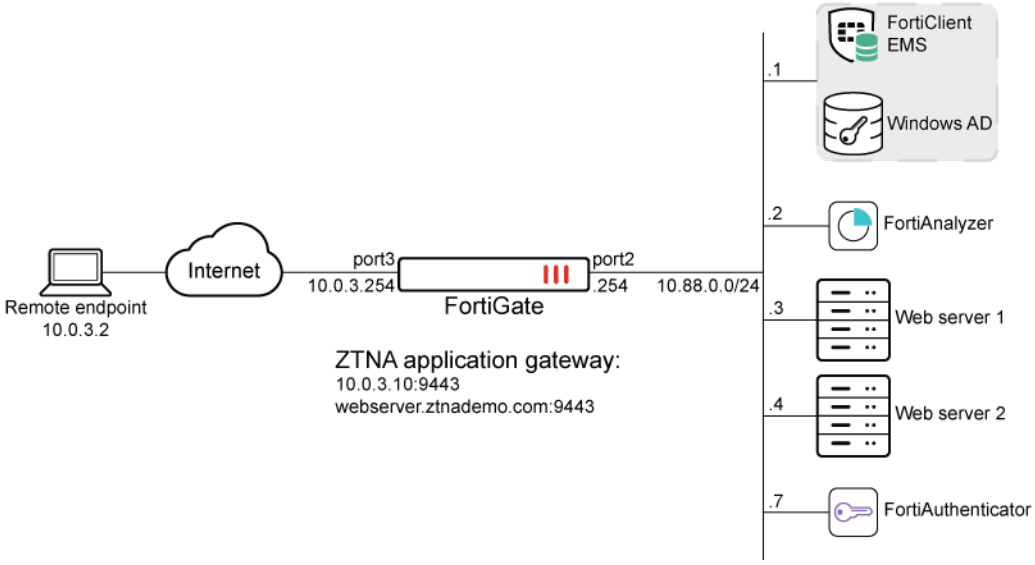
ZTNA application gateway with SAML and MFA using FortiAuthenticator example

ZTNA application gateway supports device verification using device certificates that are issued by EMS. To authenticate users, administrators can use either basic or SAML authentication. An advantage of SAML authentication is that multi-factor authentication (MFA) can be provided by the SAML Identity Provider (IdP).

In these examples, a FortiAuthenticator is used as the IdP, and MFA is applied to user authentication for remote users accessing the web, RDP, and SSH resources over the ZTNA application gateway. It is assumed that the FortiGate EMS fabric connector has already been successfully connected.

- Configuring FortiAuthenticator on page 1503
- Configuring the FortiGate SAML settings on page 1507
- Example 1 - Applying SAML and MFA to ZTNA HTTPS access proxy on page 1512

- Example 2 - Applying SAML and MFA to a ZTNA TCP forwarding access proxy for RDP connections on page 1515
- Example 3 - Applying SAML and MFA to a ZTNA SSH access proxy on page 1517



DNS resolutions:

- webserver.ztnademo.com:9443 -> 10.0.3.10:9443
- fac.ztnademo.com -> 10.0.3.7

The FortiAuthenticator (FAC) integrates with Active Directory (AD) on the Windows Domain Controller, which is also acting as the EMS server. Users are synchronized from the AD to the FAC, and remote users are configured with token-based authentication. SAML authentication is configured on the FortiGate, pointing to the FAC as the SAML IdP. The SAML server is applied to the ZTNA application gateway authentication scheme and rule, to provide the foundation for applying user authentication on individual ZTNA policies.

Configuring FortiAuthenticator

First configure FortiAuthenticator to synchronize users from AD using LDAP, apply MFA to individual remote users, and be the IdP.

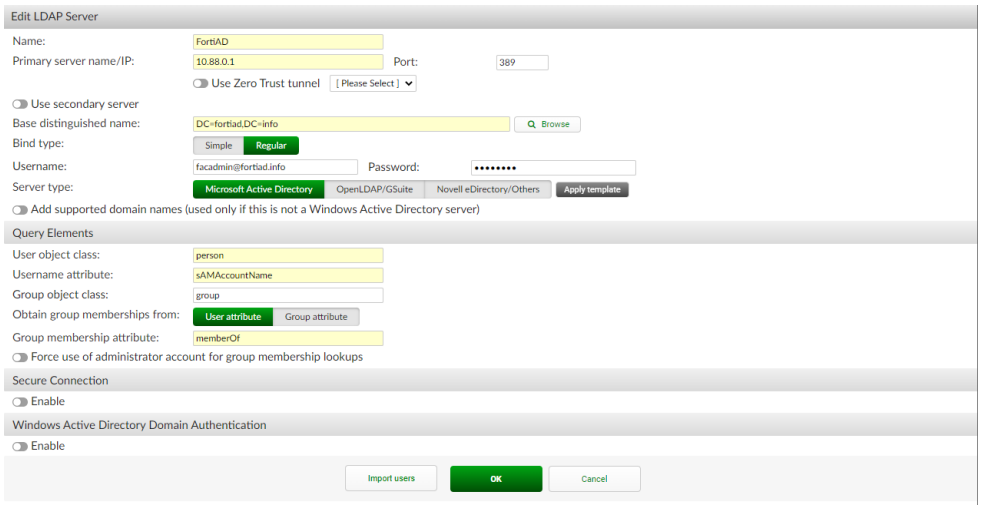
To create a remote authentication server pointing to the Windows AD:

1. Go to *Authentication* > *Remote Auth. Servers* > *LDAP* and click *Create New*.
2. Configure the following:

Name	FortiAD
Primary server name / IP	10.88.0.1
Port	389 (or another port if using LDAPS)
Based distinguished name	DC=fortiad,DC=info
Bind type	Regular

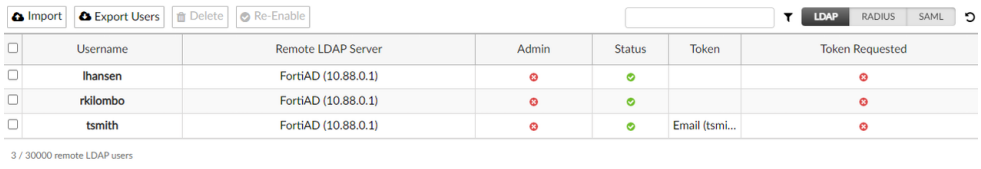
Username	<user account used for LDAP bind>
Password	<password of user>
Server Type	Microsoft Active Directory
User object class	person (default)
Username attribute	sAMAccountName (default)
Group object class	group (default)
Obtain group membership from	User attribute
Group membership attribute	memberOf (default)
Secure connection	Enable if using LDAPS or STARTTLS

3. Click *OK*.
4. Edit the *FortiAD* entry.
5. At the bottom, click *Import users*.



6. On the *Import Remote LDAP User* screen, configure the following settings:
   a. For *Remote LDAP Server*, select *FortiAD*.
   b. For *Action*, select *Import users*.
      i. Click *Go*.
      ii. Select the users to import.
      iii. Click *OK*.

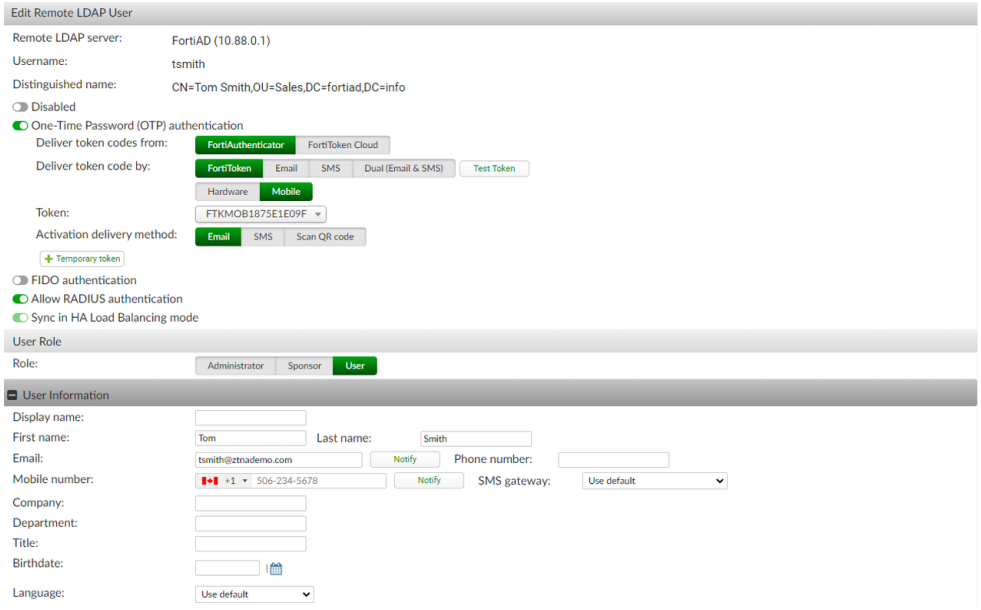
   The screen displays the users that are imported.



For more details, see LDAP in the FortiAuthenticator Administration Guide.

To configure a remote LDAP user to use MFA:

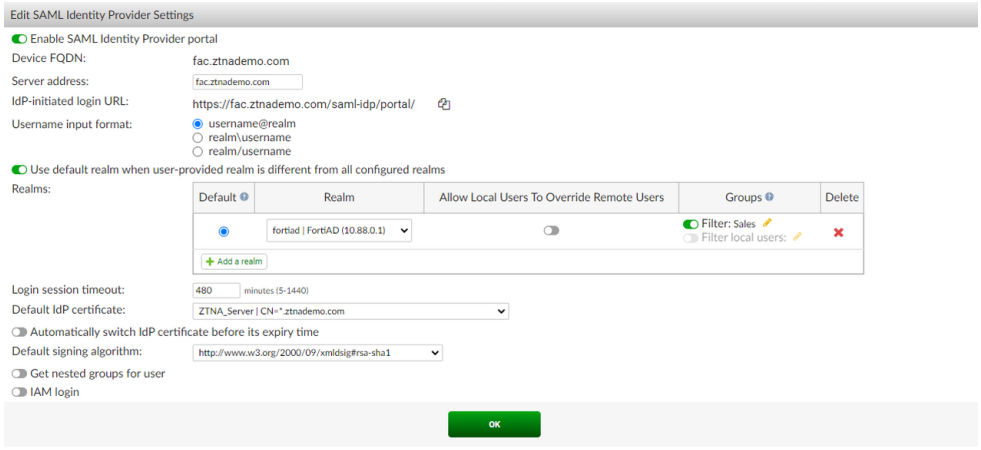
1. Go to *Authentication > User Management > Remote Users*, and edit a user.
2. Enable *One-Time Password (OTP) authentication*.
   a. Set *Deliver token codes from*.
   b. Set *Deliver token by*.
   For this example, select *FortiToken > Mobile*, select the Token from the drop-down list, and set the *Activation delivery method* to email.
3. In the *User Information* section, add the email address that will be used for the FortiToken activation.



4. Click *OK*.
   An activation email is sent to the user that they can use to install the token to their FortiToken Mobile app.
   For more details, see Remote users in the FortiAuthenticator Administration Guide.

To configure SAML IdP:

1. Go to *Authentication > SAML IdP > General* and enable *Enable SAML Identity Provider portal*.
2. The *Server address* is the device FQDN or IP address (configured in the System Information widget at *System > Dashboard > Status*). In this example, it is *fac.ztnademo.com*.
3. Set *Username input format* to *username@realm*.
4. Click *Add a realm* in the *Realms* table:
   a. Set *Realm* to the just created LDAP realm (*FortiAD*).
   b. Optionally, enable *Filter* and select the required users groups. In this example, *Sales* is configured.
5. Set *Default IdP certificate* to the certificate that will be used in the HTTPS connection to the IdP portal.

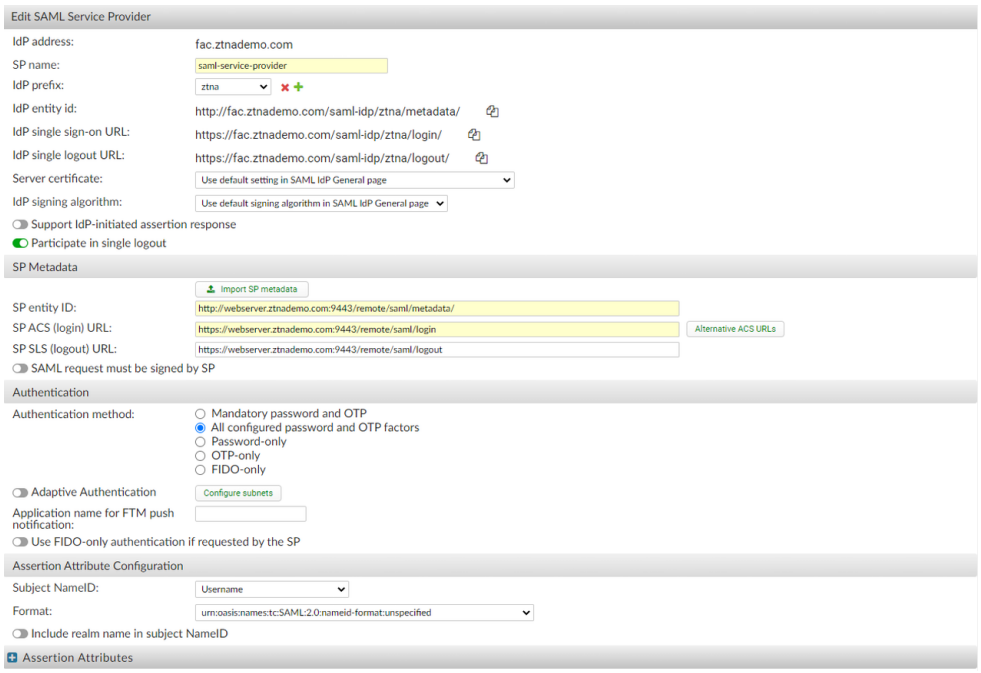


6. Click *OK*.
7. Go to *Authentication > SAML IdP > Service Providers*, and click *Create New* to create a service provider (SP) for the FortiGate SP.
8. Configure the following, which must match what will be configured on the FortiGate:

SP name	saml-service-provider
IdP prefix	ztna
Server certificate	Use default setting in *SAML IdP > General* page.
SP entity ID	http://webserver.ztnademo.com:9443/remote/saml/metadata/
SP ACS (login) URL	https://webserver.ztnademo.com:9443/remote/saml/login
SP SLS (logout) URL	https://webserver.ztnademo.com:9443/remote/saml/logout
Participate in single logout	Enable

Where the *SP entity ID*, *SP ACS (login) URL*, and *SP SLS (logout) URL* break down as follows:

- *webserver.ztnademo.com* - The FQDN that resolves to the FortiGate SP.
- *9443* - The port that is used to map to the FortiGate's SAML SP service.
- */remote/saml* - The custom, user defined fields.
- */metadata*, */login*, and */logout* - The standard convention used to identify the SP entity, log in portal, and log out portal.



9. Click *OK*.
10. Edit the just created SP object and, under *Assertion Attribute*, click *Add Assertion Attribute*.
11. Set *SAML attribute* to the username and set *User attribute* to *Username*, then click *OK*.
12. Click *OK*.

For more details, see Configuring SAML settings in the SAML Interoperability Guide.

Configuring the FortiGate SAML settings

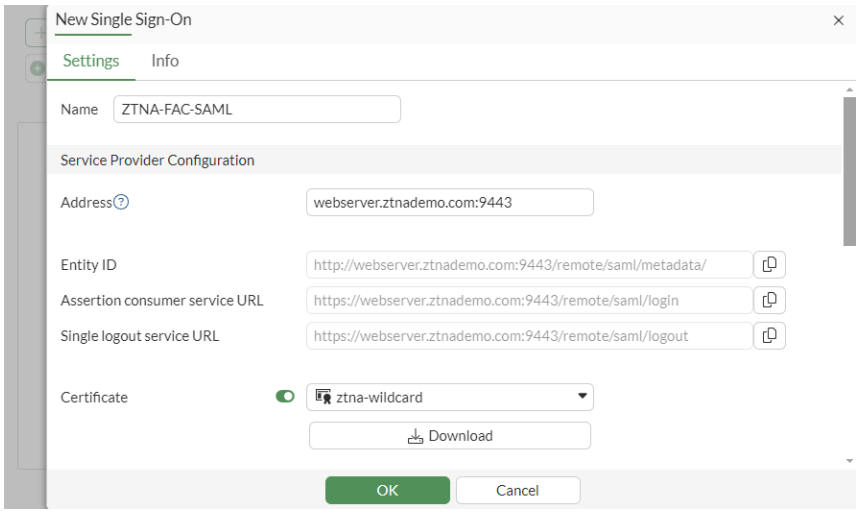
On FortiGate, a SAML user is used to define the SAML SP and IdP settings. This user is then applied to the ZTNA proxy using an authentication scheme, rule, and settings. A ZTNA server is then created to allow access to the SAML SP server so that end users can reach the FortiGate SP's captive portal. The SAML user must then be added to a ZTNA policy to trigger authentication when accessing the ZTNA application gateway.

To create a new SAML user/server from the GUI:

1. On the FortiGate, go to *User & Authentication* > *Single Sign-On*.
2. Click *Create New*.
3. Set *Name* to *ZTNA-FAC-SAML*.
4. Set *Address* to *webserver.ztnademo.com:9443*.

   The *Entity ID*, *Assertion consumer service URL* and *Single logout service URL* will be updated. These should be the same URLs you inputted into FAC.
5. Enable *Certificate*, then select the certificate used for the client.

   In this example, the *ztna-wildcard* certificate is a local certificate that is used to sign SAML messages that are exchanged between the client and the FortiGate SP.

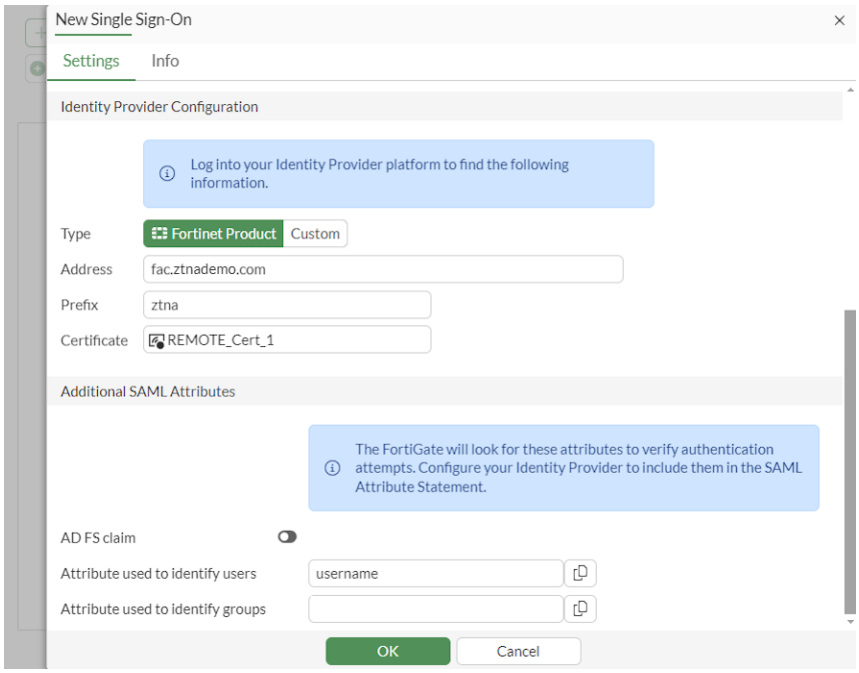


6. Use the settings from the Identity Provider to fill the custom *Identity Provider Details*. In this example, we select *Fortinet Product*, and fill in the fields as follows:

Address	fac.ztnademo.com
Prefix	ztna
IdP certificate	REMOTE_Cert_1

   - Where the `REMOTE_Cert_1` certificate is a remote certificate that is used to identify the IdP; in this example, fac.ztnademo.com.

7. Set *Attribute used to identify users* to *username*. Attributes to identify users and groups are case sensitive.



8. Click *Submit* to save the settings.

To create a new SAML user/server from the CLI:

```
config user saml
    edit "ZTNA-FAC-SAML"
        set cert "ztna-wildcard"
        set entity-id "http://webserver.ztnademo.com:9443/remote/saml/metadata/"
        set single-sign-on-url "https://webserver.ztnademo.com:9443/remote/saml/login"
        set single-logout-url "https://webserver.ztnademo.com:9443/remote/saml/logout"
        set idp-entity-id "http://fac.ztnademo.com/saml-idp/ztna/metadata/"
        set idp-single-sign-on-url "https://fac.ztnademo.com/saml-idp/ztna/login/"
        set idp-single-logout-url "https://fac.ztnademo.com/saml-idp/ztna/logout/"
        set idp-cert "REMOTE_Cert_1"
        set user-name "username"
        set digest-method sha1
    next
end
```

To create a user group for the SAML user object:

1. Under *User & Authentication > User Groups*, click *Create New*.
2. Set *Name* to *ztna-saml-users*.
3. Under *Remote Groups*, click *Add*.
4. For *Remote Server*, select *ZTNA-FAC-SAML*.
5. Click *OK*.
6. Click *OK* again to save.

To apply the SAML server to proxy authentication from the GUI:

1. Go to *Policy & Objects > Authentication Rules*.
2. Go to the *Authentication Schemes* tab and click *Create New*.
3. Set the name to *ZTNA-SAML-scheme*.
4. Set *Method* to *SAML*.
5. Set *SAML SSO server* to *ZTNA-FAC-SAML*.
6. Click *OK*.
7. Go to *Policy & Objects > Authentication Rules*.
8. Click *Create New*.
9. Set the *Name* to *ZTNA-SAML-rule*.
10. Set *Source Address* to *all*.
11. Set *Incoming interface* to *port3*.
12. Set *Protocol* to *HTTP*.
13. Enable *Authentication Scheme* and select *ZTNA-SAML-scheme*.
14. Set *IP-based Authentication* to *Disable*.
15. Click *OK*.

To apply the SAML server to proxy authentication from the CLI:

```
config authentication scheme
    edit "ZTNA-SAML-scheme"
        set method saml
        set saml-server "ZTNA-FAC-SAML"
    next
end
config authentication rule
    edit "ZTNA-SAML-rule"
        set srcintf "port3"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "ZTNA-SAML-scheme"
        set web-auth-cookie enable
    next
end
```

Assign an active authentication scheme and captive portal to serve the log in page for the SAML requests.

To configure the active authentication scheme and captive portal from the GUI:

1. Go to *User & Authentication > Authentication Settings*.
2. Enable *Authentication scheme*.
3. Select *ZTNA-SAML-scheme*.
4. Set *Captive portal type* to *FQDN*.
5. Enable *Captive portal*.
6. Select the firewall address *webserver.ztnademo.com*. If this has not be created, create this firewall address.
7. Click *Apply* to save.

To configure the active authentication scheme and captive portal from the CLI:

```
config firewall address
    edit "webserver.ztnademo.com"
        set type fqdn
        set fqdn "webserver.ztnademo.com"
    next
end
config authentication setting
    set active-auth-scheme "ZTNA-SAML-scheme"
    set captive-portal "webserver.ztnademo.com"
end
```

To configure a ZTNA application gateway to allow SAML authentication requests to the SP:

1. Configure the ZTNA server:
   a. Go to *Policy & Objects > ZTNA*, select the *ZTNA Server* tab, and click *Create New*.
   b. Configure the following:

Name	ZTNA-access
Interface	Any
IP address	10.0.3.10
Port	9443
SAML	Enabled
SAML SSO server	ZTNA-FAC-SAML
Default certificate	ztna-wildcard

c. Click *OK*.

2. Define the full ZTNA policy to allow access to the ZTNA server:
   a. Go to *Policy & Objects > Proxy policy* and click *Create New*.
   b. Configure the following:

Name	ZTNA-Rule
Type	ZTNA
Incoming Interface	port3
Source (Address)	all
Source (User)	ztna-saml-users
Destination	all
ZTNA Server	ZTNA-access
Action	Accept
Log Allowed Traffic	All Sessions

   c. Click *OK*.

To configure a VIP and a firewall policy to forward IdP authentication traffic to the FortiAuthenticator:

Remote clients connect to the FortiAuthenticator IdP behind the FortiGate using a VIP. In this example, users connect to the FQDN fac.ztnademo.com that resolves to the VIP's external IP address.

1. Configure the VIP to forward traffic to the FortiAuthenticator:
   a. Go to *Policy & Objects > Virtual IPs* and navigate to the *Virtual IP* tab.
   b. Click *Create new* .
   c. Configure the following:

Name	FAC-VIP
Interface	Any
External IP address/range	10.0.3.7

Map to > IPv4 address/range	10.88.0.7
Port Forwarding	Enabled
Protocol	TCP
External service port	443
Map to IPv4 port	443

d. Click *OK*.

2. Configure a firewall policy to allow VIP:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Configure the following:

Name	WAN_to_FAC
Schedule	Always
Action	Accept
Type	Standard
Incoming Interface	port3
Outgoing Interface	port2
Source	All
ZTNA server	FAC-VIP
Service	HTTP. HTTPS
NAT	disabled

   c. Click *OK*.

Example 1 - Applying SAML and MFA to ZTNA HTTPS access proxy

In this HTTPS access proxy example, two real servers are implemented with round robin load balancing performed between them. The HTTPS access proxy is configured on the same ZTNA server as was configured in the authentication step. The same ZTNA rule and firewall policy also apply.

To configure the ZTNA server for HTTPS access proxy with load balancing:

1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Server* tab.
2. Edit the ZTNA-access server.
3. In the *Service/server mapping* table, click *Create New*:
   a. Set *Service* to *HTTPS*.
   b. Set *Virtual Host* to *Any Host*.
   c. In the *Server* section, select *IP*:

   i. Set *IP address* to *10.88.0.3*.
   ii. Set *Port* to *9443*.
   iii. Click *OK*.
4. Click *OK*.
5. Use the CLI to configure the second server with IP *10.88.0.4*.

```
config firewall access-proxy
    edit "ZTNA-access"
        config api-gateway
            edit 1
                config realservers
                    edit 0
                        set ip 10.88.0.4
                        set port <real server 2 port>
                    next
                end
            next
        end
    next
end
```

6. In the GUI, edit the ZTNA-access server and verify the server mapping.
   a. In the *Service/server* mapping table, edit the entry. The *Load balancing* option is visible, and additional real servers can be added by clicking *Create new*.
   b. Click *Cancel*.

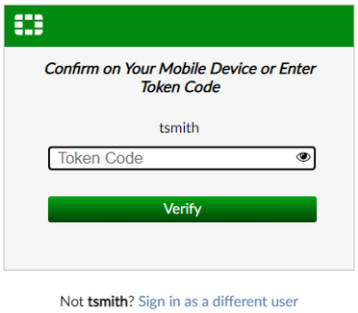
Testing and verification:

From the remote endpoint, user Tom Smith attempts to connect to the web server over ZTNA:

1. On the remote Windows computer, open FortiClient and register to the EMS server.

It is not necessary to configure a *ZTNA Destination* on the FortiClient for the HTTPS access proxy use case. In fact, configuring a *ZTNA Destination* rule for the website may interfere with its operation.

2. Open a browser and attempt to connect to the web server at *https://webserver.ztnademo.com:9443*.
3. Device authentication prompts the user for their device certificate. Select the certificate issued by EMS and click *OK*.
4. FortiGate receives the SAML request and redirects the user to the IdP login screen. Enter the username and password for Tom Smith and click *Login*.
5. A second prompt opens asking for the *Token Code*. Enter the code then click *Verify*.



6. The FortiAuthenticator IdP verifies the login, then sends the SAML assertion back to the user.
7. The browser redirects the assertion to the FortiGate SP, which decides if the user is allowed access.
8. On a successful log in, FortiGate redirects the user to the web page that they are trying to access.

Logs and debugs:

On the FortiGate, a successful connection can be seen in *Log & Report > Forward Traffic log*, or by using the CLI:

```
# execute log filter category 0
# execute log filter field subtype srcip
# execute log display
...
2: date=2023-05-09 time=00:47:56 eventtime=1683618475812847145 tz="-0700" logid="0005000024"

```

Log number ten shows that authentication first passes through the WAN_to_FAC policy. Log numbers two and eight show the traffic allowed through the ZTNA proxy-policy over two successive sessions. Note that they have different destination IP addresses (`dstip`), indicating that ZTNA was performing server load balancing.

Use the following command to show if the FortiGate's WAD process has an active record of the SAML user login:

```
# diagnose wad user list

ID: 8, VDOM: root, IPv4: 10.0.3.2
  user name    : tsmith
  worker       : 1
  duration     : 332
  auth_type    : Session
  auth_method  : SAML
  pol_id       : 1
  g_id         : 4
  user_based   : 0
  expire       : 390
  LAN:
    bytes_in=29519 bytes_out=629987
  WAN:
    bytes_in=958636 bytes_out=19201
```

Example 2 - Applying SAML and MFA to a ZTNA TCP forwarding access proxy for RDP connections

In this TCP forwarding access proxy example, RDP connections are allowed to be forwarded to the Windows/EMS server. Traffic to TCP/3389 is allowed through the ZTNA proxy.

To configure the ZTNA server for TCP forwarding on TCP/3389:

1. Create a firewall address for the Windows/EMS server:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. Configure the following:

Name	winserver
Interface	any
Type	Subnet
IP/Netmask	10.88.0.1/32

   d. Click *OK*.
2. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Server* tab.
3. Edit the ZTNA-access server.
4. In the *Service/server mapping* table, click *Create New*:
   a. Set *Service* to *TCP Forwarding*.
   b. In the *Server* section, set *Address* to *winserver*.

   c. Set *Ports* to *3389*.
   d. Click *OK*.
5. Click *OK*.

Testing and verification:

On the remote endpoint, manually configure a ZTNA destination to forward RDP traffic to the ZTNA application gateway. The rules can also be pushed from the EMS server; for details see Provisioning ZTNA TCP forwarding rules via EMS.

Configure the ZTNA Destination:

1. On the remote Windows computer, open FortiClient.
2. Register to the EMS server.
3. On the *ZTNA Destination* tab, click *Add Destination* to add a TCP forwarding rule.
4. Configure the following:

Rule Name	RDP-server
Destination Host	10.88.0.1:3389
Proxy Gateway	10.0.3.10:9443
Mode	Transparent
Encryption	Disabled *Encryption* can be enabled or disabled. When it is disabled, the client to access proxy connection is not encrypted in HTTPS. Because RDP is encrypted by default, disabling *Encryption* does not reduce security.

5. Click *Create*.

Connect over RDP:

1. On the remote PC, open a new RDP connection.
2. Enter the IP address 10.88.0.1. By default, RDP session use port 3389.

   When the connection to the ZTNA application gateway is established, FortiGate will redirect the SAML login request to the FortiAuthenticator IdP.

   A FortiClient prompt will open with the FortiAuthenticator login screen.
3. Enter the username and password then click *Login*.
4. A second prompt opens asking for the *Token Code*. Enter the code from your FortiToken app, then click *Verify*.
5. FortiAuthenticator verifies the token code, determines if the login is successful, then sends the SAML assertion back to the client.
6. The client redirects the response back to the FortiGate SP.
7. If the log in was successful, the user can now log on to the RDP session.

Logs and debugs:

On the FortiGate, a successful connection can be seen in *Log & Report > Forward Traffic log*, or by using the CLI:

```
# execute log filter category 0
# execute log filter field srcip 10.0.3.2
# execute log display
...
8: date=2023-05-09 time=01:14:34 eventtime=1683620074907124357 tz="-0700" logid="0005000024"

```

Use the following command to show if the FortiGate's WAD process has an active record of the SAML user login:

```
# diagnose wad user list

ID: 9, VDOM: root, IPv4: 10.0.3.2
  user name    : tsmith
  worker       : 1
  duration     : 164
  auth_type    : Session
  auth_method : SAML
  pol_id       : 1
  g_id         : 4
  user_based   : 0
  expire       : no
  LAN:
    bytes_in=80950 bytes_out=233010
  WAN:
    bytes_in=219973 bytes_out=58315
```

Example 3 - Applying SAML and MFA to a ZTNA SSH access proxy

In this SSH access proxy example, SSH connections can be forwarded to the FortiAnalyzer (10.88.0.2).

To configure the ZTNA server for SSH access proxy:

1. Create a firewall address for the web server:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. Configure the following:

Name	FAZ
Interface	any
Type	Subnet
IP/Netmask	10.88.0.2/32

   d. Click *OK*.
2. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Server* tab.
3. Edit the ZTNA-access server.
4. In the *Service/server mapping* table, edit the *TCP Forwarding* entry:
   a. In the *Servers* table click *Create New*:
      i. Set *Address* to *FAZ*.
      ii. Set *Ports* to *22*.
      iii. Optionally, enable *Additional SSH Options* to configure other SSH options as needed.
      iv. Click *OK*.
   b. Click *OK*.
5. Click *OK*.

Testing and verification:

On the remote endpoint, manually configure ZTNA destination to forward SSH traffic to the ZTNA access proxy. The destination can also be pushed from the EMS server; for details see Provisioning ZTNA TCP forwarding rules via EMS.

Configure the ZTNA Destination:

1. On the remote Windows computer, open FortiClient.
2. Register to the EMS server.
3. On the *ZTNA Destination* tab, click *Add Destination* to add a TCP forwarding rule.
4. Configure the following:

Rule Name	SSH-FAZ
Destination Host	10.88.0.2:22
Proxy Gateway	10.0.3.10:9443
Mode	Transparent
Encryption	Disabled

5. Click *Create*.

Connect over SSH:

1. On the remote PC, open a new SSH connection.
2. Enter the host admin@10.88.0.2 on port 22.
   When the connection to the ZTNA application is established, FortiGate will redirect the SAML login request to the FortiAuthenticator IdP.
   A FortiClient prompt will open with the FortiAuthenticator login screen.
3. Enter the username and password then click *Login*.

4. A second prompt opens asking for the *Token Code*. Enter the code from your FortiToken app, then click *Verify*.
5. FortiAuthenticator verifies the token code, determines if the login is successful, then sends the SAML assertion back to the client.
6. The client redirects the response back to the FortiGate SP.
7. If the log in was successful, the user can now log on to the SSH session.

Logs and debugs:

On the FortiGate, a successful connection can be seen in *Log & Report > Forward Traffic log*, or by using the CLI:

```
# execute log filter category 0
# execute log filter field srcip 10.0.3.2
# execute log display
...
5: date=2023-05-09 time=10:06:04 eventtime=1683651963820802005 tz="-0700" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=22536
srcintf="port3" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved" dstip=10.88.0.2
dstport=22 dstintf="port2" dstintfrole="dmz" sessionid=151696 service="SSH" proxyapptype="http"

```

Use the following command to show if the FortiGate's WAD process has an active record of the SAML user login:

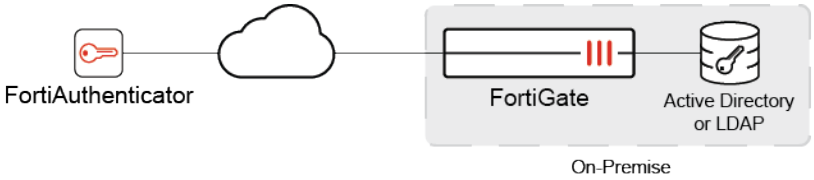
```
# diagnose wad user list

ID: 10, VDOM: root, IPv4: 10.0.3.2
  user name   : tsmith
  worker      : 1
  duration    : 387
  auth_type   : Session
  auth_method : SAML
  pol_id      : 1
  g_id        : 4
  user_based  : 0
  expire      : no
  LAN:
    bytes_in=23261 bytes_out=14024
  WAN:
    bytes_in=3242 bytes_out=2541
```

Secure LDAP connection from FortiAuthenticator with zero trust tunnel example

When an on-premise Active Directory or LDAP server must be accessed remotely, a secure connection is important. LDAP without security should not be exposed on the internet, as user information and passwords are transferred in plain text.

This example describes how to configure a secure LDAP connection from a remote FortiAuthenticator to an on-premise AD server.



The on-premise FortiGate acts as a ZTNA application gateway to allow the FortiAuthenticator access to the AD using a TCP forwarding access proxy. Traditionally, this requires endpoints to have FortiClient installed with ZTNA destinations configured in order to connect and authenticate with a client certificate. In this scenario, the FortiAuthenticator will operate a local certificate authority, which generates a client certificate for the connection. The local root CA certificate is exported and installed on the FortiGate in order to authenticate and trust the client connection. This replaces the need for a FortiClient EMS server to manage the client certificate and act as the certificate authority.

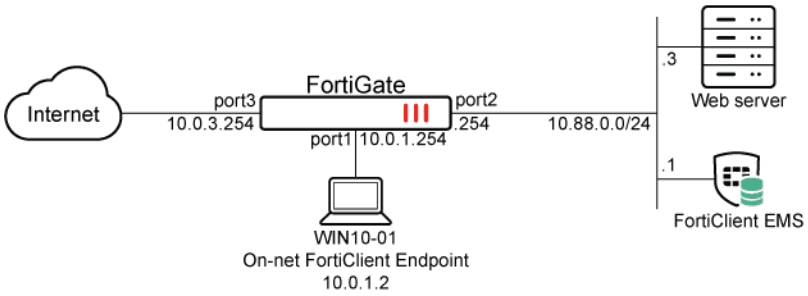
For detailed configuration steps, see Setting up a zero trust tunnel on the FortiAuthenticator page.

ZTNA IP MAC based access control example

In this example, firewall policies are configured that use security posture tags to control access between on-net devices and an internal web server. This mode does not require the use of the access proxy, and only uses security posture tags for access control. Traffic is passed when the FortiClient endpoint meets two conditions.

1. It is tagged with the *Domain-Users* security posture tag, identifying the device as logged on to the Domain.
2. It has the *High* importance classification tag indicating the device is High importance and low risk.

Traffic is denied when the FortiClient endpoint is tagged with *Malicious-File-Detected*.



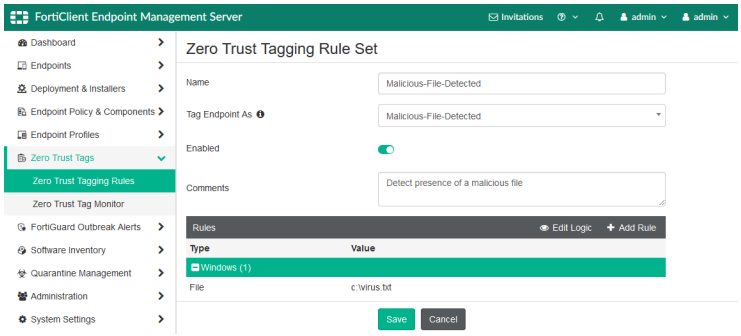
This example assumes that the FortiGate EMS fabric connector is already successfully connected.

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 98 for more information.

To configure ZTNA in the GUI, go to *System* > *Feature Visibility* and enable *Zero Trust Network Access*.

To configure Zero Trust tagging rules on the FortiClient EMS:

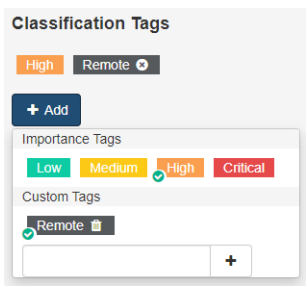
1. Log in to the FortiClient EMS.
2. Go to *Zero Trust Tags* > *Zero Trust Tagging Rules*, and click *Add*.
3. In the *Name* field, enter *Malicious-File-Detected*.
4. In the *Tag Endpoint As* dropdown list, select *Malicious-File-Detected*.
5. Click *Add Rule* then configure the rule:
   a. For *OS*, select *Windows*.
   b. From the *Rule Type* dropdown list, select *File* and click the + button.
   c. Enter a file name, such as *C:\virus.txt*.
   d. Click *Save*.



6. Click *Save*.
7. Click *Add* again to add another rule.
8. In the *Name* field, enter *Domain-Users*.
9. In the *Tag Endpoint As* dropdown list, enter *Domain-Users* and press `Enter`.
10. Click *Add Rule*, then configure the rule:
    a. For *OS*, select *Windows*.
    b. From the *Rule Type* dropdown list, select *User in AD Group*.
    c. For *AD Group*, select the *Domain-Users* AD group.
    d. Click *Save*.

To configure a classification tag on the FortiClient EMS:

1. Go to *Endpoint* > *All Endpoints*.
2. Select the WIN10-01 computer that will be granted access. This computer should be already registered to FortiClient EMS.
3. In the *Summary* tab, under *Classification Tags*, click *Add* and then set to High Importance.



4. Go to *Administration* > *Fabric Devices*.

5. Select the connecting FortiGate, then click *Edit*.
6. Under *Tag Types Being Shared*, add *Classification Tags*.
7. Click *Save*.

To configure a firewall policy with IP/MAC based access control to deny traffic in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Set *Name* to *block-internal-malicious-access*.
3. Set *Action* to *DENY*.
4. Set *Type* to *Standard*.
5. Set *Incoming Interface* to *port1*.
6. Set *Outgoing Interface* to *port2*.
7. Set *Source* to *all*.
8. Set *Security posture tag* to *EMS1_ZTNA_Malicious-File-Detected*.
9. Set *Destination* to the address of the Web server. If no address is created, create a new address object for 10.88.0.3/32.
10. Set *Service* to *ALL*.
11. Enable *Log Violation Traffic*.
12. Configuring the remaining settings as needed.
13. Click *OK*.

To configure a firewall policy with IP/MAC based access control to allow access in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Set *Name* to *allow-internal-access*.
3. Set *Action* to *ACCEPT*.
4. Set *Type* to *Standard*.
5. Set *Incoming interface* to *port1*.
6. Set *Outgoing interface* to *port2*.
7. Set *Source* to *all*.
8. Set *Security posture tag* to *EMS1_ZTNA_Domain-Users*, and set the *And any of* field to *EMS1_CLASS_High*.
   The secondary group of tags is used with a logical And operator. The secondary group tags can be same or different types than the primary group.
9. Set *Destination* to the address of the Web server.
10. Set *Service* to *ALL*.
11. Enable *Log allowed traffic* and set it to *All Sessions*.
12. Configuring the remaining settings as needed.
13. Click *OK*.

To configure firewall policies with IP/MAC based access control to block and allow access in the CLI:

```
config firewall policy
    edit 10
        set name "block-internal-malicious-access"
        set srcintf "port1"
```

```
        set dstintf "port2"
        set ztna-status enable
        set srcaddr "all"
        set dstaddr "Webserver"
        set ztna-ems-tag "EMS1_ZTNA_Malicious-File-Detected"
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
    edit 12
        set name "allow-internal-access"
        set srcintf "port1"
        set dstintf "port2"
        set action accept
        set ztna-status enable
        set srcaddr "all"
        set dstaddr "Webserver"
        set ztna-ems-tag "EMS1_ZTNA_Domain-Users"
        set ztna-ems-tag-secondary "EMS1_CLASS_High"
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
end
```

When multiple tags are selected with `set ztna-ems-tag <tags>`, matching occurs using a logical OR operator. Any single tag that matches will return true.

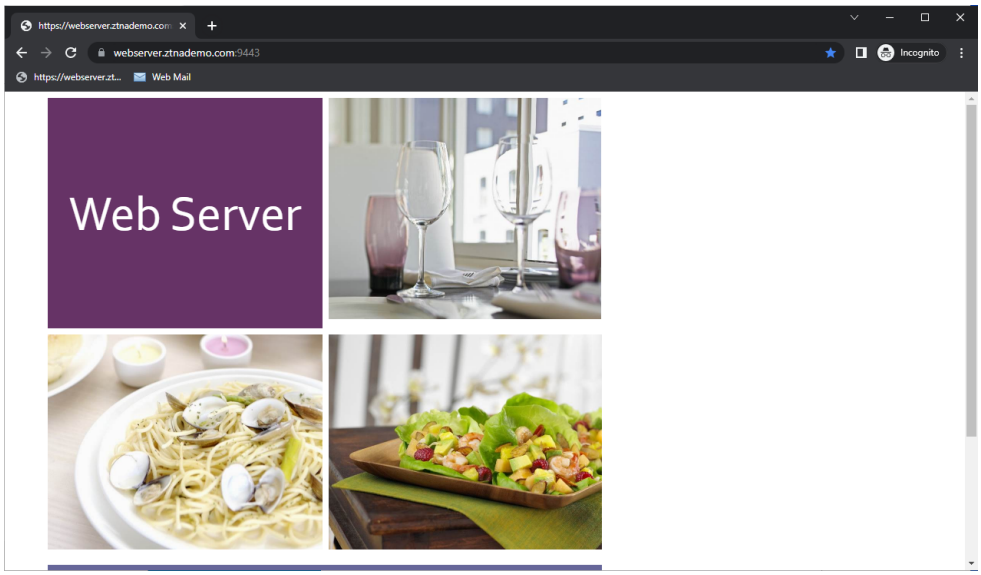
The `set ztna-ems-tag-secondary <tags>` command allows a second group of tags to be specified that is used with a logical And operator. The secondary group tags can be same or different types than the primary group.

The `set ztna-tags-match-logic {and | or}` command does not change the logical operator. It is applied by WAD to tags selected for ZTNA proxy-policy.

Testing the access to the web server from the on-net client endpoint

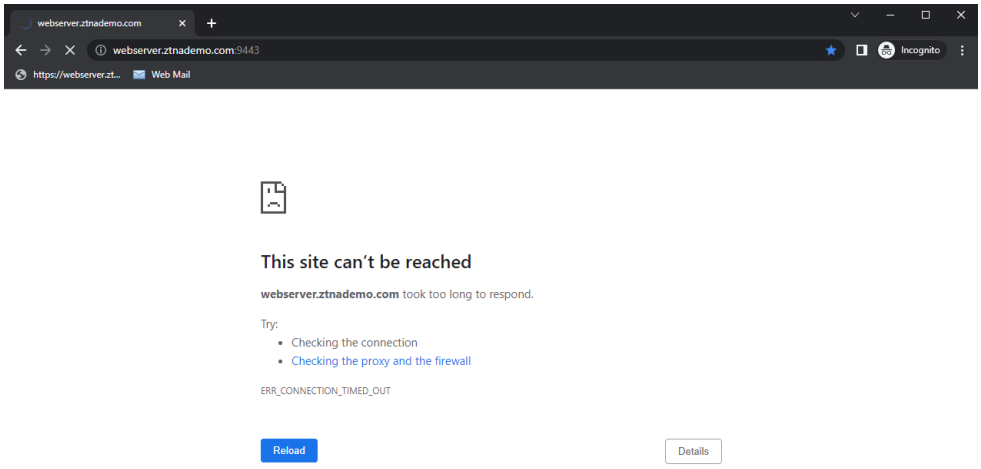
Access allowed:

1. On the WIN10-01 PC, open FortiClient.
2. On the *Zero Trust Telemetry* tab, make sure that you are connected to the EMS server.
3. Open a browser and enter the address of the server.
4. The FortiGate matches your security posture by verifying your security posture tags and matching the corresponding `allow-internal-access` firewall policy, and you are allowed access to the web server.



Access denied:

1. On the WIN10-01 PC, trigger the Zero Trust Tagging Rule by creating the file in C:\virus.txt.
2. Open a browser and enter the address of the server.
3. FortiGate checks your security posture. Because EMS has tagged the PC with the *Malicious-File-Detected* tag, it matches the *block-internal-malicious-access* firewall policy.
4. You are denied access to the web server.



Logs and debugs

Access allowed:

```
# diagnose endpoint ec-shm list

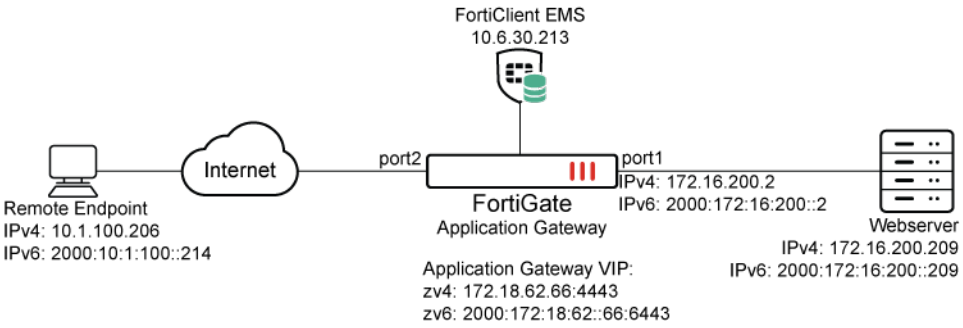
ZTNA IPv6 examples

IPv6 can be configured in ZTNA in several scenarios:

- IPv6 Client — IPv6 Access Proxy — IPv6 Server
- IPv6 Client — IPv6 Access Proxy — IPv4 Server
- IPv4 Client — IPv4 Access Proxy — IPv6 Server

These examples show the basic configuration for each scenario. It is assumed that the EMS fabric connector is already successfully connected.



Example 1: IPv6 Client — IPv6 Access Proxy — IPv6 Server

To configure the FortiGate:

1. Configure the IPv6 access proxy VIP:

```
config firewall vip6
    edit "zv6"
        set type access-proxy
        set extip 2000:172:18:62::66
        set server-type https
        set extport 6443
        set ssl-certificate "cert"
    next
end
```

2. Configure a virtual host:

```
config firewall access-proxy-virtual-host
    edit "vhost_ipv6"
        set ssl-certificate "cert"
        set host "qa6.test.com"
```

```
   next
end
```

The client uses this address to connect to the access proxy.

3. Configure an IPv6 access proxy and IPv6 api-gateway, apply the VIP6 and virtual host to it, and assign an IPv6 address to the realserver:

```
config firewall access-proxy6
    edit "zs6"
        set vip "zv6"
        config api-gateway6
            edit 1
                set virtual-host "vhost_ipv6"
                config realservers
                    edit 1
                        set ip 2000:172:16:200::209
                    next
                end
            next
        end
    next
end
```

4. Apply the IPv6 access proxy to a proxy policy:

```
config firewall proxy-policy
    edit 1
        set name "ztna_rule"
        set proxy access-proxy
        set access-proxy6 "zs6"
        set srcintf "port2"
        set action accept
        set schedule "always"
        set logtraffic all
        set srcaddr6 "all"
        set dstaddr6 "all"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
        set webfilter-profile "monitor-all"
    next
end
```

5. Apply the IPv6 VIP to a firewall policy:

```
config firewall policy
    edit 4
        set name "ZTNA"
        set srcintf "port2"
        set dstintf "any"
        set action accept
        set srcaddr6 "all"
        set dstaddr6 "zv6"
```

```
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set logtraffic all
        set nat enable
    next
end
```

To test the configuration:

1. On an IPv6 client, ensure that the address qa6.test.com resolves to the IPv6 VIP address of 2000:172:18:62::66.
2. In a browser, connect to https://qa6.test.com:6443.
3. After device certificate verification, the browser will open up the webpage on the IPv6 real server.
4. In the Forward Traffic Log, the following log is available:

```
3: date=2021-06-25 time=13:38:18 eventtime=1624653498459580215 tz="-0700" logid="0000000024"
type="traffic" subtype="forward" level="notice" vd="root" srcip=2000:10:1:100::214
srcport=55957 srcintf="port2" srcintfrole="undefined" dstcountry="Reserved"
srccountry="Reserved" dstip=2000:172:16:200::209 dstport=443 dstintf="root"
dstintfrole="undefined" sessionid=92406 service="HTTPS" proto=6 action="accept" policyid=1
policytype="proxy-policy" poluuid="7afdac8c-d5db-51eb-dfc6-67bb86e4bdcf" policyname="ztna_
rule" duration=5 wanin=2031 rcvdbyte=2031 wanout=1332 lanin=1247 sentbyte=1247 lanout=950
appcat="unscanned" utmaction="allow" countweb=1 utmref=65445-0
```

Example 2: IPv6 Client — IPv6 Access Proxy — IPv4 Server

To configure the FortiGate:

1. Configure the IPv6 access proxy VIP:

```
config firewall vip6
    edit "zv6"
        set type access-proxy
        set extip 2000:172:18:62::66
        set server-type https
        set extport 6443
        set ssl-certificate "cert"
    next
end
```

2. Configure a virtual host:

```
config firewall access-proxy-virtual-host
    edit "vhost_ipv6"
        set ssl-certificate "cert"
        set host "qa6.test.com"
    next
end
```

The client uses this address to connect to the access proxy.

3. Configure an IPv6 access proxy and IPv6 api-gateway, apply the VIP6 and virtual host to it, and assign an IPv4 address to the realserver:

```
config firewall access-proxy6
    edit "zs6"
        set vip "zv6"
        config api-gateway6
            edit 1
                set virtual-host "vhost_ipv6"
                config realservers
                    edit 1
                        set ip 172.16.200.209
                    next
                end
            next
        end
    next
end
```

4. Apply the IPv6 access proxy to a proxy policy:

```
config firewall proxy-policy
    edit 1
        set name "ztna_rule"
        set proxy access-proxy
        set access-proxy6 "zs6"
        set srcintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set logtraffic all
        set srcaddr6 "all"
        set dstaddr6 "all"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
        set webfilter-profile "monitor-all"
    next
end
```

5. Apply the IPv6 VIP to a firewall policy:

```
config firewall policy
    edit 4
        set name "ZTNA"
        set srcintf "port2"
        set dstintf "any"
        set action accept
        set srcaddr6 "all"
        set dstaddr6 "zv6"
        set schedule "always"
        set service "ALL"
```

```
        set inspection-mode proxy
        set logtraffic all
        set nat enable
    next
end
```

To test the configuration:

1. On an IPv6 client, ensure that the address qa6.test.com resolves to the IPv6 VIP address of 2000:172:18:62::66.
2. In a browser, connect to https://qa6.test.com:6443.
3. After device certificate verification, the browser will open up the webpage on the IPv4 real server.
4. In the Forward Traffic Log, the following log is available:

```
2: date=2021-06-25 time=13:46:54 eventtime=1624654014129553521 tz="-0700" logid="0000000024"
type="traffic" subtype="forward" level="notice" vd="root" srcip=2000:10:1:100::214
srcport=60530 srcintf="port2" srcintfrole="undefined" dstcountry="Reserved"
srccountry="Reserved" dstip=172.16.200.209 dstport=443 dstintf="root" dstintfrole="undefined"
sessionid=219 service="HTTPS" proto=6 action="accept" policyid=1 policytype="proxy-policy"
poluuid="7afdac8c-d5db-51eb-dfc6-67bb86e4bdcf" policyname="ztna_rule" duration=5 wanin=2028
rcvdbyte=2028 wanout=1321 lanin=1236 sentbyte=1236 lanout=947 appcat="unscanned"
utmaction="allow" countweb=1 utmref=65443-14
```

Example 3: IPv4 Client — IPv4 Access Proxy — IPv6 Server

To configure the FortiGate:

1. Configure the IPv4 access proxy VIP:

```
config firewall vip
    edit "zv4"
        set type access-proxy
        set extip 172.18.62.66
        set extintf “any”
        set server-type https
        set extport 4443
        set ssl-certificate "cert"
    next
end
```

2. Configure a virtual host:

```
config firewall access-proxy-virtual-host
    edit "vhost_ipv4"
        set ssl-certificate "cert"
        set host "qa.test.com"
    next
end
```

The client uses this address to connect to the access proxy.

3. Configure an IPv4 access proxy and IPv6 api-gateway, apply the VIP and virtual host to it, and assign an IPv6 address to the realserver:

```
config firewall access-proxy
    edit "zs4"
        set vip "zv4"
        config api-gateway6
            edit 1
                set virtual-host "vhost_ipv4"
                config realservers
                    edit 1
                        set ip 2000:172:16:200::209
                    next
                end
            next
        end
    next
end
```

4. Apply the IPv4 access proxy to a proxy policy:

```
config firewall proxy-policy
    edit 1
        set name "ztna_rule"
        set proxy access-proxy
        set access-proxy "zs4"
        set srcintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set logtraffic all
        set srcaddr6 "all"
        set dstaddr6 "all"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
        set webfilter-profile "monitor-all"
    next
end
```

5. Apply the IPv4 VIP to a firewall policy:

```
config firewall policy
    edit 4
        set name "ZTNA"
        set srcintf "port2"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "zv4"
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
```

```
        set logtraffic all
        set nat enable
    next
end
```

To test the configuration:

1. On an IPv4 client, ensure that the address qa6.test.com resolves to the IPv4 VIP address of 172.18.62.66.
2. In a browser, connect to https://qa6.test.com:6443.
3. After device certificate verification, the browser will open up the webpage on the IPv6 real server.
4. In the Forward Traffic Log, the following log is available:

```
1: date=2021-06-25 time=13:52:30 eventtime=1624654350689576485 tz="-0700" logid="0000000024"

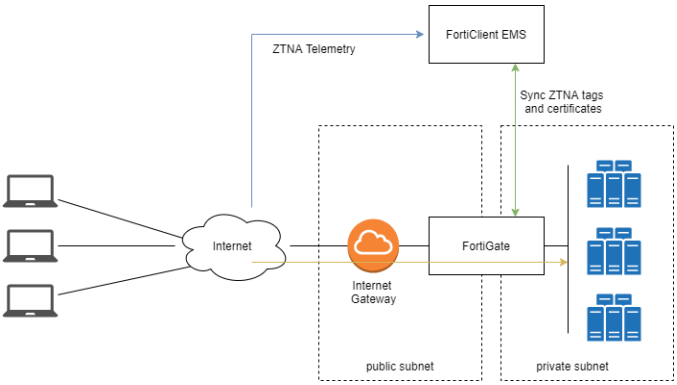
```

ZTNA Zero Trust application gateway example

The Zero Trust application gateway (ZTAG) for SaaS applications delivers Zero Trust Network Access (ZTNA) to companies that deploy SaaS applications and services in the cloud. A Zero Trust application gateway is deployed in the cloud, protecting resources on the private subnets by enforcing security and access control.



A Zero Trust application gateway can be deployed directly on AWS, Azure, and VMware. The deployment template can configure the necessary ZTNA settings to get the ZTNA configurations started.

For more information, see the Zero Trust Application Gateway Admin Guide.

ZTNA SaaS application access control with Inline CASB

The FortiGate ZTNA application gateway can be configured to act as an inline cloud access security broker (CASB) by providing access control to software-as-a-service (SaaS) traffic using ZTNA access control rules and an inline CASB profile. A CASB sits between users and their cloud service to enforce security policies as they access cloud-based resources.

The following components are required to use the ZTNA inline CASB feature:

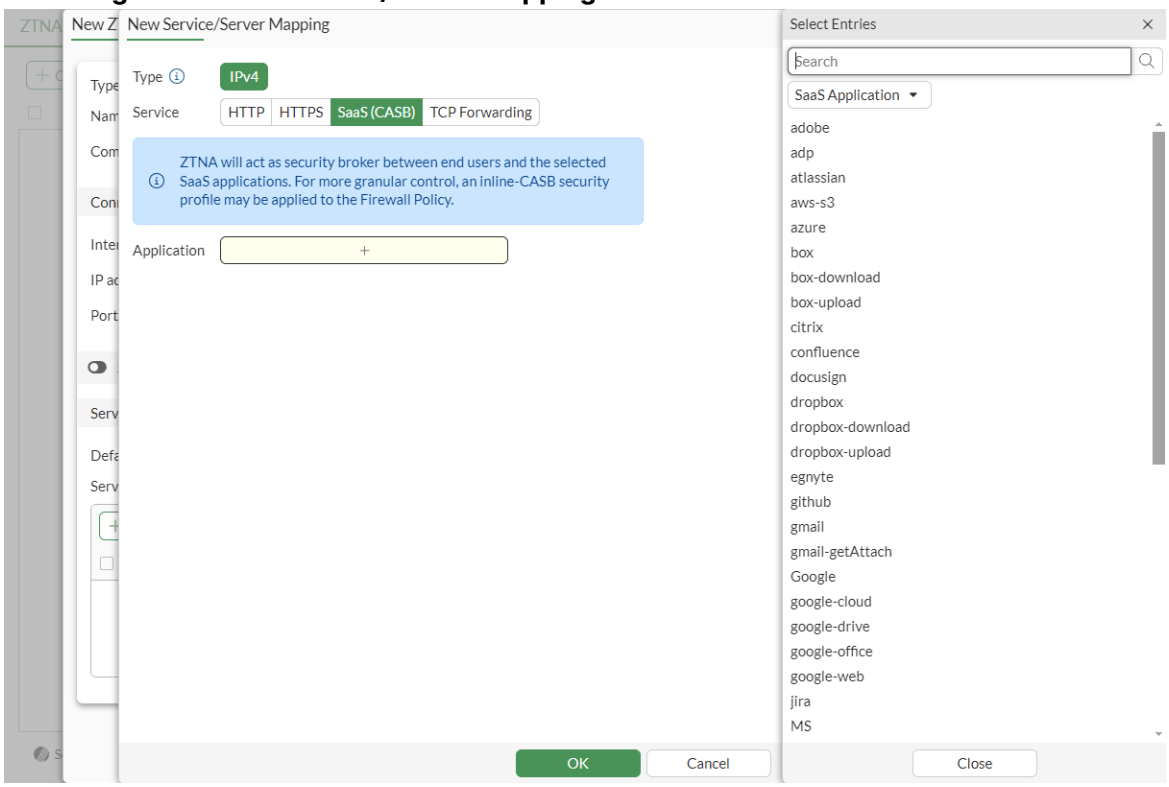
- The FortiGuard Inline CASB Database (ICDB) used by the FortiGate and FortiClient EMS.

  This database includes all FQDNs related to specific SaaS applications and corresponding FortiGuard packages for FortiOS and FortiClient.
- A FortiGate ZTNA TCP forwarding access proxy configuration that specifies SaaS application destinations using application names defined in the ICDB.
- ZTNA connection rules for SaaS traffic that are provisioned using FortiClient EMS (version 7.2.2 and later).
- FortiClient (version 7.2.0 and later) installed on the user's machine to receive the ZTNA connection rules for SaaS traffic from FortiClient EMS.

Syntax

Users can configure the ZTNA application gateway using the SaaS proxy access type and conveniently specify SaaS application destinations by application name or by application group name without needing to manually search for and enter FQDNs specific to each SaaS application. This can be configured in the GUI or in the CLI.

To configure a ZTNA service/server mapping to use SaaS from the GUI:

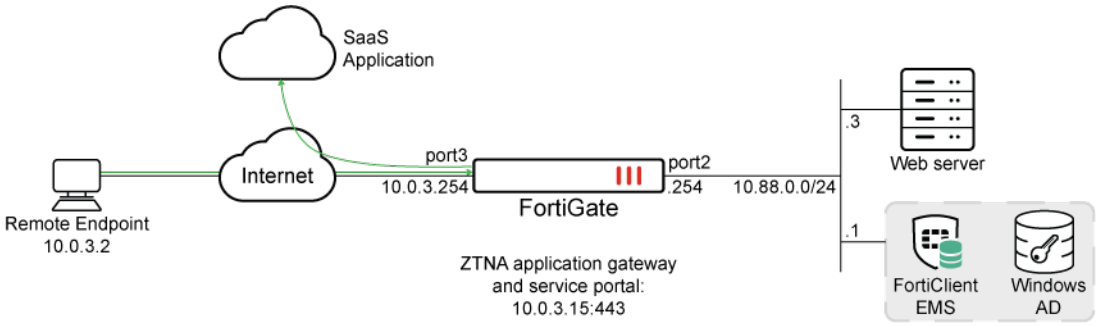


To configure a ZTNA application gateway to use SaaS from the CLI:

```
config firewall access-proxy
    edit <name>
        config api-gateway
            edit <ID>
                set url-map "/saas"
                set service saas
                set application <app 1> [app 2] ...
            next
        end
    next
end
```

Example

In this example, the FortiGate is configured as a ZTNA application gateway with a VIP of 10.0.3.15 and uses the SaaS access proxy type. SaaS application Gmail is allowed, but the action of uploading an attachment on Gmail is blocked.



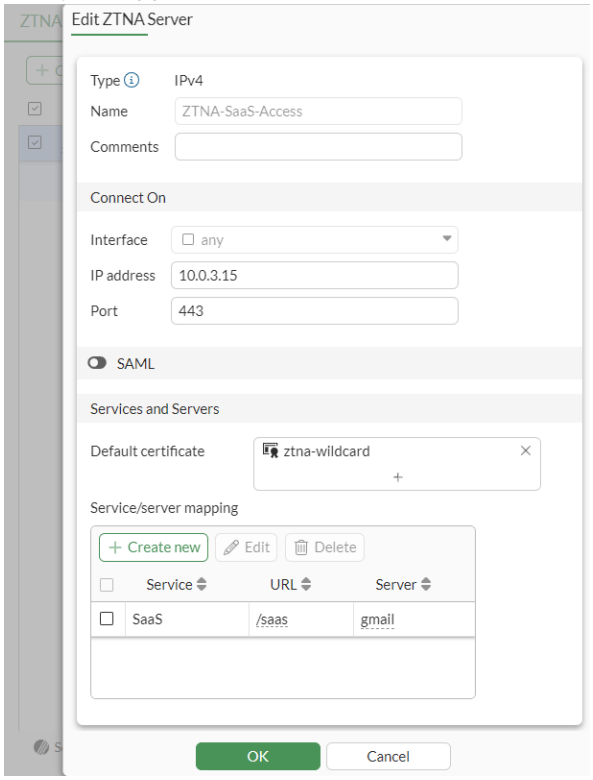
To configure the ZTNA server object from in the GUI:

1. Go to *Policy & Objects* > *ZTNA*.
2. Under *ZTNA Server*, click *Create new*.
3. Input the following:

Name	*ZTNA-SaaS-Access*
Interface	*Any*
IP Address	*10.0.3.15*
Port	*443*
Default Certificate	<choose a default certificate>

4. Under *Service/server mapping*, click *Create new*.

a. Change the Service to *SaaS (CASB)*.
b. Pick your Application(s). In this case, we will use the *gmail* application.



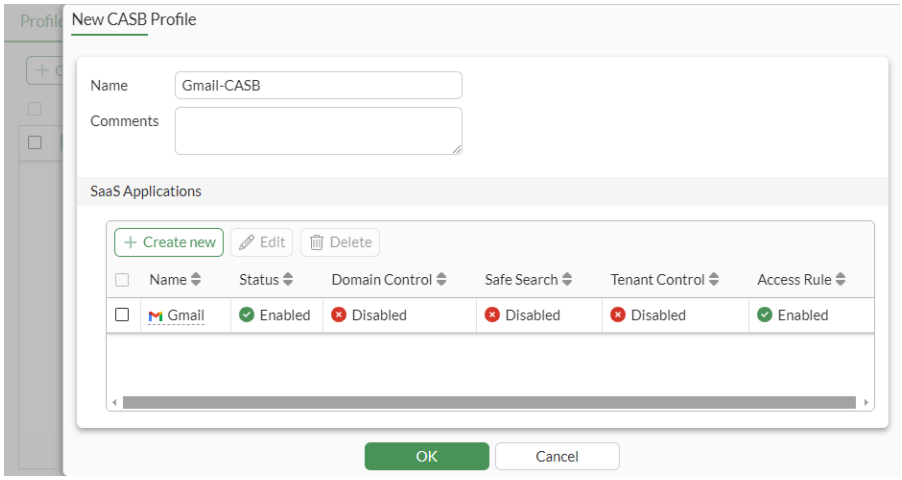
c. Click *OK*.

5. Click *OK*.

To configure the Inline CASB profile from the GUI:

1. Go to *System* > *Feature Visibility*.
2. Under *Security Features*, enable *Inline-CASB*.
3. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
4. Name the new profile *Gmail-CASB*.
5. Under *SaaS Applications*, click *Create new*.
6. In *Select application* – select *Gmail*.
7. Click Next
8. In *Choose CASB control* – block uploading file by:

a. Under *Privilege Control*, select *upload-file*, and *Set Action to Block*.
b. Click *OK*.



9. Click *OK*.

To configure the ZTNA policy from the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create new*.
3. Enter the following:

Name	*ZTNA-SaaS-Access*
Type	*ZTNA*
Incoming Interface	*WAN (port3)*
Source	*All*
User/group	<include, if needed>
Security posture tag	<include, if needed>
ZTNA server	*ZTNA-SaaS-Access*
Inspection mode	*Proxy-based*
Inline-CASB	*Enabled* (Select *Gmail-CASB*)
SSL inspection	*custom-deep-inspection*
Log allowed traffic	*Enabled* (All sessions)

4. Click *OK*.
5. Click *OK* to confirm the use of full SSL Inspection. Ensure that your clients trust the CA that is used in the SSL Inspection profile.

Optionally, if user authentication is configured, the ZTNA rule (`set users` or `set groups`), configure the authentication scheme and rule (see Applying user authentication in the ZTNA Deployment guide).

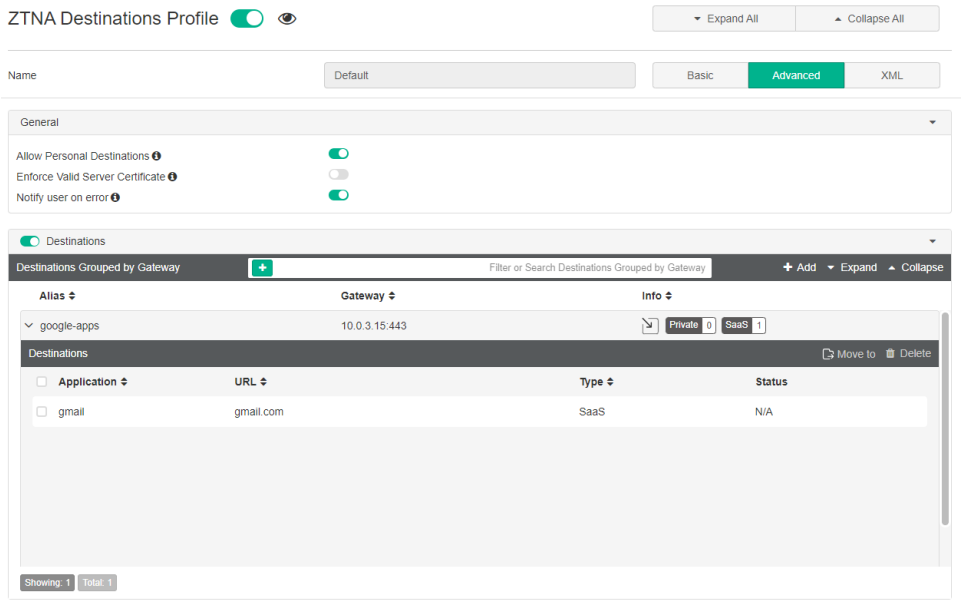
Before connecting, the users must have corresponding ZTNA Destinations in FortiClient. In FortiClient EMS, configure SaaS applications in *Endpoint Profiles > ZTNA Destinations* and push application destinations to FortiClient.

To configure the FortiClient EMS:

1. On FortiClient EMS, go to *Endpoint Profiles > ZTNA Destinations*.
2. Edit the *Default* profile.
3. Besides *Name*, click *Advanced*.
4. Click the eye icon beside *ZTNA Destination Profile* to enable this profile to be viewed on the FortiClient.
5. Under *Destinations*, click *Add* . The *Add New Gateway* dialog is displayed.
6. In *Proxy Gateway*, enter the following:

Enter the gateway proxy address	10.0.3.15:443
Select browser user-agent for SAML login	Use FortiClient embedded browser
Alias	gmail

7. Click *Next*.
8. In *Private Applications*, click *Next*.
9. In *SaaS Applications*, expand *Google* and then select *gmail*.



10. Click *Finish*.
11. Click *Save*.
    The FortiClient endpoints will synchronize the destination from EMS.

Testing and results

Once connected, the FortiClient retrieves the list of hosted ZTNA services, including the SaaS service, and adds corresponding ZTNA connection rules for the configured SaaS applications.

Connect to Gmail from a browser. The traffic is allowed.

After closing the session, the corresponding traffic logs can be viewed from the FortiGate GUI or from the CLI.

```
# execute log filter field subtype ztna
```

```
# exec log display
```

```
61 logs found.
```

```
10 logs returned.
```

```

```

```

ZTNA application gateway with KDC to access shared drives

Fortinet technical support cannot troubleshoot third-party applications involved in this solution.

Kerberos Key Distribution Center (KDC) proxy protocol can be used to remotely authenticate domain users and issue Kerberos tickets. A remote user can use the same Kerberos ticket to authenticate when remotely accessing shared drives through ZTNA application gateway.

The following options are available when setting up ZTNA application gateway on TCP 445 for remote access to mapped drives:

- Create the mapped drive using the server's IP address, which uses Windows NT LAN Manager (NTLM) to authenticate users.
- Create the mapped drive using the server's FQDN (or DNS name), which requires Kerberos authentication.

The preferred way to create mapped drives is using the server's DNS name. KDC proxy protocol can be a reliable way to initiate Kerberos authentication for remote users to seamlessly access mapped drives and requires the following steps:

1. Set up the KDC proxy service on a server.
2. Set up the ZTNA application gateway for mapped drives.

The KDC Proxy only works for domain-joined workstations.

Setting up the KDC proxy service

The following steps are required to set up the KDC proxy service on a server:

1. Deploy a server that is joined to the domain and create a trusted certificate.
2. Configure the KDC proxy service on the server.
3. Configure clients to use the KDC proxy.
4. If client machines cannot retrieve group policy updates, configure registry keys on the clients.

Deploying a server and creating a certificate

Deploy a server that is joined to the domain. At a minimum, the server must have a public network interface with a domain name pointed to it. Clients will connect to the server over the internet. For networking, you can forward port 443 if necessary.

Create a trusted certificate for the public domain name of the proxy endpoint:

- Domain: fortitest.net
- KDC proxy: kdcproxy.fortitest.net

The KDC proxy service is present on the server, but not configured.

Configuring the KDC proxy service on the server

The KDC proxy service must be configured before it can be started.

To configure the server:

1. Start an elevated command prompt, and configure a URL ACL for the endpoint:

```
netsh http add urlacl url=https://+:443/KdcProxy user="NT authority\Network Service"
```

2. Associate the certificate created previously with the endpoint:

```
netsh http add sslcert ipport=0.0.0.0:443 certhash=<thumbprint of your certificate> appid=
{generated Guid}
```

This association instructs `HTTP.SYS` to use the certificate when connections occur over HTTPS.

For example: `netsh http add sslcert ipport=0.0.0.0:443 certhash=aaaabbbbccccddddeeeeffff0000111122223333 appid={aaaaaaaa-bbbb-cccc-dddd-aaaabbbbcccc}`

For `appid` you should generate a random GUID here. From PowerShell try `[Guid]::NewGuid()`. The `certhash` is the thumbprint of your certificate.

If the certificate contains extensions for CRL or AIA, those URLs should be reachable from the remote client.

3. If not using smart card certificates (or Windows Hello) for authentication, disable the certificate authentication requirement:

```
REG ADD "HKLM\SYSTEM\CurrentControlSet\Services\KPSSVC\Settings" /v HttpsClientAuth /t REG_
DWORD /d 0x0 /f
```

4. Additionally if not using certificates, enable password authentication:

```
REG ADD "HKLM\SYSTEM\CurrentControlSet\Services\KPSSVC\Settings" /v
DisallowUnprotectedPasswordAuth /t REG_DWORD /d 0x0 /f
```

5. Configure the KDC Proxy Service (KPSSVC) to start automatically:

```
sc config kpssvc start=auto
```

6. Start the service:

```
net start kpssvc
```

Configuring clients to use a KDC proxy

Clients must be configured to use a KDC proxy. This can be done through GPO or through modifying the registry directly. The GPO path is:

```
Computer Configuration\Policies\Administrative Templates\System\Kerberos\Specify KDC proxy servers
for Kerberos clients
```

Enabling this policy requires setting a realm-to-value mapping. The realm is your domain name, starting with a period (for example `".fortitest.net"`), or a `"*"` to include all domains in a wildcard format. The value is specially crafted:

```
<https kdcproxy.fortitest.net:kdcproxy />
```

Deploy the policy, and reboot the client. Wait a while for caching to complete, and then log in. You should find users are now authenticating over the KDC proxy endpoint.

To verify from a logged in session, launch a command prompt and try the following command:

```
klist get krbtgt
```

Configuring registry keys on clients

If you are trying to deploy these settings on a client machine that cannot retrieve group policy updates, manually configure the registry keys for the client:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System\Kerberos]
"KdcProxyServer_Enabled"=dword:00000001
```

```
[HKEY_LOCAL_
MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System\Kerberos\KdcProxy\ProxyServers]
"*"="<https kdcproxy.fortitest.net />" or ".fortitest.net"="<https kdcproxy.fortitest.net />"
```

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System\Kerberos\Parameters]
"NoRevocationCheck"=dword:00000000
```

Setting up the ZTNA application gateway for mapped drives

The following steps are required to set up ZTNA application gateway for mapped drives on the FortiGate:

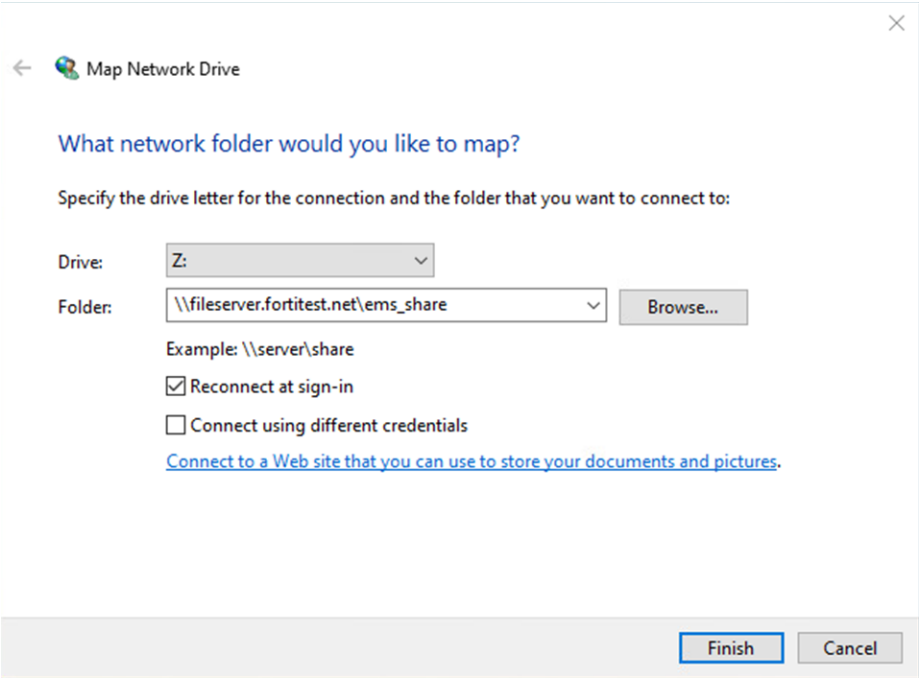
1. Configure FortiClient to have the ZTNA destination rule.
2. Configure a ZTNA server and proxy policy on FortiGate.

Configuring a ZTNA destination rule on FortiClient

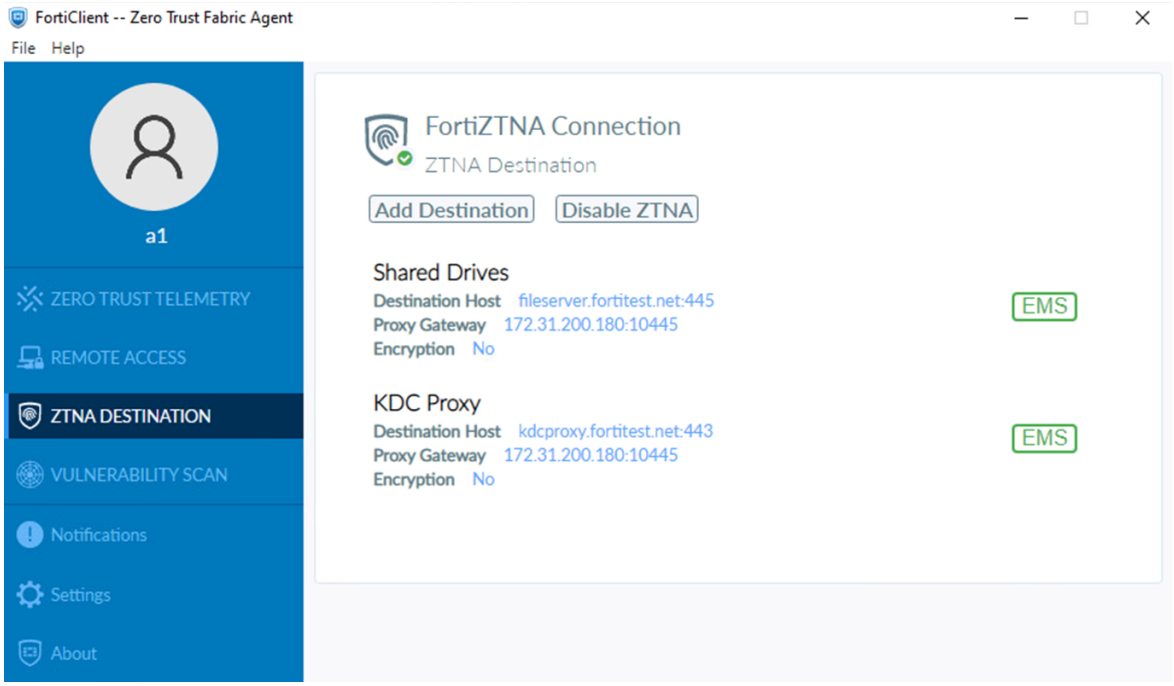
The ZTNA destination rule can be configured by using FortiClient EMS or by manually configuring FortiClient. The destination host matches the server's FQDN on port 445, and the proxy gateway should be the FortiGate WAN port on the chosen external port.

Another rule is required for the KDC proxy communication with the destination host defined as the FQDN of the KDC proxy server and port 443.

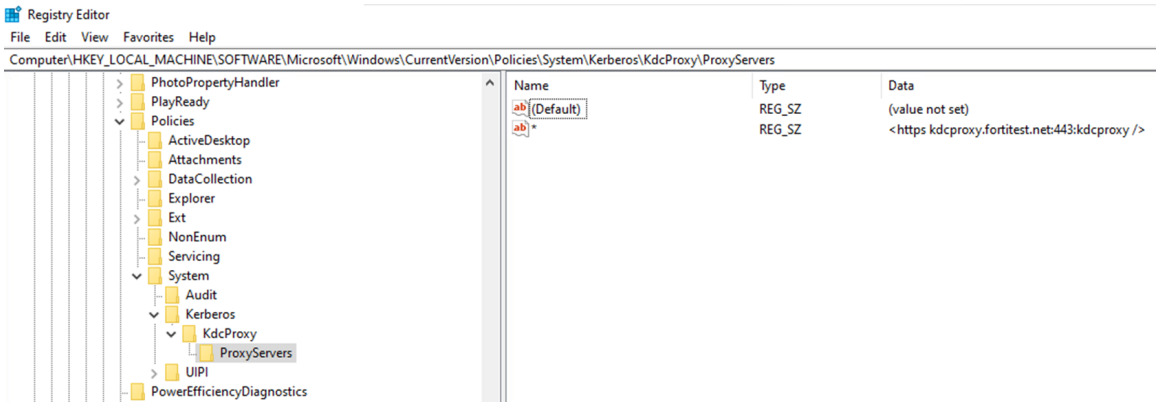
The map network drive configuration should be the last step after configuring the FortiGate. The following example shows the mapped drive:



The following example shows a ZTNA destination configured in FortiClient with the *Proxy Gateway*:



The following example shows the registry settings:



Configuring FortiGate

A ZTNA server and a proxy policy are required to verify and forward the incoming requests on port 10445 to the file server on port 445 as well as to the KDC proxy server on port 443.

To configure the ZTNA server:

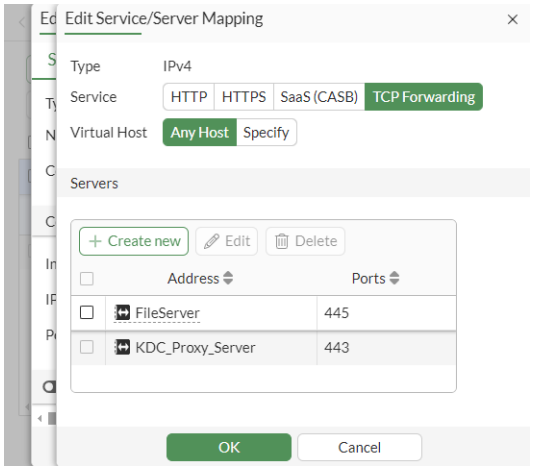
1. Go to *Policy & Objects* > *ZTNA* and navigate to the *ZTNA Server* tab.
2. Click *Create new*.
3. Set the *Name* to *Mapped Drive Using KDC*.
4. Set the *Interface* to *FGT-WAN (port1)*.
5. Set the *IP address* to *172.31.200.180*.
6. Set the *Port* to *10445*.
7. Set the *Default certificate* to *FGT_Web*.

8. Click *Create new* for *Service/server mapping*.
9. Configure the first real server:
   a. Set the *Service* to *TCP Forwarding*.
   b. Set the *Virtual Host* to *Any Host*.
   c. Set the *Address* to *File-Server*.
   d. Set the *Ports* to *445*.
   e. Click *OK*.
10. Configure the second real server in the CLI:

```
config firewall access-proxy
    edit "Mapped Drive Using KDC"
        config api-gateway
            edit 1
                config realservers
                    edit 2
                        set address "KDC_Proxy_Server"
                        set mappedport 443
                    next
                end
            next
        end
    next
end
```

11. Click *OK*.

The following example shows the ZTNA server:

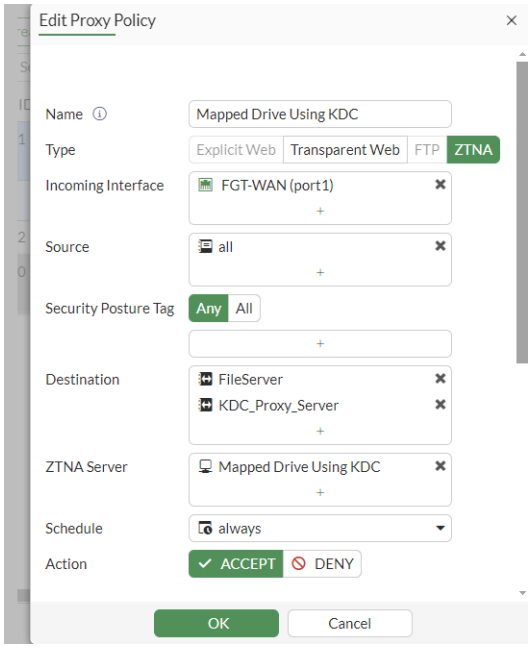


To configure the proxy policy:

1. Go to *Policy & Objects* > *Proxy Policy*.
2. Click *Create new*.
3. Configure the following:

Name	Mapped Drive Using KDC

Type	ZTNA
Incoming Interface	FGT-WAN (port1)
Source	all
Security Posture Tag	Any
Destination	FileServer KDC_Proxy_Server
ZTNA Server	Mapped Drive Using KDC
Schedule	always
Action	Accept
Log Allowed Traffic	Enabled All Sessions
Enable this policy	Enabled



4. Click *OK*.

Custom replacement message for ZTNA virtual hosts

Each ZTNA virtual host can be configured to display messages from a custom replacement message group.

First create a replacement message group, and customize one ore more messages in the group. Then configure one or more ZTNA virtual hosts to use the replacement message group.

```
config firewall access-proxy-virtual-host
    edit <host name>
```

```
        set replacemsg-group <replacemsg group>
    next
end
```

When a client fails a ZTNA check with the virtual host, the replacement message is displayed.

Example

In this example, a ZTNA virtual host named *server1.ztna.local* is mapped to a replacement message group named *test-vhost*, and the group includes a customized *ZTNA Empty Certificate Error Page* message. The message is customized with a Company Y logo.

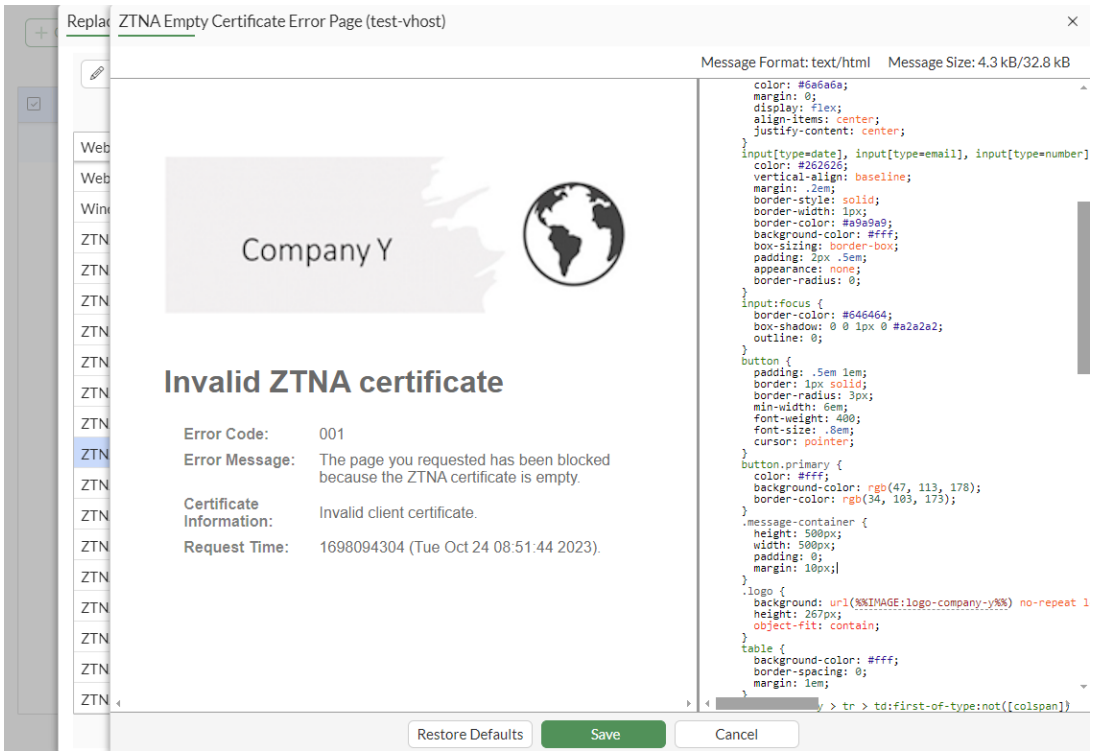
When clients fail a ZTNA check with the ZTNA virtual host (server1.ztna.local) because of an empty certificate, the custom replacement message is displayed.

Go to *System > Feature Visibility* and enable *Replacement Message Groups*. See Feature visibility on page 3595 for more information.

To customize replacement messages for ZTNA virtual hosts:

1. Upload a logo to the FortiGate to use in replacement messages:
   a. Go to *System > Replacement Messages* and click *Manage Images*.
   b. Click *Create New*.
   c. Name and upload an image file.
   d. Click *OK*. The logo is uploaded to the FortiGate.
2. Create a replacement message group named, for example, *test-vhost*:
   a. Go to *System > Replacement Message Groups* and click *Create New*.
   b. Specify a name for the group, such as *test-vhost*.
   c. Set *Group Type* to *Security*.
   d. Click *OK*.
3. Customize one or more messages in the *test-vhost* group:
   In this example, the *ZTNA Empty Certificate Error Page* message is edited to add a custom logo.
   a. Double-click the *test-vhost* replacement message group to open it for editing.
   b. Select the *ZTNA Empty Certificate Error Page* message and click *Edit*.
   c. In the right pane, edit the URL for the `.logo` section by typing the logo name to select the uploaded logo, for example, *logo-company-y*.

```
...
}
.logo {
  background: url(%%IMAGE:logo-company-y%%) no-repeat left center;
  height: 267px;
  object-fit: contain;
}
...
```



d. Click *Save*. A green checkmark is displayed in the *Modified* column to indicate a customized message.

4. Configure a ZTNA server with a ZTNA virtual host named *server1.ztna.local*. See Configure a ZTNA server on page 1405.

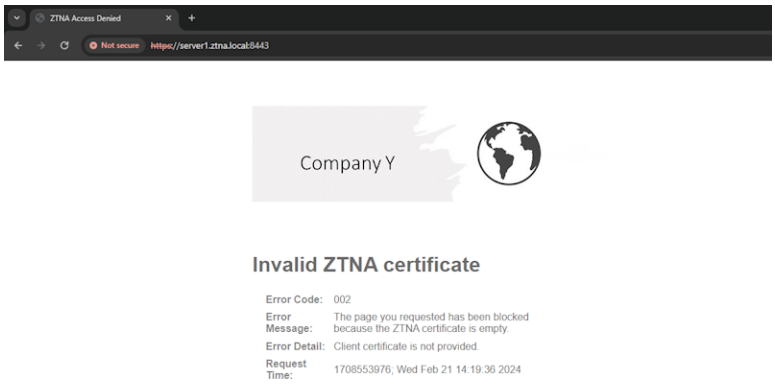
   In the *Service/server* mapping, be sure to set *Virtual Host* to *Specify*, and enter the name or IP address of the host that the request must match. For example, if server1.ztna.local is entered as the host, then only requests to server1.ztna.local will match.

5. Map the ZTNA virtual host to the replacement message group in the CLI.

   In this example, the ZTNA virtual host named `server1.ztna.local` is configured to use the `test-vhost` replacement message group.

```
config firewall access-proxy-virtual-host
    edit "server1.ztna.local"
        set replacemsg-group "test-vhost"
    next
end
```

6. Create a ZTNA policy to allow traffic to the ZTNA server. See Configure a ZTNA policy on page 1409.
7. When a client fails to access the ZTNA virtual host named *server1.ztna.local* because of an empty certificate error, the following custom replacement message with the Company Y logo is displayed.



ZTNA troubleshooting and debugging commands

The following debug commands can be used to troubleshoot ZTNA issues:

Command	Description
`# diagnose endpoint fctems test-connectivity <EMS>`	Verify FortiGate to FortiClient EMS connectivity.
`# execute fctems verify <EMS>`	Verify the FortiClient EMS's certificate.
`# diagnose test application fcnacd 2`	Dump the EMS connectivity information.
`# diagnose debug app fcnacd -1` `# diagnose debug enable`	Run real-time FortiClient NAC daemon debugs.
`# diagnose endpoint ec-shm list <ip> <mac> <EMS_serial_number> <EMS_tenant_id>`	Show the endpoint record list. Optionally, add filters.
`# diagnose endpoint lls-comm send ztna find-uid <uid> <EMS_serial_number> <EMS_tenant_id>`	Query endpoints by client UID, EMS serial number, and EMS tenant ID.
`# diagnose endpoint lls-comm send ztna find-ip-vdom <ip> <vdom>`	Query endpoints by the client IP-VDOM pair.
`# diagnose wad dev query-by uid <uid> <EMS_serial_number> <EMS_tenant_id>`	Query from WAD diagnose command by UID, EMS serial number, and EMS tenant ID.
`# diagnose wad dev query-by ipv4 <ip>`	Query from WAD diagnose command by IP address.
`# diagnose firewall dynamic list`	List EMS security posture tags and all dynamic IP and MAC addresses.
`# diagnose test application fcnacd 7` `# diagnose test application fcnacd 8`	Check the FortiClient NAC daemon ZTNA and route cache.
`# diagnose wad worker policy list`	Display statistics associated with application gateway rules.
`# diagnose wad debug enable category all` `# diagnose wad debug enable level verbose`	Run real-time WAD debugs.

Command	Description
`# diagnose debug enable`	
`# diagnose debug reset`	Reset debugs when completed.
`# diagnose wad user list`	List the ZTNA/proxy users.
`# diagnose wad user clear <id> <ip> <vdom>`	Clear a single ZTNA/proxy user.
`# diagnose wad user clear`	Clear all ZTNA/proxy users.

The WAD daemon handles proxy related processing. The FortiClient NAC daemon (fcnacd) handles FortiGate to EMS connectivity.

Troubleshooting usage and output

1. Verify the FortiGate to EMS connectivity and EMS certificate:

```
# diagnose endpoint fctems test-connectivity WIN10-EMS
Connection test was successful:
```

```
# execute fctems verify WIN10-EMS
Server certificate already verified.
```

```
# diagnose test application fcnacd 2
EMS context status:
FortiClient EMS number 1:
        name: WIN10-EMS confirmed: yes
        fetched-serial-number: FCTEMS0000109188
Websocket status: connected
```

2. If fcnacd does not report the proper status, run real-time fcnacd debugs:

```
# diagnose debug app fcnacd -1
# diagnose debug enable
```

3. Verify the following information about an endpoint:
   - Network information
   - Registration information
   - Client certificate information
   - Device information
   - Vulnerability status
   - Relative position with the FortiGate

```
# diagnose endpoint ec-shm list 10.6.30.214
Record 0:
                IP Address = 10.6.30.214
```

```
                MAC Address = 00:0c:29:ba:1e:61
                MAC list = 00:0c:29:ba:1e:61;00:0c:29:ba:1e:6b;
                VDOM = root (0)
                EMS serial number: FCTEMS8821001322
                EMS tenant id: 00000000000000000000000000000000
                Client cert SN: 17FF6595600A1AF53B87627AB4EBEDD032593E64
                Quarantined: no
                Online status: online
                Registration status: registered
                On-net status: on-net
                Gateway Interface: port2
                FortiClient version: 7.0.0
                AVDB version: 84.778
                FortiClient app signature version: 18.43
                FortiClient vulnerability scan engine version: 2.30
                FortiClient UID: 5FCFA3ECDE4D478C911D9232EC9299FD
                Host Name: ADPC
    …
                Number of Routes: (1)
                        Gateway Route #0:
                                - IP:10.1.100.214, MAC: 00:0c:29:ba:1e:6b, Indirect: no
                                - Interface:port2, VFID:0, SN: FG5H1E5819902474

```

4. Query the endpoint information, include security posture tags, by UID or IP address:

```
# diagnose endpoint lls-comm send ztna find-uid 5FCFA3ECDE4D478C911D9232EC9299FD
FCTEMS8821001322 00000000000000000000000000000000
UID: 5FCFA3ECDE4D478C911D9232EC9299FD
EMS Fabric ID: FCTEMS8821001322:00000000000000000000000000000000
        status code:ok
        Domain: qa.wangd.com
        User: user1
        Cert SN:17FF6595600A1AF53B87627AB4EBEDD032593E64
        EMS SN: FCTEMS8821001322
        Routes(1):
         - route[0]: IP=10.1.100.214, VDom=root
        Tags(3):
         - tag[0]: name=ZT_OS_WIN
         - tag[1]: name=all_registered_clients
         - tag[2]: name=Medium
```

```
# diagnose endpoint lls-comm send ztna find-ip-vdom 10.1.100.214 root
UID: 5FCFA3ECDE4D478C911D9232EC9299FD
        status code:ok
        Domain: qa.wangd.com
        User: user1
        Cert SN:17FF6595600A1AF53B87627AB4EBEDD032593E64
        EMS SN: FCTEMS8821001322
        Routes(1):
         - route[0]: IP=10.1.100.214, VDom=root
        Tags(3):
```

```
          - tag[0]: name=ZT_OS_WIN
          - tag[1]: name=all_registered_clients
          - tag[2]: name=Medium
```

5. Query endpoint information from WAD by UID or IP address:

```
# diagnose wad dev query-by uid 5FCFA3ECDE4D478C911D9232EC9299FD FCTEMS8821001322
00000000000000000000000000000000
Attr of type=0, length=32, value(ascii)=5FCFA3ECDE4D478C911D9232EC9299FD
Attr of type=4, length=30, value(ascii)=MAC_FCTEMS8821001322_ZT_OS_WIN
Attr of type=4, length=26, value(ascii)=FCTEMS8821001322_ZT_OS_WIN
Attr of type=4, length=43, value(ascii)=MAC_FCTEMS8821001322_all_registered_clients

Attr of type=5, length=18, value(ascii)=FOSQA@qa.wangd.com
Attr of type=6, length=40, value(ascii)=17FF6595600A1AF53B87627AB4EBEDD032593E64
```

6. List all the dynamic ZTNA IP and MAC addresses learned from EMS:

```
# diagnose firewall dynamic list
List all dynamic addresses:
FCTEMS0000109188_all_registered_clients: ID(51)
        ADDR(172.17.194.209)
        ADDR(192.168.40.8)
…
FCTEMS0000109188_Low: ID(78)
        ADDR(172.17.194.209)
        ADDR(192.168.40.8)
…
FCTEMS0000109188_Malicious-File-Detected: ID(190)
        ADDR(172.17.194.209)
        ADDR(192.168.40.8)
…
```

7. Check the FortiClient NAC daemon ZTNA and route cache:

```
# diagnose test application fcnacd 7
ZTNA Cache:
-uid 5FCFA3ECDE4D478C911D9232EC9299FD: { "tags": [ "ZT_OS_WIN", "all_registered_clients",
"Medium" ], "domain": "qa.wangd.com", "user_name": "user1", "client_cert_sn":
```

```
"17FF6595600A1AF53B87627AB4EBEDD032593E64", "owner": "FOSQA@qa.wangd.com", "gateway_route_
list": [ { "gateway_info": { "fgt_sn": "FG5H1E5819902474", "interface": "port2", "vdom":
"root" }, "route_info": [ { "ip": "10.1.100.214", "mac": "00-0c-29-ba-1e-6b", "route_type":
"direct" } ] } ], "ems_sn": "FCTEMS8821001322" }
```

```
# diagnose test application fcnacd 8
IP-VfID Cache:
IP: 10.1.100.206, vfid: 0, uid: 3DED29B54386416E9888F2DCBD2B9D21
IP: 10.1.100.214, vfid: 0, uid: 5FCFA3ECDE4D478C911D9232EC9299FD
```

8. Troubleshoot WAD with real-time debugs to understand how the proxy handled a client request:

```
# diagnose wad debug enable category all
# diagnose wad debug enable level verbose
# diagnose debug enable

[0x7fbd7a46bb60] Received request from client: 10.10.10.20:56312

Always reset the debugs after using them:

```
# diagnose debug reset
```

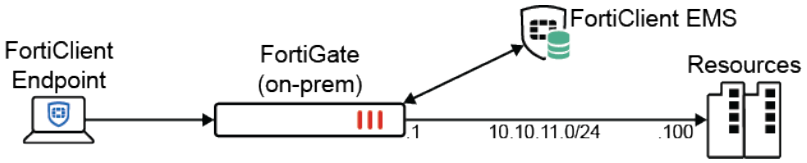
ZTNA troubleshooting scenarios

This topic describes how to troubleshoot common FortiClient endpoint IP/MAC access control issues for the following topologies:

- ZTNA access control on page 1557
- IP/MAC based access control on page 1558

ZTNA access control

In this topology, FortiClient endpoints use an SSL encrypted connection to the FortiGate application gateway to access protected resources. FortiGate works with FortiClient EMS to use a combination of IP/MAC addresses and security posture tags to control FortiClient endpoint access to resources.



This section describes how to handle the following errors:

- Invalid ZTNA certificate on page 1557
- ZTNA policy mismatch on page 1557

Invalid ZTNA certificate

When FortiClient attempts to access a server protected by ZTNA, an *Invalid ZTNA certificate* error is shown. This error often appears when the serial number for the ZTNA certificate differs between the endpoint and the FortiGate.

1. Check the serial number for the ZTNA certificate on the endpoint and the FortiGate:
   a. On the endpoint, check the serial number for the certificate.
   b. On the FortiGate, check the serial number for the client certificate by running the following command:

```
# diagnose endpoint ec-shm list
```

2. If the serial number for the ZTNA certificate differs between the endpoint and the FortiGate, and the serial number on the FortiGate is comprised of zeros, check the following:
   a. For FortiClient, make sure that the endpoint is running FortiClient 7.0 or later. FortiClient versions earlier than 7.0 do not support ZTNA.
   b. For FortiClient EMS, make sure that ZTNA is enabled. Check the profile on EMS and the endpoint's summary information.
   c. For licensing, make sure that you have a ZTNA agent license entitlement. Only some license types support ZTNA.
3. If the serial numbers still do not match, deregister FortiClient from EMS, and then connect FortiClient to EMS again to trigger a new certificate signing request.

ZTNA policy mismatch

In most cases, FortiGate denies incoming ZTNA requests because the endpoint FortiClient does not meet the tagging criteria configured in the ZTNA rule and is considered a policy mismatch.

1. On the FortiGate, look at the ZTNA event logs and the forwarded logs.
2. Run the following commands on the ZTNA server:

```
# diagnose wad debug enable category policy
```

```
# diagnose wad debug enable level verbose
```

```
# diagnose debug enable
```

The command output contains incoming ZTNA requests and the FortiGate process for matching the connection to a ZTNA rule.

3. Verify the zero trust tags for the endpoint:
   - On FortiClient, verify the applied tags. Click the avatar to view the zero trust tags.
   - On FortiClient EMS, verify the endpoint's tags. Go to the endpoint list and click the endpoint.
   - On FortiGate, verify the tags using the following commands:
     - Display ZTNA cache data for all endpoints:

       ```
       # diagnose test application fcnacd 7
       ```

     - Display ZTNA cache data for an individual endpoint:

       ```
       # diagnose wad dev query-by uid <UID> <EMS S/N> <tenant ID>
       ```

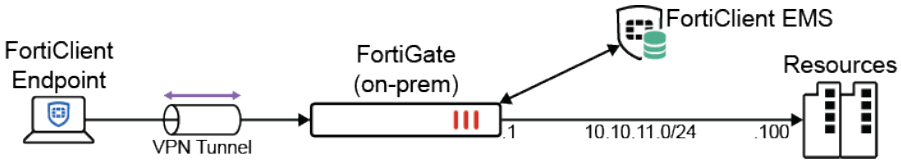
4. If the tagging information differs between FortiGate and EMS, examine the EMS tag exchange communication between FortiGate and EMS by looking at the cmNotify and python logs in the debug diagnostics for EMS.

   For more information about FortiClient EMS diagnostics, see Generate Diagnostic Log in the FortiClient EMS Administration Guide.

IP/MAC based access control

In the following ZTNA topology, FortiClient endpoints use VPN to access resources. FortiGate works with FortiClient EMS to use a combination of IP/MAC addresses and security posture tags to control FortiClient endpoint access to resources.

For more information, see ZTNA IP MAC based access control example on page 1520.



Security posture tag information missing on the FortiGate

If the IP address for the FortiClient endpoint is not associated with a security posture tag on the FortiGate, a firewall policy mismatch occurs, and the FortiGate denies network access to the FortiClient endpoint.

The following workflow summarizes how FortiGate retrieves the IP address and tags for the FortiClient endpoint to help you better understand how to troubleshoot the situation:

1. FortiClient establishes a VPN connection to the FortiGate.
2. FortiGate uses the API to pass FortiClient's UUID and VPN IP address to FortiClient EMS.
3. FortiGate requests system information and tags from FortiClient based on the response from EMS.

Based on the workflow, start troubleshooting before the FortiClient endpoint attempts to establish a VPN connection to FortiGate. On FortiGate, run the following commands:

```
# diagnose debug application fcnacd -1
```

```
# diagnose debug console timestamp enable
```

```
# diagnose endpoint filter show-large-data yes
```

```
# diagnose debug enable
```

The following outputs illustrate how to examine the command output. The output can differ between environments. The outputs help illustrate how to understand the communication between FortiGate and FortiClient EMS.

In the following output, FortiGate's VPN daemon sends FortiClient's UUID and the VPN IP address to FortiClient EMS using the API. The NAC daemon makes the API call to send the details to FortiClient EMS:

```
2022-10-17 08:50:41 [fcems_call_vpn_client_gateway_call:1147] VPN act connect (UID:

user: FG10E0TB20903081]: Request with SN [FG10E0TB20903034,FG10E0TB20903081] success. Returned 1
endpoints. uid_offset: D997B2A7A78E4E6F832309FF97FC2215, updated_after: 2022-10-26
15:59:37.8237471, is_final: True
2022-10-26 11:59:38,543 DEBUG ems_logger 6 7 [UID-Tags e6ecc42c058e48b2b71cf7d65ecd432c
Certificate user: FG10E0TB20903081]: Request with SN [FG10E0TB20903034,FG10E0TB20903081] success.
uid_offset: D997B2A7A78E4E6F832309FF97FC2215, updated_after: 2022-10-26 15:59:37.8227461, is_
final: True
```

FortiGate uses the information from FortiClient EMS to make a targeted API call to FortiClient EMS to retrieve both system information and tag information (with the means of uid_offset and updated_after parameters) for the endpoint. The following is the API call to retrieve the tags from FortiClient EMS:

```
https://172.31.200.182/api/v1/report/fct/uid_tags?sn_list[]=FGVM02TM22018374&updated_after=2022-
10-17 15:59:37.8227461&uid_offset=3358095CFDCB414B9EDA49ADE79AF428
```

The following in an example of the API call and subsequent communication between FortiGate and FortiClient EMS to retrieve tags for the FortiClient endpoint IP address:

```
2022-10-17 08:50:42 [ec_ez_worker_base_prep_resolver:373] Outgoing interface index 0 for 2
(FortiClientEMS).
2022-10-17 08:50:42 [ec_ez_worker_prep_data_url:98] request (26):

Other useful CLI commands

Output the JSON-formatted list of FortiGate interfaces (gateways) with IP and MAC addresses. This is the list that FortiGate sends to EMS so that EMS can identify the endpoints that are directly connected to the firewall:

```
# diagnose endpoint fctems json gateway-mac-request
```

Makes EMS execute API calls to the EMS API endpoints on demand:

```
# diagnose test application fcnacd 5
```

Send the gateway list to EMS on demand. It could be useful to execute `diagnose test application fcnacd 5` right after command during troubleshooting, as EMS will have an updated list of firewall interfaces:

```
# diagnose test application fcnacd 99
```

For more commands, see ZTNA troubleshooting and debugging commands on page 1551.

Policy and Objects

This section contains topics on configuring policies and traffic shaping:

- Policies on page 1562
- Address objects on page 1744
- Protocol options on page 1792
- Traffic shaping on page 1798
- Internet Services on page 1867

Policies

The firewall policy is the axis around which most features of the FortiGate revolve. Many firewall settings end up relating to or being associated with the firewall policies and the traffic they govern. Any traffic going through a FortiGate has to be associated with a policy. These policies are essentially discrete compartmentalized sets of instructions that control the traffic flow going through the firewall. These instructions control where the traffic goes, how it is processed, if it is processed, and whether or not it is allowed to pass through the FortiGate.

When the firewall receives a connection packet, it analyzes the source address, destination address, and service (by port number). It also registers the incoming interface, the outgoing interface it needs to use, and the time of day. Using this information, the FortiGate firewall attempts to locate a security policy that matches the packet. If a policy matches the parameters, then the FortiGate takes the required action for that policy. If it is *Accept*, the traffic is allowed to proceed to the next step. If the action is *Deny* or a match cannot be found, the traffic is not allowed to proceed.

The two basic actions at the initial connection are either *Accept* or *Deny*:

- If the action is *Accept*, the policy permits communication sessions. There may be other packet processing instructions, such as requiring authentication to use the policy or restrictions on the source and destination of the traffic.
- If the action is *Deny*, the policy blocks communication sessions, and you can optionally log the denied traffic. If no security policy matches the traffic, the packets are dropped. A *Deny* security policy is needed when it is required to log the denied traffic, also called *violation traffic*.

One other action can be associated with the policy:

- *IPsec*: this is an *Accept* action that is specifically for IPsec VPNs.

Each field in a firewall policy that accepts multiple inputs, such as srcaddr and dstaddr, can accept as many inputs as there are unique objects created. The maximum number of objects depends on the model. See the Maximum Values Table for more details.

The following topics provide information on the available types of policies and configuration instructions:

- Firewall policy on page 1563
- NGFW policy on page 1586
- Local-in policy on page 1605
- DoS policy on page 1621
- Access control lists on page 1629
- Interface policies on page 1630

The following topics provide instructions on configuring policies:

- Source NAT on page 1631
- Destination NAT on page 1658
- Examples and policy actions on page 1682

Firewall policy

The firewall policy is the axis around which most of the other features of the FortiGate firewall revolve. A large portion of the settings in the firewall at some point will end up relating to or being associated with the firewall policies and the traffic that they govern. Any traffic going through a FortiGate unit has to be associated with a policy. These policies are essentially discrete compartmentalized sets of instructions that control the traffic flow going through the firewall. These instructions control where the traffic goes, how it's processed, if it's processed, and even whether or not it's allowed to pass through the FortiGate.

The following topics provide information on the firewall policy and configuration:

- Firewall policy parameters on page 1563
- Configurations in the GUI on page 1564
- Configurations in the CLI on page 1573
- Policy views on page 1579
- Policy match on page 1581
- Services on page 1582

Firewall policy parameters

For traffic to flow through the FortiGate firewall, there must be a policy that matches its parameters:

- Incoming interface(s)
- Outgoing interface(s)
- Source address(es)
- Destination address(es)
- User(s) identity
- Service(s)
- Schedule

Traffic parameters are checked against the configured policies for a match. If the parameters do not match any configured policies, the traffic is denied.

Traffic flow initiated from each direction requires a policy, that is, if sessions can be initiated from both directions, each direction requires a policy.

Just because packets can go from point A to point B on port X does not mean that the traffic can flow from point B to point A on port X. A policy must be configured for each direction.

When designing a policy, there is often reference to the traffic flow, but most communication is two-way so trying to determine the direction of the flow might be confusing. If traffic is HTTP web traffic, the user sends a request to the website, but most of the traffic flow will be coming from the website to the user or in both directions? For the purposes of determining the direction for a policy, the important factor is the direction of the initiating communication. The user is sending a request to the website, so this is the initial communication; the website is responding so the traffic is from the user's network to the Internet.

FortiOS does not perform a reverse-path check on reply traffic that matches an allowed session based on the IP tuple. The request traffic can be sent on one interface and the reply traffic could return on another interface.

Configurations in the GUI

Firewall policies can be created in the GUI by configuring the necessary parameters.

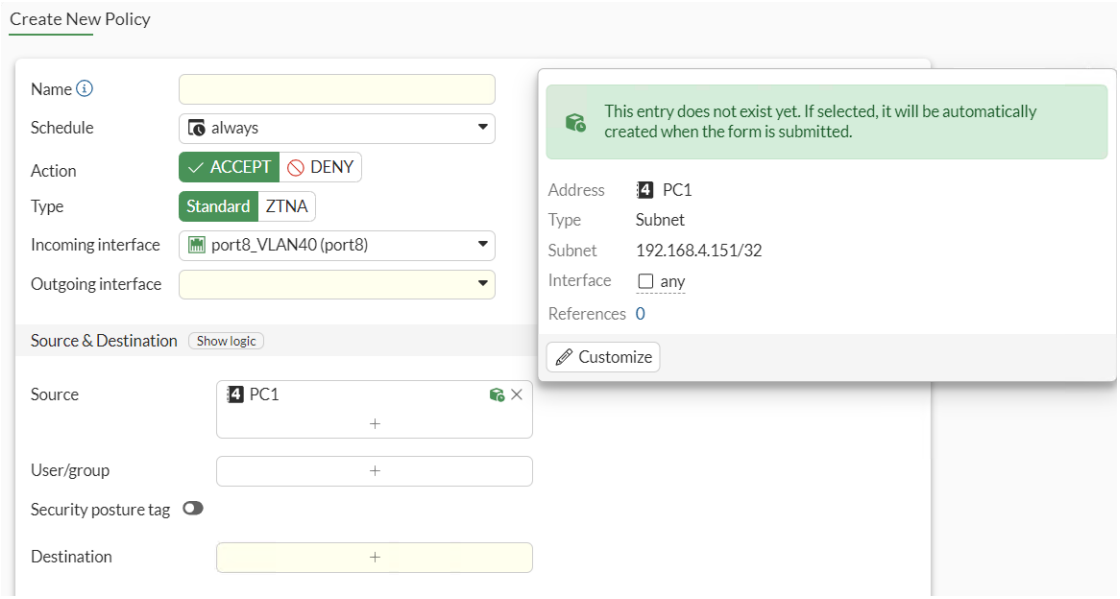
Schedule	The time frame that is applied to the policy. This can be something as simple as a time range that the sessions are allowed to start, such as between 8:00 am and 5:00 pm. Something more complex like business hours that include a break for lunch and time of the session's initiation may need a schedule group because it will require multiple time ranges to make up the schedule.
Incoming interface (s)	This is the interface or interfaces by which the traffic is first connected to the FortiGate unit. The exception being traffic that the FortiGate generates itself. This is not limited to the physical Ethernet ports found on the device. The incoming interface can also be a logical or virtual interface such as a VPN tunnel, a Virtual WAN link, or a wireless interface.
Outgoing interface (s)	This is the interface or interfaces used by traffic leaving a port once it has been processed by the firewall. Similar to incoming interfaces, it is not limited to only physical interfaces.
Source address (es)	The addresses that a policy can receive traffic from can be wide open or tightly controlled. For a public web server that the world at large should be able to access, the best choice will be *all*. If the destination is a private web server that only the branch offices of a company should be able to access, or a list of internal computers that are the only ones allowed to access an external resource, then a group of preconfigured addresses is the better strategy
User/group	This parameter is based on a user identity that can be from a number of authentication authorities. It will be an account or group that has been set up in advance that can be selected from the drop down menu. The exception to this is the feature that allows the importing of LDAP Users. When the feature is used, a small wizard window will appear to guide the user through the setup. The caveat is that the LDAP server object in the *User & Authentication > LDAP Servers* section has to be already configured to allow the use of this import feature.

Destination address(es)	In the same way that the source address may need to be limited, the destination address can be used as a traffic filter. When the traffic is destined for internal resources, the specific address of the resource can be defined to better protect the other resources on the network. One of the specialized destination address options is to use a Virtual IP address. If the destination address doesn't need to be internal, you can define policies that are only for connecting to specific addresses on the Internet.
Internet service(s)	In this context, an Internet service is a combination of one or more addresses and one or more services associated with a service found on the Internet such as an update service for software.
Service	The services chosen represent the TCP/IP suite port numbers that will most commonly be used to transport the named protocols or groups of protocols. This is different than *Application Control* which looks more closely at the packets to determine the actual protocol used to create them. A case where either side can initiate the communication, like between two internal interfaces on the FortiGate unit, would be a more likely situation to require a policy for each direction.

To create a policy by an IP address with new objects in the GUI:

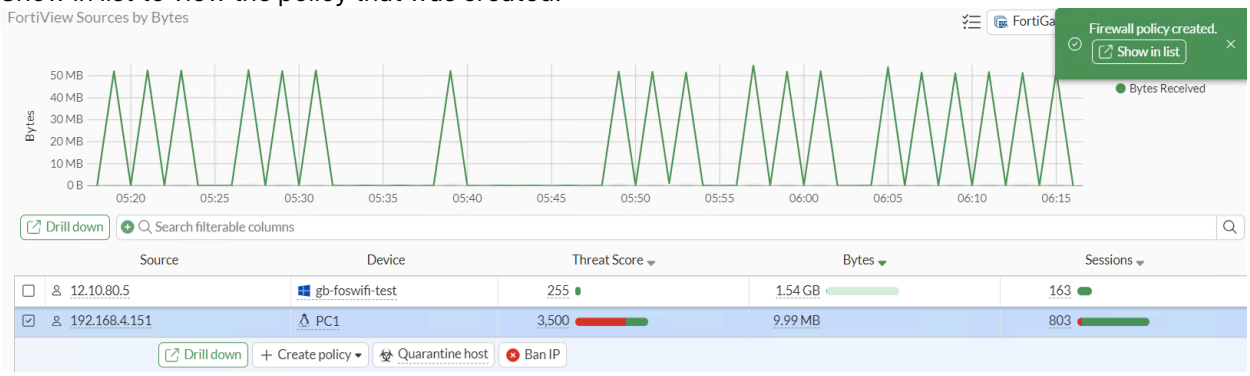
1. From the *Dashboard > FortiView Sources* page, choose any entry.
2. Click *Create policy > Create firewall policy by IP address*. The *Create New Policy* pane opens.
3. The *Incoming interface* field is auto-filled with the correct interface and the *Source* field is auto-filled with a new staged object and a green icon.
4. Hover over the icon and a warning is shown: *This entry does not exist yet. If selected, it will be automatically created when the form is submitted*. Check that the stage object has the correct IP address.

Staged objects can be customized by clicking *Customize*.



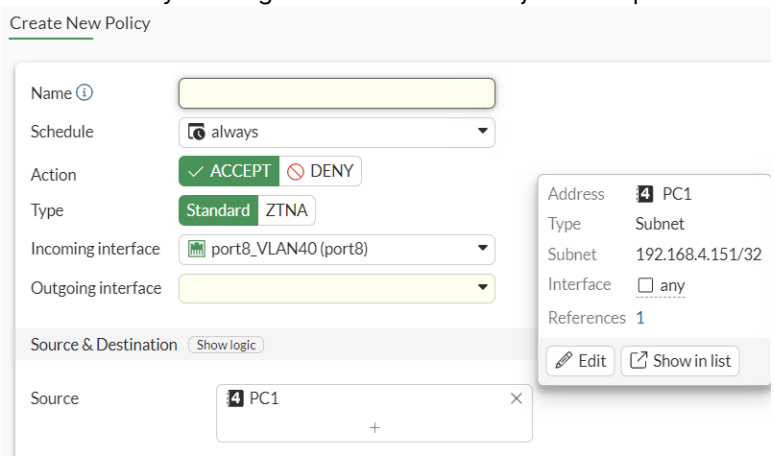
The staged object will not be saved if you click *Cancel* on the *Create New Policy* pane.

5. Fill in all other fields with the necessary data and save the policy.
6. When the policy is successfully created, a green notification displays in the top right of the window. Click *Show in list* to view the policy that was created.



To create a policy with existing objects:

1. Navigate to the *Dashboard* > *FortiView Sources* page and choose any source entry that was saved as an address during policy creation in the previous section
2. Click *Create policy* > *Create firewall policy by IP address*. The *Create New Policy* pane opens.
3. The *Incoming interface* field is auto-filled with the correct interface and the *Source* field is auto-filled with the correct address object. No green icon is shown for the address object. The object can be found in the *Address list* by clicking *Show in list* in the object tooltip.



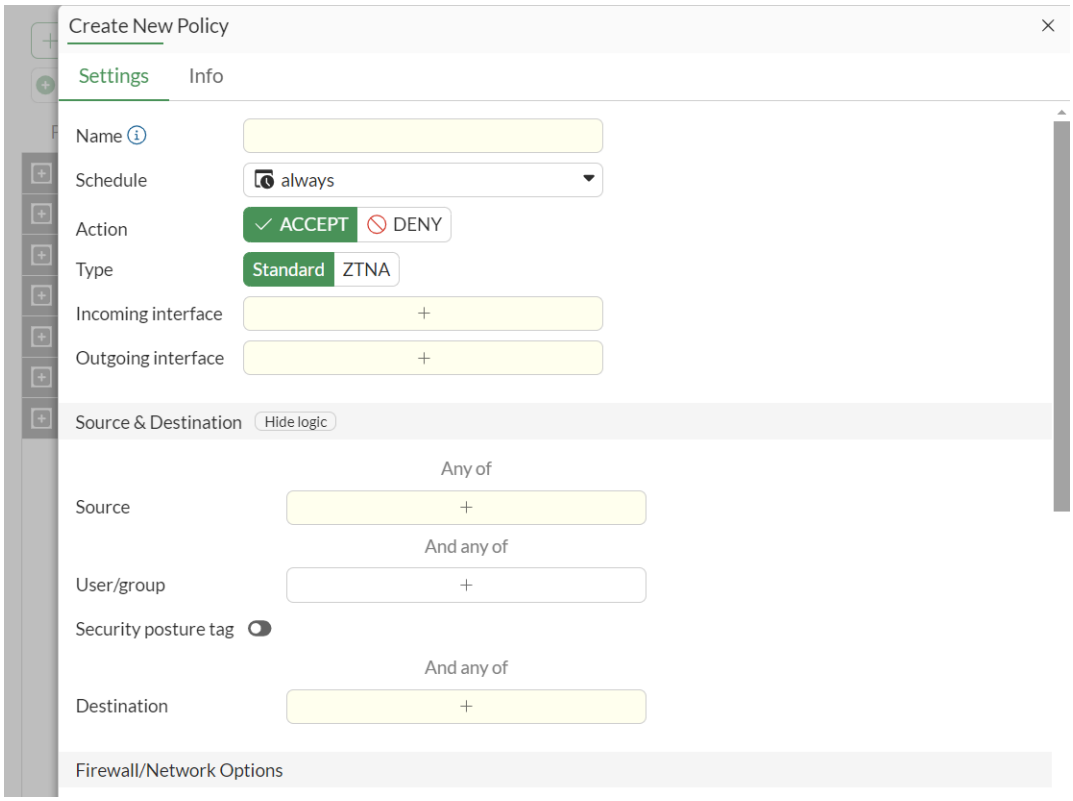
4. Fill in the other fields with required data and save the policy. When the policy is successfully created, a green notification displays in the top right of the window.
5. Click *Show in list* to view the policy.

Displaying logic between firewall policy objects in the GUI

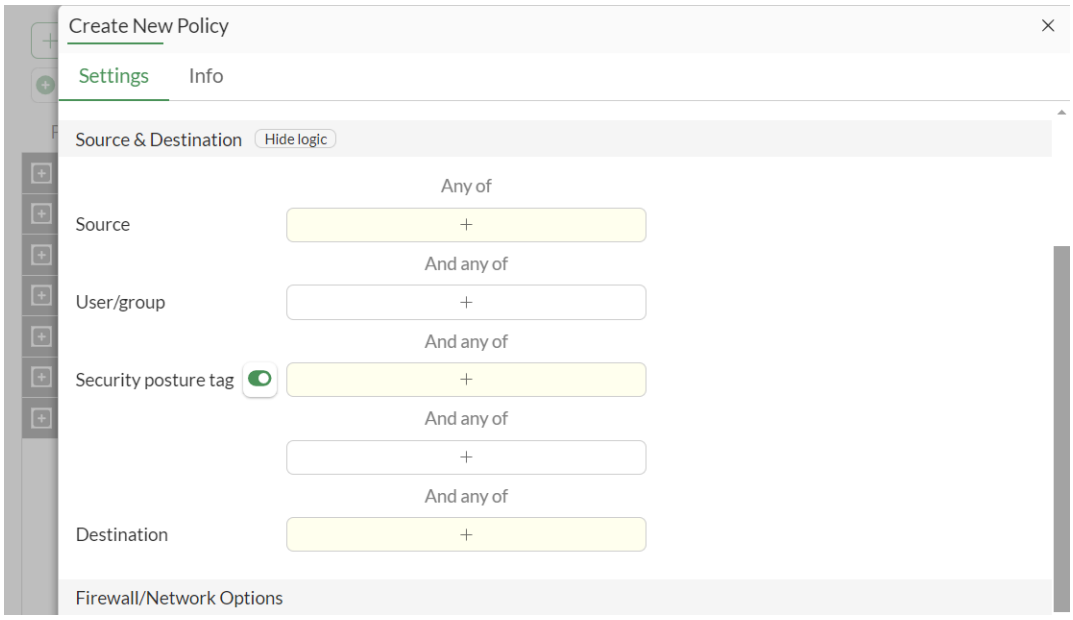
The FortiOS GUI can display the logical AND relationship in firewall policies between source and destination objects, including security posture tags when enabled, to help you configure firewall policies.

To display the logic in firewall policies in the GUI:

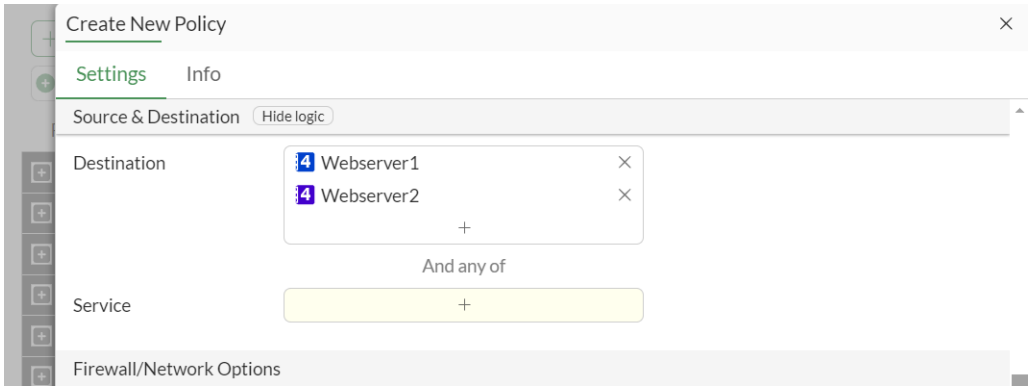
1. Go to *Policy & Objects* > *Firewall Policy*, and click *Create New*. The *Create New Policy* pane opens.
2. In the *Source & Destination* section, click *Show Logic*.
   - The labels *Any of* and *And any of* appear to clarify how the objects are used to match traffic. The *And any of* label indicates a logical AND relationship between the objects.



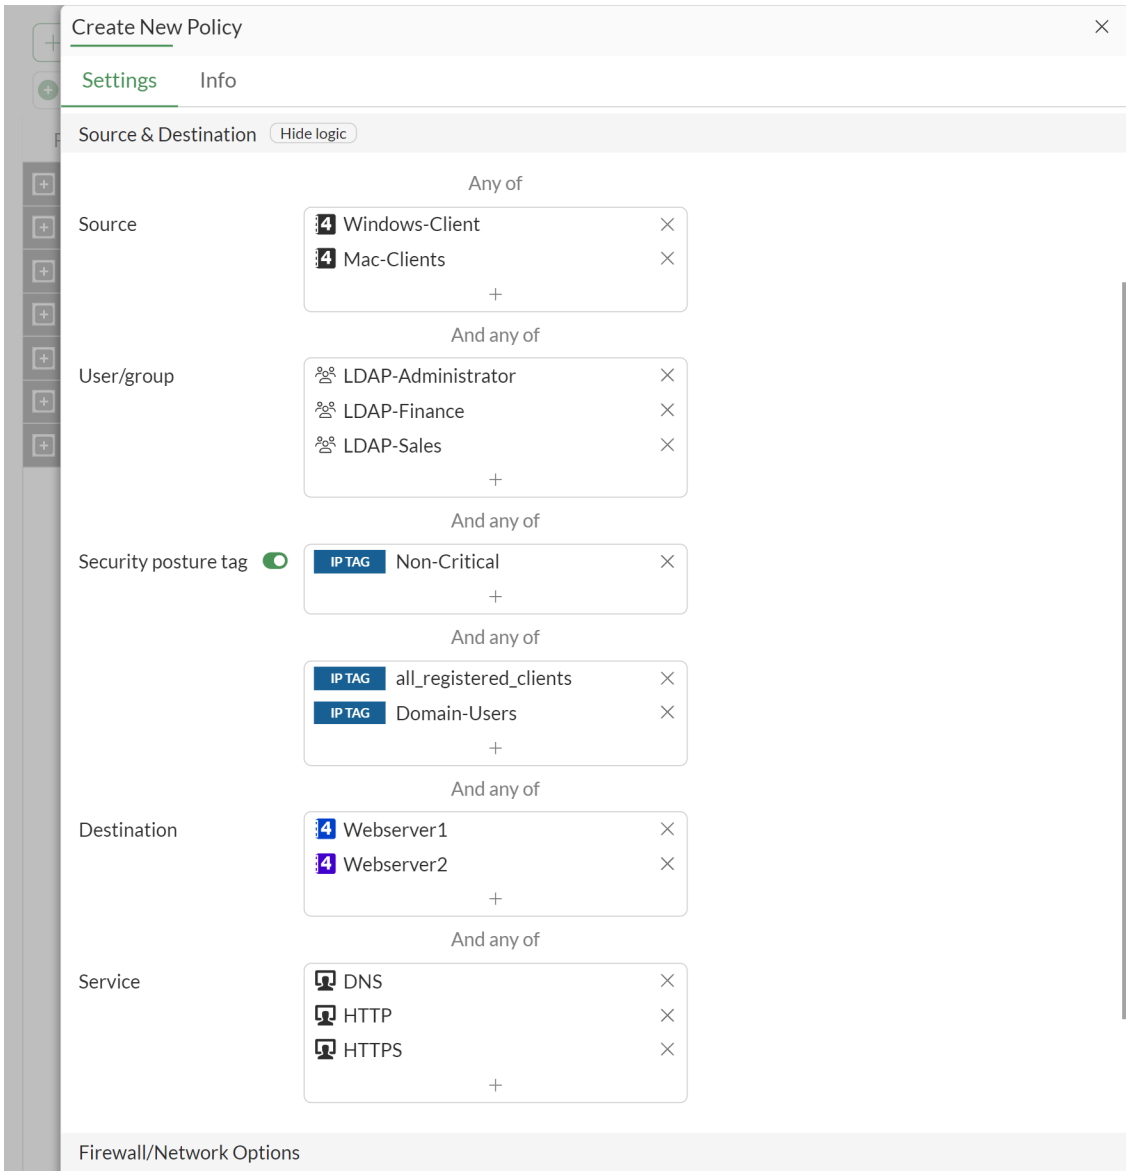
3. Enable *Security posture tag*:
   - The labels *And any of* appear, indicating a logical AND relationship between the two security posture tag objects.
   - The first security posture tag group is required when *Security posture tag* is enabled and is considered the primary tag group.
   - A second security posture tag group is optional when *Security posture tag* is enabled and is considered the secondary tag group.
   - Within each of the tag groups, there is a logical OR relationship between the tags when multiple tags are used.



4. In the *Destination* list, select one or more destinations to display *And any of* between the *Destination* and *Service* fields.



Following is the logic of using the mandatory and optional fields in the *Source & Destination* section, based on the following configurations:



Traffic must match all criteria below:

- Any *Source*: either *Windows-Client* OR *Mac-Clients*
- Any *User/group*: either *LDAP-Administrator*, *LDAP-Finance*, OR *LDAP-Sales*
- The primary *Security posture tag*: *Non-Critical*
- Any secondary security posture tags: either *all_registered_clients* OR *Domain-Users*
- Any *Destination*: either *Webserver1* OR *Webserver2*
- Any *Service*: Either *DNS*, *HTTP*, OR *HTTPS*

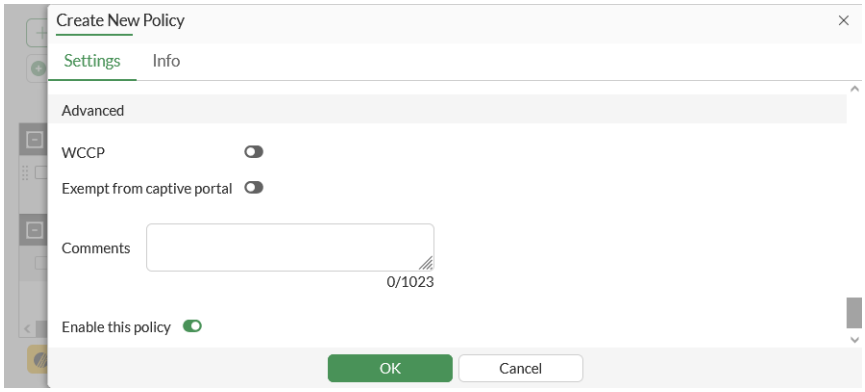
Enabling advanced policy options in the GUI

Advanced policy options can be enabled so that you can configure the options in the GUI.

To enable advanced policy options:

```
config system settings
    set gui-advanced-policy enable
end
```

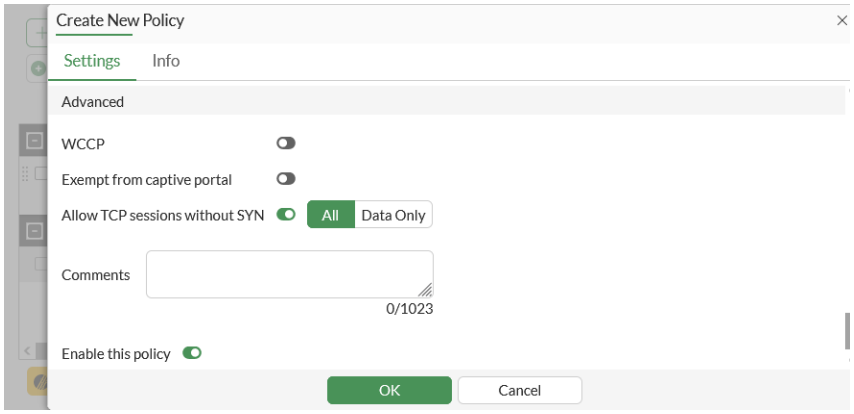
Advanced policy options are now available when creating or editing a policy in the GUI:



To enable configuring TCP sessions without SYN:

```
config system settings
    set tcp-session-without-syn enable
end
```

TCP sessions without SYN can now be configured when creating or editing a policy in the GUI:



Add Policy change summary and Policy expiration to Workflow Management

Two options, *Policy change summary* and *Policy expiration*, are included in *Workflow Management*. *Policy change summary* enforces an audit trail for changes to firewall policies. *Policy expiration* allows administrators to set a date for the firewall policy to be disabled.

There are three states for the *Policy change summary*:

- *Disable*: users will not be prompted to add a summary when editing a policy.
- *Required*: the *Policy change summary* will be enabled and will require users to add a summary when editing or creating a firewall policy.
- *Optional*: the *Policy change summary* will be enabled but users can leave the summary empty, if preferred, when editing or creating a firewall policy.

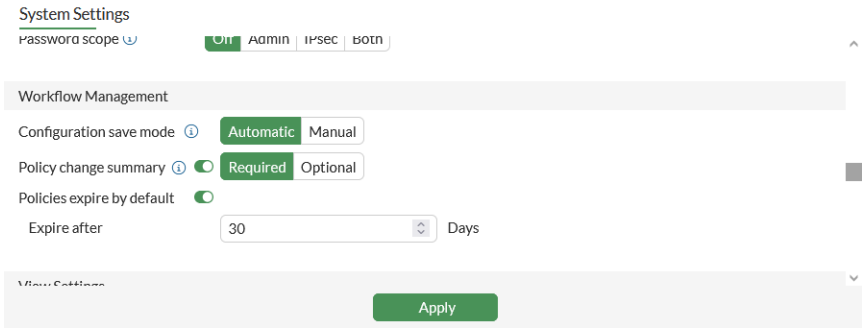
There are three states for *Policy expiration*:

- *Disable*: the firewall policy will not expire. This is the default setting for *Policy expiration*.
- *Default*: the firewall policy will expire after the default number of days.
- *Specify*: the firewall policy will expire at a set date and time.

The default value for *Policy expiration* is 30 days. This number can be changed in the CLI or in *System > Settings* in the GUI to any value between zero and 365 days. If the default value is set to zero, the *Default* state will disable the *Policy expiration*.

To configure the firewall policy change summary and default expiration in the GUI:

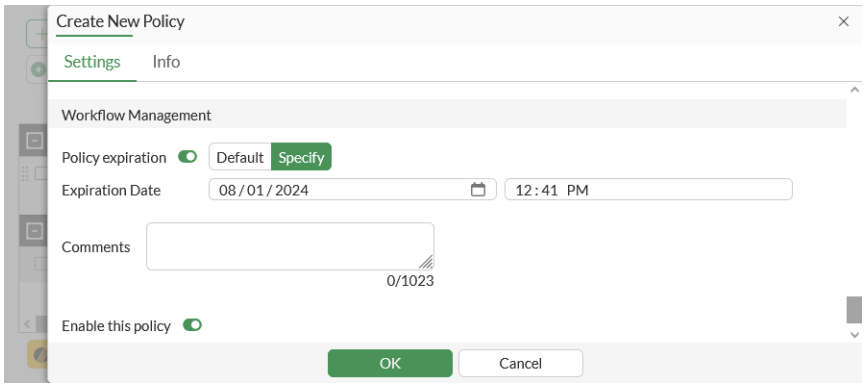
1. Go to *System > Feature Visibility*.
2. Enable *Workflow Management*.
3. Click *Apply*.
4. Go to *System > Settings*.
5. In the *Workflow Management* section, set *Policy change summary* to *Required*. *Policies expire by default* is enabled by default with an *Expire after* value of *30*.



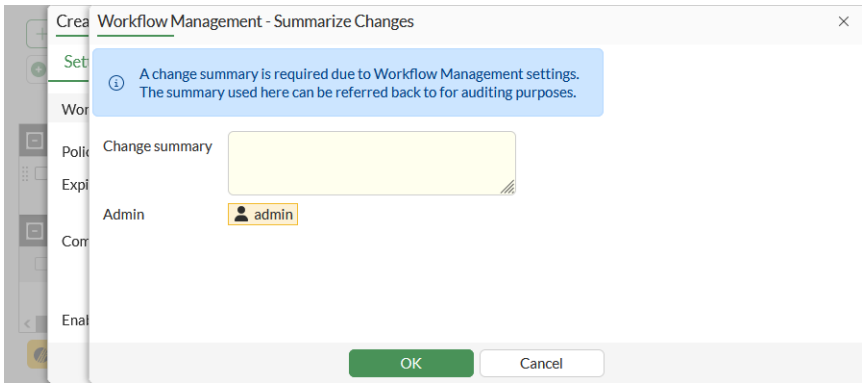
6. Click *Apply*.

To configure firewall policy expiration in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Name the policy and configure the necessary parameters.
3. Set *Policy expiration* to *Specify*.



4. Select the date and time for the policy to expire from the *Expiration date* fields.
5. Click *OK*. The *Workflow Management - Summarize Changes* pane opens.



6. In the *Change summary* field, enter details about the changes made to the policy. These details can be referred to later for auditing purposes.
7. Click *OK*.

To configure the firewall policy change summary in the CLI:

```
config system settings
    set gui-enforce-change-summary {disable | require | optional}
end
```

To configure the policy expiration default value in the CLI:

```
config system settings
    set default-policy-expiry-days <integer>
end
```

To configure firewall policy expiration in the CLI:

```
config firewall policy
    edit <id>
        set policy-expiry {enable | disable}
        set policy-expiry-date <YYYY-MM-DD HH:MM:SS>
```

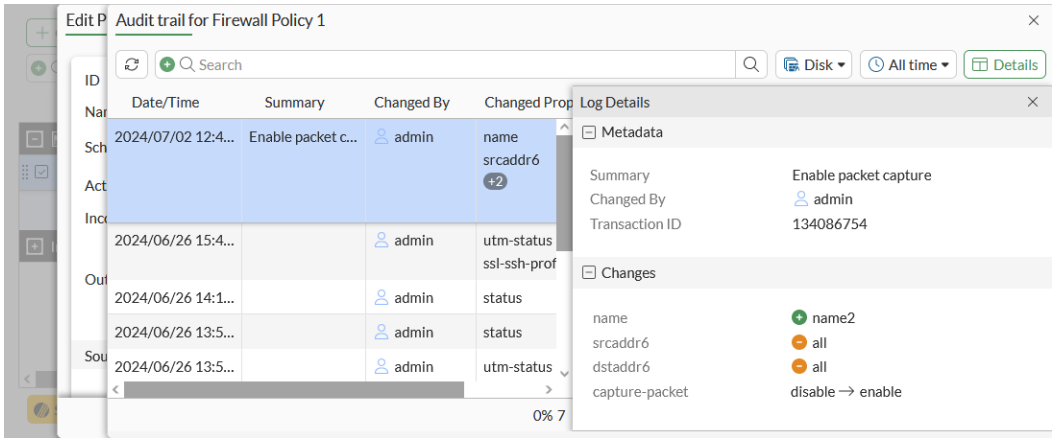
```
    next
end
```

Policy change summaries are used to track changes made to a firewall policy. The *Audit Trail* allow users to review the policy change summaries, including the date and time of the change and which user made the change.

The *Audit Trail* is only supported by FortiGate models with disk logging.

To review the audit trail in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Select the policy you want to review and click *Edit*.
3. In the right-side banner (or on the *Info* tab if shown), click *Audit Trail*. The *Audit trail for Firewall Policy* pane opens and displays the policy change summaries for the selected policy.



4. Select an entry to review the details of the change made.
5. When you are done reviewing the *Audit Trail*, click *Close*.
6. Click *Cancel* to exit the *Edit Policy* page.

Configurations in the CLI

Firewall policies can be created in the CLI by configuring the necessary parameters. See Configurations in the GUI on page 1564 for more information on the various parameters.

Parameter	Definition
srcintf	Incoming (ingress) interface.
dstintf	Outgoing (egress) interface.
srcaddr	Source IPv4 address and address group names.
dstaddr	Destination IPv4 address and address group names.

Parameter	Definition
internet-service	Enable/disable use of Internet Services for this policy. If enabled, destination address and service are not used.
schedule	Schedule name.
service	Service and service group names.
anti-replay	Enable/disable checking of TCP flags per policy.
match-vip	Enable/disable matching of VIPs when used in a policy with a deny action.
auto-asic-offload	Enable/disable hardware acceleration. Available on select FortiGate models with Secure Processing Unit (SPU) hardware only.
tcp-mss-sender	Sender TCP maximum segment size (MSS).
tcp-mss-receiver	Receiver TCP maximum segment size (MSS).
session-ttl	Time-to-live (TTL) in seconds for session accepted by this policy.

Firewall anti-replay option per policy

When the global anti-replay option is disabled, the FortiGate does not check TCP flags in packets. The per policy anti-replay option overrides the global setting. This allows you to control whether or not TCP flags are checked per policy.

To enable the anti-replay option so TCP flags are checked using the CLI:

```
config firewall policy
    edit 1
        set name "policyid-1"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set anti-replay enable
        set logtraffic all
        set nat enable
    next
end
```

Deny matching with a policy with a virtual IP applied

Preventing hosts with specific source addresses from accessing a server behind the FortiGate may be required in some cases. For this scenario, you should have previously configured a firewall policy with a virtual IP (VIP) object applied to it to allow such access. See Destination NAT on page 1658 for details.

When denying traffic destined for a typical firewall policy without a VIP applied, you would simply configure a new firewall policy with an action of deny and with specific source addresses above the firewall policy that you

want to prevent these hosts from accessing. However, the FortiGate matches firewall policies with VIPs applied differently than typical firewall policies. Policies with VIPs applied have priority over typical firewall policies.

Therefore, to block specific source traffic destined for a firewall policy specified with an action of `accept` and with a VIP applied, you should configure `set match-vip enable` on the firewall policy with a `deny` action that has been configured to match traffic before the firewall policy with the VIP applied. By default, new `deny` action firewall policies have `match-vip` enabled.

If the policy action is set to `accept`, `match-vip` cannot be enabled.

To block VIP traffic in a deny policy:

```
config firewall policy
    edit 1
        set name "deny-policy-1"
        set srcintf "wan1"
        set dstintf "lan1"
        set srcaddr "src-hosts-to-deny-access"
        set dstaddr "all"
        set action "deny"
        set schedule "always"
        set service "all"
        set match-vip enable
    next
    edit 2
        set name "vip-policy-1"
        set srcintf "wan1"
        set dstintf "lan1"
        set srcaddr "all"
        set dstaddr "vip-object-1"
        set action "accept"
        set schedule "always"
        set service "ALL"
    next
end
```

Alternatively, to block access to a firewall policy with a VIP applied, you can configure a new VIP object configured with `set src-filter <range>`. Configure a new firewall policy with a `deny` action and with this new VIP applied, and then configure this policy to match traffic before the firewall policy with the same VIP applied with an action of `accept`. In this case, the firewall policy can simply have `set match-vip disable`.

To specify a VIP with source addresses specified with a deny policy:

```
config firewall vip
    edit “vip-with-srcaddr-to-deny”
        set extip "10.1.100.199"
        set extintf "wan1"
        set mappedip "172.16.200.55"
```

```
        set src-filter "1.1.1.1/24"
    next
end
config firewall policy
    edit 3
        set name "deny-policy-3"
        set srcintf "wan1"
        set dstintf "lan1"
        set srcaddr "all"
        set dstaddr "vip-with-srcaddr-to-deny"
        set action "deny"
        set match-vip disable
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "vip-policy-1"
        set srcintf "wan1"
        set dstintf "lan1"
        set srcaddr "all"
        set dstaddr "vip-object-1"
        set action "accept"
        set match-vip disable
        set schedule "always"
        set service "ALL"
    next
end
```

Hardware acceleration

Hardware acceleration is supported on select FortiGate devices and is enabled by default on all firewall policies to ensure optimal performance when processing network traffic traversing the FortiGate. See the Hardware Acceleration Reference Manual for details.

Typically, hardware acceleration on a specific firewall policy is disabled for one of two purposes:

- To allow CLI commands such as the packet sniffer and debug flow to display all traffic matching the policy since traffic offloaded by SPU hardware on a FortiGate device is not visible by those CLI tools.
- To troubleshoot any possible issues arising by using hardware acceleration.

To disable hardware acceleration in an IPv4 firewall policy:

```
config firewall policy
    edit 1
        set auto-asic-offload disable
    next
end
```

To disable hardware acceleration in an IPv6 firewall policy:

```
config firewall policy6
    edit 1
        set auto-asic-offload disable
    next
end
```

To disable hardware acceleration in a multicast firewall policy:

```
config firewall multicast-policy
    edit 1
        set auto-asic-offload disable
    next
end
```

TCP Maximum Segment Size (MSS)

The TCP maximum segment size (MSS) is the maximum amount of data that can be sent in a TCP segment. The MSS is the MTU size of the interface minus the 20 byte IP header and 20 byte TCP header. By reducing the TCP MSS, you can effectively reduce the MTU size of the packet.

The TCP MSS can be configured in a firewall policy, or directly on an interface. See Interface MTU packet size on page 188 for details on configuring TCP MSS directly on an interface.

To configure TCP MSS in a firewall policy:

```
config firewall policy
    edit <policy ID>
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.10.10.6"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set tcp-mss-sender 1448
        set tcp-mss-receiver 1448
    next
end
```

Adjusting session time-to-live (TTL)

A session is a communication channel between two devices or applications across the network. Sessions allow FortiOS to inspect and act on a sequential group of packets in a session all at once instead of inspecting each packet individually. Each session has an entry in the session table that includes important information about the session.

The session time-to-live (TTL) parameter determines how long a session of a particular protocol such as TCP, UDP, or ICMP remains in the session table. To ensure proper operation of some devices or applications, the

session TTL parameter may need to be increased or decreased to allow sessions to remain active in the session table for a longer or shorter duration, respectively.

To configure a modified session TTL in a firewall policy:

```
config firewall policy
    edit <policy ID>
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.10.10.6"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set session-ttl 1800
    next
end
```

The session TTL can be set to zero or `never` to ensure a session never times out. See No session timeout on page 1708 for details.

Session TTL should only be set to zero or `never` after careful consideration of:

- The connected device's or application's requirements for sessions to always stay alive
- The expectation that a connected device or application will use the same session determined by traffic using a fixed source port, fixed destination port, fixed source IP address, and fixed destination IP address.

When session TTL is set to zero or `never`, then sessions will not be cleared from the session table or expire after a specified time unless the CLI commands `diagnose system session filter <filter>` and `diagnose system session clear` are used.

If this setting is used in the case when traffic through a firewall policy can generate numerous unique sessions, then this may have unintended consequences to the FortiGate's memory usage and performance due to the session table constantly growing and not clearing out idle sessions.

To disable session TTL in a firewall policy:

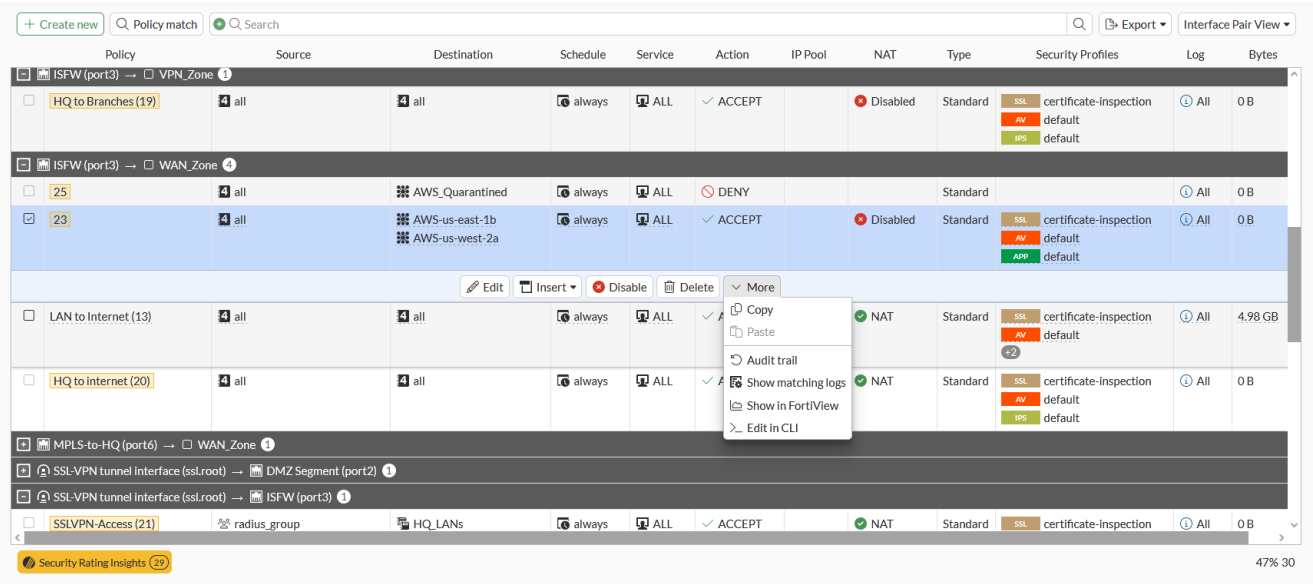
```
config firewall policy
    edit <policy ID>
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.10.10.6"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set session-ttl never
    next
end
```

Policy views

In *Policy & Objects* policy list pages, there are three policy views: *Interface Pair View*, *Sequence Grouping View*, and *By Sequence*. For large policy tables (thousands of policies), the *By Sequence* view will load the fastest.

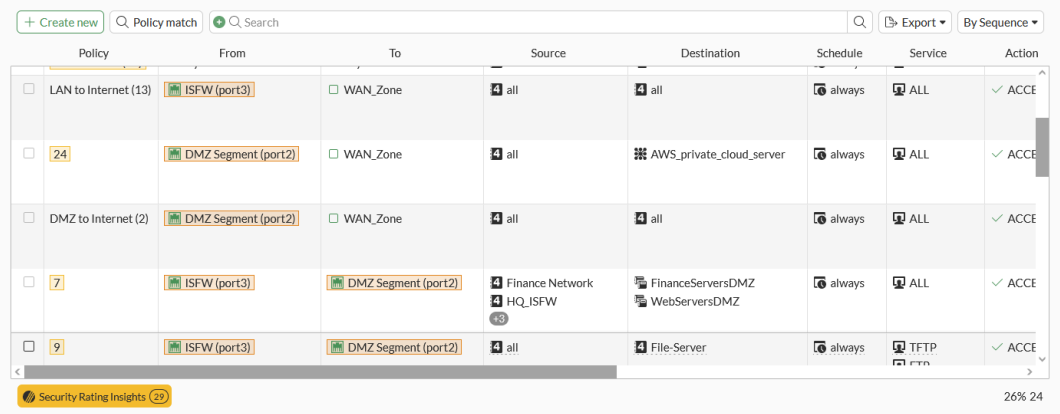
Interface Pair View displays the policies in the order that they are checked for matching traffic, grouped by the pairs of incoming and outgoing interfaces in collapsible sections. The *Interface Pair View* can be used when a policy is configured with multiple interfaces. Right-click on any pair name and click *Expand All* or *Collapse All* to expand or collapse all of the pairs.

When a policy is inserted, the Incoming and Outgoing interfaces are automatically filled in, and you can confirm the location of the new policy in the right-side gutter before clicking *OK* to insert the policy.



When a single policy is selected, an inline menu opens below the row. The *More* dropdown menu includes the same expanded list of options that are available in the right-click menu. When multiple policies are selected, the top menu bar changes to show buttons that are applicable to the multiple selections and you can click View selected to show only the selected policies on the page.

By Sequence displays policies in the order that they are checked for matching traffic without any grouping.

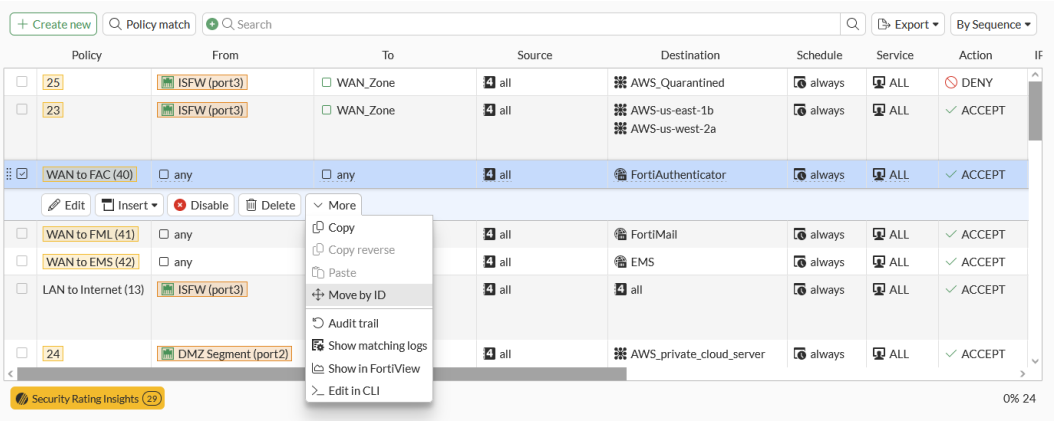


Policies can then be moved by their policy ID before or after another specified policy ID.

Moving policies by ID is only available when viewing the *Firewall Policy* page in *By Sequence* or *Sequence Grouping View*.

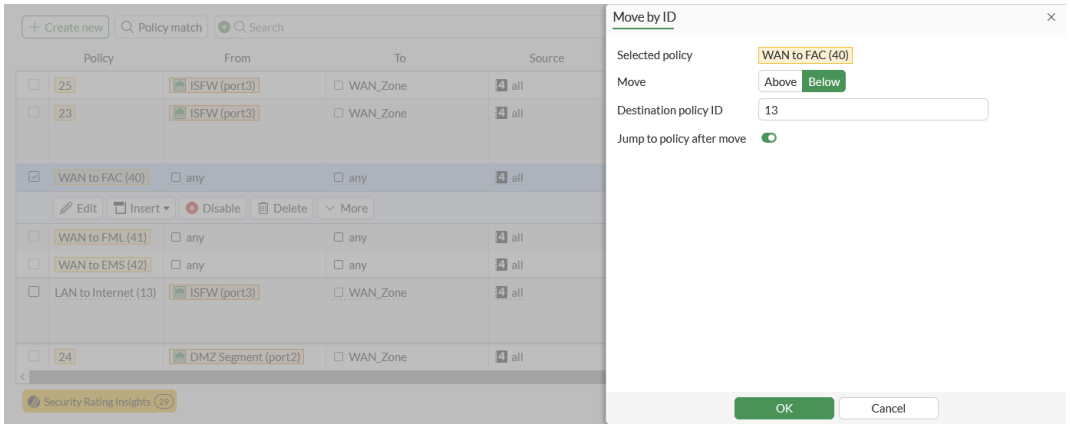
To move a policy by policy ID:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Select the policy you want to move.
3. Select *More* > *Move by ID*.



The *Move by ID* pane is displayed.

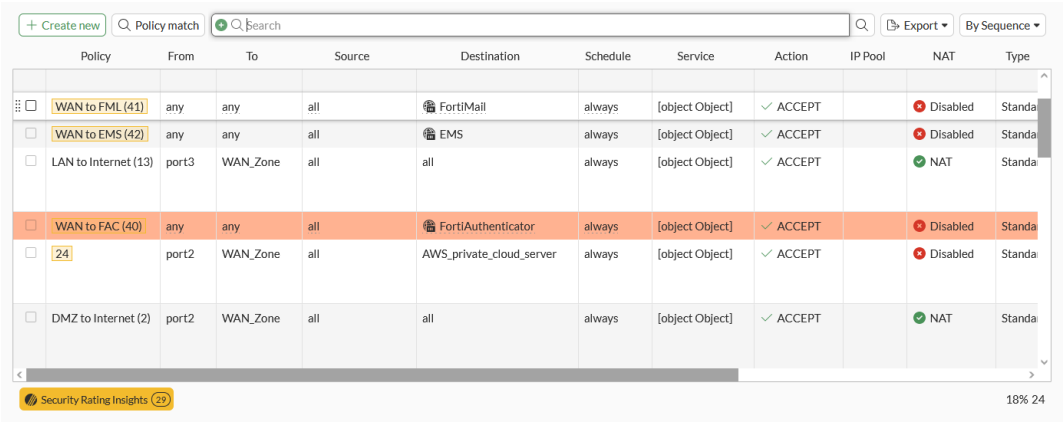
4. Define the new location of the policy:
   a. Select whether the policy should be moved *Above* or *Below* the policy ID you will define in the next step.
   b. In the *Destination policy ID* field, enter the ID of the destination policy or select it from the dropdown menu.



5. If you do not want to automatically view the new location of the policy, disable *Jump to policy after move*. This feature is enabled by default.
6. Click *OK*.

If *Workflow Management* is enabled in *System > Feature Visibility*, the *Workflow Management - Summarize Changes* pane is displayed. Enter a *Change summary* then click *OK* to continue.

The policy will be moved to the new location.



Policy match

Firewall policy match is based on the `Source_interfaces/Protocol/Source_Address/Destination_Address` that matches the `source-port` and `dst-port` of the protocol. Use this tool to find out which policy matches specific traffic from a number of policies. After completing the match, the matching firewall policy is highlighted on the policy list page.

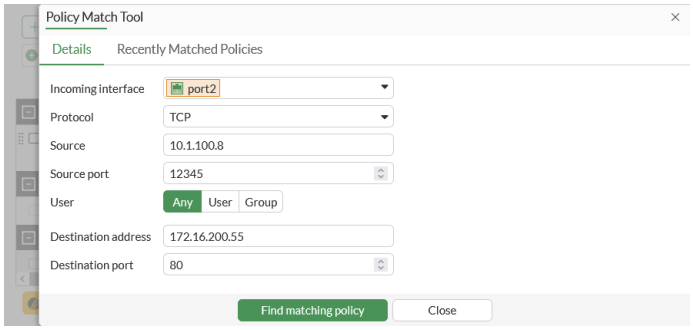
The *Policy match* tool has the following requirements:

- Transparent mode does not support policy match function.
- When executing the policy match, you need to confirm whether the relevant route required for the policy work already exists.

Sample configuration

This example uses the TCP protocol to show how policy match works:

1. On a *Policy & Objects* policy list page, click *Policy match* and enter the traffic parameters.



2. Click *Find matching policy* to display the policy match results.

Services

Services represent typical traffic types and application packets that pass through the FortiGate. Services include the service protocol type (TCP, UDP, ICMP, and so on), address, category, and logical destination port. Services can then be applied in a firewall policy to represent the TCP/IP suite port numbers that will most commonly be used to transport the named protocols or groups of protocols. Likewise, security profiles use service definitions to match session types.

The following services are available:

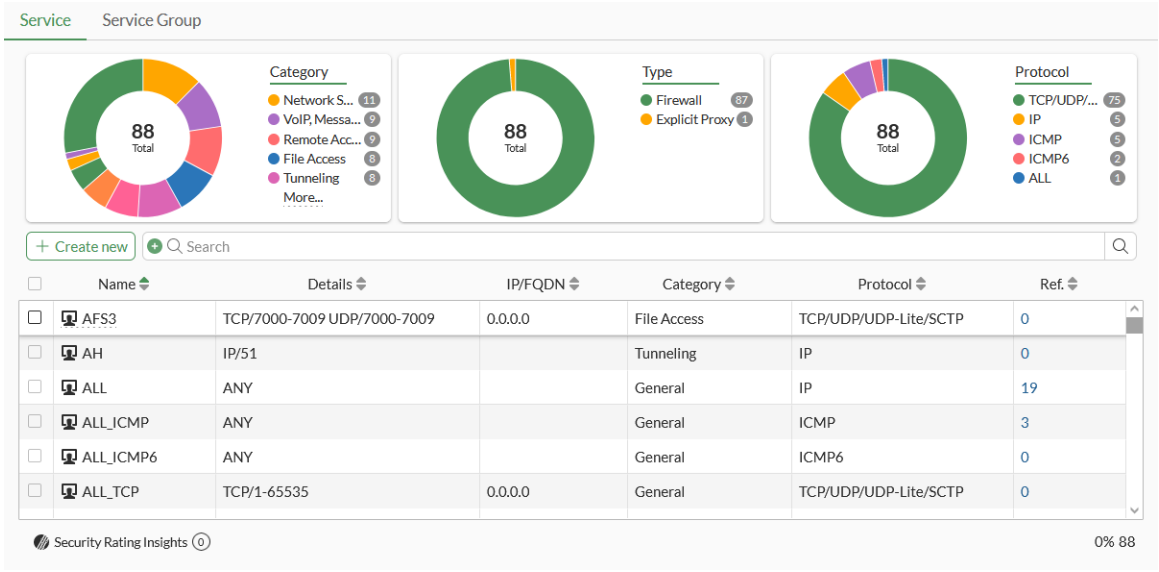
- Predefined services on page 1582
- Custom services on page 1584
- Service groups on page 1585

Predefined services

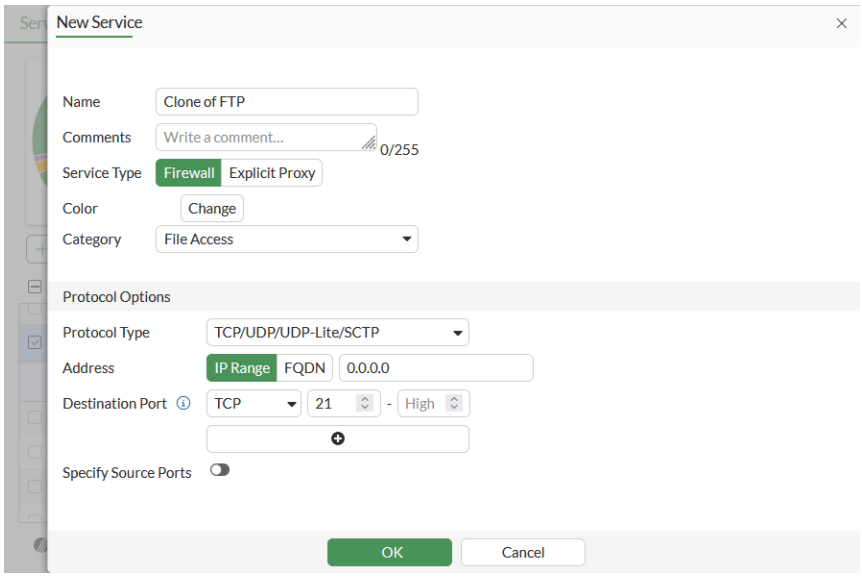
Firewall policies can be configured with default, predefined services that have been created for common traffic types. Predefined services can be edited, cloned, and deleted from the *Policy & Objects* > *Services* list. Cloning a services allows you to create a copy of the service parameters and edit it to create a similar service while still maintaining the existing service.

To clone a service:

1. Go to *Policy & Objects* > *Services*.
2. Go to the *Services* tab.



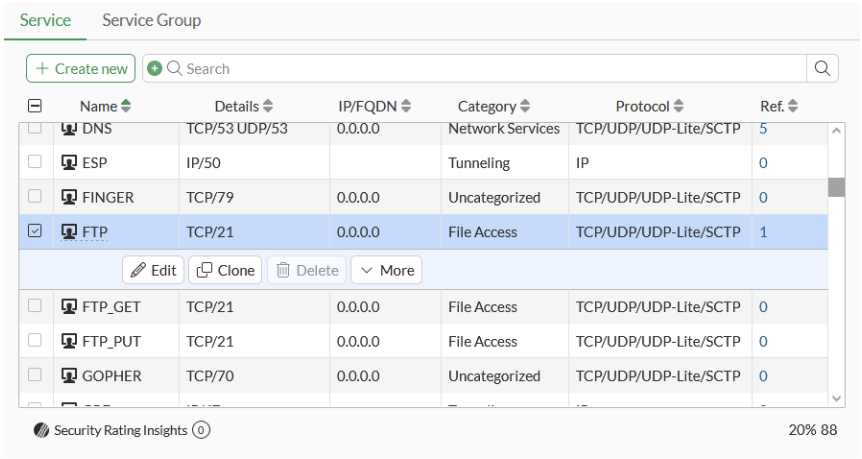
3. Select the service you want to clone.
4. Click *Clone*. The *New Service* page is displayed.



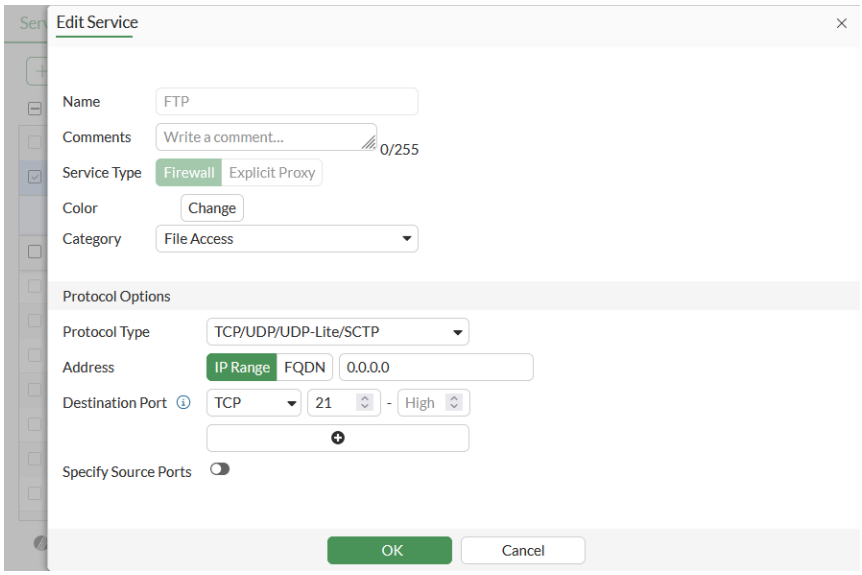
5. Edit the service details as needed.
6. Click *OK*.

To edit a service:

1. Go to *Policy & Objects* > *Services*.
2. Go to the *Services* tab and select the service that you need to edit.



3. Click *Edit*. The *Edit Service* page is displayed.



4. Edit the service details as needed.
5. Click *OK*.

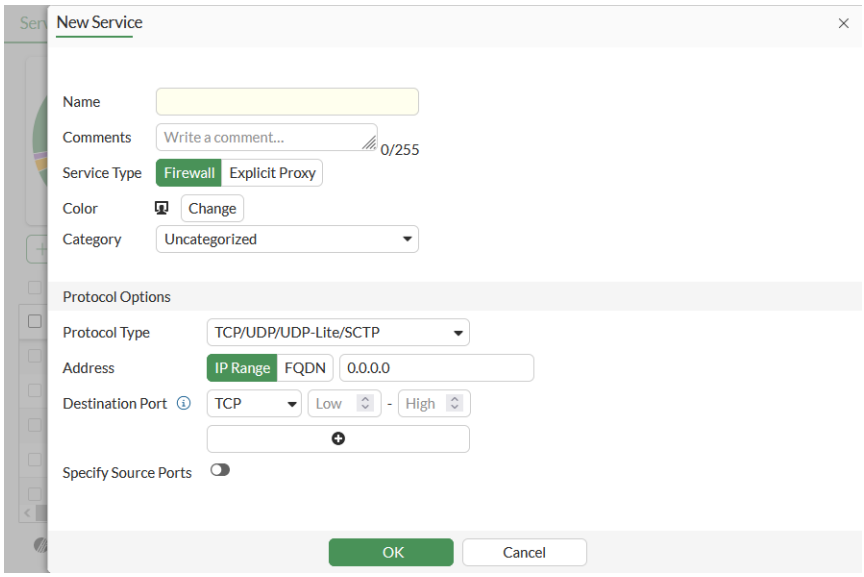
Custom services

You can create new, customized services in the *Policy & Objects > Services* page and the CLI. When creating a custom service, the ports, IP addresses, and protocols must be known for proper configuration. Once a service has been created, it must be applied to a firewall policy to take effect.

Custom services can also be created while configuring a new firewall policy.

To configure a custom service in the GUI:

1. Go to *Policy & Objects > Services*.
2. Go to the *Services* tab and click *Create new*.
3. Configure the service parameters as needed.



4. Click *OK*.

Custom services can be configured in the CLI for `TCP/UDP/UDP-Lite/SCTP`, `ICMP`, `ICMP6`, and `IP` protocols. Service parameters are dependent on the protocol type. See config firewall service custom in the CLI Reference guide for more information.

To configure a custom service in the CLI:

```
config firewall service custom
    edit <name>
        set protocol TCP/UDP/UDP-Lite/SCTP
        set tcp-portrange <destination port range>
        set udp-portrange <destination port range>
        set udplite-portrange <destination port range>
        set sctp-portrange <destination port range>
    next
end
```

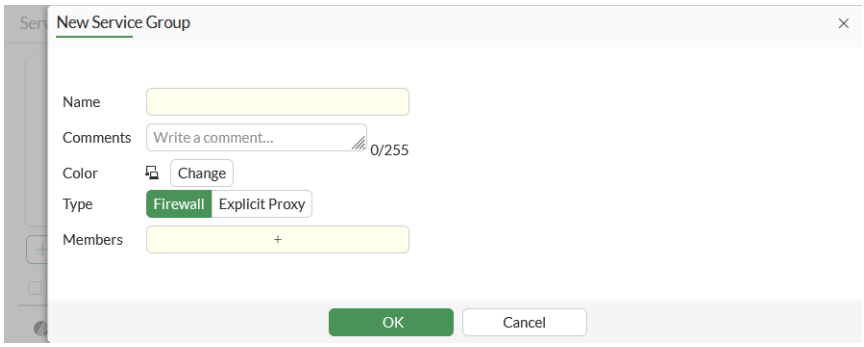
Service groups

Service groups are a collection of services and other service groups, allowing multiple services to be applied in a firewall policy at once.

Service groups can be cloned and edited in the *Service Groups* tab using the same process as services. See Predefined services on page 1582.

To configure a service group in the GUI:

1. Go to *Policy & Objects* > *Services*.
2. Go to the *Service Groups* tab and click *Create new*. The *New Service Group* page is displayed.



3. Enter the *Name* of the group.
4. (Optional) Enter a comment and select a color for the service group.
5. Select the group type.
6. Click the *Members* field and select the services and service groups to include in the group.
7. Click *OK*.

To configure a service group in the CLI:

```
config firewall service group
    edit <name>
        set fabric-object {enable | disable}
        set member <service name1>, <service name2>
        set proxy {enable | disable}
    next
end
```

NGFW policy

Profile-based next-generation firewall (NGFW) mode is the traditional mode where you create a profile (antivirus, web filter, and so on) and then apply the profile to a policy.

In policy-based NGFW mode, you allow applications and URL categories to be used directly in security policies, without requiring web filter or application control profiles. However, it is possible to select and apply web filter URL categories and groups.

In policy-based mode:

- Central NAT is always enabled. If no Central SNAT policy exists, you must create one. See Central SNAT on page 1642 for more information.
- Pre-match rules are defined separately from security policies, and define broader rules, such as SSL inspection and user authentication.
- The IPsec wizard is not supported.

If your FortiGate operates in NAT mode, rather than enabling source NAT in individual NGFW policies, go to *Policy & Objects* > *Central SNAT* and add source NAT policies that apply to all matching traffic. In many cases, you may only need one SNAT policy for each interface pair.

The NGFW mode is set per VDOM, and it is only available when the VDOM inspection mode is flow-based. You can operate your entire FortiGate or individual VDOMs in NGFW policy mode. The application default port can be set as a service port in the NGFW mode using the `default-app-port-as-service` option.

In NGFW mode, administrators can configure a security policy in learn mode to monitor traffic. See Learn mode in security policies in NGFW mode on page 1600 for more information.

Enabling policy-based NGFW mode

To enable policy-based NGFW mode without VDOMs in the GUI:

1. Go to *System* > *Settings*.
2. In *NGFW Mode*, select *Policy-based*.
3. Click *Apply*.

To enable policy-based NGFW mode with VDOMs in the GUI:

1. Go to *System* > *VDOM* .
2. Double-click a VDOM to edit the settings.
3. In *NGFW Mode*, select *Policy-based*.
4. Click *OK*.

To enable policy-based NGFW mode without VDOMs in the CLI:

```
config system settings
    set ngfw-mode policy-based
end
```

To enable policy-based NGFW mode with VDOMs in the CLI:

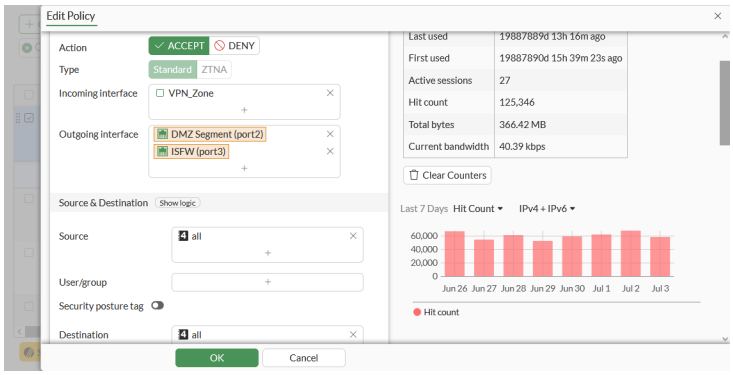
```
config vdom
    edit <vdom>
        config system settings
            set ngfw-mode policy-based
        end
    next
end
```

Hit count

When you edit a security policy, you can view the hit count for the last seven days. The hit count offers a rolling tally of how many times over the previous seven days a policy has been triggered, providing comprehensive, dynamic insight into policy usage patterns.

To view the hit count in the GUI:

1. Go to *Policy & Objects* > *Security Policy*.
2. Select a security policy, and click *Edit*. The *Last 7 Days* chart displays the hit count for the policy.



To view the hit count in the CLI:

1. Check the hit counter for a policy. The following example checks the hit count for the security policy with ID 1:

```
# diagnose ips pme policy stats
[  357] vdom:2 policy:1 ""
  first hit: 2024-06-26 10:22:56
  last hit:  2024-07-03 10:28:38
  hit count: 6 (1 0 0 1 1 1 1 1)

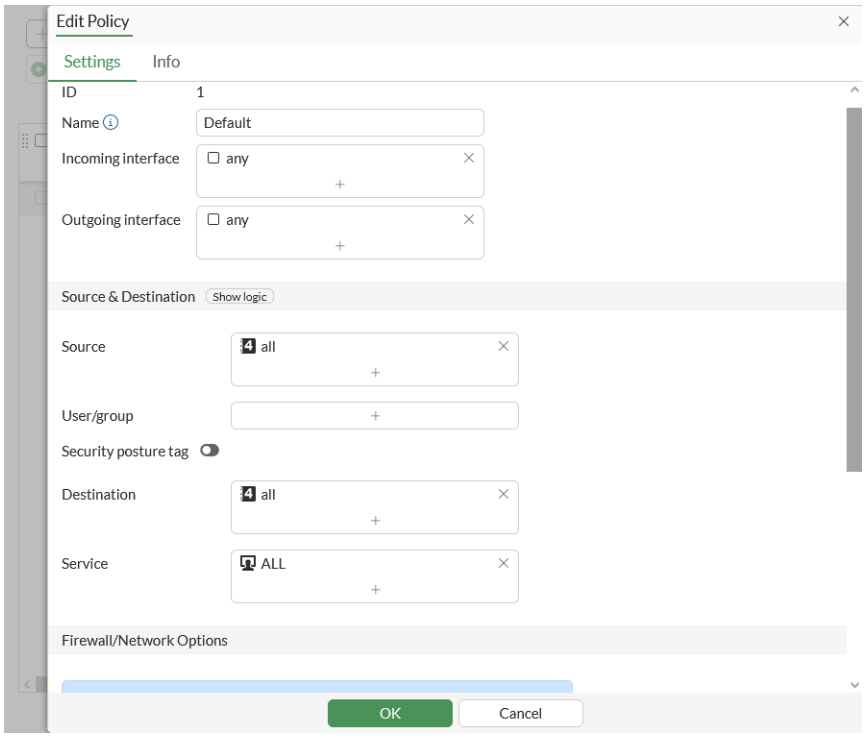
...
```

Security and SSL Inspection & Authentication policies

Security policies work with SSL Inspection & Authentication policies to inspect traffic. To allow traffic from a specific user or user group, both Security and SSL Inspection & Authentication policies must be configured. A default SSL Inspection & Authentication policy with the certificate-inspection SSL Inspection profile is preconfigured. Traffic will match the SSL Inspection & Authentication policy first. If the traffic is allowed, packets are sent to the IPS engine for application, URL category, user, and user group match, and then, if enabled, UTM inspection (antivirus, IPS, DLP, and email filter) is performed.

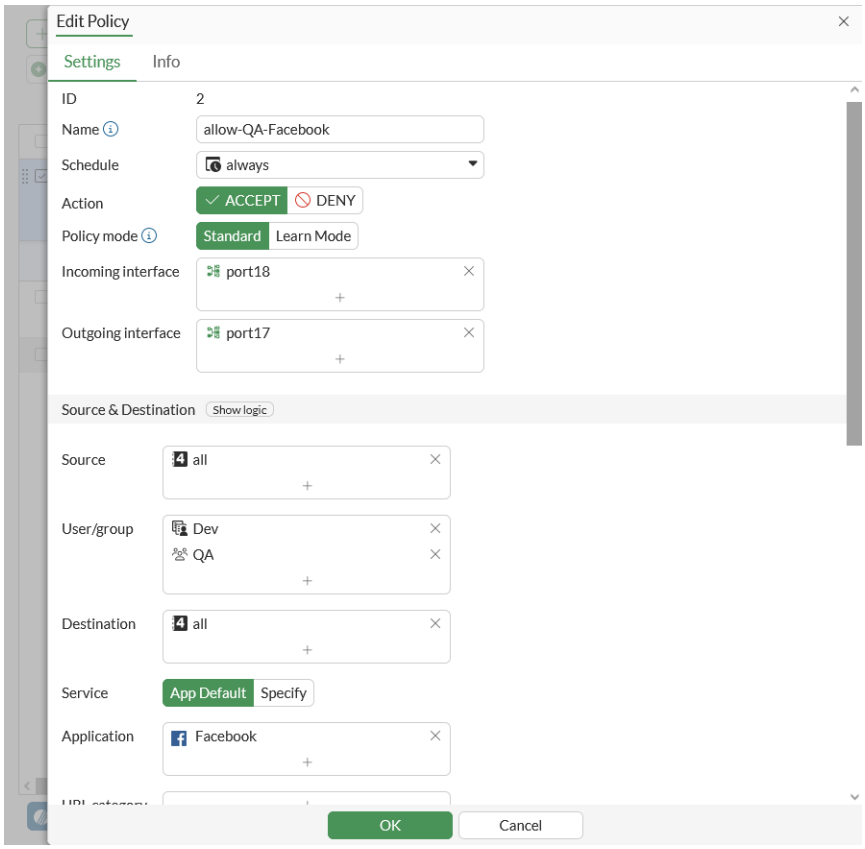
SSL Inspection & Authentication policies are used to pre-match traffic before sending the packets to the IPS engine:

- There are no schedule or action options; traffic matching the policy is always redirected to the IPS engine.
- SSL inspection, formerly configured in the VDOM settings, is configured in an SSL Inspection & Authentication policy.
- Users and user groups that require authentication must be configured in an SSL Inspection & Authentication policy.



Security policies work with SSL Inspection & Authentication policies to inspect traffic:

- Applications and URL categories can be configured directly in the policy.
- Users and user groups that require authentication must also be configured in a security policy.
- The available actions are *Accept* or *Deny*.
- The *Service* option can be used to enforce the standard port for the selected applications.
- UTM inspection is configured in a security policy.



To configure policies for Facebook and Gmail access in the CLI:

1. Configure an SSL Inspection & Authentication policy:

```
config firewall policy
    edit 1
        set name "Policy-1"
        set srcintf "port18"
        set dstintf "port17"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        set ssl-ssh-profile "new-deep-inspection"
        set groups "Dev" "HR" "QA" "SYS"
    next
end
```

2. Configure security policies:

```
config firewall security-policy
    edit 2
        set name "allow-QA-Facebook"
        set srcintf "port18"
        set dstintf "port17"
        set srcaddr "all"
```

```
        set dstaddr "all"
        set action accept
        set schedule "always"
        set application 15832
        set groups "Dev" "QA"
    next
    edit 4
        set name "allow-QA-Email"
        set srcintf "port18"
        set dstintf "port17"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set url-category 23
        set groups "QA"
    next
end
```

Logs

In the application control and web filter logs, `securityid` maps to the security policy ID.

Application control log:

```
date=2024-06-17 time=16:35:47 logid="1059028704" type="utm" subtype="app-ctrl"

```

Other NGFW policy-based mode options

You can combine *Application Control* and *Web Filter* in the same NGFW mode policy.

The following security profiles can be used in NGFW policy-based mode:

- AntiVirus
- Web Filter
- Intrusion Prevention
- File Filter
- Email Filter
- DNS Filter

Logging can also be enabled in security policies.

Inspection mode per policy

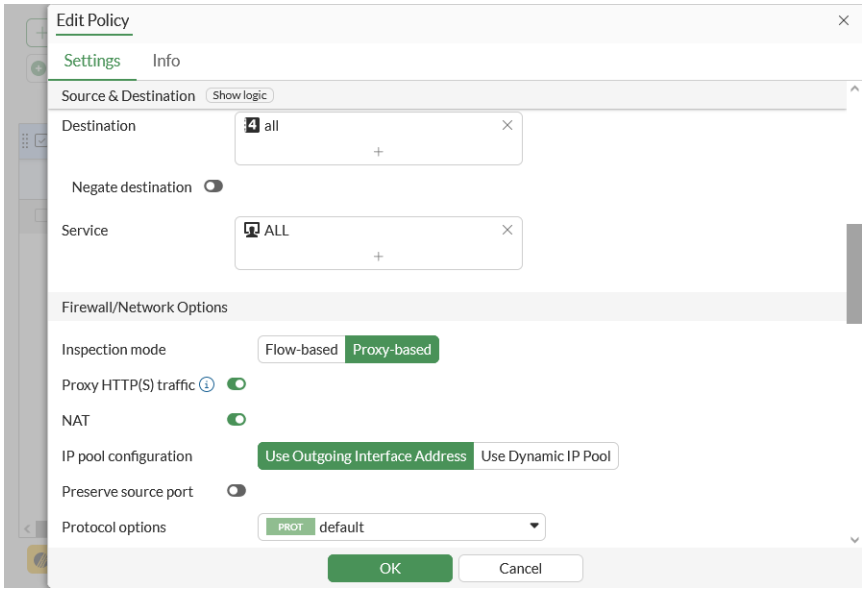
Inspection mode is configured on a per-policy basis in NGFW mode. This gives you more flexibility when setting up different policies.

When configuring a firewall policy, you can select a *Flow-based* or *Proxy-basedInspection Mode*. The default setting is *Flow-based*.

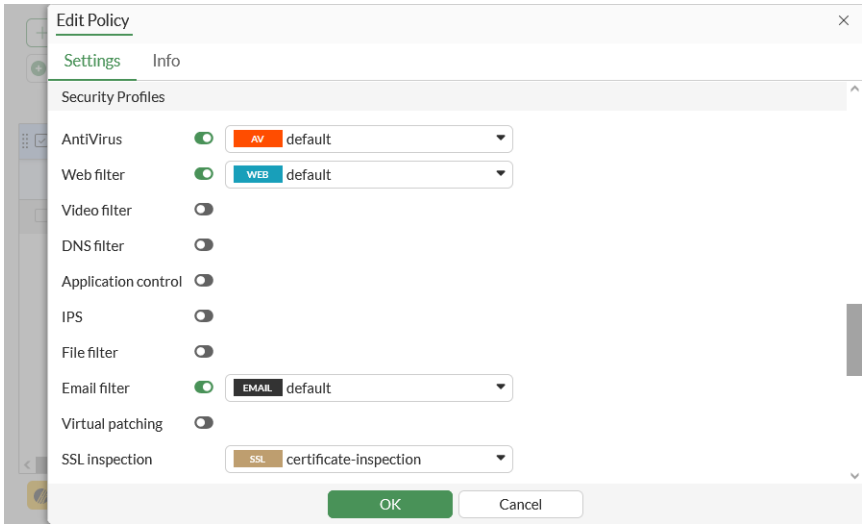
To configure inspection mode in a policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a new policy, or edit an existing policy.
3. Configure the policy as needed.

a. If you change the *Inspection Mode* to *Proxy-based*, the *Proxy HTTP(S) traffic* option displays.



b. In the *Security Profiles* section, if no security profiles are enabled, the default *SSL Inspection* is *no-inspection*. If you enable any security profile, the *SSL Inspection* should be changed *certificate-inspection*, *deep-inspection*, or a custom inspection profile.



To see the inspection mode changes using the CLI:

```
config firewall policy
    edit 1
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
        set inspection-mode proxy
        set nat enable
    next
end
```

To see the HTTP and SSH policy redirect settings when inspection mode is set to proxy using the CLI:

```
config firewall policy
    edit 1
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set http-policy-redirect enable
        set ssh-policy-redirect enable
        set nat enable
    next
end
```

To see the default SSL-SSH policy set to no inspection using the CLI:

```
config firewall policy
    edit 1
       show fu | grep ssl-ssh-profile
        set ssl-ssh-profile "no-inspection"
    next
end
```

NGFW policy mode application default service

In NGFW policy-based mode, the application default service enforces applications running only on their default service port. The applications specified in the policy are monitored, and if traffic is detected from a nonstandard port, it is blocked, and a log entry is recorded with a *port-violation* event type.

If you are not using the default ports, and need to pick specific services, select *Specify* to select the required services.

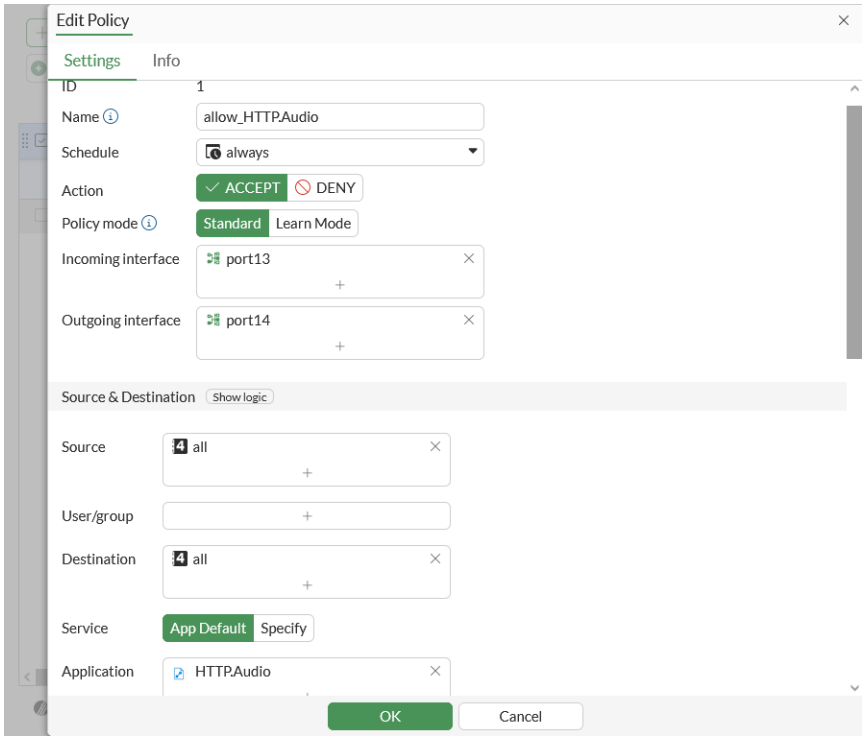
Example

In this example, the standard port is enforced for HTTPS traffic using the HTTP.Audio application.

First, an SSL Inspection & Authentication policy is created do to traffic pre-match, and then a security policy is created to allow the HTTP.Audio application when using the default port. Fetching an MP3 file from an HTTP server using port 443 is allowed, but is blocked when using a nonstandard port, such as 8443.

To enforce the HTTP.Audio application using the default port in the GUI:

1. Create a new SSL Inspection & Authentication policy, or use the default policy.
2. Go to *Policy & Objects* > *Security Policy*, and click *Create New*.
3. Enter a name for the policy, such as *allow_HTTP.Audio*.
4. Configure the ports as needed.
5. Set *Service* to *App Default*.
6. In the *Application* field, select *HTTP.Audio*.
7. Set the *Action* to *Accept*.



8. Click *OK*.

To enforce the HTTP.Audio application using the default port in the CLI:

1. Create a firewall policy:

```
config firewall policy
    edit 1
        set name "consolidated_all"
        set srcintf "port13"
        set dstintf "port14"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        set ssl-ssh-profile "new-deep-inspection"
    next
end
```

2. Create a security policy:

```
config firewall security-policy
    edit 1
        set name "allow_HTTP.Audio"
        set srcintf "port13"
        set dstintf "port14"
        set srcaddr "all"
        set dstaddr "all"
        set enforce-default-app-port enable
        set action accept
        set schedule "always"
        set logtraffic all
        set application 15879
    next
end
```

Logs

The application logs show logs with an event type of `port-violation` for traffic on port 8443 that is blocked, and an event type of `signature` for traffic on port 443 that is allowed.

Blocked:

```
2: date=2024-06-18 time=16:15:40 logid="1060028736" type="utm" subtype="app-ctrl" eventtype="port-
violation" level="warning" vd="vd1" eventtime=1560899740218875746 tz="-0700" appid=15879
srcip=10.1.100.22 dstip=172.16.200.216 srcport=52680 dstport=8443 srcintf="port13"
srcintfrole="undefined" dstintf="port14" dstintfrole="undefined" proto=6 service="HTTPS"
direction="incoming" policyid=1 sessionid=5041 appcat="Video/Audio" app="HTTP.Audio"
action="block" hostname="172.16.200.216" incidentserialno=1906780850 url="/app_data/story.mp3"
securityid=2 msg="Video/Audio: HTTP.Audio," apprisk="elevated"
```

Allowed:

```
1: date=2024-06-18 time=16:15:49 logid="1059028704" type="utm" subtype="app-ctrl"
eventtype="signature" level="information" vd="vd1" eventtime=1560899749258579372 tz="-0700"
appid=15879 srcip=10.1.100.22 dstip=172.16.200.216 srcport=54527 dstport=443 srcintf="port13"
srcintfrole="undefined" dstintf="port14" dstintfrole="undefined" proto=6 service="HTTPS"
direction="incoming" policyid=1 sessionid=5064 appcat="Video/Audio" app="HTTP.Audio" action="pass"
hostname="172.16.200.216" incidentserialno=1139663486 url="/app_data/story.mp3" securityid=2
msg="Video/Audio: HTTP.Audio," apprisk="elevated"
```

Add option to set application default port as a service port

The `default-app-port-as-service` option can be used in NGFW mode to set the application default port as a service port. This allows applications to match the policy and be blocked immediately the first time that traffic hits the firewall. When this option is enabled, the NGFW policy aggregates the ports used by the applications in the policy and performs a pre-match on the traffic.

```
config system settings
    set default-app-port-as-service {enable | disable}
end
```

This option can be configured on a per-VDOM level.

This setting is enabled by default on new installations. When upgrading, the setting is disabled to retain the previous behavior.

To configure the application default port as service port:

1. Configure the VDOM settings:

```
config system settings
    set vdom-type traffic
    set opmode nat
    set ngfw-mode policy-based
    set block-land-attack disable
    set default-app-port-as-service enable
    set application-bandwidth-tracking disable
end
```

2. Configure the NGFW policy:

```
config firewall security-policy
    edit 1
        set name "test"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set internet-service-src disable
        set enforce-default-app-port enable
        set action accept
    next
end
```

Sample logs

The following logging behavior occurs in NGFW mode with `default-app-port-as-service`:

- When `default-app-port-as-service` and `enforce-default-app-port` are enabled, traffic that does not match the default port is blocked immediately. Only a traffic log is generated.

  Log with SSH and FTP traffic:

```
1: date=2024-06-24 time=11:16:36 eventtime=1645730197145603994 tz="-0800" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="vd1" srcip=10.1.100.12 srcport=40402
srcintf="port2" srcintfrole="undefined" dstip=172.16.200.55 dstport=21 dstintf="port1"
dstintfrole="undefined" srccountry="Reserved" dstcountry="Reserved" sessionid=6811 proto=6
action="deny" policyid=0 policytype="security-policy" poluuid="7ed35582-95a2-51ec-0d21-
4093cb91e67b" policyname="Default" centralnatid=1 service="FTP" trandisp="snat"
```

```
transip=172.16.200.4 transport=40402 duration=10 sentbyte=0 rcvdbyte=0 sentpkt=0 rcvdpkt=0
appcat="unscanned"
```

Log with SSH and FTP traffic with port 2121:

```
1: date=2024-06-24 time=11:19:20 eventtime=1645730360685614031 tz="-0800" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="vd1" srcip=10.1.100.12 srcport=41362
srcintf="port2" srcintfrole="undefined" dstip=172.16.200.55 dstport=2121 dstintf="port1"
dstintfrole="undefined" srccountry="Reserved" dstcountry="Reserved" sessionid=7213 proto=6
action="deny" policyid=0 policytype="security-policy" poluuid="7ed35582-95a2-51ec-0d21-
4093cb91e67b" policyname="Default" centralnatid=1 service="tcp/2121" trandisp="snat"
transip=172.16.200.4 transport=41362 duration=9 sentbyte=60 rcvdbyte=0 sentpkt=1 rcvdpkt=0
appcat="unscanned"
```

- When `default-app-port-as-service` is disabled and `enforce-default-app-port` is enabled, traffic that does not match the default port is not blocked immediately. Application and traffic logs are generated.

  Traffic log with SSH and FTP traffic:

  ```
  1: date=2024-06-24 time=11:21:51 eventtime=1645730511325606916 tz="-0800" logid="0000000013"

```

Application logging in NGFW policy mode

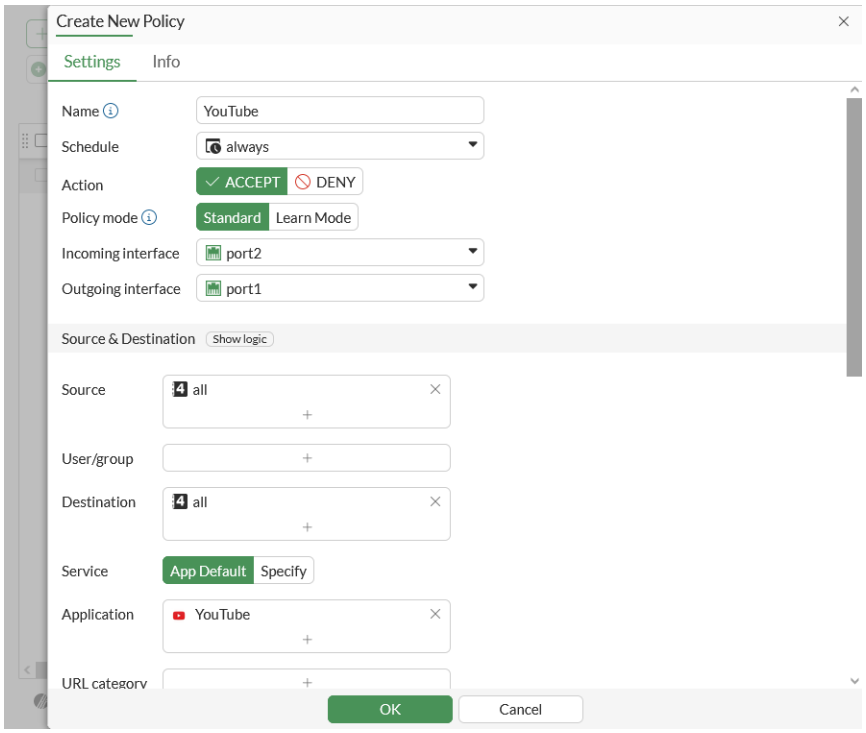
In NGFW policy mode, if an application, application category, or application group is selected on a security policy, and traffic logging is set to *UTM* or *All*, then application control logs will be generated. In addition, when a signature is set to the *ACCEPT* action under a security policy, all corresponding child signatures will be assessed and logged as well.

Under NGFW, with `default-app-port-as-service` enabled, enable APP Default. The traffic which doesn't match the default port will be blocked immediately, and there is only traffic log generated.

Under NGFW, with `default-app-port-as-service` disabled, enable APP Default. The traffic which doesn't match the default port will not be blocked immediately, and there is app and traffic logs generated.

To verify application logging:

1. Go to *Policy & Objects* > *Security Policy* and configure a new policy for YouTube.
2. Set *Application* to *YouTube*.
3. Set *Action* to *ACCEPT* and *Log Allowed Traffic* to *Security Events*.



4. Configure the remaining settings as required, then click *OK*.
5. On a client system, play some YouTube videos.
6. On FortiOS, go to *Log & Report* > *Security Events* and view the *Application Control* logs.

   There are logs not only for *YouTube*, but also for *YouTube_Video.Play*, *YouTube_Video.Access*, and so on, as verified from the *Application Name* column.

Learn mode in security policies in NGFW mode

In NGFW mode, administrators can configure a security policy in learn mode to monitor traffic that passes through the source and destination interfaces. The learn mode uses a special prefix in the `policymode` and `profile` fields in traffic and UTM logs for use by FortiAnalyzer and the Policy Analyzer Management Extension Application (MEA) that is available with FortiManager.

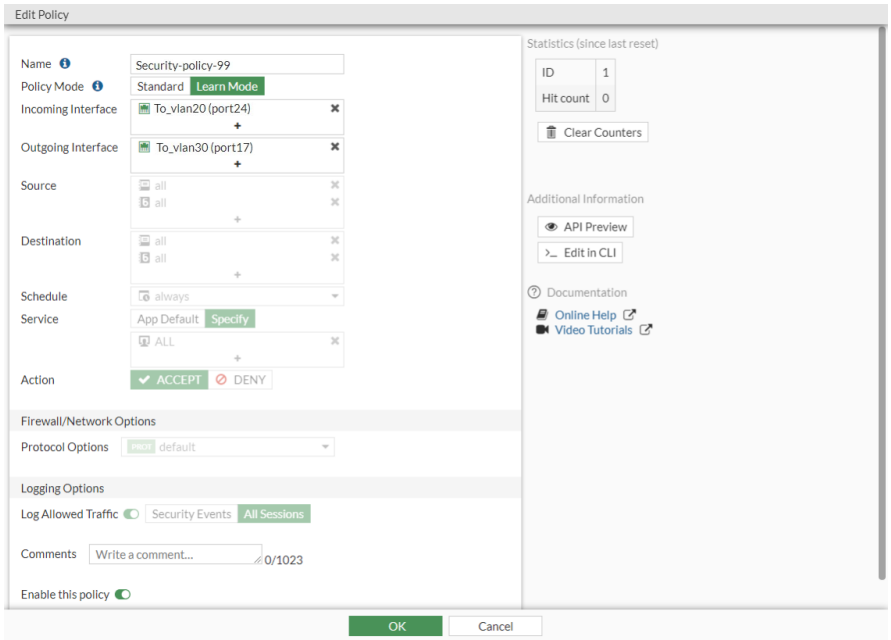
When enabled on FortiManager, Policy Analyzer MEA works with security policies in learning mode to analyze logs sent from a managed FortiGate to FortiAnalyzer. Based on the analyzed traffic, FortiManager administrators can choose to automatically create a policy in FortiManager for the managed FortiGate. For more information about Policy Analyzer MEA, see the Policy Analyzer Administration Guide.

The following limitations apply when learn mode is enabled in a security policy:

- Only interfaces with `device-identification enable` can be used as source interfaces in a security policy with learning mode enabled.
- Incoming and outgoing interfaces do not support any.
- Internet service is not supported.
- NAT46 and NAT64 are not supported.
- Users and groups are not supported.
- Some negate options are not supported.

To enable learn mode in the GUI:

1. Enable policy-based NGFW mode:
   a. Go to *System* > *Settings*.
   b. Set the *NGFW Mode* to *Policy-based* and click *Apply*.
2. Go to *Policy & Objects* > *Security Policy*, and open a security policy for editing.
3. Set the *Policy Mode* to *Learn Mode*.



4. Select an *Incoming Interface*.
5. Select an *Outgoing Interface*.
6. (Optional) Type a comment in the *Comments* box.
7. Toggle on *Enable this policy*.
8. Click *OK* to save the security policy.

To enable learn mode in the CLI:

1. Enable policy-based NGFW mode:

```
config system settings
    set ngfw-mode policy-based
end
```

2. Enable learn mode in a security policy:

```
config firewall security-policy
    edit <id>
        set learning-mode enable
    next
end
```

To view learn mode fields in logs in the CLI:

1. Filter and view fields in traffic logs:

```
# execute log filter category 0

# execute log display

1 logs found.

1 logs returned.

1: date=2022-03-21 time=10:21:11 eventtime=1647883271150012188 tz="-0700" logid="0000000013"

Dynamic address tags

Tags for dynamic addresses, including EMS (normal and local EMS tags), FortiPolicy, FortiVoice, and FortiNAC can be used as the source or destination address in security policies. Once these tags are used in security policies, run `diagnose ips pme dynamic-address list` to show the addresses that are used in the policy. The following example uses an EMS tag.

To apply an EMS tag object to a security policy in the GUI:

1. Go to *Policy & Objects* > *Security Policy*.
2. Click *Create new* or edit an existing policy.
3. In the *Source* field, click the *+* and select *EMS1_ZTNA_ZT_OS_WIN*.
4. Configure the other settings as needed.

5. Click *OK*.

To apply an EMS tag object to a security policy in the CLI:

1. Configure the policy:

```
config firewall security-policy
    edit 1
        set name "ddd"
        set srcintf "port8"
        set dstintf "port7"
        set srcaddr "EMS1_ZTNA_ZT_OS_WIN"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set logtraffic all
    next
end
```

2. Verify which IP addresses are used in the policy:

```
# diagnose ips pme dynamic-address list
EMS1_ZTNA_ZT_OS_WIN [vdom=0 type=IP]:
```

Local-in policy

While security profiles control traffic flowing through the FortiGate, local-in policies control inbound traffic that is going to a FortiGate interface.

Administrative access traffic (HTTPS, PING, SSH, and others) can be controlled by allowing or denying the service in the interface settings. Trusted hosts can be configured under an administrator to restrict the hosts that can access the administrative service.

Local-in policies allow administrators to granularly define the source and destination addresses, interface, and services. Traffic destined for the FortiGate interface specified in the policy that meets the other criteria is subject to the policies action.

Local-in policies can be used to restrict administrative access or other services, such as VPN, that can be specified as services. You can define source addresses or address groups to restrict access from. For example, by using a geographic type address you can restrict a certain geographic set of IP addresses from accessing the FortiGate. An IP Address external feed can also be used as either a source or destination address; see Applying an IP address external feed in a local-in policy on page 4087 for more information.

Local-in policies can also use virtual patching to mitigate known vulnerabilities targeted at the FortiGate. Vulnerability rules are scanned on local-in traffic on the specified interface, and all matched local-in traffic is dropped accordingly. See Virtual patching on the local-in management interface on page 1725 for more information.

This topic includes the following sections:

- Default local-in policy on page 1606
- Configuring the local-in policy on page 1606

- Implicit deny rule on page 1611
- Additional options on page 1613
- Logging local traffic per local-in policy on page 1615

Default local-in policy

The default local-in policy has internet service source enabled for Malicious-Malicious.Server, Tor-Exit.Node, and Tor-Relay.Node ISDB sources. This policy is designed to utilize these three sources to identify known malicious threat actors and prevent them from accessing any interface on the FortiGate on any service and port.

The default local-in policy is automatically added when a FortiGate is in factory default setting, or a new VDOM is created. Resetting your device to factory default settings is not recommended, so you can manually add the policy on FortiOS versions that support ISDB as a local-in policy source (7.4.4 and higher).

To manually add the policy:

```
config firewall local-in-policy
    edit 1
        set intf "any"
        set dstaddr "all"
        set internet-service-src enable
        set internet-service-src-name "Malicious-Malicious.Server" "Tor-Exit.Node" "Tor-
Relay.Node"
        set service "ALL"
        set schedule "always"
    next
end
```

To view the malicious sources that are blocked:

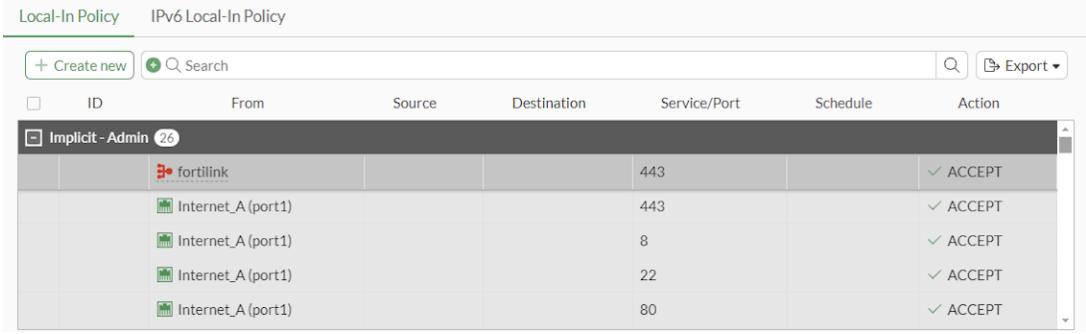
1. Go to *Policy & Objects* > *Internet Service Database* and select the *Internet Service* tab.
2. Search for *Malicious-Malicious.Server*, *Tor-Exit.Node*, or *Tor-Relay.Node*.
3. Hover over the entry and, in the pop-up, click *View/Edit Entries*.
   The listed addresses are the sources that will be blocked.

Configuring the local-in policy

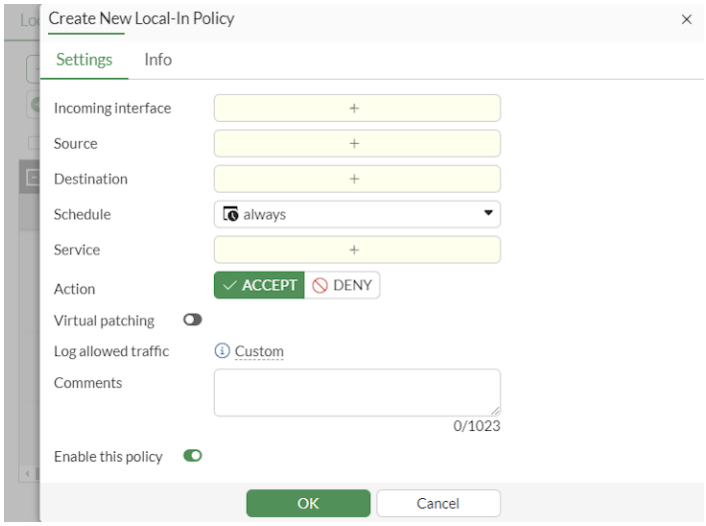
Local-in policies can be configured in the GUI and CLI.

To create an IPv4 local-in policy in the GUI:

1. Go to *Policy & Objects* > *Local-In Policy*.
2. Go to the *Local-In Policy* tab.



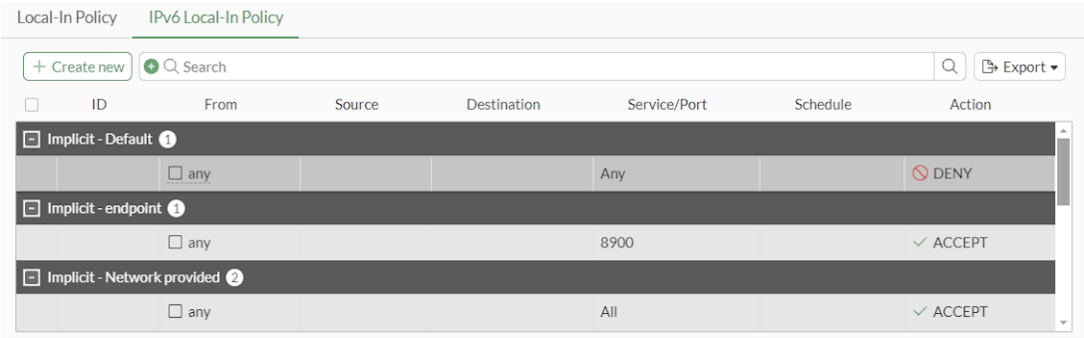
3. Click *Create new*. The *Create New Local-In Policy* pane is displayed.



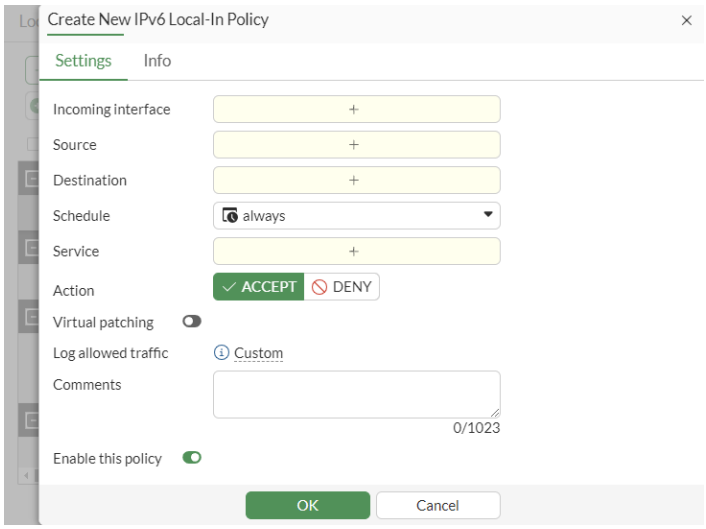
4. Configure the policy parameters.
5. Click *OK*.

To create an IPv6 local-in policy in the GUI:

1. Go to *Policy & Objects* > *Local-In Policy*.
2. Go to the *IPv6 Local-In Policy* tab.



3. Click *Create new*. The *Create New IPv6 Local-In Policy* pane is displayed.



4. Configure the policy parameters.
5. Click *OK*.

To configure a local-in policy using the CLI:

```
config firewall {local-in-policy | local-in-policy6}
    edit <policy_number>
        set intf <interface>
        set srcaddr <source_address> [source_address] ...
        set dstaddr <destination_address> [destination_address] ...
        set action {accept | deny}
        set service <service_name> [service_name] ...
        set schedule <schedule_name>
        set virtual-patch {enable | disable}
        set comments <string>
    next
end
```

Example 1

In this example, a local-in policy will be configured to prevent the source subnet 10.10.10.0/24 from pinging port1, but allow administrative access for PING on port1.

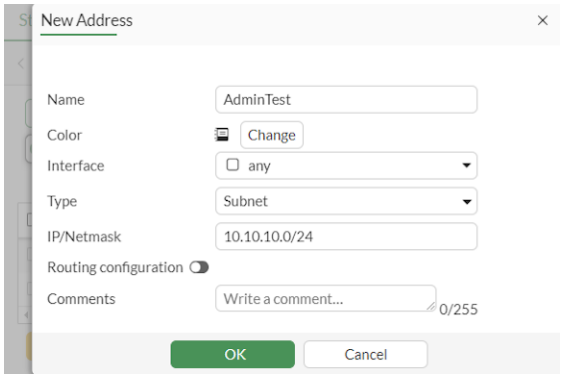
To configure the local-in policy for admin access in the CLI:

```
config firewall address
    edit "10.10.10.0"
        set subnet 10.10.10.0 255.255.255.0
    next
end
config firewall local-in-policy
    edit 1
        set intf "port1"
        set srcaddr "10.10.10.0"
```

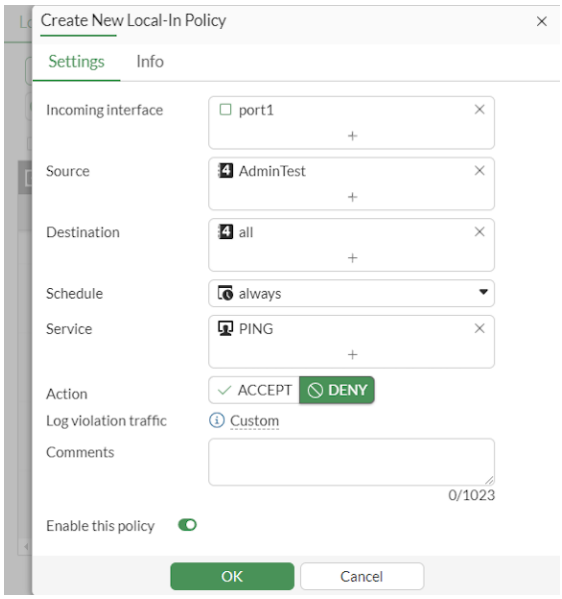
```
        set dstaddr "all"
        set service "PING"
        set schedule "always"
    next
end
```

To configure the local-in policy for admin access:

1. Configure the firewall address:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create new*.
   c. Enter a name for the address.
   d. Set *Type* to *Subnet*.
   e. Set *IP/Netmask* to *10.10.10.0/24*.
   f. Click *OK*.



2. Configure the local-in policy:
   a. Go to *Policy & Objects* > *Local-In Policy*.
   b. Click *Create new*.
   c. Configure the following:
      i. Set *Interface* to *port1*.
      ii. Set *Source* to the address created previously.
      iii. Set *Destination* to *all*.
      iv. Set *Schedule* to *always*.
      v. Set *Service* to *PING*.
      vi. Set *Action* to *DENY*.



d. Click *OK*.

To test the configuration:

1. From the PC at 10.10.10.12, start a continuous ping to port1:

```
ping 192.168.2.5 -t
```

2. On the FortiGate, enable debug flow:

```
# diagnose debug flow filter addr 10.10.10.12
# diagnose debug flow filter proto 1
# diagnose debug enable
# diagnose debug flow trace start 10
```

3. The output of the debug flow shows that traffic is dropped by local-in policy 1:

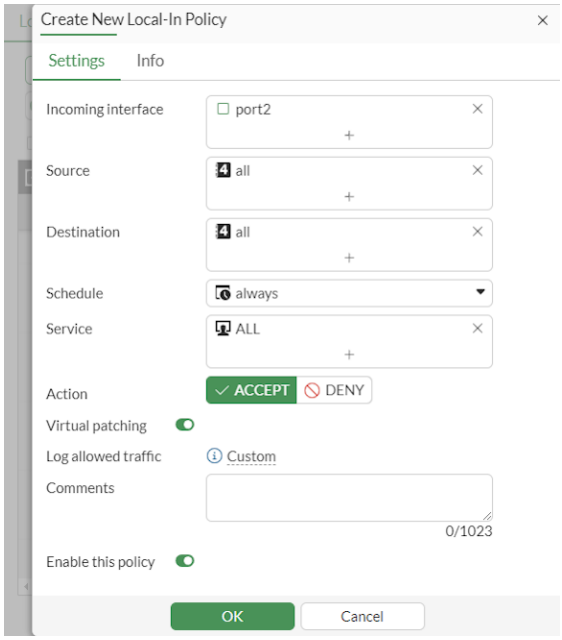
```
# id=20085 trace_id=1 func=print_pkt_detail line=5746 msg="vd-root:0 received a packet
(proto=1, 10.10.10.12:1->192.168.2.5:2048) from port1. type=8, code=0, id=1, seq=128."
id=20085 trace_id=1 func=init_ip_session_common line=5918 msg="allocate a new session-
0017c5ad"
id=20085 trace_id=1 func=vf_ip_route_input_common line=2615 msg="find a route: flag=80000000
gw-192.168.2.5 via root"
id=20085 trace_id=1 func=fw_local_in_handler line=474 msg="iprope_in_check() check failed on
policy 1, drop"
```

Example 2

The following example demonstrates how to enable virtual patching on the port2 interface using a local-in policy. For information on enabling virtual patching in the CLI and observing the outcomes, see Virtual patching on the local-in management interface on page 1725.

To enable virtual patching:

1. Go to *Policy & Objects* > *Local-In Policy*.
2. Click *Create new*.
3. Configure the following:
   a. Set *Interface* to *port2*.
   b. Set *Source* to *all*.
   c. Set *Destination* to *all*.
   d. Set *Schedule* to *always*.
   e. Set *Service* to *ALL*.
   f. Set *Action* to *ACCEPT*.
   g. Enable *Virtual patching*.



4. Click *OK*.

Implicit deny rule

If a local-in-policy is not functioning correctly and traffic that should be blocked is being allowed through, the issue may be that the implicit deny local-in-policy has not been created. Unlike IPv4 policies, there is no default implicit deny policy. The implicit deny policy should be placed at the bottom of the list of local-in-policies. Local-in-policies are created for each interface, but if you want to create a general implicit deny rule for all interfaces for a specific service, source, address, or destination address, use the any interface.

When you define a local-in policy, if no action is set manually, then the action will default to deny.

For example, to allow only the source subnet 172.16.200.0/24 to ping port1:

```
config firewall address
    edit "172.16.200.0"
        set subnet 172.16.200.0 255.255.255.0
    next
end
config firewall local-in-policy
    edit 2
        set intf "port1"
        set srcaddr "172.16.200.0"
        set dstaddr "all"
        set action accept
        set service "PING"
        set schedule "always"
    next
    edit 3
        set intf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "PING"
        set schedule "always"
    next
end
```

To test the configuration:

1. From the PC at 172.16.200.2, start a continuous ping to port1:

```
ping 172.16.200.1 –t
```

2. On the FortiGate, enable debug flow:

```
# diagnose debug flow filter proto 1
# diagnose debug enable
# diagnose debug flow trace start 10
```

3. The output of the debug flow shows that ping traffic coming from the 172.16.200.0 subnet is allowed:

```
# id=65308 trace_id=25 func=print_pkt_detail line=5939 msg="vd-root:0 received a packet
(proto=1, 172.16.200.2:5->172.16.200.1:2048) tun_id=0.0.0.0 from port1. type=8, code=0, id=5,

policy 3, drop"
```

Additional options

To disable or re-enable the local-in policy, use the `set status {enable | disable}` command.

To dedicate the interface as an HA management interface, use the `set ha-mgmt-intf-only enable` command.

Example:

```
config firewall local-in-policy
    edit 1
        set ha-mgmt-intf-only enable
        set intf port4
        set srcaddr all
        set dstaddr all
        set service ALL
        set schedule always
        set action accept
        set status enable
    next
end
```

If a user tries to set the HA reserved management interface during the local-in policy an error is generated. Use the `set ha-mgmt-intf-only enable` command to avoid the error.

TTL policies

You can configure a time-to-live (TTL) policy to block attack traffic with high TTLs. This feature only applies to local-in traffic and does not apply to traffic passing through the FortiGate. You can use `srcintf` to set the interface that the local-in traffic hits. See config firewall ttl-policy.

To configure a TTL policy using the CLI:

```
config firewall ttl-policy
    edit <id>
        set status {enable | disable}
        set action {accept | deny}
        set srcintf <interface>
        set srcaddr <source_address> [source_address] ...
        set service <service_name> [service_name] ...
        set schedule <schedule_name>
        set ttl <value/range>
    next
end
```

Internet service as source addresses

An internet service can be used as the source address in a local-in policy. This allows for more flexibility and control when managing local traffic, enhancing network security and efficiency.

```
config firewall local-in-policy
    edit <id>
        set internet-service-src {enable | disable}
        set internet-service-src-name <string>
        set internet-service-src-group <string>
        set internet-service-src-custom <string>
        set internet-service-src-custom-group <string>
        set internet-service-src-negate {enable | disable}
    next
end
```

internet-service-src {enable | disable}	Enable/disable use of Internet Services in source for this local-in policy. If enabled, the source address is not used.
internet-service-src-name <string>	Internet Service source name.
internet-service-src-group <string>	Internet Service source group name.
internet-service-src-custom <string>	Custom Internet Service source name.
internet-service-src-custom-group <string>	Custom Internet Service source group name.
internet-service-src-negate {enable | disable}	When enabled, `internet-service-src` specifies what the service must NOT be.

Logging local traffic per local-in policy

Local traffic logging can be configured for each local-in policy. This enables more precise and targeted logging by focusing on specific local-in policies that are most relevant to your needs.

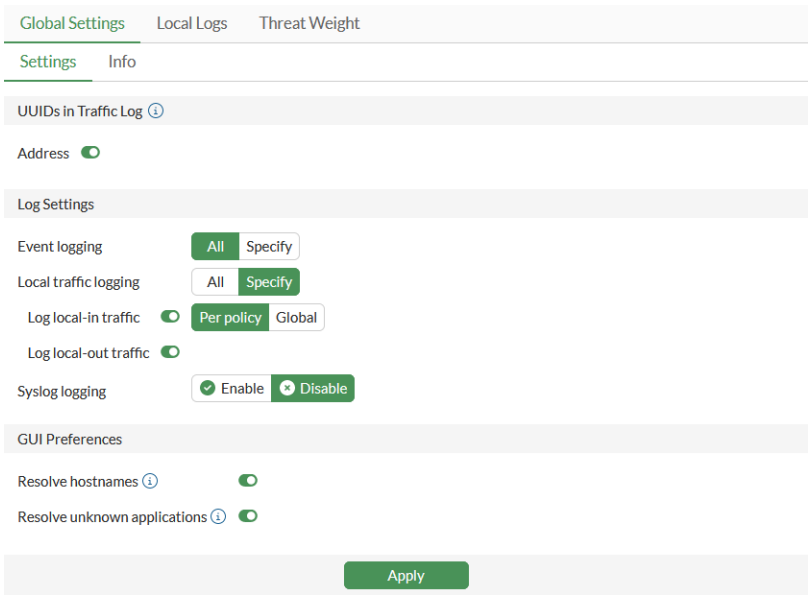
Logging can be configured per local-in policy in the *Log & Report > Log Settings* page or by using the following commands:

```
config log setting
    set local-in-policy-log {enable | disable}
end
config firewall local-in-policy
    edit <id>
        set logtraffic {enable | disable}
    next
end
config firewall local-in-policy6
    edit <id>
        set logtraffic {enable | disable}
    next
end
```

If per policy local-in traffic logging is enabled, the allowed traffic, denied unicast traffic, and denied broadcast traffic logging does not need to be configured for the log settings. When traffic logging is enabled for the local-in policy, the denied unicast traffic and denied broadcast traffic logs will be included.

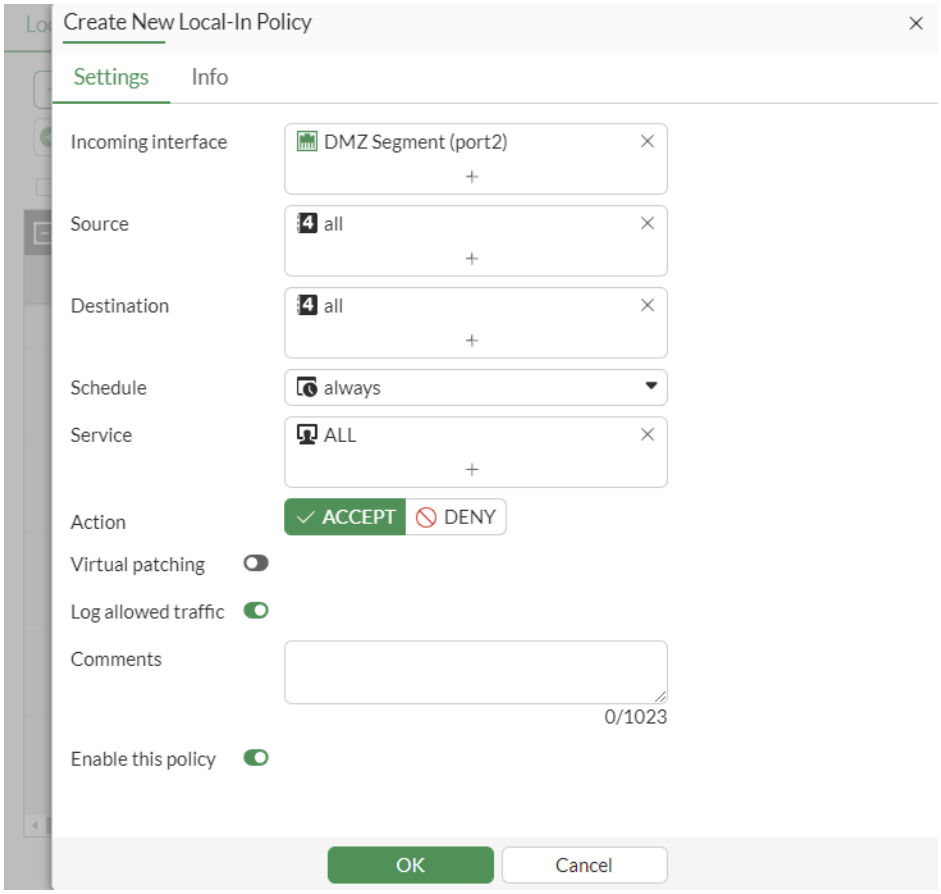
To log local traffic per local-in policy in the GUI:

1. Enable local-in traffic logging per policy:
   a. Go to *Log & Report > Log Settings*.
   b. Go to the *Global Settings* tab.
   c. Set *Local traffic logging* to *Specify*.
   d. Enable *Log local-in traffic* and set it to *Per policy*.

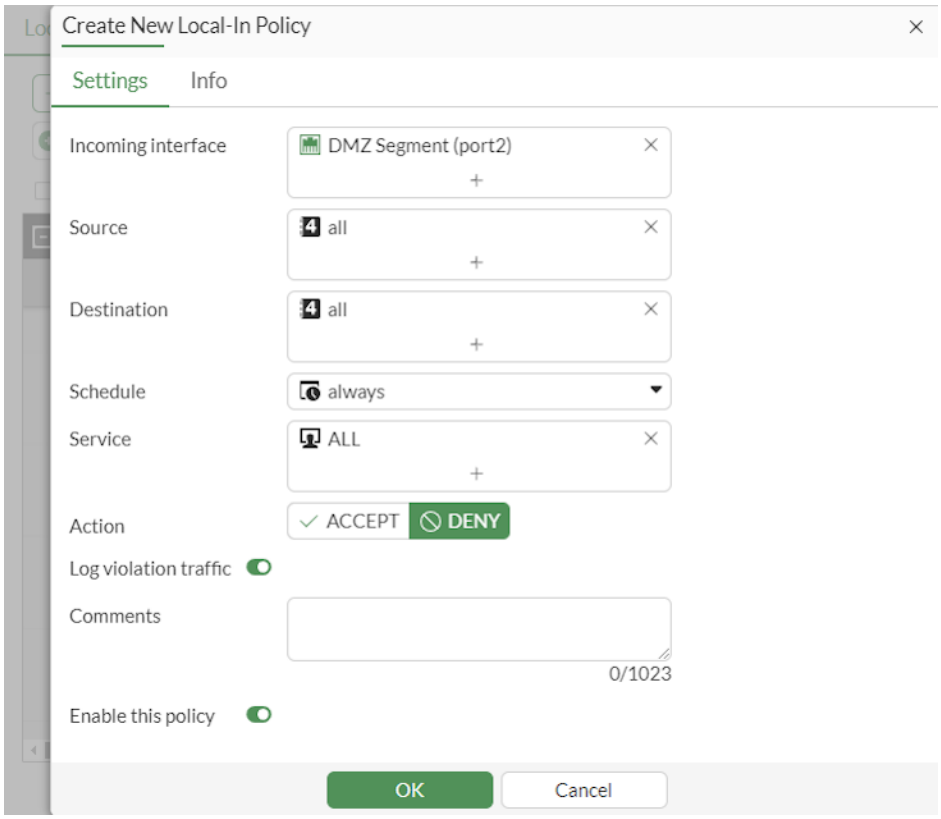


2. Log traffic in a local-in policy:
   a. Go to *Policy & Objects* > *Local-In Policy*.
   b. Select whether you want to configure a *Local-In Policy* or *IPv6 Local-In Policy*.
   c. Create a new policy or edit an existing policy.
   d. Enable traffic logging:

- For policies with the *Action* set to *ACCEPT*, enable *Log allowed traffic*.



- For policies with the *Action* set to *DENY*, enable *Log violation traffic*.



If traffic logging is enabled in the local-in policy, log denied unicast traffic and log denied broadcast traffic logs will display in *Log & Report > Local Traffic*.

To log local traffic per local-in policy in the CLI:

1. Enable logging local-in traffic per policy:

```
config log setting
    set local-in-policy-log enable
end
```

2. Enable local traffic logging in the policy:

```
config firewall local-in-policy
    edit 1
        set logtraffic enable
    next
end
config firewall local-in-policy6
    edit 2
        set logtraffic enable
    next
end
```

3. Review local logs. Traffic is logged for the local-in policies and denied unicast traffic and denied broadcast traffic logs are included.

```

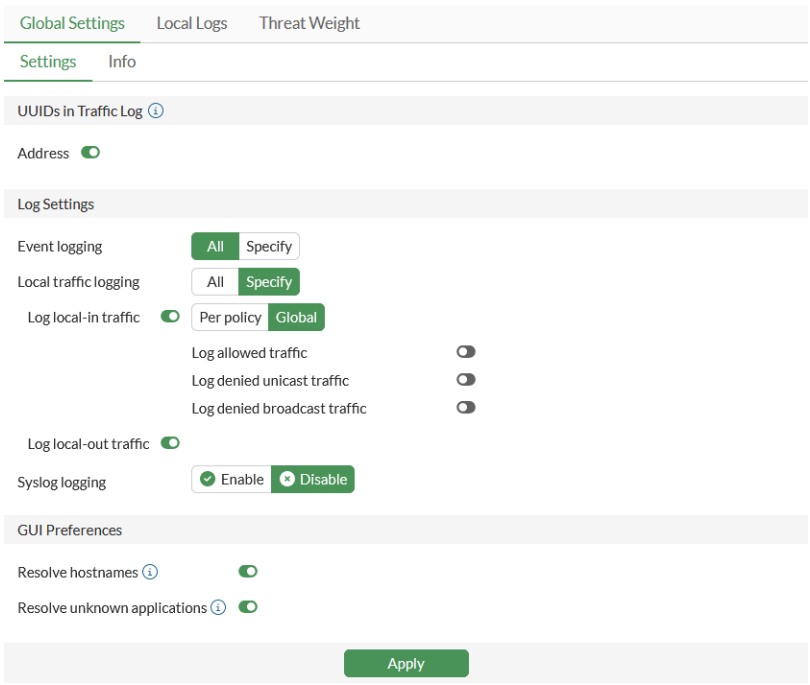
```

Global logging

Local-in traffic can also continue to be logged globally instead of per policy. To configure global local-in traffic logging in the CLI, disable `local-in-policy-log`.

To configure global local traffic logging in the GUI:

1. Enable local-in traffic logging per policy:
   a. Go to *Log & Report > Log Settings*.
   b. Go to the *Global Settings* tab.
   c. Set *Local traffic logging* to *Specify*.
   d. Enable *Log local-in traffic* and set it to *Global*.



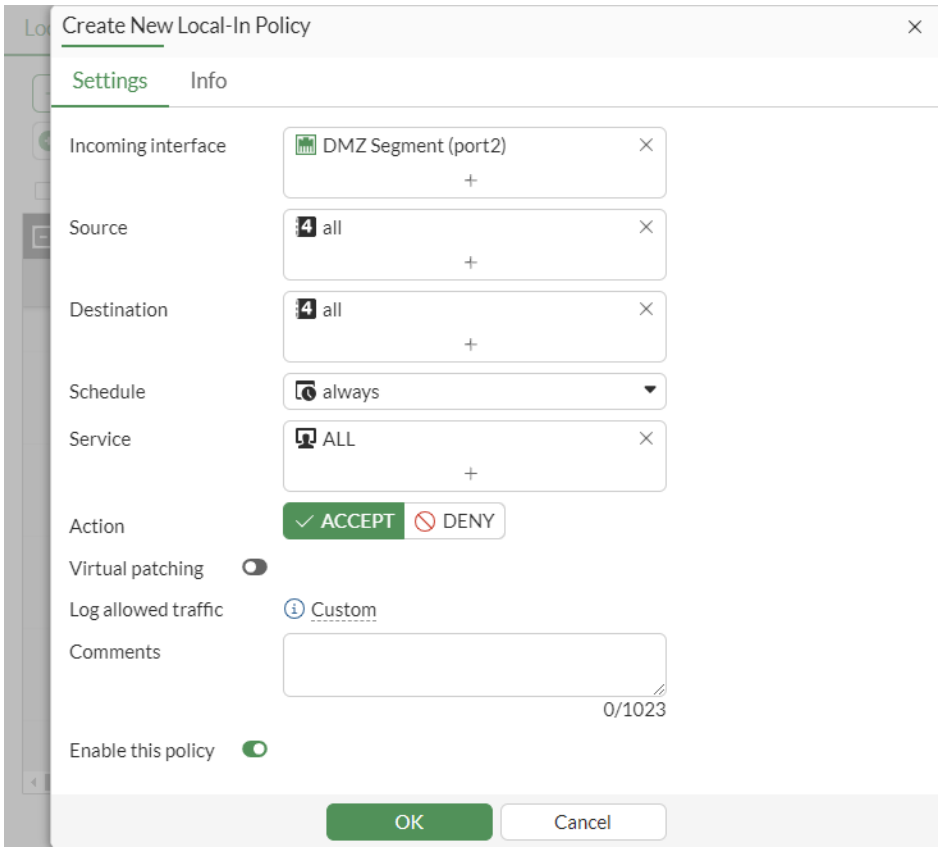
e. Enable the log events that should be globally logged.

2. Review logging in a local-in policy:

a. Go to *Policy & Objects* > *Local-In Policy*.

b. Select whether you want to configure a *Local-In Policy* or *IPv6 Local-In Policy*.

c. Create a new policy or edit an existing policy.



Log allowed traffic and *Log violation traffic* will be set to *Custom* and cannot be changed in the policy.

DoS policy

A Denial of Service (DoS) policy examines network traffic arriving at a FortiGate interface for anomalous patterns, which usually indicates an attack.

A denial of service occurs when an attacking system starts an abnormally large number of sessions with a target system. The large number of sessions slows down or disables the target system, preventing legitimate users from using it.

DoS policies are checked before security policies, preventing attacks from triggering more resource intensive security protection and slowing down the FortiGate.

DoS anomalies

Predefined sensors are setup for specific anomalous traffic patterns. New DoS anomalies cannot be added by the user.

The predefined anomalies that can be used in DoS policies are:

Anomaly	Description	Recommended Threshold
tcp_syn_flood	If the SYN packet rate of new TCP connections, including retransmission, to one destination IP address exceeds the configured threshold value, the action is executed. *	2000 packets per second.
tcp_port_scan	If the SYN packet rate of new TCP connections, including retransmission, from one source IP address exceeds the configured threshold value, the action is executed.	1000 packets per second.
tcp_src_session	If the number of concurrent TCP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
tcp_dst_session	If the number of concurrent TCP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
udp_flood	If the UDP traffic to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second.
udp_scan	If the UDP sessions setup rate originating from one source IP address exceeds the configured threshold value, the action is executed.	2000 sessions per second.
udp_src_session	If the number of concurrent UDP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
udp_dst_session	If the number of concurrent UDP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
icmp_flood	If the number of ICMP packets sent to one destination IP address exceeds the configured threshold value, the action is executed.	250 packets per second.
icmp_sweep	If the ICMP sessions setup rate originating from one source IP address exceeds the configured threshold value, the action is executed.	100 sessions per second.
icmp_src_session	If the number of concurrent ICMP connections from one source IP address exceeds the configured threshold value, the action is executed.	300 concurrent sessions
icmp_dst_session	If the number of concurrent ICMP connections to one destination IP address exceeds the configured threshold value, the action is executed.	1000 concurrent sessions
ip_src_session	If the number of concurrent IP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.

Anomaly	Description	Recommended Threshold
ip_dst_session	If the number of concurrent IP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
sctp_flood	If the number of SCTP packets sent to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second
sctp_scan	If the number of SCTP sessions originating from one source IP address exceeds the configured threshold value, the action is executed.	1000 packets per second
sctp_src_session	If the number of concurrent SCTP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions
sctp_dst_session	If the number of concurrent SCTP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions

* The NP7 and NP6XLite have hardware modules that can provide tcp_syn-flood protection using the SYN cookies mechanism. The modules activate the mechanism by sending a reply in the hardware only after the tcp_syn_flood threshold is exceeded. DoS-offloading is required; see DoS policy hardware acceleration for more information.

For thresholds based on the number of concurrent sessions, blocking the anomaly will not allow more than the number of concurrent sessions to be set as the threshold.

For example, if the period for a particular anomaly is 60 seconds, such as those where the threshold is measured in concurrent sessions, after the 60 second timer has expired the number of allowed sessions that match the anomaly criteria is reset to zero. This means that, if you allow 10 sessions through before blocking, after the 60 seconds has elapsed, another 10 sessions will be allowed. The attrition of sessions from expiration should keep the allowed sessions from reaching the maximum.

For rate based thresholds, where the threshold is measured in packets per second, the *Block* action prevents anomalous traffic from overwhelming the firewall in two ways:

- continuous: Block packets once an anomaly is detected, and continue to block packets while the rate is above the threshold. This is the default setting.
- periodical: After an anomaly is detected, allow the configured number of packets per second.

For example, if a DoS policy is configured to block icmp_flood with a threshold of 10pps, and a continuous ping is started at a rate of 20pps for 1000 packets:

- In continuous mode, the first 10 packets are passed before the DoS sensor if triggered, and then the remaining 990 packets are blocked.
- In periodical mode, 10 packets are allowed to pass per second, so 500 packets are blocked in the 50 seconds during which the ping is occuring.

The actual numbers of passed and blocked packets may not be exact, as fluctuations in the rates can occur, but the numbers should be close to the defined threshold.

To configure the block action for rate based anomaly sensors:

```
config ips global
    set anomaly-mode {continuous | periodical}
end
```

DoS policies

A DoS policy can be configured to use one or more anomalies.

To configure a DoS policy in the GUI:

1. Go to *Policy & Objects* > *IPv4 DoS Policy* or *Policy & Objects* > *IPv6 DoS Policy* and click *Create New*.
   If the option is not visible, enable *DoS Policy* in *Feature Visibility*. See Feature visibility on page 3595 for details.
2. Configure the following:

Name	Enter a name for the policy.
Incoming Interface	Enter the interface that the policy applies to.
Source Address	Enter the source address.
Destination Address	Enter the destination address. This is the address that the traffic is addressed to. In this case, it must be an address that is associated with the firewall interface. For example, it could be an interface address, a secondary IP address, or the address assigned to a VIP address.
Service	Select the services or service groups. The ALL service can used or, to optimize the firewall resources, only the services that will be answered on an interface can be used.

L3 Anomalies
L4 Anomalies
	Configure the anomalies:
	• *Logging*: Enable/disable logging for specific anomalies or all of them. Anomalous traffic will be logged when the action is *Block* or *Monitor*.
	• *Action*: Select the action to take when the threshold is reached:
	  • *Disable*: Do not scan for the anomaly.
	  • *Block*: Block the anomalous traffic.
	  • *Monitor*: Allow the anomalous traffic, but record a log message if logging is enabled.
	• *Threshold*: The number of detected instances that triggers the anomaly action.

Comments	Optionally, enter a comment.

3. Enable the policy, then click *OK*.

The quarantine option is only available in the CLI. See Quarantine on page 1626 for information.

To configure a DoS policy in the GUI:

```
config firewall DoS-policy
    edit 1
        set name "Flood"
        set interface "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        config anomaly
            edit "icmp_flood"
                set status enable
                set log enable
                set action block
                set quarantine attacker
                set quarantine-expiry 1d1h1m
                set quarantine-log enable
                set threshold 100
            next
        end
    next
end
```

`name <string>`	Enter a name for the policy.
`interface <string>`	Enter the interface that the policy applies to.
`srcaddr <string>`	Enter the source address.
`dstaddr <string>`	Enter the destination address. This is the address that the traffic is addressed to. In this case, it must be an address that is associated with the firewall interface. For example, it could be an interface address, a secondary IP address, or the address assigned to a VIP address.
`service <string>`	Enter the services or service groups. The `ALL` service can used or, to optimize the firewall resources, only the services that will be answered on an interface can be used.
`status {enable | disable}`	Enable/disable this anomaly.
`log {enable | disable}`	Enable/disable anomaly logging. When enabled, a log is generated whenever the anomaly action is triggered, regardless of which action is configured.
`action {pass | block}`	Set the action to take when the threshold is reached: • `pass`: Allow traffic, but record a log message if logging is enabled.

	• `block`: Block traffic if this anomaly is found.
`quarantine {none | attacker}`	Set the quarantine method (see Quarantine on page 1626): • `none`: Disable quarantine. • `attacker`: Block all traffic from the attacker's IP address, and add the attacker's IP address to the banned user list.
`quarantine-expiry <###d##h##m>`	Set the duration of the quarantine, in days, hours, and minutes (###d##h##m) (1m - 364d23h59m, default = 5m). This option is available if `quarantine` is set `attacker`.
`quarantine-log {enable | disable}`	Enable/disable quarantine logging (default = disable). This option is available if `quarantine` is set `attacker`.
`threshold <integer>`	The number of detected instances - packets per second or concurrent session number - that triggers the anomaly action.

Quarantine

Quarantine is used to block any further traffic from a source IP address that is considered a malicious actor or a source of traffic that is dangerous to the network. Traffic from the source IP address is blocked for the duration of the quarantine, and the source IP address is added to the banned user list.

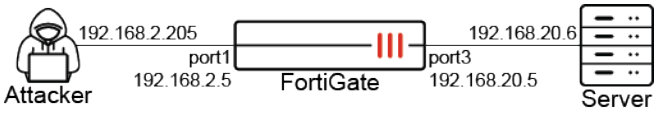
The banned user list is kept in the kernel, and used by Antivirus, Data Loss Prevention (DLP), DoS, and Intrusion Prevention System (IPS). Any policies that use any of these features will block traffic from the attacker's IP address.

To view the quarantined user list:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
192.168.2.205     Wed Nov 25 12:47:54 2020 Wed Nov 25 12:57:54 2020 DOS
```

Troubleshooting DoS attacks

The best way to troubleshoot DoS attacks is with Anomaly logs and IPS anomaly debug messages.



To test an icmp_flood attack:

1. From the Attacker, launch an icmp_flood with 50pps lasting for 3000 packets.
2. On the FortiGate, configure continuous mode and create a DoS policy with an icmp_flood threshold of 30pps:

```
config firewall DoS-policy
    edit 1
```

```
        set name icmpFlood
        set interface "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        config anomaly
            edit "icmp_flood"
                set status enable
                set log enable
                set action block
                set threshold 30
            next
        end
    next
end
```

3. Configure the debugging filter:

```
# diagnose ips anomaly config
DoS sensors in kernel vd 0:
DoS id 1 proxy 0
  0 tcp_syn_flood status 0 log 0 nac 0 action 0 threshold 2000
  ...
  7 udp_dst_session status 0 log 0 nac 0 action 0 threshold 5000
  8 icmp_flood status 1 log 1 nac 0 action 7 threshold 30
  9 icmp_sweep status 0 log 0 nac 0 action 0 threshold 100
  ...
total # DoS sensors: 1.
```

```
# diagnose ips anomaly filter id 8
```

4. Launch the icmp_flood from a Linux machine. This example uses Nmap:

```
$ sudo nping --icmp --rate 50 -c 3000 192.168.2.50
SENT (0.0522s) ICMP [192.168.2.205 > 192.168.2.50 Echo request (type=8/code=0) id=8597 seq=1]
IP [ttl=64 id=47459 iplen=28 ]
...
Max rtt: 11.096ms | Min rtt: 0.028ms | Avg rtt: 1.665ms
Raw packets sent: 3000 (84.000KB) | Rcvd: 30 (840B) | Lost: 2970 (99.00%)
Nping done: 1 IP address pinged in 60.35 seconds
```

5. During the attack, check the anomaly list on the FortiGate:

```
# diagnose ips anomaly list
list nids meter:
id=icmp_flood         ip=192.168.2.50 dos_id=1 exp=998 pps=46 freq=50

total # of nids meters: 1.
```

id=icmp_flood	The anomaly name.

ip=192.168.2.50	The IP address of the host that triggered the anomaly. It can be either the client or the server. For icmp_flood, the IP address is the destination IP address. For icmp_sweep, it would be the source IP address.
dos_id=1	The DoS policy ID.
exp=998	The time to be expired, in jiffies (one jiffy = 0.01 seconds).
pps=46	The number of packets that had been received when the diagnose command was executed.
freq=50	For session based anomalies, freq is the number of sessions. For packet rate based anomalies (flood, scan): • In continuous mode: freq is the greater of pps, or the number of packets received in the last second. • In periodic mode: freq is the pps.

6. Go to *Log & Report > Security Events* and download the *Anomaly* logs:

```
date=2020-11-20 time=14:38:39 eventtime=1605911919824184594 tz="-0800" logid="0720018433"

```

Analysis

In the first log message:

msg="anomaly: icmp_flood, 31 > threshold 30	At the beginning of the attack, a log is recorded when the threshold of 30pps is broken.
repeats 28 times	The number of packets that has exceeded the threshold since the last time a log was recorded.
srcip=192.168.2.205 **dstip=192.168.2.50**	The source and destination IP addresses of the attack.
action="clear_session"	Equivalent to block. If `action` was set to `monitor` and logging was enabled, this would be `action="detected"`.

In the second log message:

- Because it is an ongoing attack, the FortiGate generates one log message for multiple packets every 30 seconds..
- It will not generate a log message if:
  - The same attack ID happened more than once in a five second period, or
  - The same attack ID happened more than once in a 30 second period and the actions are the same and have the same source and destination IP addresses.

msg="anomaly: icmp_flood, 50 > threshold 30	In the second before the log was recorded, 50 packets were detected, exceeding the configured threshold.
repeats 1497 times	The number of packets that has exceeded the threshold since the last time a log was recorded

Access control lists

An access control list (ACL) is a granular, targeted blocklist that is used to block IPv4 and IPv6 packets on a specified interface based on the criteria configured in the ACL policy.

On FortiGate models with ports that are connected through an internal switch fabric with TCAM capabilities, ACL processing is offloaded to the switch fabric and does not use CPU resources. VLAN interfaces that are based on physical switch fabric interfaces are also supported. Interfaces that are connected through an internal switch fabric usually have names prefixed with *port* or *lan*, such as *port1* or *lan2*; other interfaces are not supported.

The packets will be processed by the CPU when offloading is disabled or not possible, such as when a port on a supported model does not connect to the internal fabric switch.

ACL is supported on the following FortiGate models:

- 100D, 100E, 100EF, 101E
- 140D, 140D-POE, 140E, 140E-POE
- 1500D, 1500DT
- 3000D, 3100D, 3200D, 3700D, 3800D
- All 300E and larger E-series models
- All 100F and larger F-series models

Example

To block all IPv4 and IPv6 telnet traffic from port2 to Company_Servers:

```
config firewall acl
    edit 1
       set interface "port2"
       set srcaddr "all"
       set dstaddr "Company_Servers"
       set service "TELNET"
    next
```

```
end
config firewall acl6
    edit 1
        set interface "port2"
        set srcaddr "all"
        set dstaddr "Company_Servers_v6"
        set service "TELNET"
    next
end
```

Diagnose commands

To check the number of packets dropped by an ACL:

```
# diagnose firewall acl counter
ACL id 1 dropped 0 packets
```

```
# diagnose firewall acl counter6
ACL id 2 dropped 0 packets
```

To clear the packet drop counters:

```
# diagnose firewall acl clearcounter
```

```
# diagnose firewall acl clearcounter6
```

Interface policies

Interface policies are implemented before the security policies and are only flow-based. They are configured in the CLI.

This feature allows you to attach a set of IPS policies with the interface instead of the forwarding path, so packets can be delivered to IPS before entering the firewall. This feature is used for following IPS deployments:

- One-Arm: By defining interface policies with IPS and DoS anomaly checks and enabling sniff-mode on the interface, the interface can be used for one-arm IDS.
- IPv6 IPS: IPS inspection can be enabled through interface IPv6 policy.
- Scan traffic that is destined to the FortiGate.
- Scan and log traffic that are silently dropped or flooded by Firewall or Multicast traffic.

IPS sensors can be assigned to an interface policy. Both incoming and outgoing packets are inspected by IPS sensor (signature).

To configure an interface policy:

```
config firewall interface-policy
    edit 1
```

```
        set status enable
        set comments 'test interface policy #1'
        set logtraffic utm
        set interface "port2"
        set srcaddr all
        set dstaddr all
        set service "ALL"
        set application-list-status disable
        set ips-sensor-status disable
        set dsri disable
        set av-profile-status enable
        set av-profile default
        set webfilter-profile-status disable
    next
end
```

Source NAT

Network Address Translation (NAT) is the process that enables a single device, such as a router or firewall, to act as an agent between the internet or public network and a local or private network. This agent acts in real-time to translate the source or destination IP address of a client or server on the network interface. Source IP translation enables a single, public address to represent a significantly larger number of private addresses. Destination IP translation enables the firewall to translate a public, destination address to a private address. So we don't have to configure a real public IP address for the server deployed in a private network.

NAT can be subdivided into two types:

- Source NAT (SNAT)
- Destination NAT (DNAT)

This section is about SNAT. Three NAT working modes are supported: static SNAT, dynamic SNAT, and central SNAT. For information about DNAT, see Destination NAT on page 1658.

The following topics provide instructions on configuring policies with source NAT:

- Static SNAT on page 1632
- Dynamic SNAT on page 1633
- Central SNAT on page 1642
- Configuring an IPv6 SNAT policy on page 1653
- SNAT policies with virtual wire pairs on page 1655
- Configuring PCP port mapping with SNAT and DNAT on page 1730

Static SNAT

In static SNAT all internal IP addresses are always mapped to the same public IP address. This is a port address translation, Since we have 60416 available port numbers, this one public IP address can handle the conversion of 60,416 internal IP addresses to the same service, where a service is defined by a specified protocol, destination IP address, and destination port.

Internal Source IP	Source Port	Translated Source IP	Translated Source Port
10.1.100.1	11110	172.16.200.1	5117
10.1.100.1	11111	172.16.200.1	5118
10.1.100.2	11112	172.16.200.1	5119
.....	.....	172.16.200.1	.....
.....	.....	172.16.200.1	65533

FortiGate firewall configurations commonly use the Outgoing Interface address.

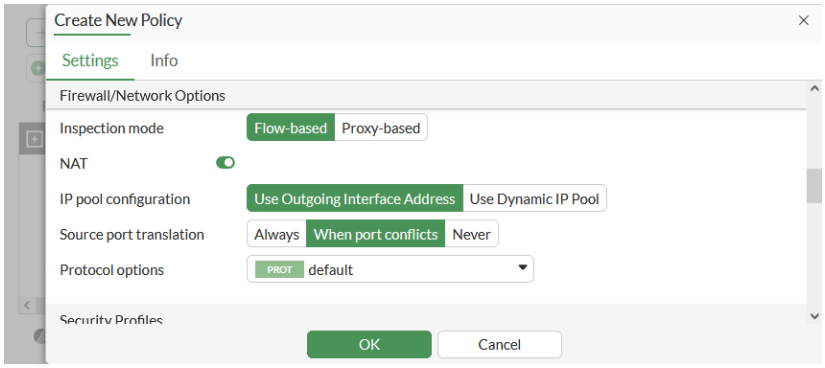
Sample configuration

The following example of static SNAT uses an internal network with subnet 10.1.100.0/24 (vlan20) and an external/ISP network with subnet 172.16.200.0/24 (vlan30).

When the clients in internal network need to access the servers in external network, We need to translate IP addresses from 10.1.100.0/24 to an IP address 172.16.200.0/24, In this example, we implement static SNAT by creating a firewall policy.

To configure static NAT:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the required policy parameters.
3. Enable *NAT* and select *Use Outgoing Interface Address*. For packets that match this policy, its source IP address is translated to the IP address of the outgoing interface.
4. The default setting for *Source Port Translation* is *When Port Conflicts*, which uses the original source port unless there is a conflict. If required, set it to *Always* to always change the source port for Source NAT, or *Never* to prevent Source NAT from changing a session's source port.



5. Click *OK*.

Dynamic SNAT

Dynamic SNAT maps the private IP addresses to the first available public address from a pool of addresses. In the FortiGate firewall, this can be done by using IP pools. IP pools is a mechanism that allows sessions leaving the FortiGate firewall to use NAT. An IP pool defines a single IP address or a range of IP addresses to be used as the source address for the duration of the session. These assigned addresses are used instead of the IP address assigned to that FortiGate interface.

IP pool types

FortiGate uses four types of IPv4 IP pools. This topic focuses on some of the differences between them.

Overload

This type of IP pool is similar to static SNAT mode. We need to define an external IP range that contains one or more IP addresses. When there is only one IP address it is almost the same as static SNAT, the outgoing interface address is used. When it contains multiple IP addresses, it is equivalent to an extended mode of static SNAT.

For instance, if we define an overload type IP pool with two external IP addresses (172.16.200.1—172.16.200.2), since there are 60,416 available port numbers per IP, this IP pool can handle 60,416*2 internal IP addresses to the same service, where a service is defined by a specific protocol, destination IP address, and destination port.

Original Source IP	Original Source Port	Translated Source IP	Translated Source Port
10.1.100.1	11110	172.16.200.1	5117
10.1.100.2	11111	172.16.200.1	5118
.....	.....	172.16.200.1	.....
.....	.....	172.16.200.1	65533
.....	.....	172.16.200.2	5117
.....	.....	.....	.....
.....	.....	172.16.200.2	65533

The mapped IP address can be calculated from the source IP address. The index number of the address in the pool is the remainder of the source IP address, in decimal, divided by the number addresses in the pool.

To calculate the decimal value of the source IP address, either use an online calculator, or use the following equation:

$$a.b.c.d = a * (256)^3 + b * (256)^2 + c * (256) + d$$

For example:

$$192.168.0.1 = 192 * (256)^3 + 168 * (256)^2 + 0 * (256) + 1 = 3232235521$$

If there is one IP pool, where:

- P_1 = the first address in the IP pool
- R_1 = the number of IP addresses in the IP pool
- X = the source IP address as a decimal number
- Y = the mapped IP address

Then the equation to determine the mapped address is:

$$Y = P_1 + X \bmod R_1$$

For example:

IP pool	Source IP address
172.26.73.20 to 172.26.73.90	192.168.1.200

1. Convert the source IP address to a decimal number:
$$192 * (256)^3 + 168 * (256)^2 + 1 * (256) + 200 = 3232235976$$
2. Determine the number of IP addresses in the pool:
$$172.26.73.90 - 172.26.73.20 = 71$$
3. Find the remainder of the source IP address divided by the number of addresses in the pool:
$$3232235976 \bmod 71 = 26$$
4. Add the remainder to the first IP address in the pool:
$$172.26.73.20 + 26 = 172.26.73.46$$
So, the mapped IP address is **172.26.73.46**.

If there are multiple IP pools, the calculation is similar to when there is only one pool.

If there are two IP pools, where:

- P_1 = the first address in the first IP pool
- P_2 = the first address in the second IP pool
- R_1 = the number of IP addresses in the first IP pool
- R_2 = the number of IP addresses in the second IP pool
- X = the source IP address as a decimal number
- Y = the mapped IP address

Then the equations to determine the mapped address are:

If $X \bmod (R_1 + R_2) >= R_1$, then $Y = P_2 + X \bmod R_2$

If $X \bmod (R_1 + R_2) < R_1$, then $Y = P_1 + X \bmod R_1$

For example:

IP pools	Source IP address
pool01: 172.26.73.20 to 172.26.73.90	192.168.1.200
pool02: 172.26.75.50 to 172.26.75.150	

1. Convert the source IP address to a decimal number:
$$192 * (256)^3 + 168 * (256)^2 + 1 * (256) + 200 = 3232235976$$
2. Determine the total number of IP addresses in the pools:
$$(172.26.73.90 - 172.26.73.20) + (172.26.75.50 - 172.26.75.150) = 71 + 101 = 172$$
3. Find the remainder of the source IP address divided by the number of addresses in the pools:
$$3232235976 \bmod 172 = 108$$
4. The remainder is greater than the number of addresses in pool01, so the address is selected from pool02 and the remainder is recalculated based only on pool02:
$$3232235976 \bmod 101 = 40$$
5. Add the new remainder to the first IP address in pool02:

172.26.75.50 + 40 = 172.26.75.90

So, the mapped IP address is **172.26.75.90**.

One-to-one

This type of IP pool means that the internal IP address and the external (translated) IP address match one-to-one. The port address translation (PAT) is disabled when using this type of IP pool. For example, if we define a one-to-one type IP pool with two external IP addresses (172.16.200.1 - 172.16.200.2), this IP pool only can handle two internal IP addresses.

Fixed port range

For the overload and one-to-one IP pool types, we do not need to define the internal IP range. For the fixed port range type of IP pool, we can define both internal IP range and external IP range. Since each external IP address and the number of available port numbers is a specific number, if the number of internal IP addresses is also determined, we can calculate the port range for each address translation combination. So we call this type fixed port range. This type of IP pool is a type of port address translation (PAT).

For instance, if we define one external IP address (172.16.200.1) and ten internal IP addresses (10.1.100.1-10.1.100.10), we have translation IP+Port combination like following table:

Original Source IP	Original Source Port	Translated Source IP	Translated Source Port Range
10.1.100.1	.....	172.16.200.1	5117~11157
10.1.100.2	.....	172.16.200.1	11158~17198
10.1.100.3	.....	172.16.200.1	.....
10.1.100.4	.....	172.16.200.1	.....
10.1.100.5	.....	172.16.200.1	.....
10.1.100.6	.....	172.16.200.1	.....
10.1.100.7	.....	172.16.200.1	.....
10.1.100.8	.....	172.16.200.1	.....
10.1.100.9	.....	172.16.200.1	53445~59485
10.1.100.10	.....	172.16.200.1	59486~65526

Custom port ranges, NAT64, and full cone NAT are supported. See Full cone NAT for fixed port range IP pools on page 1741 for more information about full cone NAT.

Port block allocation

This type of IP pool is also a type of port address translation (PAT). It gives users a more flexible way to control the way external IPs and ports are allocated. Users need to define *Block Size/Block Per User* and external IP range. *Block Size* means how many ports each Block contains. *Block per User* means how many blocks each user (internal IP) can use.

The following is a simple example:

- **External IP Range**: 172.16.200.1—172.16.200.1
- **Block Size**: 128
- **Block Per User**: 8

Result:

- **Total-PBAs**: 472 (60416/128)
- **Maximum ports can be used per User (Internal IP Address)**: 1024 (128*8)
- **How many Internal IP can be handled**: 59 (60416/1024 or 472/8)

Custom port ranges are supported.

A randomized port selection algorithm is also supported. The algorithm makes the port allocation process less predictable, which enhances security. The `port-random` option is available with:

- The `config firewall central-snat-map` command:

```
config firewall central-snat-map
    edit 1
        set port-preserve disable
        set port-random {enable | disable}
    next
end
```

- The `config firewall policy` command:

```
config firewall policy
    edit 1
        set port-preserve disable
        set port-random {enable | disable}
    next
end
```

`set port-random {enable | disable}`	Enable/disable random source port selection for source NAT (default = disable). Available when `port-preserve` is disabled.

Interim logs can be configured for port block allocation (PBA) NAT logging. This enables continuous access to PBA event logs during an ongoing session, and provides comprehensive logging throughout a session's lifespan.

PBA event logs are generated periodically based on the configured time interval:

```
config firewall ippool
    edit pba-ippool
        set type port-block-allocation
        set pba-interim-log <integer>
    next
end
```

For example, when the PBA interim log interval is set to 600 seconds, event logs are obtained every ten minutes:

- Configure the PBA IP pool with a time interval:

```
config firewall ippool
    edit "pba-ippool"
        set type port-block-allocation
        set startip 172.16.200.151
        set endip 172.16.200.151
        set block-size 64
        set num-blocks-per-user 1
```

```
        set pba-interim-log 600
    next
end
```

- Check the event logs:

```
# execute log display

2 logs found.

2 logs returned.

1: date=2024-02-04 time=13:34:04 eventtime=1707082444264865326 tz="-0800" logid="0100022024"
type="event" subtype="system" level="notice" vd="vdom1" logdesc="IP pool PBA interim log"
action="ippool-interim" saddr="10.1.100.42" nat=172.16.200.151 portbegin=5117 portend=5180
poolname="pba-ippool" duration=1200 msg="IPpool interim"

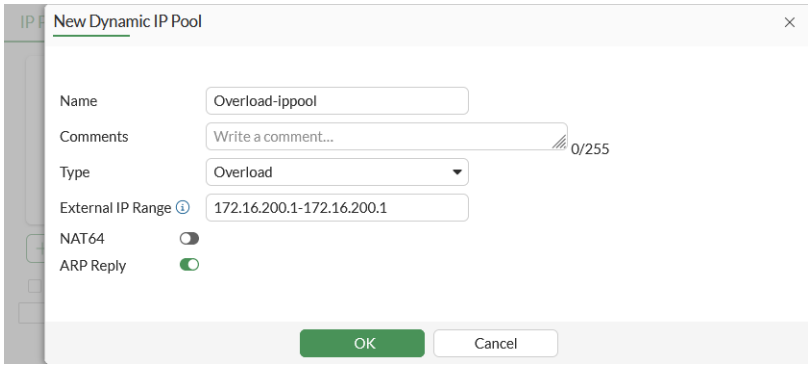
2: date=2024-02-04 time=13:24:03 eventtime=1707081844204865060 tz="-0800" logid="0100022024"
type="event" subtype="system" level="notice" vd="vdom1" logdesc="IP pool PBA interim log"
action="ippool-interim" saddr="10.1.100.42" nat=172.16.200.151 portbegin=5117 portend=5180
poolname="pba-ippool" duration=600 msg="IPpool interim"
```

Sample configuration

When an IP pool object is created with *ARP Reply* enabled, the object does not need to be referenced in any policies before a FortiGate interface starts responding to ARP requests for the addresses in the IP pool.

To configure overload IP pool in the GUI:

1. In *Policy & Objects* > *IP Pools*, click *IP Pool*.
2. Click *Create new*.
3. Set *Type* to *Overload*.
4. Enter the external IP range separated by a hyphen (*172.16.200.1-172.16.200.1*).



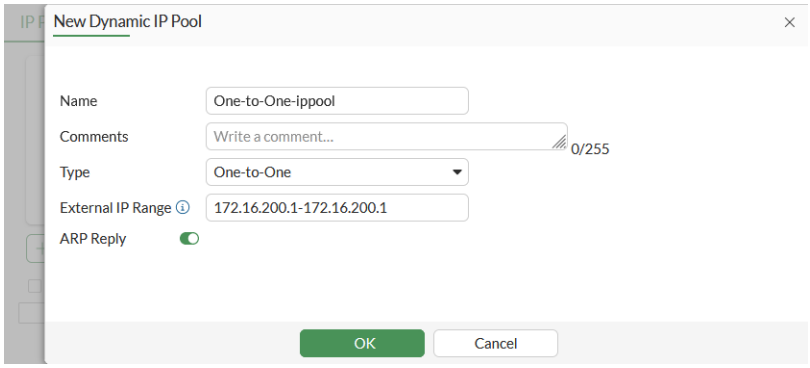
5. Click *OK*.

To configure overload IP pool in the CLI:

```
config firewall ippool
    edit "Overload-ippool"
        set startip 172.16.200.1
        set endip 172.16.200.1
    next
end
```

To configure one-to-one IP pool using the GUI:

1. In *Policy & Objects* > *IP Pools*, click *IP Pool*.
2. Click *Create new*.
3. Set *Type* to *One-to-One*.
4. Enter the external IP range separated by a hyphen (*172.16.200.1-172.16.200.2*).



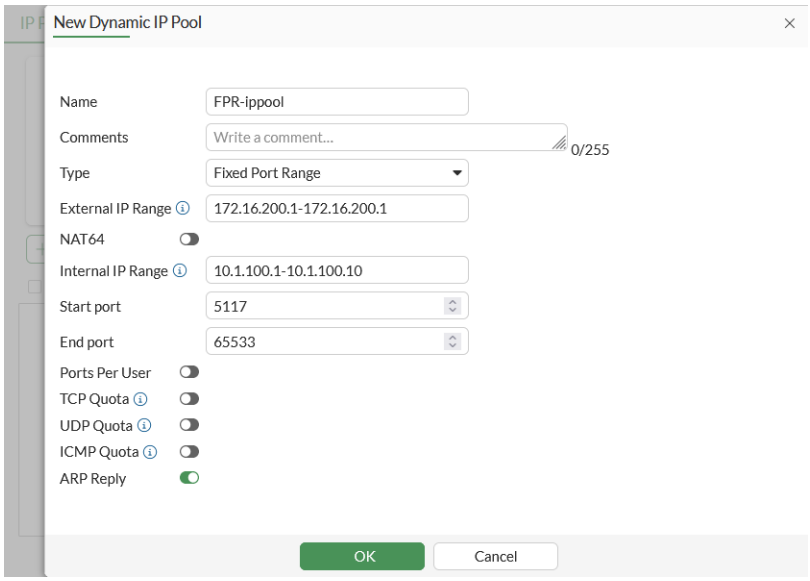
5. Click *OK*.

To configure one-to-one IP pool in the CLI:

```
config firewall ippool
    edit "One-to-One-ippool"
        set type one-to-one
        set startip 172.16.200.1
        set endip 172.16.200.2
    next
end
```

To configure fixed port range IP pool in the GUI:

1. In *Policy & Objects* > *IP Pools*, click *IP Pool*.
2. Click *Create new*.
3. Set *Type* to *Fixed Port Range*.
4. Enter the external IP range separated by a hyphen *172.16.200.1-172.16.200.1*).
5. Enter the internal IP range separated by a hyphen *10.1.100.1-10.1.100.10*).
6. (Optional) Enter the start port and end port numbers.



7. Click *OK*.

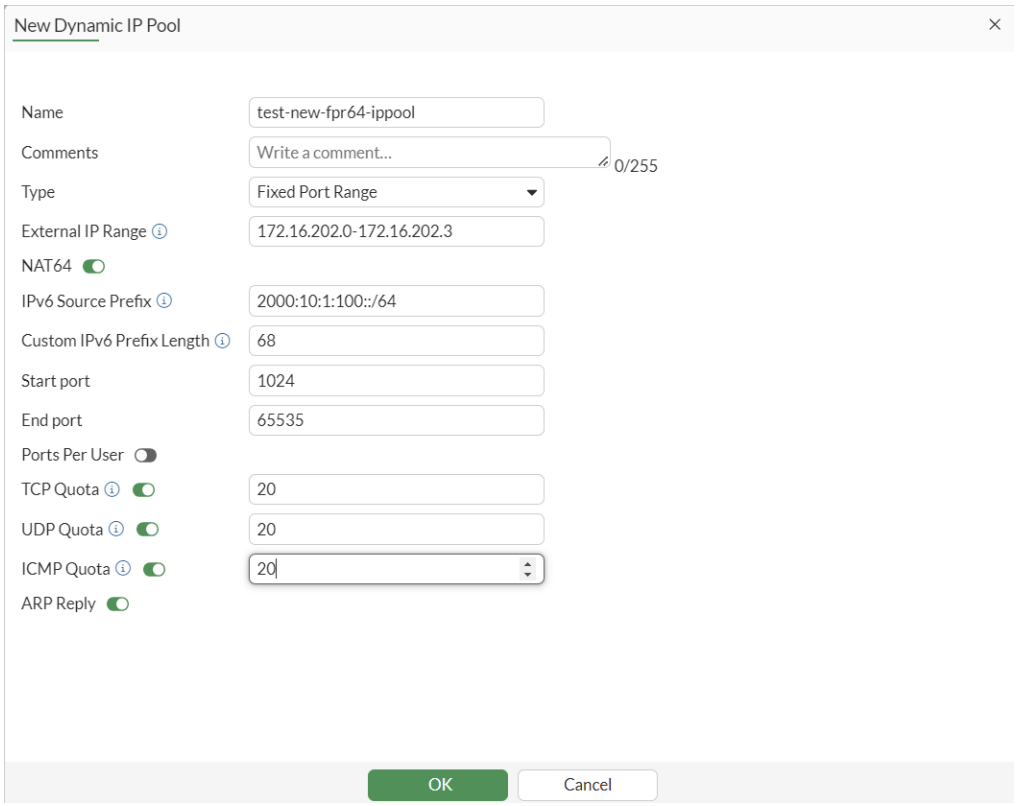
To configure fixed port range IP pool in the CLI:

```
config firewall ippool
    edit "FPR-ippool"
        set type fixed-port-range
        set startip 172.16.200.1
        set endip 172.16.200.1
        set startport 5117
        set endport 65533
        set source-startip 10.1.100.1
        set source-endip 10.1.100.10
   next
end
```

To configure NAT64 FPR IP pools in the GUI:

1. Go to *Policy & Objects* > *IP Pools*.
2. Select the *IP Pool* tab and click *Create New*.
3. Set the following options:

Name	Enter a name.
Type	Select *Fixed Port Range*.
External IP Range	Enter the IP address range.
NAT64	Enable.
IPv6 Source Prefix	Enter the source IPv6 network to be translated.
Custom IPv6 Prefix Length	Enter the subnet length of a single deterministic NAT64 client.



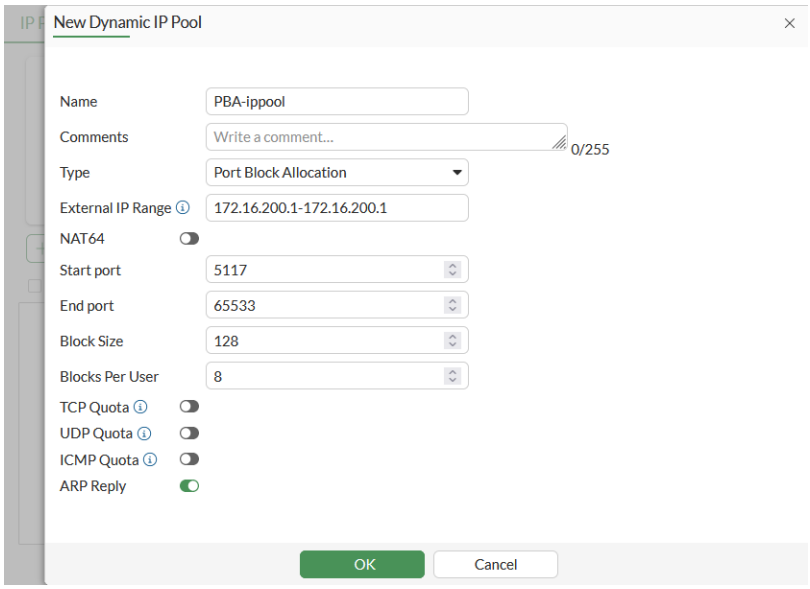
4. Set the remaining options as needed and click *OK*.

To configure NAT64 FPR IP pools in the CLI:

```
config firewall ippool
    edit "test-new-fpr64-ippool"
        set type fixed-port-range
        set startip 172.16.202.0
        set endip 172.16.202.3
        set startport 1024
        set endport 65535
        set nat64 enable
        set source-prefix6 2000:10:1:100::/64
        set client-prefix-length 68
        set tcp-session-quota 20
        set udp-session-quota 20
        set icmp-session-quota 10
    next
end
```

To configure port block allocation IP pool in the GUI:

1. In *Policy & Objects* > *IP Pools*, click *IP Pool*.
2. Click *Create new*.
3. Set *Type* to *Port Block Allocation*.
4. Enter the external IP range separated by a hyphen *172.16.200.1-172.16.200.1*).



5. Click *OK*.

To configure port block allocation IP pool in the CLI:

```
config firewall ippool
    edit PBA-ippool
        set type port-block-allocation
        set startip 172.16.200.1
        set endip 172.16.200.1
        set startport 5117
        set endport 65533
        set block-size 128
        set num-blocks-per-user 8
    next
end
```

IP pools and VIPs as local IP addresses

IP pools and VIPs are considered local IP addresses if responding to ARP requests on these external IP addresses is enabled (`set arp-reply enable`, by default). In this case, the FortiGate is considered a destination for those IP addresses and can receive reply traffic at the application layer successfully.

However, as a side-effect, once an IP pool or VIP has been configured, even if it is never used in a firewall policy, the FortiGate considers it as a local address and will not forward traffic based on the routing table. Therefore, any unused IP pools or VIPs should be deleted to prevent any unexpected behavior.

For a history of behavior changes related to IP pools and VIPs, see Technical Tip: IP pool and virtual IP behavior changes in FortiOS 6.4, 7.0, 7.2, and 7.4.

Central SNAT

The central SNAT table enables you to define and control (with more granularity) the address translation performed by FortiGate. With the NAT table, you can define the rules for the source address or address group, and which IP pool the destination address uses.

FortiGate reads the NAT rules from the top down until it hits a matching rule for the incoming address. This enables you to create multiple NAT policies that dictate which IP pool is used based on source address, destination address, and source port. NAT policies can be rearranged within the policy list. NAT policies are applied to network traffic after a security policy.

The central SNAT table allows you to create, edit, delete, and clone central SNAT entries.

Central SNAT notes

- The central NAT feature is not enabled by default.
- If central NAT is enabled, the NAT option under IPv4 policies is skipped and SNAT must be done via `central-snat-map`. The firewall policy list and dialog boxes have messages and redirection links to show this information.
- If NGFW mode is policy-based, then it is assumed that central NAT (specifically SNAT) is enabled implicitly.

Sample configuration

To enable central SNAT from the GUI:

1. In *System > Settings*, under *System Operations Settings*, enable *Central SNAT*.
2. Click *Apply*.

To enable or disable central SNAT using the CLI:

```
config system settings
   set central-nat {enable | disable}
end
```

When central NAT is enabled, *Policy & Objects* displays the Central SNAT section.

The Central SNAT policy has many options:

Field	Description
Type	Specify whether you are performing SNAT on IPv4 or IPv6. This option only appears when IPv6 is enabled under *Feature Visibility*.
Incoming Interface	Specify one or more interfaces for the ingress traffic.
Outgoing Interface	Specify one or more interfaces for the egress traffic.
Source Address	Specify the address or address group of the source.
Destination Address	Specify the address or address group of the destination.
NAT	Enable or disable to perform NAT. When disabled, no source address

Field	Description
	translation will occur.
IP Pool Configuration	Use outgoing interface address: • Use the address of the outgoing interfaces as source address. Use Dynamic IP Pool: • Choose an IP Pool to perform source NAT.
Protocol	Choose from any, TCP, UDP, SCTP, or specify the protocol number to match. For example, for ICMP, click *specify* with the protocol number 1.
Explicit port mapping	Enable in order to match this NAT policy only when the following ports are a match: • Choose an original source port from one to 65535. NAT'd port will be chosen by the FortiGate based on the IP Pool configuration. Explicit port mapping cannot apply to some protocols which do not use ports, such as ICMP. When enabling a NAT policy which uses Explicit port mapping, always consider that ICMP traffic will not match this policy. When using IP Pools, only the Overload type IP Pool allows Explicit port mapping. When Explicit port mapping is applied, you must define an original source port range and a translated sort port range. The source port will map one to one with the translated port. Refer to Dynamic SNAT to understand how each IP Pool type works.
Comments	Enter comments for this NAT policy.
Enable this policy	Enable or disable this policy.

To configure central SNAT using the CLI:

```
config firewall central-snat-map
    edit <policyID number>
        set status {enable | disable}
        set orig-addr <valid address object preconfigured on the FortiGate>
        set srcintf <name of interface on the FortiGate>
        set dst-addr <valid address object preconfigured on the FortiGate>
        set dstintf <name of interface on the FortiGate>
        set protocol <integer for protocol number>
        set dst-port <integer for destination port or port range>
        set orig-port <integer for original port number>
        set nat-port <integer for translated port number>
        set comments <string>
    next
end
```

Setting the destination port for traffic matching is available when the protocols are TCP, UDP, or SCTP.

The following examples demonstrate configuring central SNAT:

- Example one: Apply SNAT to all traffic on page 1644
- Example two: Apply an IP pool to all TCP traffic on page 1644
- Example three: Apply an IP pool to all traffic with a specific original port range on page 1646
- Example four: Create two central SNAT rules on page 1647
- Example five: Fine-tuning source port behavior on page 1649

IP address external feed objects can also be used as the source address of central SNAT policies. See Apply external feed connectors as source addresses in central SNAT on page 4104.

Example one: Apply SNAT to all traffic

Apply SNAT to all traffic from port2 to port3.

To configure from the CLI:

```
config firewall central-snat-map
    edit 1
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
    next
end
```

Example two: Apply an IP pool to all TCP traffic

Apply an IP pool to all traffic from port3 to port2 that are TCP. NAT all other traffic using the outgoing interface IP.

To configure from the CLI:

```
config firewall ippool
    edit "Overload-IPPOOL"
        set startip 192.168.2.201
        set endip 192.168.2.202
    next
end
config firewall central-snat-map
    edit 1
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
        set protocol 6
        set nat-ippool "Overload-IPPOOL"
    next
    edit 2
```

```
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
    next
end
```

To collect session table output from the CLI:

```
diagnose sys session list
```

The TCP session (protocol 6) is NAT'd with Overload-IPPOOL to 192.168.2.201:

```
session info: proto=6 proto_state=05 duration=14 expire=0 timeout=3600 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=860/7/1 reply=555/8/1 tuples=2
tx speed(Bps/kbps): 60/0 rx speed(Bps/kbps): 38/0
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:49531->23.57.57.114:443(192.168.2.201:61776)
hook=pre dir=reply act=dnat 23.57.57.114:443->192.168.2.201:61776(192.168.0.10:49531)
pos/(before,after) 0/(0,0), 0/(0,0)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=00011065 tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

A UDP session (protocol 17) is NAT'd to the outgoing interface IP address 192.168.2.86:

```
session info: proto=17 proto_state=01 duration=16 expire=163 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ helper=dns-udp vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=59/1/1 reply=187/1/1 tuples=2
tx speed(Bps/kbps): 3/0 rx speed(Bps/kbps): 11/0
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:52177->4.2.2.1:53(192.168.2.86:61770)
hook=pre dir=reply act=dnat 4.2.2.1:53->192.168.2.86:61770(192.168.0.10:52177)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=00011061 tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
```

```
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Example three: Apply an IP pool to all traffic with a specific original port range

Apply an IP Pool to all traffic from port3 to port2 that have a specific original port range, mapping the ports to the same NAT'd port range. Nat all other traffic using the outgoing interface IP.

To configure from the CLI:

```
config firewall central-snat-map
    edit 1
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
        set orig-port 50000-65535
        set nat-ippool "Overload-IPPOOL"
        set nat-port 50000-65535
    next
    edit 2
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
    next
end
```

To collect session table output from the CLI:

```
diagnose sys session list
```

Traffic with original port in the range between 50000-65535 will be NAT'd with the Overload type IP Pool. The mapped port is in the same port range:

```
session info: proto=17 proto_state=01 duration=3 expire=176 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ helper=dns-udp vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=71/1/1 reply=123/1/1 tuples=2
tx speed(Bps/kbps): 23/0 rx speed(Bps/kbps): 40/0
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:52540->4.2.2.1:53(192.168.2.201:52540)
hook=pre dir=reply act=dnat 4.2.2.1:53->192.168.2.201:52540(192.168.0.10:52540)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=00011399 tos=ff/ff app_list=0 app=0 url_cat=0
```

```
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Traffic with original port outside the range of 50000-65535 will be NAT'd to the outgoing interface IP:

```
session info: proto=6 proto_state=01 duration=3 expire=3597 timeout=3600 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=2262/10/1 reply=2526/11/1 tuples=2
tx speed(Bps/kbps): 741/5 rx speed(Bps/kbps): 828/6
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:49805->142.250.68.66:443(192.168.2.86:62214)
hook=pre dir=reply act=dnat 142.250.68.66:443->192.168.2.86:62214(192.168.0.10:49805)
pos/(before,after) 0/(0,0), 0/(0,0)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=0001139a tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Protocols which do not use ports, such as ICMP, will be NAT'd to the outgoing interface IP:

```
session info: proto=1 proto_state=00 duration=7 expire=59 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=480/8/1 reply=480/8/1 tuples=2
tx speed(Bps/kbps): 66/0 rx speed(Bps/kbps): 66/0
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:1->4.2.2.1:8(192.168.2.86:62209)
hook=pre dir=reply act=dnat 4.2.2.1:62209->192.168.2.86:0(192.168.0.10:1)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=0001138b tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Example four: Create two central SNAT rules

In the following example, two central SNAT rules will be created:

- Rule 3 will have a destination port set and IP pool `test-ippool4-3` applied.
- Rule 5 will have IP pool `test-ippool4-1` applied but will not set the destination port.

Example traffic will then be passed to see how the rule is matched.

To test central SNAT rule destination port support:

1. Configure central SNAT rule 3 with the destination port range specified:

```
config firewall ippool
    edit "test-ippool4-3"
        set startip 172.16.200.150
        set endip 172.16.200.150
    next
end
config firewall central-snat-map
    edit 3
        set srcintf "port24"
        set dstintf "port17"
        set orig-addr "all"
        set dst-addr "all"
        set protocol 6
        set nat-ippool "test-ippool4-3"
        set dst-port 80-443
    next
end
```

2. Configure central SNAT rule 5:

```
config firewall ippool
    edit "test-ippool4-1"
        set startip 172.16.200.151
        set endip 172.16.200.151
    next
end
config firewall central-snat-map
    edit 5
        set srcintf "port24"
        set dstintf "port17"
        set orig-addr "all"
        set dst-addr "all"
        set nat-ippool "test-ippool4-1"
    next
end
```

3. Send HTTP traffic to pass through the FortiGate that is expected to match central SNAT rule 3. IP pool `test-ippool4-3` will perform source NAT.
4. Check the session to review for expected behavior:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=2 expire=3599 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
```

```
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=1800/31/1 reply=77304/60/1 tuples=2
tx speed(Bps/kbps): 602/4 rx speed(Bps/kbps): 25854/206
orgin->sink: org pre->post, reply pre->post dev=24->17/17->24 gwy=172.16.200.55/10.1.100.42
hook=post dir=org act=snat 10.1.100.42:46731->172.16.200.55:80(172.16.200.150:46731)
hook=pre dir=reply act=dnat 172.16.200.55:80->172.16.200.150:46731(10.1.100.42:46731)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=99 pol_uuid_idx=15864 auth_info=0 chk_client_info=0 vd=0
serial=00003c37 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000001 no_offload
no_ofld_reason:  disabled-by-policy
total session 1
```

5. Send PING traffic to pass through the FortiGate that is expected to match central SNAT rule 5. IP pool `test-ippool4-1` will perform source NAT.
6. Check the session to review for expected behavior:

```
# diagnose sys session list
session info: proto=1 proto_state=00 duration=2 expire=59 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=252/3/1 reply=252/3/1 tuples=2
tx speed(Bps/kbps): 99/0 rx speed(Bps/kbps): 99/0
orgin->sink: org pre->post, reply pre->post dev=24->17/17->24 gwy=172.16.200.55/10.1.100.42
hook=post dir=org act=snat 10.1.100.42:36732->172.16.200.55:8(172.16.200.151:36732)
hook=pre dir=reply act=dnat 172.16.200.55:36732->172.16.200.151:0(10.1.100.42:36732)
misc=0 policy_id=99 pol_uuid_idx=15864 auth_info=0 chk_client_info=0 vd=0
serial=00003f62 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000001 no_offload
no_ofld_reason:  disabled-by-policy
total session 1
```

Example five: Fine-tuning source port behavior

FortiOS supports maintaining or altering the original source port in SNAT using the `port-preserve` command:

- When `port-preserve` is enabled, SNAT will use the original source port if it is not already in use. This is the default.
- When `port-preserve` is disabled, SNAT will always change the source port to use the next higher, available port in the range. When the highest available port is reached, the counter will roll back to the first available port in the range. This allows ports to remain free until the counter rolls back to them.

The `port-preserve` command is available for the central SNAT or for firewall policies when NAT is enabled.

Only ports within the source port range of 5117 to 65533 will be preserved. Anything below 5117 will be translated to a port higher than 5117 based on the internal SNAT source port algorithm. If your source port is less than 5117 and you want to preserve it, explicit port mapping must be used. For more information, see Explicit port mapping on page 1643.

To configure source port behavior for central SNAT:

```
config firewall central-snat-map
    edit 1
        set port-preserve {enable | disable}
    next
end
```

To preserve the original source port in a firewall policy:

1. Enable original source port preservation in the policy:

```
config firewall policy
    edit 2
        set srcintf "port7"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set port-preserve enable
    next
end
```

2. Check the session after the first traffic passes through the FortiGate:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=7 expire=3594 timeout=3600 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty src-vis
statistic(bytes/packets/allow_err): org=165/3/1 reply=112/2/1 tuples=2
tx speed(Bps/kbps): 21/0 rx speed(Bps/kbps): 14/0
orgin->sink: org pre->post, reply pre->post dev=15->9/9->15 gwy=0.0.0.0/10.2.2.1
hook=post dir=org act=snat 10.1.100.42:20042->172.16.200.155:2156(172.16.200.199:5162)
hook=pre dir=reply act=dnat 172.16.200.155:2156->172.16.200.199:5162(10.1.100.42:20042)
po/(before,after) 0/(0,0), 0/(0,0)
src_mac=94:ff:3c:6e:d2:90  dst_mac=00:0c:29:3d:83:02
misc=0 policy_id=2 pol_uuid_idx=16000 auth_info=0 chk_client_info=0 vd=1
```

```
serial=0001cf04 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  mac-host-check disabled-by-policy
total session: 1
```

SNAT uses source port 5162.

3. Clear the old session.
4. Send traffic again with the same source port from the client.
5. Check the new session:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=4 expire=3598 timeout=3600 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty src-vis
statistic(bytes/packets/allow_err): org=165/3/1 reply=112/2/1 tuples=2
tx speed(Bps/kbps): 41/0 rx speed(Bps/kbps): 28/0
orgin->sink: org pre->post, reply pre->post dev=15->9/9->15 gwy=0.0.0.0/10.2.2.1
hook=post dir=org act=snat 10.1.100.42:20042->172.16.200.155:2156(172.16.200.199:5162)
hook=pre dir=reply act=dnat 172.16.200.155:2156->172.16.200.199:5162(10.1.100.42:20042)
pos/(before,after) 0/(0,0), 0/(0,0)
src_mac=94:ff:3c:6e:d2:90  dst_mac=00:0c:29:3d:83:02
misc=0 policy_id=2 pol_uuid_idx=16000 auth_info=0 chk_client_info=0 vd=1
serial=0001d0bf tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  mac-host-check disabled-by-policy
total session: 1
```

The same source port has been used.

To alter the original source port in a firewall policy:

1. Disable original source port preservation in the policy:

```
config firewall policy
    edit 2
        set srcintf "port7"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set port-preserve disable
```

```
    next
end
```

2. Check the session after the first traffic passes through the FortiGate:

```
# diagnose sys session list
session info: proto=6 proto_state=05 duration=34 expire=113 timeout=3600 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=

npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session: 1
```

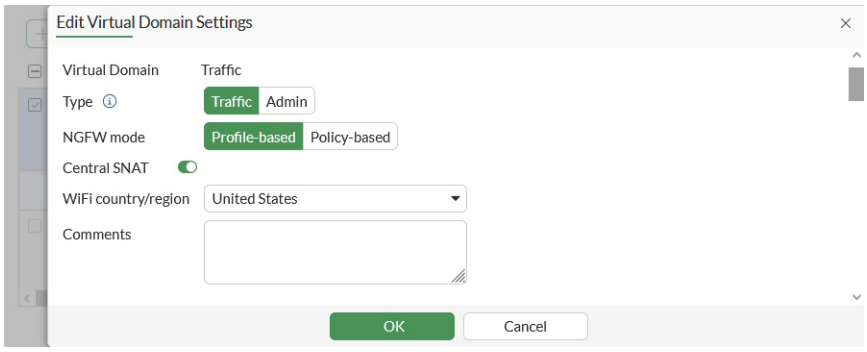
Another new source port has been used.

Configuring an IPv6 SNAT policy

IPv4 and IPv6 central SNAT maps are displayed in the same table.

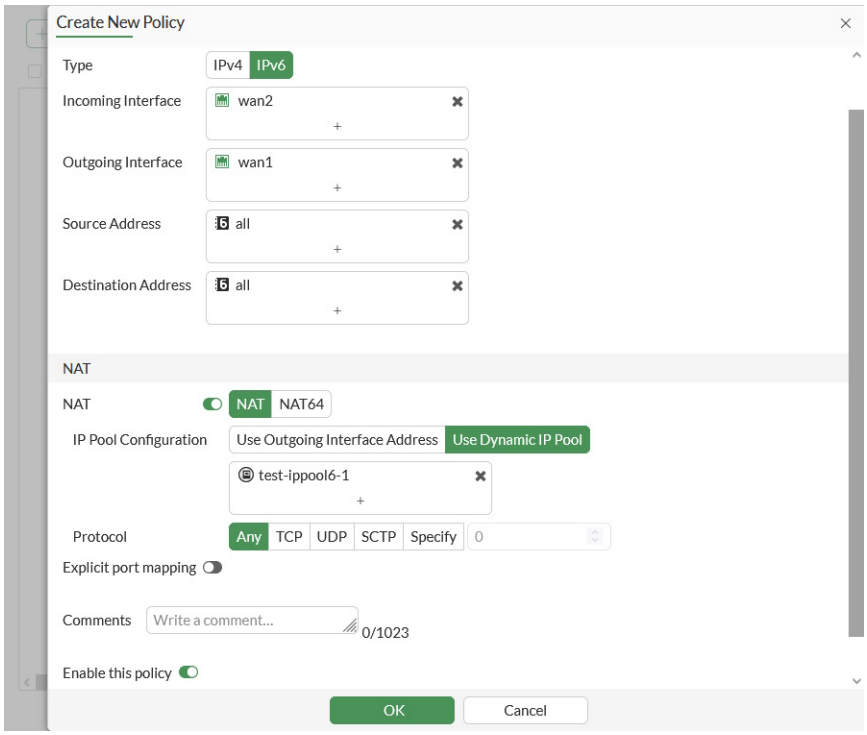
To configure an IPv6 policy with central SNAT in the GUI:

1. Enable central SNAT:
   a. In the Global VDOM, go to *System > VDOM*.
   b. Select a VDOM and click *Edit*. The *Edit Virtual Domain Settings* pane opens.
   c. Enable *Central SNAT*.



d. Click *OK*.

2. In the VDOM with central SNAT enabled (FG-traffic in this example), go to *Policy & Objects* > *Central SNAT* and click *Create New*.
3. Configure the policy settings:
   a. For *Type*, select *IPv6*.
   b. Enter the interface, address, and IP pool information.
   c. Configure the remaining settings as needed.



d. Click *OK*.
The matching SNAT traffic will be handled by the IPv6 central SNAT map.

To configure an IPv6 policy with central SNAT in the CLI:

1. Enable central SNAT:

```
config vdom
    edit FG-traffic
```

```
        config system settings
            set central-nat enable
        end
    next
end
```

2. Create an IPv6 central SNAT policy:

```
config vdom
    edit FG-traffic
        config firewall central-snat-map
            edit 2
                set type ipv6
                set srcintf "wan2"
                set dstintf "wan1"
                set orig-addr6 "all"
                set dst-addr6 "all"
                set nat-ippool6 "test-ippool6-1"
            next
        end
    next
end
```

3. Verify the SNAT traffic:

```
(FG-traffic) # diagnose sniffer packet any icmp6 4
interfaces=[any]
filters=[icmp6]
3.602891 wan2 in 2000:10:1:100::41 -> 2000:172:16:200::55: icmp6: echo request seq 0
3.602942 wan1 out 2000:172:16:200::199 -> 2000:172:16:200::55: icmp6: echo request seq 0
3.603236 wan1 in 2000:172:16:200::55 -> 2000:172:16:200::199: icmp6: echo reply seq 0
3.603249 wan2 out 2000:172:16:200::55 -> 2000:10:1:100::41: icmp6: echo reply seq 0
4.602559 wan2 in 2000:10:1:100::41 -> 2000:172:16:200::55: icmp6: echo request seq 1
4.602575 wan1 out 2000:172:16:200::199 -> 2000:172:16:200::55: icmp6: echo request seq 1
4.602956 wan1 in 2000:172:16:200::55 -> 2000:172:16:200::199: icmp6: echo reply seq 1
4.602964 wan2 out 2000:172:16:200::55 -> 2000:10:1:100::41: icmp6: echo reply seq 1
^C
8 packets received by filter
0 packets dropped by kernel
```

SNAT policies with virtual wire pairs

Source NAT (SNAT) can be configured in IPv4 and IPv6 policies with virtual wire pair (VWP) interfaces, and between VWP interfaces when central NAT is enabled.

To configure a policy using SNAT and a VWP interface when central NAT is disabled:

1. Create the VWP interface:

```
config system virtual-wire-pair
    edit "test-vw-1"
```

```
        set member "port1" "port4"
    next
end
```

2. Create the IP pool. The IP pool must have a different subnet than the VWP peers.

```
config firewall ippool
    edit "vwp-pool-1"
        set startip 172.16.222.99
        set endip 172.16.222.100
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 88
        set srcintf "port4"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set ippool enable
        set poolname "vwp-pool-1"
    next
end
```

4. Verify the IP pool functions as expected and traffic passes through:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
23.438095 port4 in 172.16.200.11 -> 172.16.200.156: icmp: echo request
23.438126 port1 out 172.16.222.100 -> 172.16.200.156: icmp: echo request
23.438492 port1 in 172.16.200.156 -> 172.16.222.100: icmp: echo reply
23.438501 port4 out 172.16.200.156 -> 172.16.200.11: icmp: echo reply
24.439305 port4 in 172.16.200.11 -> 172.16.200.156: icmp: echo request
24.439319 port1 out 172.16.222.100 -> 172.16.200.156: icmp: echo request
24.439684 port1 in 172.16.200.156 -> 172.16.222.100: icmp: echo reply
24.439692 port4 out 172.16.200.156 -> 172.16.200.11: icmp: echo reply

8 packets received by filter
0 packets dropped by kernel
```

To configure a SNAT between VWP interfaces when central NAT is enabled:

1. Enable central NAT:

```
config system settings
    set central-nat enable
end
```

2. Create the VWP interface:

```
config system virtual-wire-pair
    edit "test-vw-1"
        set member "port1" "port4"
    next
end
```

3. Create the IP pool. The IP pool must have a different subnet than the VWP peers.

```
config firewall ippool
    edit "vwp-pool-1"
        set startip 172.16.222.99
        set endip 172.16.222.100
    next
end
```

4. Configure the SNAT policy:

```
config firewall central-snat-map
    edit 2
        set srcintf "port4"
        set dstintf "port1"
        set orig-addr "all"
        set dst-addr "all"
        set nat-ippool "vwp-pool-1"
    next
end
```

5. Configure the firewall policy:

```
config firewall policy
    edit 90
        set srcintf "port4"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
end
```

Destination NAT

Network Address Translation (NAT) is the process that enables a single device, such as a router or firewall, to act as an agent between the internet or public network and a local or private network. This agent acts in real-time to translate the source or destination IP address of a client or server on the network interface. NAT can be subdivided into two types:

- Source NAT (SNAT)
- Destination NAT (DNAT)

This section is about DNAT. For information about SNAT, see Source NAT on page 1631.

A virtual IP (VIP) maps external IP addresses to internal IP addresses for DNAT. See Configuring VIPs on page 1658 and Configuring VIP groups on page 1661.

The following types of VIPs can be created:

Static VIP	A virtual IP that maps an IP address or range to another IP address or range. Custom settings can allow the VIP to be filtered by Source Address and/or services, so that the VIP only applies to the filtered traffic. See Static virtual IPs on page 1662.
Static VIP with services	A virtual IP that defines services for a single port number mapping. See Virtual IP with services on page 1664.
Static VIP with port forwarding	A virtual IP that hides the port number for an internal server or maps several internal servers to the same public IP address. See Virtual IPs with port forwarding on page 1665. See also .
FQDN-based VIP	A virtual IP mapped to an FQDN. See Configure FQDN-based VIPs on page 1678.
Virtual server load balancing	A special type of virtual IP used to implement server load balancing. See Virtual server load balance on page 1667. Virtual IPs can also be used for server load balance multiplexing. See Virtual server load balance multiplexing on page 1676.
Central DNAT	Where DNAT is configured by creating virtual IPs and selecting the VIPs in firewall policies, central NAT is not configured in the firewall policy. Central NAT is enabled in *System Settings*. When enabled, the *Policy & Objects* tree displays the *Central SNAT* policy option. Use the *Central SNAT* policy to configure VIPs as separate objects. During use, FortiGate reads the enabled NAT rules from the top down, until it locates a matching rule. See Central DNAT on page 1679.

See also Configuring PCP port mapping with SNAT and DNAT on page 1730.

Configuring VIPs

Virtual IPs can be configured for IPv4 and IPv6. After creating the VIP, add it to a firewall policy.

FortiOS does not check whether VIPs overlap. As a result, you can configure multiple VIPs with the same external interface and IP. However, you can view overlapping VIPs in the security rating report. See Viewing VIP overlap in security rating reports on page 1660.

To configure a VIP in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs*.
2. Select the *Virtual IP* tab, and click *Create New*.
3. Configure the following settings:

Name		Enter a name for the VIP.
Comments		Enter a description of the VIP.
Color		Click *Change* to select a color for the VIP.
Network		
	Interface (`extintf`)	The external interface that the firewall policy source interface must match. For example, if the external interface is port1, then the VIP can be used in a policy from port1 to port3, but not in a policy from port2 to port3. If the external interface is *any*, then the VIP can be used in any firewall policy.
	Type (`type`)	• Static NAT - Use an external IP address or address range. • FQDN - Use an external IP or FQDN address. • load-balance (CLI only) - Load balance traffic. • server-load-balance - Load balance traffic across multiple servers. SSL processing can be offloaded to the FortiGate. This type of VIP is configure from *Policy & Objects* > *Virtual Servers*. • dns-translation (CLI only) - DNS translation. • access-proxy - Used for ZTNA. See ZTNA HTTPS access proxy example on page 1461 for details.
	External IP address/range (`extip`)	In a static NAT VIP, the external IP address is the IP address that the FortiGate listens for traffic on. When the external interface is not *any*, 0.0.0.0 can be used to make the external IP address equivalent to the external interface's IP address. The external IP address is also used to perform SNAT for the mapped server when the server outbound traffic with a destination interface that matches the external interface. The firewall policy must also have NAT enabled.
Map to		
	IPv4 address/range (`mappedip`)	The IPv4 address or range that the internal resource is being mapped to.

	IPv6 address/range (`ipv6-mappedip`)	The IPv6 address or range that the internal resource is being mapped to.
Optional Filters		Enable to access additional options.
	Source address (`src-filter`)	Restrict the source IP address, address range, or subnet that is allowed to access the VIP.
	Services (`service`)	Set the services that are allowed to be mapped.
Port Forwarding (`portforward`)		Enable port forwarding and display additional options. Enable port forwarding to specify the port (`mappedport`) to map to.
	Protocol (`protocol`)	Select the protocol to use when forwarding packets to the port.
	Port Mapping Type	• One to one - Each external service port is mapped to one port. A range is allowed, but the number of ports should be the same. • Many to Many - The port mapping can be one to one, one to many, or many to one. There are no restrictions on how many external ports must map to internal ports.
	External service port (`extport`)	Enter the external service port range to be mapped to a port range on the destination network.
	Map to IPv4 port (`mappedport`)	Enter the mapped IPv4 port range on the destination network.
	Map to IPv6 port (`ipv6-mappedport`)	Enter the mapped IPv6 port range on the destination network.

4. Click *OK* to save the VIP.

Viewing VIP overlap in security rating reports

There is no overlap check for VIPs, so there are no constraints when configuring multiple VIPs with the same external interface and IP. A new security rating report alerts users of any VIP overlaps.

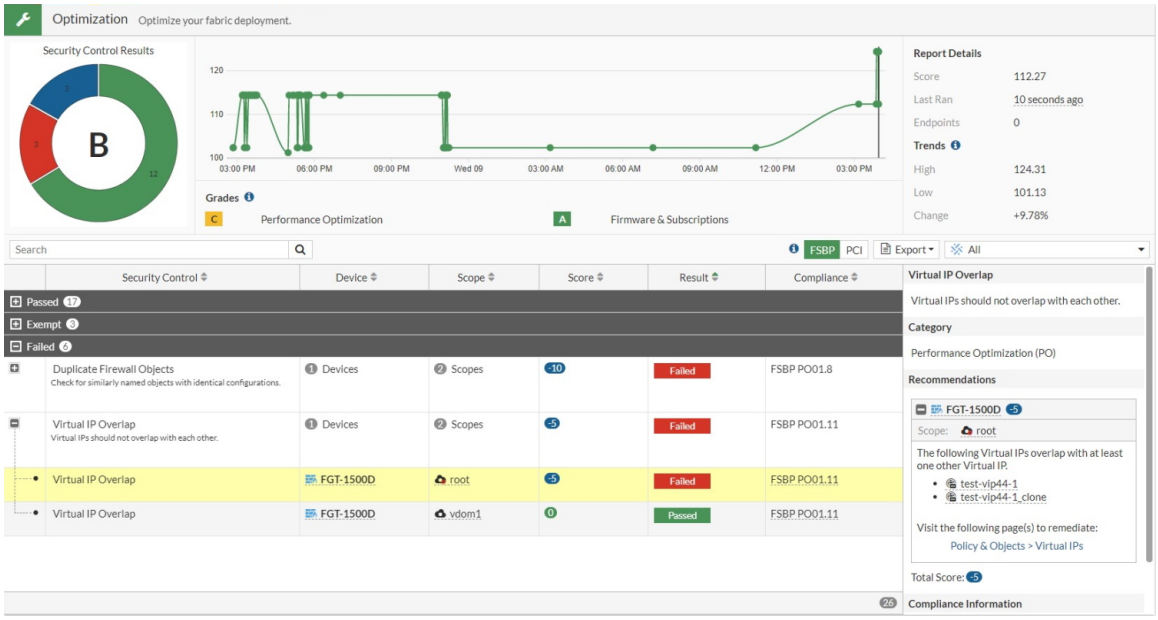
To configure two VIPs with the same external interface and IP:

```
config firewall vip
    edit "test-vip44-1"
        set extip 10.1.100.154
        set mappedip "172.16.200.156"
        set extintf "port24"
    next
    edit "test-vip44-1_clone"
        set extip 10.1.100.154
        set mappedip "172.16.200.156"
        set extintf "port24"
        set src-filter 10.1.100.11
    next
end
```

No error message appears regarding the overlapping VIPs.

To view the security rating report:

1. Go to *Security Fabric* > *Security Rating* and click the *Optimization* scorecard.
2. Expand the *Failed* section. The *Virtual IP Overlap* results show an overlap (*test-vip44-1* and *test-vip44-1_clone*) on the root FortiGate.



Configuring VIP groups

Virtual IP addresses (VIPs) can be organized into groups. After creating the VIP group, add it to a firewall policy.

VIP groups are useful when multiple VIPs are used together in firewall policies. If the VIP group members change, or a group member's settings change (such as the IP address, port, or port mapping type), then those changes are automatically updated in the corresponding firewall policies.

The following table summarizes which VIP types are allowed and not allowed to be members of a VIP group:

Group type	VIP types allowed as members	VIP types not allowed as members
IPv4	• Static NAT • Load balance • DNS translation • FQDN	• Access proxy • Server load balance
IPv6	• Static NAT	• Access proxy • Server load balance

Different VIP types can be added to the same group.

To configure a VIP group in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs*.
2. Navigate to the *Virtual IP Group* or *IPv6 Virtual IP Group* tab.
3. Click *Create new*.
4. Enter a name.
5. Optionally, enter additional information in the *Comments* field.
6. For IPv4 groups, select the *Interface*. Select a specific interface if all of the VIPs are on the same interface; otherwise, select *any*.
7. Click the *+* in the *Members* field and select the members to add to the group.
8. Click *OK*.

To configure an IPv4 VIP group in the CLI:

```
config firewall vipgrp
    edit <name>
        set interface <name>
        set member <vip1> <vip2> ...
    next
end
```

To configure an IPv6 VIP group in the CLI:

```
config firewall vipgrp6
    edit <name>
        set member <vip1> <vip2> ...
    next
end
```

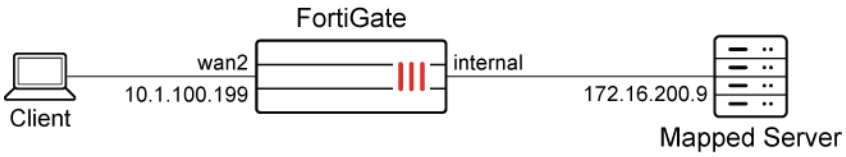
Static virtual IPs

Static Virtual IPs (VIP) are used to map external IP addresses to internal IP addresses. This is also called destination NAT, where a packet's destination is being NAT'd, or mapped, to a different address.

Static VIPs are commonly used to map public IP addresses to resources behind the FortiGate that use private IP addresses. A static one-to-one VIP is when the entire port range is mapped. A port forwarding VIP is when the mapping is configured on a specific port or port range.

When Central NAT is enabled, DNAT is no longer configured on the *Policy & Objects* > *Virtual IPs* page and is instead configured on the *Policy & Objects* > *DNAT & Virtual IPs* page. See Central DNAT on page 1679 for more information.

Sample configuration



To create a virtual IP in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs* or, if Central NAT is enabled, *Policy & Objects* > *DNAT & Virtual IPs*.
2. Select the *Virtual IP* or *IPv6 Virtual IP* tab based on the IP versions used.
3. Click *Create new*.
4. Enter a unique name for the virtual IP.
5. Enter values for the external IP address/range and map to IPv4/IPv6 address/range fields.
6. Click *OK*.

To create a virtual IP in the CLI:

```
config firewall vip
    edit "Internal_WebServer"
        set extip 10.1.100.199
        set extintf "any"
        set mappedip "172.16.200.55"
    next
end
```

To apply a virtual IP to policy in the CLI:

```
config firewall policy
    edit 8
        set name "Example_Virtual_IP_in_Policy"
        set srcintf "wan2"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "Internal_WebServer"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

IP pools and VIPs as local IP addresses

IP pools and VIPs are considered local IP addresses if responding to ARP requests on these external IP addresses is enabled (`set arp-reply enable`, by default). In this case, the FortiGate is considered a destination for those IP addresses and can receive reply traffic at the application layer successfully.

However, as a side-effect, once an IP pool or VIP has been configured, even if it is never used in a firewall policy, the FortiGate considers it as a local address and will not forward traffic based on the routing table. Therefore, any unused IP pools or VIPs should be deleted to prevent any unexpected behavior.

For a history of behaviour changes related to IP pools and VIPs, see Technical Tip: IP pool and virtual IP behaviour changes in FortiOS 6.4, 7.0, 7.2, and 7.4.

Virtual IP with services

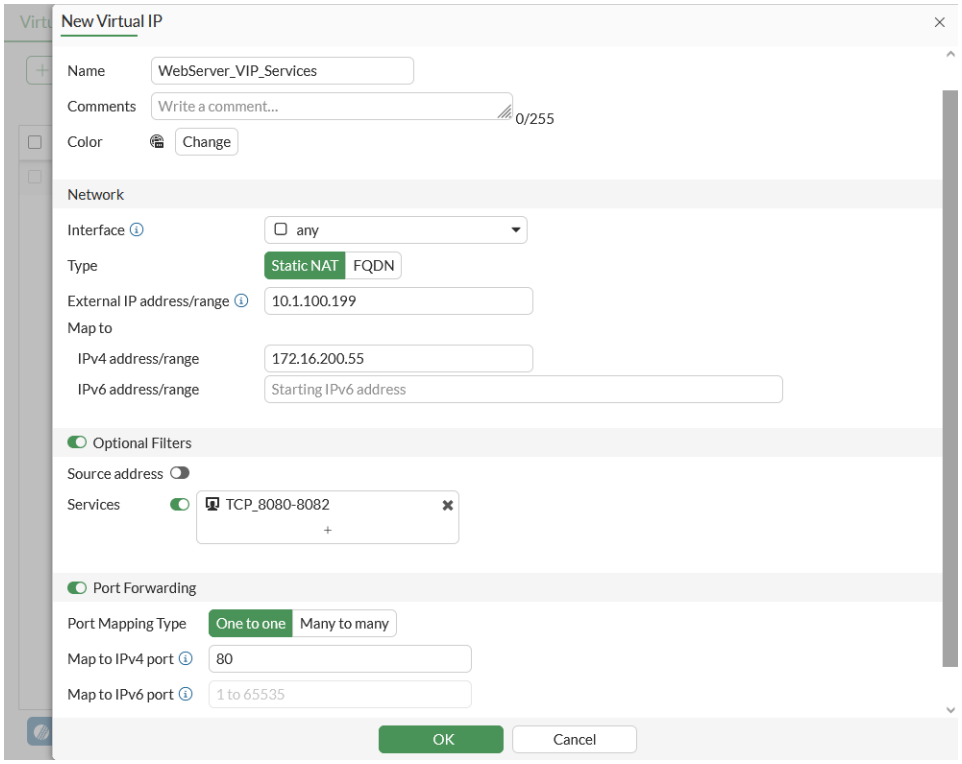
Virtual IP with services is a more flexible virtual IP mode. This mode allows users to define services to a single port number mapping.

This topic shows how to use virtual IP with services enabled. This example has one public external IP address. We map TCP ports 8080, 8081, and 8082 to an internal WebServer TCP port 80. This allows remote connections to communicate with a server behind the firewall.

Sample configuration

To create a virtual IP with services in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
2. Click *Create new*.
3. Enter a unique name for the virtual IP.
4. Configure the fields in the *Network* section. For example:
   - Set *Interface* to *any*.
   - Set *External IP Address/Range* to *10.1.100.199*.
   - Set *Mapped IP Address/Range* to *172.16.200.55*.
5. Enable *Optional Filters* and then enable *Services*.
6. In the *Services* field, add TCP ports 8080, 8081, 8082. See Internet service customization on page 1889 for information about creating a custom port range service.
7. Enable *Port Forwarding* and set *Map to IPv4 port* to *80*.



8. Click *OK*.

To see the results:

1. Apply the above virtual IP to the firewall policy.
2. The results are:
   - Access 10.1.100.199:8080 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
   - Access 10.1.100.199:8081 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
   - Access 10.1.100.199:8082 from external network and FortiGate maps to 172.16.200.55:80 in internal network.

To create a virtual IP with services in the CLI:

```
config firewall vip
    edit "WebServer_VIP_Services"
        set service "TCP_8080-8082"
        set extip 10.1.100.199
        set extintf "any"
        set portforward enable
        set mappedip "172.16.200.55"
        set mappedport 80
    next
end
```

Virtual IPs with port forwarding

If you need to hide the internal server port number or need to map several internal servers to the same public IP address, enable port-forwarding for Virtual IP.

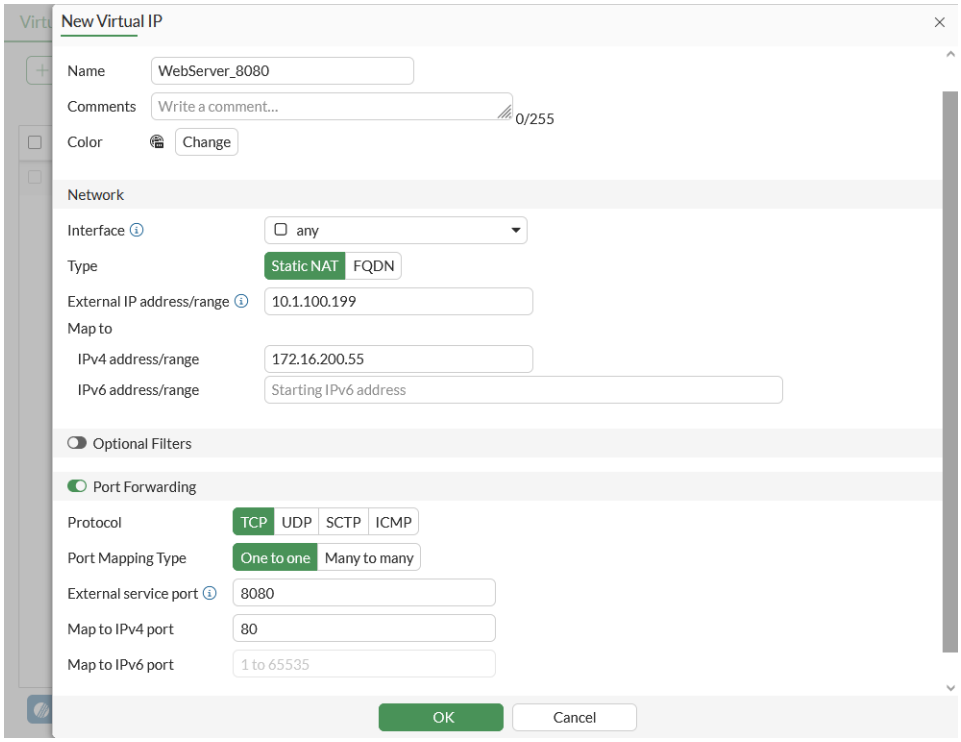
This topic shows how to use virtual IPs to configure port forwarding on a FortiGate unit. This example has one public external IP address. We map TCP ports 8080, 8081, and 8082 to different internal WebServers' TCP port 80. This allows remote connections to communicate with a server behind the firewall.

Sample configuration

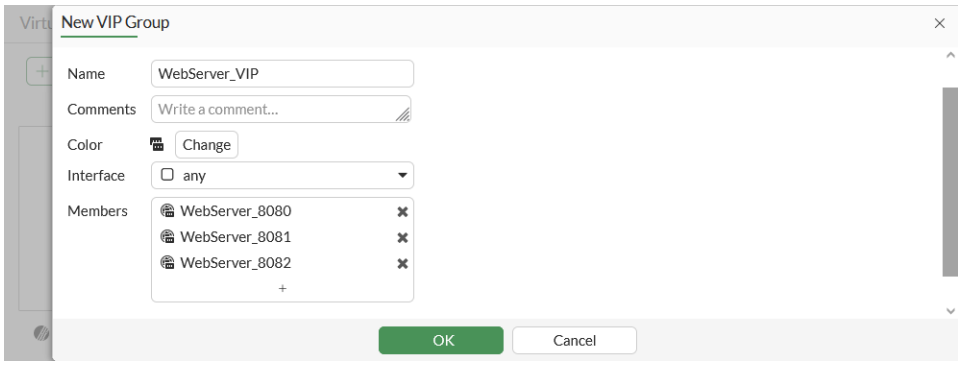
To create a virtual IP with port forwarding in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
2. Click *Create new*.
3. Enter a unique name for the virtual IP.
4. Configure the fields in the *Network* section. For example:
   - Set *Interface* to *any*.
   - Set *External IP Address/Range* to *10.1.100.199*.
   - Set *Mapped IP Address/Range* to *172.16.200.55*.
5. Leave *Optional Filters* disabled.
6. Enable *Port Forwarding* and configure the fields. For example:

- Set *Protocol* to *TCP*.
- Set *External Service Port* to *8080*.
- Set *Map to IPv4 port* to *80*.



7. Click *OK*.
8. Follow the above steps to create two additional virtual IPs.
   a. For one virtual IP:
      - Use a different *Mapped IP Address/Range*, for example *172.16.200.56*.
      - Set *External Service Port* to *8081*.
      - Use the same *Map to IPv4 port* number: *80*.
   b. For the other virtual IP:
      - Use a different *Mapped IP Address/Range*, for example *172.16.200.57*.
      - Set *External Service Port* to *8082*.
      - Use the same *Map to IPv4 port* number: *80*.
9. Create a *Virtual IP Group* and put the above three virtual IPs into that group:
   a. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP Group* tab.
   b. Click *Create new*.
   c. Enter a name for the group.
   d. Add the three previously created virtual IPs as members.



e. Click *OK*.

To see the results:

1. Apply the above virtual IP to the Firewall policy.
2. The results are:
   - Access 10.1.100.199:8080 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
   - Access 10.1.100.199:8081 from external network and FortiGate maps to 172.16.200.56:80 in internal network.
   - Access 10.1.100.199:8082 from external network and FortiGate maps to 172.16.200.57:80 in internal network

Virtual server load balance

This topic shows a special virtual IP type: virtual server. Use this type of VIP to implement server load balancing.

The FortiOS server load balancing contains all the features of a server load balancing solution. You can balance traffic across multiple backend servers based on multiple load balancing schedules including:

- Static (failover)
- Round robin
- Weighted (to account for different sized servers or based on the health and performance of the server including round trip time and number of connections)

The load balancer supports HTTP, HTTPS, IMAPS, POP3S, SMTPS, SSL/TLS, and generic TCP/UDP and IP protocols. Session persistence is supported based on the SSL session ID based on an injected HTTP cookie, or based on the HTTP or HTTPS host. SSL/TLS load balancing includes protection from protocol downgrade attacks. Server load balancing is supported on most FortiGate devices and includes up to 10,000 virtual servers on high-end systems.

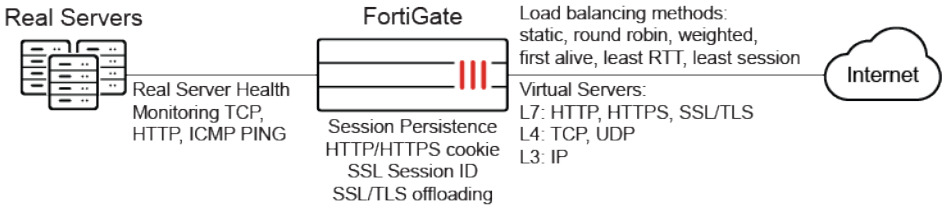
This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 98 for more information.

The following models do not support load balancing of Layer 7 protocols (HTTP, HTTPS, IMAPS, POP3S, SMTPS and SSL): FortiGate 40F, 60F and its variants.

FortiOS HTTP and HTTPS server load balancing does not support load balancing based on URL routing. You can use FortiWeb server pools or FortiADC server load balancing to load balance sessions to two or more URL based routes.

A policy with proxy-based inspection can accept all types of protocols configured in the Virtual Server object. However, a policy with flow-based inspection can only accept TCP/UDP/IP types in the Virtual Server object.

Sample topology



SSL/TLS offloading

FortiGate SSL/TLS offloading is designed for the proliferation of SSL/TLS applications. The key exchange and encryption/decryption tasks are offloaded to the FortiGate unit where they are accelerated using FortiASIC technology which provides significantly more performance than a standard server or load balancer. This frees up valuable resources on the server farm to give better response to business operations. Server load balancing offloads most SSL/TLS versions including SSL 3.0, TLS 1.0, and TLS 1.2, and supports full mode or half mode SSL offloading with DH key sizes up to 4096 bits.

FortiGate SSL offloading allows the application payload to be inspected before it reaches your servers. This prevents intrusion attempts, blocks viruses, stops unwanted applications, and prevents data loss. SSL/TLS content inspection supports TLS versions 1.0, 1.1, and 1.2 and SSL versions 1.0, 1.1, 1.2, and 3.0.

The certificate used for SSL/TLS offloading by the virtual server configuration may contain multiple domain names, including wildcard domains. This certificate is returned to clients attempting to connect to the real server behind the FortiGate.

Virtual server requirements

When creating a new virtual server, you must configure the following options:

- Virtual Server Type.
- Load Balancing Methods.
- Health check monitoring (optional).
- Session persistence (optional).
- Virtual Server IP (External IP Address).
- Virtual Server Port (External Port).
- Real Servers (Mapped IP Address & Port).

Virtual server types

Select the protocol to be load balanced by the virtual server. If you select a general protocol such as IP, TCP, or UDP, the virtual server load balances all IP, TCP, or UDP sessions. If you select specific protocols such as HTTP, HTTPS, or SSL, you can apply additional server load balancing features such as *Persistence* and *HTTP Multiplexing*.

HTTP	Select *HTTP* to load balance only HTTP sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 80 for HTTP sessions). You can enable *HTTP Multiplexing*. You can also set *Persistence* to *HTTP Cookie* to enable cookie-based persistence.
HTTPS	Select *HTTPS* to load balance only HTTPS sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 443 for HTTPS sessions). You can enable *HTTP Multiplexing*. You can also set *Persistence* to *HTTP Cookie* to enable cookie-based persistence, or you can set *Persistence* to *SSL Session ID*.
IMAPS	Select *IMAPS* to load balance only IMAPS sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 993 for IMAPS sessions). You can also set *Persistence* to *SSL Session ID*.
POP3S	Select *POP3S* to load balance only POP3S sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 995 for POP3S sessions). You can also set *Persistence* to *SSL Session ID*.
SMTPS	Select *SMTPS* to load balance only SMTPS sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 465 for SMTPS sessions). You can also set *Persistence* to *SSL Session ID*.
SSL	Select *SSL* to load balance only SSL sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced. You can also set *Persistence* to *SSL Session ID*.
TCP	Select *TCP* to load balance only TCP sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced.
UDP	Select *UDP* to load balance only UDP sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced.
IP	Select *IP* to load balance all sessions accepted by the security policy that contains this virtual server.

Load balancing methods

The load balancing method defines how sessions are load balanced to real servers.

All load balancing methods do not send traffic to real servers that are down or not responding. FortiGate can only determine if a real server is not responding by using a health check monitor. You should always add at least one health check monitor to a virtual server or to real servers; otherwise load balancing might try to distribute sessions to real servers that are not functioning.

Static	The traffic load is statically spread evenly across all real servers. Sessions are not assigned according to how busy individual real servers are. This load balancing method provides some persistence because all sessions from the same source address always go to the same real server. Because the distribution is stateless, so if a real server is added, removed, or goes up or down, the distribution is changed and persistence might be lost.
Round Robin	Directs new requests to the next real server. This method treats all real servers as equals regardless of response time or the number of connections. This method does not direct requests to real servers that down or non responsive.
Weighted	Real servers with a higher weight value receive a larger percentage of connections. Set the real server weight when adding a real server.
Least Session	Directs requests to the real server that has the least number of current connections. This method works best in environments where the real servers or other equipment you are load balancing all have similar capabilities. This load balancing method uses the FortiGate session table to track the number of sessions being processed by each real server. The FortiGate unit cannot detect the number of sessions actually being processed by a real server.
Least RTT	Directs sessions to the real server with the lowest round trip time. The round trip time is determined by a ping health check monitor. The default is 0 if no ping health check monitors are added to the virtual server.
First Alive	Directs sessions to the first live real server. This load balancing schedule provides real server failover protection by sending all sessions to the first live real server. If a real server fails, all sessions are sent to the next live real server. Sessions are not distributed to all real servers so all sessions are processed by the first real server only.
HTTP Host	Load balances HTTP host connections across multiple real servers using the host's HTTP header to guide the connection to the correct real server.

Health check monitoring

In the FortiGate GUI, you can configure health check monitoring so that the FortiGate unit can verify that real servers are able respond to network connection attempts. If a real server responds to connection attempts, the load balancer continues to send sessions to it. If a real server stops responding to connection attempts, the load balancer assumes that the server is down and does not send sessions to it. The health check monitor configuration determines how the load balancer tests real servers. You can use a single health check monitor for multiple load balancing configurations. You can configure TCP, HTTP, DNS, and ping health check monitors. You usually set the health check monitor to use the same protocol as the traffic being load balanced to it. For example, for an HTTP load balancing configuration, you would normally use an HTTP health check monitor.

Session persistence

Use persistence to ensure a user is connected to the same real server every time the user makes an HTTP, HTTPS, or SSL request that is part of the same user session. For example, if you are load balancing HTTP and HTTPS sessions to a collection of eCommerce web servers, when users make a purchase, they will be starting multiple sessions as they navigate the eCommerce site. In most cases, all the sessions started by this user during one eCommerce session should be processed by the same real server. Typically, the HTTP protocol keeps track of these related sessions using cookies. HTTP cookie persistence ensure all sessions that are part of the same user session are processed by the same real server.

When you configure persistence, the FortiGate unit load balances a new session to a real server according to the load balance method. If the session has an HTTP cookie or an SSL session ID, the FortiGate unit sends all subsequent sessions with the same HTTP cookie or SSL session ID to the same real server.

Real servers

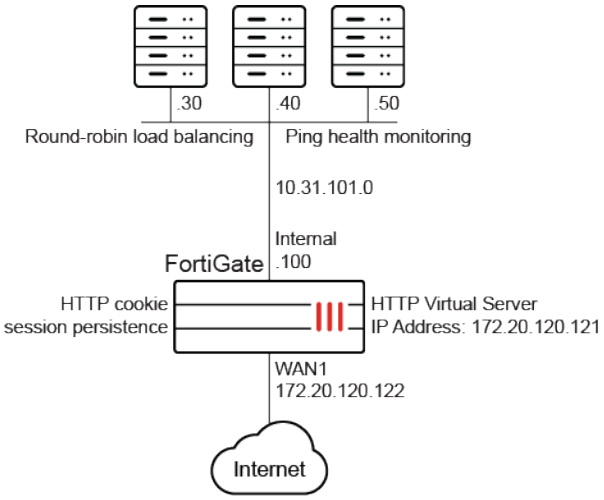
Add real servers to a load balancing virtual server to provide information the virtual server requires to send sessions to the server. A real server configuration includes the IP address of the real server and port number the real server receives sessions on. The FortiGate unit sends sessions to the real server's IP address using the destination port number in the real server configuration.

When configuring a real server, you can also specify the weight (if the load balance method is set to *Weighted*) and you can limit the maximum number of open connections between the FortiGate unit and the real server. If the maximum number of connections is reached for the real server, the FortiGate unit automatically switches all further connection requests to other real servers until the connection number drops below the limit. Setting *Maximum Connections* to 0 means that the FortiGate unit does not limit the number of connections to the real server.

Sample of HTTP load balancing to three real web servers

This example describes the steps to configure the load balancing configuration below. In this configuration, a FortiGate unit is load balancing HTTP traffic from the Internet to three HTTP servers on the internal network. HTTP sessions are accepted at the wan1 interface with destination IP address 172.20.120.121 on TCP port 8080, and forwarded from the internal interface to the web servers. When forwarded, the destination address of the session is translated to the IP address of one of the web servers.

This load balancing configuration also includes session persistence using HTTP cookies, round-robin load balancing, and TCP health monitoring for the real servers. Ping health monitoring consists of the FortiGate unit using ICMP ping to ensure the web servers can respond to network traffic.



General steps:

1. Create a health check monitor.

   A ping health check monitor causes the FortiGate to ping the real servers every 10 seconds. If one of the servers does not respond within 2 seconds, the FortiGate unit will retry the ping 3 times before assuming

that the HTTP server is not responding.

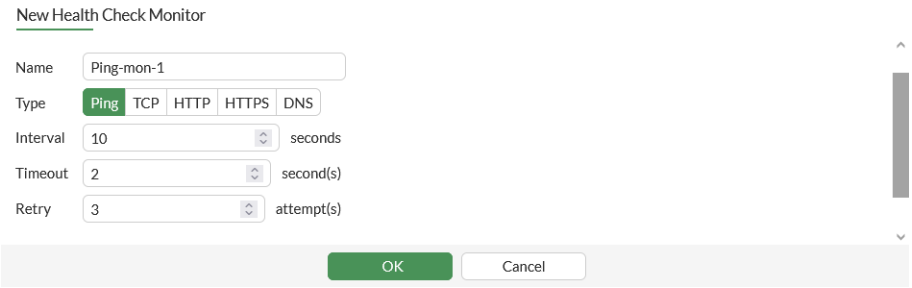
2. Create a load balance virtual server with three real servers.
3. Add the load balancing virtual server to a policy as the destination address.

To see the virtual servers and health check monitors options in the GUI, *Load Balance* must be selected in *Feature Visibility* > *Additional Features*. See Feature visibility on page 3595 on page 1 for details.

Configure a load balancing virtual server in the GUI

To create a health check monitor:

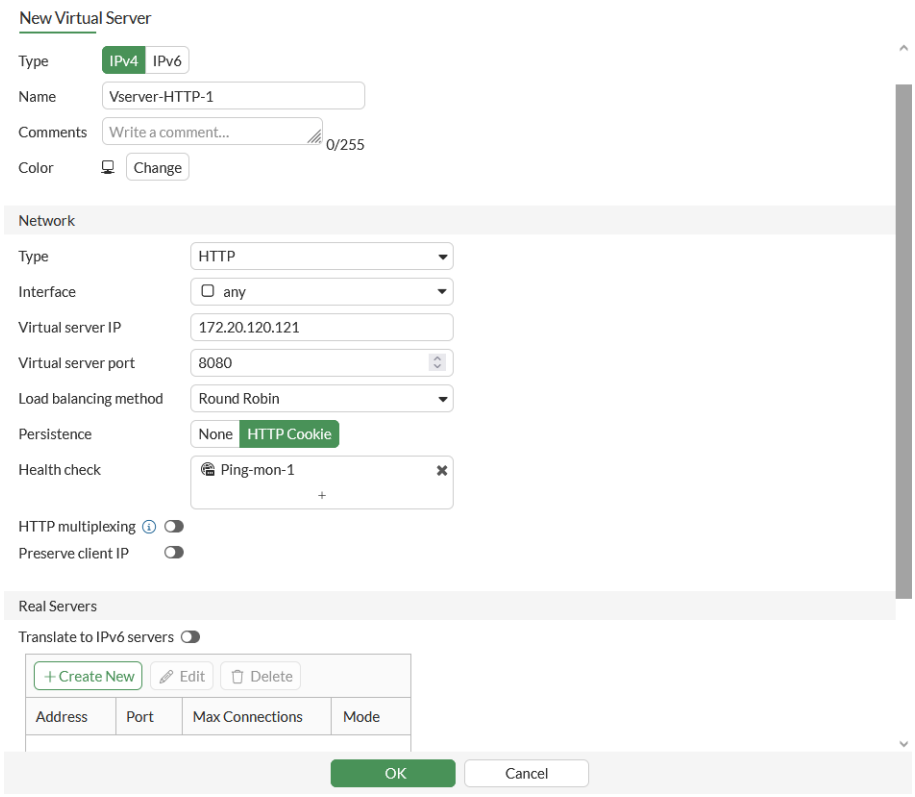
1. Go to *Policy & Objects* > *Health Check*.
2. Click *Create New*.
3. Set the following:
   - *Name* to *Ping-mon-1*
   - *Type* to *Ping*
   - *Interval* to *10* seconds
   - *Timeout* to *2* seconds
   - *Retry* to *3* attempt(s)



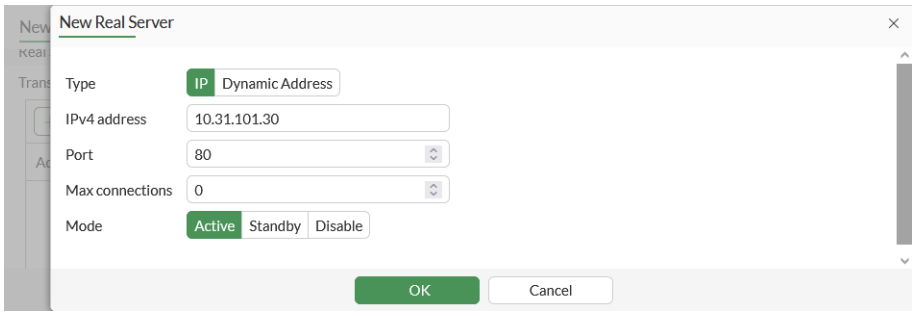
4. Click *OK*.

To create a virtual server:

1. Go to *Policy & Objects* > *Virtual Servers*.
2. Click *Create New*.
3. Set the following:
   - *Name* to *Vserver-HTTP-1*
   - *Type* to *HTTP*
   - *Interface* to *wan1*
   - *Virtual Server IP* to *172.20.120.121*
   - *Virtual Server Port* to *8080*
   - *Load Balance Method* to *Round Robin*
   - *Persistence* to *HTTP Cookie*
   - *Health Check* to *Ping-mon-1*



4. In the *Real Servers* table, click *Create New*.
5. Set the following for the first real server:
   - *Type* to *IP*
   - *IP Address* to *10.31.101.30*
   - *Port* to *80*
   - *Max Connections* to *0*
   - *Mode* to *Active*

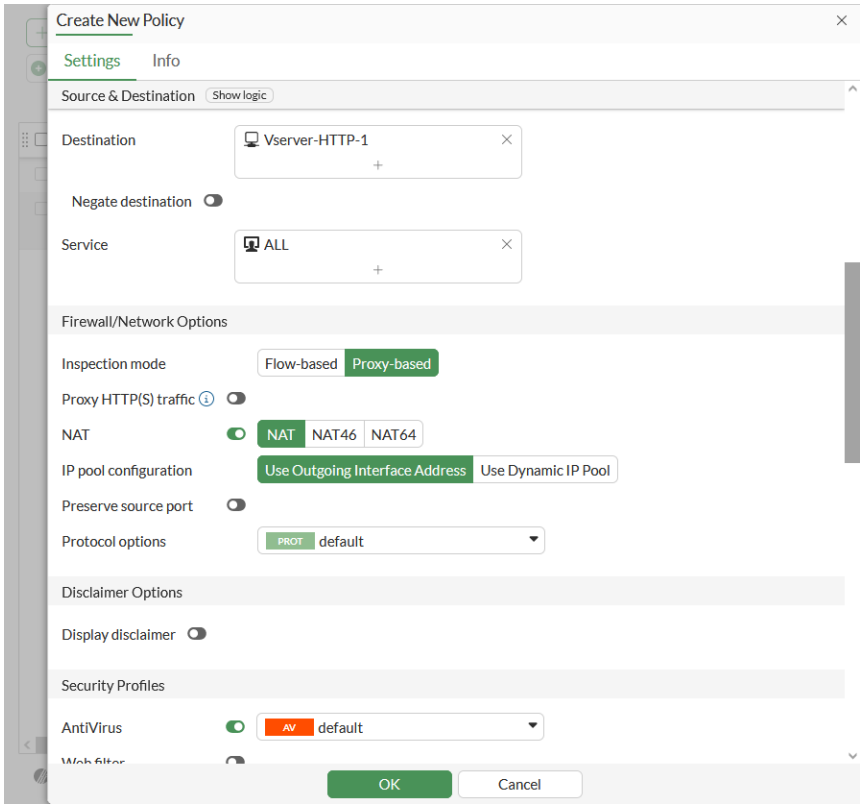


6. Click *OK*. Configure two more real servers with IP addresses 10.31.101.40 and 10.31.101.50, and the same settings as the first real server.
7. Click *OK*.

To create a security policy that includes the load balance virtual server as the destination address:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.

3. Set the *Inspection Mode* to *Proxy-based*. A flow-based firewall policy can only accept TCP/UDP/IP type virtual servers.
4. Set the following:
   - *Name* to *LB-policy*
   - *Incoming Interface* to *wan1*
   - *Outgoing Interface* to *internal*
   - *Source* to *all*
   - *Destination* to *Vserver-HTTP-1*
   - *Schedule* to *always*
   - *Service* to *ALL*
   - *Action* to *ACCEPT*
5. Enable *NAT* and set *IP Pool Configuration* to *Use Outgoing Interface Address*.
6. Enable *AntiVirus* and select an antivirus profile.



7. Click *OK*.

Configure a load balancing virtual server in the CLI

To configure HTTP load balancing to three real web servers in the CLI:

1. Create a health check monitor:

```
config firewall ldb-monitor
    edit "Ping-mon-1"
```

```
        set type ping
        set interval 10
        set timeout 2
        set retry 3
    next
end
```

2. Create a virtual server:

```
config firewall vip
    edit "Vserver-HTTP-1"
        set type server-load-balance
        set extip 172.20.120.121
        set extintf "any"
        set server-type http
        set monitor "Ping-mon-1"
        set ldb-method round-robin
        set persistence http-cookie
        set extport 8080
        config realservers
            edit 1
                set type ip
                set ip 10.31.101.30
                set port 80
            next
            edit 2
                set type ip
                set ip 10.31.101.40
                set port 80
            next
            edit 3
                set type ip
                set ip 10.31.101.50
                set port 80
            next
        end
    next
end
```

3. Add the load balancing virtual server to a policy as the destination address:

```
config firewall policy
    edit 2
        set name "LB-policy"
        set inspection-mode proxy
        set srcintf "wan1"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "Vserver-HTTP-1"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set av-profile "default"
        set fsso disable
        set nat enable
    next
end
```

Results

Traffic accessing 172.20.120.121:8080 is forwarded in turn to the three real servers.

If the access request has an http-cookie, FortiGate forwards the access to the corresponding real server according to the cookie.

Virtual server load balance multiplexing

HTTP2 connection coalescing and concurrent multiplexing allows multiple HTTP2 requests to share the same TLS connection when the destination IP is the same.

To configure the load balanced virtual server:

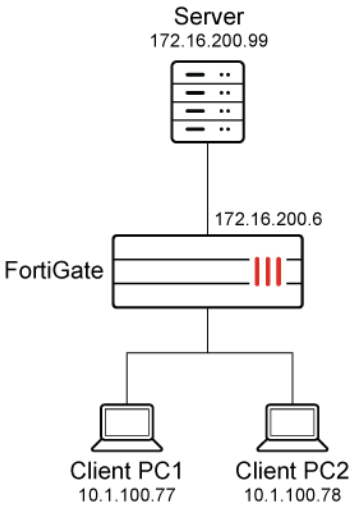
```
config firewall vip
    edit <name>
        set type server-load-balance
        set server-type {http | https}
        set http-multiplex {enable | disable}
        set http-multiplex-ttl <integer>
        set http-multiplex-max-request <integer>
        set http-supported-max-version {http1 | http2}
    next
end
```

`http-multiplex {enable | disable}`	Enable/disable HTTP multiplexing.
`http-multiplex-ttl <integer>`	Set the time-to-live for idle connections to servers (in seconds, 0 - 2147483647, default = 15).
`http-multiplex-max-request <integer>`	Set the maximum number of requests that the multiplex server can handle before disconnecting (0 - 2147483647, default = 0).
`http-supported-max-version {http1 | http2}`	Set the maximum supported HTTP version: • http1: support HTTP 1.1 and HTTP1. • http2: support HTTP2, HTTP 1.1, and HTTP1 (default).

Example

In this example, multiple clients submit requests in HTTP2. The requests hit the VIP address, and then FortiGate opens a session between itself (172.16.200.6) and the server (172.16.200.99). The coalescing occurs in this

session as the multiple streams share the same TLS session to connect to the same destination server.



To configure connection coalescing and concurrent multiplexing with virtual server load balancing:

1. Configure the virtual server:

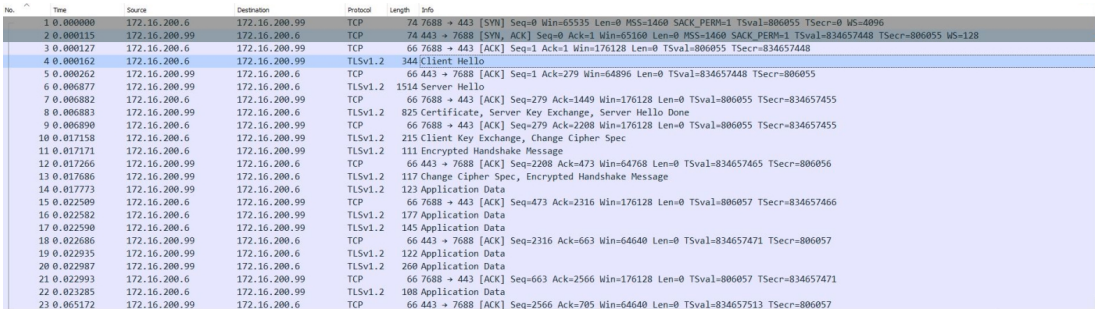
```
config firewall vip
    edit "vip-test"
        set type server-load-balance
        set extip 10.1.100.222
        set extintf "port2"
        set server-type https
        set extport 443
        config realservers
            edit 1
                set ip 172.16.200.99
                set port 443
            next
        end
        set http-multiplex enable
        set ssl-mode full
        set ssl-certificate "Fortinet_SSL"
    next
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "vip-test"
        set schedule "always"
        set service "ALL"
```

```
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection-clone"
        set av-profile "av"
        set logtraffic all
        set nat enable
    next
end
```

3. Get the clients to access the VIP address (10.1.100.222). The FortiGate shares the first TLS connection with second TLS connection.
4. Verify the sniffer packet capture on the FortiGate server side. There is one client hello.



No.	Time	Source	Destination	Protocol	Length	Info

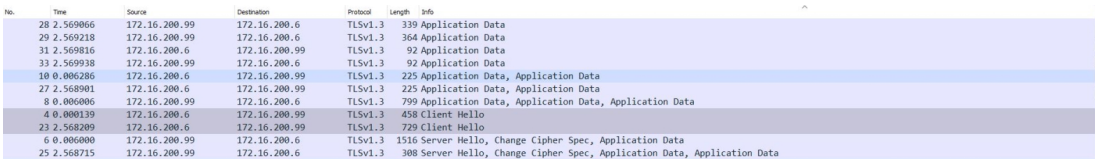
19	0.022935	172.16.200.99	172.16.200.6	TLSv1.2	122	Application Data
20	0.022987	172.16.200.99	172.16.200.6	TLSv1.2	260	Application Data
21	0.022993	172.16.200.6	172.16.200.99	TCP	66	7688 → 443 [ACK] Seq=663 Ack=2566 Win=176128 Len=0 TSval=806057 TSecr=834657471
22	0.023285	172.16.200.6	172.16.200.99	TLSv1.2	108	Application Data
23	0.065172	172.16.200.99	172.16.200.6	TCP	66	443 → 7688 [ACK] Seq=2566 Ack=705 Win=64640 Len=0 TSval=834657513 TSecr=806057

5. Disable HTTP multiplexing:

```
config firewall vip
    edit "vip-test"
        config realservers
            edit 1
                set type ip
                set ip 172.16.200.99
                set port 443
            next
        end
        set http-multiplex disable
    next
end
```

6. Verify the sniffer packet capture. This time, the FortiGate does reuse the TLS connection, so there are two client hellos sent to the real server.



No.	Time	Source	Destination	Protocol	Length	Info
28	2.569066	172.16.200.99	172.16.200.6	TLSv1.3	339	Application Data

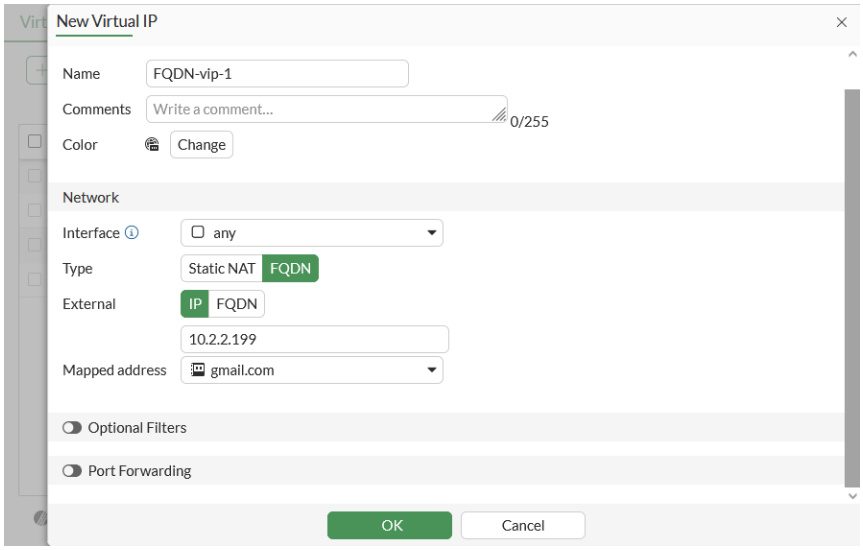
Configure FQDN-based VIPs

In public cloud environments, sometimes it is necessary to map a VIP to an FQDN address.

To configure an FQDN-based VIP in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
2. Click *Create new*.
3. Enter a name for the VIP.
4. Select an interface.
5. For *Type*, select *FQDN*.
6. For *External*, select *IP* and enter the external IP address.
7. For *Mapped address*, select an FQDN address.



8. Click *OK*.

To configure an FQDN-based VIP in the CLI:

```
config firewall vip
    edit "FQDN-vip-1"
        set type fqdn
        set extip 10.2.2.199
        set extintf "any"
        set mapped-addr "destination"
    next
end
```

Central DNAT

Central NAT allows for the central configuration of SNAT (source NAT) and DNAT (destination NAT).

To enable central NAT in the GUI:

1. Go to *System* > *Settings*.
2. In the *System Operation Settings*, enable *Central SNAT*.
3. Click *Apply*.

To enable central NAT in the CLI:

```
config system settings
    set central-nat {enable | disable}
end
```

When central NAT is enabled, virtual IPs (VIPs) are not configured in the firewall policy. The VIPs are configured as separate objects where their status must be enabled.

This option is only available for IPv4 VIP and VIP46 objects.

Configuring a DNAT and VIP object in central NAT mode is similar to configuring a VIP when central NAT is disabled. See Static virtual IPs on page 1662 for more information on each setting.

VIP objects can carry over when switching from non-central NAT mode to central NAT mode or vice-versa. However, if a VIP is assigned to a firewall policy in non-central NAT mode, it must be unassigned before switching to central NAT mode.

In this example, a DNAT and VIP are configured to forward traffic from 10.1.100.130 to 172.16.200.44. This example assumes that the firewall address, Addr_172.16.200.44/32, has already been configured.

To configure DNAT and a VIP in the GUI:

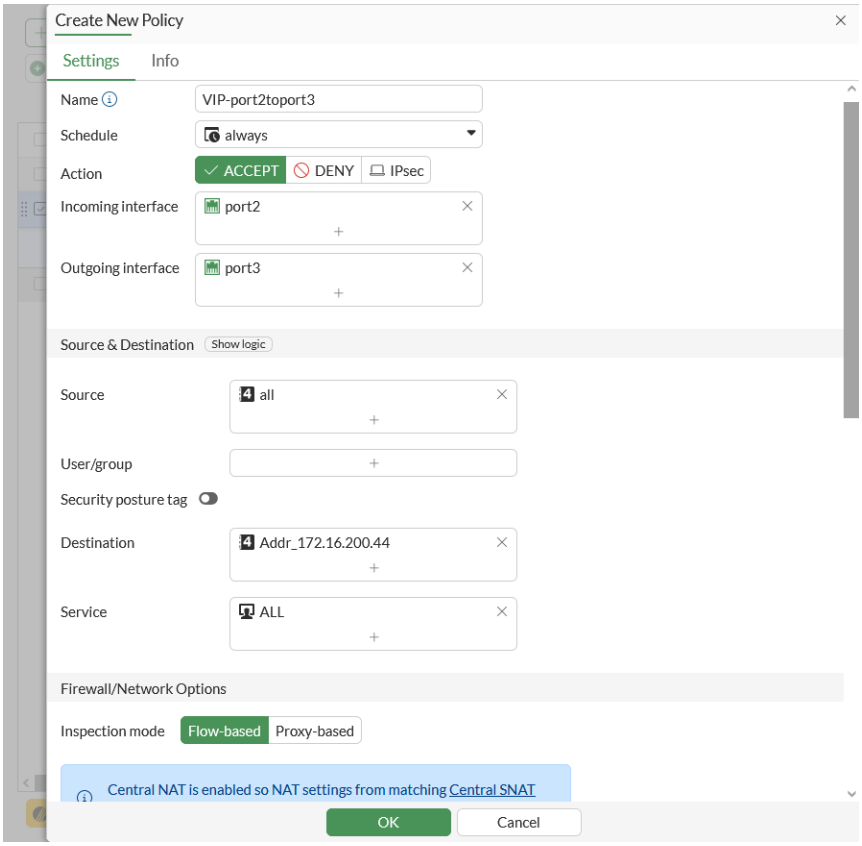
1. Configure the VIP:
   a. Go to *Policy & Objects* > *DNAT & Virtual IPs* and on the *Virtual IP* tab, click *Create New*.
   b. Enter a name (*test-vip44-1*).
   c. Set the *External IP address/range* to *10.1.100.130*.
   d. Set the *Map to IPv4 address/range* to *172.16.200.44*.

   e. Click *OK*.
2. Configure a firewall policy that allows traffic in the direction of the VIP:

a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
b. Configure the following settings:

Name	*VIP-port2toport3*
Source	*all*
Destination	*Addr_172.16.200.44*
Schedule	*always*
Service	*ALL*
Action	*ACCEPT*

c. Configure the other settings as needed. There is no SNAT configuration section, so central SNAT policies will be applied.



d. Click *OK*.

To configure DNAT and a VIP in the CLI:

1. Configure the VIP:

```
config firewall vip
    edit "test-vip44-1"
        set extip 10.1.100.130
        set mappedip "172.16.200.44"
```

```
        set extintf "any"
        set status enable
    next
end
```

2. Configure a firewall policy that allows traffic in the direction of the VIP:

```
config firewall policy
    edit 3
        set name "VIP-port2toport3"
        set srcintf "port2"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "Addr_172.16.200.44"
        set schedule "always"
        set service "ALL"
    next
end
```

To verify the DNAT and VIP:

If the VIP status is enabled, it will appear in the VIP table:

```
# diagnose firewall iprope list 100000
policy index=7 uuid_idx=625 action=accept
flag (8000104): f_p nat pol_stats
cos_fwd=0  cos_rev=0
group=00100000 av=00000000 au=00000000 split=00000000
host=0 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
source(1): 0.0.0.0-255.255.255.255, uuid_idx=0,
dest(1): 10.1.100.130-10.1.100.130, uuid_idx=625,
service(1):
        [0:0x0:0/(0,0)->(0,0)] helper:auto
nat(1): flag=0 base=10.1.100.130:0 172.16.200.44-172.16.200.44(0:0)
```

If the VIP status is disabled, it will not appear in the VIP table.

In this example, a one-to-one static NAT is enabled. Send a ping to 10.1.100.130, and the traffic will be forwarded to the destination 172.16.200.44.

Examples and policy actions

The following topics provide examples and instructions on policy actions:

- NAT46 and NAT64 policy and routing configurations on page 1683
- Hairpin NAT on page 1694
- Mirroring SSL traffic in policies on page 1698
- Recognize anycast addresses in geo-IP blocking on page 1700

- Matching GeoIP by registered and physical location on page 1701
- HTTP to HTTPS redirect for load balancing on page 1703
- Use Active Directory objects directly in policies on page 1704
- No session timeout on page 1708
- MAP-E support on page 1710
- DHCP-PD support for MAP-E on page 1714
- Seven-day rolling counter for policy hit counters on page 1720
- Cisco Security Group Tag as policy matching criteria on page 1722
- Virtual patching on the local-in management interface on page 1725
- Configuring PCP port mapping with SNAT and DNAT on page 1730
- Refreshing active sessions for specific protocols and port ranges per VDOM in a specified direction on page 1735
- Per-policy disclaimer messages on page 1738
- Full cone NAT for fixed port range IP pools on page 1741

NAT46 and NAT64 policy and routing configurations

Multiple NAT46 and NAT64 related objects are consolidated into regular objects. A per-VDOM virtual interface, naf.<vdom>, is automatically added to process NAT46/NAT64 traffic. The features include:

- `vip46` and `vip64` settings are consolidated in `vip` and `vip6` configurations.
- `policy46` and `policy64` settings are consolidated in `firewall policy` settings.
- `nat46`/`nat64` are included in `firewall policy` settings.
- `ippool` and `ippool6` support NAT46 and NAT64 (when enabled, the IP pool should match a subnet).
- Central SNAT supports NAT46 and NAT64.
- `add-nat46-route` in `ippool6` and `add-nat64-route` in `ippool` are enabled by default. The FortiGate generates a static route that matches the IP range in `ippool6` or `ippool` for the naf tunnel interface.

Automatic processing of the naf tunnel interface is not supported in security policies.

To configure NAT46/NAT64 translation, use the standard `vip`/`vip6` setting, apply it in a firewall policy, enable NAT46/NAT64, and enter the IP pool to complete the configuration.

The external IP address cannot be the same as the external interface IP address.

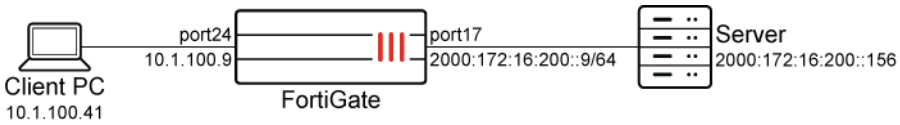
Examples

IPv6 must be enabled to configure these examples. In the GUI, so go to *System > Feature Visibility* and enable *IPv6*. In the CLI, enter the following:

```
config system global
    set gui-ipv6 enable
end
```

NAT46 policy

In this example, a client PC is using IPv4 and an IPv4 VIP to access a server that is using IPv6. The FortiGate uses NAT46 to translate the request from IPv4 to IPv6 using the virtual interface naf.root. An `ippool6` is applied so that the request is SNATed to the `ippool6` address (2000:172:16:101::1 - 2000:172:16:101::1).



To create a NAT46 policy in the GUI:

1. Configure the VIP:
   a. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
   b. Click *Create new*.

Name	test-vip46-1
Interface	To_vlan20
Type	Static NAT
External IP address/range	10.1.100.150
Map to IPv6 address/range	2000:172:16:200::156

   Enter the following:

   c. Click *OK*.
2. Configure the IPv6 pool:

a. Go to *Policy & Objects* > *IP Pools* and select the *IPv6 IP Pool* tab.
b. Click *Create new*.
c. Enter the following:

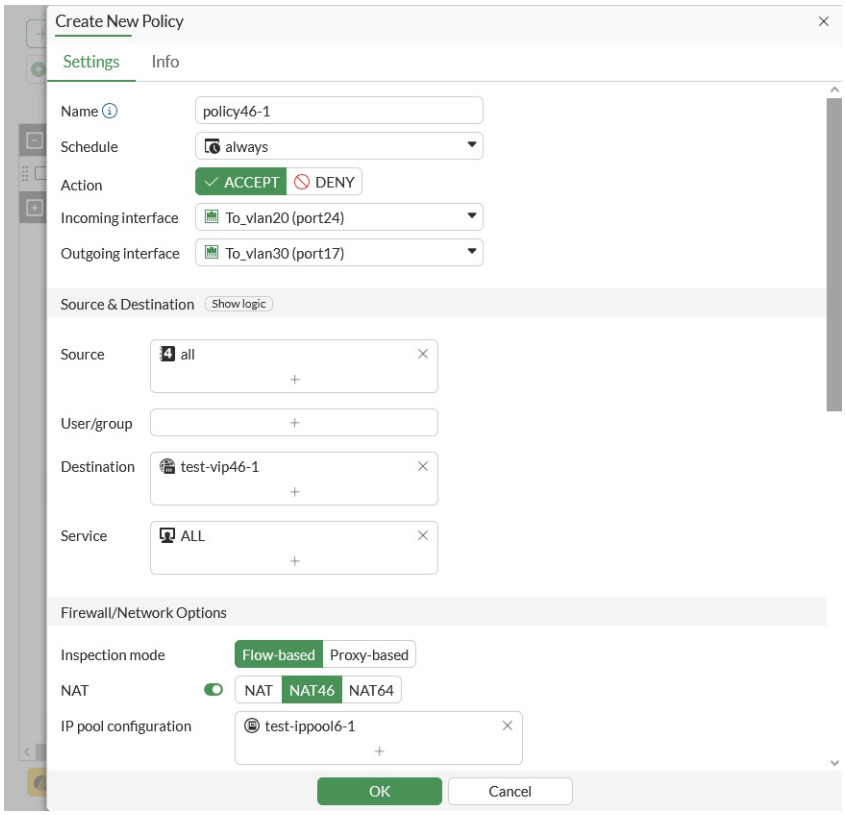
Name	test-ippool6-1
External IP address/range	2000:172:16:101::1-2000:172:16:101::1
NAT46	Enable

d. Click *OK*.

3. Configure the firewall policy:
a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New* or edit an existing policy.
b. Enter the following:

Name	policy46-1
Schedule	always
Action	ACCEPT
Incoming Interface	To_vlan20
Outgoing Interface	To_vlan30
Source	all
Destination	test-vip46-1
Service	ALL
NAT	NAT46
IP Pool Configuration	test-ippool6-1

c. Configure the other settings as needed.



d. Click *OK*.

To create a NAT46 policy in the CLI:

1. Configure the VIP:

```
config firewall vip
    edit "test-vip46-1"
        set extip 10.1.100.150
        set nat44 disable
        set nat46 enable
        set extintf "port24"
        set arp-reply enable
        set ipv6-mappedip 2000:172:16:200::156
    next
end
```

2. Configure the IPv6 pool:

```
config firewall ippool6
    edit "test-ippool6-1"
        set startip 2000:172:16:101::1
        set endip 2000:172:16:101::1
        set nat46 enable
        set add-nat46-route enable
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 2
        set name "policy46-1"
        set srcintf "port24"
        set dstintf "port17"
        set action accept
        set nat46 enable
        set srcaddr "all"
        set dstaddr "test-vip46-1"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set ippool enable
        set poolname6 "test-ippool6-1"
    next
end
```

To verify the traffic and session tables:

1. Verify the traffic by the sniffer packets:

```
(root) # diagnose sniffer packet any 'icmp or icmp6' 4
interfaces=[any]
filters=[icmp or icmp6]
2.593302 port24 in 10.1.100.41 -> 10.1.100.150: icmp: echo request
2.593344 naf.root out 10.1.100.41 -> 10.1.100.150: icmp: echo request
2.593347 naf.root in 2000:172:16:101::1 -> 2000:172:16:200::156: icmp6: echo request seq 1
2.593383 port17 out 2000:172:16:101::1 -> 2000:172:16:200::156: icmp6: echo request seq 1
2.593772 port17 in 2000:172:16:200::156 -> 2000:172:16:101::1: icmp6: echo reply seq 1
2.593788 naf.root out 2000:172:16:200::156 -> 2000:172:16:101::1: icmp6: echo reply seq 1
2.593790 naf.root in 10.1.100.150 -> 10.1.100.41: icmp: echo reply
2.593804 port24 out 10.1.100.150 -> 10.1.100.41: icmp: echo reply
11 packets received by filter
0 packets dropped by kernel
```

2. Verify the session tables for IPv4 and IPv6:

```
(root) # diagnose sys session list
session info: proto=1 proto_state=00 duration=2 expire=59 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00 netflow-origin netflow-reply
statistic(bytes/packets/allow_err): org=252/3/1 reply=252/3/1 tuples=2
tx speed(Bps/kbps): 106/0 rx speed(Bps/kbps): 106/0
```

```
orgin->sink: org pre->post, reply pre->post dev=24->53/53->24 gwy=10.1.100.150/10.1.100.41

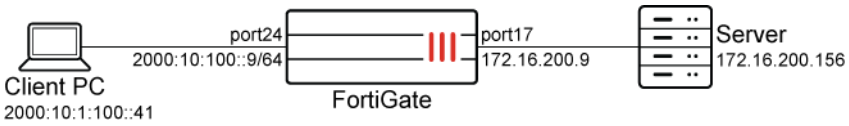
no_ofld_reason:  disabled-by-policy
total session 1
```

The IPv4 session is between the incoming physical interface port24 and naf.root. The IPv6 session is between the naf.root and the outgoing physical interface port17.

NAT64 policy

In this example, a client PC is using IPv6 and an IPv6 VIP to access a server that is using IPv4. The FortiGate uses NAT64 to translate the request from IPv6 to IPv4 using the virtual interface naf.root. An `ippool` is applied so that the request is SNATed to the `ippool` address (172.16.101.2 - 172.16.101.3).

An embedded VIP64 object is used in this configuration so a specific IPv4 mapped IP does not need to be set. The lower 32 bits of the external IPv6 address are used to map to the IPv4 address. Only an IPv6 prefix is defined. In this example, the IPv6 prefix is 2001:10:1:100::, so the IPv6 address 2001:10:1:100::ac10:c89c will be translated to 172.16.200.156.



To create a NAT64 policy in the GUI:

1. Configure the VIP:
   a. Go to *Policy & Objects* > *Virtual IPs* and select the *IPv6 Virtual IP* tab.
   b. Click *Create new*.
   c. Enter the following:

Name	test-vip64-1
External IP address/range	2000:10:1:100::150
Map to IPv4 address/range	**Specify**: 172.16.200.156

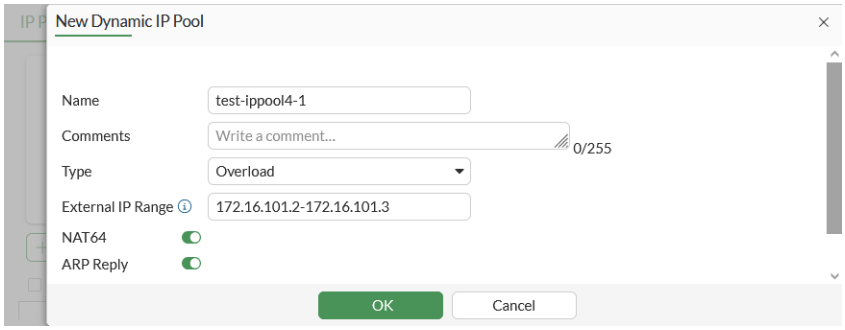
   d. Click *OK*.
2. Configure the VIP with the embedded IPv4 address enabled:
   a. Go to *Policy & Objects* > *Virtual IPs* and select the *IPv6 Virtual IP* tab.
   b. Click *Create new*.
   c. Enter the following:

Name	test-vip64-2
External IP address/range	2001:10:1:100::-2001:10:1:100::ffff:ffff
Map to IPv4 address/range	Use Embedded

   d. Click *OK*.
3. Configure the IP pool:
   a. Go to *Policy & Objects* > *IP Pools* and select the *IP Pool* tab.
   b. Click *Create new*.

c. Enter the following:

Name	test-ippool4-1
Type	Overload
External IP address/range	172.16.101.2-172.16.101.3
NAT64	Enable

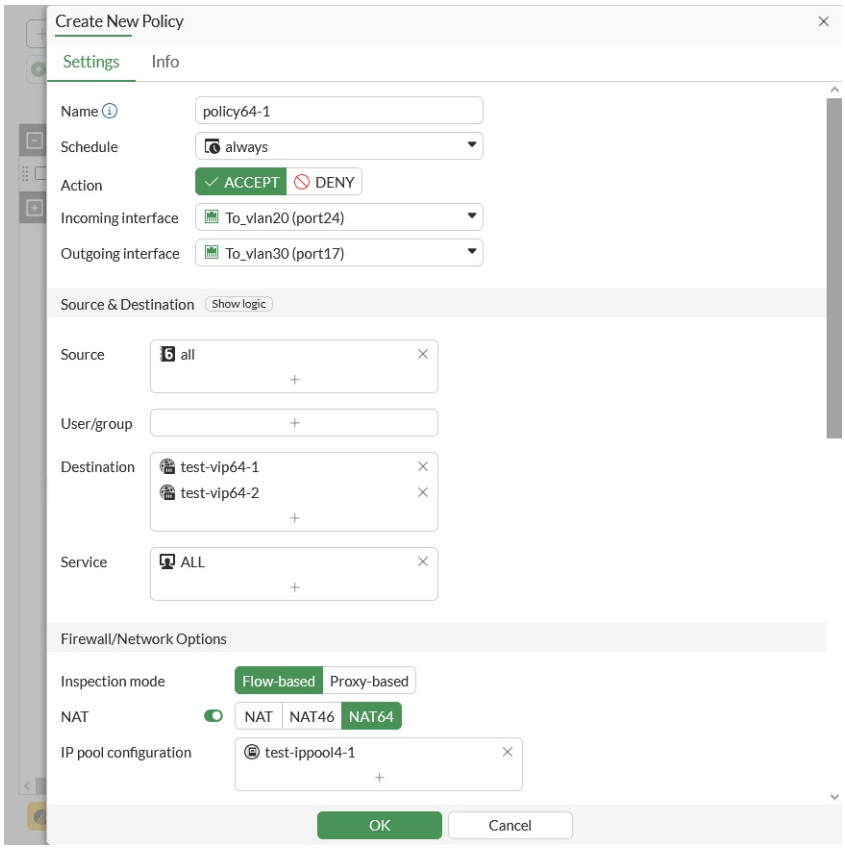


d. Click *OK*.

4. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New* or edit an existing policy.
   b. Enter the following:
   c.

Name	policy64-1
Incoming Interface	To_vlan20
Outgoing Interface	To_vlan30
Source	all
Destination	test-vip64-1 test-vip64-2
Schedule	always
Service	ALL
Action	ACCEPT
NAT	NAT64
IP Pool Configuration	test-ippool4-1

   d. Configure the other settings as needed.



e. Click *OK*.

To create a NAT64 policy in the CLI:

1. Configure the VIP:

```
config firewall vip6
    edit "test-vip64-1"
        set extip 2000:10:1:100::150
        set nat66 disable
        set nat64 enable
        set ipv4-mappedip 172.16.200.156
    next
end
```

2. Configure the VIP with the embedded IPv4 address enabled:

```
config firewall vip6
    edit "test-vip64-2"
        set extip 2001:10:1:100::-2001:10:1:100::ffff:ffff
        set nat66 disable
        set nat64 enable
        set embedded-ipv4-address enable
    next
end
```

3. Configure the IP pool:

```
config firewall ippool
    edit "test-ippool4-1"
        set startip 172.16.101.2
        set endip 172.16.101.3
        set nat64 enable
        set add-nat64-route enable
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "policy64-1"
        set srcintf "port24"
        set dstintf "port17"
        set action accept
        set nat64 enable
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "test-vip64-1" "test-vip64-2"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set ippool enable
        set poolname "test-ippool4-1"
    next
end
```

To verify the traffic and session tables:

1. Verify the VIP64 traffic by the sniffer packets:

```
(root) # diagnose sniffer packet any 'icmp or icmp6' 4
interfaces=[any]
filters=[icmp or icmp6]
20.578417 port24 in 2000:10:1:100::41 -> 2000:10:1:100::150: icmp6: echo request seq 1
20.578495 naf.root out 2000:10:1:100::41 -> 2000:10:1:100::150: icmp6: echo request seq 1
20.578497 naf.root in 172.16.101.2 -> 172.16.200.156: icmp: echo request
20.578854 port17 out 172.16.101.2 -> 172.16.200.156: icmp: echo request
20.579083 port17 in 172.16.200.156 -> 172.16.101.2: icmp: echo reply
20.579093 naf.root out 172.16.200.156 -> 172.16.101.2: icmp: echo reply
20.579095 naf.root in 2000:10:1:100::150 -> 2000:10:1:100::41: icmp6: echo reply seq 1
20.579377 port24 out 2000:10:1:100::150 -> 2000:10:1:100::41: icmp6: echo reply seq 1
11 packets received by filter
0 packets dropped by kernel
```

2. Verify the session tables for IPv6 and IPv4:

```
(root) # diagnose sys session6 list
session6 info: proto=58 proto_state=00 duration=5 expire=56 timeout=0 flags=00000000
sockport=0 socktype=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty
statistic(bytes/packets/allow_err): org=312/3/0 reply=312/3/0 tuples=2
tx speed(Bps/kbps): 55/0 rx speed(Bps/kbps): 55/0
orgin->sink: org pre->post, reply pre->post dev=24->53/53->24
hook=pre dir=org act=noop 2000:10:1:100::41:29949->2000:10:1:100::150:128(:::0)
hook=post dir=reply act=noop 2000:10:1:100::150:29949->2000:10:1:100::41:129(:::0)
peer=172.16.101.2:45392->172.16.200.156:8 naf=1
hook=pre dir=org act=noop 172.16.101.2:45392->172.16.200.156:8(0.0.0.0:0)
hook=post dir=reply act=noop 172.16.200.156:45392->172.16.101.2:0(0.0.0.0:0)
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=0
serial=000021ec tos=ff/ff ips_view=1024 app_list=0 app=0 url_cat=0

npu_state=0x040001 no_offload
no_ofld_reason:  disabled-by-policy non-npu-intf
total session 1
```

```
(root) # diagnose sys session list
session info: proto=1 proto_state=00 duration=7 expire=54 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=252/3/1 reply=252/3/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=53->17/17->53 gwy=172.16.200.156/172.16.101.2
hook=pre dir=org act=noop 172.16.101.2:45392->172.16.200.156:8(0.0.0.0:0)
hook=post dir=reply act=noop 172.16.200.156:45392->172.16.101.2:0(0.0.0.0:0)
peer=2000:10:1:100::150:29949->2000:10:1:100::41:129 naf=2
hook=pre dir=org act=noop 2000:10:1:100::41:29949->2000:10:1:100::150:128(:::0)
hook=post dir=reply act=noop 2000:10:1:100::150:29949->2000:10:1:100::41:129(:::0)
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=0
serial=0001347f tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session 1
```

The IPv6 session is between the incoming physical interface port24 and naf.root. The IPv4 session is between the naf.root and the outgoing physical interface port17.

3. Verify the embedded VIP64 traffic by the sniffer packets:

```
(root) # diagnose sniffer packet any 'icmp or icmp6' 4
interfaces=[any]
filters=[icmp or icmp6]
7.696010 port24 in 2000:10:1:100::41 -> 2001:10:1:100::ac10:c89c: icmp6: echo request seq 1
7.696057 naf.root out 2000:10:1:100::41 -> 2001:10:1:100::ac10:c89c: icmp6: echo request seq 1
7.696060 naf.root in 172.16.101.2 -> 172.16.200.156: icmp: echo request
7.696544 port17 out 172.16.101.2 -> 172.16.200.156: icmp: echo request
7.696821 port17 in 172.16.200.156 -> 172.16.101.2: icmp: echo reply
7.696839 naf.root out 172.16.200.156 -> 172.16.101.2: icmp: echo reply
7.696841 naf.root in 2001:10:1:100::ac10:c89c -> 2000:10:1:100::41: icmp6: echo reply seq 1
7.697167 port24 out 2001:10:1:100::ac10:c89c -> 2000:10:1:100::41: icmp6: echo reply seq 1
11 packets received by filter
0 packets dropped by kernel
```

Hairpin NAT

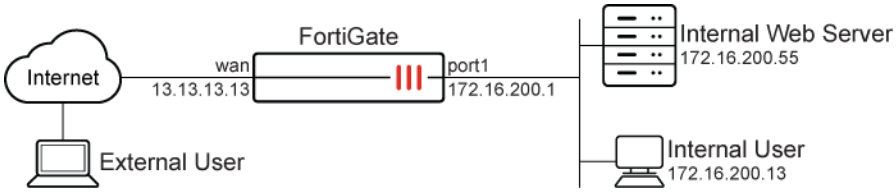
Hairpin NAT, also known as NAT loopback or U-turn NAT, allows devices on the same internal network to communicate using their external IP addresses. This simplifies network configurations and enhances connectivity.

How hairpin NAT works:

1. Request initiation: An employee within the office network attempts to access an internal resource using its external IP address.
2. NAT processing: The request is sent to the FortiGate, which recognizes that the destination IP address is its own external IP on the WAN interface.
3. Hairpin NAT: The FortiGate redirects the request back into the internal network, forwarding it to the web server's internal IP address and allowing the employee to access the internal web server using the external address.

Example

This configuration allows both internal and remote employees to use the same domain name to access the server. Hairpin NAT ensures consistency, avoiding confusion and complications in network configurations. This setup is particularly useful for companies that save bookmarks to internal web servers using public domain names in users' profiles, ensuring access whether connected to the internal LAN or the internet.



In this scenario, the user can access saved bookmarks containing public domain names from both their office computer on the internal network and their personal computer over the internet.

Before continuing, make sure that the port1 and wan interfaces have been configured with valid IP addresses and some publicly accessible domain names are saved as bookmarks in the user profile.

It is assumed that you have administrative access, the FortiGate is incorporated into your network, and the external IP address is the same as the FortiGate wan interface.

The configuration has four steps:

1. Create a VIP: Map the external IP address to the internal IP address.
2. Create a firewall policy for DNAT: Attach the VIP to a firewall policy, allowing external users to access the internal server using the external IP address. See Static virtual IPs on page 1662 for more information.
3. Create a firewall policy for SNAT: Allow internal users to access the external servers using the external IP address. See Static SNAT on page 1632 for more information.
4. Verify the result: Confirm that the employee can access the internal web server using the external address.

To create a VIP in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs* or, if Central NAT is enabled, *Policy & Objects* > *DNAT & Virtual IPs*.
2. Select the *Virtual IP* and click *Create new*.
3. Configure the following:

Field	Value
Name	Internal_WebServer
Interface	any
Type	Static NAT
External IP address/range	13.13.13.13
IPv4 address/range	172.16.200.55

4. Click *OK*.

To create a firewall policy for DNAT in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*, and click *Create New*.
2. Configure the following:

Field	Value
Name	wan-lan
Schedule	always
Action	ACCEPT
Type	Standard
Incoming interface	wan
Outgoing interface	port1
Source	all
Destination	Internal_WebServer
Service	ALL

Field	Value
NAT	Enabled
IP pool configuration	Use Outgoing Interface Address
Log allowed traffic	All sessions

3. Click *OK*.

To create a firewall policy for SNAT in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*, and click *Create New*.
2. Configure the following:

Field	Value
Name	lan-wan
Schedule	always
Action	ACCEPT
Type	Standard
Incoming interface	port1
Outgoing interface	wan
Source	all
Destination	all
Service	ALL
NAT	Enabled
IP pool configuration	Use Outgoing Interface Address
Log allowed traffic	All sessions

3. Click *OK*.

To configure the VIP and policies in the CLI:

1. Create the VIP:

```
config firewall vip
    edit "Internal_WebServer "
        set extip 13.13.13.13
        set mappedip "172.16.200.55"
        set extintf "any"
    next
end
```

2. Create firewall policies for DNAT (`wan-lan`) and SNAT (`lan-wan`):

```
config firewall policy
    edit 2
        set name "wan-lan"
        set srcintf "wan"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "Internal_WebServer"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
    edit 3
        set name "lan-wan"
        set srcintf "port1"
        set dstintf "wan"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
end
```

To verify the results:

1. Access the internal machine and use the saved bookmark or the external IP address of the internal web server to access it. This should be successful, and the web server should load correctly. On the FortiGate, this can be verified using the logs and session list
2. On the FortiGate, go to *Log & Report > Forward Traffic* and double click the desired log entry to view its details, or use the CLI to view the logs:

```
#execute log filter category 0
#execute log display
1: date=2024-12-05 time=11:43:58 eventtime=1733427838055576829 tz="-0800" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="root" srcip=172.16.200.13 srcport=54134
srcintf="port1" srcintfrole="undefined" dstip=13.13.13.13 dstport=443 dstintf="wan"
dstintfrole="undefined" srccountry="Reserved" dstcountry="Reserved" sessionid=5797 proto=6
action="close" policyid=2 policytype="policy" poluuid="1dbc281e-b32c-51ef-f783-7b95542c1baf"
policyname="wan-lan" service="HTTPS" trandisp="snat+dnat" tranip=172.16.200.55 tranport=443
transip=172.16.200.1 transport=54134 appcat="unscanned" duration=2 sentbyte=2063 rcvdbyte=1748
sentpkt=8 rcvdpkt=5
```

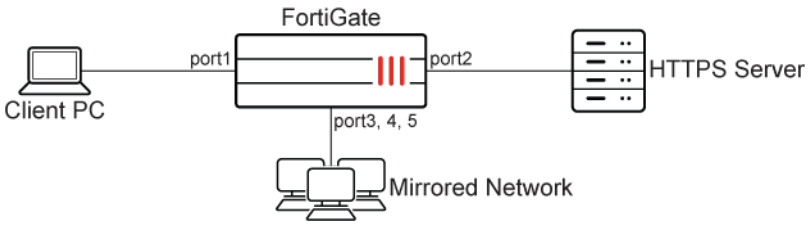
If the logs are missing, go to *Log & Report > Forward Traffic* and increase the time frame to ensure that all pertinent log entries are available.

3. Check session list:

```
#get system session list | grep 13.13.13.13
PROTO   EXPIRE SOURCE           SOURCE-NAT       DESTINATION      DESTINATION-NAT
tcp     59     172.16.200.13:3  172.16.200.1:3   13.13.13.13:8    172.16.200.55:3
```

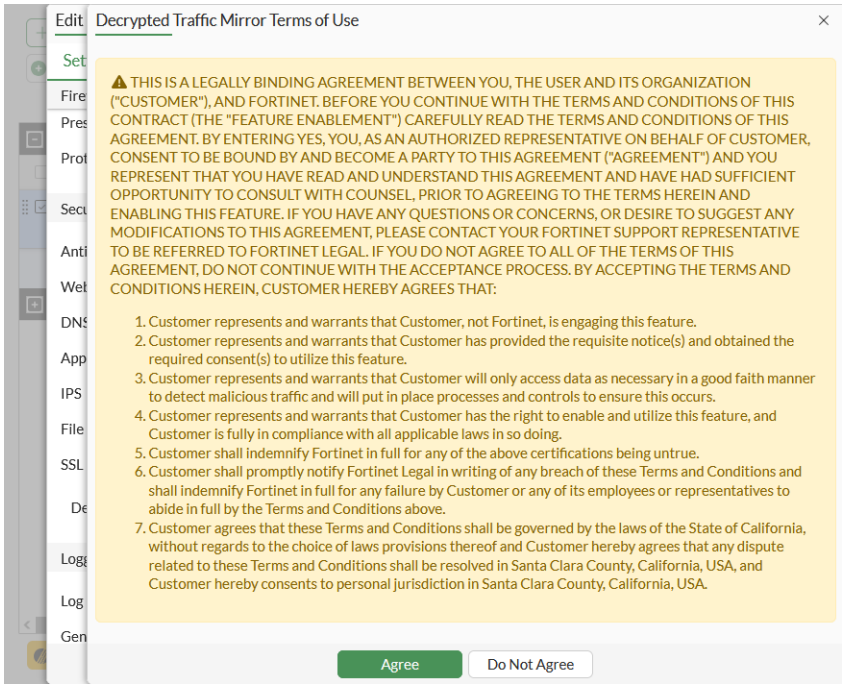
Mirroring SSL traffic in policies

SSL mirroring allows the FortiGate to decrypt and mirror traffic to a designated port. A new decrypted traffic mirror profile can be applied to IPv4, IPv6, and explicit proxy firewall policies in both flow and proxy mode. Full SSL inspection and in flow mode, a security profile, must be used in the policy for the traffic mirroring to occur. Proxy mode must be used if a security profile cannot be applied.

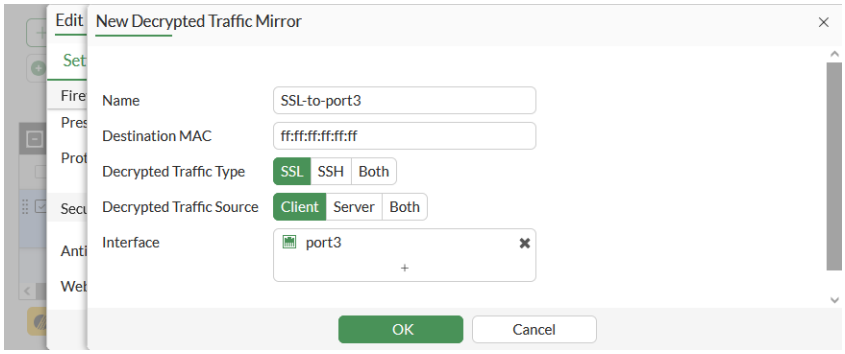


To configure SSL mirroring in a policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a new policy, or edit an existing one.
3. Configure the interfaces, sources, and other required information.
4. In the *Security Profiles* section, for *SSL Inspection*, select *deep-inspection*, or another profile that uses *Full SSL Inspection*.
5. If using flow mode, apply a security profile.
6. Enable *Decrypted Traffic Mirror* . The terms of use agreement opens.



7. Click *Agree* to accept the terms.
8. In the drop-down list, select a decrypted traffic mirror, or click *Create* to create a new one.
   In this example, a new decrypted traffic mirror is created using the port3 interface.



9. Click *OK* to save the policy.

To configure SSL mirroring in proxy mode in the CLI:

1. Create the decrypted traffic mirror profile:

```
config firewall decrypted-traffic-mirror
    edit SSL-to-port3
        set dstmac ff:ff:ff:ff:ff:ff
        set traffic-type ssl
        set traffic-source client
        set interface port3
    next
end
```

2. Configure the policy to enable SSL traffic mirroring. If using flow mode, a security profile must also be applied.

```
config firewall policy
    edit 1
        set name "mirror-policy"
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set ssl-ssh-profile "deep-inspection"
        set decrypted-traffic-mirror "SSL-to-port3"

THIS IS A LEGALLY BINDING AGREEMENT BETWEEN YOU, THE USER AND ITS ORGANIZATION ("CUSTOMER"),
AND FORTINET. BEFORE YOU CONTINUE WITH THE TERMS AND CONDITIONS OF THIS CONTRACT (THE "FEATURE
ENABLEMENT") CAREFULLY READ THE TERMS AND CONDITIONS OF THIS AGREEMENT. BY ENTERING YES, YOU,
AS AN AUTHORIZED REPRESENTATIVE ON BEHALF OF CUSTOMER, CONSENT TO BE BOUND BY AND BECOME A
PARTY TO THIS AGREEMENT ("AGREEMENT") AND YOU REPRESENT THAT YOU HAVE READ AND UNDERSTAND THIS
```

```
AGREEMENT AND HAVE HAD SUFFICIENT OPPORTUNITY TO CONSULT WITH COUNSEL, PRIOR TO AGREEING TO
THE TERMS HEREIN AND ENABLING THIS FEATURE. IF YOU HAVE ANY QUESTIONS OR CONCERNS, OR DESIRE
TO SUGGEST ANY MODIFICATIONS TO THIS AGREEMENT, PLEASE CONTACT YOUR FORTINET SUPPORT
REPRESENTATIVE TO BE REFERRED TO FORTINET LEGAL. IF YOU DO NOT AGREE TO ALL OF THE TERMS OF
THIS AGREEMENT, DO NOT CONTINUE WITH THE ACCEPTANCE PROCESS. BY ACCEPTING THE TERMS AND
CONDITIONS HEREIN, CUSTOMER HEREBY AGREES THAT:

1. Customer represents and warrants that Customer, not Fortinet, is engaging this feature.

2. Customer represents and warrants that Customer has provided the requisite notice(s) and
obtained the required consent(s) to utilize this feature.

3. Customer represents and warrants that Customer will only access data as necessary in a good
faith manner to detect malicious traffic and will put in place processes and controls to
ensure this occurs.

4. Customer represents and warrants that Customer has the right to enable and utilize this
feature, and Customer is fully in compliance with all applicable laws in so doing.

5. Customer shall indemnify Fortinet in full for any of the above certifications being untrue.

6. Customer shall promptly notify Fortinet Legal in writing of any breach of these Terms and
Conditions and shall indemnify Fortinet in full for any failure by Customer or any of its
employees or representatives to abide in full by the Terms and Conditions above.

7. Customer agrees that these Terms and Conditions shall be governed by the laws of the State
of California, without regards to the choice of laws provisions thereof and Customer hereby
agrees that any dispute related to these Terms and Conditions shall be resolved in Santa Clara
County, California, USA, and Customer hereby consents to personal jurisdiction in Santa Clara
County, California, USA.

Recognize anycast addresses in geo-IP blocking

An anycast IP can be advertised from multiple locations and the router selects a path based on latency, distance, cost, number of hops, and so on. This technique is widely used by providers to route users to the closest server. Since the IP is hosted in multiple geographic locations, there is no way to specify one single location to that IP.

Anycast IP address ranges can be bypassed in geo-IP blocking. The ISDB contains a list of confirmed anycast IP ranges that can be used for this purpose.

When the source or destination is set to `geoip`, you can enable the `geoip-anycast` option. Once enabled, IPs where the anycast option is set to `1` in `geoip_db` are bypassed in country matching and blocking.

You can only use the CLI to configure this feature.

To enable the geoip-anycast option using the CLI:

```
config firewall policy
   edit 1
      set name "policyid-1"
      set srcintf "wan2"
      set dstintf "wan1"
      set srcaddr "all"
      set dstaddr "test-geoip-CA_1"
      set action accept
      set schedule "always"
      set service "ALL"
      set geoip-anycast enable
      set logtraffic all
      set nat enable
   next
end
```

To check the geoip-anycast option for an IP address using the CLI:

```
diagnose geoip ip2country 1.0.0.1
   1.0.0.1 - Australia, is anycast ip
```

The anycast IP is `1.0.0.1`.

Matching GeoIP by registered and physical location

IP addresses have both a physical and registered location in the geography IP database. Sometimes these two locations are different. The `geoip-match` command allows users to match an IPv4 address in an firewall policy to its physical or registered location when a GeoIP is used as a source or destination address. IPv6 policies currently support geography address objects but do not support `geoip-match`.

In the following example, the physical location of 220.243.219.10 is CA (Canada), the registered location is CN (China), and it is not an anycast IP.

To configure GeoIP matching based on registered location:

1. Create a firewall policy to match the IP:

```
config firewall policy
    edit 1
        set name "policy_id_1"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "test-geoip-CA"
        set action accept
        set schedule "always"
        set service "ALL"
        set geoip-match registered-location
        set logtraffic all
        set auto-asic-offload disable
```

```
        set nat enable
    next
end
```

Since CA is applied as a destination address and registered location IP matching is enabled, if the destination IP of the traffic is 220.243.219.10, then the traffic will be blocked because the registered location is CN.

2. Verify that the policy is blocking traffic from the IP address:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
5.383798 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
6.381982 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
7.382608 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
^C
3 packets received by filter
0 packets dropped by kernel
```

To configure GeoIP matching based on physical location:

1. Create a firewall policy to match the IP:

```
config firewall policy
    edit 1
        set name "policy_id_1"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "test-geoip-CA"
        set action accept
        set schedule "always"
        set service "ALL"
        set geoip-match physical-location
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Since CA is applied as a destination address and physical location IP matching is enabled, if the destination IP of the traffic is 220.243.219.10, then the traffic will pass through.

2. Verify that the policy is allowing traffic from the IP address:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
5.273985 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
5.274176 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
6.274426 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
6.274438 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
```

```
7.273978 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
7.273987 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
^C
6 packets received by filter
0 packets dropped by kernel
```

HTTP to HTTPS redirect for load balancing

You can configure a virtual server with HTTP to HTTPS redirect enabled. When enabled, a virtual server can convert a client's HTTP requests to HTTPS requests. Through this mandatory conversion, HTTP traffic is converted to HTTPS traffic. This conversion improves the security of the user network.

You can only enable this feature by using the CLI. After you enable this feature, traffic flows as follows:

- When FortiGate receives an HTTP request for an external IP, such as 10.1.100.201 in the following example, FortiGate sends an HTTP 303 response back to the original client and redirects HTTP to HTTPS, instead of forwarding the HTTP request to the real backend servers.
- The client browser restarts the TCP session to HTTPS.
- The HTTPS session comes to the FortiGate where a matching firewall policy allows the HTTPS traffic and establishes a secure SSL connection, and then forwards the request to the real backend servers.

To configure virtual server with HTTPS redirect enabled:

1. Create a virtual server with `server-type` set to `http`:

```
config firewall vip
    edit "virtual-server-http"
        set type server-load-balance
        set extip 10.1.100.201
        set extintf "wan2"
        set server-type http
        set ldb-method round-robin
        set extport 80
        config realservers
            edit 1
                set ip 172.16.200.44
                set port 80
            next
            edit 2
                set ip 172.16.200.55
                set port 80
            next
        end
    next
end
```

2. Create a virtual server with `server-type` set to `https` and with the same external IP address:

```
config firewall vip
    edit "virtual-server-https"
        set type server-load-balance
```

```
        set extip 10.1.100.201
        set extintf "wan2"
        set server-type https
        set ldb-method round-robin
        set extport 443
        config realservers
            edit 1
                set ip 172.16.200.44
                set port 443
            next
            edit 2
                set ip 172.16.200.55
                set port 443
            next
        end
        set ssl-certificate "Fortinet_SSL"
    next
end
```

3. Enable the `http-redirect` option for the virtual server with `server-type` set to `http`:

```
config firewall vip
    edit "virtual-server-http"
        <b>set http-redirect enable</b>
    next
end
```

4. Add the two virtual servers to a policy:

```
config firewall policy
    edit 9
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "virtual-server-http" "virtual-server-https"
        set action accept
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Use Active Directory objects directly in policies

Active Directory (AD) groups can be used directly in identity-based firewall policies. You do not need to add remote AD groups to local FSSO groups before using them in policies.

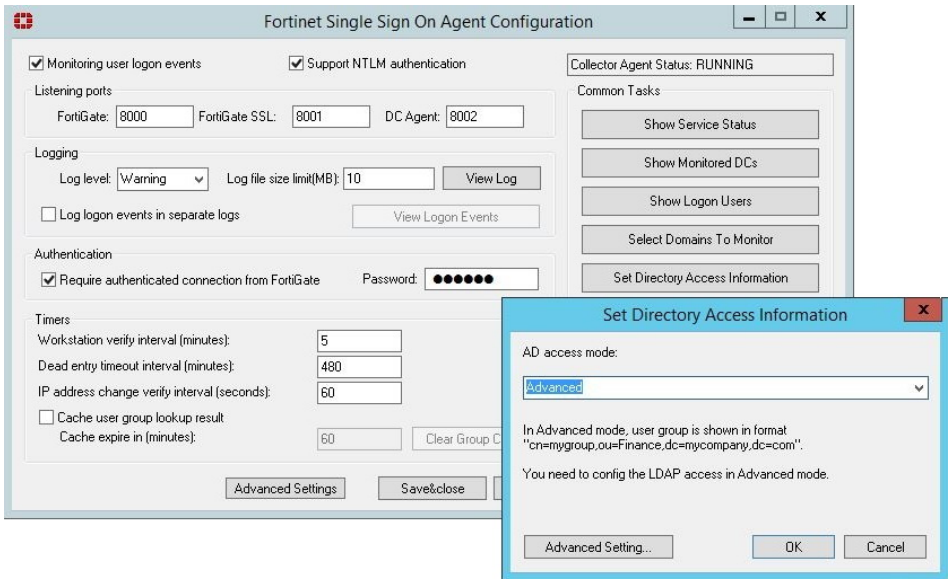
FortiGate administrators can define how often group information is updated from AD LDAP servers.

To retrieve and use AD user groups in policies:

1. Set the FSSO Collector Agent AD access mode on page 1705
2. Add an LDAP server on page 1705
3. Create the FSSO collector that updates the AD user groups list on page 1706
4. Use the AD user groups in a policy on page 1708

Set the FSSO Collector Agent AD access mode

To use this feature, you must set FSSO Collector Agent to *Advanced* AD access mode. If the FSSO Collector Agent is running in the default mode, FortiGate cannot correctly match user group memberships.



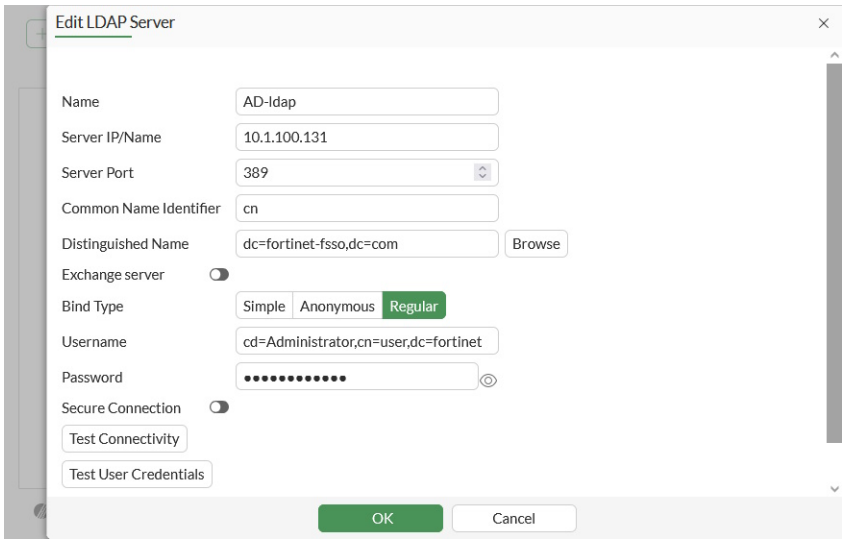
Add an LDAP server

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 3014 and Configuring client certificate authentication on the LDAP server on page 3029.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 3022.

To add an LDAP server in the GUI:

1. Go to *User & Authentication* > *LDAP Servers*.
2. Click *Create New*.
3. Configure the settings as needed.



4. If secure communication over TLS is supported by the remote AD LDAP server:
   a. Enable *Secure Connection* .
   b. Select the protocol.
   c. Select the certificate from the CA that issued the AD LDAP server certificate.
      If the protocol is LDAPS, the port will automatically change to 636.
5. Click *OK*.

To add an LDAP server in the CLI:

```
config user ldap
    edit "AD-ldap"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password XXXXXXXXXXXXXXXXXXXXXXXX
    next
end
```

Create the FSSO collector that updates the AD user groups list

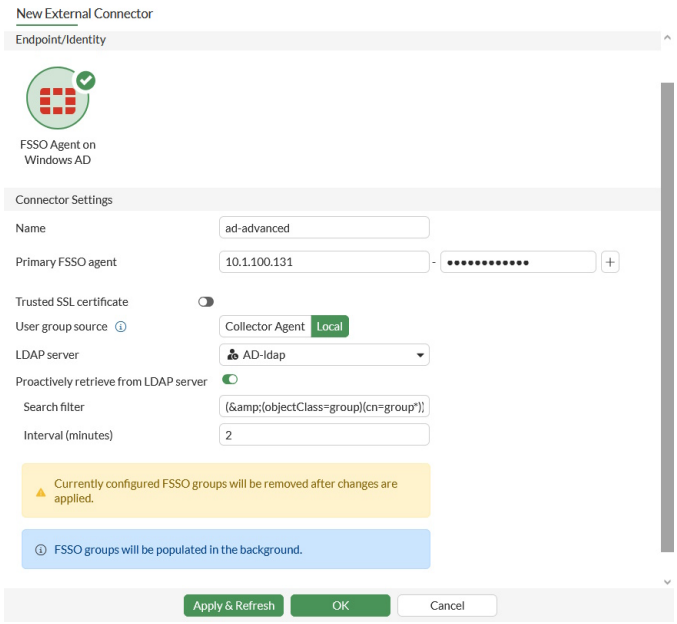
To create an FSSO agent connector in the GUI:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.
3. In the *Endpoint/Identity* section, click *FSSO Agent on Windows AD*.
4. Fill in the *Name*
5. Set the *Primary FSSO Agent* to the IP address of the FSSO Collector Agent, and enter its password.
6. Set the *User Group Source* to *Local*.
7. Set the *LDAP Server* to the just created *AD-ldap* server.

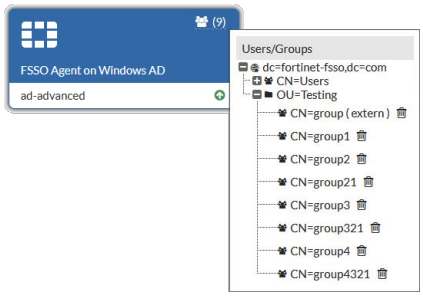
8. Enable *Proactively Retrieve from LDAP Server*.
9. Set the *Search Filter* to *(&(objectClass=group)(cn=group*))*.

   The default search filter retrieves all groups, including Microsoft system groups. In this example, the filter is configured to retrieve *group1*, *group2*, etc, and not groups like *grp199*.

   The filter syntax is not automatically checked; if it is incorrect, the FortiGate might not retrieve any groups.
10. Set the *Interval (minutes)* to configure how often the FortiGate contacts the remote AD LDAP server to update the group information.



11. Click *OK*.
12. To view the AD user groups that are retrieved by the FSSO agent, hover the cursor over the group icon on the fabric connector listing.



To create an FSSO agent connector in the CLI:

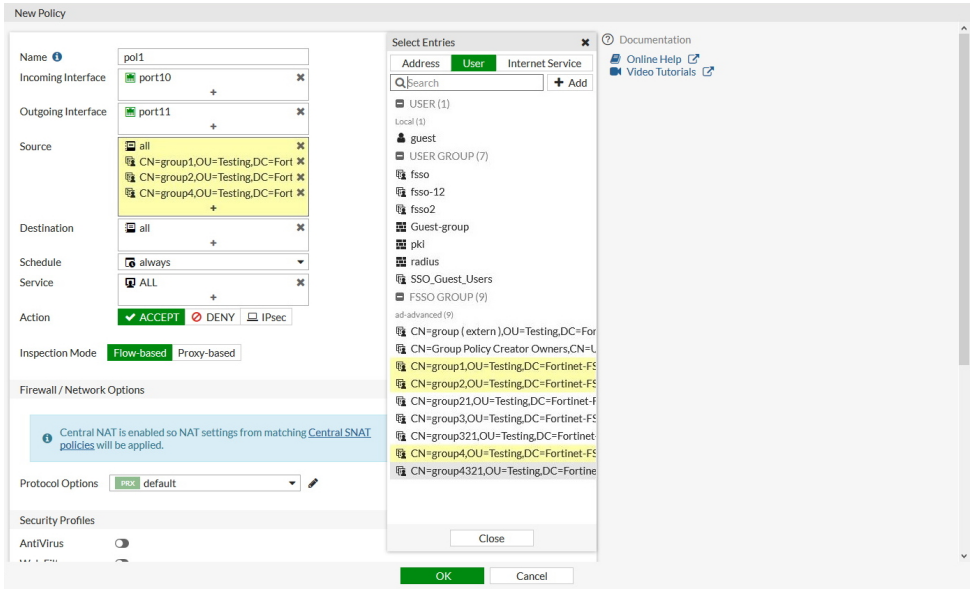
```
config user fsso
    edit "ad-advanced"
        set server "10.1.100.131"
        set password XXXXXXXXXXXXXX
        set ldap-server "AD-ldap"
        set ldap-poll enable
        set ldap-poll-interval 2
        set ldap-poll-filter "(&amp;(objectClass=group)(cn=group*))"
```

```
    next
end
```

You can view the retrieved AD user groups with the `show user adgrp` command.

Use the AD user groups in a policy

The AD user groups retrieved by the FortiGate can be used directly in firewall policies.



No session timeout

To allow clients to permanently connect with legacy medical applications and systems that do not have keepalive or auto-reconnect features, the session timeout can be set to never for firewall services, policies, and VDOMs.

The options to disable session timeout are hidden in the CLI.

To set the session TTL value of a custom service to never:

```
config firewall service custom
    edit "tcp_23"
        set tcp-portrange 23
        set session-ttl never
    next
end
```

To set the session TTL value of a policy to never:

```
config firewall policy
    edit 201
```

```
        set srcintf "wan1"
        set dstintf "wan2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "TCP_8080"
        set logtraffic disable
        set session-ttl never
        set nat enable
    next
end
```

To set the session TTL value of a VDOM to never:

```
config system session-ttl
    set default never
    config port
        edit 1
            set protocol 6
            set timeout never
            set start-port 8080
            set end-port 8080
        next
    end
end
```

To view a session list with the timeout set to never:

```
# diagnose sys session list

session info: proto=6 proto_state=01 duration=9 expire=never timeout=never flags=00000000
sockflag=00000000 sockport=0 av_idx=0 use=3

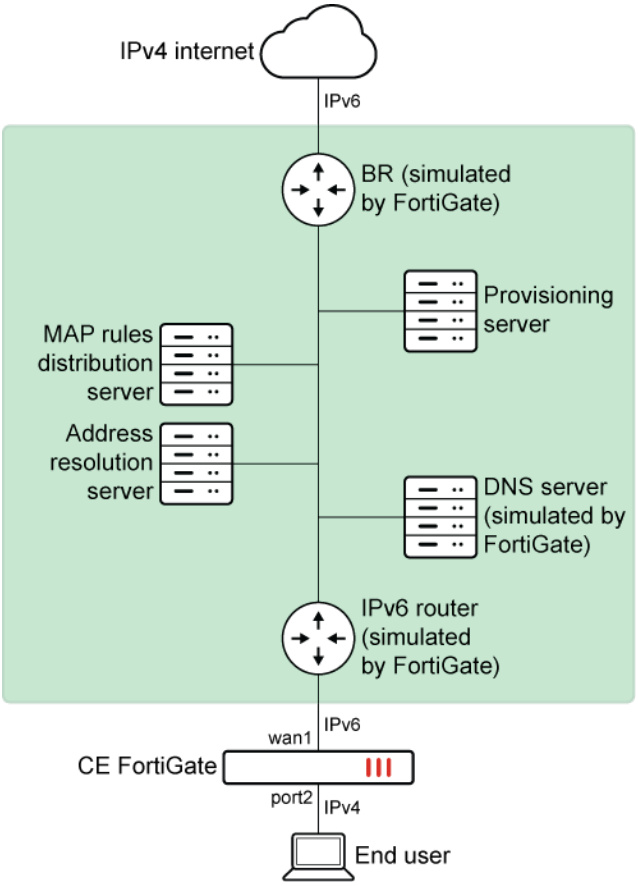
MAP-E support

On a customer edge (CE) FortiGate, an IPv4-over-IPv6 (MAP-E) tunnel can be created between the FortiGate and the border relay (BR) operating in an IPv6 network. A tunnel interface is created between the FortiGate and BR, which can be applied to firewall policies and IPsec VPN.



To configure a MAP-E tunnel between the FortiGate and the BR:

1. Configure fixed IP mode.
   a. Configure IPv6 on the interface:

```
config system interface
    edit "wan1"
        config ipv6
            set autoconf enable
            set unique-autoconf-addr enable
            set interface-identifier ::6f:6c1f:3400:0
        end
```

```
    next
end
```

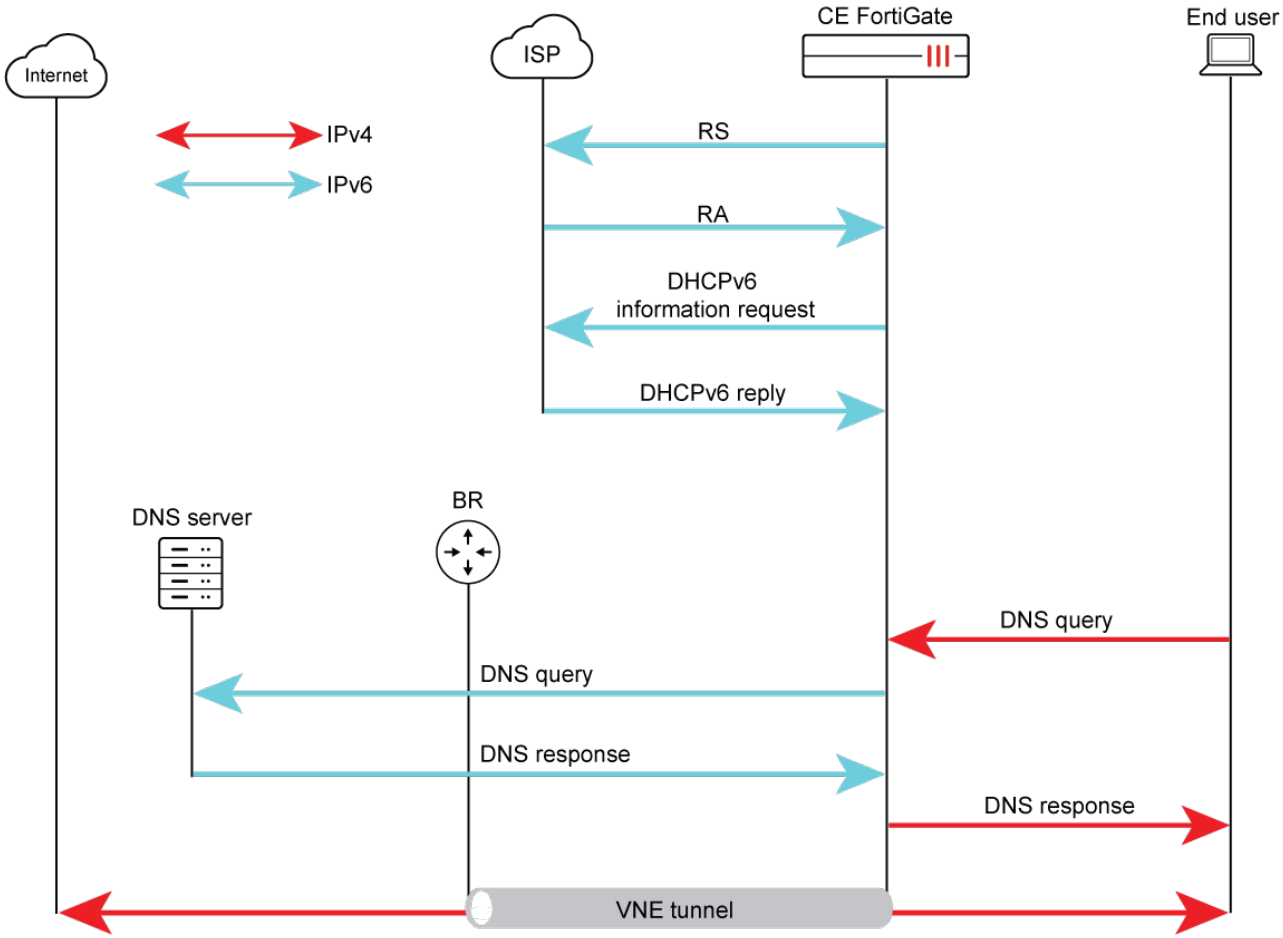
The `interface-identifier` is an IPv6 address. Its last 64-bit will be kept and the rest will be cleared automatically. It will combine with the IPv6 prefix it gets from the IPv6 router to generate the IPv6 address of the interface.

By default, `unique-autoconf-addr` is disabled. It must be enabled so it can handle IPv6 prefix changing.

b. Configure the VNE tunnel:

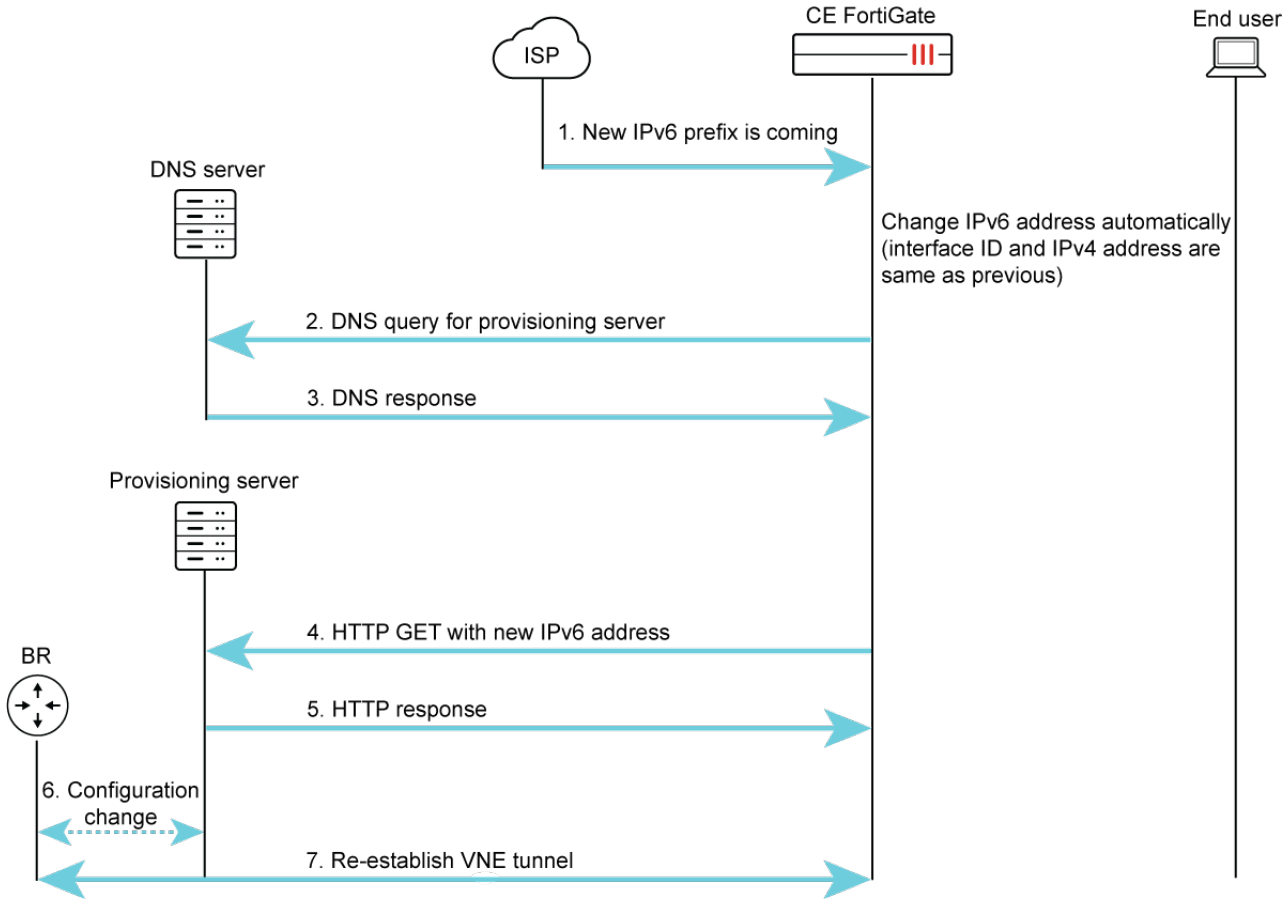
```
config system vne-interface
    edit vne1
        set interface "wan1"
        set mode fixed-ip
        set ipv4-address 10.10.81.81 255.255.255.0
        set br 2001:160::82
        set update-url http://qa.forosqa.com/update?user=xxxx&pass=yyyy
    next
end
```

Initial sequence overview of VNE tunnel under fixed IP mode:



Once the IPv6 address of the FortiGate changes, the tunnel will be down because the BR does not know the FortiGate's new IPv6 address. The FortiGate uses `update-url` to update the new IPv6 address to the provisioning server. The provisioning server updates the FortiGate's IPv6 address to the BR so the VNE tunnel can be re-established.

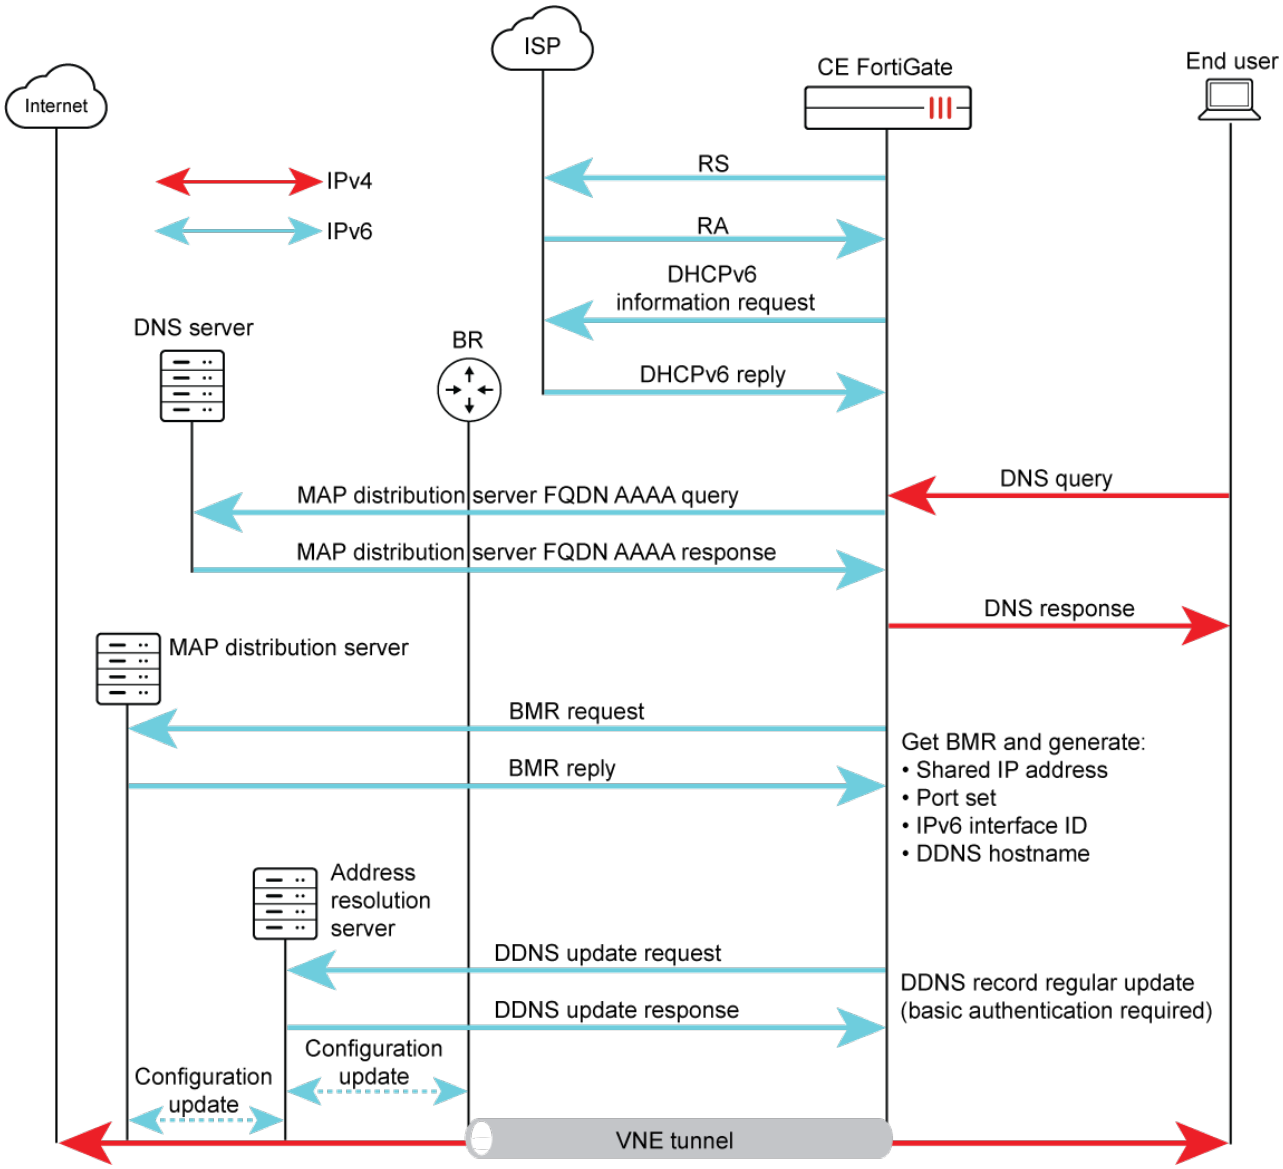
Communication sequence overview of re-establishing VNE tunnel:



2. Configure the VNE tunnel to use MAP-E mode:

```
config system vne-interface
    edit vne1
        set interface 'wan1'
        set ssl-certificate "Fortinet_Factory"
        set bmr-hostname ********
        set auto-asic-offload enable
        set mode map-e
    next
end
```

Initial sequence overview of VNE tunnel under MAP-E mode:



The FortiGate sends a MAP rule request to the MAP distribution server once the IPv6 address is configured on the FortiGate by RS/RA. Next, the FortiGate will send an AAAA query to get the IPv6 address of the MAP distribution server. After sending the BMR request to the MAP distribution server, the FortiGate will get the IPv4 address, port set, BR IPv6 address, and hostname of the address resolution server from the BMR reply. The VNE tunnel between the FortiGate and BR is now established.

The address resolution server is actually a dynamic DNS. The hostname is used for the FortiGate to maintain an IPv6 address when it changes.

The FortiGate updates the DDNS server with its IPv6 address whenever it updates, which in turn provides the update to the MAP distribution server and BR so they know how to resolve the FortiGate by hostname.

Once the VNE tunnel is established, an IPv4-over-IPv6 tunnel is set up between the FortiGate and BR. The route, firewall policy, and DNS server can now be configured to let the traffic go through the VNE tunnel and protect the end-user. The VNE tunnel can also be used in IPsec phase 1.

3. Configure the route:

```
config router static
    edit 1
        set device "vne1"
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 111
        set name "ff"
        set srcintf "port2"
        set dstintf "vne1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set av-profile "default"
        set nat enable
    next
end
```

5. Configure the DNS server:

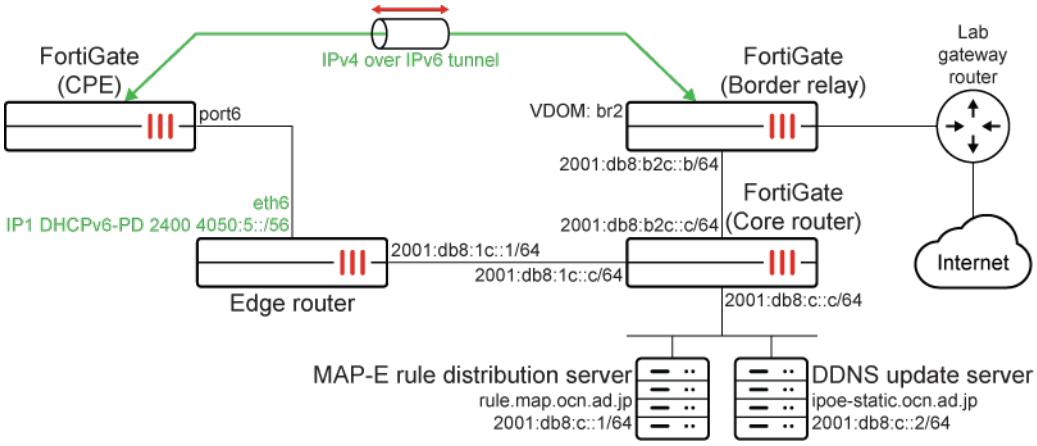
```
config system dns-server
    edit "port2"
    next
end
```

MAP-E can also operate in DHCPv6-PD environments; see DHCP-PD support for MAP-E on page 1714 for more information.

DHCP-PD support for MAP-E

Mapping of address and port with encapsulation (MAP-E) can operate in DHCPv6 prefix delegation (DHCPv6-PD) environments, providing greater flexibility, improved automation, and scalability in network configurations. Previously, MAP-E utilized the RA IPv6 prefix for deployment; see MAP-E support.

MAP-E mode



To configure MAP-E mode:

1. Configure the border relay FortiGate:

```
config system interface
    edit "core-br21"
        set vdom "br2"
        set type vdom-link
        set snmp-index 27
        config ipv6
            set ip6-address 2001:db8:b2c::b/64
            set ip6-allowaccess ping
        end
    next
end
config system ipv6-tunnel
    edit "6"
        set source 2001:db8:b2c::b
        set destination 2400:4050:6:0:c0:2:2200:0
    next
end
```

2. Configure the CPE FortiGate:
   a. Configure port6 to get an IPv6 address through the delegate:

```
config system interface
    edit "port6"
        set vdom "root"
        set type physical
        set snmp-index 6
        config ipv6
            set ip6-mode delegated
            set ip6-allowaccess ping
            set dhcp6-prefix-delegation enable
            set ip6-delegated-prefix-iaid 1
```

```
            set ip6-upstream-interface "port6"
            set ip6-subnet ::1/64
            config dhcp6-iapd-list
                edit 1
                    set prefix-hint ::/56
                next
            end
        end
    next
end
```

```
# dianose ipv ad list | grep port6
dev=7 devname=port6 flag= scope=0 prefix=64 addr=2400:4050:6::1 preferred=22 valid=45
cstamp=9913 tstamp=6047755
dev=7 devname=port6 flag=P scope=253 prefix=64 addr=fe80::20c:29ff:fe7b:d83b
preferred=4294967295 valid=4294967295 cstamp=6263 tstamp=6263
```

b. Configure the virtual network enabler (VNE) tunnel:

```
config system vne-interface
    edit "vne.port6"
        set interface "port6"
    next
end
```

```
# diagnose test application vned 1
------------------------------------------------------------------------------
vdom: root/0, is master, devname=port6 link=1 tun=vne.port6 mode=map-e ssl_cert=Fortinet_
Factory
end user ipv6 perfix: 2400:4050:6::/56
interface ipv6 addr: 2400:4050:6::1
bmr rule ipv6 perfix: 2400:4050:6::/56
bmr rule ipv4 perfix: 192.0.2.34/32
bmr rule br: 2001:db8:b2c::b
bmr rule hostname: Testbed6_dhcpv6-pd-IP1
saved hostname: Testbed6_dhcpv6-pd-IP1
tunnel br: 2001:db8:b2c::b
tunnel ipv6 addr: 2400:4050:6:0:c0:2:2200:0
tunnel ipv4 addr: 192.0.2.34/255.255.255.255
update result: good

Map-e rule client: state=succeed retries=0 interval=60 expiry=23634 reply_code=200
fqdn=rule.map.ocn.ad.jp num=1 cur=0 ttl=86400 expiry=0
2001:db8:c::1
Map-e DDNS client: state=succeed retries=0 interval=120 expiry=61372 reply_code=200
fqdn=ipoe-static.ocn.ad.jp num=1 cur=0 ttl=86400 expiry=0
2001:db8:c::2
```

vne.port6 is automatically configured after the VNE tunnel is set up:

```
config system interface
    edit "vne.port6"
```

```
        set vdom "root"
        set ip 192.0.2.34 255.255.255.255
        set type tunnel
        set snmp-index 16
        set interface "port6"
    next
end
```

```
# diagnose ipv ad li | grep port6
dev=7 devname=port6 flag=Pn scope=0 prefix=128 addr=2400:4050:6:0:c0:2:2200:0
preferred=4294967295 valid=4294967295 cstamp=10620 tstamp=10620
dev=7 devname=port6 flag= scope=0 prefix=64 addr=2400:4050:6::1 preferred=37 valid=60
cstamp=9913 tstamp=6108593
dev=7 devname=port6 flag=P scope=253 prefix=64 addr=fe80::20c:29ff:fe7b:d83b
preferred=4294967295 valid=4294967295 cstamp=6263 tstamp=6263
```

c. Traffic can now pass through the VNE tunnel:

```
config router static
    edit 1
        set device "vne.port6"
    next
end
```

```
# execute ping 8.8.8.8
PING 8.8.8.8 (8.8.8.8): 56 data bytes
64 bytes from 8.8.8.8: icmp_seq=0 ttl=116 time=5.3 ms

```

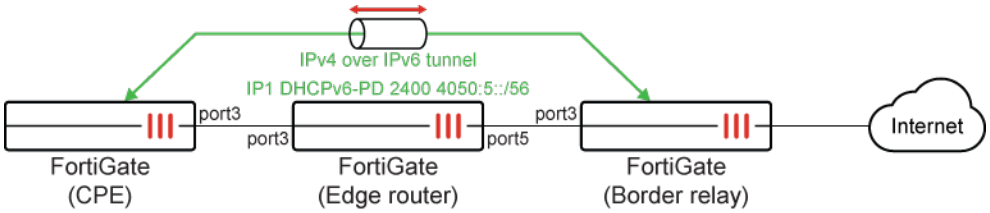
Fixed IP mode



To configure fixed IP mode:

1. Configure the border relay FortiGate:

```
config system ipv6-tunnel
    edit "VNE-IPV6-2"
        set source 2606:f900:8102:302::2
        set destination 2606:f900:8102:301:8000::
        set interface "port3"
    next
end
config system interface
    edit "port3"
        set vdom "root"
        set type physical
        set snmp-index 9
        config ipv6
            set ip6-address 2606:f900:8102:302::2/64
            set ip6-allowaccess ping
        end
    next
end
```

2. Configure the CPE FortiGate:
   a. Configure port3 to get an IPv6 address through the delegate:

```
config system interface
    edit "port3"
        set vdom "root"
        set type physical
        set snmp-index 9
```

```
        config ipv6
            set ip6-mode delegated
            set ip6-allowaccess ping
            set dhcp6-prefix-delegation enable
            set ip6-delegated-prefix-iaid 1
            set ip6-upstream-interface "port3"
            set ip6-subnet ::8000:0:0:0/64
            config dhcp6-iapd-list
                edit 1
                    set prefix-hint 2606:f900:8102:301::/64
                next
                edit 2
                    set prefix-hint 2606:f900:8102:303::/64
                next
            end
        end
    next
end
```

```
# diagnose ipv ad list | grep port3
dev=13 devname=port3 flag=P scope=0 prefix=64 addr=2606:f900:8102:301:8000::
preferred=4294967295 valid=4294967295 cstamp=61106 tstamp=61106
dev=13 devname=port3 flag=P scope=253 prefix=64 addr=fe80::e223:ffff:fe67:8e6e
preferred=4294967295 valid=4294967295 cstamp=56882 tstamp=56882
```

b. Configure the VNE tunnel:

```
config system vne-interface
    edit "VNE"
        set interface "port3"
        set ipv4-address 10.100.100.1 255.255.255.0
        set br "2606:f900:8102:302::2"
        set update-url "http://test.com"
        set mode fixed-ip
    next
end
```

```
# diagnose test application vned 1
------------------------------------------------------------------------
vdom: root/0, is master, devname=port3 link=1 tun=VNE mode=fixed-ip ssl_cert=Fortinet_
Factory
end user ipv6 perfix: 2606:f900:8102:301::/64
interface ipv6 addr: 2606:f900:8102:301:8000::
config ipv4 perfix: 10.100.100.1/255.255.255.0
config br: 2606:f900:8102:302::2
HTTP username:
update url: http://test.com
host: test.com path: / port:80 ssl: 0
tunnel br: 2606:f900:8102:302::2
tunnel ipv6 addr: 2606:f900:8102:301:8000::
tunnel ipv4 addr: 10.100.100.1/255.255.255.0
update result:
```

```
Fixed IP rule client: state=succeed retries=0 interval=0 expiry=0 reply_code=0
fqdn=2606:f900:8102:302::2 num=1 cur=0 ttl=4294967295 expiry=0
2606:f900:8102:302::2
Fixed IP DDNS client: state=init retries=0 interval=10 expiry=4 reply_code=0
fqdn=test.com num=0 cur=0 ttl=0 expiry=0
```

c. Traffic can now pass through the VNE tunnel:

```
# execute ping 8.8.8.8
PING 8.8.8.8 (8.8.8.8): 56 data bytes
64 bytes from 8.8.8.8: icmp_seq=0 ttl=52 time=5.0 ms

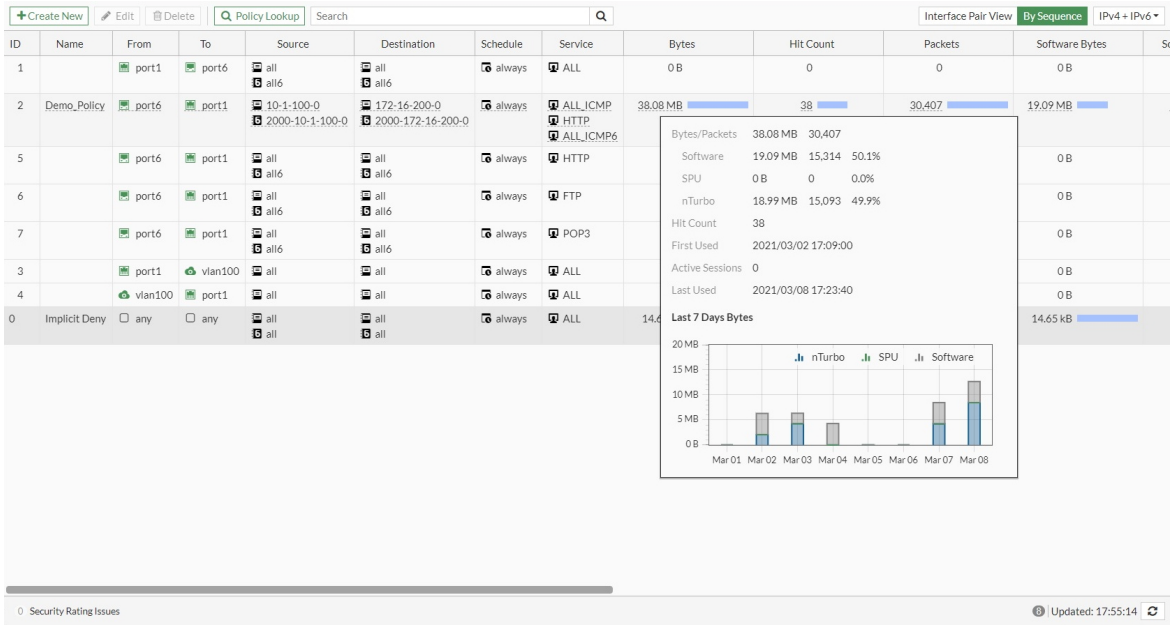
Seven-day rolling counter for policy hit counters

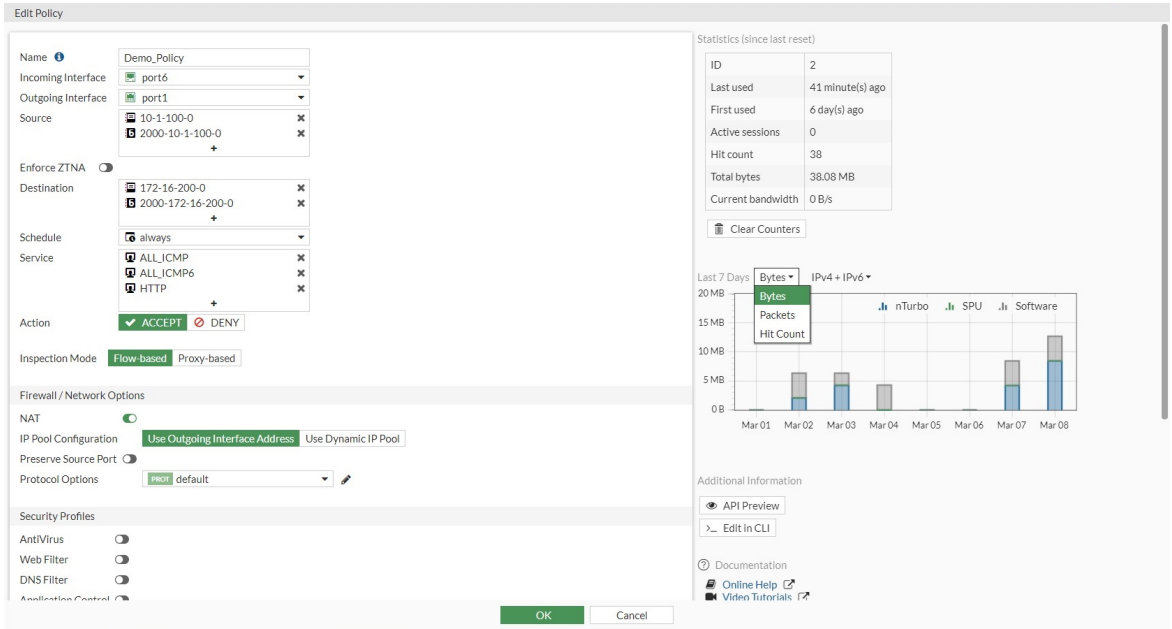
Instead of storing a single number for the hit count and byte count collected since the inception of each policy, seven numbers for the last seven days and an active counter for the current day are stored. The past seven-day hit count is displayed in the policy list and policy pages. A seven-day bar chart shows statistics on each policy page. This feature is currently supported in firewall and multicast policies, but not security policies.

To view the rolling counter information in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* or *Policy & Objects* > *Multicast Policy*.
2. Select a policy and hover over the *Bytes*, *Packets*, or *Hit Count* values to view the tooltip with the corresponding traffic statistics and bar graph (this example uses firewall policies).



3. Click *Edit*. The policy traffic statistics appear in the right-hand side of the page.
4. Use the dropdowns to filter the bar graph data by counter (*Bytes*, *Packets*, or *Hit Count*) and policy type (*IPv4*, *IPv6*, or *IPv4 + IPv6*).



5. Optionally, click *Clear Counters* to delete the traffic statistics for the policy.
6. Click *OK*.

To view the rolling counter information in the CLI:

```
# diagnose firewall iprope show 100004 2
idx=2 pkts/bytes=14709/18777329 asic_pkts/asic_bytes=8087/10413737 nturbo_pkts/nturbo_
bytes=8087/10413737 flag=0x0 hit count:19 (4 7 0 1 1 3 3 0)

    first est:2021-03-02 17:11:43 last est:2021-03-08 17:23:33
```

Cisco Security Group Tag as policy matching criteria

The FortiGate can read the Cisco Security Group Tag (SGT) in Ethernet frames, and use them as matching criteria in firewall policies. A policy can match based on the presence of an SGT, or the detection of a specific ID or IDs.

When a packet with a SGT passes through and a session is established, the `ext_header_type=0xc5:0xc5` flag is included in the session table.

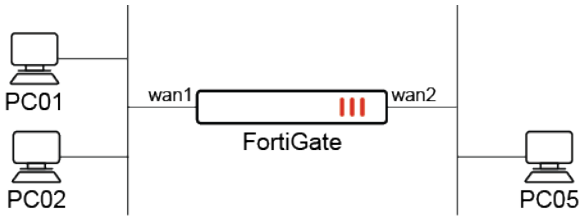
This feature is available in flow mode policies for virtual wire pair policies only.

To configure a firewall policy to detect SGTs in Ethernet frames:

```
config firewall policy
    edit 1
        set sgt-check {enable | disable}
        set sgt <ID numbers>
    next
end
```

Examples

In these examples, wan1 and wan2 are in a virtual wire pair. Firewall policies are created that pass traffic with SGTs with a specific ID number, any ID number, or either of two specific ID numbers.



To configure the virtual wire pair:

```
config system virtual-wire-pair
    edit "test-vwp-1"
        set member "wan1" "wan2"
        set wildcard-vlan enable
    next
end
```

To configure a firewall policy to match frames that have an SGT with ID 20 and allow them through:

```
config firewall policy
    edit 1
        set srcintf "wan1"
        set dstintf "wan2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set sgt-check enable
        set sgt 20
    next
end
```

To configure a firewall policy to match frames that have an SGT with any ID:

```
config firewall policy
    edit 1
        set srcintf "wan1"
        set dstintf "wan2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set sgt-check enable
    next
end
```

To configure a firewall policy to match frames that have the SGT with IDs 20 or 21:

```
config firewall policy
    edit 1
        set srcintf "wan1"
        set dstintf "wan2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
```

```
        set service "ALL"
        set sgt-check enable
        set sgt 20 21
    next
end
```

Processing only Ethernet frames with a Cisco Security Group Tag

In this example, an Ethernet frame is sent from PC01 with an SGT tag (ID 20), which can pass through to PC05 based on any of the firewall policies in the previous examples.

To verify the configuration:

```
# diagnose sys session list

session info: proto=6 proto_state=01 duration=10 expire=3593 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty br dst-vis f00
statistic(bytes/packets/allow_err): org=112/2/1 reply=60/1/1 tuples=2
tx speed(Bps/kbps): 10/0 rx speed(Bps/kbps): 5/0
orgin->sink: org pre->post, reply pre->post dev=13->10/10->13 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=noop 10.1.1.11:36970->10.1.2.11:80(0.0.0.0:0)
hook=post dir=reply act=noop 10.1.2.11:80->10.1.1.11:36970(0.0.0.0:0)
pos/(before,after) 0/(0,0), 0/(0,0)
dst_mac=00:b0:e1:22:cf:e4
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=1
serial=0000183c tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
ext_header_type=0xc5:0xc5
total session 1
```

Processing Ethernet frames with a Cisco Security Group Tag and VLAN tag

The FortiGate has the ability to process Ethernet frames with both the Cisco Security Group Tag and VLAN tag.

In this example, PC02 is connected to a switch port configured for VLAN 2. An Ethernet frame is sent from PC02 with an SGT tag (ID 20) and VLAN ID (2), which can pass through to PC05 based on any of the firewall policies in the previous examples.

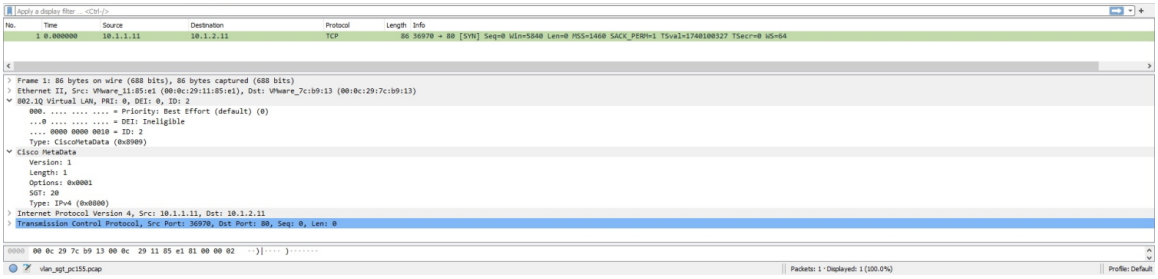
To verify the configuration:

1. Check the session list:

```
# diagnose sys session list

session info: proto=6 proto_state=01 duration=2007 expire=3482 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=may_dirty br
statistic(bytes/packets/allow_err): org=164/3/1 reply=120/2/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=noop 10.1.1.11:36970->10.1.2.11:80(0.0.0.0:0)
hook=post dir=reply act=noop 10.1.2.11:80->10.1.1.11:36970(0.0.0.0:0)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=1 pol_uuid_idx=572 auth_info=0 chk_client_info=0 vd=0
serial=0432fb8f tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
vlanid=2
npu_state=0x4000001 no_offload
no_ofld_reason:  disabled-by-policy
            ext_header_type=0xc5:0xc5
```

2. Perform a packet capture on PC05 (Wireshark is used in this example) and check that the packet includes the VLAN ID and Cisco SGT fields.



Virtual patching on the local-in management interface

Virtual patching is a method of mitigating vulnerability exploits by using the FortiGate's IPS engine to block known vulnerabilities. Virtual patching can be applied to traffic destined to the FortiGate by applying the FMWP (Firmware Virtual Patch) database to the local-in interface using local-in policies. Attacks geared towards GUI and SSH management access, for example, can be mitigated using the FMWP database pushed from FortiGuard, thereby virtually patching these vulnerabilities.

When the `virtual-patch` option is enabled in a local-in policy, the IPS engine queries the FortiGuard API server to:

- Obtain a list of vulnerabilities targeting the FortiGate on a particular version
- Determine whether the session destined to the local-in interface on the FortiGate requires a scan by identifying and tagging services in the session. The session's port number and protocol are used to identify the services. Currently only SSL VPN and web GUI services are tagged in a session.

If a tagged session lacks vulnerability signatures for the FortiOS version, then the IPS engine bypasses the session. This optimizes performance by only scanning and dropping sessions that are exploiting a vulnerability.

To configure virtual patching:

```
config firewall local-in-policy
    edit <id>
        set action accept
        set virtual-patch {enable | disable}
    next
end
```

The FortiGate must have a valid FMWR (Firmware) license to install the FMWP database. The FMWP database can be viewed by running the `diagnose autoupdate versions` command.

```
# diagnose autoupdate versions
FMWP Definitions
---------
Version: 23.00084 signed
Contract Expiry Date: Wed Jan  1 2031
Last Updated using manual update on Wed Sep  6 15:19:11 2023
Last Update Attempt: Wed Sep  6 15:40:08 2023
Result: No Updates
```

Once `virtual-patch` is enabled, the WAD process will periodically query vulnerability items from the FortiGuard API server at "productapi.corp.fortinet.com" and forward it to IPS.

For SSL VPN and ZTNA connections that terminate on the FortiGate from a client that is using a client certificate, enabling `virtual-patch` will cause the connection to fail. Do not enable `virtual-patch` if you are using either of these configurations.

Sample vulnerability item found on the FortiGuard API server

```
{"ID":918630,"product":"fortios","vendor":"fortinet","max_version":"7.2.5","min_
version":"7.2.0","severity":"high","vuln_type":"Format String","refs":
["https://www.fortiguard.com/psirt/FG-IR-23-137"],"description":"This indicates detection of a
Zero-Day vulnerability protected by a signature from Fortinet's FortiGuard Labs. This signature
should help mitigate the threat proactively both prior to, and after an official statement is
available from the vendor. Once an official advisory or statement is available from the vendor,
the signature name and its description will be updated to provide more details regarding this
vulnerability. Further details may also be made available in an advisory on FortiGuard Center
(http://www.fortiguard.com).","patch_sig_id":10004065,"patch_sig_ids":[],"detection_sig_
ids":null,"date_added":"2023-08-22T13:09:11","date_updated":"2023-08-22T13:09:11"}
```

FortiGuard can be queried from the FortiOS CLI for a list of vulnerability rules while specifying parameters for the vendor, version, product, and model by running the `diagnose wad dev-vuln query` command. For example, to query Fortinet Inc.'s FortiOS 7.2.5:

```
# diagnose wad dev-vuln query vendor=fortinet&version=7.2.5&product=fortios
Dev-Vuln Lookup result: success, cache: found, fgd: unknown, item: 0x7fb474e0b4a0
Vulnerability details:
info entry (1):
        'vendor' = fortinet
       'product' = fortios
         'model' = N/A
   'version.min' = 7.2.0
   'version.max' = 7.2.5
      'firmware' = N/A
         'build' = N/A
    'date_added' = 2023-08-22T13:09:11
  'date_updated' = 2023-08-22T13:09:11
       'sig_id' = 10004065
      'vuln_id' = 918630
      'severity' = 3
...
```

After receiving the vulnerability rules from the WAD process, the IPS engine marks them as virtual patch rules mapped to each CVE vulnerability signature. For example:

FortiOS.NodeJS.Proxy.Authentication.Bypass(CVE-2022-40684)

FortiOS.SSL.VPN.Web.Portal.Password.Improper.Authentication(CVE-2018-13382)

FortiOS.SSL.VPN.Web.Protoal.Pathname.Information.Disclosure(CVE-2018-13379)

To show the list of available FMWP signatures from the FMWP database:

```
# get rule fmwp status
rule-name: "FortiOS.Fclicense.Daemon.Format.String."
rule-id: 10004067
rev: 23.082
date: 1697644800
action: block
status: enable
log: disable
log-packet: disable
severity: 3.high
service: TCP, HTTP
location: server
os: Linux
application: Other
rate-count: 0
rate-duration: 0
rate-track: none
rate-mode: continuous
vuln_type: Format String
cve: 202329181
```

```
fos_comp: Web-GUI
....
```

The following are the diagnose commands:

```
# diagnose ips vpatch {fmwp-status | fmwp-enable-all  | fmwp-reset}
```

`fmwp-status`	Shows the current status of enabled FMWP signatures.
`fmwp-enable-all`	Enable all FMWP signatures in FMWP database.
`fmwp-reset`	Revert the results of `fmwp-enable-all`.

Example

In this example, virtual patching is enabled for the local-in policy and the following scenarios are described:

- FortiGate with an SSL VPN vulnerability
- FortiGate with a web GUI vulnerability
- FortiGate with both an SSL VPN and web GUI vulnerability

To enable virtual patching:

1. Enable virtual patching in the local-in policy:

```
config firewall local-in-policy
    edit 1
        set intf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set service "ALL"
        set schedule "always"
        set virtual-patch enable
    next
end
```

For enabling virtual patching in a local-in policy in the GUI, see Local-in policy on page 1605.

Because the IPS engine can currently only tag services related to SSL VPN and web GUI signatures, all other protocols are scanned when `service` is set to `ALL`. However, you can bypass scanning of other protocols, such as SSH and FTP, by setting `service` to only `HTTPS`.

2. Observe the outcome of the following scenarios:
   - In this example, FortiOS has an SSL VPN vulnerability. The IPS engine drops SSL VPN traffic to the local-in interface on the FortiGate and bypasses web GUI traffic. Traffic for other services is scanned and passed to the interface.

Following is a log of the SSL VPN traffic that was dropped because of the vulnerability. Bypassed web GUI traffic did not generate any logs.

```
# diagnose ips vpatch fmwp-status
Enabled FMWP signatures: 3

  10002887 FortiOS.SSL-VPN.Heap.Buffer.Overflow.

Configuring PCP port mapping with SNAT and DNAT

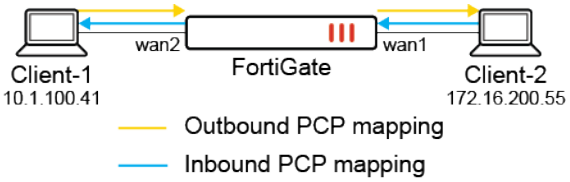
FortiOS supports the Port Control Protocol (PCP) by allowing the FortiGate to act as a PCP server, and dynamically manage network addresses and port translations for PCP clients. The PCP server must be enabled with a pool (`config system pcp-server`). In the firewall policy, enable either `pcp-outbound` or `pcp-inbound` mode and assign the pool.

```
config system pcp-server
    set status {enable | disable}
    config pools
        edit <name>
            set client-subnet <ip_address/subnet>
            set ext-intf <string>
            set extip ip>[-<ip>]
            set extport <port>[-<port>]
            set minimal-lifetime <integer>
            set maximal-lifetime <integer>
            set client-mapping-limit <integer>
            set mapping-filter-limit <integer>
            set allow-opcode {map peer announce}
            set third-party {allow | disallow}
            set multicast-announcement {enable | disable}
            set announcement-count <integer>
            set intl-intf <string>
            set recycle-delay <integer>
        next
```

```
    end
end
```

`client-subnet <ip_address/subnet>`	Enter the IP address with subnet from which PCP requests are accepted.
`ext-intf <string>`	Enter the external interface name.
`extip <ip>[-<ip>]`	Enter the IP address or address range on the external interface to map to an address on the internal network.
`extport <port>[-<port>]`	Enter the incoming port number or port range to map to a port number on the internal network.
`minimal-lifetime <integer>`	Set the minimal lifetime of a PCP mapping, in seconds (60 - 300, default = 120).
`maximal-lifetime <integer>`	Set the maximal lifetime of a PCP mapping, in seconds (3600 - 604800, default = 86400).
`client-mapping-limit <integer>`	Mapping limit per client (0 - 65535, default = 0, 0 = unlimited).
`mapping-filter-limit <integer>`	Filter limit per mapping (0 - 5, default = 1).
`allow-opcode {map peer announce}`	Set the allowed PCP OpCode: • `map`: allow MAP OpCode • `peer`: allow PEER OpCode • `announce`: allow ANNOUNCE OpCode
`third-party {allow | disallow}`	Allow/disallow the third-party option.
`multicast-announcement {enable | disable}`	Enable/disable multicast announcements.
`announcement-count <integer>`	Set the number of multicast announcements (3 - 10, default = 3).
`intl-intf <string>`	Enter the internal interface name.
`recycle-delay <integer>`	Set the minimum delay the PCP server will wait before recycling mappings that have expired, in seconds (0 - 3600, default = 0).

The following topology is used to demonstrate two use cases of PCP mapping: with SNAT and DNAT.



Example 1: PCP mapping with SNAT

This example demonstrates how PCP mapping works with SNAT. In the FortiGate PCP server settings, the pcp-pool1 pool is applied in the firewall policy with `pcp-outbound` mode. A PCP request is sent from Client-1 to the

FortiGate to create PCP outbound mapping. When traffic is sent from Client-1 to Client-2, SNAT is performed by the PCP outbound mapping.

To configure the FortiGate as a PCP server:

1. Configure the PCP server settings:

```
config system pcp-server
    set status enable
    config pools
        edit "pcp-pool1"
            set client-subnet "10.1.100.41/32"
            set ext-intf "wan1"
            set extip 172.16.200.231
            set extport 50000-51000
            set intl-intf "wan2"
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 999
        set name "Outbound-pcp-policy999"
        set srcintf "wan2"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
        set pcp-outbound enable
        set pcp-poolname "pcp-pool1"
    next
end
```

To verify the configuration:

1. Generate a PCP peer request from Client-1 (10.1.100.41) to the FortiGate.
2. Verify the client's PCP request to the PCP server. In this example, an PCP client was installed on Ubuntu:

```
root@pc41:~# pcp -i 10.1.100.41:41111 -p 172.16.200.55:80 -s 10.1.100.8
```

3. On the FortiGate, verify the PCP outbound mappings list:

```
# diagnose firewall pcp-mapping list outbound
PCP outbound mappings (vdom=root):
pool:1 nonce:04307eb4037e0448317dc8b7 protocol:6 duration:8 lifetime:900 expiry:893
intl:10.1.100.41:41111 ext:172.16.200.231:50000 remote:172.16.200.55:80
```

4. Send HTTP traffic that passes through the FortiGate and access Client-2 (172.16.200.55:80) from Client-1.
5. On the FortiGate, verify the session list. The source IP address of Client-1 is translated to 172.16.200.231:50000, which follows the PCP outbound mapping:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=8 expire=3599 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00 pcp_outbound
statistic(bytes/packets/allow_err): org=1812/33/1 reply=124168/92/1 tuples=2
tx speed(Bps/kbps): 204/1 rx speed(Bps/kbps): 13998/111
orgin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=172.16.200.55/10.1.100.41
hook=post dir=org act=snat 10.1.100.41:41111->172.16.200.55:80(172.16.200.231:50000)
hook=pre dir=reply act=dnat 172.16.200.55:80->172.16.200.231:50000(10.1.100.41:41111)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=999 pol_uuid_idx=677 auth_info=0 chk_client_info=0 vd=0
serial=0000b4f8 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000001 no_offload
no_ofld_reason:  disabled-by-policy
total session 1
```

6. Send HTTP traffic that passes through the FortiGate and access another server from Client-1.
7. On the FortiGate, verify the session list. This time, the source IP address of Client-1 is not translated to 172.16.200.231:50000, since the traffic does not match the existing PCP outbound mapping:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=6 expire=3596 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=1449/26/1 reply=98808/72/1 tuples=2
tx speed(Bps/kbps): 215/1 rx speed(Bps/kbps): 14703/117
orgin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=172.16.200.155/10.1.100.41
hook=post dir=org act=snat 10.1.100.41:41111->172.16.200.155:80(172.16.200.8:41111)
hook=pre dir=reply act=dnat 172.16.200.155:80->172.16.200.8:41111(10.1.100.41:41111)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=999 pol_uuid_idx=677 auth_info=0 chk_client_info=0 vd=0
serial=0000b596 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
```

```
npu_state=0x4000001 no_offload
no_ofld_reason:  disabled-by-policy
total session 1
```

Example 2: PCP mapping with DNAT

This example demonstrates how PCP mapping works with DNAT. In the FortiGate PCP server settings, the pcp-pool1 pool is applied in the firewall policy with `pcp-inbound` mode. A PCP request is sent from Client-1 to the FortiGate to create PCP inbound mapping. When traffic is sent from Client-2 to access the external IP of Client-1 (172.16.200.231:50000), traffic passes by due to the PCP inbound mapping.

To configure the FortiGate as a PCP server:

1. Configure the PCP server settings:

```
config system pcp-server
    set status enable
    config pools
        edit "pcp-pool1"
            set client-subnet "10.1.100.41/32"
            set ext-intf "wan1"
            set extip 172.16.200.231
            set extport 50000-51000
            set intl-intf "wan2"
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 998
        set name "Inbound-pcp-policy998"
        set srcintf "wan1"
        set dstintf "wan2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
        set pcp-inbound enable
        set pcp-poolname "pcp-pool1"
    next
end
```

To verify the configuration:

1. Generate a PCP peer request from Client-1 (10.1.100.41) to the FortiGate.
2. Verify the client's PCP request to the PCP server. In this example, an PCP client was installed on Ubuntu:

```
root@pc41:~# pcp -i 10.1.100.41:80 -s 10.1.100.8
```

3. On the FortiGate, verify the PCP inbound mappings list:

```
# diagnose firewall pcp-mapping list inbound
PCP inbound mappings (vdom=root):
pool:1 nonce:35e2ff035b959f7a4e669791 protocol:6 duration:3 lifetime:900 expiry:900
intl:10.1.100.41:80 ext:172.16.200.231:50000
```

4. From Client-2 (172.16.200.55:80), send traffic that passes through the FortiGate and access the external IP of Client-1 (172.16.200.231:50000).
5. On the FortiGate, run a sniffer trace. The traffic is allowed through policy 998, and the destination IP:port is translated from 172.16.200.231:50000 to 10.1.100.41:80, which follows the PCP inbound mapping:

```
# diagnose sniffer packet any 'tcp and port 50000 or port 80' 4
interfaces=[any]
filters=[tcp and port 50000 or port 80]
2.959915 wan1 in 172.16.200.55.43284 -> 172.16.200.231.50000: syn 3480016601

2.996230 wan1 in 172.16.200.55.43284 -> 172.16.200.231.50000: ack 2813145876
2.996245 wan2 out 10.1.100.8.43284 -> 10.1.100.41.80: ack 2813145876
```

Only traffic matching the PCP inbound mapping will be forwarded by policy 998. Any other traffic is dropped.

Refreshing active sessions for specific protocols and port ranges per VDOM in a specified direction

Active sessions can be refreshed for specific protocols and port ranges per VDOM in a specified direction. This option can help prevent potential denial of service (DoS) attacks by controlling the direction of traffic that

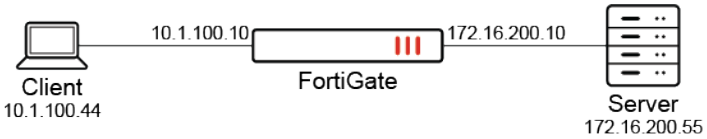
refreshes existing sessions.

```
config system session-ttl
    config port
        edit <id>
            set protocol <integer>
            set timeout <timeout_value>
            set refresh-direction {both | outgoing | incoming}
        next
    end
end
```

Setting the `refresh-direction` to `outgoing` will use the original direction, while `incoming` will use the reply direction. To refresh in both directions, select `both`.

Example

In this example, active sessions for UDP port 5001 will be refreshed in the incoming direction.



To refresh active sessions for UDP port 5001 in the incoming direction:

1. Configure the global session TTL timer:

```
config system session-ttl
    set default 3600
    config port
        edit 5001
            set protocol 17
            set timeout 5001
            set refresh-direction incoming
            set start-port 5001
            set end-port 5001
        next
    end
end
```

2. Send UDP 5001 traffic from the client to the server.
3. Verify the session table:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=77 expire=4923 timeout=5001 refresh_dir=reply
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty f00
```

```
statistic(bytes/packets/allow_err): org=58/2/1 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=18->17/17->18 gwy=172.16.200.55/0.0.0.0
hook=post dir=org act=snat 10.1.100.41:2041->172.16.200.55:5001(172.16.200.10:62458)
hook=pre dir=reply act=dnat 172.16.200.55:5001->172.16.200.10:62458(10.1.100.41:2041)
src_mac=00:0c:29:b6:e8:be  dst_mac=00:0c:29:92:89:96
misc=0 policy_id=99 pol_uuid_idx=1501 auth_info=0 chk_client_info=0 vd=0
serial=00005071 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session: 1
```

The timeout and refresh for the reply direction are attached to the session.

4. Send UDP 5001 traffic again from the client to the server.
5. Verify the diagnostics.
   a. Run the sniffer trace:

```
# diagnose sniffer packet any 'udp and port 5001' 4
interfaces=[any]
filters=[udp and port 5001]
3.387747 wan2 in 10.1.100.41.2041 -> 172.16.200.55.5001: udp 1
3.387757 wan1 out 172.16.200.10.62458 -> 172.16.200.55.5001: udp 1
^C
2 packets received by filter
0 packets dropped by kernel
```

   b. Verify the session table:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=119 expire=4881 timeout=5001 refresh_
dir=reply flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=116/4/1 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 1/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=18->17/17->18 gwy=172.16.200.55/0.0.0.0
hook=post dir=org act=snat 10.1.100.41:2041->172.16.200.55:5001(172.16.200.10:62458)
hook=pre dir=reply act=dnat 172.16.200.55:5001->172.16.200.10:62458(10.1.100.41:2041)
src_mac=00:0c:29:b6:e8:be  dst_mac=00:0c:29:92:89:96
misc=0 policy_id=99 pol_uuid_idx=1501 auth_info=0 chk_client_info=0 vd=0
serial=00005071 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session: 1
```

As the traffic flows from the client to the server (outgoing), the expiration timer continues to count down and is not refreshed.

6. Send reverse UDP 5001 traffic from the server to the client.
7. Verify the diagnostics again.
   a. Run the sniffer trace:

```
# diagnose sniffer packet any 'udp and port 62458 or port 2041' 4
interfaces=[any]
filters=[udp and port 62458 or port 2041]
3.237328 wan1 in 172.16.200.55.5001 -> 172.16.200.10.62458: udp 1
3.237339 wan2 out 172.16.200.55.5001 -> 10.1.100.41.2041: udp 1
^C
2 packets received by filter
0 packets dropped by kernel
```

   b. Verify the session table:

```
# diagnose sys session list
session info: proto=17 proto_state=01 duration=1710 expire=4995 timeout=5001 refresh_
dir=reply flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty f00

no_ofld_reason:  disabled-by-policy
total session: 1
```

   As the traffic flows from the server to the client (incoming), the expiration timer is refreshed.

Per-policy disclaimer messages

FortiOS supports a customizable captive portal to direct users to install or enable required software.

Per-policy custom disclaimers in each VDOM are supported. For example, you may want to configure three firewall policies, each of which matches traffic from endpoints with different FortiClient statuses:

Endpoint status	FortiOS behavior
Endpoint does not have FortiClient installed.	Traffic matches a firewall policy that displays an in-browser warning to install FortiClient from the provided link.

Endpoint status	FortiOS behavior
Endpoint has FortiClient installed, registered to EMS, and connected to the FortiGate.	Traffic matches a dynamic firewall policy which allows the endpoint to reach its destination via this policy.
Endpoint is deregistered from EMS and disconnected from the FortiGate.	Traffic matches another dynamic firewall policy that displays warning to register FortiClient to EMS.

The replacement message groups and policy disclaimer settings must be enabled.

To enable per-policy disclaimer messages in the GUI:

1. Go to *System* > *Feature Visibility*.
2. Enable *Replacement Message Groups* and *Policy Disclaimer*.
3. Click *Apply*.

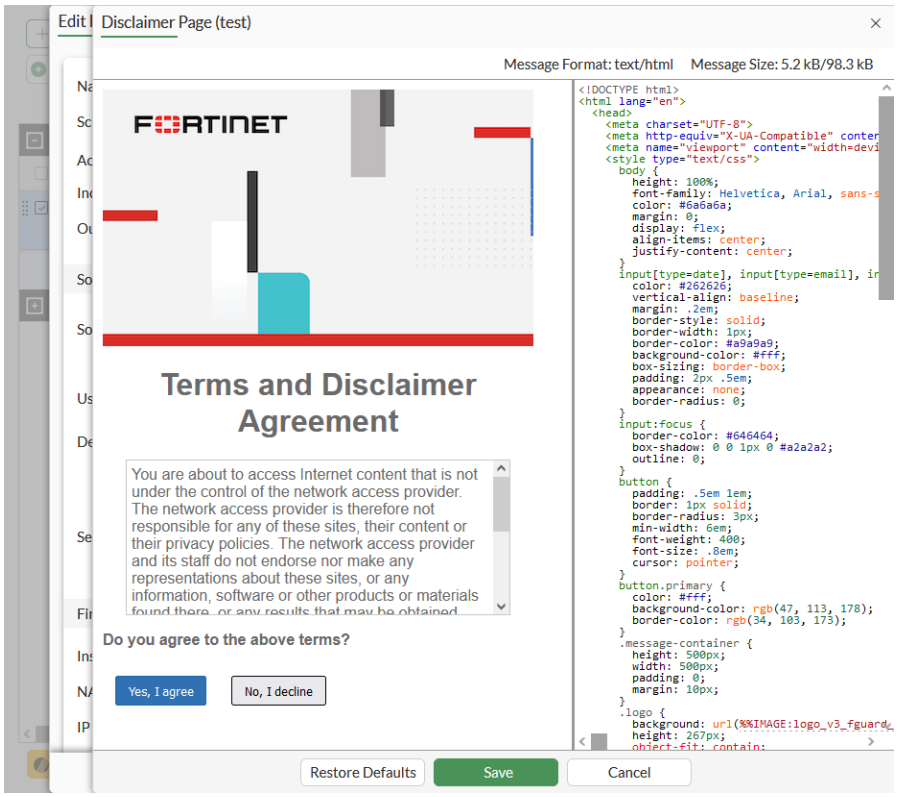
To enable per-policy disclaimer messages in the CLI:

```
config system global
    set gui-replacement-message-groups enable
end
```

```
config system settings
    set gui-policy-disclaimer enable
end
```

To configure per-policy disclaimers in the GUI:

1. Ensure the per-policy disclaimer messages option is enabled.
2. Go to *Policy & Objects* > *Firewall Policy*.
3. Edit the policy that applies when an endpoint does not have FortiClient installed.
4. Under *Disclaimer Options*, enable *Display Disclaimer* and *Customize Messages*.
5. Add a replacement message group:
   a. Select an existing replacement message group from the dropdown and click *Edit Disclaimer Message*.
   b. Click *Create*, enter a name, and click *OK*. Select the replacement message group and click *Edit Disclaimer Message*.



6. Edit the message to warn users to install FortiClient, and provide the FortiClient download link.
7. Click *Save*.
8. Repeat the above steps for each policy that requires a custom disclaimer message.

To configure per-policy disclaimers in the CLI:

```
config firewall policy
    edit 1
        set name "111"
        set srcintf "port12"
        set dstintf "port11"
        set srcaddr "all"
        set dstaddr "pc155_address"
        set action accept
        set schedule "always"
        set service "ALL"
        set wsso disable
        set groups "ems_03_group"
        set disclaimer enable
        set replacemsg-override-group "test"
        set nat enable
    next
    edit 4
        set name "44"
        set srcintf "port12"
        set dstintf "port11"
```

```
        set srcaddr "all"
        set dstaddr "pc5-address"
        set action accept
        set schedule "always"
        set service "ALL"
        set wsso disable
        set groups "ems_03_group"
        set disclaimer enable
        set replacemsg-override-group "test2"
        set nat enable
    next
    edit 6
        set name "66"
        set srcintf "port12"
        set dstintf "port11"
        set srcaddr "all"
        set dstaddr "all"
        set status disable
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set fsso disable
        set block-notification enable
        set replacemsg-override-group "endpoint-override"
    next
end
```

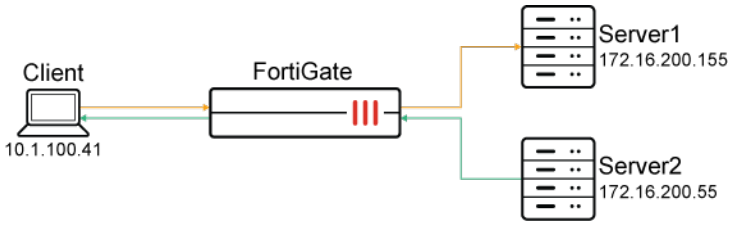
Full cone NAT for fixed port range IP pools

Full cone Network Address Translation (NAT) support is added for Fixed Port Range (FPR) IP pools. It allows all external hosts to send packets to internal hosts through a mapped external IP address and port, enhancing connectivity and communication efficiency. Full cone NAT is also known as Endpoint Independent Filtering (EIF).

To enable full cone NAT, enable the `permit-any-host` command when configuring the FPR IP pool.

```
config firewall ippool
    edit <name>
        set type fixed-port-range
        set permit-any-host {enable | disable}
    next
end
```

Only UDP is supported for full cone NAT.



In this example, a NAT44 FPR IP pool with `permit-any-host` enabled is created and applied to a policy. The packet is sent from Client1 to Server1 that hits the policy. The session list is checked for the NAT IP address and port, 172.16.201.3 and 1033. The expectation session list is checked to see that the session will be used to allow access to the NAT IP address and port from any other external host, such as Server2. The packet sent from Server2 to the NAT IP address and port is forwarded to Client1.

To configure and check the full cone IP pool:

1. Create an IP pool with full cone NAT:

```
config firewall ippool
    edit "test-new-fpr-ippool-1"
        set type fixed-port-range
        set startip 172.16.201.3
        set endip 172.16.201.4
        set startport 1024
        set endport 1087
        set source-startip 10.1.100.41
        set source-endip 10.1.100.42
        set port-per-user 64
        set permit-any-host enable
        set comments "test"
    next
end
```

2. Use the IP pool with full cone NAT in a policy:

```
config firewall policy
    edit 7
        set name "policy-fpr-ippool"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
        set ippool enable
        set poolname "test-new-fpr-ippool-1"
    next
end
```

3. Check the session list:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=65 expire=175 timeout=0 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=5
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=58/2/1 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=0.0.0.0/0.0.0.0
hook=post dir=org act=snat 10.1.100.41:20041->172.16.200.155:2156(172.16.201.3:1033)
hook=pre dir=reply act=dnat 172.16.200.155:2156->172.16.201.3:1033(10.1.100.41:20041)
misc=0 policy_id=7 pol_uuid_idx=8173 auth_info=0 chk_client_info=0 vd=0
serial=0001fb57 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session: 1
```

4. Check the expectation session list:

```
# diagnose sys session list expectation
session info: proto=17 proto_state=00 duration=74 expire=-44 timeout=0 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=2
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=255/255
state=new log f31
statistic(bytes/packets/allow_err): org=0/0/0 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=dnat 10.1.100.41:0->172.16.201.3:1033(10.1.100.41:0)
hook=pre dir=org act=noop 0.0.0.0:0->0.0.0.0:0(0.0.0.0:0)
misc=0 policy_id=7 pol_uuid_idx=8173 auth_info=0 chk_client_info=0 vd=0
serial=0001fb57 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  new disabled-by-policy

session info: proto=17 proto_state=00 duration=74 expire=-44 timeout=0 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=2
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=1 tunnel=/ vlan_cos=255/255
state=new log f31
statistic(bytes/packets/allow_err): org=0/0/0 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=0->8/8->0 gwy=0.0.0.0/0.0.0.0
```

```
hook=pre dir=org act=dnat 0.0.0.0:0->172.16.201.3:1033(10.1.100.41:20041)
hook=pre dir=org act=noop 0.0.0.0:0->0.0.0.0:0(0.0.0.0:0)
misc=0 policy_id=7 pol_uuid_idx=8173 auth_info=0 chk_client_info=0 vd=0
serial=0001fb57 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  new disabled-by-policy
```

5. Check that the packet sent from Server2 to the NAT IP address and port number is forwarded to Client1:

```
# diagnose sniffer packet any 'udp and port 1033 or 20041' 4
interfaces=[any]
filters=[udp and port 1033 or 20041]
12.001145 port1 in 172.16.200.55.4155 -> 172.16.201.3.1033: udp 4
12.001180 port2 out 172.16.200.55.4155 -> 10.1.100.41.20041: udp 4

2 packets received by filter
0 packets dropped by kernel
```

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=234 expire=1734 timeout=0 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=4
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=1 tunnel=/ vlan_cos=255/255
state=log intree
statistic(bytes/packets/allow_err): org=32/1/0 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=7->8/8->7 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=dnat 172.16.200.55:4155->172.16.201.3:1033(10.1.100.41:20041)
hook=post dir=reply act=snat 10.1.100.41:20041->172.16.200.55:4155(172.16.201.3:1033)
misc=0 policy_id=7 pol_uuid_idx=8173 auth_info=0 chk_client_info=0 vd=0
serial=0001fb57 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
```

Address objects

Addresses define sources and destinations of network traffic and can be used in many functions such as firewall policies, ZTNA, etc.

To view the possible uses list of address object usage:

1. Go to *Policy & Objects* > *Addresses*.
2. Click the number under *Ref*. The *Usage of Address:<Predefined address>* pane opens, where *<Predefined address>* is one of the predefined addresses, such as SSLVPN_TUNNEL_ADDR1.

3. In the *Usage of Address:<Predefined address>* pane, click *Possible Uses* to view the list.

When properly set up, these address objects can be used with great flexibility to make the configuration of different functions simpler and more intuitive. When used in a firewall policy, the FortiGate compares the IP addresses contained in packet headers with a policy's source and destination addresses to determine if the policy matches the traffic. The matching of IP addresses in packet headers is also performed for other FortiGate functions configured with address objects.

Address Types

When creating an IPv4 address, there are several different types of addresses that can be specified. Which one is chosen will depend on which method most easily yet accurately describes the addresses that you are trying to include with as few entries as possible based on the information that you have. For instance, if you are trying to describe the addresses of a specific company's web server but do not know how extensive their web server farm is, you would be more likely to use a Fully Qualified Domain Name (FQDN) rather than a specific IP address. On the other hand, some computers do not have FQDNs and a specific IP address must be used.

The following table provides a short description of the different types of addresses:

Address type	Description
Subnet	The subnet type of address is expressed using a host address and a subnet mask. This is the most flexible of the address types because the address can refer to as little as one individual address (x.x.x.x/32) or as many as all of the available addresses (0.0.0.0/0). See Subnet on page 1747 and Dynamic policy — Fabric devices on page 1748 for more information.
IP range	The IP range type can be used to define a continuous set of IP addresses between one specific IP address and another (inclusive). It is a flexible way to describe a continuous set of addresses while being specific and granular, without needing to fall within the boundaries of standard subnets. See IP range on page 1751 for more information.
FQDN	The Fully Qualified Domain Name (FQDN) address type accepts an address string and resolves it to one or more IP addresses. It relies on DNS to keep up with address changes without having to manually change the IP addresses on the FortiGate. See FQDN addresses on page 1751 for more information. FQDN can also be specified as wildcard addresses such as *.example.com. See Using wildcard FQDN addresses in firewall policies on page 1752 for more information.
Geography	Geography addresses are those determined by the country/region of origin. The IPs for the country/region is automatically determined from the Geography IP database. See Geography based addresses on page 1755 and IPv6 geography-based addresses on page 1758 for more information.

Address type	Description
Dynamic	Dynamic address objects are collections of addresses that are integrated from different external sources or other modules within the FortiGate. They can be used in policies that support the dynamic address type and come in different subtypes. • ClearPass: IP addresses gathered from the ClearPass Policy Manager. See ClearPass integration for dynamic address objects on page 1771 for more information. • Device & OS Identification: MAC addresses gathered from device detection that can be filtered by hardware vendor, model, OS, and OS version. See MAC address-based policies on page 1781 for more information. • Fabric Connector Address: IP addresses retrieved from SDN connectors, such as public and private cloud connectors. See Getting started with public and private SDN connectors on page 3983 for more information. • FortiNAC Tag: IP addresses collected from FortiNAC. See FortiNAC tag dynamic address on page 1774 for more information. • FortiVoice Tag: IP and MAC addresses collected from FortiVoice. See FortiVoice tag dynamic address on page 1777 for more information. • FortiPolicy Tag: IP addresses pushed from FortiPolicy. See Configuring FortiPolicy on page 3776 for more information. • Fortinet Single Sign-On (FSSO): IP addresses of authenticated users from a FSSO collector agent, CPPM by FortiManager, or FortiNAC. See FSSO dynamic address subtype on page 1767 for more information. • RADIUS Single Sign-On (RSSO): IP address of the RADIUS single sign-on user matching the group value. See RSSO dynamic address subtype on page 1787 for more information. • Switch Controller NAC Policy Tag: MAC addresses collected from NAC policies.
Device (Mac address)	A MAC address is a link layer-based address type and it cannot be forwarded across different IP segments. In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range. See MAC address-based policies on page 1781, Adding MAC-based addresses to devices on page 133, ISDB well-known MAC address list on page 1783, and IPv6 MAC addresses and usage in firewall policies on page 1785 for more information.
Wildcard (CLI only)	Wildcard addresses are addresses that identify ranges of IP addresses, reducing the amount of firewall addresses and security policies required to match some of the traffic on your network. See Wildcard addressing on page 1760 for more information.

Address type	Description
Interface subnet (CLI only)	For all interfaces set to a LAN or DMZ role, an option is available and enabled by default to automatically create an address object for the connected network. If the interface's subnet changes, the address object subnet changes too. See Interface subnet on page 1761 for more information.

Address Group

Address groups are designed for ease of use in the administration of the device. If you have several addresses or address ranges that will commonly be treated the same or require the same security policies, you can put them into address groups, rather than entering multiple individual addresses in each policy that refers to them.

There are two different types of address groups and the following table provides a short description of each type:

Address group type	Description
Group	Members of an address group type group can belong to multiple address groups. See Address group on page 1763, Allow empty address groups on page 1765, and Address group exclusions on page 1766 for more information.
Folder	Members or an address group type folder can only belong to a single address folder. See Address folders on page 1763 for more information.

When an address group with no members is configured in a firewall policy, the policy will not match any traffic and will just match the implicit deny policy. See Allow empty address groups on page 1765 for more information.

Subnet

A subnet address object is usually used to refer internal networks or addresses which are defined by the network administrator.

A subnet address usually consists of a network address and a netmask, for example, 192.168.1.0 255.255.255.0. In this example, the network address is 192.168.1.0 and the netmask is 255.255.255.0. The network address defines the network to match and the netmask specify the IP address to match on the network.

In the above example, the subnet address 192.168.1.0 255.255.255.0 would match the following IP addresses:

```
192.168.1.1
192.168.1.2
192.168.1.3
```

```
...
192.168.1.255
```

For defining a subnet address object the valid format of IP address and netmask could be either:

`x.x.x.x/x.x.x.x`, such as 192.168.1.0/255.255.255.0

or

`x.x.x.x/x`, such as 192.168.1.0/24

To define a single address using subnet, use the netmask 255.255.255.255 or /32. A warning message will be shown if any other netmask is used and will not let the user save the address object.

To create a subnet address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Select *Create new*.
3. Enter a *Name* for the address object.
4. In the *Type* field, select *Subnet* from the dropdown menu.
5. In the *IP/Netmask* field, enter the address and subnet mask according to the format x.x.x.x/x.x.x.x or the short hand format of x.x.x.x/x
6. In the *Interface* field, leave as the default *any* or select a specific interface from the dropdown menu.
7. Enable/disable *Static route configuration*.
8. Enter any additional information in the *Comments* field.
9. Click *OK*.

Dynamic policy — Fabric devices

The dynamic address group represents the configured IP addresses of all Fortinet devices connected to the Security Fabric. It currently includes FortiManager, FortiAnalyzer, FortiClient EMS, FortiMail, FortiAP(s), and FortiSwitch(es). Like other dynamic address groups for fabric connectors, it can be used as an IPv4 address in firewall policies and objects.

The list of firewall addresses includes a default address object called `FABRIC_DEVICE`. You can apply the `FABRIC_DEVICE` object to the following types of policies:

- Firewall policy, including virtual wire pairs, NAT 46, and NAT 64 (IPv4 only)
- IPv4 shaping policy
- IPv4 ACL policy
- Security policy (NGFW mode)

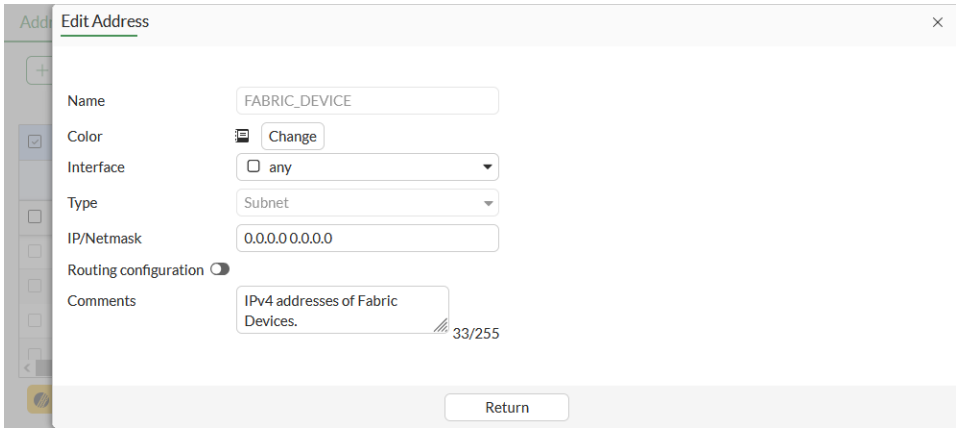
You cannot apply the `FABRIC_DEVICE` object to the following types of policies:

- IPv4 explicit proxy policy

You also cannot use the `FABRIC_DEVICE` object with the following settings:

- Custom extension on `internet-service`
- Exclusion of `addrgrp`

Initially the `FABRIC_DEVICE` object does not have an address value. The address value is populated dynamically as things change. As a result, you cannot edit the `FABRIC_DEVICE` object, add any addresses to the object, or remove any addresses from the object. The *Edit Address* pane in the GUI only has a *Return* button because the object is read-only:



The `FABRIC_DEVICE` object address values are populated based on:

- FortiAnalyzer IP (from the *Fabric Settings* pane)
- FortiManager IP (from the *Fabric Settings* pane)
- FortiMail IP (from the *Fabric Settings* pane)
- FortiClient EMS IP (from the *Fabric Settings* pane)
- FortiAP IPs (from the *FortiAP Setup* pane or DHCP)
- FortiSwitch IPs (from the *FortiSwitch Setup* page or DHCP)

To apply the FABRIC_DEVICE object to a firewall policy using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a new policy or edit an existing policy.
3. For the *Destination* field, select *FABRIC_DEVICE* from the list of address entries.
4. Configure the rest of the policy as needed.
5. Click *OK*.

To apply the FABRIC_DEVICE object to a firewall policy using the CLI:

```
config firewall address
    edit "FABRIC_DEVICE"
        set type ipmask
        set comment "IPv4 addresses of Fabric Devices."
        set visibility enable
        set associated-interface ''
        set color 0
        set allow-routing disable
        set subnet 0.0.0.0 0.0.0.0
```

```
    next
end
```

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "FABRIC_DEVICE"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set fsso disable
        set nat enable
    next
end
```

Diagnose commands

You can run diagnose commands to list IP addresses of Fortinet devices that are configured in the Security Fabric or used in a security policy.

To view the IP addresses of Fabric devices:

```
(root) # diagnose firewall sf-addresses list

FabricDevices: 172.18.64.48
FortiAnalyzer: 172.18.60.25
FortiSandbox: 172.18.52.154
FortiManager: 172.18.28.31
FortiClientEMS: 172.18.62.6
FortiAP:
FortiSwitch:
FortiAP/SW-DHCP:
```

To view which IP addresses are used in a security policy:

```
(root) # diagnose ips pme fabric-address list
VDOM 0:
- builtin [mask=0x1e]:
  - type=4: 172.18.62.213
  - type=4: 172.18.62.219
  - type=2: 172.18.70.82
- query:
  - 168.254.1.2
  - 0.0.0.0
  - 168.254.1.2
```

IP range

The IP range type of address can describe a group of addresses while being specific and granular. It does this by specifying a continuous set of IP addresses between one specific IP address and another.

The format would be:

`x.x.x.x-x.x.x.x`, such as 192.168.110.100-192.168.110.120

To create an IP range address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Select *Create new*.
3. Enter a *Name* for the address object.
4. In the *Type* field, select *IP Range* from the dropdown menu.
5. In the *IP Range* field, enter the range of addresses in the following format: x.x.x.x-x.x.x.x (no spaces)
6. In the *Interface* field, leave as the default any or select a specific interface from the drop down menu.
7. Enter any additional information in the *Comments* field.
8. Click *OK*.

FQDN addresses

By using Fully Qualified Domain Name (FQDN) addressing you can take advantage of the dynamic ability of DNS to keep up with address changes without having to manually change the addresses on the FortiGate. FQDN addresses are most often used with external web sites but they can be used for internal web sites as well if there is a trusted DNS server that can be accessed. FQDN addressing also comes in handy for large web sites that may use multiple addresses and load balancers for their web sites. The FortiGate firewall automatically maintains a cached record of all the addresses resolved by the DNS for the FQDN addresses used.

For example, if you were doing this manually and you wanted to have a security policy that involved Google, you could track down all of the IP addresses that they use across multiple countries. Using the FQDN address is simpler and more convenient.

When representing hosts by an FQDN, the domain name can also be a subdomain, such as mail.example.com.

Valid FQDN formats include:

- <host_name>.<top_level_domain_name>, such as example.com
- <host_name>.<second_level_domain_name>.<top_level_domain_name>, such as mail.example.com.

The FortiGate firewall keeps track of the DNS TTLs so as the entries change on the DNS servers the IP address will effectively be updated for the FortiGate. As long as the FQDN address is used in a security policy, it stores the address in the DNS cache.

There is a possible security downside to using FQDN addresses. Using a fully qualified domain name in a security policy means that your policies are relying on the DNS server to be accurate and correct. Should the DNS server be compromised, security policies requiring domain name resolution may no longer function properly.

To create a Fully Qualified Domain Name address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Select *Create new*.
3. Enter a *Name* for the address object.
4. In the *Type* field, select *FQDN* from the dropdown menu.
5. Enter the domain name in the *FQDN* field.
6. In the *Interface* field, leave as the default *any* or select a specific interface from the dropdown menu.
7. Enable/disable *Static route configuration*.
8. Enter any additional information in the *Comments* field.
9. Click *OK*.

Using wildcard FQDN addresses in firewall policies

You can use wildcard FQDN addresses in firewall policies. IPv4, IPv6, ACL, local, shaping, NAT64, NAT46, and NGFW policy types support wildcard FQDN addresses. Wildcard FQDN addresses can also be used in Web and FTP proxy policies for FortiGate firewalls.

For wildcard FQDN addresses to work, the FortiGate should allow DNS traffic to pass through.

Initially, the wildcard FQDN object is empty and contains no addresses. When the client tries to resolve a FQDN address, the FortiGate will analyze the DNS response. The IP address(es) contained in the answer section of the DNS response will be added to the corresponding wildcard FQDN object. It is therefore necessary to have the DNS session-helpers defined in the `config system session-helper` setting.

Since FortiGate must analyze the DNS response, it does not work with DNS over HTTPS.

In FortiOS 7.0 and later, FortiGate supports DNS over TLS. It is possible to analyze DNS responses sent over DoT, as long as there is a firewall policy that allows the DNS traffic from the client and is configured with a DNS filter that supports DoT. For information on configuring this, see DNS inspection with DoT and DoH on page 2065.

When the wildcard FQDN gets the resolved IP addresses, FortiOS loads the addresses into the firewall policy for traffic matching.

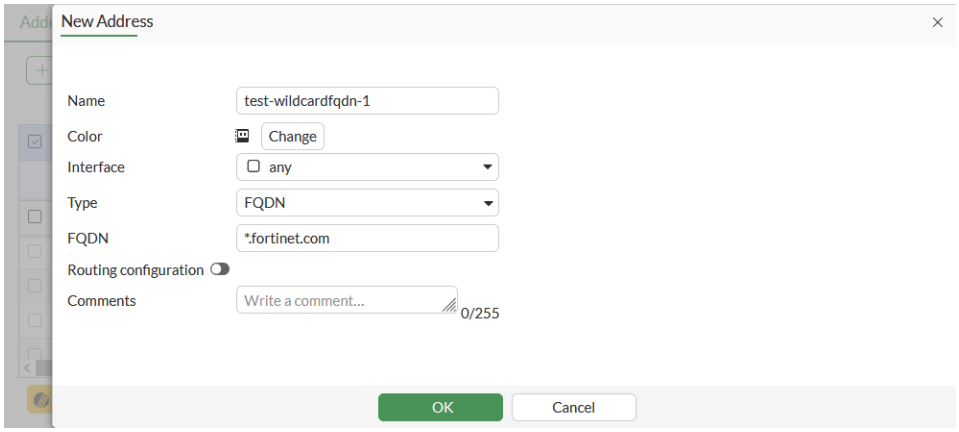
The FortiGate will keep the IP addresses in the FQDN object table as long as the DNS entry itself has not expired. Once it expires, the IP address is removed from the wildcard FQDN object until another query is made. At any given time, a single wildcard FQDN object may have up to 1000 IP addresses.

The DNS expiry TTL value is set by the authoritative name server for that DNS record. If the TTL for a specific DNS record is very short and you would like to cache the IP address longer, then you can extend it with the CLI. See To extend the TTL for a DNS record in the CLI: on page 1754

Wildcard FQDN IPs are synchronized to other autoscale members whenever a peer learns of a wildcard FQDN address.

To create a wildcard FQDN using the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Specify a *Name*.
4. For *Type*, select *FQDN*.
5. For *FQDN*, enter a wildcard FQDN address, for example, `*.fortinet.com`.



6. Click *OK*.

To use a wildcard FQDN in a firewall policy using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. For *Destination*, select the wildcard FQDN.
3. Configure the rest of the policy as needed.
4. Click *OK*.

To create a wildcard FQDN using the CLI:

```
config firewall address
    edit "test-wildcardfqdn-1"
        set type fqdn
        set fqdn "*.fortinet.com"
    next
end
```

To use wildcard FQDN in a firewall policy using the CLI:

```
config firewall policy
    edit 2
        set srcintf "port3"
```

```
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "test-wildcardfqdn-1"
        set action accept
        set schedule "always"
        set service "ALL"
        set auto-asic-offload disable
        set nat enable
    next
end
```

To use the diagnose command to list resolved IP addresses of wildcard FQDN objects:

```
# diagnose firewall fqdn list
List all FQDN:
*.fortinet.com: ID(48) ADDR(96.45.36.159) ADDR(192.168.100.161) ADDR(65.39.139.161)
```

Alternatively:

```
# diagnose test application dnsproxy 6
worker idx: 0
vfid=0 name=*.fortinet.com ver=IPv4  min_ttl=3266:0, cache_ttl=0 , slot=-1, num=3, wildcard=1
      96.45.36.159 (ttl=68862:68311:68311) 192.168.100.161 (ttl=3600:3146:3146) 65.39.139.161
(ttl=3600:3481:3481)
```

To use the diagnose command for firewall policies which use wildcard FQDN:

```
# diagnose firewall iprope list 100004
...
destination fqdn or dynamic address (1):*.fortinet.com ID(48) uuid_idx=57 ADDR(208.91.114.104)
ADDR(208.91.114.142) ADDR(173.243.137.143) ADDR(65.104.9.196) ADDR(96.45.36.210)
...
```

To extend the TTL for a DNS record in the CLI:

The TTL for DNS records can be configured globally, or for a specific FQDN address. If it is configured for an FQDN address, that setting will supersede the global setting for that address. See Important DNS CLI commands on page 289 for information about configuring a global TTL.

In this the example the `set cache-ttl` value has been extended to 3600 seconds.

```
config firewall address
    edit "fortinet.com"
        set type fqdn
        set fqdn "www.fortinet.com"
        set cache-ttl 3600
    next
end
```

Geography based addresses

Geography addresses are those determined by country of origin. The IP for the country or region is automatically determined from the Geography IP database.

To view IP Geography database:

```
#diagnose autoupdate versions | grep -A 6 "IP Geography DB"
IP Geography DB
---------
Version: 3.00152
Contract Expiry Date: n/a
Last Updated using manual update on Thu Nov 17 17:52:00 2022
Last Update Attempt: Wed Nov 23 10:56:46 2022
Result: No Updates
```

Without a valid license, local IP geography database will continue to work. However the FortiGate will stop receiving geography IP updates from the FortiGuard servers and the geography IP database will no longer be updated. IP geolocation service is part of base services included with all FortiCare support contracts. See FortiGuard Security Services for more information.

To create a geography address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Select *Create new*.
3. Enter a *Name* for the address object.
4. In the *Type* field, select *Geography* from the dropdown menu.
5. In the *Country/Region* field, select a single country from the dropdown menu.
6. In the *Interface* field, leave as the default *any* or select a specific interface from the dropdown menu.
7. Enter any additional information in the *Comments* field.
8. Click *OK*.

Overrides

It is possible to assign a specific IP address range to a customized country ID. Generally, geographic addressing is done at the VDOM level; it could be considered global if you are using the root VDOM, but the `geoip-override setting` is a global setting.

To configure a geography IP override:

1. Assign a specific IP address range to a customized country ID:

```
config system geoip-override
    edit "MyCustomCountry"
```

```
        config ip-range
            edit 1
                set start-ip 1.1.1.1
                set end-ip 1.1.1.2
            next
        end
    next
end
```

2. Use get sys geoip-country XX to determine the name corresponding to the custom 2-digit country code A0:

```
# get sys geoip-country A0
id                  : A0
name                : MyCustomCountry
```

3. Show the full configuration of the geography IP override just created to show that it corresponds to country code A0:

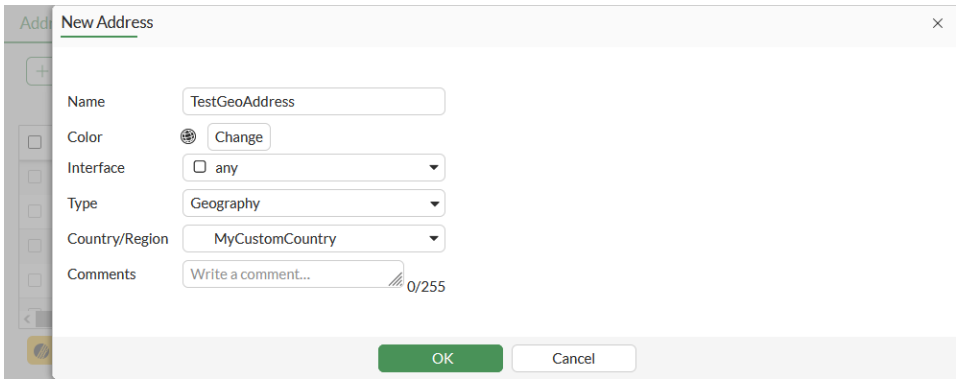
```
# show full sys geoip-override
config system geoip-override
    edit "MyCustomCountry"
        set description ''
        set country-id "A0"
        config ip-range
            edit 1
                set start-ip 1.1.1.1
                set end-ip 1.1.1.2
            next
        end
    next
end
```

To configure a geography address:

1. Enable debug to display the CLI commands running on the backend in response to certain GUI configuration:

```
# diagnose debug enable
# diagnose debug cli 7
Debug messages will be on for 30 minutes.
```

2. Go to *Policy & Objects > Addresses* and create a geography address using the previously created custom country code:



3. Observe the corresponding CLI commands run on the backend:

```
FGT # 0: config firewall address
0: edit "TestGeoAddress"
0: set type geography
0: set country "A0"
0: end
```

Diagnose commands

There are a few diagnose commands used with geographic addresses:

```
diagnose firewall ipgeo [country-list | ip-list | ip2country | override | copyright-notice]
```

Diagnose command	Description
country-list	List of all countries.
ip-list	List of the IP addresses associated with the country.
ip2country	Used to determine the physical and registered locations of the IP address as well and if the type is anycast.
override	List of user defined geography data; items configured with the `config system geoip-override` command.
copyright-notice	Shows the copyright notice.

```
diagnose geoip [geoip-query | ip2country | iprange]
```

Diagnose command	Description
geoip-query	Used to determine the complete geolocation of a specific IP address from the FortiGuard IP Geography DB.
ip2country	Used to determine which country a specific IP address is assigned to.
Iprange	List the IP addresses or IP ranges associated with the country.

For more details and examples using these diagnose commands, see the Fortinet Community article Technical Tip: Commands to verify GeoIP information and troubleshoot GeoIP database.

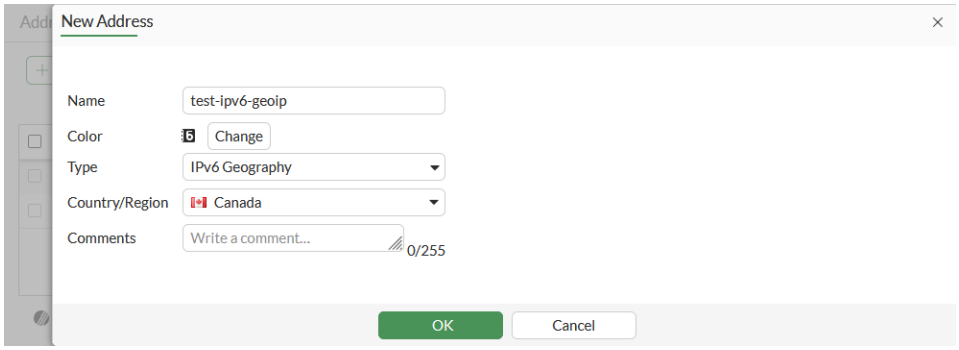
IPv6 geography-based addresses

Geography-based IPv6 addresses can be created and applied to IPv6 firewall policies.

IPv6 geography-based addresses do not support `geoip-override` or `geoip-anycast`.

To create an IPv6 geography-based address in the GUI:

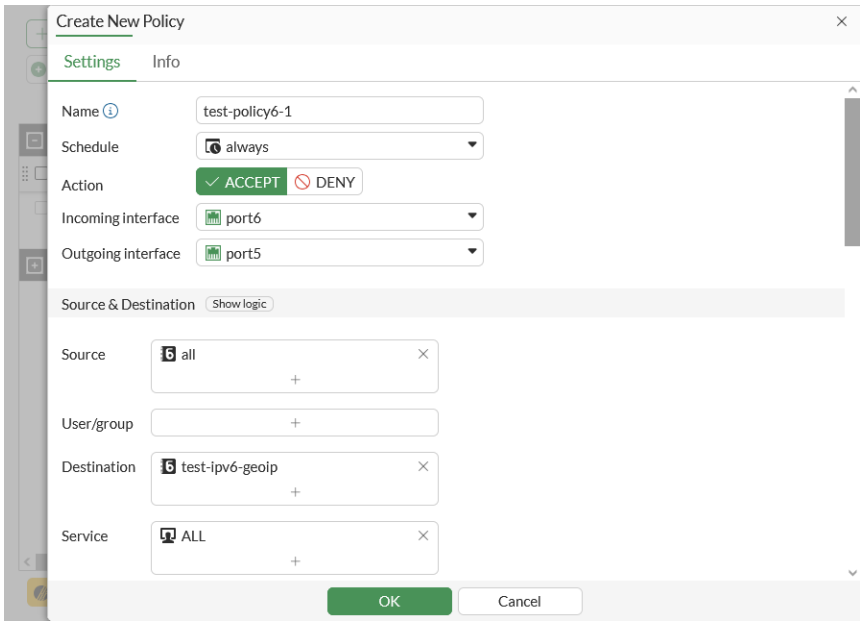
1. Go to *Policy and Objects* > *Addresses* and select *IPv6 Address*.
2. Click *Create new*.
3. Enter a name for the address.
4. Set *Type* to *IPv6 Geography*.
5. Select the *Country/Region* from the list.
6. Optionally, enter comments.



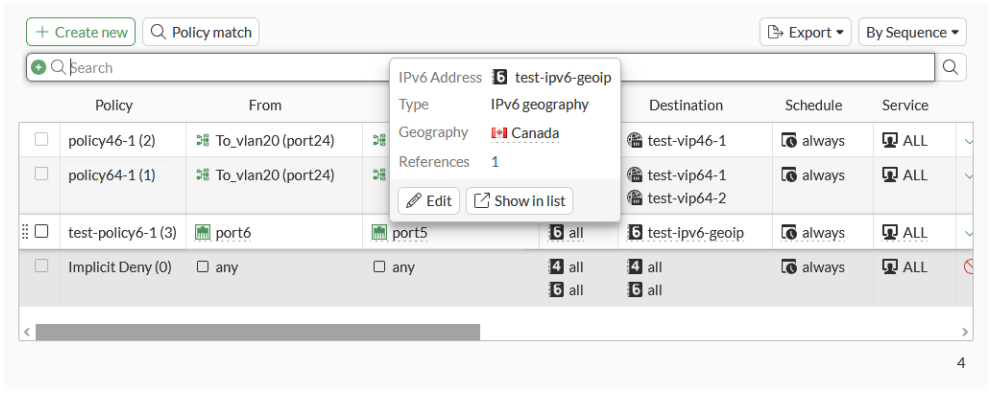
7. Click *OK*.

To use the IPv6 geography address in a policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit an existing policy, or create a new one, using the IPv6 geography address as the *Source* or *Destination Address*.



3. In the policy list, hover over the address to view details.



To configure an IPv6 geography-based address in the CLI:

1. Create an IPv6 geography-based address:

```
config firewall address6
    edit "test-ipv6-geoip"
        set type geography
        set color 6
        set comment "IPv6 Geography address"
        set country "CA"
    next
end
```

2. Use the IPv6 geography-based address in a policy:

```
config firewall policy
    edit 1
        set name "test-policy6-1"
```

```
        set srcintf "port6"
        set dstintf "port5"
        set srcaddr6 "all"
        set dstaddr6 "test-ipv6-geoip"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Wildcard addressing

Wildcard addresses are addresses that identify ranges of IP addresses, reducing the amount of firewall addresses and security policies required to match some of the traffic on your network. Wildcard addresses are an advanced feature, usually required only for complex networks with complex firewall filtering requirements. By using these wildcard addresses in the firewall configuration, administrators can eliminate creating multiple, separate IP based address objects and then grouping them to then apply to multiple security policies.

A wildcard address consists of an IP address and a wildcard netmask, for example, 192.168.0.56 255.255.0.255. In this example, the IP address is 192.168.0.56 and the wildcard netmask is 255.255.0.255. The IP address defines the networks to match and the wildcard netmask defines the specific addresses to match on these networks.

In a wildcard netmask, zero denotes ignoring the value of the octet in the IP address. This means the wildcard firewall address matches any number in this address octet. This also means that the number included in this octet of IP address is ignored and can be any number. Usually, if the octet in the wildcard netmask is zero, the corresponding octet in the IP address is also zero.

In a wildcard netmask, a number denotes matching addresses according to how the numbers translate into binary addresses. For example, the wildcard netmask is 255; the wildcard address will only match addresses with the value for this octet that is in the IP address part of the wildcard address. So, if the first octet of the IP address is 192 and the first octet of the wildcard netmask is 255, the wildcard address will only match addresses with 192 in the first octet.

In the above example, the wildcard address 192.168.0.56 255.255.0.255 would match the following IP addresses:

```
192.168.0.56
192.168.1.56
192.168.2.56
...
192.168.255.56
```

The wildcard addresses 192.168.0.56 255.255.0.255 and 192.168.1.56 255.255.0.255 define the same thing since the 0 in the wildcard mask means to match any address in the third octet.

The following is an example of how to configure a wildcard firewall address.

```
config firewall address
    edit example_wildcard_address
```

```
        set type wildcard
        set wildcard 192.168.0.56 255.255.0.255
    next
end
```

Wildcard firewall addresses are initially configured in the CLI. You cannot choose wildcard in the GUI when creating the address, but after the address is created in the CLI, it will show up in the GUI. The *Type* field shows a grayed-out value of *Wildcard* and the settings, other than the *Type*, can be edited.

Interface subnet

Interface subnet address type enables an address object to be created automatically for the interface with which it is associated. Once created, the address object is updated when the interface IP/netmask changes on the associated interface.

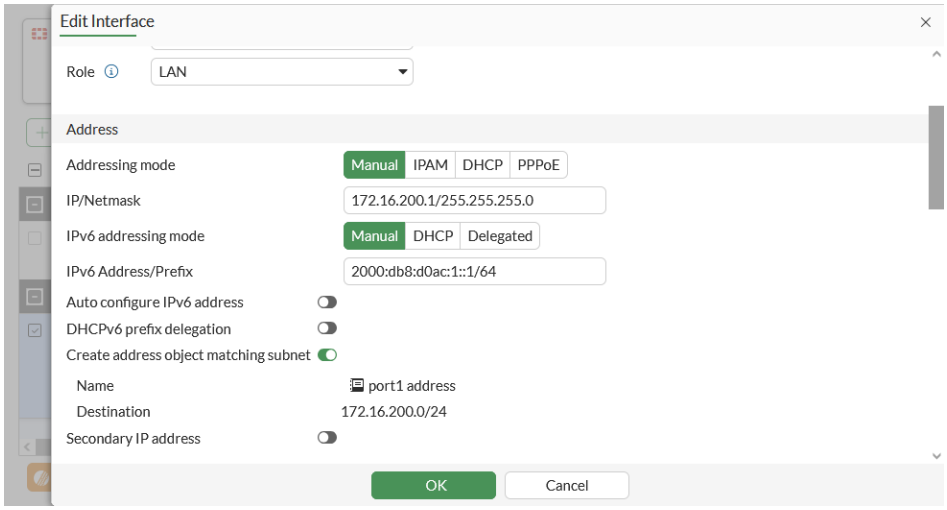
To create the interface subnet address type object, create or edit an interface under *Network* > *Interfaces*, and enable the *Create address object matching subnet* option.

The *Create address object matching subnet* option is automatically enabled and displayed in the GUI when *Role* is set to *LAN* or *DMZ*.

When you disable the *Create address object matching subnet* option, the feature is disabled, and the associated firewall address is deleted.

To create an interface subnet:

1. Go to *Network* > *Interfaces*.
2. Select *Create New* > *Interface* or select existing interface and *Edit*.
3. Set *Role* to either *LAN* or *DMZ*.
4. Verify that *Create address object matching subnet* is available and automatically enabled.



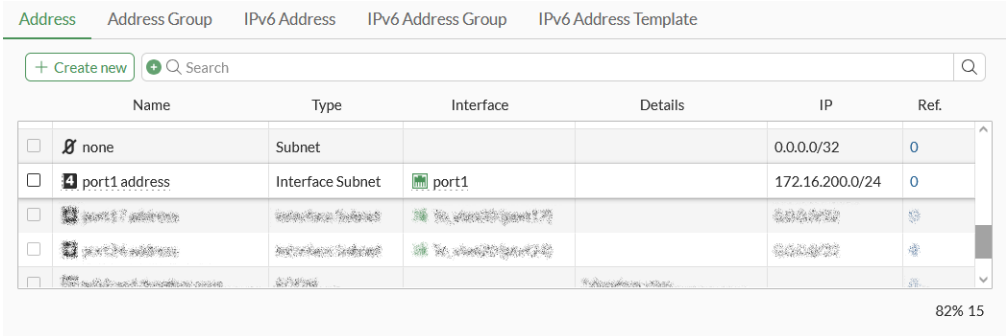
5. Click *OK*.

The following is an example of how to configure an interface subnet firewall address on the CLI:

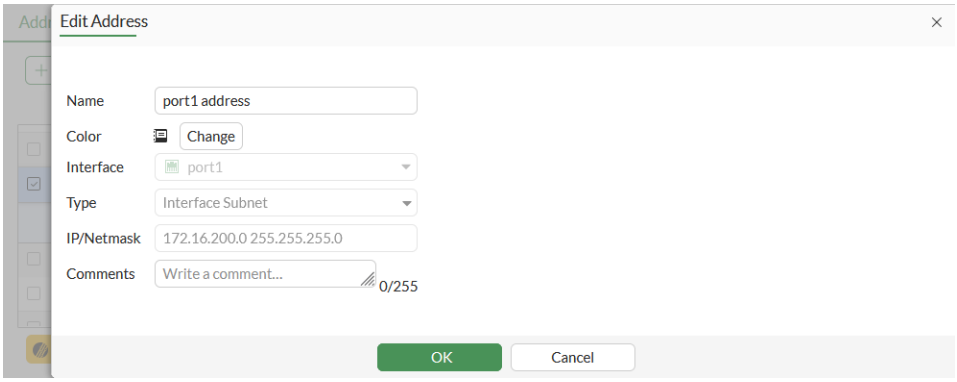
```
config firewall address
    edit "port1 address"
        set type interface-subnet
        set interface "port1"
    next
end
```

Interface subnet addresses are automatically created when *Role* is set to *LAN* or *DMZ* in the *Interface* page, or you can manually configure interface subnet addresses in the CLI. You cannot choose *Interface Subnet* in the GUI when creating the address, but after the address is created, *Interface Subnet* displays in the GUI. However, all the settings are grayed out, except *Name* and *Comments*, which can be edited.

When *Role* is set to *LAN* or *DMZ* in the *Interface* page, the new address object displays on the *Policy & Objects* > *Address* page.



After the address is created, the subnet is dynamically assigned to the address object, which can be seen in both GUI and CLI. If the interface address changes, the subnet will update dynamically.



```
config firewall address
    edit "port1 address"
        set type interface-subnet
        set subnet 172.16.200.0 255.255.255.0
        set interface "port1"
    next
end
```

Address group

The use of groups is not mandatory. However, adding individual addresses to a policy sometimes becomes tedious. If you use several different addresses with a given policy, these address objects can be grouped into an address group as it is much easier to add or subtract addresses from the group.

Security policies require addresses with homogenous network interfaces. Therefore, address groups should contain only addresses bound to the same network interface or Any.

For example, if address 1.1.1.1 is associated with port1, and address 2.2.2.2 is associated with port2, they cannot be in the same group. However, if 1.1.1.1 and 2.2.2.2 are configured with an interface of Any, they can be grouped, even if the addresses involve different networks.

To create an address group:

1. Go to *Policy & Objects* > *Addresses* and select *Address Group*.
2. Go to *Create new*.
3. Enter a *Name* for the address object.
4. In the *Type* field, select *Group*.
5. Select the *+* in the *Members* field. The *Select Entries* pane opens.
6. Select members of the group. It is possible to select more than one entry. Select the *x* icon in the field to remove an entry.
7. Enable/disable *Static route configuration*.
8. Enter any additional information in the *Comments* field.
9. Click *OK*.

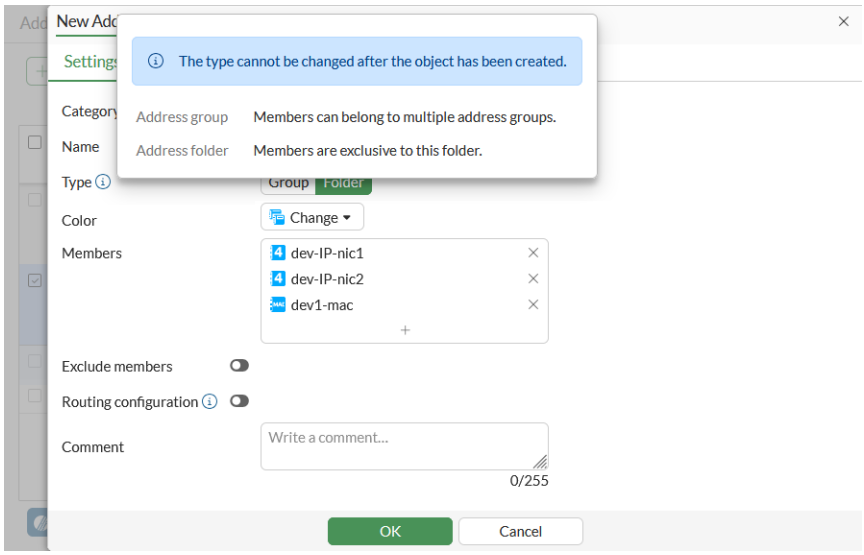
Address folders

Some address objects logically belong to the same device, such as two IPs from the same computer. These address objects can be grouped into an address folder, which is an exclusive list of address objects that do not appear in other address groups or folders.

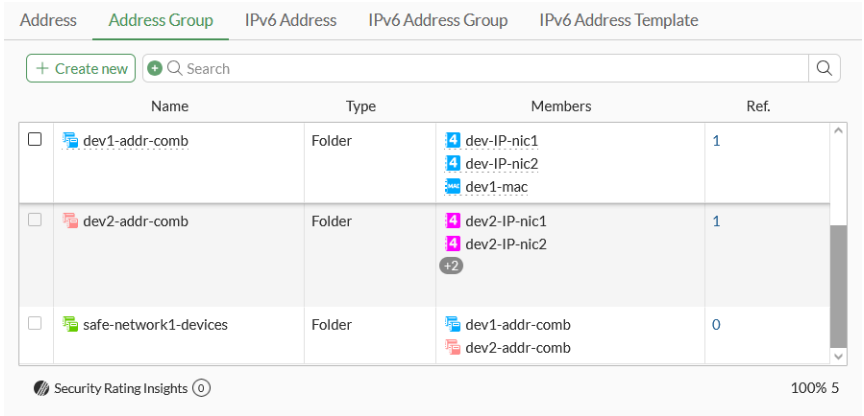
In the CLI, the folder type can be set after the member list is already populated. If the member list contains an incompatible entry, then the setting will be discarded when the `next`/`end` command is issued. If the folder type is set before the member list is populated, then the possible member entry list will be filtered according to the selected type.

To create an address folder in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address Group*.
2. Click *Create new* and enter a name.
3. For *Type*, select *Folder*.
4. For *Members*, click the *+* to add the addresses. Address folders and groups are exclusive, so the *Select Entries* window filters out address objects that are a member of an existing group or folder.



5. Click *OK*.
6. In the address group table, the folders' members are shown in the *Members* column:



To configure an address folder in the CLI:

```
config firewall addrgrp
    edit "dev1-addr-comb"
        set type folder
        set member "dev1-IP-nic1" "dev1-IP-nic2" "dev1-mac"
        set comment ''
        set exclude disable
        set color 18
    next
end
```

```
config firewall addrgrp
    edit "dev2-addr-comb"
        set type folder
        set member "dev2-IP-nic1" "dev2-IP-nic2" "dev2-IP-nic3" "dev2-mac"
        set comment ''
        set exclude disable
```

```
        set color 5
    next
end
```

```
config firewall addrgrp
    edit "safe-network1-devices"
        set type folder
        set member "dev1-addr-comb" "dev2-addr-comb"
        set comment ''
        set exclude disable
        set color 13
    next
end
```

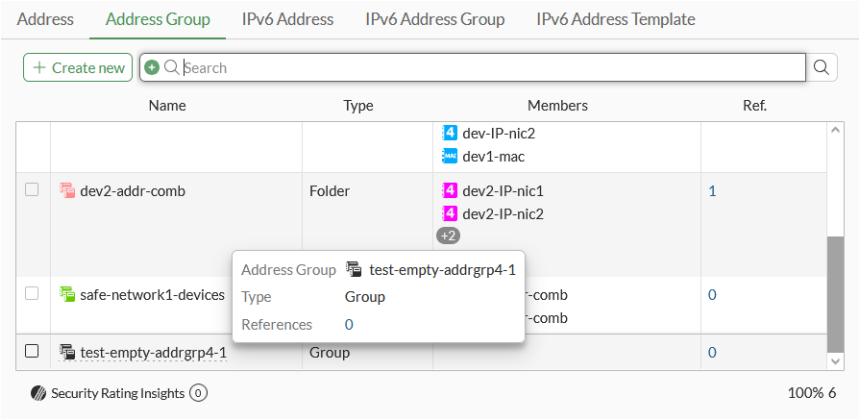
Allow empty address groups

Address groups with no members can be configured in the GUI, CLI, and through the API. In previous versions of FortiOS, error messages appear for empty address groups and they cannot be configured.

When an address group with no members is configured in a firewall policy, the policy will not match any traffic. In this case, policy matching logic will proceed down the list of firewall policies until matching the implicit deny policy.

To create an empty address group in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address Group*.
2. Click *Create new* .
3. Enter a name.
4. Click *OK*. The *This field is required* error is not displayed under the *Members* field, and the group is listed in the *Address Group* list with no members:



To create an empty address group in the CLI:

```
config firewall addrgrp
    edit "test-empty-addrgrp4-1"
```

```
    next
end
```

No error message is returned in the console.

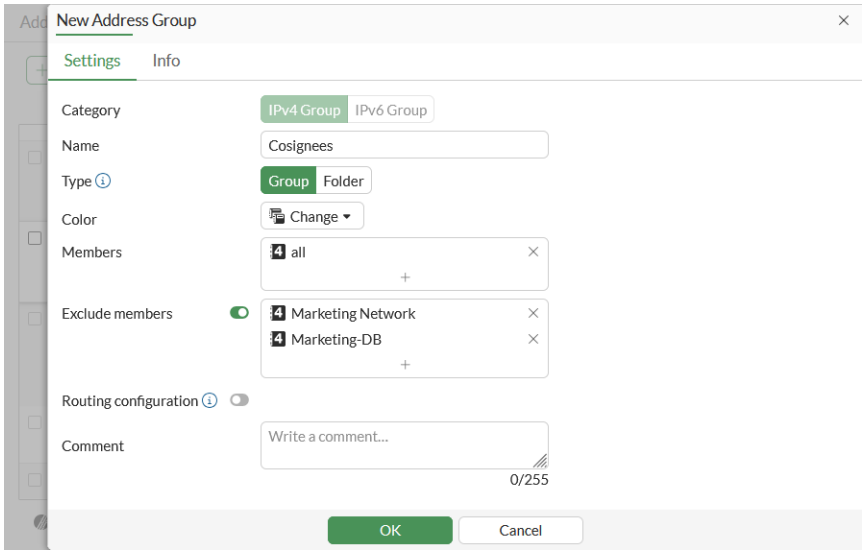
Address group exclusions

Specific IP addresses or ranges can be subtracted from the address group with the *Exclude Members* setting in IPv4 address groups.

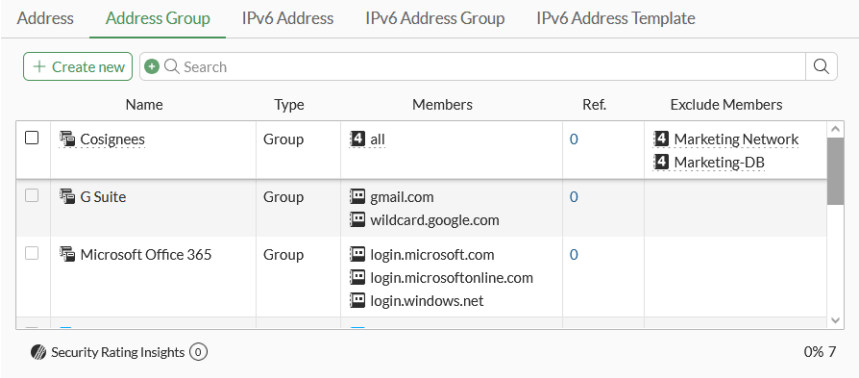
This feature is only supported for IPv4 address groups, and only for addresses with a *Type* of *IP Range* or *Subnet*.

To exclude addresses from an address group using the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address Group*.
2. Create a new address group, or edit an existing address group.
3. Enable *Exclude Members* and click the *+* to add entries.
4. Configure the other settings as needed.
5. Click *OK*.



The excluded members are listed in the *Exclude Members* column. Note that the *Exclude Members* column is not shown by default, see Column settings on page 46.



To exclude addresses from an address group using the CLI:

```
config firewall addrgrp
    edit <address group>
        set exclude enable
        set exclude-member <address> <address> ... <address>
    next
end
```

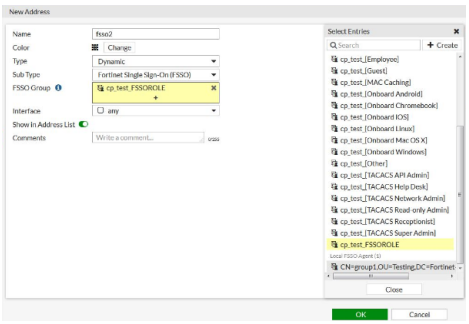
FSSO dynamic address subtype

The Fortinet Single Sign-ON (FSSO) dynamic firewall address subtype can be used in policies that support dynamic address types. The FortiGate will update the dynamic address used in firewall policies based on the source IP information for the authenticated FSSO users.

It can also be used with FSSO group information that is forwarded by ClearPass Policy Manager (CPPM) via FortiManager, and other FSSO groups provided by the FSSO collector agent or FortiNAC. Up to 3000 dynamic FSSO IP addresses are supported per dynamic FSSO group.

To configure FSSO dynamic addresses with CPPM and FortiManager in the GUI:

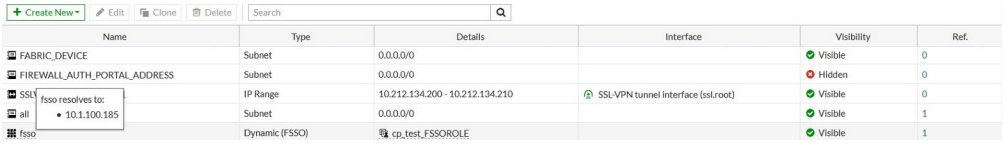
1. Create the dynamic address object:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. For *Type*, select *Dynamic*.
   d. For *Sub Type*, select *Fortinet Single Sign-On (FSSO)*.
   e. Select one or more groups.
   f. Click *OK* to save the configuration.



In the address table, there will be an error message for the address you just created (*Unresolved dynamic address: fsso*). This is expected because there are currently no authenticated FSSO users (based on source IP) in the local FSSO user list.

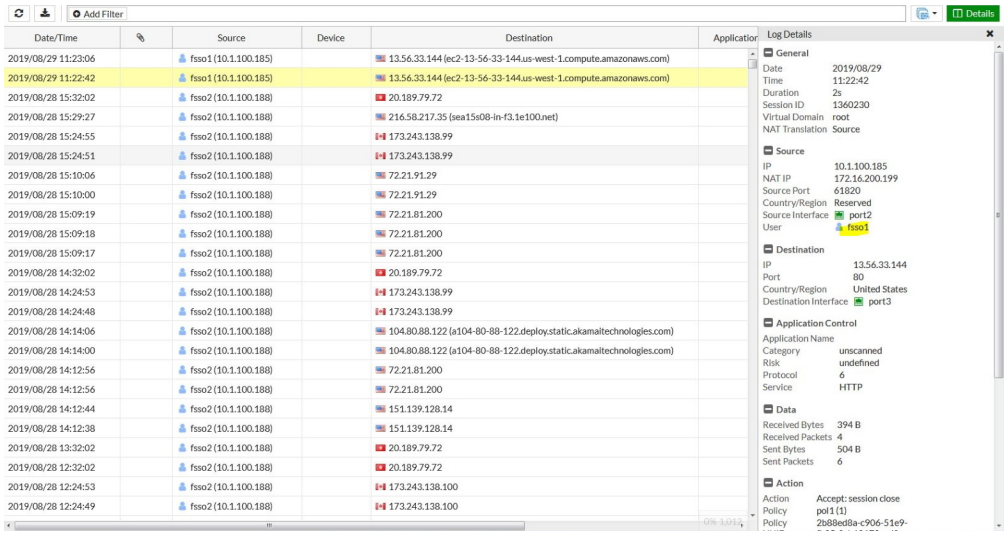
2. Add the dynamic address object to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Create a new policy or edit an existing policy.
   c. For *Source*, select Address from the dropdown list and add the dynamic FSSO address object you just created.
   d. Configure the rest of the policy as needed.
   e. Click *OK* to save your changes.
3. Test the authentication to add a source IP address to the FSSO user list:
   a. Log in as user and use CPPM for user authentication to connect to an external web server. After successful authentication, CPPM forwards the user name, source IP address, and group membership to the FortiGate via FortiManager.
   b. Go to *Monitor* > *Firewall User Monitor* to view the user name (*fsso1*) and IP address.

   c. Go to *Policy & Objects* > *Addresses* to view the updated address table. The error message no longer appears.
   d. Hover over the dynamic FSSO address to view the IP address (*fsso resolves to: 10.1.100.185*).

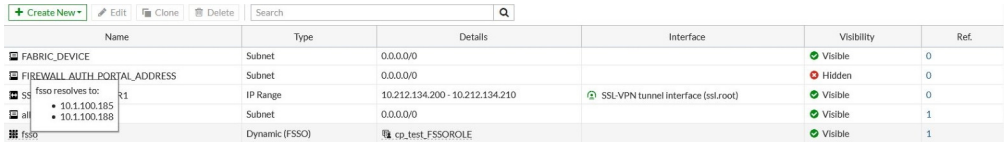


To verify user traffic in the GUI:

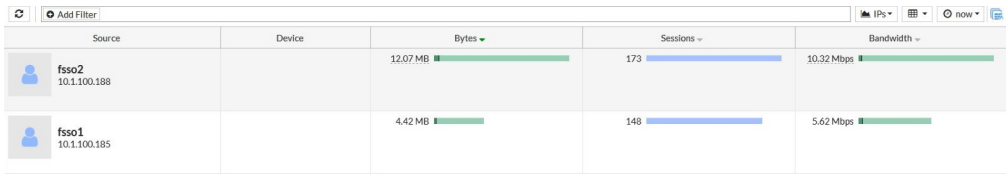
1. Go to *Log & Report* > *Forward Traffic*.
   Details for the user *fsso1* are visible in the traffic log:



- If another user is authenticated by CPPM, then the dynamic address *fsso* entry in the address table will be updated. The IP address for user *fsso2* (*10.1.100.188*) is now visible:



2. Go to *FortiView* > *Sources* to verify that the users were able to successfully pass the firewall policy.



If a user logs off and CPPM receives log off confirmation, then CPPS updates the FortiGate FSSO user list via FortiManager. The user IP address is deleted from the dynamic FSSO address, and the user is no longer be able to pass the firewall policy.

To configure FSSO dynamic addresses with CPPM and FortiManager in the CLI:

1. Create the dynamic address object:

```
config firewall address
    edit "fsso"
        set type dynamic
        set sub-type fsso
        set fsso-group "cp_test_FSSOROLE"
    next
end
```

2. Add the dynamic address object to a policy:

```
config firewall policy
    edit 1
        set name "pol1"
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "fsso"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set fsso disable
        set nat enable
    next
end
```

To verify user traffic in the CLI:

1. Check the FSSO user list:

```
diagnose debug authd fsso list
----FSSO logons----
IP: 10.1.100.185  User: fsso1  Groups: cp_test_FSSOROLE  Workstation:  MemberOf: FSSO-CPPM cp_
test_FSSOROLE
Total number of logons listed: 1, filtered: 0
----end of FSSO logons----
```

2. Check the authenticated firewall users list:

```
diagnose firewall auth list
10.1.100.185, fsso1
type: fsso, id: 0, duration: 2928, idled: 2928
server: FortiManager
packets: in 0 out 0, bytes: in 0 out 0
group_id: 2 33554433
group_name: FSSO-CPPM cp_test_FSSOROLE
----- 1 listed, 0 filtered ------
```

After user traffic passes through the firewall, the nu

```
diagnose firewall auth list
10.1.100.185, fsso1
type: fsso, id: 0, duration: 3802, idled: 143
server: FortiManager
packets: in 1629 out 1817, bytes: in 2203319 out 133312
group_id: 2 33554433
group_name: FSSO-CPPM cp_test_FSSOROLE
----- 1 listed, 0 filtered ------
```

ClearPass integration for dynamic address objects

ClearPass Policy Manager (CPPM) can gather information about the statuses of network hosts, for example, the latest patches or virus infections. Based on this information, CPPM send the IP addresses and current states, such as Healthy or Infected, to the FortiGate.

On the FortiGate, the IP addresses received from CPPM are added to a dynamic firewall address with the *clearpass-spt* subtype. This address can be used in any policy that supports dynamic addresses, such as Firewall or SSL-VPN policies.

In this example, you create two dynamic IP addresses that are used in two firewall policies (deny and allow). One policy allows traffic (host state = Healthy), and the other denies traffic (host state = Infected). When CPPM sends the information, the IP addresses are assigned according to their host state: Healthy or Infected.

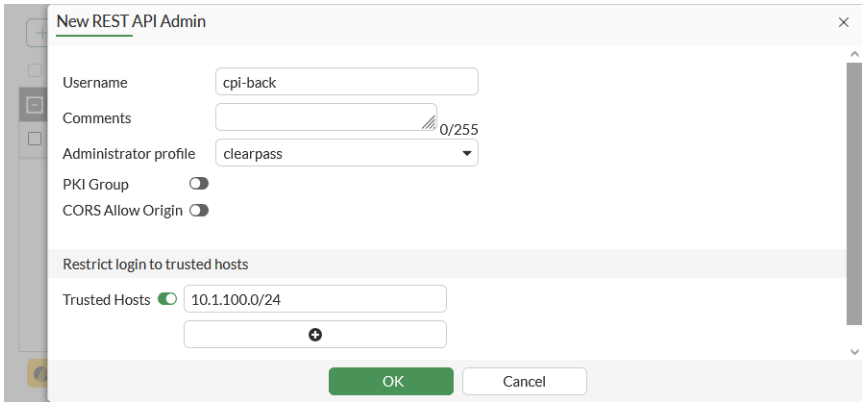
You can then verify that traffic from the Infected host is denied access by the deny policy, and traffic from the Healthy host is allowed access by the allow policy.

Create a REST API administrator

A REST API administrator is required to generate an authorization token for REST API messages, and to limit hosts that can send REST API messages to the FortiGate.

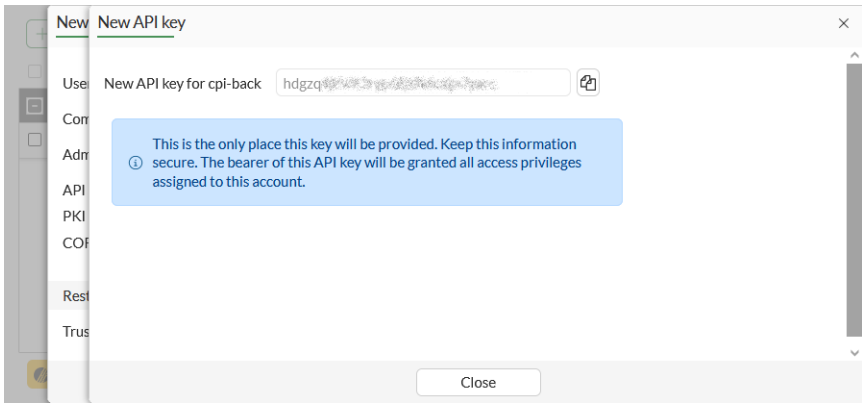
To create a REST API administrator in the GUI:

1. Go to *System* > *Administrators*.
2. Click *Create New* > *REST API Admin*.
3. Configure the *Username* and other information as needed.
4. Disable *PKI Group*.
5. In the *Trusted Hosts* field, enter *10.1.100.0/24*.



For this example, an administrator profile called *clearpass* was created with full read/write access. See Administrator profiles on page 3218 for details.

6. Click *OK*.
The *New API key* pane opens.



The API key is the REST API authorization token that is used in REST API messages sent by CPPM to the FortiGate.

7. Copy the API key to a secure location. A new key can be generated if this one is lost or compromised.
8. Click *Close*.

To create a REST API administrator in the CLI:

```
config system api-user
    edit "cpi-back"
        set accprofile "clearpass"
        config trusthost
            edit 1
                set ipv4-trusthost 10.1.100.0 255.255.255.0
            next
        end
    next
end
```

```
execute api-user generate-key cp-api
    New API key: 0f1HxGHh9r9p74k7qgfHNH40p51bjs
    NOTE: The bearer of this API key will be granted all access privileges assigned to the api-
user cp-api.
```

Create dynamic IP addresses with the clearpass subtype

Two dynamic IP addresses are required, one for the allow policy, and the other for the deny policy.

To create the dynamic IP addresses:

```
config firewall address
    edit "cppm"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt healthy
        set comment ''
        set visibility enable
```

```
        set associated-interface ''
        set color 0
    next
    edit "cppm-deny"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt infected
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
    next
end
```

Create firewall policies

Two firewall policies are required, one to accept traffic (*cppm-allow*), and the other to deny traffic (*cppm-deny*).

To create the firewall policies in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Configure the allow policy:
   a. Click *Create New*.
   b. Enter a name for the policy.
   c. Set *Source* set to *cppm*.
   d. Set *Action* to *ACCEPT*.
   e. Configure the remaining settings as needed.
   f. Click *OK*.
3. Configure the deny policy:
   a. Click *Create New*.
   b. Enter a name for the policy.
   c. Set *Source* set to *cppm-deny*.
   d. Set *Action* to *DENY*.
   e. Configure the remaining settings as needed.
   f. Click *OK*.

To create the firewall policies in the CLI:

```
config firewall address
    edit "cppm"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt healthy
        set comment ''
        set visibility enable
        set associated-interface ''
```

```
        set color 0
    next
    edit "cppm-deny"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt infected
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
    next
end
```

Verification

Go to *Log & Report* > *Forward Traffic* to review traffic logs and ensure that traffic is allowed or denied as expected.

To verify that FortiGate addresses are assigned correctly, enter the following:

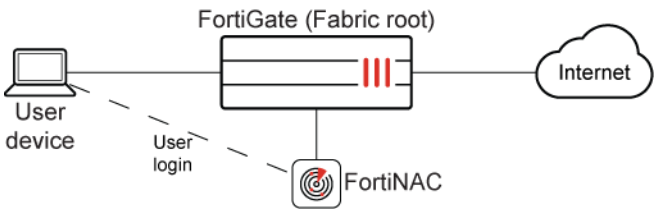
```
# diagnose firewall dynamic list
List all dynamic addresses:
cppm-deny: ID(141)
        ADDR(10.1.100.188)

cppm: ID(176)
        ADDR(10.1.100.185)
        ADDR(10.1.100.186)
```

FortiNAC tag dynamic address

The FortiNAC tag dynamic firewall address type is used to store the device IP, FortiNAC firewall tags, and FortiNAC group information sent from FortiNAC by the REST API when user logon and logoff events are registered.

In the following example, the user connecting to the network will be required to first log on to the FortiNAC. When the login succeeds, the logon information is synchronized to the FortiGate using the REST API. The FortiGate updates the dynamic firewall address object with the user and IP information of the user device. This firewall address is used in firewall policies to dynamically allow network access for authenticated users, thereby allowing SSO for the end user.

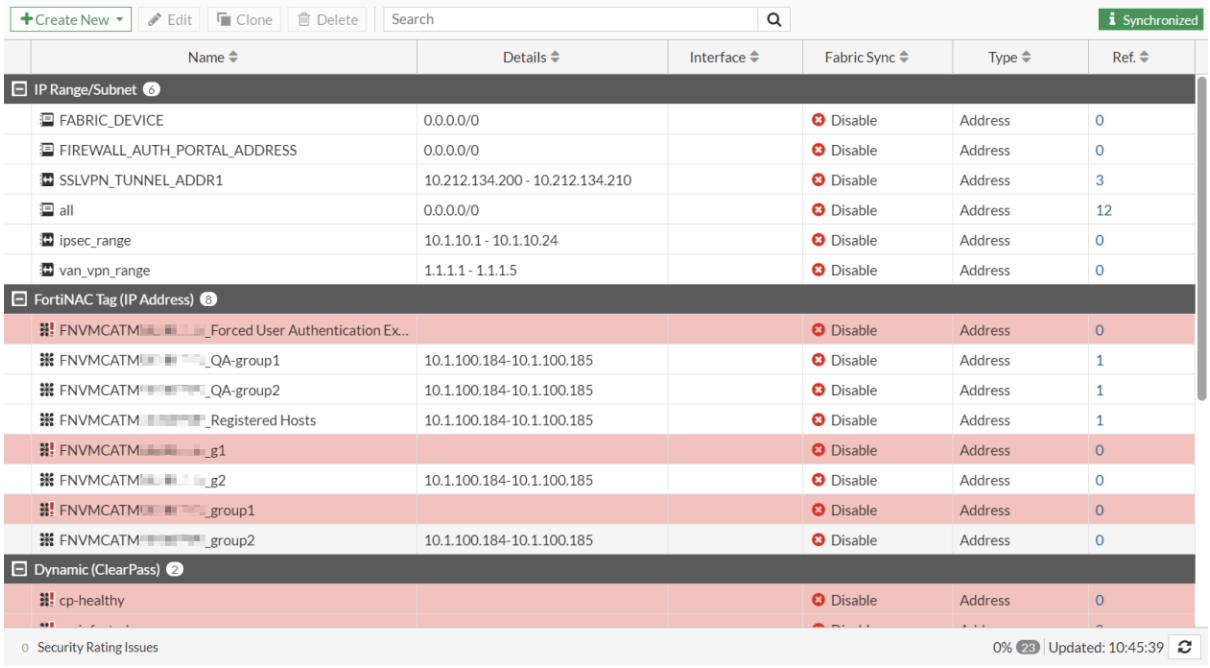


This example assumes the following:

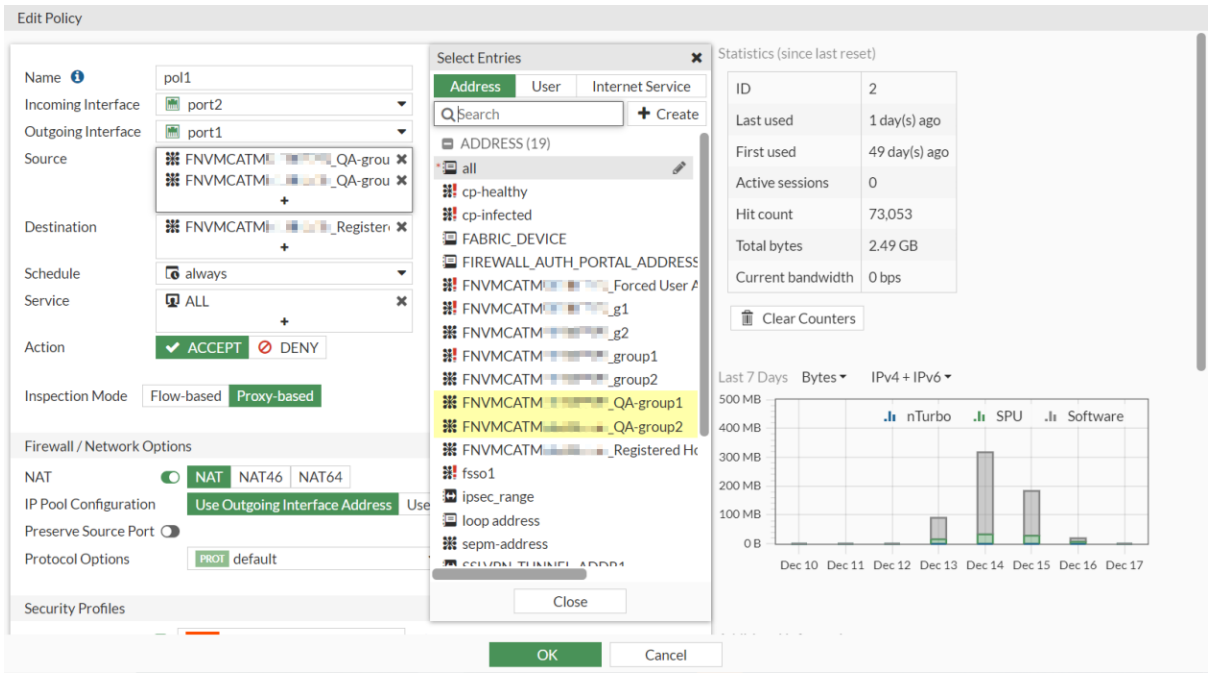
- The FortiGate is the Security Fabric root device (refer to Configuring the root FortiGate and downstream FortiGates on page 3702 for more information).
- The FortiNAC is running version 9.2.2 (or later), and it is connected to the Security Fabric (refer to Configuring FortiNAC on page 3773 for more information).
- Firewall tags and groups have been assigned in FortiNAC to the registered FortiGate (refer to Virtualized Devices for more information). Unlike firewall tags, which are simple labels that can be configured on FortiNAC, firewall groups can be local, built-in, user-defined, or remote user groups imported from a remote server used for user authentication. Only groups that the user of the current logon event belongs to are sent to the FortiGate. Firewall tags are sent for all user authentication.

To use a FortiNAC tag dynamic firewall address in a policy:

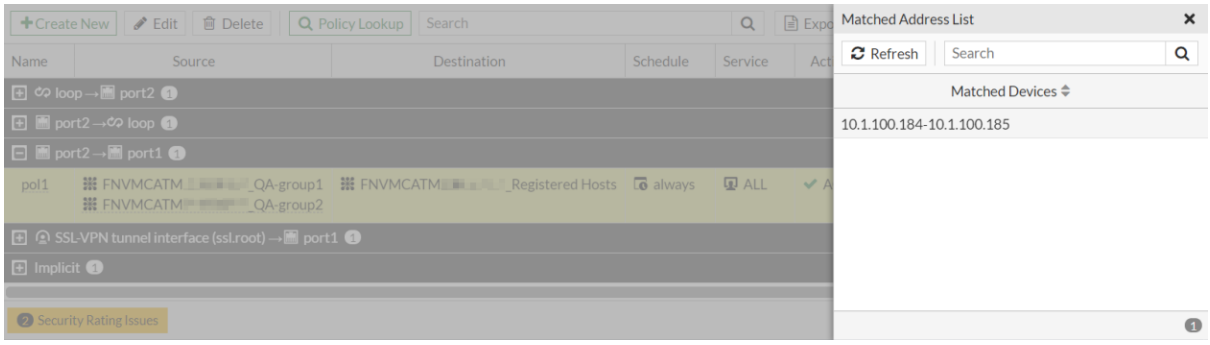
1. Trigger two user logon events on the FortiNAC.
2. In FortiOS, go to *Policy & Objects* > *Addresses*, and expand the *FortiNAC Tag (IP Address)* section to view the newly created dynamic firewall address objects. The dynamic firewall addresses matching the current user logon status on FortiNAC have the current IP address of user devices. The addresses without matching user logons are marked with a red exclamation mark (!).



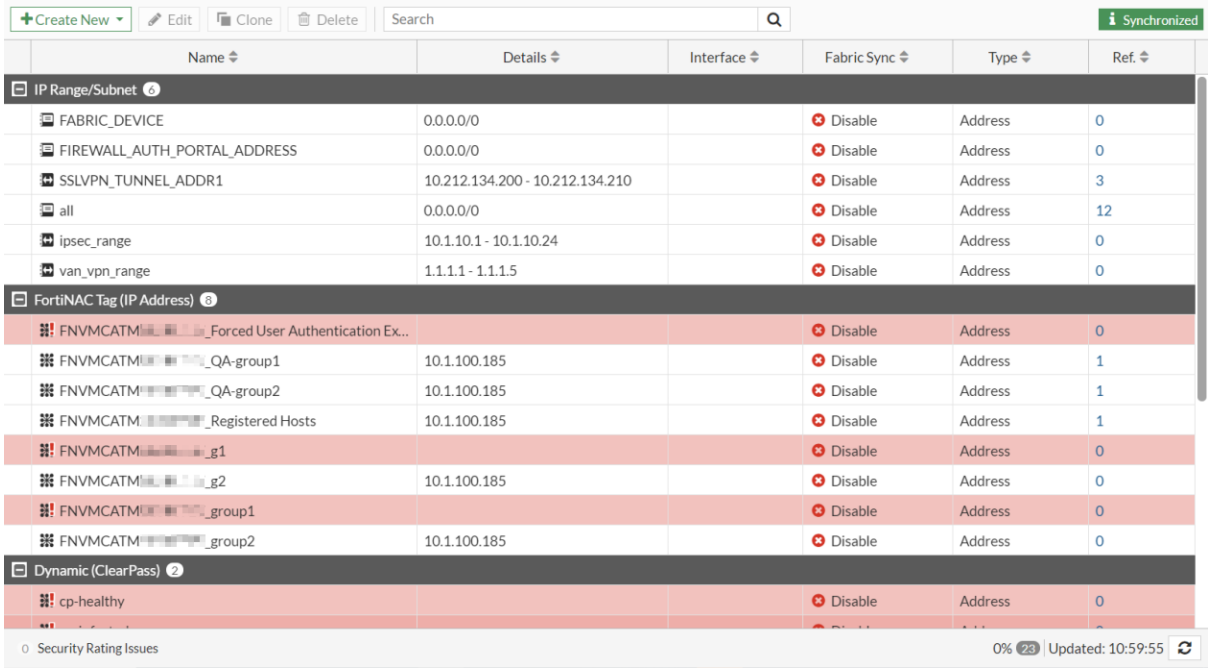
3. Go to *Policy & Objects* > *Firewall Policy* and click *Create New* or edit an existing policy. FortiNAC tag dynamic firewall address an be used as source or destination addresses.



4. Configure the settings as needed, then click *OK*. In this policy, traffic can only pass if it originates from any of the mapped IP addresses (10.1.100.184 and 10.1.100.185); other traffic cannot pass.
5. Hover over the address in the policy, then in the tooltip, click *View Matched Addresses*.

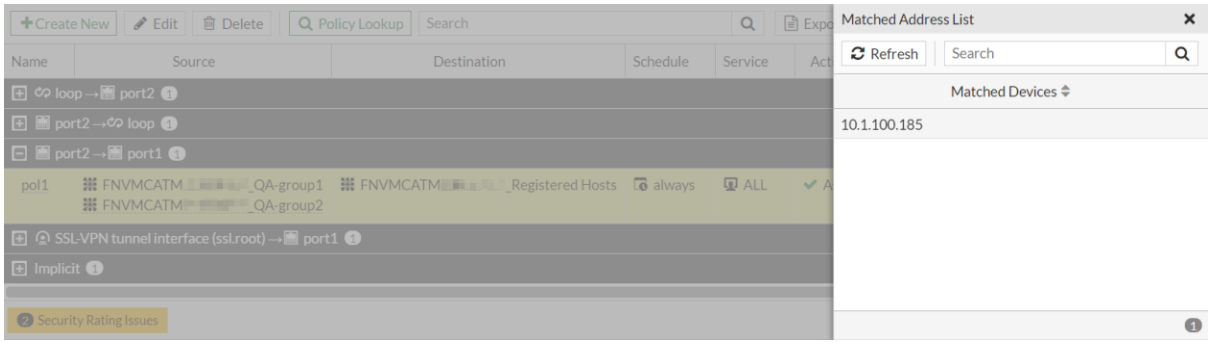


6. Have one of the users log off from the FortiNAC.
7. In FortiOS, go to *Policy & Objects* > *Addresses* and verify the *FortiNAC Tag* addresses. A user logged off from 10.1.100.184, so now only 10.1.100.185 is mapped to the dynamic firewall objects.



All firewall policies using those objects are automatically updated.

8. Go to *Policy & Objects > Firewall Policy* . Hover over the address in the policy, then in the tooltip, click *View Matched Addresses*.



The firewall policy was automatically updated so that traffic from 10.1.100.184 can no longer pass, and only traffic from 10.1.100.185 can pass.

FortiVoice tag dynamic address

When a FortiVoice-supplied MAC or IP address is used in a firewall policy, a FortiVoice tag (MAC/IP) dynamic address is automatically created on the FortiGate that contains all the provisioned FortiFones registered with FortiVoice. The dynamic address can be used in firewall policies to restrict rules to authorized FortiFones only. This is useful for large voice deployments that require security and efficiency. See Example of a firewall policy on page 1778.

FortiVoice tag dynamic addresses can also be applied to a NAC policy. See Example of a NAC policy on page 1779.

Example of a firewall policy

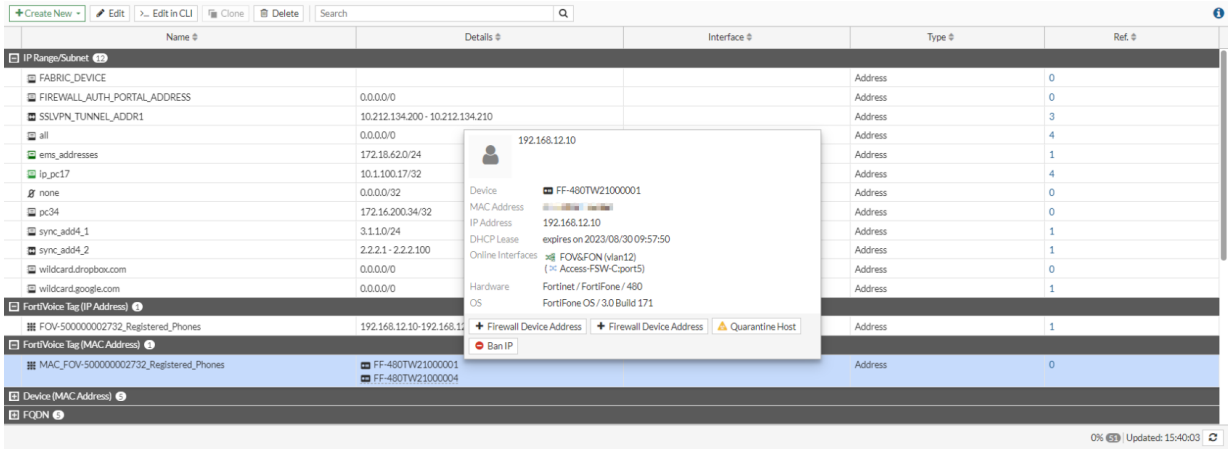
In this example, two FortiFones are registered to FortiVoice and are assigned names and extension numbers. A FortiVoice Fabric connector has been authorized to join the Security Fabric. The dynamic FortiVoice tags are applied to a firewall policy.

To use a FortiVoice tag dynamic firewall address in a policy:

1. Configure and authorize the FortiVoice Fabric connector (see Configuring FortiVoice on page 3781 for more information).
2. Go to *Policy & Objects* > *Addresses* to view the newly created dynamic firewall address objects:
   a. Expand the *FortiVoice Tag (IP Address)* section.

   There is one entry, *FOV-500000002732_Registered_Phones*, which matches 192.168.12.10 to 192.168.12.11.

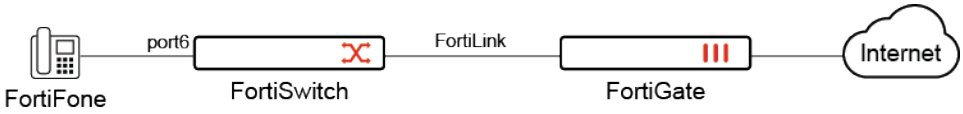
   b. Expand the *FortiVoice Tag (MAC Address)* section. There is one entry, *MAC_FOV-500000002732_Registered_Phones*, which matches two devices. Hover over the device serial number to view the tooltip that contains the MAC address and additional information.



3. Go to *Policy & Objects* > *Firewall Policy* and click *Create new* or edit an existing policy.
4. In the *Source* field, click the + and add the *FOV-500000002732_Registered_Phones* and *MAC_FOV-500000002732_Registered_Phones* addresses.
5. In the *Destination* field, click the + and add the *FOV-500000002732_Registered_Phones* address.
6. Configure the other settings as needed.
7. Click *OK*.

Example of a NAC policy

In this example, a dynamic FortiVoice tag MAC address (MAC_FOV-500000003139_Registered_Phones) is applied to a NAC policy on the FortiGate. Subsequently, the connected FortiSwitch port is moved to vlan12, where traffic can be controlled for registered FortiFones. For more information about NAC policies, see Defining a FortiSwitch NAC policy in the FortiLink Administration Guide. This example assumes that the FortiVoice Fabric connector is authorized to join the Security Fabric and vlan12 is already configured. See Configuring FortiVoice for more information.



To configure FortiVoice Tag MAC address on NAC policies:

1. Configure the NAC policy:
   a. Go to *WiFi & Switch Controller* > *NAC Policies* and click *Create New*, or edit an existing policy.
   b. In the *Device Patterns* section:
      - Set *Category* to *FortiVoice tag*.
      - Set *FortiVoice tag* to *MAC_FOV-500000003139_Registered_Phones*.
   c. In the *Switch Controller Action* section, enable *Assign VLAN* and select *vlan12*.
   d. Configure the other settings as needed.
   e. Click *OK*.
2. Enable NAC mode on the desired FortiSwitch ports (port6 in this example):
   a. Go to *WiFi & Switch Controller* > *FortiSwitch Ports*.
   b. Select *port6*, then right-click and set the *Mode* to *NAC*.
3. Configure firewall policy that is used to control outbound internet access for FortiFones (vlan12 to wan1):
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Click *Create New*.
   c. Name the policy and configure the following parameters:

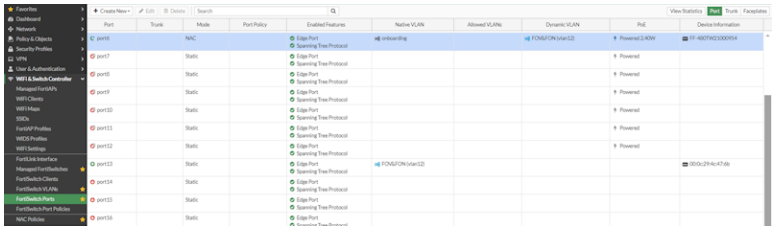
Incoming Interface	vlan12
Outgoing Interface	wan1
Source	all
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT

   d. Configure the other settings as needed.
   e. Click *OK*.
4. Generate traffic from the FortiFone.

5. Once the NAC policy is matched, go to *WiFi & Switch Controller > NAC Policies* to view the device matched to the policy.

FortiFone is also shown on *Dashboards > Assets & Identities* in the *Matched NAC Devices* widget.

6. Go to *WiFi & Switch Controller > FortiSwitch Ports* and locate the port that the FortiFone is connected to. The port has been dynamically assigned vlan12.



To configure FortiVoice Tag MAC address on NAC policies in the CLI:

1. Configure the NAC policy:

```
config user nac-policy
    edit "nac-policy-1"
        set category fortivoice-tag
        set fortivoice-tag "MAC_FOV-500000003139_Registered_Phones"
        set switch-fortilink "fortilink"
        set switch-mac-policy "mac-policy-
    next
end
```

2. Configure the VLAN in the MAC policy:

```
config switch-controller mac-policy
    edit "mac-policy-1"
        set fortilink "fortilink"
        set vlan "vlan12"
    next
end
```

3. Enable NAC mode on the desired FortiSwitch ports:

```
config switch-controller managed-switch
    edit "Access-FSW-C”
        config ports
            edit "port6"
                set access-mode nac
            next
```

```
        end
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "c_fov_fon"
        set srcintf "vlan12"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
end
```

MAC address-based policies

MAC addresses can be added to the following IPv4 policies:

- Firewall
- Virtual wire pair
- ACL
- Central SNAT
- DoS

A MAC address is a link layer-based address type and it cannot be forwarded across different IP segments. In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range.

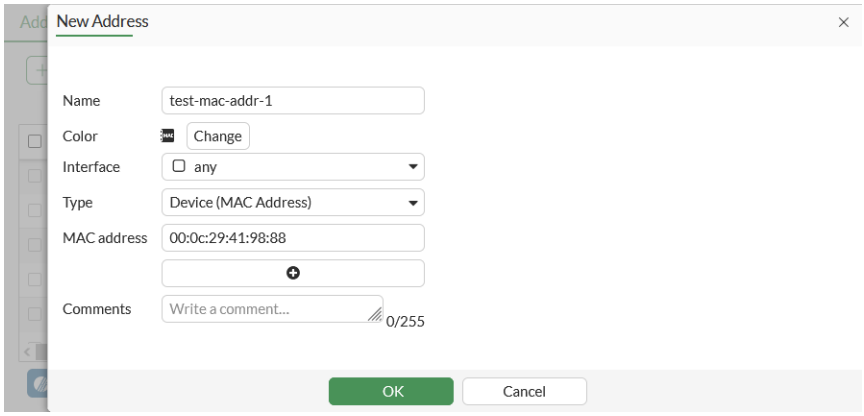
FortiOS only supports the MAC address type as source address for policies in NAT mode VDOM. When you use the MAC address type in a policy as source address in NAT mode VDOM, IP address translation (NAT) is still performed according to the rules defined in the policy. The MAC address type only works for source address matching. It does not have any association with NAT actions.

For policies in transparent mode or the virtual wire pair interface, you can use the MAC address type as source or destination address.

To configure a MAC address using the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Enter a name.
4. For *Category*, select *Address*.
5. For *Type*, select *Device (MAC Address)*.

6. Enter the MAC address.



7. Click *OK*.
8. Go to *Policy & Objects* > *Firewall Policy* to apply the address type to a policy in NAT mode VDOM:
   a. For *Source*, select the MAC address you just configured.
   b. For *Destination*, select an address.

   In NAT mode VDOM, this address type cannot be used as destination address.

   c. Configure the other settings as needed.
   d. Click *OK*.

To configure a MAC address using the CLI:

1. Create a new MAC address:

```
config firewall address
    edit "test-mac-addr-1"
        set type mac
        set macaddr 00:0c:29:41:98:88
    next
end
```

2. Apply the address type to a policy. In transparent mode or the virtual wire pair interface, this address type can be mixed with other address types in the policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "test-mac-addr-1" "10-1-100-42"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
```

```
        set nat enable
    next
end
```

Device & OS Identification dynamic address subtype

Another type of MAC address object is the dynamic *Device & OS identification* subtype. This firewall address subtype is an advanced feature that can be used in policies that support dynamic address subtypes, and it relies on device detection configured on the interface connected to user devices to determine device information.

The FortiGate will update the dynamic address used in firewall policies based on the MAC address and other device and OS information for devices matching configured criteria. The criteria could be hardware vendor, hardware model, software OS, software version, or a combination of these parameters.

Only existing devices whose device information has already been detected by the FortiGate and is known can be added to this dynamic address subtype.

Similar to MAC address-based objects, the dynamic address subtype can be used as a source address for firewall policies, proxy policies, and ZTNA rules. The dynamic address subtype can be used as a source or destination address for transparent mode policies or a virtual wire pair policy.

To use the dynamic *Device & OS Identification* subtype, go to *System > Feature Visibility* and enable *Dynamic Device & OS Identification*. Once enabled, the dynamic address subtype can be configured on the *Policy & Objects > Addresses* page.

ISDB well-known MAC address list

The Internet Service Database (ISDB) includes well-known vendor MAC address range lists. The lists can only be used for source MAC addresses in IPv4 policies, and include the vendor name and the MAC address ranges that the vendor belongs to.

To view the vendor list:

```
# diagnose vendor-mac id
Please input Vendor MAC ID.
ID: 1 name: "Asus"
ID: 2 name: "Acer"
ID: 3 name: "Amazon"
ID: 4 name: "Apple"
ID: 5 name: "Xiaomi"
ID: 6 name: "BlackBerry"
ID: 7 name: "Canon"
ID: 8 name: "Cisco"
ID: 9 name: "Linksys"
ID: 10 name: "D-Link"
```

```
ID: 11 name: "Dell"
ID: 12 name: "Ericsson"
ID: 13 name: "LG"
ID: 14 name: "Fujitsu"
ID: 15 name: "Fitbit"
ID: 16 name: "Fortinet"
ID: 17 name: "OPPO"
ID: 18 name: "Hitachi"
ID: 19 name: "HTC"
ID: 20 name: "Huawei"
ID: 21 name: "HP"
ID: 22 name: "IBM"
ID: 23 name: "Juniper"
ID: 24 name: "Lenovo"
ID: 25 name: "Microsoft"
ID: 26 name: "Motorola"
ID: 27 name: "Netgear"
ID: 28 name: "Nokia"
ID: 29 name: "Nintendo"
ID: 30 name: "PaloAltoNetworks"
ID: 31 name: "Polycom"
ID: 32 name: "Samsung"
ID: 33 name: "Sharp"
ID: 34 name: "Sony"
ID: 35 name: "Toshiba"
ID: 36 name: "VMware"
ID: 37 name: "Vivo"
ID: 38 name: "Zyxel"
ID: 39 name: "ZTE"
```

To view the MAC address ranges for a vendor:

```
# diagnose vendor-mac id 16
Vendor MAC: 16(Fortinet)
Version: 0000700021
Timestamp: 201908081432
Number of MAC ranges: 6
00:09:0f:00:00:00 - 00:09:0f:ff:ff:ff
04:d5:90:00:00:00 - 04:d5:90:ff:ff:ff
08:5b:0e:00:00:00 - 08:5b:0e:ff:ff:ff
70:4c:a5:00:00:00 - 70:4c:a5:ff:ff:ff
90:6c:ac:00:00:00 - 90:6c:ac:ff:ff:ff
e8:1c:ba:00:00:00 - e8:1c:ba:ff:ff:ff
```

To query the vendor of a specific MAC address or range:

```
# diagnose vendor-mac match 00:09:0f:ff:ff:ff 48
Vendor MAC: 16(Fortinet), matched num: 1
```

To use the vendor ID in a firewall policy:

```
config firewall policy
    edit 9
        set name "policy_id_9"
        set uuid 6150cf30-308d-51e9-a7a3-bcbd05d61f93
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set vendor-mac 36 16
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Only packets whose source MAC address belong to Fortinet or VMware are passed by the policy.

IPv6 MAC addresses and usage in firewall policies

Users can define IPv6 MAC addresses that can be applied to the following policies:

- Firewall
- Virtual wire pair
- ACL/DoS
- Central NAT
- NAT64
- Local-in

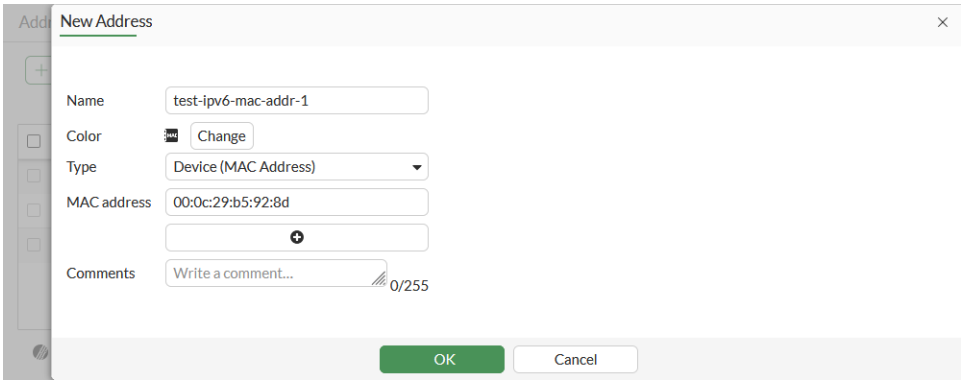
In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range. In this example, a firewall policy is configured in a NAT mode VDOM with the IPv6 MAC address as a source address.

IPv6 MAC addresses cannot be used as destination addresses in VDOMs when in NAT operation mode.

To configure IPv6 MAC addresses in a policy in the GUI:

1. Create the MAC address:
   a. Go to *Policy & Objects* > *Addresses* and select *IPv6 Address*.
   b. Click *Create New*.
   c. Enter an address name.
   d. For *Type*, select *Device (MAC Address)*.

e. Enter the the MAC address.



f. Click *OK*.

2. Configure the policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. For *Source*, select the IPv6 MAC address object.
   c. Configure the other settings as needed.
   d. Click *OK*.

To configure IPv6 MAC addresses in a policy in the CLI:

1. Create the MAC address:

```
config firewall address6
    edit "test-ipv6-mac-addr-1"
        set type mac
        set macaddr 00:0c:29:b5:92:8d
    next
end
```

2. Configure the policy:

```
config firewall policy
    edit 2
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "test-ipv6-mac-addr-1" "2000-10-1-100-0"
        set dstaddr6 "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

RSSO dynamic address subtype

The RSSO dynamic address object subtype can be used in a firewall policy's source and destination fields. It allows for more granular and precise policies based on RSSO group membership, enhancing security and flexibility when managing network traffic and enforcing policies.

When the sub-type is `rsso`, the `sso-attribute-value` must be set. The IP address of the RADIUS single sign-on user matching the group value will be loaded to the address object.

To configure the RSSO dynamic address subtype:

```
config firewall address
    edit "test-rsso-addr-1"
        set type dynamic
        set sub-type rsso
        set sso-attribute-value <name(s)>
    next
end
```

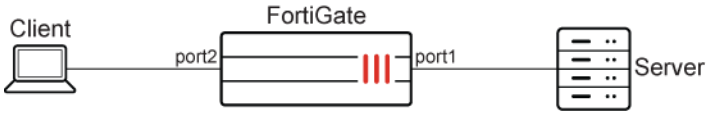
Variable	Description
`sub-type rsso`	RSSO address sub-type.
`sso-attribute-value <name (s)>`	Name(s) of the RADIUS user groups that this address includes.

To check the RADIUS dynamic address database information :

```
# diagnose test application radiusd {6 | 66}
```

Test level	Description
6	Show RADIUS dynamic address database summary information.
66	Show RADIUS dynamic address database information.

Example



To configure and use an RSSO dynamic address object:

1. Enable RADIUS account access on port 1.
   When the RADIUS server sends an RSSO message to the FortiGate on port 1, which includes an IP address, the FortiGate will add it to the RSSO dynamic address list.

```
config system interface
    edit port1
        append allowaccess radius-acct
    next
end
```

2. Configure the RADIUS user and user group for the RSSO address:

```
config user radius
    edit "rsso_server"
        set rsso enable
        set rsso-radius-response enable
        set rsso-secret **************
        set rsso-flush-ip-session enable
    next
end
config user group
    edit "rsso_g1"
        set group-type rsso
        set sso-attribute-value "rsso_group_1"
    next
end
```

3. Configure a dynamic address with RSSO subtype:

```
config firewall address
    edit "test-rsso-addr-1"
        set type dynamic
        set sub-type rsso
        set sso-attribute-value "rsso_group_1"
    next
end
```

4. Apply the RSSO dynamic address as a destination in the firewall policy:

```
config firewall policy
    edit 44
        set name "nat44_policy"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "10-1-100-0"
        set dstaddr "test-rsso-addr-1"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

5. Check the RSSO dynamic address. In this case, 172.16.200.155 is loaded into the RSSO dynamic address:

```
# diagnose test application radiusd 6
dynamic addresses total[vd:root]:0.
dynamic addresses total[vd:vdom1]:1.
  name, ip_db-total
  test-rsso-addr-1, 1
```

```
# diagnose test application radiusd 66
dynamic addresses total[vd:root]:0.
dynamic addresses total[vd:vdom1]:1.
  name:test-rsso-addr-1, ip_db total:1.
        ip,     installed
        172.16.200.155, 1.
```

```
# diagnose firewall dynamic list test-rsso-addr-1
CMDB name: test-rsso-addr-1
test-rsso-addr-1: ID(90)
        ADDR(172.16.200.155)
Total IP dynamic range blocks: 0.
Total IP dynamic addresses: 1.
```

6. Send a packet that hits the policy, then check the session to see that the RSSO dynamic address works as a destination in the firewall policy:

```
# diagnose sys session list
session info: proto=6 proto_state=07 duration=6 expire=115 timeout=3600 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3

total session: 1
```

ISDB record for SOCaaS

The *Fortinet-FortiGuard.SOCaaS* Internet service database (ISDB) entry for Fortinet SOCaaS enables policies to be configured for devices to forward data to SOCaaS collectors without relying on DNS. Eliminating the dependency on DNS reduces the risk of DNS mapping failures and helps ensure a more reliable and seamless data forwarding processing.

To check that the new entry is added to the ISDB:

1. Update the object versions:

```
# diagnose autoupdate versions

Internet-service Full Database
---------
Version: 7.03917 signed
Contract Expiry Date: n/a
Last Updated using manual update on Wed Oct 30 10:33:22 2024
Last Update Attempt: Wed Oct 30 10:33:22 2024
Result: Updates Installed
```

2. Check the Internet service database for the entry:

```
# diagnose internet-service id 1245514

Internet Service: 1245514(Fortinet-FortiGuard.SOCaaS)
Version: 00007.03917
Timestamp: 202410291605
Number of Entries: 14

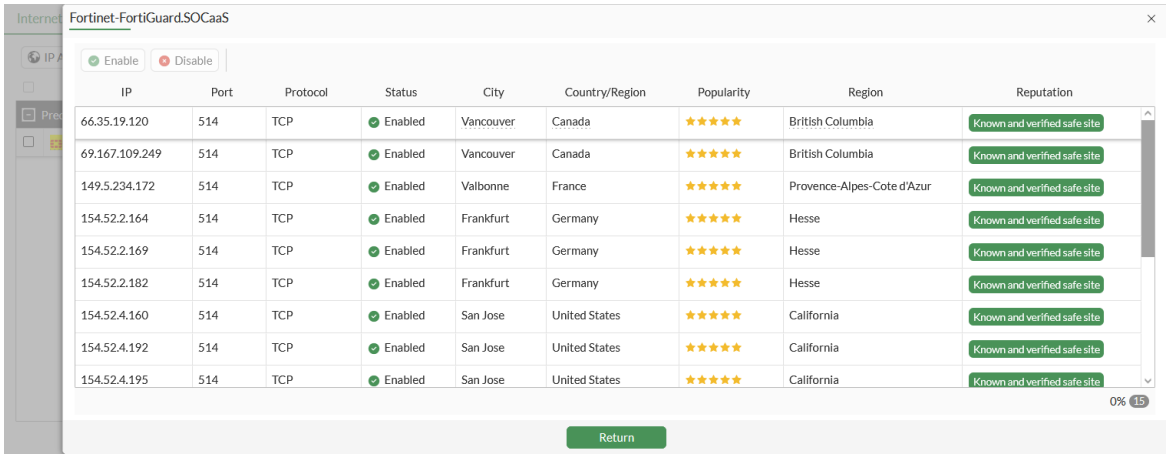
```

3. Check the entry in the GUI:

a. Go to *Policy & Objects* > *Internet Service Database* and select the *Internet Service* tab.
b. Search for *Fortinet-FortiGuard.SOCaaS*.
c. Hover over the result, and click *View/Edit Entries*.



To use the new entry in a firewall policy:

1. Configure a firewall policy:

```
config firewall policy
    edit 99
        set name "ISDB_Policy"
        set srcintf "wan2"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set internet-service enable
        set internet-service-name "Fortinet-FortiGuard.SOCaaS"
        set schedule "always"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

2. Generate and then check a log generated by traffic hitting the policy:

```
1: date=2024-10-29 time=17:52:49 eventtime=1730249569310005321 tz="-0700" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="root" srcip=10.1.100.42 srcport=38380

mastersrcmac="00:0c:29:6e:3a:47" srcmac="00:0c:29:6e:3a:47" srcserver=0
```

Protocol options

Firewall policies contain a *Protocol Options* field that defines the parameters for handling protocol-specific traffic. Multiple protocol options profiles can be configured in FortiOS since the requirements may differ between policies. A single protocol options profile is applied per policy, but the profile can be used in multiple policies.

To create a protocol options profile, go to *Policy & Objects* > *Protocol Options*. The following settings can be configured.

Log oversized files

Enable this option to log the occurrence of oversized files being processed. This does not change how they are processed. It only allows the FortiGate to log that they were either blocked or allowed through.

It is common practice to allow larger files through without antivirus processing. Monitor the logs for the frequency of oversized file processing to determine whether or not to alter the settings for treating oversized files. The threshold setting for oversized files and emails is located in the *Common Options* section.

RPC over HTTP

This protocol is used by Microsoft Exchange Servers to perform virus scanning on emails that use RPC over HTTP.

Protocol port mapping

To optimize the FortiGate's resources, the mapping and inspection of the following protocols can be enabled or disabled:

- HTTP
- SMTP
- POP3
- IMAP
- FTP
- NNTP
- MAPI
- DNS
- CIFS

Each protocol has a default TCP port. The ports can be modified to inspect any port with flowing traffic. The packet headers indicate which protocol generated the packet.

Protocol port mapping only works with proxy-based inspection. Flow-based inspection inspects all ports regardless of the protocol port mapping configuration.

Common options

The *Comfort Clients* and *Block Oversized File/Email* options apply to multiple protocols.

Comfort clients

When proxy-based antivirus scanning is enabled, the FortiGate buffers files as they are downloaded. Once the entire file is captured, the FortiGate begins scanning the file. The user must wait during the buffering and scanning procedure. After the scan is completed and if no infection is found, the file is sent to the next step in the process flow. If the file is large, this part of the process can take some time. In some cases, enough time that some users may get impatient and cancel the download.

The *Comfort Clients* option mitigates this potential issue by feeding a trickle of data while waiting for the scan to complete. The user is aware that processing is taking place, and that there has not been a failure in the transmission. The slow transfer rate continues until the antivirus scan is complete. The transfer will proceed at full speed once the file is scanned successfully and does not contain any viruses.

If there is evidence of an infection, the FortiGate caches the URL and drops the connection. The client does not receive any notification of what happened because the download to the client has already started. Instead, the download stops and the user is left with a partially downloaded file. If the user tries to download the same file again within a short period of time, the cached URL is matched and the download is blocked. A notification is displayed that the download was blocked. The number of URLs in the cache is limited by the size of the cache.

Client comforting is available for HTTP and FTP traffic. If the FortiGate supports SSL content scanning and inspection, client comforting can be configured for HTTPS and FTPS traffic.

Buffering the entire file allows the FortiGate to eliminate the danger of missing an infection due to fragmentation because the file is reassembled before examination. This buffering is performed whenever the *Comfort Clients* option is disabled.

Client comforting can send unscanned and potentially infected content to the client, so only enable this option if you are prepared to accept this risk. Keeping the client comforting interval high and the amount low will reduce the amount of potentially infected data that is downloaded.

Block oversized files and emails

This option is related to antivirus scanning. The FortiGate has a finite amount of resources to buffer and scan a file. If a large file (such as an ISO image or video file) is downloaded, this could overwhelm or exceed the FortiGate's memory, especially if other large files are being downloaded at the same time.

A threshold is assigned to identify an oversize file or email. The default is 10 MB. The range varies per model, and the minimum is 1 MB. Any file or email over this threshold will not be processed by policies applying the antivirus security profile.

If the FortiGate enters conserve mode on a regular basis, lowering the threshold can lessen the impact of processing the files on memory. This can increase risk, even though malware is more likely to be in smaller files.

Web options

The *Chunked Bypass* option applies to traffic containing web protocols.

Chunked bypass

Chunked bypass is a mechanism in HTTP 1.1 that allows a web server to start sending chunks of dynamically generated output in response to a request before actually knowing the actual size of the content. For dynamically generated content, enabling chunked bypass speeds up the initial response to HTTP requests, but the content is not held in the proxy as an entire file before proceeding.

Email options

The *Allow Fragmented Messages* and *Append Signature (SMTP)* options apply to email protocols.

Allow fragmented messages

The specifications of RFC 2046 allow for the breaking up of emails and sending the fragments in parallel to be rebuilt and read at the other end by the mail server. It was originally designed to increase the performance over slower connections where larger email messages were involved. Feasibility of using this function depends on the mail configuration. Outside of Microsoft Outlook, not many email clients are set up to break up messages like this. The drawback of this feature is that if malware is broken up between multiple fragments of the message, there is a risk that it will not be detected by some antivirus configurations because all the code may not be present at the same time to identify the malware.

Append signature

This option adds a plain text email signature to SMTP email messages as they pass through the FortiGate. The message maximum is 1023 characters.

This feature works best in an environment where there is some standardization of what goes into the senders' personal signatures so that there is no duplication or contradiction of information. For example:

- *This email should not be forwarded without prior approval.*
- *Please consider the environment before printing this email.*
- *For questions regarding purchasing our products, please call ...*

Stripping the X-Forwarded-For value in the HTTP header

The X-Forwarded-For value in the HTTP header can be stripped when the `strip-x-forwarded-for` option is enabled under `firewall profile-protocol-options`. This feature sets the value to empty using the IPS engine.

The following types of traffic support X-Forwarded-For stripping:

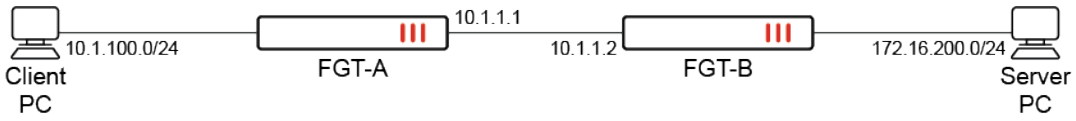
- HTTP/1.1, HTTP/2, and HTTP/3 traffic that matches an NGFW mode security policy with flow-based inspection.
- Plain HTTP/1.1 traffic that matches a firewall policy with proxy-based inspection.

The following types of traffic do not support X-Forwarded-For stripping:

- HTTPS traffic that matches a firewall policy with proxy-based inspection.
- HTTP and HTTPS traffic that matches an explicit web proxy policy.

Example

In this example, FGT-A is configured with `strip-x-forwarded-for` enabled for HTTP. On FGT-B, the IPS sensor is configured to monitor the Eicar.Virus.Test.File signature. The IPS logs on FGT-B are used to verify the traffic sent from FGT-A to FGT-B, namely the `forwardedfor` value in the `rawdata` field.



To configure X-Forwarded-For stripping:

1. Configure FGT-A:
   a. Configure the protocol options for HTTP:

```
config firewall profile-protocol-options
    edit "protocol-xff"
        config http
            set ports 80
            unset options
            set strip-x-forwarded-for enable
            unset post-lang
        end
    next
end
```

   b. Configure the firewall policy (ensure that an IPS sensor is applied):

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port5"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set profile-protocol-options "protocol-xff"
        set ssl-ssh-profile "ssl-deep"
        set ips-sensor "default"
```

```
        set nat enable
    next
end
```

2. Configure FGT-B:
   a. Configure the IPS sensor with extended logging:

```
config ips sensor
    edit "monitor-eicar"
        set extended-log enable
        config entries
            edit 1
                set rule 29844
                set status enable
                set action pass
            next
        end
    next
end
```

   b. Configure the firewall policy (ensure that an IPS sensor is applied):

```
config firewall policy
    edit 3
        set srcintf "port5"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "ssl-deep"
        set ips-sensor "monitor-eicar"
        set nat enable
    next
end
```

To verify the configuration:

1. Use a cURL request to send HTTPS traffic with HTTP header X-Forwarded-For from the Client PC to the Server PC:

```
curl -vk -H "X-Forwarded-For: 10.22.22.22" https://172.16.200.52/eicar.com
```

2. On FGT-B, verify the corresponding IPS logs.
   a. For HTTP/1.1, the `X-Forwarded-For` value is removed from the `rawdata` field, and the `forwardedfor` value is not included:

```
1: date=2023-09-21 time=14:05:34 eventtime=1695330334919589600 logid="0419016384"
type="utm" subtype="ips" eventtype="signature" level="alert" vd="root" severity="info"
```

```
srcip=10.1.1.1 srccountry="Reserved" dstip=172.16.200.42 dstcountry="Reserved"
srcintf="port5" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined"
sessionid=2471 action="detected" proto=6 service="HTTPS" policyid=3 poluuid="782b9e86-
58a3-51ee-8e0f-79c7682223dd" policytype="policy" attack="Eicar.Virus.Test.File"
srcport=36018 dstport=443 hostname="172.16.200.42" url="/eicar.com" agent="curl/7.61.1"
httpmethod="GET" direction="incoming" attackid=29844 profile="monitor-eicar"
ref="http://www.fortinet.com/ids/VID29844" incidentserialno=75497475 msg="file_transfer:
Eicar.Virus.Test.File" rawdataid="1/1" rawdata="Response-Content-Type=application/x-msdos-
program" crscore=5 craction=65536 crlevel="low"
```

b. For HTTP/2 and HTTP/3, the `X-Forwarded-For` value is removed from the `rawdata` field, and `forwardedfor` is included:

```
1: date=2023-09-21 time=14:05:56 eventtime=1695330356543624871 logid="0419016384"
type="utm" subtype="ips" eventtype="signature" level="alert" vd="root" severity="info"
srcip=10.1.1.1 srccountry="Reserved" dstip=172.16.200.52 dstcountry="Reserved"
srcintf="port5" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined"
sessionid=2474 action="detected" proto=6 service="HTTPS" policyid=3 poluuid="782b9e86-
58a3-51ee-8e0f-79c7682223dd" policytype="policy" attack="Eicar.Virus.Test.File"
srcport=37786 dstport=443 hostname="172.16.200.52" url="/eicar.com" agent="curl/7.61.1"
httpmethod="GET" direction="incoming" attackid=29844 profile="monitor-eicar"
ref="http://www.fortinet.com/ids/VID29844" incidentserialno=75497476 msg="file_transfer:
Eicar.Virus.Test.File" rawdataid="1/1" forwardedfor="\r\n" rawdata="Response-Content-
Type=application/x-msdos-program" crscore=5 craction=65536 crlevel="low"
```

3. On FGT-A, disable `strip-x-forwarded-for` for HTTP:

```
config firewall profile-protocol-options
    edit "protocol-xff"
        config http
            set strip-x-forwarded-for disable
        end
    next
end
```

4. Send the same HTTPS traffic with HTTP header X-Forwarded-For from the Client PC to the Server PC.

5. On FGT-B, verify the corresponding IPS log, which includes `forwardedfor` and `X-Forwarded-For` values in the `rawdata` field:

```
1: date=2023-09-21 time=16:33:06 eventtime=1695339187144132034 logid="0419016384" type="utm"
subtype="ips" eventtype="signature" level="alert" vd="root" severity="info" srcip=10.1.1.1
srccountry="Reserved" dstip=172.16.200.52 dstcountry="Reserved" srcintf="port5"
srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" sessionid=3776

Traffic shaping

A FortiGate provides quality of service (QoS) by applying bandwidth limits and prioritization to network traffic. Traffic shaping is one technique used by the FortiGate to provide QoS. A basic approach to traffic shaping is to prioritize higher priority traffic over lower priority traffic during periods of traffic congestion. This provides a stabilizing effect for important traffic while throttling less important traffic.

The FortiGate can be configured to deliver traffic shaping with policing or traffic shaping with queuing. The general difference between the two is as follows:

Technique	Description
Traffic shaping with policing	When traffic exceeds the configured bandwidth limits, traffic is dropped.
Traffic shaping with queuing	When traffic exceeds the configured bandwidth limits, traffic is delayed for transport until bandwidth frees up. Traffic may be dropped if the queues are full.

Policing and queuing can both prioritize traffic and deliver guaranteed bandwidth and maximum bandwidth by setting bandwidth limits. The implementation differs though, since queuing uses queues, and policing does not. In queuing, before a packet egresses an interface, it is first enqueued to a queue using an algorithm such as RED or FIFO. The kernel dequeues the packet based on the HTB algorithm before sending it out. In policing, traffic simply drops if it is over the allocated bandwidth.

The following topics provide information about configuring traffic shaping:

- Traffic shaping policies on page 1800
- Traffic shaping profiles on page 1810
- Traffic shapers on page 1821
- Global traffic prioritization on page 1838
- DSCP matching and DSCP marking on page 1841
- Examples on page 1849

Configuration methods

There are different methods to configure traffic shaping on the FortiGate. The following table lists the methods and their capabilities in order of preference. If all three methods are configured, the first will be preferred over the second, which is preferred over the third.

Method	Policing		Queuing
	Traffic prioritization	Guaranteed and maximum bandwidth limits	Traffic queuing
Traffic shaping profile*	Yes	Yes, based on percentage of outbandwidth	Yes
Traffic shaper	Yes	Yes, based on rate	No
Global traffic prioritization	Yes	No	No

* Traffic shaping profiles are configured as either policing or queuing types. Queuing allows for additional options when configuring a shaping class entry.

The features of each method's implementation are slightly different. The following is a brief summary of the traffic policing features and the approach each method takes.

Traffic prioritization

The FortiGate can place packets into different priority levels in order to prioritize certain traffic over others.

Method	Description
Traffic shaping profile	Traffic is placed into classes. A total of 30 classes are available. For each class, traffic can be configured into five priority levels.
Traffic shaper	Traffic can be prioritized into the high (2), medium (3), or low (4) levels. When traffic is below the guaranteed bandwidth of the shaper, the traffic is automatically applied the critical level (1).
Global traffic prioritization	Traffic is prioritized into high (2), medium (3), or low (4) based on ToS (type of service) or DSCP.

Guaranteed and maximum bandwidth limits

The general purpose for configuring guaranteed bandwidth is to allocate a certain proportion of the total outbandwidth to guarantee transport for a certain type of traffic. This is configured and handled differently in each method.

A traffic shaping profile, when applied to an interface's egress shaping profile, can be configured to use up to 100% of the interface's configured bandwidth between all the classes. It does not matter what priority is configured in each class. The guaranteed bandwidth is always honored.

Traffic shapers, however, do not have a hard limit on the guaranteed bandwidth. Administrators need to be aware how much guaranteed bandwidth has been allocated to all their traffic shapers, so that they do not exceed the total outbandwidth of an interface. Traffic under the guaranteed bandwidth of a traffic shaper is given a priority of one. If the total traffic with priority one exceeds the total outbandwidth, traffic can be dropped.

The maximum bandwidth limit caps the maximum bandwidth that can be used. This is configured as a percentage of the outbandwidth in a traffic shaping profile. It is configured as a rate for traffic shapers.

Configuring outbandwidth

Traffic shaping is generally configured for egress traffic leaving the FortiGate. Therefore, it is necessary for the interface outbandwidth to be defined for traffic prioritization to take place in all of the traffic shaping configuration methods. Interface outbandwidth is also needed when defining the guaranteed and maximum bandwidth in a traffic shaping profile.

For traffic shapers, configuring outbandwidth is not necessary to apply maximum bandwidth limits; however, outbandwidth is necessary for guaranteed bandwidth. Traffic under the guaranteed bandwidth limit on a traffic shaper is given priority 1. If outbandwidth is not configured, traffic prioritization does not take place and the priority is meaningless.

Traffic shaping policy

Traffic shaping profiles and traffic shapers are methods of policing traffic. Traffic shaping policies are used to map traffic to a traffic shaper or assign them to a class.

A traffic shaping policy is a rule that matches traffic based on certain IP header fields and/or upper layer criteria. For example, it can match traffic based on source and destination IP, service, application, and URL category. One common use case is to match traffic based on the ToS or DS (differentiated services) field in the IP header. This allows Type of Service or Differentiated Services (DiffServ) tags to be read from traffic from a downstream device and prioritized accordingly on the FortiGate.

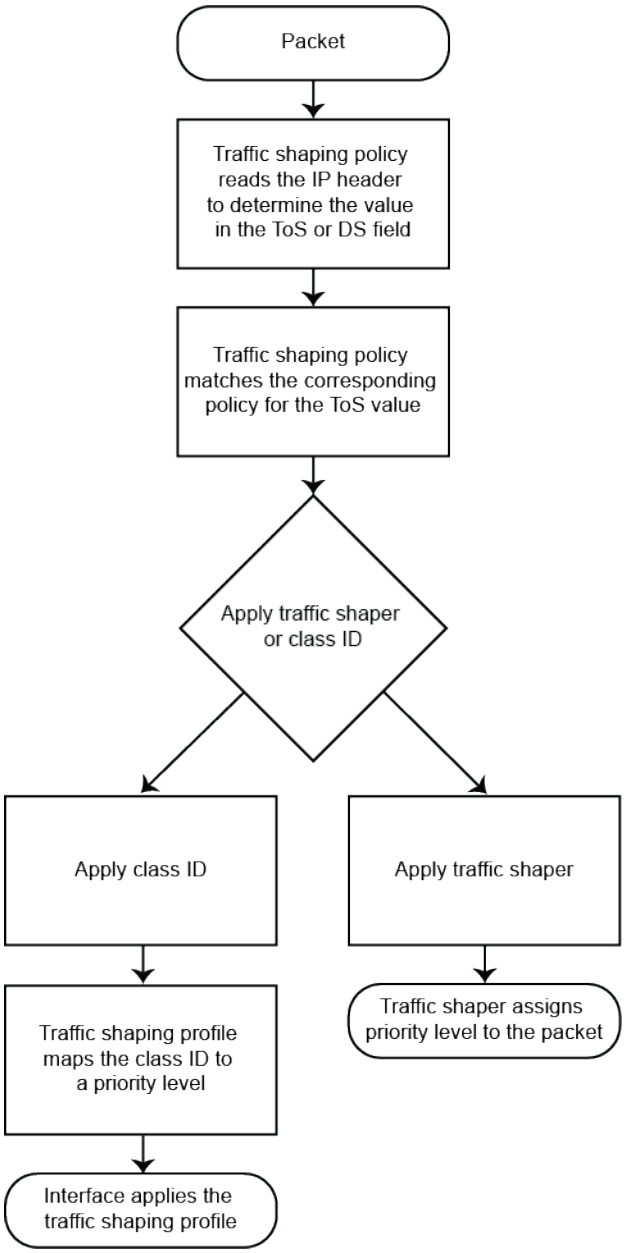
DSCP matching and DSCP marking

DSCP matching and DSCP marking can be performed on a firewall shaping policy and a regular firewall policy. DSCP matching is used to match DSCP tags from ingress traffic, and DSCP marking is used to change the DSCP tag on egress traffic.

In a firewall shaping policy and regular firewall policy, use the `tos` and `tos-mask` fields to perform DSCP matching. Use the `diffserv-forward` and `diffserv-reverse` fields to perform DSCP marking.

Traffic shaping policies

As mentioned in Traffic shaping on page 1798, traffic shaping starts with the traffic shaping policy. Traffic shaping policies are used to map traffic to a traffic shaper or assign them to a class. Traffic is then shaped by the shaper or the shaping profile that is applied on an interface.



Traffic can also be shaped by applying traffic shapers directly on a firewall policy. However, this legacy approach can only be configured from the CLI, and is not a preferred method for applying traffic shaping. As the number of firewall policies increases, managing shaping on each individual policy becomes increasingly difficult. For the same reason, it is also not recommended to mix the legacy approach with traffic shaping policies to avoid the added complexity.

Overview

A traffic shaping policy is a rule that matches traffic based on certain IP header fields and/or upper layer criteria. When traffic hits the firewall, the FortiGate will first look up a firewall policy, and then match a shaping policy. The matching traffic will apply a traffic shaper, class ID, or assign a DSCP DiffServ tag to the outgoing traffic.

The traffic shaping policies must be placed in the correct order in the traffic shaping policy list page to obtain the desired results. Policies are matched from top-down, so the traffic shaping policies should be arranged in a sequence that places the more granular policies above general policies.

The policy can be configured by going to *Policy & Objects* > *Traffic Shaping* and selecting the *Traffic Shaping Policy* tab. If the menu does not display the traffic shaping settings, go to *System* > *Feature Visibility* and enable *Traffic Shaping*.

Configuring traffic shaping policies

A traffic shaping policy can be split into two parts:

- Options used to match the traffic
- Options used to apply actions to the matched traffic

In the GUI, the options are configured in the *If Traffic Matches* and *Then* sections. In the CLI, all options are configured under `config firewall shaping-policy`. Some options can only be configured from the CLI.

The following options can be configured for traffic matching criteria:

GUI option	CLI option	Description
Source		
Address	`set srcaddr <address_object>`	Select the address object to match the source IP.
User	`set users <user_object>`	Select the user object to match the user authenticated for the session.

Internet Service	`set internet-service-src enable`
	`set internet-service-src-name <name>`
	`set internet-service-src-group <group>`
	`set internet-service-src-custom <custom>`
	`set internet-service-src-custom-group <custom_group>`
		Select the internet service to match the source of the incoming traffic. Internet service currently cannot be used with source address.

Destination		
Address	`set dstaddr <address_object>`	Select the address object to match the destination IP.

Internet Service	`set internet-service enable`
	`set internet-service-name <name>`
	`set internet-service-group <group>`
	`set internet-service-custom <custom>`
	`set internet-service-custom-group <custom_group>`
		Select the internet service to match the destination of the incoming traffic. Internet service currently cannot be used with destination address and service.

GUI option	CLI option	Description
Schedule	`set schedule <schedule>`	Enable to select a schedule (one-time, recurring, or group).
Service	`set service <service>`	Select the service or service group for the traffic.
Application		Application control must be enabled in the related firewall policy to learn the application of the traffic.
Application	`set application <application>`	Select the application to match the application of the traffic.
Category	`set app-category <category>`	Select the application category to match the application of the traffic.
Group	`set app-group <groups>`	Select the application group to match the application of the traffic.
URL Category	`set url-category <category>`	Select the URL category to match the URL of the traffic. A web filter profile must be enabled in the related firewall policy to know the URL of the traffic (see Web filter on page 1965).

n/a	`set tos-mask <hexadecimal_mask>`
	`set tos <value>`
	`set tos-negate {enable | disable}`
		Specify the type of service (ToS) and mask to match.
		These options can only be configured in the CLI.

The following options can be configured for actions to apply to the matched traffic:

GUI option	CLI option	Description
Outgoing interface	`set dstintf <interface>`	Select the destination interface that the traffic shaping applies to (required).
Apply shaper		
Shared shaper	`set traffic-shaper <shaper>`	Select the shared shaper to be applied to traffic in the ingress-to-egress direction. For example, on traffic that egresses on the wan interface, the shaper is applied to upload or outbound traffic.
Reverse shaper	`set traffic-shaper-reverse <shaper>`	Select the reverse shaper to be applied to traffic in the egress-to-ingress direction. For example, on traffic that egresses on the wan interface, the shaper is applied to download or inbound traffic.

GUI option	CLI option	Description
Per-IP shaper	`set per-ip-shaper <shaper>`	Select the per-IP shaper. Per-IP shapers affect downloads and uploads. The allotted bandwidth applies to each individual IP. In a shared shaper, the allotted bandwidth applies to all IPs.
Assign shaping class ID		
Traffic shaping class ID	`set class-id <class>`	Set the class ID to apply the matching traffic. Class IDs are further prioritized within a traffic shaping profile and applied to an interface.

n/a	`set diffserv-forward {enable | disable}`
	`set diffservcode-forward <code>`
	`set diffserv-reverse {enable | disable}`
	`set diffservcode-reverse <code>`
		Specify the settings to apply a DSCP tag to the forward or reverse traffic. The DiffServ code is in 6-bit binary format.
		These options can only be configured in the CLI.

Traffic shapers and class IDs can be applied at the same time when configuring traffic shaping policies. However, to reduce the complexity, it is recommended to use one method over the other.

The following topics include examples with traffic shaping policies:

- Local-in and local-out traffic matching on page 1804
- VLAN CoS matching on a traffic shaping policy on page 1807
- Interface-based traffic shaping profile on page 1849
- Shared traffic shaper on page 1821
- Per-IP traffic shaper on page 1826

Local-in and local-out traffic matching

A FortiGate can apply shaping policies to local traffic entering or leaving the firewall interface based on source and destination IP addresses, ports, protocols, and applications.

```
config firewall shaping-policy
    edit <id>
        set traffic-type {forwarding | local-in | local-out}
    next
end
```

This topic contains the following examples:

- Example 1: local-in traffic shaping
- Example 2: local-out traffic shaping

Example 1: local-in traffic shaping

In this example, the traffic shaping policy applies to local-in traffic. The local-in traffic originates from the Linux client and is destined to port1 on the FortiGate.

To configure the traffic shaping policy:

```
config firewall shaping-policy
    edit 2
        set traffic-type local-in
        set service "ALL"
        set schedule "always"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

To verify the configuration:

1. Check the shaping policy information for local-in traffic to verify that the correct class ID (3) is applied:

```
# diagnose firewall iprope list 100018
policy index=2 uuid_idx=1300 action=accept
flag (0):
schedule(always)
cos_fwd=0  cos_rev=0
group=00100018 av=00000000 au=00000000 split=00000000
host=1 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
source(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,
service(1):
        [0:0x0:0/(0,65535)->(0,65535)] flags:0 helper:auto
class_id: 3
```

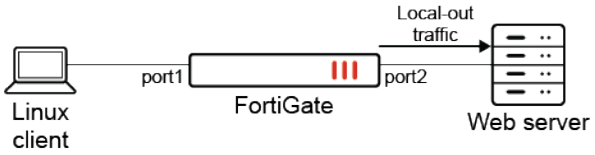
2. Check the session list to verify that the class ID (3) matches the shaping policy ID (2):

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=1195 expire=3574 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=3 shaping_policy_id=2 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
```

```
state=log local may_dirty
statistic(bytes/packets/allow_err): org=18274/350/1 reply=826037/603/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 1/0
orgin->sink: org pre->in, reply out->post dev=17->34/34->17 gwy=172.16.200.2/0.0.0.0
hook=pre dir=org act=noop 172.16.200.254:55432->172.16.200.2:443(0.0.0.0:0)
hook=post dir=reply act=noop 172.16.200.2:443->172.16.200.254:55432(0.0.0.0:0)
pos/(before,after) 0/(0,0), 0/(0,0)
src_mac=08:5b:0e:7d:42:db
misc=0 policy_id=4294967295 pol_uuid_idx=0 auth_info=0 chk_client_info=0 vd=1
serial=0000009d tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=00000000
no_ofld_reason:  local
```

Example 2: local-out traffic shaping

In this example, the traffic shaping policy applies to local-out traffic. The local-out traffic originates from port2 on the FortiGate and is destined to an external web server.



To configure the traffic shaping policy:

```
 config firewall shaping-policy
    edit 3
        set traffic-type local-out
        set service "ALL"
        set schedule "always"
        set class-id 2
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

To verify the configuration:

1. Check the shaping policy information for local-out traffic to verify that the correct class ID (2) is applied:

```
# diagnose firewall iprope list 100019
policy index=3 uuid_idx=1301 action=accept
flag (0):
schedule(always)
cos_fwd=0  cos_rev=0
group=00100019 av=00000000 au=00000000 split=00000000
host=1 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
```

```
source(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,
service(1):
        [0:0x0:0/(0,65535)->(0,65535)] flags:0 helper:auto
class_id: 2
```

2. Check the session list to verify that the class ID (2) matches the shaping policy ID (3):

```
# diagnose sys session list
session info: proto=6 proto_state=05 duration=40 expire=110 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=2 shaping_policy_id=3 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=255/255
state=log local
statistic(bytes/packets/allow_err): org=3676/14/1 reply=3848/11/1 tuples=2
tx speed(Bps/kbps): 90/0 rx speed(Bps/kbps): 94/0
orgin->sink: org out->post, reply pre->in dev=34->17/17->34 gwy=0.0.0.0/172.16.200.2

serial=00000f1b tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=00000000
no_ofld_reason:  local
```

VLAN CoS matching on a traffic shaping policy

A FortiGate can use the class of service (CoS) value of VLAN packets as a matching criterion for shaping policies. This enables the FortiGate to prioritize traffic based on the CoS value assigned by the switch or router.

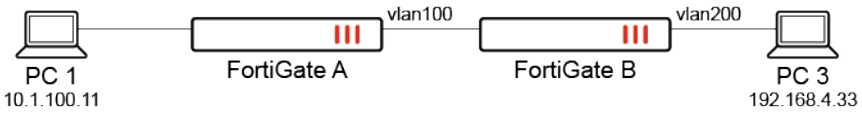
```
config firewall shaping-policy
    edit <id>
        set traffic-type {forwarding | local-in | local-out}
        set cos-mask <3-bit_binary>
        set cos <3-bit_binary>
    next
end
```

`traffic-type {forwarding | local-in | local-out}`	Set the traffic type. • `forwarding`: use forwarding traffic (default) • `local-in`: local-in traffic • `local-out`: local-out traffic
`cos-mask <3-bit_binary>`	Set the VLAN CoS evaluated bits, 3-bit binary (000 - 111). This setting is only available for forwarding traffic.

`cos <3-bit_binary>`	Set the VLAN CoS bit pattern, 3-bit binary (000 - 111). This setting is available once `cos-mask` is configured.

Example

In this example, FortiGate A forwards traffic to FortiGate B with VLAN CoS 3, which matches firewall policy 6. When FortiGate B receives traffic, it applies the traffic shaping policy and will prioritize based on the CoS value.



The VLAN CoS range is 000 to 111 (0 - 7), which includes the following values: 000, 001, 010, 011, 100, 101, 110, and 111. The `cos` and `cos-mask` settings can be used to match multiple `vlan_cos` values with a single shaping policy. The following matching logic is used: (`vlan_cos` AND `cos-mask`) == (`cos` AND `cos-mask`).

To match all possible `vlan_cos` values, set the `cos-mask` to `000`.

To configure VLAN CoS marking with traffic shaping:

1. Configure the firewall policy on FortiGate A with VLAN CoS forwarding:

```
config firewall policy
    edit 6
        set srcintf "port1"
        set dstintf "vlan100"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set vlan-cos-fwd 3
    next
end
```

   Traffic marked with CoS 3 will be forwarded to FortiGate B.

2. On FortiGate A, check the session list to verify that CoS 3 is marked:

```
# diagnose sys session list
session info: proto=1 proto_state=00 duration=1 expire=59 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=3/255
```

```
state=log may_dirty npu f00
statistic(bytes/packets/allow_err): org=168/2/1 reply=168/2/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=19->47/47->19 gwy=20.20.20.2/10.1.100.11
hook=pre dir=org act=noop 10.1.100.11:28489->192.168.4.33:8(0.0.0.0:0)
hook=post dir=reply act=noop 192.168.4.33:28489->10.1.100.11:0(0.0.0.0:0)
src_mac=00:0c:29:57:2a:01  dst_mac=70:4c:a5:7d:d4:95
misc=0 policy_id=6 pol_uuid_idx=1128 auth_info=0 chk_client_info=0 vd=2
serial=000717ca tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000c00 ofld-O ofld-R
npu info: flag=0x81/0x81, offload=8/8, ips_offload=0/0, epid=79/78, ipid=78/79,
vlan=0x0000/0x0064
vlifid=78/79, vtag_in=0x0000/0x0064 in_npu=2/2, out_npu=2/2, fwd_en=0/0, qid=0/1
```

3. Configure the traffic shaping policy to match VLAN CoS 3:

```
config firewall shaping-policy
    edit 1
        set traffic-type forwarding
        set name "vlan-cos-matching"
        set service "ALL"
        set srcintf "vlan100"
        set dstintf "vlan200"
        set class-id 2
        set cos-mask 111
        set cos 011
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Based on this shaping policy:

- `vlan_cos` = 3, which corresponds to `011`

  `cos-mask` = `111`

  AND both get `011`
- `cos-mask` = `111`

  `cos` = `011`

  AND both get `011`
- (`vlan_cos` AND `cos-mask`) == (`cos` AND `cos-mask`), so traffic will pass

The shaping policy will match `vlan_cos3`.

4. Configure the firewall policy on FortiGate B:

```
config firewall policy
    edit 3
        set srcintf "vlan100"
        set dstintf "vlan200"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
```

```
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
end
```

5. On FortiGate B, check the session list to verify that the class ID (2) matches the shaping policy ID (1):

```
# diagnose sys session list
session info: proto=1 proto_state=00 duration=672 expire=59 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=2 shaping_policy_id=1 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=56532/673/1 reply=56532/673/1 tuples=2
tx speed(Bps/kbps): 82/0 rx speed(Bps/kbps): 82/0
orgin->sink: org pre->post, reply pre->post dev=59->61/61->59 gwy=20.20.200.3/20.20.20.1
hook=pre dir=org act=noop 10.1.100.11:28735->192.168.4.33:8(0.0.0.0:0)
hook=post dir=reply act=noop 192.168.4.33:28735->10.1.100.11:0(0.0.0.0:0)
src_mac=90:6c:ac:fb:bb:97  dst_mac=04:d5:90:36:73:3f
misc=0 policy_id=3 pol_uuid_idx=1245 auth_info=0 chk_client_info=0 vd=1
serial=0000160b tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x040000
no_ofld_reason:  non-npu-intf
```

If a particular session matches both the `firewall policy` and `firewall shaping-policy`, then anything configured in the `firewall shaping-policy` overrides whatever was configured in the `firewall policy`.

Traffic shaping profiles

As mentioned in Traffic shaping on page 1798, the three main methods of configuring traffic shaping are:

- Traffic shaping profiles
- Traffic shapers
- Global traffic prioritization

A traffic shaping profile allows traffic shaping to be configured with policing or queuing. Up to 30 classes can be defined, with prioritization and bandwidth limits configured for each class. When queuing is enabled, metrics can be configured for traffic queuing in each class.

Traffic shaping with policing

At the most basic level, policing involves traffic prioritization and bandwidth limits. Traffic prioritization helps categorize traffic into different priority levels: low, medium, high, critical, and top. When bandwidth is limited, traffic with higher priority levels will take precedence over lower priority traffic. Traffic with lower priority levels that exceeds available bandwidth will be dropped. These levels are only applicable in the context of traffic shaping profiles and should not be confused with global traffic prioritization levels.

Bandwidth limits define the guaranteed and maximum bandwidth allotted to each traffic class. These limits are configured as a percentage of the outbandwidth, which is the outbound bandwidth configured on an interface.

Guaranteed bandwidth limits guarantee the minimum bandwidth that is allotted to a given class of traffic. The sum of all guaranteed bandwidth of all classes within a traffic shaping profile cannot exceed 100%. However, the sum of all guaranteed bandwidth does not need to add up to 100%. The guaranteed bandwidth is always respected, even if one class has lower priority than another.

Maximum bandwidth limits define the maximum percentage of the outbandwidth that a traffic class can use up. This value often will be 100%, given that when there is no other traffic going through other classes, you would want to fully utilize the bandwidth of the outbound link. Traffic throughput exceeding the maximum bandwidth will be dropped.

The following diagram illustrates ingress traffic and how the FortiGate assigns classes and bandwidth to each class.

When comparing traffic shaping profiles and traffic shapers, it is important to remember that guaranteed and maximum bandwidth in a traffic shaping profile is a percentage of the outbandwidth, while guaranteed and maximum bandwidth in a traffic shaper is a rate (Kbps, Mbps, and so on). As long as the outbandwidth is true to its measurement, the bandwidth usage should not exceed the available bandwidth of a link when using a traffic shaping profile.

Congestion occurs when actual traffic surpasses the outbandwidth limit. At this point, traffic prioritization helps determine which traffic will be prioritized over others. First, the guaranteed bandwidth limit is allocated for each class. The left over bandwidth is allocated to traffic classes based on priority. The traffic classes with the highest priority can use as much of the remaining bandwidth as needed. Then, the remaining bandwidth can be allocated to classes at the next priority level, and so forth.

To see examples of applied traffic prioritization and bandwidth limits, see the debugs in Verifying that the traffic is being shaped on page 1815.

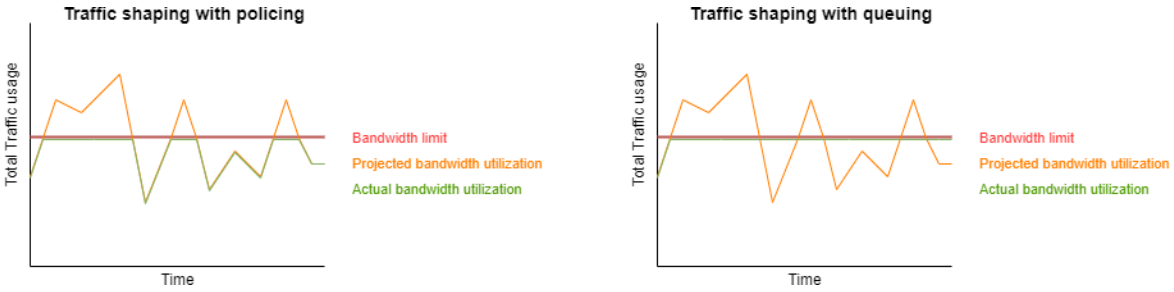
Traffic shaping with queuing

When traffic congestion occurs and if there is no queuing, then the excess packets are dropped. With queuing, when traffic exceeds the configured bandwidth limits, the traffic is delayed for transport until bandwidth frees

up. Traffic may still be dropped if the queues are full.

In queuing, before a packet egresses an interface, it is first enqueued using an algorithm, such as random early detection (RED) or first in, first out (FIFO). The kernel then dequeues the packet based on the HTB algorithm before sending it out. Queuing can be configured per shaping profile, and it can be customized per class.

The following diagram shows how traffic policing differs from traffic queuing by comparing the bandwidth limit, projected bandwidth utilization, and actual bandwidth utilization.



For more information about traffic shaping with queuing, see Traffic shaping with queuing using a traffic shaping profile on page 1816.

Configuring traffic shaping profiles

The main steps to configure traffic shaping are:

1. Configure the traffic shaping policy, and assign matched traffic to a class (see Traffic shaping policies on page 1800).
2. Configure the traffic shaping profile and apply traffic bandwidth, prioritization and/or queuing per class.
3. Configure the interface outbandwidth and apply an egress shaping profile to the interface.

Configuring the traffic shaping profile

A traffic shaping profile consists of the class ID and the settings per class ID. It also defines the type of traffic shaping to apply (policing or queuing) and the default class ID for traffic that does not match any traffic shaping policies.

A class can be configured in the GUI as part of a traffic shaping profile or policy. In the CLI, a traffic class must be defined before it can be assigned within a traffic shaping profile. Class IDs range from 2 - 31, and they can be reused between different traffic shaping profiles.

When NPU offloading is enabled on the NP6, SoC3, or SoC4 platforms, the class ID limit for egress traffic is 2 - 15. Setting the egress traffic class ID outside of these limits can result in unexpected behavior.

If NPU offloading is disabled, or enabled on the NP7 platform, the class ID limit for egress traffic is 2 - 31.

When configuring a traffic shaping profile, the settings can be defined per class.

The following options can be configured for traffic shaping classes:

GUI option	CLI option	Description
Default	`set default-class-id <class-id>`	Set the default class ID. Each profile must have one default class ID. The default class ID can be changed at any time.
Traffic shaping class ID	`set class-id <integer>`	Set the class ID (2 - 31).
Guaranteed bandwidth	`set guaranteed-bandwidth-percentage <integer>`	Set the percentage of the outbandwidth that will be guaranteed for the class ID.
Maximum bandwidth	`set maximum-bandwidth-percentage <integer>`	Set the percentage of the outbandwidth that will be the maximum bandwidth for the class ID.
Priority	`set priority {top | critical | high | medium | low}`	Select the priority level for the class ID.

To configure a traffic shaping profile in the GUI:

1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Profile* tab, and click *Create New*.
2. Enter the profile name, and optionally enter a comment.
3. In the *Traffic Shaping Classes* section, click *Create New*.
4. Configure the traffic shaping class ID settings (*Traffic shaping class ID*, *Guaranteed bandwidth*, *Maximum bandwidth*, and *Priority*).
5. Click *OK*.
6. Create more shaping classes as needed (the total guaranteed bandwidth of all classes cannot exceed 100%).
7. Click *OK*.

To configure a traffic shaping profile in the CLI:

1. Configure the shaping class:

```
config firewall traffic-class
    edit <integer>
        set class-name <string>
    next
end
```

2. Configure the shaping profile:

```
config firewall shaping-profile
    edit <name>
        set type {policing | queuing}
        set default-class-id <class-id>
        config shaping-entries
            edit <id>
                set class-id <integer>
                set priority {top | critical | high | medium | low}
```

```
                set guaranteed-bandwidth-percentage <integer>
                set maximum-bandwidth-percentage <integer>
            next
        end
    next
end
```

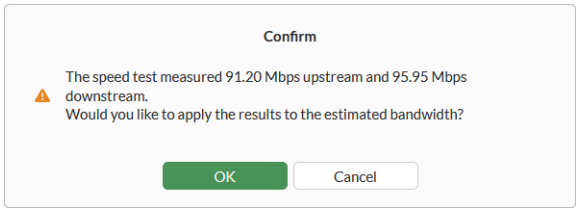
Configuring the interface outbandwidth

There are two settings that must be configured on an interface that has traffic shaping applied to egressing traffic: a traffic shaping profile must be assigned, and the outbound bandwidth must be configured.

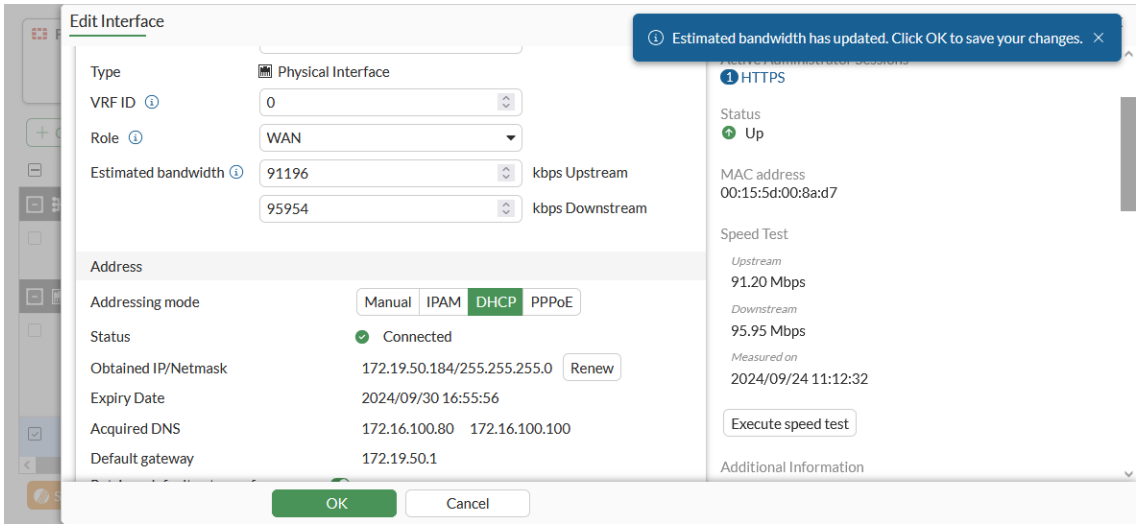
Since traffic shaping is often configured on the WAN interface for egressing traffic, the outbound bandwidth is effectively the upstream bandwidth allowed by your ISP. On the FortiGate, it is possible to perform a speed test on interfaces are assigned a WAN role assigned (see GUI speed test on page 1357). The speed test performs measurements against public cloud servers, and provides an accurate measurement of the upstream bandwidth. After the test is complete, the results can be used to populate the *Outbound bandwidth* field.

To configure traffic shaping on an interface:

1. Go to *Network* > *Interfaces* and double-click an interface to edit it.
2. For interfaces assigned a *WAN* role, in the right-side of the screen, click *Execute speed test*.
3. When the test completes, click *OK* in the *Confirm* pane to apply the results to the estimated bandwidth.



The speed test results are populated in the *Estimated bandwidth* fields for *kbps Upstream* and *kbps Downstream*.



4. In the *Traffic Shaping* section, enable *Outbound shaping profile* and select a profile.

5. Enable *Outbound bandwidth* and copy the *kbps Upstream* value from the speed test, or enter a custom value.
6. Click *OK*.

Verifying that the traffic is being shaped

In this example, three traffic classes are defined in the traffic shaping profile assigned to port1. The outbandwidth configured on port1 is 1000 Kbps. Each class has an `allocated-bandwidth`, `guaranteed-bandwidth`, `max-bandwidth`, and `current-bandwidth` value.

- The `guaranteed-bandwidth` and `max-bandwidth` are rates that are converted from the percentage of outbandwidth configured for each class. For example, `class-id` 2 has 10% `guaranteed-bandwidth`, equivalent to 100 Kbps, and 100% `max-bandwidth` equivalent to 1000 Kbps.
- The `allocated-bandwidth` displays the real-time bandwidth allocation for the traffic class based on all available factors. This value changes as traffic demand changes.
- The `current-bandwidth` displays the real-time bandwidth usage detected for the traffic class.

To verify that traffic is being shaped by the traffic shaping profile:

1. Enable debug flow to view the live traffic as it matches a traffic shaping policy:

```
# diagnose debug flow show function-name enable
# diagnose debug flow show iprope enable
# diagnose debug flow filter <filters>
# diagnose debug flow trace start <repeat_number>
# diagnose debug enable
```

   The `iprope_shaping_check` function outputs the shaping policy matched for any given traffic:

```
...
id=20085 trace_id=21 func=iprope_shaping_check line=934 msg="in-[port3], out-[port1], skb_
flags-02000000, vid-0"
id=20085 trace_id=21 func=__iprope_check line=2277 msg="gnum-100015, check-ffffffffa002a8fe"
id=20085 trace_id=21 func=__iprope_check_one_policy line=2029 msg="checked gnum-100015 policy-
3, ret-matched, act-accept"
id=20085 trace_id=21 func=__iprope_check_one_policy line=2247 msg="policy-3 is matched, act-
accept"
id=20085 trace_id=21 func=__iprope_check line=2294 msg="gnum-100015 check result: ret-matched,
act-accept, flag-00000000, flag2-00000000"
```

2. Display the session list:

```
# diagnose sys session filter <filters>
# diagnose sys session list
```

   Sessions that match a shaping policy will display `class_id` and `shaping_policy_id` fields:

```
...
session info: proto=6 proto_state=05 duration=32 expire=0 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=4
origin-shaper=
reply-shaper=
```

```
per_ip_shaper=
class_id=4 shaping_policy_id=3 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
```

3. Display the interface statistics:

```
# diagnose netlink interface list port1
if=port1 family=00 type=1 index=3 mtu=1500 link=0 master=0
ref=95 state=start present fw_flags=2001b800 flags=up broadcast run allmulti multicast
Qdisc=pfifo_fast hw_addr=52:54:00:7e:af:a6 broadcast_addr=ff:ff:ff:ff:ff:ff
inbandwidth=10000(kbps)         total_bytes=2098887K    drop_bytes=7854K
egress traffic control:
        bandwidth=1000(kbps) lock_hit=241 default_class=3 n_active_class=3
        class-id=2      allocated-bandwidth=140(kbps)   guaranteed-bandwidth=100(kbps)
                        max-bandwidth=1000(kbps)        current-bandwidth=147(kbps)
                        priority=low    forwarded_bytes=8161K
                        dropped_packets=2032    dropped_bytes=3074K
        class-id=3      allocated-bandwidth=30(kbps)    guaranteed-bandwidth=300(kbps)
                        max-bandwidth=1000(kbps)        current-bandwidth=10(kbps)
                        priority=medium         forwarded_bytes=501K
                        dropped_packets=1       dropped_bytes=1195
        class-id=4      allocated-bandwidth=830(kbps)   guaranteed-bandwidth=500(kbps)
                        max-bandwidth=1000(kbps)        current-bandwidth=810(kbps)
                        priority=high   forwarded_bytes=1393K
                        dropped_packets=379     dropped_bytes=572K
stat: rxp=8349728 txp=11101735 rxb=2216101183 txb=1394077978 rxe=0 txe=0 rxd=0 txd=0 mc=0
collision=0 @ time=1654202868
re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=95
```

If the debug output does not display egress traffic control by class and displays them by priority, it is likely that global traffic prioritization is configured. The global traffic prioritization settings must be disabled to view the preceding debug output (see Global traffic prioritization on page 1838).

Traffic shaping with queuing using a traffic shaping profile

You can use the weighted random early detection (WRED) queuing function within traffic shaping.

This topic includes two parts:

- Traffic shaping with queuing on page 1817
- Burst control in queuing mode on page 1818

You cannot configure or view WRED in the GUI; you must use the CLI.

WRED is not supported when traffic is offloaded to an NPU.

Traffic shaping with queuing

Traffic shaping has a queuing option. Use this option to fine-tune the queue by setting the profile queue size or performing random early drop (RED) according to queue usage.

This example shows setting the profile queue size limit to 5 so that the queue can contain a maximum of five packets and more packets are dropped.

To set the profile queue size limit:

```
config firewall shaping-profile
    edit "profile"
        set type queuing
        set default-class-id 31
        config shaping-entries
            edit 31
                set class-id 31
                set guaranteed-bandwidth-percentage 5
                set maximum-bandwidth-percentage 10
                set limit 5  <range from 5 to 10000; default: 1000>
            next
        end
    next
end
```

This example shows performing RED according to queue usage by setting `red-probability`, `min`, and `max`. Setting `red-probability` to `10` means start to drop packets when queue usage reaches the `min` setting. When queue usage reaches the `max` setting, drop 10% of the packets.

- Level 1: when queue is less than `min` packets, drop 0% of packets.
- Level 2: when queue reaches `min` packets, start to drop packets.
- Level 3: when queue usage is between `min` and `max` packets, drop 0–10% of packets by proportion.
- Level 4: when queue (average queue size) is more than `max` packets, drop 100% of packets.

To set RED according to queue usage:

```
config firewall shaping-profile
    edit "profile"
        set type queuing
        set default-class-id 31
        config shaping-entries
            edit 31
                set class-id 31
                set guaranteed-bandwidth-percentage 5
                set maximum-bandwidth-percentage 10
                set red-probability 10 <range from 0 to 20; default: 0 no drop>
                set min 100 <range from 3 to 3000>
                set max 300 <range from 3 to 3000>
            next
        end
```

```
    next
end
```

To troubleshoot this function, use the following diagnose commands:

```
diagnose netlink intf-class list <intf>
diagnose netlink intf-qdisc list <intf>
```

Burst control in queuing mode

In a hierarchical token bucket (HTB) algorithm, each traffic class has buckets to allow a burst of traffic. The maximum burst is determined by the bucket size `burst` (for guaranteed bandwidth) and `cburst` (for maximum bandwidth). The shaping profile has `burst-in-msec` and `cburst-in-msec` parameters for each shaping entry (`class id`) to control the bucket size.

This example uses the outbandwidth of the interface as 1 Mbps and the maximum bandwidth of class is 50%.

burst = burst-in-msec * guaranteed bandwidth = 100 ms × 1 Mbps x 50% = 50000 b = 6250 B

cburst = cburst-in-msec * maximum bandwidth = 200 ms × 1 Mbps x 50% = 100000 b = 12500 B

The following example sets `burst-in-msec` to 100 and `cburst-in-msec` to 200.

To set burst control in queuing mode:

```
config firewall shaping-profile
    edit "profile"
        set type queuing
        set default-class-id 31
        config shaping-entries
            edit 31
                set class-id 31
                set guaranteed-bandwidth-percentage 5
                set maximum-bandwidth-percentage 50
                set burst-in-msec 100 <range from 0 to 2000>
                set cburst-in-msec 200 <range from 0 to 2000>
            next
        end
    next
end
```

Example

Enabling RED for FTP traffic from QA

This example shows how to enable RED for FTP traffic from QA. This example sets a maximum of 10% of the packets to be dropped when queue usage reaches the maximum value.

To configure the firewall address:

```
config firewall address
    edit QA_team
        set subnet 10.1.100.0/24
    next
end
```

To set the shaping policy to classify traffic into different class IDs:

```
config firewall shaping-policy
    edit 1
        set service HTTPS HTTP
        set dstintf port1
        set srcaddr QA_team
        set dstaddr all
        set class-id 10
    next
    edit 2
        set service FTP
        set dstintf port1
        set srcaddr QA_team
        set dstaddr all
        set class-id 20
    next
end
```

To set the shaping policy to define the speed of each class ID:

```
config firewall shaping-profile
    edit QA_team_profile
       set type queuing
       set default-class-id 30
            config shaping-entries
                edit 1
                    set class-id 10
                    set guaranteed-bandwidth-percentage 50
                    set maximum-bandwidth-percentage 100
                next
                edit 2
                    set class-id 20
                    set guaranteed-bandwidth-percentage 30
                    set maximum-bandwidth-percentage 60
```

```
                    set red-probability 10
                next
                edit 3
                    set class-id 30
                    set guaranteed-bandwidth-percentage 20
                    set maximum-bandwidth-percentage 50
                next
            end
    next
end
```

To apply the shaping policy to the interface:

```
config sys interface
    edit port1
        set outbandwidth 10000
        set egress-shaping-profile QA_team_profile
    next
end
```

To use diagnose commands to troubleshoot:

```
# diagnose netlink intf-class list port1

Traffic shapers

The following topics provide more information about traffic shapers:

- Shared traffic shaper on page 1821
- Per-IP traffic shaper on page 1826
- Changing traffic shaper bandwidth unit of measurement on page 1830
- Multi-stage DSCP marking and class ID in traffic shapers on page 1830
- Multi-stage VLAN CoS marking on page 1832
- Adding traffic shapers to multicast policies on page 1836

Shared traffic shaper

Shared traffic shaper is used in a firewall shaping policy to indicate the priority and guaranteed and maximum bandwidth for a specified type of traffic use.

The maximum bandwidth indicates the largest amount of traffic allowed when using the policy. You can set the maximum bandwidth to a value between 1 and 16776000 Kbps. The GUI displays an error if any value outside this range is used. If you want to allow unlimited bandwidth, use the CLI to enter a value of 0.

The guaranteed bandwidth ensures that there is a consistent reserved bandwidth available. When setting the guaranteed bandwidth, ensure that the value is significantly less than the interface's bandwidth capacity. Otherwise, the interface will allow very little or no other traffic to pass through, potentially causing unwanted latency.

In a shared traffic shaper, the administrator can prioritize certain traffic as high, medium, or low. FortiOS provides bandwidth to low priority connections only when high priority connections do not need the bandwidth. For example, you should assign a high traffic priority to a policy for connecting a secure web server that needs to support e-commerce traffic. You should assign less important services a low priority.

When you configure a shared traffic shaper, you can apply bandwidth shaping per policy or for all policies. By default, a shared traffic shaper applies traffic shaping evenly to all policies that use the shared traffic shaper.

When configuring a per-policy traffic shaper, FortiOS applies the traffic shaping rules defined for each security policy individually. For example, if a per-policy traffic shaper is configured with a maximum bandwidth of 1000 Kbps, any security policies that have that traffic shaper enabled get 1000 Kbps of bandwidth each.

If a traffic shaper for all policies is configured with a maximum bandwidth of 1000 Kbps, all policies share the 1000 Kbps on a first-come, first-served basis.

The configuration is as follows:

```
config firewall shaper traffic-shaper
    edit "traffic_shaper_name"
        set per-policy enable
    next
end
```

The shared traffic shaper selected in the traffic shaping policy affects traffic in the direction defined in the policy. For example, if the source port is LAN and the destination is WAN1, the traffic shaping affects the flow in this direction only, affecting the outbound traffic's upload speed. You can define the traffic shaper for the policy in the opposite direction (reverse shaper) to affect the inbound traffic's download speed. In this example, that would be from WAN1 to LAN.

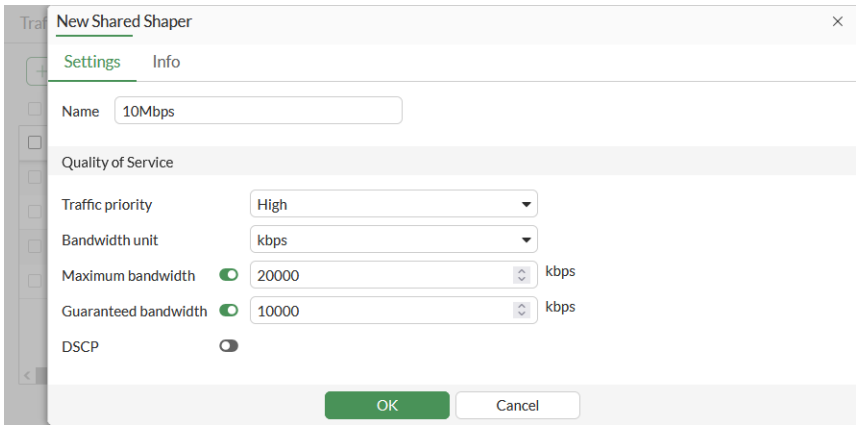
Only traffic through forward traffic shapers will be included in FortiView; reverse and per-IP shapers are not included.

Traffic shapers can be added to a multicast policy when multicast routing is enabled.

The following example shows how to apply different speeds to different types of service. The example configures two shared traffic shapers to use in two firewall shaping policies. One policy guarantees a speed of 10 Mbps for VoIP traffic. The other policy guarantees a speed of 1 Mbps for other traffic. In the example, FortiOS communicates with a PC using port10 and the Internet using port9.

To configure shared traffic shapers in the GUI:

1. Create a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set the *Name* to *Internet Access*.
   c. Set the *Incoming Interface* to *port10*.
   d. Set the *Outgoing Interface* to *port9*.
   e. Set the *Source* and *Destination* to *all*.
   f. Set the *Schedule* to *always*.
   g. Set the *Service* to *ALL*.
   h. Click *OK*.
2. Create the shared traffic shapers:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaper* tab, then click *Create New*.
   b. Set the *Name* to *10Mbps*. This shaper is for VoIP traffic.
   c. Set the *Traffic Priority* to *High*.
   d. Enable *Max Bandwidth* and enter *20000*.
   e. Enable *Guaranteed Bandwidth* and enter *10000*.



f. Click *OK*.

g. Repeat the above steps to create another traffic shaper named *1Mbps* with the *Traffic Priority* set to *Low*, the *Max Bandwidth* set to *10000*, and the *Guaranteed Bandwidth* set to *1000*.

3. Create a firewall shaping policy:

a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.

b. Set the *Name* to *VoIP_10Mbps_High*. This policy is for VoIP traffic.

c. Set the *Source* and *Destination* to *all*.

d. Set the *Service* to all VoIP services.

e. Set the *Outgoing Interface* to *port9*.

f. Enable *Shared shaper* and select *10Mbps*.

g. Enable *Reverse shaper* and select *10Mbps*.

h. Click *OK*.

i. Repeat the above steps to create another firewall shaping policy named *Other_1Mbps_Low* for other traffic, with the *Source* and *Destination* set to *all*, *Service* set to *ALL*, *Outgoing Interface* set to *port9*, and *Shared shaper* and *Reverse shaper* set to *1Mbps*.

To configure shared traffic shapers in the CLI:

1. Create a firewall policy:

```
config firewall policy
    edit 1
        set name "Internet Access"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set fsso disable
        set nat enable
    next
end
```

2. Create the shared traffic shapers:

```
config firewall shaper traffic-shaper
    edit "10Mbps"
        set guaranteed-bandwidth 10000
        set maximum-bandwidth 20000
    next
    edit "1Mbps"
        set guaranteed-bandwidth 1000
        set maximum-bandwidth 10000
        set priority low
    next
end
```

3. Create a firewall shaping policy:

```
config firewall shaping-policy
    edit 1
        set name "VOIP_10Mbps_High"
        set service "H323" "IRC" "MS-SQL" "MYSQL" "RTSP" "SCCP" "SIP" "SIP-MSNmessenger"
        set dstintf "port9"
        set traffic-shaper "10Mbps"
        set traffic-shaper-reverse "10Mbps"
        set srcaddr "all"
        set dstaddr "all"
    next
    edit 2
        set name "Other_1Mbps_Low"
        set service "ALL"
        set dstintf "port9"
        set traffic-shaper "1Mbps"
        set traffic-shaper-reverse "1Mbps"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

To troubleshoot shared traffic shapers:

1. Check if specific traffic is attached to the correct traffic shaper. The example output shows the traffic attached to the 10Mbps and 1Mbps shapers:

```
# diagnose firewall iprope list 100015
policy index=1 uuid_idx=0 action=accept
flag (0):
shapers: orig=10Mbps(2/1280000/2560000)
cos_fwd=0  cos_rev=0
group=00100015 av=00000000 au=00000000 split=00000000
host=4 chk_client_info=0x0 app_list=0 ips_view=0
misc=0 dd_type=0 dd_mode=0
zone(1): 0 -> zone(1): 38
source(1): 0.0.0.0-255.255.255.255, uuid_idx=0,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=0,
service(15):
```

```
    [6:0x0:0/(1,65535)->(1720,1720)] helper:auto
    [6:0x0:0/(1,65535)->(1503,1503)] helper:auto
    [17:0x0:0/(1,65535)->(1719,1719)] helper:auto
    [6:0x0:0/(1,65535)->(6660,6669)] helper:auto
    [6:0x0:0/(1,65535)->(1433,1433)] helper:auto
    [6:0x0:0/(1,65535)->(1434,1434)] helper:auto
    [6:0x0:0/(1,65535)->(3306,3306)] helper:auto
    [6:0x0:0/(1,65535)->(554,554)] helper:auto
    [6:0x0:0/(1,65535)->(7070,7070)] helper:auto
    [6:0x0:0/(1,65535)->(8554,8554)] helper:auto
    [17:0x0:0/(1,65535)->(554,554)] helper:auto
    [6:0x0:0/(1,65535)->(2000,2000)] helper:auto
    [6:0x0:0/(1,65535)->(5060,5060)] helper:auto
    [17:0x0:0/(1,65535)->(5060,5060)] helper:auto
    [6:0x0:0/(1,65535)->(1863,1863)] helper:auto

policy index=2 uuid_idx=0 action=accept
flag (0):
shapers: orig=1Mbps(4/128000/1280000)
cos_fwd=0  cos_rev=0
group=00100015 av=00000000 au=00000000 split=00000000
host=4 chk_client_info=0x0 app_list=0 ips_view=0
misc=0 dd_type=0 dd_mode=0
zone(1): 0 -> zone(1): 38
source(1): 0.0.0.0-255.255.255.255, uuid_idx=0,

service(1):
    [0:0x0:0/(0,0)->(0,0)] helper:auto
```

2. Check if the correct traffic shaper is applied to the session. The example output shows that the 1Mbps shaper is applied to the session:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=11 expire=3599 timeout=3600 flags=00000000
sockflag=00000000 sockport=0 av_idx=0 use=5
origin-shaper=1Mbps prio=4 guarantee 128000Bps max 1280000Bps traffic 1050Bps drops 0B
reply-shaper=
per_ip_shaper=
class_id=0 shaping_policy_id=2 ha_id=0 policy_dir=0 tunnel=/ helper=ftp vlan_cos=0/255
state=may_dirty npu npd os mif route_preserve
statistic(bytes/packets/allow_err): org=868/15/1 reply=752/10/1 tuples=2
tx speed(Bps/kbps): 76/0 rx speed(Bps/kbps): 66/0
orgin->sink: org pre->post, reply pre->post dev=39->38/38->39 gwy=172.16.200.55/0.0.0.0
hook=post dir=org act=snat 10.1.100.11:58241->172.16.200.55:21(172.16.200.1:58241)
hook=pre dir=reply act=dnat 172.16.200.55:21->172.16.200.1:58241(10.1.100.11:58241)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=4
serial=0003255f tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id = 00000000
dd_type=0 dd_mode=0
npu_state=0x100000
```

```
npu info: flag=0x00/0x00, offload=0/0, ips_offload=0/0, epid=0/0, ipid=0/0, vlan=0x0000/0x0000
vlifid=0/0, vtag_in=0x0000/0x0000 in_npu=0/0, out_npu=0/0, fwd_en=0/0, qid=0/0
no_ofld_reason:  offload-denied helper
total session 1
```

3. Check the statuses of shared traffic shapers:

```
# diagnose firewall shaper traffic-shaper list
name 10Mbps
maximum-bandwidth 2500 KB/sec
guaranteed-bandwidth 1250 KB/sec
current-bandwidth 0 B/sec
priority 2
tos ff
packets dropped 0
bytes dropped 0

name 1Mbps
maximum-bandwidth 1250 KB/sec
guaranteed-bandwidth 125 KB/sec
current-bandwidth 0 B/sec
priority 4
tos ff
packets dropped 0
bytes dropped 0
```

Per-IP traffic shaper

With per-IP traffic shaping, you can limit each IP address's behavior to avoid a situation where one user uses all of the available bandwidth. In addition to controlling the maximum bandwidth used per IP address, you can also define the maximum number of concurrent sessions for an IP address. For example, if you apply a per-IP shaper of 1 Mbps to your entire network, FortiOS allocates each user/IP address 1 Mbps of bandwidth. Even if the network consists of a single user, FortiOS allocates them 1 Mbps. If there are ten users, each user gets 1 Mbps of bandwidth, totaling 10 Mbps of outgoing traffic.

For shared shapers, all users share the set guaranteed and maximum bandwidths. For example, if you set a shared shaper for all PCs using an FTP service to 10 Mbps, all users uploading to the FTP server share the 10 Mbps.

Shared shapers affect upload speed. If you want to limit the download speed from the FTP server in the example, you must configure the shared shaper as a reverse shaper. Per-IP shapers apply the speed limit on both upload and download operations. Only traffic through forward traffic shapers will be included in FortiView; reverse and per-IP shapers are not included.

The following example shows how to apply a per-IP shaper to a traffic shaping policy. This shaper assigns each user a maximum bandwidth of 1 Mbps and allows each user to have a maximum of ten concurrent connections to the FTP server. In the example, FortiOS communicates with users using port10 and the FTP server using port9.

To configure a per-IP traffic shaper in the GUI:

1. Create a firewall policy:
   a. Go to *Policy & Objects* > *IPv4 Policy* and click *Create New*.
   b. Set the *Name* to *FTP Access*.
   c. Set the *Incoming Interface* to *port10*.
   d. Set the *Outgoing Interface* to *port9*.
   e. Set the *Source* to *all*.
   f. Set the *Destination* to *FTP_Server*.
   g. Set the *Schedule* to *always*.
   h. Set the *Service* to *ALL*.
   i. Click *OK*.
2. Create the per-IP traffic shaper:
   a. Go to *Policy & Objects* > *Traffic Shaping* and select the *Traffic Shaper* tab.
   b. Select *Per-IP* in the type drop-down, then click *Create new*.

   c. Enter the *Name* (*FTP_Max_1M*). This shaper is for VoIP traffic.
   d. Enable *Max Bandwidth* and enter *1000*.
   e. Enable *Max Concurrent Connections* and enter *10*. This means that each user can have up to ten concurrent connections to the FTP server.

   f. Click *OK*.

3. Create a firewall shaping policy:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
   b. Enter the *Name* (*FTP speed 1M*).
   c. Set the *Source* to the addresses and users that require access to the FTP server.
   d. Set the *Destination* to *FTP_Server*.
   e. Set the *Service* to *ALL*.
   f. Set the *Outgoing Interface* to *port9*.
   g. Enable *Per-IP shaper* and select *FTP_Max_1M*.
   h. Click *OK*.

To configure a per-IP traffic shaper in the CLI:

1. Create a firewall policy:

```
config firewall policy
    edit 1
        set name "FTP Access"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "FTP_Server"
        set action accept
        set schedule "always"
        set service "ALL"
        set fsso disable
        set nat enable
    next
end
```

2. Create the per-IP traffic shaper:

```
config firewall shaper per-ip-shaper
    edit "FTP_Max_1M"
        set max-bandwidth 1000
        set max-concurrent-session 10
    next
end
```

3. Create a firewall shaping policy:

```
config firewall shaping-policy
    edit 1
        set name "FTP speed 1M"
        set service "ALL"
        set dstintf "port9"
        set per-ip-shaper "FTP_Max_1M"
        set srcaddr "PC1" "WinPC" "PC2"
        set dstaddr "FTP_Server"
    next
end
```

To troubleshoot per-IP traffic shapers:

1. Check if specific traffic is attached to the correct traffic shaper. The example output shows the traffic attached to the FTP_Max_1M shaper:

```
# diagnose firewall iprope list 100015
policy index=3 uuid_idx=0 action=accept
flag (0):
shapers:  per-ip=FTP_Max_1M
cos_fwd=0  cos_rev=0
group=00100015 av=00000000 au=00000000 split=00000000
host=2 chk_client_info=0x0 app_list=0 ips_view=0
misc=0 dd_type=0 dd_mode=0
zone(1): 0 -&gt; zone(1): 38
source(3): 10.1.100.11-10.1.100.11, uuid_idx=30, 10.1.100.143-10.1.100.143, uuid_idx=32,
10.1.100.22-10.1.100.22, uuid_idx=31,
dest(1): 172.16.200.55-172.16.200.55, uuid_idx=89,
service(1):
    [0:0x0:0/(0,65535)-&gt;(0,65535)] helper:auto
```

2. Check if the correct traffic shaper is applied to the session. The example output shows that the FTP_Max_1M shaper is applied to the session:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=36 expire=3567 timeout=3600 flags=00000000
sockflag=00000000 sockport=0 av_idx=0 use=4
origin-shaper=
reply-shaper=
per_ip_shaper=FTP_Max_1M
class_id=0 shaping_policy_id=3 ha_id=0 policy_dir=0 tunnel=/ helper=ftp vlan_cos=0/255
state=may_dirty per_ip npu npd mif route_preserve
statistic(bytes/packets/allow_err): org=506/9/1 reply=416/6/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin-&gt;sink: org pre-&gt;post, reply pre-&gt;post dev=39-&gt;38/38-&gt;39
gwy=172.16.200.55/0.0.0.0
hook=post dir=org act=snat 10.1.100.11:58275-&gt;172.16.200.55:21(172.16.200.1:58275)
hook=pre dir=reply act=dnat 172.16.200.55:21-&gt;172.16.200.1:58275(10.1.100.11:58275)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=2
serial=0000211a tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id = 00000000
dd_type=0 dd_mode=0
npu_state=0x100000
npu info: flag=0x00/0x00, offload=0/0, ips_offload=0/0, epid=0/0, ipid=0/0, vlan=0x0000/0x0000
vlifid=0/0, vtag_in=0x0000/0x0000 in_npu=0/0, out_npu=0/0, fwd_en=0/0, qid=0/0
no_ofld_reason:  offload-denied helper
```

3. Check the statuses of per-IP traffic shapers. The output should resemble the following:

```
# diagnose firewall shaper per-ip-shaper list
name FTP_Max_1M
maximum-bandwidth 125 KB/sec
```

```
maximum-concurrent-session 10
tos ff/ff
packets dropped 0
bytes dropped 0
addr=10.1.100.11 status: bps=0 ses=3
```

Changing traffic shaper bandwidth unit of measurement

Bandwidth speeds are measured in kilobits per second (Kbps), and bytes that are sent and received are measured in megabytes (MB). In some cases, this can cause confusion depending on whether your ISP uses kilobits per second (Kbps), kilobytes per second (KBps), megabits per second (Mbps), or gigabits per second (Gbps).

You can change the unit of measurement for traffic shapers in the CLI.

To change the bandwidth unit of measurement for a shared traffic shaper:

```
config firewall shaper traffic-shaper
    edit <traffic_shaper_name>
        set bandwidth-unit {kbps | mbps | gbps}
    next
end
```

To change the bandwidth unit of measurement for a per-IP traffic shaper:

```
config firewall shaper per-ip-shaper
    edit <traffic_shaper_name>
        set bandwidth-unit {kbps | mbps | gbps}
    next
end
```

Multi-stage DSCP marking and class ID in traffic shapers

Traffic shapers have a multi-stage method so that packets are marked with a different differentiated services code point (DSCP) and `class id` at different traffic speeds. Marking packets with a different DSCP code is for the next hop to classify the packets. The FortiGate benefits by marking packets with a different `class id`. Combined with the egress interface shaping profile, the FortiGate can handle the traffic differently according to its `class id`.

Rule	DSCP code	Class ID
speed < guarantee bandwidth	`diffservcode`	`class id` in shaping policy
guarantee bandwidth < speed < exceed bandwidth	`exceed-dscp`	`exceed-class-id`
exceed bandwidth < speed	`maximum-dscp`	`exceed-class-id`

This example sets the following parameters:

- When the current bandwidth is less than 50 Kbps, mark packets with `diffservcode` 100000 and set `class id` to 10.
- When the current bandwidth is between 50 Kbps and 100 Kbps, mark packets with `exceed-dscp` 111000 and set `exceed-class-id` to 20.
- When the current bandwidth is more than 100 Kbps, mark packets with `maximum-dscp` 111111 and set `exceed-class-id` to 20.

To set multi-stage DSCP marking and class ID in a traffic shaper:

```
config firewall shaper traffic-shaper
    edit "50k-100k-150k"
        set guaranteed-bandwidth 50
        set maximum-bandwidth 150
        set diffserv enable
        set dscp-marking-method multi-stage
        set exceed-bandwidth 100
        set exceed-dscp 111000
        set exceed-class-id 20
        set maximum-dscp 111111
        set diffservcode 100000
    next
end
```

```
config firewall shaping-policy
     edit 1
         set service "ALL"
         set dstintf PORT2
         set srcaddr "all"
         set dstaddr "all"
         set class-id 10
     next
end
```

Traffic shapers also have an `overhead` option that defines the per-packet size overhead used in rate computation.

To set the traffic shaper overhead option:

```
config firewall shaper traffic-shaper
    edit "testing"
        set guaranteed-bandwidth 50
        set maximum-bandwidth 150
        set overhead 14 <range from 0 to 100>
    next
end
```

Example

This example shows how to mark QA traffic with a different DSCP according to real-time traffic speed.

To configure the firewall address:

```
config firewall address
    edit QA_team
        set subnet 10.1.100.0/24
    next
end
```

To configure the firewall shaper traffic shaper:

```
config firewall shaper traffic-shaper
    edit "500k-1000k-1500k"
        set guaranteed-bandwidth 500
        set maximum-bandwidth 1500
        set diffserv enable
        set dscp-marking-method multi-stage
        set exceed-bandwidth 1000
        set exceed-dscp 111000
        set maximum-dscp 111111
        set diffservcode 100000
    next
end
```

```
config firewall shaping-policy
    edit QA_team
        set service "ALL"
        set dstintf port1
        set traffic-shaper "500k-1000k-1500k"
        set traffic-shaper-reverse "500k-1000k-1500k"
        set srcaddr "QA_team"
        set dstaddr "all"
    next
end
```

Multi-stage VLAN CoS marking

A FortiGate can configure the traffic shaper to dynamically change the CoS value of outgoing VLAN packets based on the shaper profile. This allows the FortiGate to mark traffic with different CoS values at different stages of the shaping process.

```
config firewall shaper traffic-shaper
    edit <name>
        set bandwidth-unit {kbps | mbps | gbps}
        set guaranteed-bandwidth <integer>
        set maximum-bandwidth <integer>
```

```
        set cos-marking {enable | disable}
        set cos-marking-method {static | multi-stage}
        set cos <3-bit_binary>
        set exceed-cos <3-bit_binary>
        set maximum-cos <3-bit_binary>
        set exceed-bandwidth <integer>
    next
end
```

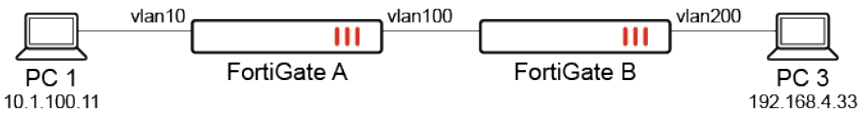
`cos-marking {enable | disable}`	Enable/disable VLAN CoS marking (default = `disable`).
`cos-marking-method {static | multi-stage}`	Set the VLAN CoS marking method. • `static`: use static VLAN CoS marking (default) • `multi-stage`: multi-stage VLAN CoS marking
`cos <3-bit_binary>`	Set the VLAN CoS mark, 3-bit binary (000 - 111).
`exceed-cos <3-bit_binary>`	Set the VLAN CoS mark for traffic in `guaranteed-bandwidth` and `exceed-bandwidth`, 3-bit binary (000 - 111).
`maximum-cos <3-bit_binary>`	Set the VLAN CoS mark for traffic in `exceed-bandwidth` and `maximum-bandwidth`, 3-bit binary (000 - 111).
`exceed-bandwidth <integer>`	Set the exceed bandwidth used for DSCP or VLAN CoS multi-stage marking. The integer value range depends on the `bandwidth-unit` setting. This setting is only available for CoS multi-stage marking.

Example

In this example, mutli-stage VLAN CoS marking is configured using traffic shapers on FortiGate A and FortiGate B. FortiGate A applies multi-stage CoS marking with the following traffic shaper settings:

- Traffic below the guaranteed bandwidth will apply CoS 6.
- Traffic greater than the guaranteed bandwidth will apply CoS 6 and 5.
- Traffic greater than the exceed bandwidth will apply CoS 6, 5, and 4.

A traffic shaper and shaping policy are configured on FortiGate B. When traffic comes from FortiGate A with CoS 6, the traffic shaping policy will be applied because the CoS matches.



Multi-stage VLAN CoS marking is not supported on NP models. Traffic is not offloaded when it is enabled.

To configure mutli-stage VLAN CoS marking on FortiGate A:

1. Configure the firewall policy:

```
config firewall policy
    edit 7
        set srcintf "port1"
        set dstintf "vlan100"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set traffic-shaper "multi-stage-cos-fgta"
        set traffic-shaper-reverse "multi-stage-cos-fgta"
    next
end
```

2. Configure the traffic shaper:

```
config firewall shaper traffic-shaper
    edit "multi-stage-cos-fgta"
        set guaranteed-bandwidth 1000
        set maximum-bandwidth 4000
        set per-policy enable
        set exceed-bandwidth 2000
        set cos-marking enable
        set cos-marking-method multi-stage
        set cos 110
        set exceed-cos 101
        set maximum-cos 100
    next
end
```

3. Check the session list to verify that CoS 6 is marked:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=6 expire=180 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=multi-stage-cos-fgta prio=2 guarantee 125000Bps max 500000Bps traffic 504900Bps
drops 163905268B
reply-shaper=multi-stage-cos-fgta prio=2 guarantee 125000Bps max 500000Bps traffic 504900Bps
drops 0B
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=6/6
state=log may_dirty npu npd os rs f00
statistic(bytes/packets/allow_err): org=3804176/292/1 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 583462/4667 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=19->47/47->19 gwy=20.20.20.2/0.0.0.0
hook=pre dir=org act=noop 10.1.100.11:37586->192.168.4.33:5001(0.0.0.0:0)
```

```
hook=post dir=reply act=noop 192.168.4.33:5001->10.1.100.11:37586(0.0.0.0:0)
src_mac=00:0c:29:57:2a:01  dst_mac=70:4c:a5:7d:d4:95
misc=0 policy_id=7 pol_uuid_idx=1129 auth_info=0 chk_client_info=0 vd=2
serial=0006613c tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000000
npu info: flag=0x00/0x00, offload=0/0, ips_offload=0/0, epid=0/0, ipid=0/0, vlan=0x0000/0x0000
vlifid=0/0, vtag_in=0x0000/0x0000 in_npu=0/0, out_npu=0/0, fwd_en=0/0, qid=0/0
no_ofld_reason:  offload-denied
```

To configure mutli-stage VLAN CoS marking on FortiGate B:

1. Configure the firewall policy:

```
config firewall policy
    edit 4
        set srcintf "vlan100"
        set dstintf "vlan200"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
end
```

2. Configure the traffic shaper:

```
config firewall shaper traffic-shaper
    edit "multi-stage-cos-fgtb"
        set guaranteed-bandwidth 250
        set maximum-bandwidth 1000
        set per-policy enable
        set cos-marking enable
        set cos-marking-method multi-stage
        set cos 100
        set exceed-cos 101
        set maximum-cos 110
        set exceed-bandwidth 500
    next
end
```

Based on this traffic shaper, the following CoS marking rules will be applied:

- If all traffic is less than the guaranteed bandwidth, then the traffic will be marked with CoS 4.
- If all traffic is greater than the guaranteed bandwidth but less than the exceed bandwidth, then 50% of the traffic will be marked as CoS 4 and 50% as CoS 5.
- If traffic is greater than the guaranteed bandwidth but less than the maximum bandwidth, then 50% of the traffic will be marked as CoS 6; CoS 4 and 5 will have another 50%.

- If traffic is greater than the maximum bandwidth, then 50% of the traffic will be marked as CoS 6, 25% will be marked as CoS 4, and 25% will be marked as CoS 5. Packet drops will be visible in the debug output.

3. Configure the traffic shaping policy:

```
config firewall shaping-policy
    edit 1
        set service "ALL"
        set srcintf "vlan100"
        set dstintf "vlan200"
        set traffic-shaper "multi-stage-cos-fgtb"
        set traffic-shaper-reverse "multi-stage-cos-fgtb"
        set class-id 2
        set cos-mask 111
        set cos 110
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

4. Check the session list to verify that the shaping ID (1) applied and CoS 4 is marked:

```
# diagnose sys session list
session info: proto=1 proto_state=00 duration=1 expire=59 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=multi-stage-cos-fgtb prio=2 guarantee 31250Bps max 125000Bps traffic 236Bps
drops 0B
reply-shaper=multi-stage-cos-fgtb prio=2 guarantee 31250Bps max 125000Bps traffic 236Bps drops
0B
per_ip_shaper=
class_id=2 shaping_policy_id=1 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=4/4
state=log may_dirty os rs f00
statistic(bytes/packets/allow_err): org=168/2/1 reply=168/2/1 tuples=2
tx speed(Bps/kbps): 120/0 rx speed(Bps/kbps): 120/0
orgin->sink: org pre->post, reply pre->post dev=59->61/61->59 gwy=20.20.200.3/20.20.20.1
hook=pre dir=org act=noop 10.1.100.11:29899->192.168.4.33:8(0.0.0.0:0)
hook=post dir=reply act=noop 192.168.4.33:29899->10.1.100.11:0(0.0.0.0:0)
src_mac=90:6c:ac:fb:bb:97  dst_mac=04:d5:90:36:73:3f
misc=0 policy_id=3 pol_uuid_idx=1377 auth_info=0 chk_client_info=0 vd=4
serial=00024329 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x040000
no_ofld_reason:  non-npu-intf
total session 1
```

Adding traffic shapers to multicast policies

When multicast routing is enabled, a traffic shaper can be added to a multicast policy.

Only a shared traffic shaper with the `per-policy` option disabled can be used. This is the default state of the `per-policy` option. The `auto-asic-offload` option must also be disabled on the multicast policy.

This feature is currently not supported on IPv6 multicast policies or on transparent mode VDOMs.

Example

In this example, a traffic shaper is applied to the multicast policy. A multicast flow sender sends the multicast data stream. The shaper attached to the multicast session is checked, and the shaping of the data stream is confirmed in the multicast session.

To apply traffic shaping to a multicast policy:

1. Enable multicast routing on the VDOM:

```
config router multicast
    set multicast-routing enable
    config pim-sm-global
        config rp-address
            edit 1
                set ip-address 10.1.100.10
            next
        end
    end
    config interface
        edit "wan2"
            set pim-mode sparse-mode
        next
        edit "wan1"
            set pim-mode sparse-mode
        next
    end
end
```

2. Create a traffic shaper:

```
config firewall shaper traffic-shaper
    edit "shaper128kbps-high"
        set guaranteed-bandwidth 128
        set maximum-bandwidth 128
        set per-policy disable
        set diffserv enable
        set diffservcode 010101
    next
end
```

3. Apply the traffic shaper to the multicast policy and disable NPU offloading:

```
config firewall multicast-policy
    edit 1
        set name "test_multicast-policy"
        set logtraffic enable
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set snat enable
        set auto-asic-offload disable
        set traffic-shaper "shaper128kbps-high"
    next
end
```

4. Check the shaper and DSCP in the multicast session:

```
# diagnose sys mcast-session list
    session info: id=26 vf=0 proto=17 10.1.100.41.35537->230.0.0.1.7878
    used=2 path=1 duration=118 expire=179 indev=18 pkts=119 bytes=64260
    state=00000000:
    session-npu-info: ipid/vlifid=0/0 vlanid/vtag_in=0/0 in_npuid=0 tae_index=0 qid=0 fwd_
map=0x00000000
    path: log snat npu-deny nsaddr=172.16.200.10 policy=1, outdev=17, tos=0x15
            origin-shaper=shaper128kbps-high prio=2 tos=0x15 guarantee 16000Bps max 16000Bps
traffic 620Bps drops 0pkt/0B
    Total 1 sessions
```

Global traffic prioritization

Global traffic prioritization allows your traffic to be prioritized as high (2), medium (3), or low (4) based on ToS (type of service) or DSCP. When using ToS-based priority, integers 0 to 15 can be used, which correspond to the definitions of the ToS field values in RFC 1349. When using DSCP, values 0 to 63 can be used, which correspond to the six bits in the DSCP value.

The outbandwidth must be defined in order for global prioritization to take effect. When the outbandwidth is defined on an interface without an applied `egress-shaping-profile`, the interface has a total of five priority levels:

Priority level	Description
0	Top
1	Critical
2	High
3	Medium
4	Low

Priority level 0 is reserved for administrative and local out traffic. Priority level 1 is used for traffic that is below guaranteed bandwidth when using a traffic shaper.

Traffic shaper and traffic shaping profile configurations take precedence over global traffic prioritization.

CLI commands

The following commands are used to configure the prioritization either by ToS or DSCP.

To configure the traffic prioritization type and level:

```
config system global
    set traffic-priority {tos | dscp}
    set traffic-priority-level {high | medium | low}
end
```

To configure the ToS-based priority table:

```
config system tos-based-priority
    edit <id>
        set tos <0-15>
        set priority (high | medium | low)
    next
end
```

To configure the DSCP-based priority table:

```
config system dscp-based-priority
    edit <id>
        set ds <0-63>
        set priority (high | medium | low)
    next
end
```

To configure the interface outbandwidth:

```
config system interface
    edit <name>
        set outbandwidth <bandwidth in kbps>
    next
end
```

Example

In the following configuration, packets with DSCP markings of 1 are prioritized as high, and packets with DSCP markings of 2 are prioritized as medium. All the other traffic is prioritized as low. The outbandwidth on interface

port3 is set to 1000 kbps.

To configure DSCP-based traffic prioritization:

1. Configure DSCP-based prioritization in the global settings:

```
config system global
    set traffic-priority dscp
    set traffic-priority-level low
end
```

2. Configure the DSCP-based priority table:

```
config system dscp-based-priority
    edit 1
        set ds 1
        set priority high
    next
    edit 2
        set ds 2
        set priority medium
    next
end
```

3. Configure the outbandwidth on port3:

```
config system interface
    edit "port3"
        set outbandwidth 1000
    next
end
```

Verifying the traffic prioritization

When traffic exceeds the outbandwidth of 1000 kbps, traffic prioritization will take effect. Since the form of traffic shaping applied here is policing, excess packets above the outbandwidth are dropped.

In scenario 1, approximately 300 kbps of high priority traffic and 300 kbps of medium priority traffic passes through the FortiGate on port3.

To debug the bandwidth allocation:

```
# diagnose netlink interface list port3
if=port3 family=00 type=1 index=5 mtu=1500 link=0 master=0
ref=35 state=start present fw_flags=3800 flags=up broadcast run allmulti multicast
Qdisc=pfifo_fast hw_addr=52:54:00:fb:81:0c broadcast_addr=ff:ff:ff:ff:ff:ff
outbandwidth=1000(kbps)
        priority=0      allocated-bandwidth=0(kbps)     total_bytes=9311K       drop_bytes=197K
        priority=1      allocated-bandwidth=0(kbps)     total_bytes=0   drop_bytes=0
        priority=2      allocated-bandwidth=354(kbps)   total_bytes=20407K      drop_bytes=48K
        priority=3      allocated-bandwidth=354(kbps)   total_bytes=7093K       drop_bytes=1262K
        priority=4      allocated-bandwidth=290(kbps)   total_bytes=266018K     drop_bytes=7743K
```

```
stat: rxp=15450901 txp=25933756 rxb=5456860515 txb=17257309292 rxe=0 txe=0 rxd=0 txd=0 mc=0
collision=0 @ time=1629439926
re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=35
```

High priority (2) traffic is allocated 354 kbps of bandwidth. Medium priority (3) traffic is also allocated 354 kbps of bandwidth. The remaining bandwidth is allocated to low priority (4) traffic.

In scenario 2, approximately 400 kbps of high priority traffic and 800 kbps of medium priority traffic passes through the FortiGate on port3.

To debug the bandwidth allocation:

```
# diagnose netlink interface list port3
if=port3 family=00 type=1 index=5 mtu=1500 link=0 master=0
ref=36 state=start present fw_flags=3800 flags=up broadcast run allmulti multicast
Qdisc=pfifo_fast hw_addr=52:54:00:fb:81:0c broadcast_addr=ff:ff:ff:ff:ff:ff
outbandwidth=1000(kbps)
        priority=0      allocated-bandwidth=7(kbps)     total_bytes=9981K       drop_bytes=240K
        priority=1      allocated-bandwidth=0(kbps)     total_bytes=0   drop_bytes=0
        priority=2      allocated-bandwidth=425(kbps)   total_bytes=31478K      drop_bytes=101K
        priority=3      allocated-bandwidth=567(kbps)   total_bytes=12056K      drop_bytes=1984K
        priority=4      allocated-bandwidth=0(kbps)     total_bytes=266795K     drop_bytes=7771K
stat: rxp=15461740 txp=25950805 rxb=5459688950 txb=17273940560 rxe=0 txe=0 rxd=0 txd=0 mc=0
collision=0 @ time=1629440553
re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=36
```

High priority (2) traffic is allocated 425 kbps of bandwidth. Medium priority (3) traffic is allocated 567 kbps of bandwidth. Since the total bandwidth required exceeds 1000 kbps, the remaining medium priority (3) traffic is dropped. In comparing the successive debug outputs, the `drop_bytes` counter for medium priority (3) traffic gets bigger.

DSCP matching and DSCP marking

This section includes:

- DSCP matching in firewall policies
- DSCP matching in firewall shaping policies
- DSCP marking in firewall shaping policies
- DSCP marking for self-generated traffic on page 1845

DSCP matching in firewall policies

Traffic is allowed or blocked according to the Differentiated Services Code Point (DSCP) values in the incoming packets.

The following CLI variables are available in the `config firewall policy` command:

`tos-mask <mask_value>`	Non-zero bit positions are used for comparison. Zero bit positions are ignored (default = 0x00). This variable replaces the `dscp-match` variable.
`tos <tos_value>`	Type of Service (ToC) value that is used for comparison (default = 0x00). This variable is only available when `tos-mask` is not zero. This variable replaces the `dscp-value` variable.
`tos-negate {enable | disable}`	Enable/disable negated ToS match (default = disable). This variable is only available when `tos-mask` is not zero. This variable replaces the `dscp-negate` variable.

DSCP matching in firewall shaping policies

Shaping is applied to the session or not according to the DSCP values in the incoming packets. The same logic and commands as in firewall policies are used.

DSCP marking in firewall shaping policies

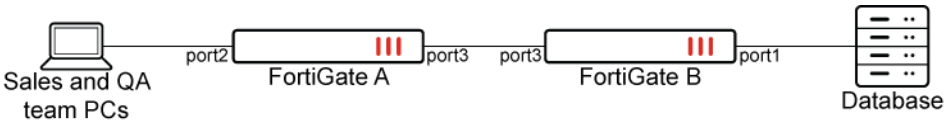
Traffic is allowed or blocked according to the DSCP values in the incoming packets. DSCP marking in firewall shaping policies uses the same logic and commands as in firewall policy and traffic-shaper.

When DSCP marking on `firewall shaper traffic-shaper`, `firewall shaping-policy`, and `firewall policy` all apply to the same session, `shaping-policy` overrides `policy`, and `shaper traffic-shaper` overrides both `shaping-policy` and `policy`.

The following CLI variables in `config firewall policy` are used to mark the packets:

`diffserv-forward {enable | disable}`	Enable/disable changing a packet's DiffServ values to the value specified in `diffservcode-forward` (default = disable).
`diffservcode-forward <dscp_value>`	The value that packet's DiffServ is set to (default = 000000). This variable is only available when `diffserv-forward` is enabled.
`diffserv-reverse {enable | disable}`	Enable/disable changing a packet's reverse (reply) DiffServ values to the value specified in `diffservcode-rev` (default = disable).
`diffservcode-rev <dscp_value>`	The value that packet's reverse (reply) DiffServ is set to (default = 000000). This variable is only available when `diffserv-rev` is enabled.

The following topology is used in the examples:



Example 1

FortiGate A marks traffic from the sales and QA teams with different DSCP values. FortiGate B does DSCP matching, allowing only the sales team to access the database.

1. Configure FortiGate A:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "QA"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 110000
        set nat enable
    next
    edit 5
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "Sales"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 111011
        set nat enable
    next
end
```

2. Configure FortiGate B:

```
config firewall policy
    edit 2
        set srcintf "port3"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "Database"
        set action accept
        set schedule "always"
        set service "ALL"
        set tos-mask 0xf0
        set tos 0xe0
        set fsso disable
```

```
        set nat enable
    next
end
```

Example 2

FortiGate A marks traffic from the sales and QA teams with different DSCP values. FortiGate B uses a firewall shaping policy to do the DSCP matching, limiting the connection speed of the sales team to the database to 10MB/s.

1. Configure FortiGate A:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "QA"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 110000
        set nat enable
    next
    edit 5
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "Sales"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 111011
        set nat enable
    next
end
```

2. Configure FortiGate B:

```
config firewall policy
    edit 2
        set srcintf "port3"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
```

```
end
config firewall shaper traffic-shaper
    edit "10MB/s"
        set guaranteed-bandwidth 60000
        set maximum-bandwidth 80000
    next
end
config firewall shaping-policy
    edit 1
        set service "ALL"
        set dstintf "port1"
        set tos-mask 0xf0
        set tos 0xe0
        set traffic-shaper "10MB/s"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Example 3

FortiGate A has a traffic shaping policy to mark traffic from the QA team with a DSCP value of 100000, while reverse traffic is marked with 000011.

1. Configure FortiGate A:

```
config firewall shaping-policy
    edit 1
        set name "QA Team 50MB"
        set service "ALL"
        set dstintf "port3"
        set traffic-shaper "50MB/s"
        set traffic-shaper-reverse "50MB/s"
        set diffserv-forward enable
        set diffserv-reverse enable
        set srcaddr "QA"
        set dstaddr "all"
        set diffservcode-forward 100000
        set diffservcode-rev 000011
    next
end
```

DSCP marking for self-generated traffic

FortiOS supports DSCP and VLAN CoS marking for both local-in and local-out traffic.

Most network providers often require that both application traffic and FortiGate self-generated traffic must be marked with specific DSCP values to ensure efficient traffic management and quality of service (QoS). FortiOS DSCP marking ensures that self-generated traffic complies with the network's standards. This enables the FortiGate to operate as a fully functional Customer Premises Equipment (CPE) that is capable of directly connecting to the provider's network without a CPE router.

This feature does not apply to self-generated traffic like DHCP requests and ARP that do not go through the kernel IP stack and therefore do not generate a kernel session to apply the traffic shaping to.

To configure DSCP and VLAN CoS for local-in traffic:

1. Configure the traffic shaper with bandwidth settings and the DSCP and VLAN CoS mark:

```
config firewall shaper traffic-shaper
    edit "test-shaper-300kbps"
        set guaranteed-bandwidth 30
        set maximum-bandwidth 300
        set per-policy enable
        set diffserv enable
        set cos-marking enable
        set cos 001
        set diffservcode 000001
    next
end
```

2. Configure the shaping policy for local-in traffic:

```
config firewall shaping-policy
    edit 2
        set traffic-type local-in
        set service "ALL"
        set traffic-shaper-reverse "test-shaper-300kbps"
        set class-id 2
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

3. Verify that the shaper was successfully applied to the shaping policy:

```
# diagnose firewall iprope list 100018
policy index=2 uuid_idx=926 action=accept
flag (0):
schedule(always)
shapers: reply=test-shaper-300kbps(2/3750/37500)
cos_fwd=255  cos_rev=255
group=00100018 av=00000000 au=00000000 split=00000000
host=2 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
source(1): 0.0.0.0-255.255.255.255, uuid_idx=799,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=799,
service(1):
        [0:0x0:0/(0,65535)->(0,65535)] flags:0 helper:auto
class_id: 2
```

4. Test local-in traffic from the PC to the FortiGate.

a. Check the session list:

```
# diagnose sys session list
session info: proto=17 proto_state=01 duration=9 expire=179 timeout=0 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=test-shaper-300kbps prio=2 guarantee 3750Bps max 37500Bps traffic 7881Bps
drops 651B
per_ip_shaper=
class_id=2 shaping_policy_id=2 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/1
state=local may_dirty rs
statistic(bytes/packets/allow_err): org=337599/4717/1 reply=342414/4708/1 tuples=2
tx speed(Bps/kbps): 34948/279 rx speed(Bps/kbps): 35446/283
orgin->sink: org pre->in, reply out->post dev=7->48/48->7 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=noop 172.16.200.55:58382->172.16.200.2:161(0.0.0.0:0)
hook=post dir=reply act=noop 172.16.200.2:161->172.16.200.55:58382(0.0.0.0:0)
src_mac=00:0c:29:d6:12:20
misc=0 policy_id=4294967295 pol_uuid_idx=0 auth_info=0 chk_client_info=0 vd=2
serial=0000249b tos=ff/01 app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=00000000
no_ofld_reason:  local
```

b. Check the shaper information to verify the DSCP mark and bandwidth limitation:

```
# diagnose firewall shaper traffic-shaper list | grep test- -A 10
name test-shaper-300kbps
maximum-bandwidth 37 KB/sec
guaranteed-bandwidth 3 KB/sec
current-bandwidth 37 KB/sec
priority 2
policy 2
overhead 0
tos 01
packets dropped 10
bytes dropped 725
```

To configure DSCP and VLAN CoS for local-out traffic:

1. Configure the traffic shaper with bandwidth settings and the DSCP and VLAN CoS mark:

```
config firewall shaper traffic-shaper
    edit "test-shaper-600kbps"
        set guaranteed-bandwidth 60
        set maximum-bandwidth 600
        set per-policy enable
        set diffserv enable
        set cos-marking enable
        set cos 110
        set diffservcode 110000
    next
end
```

2. Configure the shaping policy for local-out traffic:

```
config firewall shaping-policy
    edit 5
        set traffic-type local-out
        set service "ALL"
        set traffic-shaper "test-shaper-600kbps"
        set class-id 5
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

3. Verify that the shaper was successfully applied to the shaping policy:

```
# diagnose firewall iprope list 100019
policy index=5 uuid_idx=928 action=accept
flag (0):
schedule()
shapers: orig=test-shaper-600kbps(2/7500/75000)
cos_fwd=255  cos_rev=255
group=00100019 av=00000000 au=00000000 split=00000000
host=2 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
source(1): 0.0.0.0-255.255.255.255, uuid_idx=799,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=799,
service(1):
        [0:0x0:0/(0,65535)->(0,65535)] flags:0 helper:auto
class_id: 5
```

4. Test local-in traffic from the FortiGate to the remote PC.
   a. Check the session list:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=4 expire=3599 timeout=3600 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=test-shaper-600kbps prio=2 guarantee 7500Bps max 75000Bps traffic 73557Bps
drops 70500B
reply-shaper=
per_ip_shaper=
class_id=5 shaping_policy_id=5 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=6/255
state=log local os
statistic(bytes/packets/allow_err): org=85701/60/1 reply=2140/41/1 tuples=2
tx speed(Bps/kbps): 19172/153 rx speed(Bps/kbps): 478/3
orgin->sink: org out->post, reply pre->in dev=48->7/7->48 gwy=0.0.0.0/0.0.0.0
hook=out dir=org act=noop 172.16.200.2:23964->209.52.38.114:5201(0.0.0.0:0)
hook=in dir=reply act=noop 209.52.38.114:5201->172.16.200.2:23964(0.0.0.0:0)
pos/(before,after) 0/(0,0), 0/(0,0)
dst_mac=04:d5:90:5d:ed:fe
misc=0 policy_id=0 pol_uuid_idx=0 auth_info=0 chk_client_info=0 vd=2
serial=000152f5 tos=30/ff app_list=0 app=0 url_cat=0
```

```
rpdb_link_id=00000000 ngfwid=n/a
npu_state=00000000
no_ofld_reason:  local
```

b. Check the shaper information to verify the DSCP mark and bandwidth limitation:

```
#  diagnose firewall shaper traffic-shaper list | grep test- -A 10
name test-shaper-600kbps
maximum-bandwidth 75 KB/sec
guaranteed-bandwidth 7 KB/sec
current-bandwidth 65 KB/sec
priority 2
policy 5
overhead 0
tos 30
packets dropped 5086
bytes dropped 1148949
```

Examples

This section includes the following traffic shaping configuration examples:

- Interface-based traffic shaping profile on page 1849
- Interface-based traffic shaping with NP acceleration on page 1858
- QoS assignment and rate limiting for FortiSwitch quarantined VLANs on page 1860
- Ingress traffic shaping profile on page 1861

Interface-based traffic shaping profile

A traffic shaping policy can be used for interface-based traffic shaping by organizing traffic into 30 class IDs. The shaping profile defines the percentage of the interface bandwidth that is allocated to each class. Each traffic class ID is shaped to the assigned speed according to the outgoing bandwidth limit configured to the interface.

Traffic classification

A shaping policy classifies traffic and organizes it into different class IDs, based on matching criteria. For traffic matching a criteria, you can choose to put it into 30 different shaping classes, identified by class ID 2 - 31.

When NPU offloading is enabled on the NP6, SoC3, or SoC4 platforms, the class ID limit for egress traffic is 2 - 15. Setting the egress traffic class ID outside of these limits can result in unexpected behavior.

If NPU offloading is disabled, or enabled on the NP7 platform, the class ID limit for egress traffic is 2 - 31.

You must select an outgoing interface for the traffic. The shaping policy is only applied when the traffic goes to one of the selected outgoing interfaces.

Criterion	Description
Source	• Address: match the source address of the traffic to the selected address or address group. • User: use the user credentials of the traffic to match the selected user or user group. At least one address, address group, or internet service must also be selected. • Internet service: match the traffic to the selected internet service. Internet services cannot be used if addresses or address or groups are used.
Destination	• Address: match the destination address of the traffic to the selected address or address group. • Internet service: match the traffic to the selected internet service. Internet services cannot be used if addresses or address or groups are used.
Schedule	Match the current date and time to the selected schedule. You can select a one-time schedule, recurring schedule, or schedule group. This setting is optional.
Service	Match the service of the traffic to the selected service or service group.
Application	Match the application of the traffic to the selected application, application category, or application group. Application control must be enabled in the related firewall policy to know the application of the traffic. See Application control on page 2077 for more information.
URL category	Match the URL of the traffic to the selected URL category. Web filter must be enabled in the related firewall policy to know the URL of the traffic. See Web filter on page 1965 for more information.

When multiple items are selected in one criterion, it is considered a match when traffic matches any one of them.

Traffic prioritization

Shaping profiles define how different shaping classes of traffic are prioritized. For each class, you can define three prioritization strategies: guaranteed bandwidth, maximum bandwidth, and priority.

For each shaping profile, a default shaping class must be defined. Traffic is prioritized based on the default shaping group in the following two circumstances:

- All traffic to the outgoing interface that does not match to any shaping policy
- Traffic with a shaping group that is not defined in a shaping profile

Prioritization strategy	Description
Guaranteed bandwidth	The percentage of the link speed that is reserved for the shaping group.

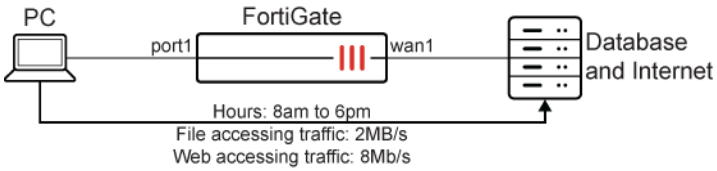
Prioritization strategy	Description
	The total guaranteed bandwidth for all shaping groups cannot exceed 100%.
Maximum bandwidth	The maximum percentage of the link speed that the shaping group can use.
Priority	The shaping class priority: top, critical, high, medium, or low. When groups are competing for bandwidth on the interface, the group with the higher priority wins.

Applying a shaping profile to an interface

Traffic shaping is accomplished by configuring the outgoing bandwidth and outgoing shaping profile on an interface. The shaping profile uses the outgoing bandwidth of the interface as the maximum link speed, and it only works when the outgoing bandwidth is configured.

This example shows how to apply interface-based traffic shaping to web and file accessing traffic according to a schedule:

- The link speed of the wan1 interface is 10 Mb/s.
- File access can use up to 2 Mb/s from 8:00 AM to 6:00 PM.
- Web access can use 8 Mb/s from 8:00 AM to 6:00 PM.



Putting the traffic into shaping classes

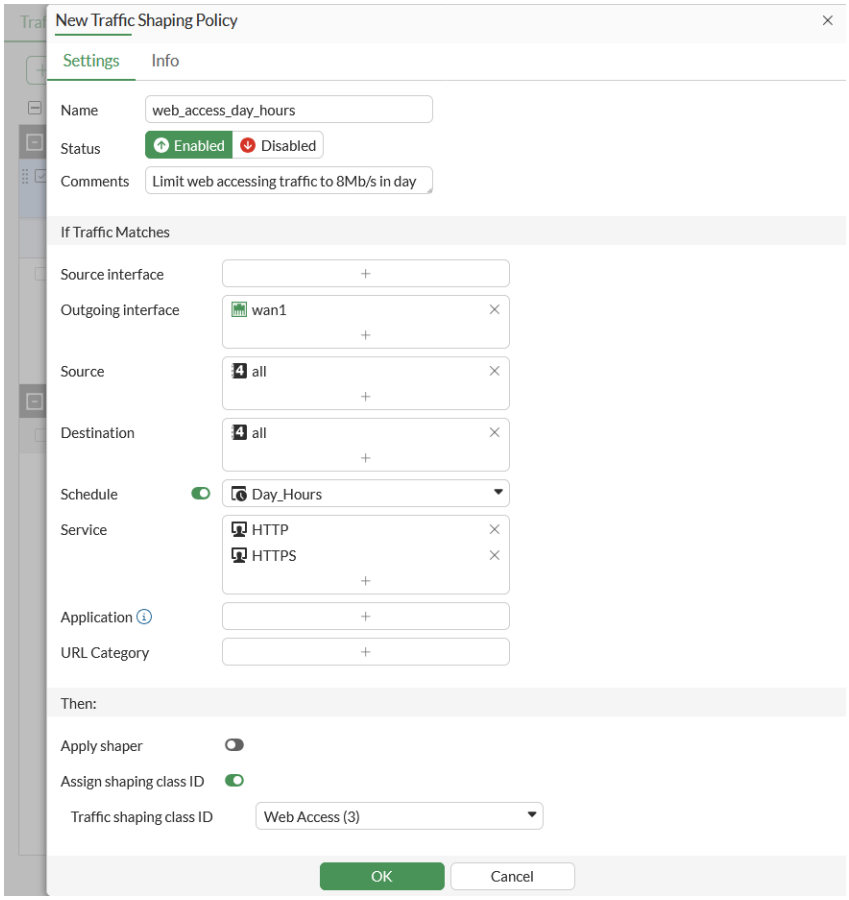
To create a recurring schedule in the GUI:

1. Go to *Policy & Objects* > *Schedules* and navigate to the *Recurring Schedule* tab.
2. Click *Create New*.
3. Configure a recurring schedule called *Day_Hours* for everyday from 8:00 AM to 6:00 PM.
4. Click *OK*.

To create a traffic shaping policy and class ID for the web accessing traffic in the GUI:

1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
2. Enter a name for the policy, such as *web_access_day_hours*.
3. Set *Outgoing interface* to *wan1*.
4. Enable *Schedule* and select the schedule you just created.
5. Set *Service* to web accessing services, such as *HTTP* and *HTTPS*.
6. Enable *Assign shaping class ID*.
7. Click the *Traffic shaping class ID* drop down then click *Create*.
8. Enter an integer value for the *ID* (*3*) and a description for the *Name*, such as *Web Access*.
9. Click *OK*.

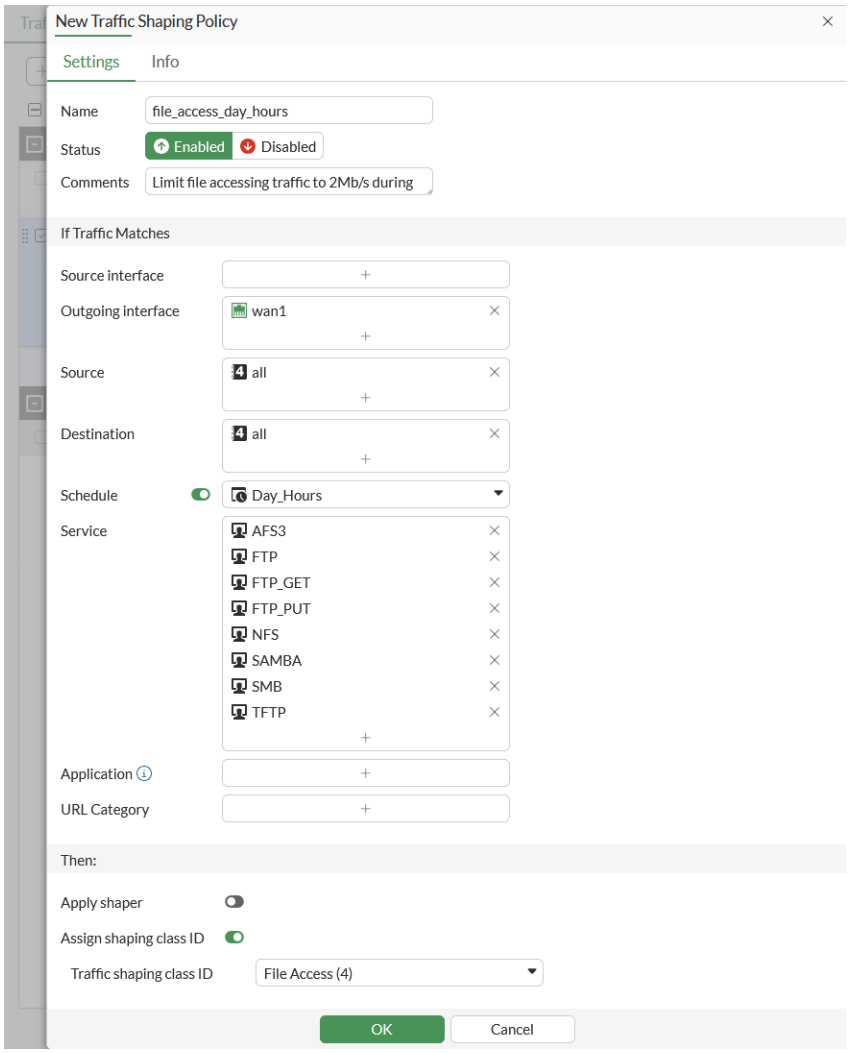
10. Select the class ID you just created for *Traffic shaping class ID*.



11. Configure the remaining settings as required.
12. Click *OK*.

To create a traffic shaping policy and class ID for the file accessing traffic in the GUI:

1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
2. Enter a name for the policy, such as *file_access_day_hours*.
3. Set *Outgoing interface* to *wan1*.
4. Enable *Schedule* and select the schedule you just created.
5. Set *Service* to file accessing services, such as *ASF3*, *FTP* and *SMB*.
6. Enable *Assign shaping class ID*.
7. Click the *Traffic shaping class ID* drop down then click *Create*.
8. Enter an integer value for the *ID* (*4*) and a description for the *Name*, such as *File Access*.
9. Click *OK*.
10. Select the class ID you just created for *Traffic shaping class ID*.



11. Configure the remaining settings as required.
12. Click *OK*.

To put the traffic into shaping classes in the CLI:

1. Create a recurring schedule:

```
config firewall schedule recurring
    edit "Day_Hours"
        set start 08:00
        set end 18:00
        set day sunday monday tuesday wednesday thursday friday saturday
    next
end
```

2. Create the traffic class IDs:

```
config firewall traffic-class
    edit 3
```

```
        set class-name "Web Access"
    next
    edit 4
        set class-name "File Access"
    next
end
```

3. Create the web and file accessing traffic shaping policies:

```
config firewall shaping-policy
    edit 2
        set name "web_access_day_hours"
        set comment "Limit web accessing traffic to 8Mb/s in day time"
        set service "HTTP" "HTTPS"
        set schedule "Day_Hours"
        set dstintf "wan1"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
    edit 3
        set name "file_access_day_hours"
        set comment "Limit file accessing traffic to 2Mb/s during the day"
        set service "AFS3" "FTP" "FTP_GET" "FTP_PUT" "NFS" "SAMBA" "SMB" "TFTP"
        set schedule "Day_Hours"
        set dstintf "wan1"
        set class-id 4
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

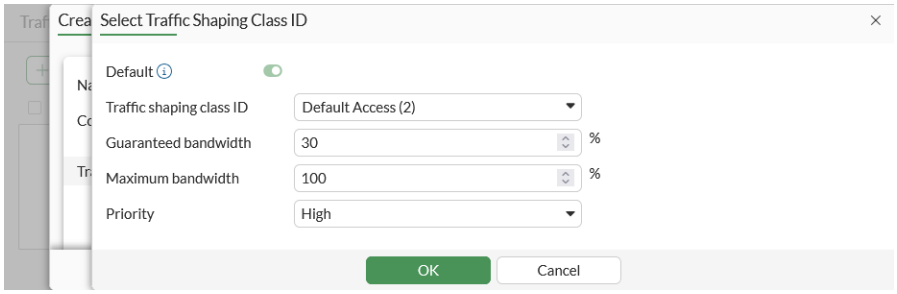
Allocating bandwidth to the shaping classes

A traffic shaping profile defines the guaranteed and maximum bandwidths each class receives. In this example, file access can use up to 2 Mb/s and web access can use 8 Mb/s from 8:00 AM to 6:00 PM.

To create a traffic shaping profile using the GUI:

1. Go to *Policy & Objects > Traffic Shaping*, select the *Traffic Shaping Profile* tab, and click *Create New*.
2. Enter a name for the profile, such as *Day_Hours_Profile*.
3. Configure a default traffic shaping class:
   This class has a high priority, meaning that when the other classes have reached their guaranteed bandwidths, this default class will use the rest of the available bandwidth.
   a. In the *Traffic Shaping Classes* table click *Create New*.
   b. Click the *Traffic shaping class ID* drop down then click *Create*.
   c. Enter a name for the class, such as *Default Access*.
   d. Click *OK*.
   e. Select the class ID you just created for *Traffic shaping class ID*.
   f. Configure the following settings, then click *OK*:

Guaranteed bandwidth	30
Maximum bandwidth	100
Priority	High

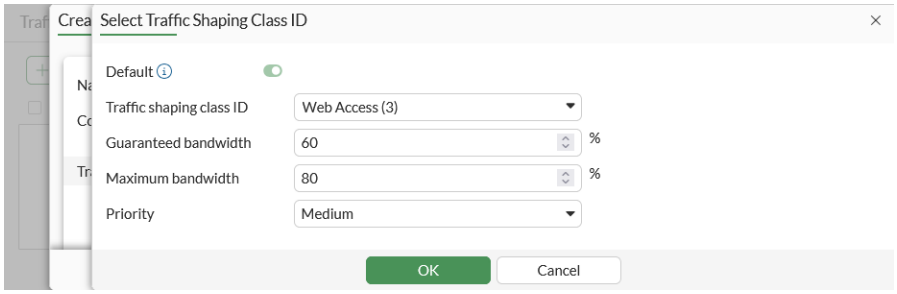


4. Configure a web accessing traffic shaping class:

   When other types of traffic are competing for bandwidth, this class is guaranteed to 6 Mb/s, or 60% of the bandwidth.

   a. In the *Traffic Shaping Classes* table click *Create New*.
   b. Configure the following settings, then click *OK*:

Traffic shaping class ID	Web Access
Guaranteed bandwidth	60
Maximum bandwidth	80
Priority	Medium



5. Configure a file accessing traffic shaping class:

   When other types of traffic are competing for bandwidth, this group is guaranteed to 1 Mb/s, or 10% of the bandwidth.

   a. In the *Traffic Shaping Classes* table click *Create New*.
   b. Configure the following settings, then click *OK*:

Traffic shaping class ID	File Access
Guaranteed bandwidth	10
Maximum bandwidth	20
Priority	Medium

6. Click *OK*.

To create a traffic shaping profile using the CLI:

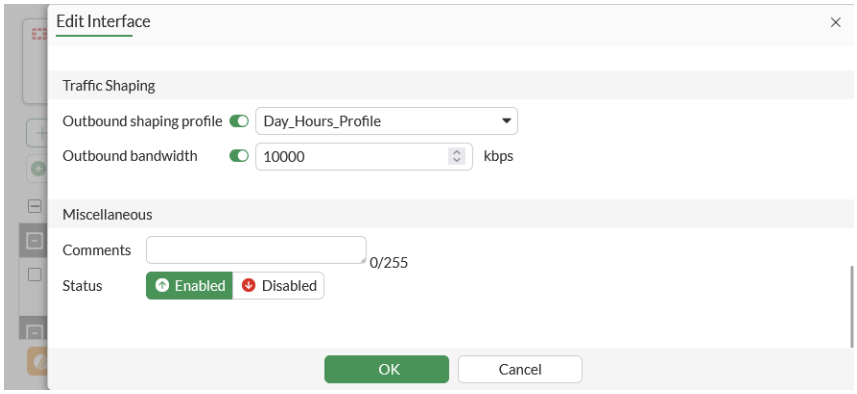
```
config firewall shaping-profile
    edit "Day_Hours_Profile"
        set default-class-id 2
        config shaping-entries
            edit 1
                set class-id 2
                set guaranteed-bandwidth-percentage 30
                set maximum-bandwidth-percentage 100
            next
            edit 2
                set class-id 3
                set priority medium
                set guaranteed-bandwidth-percentage 60
                set maximum-bandwidth-percentage 80
            next
            edit 3
                set class-id 4
                set priority medium
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 20
            next
        end
    next
end
```

Defining the available bandwidth on an interface

In this example, the link speed of the wan1 interface is 10 Mb/s.

To set the bandwidth of the wan1 interface in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit the wan1 interface.
3. Under Traffic Shaping, enable *Outbound shaping profile* and select the profile that you just created, *Day_Hours_Profile*.
4. Enable *Outbound Bandwidth* and set it to *10000* Kbps.



5. Click *OK*.

To set the bandwidth of the wan1 interface in the CLI:

```
config system interface
    edit "wan1"
        set egress-shaping-profile "Day_Hours_Profile"
        set outbandwidth 10000
    next
end
```

Diagnose commands

To check that the specific traffic is put into the correct shaping group or class ID:

```
# diagnose firewall iprope list 100015
```

To check the speed limit for each class ID on an interface:

```
# diagnose netlink interface list wan1
```

Interface-based traffic shaping with NP acceleration

Interface-based traffic shaping with NP acceleration is supported on some devices.

An administrator configures the WAN interface's maximum outbound bandwidth and, based on that, creates a traffic shaping profile with a percentage based shaper. This allows for proper QoS and traffic shaping. VLAN interfaces are not supported.

This feature is supported on FortiGate 600E, 500E, 400E, and 300E models.

To configure interface-based traffic shaping:

1. Enable NPU offloading when doing interface-based traffic shaping according to the egress-shaping-profile:

```
config system npu
    set intf-shaping-offload enable
end
```

2. Configure shaping profiles:

```
config firewall shaping-profile
    edit "sdwan"
        set default-class-id 4
        config shaping-entries
```

```
            edit 1
                set class-id 4
                set guaranteed-bandwidth-percentage 3
                set maximum-bandwidth-percentage 5
            next
            edit 2
                set class-id 3
                set priority medium
                set guaranteed-bandwidth-percentage 50
                set maximum-bandwidth-percentage 100
            next
            edit 3
                set class-id 2
                set priority low
                set guaranteed-bandwidth-percentage 1
                set maximum-bandwidth-percentage 5
            next
        end
    next
end
```

The class number is limited to 16.

3. Configure a traffic shaper and shaping policy:

```
config firewall shaper traffic-shaper
    edit "Transactional"
        set priority medium
    next
end
```

```
config firewall shaping-policy
    edit 1
        set service "ALL"
        set dstintf "any"
        set traffic-shaper "Transactional"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

4. Apply the egress shaping profile on the interface:

```
config system interface
    edit "port2"
        set vdom "root"
        set ip 10.1.100.23 255.255.255.0
        set allowaccess ping
        set type physical
        set outbandwidth 500
        set egress-shaping-profile "sdwan"
        set snmp-index 4
```

```
    next
end
```

5. Configure a firewall policy:

```
config firewall policy
    edit 3
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
end
```

QoS assignment and rate limiting for FortiSwitch quarantined VLANs

When devices are quarantined, they are isolated from the rest of the network. However, they can still impact the network if not controlled beyond isolation. A quarantined host, which offers heavy traffic, could congest the network and create a DOS-style reduction in service to authorized hosts.

Within the quarantined VLAN, two restrictions are available within the network:

- Traffic policing (also known as rate limiting)
- QoS (Quality of Service) assignment (also known as priority assignment)

Each quarantined host's traffic can be subject to rate limiting and priority adjustment. This reduces the impact that any quarantined host can have on authorized traffic on the network.

To configure QoS assignment and rate limiting for quarantined VLANs:

1. Configure a traffic policy, or use the default "quarantine" policy:

```
config switch-controller traffic-policy
    edit "quarantine"
        set description "Rate control for quarantined traffic"
        set guaranteed-bandwidth 163840
        set guaranteed-burst 8192
        set maximum-burst 163840
        set cos-queue 0
    next
end
```

2. Configure an interface:

```
config system interface
    edit "qtn.aggr1"
        set vdom "root"
        set ip 10.254.254.254 255.255.255.0
        set description "Quarantine VLAN"
        set security-mode captive-portal
        set replacemsg-override-group "auth-intf-qtn.aggr1"
        set device-identification enable
        set snmp-index 30
        set switch-controller-access-vlan enable
        set switch-controller-traffic-policy "quarantine"
        set color 6
        set interface "aggr1"
        set vlanid 4093
    next
end
```

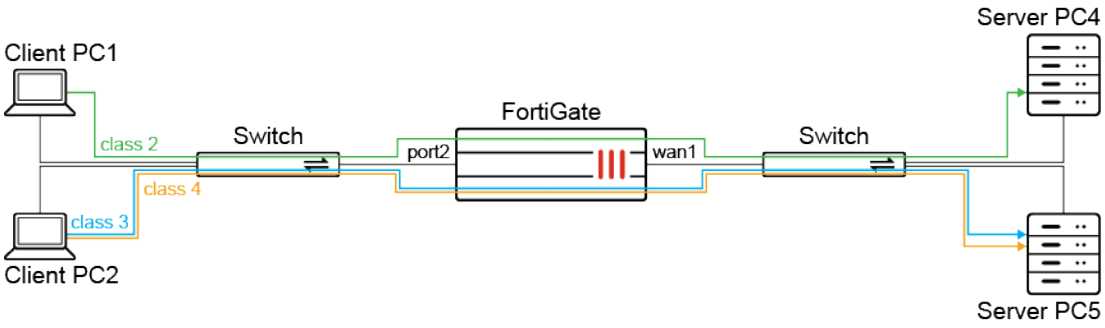
By default, `switch-controller-traffic-policy` is empty. You need to apply the necessary traffic policy (not only limited to "quarantine").

Ingress traffic shaping profile

A traffic shaping profile can be applied to an interface for traffic in the ingress direction. Similar to an egress traffic shaping profile, the guaranteed bandwidth and priority of the profile will be respected when an interface receives inbound traffic. When congestion occurs, any remaining bandwidth will be allotted to classes based on priority.

Example

In this example, the port2 interface has a total inbound bandwidth of 100 Mbps. Traffic from certain clients to certain servers are assigned different classes.



IPv6 traffic from any client PCs to server PCs is assigned class 5.

For each class, the priority, guaranteed bandwidth, and maximum bandwidth are as follows:

Class	Priority	Guaranteed bandwidth	Maximum bandwidth
2	Low	10%	60%

Class	Priority	Guaranteed bandwidth	Maximum bandwidth
3	High	20%	100%
4	High	30%	100%
5	Medium	10%	50%

Bandwidth will first be allotted to each class according to its guaranteed bandwidth. Then remaining available bandwidth will be allotted to class 3 and 4 first based on their priority. The allocation will be proportional to their guaranteed bandwidth ratio.

To configure ingress traffic shaping:

1. Configure the client and server addresses:

```
config firewall address
    edit "pc1"
        set subnet 10.1.100.11 255.255.255.255
    next
    edit "pc2"
        set subnet 10.1.100.22 255.255.255.255
    next
    edit "pc4"
        set subnet 172.16.200.44 255.255.255.255
    next
    edit "pc5"
        set subnet 172.16.200.55 255.255.255.255
    next
end
```

2. Configure the class IDs:

```
config firewall traffic-class
    edit 2
        set class-name "class2"
    next
    edit 3
        set class-name "class3"
    next
    edit 4
        set class-name "class4"
    next
    edit 4
        set class-name "class5"
    next
end
```

3. Configure traffic shaping policies to assign classes to each group of traffic.
   a. Configure a policy to assign traffic from PC1 to PC4 in class 2:

```
config firewall shaping-policy
    edit 1
```

```
        set name "shaping policy 1"
        set service "ALL"
        set dstintf "wan1"
        set class-id 2
        set srcaddr "pc1"
        set dstaddr "pc4"
    next
end
```

b. Configure a policy to assign traffic from PC2 to PC4 in class 3:

```
config firewall shaping-policy
    edit 2
        set name "shaping policy 2"
        set service "ALL"
        set dstintf "wan1"
        set class-id 3
        set srcaddr "pc2"
        set dstaddr "pc4"
    next
end
```

c. Configure a policy to assign traffic from PC2 to PC5 in class 4:

```
config firewall shaping-policy
    edit 3
        set name "shaping policy 3"
        set service "ALL"
        set dstintf "wan1"
        set class-id 4
        set srcaddr "pc2"
        set dstaddr "pc5"
    next
end
```

d. Configure a policy to assign all IPv6 traffic to class 5:

```
config firewall shaping-policy
    edit 4
        set name "shaping policy 4"
        set ip-version 6
        set service "ALL"
        set dstintf "wan1"
        set class-id 5
        set srcaddr6 "all"
        set dstaddr6 "all"
    next
end
```

4. Configure a shaping profile to set the priority, and the guaranteed and maximum bandwidth percentages for each class:

```
config firewall shaping-profile
    edit "ingShapeProfile"
        set default-class-id 2
        config shaping-entries
            edit 2
                set class-id 2
                set priority low
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 60
            next
            edit 3
                set class-id 3
                set guaranteed-bandwidth-percentage 20
                set maximum-bandwidth-percentage 100
            next
            edit 4
                set class-id 4
                set guaranteed-bandwidth-percentage 30
                set maximum-bandwidth-percentage 100
            next
            edit 5
                set class-id 5
                set priority medium
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 50
            next
        end
    next
end
```

5. Configure the inbandwidth and apply the ingress shaping profile on port2:

```
config system interface
    edit "port2"
        set ip 10.1.100.1 255.255.255.0
        set inbandwidth 100000
        set ingress-shaping-profile "ingShapeProfile"
        config ipv6
            set ip6-address 2000:10:1:100::1/64
        end
    next
end
```

Inbandwidth must be configured for traffic shaping to take effect.

6. Configure a firewall policy to allow traffic to go through. Since traffic shaping is for inbound traffic on port2, the policy is defined from port2 to wan1:

```
config firewall policy
    edit 2
        set srcintf "port2"
        set dstintf "wan1"
        set action accept
```

```
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload enable
        set nat enable
    next
end
```

Ingress traffic shaping supports NPU offloading and it is enabled by default. Set `auto-asic-offload` to `disable` to disable it.

Verifying that the traffic is being shaped

In each of the following cases, the server PCs (PC4 and PC5) are configured as iPerf servers. The client PCs (PC1 and PC2) are configured as iPerf clients. The client sends traffic to the server from the client to server direction, triggering inbound traffic shaping on the port2 interface. The inbound bandwidth on port2 is 100 Mbps.

Case 1: single stream, PC1 to PC4

Traffic is sent from PC1 to PC4. There is no other traffic. Traffic is marked with class ID 2 and allocated the maximum bandwidth 60 Mbps (60%).

```
# diagnose netlink interface list port2
if=port2 family=00 type=1 index=20 mtu=1500 link=0 master=0
ref=25 state=start present fw_flags=3800 flags=up broadcast run multicast
Qdisc=mq hw_addr=70:4c:a5:7d:d4:95 broadcast_addr=ff:ff:ff:ff:ff:ff
ingress traffic control:
        bandwidth=100000(kbps) lock_hit=50 default_class=2 n_active_class=4
        class-id=2      allocated-bandwidth=60000(kbps)         guaranteed-bandwidth=10000(kbps)
                        max-bandwidth=60000(kbps)       current-bandwidth=60002(kbps)
                        priority=low    forwarded_bytes=58157K
                        dropped_packets=94K     dropped_bytes=125385K
        class-id=5      allocated-bandwidth=1000(kbps)  guaranteed-bandwidth=10000(kbps)
                        max-bandwidth=50000(kbps)       current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=3      allocated-bandwidth=15000(kbps)         guaranteed-bandwidth=20000(kbps)
                        max-bandwidth=100000(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0

misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=25
```

Case 2: dual stream, PC1 to PC4, PC2 to PC4

Traffic is sent from both PC1 and PC2 to PC4. PC1 to PC4 traffic is marked with class ID 2 and low priority, and PC2 to PC4 traffic is marked with class ID 3 and high priority. Both class 2 and 3 will be allocated their guaranteed bandwidth first, using up 10% and 20% respectively. The remaining available bandwidth is used by class 3 since it has a higher priority. Class 2 uses around 10 Mbps, and class 3 uses around 90 Mbps.

```
# diagnose netlink interface list port2
if=port2 family=00 type=1 index=20 mtu=1500 link=0 master=0
ref=36 state=start present fw_flags=3800 flags=up broadcast run multicast
Qdisc=mq hw_addr=70:4c:a5:7d:d4:95 broadcast_addr=ff:ff:ff:ff:ff:ff
ingress traffic control:
        bandwidth=100000(kbps) lock_hit=181 default_class=2 n_active_class=4
        class-id=2      allocated-bandwidth=10000(kbps)         guaranteed-bandwidth=10000(kbps)
                        max-bandwidth=60000(kbps)       current-bandwidth=10001(kbps)
                        priority=low    forwarded_bytes=1799482K
                        dropped_packets=5998K   dropped_bytes=7965553K
        class-id=5      allocated-bandwidth=1000(kbps)  guaranteed-bandwidth=10000(kbps)
                        max-bandwidth=50000(kbps)       current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=3      allocated-bandwidth=88000(kbps)         guaranteed-bandwidth=20000(kbps)
                        max-bandwidth=100000(kbps)      current-bandwidth=88000(kbps)
                        priority=high   forwarded_bytes=345039K
                        dropped_packets=324K    dropped_bytes=430862K
        class-id=4      allocated-bandwidth=1000(kbps)  guaranteed-bandwidth=30000(kbps)
                        max-bandwidth=100000(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
stat: rxp=181269891 txp=2433428 rxb=205136511596 txb=2771214402 rxe=0 txe=0 rxd=0 txd=0 mc=0

te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=36
```

Case 3: multiple streams

Multiple streams of traffic are sent at the same time:

- PC1 to PC4 traffic is assigned class 2 with low priority, and a guaranteed bandwidth of 10 Mbps.
- PC2 to PC4 traffic is assigned class 3 with high priority, and a guaranteed bandwidth of 20 Mbps.
- PC2 to PC5 traffic is assigned class 4 with high priority, and a guaranteed bandwidth of 30 Mbps.

All classes will be allocated their guaranteed bandwidth first, using up 10 Mbps, 20 Mbps, and 30 Mbps respectively. The remaining available bandwidth (40 Mbps) is shared by class 3 and class 4 based on their guaranteed bandwidth ratio of 20:30.

- Class 3's share of the remaining 40 Mbps traffic = 40 × 20/(20 + 30) =16 Mpbs
- Class 4's share of the remaining 40 Mbps traffic = 40 × 30/(20 + 30) =24 Mpbs

Each class is allocated roughly the following bandwidth:

- Class 2: 10 Mbps
- Class 3: 20 Mbps + 16 Mbps = 36 Mbps
- Class 4: 30 Mbps + 24 Mbps = 54 Mbps

```
# diagnose netlink interface list port2
if=port2 family=00 type=1 index=20 mtu=1500 link=0 master=0
ref=27 state=start present fw_flags=3800 flags=up broadcast run multicast
Qdisc=mq hw_addr=70:4c:a5:7d:d4:95 broadcast_addr=ff:ff:ff:ff:ff:ff
ingress traffic control:
        bandwidth=100000(kbps) lock_hit=148731 default_class=2 n_active_class=4
        class-id=2      allocated-bandwidth=10000(kbps)         guaranteed-bandwidth=10000(kbps)
                        max-bandwidth=60000(kbps)       current-bandwidth=10004(kbps)
                        priority=low    forwarded_bytes=2267956K
                        dropped_packets=10389K  dropped_bytes=13796469K
        class-id=5      allocated-bandwidth=1000(kbps)  guaranteed-bandwidth=10000(kbps)

Internet Services

The following topics provide instructions on configuring policies with Internet Service:

- Using Internet Service in a policy on page 1868
- Using custom Internet Service in policy on page 1872
- Using extension Internet Service in policy on page 1874
- Global IP address information database on page 1877
- IP reputation filtering on page 1879
- Internet service groups in policies on page 1880

- Allow creation of ISDB objects with regional information on page 1887
- Internet service customization on page 1889
- Look up IP address information from the Internet Service Database page on page 1890
- Internet Service Database on-demand mode on page 1891
- Enabling the ISDB cache in the FortiOS kernel on page 1894
- Apply FQDN address groups within the ISDB on page 1895

Using Internet Service in a policy

This topic shows how to apply a predefined Internet Service entry into a policy.

The Internet Service Database (ISDB) data comes from the FortiGuard service system. Information is regularly added to this database, for example, geographic location, IP reputation, popularity & DNS, and so on. All this information helps users define Internet security more effectively. You can use the contents of the database as criteria for inclusion or exclusion in a policy.

From FortiOS version 5.6, Internet Service is included in the firewall policy. It can be applied to a policy only as a destination object. From version 6.0, Internet Service can be applied both as source and destination objects in a policy. You can also apply Internet Services to shaping policy.

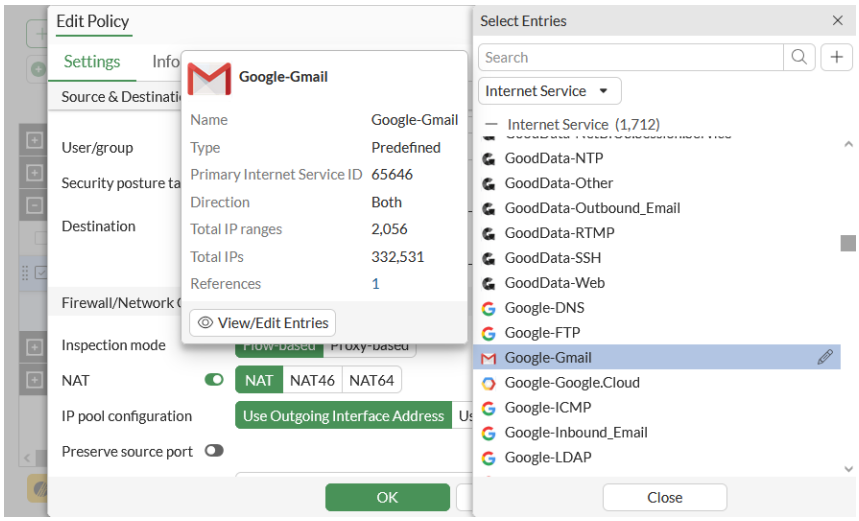
There are three types of Internet Services you can apply to a firewall policy:

- Predefined Internet Services
- Custom Internet Services
- Extension Internet Services

Sample IPv4 configuration

To apply a predefined Internet Service entry to a policy using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Click in the *Destination* field.
3. In the *Select Entries* pane, select *Internet Service* from the dropdown list and select *Google-Gmail*.



4. Configure the remaining fields as needed.
5. Click *OK*.

To apply a predefined Internet Service entry to a policy in the CLI:

In the CLI, enable the `internet-service` first and then use its ID to apply the policy.

This example uses Google Gmail and its ID is 65646. Each Internet Service has a unique ID.

```
config firewall policy
    edit 9
        set name "Internet Service in Policy"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-id 65646
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "g-default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

To diagnose an Internet Service entry in the CLI:

```
# diagnose internet-service id-summary 65646
Version: 0000600096
Timestamp: 201902111802
Total number of IP ranges: 444727
Number of Groups: 7
Group(0), Singularity(20), Number of IP ranges(142740)
Group(1), Singularity(19), Number of IP ranges(1210)
```

```
Group(2), Singularity(16), Number of IP ranges(241)
Group(3), Singularity(15), Number of IP ranges(38723)
Group(4), Singularity(10), Number of IP ranges(142586)
Group(5), Singularity(8), Number of IP ranges(5336)
Group(6), Singularity(6), Number of IP ranges(113891)
Internet Service: 65646(Google.Gmail)
Number of IP range: 60
Number of IP numbers: 322845
Singularity: 15
Reputation: 5(Known and verified safe sites such as Gmail, Amazon, eBay, etc.)
Icon Id: 510
Second Level Domain: 53(gmail.com)
Direction: dst
Data source: isdb
```

Result

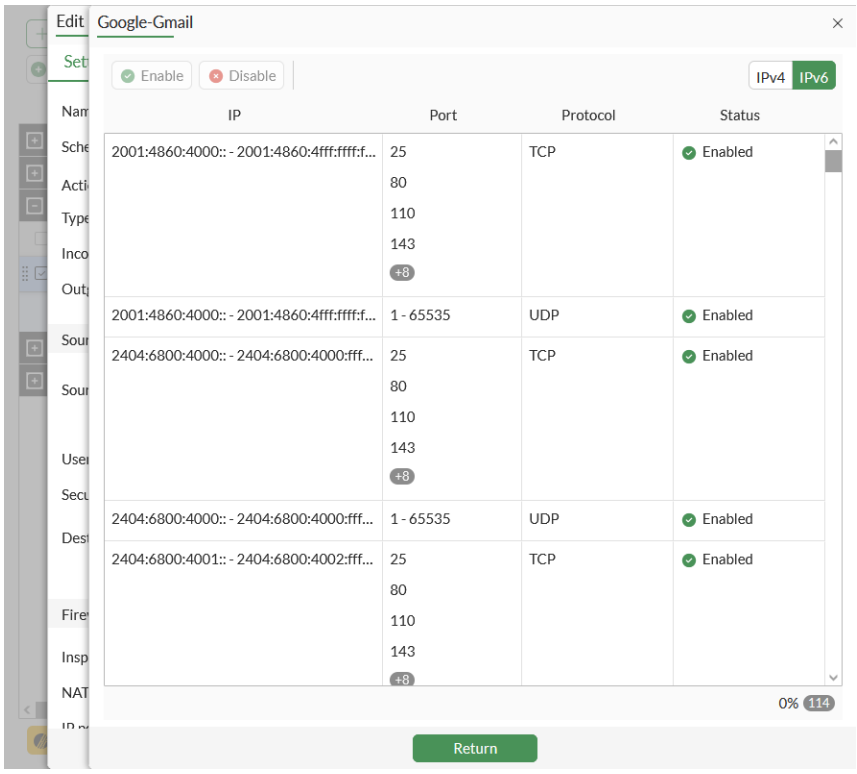
Because the IP and services related to Google Gmail on the Internet are included in this Internet Service (65646), all traffic to Google Gmail is forwarded by this policy.

Sample IPv6 configuration

In this example, the Google Gmail IPv6 ISDB address (ID 65646) is used as a destination in a firewall policy.

To apply a predefined IPv6 Internet Service entry to a policy using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. In the *Destination* field, select *Internet Service* from the dropdown list.
3. In the *IPv6 Internet Service* section, select *Google-Gmail*.
4. Optionally, hover over the *Google Gmail* and click *View/Edit Entries*. A pane appears that displays the IPv6 address ranges for this Internet Service.



5. Click *Return* to close the pane.
6. Configure the other settings as needed.
7. Click *OK*.

To apply a predefined IPv6 Internet Service entry to a policy using the CLI:

```
config firewall policy
    edit 4
        set name "Internet Service6 policy"
        set srcintf "vlan100"
        set dstintf "wan1"
        set action accept
        set srcaddr6 "all"
        set internet-service6 enable
        set internet-service6-name "Google-Gmail"
        set schedule "always"
        set nat enable
    next
end
```

To diagnose an IPv6 Internet Service entry in the CLI:

```
# diagnose internet-service6 id-summary 65646

Version: 00007.02907
Timestamp: 202212161345
```

```
Total number of IP ranges: 36878
Number of Groups: 12
Group(0), Singularity(20), Number of IP ranges(60)
Group(1), Singularity(18), Number of IP ranges(12)
Group(2), Singularity(17), Number of IP ranges(2728)
Group(3), Singularity(16), Number of IP ranges(2812)
Group(4), Singularity(15), Number of IP ranges(4011)
Group(5), Singularity(10), Number of IP ranges(2345)
Group(6), Singularity(9), Number of IP ranges(14)
Group(7), Singularity(8), Number of IP ranges(1555)
Group(8), Singularity(7), Number of IP ranges(2704)
Group(9), Singularity(6), Number of IP ranges(7300)
Group(10), Singularity(5), Number of IP ranges(3154)
Group(11), Singularity(4), Number of IP ranges(10183)
Internet Service: 65646(Google-Gmail)
Number of IP ranges: 482
Singularity: 15
Icon Id: 510
Direction: both
Data source: isdb
Country: 32 36 56 76 124 152 158 203 208 246 250 276 344 348 356 372 376 380 392 404 458 484
        528 616 634 643 682 702 710 724 752 756 784 826 840
Region: 65535
City: 65535
```

Result

Because the IP and services related to Google Gmail on the Internet are included in this Internet Service (65646), all traffic to Google Gmail is forwarded by this policy.

Using custom Internet Service in policy

Custom Internet Services can be created and used in firewall policies.

When creating a custom Internet Service, you must set following elements:

- IP or IP ranges
- Protocol number
- Port or port ranges
- Reputation

You must use CLI to create a custom Internet Service, except for geographic based services (see Allow creation of ISDB objects with regional information on page 1887).

CLI syntax

```
config firewall internet-service-custom
    edit <name>
```

```
        set comment <comment>
        set reputation {1 | 2 | 3 | 4 | 5}
        config entry
            edit <ID>
                set protocol <protocol #>
                set dst <object_name>
                config port-range
                    edit <ID>
                        set start-port <port #>
                        set end-port <port #>
                    next
                end
            next
        end
    end
end
```

Sample configuration

To configure a custom Internet Service:

```
config firewall internet-service-custom
   edit "test-isdb-1"
        set comment "Test Custom Internet Service"
        set reputation 4
        config entry
           edit 1
               set protocol 6
               config port-range
                   edit 1
                       set start-port 80
                       set end-port 443
                   next
               end
               set dst "10-1-100-0"
           next
           edit 2
               set protocol 6
               config port-range
                   edit 1
                       set start-port 80
                       set end-port 80
                   next
               end
               set dst "172-16-200-0"
           next
        end
   next
end
```

To apply a custom Internet Service into a policy:

```
config firewall policy
    edit 1
        set name "Internet Service in Policy"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-id 65646
        set internet-service-custom "test-isdb-1"
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "g-default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

Result

In addition to the IP address, IP address ranges, and services allowed by Google.Gmail, this policy also allows the traffic which access to 10.1.100.0/24 and TCP/80-443 and 172.16.200.0/24 and TCP/80.

Using extension Internet Service in policy

Extension Internet Service lets you add custom or remove existing IP address and port ranges to an existing predefined Internet Service entries. Using an extension type Internet Service is actually editing a predefined type Internet Service entry and adding IP address and port ranges to it.

When creating an extension Internet Service and adding custom ranges, you must set following elements:

- IP or IP ranges
- Protocol number
- Port or port ranges

You must use CLI to add custom IP address and port entries into a predefined Internet Service.

You must use GUI to remove entries from a predefined Internet Service.

Custom extension Internet Service CLI syntax

```
config firewall internet-service-extension
    edit <ID #>
        set comment <comment>
        config entry
            edit <ID #>
                set protocol <number #>
```

```
                set dst <object_name>
                config port-range
                    edit <ID #>
                         set start-port <number #>
                         set end-port <number #>
                    next
                end
            next
        end
    end
end
```

Sample configuration

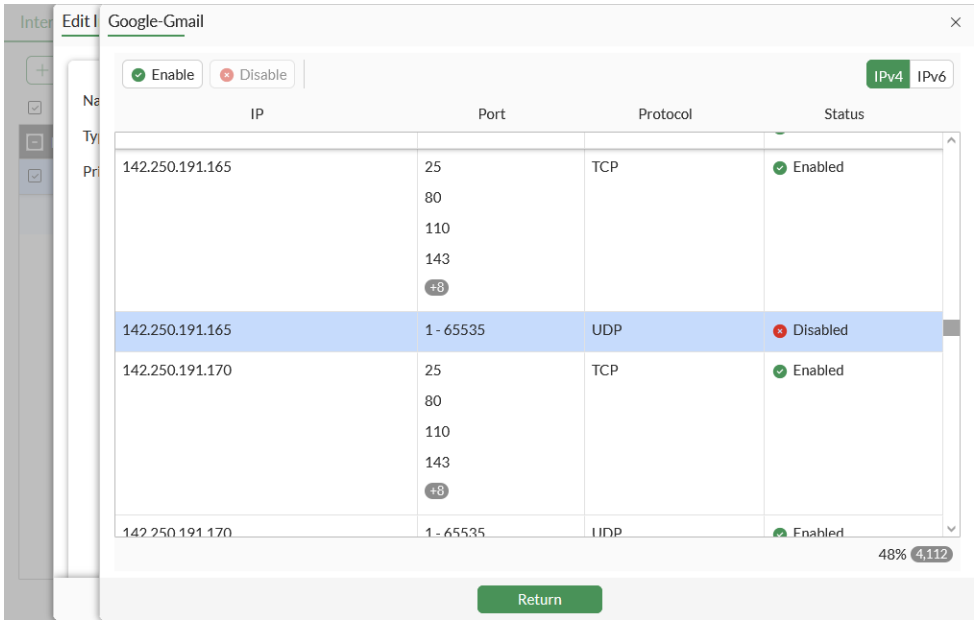
To configure an extension Internet Service in the CLI:

```
config firewall internet-service-extension
    edit 65646
        set comment "Test Extension Internet Service 65646"
        config entry
            edit 1
                set protocol 6
                config port-range
                    edit 1
                        set start-port 80
                        set end-port 443
                    next
                end
                set dst "172-16-200-0"
            next
            edit 2
                set protocol 17
                config port-range
                    edit 1
                        set start-port 53
                        set end-port 53
                    next
                end
                set dst "10-1-100-0"
            next
        end
    next
end
```

To remove IP address and port entries from an existing Internet Service in the GUI:

1. Go to *Policy & Objects > Internet Service Database*.
2. Search for *google-gmail*.
3. Select *Google-Gmail* and click *Edit*.
4. In the gutter, click *View/Edit Entries*.

5. Select the *IP* entry that you need to remove and click *Disable*.



6. Click *Return* twice.

To remove IP address and port entries from an existing Internet Service in the CLI:

```
config firewall internet-service-extension
    edit 65646
        config disable-entry
            edit 1
                set protocol 17
                config port-range
                    edit 1
                    next
                end
                config ip-range
                    edit 1
                        set start-ip 142.250.191.165
                        set end-ip 142.250.191.165
                    next
                end
            next
        end
    next
end
```

To apply an extension Internet Service into policy in the CLI:

```
config firewall policy
    edit 9
        set name "Internet Service in Policy"
        set srcintf "wan2"
```

```
        set dstintf "wan1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-id 65646
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "g-default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

Result

In addition to the IP addresses, IP address ranges, and services allowed by Google.Gmail, this policy also allows the traffic which accesses 10.1.100.0/24 and UDP/53 and 172.16.200.0/24 and TCP/80-443. At the same time, the traffic that accesses 2.20.183.160 is dropped because this IP address and port is disabled from Google.Gmail.

Global IP address information database

The Internet Service and IP Reputation databases download details about public IP address, including: ownership, known services, geographic location, blocklisting information, and more. The details are available in drilldown information, tooltips, and other mechanisms in the FortiView and other pages.

The global IP address database is an integrated database containing all public IP addresses, and is implemented in the Internet Service Database.

To view the owner of the IP address:

```
(global) # get firewall internet-service-owner ?
    id    Internet Service owner ID.
    1  Google
    2  Facebook
    3  Apple
    4  Yahoo
    5  Microsoft
    ......
    115  Cybozu
    116  VNC
```

To check for any known service running on an IP address:

```
(global) # diagnose internet-service info FG-traffic 6 80 8.8.8.8
    Internet Service: 65537(Google.Web)
```

To check GeoIP location and blocklist information:

```
(global) # diagnose internet-service id 65537 | grep 8.8.8.8
    8.8.8.8-8.8.8.8 geo_id(11337) block list(0x0) proto(6) port(80 443)
    8.8.8.8-8.8.8.8 geo_id(11337) block list(0x0) proto(17) port(443)
```

To check a known malicious server:

```
(global) # diagnose internet-service id-summary 3080383
    Version: 0000600096
    Timestamp: 201902111802
    Total number of IP ranges: 444727
    Number of Groups: 7
    Group(0), Singularity(20), Number of IP ranges(142740)
    Group(1), Singularity(19), Number of IP ranges(1210)
    Group(2), Singularity(16), Number of IP ranges(241)
    Group(3), Singularity(15), Number of IP ranges(38723)
    Group(4), Singularity(10), Number of IP ranges(142586)
    Group(5), Singularity(8), Number of IP ranges(5336)
    Group(6), Singularity(6), Number of IP ranges(113891)
    Internet Service: 3080383(Botnet.C&C.Server)
    Number of IP range: 111486
    Number of IP numbers: 111486
    Singularity: 20
    Reputation: 1(Known malicious sites related to botnet servers, phishing sites, etc.)
    Icon Id: 591
    Second Level Domain: 1(other)
    Direction: dst
    Data source: irdb
```

To check questionable usage:

```
(global) # diagnose internet-service id-summary 2818238
    Version: 0000600096
    Timestamp: 201902111802
    Total number of IP ranges: 444727
    Number of Groups: 7
    Group(0), Singularity(20), Number of IP ranges(142740)
    Group(1), Singularity(19), Number of IP ranges(1210)
    Group(2), Singularity(16), Number of IP ranges(241)
    Group(3), Singularity(15), Number of IP ranges(38723)
    Group(4), Singularity(10), Number of IP ranges(142586)
    Group(5), Singularity(8), Number of IP ranges(5336)
    Group(6), Singularity(6), Number of IP ranges(113891)
    Internet Service: 2818238(Tor.Relay.Node)
    Number of IP range: 13718
    Number of IP numbers: 13718
    Singularity: 20
    Reputation: 2(Sites providing high risk services such as TOR, proxy, P2P, etc.)
    Icon Id: 43
    Second Level Domain: 1(other)
```

```
    Direction: dst
    Data source: irdb

(global) # diagnose internet-service id-summary 2818243
    Version: 0000600096
    Timestamp: 201902111802
    Total number of IP ranges: 444727
    Number of Groups: 7

    Group(4), Singularity(10), Number of IP ranges(142586)
    Group(5), Singularity(8), Number of IP ranges(5336)
    Group(6), Singularity(6), Number of IP ranges(113891)
    Internet Service: 2818243(Tor.Exit.Node)
    Number of IP range: 1210
    Number of IP numbers: 1210
    Singularity: 19
    Reputation: 2(Sites providing high risk services such as TOR, proxy, P2P, etc.)
    Icon Id: 43
    Second Level Domain: 1(other)
    Direction: src
    Data source: irdb
```

IP reputation filtering

There are currently five reputation levels in the Internet Service Database (ISDB), and custom reputation levels can be defined in a custom internet service. You can configure firewall policies to filter traffic according to the desired reputation level. If the reputation level of either the source or destination IP address is equal to or greater than the level set in the policy, then the packet is forwarded, otherwise, the packet is dropped.

The five default reputation levels are:

1	Known malicious sites, such as phishing sites or sites related to botnet servers
2	High risk services sites, such as TOR, proxy, and P2P
3	Unverified sites
4	Reputable social media sites, such as Facebook and Twitter
5	Known and verified safe sites, such as Gmail, Amazon, and eBay

The default minimum reputation level in a policy is zero, meaning that the reputation filter is disabled.

For IP addresses that are not included in the ISDB, the default reputation level is three.

The default reputation direction is `destination`.

Example 1

Packets from the source IP address with reputation levels three, four, or five will be forwarded by this policy.

To set the reputation level and direction in a policy using the CLI:

```
config firewall policy
    edit 1
        set srcintf "wan2"
        set dstintf "port1"
        set srcaddr “all”
        set dstaddr "all"
        set reputation-minimum 3
        set reputation-direction source
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Packets from the source IP address with reputation levels three, four, or five will be forwarded by this policy.

Example 2

This policy allows only outbound FTP traffic, if the destination server has a minimum reputation of 4.

To set the reputation level and direction in a policy using the CLI:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "wan2"
        set srcaddr “all”
        set dstaddr "all"
        set reputation-minimum 4
        set reputation-direction destination
        set action accept
        set schedule "always"
        set service "FTP"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Internet service groups in policies

Groups of internet services can be created using the GUI or CLI. Once created, you can use the group with traffic shaping and firewall policies as criteria to match and shape traffic. The shaper is applied when the traffic matches.

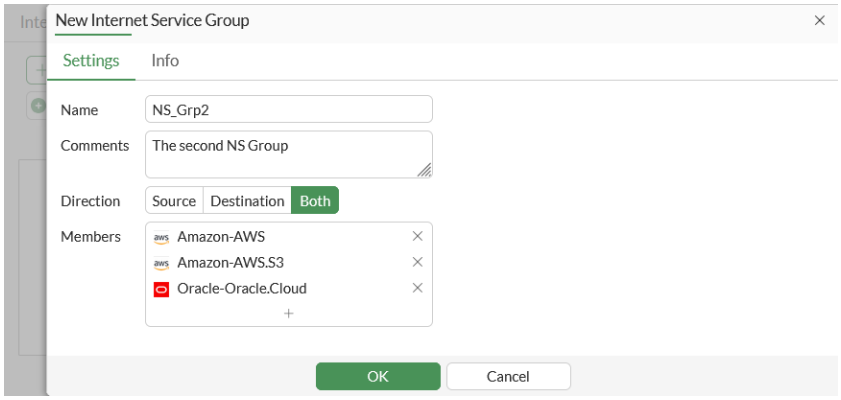
Internet service groups can be used as the source and destination of the policy. When using the CLI, `internet-service` must be enabled to use an internet service group as a destination, and `internet-service-src` must be enabled to use an internet service group as a source.

The following CLI variables are available in the `firewall policy` and `firewall shaping-policy` commands:

Variable	Description
`internet-service-group <string>`	Internet service group name.
`internet-service-custom-group <string>`	Custom internet service group name.
`internet-service-src-group <string>`	Source internet service group name.
`internet-service-src-custom-group <string>`	Custom source internet service group name.

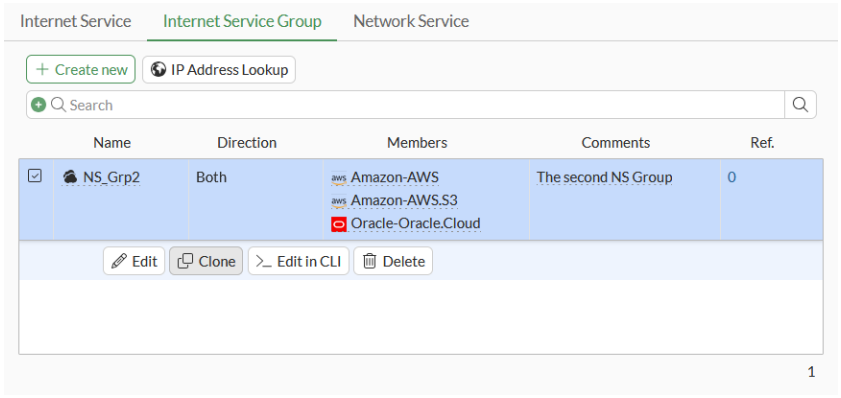
To create an internet service group in the GUI:

1. Go to *Policy & Objects* > *Internet Service Database*, select the *Internet Service Group* tab, and click *Create New*.
2. Configure the settings as needed, and click *OK*.



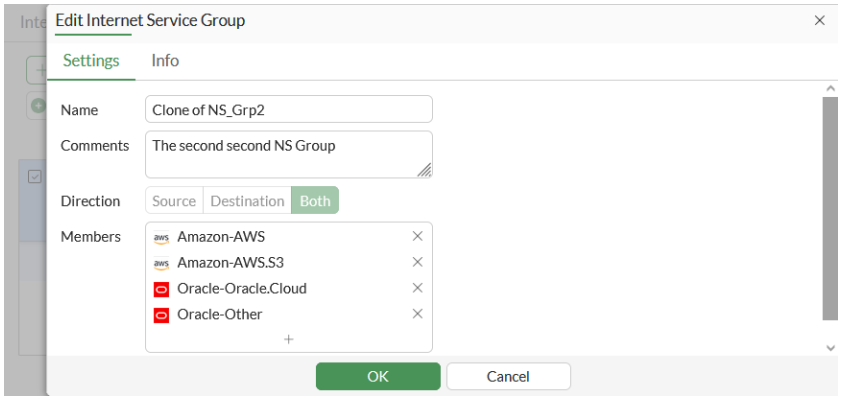
To clone an internet service group:

1. Go to *Policy & Objects* > *Internet Service Database*, and click the *Internet Service Group* tab.
2. Select an internet service group, and click *Clone*.



The *Edit Internet Service Group* pane opens.

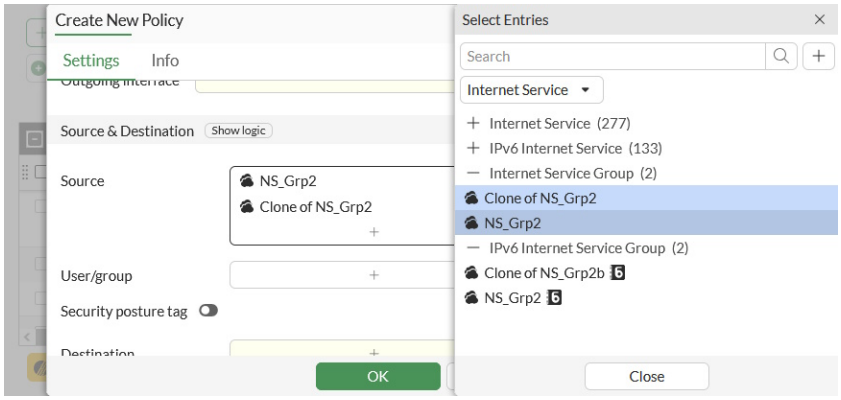
3. Edit the options.



4. Click *OK*. The clone is created.

To apply the internet service group to a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy*, and click *Create New*.
2. Select the internet service group:
   a. Click the *Source* or *Destination* field. The *Select Entries* pane opens.
   b. Select *Internet Service*, and select one or more internet service groups, such as *NS_Grp2*.
   c. Click *Close*.



3. Configure the remaining options as needed, then click *OK*.

Examples

The following examples use the below topology.

Example 1

In this example, the PC is allowed to access Google, so all Google services are put into an internet service group.

To configure access to Google services using an internet service group using the CLI:

1. Create an internet service group for Google services.
   In this example, the internet service group is named `Google_Group`.

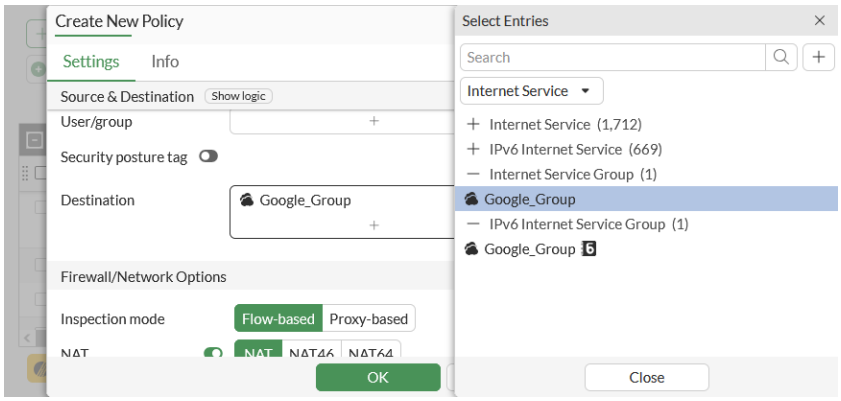
```
config firewall internet-service-group
    edit "Google_Group"
        set direction destination
        set member Google-Other Google-Web Google-ICMP Google-DNS Google-Outbound_Email
Google-SSH Google-FTP Google-NTP Google-Inbound_Email Google-LDAP Google-
NetBIOS.Session.Service Google-RTMP Google-NetBIOS.Name.Service Google-Google.Cloud Google-
Gmail
    next
end
```

2. Create a firewall policy and select the internet service group to allow access to all Google services from the PC.
   In this example, `internet-service` is `enabled`, and the internet service group named `Google_Group` is selected to allow access to all Google services from the PC.

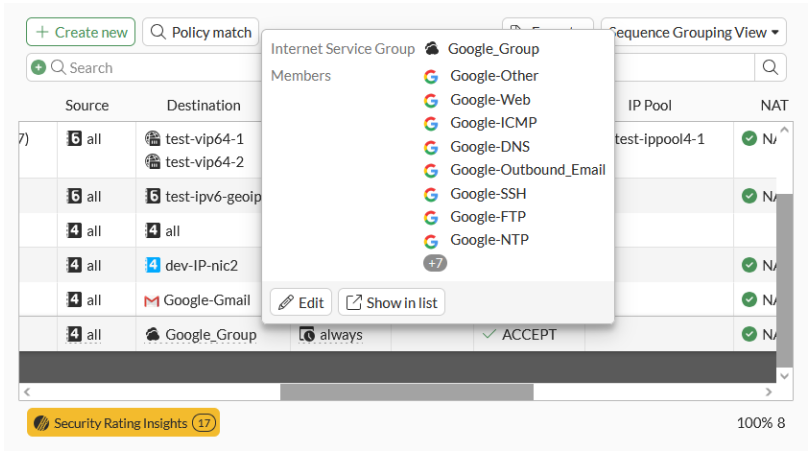
```
config firewall policy
    edit 1
        set name "PC to Google"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-group "Google_Group"
        set action accept
        set schedule "always"
        set fsso disable
        set nat enable
    next
end
```

To configure access to Google services using an internet service group in the GUI:

1. On the FortiGate, create an internet service group.
2. Go to *Policy & Objects > Firewall Policy*, and create a new policy.
3. Set the *Destination* to the internet service group.



4. Configure the remaining options, and click *OK*.
5. Go to *Policy & Objects* > *Firewall Policy* and hover over the group to view a list of its members.



Example 2

In this example, two office FTP servers are put into a custom internet service group, and the PC connection to the FTP servers is limited to 1Mbps.

To put two FTP servers into a custom internet service group and limit the PC connection speed to them in the CLI:

1. Create a custom internet service group for the internal FTP servers in the CLI:

```
config firewall internet-service-custom
    edit "FTP_PM"
        config entry
            edit 1
                config port-range
                    edit 1
                        set start-port 21
                        set end-port 21
                    next
                end
                set dst "PM_Server"
```

```
            next
        end
    next
    edit "FTP_QA"
        config entry
            edit 1
                config port-range
                    edit 1
                        set start-port 21
                        set end-port 21
                    next
                end
                set dst "QA_Server"
            next
        end
    next
end
```

2. Edit a firewall policy and add the custom internet service group to it:

```
config firewall internet-service-custom-group
    edit "Internal_FTP"
        set member "FTP_QA" "FTP_PM"
    next
end
```

3. Create a traffic shaper to limit the maximum bandwidth:

```
config firewall shaper traffic-shaper
    edit "Internal_FTP_Limit_1Mbps"
        set guaranteed-bandwidth 500
        set maximum-bandwidth 1000
        set priority medium
    next
end
```

4. Create a firewall shaping policy to limit the speed from the PC to the internal FTP servers:

```
config firewall shaping-policy
    edit 1
        set name "For Internal FTP"
        set internet-service enable
        set internet-service-custom-group "Internal_FTP"
        set dstintf "port1"
        set traffic-shaper "Internal_FTP_Limit_1Mbps"
        set traffic-shaper-reverse "Internal_FTP_Limit_1Mbps"
        set srcaddr "PC"
    next
end
```

To put two FTP servers into a custom service group and limit the PC connection speed to the in the GUI:

1. Create custom internet services for the internal FTP servers using the CLI.
2. Create a custom internet server group and add the just created custom internet services to it using the CLI.
3. Create a traffic shaper to limit the maximum bandwidth:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaper* tab, and click *Create New*.
   b. Enter a *Name* for the shaper, such as *Internal_FTP_Limit_1Mbps*.
   c. Set the *Traffic Priority* to *Medium*.
   d. Enable *Max Bandwidth* and set it to *1000*.
   e. Enable *Guaranteed Bandwidth* and set it to *500*.
   f. Click *OK*.
4. Create a firewall shaping policy to limit the speed from the PC to the internal FTP servers:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
   b. Enter a name for the policy.
   c. Set *Source* to the address of the PC.
   d. Set the *Destination* to the just created custom internet service group.
   e. Enable *Apply shaper* and apply the just create traffic shaper to the *Shared shaper* and *Reverse shaper*.

   f. Configure the remaining options as required, then click *OK*.

Allow creation of ISDB objects with regional information

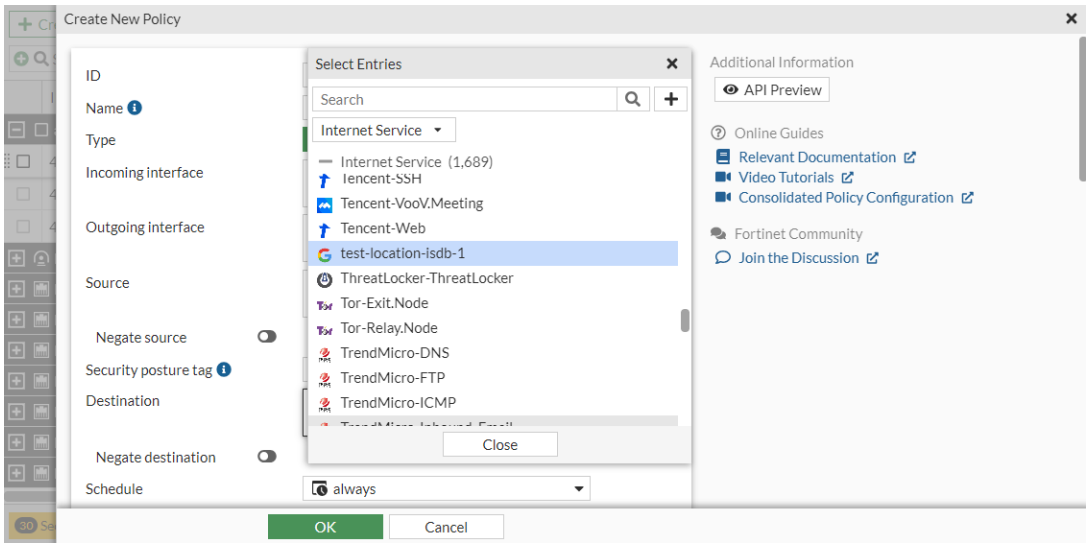
Geographic-based Internet Service Database (ISDB) objects allow users to define a country, region, and city. These objects can be used in firewall policies for more granular control over the location of the parent ISDB object. ISDB objects are now referenced in policies by name instead of ID.

To apply a location-based ISDB object to a policy in the GUI:

1. Create the ISDB object:
   a. Go to *Policy & Objects* > *Internet Service Database* and click *Create New* > *Geographic Based Internet Service*.
   b. Configure the settings as required.

   c. Click *OK*.
2. View the IP ranges in the location-based internet service:
   a. Go to *Policy & Objects* > *Internet Service Database* .
   b. In the table, hover over the object created in step 1 and click *View/Edit Entries*. The list of IPs is displayed:

   c. Click *Return*.
3. Add the ISDB object to a policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and create a new policy or edit an existing one.
   b. For *Destination*, select *Internet Service* from the dropdown list and select the ISDB object created in step 1.
   c. Configure the other settings as needed.



d. Click *OK*.

To apply a location-based ISDB object to a policy in the CLI:

1. Create the ISDB object:

```
config firewall internet-service-name
    edit "test-location-isdb-1"
        set type location
        set internet-service-id 65536
        set country-id 840
        set region-id 283
        set city-id 23352
    next
end
```

2. View the IP ranges in the location-based internet service:

```
# diagnose internet-service id 65536 | grep "country(840) region(283) city(23352)"
96.45.33.73-96.45.33.73 country(840) region(283) city(23352) blocklist(0x0) reputation(4),
domain(5) popularity(0) botnet(0) proto(6) port(1-65535)
96.45.33.73-96.45.33.73 country(840) region(283) city(23352) blocklist(0x0) reputation(4),
domain(5) popularity(0) botnet(0) proto(17) port(1-65535)
198.94.221.56-198.94.221.56 country(840) region(283) city(23352) blocklist(0x0) reputation(4),
domain(5) popularity(4) botnet(0) proto(6) port(1-65535)
198.94.221.56-198.94.221.56 country(840) region(283) city(23352) blocklist(0x0) reputation(4),
domain(5) popularity(4) botnet(0) proto(17) port(1-65535)
```

3. Add the ISDB object to a policy:

```
config firewall policy
    edit 3
        set name "PC to Google"
        set srcintf "port2"
        set dstintf "port1"
```

```
        set srcaddr "PC"
        set internet-service enable
        set internet-service-name "test-location-isdb-1"
        set action accept
        set schedule "always"
        set logtraffic all
        set logtraffic-start enable
        set auto-asic-offload disable
        set nat enable
    next
end
```

Internet service customization

Internet Service Database (ISDB) entries can be tuned for their environments by adding custom ports and port ranges, as well as port mapping.

If you are in multi-VDOM mode, Internet service customization can only occur at the Global level and not in a VDOM. See VDOM overview on page 3298 for more information.

To add a custom port range:

```
config firewall internet-service-addition
    edit 65646
        set comment "Add custom port-range:tcp/8080-8090 into 65646"
        config entry
            edit 1
                set protocol 6
                config port-range
                    edit 1
                        set start-port 8080
                        set end-port 8090
                    next
                end
            next
        end
    next
end
Warning: Configuration will only be applied after rebooting or using the 'execute internet-service
refresh' command.
```

To verify that the change was applied:

```
 # diagnose internet-service info FG-traffic 6 8080 2.20.183.160
 Internet Service: 65646(Google.Gmail)
```

To configure additional port mapping:

```
config firewall internet-service-append
    set match-port 10
    set append-port 20
end
Warning: Configuration will only be applied after rebooting or using the 'execute internet-service
refresh' command.
```

Look up IP address information from the Internet Service Database page

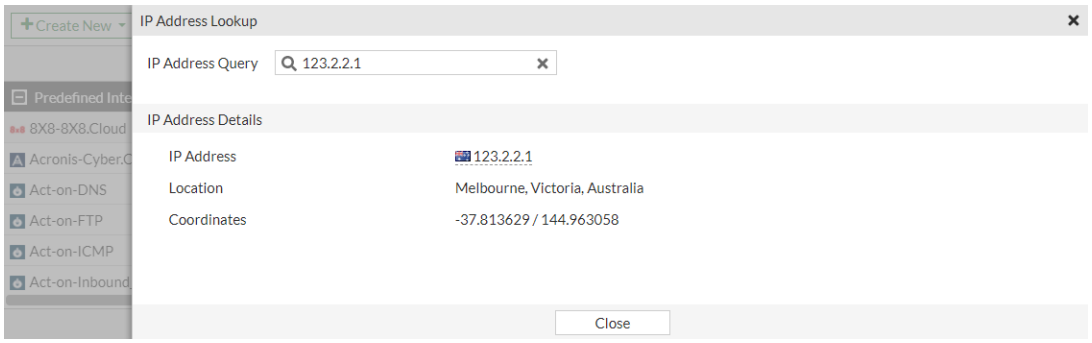
The *IP Address Lookup* button allows users to look up IP address information from the Internet Service Database and GeoIP Database. Returned IP address information includes the reverse IP address/domain lookup, location, reputation, and other internet service information.

To look up IP address information:

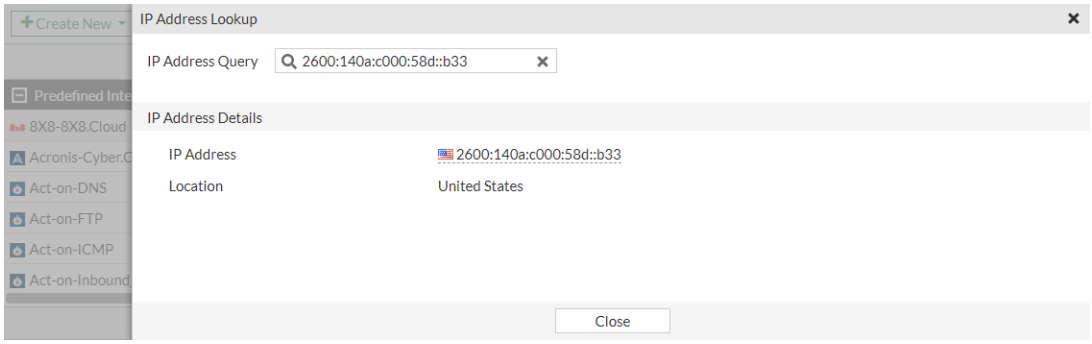
1. Go to *Policy & Objects* > *Internet Service Database*.
2. Click *IP Address Lookup*. The *IP Address Lookup* pane opens.
3. In the *IP Address Query* field, enter the IP address and press `Enter`.

   Results of an IP address from the Internet Service Database:

   Results of an IP address from the GeoIP Database:



Results of an IPv6 address from the GeoIP Database:



4. Click *Close*.

Internet Service Database on-demand mode

Internet Service Database (ISDB) on-demand mode replaces the full-sized ISDB file with a much smaller file that is downloaded onto the flash drive. This file contains only the essential entries for Internet Services. When a service is used in a firewall policy, the FortiGate queries FortiGuard to download the IP addresses and stores them on the flash drive. The FortiGate also queries the local MAC Database (MADB) for corresponding MAC information. The content of the ISDB entries used in firewall policies persists through reboots.

To enable ISDB (FFDB) on-demand mode:

1. Configure the global setting:

```
config system global
    set internet-service-database on-demand
end
```

   All FFDB files are erased.

2. Verify that there are no ISDB (FFDB) files:

```
# diagnose autoupdate versions | grep Internet -A 6
Internet-service On-Demand Database
---------
Version: 0.00000
Contract Expiry Date: n/a
```

```
Last Updated using manual update on Mon Jan  1 00:00:00 2001
Last Update Attempt: n/a
Result: Updates Installed
```

Shortly after, the ISDB (FFDB) data structure is downloaded on the FortiGate. The following message appears in the debug messages:

```
do_ffsr_update[1567]-Starting  Update FFDB ondemand:(not final retry)
```

3. Run diagnostics again to verify that the ISDB (FFDB) files are saved on the FortiGate flash drive:

```
# diagnose autoupdate versions | grep Internet -A 6
Internet-service On-Demand Database
---------
Version: 7.02950
Contract Expiry Date: n/a
Last Updated using manual update on Fri Jan  6 06:45:00 2023
Last Update Attempt: n/a
Result: Updates Installed
```

4. Since no services have been applied to a policy, the IP range and IP address values are blank in the the summary details. For example, check the summary details for ID 1245187, Fortinet DNS:

```
# diagnose internet-service id-summary 1245187
Version: 00007.02950
Timestamp: 202301060645
Total number of IP ranges: 3085
Number of Groups: 1
Group(0), Singularity(90), Number of IP ranges(3085)
Internet Service: 1245187(Fortinet-DNS)
Number of IP ranges: 0
Number of IP addresses: 0
Singularity: 0
Icon Id: 19
Direction: dst
Data source: isdb
Country:
Region:
City:
```

5. Apply the Fortinet DNS service in a firewall policy:

```
config firewall policy
    edit 1
        set name "FDNS"
        set srcintf "port1"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set internet-service enable
        set internet-service-name "Fortinet-DNS"
        set schedule "always"
```

```
        set nat enable
    next
end
```

6. Verify the summary details again for ID 1245187 (Fortinet DNS). There is now data for the IP range and IP address values:

```
# diagnose internet-service id-summary 1245187
Version: 00007.02951
Timestamp: 202301061144
Total number of IP ranges: 3558
Number of Groups: 2
Group(0), Singularity(90), Number of IP ranges(3078)
Group(1), Singularity(10), Number of IP ranges(480)
Internet Service: 1245187(Fortinet-DNS)
Number of IP ranges: 480
Number of IP addresses: 55242
Singularity: 10
Icon Id: 19
Direction: dst
Data source: isdb
Country: 12 32 36 40 56 124 158 170 203 222 250 276 320 332 344 356 360 372 380 392 458 484
        528 591 600 604 642 643 702 764 784 807 826 840

        2147 2206 65535
City: 615 679 818 1001 1106 1117 1180 1207 1330 1668 1986 2139 2812 2868 3380 3438 3485 3670
4276 4588 4622 4904
        5334 5549 5654 5827 6322 6325 6330 6355 6652 7844 9055 10199 10333 11420 12930 13426
13685 13769 14107 14813 15121
        15220 15507 15670 16347 16561 16564 16567 16631 17646 17746 17885 17975 17995 18071
18476 19066 19285 20784 21065 21092 21136
        21146 21266 21337 21779 21993 22292 22414 22912 23352 23367 23487 23574 23635 23871
23963 24076 24203 24298 24611 24955 25050
        25332 26854 27192 27350 28825 28866 65535
```

To verify MAC vendor information:

```
# diagnose vendor-mac id 1
Vendor MAC: 1(ASUS)
Version: 0000100146
Timestamp: 202301031100
Number of MAC ranges: 85
00:04:0f:00:00:00 - 00:04:0f:ff:ff:ff
00:0c:6e:00:00:00 - 00:0c:6e:ff:ff:ff
00:0e:a6:00:00:00 - 00:0e:a6:ff:ff:ff
...
```

Enabling the ISDB cache in the FortiOS kernel

A software ISDB cache can be enabled in the FortiOS kernel. This ISDB cache can be used to enhance lookup performance by circumventing the ISDB lookup penalty when revisiting the same resources.

The ISDB cache can be enabled using the following command:

```
config system settings
    set internet-service-database-cache {enable | disable}
end
```

Example

In the following example, after enabling the software ISDB cache, traffic will be generated twice to the same resource. Since the ISDB cache is enabled, no new query will occur in the ISDB. Instead, the ISDB lookup in performed in the cache table.

To enable the software ISDB cache:

1. Enable the ISDB cache:

```
config system settings
    set internet-service-database-cache enable
end
```

2. Create an ISDB firewall policy:

```
config firewall policy
    edit 1
        set internet-service enable
        set internet-service-name "Google-DNS" "Google-Other" "Google-Web"
        set internet-service6 enable
        set internet-service6-name "Google-DNS" "Google-Other" "Google-Web"
    next
end
```

3. Generate traffic to access the resource which matches the ISDB ID in the firewall policy.
4. Check the Internet Service cache lists:

```
# diagnose firewall internet-service-cache list
List Internet Service (IPV4) Cache in Kernel:
MAX_ISDB_CACHE_ENTRY_SIZE=1024 num_isdb_cache_entry=2 isdb_cache_hit_count=0 isdb_query_
count=2
proto=6 port=443 IP=10.151.118.105 id=1245185 country_id=840 region_id=283 city_id=21065
reputation=5 insert_timestamp=4302579542 cache_hit_count=0
proto=6 port=443 IP=10.8.8.8 id=65537 country_id=840 region_id=283 city_id=15905 reputation=5
insert_timestamp=4302579760 cache_hit_count=0

# diagnose firewall internet-service6-cache list
List Internet Service (IPV6) Cache in Kernel:
```

```
MAX_ISDB_CACHE_ENTRY_SIZE=1024 num_isdb_cache_entry=1 isdb_cache_hit_count=0 isdb_query_
count=1
proto=6 port=443 IP=2600:140a:1000:196::b33 id=7929993 country_id=124 region_id=65535 city_
id=65535 reputation=4 insert_timestamp=4302580009 cache_hit_count=0
```

5. Generate traffic to access the same resource again.
6. Check the Internet Service cache lists:

```
# diagnose firewall internet-service-cache list
List Internet Service (IPV4) Cache in Kernel:
MAX_ISDB_CACHE_ENTRY_SIZE=1024 num_isdb_cache_entry=2 isdb_cache_hit_count=1 isdb_query_
count=2
proto=6 port=443 IP=10.151.118.105 id=1245185 country_id=840 region_id=283 city_id=21065
reputation=5 insert_timestamp=4302579542 cache_hit_count=0
proto=6 port=443 IP=10.8.8.8 id=65537 country_id=840 region_id=283 city_id=15905 reputation=5
insert_timestamp=4302579760 cache_hit_count=1

# diagnose firewall internet-service6-cache list
List Internet Service (IPV6) Cache in Kernel:
MAX_ISDB_CACHE_ENTRY_SIZE=1024 num_isdb_cache_entry=1 isdb_cache_hit_count=1 isdb_query_
count=1
proto=6 port=443 IP=2600:140a:1000:196::b33 id=7929993 country_id=124 region_id=65535 city_
id=65535 reputation=4 insert_timestamp=4302580009 cache_hit_count=1
```

The ISDB lookup is performed in the cache table so there is no new query in the full ISDB.

Apply FQDN address groups within the ISDB

Fully Qualified Domain Name (FQDN) address groups can be applied within the Internet Service Database (ISDB), addressing the challenge of frequently changing IP addresses and ensuring accurate and reliable firewall policies. Predefined, built-in FQDN address groups are available as custom Internet services and can be applied to various firewall policies using the `internet-service-custom` command.

The following `diagnose` commands identify predefined FQDNs:

```
# diagnose ffdb-fqdn custom-list [<Predefined Internet service name>]
# diagnose ffdb-fqdn custom-get <Predefined FQDN name>
```

Command	Description
`ffdb-fqdn custom-list`	List which specific FQDNs are included in a built-in FQDN entry. If the custom name of the predefined Internet service is appended to the end of the command, only that entry's information is displayed. If a custom name is not defined, all entries in the current database will be listed.
`ffdb-fqdn custom-get`	Determine which built-in FQDN entry the given FQDN name belongs to.

To list built-in FQDNs included in an FQDN entry:

```
# diagnose ffdb-fqdn custom-list g-BuiltIn-Microsoft-Microsoft.Update

Version: 00007.03913
Timestamp: 202410251745
Format: 1
MD5SUM: f6091dd5132f25bec4294442918e0c35

List BuiltIn FQDNs for g-BuiltIn-Microsoft-Microsoft.Update:

*.dsp.mp.microsoft.com; *.windowsupdate.com; windowsupdate.microsoft.com; *.update.microsoft.com;
*.download.microsoft.com; wustat.windows.com; ntservicepack.microsoft.com;
*.delivery.mp.microsoft.com; devicelistenerprod.microsoft.com;
```

To determine which entry a given FQDN is included in:

```
# diagnose ffdb-fqdn custom-get windowsupdate.microsoft.com

Version: 00007.03913
Timestamp: 202410251745
Format: 1
MD5SUM: f6091dd5132f25bec4294442918e0c35

Get BuiltIn Custom Name for windowsupdate.microsoft.com:

g-BuiltIn-Microsoft-Microsoft.Update
```

Example

In the following example, a predefined FQDN Internet service, `g-BuiltIn-Microsoft-Microsoft.Update`, is applied to a firewall policy. We will then review how the customer Internet service is loaded in the kernel and try to send packet sot the FortiGate from the client to hit the policy. Finally, we will review the Internet service related fields in the traffic logs.

To apply FQDN address groups within the ISDB:

1. Apply the built-in FQDN entry to the firewall policy:

```
config firewall policy
    edit 1
        set name "isdb-policy"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set internet-service enable
        set internet-service-custom "g-BuiltIn-Microsoft-Microsoft.Update"
        set schedule "always"
        set logtraffic all
```

```
        set auto-asic-offload disable
        set nat enable
    next
end
```

2. Review how the FQDN entry is loaded into the kernel:

```
# diagnose firewall iprope list 100004 | grep -A 16 index=1

policy index=1 uuid_idx=8207 action=accept
flag (8050109): log redir nat master use_src pol_stats
flag2 (6200): no_asic log_fail resolve_sso
flag3 (a0): link-local best-route
flag4 (200): port-preserve
schedule(always)
cos_fwd=255  cos_rev=255
group=00100004 av=00004e20 au=00000000 split=00000000
host=0 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 8 -> zone(1): 7
source(1): 0.0.0.0-255.255.255.255, uuid_idx=8050,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=8050,
service(1):
        [0:0x0:0/(0,65535)->(0,65535)] flags:0 helper:auto
internet service(1): g-BuiltIn-Microsoft-Microsoft.Update(4278190087,0,0,0)
```

3. Review the FQDN domain name and corresponding IP address information contained in the built-in FQDN entry are listed. The resolution of these domain names comes from the DNS server set by the FortiGate.

```
# diagnose firewall internet-service-custom list

List internet service in kernel(custom):
name=g-BuiltIn-Microsoft-Microsoft.Update id=4278190087 reputation=3 Unverified site.
singularity=0 flags=0x0 protocol=0
fqdn=(9):
        devicelistenerprod.microsoft.com ID(26) ADDR(172.179.72.126)
        *.download.microsoft.com ID(42)
        *.update.microsoft.com ID(79)
        *.dsp.mp.microsoft.com ID(83)
        ntservicepack.microsoft.com ID(147) ADDR(20.72.235.82)
        windowsupdate.microsoft.com ID(210) ADDR(20.72.235.82)
        wustat.windows.com ID(216)
        *.windowsupdate.com ID(241)
        *.delivery.mp.microsoft.com ID(339)
```

4. Send packets from the client to the FQDN domain `windowsupdate.microsoft.com`, which is one of the FQDN domains included in `g-BuiltIn-Microsoft-Microsoft.Update`. The traffic will hit and be forwarded by the firewall policy.

```

Security Profiles

This section contains information about configuring FortiGate security features, including:

- Inspection modes on page 1899
- Antivirus on page 1905
- Web filter on page 1965
- Video filter on page 2024
- DNS filter on page 2038
- Application control on page 2077
- Inline CASB examples on page 2096
- Intrusion prevention on page 2113
- File filter on page 2147
- Email filter on page 2155
- VoIP solutions on page 2173
- ICAP on page 2207
- Web application firewall on page 2224
- Data loss prevention on page 2227
- Virtual patching on page 2288
- SSL & SSH Inspection on page 2303
- Custom signatures on page 2334
- Overrides on page 2345
- IP ban on page 2360
- Profile groups on page 2366

If you are unable to view a security profile feature, go to *System* > *Feature Visibility* to enable it.

Proxy features are not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 98 for more information.

Inspection modes

FortiOS supports flow-based and proxy-based inspection in firewall policies. You can select the inspection mode when configuring a policy.

Flow-based inspection takes a snapshot of content packets and uses pattern matching to identify security threats in the content.

Proxy-based inspection reconstructs content that passes through the FortiGate and inspects the content for security threats.

Certain security profiles allows users to display flow-based or proxy-based feature sets.

This following topics provide information about inspection modes for various security profile features:

- Flow mode inspection (default mode) on page 1900
- Proxy mode inspection on page 1900
- Inspection mode feature comparison on page 1901

Flow mode inspection (default mode)

When a firewall policy's inspection mode is set to flow, traffic flowing through the policy will not be buffered by the FortiGate. Unlike proxy mode, the content payload passing through the policy will be inspected on a packet by packet basis with the very last packet held by the FortiGate until the scan returns a verdict. If a violation is detected in the traffic, a reset packet is issued to the receiver, which terminates the connection and prevents the payload from being sent successfully.

Flow-based inspection identifies and blocks security threats in real time as they are identified. All applicable flow-based security modules are applied simultaneously in one single pass, using Direct Filter Approach (DFA) pattern matching to identify possible attacks or threats. Pattern matching is offloaded and accelerated by CP8 or CP9 processors.

Flow-based inspection typically requires lower processing resources than proxy-based inspection and does not change packets, unless a threat is found and packets are blocked. Flow-based inspection is selected by default on new firewall policies. It is the recommended inspection mode, unless proxy-specific features are required. For more information, see Inspection mode feature comparison on page 1901.

Proxy mode inspection

When a firewall policy’s inspection mode is set to proxy, traffic flowing through the policy will be buffered by the FortiGate for inspection. This means that the packets for a file, email message, or web page will be held by the FortiGate until the entire payload is inspected for violations (virus, spam, or malicious web links). After FortiOS finishes the inspection, the payload is either released to the destination (if the traffic is clean) or dropped and replaced with a replacement message (if the traffic contains violations).

To optimize inspection, the policy can be configured to block or ignore files or messages that exceed a certain size. To prevent the receiving end user from timing out, you can apply client comforting. This allows small portions of the payload to be sent while it is undergoing inspection.

In proxy-based antivirus scanning, certain techniques are used to streamline scanning with either in-process or stream-based scanning. For more information, see Proxy mode stream-based scanning on page 1924.

Proxy mode provides some security profile capabilities that are not available to flow-based scanning:

- Video Filter
- Inline CASB

- Web Application Firewall (WAF)
- Content Disarm and Reconstruction (CDR)
- Web quota
- Sandbox Inline Scanning

For a complete list, see Inspection mode feature comparison on page 1901.

Some features are exclusively proxy-based:

- SSL Offloading
- Explicit Web Proxy
- ZTNA

Verify the capabilities that you need when deciding to use proxy-based or flow-based policy. Applying the same type of scan mode in all your policies also helps optimize your performance.

FortiOS supports the Zstandard (ZSTD) compression algorithm for web content. FortiOS can use proxy-based policies to decode ZSTD-encoded web content, scan it, and forward the web content to a browser. Then the web content can be passed to the user or blocked from the user based on UTM profile settings, ensuring a seamless and secure browsing experience.

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 98 for more information.

Inspection mode feature comparison

The following table shows which UTM profile can be configured on a flow mode or proxy mode inspection policy.

Some UTM profiles are hidden in the GUI and can only be configured using the CLI. To configure profiles in a firewall policy in CLI, enable the `utm-status` setting.

Some profiles might have feature differences between flow-based and proxy-based Inspection. From the GUI and CLI, you can set the *Feature set* option to be *Flow-based* or *Proxy-based* to display only the settings for that mode.

Some profiles and features are not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 98 for the list of models.

	Flow Mode Inspection Policy		Proxy Mode Inspection Policy		Feature set option
UTM Profile	GUI	CLI	GUI	CLI	
AntiVirus**	Yes	Yes	Yes	Yes	GUI/CLI
Web Filter**	Yes	Yes	Yes	Yes	GUI/CLI
Video Filter*	No	No	Yes	Yes	N/A
DNS Filter***	Yes	Yes	Yes	Yes	N/A
Application Control	Yes	Yes	Yes	Yes	N/A

UTM Profile	Flow Mode Inspection Policy		Proxy Mode Inspection Policy		Feature set option
	GUI	CLI	GUI	CLI	
Inline CASB*	No	No	Yes	Yes	N/A
Intrusion Prevention System	Yes	Yes	Yes	Yes	N/A
File Filter**	Yes	Yes	Yes	Yes	GUI/CLI
Email Filter**	Yes	Yes	Yes	Yes	GUI/CLI
VoIP	Yes	Yes	Yes	Yes	N/A
ICAP*	No	No	Yes	Yes	N/A
Web Application Firewall*	No	No	Yes	Yes	N/A
Data Loss Prevention**	No	Yes	Yes	Yes	CLI
Virtual Patching	Yes	Yes	Yes	Yes	N/A
SSL/SSH Inspection	Yes	Yes	Yes	Yes	N/A
SSH Filter*	No	No	No	Yes	N/A

* Proxy-only UTM profiles are not supported on FortiGate models with 2 GB RAM or less.

** Feature set option is not available on FortiGate models with 2 GB RAM or less. Profile only supports flow mode.

*** The transparent conditional DNS forwarder feature only works with a proxy-based firewall policy. The feature uses DNS filters with `transparent-dns-database` enabled and is not available on FortiGate models with 2 GB RAM or less.

The following sections outline differences between flow-based and proxy-based inspection for a security profile.

Feature comparison between Antivirus inspection modes

The following table indicates which Antivirus features are supported by their designated scan modes.

Part1	Replacement Message	Content Disarm	Mobile Malware	Virus Outbreak	Sandbox Post-Transfer Scanning	Sandbox Inline Scanning	NAC Quarantine
Proxy (2)	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes (1)	No	Yes	Yes	Yes	No	Yes

1. IPS Engine caches the URL and a replacement message is presented after the second attempt.
2. Not available on FortiGate models with 2 GB RAM or less.

Part 2	Archive Blocking	Emulator	Client Comforting	Infection Quarantine	Heuristics	Treat EXE as Virus
Proxy (3)	Yes	Yes	Yes	Yes (1)	Yes	Yes (2)
Flow	Yes	Yes	No	Yes (1)	Yes	Yes (2)

1. Only available on FortiGate models with HDD or when FortiAnalyzer or FortiGate Cloud is connected and enabled.
2. Only applies to inspection on IMAP, POP3, SMTP, and MAPI protocols.
3. Not available on FortiGate models with 2 GB RAM or less.

Part 3	External Blocklist	EMS External Feed	AI/ML Based Detection	FortiNDR Inline Detection
Proxy (1)	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	No

1. Not available on FortiGate models with 2 GB RAM or less.

Feature comparison between Web Filter inspection modes

The following table indicates which Web Filter features are supported by their designated inspection modes.

	FortiGuard Category-Based Filter	Category Usage Quota	Override Blocked Categories	Search Engines	Static URL Filter	Rating Option	Proxy Option	Web Profile Override
Proxy (4)	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes (1)	No	Yes (2)	Yes	Yes	Yes	Limited (3)	No

1. Local Category and Remote Category filters do not support the warning and authenticate actions.
2. Local Category and Remote Category filters cannot be overridden.
3. Only HTTP POST Action and Remove Cookies are supported.
4. Not available on FortiGate models with 2 GB RAM or less.

Feature comparison between Email Filter inspection modes

The following tables indicate which Email Filters are supported by the specified inspection modes for local filtering and FortiGuard-assisted filtering.

Local Filtering	Banned Word Check	Block/Allow List	HELO/ EHLO DNS Check	Return Address DNS Check	DNSBL/ ORBL Check	MIME Header Check
Proxy (1)	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	No	No	No	Yes

1. Not available on FortiGate models with 2 GB RAM or less

FortiGuard-Assisted Filtering	Phishing URL Check	Anti-Spam IP Check	Submit Spam to FortiGuard	Spam Email Checksum Check	Spam URL Check
Proxy (1)	Yes	Yes	Yes	Yes	Yes
Flow	No	No	No	No	No

1. Not available on FortiGate models with 2 GB RAM or less

Feature comparison between DLP inspection modes

The following table indicates which DLP filters are supported by their designated inspection modes.

	Credit Card Filter	SSN Filter	Regex Filter	File-Type Filter	File-Pattern Filter	Fingerprint Filter	Watermark Filter	Encrypted Filter	File-Size Filter
Proxy (2)	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	Yes	Yes	No	No	Yes	Yes (1)

1. File-size filtering only works if file size is present in the protocol exchange.
2. Not available on FortiGate models with 2 GB RAM or less.

Inspection of SMBv3 multichannel is not supported. To inspect SMBv3 traffic, it is advisable to disable multichannel support first. See the vendor specific documentation for more information on disabling multichannel support.

Antivirus

An antivirus software's primary function is to detect and stop viruses that could cause harm to your system or compromise the security of your connected devices. It can be installed on individual endpoints or it can operate as an antivirus engine (AV engine) to perform traffic inspection inside a Next Generation Firewall (NGFW).

The FortiGate's AV engine operates by leveraging the information stored in signature databases that is updated in real-time by the FortiGuard AV services. These databases are essentially vast repositories that contain detailed profiles of known and previously unknown viruses. The AV engine cross-references these profiles with the activities and files on your system to determine if any known or previously unknown viruses are active or attempting to infiltrate your network.

The scope of threats that the antivirus engine can neutralize extends beyond just viruses. It is equipped to deal with a wide array of malicious software, often called malware. This encompasses, but is not confined to, infected files that may carry harmful code, Trojans that disguise themselves as legitimate software, worms that can replicate themselves and spread across networks, and spyware that can collect and transmit your personal information without your consent. Furthermore, inline malware prevention powered by Sandboxing and AI extends protection to even new zero-day malware found in the wild.

This section includes information about antivirus techniques and configurations:

- Antivirus introduction on page 1905
- Advanced configurations on page 1932
- Configuration examples on page 1955

Antivirus introduction

FortiOS offers antivirus solutions in two modes: flow-based and proxy-based. Users can select the mode that best suits their needs. The default setting for a new antivirus profile is flow-based inspection, which is generally recommended unless there is a need for features specific to proxy. For more information, see Protocol comparison between antivirus inspection modes on page 1906.

FortiOS includes two preloaded antivirus profiles:

- *default*
- *wifi-default*

You can customize these profiles, or you can create your own to inspect certain protocols, remove viruses, analyze suspicious files with FortiSandbox, and apply botnet protection to network traffic. Once configured, you can add the antivirus profile to a firewall policy.

This functionality requires a subscription to FortiGuard Antivirus.

In order to download updated AV definitions, at least 1 policy with a security profile that has Antivirus scanning must be enabled.

Protocol comparison between antivirus inspection modes

The following table indicates which protocols can be inspected by the designated antivirus scan modes.

	HTTP	FTP	IMAP	POP3	SMTP	NNTP	MAPI	CIFS	SSH
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes*	Yes
Flow	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	No

* Proxy mode antivirus inspection on CIFS protocol has the following limitations:

- Cannot detect infections within some archive files.
- Cannot detect oversized files.

Other antivirus differences between inspection modes

Starting from 6.4.0, the scan mode option is no longer available for flow-based AV.

This means that AV no longer exclusively uses the default or legacy scan modes when handling traffic on flow-based firewall policies. Instead, AV in flow-based policies uses a hybrid of the two scan modes. Flow AV may use a pre-filtering database for malware detection in some circumstances as opposed to the full AV signature database in others. The scan method is determined by the IPS engine algorithm that is based on the type of file being scanned. When handling oversized files in flow-based AV, the action can either be pass (default) or block. When the action is pass, IPS appends to-be-scan data into the AV scan buffer. If the appended file size exceeds the oversize-limit that is defined in the protocol option profile, then the AV session is cleared and the file is bypassed from AV scanning.

In contrast, proxy mode maintains the scan mode option, which can be toggled between default or legacy mode. In default mode, the WAD daemon receives the file and then decides if it can do an in-process scan of the file in simple AV configuration scenarios. If the file is in an oversized archive that is supported by the stream-based decompressor, then it is sent to stream-based scan for best effort inspection. Stream-based scan decompresses and scans the entire archive without archiving the file. If the file is not supported by stream-based scan, then it is buffered and then sent to the scanunit daemon for inspection on content that is under the oversize limit.

In legacy mode, stream-based scanning is disabled, so oversized archive files and files that cannot be handled by WAD in-process scan are buffered and sent to the scanunit daemon for processing.

Antivirus techniques

The security of digital systems is a top priority for organizations. A range of techniques and tools are employed to ensure the integrity and reliability of these systems.

The following table describes some of the industry standard techniques that are used for Antivirus protection, and if they can be configured in the GUI or CLI.

Technique	Description	GUI	CLI
Signature-based detection	Antivirus scan detects and compares malicious file against virus signatures database. The FortiGuard Antivirus Service uses content pattern recognition language (CPRL), which is more efficient and accurate than traditional signature-based detection methods.	✓	✓
Content Disarm and Reconstruction (CDR)	CDR sanitizes Office, OpenOffice, PDF, RTF, and XLSB files by removing active content and active media, preserving only the text. See Content disarm and reconstruction on page 1907 for more information.	✓	✓
Virus Outbreak Prevention (VOS)	VOS enhances FortiGate's antivirus database with third-party malware hashes. It checks file hashes against FortiGuard's database. See Virus outbreak prevention on page 1908 for more information.	✓	✓
External Malware Block List	Users can add their own malware signatures to an external list. See External malware block list on page 1908 for more information.	✓	✓
EMS External Feed	FortiGate receives malware feeds from FortiClient EMS, which itself gathers detected malware hashes from FortiClients. See EMS external feed on page 1908 for more information.	✓	✓
Behavior-based detection	Submit suspected malicious files to FortiSandbox for inspection. See Using FortiSandbox post-transfer scanning with antivirus on page 1932 and Using FortiSandbox inline scanning with antivirus on page 1934 for more information.	✓	✓
CIFS Scanning	File filtering and antivirus scanning on Common Internet File System (CIFS) traffic is supported. See CIFS support on page 1950 for more information.	✓	✓
Heuristic Analysis	Identify malicious files such as Windows Portable Executables (PEs) to combat zero-day attacks. See AI-based malware detection on page 1909 for more information.		✓
AI/ML, behavioral, and human analysis	Helps identify, classify, and respond to threats. See Using FortiNDR inline scanning with antivirus on page 1945 for more information.	✓	✓

See Configuring an antivirus profile on page 1909 and Testing an antivirus profile on page 1912 for more information.

Content disarm and reconstruction

Content disarm and reconstruction (CDR) allows the FortiGate to sanitize Microsoft Office documents and PDF files (including those that are in ZIP archives) by removing active content, such as hyperlinks, embedded media, JavaScript, macros, and so on from the files (disarm) without affecting the integrity of its textual content (reconstruction).

CDR is supported on HTTP, SMTP, POP3, and IMAP.

HTTP GET is supported, but not HTTP POST.
SMTP splice and client-comfort mode are not supported.
CDR does not support flow-based inspection modes.

It allows network administrators to protect their users from malicious document files. See Content disarm and reconstruction on page 1956 for a configuration example.

Virus outbreak prevention

FortiGuard VOS allows the FortiGate antivirus database to be supplemented with third-party malware hash signatures curated by FortiGuard. This allows VOS to manage zero-day threats effectively. The hash signatures are obtained from FortiGuard's Global Threat Intelligence database. Any signature that is added to FortiGuard becomes immediately active, eliminating the need to wait for AVDB (antivirus database) update. The AVDB queries FortiGuard with the hash of a scanned file. If FortiGuard returns a match, the scanned file is deemed to be malicious. Enabling the AV engine scan is not required to use this feature.

FortiGuard VOS can be used in both proxy-based and flow-based policy inspections across all supported protocols.

The FortiGate must be registered with a valid FortiGuard outbreak prevention license.

See FortiGuard outbreak prevention on page 1958 for a configuration example.

External malware block list

The external malware block list allows users to add their own malware signatures in the form of MD5, SHA1, and SHA256 hashes. The FortiGate's antivirus database retrieves an external malware hash list from a remote server and polls the hash list every n minutes for updates. Enabling the AV engine scan is not required to use this feature.

The external malware block list can be used in both proxy-based and flow-based policy inspections, but it is not supported in AV quick scan mode.

Note that using different types of hashes simultaneously may slow down the performance of malware scanning. It is recommended to use one type of hash.

See External malware block list on page 1960 and Malware hash external feed on page 4092 for more details and configuration examples.

EMS external feed

A FortiGate can pull malware external feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. This feature is supported in proxy and flow mode.

If an external malware blocklist and the FortiGuard outbreak prevention database are also enabled in the antivirus profile, the checking order is: AV local database, EMS external feed, external malware blocklist, FortiGuard outbreak prevention database. If the EMS external feed and external malware blocklist contain the same hash value, then the EMS infection will be reported if both of them are blocked.

See Malware external feed from EMS on page 1947 for more details and configuration examples.

AI-based malware detection

The AV Engine AI malware detection model integrates into regular AV scanning to help detect potentially malicious files, such as malicious Windows Portable Executables or ELF files, in order to mitigate zero-day attacks. Previously, this type of detection was handled by heuristics that analyzed file behavior. With AV Engine AI, the module is trained by FortiGuard AV against many malware samples to identify file features that make up the malware. The AV Engine AI package can be downloaded by FortiOS via FortiGuard on devices with an active AV subscription. The machine-learning-detection setting is enabled by default at a per-VDOM level. Files detected by the AV Engine AI are identified with the W32/AI.Pallas.Suspicious virus signature.

To configure machine learning-based malware detection:

```
config antivirus settings
     set machine-learning-detection {enable| monitor | disable}
end
```

FortiGuard provides several sample files to test the AV configuration on the FortiGate, which are available to download from https://www.fortiguard.com/sample-files. Test the AI-based malware detection feature by downloading *AI Sample* file. See Example 2: AI sample file on page 1917.

Configuring an antivirus profile

In an antivirus profile, the FortiGate can be configured to apply antivirus protection to HTTP, FTP, IMAP, POP3, SMTP, CIFS, and NNTP sessions. Proxy-based profiles also support MAPI and SSH. Antivirus inspection prevents potentially unwanted and malicious files from entering the network. Antivirus profiles include multiple different functions, such as scanning files for virus signatures, scanning for advanced persistent threats, checking external malware hash lists and external feeds, and others. Malicious files can be blocked or monitored, and can be quarantined. Some antivirus profile options require a license and/or other Fortinet products. Some antivirus profile options can only be configured in the CLI (refer to the FortiOS CLI Reference).

The feature set setting (proxy or flow) in the antivirus profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based antivirus profile must be used with a flow-based firewall policy.

To configure an antivirus profile:

1. Go to *Security Profiles* > *AntiVirus* and click *Create New*.
2. Configure the following settings:

Name	Enter a unique name for the profile.
Comments	Enter a comment (optional).
AntiVirus scan	Enable one or more protocols for inspection, then enable *AntiVirus scan* for the selected protocols with a specified action. • *Block*: block the malicious traffic. • *Monitor*: log malicious traffic and allow it to pass inspection.

Feature set	Select the feature set for the profile. The feature set mode must match the inspection mode used in the associated firewall policy.
	• *Flow-based*
	• *Proxy-based*
	Additional options are available in proxy-based mode and are identified in the GUI with a *P* icon. See Inspection mode feature comparison on page 1901 for more details.
	If the *Feature set* option is not visible, enter the following in the CLI:
	`config system settings`
	`  set gui-proxy-inspection enable`
	`end`

Inspected Protocols	Enable to inspect the protocol for session inspection: HTTP, SMTP, POP3, IMAP, FTP, and CIFS. Disabled protocols are not inspected. MAPI and SSH can be inspected in proxy-based mode.
APT Protection Options	This section includes options available with FortiGuard to mitigate advanced persistent threats (APT) in file-based attacks.
Content Disarm and Reconstruction	This option is available in proxy-based mode when at least one protocol is enabled for inspection and *AntiVirus scan* is enabled. See Content disarm and reconstruction on page 1907 for more details.
Allow transmission when an error occurs	Enable to allow traffic to pass when an inspection error occurs. Disable to block traffic when an inspection error occurs.
Original File Destination	Specify how to quarantine files processed by content disarm and reconstruction. • *FortiSandbox*: quarantine files on FortiSandbox. The FortiSandbox must be enabled. See Using FortiSandbox post-transfer scanning with antivirus on page 1932 for more details. • *File Quarantine*: quarantine files on FortiGate models with a hard disk. • *Discard*: discard suspicious files.
Treat Windows executables in email attachments as viruses	Enable to deem all Windows executable files located in email traffic as viruses.
Send Files to FortiSandbox for Inspection	Enable to send files to FortiSandbox for inspection. The FortiSandbox must be enabled.

Scan strategy	FortiSandbox scans files inline for flow-based mode (*Inline*) and after the file transfer is complete for proxy-based mode (*Post Transfer*). See Using FortiSandbox inline scanning with antivirus on page 1934 and Using FortiSandbox post-transfer scanning with antivirus on page 1932 for more details.
File types	Specify which files to FortiSandbox for inspection. • *Suspicious Files Only*: only send suspicious files to FortiSandbox for inspection. • *All Supported Files*: send all supported files to FortiSandbox for inspection.
Do not submit files matching types	Click the + to exclude certain file types from being sent to FortiSandbox.
Do not submit files matching file name patterns	Click the + to enter a wildcard pattern to exclude files from being sent to FortiSandbox.
Use FortiSandbox database	Enable to use the signature database from FortiSandbox. The FortiSandbox must be enabled.
Send files to FortiNDR for inspection	This option is available in proxy-based mode when at least one protocol is enabled for inspection, *AntiVirus scan* is enabled, and FortiNDR is enabled. See Using FortiNDR inline scanning with antivirus on page 1945 for more details.
Include mobile malware protection	Enable to use the mobile malware protection database from FortiGuard for content scanning.
Quarantine	This option is available when at least one protocol is enabled for inspection and *AntiVirus scan* is enabled. Enable to quarantine infected files. See also Downloading quarantined files in archive format on page 1964.
Virus Outbreak Prevention	This section includes options available with the FortiGuard Virus Outbreak Protection Service (VOS). See Virus outbreak prevention on page 1908 and FortiGuard outbreak prevention on page 1958 for more details.
Use FortiGuard outbreak prevention database	Enable to use the outbreak prevention database that is available with Advanced Malware Protection on FortiGuard. A license is required. • *Block*: block the malicious traffic. • *Monitor*: log malicious traffic and allow it to pass inspection.
Use external malware block list	Enable to use one or more external blocklist file hashes. • *Block*: block the malicious traffic. • *Monitor*: log malicious traffic and allow it to pass inspection. • *All*: use all malware block lists. • *Specify*: select specific malware block lists. See External malware block list on page 1908and Malware hash external feed on page 4092 for more details.

Use EMS external feed	This option is available when at least one protocol is enabled for inspection and *AntiVirus scan* is enabled. Enable to use malware external feeds from FortiClient EMS. A FortiClient EMS Fabric connector with EMS external feed enabled is required. See EMS external feed on page 1908 for more details.

3. Click *OK*.

Protocol options

When applying an antivirus profile to a firewall policy, the protocol options profile defines parameters for handling protocol-specific traffic. These parameters affect functions such as the port mapping for inspecting each protocol, whether to log or block oversized files when performing AV scanning, enabling comfort client, and more. Protocol options profiles are configured by going to *Policy & Objects > Protocol Options*, or in the CLI under `config firewall profile-protocol-options`. See Protocol options on page 1792 for more information.

Scan mode

In proxy-based antivirus profiles, the scan mode can be set to either default or legacy. This setting can only be configured in the CLI. See Proxy mode stream-based scanning on page 1924 for more information.

To configure the scan mode:

```
config antivirus profile
    edit <name>
        set feature-set proxy
        set scan-mode {default | legacy}
    next
end
```

Testing an antivirus profile

Antivirus (AV) profiles can be tested using various file samples to confirm whether AV is correctly configured. In this topic, an AV profile is configured, applied to a firewall policy, and a user attempts to download sample virus test files hosted on eicar.org and fortiguard.com.

Different sample files are used to verify different features on the AV profile. The expectation is these files must be blocked by the AV profile, and the user should be presented with a block page.

File	Test case
EICAR test file	A plain text EICAR test file (hosted on eicar.org over a HTTPS connection) to test basic AV scanning on the FortiGate using deep inspection.
AI sample file	A machine learning sample file to test AI-based malware detection on the FortiGate.
Virus outbreak (VO) sample file	A zero-day sample virus file to test the outbreak prevention feature of the AV profile.

File	Test case
Behavioral-based samples	Files that are detected by a sandbox. This requires FortiSandbox integration with the FortiGate.

For the following AV test cases, the test PC has an IP of 192.168.1.110/24 and is connected to the internal1 interface. It accesses the internet through the wan1 interface.

Configuring the AV profile

The *default* AV profile is used, and the *Use FortiGuard outbreak prevention database* setting is enabled with the action set to block.

To configure the AV profile:

1. Go to *Security Profiles* > *AntiVirus* and edit the *default* profile.
2. In the *Virus Outbreak Prevention* section, enable *Use FortiGuard outbreak prevention database* and select *Block*. See FortiGuard outbreak prevention on page 1958 for more information about this setting.
3. Configure the other settings as needed (see Configuring an antivirus profile on page 1909).
4. Click *OK*.

By default, the FortiOS AV Engine has AI-based malware detection enabled (`set machine-learning-detection enable`) . The AV Engine AI malware detection model integrates into regular AV scanning to help detect potentially malicious Windows Portable Executables (PEs) in order to mitigate zero-day attacks. See AI-based malware detection on page 1909 for more information.

To verify the status of the AV Engine AI contract:

```
# diagnose autoupdate versions | grep AI -A6
AI/Machine Learning Malware Detection Model
---------
Version: 2.12588 signed
Contract Expiry Date: Tue Jul  9 2024
Last Updated using scheduled update on Tue Sep  5 08:23:15 2023
Last Update Attempt: Tue Sep  5 09:23:00 2023
Result: No Updates
```

Configuring the SSL SSH profile and firewall policy

The PC will be accessing and downloading the test files using HTTPS from the EICAR and the FortiGuard websites. Since HTTPS traffic is encrypted traffic, in order for the FortiGate to scan the encrypted traffic and inspect it for viruses and malware, it should act as the machine-in-the-middle to decrypt this communication and then re-encrypt it to send it to the website. Deep inspection must be enabled in the SSL SSH profile that will be applied to the firewall policy (see Deep inspection on page 2310). The *custom-deep-inspection* profile is modified to remove the *fortinet* FQDN address from the exemption list.

To configure the SSL SSH profile:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and edit the *custom-deep-inspection* profile.
2. In the *Exempt from SSL Inspection* section, locate the *fortinet* FQDN entry in the *Addresses* field, and click the *X* to delete it.
3. Click *OK*.

To configure the firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following settings:

Name	*To Internet*
Incoming Interface	*internal1*
Outgoing Interface	*wan1*
AntiVirus	Enable and select *default*.
SSL Inspection	Select *custom-deep-inspection*.

3. Configure the other settings as needed (see Firewall policy on page 1563).

The feature set setting (proxy or flow) in the antivirus profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based antivirus profile must be used with a flow-based firewall policy.

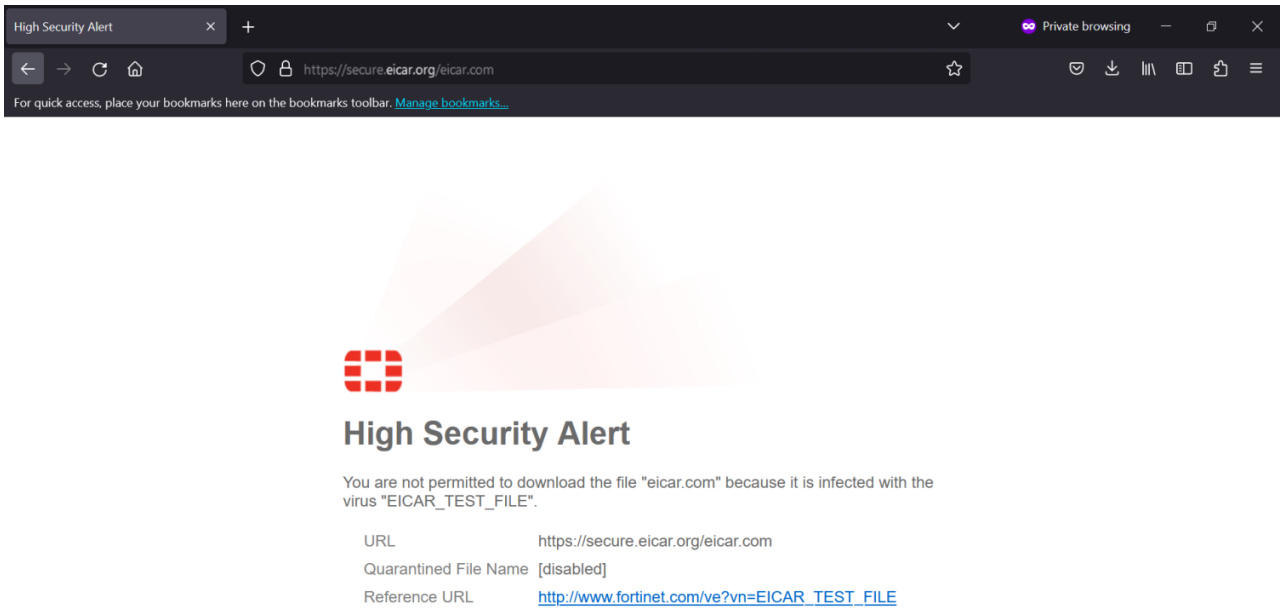
4. Click *OK*.

Example 1: EICAR test file

EICAR hosts anti-malware test files, which are available to download from https://www.eicar.org/download-anti-malware-testfile.

To test the AV profile with the EICAR test file:

1. On the PC, go to the EICAR website and download the *eicar.com* file.
2. The download attempt is blocked by the FortiGate's *default* AV profile, and a block page appears in the PC's browser.



3. Check the antivirus statistics on the FortiGate, `HTTP virus detected` increases by one:

```
# diagnose ips av stats show
 AV stats:
 HTTP virus detected: 1
 HTTP virus blocked: 0
 SMTP virus detected: 0
 SMTP virus blocked: 0
 POP3 virus detected: 0
 POP3 virus blocked: 0
 IMAP virus detected: 0
 IMAP virus blocked: 0
 NNTP virus detected: 0
 NNTP virus blocked: 0
 FTP virus detected: 0
 FTP virus blocked: 0
 SMB virus detected: 0
 SMB virus blocked: 0
```

4. Check the antivirus statistics using an SNMP walk:

```
root:~# snmpwalk -c public -v 1 10.1.100.6 1.3.6.1.4.1.12356.101.8.2.1.1
 iso.3.6.1.4.1.12356.101.8.2.1.1.1 = Counter32: 2  (fgAvVirusDetected)
 iso.3.6.1.4.1.12356.101.8.2.1.1.2.1 = Counter32: 1  (fgAvVirusBlocked)
 iso.3.6.1.4.1.12356.101.8.2.1.1.3.1 = Counter32: 1  (fgAvHTTPVirusDetected)
 iso.3.6.1.4.1.12356.101.8.2.1.1.4.1 = Counter32: 0
 iso.3.6.1.4.1.12356.101.8.2.1.1.5.1 = Counter32: 0
 iso.3.6.1.4.1.12356.101.8.2.1.1.6.1 = Counter32: 0
 iso.3.6.1.4.1.12356.101.8.2.1.1.7.1 = Counter32: 0
 iso.3.6.1.4.1.12356.101.8.2.1.1.8.1 = Counter32: 0
 iso.3.6.1.4.1.12356.101.8.2.1.1.9.1 = Counter32: 0
```

```
iso.3.6.1.4.1.12356.101.8.2.1.1.10.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.11.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.12.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.13.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.14.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.15.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.16.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.17.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.18.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.19.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.20.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.21.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.22.1 = Counter32: 0
```

5. Verify the AV log.
   a. In the GUI, go to *Log & Report* > *Security Events* and select the *AntiVirus* card. Select the log entry and click *Details*.

   b. In the CLI, enter the following:

```
# execute log filter category 2
# execute log display
date=2023-08-30 time=14:51:26 eventtime=1693432286598227820 tz="-0700" logid="0211008192"
type="utm" subtype="virus" eventtype="infected" level="warning" vd="root" policyid=1
poluuid="c65fa590-4758-51ee-4d28-f2cc75f14979" policytype="policy" msg="File is infected."
action="blocked" service="HTTPS" sessionid=15797 srcip=192.168.1.110 dstip=89.238.73.97
srcport=64641 dstport=443 srccountry="Reserved" dstcountry="Germany" srcintf="internal1"
srcintfrole="undefined" dstintf="wan1" dstintfrole="wan" srcuuid="ab8d1c24-30b1-51ee-138a-
f7be846c205d" dstuuid="ab8d1c24-30b1-51ee-138a-f7be846c205d" proto=6 direction="incoming"
filename="eicar.com" quarskip="Quarantine-disabled" virus="EICAR_TEST_FILE"
viruscat="Virus" dtype="av-engine" ref="http://www.fortinet.com/ve?vn=EICAR_TEST_FILE"
virusid=2172 url="https://secure.eicar.org/eicar.com" profile="default" agent="Mozilla/5.0
```

```
(Windows NT 10.0; Win64; x64; rv:109.0) Gecko/20100101 Firefox/116.0" httpmethod="GET"
referralurl="https://www.eicar.org/"

analyticssubmit="false" crscore=50 craction=2 crlevel="critical"
```

6. Optionally, reset the antivirus statistics to zero:

```
# diagnose ips av stats clear
```

See CLI troubleshooting cheat sheet for log gathering, analysis, and troubleshooting.

Example 2: AI sample file

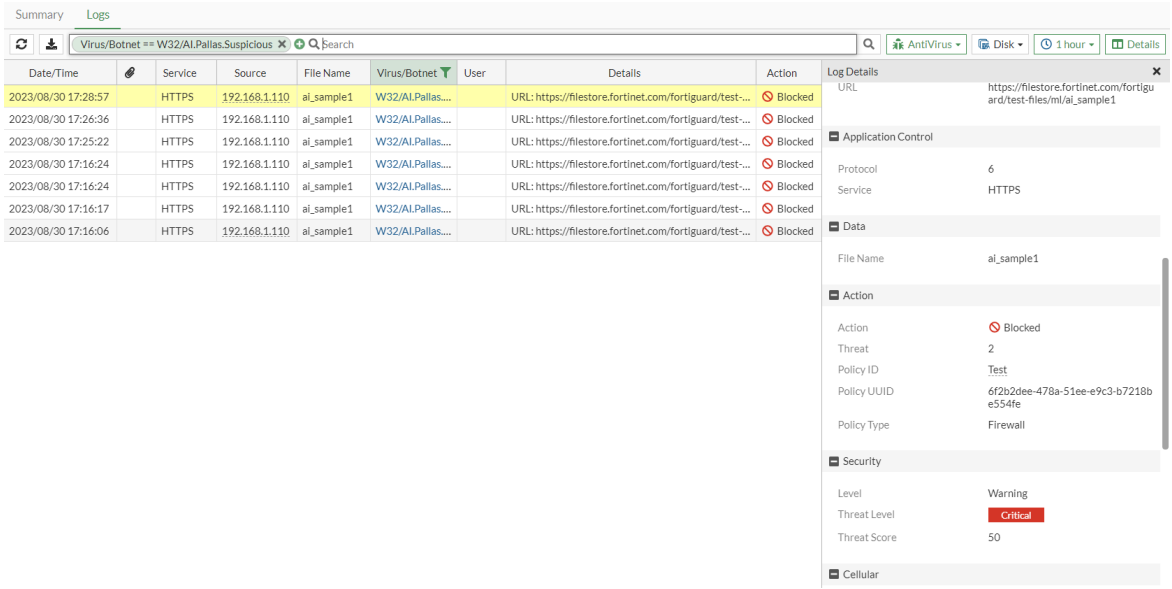
FortiGuard provides several sample files to test the AV configuration on the FortiGate, which are available to download from https://www.fortiguard.com/sample-files.

To test the AV profile with the AI sample file:

1. On the PC, go to the FortiGuard website and download the *AI Sample* file.
2. The download attempt is blocked by the FortiGate's *default* AV profile, and a block page appears in the PC's browser.

   The file is blocked due to AI-based malware detection and will be logged. Files detected by the AV Engine AI are identified with the W32/AI.Pallas.Suspicious virus signature in the AV logs.

3. Verify the AV log.
   a. In the GUI, go to *Log & Report* > *Security Events* and select the *AntiVirus* card. Select the log entry and click *Details*.



b. In the CLI, enter the following:

```
# execute log filter category 2
# execute log display
date=2023-08-30 time=17:28:57 eventtime=1693441737721077640 tz="-0700" logid="0211008192"
type="utm" subtype="virus" eventtype="infected" level="warning" vd="root" policyid=1
poluuid="c65fa590-4758-51ee-4d28-f2cc75f14979" policytype="policy" msg="File is infected."
action="blocked" service="HTTPS" sessionid=1179 srcip=192.168.1.110 dstip=209.52.38.129
srcport=63117 dstport=443 srccountry="Reserved" dstcountry="Canada" srcintf="internal1"
srcintfrole="undefined" dstintf="wan1" dstintfrole="wan" srcuuid="6c43f8d6-478a-51ee-95d8-
31177232e869" dstuuid="6c43f8d6-478a-51ee-95d8-31177232e869" proto=6 direction="incoming"

analyticssubmit="false" crscore=50 craction=2 crlevel="critical"
```

4. Verify the AV (scanunit daemon) real-time debug:

```
# diagnose sys scanunit debug  all
# diagnose sys scanunit debug level verbose
su 4655 req vfid 0 id 2 ep 0 new request from ipsengine pid 4998, size 4096, fwd-pol 1,

```

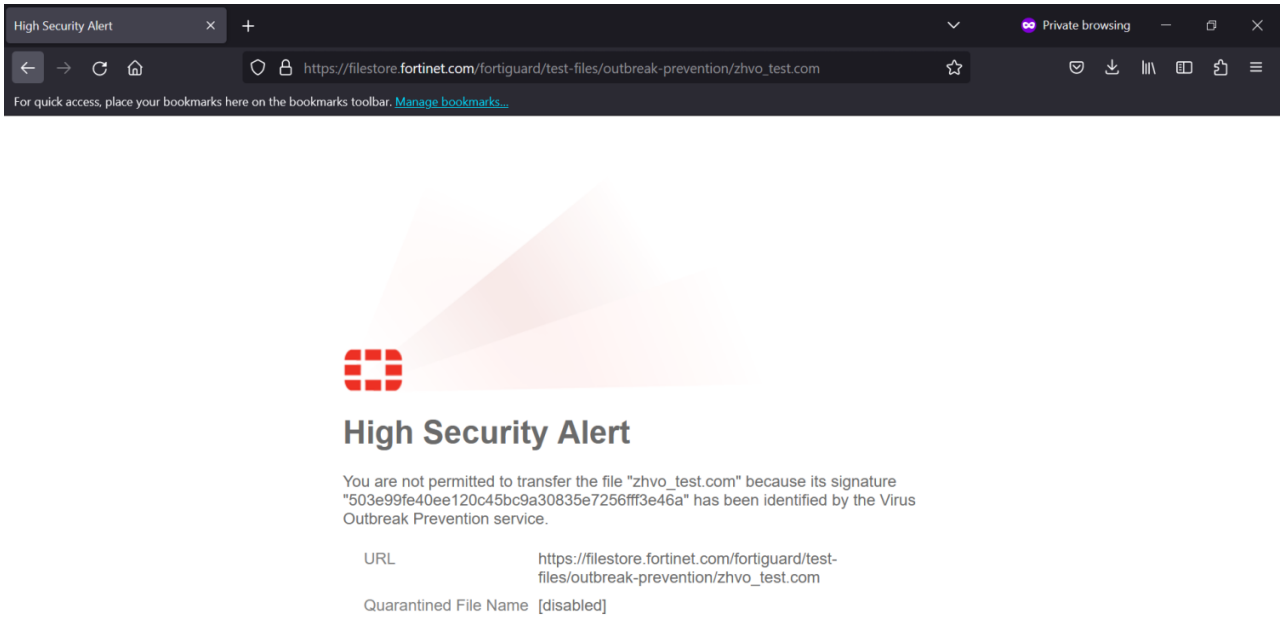
Example 3: VO sample file

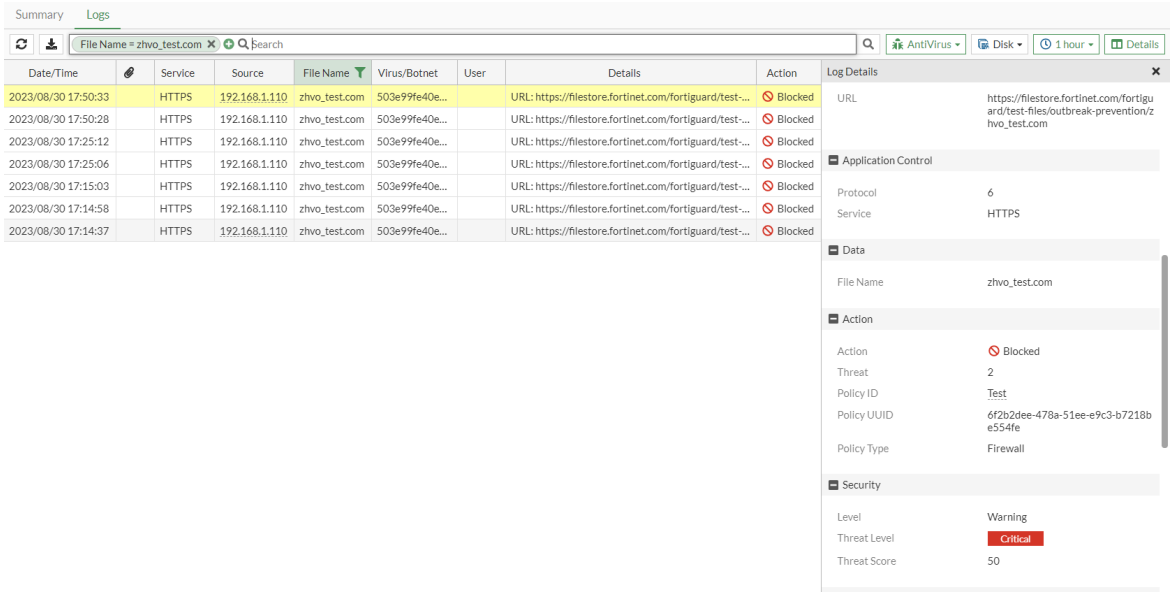
To test the AV profile with the VO sample file:

1. On the PC, go to the FortiGuard website and download the *VO Sample* file.
2. The download attempt is blocked by the FortiGate's *default* AV profile, and a block page appears in the PC's browser.



The file is blocked due to the virus outbreak protection service and database that is enabled in the *default* AV profile.

3. Verify the AV log.
   a. In the GUI, go to *Log & Report* > *Security Events* and select the *AntiVirus* card. Select the log entry and click *Details*.



b. In the CLI, enter the following:

```
# execute log filter category 2
# execute log display
date=2023-08-30 time=17:50:33 eventtime=1693443033509250120 tz="-0700" logid="0204008202"
type="utm" subtype="virus" eventtype="outbreak-prevention" level="warning" vd="root"

analyticssubmit="false" crscore=50 craction=2 crlevel="critical"
```

Example 4: behavioral-based samples detected by a sandbox

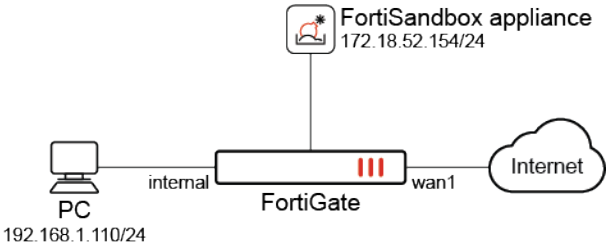
The FortiGate can be integrated with FortiSandbox appliance (used in this example), FortiSandbox Cloud, or FortiGate Cloud Sandbox. See Configuring sandboxing on page 3753 for more information about configuring the different FortiSandbox sandbox solutions.

There are two types of scan strategies that can be used in an AV profile.

- Inline: files are sent to the FortiSandbox, and the FortiGate waits for a verdict before completing the file transfer to the client (see Using FortiSandbox inline scanning with antivirus on page 1934).
- Post-transfer: files are sent to the FortiSandbox, but the FortiGate does not wait for a verdict and completes the file transfer to the client (see Using FortiSandbox post-transfer scanning with antivirus on page 1932).

- After the FortiSandbox scans and presents a verdict, it updates its malware signature database and the FortiGate retrieves the malware signature database from FortiSandbox if the FortiSandbox database on page 1930 is enabled.
- If a user attempts to download the file again, the FortiGate will either block or allow the download depending on the FortiSandbox verdict.

This example uses the inline AV scan strategy with a Windows executable sample file, and assumes that the scan profile has already been configured in FortiSandbox. See Verify the FortiSandbox Analysis in the FortiSandbox Administration Guide for more information.



To test the AV profile with a Windows executable sample file:

1. Integrate the FortiGate with the FortiSandbox appliance using the Security Fabric (see Configuring sandboxing on page 3753).
2. Update the AV profile to use inline scanning (see FortiSandbox appliance inline scanning).
3. On the PC, go to the FortiGuard website, hover over the *Windows Executable* link, right-click, and select the browser's option to copy the link.
4. Open another browser tab, paste the URL, and append the URL with `&s=<string>`, such as `https://filegen.fortinet.com/v1/sandbox-file?file_name=windows.exe&s=ftnt`.

   Every file download attempt from the FortiGuard website downloads a new file. Downloading a file with same `<string>` ensures that the downloaded file is the same, and not a new file. A file named windows.exe starts to download.

   Since inline AV scanning is in use, the client's file is held while it is sent to FortiSandbox for inspection. During this time, the FortiGate may apply client comforting (see Protocol options on page 1792) by leaking a certain amount of bytes at a certain time interval to the client.

   Once a verdict is returned from FortiSandbox, the appropriate action (allow or block) is performed on the held file. If there is an error connecting to the FortiSandbox or a timeout on the FortiSandbox scanning the file within the default 50 seconds, the file can be passed, logged, or blocked based on FortiGate's configuration. In this example, the action is set to the default (`log-only`), which allows the file to be downloaded if FortiSandbox takes more than 50 seconds to present a verdict.

   In the first attempt, the windows.exe file is downloaded on the client's PC if FortiSandbox takes more than 50 seconds for scanning the file, after which the FortiGate encounters a scan timeout.

   a. To change the FortiSandbox error and timeout settings in the AV profile, enter the following in the CLI:

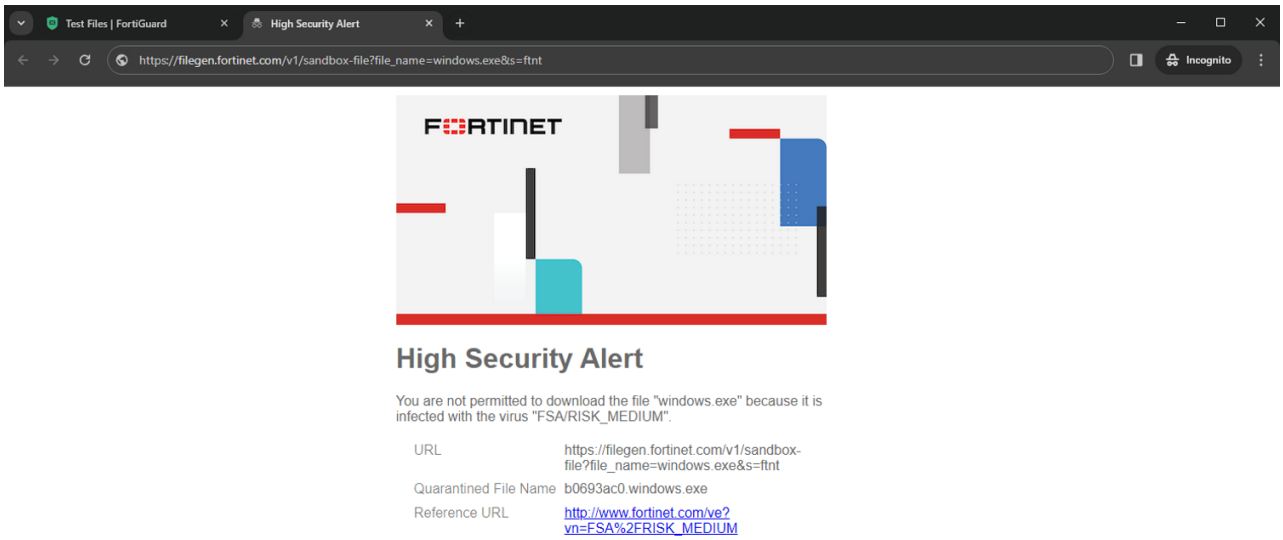
```
config antivirus profile
   edit <name>
       set fortisandbox-error-action {ignore | log-only | block}
       set fortisandbox-timeout-action {ignore | log-only | block}
   next
end
```

`fortisandbox-error-action {ignore | log-only | block}`	Set the action to take if FortiSandbox inline scanning encounters an error reaching the FortiSandbox: • `ignore`: take no action • `log-only`: log the FortiSandbox inline scan error, but allow the file (default) • `block`: block the file upon FortiSandbox inline scan error
`fortisandbox-timeout-action {ignore | log-only | block}`	Set the action to take if FortiSandbox inline scanning encounters a scan timeout: • `ignore`: take no action • `log-only`: log the FortiSandbox inline scan timeout, but allow the file (default) • `block`: block the file upon FortiSandbox inline scan timeout

5. Verify the AV log:

```
# execute log filter category 2
# execute log display
date=2023-11-01 time=11:30:45 eventtime=1698863444363194189 tz="-0700" logid="0209008225"
type="utm" subtype="virus" eventtype="inline-block" level="notice" vd="root" policyid=1
poluuid="6f2b2dee-478a-51ee-e9c3-b7218be554fe" policytype="policy" msg="Inline Block scan
timeout." action="monitored" service="HTTPS" sessionid=946497 srcip=192.168.1.110
dstip=149.5.234.147 srcport=57497 dstport=443 srccountry="Reserved" dstcountry="France"
srcintf="internal1" srcintfrole="undefined" dstintf="wan1" dstintfrole="wan"
srcuuid="a051eeb2-5284-51ee-99d0-d8b19cb7439d" dstuuid="6c43f8d6-478a-51ee-95d8-31177232e869"
proto=6 direction="incoming" filename="windows.exe" quarskip="No-quarantine-for-inline-block-
error" url="https://filegen.fortinet.com/v1/sandbox-file?file_name=windows.exe&s=ftnt
profile="default" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML,
like Gecko) Chrome/118.0.0.0 Safari/537.36" httpmethod="GET" analyticssubmit="false"
icbaction="timeout" crscore=50 craction=2 crlevel="critical"
```

6. After FortiSandbox finishes scanning the file (typically between one to three minutes), attempt to re-download the file using the same URL and separator (`https://filegen.fortinet.com/v1/sandbox-file?file_name=windows.exe&s=ftnt`).
7. The file is now blocked by the FortiGate, and a *High Security Alert* block page appears in the PC's browser.



8. Verify the AV log again.
   a. In the GUI, go to *Log & Report* > *Security Events* and select the *AntiVirus* card. Select the log entry and click *Details*.

   b. In the CLI, enter the following:

```
# execute log filter category 2
# execute log display
date=2023-11-01 time=11:46:34 eventtime=1698864393856143209 tz="-0700" logid="0211009234"
type="utm" subtype="virus" eventtype="infected" level="warning" vd="root" policyid=1

```

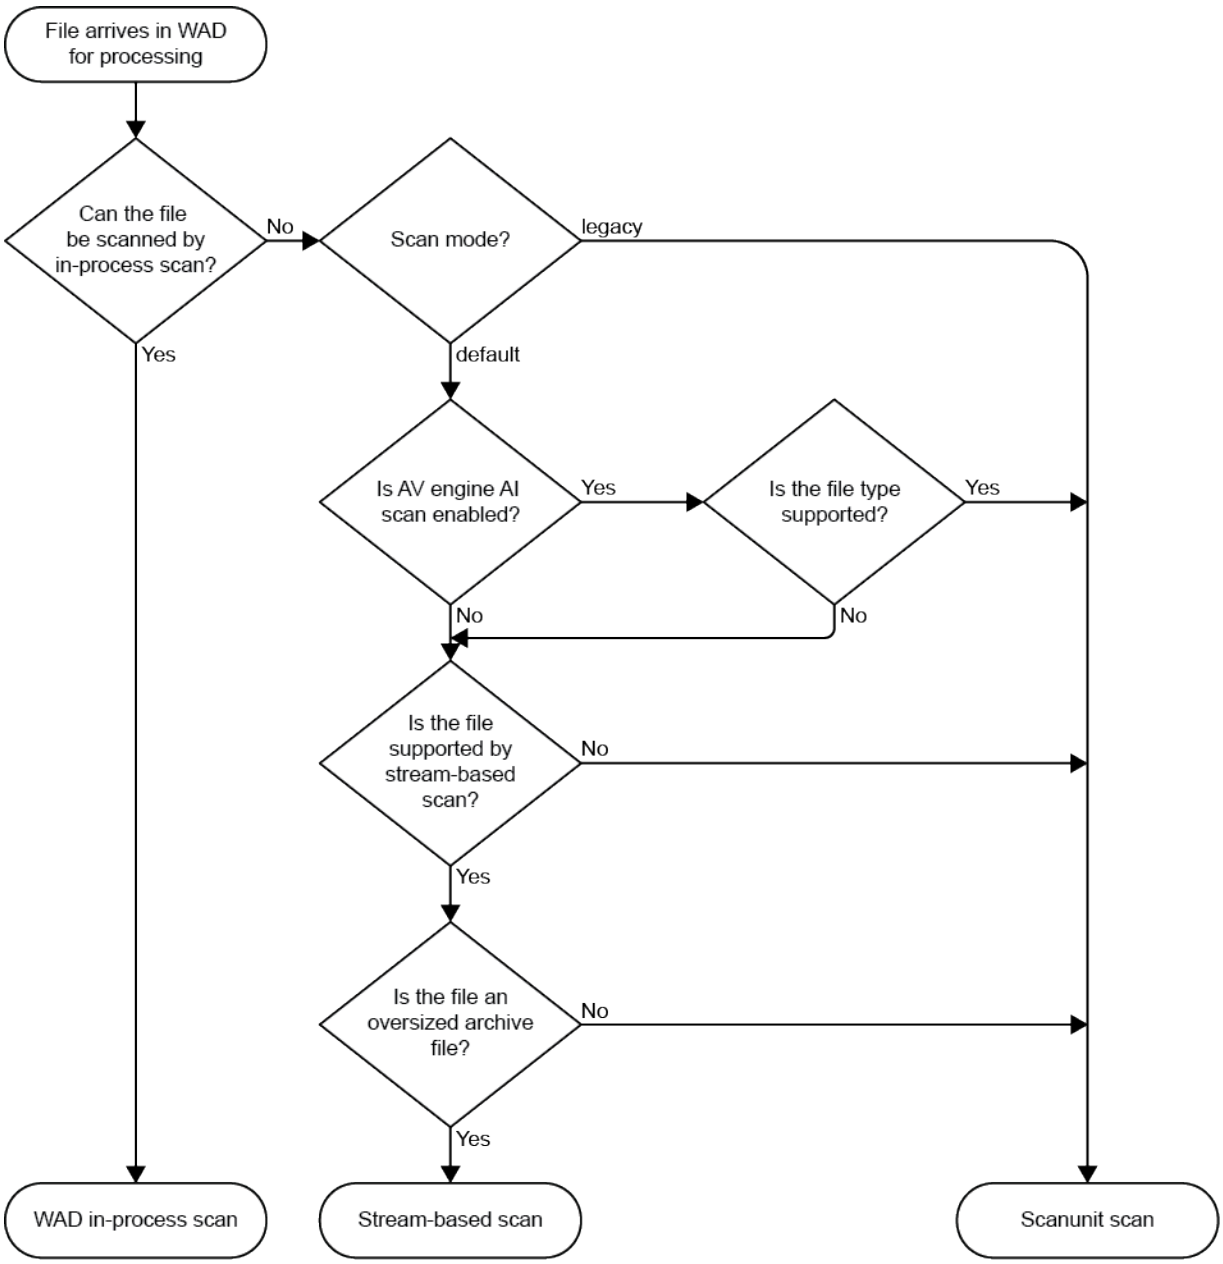
Proxy mode stream-based scanning

In proxy mode, AV scanning is processed as follows:



Can the file be scanned by in-process scan?

- This is determined by the WAD daemon.
- In-process scan can be used for simple AV configurations to quickly scan a file without handing it off to another process.
- The following, more complex feature sets cannot be processed by in-process scan:
  - AV engine AI scan
  - DLP
  - Quarantine
  - FortiGuard outbreak prevention, external block list, and EMS external feed
  - Content disarm

Scan mode?

- To configure the scan mode:

```
config antivirus profile
    edit <name>
        set feature-set proxy
        set scan-mode {default | legacy}
    next
end
```

`default`	Enable stream-based scanning (default).
`legacy`	Disable stream-based scanning.

Is AV engine AI scan enabled?

- When enabled, supported files (such as EXE, PDF, and MS Office) are forwarded to the scanunit scan.
- AV engine AI scan is enabled by default. To disable it:

```
config antivirus settings
    set machine-learning-detection disable
end
```

Is the file supported by stream-based scan?

- Stream-based scan supports the following archive file types: ZIP, GZIP, BZIP2, TAR, and ISO (ISO 9660).
- In FortiOS 7.0, stream-based scan is supported in HTTP(S), FTP(S), and SCP/SFTP.
- In FortiOS 6.4 and 6.2, stream-based scan is only supported in HTTP(S).
- Stream-based scan does not support HTTP POST.
- Stream-based scan is not supported when the following features are enabled:
  - DLP
  - Quarantine
  - FortiGuard outbreak prevention, external block list, and EMS external feed
  - Content Disarm
- If a file is not supported, it is buffered and sent to scanunit for scanning.

Is the file an oversized archive file?

- An oversized archive file is a compressed file that is oversized according to the following setting:

```
config firewall profile-protocol-options
    edit <profile>
        config <protocol>
            set oversize-limit <size>
        end
    next
end
```

- If the file is not oversized, it is buffered and sent to scanunit for scanning.

Notes

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 98 for more information.

Stream-based scans:

- Are performed with no oversize limits on a best effort basis.
- Can inspect the contents of large archive files without buffering the entire file.
- Decompress and scan the entire archive.
- Can cache infected scan results and clean the scan results (this is enabled by default):

```
config antivirus settings
    set cache-infection-result enable
    set cache-clean-result enable
end
```

Legacy scan mode:

- Used to disable stream-based scanning for troubleshooting purposes.
- Limited by the oversize and uncompressed-oversize limits:

```
config firewall profile-protocol-options
    edit <profile>
        config <protocol>
            set oversize-limit <size>
            set uncompressed-oversize-limit <size>
        end
    next
end
```

TCP windows

Some file transfer applications can negotiate large TCP windows. For example, WinSCP can negotiate an initial TCP window size of about 2 GB.

The TCP window options can be used to prevent overly large initial TCP window sizes, helping avoid channel flow control issues. It allows stream-based scan's flow control to limit peers from sending data that exceeds a policy's configured oversize limit.

To configure TCP window size options:

```
config firewall profile-protocol-options
    edit <string>
        config {http | ftp | ssh | cifs}
            set stream-based-uncompressed-limit <integer>
            set tcp-window-type {auto-tuning | system | static | dynamic}
            set tcp-window-size <integer>
            set tcp-window-minimum <integer>
            set tcp-window-maximum <integer>
        end
    next
end
```

{http | ftp | ssh | cifs}	• http: Configure HTTP protocol options. • ftp: Configure FTP protocol options. • ssh: Configure SFTP and SCP protocol options. • cifs: Configure CIFS protocol options.
stream-based-uncompressed-limit <integer>	The maximum stream-based uncompressed data size that will be scanned, in MB (default = 0 (unlimited)). Stream-based uncompression used only under certain conditions.).
tcp-window-type {auto-tuning | system | static | dynamic}	The TCP window type to use for this protocol. • auto-tuning: Allow the system to auto-tune TCP window size (default). • system: Use the system default TCP window size for this protocol. • static: Manually specify the TCP window size. • dynamic: Vary the TCP window size based on available memory within the limits configured in tcp-window-minimum and tcp-window-maximum.
tcp-window-size <integer>	The TCP static window size (65536 - 16777216, default = 262144). This option is only available when tcp-window-type is static.
tcp-window-minimum <integer>	The minimum TCP dynamic window size (65536 - 1048576, default = 131072). This option is only available when tcp-window-type is dynamic.
tcp-window-maximum <integer>	The maximum TCP dynamic window size (1048576 - 16777216, default = 8388608). This option is only available when tcp-window-type is dynamic.

Flow mode stream-based scanning

In flow mode with AV engine 7.0, FortiOS automatically uses stream-based antivirus scanning for HTML and Javascript files. The AV engine determines the necessary amount of file payload to buffer and scans the partial buffer in certain instances, eliminating the need to cache the entire file, and potentially improving memory usage.

Prior to AV engine 7.0, flow AV operates in a hybrid mode where the IPS engine will attempt an in-process AV scan by default. If the built-in AV engine in the IPS process indicates a full scan is required, the file is sent to the

`scanunit` process for a full scan. In this scenario, the whole file is cached before `scanunit` can begin scanning the file.

With this stream-based AV scanning enhancement, the built-in AV engine in the IPS process can attempt to scan HTML and Javascript files as it buffers the file. This provides better performance and potentially less memory usage overall compared to a full scan.

The full antivirus scanning method is retained for file types and configurations unsupported by stream-based scanning.

The following table summarizes the types of scans and when they are automatically used:

Default antivirus scan	• Automatically uses stream-based scanning in flow mode for HTML and Javascript files. • Automatically scans other supported files using the flow DB. • Triggers a legacy scan for unsupported configurations and file types.

Full antivirus scan	• Automatically used for files types unsupported by default antivirus scans.
	• Automatically used when any of the following antivirus scanning features are enabled:
	  • Machine learning-based malware detection (`set machine-learning-detection`)
	  • Extreme antivirus database (`set use-extreme-db`)
	  • Antivirus PUP/PUA grayware checks
	  • Mobile malware database (`set mobile-malware-db`)
	  • External block list (`set external-blocklist`)
	  • EMS external feed
	  • FortiGuard outbreak prevention
	• Automatically used when any of the following scanning features are used:
	  • Data loss prevention (DLP)
	  • File filter

Example

When the default antivirus scan is used, the AV engine uses stream-based scanning to partially buffer the file and scan it:

```
# diagnose debug application ipsengine 0x1000
diagnose sys scanunit debug all
diagnose debug enable
...
[flav-402] open file size: 68, ftype: 0
[flav-402] flowav config allows quickscan: yes
[flav-402] fsa_enabled=0 fsa_mode=2
[flav-402] heur=0 (0) bz2=1 fsa_ft=0 grayware=0 scantypes: 1
[flav-402] av_flow_write_0 flav_ctx=0x7f35a61a1000, buflen=68, rc = 2
[flav-402] file is infected or suspicious. Wait until file close due to av_exempt enabled
[flav-402] ips_avscan_file_close
[flav-402] [118]: quickscan_close() flav_ctx=0x7f35a61a1000, rc = 2
[flav-402] [118]: cached length 0, flow_bytes 68
```

```
[flav-402] [118]: virus EICAR_TEST_FILE detected!
[flav-402] quickscan_destroy(), flow_writes=1, flow_bytes=68, flav_ctx=0x7f35a61a1000
[flav-402] [118]: quickscan finalized with action 1
[flav-402] ips_avscan_file_close, action=1
[flav-402] ips_avscan_file_destroy
```

The above debug is taken while a user attempts to download a EICAR file. Partial buffering occurred and the file is scanned inside the IPS engine.

When the default antivirus scan (stream-based scanning) cannot be used for a file, the full antivirus scan is used, and the IPS engine buffers the entire file before sending it to `scanunit` for scanning:

```
# diagnose debug application ipsengine 0x1000
# diagnose sys scanunit debug all
# diagnose debug enable
...
[flav-496] [41]: quickscan_close() flav_ctx=0x7fdfc41a1000, rc = -7
[flav-496] [41]: file requires fullscan
[flav-496] attempting switch to fullscan
[flav-496] succesfully switched to fullscan
[flav-496] got FlowAV fullscan request: query_id=41 view_id=3 file_size=12939
[flav-496] quickscan_destroy(), flow_writes=10, flow_bytes=12939, flav_ctx=0x7fdfc41a1000
su 2388 open
```

The Flow AV statistics monitor can be used to view whether the default or full (legacy) scan method was used:

```
# diagnose test app ipsmonitor 24

pid: 23498 from 20240404-09:23:05 to 20240404-09:23:59
av_failopen: enabled
    FlowAV mmap                   : 0
    FlowAV file open              : 0
    FlowAV timeout                : 0
    FlowAV req success            : 0
    FlowAV req fail               : 0
    FlowAV req retry success      : 0
    FlowAV req retry fail         : 0
    FlowAV bypassed scan          : 0
    FlowAV buffer scan            : 0
    FlowAV file scan              : 0
    FlowAV interface file open    : 0
    FlowAV interface file close   : 0
    FlowAV interface file destroy : 0
    FlowAV ignored files          : 0
    FlowAV legacy scan            : 1
    FlowAV default scan           : 1
```

Databases

The antivirus scanning engine uses a virus signatures database to record the unique attributes of each infection. The antivirus scan searches for these signatures and when one is discovered, the FortiGate determines if the file is infected and takes action.

All FortiGates have the normal antivirus signature database. Some models have additional databases that you can use. The database you use depends on your network and security needs, and on your FortiGate model.

The extended virus definitions database is the default setting and provides comprehensive antivirus protection. Entry-level and some mid-range FortiGates cannot support the extreme database. The FortiGate 300D is the lowest model that supports the extreme database. All VMs support the extreme database. The `use-extreme-db` setting is only available on models that support the extreme database.

Extended	This is the default setting. This database includes currently spreading viruses, as determined by the FortiGuard Global Security Research Team, plus recent viruses that are no longer active. These viruses may have been spreading within the last year but have since nearly or completely disappeared.
Extreme	This includes the extended database, plus a large collection of zoo viruses. These are viruses that have not spread in a long time and are largely dormant. Some zoo viruses might rely on operating systems and hardware that are no longer widely used.

To change the antivirus database:

```
config antivirus settings
    set use-extreme-db {enable | disable}
end
```

FortiSandbox database

The *Use FortiSandbox database* setting in the Antivirus profile enables the FortiGate's antivirus engine to receive the latest malware signatures discovered by FortiSandbox that is stored inside FortiSandbox's malware database. By enabling *Use FortiSandbox database*, FortiGate uses these signatures from the malware database along with its existing antivirus signature database for scanning.The antivirus engine scan searches for the malware signature database and antivirus signature database in tandem to check for a match. Once a signature match is discovered, the FortiGate determines if the file is infected and takes action.

The malware signature database supplements the existing antivirus signature database on the FortiGate. This setting is useful if a FortiSandbox solution (either FortiGate Sandbox Cloud, FortiSandbox Cloud, or the FortiSandbox appliance) is deployed.

If you have multiple FortiGates deployed and FortiSandbox is in use, if *Use FortiSandbox database* is enabled in the Antivirus profile, it will enable all FortiGates to download the malware signature database from your FortiSandbox. This can prevent zero-day attacks discovered by the FortiSandbox. FortiSandbox can also be configured to submit its malware signature database with Fortinet Inc. Community by enabling the required *Contribute* settings under your scan profile. See Scan Profile Advanced Tab in the FortiSandbox Administration Guide for information on the scan profile.

FortiGuard labs later release the required submitted signatures in the form of Antivirus updates which can be downloaded by the FortiGates worldwide through FortiGuard updates. See Configuring FortiGuard updates on page 3567.

To enable using the FortiSandbox database in an antivirus profile in the GUI:

1. Go to *Security Profile* > *AntiVirus*.
2. Select the default profile and click *Edit*.
3. Under the *APT Protection Options*, enable *Use FortiSandbox database*.
4. Click *OK* to save the changes.
5. Apply this default profile to the respective firewall policy.

To enable using the FortiSandbox database in an antivirus profile in the CLI:

```
config antivirus profile
    edit “default”
        set analytics-db enable
    next
end
```

It is best practice to keep the `analytics-db` enabled.

To use the antivirus profile in a firewall policy:

```
config firewall policy
    edit 1
        set name "policyid-1"
        set srcintf "lan"
        set dstintf "wan"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set ssl-ssh-profile "certificate-inspection"
        set av-profile "default"
        set nat enable
    next
end
```

Once the Antivirus profile is configured to use the FortiSandbox database and submit files to FortiSandbox, and the antivirus profile is used in a firewall policy, the sharing of malware database from the FortiSandbox to the FortiGate needs to be configured. For information on submitting files to FortiSandbox, see Using FortiSandbox post-transfer scanning with antivirus on page 1932.

The configuration depends on the type of FortiSandbox in use. The table below shows key differences in configuration:

Type of FortiSandbox	Malware database sharing with the FortiGate
FortiSandbox	Enabled using the Global network. See Global Network in the FortiSandbox

Type of FortiSandbox	Malware database sharing with the FortiGate
Appliance/FortiSandbox VM (On-Premise)	Administration Guide.
FortiSandbox Cloud (PaaS)	Enabled by default.
FortiGate Cloud Sandbox (SaaS)	Enabled by default.

Advanced configurations

This section includes the following:

- Using FortiSandbox post-transfer scanning with antivirus on page 1932
- Using FortiSandbox inline scanning with antivirus on page 1934
- Using FortiNDR inline scanning with antivirus on page 1945
- Malware external feed from EMS on page 1947
- CIFS support on page 1950

Using FortiSandbox post-transfer scanning with antivirus

Antivirus profiles can submit potential zero-day viruses to FortiSandbox for inspection. Based on FortiSandbox's analysis, the FortiGate can supplement its own antivirus database with FortiSandbox's threat intelligence to detect files determined as malicious or suspicious. This augments the FortiGate antivirus with zero-day detection.

FortiSandbox can be used with antivirus in both proxy-based and flow-based inspection modes. The FortiGate first examines the file for any known viruses. When a match is found, the file is tagged as known malware. If no match is found, the files are forwarded to FortiSandbox using the following options:

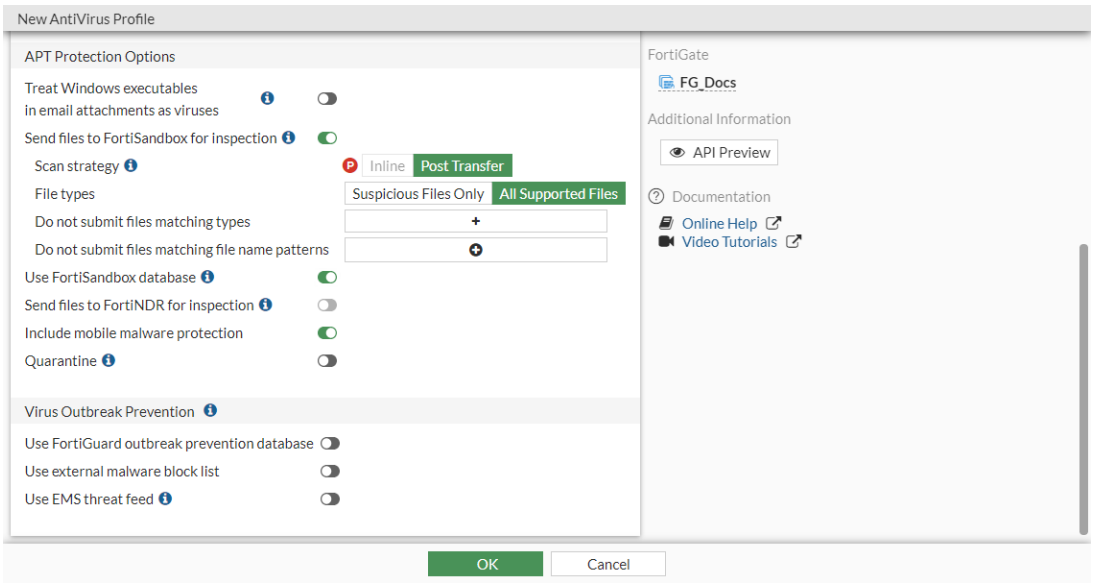
- *All Supported Files*: all files matching the file types defined in the scan profile of the FortiSandbox are forwarded.
- *Suspicious Files Only*: files classified by the antivirus as having any possibility of active content are forwarded to FortiSandbox. When using FortiGate Cloud Sandbox, we recommend selecting this option due to its submission limits.
- *None*: files are not forwarded to FortiSandbox.

For more information, see Configuring sandboxing on page 3753.

To enable FortiSandbox inspection in an antivirus profile:

1. Go to *Security Profiles* > *AntiVirus*.
2. Create, edit, or clone an antivirus profile.
3. In the *APT Protection Options* section, set *Send Files to FortiSandbox for Inspection* to either *Suspicious Files Only* or *All Supported Files*.
4. Optionally, for *Do not submit files matching types*, click the + to exclude certain file types from being sent to FortiSandbox.

5. Optionally, for *Do not submit files matching file name patterns*, click the + to enter a wildcard pattern to exclude files from being sent to FortiSandbox.



6. Enable *Use FortiSandbox Database*.
7. Click *OK*.

FortiGate diagnostics

To view the detection count:

```
# diagnose test application quarantined 7
Total: 0

Statistics:
        vfid: 0, detected: 2, clean: 1252, risk_low: 6, risk_med: 2, risk_high: 1, limit_reached:0
```

To verify the address is configured correctly:

```
# diagnose test application quarantined 1
…
fortisandbox-fsb1 is enabled: analytics, realtime=yes, taskfull=no
addr=172.18.52.154/514, source-ip=0.0.0.0, keep-alive=no. ssl_opt=3, hmac_alg=0
…
```

To run the diagnostics for real-time debugging:

```
# diagnose debug application quarantined -1
# diagnose debug enable
```

To check the FortiGate Cloud server status:

```
# diagnose test application forticldd 3
…
    Active APTServer status:  up
```

To view FortiGate Cloud Sandbox submission statistics for advanced debugging:

```
# diagnose test application quarantined 2
```

FortiSandbox diagnostics

To run the OFTP debug for advanced debugging:

```
# diagnose-debug device <client serial number>
```

Using FortiSandbox inline scanning with antivirus

FortiSandbox inline scanning can be used in proxy inspection mode. When inline scanning is enabled, the client's file is held while it is sent to FortiSandbox for inspection. During this time, the FortiGate may apply client comforting (see Protocol options on page 1792). For example, leaking a certain amount of bytes at a certain time interval to the client. Once a verdict is returned, the appropriate action (allow or block) is performed on the held file. If there is an error connecting to the FortiSandbox or a timeout on the FortiSandbox scanning the file within the default 50 seconds, the file can be passed, logged, or blocked based on FortiGate's configuration. For more information, see Configuring sandboxing on page 3753.

This topic describes how to configure the following:

- FortiSandbox appliance inline scanning on page 1934
- FortiGuard AI-based Inline Malware Prevention Service on page 1939
- FortiSandbox scanning error and timeout actions on page 1944

FortiSandbox appliance inline scanning

Inline scanning requires a FortiSandbox appliance running version 4.2 or later, and the FortiSandbox must be reachable by port 4443. See Understanding Inline Block feature in the FortiSandbox Best Practices for more information.

FortiSandbox inline scanning is disabled by default. FortiSandbox inline scanning is best used in conjunction with AV engine scanning since there is a higher rate of detection by using both at the same time.

To enable FortiSandbox inline scanning:

```
config system fortisandbox
    set status enable
```

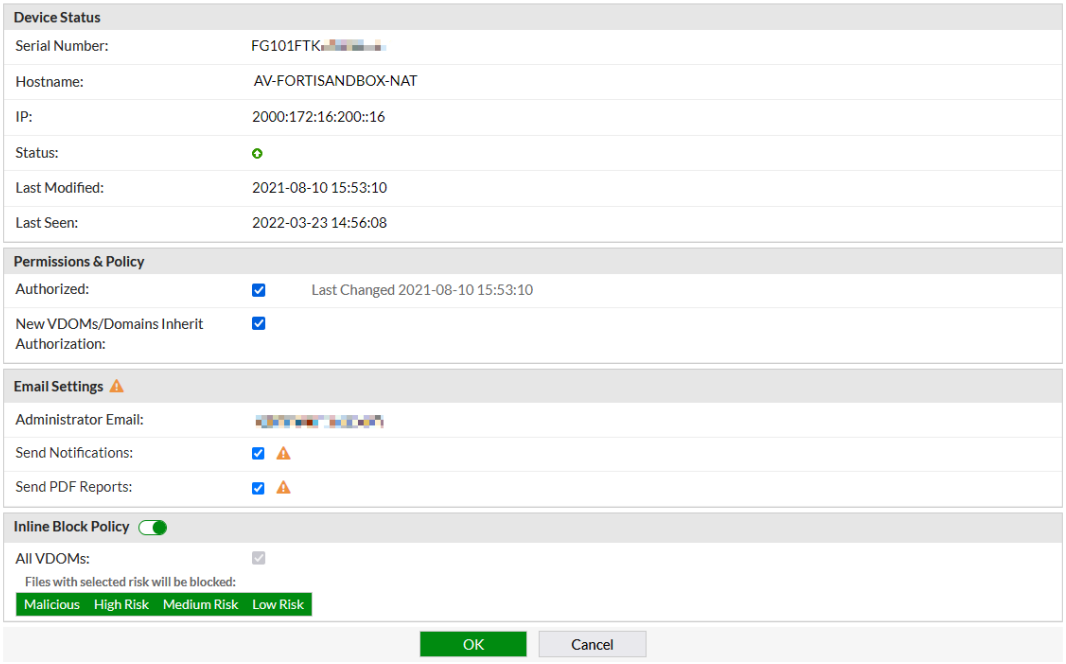
```
    set inline-scan {enable | disable}
    set server <fortisandbox_server_ip>
end
```

To configure the FortiSandbox scanning options in an antivirus profile:

```
config antivirus profile
    edit <name>
        set fortisandbox-mode {inline | analytics-suspicious | analytics-everything}
        set fortisandbox-error-action {ignore | log-only | block}
        set fortisandbox-timeout-action {ignore | log-only | block}
        set fortisandbox-max-upload <integer>
        config {http | ftp | imap | pop3 | smtp | mapi | cifs | ssh}
            set av-scan {disable | block | monitor}
            set fortisandbox {disable | block | monitor}
        end
    next
end
```

`fortisandbox-mode {inline | analytics-suspicious | analytics-everything}`	Set the FortiSandbox scan mode: • `inline`: FortiSandbox inline scanning • `analytics-suspicious`: FortiSandbox post-transfer scanning; submit supported files if heuristics or other methods determine they are suspicious • `analytics-everything`: FortiSandbox post-transfer scanning; submit supported files and known infected files (default)
`fortisandbox-error-action {ignore | log-only | block}`	Set the action to take if FortiSandbox inline scanning encounters an error reaching the FortiSandbox: • `ignore`: take no action • `log-only`: log the FortiSandbox inline scan error, but allow the file (default) • `block`: block the file upon FortiSandbox inline scan error
`fortisandbox-timeout-action {ignore | log-only | block}`	Set the action to take if FortiSandbox inline scanning encounters a scan timeout: • `ignore`: take no action • `log-only`: log the FortiSandbox inline scan timeout, but allow the file (default) • `block`: block the file upon FortiSandbox inline scan timeout
`fortisandbox-max-upload <integer>`	Set the maximum size of files that can be uploaded to FortiSandbox (1 - 396, default = 10).
`av-scan {disable | block | monitor}`	Enable the antivirus scan service. Set to `block` or `monitor` to work with FortiSandbox (default = `disable`).
`fortisandbox {disable | block | monitor}`	Set the protocol level parameter for FortiSandbox file scanning: • `disable` (default), `block`, and `monitor` are available for inline scanning • `disable` (default) and `monitor` are available for post-transfer scanning

This example assumes that *Inline Block Policy* is already enabled in FortiSandbox for the FortiGate with selected risk levels (see FortiGate devices in the FortiSandbox Administration Guide for more information). The inline block policy in this example blocks all risk levels: malicious, high risk, medium risk, and low risk.

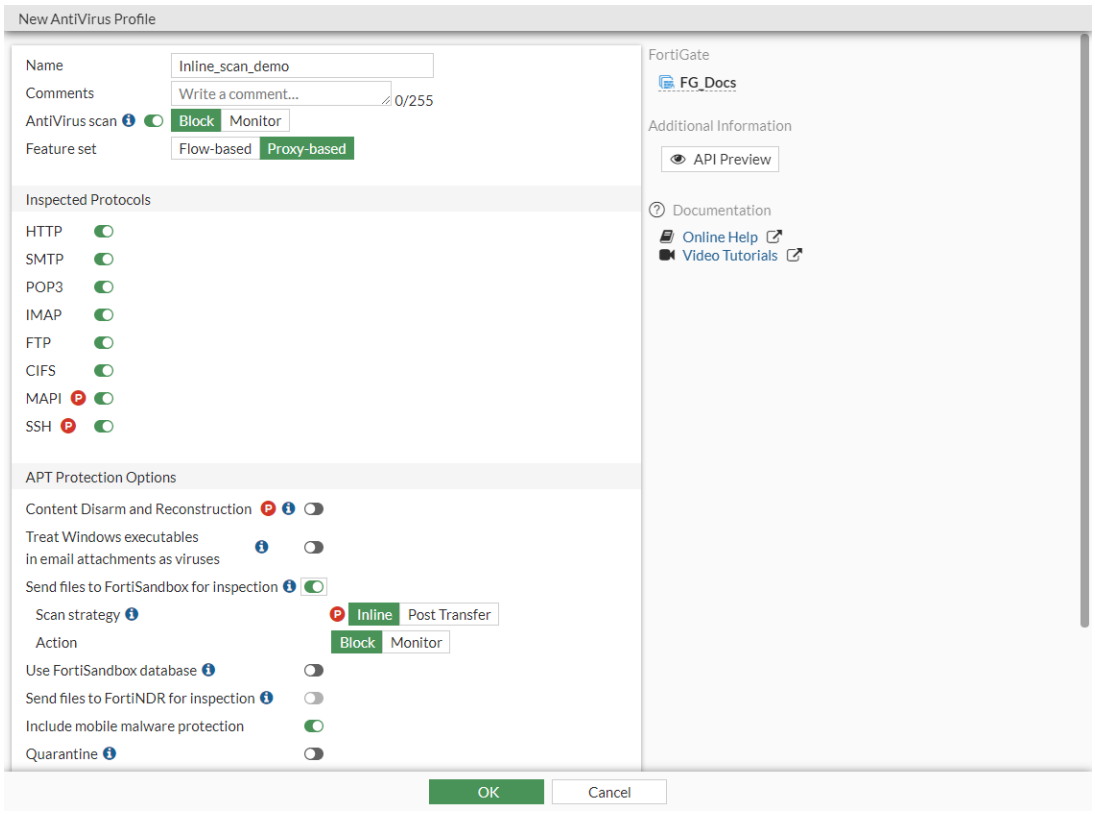


To configure FortiSandbox inline scanning in the GUI:

1. Enable FortiSandbox inline scanning globally:

```
config system fortisandbox
    set status enable
    set inline-scan enable
    set server "172.18.70.76"
end
```

2. Configure the antivirus profile:
   a. Go *to Security Profiles* > *AntiVirus* and click *Create New*.
   b. Set the *Feature set* to *Proxy-based*.
   c. Enable the protocols to inspect.
   d. Enable *AntiVirus scan* and set it to *Block*.
   e. Enable *Send files to FortiSandbox* for inspection and set the *Action* to *Block*. The *Scan strategy* appears as *Inline* because it was configured in the CLI.



f. Click *OK*.

To configure FortiSandbox inline scanning in the CLI:

1. Enable FortiSandbox inline scanning globally:

```
config system fortisandbox
    set status enable
    set inline-scan enable
    set server "172.18.70.76"
end
```

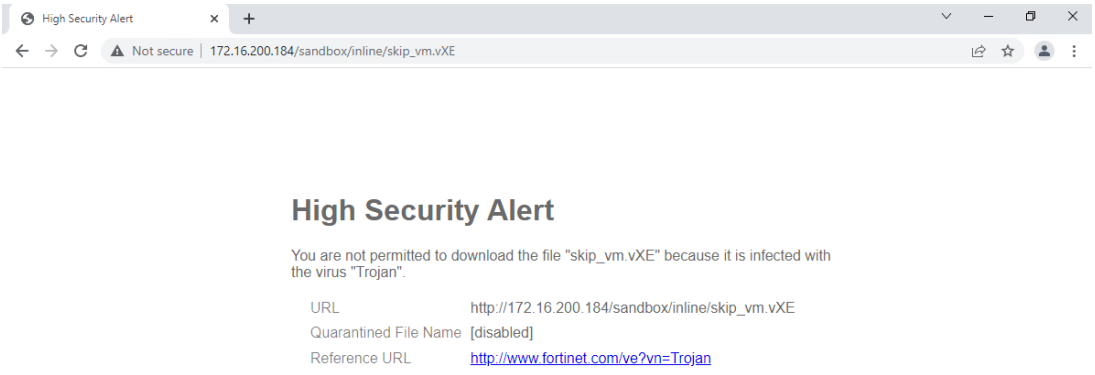
2. Configure the antivirus profile:

```
config antivirus profile
    edit "Inline_scan_demo"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set av-scan block
            set fortisandbox block
        end
        config ftp
            set av-scan block
            set fortisandbox block
        end
        config imap
```

```
            set av-scan block
            set fortisandbox block
        end
        config pop3
            set av-scan block
            set fortisandbox block
        end
        config smtp
            set av-scan block
            set fortisandbox block
        end
        config mapi
            set av-scan block
            set fortisandbox block
        end
        config cifs
            set av-scan block
            set fortisandbox block
        end
        config ssh
            set av-scan block
            set fortisandbox block
        end
    next
end
```

To verify that infected files are blocked inline:

1. On a client, open a web browser and download an infected file.
2. The file is held while being scanned by FortiSandbox. Once FortiSandbox determines that file's risk level is not tolerated by the inline block policy, the FortiGate drops the connection and displays a replacement message that the file cannot be downloaded.



3. In FortiOS, view the antivirus log.
   - In the GUI, go to *Log & Report* > *Security Events* and click the *AntiVirus* card.
   - In the CLI:

```
# execute log filter category 2
# execute log display
1 logs found.
1 logs returned.

1: date=2022-03-23 time=16:19:37 eventtime=1648077577156255080 tz="-0700"

FortiGuard AI-based Inline Malware Prevention Service

Inline scanning is supported when the FortiGate is licensed with the FortiGuard AI-based Inline Malware Prevention Service (IL MPS). It works similar to inline scanning for the FortiSandbox appliance, where the file that is being processed is first checked locally by the FortiGate. If it requires further analysis, the file is sent to the IL MPS for inspection. The file is submitted along with the following, additional information:

- Device configuration (VDOM, service)
- Username
- Device identifiers
- IP address
- Suspicious URL
- Suspicious files

The file and the above additional information remain in the FortiSandbox where they are evaluated by its multi-layered process leveraging its contained AI model. The information is not shared outside the FortiSandbox service with other large learning models. After the rating of either suspicious or clean is sent back to the FortiGate, the cloud-based service keeps the file, collected information, and derived information based on the retention period of 3 days and 60 days for files rated as Clean and Suspicious, respectively.

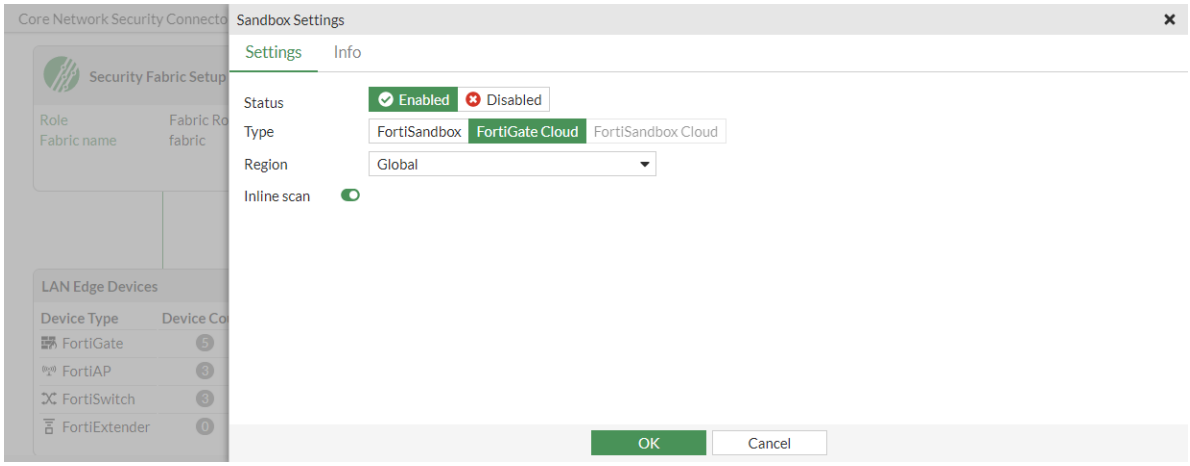
Inline scanning is supported for FortiSandbox appliances, FortiNDR, and IL MPS. On a FortiGate, only a single inline scanning type can be configured at one time.

To configure IL MPS scanning in the GUI:

1. Enable the FortiGate Cloud feature visibility:
   a. Go to *System* > *Feature Visibility*.
   b. In the *Additional Features* section, enable *FortiGate Cloud Sandbox*.

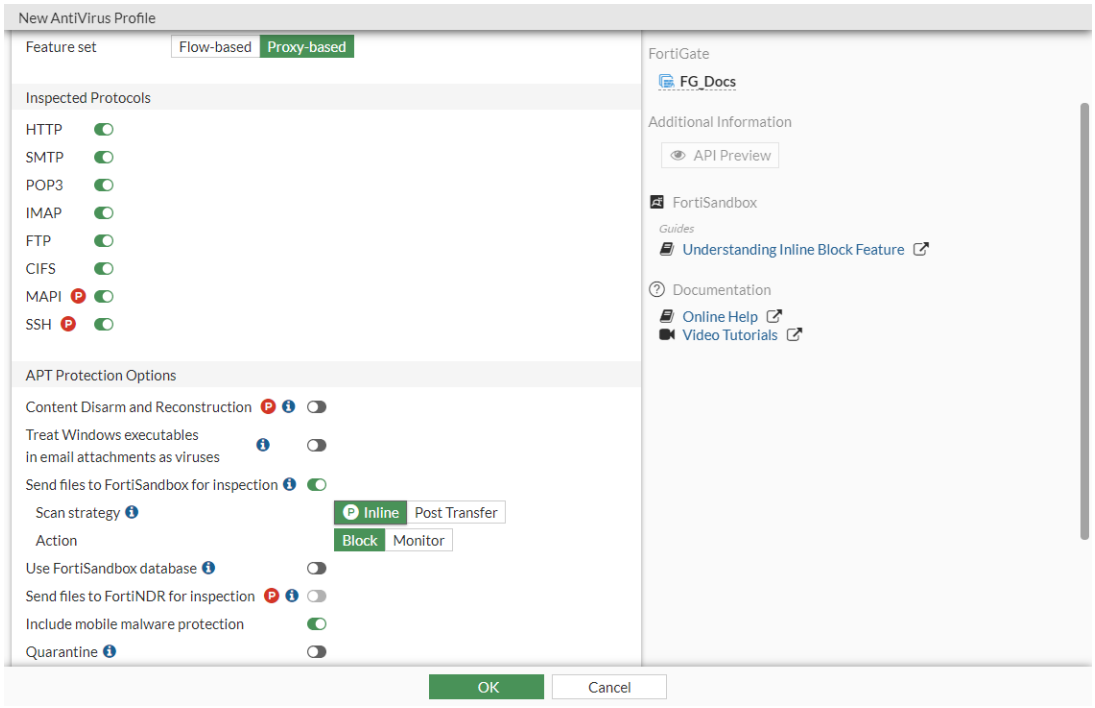
c. Click *Apply*.

2. Configure the *Sandbox* Fabric connector:
   a. Go to *Security Fabric > Fabric Connectors* and double-click the *Sandbox* card.
   b. In the *Settings* tab, set the *Type* to *FortiGate Cloud*.
   c. Select a *Region*.
   d. Enable *Inline scan*.



e. Click *OK*.

3. Configure the antivirus profile:
   a. Go to *Security Profiles > AntiVirus* and click *Create New*.
   b. Set the *Feature set* to *Proxy-based*.
   c. Enable the protocols to inspect.
   d. Enable *Send files to FortiSandbox* for inspection.
   e. Set the *Scan strategy* to *Inline*, and set the *Action* to *Block*.



f. Click *OK*.

To configure IL MPS scanning in the CLI:

1. Disable FortiSandbox appliance and FortiSandbox Cloud:

```
config system fortisandbox
    set status disable
end
```

2. Configure FortiGate Cloud Sandbox:

```
# execute forticloud-sandbox region
0  Global
1  Europe
2  Japan
3  US
Please select cloud sandbox region[0-3]:0
Cloud sandbox region is selected: Global
```

3. Enable inline scanning for FortiGate Cloud:

```
config system fortiguard
    set sandbox-region "Global"
    set sandbox-inline-scan enable
end
```

4. Configure the antivirus profile:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set fortisandbox block
        end
        config ftp
            set fortisandbox block
        end
        config imap
            set fortisandbox block
        end
        config pop3
            set fortisandbox block
        end
        config smtp
            set fortisandbox block
        end
        config mapi
            set fortisandbox block
        end
        config cifs
            set fortisandbox block
```

```
        end
        config ssh
            set fortisandbox block
        end
        set scan-mode default
    next
end
```

To verify that infected files are blocked inline:

1. On a client, open a web browser and download an infected file using HTTP.
2. The file is held while being scanned by FortiGate Cloud Sandbox. Once FortiGate Cloud Sandbox determines that file's risk level is not tolerated, the FortiGate drops the connection and displays a replacement message that the file cannot be downloaded.
3. Verify the antivirus log:

```
# execute log display
1 logs found.
1 logs returned.

1: date=2022-07-12 time=16:31:26 eventtime=1657668686245018328 tz="-0700" logid="0210008232"
type="utm" subtype="virus" eventtype="fortisandbox" level="warning" vd="vdom1" policyid=1
poluuid="54c06312-01fd-51ed-0db5-10c9586a0c2e" policytype="policy" msg="Blocked by
FortiSandbox." action="blocked" service="HTTP" sessionid=19934 srcip=10.1.100.191
dstip=172.16.200.194 srcport=51688 dstport=80 srccountry="Reserved" dstcountry="Reserved"
srcintf="port1" srcintfrole="undefined" dstintf="port9" dstintfrole="undefined"
srcuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0" dstuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0"

```

To verify that infected files are monitored:

1. Edit the antivirus profile to monitor files over HTTP:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set fortisandbox monitor
        end
    next
end
```

2. On a client, open a web browser and download an infected file using HTTP.
3. Verify the antivirus log:

```
# execute log display
1 logs found.
1 logs returned.

1: date=2022-07-12 time=16:34:25 eventtime=1657668865371976563 tz="-0700" logid="0210008233"
type="utm" subtype="virus" eventtype="fortisandbox" level="notice" vd="vdom1" policyid=1
poluuid="54c06312-01fd-51ed-0db5-10c9586a0c2e" policytype="policy" msg="Detected by

fsaseverity="high-risk" fsafileid=0 fsafiletype="exe" crscore=50 craction=2 crlevel="critical"
```

To verify that infected files are blocked inline if a scan timeout occurs:

1. Edit the antivirus profile to block files over HTTP and when there is a scan timeout:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set fortisandbox block
        end
        set fortisandbox-timeout-action block
    next
end
```

2. On a client, open a web browser and download a large ZIP file (clean file).
3. When the scan timeout occurs, a replacement message appears that *The file "zipfile.zip" is still being scanned and will be released once complete. Please try the transfer again in a few minutes.*
4. Verify the antivirus log:

```
# execute log display
1 logs found.
1 logs returned.

1: date=2022-07-12 time=16:44:51 eventtime=1657669491697816069 tz="-0700" logid="0210008236"
type="utm" subtype="virus" eventtype="fortisandbox" level="warning" vd="vdom1" policyid=1
poluuid="54c06312-01fd-51ed-0db5-10c9586a0c2e" policytype="policy" msg="FortiSandbox scan
timeout." action="blocked" service="HTTP" sessionid=20258 srcip=10.1.100.191
dstip=172.16.200.194 srcport=51830 dstport=80 srccountry="Reserved" dstcountry="Reserved"
srcintf="port1" srcintfrole="undefined" dstintf="port9" dstintfrole="undefined"
srcuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0" dstuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0"
proto=6 direction="incoming" filename="zipfile.zip" quarskip="Quarantine-disabled"
url="http://172.16.200.194/sandbox/zipfile.zip" profile="av" agent="curl/7.68.0"
```

```
httpmethod="GET" analyticssubmit="false" fsaaction="timeout" fsafileid=0 crscore=50 craction=2
crlevel="critical"
```

5. After a few minutes, download the ZIP file again.
6. When the scan is complete on the FortiSandbox side, the file is downloaded and no log is generated because the scan deemed that the file is clean.

FortiSandbox scanning error and timeout actions

In this example, the HTTP protocol settings for `av-scan` and `fortisandbox` in the AV profile are both set to `block`. All files traversing HTTP in this configuration are scanned by the AV engine first, and then by FortiSandbox inline scanning for further file analysis. Based on the FortiSandbox results, FortiOS will take the appropriate action.

Files can be blocked if they contain a scan error or timeout. The scan timeout is configured in FortiSandbox and set to 50 seconds. If the file scan takes longer than 50 seconds, FortiSandbox returns a timeout to the FortiGate, and file is dropped with the current configuration. If a user tries to download the same file again, the cached result is provided by FortiSandbox to the FortiGate based on the previous file scan.

This example assumes FortiSandbox inline scanning has been configured globally. The FortiGate will block the file if there is an inline scanning error or timeout.

To configure the antivirus profile to block files if there is an inline scanning error or timeout:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set av-scan block
            set fortisandbox block
        end
        set fortisandbox-error-action block
        set fortisandbox-timeout-action block
    next
end
```

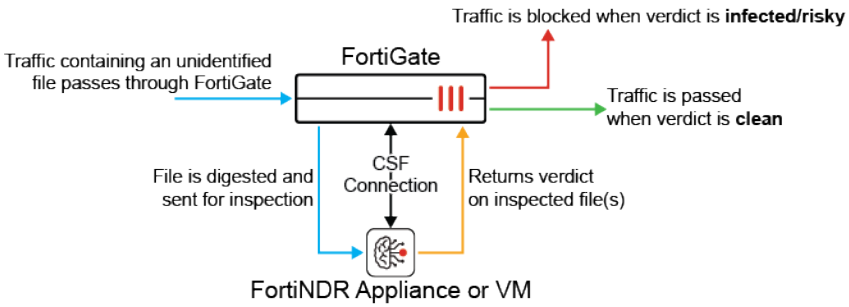
If the administrator decides to take more risk and scan all files traversing HTTP, but log or ignore an inline scanning error or timeout, the profile is modified as follows:

```
config antivirus profile
    edit "av"
        set fortisandbox-error-action {log-only | ignore}
        set fortisandbox-timeout-action {log-only | ignore}
    next
end
```

The AV engine is still used first, followed by FortiSandbox inline scanning. The FortiGate will log or ignore the file if there is an inline scanning error or timeout, and the file is allowed to pass through.

Using FortiNDR inline scanning with antivirus

FortiNDR can be used with antivirus profiles in proxy inspection mode (flow mode is currently not supported). FortiNDR inspects high-risk files and issues a verdict to the firewall based on how close the file features match those of malware. When enabled, FortiNDR can log, block, ignore, or monitor (allow) the file based on the verdict.



A licensed FortiNDR appliance is required to use this feature. Check the FortiNDR release notes for support information.

To configure FortiNDR inline inspection with an AV profile:

1. Configure FortiNDR to join a Security Fabric in FortiOS (see Configuring FortiNDR on page 3774).
2. On the FortiOS, enable inline inspection:

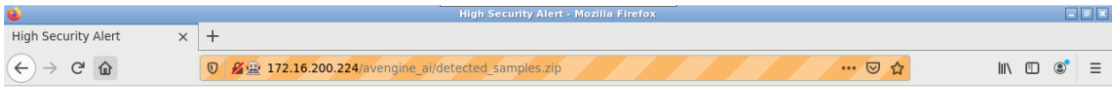
```
config system fortindr
    set status enable
end
```

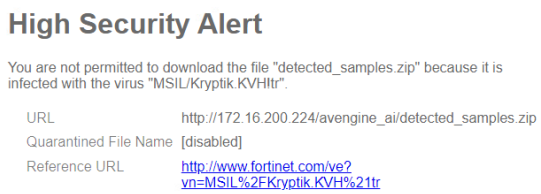
3. Configure an antivirus profile to use inline inspection and block detected infections:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        config http
            set fortindr block
        end
        config ftp
            set fortindr block
        end
        config imap
            set fortindr block
        end
        config pop3
            set fortindr block
        end
        config smtp
            set fortindr block
        end
```

```
        config mapi
            set fortindr block
        end
        config nntp
            set fortindr block
        end
        config cifs
            set fortindr block
        end
        config ssh
            set fortindr block
        end
    next
end
```

4. Add the antivirus profile to a firewall policy. When potential infections are blocked by FortiNDR inline inspection, a replacement message appears (see Replacement messages on page 3555 for more information). An infection blocked over HTTP looks similar to the following:





Sample log

```
date=2021-04-29 time=15:12:07 eventtime=1619734327633022960 tz="-0700" logid="0209008221"
type="utm" subtype="virus" eventtype="fortindr" level="notice" vd="vdom1" policyid=1 msg="Detected
by FortiNDR." action="monitored" service="HTTP" sessionid=13312 srcip=10.1.100.221
dstip=172.16.200.224 srcport=50792 dstport=80 srcintf="wan2" srcintfrole="wan" dstintf="wan1"
dstintfrole="wan" proto=6 direction="incoming" filename="detected_samples.zip" quarskip="File-was-
not-quarantined" virus="MSIL/Kryptik.KVH!tr" dtype="fortindr"
ref="http://www.fortinet.com/ve?vn=MSIL%2FKryptik.KVH%21tr" virusid=0
url="http://172.16.200.224/avengine_ai/detected_samples.zip" profile="av" agent="curl/7.68.0"
analyticssubmit="false" crscore=50 craction=2 crlevel="critical"
```

FortiNDR inline inspection with other AV inspection methods

The following inspection logic applies when FortiNDR inline inspection is enabled simultaneously with other AV inspection methods. The AV engine inspection and its verdict always takes precedence because of performance. The actual behavior depends on which inspected protocol is used.

HTTP, FTP, SSH, and CIFS protocols:

1. AV engine scan; AV database and FortiSandbox database (if applicable).
   a. FortiNDR inline inspection occurs simultaneously.
2. AV engine machine learning detection for WinPE PUPs (potentially unwanted programs).
   a. FortiNDR inline inspection occurs simultaneously.
3. Outbreak prevention and external hash list resources.
   a. FortiNDR inline inspection occurs simultaneously.

If any AV inspection method returns an infected verdict, the FortiNDR inspection is aborted.

POP3, IMAP, SMTP, NNTP, and MAPI protocols:

1. AV engine scan; AV database and FortiSandbox database (if applicable).
2. AV engine machine learning detection for WinPE PUPs (potentially unwanted programs).
   a. FortiNDR inline inspection occurs simultaneously.
3. Outbreak prevention and external hash list resources.
   a. FortiNDR inline inspection occurs simultaneously.

In an AV profile, use `set fortindr-error-action {log-only | block | ignore}` to configure the action to take if FortiNDR encounters an error.

Accepted file types

The following file types are sent to FortiNDR for inline inspection:

7Z	HTML	RTF
ARJ	JS	TAR
BZIP	LZH	VBA
BZIP2	LZW	VBS
CAB	MS Office documents (XML and non-XML)	WinPE (EXE)
ELF	PDF	XZ
GZIP	RAR	ZIP

Malware external feed from EMS

A FortiGate can pull malware external feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. This feature is supported in proxy and flow mode.

If an external malware blocklist and the FortiGuard outbreak prevention database are also enabled in the antivirus profile, the checking order is: AV local database, EMS external feed, external malware blocklist, FortiGuard outbreak prevention database. If the EMS external feed and external malware blocklist contain the same hash value, then the EMS infection will be reported if both of them are blocked.

To configure an EMS external feed in an antivirus profile in the GUI:

1. Enable the EMS external feed:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiClient EMS* card.
   b. Enable *EMS external feed* for an EMS server.
   c. Configure the other settings if needed (see Configuring FortiClient EMS on page 3722 for more details).
   d. Click *OK*.
2. Create the antivirus profile:
   a. Go to *Security Profiles* > *AntiVirus* and click *Create New*.
   b. In the *Virus Outbreak Prevention* section, enable *Use EMS external feed*.
   c. Configure the other settings as needed.

   d. Click *OK*.

To configure an EMS external feed in an antivirus profile in the CLI:

1. Enable the EMS external feed:

```
config endpoint-control fctems
    edit 2
        set status enable
```

```
        set name "WIN10-EMS"
        set server "192.168.20.10"
        set https-port 443
        set source-ip 0.0.0.0
        set pull-sysinfo enable
        set pull-vulnerabilities enable
        set pull-tags enable
        set pull-malware-hash enable
    next
end
```

2. Create the antivirus profile:

```
config antivirus profile
    edit "av"
        config http
            set av-scan block
        end
        config ftp
            set av-scan block
        end
        config imap
            set av-scan block
        end
        config pop3
            set av-scan block
        end
        config smtp
            set av-scan block
        end
        config cifs
            set av-scan block
        end
        set external-blocklist-enable-all enable
        set ems-threat-feed enable
    next
end
```

Sample log

```
# execute log filter category utm-virus
# execute log display
```

```
1: date=2021-03-19 time=16:06:46 eventtime=1616195207055607417 tz="-0700" logid="0208008217"

```

CIFS support

Antivirus scanning on Common Internet File System (CIFS) traffic is supported in flow-based and proxy-based inspection. The file filter profile handles the configuration of file filtering on CIFS. The antivirus profile handles the antivirus configuration for CIFS scanning.

File filtering for CIFS is performed by inspecting the first 4 KB of the file to identify the file's magic number. If a match occurs, CIFS file filtering prevents the CIFS command that contains that file from running. The file filter functions differently for un-encrypted and encrypted CIFS traffic:

- For un-encrypted CIFS traffic, the standalone file filter works in flow and proxy mode.
- For encrypted CIFS traffic, the CIFS profile must be enabled in the firewall policy because the SMB server's credential settings are still be configured in CIFS profile. Using the standalone file filter only works in proxy mode.

For a CIFS profile to be available for assignment in a policy, the policy must use proxy inspection mode. See Proxy mode inspection on page 1900 for details. Note that in proxy inspection mode, special condition archive files (encrypted, corrupted, mailbomb, and so on) marked by the antivirus engine are blocked automatically.

Messages that are compressed with LZNT1, LZ77, and LZ77+Huffman algorithms can be scanned in proxy mode.

To configure file-type filtering and antivirus scanning on CIFS traffic:

1. Configure a CIFS domain controller on page 1950
2. Configure a CIFS profile on page 1951
3. Configure an antivirus profile on page 1953

Configure a CIFS domain controller

The domain controller must be configured when CIFS traffic is encrypted. The configuration tells the FortiGate the network location of the domain controller and the superuser credentials.

For FortiGate to retrieve the domain information, the user needs to grant Replicating Directory Changes permissions in the Domain Controller (DC). See How to grant the "Replicating Directory Changes" permission for the Microsoft Metadirectory Services ADMA service account for more information.

To configure the CIFS domain controller:

```
config user domain-controller
    edit "SERVER_NAME"
        set hostname "host"
        set domain-name "EXAMPLE.COM"
        set username "admin-super"
        set password *********
        set ip 172.16.201.40
    next
end
```

Configure a CIFS profile

To create a CIFS profile, configure the server credential type and create a file filter profile.

Set the CIFS server credential type

The CIFS server credential type can be none, `credential-replication`, or `credential-keytab`.

none

The CIFS profile assumes the CIFS traffic is unencrypted. This is the default value.

```
config firewall profile-protocol-options
    edit "cifs"
        config cifs
            set server-credential-type none
        end
    next
end
```

credential-replication

To decrypt CIFS traffic, FortiOS obtains the session key from the domain controller by logging in to the superuser account. The domain controller must be configured.

```
config firewall profile-protocol-options
    edit "cifs"
        config cifs
            set server-credential-type credential-replication
            set domain-controller "SERVER_NAME"
        end
    next
end
```

Variable	Description
domain-controller <string>	The previously configured domain to decrypt CIFS traffic for.

credential-keytab

To decrypt CIFS traffic, FortiOS uses a series of keytab values. This method is used when the SMB connection is authenticated by Kerberos. Keytab entries must be configured, and are stored in FortiOS in plaintext.

```
config firewall profile-protocol-options
    edit "cifs"
        config cifs
            set server-credential-type credential-keytab
            config server-keytab
                edit "keytab1"
                    set keytab
"BQIAAABFAAEAC0VYQU1QTEUuQ09NAAdleGFtcGxlAAAAAVUmAlwBABIAILdV5P6NXT8RrTvapcMJQxDYCjRQiD0BzxhwS9h0V
gyM"
                next
            end
        end
    next
end
```

Variable	Description
keytab <keytab>	Base64 encoded keytab file containing the credentials of the server.

Configure CIFS file filtering

Multiple rules can be added to a file filter profile. See File filter on page 2147.

To configure a file filter for CIFS traffic:

```
config file-filter profile
    edit "cifs"
        set comment "block zip files on unencrypted cifs traffic"
        set feature-set flow
        set replacemsg-group ''
        set log enable
        config rules
            edit "rule1"
                set protocol cifs
                set action block
                set direction any
                set password-protected any
                set file-type zip
            next
        end
    next
end
```

Variable	Description
comment <string>	A brief comment describing the entry.

Variable	Description
feature-set {flow | proxy}	Flow or proxy mode feature set (default = `flow`).
replacemsg-group <string>	Replacement message group.
log {enable | disable}	Enable/disable file filter logging (default = `enable`).
scan-archive-contents [enable | disable]	Enable/disable scanning of archive contents (default = `enable`).
protocol {http ftp smtp imap pop3 mapi cifs ssh}	Filter based on the specified protocol(s).
action {log-only | block}	The action to take for matched files: • `log-only`: Allow the content and write a log message (default). • `block`: Block the content and write a log message.
direction {incoming | outgoing | any}	Match files transmitted in the session's originating (`incoming`) and/or reply (`outgoing`) direction (default = `any`).
password-protected [yes | any]	Match only password-protected files (`yes`) or any file (default = `any`).
file-type <file_type>	The file types to be matched. See Supported file types on page 2153 for details.

Configure an antivirus profile

The antivirus profile handles the antivirus configuration for CIFS scanning.

To configure an antivirus profile:

```
config antivirus profile
    edit "av"
        ...
        config cifs
            set av-scan {disable | block | monitor}
            set outbreak-prevention {disable | block | monitor}
            set external-blocklist {disable | block | monitor}
            set quarantine {enable | disable}
            set archive-block {encrypted corrupted partiallycorrupted multipart nested mailbomb
fileslimit timeout unhandled}
            set archive-log {encrypted corrupted partiallycorrupted multipart nested mailbomb
fileslimit timeout unhandled}
            set emulator {enable | disable}
        end
    next
end
```

Variable	Description
av-scan	Enable antivirus scan service:

Variable	Description
	• `disable`: Disable (default). • `block`: Block the virus infected files. • `monitor`: Log the virus infected files.
outbreak-prevention {disable | block | monitor}	Enable the virus outbreak prevention service: • `disable`: Disable (default). • `block`: Block the matched files. • `monitor`: Log the matched files.
external-blocklist {disable | block | monitor}	Enable the external blocklist: • `disable`: Disable (default). • `block`: Block the matched files. • `monitor`: Log the matched files.
quarantine {enable | disable}	Enable/disable quarantine for infected files (default = `disable`).
archive-block {encrypted corrupted partiallycorrupted multipart nested mailbomb fileslimit timeout unhandled}	Select the archive types to block: • `encrypted`: Block encrypted archives. • `corrupted`: Block corrupted archives. • `partiallycorrupted`: Block partially corrupted archives. • `multipart`: Block multipart archives. • `nested`: Block nested archives. • `mailbomb`: Block mail bomb archives. • `fileslimit`: Block exceeded archive files limit. • `timeout`: Block scan timeout. • `unhandled`: Block archives that FortiOS cannot open.
archive-log {encrypted corrupted partiallycorrupted multipart nested mailbomb fileslimit timeout unhandled}	Select the archive types to log: • `encrypted`: Log encrypted archives. • `corrupted`: Log corrupted archives. • `partiallycorrupted`: Log partially corrupted archives. • `multipart`: Log multipart archives. • `nested`: Log nested archives. • `mailbomb`: Log mail bomb archives. • `fileslimit`: Log exceeded archive files limit. • `timeout`: Log scan timeout. • `unhandled`: Log archives that FortiOS cannot open.
emulator {enable | disable}	Enable/disable the virus emulator (default = `enable`).

Log samples

File-type detection events generated by CIFS profiles are logged in the `utm-file-filter` log category. Antivirus detection over the CIFS protocol generates logs in the `utm-virus` category. See the FortiOS Log Message Reference for more information.

Logs generated by CIFS profile file filter:

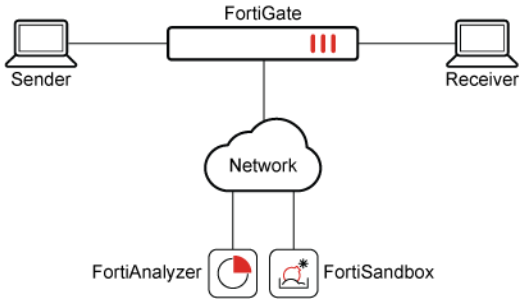
Configuration examples

This section includes the following examples:

- Content disarm and reconstruction on page 1956
- FortiGuard outbreak prevention on page 1958
- External malware block list on page 1960
- Exempt list for files based on individual hash on page 1963
- Downloading quarantined files in archive format on page 1964

Content disarm and reconstruction

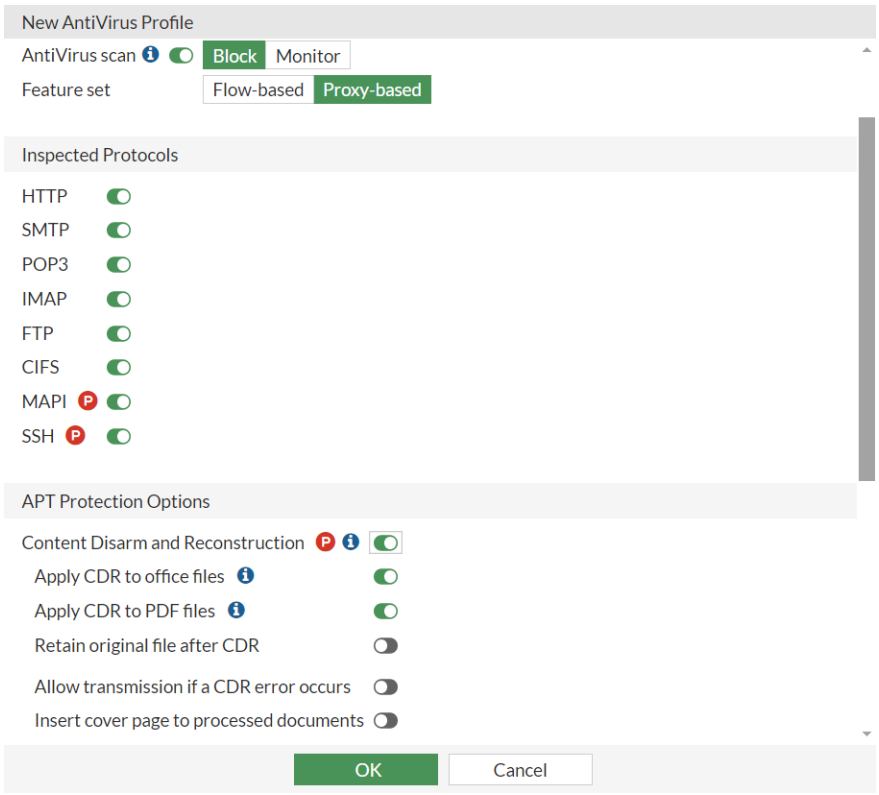
In this example, a Microsoft Office document, such as a Microsoft OneNote file, with an embedded hyperlink (that redirects to an external website) is sent to the receiver. When the user receives the file, the hyperlink in the document is deactivated. See Content disarm and reconstruction on page 1907 for more information.



To configure CDR:

1. Go to *Security Profiles* > *AntiVirus*.
2. Edit an antivirus profile, or create a new one.
3. Set *Feature set* to *Proxy-based*.
4. Under *Inspected Protocols*, enable one or more protocols to inspect.
5. Enable *AntiVirus scan*.

6. Under *APT Protection Options*, enable *Content Disarm and Reconstruction*.

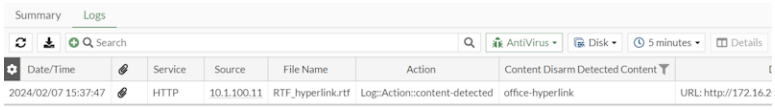


7. Enable *Retain original file after CDR*, and select a quarantine location from the available options:

Quarantine locally	Saves the original document file to disk (if possible) or a connected FortiAnalyzer based on the FortiGate log settings (`config log fortianalyzer setting`).
Send to FortiSandbox	Saves the original document file to a connected FortiSandbox.

When *Retain original file after CDR* is disabled, the original document file is discarded.

8. Click *OK*.
9. Go to *Log & Report* > *Security Events* to view CDR events in Antivirus logs.
In the following example, an AntiVirus log file includes a CDR event for an embedded hyperlink in an RTF file.



To edit the CDR detection parameters:

By default, stripping of all active Microsoft Office and PDF content types are enabled. In this example, stripping macros in Microsoft Office documents will be disabled.

```
config antivirus profile
    edit av
        config content-disarm
            set office-macro disable
```

```
            set detect-only {enable | disable}
            set cover-page {enable | disable}
        end
    next
end
```

Where:

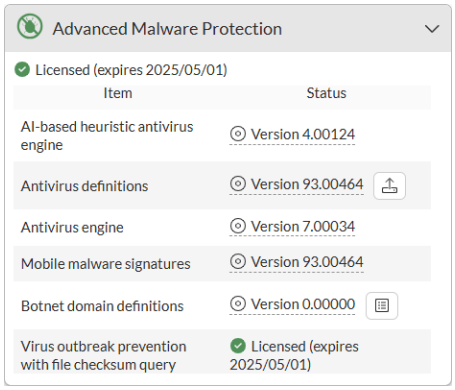
`detect-only`	Only detect disarmable files, do not alter content. Disabled by default.
`cover-page`	Attach a cover page to the file's content when the file has been processed by CDR. Enabled by default.

FortiGuard outbreak prevention

This example demonstrates how to enable FortiGuard Virus Outbreak Protection Service (VOS). See Virus outbreak prevention on page 1908 for more information.

To verify FortiGuard antivirus license information:

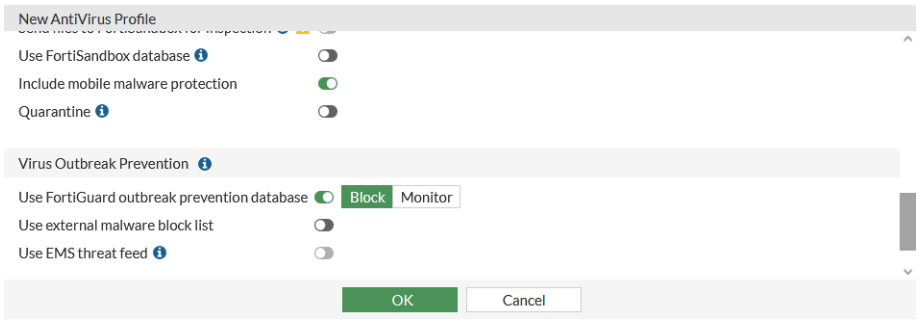
1. Go to *System* > *FortiGuard*.
2. In the *Subscriptions* > *Licensed* tab, expand the *Advanced Malware Protection* entitlement section and locate the *Virus outbreak prevention with file checksum query* entry.



3. See the instructions in the video How to Purchase or Renew FortiGuard Services, if required.

To enable FortiGuard outbreak prevention:

1. Go to *Security Profiles* > *AntiVirus*.
2. Edit an antivirus profile, or create a new one.
3. Under *Virus Outbreak Prevention*, enable *Use FortiGuard outbreak prevention database* and select *Block* or *Monitor*.



4. Click *OK*.

To verify FortiGuard antivirus license information:

```
# diagnose debug rating
Locale       : english

Service      : Web-filter
Status       : Enable
License      : Contract

Service      : Antispam
Status       : Disable

Service      : Virus Outbreak Prevention
Status       : Enable
License      : Contract

su 4739 outbreak-prevention recv error
```

FortiGuard provides several sample files to test the AV configuration on the FortiGate, which are available to download from https://www.fortiguard.com/sample-files. Test the *Virus Outbreak Prevention* feature by downloading *VO Sample* file. See Example 3: VO sample file on page 1919.

External malware block list

This example demonstrates creating and implementing an external malware block list. See External malware block list on page 1908 for more information.

To create the external block list:

1. Create the malware hash list.
   The malware hash list follows a strict format in order for its contents to be valid. Malware hash signature entries must be separated into each line. A valid signature needs to follow this format:

```
# MD5 Entry with hash description
aa67243f746e5d76f68ec809355ec234  md5_sample1

# SHA1 Entry with hash description
a57983cb39e25ab80d7d3dc05695dd0ee0e49766  sha1_sample2

# SHA256 Entry with hash description
ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379  sha256_sample1

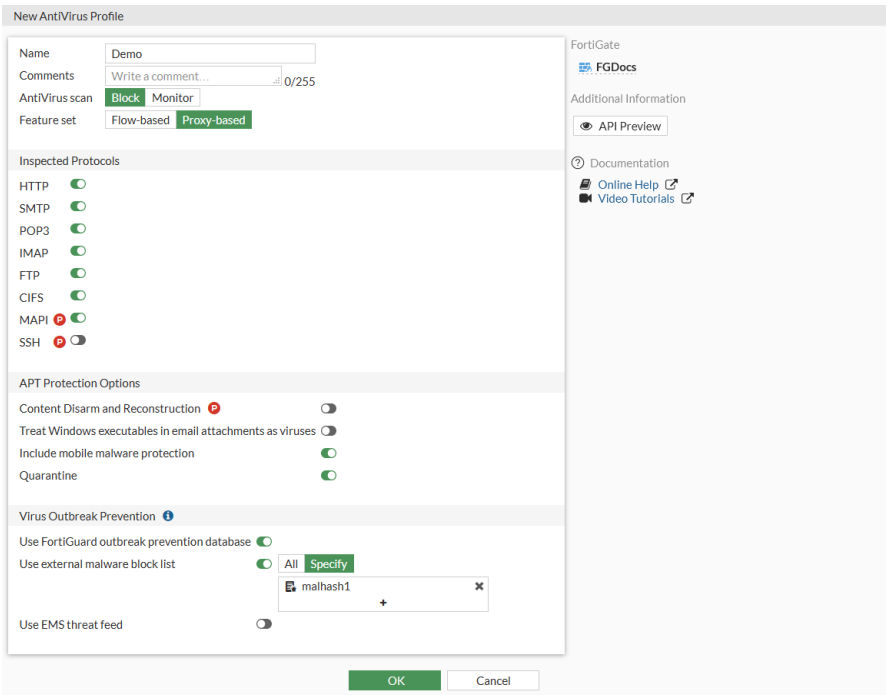
# Entry without hash description
0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521

# Invalid entries
7688499dc71b932feb126347289c0b8a_md5_sample2
7614e98badca10b5e2d08f8664c519b7a906fbd5180ea5d04a82fce9796a4b87sha256_sample3
```

2. Configure the external malware block list source:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. Click *Malware Hash*.
   c. Configure the settings as needed. The URI must point to the malware hash list on the remote server.
   d. Click *OK*.
3. To view entries inside the malware block list on the *External Connectors* page, hover over the malware hash card and click *View Entries*.

To configure antivirus to use an external block list in the GUI:

1. Go to *Security Profiles* > *AntiVirus* and edit the antivirus profile.
2. In the *Virus Outbreak Prevention* section, enable *Use external malware block list* and click *Specify*.
3. Click the *+* in the field and select an external feed.
4. Optionally, enable *Quarantine*.



5. Configure the other settings as needed.
6. Click *OK*.

To configure antivirus to use an external block list in the CLI:

```
config antivirus profile
    edit "Demo"
        set feature-set proxy
        set mobile-malware-db enable
        config http
            set av-scan disable
            set outbreak-prevention block
            set external-blocklist block
```

```
            set quarantine enable
            set emulator enable
            set content-disarm disable
        end
        config ftp
            set av-scan disable
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
        end
        config imap
            set av-scan monitor
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
            set executables default
            set content-disarm disable
        end
        config pop3
            set av-scan monitor
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
            set executables default
            set content-disarm disable
        end
        config smtp
            set av-scan monitor
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
            set executables default
            set content-disarm disable
        end
        config mapi
            set av-scan monitor
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
            set executables default
        end
        config nntp
            set av-scan disable
            set outbreak-prevention disable
            set external-blocklist disable
            set quarantine disable
            set emulator enable
```

```
        end
        config cifs
            set av-scan monitor
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
        end
        config ssh
            set av-scan disable
            set outbreak-prevention disable
            set external-blocklist disable
            set quarantine disable
            set emulator enable
        end
        set outbreak-prevention-archive-scan enable
        set external-blocklist-enable-all disable
        set external-blocklist "malhash1"
        set av-virus-log enable
        set av-block-log enable
        set extended-log disable
        set scan-mode default
    next
end
```

The quarantine setting is configured in each protocol (`set quarantine`). The malware external feed is also specified (`set external-blocklist-enable-all disable`) to the threat connector, malhash1 (`set external-blocklist "malhash1"`).

To verify the scanunit daemon updated itself with the external hashes:

```
# diagnose sys scanunit malware-list list
md5 'aa67243f746e5d76f68ec809355ec234' profile 'malhash1' description 'md5_sample1'
sha1 'a57983cb39e25ab80d7d3dc05695dd0ee0e49766' profile 'malhash1' description 'sha1_sample2'
sha256 '0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521' profile 'malhash1'
description ''
sha256 'ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379' profile 'malhash1'
description 'sha256_sample1'
```

Exempt list for files based on individual hash

The antivirus exempt list allows users to exempt known safe files that happen to be incorrectly classified as malicious by the AV signature and AV engine scan. Users can specify file hashes in MD5, SHA1, or SHA256 for matching, which are applied at a per-VDOM level. When matched, the FortiGate ignores the AV scan verdict so that the corresponding UTM behavior defined in the AV profile is not performed.

```
config antivirus exempt-list
    edit <name>
        set hash-type {md5 | sha1 | sha256}
        set hash <string>
```

```
        set status {enable | disable}
    next
end
```

The exempt list does not apply to results from outbreak prevention, machine learning, FortiNDR, or FortiSandbox inline scans.

In this example, an antivirus exempt list is configured for the EICAR anti-malware test file. Although the antivirus profile is configured to block HTTP, the client is able to download the file.

To configure an antivirus exempt list:

1. Configure the antivirus profile:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        config http
            set av-scan block
        end
    next
end
```

2. Configure the antivirus exempt list:

```
config antivirus exempt-list
    edit "test-hash"
        set comment "eicar.com"
        set hash-type md5
        set hash "44d88612fea8a8f36de82e1278abb02f"
        set status enable
    next
end
```

3. Get a client to access https://www.eicar.com/ and download the anti-malware test file.
   The FortiGate exempts the AV scan verdict and bypasses the file. The client can download the file and no replacement message is displayed.

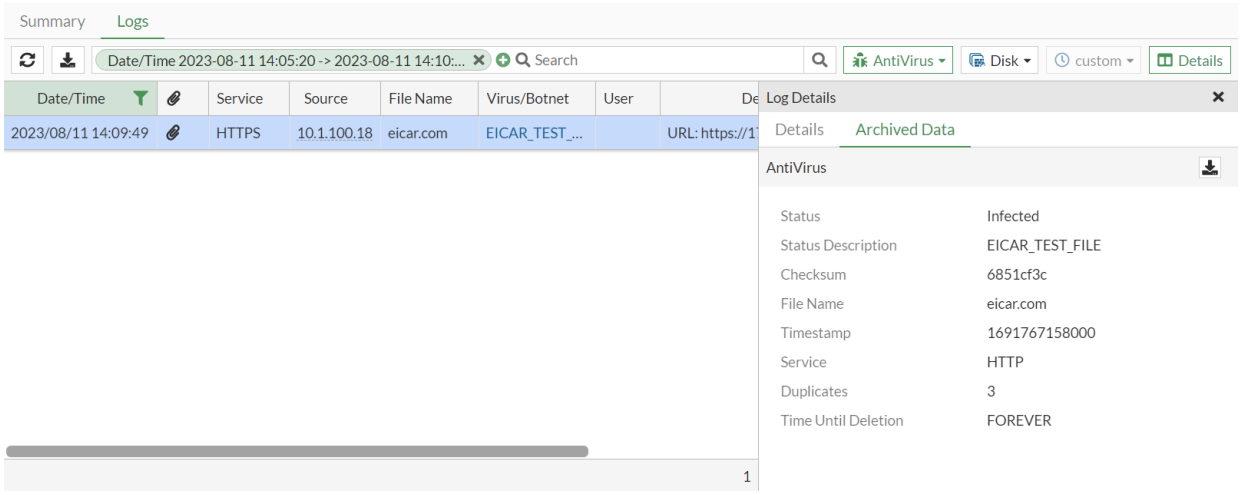
Downloading quarantined files in archive format

The FortiGate can download quarantined files in an archive format (.TGZ) instead of the original raw file. This allows for a more detailed analysis of the quarantined files and reduces the risk of malware infection.

The FortiGate must have a disk logging capacity or be connected to FortiAnalyzer for logging.

To download a quarantined archive file:

1. Ensure that quarantining files is enabled in the AV profile:
   a. Go to *Security Profiles* > *AntiVirus* and edit the AV profile.
   b. In the *APT Protection Options* section, verify that *Quarantine* is enabled. At least one protocol must be enabled in the AV profile for inspection, and *AntiVirus scan* must be enabled for the *Quarantine* option to work.
2. Go to *Log & Report* > *Security Events* and select the *AntiVirus* card.
3. Select a log entry and click *Details*. The *Log Details* pane opens.
4. Select the *Archived Data* tab and click the download icon (in the *AntiVirus* title bar).



Web filter

Web filtering feature offers a flexible and effective solution to control and manage internet usage within your organization, tailored to your specific requirements and objectives. It's a powerful tool for enhancing productivity and maintaining a secure digital environment. This feature has the ability to restrict users from accessing certain websites or Uniform Resource Locators (URLs) by inhibiting the users' browsers from loading the pages linked to these particular sites onto their devices.

Web filtering serves as the primary shield against attacks originating from the web. The FortiGuard URL Filtering Service provides comprehensive threat protection to address threats including ransomware, credential-theft, phishing, and other web-borne attacks. It uses AI-driven behavior analysis and correlation to block unknown malicious URLs almost immediately, with near-zero false negatives. The FortiGate's WAD daemon sends the URLs to FortiGuard in real-time for category determination.

This section includes information about web filter techniques and configurations:

- Web filter introduction on page 1966
- Advanced CLI configuration on page 1996
- Configuration examples on page 2016

Web filter introduction

Web filtering restricts or controls user access to web resources and can be applied to firewall policies using either policy-based or profile-based NGFW mode.

In FortiOS, there are three main components of web filtering:

- Web content filter: blocks web pages containing words or patterns that you specify.
- URL filter: uses URLs and URL patterns to block or exempt web pages from specific sources, or block malicious URLs discovered by FortiSandbox.
- FortiGuard Web Filtering service: provides many additional categories you can use to filter web traffic.

These components interact with each other to provide maximum control over what users on your network can view and protect your network from many internet content threats.

Web filters are applied in the following order:

1. URL filter
2. FortiGuard Web Filtering
3. Web content filter
4. Web script filter
5. Antivirus scanning

FortiOS includes three preloaded web filter profiles:

- *default*
- *monitor-all* (monitors and logs all URLs visited, flow-based)
- *wifi-default* (default configuration for offloading WiFi traffic)

You can customize these profiles, or you can create your own to manage network user access.

Some features of this functionality require a subscription to FortiGuard Web Filtering.

Web filter techniques

Web filtering is a crucial aspect of cybersecurity, helping organizations protect their digital systems from threats and ensure safe internet usage. A range of techniques and tools are employed to ensure a secure, reliable, and safe digital environment for organizations.

The following table describes some of the industry standard techniques that are used for Web filtering and if they can be configured in the GUI or CLI.

Technique	Description	GUI	CLI
URL filtering	Blocks access to websites based on their URLs. See for more information.	✓	✓
Category-based filtering	The FortiGuard URL Filtering Service provides comprehensive	✓	✓

Technique	Description	GUI	CLI
	threat protection to address threats including ransomware, credential-theft, phishing, and other web-borne attacks. See FortiGuard filter on page 1970 for more information.		
Image and video filtering	Remove explicit results, such as sexual content or graphic violence, that a user may encounter when conducting a search through a search engine. See Search engines on page 1980 for more information.	✓	✓
Content filtering	Block access based on specific keywords or patterns present on a web page. See Web content filter on page 1990 for more information.	✓	✓
Credential phishing preventing	Scans for corporate credentials submissions to external websites and cross-references those entries with legitimate corporate credentials. See Credential phishing prevention on page 1996 for more information.		✓
Blocklists and allowlists	Curate lists of prohibited and permitted websites. See FortiGuard category external feed on page 4081 for more information.	✓	✓
Web filter plugin	Extension that you can install on your web browser to enforce Web Filter rules. See Web browser plugin for HTTPS web filtering in the FortiClient Administration Guide for more information.	✓	✓
Endpoint filtering	Control and regulate access to websites at the level of individual devices in a network. See Web & Video Filter in the FortiClient Administration Guide for more information.	✓	✓
Websense web filtering service	Send traffic to the third-party web filtering service for rating and approval checking. See Websense Integrated Services Protocol on page 2005 for more information.		✓

See Configuring a web filter profile on page 1967 for more information.

Configuring a web filter profile

Web filtering restricts or controls user access to web resources and can be applied to firewall policies using either policy-based or profile-based NGFW mode.

The feature set setting (proxy or flow) in the web filter profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based web filter profile must be used with a flow-based firewall policy.

An SSL inspection profile (such as the certificate-inspection profile) and a web filter profile must both be selected in the associated firewall policy. See SSL & SSH Inspection on page 2303.

Some web filter profile options can only be configured in the CLI. See Advanced CLI configuration on page 1996 and the FortiOS CLI Reference for more information.

To configure a web filter profile:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*.
2. Configure the following settings:

Name	Enter a unique name for the profile.
Comments	(Optional) Enter a comment.

Feature set	Select the feature set for the profile. The feature set mode must match the inspection mode used in the associated firewall policy.
	• Flow-based
	• Proxy-based
	Additional options are available in proxy-based mode and are identified in the GUI with a P icon. See Inspection mode feature comparison on page 1901.
	If the *Feature set* option is not visible, enter the following in the CLI:
	`config system settings`
	`set gui-proxy-inspection enable`
	`end`

FortiGuard Category Based Filter	Enable to use the category-based filters from FortiGuard. A default action is assigned to each category, and you can change the action. See FortiGuard filter on page 1970.
Category Usage Quota	This option is available in proxy-based mode and can be applied to categories set to *Monitor*, *Warning*, and *Authenticate*. See Category usage quota on page 1977.
Allow users to override blocked categories	Enable to allow certain users or user groups to override websites blocked by web filtering profiles for a specified length of time. See Web profile override on page 2356.
Groups that can override	Select one or more user groups that can override blocked websites. The user group must be specified as the Source in the firewall policies using this profile.
Profile Name	Select what web filter profiles can be overridden.
Switch applies to	Specify whether the override applies to a User, User Group, or IP address. Alternately select Ask to prompt the user to log in to access the web page.
Switch duration	Select *Predefined* to specify how many days, hours, and minutes to allow the override. Select Ask to prompt the user to specify how long to allow the override.
Search Engines	
Enfore 'Safe Search' on Google, Yahoo!, Bing, Yandex	Enable to prevent explicit websites and images from appearing in search results. See Safe search on page 1980.

	Restrict YouTube Access	Enable to filter out potentially mature videos. See Restrict Google account usage to specific domains on page 1994.
	Log all search keywords	This option is available in proxy-based mode. Enable to log all search phrases. See Log all search keywords on page 1982.
Static URL Filter		
	Block invalid URLs	Enable to block websites when their SSL certificate CN field lacks a valid domain name. See Block invalid URLs on page 1983.
	URL Filter	Enable to specify URL patterns and an action for FortiGate to take when matching URL patterns are found in traffic. See URL filter on page 1983.
	Block malicious URLs discovered by FortiSandbox	Enable to block malicious URLs found by FortiSandbox. Requires FortiGate to be connected to a registered FortiSandbox. See Block malicious URLs discovered by FortiSandbox on page 1989.
	Content Filter	Enable to specify word or patterns to be used to identify and control access to web pages. See Web content filter on page 1990.
Rating Options		
	Allow websites when a rating error occurs	Enable to allow access to websites that return a rating error from the FortiGuard Web Filter service. See Allow websites when a rating error occurs on page 1993.
	Rate URLs by domain and IP address	Enable for FortiGate to always send both the URL domain name and the TCP/IP packet's IP address (except for private IP addresses) to FortiGuard for rating. See Rate URLs by domain and IP address on page 1994.
Proxy Options		
	Restrict Google account usage to specific domains	This option is available in proxy-based mode. Enable to block access to certain Google accounts and services. See Restrict Google account usage to specific domains on page 1994.
	HTTP POST Action	Enable to specify how to handle HTTP POST traffic. See HTTP POST action on page 1995.
	Remove Java Applets	This option is available in proxy-based mode. Enable to remove Java applets from web traffic. See Remove Java applets, ActiveX, and cookies on page 1995.
	Remove ActiveX	This option is available in proxy-based mode. Enable to remove ActiveX from web traffic. See Remove Java applets, ActiveX, and cookies on page 1995.
	Remove Cookies	Enable to remove cookies from web traffic. See Remove Java applets, ActiveX, and cookies on page 1995.

3. Click *OK*.

FortiGuard filter

The FortiGuard filter enhances the web filter features by sorting billions of web pages into a wide range of categories that users can allow or block.

The FortiGuard Web Filtering service includes over 45 million individual website ratings that apply to more than two billion pages. When the FortiGuard filter is enabled in a web filter profile and applied to firewall policies, if a request for a web page appears in traffic controlled by one of the firewall policies, the URL is sent to the nearest FortiGuard server. The URL category or rating is returned. If the category is blocked, the FortiGate shows a replacement message in place of the requested page. If the category is not blocked, the page request is sent to the requested URL as normal.

To use this service, you must have a valid FortiGuard license.

The following actions are available:

FortiGuard web filter action	Description
Allow	Permit access to the sites in the category.
Monitor	Permit and log access to sites in the category. User quotas can be enabled for this option (see Category usage quota on page 1977).
Block	Prevent access to the sites in the category. Users trying to access a blocked site see a replacement message indicating the site is blocked.
Warning	Display a message to the user allowing them to continue if they choose.
Authenticate	Require the user to authenticate with the FortiGate before allowing access to the category or category group.
Disable	Remove the category from the from the web filter profile. This option is only available for local or remote categories from the right-click menu.

FortiGuard web filter categories

FortiGuard has many web filter categories, including two local categories and a special remote category. Refer to the following table for more information:

FortiGuard web filter category	Where to find more information
All URL categories	See Web Filter Categories.
Local categories	See Web rating override on page 2345.
Remote category	See External feeds on page 4068.

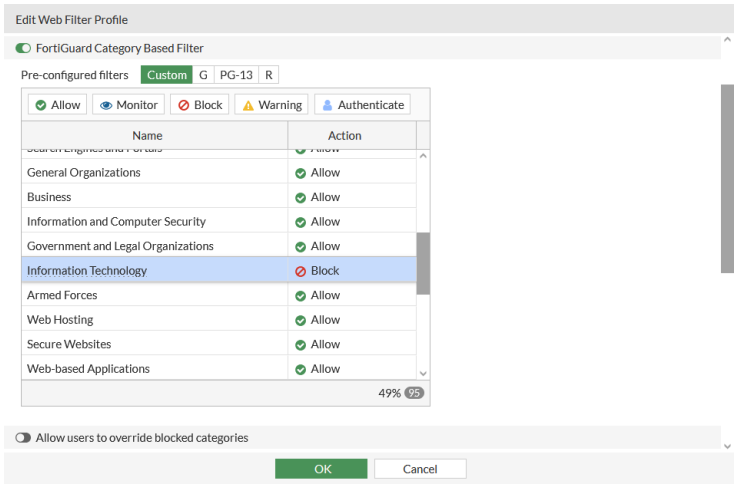
The priority of categories is local category > external category > FortiGuard built-in category. If a URL is configured as a local category, it only follows the behavior of the local category and not the external or FortiGuard built-in category.

Blocking a web category

The following example shows how to block a website based on its category. The Information Technology category (category 52) will be blocked.

To block a category in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *FortiGuard category based filter* section, select *Information Technology*, then click *Block*.



3. Configure the remaining settings as needed.
4. Click *OK*.

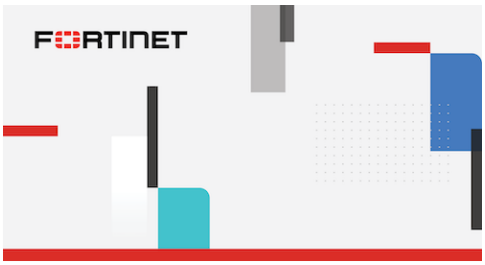
To block a category in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            unset options
            config filters
                edit 1
                    set category 52
                    set action block
                next
            end
        end
    next
end
```

You can use the `get webfilter categories` command to determine the web filtering category that corresponds to a given category ID.

To verify that the category is blocked:

1. Go to a website that belongs to the blocked category, such as www.fortinet.com.
   The page should be blocked and display a replacement message.



FortiGuard Intrusion Prevention - Access Blocked

Web Page Blocked

You have tried to access a web page that is in violation of your Internet usage policy.

Category Information Technology
URL https://www.fortinet.com/

To have the rating of this web page re-evaluated please click here.

To view the log of a blocked website in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Click the *Web Filter* card name.
3. Select an entry with *blocked* in the *Action* column and click *Details*.
4. 
To view the log of a blocked website in the CLI:

```
# execute log filter category utm-webfilter
# execute log display

4: date=2023-08-08 time=13:25:31 eventtime=1691526331836645153 tz="-0700" logid="0316013056"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="root" policyid=1
poluuid="4a4b9d00-e471-51ed-71ec-c1a3bc8f773c" policytype="policy" sessionid=254529 srcip=1.1.1.2
srcport=60836 srccountry="Australia" srcintf="internal7" srcintfrole="lan" srcuuid="45eec070-e471-
```

```
51ed-4b1c-930f37c5d882" dstip=44.240.173.227 dstport=443 dstcountry="United States" dstintf="wan1"
dstintfrole="wan" dstuuid="45eec070-e471-51ed-4b1c-930f37c5d882" proto=6 service="HTTPS"
hostname="www.fortinet.com" profile="default" action="blocked" reqtype="direct"
url="https://www.fortinet.com/" sentbyte=517 rcvdbyte=0 direction="outgoing" msg="URL belongs to a
denied category in policy" ratemethod="domain" cat=52 catdesc="Information Technology"
```

Allowing users to override blocked categories

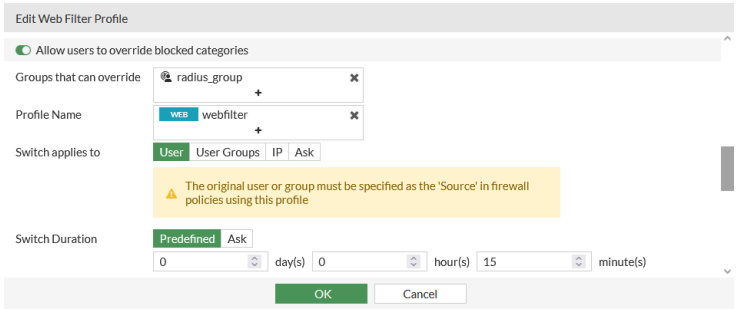
There is an option to allow users with valid credentials to override blocked categories.

To allow users to override blocked categories in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. Enable *Allow users to override blocked categories*.
3. Enter information in the following fields:

Groups that can override	Add the user group that will be allowed to override.
Profile Name	Add the web filter profile the overridden group will use. This cannot be the same profile as its own.
Switch applies to	Select *User*, *User Groups*, *IP*, or *Ask*.
Switch Duration	Select either *Predefined* to specify a duration, or *Ask* for user input.

4. Configure the other settings as needed.



5. Click *OK*.

To allow users to override blocked categories in the CLI:

```
config webfilter profile
    edit "webfilter"
        set ovrd-perm bannedword-override urlfilter-override fortiguard-wf-override contenttype-
check-override
        config override
            set ovrd-user-group "radius_group"
            set profile "webfilter"
        end
        config ftgd-wf
            unset options
        end
```

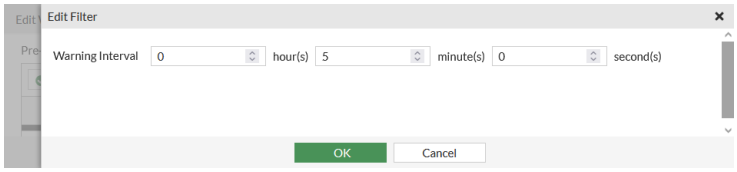
```
    next
end
```

Issuing a warning on a web category

The following example shows how to issue a warning when a user visits a website in a specific category (Information Technology, category 52).

To configure a warning for a category in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *FortiGuard category based filter* section, select *Information Technology*, then click *Warning*.
3. Set the *Warning Interval*, then click *OK*.
   The warning interval is the amount of time until the warning appears again after the user proceeds past it.



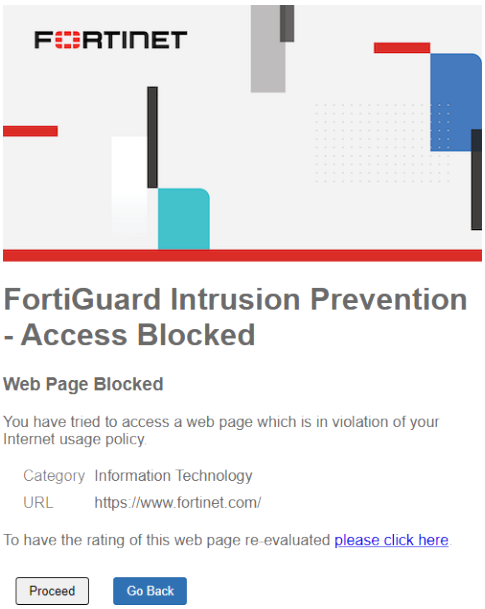
4. Configure the remaining settings as needed.
5. Click *OK*.

To configure a warning for a category in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            unset options
            config filters
                edit 1
                    set category 52
                    set action warning
                next
            end
        end
    next
end
```

To verify that the warning works:

1. Go to a website that belongs to the category, such as www.fortinet.com.
2. On the warning page, click *Proceed* or *Go Back*.



Authenticating a web category

The following example shows how to authenticate a website based on its category (Information Technology, category 52).

To authenticate a category in the GUI:

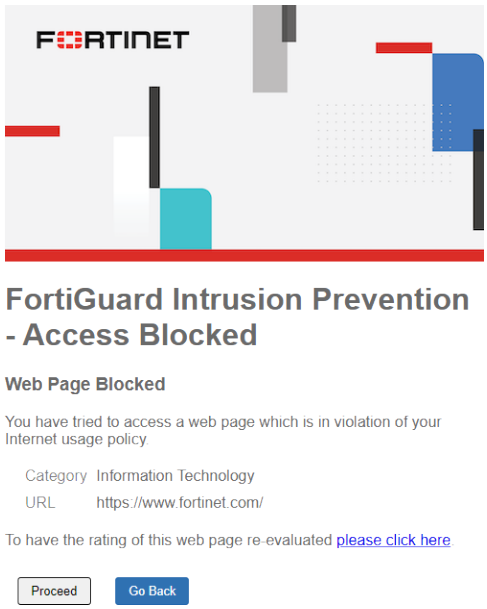
1. Go to *Security Profiles* > *Web Filter* and edit or create a new web filter profile.
2. In the *FortiGuard category based filter* section, select *Information Technology*, then click *Authenticate*.
3. Set the *Warning Interval* and select one or more user groups, then click *OK*.
4. Configure the remaining settings as needed.
5. Click *OK*.

To authenticate a category in the CLI:

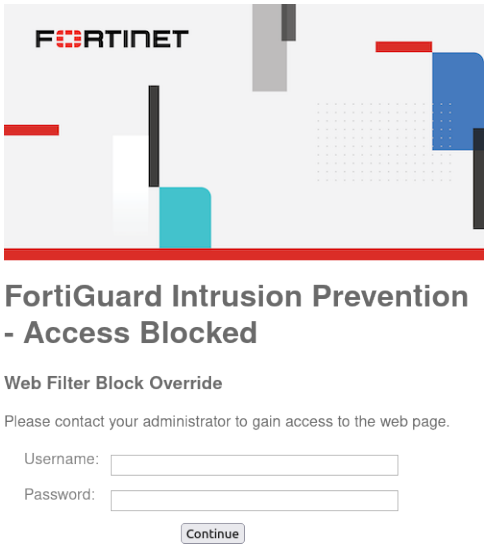
```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            unset options
            config filters
                edit 1
                    set category 52
                    set action authenticate
                    set auth-usr-grp "local_group"
                next
            end
        end
    next
end
```

To verify that you have configured authentication:

1. Go to a website that belongs to the category, such as www.fortinet.com.
2. On the warning page, click *Proceed*.



3. Enter the username and password for the configured user group, then click *Continue*.



Customizing the replacement message page

When the category action is *Block*, *Warning*, or *Authenticate*, you can customize the replacement message page that a user sees.

To customize the replacement message page:

1. Go to *Security Profiles* > *Web Filter* and edit or create a new web filter profile.
2. In the *FortiGuard category based filter* section, right-click on a category and select *Customize*.

3. Select a *Replacement Message Group*. See Replacement message groups on page 3558 for details.
4. Optionally, click *Edit FortiGuard Block Page* or *Edit FortiGuard Warning Page* to make modifications.
5. Click *Save*.
6. Configure the remaining settings as needed.
7. Click *OK*.

Customizing the CA certificate

When accessing a HTTPS webpage, in order to intercept the connection and perform an override, warning, or authentication, the connection must be proxied and the warning and/or authentication page must be signed with FortiGate's CA certificate. The client accessing the page must trust the CA in order to avoid certificate errors while browsing.

When applying the web filter profile to a firewall policy, an SSL inspection profile must also be selected.

To apply a custom certificate to the SSL inspection profile in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*, or edit an existing profile.
2. Under *SSL Inspection Options*, set *CA certificate* to the desired custom CA certificate.
3. Click *OK*.
4. On the client endpoints, ensure this custom CA is trusted.

To apply a custom certificate to the SSL inspection profile in the CLI:

```
config firewall ssl-ssh-profile
    edit <name>
        set caname <custom_CA_certificate>
    next
end
```

Category usage quota

In addition to using category and classification blocks and overrides to limit user access to URLs, you can set a daily quota by category, category group, or classification. Quotas allow access for a specified length of time or a specific bandwidth, and are calculated separately for each user. Quotas are reset daily at midnight.

Quotas can be set for the *Monitor*, *Warning*, or *Authenticate* actions. Once the quota is reached, the traffic is blocked and the replacement message page displays.

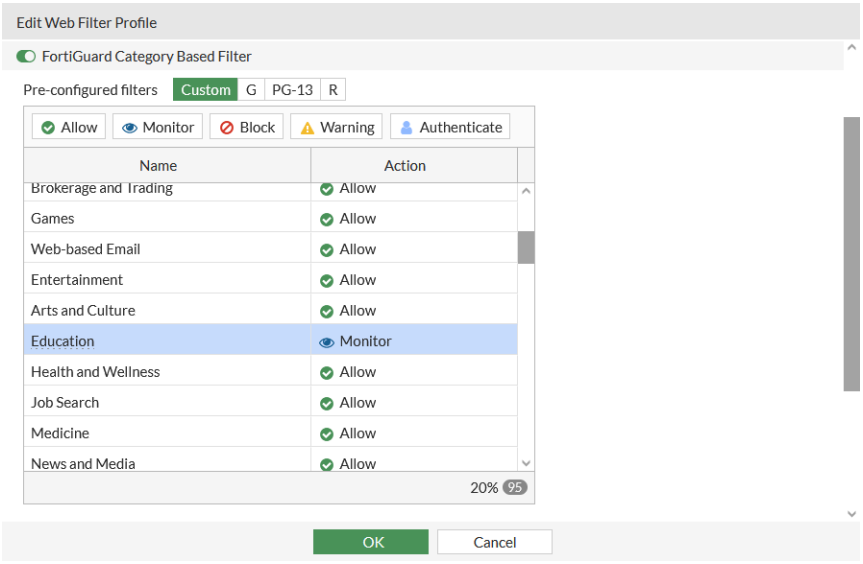
Quotas are only available in proxy-based inspection mode.

Configuring a quota

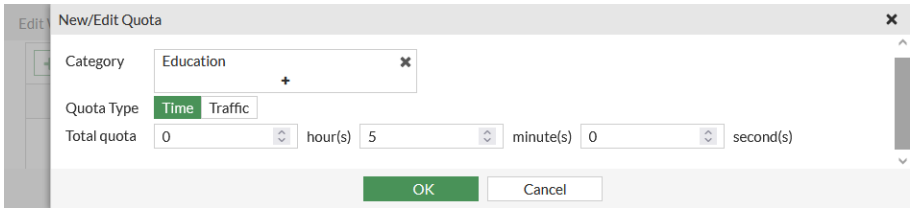
The following example shows how to set a time quota for the education category (category 30).

To configure a quota in the GUI:

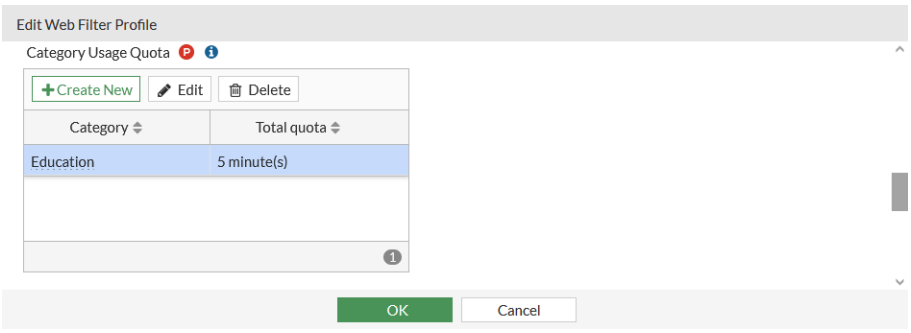
1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. For *Feature set*, select *Proxy-based*.
3. In the *FortiGuard category based filter* section, scroll to the *General Interest - Personal* and click the + to expand the section.
4. Select *Education*, then click *Monitor*.



5. In the *Category Usage Quota* section, click *Create New*.
   The *New/Edit Quota* pane opens.
6. In the *Category* field, select *Education*.
7. For the *Quota Type*, select *Time* and set the *Total quota* to 5 minutes.



8. Click *OK*. The entry appears in the table.



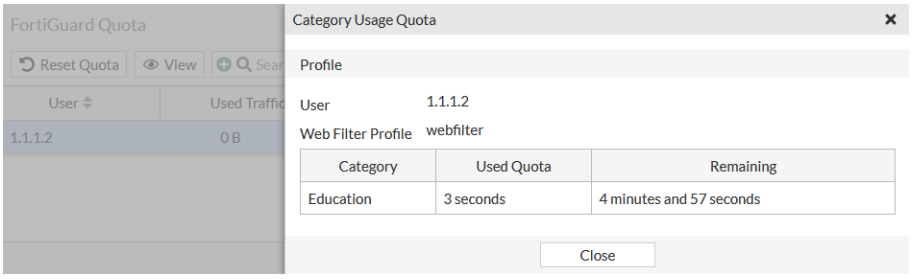
9. Configure the other settings as needed.
10. Click *OK*.

To configure a quota in the CLI:

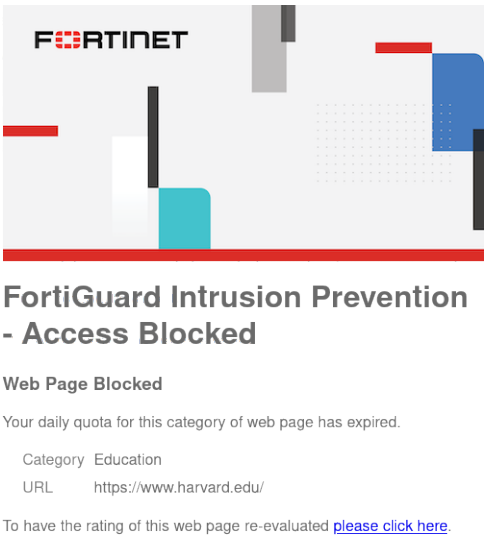
```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
           unset options
           config filters
              edit 1
                 set category 30
              next
           end
           config quota
              edit 1
                 set category 30
                 set type time
                 set duration 5m
              next
           end
        end
    next
end
```

To verify the quota usage:

1. Go to a website that belongs to the education category, such https://www.harvard.edu/. You can view websites in that category at the moment.
2. In FortiOS, go to *Dashboard* > *FortiGuard Quota Monitor* to check the used and remaining time.



3. When the quota reaches its limit, traffic is blocked and the replacement page displays.



Search engines

This topic gives examples of the following advanced filter features:

- Safe search on page 1980
- Restrict YouTube and Vimeo access on page 1981
- Log all search keywords on page 1982

Safe search

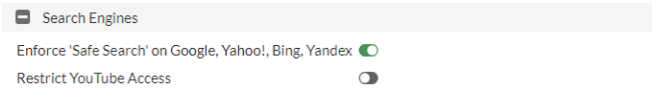
This setting applies to popular search sites and prevents explicit websites and images from appearing in search results.

The supported search sites are:

- Google
- Yahoo
- Bing
- Yandex

To enable safe search in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Enforce 'Safe Search' on Google, Yahoo!, Bing, Yandex*.



3. Click *OK*.

To enable safe search in the CLI:

```
config webfilter profile
    edit "webfilter"
        config web
            set safe-search url header
        end
    next
end
```

Restrict YouTube and Vimeo access

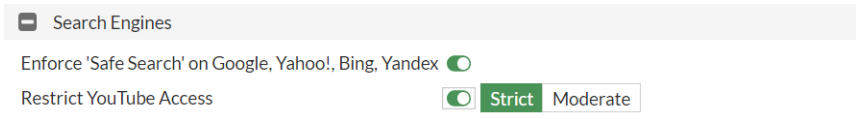
The *Restrict YouTube access* setting in the video filter profile adds the HTTP header `YouTube-Restrict: Strict` or `YouTube-Restrict: Moderate` into the HTTP request when enabled. When YouTube reads this header, it applies the appropriate content restriction based on the selected mode. YouTube Restricted Mode is an optional setting that filters out potentially mature videos while leaving a large number of videos still available (see Restrict YouTube content available to users and Manage your organization's YouTube settings for more information). Google defines the restricted YouTube access modes as follows:

- Strict Restricted YouTube access: this setting is the most restrictive. Strict Restricted Mode does not block all videos, but works as a filter to screen out many videos based on an automated system, while leaving some videos still available for viewing.
- Moderate Restricted YouTube access: this setting is similar to Strict Restricted Mode but makes a much larger collection of videos available.

To restrict YouTube access in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Enforce 'Safe Search' on Google, Yahoo!, Bing, Yandex* to display the *Restrict YouTube Access* option.

   
   When `safe-search` is set to `header` in the CLI, the *Restrict YouTube Access* option is visible in the GUI.
3. Enable *Restrict YouTube Access* and select either *Strict* or *Moderate*.

4. Click *OK*.

It is recommended to set `safe-search` to `url` and `header` because some search engines, such as Google, use the URL, and other search engines, such as Bing, use the header.

When you enable *Enforce 'Safe Search' on Google, Yahoo!, Bing, Yandex* in the GUI, `safe-search` is set to `url header` in the CLI.

To restrict YouTube access in the CLI:

```
config webfilter profile
    edit <name>
        config web
            set safe-search url header
            set youtube-restrict {none | strict | moderate}
        end
    next
end
```

The file filter profile includes a setting to restrict Vimeo access, which can only be configured in the CLI.

To restrict Vimeo access:

```
config webfilter profile
    edit <name>
        config web
            set safe-search url header
            set vimeo-restrict {7 | 134}
        end
    next
end
```

`vimeo-restrict {7 | 134}`	Set the Vimeo restriction: • 7: do not show mature content • 134: do not show unrated and mature content

Log all search keywords

Use this setting to log all search phrases.

This filter is only available in proxy-based inspection mode.

To enable logging search keywords in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Log all search keywords*.
3. Click *OK*.

To enable logging search keywords in the CLI:

```
config webfilter profile
    edit "webfilter"
        config web
            set log-search enable
```

```
        end
    next
end
```

Static URL filter

This topic gives examples of the following advanced filter features:

- Block invalid URLs on page 1983
- URL filter on page 1983
- Block malicious URLs discovered by FortiSandbox on page 1989
- Web content filter on page 1990

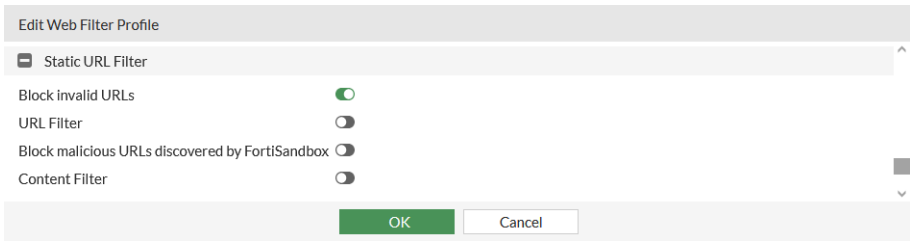
Block invalid URLs

Use this setting to block websites when their SSL certificate CN field does not contain a valid domain name.

This option also blocks URLs that contains spaces. If there is a space in the URL, it must be written as *%20* in the URL path.

To block invalid URLs in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Block invalid URLs* .



3. Click *OK*.

To block invalid URLs in the CLI:

```
config webfilter profile
    edit "webfilter"
        set options block-invalid-url
    next
end
```

URL filter

The URL filter uses specific URLs with patterns containing text and regular expressions so the FortiGate can process the traffic based on the filter action (exempt, block, allow, monitor) and web pages that match the criteria. Once a URL filter is configured, it can be applied to a firewall policy.

The following filter types are available:

URL filter type	Description
Simple	The FortiGate tries to strictly match the full context. For example, if you enter *www.facebook.com* in the *URL* field, it only matches traffic with *www.facebook.com*. It won't match *facebook.com* or *message.facebook.com*. When the FortiGate finds a match, it performs the selected URL action.
Regular expression/ wildcard	The FortiGate tries to match the pattern based on the rules of regular expressions or wildcards. For example, if you enter **fa** in the *URL* field, it matches all the content that has *fa* such as *www.facebook.com*, *message.facebook.com*, *fast.com*, and so on. When the FortiGate finds a match, it performs the selected URL action.

For more information, see the URL Filter expressions technical tip in the Knowledge Base.

The following actions are available:

URL filter action	Description
Exempt	The traffic is allowed to bypass the remaining FortiGuard web filters, web content filters, web script filters, antivirus scanning, and DLP proxy operations.
Block	The FortiGate denies or blocks attempts to access any URL that matches the URL pattern. A replacement message is displayed.
Allow	The traffic is passed to the remaining FortiGuard web filters, web content filters, web script filters, antivirus proxy operations, and DLP proxy operations. If the URL does not appear in the URL list, the traffic is permitted.
Monitor	The traffic is processed the same way as the *Allow* action. For the *Monitor* action, a log message is generated each time a matching traffic pattern is established.

The exempt URL filter action can be configured to bypass all or certain scanning and filtering operations. This setting can only be configured in the CLI.

If the `action` is set to `exempt`, use `set exempt` to select the scanning and filtering operations that exempt URLs skip.

```
config webfilter urlfilter
    edit <id>
        config entries
            edit <id>
                set action exempt
                set exempt {av web-content activex-java-cookie dlp fortiguard range-block pass
antiphish all}
            next
        end
    next
end
```

Option	Description
av	Antivirus scanning

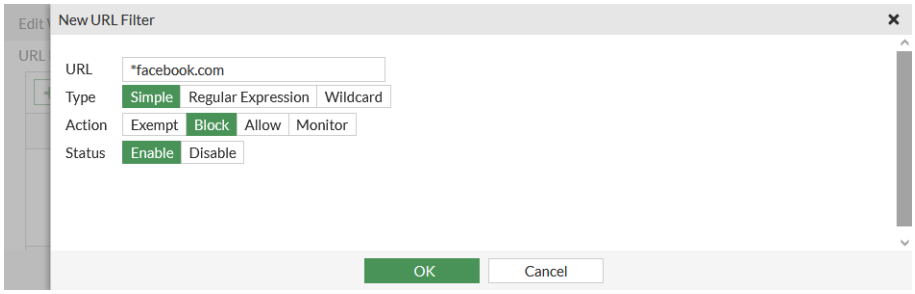
Option	Description
web-content	Web filter content matching
activex-java-cookie	ActiveX, Java, and cookie filtering
dlp	DLP scanning
fortiguard	FortiGuard web filtering
range-block	Range block feature
pass	Pass single connection from all
antiphish	Antiphish credential checking
all	Exempt from all scanning and filtering operations listed above

These exempt options are not visible in the GUI. Setting the URL filter *Action* to *Exempt* will exempt URLs from all security profiles.

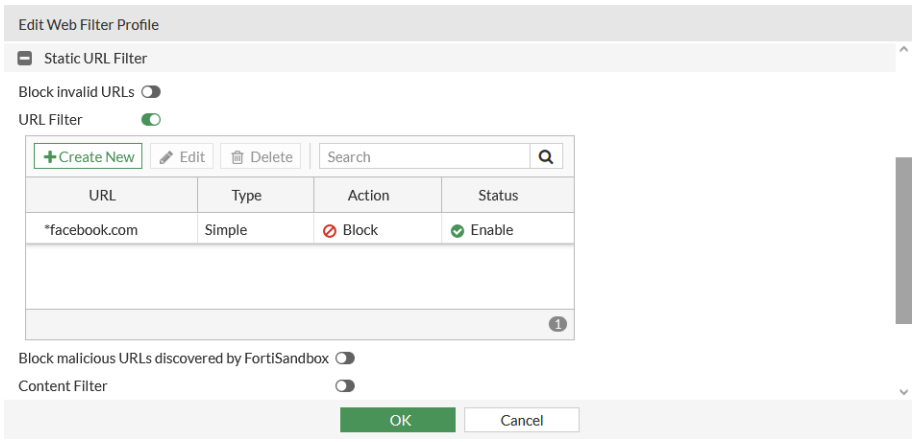
In the following example, a URL filter will be created to block the facebook.com URL using a wildcard.

To create a URL filter for Facebook in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *URL Filter*.
3. Click *Create New*. The *New URL Filter* pane opens.
4. For URL, enter **facebook.com*, for *Type*, select *Wildcard*, and for *Action*, select *Block*.



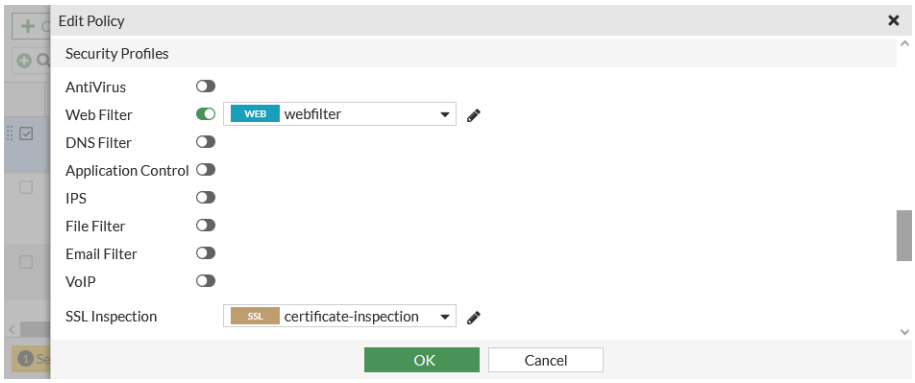
5. Click *OK*. The entry appears in the table.



6. Configure the other settings as needed.
7. Click *OK*.

To apply the web filter profile to a firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit a policy, or create a new one.
3. In the *Security Profiles* section, enable *Web Filter* and select the profile that you created.
4. Set *SSL Inspection* to *certificate-inspection*.



The *no-inspection* profile does not perform SSL inspection, so it should not be selected with other UTM profiles.

5. Configure the other settings as needed.
6. Click *OK*.

To create a URL filter for Facebook in the CLI:

```
config webfilter urlfilter
    edit 1
        set name "webfilter"
        config entries
            edit 1
```

```
                set url "*facebook.com"
                set type wildcard
                set action block
            next
        end
    next
end
```

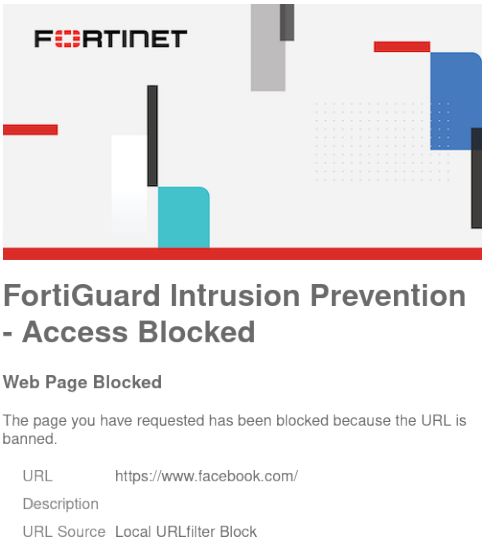
To apply the URL filter to a web filter profile in the CLI:

```
config webfilter profile
    edit "webfilter"
        config web
            set urlfilter-table 1
        end
        config ftgd-wf
            ...
        end
    next
end
```

To apply the web filter profile to a firewall policy in the CLI:

```
config firewall policy
    edit 1
        set name "WF"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set logtraffic all
        set webfilter-profile "webfilter"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

Verify the URL filter results by going to a blocked website. For example, when you go to the Facebook website, the replacement message appears:

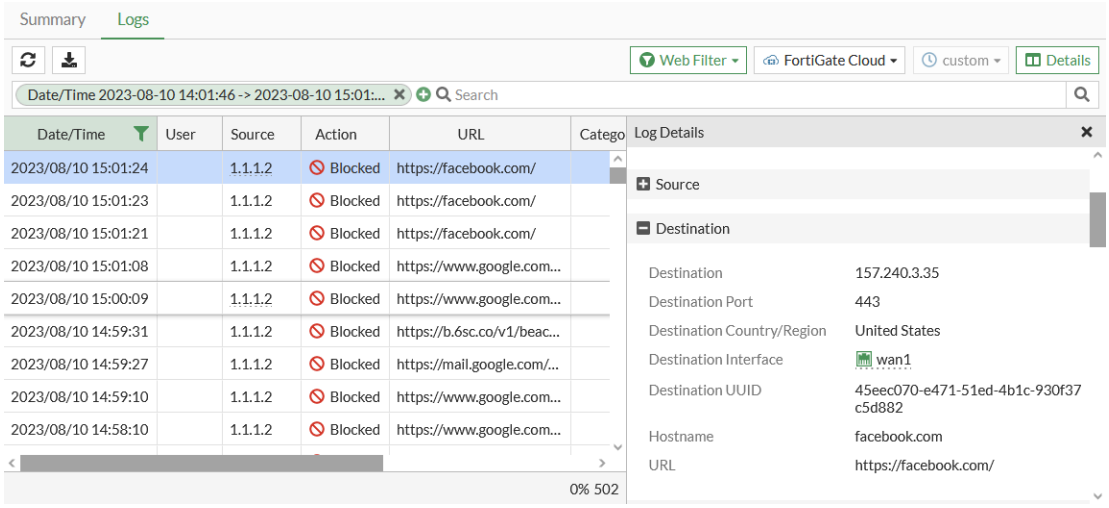


To customize the URL web page blocked message:

1. Go to *System* > *Replacement Messages*.
2. In the *HTTP* section, select *URL Block Page* and click *Edit*.
3. Edit the HTML to customize the message. See Replacement messages on page 3555 for more information.

To check web filter logs in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Click the *Web Filter* card name.
3. If there are a lot of log entries, click *Add Filter* and select *Event Type* > *urlfilter* to display logs generated by the URL filter.



To check web filter logs in the CLI:

```
# execute log filter category utm-webfilter
# execute log display

2: date=2023-08-10 time=15:02:25 eventtime=1691704944982929658 tz="-0700" logid="0315012544"
type="utm" subtype="webfilter" eventtype="urlfilter" level="warning" vd="root" urlfilteridx=1

```

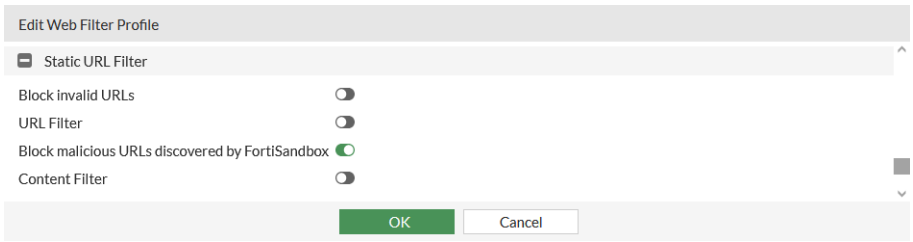
Block malicious URLs discovered by FortiSandbox

This setting blocks malicious URLs that FortiSandbox finds. Your FortiGate must be connected to a registered FortiSandbox.

For information on configuring FortiSandbox, see Using FortiSandbox post-transfer scanning with antivirus on page 1932 and Using FortiSandbox inline scanning with antivirus on page 1934.

To block malicious URLs discovered by FortiSandbox in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Block malicious URLs discovered by FortiSandbox*.



3. Click *OK*.

To block malicious URLs discovered by FortiSandbox in the CLI:

```
config webfilter profile
    edit "webfilter"
        config web
            set blocklist enable
        end
    next
end
```

Web content filter

You can control access to web content by blocking webpages containing specific words or patterns. This helps to prevent access to pages with questionable material. You can specify words, phrases, patterns, wildcards, and regular expressions to match content on webpages. You can use multiple web content filter lists and select the best one for each web filter profile.

The maximum number of web content patterns in a list depends on the model of the device. To find the maximum number of web content patterns allowed for a device, go to the Maximum Values Table (https://docs.fortinet.com/max-value-table). Select the software version and models, and click *Go*. Maximum values are displayed. In the *Search* box, enter *webfilter.content:entries* to find the maximum number.

When configuring a web content filter list, the following patterns are available:

Web content pattern type	Description
Wildcard	Use this setting to block or exempt one word or text strings of up to 80 characters. You can also use wildcard symbols such as *?* or * to represent one or more characters. For example, a wildcard expression *forti*.com* matches *fortinet.com* and *fortiguard.com*. The * represents any character appearing any number of times.
Regular expression	Use this setting to block or exempt patterns of regular expressions that use some of the same symbols as wildcard expressions, but for different purposes. In regular expressions, * represents the character before the symbol. For example, *forti*.com* matches *fortiii.com* but not *fortinet.com* or *fortiice.com*. In this case, the symbol * represents *i* appearing any number of times.

The web content filter scans the content of every webpage that is accepted by a firewall policy. The system administrator can specify banned words and phrases and attach a numerical value (or score) to the importance of those words and phrases. When the web content filter scan detects banned content, it adds the scores of banned words and phrases found on that page. If the sum is higher than a threshold set in the web filter profile, the FortiGate blocks the page.

The default score for web content filter is 10 and the default threshold is 10. This means that by default, a webpage is blocked by a single match. These settings can only be configured in the CLI.

Banned words or phrases are evaluated according to the following rules:

- The score for each word or phrase is counted only once, even if that word or phrase appears many times in the webpage.
- The score for any word in a phrase without quotation marks is counted.
- The score for a phrase in quotation marks is counted only if it appears exactly as written.

The following table is an example of how rules are applied to the webpage contents . For example, a webpage contains only this sentence:

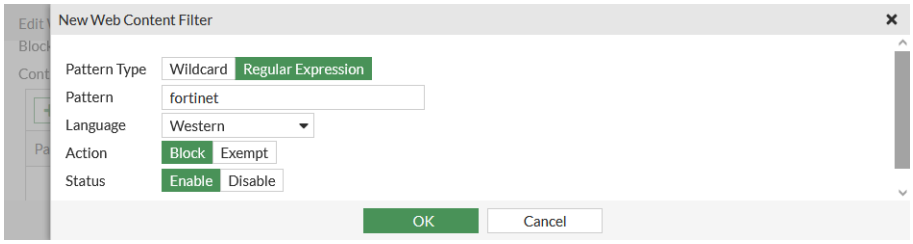
The score for each word or phrase is counted only once, even if that word or phrase appears many times in the webpage.

Banned pattern	Assigned score	Score added to the sum for the entire page	Threshold score	Comment
word	20	20	20	Appears twice but is only counted once. The webpage is blocked.
word phrase	20	40	20	Each word appears twice but is only counted once, giving a total score of 40. The webpage is blocked.
word sentence	20	20	20	*word* appears twice and *sentence* does not appear, but since any word in a phrase without quotation marks is counted, the score for this pattern is 20. The webpage is blocked.
"word sentence"	20	0	20	This phrase does not appear exactly as written. The webpage is allowed.
"word or phrase"	20	20	20	This phrase appears twice but is only counted once. The webpage is blocked.

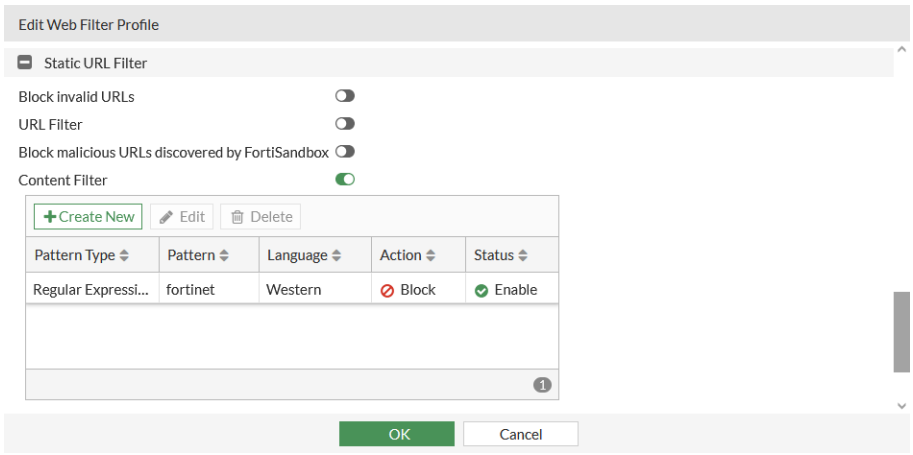
To configure a web content filter in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Content Filter*.
3. In the table, click *Create New*. The *New Web Content Filter* pane opens.
4. Configure the following settings:

Pattern Type	Regular Expression
Pattern	fortinet
Language	Western
Action	Block
Status	Enable



5. Click *OK*. The entry appears in the table.



6. Configure the other settings as needed.
7. Click *OK*.

To configure a web content filter in the CLI:

1. Create the content (banned word) table:

```
config webfilter content
   edit 1
      set name "webfilter"
      config entries
         edit "fortinet"
           set pattern-type regexp
           set status enable
           set lang western
           set score 10
           set action block
         next
      end
   next
end
```

2. Apply the content table to the web filter profile:

```
config webfilter profile
   edit "webfilter"
      config web
         set bword-threshold 10
         set bword-table 1
      end
      config ftgd-wf
         unset options
      end
   next
end
```

To verify the content filter:

1. Go to a website with the word *fortinet*, such as www.fortinet.com.
   The website is blocked and a replacement page displays:

Rating options

This topic gives examples of the following advanced filter features:

- Allow websites when a rating error occurs on page 1993
- Rate URLs by domain and IP address on page 1994

Allow websites when a rating error occurs

If you do not have a FortiGuard license, but you have enabled services that need a FortiGuard license (such as FortiGuard filter), then you will get a rating error message.

Use this setting to allow access to websites that return a rating error from the FortiGuard Web Filter service.

To allow websites with rating errors in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Rating Options* section, enable *Allow websites when a rating error occurs*.
3. Click *OK*.

To allow websites with rating errors in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            set options error-allow
        end
    next
end
```

Rate URLs by domain and IP address

If you enable this setting, in addition to only sending domain information to FortiGuard for rating, the FortiGate always sends both the URL domain name and the TCP/IP packet's IP address (except for private IP addresses) to FortiGuard for the rating.

The FortiGuard server might return a different category of IP address and URL domain. If they are different, the FortiGate uses the rating weight of the IP address or domain name to determine the rating result and decision. This rating weight is hard-coded in FortiOS.

For example, if we use a spoof IP of Google as www.irs.gov, the FortiGate will send both the IP address and domain name to FortiGuard to get the rating. We get two different ratings: one is the search engine and portals that belong to the Google IP, the second is the government and legal organizations that belongs to www.irs.gov. Because the search engine and portals rating has a higher weight than government and legal organizations, the traffic is rated as search engine and portals.

To rate URLs by domain and IP address in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Rating Options* section, enable *Rate URLs by domain and IP address*.
3. Click *OK*.

To rate URLs by domain and IP address in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            set options rate-server-ip
        end
    next
end
```

Proxy options

This topic gives examples of the following advanced filter features:

- Restrict Google account usage to specific domains on page 1994
- HTTP POST action on page 1995
- Remove Java applets, ActiveX, and cookies on page 1995

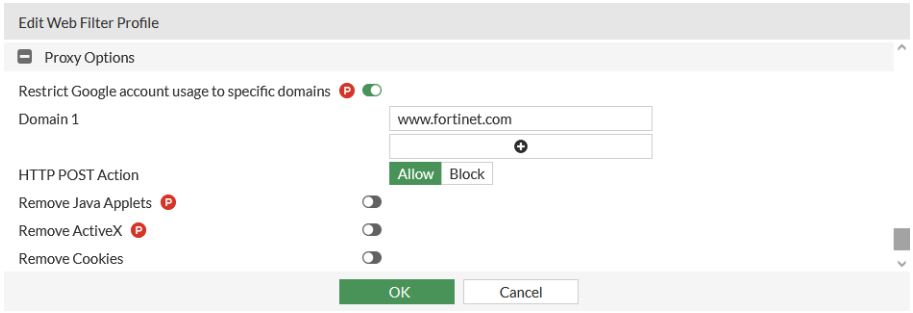
These advanced filters are only available in proxy-based inspection mode.

Restrict Google account usage to specific domains

Use this setting to block access to certain Google accounts and services, while allowing access to accounts with domains in the exception list.

To enable Google account restriction:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Proxy Options* section, enable *Restrict Google account usage to specific domains*.
3. Click the + and enter the domains that Google can access, such as www.fortinet.com.



4. Click *OK*.

When you try to use Google services like Gmail, only traffic from the domain of www.fortinet.com can go through. Traffic from other domains is blocked.

HTTP POST action

Use this setting to select the action to take with HTTP POST traffic. HTTP POST is the command used by the browser when you send information, such as a completed form or a file you are uploading to a web server. The action options are allow or block. The default is allow.

To configure HTTP POST in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Proxy Options* section, for *HTTP POST Action*, select *Allow* or *Block*.
3. Click *OK*.

To configure HTTP POST in the CLI:

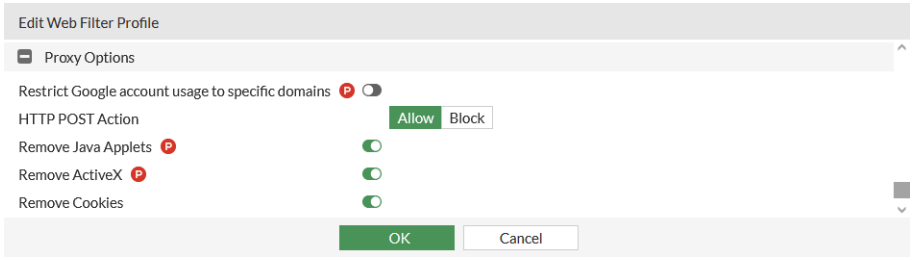
```
config webfilter profile
    edit "webfilter"
        set post-action {normal | block}
        config ftgd-wf
            unset options
        end
    next
end
```

Remove Java applets, ActiveX, and cookies

Web filter profiles have settings to filter Java applets, ActiveX, and cookies from web traffic. Note that if these filters are enabled, websites using Java applets, ActiveX, and cookies might not function properly.

To enable these filters in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile. and go to the *Proxy Options* section.
2. In the *Proxy Options* section, enabled the filters you want to use: *Remove Java Applets*, *Remove ActiveX*, or *Remove Cookies*.



To enable these filters in the CLI:

```
config webfilter profile
   edit "webfilter"
      set options {activexfilter cookiefilter javafilter}
      config ftgd-wf
         unset options
      end
   next
end
```

Advanced CLI configuration

This section includes the following:

- Credential phishing prevention on page 1996
- Additional antiphishing settings on page 1999
- Web filter statistics on page 2003
- URL certificate blocklist on page 2004
- Websense Integrated Services Protocol on page 2005
- Inspecting HTTP3 traffic on page 2006
- Using URL risk-scores in determining policy action on page 2007

Credential phishing prevention

When credential phishing prevention is enabled, the FortiGate scans for corporate credentials submitted to external websites and compares them to sensitive credentials stored in the corporate domain controller. Based on the configured antiphishing rules in proxy mode web filter profiles, the FortiGate will block the URL or alert the user if the credentials match ones that are stored on the corporate domain controller.

- The corporate domain controller must be configured in the `domain controller`.
- For FortiGate to retrieve the domain information, the user needs to grant Replicating Directory Changes permissions in the Domain Controller (DC). See How to grant the "Replicating Directory Changes" permission for the Microsoft Metadirectory Services ADMA service account for more information.
- Credentials can be matched based on sAMAccountName, user principal name (UPN), or down-level logon name.
- The antiphishing profile defines the corporate domain controller, antiphishing check option, default action if no rules match, antiphishing status, and so on.
- Inspection entries in the profile define what action occurs when the submission request matches the specified FortiGuard categories.
- The profile scans for predefined and custom username and password fields in the HTTP request, such as `username`, `auth`, and `password`. You can evaluate custom fields by configuring custom patterns.
- The URL filter defines individual URLs that the antiphish action (block or log) is applied to when the URL submission request matches.

Web-based URL filter actions and FortiGuard category-based filtering have higher priority than antiphishing URL filter actions and FortiGuard filtering:

- If a request is blocked by the web-based URL filter or FortiGuard filter, there is no further antiphishing scanning. Antiphishing scanning only happens after the web-based URL filtes and FortiGuard filters allow the traffic.
- If a submission matches an entry in the URL filter table that has an antiphishing action, the defined action is taken. No further FortiGuard category-based rules are applied.
- Like firewall rules, the URL filter table and Fortiguard category-based antiphishing rules use a top-down priority. The rule that matches first is the one that is used.

In this example, URLs that match FortiGuard category 37 (social networking) will be blocked and other categories will be logged.

To configure credential phishing prevention:

1. Configure the corporate domain controller:

```
config user domain-controller
    edit "win2016"
        set hostname "win2016"
        set domain-name "corpserver.local"
        set username "Administrator"
        set password **********
        set ip <server_ip>
    next
end
```

The `hostname` and the `domain-name` are case sensitive.

2. Configure the antiphishing profile, which includes the FortiGuard category rule:

```
config webfilter profile
    edit <profile-name>
        set feature-set proxy
        ...
        config web
            ...
        end
        config antiphish
            set status enable
            set domain-controller "win2016"
            set default-action block
            set check-uri enable
            set check-basic-auth enable
            set max-body-len 65536
            config inspection-entries
                edit "inspect-37"
                    set fortiguard-category 37
                    set action block
                next
                edit "inspect-others"
                    set fortiguard-category all
                    set action log
                next
            end
            config custom-patterns
                edit "customer-name"
                    set category username
                next
                edit "customer-passwd"
                   set category password
                next
            end
        end
        ...
        set web-antiphishing-log enable
    next
end
```

- `check-uri` enables support for scanning HTTP GET URI parameters.
- `check-basic-auth` enables support for scanning the HTTP basic authentication field.

3. Configure the URL filter to scan specific URLs.

   The antiphish action is added to the URL filter table entry, and the URL filter is applied to the web filter profile:

```
config webfilter urlfilter
    edit 1
        set name "antiphish-table"
        config entries
            edit 1
                set url "www.example.com"
                set type simple
```

```
                set antiphish-action block
                set status enable
                set referrer-host ''
            next
        end
    next
end
config webfilter profile
    edit "<profile-name>"
        config web
            set urlfilter-table 1
        end
        ...
    next
end
```

4. Optionally, define custom patterns to scan fields other than the built-in username and password keywords:

```
config webfilter profile
    edit "<profile-name>"
        config custom-patterns
                edit "customer-name"
                    set category username
                next
                edit "customer-passwd"
                   set category password
                next
            end
        end
    next
end
```

Additional antiphishing settings

The following settings are available for antiphishing:

- Enable DNS service lookup in the domain controller so that the domain controller IP does not need to be configured. The DNS server will resolve the domain controller IP.
- Specify a source IP or port for the fetching domain controller.
- Use an LDAP server as a credential source (only the OpenLDAP server is supported).
- Block or log valid usernames regardless of password match.
- Use literal custom patterns type for username and password.
- Active Directory Lightweight Directory Services (AD LDS) support

Configuration examples

To enable DNS service lookup:

```
config user domain-controller
    edit "win2016"
        set ad-mode ds
        set dns-srv-lookup enable
        set hostname "win2016"
        set username "replicate"
        set password **********
        set domain-name "SMB2016.LAB"
    next
end
```

To specify the source IP and port for the fetching domain controller:

```
config user domain-controller
    edit "win2016"
        set ad-mode ds
        set hostname "win2016"
        set username "replicate"
        set password **********
        set ip-address 172.18.52.188
        set source-ip-address 172.16.100.1
        set source-port 2000
        set domain-name "SMB2016.LAB"

    next
end
```

To use an LDAP server as a credential store:

1. Configure the LDAP server:

```
config user ldap
    edit "openldap"
        set server "172.18.60.214"
        set cnid "cn"
        set dn "dc=qafsso,dc=com"
        set type regular
        set username "cn=Manager,dc=qafsso,dc=com"
        set password **********
        set antiphish enable
        set password-attr "userPassword"
    next
end
```

2. Configure the web filter profile:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            config filters
                edit 1
                    set action block
                next
            end
        end
        config antiphish
            set status enable
            config inspection-entries
                edit "cat34"
                    set fortiguard-category 34
                    set action block
                next
            end
            set authentication ldap
            set ldap "openldap"
        end
        set log-all-url enable
    next
end
```

To configure username-only credential matching:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            ...
        end
        config antiphish
            set status enable
            set check-username-only enable
            config inspection-entries
                edit "cat34"
                    set fortiguard-category 34
                    set action block
                next
            end
            set domain-controller "win2016"
        end
        set log-all-url enable
    next
end
```

To configure different custom pattern types for usernames and passwords:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            ...
        end
        config antiphish
            set status enable
            config inspection-entries
                edit "cat34"
                    set fortiguard-category 34
                    set action block
                next
            end
            config custom-patterns
                edit "qwer"
                    set type literal
                next
                edit "[0-6]Dat*"
                next
                edit "dauw9"
                    set category password
                    set type literal
                next
                edit "[0-5]foo[1-4]"
                    set category password
                next
            end
            set domain-controller "win2016"
        end
        set log-all-url enable
    next
end
```

In this example, the `qwer` and `dauw9` entries use the literal type, while `[0-6]Dat*` and `[0-5]foo[1-4]` use the default regex type.

To configure Active Directory in LDS mode:

```
config user domain-controller
    edit "win2016adlds"
        set hostname "win2016adlds"
        set username "foo"
        set password **********
        set ip-address 192.168.10.9
        set domain-name "adlds.local"
        set ad-mode lds
        set adlds-dn "CN=adlds1part1,DC=ADLDS,DC=COM"
        set adlds-ip-address 192.168.10.9
```

```
        set adlds-port 3890
    next
end
```

Web filter statistics

FortiOS provides diagnostics commands to view web filter statistics reports, which are either proxy-based or flow-based. The commands are available in both VDOM and global command lines.

Proxy-based web filter statistics report

Use the `diagnose wad filter vd {<VDOM> | global}` command to filter for per-VDOM or global statistics reports.

In the following example, there are two VDOMs (root and vdom1) using proxy-based policies that have web filter profiles enabled.

To view per-VDOM statistics reports:

```
(global) # diagnose wad filter vd root
Drop_unknown_session is enabled.
```

```
(global) # diagnose wad stats filter list
filtering of vdom root
  dlp          = 0
  content-type = 0
  urls:
    examined = 6
    allowed = 3
    blocked = 0
    logged = 0
    overridden = 0
```

```
(global) # diagnose wad filter vd vdom1
(global) # diagnose wad stats filter list
filtering of vdom vdom1
  dlp          = 0
  content-type = 0
  urls:
    examined = 13
    allowed = 2
    blocked = 9
    logged = 8
    overridden = 0
```

```
(global) # diagnose wad filter vd ALL
(global) # diagnose wad stats filter list
filtering of all accessible vdoms
  dlp          = 0
```

```
  content-type = 0
  urls:
    examined = 19
    allowed = 5
    blocked = 9
    logged = 8
    overridden = 0
```

Flow-based web filter statistics report

Use the `diagnose webfilter stats list {<VDOM> | global}` command to check the flow-based web filter statistics.

In the following example, the VDOM is using flow-based policies that have web filter profiles enabled.

To view web filter statistics:

```
# diagnose webfilter stats list root
Proxy/flow URL filter stats:
request:   9474
blocked:   8606
allowed:   868
overridden:0
logged:    8606
pending:   0
```

URL certificate blocklist

As increasing numbers of malware have started to use SSL to attempt to bypass IPS, maintaining a fingerprint-based certificate blocklist is useful to block botnet communication that relies on SSL.

This feature adds a dynamic package that is distributed by FortiGuard and is part of the Web Filtering service. It is enabled by default for SSL/SSH profiles, and can be configured using the following CLI commands:

```
config vdom
    edit <vdom>
        config firewall ssl-ssh-profile
            edit "certificate-inspection"
                set block-blocklisted-certificates enable
            next
            edit "deep-inspection"
                set block-blocklisted-certificates enable
            next
        end
    next
end
```

Websense Integrated Services Protocol

Websense Integrated Services Protocol (WISP) is supported on the FortGate, which allows the firewall to send traffic to the third-party web filtering service for rating and approval checking.

When WISP is enabled, the FortiGate maintains a pool of TCP connections to the WISP server. The TCP connections are used to forward HTTP request information and log information to the WISP server and receive policy decisions.

When a WISP server is used in a web filter profile, in flow or proxy mode, the following web filter scanning priority sequence is used:

1. Local URL filter
2. Websense web filtering service
3. FortiGuard web filtering service

The following example uses a WISP server configured in a flow mode web filter profile.

To use a WISP server in flow mode:

1. Configure the WISP servers:

```
config web-proxy wisp
    edit "wisp1"
        set server-ip 10.2.3.4
    next
    edit "wisp2"
        set server-ip 10.2.3.5
    next
    edit "wisp3"
        set server-ip 192.168.1.2
    next
    edit "wisp4"
        set server-ip 192.168.3.4
    next
end
```

2. Configure the web filter profile:

```
config webfilter profile
    edit "webfilter_flowbase"
        set feature-set flow
        config ftgd-wf
            unset options
            config filters
                edit 64
                    set category 64
                    set action block
                next
            end
        end
        set wisp enable
        set wisp-servers "wisp1" "wisp2"
```

```
        set wisp-algorithm {primary-secondary | round-robin | auto-learning}
        set log-all-url enable
    next
end
```

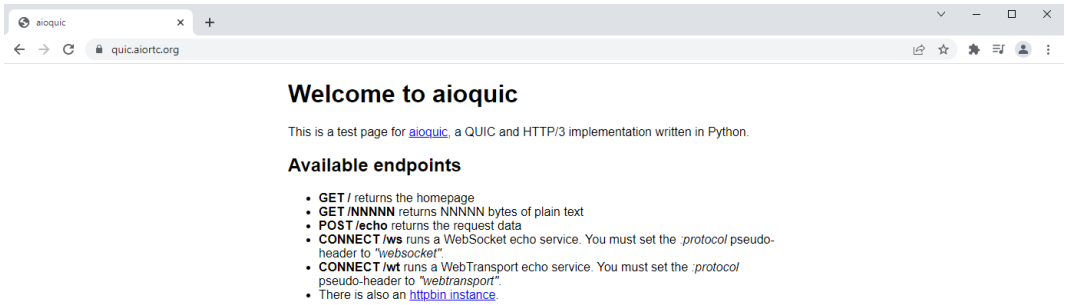
Inspecting HTTP3 traffic

HTTP/3 traffic can be inspected on the FortiGate in flow mode inspection.

When using Chrome, the browser may switch the HTTP/3 connection to HTTP/2 when deep inspection is applied, due to its sensitivity to delays caused by deep inspection.

Example

In this example, a web filter profile is created to block the words *Welcome to aioquic*, which appear in a website that uses HTTP/3.



To block content in HTTP/3 traffic:

1. Configure the web filter banned word table:

```
config webfilter content
    edit 1
        set name "aioquic"
        config entries
            edit "Welcome to aioquic"
                set status enable
            next
        end
    next
end
```

2. Apply the banned word table in the web filter profile:

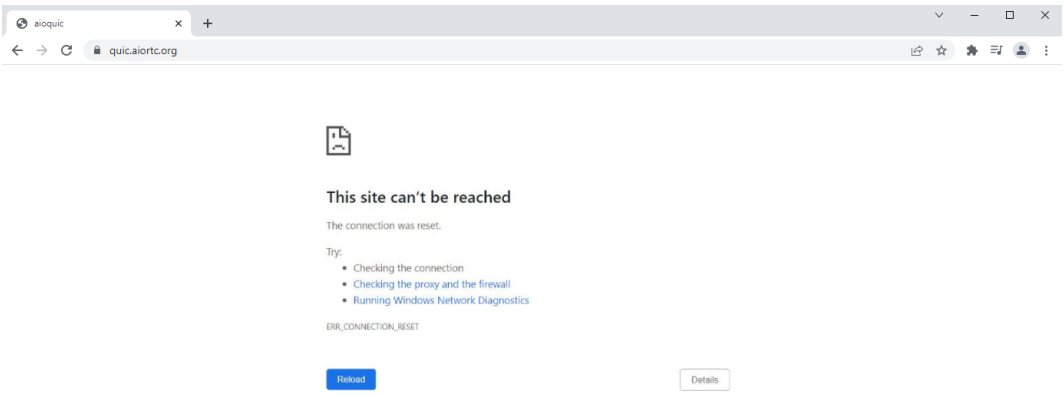
```
config webfilter profile
    edit "flow-webfilter"
        config web
```

```
            set bword-table 1
        end
        config ftgd-wf
            unset options
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set utm-status enable
        set ssl-ssh-profile "deep-inspection"
        set webfilter-profile "flow-webfilter"
        set logtraffic all
        set nat enable
    next
end
```

4. Access the website using a supported HTTP/3 client, such as Chrome or Firefox. The website is blocked by the FortiGate.



Using URL risk-scores in determining policy action

Risk level ratings can be added to the FortiGuard URL rating service. A FortiGate can query the rating service to retrieve the risk score for a URL. This risk score rates the likelihood that a website has malicious intent. It combines the results of machine learning models and human analysis together to predict how likely a given URL is malicious.

The risk score returned from FortiGuard is a value from 0-100, where:

Risk Score	Risk Level	Description
91-100	High	Strong confidence of malicious intent.
71-90	Suspicious	Medium confidence of malicious intent.
51-70	Moderate	Generally benign with a potential risk of attack.

Risk Score	Risk Level	Description
21-50	Low	Low predictive risk of attack.
1-20	Trustworthy	Very low predictive risk of attack.
0	Unrated	The URL does not exist in FortiGuard DB or the risk score of the URL is unknown.

The FortiGate can utilize this risk score and risk level in two different ways.

1. In a web filter profile, a risk level can be associated with the action *Block* or *Monitor*. When traffic hits a policy with the web filter profile applied, the URL will be used to query the FortiGuard URL rating service. If the risk score matches a level defined in the profile, the action is taken on that website.

   The firewall policy must use proxy-based inspection. Either certificate or deep inspection will work with this feature.

2. In an explicit or transparent web proxy, a proxy-policy can be configured with a risk level. The risk level becomes a matching criteria for the policy.

Furthermore, the risk score range associated with each predefined level above cannot be modified on the FortiGate. However, new risk levels can be created with a custom range. These risk levels can be used within a web filter profile or within a proxy-policy.

Tie-breaker

In a web filter profile, when both risk level and web filter category are used, the action for the matched risk level will be ranked against the action for the matched web category.

Actions have the following weight order:

1. Block
2. Warning (Authenticate)
3. Monitor
4. Allow

When the action resulting from the risk level query and web filter category query return different actions, the action higher in the weight order will be performed. For example, a block and a warning action will result in the page being blocked.

When the actions returned are the same, then that action will be applied, and the replacement message and UTM log will indicate the decision was made by web filter category check.

Finally, if multiple risk levels are matched within a web filter profile, the action that has the higher weight will be applied.

Risk score override

A risk score can be overridden by a local risk-score override value. This override applies to a single URL specified in the object name.

CLI Syntax

The follow CLI syntax are included for introducing URL risk-scores to determine policy action:

- Risk level configuration in a web filter profile:

```
config webfilter profile
    edit <name>
        set feature-set proxy
        config ftgd-wf
            unset options
            config risk
                edit <id>
                    set risk-level <pre-defined or custom level>
                    set action {block | monitor}
                    set log {enable | disable}
                next
            end
        end
    next
end
```

- Built-in read-only web filter local FortiGuard risk-level definition:

```
config webfilter ftgd-risk-level
    edit "high"
        set high 100
        set low 91
    next
    edit "suspicious"
        set high 90
        set low 71
    next
    edit "moderate"
        set high 70
        set low 51
    next
    edit "low"
        set high 50
        set low 21
    next
    edit "trustworthy"
        set high 20
        set low 1
    next
    edit "unrated"
        set high 0
        set low 0
    next
end
```

- Custom user-defined web filter local FortiGuard risk-level:

```
config webfilter ftgd-risk-level
    edit <name>
        set high <score>
        set low <score>
    next
end
```

- Web filter local FortiGuard risk-score override:

```
config webfilter ftgd-local-risk
    edit <url>
        set status {enable | disable}
        set comment <string>
        set risk-score <score>
    next
end
```

- Applying risk-level to proxy-policy match:

```
config firewall proxy-policy
    edit <id>
        set url-risk <pre-defined or custom level>
    next
end
```

Examples

The following examples demonstrate applying risk levels in different scenarios.

Two demo URLs are used for the examples:

Demo URL	Risk score	Default risk level
www.example.com	58	Moderate
www.httpbin.org	46	Low

In the web filter examples, the profile is applied to a firewall policy that utilizes proxy-based inspection and deep inspection.

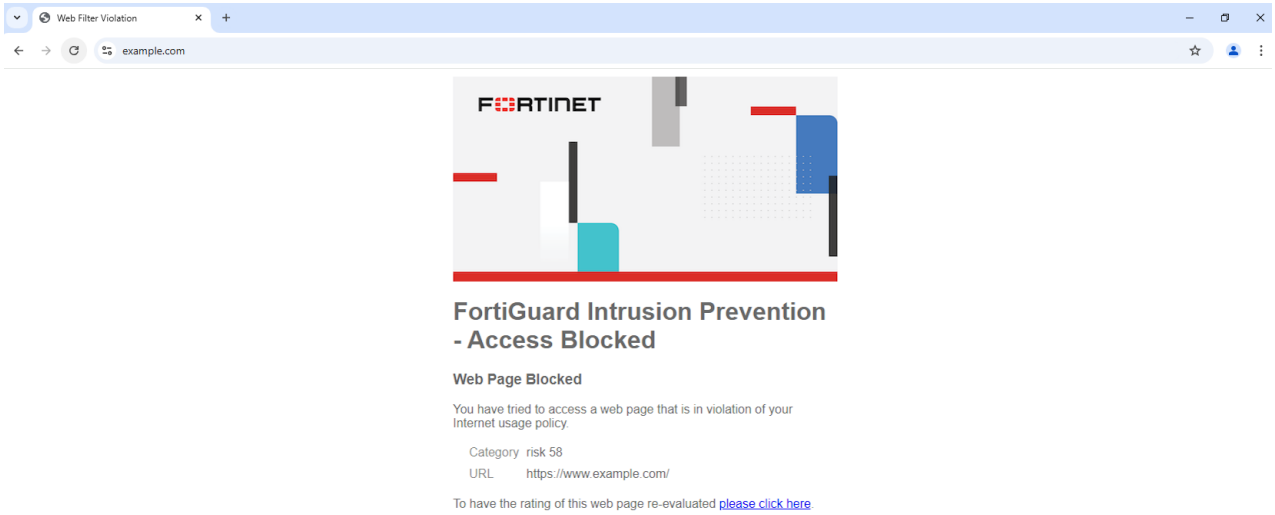
Example 1: Applying the action block to the moderate risk level

To apply the action block to the moderate risk level:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            config risk
                edit 1
                    set risk-level "moderate"
```

```
                    set action block
                next
            end
        end
    next
end
config firewall policy
    edit 1
        set name "WF"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set webfilter-profile "webfilter"
        set logtraffic all
        set nat enable
    next
end
```

When a client accesses www.example.com, the URL is blocked.



The following UTM log can be observed from CLI:

```
# execute log filter category utm-webfilter
# execute log display
1: date=2024-11-20 time=09:45:19 eventtime=1732124719100876715 tz="-0800" logid="0316013058"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="vdom1" policyid=1
poluuid="717176ae-97e7-51ef-2203-1f0b21e90462" policytype="policy" sessionid=6273
```

```
srcip=10.1.100.123 srcport=61545 srccountry="Reserved" srcintf="port2" srcintfrole="undefined"
srcuuid="8770b128-97cd-51ef-63d8-082966d66657" dstip=93.184.215.14 dstport=443
dstcountry="Belgium" dstintf="port1" dstintfrole="undefined" dstuuid="8770b128-97cd-51ef-63d8-
082966d66657" proto=6 httpmethod="GET" service="HTTPS" hostname="www.example.com"
agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KH" profile="webfilter"
action="blocked" reqtype="direct" url="https://www.example.com/" sentbyte=4559 rcvdbyte=6070
direction="outgoing" msg="URL belongs to a denied risk-level in policy" ratemethod="domain"
cat=255 urlrisk=58
```

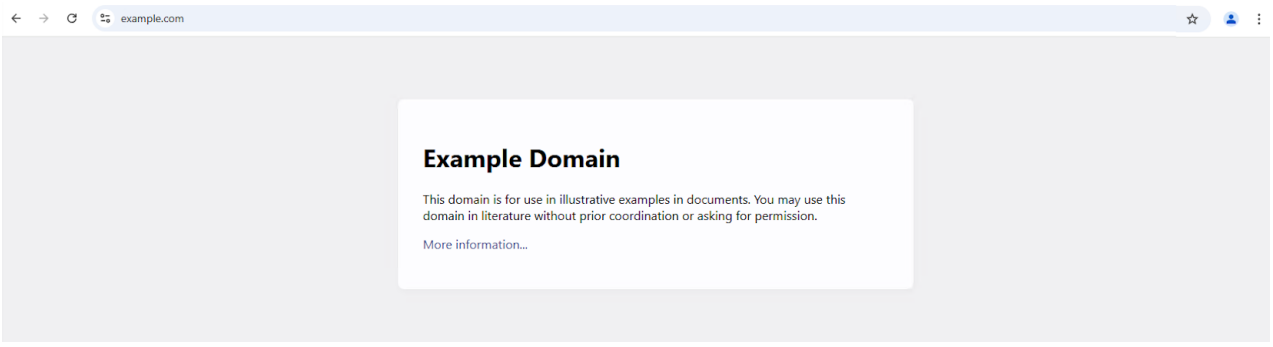
Example 2: Overriding the URL's FortiGuard risk score with local risk score

To override the URL's FortiGuard risk score with local risk score:

```
config webfilter ftgd-local-risk
    edit "www.example.com"
        set risk-score 30
    next
end
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            config risk
                edit 1
                    set risk-level "moderate"
                    set action block
                next
                edit 2
                    set risk-level "low"
                next
            end
        end
        set log-all-url enable
    next
end
```

The `low` risk-level is added to the web filter profile, with the action monitor.

When a client accesses www.example.com, the URL is allowed.



The following UTM log can be observed from CLI:

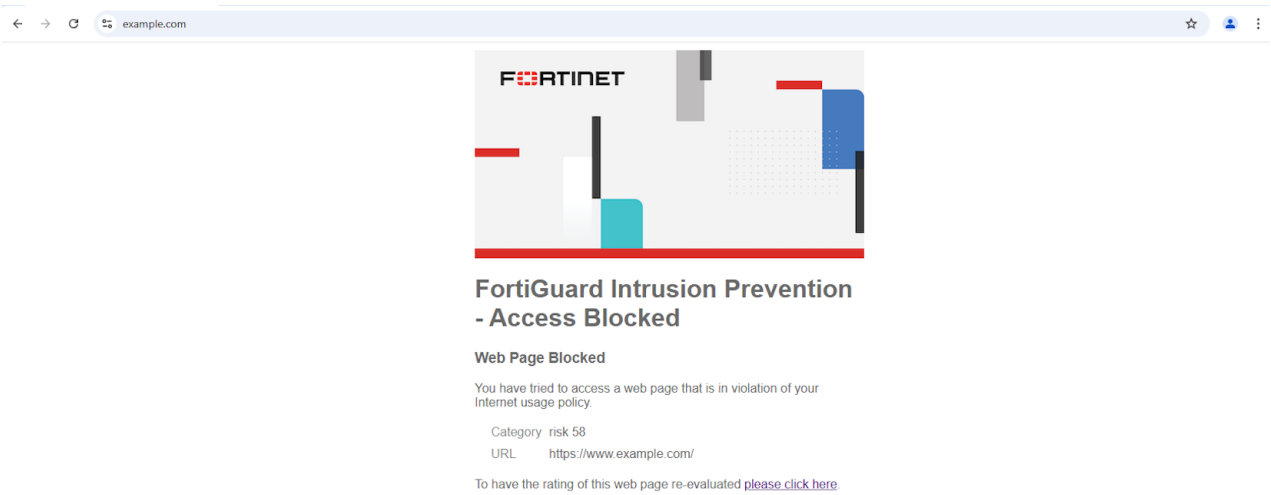
```
1: date=2024-11-20 time=11:25:55 eventtime=1732130754321650374 tz="-0800" logid="0317013313"
type="utm" subtype="webfilter" eventtype="ftgd_allow" level="notice" vd="vdom1" policyid=1
poluuid="717176ae-97e7-51ef-2203-1f0b21e90462" policytype="policy" sessionid=7648
srcip=10.1.100.123 srcport=61943 srccountry="Reserved" srcintf="port2" srcintfrole="undefined"
srcuuid="8770b128-97cd-51ef-63d8-082966d66657" dstip=93.184.215.14 dstport=443
dstcountry="Belgium" dstintf="port1" dstintfrole="undefined" dstuuid="8770b128-97cd-51ef-63d8-
082966d66657" proto=6 httpmethod="GET" service="HTTPS" hostname="www.example.com"
agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KH" profile="webfilter"
action="passthrough" reqtype="direct" url="https://www.example.com/" sentbyte=3118 rcvdbyte=4927
direction="outgoing" msg="URL belongs to an allowed risk-level in policy" ratemethod="domain"
cat=255 urlrisk=30
```

Example 3: Applying a user-defined risk level to the web filter profile

To apply a user-defined risk level to the web filter profile:

```
config webfilter ftgd-risk-level
    edit "medium-safety"
        set high 60
        set low 30
    next
end
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            config risk
                edit 1
                    set risk-level "medium-safety"
                    set action block
                next
            end
        end
        set log-all-url enable
    next
end
```

When a client accesses www.example.com, the URL is blocked.



The following UTM log can be observed from CLI:

```
1: date=2024-11-20 time=11:58:46 eventtime=1732132726031604734 tz="-0800" logid="0316013058"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="vdom1" policyid=1
poluuid="717176ae-97e7-51ef-2203-1f0b21e90462" policytype="policy" sessionid=8028
srcip=10.1.100.123 srcport=62051 srccountry="Reserved" srcintf="port2" srcintfrole="undefined"
srcuuid="8770b128-97cd-51ef-63d8-082966d66657" dstip=93.184.215.14 dstport=443
dstcountry="Belgium" dstintf="port1" dstintfrole="undefined" dstuuid="8770b128-97cd-51ef-63d8-
082966d66657" proto=6 httpmethod="GET" service="HTTPS" hostname="www.example.com"
agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KH" profile="webfilter"
action="blocked" reqtype="direct" url="https://www.example.com/" sentbyte=2962 rcvdbyte=4927
direction="outgoing" msg="URL belongs to a denied risk-level in policy" ratemethod="domain"
cat=255 urlrisk=58
```

Example 4: Matching an explicit web proxy policy by the URL's risk level

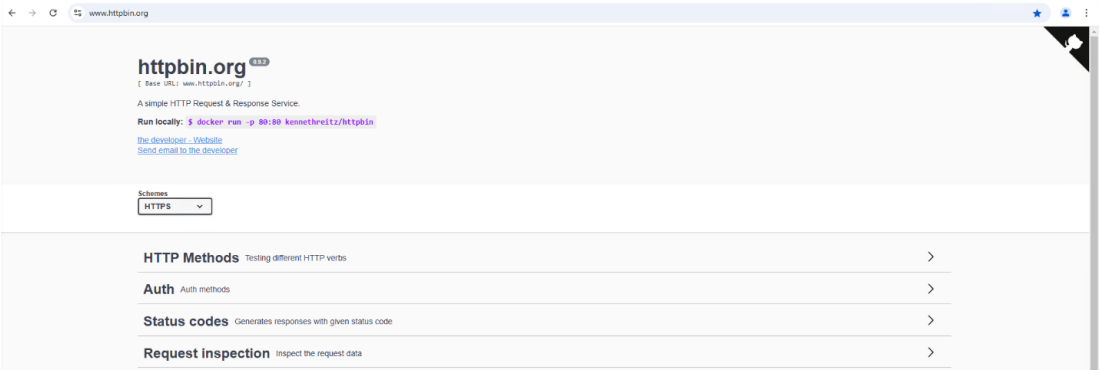
A proxy-policy is configured to allow URLs that have low risk level.

To match an explicit web proxy policy by the URL's risk level:

```
config firewall proxy-policy
    edit 1
        set name "Test"
        set proxy explicit-web
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set url-risk "low"
        set service "webproxy"
        set action accept
        set schedule "always"
        set logtraffic all
        set ssl-ssh-profile "protocols"
        set log-http-transaction enable
```

```
    next
end
```

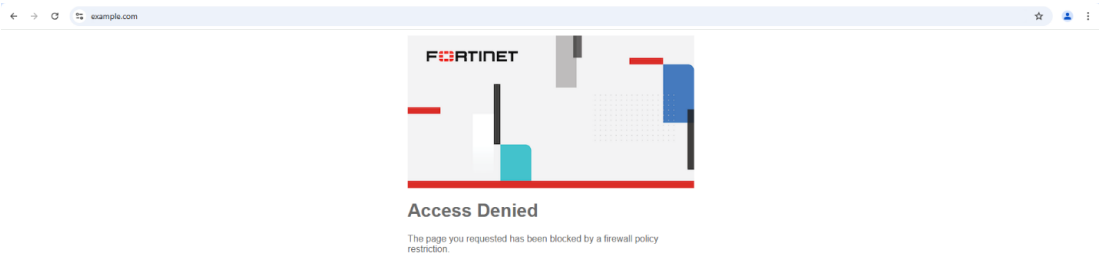
When a client accesses www.httpbin.org, the URL is allowed.



Traffic log indicates the traffic matched proxy-policy 1:

```
# execute log filter category traffic
# execute log display
2: date=2024-11-20 time=14:14:43 eventtime=1732140883609560183 tz="-0800" logid="0006000026"
type="traffic" subtype="http-transaction" level="notice" vd="vdom1" srcip=10.1.100.123
srcport=64445 dstip=52.20.148.183 dstport=443 sessionid=1798921931 transid=150995356
action="accept" policyid=1 policytype="proxy-policy" poluuid="7b6afd8e-a78b-51ef-0ae5-
5ddbd0defd25" url="https://www.httpbin.org/" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64)
AppleWebKit/537.36 (KHTML, like Gecko) Chrome/131.0.0.0 Safari/537.36" appcat="unscanned"
duration=1 reqlength=474 resplength=9751 rcvdbyte=15379 sentbyte=2809 scheme="https"
hostname="www.httpbin.org" resptype="normal" httpmethod="GET" statuscode="200" reqtime=1732140882
resptime=1732140883 respfinishtime=1732140883
```

When a client accesses www.example.com, no proxy policy is matched. The URL is blocked.



Traffic log indicates the traffic is denied:

```
2: date=2024-11-20 time=14:19:17 eventtime=1732141157742504064 tz="-0800" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="vdom1" srcip=10.1.100.123 srcport=64593
srcintf="port2" srcintfrole="undefined" dstip=93.184.215.14 dstport=443 dstintf="port1"
dstintfrole="undefined" srccountry="Reserved" dstcountry="Belgium" sessionid=1798922057 proto=6
action="deny" policyid=0 policytype="proxy-policy" service="HTTPS" trandisp="noop"
url="https://www.example.com/" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36
(KHTML, like Gecko) Chrome/131.0.0.0 Safari/537.36" appcat="unscanned" duration=0 sentbyte=222
```

```
rcvdbyte=0 sentpkt=0 rcvdpkt=0 crscore=30 craction=131072 crlevel="high" msg="Traffic denied
because of explicit proxy policy"
```

Configuration examples

This section includes the following configuration examples:

- Configuring web filter profiles with Hebrew domain names on page 2016
- Configuring web filter profiles to block AI and cryptocurrency on page 2021

Configuring web filter profiles with Hebrew domain names

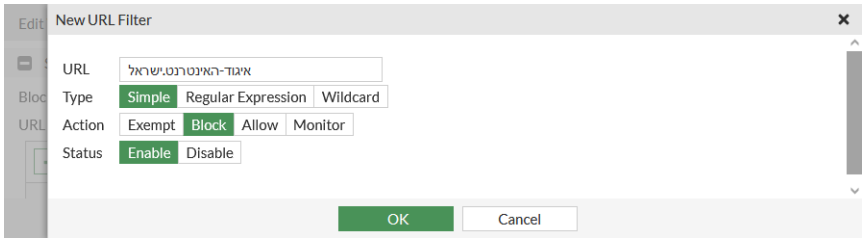
The domain name URLs in web filter profiles can be configured with non-ASCII characters, such as in Hebrew. Any configured domain name in non-ASCII characters is encoded into Punycode format, then the domain name in Punycode format is used to match the domain name in the HTTP request for URL filtering purposes.

In the following example, a Hebrew URL (`אינטרנט-איגוד.ישראל`) is blocked in by a static URL filter. The URL translates to:

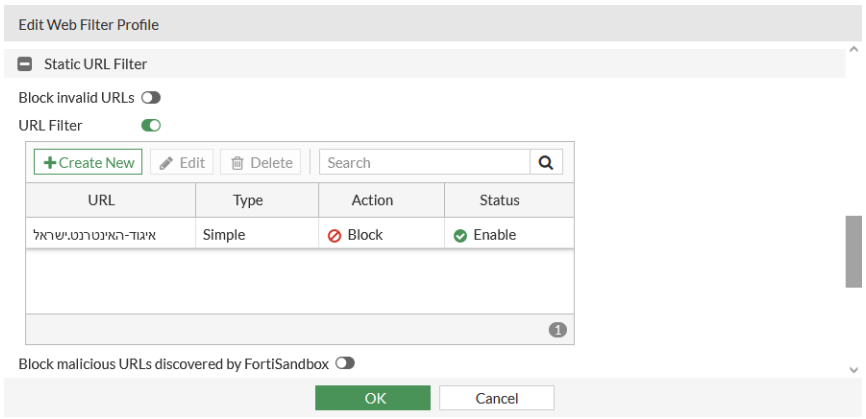
- `xn----zhcbgfhe2aacg8fb5i.xn--4dbrk0ce` in Punycode
- `en.isoc.org.il` in English

To configure the web filter profile in the GUI:

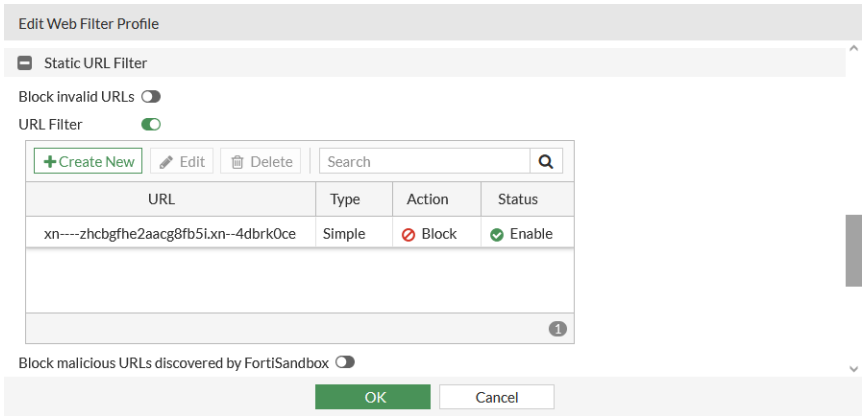
1. Go to *Security Profiles* > *Web Filter* and click *Create New*.
2. Enter a profile *Name*.
3. In the *Static URL Filter* section, enable *URL Filter* and click *Create New*.
4. Enter the Hebrew URL and set the *Action* to *Block*. The URL can be entered in Hebrew.



5. Click *OK* to save the filter. The URL appears in Hebrew in the URL filter table.



6. Click *OK* to save the web filter profile.
7. Edit the web filter profile. The URL in the table has been converted by the FortiGate into Punycode.



In the CLI, Punycode must be used to configure the Hebrew URL.

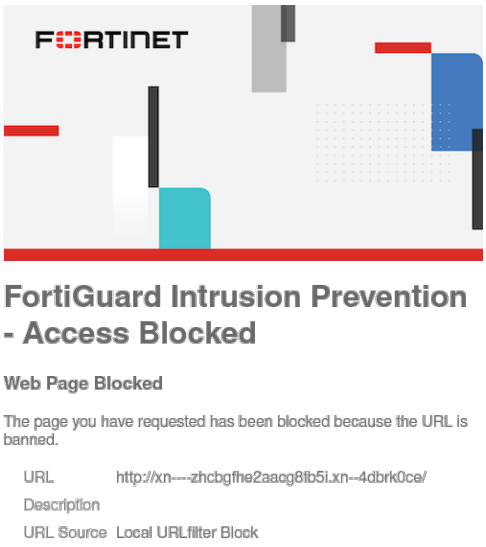
To configure the web filter profile in the CLI:

```
config webfilter urlfilter
    edit 1
        set name "Auto-webfilter-urlfilter_0wedo5f1c"
        config entries
            edit 1
                set url "xn----zhcbgfhe2aacg8fb5i.xn--4dbrk0ce"
                set action block
            next
        end
    next
end
```

To verify the configuration:

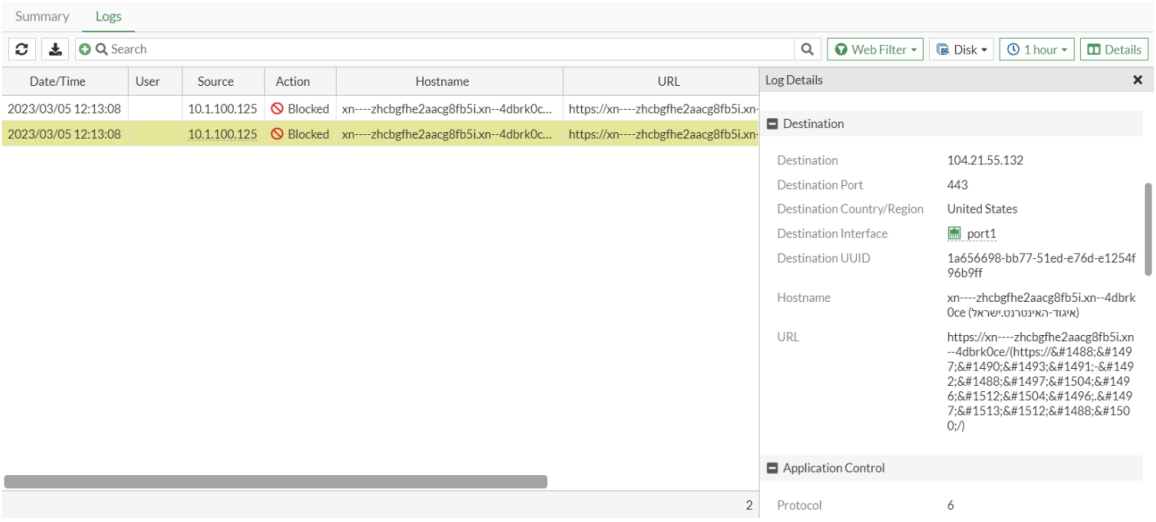
1. From a client, access the Hebrew URL over HTTPS. The website is blocked by the FortiGate.
2. The content of the replacement message displayed in the browser depends on the inspection mode.
   - In flow mode (current configuration), the URL is displayed in Hebrew.

   - In proxy mode, the URL is displayed in Punycode.



To verify the logs:

1. Go to *Log & Report* > *Security Events* and select the *Web Filter* card.
2. Select a log and click *Details*. The format of the *Hostname* and *URL* fields depends on the inspection mode.
   - In flow mode, the *Hostname* is displayed in Punycode with Hebrew in parentheses. The *URL* is displayed Punycode.



When the log file is downloaded, the hostname in the raw file cannot be displayed. Paste the log into a text editor (such as Word or Notepad) to view the URL in Hebrew.

```
# execute log display
2 logs found.
2 logs returned.

If a FortiGuard category-based filter is configured in a web filter profile, the same behavior for replacement messages and logs applies based on the inspection mode.

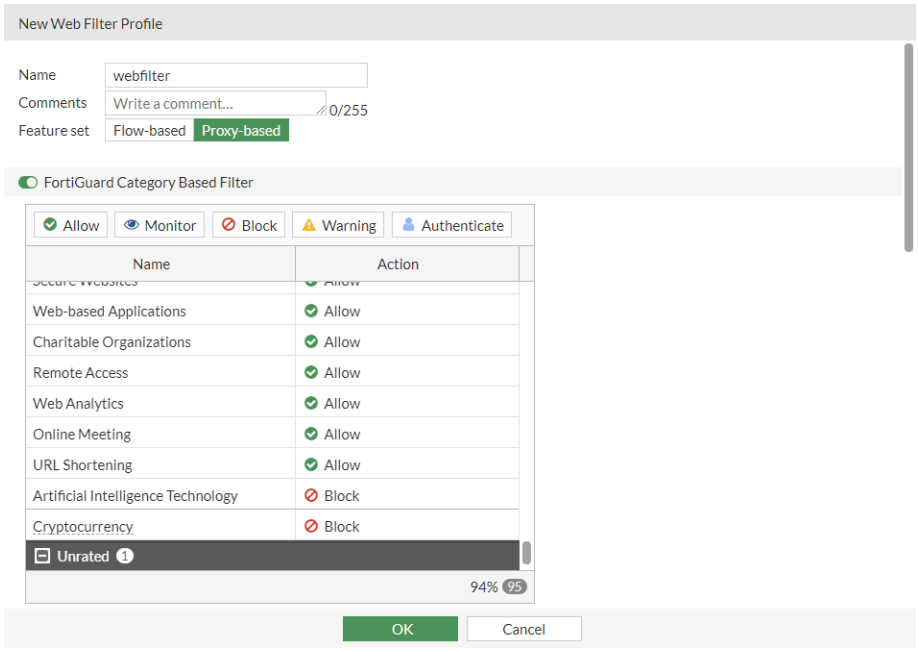
Configuring web filter profiles to block AI and cryptocurrency

The following FortiGuard web filter categories are available:

- Artificial intelligence technology (category 100): sites that offer solutions, insights, and resources related to artificial intelligence (AI).
- Cryptocurrency (category 101): sites that specialize in digital or virtual currencies that are secured by cryptography and operate on decentralized networks.

To configure a web filter profile to block the AI and cryptocurrency categories in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*.
2. Enter a name for the web filter profile.
3. In the category table, locate the *General Interest - Business* section. Select the *Artificial Intelligence Technology* and *Cryptocurrency* categories, and set the *Action* to *Block*.



4. Configure the remaining settings as needed.
5. Click *OK*.

To configure a web filter profile to block the AI and cryptocurrency categories in the CLI:

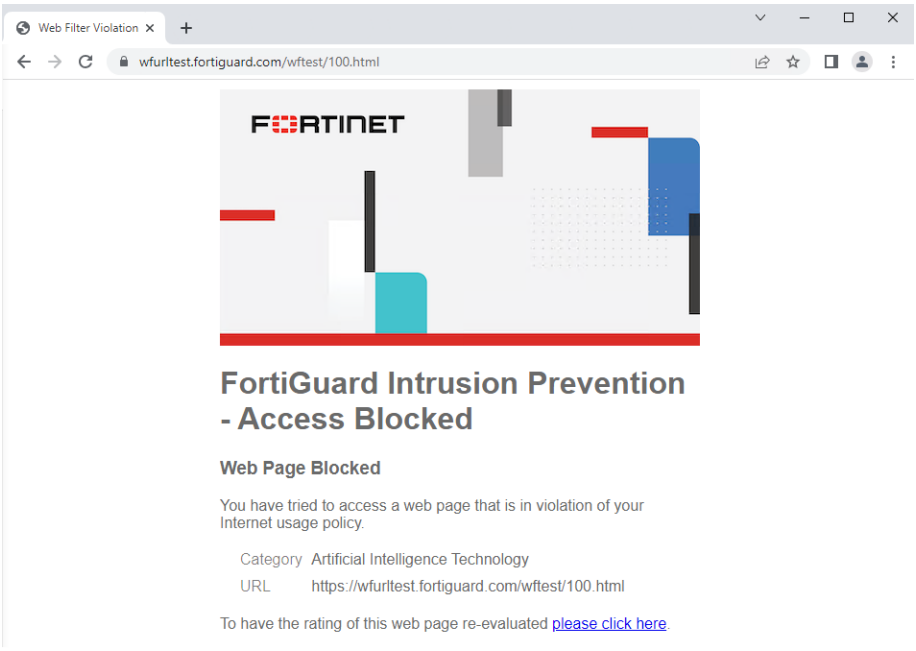
```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            config filters
                edit 100
                    set category 100
                    set action block
                next
                edit 101
                    set category 101
                    set action block
                next
                edit 52
                    set category 52
                next
            end
        end
        set log-all-url enable
    next
end
```

To verify that the categories are blocked:

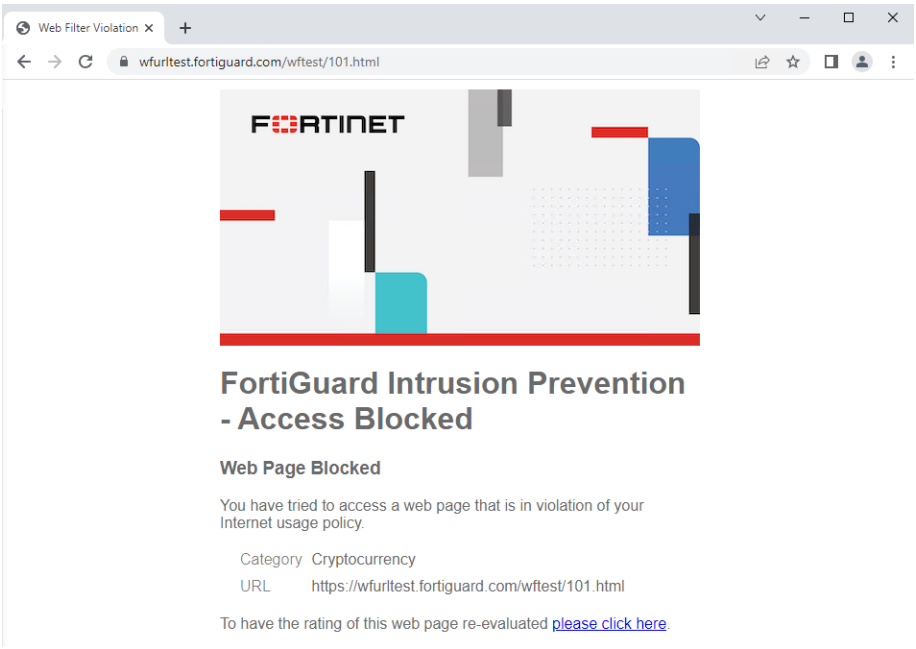
1. Apply the web filter profile in a firewall policy.
2. On a device that is connected through the FortiGate and uses the policy, visit the test URLs for each category:
   a. `https://wfurltest.fortiguard.com/wftest/100.html`
   b. `https://wfurltest.fortiguard.com/wftest/101.html`

      The browser displays a replacement message that the URL is blocked based on the FortiGuard category.

- Artificial intelligence technology:



- Cryptocurrency:



To verify the web filter logs:

1. In the GUI, go to *Log & Report* > *Security Events* and click *Web Filter*.
2. In the CLI, enter the following:

```
# execute log filter category utm-webfilter
# execute log display
1: date=2023-07-12 time=10:39:18 eventtime=1689183557968026063 tz="-0700" logid="0316013056"

```

Video filter

The video filter profile can be used to filter YouTube videos based on several criteria, including: FortiGuard categories, video titles, video descriptions, and channel IDs. These criteria provide a more granular override of a single channel, user, or video. The video filter profile is currently supported in proxy-based policies and requires SSL deep inspection. The FortiGuard Video filtering service is based on a valid FortiGuard web filter license.

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 98 for more information.

Configuring a video filter profile

In the GUI (*Security Profiles* > *Video Filter* > *Video Filter Profile*), four types of filters can be created on the *New Video Filter Profile* page: *Category*, *Title*, *Description*, and *Channel*.

When adding a *Category* type filter, the various FortiGuard categories, including *Any*, can be set to allow, monitor, or block videos in those categories. See Filtering based on FortiGuard categories on page 2026 for a detailed example and explanation of how the WAD daemon inspects videos.

The *Title* and *Description* type filters can be used to filter video based on keywords. See Configuring a video filter keyword list on page 2035 for more information. When a video's title or description matches a defined

keyword, the video filter will take the corresponding action of allow, monitor, or block. See Filtering based on title on page 2032 and Filtering based on description on page 2034 for detailed examples.

The *Channel* type filter can be used to filter all or specific YouTube channels. When a video matches a YouTube channel, the video filter will take the corresponding action of allow, monitor, or block. See Filtering based on YouTube channel on page 2030 for a detailed example.

Users can prioritize configured filters within the video filter profiles based on their sequence order. To change the sequence order, drag the selected filter to the desired position. An implicit rule within the video filter profile is set to *Allow*. If a video does not match any of the other filters, it will be subject to this implicit rule and allowed to pass through.

To configure a video filter profile:

```
config videofilter profile
    edit <name>
        config filters
            edit <id>
                set type {category* | channel | title | description}
                set log {enable* | disable}
                set action {allow | block | monitor*}
            next
        end
    next
end
```

The default values are marked with an asterisk (*).

YouTube API key

The YouTube API key is required when filtering by a:

- YouTube video title
- YouTube video description
- YouTube channel in conjunction with filtering based on FortiGuard categories

To configure the YouTube API key in the GUI:

1. Go to *Security Profiles* > *Video Filter* and select the *Video Filter Settings* tab.
2. Click the *+* to add an API key.
3. Click *OK*.

To configure the YouTube API key in the CLI:

```
config videofilter youtube-key
    edit <id>
        set key <string>
    next
end
```

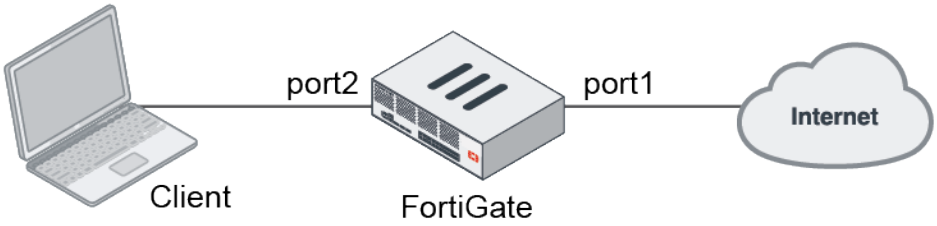
Filtering based on FortiGuard categories

Video filtering is only proxy-based and uses the WAD daemon to inspect the video in four phases:

1. When the WAD receives a video query from a client, it extracts the video ID (`vid`) and tries to check the category and channel from the local cache.
2. If there is no match from the local cache, it connects to the FortiGuard video rating server to query the video category.
3. If the FortiGuard rating fails, it uses the `videofilter.youtube-key` to communicate with the Google API server to get its category and channel ID. This is the API query setting and it requires the user's own YouTube API key string. This configuration is optional.
4. If all steps fail to match the video, the WAD calls on the IPS engine to match the video ID and channel ID from the application signature database.

The FortiGuard anycast service must be enabled to use this feature.

In this example, a new video filter profile is created to block the Knowledge category.



To configure a video filter based on FortiGuard categories in the GUI:

1. Create the video filter profile:
   a. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Profile* tab, and click *Create new*.
   b. Enter a name (*category_filter*).
   c. Create the filter:
      i. In the *Filters* table, click *Create new*.
      ii. Set the *Type* to the *Category*.
      iii. Set the *Action* to *Block*.
      iv. Set the *Category* to *Knowledge*.
      v. Click *OK* to save the filter.
   d. Click *OK* to save the video filter profile.
2. Create the firewall policy:

a. Enter the following:

Incoming Interface	port2
Outgoing Interface	port1
Source	All
Destination	All
Service	All
Inspection Mode	Proxy-based
NAT	Enable
Video Filter	Enable and select *category_filter*
Application Control	Enable and select *default*
SSL Inspection	deep-inspection
Log Allowed Traffic	All Sessions

b. Configure the other settings as needed and click *OK*.

To configure a video filter based on FortiGuard categories in the CLI:

1. Create the video filter profile:

```
config videofilter profile
    edit "category_filter"
        config filters
            edit 1
                set type category
                set category "4"
                set action block
                set log enable
            next
        end
    next
end
```

2. Create the firewall policy:

```
config firewall policy
    edit 10
        set name "client_yt_v4"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
```

```
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set application-list "default"
        set videofilter-profile "category_filter"
        set logtraffic all
        set nat enable
    next
end
```

Verifying that the video is blocked

When a user browses to YouTube and selects a video based in the Knowledge category, a replacement message will appear (see Example 3: blocking the video based on FortiGuard category on YouTube for an example replacement message). On the FortiGate, verify the forward traffic and web filter logs.

Sample forward traffic log:

```
2: date=2023-12-05 time=09:05:32 eventtime=1701796727673178582 tz="-0800" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="root" srcip=10.1.100.11 srcport=50568

utmaction="block" countweb=2 countapp=3 sentdelta=0 rcvddelta=0 utmref=65514-4674
```

Sample web filter log:

```
1: date=2023-12-05 time=09:05:37 eventtime=1701795937361806440 tz="-0800" logid="0347013664"
type="utm" subtype="webfilter" eventtype="videofilter-category" level="warning" vd="root"
msg="Video category is blocked." policyid=1 poluuid="f4fe48a4-938c-51ee-8856-3e84e3b24af4"
sessionid=480384 srcip=10.1.100.11 dstip=142.251.179.93 srcport=50568 dstport=443 srcintf="port2"
srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" proto=6 httpmethod="POST"
service="HTTPS" action="blocked" videoinfosource="FortiGuard" profile="category_filter"
videoid="hG-rVFM62J4" videocategoryid=4 videocategoryname="Knowledge" hostname="www.youtube.com"
agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KH"
referralurl="https://www.youtube.com/results?search_query=udemy"
url="https://www.youtube.com/youtubei/v1/player?key=AIzaSyAO_FJ2SlqU8Q4STEHLGCilw_Y9_
11qcW8&prettyPrint=false"
```

Troubleshooting and debugging

To verify if the FortiGuard video filtering license is valid:

```
# get system fortiguard
```

```
fortiguard-anycast  : enable
fortiguard-anycast-source: fortinet
protocol            : https
port                : 443
...
webfilter-license   : Contract
webfilter-expiration: Mon Oct 28 2024
...
```

To verify the WAD worker is running:

```
# diagnose test app wad 1000
Process [0]: WAD manager type=manager(0) pid=232 diagnosis=yes.
Process [1]: type=worker(2) index=0 pid=294 state=running
              diagnosis=no debug=enable valgrind=supported/disabled
...
Process [6]: type=YouTube-filter-cache-service(9) index=0 pid=290 state=running
              diagnosis=no debug=enable valgrind=unsupported/disabled
...
```

To display and debug video filter cache:

```
# diagnose test app wad ?
....
        321:  Display Video Filter Cache stats.
        322:  Reset Video Filter Cache stats.
        323:  Flush Video Filter Cache entries.
        324:  Display Video Filter module stats.
        325:  Request category list from Youtube API.
        326:  Display FTGD agent module stats.
        327:  Reset FTGD agent module stats.
        328:  Toggle Video Filter Cache Check.
        329:  Toggle Video Filter FTGD Query.
        330:  Toggle Video Filter API Check.
```

To enable real-time WAD debugs:

```
# diagnose wad debug enable level verbose
# diagnose wad debug enable category video
# diagnose debug enable
```

Sample output

```

Filtering based on YouTube channel

Video filtering can be configured to filter any or specific YouTube channels. When a video matches a YouTube channel, the video will take the corresponding action of allow, monitor, or block. Video filtering is only supported in proxy-based inspection mode, and deep inspection must be enabled in the firewall policy.

The YouTube API key must be configured when using this feature in conjunction with filtering based on FortiGuard categories. See YouTube API key for more information.

Videos are filtered based on their sequence order, which could allow for specific categorization. A category can be blocked, but certain channels within that category can be allowed. If no match is found, then the video will be subjected to an implicit rule and allowed to pass through See Basic configuration for an example.

Identifying the YouTube channel ID

The following table lists how to identify the YouTube channel ID based on different YouTube video URLs formats:

Video URL	Channel ID
www.youtube.com/channel/<channel-id>	<channel-id> indicates the ID for the channel.
www.youtube.com/user/<user-id>	Open the page source and locate: `<meta itemprop="channelId" content="<channel-id>">` <channel-id> indicates the channel ID for the user page.
www.youtube.com/watch?v=<string>	Open the page source and locate: `<meta itemprop="channelId" content="<channel-id>">` <channel-id> indicates the channel ID for the video.

Basic configuration

In this example, the Knowledge category in the video filter is configured to be blocked. The YouTube channel filter list is configured with the action set to monitor, which effectively creates an allowlist. The Fortinet YouTube channel ID UCJHo4AuVomwMRzgkA5DQEOA is allowed. This example uses the category_filter video filter profile and client_yt_v4 firewall policy configured in Filtering based on FortiGuard categories on page 2026.

To configure a video filter based on a YouTube channel in the GUI:

1. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Profile* tab, and edit *channel_filter*.
2. In the *Filters* table, click *Create new*.
3. Set the *Type* to the *Channel*.
4. Set the *Action* to *Monitor*.
5. Set the *Channel* to *Specify* and enter the *Channel ID*, *UCJHo4AuVomwMRzgkA5DQEOA*.
6. Click *OK* to save the filter.
7. Click *OK* to save the video filter profile.

To configure a video filter based on a YouTube channel in the CLI:

```
config videofilter profile
    edit "category_filter"
        config filters
            edit 2
                set type channel
                set channel "UCJHo4AuVomwMRzgkA5DQEOA"
                set action monitor
                set log enable
            next
        end
    next
end
```

Verifying the configuration

Perform a search from a client for a video on YouTube that falls under the Knowledge category, such as any video from the Udemy channel. The result is a blocked video. However, searching for a video from the Fortinet YouTube channel results in an accessible video.

Sample logs:

```
1: date=2023-12-13 time=09:33:20 eventtime=1702488800873289004 tz="-0800" logid="0347013664"

```

Filtering based on title

Video filtering can be configured to filter using keyword-based filters for video titles. When a video's title matches the configured keyword, the video filter will take the corresponding action of allow, monitor, or block. Video filtering is only supported in proxy-based inspection mode, and deep inspection must be enabled in the firewall policy.

The YouTube API key must be configured to use this feature. Otherwise, the title filter will not retrieve the video information and bypass the traffic. See YouTube API key for more information.

Basic configuration

In this example, videos are blocked that contain the keyword, game. For information about configuring video filter keyword lists, see Example configuration.

To configure the video filter profile in the GUI:

1. Configure the video filter profile:
   a. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Profile* tab, and click *Create new*.
   b. Enter a name (*title-filter-profile*).
   c. In the *Filters* table, click *Create new*.
   d. Configure the filter with the following settings:
      i. Set the *Type* to *Title*.
      ii. Set the *Action* to *Block*.
      iii. Set the *Keyword* to *test-keyword-match-or*.
      iv. Click *OK*.
   e. Click *OK* to save the video filter profile.
2. Apply the video filter in a firewall policy.

To configure the video filter profile in the CLI:

1. Configure the video filter profile:

```
config videofilter profile
    edit "title-filter-profile"
        config filters
            edit 1
                set type title
                set keyword 1
                set action block
                set log enable
            next
        end
    next
end
```

2. Apply the video filter in a firewall policy.

Verifying the configuration

From a client, search for a video in YouTube named "How To Use Python Steam API || Steam game API python". The video is blocked.

Sample log:

```
6: date=2023-11-24 time=09:51:30 eventtime=1700848289598975941 tz="-0800" logid="0350013712"
type="utm" subtype="webfilter" eventtype="unknown" level="warning" vd="vdom1" msg="Video title is
blocked." policyid=1 poluuid="19841eb8-841c-51ee-7047-6a6860eb3522" sessionid=384813810
srcip=10.1.100.141 dstip=142.251.33.110 srcport=21473 dstport=443 srcintf="port2"
srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" proto=6 httpmethod="GET"
service="HTTPS" action="blocked" videoinfosource="API" profile="title-filter-profile"
videoid="LaRHkSVvDjI" videotitle="How To Use Python Steam API  || Steam game API python"
hostname="www.youtube.com" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36
(KH" url="https://www.youtube.com/watch?v=LaRHkSVvDjI"
```

Filtering based on description

Video filtering can be configured to filter using keyword-based filters for video descriptions. When a video's description matches the configured keyword, the video filter will take the corresponding action of allow, monitor, or block. The description filter supports the first 100 characters of the video description. Video filtering is only supported in proxy-based inspection mode, and deep inspection must be enabled in the firewall policy.

The YouTube API key must be configured to use this feature. Otherwise, the description filter will not retrieve the video information and bypass the traffic. See YouTube API key for more information.

Basic configuration

In this example, videos are blocked where the description contains the keyword, API. For information about configuring video filter keyword lists, see Example configuration.

To configure the video filter profile in the GUI:

1. Configure the video filter profile:
   a. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Profile* tab, and click *Create new*.
   b. Enter a name (*test-description-filter*).
   c. In the *Filters* table, click *Create new*.
   d. Configure the filter with the following settings:
      i. Set the *Type* to *Description*.
      ii. Set the *Action* to *Block*.
      iii. Set the *Keyword* to *test-keyword-match-all*.
      iv. Click *OK*.
   e. Click *OK* to save the video filter profile.
2. Apply the video filter in a firewall policy.

To configure the video filter profile in the CLI:

1. Configure the video filter profile:

```
config videofilter profile
    edit "test-description-filter"
        config filters
            edit 1
                set type description
                set keyword 2
                set action block
                set log enable
            next
        end
    next
end
```

2. Apply the video filter in a firewall policy.

Verifying the configuration

From a client, search for a video in YouTube named "Postman Tutorial #7 - HTTP Methods GET and POST in Postman". The description contains the text, "POSTMAN TUTORIAL - Complete API Testing and API Test Automation Course using Postman Tool...", so the video is blocked.

Sample log:

```
4: date=2023-11-24 time=16:08:51 eventtime=1700870931146681788 tz="-0800" logid="0351013728"
type="utm" subtype="webfilter" eventtype="unknown" level="warning" vd="vdom1" msg="Video
description is blocked." policyid=1 poluuid="090ca600-83e4-51ee-158a-a920fcf8f892"
sessionid=100211 srcip=10.1.100.141 dstip=142.250.69.206 srcport=24948 dstport=443 srcintf="port2"
srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" proto=6 httpmethod="GET"
service="HTTPS" action="blocked" videoinfosource="API" profile="test-description-filter"
videoid="pUGmhtqVJRk" videodesc="Get all my courses for USD 5.99/Month - https://bit.ly/all-c..."
hostname="www.youtube.com" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36
(KH" url="https://www.youtube.com/watch?v=pUGmhtqVJRk"
```

Configuring a video filter keyword list

Users have the ability to filter videos based on the video titles and descriptions by defining a video filter keyword. Multiple keywords can be defined using a wildcard or regular expression, and can be used with AND/OR logic options.

Unicode emoji character code is currently not supported.

Configure the video filter keyword list in the GUI:

1. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Keyword* tab, and click *Create new*.
2. Configure the following:

Name	Enter a name.
Match operator	Select the match operator. • *Any*: match any keyword (OR logic) • *All*: match all keywords (AND logic)

3. Create the keywords:
   a. In the *Keywords* table, click *Create new*.
   b. Configure the following:

Pattern	Enter a regular expression or wildcard pattern string.
Pattern type	Select the pattern type. • *Wildcard*: suitable for basic search

	• *Regular Expression*: suitable for advanced search
Status	Set the status. • *Enable*: consider this keyword • *Disable*: ignore this keyword

   c. Click *OK*.
4. Click *OK* to save the keyword list.

Configure the video filter keyword list in the CLI:

```
config videofilter keyword
    edit <id>
        set name <string>
        set match {or | and}
        config word
           edit <name>
                set pattern-type {wildcard | regex}
                set status {enable | disable}
            next
        end
    next
end
```

Example configuration

In this example, two keywords, API and game, are created with the wildcard and regular expression types, respectively. The match operator is set to *Any*.

Configure the video filter keyword list in the GUI:

1. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Keyword* tab, and click *Create new*.
2. Enter a name (*test-keyword-match-or*) and set *Match operator* to *Any*.
3. In the *Keywords* table, click *Create new*.
4. Configure the API keyword with the following settings:
   a. In the *Pattern* field, enter *API*.
   b. Set the *Pattern type* to *Wildcard*.
   c. Click *OK*.
5. Click *Create new*.
6. Configure the game keyword with the following settings:
   a. In the *Pattern* field, enter *Game*.
   b. Set the *Pattern type* to *Regular Expression*.
   c. Click *OK*.
7. Click *OK* to save the keyword list.

Configure the video filter keyword list in the CLI:

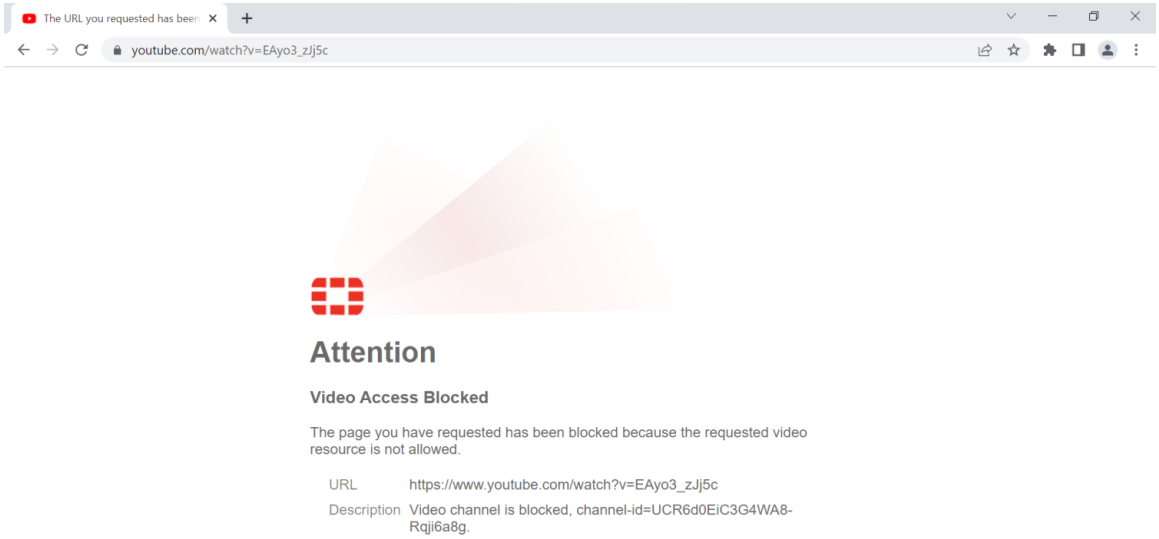
```
config videofilter keyword
    edit 1
        set name "test-keyword-match-or"
        set match or
        config word
           edit "API"
                set pattern-type wildcard
                set status enable
            next
            edit "Game"
                set pattern-type regex
                set status enable
            next
        end
    next
end
```

Replacement messages displayed in blocked videos

When a user visits a video directly by a URL, a full page replacement message is displayed. When a user loads a video from the YouTube website (homepage or recommended videos), the page loads and the replacement message is displayed in the video frame. For more information about configuring video filters, see Filtering based on FortiGuard categories on page 2026 and Filtering based on YouTube channel on page 2030.

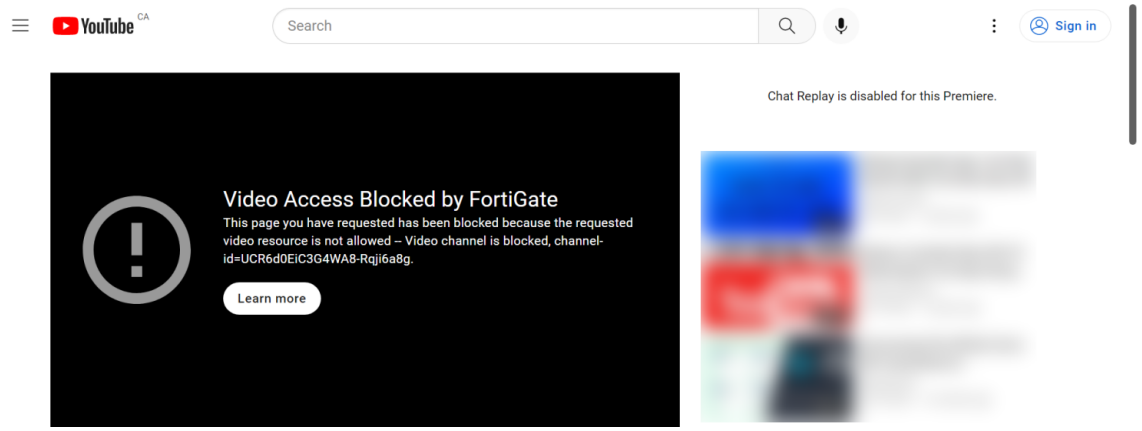
Example 1: blocking the video based on the URL

In this example, the user entered the URL of a blocked channel ID in their browser. The replacement message is displayed in the browser (full page).



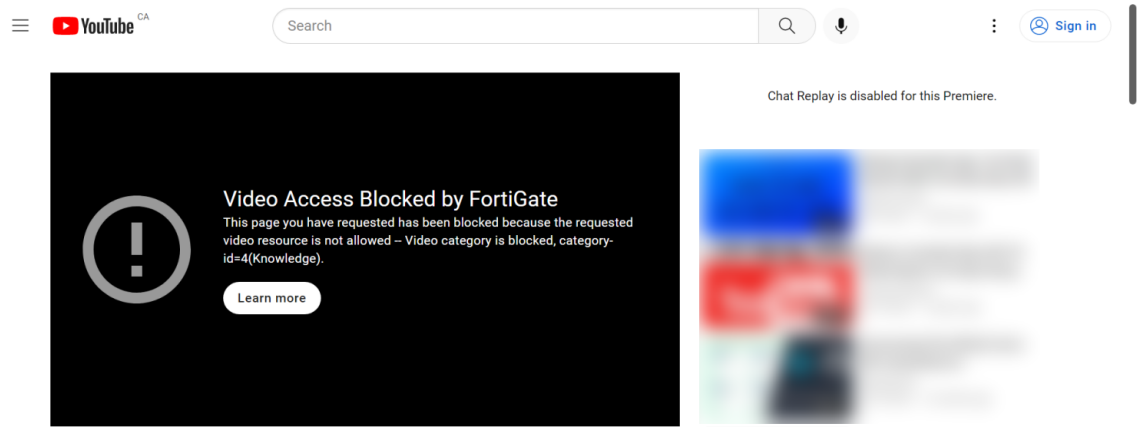
Example 2: blocking the video based on channel ID on YouTube

In this example, the user visited a blocked channel ID on the YouTube website. The replacement message is displayed in the video frame.



Example 3: blocking the video based on FortiGuard category on YouTube

In this example, the user visited a video on the YouTube website that belongs to a blocked FortiGuard category. The replacement message is displayed in the video frame.



DNS filter

You can apply DNS category filtering to control user access to web resources. You can customize the default profile, or create your own to manage network user access and apply it to a firewall policy, or you can add it to a DNS server on a FortiGate interface. For more information about configuring DNS, see DNS on page 289.

When both a DNS and a web filter are configured on a firewall policy, the DNS filter takes precedence. If certificate inspection is also used, the web filter replacement message might be shown instead of the SDNS block page. If both filters are set to block, SSL inspection is set to certificate inspection, and the destination web traffic is HTTPS, then the client receives a redirect to the SDNS server, which is then blocked by the web filter because the redirect URL cannot pass the certificate inspection.

DNS filtering has the following features:

- FortiGuard Filtering: filters the DNS request based on the FortiGuard domain rating.
- Botnet C&C domain blocking: blocks the DNS request for the known botnet C&C domains.
- External dynamic category domain filtering: allows you to define your own domain category.
- DNS safe search: enforces Google, Bing, and YouTube safe addresses for parental controls.
- Local domain filter: allows you to define your own domain list to block or allow.
- External IP block list: allows you to define an IP block list to block resolved IPs that match this list.
- DNS translation: maps the resolved result to another IP that you define.

Some DNS filter features require a subscription to FortiGuard Web Filtering.

DNS filtering connects to the FortiGuard secure DNS server over anycast by default. For more information about this configuration, see DNS over TLS and HTTPS on page 319.

The IPS engine handles the DNS filter in flow mode policies and queries the FortiGuard web filter server for FortiGuard categories. In proxy mode, the DNS proxy daemon handles the DNS filter and queries the FortiGuard SDNS server for FortiGuard categories. When a DNS filter profile is enabled in `config system dns-server`, the DNS proxy daemon handles the traffic.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 2040), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 2064).

DNS filter behavior in proxy mode

In cases where the DNS proxy daemon handles the DNS filter (described in the preceding section) and if DNS caching is enabled (this is the default setting), then the FortiGate will respond to subsequent DNS queries using the result in the DNS cache and will not forward these queries to a real DNS server.

There are two options to disable this behavior:

- Disable DNS caching globally.
- Remove the DNS filter profile from the proxy mode firewall policy or from the DNS server configured on a FortiGate interface.

To disable DNS caching globally:

```
config system dns
    set dns-cache-limit 0
end
```

There will be a performance impact to DNS queries since each query will not be cached, and will be forwarded to a real DNS server.

FortiGuard DNS rating service

DNS over TLS connections to the FortiGuard secure DNS server is supported. The CLI options are only available when `fortiguard-anycast` is enabled. DNS filtering connects to the FortiGuard secure DNS server over anycast by default.

To configure DoT to the secure DNS server in the CLI:

```
config system fortiguard
    set fortiguard-anycast enable
    set fortiguard-anycast-source fortinet
    set anycast-sdns-server-ip 0.0.0.0
    set anycast-sdns-server-port 853
end
```

The following topics provide information about DNS filters:

- Configuring a DNS filter profile on page 2040
- FortiGuard category-based DNS domain filtering on page 2045
- Botnet C&C domain blocking on page 2049
- DNS safe search on page 2052
- Local domain filter on page 2055
- DNS translation on page 2059
- Applying DNS filter to FortiGate DNS server on page 2064
- DNS inspection with DoT and DoH on page 2065
- DNS over QUIC and DNS over HTTP3 for transparent and local-in DNS modes on page 2069
- Troubleshooting for DNS filter on page 2074

Configuring a DNS filter profile

A DNS filter profile contains settings that enable or disable various forms of DNS filtering, including:

- FortiGuard filtering
- Botnet C&C domain blocking
- DNS safe search

- External dynamic category domain filtering
- Local domain filter
- External IP block list
- DNS translation

Once a DNS filter is configured, it can be applied to a firewall policy, or on a FortiGate DNS server if one is configured. In the following basic example, a DNS filter is created and applied to a firewall policy to scan DNS queries that pass through the FortiGate.

To configure a DNS filter profile in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Configure the settings as needed.

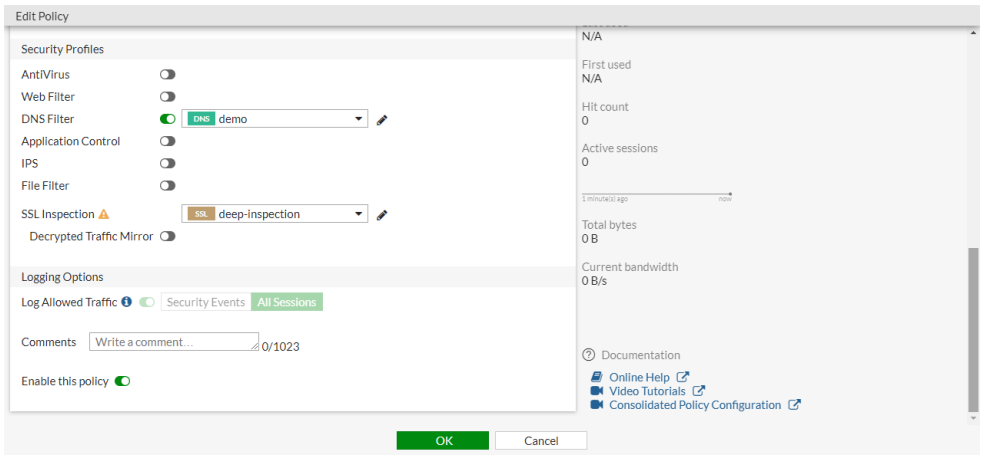
Name	Enter a unique name for the profile.
Comments	Enter a comment (optional).
Redirect botnet C&C requests to Block Portal	Enable to block botnet website access at the DNS name resolution stage. See Botnet C&C domain blocking on page 2049 for more details.
Enforce 'Safe Search' on Google, Bing, YouTube	Enable to avoid explicit and inappropriate results in the Google, Bing, and YouTube search engines. See DNS safe search on page 2052 for more details.
Restrict YouTube Access	When *Enforce 'Safe Search' on Google, Bing, YouTube* is enabled, select either *Strict* or *Moderate* to restrict YouTube access by responding to DNS resolutions with CNAME restrict.youtube.com and restrictmoderate.youtube.com respectively.
FortiGuard Category Based Filter	Enable to use the FortiGuard domain rating database to inspect DNS traffic. A FortiGuard Web Filter license is required to use this option. Expand the category groups in the table to view and edit the FortiGuard category settings to *Allow*, *Monitor*, or *Redirect to Block Portal*. See FortiGuard category-based DNS domain filtering on page 2045 for more details.
Static Domain Filter	This section includes options related to the static domain filter.
Domain Filter	Enable to define local static domain filters to allow or block specific domains. The local domain filter has a higher priority than the FortiGuard category-based domain filter. Click *Create New* in the table to add a domain filter and configure the following settings. • *Domain*: enter a domain. • *Type*: select *Simple*, *Reg. Expression*, or *Wildcard*. • *Action*: select *Redirect to Block Portal*, *Allow*, or *Monitor*. • *Status*: select *Enable* or *Disable*. See Local domain filter on page 2055 for more details.
External IP Block Lists	Enable to add one or more external IP block lists. See IP address external feed on page 4084 for more details.

	DNS Translation	Enable to translate a DNS resolved IP address to another IP address specified on a per-policy basis. Click *Create New* in the table to add a DNS translation and configure the following settings. • *Type*: select *IPv4* or *IPv6*. • *Original Destination*: enter the address of a host or subnet that you want translated. When a resolved address in a DNS response matches this destination, the FortiGate will replace the address with the address in *Translated Destination*. • *Translated Destination*: enter the address of a host or subnet that you want the resolved address to be translated to. • *Network Mask*: enter the netmask for the original and translated destination. If a single host is used for the original and translated destination, set the netmask to *255.255.255.255*. • *Status*: select *Enable* or *Disable*. Enabling DNS translation will override matching DNS responses with translated IPs. See DNS translation on page 2059 for more details.
Options		This section includes other options related to the DNS filter.
	Redirect Portal IP	Set the IP address of the SDNS redirect portal. Select *Use FortiGuard Default*, or *Specify* and enter the IP address. When *FortiGuard Category Based Filter* categories are set to *Redirect to Block Portal*, the DNS response will use this IP address in its response to the client. If the client is accessing the domain on a web browser, they will be redirected to the block portal page on this address.
	Allow DNS requests when a rating error occurs	Enable to allow all domains when FortiGuard DNS servers fail, or they are unreachable from the FortiGate. When this happens, a log message is recorded in the DNS logs by default.
	Log all DNS queries and responses	Enable to log all domains visited (detailed DNS logging).
	Strip Encrypted Client Hello service parameters	Enable removal of the ECH service parameter from supporting DNS RRs. ECH information is stripped from DoH responses, forcing the browser to not use ECH for TLS connections.

3. Click *OK*.

To apply a DNS filter profile to a policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*, or edit an existing policy.
2. In the *Security Profiles* section, enable *DNS Filter* and select the DNS filter.



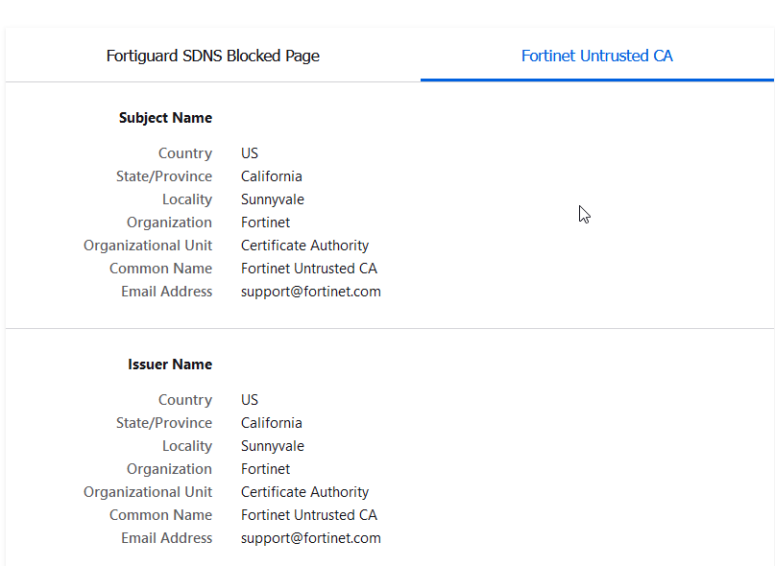
3. Configure the other settings as needed.
4. Click *OK*.

Redirecting to default Block Portal

By default, FortiGate redirects traffic to the FortiGuard SDNS block portal at 208.91.112.55, which is owned and hosted by Fortinet. When opening a blocked destination in the browser, two behaviors may occur:

- When opening a HTTP page, the blocked page is hosted on HTTP/80 and displays without errors.
- When opening a HTTPS page, the blocked page is hosted on HTTPS/443 and results in a warning.

  The warning is expected because the blocked page is redirected to the blocked portal on 208.91.112.55, but the page is served in HTTPS using the domain of the destination that the user is trying to reach. Therefore, a Fortinet CA must resign the SSL certificate in order to display the block page content. The Fortinet CA cannot be trusted natively because it is not a publicly trusted CA. As such, when you review the CA issuer, you find that the Common Name of the CA specifically indicates Fortinet Untrusted CA.



CLI-only settings

The following DNS filter profile settings can only be configured in the CLI:

```
config dnsfilter profile
    edit <name>
        set block-action {block | redirect | block-servfail}
        set sdns-ftgd-err-log {enable | disable}
    next
end
```

`block-action {block | redirect | block-servfail}`	Set the action to take for blocked domains: • `block`: return NXDOMAIN for blocked domains. • `redirect`: redirect blocked domains to SDNS portal (default). • `block-servfail`: return SERVFAIL for blocked domains. When a FortiGuard or local domain filter category is set to *Redirect to Block Portal* in the GUI, the action is set to `block` in the CLI. By default, the `block-action` applied to a DNS profile is set to `redirect`.
`sdns-ftgd-err-log {enable | disable}`	Enable/disable FortiGuard SDNS rating error logging (default = enable).

To configure a DNS filter profile in the CLI:

```
config dnsfilter profile
    edit "demo"
        set comment ''
        config domain-filter
            unset domain-filter-table
        end
        config ftgd-dns
            set options error-allow
            config filters
                edit 2
                    set category 2
                    set action monitor
                next
                edit 7
                    set category 7
                    set action block
                next
                ...
                edit 22
                    set category 0
                    set action monitor
                next
            end
        end
        set log-all-domain enable
        set sdns-ftgd-err-log enable
```

```
        set sdns-domain-log enable
        set block-action redirect
        set block-botnet enable
        set safe-search enable
        set redirect-portal 93.184.216.34
        set youtube-restrict strict
        set strip-ech enable
    next
end
```

To apply a DNS filter profile to a policy in the CLI:

```
config firewall policy
    edit 1
        set name "Demo"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set logtraffic all
        set fsso disable
        set dnsfilter-profile "demo"
        set profile-protocol-options "default"
        set ssl-ssh-profile "deep-inspection"
        set nat enable
    next
end
```

FortiGuard category-based DNS domain filtering

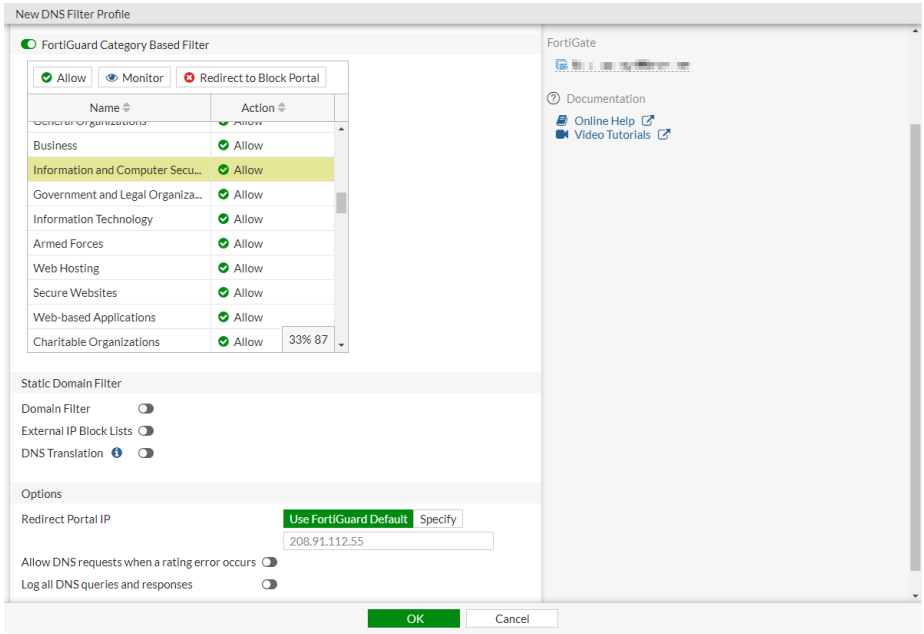
You can use the FortiGuard category-based DNS domain filter to inspect DNS traffic. This makes use of FortiGuard's continuously updated domain rating database for more reliable protection.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 2040), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 2064).

The FortiGate must have a FortiGuard Web Filter license to use the FortiGuard category-based filter.

To configure FortiGuard category-based DNS domain filtering in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *FortiGuard Category Based Filter*.
3. Select the category and then select *Allow*, *Monitor*, or *Redirect to Block Portal* for that category.
4. In the *Options* section, select a setting for *Redirect Portal IP*. Select either *Use FortiGuard Default* (208.91.112.55) or click *Specify* and enter another portal IP. The FortiGate will use the portal IP to replace the resolved IP in the DNS response packet.



5. Click *OK*.

To configure FortiGuard category-based DNS domain filtering in the CLI:

```
config dnsfilter profile
   edit "demo"
      set comment ''
      config domain-filter
         unset domain-filter-table
      end
      config ftgd-dns
         set options error-allow
         config filters
             edit 2
                 set category 2
                 set action monitor
             next
             edit 7
                 set category 7
                 set action monitor
             next
            ...
             edit 22
```

```
                set category 0
                set action monitor
            next
        end
    end
    set log-all-domain enable
    set sdns-ftgd-err-log enable
    set sdns-domain-log enable
    set block-action {redirect | block}
    set block-botnet enable
    set safe-search enable
    set redirect-portal 93.184.216.34
    set youtube-restrict strict
  next
end
```

You can use the `get webfilter categories` command to determine the web filtering category that corresponds to a given category ID.

Verifying the logs

From your internal network PC, use a command line tool, such as dig or nslookup, to do a DNS query for some domains. For example:

```
#dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 61252
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 13; ADDITIONAL: 11

;; QUESTION SECTION:

```

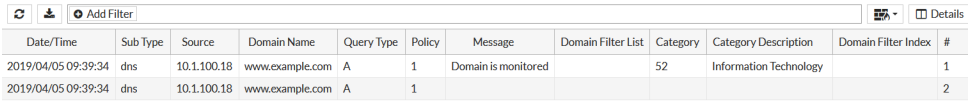
To check the DNS filter log in the GUI:

1. Go to *Log & Report > Security Events*.
2. Click the *DNS Query* card name. There are logs for the DNS traffic that just passed through the FortiGate with the FortiGuard rating for the domain name.



Add Filter | Details

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description	Domain Filter Index	#
2019/04/05 09:39:34	dns	10.1.100.18	www.example.com	A	1	Domain is monitored		52	Information Technology		1
2019/04/05 09:39:34	dns	10.1.100.18	www.example.com	A	1						2

To check the DNS filter log in the CLI:

```
# execute log filter category utm-dns

# execute log display
2 logs found.
2 logs returned.

1: date=2019-04-05 time=09:39:34 logid="1501054802" type="utm" subtype="dns" eventtype="dns-
response" level="notice" vd="vdom1" eventtime=1554482373 policyid=1 sessionid=50868

```

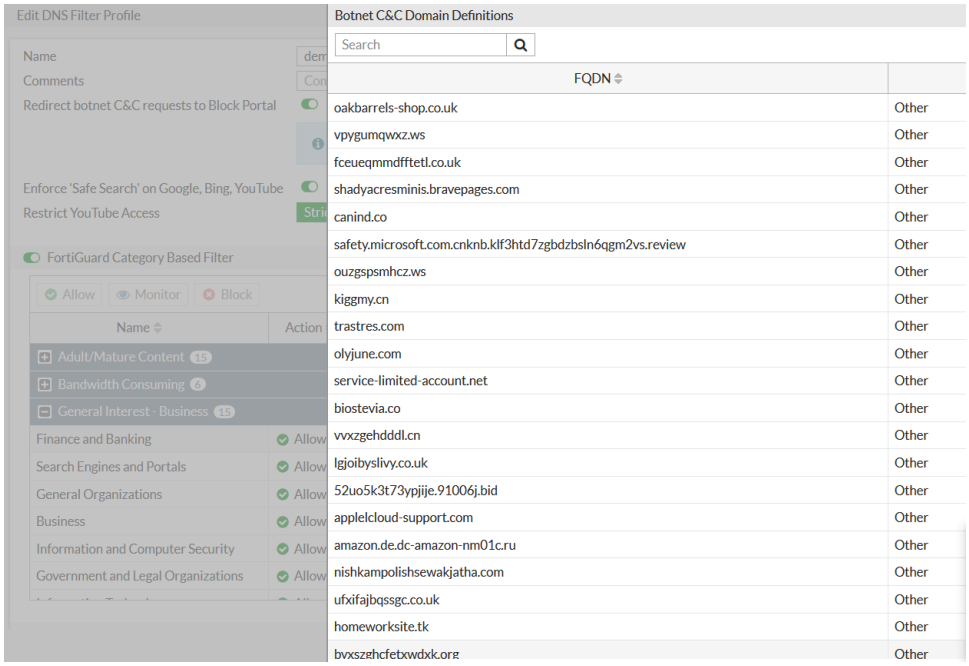
Botnet C&C domain blocking

FortiGuard Service continually updates the botnet C&C domain list. The botnet C&C domain blocking feature can block the botnet website access at the DNS name resolving stage. This provides additional protection for your network.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 2040), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 2064).

To configure botnet C&C domain blocking in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *Redirect botnet C&C requests to Block Portal*.
3. Optionally, click the *botnet package* link. The *Botnet C&C Domain Definitions* pane opens, which displays the latest list.



4. Configure the other settings as needed.
5. Click *OK*.

To configure botnet C&C domain blocking in the CLI:

```
config dnsfilter profile
   edit "demo"
      set comment ''
      config domain-filter
         unset domain-filter-table
      end
      config ftgd-dns
         set options error-allow
```

```
        config filters
           ...
        end
      end
      set log-all-domain enable
      set sdns-ftgd-err-log enable
      set sdns-domain-log enable
      set block-action block
      set block-botnet enable
      set safe-search enable
      set redirect-portal 208.91.112.55
      set youtube-restrict strict
   next
end
```

Verifying the logs

Select a botnet domain from that list. From your internal network PC, use a command line tool, such as dig or nslookup, to send a DNS query to traverse the FortiGate. For example:

```
#dig canind.co
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 997
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; canind.co.                   IN      A

;; ANSWER SECTION:
canind.co.              60      IN      A       208.91.112.55

;; Received 43 B
;; Time 2019-04-05 09:55:21 PDT
;; From 172.16.95.16@53(UDP) in 0.3 ms
```

The botnet domain query was blocked and redirected to the portal IP (208.91.112.55) .

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Click the *DNS Query* card name to view the DNS query blocked as a botnet domain.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/04 16:43:59	dns	10.1.100.18	canind.co	A	1	Domain was blocked by dns botnet C&C			
2019/04/04 16:43:59	dns	10.1.100.18	canind.co	A	1				

To check the DNS filter log in the CLI:

```
(vdom1) # execute log filter category utm-dns

(vdom1) # execute log display
2 logs found.
2 logs returned.
```

```
1: date=2019-04-04 time=16:43:59 logid="1501054601" type="utm" subtype="dns" eventtype="dns-
response" level="warning" vd="vdom1" eventtime=1554421439 policyid=1 sessionid=14135
srcip=10.1.100.18 srcport=57447 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16

dstintf="port9" dstintfrole="undefined" proto=17 profile="demo" xid=24339 qname="canind.co"
qtype="A" qtypeval=1 qclass="IN"
```

Botnet C&C IPDB blocking

FortiOS also maintains a botnet C&C IP address database (IPDB). If a DNS query response IP address (resolved IP address) matches an entry inside the botnet IPDB, this DNS query is blocked by the DNS filter botnet C&C.

To view the botnet IPDB list in the CLI:

```
(global) # diagnose sys botnet list 9000 10
9000. proto=TCP ip=103.228.28.166, port=80, rule_id=7630075, name_id=3, hits=0
9001. proto=TCP ip=5.9.32.166, port=481, rule_id=4146631, name_id=7, hits=0
9002. proto=TCP ip=91.89.44.166, port=80, rule_id=48, name_id=96, hits=0
9003. proto=TCP ip=46.211.46.166, port=80, rule_id=48, name_id=96, hits=0
9004. proto=TCP ip=77.52.52.166, port=80, rule_id=48, name_id=96, hits=0
9005. proto=TCP ip=98.25.53.166, port=80, rule_id=48, name_id=96, hits=0
9006. proto=TCP ip=70.120.67.166, port=80, rule_id=48, name_id=96, hits=0
9007. proto=TCP ip=85.253.77.166, port=80, rule_id=48, name_id=96, hits=0
9008. proto=TCP ip=193.106.81.166, port=80, rule_id=48, name_id=96, hits=0
9009. proto=TCP ip=58.13.84.166, port=80, rule_id=48, name_id=96, hits=0
```

Select an IP address from the IPDB list and use a reverse lookup service to find its corresponding domain name. From your internal network PC, use a command line tool, such as dig or nslookup, to query this domain and verify that it is blocked by the DNS filter botnet C&C. For example:

```
# dig cpe-98-25-53-166.sc.res.rr.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 35135
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; cpe-98-25-53-166.sc.res.rr.com.              IN      A

;; ANSWER SECTION:
cpe-98-25-53-166.sc.res.rr.com. 60      IN      A       208.91.112.55

;; Received 64 B
;; Time 2019-04-05 11:06:47 PDT
;; From 172.16.95.16@53(UDP) in 0.6 ms
```

Since the resolved IP address matches the botnet IPDB, the query was blocked and redirected to the portal IP (208.91.112.55) .

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *DNS Query* to view the DNS query blocked by botnet C&C IPDB.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/05 11:06:48	dns	10.1.100.18	cpe-98-25-53-166.sc.res.rr.com	A	1	Domain was blocked by dns botnet C&C			
2019/04/05 11:06:48	dns	10.1.100.18	cpe-98-25-53-166.sc.res.rr.com	A	1				

To check the DNS filter log in the CLI:

```
(global) # execute log filter category utm-dns

(global) # execute log display
2 logs found.
2 logs returned.

1: date=2019-04-05 time=11:06:48 logid="1501054600" type="utm" subtype="dns" eventtype="dns-
response" level="warning" vd="vdom1" eventtime=1554487606 policyid=1 sessionid=55232
srcip=10.1.100.18 srcport=60510 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16
dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="demo" xid=16265 qname="cpe-
98-25-53-166.sc.res.rr.com" qtype="A" qtypeval=1 qclass="IN" ipaddr="93.184.216.34" msg="Domain
was blocked by dns botnet C&C" action="redirect" botnetip=98.25.53.166

2: date=2019-04-05 time=11:06:48 logid="1500054000" type="utm" subtype="dns" eventtype="dns-query"
level="information" vd="vdom1" eventtime=1554487606 policyid=1 sessionid=55232 srcip=10.1.100.18

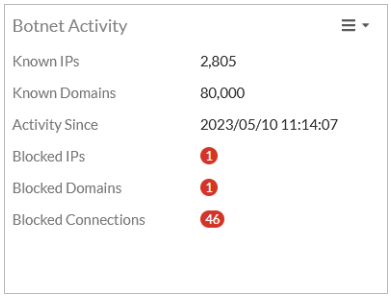
166.sc.res.rr.com" qtype="A" qtypeval=1 qclass="IN"
```

To check botnet activity:

1. Go to *Dashboard* > *Status* and locate the *Botnet Activity* widget.



2. If you do not see the widget, click *Add Widget*, and add the *Botnet Activity* widget.

DNS safe search

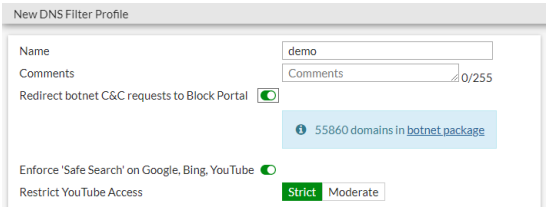
The DNS safe search option helps avoid explicit and inappropriate results in the Google, Bing, DuckDuckGo, Qwant, and YouTube search engines. The FortiGate responds with content filtered by the search engine.

For individual search engine safe search specifications, refer to the documentation for Google, Bing, DuckDuckGo, Qwant, and YouTube.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 2040), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 2064).

To configure safe search in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *Enforce 'Safe search' on Google, Bing, YouTube* (this setting also applies safe search on DuckDuckGo and Qwant).
3. For *Restrict YouTube Access*, click *Strict* or *Moderate*.



4. Configure the other settings as needed.
5. Click *OK*.

To configure safe search in the CLI:

```
config dnsfilter profile
    edit "demo"
        config ftgd-dns
            set options error-allow
            config filters
                edit 2
                    set category 2
                next
               ...
            end
        end
        set log-all-domain enable
        set block-botnet enable
        set safe-search enable
        set youtube-restrict strict
    next
end
```

Verifying the logs

From your internal network PC, use a command line tool, such as dig or nslookup, and perform a DNS query on www.bing.com. For example:

```
# dig www.bing.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 46568
;; Flags: qr rd ra; QUERY: 1; ANSWER: 2; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.bing.com.                IN      A

;; ANSWER SECTION:
www.bing.com.           103     IN      CNAME   strict.bing.com
strict.bing.com.        103     IN      A       204.79.197.220

;; Time 2019-04-05 14:34:52 PDT
;; From 172.16.95.16@53(UDP) in 196.0 ms
```

The DNS query for www.bing.com returns with a CNAME strict.bing.com, and an A record for the CNAME. The user's web browser then connects to this address with the same search engine UI, but any explicit content search is filtered out.

To check the DNS filter log in the GUI:

1. Go to *Log & Report > Security Events*.
2. Click the *DNS Query* card name.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/05 14:34:53	dns	10.1.100.18	www.bing.com	A	1	DNS Safe Search enforced		41	Search Engines and Portals
2019/04/05 14:34:53	dns	10.1.100.18	www.bing.com	A	1				

   The DNS filter log in FortiOS shows a message of *DNS Safe Search enforced*.

To check the DNS filter log in the CLI:

```
# execute log filter category utm-dns
# execute log display
2 logs found.
2 logs returned.

1: date=2019-04-05 time=14:34:53 logid="1501054804" type="utm" subtype="dns" eventtype="dns-

Local domain filter

In addition to the FortiGuard category-based domain filter, you can define a local static domain filter to allow or block specific domains.

In a DNS filter profile, the local domain filter has a higher priority than FortiGuard category-based domain filter. DNS queries are scanned and matched first with the local domain filter.

- If the local domain filter list has no match, then the FortiGuard category-based domain filter is used. If a DNS query domain name rating belongs to the block category, the query is blocked and redirected. If the FortiGuard category-based filter has no match, then the original resolved IP address is returned to the client DNS resolver.
- If the local domain filter action is set to block and an entry matches, then that DNS query is blocked and redirected.
- If the local domain filter action is set to allow and an entry matches, it will skip the FortiGuard category-based domain filter and directly return to the client DNS resolver.
- If the local domain filter action is set to monitor and an entry matches, it will skip the FortiGuard category-based domain filter, directly return to the client DNS resolver, and log the resolution.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 2040), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 2064).

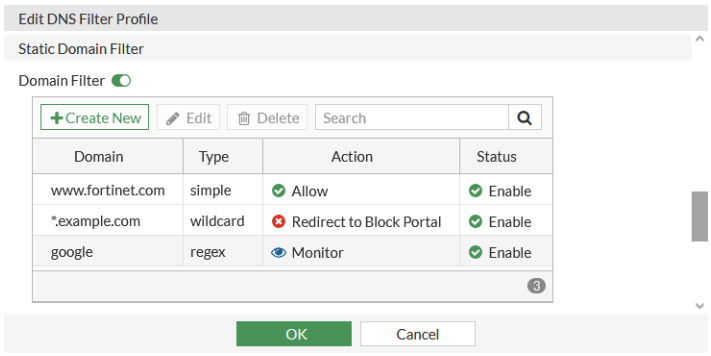
In this example, a DNS filter profile is configured and applied to a firewall policy running proxy-based inspection mode.

To configure the local domain filter in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Set *Name* to *demo*.
3. In the *Static Domain Filter* section, enable *Domain Filter*.
4. Click *Create New*. The *Create Domain Filter* pane opens.
5. Enter a domain, and select a *Type* and *Action*. This example has three filters:

Domain	Type	Action
www.fortinet.com	Simple	Allow
*.example.com	Wildcard	Redirect to Block Portal
google	Reg. Expression	Monitor

6. Click *OK*. The entry appears in the table.



7. In the *FortiGuard Category Based Filter* table, set *General Interest - Business > Search Engines and Portals* to *Redirect to Block Portal*.
8. Configure the remaining settings as required.
9. Click *OK*.

To apply the DNS filter to a policy-mode policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*, or edit an existing policy.
2. Configure the *Incoming Interface*, *Outgoing Interface*, *Source*, *Destination*, and *Service* as required.
3. Set *Inspection Mode* to *Proxy-based*.
4. Enable *DNS Filter* and select the *demo* filter.
5. Set *SSL Inspection* to *certificate-inspection*.
6. Configure the remaining settings as required.
7. Click *OK*.

To configure the local domain filter in the CLI:

```
config dnsfilter domain-filter
    edit 1
        set name "demo"
        set comment ''
        config entries
            edit 1
                set domain "www.fortinet.com"
                set type simple
                set action allow
                set status enable
            next
            edit 2
                set domain "*.example.com"
                set type wildcard
                set action block
                set status enable
            next
            edit 3
                set domain "google"
                set type regex
                set action monitor
```

```
                set status enable
            next
        end
        config domain-filter
            set domain-filter-table 1
        end
        config ftgd-dns
            config filters
                edit 23
                    set category 41
                    set action block
                next
            end
        end
    next
end
```

Wildcard entries are converted to regular expressions by FortiOS. As a result, wildcards will match any suffix, as long as there is a word boundary following the search term.

For example:

```
config entries
    edit 1
        set domain "*.host"
        set type wildcard
    next
end
```

will match `wp36.host` and `wp36.host.pressdns.com`, but not `wp36.host123.pressdnds.com`.

To avoid this, use an explicit regular expression search string:

```
config entries
    edit 1
        set domain "^.*\\.host$"
        set type regexp
    next
end
```

To apply the DNS filter to a proxy-mode policy in the CLI:

```
config firewall policy
    edit 1
        set name "port3-port1"
        set srcintf "port3"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
```

```
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "certificate-inspection"
        set dnsfilter-profile "demo"
        set logtraffic all
        set nat enable
    next
end
```

Testing and Verification

On a client computer, perform DNS lookup on the three domains:

Domain	DNS query result	Log
www.fortinet.com	Allowed. Resolved to correct IP.	None
www.example.com	Blocked. Redirected to IP of block page.	Deny log
www.google.com	Allowed. Resolved to correct IP.	Allow log

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Click the *DNS Query* card name to show the logs.

To check the DNS filter log in the CLI:

```
# execute log display
71 logs found.
10 logs returned.

1: date=2022-08-17 time=18:16:50 eventtime=1660785410733825945 tz="-0700" logid="1501054401"

DNS translation

DNS translation is a technique that allows the translation of a DNS-resolved IP address to another specified IP address on a per-policy basis.

One of its use cases is as an alternative to hairpin NAT. By utilizing DNS translation, internal clients can access internal servers using external DNS names. This is achieved by translating DNS responses to internal IP addresses, which can streamline configurations and mitigate some of the complexities associated with Hairpin NAT. However, hairpin NAT can offer faster performance in certain scenarios by eliminating the need for DNS queries, thereby providing direct routing and potentially reducing overhead. The performance difference may not always be significant and largely depends on the specific network setup. For more information, see Hairpin NAT on page 1694.

How DNS translation works:

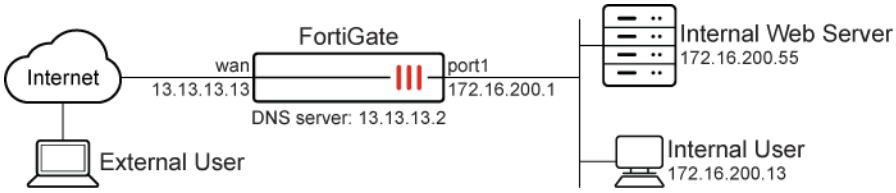
1. DNS Query Interception: When an internal client queries the DNS for the external IP address of an internal server the DNS server intercepts this request.
2. DNS Response Modification: Instead of returning the external IP address, the DNS server responds with the internal IP address of the server.
3. Direct Communication: The internal client then communicates directly with the internal server using its internal IP address, bypassing the need for NAT hairpinning.

DNS translation supports Service (SRV) records over the DNS filter profile for IPv4 and IPv6 and for flow and proxy inspection modes. The translation detects and logs DNS QTYP=SRV. You can view the records in the GUI by going to *Log & Report* > *Security Events* and filtering by *Query Type = SRV*.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 2040), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 2064).

Example

This configuration allows both internal and remote employees to use the same domain name to access the server, such as www.pochiya.com. DNS translation ensures consistency, avoiding confusion and complications in network configurations. This setup is particularly useful for companies that save bookmarks to internal web servers using public domain names in users' profiles, ensuring access whether connected to the internal LAN or the internet.



In this scenario, the user can access saved bookmarks containing public domain names from both their office computer on the internal network and their personal computer over the internet.

Before continuing, make sure that the port1 and wan interfaces have been configured with valid IP addresses and some publicly accessible domain names are saved as bookmarks in the user profile.

It is assumed that you have administrative access, the FortiGate is incorporated into your network, and the external IP address is the same as the FortiGate wan interface.

The configuration has three steps:

1. Create and attach DNS translation object: Map the external IP address to the internal IP address and attach the DNS translation object to a DNS filter profile, allowing internal clients to receive the internal IP address when querying the external DNS name.
2. Apply the DNS filter profile to a policy: DNS traffic is filtered through the DNS translation profile, allowing internal users to access the internal server using the external DNS name.
3. Verify the result: Confirm that the employee can access the internal web server using the external DNS name.

To create and attach a DNS translation object in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*.
2. Set the *Name* of the filter, such as *Reflective DNS*.
3. Under *Static Domain Filter*, enable *DNS Translation*.
4. In the *DNS Translation* table, click *Create New* and configure the new translation:

Original Destination	13.13.13.13
Translated Destination	172.16.200.55
Network Mask	255.255.255.255
Status	Enable

5. Click *OK*.
6. Enable *Log all DNS queries and responses*.
7. Click *OK*.

To configure a firewall policy for DNS translation in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*, and click *Create New*.
2. Configure the following:

Field	Value
Name	lan-wan
Schedule	always
Action	ACCEPT
Type	Standard
Incoming interface	port1
Outgoing interface	wan
Source	all
Destination	all
Service	ALL
NAT	Enabled
IP pool configuration	Use Outgoing Interface Address
DNS Filter	Enable and select *Reflective DNS*
Log allowed traffic	All sessions

3. Click *OK*.

To configure DNS translation in the CLI:

1. Create and attach a DNS translation object :

```
config dnsfilter profile
    edit "Reflective DNS"
        set log-all-domain enable
        config dns-translation
            edit 1
                set src 13.13.13.13
                set dst 172.16.200.55
                set netmask 255.255.255.255
            next
        end
    next
end
```

2. Configure a firewall policy for DNS translation:

```
config firewall policy
    edit 1
        set name "lan-wan"
```

```
        set srcintf "port1"
        set dstintf "wan"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set dnsfilter-profile "Reflective DNS"
        set logtraffic all
        set nat enable
    next
end
```

To verify the results:

1. Access the internal machine and use the saved bookmarks that contain the public domain name of the internal web server to access it. This should be successful, and the web server should load correctly. On the FortiGate, this can be verified using the logs and session list
2. On the FortiGate, go to *Log & Report* > *Security Events*, expand the *DNS Query* widget, and double click the desired log entry to view its details, or use the CLI to view the logs:

```
#execute log filter category 15
#execute log display
1: date =2024-12-13 time=07:39:37 eventtime=1734032377518565638 tz="+1200" logid="1501054802"
type="utm" subtype="dns" eventtype="dns-response" level="notice" vd="root" policyid=1
poluuid="62063350-b324-51ef-75c1-7c13a319762c" policytype="policy" sessionid=5147
srcip=172.16.200.13 srcport=60866 srccountry="Reserved" srcintf="port1"
srcintfrole="undefined" dstip=13.13.13.2 dstport=53 dstcountry="United States" dstintf="wan"
dstintfrole="undefined" proto=17 profile="Reflective DNS" xid=64 qname="www.pochiya.com"
qtype="A" qtypeval=1 qclass="IN" ipaddr="172.16.200.55" msg="Domain is monitored"
action="pass" cat==49 catdesc="Business" translationid=1

2: date=2024-12-13 time=07:39:37 eventtime=1734032377517238918 tz="+1200" logid="1500054000"
type="utm" subtype="dns" eventtype="dns-query" level="information" vd="root" policyid=1
poluuid="62063350-b324-51ef-75c1-7c13a319762c" policytype="policy" sessionid=5147
srcip=172.16.200.13 srcport=60866 srccountry="Reserved" srcintf="port1"
srcintfrole="undefined" dstip=13.13.13.2 dstport=53 dstcountry="United States" dstintf="wan"
dstintfrole="undefined" proto=17 profile="Reflective DNS" xid=64 qname="www.pochiya.com"
qtype="A" qtypeval=1 qclass="IN"
```

If the logs are missing, go to *Log & Report* > *Forward Traffic* and increase the time frame to ensure that all pertinent log entries are available.

DNS translation network mask

The following is an example of DNS translation that uses a network mask other than /32 (255.255.255.255):

To configure DNS translation in the CLI:

```
config dns-translation
        edit 1
           set src 93.184.216.34
           set dst 1.2.3.4
           set netmask 255.255.224.0
        next
    end
```

To check DNS translation using a command line tool after DNS translation:

```
# dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 6736
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.example.com.             IN      A

;; ANSWER SECTION:
www.example.com.        29322   IN      A       1.2.24.34

;; AUTHORITY SECTION:
example.com.            13954   IN      NS      a.iana-servers.net.
example.com.            13954   IN      NS      b.iana-servers.net.

;; Received 97 B
;; Time 2019-04-08 12:04:30 PDT
;; From 172.16.95.16@53(UDP) in 2.0 ms
```

The binary arithmetic to convert 93.184.216.34 to 1.2.3.4 with the subnet mask is as follows:

1. AND src(Original IP) with negative netmask (93.184.216.34 & ~255.255.224.0):

   ```
   01011101.10111000.11011000.00100010 93.184.216.34
   00000000.00000000.00011111.11111111 ~255.255.224.0
   ----------------------------------------------------- &
   00000000.00000000.00011000.00100010 0.0.24.34
   ```

2. AND dst(Translated IP) with netmask:

   ```
   00000001.00000010.00000011.00000100 1.2.3.4
   11111111.11111111.11100000.00000000 255.255.224.0
   ----------------------------------------------------- &
   00000001.00000010.00000000.00000000 1.2.0.0
   ```

3. Final step 2 bitwise-OR 3:

   ```
   00000000.00000000.00011000.00100010 0.0.24.34
   00000001.00000010.00000000.00000000 1.2.0.0
   ----------------------------------------------------- |
   00000001.00000010.00011000.00100010 1.2.24.34
   ```

Applying DNS filter to FortiGate DNS server

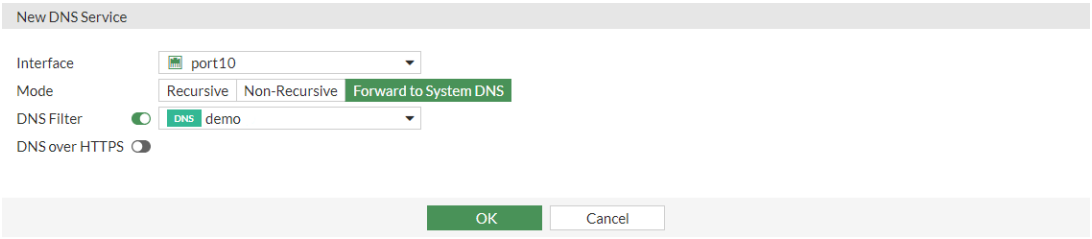
You can configure a FortiGate as a DNS server in your network. When you enable DNS service on a specific interface, the FortiGate will listen for DNS service on that interface.

Depending on the configuration, DNS service works in three modes: *Recursive*, *Non-Recursive*, or *Forward to System DNS* (server). For details on how to configure the FortiGate as a DNS server and configure the DNS database, see FortiGate DNS server on page 296.

You can apply a DNS filter profile to *Recursive* and *Forward to System DNS* mode. This is the same as the FortiGate working as a transparent DNS proxy for DNS relay traffic.

To configure DNS service in the GUI:

1. Go to *Network* > *DNS Servers* (if this option is not available, go to *System* > *Feature Visibility* and enable *DNS Database*).
2. In the *DNS Service on Interface* section, click *Create New* and select an *Interface* from the dropdown.
3. For *Mode*, select *Forward to System DNS*.
4. Enable *DNS Filter* and select a profile from the dropdown.



5. Click *OK*.

To configure DNS service in the CLI:

```
config system dns-server
    edit "port10"
        set mode forward-only
        set dnsfilter-profile "demo"
    next
end
```

To check DNS service with a DNS filter profile using a command line tool:

In this example, port10 is enabled as a DNS service with the DNS filter profile demo. The IP address of port10 is 10.1.100.5 , and the DNS filter profile is configured to block category 52 (information technology). From your internal network PC, use a command line tool, such as dig or nslookup, to perform a DNS query. For example:

```
# dig @10.1.100.5 www.fortinet.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 52809
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.fortinet.com.            IN      A
```

```
;; ANSWER SECTION:
www.fortinet.com.       60      IN      A       208.91.112.55

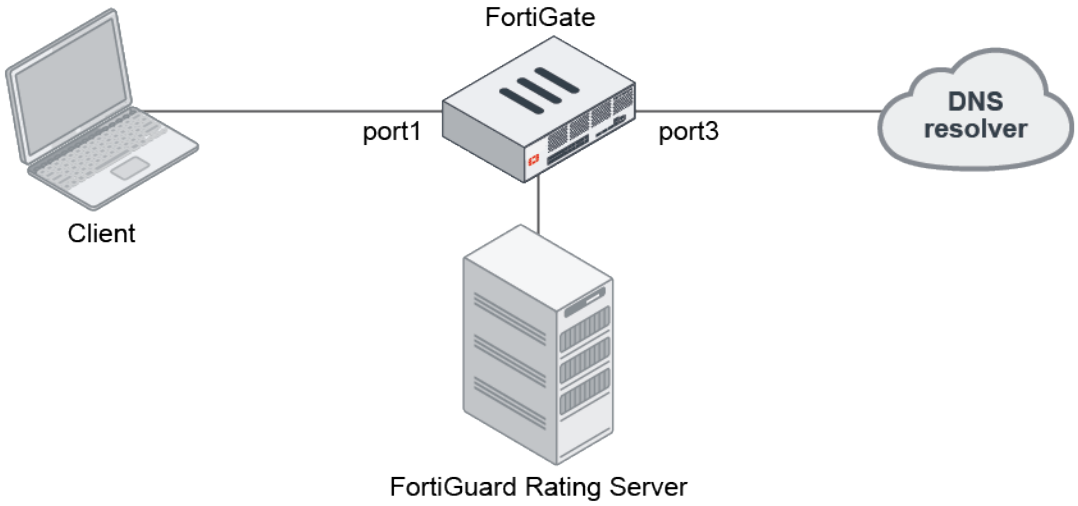
;; Received 50 B
;; Time 2019-04-08 14:36:34 PDT
;; From 10.1.100.5@53(UDP) in 13.6 ms
```

The relay DNS traffic was filtered based on the DNS filter profile configuration. It was blocked and redirected to the portal IP (208.91.112.55).

DNS inspection with DoT and DoH

DNS over TLS (DoT) and DNS over HTTPS (DoH) are supported in DNS inspection. Prior to 7.6.0, DoT and DoH inspection can only be processed in proxy mode. Starting in 7.6.0, both proxy and flow inspection modes are able to handle DoT and DoH.

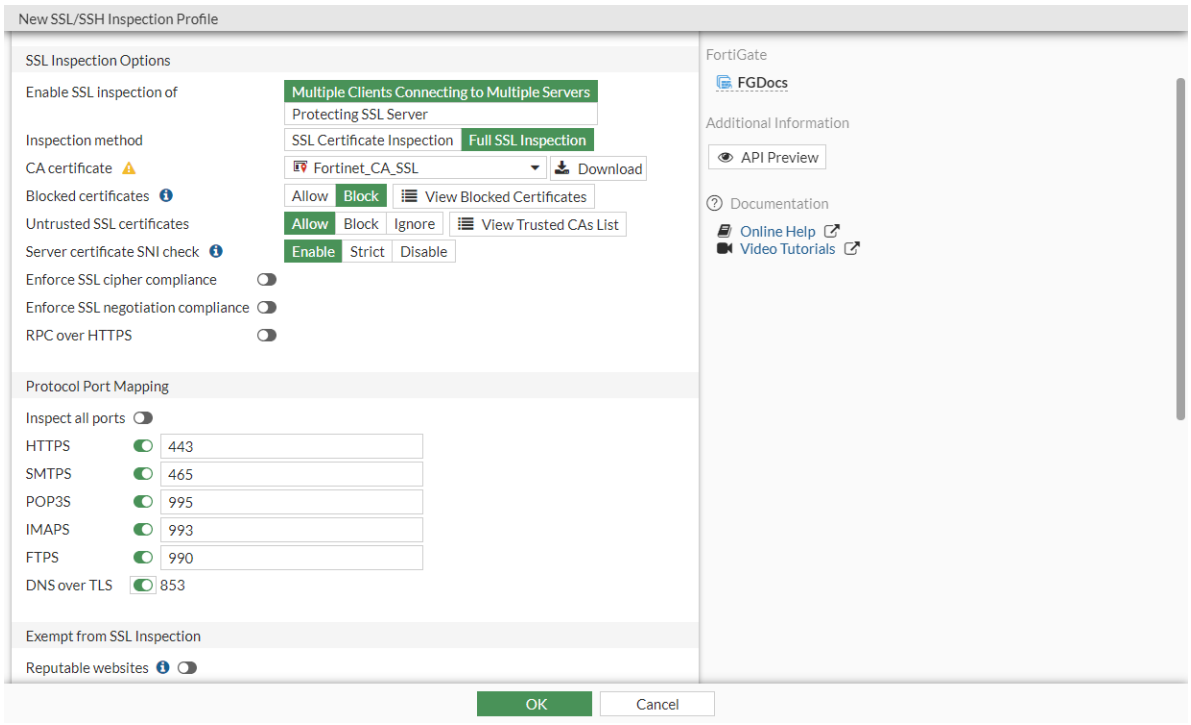
In the following examples, the FortiGate inspects DNS queries made over DoT and DoH to a Cloudflare DNS server. The DNS filter profile blocks the education category.



To configure DNS inspection of DoT and DoH queries in the GUI:

1. Configure the SSL-SSH profile:
   a. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*.
   b. Set *Inspection method* to *Full SSL Inspection*. DoT and DoH can only be inspected using doing deep inspection.

c. In the *Protocol Port Mapping* section, enable *DNS over TLS*.



d. Configure the other settings as needed.

e. Click *OK*.

2. Configure the DNS filter profile:

a. Go to *Security Profiles* > *DNS Filter* and click *Create New*.

b. Enable *Redirect botnet C&C requests to Block Portal*.

c. Enable *FortiGuard Category Based Filter* and set the *Action* for the *Education* category to *Redirect to Block Portal*.

d. Configure the other settings as needed.

e. Click *OK*.

3. Configure the firewall policy:

a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.

b. Enable *DNS Filter* and select the profile you created.

c. For *SSL Inspection*, select the profile you created.

d. Configure the other settings as needed.

e. Click *OK*.

To configure DNS inspection of DoT and DoH queries in the CLI:

1. Configure the SSL-SSH profile:

```
config firewall ssl-ssh-profile
    edit "ssl"
        config dot
            set status deep-inspection
            set client-certificate bypass
```

```
            set unsupported-ssl-cipher allow
            set unsupported-ssl-negotiation allow
            set expired-server-cert block
            set revoked-server-cert block
            set untrusted-server-cert allow
            set cert-validation-timeout allow
            set cert-validation-failure block
        end
    next
end
```

2. Configure the DNS filter profile:

```
config dnsfilter profile
    edit "dnsfilter"
        config ftgd-dns
            config filters
                edit 1
                    set category 30
                    set action block
                next
            end
        end
        set block-botnet enable
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "ssl"
        set webfilter-profile "webfilter"
        set dnsfilter-profile "dnsfilter"
        set nat enable
    next
end
```

Testing the connection

To query DNS over TLS:

1. Send a DNS query over TLS to the Cloudflare server 1.1.1.1 (this example uses kdig on an Ubuntu client). The www.ubc.ca domain belongs to the education category:

```
~$ kdig -d @1.1.1.1 +tls-ca +tls-host=cloudflare-dns.com www.ubc.ca
;; DEBUG: Querying for owner(www.ubc.ca.), class(1), type(1), server(1.1.1.1), port(853),
protocol(TCP)
;; DEBUG: TLS, imported 128 system certificates
;; DEBUG: TLS, received certificate hierarchy:
;; DEBUG:  #1, C=US,ST=California,L=San Francisco,O=Cloudflare\, Inc.,CN=cloudflare-dns.com
;; DEBUG:      SHA-256 PIN: elpYCnCs9ZtkQBI4+cb2QtZcyOl5UI9jMkSvbTsTad0=
;; DEBUG:  #2, C=US,ST=California,L=Sunnyvale,O=Fortinet,OU=Certificate

;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 56850
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.ubc.ca.                  IN      A

;; ANSWER SECTION:
www.ubc.ca.             60      IN      A       208.91.112.55

;; Received 44 B
;; Time 2021-03-12 06:53:37 UTC
;; From 1.1.1.1@853(TCP) in 6.0 ms
```

   In this query, the FortiGate inspects the DNS query to the Cloudflare DNS server. It replaces the result with the IP of the FortiGuard block page, which successfully blocks the query.

To query DNS over HTTPS:

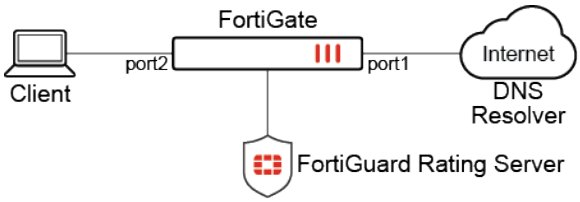
1. In your browser, enable DNS over HTTPS.
2. Go to www.ubc.ca. The website is redirected to the block page.

DNS over QUIC and DNS over HTTP3 for transparent and local-in DNS modes

DNS over QUIC (DoQ) and DNS over HTTP3 (DoH3) are supported in proxy mode inspection for transparent and local-in explicit modes. With DoQ and DoH3, connections can be established faster than with DNS over TLS (DoT) or DNS over HTTPS (DoH). The FortiGate can also handle the QUIC/TLS handshake and perform deep inspection for HTTP3 and QUIC traffic. This allows for faster and more secure DNS resolution, with improved privacy and reduced latency.

In transparent mode, the FortiGate is acting as a proxy, forwarding DNS queries, and not as a DNS server. In local-in DNS mode, the FortiGate acts as the DNS server and a DNS filter profile is applied in the system DNS server.

The firewall policy must be in proxy mode.

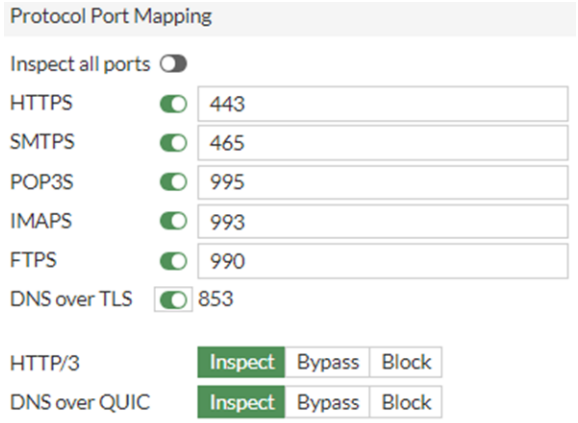


DoQ transparent and local-in query can be achieved using tools or applications in Linux, such as the q tiny command line DNS client from Natesales.

DoH3 transparent and local-in query can be achieved in Linux using q or Curl. In Windows, change the client network DNS server to the FortiGate and treat the FortiGate as an HTTP3 DNS server listening for DoH3 connections.

To enable QUIC in SSL/SSH inspection profiles in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*.
2. Under *Protocol Port Mapping*, set *HTTP/3* and *DNS over QUIC* to *Inspect*.



3. Configure the remaining settings as required.
4. Click *OK*.

To configure DoQ in transparent mode in the CLI:

1. Enable QUIC in the ssl-ssh-profile:

```
config firewall ssl-ssh-profile
    edit "protocols"
        config dot
            set status deep-inspection
            set quic inspect
        end
    next
end
```

2. Configure a DNS filter profile:

```
config dnsfilter profile
    edit "dnsfilter_fgd"
        config ftgd-dns
            config filters
                edit 1
                    set category 30
                    set action block
                next
            end
        end
    next
end
```

3. Apply the profiles to a proxy firewall policy:

```
config firewall policy
    edit 1
        set name "dnsfilter"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set dnsfilter-profile "dnsfilter_fgd"
        set logtraffic all
        set nat enable
    next
end
```

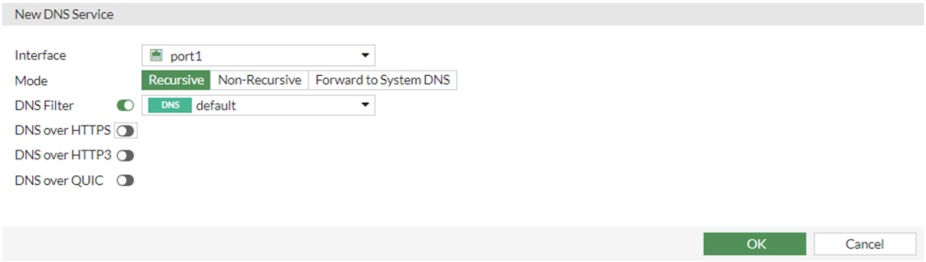
4. Test the configuration:

   On the client, use q to query a FortiGuard category30 domain with the Adguard DNS server over QUIC. The default redirect block IP address should be returned:

```
pc03:~# q www.sfu.ca @quic://dns.adguard.com --tls-no-verify
2023/08/18 18:53:44 failed to sufficiently increase receive buffer size (was: 208 kiB, wanted:
2048 kiB, got: 416 kiB). See https://github.com/quic-go/quic-go/wiki/UDP-Receive-Buffer-Size
for details.
www.sfu.ca. 1m0s A 208.91.112.55
www.sfu.ca. 1m0s AAAA 2620:101:9000:53::55
```

To enable DNS over HTTP3 or DNS over QUIC on the DNS server in the GUI:

1. Go to *Network* > *DNS Servers*.
   If this option is not available, go to *System* > *Feature Visibility* and enable *DNS Database*.
2. In the *DNS Service on Interface* section, edit an existing interface, or create a new one.
3. Set the *Mode* option as desired.
4. Enable *DNS Filter* and select a profile.
5. Enable *DNS over HTTP3* or *DNS over QUIC*.



6. Click *OK*.

To configure DoQ in local-in mode in the CLI:

1. In the FortiGate DNS server configuration, enable DoQ for a port with the previously configured DNS filter profile applied:

```
config system dns-server
    edit "port2"
        set dnsfilter-profile "dnsfilter_fgd"
        set doq enable
    next
end
```

2. Test the configuration:
   On the client, use q to query a FortiGuard category30 domain with the FortiGate interface over QUIC. The default redirect block IP address should be returned:

```
pc03:~# q www.mcgill.ca @quic://10.1.100.150 --tls-no-verify
2023/08/18 20:05:53 failed to sufficiently increase receive buffer size (was: 208 kiB, wanted:
2048 kiB, got: 416 kiB). See https://github.com/quic-go/quic-go/wiki/UDP-Receive-Buffer-Size
for details.
www.mcgill.ca. 1m0s A 208.91.112.55
www.mcgill.ca. 1m0s AAAA 2620:101:9000:53::55
```

To configure DoH3 in transparent mode in the CLI:

1. Enable QUIC in the ssl-ssh-profile:

```
config firewall ssl-ssh-profile
    edit "protocols"
        config https
            set ports 443 8443
            set status deep-inspection
            set quic inspect
        end
    next
end
```

2. Configure a DNS filter profile:

```
config dnsfilter profile
    edit "dnsfilter_fgd"
        config ftgd-dns
            config filters
                edit 1
                    set category 30
                    set action block
                next
            end
        end
    next
end
```

3. Apply the profiles to a proxy firewall policy:

```
config firewall policy
    edit 1
        set name "dnsfilter"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set dnsfilter-profile "dnsfilter_fgd"
        set logtraffic all
        set nat enable
    next
end
```

4. Test the configuration:

On the client with HTTP3 support, use q or Curl to query a FortiGuard category30 domain with the Adguard DNS server or Cloudflare DNS server over QUIC. The default redirect block IP address should be returned:

```
pc03:~# q www.mcgill.ca --http3 @https://dns.adguard.com --tls-no-verify
2023/08/18 21:04:02 failed to sufficiently increase receive buffer size (was: 208 kiB, wanted:
2048 kiB, got: 416 kiB). See https://github.com/quic-go/quic-go/wiki/UDP-Receive-Buffer-Size
for details.
www.mcgill.ca. 1m0s A 208.91.112.55
www.mcgill.ca. 1m0s AAAA 2620:101:9000:53::55
```

```
pc03:~# curl -H 'accept: application/dns-message' -v -k --http3 'https://1.1.1.1/dns-
query?dns=q80BAAABAAAAAAAAA3d3dwN1YmMCY2EAAAEAAQ' | hexdump
*   Trying 1.1.1.1:443...

0000020 0100 0000 3c00 0400 5bd0 3770
000002c
```

To configure DoH3 in local-in mode in the CLI:

1. In the FortiGate DNS server configuration, enable DoH3 for a port with the previously configured DNS filter profile applied:

```
config system dns-server
    edit "port2"
        set dnsfilter-profile "dnsfilter_fgd"
        set doh3 enable
```

```
    next
end
```

2. Test the configuration:

   On the client with HTTP3 support, use q or Curl to query a FortiGuard category30 domain with the FortiGate interface over HTTP3. The default redirect block IP address should be returned:

```
pc03:~# q www.mcgill.ca --http3 @https://10.1.100.150 --tls-no-verify
2023/08/18 20:37:55 failed to sufficiently increase receive buffer size (was: 208 kiB, wanted:
2048 kiB, got: 416 kiB). See https://github.com/quic-go/quic-go/wiki/UDP-Receive-Buffer-Size
for details.

```

Troubleshooting for DNS filter

If you have trouble with the DNS filter profile in your policy, start with the following troubleshooting steps:

- Check the connection between the FortiGate and FortiGuard DNS rating server (SDNS server).
- Check that the FortiGate has a valid FortiGuard web filter license.
- Check the FortiGate DNS filter configuration.

Checking the connection between the FortiGate and FortiGuard SDNS server

You need to ensure the FortiGate can connect to the FortiGuard SDNS server. By default, the FortiGate uses DNS over TLS (DoT, TCP port 853) to connect to the SDNS server. See DNS over TLS and HTTPS on page 319 for more information.

To check the connection between the FortiGate and SDNS server:

1. Verify the FortiGuard SDNS server information:

```
# diagnose test application dnsproxy 3
...
SDNS servers:
173.243.140.53:853 vrf=0 tz=-480 encrypt=dot req=0 to=0 res=0 rt=34 ready=1 timer=0 probe=0
failure=0 last_failed=0
```

   The SDNS server IP address might be different depending on location (in this example, it is 173.243.140.53:853).
2. In the management VDOM, check the communication between the FortiGate and the SDNS server:

```
# execute ping 173.243.140.53
```

3. If FortiGuard is not reachable using anycast, configure the default FortiGuard SDNS (unicast) server (208.91.112.220):

```
config system fortiguard
    set fortiguard-anycast disable
    set sdns-server-ip "208.91.112.220"
end
```

4. Verify the list of SDNS servers again:

```
# diagnose test application dnsproxy 3
FGD_DNS_SERVICE_LICENSE:
server=208.91.112.220:53, expiry=2023-10-28, expired=0, type=2
server=83.231.212.53:53, expiry=2023-10-28, expired=0, type=2
```

   The default FortiGuard SDNS server should work in most cases; however, you can switch to another server to see if it improves latency.

By default, DNS filtering connects to the FortiGuard secure DNS server over anycast and uses DoT (TCP port 853) when the default settings of `fortiguard-anycast enable` and `fortiguard-anycast-source fortinet` are configured. Disabling `fortiguard-anycast` will force the FortiGate to use cleartext (UDP port 53) instead of DoT (TCP port 853) in addition to disabling FortiGuard secure DNS over anycast.

Checking the FortiGuard DNS rating service license

The FortiGuard DNS rating service shares the license with the FortiGuard web filter, so you must have a valid web filter license for the DNS rating service to work. While the license is shared, the DNS rating service uses a separate connection mechanism from the web filter rating.

To check the DNS rating service license in the CLI:

1. View the DNS settings:

```
# diagnose test application dnsproxy 3
```

2. Find the `FGD_DNS_SERVICE_LICENSE` line and check that the license has not expired:

```
FGD_DNS_SERVICE_LICENSE:
server=173.243.140.53:853, expiry=2023-10-28, expired=0, type=2
```

3. Find the `SDNS servers` line to view the functioning servers:

```
SDNS servers:
173.243.140.53:853 vrf=0 tz=-480 encrypt=dot req=0 to=0 res=0 rt=34 ready=1 timer=0 probe=0
failure=0 last_failed=0
```

Checking the FortiGate DNS filter profile configuration

To check the DNS filter profile configuration:

1. In FortiOS, create a local domain filter and set the *Action* to *Redirect to Block Portal* (see Local domain filter on page 2055).
2. Apply this DNS filter profile to the policy.
3. From the client PC, perform a DNS query on this domain. If you get the profile's redirected portal address, this means that the DNS filter profile works as expected.

Additional troubleshooting

Use `diagnose test application dnsproxy <test level>` to troubleshoot further DNS proxy information, where:

Test level	Action
1	Clear DNS cache
2	Show statistics
3	Dump DNS setting
4	Reload FQDN
5	Requery FQDN

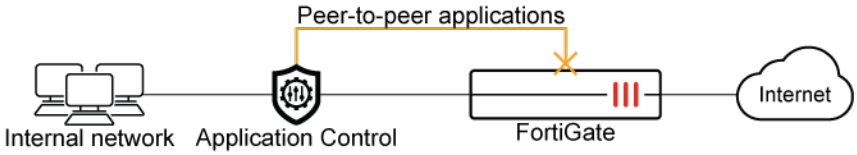
Test level	Action
6	Dump FQDN
7	Dump DNS cache
8	Dump DNS database
9	Reload DNS database
10	Dump secure DNS policy/profile
11	Dump botnet domain
12	Reload secure DNS setting
13	Show hostname cache
14	Clear hostname cache
15	Show SDNS rating cache
16	Clear SDNS rating cache
17	Show DNS debug bit mask
18	Show DNS debug object members
99	Restart the dnsproxy worker

To debug DNS proxy details:

```
# diagnose debug application dnsproxy -1
# diagnose debug {enable | disable}
```

Application control

FortiGates can recognize network traffic generated by a large number of applications. Application control sensors specify what action to take with the application traffic. Application control uses IPS protocol decoders that can analyze network traffic to detect application traffic, even if the traffic uses non-standard ports or protocols. Application control supports traffic detection using the HTTP protocol (versions 1.0, 1.1, and 2.0).



FortiOS includes three preloaded application sensors:

- *default* (monitors all applications)
- *wifi-default* (default configuration for offloading WiFi traffic)
- *block-high-risk*

You can customize these sensors, or you can create your own to log and manage the applications on your network.

Once configured, you can add the application sensor to a firewall policy.

This functionality requires a subscription to FortiGuard Application Control.

The following topics provide information about application control:

- Configuring an application sensor on page 2078
- Application matching signature priority on page 2079
- Basic category filters and overrides on page 2080
- Excluding signatures in application control profiles on page 2084
- Port enforcement check on page 2086
- Protocol enforcement on page 2087
- SSL-based application detection over decrypted traffic in a sandwich topology on page 2089
- Matching multiple parameters on application control signatures on page 2090
- Application signature dissector for DNP3 on page 2093
- Application control on page 2077

Configuring an application sensor

FortiGates can recognize network traffic generated by a large number of applications using application control, which relies on IPS protocol decoders. Application sensors control what action is taken with application traffic.

To configure an application sensor:

1. Go to *Security Profiles* > *Application Control* and click *Create New*.
2. Configure the following settings:

Name	Enter a unique name for the sensor.
Comments	Enter a comment (optional).
Categories	Configure the action to take on groups of signatures based on their category type. Applications belonging to the category trigger the configured action: monitor, allow, block, or quarantine. See Basic category filters and overrides on page 2080 for more information.
Network Protocol Enforcement	Enable/disable the enforcement of protocols over selected ports. See Protocol enforcement on page 2087 for more information.
Application and Filter Overrides	Configure multiple applications signatures with a dedicated action for a single sensor. Filters can be added based on the application category, behavior, popularity, protocol, risk, technology, or vendor subtype.

	For more information, see • Configuring application and filter overrides on page 2082 • Matching multiple parameters on application control signatures on page 2090 • Blocking applications with custom signatures on page 2335
Block applications detected on non-default ports	When enabled: • For monitor and allow actions, applications will be blocked if detected on non-default ports (as defined in FortiGuard application signatures). • Block actions still block traffic for the application regardless of the port. See Port enforcement check on page 2086 for more information.
Allow and Log DNS Traffic	The intended behavior is to allow and log DNS traffic. However, to fully enable logging, configure the following: 1. Within the application sensor profile, create a new *Application and Filter Overrides* entry. 2. Set the *Action* to *Monitor*. 3. Search for the DNS application, select it, and click *Add Selected*. 4. Click *OK* to save the override, then click *OK* to save the application sensor profile.
Replacement Messages for HTTP-based Applications	Enable/disable replacement messages for blocked applications. See Replacement messages on page 3555 for information about replacement messages.

3. Click *OK*.

Application matching signature priority

Many applications will match more than one application control signature. When attempting to match a signature to the application traffic, FortiGate evaluates several factors and selects a signature based on the following tie breakers:

1. Segments are considered in sequential order. The order of the applications within the segment does not matter.

   Segments are groupings of applications and protocols that are all evaluated at the same time for the best match. The default segment is defined by the Category section. Additional segments may be defined using the Application and Filter Overrides section. In the CLI these segments are called entries.
2. Custom signatures take precedence over FortiGuard signatures.
3. The signature with the most pre/post-match signature actions is preferred.

   For example,one signature could have a lot of the --deep_ctrl option (used for pattern matching) and each one would increment the post-match counter. Similarly, options like --quiet are considered a pre-match action that would suppress logging of the match. See Creating IPS and application control signatures for more attributes.
4. The application weight.

For predefined signatures, the weight is defined by FortiGuard signature analysts and is not configurable. Generally, more specific application signatures will have a higher weight than more broad protocol signatures. Not all application signature types (such as protocols) have the same weight.

5. Signature visibility options. Non-hidden signatures are preferred.

   A signature could have *hidden* visibility if it is a beta or test signature that is still under false-positive detection evaluation, marked --quiet, or a built-in protocol dissector/peer-to-peer rule.

6. Pattern counts.

   A comparison between signature --pattern and --pcre count. The signature with more of them is preferred.

7. ID comparison.

   A comparison between signature IDs. Select the one with a larger, and therefore most likely newer, ID.

Application weight is used the most often to decide the match. To see the weight of applications and protocols, use the `get application name status` command.

The following examples use grep to find specific applications by name. The -A flag is used to include a specific number of lines after the match is found.

```
# get application name status | grep -A10 "app-name: \"Facebook\""
app-name: "Facebook"
id: 15832
category: "Social.Media"
cat-id: 23
popularity: 5.low
risk: 3.low
weight: 10
shaping: 0
protocol: 1.TCP, 9.HTTP, 2.UDP, 26.SSL
vendor: 3.Meta
technology: 1.Browser-Based
```

```
# get application name status | grep -A10 "app-name: \"SSL\""
app-name: "SSL"
id: 15895
category: "Network.Service"
cat-id: 15
popularity: 5.low
risk: 2.high
weight: 1
shaping: 0
protocol: 1.TCP, 26.SSL
vendor: 0.Other
technology: 0.Network-Protocol
```

Basic category filters and overrides

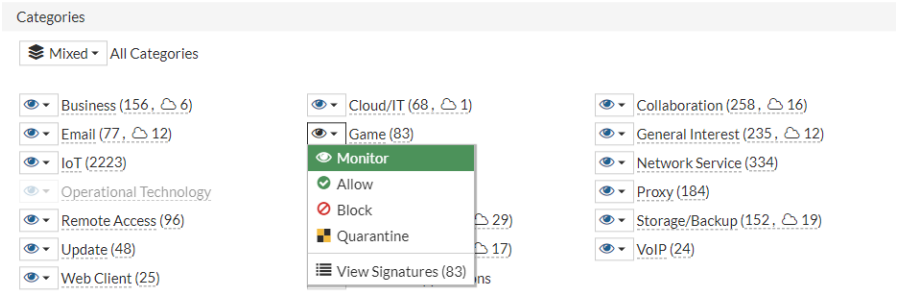
When creating an application sensor, you can define the applications that you want to control. You can add applications and filters using categories, application overrides, and/or filter overrides with designated actions (monitor, allow, block, or quarantine).

Action	Description
Monitor	Passes the traffic and generates a log message.
Allow	Passes the traffic but does not generate a log message.
Block	Drops the detected traffic and generates a log message.
Quarantine	Blocks the traffic from an attacker IP address until the expiration time is reached and generates a log message.

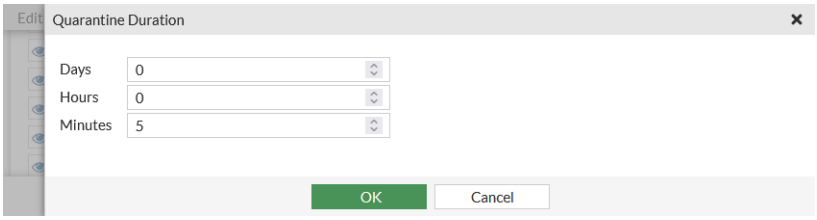
For more information about application control logs, see Security Events log page on page 4131.

To configure category filters in the GUI:

1. Go to *Security Profiles* > *Application Control* and click *Create New*, or edit an existing sensor.
2. Under *Categories*, click the icon next to the category name to set the action or view the application signatures.



3. If you select the *Quarantine* action, the *Quarantine Duration* pane will open. Enter the duration values and click *OK*.



4. Click *OK*.

To configure category filters in the CLI:

```
config application list
    edit <name>
        config entries
            edit <id>
                set category <id>
                set action {pass | block | reset}
                set quarantine {none | attacker}
                set quarantine-expiry <###d##h##m>
                set log {enable | disable}
            next
        end
```

```
    next
end
```

Configuring application and filter overrides

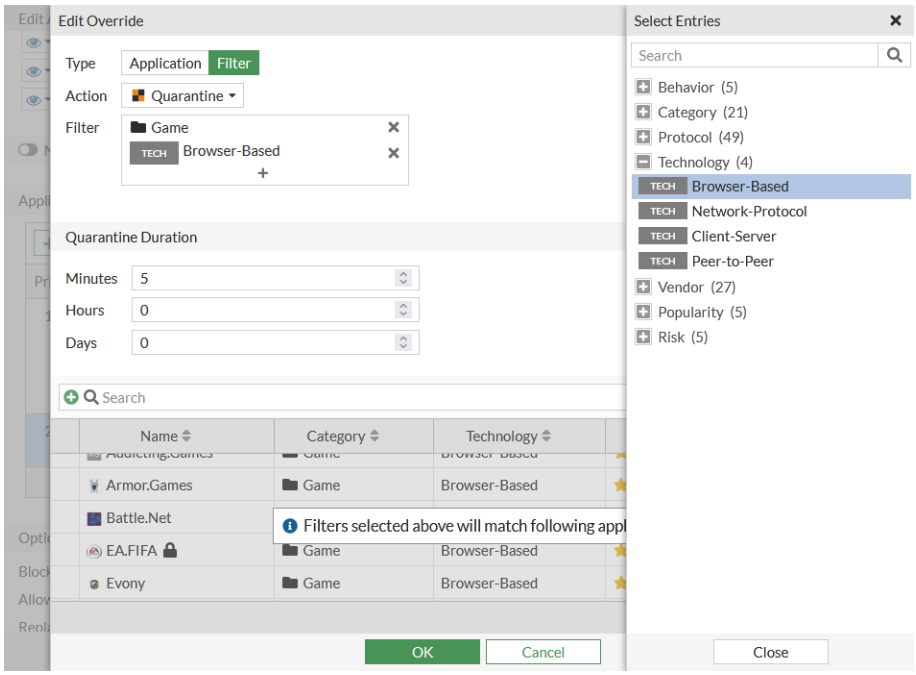
Multiple application signatures can be added for one sensor with a designated action. Filters can be added based on behavior, application category, popularity, protocol, risk, technology, or vendor subtypes.

To configure overrides in the GUI:

1. Go to *Security Profiles* > *Application Control* and click *Create New*, or edit an existing sensor.
2. Add an application:
   a. In the *Application and Filter Overrides* table, click *Create New*.
   b. For *Type*, select *Application*.
   c. Select an *Action* from the dropdown.
   d. In the *Search* box, enter an application name and press `Enter`, or click the plus icon and configure a search filter.
   e. In the search results, select the required applications (you can select multiple applications).

   f. Click *OK*.
3. Add a filter:
   a. In the *Application and Filter Overrides* table, click *Create New*.
   b. For *Type*, select *Filter*.
   c. Select an *Action* from the dropdown.
   If the action is set to *Quarantine*, set the duration of the quarantine.

d. In the *Filter* field, click the *+* . The *Select Entries* pane opens, and you can search based on filter subtypes. This example uses Browser-Based (under Technology) and Game (under Category).



e. Click *OK*.

4. Click *OK*.

To configure overrides in the CLI:

```
config application list
    edit <name>
        config entries
            edit <id>
                set protocols <integer>
                set risk <integer>
                set vendor <id>
                set technology <id>
                set behavior <id>
                set popularity <integer>
                set action {pass | block | reset}
                set quarantine {none | attacker}
                set log {enable | disable}
            next
        end
    next
end
```

`protocols <integer>`	Application protocol filter (0 - 47, or all).
`risk <integer>`	Risk or impact of allowing traffic from this application to occur (1 - 5; low (1), elevated (2), medium (3), high (4), and critical (5)).

`vendor <id>`	Application vendor filter (0 - 25, or all).
`technology <id>`	Application technology filter: • all • 0 (network-protocol) • 1 (browser-based) • 2 (client-server) • 4 (peer-to-peer)
`behavior <id>`	Application behavior filter: • all • 2 (botnet) • 3 (evasive) • 5 (excessive bandwidth) • 6 (tunneling) • 9 (cloud)
`popularity <integer>`	Application popularity filter (1 - 5, from least to most popular).
`action {pass | block | reset}`	Pass/block traffic or reset the connection for traffic from this application (default = block).
`quarantine {none | attacker}`	Set the quarantine method: • `none`: Quarantine is disabled. • `attacker`: Block all traffic sent from attacker's IP address. The attacker's IP address is also added to the banned user list. The target's address is not affected.
`log {enable | disable}`	Enable/disable logging for this application list (default = enable).

For more information, see the FortiOS CLI reference.

Excluding signatures in application control profiles

In an application control list, the exclusion option allows users to specify a list of applications they wish to exclude from an entry filtered by category, technology, or others. By excluding the signature, the application is no longer processed on the entry in which it is excluded, but may match subsequent entries that exist.

To configure signature exclusion:

```
config application list
    edit <name>
        config entries
            edit <id>
                set category <id>
                set exclusion <application id>
                set action {pass | block | reset}
            next
        end
```

```
    next
end
```

Sample configurations

In the following example, category 23 (social media) is blocked in the entries, and signature 34527 (Instagram) is excluded from this entry. Traffic to Instagram will pass because the signature is removed from entry 1 and the action of `other-application-action` is set to `pass`.

To configure signature exclusion:

```
config application list
    edit "test"
        set other-application-action pass
        set unknown-application-action pass
        set other-application-log enable
        set unknown-application-log enable
            config entries
                edit 1
                    set category 23
                    set exclusion 34527
                    set action block
                next
            end
    next
end
```

In the following example, entry 1 is configured so that category 23 (social media) is set to pass and signature 34527 (Instagram) is excluded. In entry 2, application 34527 (Instagram) is blocked, so the traffic to Instagram will be blocked, even though it is excluded in entry 1. Traffic to other signatures in category 23, such as Facebook, will still pass.

To configure signature exclusion:

```
config application list
    edit "test"
        set other-application-action pass
        set unknown-application-action pass
        set other-application-log enable
        set unknown-application-log enable
            config entries
                edit 1
                    set category 23
                    set exclusion 34527
                    set action pass
                next
                edit 2
                    set application 34527
                    set action block
```

```
                next
            end
    next
end
```

In the following example, an explicit proxy is behind the FortiGate with an excluded signature for 107347980 (Proxy.HTTP) and category 6 (proxy) is set to block. The client will allow normal proxy traffic to pass, but it will discard all proxy application traffic (such as KProxy, Tor, and so on).

To configure signature exclusion:

```
config application list
    edit "test"
        set other-application-action pass
        set unknown-application-action pass
        set other-application-log enable
        set unknown-application-log enable
            config entries
                edit 1
                    set category 6
                    set exclusion 107347980
                    set action block
                next
            end
    next
end
```

Port enforcement check

Most networking applications run on specific ports. For example, SSH runs on port 22, and Facebook runs on ports 80 and 443.

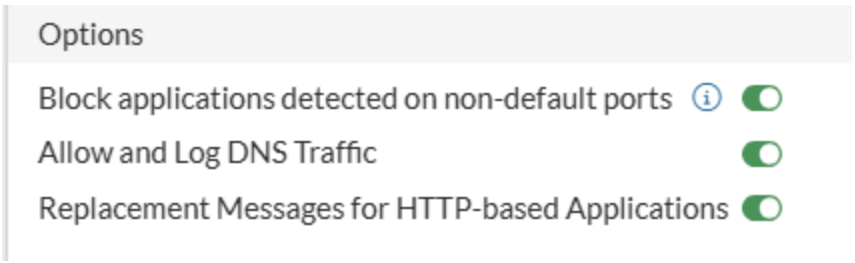
If the default network service is enabled in the application control profile, the IPS engine performs a check at the application profile level, and any detected application signatures running on the non-standard TCP/IP port are blocked. This means that each allowed application runs on its default port.

Default ports for network services are defined by FortiGuard. See Application Control Service.

In the following example, an application sensor is configured to enforce FTP on port 21.

To configure port enforcement check in the GUI:

1. Go to *Security Profiles* > *Application Control*.
2. Create a new application sensor or edit an existing one.
3. In *Options*, enable *Block applications detected on non-default ports*.



4. In *Application and Filter Overrides*, you can configure actions for individual applications, overriding the action configured for their category.
   a. Click *Create New*.
   b. Select the desired action from the dropdown list in the upper left corner. For example, select *Allow*.

   When an application is configured with an action of *Monitor* or *Allow*, when its traffic is detected on non-standard ports (as defined in FortiGuard application signatures) then the application will be blocked. An application configured with an action of *Block* will have its traffic blocked regardless of the port its traffic is detected on.

   c. Select the desired applications. For example, select *FTP*.
   d. Click *OK*. The entries are displayed in a table.
5. Click *OK*.

To configure port enforcement check in the CLI:

```
config application list
    edit <name>
        set enforce-default-app-port enable
        config entries
            edit 1
                set application 15896
                set action pass
            next
        end
    next
end
```

With the above GUI or CLI configuration, FTP traffic (application 15896 in the CLI) with the standard port (port 21) is allowed, while a non-standard port (port 2121) is blocked.

Protocol enforcement

Protocol enforcement allows you to enforce known protocols (such as FTP, HTTP, and HTTPS) on known ports (such as 21, 80, and 443). If the port of incoming traffic does not match the allowed protocols, or is not allowlisted, then the Intrusion Prevention System (IPS) engine applies the configured violation action, such as blocking or monitoring the traffic.

You can use this feature in the following scenarios:

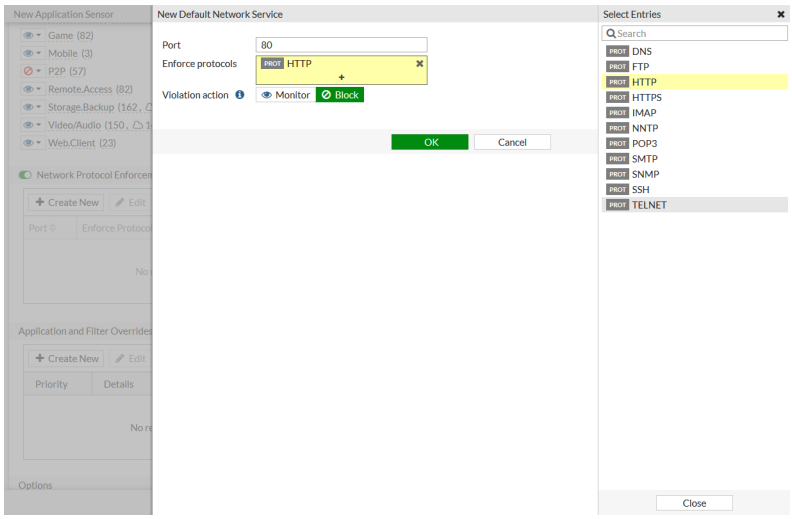
- When an IPS protocol decoder identifies a network traffic service, it checks whether the service port aligns with the enforced protocols. If the decoder finds a match, that is, the traffic is allowlisted, then the traffic proceeds without restriction. If there is no match, the traffic is classified as a violation and the specified action, monitoring or blocking, is applied.
- When there is no confirmed service for the network traffic, the traffic is classified as a violation if IPS protocol decoders rule out all of the services enforced under its server port.

In an applicable profile, a default network service list can be created to associate well known ports with accepted services. Default ports for network services are defined by FortiGuard. See Application Control Service.

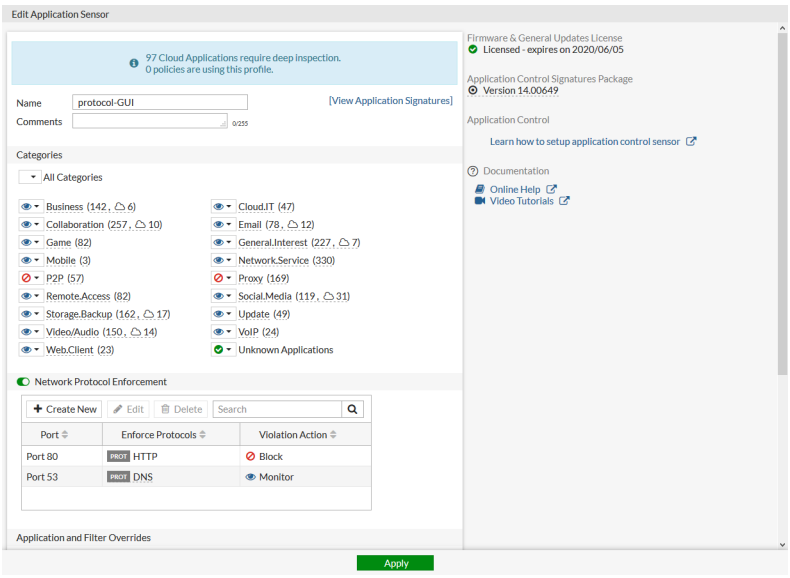
In the following example, an application sensor is configured to enforce HTTP on port 80 (block), and DNS on port 53 (monitor).

To configure protocol enforcement in the GUI:

1. Go to *Security Profiles* > *Application Control*.
2. Create a new application sensor or edit an existing one.
3. Enable *Network Protocol Enforcement*.
   Enforcement entries can be created, edited, or deleted to configure network services on certain ports and determine the violation action.
4. In the *Network Protocol Enforcement* table, click *Create New*.
5. Configure the entry for HTTP:
   a. For *Port*, enter 80.
   b. For *Enforced protocols*, select *HTTP*.
   c. For *Violation action*, select *Block*.
   d. Click *OK*.



6. Configure the entry for DNS:
   a. Click *Create New*, then for *Port*, enter 53.
   b. For *Enforced protocols*, select *DNS*.
   c. For *Violation action*, select *Monitor*.
   d. Click *OK*.
   The entries are displayed in the table.



7. Click *OK*.

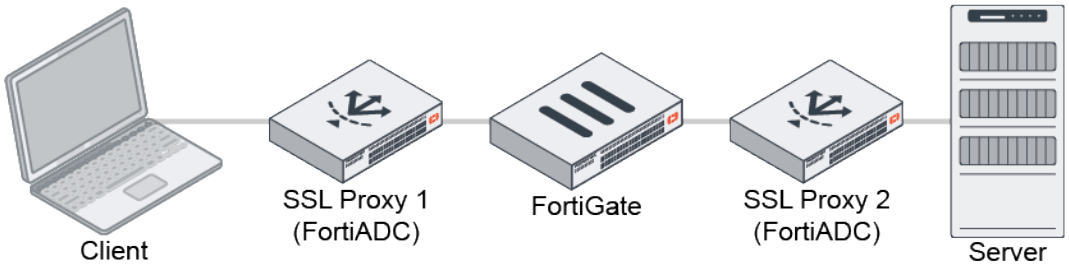
To configure protocol enforcement in the CLI:

```
config application list
    edit "protocol-GUI"
        set other-application-log enable
        set control-default-network-services enable
        config default-network-services
            edit 1
                set port 80
                set services http
                set violation-action block
            next
            edit 2
                set port 53
                set services dns
                set violation-action monitor
            next
        end
    next
end
```

SSL-based application detection over decrypted traffic in a sandwich topology

When a FortiGate is sandwiched between SSL encryption and decryption devices, the FortiGate can process the decrypted traffic that passes between those devices. This feature adds support for decrypted traffic in application control. In some predefined signatures, the signature is pre-marked with the *require_ssl_di* tag. The `force-inclusion-ssl-di-sigs` option under `application list` allows users to control the inspection of dissected traffic. When this option is enabled, the IPS engine forces the pre-marked SSL-based signatures to be

applied to the decrypted traffic of the respective applications. In the following topology, SSL Proxy 1 handles the client connection and SSL Proxy 2 handles the server connection, leaving the content unencrypted as traffic passes through the FortiGate.



To configure SSL-based application detection over decrypted traffic:

```
config application list
    edit "test"
        set force-inclusion-ssl-di-sigs {enable | disable}
    next
end
```

Example pre-marked SSL-based signature:

F-SBID(--vuln_id 15722; --attack_id 42985; --name "Facebook_Chat"; --group im; --protocol tcp; --default_action pass; --revision 4446; --app_cat 23; --vendor 3; --technology 1; --behavior 9; --pop 4; --risk 2; --language "Multiple"; --weight 20; --depend-on 15832; --depend-on 38468; ***--require_ssl_di "Yes"****; --casi 1; --casi 8; --parent 15832; --app_port "TCP/443"; --severity info; --status hidden; --service http; --flow from_client; --pattern "/pull?"; --context uri; --no_case; --pattern ".facebook.com"; --context host; --no_case; --tag set,Tag.Facebook.Pull; --tag quiet; --scan-range 10m,all; --date 20190301;)*

All signatures that include the *require_ssl_di* tag are predefined and cannot be customized.

Matching multiple parameters on application control signatures

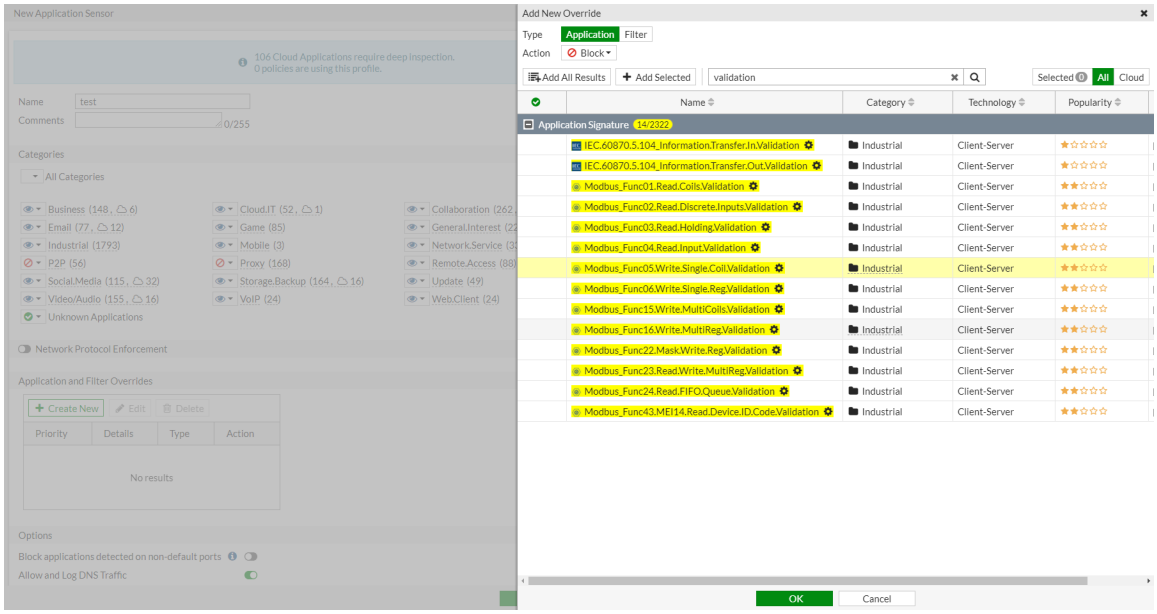
Application control signatures that support parameters (such as SCADA protocols) can have multiple parameters grouped together and matched at the same time. Multiple application parameter groups can be added to an override. Traffic will be flagged if it matches at least one parameter group.

This example uses the Modbus_Func05.Write.Single.Coil.Validation signature. This is an OT signature, so ensure that no signatures are excluded:

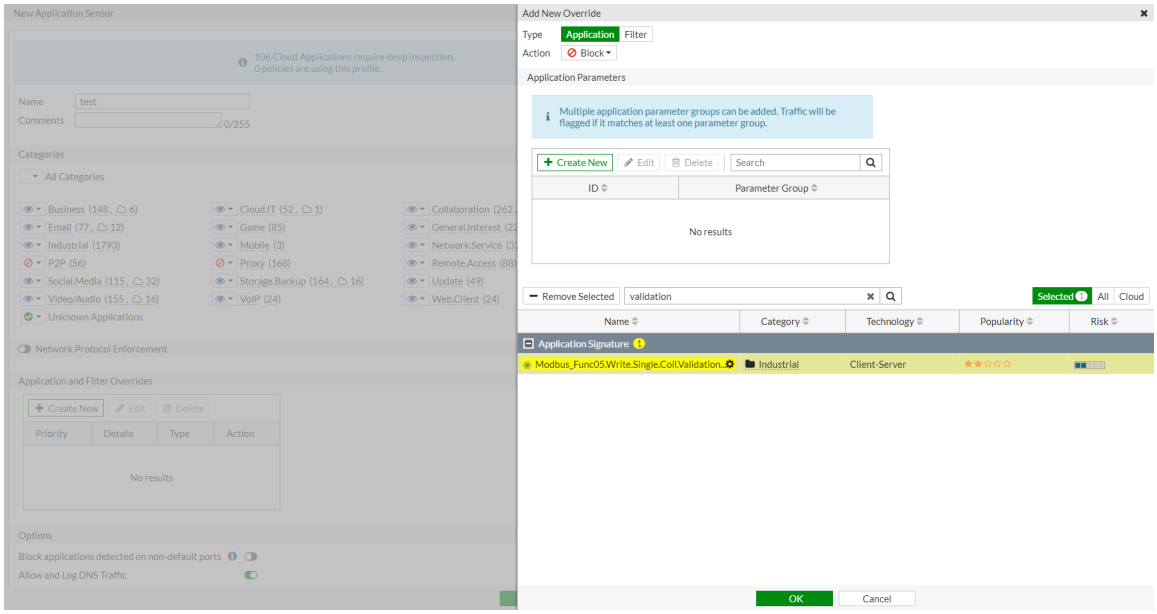
```
config ips global
    set exclude-signatures none
end
```

To configure an application sensor with multiple parameters in the GUI:

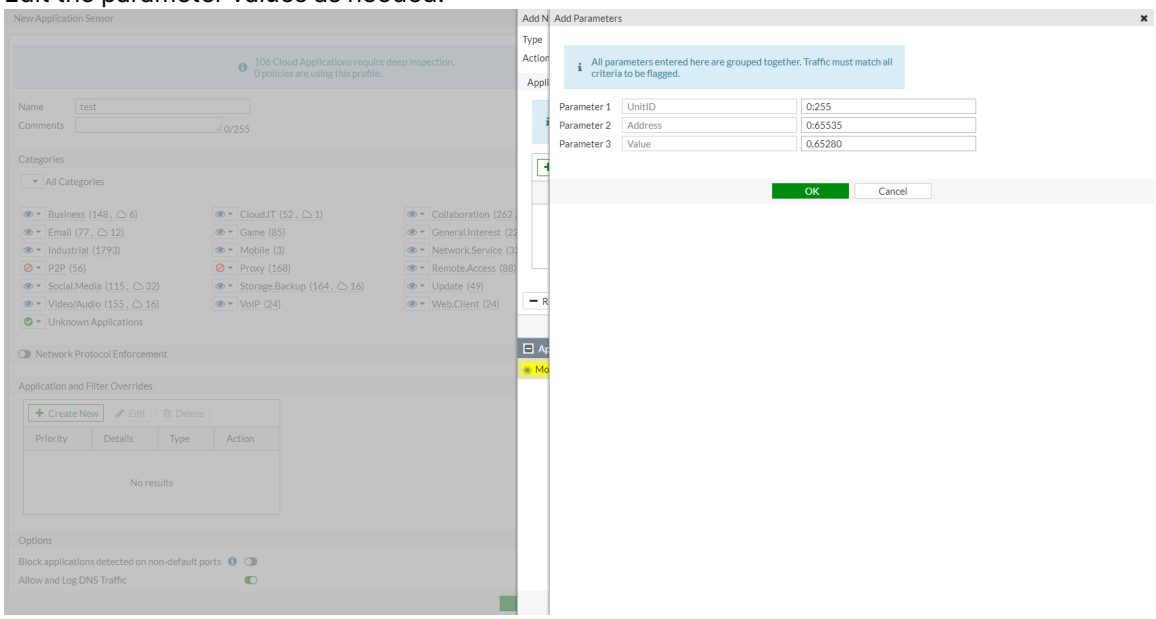
1. Go to *Security Profiles* > *Application Control* and click *Create New*, or edit an existing sensor.
2. In the *Application and Filter Overrides* table, click *Create New*.
3. Search for *Modbus_Func05.Write.Single.Coil.Validation* and press `Enter`. A gear icon beside the signature name indicates it has configurable application parameters.
4. In the search results, select *Modbus_Func05.Write.Single.Coil.Validation* and click *Add Selected*.



5. Click the *Selected* tab. In the *Application Parameters* section, click *Create New*.



6. Edit the parameter values as needed.



7. Click *OK*.
8. Add more signatures if needed.
9. Click *OK*.

To configure an application sensor with multiple parameters in the CLI:

```
config application list
    edit "test"
        set other-application-log enable
        config entries
            edit 1

                set application 48885
                config parameters
                    edit 1
                        config members
                            edit 1
                                set name "UnitID"
                                set value "0:255"
                            next
                            edit 2
                                set name "Address"
                                set value "0:65535"
                            next
                            edit 3
                                set name "Value"
                                set value "0,65280"
                            next
                        end
                    next
                end
```

```
            next
            edit 2
                set category 2 6
            next
        end
    next
end
```

Application signature dissector for DNP3

The DNP3 application signature dissector supports detecting DNP3 traffic that is encapsulated by the RealPort protocol (Net.CX). DNP3 is used in industrial solutions over serial ports, USB ports, printers, and so on. RealPort encapsulation allows transportation of the underlying protocols over TCP/IP. The FortiGate OT signatures must be enabled to use RealPort.DNP3 signatures:

```
config ips global
    set exclude-signatures none
end
```

IPS engine version 7.0015 and later supports RealPort.DNP3 dissectors.

```

Domain fronting protection

FortiOS can protect against domain fronting in both explicit proxy and proxy-based firewall policies. In both cases, FortiGate checks whether the domain of the request matches the host domain in the HTTP header, and then allows, blocks, or monitors the traffic. This feature enhances security by preventing unauthorized access that could result from domain mismatches.

```
config firewall profile-protocol-options
    edit protocol
        config http
            set domain-fronting {allow | block | monitor}
        next
    end
end
```

`set domain-fronting {allow | block | monitor}`	Configure HTTP domain fronting (default = block). • `allow`: allow domain fronting. • `block`: block and log domain fronting. • `monitor`: allow and log domain fronting.

Domain fronting protection supports HTTP/1.1 but not HTTP/2.

Example

In this example, the server name indication (SNI) in the request is `httpbin.org`, and the host header in the request is `google.com`.

When FortiGate has an explicit proxy policy configured with `set domain-fronting block`, traffic is blocked and logged when the request domain does not match the HTTP header domain.

- Example traffic log:

```
1: date=2024-06-11 time=10:38:23 eventtime=1718127503650731465 tz="-0700" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="vdom1" srcip=10.1.100.77 srcport=41548
srcintf="port2" srcintfrole="undefined" dstip=3.211.196.247 dstport=443 dstintf="port3"
dstintfrole="undefined" srccountry="Reserved" dstcountry="United States" sessionid=1542161161
proto=6 action="deny" policyid=1 policytype="proxy-policy" poluuid="01352fb2-1370-51ef-8ac3-
c46f77827b80" service="HTTPS" trandisp="noop" duration=0 sentbyte=0 rcvdbyte=0 sentpkt=0
rcvdpkt=0 appcat="unscanned" utmaction="block" countweb=1 msg="Traffic denied because of
domain fronting" utmref=65498-0
```

- Example Web filter UTM log:

```
1: date=2024-06-11 time=10:38:23 eventtime=1718127503650663438 tz="-0700" logid="0320013318"
type="utm" subtype="webfilter" eventtype="domain-fronting" level="notice" vd="vdom1"
policyid=1 poluuid="01352fb2-1370-51ef-8ac3-c46f77827b80" policytype="proxy-policy"
sessionid=1542161161 transid=1 srcip=10.1.100.77 srcport=41548 srccountry="Reserved"
srcintf="port2" srcintfrole="undefined" dstip=3.211.196.247 dstport=443 dstcountry="United
States" dstintf="port3" dstintfrole="undefined" proto=6 httpmethod="GET" service="HTTPS"
hostname="google.com" agent="curl/7.83.1" profile="protocol" action="blocked" reqtype="direct"
url="https://google.com/" sentbyte=860 rcvdbyte=5470 direction="outgoing" msg="Domain fronting
detected" rawdata="HTTP Host <google.com> does not match SNI <httpbin.org>"
```

When FortiGate has a transparent proxy policy configured with `set domain-fronting monitor`, traffic is passed and logged when the request domain does not match the HTTP header domain.

- Example traffic log:

```
1: date=2024-06-11 time=11:14:22 eventtime=1718129661884640964 tz="-0700" logid="0000000010"

reqtype="direct" url="https://google.com/" sentbyte=746 rcvdbyte=5470 direction="outgoing"
msg="Domain fronting detected" rawdata="HTTP Host <google.com> does not match SNI
<httpbin.org>"
```

Inline CASB

The inline CASB security profile enables the FortiGate to perform granular control over SaaS applications directly on firewall policies. The supported controls include:

Control	Description
Privilege control	Specify the action to apply to user activities per application such as upload, download, share, delete, log in, and so on. See Privilege control on page 2096 for an example.
Safe search	On SaaS applications that support searching, enable and select the level of safe search. See Safe search on page 2099 for an example.
Tenant control	Allow only users belonging to specific domains to access the SaaS application. See Tenant control on page 2102 for an example.
UTM bypass	For each user activity, bypass further UTM scanning any of the following security profiles: • Antivirus • DLP

Control	Description
	• File filter • Video filter • Web filter See UTM bypass on page 2105 for an example.

Administrators can customize their own SaaS applications, matching conditions, and custom controls and actions.

A firewall policy must use proxy-based inspection with a deep inspection SSL profile to apply the inline CASB profile and scan the traffic payload.

Inline CASB can be applied to a firewall policy or a proxy policy.

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 98 for more information.

The Inline-CASB Application Definitions entitlement is licensed under the basic firmware and updates contract. To view the entitlement information, go to *System > FortiGuard* and expand the *Firmware, VM, and base subscriptions* section in the *Subscriptions > Licensed* tab.

To enable inline CASB security profiles in the GUI:

1. Go to *System > Feature Visibility*.
2. Enable *Inline-CASB* in the *Security Features* section.
3. Click *Apply*.

See Inline CASB examples on page 2096 for sample configurations.

Inline CASB examples

The following examples are included:

- Privilege control on page 2096
- Safe search on page 2099
- Tenant control on page 2102
- UTM bypass on page 2105
- Customized SaaS application and user activity on page 2108

Privilege control

In this example, logging in to Microsoft Outlook is blocked by the privilege control settings in the inline CASB profile.

To configure an inline CASB profile with privilege control in the GUI:

1. Configure the inline CASB profile:
   a. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
   b. Enter a *Name*, such as *outlook_test*.
   c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
   d. Set the *Application* to *microsoft-outlook*, then click *Next*.

   e. Enable *Logging*.
   f. In the *Privilege Control* table, select *login* and from the *Set Action* dropdown, select *Block*.

   g. Click *OK*.
2. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*. Edit an existing policy, or create a new one.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *Inline-CASB* and select the *outlook_test* profile.
   d. Set the *SSL Inspection* profile to one that uses deep inspection.
   e. Configure the other settings as needed.

f. Click *OK*.

To configure an inline CASB profile with privilege control in the CLI:

1. Configure the inline CASB profile:

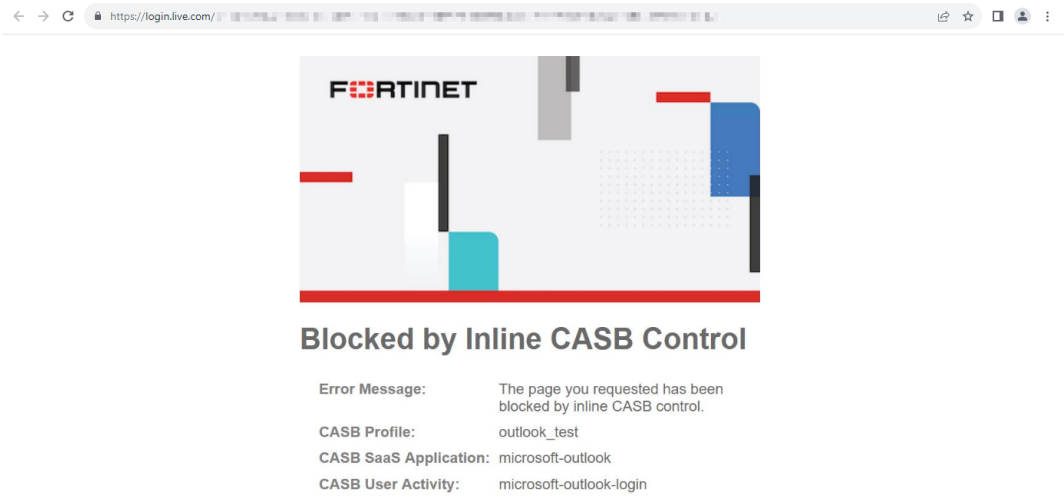
```
config casb profile
    edit "outlook_test"
        config saas-application
            edit "microsoft-outlook"
                config access-rule
                    edit "microsoft-outlook-login"
                        set action block
                    next
                end
            next
        end
    next
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 6
        set name "casb_test"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "outlook_test"
        set nat enable
    next
end
```

To test the configuration:

1. Open a browser and attempt to access the Outlook login page.
2. The traffic is blocked by the firewall policy. The browser displays a replacement message: *Blocked by Inline CASB Control*.



Sample log:

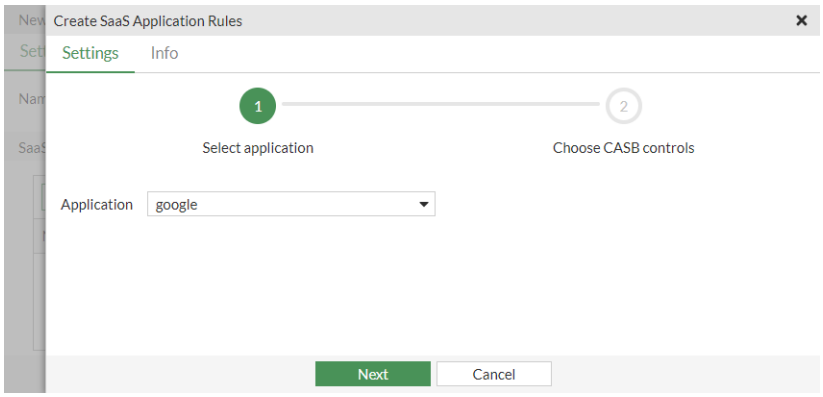
```
1: date=2023-08-18 time=16:59:32 eventtime=1692403171962221884 tz="-0700" logid="2500010000"
type="utm" subtype="casb" eventtype="casb" level="warning" vd="vdom1" msg="CASB access was blocked
because it contained banned activity." policyid=6 sessionid=63635 srcip=10.1.100.195
dstip=20.190.190.130 srcport=61013 dstport=443 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6 action="block" profile="outlook_test"
saasapp="microsoft-outlook" useractivity="microsoft-outlook-login" activitycategory="activity-
control"
```

Safe search

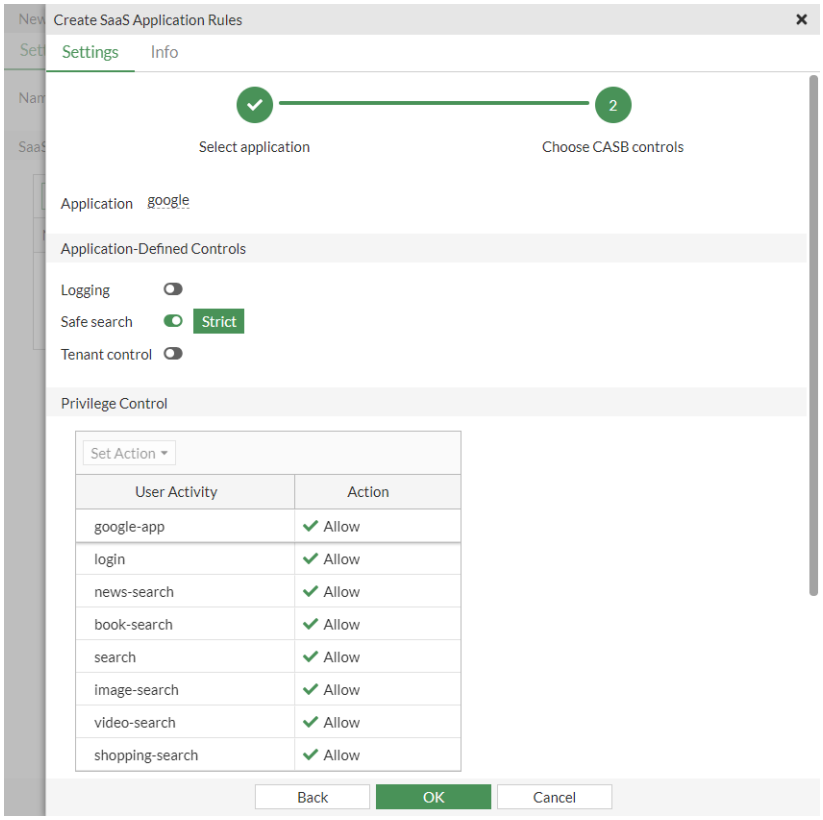
In this example, safe search is configured for Google in the inline CASB profile.

To configure an inline CASB profile with safe search in the GUI:

1. Configure the inline CASB profile:
   a. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
   b. Enter a *Name*, such as *google_test*.
   c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
   d. Set the *Application* to *google*, then click *Next*.



e. Enable *Safe search*.



f. Click *OK*.

2. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*. Edit an existing policy, or create a new one.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *Inline-CASB* and select the *google_test* profile.
   d. Set the *SSL Inspection* profile to one that uses deep inspection.
   e. Configure the other settings as needed.
   f. Click *OK*.

To configure an inline CASB profile with safe search in the CLI:

1. Configure the inline CASB profile:

```
config casb profile
    edit "google_test"
        config saas-application
            edit "google"
                set safe-search enable
                set safe-search-control "strict"
            next
        end
    next
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 7
        set name "casb_test_google"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "google_test"
        set nat enable
    next
end
```

To test the configuration:

1. Open a browser and attempt to search in Google for content that is considered mature or explicit.
2. The sensitive content is filtered out in the search results.

Sample log:

```
1: date=2023-08-18 time=17:01:36 eventtime=1692403295962385271 tz="-0700" logid="2500010002"
type="utm" subtype="casb" eventtype="casb" level="information" vd="vdom1" msg="CASB access was
monitored because it contained activity." policyid=7 sessionid=63774 srcip=10.1.100.195
dstip=142.250.217.98 srcport=61065 dstport=443 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6 action="monitor" profile="google_test"
saasapp="google" useractivity="google-safe-search" activitycategory="safe-search-control"
```

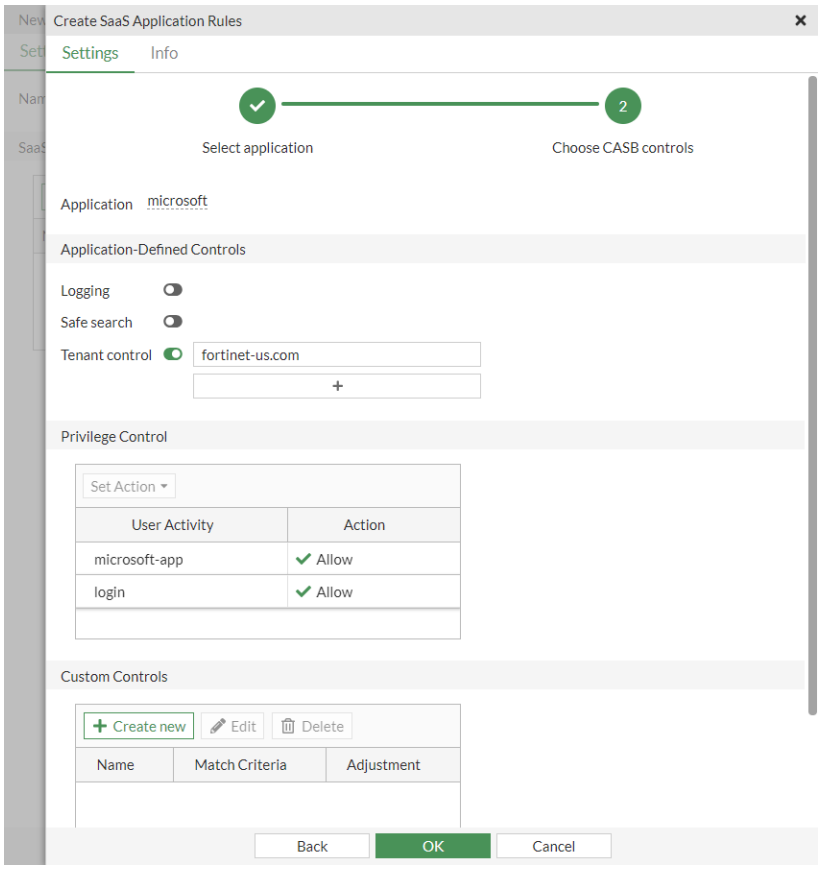
Tenant control

In this example, tenant control is configured for Microsoft in the inline CASB profile for the fortinet-us.com domain.

To configure an inline CASB profile with tenant control in the GUI:

1. Configure the inline CASB profile:
   a. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
   b. Enter a *Name*, such as *microsoft_test*.
   c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
   d. Set the *Application* to *microsoft*, then click *Next*.

   e. Enable *Tenant control*. Click the + and enter *fortinet-us.com*.



f. Click *OK*.

2. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*. Edit an existing policy, or create a new one.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *Inline-CASB* and select the *microsoft_test* profile.
   d. Set the *SSL Inspection* profile to one that uses deep inspection.
   e. Configure the other settings as needed.
   f. Click *OK*.

To configure an inline CASB profile with tenant control in the CLI:

1. Configure the inline CASB profile:

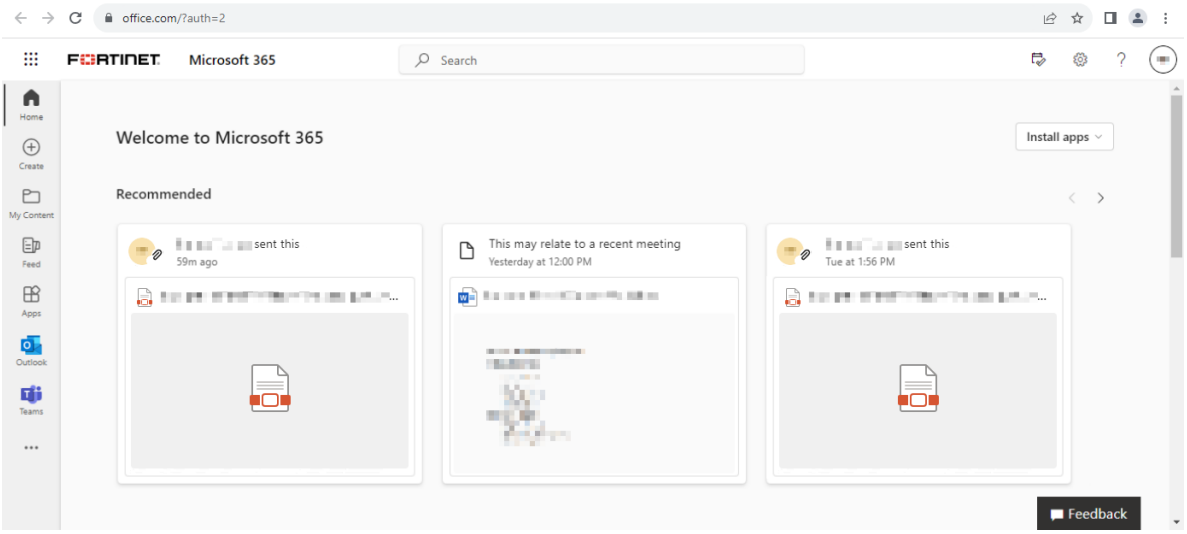
```
config casb profile
    edit "microsoft_test"
        config saas-application
            edit "microsoft"
                set tenant-control enable
                set tenant-control-tenants "fortinet-us.com"
            next
        end
    next
end
```

2. Configure the firewall policy:

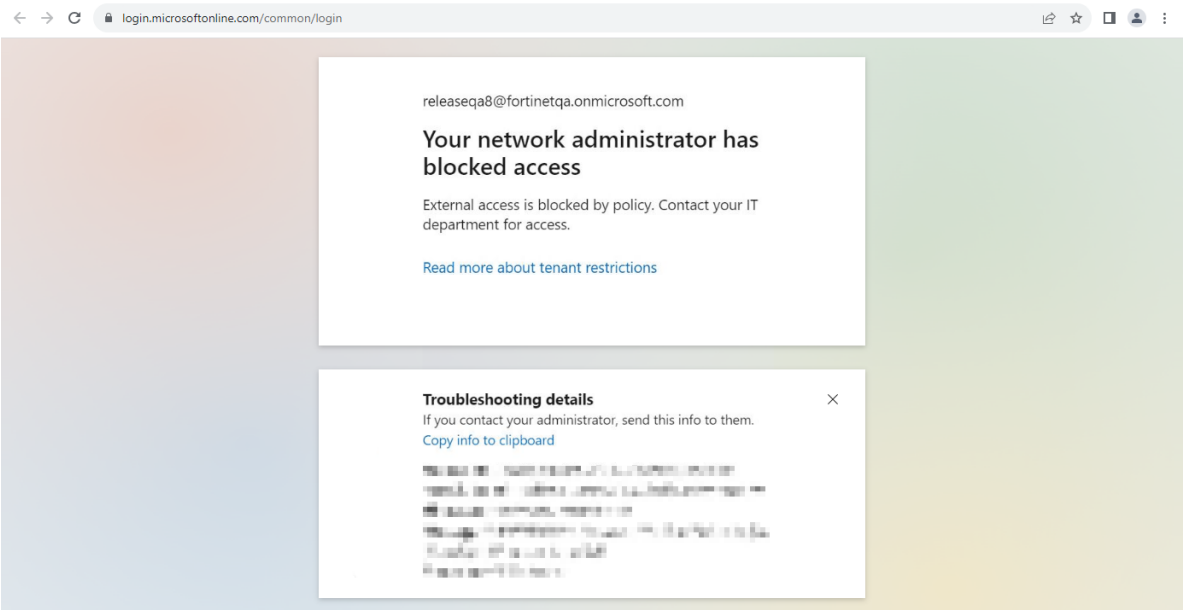
```
config firewall policy
    edit 8
        set name "casb_test_microsoft"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "microsoft_test"
        set nat enable
    next
end
```

To test the configuration:

1. Open a browser and attempt to log in to Microsoft Office 365 with a fortinet-us.com account.
2. Since the domain is valid, the user can log in successfully.



3. Attempt to log in to Microsoft Office 365 with another account with a different domain.
4. The domain is invalid. The user is unable to log in, and an error message appears: *Your network administrator has blocked access*.



Sample log:

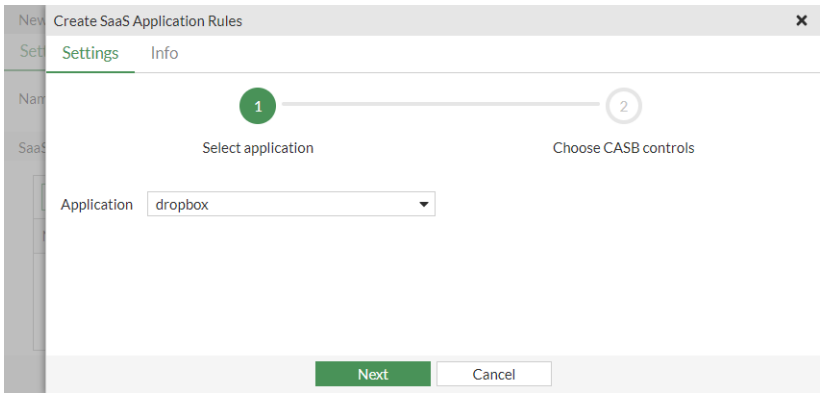
```
1: date=2023-08-18 time=17:09:25 eventtime=1692403765238967943 tz="-0700" logid="2500010002"
type="utm" subtype="casb" eventtype="casb" level="information" vd="vdom1" msg="CASB access was
monitored because it contained activity." policyid=8 sessionid=65108 srcip=10.1.100.195
dstip=20.189.173.15 srcport=61912 dstport=443 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6 action="monitor" profile="microsoft_test"
saasapp="microsoft" useractivity="ms-tenant-control" activitycategory="tenant-control"
```

UTM bypass

In this example, UTM bypass is configured for Dropbox file downloading in the inline CASB profile.

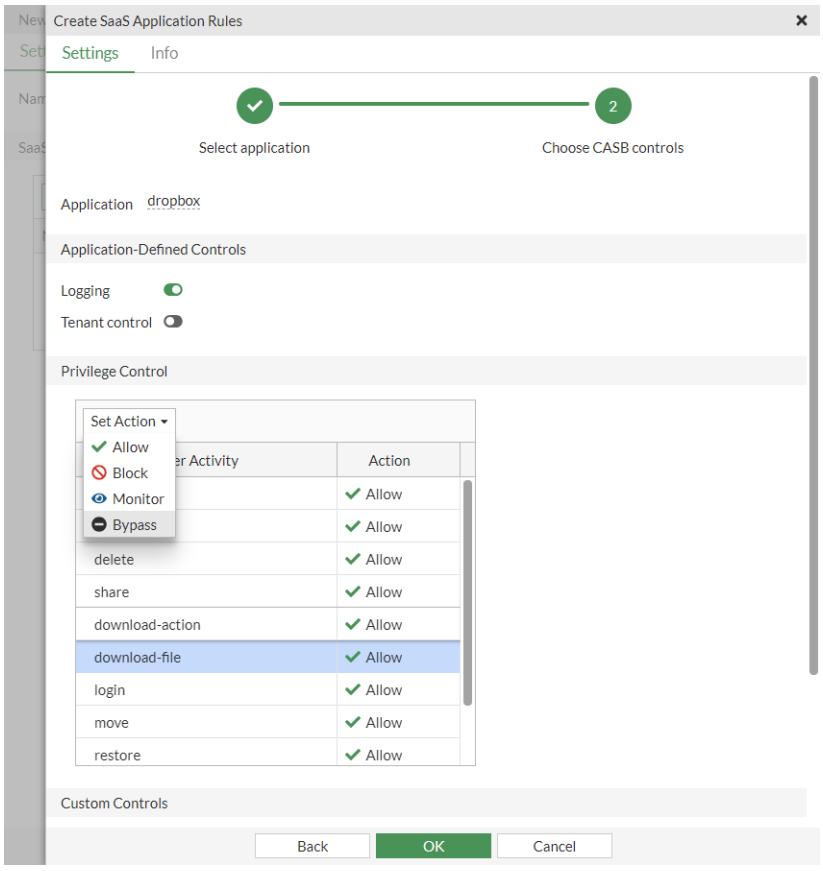
To configure an inline CASB profile with UTM bypass in the GUI:

1. Configure the inline CASB profile:
   a. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
   b. Enter a *Name*, such as *dropbox_test*.
   c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
   d. Set the *Application* to *dropbox*, then click *Next*.



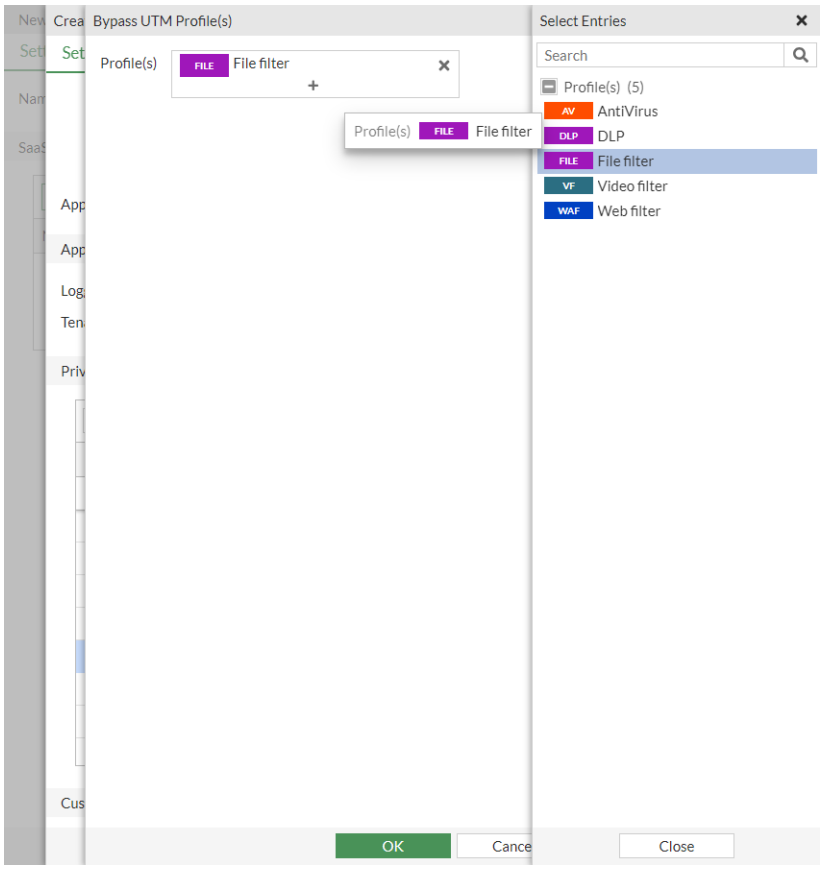
e. Enable *Logging*.

f. In the *Privilege Control* table, select *download-file* and from the *Set Action* dropdown, select *Bypass*.



The *Bypass UTM Profile(s)* pane opens.

g. Click the + and set *Profile(s)* to *File Filter*.



h. Click *OK* to save the bypass UTM profile.

i. Click *OK* to save the inline CASB profile

2. Configure the firewall policy:

a. Go to *Policy & Objects* > *Firewall Policy*. Edit an existing policy, or create a new one.

b. Set the *Inspection Mode* to *Proxy-based*.

c. In the *Security Profiles* section, enable *Inline-CASB* and select the *dropbox_test* profile.

d. Set the *SSL Inspection* profile to one that uses deep inspection.

e. Configure the other settings as needed.

f. Click *OK*.

To configure an inline CASB profile with UTM bypass in the CLI:

1. Configure the inline CASB profile:

```
config casb profile
    edit "dropbox_test"
        config saas-application
            edit "dropbox"
                config access-rule
                    edit "dropbox-download-file"
                        set bypass file-filter
                        set action bypass
                    next
```

```
                end
            next
        end
    next
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 9
        set name "casb_test_dropbox"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "dropbox_test"
        set nat enable
    next
end
```

To test the configuration:

1. Open a browser and log in to Dropbox.
2. Attempt to download a file, such as a PDF. The download is successful.

Sample log:

```
1: date=2023-08-18 time=17:15:29 eventtime=1692404129378193492 tz="-0700" logid="2500010001"
type="utm" subtype="casb" eventtype="casb" level="information" vd="vdom1" msg="CASB access was
allowed although it contained activity." policyid=9 sessionid=65452 srcip=10.1.100.195
dstip=162.125.1.15 srcport=62110 dstport=443 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6 action="bypass" profile="dropbox_test"
saasapp="dropbox" useractivity="dropbox-download-file" activitycategory="activity-control"
```

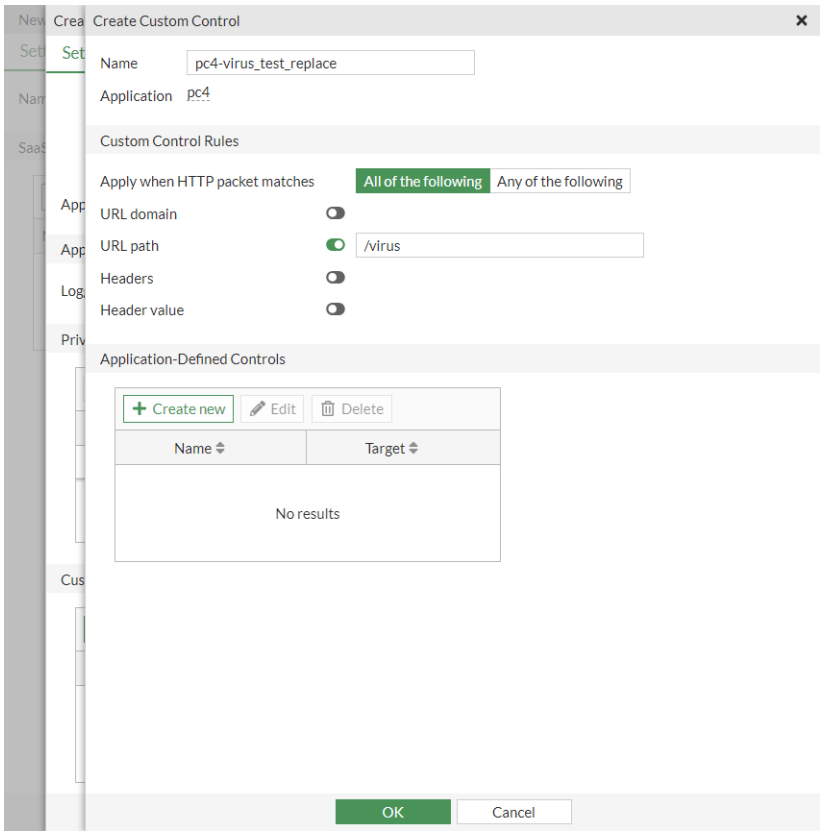
Customized SaaS application and user activity

In this example, a custom SaaS application is created (pc4) with a custom user action. When a user accesses pc4.qa.fortinet.com/virus, they are redirected to pc4.qa.fortinet.com/testweb/testweb.htm.

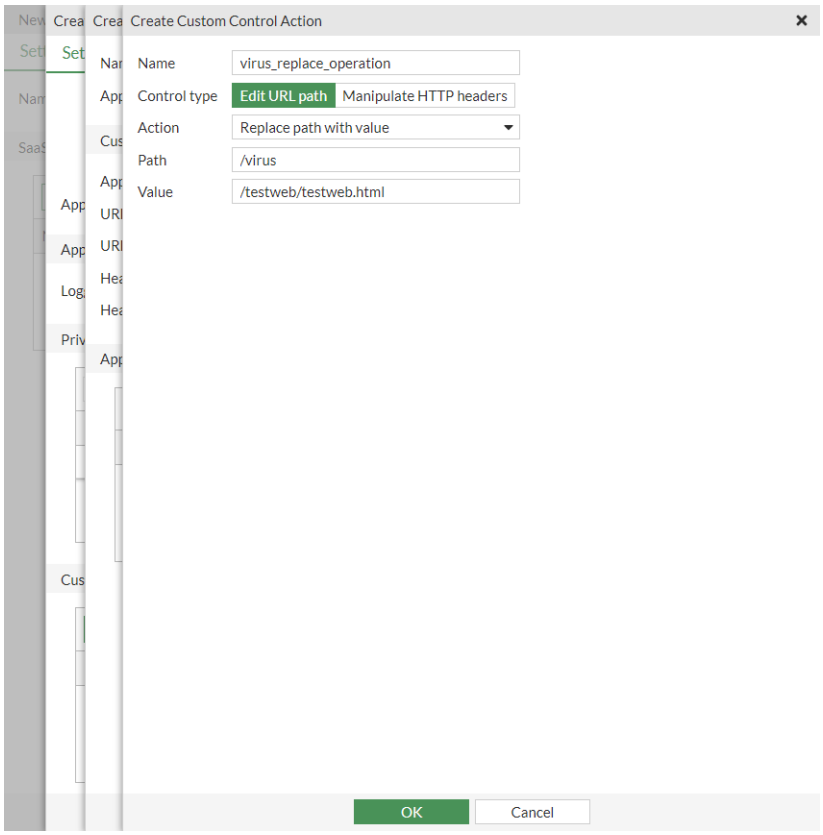
To configure a customized inline CASB profile in the GUI:

1. Configure the inline CASB profile:
   a. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
   b. Enter a *Name*, such as *custom_test*.
   c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
   d. In the *Application* dropdown, click the *+* to create a custom entry. The *Create Inline-CASB SaaS Application* pane opens.
   e. Enter the *Name* (*pc4*) and *Domains* (*pc4.qa.fortinet.com*), then click *OK*.

   f. Select *pc4* and click *Next*.
   g. Configure the custom control and action:
      i. In the *Custom Controls* table, *Create new*. The *Create Custom Control* pane opens.
      ii. Enter a *Name*, such as *pc4-virus_test_replace*.
      iii. Set *Apply when HTTP packet matches* to *All of the following*.
      iv. Enable *URL path* and enter */virus*.



v. In the *Application-Defined Controls* table, *Create new*. The *Create Custom Control Action* pane opens.
vi. Enter a *Name*, such as *virus_replace_operation*.
vii. Set the *Control Type* to *Edit URL path*.
viii. Set the *Action* to *Replace path with value*.
ix. Set the *Path* to */virus*.
x. Set the *Value* to */testweb/testweb.html*.



xi. Click *OK* to save the custom action.

xii. Click *OK* to save the custom control.

h. Click *OK* to save the application rule.

i. Click *OK* to save the inline CASB profile.

2. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*. Edit an existing policy, or create a new one.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *Inline-CASB* and select the *custom_test* profile.
   d. Set the *SSL Inspection* profile to one that uses deep inspection.
   e. Configure the other settings as needed.
   f. Click *OK*.

To configure a customized inline CASB profile in the CLI:

1. Configure the CASB SaaS application:

```
config casb saas-application
    edit "pc4"
        set domains "pc4.qa.fortinet.com"
    next
end
```

2. Configure the CASB user activity:

```
config casb user-activity
    edit "pc4-virus_test_replace"
        set application "pc4"
        set category other
        config match
            edit 1
                config rules
                    edit 1
                        set type path
                        set match-value "/virus"
                    next
                end
            next
        end
        config control-options
            edit "virus_replace_operation"
                config operations
                    edit "virus_replace_operation"
                        set target path
                        set action replace
                        set search-key "/virus"
                        set values "/testweb/testweb.html"
                    next
                end
            next
        end
    next
end
```

3. Configure the inline CASB profile:

```
config casb profile
    edit "custom_test"
        config saas-application
            edit "pc4"
                config custom-control
                    edit "pc4-virus_test_replace"
                        config option
                            edit "virus_replace_operation"
                            next
                        end
                    next
                end
            next
        end
    next
end
```

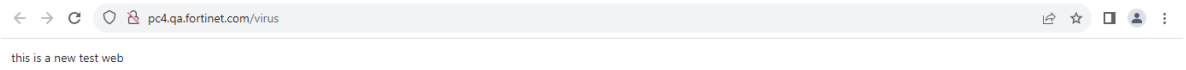
4. Configure the firewall policy:

```
config firewall policy
    edit 10
```

```
        set name "casb_test_custom"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "custom_test"
        set nat enable
    next
end
```

To test the configuration:

1. Open a browser and go to pc4.qa.fortinet.com/virus.
2. Access is redirected to pc4.qa.fortinet.com/testweb/testweb.htm.



Sample log:

```
1: date=2023-08-21 time=08:31:06 eventtime=1692631866382806917 tz="-0700" logid="2500010001"
type="utm" subtype="casb" eventtype="casb" level="information" vd="vdom1" msg="CASB access was
allowed although it contained activity." policyid=10 sessionid=3139 srcip=10.1.100.195
dstip=172.16.200.44 srcport=56774 dstport=80 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6
url="http://pc4.qa.fortinet.com/testweb/testweb.html" action="bypass" profile="custom_test"
saasapp="pc4" useractivity="pc4-virus_test_replace" activitycategory="other"
```

Intrusion prevention

Intrusion Prevention System (IPS) detects network attacks and prevents threats from compromising the network, including protected devices. IPS can be in the form of a standalone appliance, or part of the feature set of a Next Generation Firewall (NGFW), such as FortiGate. IPS utilizes signatures, protocol decoders, heuristics (or behavioral monitoring), threat intelligence (such as FortiGuard Labs), and advanced threat detection in order to prevent exploitation of known and unknown zero-day threats. FortiGate IPS is even capable of performing deep packet inspection to scan encrypted payloads in order to detect and prevent threats from attackers.

When implementing IPS profiles, Fortinet recommends tuning the sensor to reflect the environment that it is protecting. This involves selecting only signatures that match the services and devices that it is meant to protect, and adjusting thresholds for selected anomalies to suit your environment.

Networks and devices are often exploited through vulnerabilities. Software vulnerabilities are one such example where a bug or inherent weakness in the code provides attackers an opportunity to gain access to the software. More severe vulnerabilities allow unauthorized access, data loss, and execution of malicious code. Exploitation of these vulnerabilities can cause damage to the machine and infect others. While the best solution is to patch vulnerabilities as soon as patches are available, IPS signatures offer a solution to detect and block exploitation of many vulnerabilities before they enter the network.

IPS signatures

In order to download updated IPS definitions, at least 1 policy with a security profile that has IPS scanning must be enabled.

Fortinet's solution combines industry-leading threat intelligence from FortiGuard Labs with the FortiGate NGFW to identify the latest threats and prevent them from entering your network. IPS signatures are one such method for delivering the latest protection. FortiGuard Labs uses AI and Machine Learning (ML) to analyze billions of events every day. The FortiGuard Labs research team also proactively performs threat research to discover new vulnerabilities and exploitation, and produces signatures to identify such threats. These IPS signatures are delivered to each FortiGate daily, so that the IPS engine is armed with the latest databases to match the latest threats.

IPS sensors

A FortiGate IPS sensor is a collection of IPS signatures and filters that define the scope of what the IPS engine will scan when the IPS sensor is applied. An IPS sensor can have multiple sets of signatures and/or filters. A set of IPS signatures consists of manually selected signatures, while a set of IPS filters consists of filters based on signature attributes like target, severity, protocol, OS, and application. Each signature has predefined attributes and an action, such as block, allow, monitor (pass), quarantine, and reset. It is also possible to create custom IPS signatures to apply to an IPS sensor.

From the *Security Profiles* > *Intrusion Prevention* pane, you can create new IPS sensors and view a list of predefined sensors.

FortiOS includes the following predefined IPS sensors with associated predefined signatures:

Predefined IPS sensors	Description
all_default	Filters all predefined signatures, and sets action to the signature's default action.
all_default_pass	Filters all predefined signatures, and sets action to pass/monitor.
default	Filters all predefined signatures with severity of Critical/High/Medium. Sets action to signature's default action.
high_security	Filters all predefined signatures with severity of Critical/High/Medium, and sets action to Block. For Low severity signatures, sets action to signature's default action.
protect_client	Protects against client-side vulnerabilities by filtering on `Target=Client`. Sets action to signature's default action.

Predefined IPS sensors	Description
protect_email_server	Protects against email server-side vulnerabilities by filtering on `Target=Server` and `Protocol=IMAP`, `POP3` or `SMTP`. Sets action to signature's default action.
protect_http_server	Protects against HTTP server-side vulnerabilities by filtering on `Target=Server` and `Protocol=HTTP`. Sets action to signature's default action.
wifi-default	Filters all predefined signatures with severity of Critical/High/Medium. Sets action to signature's default action. Used in profile for offloading WiFi traffic.

New signatures

When new vulnerabilities are discovered and the FortiGuard team creates signatures to match them, the priority is to match the malicious traffic and release the signature as quickly as possible. As a result, the signatures are more broad at the start and become refined over time, incidentally causing some false positives. For this reason, the signatures are often released with an action of pass.

You must decide on the tradeoff between protection and usability with potential false positives. The high_security IPS sensor (or any custom sensor which overwrites the default action of Medium/High/Critical) should be used when false positives are acceptable to provide a higher level of security.

DDoS attacks

Besides protecting against threats and exploitation of vulnerabilities, the IPS engine is also responsible for mitigating Denial of Service (DoS) attacks where attackers attempt to bring a service down by flooding the target with traffic from distributed systems. Using anomaly-based defense, FortiGate can detect a variety of L3 and L4 anomalies and take action against these attacks. This can be configured under IPv4 and IPv6 DoS Policies, which is discussed in detail under DoS policy on page 1621.

This section contains the following topics:

- Signature-based defense on page 2116
- Configuring an IPS sensor on page 2119
- IPS configuration options on page 2122
- IPS signature filter options on page 2134
- SCTP filtering capabilities on page 2128
- Diameter protocol inspection on page 2130

This section also provides the following examples about IPS sensors:

- IPS with botnet C&C IP blocking on page 2138
- IPS signatures for the operational technology security service on page 2142
- IPS sensor for IEC 61850 MMS protocol on page 2144
- IPS Modbus TCP decoder on page 2145

Signature-based defense

Signature-based defense is used against known attacks or vulnerability exploits. These often involve an attacker attempting to gain access to your network. The attacker must communicate with the host in an attempt to gain access, and this communication includes commands or sequences of commands and variables. The IPS signatures include these command sequences, allowing the FortiGate unit to detect and stop the attack.

This section describes the following components used in signature-based defense:

- IPS signatures on page 2116
- Protocol decoders on page 2116
- IPS engine on page 2116
- IPS sensors on page 2116
- IPS filters on page 2117
- Custom and predefined signature entries on page 2118
- Policies on page 2119

IPS signatures

IPS signatures are the basis of signature-based intrusion prevention. Every attack can be reduced to a particular string of commands or a sequence of commands and variables. Signatures include this information, and FortiGate uses the information to detect and stop attacks.

Signatures also include characteristics about the attack they describe. These characteristics include the network protocol associated with the attack, the vulnerable operating system, and the vulnerable application.

To view the complete list of signatures, go to *Security Profiles* > *IPS Signatures*. The list of signatures includes predefined and custom signatures. You can hover over the name of the IPS signature to display a pop-up window that includes an ID number. You can click the ID number to display the FortiGuard page.

Protocol decoders

Before examining network traffic for attacks, the IPS engine uses protocol decoders to identify each protocol appearing in the traffic. Attacks are protocol-specific, so your FortiGate unit conserves resources by looking for attacks only in the protocols used to transmit them. For example, the FortiGate unit will only examine HTTP traffic for the presence of a signature describing an HTTP attack.

IPS engine

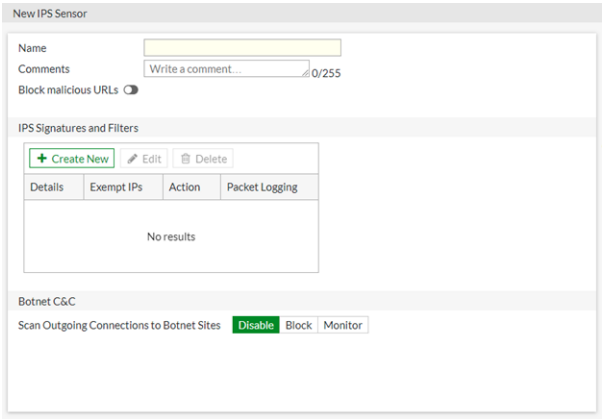
Once the protocol decoders separate the network traffic by protocol, the IPS engine examines the network traffic for the attack signatures by using IPS sensors.

IPS sensors

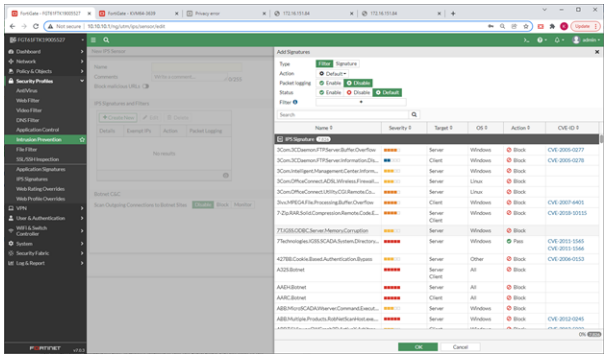
The IPS engine does not examine network traffic for all signatures. The IPS engine examines network traffic for signatures specified in IPS sensors. You must first create an IPS sensor, and then you can specify what

signatures the IPS sensor will use. You can add individual signatures to IPS sensors, or you can add filters to IPS sensors, and the filters automatically include the applicable signatures.

To view IPS sensors, go to *Security Profiles* > *Intrusion Prevention*. To create a new sensor, click *Create New*.



An IPS sensor is composed of IPS signatures and filters. Under *IPS Signatures and Filters*, click *Create New* to create a set of IPS signatures or a set of IPS filters.



You can create IPS sensors for specific types of traffic, and then select the IPS sensors in firewall policies designed to handle the same type of traffic. For example, you can specify all of the web-server related signatures in an IPS sensor, and select the IPS sensor in a firewall policy that controls all traffic to and from a web server that is protected by the FortiGate unit.

The FortiGuard Service periodically adds new predefined signatures to counter new threats. New predefined signatures are automatically included in IPS sensors that are configured to use filters when the new signatures match existing filter specifications. For example, if you have an IPS sensor with a filter that includes all signatures for the Windows operating system, your filter will automatically incorporate new Windows signatures that the FortiGuard Service adds to the database.

IPS signature and filter entries are checked from top down. When a signature is found in a set of signatures or filters, the action defined for the signature is taken.

IPS filters

IPS sensors can contain one or more IPS filters. A filter is a collection of signature attributes that you specify. The signatures that have all of the attributes specified in a filter are included in the IPS filter.

Following are the attribute groups:

- Target
- Severity
- Protocol
- OS
- Application

Starting in FortiOS 6.4.2, you can also filter by CVE ID or CVE pattern by using the CLI. See FortiOS 6.4 New Features > IPS signature filter options.

When selecting multiple attributes within the same group, the selections are combined by using a logical `OR`. When selecting multiple attributes between attribute groups, each attribute group is combined by using a logical `AND`.

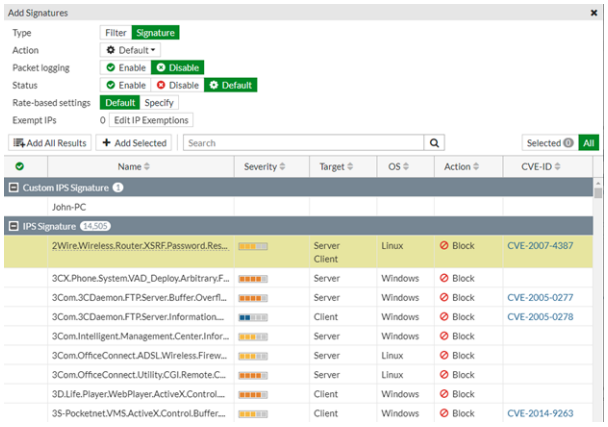
Once you select filters in the GUI, the filtered list of IPS signatures are displayed. Adjust your filters accordingly to construct a suitable list for your needs.

For example, if your FortiGate unit protects a Linux server running the Apache web server software, you could create a new filter to protect it. By setting *OS* filter attribute to *Linux*, and the filter attribute *Application* to *Apache*, the filter will include only the signatures that apply to both Linux and Apache. If you wanted to scan for all the Linux signatures and all the Apache signatures, you would create two filters, one for each.

To view the filters in an IPS sensor, go to *Security Profiles* > *Intrusion Prevention*, select the IPS sensor, and click *Edit*.

Custom and predefined signature entries

Signature entries allow you to add individual, custom or predefined IPS signatures to an IPS sensor. If you need only one signature, or you want to manually select multiple signatures that don't fall into the criteria for an IPS filter, adding a signature entry to an IPS sensor is the easiest way. Signature entries are also the only way to include custom signatures in an IPS sensor.



To select an individual signature, click a signature, and select *Add Selected*. The signature moves to the *Selected* list.

To select multiple signatures, use the *Search* bar to perform a keyword search, and then click *Add All Results* to move all entries to the *Selected* list.

Overriding the default action

Each IPS signature comes with a default action such as *Block* and *Pass*. In some scenarios, you may want to override this action. You can override a set of IPS filter or signatures. By default, a set of IPS filter or signatures has an action of *Default*, which applies a signature's default action when the signature is matched. By changing the action, you can override the setting for all signatures within the filter or signature set.

Policies

You must select an IPS sensor in a security policy or an interface policy to apply the IPS sensor to traffic. An IPS sensor that it not selected in a policy is not applied to network traffic.

Configuring an IPS sensor

You can configure IPS sensors to be used in policies in the GUI.

To configure an IPS sensor:

1. Go to *Security Profiles* > *Intrusion Prevention*.
2. Click *Create New*.
3. Configure the following settings:

Name		Enter a unique name for the sensor.
Comments		Enter a comment (optional).
Block malicious URLS		Enable to block malicious URLs based on a local malicious URL database on the FortiGate to assist in the detection of drive-by exploits. See Malicious URL database for drive-by exploits detection on page 2122.
IPS Signature and Filters		Select a signature or filter to assign to the sensor. See Configuring signatures and filters on page 2120.
Botnet C&C		
	Scan Outgoing Connections to Botnet Sites	Define the botnet scanning across traffic that matches the policy: • *Disable*: Do not scan connections to botnet servers. • *Block*: Block connections to botnet servers. • *Monitor*: Log connections to botnet servers. See IPS with botnet C&C IP blocking on page 2138.

4. Click *OK*.

For information on configuring IPS sensors in the CLI, see IPS configuration options on page 2122.

Configuring signatures and filters

Signatures and filters can be configured and added to IPS sensors. A filter is a collection of signature attributes. Any signatures that meet all of the attributes specified in a filter are automatically included in the IPS sensor. See IPS signature filter options on page 2134.

To configure a Signature entry of type Filter:

1. Go to *Security Profiles* > *Intrusion Prevention*.
2. Click *Create New*.
3. Configure the IPS sensor settings.
4. In *IPS Signatures and Filters*, click *Create New*. The *Add Signatures* pane is displayed.
5. Configure the settings as follows:

Type	Select *Filter*.
Action	Click the dropdown menu and select the action when a signature is triggered: • *Allow*: Allow traffic to continue to its destination. • *Monitor*: Allow traffic to continue to its destination and log the activity. • *Block*: Drop traffic that matches the signature. • *Reset*: Reset the session whenever the signature is triggered. • *Default*: Use the default action of the signature. Search for the signature in the *IPS Signature* pane to view the default *Action*. • *Quarantine*: Block the matching traffic. Enable packet logging. Quarantine the attacker.
Packet logging	Enable packet logging to save a copy of the packets when they match the signature. Packet copies can be analyzed later. Packet logging is not supported on all FortiGate devices. FortiAnalyzer logging or a hard disk are required to support this feature; see the Feature Platform Matrix.
Status	Define the signature status: • *Enable*: Enable the signature. • *Disable*: Disable the signature. • *Default*: Use the default status of the signature. Search for the signature in the *IPS Signature* pane to view the default *Status*.
Filter	Select the *+* to open the *Select Entries* field and select filter entries. There are different entry categories: • *Target*: Refers to the type of device targeted by the attack. • *Severity*: Refers to the level of the threat posed by the attack. • *Protocol*: Refers to the protocol that is the vector for the attack. • *OS*: Refers to the Operating System affected by the attack. • *Application*: Refers to the application affected by the attack.

6. Select one or more signatures from the *IPS Signatures* pane.

7. Click *OK*. The signature is added to the IPS sensor.
8. Click *OK*.

Individual signatures, custom or predefined IPS signatures can be selected for an IPS sensor. If you need only one signature, or you want to manually select multiple signatures that don't fall into the criteria for an IPS filter, adding a signature entry to an IPS sensor is the easiest way.

To configure a Signature entry of type Signature:

1. Go to *Security Profiles* > *Intrusion Prevention*.
2. Click *Create New*.
3. Configure the IPS sensor settings.
4. In *IPS Signatures and Filters*, click *Create New*. The *Add Signatures* pane is displayed.
5. Configure the settings as follows:

Type	Select *Signature*.
Action	Click the dropdown menu and select the action when a signature is triggered: • *Allow*: Allow traffic to continue to its destination. • *Monitor*: Allow traffic to continue to its destination and log the activity. • *Block*: Drop traffic that matches the signature. • *Reset*: Reset the session whenever the signature is triggered. • *Default*: Use the default action of the signature. Search for the signature in the *IPS Signature* pane to view the default *Action*. • *Quarantine*: Block the matching traffic. Enable packet logging. Quarantine the attacker.
Packet Logging	Enable packet logging to save a copy of the packets when they match the signature. Packet copies can be analyzed later. Packet logging is not supported on all FortiGate devices. FortiAnalyzer logging or a hard disk are required to support this feature; see the Feature Platform Matrix.
Status	Define the signature status: • *Enable*: Enable the signature. • *Disable*: Disable the signature. • *Default*: Use the default status of the signature. Search for the signature in the *IPS Signature* pane to view the default *Status*.
Rate-based settings	
Default	Use the default rate-based settings.
Specify	Specify the rate-based settings: • *Threshold*: Enter the threshold. See IPS signature rate count threshold on page 2123. • *Duration (seconds)*: Enter the duration in seconds. • *Track By*: Select the tracking method as *Any*, *Source IP*, or

	Destination IP.
Exempt IPs	Add IP addresses that are exempt from the signature rules. Click *Edit IP Exemptions* and click *Create New*. Edit the *Source IP/Netmask* and the *Destination IP/Netmask* to define the IP address for exemption. Click *OK* to add it to *Exempt IPs*.

6. Select one or more signatures from the *IPS Signatures* pane.
7. Click *OK*. The signature is added to the IPS sensor.
8. Click *OK*.

IPS configuration options

Besides configuring an IPS filter or selecting IPS signatures for an IPS sensor, you can configure additional IPS options for each sensor or globally for all sensors. This topic introduces the following available configuration options:

- Malicious URL database for drive-by exploits detection on page 2122
- IPS signature rate count threshold on page 2123
- Botnet C&C on page 2124
- Hardware acceleration for flow-based security profiles (NTurbo and IPSA) on page 2124
- Extended IPS database on page 2125
- IPS engine-count on page 2125
- OT threat definitions on page 2126
- Fail-open on page 2126
- IPS buffer size on page 2126
- Session count accuracy on page 2127
- Protocol decoders on page 2127

To configure IPS sensors, signatures, and filters in the GUI, see Configuring an IPS sensor on page 2119.

Malicious URL database for drive-by exploits detection

This feature uses a local malicious URL database on the FortiGate to assist in detection of drive-by exploits, such as adware that allows automatic downloading of a malicious file when a page loads without the user's detection. The database contains all malicious URLs active in the last one month, and all drive-by exploit URLs active in the last three months. The number of URLs controlled are in the one million range.

This feature can be enabled from an IPS sensor in the GUI by going to *Security Profiles* > *Intrusion Prevention* and editing or creating an IPS Sensor, then enabling *Block malicious URLs*. See Configuring an IPS sensor on page 2119.

To enable the blocking of malicious URLs in the CLI:

```
config ips sensor
    edit <profile>
        set block-malicious-url {enable | disable}
    next
end
```

Blocking malicious URLs is not supported on some FortiGate models, such as FortiGate 51E, 50E, or 30E.

IPS signature rate count threshold

You can use the IPS signature rate-based settings to specify a rate count threshold that must be met before the signature is triggered. A rate count threshold provides a more controlled recording of attack activity. For example, if multiple login attempts produce a failed result over a short period of time, then an alert would be sent and traffic might be blocked, which is a more manageable response than sending an alert every time a login fails.

This can be configured from the GUI by going to *Security Profiles* > *Intrusion Prevention*. Create or edit an IPS sensor. Within the sensor, edit the IPS signatures and filters. Only IPS signatures have the rate-based settings option. IPS filters do not. See Configuring an IPS sensor on page 2119.

Some settings are only available in the CLI.

To configure the IPS signature rate-based settings in the CLI:

```
config ips sensor
    edit <sensor>
        config entries
            edit <filter ID number>
                set rule <ids>
                set rate-count <integer>
                set rate-duration <integer>
                set rate-mode {continuous | periodical}
                set rate-track {none | src-ip | dest-ip | dhcp-client-mac  | dns-domain}
            next
        end
    next
end
```

`rule <ids>`	The predefined or custom IPS signatures to add to the sensor.
`rate-count <integer>`	The count of the rate (0 - 65535, default = 0). The rate-count must be configured before the other rate settings can be set.
`rate-duration <integer>`	Duration of the rate, in seconds (0 - 65535, default = 60)

`rate-mode {continuous | periodical}`	How the count threshold is met. • `continuous`: If the action is set to block, the action is engaged as soon as the rate-count is reached. For example, if the count is 10, the traffic would be blocked as soon as the signature is triggered 10 times. This is the default. • `periodical`: The FortiGate allows up to the value of the rate-count incidents where the signature is triggered during the rate-duration. For example, if the rate count is 100 and the duration is 60, the signature would need to be triggered 100 times in 60 seconds for the action to be engaged.
`rate-track {none | src-ip | dest-ip | dhcp-client-mac | dns-domain}`	Track one of the protocol fields within the packet (default = none).

Botnet C&C

See IPS with botnet C&C IP blocking on page 2138 for information on configuring settings in the CLI.

Hardware acceleration for flow-based security profiles (NTurbo and IPSA)

Some FortiGate models support a feature call NTurbo that can offload flow-based firewall sessions to network processors. See also NTurbo offloads flow-based processing in the Hardware Acceleration Guide. For IPSA enhanced pattern matching, see IPSA offloads flow-based advanced pattern matching in the Hardware Acceleration Guide.

Some FortiGate models also support offloading enhanced pattern matching for flow-based security profiles to CP8 or CP9 content processors.

To configure NTurbo and IPSA:

```
config ips global
    set np-accel-mode {none | basic}
    set cp-accel-mode {none | basic | advanced}
end
```

If the `np-accel-mode` option is available, your FortiGate supports NTurbo. The `none` option disables NTurbo, and `basic` (the default) enables NTurbo.

If the `cp-accel-mode` option is available, your FortiGate supports IPSA. The `none` option disables IPSA, and `basic` enables basic IPSA, and `advanced` enables enhanced IPSA, which can offload more types of pattern matching than basic IPSA. The `advanced` option is only available on FortiGate models with two or more CP8 processors, or one or more CP9 processors.

Extended IPS database

Some models have access to an extended IPS Database. Because the extended database may affect FortiGate performance, the extended database package may be disabled by default on some models, such as entry-level models.

You can only enable the extended IPS database by using the CLI.

To enable the extended IPS database:

```
config ips global
    set database extended
end
```

FortiGate models with the CP9 SPU receive the IPS full extended database, and the other physical FortiGate models receive a slim version of the extended database. The slim-extended DB is a smaller version of the full extended DB that contains top active IPS signatures. It is designed for customers who prefer performance.

Customers with non-CP9 SPU models need to upgrade to a CP9 SPU model (physical FortiGate) in order to get full IPS signature coverage. All FortiGate models 200 (E and F) and higher have a CP9 SPU.

See Determining the content processor in your FortiGate unit in the FortiOS Hardware Acceleration Guide to check if your device has a CP9 SPU.

FortiGate VMs with eight or more vCPUs can be configured to have a minimum of eight cores to be eligible to run the full extended database. Any FortiGate VM with less than eight cores will receive a slim version of the extended database.

IPS engine-count

FortiGate units with multiple processors can run one or more IPS engine concurrently. The `engine-count` CLI command allows you to specify how many IPS engines to use at the same time.

To specify the number of concurrent IPS engines running:

```
config ips global
    set engine-count <int>
end
```

The recommended and default setting is `0`, which allows the FortiGate unit to determine the optimum number of IPS engines.

OT threat definitions

Operational Technology (OT) threat definitions are defined to protect Industrial Control Systems (ICS), Operational Technology (OT) and SCADA systems, which are critical infrastructure used by manufacturing industries. An OT Security Service license is required to use this signature database. These signatures are excluded by default, but can be configured in the CLI.

Enabling the OT threat definitions may impact IPS performance, since this increases the number of signatures to scan. To optimize IPS performance, enable only IPS signature packages that are needed.

To configure OT signatures:

```
config ips global
    set exclude-signatures {none | ot}
end
```

Fail-open

A fail-open scenario is triggered when IPS raw socket buffer is full. Therefore IPS engine has no space in memory to create more sessions and needs to decide whether to drop the sessions or bypass the sessions without inspection.

To enable fail-open mode:

```
config ips global
    set fail-open {enable | disable}
end
```

The default setting is `disable`, so sessions are dropped by IPS engine when the system enters fail-open mode.

When enabled, the IPS engine fails open, and it affects all protocols inspected by FortiOS IPS protocol decoders, including but not limited to HTTP, HTTPS, FTP, SMTP, POP3, IMAP, and so on. When the IPS engine fails open, traffic continues to flow without IPS scanning.

Sessions offloaded to Nturbo do not support fail-open. When Nturbo data path is overloaded, traffic is dropped regardless of fail-open setting.

IPS buffer size

If system enters fail-open mode frequently, it is possible to increase the IPS socket buffer size to allow more data buffering, which reduces the chances of overloading the IPS engine. You can set the size of the IPS buffer.

To set the socket buffer size:

```
config ips global
    set socket-size <int>
end
```

The default socket size and maximum configurable value varies by model. In short, socket-size determines how much data the kernel passes to the IPS engine each time the engine samples packets.

Take caution when modifying the default value. If the socket-size is too large, the higher memory used by the IPS engine may cause the system to enter conserve mode more frequently. If set too low, the system may enter IPS fail-open mode too frequently.

Session count accuracy

The IPS engine can track the number of open session in two ways. An accurate count uses more resources than a less accurate heuristic count.

To configure the IPS open session count mode:

```
config ips global
    set session-limit-mode {accurate | heuristic}
end
```

The default is `heuristic`.

Protocol decoders

The FortiGate Intrusion Prevention system uses protocol decoders to identify the abnormal traffic patterns that do not meet the protocol requirements and standards. For example, the HTTP decoder monitors traffic to identify any HTTP packets that do not meet the HTTP protocol standards.

To change the ports a decoder examines, you must use the CLI.

To configure protocol decoder ports:

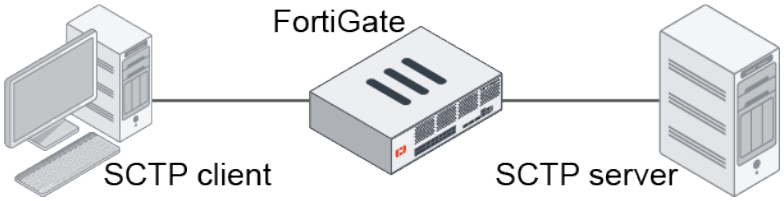
```
config ips decoder dns_decoder
    config parameter "port_list"
        set value "100,200,300"
    end
end
```

In this example, the ports examined by the DNS decoder were changed from the default 53 to 100, 200, and 300.

You cannot assign specific ports to decoders that are set to *auto* by default. These decoders can detect their traffic on any port. Specifying individual ports is not necessary.

SCTP filtering capabilities

A Stream Control Transmission Protocol (SCTP) dissector and Payload Protocol Identifier (PPID) filter can be used to either terminate the SCTP session, or replace the offending data chunk with zeros to keep the client and server sequence numbers synchronized. The SCTP filter action can also pass the data chunk.



To configure and test an SCTP filter:

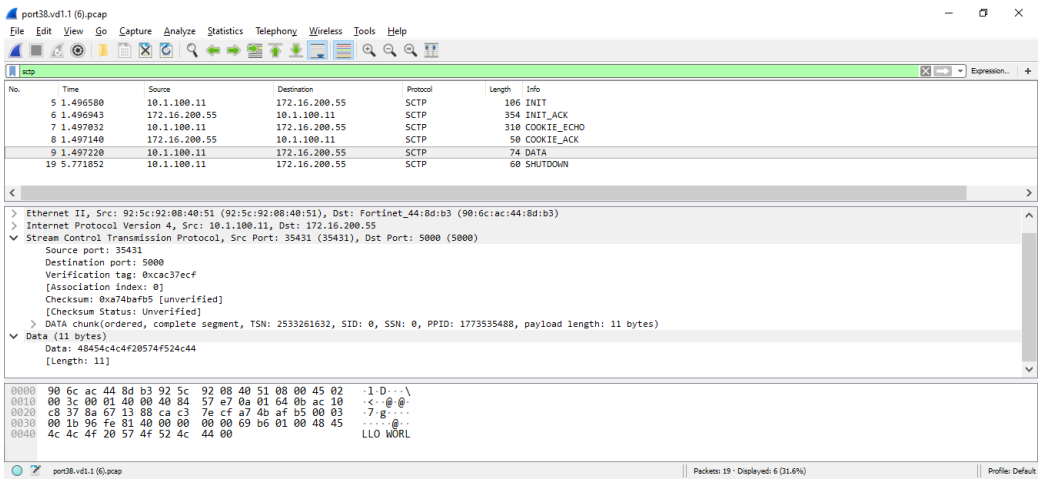
1. Configure an SCTP filter profile that uses the reset action:

```
config sctp-filter profile
    edit "sctp"
        set comment "Demo profile"
        config ppid-filters
            edit 1
                set ppid 112233
                set action reset
                set comment "test chunk"
            next
        end
    next
end
```

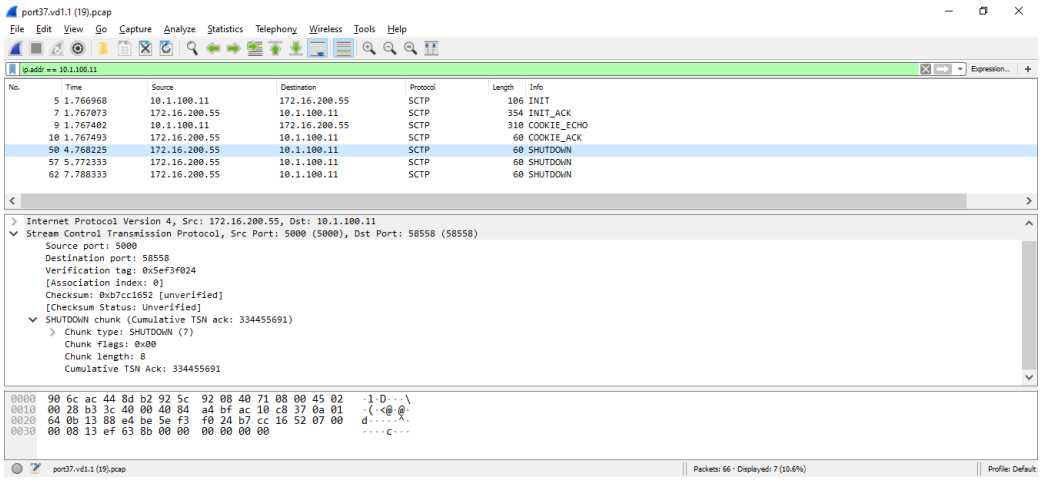
2. Use the SCTP filter profile in a firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "port38"
        set dstintf "port37"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "new-deep-inspection"
        set sctp-filter-profile "sctp"
        set logtraffic all
    next
end
```

3. On the SCTP client, confirm that the connection works and send a data chunk with PPID 112233.



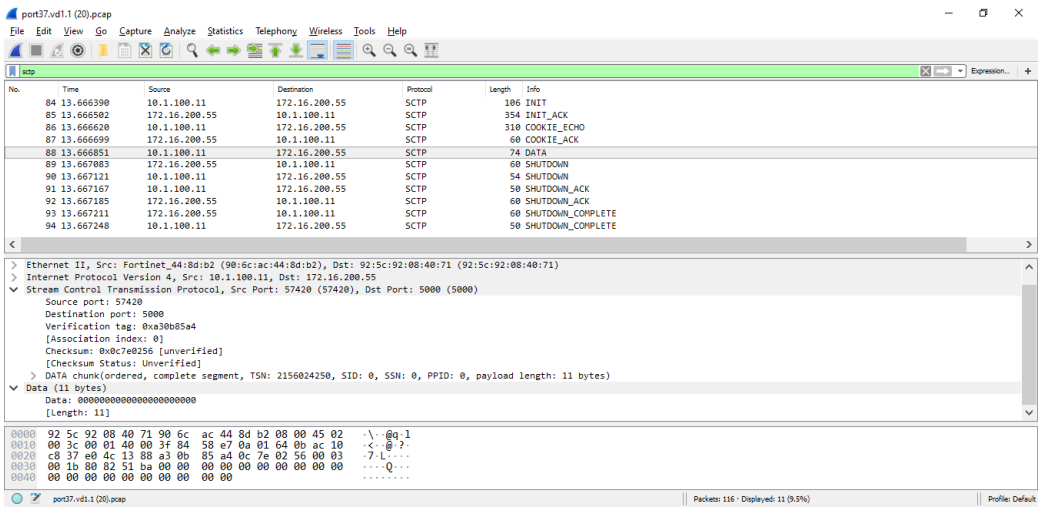
4. The IPS engine detects the data chunk. The PPID matches the PPID filter, and the filter action is reset, so the data chunk is not received on the server, and the session is terminated.



5. Change the filter action to replace:

```
config sctp-filter profile
    edit "sctp"
        config ppid-filters
            edit 1
                set action replace
            next
        end
    next
end
```

6. Resend the data chunk.
7. The IPS engine detects the data chunk. The PPID matches the PPID filter, and the filter action is replace, so the data chunk is replaced with zeros.



Diameter protocol inspection

Diameter protocol inspection is supported on the FortiGate, which offers the following capabilities.

- Diameter-based packet forwarding and routing: the FortiGate can forward and route Diameter packets that match a firewall policy with an enabled and assigned `diameter-filter profile`. These diameter packets traverse over SCTP or TCP on the reserved port 3868.
- Packet sanity checking: this feature checks if the packet passing through the FortiGate conforms to the Diameter protocol standards as defined in RFC 3588.
  - This includes checking the release version field, error command flags, message length, reserved command flag bits, command code, and tracking the request and answer of the Diameter-based packets.
- Logging: for network auditing purposes, the traffic for both dropped and forwarded Diameter-based packets of the supported commands can be logged. By default, these are disabled.

Diameter protocol is particularly important on interfaces that are used to exchange information with roaming partners, through the Internetwork Packet Exchange (IPX) network.

This feature requires a valid IPS license.

```
config diameter-filter profile
    edit <name>
        set monitor-all-messages {enable | disable}
        set log-packet {enable | disable}
        set track-requests-answers {enable | disable}
        set missing-request-action {allow | block | reset | monitor}
        set protocol-version-invalid {allow | block | reset | monitor}
        set message-length-invalid {allow | block | reset | monitor}
        set request-error-flag-set {allow | block | reset | monitor}
        set cmd-flags-reserve-set {allow | block | reset | monitor}
```

```
        set command-code-invalid {allow | block | reset | monitor}
        set command-code-range <min-max>
    next
end
```

`monitor-all-messages {enable | disable}`	Enable/disable logging for all User-Name and Result-Code AVP messages.
`log-packet {enable | disable}`	Enable/disable packet log for triggered Diameter settings.
`track-requests-answers {enable | disable}`	Enable/disable validation that each answer has a corresponding request.
`missing-request-action {allow | block | reset | monitor}`	Set the action to be taken for answers without a corresponding request. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`protocol-version-invalid {allow | block | reset | monitor}`	Set the action to be taken for an invalid protocol version. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`message-length-invalid {allow | block | reset | monitor}`	Set the action to be taken for an invalid message length. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`request-error-flag-set {allow | block | reset | monitor}`	Set the action to be taken for request messages with an error flag set. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`cmd-flags-reserve-set {allow | block | reset | monitor}`	Set the action to be taken for messages with a command flag reserve bits set. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`set command-code-invalid {allow | block | reset | monitor}`	Set the action to be taken for messages with an invalid command code. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`set command-code-range <min-max>`	Set the valid range for command codes (min = 0, max = 16777215, default = 256-16777213).

To configure Diameter protocol inspection:

1. Configure the Diameter filter profile:

```
config diameter-filter profile
    edit "diameter_profile"
        set monitor-all-messages disable
        set log-packet enable
        set track-requests-answers enable
        set missing-request-action block
        set protocol-version-invalid block
        set message-length-invalid block
        set request-error-flag-set block
        set cmd-flags-reserve-set block
        set command-code-invalid block
        set command-code-range 256-1677213
    next
end
```

2. Apply the Diameter filter to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "deep-inspection"
        set diameter-filter-profile "diameter_profile"
        set logtraffic all
        set auto-asic-offload disable
    next
end
```

NTurbo does not fully support SCTP, so if the configuration includes Diameter-over-SCTP, the `auto-asic-offload` setting should be disabled in the firewall policy. Otherwise, IPS does not get the full session packets.

Sample logs

No matching request:

```

IPS signature filter options

IPS signature filter options include hold time, CVE pattern, and IPS sensor attributes.

Hold time

The hold time option allows you to set the amount of time that signatures are held after a FortiGuard IPS signature update per VDOM. During the holding period, the signature's mode is monitor. The new signatures are enabled after the hold time to avoid false positives.

The hold time can be from 0 days and 0 hours (default) up to 7 days, in the format ##d##h.

To configure the amount of time to hold and monitor IPS signatures:

```
config system ips
    set signature-hold-time 3d12h
    set override-signature-hold-by-id enable
end
```

When a signature that is on hold is matched, the log will include the message `signature is on hold`:

```
date=2010-07-06 time=00:00:57 logid="0419016384" type="utm" subtype="ips" eventtype="signature"
level="alert" vd="vd1" eventtime=1278399657778481842 tz="-0700" severity="info" srcip=10.1.100.22
srccountry="Reserved" dstip=172.16.200.55 srcintf="port13" srcintfrole="undefined"
dstintf="port14" dstintfrole="undefined" sessionid=3620 action="detected" proto=6 service="HTTP"
policyid=1 attack="Eicar.Virus.Test.File" srcport=52170 dstport=80 hostname="172.16.200.55"
url="/virus/eicar" direction="incoming" attackid=29844 profile="test"
ref="http://www.fortinet.com/ids/VID29844" incidentserialno=25165825 msg="file_transfer:
Eicar.Virus.Test.File, (signature is on hold)"
```

To view signatures being held by rule ID 29844 on the VDOM:

```
# diagnose ips signature on-hold vd1 29844
Rule: 29844, attack_id: 58886, last updated: 20170411
Rule: 29844, attack_id: 59517, last updated: 20170411
Rule: 29844, attack_id: 60105, last updated: 20170411
...
```

To view all help signatures on the VDOM:

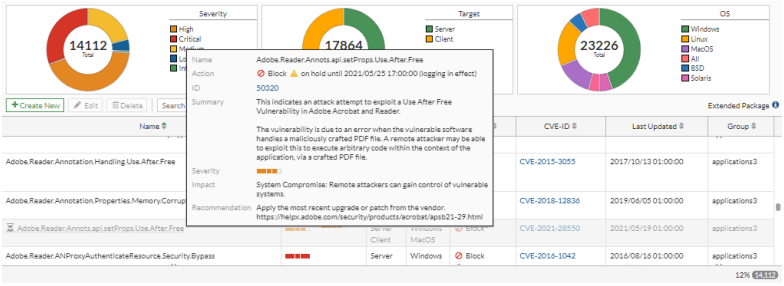
```
# diagnose ips signature on-hold vd1
Rule: 17541, attack_id: 20899, last updated: 20140423
Rule: 17557, attack_id: 20934, last updated: 20140423
Rule: 17559, attack_id: 20932, last updated: 20140423
Rule: 17560, attack_id: 20933, last updated: 20140423
Rule: 17562, attack_id: 20928, last updated: 20170908
Rule: 17677, attack_id: 21187, last updated: 20171106
Rule: 17713, attack_id: 43756, last updated: 20140424
Rule: 17759, attack_id: 21298, last updated: 20140423
...
```

When diagnosing IPS signatures in the CLI, the `Rule` field corresponds to the `attackid` log field, the *ID* in the FortiGate GUI, as well as the IPS entry ID in the FortiGuard IPS encyclopedia.

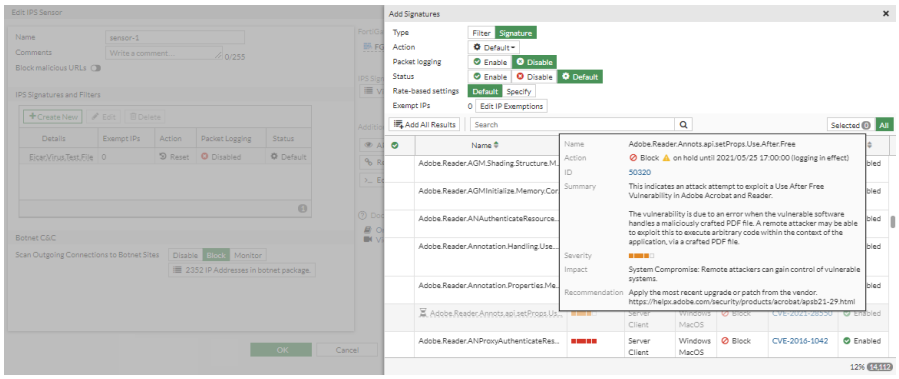
Viewing on hold information in the GUI

On hold signatures are grayed out in the GUI with an hourglass icon beside the signature name. A tooltip displays the on hold expiry time and other details.

On the *Security Profiles* > *IPS Signatures* page, for example, the *Adobe.Reader.Annots.api.setProps.Use.After.Free* signature is on hold. Hover over the grayed-out entry to view the tooltip, which includes the action and hold time expiry. On this page, all on hold signatures are displayed as on hold regardless of whether `override-signature-hold-by-id` is enabled.



The same tooltip is available on the *Edit IPS Sensor* (*Security Profiles* > *Intrusion Prevention*) page when creating or editing the IPS signatures. In the *Add Signatures* pane when the *Type* is *Signature*, signatures on hold are only displayed as on hold if `override-signature-hold-by-id` is enabled.



You can still use on hold signatures in an IPS sensor profile; however, the profile will not block matching traffic. It will monitor it instead (logging in effect) until the on hold time expires.

CVE pattern

The CVE pattern option allows you to filter IPS signatures based on CVE IDs or with a CVE wildcard, ensuring that any signatures tagged with that CVE are automatically included.

To configure CVE patterns for CVE-2010-0177 and all CVE-2017 CVEs:

```
config ips sensor
    edit "cve"
        set comment "cve"
        config entries
            edit 1
                set cve "cve-2010-0177"
                set status enable
                set log-packet enable
                set action block
            next
            edit 2
                set cve "cve-2017"
                set action reset
            next
        end
    next
end
```

For example, the CVE of the IPS signature *Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution* is CVE-2010-0177. This matches the CVE filter in the IPS sensor, so traffic is blocked and logged:

```
date=2020-07-13 time=15:44:56 logid="0419016384" type="utm" subtype="ips" eventtype="signature"
level="alert" vd="vd1" eventtime=1594593896666145871 tz="-0700" severity="critical"
srcip=10.1.100.22 srccountry="Reserved" dstip=172.16.200.55 srcintf="port2"
srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" sessionid=1638 action="dropped"
proto=6 service="HTTPS" policyid=1 attack="Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution"
```

```
srcport=58298 dstport=443 hostname="172.16.200.55" url="/Mozilla" direction="incoming"
attackid=20853 profile="sensor-1" ref="http://www.fortinet.com/ids/VID20853"
incidentserialno=124780667 msg="web_client:
Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution," crscore=50 craction=4096
crlevel="critical"
```

IPS sensor attributes

When configuring IPS sensor profiles, IPS signatures can be filtered based on the attributes: default status, default action, vulnerability type, and the last update date. When monitoring the specific, filtered signatures, logs are not generated for other, irrelevant signatures.

This avoids generating a lot of false positives due to many signatures having the pass action, which is never logged.

To configure filters in an IPS sensor profile:

```
config ips sensor
    edit "test_default"
        config entries
            edit 1
                set default-action pass
                set default-status enable
                set vuln-type 12
                set last-modified before 2020/02/02
            next
        end
    next
end
```

`default-action {pass | block | all}`	Filter by signatures' default actions (default = all).
`default-status {enable | disable | all}`	Filter by signatures' default statuses (default = all).
`vuln-type <integer> ... <integer>`	Filter by signatures' vulnerability types.
`last-modified {before | after | between} <date> [end-date]`	Filter by signatures' last modified date (default = before 00/00/00). The date format is `yyyy/mm/dd`. The year range is 2001 - 2050.

When the IPS profile is used in a firewall profile and then the EICAR virus test file signature is triggered, the signature matches the values set in the filter and logs are generated:

```
1:date=2022-02-15 time=14:07:03 eventtime=1644962823303491048 tz="-0800" logid="0419016384"

```

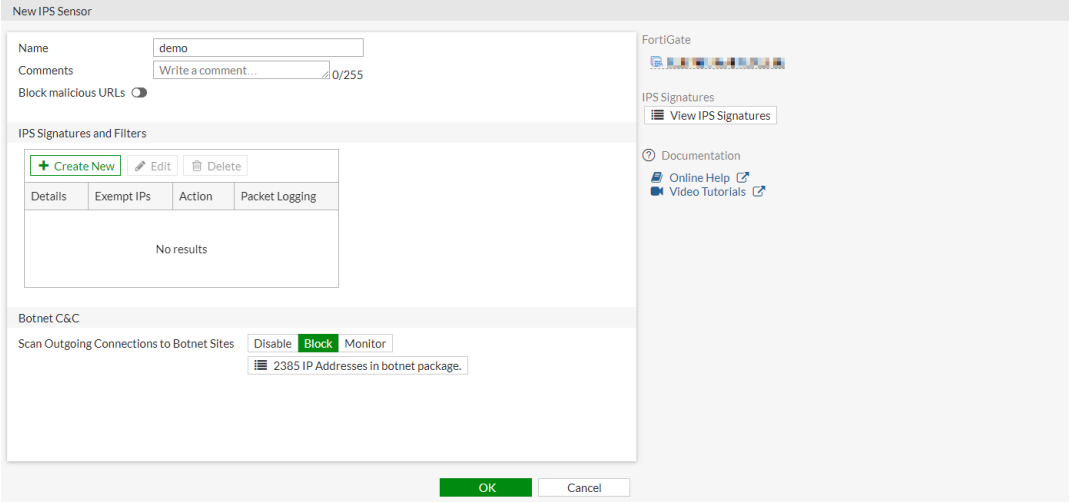
IPS with botnet C&C IP blocking

The *Botnet C&C* section consolidates multiple botnet options in the IPS profile. This allows you to enable botnet blocking across all traffic that matches the policy by configuring one setting in the GUI, or by the `scan-botnet-connections` option in the CLI.

To configure botnet C&C IP blocking in the GUI:

1. Go to *Security Profiles* > *Intrusion Prevention*, and click *Create New* to create a new IPS sensor, or double-click an existing IPS sensor to open it for editing.
2. Navigate to the *Botnet C&C* section.
3. For *Scan Outgoing Connections to Botnet Sites*, select *Block* or *Monitor*.



4. Configure the other settings as needed.
5. Click *OK* to save the IPS sensor.
6. Add the IPS sensor to a firewall policy.

   The IPS engine will scan outgoing connections to botnet sites. If you access a botnet IP address, an IPS log is generated for this attack.
7. Go to *Log & Report* > *Security Events* and click the *Intrusion Prevention* card to view the log.

To configure botnet C&C IP blocking in the CLI:

```
config ips sensor
   edit "Demo"
      set scan-botnet-connections {disable | block | monitor}
   next
end
```

The `scan-botnet-connections` option is no longer available in the following CLI commands:

- `config firewall policy`
- `config firewall interface-policy`
- `config firewall proxy-policy`
- `config firewall sniffer`

Sample log

```
# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.

1: date=2022-04-28 time=16:18:34 eventtime=1651187914585406621 tz="-0700" logid="0422016400"

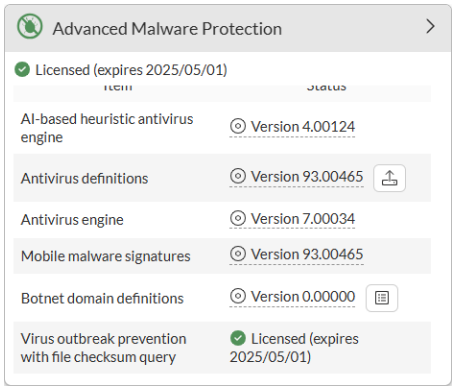
crscore=50 craction=4 crlevel="critical"
```

Botnet IPs and domains lists

To view botnet IPs and domains lists:

1. Go to *System* > *FortiGuard*.
2. Go to the *Subscriptions* > *Licensed* tab.
3. Expand *Advanced Malware Protection* to view *Botnet domain definitions* information.

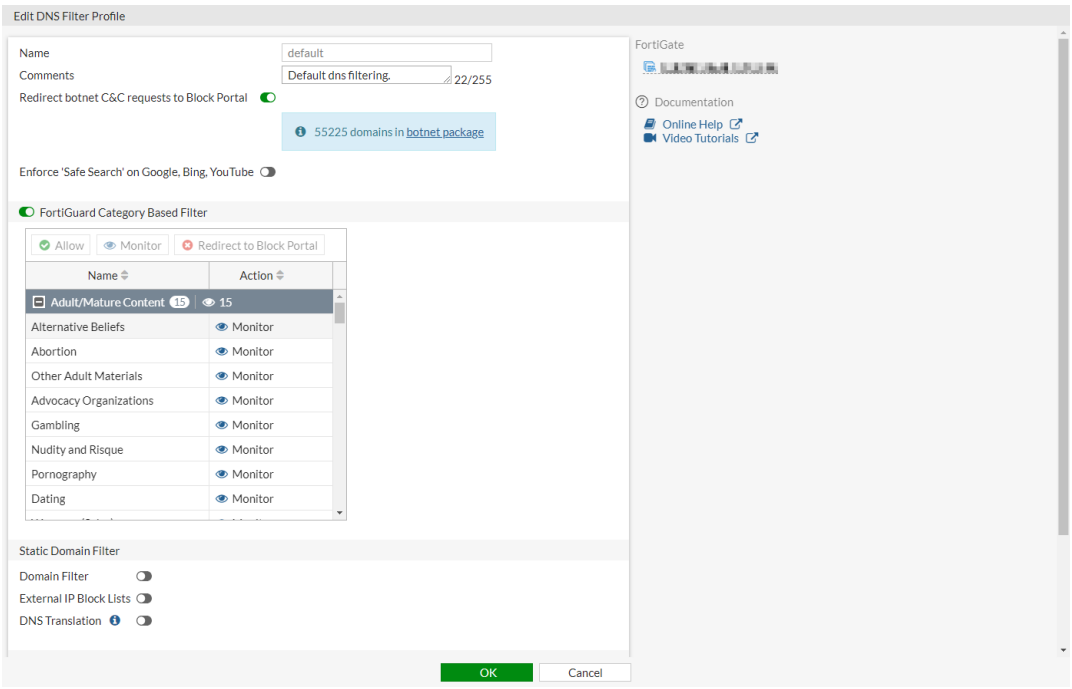


4. Click the action.

Botnet C&C domain blocking

To block connections to botnet domains:

1. Go to *Security Profiles* > *DNS Filter*, and click *Create New*, or double-click an existing filter to open it for editing.
2. Enable *Redirect botnet C&C requests to Block Portal*.

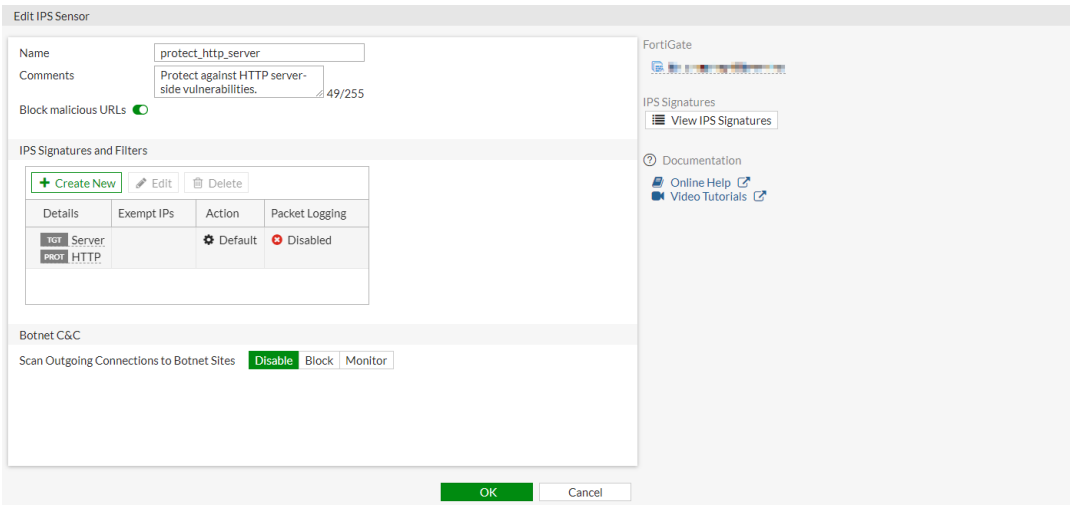


3. Configure the other settings as needed.
4. Click *OK*.
5. Add the filter profile to a firewall policy.

Botnet C&C URL blocking

To block malicious URLs:

1. Go to *Security Profiles* > *Intrusion Prevention*, and click *Create New*, or double-click an existing filter to open it for editing.
2. Enable *Block malicious URLs*.



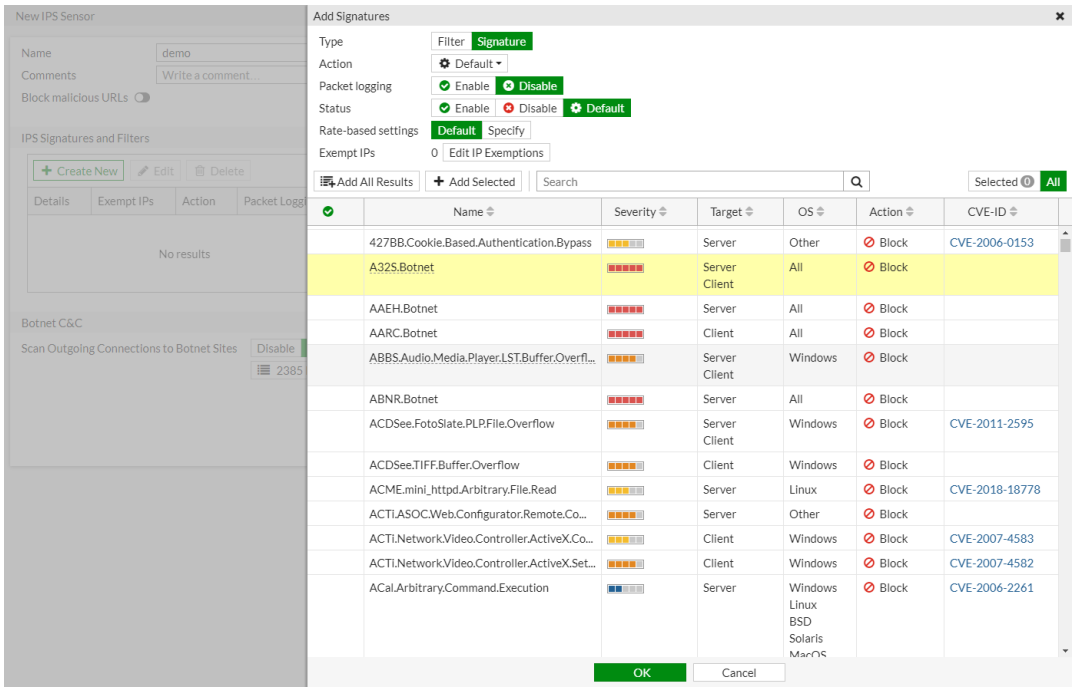
3. Configure the other settings as needed.
4. Click *OK*.

5. Add the sensor to a firewall policy.

Botnet C&C signature blocking

To add IPS signatures to a sensor:

1. Go to *Security Profiles* > *Intrusion Prevention*, and click *Create New*, or double-click an existing sensor to open it for editing.
2. In the *IPS Signatures and Filters* section, click *Create New*. A list of available signatures appears.
3. For *Type*, select *Signature*. Select the signatures you want to include from the list.
4. Configure the other settings as needed.
5. Click *Add Selected*.



6. Click *OK* to add the IPS signatures to the IPS sensor.
7. Click *OK* to save the IPS sensor.
8. Add the sensor to a firewall policy to detect or block attacks that match the IPS signatures.

IPS signatures for the operational technology security service

The FortiGuard Operational Technology (OT) includes both application control and intrusion prevention signatures for industrial applications and protocols. The OT attack definitions are only updated if the FortiGate has a valid OT Security Services license and an IPS security profile is used in a policy.

By default, OT signatures are excluded from the signature lists in the GUI.

To verify that the FortiGate has a valid OT Security Service license:

1. Go to *System* > *FortiGuard* > *Subscriptions* tab.
2. In the *Licensed* content, check the license status of *Operational Technology (OT) Security Service*.
3. Expand the *Operational Technology (OT) Security Service* entry to see the current versions.

To force the industrial DB attack definitions to update:

1. Optionally, create an IPS profile:
   a. Go to *Security Profiles* > *Intrusion Prevention* and click *Create New*.
   b. Enter a name for the profile.
   c. In the *IPS Signatures and Filters* table click *Create New*.
   d. Click *OK*.
   e. Click *OK*.
   See Intrusion prevention on page 2113 for more information.
2. Use the IPS profile in a policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Edit an existing policy, or click *Create New* to create a new policy.
   c. Under *Security Profiles*, enable *IPS* and select an IPS profile.
   d. Configure the remaining settings as needed, then click *OK*.
3. Go to *System* > *FortiGuard* and either click *Update Licenses & Definitions Now*, or wait for the next automatic update. The update could take a few minutes.
4. Refresh the page, then check the *Operational Technology (OT) Security Service* versions to confirm that they have been updated.

To make OT IPS and application control signatures available in the GUI:

```
config ips global
    set exclude-signatures none
end
```

To view the signatures in the GUI:

1. Go to *Security Profiles* > *Application Signatures* and to find signatures that identify OT protocols.
2. Go to *Security Profiles* > *IPS Signatures* to find signatures that detect networks attacks that target OT assets.

To see the entire list of OT IPS Rules and OT Application Control rules, go to the following links:

- https://www.fortiguard.com/encyclopedia?type=otips
- https://www.fortiguard.com/encyclopedia?type=otapp

To see the list of Industrial Application Control signatures, go to the following link:

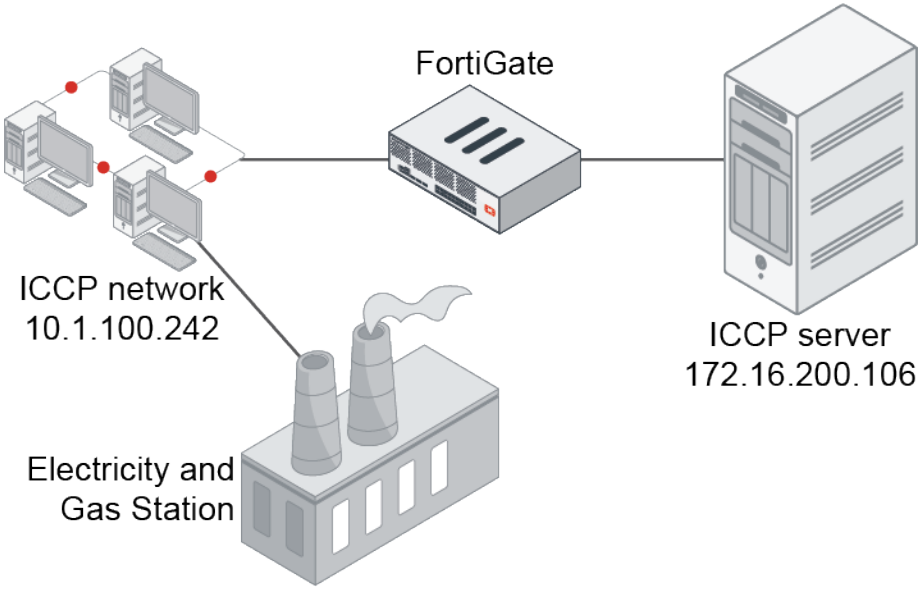
- https://www.fortiguard.com/appcontrol?category=Industrial

IPS sensor for IEC 61850 MMS protocol

IEC 61850 is a SCADA protocol whose services are mapped to a number of protocols, including MMS services. MMS/ICCP detection is supported in IPS. The purpose of the MMS dissectors is to identify every IEC 61850 service to distinguish different MMS/ICCP messages. IPS engine 6.0.12 and later support MMS dissectors.

The following scenarios are also supported:

- Multiple MMS PDUs are transferred in one TCP payload, and the IPS engine identifies individuals.
- An MMS message is split over multiple TCP segments, where MMS runs over COTP segments.
- ICCP/TASE.2 that also uses MMS transport (ISO transport over TCP for ICCP) is detected.



OT signatures must be enabled in the global IPS settings to receive MMS/ICCP signatures. By default, OT signatures are excluded.

```
config ips global
    set exclude-signatures {none | ot}
end
```

Below are some OT signatures for MMS/ICCP messages that can be detected by the IPS engine. This is not an exhaustive list.

- MMS_GetNameList.Request
- MMS_GetNamedVariableListAttributes.Request
- MMS_GetVariableAccessAttributes.Request
- MMS_Identify.Request
- MMS_Initiate.Request
- MMS_Read.Request
- MMS_Reset.Request
- ICCP_Transfer.Reporting
- ICCP_Create.Dataset
- ICCP_Abort

- ICCP_Start.Transfer.DSTransferSet
- ICCP_Get.Dataset.Element.Values
- ICCP_Get.Next.DSTransfer.Set.Value
- ICCP_Delete.Dataset
- ICCP_Start.Transfer.IMTransferSet

Diagnose command

The COTP dissector adds support for identifying every MMS PDU, and let the IPS engine separate them, like the Modbus and IEC-104 services for example.

```
# diagnose ips debug enable all
# diagnose debug enable
[284@78]ips_l7_dsct_processor: serial=8142 create: cotp
[284@78]ips_l7_dsct_processor: serial=8142 create: iec104
[284@78]ips_l7_dsct_processor: serial=8142 create: modbus
```

Log samples

MMS dissectors can be triggered, and MMS/ICCP signatures can be monitored and logged.

Log samples:

IPS Modbus TCP decoder

Modbus TCP is a protocol used to facilitate communication between devices in the Operational Technology (OT) environment. By default, it uses TCP/502 port for communication.

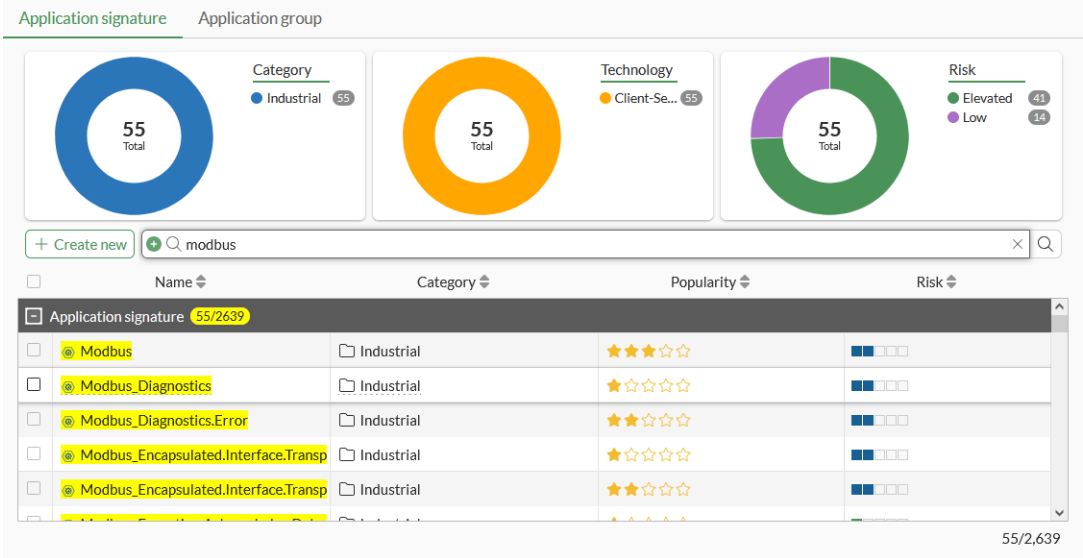
The IPS engine supports the Modbus TCP decoder, allowing it to decode Modbus protocol messages and enable application control signatures for Modbus commands and parameters. See Matching multiple parameters on application control signatures on page 2090 for information about parameter-level application policies.

OT IPS signatures must be enabled in the global IPS settings to receive Modbus signatures for application control and vulnerability protection. OT IPS signatures are part of the FortiGuard OT security service, and are excluded by default.

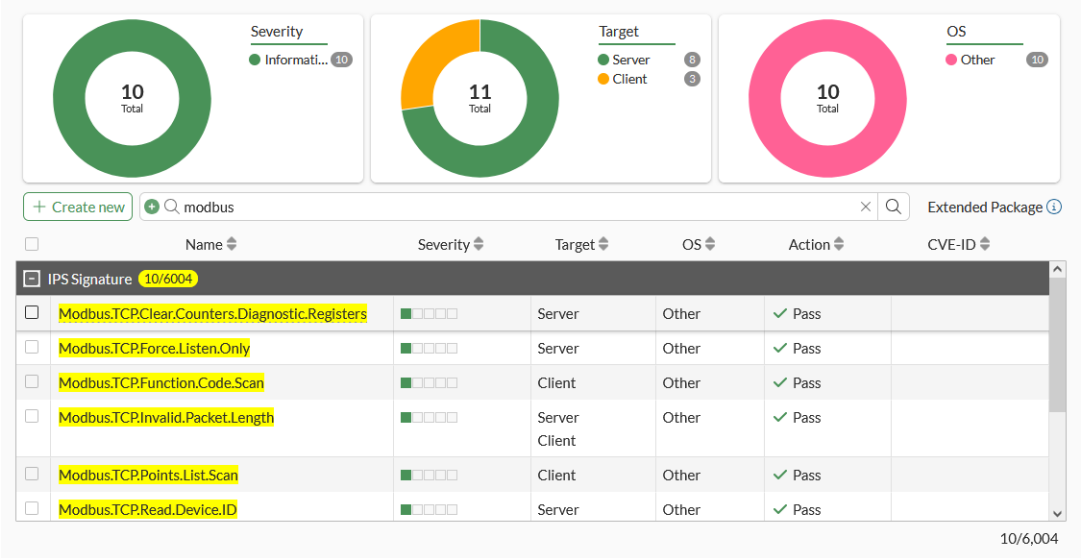
To include OT IPS signatures:

```
config ips global
    set exclude-signatures none
end
```

Modbus application control signatures are listed on *Security Profiles* > *Application Signatures*. Search for *Modbus* to see the Modbus signatures, such as *Modbus_Diagnostics* and *Modbus_Read.Coils*.



Modbus vulnerability protection signatures are listed on *Security Profiles* > *IPS Signatures*. Search for *Modbus* to see the Modbus signatures.



By default, the Modbus decoder listens on TCP/502 port only, but can be configured to listen on additional TCP ports.

To configure the Modbus decoder to listen on additional TCP ports:

```
config ips decoder "modbus_decoder"
    config parameter "port_list"
        set value "502:505"
    end
end
```

File filter

A file filter can be configured to control the flow of different types of files passing through FortiGate. This is done by setting up rules that specify which file types are allowed or blocked. The file filter can be applied directly to firewall policies and supports various traffic protocols in proxy or flow mode. The feature set setting (proxy or flow) in the file filter profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based file filter profile must be used with a flow-based firewall policy.

Prior to FortiOS 6.4.1, file filter was embedded in the web filter, email filter, SSH inspection, and CIFS profiles.

Protocol	Proxy mode	Flow mode
CIFS	Yes	Yes
FTP	Yes	Yes
HTTP	Yes	Yes
IMAP	Yes	Yes
MAPI	Yes	No
POP3	Yes	Yes
SMTP	Yes	Yes
SSH	Yes	No

File filtering is based only on the file type (file meta data) and not on file size or content. A DLP dictionary, sensor, and profile would need to be configured to block files based on size or content, such as SSN numbers, credit card numbers, or regular expressions (see Basic DLP settings on page 2230 for more information).

The following options can be configured in a file filter profile:

GUI option	CLI option	Description
Basic profile settings		
Name	`name <string>`	Enter a unique name for the profile.
Comments	`comment <var-string>`	Enter a comment (optional).
Scan archive contents	`scan-archive-contents {enable | disable}`	Enable to scan archive contents.

Feature set	`feature-set {flow | proxy}`	Select the feature set for the profile. The feature set mode must match the inspection mode used in the associated firewall policy.
		• *Flow-based*
		• *Proxy-based*
		If the *Feature set* option is not visible in the GUI, enter the following in the CLI:
		`config system settings`
		`set gui-proxy-inspection enable`
		`end`

n/a	`log {enable | disable}`	Enable to use file filter logging. This setting is enabled by default.
n/a	`extended-log {enable | disable}`	Enable to use file filter extended logging. This setting is disabled by default.
n/a	`replacemsg-group <string>`	Set a replacement message group.
File filter rule settings		
Name	`name <string>`	Enter a unique name for the rule.
Comments	`comment <var-string>`	Enter a comment (optional).
Protocols	`protocol {option1}, {option2}, ...`	Set the protocols to apply to the rule. By default, all protocols are configured: CIFS, FTP, HTTP, IMAP, POP3, and SMTP in flow mode. Additionally, MAPI and SSH are configured by default in proxy mode.
Traffic	`direction {incoming | outgoing | any}`	Set the traffic direction: • *Incoming*/`incoming`: match files transmitted in the session's reply direction. • *Outgoing*/`outgoing`: match files transmitted in the session's originating direction. • *Both*/`any`: match files transmitted in the session's originating and reply directions.

GUI option	CLI option	Description
Password-protected only	`password-protected {yes | any}`	Enable (`yes`) to match password-protected files. If the setting is not enabled, any file is matched.
File types	`file-type <name1>, <name2>, ...`	Select the file type. See Supported file types on page 2153 for the list of available options.
Action	`action {log-only | block}`	Set the action to take for a matched file: • *Monitor*/`log-only`: allow the content and write a log message. • *Block*/`block`: block the content and write a log message.

Configuring a file filter profile

In this example, a flow-based file filter is created that has two rules.

- Rule 1: applied to HTTP, FTP, SMTP, IMAP, POP3, and CIFS to monitor any matched .NET, 7-Zip, ActiveMime, ARJ, ASPack, AVI, Base64, Windows batch, BinHex, BMP, Bzip, and Bzip2 files transmitted in the session's originating and reply directions.
- Rule 2: applied to HTTP, FTP, SMTP, IMAP, POP3, and CIFS to block any matched SIS, TAR. TIFF, torrent, UPX, UUE, WAV, WMA. ZAR archive, XZ, and ZIP files transmitted in the session's originating direction.

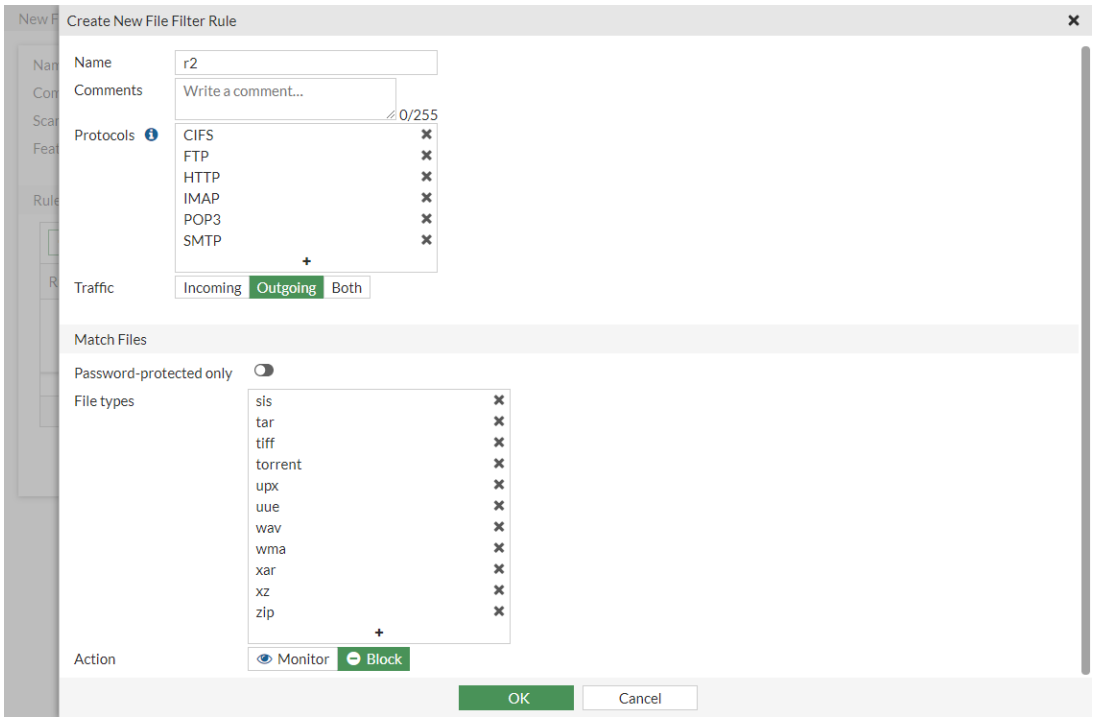
To configure a file filter in the GUI:

1. Configure the filter profile:
   a. Go to *Security Profiles* > *File Filter* and click *Create New*.
   b. Enter a name.
   c. Set the *Feature set* to *Flow-based*.
   d. In the *Rules* table, click *Create New*.
   e. Configure rule 1 as follows:

Name	r1
Protocols	HTTP, FTP, SMTP, IMAP, POP3, CIFS
Traffic	Both
Password-protected only	Deselect
File types	.net, 7z, activemime, arj, aspack, avi, base64, bat, binhex, bmp, bzip, bzip2
Action	Monitor

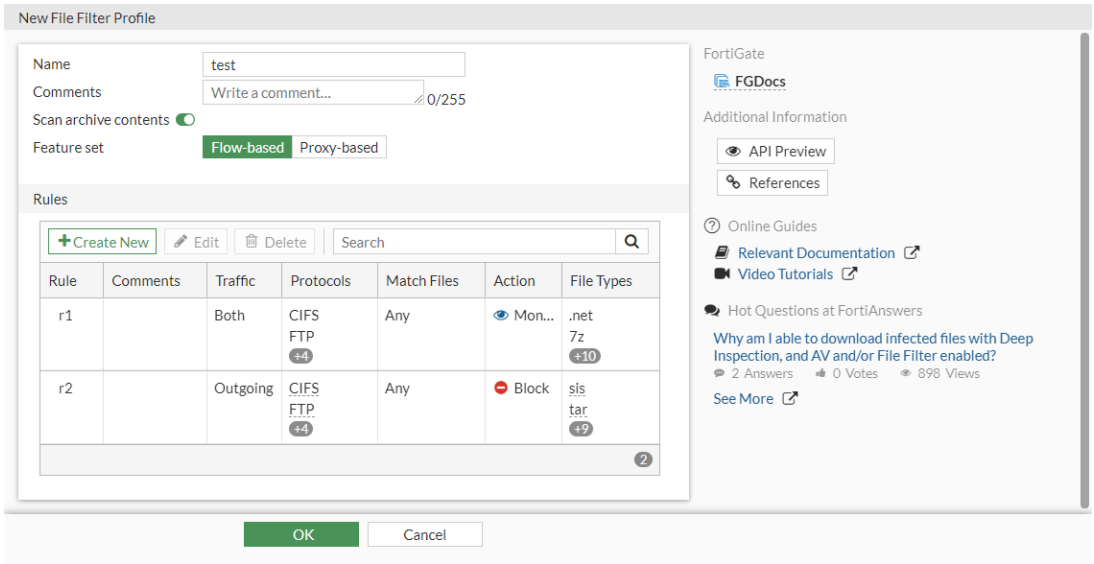
   f. Click *OK* to save the rule.
   g. In the *Rules* table, click *Create New* and configure rule 2 as follows:

Name	r2
Protocols	HTTP, FTP, SMTP, IMAP, POP3, CIFS
Traffic	Outgoing
Password-protected only	Deselect
File types	sis, tar, tiff, torrent, upx, uue, wav, wma, xar, xz, zip
Action	Block



h. Click *OK* to save the rule.

i. Click *OK* to save the filter profile.



2. Apply the filter to a policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and edit an existing policy or create a new one.
   b. In the *Security Profiles* section, enable *File Filter*.
   c. Select the filter from the dropdown box (*test*).
   d. Configure the other settings as needed.
   e. Click *OK*.

To configure a file filter in the CLI:

1. Configure the file filter profile:

```
config file-filter profile
    edit "test"
        set comment ''
        set feature-set flow
        set replacemsg-group ''
        set log enable
        set scan-archive-contents enable
        config rules
            edit "r1"
                set comment ''
                set protocol http ftp smtp imap pop3 cifs
                set action log-only
                set direction any
                set password-protected any
                set file-type ".net" "7z" "activemime" "arj" "aspack" "avi" "base64" "bat"
"binhex" "bmp" "bzip" "bzip2"
            next
            edit "r2"
                set comment ''
                set protocol http ftp smtp imap pop3 cifs
                set action block
                set direction outgoing
                set password-protected any
                set file-type "sis" "tar" "tiff" "torrent" "upx" "uue" "wav" "wma" "xar" "xz"
"zip"
            next
        end
    next
end
```

2. Apply the filter to a policy:

```
config firewall policy
    edit 1
        set name "filefilter-policy"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
```

```
        set dstaddr6 "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set file-filter-profile "test"
        set auto-asic-offload disable
        set np-acceleration disable
        set nat enable
    next
end
```

To view file filter logs in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Select the *File Filter* card.

To view file filter logs in the CLI:

```
# execute log filter category utm-file-filter
# execute log display
```

Supported file types

File filter allows the FortiGate to block files passing through based on file type based on the file's meta data only, and not on file size or file content. A DLP profile must be configured to block files based on size or content, such as SSN numbers, credit card numbers, or regexp.

The following file types are supported in file filter and DLP profiles:

Type	Description
.net	Match .NET files
7z	Match 7-Zip files
activemime	Match ActiveMime files
arj	Match ARJ compressed files
aspack	Match ASPack files
avi	Match AVI files
base64	Match Base64 files
bat	Match Windows batch files
binhex	Match BinHex files
bmp	Match BMP files

Type	Description
bzip	Match Bzip files
bzip2	Match Bzip2 files
c/cpp	Match C and CPP files
cab	Match Windows CAB files
chm	Match Windows compiled HTML help files
class	Match CLASS files
cod	Match COD files
crx	Match Chrome extension files
dmg	Match Apple disk image files
elf	Match ELF files
exe	Match Windows executable files
flac	Match FLAC files
fsg	Match FSG files
gif	Match GIF files
gzip	Match Gzip files
hlp	Match Windows help files
hta	Match HTA files
html	Match HTML files
hwp	Match HWP files
iso	Match ISO archive files
jad	Match JAD files
javascript	Match JavaScript files
jpeg	Match JPEG files
lzh	Match LZH compressed files
mach-o	Match Mach object files
mime	Match MIME files
mov	Match MOV files
mp3	Match MP3 files
mpeg	Match MPEG files
msi	Match Windows Installer MSI Bzip files

Type	Description
msoffice	Match MS-Office files. For example, DOC, XLS, PPT, and so on.
msofficex	Match MS-Office XML files. For example, DOCX, XLSX, PPTX, and so on.
pdf	Match PDF files
petite	Match Petite files
png	Match PNG files
rar	Match RAR archives
registry	Match registry files
rm	Match RM files
rpm	Match RPM files
sis	Match SIS files
tar	Match TAR files
tiff	Match TIFF files
torrent	Match torrent files
unknown*	Match unknown files
upx	Match UPX files
uue	Match UUE files
wav	Match WAV files
wma	Match WMA files
xar	Match XAR archive files
xz	Match XZ files
zip	Match ZIP files

* This file type is only available in DLP profiles.

Email filter

Email filters can be configured to perform spam detection and filtering. You can customize the default profile, or create your own and apply it to a firewall policy.

Two kinds of filtering can be defined in a single profile, and they will act independent of one another.

Filter options can be organized according to the source of the decision:

- Local options: the FortiGate qualifies the email based on local conditions, such as block/allowlists, banned words, or DNS checks using FortiGuard Antispam.
- FortiGuard-based options: the FortiGate qualifies the email based on the score or verdict returned from FortiGuard Antispam.
- Third-party options: the FortiGate qualifies the email based on information from a third-party source (like an ORB list).

Local and FortiGuard block/allowlists can be enabled and combined in a single profile. When combined, the local block/allowlist has a higher priority than the FortiGuard block list during a decision making process. For example, if a client IP address is blocklisted in the FortiGuard server, but you want to override this decision and allow the IP to pass through the filter, you can define the IP address or subnet in a local block/allowlist with the clear action. Because the information coming from the local list has a higher priority than the FortiGuard service, the email will be considered clean.

Some features of this functionality require a subscription to FortiGuard Antispam.

Protocol comparison between email filter inspection modes

The following table indicates which email filters are supported by their designated inspection modes.

	SMTP	POP3	IMAP	MAPI
Proxy	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	No

The following topics provide information about email filter profiles:

- Configuring an email filter profile on page 2156
- Local-based filters on page 2157
- FortiGuard-based filters on page 2165
- Third-party-based filters on page 2167
- Filtering order on page 2168
- Protocols and actions on page 2170
- Configuring webmail filtering on page 2171
- Spam email header on page 2172

Configuring an email filter profile

Email filters can be configured to perform spam detection and filtering.

To configure an email filter profile:

1. Go to *Security Profiles* > *Email filter* and click *Create New*.
2. Configure the following settings:

Name		Enter a unique name for the profile.
Comments		Enter a comment (optional).
Enable spam detection and filtering		Enable/disable spam detection and filtering.
	Spam Detection by Protocol	Configure settings for SMTP, POP3, IMAP, and MAPI protocols. See Protocols and actions on page 2170 and Filtering order on page 2168 for more information.
	FortiGuard Spam Filtering	The FortiGate consults FortiGuard servers to help identify spammer IP address or emails, known phishing and spam URLs, known spam email checksums, and others. See FortiGuard-based filters on page 2165 for more information.
	Local Spam Filtering	Enable and configure local spam filters. See Local-based filters on page 2157 for more information.

3. Click *OK*.

Local-based filters

There are six types of local spam filters:

- HELO DNS lookup
- Return email DNS check
- Block/allow list
- Banned words*
- Trusted IP addresses*
- MIME header*

* These filters can only be configured in the CLI.

By default, HELO DNS and return email DNS checks are done before the block/allow list check. In some situations, such as when configuring a block/allow list to clear an email from performing further filtering, configure the following to give precedence to the block/allow list:

```
config emailfilter profile
    edit <name>
        config smtp
            set local-override enable
        next
    end
end
```

HELO DNS lookup and return email DNS checking are not supported while in flow-based inspection mode. See Inspection mode feature comparison on page 1901.

HELO DNS lookup

Whenever a client opens an SMTP session with a server, the client sends a HELO command with the client domain name. The FortiGate takes the domain name specified by the client in the HELO and performs a DNS lookup to determine if the domain exists. If the lookup fails, the FortiGate determines that any emails delivered during the SMTP session are spam. The HELO DNS lookup is only available for SMTP traffic.

Return email DNS check

The FortiGate performs a DNS lookup on the return field. If no such record exists, the email is treated as spam. When return email DNS checking is enabled, the FortiGate takes the domain in the reply-to email address and reply-to domain, and checks the DNS servers to see if there is an A or MX record for the domain. If the domain does not exist, the FortiGate treats the email as spam.

Block/allow list

Block/allow lists can be made from emails or IP subnets to forbid or allow them to send or receive emails. The following table summarizes the configurable options in a block/allow list.

Type	Description	Pattern	Action
IP/Netmask and *IPv6/Netmask*	The FortiGate compares the IP address of the client delivering the email to the addresses in the IP address block/allow list specified in the email filter profile. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry against all delivered email. By default the `hdrip` setting under `config smtp` is disabled. If enabled, the FortiGate checks all the IP addresses in the header of SMTP email against the specified IP address block/allow list.	The filter is an IP address with a subnet mask.	• *Mark as Reject*: the email is dropped before reaching its destination. • *Mark as Spam*: the email is allowed through, but it will be tagged with an indicator marking the email as spam. • *Mark as Clear*: the email is allowed to go through to its destination on

Type	Description	Pattern	Action
			the assumption that it is not spam.
Recipient Address	The FortiGate compares the sender email address to the contents of the RCPT TO envelope header and To: mail header to the specified pattern. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry.	• *Wildcard*: the filter is an email address with a wildcard symbol in place of the variable characters (such as **.example.com* or *fred@*.com*). • *Regular Expression*: the filter is a regular expression. For example, *^[_a-z0-9-]+(\.[_a-z0-9-]+)*@(example|xmple|examp).(com|org|net)* can be used to filter based on a number of email domain name combinations.	• *Mark as Spam*: the email is allowed through, but it will be tagged with an indicator marking the email as spam. • *Mark as Clear*: the email is allowed to go through to its destination on the assumption that it is not spam.
Sender Address	The FortiGate compares the sender email address to the contents of the MAIL FROM envelope header, From: mail header, and Sender: mail header to the specified pattern. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry.		
Subject	The FortiGate compares the sender email address to the contents of the Subject: mail header to the specified pattern. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry.		

Banned words

When banned word checking is enabled, the FortiGate examines emails for words that appear in the banned word list specified in the email filter profile.

The banned word pattern can be either wildcard or Perl regular expression, which could include part of a word, a whole word, a phrase, multiple words, or multiple phrases.

Each time the banned word filter detects a pattern in an email, it adds the pattern score to the sum of scores for the message. The score is set when creating a new pattern to block content (`set score`). Higher scores indicate more offensive content. If the total score of the discovered banned words in the email exceeds the threshold value set in the email filter profile, then the FortiGate treats the email as spam. The score for each pattern is counted only once, even if that pattern appears many times in the email. The default score for banned word patterns is 10, and the default threshold in the email filter is 10. This means that by default, an email message is blocked by a single match.

For example, if the FortiGate scans an email containing only this sentence: “The score for each word or phrase is counted only once, even if that word or phrase appears many times in the email message.” and the banned word list contains the following patterns:

Banned word pattern	Pattern type	Assigned score	Score added to sum for entire page	Comments
word	Wildcard	20	20	The pattern appears twice, but it is counted once.
word phrase	Wildcard	20	0	Both words appear in the email, but they do not appear together as specified in the pattern. There are no matches.
word*phrase	Wildcard	20	20	A match occurs as long as “word” appears before “phrase” regardless of what is in between them. The pattern appears twice, but it is counted once.
mail*age	Wildcard	20	20	This pattern is a match because “email message” appears in the email.

The email would be treated as spam if the banned word threshold is set to 60 or less.

To apply a banned word filter to an email filter profile:

1. Configure the banned words list:

```
config emailfilter bword
    edit 1
        set name "banned"
        config entries
            edit 23
                set pattern-type {wildcard | regexp}
                set pattern <string>
                set score <1 - 99999>
            next
        end
    next
end
```

2. Configure the email filter profile:

```
config emailfilter profile
    edit "myBannedWordsProfile"
        set spam-filtering enable
        set options bannedword
        set spam-bword-threshold <0 - 2147483647>
        set spam-bword-table 23
```

```
    next
end
```

Once a banned word list is configured in the CLI and applied to an email filter profile, some settings can be edited in the GUI for that particular email filter profile. A banned word profile can be selected, and its *Threshold* (`spam-bword-threshold`) can be edited.

Trusted IP addresses

When the FortiGate creates a list of trusted IP addresses, any incoming email traffic from these IP address is exempt from having IP-based checks, such as DNSBL, RBL, FortiGuard Antispam service, or locally-defined IP block lists.

If the FortiGate sits behind a company's mail transfer units, it may be unnecessary to check email IP addresses because they are internal and trusted. In this case, only external IP addresses would be checked. In some cases, external IP addresses may be added to the list if they are known to not be spam sources.

To configure a trusted IP address list:

1. Define the IP address list:

```
config emailfilter iptrust
    edit 1
        set name "trustedIP"
        config entries
            edit 33
                set addr-type {ipv4 | ipv6}
                set ipv4-subnet <IPv4_classnet>
                set ipv6-subnet <IPv6_network>
            next
        end
    next
end
```

2. Add the list to the email filter profile:

```
config emailfilter profile
    edit "email_filter_profile"
        set spam-iptrust-table 1
    next
end
```

MIME header

This feature filters by the MIME header.

To configure a MIME header check:

1. Define the header content:

```
config emailfilter mheader
    edit 100
        set name "mheader"
        config entries
            edit 1
                set fieldname <string>
                set fieldbody <string>
                set pattern-type {wildcard | regexp}
                set action {spam | clear}
            next
        end
    next
end
```

2. Add the header to the email filter profile:

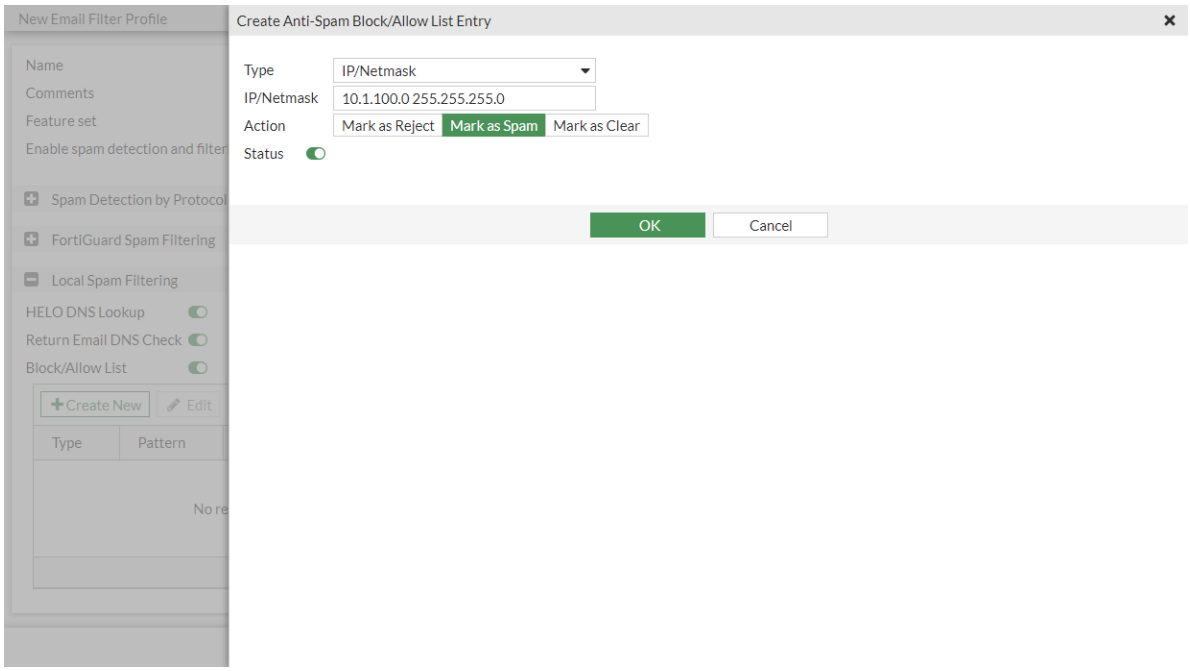
```
config emailfilter profile
    edit "email_filter_profile"
        set options spamhdrcheck
        set spam-mheader-table 100
    next
end
```

Configuring a local-based email filter

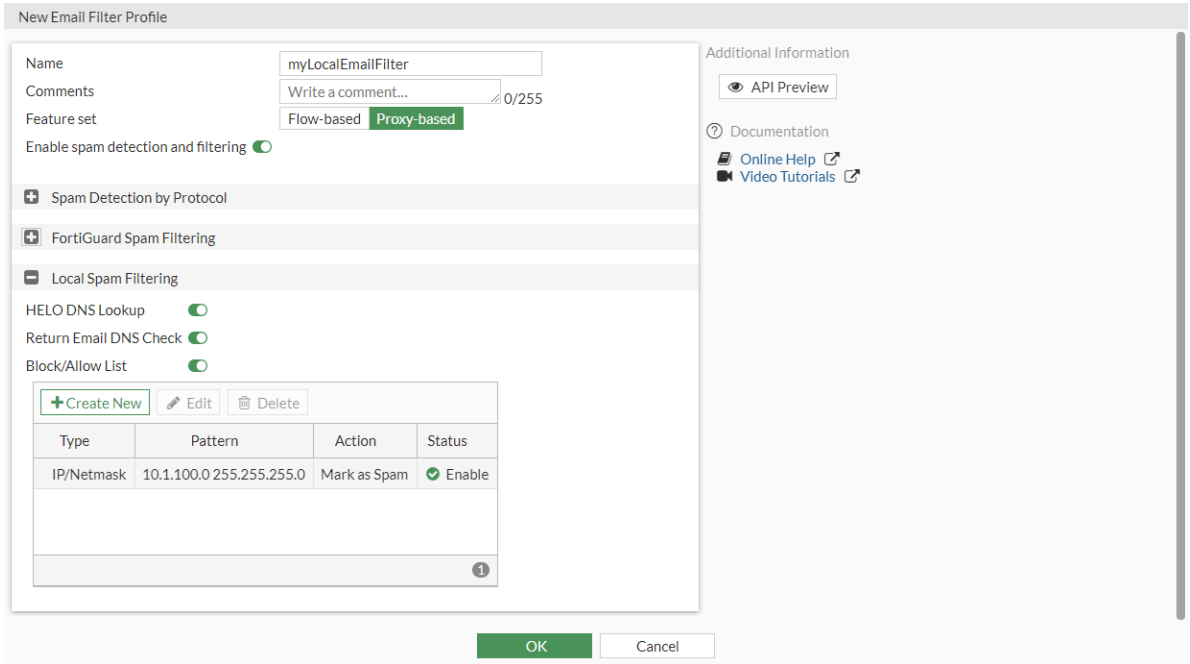
To configure a local-based email filter in the GUI:

1. Configure the email filter profile:
   a. Go to *Security Profiles* > *Email Filter* and click *Create New*, or edit an existing profile.
   b. Select a *Feature set* (*Proxy-based* is used in this example) and enable *Enable spam detection and filtering*.
   c. In the *Local Spam Filtering* section, enable the desired filters (*HELO DNS Lookup*, *Return Email DNS Check*, *Block/Allow List*).
   d. In the *Block/Allow List* table, click *Create New*. The *Create Anti-Spam Block/Allow List Entry* pane opens.
   e. Set the *Type* to *IP/Netmask* and enter an *IP/Netmask*.

f. Select an *Action*.



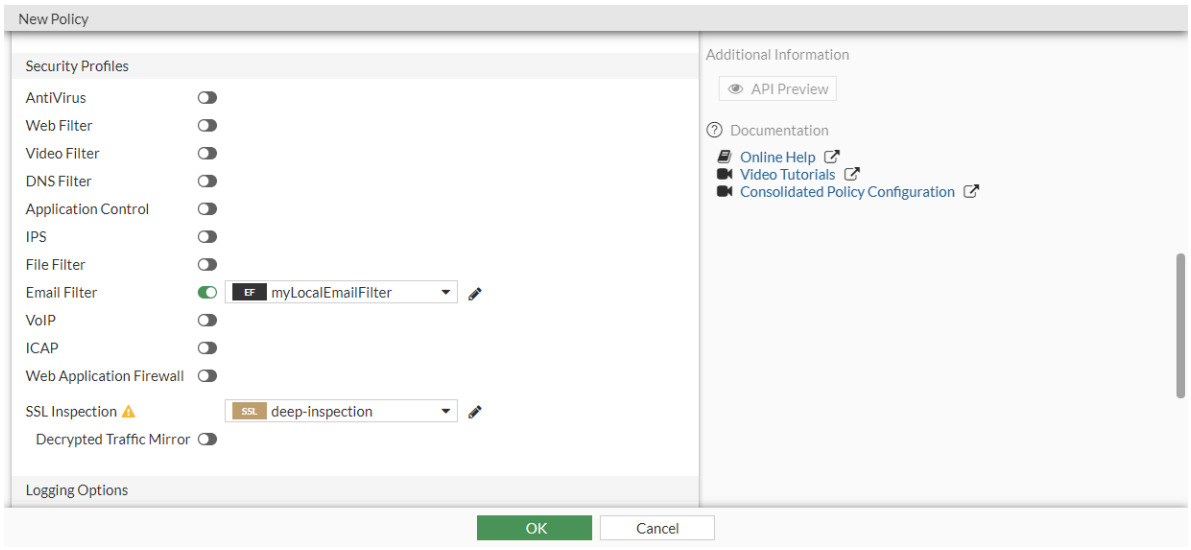
g. Click *OK* to save the block/allow list.



h. Click *OK* save the email filter profile.

2. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*, or edit an existing policy.
   b. Set the inspection-mode to *Proxy-based*.

c. Enable the *Email Filter* option and select the previously created profile.



d. Set *SSL Inspection* to a profile that has deep SSL inspection enabled.
Deep inspection is required to filter SMTP, POP3, IMAP, or any SSL/TLS encapsulated protocol.

e. Configure the other settings as needed.

f. Click *OK*.

To configure a local-based email filter in the CLI:

1. Configure a block/allow list:

```
config emailfilter block-allow-list
    edit 1
        set name "myBAL"
        config entries
            edit 1
                set status enable
                set type ip
                set action spam
                set addr-type ipv4
                set ip4-subnet 10.1.100.0 255.255.255.0
            next
        end
    next
end
```

2. Configure an email filter profile:

```
config emailfilter profile
    edit "myLocalEmailFilter"
        set spam-filtering enable
        set options spambal spamhelodns spamraddrdns
        config smtp
            set action tag
        end
```

```
        set spam-bal-table 1
    next
end
```

3. Use the profile in a firewall policy:

```
config firewall policy
    edit 1
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set emailfilter-profile "myLocalEmailFilter"
    next
end
```

FortiGuard-based filters

The FortiGate consults FortiGuard servers to help identify spammer IP address or emails, known phishing URLs, known spam URLs, known spam email checksums, and others. For more information, refer to the FortiGuard website.

There are five FortiGuard spam filtering options:

- IP address check
- URL check
- Detect phishing URLs in email (requires URL check to be enabled)
- Email checksum check
- Spam submission

FortiGuard-based filters are not supported while in flow-based inspection mode. See Inspection mode feature comparison on page 1901.

IP address check

The FortiGate queries the FortiGuard Antispam service to determine if the IP address of the client delivering the email is in the block list. If there is a match, the FortiGate treats delivered emails as spam.

The Spam-Spamming.Server category under the Internet Service Database (ISDB) also provides antispam protection, comprising the most recent and active spam IPs based on FortiGuard telemetry. Users may apply this ISDB address group in a firewall policy and specify the mail service to block. However, this category of the ISDB is only a subset of the IPs in the antispam service. For the most comprehensive spam IP reputation protection, use the IP address check feature.

URL check

The FortiGate submits all URLs that appear in the email body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL block list, the FortiGate treats the email as spam.

Detect phishing URLs in email

The FortiGate submits all URL hyperlinks that appear in the email body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL phishing list, the FortiGate removes the hyperlink from the message. The URL remains in place, but it is no longer a clickable hyperlink.

Email checksum check

The FortiGate submits a checksum of each email to the FortiGuard service for checking. If a checksum exists in the FortiGuard checksum block list, the FortiGate treats the email as spam.

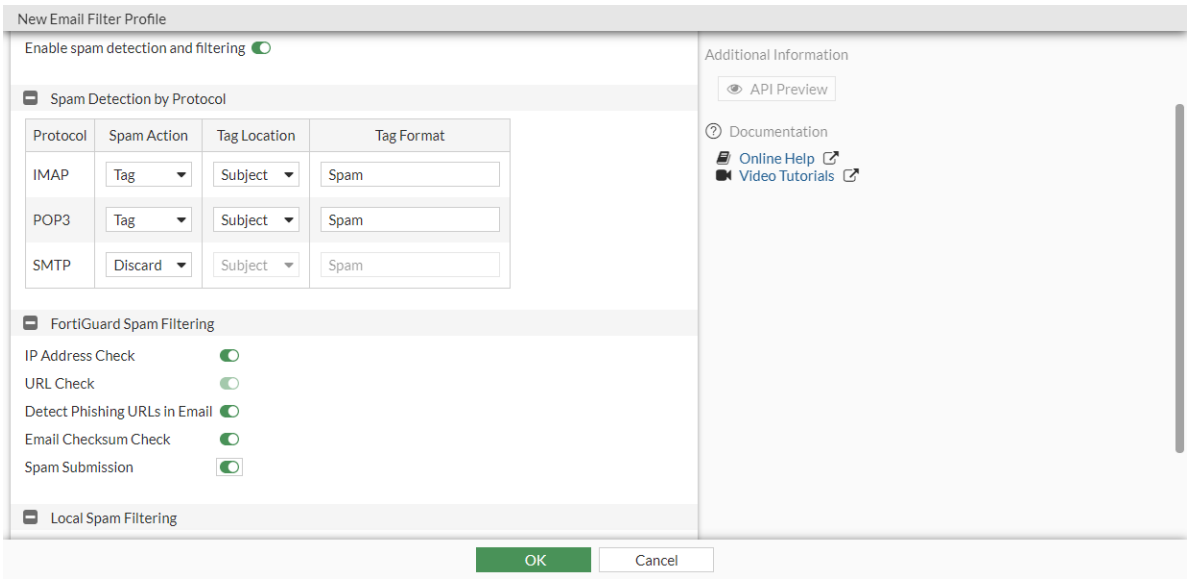
Spam submission

Spam submission is a way to inform the FortiGuard Antispam service of non-spam messages incorrectly marked as spam. When enabled, the FortiGate adds a link to the end of every email marked as spam. Click the link to notify the FortiGuard Antispam service if an email is marked incorrectly.

Configuring FortiGuard filters

To configure FortiGuard filters in the GUI:

1. Go to *Security Profiles* > *Email Filter* and click *Create New*.
2. Enable *Enable spam detection and filtering*.
3. In the *FortiGuard Spam Filtering* section, enable the following as needed:
   - *IP Address Check*
   - *URL Check*
   - *Detect Phishing URLs in Email*
   - *Email Checksum Check*
   - *Spam Submission*



4. Click *OK*.

To configure FortiGuard filters in the CLI:

```
config emailfilter profile
    edit <name>
        set spam-filtering enable
        set options spamfsip spamfsurl spamfsphish spamfschksum spamfssubmit
    next
end
```

Option	Description
`spamfsip`	Check email IP addresses
`spamfsurl`	Check email content URLs
`spamfsphish`	Check email content phishing URLs
`spamfschksum`	Check email checksums
`spamfssubmit`	Add FortiGuard Antispam spam submission text

Third-party-based filters

In addition to local and FortiGuard filters, FortiOS can leverage third-party sources, which are known as DNS-based blackhole lists (DNSBL) or Open Relay Behavior-modification Systems (ORBS). These are maintained lists of IP addresses that have been identified as associated with spamming.

The following example demonstrates how to configure a DNSBL. The `config emailfilter dnsbl` command is used to configure either DNSBL or ORBS.

To configure a DNSBL:

1. Define the server to get the DNSBL list from:

```
config emailfilter dnsbl
    edit 100
        set name "dnsbl"
        config entries
            edit 1
                set status enable
                set server <IP address or server name>
                set action {reject | spam}
            next
        end
    next
end
```

2. Add the DNSBL list to an email filter profile:

```
config emailfilter profile
    edit "email_filter_profile"
        set options spamrbl
        set spam-rbl-table 100
    next
end
```

Filtering order

The FortiGate checks for spam using various filtering techniques. The filtering order used by the FortiGate depends on which mail protocol is used.

Filters requiring a query to a server and a reply (FortiGuard Antispam service and DNSBL/ORDBL) are run simultaneously. To avoid delays, queries are sent while other filters are running. The first reply to trigger a spam action takes effect as soon as the reply is received.

Each spam filter passes the email to the next if no matches or problems are found. If the action in the filter is *Mark as Spam*, the FortiGate tags the email as spam according to the settings in the email filter profile. If the action in the filter is *Mark as Reject*, the email session is dropped. If the action in the filter is *Mark as Clear*, the email is exempt from any remaining filters. For SMTP and SMTPS, if the action is *Discard*, the email is discarded or dropped.

SMTP and SMTPS spam filtering order

The FortiGate scans SMTP and SMTPS email for spam in a specific order, which depends on whether or not the local override feature is enabled. This feature is disabled by default, but enabling it gives priority to local spam filters.

You can enable local override (`set local-override`) in an email filter profile to override SMTP or SMTPS remote checks, which includes checks for IP RBL, IP FortiGuard AntiSpam, and HELO DNS with the locally defined antispam block and/or allow lists.

SMTPS spam filtering is available on FortiGates that support SSL content scanning and inspection.

To configure local override of an antispam filter:

```
config emailfilter profile
    edit <name>
        set spam-filtering enable
        set options spambal spamfsip spamfsurl spamhelodns spamfsphish
        config smtp
            set local-override {enable | disable}
        end
        set spam-bal-table 1
    next
end
```

Local override disabled	Local override enabled
1. HELO DNS lookup, last hop IP check against ORDBL 2. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, FortiGuard IP address check, phishing URLs detection 3. Last hop IP checks local block/allow list 4. Envelope address checks local block/allow list 5. Headers IPs local block/allow list 6. Headers email address local block/allow list, MIME header checks based on local list of patterns (`mheader`) 7. Banned words (subject first, then body) based on local block/allow list (`bword`)	1. Last hop IP checks local block/allow list 2. Envelope address checks local block/allow list 3. Headers IPs local block/allow list, MIME header checks based on local list of patterns (`mheader`) 4. Headers email address local block/allow list 5. Banned words (subject first, then body) based on local list of patterns (`bword`) 6. HELO DNS lookup, last hop IP check against ORDBL 7. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, FortiGuard IP address check, phishing URLs detection

IMAP, IMAPS, POP3, and POP3S spam filtering order

The FortiGate scans IMAP, IMAPS, POP3, and POP3S email for spam in the following order:

1. MIME headers check, email address block/allow list check
2. Banned word check on email subject
3. IP block/allow list check
4. Banned word check on email body
5. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, DNSBL and ORDBL checks

IMAPS and POP3S spam filtering are available on FortiGates that support SSL content scanning and inspection.

Protocols and actions

In an email filter profile, there are options to configure settings for SMTP, POP3, IMAP, and MAPI protocols. For each protocol, you can set an action to either discard (block), tag, or pass the log for that protocol. The action options vary per protocol. For the tag action, the spam email can be tagged with configured text in the subject or header.

Some IMAP clients, such as Outlook Express and Mozilla Thunderbird, do not update the message subject when it is different from the IMAP envelope and the body. As a result, subjects are not tagged in the email list, but they are still tagged in the preview pane.

MAPI is only configurable in the CLI and with the proxy feature set.

To configure protocols in an email filer:

```
config emailfilter profile
    edit <name>
        set feature-set {flow | proxy}
        set spam-filtering enable
        set options {bannedword spambal spamfsip spamfssubmit spamfschksum spamfsurl spamhelodns
spamraddrdns spamrbl spamhdrcheck spamfsphish}
        config smtp
            set log-all {enable | disable}
            set action {pass | tag | discard}
            set tag-type {subject | header | spaminfo}
            set tag-msg <string>
            set hdrip {enable | disable}
            set local-override {enable | disable}
        end
        config imap
            set log-all {enable | disable}
            set action {pass | tag}
            set tag-type {subject | header | spaminfo}
            set tag-msg <string>
        end
        config pop3
            set log-all {enable | disable}
            set action {pass | tag}
            set tag-type {subject | header | spaminfo}
```

```
            set tag-msg <string>
        end
        config mapi
            set log-all {enable | disable}
            set action {pass | discard}
        end
    next
end
```

`options ...`	The following options are available: • bannedword: content block. • spambal: block/allow list. • spamfsip: email IP address FortiGuard antispam block list check. • spamfssubmit: add FortiGuard antispam spam submission text. • spamfschksum: email checksum FortiGuard antispam check. • spamfsurl: email content URL FortiGuard antispam check. • spamhelodns: email HELO/EHLO domain DNS check. • spamraddrdns: email return address DNS check. • spamrbl: email DNSBL and ORBL check. • spamhdrcheck: email MIME header check. • spamfsphish: email content phishing URL FortiGuard antispam check.
`tag-type {subject | header | spaminfo}`	Set the tag type: • subject: prepend text to the spam email subject. • header: append a user-defined MIME header to the spam email. • spaminfo: append spam information to the spam email header.
`tag-msg <string>`	Subject text or header added to the spam email.
`hdrip {enable | disable}`	Enable/disable SMTP email header IP checks for spamfsip, spamrbl, and spambal filters.
`local-override {enable | disable}`	Enable/disable local filter to override SMTP remote check result.

For more information, see config emailfilter profile in the FortiOS CLI Reference.

Configuring webmail filtering

You can configure an email filter to detect and log emails sent by Gmail and Hotmail. These interfaces do not use standard email protocols (SMTP, POP3, or IMAP) and use HTTPS instead. However, you can still configure the email filter to detect emails that pass through the FortiGate.

The FortiGate only detects and logs the emails, it does not discard or tag them.

To configure webmail filtering:

```
config emailfilter profile
    edit <name>
        set spam-filtering enable
        config msn-hotmail
            set log-all enable
        end
        config gmail
            set log-all enable
        end
    next
end
```

Spam email header

The following headers may be added to the x-spaminfo field of email headers:

Header	Description
`ipbal, path block/allow ip <IP address>`	IP address is contained in the local block/allow list
`dnsbl, path block/allow ip <IP address>`	Email is contained in configured third-party DNS-based blackhole lists (DNSBL), or Open Relay Behavior-modification Systems (ORBS).
`FortiGuard-AntiSpam ip, path block/allow ip <IP address>`	IP address is contained in the FortiGuard antispam block/allow list.
`FortiGuard-AntiSpam ase,`	FortiGuard antispam match (may match using: email checksum, URL check, phishing URL, and others).
`email-address, no.<INT> pattern matched`	Email address is contained in the local block/allow list.
`mime-header, no.<INT> pattern matched`	MIME header contains a match for a configured pattern.
`bannedword, <listid-hexnum hexnum ... hexnum>` `bannedword, <hexnum hexnum ... hexnum>`	Email contains one or more words listed in the local banned word list.
`helo-dns`	Whenever a client opens an SMTP session with a server, the client sends an HELO command with the client domain name. The FortiGate takes the domain name specified by the client in the HELO and performs a DNS lookup to determine if the domain exists. If the lookup fails, the FortiGate determines that any emails delivered during the SMTP session are spam.
`return-email, domain <domain name> has neither MX nor A record`	FortiGate performs a DNS lookup on the return field. If no such record exists, the email is treated as spam.

Header	Description
`return-email, domain name <domain name> has invalid syntax`	Invalid return email domain name.
`return-email, DNS request error for domain <domain name>`	Error when resolving domain name.

VoIP solutions

You can configure VoIP profiles to allow SIP and SCCP traffic and to protect your network from SIP- and SCCP-based attacks.

FortiOS includes two preloaded VoIP profiles:

- *default*
- *strict*

You can customize these profiles, or you can create your own and add them to firewall policies that allow VoIP.

VoIP profiles cannot be used in NGFW policy-based mode. See NGFW policy on page 1586 for more information.

The following topics provide information about VoIP profiles:

- General use cases on page 2173
- NAT46 and NAT64 for SIP ALG on page 2178
- SIP message inspection and filtering on page 2186
- SIP ALG and SIP session helper on page 2192
- SIP pinholes on page 2198
- SIP over TLS on page 2200
- Voice VLAN auto-assignment on page 2201
- Scanning MSRP traffic on page 2203

General use cases

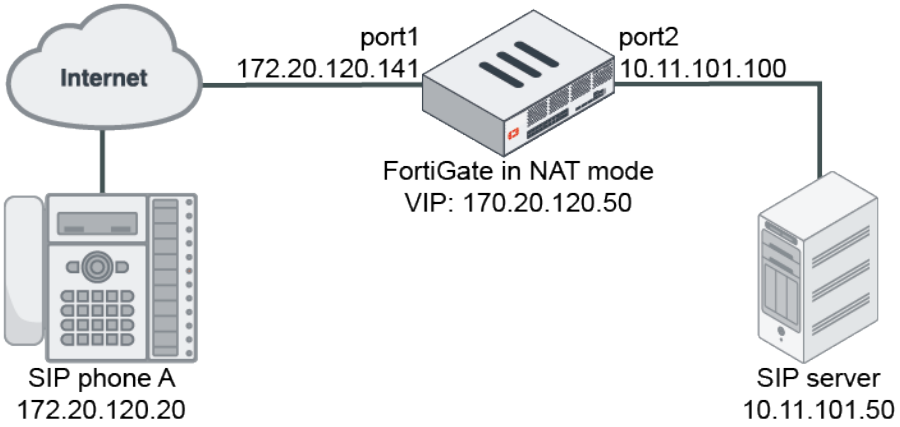
There are three scenarios in which the FortiOS session initiation protocol (SIP) solution is usually deployed:

1. The SIP server is in a private network that is protected from the internet by a FortiGate.
2. The SIP clients are in a private network that is protected from the internet by a FortiGate.
3. The SIP server is in a private network, such as a corporation's internal network or an ISP's network, that is protected from the internet by a FortiGate. The SIP clients are in a remote private network, such as a SOHO network, and behind a NAT device that is not aware of SIP applications.

The following VIP, NAT, and HNT examples show configurations for these common scenarios.

VIP

A FortiGate with SIP Application Layer Gateway (ALG) or SIP session helper protects the SIP server from the internet, while SIP phones from the internet need to register to the SIP server and establish calls through it.



A VIP needs to be configured for the SIP server, and the VIP must be applied in a firewall policy for the phones to send REGISTER messages through the FortiGate from port1 to port2.

Only one firewall policy needs to be configured for all SIP phones on both the internet and private network to register to the SIP server through port1 and set up SIP calls. This example assumes either SIP ALG or SIP session helper is enabled.

To configure the VIP for the SIP server:

```
config firewall vip
    edit "VIP_for_SIP_Server"
        set extip 172.20.120.50
        set extintf "port1"
        set mappedip "10.11.101.50"
    next
end
```

To configure the firewall policy:

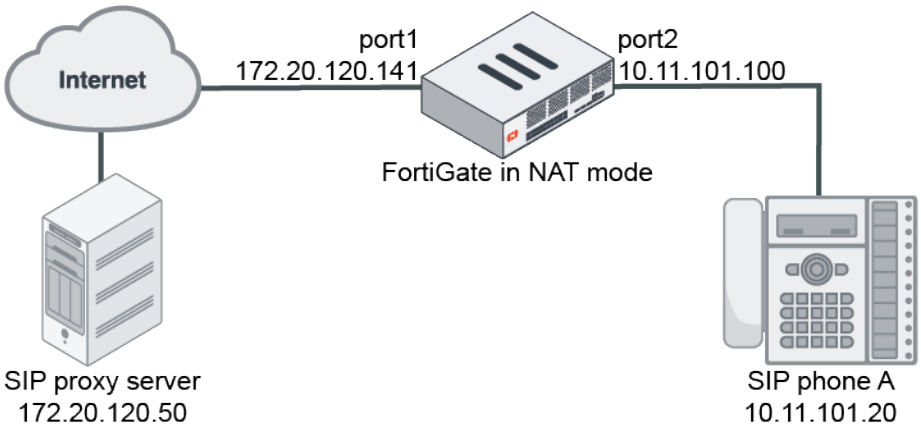
```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "VIP_for_SIP_Server"
        set action accept
        set schedule "always"
        set service "SIP"
```

```
    next
end
```

Setting `service` to `SIP` and not `all` in the firewall policy can improve protection by restricting the data traffic passing through the FortiGate to the SIP call traffic only.

NAT

A FortiGate with SIP ALG or SIP session helper protects the SIP phones and the internal network from the internet, while SIP phones in the internal network need to register to the SIP server installed on the internet and establish calls through it.



One firewall policy needs to be configured with NAT enabled for SIP phones to send REGISTER messages through the FortiGate from port2 to port1. This example assumes either SIP ALG or SIP session helper is enabled.

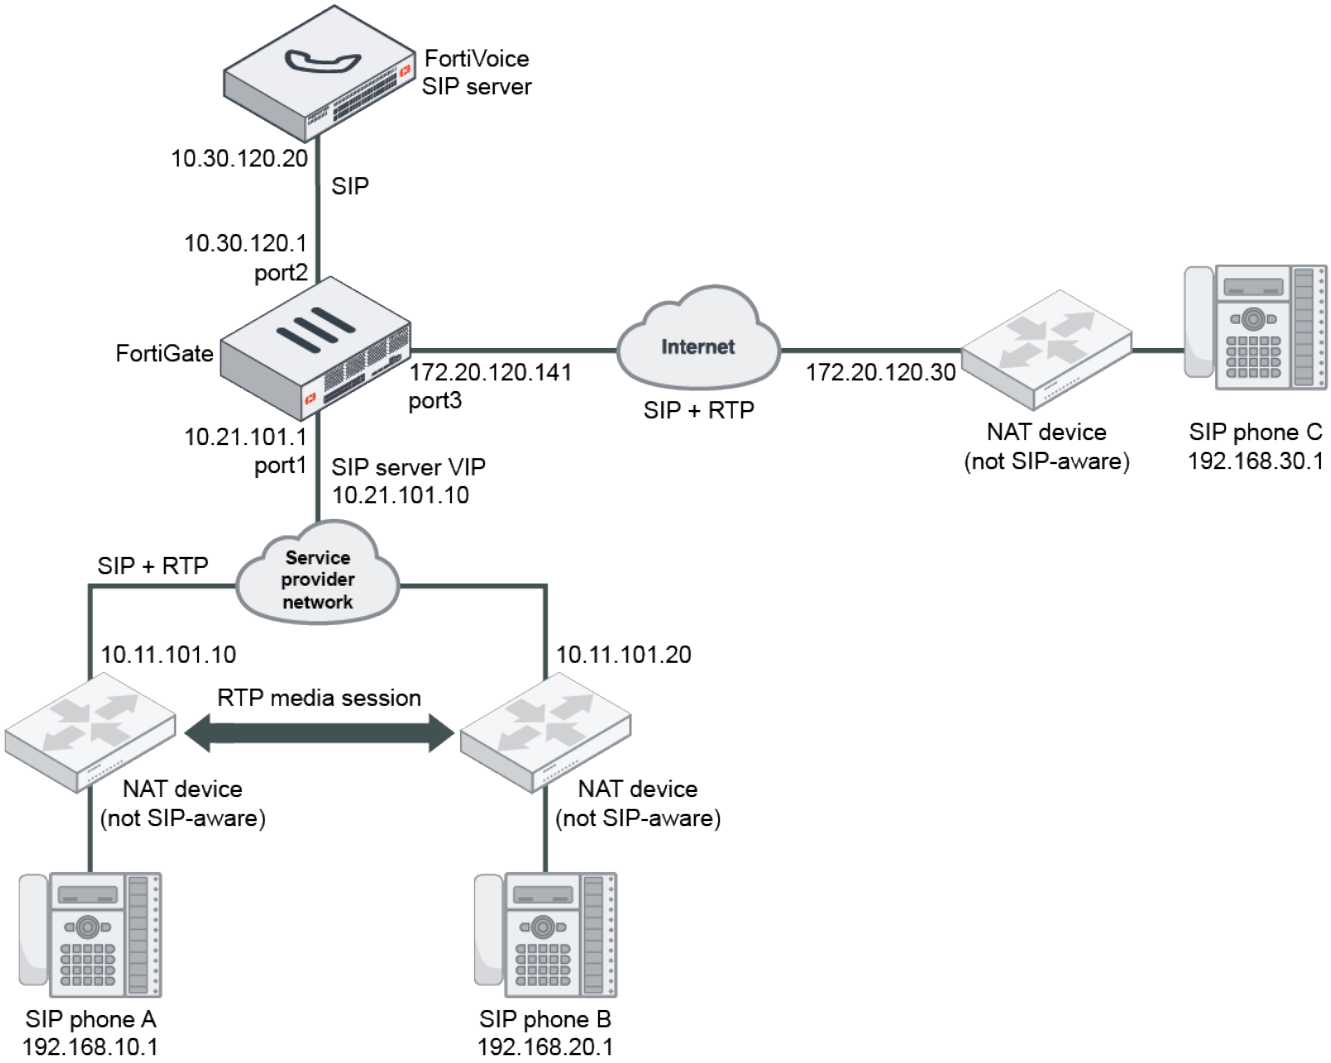
To configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "SIP"
        set nat enable
    next
end
```

HNT

A FortiGate with SIP ALG protects the SIP server from the internet, while SIP phones are in remote private networks behind NAT devices that are not aware of the SIP application.

In this example, the SIP server is located in an ISP's service cloud that is protected by the FortiGate SIP ALG, and the SIP phones are installed in the home networks of the ISP's customers.



The SIP messages traversing the remote NAT devices might have their IP addresses translated by the NAT device at the network layer, but untranslated at the SIP application layer because those NAT devices are not aware of the SIP applications. This causes problems in a SIP session initiated process. Special configurations for the hosted NAT traversal (HNT) are required to resolve this issue.

To configure the FortiGate with HNT support for SIP phones A and B to set up calls with each other:

1. Identify port1 as the external interface:

```
config system interface
    edit "port1"
        set external enable
    next
end
```

2. Configure the VIP for the SIP server:

```
config firewall vip
    edit "VIP_for_SIP_Server"
        set extip 10.21.101.10
        set extintf "port1"
        set mappedip "10.30.120.20"
    next
end
```

3. Configure a VoIP profile with HNT enabled:

```
config voip profile
    edit "hnt"
        config sip
            set hosted-nat-traversal enable
            set hnt-restrict-source-ip enable
        end
    next
end
```

`hosted-nat-traversal` must be enabled. `hnt-restrict-source-ip` does not have to be enabled, but can be enabled to restrict the RTP packets' source IP to be the same as the SIP packets' source IP.

4. Apply the VoIP profile and VIP in a firewall policy for phone A and B to register and set up SIP calls through the FortiGate and SIP server:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "VIP_for_SIP_Server"
        set action accept
        set schedule "always"
        set service "SIP"
        set utm-status enable
        set voip-profile "hnt"
        set nat enable
    next
end
```

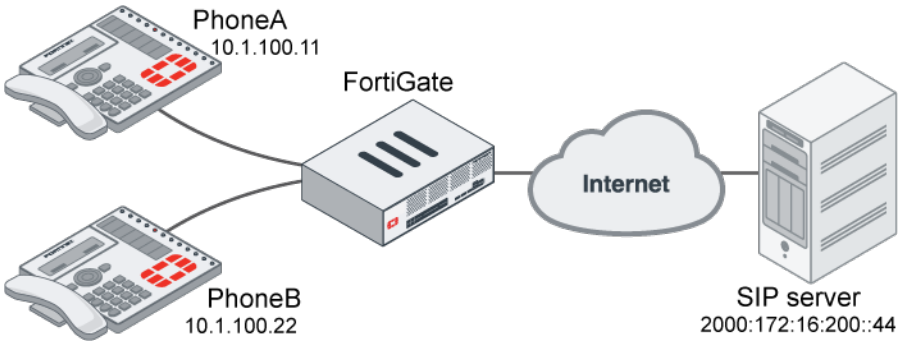
nat must be enabled in the firewall policy.

NAT46 and NAT64 for SIP ALG

NAT46 and NAT64 are supported for SIP ALG. A mix of IPv4 and IPv6 networks can use SIP ALG, allowing for proper call handling.

NAT46 example

In this example, SIP phones on the internal network use IPv4, and the SIP server on an external network uses IPv6. NAT46 is used with SIP ALG to allow for seamless communication. A VoIP profile, `sip`, has already been created.



To configure the FortiGate:

1. Configure a firewall VIP with NAT46 enabled:

```
config firewall vip
    edit "vip46_server_asterisk"
        set extip 10.1.100.100
        set nat44 disable
        set nat46 enable
        set extintf "port1"
        set ipv6-mappedip 2000:172:16:200::44
    next
end
```

2. Configure an IPv6 pool:

```
config firewall ippool6
    edit "client_server_nat46"
        set startip 2000:172:16:200::200
        set endip 2000:172:16:200::207
        set nat46 enable
```

```
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 1
        set name "policy46-1"
        set srcintf "port1"
        set dstintf "port9"
        set action accept
        set nat46 enable
        set srcaddr "all"
        set dstaddr "vip46_server_asterisk"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set voip-profile "sip"
        set logtraffic all
        set auto-asic-offload disable
        set ippool enable
        set poolname6 "client_server_nat46"
    next
end
```

To check the SIP calls and session lists when the phones are registering to the SIP server:

1. View the SIP proxy SIP calls:

```
# diagnose sys sip-proxy calls
sip calls
  vdom 3 (vdom1) vrf 0 call 7f64bf044b00
    call-id: 1513782757
    txn 7f64bf048f00 (REGISTER)
      cseq 2 dir 0 state 5 status 200 expiry 868 HA 0
      i_session: 7f64bf045e00  r_session: 7f64bf045e00
      register: present
      from: sip:2002@10.1.100.100
      to: sip:2002@10.1.100.100
      src: 10.1.100.22:5060
      dst: [2000:172:16:200::44]:5060

  vdom 3 (vdom1) vrf 0 call 7f64bf076700
    call-id: 1490871789
    txn 7f64bf047a00 (REGISTER)
      cseq 2 dir 0 state 5 status 200 expiry 861 HA 0
      i_session: 7f64bf045000  r_session: 7f64bf045000
      register: present
      from: sip:2001@10.1.100.100
```

```
      to: sip:2001@10.1.100.100
      src: 10.1.100.11:5060
      dst: [2000:172:16:200::44]:5060
```

2. View the IPv4 session list:

```
# diagnose sys session list

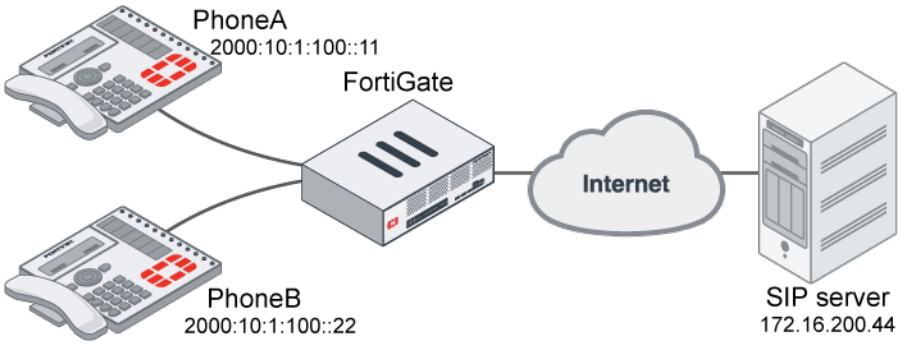
to="sip:2002@10.1.100.100"
```

NAT64 example

In this example, SIP phones on the internal network use IPv6, and the SIP server on an external network uses IPv4. NAT64 is used with SIP ALG to allow for seamless communication. A VoIP profile, `sip`, has already been created.



To configure the FortiGate:

1. Configure a firewall VIP with NAT64 enabled:

```
config firewall vip
    edit "vip64-1-asterisk"
        set extip 2000:10:1:100::100
        set nat66 disable
        set nat64 enable
        set ipv4-mappedip 172.16.200.44
    next
end
```

2. Configure an IP pool:

```
config firewall ippool
    edit "client_server_nat46"
        set startip 172.16.200.2
        set endip 172.16.200.3
        set nat64 enable
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 1
        set name "policy64-1"
        set srcintf "port1"
        set dstintf "port9"
        set action accept
        set nat64 enable
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "vip64-1-asterisk"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set voip-profile "sip"
```

```
        set logtraffic all
        set auto-asic-offload disable
        set ippool enable
        set poolname "client_server_nat64"
    next
end
```

SIP message inspection and filtering

There are two types of VoIP profiles that can be configured:

```
config voip profile
    edit <name>
        set feature-set {ips | voipd}
    next
end
```

`feature-set {ips | voipd}`	Set the inspection feature set. • `ips`: use the IPS Engine feature set for the `ips-voip-filter` firewall policy option. • `voipd`: use the SIP ALG feature set for `voip-profile` firewall policy option.

SIP ALG provides users with security features to inspect and control SIP messages that are transported through the FortiGate, including:

- Verifying the SIP message syntax.
- Blocking particular types of SIP requests.
- Restricting the rate of particular SIP requests.

Proxy-based SIP ALG (`feature-set voipd`) is also able to handle features such as pin hole creation and NAT that flow-based SIP inspection cannot. Flow-based SIP (`feature-set ips`) can handle features such as MSRP decoding and scanning that proxy-based SIP ALG cannot.

The two VoIP profile types can be configured separately or at the same time on a firewall policy:

```
config firewall policy
    edit 1
        set voip-profile "voip_sip_alg"
        set ips-voip-filter "voip_sip_ips"
    next
end
```

Where:

- `voip-profile` can select a `voip-profile` with `feature-set voipd`.
- `ips-voip-filter` can select a `voip-profile` with `feature-set ips`.

The IPS-based VoIP profile (`ips-voip-filter`) allows flow-based SIP to complement SIP ALG while working together.

When both SIP ALG and SIP IPS are used and configured with same block rules, SIP IPS will take priority and do the blocking.

Unlike previous versions (7.0 and 7.2.0-7.2.4) where the firewall policy's inspection mode determines whether the SIP traffic is scanned by SIP ALG or flow-based SIP, the inspection mode does not matter in this version. A `voipd`-based VoIP profile will activate SIP ALG inspection, while an `ips`-based VoIP profile will activate IPS-based SIP inspection.

A `voip-profile` can be selected regardless of the `inspection-mode` used in the firewall policy.

For more information about the difference between SIP ALG and the SIP session helper, see SIP ALG and SIP session helper on page 2192.

Example

In this example, SIP ALG is required for pinhole creation, handling NAT, and controlling SIP messages that requires flow-based SIP. The administrator needs to configure two SIP profiles, one with each feature set (`voipd` and `ips`), and apply these SIP profiles in the same firewall policy.

To configure SIP ALG with SIP IPS:

1. Configure the VoIP profiles:

```
config voip profile
    edit "voip_sip_alg"
        set feature-set voipd
        set comment "sip_alg_simple"
        config sip
            set log-violations enable
            set log-call-summary enable
        end
    next
    edit "voip_sip_ips"
        set feature-set ips
        set comment "ips_voip_blocking"
        config sip
            set block-invite enable
            set log-violations enable
        end
```

```
    next
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port9"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ips-sensor "g-default"
        set voip-profile "voip_sip_alg"
        set ips-voip-filter "voip_sip_ips"
        set logtraffic all
        set nat enable
    next
end
```

To verify the SIP proxy SIP calls:

1. Verify the register request:

```
# diagnose sys sip-proxy calls
sip calls
  vdom 1 (vdom1) vrf 0 call 7f2b99828300
    call-id: 619216389
    txn 7f2b998ad600 (REGISTER)
      cseq 2 dir 0 state 5 status 200 expiry 527 HA 0
      i_session: 7f2b998aac00  r_session: 7f2b998aac00
      register: present
      from: sip:2001@172.16.200.44
      to: sip:2001@172.16.200.44
      src: 10.1.100.11:5060
      dst: 172.16.200.44:5060
```

2. Verify the invite request:

```
# diagnose sys sip-proxy calls
sip calls
  vdom 1 (vdom1) vrf 0 call 7f2b99828300
    call-id: 619216389
    txn 7f2b998ad600 (REGISTER)
      cseq 2 dir 0 state 5 status 200 expiry 316 HA 0
      i_session: 7f2b998aac00  r_session: 7f2b998aac00
```

```
      register: present
      from: sip:2001@172.16.200.44
      to: sip:2001@172.16.200.44
      src: 10.1.100.11:5060
      dst: 172.16.200.44:5060
```

Sample logs

Register request:

```
date=2023-01-13 time=09:46:03 eventtime=1673631963477298677 tz="-0800" logid="0814044032"
type="utm" subtype="voip" eventtype="voip" level="information" vd="vdom1" session_id=17092 epoch=0
event_id=1 srcip=10.1.100.11 src_port=5060 dstip=172.16.200.44 dst_port=5060 proto=17 src_
int="port1" dst_int="port9" policy_id=1 profile="voip_sip_alg" voip_proto="sip" kind="register"
action="permit" status="succeeded" duration=0 dir="session_origin" call_id="619216389"
from="sip:2001@172.16.200.44" to="sip:2001@172.16.200.44"
```

Invite request:

```
date=2023-01-13 time=09:54:43 eventtime=1673632484065549240 tz="-0800" logid="0814044033"
type="utm" subtype="voip" eventtype="voip" level="notice" vd="vdom1" session_id=17092 epoch=0
event_id=0 srcip=10.1.100.11 src_port=5060 dstip=172.16.200.44 dst_port=5060 proto=17 src_
int="port1" dst_int="port9" policy_id=1 profile="voip_sip_ips" voip_proto="sip" kind="call"
action="block" status="N/A" reason="block-request" duration=0 dir="session_reverse" message_
type="request" request_name="INVITE" call_id="1967779864" count=0 from="<sip:2001@172.16.200.44>"
to="<sip:2002@172.16.200.44>" attackid=50083 attack="SIP.Invite.Method"
```

SIP message syntax inspection

For syntax verification, the following attributes are available for configuration in the VoIP profile to determine what action is taken when a specific syntax error or attack based on invalid syntax is detected. For example, the action can be set to pass or discard it.

```
malformed-request-line
malformed-header-via
malformed-header-from
malformed-header-to
malformed-header-call-id
malformed-header-cseq
malformed-header-rack
malformed-header-rseq
malformed-header-contact
malformed-header-record-route
malformed-header-route
malformed-header-expires
malformed-header-content-type
malformed-header-content-length
malformed-header-max-forwards
malformed-header-allow
malformed-header-p-asserted-identity
```

```
malformed-header-sdp-v
malformed-header-sdp-o
malformed-header-sdp-s
malformed-header-sdp-i
malformed-header-sdp-c
malformed-header-sdp-b
malformed-header-sdp-z
malformed-header-sdp-k
malformed-header-sdp-a
malformed-header-sdp-t
malformed-header-sdp-r
malformed-header-sdp-m
malformed-header-no-require*
malformed-header-no-proxy-require*
```

* = only available in flow mode

SIP message blocking

The following options are available in the VoIP profile to block SIP messages:

```
block-long-lines
block-unknown
block-ack
block-bye
block-cancel
block-info
block-invite
block-message
block-notify
block-options
block-prack
block-publish
block-refer
block-register
block-subscribe
block-update
block-geo-red-options**
```

** = only available in proxy mode

SIP message rate limiting

The rate of certain types of SIP requests that are passing through the SIP ALG can be restricted:

```
register-rate
invite-rate
subscribe-rate
message-rate
notify-rate
```

```
refer-rate
update-rate
options-rate
ack-rate
prack-rate
info-rate
publish-rate
bye-rate
cancel-rate
```

Additionally, flow-based SIP supports the following rate tracking features:

```
register-rate-track none
invite-rate-track none
subscribe-rate-track none
message-rate-track none
notify-rate-track none
refer-rate-track none
update-rate-track none
options-rate-track none
ack-rate-track none
prack-rate-track none
info-rate-track none
publish-rate-track none
bye-rate-track none
cancel-rate-track none
```

Call-Id and Content-Type regex

When the `ips` VoIP profile feature set is selected, options for Call-Id and Content-Type header values can be configured.

```
config voip profile
    edit <name>
        config sip
            set call-id-regex <string>
            set call-id-regex <string>
        end
    next
end
```

`call-id-regex <string>`	Enter a validation PCRE regular expression for the Call-Id header value.
`call-id-regex <string>`	Enter a validation PCRE regular expression for the Content-Type header value.

SIP ALG and SIP session helper

The SIP session helper is a legacy solution that provides basic support for SIP calls passing through the FortiGate by opening SIP and RTP pinholes, and by performing NAT of the addresses in SIP messages.

SIP Application Layer Gateway (ALG) provides the same basic SIP support as the SIP session helper. In addition, SIP ALG provides a wide range of features that protect your network from SIP attacks, apply rate limiting to SIP sessions, check the syntax of SIP and SDP content of SIP messages, and provide detailed logging and reporting of SIP activity.

By default, all SIP traffic is processed by the SIP ALG. If the policy that accepts the SIP traffic includes a VoIP profile, the SIP traffic is processed by that profile. If the policy does not include a VoIP profile, the SIP traffic is processed by the SIP ALG using the default VoIP profile.

To change between SIP ALG mode and SIP session helper mode:

```
config system settings
    set default-voip-alg-mode {proxy-based | kernel-helper-based}
end
```

`default-voip-alg-mode {proxy-based | kernel-helper-based}`	Set how the FortiGate handles VoIP traffic when a policy that accepts the traffic does not include a VoIP profile. • `proxy-based`: use SIP ALG to process SIP traffic (default). • `kernel-helper-based`: use the SIP session helper to process SIP traffic.

The `default-voip-alg-mode` setting works together with the VoIP profile configured in a firewall policy to determine whether SIP ALG, SIP ALG with IPS SIP, or the SIP session helper are used to process the SIP traffic. The following firewall policy settings correspond to the VoIP profiles (see also SIP message inspection and filtering on page 2186).

```
config firewall policy
    edit <id>
        set voip-profile <voipd-based_profile>
        set ips-voip-filter <ips-based_profile>
    next
end
```

The following table explains the results of configuring different combinations of the preceding settings.

Firewall policy setting		Default VoIP ALG mode setting	
voip-profile	**ips-voip-filter**	**kernel-helper-based**	**proxy-based**
Yes	Yes	SIP ALG + IPS SIP	SIP ALG + IPS SIP
Yes	No	SIP ALG	SIP ALG
No	Yes	SIP ALG + IPS SIP	SIP ALG + IPS SIP
No	No	SIP session helper	SIP ALG

SIP ALG configurations

SIP ALG can be enabled in several ways. The following configuration examples demonstrate different settings.

Example 1

In this example, a `voipd`-based profile is configured and applied to a firewall policy. The `default-voip-alg-mode` remains as the default setting (`proxy-based`).

To configure SIP ALG:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode proxy-based
end
```

2. Configure the VoIP profile:

```
config voip profile
    edit "sip-alg-profile"
        set feature-set voipd
        config sip
            set status enable
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-Proxy"
        set utm-status enable
        set voip-profile "sip-alg-profile"
    next
end
```

Example 2

In this example, the `default-voip-alg-mode` is set to `kernel-helper-based`. A VoIP profile (VoIP-Proxy) has SIP enabled and is applied to a firewall policy.

To configure SIP ALG:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode kernel-helper-based
end
```

2. Configure the VoIP profile:

```
config voip profile
    edit "sip-alg-profile"
        set feature-set voipd
        config sip
            set status enable
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-Proxy"
        set utm-status enable
        set voip-profile "sip-alg-profile"
    next
end
```

Example 3

In this example, no VoIP profile is selected in the firewall policy. However, the `default-voip-alg-mode` is set to `proxy-based`. The default `voip-profile` is implicitly applied.

To configure SIP ALG to implicitly use the default VoIP profile:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode proxy-based
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-Proxy"
        set utm-status enable
        set voip-profile ""
    next
end
```

SIP session helper configurations

In some instances, SIP providers may recommend that customers disable SIP ALG on their edge firewall. This is how you can disable SIP ALG and enable the SIP session helper.

Example 1

In this example, the `default-voip-alg-mode` is set to `kernel-helper-based`, and a VoIP profile is not applied in a firewall policy. Session helper 13 is enabled by default.

To configure the SIP session helper:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode kernel-helper-based
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-session-helper"
        set utm-status enable
        set voip-profile ""
    next
end
```

3. Configure the session helper:

```
config system session-helper
    edit 13
        set name sip
        set protocol 17
        set port 5060
    next
end
```

Example 2

In this example, the `default-voip-alg-mode` is set to either `proxy-based` or `kernel-helper-based`. A VoIP profile that has SIP disabled is applied to the firewall policy.

To configure the SIP session helper:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode {proxy-based | kernel-helper-based}
end
```

2. Configure the VoIP profile:

```
config voip profile
    edit "sip-disabled-profile"
        set feature-set voipd
        config sip
```

```
            set status disable
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-session-helper"
        set utm-status enable
        set voip-profile "sip-disabled-profile"
    next
end
```

4. Configure the session helper:

```
config system session-helper
    edit 13
        set name sip
        set protocol 17
        set port 5060
    next
end
```

Example 3

In this example, the session helper is removed because the SIP provider suggests to disable SIP ALG and the session helper altogether.

To remove the SIP session helper:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode kernel-helper-based
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-session-helper"
        set utm-status enable
        set voip-profile ""
    next
end
```

3. Remove the session helper:

```
config system session-helper
    delete 13
end
```

Modifying the SIP port

Most SIP configurations use TCP or UDP port 5060 for SIP sessions and port 5061 for SIP SSL sessions. If your SIP network uses different ports for SIP sessions, the SIP port can be changed. You can also listen to two TCP and UDP ports .

To change the SIP port:

```
config system settings
    set sip-tcp-port 5064
    set sip-udp-port 5065
    set sip-ssl-port 5066
end
```

To listen to two TCP and UDP ports:

```
config system settings
    set sip-tcp-port 5060 5064
    set sip-udp-port 5061 5065
end
```

To modify the SIP ports for the default SIP session helper:

```
config system session-helper
    edit 13
        set name sip
        set protocol 17
        set port 5065
    next
end
```

To add a new session helper to listen on UDP and TCP 5064:

```
config system session-helper
    edit 0
        set name sip
        set port 5064
    next
end
```

SIP pinholes

When SIP ALG processes a SIP call, it usually opens pinholes for SIP signaling and RTP/RTCP packets. NAT usually takes place during the process at both the network and SIP application layers. SIP ALG ensures that, with NAT happening, corresponding SIP and RTP/RTCP pinholes are created during the process when it is necessary for call sessions to be established through FortiOS devices.

By default, SIP ALG manages pinholes automatically, but some special configurations can be used to restrict the pinholes if required.

SIP pinhole restriction

The `strict-register` attribute is enabled by default. When enabled, after a SIP endpoint registers to the SIP server through a firewall policy on the FortiGate, only the SIP messages sent from the same IP address as the SIP server are allowed to pass through the SIP pinhole that is created in the FortiGate to reach the SIP endpoints. If the attribute is disabled, SIP messages from any IP addresses can pass through the pinhole created after the registration.

SIP pinhole restriction is only supported by SIP ALG and in proxy mode.

To configure registrar connection ability:

```
config voip profile
    edit <name>
        config sip
            set strict-register {enable | disable}
        end
    next
end
```

RTP/RTCP pinhole restriction

The `nat-port-range` setting is used to specify a port range in the VoIP profile to restrict the NAT port range for Real-time Transport Protocol/Real-time Transport Control Protocol (RTP/RTCP) packets in a Session Initiation Protocol (SIP) call session that is handled by the SIP application layer gateway (ALG) in a FortiGate.

When NAT is enabled, or VIP is used in a firewall policy for SIP ALG to handle a SIP call session established through a FortiGate, the SIP ALG can perform NAT to translate the ports used for the RTP/RTCP packets when they are flowing through the device between the external and internal networks.

To edit the translated port range for RTP/RTCP packets:

```
config voip profile
    edit <name>
```

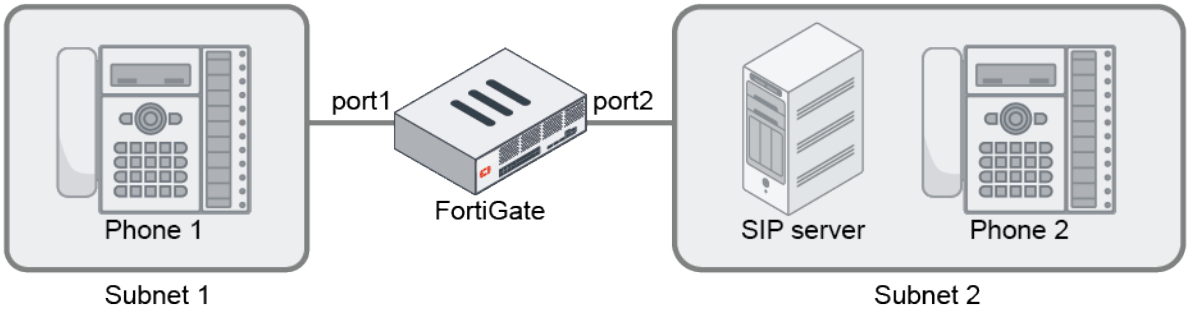
```
        config sip
            set nat-port-range <start_port_number>-<end_port_number>
        end
    next
end
```

`nat-port-range <start_port_number>-<end_port_number>`	Enter the NAT port range (minimum port number = 5117, default = 5117-65535).

Example

In this example, Phone 1 is in Subnet 1, and the SIP server and Phone 2 are in Subnet 2. All SIP signaling messages and RTP/RTCP packets go through the SIP server. The RTP/RTCP ports on Phone 1 are configured as 17078/17079.

The FortiGate administrator wants to use NAT for the port 17078/17079 to 30000/30001. If Phone 1 and Phone 2 are registered to the SIP server, and they establish a call session between them through the FortiGate and the SIP server, then the RTP/RTCP ports 17078/17079 of Phone 1 will be translated to ports 30000/30001. All RTP/RTCP packets going out of port2 have source ports of 30000/30001, and all RTP/RTCP packets going into port2 also have destination ports of 30000/30001.



To configure the custom port range:

1. Edit the VoIP profile:

```
config voip profile
    edit "natPortRange"
        config sip
            set nat-port-range 30000-30001
        end
    next
end
```

It is best practice to configure the starting port as an even number and the ending port as an odd number.

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf port1
        set dstintf port2
        set srcaddr all
        set dstaddr all
        set service SIP
        set action accept
        set schedule always
        set voip-profile natPortRange
        set nat enable
    next
end
```

SIP over TLS

Some SIP phones and servers can communicate using TLS to encrypt the SIP signaling traffic. To allow SIP over TLS calls to pass through the FortiGate, the encrypted signaling traffic must be unencrypted and inspected. The FortiGate SIP ALG intercepts, unencrypts, and inspects the SIP packets, which are then re-encrypted and forwarded to their destination.

The SIP ALG only supports full mode TLS. This means that the SIP traffic between SIP phones and the FortiGate, and between the FortiGate and the SIP server, is always encrypted. The highest TLS version supported by SIP ALG is TLS 1.3.

To enable SIP over TLS support, the SSL mode in the VoIP profile must be set to `full`. The SSL server and client certificates can be provisioned so that the FortiGate can use them to establish connections to SIP phones and servers, respectively.

This configuration is only supported in proxy mode.

To configure SIP over TLS:

1. Configure a VoIP profile with SSL enabled:

```
config voip profile
    edit "tls"
        config sip
            set ssl-mode full
            set ssl-client-certificate "ssl_client_cert"
            set ssl-server-certificate "ssl_server_cert"
        end
    next
end
```

The `ssl_server_cert`, `ssl_client_cert`, and key files can be generated using a certification tool, such as OpenSSL, and imported to the local certificate store of the FortiGate from *System > Certificates* in the GUI. Existing local certificates in the certificate store can also be used. As always for TLS connections, the certificates used must be verified and trusted at the other end of the connection when required.

For example, the CA certificate of the SIP server's certificate should be imported to the FortiGate as an external CA certification, so that the FortiGate can use it to verify the SIP server's certificate when setting up the TLS connection. The CA certificate configured as the `ssl_server_cert` should be installed as the trusted certificate on the SIP phones. The deployment of the certificates across the network depends on the SIP client and server devices that are used in the system.

2. Apply the profile to the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "vip_sip_server"
        set action accept
        set schedule "always"
        set service "SIP"
        set utm-status enable
        set voip-profile "tls"
    next
end
```

Voice VLAN auto-assignment

You can leverage LLDP-MED to assign voice traffic to the desired voice VLAN. After detection and setup, the IP phone on the network is segmented to its own VLAN for policy, prioritization, and reporting. The LLDP reception capabilities in FortiOS include LLDP-MED assignment for voice, voice signaling, guest, guest voice signaling, softphone, video conferencing, streaming video, and video signaling.

You can configureVLAN auto-assignment using the following steps:

1. Set up the VLAN for the voice device
2. Set up the DHCP server for the voice VLAN
3. Sett up the LLDP network policy
4. Enable LLDP on the physical interface that the VLAN belongs to
5. Apply the LLDP network policy on the physical interface
6. Confirm that the VLAN was assigned

To set up the VLAN for the voice device:

```
config system interface
    edit "vlan_100"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
        set alias "voice_vlan"
```

```
        set device-identification enable
        set role lan
        set snmp-index 25
        set interface "port10"
        set vlanid 100
    next
end
```

To set up the DHCP server for the voice VLAN:

```
config system dhcp server
    edit 1
        set dns-service default
        set default-gateway 192.168.1.99
        set netmask 255.255.255.0
        set interface "vlan_100"
        config ip-range
            edit 1
                set start-ip 192.168.1.110
                set end-ip 192.168.1.210
            next
        end
    next
end
```

To set up the LLDP network policy:

```
config system lldp network-policy
    edit "1"
        config voice
            set status enable
            set tag dot1q
            set vlan 100
        end
    next
end
```

To enable LLDP on the physical interface that the VLAN belongs to:

```
config system interface
    edit "port10"
        set vdom "root"
        set type physical
        set lldp-reception enable
        set lldp-transmission enable
        set snmp-index 14
    next
end
```

To apply the LLDP network policy on the physical interface:

```
config system interface
    edit "port10"
        set lldp-network-policy "1"
    next
end
```

To confirm that the VLAN was assigned as expected:

1. Connect an IP phone to the network.
2. Check the IP address on the phone.
   The IP address should belong to the voice VLAN.
3. Sniff on the FortiGate incoming interface to see if traffic from the IP phone has the desired VLAN tag.
   In this example, the voice traffic from the IP phone should be in VLAN 100.

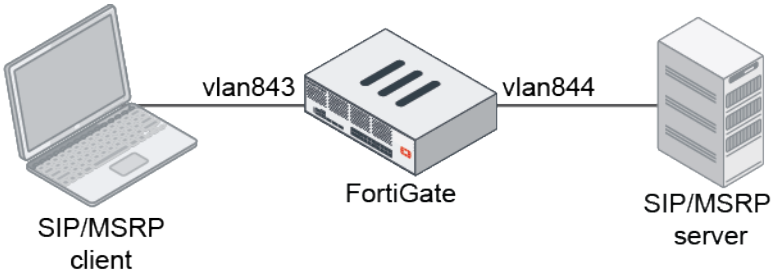
Scanning MSRP traffic

An MSRP (Message Session Relay Protocol) decoder in the IPS engine scans for IPS signatures against the application data. Malicious payload in the text message can be blocked. A VoIP profile using flow inspection mode must be configured in the firewall policy. An IPS profile must be configured in the firewall policy to inspect the payload.

```
config voip profile
    edit <name>
        set feature-set flow
        config msrp
            set status {enable | disable}
            set log-violations {enable | disable}
            set max-msg-size <integer>
            set max-msg-size-action {pass | block | reset | monitor}
        end
    next
end
```

`status {enable | disable}`	Enable/disable MSRP.
`log-violations {enable | disable}`	Enable/disable logging of MSRP violations.
`max-msg-size <integer>`	Maximum allowable MSRP message size, in bytes (0 - 65535, default = 0).
`max-msg-size-action {pass | block | reset | monitor}`	Action for violating maximum MSRP message size: • pass: pass or allow matching traffic (default) • block: block or drop matching traffic • reset: reset sessions for matching traffic • monitor: pass and log matching traffic

Examples



In this first example, MSRP messages larger than 10 bytes will be blocked. The client sends an oversized MSRP message to the server. Message Automation & Protocol Simulation (MAPS™) is used, and a client-server model was configured to use the software to send MSRP traffic from vlan843 (client) to vlan844 (server) with plain text placed in the message field. The software uses the content of the MsrpInputMessage.txt file located in the default folder, where anything in that file will be sent by MSRP. The following text is used:

> GL's Message Automation & Protocol Simulation (MAPS™) is a protocol simulation and conformance test tool that supports a variety of protocols such as SIP, MEGACO, MGCP, SS7, ISDN, GSM, MAP, CAS, LTE, UMTS, SS7 SIGTRAN, ISDN SIGTRAN, SIP I, GSM AoIP, Diameter and others. This message automation tool covers solutions for both protocol simulation and protocol analysis. The application includes various test plans and test cases to support the testing of real-time entities. Along with automation capability, the application gives users the unlimited ability to edit messages and control scenarios (message sequences).

To configure MSRP traffic scanning:

1. Configure the VoIP profile:

```
config voip profile
    edit msrp_test
        set feature-set flow
        config msrp
            set status enable
            set log-violations enable
            set max-msg-size 10
            set max-msg-size-action block
        end
    next
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "vdom3"
        set srcintf "vlan843"
        set dstintf "vlan844"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
```

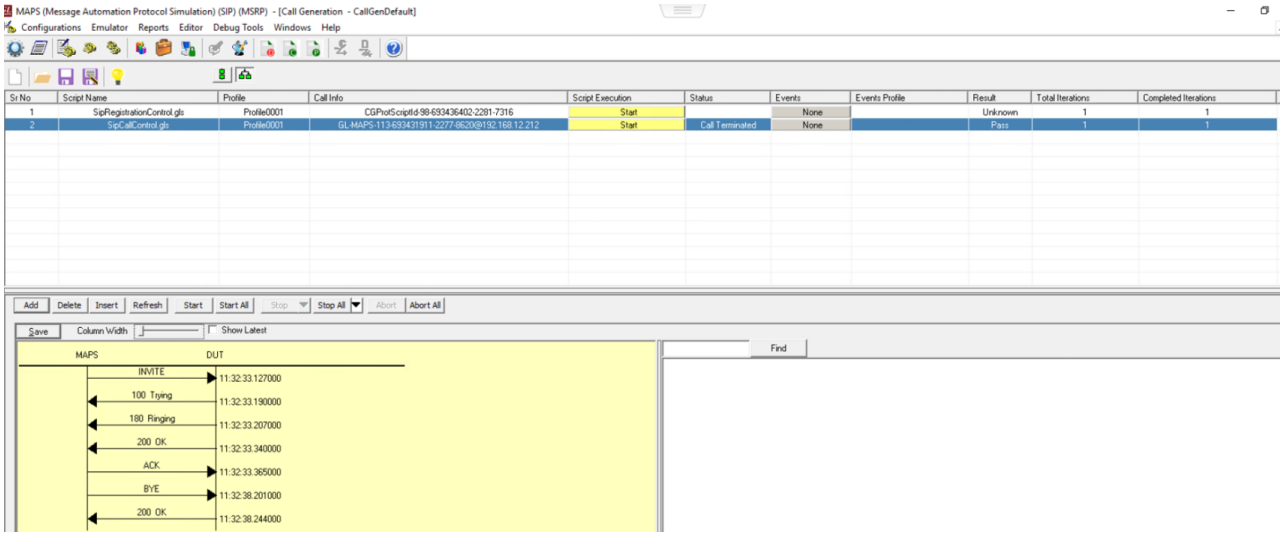
```
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set voip-profile "msrp_test"
        set logtraffic all
    next
end
```

3. Verify the log:

```
# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.

1: date=2021-06-10 time=17:21:19 eventtime=1623370879840284165 tz="-0700" logid="0419016384"
type="utm" subtype="ips" eventtype="signature" level="alert" vd="vdom3" severity="info"
srcip=192.168.12.212 srccountry="Reserved" dstip=192.168.12.213 srcintf="vlan843"
srcintfrole="lan" dstintf="vlan844" dstintfrole="lan" sessionid=27700 action="dropped" proto=6
service="MSRP" policyid=1 attack="MSRP.Max.Message.Size.Exceeded" srcport=20036 dstport=20036
direction="outgoing" attackid=1000000 profile="g-default"
ref="http://www.fortinet.com/ids/VID1000000" incidentserialno=189792275 psrcport=0 pdstport=0
msg="msrp_decoder: MSRP.Max.Message.Size.Exceeded, msg_size=270 exceeds config maximum=10"
```

4. In MAPS, verify that the call was terminated:



In this second example, malicious files will be blocked. The client sends an EICAR test sample to the server in an MSRP message. Message Automation & Protocol Simulation (MAPS™) is used, and a client-server model was configured to use the software to send MSRP traffic from vlan843 (client) to vlan844 (server) with a plain text EICAR file containing a virus in the message field. The following text is used:

X5O!P%@AP[4\PZX54(P^)7CC)7}$EICAR-STANDARD-ANTIVIRUS-TEST-FILE!$H+H*

To configure MSRP traffic scanning:

1. Configure the VoIP profile:

```
config voip profile
    edit msrp_test
        set feature-set flow
        config msrp
            set status enable
            set log-violations enable
            set max-msg-size 0
            set max-msg-size-action pass
        end
    next
end
```

2. Configure the IPS profile:

```
config ips sensor
    edit "msrp"
        set extended-log enable
        config entries
            edit 1
                set rule 7470 29844
                set status enable
                set action block
            next
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "vdom3"
        set srcintf "vlan843"
        set dstintf "vlan844"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set ips-sensor "msrp"
        set voip-profile "msrp_test"
        set logtraffic all
    next
end
```

4. Verify the log:

```
# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.

1: date=2021-09-16 time=11:29:48 eventtime=1631816988947762597 tz="-0700" logid="0419016384"

```

ICAP

Internet Content Adaptation Protocol (ICAP) is an application layer protocol that is used to offload tasks from the firewall to separate, specialized servers. For more information see RFC 3507.

ICAP profiles can only be applied to policies that use proxy-based inspection. If you enable ICAP in a policy, HTTP and HTTPS (if HTTPS inspection is supported) traffic that is intercepted by the policy is transferred to the ICAP server specified by the selected ICAP profile. Responses from the ICAP server are returned to the FortiGate, and then forwarded to their destination.

By default, *ICAP* is not visible in the GUI. See Feature visibility on page 3595 for instructions on making it visible.

ICAP filter profiles cannot be used in NGFW policy-based mode. See NGFW policy on page 1586 for more information.

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 98 for more information.

To configure ICAP:

1. Set up your ICAP server.
2. On the FortiGate, add an ICAP server.
3. Create an ICAP profile.
4. Use the ICAP profile in a firewall policy that covers the traffic that needs to be offloaded to the ICAP server.

The following topics provide information about ICAP:

- ICAP configuration example on page 2208
- ICAP response filtering on page 2211

- Secure ICAP clients on page 2213
- ICAP scanning with SCP and FTP on page 2214
- Domain name in XFF with ICAP on page 2217
- Selective forwarding to ICAP server on page 2222

TCP connection pool for connections to ICAP server

A TCP connection pool can maintain local-out TCP connections to the external ICAP server due to a backend update in FortiOS. TCP connections will not be terminated once data has been exchanged with the ICAP server, but instead are reused in the next ICAP session to maximize efficiency.

For example, consider a scenario where an ICAP profile is used as a UTM profile in an explicit web proxy policy, and a client visits web servers through this proxy policy.

Once the WAD is initialized, when a HTTP request is sent from the client to the server through the FortiGate with an ICAP profile applied to the matched proxy policy, a TCP connection is established between the FortiGate and the ICAP server to exchange data.

When an ICAP session is finished, the TCP connection is kept in the WAD connection pool. When another ICAP session needs to be established, the WAD will check if there are any idle connections available in the connection pool. If an idle connection is available, then it will be reused; otherwise, a new TCP connection is established for the ICAP session. This process can be checked in the WAD debug log.

ICAP configuration example

In this example, the ICAP server performs proprietary content filtering on HTTP and HTTPS requests. If the content filter is unable to process a request, then the request is blocked. Streaming media is not considered by the filter, so it is allowed through and is not processed.

To configure the ICAP setup in the GUI:

1. Add the ICAP server:
   a. Go to *Security Profiles* > *ICAP Servers* and click *Create New*.
   b. In the *Name* field, enter a name for the ICAP server, such as *content-filtration-server4*.
   c. Select the *IP Version*.
   d. In the *IP Address* field, enter the IP address of the ICAP server.
   e. In the *Port* field, enter a new port number if required. The default value is *1344*.

   f. Click *OK*.

The maximum number of concurrent connections to ICAP server can be configured in the CLI (`set max-connections`). The default setting is 100 connections.

2. Create the ICAP profile:
   a. Go to *Security Profiles* > *ICAP* and click *Create New*.
   b. In the *Name* field, enter a name for the ICAP profile, such as *Prop-Content-Filtration*.
   c. Enable *Request Processing* and set the following:
      - *Server*: select the ICAP server (*content-filtration-server4*).
      - *Path*: enter the path to the processing component on the server, such as */proprietary_code/content-filter/*.
      - *On Failure*: select *Error* to block the request. If the message cannot be processed, it will be blocked.
   d. Enable *Response Processing* and set the following:
      - *Server*: select the ICAP server (*content-filtration-server4*).
      - *Path*: enter the path to the processing component on the server, such as */proprietary_code/content-filter/*.
      - *On Failure*: select *Error* to block the request. If the message cannot be processed, it will be blocked.
   e. Enable *Streaming Media Bypass* to not offload streaming media to the ICAP server.

   f. Click *OK*.
3. Add the ICAP profile to a policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set *Inspection Mode* to *Proxy-based*.
   c. Under *Security Profiles*, enable *ICAP* and select the ICAP server.

   d. Configure the other settings as needed.
   e. Click *OK*.

To configure the ICAP setup in the CLI:

1. Add the ICAP server:

```
config icap server
    edit "content-filtration-server4"
        set ip-version 4
        set ip-address 172.16.100.55
        set port 1344
        set max-connections 200
    next
end
```

2. Create the ICAP profile:

```
config icap profile
    edit "Prop-Content-Filtration"
        set request enable
        set response enable
        set streaming-content-bypass enable
        set request-server "content-filtration-server4"
        set response-server "content-filtration-server4"
        set request-failure error
        set response-failure error
        set request-path "/proprietary_code/content-filter/"
        set response-path "/proprietary_code/content-filter/"
        set methods delete get head options post put trace other
    next
end
```

3. Add the ICAP profile to a policy:

```
config firewall policy
    edit 5
        set name "icap_filter3"
        set srcintf "virtual-wan-link"
        set dstintf "virtual-wan-link"
        set srcaddr "FABRIC_DEVICE"
        set dstaddr "FABRIC_DEVICE"
        set dstaddr-negate enable
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "certificate-inspection"
        set icap-profile "Prop-Content-Filtration"
        set logtraffic disable
        set fsso disable
        set nat enable
    next
end
```

ICAP response filtering

ICAP HTTP responses can be forwarded or bypassed based on the HTTP header value and status code.

When configuring the ICAP profile, if `response` is enabled, the `respmod-default-action` option can be configured:

- If `respmod-default-action` is set to `forward`, FortiGate will treat every HTTP response and send ICAP requests to the ICAP server.
- If `respmod-default-action` is set to `bypass`, FortiGate will only send ICAP requests if the HTTP response matches the defined rules, and the rule's action is set to forward.

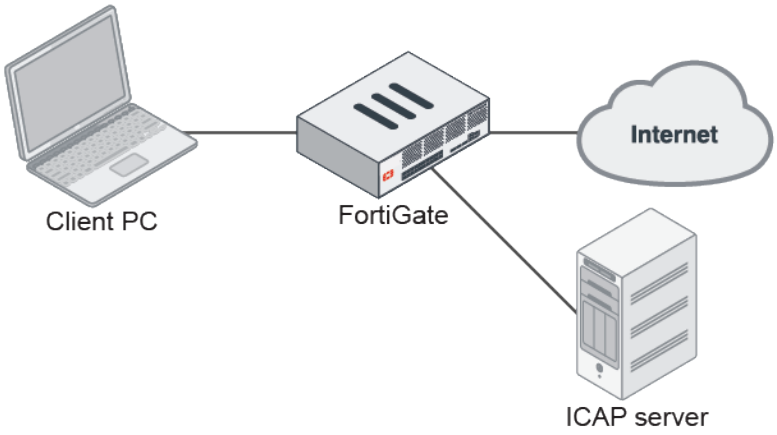
When configuring a response rule:

- The `http-resp-status-code` option is configured to specific HTTP response codes. If the HTTP response has any one of the configured values, then the rule takes effect.
- Multiple header value matching groups can be configured. If the header value matches one of the groups, then the rule takes effect.
- If both status codes and header values are specified in a rule, the response must match at least one of each.

The UTM ICAP log category is used for logging actions when FortiGate encounters errors with the ICAP server, such as no service, unreachable, error response code, or timeout. If an error occurs, a traffic log and an associated UTM ICAP log will be created.

Example

The FortiGate acts as a gateway for the client PC and connects to a reachable ICAP server. The ICAP server can be in NAT, transparent, or proxy mode.



In this example, client request HTTP responses will be forwarded to the ICAP server from all hosts if they have an HTTP status code of 200, 301, or 302, and have `content-type: image/jpeg` in the their header.

To configure an ICAP profile with HTTP response rules:

```
config icap profile
    edit "icap_profile2"
        set request disable
        set response enable
        set streaming-content-bypass disable
        set preview disable
        set response-server "icap_server1"
        set response-failure error
        set response-path ''
        set methods delete get head options post put trace other
        set response-req-hdr disable
        set respmod-default-action bypass
        config respmod-forward-rules
            edit "rule2"
                set host "all"
                set action forward
                set http-resp-status-code 200 301 302
                config header-group
                    edit 2
                        set header-name "content-type"
                        set header "image/jpeg"
                    next
                end
            next
        end
    next
end
```

To view the logs if an error occurs:

1. View the traffic log:

```
# execute log filter category 0
# execute log display
1 logs found.
1 logs returned.

 1: date=2019-10-25 time=17:43:47 logid="0000000013" type="traffic" subtype="forward"
level="notice" vd="vdom1" eventtime=1572050627037314464 tz="-0700" srcip=10.1.100.145
srcport=47968 srcintf="port1" srcintfrole="undefined" dstip=172.16.200.46 dstport=80
dstintf="port2" dstintfrole="undefined" poluuid="a4d5324e-f6c3-51e9-ce2d-f360994fb547"
sessionid=43549 proto=6 action="close" policyid=1 policytype="policy" service="HTTP"
dstcountry="Reserved" srccountry="Reserved" trandisp="snat" transip=172.16.200.1
transport=47968 duration=1 sentbyte=485 rcvdbyte=398 sentpkt=6 rcvdpkt=5 appcat="unscanned"
wanin=478 wanout=165 lanin=165 lanout=165 utmaction="block" counticap=1 crscore=5
craction=262144 crlevel="low" utmref=65532-0
```

2. View the UTM ICAP log:

```
# execute log filter category 20
# execute log display
1 logs found.
1 logs returned.

 1: date=2019-10-25 time=17:43:46 logid="2000060000" type="utm" subtype="icap"
eventtype="icap" level="warning" vd="vdom1" eventtime=1572050626010097145 tz="-0700"
msg="Request blocked due to ICAP server error" service="HTTP" srcip=10.1.100.145
dstip=172.16.200.46 srcport=47968 dstport=80 srcintf="port1" srcintfrole="undefined"
dstintf="port2" dstintfrole="undefined" policyid=1 sessionid=43549 proto=6 action="blocked"
profile="icap_profile1" url="/icap_test/"
```

The logs show that the ICAP services stopped before the access. When the client tried to access HTTP and ICAP took effect, the FortiGate sent the ICAP request to the ICAP server and received an error. The client sees a *502 Bad Gateway* message, and FortiGate writes the two logs. In the GUI, the logged traffic is displayed as *Result: Deny: UTM Blocked*.

Secure ICAP clients

A secure SSL connection from the FortiGate to the ICAP server can be configured as follows:

```
config icap server
    edit <name>
        set secure {enable | disable}
        set ssl-cert <certificate>
    next
end
```

To configure a secure ICAP client:

1. Configure the ICAP server:

```
config icap server
    edit "icap_server1"
        set ip-version 4
        set ip-address 192.168.10.2
        set port 11344
        set max-connections 100
        set secure enable
        set ssl-cert "ACCVRAIZ1"
    next
end
```

Port 11344 is the standard port for secure ICAP. This must be configured manually if the secure connection is enabled.

2. Configure the ICAP profile:

```
config icap profile
    edit "icap_profile1"
        set request enable
        set response enable
        set streaming-content-bypass enable
        set request-server "icap_server1"
        set response-server "icap_server1"
    next
end
```

3. Configure the firewall policy:

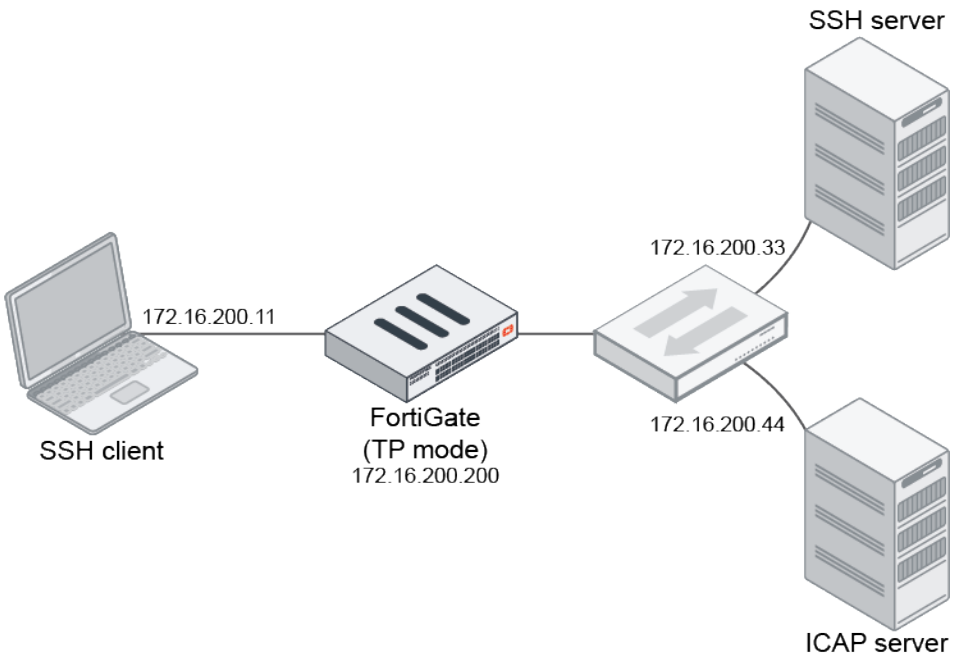
```
config firewall policy
    edit 1
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "protocols"
        set icap-profile "icap_profile1"
    next
end
```

ICAP scanning with SCP and FTP

A FortiGate can forward files transferred by SCP and FTP to an ICAP server for further scanning. Previously, only HTTP and HTTPS were supported for ICAP forwarding.

Example

The FortiGate used in this example is operating in transparent mode. The SSH client, 172.16.200.11, sends a file named `today` to the SSH server at 172.16.200.33 using SCP. Since SCP transfers are encrypted inside an SSH tunnel, for the FortiGate to scan the traffic, deep inspection must be enabled in the SSL SSH profile.



To configure ICAP scanning with SCP:

1. Configure the ICAP server settings:

```
config icap server
    edit "icap_server1"
        set ip-address 172.16.200.44
    next
end
```

2. Configure the ICAP profile for SSH:

```
config icap profile
    edit "icap_profile1"
        set file-transfer ssh
        set file-transfer-server "icap_server1"
        set file-transfer-path "ssh_test"
    next
end
```

If the file transfer is over FTP, configure the profile as follows:

```
config icap profile
    edit "icap_profile1"
        set file-transfer ftp
        set streaming-content-bypass enable
        set file-transfer-server "icap_server1"
        set file-transfer-path "ftp_test"
    next
end
```

3. Configure the SSL SSH profile:

```
config firewall ssl-ssh-profile
    edit "protocols"
        config ssh
            set ports 22
            set status deep-inspection
        end
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "ICAP"
        set srcintf "lan"
        set dstintf "mgmt"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set icap-profile "icap_profile1"
    next
end
```

To test the configuration:

1. On a Linux client, copy a filed named `today` to the SSH server using SCP:

```
scp today fosqa@172.16.200.33:/home/fosqa/ssh_depot/
```

2. Capture a sniffer trace between the FortiGate and ICAP server, then verify the output from the ICAP protocol session.
   a. The client request and the file to be inspected:

```
Icap_client REQMOD:
172.016.200.200.13185-172.016.200.044.01344: REQMOD icap://172.16.200.44:1344/ssh_test
ICAP/1.0
Host: 172.16.200.44:1344
X-Client-IP: 172.16.200.11
X-Server-IP: 172.16.200.33
X-Authenticated-User: TG9jYWw6Ly9hbm9ueW1vdXM=
X-Authenticated-Groups: TG9jYWw6Ly9sb2NhbGhvc3Qvbm8gYXV0aGVudGljYXRpb24=
User-Agent: FortiOS v7.2.0
Encapsulated: req-hdr=0, req-body=116

PUT /scp/today HTTP/1.1
```

```
Host: 172.16.200.11
Content-Type: application/octet-stream
Transfer-Encoding: chunked

1d
Tue Sep 20 04:01:50 UTC 2022
```

Where:

- `X-Client-IP` = the client sending the file
- `X-Server-IP` = the server receiving the file
- `Tue Sep 20 04:01:50 UTC 2022` = the content of the file, which is in clear text after the FortiGate performs deep inspection

b. The ICAP server response that the file is cleared and allowed to pass without modifications:

```
Icap-server reply:
172.016.200.044.01344-172.016.200.200.13185: ICAP/1.0 200 OK
ISTag: "GreasySpoon-1.0.7-b03"
Host: 0.0.0.0:1344
Encapsulated: req-hdr=0, req-body=136
Connection: keep-alive

PUT /scp/today HTTP/1.1
Host: 172.16.200.11
Content-Type: application/octet-stream
Transfer-Encoding: chunked
Content-Length: 29

1d
Tue Sep 20 04:01:50 UTC 2022
```

3. On a Linux client, copy the file from the server locally using SCP:

```
scp fosqa@172.16.200.33:/home/fosqa/ssh_depot/today2/
```

4. Similar outputs are observed. The ICAP client request indicates that the file is copied from the SSH server:

```
PUT /scp/today2 HTTP/1.1
Host: 172.16.200.33
```

Domain name in XFF with ICAP

The FortiGate can forward additional domain-related information to the ICAP server. Once domain information is gathered from an external authentication server (such as LDAP or an FSSO collector agent), FortiOS incorporates this domain information in `WinNT://DOMAIN/Username` format and forwards it to the ICAP server.

Basic ICAP configuration

The ICAP server and profile are configured on the FortiGate. The ICAP profile's header settings uses the `WinNT://$domain/$user` variable for the user information provided by the remote authentication server.

To configure the ICAP settings:

1. Configure the ICAP server:

```
config icap server
    edit "content-filtration-server4"
        set ip-address 10.1.100.41
        set max-connections 200
    next
end
```

2. Configure the ICAP profile:

```
config icap profile
    edit "Prop-Content-Filtration"
        set request enable
        set response enable
        set streaming-content-bypass enable
        set request-server "content-filtration-server4"
        set response-server "content-filtration-server4"
        set request-path "/proprietary_code/content-filter/"
        set response-path "/proprietary_code/content-filter/"
        set methods delete get head options post put trace other
        config icap-headers
            edit 1
                set name "X-Authenticated-User"
                set content "WinNT://$domain/$user"
            next
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 4
        set name "icap_filter3"
        set srcintf "port10"
        set dstintf "port9"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
```

```
        set icap-profile "Prop-Content-Filtration"
        set logtraffic all
        set nat enable
        set groups "ldap group" "AD-group"
    next
end
```

LDAP example

In this example, an AD LDAP server and remote user group are configured. When successful user authentication occurs, FortiOS retrieves all the user information (such as the domain name) from the UserPrincipalName attribute. A packet capture is used to compare the user and domain information before and after authentication in the ICAP REQMOD message.

To configure the LDAP authentication:

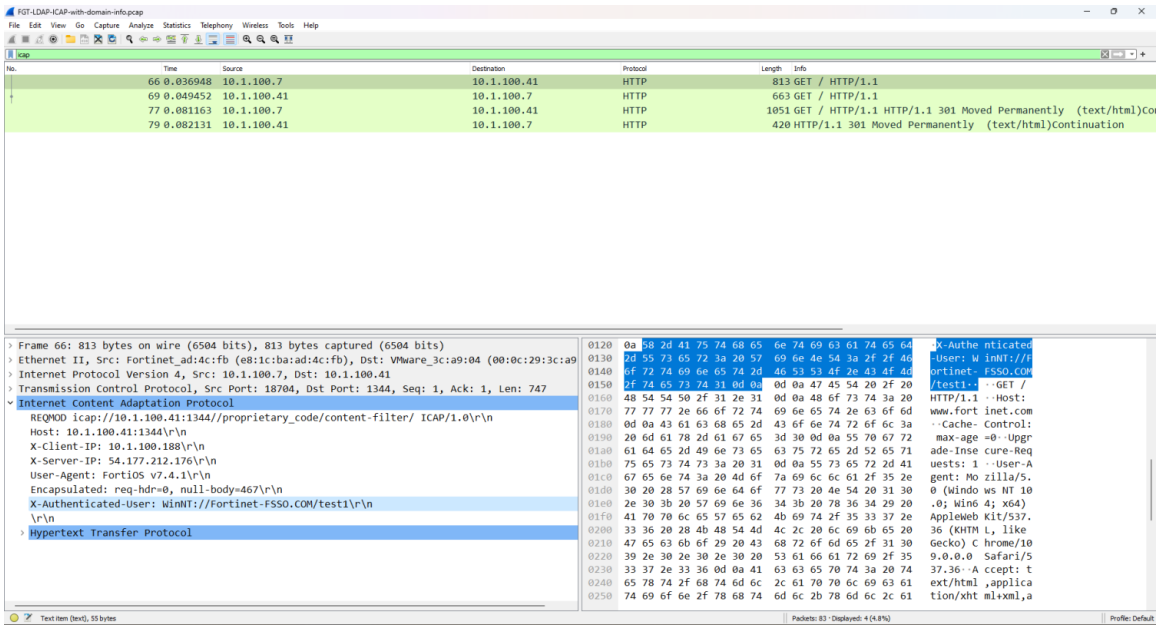
1. Configure the LDAP server:

```
config user ldap
    edit "AD-ldap"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password **********
    next
end
```

2. Configure the LDAP user group:

```
config user group
    edit "ldap group"
        set member "AD-ldap"
        config match
            edit 1
                set server-name "AD-ldap"
                set group-name "CN=group1,OU=Testing,DC=Fortinet-FSSO,DC=COM"
            next
            edit 2
                set server-name "AD-ldap"
                set group-name "CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM"
            next
        end
    next
end
```

3. Start local traffic dump between the FortiGate and ICAP server before a user authenticates and save it in a PCAP file.
4. Verify the PCAP file. The Fortinet-fsso.com domain appears in the ICAP REQMOD message.



5. Optionally, run the following command to verify WAD debugs:

```
# diagnose wad debug enable category icap
```

FSSO example

In this example, a local FSSO agent and remote user group are configured. When successful user authentication occurs, FortiOS retrieves all the user information (such as the domain name). A packet capture is used to compare the user and domain information before and after authentication in the ICAP REQMOD message.

To configure the FSSO authentication:

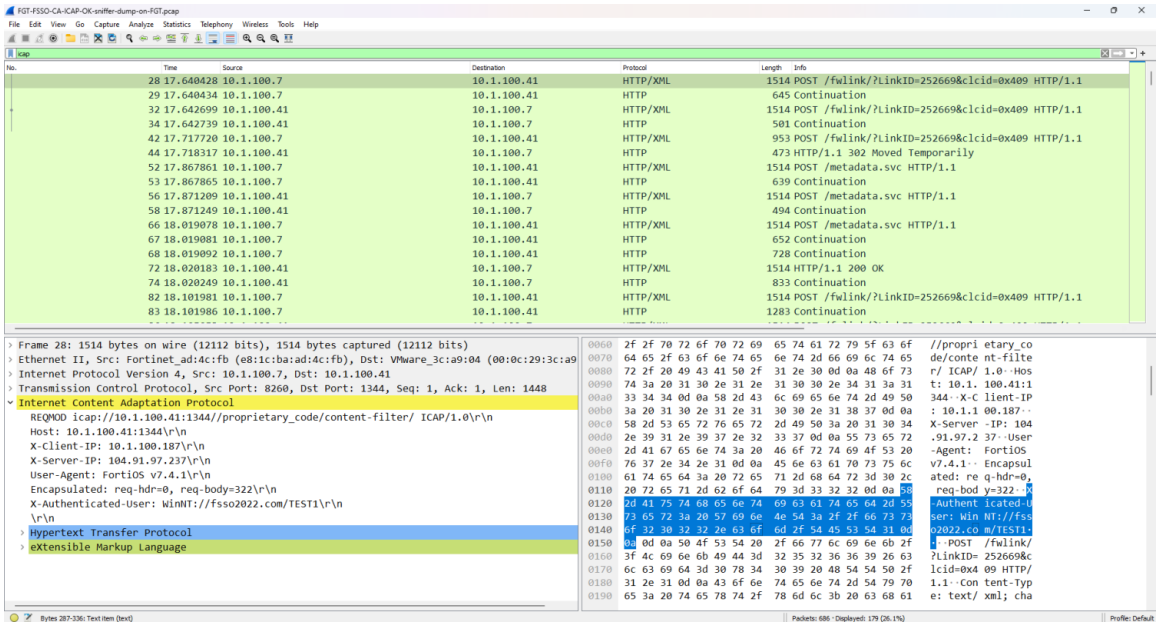
1. Configure the FSSO agent:

```
config user fsso
    edit "AD-fsso"
        set server "10.1.100.199"
        set password **********
    next
end
```

2. Configure the FSSO user group:

```
config user group
    edit "AD-group"
        set group-type fsso-service
        set member "FORTINET-FSSO/GROUP1" "FORTINET-FSSO/GROUP2"
    next
end
```

3. Start local traffic dump between the FortiGate and ICAP server before a user authenticates and save it in a PCAP file.
4. Verify the PCAP file. The fsso2022.com domain appears in the ICAP REQMOD message.



5. Optionally, verify the FSSO log file and search for the `get_dns_domain` lines:

```
...
06/20/2023 14:58:58 [ 1484] FortiGate connection accepted, auth OK.
06/20/2023 14:58:58 [ 1484] FortiGate:FG4H1E5819900343-root connected on socket (2004).

```

Selective forwarding to ICAP server

The ICAP profile can allow the selective forwarding of only image files, such as JPEG, JPG, and PNG, to an ICAP (Internet Content Adaptation Protocol) server for OCR (optical character recognition) scanning. When enabled, FortiGate forwards only image files that are relevant for OCR scanning to the ICAP server. This selective forwarding applies only to image files in HTTP responses; it does not apply to image files in HTTP requests. By reducing processing time and optimizing resource usage, this feature enhances overall system efficiency.

```
config icap profile
    edit <name>
        set ocr-only {enable | disable}
    next
end
```

`set ocr-only {enable | disable}`	Enable/disable only passing OCR scan requests of images files to ICAP server (default = disabled). When enabled, also enable `response` to allow FortiGate to forward images to the ICAP server.

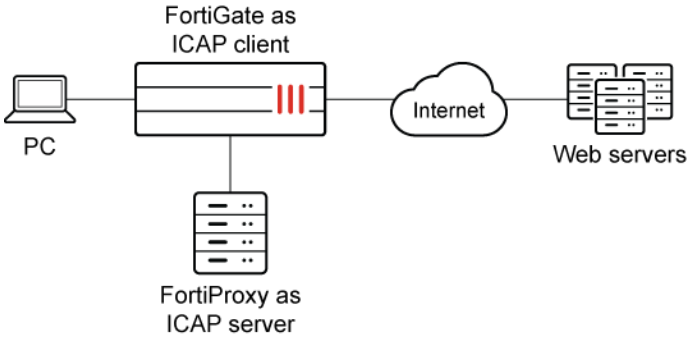
You cannot enable the `ocr-only` and `streaming-content-bypass` options in an ICAP profile at the same time. When `ocr-only` is enabled, the `streaming-content-bypass` option is removed from the CLI.

The ocr-only feature applies only to HTTP. FTP and SCP are not supported. In addition, this feature applies only to HTTP downloads. HTTP uploads are not supported.

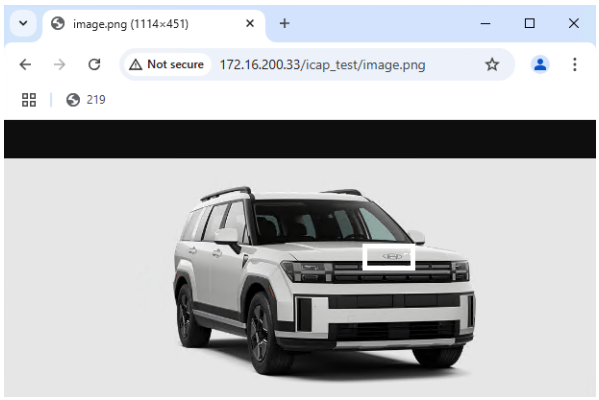
Example

In this example, FortiGate acts as the ICAP client, and FortiProxy acts as the ICAP server. An ICAP profile is configured on FortiGate with *ocr-only* enabled. An ICAP server is configured on FortiProxy with the `icap-service` configured to use an image-analyzer ICAP profile.

When a client HTTP response includes an image that is of interest to OCR, FortiGate forwards only the image file to the ICAP server for OCR scanning, and the scan results determine whether the image is passed or blocked.



When OCR scanning passes the image in the HTTP response, the image is displayed to the client, for example:



When OCR scanning blocks the image in the HTTP response, an alert message is displayed instead of the image:

Only configurations relevant to selective forwarding are described.

To enable selective forwarding on the ICAP client:

1. On FortiGate, enable `ocr-only` in the ICAP profile:
   In this example, `ocr-only` and `response` are enabled. Responses are enabled to allow FortiGate to forward images files to the ICAP server.

```
config icap profile
    edit "ocr"
        set request enable
        set response enable
        set ocr-only enable
        set request-server "icap_server1"
        set response-server "icap_server1"
    next
end
```

To enable image scanning on the ICAP server:

1. On FortiProxy acting as an ICAP server, create an image-analyzer ICAP profile:
   In this example, an image-analyzer profile named default is created.

```
config image-analyzer profile
    edit "default"
        set comment "Analyze image content"
        set alcohol-status allow
        set drugs-status allow
```

```
        set extremism-status allow
        set gambling-status allow
        set gore-status allow
        set porn-status allow
        set swim_underwear-status allow
        set weapons-status allow
        set log-option all
        set blocked-img-cache enable
        set rating-err-action block
        set optical-character-recognition enable
        set ocr-activation-threshold 100
    next
end
```

2. On FortiProxy, configure the ICAP service to use the image-analyzer profile:
   The *icap-service* is configured to use the image-analyzer profile named default.

```
config icap local-server
    edit 1
        set interface "port1"
        set incoming-ip 10.211.255.147
        set srcaddr "all"
        config icap-service
            edit 1
                set name "profile"
                set dlp-profile "default"
                set image-analyzer-profile "default"
            next
        end
    next
end
```

Web application firewall

Web application firewall (WAF) profiles can detect and block known web application attacks. You can configure WAF profiles to use signatures and constraints to examine web traffic. You can also enforce an HTTP method policy, which controls the HTTP method that matches the specified pattern.

You can customize the default profile, or you can create your own profile to apply access rules and HTTP protocol constraints to traffic. You can apply WAF profiles to firewall policies when the inspection mode is set to proxy-based.

WAF signatures are pre-loaded on the FortiGate and do not require a license to use.

Web application firewall profiles cannot be used in NGFW policy-based mode. See NGFW policy on page 1586 for more information.

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 98 for more information.

The following topic provides information about WAF profiles:

- Protecting a server running web applications on page 2225

Protecting a server running web applications

You can use a web application firewall profile to protect a server that is running a web application, such as webmail.

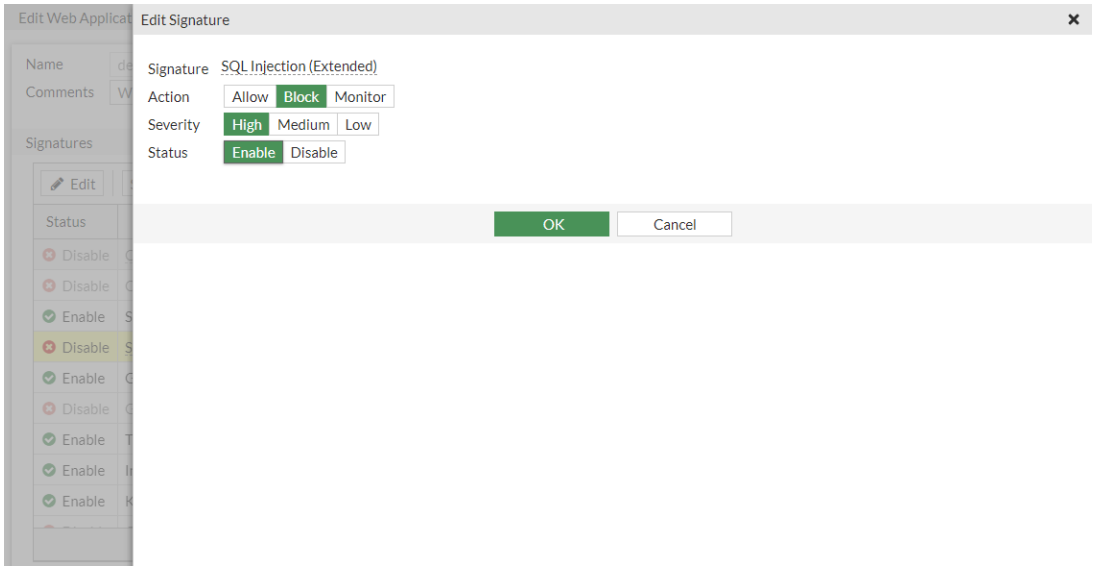
Web application firewall profiles are created with a variety of options called signatures and constraints. Once these options are enabled, the action can be set to allow, monitor, or block. The severity can be set to high, medium, or low.

In the following example, the default profile will be targeted to block SQL injection attempts and generic attacks.

The web application firewall feature is only available when the policy inspection mode is proxy-based.

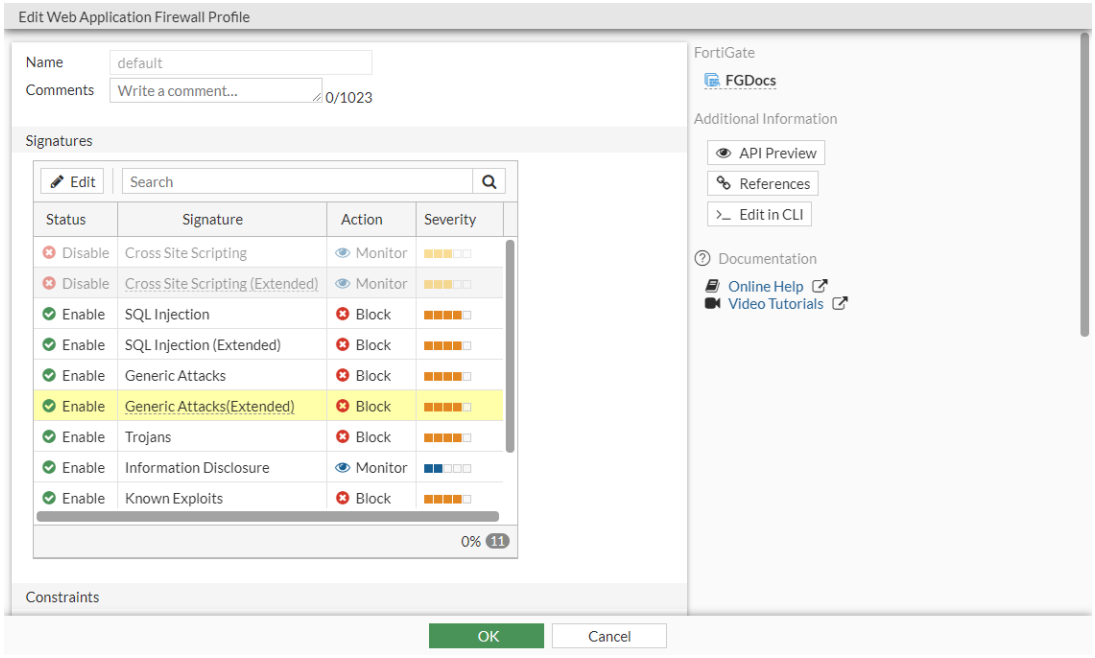
To protect a server running web applications:

1. Enable the web application firewall:
   a. Go to *System* > *Feature Visibility*.
   b. Under *Security Features*, enable *Web Application Firewall*.
   c. Click *Apply*.
2. Edit the default web application firewall profile (*Trojans* and *Known Exploits* are blocked by default):
   a. Go to *Security Profiles* > *Web Application Firewall* and edit the *default* profile signature.
   b. Select *SQL Injection (Extended)* and edit it so that it is enabled, the *Action* is set to *Block*, and the *Severity* is set to *High*.
   c. Click *OK*.



d. Enable *Generic Attacks (Extended)* and edit it so that it is enabled, the *Action* is set to *Block*, and the *Severity* is set to *High*.

e. Click *OK*.



f. Click *OK*.

3. Apply the profile to a security policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and edit the policy that allows access to the web server.
   b. For *Firewall / Network Options*, select the appropriate *Protocol Option*.
   c. For *Security Profiles*, enable *Web Application Firewall* and set it to use the *default* profile.
   d. Set the *SSL Inspection* to use the *deep-inspection* profile.
   e. Configure the other settings as needed.
   f. Click *OK*.
4. Verify that the web application firewall blocks traffic:
   a. Use the following URL to simulate an attack on your web server and substitute the IP address of your server: `http://<server IP>/index.php?username=1'%20or%20'1'%20=%20'1&password=1'%20or%20'1'%20=%20'1`
   An error message appears, stating that the web application firewall has blocked the traffic:

Using FortiWeb for protection

Another way of protecting web applications is to forward HTTP traffic to a FortiWeb for scanning and inspection. A typical use case is to use a one-arm topology with FortiWeb running in reverse proxy mode to scan traffic before accessing the webpage on the web servers. See Planning the network topology in the FortiWeb Administration Guide for more information.

Data loss prevention

The FortiGate data loss prevention (DLP) system prevents sensitive data from leaving or entering your network by scanning for various patterns while inspecting traffic passing through the FortiGate. Data that matches defined sensitive data patterns is blocked, logged, allowed, or quarantined when it passes through the FortiGate.

The DLP system is configured based on the following components:

Component	Description
Data type	Define the type of pattern that DLP is trying to match. For example, this can be a predefined type such as keyword, regex, hex, credit card, US social security number (SSN), or other patterns. You can also create custom data types.
Dictionary	A collection of data type entries. When selecting a data type such as keyword, regex or hex, define the pattern that you are looking for.
EDM template	An exact data match (EDM) template pairs the data from an external file, such as a data external feed file, with built-in FortiGate data types. The EDM template can link to a file on an external server to support dynamic updates, or the file can be uploaded to the EDM template.
Sensor	Define which dictionaries and/or EDM templates to check. Sensors can consist of dictionaries and EDM templates. You can match any dictionary or EDM template, all dictionaries and/or EDM templates, or a special logical combination of the dictionaries and/or EDM templates. Sensors can also count the number of matches to trigger the sensor.
File pattern	Define groups of file patterns based on predefined file types, or define your own pattern to match the file name.
DLP profile	Define rules for matching a sensor based on a file type or a message, and the type of protocol being used. It also allows you to choose the action to allow, log, block, or quarantine the address.

A DLP profile selects one or more sensors, and applies the sensor's pattern matching against the file type or message that is passing through selected protocols. The profile can be applied to a firewall policy where the traffic will be inspected.

In the backend, DLP uses Hyperscan to perform a one-parse algorithm for scanning multiple patterns. This allows DLP to scale up without any performance downgrade.

The FortiGuard Data Loss Prevention service enables the identification, monitoring, and protection of an organization's data through data breaches, insider threats, and data exfiltration. It uses a customizable database of more than 500 predefined data patterns and policies to simplify and expedite DLP deployment and integration into existing environments (see FortiGuard DLP service on page 2243 for more information).

Protocol comparison between DLP inspection modes

The following table indicates which protocols can be inspected by DLP based on the specified inspection modes.

	HTTP	FTP	IMAP	POP3	SMTP	NNTP	MAPI	CIFS	SFTP/SCP
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	No

DLP can be configured in both the CLI and the GUI irrespective or firewall policy inspection mode.

To use DLP profiles in a flow-based firewall policy, `set feature-set flow` must be set from the CLI. See Configuring DLP from the CLI on page 2233 for more information.

DLP profiles can only be added to a flow-based firewall policy from the CLI.

Archiving

DLP can archive some or all of the content that passes through the DLP system. There are two forms of DLP archiving.

- Summary only: a summary of all the activity detected by the profile is recorded. For example, when an email message is detected, the sender, recipient, message subject, and total size are recorded. When a user accesses a web browser, every URL that they visit is recorded.
- Full: detailed records of all the activity detected by the profile is recorded. For example, when an email message is detected, the message itself, including any attachments, is recorded. When a user accesses a web browser, every page that they visit is archived.

You can configure the type of archiving per protocol.

Logging and blocking files by file name

Sometimes, file names are not accurately recorded in DLP logs, even though the files are blocked correctly based on the DLP profile. This is particularly apparent on cloud-based services, such as Google Drive or SharePoint.

For HTTP file uploads, some cloud services use proprietary encodings and APIs to transfer files and exchange metadata, instead of standard HTTP mechanisms, requiring custom handling of the proprietary API. If a cloud service changes the API without notice, the custom handling becomes outdated and file names might not be logged properly. Due to this, special consideration must be taken when using DLP to block files by file pattern. To block a specific file type, it is better to block by file type, and not by file name pattern.

The following topics provide information about DLP:

- DLP techniques on page 2229
- Basic DLP settings on page 2230
- Advanced DLP configurations on page 2235

- DLP fingerprinting on page 2238
- FortiGuard DLP service on page 2243
- Sensitivity labels on page 2247
- Exact data matching on page 2251
- DLP examples on page 2258

DLP techniques

The security of sensitive data is a top priority for organizations. A range of techniques and tools are used to maintain the confidentiality and accessibility of data.

The following table describes some of the industry standard techniques that are used for data loss protection, and if they can be configured in the GUI or CLI.

Technique	Description	GUI	CLI
Indexed Document Matching (IDM)	IDM creates unique fingerprints for your organization's crucial documents that hold sensitive information. This process involves analyzing the content of these documents and generating a checksum for each one. See DLP fingerprinting on page 2238 for more information.		✓
Exact Data Matching (EDM)	EDM identifies particular data values within an indexed data source that require safeguarding. See Exact data matching on page 2251 for more information.	✓	✓
Described Content Matching (DCM)	DCM scans through data to identify the presence of specific patterns using regular expressions (Regex). See Built-in DLP data type on page 2236 for more information.	✓	✓
Optical Character Recognition (OCR)	OCR scans and analyzes the content embedded within images for sensitive information, extending data protection to image-based content.		
Predefined data patterns	Default DLP patterns that classify private and confidential data that should be regulated in accordance with regulatory compliance requirements. See Built-in DLP data type on page 2236 for more information.	✓	✓
Custom data classification tags (data pattern)	FortiGate allows you to create patterns for your custom data type. See Custom DLP data type on page 2236 for more information.	✓	✓
True file type filtering	Identify a file by the data type in its meta data. See DLP file pattern on page 2238 for more information.	✓	✓
File size filtering	Identify a file based on its size. See Block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB on page 2267 for an example.		✓

Technique	Description	GUI	CLI
Microsoft Purview sensitivity labels	Sensitivity labels provide a mechanism to categorize and safeguard your data. They function as identifiers and highlight the significance of the data that they are attached to. See Sensitivity labels on page 2247 for more information.	✓	✓
FortiGuard DLP service	A database of predefined DLP patterns, such as data types, dictionaries, and sensors, that are dynamically managed by FortiGuard. A valid DLP license is required. See FortiGuard DLP service on page 2243 for more information.	✓	✓

Basic DLP settings

DLP settings can be configured for data types, dictionaries, EDM templates, sensors, file patterns, and profiles. DLP can be configured in both the CLI and the GUI irrespective of firewall policy inspection mode.

To use DLP profile in a flow-based firewall policy, `set feature-set flow` must be set from the CLI. See Configuring DLP from the CLI on page 2233 for more information.

DLP profiles can only be added to a flow-based firewall policy from the CLI.

On the *Security Profiles* > *Data Loss Prevention* page, there are *Profile*, *Sensor*, *Dictionary*, and *EDM Template* tabs to configure those DLP settings. DLP profiles can be added to proxy-based firewall policies and proxy policies from the GUI.

If *Data Loss Prevention* is not visible in the tree menu, go to *System* > *Feature Visibility* and enable it.

This section breaks down the DLP configuration into a sequence of steps:

1. Configure the DLP dictionary and/or EDM template:
   - A DLP dictionary is a collection of data type entries. See Built-in DLP data type on page 2236 for more information.
   - An EDM template pairs the data from an external file, such as a data external feed file, with built-in data types.
2. Configure the DLP sensor:
   - A DLP sensor defines which dictionary and/or EDM template to check. It counts the number of matches to trigger the sensor.
3. Configure the DLP profile:
   - A DLP profile allows for filtering by size and file type. See DLP file pattern on page 2238 for custom file type.
4. Add the DLP profile to a firewall policy.

All the steps mentioned above should be configured in the exact order given for ease of configuration.

Configuring DLP from the GUI

Use the following steps to configure DLP from the GUI.

To configure a DLP dictionary:

1. Go to *Security Profiles* > *Data Loss Prevention*.
2. Select the *Dictionary* tab and click *Create New*.
3. Enter a name.
4. In the *Dictionary Entries* section, click *Create New*.
5. Set the *Type* and click *OK*.
6. Click *OK* to save the dictionary.

To configure an EDM template:

1. Go to *Security Profiles* > *Data Loss Prevention*.
2. Select the *EDM Template* tab and click *Create New*.
3. Enter a name.
4. In the *Resource settings* section, select one of the following:

File upload	Select to upload an external file of data to use with built-in data types. The external file can be in text (TXT) or comma-separated value (CSV) format.
External feed	Select to provide the URL to a file of data on an external server to use with built-in data types. The external file must be in comma-separated value (CSV) format. FortiGate will periodically fetch entries from the external file using HTTPS.
External feed URL	Specify the URL to the data file in CSV format on the external server.
HTTP basic authentication	Enable to use basic HTTP authentication when accessing the file on the external server. Specify the username and password for the external server.
Refresh rate	Specify the time interval to refresh the external resource (minutes).

5. Set the *Match criteria* section:
   Each column in the external file represents data for a built-in data type. The patterns in the data file must be valid for the data type. If the patterns are invalid, FortiGate cannot use them, and no warning is displayed.

+All of these fields	Click to pair each column in the external data file with a built-in data type. All of the specified data in this section must match for FortiGate to take an action.
Column index	Specify the column number in the external file that contains the data.
Column data type	Indicate which built-in data type pairs with the column index. Choose from: • credit-card

	• edm-keyword • mip-label • ssn-us
+Any of these fields	Click to pair the column in the external data file with a built-in data type, and to specify how many of these pairs must match for FortiGate to take an action.
Minimum number of fields matched	Specify how many of the fields in the *Any of these fields* section must match for FortiGate to take an action.
Column index	Specify the column number in the external file that contains the data.
Column data type	Indicate which built-in data type pairs with the column index. Choose from: • credit-card • edm-keyword • mip-label • ssn-us • fg-edm-can-natl_id-sin The data type *fg-edm-can-natl_id-sin*, which represents the Canadian Social Insurance Number (SIN), is dynamically managed by FortiGuard. It is available for use as one of the data types in EDM templates, provided the user has a valid FortiGuard DLP service license.

6. Click *OK* to save the EDM template.

To configure a DLP sensor:

1. Go to *Security Profiles* > *Data Loss Prevention*.
2. Select the *Sensor* tab and click *Create New*.
3. Enter a name.
4. In the *Sensors Entries* section, click *Add*. The *Select Entries* pane is displayed.
5. Select the management method from the dropdown menu.
6. From the list, select the dictionary or EDM template.
7. Click *Apply*.
8. Click *OK* to save the sensor.

To configure a DLP profile:

1. Go to *Security Profiles* > *Data Loss Prevention*.
2. Select the *Profile* tab and click *Create New*.
3. Enter a name.
4. In the *Rules* section, click *Create New*.
5. Configure the following settings:

Name	Filter name.
Data source type	Specify what type of data source to use: • *Sensor*: Use DLP sensors, such as dictionaries or EDM templates to match content. • *MIP label*: Use MIP label dictionaries to match content.
Sensors	Select DLP sensors or MIP labels: • *Sensor*: Select one or more DLP sensors when *Data source type* is set to *Sensor*. • *MIP label*: Select one or more MIP label dictionaries when *Data source type* is set to *MIP label*.
Severity	Select the severity or threat level that matches this filter.
Action	Action to take with content that this DLP profile matches.
Match type	Select whether to check the content of messages (an email message) or files (downloaded files or email attachments).
File type	Select the number of a DLP file pattern table to match.
Protocol	Check messages or files over one or more of these protocols.

6. Click *OK*.
7. Click *OK* to save the profile.

To add the DLP profile to a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Set the *Inspection Mode* to *Proxy-based*.
4. In the *Security Profiles* section, enable *DLP Profile* and select the desired profile.
5. Configure the other settings as needed.
6. Click *OK*.

Configuring DLP from the CLI

Use the following steps to configure DLP from the CLI.

To configure a DLP dictionary:

```
config dlp dictionary
    edit <name>
        config entries
            edit 1
                set type {credit-card | hex | keyword | mip-label | regex | ssn-us}
                set pattern <string>
                set repeat {enable | disable}
                set status {enable | disable}
```

```
            next
        end
    next
end
```

To configure an EDM template:

When configuring an EDM template from the CLI, you must link to a data file in CSV format on an external server; you cannot upload the data file to FortiGate.

1. Add the URL for the data external feed file to FortiGate.

```
config system external-resource
    edit <name>
        set type data
        set resource <URL to resource file on external server>
        end
    next
end
```

2. Configure the EDM template.

```
config dlp exact-data-match
    edit <name>
        set optional <number of optional columns that must match>
        set data <name of external resource file>
        config columns
            edit <column index number>
                set type {credit-card | edm-keyword | mip-label | ssn-us | fg-edm-can-natl_id-
sin}
            next
        end
    next
end
```

The data type `fg-edm-can-natl_id-sin`, which represents the Canadian Social Insurance Number (SIN), is dynamically managed by FortiGuard. It is available for use as one of the data types in EDM templates, provided the user has a valid FortiGuard DLP service license.

To configure a DLP sensor:

```
config dlp sensor
    edit <name>
        set match-type {match-all | match-any | match-eval}
        set eval <string>
        config entries
            edit <id>
                set dictionary <dlp dictionary or EDM template>
                set count <integer>
                set status {enable | disable}
```

```
            next
        end
    next
end
```

See Evaluation by logical relationship on page 2238 for more information about `match-eval`.

To configure a DLP profile:

```
config dlp profile
    edit <name>
        set feature-set {flow | proxy}
        config rule
            edit <id>
                set proto <protocol> <protocol> ...
                set sensor <dlp_sensor>
                set action {allow | log-only | block | quarantine-ip}
            next
        end
    next
end
```

To add the DLP profile to a firewall policy:

```
config firewall policy
    edit <id>
        set srcintf <interface>
        set dstintf <interface>
        set action accept
        set srcaddr <address>
        set dstaddr <address>
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set dlp-profile <string>
    next
end
```

See DLP examples on page 2258 for sample configurations.

Advanced DLP configurations

The following topic provides information on advanced DLP configurations.

Built-in DLP data type

Built-in DLP data type includes predefined data types to match for keyword, regex, hex, mip label, credit card, and social security number (SSN). See Predefined data patterns on page 2229 for more information. The built-in DLP data type regex employs DCM to detect patterns. See Described Content Matching (DCM) on page 2229 for more information.

```
config dlp data-type
    edit "keyword"
        set pattern "built-in"
    next
    edit "regex"
        set pattern "built-in"
    next
    edit "hex"
        set pattern "built-in"
    next
    edit "mip-label"
        set pattern "^[[:xdigit:]]{8}-[[:xdigit:]]{4}-[[:xdigit:]]{4}-[[:xdigit:]]{4}-[[:xdigit:]]
{12}$"
        set transform "built-in"
    next
    edit "credit-card"
        set pattern "\\b([2-6]{1}\\d{3})[- ]?(\\d{4})[- ]?(\\d{2})[- ]?(\\d{2})[- ]?(\\d{2,4})\\b"
        set verify "built-in"
        set look-back 20
        set transform "\\b\\1[- ]?\\2[- ]?\\3[- ]?\\4[- ]?\\5\\b"
    next
    edit "ssn-us"
        set pattern "\\b(\\d{3})-(\\d{2})-(\\d{4})\\b"
        set verify "(?<!-)\\b(?!666|000|9\\d{2})\\d{3}-(?!00)\\d{2}-(?!0{4})\\d{4}\\b(?!-)"
        set look-back 12
        set transform "\\b\\1-\\2-\\3\\b"
    next
end
```

Custom DLP data type

Custom data types can be added. See Custom data classification tags (data pattern) on page 2229 for more information.

Custom DLP data type allows for both the proximity keyword check and data validation check within the same data type. The data type simultaneously supports two verification checks and one proximity match check to significantly lower the occurrence of false positives, enhancing the precision and dependability of the search.

To configure a custom DLP data type used by DLP scans:

```
config dlp data-type
    edit <name>
        set verify <string>
```

```
        set verify2 <string>
        set look-ahead <integer>
        set look-back <integer>
        set match-around <string>
        set match-ahead <integer>
        set match-back <integer>
        set pattern <string>
    next
end
```

<name>	The name of the table containing the data type.
pattern <string>	Specify the regular expression pattern string without look around
verify <string>	Specify the regular expression pattern string used to verify the data type.
verify2 <string>	Specify the extra regular expression pattern string used to verify the data type.
look-ahead <integer>	Specify the number of character to obtain in advance for verification (1 - 255, default = 1).
look-back <integer>	Specify the number of characters required to save for verification (1 - 255, default = 1).
match-around <string>	Dictionary to check whether it has a match around (only support match-any and basic types, no repeat supported).
match-back <integer>	Specify the number of characters in front for match-around (1 - 4096, default = 1).
match-ahead <integer>	Specify the number of characters behind for match-around (1 - 4096, default = 1).

The `set pattern` command can be used to define a regular expression for use with Hyperscan. However, Hyperscan does not fully support Perl Compatible Regular Expressions (PCRE), such as `look-ahead` and `look-behind`. To use advanced features supported by PCRE, you can use the `set verify` or `set verify2` commands.

To use "?" in a regex pattern, see CLI basics on page 62. This method only supports direct console connection and SSH. It does not support the CLI console in the GUI.

See Proximity search on page 2280 for a sample configuration.

DLP file pattern

A DLP file pattern can block, allow, log, or quarantine a file based on the specified file type in the file filter list (see Supported file types on page 2153). It employs True file type filtering to identify a file. See True file type filtering on page 2229 for more information.

To configure a DLP file pattern:

```
config dlp filepattern
    edit <id>
        set name <name>
        config entries
            edit <name>
                set filter-type {type | pattern}
                set file-type <file_type>
            next
        end
    next
end
```

Evaluation by logical relationship

Evaluation by logical relationship is a powerful tool used to combine multiple dictionary entries to define an accurate DLP sensor using logical expression.

Syntax examples:

1. `set eval "dict(1) == 2"`
   Match DLP sensor only when dictionary one match count is two.
2. `set eval "(dict(1) + dict(2)) == 3"`
   Match DLP sensor only when dictionary one and dictionary two combined match count is three.
3. `set eval "(dict(1) == 2) && (dict(2) == 1)"`
   Match DLP sensor only when dictionary one match count is equal to two and dictionary two match count is equal to one.
4. `set eval "(dict(1) == 2) || (dict(2) == 1)"`
   Match DLP sensor only when dictionary one match count is equal to two or dictionary two match count is equal to one.
5. `set eval "dict(1) > dict(2)"`
   Match DLP sensor only when dictionary one match count is greater than dictionary two match count.

See Block HTTPS upload traffic that includes Visa or Mastercard information using evaluation through logical expression on page 2268.

DLP fingerprinting

DLP fingerprinting employs Indexed Document Matching (IDM) to detect sensitive data. See Indexed Document Matching (IDM) on page 2229 for more information. The file that the DLP profile filters is uploaded and the FortiGate generates and stores a checksum fingerprint. The FortiGate generates a fingerprint for all the files

that are detected in network traffic, and compares all the checksums stored in its database. If a match is found, the configured action is taken. Any type of file can be detected by DLP fingerprinting, and fingerprints can be saved for each revision of a file as it is updated.

Using fingerprinting requires:

1. Creating a DLP fingerprint database by allowing the FortiGate to access a file server containing files from which to create fingerprints.
2. Adding fingerprinting filters to DLP profiles.
3. Adding the profiles to firewall policies that accept traffic that the fingerprinting will be applied on.

See Fingerprinting example on page 2240 for a sample configuration.

The document fingerprint feature requires a FortiGate that has internal storage.

To configure a DLP fingerprint document:

```
config dlp fp-doc-source
    edit <name>
        set server <string>
        set username <string>
        set password <password>
        set file-path <string>
        set sensitivity <Critical | Private | Warning>
    next
end
```

Command	Description
`server <string>`	Enter the IPv4 or IPv6 address of the file server.
`username <string>`	Enter the user name required to log into the file server.
`password <password>`	Enter the password required to log into the file server.
`file-path <string>`	Enter the path on the server to the fingerprint files.
`sensitivity <Critical | Private | Warning>`	Set the sensitivity or threat level for matches with this fingerprint database.

See config dlp fp-doc-source in the FortiOS CLI Reference for a comprehensive list of commands and supported FortiGate models.

A file server is required for the user to upload files. Each uploaded file will have a fingerprint generated by FortiGate, and will be stored locally as a checksum. Currently, only servers that are using the Samba (SMB) protocol are compatible.

To configure a DLP fingerprint profile:

```
config dlp profile
    edit <name>
        set feature-set proxy
        config rule
            edit <id>
                set proto {smtp | pop3 | imap | http-get | http-post | ftp | nntp | mapi | ssh |
cifs}
                set filter-by fingerprint
                set sensitivity {Critical | Private | Warning}
                set match-percentage <integer>
                set action {allow | log-only | block | quarantine-ip}
            next
        end
    next
end
```

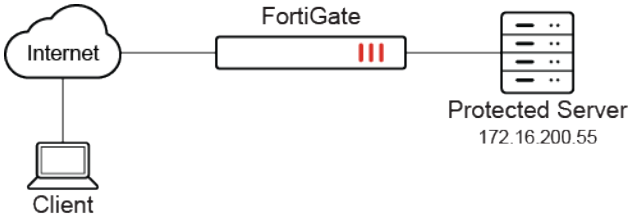
Command	Description
`proto {smtp | pop3 | imap | http-get | http-post | ftp | nntp | mapi | ssh | cifs}`	Set the protocol to inspect.
`filter-by fingerprint`	Set to match against a fingerprint sensitivity.
`sensitivity {Critical | Private | Warning}`	Set the DLP file pattern sensitivity to match.
`match-percentage <integer>`	Set the percentage of the checksum required to match before the profile is triggered.
`action {allow | log-only | block | quarantine-ip}`	Set the action to take with content that matches the DLP profile.

Fingerprinting example

This configuration will block HTTPS download traffic that matches the checksums that are stored in the FortiGate fingerprint database.

When utilizing commonly-used SSL-encrypted protocols, such as HTTPS, SMTPS, POP3S, IMAPS, and FTPS, SSL inspection must be set to Deep Inspection. See Deep inspection on page 2310 for more information.

The client machine must also have the corresponding deep inspection Certificate Authority (CA) certificate installed.



In this example, a text document with sensitive data is being downloaded by the client using the HTTP GET method. The term *Protected Server* refers to the Samba file server that stores the fingerprint files. It is assumed that you already have a configured Samba file server.

The FortiGate intercepts the traffic using deep inspection and blocks the traffic as it matches the DLP profile configured on this FortiGate. See Sample log on page 2243 for a log sample.

To block network traffic that matches the checksums stored in the FortiGate fingerprint database:

1. Configure the DLP fingerprint database:

```
config dlp fp-doc-source
    edit "test"
        set server "172.16.200.55"
        set username "kiki"
        set password *****
        set file-path "/sambashare/upload/"
        set sensitivity "Critical"
    next
end
```

   This step can only be configured in the CLI.

2. Configure the DLP profile:

```
config dlp profile
    edit "fingerprint"
        set feature-set proxy
        config rule
            edit 1
                set proto http-get
                set filter-by fingerprint
                set sensitivity "Critical"
                set action block
            next
        end
    next
end
```

   DLP profiles that filter by fingerprint can only be configured in the CLI.

3. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
```

```
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "fingerprint"
        set nat enable
    next
end
```

This can also be configured in the GUI. See To add the DLP profile to a firewall policy.

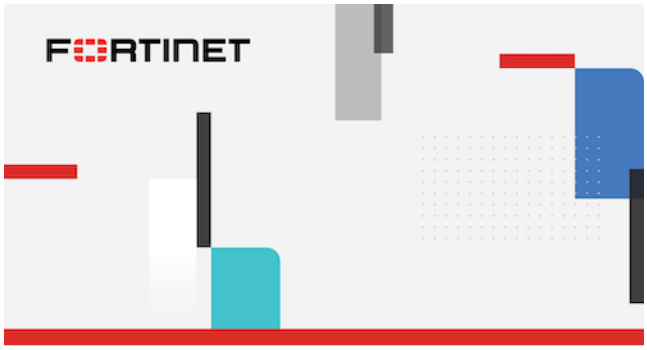
To verify the results:

1. Verify that the DLP fingerprint database is present on the FortiGate:

```
# diagnose test application dlpfingerprint 3
File DB:
---------------------------------------
id,     filename,       vdom,   archive,        deleted,        scanTime,       docSourceSrvr,
 sensitivity,    chunkCnt,       reviseCnt,
1,      /sambashare/upload/testdlp,     root,   0,      0,      1706727347,     test,   2,
 1,      0,
2,      /sambashare/upload/testdlp.txt, root,   0,      0,      1706728230,     test,   2,
 1,      0,
```

2. Verify HTTP GET traffic that matches the checksums stored in the FortiGate fingerprint database is being blocked:

   A download attempt of a text file from a Windows device was made using Chrome browser. This text file is located on the protected server and its fingerprint is saved in the FortiGate fingerprint database.



Attention

The transfer attempt has been blocked because it appears to match a data loss prevention profile.

URL https://172.16.200.55/testdlp.txt

   The download was unsuccessful, leading to the creation of a sample log. See Sample log on page 2243.

Sample log

To view the sample log:

1. Go to *Log & Report* > *Security Events* and select *AntiVirus*.
2. View the log details in the GUI, or download the log file:

```
1: date=2024-02-01 time=08:47:25 eventtime=1706734045777192462 tz="+1200" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1
dlpextra="Critical" filtertype="fingerprint" filtercat="file" severity="medium" policyid=1
poluuid="f4fe48a4-938c-51ee-8856-3e84e3b24af4" policytype="policy" sessionid=308873
epoch=813849496 eventid=0 srcip=13.13.13.13 srcport=51058 srccountry="United States"
srcintf="port2" srcintfrole="undefined" srcuuid="d2f06fda-15e7-51ee-0d22-faaf5170dad2"
dstip=172.16.200.55 dstport=443 dstcountry="Reserved" dstintf="port1" dstintfrole="undefined"
dstuuid="d2f06fda-15e7-51ee-0d22-faaf5170dad2" proto=6 service="HTTPS" filetype="unknown"
direction="incoming" action="block" hostname="172.16.200.55"
url="https://172.16.200.55/testdlp.txt" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64)
AppleWebKit/537.36 (KHTML, like Gecko) Chrome/121.0.0.0 Safari/537.36 Edg/121.0.0.0"
httpmethod="GET" filename="testdlp.txt" filesize=20 profile="fingerprint"
```

FortiGuard DLP service

The FortiGuard DLP service offers a database of predefined DLP patterns such as data types, dictionaries, and sensors. Example include:

- Drivers licenses for various countries, various states in the USA, and various provinces in Canada
- Tax numbers for various countries
- Credit card numbers
- Bank statements

When enabled, the DLP database (DLDB) is downloaded to the FortiGate and its predefined patterns can be configured in DLP profiles.

To configure DLP database updates:

```
config system fortiguard
    set update-dldb {enable | disable}
end
```

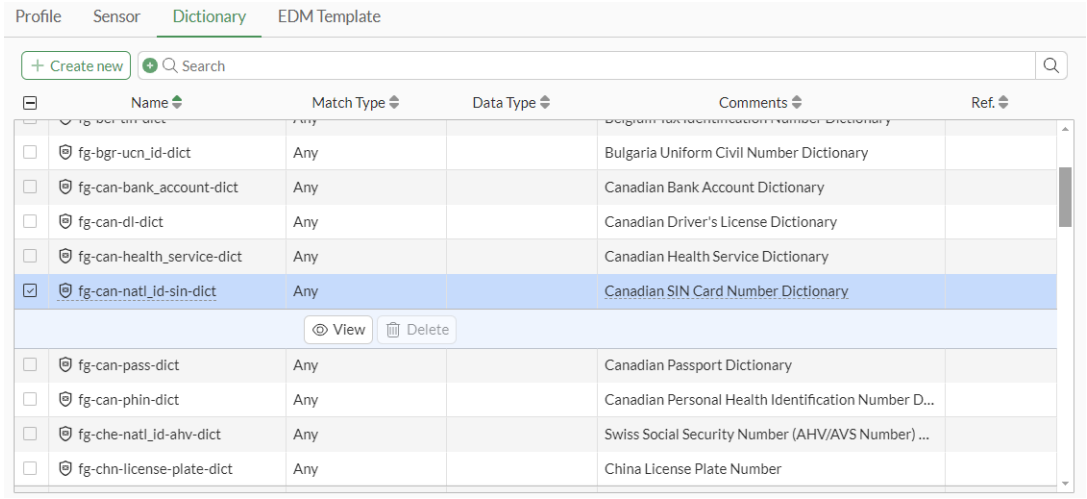
To verify the database signature status:

```
# diagnose autoupdate versions
...
DLP Signature
---------
Version: 1.00010 signed
Contract Expiry Date: n/a
Last Updated using manual update on Fri Jan 27 15:25:00 2023
```

```
Last Update Attempt: Mon Jan 30 15:18:39 2023
Result: No Updates
```

Example

In this example, the administrator wants to look for data leakage of Canadian social insurance number (SIN) information and block this traffic. A DLP profile is created that uses the predefined dictionary, *fg-can-natl_id-sin-dict*, to check for Canadian Social Insurance Numbers (SINs).

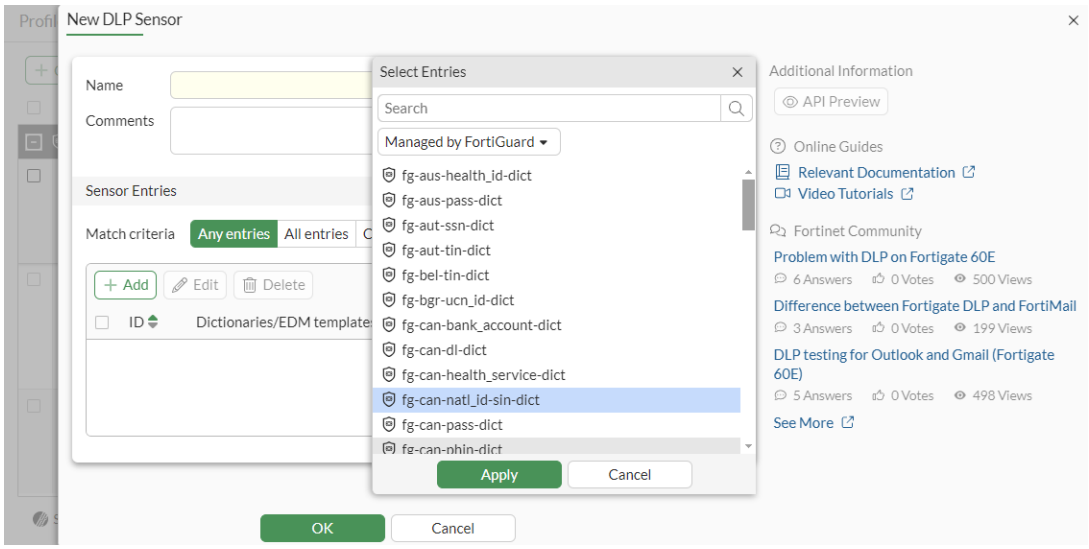


To verify that the Canadian SIN data type is added to the list of predefined data types:

```
show dlp data-type
config dlp data-type
    ...
    edit "fg-can-natl_id-proximity"
        set pattern "fortiguard dlp signature"
    next
end
```

To configure the DLP profile in the GUI:

1. Configure the DLP sensor using the predefined dictionary from FortiGuard:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Sensor* tab, and click *Create New*.
   b. Enter a name (*sin*).
   c. In the *Sensor Entries* section, click *Add*. The *Select Entries* pane is displayed.
   d. Select *Managed by FortiGuard* from the dropdown menu.
   e. Select *fg-can-natl_id-sin-dict* and click *Apply*.



f. Click *OK* to save the sensor.

2. Configure the DLP profile:

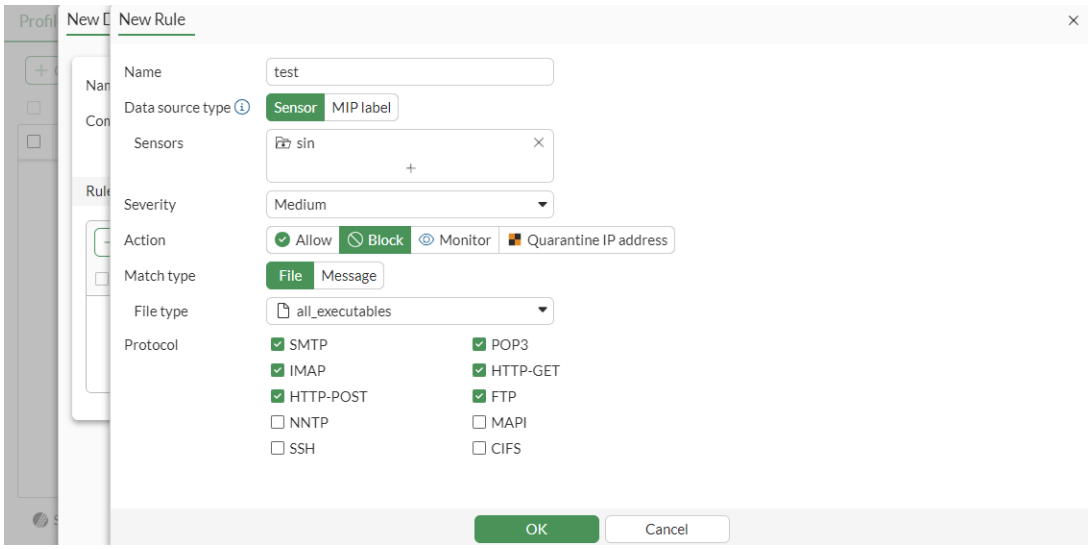
a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Profile* tab, and click *Create New*.

b. Enter a name (*test*).

c. In the *Rules* section, click *Create New*.

d. Configure the following settings:

Name	*test*
Sensors	*sin*
Severity	*Medium*
Action	*Block*
Type	*File*
File type	*all_executables*
Protocol	*SMTP*, *POP3*, *IMAP*, *HTTP-GET*, *HTTP-POST*, *FTP*



e. Click *OK*.

f. Click *OK* to save the profile.

To configure the DLP profile in the CLI:

1. Configure the DLP sensor using the predefined dictionary from FortiGuard:

```
config dlp sensor
    edit "sin"
        config entries
            edit 1
                set dictionary "fg-can-natl_id-sin-dict"
            next
        end
    next
end
```

2. Configure the DLP profile:

```
config dlp profile
    edit "test"
        set feature-set proxy
        config rule
            edit 1
                set name "test"
                set proto smtp pop3 imap http-get http-post ftp
                set filter-by sensor
                set file-type 2
                set sensor "sin"
                set action block
            next
        end
    next
end
```

Sensitivity labels

In order to safeguard your organization's data, labels can be employed as markers for sensitive information. Microsoft provides sensitivity labels, which act as identifiers emphasizing the importance of the data they're associated with, thereby enhancing the security measures in place. See Protect your sensitive data with Microsoft Purview (formerly MIP) for more information.

Any data traffic that includes a sensitivity label can be effectively managed using FortiGate. This is made possible through the utilization of a predefined data type, *mip-label*, specifically designed for MIP in the Data Loss Prevention (DLP) dictionary. See Microsoft Purview sensitivity labels on page 2230 for more information.

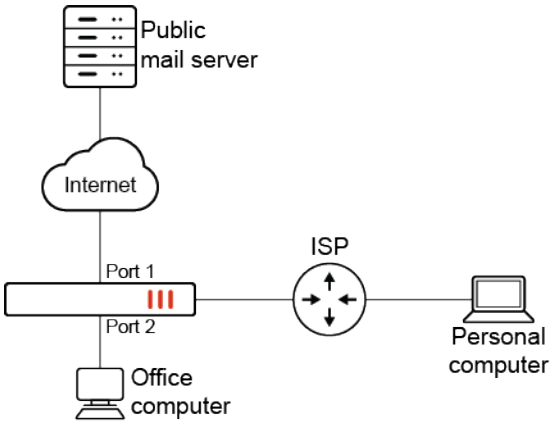
Example

This configuration will block HTTPS upload traffic that matches the DLP profile.

When utilizing commonly-used SSL-encrypted protocols such as HTTPS, SMTPS, POP3S, IMAPS, and FTPS, SSL inspection must be set to Deep Inspection. See Deep inspection on page 2310 for more information.

Additionally, the client machine must have the corresponding deep inspection Certificate Authority (CA) certificate installed.

Sample topology



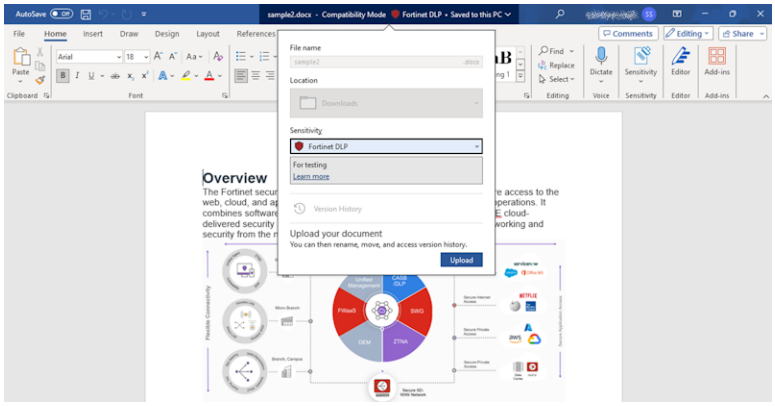
In this example, a Microsoft Office document that is marked with a sensitivity label is being attached to an email in the Chrome browser using Office Desktop. See Learn about sensitivity labels for more information. The FortiGate intercepts this traffic using deep inspection and blocks the attachment of the file because it matches the DLP profile that has been set up on this FortiGate.

When a sensitivity label is included in HTTPS upload traffic, the file is blocked and a DLP log is generated. See Sample log on page 2250 for a log sample.

Prerequisites

Before configuring FortiGate, complete the following steps:

1. Create and configure sensitivity labels and their policies. See Create sensitivity labels for more information.
2. Apply a sensitivity label to content. See Apply sensitivity labels to your files and email for more information.
   Once the sensitivity label is applied on a file, you'll see it displayed on the sensitivity bar.



3. Obtain Globally Unique Identifier (GUID) for your sensitivity labels. See Search for documents by sensitivity label for more information.
   Sample GUID:

```
PS C:\Windows\system32> Get-Label |Ft Name, Guid

Name                                Guid
----                                ----
Fortinet DLP                        ca51e4ff-0733-4744-bebb-d3e1eb6383f4
```

FortiGate uses the GUID for label matching. The *Pattern* for *mip-label* is configured to correspond to the label's GUID.

To block HTTPS upload traffic that includes MIP labels in the GUI:

1. Configure the DLP dictionary:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Dictionary* tab, and click *Create New*.
   b. Set *Name* to *dic-case5*.
   c. In the *Dictionary Entries* table click *Create New*:
      i. Set *Type* to *mip-label*.
      ii. Set *Pattern* to *ca51e4ff-0733-4744-bebb-d3e1eb6383f4*.

      The pattern set here corresponds to the GUID of a specific sensitivity label. Please use your own GUID in this step. See step 3 of Prerequisites on page 2247 for how to obtain your label GUID.

      iii. Click *OK*.
   d. Click *OK*.
2. Configure the DLP profile:
   a. Go to *Security Profiles* > *Data Loss Prevention*, and select the *Profile* tab, then click *Create New*.
   b. Enter a name, such as *profile-case5*.
   c. In the *Rules* section, click *Create New*.

d. Configure the following settings:

Name	mip-label
DATA source type	MIP label
MIP	dic-case5
Severity	Critical
Action	Block
Match type	File
File type	builtin-patterns
Protocol	SMTP, POP3, IMAP, HTTP-GET HTTP-POST, FTP, NNTP, MAPI, SSH, CIFS

e. Click *OK*.
f. Click *OK* to save the profile.

3. Add the DLP profile to a firewall policy:
a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
b. Set the *Inspection Mode* to *Proxy-based*.
c. In the *Security Profiles* section, enable *DLP Profile* and select *profile-case5*.
d. Set *SSL Inspection* to *deep-inspection*.
e. Configure the other settings as needed.
f. Click *OK*.

To block HTTPS upload traffic that includes MIP labels in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "dic-case5"
        config entries
            edit 1
                set type "mip-label"
                set pattern "ca51e4ff-0733-4744-bebb-d3e1eb6383f4"
            next
        end
    next
end
```

The `set pattern` is set to the GUID of a specific sensitivity label. Please use your own GUID in this step. See step 3 of Prerequisites on page 2247 for how to obtain your label GUID.

2. Configure the DLP profile:

```
config dlp profile
    edit "profile-case5"
```

```
        set feature-set proxy
        config rule
            edit 1
                set name "mip-label"
                set severity critical
                set proto smtp pop3 imap http-get http-post ftp nntp mapi ssh cifs
                set filter-by mip
                set file-type 1
                set label "dic-case5"
                set action block
            next
        end
    next
end
```

3. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "profile-case5"
        set nat enable
    next
end
```

Sample log

An attempt was made to send an email from a Windows device using Gmail's webmail service. The email was intended to include an attachment with a MIP label, but the attachment failed to upload, resulting in the generation of a sample log.

```
1: date=2023-11-02 time=06:31:07 eventtime=1698863466313615946 logid="0954024576" type="utm"

```

Exact data matching

Exact Data Matching (EDM) identifies particular data values within an indexed data source that require safeguarding. It offer precise detection and handling of sensitive data based on user-defined criteria. This enhances security and improves efficiency by reducing false-positive detections.

Administrators can define a dataset in a CSV or TXT file on a server, upload file directly on FortiGate or point FortiGate to the external resource. See EDM template on page 2251 for more information.

CSV file example:

Jason	Valentino	120 Jefferson St.	Riverside	CA	92504
Marry	Baxter	415 W Willow Grove Ave	Philadelphia	PA	19118
David	Solace	555 Pierce Street APT #123	Albany	CA	94706
Thomas	Jefferson	1600 Pennsylvania Avenue NW	Washington	DC	20500

TXT file example:

```
213321,john,doe
201111,karen,smith
322122,rick,wong
```

A CSV or TXT file can have a maximum of 32 columns. Each indexed column in the external file represents data (or patterns) for a built-in data type that you want to match using EDM template.

EDM template

The EDM template is used to specify the URL location of the data external feed file or upload the file directly on to the FortiGate. Once the data is imported, it can be utilized with an EDM template to map individual columns of data (or patterns) from a file to built-in data types to match credit card, keyword, mip label, social insurance number (SIN), and social security number (SSN) data. When the data passing through FortiGate matches with the EDM template, FortiGate responds according to the preset rules.

A CSV or TXT file can be uploaded directly to FortiGate using the File Upload option. However, this option is exclusively available through the GUI. It's important to note that file upload is only possible if your FortiGate unit is equipped with a hard disk. In the absence of a hard disk, the File Upload option will be grayed out. See Feature Platform Matrix.

Please note that if the CSV or TXT file is uploaded using the File Upload option, it will not be dynamically synchronized nor periodically updated. This means that any changes made to the file will not be imported by FortiOS. Therefore, users are required to manually update the file again on the FortiGate using the Update file option. This option is located under Resource Type and is only visible if the file was previously uploaded via the File Upload option.

The sequence of steps for configuring EDM is consistent with other DLP configurations. See Basic DLP settings on page 2230 for more information.

Data external feed

A data external feed is a dynamic list that contains data. The data is patterns for DLP data types. The dynamic list is stored in a text (TXT) or comma-separated value (CSV) file format on an external server and periodically updated. After FortiGate can access the file, the patterns can be used with an EDM template.

```
config system external-resource
    edit <name>
        set type data
        set resource <string>
        set refresh-rate <integer>
    next
end
```

Command	Description
`type {category | domain | malware | address | mac-address | data}`	Specify the type of user resource. • `data`: Specify a data file as the user source.
`resource <string>`	Specify the URL of the external resource.
`refresh-rate <integer>`	Time interval to refresh the external resource (minutes).

The size of the Data External Feed file varies depending on the device model. The maximum file size limit for each model is as follows:

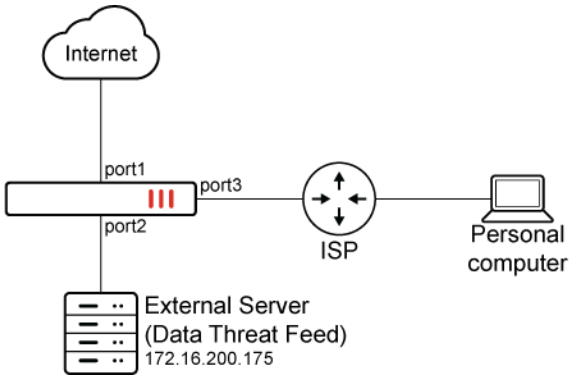
- 128 MB for High-End (Data Center) models
- 64 MB for Mid-Range (Campus) models
- 32 MB for Entry-Level (Branch) models.

Example

This configuration will block HTTPS upload traffic that matches the DLP profile.

When utilizing commonly-used SSL-encrypted protocols such as HTTPS, SMTPS, POP3S, IMAPS, and FTPS, SSL inspection must be set to Deep Inspection. See Deep inspection for more information.

Additionally, the client machine must have the corresponding deep inspection Certificate Authority (CA) certificate installed.



In this example, an EDM template named Customer SSN EDM is created on the FortiGate. During this process, a CSV file (customer_data.csv) located on an external server is imported using the data thread feed.

Sample CSV file:

SSN	Last Name	First Name	Address	City	State	ZIP	Phone	Email	CCN
172-32-1176	Doe	John	10932 Big Rd	Malibu	CA	94025	408-497-7223	jdoe@domain.com	5270-4267-6450-5516
514-14-8905	Bard	Ashley	4469 Sher St	Golf	KS	66428	785-939-6046	abard@domain.com	5370-4638-8881-302

In this example, the EDM template specifies:

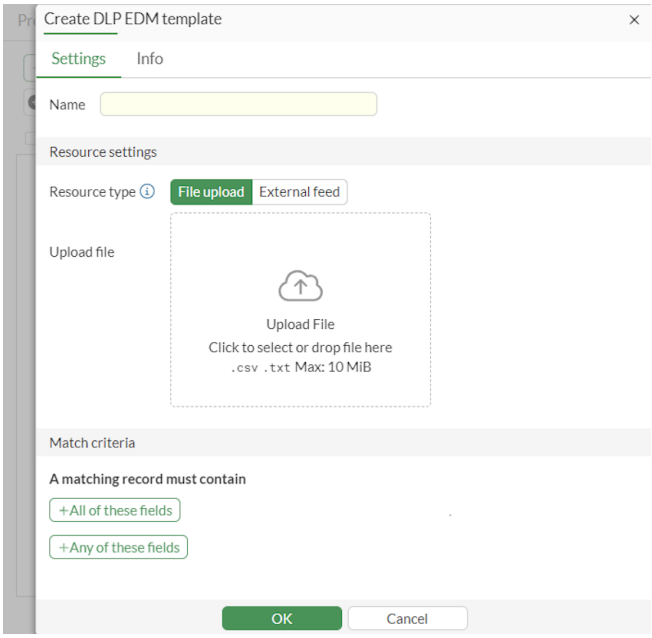
- Column index 1 in the external data feed file contains patterns for the `ssn-us` data type.
- Column index 3 and 9 contain patterns for the `edm-keyword` data type.
- The patterns from column index 1 must match for FortiGate to take an action.
- The pattern from either column index 3 or 9 must match for FortiGate to take an action.

Based on the aforementioned template, the DLP profile will match any traffic containing data that corresponds to the SSN in column 1, and either the First Name in column 3 or the Email in column 9. For instance, if the HTTPS upload traffic sent from personal computer contains '172-32-1176' AND 'John', or '172-32-1176' AND 'jdoe@domain.com', the traffic will be blocked and a DLP log is generated. See Sample log for a log sample.

To configure EDM for DLP in the GUI:

1. Ensure that *Data Loss Prevention* is enabled.
   a. Go to *System* > *Feature Visibility*.
   b. Under *Security Features*, enable *Data Loss Prevention*, and click *Apply*.
2. Create an EDM template with matching criteria:

a. Go to *Security Profiles* > *Data Loss Prevention* > *EDM Template*, and click *Create New*.



b. Specify a name for the template, such as *Customer SSN EDM*.

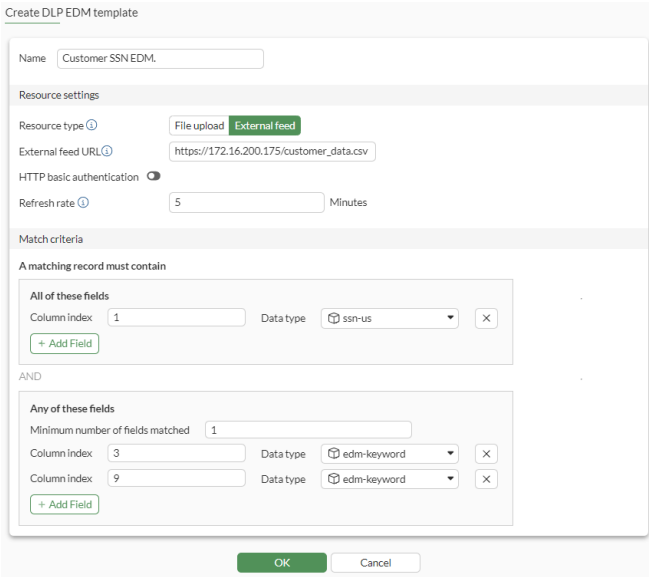
c. Set *Resource type* to *External feed*, and set *External feed URL* to the location of the file on the external server, such as *https://172.16.200.175/customer_data.csv*.

d. Click *+All of these fields* to pair the column index of patterns with a DLP data type. All of the specified data in this section must match for FortiGate to take an action.

In this example, column 1 in the external resource file contains the patterns for the *ssn-us* data type.

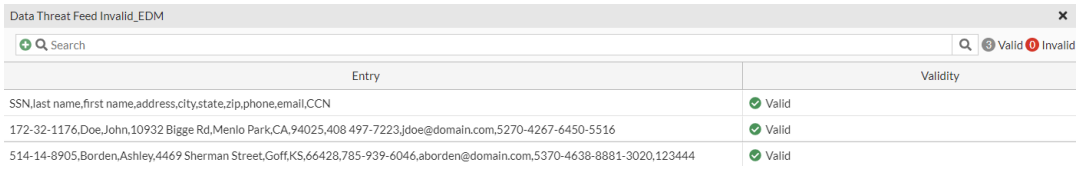
e. Click *+Any of these fields* to pair the column index of patterns with a DLP data type, and to specify how many of these pairs must match for FortiGate to take an action.

In this example, columns 3 and 9 in the external resource file contains the patterns for the *edm-keyword* data type. Only one pattern from the two columns must match.



f. Click *OK*.

g. Edit the DLP EDM template and click *View Entries* to view the data entries in the field.



When viewing EDM entries, the GUI currently does not validate the entries and displays all entries as Valid. However, a Valid entry must have all values matching the data-type of the specific column. If one value does not match, the entry is invalid and will not be used for pattern matching.

3. Configure a DLP sensor for the EDM template.
   a. In *Security Profiles* > *Data Loss Prevention*, click *Sensor* > *Create New*.
   b. Specify a name for the DLP sensor, such as *Sensor SSN EDM*.
   c. Click *Add*. The *Select Entries* pane is displayed.
   d. Select *Managed Locally* from the dropdown menu.
   e. From the list, select *Customer SSN EDM*, and click *Apply*.

   f. Click *OK*.
4. Create a DLP profile and select the DLP sensor for the EDM template.
   a. In *Security Profiles* > *Data Loss Prevention*, click *Profile* > *Create New*.
   b. Specify a name for the DLP profile, such as *Profile SSN EDM*.
   c. Click *Create New*. The *New Rule* pane is displayed.
   d. Specify a name for the rule, such as *Rule SSN EDM*.
   e. Set *Data source type* to *Sensor*, and select *Sensor SSN EDM*.
   f. Set *Action* to *Block*.
   g. Set *Match type* to *Message*.
   h. Select *HTTP-POST* protocol.
   i. Click *OK*. The *New DLP Profile* pane is displayed.
   j. Click *OK* to save the profile.

5. Add the DLP profile to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Click *Create New*.
   c. Set the *Inspection Mode* to *Proxy-based*.
   d. In the *Security Profiles* section, enable *DLP Profile* and select *Profile SSN EDM*.
   e. Set *SSL Inspection* to *deep-inspection*.
   f. Configure the other settings as needed.
   g. Click *OK*.

To configure EDM for DLP in the CLI:

1. Add the URL for the data external feed file to FortiGate.
   In this example, an external resource named `customer data EDM` is created, and it defines the location of the data external feed file in CSV format on an external server.

```
config system external-resource
    edit "customer data EDM"
        set type data
        set resource "https://172.16.200.175/customer_data.csv"
        end
    next
end
```

2. Configure the EDM template.
   In this example, an exact data-match template named `Customer SSN EDM` is created for the external resource named `customer data EDM`. The matching record must contain the pattern for the data type from column index 1 (`ssn-us`) and at least one pattern for the data type from column index 3 (`edm-keyword`) or 9 (`edm-keyword`).

```
config dlp exact-data-match
    edit "Customer SSN EDM"
        set optional 1
        set data "customer data EDM"
        config columns
            edit 1
                set type "ssn-us"
            next
            edit 3
                set type "edm-keyword"
                set optional enable
            next
            edit 9
                set type "edm-keyword"
                set optional enable
            next
        end
    next
end
```

3. Add the EDM template to a DLP sensor.

```
config dlp sensor
    edit "Sensor SSN EDM"
        config entries
            edit 1
                set dictionary "Customer SSN EDM"
            next
        end
    next
end
```

4. Configure a DLP profile to use the DLP sensor.

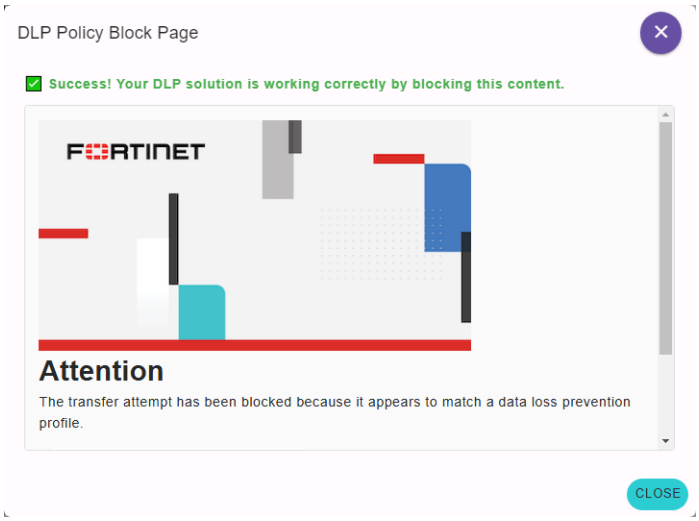
```
config dlp profile
    edit "Profile SSN EDM"
        set feature-set proxy
        config rule
            edit 1
                set name "Rule SSN EDM"
                set type message
                set proto http-post
                set filter-by sensor
                set sensor “Sensor SSN EDM”
                set action block
            next
        end
    next
end
```

5. Add the DLP profile to a firewall policy.

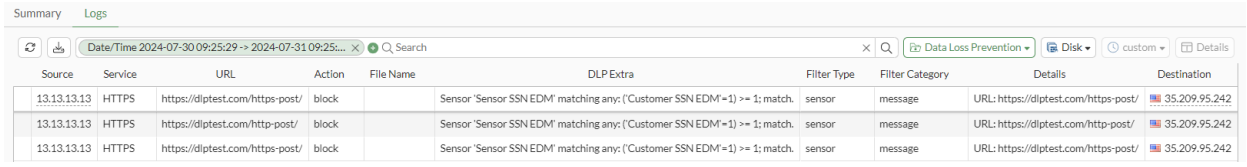
```
config firewall policy
    edit 1
        set name "Internet"
        set srcintf "port3"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "Profile SSN EDM"
    next
end
```

To verify:

1. A user attempts to post a sensitive message through HTTPS to dlptest.ai, and the message content matches the EDM template.
2. FortiGate blocks the user's attempt and displays a replacement message:



3. FortiGate generates a DLP log:



```
1: date=2024-07-31 time=09:24:44 eventtime=1722443083953870602 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1 rulename="Rule SSN
EDM" dlpextra="Sensor 'Sensor SSN EDM' matching any: ('Customer SSN EDM'=1) >= 1; match."
filtertype="sensor" filtercat="message" severity="medium" policyid=1 poluuid="1696f98a-3413-

profile="Profile SSN EDM"
```

DLP examples

The following topics provide examples of DLP:

- Block HTTPS upload traffic that includes credit card information on page 2259
- Log FTP upload traffic with a specific pattern on page 2262
- Block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB on page 2267
- Block HTTPS upload traffic that includes Visa or Mastercard information using evaluation through logical expression on page 2268
- Block access to LLM applications using keywords and FQDN on page 2273
- Proximity search on page 2280
- Assign confidence levels in FortiGuard managed DLP dictionaries on page 2284

Block HTTPS upload traffic that includes credit card information

This configuration will block HTTPS upload traffic that includes credit card information. The predefined data type for credit card is used in the dictionary.

To block HTTPS upload traffic that includes credit card information in the GUI:

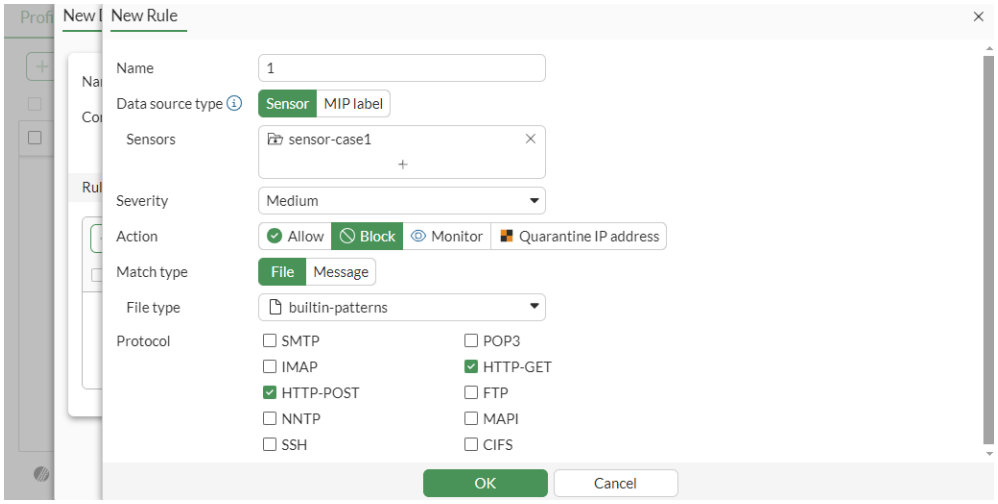
1. Configure the DLP dictionary:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Dictionary* tab, and click *Create New*.
   b. Enter a name (*dic-case1*).
   c. In the *Dictionary Entries* section, click *Create New*.
   d. Set the *Type* to *credit-card* and click *OK*.

   e. Click *OK*.
   f. Click *OK* to save the dictionary.
2. Configure the DLP sensor:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Sensor* tab, and click *Create New*.
   b. Enter a name (*sensor-case1*).
   c. In the *Sensor Entries* section, click *Add*. The *Select Entries* pane is displayed.
   d. Select *Managed Locally* from the dropdown menu.
   e. Select *dic-case1* and click *Apply*.

   f. Click *Apply*.
   g. Click *OK* to save the sensor.
3. Configure the DLP profile:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Profile* tab, and click *Create New*.
   b. Enter a name (*profile-case1*).
   c. In the *Rules* section, click *Create New*.

d. Configure the following settings:

Name	*1*
Sensors	*sensor-case1*
Severity	*Medium*
Action	*Block*
Type	*File*
File type	*builtin-patterns*
Protocol	*HTTP-POST*, *HTTP-GET*



e. Click *OK*.

f. Click *OK* to save the profile.

4. Add the DLP profile to a firewall policy:

a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.

b. Set the *Inspection Mode* to *Proxy-based*.

c. In the *Security Profiles* section, enable *DLP Profile* and select *profile-case1*.

d. Configure the other settings as needed.

e. Click *OK*.

When a credit card is included in HTTP POST traffic, the file is blocked and a DLP log is generated.

To block HTTPS upload traffic that includes credit card information in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "dic-case1"
        config entries
            edit 1
                set type "credit-card"
            next
        end
```

```
    next
end
```

2. Configure the DLP sensor:

```
config dlp sensor
    edit "sensor-case1"
        config entries
            edit 1
                set dictionary "dic-case1"
            next
        end
    next
end
```

3. Configure the DLP profile:

```
config dlp profile
    edit "profile-case1"
        set feature-set proxy
        config rule
            edit 1
                set name "1"
                set proto http-get http-post
                set filter-by sensor
                set file-type 1
                set sensor "sensor-case1"
                set action block
            next
        end
    next
end
```

4. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set dlp-profile "profile-case1"
        set nat enable
```

```
    next
end
```

When a credit card is included in HTTP POST traffic, a replacement message appears because it is blocked. A DLP log is generated.

Sample log

From Windows, the following command below can be used to generate a sample log, using the cURL tool to post data, which contains a sample credit card number. See sample-data for sample credit card numbers.

```
# curl -k -d 4024007149133315 https://172.16.200.55/card.doc -o?

1: date=2022-10-26 time=11:25:01 eventtime=1666808700281057923 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1 rulename="1"
dlpextra="builtin-patterns;sensor-case1" filtertype="sensor" filtercat="file" severity="medium"
policyid=1 poluuid="891a526a-51cd-51ed-577a-6505bec88af9" policytype="policy" sessionid=3905

action="block" hostname="172.16.200.55" url="https://172.16.200.55/card.doc" agent="curl/7.83.1"
httpmethod="POST" filename="card.doc" filesize=108 profile="profile-case1"
```

Log FTP upload traffic with a specific pattern

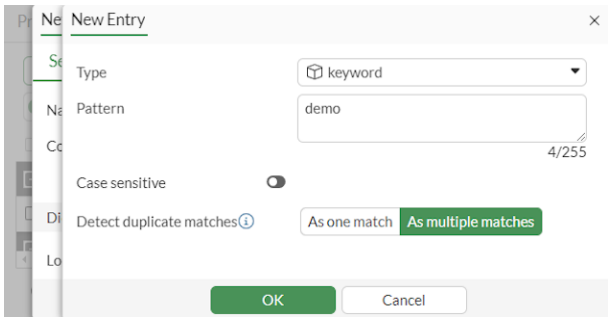
This configuration will log FTP upload traffic with the following patterns:

- keyword = demo
- regex = demo(regex){1,5}
- hex = e6b58be8af95

The dictionary entries have repeat match enabled. The DLP sensor is set so this is repeated five times.

To log FTP upload traffic that has specific keyword, regex, and hex patterns repeated for five times in the GUI:

1. Configure the DLP dictionary with three entries:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Dictionary* tab, and click *Create New*.
   b. Enter a name (*dic-case2*).
   c. In the *Dictionary Entries* section, click *Create New*.
   d. Set the *Type* to *keyword* and the *Pattern* to *demo*.
   e. Set *Detect duplicate matches* to *As multiple matches*.

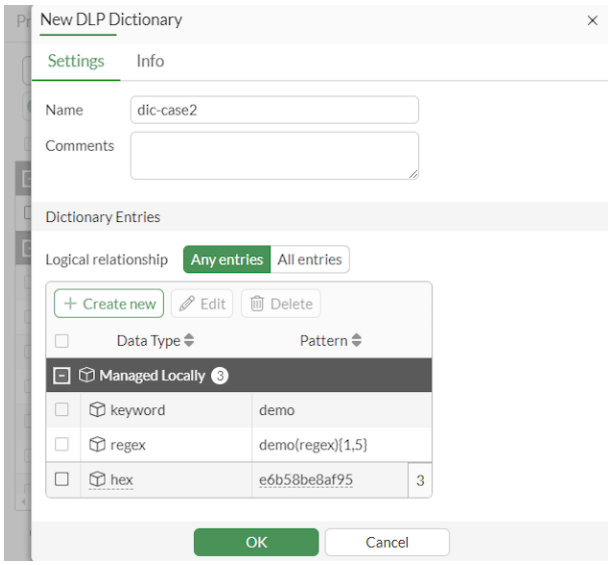


f. Click *OK*.

g. Repeat these steps to add dictionary entries for the following (with *Repeats* enabled):

i. Set the *Type* to *regex* and the *Pattern* to *demo(regex){1,5}*.

ii. Set the *Type* to *hex* and the *Pattern* to *e6b58be8af95*.



h. Click *OK* to save the dictionary.

2. Configure the DLP sensor:

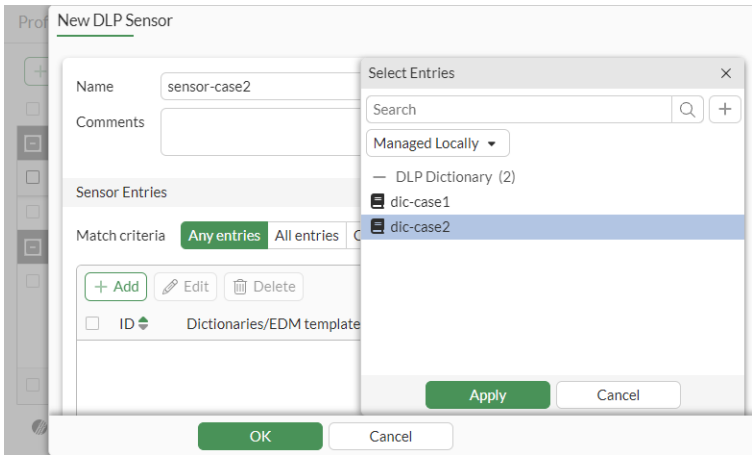
a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Sensor* tab, and click *Create New*.

b. Enter a name (*sensor-case2*).

c. In the *Sensor Entries* section, click *Add*. The *Select Entries* pane is displayed.

d. Select *Managed Locally* from the dropdown menu.

e. Select *dic-case2* and click *Apply*.



f. Edit the new entry and set the *Number of matches required* to *5*.

g. Click *OK*.

h. Click *OK* to save the sensor.

3. Configure the DLP profile:

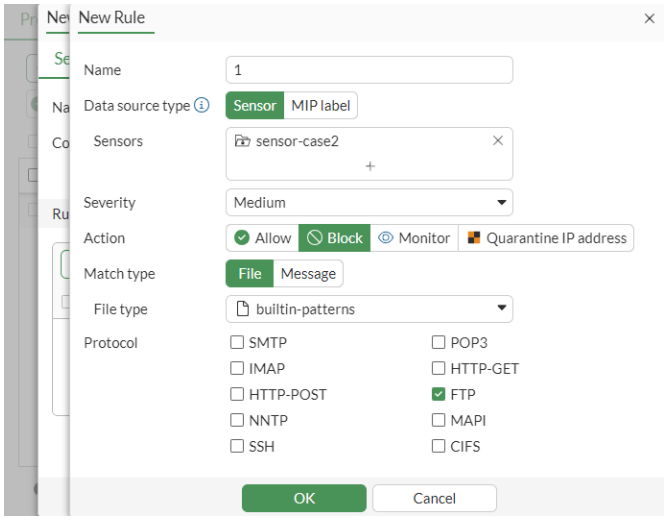
a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Profile* tab, and click *Create New*.

b. Enter a name (*profile-case2*).

c. In the *Rules* section, click *Create New*.

d. Configure the following settings:

Name	*1*
Sensors	*sensor-case2*
Severity	*Medium*
Action	*Block*
Type	*File*
File type	*builtin-patterns*
Protocol	*FTP*



e. Click *OK*.
f. Click *OK* to save the profile.

4. Add the DLP profile to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *DLP Profile* and select *profile-case2*.
   d. Configure the other settings as needed.
   e. Click *OK*.
5. Upload a Word document that contains "demo, demo, demo, demoregexregex," using FTP.
   A DLP log is generated after the FTP traffic passes.

To log FTP upload traffic that has specific keyword, regex, and hex patterns repeated for five times in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "dic-case2"
        config entries
            edit 1
                set type "keyword"
                set pattern "demo"
                set repeat enable
            next
            edit 2
                set type "regex"
                set pattern "demo(regex){1,5}"
                set repeat enable
            next
            edit 3
                set type "hex"
                set pattern "e6b58be8af95"
                set repeat enable
            next
        end
    next
end
```

2. Configure the DLP sensor:

```
config dlp sensor
    edit "sensor-case2"
        config entries
            edit 1
                set dictionary "dic-case2"
                set count 5
            next
        end
    next
end
```

3. Configure the DLP profile:

```
config dlp profile
    edit "profile-case2"
        set feature-set proxy
        config rule
            edit 1
                set proto ftp
                set filter-by sensor
                set file-type 1
                set sensor "sensor-case2"
                set action block
            next
        end
    next
end
```

4. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set dlp-profile "profile-case2"
        set nat enable
    next
end
```

5. Upload a Word document that contains "demo, demo, demo, demoregexregex," using FTP.
   A DLP log is generated after the FTP traffic passes.

Sample log

```
1: date=2022-10-26 time=12:37:57 eventtime=1666813077679725858 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1 rulename="1"
dlpextra="builtin-patterns;sensor-case2" filtertype="sensor" filtercat="file" severity="medium"
policyid=1 poluuid="891a526a-51cd-51ed-577a-6505bec88af9" policytype="policy" sessionid=6267

```

```
51cd-51ed-a24e-a091f4ff6fed" proto=6 service="FTP" filetype="msoffice" direction="outgoing"
action="block" filename="realizedDoc.doc" filesize=26624 profile="profile-case2"
```

Block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB

FortiGate can detect any file larger than the configured limit. See File size filtering on page 2229 for more information.

This configuration will block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB.

To block HTTPS download of EXE files and log downloads larger than 500 KB:

1. Configure the DLP file pattern:

```
config dlp filepattern
    edit 3
        set name "case3-exe"
        config entries
            edit "exe"
                set filter-type type
                set file-type exe
            next
        end
    next
end
```

2. Configure the DLP profile:

```
config dlp profile
    edit "profile-case3-type-size"
        config rule
            edit 1
                set proto http-get
                set filter-by none
                set file-type 3
                set action block
            next
            edit 2
                set proto http-get
                set filter-by none
                set file-size 500
                set action log-only
            next
        end
    next
end
```

3. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "custom-deep-inspection"
        set dlp-profile "profile-case3-type-size"
        set logtraffic all
        set nat enable
    next
end
```

4. Download an EXE file using HTTPS. The download is blocked, a replacement message appears, and a DLP log is generated.

Sample log

```
1: date=2022-02-15 time=11:54:29 eventtime=1644954869682887856 tz="-0800" logid="0954024577"
type="utm" subtype="dlp" eventtype="dlp" level="notice" vd="root" ruleid=2 dlpextra="500 kB"
filtertype="none" filtercat="file" severity="medium" policyid=1 poluuid="905fb604-7ed4-51ec-0853-
79e498591bf8" policytype="policy" sessionid=12082 epoch=901683674 eventid=0 srcip=10.1.100.18

url="https://2.na.dl.wireshark.org/win64/Wireshark-win64-3.6.2.exe" agent="curl/7.61.1"
filename="Wireshark-win64-3.6.2.exe" filesize=10502090 profile="profile-case3-type-size"
```

Block HTTPS upload traffic that includes Visa or Mastercard information using evaluation through logical expression

This example will allow users to create a subset of the existing DLP data type, *credit-card*. It can be very beneficial for an organization that wants to prevent only certain types of credit cards and not all.

This configuration will block HTTPS traffic that includes Visa or Mastercard information. Two dictionary entries with DLP data-type regex are created with custom patterns to match Visa and Mastercard numbers respectively, and a third dictionary entry is created with predefined data type *credit-card*. All three entries are used in the sensor using evaluation via logical expression to further supplement the detection.

In the CLI, evaluation via logical expression can be defined using the command `match-eval`. It is a tool used to combine multiple entries to define an accurate DLP sensor.

Sample topology

In this example, a Microsoft Office document with Visa credit card information is sent securely to the receiver using the HTTP POST method. The FortiGate intercepts the traffic using deep inspection and blocks the traffic as it matches the DLP profile configured on this FortiGate.

To block HTTPS upload traffic that includes Visa or Mastercard credit card information in the GUI:

1. Configure the DLP dictionary:
   a. Go to *Security Profiles > Data Loss Prevention*, select the *Dictionary* tab, and click *Create New*.
   b. Create an entry for Visa:
      i. Enter a name (*Finance_Credit_Card_Visa*).
      ii. In the *Dictionary Entries* section, click *Create New*.
      iii. Set the *Type* to *regex*.
      iv. Set *Pattern* to *4[0-9]{12}(?:[0-9]{3})* and click *OK*.
      v. Click *OK* to save the dictionary.
   c. Create an entry for Mastercard:
      i. Enter a name (*Finance_Credit_Card_Mastercard*).
      ii. In the *Dictionary Entries* section, click *Create New*.
      iii. Set the *Type* to *regex*.
      iv. Set *Pattern* to *(?:5[1-5][0-9]{2}|222[1-9]|22[3-9][0-9]|2[3-6][0-9]{2}|27[01][0-9]|2720)[0-9]{12}* and click *OK*.
      v. Click *OK* to save the dictionary.
   d. Create an entry for Credit Card:
      i. Enter a name (*CC_Number*).
      ii. In the *Dictionary Entries* section, click *Create New*.
      iii. Set the *Type* to *credit-card* and click *OK*.
      iv. Click *OK* to save the dictionary.
2. Configure the DLP sensor:
   a. Go to *Security Profiles > Data Loss Prevention*, select the *Sensor* tab, and click *Create New*.
   b. Enter a name (*Finance_Credit_Card_High*).
   c. In the *Sensor Entries* section, click *Add*. The *Select Entries* pane is displayed.
   d. Select *Managed Locally* from the dropdown menu.
   e. Select *Finance_Credit_Card_Visa* and click *Apply*.
   f. Repeat the previous step twice to add *Finance_Credit_Card_Mastercard* and *CC_Number* in this order.
   g. Click *OK* to save the sensor.
   h. Edit the newly created sensor.
   i. Set the *Match criteria* to *Custom expression*.
   j. In the *Evaluated by* field, enter *(dict(1) > 0 && dict(3) > 0) || (dict(2) > 0 && dict(3) > 0)*.
   k. Click *OK* to save the sensor.

For the DLP sensor with the *Logical relationship* set to *Evaluate*, *Count* and *Status* of any sensor entry will be ignored.

3. Configure the DLP profile:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Profile* tab, and click *Create New*.
   b. Enter a name (*cc-block*).
   c. In the *Rules* section, click *Create New*.
   d. Configure the following settings:

Name	*1*
Sensors	*Finance Credit Card High*
Severity	*Critical*
Action	*Block*
Type	*File*
File type	*builtin-patterns*
Protocol	*HTTP-POST*, *HTTP-GET*

   e. Click *OK*.
   f. Click *OK* to save the profile.
4. Add the DLP profile to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *DLP Profile* and select *cc-block*.
   d. Set *SSL Inspection* to *deep-inspection* to inspect HTTPS traffic.
   e. Configure the other settings as needed.
   f. Click *OK*.

When a Visa or Mastercard credit card is included in HTTP GET or POST traffic, the file is blocked and a DLP log is generated. See the Sample log on page 2272 for details on how to test this configuration.

To block HTTPS upload traffic that includes Visa or Mastercard credit card information in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "Finance_Credit_Card_Visa"
        config entries
            edit 1
                set type "regex"
                set pattern "4[0-9]{12}(?:[0-9]{3})"
                set repeat enable
                set comment "Visa"
            next
        end
```

```
    next
    edit "Finance_Credit_Card_Mastercard"
        config entries
            edit 1
                set type "regex"
                set pattern "(?:5[1-5][0-9]{2}|222[1-9]|22[3-9][0-9]|2[3-6][0-9]{2}|27[01][0-
9]|2720)[0-9]{12}"
                set repeat enable
                set comment "Mastercard"
            next
        end
    next
    edit "CC_Number"
        config entries
            edit 1
                set type "credit-card"
            next
        end
    next
end
```

To use "?" in a regex pattern, see CLI basics on page 62. This method only supports direct console connection and SSH. It does not support the CLI console in the GUI.

2. Configure the DLP sensor:

```
config dlp sensor
    edit "Finance_Credit_Card_High"
        config entries
            edit 1
                   set dictionary "Finance_Credit_Card_Visa"
            next
            edit 2
                set dictionary "Finance_Credit_Card_Mastercard"
            next
            edit 3
                set dictionary "CC_Number"
            next
        end
        set match-type match-eval
        set eval "(dict(1) > 0 && dict(3) > 0) || (dict(2) > 0 && dict(3) > 0)"
    next
end
```

3. Configure the DLP profile:

```
config dlp profile
    edit "cc_block"
        set feature-set proxy
        config rule
```

```
            edit 1
                set name "1"
                set severity critical
                set proto http-get http-post
                set filter-by sensor
                set file-type 1
                set sensor "Finance_Credit_Card_High"
                set action block
            next
        end
    next
end
```

4. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "cc_block"
        set nat enable
    next
end
```

When a Visa or Mastercard credit card is included in HTTP GET or POST traffic, a replacement message appears because it is blocked. A DLP log is generated. See the Sample log on page 2272 for details on how to test this configuration.

Sample log

From Windows, the following command below can be used to generate a sample log via HTTP POST traffic, using the cURL tool to post data, which contains a sample Visa credit card number. See sample-data for sample credit card numbers.

```
# curl –k -d 4024007149133315 https://192.168.10.13/cc.doc -o?

1: date=2023-03-17 time=15:37:41 eventtime=1679092660998869199 tz="-0700" logid="0954024576"

```

Block access to LLM applications using keywords and FQDN

Large language models (LLMs), such as GPT, are a type of Generative AI (GenAI) and are widely used in applications like chatbots. This configuration will block HTTPS upload traffic to LLM applications that include sensitive keywords. The predefined data type, keyword, is used in the Data Loss Prevention (DLP) dictionary.

Web-based chatbot implementations are dynamic and and can exhibit a wide range of variations. To maximize the effectiveness of blocking unwanted keywords, it is advised to add both a message and a file-based DLP rule. While this method enhances detection, it may not be entirely infallible. For optimal protection, it is recommended to restrict access to LLM applications.

To entirely prevent access to LLM applications, use a web filter profile with the FortiGuard *Artificial Intelligence Technology* category set to block. See Configuring web filter profiles to block AI and cryptocurrency on page 2021 for more information.

To confirm that the URL of the LLM application that you need to block is in the *Artificial Intelligence Technology* category. The URL category can be verified using the FortiGuard Web Filter Lookup.

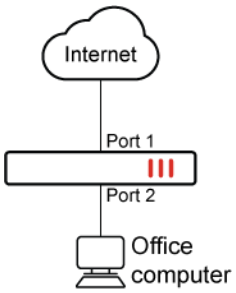
When utilizing commonly-used SSL-encrypted protocols such as HTTPS, SMTPS, POP3S, IMAPS, and FTPS, SSL inspection must be set to Deep Inspection. See Deep inspection on page 2310 for more information.

Additionally, the client machine must have the corresponding deep inspection Certificate Authority (CA) certificate installed.

Example

In this example, a user is conducting a search on an LLM application in the Chrome browser on an office computer, using a sensitive keyword that has been configured in the DLP dictionary. The FortiGate intercepts this traffic using deep inspection and prevents the search that contains sensitive keywords because it matches the DLP profile that has been set up on this FortiGate.

When a sensitive keyword is included in HTTPS upload traffic, the request is blocked and a DLP log is generated.



To block HTTPS upload traffic that includes sensitive keywords in the GUI:

1. Configure the DLP dictionary:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Dictionary* tab, then click *Create New*.
   b. Set *Name* to *llmapps*.
   c. In the *Dictionary Entries* table click *Create New*:
      i. Set *Type* to *keyword*.
      ii. Set *Pattern* to *fortinet*.
      iii. Enable *Case sensitive*.
      iv. Click *OK*.
   d. Repeat step c and set *Pattern* to *source code*.
   e. Click *OK*.
2. Configure the DLP sensor:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Sensor* tab, then click *Create New*.
   b. Set *Name* to *llmapps*.
   c. In the *Sensor Entries* section, click *Add*. The *Select Entries* pane is displayed.
   d. Select *Managed Locally* from the dropdown menu.
   e. Select *llmapps* and click *Apply*.
   f. Click *OK*.
3. Configure the DLP profile:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Profile* tab, then click *Create New*.
   b. Set *Name* to *llmapps*.
   c. In the *Rules* section, click *Create New*:
      i. Configure the following settings:

Name	llmapps1
Sensors	llmapps
Severity	Critical
Action	Block
Type	File
File type	builtin-patterns
Protocol	HTTP-POST

      ii. Click *OK*.
   d. In the *Rules* section, click *Create New* again:

i. Configure the following settings:

Name	llmapps2
Sensors	llmapps
Severity	Critical
Action	Block
Type	Message
Protocol	HTTP-POST

ii. Click *OK*.

e. Click *OK* to save the profile.

f. Unset the file type option to enable filtering of all file types, including unknown ones:

```
config dlp profile
    edit "llmapps"
        config rule
            edit 1
                unset file-type
            next
        end
    next
end
```

4. Configure the firewall address for the LLM application:
   a. Go to *Policy & Objects* > *Addresses*, select the *Standard* tab, then click *Create New*.
   b. Set the following:

Name	<name>
Type	FQDN
FQDN	See FQDN on page 2278 for the FQDN on the specific LLM application.

   c. Click *OK*.
5. Add the firewall address to a group:
   a. Go to *Policy & Objects* > *Addresses*, select the *Address Group* tab, then click *Create New*.
   b. Set the following:

Group name	llmapps
Members	ChatGpt, Gemini, DeepSeek

6. Add the DLP profile and the address group to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. Set the *Destination* to *llmapps*.
   d. In the *Security Profiles* section:

   i. Enable *Application control* and select the profile that *QUIC* is blocked in. In this example, the *default* profile is selected.
   ii. Enable *DLP Profile* and select *llmapps*.
e. Set *SSL Inspection* to *deep-inspection*.
f. Configure the other settings as needed.
g. Click *OK*.

To block HTTPS upload traffic that includes sensitive keywords in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "llmapps"
        config entries
            edit 1
                set type "keyword"
                set pattern "source code"
                set ignore-case enable
            next
            edit 2
                set type "keyword"
                set pattern "fortinet"
                set ignore-case enable
            next
        end
    next
end
```

2. Configure the DLP sensor:

```
config dlp sensor
    edit "llmapps"
        config entries
            edit 1
                set dictionary "llmapps"
            next
        end
    next
end
```

3. Configure the DLP profile:

```
config dlp profile
    edit "llmapps"
        set feature-set proxy
        config rule
            edit 1
                set name "llmapps1"
                set severity critical
                set proto http-post
                set filter-by sensor
                set sensor "llmapps"
```

```
                set action block
            next
            edit 2
                set name "llmapps2"
                set type message
                set proto http-post
                set filter-by sensor
                set sensor "llmapps"
                set action block
            next
        end
    next
end
```

4. Configure the firewall address for the LLM application:

```
config firewall address
    edit <name>
        set type fqdn
        set fqdn <string>
    next
end
```

See FQDN on page 2278 for the FQDN on the specific LLM application.

5. Add the firewall addresses to a group:

```
config firewall addrgrp
    edit "llmapps"
        set member "ChatGpt" "Gemini" "DeepSeek"
    next
end
```

6. Add the DLP profile and the FQDN address to a firewall policy:

```
config firewall policy
    edit 1
        set name "llmapps "
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "llmapps"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "llmapps"
        set application-list "default"
        set nat enable
    next
end
```

FQDN

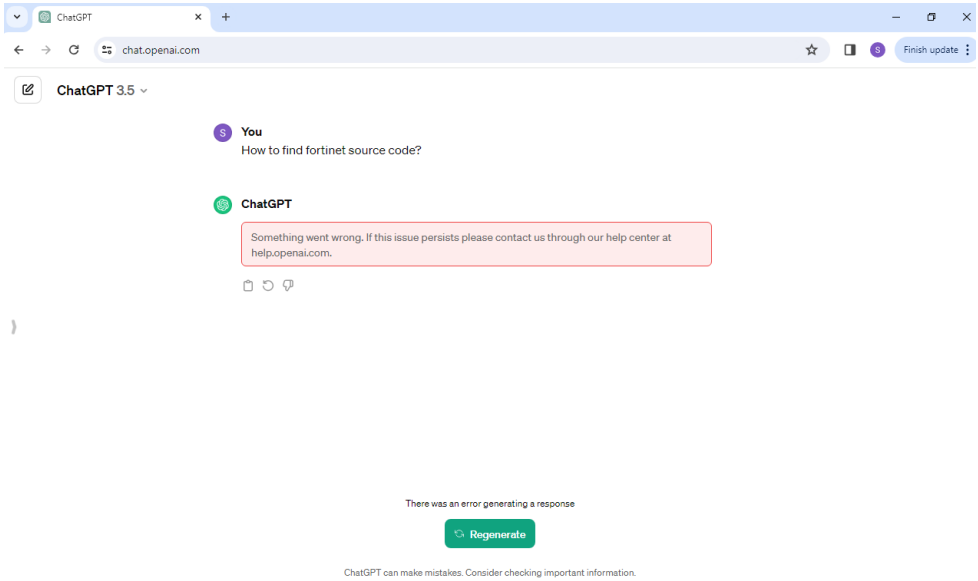
A firewall address should be created for each LLM application:

LLM application	FQDN
ChatGPT	*chat.openai.com*
Gemini	*gemini.google.com*
DeepSeek	*chat.deepseek.com*

Verification

ChatGPT:

1. Visit https://chat.openai.com.
2. Search for any phrase that includes keywords set up in the DLP dictionary.



3. Verify that the request failed and an error was generated.
4. Review the log that was generated when the attempt was made to send an HTTP POST request containing sensitive keywords:

```
1: date=2024-03-15 time=09:59:35 eventtime=1710453575538415503 tz="+1200" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1
rulename="llmapps1" dlpextra="Sensor 'llmapps' matching any: ('llmapps'=1) >= 1; match."
filtertype="sensor" filtercat="file" severity="critical" policyid=1 poluuid="eea32b46-db4e-
51ee-92a9-b46e5580db33" policytype="policy" sessionid=69254 epoch=424445846 eventid=1
srcip=13.13.13.13 srcport=56747 srccountry="United States" srcintf="port2"

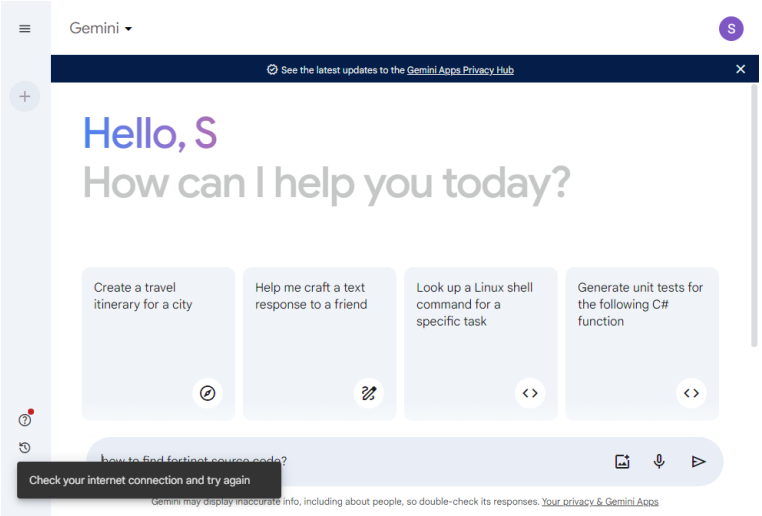
dstport=443 dstcountry="United States" dstintf="port1" dstintfrole="undefined"
```

Gemini:

1. Visit https://gemini.google.com .
2. Search for any phrase that includes keywords set up in the DLP dictionary.



3. Verify that the request failed and an error was generated.
4. Review the log that was generated when the attempt was made to send an HTTP POST request containing sensitive keywords:

```
1: date=2024-03-15 time=12:46:08 eventtime=1710463568053453203 tz="+1200" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1
rulename="llmapps1" dlpextra="Sensor 'llmapps' matching any: ('llmapps'=1) >= 1; match."
filtertype="sensor" filtercat="file" severity="critical" policyid=1 poluuid="eea32b46-db4e-

```

Proximity search

In this example, any HTTPS upload traffic containing both a keyword and a username within a specified proximity can be identified. The FortiGate intercepts this traffic through deep inspection. When HTTPS upload traffic includes both a keyword and a username, which match the criteria defined on the data loss prevention (DLP) profile configured on the FortiGate, the traffic is blocked. This action subsequently generates a DLP log. See Verification on page 2284 for a log sample.

To block HTTPS upload traffic that match the DLP profile in the GUI:

1. Configure the DLP dictionary:
   a. Go to *Security Profiles* > *Data Loss Prevention* and select the *Dictionary* tab.
   b. Select *Create New*.
   c. Set *Name* to: *matcharound*.
   d. In the *Dictionary Entries* table, click *Create New*:
      i. Set *Type* to *keyword*
      ii. Set *Pattern* to *user*
      iii. Enable *Case sensitive*

iv. Click *OK*.

e. Click *OK*.

f. Select the newly created dictionary and click *Edit*.

g. Select *Edit in CLI* and enter the following command:

```
#set match-around enable
end
```

h. Close the CLI Console and click *Cancel*.

DLP data types can only be configured in the CLI. See step 2 of To block HTTPS upload traffic that match the DLP profile in the CLI: on page 2282.

2. Configure the DLP dictionary:
   a. Go to *Security Profiles* > *Data Loss Prevention* and select the *Dictionary* tab.
   b. Click *Create New*.
   c. Set *Name* to *username*.
   d. In the *Dictionary Entries* table, click *Create New*:
      i. Set *Type* to *user*
      ii. Click *OK*.
   e. Click *OK*.
3. Configure the DLP sensor:
   a. Go to *Security Profiles* > *Data Loss Prevention* and select the *Sensor* tab.
   b. Click *Create New*.
   c. Enter a name *(user)*.
   d. In the *Sensor Entries* section, click *Add*. The *Select Entries* pane is displayed.
   e. Select *Managed Locally* from the dropdown menu.
   f. Select *username* and click *Apply*.
   g. Click *OK* to save the sensor.
4. Configure the DLP profile:
   a. Go to *Security Profiles* > *Data Loss Prevention* and select the *Profile* tab.
   b. Click *Create New*.
   c. Enter a name *(keyword)*.
   d. In the *Rules* section, click *Create New*.
   e. Configure the following settings:

Name	keyword
Data source type	Sensor
Sensors	user
Severity	Critical
Action	Block
Match Type	Message
Protocol	HTTP-POST

f. Click *OK*.
g. Click *OK* to save the profile.

5. Add the DLP profile to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *DLP Profile* and select *keyword*.
   d. Set *SSL Inspection* to *deep-inspection* to inspect HTTPS traffic.
   e. Configure the other settings, as needed.
   f. Click *OK*.

To block HTTPS upload traffic that match the DLP profile in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "matcharound"
        set match-around enable
        config entries
            edit 1
                set type "keyword"
                set pattern "user"
                set ignore-case enable
            next
        end
    next
end
```

2. Configure the DLP data type:

```
config dlp data-type
    edit "user"
        set pattern "\\b[a-zA-Z]{6,12}\\b"
        set verify "(?<=@)\\w+"
        set match-around "matcharound"
        set look-back 13
        set match-back 15
    next
end
```

The pattern specified using the `set pattern` command, is designed to match any word, irrespective of case sensitivity, that contains between 6 and 12 characters. On the other hand, the pattern specified using the `set verify` command employs a positive lookbehind assertion. This assertion checks for the presence of the @ symbol preceding the word, without including it in the match. This is a feature supported in PCRE but not in Hyperscan. For a match to occur, the content must satisfy all parameters defined in the DLP Data type.

3. Configure the DLP dictionary:

```
config dlp dictionary
    edit "username"
        config entries
            edit 1
                set type "user"
            next
        end
    next
end
```

4. Configure the DLP sensor:

```
config dlp sensor
    edit "user"
        config entries
            edit 1
                set dictionary "username"
            next
        end
    next
end
```

5. Configure the DLP profile:

```
config dlp profile
    edit "keyword"
        set feature-set proxy
        config rule
            edit 1
                set name "keyword"
                set severity critical
                set type message
                set proto http-post
                set filter-by sensor
                set sensor "user"
                set action block
            next
        end
    next
end
```

6. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set name "keyword"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
```

```
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "keyword"
        set logtraffic all
        set nat enable
    next
end
```

Verification

1. Visit https://dlptest.ai/http-post/com.
2. Enter any phrase that will match the DLP profile configured on the FortiGate and click *Submit*.
   Example:
   user: @kikinaynay
3. Verify that the replacement message indicates the transfer attempt has been blocked.
4. Review the log that was generated when the attempt was made to send an HTTP POST request containing sensitive keywords:

```
1: date=2024-05-17 time=13:12:33 eventtime=1715908352455559762 tz="+1200"
logid="0954024576" type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root"
ruleid=1 rulename="keyword" dlpextra="Sensor 'user' matching any: ('username'=1) >= 1;
match." filtertype="sensor" filtercat="message" severity="critical" policyid=1
poluuid="8abe7a4e-08ae-51ef-edb0-45c05b514641" policytype="policy" sessionid=18462

referralurl="https://dlptest.ai/http-post/" profile="keyword"
```

Assign confidence levels in FortiGuard managed DLP dictionaries

Users can select a FortiGuard dictionary with varying confidence levels based on their specific requirements.

- The high level provides maximum precision to minimize false positives.
- The medium level balances match quantity and precision.
- The low level captures the most matches, but may result in more false positives.

A valid DLP license is required to obtain the latest package.

When applying a FortiGuard built-in dictionary to a custom sensor, the dictionary with the highest confidence level is selected by default.

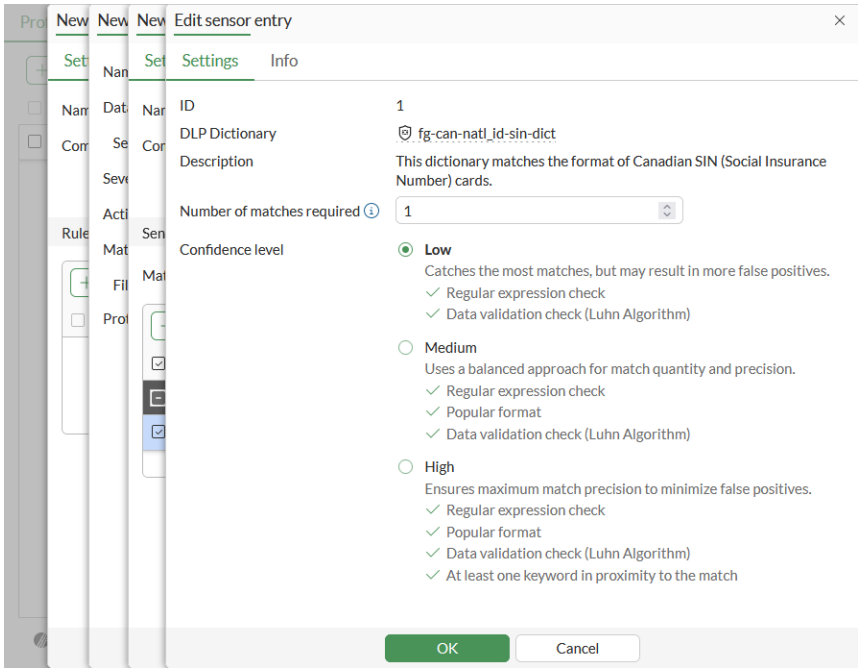
Use case examples

In these use case examples, various Canadian Social Insurance Number (SIN) formats are tested at different confidence levels using different protocols.

SIN format	Low Confidence Matching criteria: regular expression, data validation	Medium Confidence Matching criteria: regular expression, data validation SIN format validation	High Confidence Matching criteria: regular expression, data validation, SIN format validation, Match-around data
815489034	match	does not match	does not match
193849270	match	match	does not match
sin# 193849270	match	match	match

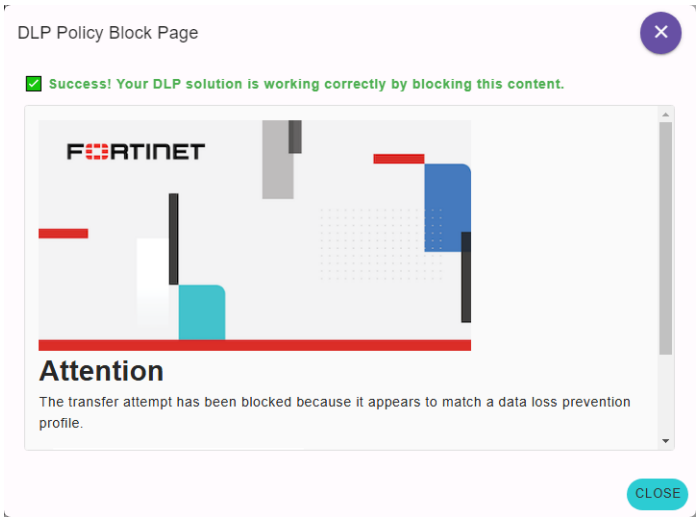
To verify that a FortiGuard dictionary with the low confidence level will block matching message through an HTTPS post:

1. Configure a DLP profile with a DLP sensor that uses the Canadian SIN card dictionary (`fg-can-natl_id-sin-dict`) DLP dictionary with the *Confidence level* set to *Low* and then use the profile in a policy.



2. Test that an HTTPS message containing a SIN is blocked. DLP Test > HTTPS Post can be used to send a test message.

   The message is blocked:

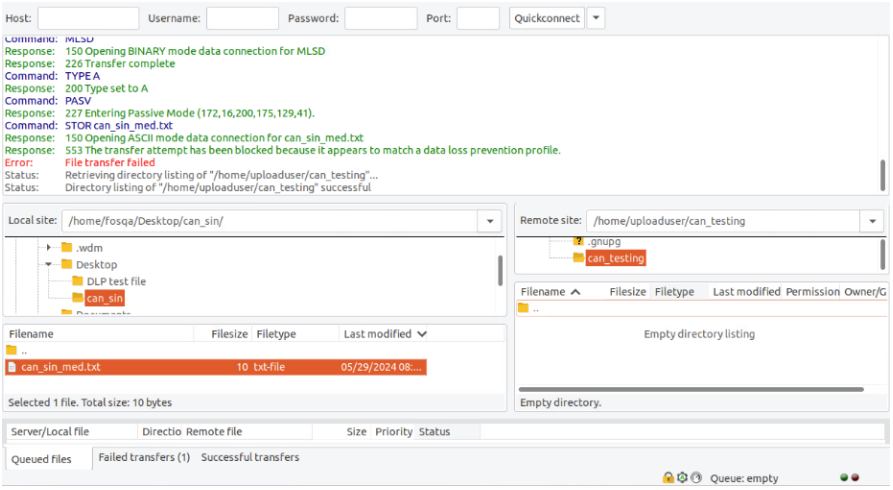


3. Go to *Log & Report > Security Events* and view the *Data Loss Prevention* logs matching the *can-natl_id-sin-dict-low* dictionary.
4. Check the raw logs:

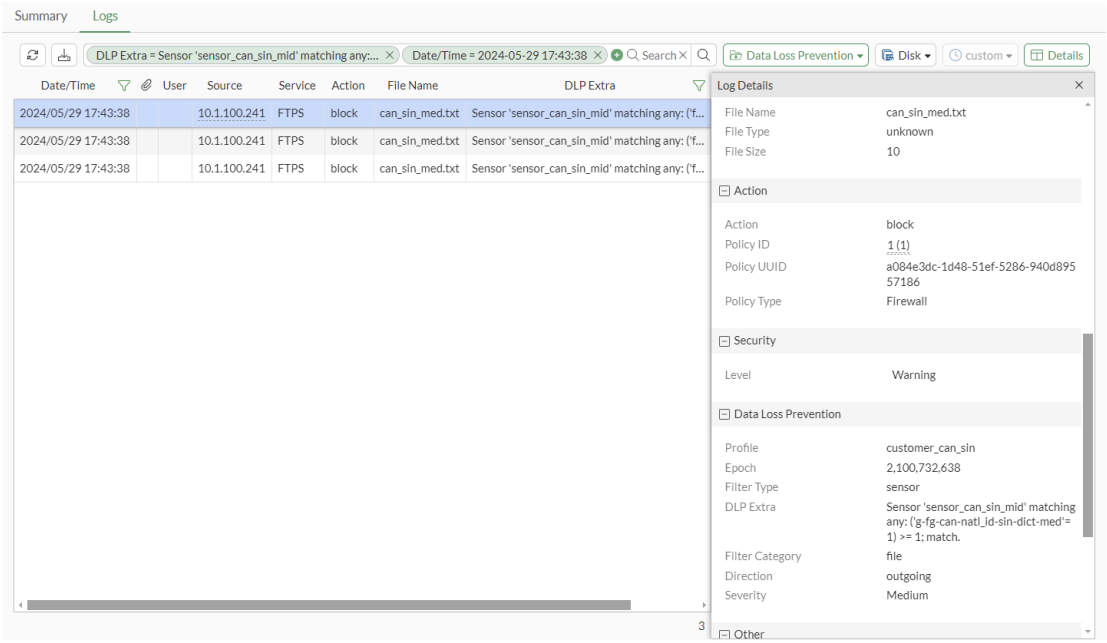
```
1: date=2024-05-29 time=16:55:27 eventtime=1717026926501493215 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="vdom1" ruleid=1 rulename="sensor_
can_sin_low" dlpextra="Sensor 'sensor_can_sin_low' matching any: ('g-fg-can-natl_id-sin-dict-
low'=1) >= 1; match." filtertype="sensor" filtercat="message" severity="medium" policyid=1
poluuid="a084e3dc-1d48-51ef-5286-940d89557186" policytype="policy" sessionid=64304
epoch=2100732550 eventid=1 srcip=10.1.100.241 srcport=34184 srccountry="Reserved"
srcintf="port2" srcintfrole="undefined" srcuuid="5a9d01f6-1d48-51ef-1c5f-c5a49f106988"
dstip=35.209.95.242 dstport=443 dstcountry="United States" dstintf="port1"
dstintfrole="undefined" dstuuid="5a9d01f6-1d48-51ef-1c5f-c5a49f106988" proto=6 service="HTTPS"
filetype="N/A" direction="outgoing" action="block" hostname="dlptest.ai"
url="https://dlptest.ai/https-post/" agent="Mozilla/5.0 (X11; Linux x86_64) AppleWebKit/537.36
(KHTML, like Gecko) Chrome/122.0.0.0 Safari/537.36" httpmethod="POST"
referralurl="https://dlptest.ai/https-post/" profile="customer_can_sin"
```

To verify that a FortiGuard dictionary with medium confidence level will block matching message through a FTPS post:

1. Configure a DLP profile with a DLP sensor that uses the Canadian SIN card dictionary (`fg-can-natl_id-sin-dict`) DLP dictionary with the *Confidence level* set to *Medium* and then use the profile in a policy.
2. Test that posting a file that contains `193849270` is blocked.



3. Go to *Log & Report > Security Events* and view the *Data Loss Prevention* logs matching the *can-natl_id-sin-dict-med* dictionary.



4. Check the raw logs:

```
1: date=2024-05-29 time=17:43:38 eventtime=1717029818309788622 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="vdom1" ruleid=2 rulename="sensor_
can_sin_med" dlpextra="Sensor 'sensor_can_sin_mid' matching any: ('g-fg-can-natl_id-sin-dict-
med'=1) >= 1; match." filtertype="sensor" filtercat="file" severity="medium" policyid=1
poluuid="a084e3dc-1d48-51ef-5286-940d89557186" policytype="policy" sessionid=65893
epoch=2100732638 eventid=0 srcip=10.1.100.241 srcport=37561 srccountry="Reserved"
srcintf="port2" srcintfrole="undefined" srcuuid="5a9d01f6-1d48-51ef-1c5f-c5a49f106988"
dstip=172.16.200.175 dstport=33065 dstcountry="Reserved" dstintf="port1"
dstintfrole="undefined" dstuuid="5a9d01f6-1d48-51ef-1c5f-c5a49f106988" proto=6 service="FTPS"
filetype="unknown" direction="outgoing" action="block" filename="can_sin_med.txt" filesize=10
profile="customer_can_sin"
```

To verify that the FortiGuard dictionary with a high confidence level will block matching message through an SMTP post:

1. Configure a DLP profile with a DLP sensor that uses the Canadian SIN card dictionary (`fg-can-natl_id-sin-dict`) DLP dictionary with the *Confidence level* set to *High* and then use the profile in a policy.
2. Test that sending email with an attached file that contains `sin# 193849270` is blocked.
3. Go to *Log & Report > Security Events* and view the *Data Loss Prevention* logs matching the *can-natl_id-sin-dict-high* dictionary.
4. Check the raw logs:

```
1: date=2024-05-30 time=11:37:18 eventtime=1717094238851929893 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="vdom1" ruleid=3 rulename="sensor_
can_sin_high" dlpextra="Sensor 'sensor_can_sin_high' matching any: ('g-fg-can-natl_id-sin-
dict-high'=1) >= 1; match." filtertype="sensor" filtercat="file" severity="medium" policyid=1
poluuid="a084e3dc-1d48-51ef-5286-940d89557186" policytype="policy" sessionid=96838

SIN" attachment="yes" filename="sin.txt" filesize=70 profile="customer_can_sin"
```

Virtual patching

Virtual patching is a method for mitigating vulnerability exploits against OT and IoT devices by applying patches virtually on the FortiGate. This is done in several steps:

1. A FortiGate uses the OT Detection Signatures and Service to collect device information from OT and IoT devices that are connected to an interface.
2. The device information is used to perform a vulnerability lookup by querying FortiGuard for device-specific vulnerabilities and mitigation rules.

   FortiGuard returns OT virtual patching signatures and IPS signatures.
3. The FortiGate caches the applicable signatures and mitigation rules that apply to each device. The signatures and rules are mapped to the MAC address of the device.
4. When a virtual patching profile is applied to a firewall policy, traffic that enters the firewall policy is subject to signature matching on a per-device basis.
   a. The IPS engine uses the MAC address of the device to match any mitigation rules that should apply.
   b. If the MAC address is in the exempted list, then patching is exempted or skipped.
   c. If the signature rule is in the exempted list, then patching is also exempted or skipped for that signature.
   d. Otherwise, all applicable rules for the device will be applied.

OT and IoT device detection

When device detection is enabled on a LAN interface, FortiGate detects OT and IoT devices that are connected to the interface by using the OT Detection Signatures and Service.

Device detection can be enabled in the GUI and CLI. In the GUI, go to *Network* > *Interfaces*, edit a LAN interface, enable *Device detection*, and click *OK*. In the CLI:

```
config system interface
    edit <name>
        set device-identification enable
    next
end
```

You can further refine OT and IoT device detection by excluding OT and/or IoT application control signatures in the CLI.

```
config system interface
    edit <name>
        set device-identification enable
        set exclude-signatures {iot ot}
    next
end
```

Command	Description
device-identification {enable | disable}	Enable/disable passively gathering of device identity information about the devices on the network connected to this interface (default = disable).
exclude-signatures {iot ot}	Exclude OT and/or IoT application control signatures. This option is hidden when device-identification is disabled.

For example, when an IoT application control signature is excluded from device detection (`exclude-signatures iot`), IoT devices are not detected.

When OT and IoT signatures are included in the policy interfaces, FortiGate automatically creates and applies a built-in application list to ensure relative IoT and OT device categories are active.

A firewall policy with `utm-status` enabled must be configured for the LAN interface for OT and IoT device detection to occur.

Virtual patching profiles

A virtual patching profile can be applied to firewall policies in any direction, protecting traffic from or to the vulnerable OT and IoT devices. Virtual patching profiles can also be combined with virtual patching on NAC policies, so that vulnerable OT and IoT devices are first assigned to a protected VLAN, and then firewall policies associated with the VLAN will apply the virtual patching profile. See OT and IoT virtual patching on NAC policies on page 2300 for more information.

The following are requirements for the virtual patching feature:

- Purchase the appropriate OT-related license (virtual patching only applies to OT devices). See License and entitlement information for more details.
- Enable device detection on the LAN interface.
- Configure a firewall policy with `utm-status` enabled in order for device detection to occur.

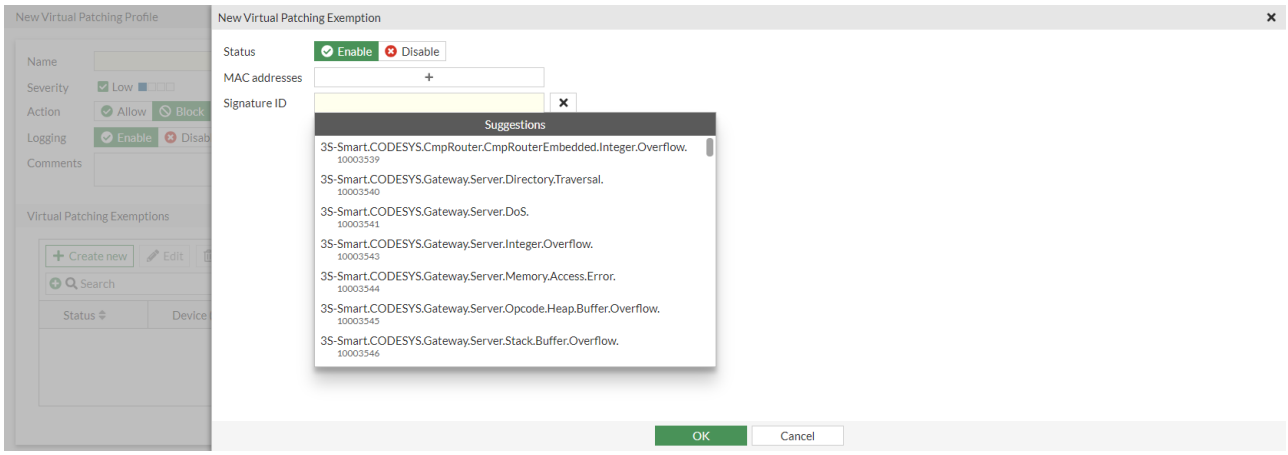
The following options can be configured in a virtual patching profile (see also OT virtual patching basic examples on page 2294):

GUI option	CLI option	Description
Basic profile settings		
Name	`name <string>`	Enter a unique name for the profile.
Severity	`severity {low medium high critical}`	Set the relative severity of the signature, from low to critical.
Action	`action {pass | block}`	Set the action to take for a matched device: • *Pass*/`pass`: allow sessions that match the profile. • *Block*/`block`: block sessions that match the profile (default).
Logging	`log {enable | disable}`	Enable/disable detection logging. This setting is enabled by default.
Comments	`comment <var-string>`	Enter a comment (optional).
Virtual patching exemptions settings		
Status	`status {enable | disable}`	Enable/disable exemption.
MAC addresses	`device <mac_address1>, <mac_address2>, ...`	Enter the device MAC addresses to exempt.
Signature ID	`rule <id1>, <id2>, ...`	Enter the predefined or custom signatures to exempt. See Virtual patching exemptions for more details.

To configure virtual patching in the GUI, ensure that *Virtual Patching* is enabled on the *System > Feature Visibility* page.

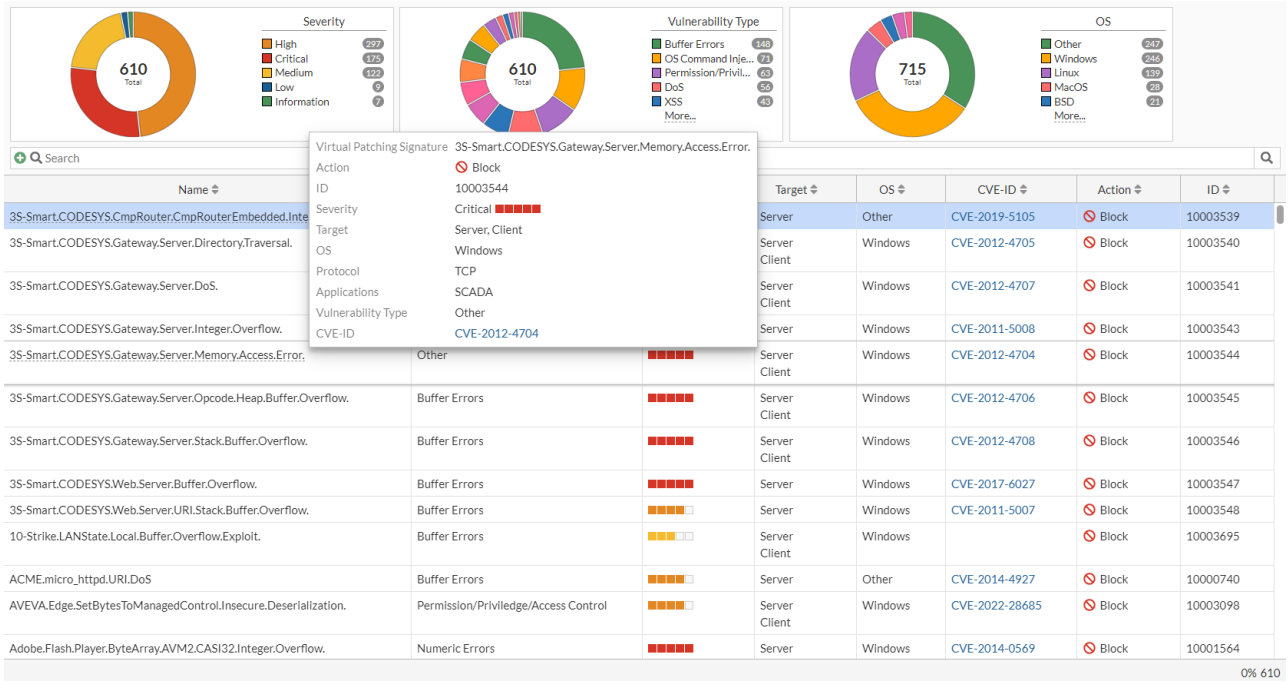
Virtual patching exemptions

The *Signature ID* field includes a dropdown below it with suggestions (signature name and ID). Users can select a signature from the *Suggestions* dropdown or type in the *Signature ID* field to find a specific signature.

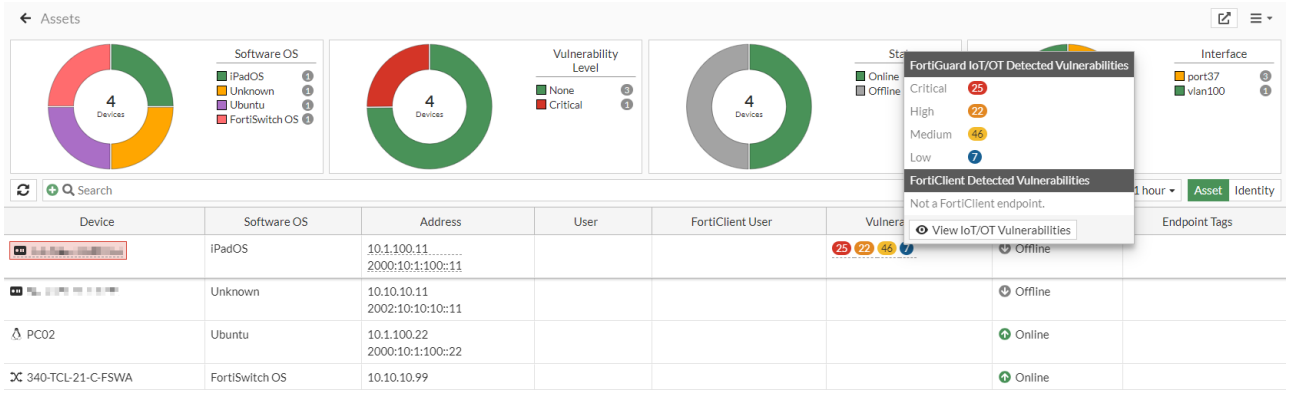


Virtual patching signatures

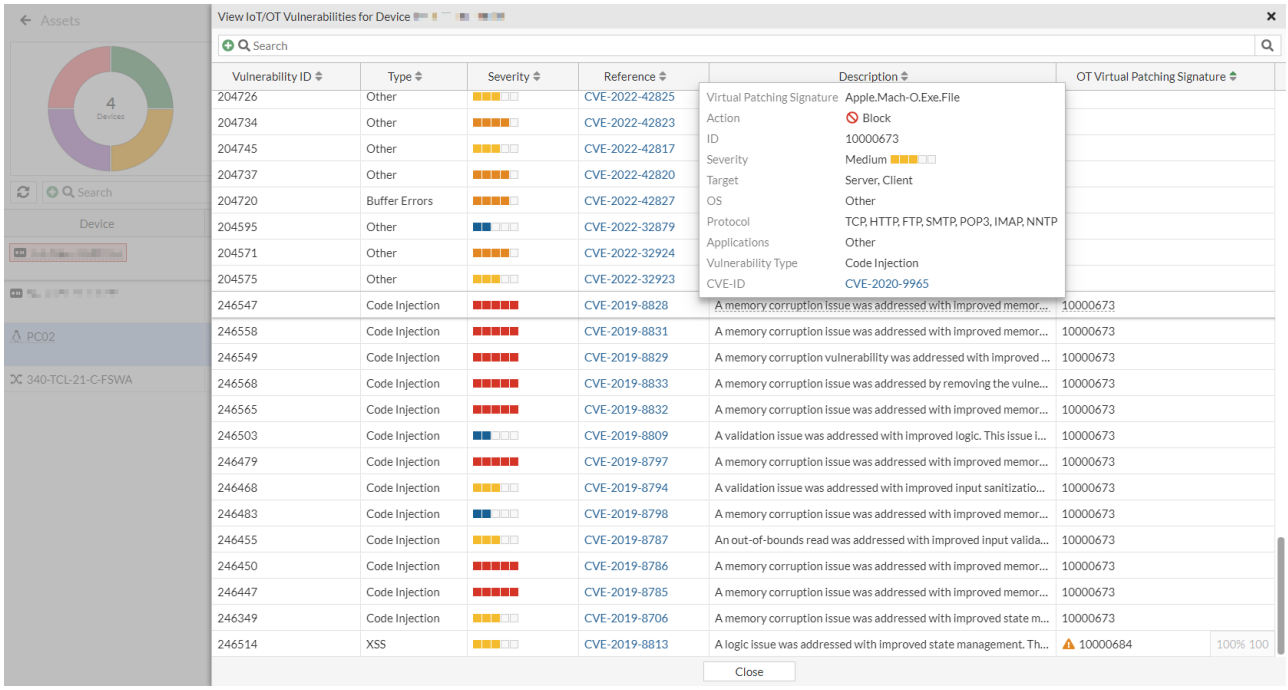
The *Security Profiles* > *Virtual Patching Signatures* page displays all OT virtual patching signatures. When using multi-VDOM mode, the OT virtual patching signatures are displayed per VDOM.



The *Dashboard* > *Assets & Identities* > *Assets* widget displays a tooltip for detected IoT and OT vulnerabilities when hovering over the *Vulnerabilities* column.

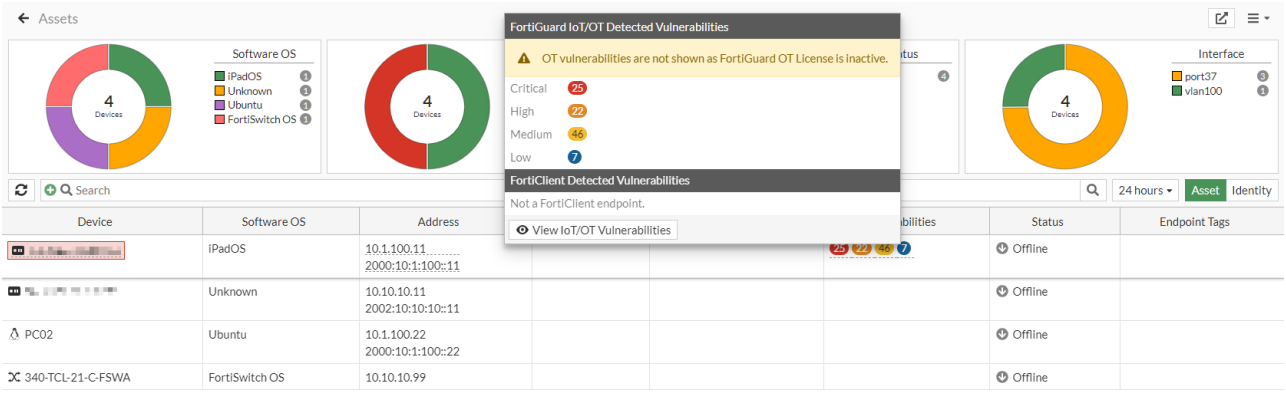


Clicking *View IoT/OT Vulnerabilities* in the tooltip displays a list of vulnerabilities retrieved from the FortiGuard API server for the device. The *OT Virtual Patching Signature* column includes the virtual patch signature ID that is mapped to the *Vulnerability ID*.



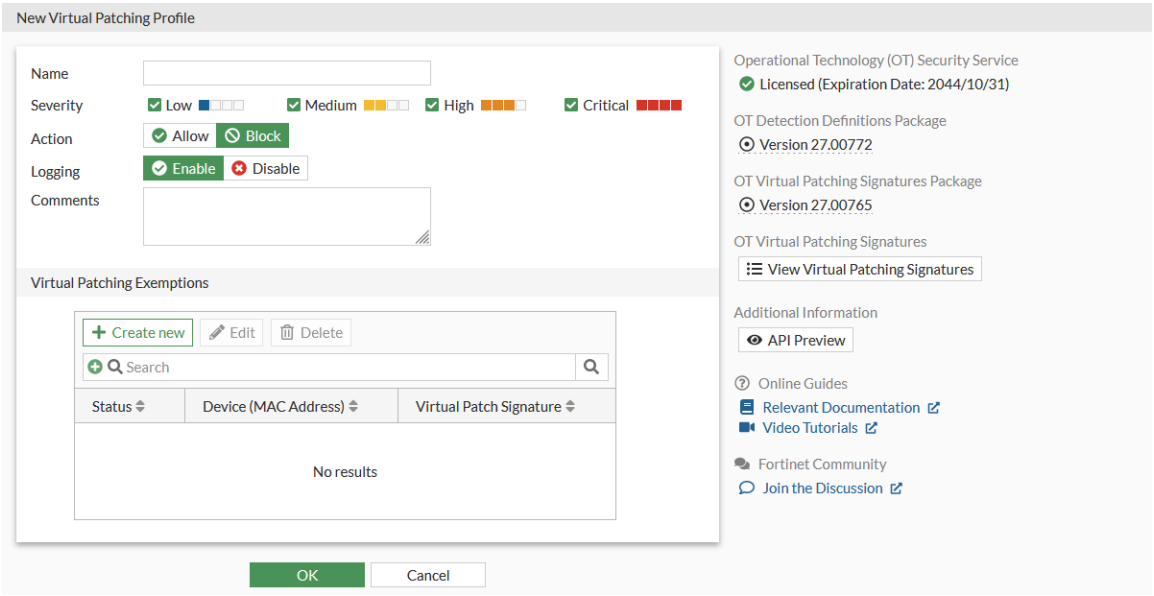
License and entitlement information

If a FortiGate does not have a valid OT license, a warning message is included in top of the IoT and OT vulnerabilities tooltip (*Assets* widget), indicating that OT vulnerabilities will not be detected.

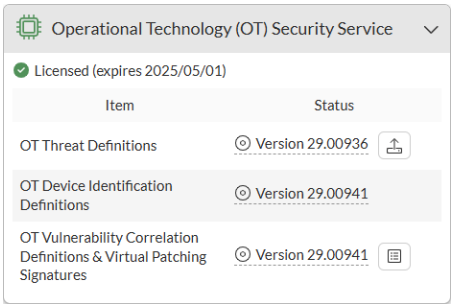


The right-side gutter of virtual patching profile pages includes information about the following:

- *Operational Technology (OT) Security Service* entitlement status
- *OT Detection Definitions Package* version
- *OT Virtual Patching Signatures Package* version



The *System* > *FortiGuard* > *Subscriptions* tab also includes the list of signatures under the *Operational Technology (OT) Security Service* entitlement.

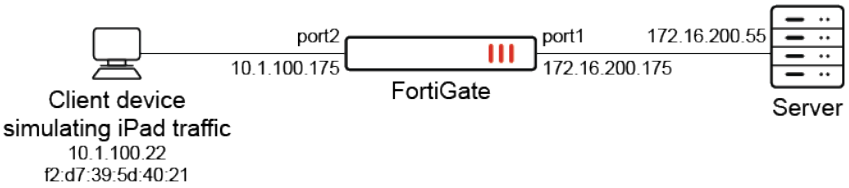


OT virtual patching basic examples

This topic contains two OT virtual patching examples: a basic configuration, and configuration that uses a NAC policy.

Example 1: basic configuration

This example demonstrates the flow for OT virtual patching from start to finish. First, a device (10.1.100.22) goes through device detection, which matches an OT detection signature downloaded on the FortiGate. Next, known vulnerabilities and OT patch signatures for this device are mapped to its MAC address. When traffic is generated by this device, IPS scans the traffic to identify any traffic patterns that match known OT patch signatures for this device. If a match is found, traffic is blocked by the FortiGate.



For demonstrative purposes, the simulated vulnerable OT device is a PC simulating web traffic from an iPad. An OT detection signature is specially crafted to match this Apple iPad traffic to the OT device category. To simulate vulnerable traffic, a test OT patch signature is used to match a generic cross-site scripting (XSS) attack over HTTP.

To verify the status of the OT related definitions:

1. Verify the current contracts licensed to the FortiGate:

```
# diagnose test update info
…
OTDT,Mon Sep 24 17:00:00 2029
OTVP,Mon Sep 24 17:00:00 2029
…
```

2. Verify the versions and status of the OT definitions:

```
# diagnose autoupdate versions
…
OT Detect Definitions
---------
Version: 23.00545 signed
Contract Expiry Date: Sun Sep 23 2029
Last Updated using manual update on Thu Jul 20 09:40:03 2023
Last Update Attempt: n/a
Result: Updates Installed
--
OT Patch Definitions
---------
Version: 23.00505 signed
```

```
Contract Expiry Date: Sun Sep 23 2029
Last Updated using manual update on Thu Jul 20 09:39:50 2023
Last Update Attempt: n/a
Result: Updates Installed
…
```

3. View the OT detection rules downloaded on the FortiGate. In this example, the OT detection rule ID 10000870 is a specially crafted signature to match Apple iPad traffic to the OT category:

```
# get rule otdt status
app-name: "Apple.iPad"
id: 10000870
category: "OT"
cat-id: 34
popularity: 5.low
risk: 1.medium
weight: 10
shaping: 0
protocol: 1.TCP, 9.HTTP
vendor: 7.Apple
technology: 0.Network-Protocol
behavior:
dev_cat: Other
```

4. View the OT patch rules downloaded on the FortiGate. In this example, the OT patch rule is a specially crafted signature to match a generic XSS attack to a vulnerability:

```
# get rule otvp status
rule-name: "WAP.Generic.XSS"
rule-id: 10000684
rev: 20.321
date: 1653379200
action: pass
status: enable
log: disable
log-packet: disable
severity: 2.medium
service: TCP, HTTP
location: server
os: Other
application: Other
rate-count: 0
rate-duration: 0
rate-track: none
rate-mode: continuous
vuln_type: XSS
cve: 20198625
```

To configure virtual patching in the GUI:

1. Enable device detection on port2 :
   a. Go to *Network* > *Interfaces* and edit port2.
   b. In the *Network* section, enable *Device detection*.
   c. Click *OK*.
2. Configure the virtual patching profile:
   a. Go to *Security Profiles* > *Virtual Patching* and click *Create New*.
   b. Configure the following settings:

Name	*test*
Severity	Select *Info*, *Low*, *Medium*, *High*, and *Critical*
Action	*Block*
Logging	*Enable*

   c. Click *OK*.
3. Apply the virtual patching profile to a firewall policy for traffic from port2 to port1:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. In the *Security Profiles* section, enable *Virtual Patching* and select the virtual patch profile (*test*).
   c. Set *SSL Inspection* to a profile that uses deep inspection profile in order to scan SSL encrypted traffic.
   d. Configure the other settings as needed.
   e. Click *OK*.

To configure virtual patching in the CLI:

1. Enable device detection on port2:

```
config system interface
    edit "port2"
        set device-identification enable
    next
end
```

2. Configure the virtual patching profile:

```
config virtual-patch profile
    edit "test"
        set comment ''
        set severity info low medium high critical
        set action block
        set log enable
    next
end
```

3. Apply the virtual patching profile to a firewall policy:

```
config firewall policy
    edit 1
```

```
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
        set virtual-patch-profile "default"
        set nat enable
    next
end
```

To test the virtual patching:

1. On the PC, generate traffic that simulates web traffic from an iPad. This traffic is generated in order for the FortiGate to perform device detection on port2. The OT detection signature 10000870 will be triggered, which considers this traffic from an OT device in this simulated scenario:

   ```
   # curl 172.16.200.55 -H "User-Agent: Mozilla/5.0 (iPad; CPU OS 12_5_5 like Mac OS X)
   AppleWebKit/605.1.15 (KHTML, like Gecko) Version/10.1.2 Mobile/15E148 Safari/604.1"
   ```

   A log is generated, indicating the traffic that triggered the match:

   ```
   3: date=2023-07-24 time=15:31:26 eventtime=1690237885960202460 tz="-0700" logid="1059028704"
   type="utm" subtype="app-ctrl" eventtype="signature" level="information" vd="root"
   appid=10000870 srcip=10.1.100.22 srccountry="Reserved" dstip=172.16.200.55
   dstcountry="Reserved" srcport=51548 dstport=80 srcintf="port2" srcintfrole="undefined"
   dstintf="port1" dstintfrole="undefined" proto=6 service="HTTP" direction="outgoing" policyid=1
   poluuid="a3424268-1ffc-51ed-3ba9-f3a60e2271cf" policytype="policy" sessionid=7284
   applist="default" action="pass" appcat="OT" app="Apple.iPad" hostname="172.16.200.55"
   incidentserialno=18882457 url="/" agent="Mozilla/5.0 (iPad; CPU OS 12_5_5 like Mac OS X)
   AppleWebKit/605.1.15 (KHTML, like Gecko) Version/10.1.2 Mobile/15E148 Safari/604.1"
   httpmethod="GET" msg="OT: Apple.iPad" clouddevice="Vendor=Apple, Product=ipados,
   Version=12.5.5, Firmware=IOS" apprisk="low"
   ```

   The FortiGate queries the FortiGuard OT query service with information about the OT device vendor and product. The service responds with the vulnerabilities and patch_sign_id applicable to this device. IPS caches this information in its device vulnerability database.
2. Verify the vulnerability by device MAC and IP address:

   ```
   # diagnose user-device-store device memory vulnerability-query f2:d7:39:5d:40:21 10.1.100.22
   Got 28 vulnerabilities, response size:1792
   [Vulnerability-0]
           'vulnerability_id' = '110977'
           'severity' = '2'
           'signature' = '10000684'
   ```

3. Verify the virtual patch signatures stored and enabled on the FortiGate:

```
# diagnose ips share list otvp_cfgcache
f2:d7:39:5d:40:21 1 10000684
```

4. Using the vulnerable device 10.1.100.22, generate vulnerable traffic to the destination server 172.16.200.55. The traffic from this IP and MAC address triggers OT patch signature 1000684 to match and is subsequently blocked by the firewall policy:

```
# curl -X POST http://172.16.200.55/'index.html?<javascript>'
```

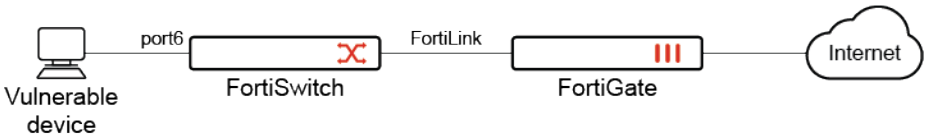
5. Verify the UTM virtual patch log that was recorded with information about the vulnerability that was virtually patched:

```
# execute log filter category 24
# execute log display
2 logs found.
2 logs returned.

1: date=2023-07-20 time=16:03:00 eventtime=1689894179977743851 tz="-0700" logid="2400064600"
type="utm" subtype="virtual-patch" eventtype="virtual-patch" level="warning" vd="root"
count=medium srcip=10.1.100.22 profiletype="Reserved" dstip=172.16.200.55 direction="Reserved"
srcintfrole="port2" dstintf="undefined" dstintfrole="port1" sessionid=undefined
eventtype="12514" action="dropped" proto=6 service="HTTP" policyid=1 poluuid="a3424268-1ffc-
51ed-3ba9-f3a60e2271cf" policytype="policy" attack="WAP.Generic.XSS" srcport=47830 dstport=80
hostname="172.16.200.55" url="/index.html?<javascript>" agent="curl/7.61.1" httpmethod="POST"
direction="outgoing" attackid=10000684
```

Example 2: NAC policy

In this example, a NAC policy is pre-configured to detect devices with information or higher vulnerabilities, as demonstrated in OT and IoT virtual patching on NAC policies on page 2300. The NAC policy assigns the devices to vlan300.



A virtual patching profile is created to block any vulnerabilities with low, medium, high, or critical severity. The profile is applied to a firewall policy for outbound traffic.

To configure virtual patching in the GUI:

1. Enable device detection on vlan300:
   a. Go to *Network* > *Interfaces* and edit vlan300.
   b. In the *Network* section, enable *Device detection*.
   c. Click *OK*.
2. Configure the virtual patching profile:
   a. Go to *Security Profiles* > *Virtual Patching* and click *Create New*, or edit an existing profile.
   b. Configure the following settings:

Name	*OT_check*
Severity	Select *Info*, *Low*, *Medium*, *High*, and *Critical*
Action	*Block*
Logging	*Enable*

c. Click *OK*.

3. Apply the virtual patching profile to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*, or edit an existing policy.
   b. In the *Security Profiles* section, enable *Virtual Patching* and select the virtual patch profile (*OT_check*).
   c. Configure the other settings as needed.
   d. Click *OK*.

To configure virtual patching in the CLI:

1. Enable device detection on vlan300:

```
config system interface
    edit "vlan300"
        set device-identification enable
    next
end
```

2. Configure the virtual patching profile:

```
config virtual-patch profile
    edit "OT_check"
        set severity info low medium high critical
    next
end
```

3. Apply the virtual patching profile to a firewall policy:

```
config firewall policy
    edit 1
        set name "virtualpatch-policy"
        set srcintf "vlan300"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set virtual-patch-profile "OT_check"
        set logtraffic all
    next
end
```

4. Verify the logs:

```
# execute log filter category utm-virtual-patch
# execute log display
...
1: date=2023-06-20 time=16:21:00 eventtime=1686180059982988434 tz="-0700" logid="2400064600"
type="utm" subtype="virtual-patch" eventtype="virtual-patch" level="warning" vd="root"

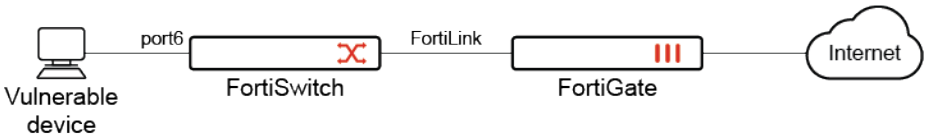
```

OT and IoT virtual patching on NAC policies

OT and IoT virtual patching can be applied to a NAC policy by setting the category to *Vulnerability* and configuring the *Match* criteria based on severity. Devices that match the criteria can be assigned and isolated to a NAC VLAN.

Example

In this example, a device with a certain vulnerability severity is detected by the NAC policy on the FortiGate. Subsequently, the FortiSwitch port in which it is connected to is moved to vlan300 where traffic can be controlled for vulnerable devices. For more information about NAC policies, see Defining a FortiSwitch NAC policy in the FortiLink Administration Guide. This example assumes the vlan300 has already been configured.



The following settings are required for IoT device detection:

- A valid Attack Surface Security Rating service license to download the IoT signature package.
- Enable device detection on the LAN interface used by IoT devices.
  - In the GUI, go to *Network* > *Interfaces*, edit a LAN interface, enable *Device detection*, and click *OK*.
  - In the CLI, enter:

    ```
    config system interface
        edit <name>
            set device-identification enable
        next
    end
    ```

- Configure a firewall policy with `utm-status` enabled in order for device detection to occur.

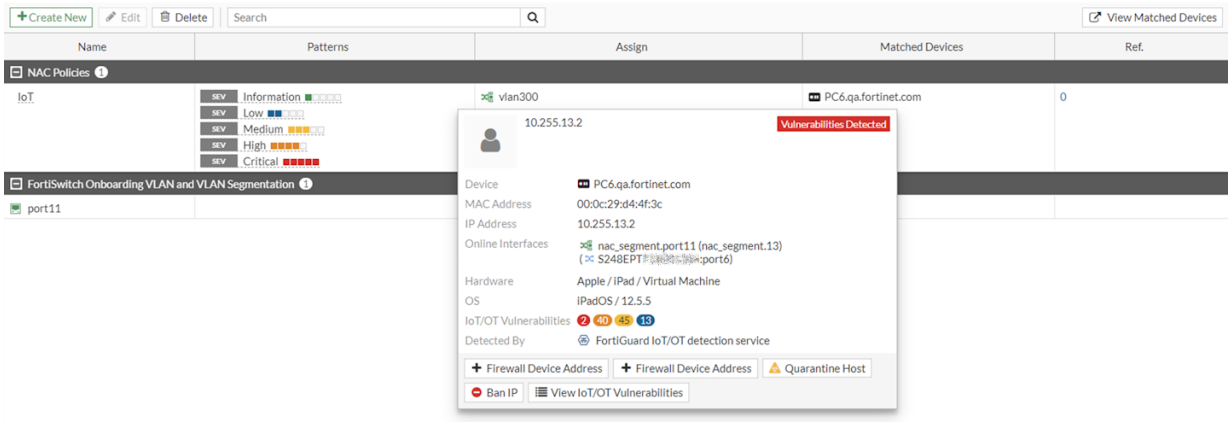
To configure virtual patching on NAC policies

1. Configure the NAC policy:
   a. Go to *WiFi & Switch Controller* > *NAC Policies* and click *Create New*, or edit an existing policy.
   b. In the *Device Patterns* section, set *Category* to *Vulnerability*.
   c. Set *Match* to *Severity is at least* and select a severity level (*Information* is used in this example).
   d. In the *Switch Controller Action* section, enable *Assign VLAN* and select *vlan300*.

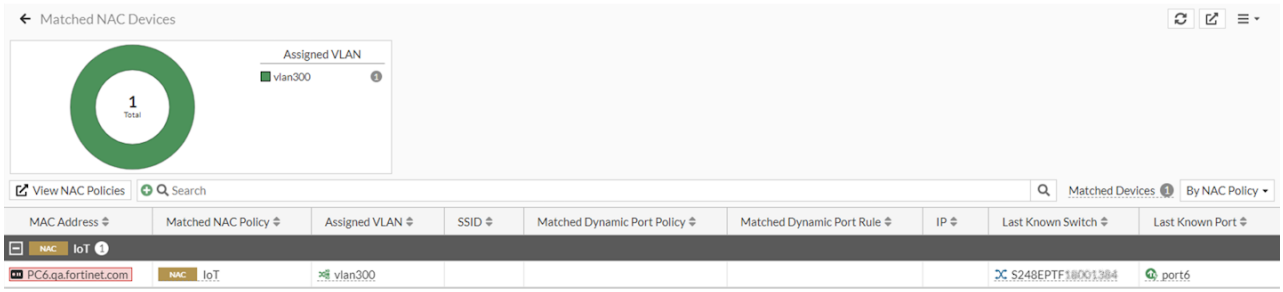
   e. Configure the other settings as needed.
   f. Click *OK*.
2. Enable NAC mode on the desired FortiSwitch ports (port6 in this example):
   a. Go to *WiFi & Switch Controller* > *FortiSwitch Ports*.
   b. Select *port6*, then right-click and set the *Mode* to *NAC*.
3. Enable utm-status on the firewall policy that is used to control outbound internet access for vulnerable devices (vlan300 to port1).

```
config firewall policy
    edit <name>
        set utm-status enable
    next
end
```

4. Generate traffic on the vulnerable client device.
5. Once the NAC policy is matched, go to *WiFi & Switch Controller* > *NAC Policies* to view the device matched to the policy.



The vulnerable device is also shown on *Dashboards* > *Assets & Identities* in the *Matched NAC Devices* widget.



To configure virtual patching on NAC policies in the CLI:

1. Configure the VLAN in the MAC policy:

```
config switch-controller mac-policy
    edit "IoT"
        set fortilink "fortilink"
        set vlan "vlan300"
    next
end
```

2. Configure the NAC policy:

```
config user nac-policy
    edit "IoT"
        set category vulnerability
        set severity 0 1 2 3 4
        set switch-fortilink "fortilink"
        set switch-mac-policy "IoT"
    next
end
```

3. Enable NAC mode on the desired FortiSwitch ports:

```
config switch-controller managed-switch
    edit "S248E**********"
```

```
        config ports
            edit "port6"
                set access-mode nac
            next
        end
    next
end
```

4. Configure a firewall policy with `utm-status` enabled to limit access for devices in this VLAN (vlan300).

SSL & SSH Inspection

Secure Sockets Layer (SSL) content scanning and inspection allows you to apply antivirus scanning, web filtering, and email filtering to encrypted traffic. You can apply SSL inspection profiles to firewall policies.

FortiOS includes four preloaded SSL/SSH inspection profiles, three of which are read-only and can be cloned:

- *certificate-inspection*
- *deep-inspection*
- *no-inspection*

The *custom-deep-inspection* profile can be edited, or you can create your own SSL/SSH inspection profiles.

Deep inspection (also known as SSL/SSH inspection) is typically applied to outbound policies where destinations are unknown. Depending on your policy requirements, you can configure the following:

- Which CA certificate will be used to decrypt the SSL encrypted traffic
- Which SSL protocols will be inspected
- Which ports will be associated with which SSL protocols for inspection
- Whether or not to allow invalid SSL certificates
- Whether or not SSH traffic will be inspected
- Which addresses or web category allowlists can bypass SSL inspection

The following topics provide information about SSL & SSH Inspection:

- Configuring an SSL/SSH inspection profile on page 2304
- Certificate inspection on page 2307
- Deep inspection on page 2310
- Protecting an SSL server on page 2313
- Handling SSL offloaded traffic from an external decryption device on page 2314
- SSH traffic file scanning on page 2317
- Redirect to WAD after handshake completion on page 2319
- HTTP/2 support in proxy mode SSL inspection on page 2320
- Define multiple certificates in an SSL profile in replace mode on page 2321
- Disabling the FortiGuard IP address rating on page 2323
- Block or allow ECH TLS connections on page 2324

Configuring an SSL/SSH inspection profile

The *custom-deep-inspection* profile can be edited or new SSL/SSH inspection profiles can be configured to be used in firewall policies.

To configure an SSL/SSH inspection profile in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*.
2. Configure the following settings:

Name		Enter a unique name for the profile.
Comments		Enter a comment (optional).
SSL Inspection Options		
	Enable SSL Inspection of	Enable SSL inspection of: • *Multiple Clients Connecting to Multiple Servers*: Use this option for generic policies where the destination is unknown. This is normally used when inspecting outbound internet traffic. Other *SSL Inspection Options* become available to configure if this option is selected. • *Protecting SSL Server*: Use this option when setting up a profile customized for a specific SSL server with a specific certificate. Define the certificate using the *Server certificate* field. See Protecting an SSL server on page 2313 for more information.
	Inspection method	Define the inspection method: • *SSL Certificate Inspection*: Only inspects the certificate, by way of the headers up to the SSL/TLS layer, and not the contents of the traffic. Allows Encrypted Client Hello (ECH) to be allowed or blocked. • *Full SSL Inspection*: Inspects the SSL/TLS encrypted traffic payload. See Deep inspection on page 2310.
	CA certificate	Use the dropdown menu to select one of the installed certificates for the inspection of the packets. Click *Download* to save the certificate.
	Blocked certificates	Block or allow potentially malicious certificates. Select *View Blocked Certificates* for a detailed list of blocked certificates, including the listing reason and date.
	Untrusted SSL certificates	Configure the action to take when a server certificate is not issued by a trusted CA. • *Allow*: Allow the untrusted server certificate. This is the default value. • *Block*: Block the session. • *Ignore*: This option is for *Full SSL inspection* only. It re-signs the server certificate as trusted. When configured in the GUI for certificate inspection it has no effect and the setting is not saved.

		Click *View Trusted CAs List* to see a list of the factory bundled and user imported CAs that are trusted by the FortiGate.
	Server certificate SNI check	Check the SNI in the hello message with the CN or SAN field in the returned server certificate: • *Enable*: If it is mismatched, use the CN in the server certificate for URL filtering. • *Strict*: If it is mismatched, close the connection. • *Disable*: Server certificate SNI check is disabled.
	Enforce SSL cipher compliance	Enable/disable SSL cipher compliance. This option is for *Full SSL inspection* only.
	Enforce SSL negotiation compliance	Enable/disable SSL negotiation compliance. This option is for *Full SSL inspection* only.
	RPC over HTTPS	Enable/disable inspection of Remote Procedure Calls (RPC) over HTTPS traffic. This option is for *Full SSL inspection* only.
	MAPI over HTTPS	Enable/disable inspection of Messaging Application Programming Interface (MAPI) over HTTPS traffic.
Protocol Port Mapping		
	Inspect all ports	Inspect all ports with the IPS engine by enabling *Inspect all ports*. Choose whether to disable *DNS over TLS*.
	HTTPS, SMTPS, POP3S, IMAPS, FTPS	If *Inspect all ports* is disabled, specify the port through which traffic will be inspected in the field next to the listed protocols. See Inspecting all ports on page 2307 for details.
	DNS over TLS	Enable/disable inspection of DNS over TLS.
	Encrypted Client Hello	Allow or block TLS connections that use Encrypted Client Hello (ECH).
	HTTP/3	When *Inspection method* is set to *SSL Certificate Inspection* or *HTTPS* is disabled, *HTTP/3* is set to *Bypass* and cannot be changed. When *Inspection method* is set to *Full SSL Inspection*, choose whether to *Inspect*, *Bypass*, or *Block* HTTP/3.
	DNS over QUIC	Available when *Inspection method* is set to *Full SSL Inspection*. Choose whether to *Inspect*, *Bypass*, or *Block* DNS over QUIC.
Exempt from SSL Inspection		These options are for *Full SSL inspection* only. Use the menus in this section to specify any reputable websites, FortiGuard Web Categories, or addresses that will be exempt from SSL inspection: • *Reputable Websites*: Enable this option to exempt any websites identified by FortiGuard as reputable. • *Web Categories*: The categories of *Finance and Banking*, *Health and Wellness*, and *Personal Privacy* have been added by default. These categories are the most likely to have applications that will require a specific certificate.

	• *Addresses*: These can be any of the address objects that have an interface of *any*. • *Log SSL exemptions*: Enable this option to log all SSL exemptions. See Exempt web sites from deep inspection on page 2312 for more information.
SSH Inspection Options	
SSH deep scan	Enable/disable SSH protocol packet deep scanning capabilities. *SSH port* will become available if *SSH deep scan* is enabled.
SSH port	Define what ports will search for SSH protocol packets: • *Any*: Select this option to search all traffic regardless of service or TCP/IP port for packets that conform to the SSH protocol. • *Specify*: Select this option and enter the port number to restrict the search for SSH protocol packets to the TCP/IP port number specified. This is not as comprehensive but it is easier on the performance of the firewall.
Common Options	
Invalid SSL certificates	Allow or block the passing of traffic in invalid certificates. Additional common options that provide more granularity with actions for different types of invalid SSL certificates will become available if *Invalid SSL certificates* is set to *Custom*: • *Expired certificates*: Action to take when the server certificate is expired. The default action is block. • *Revoked certificates*: Action to take when the server certificate is revoked. The default action is block. • *Validation timed-out certificates*: Action to take when the server certificate validation times out. For certificate inspection, the default action is allow. For deep inspection, the default action is Keep Untrusted & Allow. • *Validation failed certificates*: Action to take when the server certificate validation fails. The default action is block. For deep inspection, the above options have the following actions: • *Keep Untrusted & Allow*: Allow the server certificate and keep it untrusted. • *Block*: Block the certificate. • *Trust & Allow*: Allow the server certificate and re-sign it as trusted.
Log SSL anomalies	Enable this feature to record and log traffic sessions containing invalid certificates. By default, SSL anomalies logging is enabled. Logs are generated in the UTM log type under the SSL subtype when invalid certificates are detected.

3. Click *OK*.

Inspecting all ports

The behavior of inspecting all ports can be different between flow and proxy mode inspection when the inspection mode is configured in a firewall policy.

In proxy mode inspection, when deep inspection is enabled:

- If *Inspect all ports* is disabled, only the ports specified in the *Protocol Port Mapping* section will be scanned.
- If *Inspect all ports* is enabled, all ports will be scanned.

In flow mode inspection, when deep-inspection is enabled:

- All ports will be scanned, regardless of whether or not *Inspect all ports* is enabled or disabled.

When performing certificate inspection instead of deep inspection, flow and proxy mode inspection behave the same:

- If *Inspect all ports* is disabled, only the ports specified in the *Protocol Port Mapping* section will be scanned.
- If *Inspect all ports* is enabled, all ports will be scanned.

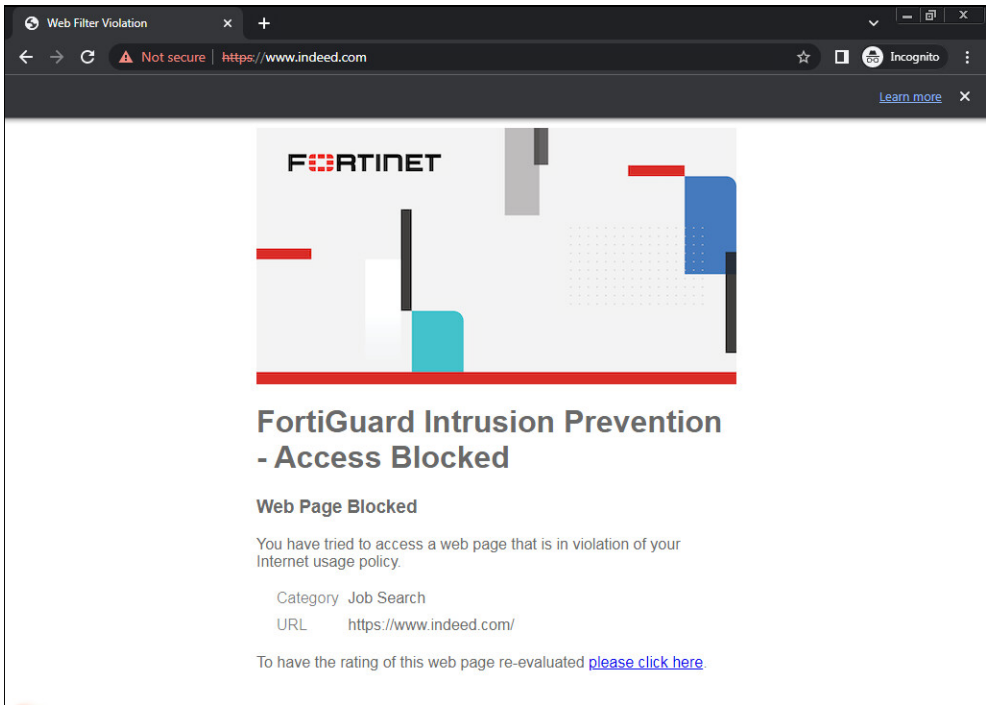
Certificate inspection

FortiGate supports certificate inspection. The default configuration has a built-in *certificate-inspection* profile which you can use directly. When you use certificate inspection, the FortiGate only inspects the headers up to the SSL/TLS layer.

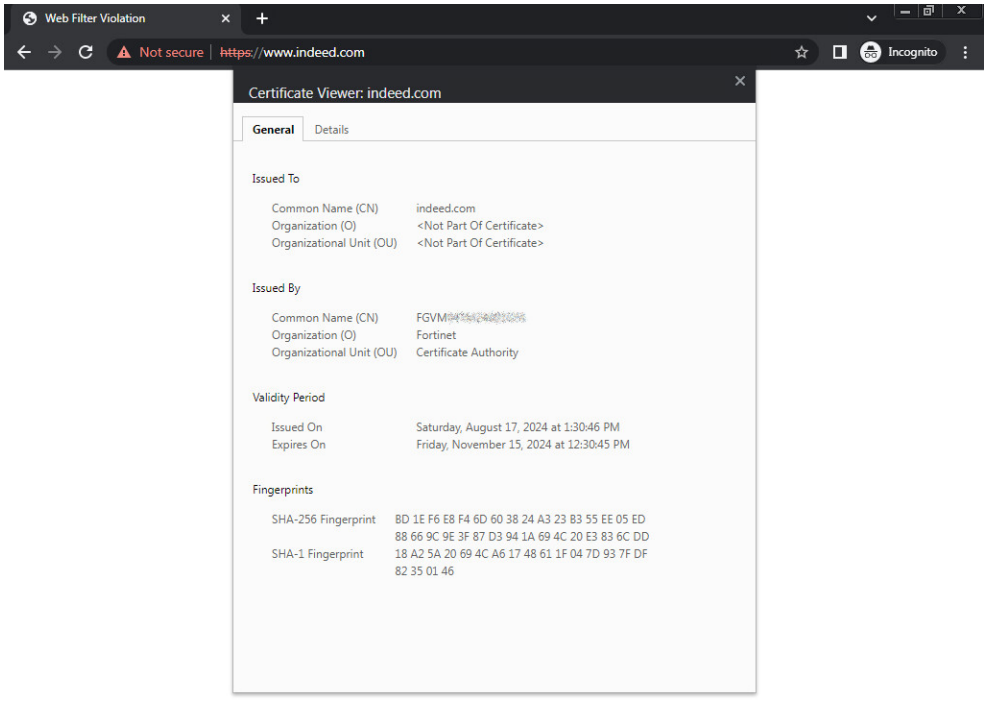
If you do not want to deep scan for privacy reasons but you want to control web site access, you can use *certificate-inspection*.

Replacement messages for HTTPS connections

When using certificate inspection in a firewall policy, a user will encounter a block page served in HTTPS when accessing an HTTPS web page that triggers a replacement message.



The replacement message can display for many reasons, such as a page being blocked by a web filter category, a page displaying a warning for a web filter category, a page requiring authentication, and so on. If you inspect the certificate, it shows that the replacement page is signed by the FortiGate CA.



For your clients to no longer see a warning message for an invalid certificate, install the respective CA certificate in the client's certificate store.

To download the CA certificate:

1. Go to *Security Profiles* > *SSL/SSH Inspection*.
2. Edit the SSL/SSH inspection profile that is being used in the firewall policy.
3. Beside the *CA Certificate* field, click *Download*.
4. Share and install this certificate on the client endpoints devices.

By default, the SSL/SSH inspection profile uses the *Fortinet_CA_SSL* certificate. You can customize this certificate by changing the selection in the *CA Certificate* field to another certificate in the FortiGate's certificate store.

Inspect non-standard HTTPS ports

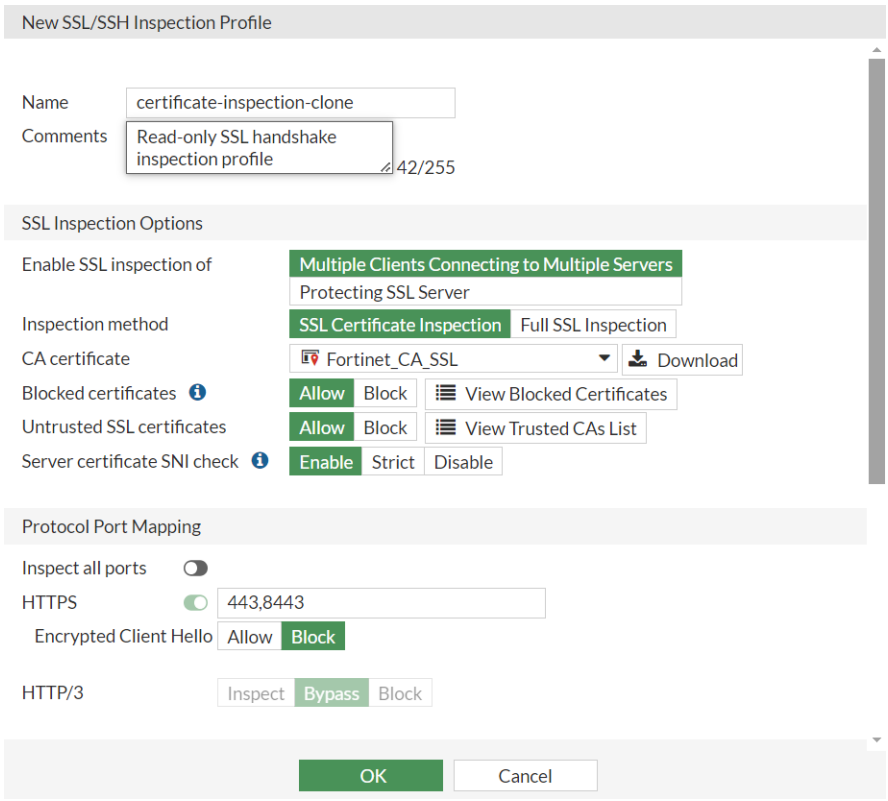
The built-in *certificate-inspection* profile is read-only and only listens on port 443. If you want to make changes, you must create a new certificate inspection profile.

If you know the non-standard port that the web server uses, such as port 8443, you can add this port to the *HTTPS* field.

To add a port to the inspection profile in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection*.
2. Create a new profile, or clone the default profile.
3. If you do no know what port is used in the HTTPS web server, under *Protocol Port Mapping*enable *Inspect All Ports*.

   If you know the port, such as port 8443, then set *HTTPS* to *443,8443*.



4. Configure the remaining setting as needed.
5. Click *OK*.

Common options

Invalid SSL certificates can be blocked, allowed, or a different actions can be configured for the different invalid certificates types. See Configuring an SSL/SSH inspection profile on page 2304.

Deep inspection

You can configure address and web category allowlists to bypass SSL deep inspection.

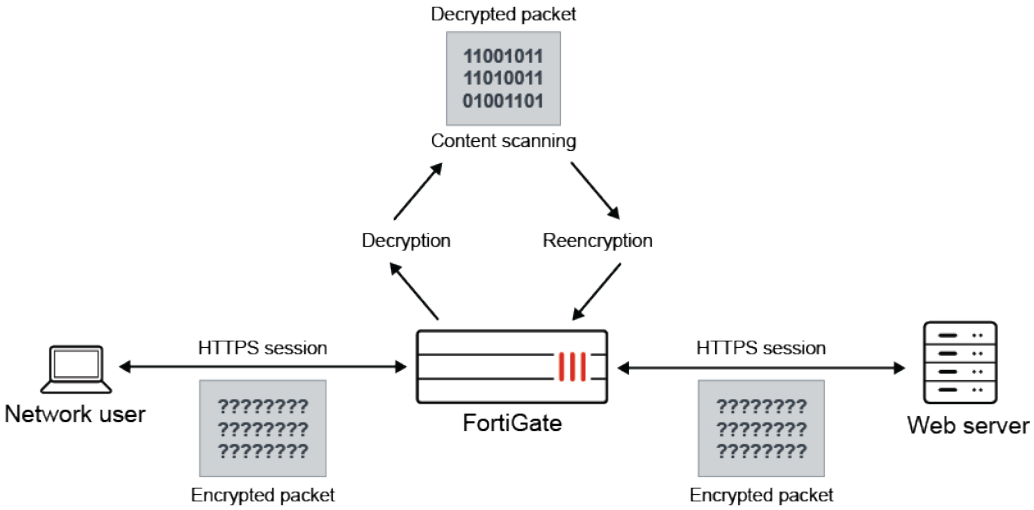
Reasons for using deep inspection

While Hypertext Transfer Protocol Secure (HTTPS) offers protection on the Internet by applying Secure Sockets Layer (SSL) encryption to web traffic, encrypted traffic can be used to get around your network's normal defenses.

For example, you might download a file containing a virus during an e-commerce session, or you might receive a phishing email containing a seemingly harmless download that, when launched, creates an encrypted session to a command and control (C&C) server and downloads malware onto your computer. Because the sessions in these attacks are encrypted, they might get past your network's security measures.

When you use deep inspection, the FortiGate impersonates the recipient of the originating SSL session, then decrypts and inspects the content to find threats and block them. It then re-encrypts the content and sends it to the real recipient.

Deep inspection not only protects you from attacks that use HTTPS, it also protects you from other commonly-used SSL-encrypted protocols such as SMTPS, POP3S, IMAPS, and FTPS.



Protocol port mapping

To optimize the FortiGate's resources, the mapping and inspection of the following protocols can be enabled or disabled:

- HTTPS
- SMTPS
- POP3S
- IMAPS
- FTPS
- DNS over TLS

Each protocol has a default TCP port. The ports can be modified to inspect any port with flowing traffic. The packet headers indicate which protocol generated the packet.

Protocol port mapping only works with proxy-based inspection. Flow-based inspection inspects all ports regardless of the protocol port mapping configuration.

Browser messages when using deep inspection

When the FortiGate re-encrypts the content, it uses a stored certificate, such as *Fortinet_CA_SSL*, *Fortinet_CA_Untrusted*, or your own CA certificate that you uploaded.

Because there is no *Fortinet_CA_SSL* in the browser trusted CA list, the browser displays an untrusted certificate warning when it receives a FortiGate re-signed server certificate. To stop the warning messages, trust the FortiGate-trusted CA *Fortinet_CA_SSL* and import it into your browser.

If you still get messages about untrusted certificates after importing *Fortinet_CA_SSL* into your browser, it is due to *Fortinet_CA_Untrusted*. Never import the *Fortinet_CA_Untrusted* certificate into your browser.

To import *Fortinet_CA_SSL* into your browser:

1. On the FortiGate, go to *Security Profiles* > *SSL/SSH Inspection* and edit the *deep-inspection* profile.
   The default *CA Certificate* is *Fortinet_CA_SSL*.
2. Click *Download* and save the certificate to the management computer.
3. On the client PC, use the *Certificate Import Wizard* to install the certificate into the *Trusted Root Certificate Authorities* store.
   If a security warning appears, select *Yes* to install the certificate.

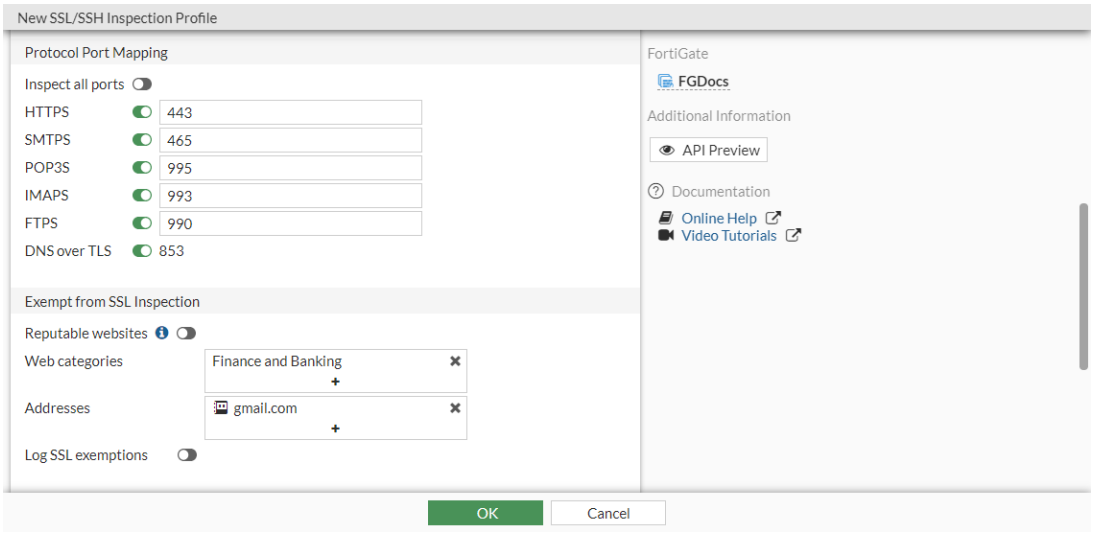
You can upload and distribute CA certificates using a group policy on multiple Windows devices that are part of an Active Directory. See Distribute certificates to Windows devices by using Group Policy.

Exempt web sites from deep inspection

If you do not want to apply deep inspection for privacy or other reasons, you can exempt the session by address, category, or allowlist.

If you know the address of the server you want to exempt, you can exempt that address. You can exempt specific address type including IP address, IP address range, IP subnet, FQDN, wildcard-FQDN, and geography.

If you want to exempt all bank web sites, an easy way is to exempt the *Finance and Banking* category, which includes all finance and bank web sites identified in FortiGuard. For information about creating and using custom local and remote categories, see Web rating override on page 2345 and External feeds on page 4068.



If you want to exempt commonly trusted web sites, you can bypass the SSL allowlist in the SSL/SSH profile by enabling *Reputable websites*. The allowlist includes common web sites trusted by FortiGuard.

SSL version support

There are two ways to limit which SSL versions deep inspection is applied to.

- In the global attributes:

```
config system global
    set strong-crypto enable
end
```

- In the protocol configuration of a deep inspection profile:

```
config firewall ssl-ssh-profile
    edit <name>
        config {ssl | https | ftps}
            set min-allowed-ssl-version {ssl-3.0 | tls-1.0 | tls-1.1 | tls-1.2 | tls-1.3}
        end
    next
end
```

Enabling `strong-crypto` in the global attributes sets the `min-allowed-ssl-version` to `tls-1.1` by default.

When a session is attempted using an SSL version below the minimum allowed version, the session can be blocked (default) or allowed.

To configure the action based on the SSL version used being unsupported:

```
config firewall ssl-ssh-profile
    edit <name>
        config {ssl | https | ftps | imaps | pop3s | smtps | dot}
            set unsupported-ssl-version {allow | block}
        end
    next
end
```

Flow-based inspection does not support SSL version control.

HTTPS and DOT options can enable QUIC inspection using the `set quic inspect` command. See DNS over QUIC and DNS over HTTP3 for transparent and local-in DNS modes on page 2069 for more information.

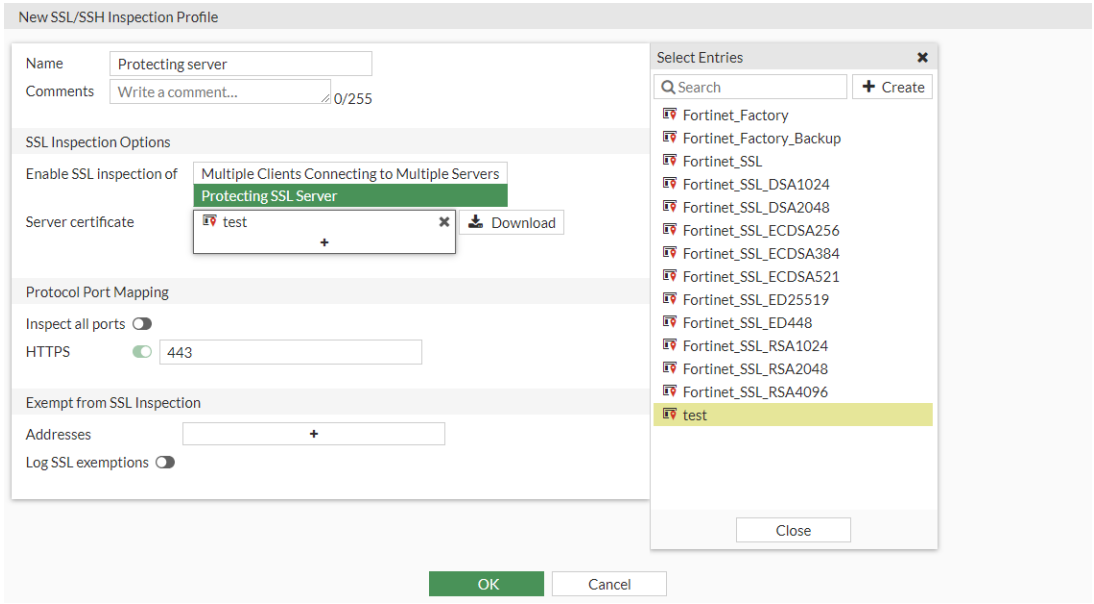
Protecting an SSL server

The *Protecting SSL Server* option of the SSL/SSH Inspection profile is typically applied to an inbound firewall policy for clients on the internet that access a server behind the FortiGate. FortiGate uses the server certificate of the protected server to simulate the real server, which enables FortiGate to decrypt and inspect traffic

destined to the real server. Therefore, a valid server certificate must be installed on the FortiGate to enable traffic inspection.

To upload a server certificate into FortiGate and use that certificate in the SSL/SSH inspection profile:

1. Go to *System* > *Certificates*.
2. Select *Import* > *Local Certificate* and upload the certificate.
3. Go to *Security Profiles* > *SSL/SSH Inspection* and edit or create a new profile.
4. For *Enable SSL Inspection of*, select *Protecting SSL Server*.
5. For *Server Certificate*, click the *+* and select the local certificate you imported.



6. Click *OK*.

When you apply the *Protecting SSL Server* profile in a policy, the FortiGate will send the server certificate to the client as your server does.

Handling SSL offloaded traffic from an external decryption device

In scenarios where the FortiGate is sandwiched between load-balancers and SSL processing is offloaded on the external load-balancers, the FortiGate can perform scanning on the unencrypted traffic by specifying the `ssl-offloaded` option in firewall `profile-protocol-options`. This option is supported in proxy and flow mode (previous versions only supported proxy mode).

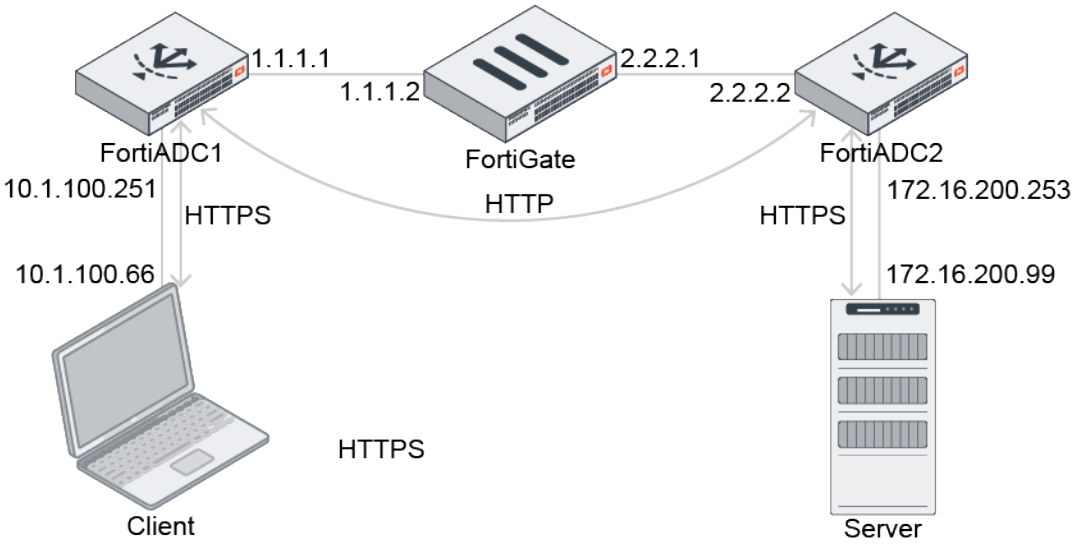
If the FortiGate receives an AUTH TLS, PBSZ, or PROT command before receiving plain text traffic from a decrypted device, by default, it will expect encrypted traffic, determine that the traffic belongs to an abnormal protocol, and bypass the traffic.

When the `ssl-offloaded` command is enabled, the AUTH TLS command is ignored, and the traffic is treated as plain text rather than encrypted data. SSL decryption and encryption are performed by the external device.

Sample topology

In this example, the FortiGate is between two FortiADCs and in SSL offload sandwich mode. The FortiGate receives plain text from ADC1 and forwards plain text to ADC2. There is no encrypted traffic passing through the FortiGate.

The client sends HTTPS traffic to ADC1, which then decrypts the traffic and sends HTTP to the FortiGate. The FortiGate forwards HTTP to ADC2, and the ADC2 re-encrypts the traffic to HTTPS.



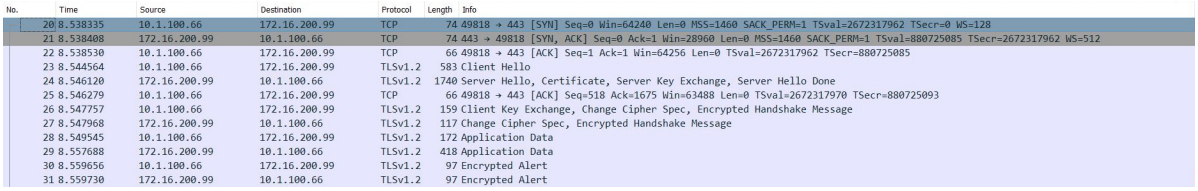
To configure SSL offloading:

```
config firewall profile-protocol-options
    edit "default-clone"
        config http
            set ports 80
            unset options
            unset post-lang
            set ssl-offloaded yes
        end
        config ftp
            set ports 21
            set options splice
            set ssl-offloaded yes
        end
        config imap
            set ports 143
            set options fragmail
            set ssl-offloaded yes
        end
        config pop3
            set ports 110
            set options fragmail
            set ssl-offloaded yes
        end
```

```
        config smtp
            set ports 25
            set options fragmail splice
            set ssl-offloaded yes
        end
    next
end
```

Verifying the packet captures

The ADC1 incoming port capture shows that ADC1 receives HTTPS traffic:



No.	Time	Source	Destination	Protocol	Length	Info
20	8.538335	10.1.100.66	172.16.200.99	TCP	74	49818 → 443 [SYN] Seq=0 Win=64240 Len=0 MSS=1460 SACK_PERM=1 TSval=2672317962 TSecr=0 WS=128
