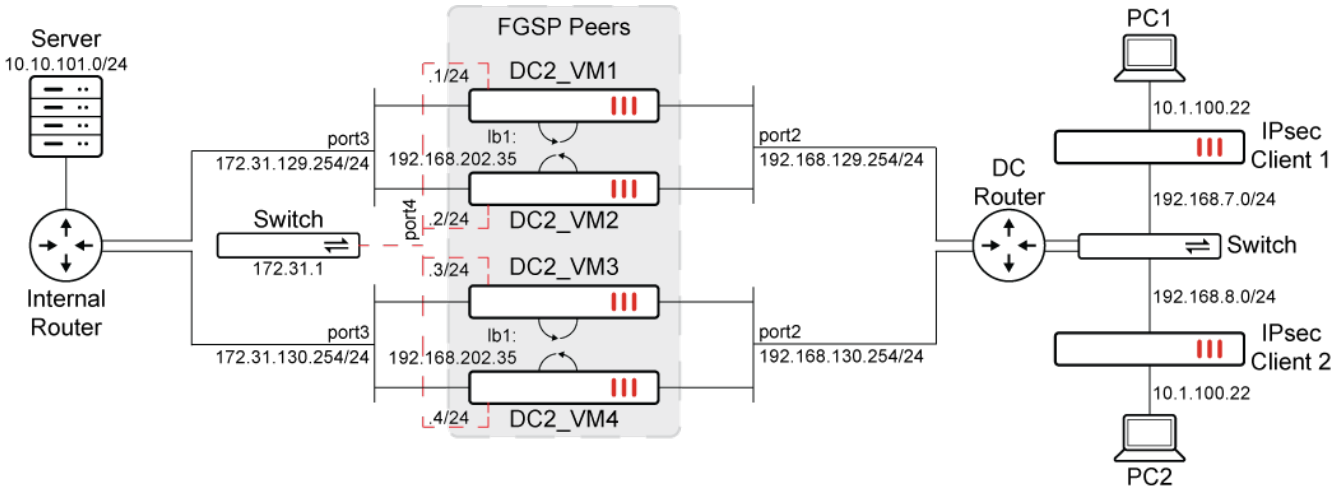
During FGSP per-tunnel failover for IPsec, the same IPsec dialup server configured on each FGSP member may establish tunnels with dialup clients as the primary gateway. The IPsec SAs are synchronized to all other FGSP peers that have FGSP synchronization for IPsec enabled. Other FGSP members may establish a tunnel with other clients on the same dialup server and synchronize their SAs to other peers.

Upon the failure of the FGSP member that is the primary gateway for a tunnel, the upstream router will fail over the tunnel traffic to another FGSP member. The other FGSP member will move from standby to the primary gateway for that tunnel and continue to forward traffic.

```
config vpn ipsec phase1-interface
    edit <name>
        set fgsp-sync {enable | disable}
    next
end
```

Example

In this example, the FGSP peers are connected on port4 over 172.31.1.1-4/24. Each peer has a loopback interface, lb1, with the same IP address. This loopback interface is used as the local gateway on each of the phase 1 connections to avoid each FGSP member having different IPs on port2. The DC Router uses ECMP to distribute traffic to each FGSP peer. It is assumed that the networking addresses are already configured properly.



Interface/setting	DC1_VM1	DC1_VM2	DC1_VM3	DC1_VM4
port2	192.168.125.254/24	192.168.126.254/24	192.168.127.254/24	192.168.128.254/24
port3	172.31.125.254/24	172.31.126.254/24	172.31.127.254/24	172.31.128.254/24
port4	172.31.1.1/24	172.31.1.2/24	172.31.1.3/24	172.31.1.4/24
lb1	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32
`fgsp-sync`	Enabled	Enabled	Enabled	Disabled

Out of the four FGSP peers, DC1_VM1, DC1_VM2, and DC1_VM3 have `fgsp-sync` enabled in their IPsec phase 1 configurations. This allows the three FGSP members to synchronize IPsec SAs as clients establish dialup tunnels to them individually. DC1_VM4, which does not have `fgsp-sync` configured, will not participate in synchronizing IPsec SAs or establishing tunnels. The DC Router uses ECMP to route traffic to the destination 192.168.202.31 through each of the participating FGSP peers.

In a larger scale there may be many more IPsec dialup clients connecting, with each eligible FGSP peer being the primary gateway for a set of dialup tunnels, and is in standby for the rest of the tunnels. If an FGSP peer fails, traffic will fail over to other peers, and these peers will become primary gateways for the respective dialup tunnels.

To configure the FGSP peers (DC1_VM1):

The following steps are to configure DC1_VM1. The other peers have similar configurations based on the preceding table. In the `config vpn ipsec phase1-interface` settings, all peers should have the same local gateway external interface (192.168.202.31).

1. Configure the FGSP settings:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    config cluster-peer
```

```
        edit 1
            set peerip 172.31.1.2
        next
        edit 2
            set peerip 172.31.1.3
        next
        edit 3
            set peerip 172.31.1.4
        next
    end
end
```

2. Configure the VPN tunnel phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "vpn1"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set local-gw 192.168.202.31
        set keylife 90000
        set peertype one
        set net-device disable
        set proposal aes128-sha1
        set dpd on-idle
        set dhgrp 2
        set fgsp-sync enable
        set nattraversal disable
        set peerid "Nokia_Peer"
        set psksecret xxxxx
        set dpd-retryinterval 60
    next
end
```

3. Configure the VPN tunnel phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "vpn1"
        set phase1name "vpn1"
        set proposal aes128-sha1
        set keylifeseconds 10800
    next
end
```

To verify the configuration:

1. Once the FGSP members establish peering with each other, verify the standalone peers on DC1_VM1:

```
DC1_VM1 # diagnose sys ha standalone-peers
Group=1, ID=1
Detected-peers=3
Kernel standalone-peers: num=3.
```

```
peer0: vfid=0, peerip:port = 172.31.1.2:708, standalone_id=2
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
peer1: vfid=0, peerip:port = 172.31.1.3:708, standalone_id=3
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
peer2: vfid=0, peerip:port = 172.31.1.4:708, standalone_id=4
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
Kernel standalone dev_base:
        standalone_id=0:
        standalone_id=1:
                phyindex=0: mac=00:0c:29:22:00:6b, linkfail=1

        ...
        standalone_id=15:
```

2. Initiate a dialup tunnel connection from the IPsec Client 2 FortiGate (192.168.1.2).
3. Verify the tunnel list for vpn1_1 on each peer. The output shows the bi-directional SAs for that particular tunnel are synchronized to all participating FGSP peers.

```

d. DC1_VM4:

```
DC1_VM4 # diagnose vpn tunnel list name vpn1_1
list ipsec tunnel by names in vd 0
```

The IPsec tunnel `role=sync-primary`on DC1_VM1 indicates that the IPsec tunnel was established on the FortiGate and traffic is being forwarded. On DC1_VM2 and DC1_VM3, the IPsec tunnel `role=standby` indicates that they are synchronized from the FGSP peer and are in standby for traffic forwarding.

The IPsec SAs do not synchronize to DC1_VM4 because `fgsp-sync` is disabled.

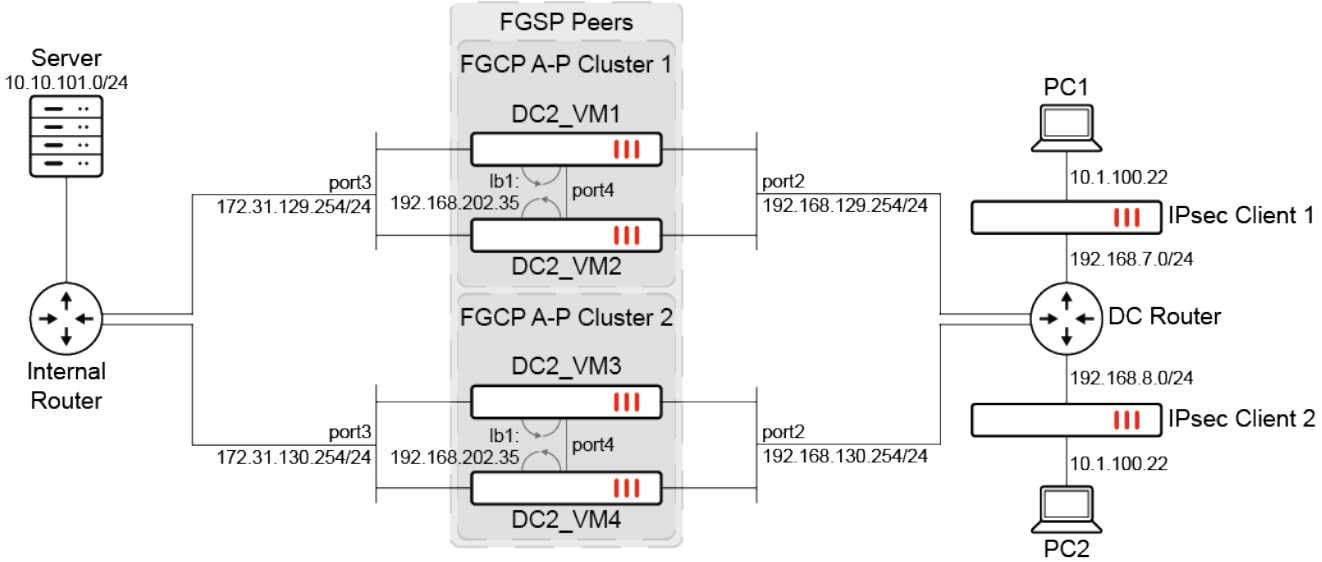
4. When a failure occurs on DC1_VM1, the tunnel traffic will fail over to either DC1_VM2 or DC1_VM3. Its tunnel role will become `role=sync-primary`.

FGCP over FGSP per-tunnel failover for IPsec

For additional redundancy, an FGCP cluster on one site may form FGSP peering with FGCP clusters on other sites. The FGCP over FGSP peers can still synchronize IPsec SAs and act as the primary gateway for individual tunnels for the same dialup servers. When failover happens within an FGCP cluster, tunnel traffic will failover to the other FGCP cluster member. When an FGCP cluster fails, tunnel traffic will failover to the other FGSP peer.

Example

In this example, each FGCP A-P cluster is connected on port4 as the heartbeat interface. The FGSP peers are connected on port5 over 172.31.2.1-2/24. Each FGSP peer and FGCP cluster has a loopback interface, lb1, with the same IP address. This loopback interface is used as the local gateway on each of the phase 1 connections to avoid each FGSP member having different IPs on port2. The DC Router uses ECMP to distribute traffic to each FGSP peer. It is assumed that the networking addresses are already configured properly.



Interface/setting	DC2_VM1	DC2_VM2	DC2_VM3	DC2_VM4
port2	192.168.129.254/24	192.168.129.254/24	192.168.130.254/24	192.168.130.254/24
port3	172.31.129.254/24	172.31.129.254/24	172.31.130.254/24	172.31.130.254/24

Interface/setting	DC2_VM1	DC2_VM2	DC2_VM3	DC2_VM4
port4	FGCP HA heartbeat interface	FGCP HA heartbeat interface	FGCP HA heartbeat interface	FGCP HA heartbeat interface
port5	172.31.2.1/24	172.31.2.1/24	172.31.2.2/24	172.31.2.2/24
lb1	192.168.202.35/32	192.168.202.35/32	192.168.202.35/32	192.168.205.35/32
fgsp-sync	Enabled	Enabled	Enabled	Enabled

There are two pairs of FGCP A-P HA clusters that form FGSP peering with each other. This is a typical FGCP over FGSP configuration used in large enterprises and service provider environments where high redundancy is needed. Each cluster uses the same loopback address for the local gateway. The DC Router uses ECMP to route traffic to the destination 192.168.202.31 through each of the participating FGSP peers.

In a larger scale there may be many more members in the FGCP clusters, more FGSP peers, and more IPsec dialup clients connecting. Each eligible FGSP peer will be the primary gateway for a set of dialup tunnels, and is in standby for the rest of the tunnels. When the FGCP cluster is configured in A-P mode, the tunnels will be established on the primary unit and synchronized to the standby unit.

The following configurations and example demonstrates PC1 initiating traffic to the Server. First, a dialup tunnel is formed between FortiGate IPsec Client 1 and DC2_VM1, which allows traffic to go through. IPsec SAs are synchronized to the FGCP standby unit, and to the FGSP peer. Upon failure of DC2_VM1, DC2_VM2 takes over as the primary of the HA cluster, and assumes the primary role for the failover tunnels.

If both DC2_VM1 and DC2_VM2 fail, the tunnels that were formed on this FGSP peer will now be re-routed to the other FGSP peer. The primary FGCP cluster member, DC2_VM3, will now pick up the tunnel traffic and assume the primary role for the failover tunnels.

To configure the HA clusters:

1. Configure FGCP A-P Cluster 1 (use the same configuration for DC2_VM1 and DC2_VM2):

```
config system ha
    set group-id 1
    set group-name "DC2_VM12"
    set mode a-p
    set password ********
    set hbdev "port4" 50
    set session-pickup enable
    set upgrade-mode simultaneous
    set override disable
    set priority 100
end
```

2. Configure FGCP A-P Cluster 2 (use the same configuration for DC2_VM3 and DC2_VM4):

```
config system ha
    set group-id 2
    set group-name "DC2_VM34"
    set mode a-p
    set password ********
    set hbdev "port4" 50
```

```
    set session-pickup enable
    set upgrade-mode simultaneou
    set override disable
    set priority 100
end
```

To configure the FGSP peers:

1. Configure DC2_VM1:

```
config system standalone-cluster
    set standalone-group-id 2
    set group-member-id 1
    config cluster-peer
        edit 1
            set peerip 172.31.2.2
        next
    end
end
```

   The configuration is automatically synchronized to DC2_VM2.

2. Configure DC2_VM3:

```
config system standalone-cluster
    set standalone-group-id 2
    set group-member-id 2
    config cluster-peer
        edit 1
            set peerip 172.31.2.1
        next
    end
end
```

   The configuration is automatically synchronized to DC2_VM4.

3. To configure the IPsec VPN settings (use the same configuration for DC2_VM1 and DC2_VM3).
   a. Configure the VPN tunnel phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "vpn1"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set local-gw 192.168.202.35
        set keylife 90000
        set peertype one
        set net-device disable
        set proposal aes128-sha1
        set add-route disable
        set dpd on-idle
        set dhgrp 2
        set fgsp-sync enable
```

```
        set nattraversal disable
        set peerid "Nokia_Peer"
        set psksecret ********
        set dpd-retryinterval 60
    next
end
```

b. Configure the VPN tunnel phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "vpn1"
        set phase1name "vpn1"
        set proposal aes128-sha1
        set keylifeseconds 10800
    next
end
```

To verify the configuration:

1. The FGCP HA cluster and the FGSP peering have formed. Verify the respective HA statuses.
   a. Verify the FGCP cluster status on DC2_VM1:

```
DC2_VM1 # diagnose sys ha status

HA information
Statistics
        traffic.local = s:0 p:439253 b:89121494
        traffic.total = s:0 p:440309 b:89242174
        activity.ha_id_changes = 2
        activity.fdb  = c:0 q:0

Model=80006, Mode=2 Group=1 Debug=0
nvcluster=1, ses_pickup=1, delay=0

[Debug_Zone HA information]

npuid=0
```

The IPsec tunnel `role=sync-primary`on DC2_VM1 indicates that it is being used to carry IPsec traffic. On DC2_VM2, DC2_VM3, and DC2_VM4, the IPsec tunnel `role=standby` indicates that they are in standby for traffic forwarding.

To test failover scenarios:

1. Verify the sniffer trace on DC2_VM1 before FGCP HA failover:

```
DC2_VM1 # diagnose sniffer packet any icmp 4
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
0.171753 vpn1 in 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.171763 port3 out 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.171941 port3 in 10.10.101.2 -> 10.10.1.2: icmp: echo reply
0.171947 vpn1 out 10.10.101.2 -> 10.10.1.2: icmp: echo reply
```

   Traffic passes through DC2_VM1.
2. Reboot the primary FortiGate, DC2_VM1.
3. Verify the sniffer trace on DC2_VM2 after FGCP HA failover:

```
DC2_VM2 # diagnose sniffer packet any icmp 4
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
0.111107 vpn1 in 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.111118 port3 out 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.111293 port3 in 10.10.101.2 -> 10.10.1.2: icmp: echo reply
0.111298 vpn1 out 10.10.101.2 -> 10.10.1.2: icmp: echo reply
^C
16 packets received by filter
0 packets dropped by kernel
```

   Traffic passes through DC2_VM2.
4. Verify the tunnel list for vpn1_1 on DC2_VM2:

```
DC2_VM2 # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=vpn1_1 ver=2 serial=4 192.168.202.35:0->192.168.7.2:0 tun_id=192.168.7.2 tun_

```

The role has changed to `role=sync-primary`.

5. Shut down DC2_VM1 and the DC2_VM2 IPsec uplink interface.
6. Verify the sniffer trace on DC2_VM3. As expected, traffic now passes through DC2_VM3:

```
DC2_VM3 # diagnose sniffer packet any icmp 4
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
0.165088 vpn1 in 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.165102 port3 out 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.165294 port3 in 10.10.101.2 -> 10.10.1.2: icmp: echo reply
0.165301 vpn1 out 10.10.101.2 -> 10.10.1.2: icmp: echo reply
^C
14 packets received by filter
0 packets dropped by kernel
```

7. Verify the tunnel list for vpn1_1 on DC2_VM3:

```
DC2_VM3 # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=vpn1_1 ver=2 serial=4 192.168.202.35:0->192.168.7.2:0 tun_id=192.168.7.2 tun_

npuid=0
```

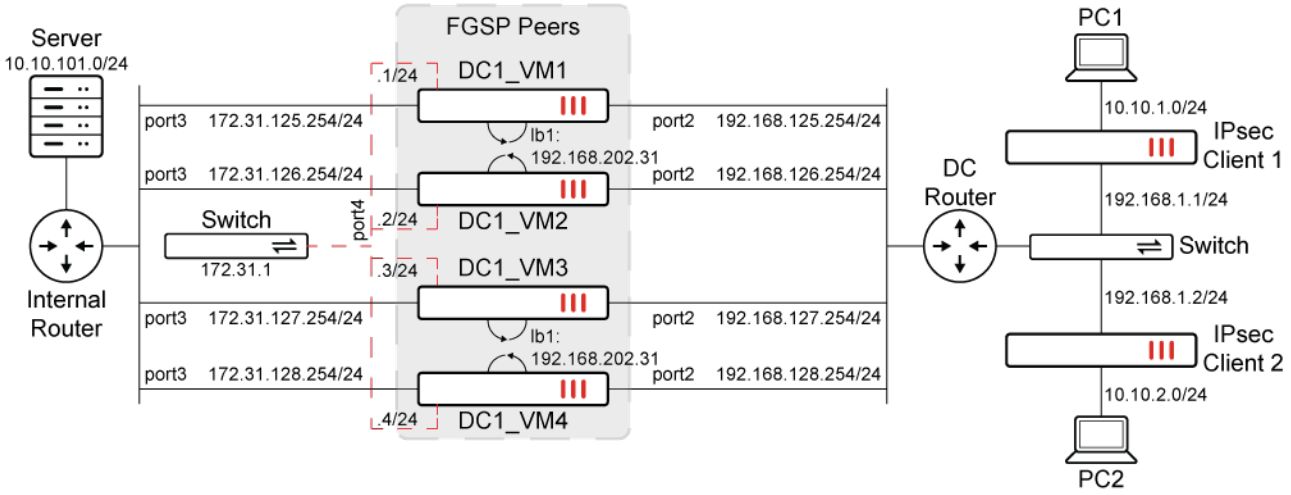
The role has changed to `role=sync-primary`.

Allow IPsec DPD in FGSP members to support failovers

In conjunction with support for FGSP per-tunnel failover for IPsec on page 3484, configuring DPD (dead peer detection) on an FGSP member is permitted. This allows a failed FGSP member to send out DPD probes during failover to detect unreachable remote peers and to flush the corresponding tunnels.

Example

In this example, using the same configuration as in FGSP per-tunnel failover for IPsec on page 3484, a tunnel can be established from one of the remote IPsec clients to one of the FGSP members (DC1_VM1). DPD can be set to `on-idle`, with a configured `dpd-retryinterval` of 60 seconds. When a client disappears, whether it is due to remote client failures or server-side routing failures, the FGSP member or gateway (DC1_VM1) will send out DPD probes for detection. Once the three iterations are complete and no responses are detected, the FGSP member will flush the tunnel and remove any routing to that peer.



Interface/setting	DC1_VM1	DC1_VM2	DC1_VM3	DC1_VM4
port2	192.168.125.254/24	192.168.126.254/24	192.168.127.254/24	192.168.128.254/24
port3	172.31.125.254/24	172.31.126.254/24	172.31.127.254/24	172.31.128.254/24
port4	172.31.1.1/24	172.31.1.2/24	172.31.1.3/24	172.31.1.4/24
lb1	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32
`fgsp-sync`	Enabled	Enabled	Enabled	Disabled

To configure the FGSP peers (DC1_VM1):

The following steps are to configure DC1_VM1. The other peers have similar configurations based on the preceding table. In the `config vpn ipsec phase1-interface` settings, all peers should have the same local gateway external interface (192.168.202.31). For DC1_VM4, `fgsp-sync` is disabled in the VPN tunnel phase 1 settings.

1. Configure the FGSP settings:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    config cluster-peer
        edit 1
            set peerip 172.31.1.2
        next
        edit 2
            set peerip 172.31.1.3
        next
        edit 3
            set peerip 172.31.1.4
        next
    end
end
```

2. Configure the VPN tunnel phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "vpn1"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set local-gw 192.168.202.31
        set keylife 90000
        set peertype one
        set net-device disable
        set proposal aes128-sha1
        set dpd on-idle
        set dhgrp 2
        set fgsp-sync enable
        set nattraversal disable
        set peerid "Nokia_Peer"
        set psksecret xxxxx
        set dpd-retryinterval 60
    next
end
```

3. Configure the VPN tunnel phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "vpn1"
```

```
        set phase1name "vpn1"
        set proposal aes128-sha1
        set keylifeseconds 10800
    next
end
```

To verify the configuration:

1. Once the FGSP members establish peering with each other, verify the standalone peers on DC1_VM1:

```
DC1_VM1 # diagnose sys ha standalone-peers
Group=1, ID=1
Detected-peers=3
Kernel standalone-peers: num=3.
peer0: vfid=0, peerip:port = 172.31.1.2:708, standalone_id=2
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
peer1: vfid=0, peerip:port = 172.31.1.3:708, standalone_id=3
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
peer2: vfid=0, peerip:port = 172.31.1.4:708, standalone_id=4
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
Kernel standalone dev_base:

Standalone configuration synchronization

You can configure synchronization from one standalone FortiGate to another standalone FortiGate (`standalone-config-sync`). With the exception of some configurations that do not sync (settings that identify the FortiGate to the network), the rest of the configurations are synced, such as firewall policies, firewall addresses, and UTM profiles.

This option is useful in situations when you need to set up FGSP peers, or when you want to quickly deploy several FortiGates with the same configurations. You can set up `standalone-config-sync` for multiple members.

`standalone-config-sync` is an independent feature and should be used with caution as there are some limitations. We recommend disabling it once the configurations have been synced over.

Limitations

When standalone configuration synchronization is enabled, there are some limitations, including but not limited to the following:

- Network interruptions occur during firmware upgrades: when upgrading the firmware, all members in the `standalone-config-sync` group are upgraded simultaneously. This creates downtime if the FortiGates are the only outgoing gateway in the network. We recommend disabling the option before upgrading firmware.
- Some unwanted configurations might be synced: the current design and implementation of `standalone-config-sync` is based on requirements from specific customers. Thus, some users may find that unwanted parts of the configurations are synced. Should this occur, we recommend disabling the option and modifying those configurations manually.
- The wrong primary device might be selected accidentally: `standalone-config-sync` is derived from the HA primary unit selection mechanism. All members in the group will join the selection process in the same way as a the HA cluster selection process. It is important to select the correct device as the primary, otherwise the wrong device could be selected and existing configurations could be overwritten.

Setting up standalone configuration synchronization

Two or more standalone FortiGates should be connected to each other with one or more heartbeat interfaces, either back-to-back or via a switch. In the following example, the device supplying the configurations is called "conf-prim," and the devices receiving the configurations are called "conf-secos."

To set up standalone configuration synchronization:

1. Configure the conf-prim device for the group:

```
config system ha
    set password **********
    set hbdev ha1 50 ha2 100
    set priority 255
```

```
    set override enable
    set standalone-config-sync enable
end
```

2. Configure the conf-prim device as needed to be functional.
3. Configure the other group members as conf-secos:

```
config system ha
    set password **********
    set standalone-config-sync enable
end
```

4. Wait 10–15 minutes for the configurations to sync over.
5. Verify the synchronization status:

```
# get system ha status
path=system, objname=ha, tablename=(null), size=5912
HA Health Status:

```

If all members are `in-sync`, this means all members share the same configurations, except those that should not be synced. If any members are `out-of-sync`, this means the member failed to sync with the primary device.

Debugging is similar when a cluster is out of sync.

The following topic provides more information about standalone configuration synchronization:

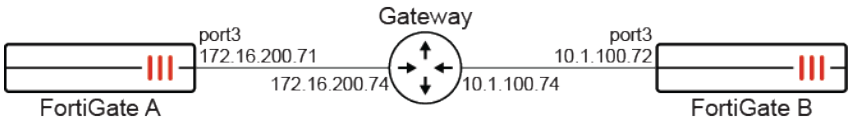
- Layer 3 unicast standalone configuration synchronization on page 3508

Layer 3 unicast standalone configuration synchronization

Unicast standalone configuration synchronization is supported on layer 3, allowing peers to be synchronized in cloud environments that do not support layer 2 networking. Configuring a unicast gateway allows peers to be in different subnets.

Example

In this example, two FortiGates in different subnets are connected through a unicast gateway. Both cluster members use the same port for the heartbeat interface.



To configure unicast synchronization between peers:

1. Configure FortiGate A:

```
config system ha
    set group-name "testcs"
    set password **********
    set hbdev "port3" 50
    set standalone-config-sync enable
    set unicast-status enable
    config unicast-peers
        edit 1
            set peer-ip 10.1.100.72
        next
    end
    set override enable
    set priority 200
```

```
    set unicast-gateway 172.16.200.74
end
```

2. Configure FortiGate B:

```
config system ha
    set group-name "testcs"
    set password **********
    set hbdev "port3" 50
    set standalone-config-sync enable
    set unicast-status enable
    config unicast-peers
        edit 1
            set peer-ip 172.16.200.71
        next
    end
    set override enable
    set priority 100
    set unicast-gateway 10.1.100.74
end
```

3. Check the HA status on FortiGate A:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-VM64
Mode: ConfigSync
Group Name: testcs
Group ID: 0
Debug: 0
Cluster Uptime: 2 days 3:40:25
Cluster state change time: 2021-03-08 12:00:38
Primary selected using:
    <2021/03/08 12:00:38> FGVMSLTM00000001 is selected as the primary because its override
priority is larger than peer member FGVMSLTM00000002.
    <2021/03/06 11:50:35> FGVMSLTM00000001 is selected as the primary because it's the only
member in the cluster.
ses_pickup: disable
override: enable
Configuration Status:
    FGVMSLTM21000151(updated 5 seconds ago): in-sync
    FGVMSLTM21000152(updated 5 seconds ago): in-sync
System Usage stats:
    FGVMSLTM21000151(updated 5 seconds ago):
        sessions=7, average-cpu-user/nice/system/idle=0%/0%/0%/100%, memory=24%
    FGVMSLTM21000152(updated 5 seconds ago):
        sessions=5, average-cpu-user/nice/system/idle=0%/0%/0%/100%, memory=23%
HBDEV stats:
    FGVMSLTM21000151(updated 5 seconds ago):
        port3: physical/1000auto, up, rx-bytes/packets/dropped/errors=466060007/1049137/0/0,
tx=429538329/953028/0/0
    FGVMSLTM21000152(updated 5 seconds ago):
```

```
        port3: physical/1000auto, up, rx-bytes/packets/dropped/errors=48805199/85441/0/0,
tx=33470286/81425/0/0
Primary     : FGT-71          , FGVMSLTM00000001, HA cluster index = 1
Secondary   : FGT-72          , FGVMSLTM00000002, HA cluster index = 0
number of vcluster: 1
vcluster 1: work 0.0.0.0
Primary: FGVMSLTM00000001, HA operating index = 0
Secondary: FGVMSLTM00000002, HA operating index = 1
```

4. Check the HA checksums on FortiGate A:

```
# diagnose sys ha checksum cluster

================== FGVMSLTM00000001 ==================

is_manage_primary()=1, is_root_primary()=1
debugzone
global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee
root: 16 af 5d a4 ac cf a5 4b b7 22 93 ce f9 02 68 bc
all: 6e 28 7f 8a 74 f7 37 43 8f 32 73 68 1e d6 ca cd

checksum
global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee
root: 16 af 5d a4 ac cf a5 4b b7 22 93 ce f9 02 68 bc
all: 6e 28 7f 8a 74 f7 37 43 8f 32 73 68 1e d6 ca cd

================== FGVMSLTM00000002 ==================

is_manage_primary()=0, is_root_primary()=1
debugzone
global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee
root: 16 af 5d a4 ac cf a5 4b b7 22 93 ce f9 02 68 bc
all: 6e 28 7f 8a 74 f7 37 43 8f 32 73 68 1e d6 ca cd

checksum
global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee
root: 16 af 5d a4 ac cf a5 4b b7 22 93 ce f9 02 68 bc
all: 6e 28 7f 8a 74 f7 37 43 8f 32 73 68 1e d6 ca cd
```

5. Verify that configuration changes on the primary FortiGate are synchronized to the secondary FortiGate:
   a. Adjust the administrator timeout value on FortiGate A:

```
config system global
    set admintimeout 100
end
```

   b. Check the debug messages on FortiGate B:

```
# diagnose debug cli 7
Debug messages will be on for 30 minutes.

# diagnose debug enable
```

```
create pid=15639, clictxno=0, last=1615246288
0: conf sys global
0: set admintimeout 100
0: end
```

VRRP

A Virtual Router Redundancy Protocol (VRRP) configuration can be used as a high availability solution to ensure that a network maintains connectivity with the internet (or with other networks) even if the default router for the network fails. If a router or a FortiGate fails, all traffic to this device transparently fails over to another router or FortiGate that takes over the role of the failed device. If the failed device is restored, it will take over processing the network traffic.

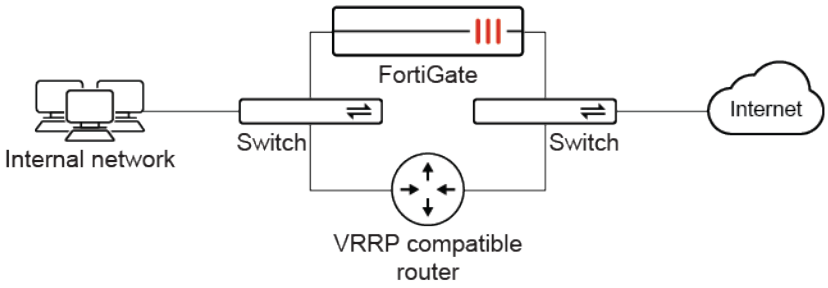
FortiOS supports VRRP versions 2 and 3. VRRP domains can be created, which can include multiple FortiGates and other VRRP-compatible routers. Different FortiGate models can be added to the same VRRP domain.

FortiOS supports IPv4 and IPv6 VRRP, so IPv4 and IPv6 VRRP virtual routers can be added to the same interface. FortiGates can quickly and easily integrate into a network that has already deployed VRRP.

Basic VRRP configuration

The most common VRRP application is to provide redundant default routers between an internal network and the internet. The default routers can be FortiGates or any routers that support VRRP.

Two or more FortiGate interfaces or routers must be configured with the same virtual router ID and IP address so they can automatically join the same VRRP domain. Priorities must be assigned to each FortiGate interface or router in the VRRP domain. All of the routers in the VRRP domain should have different priorities. One FortiGate interface or router must have the highest priority to become the primary router. The other FortiGates or routers in the domain are assigned lower priorities and become backups. If the primary router fails, VRRP automatically fails over to the router in the domain with the next highest priority.



To configure VRRP:

1. Add a virtual VRRP router to the internal interface of each FortiGate and/or router. This adds the FortiGates and routers to the same VRRP domain.
2. Set the VRRP IP address of the domain to the internal network default gateway IP address.
3. Set the priorities.

See Adding IPv4 and IPv6 virtual routers to an interface on page 3512 Single-domain VRRP example on page 3519, and Multi-domain VRRP example on page 3520 for configuration examples.

During normal operations, all traffic from the internal network to the internet passes through the primary VRRP router. The primary router also sends VRRP advertisement messages to the backup routers. A backup router will not attempt to become a primary router while receiving these messages. If the primary router fails, the backup router with the highest priority becomes the new primary router after a short delay. All packets sent to the default route are now sent to the new primary router. If the new primary router is a FortiGate, the network continues to benefit from FortiOS security features. If the new primary router is just a router, traffic continues to flow, but FortiOS security features are unavailable until the FortiGate is back online.

If the backup router is a FortiGate, during a VRRP failover as the FortiGate begins operating as the new primary router, it will not have session information for all of the failed over in-progress sessions. So, it would normally not be able to forward in-progress session traffic.

Adding IPv4 and IPv6 virtual routers to an interface

This topic describes to how to add IPv4 and IPv6 virtual routers to an interface. VRRP can only be configured on physical or VLAN interfaces. VRRP cannot be configured on hardware switch interfaces where multiple physical interfaces are combined into a hardware switch interface.

The hello timer for the VRRP dictates the rate at which VRRP advertisements are sent. With this enhanced control, you can ensure quick failover and high availability where necessary.

IPv4 virtual router

In this example, an IPv4 VRRP router is added to port10 on the FortiGate. The VRRP virtual router has a virtual router ID of 200, uses IP address 10.31.101.200, and has a priority of 255. Since this is the highest priority in the configuration, this interface is configured to be the primary router of the VRRP domain.

To configure the interface settings:

```
config system interface
    edit port10
        config vrrp
            edit 200
                set vrip 10.31.101.200
                set priority 255
                set adv-interval 250
            next
        end
    next
end
```

IPv6 virtual router

In this example, an IPv6 VRRP router is added to port20 on the FortiGate. The VRRP virtual router has a virtual router ID of 220, uses IP address 2001:db8:1::12, and has a priority of 255. Since this is the highest priority in the configuration, this interface is configured to be the primary router of the VRRP domain.

To configure the interface settings:

```
config system interface
    edit port20
        config ipv6
            set vrip6_link_local <IPv6_address>
            config vrrp6
                edit 220
                    set vrip 2001:db8:1::12
                    set priority 255
                    set adv-interval 250
                next
            end
        end
    next
end
```

VRRP failover

VRRP routers in a VRRP domain periodically send VRRP advertisement messages to all routers in the domain to maintain one router as the primary router and the others as backup routers. The primary router has the highest priority. If the backup routers stop receiving these packets from the primary router, the backup router with the highest priority becomes the new primary router.

The primary router stops sending VRRP advertisement messages if it fails or becomes disconnected. Up to two VRRP destination addresses can be configured to be monitored by the primary router. As a best practice, the destination addresses should be remote addresses. If the primary router is unable to connect to these destination addresses, it stops sending VRRP advertisement messages, and the backup router with the highest priority becomes the primary router.

To configure IPv4 VRRP with two destination addresses for monitoring:

```
config system interface
    edit port14
        config vrrp
            edit 12
                set vrdst 10.10.10.20 10.20.20.10
            next
        end
    next
end
```

To configure IPv6 VRRP with one destination address for monitoring:

```
config system interface
    edit port23
        config ipv6
            config vrrp6
                edit 223
```

```
                    set vrdst 2001:db8:1::12
                next
            end
        end
    next
end
```

IPv4 VRRP active failover

The `vrdst-priority` option can be used to reduce IPv4 VRRP failover times. This option causes the primary router to actively signal to the backup routers when the primary router cannot reach its configured destination addresses. The primary router sends a lower priority for itself in the VRRP advertisement messages. The backup router with the highest priority becomes the new primary router and takes over traffic processing.

In this example, the primary router is configured to have a priority of 255, so it should always become the primary router. The `vrdst-priority` is set to 10. If the primary router cannot connect to the 10.10.10.1 destination address, then the primary router informs the VRRP group that its priority is now 10.

To set the priority of the virtual router when the destination address is unreachable:

```
config system interface
    edit port10
        config vrrp
            edit 12
                set vrip 10.31.101.200
                set priority 255
                set vrdst 10.10.10.1
                set vrdst-priority 10
            next
        end
    next
end
```

IPv4 VIP and IP pool failover

The `proxy-arp` option can be used to map VIPs and IP pool address ranges to each router's VMAC (virtual MAC). After failover, the IP or ranges configured in the VRRP settings are routed to the new primary router's VMAC. In this example, a single IP and an address range are added for proxy ARP.

To configure the IP addresses for proxy ARP:

```
config system interface
    edit port5
        set vrrp-virtual-mac enable
        config vrrp
            edit 1
                config proxy-arp
                    edit 1
                        set ip 192.168.62.100-192.168.62.200
                    next
```

```
                    edit 2
                        set ip 192.168.62.225
                    next
                end
            next
        end
    next
end
```

Changing the advertisement message interval

By default, VRRP advertisement messages are sent once every second. The frequency can be changed with the `adv-interval` option to change the frequency of sending these messages (1 - 255 seconds).

The `adv-interval` also affects the period of time that a backup VRRP router waits before assuming the primary router has failed. The waiting period is three times the `adv-interval`. For example, if the `adv-interval` is set to 5, then the backup router waits for up to 15 seconds to receive a VRRP advertisement from the current primary router before taking over the role as the primary router.

To configure IPv4 VRRP to send advertisement messages every 10 seconds:

```
config system interface
    edit port14
        config vrrp
            edit 12
                set adv-interval 10
            next
        end
    next
end
```

To configure IPv6 VRRP to send advertisement messages every 20 seconds:

```
config system interface
    edit port23
        config ipv6
            config vrrp6
                edit 223
                set adv-interval 20
            next
        end
    next
end
```

Changing the VRRP startup time

The VRRP startup time is the time a backup or primary VRRP router waits before sending or receiving VRRP advertisements before potentially changing state (`start-time` in seconds, 1 - 255, default = 3). This timer is mainly visible when VRRP-monitored interfaces become up after previously been down. When this occurs, the device will wait for the time period before considering, and potentially changing its status.

There are some instances when the advertisement messages might be delayed. For example, some switches with spanning tree enabled may delay some of the advertisement message packets. If backup routers are attempting to become primary routers even though the primary router has not failed, extend the start time to ensure that the backup routers wait long enough for the advertisement messages.

To configure the IPv4 VRRP startup time to 10 seconds:

```
config system interface
    edit port14
        config vrrp
            edit 12
                set start-time 10
            next
        end
    next
end
```

To configure the IPv6 VRRP startup time to 15 seconds:

```
config system interface
    edit port23
        config ipv6
            config vrrp6
                edit 223
                set start-time 15
            next
        end
    next
end
```

VRRP groups

If VRRP routers are added to multiple interfaces of the same FortiGate, each router will be in a different VRRP domain. If one of the VRRP routers fails, it is useful if all of the VRRP routers added to the FortiGate also fail.

VRRP can only check the routers' status in a single VRRP domain and cannot track the status of routers in other domains. For multiple VRRP domains on a single FortiGate, only one can switch to being a backup, and the others remain operating normally. Using VRRP groups resolves this issue.

All the VRRP virtual routers on the FortiGate can be added to a VRRP group. If one of the virtual routers in a VRRP group switches to the backup, the VRRP group forces all members to switch to backups. All VRRP traffic being processed by the FortiGate fails over to other devices in the network.

The status of the virtual routers in a VRRP group only changes when one or more of the virtual routers in the group changes status. A VRRP group should not be used to manually change the status of the virtual routers in the group.

To configure two IPv4 VRRP routers in a VRRP group:

```
config system interface
    edit port10
        config vrrp
            edit 200
                set vrip 10.31.101.200
                set priority 255
                set vrgrp 10
            next
        end
    next
    edit port20
        config vrrp
            edit 100
                set vrip 10.23.1.223
                set priority 20
                set vrgrp 10
            next
        end
    next
end
```

To configure two IPv6 VRRP routers in a VRRP group:

```
config system interface
    edit port11
        config ipv6
            set vrip6_link_local <IPv6_address>
            config vrrp6
                edit 220
                    set vrip 2001:db8:1::12
                    set priority 255
                    set vrgrp 90
                next
            end
        end
    next
    edit port12
        config ipv6
            set vrip6_link_local <IPv6_address>
            config vrrp6
                edit 220
                    set vrip 2001:db8:1::14
                    set priority 100
                    set vrgrp 90
                next
            end
        end
    next
end
```

VRRP virtual MACs

The VRRP virtual MAC address (or virtual router MAC address) is a shared MAC address adopted by the primary router. If the primary router fails, the same virtual MAC address is picked up by the new primary router, allowing all devices on the network to transparently connect to the default route using the same virtual MAC address. This feature must be enabled on all members in a VRRP domain.

Each VRRP router has its own virtual MAC address. The last part octet is based on the VRRP router ID using the following format:

```
00-00-5E-00-01-<VRID_hex>
```

Where <VRID_hex> is the VRRP router ID in hexadecimal format in internet standard bit-order. For more information about virtual MAC formatting, see RFC 3768.

For example:

- If the VRRP router ID is 10, then the virtual MAC is `00-00-5E-00-01-0a`.
- If the VRRP router ID is 200, then the virtual MAC is `00-00-5E-00-01-c8`.

If the VRRP virtual MAC address feature is disabled (the default setting), the VRRP domain uses the MAC address of the primary router. On a FortiGate VRRP virtual router, this is the MAC address of the FortiGate interface that the VRRP router is added to. If the primary fails, when the new primary takes over, it sends gratuitous ARPs to associate the VRRP router IP address with the MAC address of the new primary (or the FortiGate interface that became the new primary).

When a VRRP virtual MAC address is enabled, the new primary uses the same MAC address as the old primary.

Since devices on the LAN do not have to learn a new MAC address for a new VRRP router in the event of a failover, this feature can improve network efficiency, especially in large and complex networks.

To enable virtual MAC addresses in IPv4 VRRP:

```
config system interface
    edit <name>
        set vrrp-virtual-mac enable
    next
end
```

To enable virtual MAC addresses in IPv6 VRRP:

```
config system interface
    edit <name>
        config ipv6
            set vrrp-virtual-mac6 enable
        end
    next
end
```

Preempt mode

When preempt mode is enabled (the default setting), a higher priority backup router can preempt a lower priority primary router. This can happen if the primary router fails, the backup router becomes the primary router, and the failed primary router restarts. Since the restarted router has a higher priority, if preempt mode is enabled, the restarted router replaces the current primary router becoming the new primary router. If preempt mode is disabled, a restarted router that has a higher priority would not take over as the primary router.

Based on RFC 3768 Section 5.3.4, "The priority value for the VRRP router that owns the IP address(es) associated with the virtual router MUST be 255 (decimal). VRRP routers backing up a virtual router MUST use priority values between 1-254 (decimal)."

Therefore, in cases where preempt mode is disabled, but the priority is set to 255, the restarted unit will take over as the primary router.

To configure preempt mode in IPv4 VRRP:

```
config system interface
    edit <name>
        config vrrp
            edit <vrid>
                set preempt {enable | disable}
            next
        end
    next
end
```

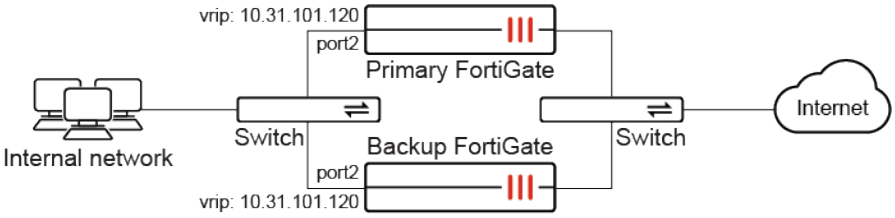
To configure preempt mode in IPv6 VRRP:

```
config system interface
    edit <name>
        config ipv6
            config vrrp6
                edit <vrid>
                    set preempt {enable | disable}
                next
            end
        end
    next
end
```

Single-domain VRRP example

This example consists of a VRRP domain with two FortiGates that connect an internal network to the internet. The FortiGate port2 interfaces connect to the internal network, and a VRRP virtual router is added to each port2 interface with VRRP virtual MAC addresses enabled. The internal network default route is 10.31.101.120. Each FortiGate port2 interface has an IP address that is different from the virtual router IP address. Since `vrrp-`

`virtual-mac` is enabled, upon failover, the new primary VRRP router will use the same VMAC as the previous router.



To configure the primary FortiGate:

```
config system interface
    edit port2
        set vrrp-virtual-mac enable
        config vrrp
            edit 5
                set vrip 10.31.101.120
                set priority 255
            next
        end
    next
end
```

To configure the backup FortiGate:

```
config system interface
    edit port2
        set vrrp-virtual-mac enable
        config vrrp
            edit 5
                set vrip 10.31.101.120
                set priority 50
            next
        end
    next
end
```

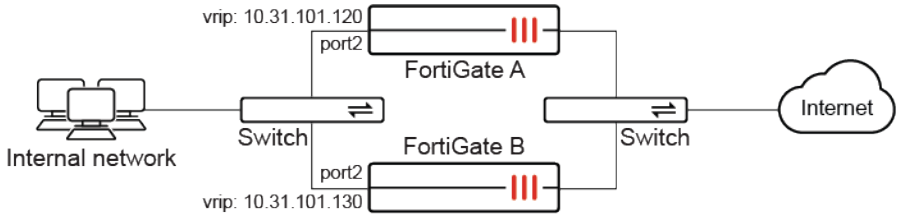
Multi-domain VRRP example

This example consists of two VRRP domains, and both FortiGates participate in the domains that connect an internal network to the internet. One FortiGate is the primary router of one domain and the other FortiGate is the primary router of the other domain. The network distributes traffic between two different default routes (10.31.101.120 and 10.31.101.130). One VRRP domain is configured with one of the default route IP addresses and the other VRRP domain gets the other default route IP address. During normal operation, both FortiGates process traffic, and the VRRP domains are used to load balance the traffic between the two FortiGates.

If one of the FortiGates fails, the remaining FortiGate becomes the primary router of both VRRP domains. The network sends all traffic for both default routes to this FortiGate. The result is a configuration that (under normal

operational load) balances traffic between two FortiGates, but if one of the FortiGates fails, all traffic fails over to the FortiGate that is still operating.

VRRP virtual MAC address are enabled on both FortiGates' port2 interfaces so that the VRRP domains use their VRRP virtual MAC addresses.



Device	VRRP primary			VRRP backup		
	Virtual router IP	ID	Priority	Virtual router IP	ID	Priority
FortiGate A	10.31.101.120	50	255	10.31.101.130	100	50
FortiGate B	10.31.101.130	100	255	10.31.101.120	50	50

To configure FortiGate A:

```
config system interface
    edit port2
        set vrrp-virtual-mac enable
        config vrrp
            edit 50
                set vrip 10.31.101.120
                set priority 255
            next
            edit 100
                set vrip 10.31.101.130
                set priority 50
            next
        end
    next
end
```

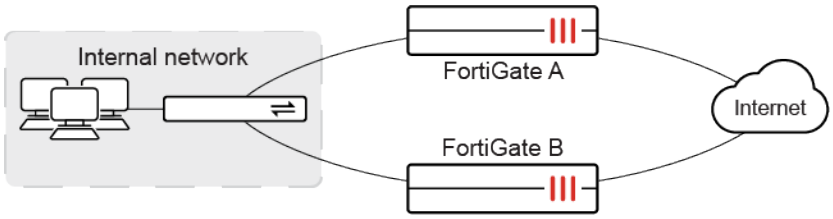
To configure FortiGate B:

```
config system interface
    edit port2
        set vrrp-virtual-mac enable
        config vrrp
            edit 50
                set vrip 10.31.101.120
                set priority 50
            next
            edit 100
                set vrip 10.31.101.130
                set priority 255
```

```
            next
        end
    next
end
```

VRRP on EMAC-VLAN interfaces

Virtual Router Redundancy Protocol (VRRP) can be configured on EMAC-VLAN interfaces.



To configure the interfaces:

1. Configure FortiGate A:

```
config system interface
    edit "emac"
        set vdom "root"
        set ip 172.16.209.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet fgfm
        set type emac-vlan
        set vrrp-virtual-mac enable
        config vrrp
            edit 1
                set vrip 172.16.209.111
                set priority 200
            next
        end
        set snmp-index 61
        set interface "port1"
    next
end
```

2. Configure FortiGate B:

```
config system interface
    edit "emac"
        set vdom "root"
        set ip 172.16.209.2 255.255.255.0
        set allowaccess ping https ssh snmp http telnet fgfm
        set type emac-vlan
        set vrrp-virtual-mac enable
        config vrrp
            edit 1
                set vrip 172.16.209.111
```

```
                set priority 222
            next
        end
        set snmp-index 32
        set interface "port1"
    next
end
```

Check the VRRP information on the FortiGates:

Because FortiGate B has a higher priority, it is the primary device and FortiGate A is the backup.

1. FortiGate A:

```
# get router info vrrp
Interface: emac, primary IP address: 172.16.209.1
  UseVMAC: 1, SoftSW: 0, EmacVlan: 1 BrPortIdx: 0, PromiscCount: 0
  HA mode: primary (0:0:1) VRRP master number: 0
  VRID: 1 verion: 2
    vrip: 172.16.209.111, priority: 200 (200,0), state: BACKUP
    adv_interval: 1, preempt: 1, ignore_dft: 0 start_time: 3
    master_adv_interval: 100, accept: 1
    vrmac: 00:00:5e:00:01:01
    vrdst:
    vrgrp: 0
```

2. FortiGate B:

```
# get router info vrrp
Interface: emac, primary IP address: 172.16.209.2
  UseVMAC: 1, SoftSW: 0, EmacVlan: 1 BrPortIdx: 0, PromiscCount: 1
  HA mode: primary (0:0:1) VRRP master number: 1
  VRID: 1 verion: 2
    vrip: 172.16.209.111, priority: 222 (222,0), state: PRIMARY
    adv_interval: 1, preempt: 1, ignore_dft: 0 start_time: 3
    master_adv_interval: 100, accept: 1
    vrmac: 00:00:5e:00:01:01
    vrdst:
    vrgrp: 0
```

Ignore VRRP default route

Administrators can choose to exclude the default route from the calculation of available routes to the IPv6 VRRP destination, to better manage and control the VRRP states. Previously, the VRRP state would be `Primary` as long as any route, including the default route, could reach the IPv6 VRRP destination.

```
config system interface
    edit <name>
        config ipv6
            config vrrp6
                edit <id>
```

```
                    set ignore-default-route {enable | disable}
                next
            end
        end
    next
end
```

`set ignore-default-route {enable | disable}`	Set the default route to be ignored: • `enable`: Ignore the default route when checking the VRRP destination. • `disable`: Include the default route when checking the VRRP destination (default).

Example

In this example, the IPv6 VRRP destination (`vrdst6`) is set with an IPv6 address of `2000:172:22:20::22`, and `ignore-default-route` is enabled for the destination. As long as non-default routes exist to the VRRP destination, the VRRP state is `Primary`. When only the default route to the VRRP destination exists, the VRRP state changes to `Backup`.

To ignore the default route when checking the IPv6 VRRP destination:

1. Enable the default route to be ignored for IPv6 VRRP.
   The IPv6 VRRP destination (`vrdst6`) is set with an IPv6 address of `2000:172:22:20::22`, and `ignore-default-route` is enabled for the destination.

```
config system interface
    edit "port2"
        config ipv6
            set vrrp-virtual-mac6 enable
            set vrip6_link_local fe80::926c:acff:2222:2222
            config vrrp6
                edit 100
                    set vrgrp 100
                    set vrip6 2000:10:1:100::222
                    set priority 200
                    set vrdst6 2000:172:22:20::22
                    set ignore-default-route enable
                next
            end
        end
    next
end
```

2. Check the route for IPv6 VRRP destination.
   The routing table shows an active route through `port1` to the IPv6 VRRP destination of `2000:172:22:20::22`. The active route is not a default route.

```
# get router info6 routing-table 2000:172:22:20::22
Routing entry for 2000:172:22:20::/80
  Known via "static", distance 10, metric 0
```

```
  Last update 00:00:15 ago
    via 2000:172:16:200::55, port1
```

3. Check VRRP group information for IPv6.

   The VRRP state is `Primary` because non-default routes to the IPv6 VRRP destination exist as shown in the previous step.

```
# get router info6 vrrp
Interface: port2, primary IPv6 address: 2000:10:1:100::1
link-local IPv6 address: fe80::96f3:92ff:fe15:1ecd
Virtual link-local IPv6 address: fe80::926c:acff:2222:2222
  UseVMAC: 1, SoftSW: 0, EmacVlan: 0 BrPortIdx: 0, PromiscCount: 1
  HA mode: primary (0:0:1)
  VRT primary count: 1
  VRID: 100 version: 3
    vrip: 2000:10:1:100::222, priority: 200, state: PRIMARY
    adv_interval: 1, preempt: 1, ignore_dft: 0, start_time: 3
    primary_adv_interval: 100, accept: 1
    vrmac: 00:00:5e:00:02:64
    vrdst: 2000:172:22:20::22
    vrgrp: 100
```

4. Delete the non-default routes to the IPv6 VRRP destination (`vrdst6`), and check the routes again.

   The routing table shows only the default route (`::/0`) is available to the IPv6 VRRP destination of `2000:172:22:20::22`.

```
# get router info6 routing-table 2000:172:22:20::22
Routing entry for ::/0
  Known via "static", distance 10, metric 0, best
  Last update 02:02:09 ago
  * via 2000:172:16:200::254, port1
```

5. Check VRRP group information for IPv6.

   The VRRP state is `Backup` because only the default route is available to the IPv6 VRRP destination as shown in the previous step.

```
#get router info6 vrrp
Interface: port2, primary IPv6 address: 2000:10:1:100::1
link-local IPv6 address: fe80::96f3:92ff:fe15:1ecd
Virtual link-local IPv6 address: fe80::926c:acff:2222:2222
  UseVMAC: 1, SoftSW: 0, EmacVlan: 0 BrPortIdx: 0, PromiscCount: 0
  HA mode: primary (0:0:1)
  VRT primary count: 0
  VRID: 100 version: 3
    vrip: 2000:10:1:100::222, priority: 0, state: BACKUP
    adv_interval: 1, preempt: 1, ignore_dft: 1, start_time: 3 but
    primary_adv_interval: 100, accept: 1
    vrmac: 00:00:5e:00:02:64
    vrdst: 2000:172:22:20::22
    vrgrp: 100
```

Session failover

Session failover means that after the primary unit fails, communications sessions resume on the new primary unit with minimal or no interruption. Two categories of sessions need to be resumed after a failover:

- Sessions passing through the cluster
- Sessions terminated by the cluster

Session failover (also called session-pickup) is not enabled by default for FortiGate. See Session pickup on page 3526 for more information

Using the `session-sync-dev` option, you can select one or more FortiGate interfaces to use for synchronizing sessions as required for session pickup. See Improving session sync performance on page 3531 for more information.

After a failover the new primary unit recognizes open sessions that were being handled by the cluster. The sessions continue to be processed by the new primary unit and are handled according to their last known state.

Session-pickup has some limitations. For example, session failover is not supported for sessions being scanned by proxy-based security profiles. Session failover is supported for sessions being scanned by flow-based security profiles; however, flow-based sessions that fail over are not inspected after they fail over. For more limitations, see Pass-through sessions on page 3528.

Sessions terminated by the cluster do not failover and have to be restarted. There are some exceptions though, particularly for IPsec and SSL VPN. For more information, see Terminated sessions on page 3530.

Session pickup

When session-pickup is enabled, the FGCP synchronizes the primary unit's TCP session table to all cluster units. As soon as a new TCP session is added to the primary unit's session table, that session is synchronized to all cluster units. This synchronization happens as quickly as possible to ensure the session tables remain synchronized.

If the primary unit fails, the new primary unit uses its synchronized session table to resume all TCP sessions that were being processed by the former primary unit, resulting in only minimal interruption. Under ideal conditions, all TCP sessions should be resumed. However, this is not guaranteed, and under less than ideal conditions, some TCP sessions may need to be restarted.

To enable session pickup in the GUI:

1. Go to *System* > *HA*.
2. Select the Primary FortiGate and click *Edit*.
3. Under *Cluster Settings*, enable *Session pickup*.
4. Click *OK* to save the setting.

To enable session pickup in the CLI:

```
config system ha
    set session-pickup enable
end
```

Enabling UDP, ICMP and broadcast packet session failover

By default, the FGCP does not maintain a session table for UDP, ICMP, or broadcast packets, even when session pickup is enabled. This means that the cluster does not specifically support the failover of these types of packets. However, it is possible to enable session pickup for UDP and ICMP packets. To do this, you must first enable session pickup for TCP sessions. After that, you can enable session pickup for connectionless sessions:

```
config system ha
    set session-pickup enable
    set session-pickup-connectionless enable
end
```

This configuration causes the cluster units to synchronize UDP and ICMP session tables and if a failover occurs UDP and ICMP sessions are maintained.

Enabling multicast session failover

To configure multicast session failover, use the following command to change the multicast TTL timer to a smaller value than the default. The recommended setting to support multicast session failover is 120 seconds (2 minutes). The default setting is 600 seconds (10 minutes).

```
config system ha
    set multicast-ttl 120
end
```

The multicast TTL timer controls how long to keep synchronized multicast routes on the backup unit, ensuring they are present on the backup unit when it becomes the new primary unit after a failover. If you set the multicast TTL lower, the multicast routes on the backup unit are refreshed more often, and are therefore more likely to be accurate. However reducing this time causes route synchronization to happen more often, which could affect performance.

Disabling session pickup

If you leave session pickup disabled, the cluster doesn't track sessions, and active sessions must be restarted or resumed after a failover. This is usually handled by TCP/IP communications.

The `session-pickup` setting does not affect session failover for sessions terminated by the cluster.

Disabling session pickup can reduce CPU and network bandwidth usage, especially if your cluster is mainly used for unsynchronized traffic. However, if session pickup is not enabled, sessions won't resume after a failover, causing a brief interruption. Most protocols can restart sessions with minimal data loss. For instance, web users

can refresh their browsers to resume browsing, but large file downloads may need to be restarted. Some protocols may require manual session restarts, like FTP file downloads.

Pass-through sessions

This section contains information about session failover for communication sessions passing through the cluster. In general, if session pickup is enabled, session failover is supported for most TCP traffic.

Protocol	Session failover
Most TCP sessions	Supported if session-pickup is enabled. See TCP session failover on page 3528 for more information.
Multicast sessions	Supported if multicast session-pickup is enabled. See Enabling multicast session failover on page 3527 for more information.
IPv6, NAT64, and NAT66	Supported if session-pickup is enabled.
Proxy-based security profile sessions	Not Supported; sessions have to be restarted. Proxy-based features require the FortiGate to maintain very large amounts of internal state information for each session. The FGCP does not synchronize this internal state information. As a result, proxy-based sessions are not failed over. Active-active clusters can resume some of these sessions after a failover. See Resume active-active HA subordinate units sessions after failover on page 3529 for more information.
Flow-based security profile sessions	Supported if session-pickup is enabled; however, internal state information is not synchronized so flow-based sessions that fail over are not inspected after they fail over. If both flow-based and proxy-based security profile features are applied to a TCP session, that session will not resume after a failover.
UDP, ICMP, or broadcast sessions	Supported if connectionless session-pickup is enabled. See Enabling UDP, ICMP and broadcast packet session failover on page 3527 for more information.
GPRS Tunneling Protocol (GTP)	Supported with limitations. See FortiOS Carrier GTP session failover on page 3529 for more information.
SIP	Supported for active-passive HA only. See SIP session failover on page 3529 for more information.
SIMPLE or SCCP signal session	Not supported; sessions have to be restarted.
SSL offloading and HTTP multiplexing	Not supported; sessions have to be restarted. See SSL offloading and HTTP multiplexing session failover on page 3529 for more information.

TCP session failover

TCP sessions that are not being processed by security profile features resume after a failover even if these sessions are accepted by security policies with security profiles. Only TCP sessions that are actually being processed by these security profile features do not resume after a failover.

- TCP sessions that are not virus scanned, web filtered, spam filtered, content archived, or are not SIP, SIMPLE, or SCCP signal traffic resume after a failover, even if they are accepted by a security policy with security profile options enabled. For example, SNMP TCP sessions through the FortiGate resume after a failover because FortiOS does not apply any security profile options to SNMP sessions.
- TCP sessions for a protocol for which security profile features have not been enabled resume after a failover even if they are accepted by a security policy with security profile features enabled. For example, if you have not enabled any antivirus or content archiving settings for FTP, FTP sessions resume after a failover.

SIP session failover

If session pickup is enabled, the FGCP supports SIP session failover (also called stateful failover) for active passive HA.

SIP session failover replicates SIP states to all cluster units. If an HA failover occurs, all in-progress SIP calls (setup complete) and their RTP flows are maintained and the calls will continue after the failover with minimal or no interruption.

SIP calls being set up at the time of a failover may lose signaling messages. In most cases the SIP clients and servers should use message retransmission to complete the call setup after the failover has completed. As a result, SIP users may experience a delay if their calls are being set up when an HA a failover occurs. But in most cases the call setup should be able to continue after the failover.

FortiOS Carrier GTP session failover

FortiOS Carrier HA supports GTP session failover. Once the GTP tunnel setup is completed, the primary unit synchronizes the GTP tunnel state across all cluster units. Although HA does not synchronize UDP sessions used by GTP, the new primary unit retains the GTP tunnel state information after a failover. This allows GTP UDP sessions using the same tunnel to continue to flow, albeit with certain limitations.

The limitation on packets continuing to flow is that there has to be a security policy to accept the packets. For example, if the FortiOS Carrier unit has an internal to external security policy, GTP UDP sessions using an established tunnel that are received by the internal interface are accepted by the security policy and can continue to flow. However, GTP UDP packets for an established tunnel that are received at the external interface cannot flow until packets from the same tunnel are received at the internal interface.

If you have bi-directional policies that accept GTP UDP sessions then traffic in either direction that uses an established tunnel can continue to flow after a failover without interruption.

SSL offloading and HTTP multiplexing session failover

SSL offloading and HTTP multiplexing requires the FortiGate to maintain very large amounts of internal state information for each session. Sessions accepted by security policies containing virtual IPs or virtual servers with SSL offloading or HTTP multiplexing enabled do not resume after a failover.

Resume active-active HA subordinate units sessions after failover

In an active-active cluster, subordinate units process sessions. After a failover, all cluster units that are still operating may be able to continue processing the sessions that they were processing before the failover. These sessions are maintained because after the failover the new primary unit uses the HA session table to continue to send session packets to the cluster units that were processing the sessions before the failover. Cluster units

maintain their own information about the sessions that they are processing and this information is not affected by the failover. In this way, the cluster units that are still operating can continue processing their own sessions without loss of data.

The cluster keeps processing as many sessions as it can. But some sessions can be lost. Depending on what caused the failover, sessions can be lost in the following ways:

- A cluster unit (subordinate unit) fails. All sessions that were being processed by that cluster unit are lost.
- A link failure occurs. All sessions that were being processed through the network interface that failed are lost.

Terminated sessions

This section contains information about session failover for communication sessions terminated by the cluster. Sessions terminated by the cluster include management sessions as well as IPsec and SSL VPN, WAN Optimization and so on between the cluster and a client.

In general, most sessions terminated by the cluster have to be restarted after a failover. There are some exceptions though. For example, the FGCP provides failover for IPsec and SSL VPN sessions terminated by the cluster.

The session pickup setting does not affect session failover for sessions terminated by the cluster. Also other cluster settings such as active-active or active-passive mode do not affect session failover for sessions terminated by the cluster.

Protocol	Session failover
Administrative or management connections such as connecting to the GUI or CLI, SNMP, syslog, communication with FortiManager, FortiAnalyzer and so on	Not supported, sessions have to be restarted.
Explicit web proxy, WCCP, WAN Optimization and Web Caching	Not supported, sessions have to be restarted. See Explicit web proxy, explicit FTP proxy, WCCP, WAN optimization and Web Caching session failover on page 3531 for more information.
IPsec VPN tunnels terminating at the FortiGate	Supported. Security associations (SAs) and related IPsec VPN tunnel data is synchronized to cluster members. See IPsec VPN SA sync on page 3531 for more information.
SSL VPN tunnels terminating at the FortiGate	Partially supported. Sessions are not synchronized and have to be restarted. Authentication failover and cookie failover is supported for SSL VPN web mode sessions. Authentication failover is not supported for FortiClient SSL VPN sessions. See SSL VPN session failover and SSL VPN authentication failover on page 3531 for more information.
PPTP and L2TP VPN terminating at the FortiGate	Not supported; sessions have to be restarted. See PPTP and L2TP VPN sessions on page 3531 for more information.

Explicit web proxy, explicit FTP proxy, WCCP, WAN optimization and Web Caching session failover

Explicit web proxy, explicit FTP proxy, WCCP, WAN optimization and web caching sessions all require the FortiGate to maintain very large amounts of internal state information for each session. This information is not maintained and these sessions do not resume after a failover.

The active-passive HA clustering is recommended for WAN optimization. All WAN optimization sessions are processed by the primary unit only. Even if the cluster is operating in active-active mode, HA does not load-balance WAN optimization sessions.

Web cache and byte cache databases are only stored on the primary unit. These databases are not synchronized to the cluster. So, after a failover, the new primary unit must rebuild its web and byte caches. The new primary unit cannot connect to a SAS partition that the failed primary unit used.

Rebuilding the byte caches can happen relatively quickly because the new primary unit gets byte cache data from the other FortiGates that it is participating with in WAN optimization tunnels.

IPsec VPN SA sync

The FGCP synchronizes IPsec SAs between cluster members so that if a failover occurs, the cluster can resume IPsec sessions without having to establish new SAs. The result is improved failover performance because IPsec sessions are not interrupted to establish new SAs. Also, establishing a large number of SAs can reduce cluster performance.

SSL VPN session failover and SSL VPN authentication failover

Session failover is not supported for SSL VPN tunnels. However, authentication failover is supported for SSL VPN web mode sessions. This means that after a failover, SSL VPN web mode sessions can re-establish the SSL VPN session between the SSL VPN client and the FortiGate without having to authenticate again.

Authentication failover is not supported for FortiClient SSL VPN sessions.

All sessions inside the SSL VPN tunnel that were running before the failover are stopped and have to be restarted. For example, file transfers that were in progress would have to be restarted. As well, any communication sessions with resources behind the FortiGate that are started by an SSL VPN session have to be restarted.

To support SSL VPN cookie failover, when an SSL VPN session starts, the FGCP distributes the cookie created to identify the SSL VPN session to all cluster units.

PPTP and L2TP VPN sessions

PPTP and L2TP VPNs are supported in HA mode. For a cluster you can configure PPTP and L2TP settings and you can also add security policies to allow PPTP and L2TP pass through. However, the FGCP does not provide session failover for PPTP or L2TP. After a failover, all active PPTP and L2TP sessions are lost and must be restarted.

Improving session sync performance

Two HA configuration options are available to reduce the performance impact of enabling session-pickup:

- Reducing the number of sessions that are synchronized.
- Using more FortiGate interfaces for session synchronization.

Reducing the number of sessions that are synchronized

When session pickup is enabled, new sessions are synced across cluster units. To reduce the number of synced sessions, enable the `session-pickup-delay` option, which only syncs sessions active for more than 30 seconds. This can reduce syncs for clusters with many short sessions, like HTTP traffic.

Use the following commands to enable a 30-second delay:

```
config system ha
    set session-pickup-delay enable
end
```

This may result in more sessions not resuming after a failover, but most short sessions can restart with minor interruption.

Using multiple FortiGate interfaces for session synchronization

The `session-sync-dev` option allows you to choose one or more FortiGate interfaces for session synchronization, which is necessary for session pickup. Typically, session synchronization takes place over the HA heartbeat link. However, with this HA option, only the chosen interfaces are used for session synchronization, not the HA heartbeat link. If multiple interfaces are selected, the session synchronization traffic is load balanced among the selected interfaces.

Shifting session synchronization away from the HA heartbeat interface can reduce the bandwidth needed for HA heartbeat traffic, potentially enhancing the cluster's efficiency and performance. This is particularly true if the cluster is synchronizing a large volume of sessions. Load balancing session synchronization across multiple interfaces can further boost performance and efficiency when dealing with a large number of sessions.

To perform cluster session synchronization using the port10 and port12 interfaces:

```
config system ha
    set session-sync-dev port10 port12
end
```

The interfaces chosen for session synchronization must be interconnected, either directly with the appropriate cable (if the cluster only contains two units) or through switches. If one of the interfaces becomes disconnected the cluster uses the remaining interfaces for session synchronization. If all of the session synchronization interfaces become disconnected, session synchronization reverts back to using the HA heartbeat link. All session synchronization traffic is between the primary unit and each subordinate unit.

Since large amounts of session synchronization traffic can increase network congestion, it is recommended to isolate this traffic from your network by using dedicated connections.

SNMP

SNMP enables you to monitor hardware on your network. You can configure the hardware, such as the FortiGate SNMP agent, to report system information and send traps (alarms or event messages) to SNMP managers. SNMP traps alert you to events that happen, such as when a log disk is full or a virus is detected.

The FortiGate SNMP implementation is read-only. SNMP v1/v2c and v3 compliant SNMP managers have read-only access to FortiGate system information through queries, and can receive trap messages from the FortiGate unit. See SNMP Overview for more information.

- Basic configuration on page 3533
- MIB files on page 3536
- Access control for SNMP on page 3537
- Important SNMP traps on page 3539
- SNMP traps and automation-stitch notifications for DIO module on page 3543
- SNMP examples on page 3546

Basic configuration

SNMP configuration has four steps that should be configured in order:

1. Configure interface access

   Before a remote SNMP manager can connect to the FortiGate SNMP agent, you must configure one or more FortiGate interfaces to accept SNMP connections.
2. Configure the SNMP agent

   The SNMP agent sends SNMP traps originating on the FortiGate to an external monitoring SNMP manager defined in an SNMP community. The SNMP manager can monitor the FortiGate system to determine if it is operating properly or if any critical events are occurring.

   The description, location, and contact information for this FortiGate system will be part of the information that the SNMP manager receives. This information is useful if the SNMP manager is monitoring many devices, and enables faster responses when the FortiGate system requires attention.
3. Configure SNMP v1/v2c communities

   An SNMP community is a grouping of equipment for network administration purposes. A single device can belong to multiple communities. It is not mandatory if SNMP v3 is configured.

   You must add an SNMP community to the FortiGate so that the SNMP manager can receive traps and system information. Up to three communities can be added.
4. Configure SNMP v3 users

   Authentication is used to ensure the identity of users. Privacy allows for the encryption of SNMP v3 messages to ensure the confidentiality of data. These protocols provide a higher level of security than is available in SNMP v1/v2c, which use community strings for security. Both authentication and privacy are optional.

To configure SNMP in the GUI:

1. Configure interface access:
   a. Go to *Network* > *Interfaces* and edit an interface.
   b. In the *Administrative Access* options, enable *SNMP*.
   c. Click *OK*.
2. Configure the SNMP agent:
   a. Go to *System* > *SNMP*.
   b. Enable *SNMP Agent* and configure the following:

Description	A description of the agent.
Location	The location of the FortiGate.
Contact Info	A contact or administrator for the SNMP agent or FortiGate.

   c. Click *Apply*.
3. Configure an SNMP v1/v2c community:
   a. Go to *System* > *SNMP*.
   b. In the *SNMP v1/v2c* table, click *Create New*.
   c. Configure the following:

Community Name	The name of the community.
Hosts	Enter the *IP Address* and select the *Host Type* for each SNMP manager.
Queries	Enable or disable v1 and v2c queries, then enter the port numbers that the SNMP managers in this community use for them.
Traps	Enable or disable v1 and v2c traps, then enter the local and remote port numbers that the SNMP managers in this community use for them.
SNMP Events	Enable or disable the events that activate traps in this community.

   d. Click *OK*.
4. Configure an SNMP v3 user:
   a. Go to *System* > *SNMP*.
   b. In the *SNMP v3* table, click *Create New*.
   c. Configure the following:

User Name	The name of the user.
Security Level	Configure the security level: • *No Authentication*: No authentication or encryption. • *Authentication*: Select the authentication algorithm and password. • *Authentication and Private*: Select both the authentication and encryption algorithms and password.

Hosts	The *IP Address* for each SNMP manager.
Queries	Enable or disable queries, then enter the port number that the SNMP managers use for them.
Traps	Enable or disable traps, then enter the local and remote port numbers that the SNMP managers use for them
SNMP Events	Enable or disable the events that activate traps.

d. Click *OK*.

To configure SNMP in the CLI:

1. Configure the Interface access:

```
config system interface
    edit <interface>
        append allowaccess snmp
        config ipv6
            append ip6-allowaccess snmp
        end
    next
end
```

2. Configure the SNMP agent:

```
config system snmp sysinfo
    set status enable
    set description <string>
    set contact-info <string>
    set location <string>
end
```

3. Configure an SNMP v1/v2c community:

```
config system snmp community
    edit <id>
        set name <string>
        set status {enable | disable}
        config hosts
            edit <host_id>
                set interface-select-method {auto | sdwan | specify}
                set ip <ip/mask>
                set source-ip <class_ip>
                set ha-direct {enable | disable}
                set host-type {any | query | trap}
            next
        end
        set query-v1-port <port_number>
        set query-v1-status {enable | disable}
        set query-v2c-port <port_number>
        set query-v2c-status {enable | disable}
```

```
        set trap-v1-lport <port_number>
        set trap-v1-rport <port_number>
        set trap-v1-status {enable | disable}
        set trap-v2c-lport <port_number>
        set trap-v2c-rport <port_number>
        set trap-v2c-status {enable | disable}
        set events <events>
    next
end
```

4. Configure an SNMP v3 user:

```
config system snmp user
    edit <user>
        set status {enable | disable}
        set trap-status {enable | disable}
        set trap-lport <port_number>
        set trap-rport <port_number>
        set queries {enable | disable}
        set query-port <port_number>
        set notify-hosts <class_ip> ... <class_ip>
        set source-ip <class_ip>
        set ha-direct {enable | disable}
        set interface-select-method {auto | sdwan | specify}
        set events <events>
        set security-level {no-auth-no-priv | auth-no-priv | auth-priv}
        set auth-proto {md5 | sha | sha224 | sha256 | sha384 | sha512}
        set auth-pwd <password>
        set priv-proto {aes | des | aes256 | aes256cisco}
        set priv-pwd <password>
    next
end
```

See SNMP examples on page 3546 for sample configurations.

MIB files

The FortiGate SNMP agent supports Fortinet proprietary MIBs, as well as the parts of RFC 2665 and RFC 1213 that apply to FortiGate unit configuration.

Your SNMP manager may already include standard and private MIBs in a compiled database that is ready to use. You must add the Fortinet proprietary MIBs to this database to have access to Fortinet specific information.

MIB file or RFC	Description
FORTINET-CORE-MIB.mib	The Fortinet core MIB includes all system configuration and trap information that is common to all Fortinet products. Your SNMP manager requires this information to monitor Fortinet device settings and receive traps from the FortiGate SNMP agent.

MIB file or RFC	Description
FORTINET-FORTIGATE-MIB.mib	The FortiGate MIB includes all system configuration information and trap information that is specific to FortiGate units. Your SNMP manager requires this information to monitor FortiGate settings and receive traps from the FortiGate SNMP agent.
RFC-1213 (MIB II)	The FortiGate SNMP agent supports MIB II groups with the following exceptions: • No support for the EGP group from MIB II (RFC 1213, section 3.11 and 6.10). • Protocol statistics returned for MIB II groups (IP/ICMP/TCP/UDP/etc.) do not accurately capture all Fortinet traffic activity. More accurate information can be obtained from the information reported by the Fortinet MIB.
RFC-2665 (Ethernet-like MIB)	The FortiGate SNMP agent supports Ethernet-like MIB information. FortiGate SNMP does not support for the dot3Tests and dot3Errors groups.

To download the MIB files:

1. Go to *System* > *SNMP*.
2. Click *Download FortiGate MIB File* and save the file to the management computer.
3. Click *Download Fortinet Core MIB File* and save the file to the management computer.

Access control for SNMP

Administrators can provide access control to SNMP users and communities based on restricting a MIB view to specific OID subtrees. They can also define access based on the VDOM. This allows multi-tenant FortiGate deployments to provide restricted access per VDOM.

- MIB view access control allows the SNMP clients to query specific OIDs that are filtered by the MIB view settings.
- VDOM access control allows the SNMP clients to query data from specific VDOMs that are filtered by the VDOM settings.

When access control is enabled, the users can only access the information that is allowed by the access control, and all other information is inaccessible. Administrators have granular control, and can easily restrict specific information based on access control.

To configure MIB views:

```
config system snmp mib-view
    edit <name>
        set include <OIDs>
        set exclude <OIDs>
    next
end
```

include <OIDs>	Enter the OID subtrees to be included in the view. A maximum of 16 subtrees can be added.
exclude <OIDs>	Enter the OID subtrees to be excluded in the view. A maximum of 64 subtrees can be added.

To configure access control based on MIB views and VDOMs for SNMP users and communities:

```
config system snmp user
    edit <user>
        set mib-view <view>
        set vdoms <vdoms>
    next
end
```

```
config system snmp community
    edit <community>
        set mib-view <view>
        set vdoms <vdoms>
    next
end
```

mib-view <view>	Set the SNMP access control MIB view.
vdoms <vdoms>	Set the SNMP access control VDOMs.

Example

In this example, two MIB views are created and, with VDOMs, used to control access for SNMP users and communities.

To configure access control for SNMP users and communities:

1. Configure two MIB views:

```
config system snmp mib-view
    edit "view1"
        set include "1.3.6.1.2"
    next
    edit "view2"
        set include "1.3.6.1.2.1"
        set exclude "1.3.6.1.2.1.2.1" "1.3.6.1.2.1.4.31" "1.3.6.1.2.1.1.9.1"
    next
end
```

2. Add the MIB view and VDOM restrictions to SNMP users:

```
config system snmp user
    edit "v3user"
        set mib-view "view1"
```

```
    next
    edit "v3user1"
        set vdom "vdom1"
    next
    edit "v3user2"
        set mib-view "view1"
        set vdoms "root" "vdom1"
    next
end
```

3. Add the MIB view and VDOM restrictions to SNMP communities:

```
config system snmp community
    edit 1
        set name "REGR-SYS"
        set vdoms "vdom1"
    next
    edit 2
        set name "REGR-SYS1"
        set mib-view "view2"
    next
    edit 3
       set name "REGR-SYS2"
       set mib-view "view1"
       set vdoms "root" "vdom1"
    next
end
```

Important SNMP traps

Link Down and Link Up traps

This trap is sent when a FortiGate port either goes down or is brought up.

For example, the following traps are generated when the state of port34 is set to down using `set status down`, and then brought up using `set status up`:

```
NET-SNMP version 5.7.3 2019-01-31 14:11:48 10.1.100.1(via UDP: [10.1.100.1]:162->
[10.1.100.11]:162) TRAP, SNMP v1, community REGR-SYS SNMPv2-MIB::snmpTraps Link Down Trap (0)
Uptime: 0:14:44.95 IF-MIB::ifIndex.42 = INTEGER: 42 IF-MIB::ifAdminStatus.42 = INTEGER: down(2)
IF-MIB::ifOperStatus.42 = INTEGER: down(2) FORTINET-CORE-MIB::fnSysSerial.0 = STRING:
FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE
```

```
2019-01-31 14:11:48 <UNKNOWN> [UDP: [10.1.100.1]:162->[10.1.100.11]:162]: DISMAN-EVENT-
MIB::sysUpTimeInstance = Timeticks: (88495) 0:14:44.95 SNMPv2-MIB::snmpTrapOID.0 = OID: IF-
MIB::linkDown IF-MIB::ifIndex.42 = INTEGER: 42 IF-MIB::ifAdminStatus.42 = INTEGER: down(2) IF-
MIB::ifOperStatus.42 = INTEGER: down(2) FORTINET-CORE-MIB::fnSysSerial.0 = STRING:
FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE 2019-01-31 14:12:01 10.1.100.1
(via UDP: [10.1.100.1]:162->[10.1.100.11]:162) TRAP, SNMP v1, community REGR-SYS SNMPv2-
```

```
MIB::snmpTraps Link Up Trap (0) Uptime: 0:14:57.98 IF-MIB::ifIndex.42 = INTEGER: 42 IF-
MIB::ifAdminStatus.42 = INTEGER: up(1) IF-MIB::ifOperStatus.42 = INTEGER: up(1) FORTINET-CORE-
MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE
```

```
2019-01-31 14:12:01 <UNKNOWN> [UDP: [10.1.100.1]:162->[10.1.100.11]:162]: DISMAN-EVENT-
MIB::sysUpTimeInstance = Timeticks: (89798) 0:14:57.98 SNMPv2-MIB::snmpTrapOID.0 = OID: IF-
MIB::linkUp IF-MIB::ifIndex.42 = INTEGER: 42 IF-MIB::ifAdminStatus.42 = INTEGER: up(1) IF-
MIB::ifOperStatus.42 = INTEGER: up(1) FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330
SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE
```

fgFmTrapIfChange trap

This trap is sent when any changes are detected on the interface. The change can be very simple, such as giving an IPV4 address.

For example, the user has given the IP address of 1.2.3.4/24 to port 1 and the EMS Manager has detected the following trap:

```
DISMAN-EXPRESSION-MIB::sysUpTimeInstance = Timeticks: (7975058) 22:09:10.58 SNMPv2-
MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgFmTrapIfChange FORTINET-CORE-
MIB::fnSysSerial.0 = STRING: FG140P3G15800330 IF-MIB::ifName.45 = STRING: port1 FORTINET-
FORTIGATE-MIB::fgManIfIp.0 = IpAddress: 1.2.3.4 FORTINET-FORTIGATE-MIB::fgManIfMask.0 = IpAddress:
255.255.255.0 FORTINET-FORTIGATE-MIB::fgManIfIp6.0 = STRING: 0:0:0:0:0:0:0:0
```

entConfigChange trap

The change to the interface in the previous example has also triggered the *ConfChange Trap* which is sent along with the *fgFmTrapIfChange* trap:

```
2018-11-15 09:30:23 FGT_A [UDP: [172.16.200.1]:162->[172.16.200.55]:162]: DISMAN-EXPRESSION-
MIB::sysUpTimeInstance = Timeticks: (8035097) 22:19:10.97 SNMPv2-MIB::snmpTrapOID.0 = OID: ENTITY-

```

fgTrapDeviceNew trap

This trap is triggered when a new device, like a FortiSwitch, is connected to the FortiGate.

For example, the following scenario has given the device a new trap for adding FortiAP on a PoE interface a FortiGate 140D-POE. The trap has important information about the device name, device MAC address, and when it was last seen.

```
2018-11-15 11:17:43 UDP/IPv6: [2000:172:16:200::1]:162 [UDP/IPv6: [2000:172:16:200::1]:162]:

STRING: 90:6c:ac:f9:97:a0
```

fgTrapAvOversize trap

The `fgTrapAvOversize` trap is generated when the antivirus scanner detects an oversized file:

```
019-01-31 13:22:04 10.1.100.1(via UDP: [10.1.100.1]:162->[10.1.100.11]:162) TRAP, SNMP v1,

MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE
```

BIOS security level trap

SNMP clients can query the BIOS security level of a FortiGate using the OID 1.3.6.1.4.1.12356.101.4.1.38.

Memory usage traps

Both free memory usage and freeable memory of FortiGate devices can be monitored through the Simple Network Management Protocol (SNMP). SNMP object identifier (OID) entries are available in Fortinet MIB files to show the percentage of free memory usage and freeable memory in an SNMP manager:

- `1.3.6.1.4.1.12356.101.4.1.36 .fgSysFreeMemUsage`
- `1.3.6.1.4.1.12356.101.4.1.37 .fgSysFreeableMemUsage`

The following commands are available to configure memory thresholds to trigger SNMP traps:

```
config system snmp sysinfo
    set trap-free-memory-threshold <integer>
    set trap-freeable-memory-threshold <integer>
end
```

`set trap-free-memory-threshold <integer>`	Use an integer from 1 to 100 (default 5) to identify what percentage of free memory usage will trigger an SNMP trap. SNMP traps are sent when the free memory is *lower* than the specified threshold. For example, the free memory threshold is set to 5, and SNMP traps are sent when free memory is lower than 5%.
`set trap-freeable-memory-threshold <integer>`	Use an integer from 1 to 100 (default 60) to identify what percentage of freeable memory will trigger an SNMP trap.

	SNMP traps are sent when the freeable memory is *higher* than the specified threshold. For example, the freeable memory threshold is set to 60, and SNMP traps are sent when freeable memory is higher than 60%.

Example

In this example, the SNMP agent is configured to monitor FortiGate memory and send traps. The `trap-free-memory-threshold` is set to `10`, and the `trap-freeable-memory-threshold` is set to `50`. SNMP traps are triggered for both thresholds because:

- The free memory on the FortiGate is 9%, which is lower than the threshold of 10.
- The freeable memory on the FortiGate is 56%, which is higher than the threshold of 50.

To configure SNMP for monitoring memory usage on FortiGates:

1. Configure the SNMP agent to monitor FortiGate memory usage and freeable memory.

   In this example, the `trap-free-memory-threshold` is set to `10`, and the `trap-freeable-memory-threshold` is set to `50`.

   ```
   config system snmp sysinfo
       set status enable
       set engine-id <string for local SNMP engine ID>
       set description <string>
       set contact-info <string>
       set location <string>
       set trap-high-cpu-threshold 60
       set trap-free-memory-threshold 10
       set trap-freeable-memory-threshold 50
   end
   ```

2. Verify that the SNMP manager can successfully query and receive a response on the current memory status of the FortiGate.

   In the following example, the free memory on the FortiGate is reported as 9%, and the freeable memory on the FortiGate is reported as 56%.

   ```
   # snmpwalk -v2c -c REGR-SYS 172.16.200.1 1.3.6.1.4.1.12356.101.4.1.36
   FORTINET-FORTIGATE-MIB::fgSystemInfo.36.0 = Gauge32: 9
   fosqa@pc05:~$ snmpwalk -v2c -c REGR-SYS 172.16.200.1 1.3.6.1.4.1.12356.101.4.1.37
   FORTINET-FORTIGATE-MIB::fgSystemInfo.37.0 = Gauge32: 56
   ```

3. Use the SNMP manager to monitor memory usage on the FortiGate.

   Following is an example of the SNMP trap messages sent when thresholds are surpassed for freeable memory and free memory usage on FortiGates:

   ```
   2023-12-08 19:53:14 172.16.200.1(via UDP: [172.16.200.1]:162->[172.16.200.55]:162) TRAP, SNMP

```

SNMP traps and automation-stitch notifications for DIO module

FortiGate Rugged 70F and FortiGate Rugged 70F-3G4G include a general purpose input output (GPIO) module, also known as a digital I/O (DIO) module. The module supports SNMP traps and automation-stitch notifications when DIO module alarm functionality is activated. The DIO module triggers an alarm when it detects a change in any digital input, and the digital output is activated. Notification support depends on previously configured `config system digital-io` and `execute digital-io set-output` settings prior to event notification. See FGR-70F/FGR-70F-3G4G GPIO/DIO module on page 99 for more information.

CLI for configuring SNMP traps and automation-stitch notifications is available only on FortiGate Rugged 70F and FortiGate Rugged 70F-3G4G devices.

The `config system automation-condition` command includes the following relevant options:

```
config system automation-condition
    edit <name>
        set condition-type input
        set input-state {open|close}
    next
end
```

`set condition-type input`	Configure the type of condition to `input` for the DIO module on the FortiGate 70F series.
`set input-state {open|close}`	Configure the input state: • `open`: Input switch is open. • `close`: Input switch is closed.

The `config system snmp community` command includes the following relevant option:

```
config system snmp community
    edit <id>
        set events dio
    next
end
```

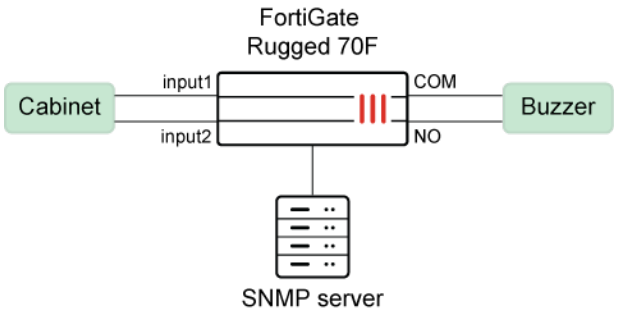
`set events dio`	Configure the SNMP trap event for the DIO module of the FortiGate Rugged 70F series. When enabled, system events are also logged.

For more information about the DIO module, see the FortiGate Rugged 70F Series QuickStart Guide and the Technical Tip: Overview of the Digital Input/Output (DIO) Module in FortiGate Rugged 70F Series community article.

Example

In this example, a FortiGate Rugged 70F is configured to monitor the open/close status of a cabinet door, and the output is connected to a buzzer. An automation stitch and SNMP trap are also configured.

When the status of the cabinet door changes from open to closed or closed to open, FortiGate triggers the buzzer, automation stitch, and SNMP trap. A system event is also logged when SNMP traps are sent.



Before you configure automation stitches and SNMP traps for DIO module alarms, you must configure the alarms using the `config system digital-io` and `execute digital-io set-output` settings. See FGR-70F/FGR-70F-3G4G GPIO/DIO module on page 99 for more information.

To configure an automation stitch for DIO module alarms:

1. Configure an automation-stitch condition for when the DIO module detects an input state of open:
   In this example, the condition type is set to `input`, and the input state is set to `open`.

```
config system automation-condition
    edit "Cabinet-Open"
        set description "Cabinet open"
        set condition-type input
        set input-state open
    next
end
```

2. Configure an automation-stitch trigger:

```
config system automation-trigger
    edit "DIO-trigger"
        set description "DIO-trigger"
    next
end
```

3. Configure a stitch to use the condition to trigger an action, such as an email notification:
   In this example, the automation stitch uses the previously configured trigger (DIO-trigger) and condition (Cabinet-Open) to trigger an email notification.

```
config system automation-stitch
    edit "dio"
        set description "DIO-stitch"
        set trigger "DIO-trigger"
        set condition "Cabinet-Open"
        config actions
            edit 1
                set action "Email Notification"
                set required enable
            next
        end
    next
end
```

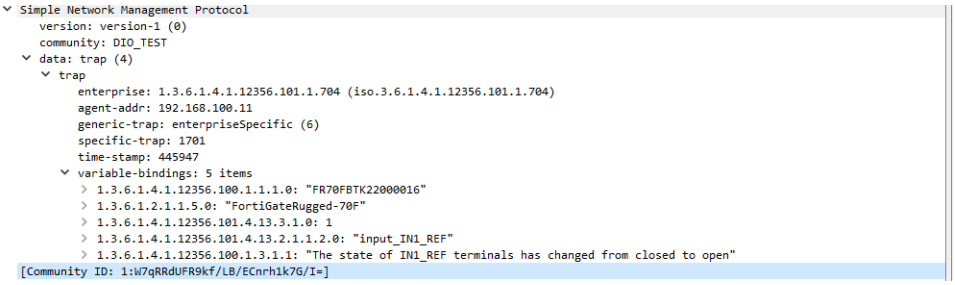
To configure an SNMP trap for DIO module alarms:

1. Configure a DIO module event in an SNMP community:
   With `set events dio` configured, SNMP traps are triggered for DIO module alarms.

```
config system snmp community
    edit 1
        set name "DIO_TEST"
        config hosts
            edit 1
                set ip 172.16.200.55 255.255.255.255
            next
        end
        set events dio
    next
end
```

Results:

When the cabinet door being monitored by the DIO module opens unexpectedly, it triggers an SNMP event:



It also triggers a system log:

```
9: date=2024-11-18 time=17:26:13 eventtime=1731979573581176380 tz="-0800" logid="0100022907"
type="event" subtype="system" level="notice" vd="root" logdesc="Digital-IO input state change"
connector="input_IN1_REF" mode="default" state="open" msg="The state of IN1_REF terminals has
changed from closed to open"
```

When the cabinet door is opened, it also triggers an email notification as configured by the automation stitch.

SNMP examples

This topic includes examples that incorporate several SNMP settings:

- Example 1: SNMP traps for monitoring interface status using SNMP v3 user on page 3546
- Example 2: SNMP traps and query for monitoring DHCP pool using SNMP v3 user on page 3548
- Example 3: Enabling the INDEX extension on page 3550
- Example 4: Ethernet Statistics Group on page 3553
- Example 5: Enabling non-management VDOMs to send queries using SNMP v3 on page 3554

Example 1: SNMP traps for monitoring interface status using SNMP v3 user

This configuration enables the SNMP manager (172.16.200.55) to receive notifications when a FortiGate port either goes down or is brought up. The SNMP manager can also query the current status of the FortiGate port.

To configure SNMP for monitoring interface status in the GUI:

1. Configure interface access:
   a. Go to *Network* > *Interfaces* and edit *port1*.
   b. In the *Administrative Access* options, enable *SNMP*.
   c. Click *OK*.
2. Configure the SNMP agent:
   a. Go to *System* > *SNMP*.
   b. Enable *SNMP Agent* and enter the following:

Description	Branch
Location	Burnaby
Contact Info	Jane Doe

   c. Click *Apply*.
3. Configure an SNMP v3 user:
   a. Go to *System* > *SNMP*.
   b. In the *SNMP v3* table, click *Create New*.
   c. Configure the following:

User Name	Interface_Status
Security Level	Authentication
Authentication Algorithm	SHA1
Password	*******
Hosts IP Address	172.16.200.55

   d. Click *OK*.

To configure SNMP for monitoring interface status in the CLI:

1. Configure interface access:

```
config system interface
    edit port1
        append allowaccess snmp
    next
end
```

2. Configure the SNMP agent:

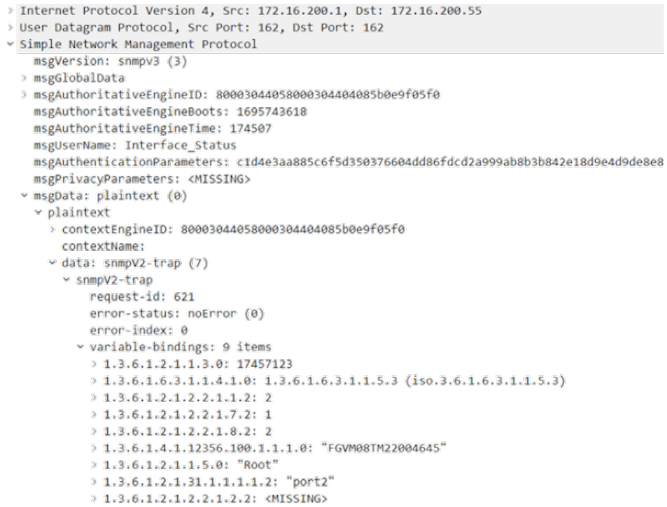
```
config system snmp sysinfo
    set status enable
    set description Branch
    set contact-info Jane Doe
    set location Burnaby
end
```

3. Configure an SNMP v3 user:

```
config system snmp user
    edit "Interface_Status"
        set notify-hosts 172.16.200.55
        set security-level auth-no-priv
        set auth-proto sha
        set auth-pwd ********************
    next
end
```

Verification

1. Start the packet capture on interface port1 with the filter set to port 162. See Using the packet capture tool on page 884 for more information.
2. Turn off one of the FortiGate interface statuses to down, in this case, port2.
3. Save the packet capture.



The SNMP v3 trap is transmitted from port1 to the SNMP manager. Note that `msgAuthenticationParameters` is configured, indicating that authentication is active. The absence of `msgPrivacyParameters` suggests that encryption is not configured. This is further confirmed by `plaintext` in `msgData`.

4. Verify that the SNMP manager has received the trap. See Important SNMP traps on page 3539 for an example of a trap.
5. Verify that the SNMP manager can successfully query and receive receive a response on the current status of the FortiGate ports:

```
# snmpwalk -v3 -u Interface_Status  -l authNoPriv -a SHA -A xxxxxxxx 172.16.200.1
1.3.6.1.2.1.2.2.1.8
iso.3.6.1.2.1.2.2.1.8.1 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.2 = INTEGER: 2
iso.3.6.1.2.1.2.2.1.8.3 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.4 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.5 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.6 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.7 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.8 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.9 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.10 = INTEGER: 1
```

Example 2: SNMP traps and query for monitoring DHCP pool using SNMP v3 user

This configuration enables the SNMP manager (172.16.200.55) to receive DHCP-related notifications from FortiGate.

The SNMP DHCP event contains three traps and one query.

Traps are sent when:

- DHCP server IP pool usage reaches 90%
- DHCP server detect an IP address that is already in use
- DHCP client receives DHCP NAK

SNMP queries are accepted for DHCP lease usage information (OID = 1.3.6.1.4.1.12356.101.23). The query result is based on the leased out percentage.

To configure SNMP for monitoring DHCP pool in the GUI:

1. Configure interface access:
   a. Go to *Network* > *Interfaces* and edit *port1*.
   b. In the *Administrative Access* options, enable *SNMP*.
   c. Click *OK*.
2. Configure the SNMP agent:
   a. Go to *System* > *SNMP*.
   b. Enable *SNMP Agent* and enter the following:

Description	Branch
Location	Burnaby
Contact Info	Jane Doe

c. Click *Apply*.

3. Configure an SNMP v3 user:
   a. Go to *System* > *SNMP*.
   b. In the *SNMP v3* table, click *Create New*.
   c. Configure the following:

User Name	DHCP_Status
Security Level	Authentication
Authentication Algorithm	SHA384
Password	*******
Private	Enabled
Encryption Algorithm	AES256
Password	*******
Hosts IP Address	172.16.200.55

   d. Click *OK*.

To configure SNMP for monitoring the DHCP pool in the CLI:

1. Configure interface access:

```
config system interface
    edit port1
        append allowaccess snmp
    next
end
```

2. Configure the SNMP agent:

```
config system snmp sysinfo
    set status enable
    set description Branch
    set contact-info Jane Doe
    set location Burnaby
end
```

3. Configure an SNMP v3 user:

```
config system snmp user
    edit "DHCP_Status"
        set notify-hosts 172.16.200.55
        set security-level auth-priv
```

```
        set auth-proto sha384
        set auth-pwd ********************
        set priv-proto aes256
        set priv-pwd ********************
    next
end
```

Verification

1. Start the packet capture on interface port1 with the filter set to port 162. See Using the packet capture tool on page 884 for more information.
2. Overload the DHCP server IP pool.
3. Save the packet capture.

   The SNMP v3 trap is transmitted from port1 to the SNMP manager. Note that both `msgAuthenticationParameters` and `msgPrivacyParameters` are set up, indicating that authentication and encryption are active. This is further confirmed by `encryptedPDU` in `msgData`.
4. Verify that the SNMP manager has received the trap. See Important SNMP traps on page 3539 for an example of a trap.
5. Verify that the SNMP manager can successfully query and receive DHCP lease usage information for FortiGate:

```
# snmpwalk -v3 -u DHCP_Status  -l authPriv -a SHA384 -A xxxxxxxx -x AES256 -X xxxxxxxx
172.16.200.1 1.3.6.1.4.1.12356.101.23
iso.3.6.1.4.1.12356.101.23.1.1.0 = INTEGER: 6
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.1 = INTEGER: 0
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.2 = INTEGER: 0
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.3 = INTEGER: 0
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.4 = INTEGER: 0
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.5 = INTEGER: 0
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.6 = INTEGER: 100
```

Example 3: Enabling the INDEX extension

In the following example, the same IP address will be set on different ports in two VDOMs. The ipAddrTable SNMP Tree output will then be reviewed before and after enabling the *append-index* command.

When the `append-index` command is enabled:

- VDOM and interface indexes are appended as the INDEX extension in RFC tables.
- In multi-VDOM mode, duplicated IP addresses in different VDOMs will result in multiple entries in the RFC table.

When the `append-index` command is disabled:

- VDOM and interface indexes are not appended in RFC tables.
- In multi-VDOM mode, duplicated IP addresses in different VDOMs will only be presented once in the RFC table.

To enable the INDEX extension:

1. In two different VDOMs, set the same address on two different ports.

```
config system interface
    edit "port3"
        set vdom "vdom1"
        set ip 10.1.1.1 255.255.255.0
        set type physical
        set snmp-index 5
    next
end
config system interface
    edit "port4"
        set vdom "root"
        set ip 10.1.1.1 255.255.255.0
        set type physical
        set snmp-index 6
    next
end
```

2. Configure the SNMP information but do not enable the INDEX extension.

```
config system snmp sysinfo
    set status enable
    set description "REGR-SYS"
end
```

3. On your PC, review the ipAddrTable SNMP Tree (OID 1.3.6.1.2.1.4.20). The IP address 10.1.1.1 is only displayed once.

```
snmpwalk -v2c -c REGR-SYS 172.16.200.1 1.3.6.1.2.1.4.20

IP-MIB::ipAdEntAddr.10.1.1.1 = IpAddress: 10.1.1.1
IP-MIB::ipAdEntAddr.10.255.1.1 = IpAddress: 10.255.1.1
IP-MIB::ipAdEntAddr.172.16.200.1 = IpAddress: 172.16.200.1
IP-MIB::ipAdEntAddr.192.168.1.99 = IpAddress: 192.168.1.99
IP-MIB::ipAdEntIfIndex.10.1.1.1 = INTEGER: 5
IP-MIB::ipAdEntIfIndex.10.255.1.1 = INTEGER: 39
IP-MIB::ipAdEntIfIndex.172.16.200.1 = INTEGER: 3
IP-MIB::ipAdEntIfIndex.192.168.1.99 = INTEGER: 2
IP-MIB::ipAdEntNetMask.10.1.1.1 = IpAddress: 255.255.255.0
```

```
IP-MIB::ipAdEntNetMask.10.255.1.1 = IpAddress: 255.255.255.0
IP-MIB::ipAdEntNetMask.172.16.200.1 = IpAddress: 255.255.255.0

IP-MIB::ipAdEntReasmMaxSize.192.168.1.99 = INTEGER: 65535
```

4. Enable the INDEX extension.

```
config system snmp sysinfo
    set status enable
    set description "REGR-SYS"
    set append-index enable
end
```

5. Review the ipAddrTable SNMP Tree (OID 1.3.6.1.2.1.4.20) again. The IP address 10.1.1.1 is now displayed twice.

```
snmpwalk -v2c -c REGR-SYS 172.16.200.1 1.3.6.1.2.1.4.20

IP-MIB::ipAdEntAddr.10.1.1.1.1 = IpAddress: 10.1.1.1
IP-MIB::ipAdEntAddr.10.1.1.1.2 = IpAddress: 10.1.1.1
IP-MIB::ipAdEntAddr.10.255.1.1.1 = IpAddress: 10.255.1.1
IP-MIB::ipAdEntAddr.172.16.200.1.2 = IpAddress: 172.16.200.1
IP-MIB::ipAdEntAddr.192.168.1.99.1 = IpAddress: 192.168.1.99
IP-MIB::ipAdEntIfIndex.10.1.1.1.1 = INTEGER: 6
IP-MIB::ipAdEntIfIndex.10.1.1.1.2 = INTEGER: 5
IP-MIB::ipAdEntIfIndex.10.255.1.1.1 = INTEGER: 39
IP-MIB::ipAdEntIfIndex.172.16.200.1.2 = INTEGER: 3
IP-MIB::ipAdEntIfIndex.192.168.1.99.1 = INTEGER: 2
IP-MIB::ipAdEntNetMask.10.1.1.1.1 = IpAddress: 255.255.255.0
IP-MIB::ipAdEntNetMask.10.1.1.1.2 = IpAddress: 255.255.255.0
IP-MIB::ipAdEntNetMask.10.255.1.1.1 = IpAddress: 255.255.255.0
IP-MIB::ipAdEntNetMask.172.16.200.1.2 = IpAddress: 255.255.255.0
IP-MIB::ipAdEntNetMask.192.168.1.99.1 = IpAddress: 255.255.255.0
IP-MIB::ipAdEntBcastAddr.10.1.1.1.1 = INTEGER: 1
IP-MIB::ipAdEntBcastAddr.10.1.1.1.2 = INTEGER: 1
IP-MIB::ipAdEntBcastAddr.10.255.1.1.1 = INTEGER: 1
IP-MIB::ipAdEntBcastAddr.172.16.200.1.2 = INTEGER: 1
IP-MIB::ipAdEntBcastAddr.192.168.1.99.1 = INTEGER: 1
IP-MIB::ipAdEntReasmMaxSize.10.1.1.1.1 = INTEGER: 65535
IP-MIB::ipAdEntReasmMaxSize.10.1.1.1.2 = INTEGER: 65535
IP-MIB::ipAdEntReasmMaxSize.10.255.1.1.1 = INTEGER: 65535
IP-MIB::ipAdEntReasmMaxSize.172.16.200.1.2 = INTEGER: 65535
IP-MIB::ipAdEntReasmMaxSize.192.168.1.99.1 = INTEGER: 65535
```

Example 4: Ethernet Statistics Group

FortiOS supports the Ethernet Statistics Group for Remote Network Monitoring (RMON), which provides detailed statistics about the traffic that passes through the Ethernet interface, such as drop events and collisions. This enhancement enables comprehensive monitoring and management of network performance, helping to ensure optimal operation and quickly identify any potential issues.

The Ethernet Statistics Group consists of the etherStatsTable .1.3.6.1.2.1.16.1.1 and can be leveraged using the following:

```
config system snmp rmon-stat
    edit 1
        set source <data source of the Ethernet statistics entry>
        set owner <owner of the Ethernet statistics entry>
    next
end
```

To enable entries to the Ethernet Statistics Group:

1. Configure the RMON group on the FortiGate:

   ```
   config system snmp rmon-stat
       edit 1
           set source "port2"
           set owner "test"
       next
   end
   ```

   An etherStatsEntry is created in the rmon-statistics table.
2. Query the etherStatsTable .1.3.6.1.2.1.16.1.1 on the SNMP server:

   ```
   # snmpwalk -v2c -c REGR-SYS 172.16.200.1 etherStatsTable
   RMON-MIB::etherStatsIndex.1 = INTEGER: 1
   RMON-MIB::etherStatsDataSource.1 = OID: IF-MIB::ifIndex.8
   RMON-MIB::etherStatsDropEvents.1 = Counter32: 0
   RMON-MIB::etherStatsOctets.1 = Counter32: 39388877 Octets
   RMON-MIB::etherStatsPkts.1 = Counter32: 125770 Packets
   RMON-MIB::etherStatsBroadcastPkts.1 = Counter32: 0 Packets
   RMON-MIB::etherStatsMulticastPkts.1 = Counter32: 84212 Packets
   RMON-MIB::etherStatsCRCAlignErrors.1 = Counter32: 0 Packets
   RMON-MIB::etherStatsUndersizePkts.1 = Counter32: 0 Packets
   RMON-MIB::etherStatsOversizePkts.1 = Counter32: 0 Packets
   RMON-MIB::etherStatsFragments.1 = Counter32: 0 Packets
   RMON-MIB::etherStatsJabbers.1 = Counter32: 0 Packets
   RMON-MIB::etherStatsCollisions.1 = Counter32: 0 Collisions
   RMON-MIB::etherStatsPkts64Octets.1 = Counter32: 0 Packets
   RMON-MIB::etherStatsPkts65to127Octets.1 = Counter32: 0 Packets
   RMON-MIB::etherStatsPkts128to255Octets.1 = Counter32: 0 Packets
   RMON-MIB::etherStatsPkts256to511Octets.1 = Counter32: 0 Packets
   RMON-MIB::etherStatsPkts512to1023Octets.1 = Counter32: 0 Packets
   RMON-MIB::etherStatsPkts1024to1518Octets.1 = Counter32: 0 Packets
   ```

```
RMON-MIB::etherStatsOwner.1 = STRING: "test"
RMON-MIB::etherStatsStatus.1 = INTEGER: valid(1)
```

Example 5: Enabling non-management VDOMs to send queries using SNMP v3

Although non-management and management VDOMs can perform queries using SNMP v3, this example shows how to enable non-management VDOMs to send queries.

PC1 connects to the port on FortiGate for the non-management VDOM, and SNMP v3 queries from non-management VDOMs are enabled. PC5 connects to the port on FortiGate for the management VDOM. With this configuration, SNMP queries are performed by both the non-management and the management VDOMs

To enable non-management VDOM SNMPv3 queries:

1. On FortiGate, enable non-management VDOM queries:

```
config system snmp sysinfo
    set status enable
    set engine-id-type text
    set engine-id ''
    set description ''
    set contact-info ''
    set location ''
    set trap-high-cpu-threshold 80
    set trap-low-memory-threshold 80
    set trap-log-full-threshold 90
    set trap-free-memory-threshold 5
    set trap-freeable-memory-threshold 60
    set append-index disable
    set non-mgmt-vdom-query enable
end
```

2. Check the SNMP information:

   This example uses the SNMP walk application to confirm that both management and non-management VDOMs are performing SNMP queries to PC1 and PC5.

```
pc01:~$ snmpwalk -v3 -u v3user 10.1.100.1 1.3.6.1.4.1.12356.101.5.1.2.1.1.1
FORTINET-FORTIGATE-MIB::fgFwPolID.1.0 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fgFwPolID.1.1 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fgFwPolID.2.0 = INTEGER: 0

pc05~$ snmpwalk -v3 -u v3user 172.16.200.1 1.3.6.1.4.1.12356.101.5.1.2.1.1.1
```

```
FORTINET-FORTIGATE-MIB::fgFwPolID.1.0 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fgFwPolID.1.1 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fgFwPolID.2.0 = INTEGER: 0
```

Replacement messages

FortiOS has replacement messages that are HTML and text files. These messages can be customized to meet user requirements. The content can be modified, and images can be added.

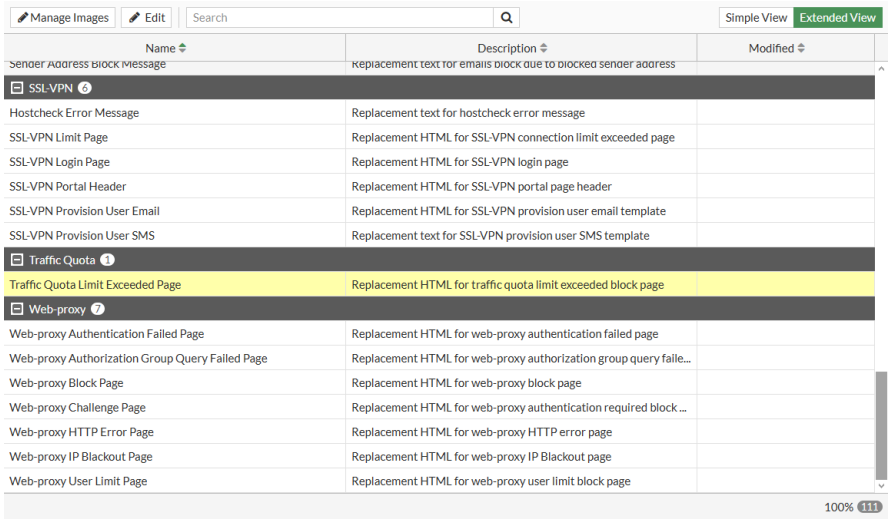
Modifying replacement messages

The *Replacement Messages* page has two views. *Simple View* (the default view) shows the most commonly used replacement messages. *Extended View* shows the entire list and all replacement message categories.

To modify a replacement message in the GUI:

1. Go to *System* > *Replacement Messages*.
2. Select a replacement message and click *Edit*.

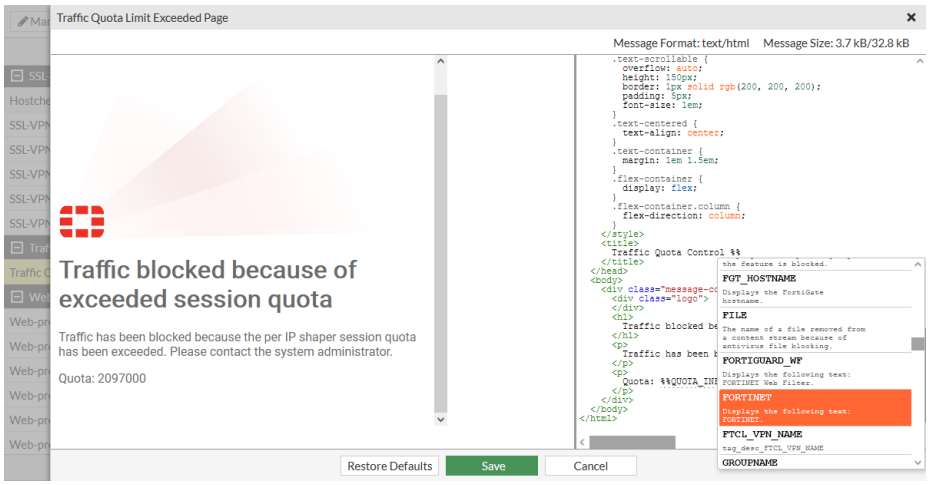
   If the message you want to edit is not visible, click *Extended View* in the upper right-hand corner of the top menu.



3. Edit the HTML code.

   The message is visible on the left alongside the HTML code on the right. The message view updates in real-time as you edit the content.

   When adding a variable to the code, right-click and select *Insert Tag* or type *%%* to view a list of the available variables, or start typing the variable name then press *Enter* or *TAB* to auto-complete the variable name.



4. Click *Save*.

Click *Restore Defaults* to return to the original message and code base.

To modify a replacement message in the CLI:

For example, to modify the *Traffic Quota Limit Exceeded Page* message:

```
config system replacemsg traffic-quota "per-ip-shaper-block"
    set buffer "<html>
  <head>
    <title>
      Traffic Quota Control
    </title>
  </head>
  <body>
    <font size=2>
      <table width=\"100%\">
        <tr>
          <td bgcolor=#3300cc align=\"center\" colspan=2>
            <font color=#ffffff>
              <b>
                Traffic blocked because exceeded session quota
              </b>
            </font>
          </td>
        </tr>
      </table>
      <br>
      <br>
      Traffic blocked because it exceeded the per IP shaper session quota. Please contact the
system administrator.
      <br>
      %%QUOTA_INFO%%
```

```
      <br>
      <br>
      <hr>
    </font>
  </body>
</html>"
    set header http
    set format html
end
```

Replacement message images

Images can be added to replacement messages on:

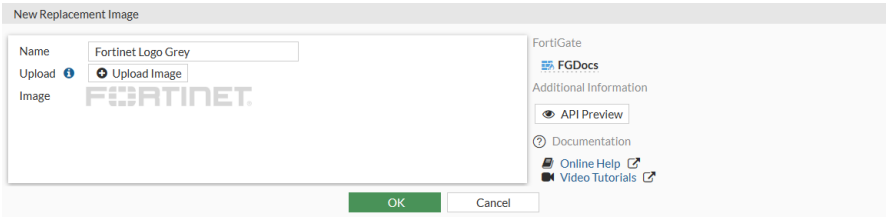
- Disclaimer pages
- Login pages
- Declined disclaimer pages
- Login failed pages
- Login challenge pages
- Keepalive pages

The supported image formats are GIF, JPEG, TIFF, and PNG. The maximum file size supported is 24 KB.

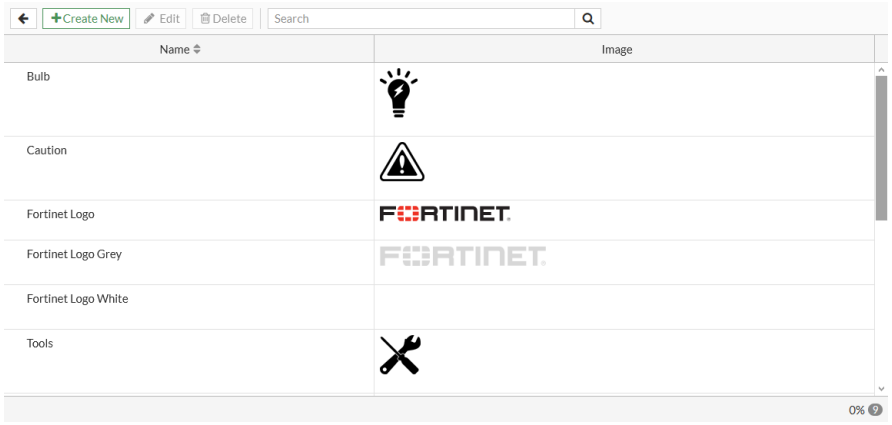
Adding images to replacement messages

To add images to replacement messages in the GUI:

1. Go to *System* > *Replacement Messages*.
2. In the top menu, click *Manage Images*.
3. Click *Create New*.
4. Enter a name for the image.
5. Click *Upload Image* and locate the file.



6. Click *OK*.
   The file is now visible in the list.



7. Return to the replacement message list and edit a message.
8. Right-click in the message code where you want to add the image, and select *Insert Image*.
9. Select the image from the list then press *Enter*, or double-click on the image to add it to the message.
10. Click *Save*.

To add images to replacement messages in the CLI:

1. Add the image to the FortiGate:

```
config system replacemsg-image
    edit <image_name>
        set image-type {gif | jpg | tiff | png}
        set image-base64 <string>
    next
end
```

2. Edit the replacement message, and include `%%IMAGE:<image name>%%` in the code to add the image.

Replacement message groups

Replacement message groups allow users to customize replacement messages for individual policies and profiles.

There are two types of replacement message groups:

Type	Usage	Customizable categories
utm	Used with UTM settings in firewall policies.	• admin • alertmail • custom-message • fortiguard-wf • ftp • http • icap

Type	Usage	Customizable categories
		• mail • nac-quar • spam • sslvpn • traffic-quota • utm • webproxy
auth	Used with authentication pages in firewall policies.	• auth • webproxy

The messages added to a group do not need to be customized. The message body content, header type, and format will use the default values if not customized.

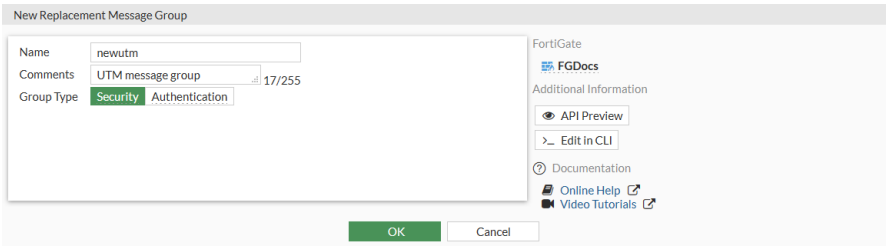
To make replacement message groups visible in the GUI:

```
config system global
    set gui-replacement-message-groups enable
end
```

In the following example, two replacement message groups are created. The UTM message group includes custom mail-related messages and is assigned to an email filter profile. The authentication message group has a custom authentication success message that is applied to a proxy-based firewall policy that has an assigned email filter profile.

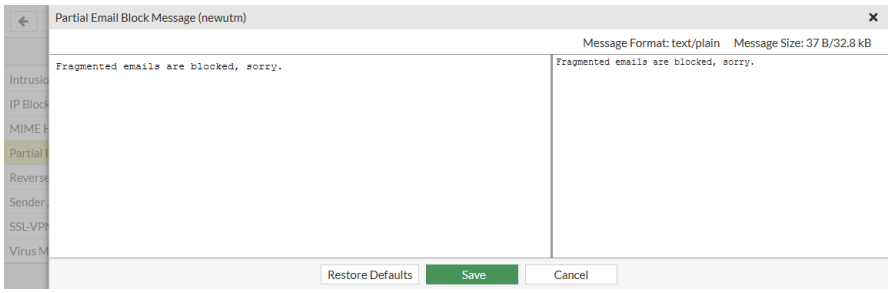
To create replacement message groups in the GUI:

1. Create the *Security* replacement message group:
   a. Go to *System* > *Replacement Message Groups*.
   b. Click *Create New*.
   c. For *Name*, enter *newutm*.
   d. In the *Comments* field, enter *UTM message group*.
   e. For *Group Type*, select *Security*.
   f. Click *OK*.



2. Customize the replacement messages in the *newutm* group:
   a. Go to *System* > *Replacement Message Groups*.
   b. Edit the *newutm* group.

c. Select the *Partial Email Block Message*.



d. Edit the message and click *Save*.

e. Select the *ASE Block Message*.

f. Edit the message and click *Save*.

3. Create the *Authentication* replacement message group:

a. Go to *System* > *Replacement Message Groups*.

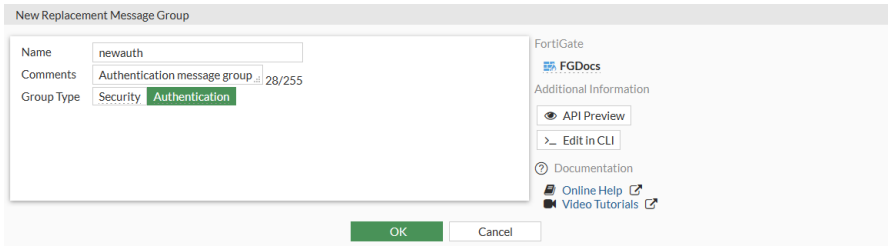
b. Click *Create New*.

c. For *Name*, enter *newauth*.

d. In the *Comments* field, enter *Authentication message group*.

e. For *Group Type*, select *Authentication*.

f. Click *OK*.



4. Apply the *newutm* replacement message group to an email filter profile in the CLI:

```
config emailfilter profile
    edit "newmsgs"
        set replacemsg-group "newutm"
    next
end
```

5. Apply the *newauth* replacement message group and the email filter profile to a firewall policy in the CLI:

```
config firewall policy
    edit 1
        ...
        set replacemsg-override-group "newauth"
        set inspection-mode proxy
        set emailfilter-profile "newmsgs"
        ...
    next
end
```

To create replacement message groups in the CLI:

1. Create the replacement message groups:

```
config system replacemsg-group
    edit "newutm"
        set comment "UTM message group"
        set group-type utm
        config mail
            edit "partial"
                set buffer "Fragmented emails are blocked, sorry."
            next
        end
        config spam
            edit "smtp-spam-ase"
                set buffer "This message has been blocked because ASE reports it as spam.
You\'re welcome."
            next
        end
    next
    edit "newauth"
        set comment 'Authentication message group'
        set group-type auth
        config auth
            edit "auth-success-msg"
                set buffer "Welcome to the firewall. Your authentication has been accepted,
please reconnect."
            next
        end
    next
end
```

2. Apply the message group to the email filter:

```
config emailfilter profile
    edit "newmsgs"
        set replacemsg-group "newutm"
    next
end
```

3. Apply the email filter and message group to the policy:

```
config firewall policy
    edit 1
        ...
        set replacemsg-override-group "newauth"
        set inspection-mode proxy
        set emailfilter-profile "newmsgs"
        ...
    next
end
```

FortiGuard

FortiGuard services comprise of signature packages and querying services that provide content, web and device security. It is delivered via various types of FortiGuard servers that are part of the FortiGuard Distribution Network (FDN).

FortiGuard service subscriptions can be purchased and registered to your FortiGate unit. The FortiGate must be connected to the Internet in order to automatically connect to the FDN to validate the license and download FDN updates or perform real-time queries.

To view FDN support contract information, go to *System > FortiGuard*. The *Licensed* widgets show the status of your FortiGate's entitlements and breaks down the status of each service.

License Information widget

The service entitlements and the license statuses are listed on the *System > FortiGuard > Subscriptions* tab. Upon expanding each entitlement, the corresponding definitions associated with the service are listed.

The following table list the available FortiGuard services and entitlements with a brief description.

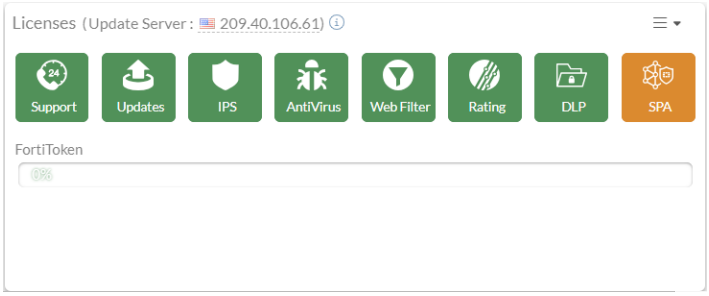
Entitlement	FortiGuard service description
Advanced Malware Protection AI Malware Detection Model AntiVirus Definitions AntiVirus Engine Mobile Malware Outbreak Prevention	The Advanced Malware Protection service includes various engines, databases, and definitions used in the AV profile. In order to download updated AV definitions, at least 1 policy with a security profile that has Antivirus scanning must be enabled. SeeAntivirus on page 1905 for details.
Attack Surface Security IoT Detection Definitions Outbreak Package Definitions Security Rating & CIS Compliance	The Attack Surface Security service includes: • Running all the built-in free and paid security rating rules • Displaying CIS compliance information within security ratings • IoT Detection and IoT Query
Data Loss Prevention (DLP) Signatures DLP Signatures	The Data Loss Prevention service offers a database of predefined DLP patterns such as data types, dictionaries, and sensors that are used in the DLP profile.
Email Filtering	Email Filtering includes spam and DNS filtering by FortiGuard.
Intrusion Prevention System (IPS) IPS Definitions IPS Engine	The IPS service includes engines, databases, and definitions used in the IPS and application control profiles.

Entitlement	FortiGuard service description
Malicious URLs Botnet IPs Botnet Domains	In order to download updated IPS definitions, at least 1 policy with a security profile that has IPS scanning must be enabled. See Intrusion prevention on page 2113 and Application control on page 2077 for details.
Operational Technology (OT) Security Service OT Threat Definitions OT Detection Definitions OT Virtual Patching Signatures	The OT Security service includes OT-related threat definitions used in IPS and application control profiles. It also includes OT Detection Definitions and Virtual Patching Signatures used in the virtual patching profile.
URL, DNS & Video Filtering Blocked Certificates DNS Filtering Video Filtering	The Web Security service includes: • FortiGuard categories used in web filter profiles • Malicious certificates used in SSL/SSH inspection profiles • FortiGuard categories used in DNS filter profiles • FortiGuard categories used in video filter profiles
SD-WAN Network Monitor	SD-WAN Underlay Bandwidth and Quality Monitoring service
SD-WAN Overlay as a Service	SD-WAN Overlay as a Service
FortiSASE SPA Service Connection	SD-WAN Connector for FortiSASE Secure Private Access
FortiSASE Secure Edge Management	Allows the FortiGate to act as the FortiSASE Secure Edge
FortiGate Cloud	FortiGate Cloud management, analysis, and log retention services
FortiAnalyzer Cloud SoCaaS	FortiAnalyzer Cloud service The SoCaaS entitlement includes cloud-based managed log monitoring, incident triage, and SOC escalation services.
FortiManager Cloud	FortiManager Cloud service
FortiToken Cloud	FortiToken Cloud service
Firmware, VM, and base subscriptions Application Control Signatures Device & OS Identification FortiGate Virtual Patch Signatures Inline-CASB Application Definitions	The FortiCare support entitlement includes firmware and general updates that come with various default signatures and definitions: • Application control signatures used in application control profiles • Device & OS identification used for device detection and asset management • Virtual patch signatures used in local-in policies • Inline CASB application definitions used in inline CASB profiles • ISDB destinations that can be applied in various policies and rules • PSIRT vulnerability definitions used in security ratings

Entitlement	FortiGuard service description
Internet Service Database Definitions	
PSIRT Package Definitions	
Support	
FortiCloud Account	
Enhanced Support	
FortiConverter Hosted Service	FortiConverter service

Licenses widget

On the *Dashboard* > *Status* page, the *Licenses* widget lists the status of major entitlements. Licensed entitlement icons are green, and unlicensed entitlement icons are orange.



The following topics contain more information:

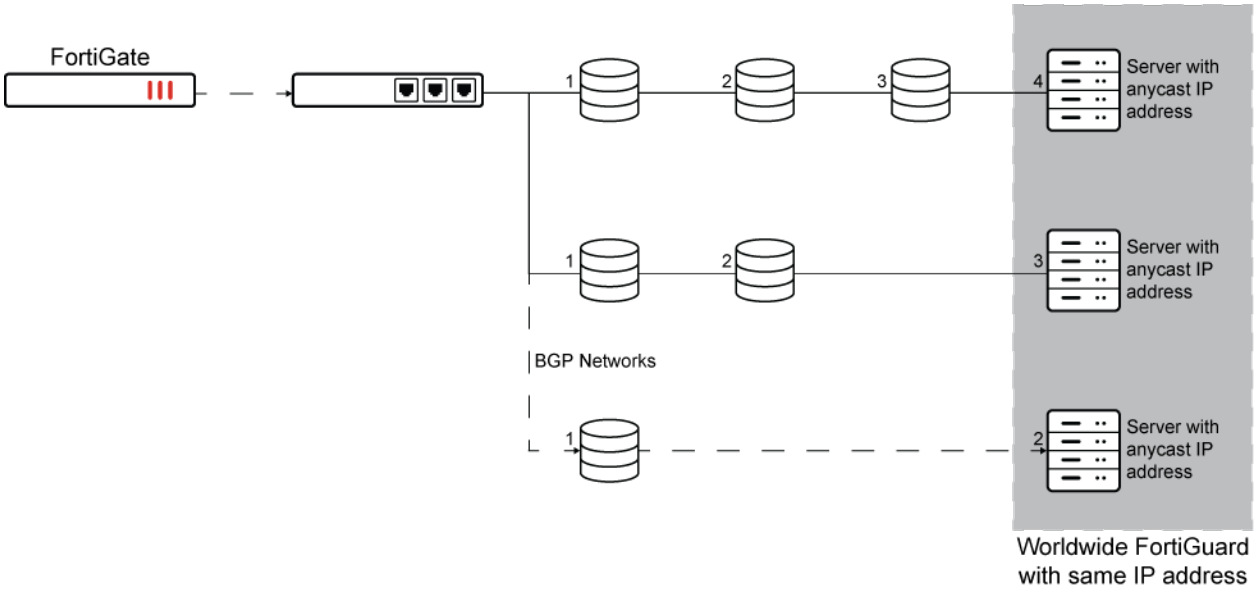
- Anycast on page 3565
- Connection and OCSP stapling on page 3565
- Configuring FortiGuard updates on page 3567
- Using a proxy server to connect to the FortiGuard Distribution Network on page 3568
- Manual updates on page 3569
- Automatic updates on page 3570
- Scheduled updates on page 3570
- Sending malware statistics to FortiGuard on page 3571
- Update server location on page 3572
- Filtering on page 3573
- Online security tools on page 3575
- Anycast and unicast services on page 3575
- Using FortiManager as a local FortiGuard server on page 3576
- Cloud service communication statistics on page 3579
- IoT detection service on page 3580
- FortiAP query to FortiGuard IoT service to determine device details on page 3585
- FortiGate Cloud / FDN communication through an explicit proxy on page 3585
- FDS-only ISDB package in firmware images on page 3587

- Licensing in air-gap environments on page 3588
- License expiration on page 3589
- FortiGate StateRamp support on page 3591
- Disable all cloud communication on page 3594

Anycast

FortiGuard servers use Anycast addresses in order to optimize and distribute traffic across many servers. Anycast is the default access mode for FortiGates when connecting to FortiGuard which by default utilizes HTTPS and port 443.

Each type of FortiGuard servers and services have a FortiGuard domain name that resolves to a single Anycast IP address. Regardless of where the FortiGate is located, the resolution is still the same. Fortinet maintains the network in the background to ensure routes to the FortiGuard servers are optimized. In the below diagram, several servers have the same Anycast IP, but the FortiGate will connect to the one with the least hops.



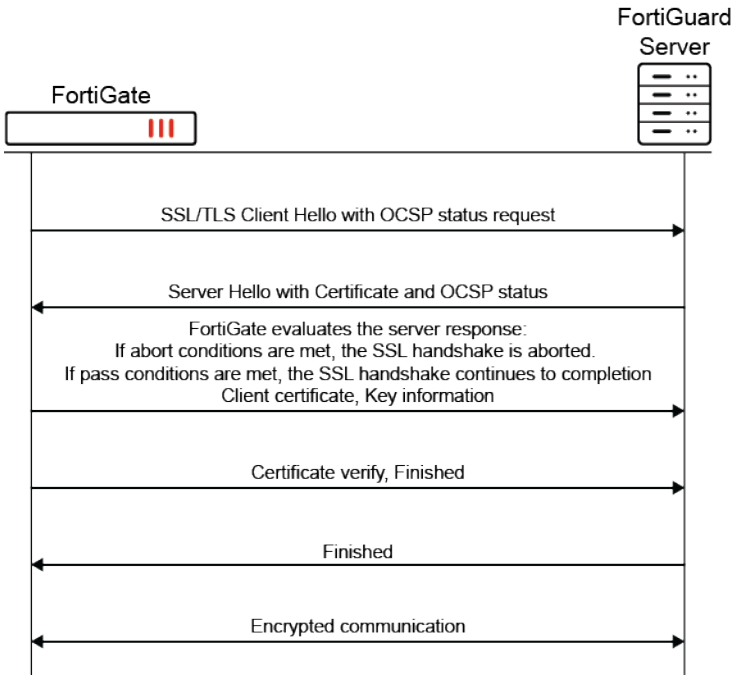
Connection and OCSP stapling

When the FortiGate connects to a FortiGuard server, it is important for it to validate the server is indeed a real FortiGuard server. Hence, FortiGuard servers provide the following security:

- The domain name of each FortiGuard service is the common name in that service's certificate, which is signed by a third-party intermediate CA.
- The FortiGuard server also applies Online Certificate Status Protocol (OCSP) stapling check, in which it attaches a time-stamped OCSP status of the server certificate from the OCSP server to the TLS response.

This ensures FortiGate can validate the FortiGuard server certificate efficiently during the TLS handshake.

The following illustrates the connection process:



FortiGate will only complete the TLS handshake with an anycast server when abort conditions are not met. Abort conditions include:

- The CN in the server's certificate does not match the domain name resolved from the DNS.
- The OCSP status is revoked or unknown.
- The issuer-CA is revoked by the root-CA.

To configure the anycast FortiGuard access mode:

```
config system fortiguard
    set fortiguard-anycast enable
end
```

If FortiGuard is not reachable via Anycast, choose between the following options to work around this issue:

1. Switch to other Anycast servers:

   ```
   config system fortiguard
       set fortiguard-anycast enable
       set fortiguard-anycast-source aws
   end
   ```

2. Disable Anycast and use HTTPS:

   ```
   config system fortiguard
       set fortiguard-anycast disable
       set protocol https
       set port 8888
   end
   ```

3. Disable Anycast and use UDP:

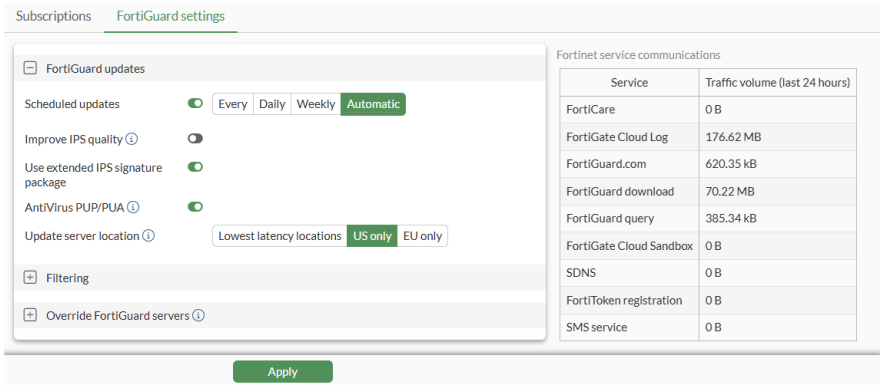
```
config system fortiguard
    set fortiguard-anycast disable
    set protocol udp
    set port 53
end
```

Configuring FortiGuard updates

To configure FortiGuard updates:

1. Go to the *System* > *FortiGuard* > *FortiGuard settings* tab.
2. In the *FortiGuard updates* section, configure the options for connecting and downloading definition files:

Immediately download updates	The option can be enabled on 2U and larger hardware models when the FortiGuard are servers are connected in anycast mode. The FortiGate forms a secure, persistent connection with FortiGuard to get notifications of new updates through an HTTPS connection. The FortiGate uses the fds_notify daemon to wait for the notification, then makes another connection to the FortiGuard server to download the updates.
Scheduled Updates	Enable to schedule updates to be sent to the FortiGate at the specified time or automatically. See Scheduled updates on page 3570 and Automatic updates on page 3570.
Improve IPS quality	Enable to send information to the FortiGuard servers when an attack occurs. This can help keep the FortiGuard database current as attacks evolve, and improve IPS signatures.
Use extended IPS signature package	Enable to use the extended IPS database, that includes protection from legacy attacks, along with the regular IPS database that protects against the latest common and in-the-wild attacks.
AntiVirus PUP/PUA	Enable antivirus grayware checks for potentially unwanted applications.
Update server location	The FortiGuard update server location. See Update server location on page 3572 for details.



3. Click *Apply*.

Using a proxy server to connect to the FortiGuard Distribution Network

You can configure FortiOS to use a proxy server to connect to the FortiGuard Distribution Network (FDN).

Proxy tunneling is supported only for registration, AV, and IPS updates. For FortiGate virtual machines, proxy tunneling can also be used for license validation. For web filtering or spam filtering, UDP protocol is used on ports 53 or 8888. UDP protocol traffic cannot be directed over a proxy server, even if you are using versions of FortiOS that support web filtering over port 443.

Consider the following before configuring FortiOS to use a proxy server to connect to FDN:

- FortiOS connects to the proxy server using the HTTP CONNECT method. For information about the HTTP CONNECT method, see RFC 2616.
- The proxy server must not inspect the HTTPS traffic used for FortiOS communication.
- FortiOS sends to the proxy server an HTTP CONNECT request that specifies the IP address and port required for the FDN connection. Authentication information is optional for the request.
- FortiOS or the proxy server must be configured to use DNS servers that resolve the addresses of FDN servers to support AV and IPS updates.
- The proxy server establishes the connection to FDN and passes information between FortiOS and FDN.

Use the following syntax to configure a proxy server in the CLI:

```
config system autoupdate tunneling
    set address <proxy_address>
    set port <proxy_port>
    set username <username>
    set password <password>
    set status {enable | disable}
end
```

In the following example, a proxy server with IP address 10.1.1.1 is configured to listen on port TCP/3128 without authentication.

To configure a proxy server:

```
config system autoupdate tunneling
    set address 10.1.1.1
    set port 3128
    set status enable
end
```

Alternatively, in a closed network without direct internet connection for web filtering or spam filtering, you can use FortiManager as a local FortiGuard server. FortiManager supports allowing FortiOS to retrieve its updates and ratings through FortiManager. See Using FortiManager as a local FortiGuard server on page 3576.

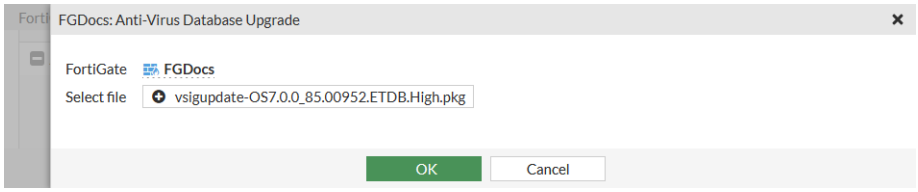
Manual updates

In order to download updated AV definitions, at least 1 policy with a security profile that has Antivirus scanning must be enabled. To download updated IPS definitions, at least 1 policy with a security profile that has IPS scanning must be enabled.

When needed, FortiGuard Distribution Network (FDN) updates can be manually uploaded.

To manually update the signature definitions files:

1. Log in to the Fortinet Support website.
2. Go to *Support* > *Service Updates*.
3. Select your *OS Version* from the dropdown list.
4. Locate your device in the table, and download the signature definitions files.
5. On the FortiGate, go to *System* > *FortiGuard*.
6. In the *License Information* table, locate and expand the definitions that you are updating.
7. From the *Actions* menu in the rightmost column, select *Upgrade Database*.
8. In the pane that opens, click *Upload*, locate the downloaded definitions file on your computer, then click *Open*.
   The download may take a few minutes to complete.



9. Click *OK*.

AV and IPS manual updates

To execute the update:

```
# execute restore ips tftp nids-720-19.261.pkg 172.16.200.55
```

To verify the manual AV and IPS package updates:

```
# diagnose debug app updated -1
# diagnose debug enable
```

Security levels are pre-configured on the BIOS. See BIOS-level signature and file integrity checking on page 3644 and Real-time file system integrity checking on page 3648 for more information.

Automatic updates

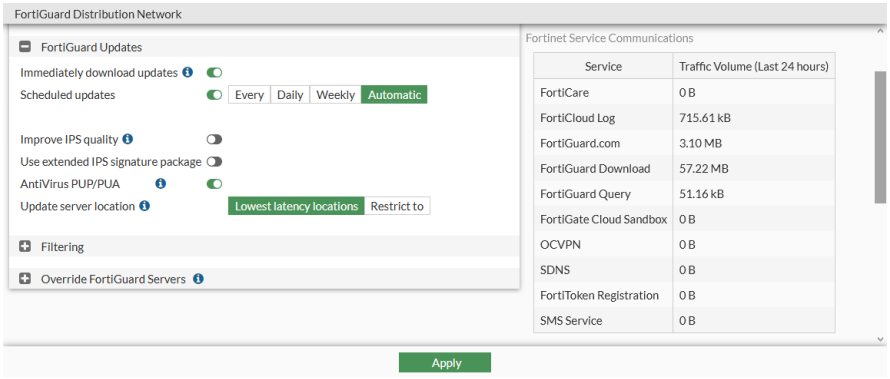
In order to download updated AV definitions, at least 1 policy with a security profile that has Antivirus scanning must be enabled. To download updated IPS definitions, at least 1 policy with a security profile that has IPS scanning must be enabled.

The default auto-update schedule for FortiGuard packages is automatic. The update interval is calculated based on the model and percentage of valid subscriptions, within one hour.

For example, if a FortiGate 501E has 78% valid contracts, then based on this device model, the update schedule is calculated to be every 10 minutes. If you verify the system event logs (ID 0100041000), they are generated approximately every 10 minutes.

To configure automatic updates in the GUI:

1. Go to *System* > *FortiGuard*
2. In the *FortiGuard Updates* section, enable *Scheduled Updates* and select *Automatic*.



3. Click *Apply*.

To configure scheduled updates in the CLI:

```
config system autoupdate schedule
    set status enable
    set frequency automatic
end
```

Scheduled updates

In order to download updated AV definitions, at least 1 policy with a security profile that has Antivirus scanning must be enabled. To download updated IPS definitions, at least 1 policy with a security profile that has IPS scanning must be enabled.

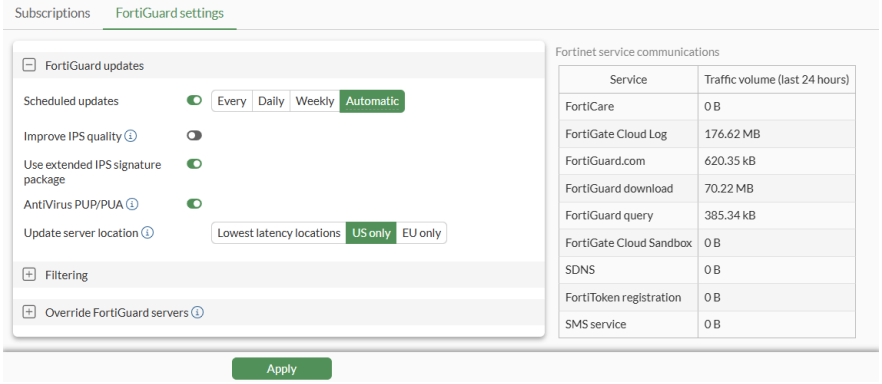
Scheduling updates ensures that the virus and IPS definitions are downloaded to your FortiGate on a regular basis.

Updating definitions can cause a brief disruption in traffic that is currently being scanned while the FortiGate unit applies the new signature database. Updates should be scheduled during off-peak hours when network usage is at a minimum to ensure that network activity will not be affected by downloading the definitions files.

A schedule of once a week means any urgent updates will not be pushed until the scheduled time. If an urgent update is required, click the *Update Licenses & Definitions Now* button to manually update the definitions.

To configure scheduled updates in the GUI:

1. Go to *System* > *FortiGuard*
2. In the *FortiGuard Updates* section, enable *Scheduled Updates*.
3. Configure the update schedule:



4. Click *Apply*.

To configure scheduled updates in the CLI:

```
config system autoupdate schedule
    set status enable
    set frequency {every | daily | weekly}
    set time <hh:mm>
    set day <day_of_week>
end
```

Sending malware statistics to FortiGuard

FortiGate devices periodically send encrypted antivirus, IPS, botnet IP list, and application control statistics to FortiGuard. Included with these data is the IP address and serial number of the FortiGate, and the country that it is in. This information is never shared with external parties, Fortinet Privacy Policy.

The malware statistics are used to improve various aspects of FortiGate malware protection. For example, antivirus data allow FortiGuard to determine what viruses are currently active. Signatures for those viruses are kept in the Active AV Signature Database that is used by multiple Fortinet products.Inactive virus signatures are moved to the Extended AV Signature Database (see Configuring FortiGuard updates on page 3567). When

events for inactive viruses start appearing in the malware data, the signatures are moved back into the AV Signature Database.

The FortiGate and FortiGuard servers go through a 2-way SSL/TLS 1.2 authentication before any data is transmitted. The certificates used in this process must be trusted by each other and signed by the Fortinet CA server.

The FortiGate only accepts data from authorized FortiGuard severs. Fortinet products use DNS to find FortiGuard servers and periodically update their FortiGate server list. All other servers are provided by a list that is updated through the encrypted channel.

Malware statistics are accumulated and sent every 60 minutes by default.

To configure sharing this information, use the following CLI command:

```
config system global
    set fds-statistics {enable | disable}
    set fds-statistics-period <minutes>
end
```

The submission of malware data is in accordance with the Fortinet Privacy Policy.

There is no sensitive or personal information included in these submissions. Only malware statistics are sent.

Fortinet uses the malware statistics collected in this manner to improve the performance of the FortiGate services and to display statistics on the Fortinet Support website for customers registered FortiGate devices.

Fortinet may also publish or share statistics or results derived from this malware data with various audiences. The malware statistics shared in this way do not include any customer data.

Update server location

Administrators can specify the location of the FortiGuard update server used by FortiGate. You can can set the location to only servers in the USA, only servers in the European Union (EU), or to servers with the lowest latency.

In EU locations, it can be required that certain traffic is only handled by servers located in the EU. By setting the update server location to EU only, the FortiGate will use EU domains to resolve to EU servers for FortiGuard traffic to update, URL rating, and IoT servers.

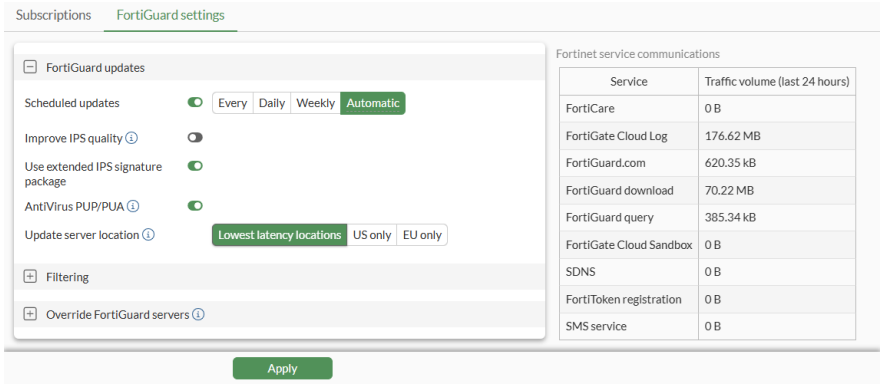
Server location	Anycast domain name	Non-Anycast FQDN addresses
EU only	euupdate.fortinet.net euguardservice.fortinet.net	
US only	usupdate.fortinet.net usguardservice.fortinet.net	usupdate.fortiguard.net UDP: usservice.fortiguard.net HTTPS: ussecurewf.fortiguard.net

Server location	Anycast domain name	Non-Anycast FQDN addresses
Lowest latency (automatic)	globalupdate.fortinet.net globalguardservice.fortinet.net	update.fortiguard.net UDP: service.fortiguard.net HTTPS: securewf.fortiguard.net

On hardware FortiGate devices, the default is *Lowest latency locations*. On VM devices, the default is *US only*.

To configure the update server location in the GUI:

1. Go to the *System* > *FortiGuard* > *FortiGuard settings* tab.
2. In the *FortiGuard updates* section, set *Update server location* to *Lowest latency locations*, *US only*, or *EU only*.



3. Click *Apply*.

To configure the update server location in the CLI:

```
config system fortiguard
    set update-server-location {automatic | usa | eu}
end
```

Filtering

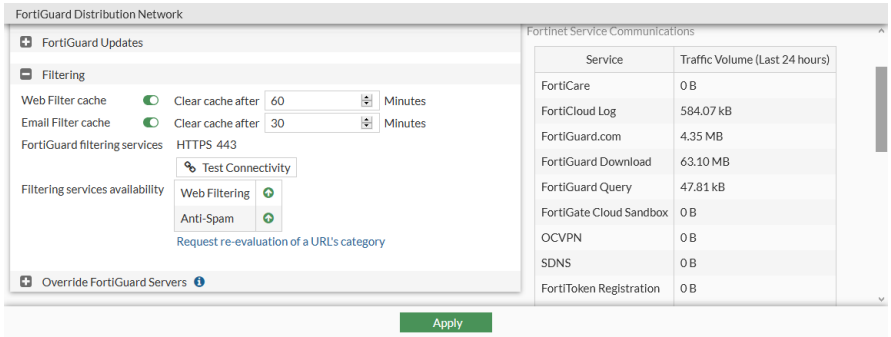
Web filtering is used to block access to harmful, inappropriate, and dangerous web sites (see FortiGuard filter on page 1970).

Email filtering is used to detect and block spam messages (see FortiGuard-based filters on page 2165).

To configure filtering in the GUI:

1. Go to *System* > *FortiGuard*
2. In the *Filtering* section configure the settings as needed:

Web Filter Cache	Enable/disable web filter cache, and set the amount of time that the FortiGate will store a blocked IP address or URL locally. After the time expires, the FortiGate contacts the FDN to verify the address.
Email Filter Cache	Enable/disable email filter cache, and set the amount of time that the FortiGate will store an email address locally.
FortiGuard filtering services	The protocol and port used to contact the FortiGuard servers. These options can be changed in the CLI.
Filtering service availability	The status of the filtering service. Click *Test Connectivity* if the filtering service is not available.
Request re-evaluation of a URL's category	Click to re-evaluate a URL category rating on the FortiGuard web filter service.



3. Click *Apply*.

To configure filtering in the CLI:

```
config system fortiguard
    set protocol {https | udp}
    set port {443 | 53 | 8888}
    set antispam-force-off {enable | disable}
    set antispam-cache {enable | disable}
    set antispam-cache-ttl <integer>
    set antispam-cache-mpercent <percent>
    set antispam-timeout <integer>
    set webfilter-force-off {enable | disable}
    set webfilter-cache {enable | disable}
    set webfilter-cache-ttl <integer>
    set webfilter-timeout <integer>
end
```

When anycast is enabled (by default) the protocol is HTTPS and the port is 443.

Online security tools

FortiGuard Labs provides a number of online security tools, including but not limited to:

- **URL lookup**
  Enter a website address to see if it has been rated and what category and classification it is filed as. If you find a site that has been wrongly categorized, use this page to request that the site be re-evaluated: https://www.fortiguard.com/webfilter
- **Threat Encyclopedia**
  Browse FortiGuard Labs extensive encyclopedia of threats. Search for viruses, botnet C&C, IPS, endpoint vulnerabilities, and mobile malware: https://www.fortiguard.com/encyclopedia
- **Application Control**
  Browse FortiGuard Labs extensive encyclopedia of applications: https://www.fortiguard.com/appcontrol

Anycast and unicast services

The following services are accessed by FortiGate:

Service	Non-Anycast FQDN addresses	Anycast Domain name
FortiGuard Object download	update.fortiguard.net	globalupdate.fortinet.net
Querying service (web-filtering, anti-spam ratings) over HTTPS	securewf.fortiguard.net	globalguardservice.fortinet.net
Querying service (web-filtering, anti-spam ratings) over UDP	service.fortiguard.net	Service only in Unicast
Device info Collection	Service only in Anycast	globaldevcollect.fortinet.net
Device info Query	Service only in Anycast	globaldevquery.fortinet.net
FortiGate Cloud logging	logctrl1.fortinet.com	globallogctrl.fortinet.net
FortiGate Cloud management	mgrctrl1.fortinet.com	globalmgrctrl.fortinet.net
FortiGate Cloud messaging	msgctrl1.fortinet.com	globalmsgctrl.fortinet.net
FortiGate Cloud sandbox	aptctrl1.fortinet.com	globalaptctrl.fortinet.net
FortiCare registration	directregistration.fortinet.com	globalregistration.fortinet.net
Secure DNS	sdns.fortinet.net	globalsdns.fortinet.net
FortiCloud FortiClient	forticlient.fortinet.net	globalfctupdate.fortinet.net
FortiMobile Tokens	directregistration.fortinet.com	globalftm.fortinet.net
EMS cloud	forticlient-emsproxy.forticloud.com	Service only in Unicast
DDNS	ddns.fortinet.net	globalddns.fortinet.net

Service	Non-Anycast FQDN addresses	Anycast Domain name
GeoIP	gip.fortinet.net	globalgip.fortinet.net
IP blocklist	ipbl.fortinet.net	N/A

Using FortiManager as a local FortiGuard server

FortiManager can provide a local FortiGuard server with port 443 access.

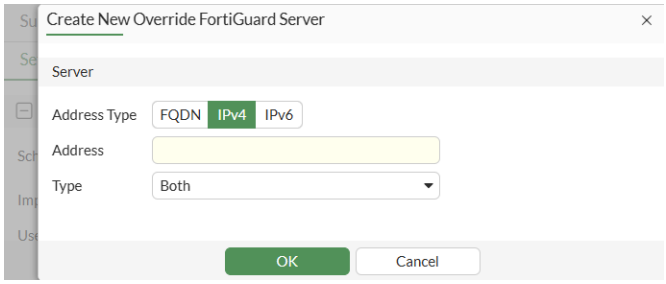
Anycast FortiGuard settings force the rating process to use port 443, even with an override server. Using a unique address in the same subnet as the FortiManager access IP address, the FortiManager can provide local FortiGuard updates and rating access with a dedicated IP address and port 443.

On FortiManager, use the *Bind to IP* addresses for the update and rating services over TCP/443.

The *Bind to IP* address does not need to be configured for update services if the default port was not changed to TCP/443. See Configuring network interfaces in the FortiManager Administration Guide for more information.

To use a FortiManager as a local FortiGuard server in the GUI:

1. Go to the *System* > *FortiGuard* > *FortiGuard settings* tab.
2. In the *Override FortiGuard servers* table, click *Create New*. The *Create New Override FortiGuard Server* pane opens.



3. Select the server address type: *IPv4*, *IPv6*, or *FQDN*.
4. Enter the FortiManager address in the *Address* field.
5. Select the type of server: *AntiVirus & IPS Updates*, *Filtering*, or *Both*.
6. Click *OK*.
7. Click *Create New* again to add a second override FortiManager for *Filtering*.
8. Click *OK*, then click *Apply*.

To use a FortiManager as a local FortiGuard server in the CLI:

```
config system central-management
    set type fortimanager
    set fmg "172.18.37.148"
    config server-list
```

```
        edit 1
            set server-type update
            set server-address 172.18.37.150
        next
        edit 2
            set server-type rating
            set server-address 172.18.37.149
        next
    end
    set fmg-update-port 443
    set include-default-servers enable
end
```

When `fmg-update-port` is set to `443`, the update process will use port 443 to connect to the override update server, which is the local FortiGuard server in the FortiManager. If this is not set, the update process will use port 8890, and the server address setting has to be the FortiManager access IP address. Override FortiGuard services come from the server list that is the local FortiGuard server in the FortiManager, and use the traditional, non-OCSP TLS handshake. If override servers in the FortiManager are not available, the default FortiGuard servers are connected, and the anycast OCSP TLS handshake is used.

The FortiManager IP address used in `set server-address` (for example, `set server-address 172.18.37.149`) corresponds to the *Bind to IP* setting configured on the FortiManager interface.

HA considerations

When FortiGate and FortiManager units are both in high availability (HA) clusters, and FortiGate is using FortiManager as an update server, you must configure the following secondary IP addresses:

- Configure secondary IP addresses for the service on both FortiManager units in the HA cluster
- Configure FortiGate to use the secondary FortiManager IP addresses.

In this example, the primary FortiManager unit is configured to use the secondary IP address of `10.4.1.204` for the rating service, and the secondary FortiManager unit is configured to use the secondary IP address of `10.4.1.205` for the rating service. FortiGate is configured to use the secondary IP addresses on FortiManager.

To configure FortiManager units in an HA cluster as web filter rating servers:

1. On the primary FortiManager in the HA cluster, configure a secondary IP address for the rating service:
   The `set rating-service-ip` is set to the secondary IP address for the rating query.

   ```
   config system interface
       edit "port1"
           set ip 10.4.1.104 255.255.0.0
           set allowaccess ping https ssh snmp http webservice
           set serviceaccess fgtupdates fclupdates webfilter-antispam
           set rating-service-ip 10.4.1.204 255.255.0.0
           set type physical
       next
   end
   ```

2. On the secondary FortiManager in the HA cluster, configure a secondary IP address for the rating service:
   The `set rating-service-ip` is set to the secondary IP address for the rating query.

```
config system interface
    edit "port1"
        set ip 10.4.1.105 255.255.0.0
        set allowaccess ping https ssh snmp http webservice
        set serviceaccess fgtupdates fclupdates webfilter-antispam
        set rating-service-ip 10.4.1.205 255.255.0.0
        set type physical
    next
end
```

3. On both the primary and secondary FortiManager units in the HA cluster, enable web filter query:

```
config fmupdate service
    set query-webfilter enable
end
```

4. On both the primary and secondary FortiManager units in the HA cluster, enable all web filter logs:

```
config fmupdate web-spam fgd-setting
    set wf-log all
end
```

5. As needed, run the `diagnose debug application fgdsvr 255` command.
   For additional details, use shell and run `bash$ tail -f /var/log/fgdsvr.log` to display the incoming URL queries.

To configure FortiGate:

1. On FortiGate, configure central management to use the secondary FortiManager IP addresses for the rating service:
   The `set rating-service-ip` is set to the secondary IP address on the primary and secondary FortiManager units in the HA cluster.

```
config system central-management
    set type fortimanager
    config server-list
        edit 1
            set server-type update
            set server-address 10.4.1.104
        next
        edit 3
            set server-type update
            set server-address 10.4.1.105
        next
        edit 2
            set server-type rating
            set server-address 10.4.1.204
        next
        edit 4
            set server-type rating
            set server-address 10.4.1.205
        next
```

```
    end
    set include-default-servers disable
end
```

2. Disable Anycast:

```
config system fortiguard
    set fortiguard-anycast disable
end
```

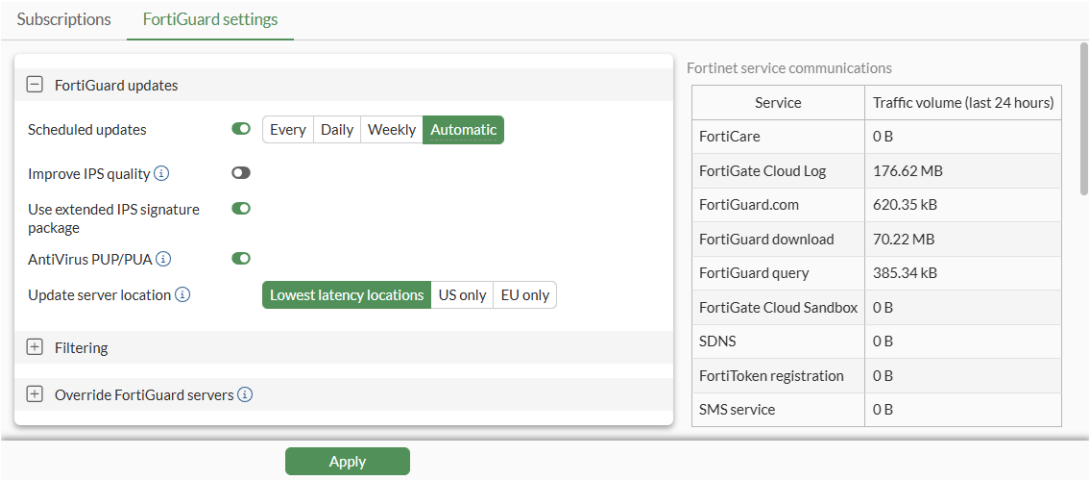
3. As needed, run the following diagnose commands:
   - Run `diagnose debug app urlfilter -1` to show the rating query response.
   - Run `diagnose debug rating` to show the rating service information.

Cloud service communication statistics

Fortinet service communications statistics are displayed on the *FortiGuard* page. The statistics correspond with the output from `diagnose sys service-communication`. The traffic volume values in the GUI are the sums of data from the last 24 hours.

To view Fortinet service communications statistics:

1. Go to the *System* > *FortiGuard* > *FortiGuard settings* tab.
   The *Fortinet service communications* statistics are displayed on the right side of the screen:



2. Enter the following CLI command:

```
# diagnose sys service-communication
FortiCare:
The last 1 hour(in bytes):  0 0 0 0 0 0 0 0 0 0 0 0
The last 24 hours(in bytes):  0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0
The last 7 days(in bytes):  0 0 0 0 0 0 0
FortiGuard Download:
The last 1 hour(in bytes):  0 648 3024 0 0 3056744 0 0 3024 0 0 3336
The last 24 hours(in bytes):  3066776 2960576 47616 71768 102384 68864 48224 82368 95376 70984
```

```
68048 75360 75112 83496
69848 51640 128360 20437472 99456 104384 48376 143024 25238104 73992
The last 7 days(in bytes):  6758344 120704952 0 0 0 0 0

```

IoT detection service

Internet of Things (IoT) detection is part of the Attack Surface Security Rating service that allows FortiGate to:

- Download an IoT Detection signature package (IOTD), which is used to detect and extract metadata of IoT devices
- Query FortiGuard IoT Query service for devices that are not detected by the local Device Database (CIDB) or by the IoT Detection signatures
- Query the FortiGuard vulnerability lookup server to look up vulnerabilities for a device

The service allows the FortiGate to accurately detect and identify connected IoT devices and to identify vulnerabilities that apply to these devices.

Applications

A subscription to the IoT detection service provides many practical applications.

Device information	Enable the FortiGate to obtain updated device information, store the information in the asset inventory, and display the information in various places, such as the *Dashboard > Asset and Identities* widget.
Vulnerability information	Enable the FortiGate to query and display vulnerabilities associated with a device on the *Asset and Identities* widget.
Allow managed FortiSwitch and FortiAP devices to query device info	Device detection is effective when devices are connected on an interface. As such, when devices are connected to managed FortiSwitch and FortiAP devices, they can utilize IoT detection to gather information about the connected devices. See FortiAP query to FortiGuard IoT service to determine device details on page 3585 for more information. See also FortiSwitch Devices Managed by FortiOS guide.
Perform NAC on IoT devices with vulnerabilities	NAC policies can be configured to detect devices with different levels of vulnerabilities and assign these devices dynamically to a quarantine VLAN. See OT and IoT virtual patching on NAC policies on page 2300.
Perform IoT Vulnerability rating check in Security Rating	Using the *Security Fabric > Security Rating* feature, perform a FortiGuard IoT Vulnerability check to identify devices with detected vulnerabilities.
Detect and log IoT devices in Application Control	IoT signatures are used in application control to detect and log IoT devices. In *Security Profiles > Application Signatures*, filter on the IoT category to see the list of IoT application signatures. Alternatively, view the signatures using the following command: `# get application name status | grep IoT -B2 -A10`

Device detection

When device detection is enabled on an interface, FortiGate will perform passive scanning on incoming traffic to collect information about devices such as their MAC address, IP address, Operating System, Hostname, username, endpoint tags and interface in which it entered . The firewall is able to scan different protocols to obtain basic device information. FortiGates by default comes with a built-in local Device Database (CIDB) containing information about known devices which can be used to obtain more detailed information.

When the CIDB cannot identify the device, FortiGate can utilize the IoT Query service by sending some device information to the FortiGuard collection server. If a new device is detected, FortiGate obtains the results from the FortiGuard query for more information about the device.

Device detection is intended for devices directly connected to your LAN and DMZ ports. Since the IoT detection service relies on device detection, the device must be on the same Layer 2 network as the FortiGate.

Configurations

This feature requires an Attack Surface Security Rating service license.

FortiGate device requirements:

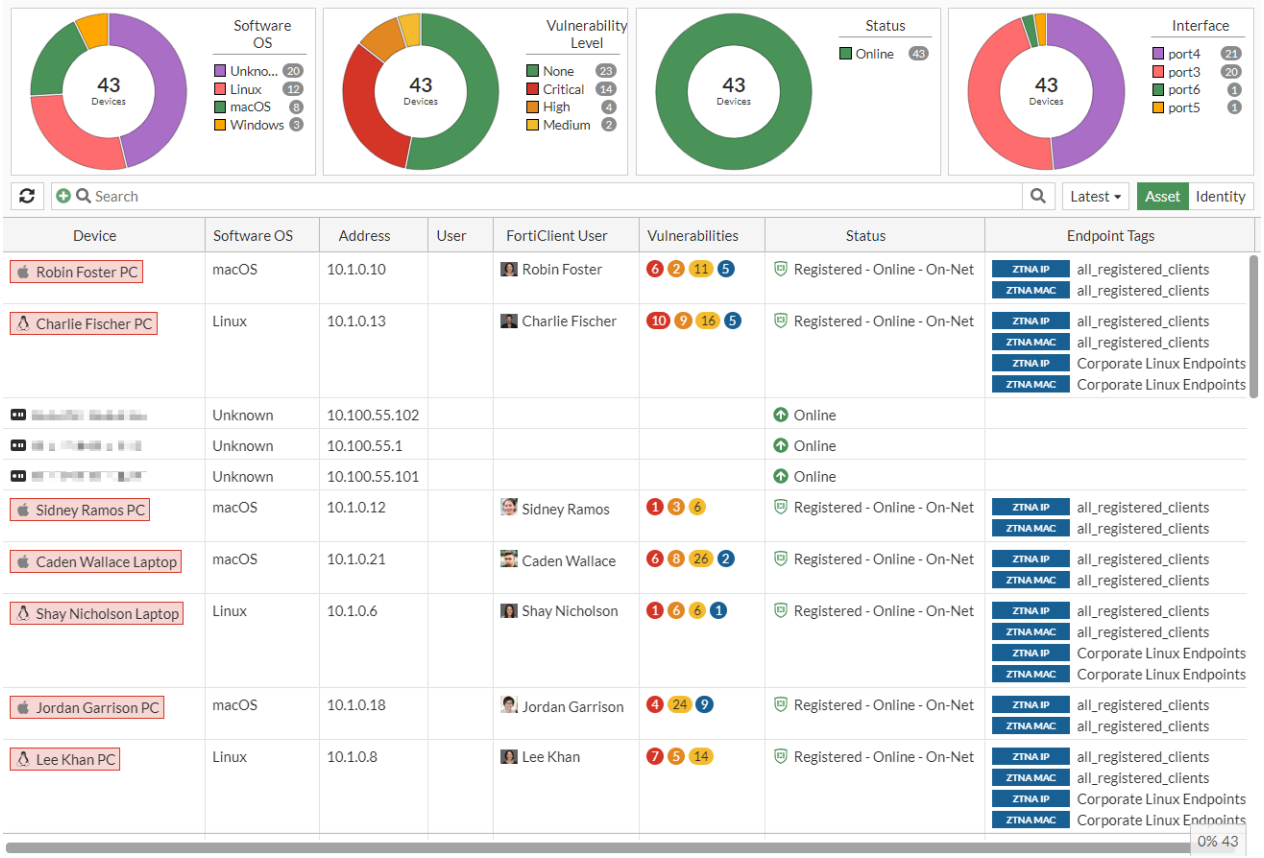
The FortiGate device must be:

- Registered with FortiCare
- Connected to an anycast FortiGuard server

How the service works:

1. Enable Device Detection on an interface.
2. FortiGate uses the interface to detect device traffic flow.
3. Upon detecting traffic from an unknown device, FortiGate sends the device data to the FortiGuard collection server.
4. The collection server returns data about the new device to the FortiGuard query server.
5. If the device signature does not appear in the local Device Database (CIDB) or some fields are not complete, FortiGate queries FortiGuard for more information about the device.

To view the latest device information in the GUI, go to *Dashboard* > *Assets & Identities* and expand the *Assets* widget. For more information, see Asset Identity Center page on page 3792.



To debug the IoT daemon in the CLI:

1. Enable iotd real-time debugs to collect information about the communication between FortiGate and the FortiGuard server:

```
# diagnose debug application iotd -1
# diagnose debug enable
```

2. Optionally, disable the local device database to force all queries to go to FortiGuard.

```
# diagnose cid sigs disable
```

3. View the debug output.
FortiGate sends the device data to the FortiGuard collection server:

```
# [iotd] recv request from caller size:61
[iotd] service:collect hostname: ip: fd:-1 request tlv_len:41
[iotd] txt(.....y...w.....Jasons-iPhone6....579=23..)

(good)
```

4. Upon completion of the FortiGuard query, the query server returns the device information including the information source (`src fortiguard`).

```
# diagnose user device list
    vd root/0  f8:87:f1:1f:ab:95  gen 26  req OUA/34
        created 503s  gen 23  seen 102s  lan  gen 7
        ip 192.168.1.110  src arp
        hardware vendor 'Apple'  src fortiguard  id 0  weight 100
        type 'Mobile'  src fortiguard  id 0  weight 100
        family 'Mobile'  src fortiguard  id 0  weight 100
        os 'iOS'  src fortiguard  id 0  weight 100
        host 'Jasons-iPhone6'  src dhcp
```

Using FortiManager as an override server for IoT query services

FortiGate can use FortiManager as an override server for IoT query services. The FortiManager must be running 7.2.1 or later.

All IoT daemon query and collected data can be sent to a FortiManager, instead of directly to FortiGuard. This is useful when there are strict policies controlling the kind of traffic that can go to the internet.

To send all IoT daemon query and collected data to a FortiManager:

```
config system central-management
    config server-list
        edit 1
            set server-type vpatch-query iot-collect
            set server-address <x.x.x.x>
        next
    end
end
```

`server-type vpatch-query iot-collect`	Set the FortiGuard service types: • `vpatch-query`: Virtual patch query server. • `iot-collect`: IoT device collection server.
`server-address <x.x.x.x>`	Enter the IPv4 address of the FortiManager.

FortiAP query to FortiGuard IoT service to determine device details

A FortiAP collects packets from devices and queries FortiGuard with the help of the FortiGate. Device detection results are reported back to the FortiGate where this information is displayed. Querying the FortiGuard service requires an Attack Surface Security Rating service license.

The following attributes can be configured in `wireless-controller setting`:

Attribute	Description
device-weight <integer>	Set the device upper limit of confidence (0 - 255, default = 1, 0 = disable).
device-holdoff <integer>	Set the device lower limit of creation time, in minutes (0 - 60, default = 5).
device-idle <integer>	Set the device upper limit of idle time, in minutes (0 - 14400, default = 1440).

To query the FortiGuard IoT service:

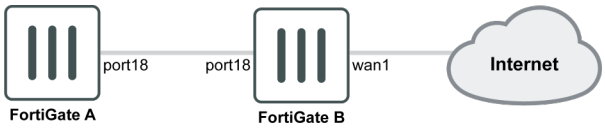
```
config wireless-controller setting
    ...
    set device-weight 1
    set device-holdoff 5
    set device-idle 1440
    ...
end
```

```
# diagnose user device list
  vd root/0  54:27:1e:e6:26:3d  gen 89  req OUA/34
    created 70s  gen 86  seen 2s  port29  gen 28
    ip 10.29.1.214  src mac
    hardware vendor 'Asustek compute'  src fortiguard  id 0  weight 21
    type 'Home & Office'  src fortiguard  id 0  weight 21
    family 'Computer'  src fortiguard  id 0  weight 21
    os 'Linux'  src dhcp  id 822  weight 128
    host 'test-wifi'  src dhcp
```

FortiGate Cloud / FDN communication through an explicit proxy

Explicit proxy communication to FortiGate Cloud and FortiGuard servers from FortiGate is enabled. A proxy server can be configured in the FortiGuard settings so that all FortiGuard connections under the `forticldd` process can be established through the proxy server.

Not all FortiGuard services are supported by these proxy settings. For example, web filter service traffic to FortiGuard will not be directed to the configured proxy.



To configure a proxy server and communicate with FortiGate Cloud though it:

1. Configure FortiGate B as a proxy server:

```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
        set logtraffic all
        set users "guest1"
    next
end
config user local
    edit "guest1"
        set type password
        set passwd 123456
    next
end
config authentication scheme
    edit "local-basic"
        set method basic
        set user-database "local-user-db"
    next
end
config authentication rule
    edit "local-basic-rule"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "local-basic"
    next
end
```

2. Configure a firewall policy on FortiGate B to allow FortiGate A to get DNS resolution:

```
config firewall policy
    edit 1
        set name "dns"
        set srcintf "port18"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
```

```
        set schedule "always"
        set service "DNS"
        set fsso disable
        set nat enable
    next
end
```

3. Configure the FortiGuard proxy settings on FortiGate A:

```
config system fortiguard
    set proxy-server-ip 10.2.2.2
    set proxy-server-port 8080
    set proxy-username "guest1"
    set proxy-password 123456
end
```

4. On FortiGate A, log in to FortiGate Cloud to activate the logging service:

```
execute fortiguard-log login <username> <password>
```

5. On FortiGate A, view the `forticldd` debug message to see the connection to the log controller through the proxy server:

```
# diagnose test application forticldd 1
```

FDS-only ISDB package in firmware images

FortiOS firmware images include Fortinet objects in the built-in Internet Service Database (ISDB).

```
# diagnose firewall internet-service list
List internet service in kernel(global):
Internet Service Database Kernel Table: size 14974 bytes, Entry size 5844 bytes, number of index
table entries 165 number of IP range table entries 0

Group(0): Weight(15), number of entries(162)
......
```

This lightweight ISDB package allows firewall rules and policy routes that use ISDB to access FortiGuard servers to continue working after upgrading FortiOS. For example, the following policy will work after an upgrade:

```
config firewall policy
    edit 440
        set name "Fortinet Updates"
        set srcintf "port25"
        set dstintf "port1"
        set srcaddr "FortiAnalyzer" "FortiAuthenticator" "Tesla Management Interface"
"BackupFortinet" "SipFW" "ConnectVPNMgmt"
        set internet-service enable
        set internet-service-id 1245187 1245326 1245324 1245325 1245193 1245192 1245190 1245185
        set action accept
        set schedule "always"
```

```
        set logtraffic all
        set fsso disable
    next
end
```

After the FortiGate reboots after a firmware update, an automatic update will run in five minutes so that the FortiGate can get the ISDB, whether or not scheduled update is enabled.

```
# diagnose autoupdate versions | grep Internet -A 6

Internet-service Full Database
---------
Version: 7.02217 signed
Contract Expiry Date: n/a
Last Updated using manual update on Thu Mar 10 12:06:58 2022
Last Update Attempt: Thu Mar 10 12:07:27 2022
```

Licensing in air-gap environments

In the Operational Technology industry, industrial equipment is critical and must not be connected to the internet. However, the equipment is still required to be protected by a firewall in this air-gap environment. Without a gateway to FortiGuard in air-gap environments, FortiGuard packages, such as AntiVirus and IPS, must be manually uploaded to the FortiGate. FortiGate licenses can be downloaded from FortiCloud and uploaded manually to the FortiGate.

Manual licensing for air-gap environments is supported on FortiGate hardware appliances and FortiGate virtual machine (VM) appliances running FortiOS 7.2.0 or later. When running on a Virtual appliance, the VM licensing still needs to connect to a licensing FortiManager or FortiGuard server. See VM license on page 4263 for details

To manually upload FortiGate licenses in the GUI:

1. Register the FortiGuard license on FortiCloud. See Registration for more information.
2. Download the product entitlement file in FortiCloud:
   a. Go to *Products* > *Product List*.
   b. Select the serial number of the FortiGate. The product page opens.
   c. In the *License & Key* section, click *Get The License File*. The file downloads to your device in the format `FG201E*********ProductEntitlement.lic`.
3. In FortiOS, go to the *System* > *FortiGuard* > *Subscriptions* tab.
4. From the *Update licenses & definitions now* dropdown, select *Upload License File*. The file explorer opens.
5. Navigate to the product entitlement file and click *Open*.
   The license file uploads to the FortiGate. This operation does not require reboot. Once the upload is complete, the FortiGate shows that it is registered and licensed.

To manually upgrade the AntiVirus Database in the GUI:

1. Download the static upgrade file from FortiCloud:
   a. Go to support.fortinet.com.
   b. Go to *Download* > *Download FortiGuard Service Updates* > *FortiGate*.
   c. Select the FortiOS version from the *OS Version* dropdown.
   d. Select the file from the appropriate FortiGate product model section. The file downloads to your device.
2. In FortiOS, go to the *System* > *FortiGuard* > *Subscriptions* tab and expand the *Advanced Malware Protection* widget to view the current licenses.
3. Click the upgrade button. The *Anti-Virus Database Upgrade* pane opens.
4. Click *Upload File*. The file explorer opens.
5. Navigate to the static upgrade file and click *Open*.
6. Click *OK*.

To manually upload FortiGate licenses in the CLI:

```
# execute restore manual-license {ftp | tftp} <license file name> <server> [args]
```

License expiration

The FortiGate will still function as a firewall if any or all of the FortiGuard licenses are expired. Valid FortiGuard licenses are required to receive database and signature updates, and to perform real-time or near-real-time security lookups to detect and quickly adjust your security posture for newly discovered attacks.

FortiGuard services are designed to be continuous. Any lapses in the service will require coverage back to the contract expiration date. For more information, see FortiCare/FortiGuard Renewal Continuous Service Policy.

License type	Expiration impact
Firmware & General Updates	Application Control Signatures, Device & OS Identification, FortiGate Virtual Patch Signatures, Inline-CASB Application Definitions, Internet Service Database Definitions, and PSIRT Package Definitions continue to work, but the databases are not updated and no new signatures are added. For example, if application control is used in a firewall policy that has an internet service applied to the source or destination addresses, then the policy will continue to inspect matching traffic using the FortiGate's existing application control signatures and ISDB definitions. Application Control Signatures, Device & OS Identification, FortiGate Virtual Patch Signatures, Inline-CASB Application Definitions, Internet Service Database Definitions, and PSIRT Package Definitions are included in the base services that are included with all FortiCare support contracts See FortiGuard Security Services for details.

License type	Expiration impact
Intrusion Prevention	IPS scanning continues to work, but the IPS databases are not updated and no new signatures are added. For example, if an IPS sensor with *Block malicious URLs* enabled is used in a firewall policy, then the policy will continue to inspect matching traffic using the FortiGate's existing IPS signatures and malicious URLs database. An active IPS license is critical for stopping sophisticated and zero-day attacks, as FortiGuard IPS provides near-real-time intelligence with thousands of intrusion prevention rules to detect and block known and zero-day threats. For more information, see Intrusion prevention on page 2113.
Botnet IPs/Domains	IPS sensors and DNS Filter profiles with Botnet C&C configured continue to work, but the Botnet IPs and Botnet Domain databases are not updated and no new signatures are added. While Botnet IPs and Domain are listed in the Intrusion Prevention category, they are actually part of the Firmware & General Updates contract. For more information, see Botnet C&C domain blocking on page 2049 and IPS with botnet C&C IP blocking on page 2138.
AntiVirus	Antivirus scanning continues to work, but the antivirus database is not updated and no new signatures are added. For more information, see Antivirus on page 1905.
Web and DNS Filtering	Category-based Web and DNS filtering stops working, as URLs and domains are sent to FortiGuard in real-time to determine the category. By default, all web and DNS traffic is dropped. If allowing website or DNS requests when a rating error occurs is enabled, then all web and DNS traffic passes through without filtering. If static URL or domain filtering is applied in a filter profile, those filters continue to work. Configurations where only specific URLs and domains are allowed and all others are blocked continue to work, but this is not a scalable solution blocking websites or performing category filtering. For more information, see FortiGuard filter on page 1970 and FortiGuard category-based DNS domain filtering on page 2045.
Email Filtering	Spam filtering stops working, as it queries the FortiGuard spam filtering server in real-time to check spammer IP addresses and emails (except those that are locally configured), phishing URLs, spam URLs, spam email checksums, and spam submissions. Anti-spam signatures are not updated. Profile options based on local spam filtering continue to work. For more information, see Email filter on page 2155.
Outbreak Prevention	Outbreak prevention stops working, as it uses real-time lookups to the FortiGuard Global Threat Intelligence database. For more information, see FortiGuard outbreak prevention on page 1958.

License type	Expiration impact
Security Rating & CIS Compliance	Paid security rating checks stop working. CIS security control mappings are also disabled. The Security Rating & CIS Compliance component of the Attack Surface Security Rating entitlement is required to run paid security rating checks across all of the devices in the Security Fabric. They allow rating scores to be submitted to and received from FortiGuard for network ranking. Without the Security Rating entitlement, only built-in security rating rules can be run. PSIRT-related vulnerability rules depend on the Firmware license support. For more information, see Security rating on page 3859.
Operational Technology (OT) Threat Definitions	OT Security Services signatures continue to work, but the database attack definitions are not updated and no new signatures are added. OT Security Services include application control and IPS signatures for OT applications and protocols. For example, if an IPS sensor enabled with OT Security Service signatures is used in a firewall policy, then the policy will continue to inspect matching traffic using the FortiGate's existing OT threat definition IPS signatures. For more information, see OT threat definitions on page 2126.

FortiGate StateRamp support

A StateRamp FortiGate SKU entitles the FortiGate to use dedicated FortiGuard servers located in the United States. It also entitles customers to access their support tickets through a dedicated FortiCare service located in the United States.

When you purchase a StateRamp FortiGate, you will receive a FortiGate that automatically boots up in StateRamp mode. It will contact the dedicated FortiGuard server to learn the rest of its entitlement.

All FortiGuard services that are supported by the StateRamp device are United States-based and use a specific FQDN. The FortiGuard servers only support connections through Anycast. Any un-used cloud services are disabled on the FortiGate.

Supported FortiGuard services

The following table lists supported FortiGuard services:

Feature or service	FQDN	IP address
FortiGate firmware upgrade Contract / License Update	update.fortinetgov.com	23.249.62.6
FortiGuard Query	guardservice.fortinetgov.com	23.249.62.16
Video Query	videoquery.fortinetgov.com	23.249.62.18
SDNS	sdns.fortinetgov.com	23.249.62.53

Feature or service	FQDN	IP address
Geo IP address Database	gip.fortinetgov.com	23.249.62.16
Device Query	devquery.fortinetgov.com	23.249.62.16
Default DNS server		23.249.63.52 / 23.249.63.53
Default NTP server	time-a-g.nist.gov time-b-g.nist.gov	129.6.15.28 129.6.15.29

Unsupported FortiGuard services

The following lists the unsupported FortiGuard services:

- FortiCare server connection
- Central management to FortiManager or FortiGuard
- Logging to FortiAnalyzer
- FortiSandbox (FSA) and FSA Cloud configuration
- FortiGuard DDNS service
- FortiSwitch authorization
- FortiExtender pre-authorization
- Regular FortiGuard NTP setting
- Local FortiClient EMS
- FortiClient EMS cloud
- Product API: Device vulnerability on GUI device assets
- Security fabric CSF: Configured as root
- Security fabric CSF: Configured as leaf
- Alert email - User must configure their own email server
- FortiNDR
- Email Filter query to RBL_SERVER (dnsbl.sorbs.net)
- FortiToken server connection
- Logging to FortiGate Cloud server
- SD-WAN overlay
- Activating FortiGate Cloud account
- Regular FortiGuard DNS setting
- FortiAP pre-authorization
- Security rating under Security Fabric
- Attack Surface Security Rating

The following lists FortiGuard services that are subject to limitations:

- Security Rating, FortiSwitch, FortiAP, FortiClient, FortiExplorer, and FortiNAC related automation stitch, trigger, or action

Blocking unsupported features on StateRamp devices

When trying to enable services that are not supported on StateRamp devices, an error will be returned in the GUI and CLI. Likewise, some features are hidden in the GUI if they are disabled for StateRamp devices.

In the following example, the user attempts to enable FortiAnalyzer on a StateRamp FortiGate which is an unsupported service on StateRamp devices.

To view StateRamp device unsupported feature errors:

1. In the CLI, verify that the device has a StateRamp license:

```
# get system status
Version: FortiGate-1101E v7.2.6,build4553,230821 (interim)
Security Level: 1
Firmware Signature: un-certified
...
License Status: StateRAMP
```

2. Test configuring the unsupported feature in the GUI:
   a. In the GUI, go to *Security Fabric* > *Fabric Connectors*.
   b. Edit *Logging & Analytics*.
   c. Attempt to enable FortiAnalyzer.

   An error is displayed and the *Switch Controller* feature is hidden.

3. Test configuring the unsupported feature in the CLI:
   a. Attempt to enable FortiAnalyzer.

```
config log fortianalyzer setting
    set status enable
        Cannot enable FortiAnalyzer logging when StateRAMP license is used.
        node_check_object fail! for status enable

        value parse error before 'enable'
        Command fail. Return code -39
```

An error is displayed.

Disable all cloud communication

The FortiGate communicates with various services, such as FortiGuard download and query services and FortiCloud and other cloud related services to download service packages. It also makes queries for various real-time filtering capabilities, and performs logging and synchronization tasks.

The communication statistics can be viewed in the GUI at *System* > *FortiGuard* on the *FortiGuard settings* tab. The statistics can also be retrieved from the CLI:

```
# diagnose sys service-communication
```

To disable these communications, use the following CLI command::

```
config system global
    set cloud-communication disable
end
```

When cloud-communication is disabled, the forticldd and updated daemons are shutdown and multiple settings are disabled.

The following settings are automatically changed:

```
config system global
    set fds-statistics disable
end
config system central-management
    set type none
    set include-default-servers disable
end
config system fortiguard
    set antispam-force-off enable
    set outbreak-prevention-force-off enable
    set webfilter-force-off enable
end
config system email-server
    set server ''
end
config system ntp
    set ntpsync disable
end
config system autoupdate schedule
    set status disable
end
config system autoupdate tunneling
    set status disable
end
config log fortiguard setting
    set status disable
end
```

To reenable cloud communications, each individual setting must be changed after running the following CLI command:

```
config system global
    set cloud-communication enable
end
```

For example, to reenable automatically connecting and logging in to FortiCloud:

```
config system fortiguard
    set auto-join-forticloud enable
end
```

To reenable the email server:

```
config system email-server
    set server "fortinet-notifications.com"
    set port 465
    set security smtps
end
```

To reenable NTP synchronization:

```
config system ntp
    set ntpsync enable
end
```

Feature visibility

Feature visibility is used to control which features are visible in the GUI. This allows features that are not in use to be hidden. Some features are also invisible by default and must be made visible before they can be configure in the GUI.

The visibility of a feature does not affect its functionality or configuration. Invisible features can still be configured using the CLI.

To change the visibility of features:

1. Go to *System* > *Feature Visibility*.
2. Change the visibility of the features as required.
   For information about what settings each option affects, click on the + icon to the right of the feature name.
   Changes are listed on the right side of the content pane.
3. Click *Apply*.

Certificates

This section contains topics about uploading certificates and provides examples of how certificates may be used to encrypt and decrypt communications, and represent the identity of the FortiGate. This sections assumes that you have a high level understanding of the public key infrastructure (PKI) system, particularly how entities leverage trusted certificate authorities (CAs) to verify the authenticating party, and how public and private certificate keys work to secure communications.

The certificates feature is hidden by default in FortiOS. In the GUI, go to *System > Feature Visibility* and enable *Certificates*.

Common certificate uses in FortiOS

Type	How to generate/import certificate	FortiGate Use Examples	Private Key[1]
Local Certificate	ACME, Self Sign, CSR, File Upload (PKCS #12 & CER+PEM)	Client certificates: • Site-to-Site VPN • Dialup SSL VPN • Dialup IPsec VPN Server certificates: • HTTPS admin access • Protecting an SSL Server	Yes
Remote Certificate	File Upload	SAML • SP: Security Fabric > Fabric Connectors > Security Fabric Setup > Advanced Options > SP certificate • IdP: Security Fabric > Fabric Connectors > Security Fabric Setup > Edit/create a SP > IdP certificate	No
Local CA (and sub-CA)	Online SCEP, File Upload	SSL Inspection Multiple Clients Connecting to Multiple Servers • Security Profiles > SSL/SSH Inspection > *profile_name* > CA certificate	Yes
Remote CA	Online SCEP, File Upload	Enable FortiGate to trust certificates signed by the remote CA. Example uses: • LDAPS connection • User authentication (policy & admin access) • FortiAnalyzer OFTP tunnel	No

[1]Certificates with a private key are uploaded in the following common formats:

- Certificate and private key in one file (PKCS #12)
  - .PFX
- Certificate and private key in separate files
  - Certificate: .CER, .DER
  - Key: .PEM
- When using Certificate Signing Request (CSR), the private key remains on the FortiGate and the signed CSR is returned to the FortiGate to complete the cert+key pair.
  - .CER

  See Import a certificate on page 3604 for more details.

For additional capabilities and enhanced certificate management, please review the FortiAuthenticator Administration Guide and Examples. FortiManager can integrate with FortiAuthenticator to provide large scale FortiGate certificate deployment and management; see FortiManager Examples.

The following topics provide information about certificates:

- Automatically provision a certificate on page 3597
- Generate a new certificate on page 3602
- Regenerate default certificates on page 3603
- Import a certificate on page 3604
- Generate a CSR on page 3606
- CA certificate on page 3609
- Remote certificate on page 3610
- Certificate revocation list on page 3610
- Export a certificate on page 3611
- Uploading certificates using an API on page 3611
- Enrollment over Secure Transport for automatic certificate management on page 3632

The following topics provide examples of how to use certificates:

- Procuring and importing a signed SSL certificate on page 3616
- Microsoft CA deep packet inspection on page 3619
- Administrative access using certificates on page 3624
- Creating certificates with XCA on page 3624
- Basic site-to-site VPN with digital certificate on page 2423
- Configuring FortiClient EMS on page 3722
- SSL VPN with certificate authentication on page 2853
- SSL VPN with LDAP-integrated certificate authentication on page 2858
- Configuring certificates for SAML SSO on page 3847
- Protecting an SSL server on page 2313
- Using the default certificate for HTTPS administrative access on page 3292

Automatically provision a certificate

The Automated Certificate Management Environment (ACME), as defined in RFC 8555, is used by the public Let's Encrypt certificate authority (https://letsencrypt.org) to provide free SSL server certificates. The FortiGate

can be configured to use certificates that are managed by Let's Encrypt, and other certificate management services, that use the ACME protocol. The server certificates can be used for secure administrator log in to the FortiGate.

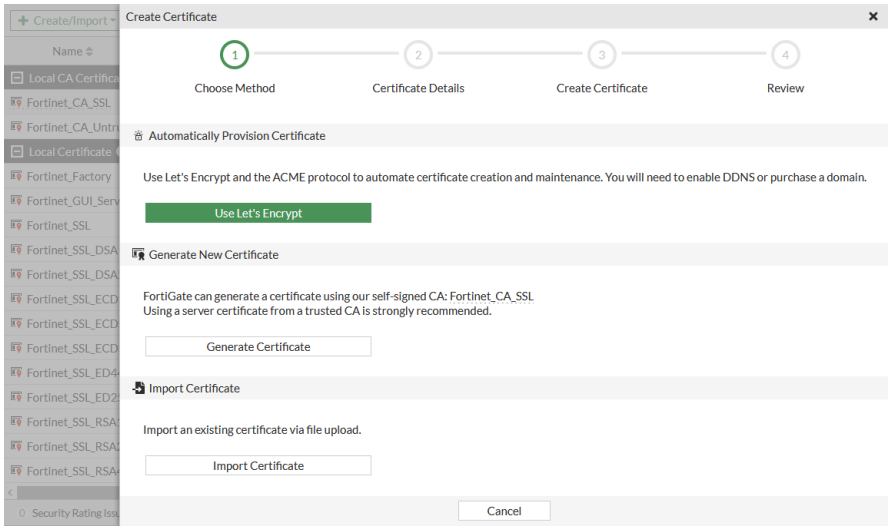
- The FortiGate must have a public IP address and a hostname in DNS (FQDN) that resolves to the public IP address.
- The configured ACME interface must be public facing so that the FortiGate can listen for ACME update requests. It must not have any VIPs, or port forwarding on port 80 (HTTP) or 443 (HTTPS).
- The Subject Alternative Name (SAN) field is automatically filled with the FortiGate DNS hostname. It cannot be edited, wildcards cannot be used, and multiple SANs cannot be added.

ACME certificates do not support loopback interfaces.

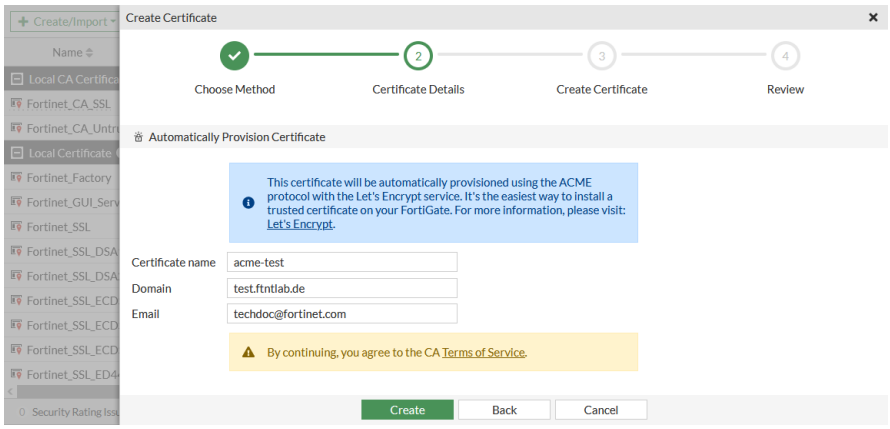
This example shows how to import an ACME certificate from Let's Encrypt, and use it for secured remote administrator access to the FortiGate.

To generate a certificate using ACME and Let's Encrypt:

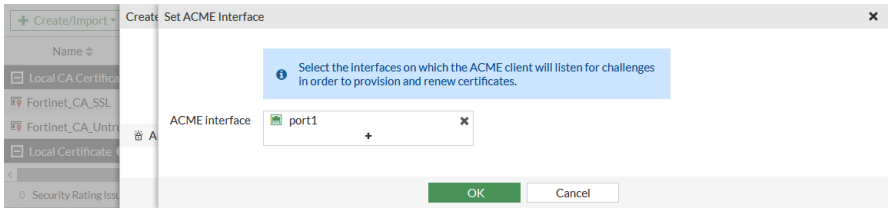
1. Go to *System* > *Certificates* and click *Create/Import* > *Certificate*.



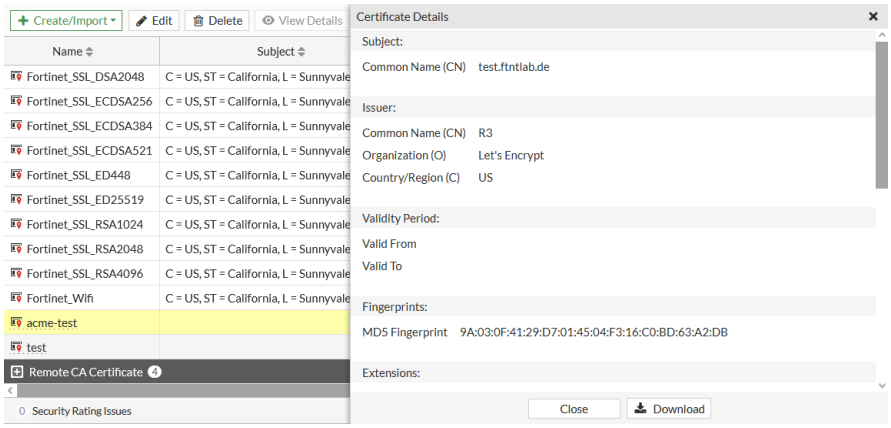
2. Click *Use Let's Encrypt*.
3. Set *Certificate name* to an appropriate name for the certificate. This is what is referenced when using the certificate in FortiGate configurations.
4. Set *Domain* to the public FQDN of the FortiGate.
5. Set *Email* to a valid email address. The email is not used during the enrollment process.



6. Click *Create*.
7. Set the *ACME interface*, on which the ACME client will listen for challenges in order to provision and renew certificates. The challenge is how the certificate signing request is validated by Let's Encrypt.



8. Click *OK*. Let's Encrypt provisions the certificate and the certificate is added to the certificate list in the *Local Certificates* section.
9. Click *View Details* to verify that the FortiGate's FQDN is in the certificate's *Subject: Common Name (CN)*.



To import an ACME certificate in the CLI:

1. Set the interface that the FortiGate communicates with Let's Encrypt on:

```
config system acme
    set interface "port1"
end
```

2. Make sure that the FortiGate can contact the Let's Encrypt enrollment server:

```
# execute ping acme-v02.api.letsencrypt.org
PING ca80a1adb12a4fbdac5ffcbc944e9a61.pacloudflare.com (172.65.32.248): 56 data bytes
64 bytes from 172.65.32.248: icmp_seq=0 ttl=60 time=2.0 ms
64 bytes from 172.65.32.248: icmp_seq=1 ttl=60 time=1.7 ms
64 bytes from 172.65.32.248: icmp_seq=2 ttl=60 time=1.7 ms
64 bytes from 172.65.32.248: icmp_seq=3 ttl=60 time=2.1 ms
64 bytes from 172.65.32.248: icmp_seq=4 ttl=60 time=2.0 ms

--- ca80a1adb12a4fbdac5ffcbc944e9a61.pacloudflare.com ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 1.7/1.9/2.1 ms
```

3. Configure the local certificate request:

```
config vpn certificate local
    edit "acme-test"
        set enroll-protocol acme2
        set acme-domain "test.ftntlab.de"
        set acme-email "techdoc@fortinet.com"
    next
By enabling this feature you declare that you agree to the Terms of Service at https://acme-
v02.api.letsencrypt.org/directory
Do you want to continue? (y/n)y
end
```

4. Verify that the enrollment was successful:

```
# get vpn certificate local details acme-test
path=vpn.certificate, objname=local, tablename=(null), size=2632
== [ acme-test ]
        Name:        acme-test
        Subject:     CN = test.ftntlab.de
        Issuer:      C = US, O = Let's Encrypt, CN = R3
        Valid from:  2021-03-11 17:43:04  GMT
        Valid to:    2021-06-09 17:43:04  GMT
        Fingerprint: 9A:03:0F:41:29:D7:01:45:04:F3:16:C0:BD:63:A2:DB
        Serial Num:  03:d3:55:80:d2:e9:01:b4:ca:80:3f:2e:fc:24:65:ad:7c:0c
ACME details:
        Status: The certificate for the managed domain has been renewed successfully and can
be used (valid since Thu, 11 Mar 2021 17:43:04 GMT).
        Staging status: Nothing in staging
```

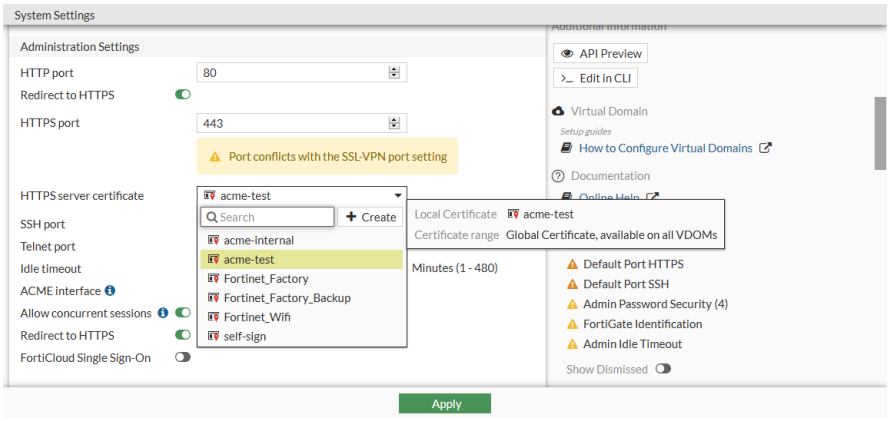
5. Check the ACME client full status log for the CN domain:

```
# diagnose sys acme status-full test.ftntlab.de
{
  "name": "test.ftntlab.de",
  "finished": true,
  "notified": false,
  "last-run": "Thu, 11 Mar 2021 18:43:02 GMT",
  "valid-from": "Thu, 11 Mar 2021 17:43:04 GMT",
  "errors": 0,
```

```
  "last": {
    "status": 0,
    "detail": "The certificate for the managed domain has been renewed successfully and can be
used (valid since Thu, 11 Mar 2021 17:43:04 GMT). A graceful server restart now is
recommended.",
    "valid-from": "Thu, 11 Mar 2021 17:43:04 GMT"
  },
  "log": {
    "entries": [
      {
        "when": "Thu, 11 Mar 2021 18:43:05 GMT",
        "type": "message-renewed"
      },
      ...
      {
        "when": "Thu, 11 Mar 2021 18:43:02 GMT",
        "type": "starting"
      }
    ]
  }
}
```

To exchange the default FortiGate administration server certificate for the new public Let's Encrypt server certificate in the GUI:

1. Go to *System* > *Settings*.
2. Set *HTTPS server certificate* to the new certificate.



3. Click *Apply*.
4. Log in to the FortiGate using an administrator account from any internet browser. There should be no warnings related to non-trusted certificates, and the certificate path should be valid.

To exchange the default FortiGate administration server certificate for the new public Let's Encrypt server certificate in the CLI:

```
config system global
    set admin-server-cert "acme-test"
end
```

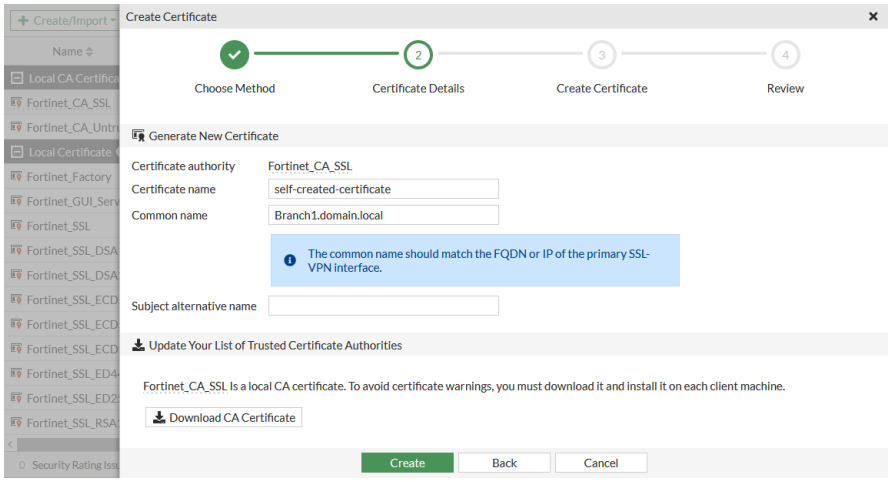
When you log in to the FortiGate using an administrator account there should be no warnings related to non-trusted certificates, and the certificate path should be valid.

Generate a new certificate

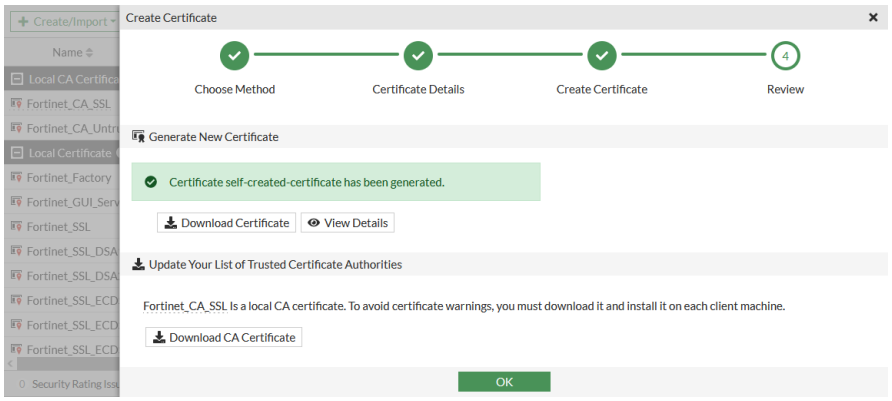
The FortiGate can generate a certificate using a pre-loaded, self-signed CA certificate: *Fortinet_CA_SSL*, instead of generating a CSR and providing it to a CA for signing. It is recommended that a server certificate from a well-known and trusted CA is used.

To generate a new certificate:

1. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
2. Click *Generate Certificate*.
3. Set *Certificate name* to the name of the certificate. This is what is referenced when using the certificate in FortiGate configurations.
4. Set the *Common name* (CN) for the certificate. The common name should match the FQDN or IP of the primary SSL-VPN interface.
5. Optionally, set the *Subject alternative name*.
6. Click *Download CA Certificate* to download the CA certificate so that it can be installed or imported to all the machines that need to trust this certificate.



7. Click *Create*.
8. After the certificate is created, click *Download Certificate* to download the certificate. Click *View Details* to review the certificate details.



9. Click *OK*.

Regenerate default certificates

The FortiGate includes default certificates that are generated the first time that the FortiGate is booted up. In some circumstances, it can be necessary to regenerate these certificates, such as when they are nearing expiry, or if the key becomes compromised.

To regenerate default certificates:

```
# execute vpn certificate local generate default-gui-mgmt-cert
```

```
# execute vpn certificate local generate default-ssl-ca
```

```
# execute vpn certificate local generate default-ssl-ca-untrusted
```

```
# execute vpn certificate local generate default-ssl-key-certs
```

```
# execute vpn certificate local generate default-ssl-serv-key
```

`default-gui-mgmt-cert`	Regenerate the default GUI management admin-server (Fortinet_GUI_Server) certificate.
`default-ssl-ca`	Regenerate the default CA certificate (Fortinet_CA_SSL) used by SSL Inspection.
`default-ssl-ca-untrusted`	Regenerate the default untrusted CA certificate (Fortinet_CA_Untrusted) used by SSL Inspection.
`default-ssl-key-certs`	Regenerate the default RSA, DSA, ECDSA, and EdDSA key certificates for SSL resign: • Fortinet_SSL_DSA1024 • Fortinet_SSL_DSA2048 • Fortinet_SSL_ECDSA256 • Fortinet_SSL_ECDSA384 • Fortinet_SSL_ECDSA521

	• Fortinet_SSL_ED448 • Fortinet_SSL_ED25519 • Fortinet_SSL_RSA1024 • Fortinet_SSL_RSA2048 • Fortinet_SSL_RSA4096
`default-ssl-serv-key`	Regenerate the default server key (Fortinet_SSL) used by SSL Inspection.

Import a certificate

You can upload a certificate to the FortiGate that was generated on its own. This is typical of wildcard certificates (*.domain.tld) where the same certificate is used across multiple devices (FGT.domain.tld, FAZ.domain.tld, and so on), but can also be used for individual certificates as long as the information provided to the signing CA matches that of the FortiGate.

Any certificate uploaded to a VDOM is only accessible to that VDOM. Any certificate uploaded to the Global VDOM is globally accessible by all VDOMs.

A signed certificate that is created using a CSR that was generated by the FortiGate does not include a private key, and can be imported to the FortiGate from a the management computer or a TFTP file server.

There are three options:

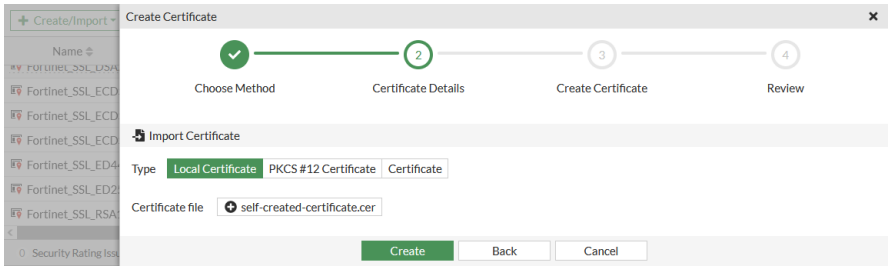
- Local certificate on page 3604
- PKCS #12 certificate on page 3605
- Certificate on page 3605

Local certificate

This option allows you to upload a single file and no key. Use it when you have created a CSR on the FortiGate (Generate a CSR on page 3606), as the key is generated as part of the CSR process and remains on the FortiGate. You must upload a .CER file.

To import a local certificate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *Local Certificate*.
4. Click *Upload*, and locate the certificate on the management computer.



5. Click *Create*, then click *OK* on the confirmation page.

To import a local certificate in the CLI:

```
execute vpn certificate local import tftp <filename> <tftp_IP> cer
```

PKCS #12 certificate

This option takes a specific certificate file type that contains the private key. The certificate is encrypted and a password must be supplied with the certificate file. PKCS #12 certificates are .PFX files.

To import a PKCS #12 certificate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *PKCS #12 Certificate*.
4. Click *Upload*, and locate the certificate on the management computer.
5. Enter the password, then confirm the password.
6. Optionally, customize the *Certificate name*.
7. Click *Create*, then click *OK* on the confirmation page.

To import a PKCS #12 certificate in the CLI:

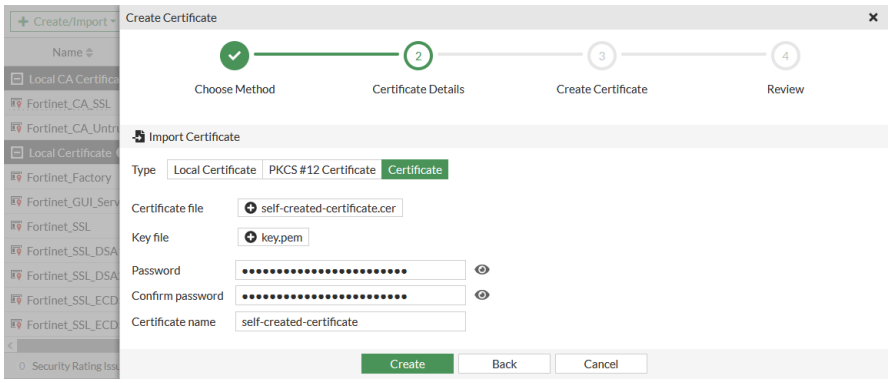
```
execute vpn certificate local import tftp <filename> <tftp_IP> p12 <password>
```

Certificate

This option is intended for certificates that were generated without using the FortiGate's CSR. Because the certificate private key is being uploaded, a password is required. This option is similar to PKCS #12 certificate, but the certificate and key file are separate files, usually .CER and .PEM files.

To import a certificate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *Certificate*.
4. In the *Certificate* field, click *Upload*, and locate the certificate on the management computer.
5. In the *Key file* field, click *Upload*, and locate the key file on the management computer.
6. Enter the password, then confirm the password.



7. Optionally, customize the *Certificate name*.
8. Click *Create*, then click *OK* on the confirmation page.

To import a certificate that requires a private key to a VDOM, or when VDOMs are disabled:

```
config vpn certificate {local | ca | remote | ocsp-server | crl}
```

Refer to the FortiOS CLI Reference for detailed options for each certificate type (local, CA, remote, OSCP server, CRL).

To import a global certificate that requires a private key when VDOMs are enabled:

```
config certificate {local | ca | remote | crl}
```

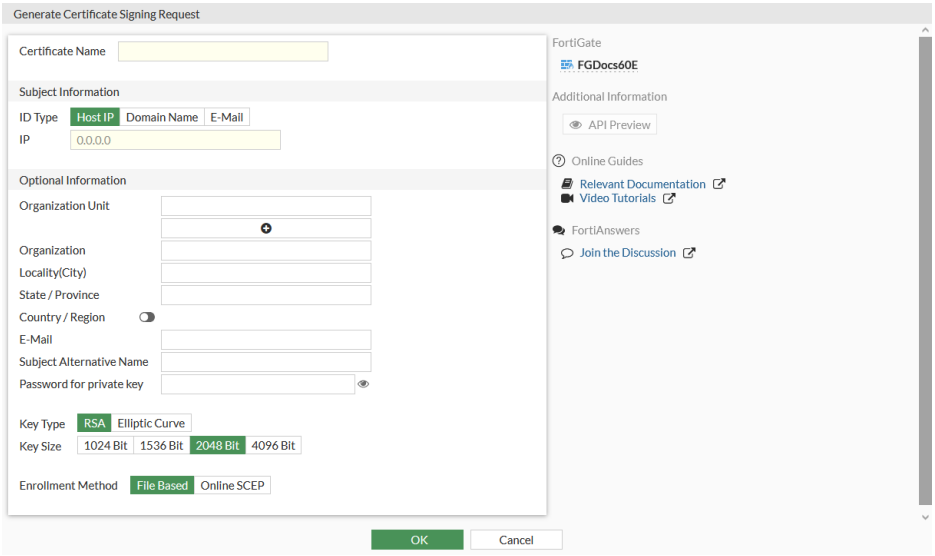
This command is only available when VDOMs are enabled. For details, see the FortiOS CLI Reference.

Generate a CSR

Certificate signing requests (CSRs) are used to generate a certificate which is then signed by a CA to create a chain of trust. The CSR includes details about the FortiGate and its public key. A CSR is not strictly necessary; some CAs allow you to provide the details of the FortiGate manually, but a CSR helps streamline the process.

To generate a CSR in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Generate CSR*.



2. Enter the following information:

Certificate Name	Enter the certificate name; this is how it will appear in the *Local Certificates* list.
Subject Information	Specify an ID type: host IP address, domain name (FQDN), or email address.
Optional Information	Although listed as optional, we recommended entering the information for each field in this section. If you are generating a CSR for a third-party CA, you need to insure that these values reflect those listed for your company or organization at said certificate authority. If you are generating a certificate for a Microsoft CA, you need to check with the administrator regarding these values.
Organization Unit	Enter the name of the organizational unit under which the certificate will be issued.
Organization	Enter the overall name of the organization.
Locality(City)	Enter the city where the SSL certificate is located.
State / Province	Some issuers will reject a CSR that has an abbreviated state or province, so enter the full name of the state or province.
Country / Region	Enable the option and select the country from the dropdown.
E-Mail	Enter the email address of the technical contact for the SSL certificate that is being requested.

Subject Alternative Name	This field allows multiple domains to be used in an SSL certificate. Select from email addresses, IP addresses, URIs, DNS names, and so on.
Password for private key	If supplied, this is used as an encryption password for the private key file.
Key Type	Select *RSA* or *Elliptic Curve*.
Key Size	When *Key Type* is *RSA*, select 1024, 1536, 2048, or 4096 for bit-size/strength. We recommend using at least 2048 if your CA can issue certificates of that size.
Curve Name	When *Key Type* is *Elliptic Curve*, select the elliptic curve type: secp256r1, secp384r1, or secp521r1.

Enrollment Method	Select one of the following methods that determines how the CSR will be signed.
	• *File Based*: this will generate a certificate in the certificate menu under *Local Certificate*, which differs from the existing ones because it has no *Subject*, *Comments*, *Issuer*, or *Expires* values in the table. It will also show a *Pending* status because it is only a CSR at the moment and cannot function as a certificate just yet. You can download the CSR to provide to a CA for signing. If you open the CSR file, it should look similar to this:
	`-----BEGIN CERTIFICATE REQUEST-----`
	`MIIC7jCCAdYCAQAwgZUxCzAJBgNVBAYT (… )HEKjDX+Hg==`
	`-----END CERTIFICATE REQUEST-----`
	Next. the CSR file is supplied to a CA for signing and the returned file from the CA should be in .CER format. This file is then uploaded to the FortiGate by going to *System > Certificates > Import > Local Certificate* and uploading the CER file.
	• *Online SCEP*: the Simple Certificate Enrollment Protocol (SCEP) allows devices to enroll for a certificate by using a URL and a password. The SCEP server works as a proxy to forward the FortiGate's request to the CA and returns the result to the FortiGate (setting up an SCEP server is beyond the scope of this topic). Once the request is approved by the SCEP server, the FortiGate will have a signed certificate containing the details provided in the CSR.

3. Click *OK*.
   The CSR generated, and can be downloaded from the local certificate list.

To generate a CSR in the CLI:

```
# execute vpn certificate local generate cmp-ec <certificate_name> <key_size> <server> <path>
<server_certificate> <auth_certificate> <user> <password> <subject> [SANs] [source_IP]
```

```
# execute vpn certificate local generate cmp-rsa <certificate_name> <key_size> <server> <path>
<server_certificate> <auth_certificate> <user> <password> <subject> [SANs] [source_IP]
```

```
# execute vpn certificate local generate ec <certificate_name> <curve_name> <subject> <country>
<state/province> <city> <organization> <OU> <email> [SANs] [options]
```

```
# execute vpn certificate local generate rsa <certificate_name> <key_size> <subject> <country>
<state/province> <city> <organization> <OU> <email> [SANs] [options]
```

cmp-ec	Generate a ECDSA certificate request over CMPv2. To enable SSL/TLS, append `https://` to the server address.
cmp-rsa	Generate a RSA certificate request over CMPv2. To enable SSL/TLS, append `https://` to the server address.
ec	Generate an elliptic curve certificate request.
rsa	Generate a RSA certificate request.

CA certificate

FortiGates come with many CA certificates from well-known certificate authorities pre-installed, just as most modern operating systems like Windows and MacOS. Use this option to add private CA certificates to the FortiGate so that certificates signed by this private CA are trusted by the FortiGate.

For example, a private CA can be used when two FortiGates are establishing a site-to-site VPN tunnel using a certificate not signed by a public or trustworthy CA, or for your LDAPS connection to your corporate AD server that also uses a certificate signed with a private CA in your domain. It is very common to upload a private CA when using PKI user authentication, since most PKI user certificates will be signed by an internal CA.

To import a CA certificate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *CA Certificate*.
2. Set the *Type* to *Online SCEP* or *File*.
   - *Online SCEP*: Enter the *URL of the SCEP server* and optionally, the *Optional CA Identifier*. The FortiGate contacts an SCEP server to request the CA certificate.
   - *File*: Upload the CA certificate file directly from the management computer.
3. Click *OK*.

To import a CA certificate in the CLI:

```
# execute vpn certificate ca import auto <CA_server> [identifier] [source_ip] [fingerprint]
```

```
# execute vpn certificate ca import bundle <filename> <tftp_IP>
```

```
# execute vpn certificate ca import tftp <filename> <server_address>
```

```
# execute vpn certificate ems_ca import tftp <filename> <server_address>
```

`auto`	Import CA certificate via SCEP.
`bundle`	Import certificate bundle from a TFTP server.
`tftp`	Import CA certificate from a TFTP server.

Remote certificate

Remote certificates are public certificates and contain only the public key. They are used to identify a remote device. For example, when configuring your FortiGate for SAML authentication with the FortiGate as an identity provider (IdP), you can optionally specify the service provider (SP) certificate. However, when configuring your FortiGate as a SP, you must specify the certificate used by the IdP. Both these certificates can be uploaded to the FortiGate as a remote certificate, since the private key is not necessary for its implementation.

To upload a remote certificate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Remote Certificate*.
2. Upload the remote certificate file directly from the management computer.
3. Click *OK*.

To upload a remote certificate in the CLI:

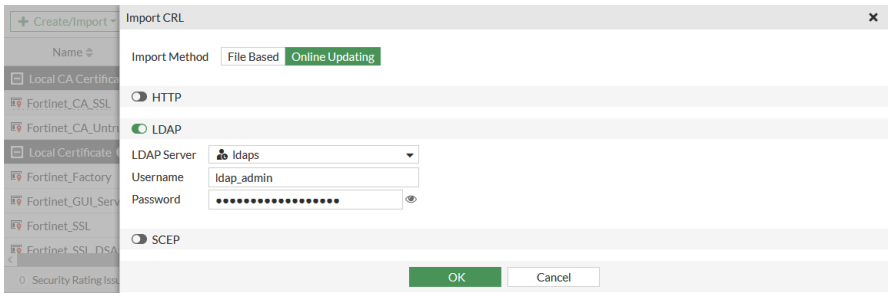
```
# execute vpn certificate remote import tftp <file_name> <server_address>
```

Certificate revocation list

Because it is not possible to recall a certificate, the certificate revocation list (CRL) details certificates signed by valid CAs that should no longer be trusted. Certificates may be revoked for many reasons, such as if the certificate was issued erroneously or if the private key of a valid certificate has been compromised.

To import a CRL in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *CRL*.
2. Set the *Import Method* to *File Based* or *Online Updating*.
   - *File Based*: Upload the CRL file directly from the management computer. CAs publish files containing the list of certificates that should no longer be trusted.
   - *Online Updating*: This is the preferred method to keep the list of revoked certificates up to date. Configure the protocols as required.
     - *HTTP*: Enter the *URL of the HTTP server*.
     - *LDAP*: Select the *LDAP Server* and enter the *Username* and *Password*.
     - *SCEP*: Select the *Certificate* and enter the *URL of the SCEP server*.



3. Click *OK*.

To import a CRL in the CLI:

```
# execute vpn certificate crl import auto <CRL_name>
```

Export a certificate

Certificates can be downloaded to the management computer in the GUI and exported to a TFTP server in the CLI.

To back up a certificate in the GUI:

1. Go to *System* > *Certificates*.
2. Select the certificate from the list.
3. Click *Download*.
4. Save the file to the management computer.

To export the certificate in the CLI:

```
# execute vpn certificate ca export tftp <certificate_name> <filename> <tftp_IP>
```

```
# execute vpn certificate local export tftp <certificate_name> <file_type> <filename> <tftp_
server>
```

```
# execute vpn certificate remote export tftp <certificate_name> <filename> <tftp_server>
```

Uploading certificates using an API

There are several API methods to upload a certificate based on the type and purpose of the certificate. The parameters of each method are available options, and some methods do not require all parameters to upload the certificate.

When uploading a certificate to the FortiGate using API, the certificate must be provided to the FortiGate in Base64 encoding. You must create a REST API user to authenticate to the FortiGate and use the generated API token in the request.

api/v2/monitor/vpn-certificate/ca/import

```
{
  "import_method": "[file|scep]",
  "scep_url": "string",
  "scep_ca_id": "string",
  "scope": "[vdom*|global]",
  "file_content": "string"
}
```

api/v2/monitor/vpn-certificate/crl/import

```
{
  "scope": "[vdom*|global]",
  "file_content": "string"
}
```

api/v2/monitor/vpn-certificate/local/import

```
{
  "type": "[local|pkcs12|regular]",
  "certname": "string",
  "password": "string",
  "key_file_content": "string",
  "scope": "[vdom*|global]",
  "acme-domain": "string",
  "acme-email": "string",
  "acme-ca-url": "string",
  "acme-rsa-key-size": 0,
  "acme-renew-window": 0,
  "file_content": "string"
}
```

api/v2/monitor/vpn-certificate/remote/import

```
{
  "scope": "[vdom*|global]",
  "file_content": "string"
}
```

api/v2/monitor/vpn-certificate/csr/generate

```
{
  "certname": "string",
  "subject": "string",
  "keytype": "[rsa|ec]",
  "keysize": [1024|1536|2048|4096],
  "curvename": "[secp256r1|secp384r1|secp521r1]",
```

```
  "orgunits": [
    "string"
  ],
  "org": "string",
  "city": "string",
  "state": "string",
  "countrycode": "string",
  "email": "string",
  "sub_alt_name": "string",
  "password": "string",
  "scep_url": "string",
  "scep_password": "string",
  "scope": "[vdom*|global]"
}
```

Example

In this example, a PKCS 12 certificate is uploaded as a local certificate using Postman as the API client. PowerShell is used for the Base64 encoding.

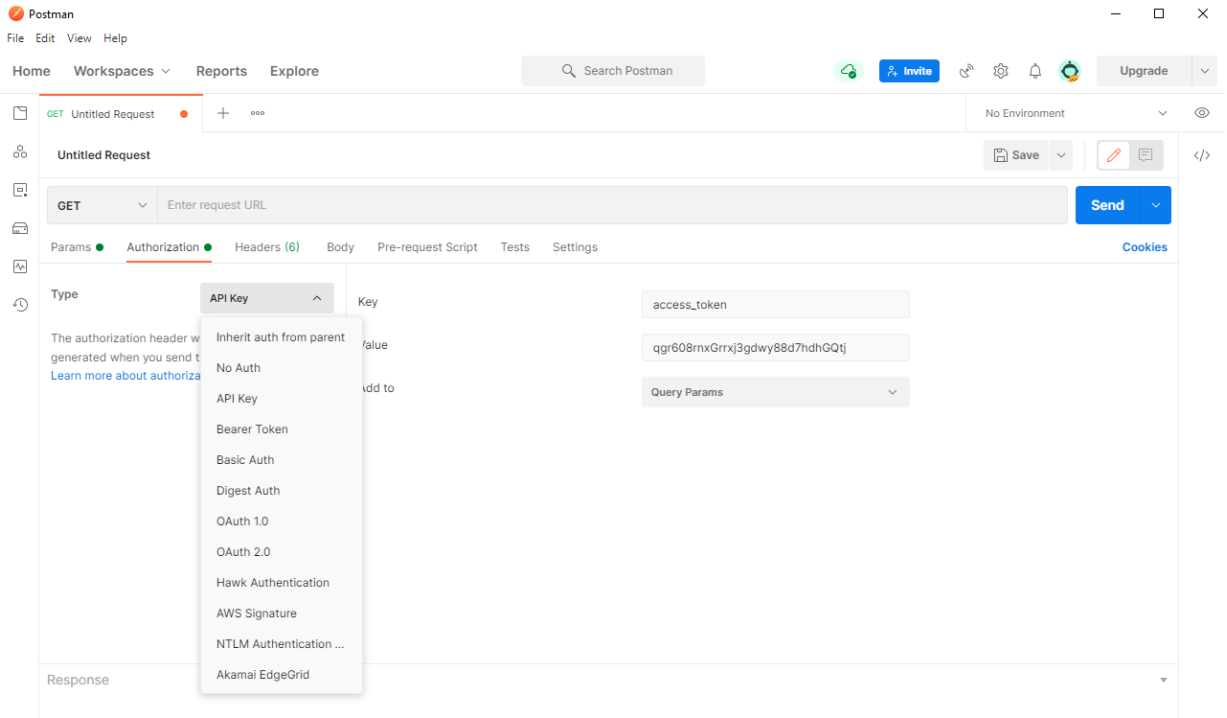
To upload a PKCS 12 certificate using an API:

1. In PowerShell , encode the PKCS 12 certificate to Base64:

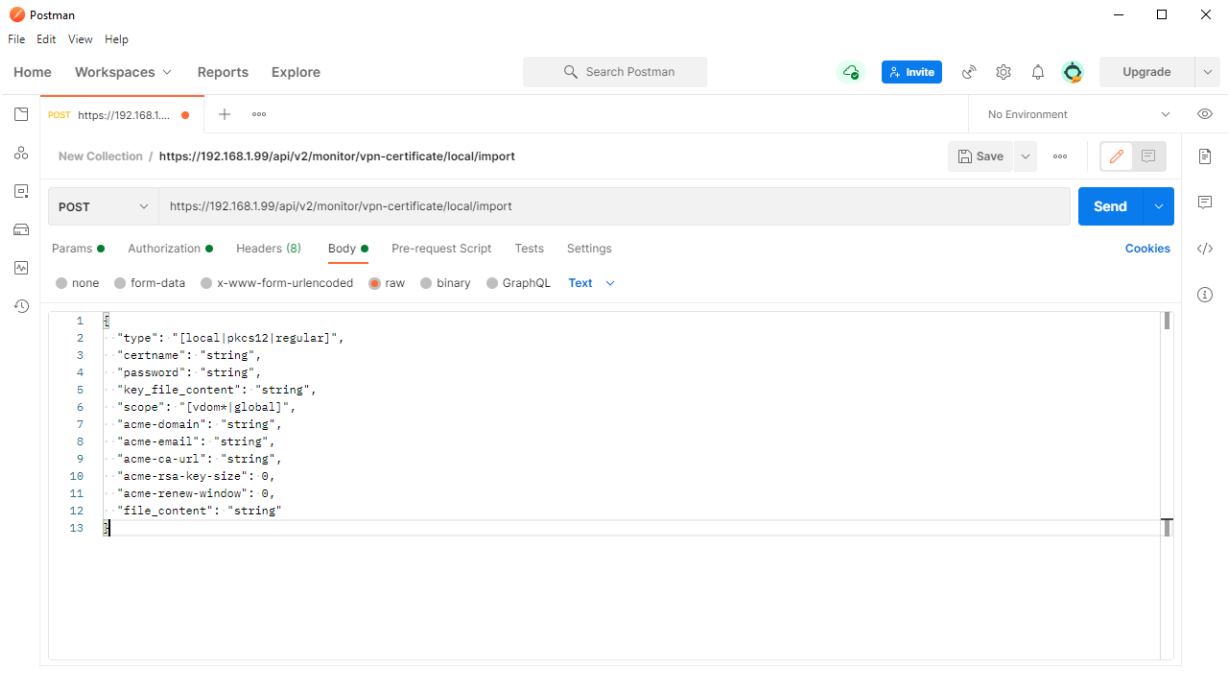
   ```
   cd C:\users\username\desktop
   $pkcs12cert = get-content 'C:\users\path\to\certificate\certificatename.p12' -Encoding Byte
   [System.Convert]::ToBase64String($pkcs12cert) | Out-File ‘base12encodedcert.txt’
   ```

   These three lines of code do the following:

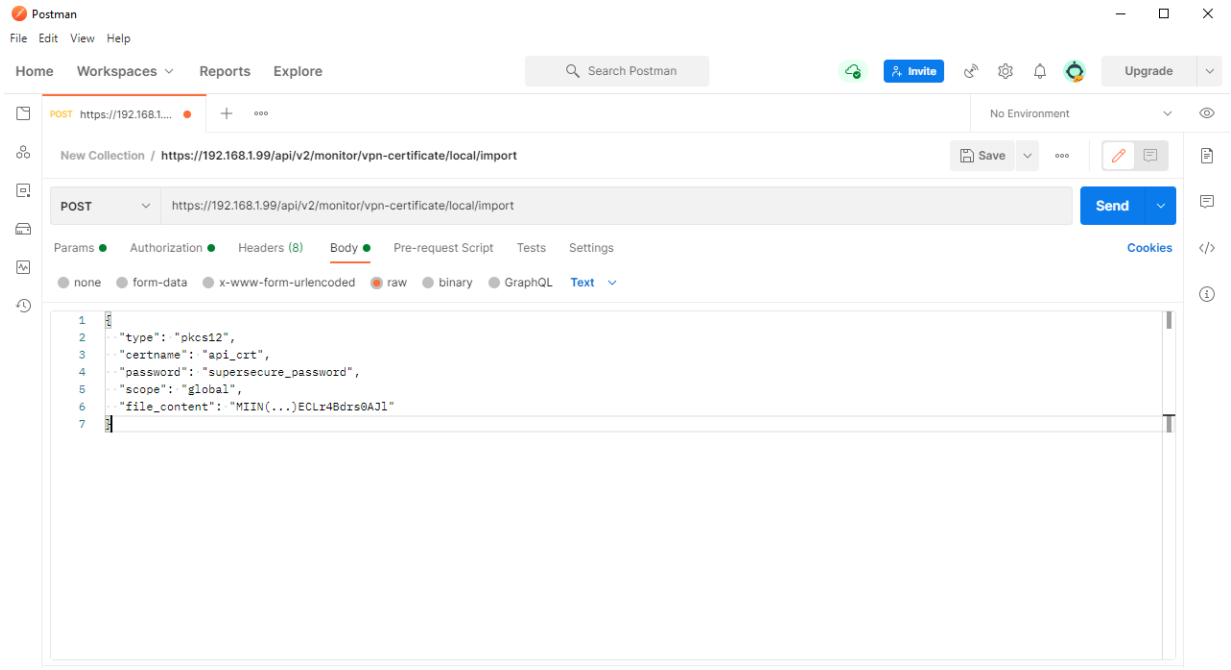
   a. Changes to working directory to the location where the encoded certificate will be created. In this example, it is the desktop.
   b. Creates a variable called `pkcs12cert` and defines it as the certificate file by specifying the full path to the certificate.
   c. Creates a text file called `base12encodedcert` at the location specified in the first step. You will copy and paste the contents of this as `file_content` later in Postman.
2. Generate an API token on the FortiGate by creating a REST API user. See Generate an API token on the Fortinet Developer Network. A subscription to the Fortinet Developer Network is required to view this topic.
3. Open Postman and create a new request:
   a. Click the *+*.
   b. Click the *Authorization* tab and in the *Type* dropdown, select *API Key*.
   c. For *Key*, enter *access_token* and enter the *Value* for the API user.
   d. For *Add to*, select *Query Params*.



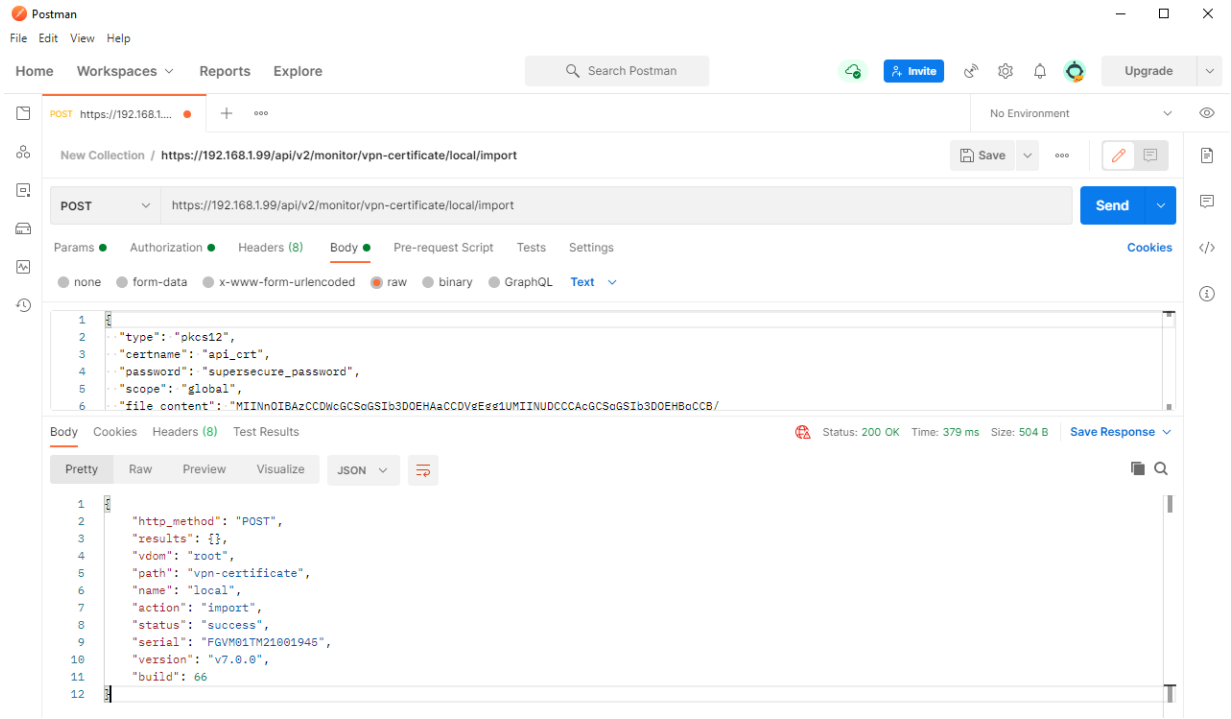
4. In the HTTP request dropdown, change the request from *GET* to *POST*, and enter the FortiGate's IP address and the URL of the API call.
5. Click the *Body* tab, and copy and paste the API parameters.



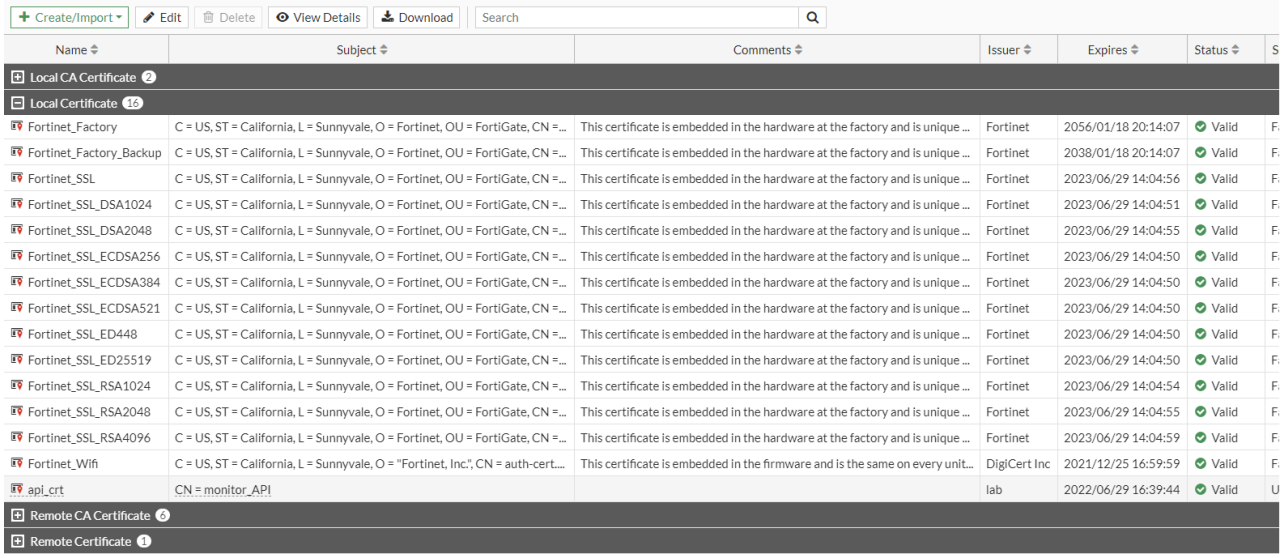
6. Remove unnecessary parameters (ACME related parameters and `key_file_content`) and enter the correct settings for your certificate. Copy and paste the contents of the file generated by PowerShell earlier into `file_content`.



7. Click *Send*. The lower window will return the results.



8. In FortiOS, go to *System* > *Certificates* and verify that the uploaded certificate is shown in the table (*api_crt*).



To debug using the HTTPS daemon:

```
# diagnose debug reset
# diagnose debug enable
# diagnose debug application httpsd -1
<output>
# diagnose debug disable
```

Procuring and importing a signed SSL certificate

A signed SSL certificate can be used when configuring SSL VPN, for administrator GUI access, and for other functions that require a certificate.

Before creating a certificate, you must have a registered domain. With a valid FortiGuard subscription, FortiDDNS can be used to register a domain; see DDNS on page 313 for more information.

Follow these instructions to purchase, import, and use a signed SSL certificate:

- Obtain, setup, and download an SSL certificate package from a certificate authority
- Generate a CSR
- Import the signed certificate into your FortiGate
- Configure your FortiGate to use the signed certificate

Obtain, setup, and download an SSL certificate package from a certificate authority

SSL certificate packages can be purchased from any Certificate Authority (CA), such as DigiCert, GoDaddy, or GlobalSign.

Let's Encrypt can be used to generate a free, trusted SSL certificate. See Automatically provision a certificate on page 3597 for more information.

A third party CA might not sign a certificate with an intranet name or IP address. For details, see Can I request a certificate for an intranet name or IP address?

The process for purchasing, setting up, and downloading a certificate will vary depending on the CA that is used, and if a CSR must be generated on the FortiGate.

To purchase a certificate package:

1. Create an account with your chosen vendor, or use the account that you used to purchase your domain.
2. Locate the SSL Certificates page.
3. Purchase a basic SSL certificate for domain validation only. If required, a more secure SSL certificate can be purchased.
4. If required, load the CSR, either by uploaded the text file or copying and pasting the contents into the requisite text box. See Generate a CSR on page 3617 for information on generating the CSR on the FortiGate.
5. If required, set the server type to *Other*.
6. Verify the certificate per the requirements of the CA.
7. Download the signed certificate to your computer.
8. Import the signed certificate into your FortiGate; see Import the signed certificate into your FortiGate on page 3618.

Generate a CSR

Some CAs can auto-generate the CSR during the signing process, or provide tools for creating CSRs. If necessary, a CSR can be created in your FortiGate device's GUI.

To generate a CSR on your FortiGate:

1. Go to *System* > *Certificates* and select *Create/Import* > *Generate CSR*.
2. Configure the CSR:
   - Ensure that the certificate has a unique name.
   - Set the *ID Type* to *Domain Name* and enter a *Domain Name*.
   - An email address is required.

- Ensure that the *Key Size* is set to *2048 Bit*.
- Set the *Enrollment Method* to *File Based*.

3. Click *OK*.
   The CSR will be added to the certificate list with a status of *PENDING*.
4. In the certificate list, select the new CSR then click *Download* to save the CSR to your computer.
   The CSR file can be opened in any text editor, and will resemble the following:

```
-----BEGIN CERTIFICATE REQUEST-----
MIICuTCCAaECAQAwSzEcMBoGA1UEAxMTZm9ydGlzc2x2cG5kZW1vLmNvbTErMCkG

-----END CERTIFICATE REQUEST-----
```

Import the signed certificate into your FortiGate

To import the signed certificate into your FortiGate:

1. Unzip the file downloaded from the CA.
   There should be two CRT files: a CA certificate with *bundle* in the file name, and a local certificate.
2. Import the local certificate:
   a. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
   b. Click *Import Certificate*.
   c. Set *Type* to *Local Certificate*, upload the local certificate file, then click *Create*. See Local certificate on page 3604 for more information.
      The status of the certificate will change from *PENDING* to *OK*.
3. Import the CA certificate:
   a. Go to *System* > *Certificates* and select *Create/Import* > *CA Certificate*.
   b. Set the *Type* to *File*, upload the CA certificate file, then click *OK*. See CA certificate on page 3609 for more information.
      The CA certificate will be listed in the *CA Certificates* section of the certificates list.

Configure your FortiGate to use the signed certificate

After the signed certificates have been imported, you can use it when configuring SSL VPN, for administrator GUI access, and for other functions that require a certificate.

To configure your FortiGate to use the signed certificate for SSL VPN:

1. Go to *VPN > SSL-VPN Settings*.
2. Set *Server Certificate* to the new certificate.
3. Configure other settings as needed.
4. Click *Apply*.

For more information on configuring SSL VPN, see SSL VPN on page 2775 and the Setup SSL VPN video in the Fortinet Video Library.

To configure using the certificate for administrator GUI access in the CLI:

```
config system global
    set admin-server-cert fortisslvpndemo
end
```

To change the certificate that is used for administrator GUI access in the GUI:

1. Go to *System > Settings*.
2. In the *Administration Settings* section, change *HTTPS server certificate* as needed.
3. Click *Apply*. You will be logged out of FortiOS.

Microsoft CA deep packet inspection

In most production environments, you want to use a certificate issued be your own PKI for deep packet inspection (DPI).

An existing Microsoft root CA can be used to issue a subordinate CA (sub CA) certificate that is installed as a DPI certificate on the FortiGate.

Complete the following steps to create your own sub CA certificate and use it for DPI:

1. Create a Microsoft sub CA certificate
2. Export the certificate and private key
3. Import the certificate and private key into the FortiGate
4. Configure a firewall policy for DPI
5. Verify that the sub CA certificate is being used for DPI

The FortiGate firewall uses information in the original web server certificate, then issues a new certificate signed by the Microsoft DPI certificate. The FortiGate then sends this certificate with the issuing DPI certificate to the client's web browser when the SSL session is being established.

The browser verifies that the certificate was issued by a valid CA, then looks for the issuing CA of the Microsoft DPI certificate in its loca trusted root CA store to complete the path to trusted root CA.

The Microsoft CA root certificate is normally deployed to all client PCs in the Windows domain, so the client can complete the certificate path up to a trusted root CA. The FortiGate now controls and can inspect the two HTTPS sessions: one with the external web server, and one with the client PC.

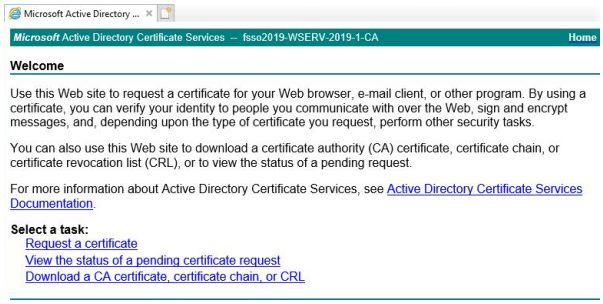
Create a Microsoft sub CA certificate

A Microsoft sub CA certificate can be created on a Microsoft CA server, or remotely using a web browser.

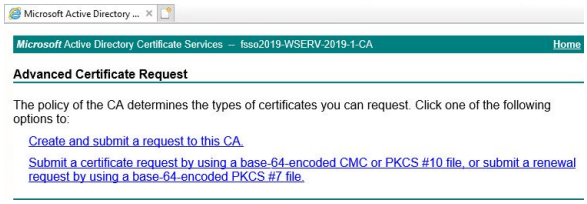
Creating a certificate remotely requires that the web enrollment option is configured on the Microsoft CA server. Remote certificate requests require HTTPS; requests are not allowed with HTTP.

To create a Microsoft sub CA certificate remotely:

1. Open a web browser and go to one of the following URLs:
   - *https://<FQDN-CA-server>/CertSrv*
   - *https://<IP-CA-server>/CertSrv*.
2. Log in to a domain administrator account that has web enrollment rights.

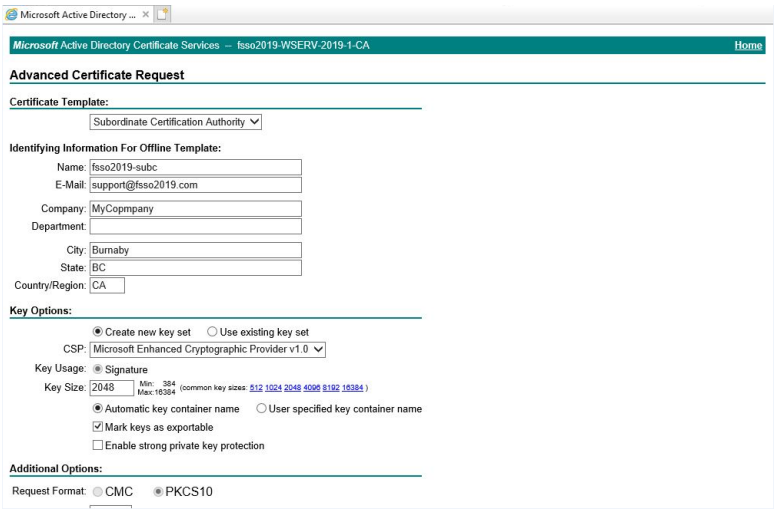


3. Click *Request a certificate*.
4. Click *advanced certificate request*.



5. Click *Create and submit a request to this CA*, then click *Yes* in the *Web Access Confirmation* warning.
6. For the *Certificate Template*, select *Subordinate Certification Authority*.
7. Enable *Mark keys as exportable*.

8. Fill out the remaining information according to your security policy.

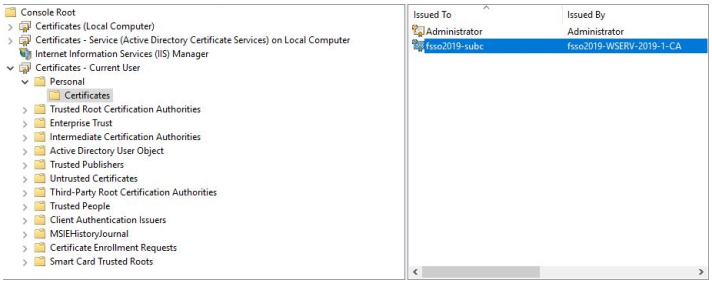


9. Submit the request.
10. Click *Yes* in the *Web Access Confirmation* warning.
11. Click *Install this certificate*.
    The certificate and private key are located in the current user's certificate store.

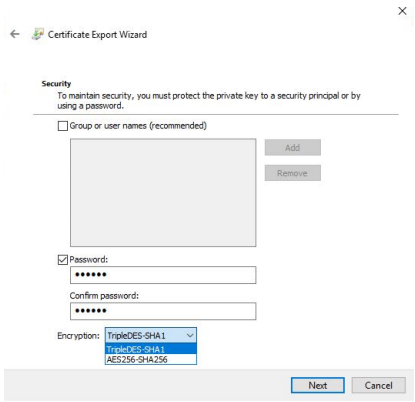
Export the certificate and private key

To export the certificate and private key:

1. Open the Microsoft Management Console (MMC) and add the *Certificate Snap-in*.
2. Go to the user's certificate store to locate the sub CA certificate that you just installed.



3. Right-click the certificate and select *All Tasks* > *Export*.
4. Click *Next* to start the *Microsoft Certificate Export Wizard*.
5. Follow the steps in the wizard:
   - When asked, select *Yes, export the private key*.
   - Only the PKCS #12 (.PFX) format is available, and it requires a password.
   - When selecting the encryption type, select *TripleDES-SHA1* if you are using an older version of FortiOS (5.6.9 and earlier). Otherwise, select *AES256-SHA256*.



6. Complete the wizard, and save the DPI certificate to a local folder.

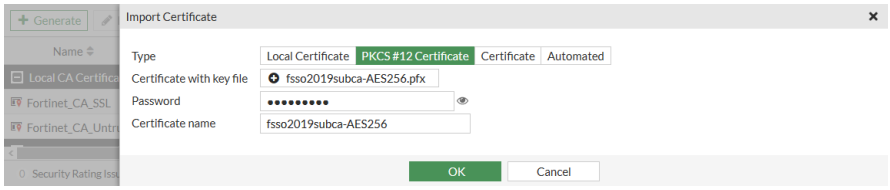
Import the certificate and private key into the FortiGate

The certificate can be imported from the local computer using the GUI, or from a TFTP server using the CLI.

After importing the certificate, you can view it in the GUI to verify that it was successfully imported.

To import the certificate and private key into the FortiGate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *PKCS #12 Certificate*.
4. Click *Upload*, and locate the certificate on the management computer.
5. Enter the password, then confirm the password.
6. Optionally, customize the *Certificate name*.



7. Click *OK*.

To import the certificate and private key into the FortiGate in the CLI:

```
execute vpn certificate local import tftp fsso2019subca-AES256.pfx <tftp_IP> p12 <password>
```

To verify that the certificate was imported:

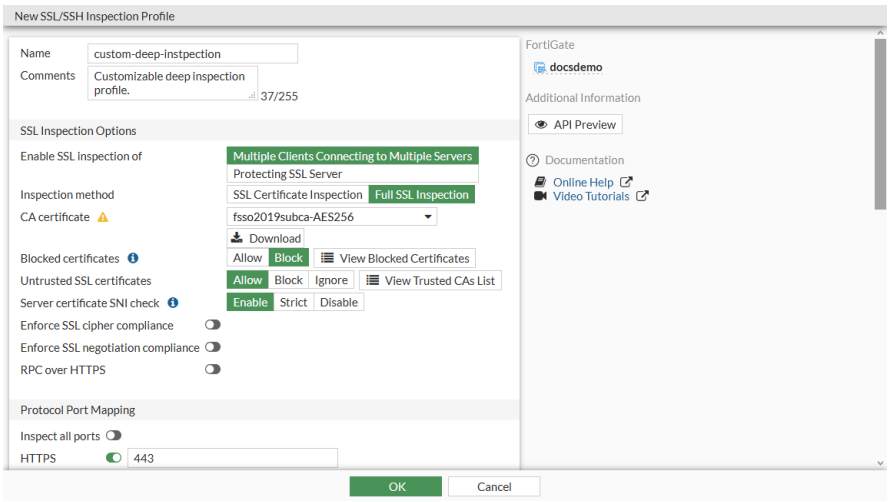
1. Go to *System* > *Certificates*.
2. Locate the newly imported certificate in the table.
3. Select the certificate and click *View Details* to view the certificate details.

Configure a firewall policy for DPI

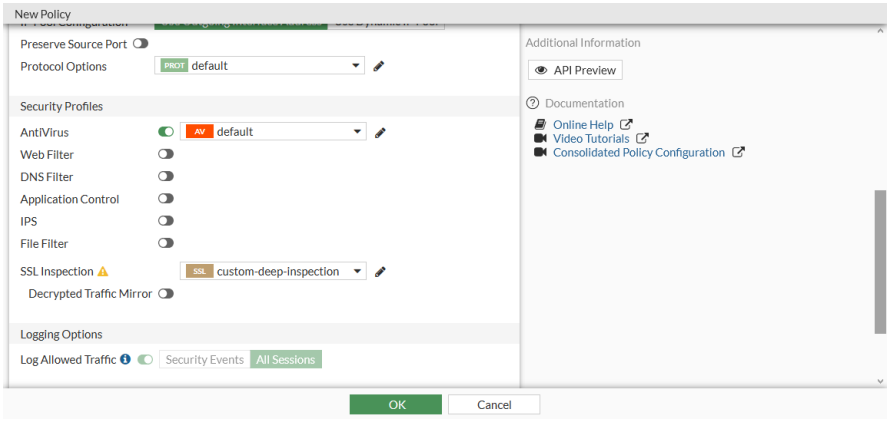
The certificate is used in an SSL/SSH inspection profile that is then used in a firewall policy.

To configure a firewall policy for DPI:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*.
2. Configure the inspection profile, selecting the new certificate



3. Click *Apply*.
4. Go to *Policy & Objects* > *Firewall Policy*.
5. Create a new policy, or edit an existing policy.
6. In the *SSL Inspection* field, select the new SSL inspection profile.



7. Configure the remaining settings as needed.
8. Click *OK*.

Verify that the sub CA certificate is being used for DPI

You can verify that the certificate is being used for resigning web server certificates when a user connects to an external HTTPS website.

To verify that the certificate is being used:

1. On a client PC that is behind the FortiGate, go to an external HTTPS website.
   When connecting to the website, no certificate warning should be shown.
2. In your web browser, view the certificate and certificate path.
   The methods for doing this vary depending on the browser. See your browsers documentation for information.

Administrative access using certificates

Certificates can be used for administrative authentication.

Generated key pairs can also be used for this authentication. See Public key SSH access on page 3208 for information about generating a key pair.

To log in to the FortiGate with a certificate private key:

1. On the PC, generate a certificate.
2. In FortiOS, import the PEM file for the remote certificate:

```
# execute vpn certificate remote import tftp certificate.pem 172.16.200.55
```

3. Display the imported remote certificate:

```
config certificate remote
    edit "REMOTE_Cert_1"
    next
end
```

4. Apply the remote certificate to the administrative user:

```
config system admin
    edit "admin1"
        set accprofile "prof_admin"
        set vdom "root"
        set ssh-certificate "REMOTE_Cert_1"
        set password ************
    next
end
```

5. On the PC, verify that the administrator can log in to the FortiGate with the SSH certificate:

```
root@PC05:~# ssh -i certificate-private.pem admin1@172.16.200.1
FortiGate-101F $ get system status
Version: FortiGate-101F v7.0.2,build0234,211019 (GA)
```

Creating certificates with XCA

This topic explains how to generate various certificates to be used in conjunction with a FortiGate, including:

- CA certificate
  - Signing server and client certificates
  - Issuing subordinate CAs for deep inspection
- Server certificate
  - SSL/TLS web administration authentication
  - VPN authentication
  - Internal SSL server protection
- Client certificate
  - End user authentication for SSL or IPsec VPN

XCA is an x509 certificate generation tool that handles RSA, DSA, and EC keys, as well as certificate signing requests (PKCS #10) and CRLs.

There are several options for generating and managing certificates. This topic covers basic certificate generation for XCA. It is not a comprehensive guide to its application and does not explore all options available when generating a certificate.

Creating the XCA database

Before creating any certificates, you must create an XCA database to group the certificates in. You should use a different database for each PKI you create.

To create the database:

1. Go to *File* > *New Database*.
2. Select a directory to store the created certificates and keys.
3. Enter a name. The provided password encrypts the private keys and is used to access the XCA database in the future.

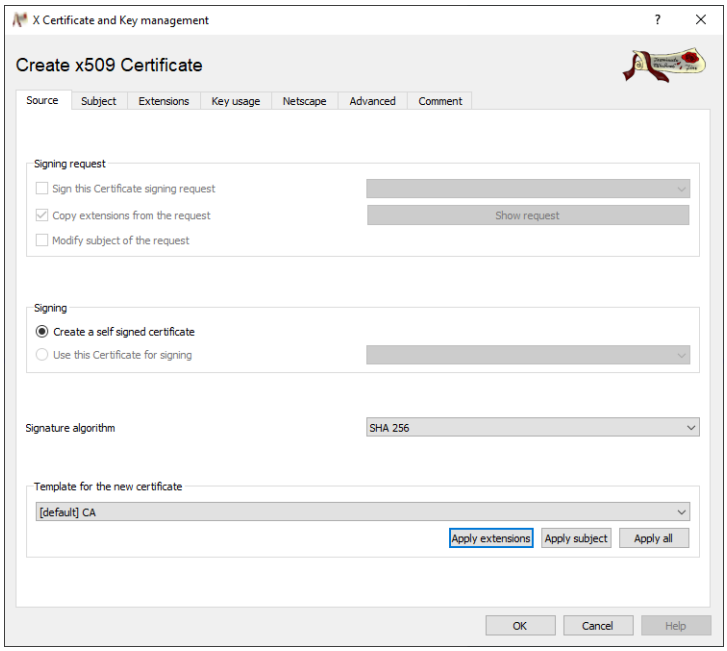
The remaining procedures in this topic assume you are using this XCA database.

Creating a CA certificate

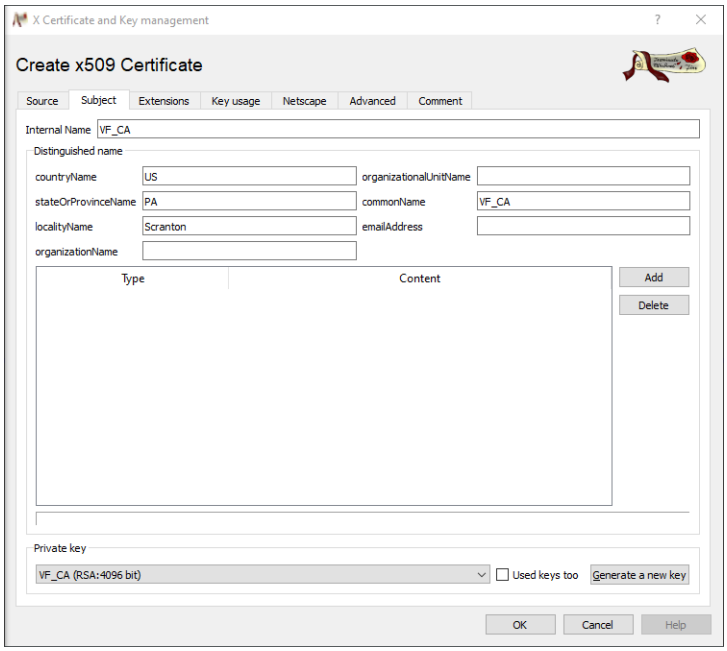
A CA certificate marks the root of a certificate chain. If this CA certificate is trusted by an end entity, any certificates signed by the CA certificate are also trusted.

To create a CA certificate:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
   a. Set *Template for the new certificate* to *[default] CA*.
   b. Click *Apply extensions*.



3. Edit the *Subject* tab:
   a. Enter an *Internal Name* to reference this certificate within XCA.
   b. Enter a *commonName*.
   c. Optionally, click *Add* to add other distinguished name fields.
   d. Since this XCA database does not contain any keys yet, click *Generate a new key*. The *Private key* field is now populated.



4. Optionally, edit the *Extensions* tab:
   a. Adjust the *Time range* if needed.
   b. Click *Apply*.
5. Click *OK*.

Issuing a subordinate CA certificate for deep inspection

Subordinate CA certificates are similar to CA certificates because they are used to sign other certificates to establish trust of the signed certificate's content. This trust of the signed certificate is only valid if the subordinate CA is also trusted by the client.

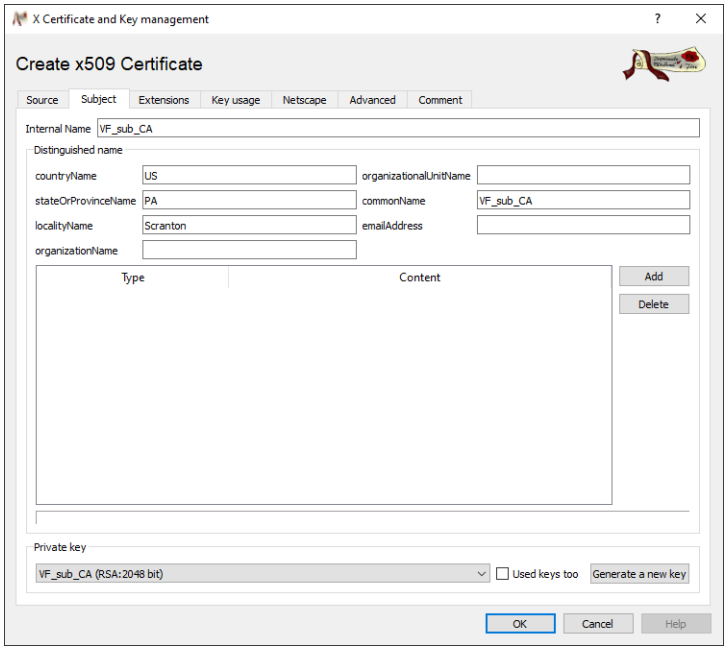
When performing deep inspection on a FortiGate, the FortiGate proxies the connection between the endpoint and the server. This is done transparently so that the end user believes they are communicating with the server, and the server with the client. To do this, when the webpage is requested by a client, the FortiGate must present a certificate that matches the requested website and is trusted by the client.

The certificate presented by the FortiGate is generated on-demand to match the requested website and is signed by this subordinate CA to establish trust with the requesting endpoint. The subordinate CA must be installed on the ForitGate (with the private key) and on the client device (without the private key).

A subordinate CA is used in place of a CA so that it may be revoked as necessary. This is critical since the subordinate CA's private key is exported and becomes susceptible of being compromised. If the CA private key becomes compromised, you would be forced to re-create your entire PKI with a new root CA because root CAs cannot be revoked. See Microsoft CA deep packet inspection on page 3619 for more information about using subordinate CA certificates.

To issue a subordinate CA certificate for deep inspection:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
   a. Set *Use this Certificate for signing* to the CA created previously.
   b. Set *Template for the new certificate* to *[default] CA*.
   c. Click *Apply extensions*.
3. Edit the *Subject* tab:
   a. Enter an *Internal Name* to reference this certificate within XCA.
   b. Enter a *commonName*.
   c. Optionally, click *Add* to add other distinguished name fields.
   d. Click *Generate a new key* to create a new private key for the subordinate CA.



4. Optionally, edit the *Extensions* tab:
   a. Adjust the *Time range* if needed.
   b. Click *Apply*.
5. Click *OK*.

Creating a server host certificate

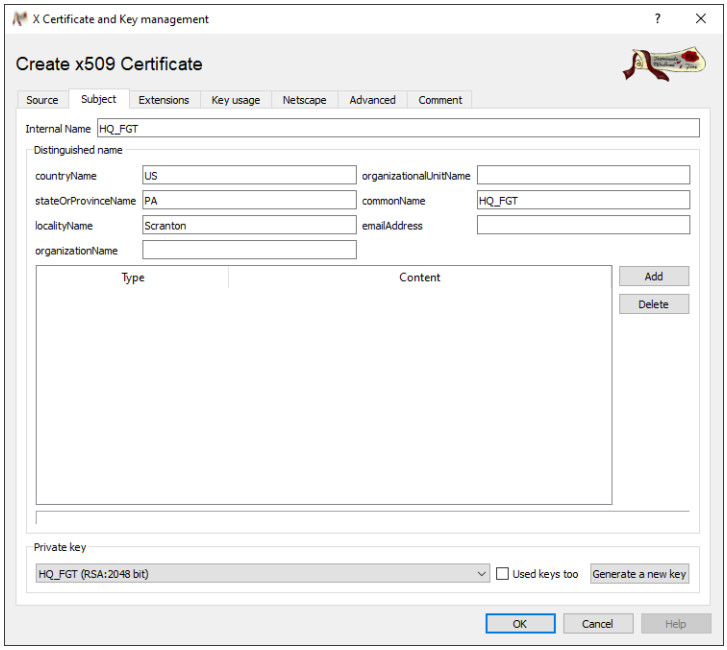
When a CA signs a host certificate, that CA is vouching for the credentials in the certificate. These credentials are what identifies the host.

Some endpoints can generate a certificate signing request (CSR). A CSR is a certificate outline that specifies the details of the endpoint, including its public key. This allows the CA to review the details and sign the request if they are true. This request is then returned or uploaded to the generating endpoint to be used.

Since some endpoints cannot generate their own CSR, you can create the certificate manually in XCA. If you already have a CSR, use the *Certificate signing requests* tab to import and then sign it.

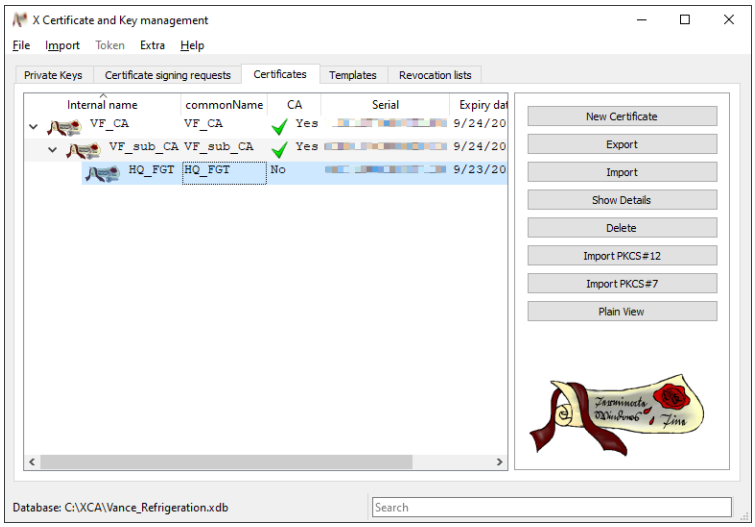
To create a server host certificate:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
   a. Set *Template for the new certificate* to *[default] TLS_server*.
   b. Click *Apply extensions*.
   c. In the *Signing* section, select *Use this Certificate for signing* and select the subordinate CA certificate.
3. Edit the *Subject* tab:
   a. Enter an *Internal Name* to reference this certificate within XCA.
   b. Enter the distinguished name fields as needed.
   c. Click *Generate a new key*.



4. Edit the *Extensions* tab:
   a. For *X509v3 Subject Alternative Name*, enter *email:user@domain.tld*.
5. Click *OK*.

6. Click the *Certificates* tab to view the certificate.



This certificate may be used to identify an SSL or TLS server by uploading the certificate and key pair to the server, such as when the FortiGate presents the administrative webpage or for SSL VPN authentication (see Configure your FortiGate to use the signed certificate on page 3619). Another use case for a server host certificate is to enable SSL server protection so the FortiGate simulates the real server and brokers the connection (see Protecting an SSL server on page 2313).

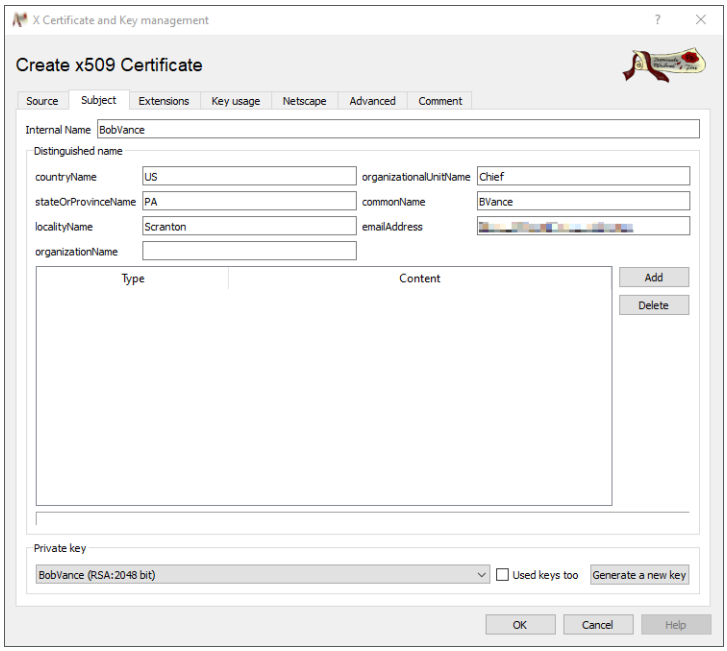
Creating a client host certificate

A client host certificate is used to identify an end entity in a more secure way than a username and password. Once the client host certificate is generated, see SSL VPN with certificate authentication on page 2853 for more information about using the certificate.

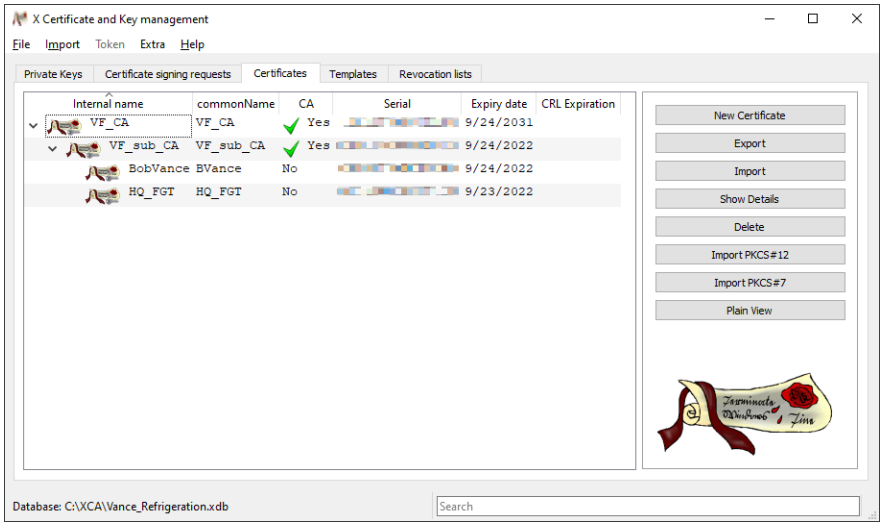
To create a client host certificate:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
   a. In the *Signing* section, select *Use this Certificate for signing* and select the CA or subordinate CA.
   b. Set *Template for the new certificate* to *[default] TLS_client*.
   c. Click *Apply extensions*.
3. Edit the *Subject* tab:
   a. Enter an *Internal Name* to reference this certificate within XCA.
   b. Enter the distinguished name fields as needed.

c. Click *Generate a new key*.



4. Click *OK*.
5. Click the *Certificates* tab. The FortiGate and client certificates are listed under the signing CA certificate and are ready to be exported.



6. Select a certificate and click *Export*.
7. Enter the file name and select an export format.
8. Click *OK*.

Certificate formats

Certificate file formats indicate what is contained in the file, how it is formatted, and how it is encoded. See Import a certificate on page 3604 for more information about which formats the FortiGate expects for a given certificate type.

Enrollment over Secure Transport for automatic certificate management

The FortiGate supports Enrollment over Secure Transport (EST) and the RFC 7030 standards when generating a new CSR request, performing automatic renewals, or manually regenerating a certificate. EST provides more security for automatic certificate management than Simple Certificate Enrollment Protocol (SCEP), which is commonly used for certificate enrollment.

Background

SCEP helps automate and simplify the process for obtaining a digital certificate from a certificate authority (CA). However, SCEP does not natively support secure connections, and instead relies on the underlying transport protocol to provide security. EST was developed, which uses TLS to establish a secure communication channel over which subsequent certificate management protocol messages like initial certificate enroll and certificate renewal messages are exchanged.

On the FortiGate, when generating a certificate signing request (CSR), you can use the SCEP method to send the request to an SCEP server, or use EST to send the request to an EST server to be signed by a CA.

To configure the enrollment protocol settings for a local certificate:

```
config vpn certificate local
    edit <name>
        set enroll-protocol est
        set est-server <string>
        set est-ca-id <string>
        set est-http-username <string>
        set est-http-password <string>
        set est-client-cert <certificate>
        set est-server-cert <certificate>
        set est-srp-username <string>
        set est-srp-password <string>
    next
end
```

`est-server <string>`	Enter the address and port for EST server (such as https://example.com:1234).
`est-ca-id <string>`	Enter the CA identifier of the CA server for signing with EST.
`est-http-username <string>`	Enter the HTTP Authentication username for signing with EST.
`est-http-password <string>`	Enter the HTTP Authentication password for signing with EST.
`est-client-cert <certificate>`	Enter the certificate used to authenticate this FortiGate to the EST server.
`est-server-cert <certificate>`	Enter the EST server's certificate that has to be verifiable by the specified certificate on the FortiGate.

`est-srp-username <string>`	Enter the EST SRP authentication username.
`est-srp-password <string>`	Enter the EST SRP authentication password.

To manually generate a CSR for the EST server to be signed by a CA:

```
# execute vpn certificate local generate est {reqired_1} {reqired_2} {reqired_3} [options]
```

option 1 (required)	Name of the local server certificate.
option 2 (required)	Cryptography algorithm: `rsa-1024`, `rsa-1536`, `rsa-2048`, `rsa-4096`, `ec-secp256r1`, `ec-secp384r1`, or `ec-secp521r1`.
option 3 (required)	URL and listening port of the remote EST responder.
option 4 (optional)	Server certificate subject in the certificate enroll request. Separate fields by a comma (,).
option 5 (optional)	Subject Alternative Name (SAN). This can be an FQDN and/or IP. Use DNS:<FQDN>,IP:<IP_address> for example. If the issuing CA does not support SAN, this option will be ignored. Separate fields by a comma (,).
option 6 (optional)	HTTP authentication username.
option 7 (optional)	HTTP authentication password.
option 8 (optional)	CA identifier.
option 9 (optional)	CA certificate used to verify the remote EST responder server certificate and certificates issued by a remote PKI.
option 10 (optional)	Password for the private key.
option 11 (optional)	Client certificate.
option 12 (optional)	Source IP for communications to the CA server.
option 13 (optional)	TLS-SRP username.
option 14 (optional)	TLS-SRP password.

Example 1: enrolling for a new FortiGate server certificate with EST

To enroll for a new FortiGate server certificate with EST:

1. Verify that the FortiGate can communicate with remote EST responder (testrfc7030.com):

```
# execute ping testrfc7030.com
PING testrfc7030.com (54.70.32.33): 56 data bytes
64 bytes from 54.70.32.33: icmp_seq=0 ttl=31 time=13.6 ms
64 bytes from 54.70.32.33: icmp_seq=1 ttl=31 time=19.1 ms
64 bytes from 54.70.32.33: icmp_seq=2 ttl=31 time=16.5 ms
^C
--- testrfc7030.com ping statistics ---
```

```
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 13.6/16.4/19.1 ms
```

2. Start running debugs to track the progress of the enrollment:

```
# diagnose debug application est -1
# diagnose debug enable
```

3. Create a new server CSR file locally and send it to the remote EST responder:

```
# execute vpn certificate local generate est est-test101 ec-secp256r1
https://testrfc7030.com:8443 CN=firewall-portal1,DC=local,DC=COM DNS:firewall-
portal1.local.ca,IP:172.18.60.184 estuser estpwd G_CA_Cert_1
```

The CA certificate (G_CA_Cert_1) is used to verify the remote EST responder server certificate and certificates issued by a remote PKI.

testrfc7030.com is a self-signed CA, which by default is not in the local trusted root store and must be imported prior to enrollment.

If the CA that issues the server certificate is not in the local root store, an error would appear in the debug messages:

```
# diagnose debug application est -1
# diagnose debug enable
...
[1795] est_curl_req: Error buf: SSL certificate problem: self-signed
certificate in certificate chain,
[2402] est_simple_enroll: Failed to get ca certs: -1.
...
```

4. If the enrollment was successful, in a few seconds, a Done message appears. Verify the debugs to view the enrollment process.
   a. The remote CA's certificate is retrieved and stored locally in the EST configuration after being verified with the CA in the trusted root store:

```
[1962] __est_curl_set_auth: trace
[2046] __est_curl_set_auth: HTTP Authentication username is set
[2050] __est_curl_set_auth: HTTP Authentication password is set
[2075] __est_get_ca_certs: ============STARTED============
[1728] est_curl_req: URL: https://testrfc7030.com:8443/.well-known/est/cacerts
[1776] est_curl_req: HTTP GET
[143] __curl_ssl_ctx_finalizer: global CAs are loaded.
[165] __curl_ssl_ctx_finalizer: SSL_CTX ex data is set.
[1651] curl_header_debug_func: Header received:HTTP/1.1 200 OK
```

   b. The debug displays the CA used by the remote EST responder:

```
[1191] save_pkcs7_certs: Saving pkcs7 response
[505] est_print_pkcs7: Certs: (1 in total)
[507] est_print_pkcs7: Cert 1:
[427] est_print_x509:         Version: 3 (0x2)
```

```
        Serial Number:
            ab:e8:32:e1:f6:6a:6b:43
        Issuer: CN=estExampleCA
        Subject: CN=estExampleCA
        X509v3 extensions:
            X509v3 Basic Constraints:
                CA:TRUE
            X509v3 Subject Key Identifier:
                1A:DF:39:84:C2:56:E6:6C:CF:2A:B4:26:A5:FD:0C:D2:43:F5:3D:3E

[1220] save_pkcs7_certs: Received 1 certs
[1228] save_pkcs7_certs: Saving cert(s):
        is_global:1
        est_url:https://testrfc7030.com:8443
        source_ip:NULL
        ca_identifier:NULL
```

c. The CA certificate is imported. FortiOS sends a query to learn about the attributes supported by the CA in the certificate request and will then create the CSR accordingly:

```
[1288] save_pkcs7_certs: CA certs imported!
[2101] __est_get_csr_attrs: ============STARTED============
[1728] est_curl_req: URL: https://testrfc7030.com:8443/.well-known/est/csrattrs

[1474] decode_csrattrs_callback: Object: 1.3.6.1.1.1.1.22 undefined
[1474] decode_csrattrs_callback: Object: 1.2.840.113549.1.9.1 emailAddress
[1474] decode_csrattrs_callback: Object: 1.3.132.0.34 secp384r1
[1474] decode_csrattrs_callback: Object: 2.16.840.1.101.3.4.2.2 sha384
```

d. The CSR information is generated, which is sent to the remote EST responder:

```
        est_ctx: is_global:1
        vfid:0
        svr_original_url:https://testrfc7030.com:8443
        svr_hostinfo:Exists
        ca_identifier:(null)
        http_username:estuser
        http_password:*
        clt_cert:(null)
        svr_cert:(null)
        srp_username:(null)
        srp_password:(null)
        source_ip:(null)
        need_pop:0
```

```
        newcert_name:est-test101
        passwd:(null)
        rsa_keysize:0
        ec_curvename:secp256r1
        subject:CN=firewall-portal1,DC=local,DC=COM
        sub_alt_name:DNS:firewall-portal1.local.ca,IP:172.18.60.184
        svr_cert_x509:NULL
        csr_attrs:Exists
        csr:NULL
        pkey:NULL
        header_ptr:NULL
        tmp_p10:NULL
[2259] __est_simple_enroll: ============STARTED============
```

e. The CSR is sent to the EST responder:

```
[1728] est_curl_req: URL: https://testrfc7030.com:8443/.well-known/est/simpleenroll
[1753] est_curl_req: HTTP POST
[1651] curl_header_debug_func: Header received:HTTP/1.1 200 OK
[1651] curl_header_debug_func: Header received:Status: 200 OK
[1651] curl_header_debug_func: Header received:Content-Type: application/pkcs7-mime;
smime-type=certs-only
[1651] curl_header_debug_func: Header received:Content-Transfer-Encoding: base64
[1651] curl_header_debug_func: Header received:Content-Length: 585
[1651] curl_header_debug_func: Header received:
```

f. The CA issues the certificate and sends it back in a PKCS #7 structure:

```
[1787] est_curl_req: Response 200
[1788] est_curl_req:
Buffer:MIIBqwYJKoZIhvcNAQcCoIIBnDCCAZgCAQExADALBgkqhkiG9w0BBwGgggGAMIIB
fDCCASOgAwIBAgIDB0aXMAoGCCqGSM49BAMCMBcxFTATBgNVBAMTDGVzdEV4YW1w
...
```

g. The FortiGate decodes and displays the attributes of the certificate, then saves the certificate:

```
[1191] save_pkcs7_certs: Saving pkcs7 response
[505] est_print_pkcs7: Certs: (1 in total)
[507] est_print_pkcs7: Cert 1:

[2408] est_simple_enroll: POST ret:0
[592] est_ctx_clear_tmp_data: trace
Done.
```

Example 2: automatically renewing a FortiGate server certificate with EST

When the time for certificate renewal is up, the FortiGate will use the existing EST parameters to perform an automatic renewal. This example demonstrates the renewal process through debugs.

To automatically renew a FortiGate server certificate with EST:

1. Verify the current local certificate configuration:

```
config vpn certificate local
(local) # get est-test101
name                : est-test101
password            : *
comments            :
private-key         : *
certificate         :
        Subject:     CN = firewall-portal1
        Issuer:      CN = estExampleCA
        Valid from:  2023-04-06 22:37:34  GMT
        Valid to:    2024-04-05 22:37:34  GMT
```

```
        Fingerprint: AE:67:11:CF:7D:F9:57:A4:09:8B:55:0A:F1:B1:7A:CF
...
state               : OK
range               : global
source              : user
source-ip           : 0.0.0.0
ike-localid-type    : asn1dn
enroll-protocol     : est
est-server          : https://testrfc7030.com:8443
est-ca-id           :
est-http-username   : estuser
est-http-password   : *
est-client-cert     :
est-server-cert     :
est-srp-username    :
est-srp-password    :
auto-regenerate-days: 0
auto-regenerate-days-warning: 0
```

Note that the current `Valid to` date and time is `2024-04-05 22:37:34 GMT`, which is one year from the issue date.

2. Start running debugs to track the progress of the renewal:

```
# diagnose debug application est -1
# diagnose debug enable
```

3. For demonstration purposes, update the `auto-regenerate-days` setting to 364 days to trigger the automatic renewal on the FortiGate:

```
config vpn certificate local
    edit est-test101
        set auto-regenerate-days 364
    next
end
```

4. Verify the debugs to confirm that the certificate was renewed.
   a. The FortiGate uses the content of the current certificate to create a new CSR. User credentials used for the initial enrollment are stored in local certificate configuration, but they are not used for renewal:

```
[1024] reconstruct_est_ctx: Reconstruction succeeded
est_ctx:        is_global:1
        vfid:0
        svr_original_url:https://testrfc7030.com:8443
        svr_hostinfo:NULL
        ca_identifier:
        http_username:estuser
        http_password:*
        clt_cert:
        svr_cert:
        srp_username:
        srp_password:
```

```
        source_ip:(null)
        need_pop:0
        newcert_name:est-test101
        passwd:f51da8548af5fef820edfe6267b0c178e76f7c3eae40ee0900318fc77ab6bd
        rsa_keysize:0
        ec_curvename:(null)
        subject:(null)
        sub_alt_name:(null)
        svr_cert_x509:NULL
        csr_attrs:NULL
        csr:NULL
        pkey:NULL
        header_ptr:NULL
        tmp_p10:NULL
```

b. The FortiGate sends the current server certificate for authentication/authorization and not the username/password used for initial enrollment:

```
[2453] est_simple_reenroll: Try to use est-test101 as client cert to authenticate
[1962] __est_curl_set_auth: trace
[2011] __est_curl_set_auth: Warning: cert est-test101 may not have the correct key usage
for TLS client authentication

[1474] decode_csrattrs_callback: Object: 2.16.840.1.101.3.4.2.2 sha384
est_ctx:        is_global:1
        vfid:0
        svr_original_url:https://testrfc7030.com:8443
        svr_hostinfo:Exists
        ca_identifier:
        http_username:estuser
        http_password:*
        clt_cert:est-test101
        svr_cert:
        srp_username:
        srp_password:
        source_ip:(null)
        need_pop:0
        newcert_name:est-test101
        passwd:f51da8548af5fef820edfe6267b0c178e76f7c3eae40ee0900318fc77ab6bd
        rsa_keysize:0
        ec_curvename:(null)
        subject:(null)
        sub_alt_name:(null)
        svr_cert_x509:NULL
```

```
        csr_attrs:Exists
        csr:NULL
        pkey:NULL
        header_ptr:NULL
        tmp_p10:NULL
[2274] __est_simple_reenroll: ============STARTED============
```

c. The CSR for renewal is successfully generated:

```
[965] est_generate_csr_from_cert: Successfully generated CSR for est-test101
[2200] __est_simple_post: Data to be posted:

            X509v3 Authority Key Identifier:
                1A:DF:39:84:C2:56:E6:6C:CF:2A:B4:26:A5:FD:0C:D2:43:F5:3D:3E

[827] est_cmdb_update_cert: Cert est-test101 updated in CMDB
[1276] save_pkcs7_certs: The cert is saved!
[592] est_ctx_clear_tmp_data: trace
[2477] est_simple_reenroll: POST ret:0
[592] est_ctx_clear_tmp_data: trace
```

5. Verify the renewed local certificate configuration:

```
config vpn certificate local
(local) # get est-test101
name                : est-test101
password            : *
comments            :
private-key         : *
certificate         :
        Subject:     CN = firewall-portal1
        Issuer:      CN = estExampleCA
        Valid from:  2023-04-06 22:55:09  GMT
        Valid to:    2024-04-05 22:55:09  GMT
        Fingerprint: D9:51:6C:EF:04:E9:79:8D:A0:EE:10:23:4A:F4:46:B7
        Root CA:     No
        Version:     3
        Serial Num:
                07:46:a5
        Extensions:
                Name:     X509v3 Basic Constraints
                Critical: no
                Content:
```

Note that the `Valid to` date and time is now `2024-04-05 22:55:09 GMT`.

Example 3: manually regenerating a local certificate with EST

Note that manually regenerating the certificate will not generate a new server key pair.

To manually regenerate a local certificate with EST:

1. Run the following command:

```
# execute vpn certificate local generate est est-test101
Certificate 'est-test101' already exists, re-generate will ignore all the options you have
provided.
```

```
Are you sure to re-generate the certificate?
Do you want to continue? (y/n) y
```

2. Verify the debugs to confirm that the certificate was generated:

```
# diagnose debug application est -1
# diagnose debug enable
...
[1024] reconstruct_est_ctx: Reconstruction succeeded
est_ctx:        is_global:1
        vfid:0
        svr_original_url:https://testrfc7030.com:8443
        svr_hostinfo:NULL
        ca_identifier:
        http_username:estuser
        http_password:*
        clt_cert:
        svr_cert:
        srp_username:
        srp_password:
        source_ip:(null)
        need_pop:0
        newcert_name:est-test101
        passwd:f51da8548af5fef820edfe6267b0c178e76f7c3eae40ee0900318fc77ab6bd
        rsa_keysize:0
        ec_curvename:(null)
        subject:(null)
        sub_alt_name:(null)
        svr_cert_x509:NULL
        csr_attrs:NULL
        csr:NULL
        pkey:NULL
        header_ptr:NULL
        tmp_p10:NULL
[2453] est_simple_reenroll: Try to use est-test101 as client cert to authenticate
[1962] __est_curl_set_auth: trace
...
```

3. Once the certificate is saved, verify the local certificate configuration:

```
config vpn certificate local
(local) # get est-test101
name                : est-test101
password            : *
comments            :
private-key         : *
certificate         :
        Subject:     CN = firewall-portal1
        Issuer:      CN = estExampleCA
        Valid from:  2023-04-13 17:23:40  GMT
        Valid to:    2024-04-12 17:23:40  GMT
        Fingerprint: 4A:96:E1:73:6D:D3:64:FE:A3:A8:28:56:1D:39:05:37
```

```
        Root CA:     No
        Version:     3
        Serial Num:
                07:47:02

BIOS-level signature and file integrity checking

The BIOS-level signature and integrity checking includes several checks that occur during different stages.

Stage	Checks
BIOS-level signature and integrity check during file upload	Dually-signed images such as the firmware image, AV engine file and IPS engine file are verified during file upload while FortiOS is running.
BIOS-level signature and integrity check during the boot process	Dually-signed images such as the firmware image, AV engine file and IPS engine file are verified during the boot process before the kernel is mounted.
BIOS-level file integrity check during bootup as files are mounted	Signed hashes of important files related to the kernel, filesystems and AV/IPS engines and executables are verified during bootup as they are mounted and loaded into user space.

Each FortiOS GA firmware image, AV engine file, and IPS engine file are dually-signed by the Fortinet CA and a third-party CA.

Signature checking occurs when the FortiOS firmware, AV, and IPS engine files are uploaded. This allows the FortiGate to either warn users of potential risks involved with uploading an unauthenticated file, or block the file upload depending on the BIOS security level.

During the boot process before the kernel is loaded, the BIOS also verifies that each file matches their secure hash as indicated by their certificates. Users are warned when there is a failed integrity check, and the system may be prevented from booting depending on the severity and the BIOS security level.

Once the signature check passes, important files are extracted, mounted and loaded into user space during the bootup. All the important files are verified against their signed hashes to validate the integrity of the files before they can be mounted or loaded into user space. The hash file containing hashes of all executables and shared libraries is also verified to ensure the integrity of the file before the individual hashes are loaded into memory.

When the system is started, real-time protection kicks in. See Real-time file system integrity checking on page 3648 for more details.

BIOS-level signature and integrity check on firmware images

The outcome of the signature and integrity check during file upload and boot process depends on the security level configured in BIOS and the certificate authority that signed the file.

The following table summarizes the use cases and the potential outcome based on the security level.

Use case	Certificate signed by		Outcome based on security level	
	Fortinet CA	Third-party CA	Level High	Level Low
GA-Certified (GA firmware, Beta firmware, Special Technical Support final builds)	Yes	Yes	Accept	Accept
Non-GA certified (Special builds: Special Technical Support and NPI quick builds)	Yes	No	Warning	Accept
Interim and Dev builds, or unknown build	No	Yes or No	Reject	Warning

The security levels on the BIOS are:

FortiOS level	Behavior
High	FortiOS and BIOS only accept certified images.
Low	FortiOS and BIOS only accept certified images without a warning and un-certified images with a warning

On FortiGates without supported BIOS security levels, the device acts like security level High. For example, on a FortiGate-VM that does not have BIOS, the security level is defaulted to level High.

Platforms with old BIOS versions will support security levels 0, 1, and 2, while FortiOS will support levels High and Low. BIOS level 2 will correspond to the behaviors in Level High, and BIOS level 0 and 1 will correspond to behaviors in Level Low.

Security levels can be verified using the command `get system status`.

Examples of BIOS-level signature and integrity check during file upload

The following examples outline the different use cases when upgrading firmware and AV files on a FortiGate model that supports BIOS security levels, and a FortiGate model that does not support BIOS security levels.

For more information, see the Firmware & Registration on page 3222 section and Manual updates on page 3569.

Upgrading on a device with BIOS security levels

The following use cases are applicable when upgrading firmware and AV files on a FortiGate with BIOS security levels. Firmware is upgraded using the *System > Firmware & Registration* page, and AV files are upgraded using the *System > FortiGuard* page.

Security Level	Use case	Behavior
High	Load certified GA image in TFTP in boot menu	FortiGate boots up without warning messages.
High	Restore certified GA image in CLI	FortiGate boots up without warning messages.
High	Load certified non-GA image in TFTP in boot menu	FortiGate boots up with a warning message: `Warning: Non GA FOS image!`

High	Restore certified non-GA image in CLI	FortiGate displays a warning upon upload:
		`Warning: This firmware image is no GA certified!`
		FortiGate boots up with a warning message:
		`Warning: Non GA FOS image!`

High	Load un-certified interim image in TFTP in boot menu	The upload is blocked.
		A warning is displayed:
		`Checking image… This firmware image is not certified!`
		`Aborting firmware installation. Please power cycle.`
		`System halted.`

High	Restore un-certified interim image in CLI	The upload is blocked.
		A warning is displayed:
		`Image verification failed!`
		`…`

Low	Load certified GA or non-GA image in TFTP in boot menu	FortiGate boots up without warning messages.
Low	Restore certified GA or non-GA image in CLI	FortiGate boots up without warning messages.
Low	Load un-certified interim image in TFTP in boot menu	FortiGate outputs a warning message, but the upload is allowed to proceed: `Warning: Image decode failed. Try to continue under security level 1…`

Security Level	Use case	Behavior
		OK This firmware image is not certified! Save as Default firmware/Backup firmware/Run image without saving [D/B/R]? After boot up: System file integrity init check failed!
Low	Restore un-certified interim image in CLI	FortiGate outputs a warning message, but the upload is allowed to proceed: Image verification failed! ... Please continue only if you understand and are willing to accept the risks. Do you want to continue? (y/n) During boot up: Warning: FOS is not authenticated! Continue booting under security level 1... Initializing firewall... After boot up: System file integrity init check failed!

Upgrading on a device without BIOS security levels

The following use cases are applicable when upgrading firmware and AV files on a FortiGate without BIOS security levels. Firmware is upgraded using the *System > Firmware & Registration* page, and AV files are upgraded using the *System > FortiGuard* page. A FortiGate 60F is used in these examples and acts like it has security level 1.

When upgrading from 7.2.4 to 7.4.0 with a dually-signed firmware image, FortiOS verifies the certificates and accepts the image.

When upgrading from 7.2.4 to 7.4.0 with an unsigned firmware image in the GUI, FortiOS is unable to verify the certificates and the image fails verification. A warning dialog is displayed indicating that *This firmware failed signature validation*, but the user can click *Continue* to use the firmware.

When running 7.4.0 and uploading an unsigned AV engine file on the *System > FortiGuard* page, FortiOS is unable to verify the certificates and the file fails verification. A warning dialog is displayed indicating that *This package file has no signature for validation*, but the user can click *OK* to use the file.

BIOS-level file integrity check on important file-system and object files

During bootup, the kernel is required to verify the signed hashes of important file-system and object files. This prevents unauthorized changes to file-systems to be mounted and other unauthorized objects to be loaded into user space on bootup.

This verification does not depend on the security level of the device. The verification will always run when the firmware image type is a GA, SA, Beta, or Top3 image. If the signed hash verification fails, the system will halt during bootup.

Example

Upon detection of an altered IPS library file upon bootup, the system will halt as follows:

```
FortiGate-60F (18:03-01.27.2017)
Ver:05000012
Serial number: FGT60FTK1804xxxx
CPU: 1000MHz
Total RAM: 2 GB
Initializing boot device...
Initializing MAC... nplite#0
Please wait for OS to boot, or press any key to display configuration menu......
```

```
Booting OS...
Reading boot image... 2891501 bytes.
Initializing firewall...
fos_ima: System Integrity check failed....
CPU3: stopping
CPU1: stopping
CPU0: stopping
```

The exact display in the CLI may vary depending on the device model, security level, or reasons for the failed verification.

Real-time file system integrity checking

Real-time file system integrity checking has two main purposes:

- Prevent unauthorized modification of important binaries.
- Detect unauthorized binaries and prevent them from running.

How it works

A hash of all executable binary files and shared libraries are taken during image build time. The file containing these hashes, called the executable hash, is also hashed. This new hash is signed together with other important files like the FortiOS firmware, AV and IPS engine files.

When the FortiGate boots, the system performs a BIOS level integrity check on the firmware image, the AV engine file, and the IPS engine file. These files are signed by the process described in BIOS-level signature and file integrity checking on page 3644, and the BIOS verifies their signature against their certificates. The hash of the executable hash will also follow the BIOS-level signature and integrity check during the boot process, to prevent any unauthorized changes from being loaded.

Once these files are verified to be authentic, the BIOS can extract and boot the root filesystem and other executables and libraries, which then go through another file integrity check.

Once the file integrity checks passes, the corresponding hashes of every executable and shared library can be extracted from the executable hash and loaded into memory. The system is started and real-time protection begins.

The important executables and binaries are protected from write access and any modifications. It also blocks the kernel from loading any modules. Any unauthorized loading of modules is blocked. If violations are found, logs are triggered.

When each executable and shared library is initialized, it will be verified against its respective hashes to ensure integrity. If there is a hash mismatch when attempting to run a binary, that binary is blocked from running, and the system is rebooted. A log will be generated with ID 20234.

If there is a missing hash when attempting to run a binary, then the system is rebooted. A log will be generated with ID 20223.

The system also runs a periodic check to verify the integrity of important binaries and AV and IPS engines.

Log summary

The following logs are recorded when specific actions take place.

Log	Description
20230 - LOG_ID_SYS_ SECURITY_WRITE_VIOLATION 432	The root filesystem is read only. Any modification triggers this log.
20231 - LOG_ID_SYS_ SECURITY_HARDLINK_ VIOLATION 432	An attacker trying to replace symlink triggers this log.
20232 - LOG_ID_SYS_ SECURITY_LOAD_MODULE_ VIOLATION 433	Only the kernel can load modules. Any unusual loading of modules triggers this log.
20233 - LOG_ID_SYS_ SECURITY_FILE_HASH_ MISSING 434	File hashes are generated for legitimate files during bootup. If a hash cannot be found, the file may be suspicious as it could be a new routine inserted by an attacker. The binary is blocked.

Log	Description
20234 - LOG_ID_SYS_SECURITY_FILE_HASH_MISMATCH 434	File hashes are generated for legitimate files during bootup. If a hash does not match when the file is exercised, it is an indication that it could have been modified by an attacker. The system is rebooted.

Detection examples

Example 1: system reboots due to mismatched hash

```
fos_ima: fos_process_appraise 110: Executable File(/bin/node) doesn't match previous hash, it has
been changed
Restarting system.
…
fos_ima: fos_process_appraise 110: Executable File(/lib/libc.so.6) doesn't match previous hash, it
has been changed
Restarting system.
…
```

Logs similar to the following are captured:

```
date="2023-06-16" time="12:01:44" id=7245222014288399309 bid=471609558 dvid=6533 itime=1686909705
euid=3 epid=3 dsteuid=3 dstepid=3 logver=604132092 logid="0100020234" type="event"
subtype="system" level="alert" msg="Hash of executable file(/bin/init) doesn't match the
previous." logdesc="Integrity check of Run/loading Excutable File failed without Integrity
measure" severity="alert" eventtime=1686909705825483706 tz="+0200" devid="xxxxxxxxx" vd="root"
devname="xxxxxxxxx"

date="2023-06-15" time="09:57:54" id=7244819017507013700 bid=470303007 dvid=1431 itime=1686815875
euid=3 epid=3 dsteuid=3 dstepid=3 logver=604132092 logid="0100020234" type="event"
subtype="system" level="alert" msg="Hash of executable file(/lib/libc.so.6) doesn't match the
previous." logdesc="Integrity check of Run/loading Excutable File failed without Integrity
measure" severity="alert" eventtime=1686815874936267770 tz="+0200" devid=" xxxxxxxxx " vd="root"
devname=" xxxxxxxxx”
```

Example 2: suspected compromise due to an observed indicator of compromise (IoC)

```
fos_ima: fos_process_appraise 99: Suspicous Executable File(/data2/libcrashpad.so) is missing hash
…
fos_ima: fos_process_appraise 99: Suspicous Executable File(/data2/flatkc_info) is missing hash
…
```

No logs are found.

Corrective action

In the previous examples where a mismatched or missing hash occurs, alert technical support straight away so that they may gather information to start a forensic analysis with our internal PSIRT team. There are two

possible outcomes:

1. The firewall is reporting a false positive, in which a bug causes a mismatched or missing hash.
   Once verified by technical support, the corrective action may to be upgrade to a newer build where the bug is fixed
2. An actual compromise has occurred, or is occurring.
   The system could be blocking an offending binary that causes the system to malfunction, or the system could reboot to protect itself from compromise.

In either case, contact technical support for further forensic analysis. If an IoC is detected and it is determined that the persistent threat resides on the FortiGate, a reflash and reload of the firmware may be recommended.

Unauthorized firmware modification attempt reporting

In the rare event that unauthorized modification is detected in the firmware, the system will immediately log and report the modification attempt to FortiGuard through a secure channel. Payloads are encrypted to ensure the security of the transferred information. Information about the attempted modification of firmware helps Fortinet Inc. proactively investigate the incident and protect future malicious attempts at compromising the system.

After reporting the modification attempt, the FortiGate real-time file system integrity checking feature continues with the required actions based on the assessed threat. This may involve reverting the change and rebooting the firewall to mitigate the threat.

Example

This example demonstrates when an attempt to alter files in the 'bin' directory was made by a threat actor.

Captured log:

```
1: date=2024-02-16 time=18:29:15 eventtime=1708136955710925685 tz="-0800" logid="0100020230"
type="event" subtype="system" level="alert" vd="vd1" logdesc="Write Permission Violation" msg="
[Write Violation: try to write readonly file](/bin/lspci)."
```

The FortiGate sends an encrypted report to FortiGuard with information about the affected platform and the Modification Attempt such as:

- FortiGate serial number
- Model number
- FortiOS firmware
- Type of modification attempt (such as *Write violation*)
- File path (such as */bin/lspci*)
- File size
- Time of access and modification

Running a file system check automatically

There is an option in FortiOS to enable automatic file system checks if the FortiGate shuts down ungracefully.

By default, the automatic file system check is disabled. When an administrator logs in after an ungraceful shutdown, a warning message appears advising them to manually run a file system check. A warning also appears in the CLI:

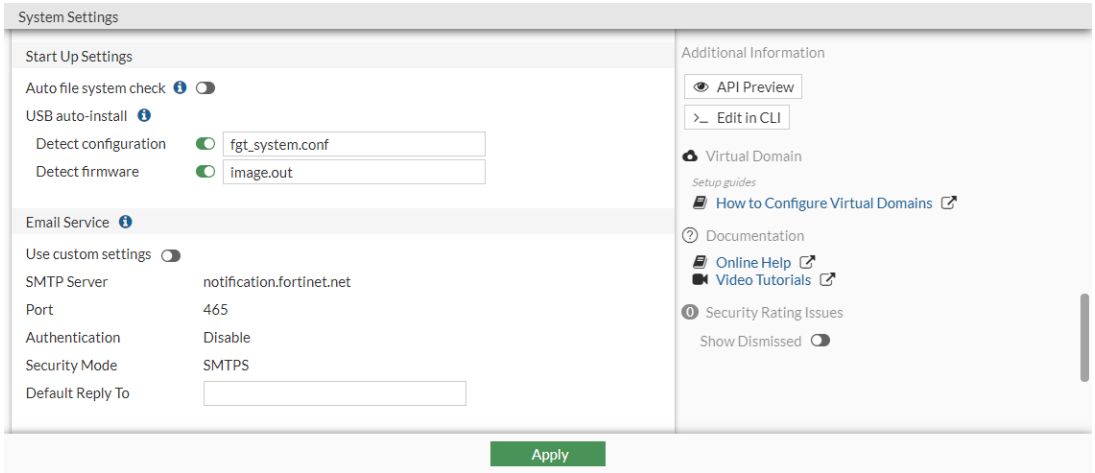
```
WARNING: File System Check Recommended! Unsafe reboot may have caused inconsistency in disk drive.
It is strongly recommended that you check file system consistency before proceeding.
Please run 'execute disk scan 17'
Note: The device will reboot and scan during startup. This may take up to an hour
```

Enabling automatic file system checks

You can enable automatic file system checks in both the GUI and CLI.

To enable automatic file system checks in the GUI:

1. Go to *System > Settings*.
2. In the *Start Up Settings* section, enable *Auto file system check*.
3. Click *Apply*.



To enable automatic file system checks using the CLI:

```
config system global
   set autorun-log-fsck enable
end
```

Built-in entropy source

FortiOS includes a built-in entropy source, which eliminates the need for a physical USB entropy token when booting up in FIPS mode on any platform. This enhancement continues to meet the requirements of FIPS 140-3 Certification by changing the source of entropy to CPU jitter entropy.

The `entropy-token` parameter under `config system fips-cc` is removed if the FortiGate is a SoC3, SoC4, or CP9 device.

To verify that jitter entropy is used:

1. Enable FIPS-CC mode, which will cause the FortiGate to reboot:

```
config system fips-cc
    set status enable
end

Please enter admin administrator password:********
Please re-enter admin administrator password:********

Warning: most configuration will be lost,
do you want to continue?(y/n) y
The system is going down NOW !!

Please stand by while rebooting the system.
Restarting system.
...
Reading boot image 2919154 bytes.

FortiGate VM unique certificate

To safeguard against certificate compromise, FortiGate VM and FortiAnalyzer VM use the same deployment model as FortiManager VM where the license file contains a unique certificate tied to the serial number of the virtual device.

A hardware appliance usually comes with a BIOS certificate with a unique serial number that identifies the hardware appliance. This built-in BIOS certificate is different from a firmware certificate. A firmware certificate is distributed in all appliances with the same firmware version.

Using a BIOS certificate with a built-in serial number provides a high trust level for the other side in X.509 authentication.

Since a VM appliance has no BIOS certificate, a signed VM license can provide an equivalent of a BIOS certificate. The VM license assigns a serial number in the BIOS equivalent certificate. This gives the certificate an abstract access ability, which is similar to a BIOS certificate with the same high trust level.

Sample configurations

Depending on the firmware version and VM license, the common name (CN) on the certificate will be configured differently.

License	Firmware	
	6.0	6.2 and later
6.0	CN = FortiGate	CN = FortiGate
6.2 and later	CN = FortiGate	CN = serial number

To view validated certificates:

1. Go to *System* > *Certificates*.
2. Double-click on a VM certificate. There are two VM certificates:

- *Fortinet_Factory*
- *Fortinet_Factory_Backup*

The *Certificate Detail Information* window displays.

Closed network VM license security

The CMS signature is verified immediately after the license is loaded. This ensures that the license is from FortiCare and confirms the authenticity of the license's contents and contracts, enhancing license integrity and customer trust.

If a valid offline license with a CMS signature is loaded:

```
FGVM2VTM22222222# get system status
Version: FortiGate-VM64-KVM v7.6.0,build9999,240524
First GA patch build date: 230509
Security Level: 0
Firmware Signature: not-certified
...
Serial-Number: FGVM2VTM22222222
License Status: Valid
License Expiration Date: 2024-08-02
VM Resources: 1 CPU/2 allowed, 1992 MB RAM
...
```

```
FGVM2VTM22222222# diagnose debug vm-print-license
SerialNumber: FGVM2VTM22222222
CreateDate: Wed Mar 20 18:47:49 2024
License expires: Fri Aug  2 00:00:00 2024
Expiry: 134
UUID: fdbf7aa999999999a9999aa578127e67
Default Contract: FMWR:6:20230802:20240804,ENHN:20:20230802:20240804,...,IPMC:6:20230802:20240804
Key: yes
Cert: yes

  subscription: 0
```

Encrypt configuration files in the eCryptfs file system

Configuration files are encrypted in the eCryptfs file system when the system reboots or shuts down, and are decrypted when the system boots up and has to load the configuration to CMDB.

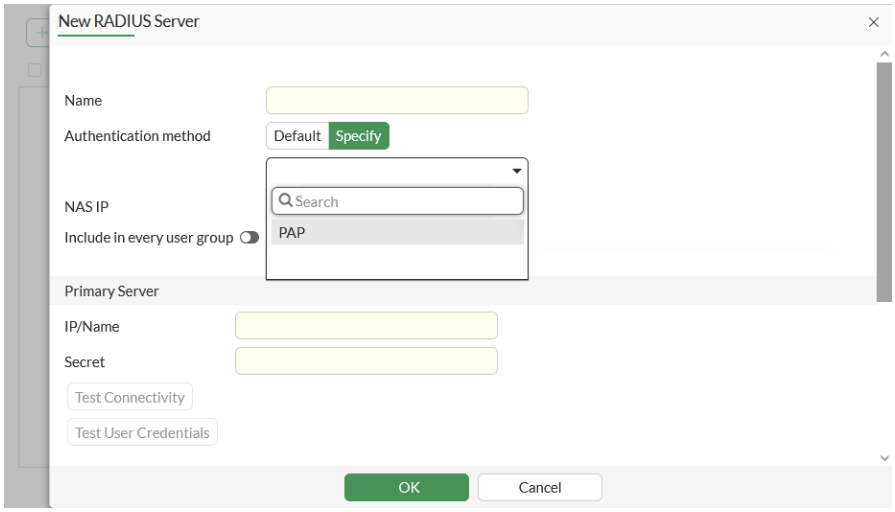
If the device supports TPM, the 32 byte eCryptfs encryption key is randomly generated and stored in the TPM, like the private-data-encryption key. If the device does not support TPM, the key is generated by the cryptographically secure pseudorandom number generator (CSPRNG) and stored on the disk. See Trusted platform module support on page 3289 and TPM support for FortiGate-VM on page 4285 for more information.

FIPS-CC mode and OpenSSL FIPS provider

When the device is in FIPS-CC mode, the OpenSSL FIPS provider is installed globally at startup, ensuring that any OpenSSL application is automatically compliant with FIPS regulations. An OpensSSL FIPS provider test (`ossl-fips-provider-test`) is added, and the self-test runs automatically at startup. The TLSv1.1 KDF self-test is removed.

The system defaults to the more secure TLSv1.2 and TLSv1.3 protocols instead of SSL3.0 and TLS1.1, and only Diffie-Hellman parameters of 2048 bits or higher are permitted, ensuring a robust security posture and aligning with industry standards.

When configuring a RADIUS server, *Authentication method* (`auth-type`) can only be set to *PAP* (password authentication protocol), and `transport-protocol` can only be set to `tls`.



To manually run the OpenSSL FIPS provider self-test:

```
# execute fips kat ossl-fips-provider-test
HMAC              : KAT_Integrity        : Pass
HMAC              : Module_Integrity     : Pass
SHA1              : KAT_Digest           : Pass
SHA2              : KAT_Digest           : Pass
SHA3              : KAT_Digest           : Pass
AES_GCM           : KAT_Cipher           : Pass
AES_ECB_Decrypt   : KAT_Cipher           : Pass
RSA               : KAT_Signature        : Pass
ECDSA             : KAT_Signature        : Pass
ECDSA             : KAT_Signature        : Pass
DSA               : KAT_Signature        : Pass
TLS13_KDF_EXTRACT : KAT_KDF              : Pass

```

Enhanced administrator password security

The PBKDF2 hashing scheme with randomized salts is now used to store system administrator passwords on the FortiGate to enhance security. Previously the SHA256 hashing algorithm was used.

With this change, a new command is available to maintain FortiOS downgrade:

```
config system password-policy
    set login-lockout-upon-downgrade {enable | disable}
end
```

`set login-lockout-upon-downgrade {enable | disable}`	Enable/disable system administrator login lockout after downgrade to FortiOS firmware that does not support safer passwords (default = disable).

	When disabled, system administrator passwords with SHA256 hash are kept after successfully converting to PBKDF2 hash. SHA256 hashed passwords are used after downgrading to a firmware version that does not support PBKDF2 hashed passwords. When enabled, system administrator passwords that are converted to PBKDF2 hash will immediately remove the SHA256 hashed password. Upon downgrading the FortiOS firmware to a lower version, where safer passwords are unsupported, the administrators will be locked out.

When creating a new administrative user in FortiOS 7.6.1 or later, the PBKDF2 hashing scheme is used to store the password. When displayed in the CLI, the password is encoded with a prefix of PB2:

```
# config  system  admin
(admin)# edit  admin2
new entry 'admin2' added
(admin2)# set accprofile  super_admin
(admin2)# set vdom  root
(admin2)# set password 123456
(admin2)# show
config system admin
    edit "admin2"
        set accprofile "super_admin"
        set vdom "root"
        set password ENC
PB20jOHUbfWEI7eKFTnKkE/qBgE5md70OjpXqiHhHTxo48GnIZshrIq67dT1IUouJSxgEZ6NYeAdAS9vLHpZGlcpBmtfUbfFOa
6qKaVAN+F9CM=
    next
end
```

Upgrade

To view system administrator passwords before and after upgrade to FortiOS 7.6.1:

1. Before upgrade to FortiOS 7.6.1 or later, view the encoded password. The encoded password shows a SH2 prefix because it was hashed with the SHA256 algorithm:

   ```
   # show  system  admin
   config system admin
       edit "admin1"
           set accprofile "prof_admin"
           set vdom "root"
           set password ENC SH2RHqyB8gaEKC10dzpgU6lZg7YSpnb21wWLFOtqzMlpyKJZyyq3ISFYPyIL/s=
       next
   end
   ```

2. Upgrade to FortiOS 7.6.1 or later. Each system administrator password hashed with SHA256 is stored on FortiGate until each system administrator successfully logs in to FortiOS.

   If a system administrator does not log in to FortiGate after upgrading to FortiOS 7.6.1 or later, their password remains saved as the SHA256 hashed password.
3. Log in to FortiOS. The password is converted to a PBKDF2 hashed password.

4. View the encoded password. The encoded password shows a PB2 prefix because it was hashed with the PBKDF2 algorithm:

```
FortiGate login: admin1
Password:
Verifying password...
$ show  system  admin
config system admin
    edit "admin1"
        set accprofile "prof_admin"
        set vdom "root"
        set password ENC
PB2a2X8D3DIt0gXbBXVdknLZb48BKrGTD50z//UrbpWAD5kpFdwqBKie0h8STxL6Db//wQ2ZWN/5FW3+DkX3+0nBE1RNbe
TKSVi18WcFmSPDQM=
    next
end
```

Downgrade

To support downgrading to an older version that does not support the PBKDF2 hashed password, by default, the old SHA256 hashed password is still stored in the system after being converted to PBKDF2. This is controlled by the following setting that is disabled by default:

```
config system password-policy
    set login-lockout-upon-downgrade disable
end
```

Downgrading will successfully restore the SHA256 hashed password and operations will continue uninterrupted.

If the `login-lockout-upon-downgrade` option is enabled:

```
config system password-policy
    set login-lockout-upon-downgrade enable
end
```

The SHA256 hashed password will be removed from the system as soon as it is converted to a PBKDF2 hashed password upon a successful login.

During a downgrade operation, the system will display the following warning:

```
# execute restore  image  ftp FGT_2601F-v7.6.0.F-build3401-FORTINET.out 172.16.106.105 username
password
This operation will replace the current firmware version and reboot the system!
Do you want to continue? (y/n)y
Please wait...
Connect to ftp server 172.16.106.105 ...
Get image from ftp server OK.
Verifying the signature of the firmware image.
Image verification OK!
Warning: Installing image v7.6.0 from v7.6.1 is not a recommended upgrade path. Continuing with
the upgrade may result in loss of configuration. Do you want to proceed?
```

```
Do you want to continue? (y/n)y
…
You are downgrading to a version that does not support safer passwords.
After downgrade, some administrative user (e.g., admin1) no longer will be able to login.
Do you want to continue? (y/n)
```

Administrators can choose to proceed or abort this downgrade.

Finally, if an administrator wants to restore the SHA256 hashed password for a downgrade, they can do the following:

1. Disable the `login-lockout-upon-downgrade` option.
2. Log out the current administrator.
3. For each system administrator, log in to the FortiGate to generate the SHA256 hashed password by running the SHA256 hashing algorithm.

After administrator passwords are converted to PBKDF2 hashed passwords, loading the config file to an older version that does not support safer passwords will lock out the administrators.

Configuration scripts

Configuration scripts are text files that contain CLI command sequences. They can be created using a text editor or copied from a CLI console, either manually or using the *Record CLI Script* function.

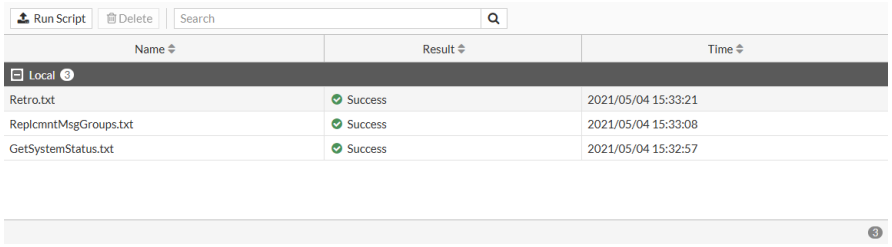
Scripts can be used to run the same task on multiple devices. For example, if your devices use the same security policies, you can enter or record the commands to create those policies in a script, and then run the script on each device. You could also create the policies in the GUI, and then copy and paste the CLI commands from the *CLI Console* using the *show* command.

If the FortiGate is managed by FortiManager, scripts can be uploaded to FortiManager and then run on any other FortiGates that are managed by that FortiManager. See Scripts in the FortiManager Administration Guide.

A comment line in a script starts with the number sign (#). Comments are not executed.

To run a script using the GUI:

1. Click on your username and select *Configuration* > *Scripts*.
2. Click *Run Script*.
3. Select the text file containing the script on your management computer, then click *OK*.
   The script runs immediately, and the *Script Execution History* table is updated, showing if the script ran successfully.



Workspace mode

Workspace mode allows administrators to make a batch of changes that are not implemented until the transaction is committed. Prior to committing, the changes can be reverted or edited as needed without impacting current operations.

When an object is edited in workspace mode it is locked, preventing other administrators from editing that object. A warning message will be shown to let the administrator know that the object is currently being configured in another transaction.

All administrators can use workspace mode; their permissions in workspace mode are the same as defined in their account profile.

A workspace mode transaction times out after five minutes if there is no activity. When a transaction times out, all changes are discarded. A warning message will be shown to let the administrator know that a timeout is imminent, or has already happened:

```
config transaction id=1 will expire in 30 seconds
config transaction id=1 will expire in 20 seconds
config transaction id=1 will expire in 10 seconds
config transaction id=1 has expired
```

The following commands are not changeable in a workspace transaction:

```
config system console
config system resource-limits
config system elbc
config system global
   set split-port
   set vdom-admin
   set management-vdom
   set wireless-mode
   set internal-switch-mode
end
config system settings
   set opmode
end
config system npu
config system np6
config system wireless
   set mode
end
config system vdom-property
config system storage
```

The `execute batch` command cannot be used in or to start workspace mode.

To use workspace mode:

1. Start workspace mode:
   ```
   execute config-transaction
   ```
   Once in workspace mode, the administrator can make configuration changes, all of which are made in a local CLI process that is not viewable by other processes.
2. Commit configuration changes:
   ```
   execute config-transaction commit
   ```
   After performing the commit, the changes are available for all other processes, and are also made in the kernel.
3. Abort configuration changes:
   ```
   execute config-transaction abort
   ```
   If changes are aborted, no changes are made to the current configuration or the kernel.

Diagnose commands

```
diagnose sys config-transaction show txn-meta
```

Show config transaction meta information. For example:

```
# diagnose sys config-transaction show txn-meta
txn_next_id=8, txn_nr=2
```

```
diagnose sys config-transaction show txn-info
```

Show config transaction information. For example:

```
# diagnose sys config-transaction show txn-info
current_jiffies=680372

txn_id=6, expire_jiffies=706104, clicmd_fpath='/dev/cmdb/txn/6_EiLl9G.conf'
txn_id=7, expire_jiffies=707427, clicmd_fpath='/dev/cmdb/txn/7_UXK6wY.conf'
```

```
diagnose sys config-transaction show txn-entity
```

Show config transaction entity. For example:

```
# diagnose sys config-transaction show txn-entity
vd='global', cli-node-oid=37(system.vdom), txn_id=7. location: fileid=0, storeid=0, pgnr=0,
      pgidx=0
vd='global', cli-node-oid=46(system.interface), txn_id=7. location: fileid=3, storeid=0,
      pgnr=0, pgidx=0
```

```
diagnose sys config-transaction show txn-lock
```

Show transaction lock status. For example:

```
# diagnose sys config-transaction show txn-lock
type=-1, refcnt=0, value=256, pid=128
```

```
diagnose sys config-transaction status
```

Show the transaction status in the current CLI.

Custom languages

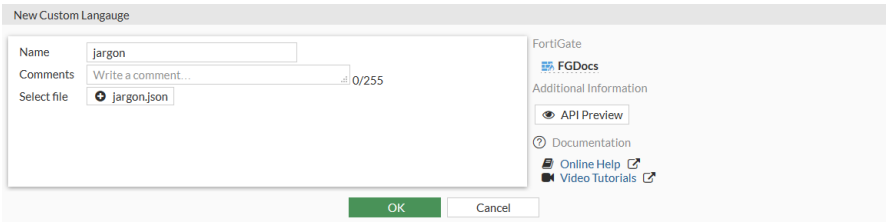
Custom languages can be uploaded and used for SSL VPN web portals. Custom languages must be enabled before they can be added in the GUI.

To enable custom languages:

```
config system global
    set gui-custom-language enable
end
```

To configure a custom language in the GUI:

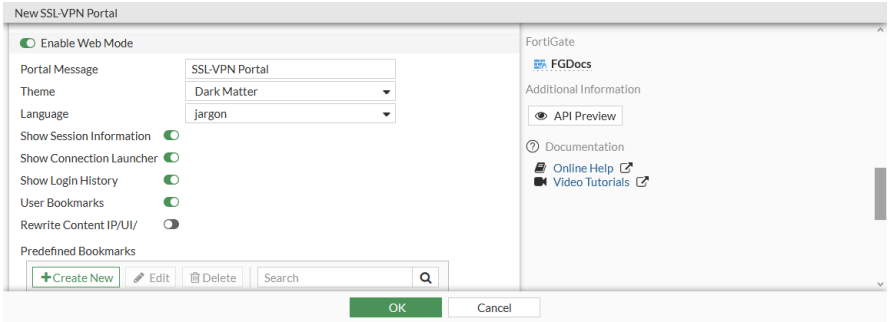
1. Go to *System* > *Custom Languages* and click *Create New*.
2. Enter the name of the language.
3. Optionally, enter a comment.
4. Click *Upload* and upload the language JSON file from your management computer.



5. Click *OK*.

To configure a language in an SSL VPN web portal in the GUI:

1. Go to *VPN* > *SSL-VPN Portals*.
2. Edit an existing portal, or click *Create New* to create a new one.
3. Enable *Enable Web Mode*, then select the language from the *Language* field.



4. Click *OK*.

To configure a custom language in the CLI:

```
config system custom-language
    edit <language>
        set filename <file>
    next
end
```

To configure a language in an SSL VPN web portal in the GUI:

```
config vpn ssl web portal
    edit <portal>
        set web-mode enable
        set custom-lang <language>
    next
end
```

RAID

Most FortiGate devices with multiple disk drives (SSD or HHD) can be configured to use RAID.

Enabling or disabling RAID, and changing the RAID level, erases all data on the log disk and reboots the device.

To verify that the FortiGate has multiple disks:

- List disk devices and partitions:

```
# execute disk list

Disk SSD1 ref: 255 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sda
  partition ref: 1 220.1GiB, 219.0GiB free mounted: Y label: LOGUSEDXA707476A dev: /dev/sda1
start: 2048

Disk SSD2 ref: 16 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sdb
  partition ref: 17 62.7GiB, 62.4GiB free mounted: Y label: WANOPTXX1FEBBFA1 dev: /dev/sdb1
start: 2048
  partition ref: 18 63.7GiB, 63.7GiB free mounted: N label: dev: /dev/sdb2 start: 133625856
  partition ref: 19 85.0GiB, 85.0GiB free mounted: N label: dev: /dev/sdb3 start: 267249664
```

- Display information about all of the disks:

```
# diagnose hardware deviceinfo disk

Disk SSD1 ref: 255 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sda
  partition ref: 1 220.1GiB, 219.0GiB free mounted: Y label: LOGUSEDXA707476A dev: /dev/sda1
```

```
start: 2048

Disk SSD2 ref: 16 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sdb
  partition ref: 17 62.7GiB, 62.4GiB free mounted: Y label: WANOPTXX1FEBBFA1 dev: /dev/sdb1
start: 2048
  partition ref: 18 63.7GiB, 63.7GiB free mounted: N label: dev: /dev/sdb2 start: 133625856
  partition ref: 19 85.0GiB, 85.0GiB free mounted: N label: dev: /dev/sdb3 start: 267249664

Disk SYSTEM(boot) 14.9GiB type: SSD [ATA 16GB SATA Flash] dev: /dev/sdc
  partition 247.0MiB, 155.0MiB free mounted: N label: dev: /dev/sdc1(boot) start: 1
  partition 247.0MiB, 154.0MiB free mounted: Y label: dev: /dev/sdc2(boot) start: 524289
  partition ref: 35 14.2GiB, 14.0GiB free mounted: Y label: dev: /dev/sdc3 start: 1048577

Disk USB-6(user-usb) ref: 48 28.6GiB type: USB [SanDisk Ultra] dev: /dev/sdd <<<<<<===this
info for usb disk because i have usb disk on FGT301E
  partition ref: 49 28.6GiB, 28.6GiB free mounted: Y label: dev: /dev/sdd1 start: 0

Total available disks: 4
Max SSD disks: 2 Available storage disks: 2
```

To check the RAID status:

- RAID enabled:

```
# execute disk raid status
RAID Level: Raid-1
RAID Status: OK (Background-Synchronizing) (9%)
RAID Size: 239GB

Disk 1: OK Used 228GB
Disk 2: OK Used 228GB
```

- RAID disabled:

```
# execute disk raid status
RAID Level: Unavailable
RAID Status: Unavailable
RAID Size: 0GB

Disk 1: OK Not-Used 228GB
Disk 2: OK Not-Used 228GB
```

To enable RAID:

```
# execute disk raid enable
This will erase all data on the log disk, and system will reboot!
Do you want to continue? (y/n)y

Dependent storage SSD2 removed.
Dependent storage SSD1 removed.
Raid-0 created with 2 disks.
```

```
Performing raid on the requested disk(s) and rebooting, please wait.. .

Configuring raid...
- unmounting /data2 : ok
- unmounting /var/log : ok
- unmounting /usb : ok
- unmounting /var/storage/SSD2-WANOPTXX0EA0EF17 : ok

Formatting the disk...
- unmounting /usb : ok
Formatting /dev/md0 ... done

The system is going down NOW !!

Please stand by while rebooting the system.
Restarting system.
```

To rebuild the RAID:

```
# execute disk raid rebuild
```

To rebuild the RAID to another level:

1. Check the supported RAID levels:

```
# execute disk raid rebuild-level
<RAID level> supported: Raid-0, Raid-1
```

2. Rebuild the RAID to the required level:

```
# execute disk raid rebuild-level Raid-1
This will erase all data on the log disk, and system will reboot!
Do you want to continue? (y/n)y

Dependent storage RAID removed.
Raid-1 created with 2 disks.

Performing raid on the requested disk(s) and rebooting, please wait...

Configuring raid...
- unmounting /data2 : ok
- unmounting /var/log : ok
- unmounting /usb : ok

Formatting the disk...
- unmounting /usb : ok
Formatting /dev/md0 ... done

The system is going down NOW !!
```

```
Please stand by while rebooting the system.
Restarting system.
```

To disable RAID:

```
# execute disk raid disable
This will erase all data on the log disk, and system will reboot!
Do you want to continue? (y/n)y

Dependent storage RAID removed.

Performing format on the requested disk(s) and rebooting, please wait...

Configuring raid...
- unmounting /data2 : ok
- unmounting /var/log : ok
- unmounting /usb : ok

System is starting...
```

FortiGate encryption algorithm cipher suites

FortiGates use SSL/TLS encryption for HTTPS and SSH administrative access, and SSL VPN remote access. When establishing an SSL/TLS or SSH connection, you can control the encryption level and the ciphers that are used in order to control the security level.

HTTPS access

HTTP administrative access encryption is controlled using the following commands:

```
config system global
    set strong-crypto {enable | disable}
    set admin-https-ssl-versions {tlsv1-1 tlsv1-2 tlsv1-3}
    set admin-https-ssl-ciphersuites {<cipher_1> ... <cipher_n>}
    set admin-https-ssl-banned-ciphers {<cipher_1> ... <cipher_n>}
end
```

When strong encryption is enabled, only TLS 1.2 and TLS 1.3 are allowed. If strong encryption is then disabled, TLS 1.1 has to be manually enabled.

Setting `admin-https-ssl-ciphersuites` controls which cipher suites are offered in TLS 1.3. TLS 1.2 and lower are not affected by this command. To disable all TLS 1.3 cipher suites, remove TLS1-3 from `admin-https-ssl-versions`.

Setting `admin-https-ssl-banned-ciphers` controls which cipher technologies will not be offered for TLS 1.2 and lower.

Specific cipher suites are supported by each TLS version:

TLS version	Supported cipher suites	
TLS 1.1[1]	ECDHE-RSA-AES256-SHA[1]	AES256-SHA[1]
	ECDHE-RSA-AES128-SHA[1]	AES128-SHA[1]
TLS 1.2	ECDHE-RSA-AES256-GCM-SHA384	AES256-GCM-SHA384[1]
	ECDHE-RSA-AES128-GCM-SHA256	AES128-GCM-SHA256[1]
	ECDHE-RSA-CHACHA20-POLY1305	AES256-SHA256
	ECDHE-RSA-AES256-SHA384	AES128-SHA256
	ECDHE-RSA-AES128-SHA256	AES256-SHA[1]
	ECDHE-RSA-AES256-SHA[1]	AES128-SHA[1]
	ECDHE-RSA-AES128-SHA[1]	
TLS 1.3	TLS-AES-128-GCM-SHA256	TLS-AES-128-CCM-8-SHA256
	TLS-AES-256-GCM-SHA384	TLS-CHACHA20-POLY1305-SHA256
	TLS-AES-128-CCM-SHA256	

[1] Disabled if strong encryption (`strong-crypto`) is enabled.

SSH access

SSH access encryption is controlled using the following command:

```
config system global
    set admin-ssh-v1 {enable | disable}
    set strong-crypto {enable | disable}
end
```

```
config system ssh-config
    set ssh-enc-algo <algo_1> [<algo_2> ... <algo_n>]
    set ssh-hsk-algo <algo_1> [<algo_2> ... <algo_n>]
    set ssh-kex-algo <algo_1> [<algo_2> ... <algo_n>]
    set ssh-mac-algo <algo_1> [<algo_2> ... <algo_n>]
end
```

The algorithms available when configuring `set ssh-enc-algo` are affected by `set strong-crypto` as follows:

Strong encryption setting	Supported ciphers	
Enabled	aes256-gcm@openssh.com	aes256-ctr
Disabled	chacha20-poly1305@openssh.com	aes128-ctr
	aes192-ctr	aes256-ctr
	arcfour256	arcfour128
	aes128-cbc	3des-cbc
	blowfish-cbc	cast128-cbc
	aes192-cbc	aes256-cbc
	arcfour	rijndael-cbc@lysator.liu.se
	aes128-gcm@openssh.com	aes256-gcm@openssh.com

The following options are available for the `ssh-hsk-algo` algorithm based on the strong encryption setting:

Strong encryption setting	Supported ciphers	
Enabled	ecdsa-sha2-nistp521	ecdsa-sha2-nistp384
	ecdsa-sha2-nistp256	rsa-sha2-256
	rsa-sha2-512	ssh-ed25519
Disabled	ssh-rsa	ecdsa-sha2-nistp521
	ecdsa-sha2-nistp384	ecdsa-sha2-nistp256
	rsa-sha2-256	rsa-sha2-512
	ssh-ed25519	

The following options are available for the `ssh-kex-algo` algorithm based on the strong encryption setting:

Strong encryption setting	Supported ciphers	
Enabled	diffie-hellman-group14-sha256	diffie-hellman-group16-sha512
	diffie-hellman-group18-sha512	diffie-hellman-group-exchange-sha256
	curve25519-sha256@libssh.org	ecdh-sha2-nistp256
	ecdh-sha2-nistp384	ecdh-sha2-nistp521
Disabled	diffie-hellman-group14-sha1	diffie-hellman-group14-sha256
	diffie-hellman-group16-sha512	diffie-hellman-group18-sha512
	diffie-hellman-group-exchange-sha1	diffie-hellman-group-exchange-sha256
	curve25519-sha256@libssh.org	ecdh-sha2-nistp256
	ecdh-sha2-nistp384	ecdh-sha2-nistp521

The following options are available for the `ssh-mac-algo` algorithm based on the strong encryption setting:

Strong encryption setting	Supported ciphers	
Enabled	hmac-sha2-256	hmac-sha2-256-etm@openssh.com
	hmac-sha2-512	hmac-sha2-512-etm@openssh.com
Disabled	hmac-md5	hmac-md5-etm@openssh.com
	hmac-md5-96	hmac-md5-96-etm@openssh.com
	hmac-sha1	hmac-sha1-etm@openssh.com
	hmac-sha2-256	hmac-sha2-256-etm@openssh.com
	hmac-sha2-512	hmac-sha2-512-etm@openssh.com
	hmac-ripemd160	hmac-ripemd160@openssh.com
	hmac-ripemd160-etm@openssh.com	umac-64@openssh.com
	umac-128@openssh.com	umac-64-etm@openssh.com
	umac-128-etm@openssh.com	

SSL VPN

For SSL VPN connections, the TLS versions and cipher suites are controlled using the following commands:

```
config vpn ssl setting
    set algorithm {high | medium | low}
    set ssl-max-proto-ver {tls1-0 | tls1-1 | tls1-2 | tls1-3}
    set ssl-min-proto-ver {tls1-0 | tls1-1 | tls1-2 | tls1-3}
    set ciphersuite {TLS-AES-128-GCM-SHA256 TLS-AES-256-GCM-SHA384 TLS-CHACHA20-POLY1305-SHA256
TLS-AES-128-CCM-SHA256 TLS-AES-128-CCM-8-SHA256}
end
```

Only cipher suites supported by TLS 1.3 can be set using the `set ciphersuite` command.

When the SSL VPN security level (`algorithm`) is set to high, only high levels are allowed. When it is set to medium, high and medium levels are allowed. When it is set to low, any level is allowed.

The strong encryption (`strong-crypto`) command has no effect on the SSL VPN encryption level or ciphers.

Specific cipher suites are supported by each TLS version:

TLS version	Supported cipher suites	
TLS 1.0	ECDHE-RSA-AES256-SHA	DHE-RSA-CAMELLIA128-SHA
	DHE-RSA-AES256-SHA	AES128-SHA
	DHE-RSA-CAMELLIA256-SHA	SEED-SHA[1]
	AES256-SHA	CAMELLIA128-SHA
	CAMELLIA256-SHA	ECDHE-RSA-DES-CBC3-SHA[1*]
	ECDHE-RSA-AES128-SHA	EDH-RSA-DES-CBC3-SHA[1*]
	DHE-RSA-AES128-SHA[1]	DES-CBC3-SHA[1*]
	DHE-RSA-SEED-SHA	
TLS 1.1	ECDHE-RSA-AES256-SHA	DHE-RSA-CAMELLIA128-SHA
	DHE-RSA-AES256-SHA	AES128-SHA
	DHE-RSA-CAMELLIA256-SHA	SEED-SHA[1]
	AES256-SHA	CAMELLIA128-SHA
	CAMELLIA256-SHA	ECDHE-RSA-DES-CBC3-SHA[1*]
	ECDHE-RSA-AES128-SHA	EDH-RSA-DES-CBC3-SHA[1*]
	DHE-RSA-AES128-SHA	DES-CBC3-SHA[1*]
	DHE-RSA-SEED-SHA[1]	

TLS version	Supported cipher suites	
TLS 1.2	ECDHE-RSA-AES256-GCM-SHA384	ECDHE-RSA-AES128-SHA
	ECDHE-RSA-AES256-SHA384	DHE-RSA-AES128-GCM-SHA256
	ECDHE-RSA-AES256-SHA	DHE-RSA-AES128-CCM8
	DHE-RSA-AES256-GCM-SHA384	DHE-RSA-AES128-CCM
	ECDHE-RSA-CHACHA20-POLY1305	AES128-CCM8
	DHE-RSA-CHACHA20-POLY1305	AES128-CCM
	DHE-RSA-AES256-CCM8	DHE-RSA-AES128-SHA256
	DHE-RSA-AES256-CCM	DHE-RSA-AES128-SHA
	DHE-RSA-AES256-SHA256	ECDHE-RSA-CAMELLIA128-SHA256
	DHE-RSA-AES256-SHA	DHE-RSA-CAMELLIA128-SHA256
	ECDHE-RSA-CAMELLIA256-SHA384	DHE-RSA-SEED-SHA[1]
	DHE-RSA-CAMELLIA256-SHA256	DHE-RSA-CAMELLIA128-SHA
	DHE-RSA-CAMELLIA256-SHA	AES128-GCM-SHA256
	AES256-GCM-SHA384	AES128-SHA256
	AES256-CCM8	AES128-SHA
	AES256-CCM	CAMELLIA128-SHA256
	AES256-SHA256	SEED-SHA[1]
	AES256-SHA	CAMELLIA128-SHA
	CAMELLIA256-SHA256	ARIA128-GCM-SHA256
	CAMELLIA256-SHA	DHE-RSA-ARIA128-GCM-SHA256
	ARIA256-GCM-SHA384	ECDHE-ARIA128-GCM-SHA256
	DHE-RSA-ARIA256-GCM-SHA384	ECDHE-RSA-AES256-GCM-SHA384
	ECDHE-ARIA256-GCM-SHA384	ECDHE-RSA-DES-CBC3-SHA[1*]
	ECDHE-RSA-AES128-GCM-SHA256	EDH-RSA-DES-CBC3-SHA[1*]
	ECDHE-RSA-AES128-SHA256	DES-CBC3-SHA[1*]
TLS 1.3	TLS_AES_256_GCM_SHA384	TLS_AES_128_CCM_SHA256
	TLS_CHACHA20_POLY1305_SHA256	TLS_AES_128_CCM_8_SHA256
	TLS_AES_128_GCM_SHA256	

[1] This cipher is not available when the SSL VPN security level (`algorithm`) is set to high.

[*] This cipher is not available when the SSL VPN security level (`algorithm`) is set to medium.

Additional features

Security hardening for other FortiOS features can also be achieved by managing the encryption level or ciphers. See SSL algorithm security level on page 3676 for more information about different levels of security.

An asterisk (*) represents the default values for each feature.

Some of these features are described next.

WAN optimization

For WAN optimization tunnel connections, the encryption algorithm is controlled using the following commands:

```
config wanopt settings
    set tunnel-ssl-algorithm {high* | medium | low}
end
```

Explicit FTP proxy

For explicit FTP proxy, the encryption algorithm is controlled using the following commands:

```
config ftp-proxy explicit
    set ssl-algorithm { high* | medium | low}
end
```

Explicit web proxy

For explicit web proxy, the encryption algorithm is controlled using the following commands:

```
config web-proxy explicit
    set ssl-algorithm {high | medium | low*}
end
```

SSL Server

For SSL server, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config firewall ssl-server
    edit <name>
        set ssl-algorithm {high* |medium | low}
        set ssl-max-version {tls-1.0* |tls-1.1 | tls-1.2 | tls-1.3}
        set ssl-min-version {tls-1.0 |tls-1.1 | tls-1.2 | tls-1.3*}
```

```
    next
end
```

VIP

For VIP, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config firewall vip
        set ssl-max-version {ssl-3.0|tls-1.1 | tls1-2 | tls-1.3* | client}
        set ssl-min-version {ssl-3.0|tls-1.1* | tls1-2 | tls-1.3 |client}
        set ssl-algorithm {high* | medium | low | custom}
        config ssl-cipher-suites
            edit <priority>
                set cipher {TLS-AES-128-GCM-SHA256 | TLS-AES-256-GCM-SHA384|...}
                set versions {option1}, {option2}, ...
            next
        end
        set ssl-server-max-version [ssl-3.0|tls-1.1 | tls1-2 | tls-1.3 | client*}
        set ssl-server-min-version [ssl-3.0|tls-1.1 | tls1-2 | tls-1.3 | client*}

        set ssl-server-algorithm {high | medium | low | custom | client* }
        config ssl-server-cipher-suites
            edit <priority>
                set cipher {TLS-AES-128-GCM-SHA256 | TLS-AES-256-GCM-SHA384|...}
                set versions {option1}, {option2}, ...
            next
        end
    next
end
```

The command `config ssl-cipher-suites` is available only under certain conditions:

- When `set type` is set to either `server-load-balance` or `access-proxy`
- When `set ssl-algorithm` is set to `custom`

Similarly, the command `config ssl-server-cipher-suites` is available only under certain conditions:

- When `set type` is set to `server-load-balance`
- When `set ssl-mode` is set to `full`
- When `set ssl-algorithm` is set to `custom`

VoIP

For VoIP, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config voip profile
      edit <name>
     config sip
        set ssl-algorithm {high* |medium | low}
```

```
        set ssl-max-version {ssl-3.0 | tls-1.0* |tls-1.1 | tls-1.2 | tls-1.3}
        set ssl-min-version {ssl-3.0 | tls-1.0 |tls-1.1 | tls-1.2 | tls-1.3*}
    next
end
```

SSL algorithm security level

Option	Description
high	High encryption. Allow only AES and ChaCha.
medium	Medium encryption. Allow AES, ChaCha, 3DES, and RC4.
low	Low encryption. Allow AES, ChaCha, 3DES, RC4, and DES.
*custom	Custom encryption. Use `ssl-server-cipher-suites` to select the cipher suites that are allowed.
*client	Use the same encryption algorithms for both client and server sessions.

The SSL algorithm security levels marked with an asterisk (*) are not supported across different FortiOS features.

Other Products

The security level of communication to and from FortiOS can be managed by controlling the encryption level and ciphers used. See Encryption algorithm security level on page 3678 for more information about different levels of security.

An asterisk (*) represents the default value for each product.

Some products that commonly interact with the FortiGate device are listed next.

syslog server

For syslog server, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config log syslogd setting
    set enc-algorithm {high-medium | high | low | disable*}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
end
config log syslogd override-setting
    set enc-algorithm {high-medium | high | low | disable*}
```

```
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
end
```

The command `ssl-min-proto-version` set to `default` means that the system global setting will be followed.

FortiCloud

For logging to FortiCloud, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config log fortiguard setting
    set enc-algorithm {high-medium | high* | low}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
end
```

FortiAnalyzer Cloud

For FortiAnalyzer Cloud, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config log fortianalyzer-cloud setting
    set enc-algorithm {high-medium | high* | low}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2 | TLSv1-3}
end
```

FortiAnalyzer

For FortiAnalyzer, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config log fortianalyzer setting
    set enc-algorithm {high-medium | high* | low}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2 | TLSv1-3}
end
config log fortianalyzer override-setting
    set enc-algorithm {high-medium | high* | low}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2 | TLSv1-3}
end
```

FortiSandbox

For FortiSandbox, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config system fortisandbox
    set enc-algorithm {default* | high | low}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
end
```

FortiManager

For central management, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config system central-management
    set enc-algorithm {default | high* | low}
end
```

Encryption algorithm security level

Option	Description
*high-medium/ default	SSL communication with high and medium encryption algorithms.
high	SSL communication with high encryption algorithm
low	SSL communication with low encryption algorithms.
*disable	Disable SSL communication.

Encryption algorithm security levels marked with an asterisk (*) are not supported across different products.

Conserve mode

Each FortiGate model has a specific amount of memory that is shared by all operations. If most or all of that memory is in use, system operations can be affected in unexpected ways. To control how FortiOS functions when the available memory is very low, FortiOS enters conserve mode. This causes functions, such as antivirus scanning, to change how they operate to reduce the functionality and conserve memory without compromising security.

Three memory thresholds can be configured:

```
config system global
    set memory-use-threshold-extreme <integer>
    set memory-use-threshold-green <integer>
    set memory-use-threshold-red <integer>
end
```

`memory-use-threshold-extreme <integer>`	The threshold at which memory usage is considered extreme and new sessions are dropped, in percent of total RAM (70 - 97, default = 95).
`memory-use-threshold-green <integer>`	The threshold at which memory usage forces the FortiGate to leave conserve mode, in percent of total RAM (70 - 97, default = 82).
`memory-use-threshold-red <integer>`	The threshold at which memory usage forces the FortiGate to enter conserve mode, in percent of total RAM (70 - 97, default = 88).

Proxy inspection in conserve mode

The FortiGate's proxy-based inspection behavior while in conserve mode is configured with the antivirus failopen command.

```
config system global
    set av-failopen {pass | off | one-shot}
end
```

`pass`	This is the default settings. Bypass the antivirus proxy and allow traffic to continue to its destination. Because traffic bypasses the proxy, security profiles that require the antivirus proxy are also bypassed. Security profiles that do not use the antivirus proxy continue to function normally. Use this setting when access is more important than security while the issue is resolved.
`off`	Force the FortiGate to stop all traffic that uses the antivirus proxy. New sessions are blocked, but active sessions continue to be processed normally unless they request more memory and are then terminated. If a security policy is configured to use antivirus scanning, then the traffic that it permits is blocked while in conserve mode. So, a policy with only IPS scanning enabled will continue normally, but a policy with both IPS and antivirus scanning is blocked because antivirus scanning requires the antivirus proxy. Use this setting when security is more important than access while the issue is resolved.
`one-shot`	Continue to bypass the antivirus proxy after the FortiGate is out of conserve mode, until the failopen setting is changed or the FortiGate is restarted.

Flow inspection in conserve mode

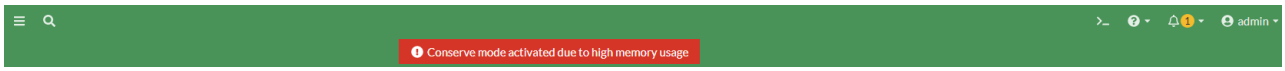
The FortiGate's flow-based inspection behavior while in conserve mode is configured with the IPS failopen command.

```
config ips global
    set fail-open {enable | disable}
end
```

- When disabled (default), the IPS engine drops all new sessions that require flow-based inspection.
- When enabled, the IPS engine does not perform any scans and allows new packets.

Diagnostics

When in conserve mode, FortiOS generates conserve mode log messages and SNMP traps, and a conserve mode banner is shown in the GUI.



To view current information about memory conservation status:

```
# diagnose hardware sysinfo conserve
memory conserve mode:                          on
total RAM:                                        997 MB
memory used:                                      735 MB   73% of total RAM
memory freeable:                                  173 MB   17% of total RAM
memory used + freeable threshold extreme:         947 MB   95% of total RAM
memory used threshold red:                        877 MB   88% of total RAM
memory used threshold green:                      817 MB   82% of total RAM
```

To view logs:

1. Go to *Log & Report* > *System Events* in the GUI.
2. If historical FortiView is enabled, select the *Logs* tab.
3. If the GUI is unresponsive due to high memory usage, making the logs inaccessible, they can be viewed in the CLI:

```
# execute log filter category 1
# execute log display
```

```
1: date=2022-11-02 time=16:58:37 eventtime=1667433517502192693 tz="-0700" logid="0100022011"
type="event" subtype="system" level="critical" vd="root" logdesc="Memory conserve mode
entered" service="kernel" conserve="on" total=997 MB used=707 MB red="877 MB" green="698 MB"
msg="Kernel enters memory conserve mode
```

To view the crash log in the CLI:

```
# diagnose debug crashlog read
```

```
1: 2022-10-27 14:22:36 service=kernel conserve=on total="997 MB" used="720 MB" red="877 MB"
2: 2022-10-27 14:22:36 green="817 MB" msg="Kernel enters memory conserve mode"
```

Using APIs

Administrators can use API calls to a FortiGate to:

- Retrieve, create, update, and delete configuration settings
- Retrieve system logs and statistics
- Perform basic administrative actions, such as a reboot or shut down through programming scripts.

Token-based authentication

FortiGate supports only token-based authentication for API calls. Token-based authentication requires the administrator to generate a token, which is then included in each API request for authentication. A token is automatically generated when a new API administrator is created in FortiOS.

Once the API administrator is created and the token displays, there is no way for the FortiGate to provide this token again. Ensure you record the token, and store it in a safe location; otherwise, you will have to generate a new token.

Creating the API administrator and generating the API token

When creating an API administrator, it is best practice to provide this account (and the associated token) with the minimum permissions required to complete the function. For example, if you only plan to use API calls to retrieve statistics or information from the FortiGate, the account should have read permissions.

The API administrator account used in this topic's examples has full permissions strictly to illustrate various call types and does not adhere to the preceding recommendation.

See REST API administrator on page 3196 for detailed steps to create a REST API administrator.

Best Practices

Using API tokens with a request header

The API token can be included in any REST API request in either the request header or URL parameter. For added security, it is strongly recommended to use API tokens in the request header or transition your applications to include the API token in the request header instead of the URL parameter.

To pass the API token in the request header, the user needs to explicitly add the following field to the request header:

```
Authorization: Bearer <YOUR-API-TOKEN>
```

Configuring security options when creating a REST API administrator

In addition to using API tokens in the request header, for added security when creating a new REST API administrator, one or more of the following fields should be configured, listed in order of configuration difficulty from easy to difficult:

- **Trusted Hosts**

  To ensure that only trusted hosts/subnets can access the FortiGate REST API, you should configure the *Trusted Hosts* field when creating a new REST API administrator. You need your *Source Address* to create the trusted host.
- **CORS Allow Origin**

  Cross Origin Resource Sharing (CORS) allows third-party web apps to make API requests to the FortiGate using the token. For this field, specify the `Access-Control-Allow-Origin` on API responses. If possible, avoid using '*'.
- **PKI Group**

  Configure a PKI group to enable peer authentication using certificate matching, which provides an extra layer of security. Both the client certificate and token must match to be granted access to the API. The PKI group is typically specified as the name of a peer group defined under `config user group` which has PKI members. See Configuring a PKI user on page 3151 for details.

Making an API call to retrieve information from the FortiGate

The newly created API token is used to query the FortiGate for all firewall addresses. Many applications can be used for this query; this example uses the curl and Postman clients to demonstrate the functionality.

To ensure maximum security when using API tokens, HTTPS is enforced. HTTP cannot be used.

Replace the placeholders below with values for your FortiGate:

- `<FortiGate_address>` is the IP address or hostname of your FortiGate as well as the HTTPS port number (default = 443 and does not need to be explicitly specified).
- `<API-TOKEN>` is the token you generated.

General API call

One of the simplest API calls is `api/v2/cmdb/firewall/address`, which returns all information about all firewall addresses.

To make a general API call using curl:

```
curl --insecure \
-H "Accept: application/json" \
-H "Authorization: Bearer <API-TOKEN>" https://<FortiGate_address>/api/v2/cmdb/firewall/address
```

The backslash (\) allows for multiline commands in curl. You can choose to enter the backslashes or enter the commands into a single wrapping line.

To make a general API call using Postman:

1. Open the Postman client.
2. Go to *Settings* > *General* and turn off *SSL certificate verification*.
3. Click on *New* and select *HTTP*
4. In the new request, click on the *Authorization* tab, select *Type* as *Bearer Token* and enter `<YOUR-API-TOKEN>` in the *Token* field.
5. Enter a URL like the one below:

   ```
   https://<YOUR-FORTIGATE-ADDRESS>/api/v2/cmdb/firewall/address
   ```

6. Click *Send*.

Results of the general API call:

curl and Postman display the output similar to the following (output shortened for brevity):

```
{
  "http_method": "GET",
  "size": 17,
  "limit_reached": false,
  "matched_count": 17,
  "next_idx": 16,
  "revision": "bd002ee1735120907182831e7528dc8b",
  "results": [
      {
          "name": "EMS_ALL_UNKNOWN_CLIENTS",
          "q_origin_key": "EMS_ALL_UNKNOWN_CLIENTS",
          "uuid":"********-****-****-****-************"
          "type": "dynamic",
          "route-tag": 0,
          "sub-type": "ems-tag",
          "clearpass-spt": "unknown",
          "macaddr": [],
          "country": "",
          "cache-ttl": 0,
          "sdn": "",
          "fsso-group": [],
          "interface": "",
          "obj-tag": "",
          "obj-type": "ip",
          "tag-detection-level": "",
```

```
            "tag-type": "",
            "dirty": "clean",
            "hw-vendor": "",
            "hw-model": "",
            "os": "",
            "sw-version": "",
            "comment": "",
            "associated-interface": "",
            "color": 0,
            "filter": "",
            "sdn-addr-type": "private",
            "node-ip-only": "disable",
            "obj-id": "",
            "list": [],
            "tagging": [],
            "allow-routing": "disable",
            "fabric-object": "disable"
        },
        {
            "name": "EMS_ALL_UNMANAGEABLE_CLIENTS",
            "q_origin_key": "EMS_ALL_UNMANAGEABLE_CLIENTS",
            "uuid":"********-****-****-****-************",
```

Formatting an API call

Since a general API call for address objects returns a large amount of information, it may be beneficial to format the API call to display certain information using the `format` parameter. In this example, the `format` parameter is used to display the name and comment for each firewall address.

To use the format parameter in an API call using curl:

```
curl --insecure \
-H "Accept: application/json" \
-H "Authorization: Bearer <API-TOKEN>" https://<FortiGate_
address>/api/v2/cmdb/firewall/address?format="name|comment"
```

The backslash (\) allows for multiline commands in curl. You can choose to enter the backslashes or enter the commands into a single wrapping line.

To use the format parameter in an API call using Postman:

1. Open the Postman client.
2. Go to *Settings* > *General* and turn off *SSL certificate verification*.
3. Click on *New* and select *HTTP*
4. In the new request, click on the *Authorization* tab, select *Type* as *Bearer Token* and enter `<YOUR-API-TOKEN>` in the *Token* field.
5. Enter a URL like the one below:

   ```
   https://<FortiGate_address>/api/v2/cmdb/firewall/address/? format=name|comment.
   ```

6. Click *Send*.

Results of the formatted API call:

curl and Postman display the output similar to the following (output shortened for brevity):

```
{
  "http_method": "GET",
  "size": 17,
  "limit_reached": false,
  "matched_count": 17,
  "next_idx": 16,
  "revision": "bd002ee1735120907182831e7528dc8b",
  "results": [
      {
          "name": "EMS_ALL_UNKNOWN_CLIENTS",
          "q_origin_key": "EMS_ALL_UNKNOWN_CLIENTS",
          "comment": ""
      },
      {
          "name": "EMS_ALL_UNMANAGEABLE_CLIENTS",
          "q_origin_key": "EMS_ALL_UNMANAGEABLE_CLIENTS",
          "comment": ""
      },
      {
          "name": "FABRIC_DEVICE",
          "q_origin_key": "FABRIC_DEVICE",
          "comment": "IPv4 addresses of Fabric Devices."
      },
```

Filtering an API call

The filter parameter can be used to specify a field and a keyword to limit what results match and are returned by a call. In this example, the preceding call is used with a filter to return only names and comments for address objects with the word `Sales` in the name.

To use the filter parameter in an API call using curl:

```
curl --insecure \
-H "Accept: application/json" \
-H "Authorization: Bearer <API-TOKEN>" https://<FortiGate_
address>/api/v2/cmdb/firewall/address?format="name|comment&filter=name=@SSLVPN"
```

The backslash (\) allows for multiline commands in curl. You can choose to enter the backslashes or enter the commands into a single wrapping line.

To use the filter parameter in an API call using Postman:

1. Open the Postman client.
2. Go to *Settings* > *General* and turn off *SSL certificate verification*.

3. Click on *New* and select *HTTP*
4. In the new request, click on the *Authorization* tab, select *Type* as *Bearer Token* and enter `<YOUR-API-TOKEN>` in the *Token* field.
5. Enter a URL like the one below:

```
https://<FortiGate_address>/api/v2/cmdb/firewall/address/?
format=name|comment&filter=name=@SSLVPN.
```

6. Click *Send*.

Results of the formatted API call:

curl and Postman display the output similar to the following (output shortened for brevity):

```
{
  "http_method": "GET",
  "size": 17,
  "limit_reached": false,
  "matched_count": 1,
  "next_idx": 5,
  "revision": "bd002ee1735120907182831e7528dc8b",
  "results": [
      {
          "name": "SSLVPN_TUNNEL_ADDR1",
          "q_origin_key": "SSLVPN_TUNNEL_ADDR1",
          "comment": ""
      }
  ],
  "vdom": "root",
  "path": "firewall",
  "name": "address",
  "status": "success",
  "http_status": 200,
  "serial": "****************",
  "version": "******",
  "build": ****}
```

For a complete list of API calls, see the Fortinet Development Network (FNDN). A subscription is required to access the FNDN.

Configuration backups and reset

Once you successfully configure the FortiGate, it is extremely important that you back up the configuration. In some cases, you may need to reset the FortiGate to factory defaults or perform a TFTP upload of the firmware, which will erase the existing configuration. In these instances, the configuration on the device must be recreated, unless a backup can be used to restore it.

You can use the GUI or CLI to back up the configuration in FortiOS or YAML format. You have the option to save the configuration file in FortiOS format to various locations including the local PC, USB key, FTP, and TFTP

server. FTP and TFTP are only configurable through the CLI. In YAML format, configuration files can be backed up or restored on an FTP or TFTP server through the CLI.

This topic includes the following information:

- Backing up and restoring configurations from the GUI on page 3687
- Backing up and restoring configurations from the CLI on page 3690
- Configuration revision on page 3694
- Restore factory defaults on page 3695
- Secure file copy on page 3696

Administrators can back up a configuration file when using an admin profile with access permissions for *System* set to *Read/Write*. Therefore, administrators using admin profiles with access permissions for *System* set to *Read* cannot back up a config file from the FortiGate or through SCP.

For more granularity within the admin profile, set access permission for *System* to *Custom* to access additional fields. When *System* is set to *Custom*, the *Administrator Users* field dictates whether the config file can be backed up in the GUI. Whereas the *Configuration* field dictates whether the config file can be backed up in the CLI.

Backing up and restoring configurations from the GUI

Configurations can be backed up using the GUI to your PC or a USB disk.

Field	Description
Scope	When the FortiGate is in multi-vdom mode and a user is logged in as a global administrator.
Backup to	You can choose where to save the configuration backup file. • *Local PC*: Save the configuration file to your PC. • *USB Disk*: Save the configuration file to an external USB disk. This option is not available if there is no USB drive inserted in the USB port. You can also back up to FortiManager using the CLI.
File format	The configuration file can be saved in FortiOS or YAML format.
Password mask	Use password masking when sending a configuration file to a third party. When password masking is enabled, passwords and secrets will be replaced in the configuration file with `FortinetPasswordMask`.
Encryption	Enable *Encryption* to encrypt the configuration file. A configuration file cannot be restored on the FortiGate without a set password. Encryption is performed using AES-GCM algorithm.

To back up the configuration in FortiOS format using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration* > *Backup*.
2. Direct the backup to your *Local PC* or to a *USB Disk*.

The *USB Disk* option will not be available if no USB drive is inserted in the USB port. You can also backup to the FortiManager using the CLI.

3. If VDOMs are enabled, indicate whether the scope of the backup is the entire FortiGate configuration (*Global*) or only a specific VDOM configuration (*VDOM*).

   If backing up a VDOM configuration, select the VDOM name from the list.
4. Enable *Encryption*.

This is recommended to secure your backup configurations and prevent unauthorized parties from reloading your configuration.

5. Enter a password, and enter it again to confirm it. This password will be required to restore the configuration.
6. Click *OK*.
7. When prompted, select a location on the PC or USB disk to save the configuration file. The configuration file will have a .conf extension.

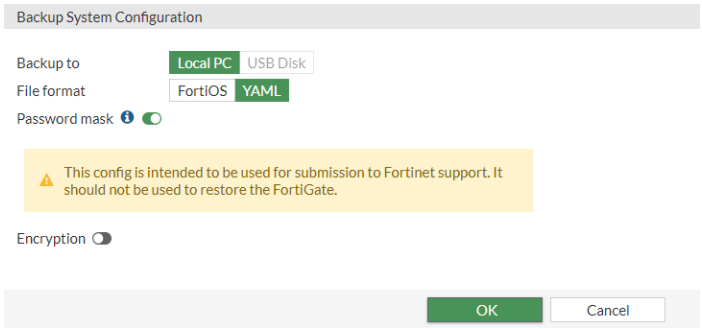
To back up the configuration in YAML format using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration* > *Backup*.
2. Direct the backup to your *Local PC* or to a *USB Disk*.
3. Select *YAML* for the *File format*.
4. Click *OK*.

When backing up a configuration that will be shared with a third party, such as Fortinet Inc. Support, passwords and secrets should be obfuscated from the configuration to avoid information being unintentionally leaked. Password masking can be completed in the *Backup System Configuration* page and in the CLI. When password masking is enabled, passwords and secrets will be replaced in the configuration file with `FortinetPasswordMask`.

To mask passwords in the GUI:

1. Click on the username in the upper right-hand corner of the screen and select *Configuration* > *Backup*.
2. Select *YAML* as the *File format*.
3. Enable *Password mask*. A warning message is displayed.



4. Click *OK*. The configuration file is saved to your computer with passwords and secrets obfuscated.

The following is an example of output with password masking enabled:

```
config system admin
    edit "1"
        set accprofile "prof_admin"
        set vdom "root"
        set password FortinetPasswordMask
    next
end
config vpn ipsec phase1-interface
    edit "vpn-1"
        set interface "port1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set comments "VPN: vpn-1 (Created by VPN wizard)"
        set wizard-type static-fortigate
        set remote-gw 172.16.200.55
        set psksecret FortinetPasswordMask
    next
end
config wireless-controller vap
    edit "ssid-1"
        set passphrase FortinetPasswordMask
        set schedule "always"
    next
end
```

Restoring configuration files from the GUI

Configuration files can be used to restore the FortiGate to a previous configuration in the *Restore System Configuration* page.

To restore the FortiGate configuration using the GUI:

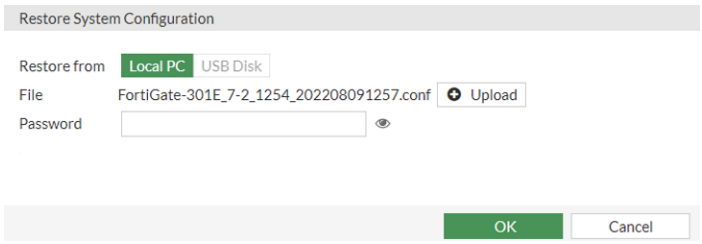
1. Click on the user name in the upper right-hand corner of the screen and select *Configuration* > *Restore*.
2. Identify the source of the configuration file to be restored: your *Local PC* or a *USB Disk*.
   The *USB Disk* option will not be available if no USB drive is inserted in the USB port. You can restore from the FortiManager using the CLI.
3. Click *Upload*, locate the configuration file, and click *Open*.
4. Enter the password if required.
5. Click *OK*.

When restoring a configuration file that has password masking enabled, obfuscated passwords and secrets will be restored with the password mask.

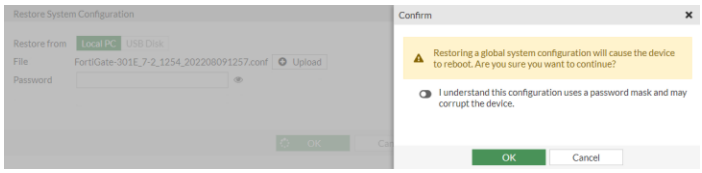
Restoring the FortiGate with a configuration with passwords obfuscated is not recommended.

To restore an obfuscated YAML configuration using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration* > *Restore*.
2. Click *Upload*. The File Explorer is displayed.
3. Navigate to the configuration file and click *Open*.



4. (Optional) Enter the file password in the *Password* field.
5. Click *OK*. The *Confirm* pane is displayed with a warning.



6. Toggle the acknowledgment.
7. Click *OK*.

Backing up and restoring configurations from the CLI

Configuration backups in the CLI are performed using the `execute backup` commands and can be backed up in FortiOS and YAML format.

Configuration files can be backed up to various locations depending on the command:

- `flash`: Backup the configuration file to the flash drive.
- `ftp`: Backup the configuration file to an FTP server.
- `management-station`: Backup the configuration file to a management station, such as FortiManager or FortiGate Cloud.
- `sftp`: Backup the configuration file to a SFTP server.
- `tftp`: Backup the configuration file to a TFTP server.
- `usb`: Backup the configuration file to an external USB drive.
- `usb-mode`: Backup the configuration file for USB mode.

Command	Description
`# execute backup config`	Back up the configuration in FortiOS format. Backup your configuration file to: • `flash` • `ftp` • `management-station` • `sftp`

Command	Description
	• tftp • usb • usb-mode
# execute backup full-config	Backup the configuration, including backups of default configuration settings. Backup your configuration file to: • ftp • sftp • tftp • usb • usb-mode
# execute backup yaml-config	Backup the configuration in YAML format. Backup your configuration file to: • ftp • tftp
# execute backup obfuscated-config	Backup the configuration with passwords and secrets obfuscated. Backup your configuration file to: • ftp • management-station • sftp • tftp • usb
# execute backup obfuscated-full-config	Backup the configuration (including default configuration settings) with passwords and secrets obfuscated. Backup your configuration file to: • ftp • sftp • tftp • usb
# execute backup obfuscated-yaml-config	Backup the configuration in YAML format with passwords and secrets obfuscated. Backup your configuration file to: • ftp • tftp

To back up the configuration in FortiOS format using the CLI:

For FTP, note that port number, username are optional depending on the FTP site:

```
# execute backup config ftp <backup_filename> <ftp_server>[<:ftp_port>] [<user_name>] [<password>]
[<backup_password>]
```

or for TFTP:

```
# execute backup config tftp <backup_filename> <tftp_servers> [<backup_password>]
```

or for SFTP:

```
# execute backup config sftp <backup_filename> <sftp_server>[<:sftp_port>] <user> <password>
[<backup_password>]
```

or:

```
# execute backup config management-station <comment>
```

or:

```
# execute backup config usb <backup_filename> [<backup_password>]
```

Use the same commands to backup a VDOM configuration by first entering the commands:

```
config vdom
    edit <vdom_name>
```

See Backing up and restoring configurations in multi-VDOM mode on page 3312 for more information.

When backing up a configuration in YAML format, if it is not already specified in the file name, `.yaml` will be appended to the end. For example, if the file name entered is `301E.conf`, the name will become `301E.conf.yaml` after the configuration is backed up.

To back up the configuration in YAML format using the CLI:

```
# execute backup yaml-config {ftp | tftp} <filename> <server> [username] [password]
```

For example:

```
# execute backup yaml-config  tftp  301E.conf 172.16.200.55
    Please wait...
    The suffix '.yaml' will be appended to the filename if user does not add it specifically.
    Connect to tftp server 172.16.200.55 ...
    #
    Send config file to tftp server OK.
```

Configuration files can be configured with obfuscated passwords and secrets to not unintentionally leak information when sharing configuration files with third parties.

To mask passwords in a configuration backup in the CLI:

```
# execute backup obfuscated-config {ftp | management-station | sftp | tftp | usb}
```

To mask passwords in the full configuration backup in the CLI:

```
# execute backup obfuscated-full-config {ftp | sftp | tftp | usb}
```

To mask passwords in a configuration backup with YAML formatting in the CLI:

```
# execute backup obfuscated-yaml-config {ftp | tftp}
```

If a configuration is being backed up on a server, server information must be included with the command. Other information that may be required with an `execute backup` command includes file names, passwords, and comments.

Restoring configuration files from the CLI

Configuration files can be used to restore the FortiGate using the CLI.

Command	Description
`# execute restore config`	Restore a configuration that is in FortiOS or YAML format. The file format is automatically detected when it is being restored. Configurations can be loaded from: • `flash`: Load the configuration file from flash to firewall. • `ftp`: Load the configuration file from an FTP server. • `management-station`: Load the configuration from a management station. • `tftp`: Load the configuration from from a TFTP server. • `usb`: Load the configuration file from an external USB disk to firewall. • `usb-mode`: Load the configuration file from an external USB disk and reboot.

To restore the FortiGate configuration using the CLI:

For FTP, note that port number, username are optional depending on the FTP site:

```
# execute restore config ftp <backup_filename> <ftp_server>[<:port>] [<user_name>] [<password>]
[<backup_password>]
```

or for TFTP:

```
# execute restore config tftp <backup_filename> <tftp_server> [<backup_password>]
```

For restoring the configuration from FortiManager or FortiGate Cloud:

```
# execute restore config management-station normal <revision ID>
```

or:

```
# execute restore config usb <backup_filename> [<backup_password>]
```

The FortiGate will load the configuration file and restart. Once the restart has completed, verify that the configuration has been restored.

Troubleshooting

When restoring a configuration, errors may occur, but the solutions are usually straightforward.

Error message	Reason and Solution
Configuration file error	This error occurs when attempting to upload a configuration file that is incompatible with the device. This may be due to the configuration file being for a different model or being saved from a different version of firmware. **Solution**: Upload a configuration file that is for the correct model of FortiGate device and the correct version of the firmware.
Invalid password	When the configuration file is saved, it can be protected by a password. The password entered during the upload process is not matching the one associated with the configuration file. **Solution**: Use the correct password if the file is password protected.

Configuration revision

You can manage multiple versions of configuration files on models that have a 512MB flash memory and higher. Revision control requires either a configured central management server or the local hard drive, if your FortiGate has this feature. Typically, configuration backup to local drive is not available on lower-end models.

Central management server

The central management server can either be a FortiManager unit or FortiGate Cloud.

If central management is not configured on your FortiGate, a message appears instructing you to either enable central management, or obtain a valid license.

To enable central management from the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Central Management* card.
2. Set the *Status* to *Enabled* and select a *Type*.
3. Click *OK*.

To enable central management from the CLI:

```
config system central-management
    set type {fortimanager | fortiguard}
    set mode backup
    set fmg <IP address>
end
```

To backup to the management server:

```
# execute backup config management-station <comment>
```

To view a backed up revision:

```
# execute restore config management-station normal 0
```

To restore a backed up revision:

```
# execute restore config management-station normal <revision ID>
```

Backing up to a local disk

When revision control is enabled on your FortiGate unit, and configuration backups have been made, a list of saved revisions of those backed-up configurations appears.

Configuration backup occurs by default with firmware upgrades but can also be configured to occur every time you log out.

To configure configuration backup when logging out:

```
config system global
  set revision-backup-on-logout enable
end
```

To manually force backup:

```
# execute backup config flash <comment>
```

Configuration revisions are viewed by clicking on the user name in the upper right-hand corner of the screen and selecting *Configuration* > *Revisions*.

To view a list of revisions backed up to the disk from the CLI:

```
# execute revision list config
```

To restore a configuration from the CLI:

```
# execute restore config flash <revision ID>
```

Restore factory defaults

There may be a need to reset the FortiGate to its original defaults; for example, to begin with a fresh configuration. There are two options when restoring factory defaults:

`# execute factoryreset`	Reset the device to factory default configuration. The firmware version and antivirus and IPS attack definitions are not changed.

`# execute factoryreset2`	Reset to factory default configuration without losing management access to the FortiGate. Interface and VDOM configurations, as well as the firmware version and antivirus and IPS attack definitions, are not changed.

Secure file copy

You can also back up and restore your configuration using Secure File Copy (SCP). See How to download a FortiGate configuration file and upload firmware file using secure file copy (SCP).

You enable SCP support using the following command:

```
config system global
    set admin-scp enable
end
```

For more information about this command and about SCP support, see config system global.

Fortinet Security Fabric

The Fortinet Security Fabric provides an intelligent architecture that interconnects discrete security solutions into an integrated whole to detect, monitor, block, and remediate attacks across the entire attack surface. It delivers broad protection and visibility into every network segment and device, be they hardware, virtual, or cloud based.

- The physical topology view shows all connected devices, including access layer devices. The logical topology view shows information about the interfaces that each device is connected to.
- Security rating checks analyze the Security Fabric deployment to identify potential vulnerabilities and highlight best practices to improve the network configuration, deploy new hardware and software, and increase visibility and control of the network.
- Fabric connectors provide integration with multiple SDN, cloud, and partner technology platforms to automate the process of managing dynamic security updates without manual intervention.
- Automation pairs an event trigger with one or more actions to monitor the network and take the designated actions automatically when the Security Fabric detects a threat.

As part of improvements to reducing memory usage, FortiGate models with 2 GB RAM can authorize up to five devices when serving as a Fabric root.

The affected models are the FortiGate 40F and 60F series devices and their variants.

A maximum of 35 downstream FortiGates is recommended.

Components

As part of improvements to reducing memory usage, FortiGate models with 2 GB RAM can authorize up to five devices when serving as a Fabric root.

The affected models are the FortiGate 40F and 60F series devices and their variants.

The Fortinet Security Fabric consists of different components that work together to secure you network.

The following devices are required to create a Security Fabric:

Device	Description
FortiGate	FortiGates are the core of the Security Fabric and can have one of the following roles: • **Root**: the root FortiGate is the main component in the Security Fabric. It is typically located on the edge of the network and connects the internal devices and

Device	Description
	networks to the internet through your ISP. From the root FortiGate, you can see information about the entire Security Fabric on the *Physical* and *Logical Topology* pages in the GUI. • **Downstream**: after a root FortiGate is installed, all other FortiGate devices in the Security Fabric act as Internal Segmentation Firewalls (ISFWs), located at strategic points in your internal network, rather than on the network edge. This allows extra security measures to be taken around key network components, such as servers that contain valuable intellectual property. ISFW FortiGates create network visibility by sending traffic and information about the devices that are connected to them to the root FortiGate. A maximum of 35 downstream FortiGates is recommended. See Configuring the root FortiGate and downstream FortiGates on page 3702 for more information about adding FortiGate devices in the Security Fabric. FortiGate documentation: https://docs.fortinet.com/product/fortigate
FortiAnalyzer*	FortiAnalyzer gives you increased visibility into your network, centralized monitoring, and awareness of threats, events, and network activity by collecting and correlating logs from all Security Fabric devices. This gives you a deeper and more comprehensive view across the entire Security Fabric. See Configuring FortiAnalyzer on page 3711 for more information about adding FortiAnalyzer devices in the Security Fabric. FortiAnalyzer documentation: https://docs.fortinet.com/product/fortianalyzer
Cloud Logging*	There are two options for cloud logging: FortiAnalyzer Cloud and FortiGate Cloud. Either can be used to enable the Security Fabric root device; however, if using FortiGate Cloud, all downstream devices must belong to the same FortiCloud account. See Configuring cloud logging on page 3714 for more information about configuring a Security Fabric with FortiGate Cloud. FortiGate Cloud documentation: https://docs.fortinet.com/product/fortigate-cloud

* FortiAnalyzer or Cloud Logging is a required component for the Security Fabric. Either FortiAnalyzer, FortiAnalyzer Cloud, or FortiGate Cloud can be used to met this requirement.

The following devices are recommended:

Device	Description
FortiClient	FortiClient adds endpoint control to devices that are located in the Security Fabric, allowing only traffic from compliant devices to flow through the FortiGate. FortiClient compliance profiles are applied by the first FortiGate that a device's traffic flows through. Device registration and on-net status information for a device that is running FortiClient appears only on the FortiGate that applies the FortiClient profile to that device. FortiClient documentation: https://docs.fortinet.com/product/forticlient
FortiClient EMS	FortiClient EMS is used in the Security Fabric to provide visibility across your network, securely share information, and assign security profiles to endpoints.

Device	Description
	See Configuring FortiClient EMS on page 3722 for more information about adding FortiClient EMS devices in the Security Fabric. FortiClient EMS documentation: https://docs.fortinet.com/product/forticlient
FortiAP	Add FortiAP devices to extend the Security Fabric to your wireless devices. Devices connected to a FortiAP appear in the Physical and Logical Topology pages in the Security Fabric menu. See Configuring LAN edge devices on page 3746 for more information about adding FortiAP devices in the Security Fabric. FortiAP documentation: https://docs.fortinet.com/product/fortiap
FortiSwitch	A FortiSwitch can be added to the Security Fabric when it is managed by a FortiGate that is in the Security Fabric with the FortiLink protocol, and connected to an interface with *Security Fabric Connection* enabled. FortiSwitch ports to become logical extensions of the FortiGate. Devices connected to the FortiSwitch appear in the Physical and Logical Topology pages in the Security Fabric menu, and security features, such as FortiClient compliance profiles, are applied to them. See Configuring LAN edge devices on page 3746 for more information about adding FortiSwitch devices in the Security Fabric. FortiSwitch documentation: https://docs.fortinet.com/product/fortiswitch
FortiExtender	FortiExtender cellular gateways provide ultra-fast LTE and 5G wireless to connect and scale any WAN edge. See Configuring LAN edge devices on page 3746 for more information about adding FortiExtender devices in the Security Fabric. FortiExtender documentation: https://docs.fortinet.com/product/fortiextender
FortiManager	Add FortiManager to simplify the network management of devices in the Security Fabric by centralizing management access in a single device. This allows you to easily control the deployment of security policies, FortiGuard content security updates, firmware revisions, and individual configurations for devices in the Security Fabric. See Configuring central management on page 3748 for more information about adding FortiManager devices in the Security Fabric. FortiManager documentation: https://docs.fortinet.com/product/fortimanager
FortiSandbox	Add FortiSandbox to your Security Fabric to improve security with sandbox inspection. Sandbox integration allows FortiGate devices in the Security Fabric to automatically receive signature updates from FortiSandbox and add the originating URL of any malicious file to a blocked URL list. See Configuring sandboxing on page 3753 for more information about adding FortiSandbox devices in the Security Fabric. FortiSandbox documentation: https://docs.fortinet.com/product/fortisandbox
FortiADC	FortiADC devices optimize the availability, user experience, and scalability of enterprise application delivery. They enable fast, secure, and intelligent acceleration and distribution of even the most demanding enterprise applications.

Device	Description
	FortiADC documentation: https://docs.fortinet.com/product/fortiadc
FortiDDoS	FortiDDoS is a Network Behavior Anomaly (NBA) prevention system that detects and blocks attacks that intend to disrupt network service by overutilizing server resources. FortiDDoS documentation: https://docs.fortinet.com/product/fortiddos
FortiDeceptor	FortiDeceptor automatically lays out a layer of decoys and lures, which helps conceal sensitive and critical assets behind a fabricated deception surface to confuse and redirect attackers while revealing their presence on your network. See Configuring FortiDeceptor on page 3769 for more information about adding FortiDeceptor devices in the Security Fabric. FortiDeceptor documentation: https://docs.fortinet.com/product/fortideceptor
FortiMail	FortiMail antispam processing helps offload from other devices in the Security Fabric that would typically carry out this process. See Configuring FortiMail on page 3771 for more information about adding FortiMail devices in the Security Fabric. FortiMail documentation: https://docs.fortinet.com/product/fortimail
FortiMonitor	FortiMonitor is a holistic, SaaS-based digital experience and network performance monitoring solution. It facilitates deep analysis of both network health metrics and application performance to identify potential problem areas that impact user access. See Configuring FortiMonitor on page 3771for more information about adding FortiMonitor devices in the Security Fabric. FortiMonitor documentation: https://docs.fortinet.com/product/fortimonitor
FortiNAC	FortiNAC provides visibility to all administrators to see everything connected to their network, and the ability to control those devices and users, including dynamic, automated responses. See Configuring FortiNAC on page 3773 for more information about adding FortiNAC devices in the Security Fabric. FortiNAC documentation: https://docs.fortinet.com/product/fortinac
FortiNDR	FortiNDR (formerly FortiAI) uses artificial neural networks (ANN) that can deliver sub-second malware detection and a verdict. Add FortiNDR to your Security Fabric to automatically quarantine attacks. See Configuring FortiNDR on page 3774 for more information about adding FortiNDR devices in the Security Fabric. FortiNDR documentation: https://docs.fortinet.com/product/fortindr
FortiPolicy	FortiPolicy is a containerized security platform that implements and automates security orchestration with full-flow inspection and segmented and microsegmented policy enforcement while auto-scaling to accommodate infrastructure changes. See Configuring FortiPolicy on page 3776 for more information about adding FortiPolicy devices in the Security Fabric. FortiPolicy documentation: https://docs.fortinet.com/product/fortipolicy

Device	Description
FortiTester	FortiTester can be used for performance testing and validating network security infrastructure and services. It provides a comprehensive range of application test cases to evaluate equipment and right-size infrastructure. See Configuring FortiTester on page 3779 for more information about adding FortiTester devices in the Security Fabric. FortiTester documentation: https://docs.fortinet.com/product/fortitester
FortiWeb	FortiWeb defends the application attack surface from attacks that target application exploits. You can also configure FortiWeb to apply web application firewall features, virus scanning, and web filtering to HTTP traffic to help offload from other devices in the Security Fabric that would typically carry out these processes. See Configuring FortiWeb on page 3782 for more information about adding FortiWeb devices in the Security Fabric. FortiWeb documentation: https://docs.fortinet.com/product/fortiweb
FortiWLC	FortiWLC delivers seamless mobility and superior reliability with optimized client distribution and channel utilization. Both single and multi channel deployment options are supported, maximizing efficiency to make the most of available wireless spectrum. FortiWLC documentation: https://docs.fortinet.com/product/wireless-controller
FortiVoice	FortiVoice includes integrated high-definition voice, conferencing, and fax capabilities that enables organizations to communicate and collaborate easily and securely. See Configuring FortiVoice on page 3781 for more information about adding FortiVoice devices in the Security Fabric. FortiVoice documentation: https://docs.fortinet.com/product/fortivoice-enterprise
Other Fortinet products	Other Fortinet products can be added to the Security Fabric, including FortiAuthenticator, FortiToken, FortiCache, and FortiSIEM. Documentation: https://docs.fortinet.com/
Third-party products	Third-party products that belong to the Fortinet Fabric-Ready Partner Program can be added to the Security Fabric.

Security Fabric connectors

This section contains information about how to configure the following devices as part of the Fortinet Security Fabric:

- Configuring the root FortiGate and downstream FortiGates
- Configuring logging and analytics on page 3710
  - Configuring FortiAnalyzer on page 3711
  - Configuring cloud logging on page 3714
- Configuring FortiClient EMS on page 3722
- Synchronizing FortiClient ZTNA tags on page 3743
- Configuring LAN edge devices on page 3746

- Configuring central management on page 3748
- Configuring sandboxing on page 3753
- Configuring supported connectors on page 3760
  - Configuring FortiNDR on page 3774
  - Configuring FortiDeceptor on page 3769
  - Configuring FortiMail on page 3771
  - Configuring FortiMonitor on page 3771
  - Configuring FortiNAC on page 3773
  - Configuring FortiTester on page 3779
  - Configuring FortiVoice on page 3781
  - Configuring FortiWeb on page 3782
  - Configuring FortiPolicy on page 3776
- Allowing FortiDLP Agent communication through the FortiGate on page 3784

System requirements

To set up the Security Fabric, the devices that you want to include must meet the Product Integration and Support requirements in the FortiOS Release Notes.

Some features of the Security Fabric are only available in certain firmware versions and models. Not all FortiGate models can run the FortiGuard Surface Attack Security Rating Service if they are the root FortiGate in a Security Fabric. For more information, see the Special Notices in the FortiOS Release Notes.

Prerequisites

- If devices are not already installed in your network, complete basic installation and configuration tasks by following the instructions in the device documentation.
- FortiGate devices must be operating in NAT mode.

Configuring the root FortiGate and downstream FortiGates

The following procedures include configuration steps for a typical Security Fabric implementation, where the edge FortiGate is the root FortiGate with other FortiGates that are downstream from the root FortiGate.

For information about the recommended number of downstream FortiGates, see the *FortiOS Best Practices*.

As part of improvements to reducing memory usage, FortiGate models with 2 GB RAM can authorize up to five devices when serving as a Fabric root.

The affected models are the FortiGate 40F and 60F series devices and their variants.

Prerequisite

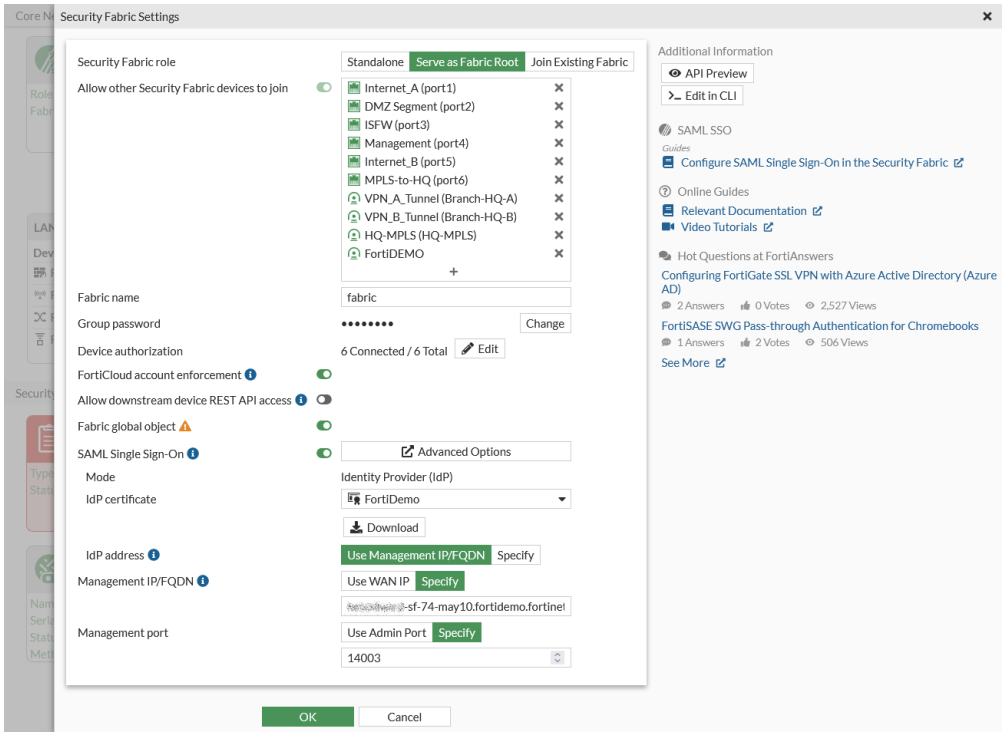
- The FortiGates must be operating in NAT mode.

Configuring the root FortiGate

The edge FortiGate is typically configured as the root FortiGate, as this allows you to view the full topology of the Security Fabric from the top down. The following steps describe how to add the FortiGate to serve as the root device.

To configure the root FortiGate:

1. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. Set the *Security Fabric role* to *Serve as Fabric Root*.
3. Enter a *Fabric name*.
4. Ensure *Allow other Security Fabric devices to join* is enabled.
5. Select the interfaces that will be listening for device join requests. Enabling an interface here has the same effect as going to *Network* > *Interfaces*, editing an interface, and enabling *Security Fabric Connection* under *Administrative Access*.



6. Optionally, enable *Allow downstream device REST API access* to allow access to the REST API of the root FortiGate for API requests coming from downstream Security Fabric devices. This option must be enabled to use certain supported devices (such as FortiDeceptor, FortiMonitor, and FortiNAC) and the Fabric event trigger.
7. Click *OK*.

Using the root FortiGate with disk to store historic user and device information

This backend implementation allows the root FortiGate in a Security Fabric to store historic user and device information in a database on its disk. This will allow administrators to visualize users and devices over a period

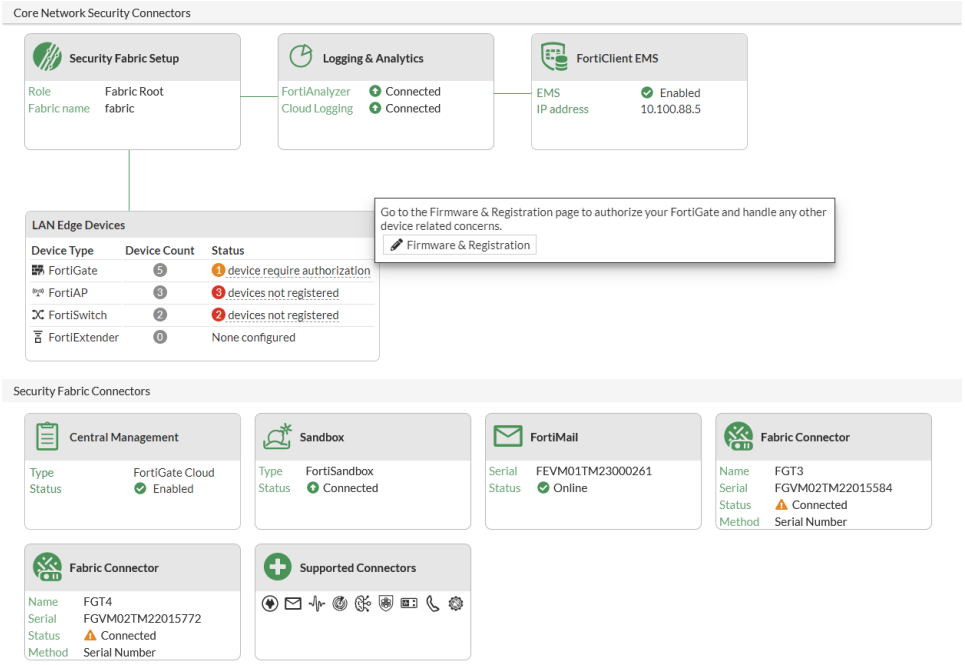
of time.

The daemon, user_info_history, stores this data on the disk. The information source for the historical data will be the user_info daemon, which would be recorded on the disk when user_info notifies user_info_history that a user has logged out or the device is no longer connected.

Adding downstream devices

Downstream device serial numbers can be pre-authorized from the root FortiGate, or allowed to join by request. New authorization requests include the device serial number, IP address, and HA members. HA members can include up to four serial numbers and is used to ensure that, in the event of a fail over, the secondary FortiGate is still authorized. A downstream device's certificate can also be used to authorize the device by uploading the certificate to the root FortiGate.

The *LAN Edge Devices* card on the *Fabric Connectors* page displays a summary about the FortiGates, FortiAPs, FortiSwitches, and FortiExtenders in the Fabric. Information about the device type, number of devices, and number of unregistered and unauthorized devices is displayed. If there are devices that do not have a green checkmark in the *Status* column, hover over the status message to view the tooltip with required action. In this example, there is a downstream FortiGate that require authorization. The tooltip includes a link to the *System > Firmware & Registration* page to authorize the FortiGates.



The *Supported Connectors* card displays the icons of different Fortinet devices that support full Security Fabric integration. See Configuring supported connectors on page 3760 for more information about configuring supported Fabric connectors.

Pre-authorizing the downstream FortiGate

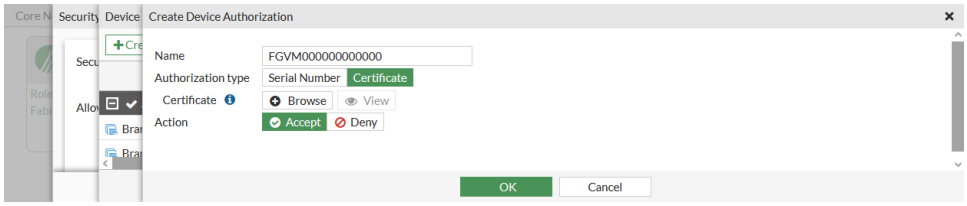
When a downstream Fortinet device's serial number or certificate is added to the trusted list on the root FortiGate, the device can join the Security Fabric as soon as it connects. After the new device is authorized,

connected FortiAP and FortiSwitch devices are automatically included in the topology, where they can be authorized with one click.

The interface that connects to the downstream FortiGate must have *Security Fabric Connection* enabled.

To pre-authorize a FortiGate:

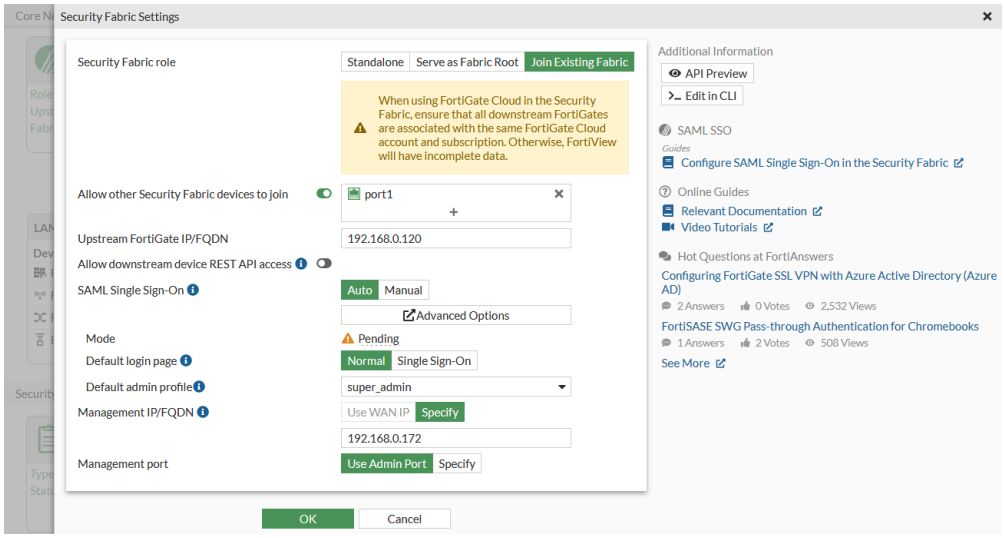
1. On the root FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. In the *Device authorization* field and click *Edit*. The *Device Authorization* pane opens.
3. Click *Create New* to add a new device for pre-authorization.
4. Enter the device name in the *Name* field.
5. Select the *Authorization type*, either *Serial Number* or *Certificate*.



6. If *Certificate* is selected, click *Browse* to upload the downstream device's certificate from the management computer.
7. Set the *Action* to *Accept*.
8. Click *OK* and add more devices as required.
9. Click *OK*.

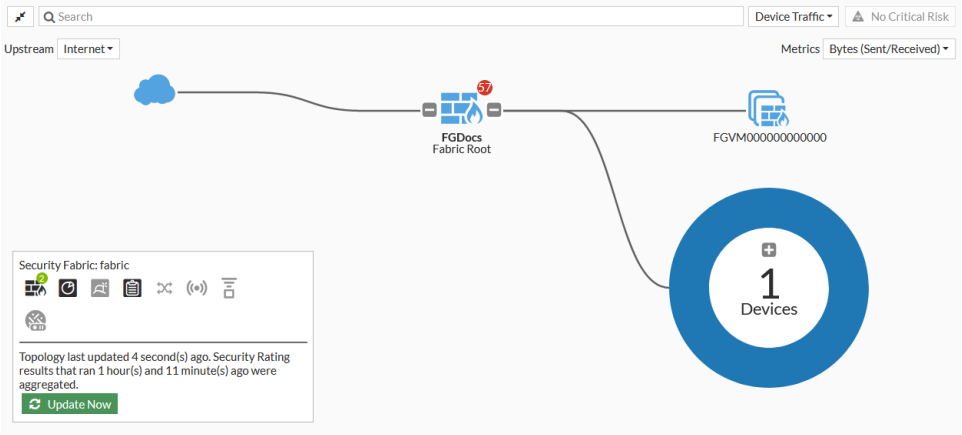
To configure a downstream FortiGate to connect to an upstream FortiGate:

1. Configure the downstream FortiGate:
   a. On the downstream FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. Set the *Security Fabric role* to *Join Existing Fabric*.
   c. Enter the IP address of the root FortiGate in the *Upstream FortiGate IP/FQDN* field.



d. Click *OK*.

2. On the root FortiGate, go to *Security Fabric* > *Physical Topology* and verify that the downstream FortiGate that you added appears in the Security Fabric topology.

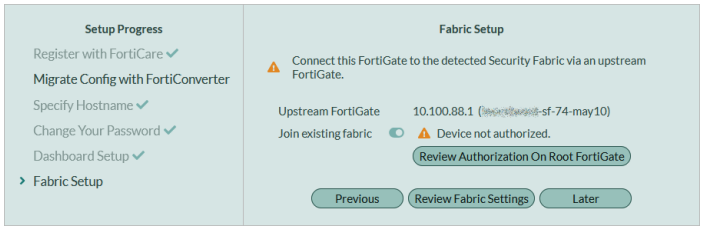


Authorizing a downstream FortiGate

When you log in to an unauthorized downstream FortiGate, the log in prompt includes the option to authorize the device on the root FortiGate.

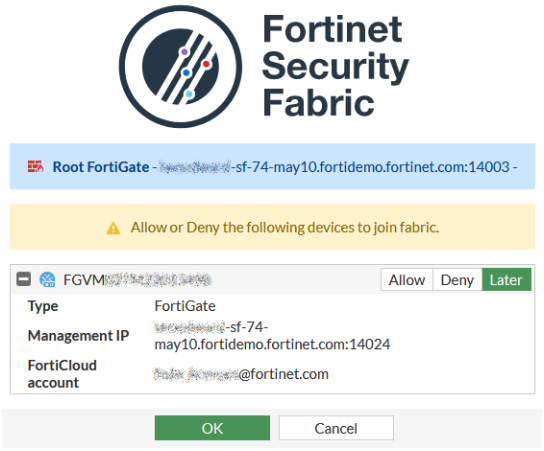
To authorize a downstream FortiGate:

1. Log in to the unauthorized, downstream device.



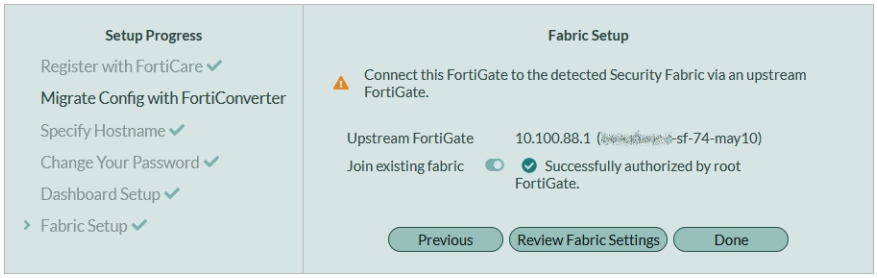
2. In the *Fabric Setup* step, click *Review Authorization on Root FortiGate*.
   A pop-up window opens to a log in screen for the root FortiGate.

3. Enter the log in credentials for the root FortiGate, then click *Login*.
   A list of pending authorizations is shown.



4. Select *Allow* and then click *OK* to authorize the downstream FortiGate. You can also select *Deny* to reject the authorization, or *Later* to postpone the decision to the next time that you log in.

   When authorization is allowed, the pop-up window closes, and the log in prompt shows that the downstream FortiGate has been authorized.



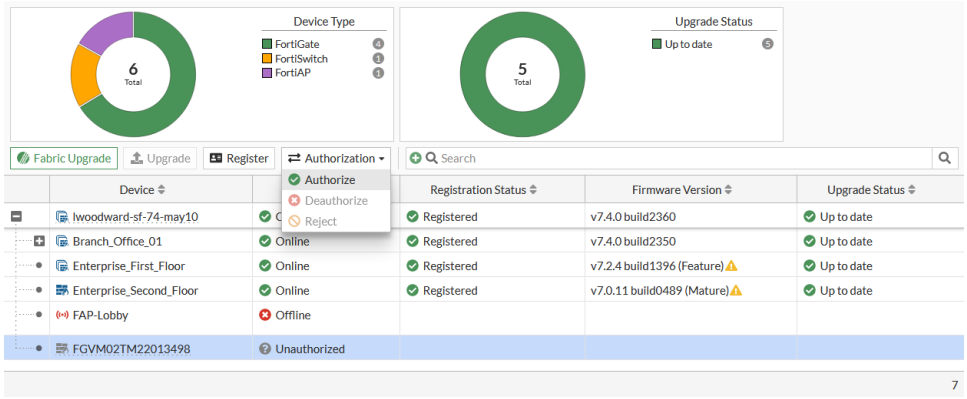
5. Click *Done* to log in to the downstream FortiGate.

Triggering authorization from the GUI

A downstream device can be authorized in the root FortiGate's GUI by using the *Firmware & Registration* page (see Authorizing devices on page 3251 for more information).

To authorize a downstream FortiGate from the Firmware & Registration page:

1. Go to *System* > *Firmware & Registration*.
2. Select the unauthorized device and click *Authorization* > *Authorize*.



A notification appears in the top-right corner once the device is authorized.

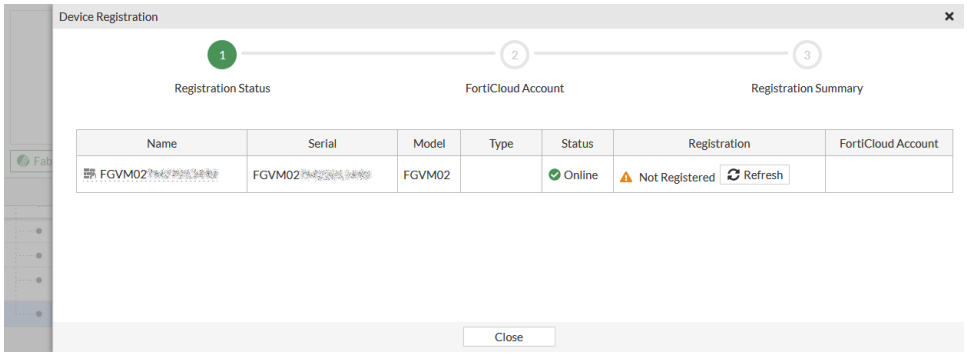
3. Refresh the page. The FortiGate's status is now *Online*.

Registering the downstream devices to FortiCloud

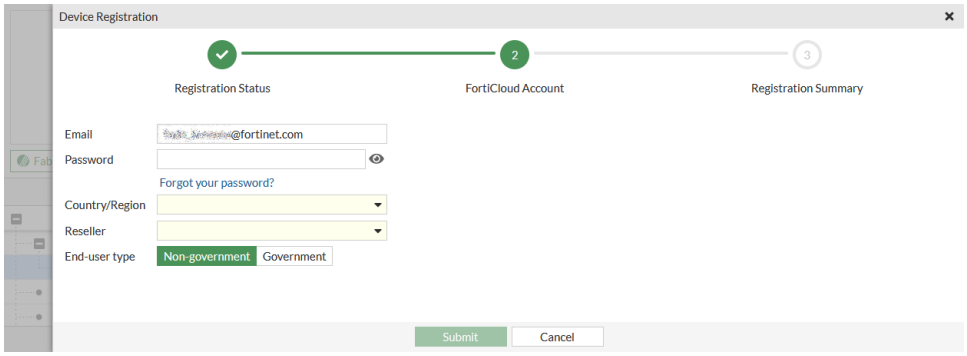
In this example, a downstream FortiGate has just been authorized, but it is not registered to a FortiCloud account. A device can be registered on the root FortiGate to a FortiCloud account.

To register the downstream FortiGate from the root:

1. Log in to the root FortiGate and go to *System > Firmware & Registration*
2. Select an unregistered device and click *Register*. The *Device Registration* pane opens.



3. Enter the required information (password, country/region, reseller, and end-user type).



4. Click *Submit*. The *Registration Summary* pane opens.
5. Click *Close*.

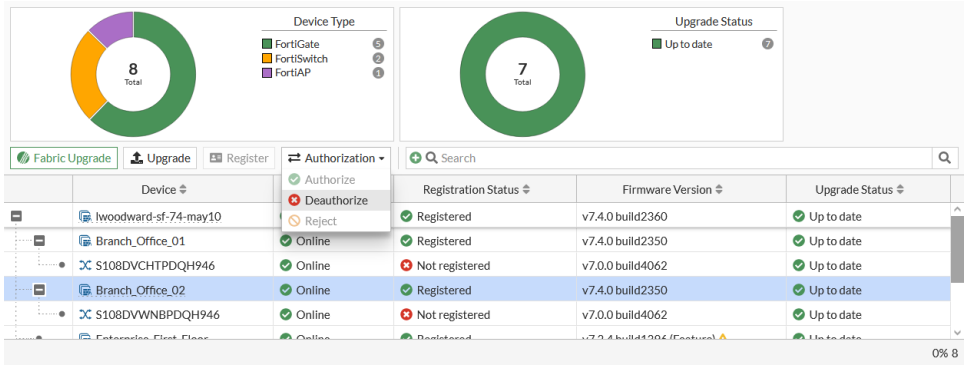
You can use IPAM to automatically assign subnets to downstream FortiGates to prevent duplicate IP addresses from overlapping within the same Security Fabric. See Configure IPAM locally on the FortiGate on page 179.

Deauthorizing a device

A device can be deauthorized to remove it from the Security Fabric in the root FortiGate's GUI by using the *Firmware & Registration* page (see Authorizing devices on page 3251 for more information).

To deauthorize a device from the Firmware & Registration page:

1. Go to *System* > *Firmware & Registration*.
2. Select the authorized device and click *Authorization* > *Deauthorize*.



A notification appears in the top-right corner once the device is deauthorized.

3. Refresh the page. The FortiGate is moved to the bottom of the list, and it's status is *Unauthorized*.

After a device is deauthorized, the serial number is saved in a trusted list that can be viewed in the CLI using the `show system csf` command. For example, this result shows a deauthorized FortiSwitch:

```
show system csf
    config system csf
        set status enable
        set group-name "Office-Security-Fabric"
        set group-password ************
        config trusted-list
            edit "FGT6HD391800000"
        next
            edit "S248DF3X1700000"
                set action deny
            next
        end
    end
```

CLI commands

Use the following commands to view, accept, and deny authorization requests, to view upstream and downstream devices, and to list or test Fabric devices:

Command	Description
`diagnose sys csf authorization pending-list`	View pending authorization requests on the root FortiGate.
`diagnose sys csf authorization accept <serial number> [name]`	Authorize a device to join the Security Fabric.

Command	Description
`diagnose sys csf authorization deny <serial number> [name]`	Deny a device from joining the Security Fabric.
`diagnose sys csf downstream`	Show connected downstream FortiGates.
`diagnose sys csf downstream-devices <device type>`	Show downstream fabric devices.
`diagnose sys csf upstream`	Show connected upstream devices.
`diagnose sys csf fabric-device list`	List all known Fabric devices.
`diagnose sys csf global`	Show a summary of all connected members in Security Fabric.

Desynchronizing settings

By default, the settings for FortiAnalyzer logging, central management, sandbox inspection, and FortiClient EMS are synchronized between all FortiGates in the Security Fabric.

To disable automatic synchronization:

```
config system csf
    set configuration-sync local
end
```

Configuring logging and analytics

FortiAnalyzer or Cloud Logging is a required component for the Security Fabric. Either FortiAnalyzer, FortiAnalyzer Cloud, or FortiGate Cloud can be used to met this requirement. These settings are configured on the *Logging & Analytics* card on the *Security Fabric > Fabric Connectors* page. If there are multiple services enrolled on the FortiGate, the preference is: FortiAnalyzer Cloud logging, FortiAnalyzer logging, then FortiGate Cloud logging.

The following topics provide more information about configuring the logging and analytics connector:

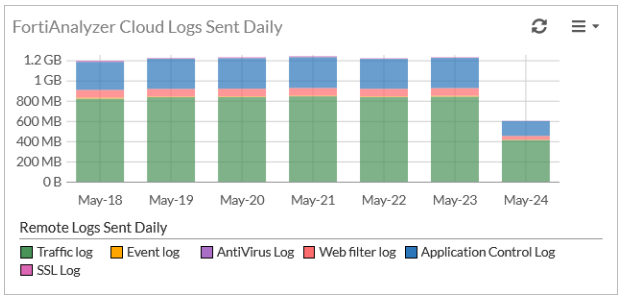
- Configuring FortiAnalyzer on page 3711
- Configuring cloud logging on page 3714

Logs Sent daily chart for remote logging sources

The *Logs Sent* widget displays a chart for a select remote logging source (FortiAnalyzer, FortiGate Cloud, and FortiAnalyzer Cloud). Once configured, the same data is available on the *FortiAnalyzer* and *Cloud Logging* tabs of the *Logging & Analytics* card.

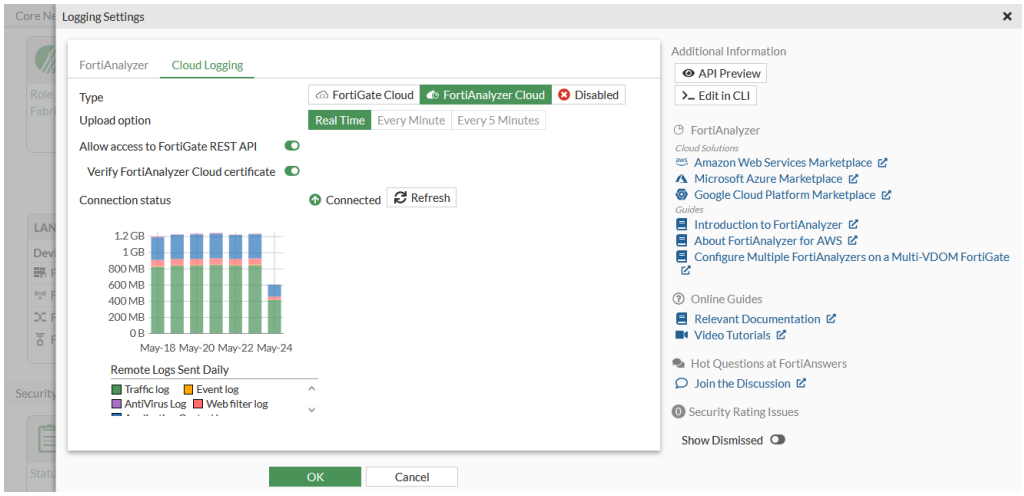
To add the Logs Sent widget:

1. Go to *Dashboard* > *Status* and click *Add Widget*.
2. Search for *Logs Sent* and click to add the widget to the dashboard.
3. Select a *Logging Source* (*FortiAnalyzer*, *FortiAnalyzer Cloud*, or *FortiGate Cloud*). *FortiAnalyzer Cloud* is used in this example.
4. Click *OK* and click *Close*. The *FortiAnalyzer Logs Sent Daily* widget is displayed in the dashboard.



To view the chart on the Logging & Analytics card:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Logging & Analytics* card.
   The *Logging Settings* pane is displayed.
2. Go to the *FortiAnalyzer* or *Cloud Logging* tabs to view the *Remote Logs Sent Daily* chart. *FortiAnalyzer Cloud* is used in this example.



3. Click *OK* to close the pane.

Configuring FortiAnalyzer

FortiAnalyzer allows the Security Fabric to show historical data for the Security Fabric topology and logs for the entire Security Fabric. For more information about using FortiAnalyzer, see the FortiAnalyzer Administration Guide.

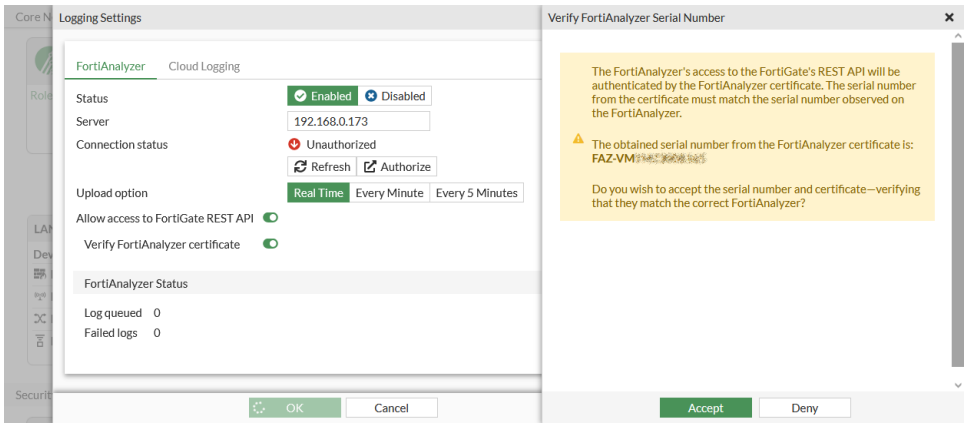
To authorize a FortiAnalyzer in the Security Fabric:

1. In FortiAnalyzer, configure the authorization address and port:
   a. Go to *System Settings* > *Settings*.
   b. In the *Fabric Authorization* section, enter an *Authorization Address* and *Authorization Port*. This is used to access the FortiAnalyzer login screen.

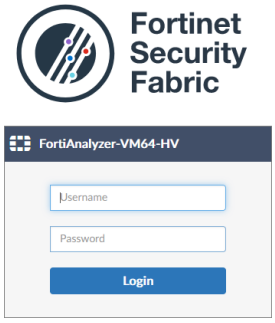
   c. Click *Apply*.
2. In FortiOS, go to *Security Fabric* > *Fabric Connectors* and double-click the *Logging & Analytics* card.
3. On the *FortiAnalyzer* tab, set the *Status* to *Enabled*.
4. Enter the FortiAnalyzer IP in the *Server* field.
5. Optionally, configure the remaining log settings:

Upload option	Select the frequency of log uploads to the remote device: • *Real Time*: logs are sent to the remote device in real time. • *Every Minute*: logs are sent to the remote device once every minute. This option is unavailable if the Security Fabric connection is configured. • *Every 5 Minutes*: logs are sent to the remote device once every five minutes. This is the default option. This option is unavailable if the Security Fabric connection is configured. • `store-and-upload`: store logs to a local disk before uploading to FortiAnalyzer or FortiManager at a scheduled time. This option is only available in the CLI.
Allow access to FortiGate REST API	Define access to FortiGate REST API: • *Enable*: the REST API accesses the FortiGate topology and shares data and results. • *Disable*: the REST API does not share data and results.
Verify FortiAnalyzer certificate	Define the FortiAnalyzer certificate verification process: • *Enable*: the FortiGate will verify the FortiAnalyzer serial number against the FortiAnalyzer certificate. When verified, the serial number is stored in the FortiGate configuration. • *Disable*: the FortiGate will not verify the FortiAnalyzer certificate against the serial number.

6. Click *OK*. The FortiAnalyzer *Connection status* is *Unauthorized* and a pane might open to verify the FortiAnalyzer's serial number.

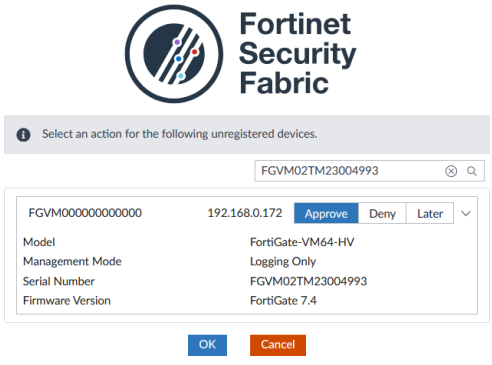


7. Click *Accept*.
8. Double-click the *Logging & Analytics* card again.
9. Click OK in the confirmation popup to open a window to authorize the FortiGate on the FortiAnalyzer.
   A login screen opens in a new browser window.
10. Enter the username and password, then click *Login*.

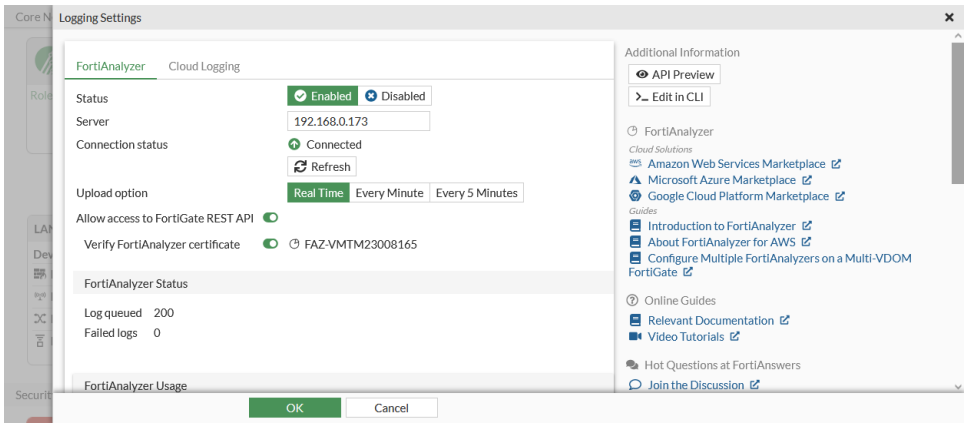


The authorization dialog opens.

11. Select *Approve* in the row for the FortiGate, and then click *OK* to authorize the FortiGate.



12. In FortiOS, *Connection status* is now *Authorized* on the *Logging Settings* pane.



FortiGates with a FortiAnalyzer Cloud license can send all logs to FortiAnalyzer Cloud.

Configuring cloud logging

There are two options available in the *Cloud Logging* tab of the *Logging & Analytics* connector card: *FortiGate Cloud* and *FortiAnalyzer Cloud*. If there are multiple services enrolled on the FortiGate, the preference is: FortiAnalyzer Cloud logging, FortiAnalyzer logging, then FortiGate Cloud logging.

This topic covers the following cloud logging aspects:

- Configuring FortiGate Cloud
  - Registration and activation
  - Enabling logging to FortiGate Cloud
  - Logging into the FortiGate Cloud portal
  - Configuring a Security Fabric with FortiGate Cloud logging
  - Cloud sandboxing
- Configuring FortiAnalyzer Cloud

Configuring FortiGate Cloud

FortiGate Cloud is a hosted security management and log retention service for FortiGate devices. It provides centralized reporting, traffic analysis, configuration management, and log retention without the need for additional hardware or software.

FortiGate Cloud offers a wide range of features:

- **Simplified central management**

  FortiGate Cloud provides a central GUI to manage individual or aggregated FortiGate and FortiWiFi devices. Adding a device to the FortiGate Cloud management subscription is straightforward. FortiGate Cloud has detailed traffic and application visibility across the whole network.
- **Hosted log retention with large default storage allocated**

  Log retention is an integral part of any security and compliance program, but administering a separate storage system is onerous. FortiGate Cloud takes care of this automatically and stores the valuable log

information in the cloud. Different types of logs can be stored, including Traffic, System Events, Web, Applications, and Security Events.

- **Monitoring and alerting in real time**

  Network availability is critical to a good end-user experience. FortiGate Cloud enables you to monitor your FortiGate network in real time with different alerting mechanisms to pinpoint potential issues. Alerting mechanisms can be delivered via email.
- **Customized or pre-configured reporting and analysis tools**

  Reporting and analysis are your eyes and ears into your network's health and security. Pre-configured reports are available, as well as custom reports that can be tailored to your specific reporting and compliance requirements. The reports can be emailed as PDFs, and can cover different time periods.
- **Maintain important configuration information uniformly**

  The correct configuration of the devices within your network is essential for maintaining optimum performance and security posture. In addition, maintaining the correct firmware (operating system) level allows you to take advantage of the latest features.
- **Service security**

  All communication (including log information) between the devices and the cloud is encrypted. Redundant data centers are always used to give the service high availability. Operational security measures have been put in place to make sure your data is secure — only you can view or retrieve it.

For more information, refer to the FortiGate Cloud documentation.

For FortiGates managed by FortiGate Cloud, automatic firmware patch may be enabled depending on the FortiGate Cloud version and portal in use. See the Administration Guide for the applicable FortiGate Cloud version and portal:

- Standard Portal Administration Guide
- 25.1.a Portal (Beta) Administration Guide
- Premium Portal Administration Guide

Registration and activation

Before you can activate a FortiGate Cloud account, you must register your device first.

FortiGate Cloud accounts can be registered manually through the FortiGate Cloud website, https://www.forticloud.com, or you can easily register and activate your account directly from your FortiGate.

To activate your FortiGate Cloud account:

1. On your device, go to *Dashboard* > *Status*.
2. In the *FortiGate Cloud* widget, click the *Not Activated* > *Activate* button in the *Status* field.
3. A pane will open asking you to register your FortiGate Cloud account. Click *Create Account*, enter your information, view and accept the terms and conditions, and then click *OK*.
4. A second dialogue window opens, asking you to enter your information to confirm your account. This sends a confirmation email to your registered email. The dashboard widget then updates to show that confirmation is required.

5. Open your email, and follow the confirmation link it contains.
   A FortiGate Cloud page will open, stating that your account has been confirmed. The *Activation Pending* message on the dashboard will change to state the type of account you have, and will provide a link to the FortiGate Cloud portal.

Enabling logging to FortiGate Cloud

To enable logging to FortiGate Cloud:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Logging & Analytics* card.
2. On the *Cloud Logging* tab, set *Type* to *FortiGate Cloud*.
3. Select an upload option:
   - *Real Time*: logs are sent to the cloud device in real time.
   - *Every Minute*: logs are sent to the cloud device once every minute.
   - *Every 5 Minutes*: logs are sent to the cloud device once every five minutes (default).

   If the Security Fabric connection is configured, only the *Real Time* option is available.
4. Click *OK*.

Logging into the FortiGate Cloud portal

Once logging has been configured and you have registered your account, you can log into the FortiGate Cloud portal and begin viewing your logging results. There are two methods to reach the FortiGate Cloud portal:

- If you have direct network access to the FortiGate:
  a. Go to *Dashboard > Status*.
  b. In the *FortiGate Cloud* widget, in the *Status* field, click *Activated > Launch Portal*, or, in the *Licenses* widget, click *Support > Login to My Account*.
- If you do not have access to the FortiGate's interface, visit the FortiGate Cloud website (https://www.forticloud.com) and log in remotely, using your email and password. It will ask you to confirm the FortiGate Cloud account you are connecting to and then you will be granted access.

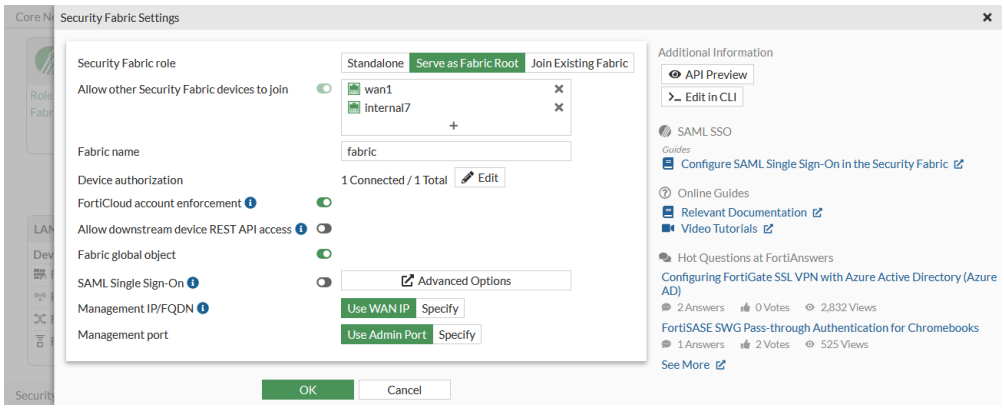
Configuring a Security Fabric with FortiGate Cloud logging

A Security Fabric can be created on the root device using FortiGate Cloud for cloud logging. When the FortiCloud account enforcement is enabled (by default), members joining the Fabric must be registered to the same FortiCloud account. Devices that are not activated with FortiCloud are also allowed.

For example, the root FortiGate (FGT_10_101F) is configured with FortiGate Cloud logging. In the Security Fabric settings, the *FortiCloud account enforcement* option is enabled by default. The downstream FortiGate, FGT-F-VM, with the same FortiCloud account ID is able to join the Fabric.

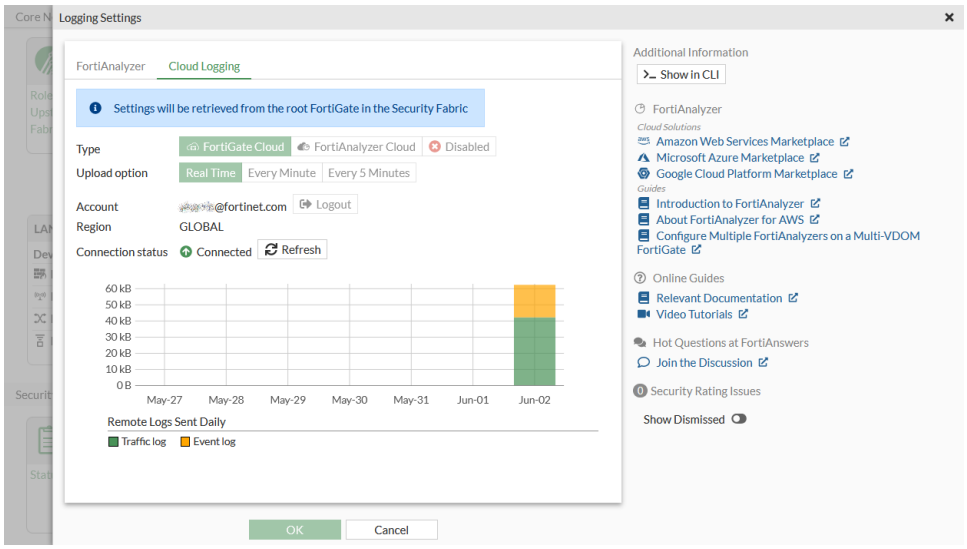
To configure a Security Fabric with FortiCloud logging in the GUI:

1. Configure the Security Fabric settings on the root FortiGate (see Configuring the root FortiGate and downstream FortiGates on page 3702). The *FortiCloud account enforcement* setting is enabled by default.



2. Configure FortiCloud logging on the root FortiGate:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Logging & Analytics* card.
   b. On the *Cloud Logging* tab, set *Type* to *FortiGate Cloud*.

   c. Click *OK*.
3. Configure the FGT-F-VM to join the Security Fabric:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. Set *Security Fabric role* to *Join Existing Fabric*.
   c. Click *OK*. The FortiGate is authorized and successfully joins the Security Fabric.
4. Check the FortiCloud logging settings:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Logging & Analytics* card.
   b. Go to the *Cloud Logging* tab. The settings are automatically retrieved from the root FortiGate and the *Account* is the same.



To configure a Security Fabric with FortiCloud logging in the CLI:

```
config log fortiguard setting
    set status enable
    set upload-option realtime
end
```

The FortiCloud account enforcement setting is enabled by default in the Security Fabric settings:

```
show system csf
    config system csf
        set status enable
        set group-name "CSF_101"
        set forticloud-account-enforcement enable
    end
```

Cloud sandboxing

FortiGate Cloud can be used for automated sample tracking, or sandboxing, for files from a FortiGate. This allows suspicious files to be sent to be inspected without risking network security. If the file exhibits risky behavior, or is found to contain a virus, a new virus signature is created and added to the FortiGuard antivirus signature database.

See Configuring sandboxing on page 3753 for instructions to configure FortiGate Cloud Sandbox. Sandboxing results are shown on the *Sandbox* tab in the FortiGate Cloud portal.

Configuring FortiAnalyzer Cloud

FortiAnalyzer Cloud differs from FortiAnalyzer in the following ways:

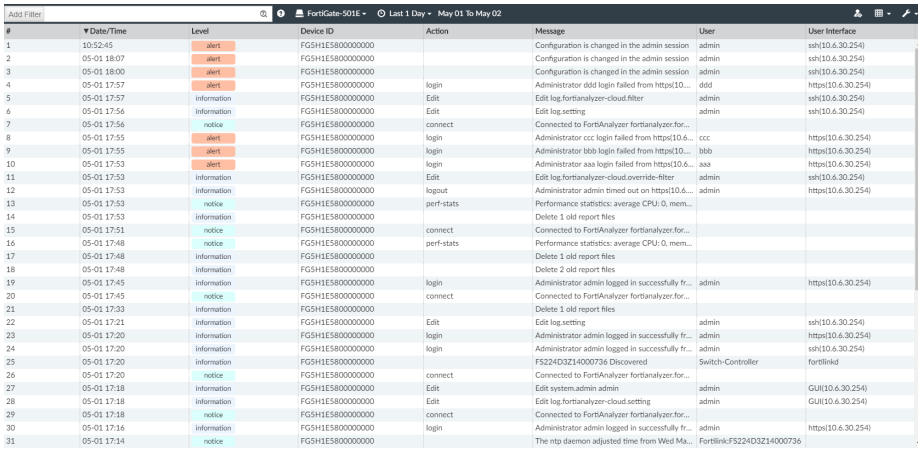
- You cannot enable FortiAnalyzer Cloud in `vdom override-setting` when global FortiAnalyzer Cloud is disabled.
- You must use the CLI to retrieve and display logs sent to FortiAnalyzer Cloud. The FortiOS GUI is not supported.

- You cannot enable FortiAnalyzer Cloud and FortiGate Cloud at the same time.

For more information, see Licensing in the FortiAnalyzer Cloud Deployment Guide.

In the *Security Fabric > Fabric Connectors > Logging & Analytics* card settings, *FortiAnalyzer Cloud* is grayed out when you do not have a FortiAnalyzer Cloud entitlement. When you have a FortiAnalyzer Cloud entitlement, *FortiAnalyzer Cloud* is available and you can authenticate by the certificate.

In FortiAnalyzer Cloud, you can view logs from FortiOS in the *Event > All Types* page.



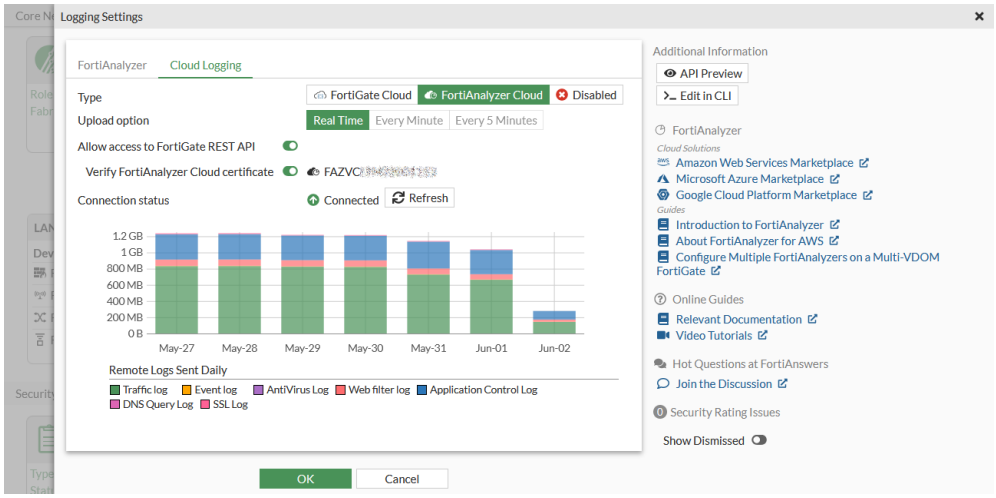
To configure FortiAnalyzer Cloud logging in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Logging & Analytics* card.
2. Select the *Cloud Logging* tab and set the *Type* to *FortiAnalyzer Cloud*.
3. Optionally, configure the remaining log settings:

Upload option	Select the frequency of log uploads to the remote device: • *Real Time*: logs are sent to the remote device in real time. • *Every Minute*: logs are sent to the remote device once every minute. This option is unavailable if the Security Fabric connection is configured. • *Every 5 Minutes*: logs are sent to the remote device once every five minutes. This is the default option. This option is unavailable if the Security Fabric connection is configured.
Allow access to FortiGate REST API	Define access to FortiGate REST API: • *Enable*: the REST API accesses the FortiGate topology and shares data and results. • *Disable*: the REST API does not share data and results.
Verify FortiAnalyzer Cloud certificate	Define the FortiAnalyzer Cloud certificate verification process: • *Enable*: the FortiGate will verify the FortiAnalyzer Cloud serial number against the FortiAnalyzer certificate. When verified, the serial number is stored in the FortiGate configuration. • *Disable*: the FortiGate will not verify the FortiAnalyzer Cloud certificate against the serial number.

4. Click *OK*. A prompt appears to verify the FortiAnalyzer Cloud serial number.

5. Click *Accept*.
6. The verified FortiAnalyzer Cloud certificate appears in the settings.



To enable FortiAnalyzer Cloud logging in the CLI:

1. Configure the FortiAnalyzer Cloud settings:

```
config log fortianalyzer-cloud setting
    set status enable
    set ips-archive disable
    set certificate-verification enable
    set serial "FAZVCLTM19000000"
    set access-config enable
    set enc-algorithm high
    set ssl-min-proto-version default
    set conn-timeout 10
    set monitor-keepalive-period 5
    set monitor-failure-retry-period 5
    set upload-option realtime
end
```

2. Configure the FortiAnalyzer Cloud filters:

```
config log fortianalyzer-cloud filter
    set severity information
    set forward-traffic disable
    set local-traffic disable
    set multicast-traffic disable
    set sniffer-traffic disable
    set anomaly disable
    set voip disable
    set dlp-archive disable
end
```

To disable FortiAnalyzer Cloud logging for a specific VDOM in the CLI:

1. Enable override FortiAnalyzer in the general log settings:

```
config log setting
    set faz-override enable
end
```

2. Disable the override FortiAnalyzer Cloud setting:

```
config log fortianalyzer-cloud override-setting
    set status disable
end
```

To set FortiAnalyzer Cloud logging to filter for a specific VDOM in the CLI:

1. Enable override FortiAnalyzer in the general log settings:

```
config log setting
    set faz-override enable
end
```

2. Enable the override FortiAnalyzer Cloud setting:

```
config log fortianalyzer-cloud override-setting
    set status enable
end
```

3. Configure the override filters for FortiAnalyzer Cloud:

```
config log fortianalyzer-cloud override-filter
    set severity information
    set forward-traffic disable
    set local-traffic disable
    set multicast-traffic disable
    set sniffer-traffic disable
    set anomaly disable
    set voip disable
    set dlp-archive disable
end
```

To display FortiAnalyzer Cloud logs in the CLI:

```
# execute log filter device fortianalyzer-cloud
# execute log filter category event
# execute log display
```

Configuring FortiClient EMS

The FortiGate Security Fabric root device can link to FortiClient Endpoint Management System (EMS) and FortiClient EMS Cloud (a cloud-based EMS solution) for endpoint connectors and automation. Multiple EMS servers can be added to the Security Fabric, including FortiClient EMS Cloud server. EMS settings are synchronized between all Fabric members.

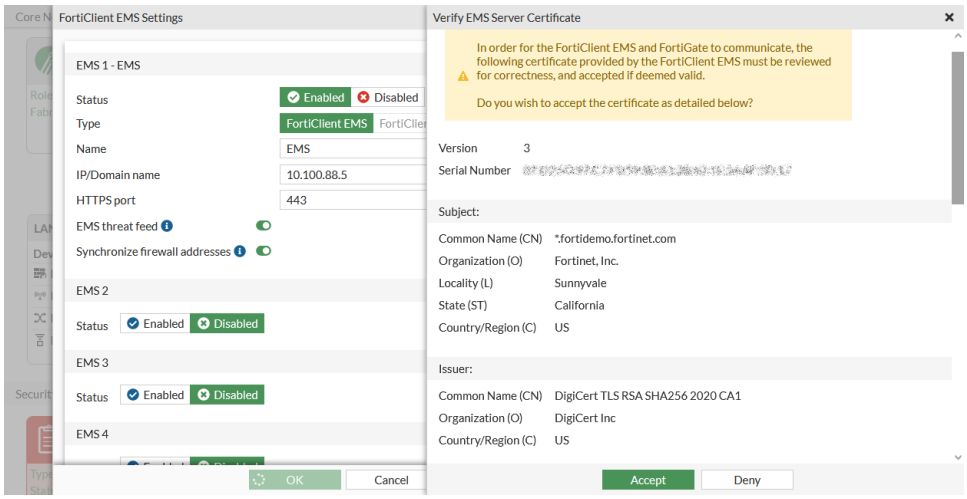
To enable cloud-based EMS services, the FortiGate must be registered to FortiCloud with an appropriate user account. The following examples presume that the EMS certificate has already been configured.

To add an on-premise FortiClient EMS server to the Security Fabric in the GUI:

1. On the root FortiGate, go to *System > Feature Visibility* and enable *Endpoint Control*.
2. Go to *Security Fabric > Fabric Connectors* and double-click the *FortiClient EMS* card.
3. Enable an EMS, and set *Type* to *FortiClient EMS*.
4. Enter a name and IP address or FQDN.

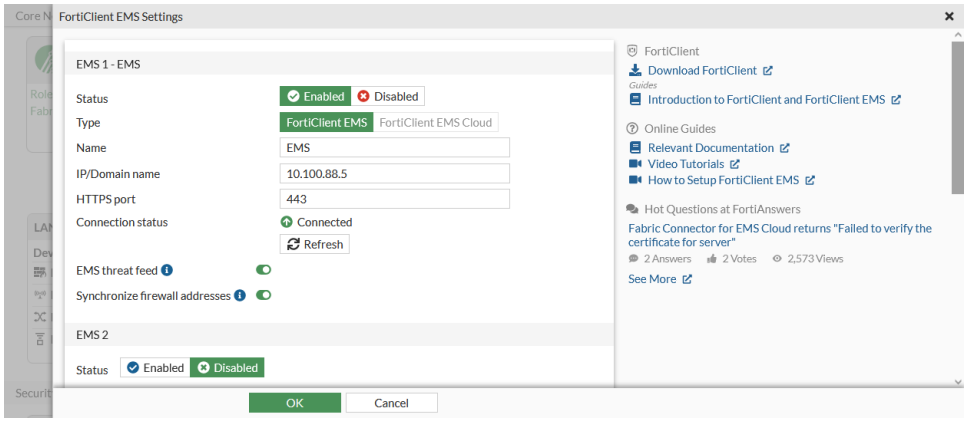
   When connecting to a multitenancy-enabled EMS, Fabric connectors must use an FQDN to connect to EMS, where the FQDN hostname matches a site name in EMS (including "Default"). The following are examples of FQDNs to provide when configuring the connector to connect to the default site and to a site named SiteA, respectively: default.ems.yourcompany.com, sitea.ems.yourcompany.com. See Multitenancy.
5. Optionally, enable *EMS External Feed*. See Malware external feed from EMS on page 1947 for more information about using this setting in an AV profile.
6. Click *OK*.

   A window appears to verify the EMS server certificate:



7. Click *Accept*.
8. Click *Accept*.

   The *Connection status* is now *Connected*:



9. If the device is not authorized, log in to the FortiClient EMS to authorize the FortiGate under *Administration > Fabric Devices*.

   In FortiClient 7.2.5 and above, approvals are performed under *Fabric & Connectors > Fabric Devices*.

To add a FortiClient EMS Cloud server to the Security Fabric in the GUI:

FortiClient EMS Cloud can only be configured when the FortiGate is registered to FortiCloud and the EMS Cloud entitlement is verified.

If the FortiCloud account does not pass the FortiClient EMS Cloud entitlement check, the option is not selectable in the FortiClient EMS connector settings.

1. Go to *Security Fabric > Fabric Connectors* and double-click the *FortiClient EMS* card.
2. Set the *Type* to *FortiClient EMS Cloud*.
3. Enter a name.
4. Click *OK*.

   A window appears to verify the EMS server certificate.
5. Click *Accept*.

The *Connection status* is now *Connected*.

To test connectivity with the EMS server:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *FortiClient EMS* card.
2. In the *Connection status* section, click *Refresh*.

To add an on-premise FortiClient EMS server to the Security Fabric in the CLI:

```
config endpoint-control fctems
    edit {1 | 2 | 3 | 4 | 5}
        set status {enable | disable}
        set name <string>
        set server <ip_address>
        set certificate <string>
        set https-port <integer>
        set source-ip <ip_address>
    next
end
```

The `https-port` is the EMS HTTPS access port number, and the `source-ip` is the REST API call source IP address.

To add a FortiClient EMS Cloud server to the Security Fabric in the CLI:

```
config endpoint-control fctems
    edit {1 | 2 | 3 | 4 | 5}
        set status {enable | disable}
        set name <string>
        set fortinetone-cloud-authentication enable
        set certificate <string>
    next
end
```

To verify the EMS Cloud entitlement in the CLI:

```
# diagnose test update info
```

To verify an EMS certificate in the CLI:

```
# execute fctems verify ems137

EMS configuration needs user to confirm server certificate.
Do you wish to add the above certificate to trusted remote certificates? (y/n)y
```

FortiClient multi-tenancy

Multi-tenancy gives administrators the flexibility to deploy a single FortiGate with access to multiple FortiClient EMS servers, or a single FortiClient EMS with multiple tenants. The FortiGate can support up to seven EMS servers in a single VDOM. When multi-VDOM is enabled on the FortiGate, each VDOM can override the global EMS configurations to connect to their own EMS servers.

The override feature requires FortiClient EMS 7.2.1 and later, and FortiGate running FOS 7.4.0 or later. To use override with FortiClient EMS Cloud, a FortiGate must be running FOS 7.4.4 or later. To connect to a FortiClient Cloud instance registered under a FortiCloud sub-OU in the GUI, a FortiGate must be running FOS 7.6.1 or later.

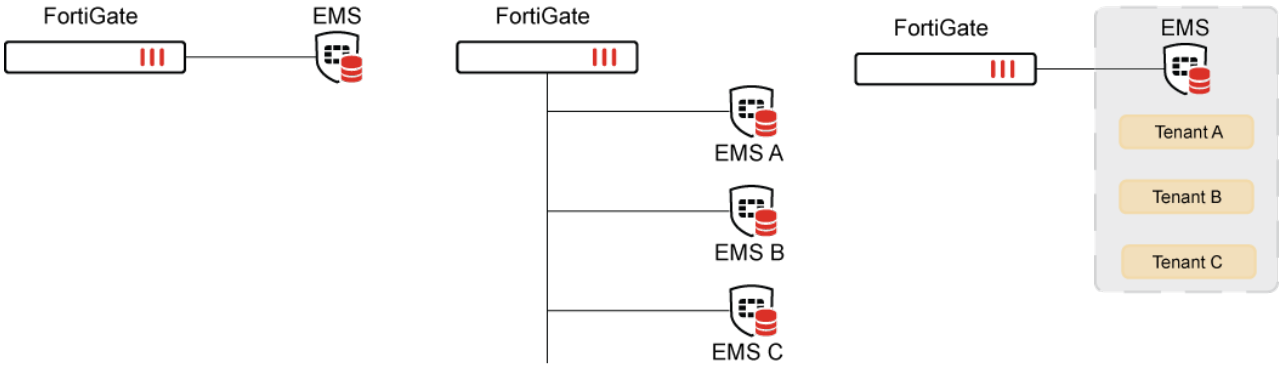
This functionality can be applied to MSSP (managed security service provider) configurations, and each VDOM has its own *FortiClient EMS* card for the EMS server or instance.

The following reference table provides a high-level view of single versus multi-tenancy scenarios, depending on the status of the FortiGate (whether VDOM is enabled or disabled) and FortiClient EMS:

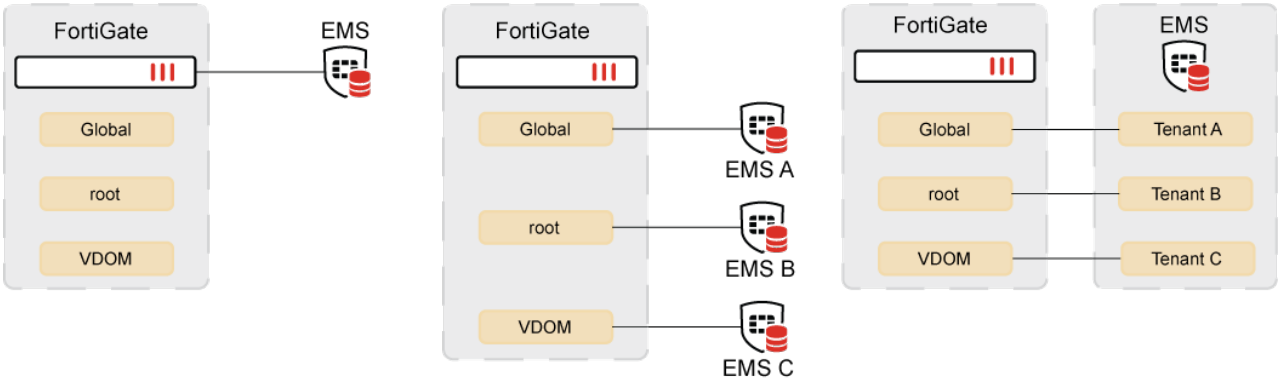
FortiGate	Single FortiClient EMS instance	Multiple FortiClient EMS instances	Single FortiClient EMS instance with multi-tenancy
No VDOM	Single tenant	Multi-tenancy without override	Multi-tenancy without override
VDOM	Global FortiClient EMS multi-tenancy	Multi-tenancy with override	Multi-tenancy with override

These scenarios can further be demonstrated as follows:

- No VDOM:



- VDOM:



Basic configurations

In a single VDOM configuration, you can configure multiple EMS servers.

To configure FortiClient EMS servers in a single VDOM set up:

1. Go to *Security Fabric > Fabric Connectors*.
2. Double-click on the *FortiClient EMS* card to edit.
3. For each EMS server, click *Enabled*, and fill in the configurations for that EMS server.
4. Click *OK* to save the settings.

In a multi-VDOM configuration, first configure the global EMS configurations, then configure override on each VDOM. If a VDOM does not enable override, it will inherit the global configurations.

To configure FortiClient EMS servers in a multi-VDOM set up:

1. In the Global VDOM, go to *Security Fabric > Fabric Connectors*.
2. Double-click on the *FortiClient EMS* card to edit.
3. For each EMS server, click *Enabled*, and fill in the configurations for that EMS server.
4. Click *OK* to save the settings.
5. Enter a VDOM.
6. From the CLI, edit the following settings:

```
config endpoint-control settings
    set override enable
end
```

7. Back in the GUI, go to *Security Fabric > Fabric Connectors*.
8. Configure each EMS server as needed.
9. Click *OK* to save.

Advanced configurations

FortiGate supports connecting to a FortiClient Cloud instance registered under a sub-OU in FortiCloud. Furthermore, a FortiGate can override FortiClient Cloud access key setting on a per-VDOM basis. With these enhancements, a FortiGate can support FortiClient Cloud in multi-tenancy scenarios.

This feature includes the following scope and limitations:

- The FortiGate will perform an entitlement check on the registered FortiCloud Account to verify a FortiClient Cloud entitlement exists on the root FortiCloud account. If the FortiGate has no FortiClient Cloud entitlement, you cannot select the FortiClient EMS Cloud type or input an access key.
- Using the FortiClient Cloud access key, a FortiGate can connect to a FortiClient Cloud instance belonging to a sub-OU in the same FortiCloud account or a different FortiCloud account.
- Within the same VDOM, the FortiGate can have an EMS connector connecting to multiple FortiClient Cloud instances.

The FortiClient Cloud access key can be implemented in the `cloud-authentication-access-key` parameter in the CLI.

```
config endpoint-control fctems-override
    edit 1
        set status enable
        set name <name>
        set fortinetone-cloud-authentication enable
        set cloud-authentication-access-key <key>
    next
end
```

Examples

Example 1: Enabling override on the root VDOM using the CLI

To enable override on the root VDOM in the CLI:

1. Enable override on the required VDOMs:

```
config endpoint-control settings
    set override enable
end
```

2. Configure the EMS server on the desired VDOM:

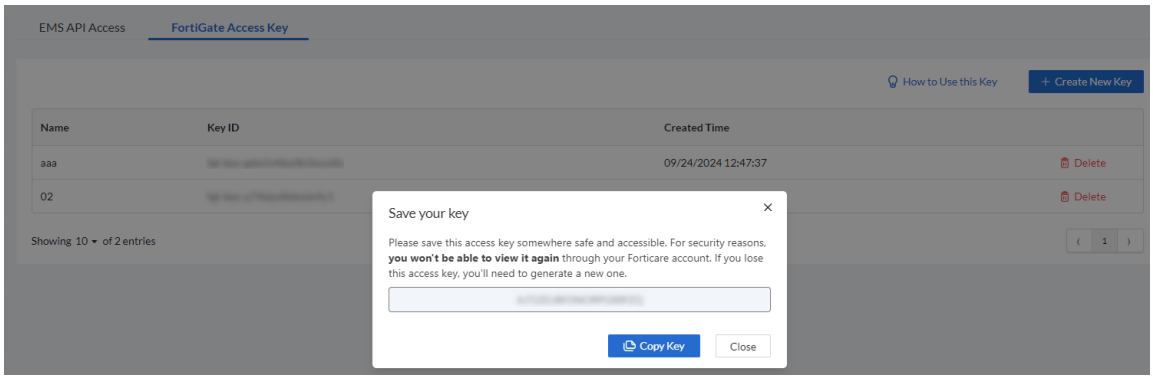
```
(root) config endpoint-control fctems-override
    edit 1
        set status enable
        set name "ems140_root"
        set server "172.16.200.140"
        set serial-number "FCTEMS8821******"
        set tenant-id "00000000000000000000000000000000"
        set capabilities fabric-auth silent-approval websocket websocket-malware push-ca-certs
common-tags-api tenant-id single-vdom-connector
    next
    edit 2
        set name "ems133_root"
        set server "172.16.200.133"
    next
end
```

Example 2: Connecting to different FortiClient Cloud instances

In this example, a FortiGate will connect to different FortiClient Cloud instances between the Global EMS connector, root and vdom1.

To connect to different FortiClient Cloud instances in the CLI:

1. Obtain the access by from FortiClient Cloud by going to *FortiCloud* > *FortiClient Cloud*.
2. Click *Access Key* and switch to the *FortiGate Access Key* tab.
3. Click *Create New Key* to generate a new key.



4. Repeat this for another FortiClient Cloud instance to be applied to vdom1.
5. On the FortiGate with multi-VDOM enabled, configure the Global EMS connector:

```
config global
    config endpoint-control fctems
        edit 2
            set status enable
            set name "Cloud_EMS_Global"
            set fortinetone-cloud-authentication enable
            set serial-number "FCTEMSXXXXXXXXXX"
            set tenant-id "00000000000000000000000000000000"
        next
    end
end
```

6. Switch to and configure the root VDOM:

```
config vdom
    edit root
        config endpoint-control settings
            set override enable
        end
        config endpoint-control fctems-override
            edit 1
                set status enable
                set name "cloud_ems_root"
                set fortinetone-cloud-authentication enable
                set cloud-authentication-access-key "XXXXXXXXXXXXXXXXXXXX"
                set serial-number "FCTEMSXXXXXXXXXX"
                set tenant-id "00000000000000000000000000000000"
            next
        end
    next
end
```

7. Repeat the same steps for vdom1:

```
config vdom
    edit vdom1
        config endpoint-control settings
            set override enable
```

```
        end
        config endpoint-control fctems-override
            edit 1
                set status enable
                set name "cloud_vdom1"
                set fortinetone-cloud-authentication enable
                set cloud-authentication-access-key "XXXXXXXXXXXXXXXXXXX"
                set serial-number "FCTEMSXXXXXXXXXX"
                set tenant-id "00000000000000000000000000000000"
            next
        end
    next
end
```

8. From the CLI, run the following commands to troubleshoot.

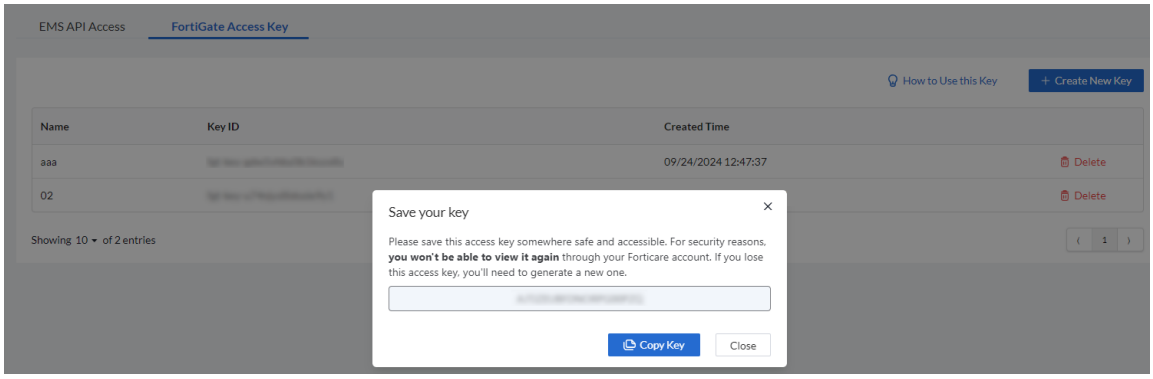
```
# diagnose endpoint filter show-large-data yes
# diagnose debug application fcnacd -1
# diagnose debug enable
```

A successful connection will look like the following:

```
…
[ec_ez_worker_base_prep_resolver:382] Outgoing interface index 0 for 1 (cloud_vdom1).
[ec_ez_worker_prep_data_url:190] Full URL: https://sf.00000-XXXXXXXXXXXXXXXXXXX.fortinet-
ca2.fortinet.com/api/v1/system/serial_number
[ec_ez_worker_base_prep_ssl:429] verify peer method: 3, current ssl_cb: (nil), new ssl_cb:
0x55c1163571b0
[ec_ems_context_submit_work:642] Call submitted successfully.
    obj-id: 0, desc: REST API to get EMS Serial Number., entry: api/v1/system/serial_number.
[__match_server_cert_key:462] verify_peer_method: 3
```

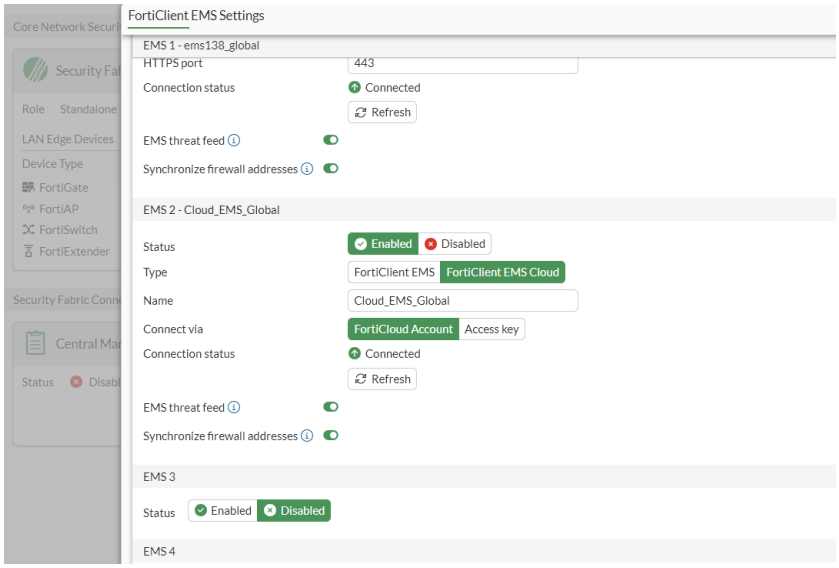
To connect to different FortiClient Cloud instances in the GUI:

1. Obtain the access by from FortiClient Cloud by going to *FortiCloud* > *FortiClient Cloud*.
2. Click *Access Key* and switch to the *FortiGate Access Key* tab.
3. Click *Create New Key* to generate a new key.

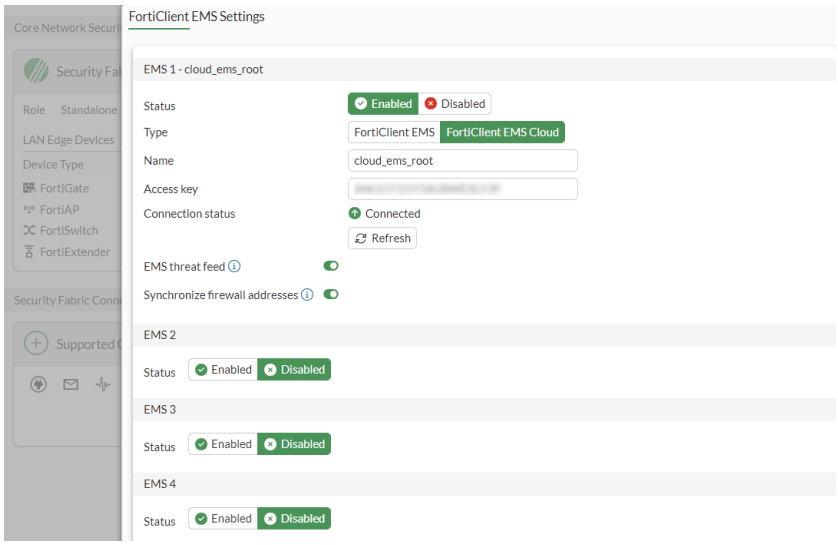


4. Repeat this for another FortiClient Cloud instance to be applied to vdom1.
5. On the FortiGate with multi-vdom enabled, go to *Global*.

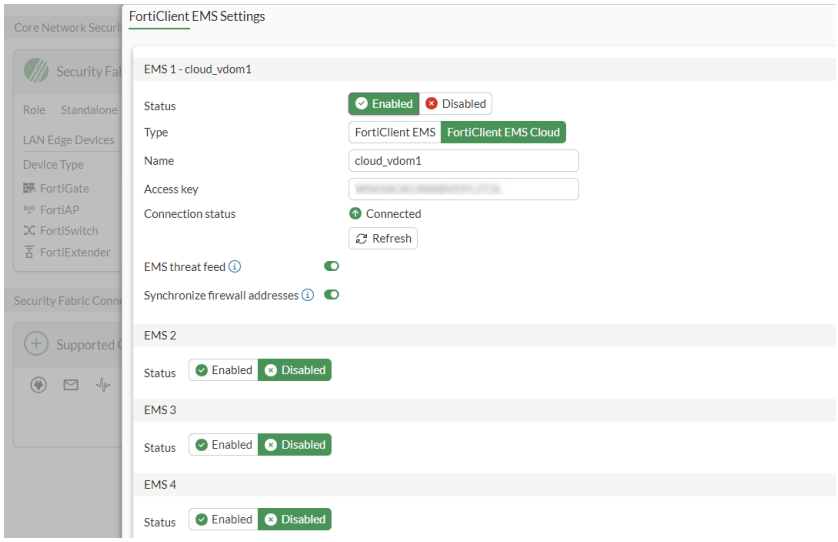
a. Go to *Security Fabric > Fabric Connectors*.
b. Edit the *FortiClient EMS* connector.
c. Set *Status* to *Enabled*.
d. Set *Type* to *FortiClient EMS Cloud*.
e. Set *Name* to *Cloud_EMS_Global*.
f. Set *Connect via* to *FortiCloud Account*.
g. Click *OK* to save. Verify the certificate when prompted and continue saving the settings.



6. Switch to the root vdom.
   a. Go to *Security Fabric > Fabric Connectors*.
   b. Edit the *FortiClient EMS* connector.
   c. Set *Status* to *Enabled*.
   d. Set *Type* to *FortiClient EMS Cloud*.
   e. Set *Name* to *cloud_ems_root*.
   f. Set *Access key* to the key retrieved from FortiClient Cloud.
   g. Click *OK* to save.



7. Repeat the same steps above for vdom1.



FortiClient EMS capabilities

FortiClient EMS supports many capabilities that are integrated with the FortiGate though the EMS connector. New versions of FortiClient EMS may support new capabilities. The FortiGate is able to detect and synchronize the capabilities from each EMS server as it establishes the EMS connection.

Using EMS silent approval in the Security Fabric

FortiClient EMS with Fabric authorization and silent approval capabilities can approve the root FortiGate in a Security Fabric once, and then silently approve remaining downstream FortiGates in the Fabric. Similarly in an HA scenario, an approval only needs to be made once to the HA primary unit. The remaining cluster members are approved silently.

To use EMS silent approval:

1. Configure the EMS entry on the root FortiGate or HA primary:

```
config endpoint-control fctems
    edit 1
        set status enable
        set name "ems139"
        set fortinetone-cloud-authentication disable
        set server "172.16.200.139"
        set https-port 443
        set source-ip 0.0.0.0
        set pull-sysinfo enable
        set pull-vulnerabilities enable
        set pull-tags enable
        set pull-malware-hash enable
        unset capabilities
        set call-timeout 30
        set websocket-override disable
    next
end
```

   When the entry is created, the capabilities are unset by default.

2. Authenticate the FortiGate with EMS:

```
# execute fctems verify ems_139
...
```

   The FortiGate will enable the Fabric authorization and silent approval based on the EMS supported capabilities.

```
config endpoint-control fctems
    edit 1
        set server "172.18.62.12"
        set capabilities fabric-auth silent-approval websocket
    next
end
```

3. Configure a downstream device in the Security Fabric (see Configuring the root FortiGate and downstream FortiGates on page 3702 for more details). The downstream device will be silently approved.
4. Configure a secondary device in an HA system (see HA active-passive cluster setup on page 3357 and HA active-active cluster setup on page 3363 for more details). The secondary device will be silently approved.

Allowing deep inspection certificates to be synchronized to EMS and distributed to FortiClient

On FortiClient EMS versions that support `push CA certs` capability, the FortiGate will push CA certificates used in SSL deep inspection (see Deep inspection on page 2310 for more details) to the EMS server. On the EMS server, the CA certificates can be selected in the managed endpoint profiles so they can be installed on managed endpoints. FortiClient EMS 7.0.1 and later is required to use this feature.

To configure deep inspection certificate synchronization to EMS:

1. Configure the EMS Fabric connector:

```
config endpoint-control fctems
    edit 2
        set status enable
        set name "ems138"
        set fortinetone-cloud-authentication disable
        set server "172.16.200.138"
        set https-port 443
        set source-ip 0.0.0.0
        set pull-sysinfo enable
        set pull-vulnerabilities enable
        set pull-tags enable
        set pull-malware-hash enable
        set capabilities fabric-auth silent-approval websocket websocket-malware push-ca-certs
        set call-timeout 30
        set websocket-override disable
    next
end
```

2. Apply the certificate to an SSL/SSH profile for deep inspection:

```
config firewall ssl-ssh-profile
    edit "deep-inspection"
        set comment "Read-only deep inspection profile."
        config https
            set ports 443
            set status deep-inspection
        end
        ...
        set server-cert-mode re-sign
        set caname "Fortinet_CA_SSL"
        set untrusted-caname "Fortinet_CA_Untrusted"
    next
end
```

   The default deep inspection profile, CA certificate, and untrusted CA certificates are used in this example.

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "deep-inspection"
        set srcintf "port14"
        set dstintf "port13"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
```

```
        set ssl-ssh-profile "deep-inspection"
        set av-profile "default"
        set nat enable
    next
end
```

4. In EMS, verify that the CA certificate was pushed to EMS:
   a. Go to *Endpoint Policy & Components > CA Certificates*.

   b. Verify the certificate table to see that the EMS server received the CA certification from the different FortiGates.

5. Select the CA certificate in the endpoint profile:
   a. Go to *Endpoint Profiles > System Settings* and edit a profile. The default profile is used in this example.
   b. In the *Other* section, enable *Install CA Certificate on Client* and select the *Fortinet_CA_SSL* certificate for the desired endpoint.

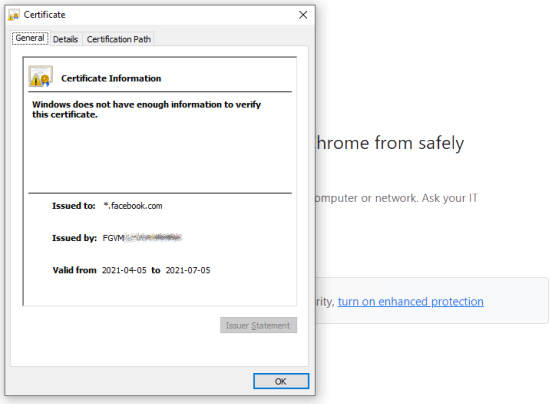
   c. Click *Save*.

   After the FortiClient endpoint is registered, it receives the CA certificate. When the FortiClient endpoint tries to access the internet through the FortiGate with the firewall policy that has deep inspection, no warning message is displayed. The server certificate is trusted with the installed CA certificate to complete the certificate chain.

Verification

Before configuring deep inspection certificate synchronization, a warning message is displayed when a FortiClient endpoint accesses the internet through the FortiGate with the firewall policy that has deep inspection. The FortiClient certificate store does not have the FortiGate's CA that is used in the deep inspection SSL/SSH profile.

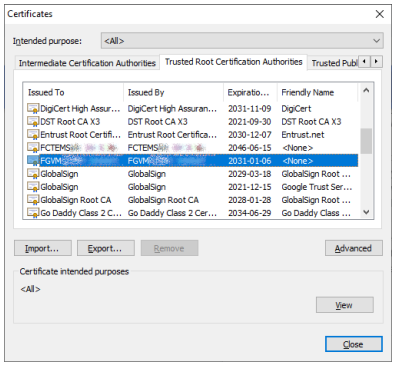
For example, accessing https://www.facebook.com in Chrome shows a warning. In the address bar, clicking *Not secure* > *Certificate* opens the *Certificate* dialog, which indicates that *Windows does not have enough information to verify the certificate*.



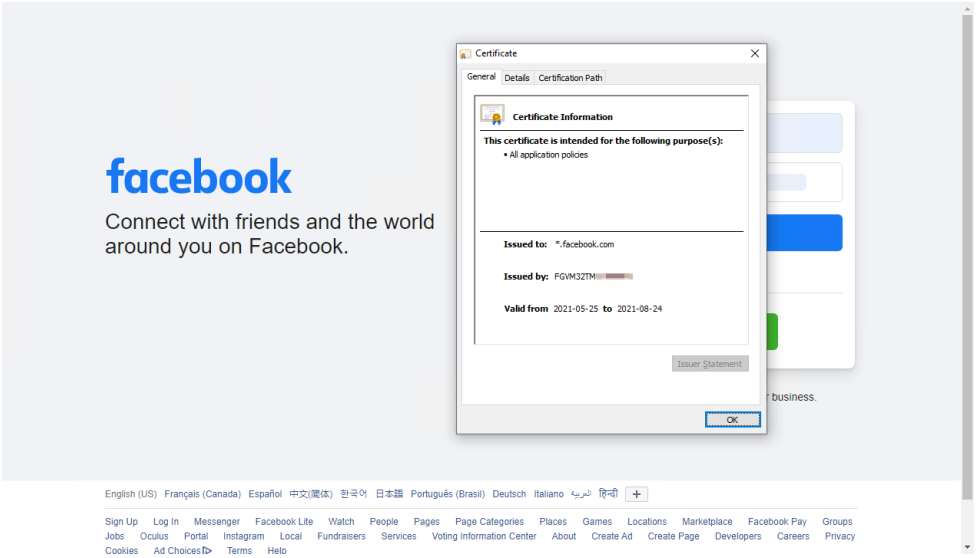
After the EMS profile is pushed to FortiClient endpoint, the expected FortiGate's certificate is shown in its certificate store.

To verify the deep inspection certificate synchronization:

1. In Chrome, go to *Settings* > *Privacy and security* and open *Manage certificates*.
2. Click the *Trusted Root Certification Authorities* tab. The FortiGate's certificate appears in the list.



3. On the FortiClient endpoint using Chrome, go to https://www.facebook.com. The website is displayed.
4. In the address bar, click the padlock, then click *Certificate*. The dialog displays the valid certificate information.



Diagnostics

Use the `diagnose endpoint fctems json deep-inspect-cert-sync` command in FortiOS to verify the certificate information. In the following example, there are multiple VDOMs with FortiGates in HA mode.

To verify the primary FortiGate:

```
FGT_EC_Primary (global) # diagnose endpoint fctems json deep-inspect-cert-sync
JSON:
"""
{
  "fortigates":[
    "FG2K5E39169*****",
    "FG2K5E39169*****"
  ],
  "vdoms":[
    {
      "vdom":"root",
      "certs":[
        {
          "name":"Fortinet_CA_SSL",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X\/bv+q\\n-----END
CERTIFICATE-----\\n"
        },
        {
          "name":"Fortinet_CA_Untrusted",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID8DCCAtig...3zBbfzP+nVUpC\\nZDPRZA==\\n-----END
CERTIFICATE-----"
        }
      ]
    },
    {
      "vdom":"vdom1",
```

```
      "certs":[
        {
          "name":"Fortinet_CA_SSL",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X\/bv+q\\n-----END
CERTIFICATE-----\\n"
        },
        {
          "name":"Fortinet_CA_Untrusted",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID8DCCAtig...3zBbfzP+nVUpC\\nZDPRZA==\\n-----END
CERTIFICATE-----"
        }
      ]
    }
  ]
}
"""
```

To verify the secondary FortiGate:

```
FGT_EC_Secondary(global) # diagnose endpoint fctems json deep-inspect-cert-sync
JSON:
"""
{
  "fortigates":[
    "FG2K5E39169*****",
    "FG2K5E39169*****"
  ],
  "vdoms":[
    {
      "vdom":"root",
      "certs":[
        {
          "name":"Fortinet_CA_SSL",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X\/bv+q\\n-----END
CERTIFICATE-----\\n"
        },
        {
          "name":"Fortinet_CA_Untrusted",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID8DCCAtig...3zBbfzP+nVUpC\\nZDPRZA==\\n-----END
CERTIFICATE-----"
        }
      ]
    },
    {
      "vdom":"vdom1",
      "certs":[
        {
          "name":"Fortinet_CA_SSL",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X\/bv+q\\n-----END
CERTIFICATE-----\\n"
        },
        {
```

```
          "name":"Fortinet_CA_Untrusted",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID8DCCAtig...3zBbfzP+nVUpC\\nZDPRZA==\\n-----END
CERTIFICATE-----"
        }
      ]
    }
  ]
}
"""
```

Allowing FortiClient EMS connectors to trust EMS server certificate renewals based on the CN field

When a FortiGate establishes a Fabric connection with FortiClient EMS, the FortiGate must trust the CA that signed the server certificate. Upon the approval of the EMS certificate, the FortiGate saves the CN field and will trust future certificates that are signed by the same CA and have the same CN field. This allows EMS servers to update their certificates at regular intervals without requiring re-authorization on the FortiGate side, as long as the CN field matches. This prevents interruptions to the EMS Fabric connection when a certificate is updated. Previously, upon the user's approval of the certificate, the certificate fingerprint was saved on the FortiGate, and this required the FortiGate to re-authorize the EMS connection each time the server certificate is updated.

```
config endpoint-control fctems
    edit <id>
        set trust-ca-cn {enable | disable}
    next
end
```

This feature is supported for EMS on-premise and cloud connections, and is the default setting. To authorize based on the certificate fingerprint, disable the `trust-ca-cn` setting. If the setting is changed back to be enabled at a later time, the user will have to re-approve the EMS certificate.

To configure the EMS Fabric connector to trust EMS server certificate renewals based on the CN field:

```
config endpoint-control fctems
    edit 1
        set status enable
        set name "ems133"
        set dirty-reason none
        set fortinetone-cloud-authentication disable
        set server "172.18.62.35"
        set https-port 443
        set serial-number "FCTEMS8822000000"
        set tenant-id "00000000000000000000000000000000"
        set source-ip 0.0.0.0
        set pull-sysinfo enable
        set pull-vulnerabilities enable
        set pull-tags enable
        set pull-malware-hash enable
        set capabilities fabric-auth silent-approval websocket websocket-malware push-ca-certs
```

```
common-tags-api tenant-id
        set call-timeout 30
        set out-of-sync-threshold 180
        set websocket-override disable
        set interface-select-method auto
        set trust-ca-cn enable
    next
end
```

To verify the configuration:

1. Download the FortiGate configuration file.
2. Verify the `ca-cn-info` entry, which lists the trusted CA certificate information. In this example, ems133 connector has `trust-ca-cn` enabled and ems138 connector has `trust-ca-cn` disabled. For ems138, the `ca-cn-info` entry does not appear, and there is a `certificate-fingerprint` field instead:

```
config endpoint-control fctems
    edit 1
        set status enable
        set name "ems133"
        set server "172.18.62.35"
        set serial-number "FCTEMS8822000000"
        set tenant-id "00000000000000000000000000000000"
        set capabilities fabric-auth silent-approval websocket websocket-malware push-ca-certs
common-tags-api tenant-id
        set ca-cn-info "C = CA, ST = BC, L = VANCOUVER, O = FTNT, OU = ReleaseQA, CN =
Release_QA, emailAddress = ********@fortinet.comRelease_QA"
    next
    edit 2
        set status enable
        set name "ems138"
        set server "172.18.62.18"
        set serial-number "FCTEMS8821000000"
        set tenant-id "00000000000000000000000000000000"
        set capabilities fabric-auth silent-approval websocket websocket-malware push-ca-certs
common-tags-api tenant-id
        set certificate-fingerprint
"18:51:76:67:EB:4C:31:A1:51:3F:74:F7:8E:1D:47:5C:18:0F:FE:45:DF:52:91:52:37:0B:27:E7:F1:85:5B:
01:8C:7D:FB:2D:C7:D2:CC:FE:4A:E3:0E:A9:2A:1C:27:4D:D2:A6:C5:87:B8:97:98:57:75:10:15:28:EF:A2:2
3:7C"
        set trust-ca-cn disable
    next
    ...
end
```

3. Run diagnostics to view the certificate information:

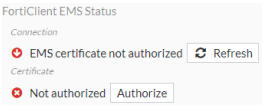
```
# diagnose test application fcnacd 96
ems_id 1, certificate authority and common name: C = CA, ST = BC, L = VANCOUVER, O = FTNT, OU
= ReleaseQA, CN = Release_QA, emailAddress = ********@fortinet.comRelease_QA
ems_id 1, fingerprint_sha512:
```

```
ems_id 2, certificate authority and common name:
ems_id 2, fingerprint_sha512:
18:51:76:67:EB:4C:31:A1:51:3F:74:F7:8E:1D:47:5C:18:0F:FE:45:DF:52:91:52:37:0B:27:E7:F1:85:5B:0
1:8C:7D:FB:2D:C7:D2:CC:FE:4A:E3:0E:A9:2A:1C:27:4D:D2:A6:C5:87:B8:97:98:57:75:10:15:28:EF:A2:23
:7C
```

FortiClient troubleshooting

Certificate not trusted

When configuring a new connection to an EMS server, the certificate might not be trusted.



When you click *Authorize*, a warning displays: *The server certificate cannot be authenticated with installed CA certificates. Please install its CA certificates on this FortiGate*.

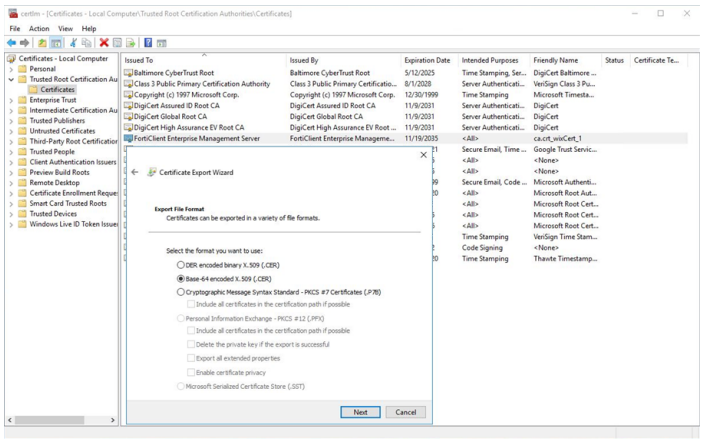
In the CLI, an error message displays when you try to verify the certificate:

```
# execute fctems verify Win2K16-EMS
certificate not configured/verified: 2
Could not verify server certificate based on current certificate authorities.
Error 1--92-60-0 in get SN call: EMS Certificate is not signed by a known CA.
```

The default FortiClient EMS certificate that is used for the SDN connection is signed by the CA certificate that is saved on the Windows server when FortiClient EMS is first installed. You can manually export and install it on the FortiGate.

To manually export and install the certificate on to the FortiGate:

1. Export the EMS certificate on the server that EMS is installed on:
   a. On the Windows server that EMS is installed on, go to *Settings > Manage computer certificates*.
   b. In the certificate management module, go to *Trusted Root Certification Authorities > Certificates*.
   c. Right click on the certificate issued by FortiClient Enterprise Management Server and select *All Tasks > Export*.
   d. The *Certificate Export Wizard* opens. Click *Next*.
   e. Select *Base-64 encoded X.509*, then click *Next*.



f. Enter a file name for the certificate and click *Browse* to select the folder where it will be located, then click *Next*.

g. Review the settings, then click *Finish*. The certificate is downloaded to the specified folder.

2. On the FortiGate, import the certificate:

a. Go to *System* > *Certificate*. By default, the *Certificate* option is not visible, see Feature visibility on page 3595 for information.

b. Click *Import* > *CA Certificate*.

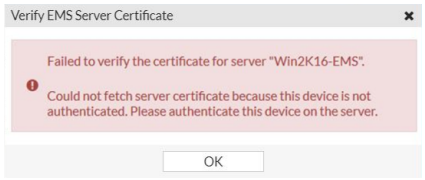
c. Set *Type* to *File*, and click *Upload* to import the certificate from the management computer.

d. Click *OK*. The imported certificate is shown in the *Remote CA Certificate* section of the certificate table.

3. Try to authorize the certificate on the FortiGate:

a. Go to *Security Fabric* > *Fabric Connectors* and edit the FortiClient EMS connector. The connection status should now say that the certificate is not authorized.

b. Click *Authorize*. The following warning is shown:



The warning can also be seen in the CLI:

```
# execute fctems verify Win2K16-EMS
failure in certificate configuration/verification: -4
Could not verify EMS. Error 1--94-0-401 in get SN call: Authentication denied.
```

4. Authorize the FortiGate on EMS:

a. Log in to the EMS server console and go to *Administration* > *Fabric Devices*.

b. Select the serial number of the FortiGate device, then click *Authorize*.

5. Try to authorize the certificate on the FortiGate again:

a. On the FortiGate, go to *Security Fabric* > *Fabric Connectors* and edit the *FortiClient EMS* card.

b. Click *Refresh*.

c. When presented with the EMS server certificate, click *Accept* to accept the certificate.
Your connection should now be successful and authorized.

d. Click *OK*.

Synchronizing FortiClient ZTNA tags

ZTNA tags (formerly FortiClient EMS tags in FortiOS 6.4 and earlier) are tags synchronized from FortiClient EMS as dynamic address objects on the FortiGate. FortiClient EMS uses zero-trust tagging rules to automatically tag managed endpoints based on various attributes detected by the FortiClient. When the FortiGate establishes a connection with the FortiClient EMS server through the EMS Fabric connector, it pulls zero-trust tags containing device IP and MAC addresses and converts them to read-only dynamic address objects. It also establishes a persistent WebSocket connection to monitor for changes in zero-trust tags, which keeps the device information current. These ZTNA tags can then be used in ZTNA rules, firewall rules, and NAC policies to perform security posture checks. ZTNA tags are displayed in the *Device Inventory* widget, *FortiClient* widget, and *Asset Identity Center* page.

By enabling ZTNA EMS tag checking in a firewall policy, you can include EMS tag information in the traffic log.

When primary and secondary ZTNA EMS tag checking is enabled using address groups, the *Primary EMS tag* and *Secondary EMS tag* fields will be included in the GUI traffic logs. Likewise, the `emstag` and `emstag2` fields will be included in the CLI traffic logs.

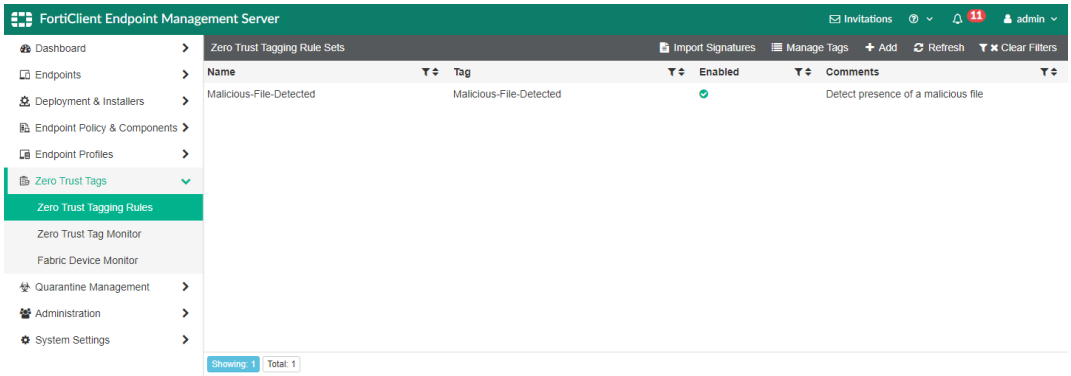
When using WebSocket, EMS pushes notifications to the corresponding FortiGate when there are updates to tags or other monitored attributes. The FortiGate then fetches the updated information using the REST API over TCP/8013. When WebSocket is not used (due to an override or unsupported EMS version), updates are triggered on demand from the FortiGate side over the REST API.

If the WebSocket capability is detected, the capabilities setting will automatically display the WebSocket option. You can use the `diagnose test application fcnacd 2` command to view the status of the WebSocket connection.

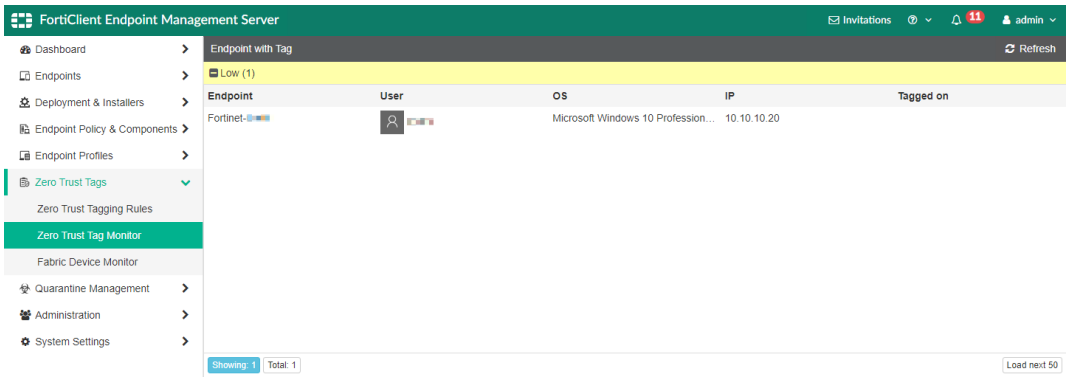
In the following example, the FortiGate connects to and retrieves ZTNA tags from a FortiClient EMS configured with tagging rules. It is assumed that zero-trust tags and rules are already created on the FortiClient EMS. For more information, see the Zero Trust Tags section of the EMS Administration Guide.

To verify zero-trust tags in FortiClient EMS:

1. Go to *Zero Trust Tags* > *Zero Trust Tagging Rules* to view the tags.



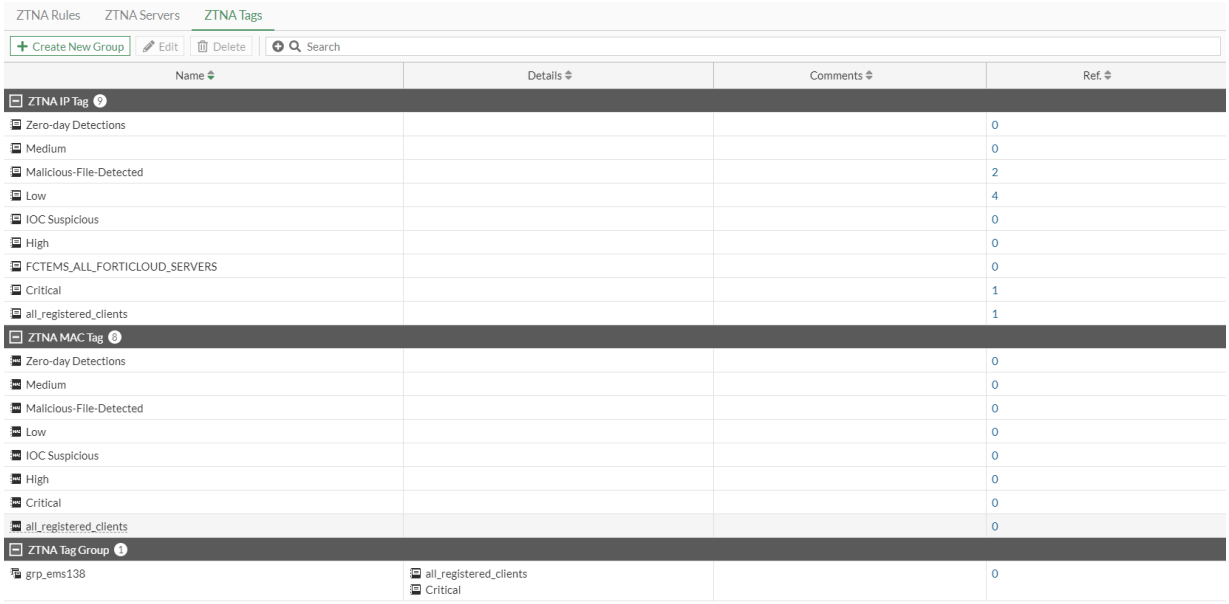
2. Go to *Zero Trust Tags* > *Zero Trust Tag Monitor* to view the registered users who match the defined tag.



To configure the EMS Fabric connector to synchronize ZTNA tags in the GUI:

1. Configure the EMS Fabric connector:
   a. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiClient EMS* card.
   b. In the *Settings* tab, set the *Status* to *Enabled*.
   c. Enable *Synchronize firewall addresses*.

   d. Configure the other settings as needed and validate the certificate.
   e. Click *OK*.
2. Enable ZTNA:
   a. Go to *System* > *Feature Visibility* and enable *Zero Trust Network Access*.
   b. Click *Apply*.
3. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Tags* tab. You will see the ZTNA IP and ZTNA MAC tags synchronized from the FortiClient EMS.



To configure the EMS Fabric connector to synchronize ZTNA tags in the CLI:

1. Configure the EMS Fabric connector on the root FortiGate:

```
config endpoint-control fctems
    edit 1
        set status enable
        set name "WIN10-EMS"
        set server "192.168.20.10"
        set https-port 443
        set pull-sysinfo enable
        set pull-vulnerabilities enable
        set pull-tags enable
        set pull-malware-hash enable
        set capabilities fabric-auth silent-approval websocket
    next
end
```

2. Verify which IPs the dynamic firewall address resolves to:

```
# diagnose firewall dynamic list
List all dynamic addresses:
FCTEMS0000100000_all_registered_clients: ID(51)
        ADDR(172.17.194.209)
        ADDR(10.10.10.20)
…

FCTEMS0000100000_Low: ID(78)
        ADDR(172.17.194.209)
        ADDR(10.10.10.20)
…

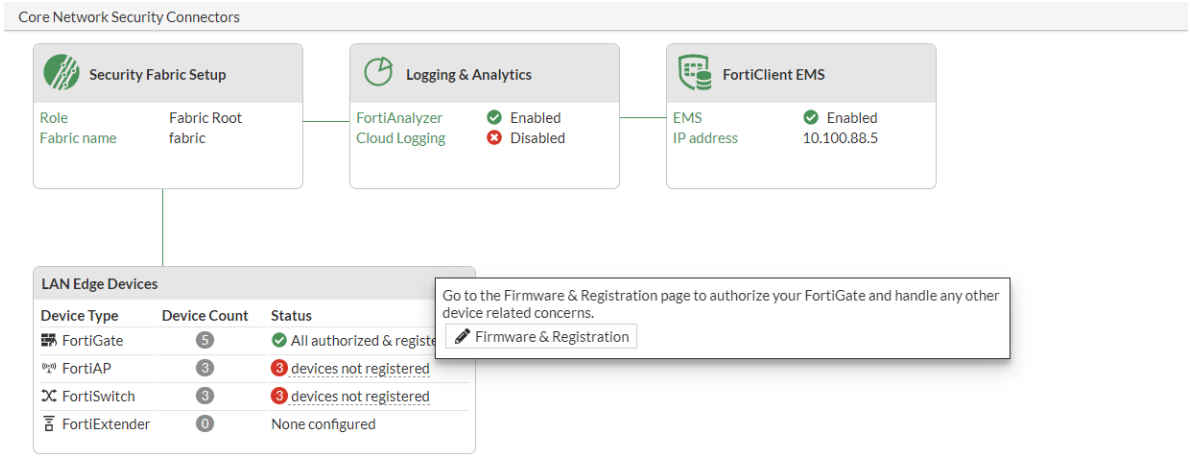
FCTEMS0000100000_Malicious-File-Detected: ID(190)
```

```
        ADDR(172.17.194.209)
        ADDR(10.10.10.20)
…
```

When running the FortiGate in multi-VDOM mode, by default, EMS is configured in the global VDOM. All ZTNA tags synchronized with the globally configured EMS are shared by all VDOMs. FortiOS 7.4 and later supports configuring EMS on a per-VDOM basis. See Configuring FortiClient EMS and FortiClient EMS Cloud on a per-VDOM basis for more information.

Configuring LAN edge devices

The *LAN Edge Devices* connector card displays a summary about the FortiGates, FortiAPs, FortiSwitches, and FortiExtenders in the Security Fabric. Information about the device type, number of devices, and number of unregistered and unauthorized devices is displayed. If there are devices that do not have a green checkmark in the *Status* column, hover over the status message to view the tooltip with required action. In this example, there are FortiAPs and FortiSwitches that are not registered. The tooltip includes a link to the *System > Firmware & Registration* page to register or authorize the devices. The tooltip for FortiExtenders includes a link to the *Network > FortiExtenders > Managed FortiExtenders* page to register or authorize the devices.



If the default `auto-auth-extension-device` settings on the FortiAP or FortiSwitch have been modified, manual authorization in the Security Fabric may not be required.

For more information about configuring FortiAPs, see Configuring the FortiGate interface to manage FortiAP units and Discovering, authorizing, and deauthorizing FortiAP units.

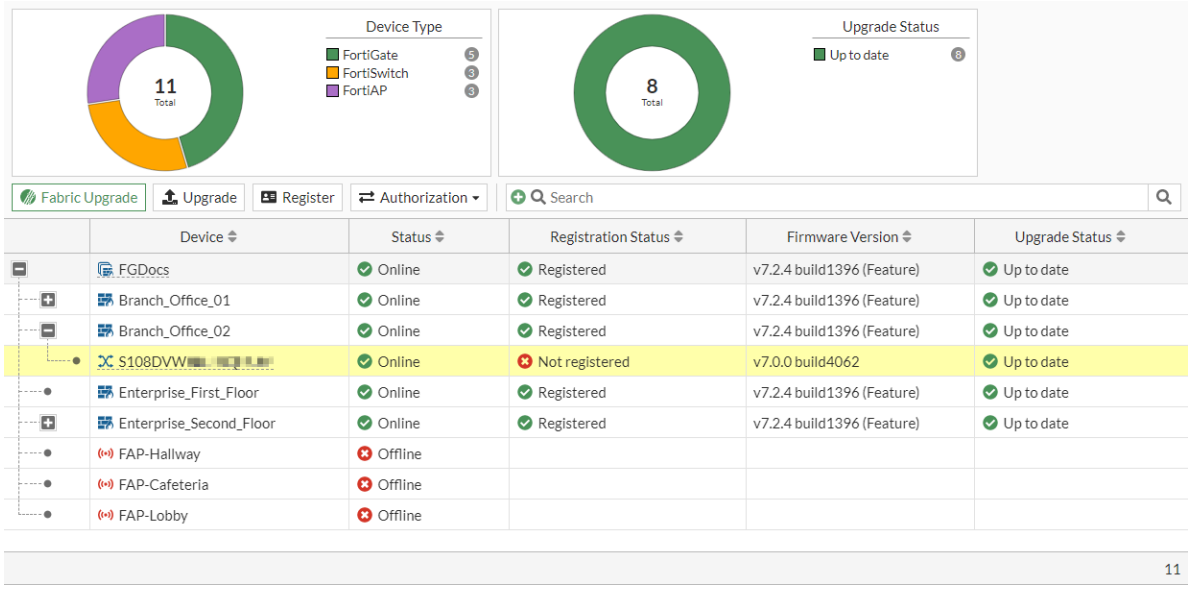
For more information about configuring FortiSwitches, see Discovering, authorizing, and deauthorizing FortiSwitch units.

For more information about configuring FortiExtenders, see Adding a FortiExtender on page 632 and FortiExtender and FortiGate integration.

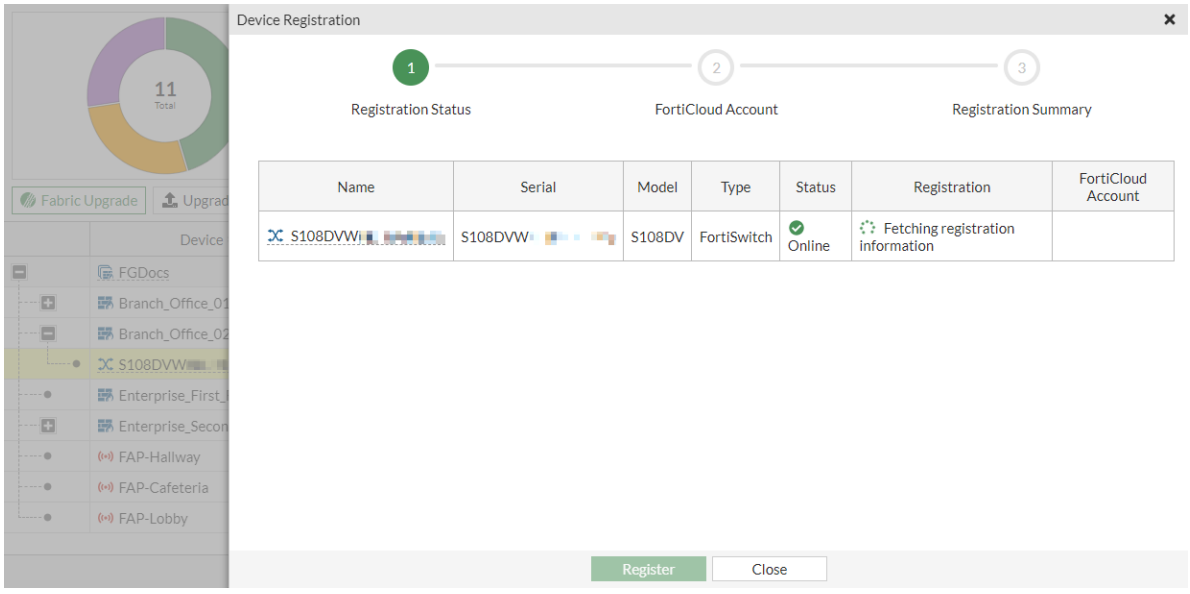
The following example shows how to register a FortiSwitch that has been authorized to join the Security Fabric. The procedure is similar for FortiAPs and FortiExtenders. If the device requires authorization, refer to Authorizing devices on page 3251.

To register a FortiSwitch:

1. Connect the device to the root FortiGate.
2. On the root FortiGate, go to *System* > *Firmware & Registration*. (Use the same page for a FortiAP, or *Network* > *FortiExtenders* > *Managed FortiExtenders* for a FortiExtender.)
3. Select the unregistered device and click *Register*.



The *Device Registration* pane opens and the FortiGate verifies the registration information.



4. Once the registration process is complete, click *Close*.

Configuring central management

The *Central Management* Fabric connector card on the root FortiGate is used to configure the FortiManager settings, which includes on-premises FortiManager, FortiGate Cloud, and FortiManager Cloud. After the *Central Management* connector is configured, it automatically synchronizes with any connected downstream devices.

This topic covers the following central management aspects:

- Configuring FortiManager
- Configuring FortiManager Cloud

Configuring FortiManager

Once the *Central Management* Fabric connector is configured, the root FortiGate pushes this configuration to downstream FortiGates. FortiManager provides remote management of FortiGate devices over TCP port 541. The FortiManager must have internet access for it to join the Security Fabric.

Once configured, the FortiGate can receive antivirus and IPS updates, and allows remote management through FortiManager or the FortiGate Cloud service. The FortiGate management option must be enabled so that the FortiGate can accept management updates to its firmware and FortiGuard services.

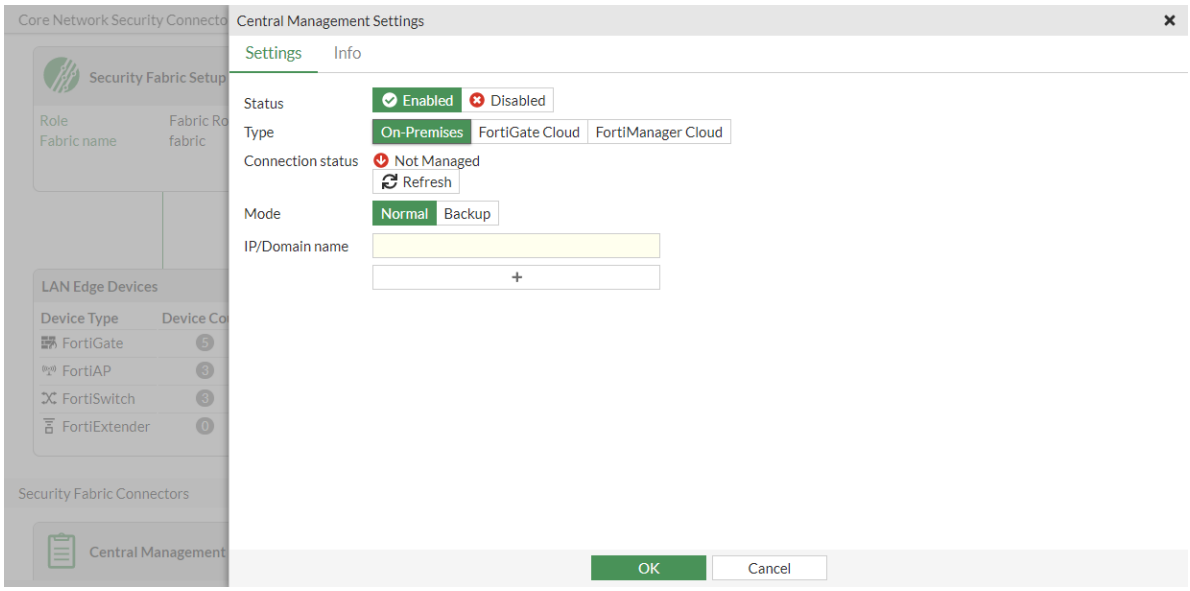
Adding a FortiManager device to the Security Fabric requires the following steps in FortiOS, which can be completed in the GUI or CLI:

- Specify the FortiManager IP address or domain name.
- Approve the FortiManager serial number returned by the FortiManager server certificate. This ensures that the administrator is connecting the FortiGate to the desired FortiManager.

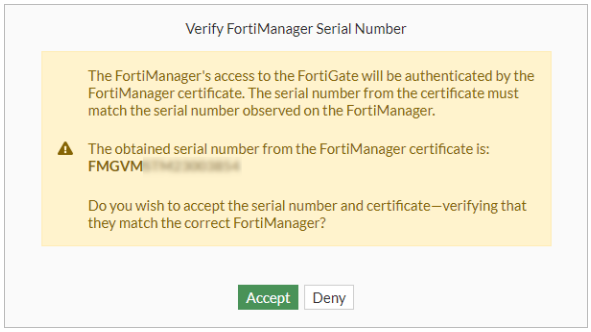
After completing the steps in FortiOS, go to FortiManager to complete the process by authorizing the FortiGate.

To add a FortiManager to the Security Fabric in the GUI:

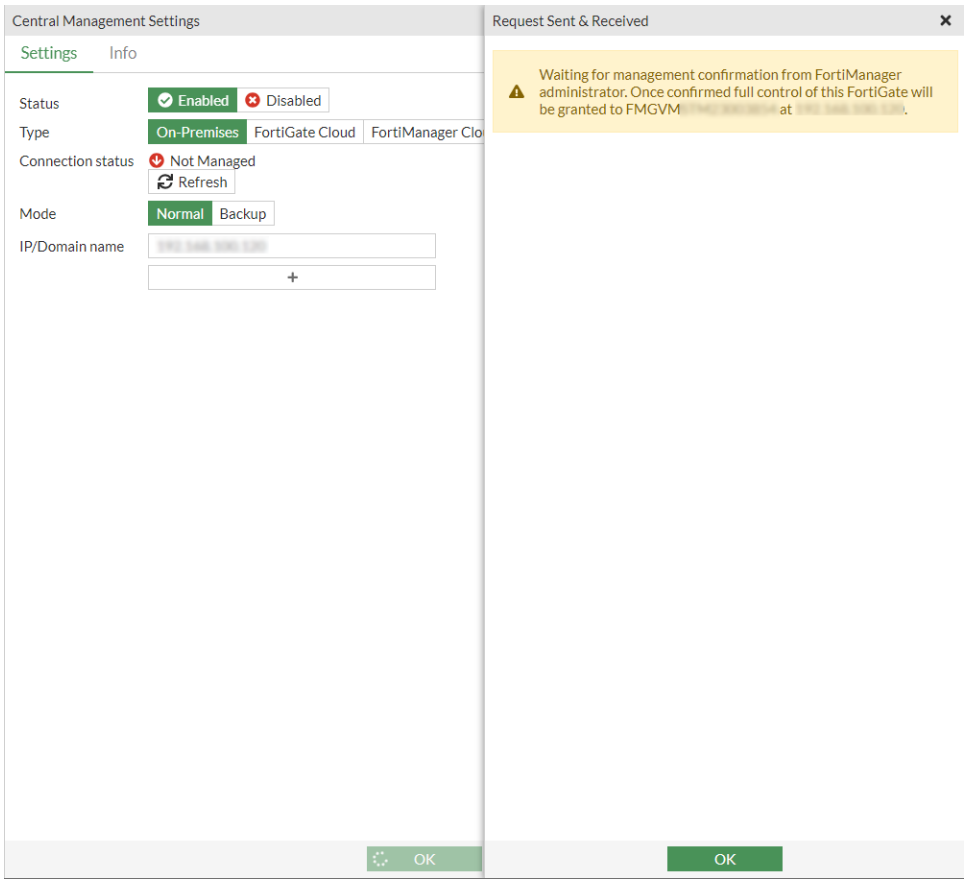
1. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors* and double-click the *Central Management* card.
2. Set the *Status* to *Enabled*.
3. Set the *Type* to *On-Premises*.



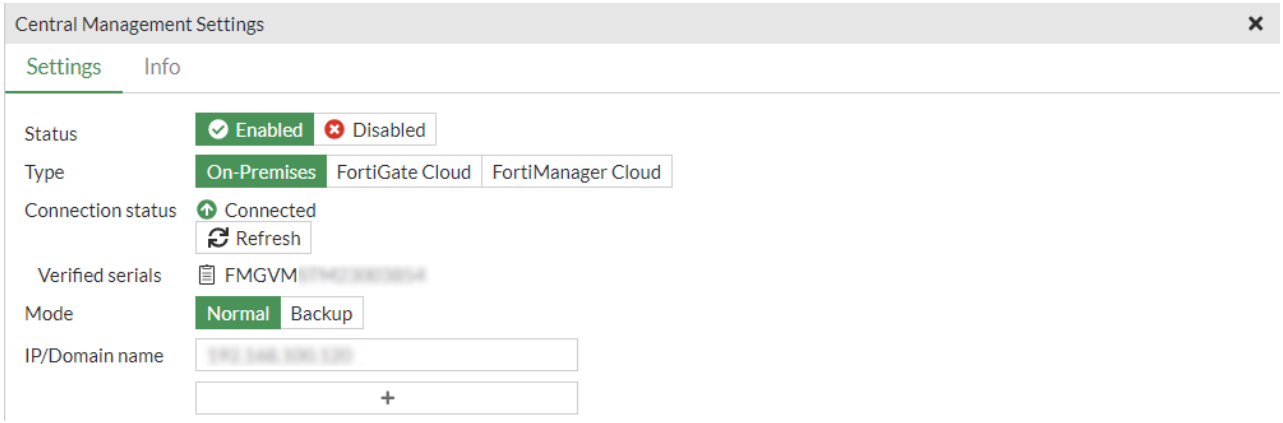
4. Enter the *IP/Domain Name* of the FortiManager.
5. Click *OK*.
   The *Verify FortiManager Serial Number* pane appears.



6. Review the serial number, and click *Accept*.
   The *Request Sent & Received* pane appears, indicating the FortiGate must be authorized on FortiManager.



7. Go to FortiManager and authorize the FortiGate. See Authorizing the FortiGate in FortiManager on page 3752.
8. After the FortiGate is registered, log in to FortiGate again as either read-only or read/write.
9. Go to *Security Fabric > Fabric Connectors* and double-click the *Central Management* card. The *Connection Status* is updated to *Connected*.



To add a FortiManager to the Security Fabric in the CLI:

1. Enter the FortiManager connection information:

```
config system central-management
    set type fortimanager
    set fmg {<IP_address> | <Domain name>}
end

The Serial Number for FortiManager is not entered.
In order to verify identity of FortiManager serial number is needed.
If serial number is not set, connection will be set as unverified.
FortiGate can establish a connection to obtain the serial number now.Do you want to try to
connect now? (y/n)y
Obtained serial number from FortiManager 172.16.200.1 is: FMGVMSTM2300xxxx
Do you confirm that this is the correct serial number? (y/n)y

Successfully registered to FortiManager. This device may need to be authorized on
FortiManager.
Auto firmware upgrade in system.fortiguard has been paused since this FortiGate is now managed
by FortiManager. The upgrade will resume automatically when this FortiGate is released from
FortiManager. The upgrade status may be viewed using the following command diagnose test
application forticldd 13.
Any pending automatic patch-level firmware upgrade has been removed
```

2. Go to FortiManager and authorize the FortiGate. See Authorizing the FortiGate in FortiManager on page 3752.
3. If necessary on FortiGate, use the `diagnose fdsm central-mgmt-status` command to diagnose the connection.
   - If the connection is not yet successful because the FortiManager serial number is not verified, the following information is displayed:

```
# diagnose fdsm central-mgmt-status
Connection status: Handshake
Registration status: Unknown
Serial: FMGVMSTM2300xxxx
```

   - If the connection is up, but the FortiGate has not been authorized by FortiManager, the following information is displayed:

```
# diagnose fdsm central-mgmt-status
Connection status: Up
Registration status: Unregistered
Serial: FMGVMSTM2300xxxx
```

   - If the connection is up, and the FortiGate has been authorized, the following information is displayed:

```
# diagnose fdsm central-mgmt-status
Connection status: Up
Registration status: Registered
Serial: FMGVMSTM2300xxxx
```

Authorizing the FortiGate in FortiManager

After completing the GUI or CLI steps in FortiOS, go to FortiManager to authorize the FortiGate to complete the process.

To authorize the FortiGate in FortiManager:

1. On FortiManager, go to *Device Manager* and find the FortiGate in the *Unauthorized Devices* list.
   The unauthorized device list is located in the root ADOM, regardless of the firmware version of the root ADOM or FortiOS.
2. Select the FortiGate device or devices, and click *Authorize* in the toolbar.
3. In the *Authorize Device* pop-up, adjust the device names as needed, select the appropriate ADOM (if applicable), and click *OK*.

For more information about using FortiManager, see the FortiManager Administration Guide.

Configuring FortiManager Cloud

This cloud-based SaaS management service is available through FortiManager. This service is included in FortiCloud accounts with a FortiManager Cloud account level subscription (ALCI).

Configuring a per-device license

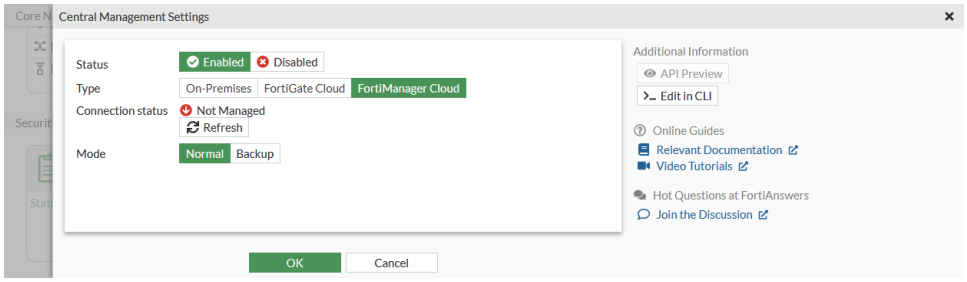
Once the FortiGate has acquired a contract named *FortiManager Cloud*, FortiCloud creates a cloud-based FortiManager instance under the user account. You can launch the portal for the cloud-based FortiManager from FortiCloud, and its URL starts with the User ID.

You can use a FortiGate with a contract for *FortiManager Cloud* to configure central management by using the FQDN of *fortimanager.forticloud.com*. A FortiGate-FortiManager tunnel is established between FortiGate and the FortiManager instance.

After the tunnel is established, you can execute FortiManager functions from the cloud-based FortiManager portal.

To configure FortiManager Cloud central management:

1. Enable FortiManager Cloud.
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Central Management* card.
   b. Set the *Status* to *Enabled*.
   c. Set the *Type* to *FortiManager Cloud*.



d. Click *OK*.

The *FortiManager Cloud* button can only be selected if you have a FortiManager Cloud product entitlement.

2. In the FortiManager Cloud instance, go to *Device Manager* and authorize the FortiGate. See Authorizing devices for more information.

   When using the FortiGate to enable FortiManager Cloud, the FortiGate appears as an unauthorized device. After authorizing the FortiGate, it becomes a managed device.

   In FortiOS, the *Security Fabric > Fabric Connectors* page now displays green arrow in the *Central Management* card because FortiManager Cloud is registered.

Diagnostics

To verify the contract information:

```
# diagnose test update info contract
...
System contracts:
    ...
Account contracts:
    FMGC,Thu Dec  2 16:00:00 2022
...
```

To verify the FortiManager Cloud instance has launched and the FortiGate is registered:

```
# diagnose fdsm central-mgmt-status
Connection status: Up
Registration status: Registered
Serial: FMGVMSTM2300xxxx
```

Configuring sandboxing

The Security Fabric supports the following types of FortiSandbox deployments:

Type	Description	Requirements	Next steps
FortiGate Cloud Sandbox (FortiSandbox SaaS)	Files are sent to Fortinet's Cloud Sandbox cluster for post-processing.	• The FortiGate must be subscribed to the Advanced Malware Protection (AMP) license, which includes the AV license.	• Activate and configure your FortiGate Cloud Sandbox. • Use post-transfer scan with Antivirus.

Type	Description	Requirements	Next steps
FortiGuard Inline Malware Prevention System	Files are sent to Fortinet's Cloud Sandbox cluster for real-time processing.	• The FortiGate must either be subscribed to the Enterprise Protection bundle or have an a la carte Inline Malware Prevention license.	• Verify your license. • Configure your FortiGate. • Use Inline Scan with Antivirus. • Verify Sandbox detection.
FortiSandbox Cloud (FortiSandbox PaaS)	Files are sent to a dedicated FortiCloud hosted instance of FortiSandbox for processing.	• FortiCloud premium license. • FortiSandbox Cloud entitlement. • The FortiGate and FortiCloud licenses are registered to the same account.	• Provision your dedicated instance. • Configure your FortiGate for post-transfer scan or inline scan. • Verify Sandbox detection.
FortiSandbox Appliance	Files are sent to a physical or VM appliance, typically residing on premise, for processing.	• None	• Configure your FortiSandbox. • Configure your FortiGate for post-transfer scan or inline scan. • Verify Sandbox detection.

To apply sandboxing in a Security Fabric, connect one of the FortiSandbox deployments, then configure an antivirus profile to submit files for dynamic analysis. The submission results supplement the AV signatures on the FortiGate. FortiSandbox inspection can also be used in web filter profiles.

In a Security Fabric environment, sandbox settings are configured on the root FortiGate. Once configured, the root FortiGate pushes the settings to other FortiGates in the Security Fabric.

FortiGate Cloud Sandbox (FortiSandbox SaaS)

FortiGate Cloud Sandbox allows users to take advantage of FortiSandbox features without having to purchase, operate, and maintain a physical appliance. It also allows you to control the region where your traffic is sent to for analysis. This allows you to meet your country's compliance needs regarding data storage locations.

Users are not required to have a FortiCloud account to use FortiGate Sandbox Cloud.

The submission to the cloud with a valid FortiGuard Antivirus (AVDB) license is rate limited per FortiGate model. Refer to the Service Description for details. For those without any AVDB license, the submission is limited to only 100 per day.

To configure FortiGate Cloud Sandbox, you must first activate the connection from the CLI. Note that FortiGate Cloud Sandbox is decoupled from FortiGate Cloud logging, so you do not need to have a FortiCloud account or have cloud logging enabled.

To activate the FortiGate Cloud Sandbox connection:

To ensure proper connectivity to FortiGate Cloud Sandbox, on the FortiGate in *Security Profiles* > *AntiVirus*, create a profile with *Send files to FortiSandbox for inspection* configured, and create a firewall policy with logging enabled that uses the Sandbox-enabled AV profile.

```
# execute forticloud-sandbox region
0  Europe
1  Global
2  Japan
3  US
Please select cloud sandbox region[0-3]:3
```

After a region is selected, the following configuration is added:

```
config system fortiguard
    set sandbox-region {0 | 1 | 2 | 3}
end
```

Alternatively, using the `execute forticloud-sandbox update` command also works.

To obtain or renew a FortiGuard antivirus license:

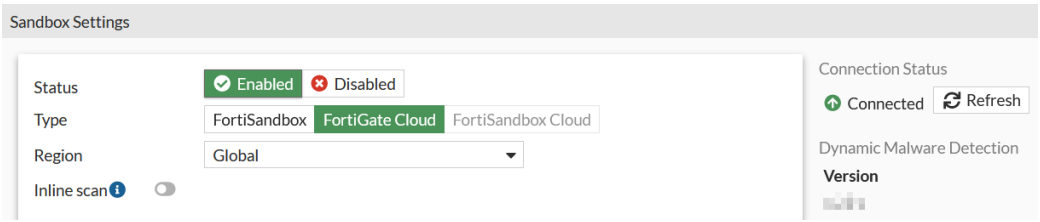
1. See the How to Purchase or Renew FortiGuard Services video for FortiGuard antivirus license purchase instructions.
2. Once a FortiGuard license is purchased and activated, users are provided with a paid FortiSandbox Cloud license.
   a. Go to *Dashboard* > *Status* to view the FortiSandbox Cloud license indicator.

   b. Alternatively, go to *System* > *FortiGuard* to view the FortiSandbox Cloud license indicator.

To enable FortiGate Cloud Sandbox in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Sandbox* card.
2. Set the *Status* to *Enabled*.

3. Set the *Type* to *FortiGate Cloud*.
4. Select a *Region* from the dropdown.



5. Click *OK*.

FortiSandbox Cloud (FortiSandbox PaaS)

FortiSandbox Cloud offers more features and better detection capability. Connecting to FortiSandbox Cloud will automatically use the cloud user ID of the FortiGate to connect to the dedicated FortiSandbox Cloud instance. The FortiGate automatically detects if there is a valid entitlement.

The following items are required to initialize FortiSandbox Cloud:

- A FortiCloud premium account.
- A valid FortiSandbox Cloud contract on the FortiGate. To view contract information in the CLI, enter `diagnose test update info`. The `User ID` at the end of the output shows FortiCloud which FortiSandbox Cloud account the FortiGate is connected to.
- A provisioned FortiSandbox Cloud. See Deploying FortiSandbox Cloud for information.

To configure FortiSandbox Cloud in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Sandbox* card.
2. Set the *Status* to *Enabled*.
3. Set the *Type* to *FortiSandbox Cloud*.

If the *FortiSandbox Cloud* option is grayed out or not visible, enter the following in the CLI:

```
config system global
    set gui-fortigate-cloud-sandbox enable
end
```

4. Click *OK*.

To configure FortiSandbox Cloud in the CLI:

```
config system fortisandbox
    set status enable
    set forticloud enable
    set server fortisandboxcloud.com
end
```

If the FortiGate does not detect the proper entitlement, a warning is displayed and the CLI configuration will not save.

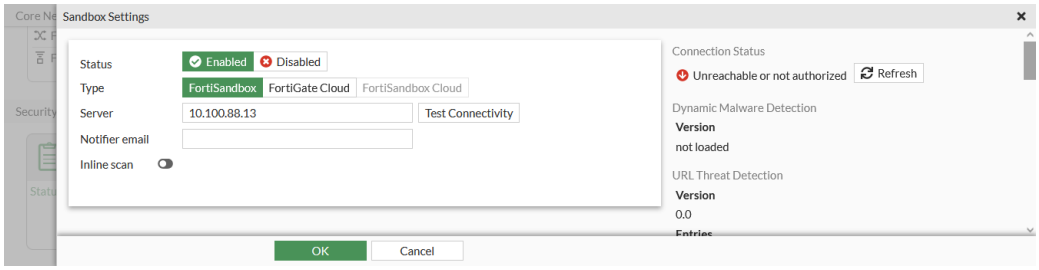
If the FortiSandbox Cloud is running version 4.0.0 and later, the FortiGate will automatically connect to fortisandboxcloud.com, and then discover the specific region and server to connect to based on which region the customer selected to deploy their FortiSandbox Cloud instance. The FortiGate must have a FortiCloud premium account license and a FortiSandbox Cloud VM license for this functionality.

FortiSandbox appliance

FortiSandbox appliance is the on-premise option for a full featured FortiSandbox. Connecting to a FortiSandbox appliance requires that Cloud Sandbox is disabled.

To enable FortiSandbox appliance in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Sandbox* card.
2. Set the *Status* to *Enabled*.
3. In the *Server* field, enter the FortiSandbox device's IP address.



4. Optionally, enter a *Notifier email*.
5. Click *OK*.

To enable FortiSandbox appliance in the CLI:

```
config system fortisandbox
    set status enable
    set forticloud disable
    set server <address>
end
```

Authorizing the FortiGate from FortiSandbox Cloud and a FortiSandbox appliance

Once the FortiGate makes a connection to the FortiSandbox Cloud or appliance, the FortiGate must be authorized. See FortiGate devices in the FortiSandbox Administration guide for information.

Antivirus profiles

An antivirus profile must be configured to send files to the sandbox. Once submitted, sandbox inspection is performed on the file to detect malicious activities. The FortiGate can use the dynamic malware detection database from the sandbox to supplement the AV signature database. See Using FortiSandbox post-transfer scanning with antivirus on page 1932 for more information.

FortiSandbox inline scanning is supported on FortiSandbox appliances in proxy inspection mode. When inline scanning is enabled, the client's file is held while it is sent to FortiSandbox for inspection. Once a verdict is returned, the appropriate action is performed on the held file. If there is an error or timeout on the FortiSandbox, the FortiGate's configuration determines what to do with the held file. See Using FortiSandbox inline scanning with antivirus on page 1934 for more information.

Inline scanning requires FortiSandbox version 4.2 or later.

Web filter profiles

Sandbox inspection can be used in web filter profiles. The FortiGate uses URL threat detection database from the sandbox to block malicious URLs. See Block malicious URLs discovered by FortiSandbox on page 1989 for more information.

FortiSandbox Files FortiView monitor

In the *FortiSandbox Files* FortiView monitor, users can select a submitted file and drill down to view its static and dynamic file analysis. The full FortiSandbox report can be downloaded in PDF format. This feature works with FortiGate Cloud Sandbox, FortiSandbox Cloud, and FortiSandbox appliance. FortiSandbox must be running version 3.2.1 and later.

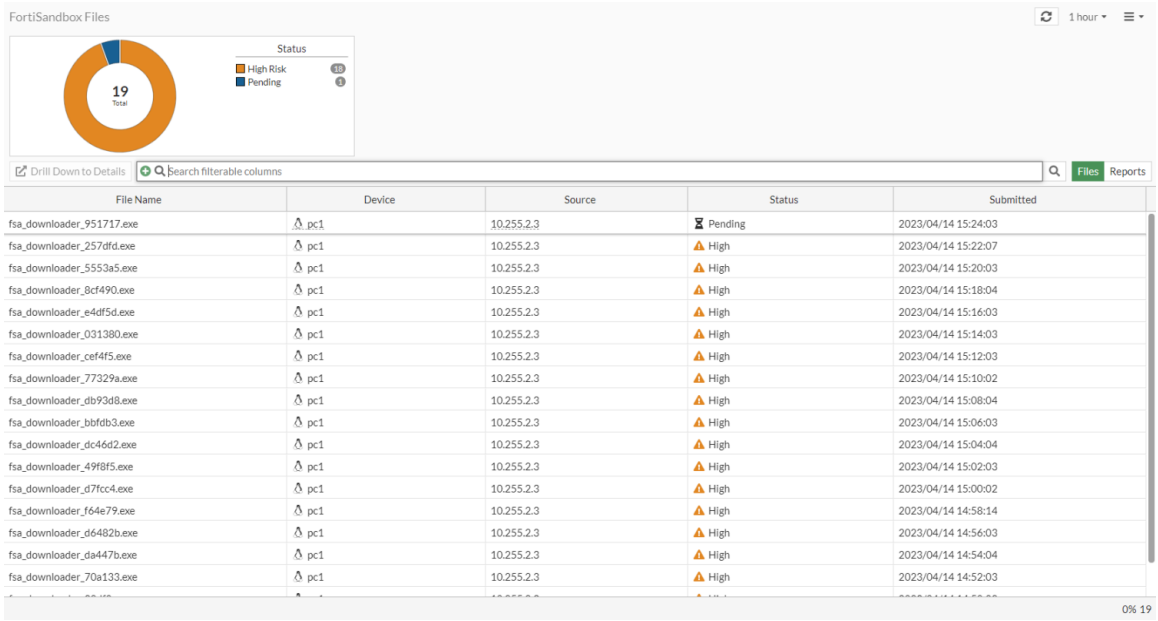
PDF reports are downloaded on-demand. By default, only 10 are kept in memory. PDFs are deleted from memory after 24 hours.

Prerequisites:

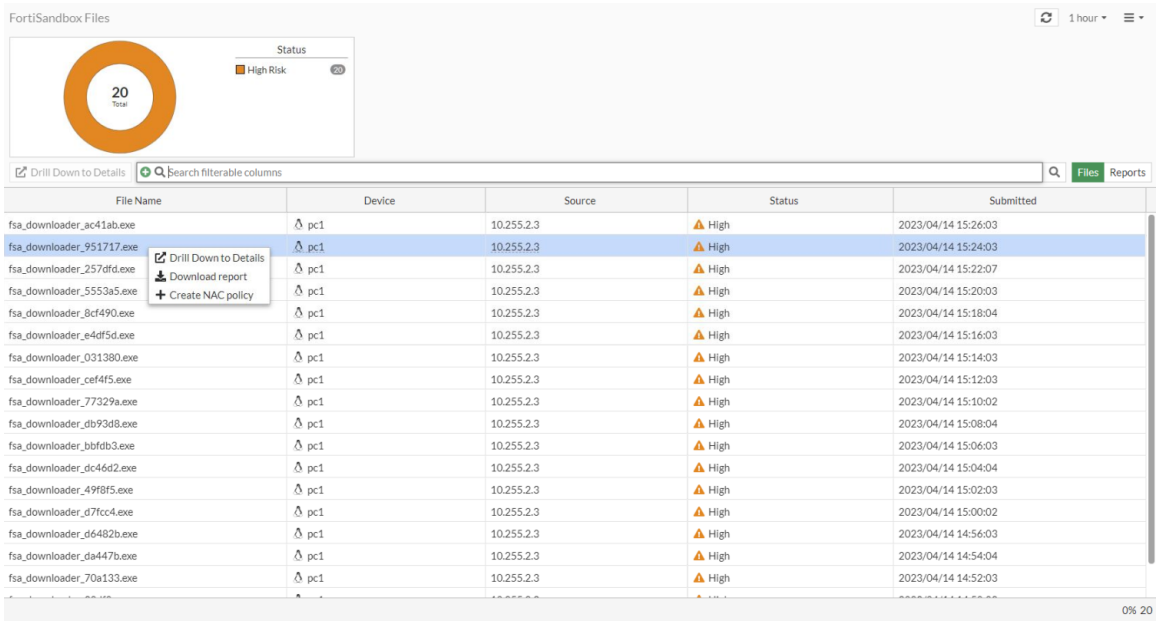
1. Add FortiSandbox to the Security Fabric.
2. Configure an AV profile with *Send files to FortiSandbox for inspection* enabled (see Using FortiSandbox post-transfer scanning with antivirus on page 1932).
3. Configure a firewall policy with the AV profile that allows traffic to the internet.
4. Add the *Top FortiSandbox Files* FortiView monitor (see Adding FortiView monitors on page 143).
5. On a client PC, attempt to download a suspicious file.

To view the FortiSandbox analysis and download the PDF:

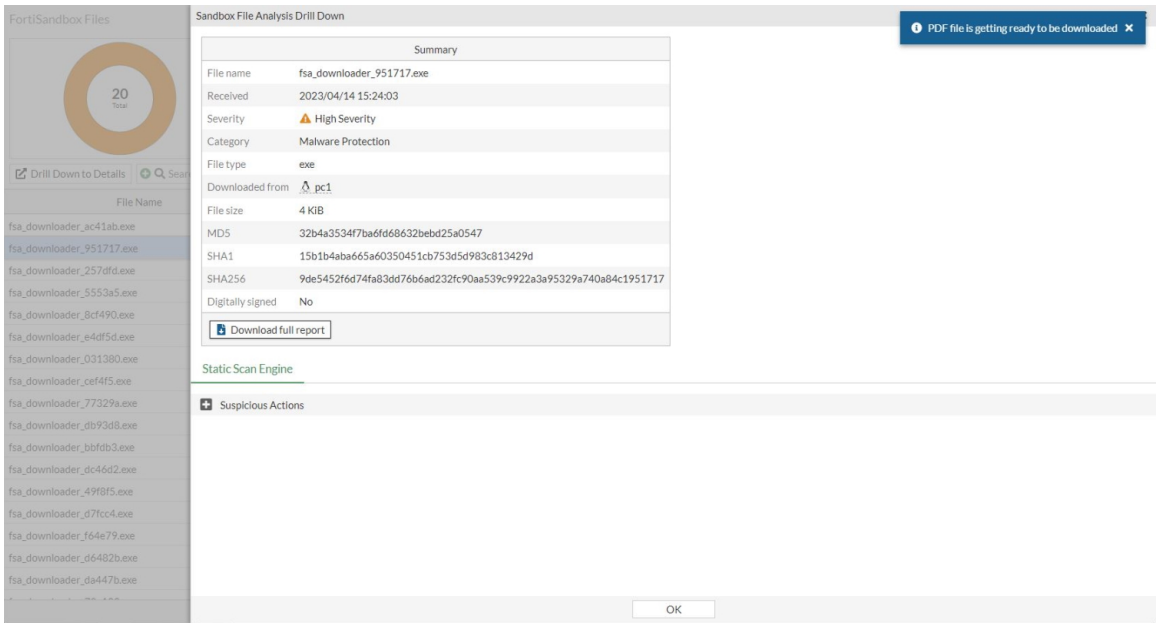
1. Go to *Dashboard* > *FortiSandbox Files*. The entry appears in the table, but the analysis is not available yet because the *Status* is *Pending*. The default view is *Files*.



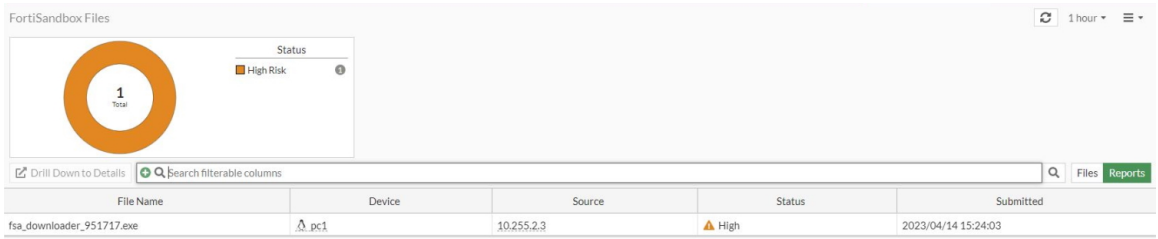
2. After about five to ten minutes, refresh the table. The analysis is now available.
3. Select the entry, then right-click and select *Drill Down to Details*.



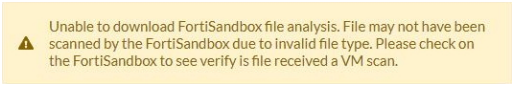
The *Sandbox File Analysis Drill Down* pane opens.



4. Click *Download full report* to download the detailed PDF report.
5. Change the view to *Reports* to verify that the file was downloaded successfully. The reports contains FortiSandbox job information and detailed file information.



When the file type is not supported, a warning message appears that the file was not scanned when the *Sandbox File Analysis Drill Down* pane opens.



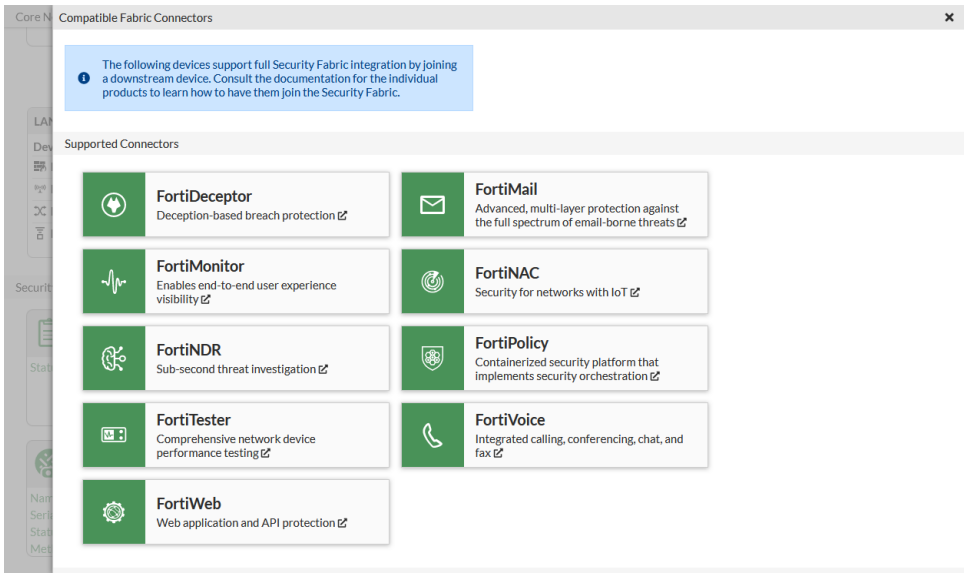
To change the maximum number of PDFs kept in memory:

```
# diagnose test analytics-pdf-report max <integer>
```

The range is 1 - 10, and the default is 10. After the FortiGate is restarted, this value will revert to the default.

Configuring supported connectors

The *Supported Connectors* card displays the icons of different Fortinet devices that support full Security Fabric integration. Configuration of supported connectors requires some configuration on FortiOS and some configuration on the supported connector device.



Click a device name card to access documentation that explains how configure it in the Security Fabric.

Supported connectors overview

The following is an overview of how to add supported connectors to the Security Fabric:

1. In FortiOS, ensure Security Fabric is enabled, and prepare the root FortiGate for communication with supported Security Fabric devices. See Preparing FortiGate for supported Security Fabric devices on page 3762.
2. (Optional) Configure pre-authorization of the supported Security Fabric device. See Configuring pre-authorization of supported Security Fabric devices on page 3763.
3. On the supported Security Fabric device, configure the device to join the Security Fabric. See:
   - Configuring FortiDeceptor on page 3769
   - Configuring FortiMail on page 3771
   - Configuring FortiMonitor on page 3771
   - Configuring FortiNAC on page 3773
   - Configuring FortiNDR on page 3774
   - Configuring FortiPolicy on page 3776
   - Configuring FortiTester on page 3779
   - Configuring FortiVoice on page 3781
   - Configuring FortiWeb on page 3782
4. Wait for the supported Security Fabric device to establish a connection with the root FortiGate in the Security Fabric.
5. In FortiOS, authorize the supported Security Fabric device. See Authorizing supported connectors on page 3768.

   If the supported device is pre-authorized, you can skip this step.
6. In FortiOS, go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view information about the authorized device.

Preparing FortiGate for supported Security Fabric devices

Before adding supported Security Fabric devices to FortiGate, ensure the following:

- On FortiGate, ensure that Security Fabric is enabled.
- On the root FortiGate of the Security Fabric, ensure that *Allow other Security Fabric devices to join* is enabled.
- On the root FortiGate, ensure that the appropriate interface is enabled to listen for supported Fabric devices.
- (As needed) On the root FortiGate, ensure that *Allow downstream device REST API access* is enabled, if the device requires REST API access to the root FortiGate, and select an administrator profile.

  The minimum permission required for the selected *Administrator profile* is *Read/Write* for *User & Device* (`set authgrp read-write`).

See Configuring the root FortiGate and downstream FortiGates on page 3702 for details.

Although optional, you can configure pre-authorization of the supported Fabric device on the root FortiGate. Pre-authorized devices can join the Security Fabric at any time, and do not require manual authorization in FortiOS. See Configuring pre-authorization of supported Security Fabric devices on page 3763.

The following table identifies commands used for adding supported devices to the Security Fabric.

Command	Description

`config system interface`
`edit <port name>`
`set allowaccess {protocols}`
`next`
`end`
	Specify management access to the port for the supported Security Fabric device.

`config system csf` `set status enable`	Enable the Security Fabric on FortiGate.
`config system csf` `set group-name <string>`	Specify a group name for the Security Fabric.
`config system csf` `set downstream-access enable`	On the root FortiGate of the Security Fabric, enable downstream access.
`config system csf` `set downstream-accprofile <string>`	Specify the administration profile used for REST API access.
`config system csf` `config trusted-list`	Configure pre-authorization for a device.

In this example FortiNDR is added to the Security Fabric using the CLI.

To add FortiNDR to the Security Fabric in the CLI:

1. Configure the interface to allow other Security Fabric devices to join:

```
config system interface
    edit "port1"
        set allowaccess ping https ssh http fgfm fabric
    next
end
```

2. Enable the Security Fabric:

```
config system csf
    set status enable
    set group-name "fabric-ai"
end
```

3. In FortiNDR, configure the device to join the Security Fabric:

```
config system csf
    set status enable
    set upstream-ip 10.6.30.14
    set managment-ip 10.6.30.251
end
```

4. Authorize the FortiNDR in FortiOS:

```
config system csf
    config trusted-list
        edit "FAIVMSTM21000000"
            set authorization-type certificate
            set certificate "********************"
        next
    end
end
```

Configuring pre-authorization of supported Security Fabric devices

When the serial number or certificate for a supported Security Fabric device is added to the trusted list on the root FortiGate, the device can join the Security Fabric as soon as it connects.

Pre-authorization is optional. When a supported Security Fabric device connects to the Security Fabric without pre-authorization configured, you can manually authorize the device in FortiOS. See Authorizing supported connectors on page 3768.

Before you can configure pre-authorization with a certificate, you must download the certificate for the device to your management computer.

To configure pre-authorization in the GUI:

1. On the root FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. In the *Device authorization* field and click *Edit*. The *Device Authorization* pane opens.
3. Click *Create New* to add a new device for pre-authorization.
4. Enter the device name in the *Name* field.
5. Select the *Authorization type*, either *Serial Number* or *Certificate*.
6. If *Certificate* is selected, click *Browse* to upload the certificate from the management computer for the supported Security Fabric device.
7. Set the *Action* to *Accept*.
8. Click *OK* and add more devices as required.
9. Click *OK*.

To configure pre-authorization in the CLI:

This example shows how to configure pre-authorization of a FortiVoice with a certificate.

```
config system csf
    config trusted-list
        edit "<name>"
            set action accept
            set authorization-type certificate
            set certificate "-----BEGIN CERTIFICATE-----
...
<encrypted_certificate_data>
...
-----END CERTIFICATE-----"
        next
    end
end
```

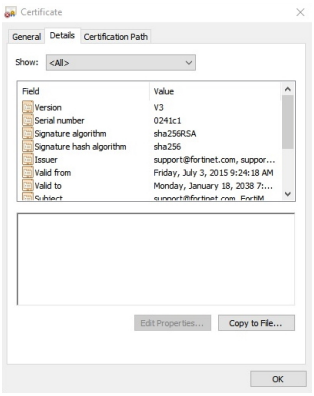
Pre-authorizing using the FortiMail certificate

In this example, FortiMail is configured for pre-authorization using a certificate.

To pre-authorize FortiMail using a third-party or default certificate:

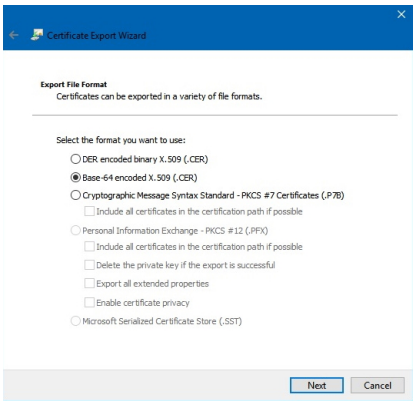
1. Log in to FortiMail.
2. Download the certificate. For example, in Chrome:
   a. In the left side of the address bar, click the icon to view the site information.
   b. Click *Certificate*.

c. Click the *Details* tab, then click *Copy to File*.



d. The *Certificate Export Wizard* opens. Click *Next* to continue.

e. For the file format, select *Base-64 encoded X.509 (.CER)*, then click *Next*.



f. Browse to the folder location and enter a file name, then click *Next*.

g. Click *Finish*, then click *OK* to close the dialog box.

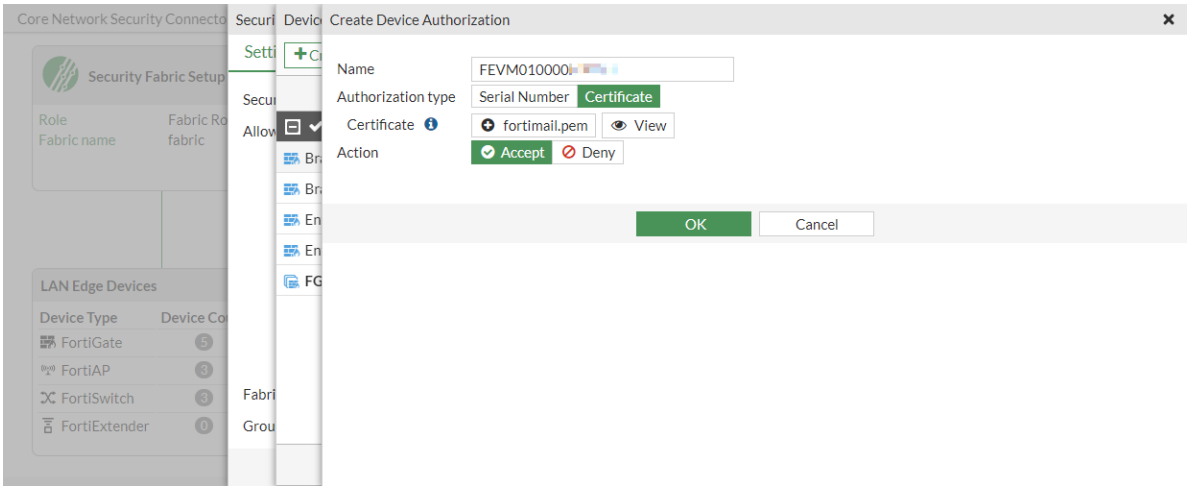
3. In FortiOS, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.

4. Beside *Device authorization*, click *Edit > Create New* and configure the following:

a. Enter the FortiMail serial number.

b. Set the *Authorization type* to *Certificate*.

c. Click *Browse* to upload the .CER file you saved previously.



d. Click *OK*.

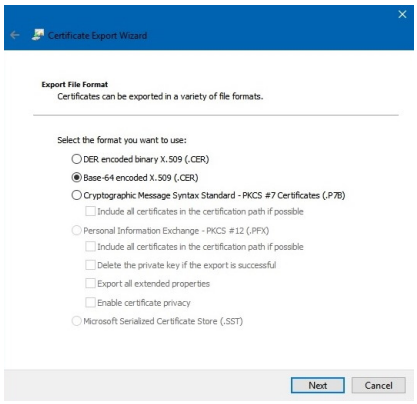
Pre-authorizing using the FortiVoice certificate

In this example, FortiVoice is configured for pre-authorization using a certificate.

To pre-authorize a FortiVoice using a third-party or default certificate in the GUI:

1. Log in to the FortiVoice.
2. Download the certificate. For example, in Chrome:
   a. In the left side of the address bar, click the icon to view the site information.
   b. Click *Certificate*.
   c. In the *Certificate* window, click the *Details* tab, then click *Copy to File*.

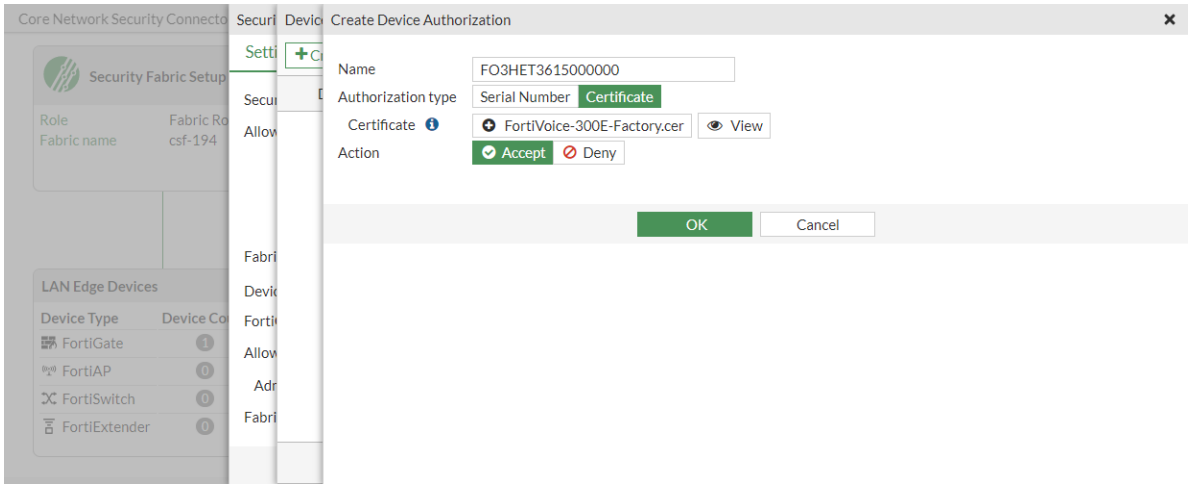
   d. The *Certificate Export Wizard* opens. Click *Next*.
   e. Set the format to *Base-64 encoded X.509 (.CER)*, then click *Next*.



f. Browse to the folder location, enter a file name, then click *Next*.

g. Click *Finish*, then click *OK* to close the wizard.

3. In FortiOS, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
4. Beside *Device authorization*, click *Edit*.
5. Click *Create New* and enter the following:
   a. In the *Name* field, enter the FortiVoice serial number.
   b. Set the *Authorization type* to *Certificate*.
   c. Upload the .CER file.



d. Click *OK*, then close the *Device authorization* pane.

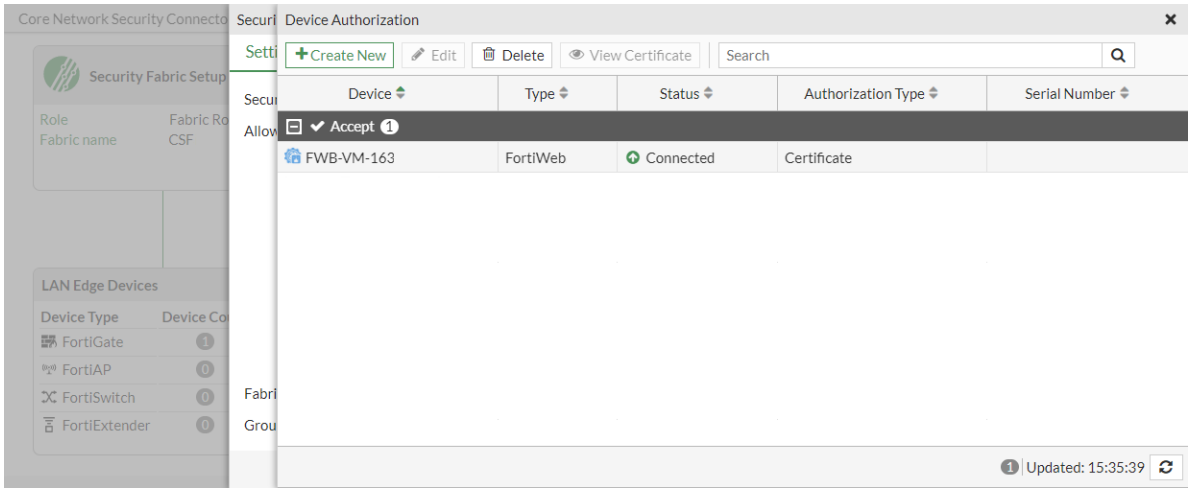
Pre-authorizing using the FortiWeb certificate

In this example, FortiWeb is configured for pre-authorization using a certificate.

To authorize a FortiWeb to join the Security Fabric in FortiOS:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. Beside *Device authorization*, click *Edit*. The *Device authorization* pane opens.
3. Add the FortiWeb:
   a. Click *Create New* and enter a device name.
   b. For *Authorization type*, select *Certificate*.

c. Click *Browse* to upload the certificate.
d. For *Action*, select *Accept*.
e. Click *OK*. The FortiWeb appears in the table.



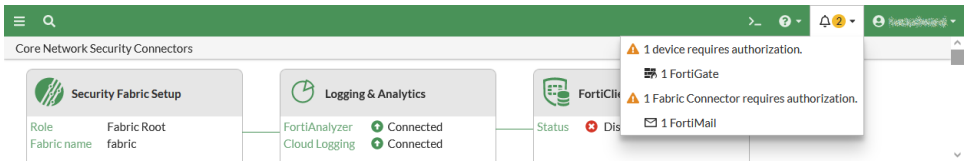
Authorizing supported connectors

Supported connectors can be authorized from the *Security Fabric* > *Fabric Connectors* page.

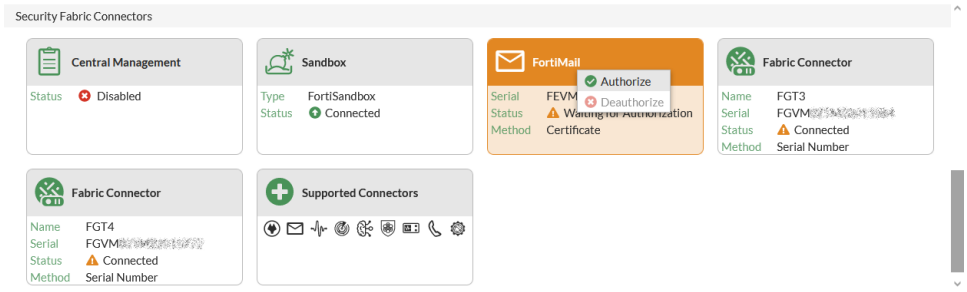
For information about authorizing other devices, see Authorizing devices on page 3251.

To authorize a supported connector in the GUI:

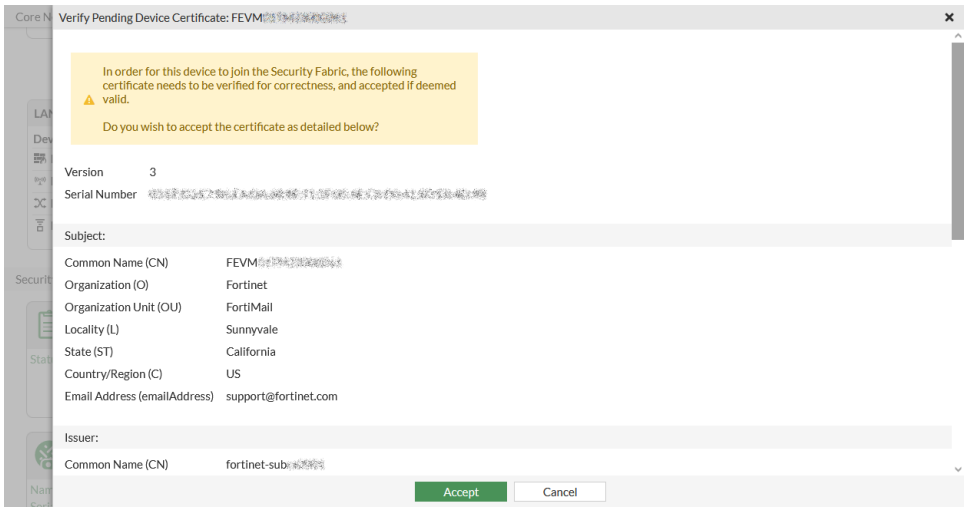
1. Go to *Security Fabric* > *Fabric Connectors* , either by selecting it in the tree menu, or clicking the link in the notification center dropdown.



2. In the *Security Fabric Connectors* section, click on the card of the unauthorized device, and select *Authorize*.



3. Verify the device certificate, then click *Accept*.



The device is authorized and should come online in a few moments. If the device does not come online in six to eight minutes, check its connection settings.

To authorize a supported connector in the CLI:

```
config system csf
    config trusted-list
        edit "<serial number>"
            set action accept
        next
    end
end
```

Configuring FortiDeceptor

FortiDeceptor can be added to the Security Fabric so it appears in the topology views and the dashboard widgets.

FortiDeceptor requires REST API access to FortiGate.

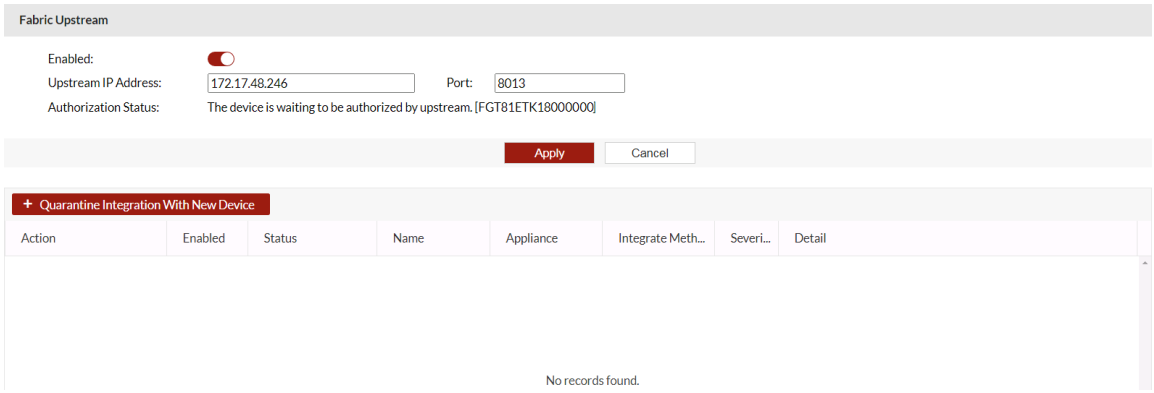
To add FortiDeceptor to the Security Fabric in the GUI:

1. In FortiOS, ensure that FortiGate is prepared to add FortiDeceptor to the Security Fabric. See Preparing FortiGate for supported Security Fabric devices on page 3762.
2. (Optional) In FortiOS, configure pre-authorization of FortiDeceptor to enable the device to join the Security Fabric as soon as it connects. See Configuring pre-authorization of supported Security Fabric devices on page 3763.
3. In FortiDeceptor, integrate the device:

   FortiDeceptor instructions are included for convenience. For the latest FortiDeceptor instructions, see the *FortiDeceptor Administration Guide*.

   a. Go to *Fabric > Quarantine Integration*.
   b. Click *Quarantine Integration With New Device*.
   c. Click the toggle to enable the device.

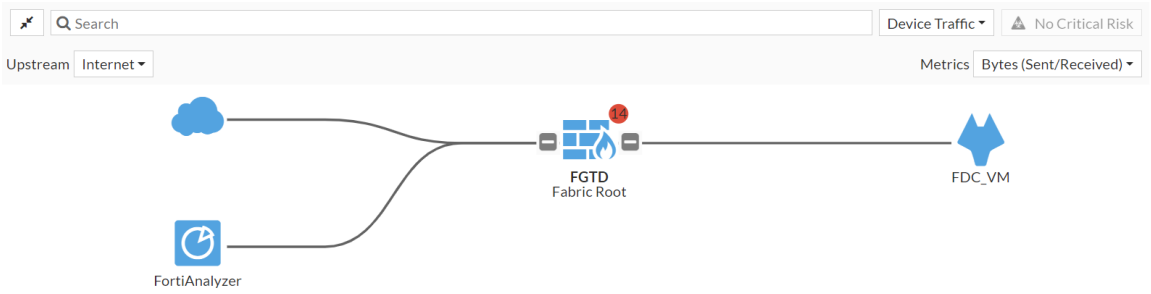
d. For *Upstream IP Address*, enter the root FortiGate's management IP address.

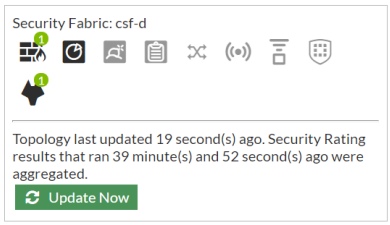


e. Click *Apply*.

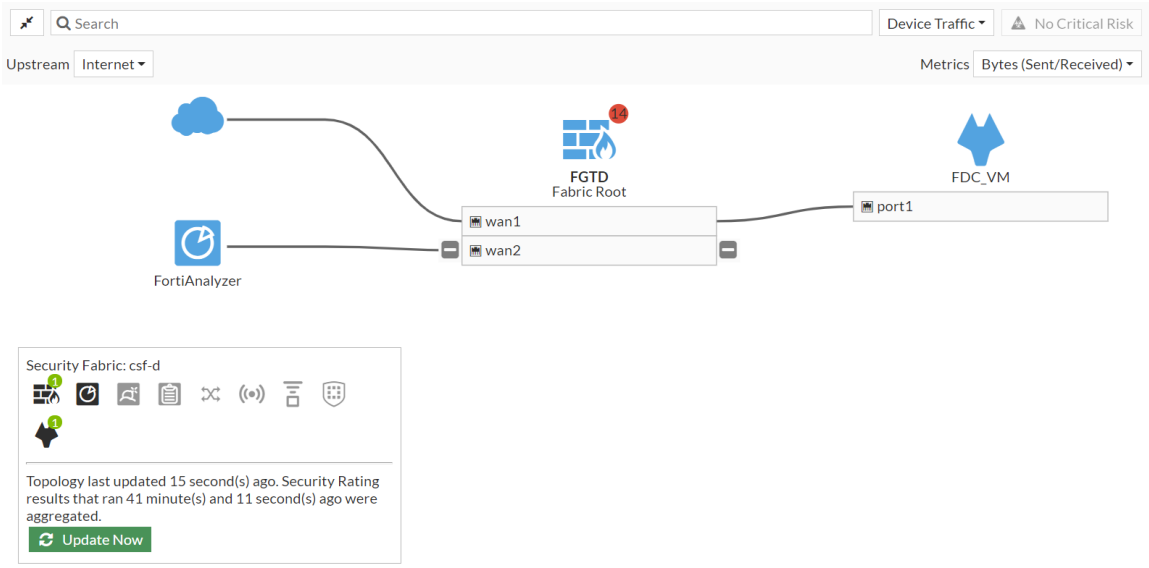
4. In FortiOS, authorize the FortiDeceptor. See Authorizing supported connectors on page 3768.
If FortiDeceptor is pre-authorized, you can skip this step.

5. Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information.
Physical topology view:





Logical topology view:



Configuring FortiMail

FortiMail can be added to the Security Fabric so it appears in the topology views and the dashboard widgets.

To add FortiMail to the Security Fabric in the GUI:

1. In FortiOS, ensure that FortiGate is prepared to add FortiMail to the Security Fabric. See Preparing FortiGate for supported Security Fabric devices on page 3762.
2. (Optional) In FortiOS, configure pre-authorization of FortiMail to enable the device to join the Security Fabric as soon as it connects. See Configuring pre-authorization of supported Security Fabric devices on page 3763.
3. In FortiMail, integrate the device:

   FortiMail instructions are included for convenience. For the latest FortiMail instructions, see the *FortiMail Administration Guide*.

   a. Go to *System* > *Customization* and click the *Corporate Security Fabric* tab (or the *Corporate Security Fabric* tab in FortiMail 6.4.2 and earlier).
   b. Click the toggle to enable the Fabric.
   c. Enter the *Upstream IP Address* (root FortiGate) and the *Management IP* of the FortiMail.
   d. Click *Apply*.
4. In FortiOS, authorize the device. See Authorizing supported connectors on page 3768.

   If FortiMail is pre-authorized, you can skip this step.
5. On FortiOS, go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology* to view more information.

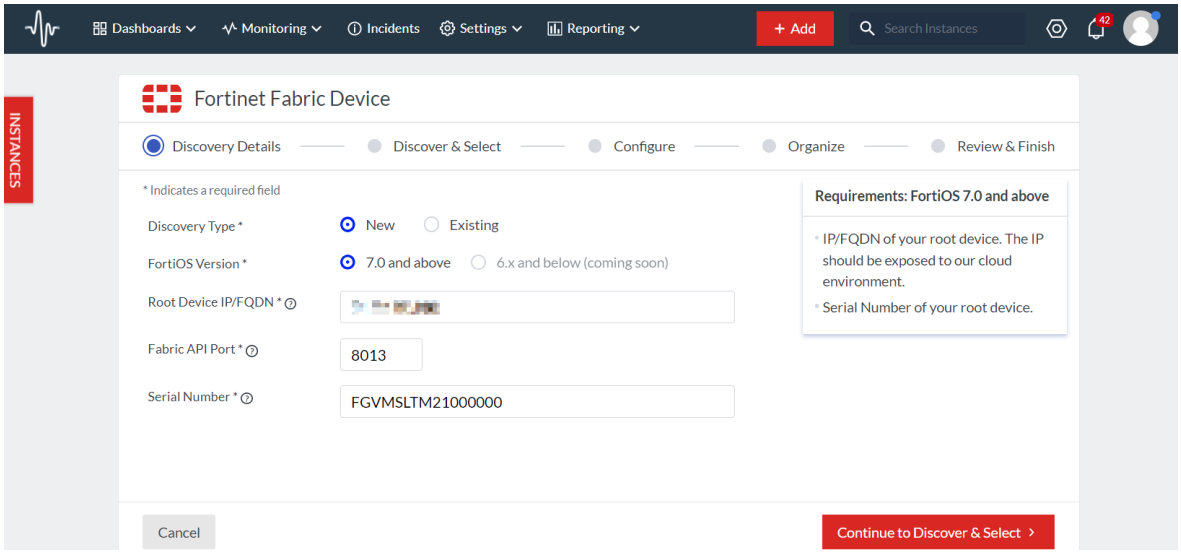
Configuring FortiMonitor

FortiMonitor can be added to the Security Fabric so it appears in the topology views and the dashboard widgets.

FortiMonitor requires REST API access to FortiGate.

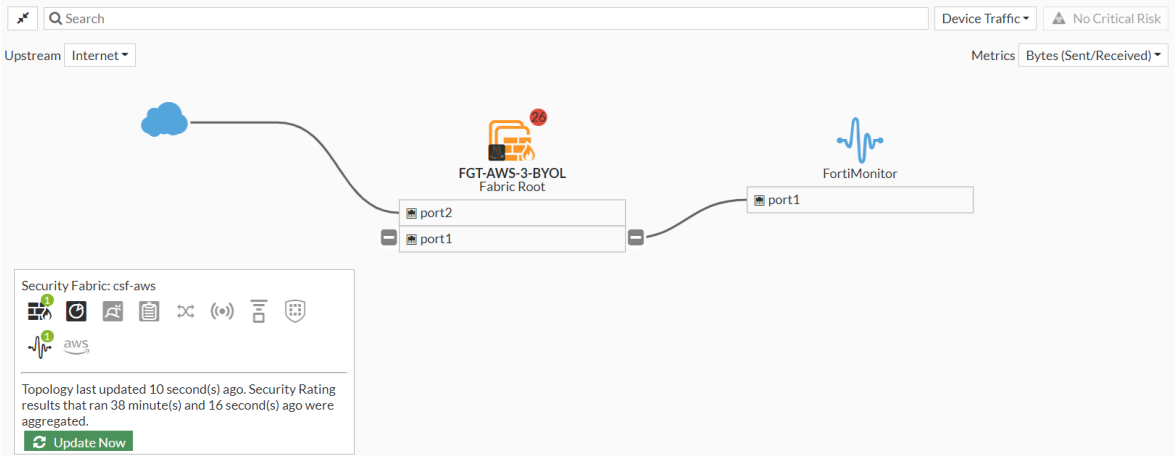
To add FortiMonitor to the Security Fabric:

1. In FortiOS, ensure that FortiGate is prepared to add FortiMonitor to the Security Fabric. See Preparing FortiGate for supported Security Fabric devices on page 3762.
2. (Optional) In FortiOS, configure pre-authorization of FortiMonitor to enable the device to join the Security Fabric as soon as it connects. See Configuring pre-authorization of supported Security Fabric devices on page 3763.
3. In FortiMonitor, start configuring the device to join the Security Fabric (see Enable Security Fabric monitoring for detailed instructions):
   a. Complete the *Discovery Details* page.



4. In FortiOS, authorize the FortiMonitor. See Authorizing supported connectors on page 3768.
   If FortiMonitor is pre-authorized, you can skip this step.
5. Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information.
   Physical topology view:

   Logical topology view:



6. In FortiMonitor, complete the device configuration. (See Enable Security Fabric monitoring for detailed instructions.)

Configuring FortiNAC

A FortiNAC device can be added to the Security Fabric on the root FortiGate. After the device has been added and authorized, you can log in to the FortiNAC from the FortiGate topology views.

Adding a FortiNAC to the Security Fabric requires a FortiNAC with a license issued in the year 2020 or later that includes an additional certificate. The device cannot be added if it has an older license. Use the `licensetool` in the FortiNAC CLI to determine if your license includes the additional certificate.

The FortiNAC tags connector under *Security Fabric > Fabric Connectors* has been deprecated. It was replaced with a REST API (in FortiNAC and FortiOS) that is used by FortiNAC to send user logon and logoff information to the FortiGate. The FortiNAC tag dynamic firewall address type is used to store the device IP, FortiNAC firewall tags, and FortiNAC group information sent from FortiNAC by the REST API when user logon and logoff events are registered (see FortiNAC tag dynamic address on page 1774 for more information).

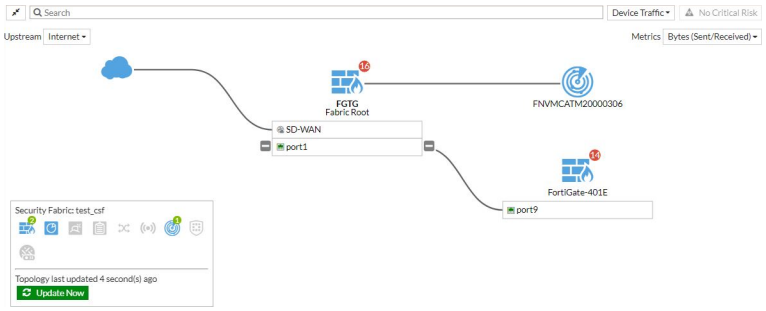
For upgrade support, the FSSO FortiNAC user type can still be configured in the CLI.

To add FortiNAC to the Security Fabric in the GUI:

1. In FortiOS, ensure that FortiGate is prepared to add FortiNAC to the Security Fabric. See Preparing FortiGate for supported Security Fabric devices on page 3762.
2. (Optional) In FortiOS, configure pre-authorization of FortiNAC to enable the device to join the Security Fabric as soon as it connects. See Configuring pre-authorization of supported Security Fabric devices on page 3763.
3. On FortNAC, configure telemetry and input the IP address of the root FortiGate. See Security Fabric Connection in the *FortiNAC Administration Guide* for more information.

4. In FortiOS on the root FortiGate, authorize the FortiNAC. See Authorizing supported connectors on page 3768.
   If FortiNAC is pre-authorized, you can skip this step.
5. Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information.
   Physical topology view:

   Logical topology view:



6. Run the following command in the CLI to view information about the FortiNAC device's status:

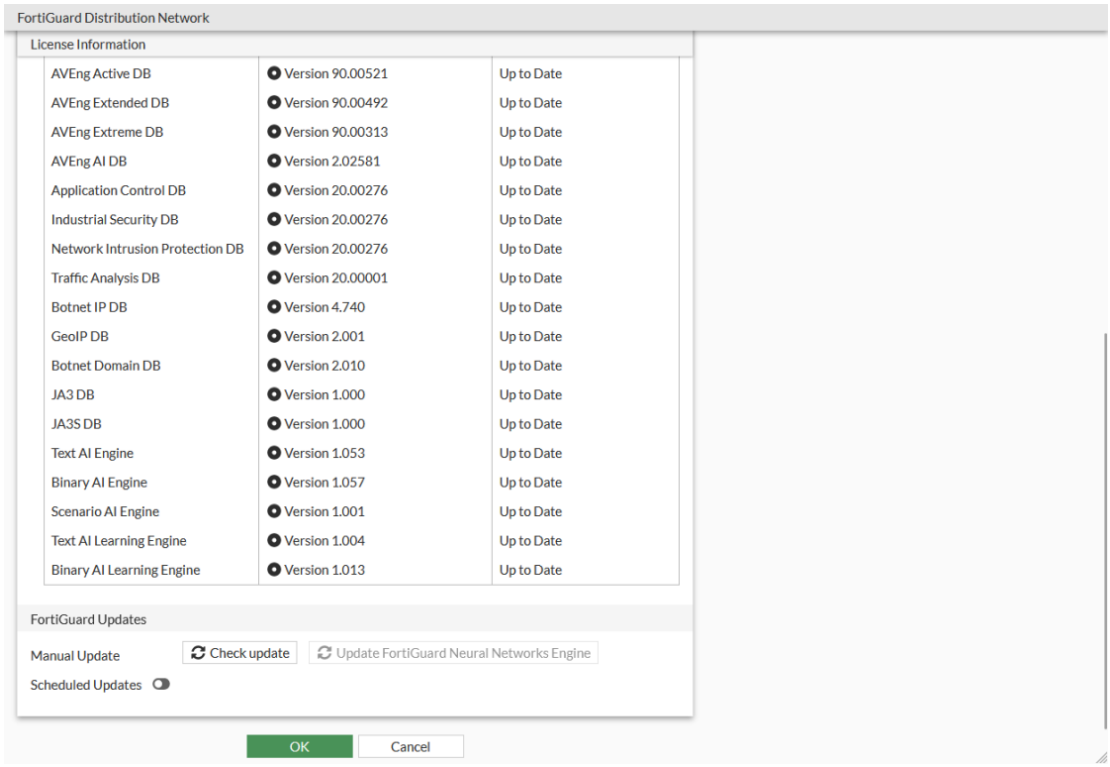
```
# diagnose sys csf downstream-devices fortinac
{
  "path":"FG5H1E5818900126:FNVMCATM20000306",
  "mgmt_ip_str":"10.1.100.197",
  "mgmt_port":0,
  "admin_port":8443,
  "serial":"FNVMCATM20000306",
  "host_name":"adnac",
  "device_type":"fortinac",
  "upstream_intf":"port2",
  "upstream_serial":"FG5H1E5818900126",
  "is_discovered":true,
  "ip_str":"10.1.100.197",
  "downstream_intf":"eth0",
  "authorizer":"FG5H1E5818900126",
  "idx":1
}
```

Configuring FortiNDR

FortiNDR (formerly FortiAI) can be added to the Security Fabric so that it appears in the topology views and the dashboard widgets.

To add FortiNDR to the Security Fabric in the GUI:

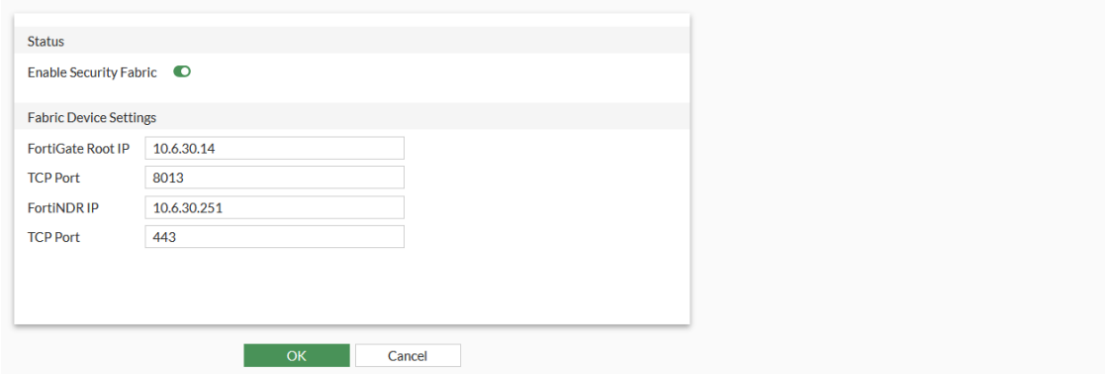
1. In FortiOS, ensure that FortiGate is prepared to add FortiNDR to the Security Fabric. See Preparing FortiGate for supported Security Fabric devices on page 3762.
2. (Optional) In FortiOS, configure pre-authorization of FortiNDR to enable the device to join the Security Fabric as soon as it connects. See Configuring pre-authorization of supported Security Fabric devices on page 3763.
3. In FortiNDR, go to *System* > *FortiGuard* and verify that the pre-trained models (engines) are up to date. Refer to the FortiGuard website for the latest FortiNDR ANN versions.



4. In FortiNDR GUI, configure and authorize the FortiGate:

   FortiNDR instructions are included for convenience. For the latest FortiNDR instructions, see the *FortiNDR Administration Guide*.

   a. Go to *Security Fabric* > *Fabric Connectors* and click the gear icon in the top right corner of the *Security Fabric* card.
   b. Click the toggle to *Enable Security Fabric*.
   c. Enter the IP addresses for the root FortiGate and the FortiNDR.



d. Click *OK*. The FortiNDR is now authorized.

5. In FortiOS, authorize the FortiNDR. See Authorizing supported connectors on page 3768.

   If FortiNDR is pre-authorized, you can skip this step.
6. On FortiOS, go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology* to view more information.

Configuring FortiPolicy

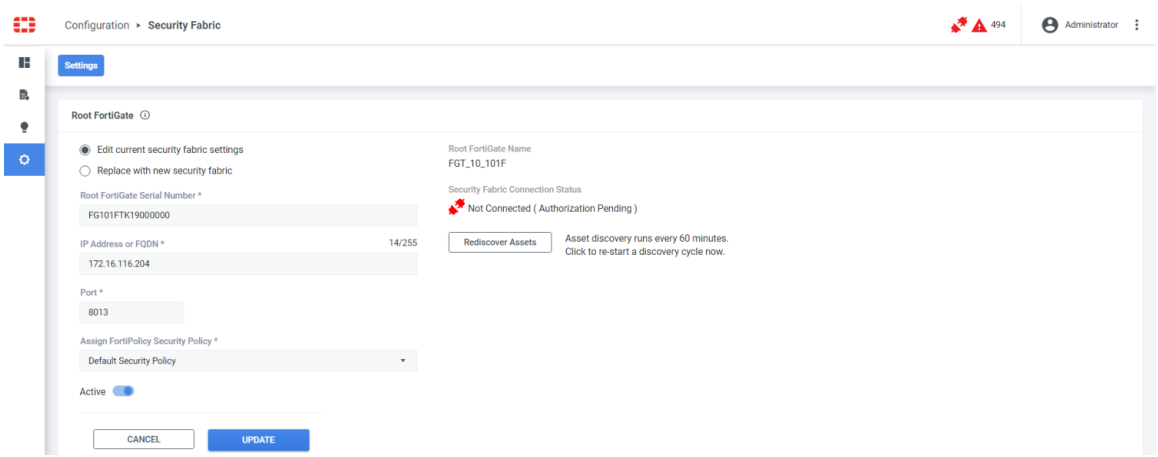
FortiPolicy can be added to the Security Fabric. When FortiPolicy joins the Security Fabric and is authorized in the *Security Fabric* widget, it appears in the Fabric topology pages. A FortiGate can grant permission to FortiPolicy to perform firewall address and policy changes.

FortiPolicy requires REST API access to FortiGate.

To add FortiPolicy to the Security Fabric in the GUI:

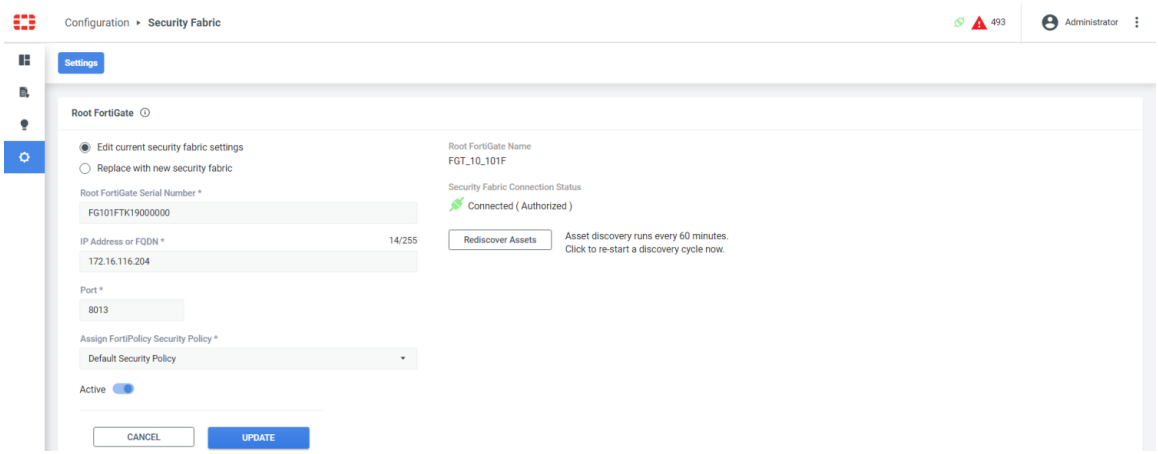
1. In FortiOS, ensure that FortiGate is prepared to add FortiPolicy to the Security Fabric. See Preparing FortiGate for supported Security Fabric devices on page 3762.
2. (Optional) In FortiOS, configure pre-authorization of FortiPolicy to enable the device to join the Security Fabric as soon as it connects. See Configuring pre-authorization of supported Security Fabric devices on page 3763.
3. In FortiPolicy, edit the Security Fabric settings.

   FortiPolicy instructions are included for convenience. For the latest FortiPolicy instructions, see the *FortiPolicy Administration Guide*.
   a. Go to *Configuration* > *Security Fabric* and select *Edit current security fabric settings*.
   b. Enter the root FortiGate's IP address.
   c. Set the *Port* (the default is *8013*).
   d. Select a FortiPolicy security policy.



e. Click *UPDATE*. The connection status is *Not Connected (Authorization Pending)*.

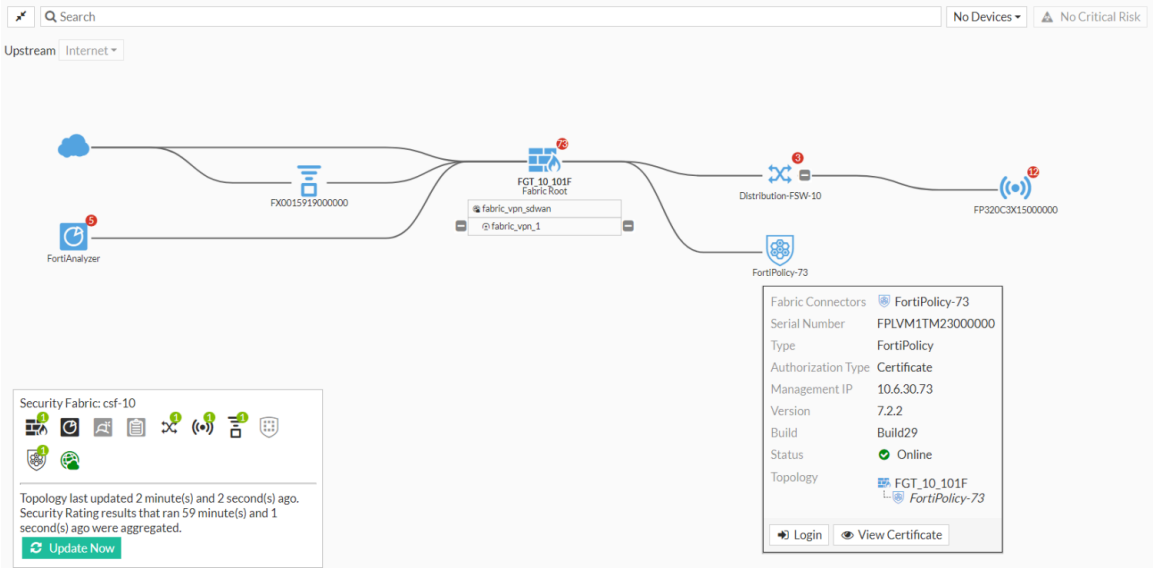
4. In FortiOS, authorize the FortiPolicy. See Authorizing supported connectors on page 3768.
   If FortiPolicy is pre-authorized, you can skip this step.
5. In FortiPolicy, refresh the *Configuration* > *Security Fabric* page, and verify that the connection status is *Connected (Authorized)*.



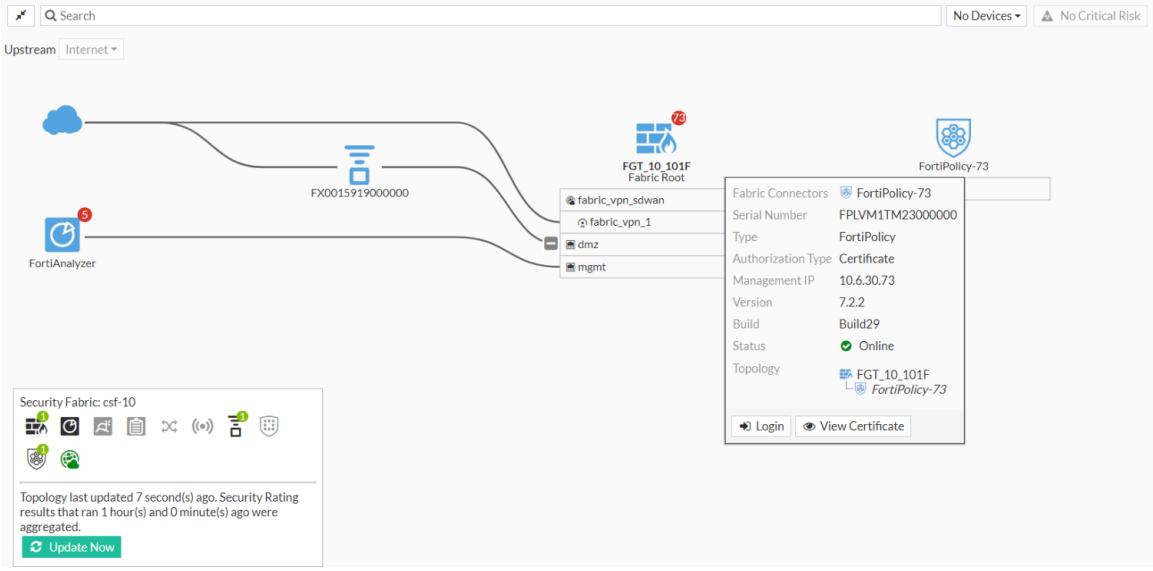
6. In FortiOS, grant FortiPolicy write access permission in the CLI:

```
config system csf
    config fabric-connector
        edit "FPLVM1TM23000000"
            set configuration-write-access enable
        next
    end
end
```

7. Go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology* to view more information.
   Physical topology view:

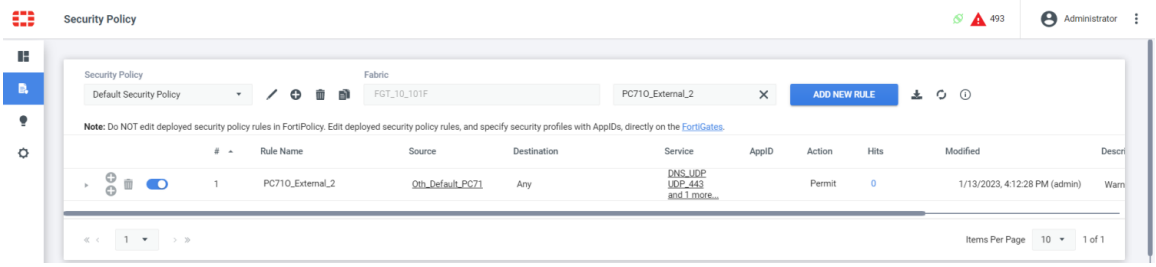


Logical topology view:



To deploy firewall policies from FortiPolicy to the root FortiGate:

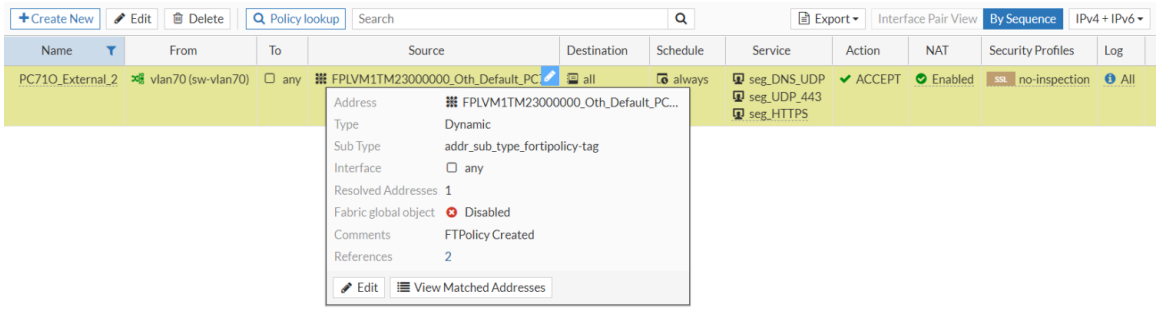
1. Create a policy in FortiPolicy (see Customizing policies in the FortiPolicy Administration Guide).



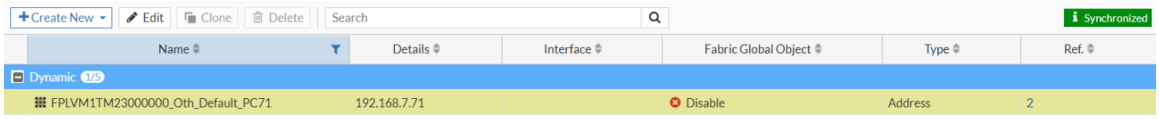
In this example, a default security policy rule called *PC71O_External_2* is created. Since the FortiPolicy is integrated in the Security Fabric, it will use the REST API to push the static policy, dynamic firewall objects,

and service objects to the root FortiGate.

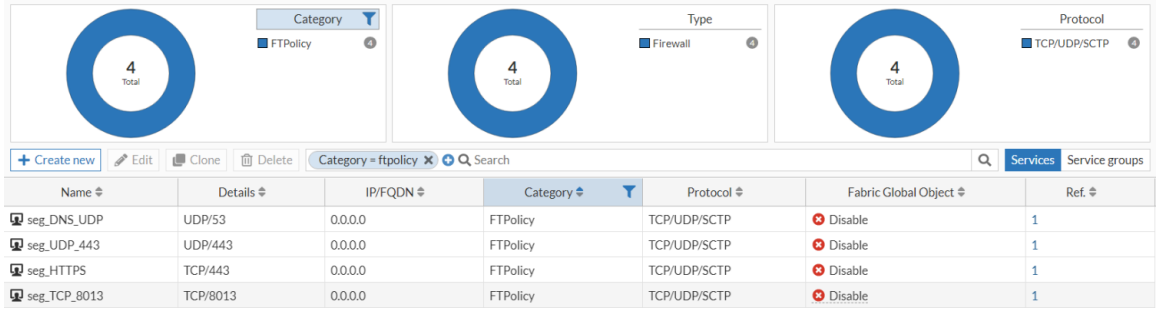
2. In FortiOS, go to *Policy & Objects* > *Firewall Policy* to view the policy named *PC71O_External_2*.



3. Go to *Policy & Objects* > *Addresses* to view the dynamic firewall address associated with the policy (*FPLVM1TM23000000_Oth_Default_PC71*).



4. Go to *Policy & Objects* > *Services* to view the service objects associated with the policy (*seg_DNS_UDP*, *seg_UDP_443*, *seg_HTTPS*, and *seg_TCP_8013*).



Configuring FortiTester

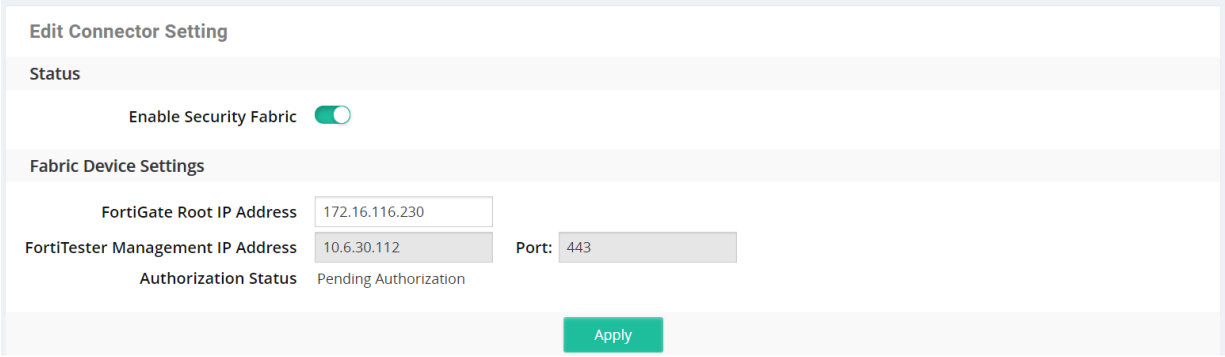
FortiTester can be added to the Security Fabric and authorized from the Security Fabric topology views. Once added, the FortiTester will appear in the *Security Fabric* widget on the dashboard.

To add FortiTester to the Security Fabric in the GUI:

1. In FortiOS, ensure that FortiGate is prepared to add FortiTester to the Security Fabric. See Preparing FortiGate for supported Security Fabric devices on page 3762.
2. (Optional) In FortiOS, configure pre-authorization of FortiTester to enable the device to join the Security Fabric as soon as it connects. See Configuring pre-authorization of supported Security Fabric devices on page 3763.
3. In FortiTester, enable the Security Fabric:

   See also the *FortiTester Administration Guide*.

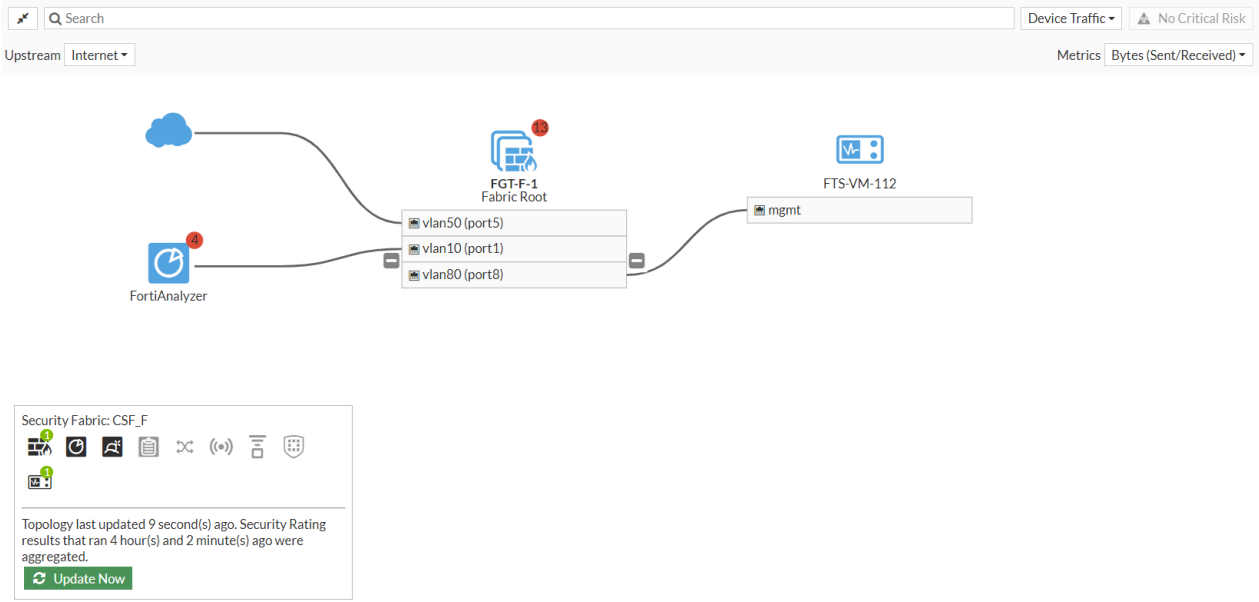
   a. Go to *System Settings* > *Security Fabric* > *Settings*.
   b. Click the toggle to enable the device (*Enable Security Fabric*).
   c. Enter the *FortiGate Root IP Address*.



d. Click *Apply*.

4. In FortiOS, authorize the FortiTester. See Authorizing supported connectors on page 3768.
   If FortiTester is pre-authorized, you can skip this step.
5. Go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology* to view more information.
   Physical topology view:

   Logical topology view:

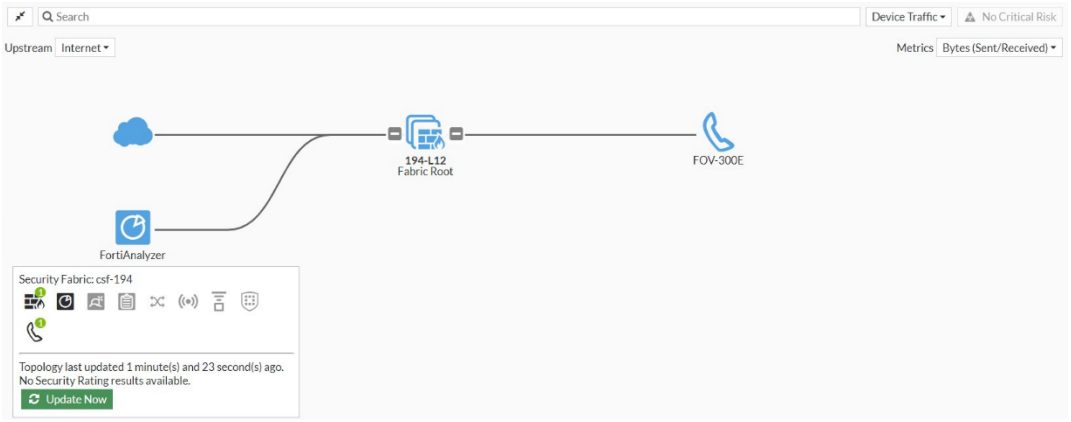


Configuring FortiVoice

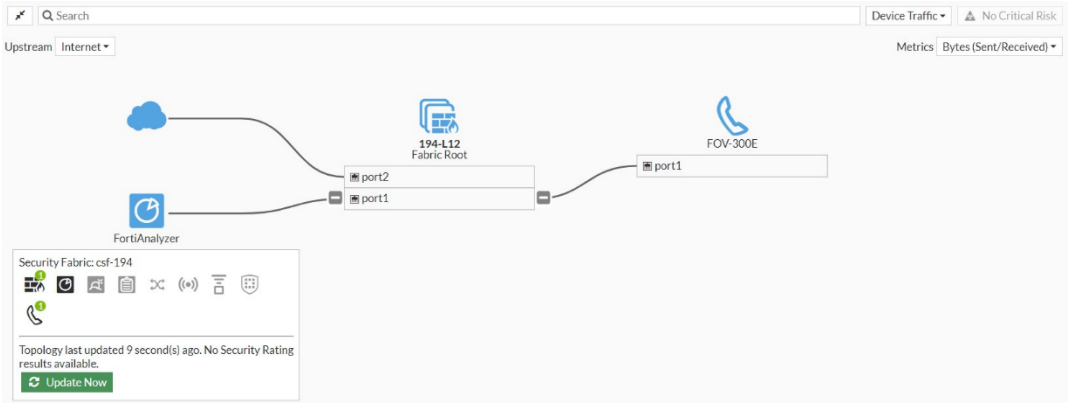
A FortiVoice can be added to the Security Fabric on the root FortiGate. Once the FortiVoice is added and authorized, you can log in to the device from the Security Fabric topology pages.

To add FortiVoice to the Security Fabric in the GUI:

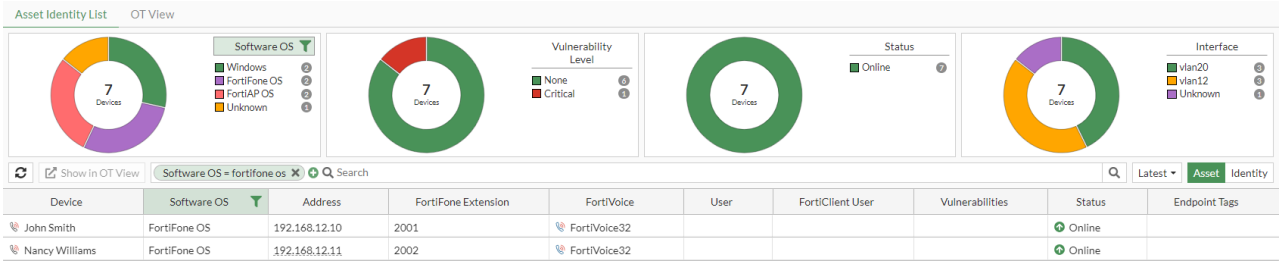
1. In FortiOS, ensure that FortiGate is prepared to add FortiVoice to the Security Fabric. See Preparing FortiGate for supported Security Fabric devices on page 3762.
2. (Optional) In FortiOS, configure pre-authorization of FortiVoice to enable the device to join the Security Fabric as soon as it connects. See Configuring pre-authorization of supported Security Fabric devices on page 3763.
3. On FortiVoice, enable the Security Fabric. See Enabling Security Fabric in the FortiVoice Phone System Administration Guide.
4. In FortiOS, authorize the FortiVoice. See Authorizing supported connectors on page 3768.
   If FortiVoice is pre-authorized, you can skip this step.
5. Go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology* to view more information.
   Physical topology view:



Logical topology view:



6. For additional device (FortiFone) information, go to the *Security Fabric* > *Asset Identity Center* page.



Configuring FortiWeb

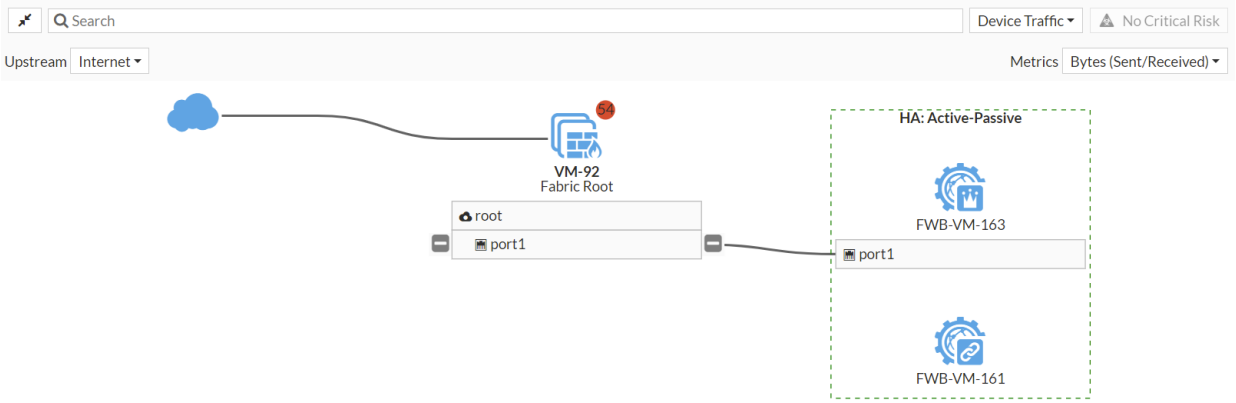
A FortiWeb can be added to the Security Fabric on the root FortiGate.

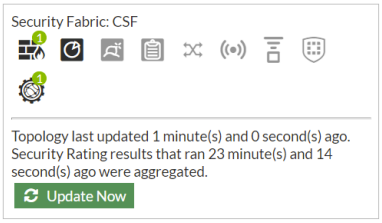
To add FortiWeb to the Security Fabric in the GUI:

1. In FortiOS, ensure that FortiGate is prepared to add FortiWeb to the Security Fabric. See Preparing FortiGate for supported Security Fabric devices on page 3762.
2. (Optional) In FortiOS, configure pre-authorization of FortiWeb to enable the device to join the Security Fabric as soon as it connects. See Configuring pre-authorization of supported Security Fabric devices on page 3763.

3. On FortiWeb, edit the FortiGate *Fabric Connector* settings. See Fabric Connector: Single Sign On with FortiGate. The *Connection Status* is currently *Authorize pending*.
4. In FortiOS, authorize the FortiWeb. See Authorizing supported connectors on page 3768.
   If FortiWeb is pre-authorized, you can skip this step.
5. Go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology* to view more information.
   Physical topology view:

   Logical topology view:





Allowing FortiDLP Agent communication through the FortiGate

Every FortiDLP Agent requires a direct connection to the FortiDLP Cloud to report real-time data and receive configuration updates. This is outlined in Allowing communication between the FortiDLP Agent and FortiDLP Cloud.

As such, FortiDLP Agents operating behind the FortiGate firewall must be able to reach the FortiDLP Cloud servers. The servers must be trusted by the FortiGate and a corresponding firewall policy must allow traffic to these servers.

To view the FortiDLP Cloud server addresses on the FortiGate:

1. Go to *Policy & Objects* > *Internet Service Database*.
2. Search for *FortiDLP*.
3. Double-click the *Fortinet-FortiDLP.Cloud* entry to view it.
4. In the right hand panel, click *View/Edit Entries* to see the addresses.

To allow traffic to FortiDLP Cloud servers:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create new*.
3. Select the *Incoming interface* and the *Outgoing interface*.
4. Select the *Source* address.
5. For the *Destination* address
   a. Click in the field and, in the slide-out pane, select *Internet Service* from the drop-down menu.
   b. Search for *FortiDLP*.
   c. Select the *Fortinet-FortiDLP.Cloud* entry.
   d. Click *Close*.
6. Leave remaining settings as their default values and click *OK*.

Using the Security Fabric

The following topics provide information about using and deploying the Security Fabric:

- Dashboard widgets on page 3785
- Topology on page 3786
- Asset Identity Center page on page 3792
- OT asset visibility and network topology on page 3797
- KEV information in IoT/OT vulnerabilities on page 3804
- WebSocket for Security Fabric events on page 3808
- Deploying the Security Fabric on page 3809
- Deploying the Security Fabric in a multi-VDOM environment on page 3817

- Other Security Fabric topics on page 3823

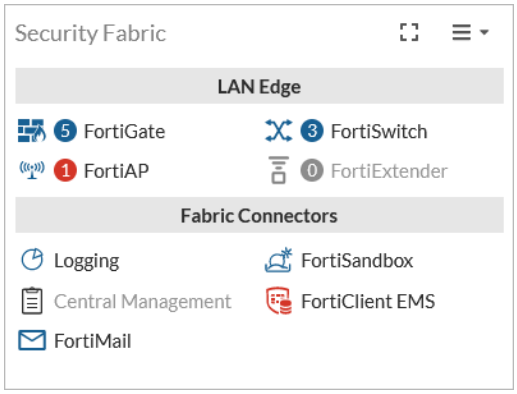
Dashboard widgets

Security Fabric widgets can be added to FortiGate dashboards, including:

- Security Fabric status on page 3785
- FortiGate Cloud on page 3785

Security Fabric status

The Security Fabric status widget shows a summary of the devices in the Security Fabric.



Hover the cursor over the top icons to view pop-ups showing the statuses of the devices in the fabric.

The device tree shows devices that are connected, or could be connected, to you Security Fabric, according to the following color scheme:

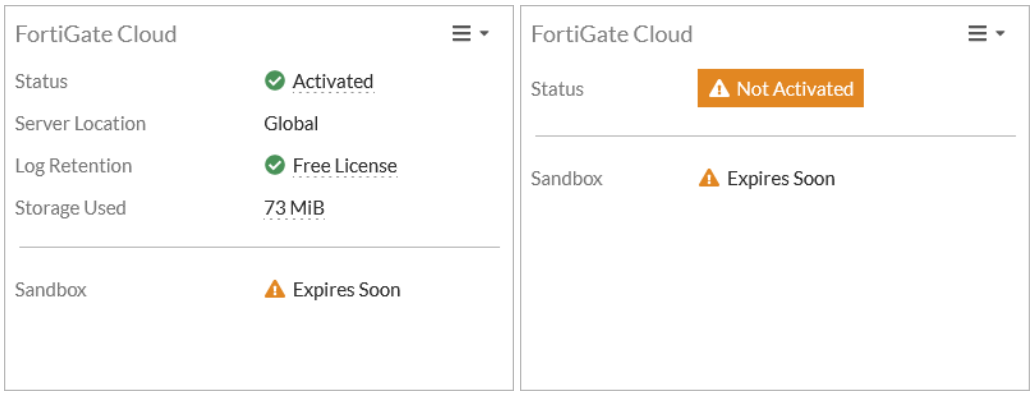
- Blue: connected to the network
- Gray: not configured or not detected
- Red: no longer connected or not authorized

Hover over a device in the tree to view details about the device, such as it's serial number, operation mode, IP address, CPU and memory usage, and others, depending on the device type.

Unauthorized FortiAP and FortiSwitch devices are highlighted in the list, and can be authorized by clicking on the device name.

FortiGate Cloud

The FortiGate Cloud widget shows the FortiGate Cloud status and information. If your account is not activated, you can activate it from the widget.



To activate your FortiGate Cloud account:

1. Click on the *Not Activated* button and select *Activate*. The *Activate FortiGate Cloud* pane opens.
2. If you already have an account:
   a. Fill in your email address, password, country or region, and reseller.
   b. Click *OK*.
3. If you are creating an account:
   a. In the *FortiCloud* field select *Create Account*.
   b. Fill in all of the required information.
   c. Click *OK*.

Topology

The full Security Fabric topology can be viewed on the root FortiGate. Downstream FortiGate devices' topology views do not include upstream devices.

The *Physical Topology* page shows the physical structure of your network, including all connected devices and the connections between them. The *Logical Topology* page shows information about the interfaces that connect devices to the Security Fabric.

In both topology pages, you can use filtering and sorting options to control the information that is shown. Hover the cursor over a device icon, port number, or endpoint to open a tooltip that shows information about that specific device, port, or endpoint. Right-click on a device to log into, configure, or deauthorize it. Right-click on an endpoint to perform various tasks, such as drilling down for more details in FortiView, quarantining the host, and banning the IP address.

The small number that might be shown in the top right corner of a device icon is the number of security ratings recommendations or warnings for that device. The circle color indicates the severity of the highest security rating check that failed. Clicking it opens the *Security Rating* page. See Security rating on page 3859 for more information.

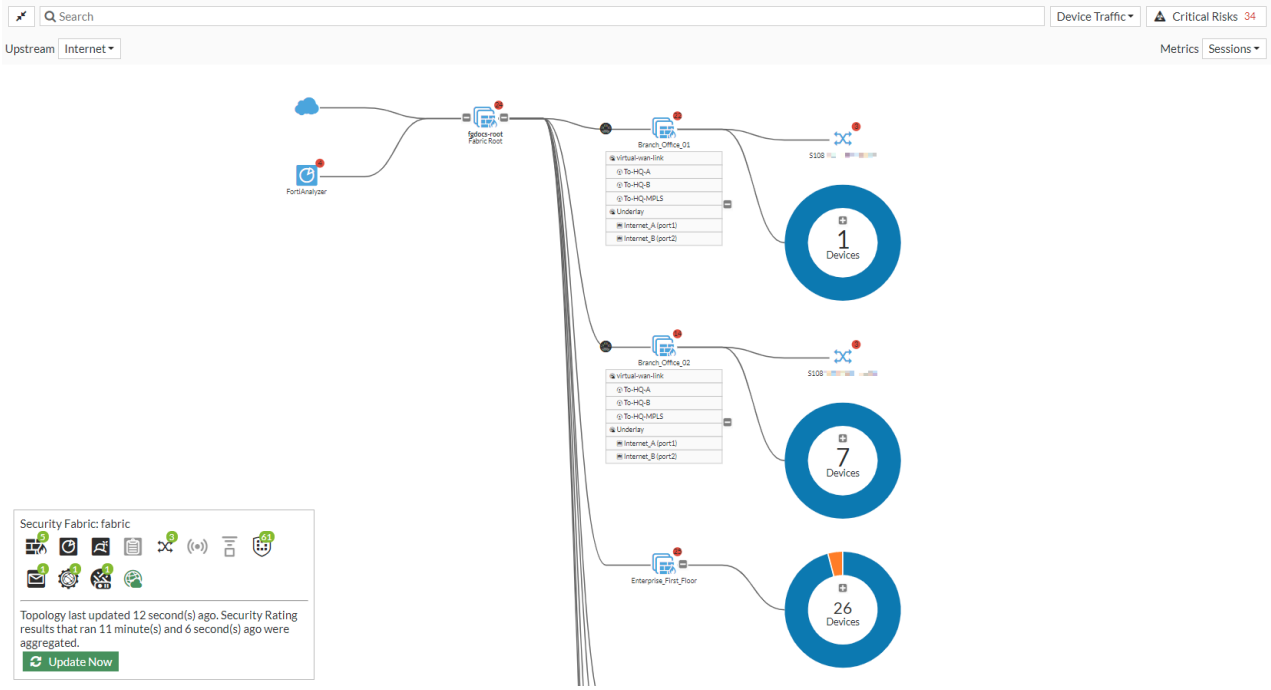
Views

From the dropdown list beside the search bar, select one of the following views:

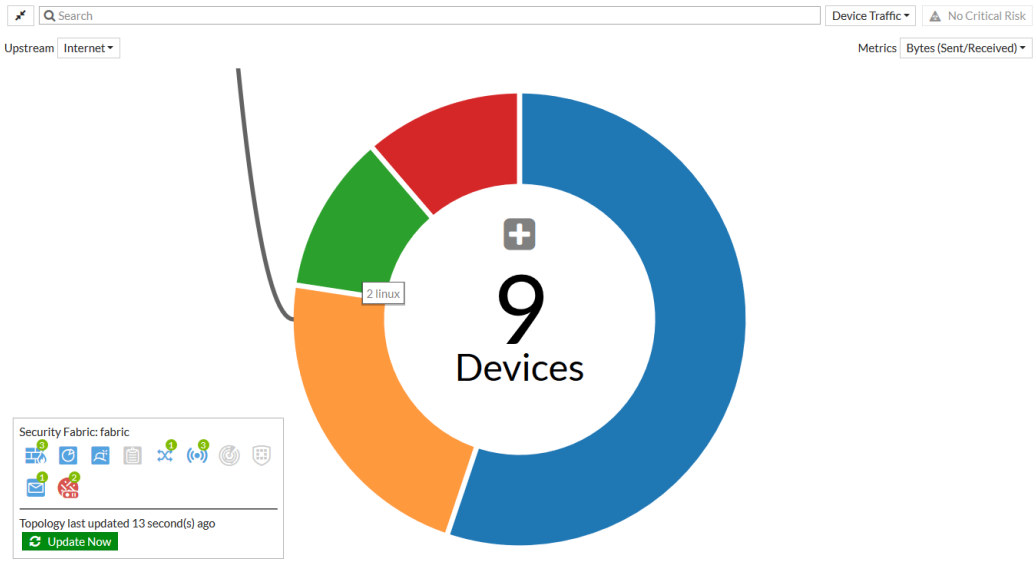
- *Device Traffic*: organize devices by traffic.
- *Device Count*: organize devices by the number of devices connected to it.
- *Device Operating System*: organize devices by operating system.
- *Device Hardware Vendor*: organize devices by hardware vendor.
- *Risk*: only include devices that have endpoints with medium, high, or critical risk values of the specified type: *All*, *Compromised Host*, *Vulnerability*, or *Threat Score*.
- *No Devices*: do not show endpoints.

Endpoint groups

The *Device Traffic* and *Device Count* views display endpoint groups as donut charts, with the total number of endpoints in the group in the center of the chart. Each sector of the donut chart represents a different endpoint operating system.



To zoom in on a donut chart, click any chart sector. Each sector represents a different endpoint OS. Hovering over each sector allows you to see the OS that the sector represents and the number of endpoints that have that OS installed.



In this example, the endpoint group contains a total of nine endpoints, with the following OSes installed:

Donut sector color	OS	Number of endpoints
Orange	Linux	2
Green	FortiMail	1
Red	FortiManager	1
Blue	Other	5

To view the endpoint group in a bubble pack display, click the + button in the center of the donut chart. You can view each individual endpoint in the bubble pack view.

FortiAP and FortiSwitch devices

Newly discovered FortiAP and FortiSwitch devices are initially shown in the topologies with gray icons to indicate that they have not been authorized. To authorize a device, click on the device icon or name and select *Authorize*. Once authorized, the device icon will turn blue.

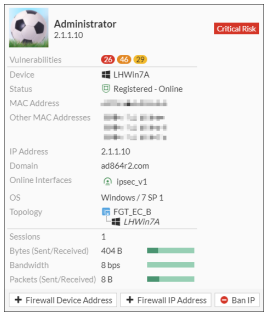
Right-click on an authorized FortiAP device to *Deauthorize* or *Restart* the device. Right-click on a FortiSwitch device to *Deauthorize*, *Restart*, or *Upgrade* the device, or to *Connect to the CLI*.

FortiAP and FortiSwitch links are enhanced to show link aggregation groups for the inter-switch link (ISL-LAG). To differentiate them from physical links, ISL-LAG links are shown with a thicker line. The endpoint circles can also be used as a reference to identify ISL-LAG groups that have more than two links.

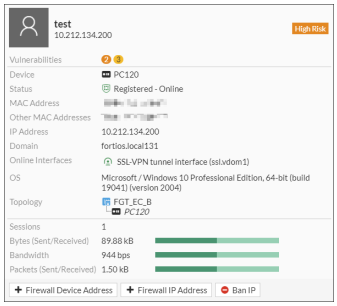
Managed clients connected over a VPN

When managed clients are connected over a VPN, EMS collects user information about these registered clients, such as the VPN connection information. The FortiGate can synchronize this user information from EMS and display it in the logical topology view to provide a detailed picture of clients and their associated VPN interfaces.

Client using an IPsec VPN interface:



Client using an SSL VPN interface:



Critical risks

Click the *Critical Risks* button to see a list of endpoints that are deemed critical risks, organized by threat severity. These are the red endpoints in the current topology view.

For each endpoint, the user's photo, name, IP address, email address, and phone number are shown. The number of vulnerabilities of each severity is shown, and if the IoC verdict is that the endpoint is compromised.

If applicable, the endpoint's host can be quarantined (click *Quarantine Host*) or their IP address can be banned (click *Ban IP*).

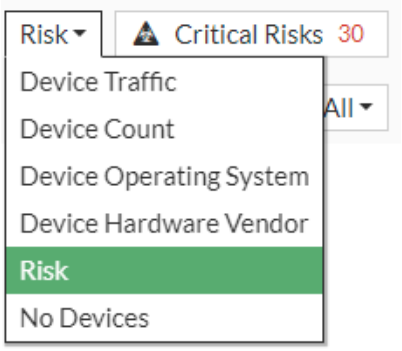
The dropdown menu also provides options to drill down to more information on compromised hosts or endpoint vulnerabilities.

Consolidated risk view

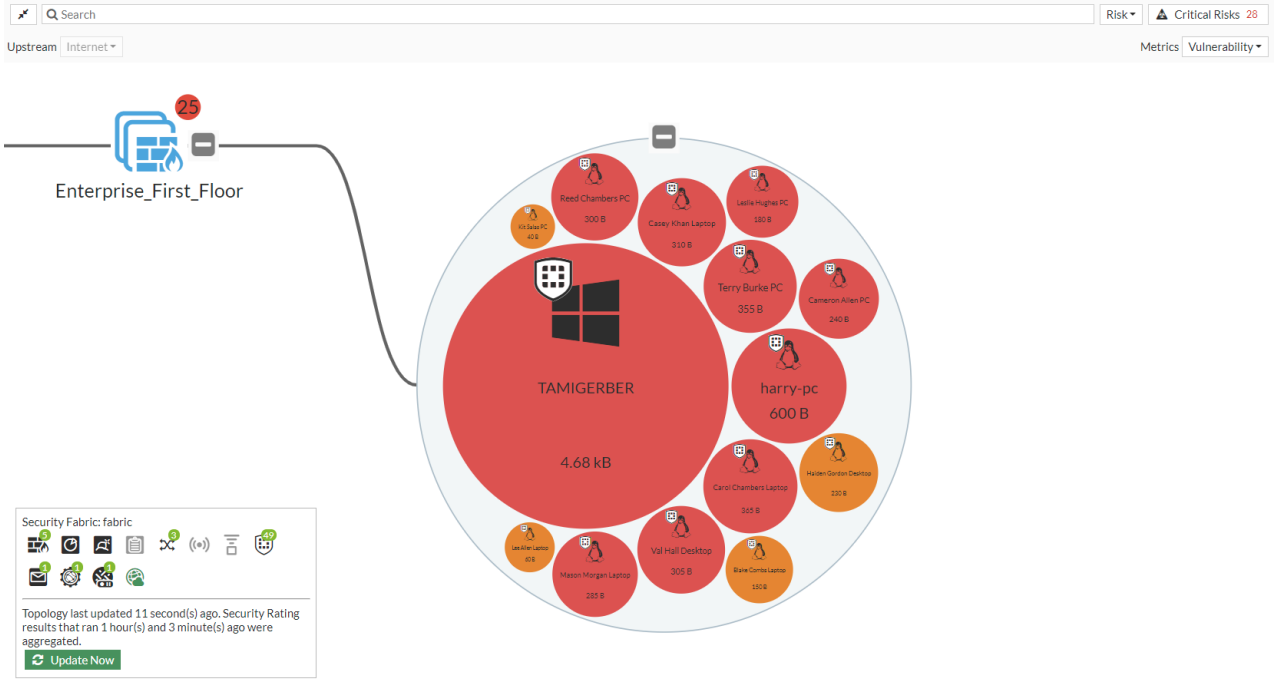
The consolidated *Risk* view mode displays different risks within the Security Fabric topology. You can use the *Risk* view mode to filter threats by *Compromised Hosts*, *Vulnerability*, and *Threat Score*.

To access the consolidated risk view mode:

1. On one of the topology pages, in the view option dropdown list beside the search bar, select *Risk*.



2. Select one of the following options from the *Risk Type* dropdown menu:
   a. *All*
   b. *Compromised Hosts*
   c. *Vulnerability*
   d. *Threat Score*
3. When devices fit into the risk metric, they will appear in the endpoint groups. Click the *+* in the endpoint group to display the devices in a bubble chart.

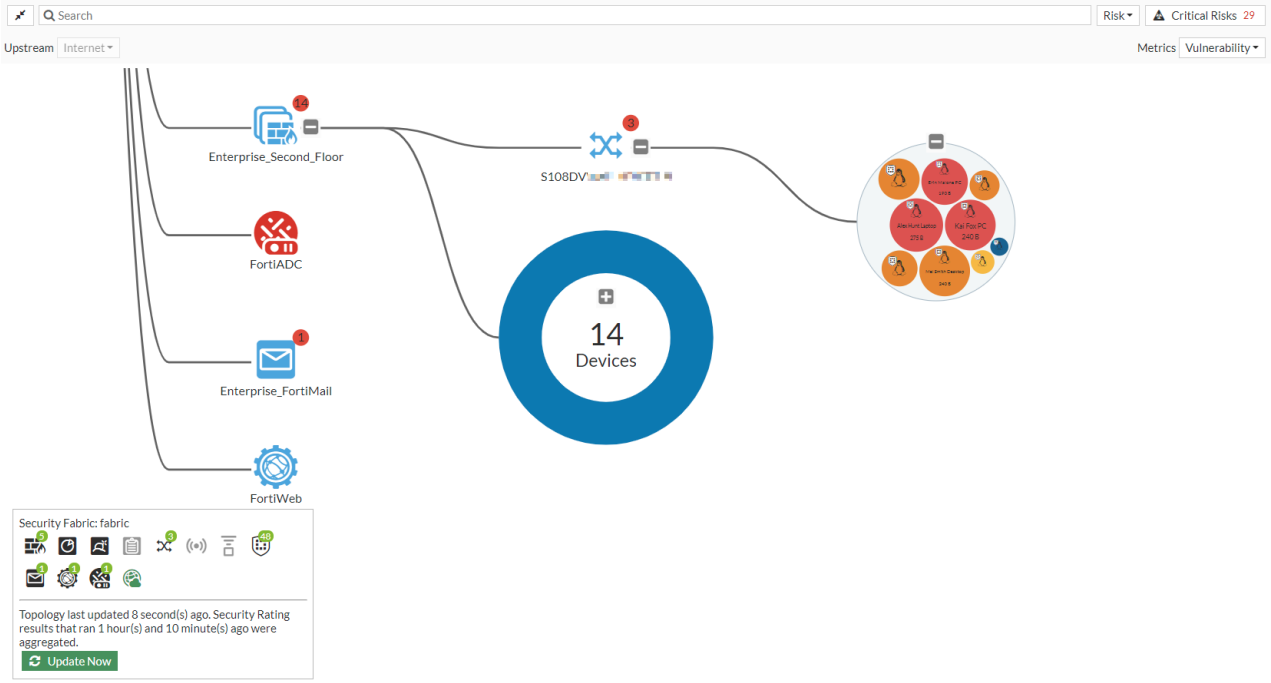


Viewing and controlling network risks in topology view

On the physical and logical topology pages, you can view and control compromised hosts. Compromised hosts behind a FortiSwitch or FortiAP can be quarantined.

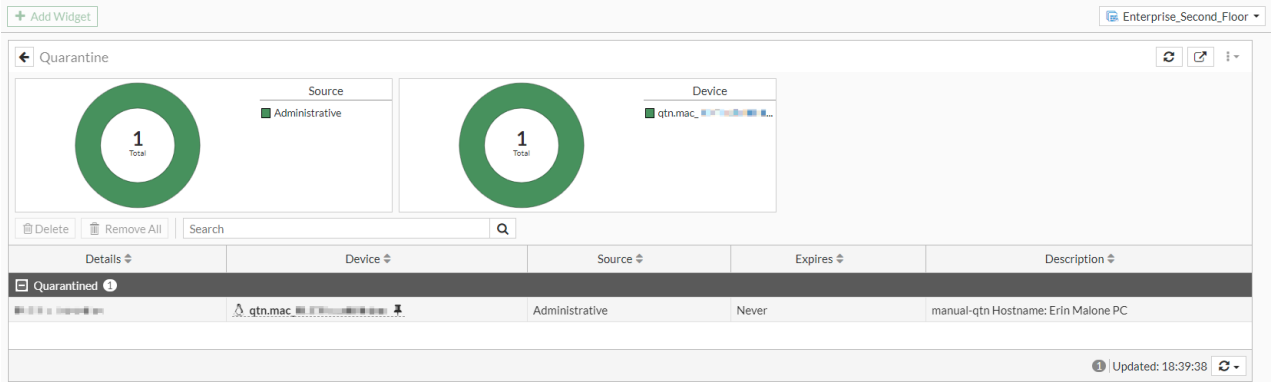
To view a compromised endpoint host:

1. Test that FortiGate detects a compromised endpoint host by opening a browser on the endpoint host and entering a malicious website URL. The browser displays a *Web Page Blocked!* warning and does not allow access to the website.
2. On the root FortiGate, go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology*. Expand the endpoint group connected to a FortiSwitch or FortiAP.
   The endpoint host connected to the switch is highlighted in red. Mouse over the endpoint host to view a tooltip that shows the IoC verdict. The endpoint host is compromised.



To quarantine a compromised endpoint host:

1. On the *Physical Topology* or *Logical Topology* page, right-click the endpoint host and select *Quarantine Host*.
   A dialog displays the FortiGate, host MAC address, and description of the host to be quarantined. Quarantine entries for each MAC address will be created on the FortiGate that the FortiSwitch or FortiAP is connected to.
2. Click *OK*.
3. Go to *Dashboard > Assets & Identities* and click the *Quarantine* widget to expand it.
4. In the top-right corner, use the dropdown to select the FortiGate in which this host was quarantined. In this example, it is the Enterprise_Second_Floor FortiGate.



5. On the endpoint host, open a browser and visit a website such as https://www.fortinet.com/. If the website cannot be accessed, this confirms that the endpoint host is quarantined.

To show the quarantined device from the CLI:

1. Log in to the downstream device where the host was quarantined (Enterprise_Second_Floor).
2. Enter the following show command:

```
Enterprise_Second_Floor # show user quarantine
config user quarantine
    set firewall-groups "QuarantinedDevices"
    config targets
        edit "Erin Malone PC"
            set description "Manually quarantined"
            config macs
                edit **:**:**:**:**:**
                    set description "manual-qtn Hostname: Erin Malone PC"
                next
            end
        next
    end
end
```

Asset Identity Center page

The *Asset Identity Center* page unifies information from detected addresses, devices, and users into a single page, while building a data structure to store the user and device information in the backend. The *Asset* view groups information by *Device*, while the *Identity* view groups information by *User*. Hover over a device or a user in the GUI to perform different actions relevant to the object, such as adding a firewall device address, adding an IP address, banning the IP, quarantining the host, and more.

When the FortiGate does not have a disk:

- Device charts are hidden on the *Security Fabric > Asset Identity Center* page.
- In *Dashboard > Assets & Identities*, the widget preview page displays a total count instead of the preview chart for asset-related widgets. Asset-related widgets include *Assets*, *Assets - FortiClient* and *Assets - Vulnerability*.

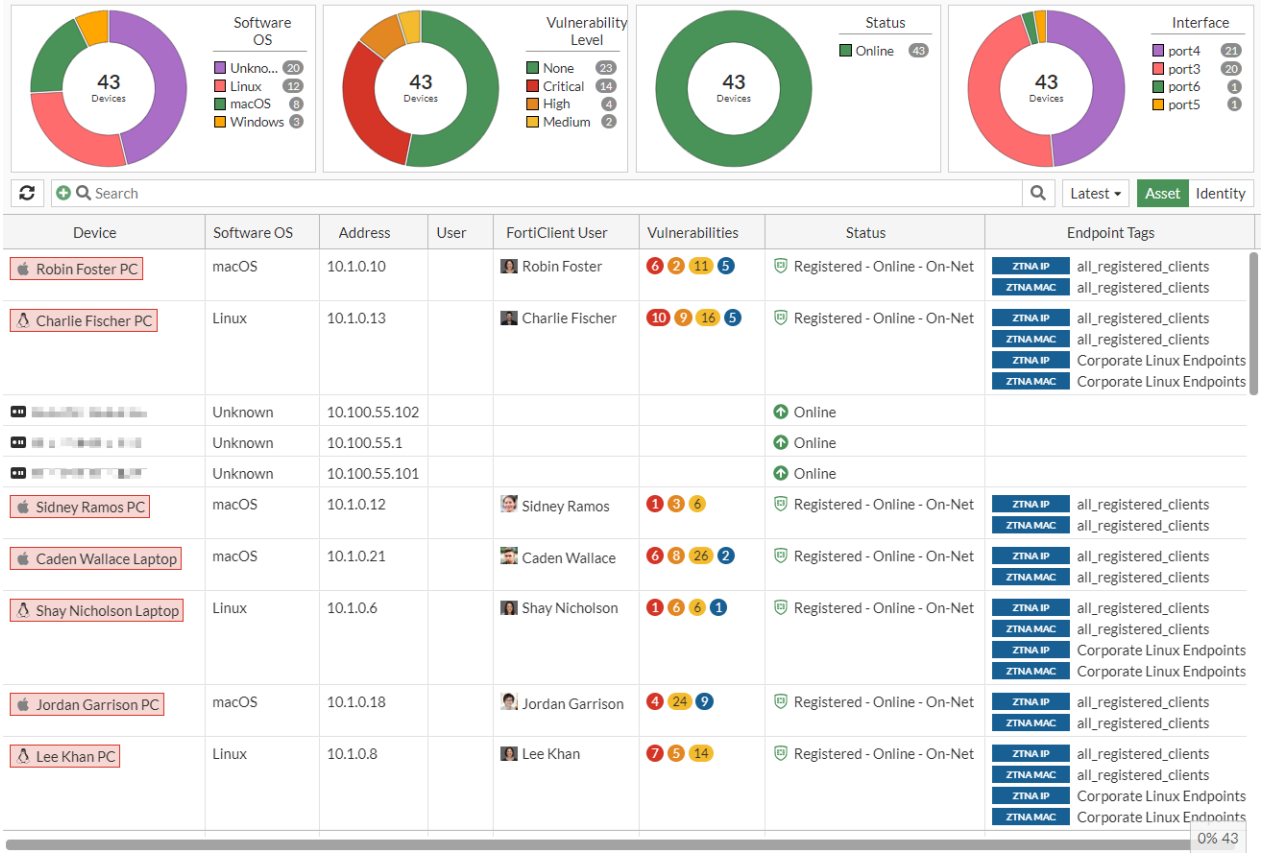
To view the Asset Identity Center page:

1. Go to *Security Fabric* > *Asset Identity Center*.
2. Click *Asset* to view information by device.

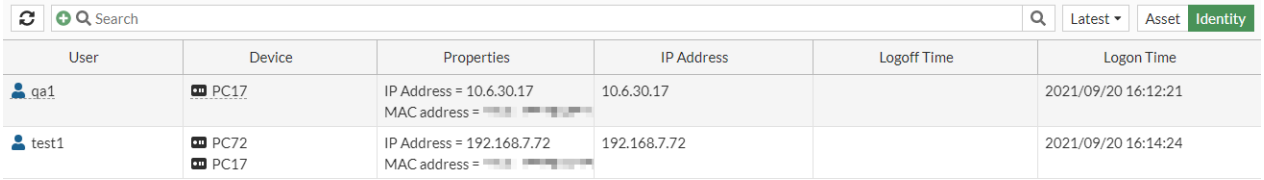
   There are four donut charts with device related information: *Software OS*, *Vulnerability Level*, *Status*, and *Interface*.

   The default table columns are *Device*, *Software OS*, *Address*, *User*, *FortiClient User*, *Vulnerabilities*, *Status*, and *Endpoint Tags*. The optional columns are *Device Family*, *Device Type*, *EMS Serial*, *EMS Tenant ID*, *Firewall Address*, *FortiSwitch*, *Hardware Vendor*, *Hardware Version*, *Hostname*, *Interface*, *IP Address*, *Last Seen*, *Port*, *Server*, *VLAN*, and *Vulnerability Level*.

   Devices with vulnerabilities are highlighted in red.

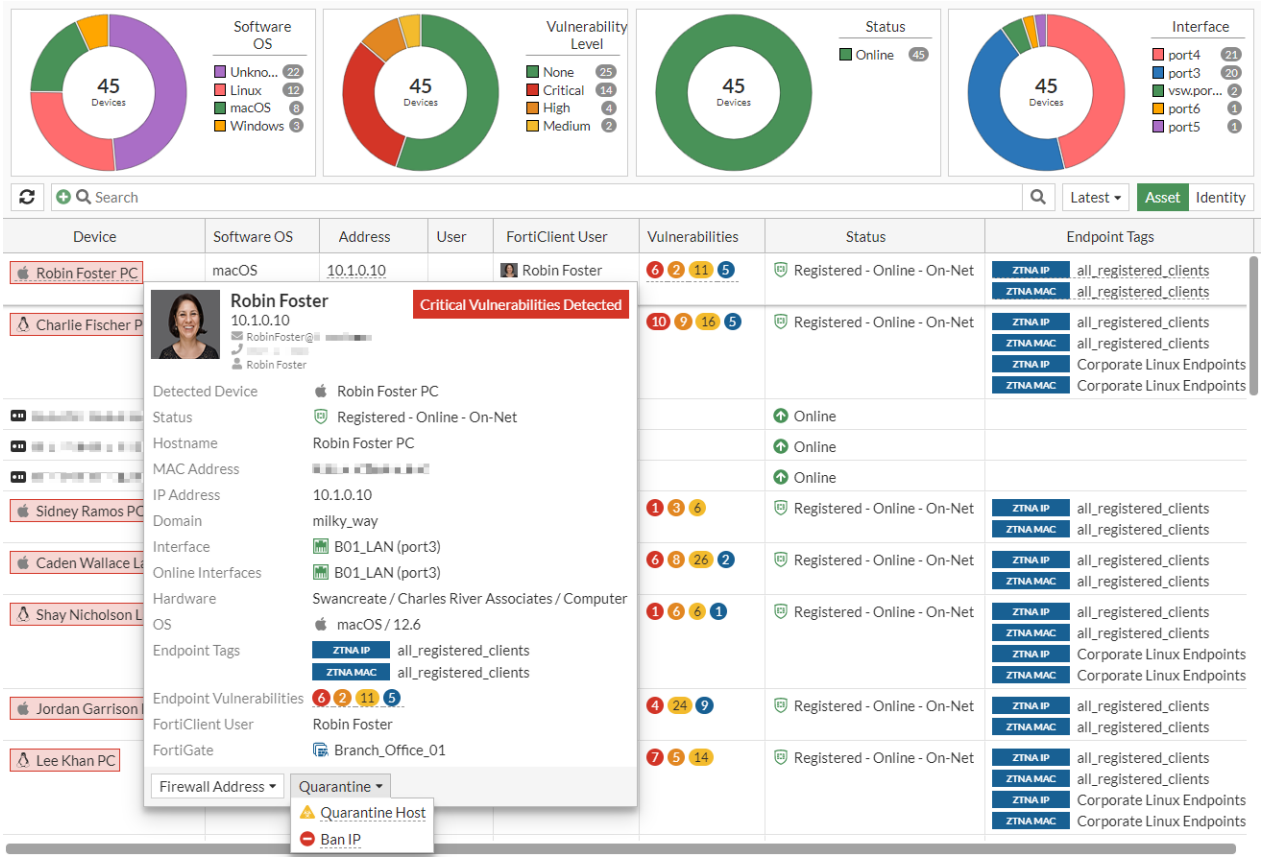


3. Click *Identity* to view information by user. The default table columns are *User*, *Device*, and *Properties*. The optional columns are *IP Address*, *Logoff Time*, and *Logon Time*.



Each view has a dropdown option to view the information within different time frames (*Latest*, *1 hour*, *24 hours*, and *7 days*). The page displays user and device relationships, such as which users are logged in to multiple devices or if multiple users are logged in to single devices.

4. Hover over a device in the list to view the tooltip and possible actions. The options under the *Firewall Address* dropdown are *Create Firewall Device Address* and *Create Firewall IP Address*. The options under the *Quarantine* dropdown are *Quarantine Host* and *Ban IP*.



Diagnostics

The following options are available for `diagnose user-device-store unified <option>`:

Option	Description
`device-memory-query`	Get device records and associated user records from memory.
`device-query`	Get device records and associated user records from memory and disk.
`user-memory-query`	Get user records and associated device records from memory.
`user-query`	Get user records and associated device records from memory and disk.
`re-query`	Retrieve query by `<query-id> <iteration-start> <iteration-count>` (takes 0-3 arguments).
`list`	List unified queries.
`clear`	Delete all unified queries.
`dump`	Dump unified query stats by `<query-id>` (takes 0-1 arguments).

Option	Description
`delete`	Delete unified query by `<query-id>` (takes 0-1 arguments).
`stats`	Get statistics for unified queries.
`debug`	Enable/disable debug logs for unified queries.

IoT vulnerabilities

Hovering over the data in the *Vulnerabilities* column displays a list of *FortiGuard IoT/OT Detected Vulnerabilities* and *FortiClient Detected Vulnerabilities*. Clicking the *View IoT/OT Vulnerabilities* button in the tooltip opens the *View IoT/OT Vulnerabilities* table that includes the *Vulnerability ID*, *Type*, *Severity*, *Reference*, *Description*, and *Patch Signature ID*. Each entry in the *Reference* column includes the CVE number and a link to the CVE details.

The following settings are required to display IoT devices:

1. The FortiGate must have a valid Attack Surface Security Rating service license.
2. Device detection must be configured on a LAN interface used by IoT devices.

   To configure device detection in the GUI:

   a. Go to *Network* > *Interfaces* and edit a LAN interface.
   b. Enable *Device detection*.
   c. Click *OK*.

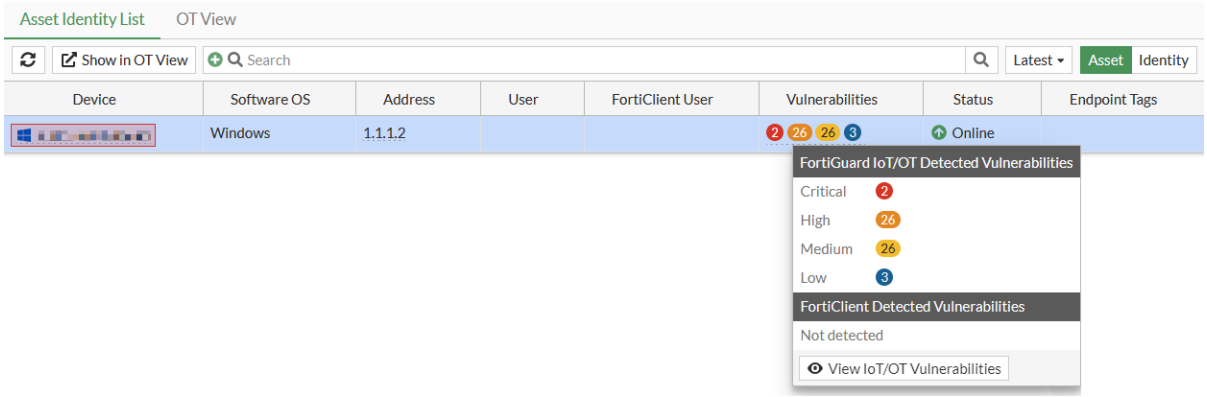
   To configure device detection in the CLI:

```
config system interface
    edit <name>
        set device-identification enable
    next
end
```

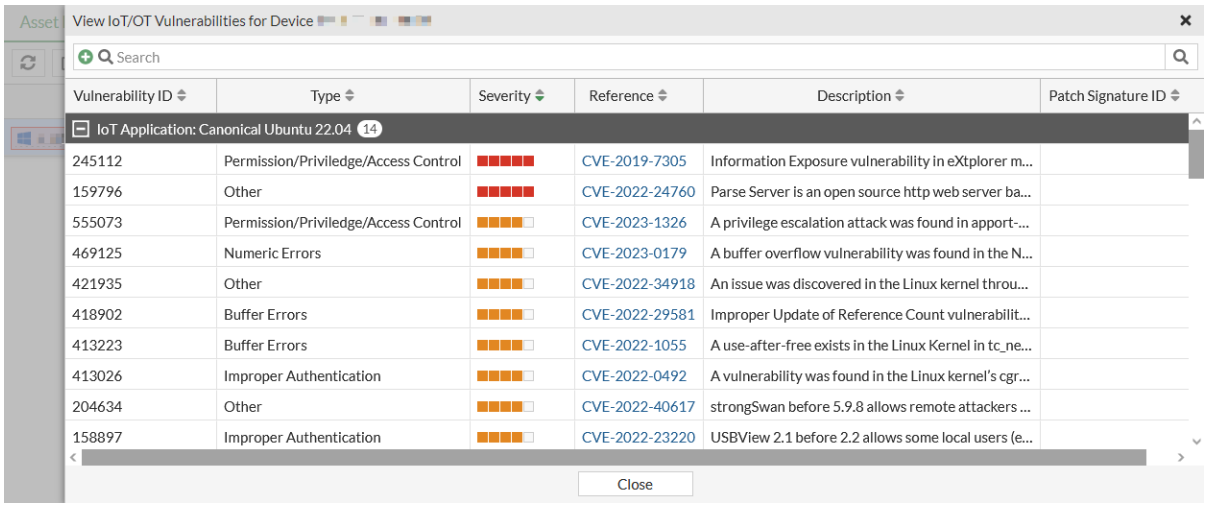
3. Configure a firewall policy with an application control sensor.

To view IoT asset vulnerabilities in the GUI:

1. Go to *Security Fabric* > *Asset Identity Center*. Ensure the *Asset* list view is selected.
2. Select a device with IoT vulnerabilities.
3. Hover over the *Vulnerabilities* count to view the tooltip and click *View IoT/OT Vulnerabilities*.



A table with the list of vulnerabilities and related information for the device is displayed, including the CVE references and descriptions.



4. Click a hyperlink in the *Reference* column to view more information about the CVE, or click *Close*.

To view IoT asset vulnerabilities in the CLI:

```
# diagnose user-device-store device memory list
...

        device_info
                'ipv4_address' = '1.1.1.2'
                'mac' = '**:**:**:**:**:**'
                'hardware_vendor' = 'Samsung'
                'hardware_type' = 'Home & Office'
                'hardware_family' = 'Computer'
                                ...
                'purdue_level' = '3'
                'iot_vuln_count' = '57'
                'max_vuln_level' = 'Critical'
                'total_vuln_count' = '100'
        ...
        iot_info
                'vendor' = 'Mozilla'
```

```
                'product' = 'Firefox'

        ...
```

OT asset visibility and network topology

When the *Operational Technology (OT)* feature is enabled, tabs are added in the *Asset Identity Center* page to view the OT asset list and OT network topology using Purdue Levels. This feature is available regardless of whether a Security Fabric is enabled.

To enable the OT features in the GUI:

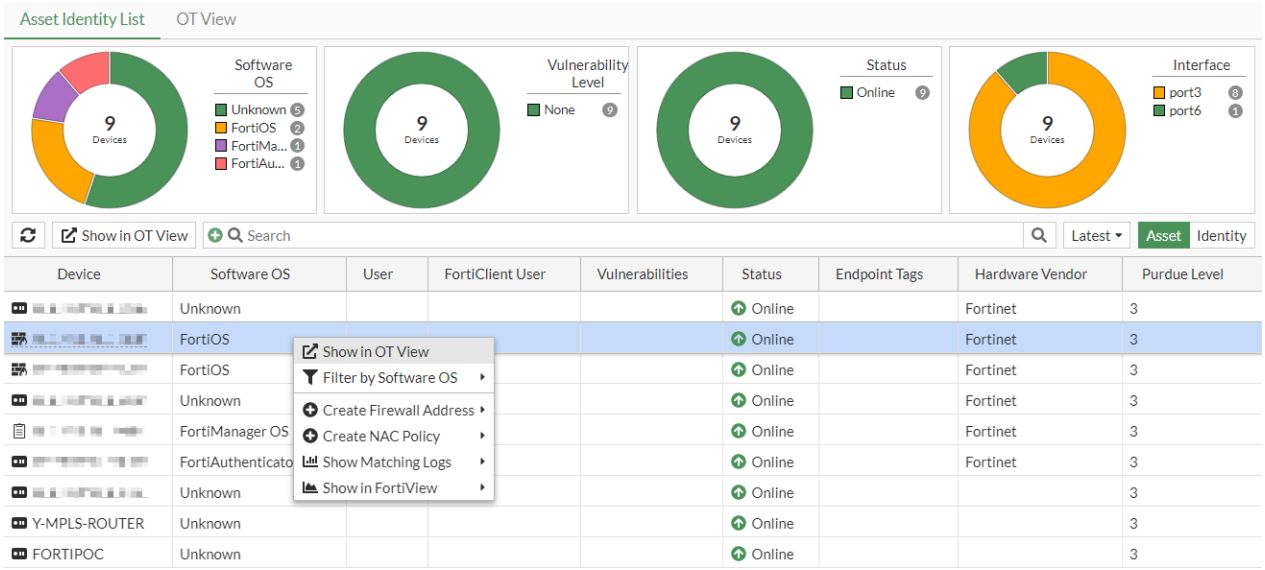
1. Go to *System* > *Feature Visibility*.
2. In the *Additional Features* section, enable *Operational Technology (OT)*.
3. Click *Apply*.

To enable the OT features in the CLI:

```
config system settings
    set gui-ot enable
end
```

Once enabled, the *Security Fabric* > *Asset Identity Center* page displays an *Asset Identity List* tab and an *OT View* tab.

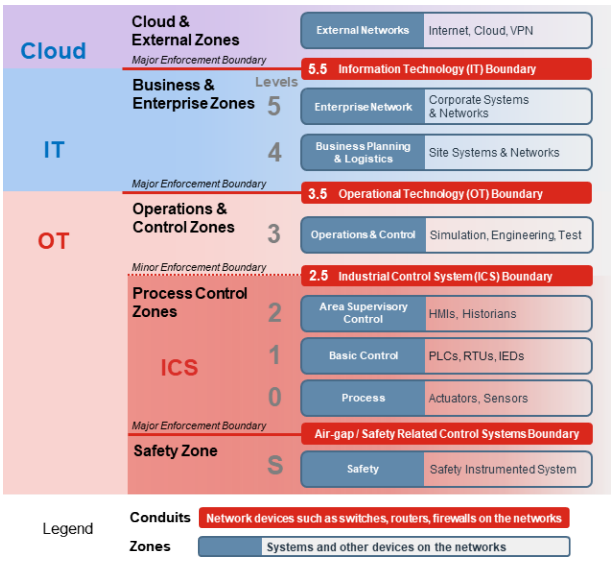
- The *Asset Identity List* tab includes a configurable *Purdue Level* column and a *Show in OT View* option for selected devices in the table.



- The *OT View* tab shows a topology of detected components and connections mapped to Purdue Levels. The default view is locked, but devices can be dragged and dropped to other Purdue Levels if the view is unlocked.

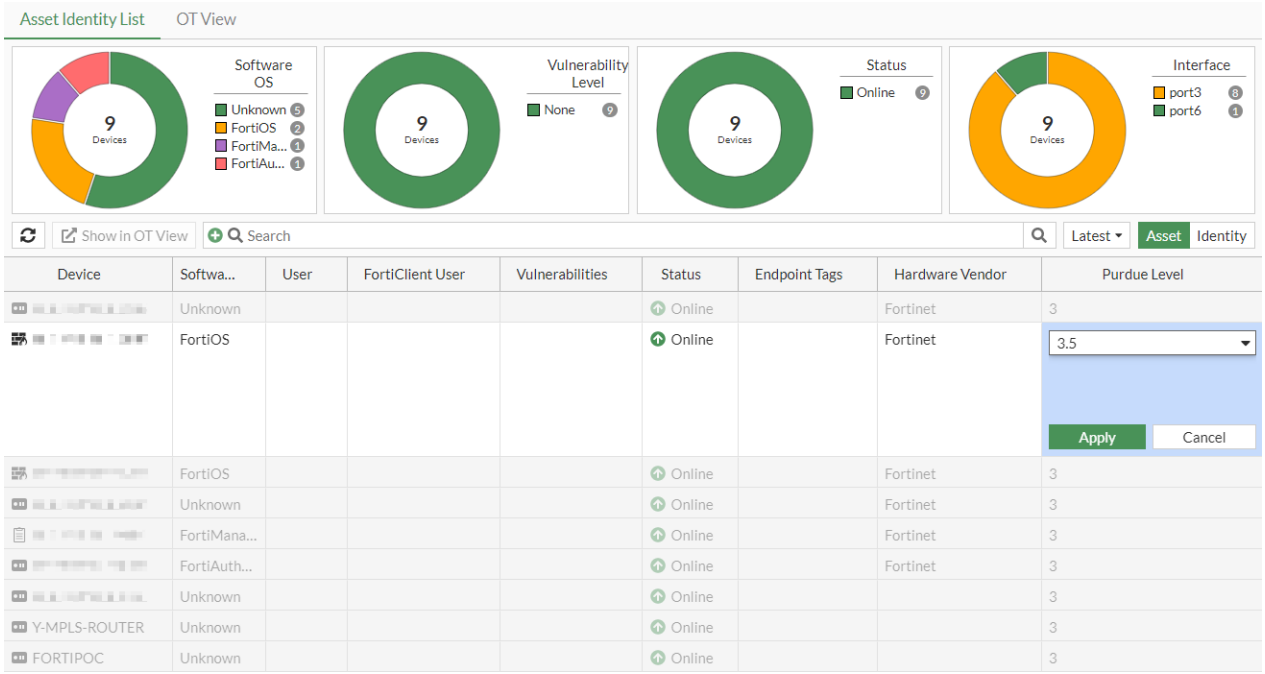
Devices are assigned Purdue Level 3 by default and can be changed (except to level S, 0, or external), including FortiGates, managed FortiSwitches, and FortiAPs.

The following diagram lists the Purdue Levels based on OT network topologies:



To change the Purdue Level in the Asset Identity List tab:

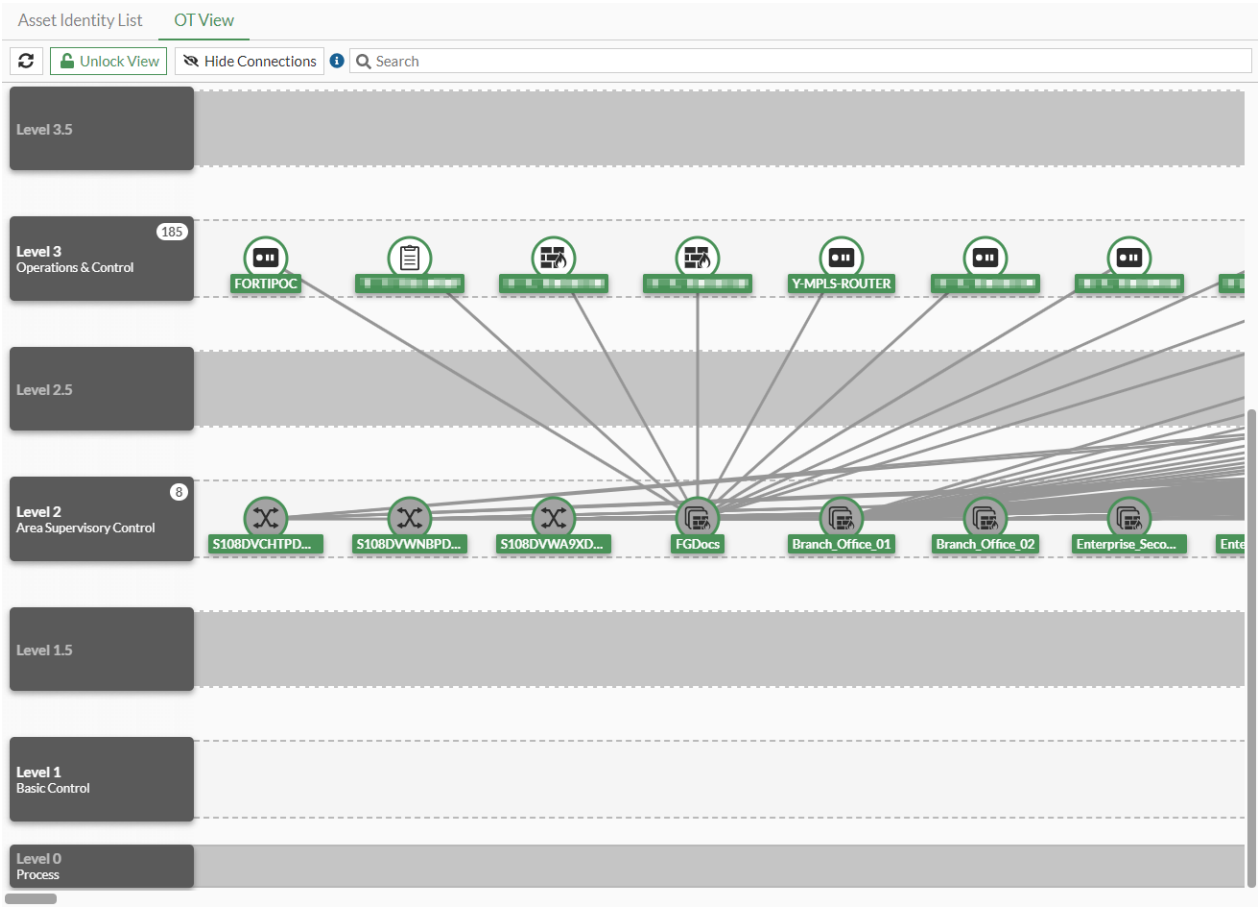
1. Go to *Security Fabric* > *Asset Identity Center* and select the *Asset Identity List* tab.
2. Add the *Purdue Level* column to the table:
   a. Hover over the table header and click the gear icon (*Configure Table*).
   b. Select *Purdue Level*.
   c. Click *Apply*.
3. Select a device and hover over the *Purdue Level* value.
4. Click the pencil icon to edit the level.
5. Select a value from the dropdown.



6. Click *Apply*.

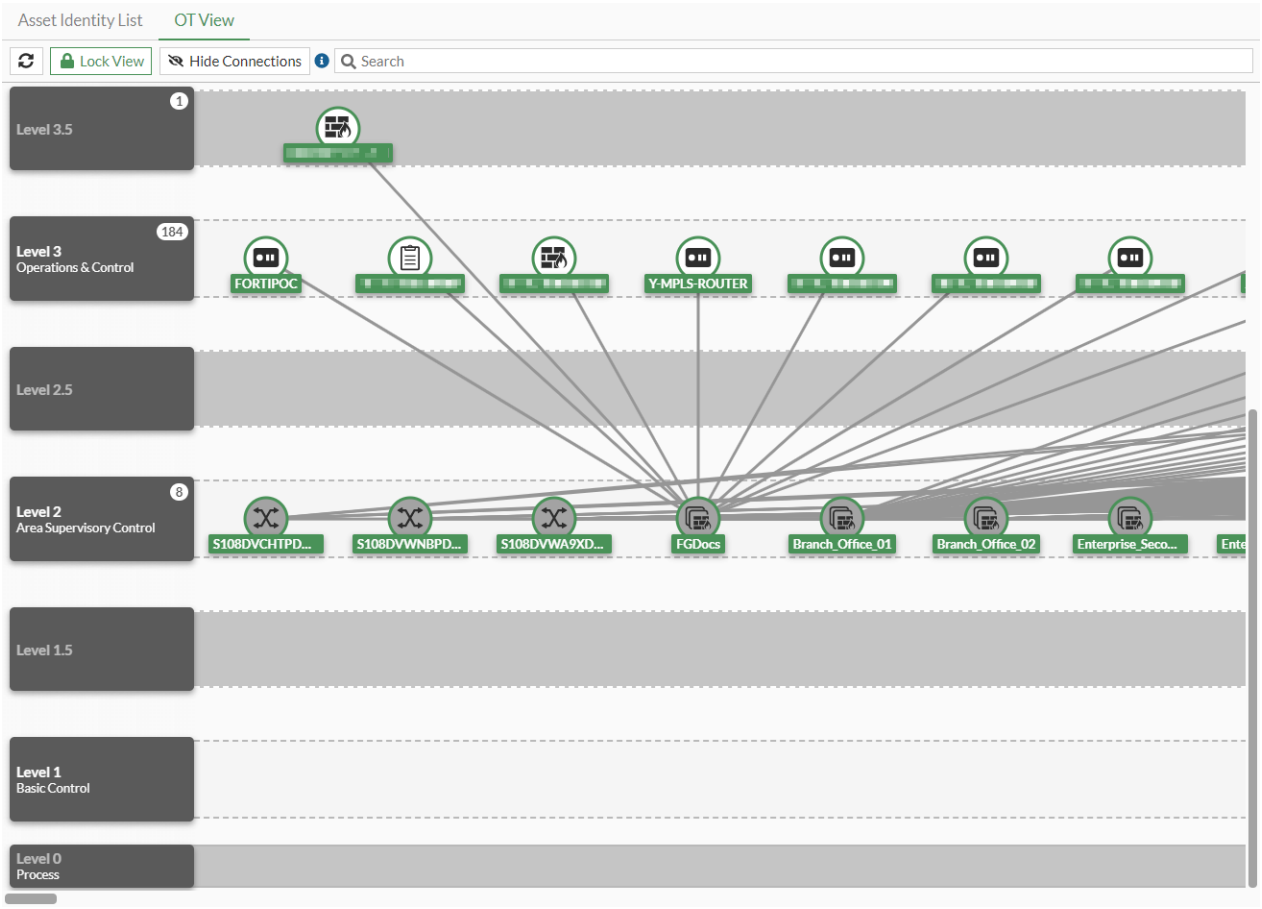
To change the Purdue Level in the OT View tab:

1. Go to *Security Fabric* > *Asset Identity Center* and select the *OT View* tab.
2. Click *Unlock View*.



3. Select a device.

4. Drag the device icon to another level row.



5. Optionally, click *Lock View* to revert to the locked view.

To change the Purdue Level in the CLI:

```
# diagnose user-device-store device memory ot-purdue-set <mac> <ip> <level>
```

`mac`	Enter the MAC address of the device.
`ip`	Enter the IPv4 address of the device.
`level`	Enter the Purdue Level: 1, 1.5, 2, 2.5, 3, 3.5, 4, 5, 5.5.

To configure the FortiGate Purdue Level in the CLI:

```
config system global
    set purdue-level <level 1 - 5.5>
end
```

To configure the managed FortiSwitch Purdue Level in the CLI:

```
config switch-controller managed-switch
    edit "<managed FortiSwitch name>"
        set purdue-level <level 1 - 5.5>
    next
end
```

To configure the FortiAP Purdue Level in the CLI:

```
config wireless-controller wtp
    edit "<WTP ID>"
        set purdue-level <level 1 - 5.5>
    next
end
```

Configuring the Purdue Level for discovered assets based on detected interface

The default Purdue Level can be set or unset in the CLI (`default-purdue-level`) within the system interface configuration. The default Purdue Level can be applied to discovered assets based on the interface with which they were detected. This feature requires a FortiGuard Industrial Security Service (ISS) license on the FortiGate so the Industrial Database (ISDB) can be used. Device identification must be enabled on interfaces connected to OT devices.

```
config system interface
    edit <name>
        set device-identification enable
        set default-purdue-level {1 | 1.5| 2 | 2.5| 3 | 3.5 | 4 | 5 | 5.5}
    next
end
```

By default, the `default-purdue-level` value is `3`. If the asset's Purdue Level is manually overridden, then it takes precedence over this default value set in the interface.

For example, if the default Purdue Level on port1 is changed to 3.5, subsequently, the Purdue Level of a detected device on port1 is manually changed to 4 on the *Asset Identity Center* page. After the manual change on the device, the Purdue Level remains at 4.

To configure the default Purdue Level:

1. Configure the interface settings:

```
config system interface
    edit "port1"
        set device-identification enable
        set default-purdue-level 3.5
    next
end
```

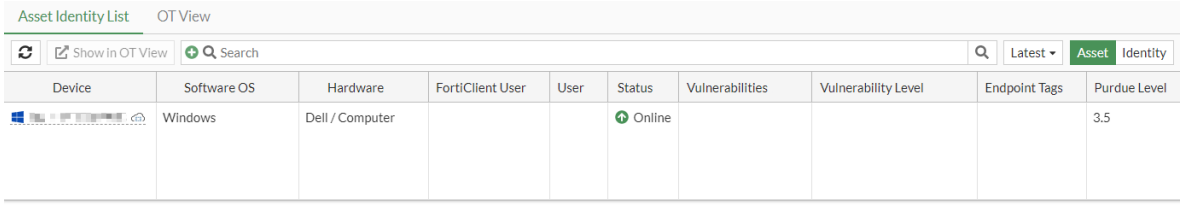
2. Verify that the Purdue Level as been updated in the user device store list:

```
# diagnose user-device-store device memory list

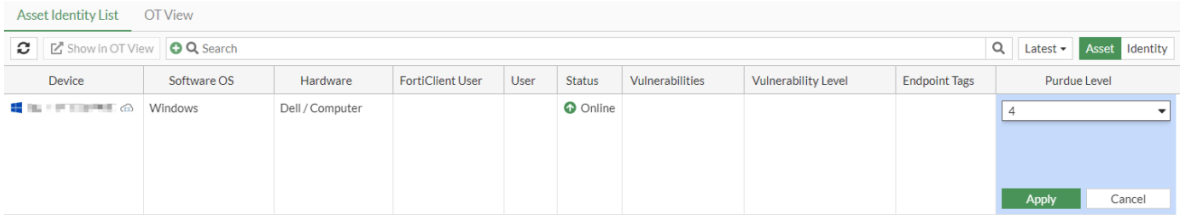
Record #1:

        device_info
                'ipv4_address' = '192.168.1.64'
                'mac' = '**:**:**:**:**:**'
                'hardware_vendor' = 'Dell'
                'hardware_type' = 'Home & Office'
                'hardware_family' = 'Computer'
                'vdom' = 'root'
                'os_name' = 'Windows'
                'os_version' = '10 / 2016'
                'last_seen' = '1680115135'
                'host_src' = 'mwbs'
                'unjoined_forticlient_endpoint' = 'false'
                'is_online' = 'true'
                'active_start_time' = '1680113976'
                'dhcp_lease_status' = 'leased'
                'dhcp_lease_expire' = '1680651757'
                'dhcp_lease_reserved' = 'false'
                'dhcp_server_id' = '2'
                'is_fortiguard_src' = 'true'
                'purdue_level' = '3.5'
                ...
```

3. Go to *Security Fabric > Asset Identity Center* and select the *Asset Identity List* tab. The device's *Purdue Level* is currently *3.5*.



4. Manually change the device's Purdue Level:
   a. Select the device and hover over the *Purdue Level* value.
   b. Click the pencil icon to edit the level.
   c. Select *4* and click *Apply*.



5. Verify that the Purdue Level as been updated in the user device store list:

```
# diagnose user-device-store device memory list

Record #1:

        device_info
                'ipv4_address' = '192.168.1.64'
                'mac' = '**:**:**:**:**:**'
                'hardware_vendor' = 'Dell'
                'hardware_type' = 'Home & Office'
                'hardware_family' = 'Computer'
                'vdom' = 'root'
                'os_name' = 'Windows'
                'os_version' = '10 / 2016'
                'last_seen' = '1680115467'
                'host_src' = 'mwbs'
                'unjoined_forticlient_endpoint' = 'false'
                'is_online' = 'true'
                'active_start_time' = '1680113976'
                'dhcp_lease_status' = 'leased'
                'dhcp_lease_expire' = '1680651757'
                'dhcp_lease_reserved' = 'false'
                'dhcp_server_id' = '2'
                'is_fortiguard_src' = 'true'
                'purdue_level' = '4'
                ...
```

KEV information in IoT/OT vulnerabilities

Known Exploited Vulnerabilities (KEVs) information is included in IoT/OT vulnerabilities in the user/device store. KEV counts and warnings are displayed in the *Assets* widget on the *Asset & Identities* dashboard, enhancing security visibility.

To enable device detection for IoT/OT devices, device identification must be enabled on the interface and utm-status must be enabled in firewall policy:

```
config system interface
    edit <interface>
        set device-identification enable
    next
end
config firewall policy
    edit <policy ID>
        set utm-status enable
    next
end
```

Example

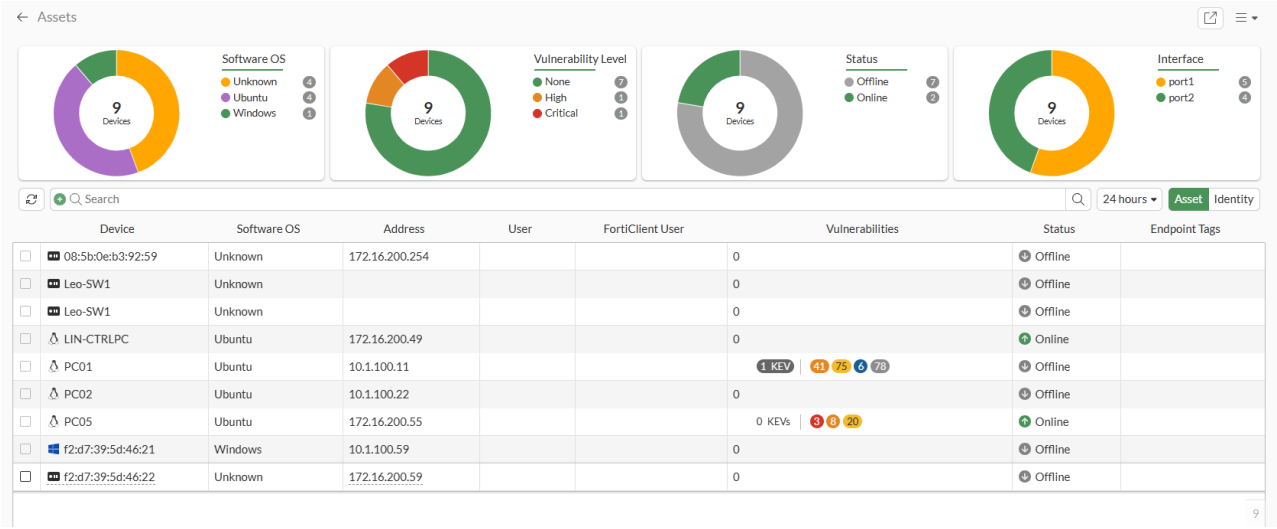
When Ubuntu is updated and upgraded from an older version, like 18.04, using the `sudo apt-get update && sudo apt-get -y upgrade` command, OT device information is logged in an appctrl log and sent to WAD:

```
1: date=2024-11-15 time=10:00:53 eventtime=1731621653528292983 tz="+1200" logid="1059028704"
type="utm" subtype="app-ctrl" eventtype="signature" level="information" vd="vd1" appid=10000501
srcip=10.1.100.11 srccountry="Reserved" dstip=91.189.91.81 dstcountry="United States"
srcport=37186 dstport=80 srcintf="port2" srcintfrole="undefined" dstintf="port1"
dstintfrole="undefined" proto=6 service="HTTP" direction="outgoing" policyid=1 poluuid="b8a98718-
dfc9-51ee-3aff-53c8c1b65d82" policytype="policy" sessionid=1469 applist="g-default" action="pass"
appcat="OT" app="Canonical.Ubuntu" hostname="ca.archive.ubuntu.com" incidentserialno=170919395
url="/ubuntu/dists/bionic/InRelease" agent="Debian APT-HTTP/1.3 (1.6.17)" httpmethod="GET"
msg="OT: Canonical.Ubuntu" clouddevice="Vendor=Canonical, Product=Ubuntu, Version=18.04"
apprisk="low"
```

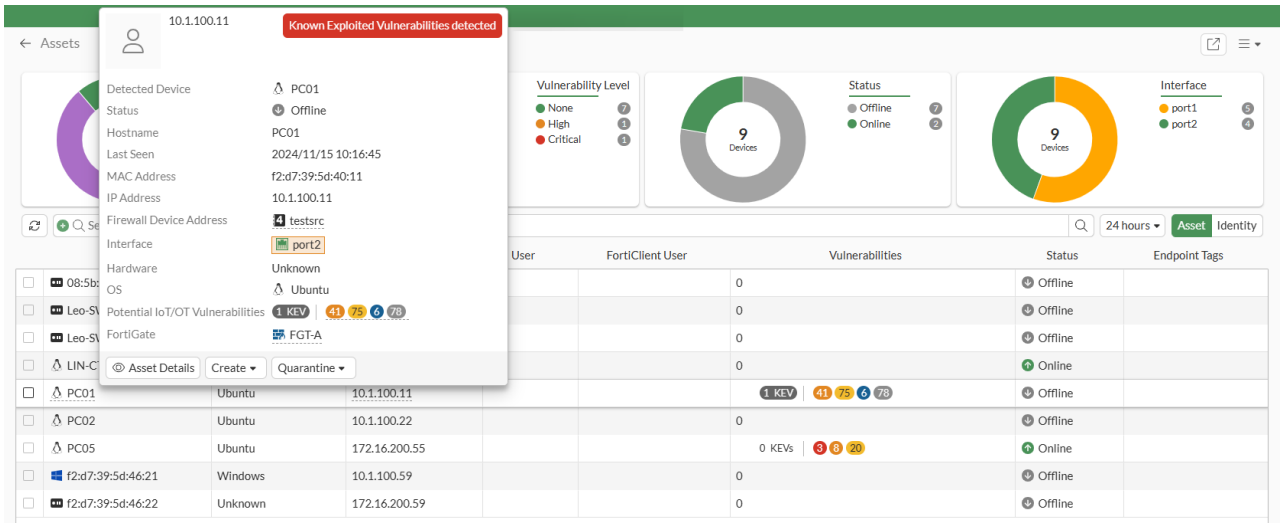
WAD then sends a device query to FortiGuard to retrieve the vulnerability list for this OT device. The KEV information is included in the vulnerability list and can be viewed in the GUI and CLI.

To view the KEV information in the GUI:

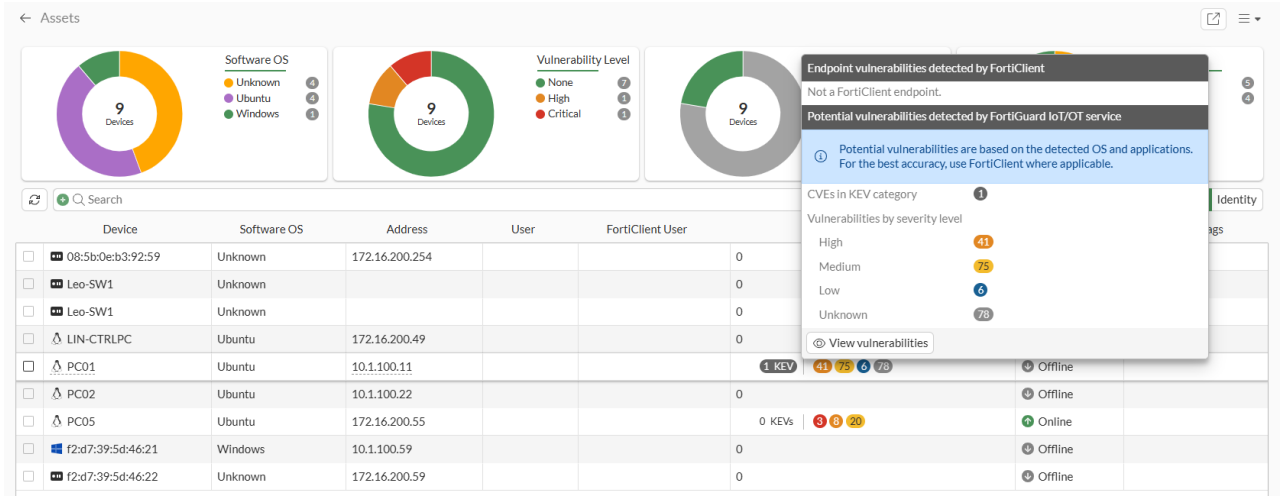
1. Go to *Dashboard* > *Assets & Identities*.
2. Expand the *Assets* widget. The KEV vulnerabilities are shown in the *Vulnerabilities* column:



3. Hover over the device name. In the tooltip, a *Known Exploited Vulnerabilities detected* label is added when KEVs are detected for IoT/OT:

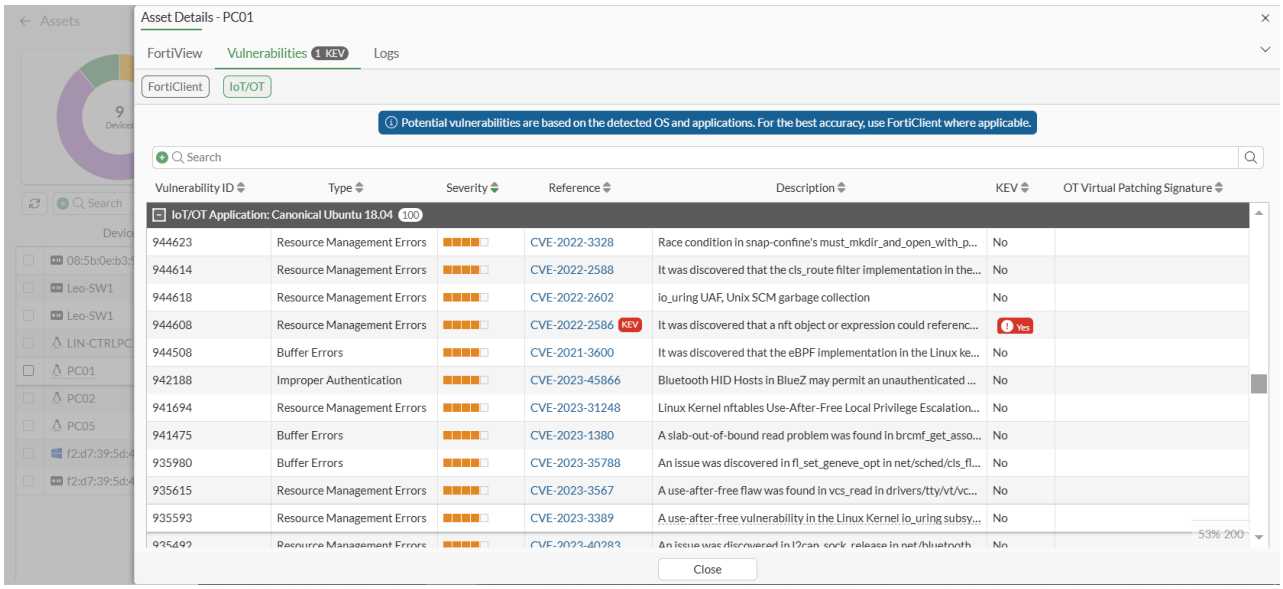


4. Hover over the vulnerabilities. In the tooltip, the *CVEs in KEV category* field shows the number of potential KEVs detected by the FortiGuard IoT/OT service:



5. In the tooltip, click *View vulnerabilities* to open the *Asset Details* pane on the *Vulnerabilities* tab and select *IoT/OT*.

   A *KEV* label is shown as a critical severity label next to the CVE-ID in the *Reference* column, and a *KEV* column can be added to show if a vulnerability has a KEV.



To view the KEV information in the CLI:

```
# diagnose user-device-store device memory list

Record #1:
        device_info
                'ipv4_address' = '10.1.100.11'

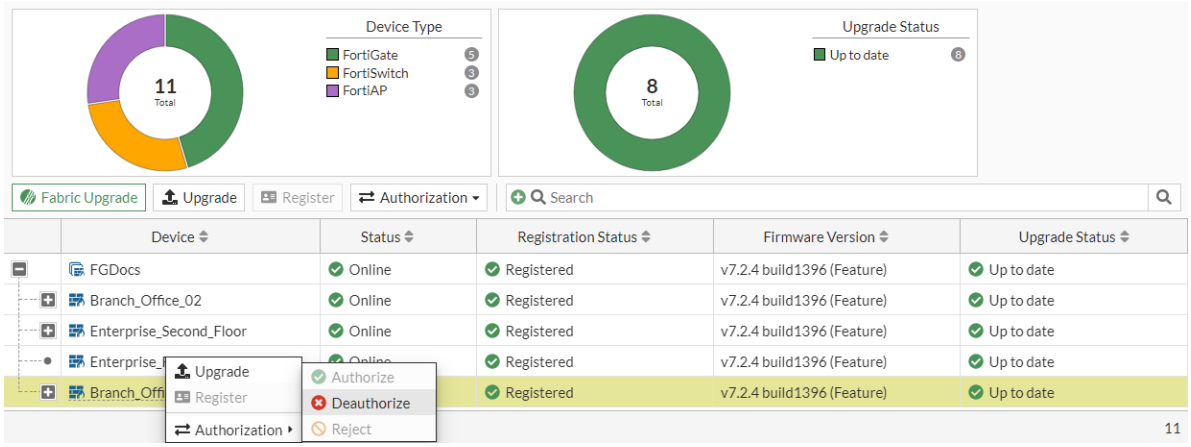
WebSocket for Security Fabric events

With the WebSocket for Security Fabric events, subscribers to the WebSocket (such as the *Firmware & Registration* page) are updated upon new Fabric events and alert users to reload the page.

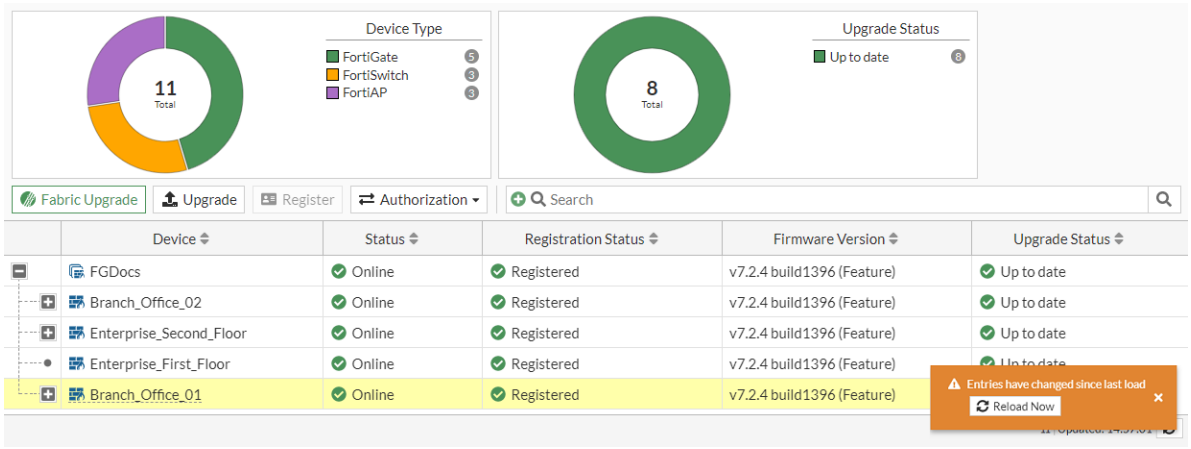
Example

To deauthorize a downstream FortiGate:

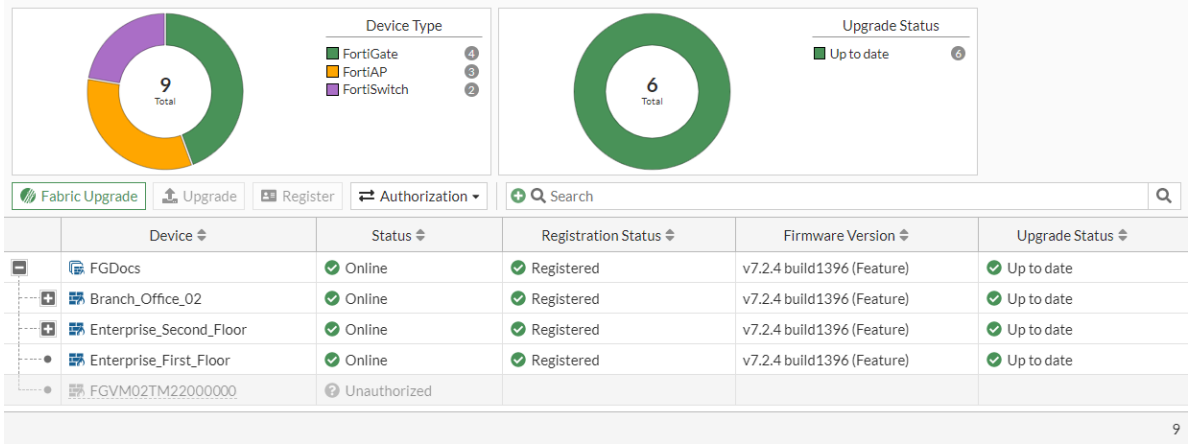
1. Go to *System* > *Firmware & Registration* and select a downstream FortiGate in the table.
2. Right-click on the device and select *Authorization* > *Deauthorize*.



3. An alert appears in the bottom-right corner of the page. Click *Reload Now* to refresh the page.



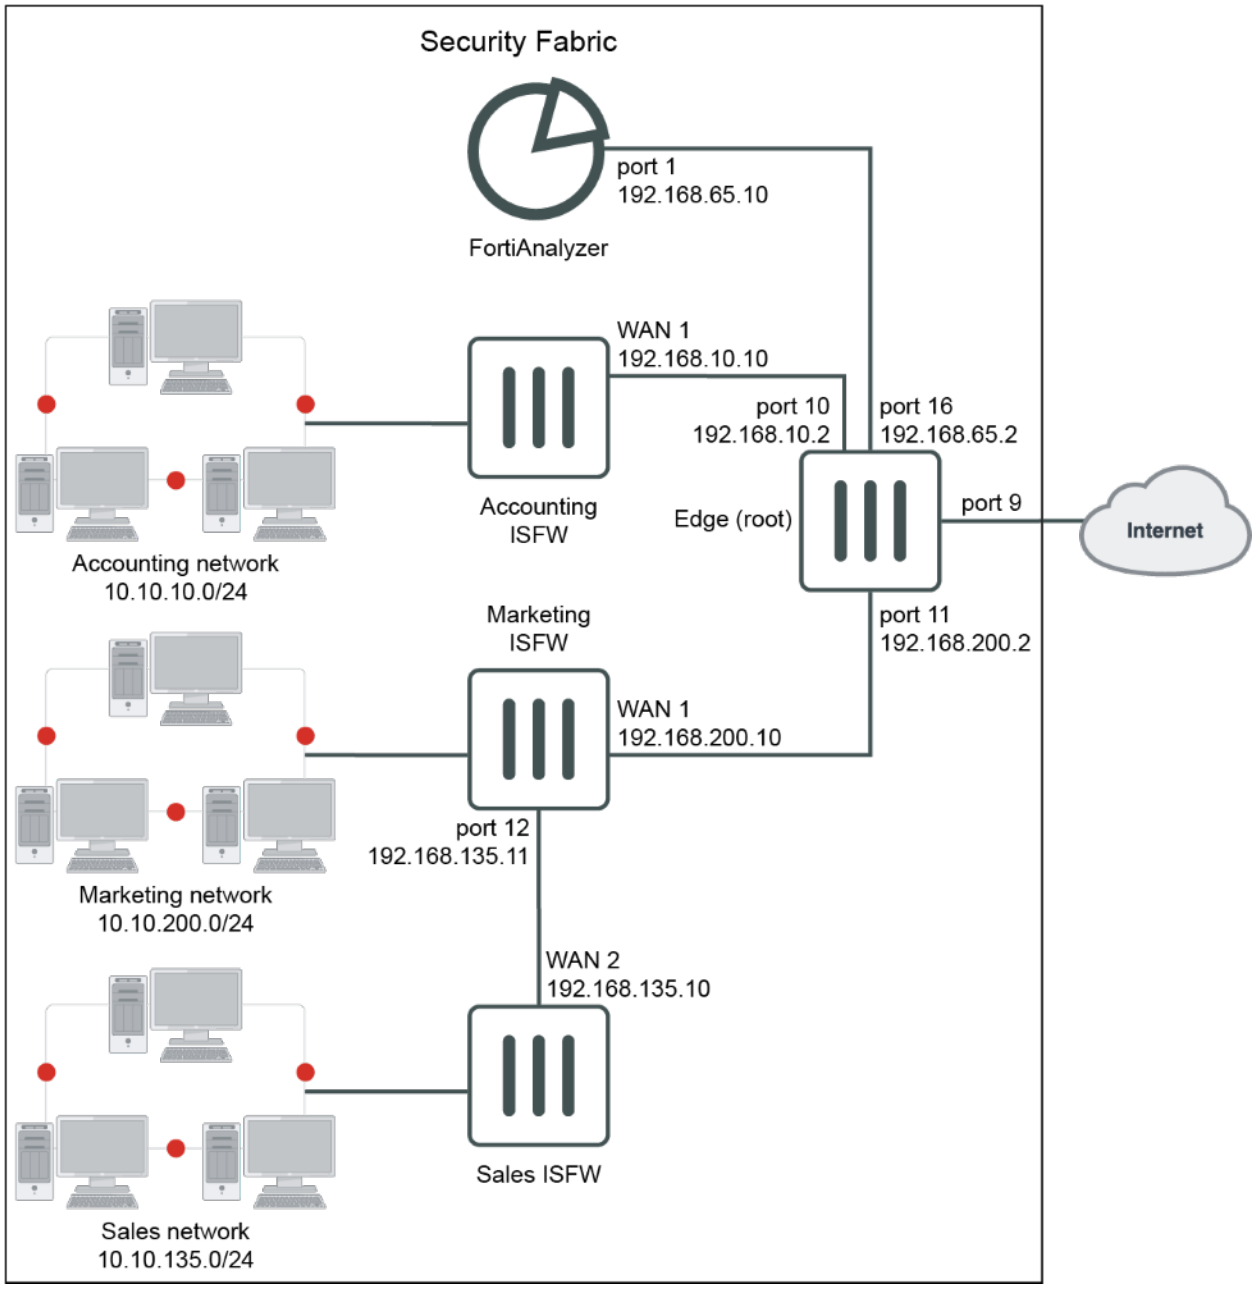
The deauthorized FortiGate's status is now listed as *Unauthorized*.



Deploying the Security Fabric

This topic provides an example of deploying Security Fabric with three downstream FortiGates connecting to one root FortiGate. To deploy a Security Fabric, you need a FortiAnalyzer running firmware version 6.2 or later.

The following shows a sample network topology with three downstream FortiGates (Accounting, Marketing, and Sales) connected to the root FortiGate (Edge).



To configure the root FortiGate (Edge):

1. Configure the interfaces:
   a. Go to *Network* > *Interfaces*.
   b. Edit *port16*:

- Set *Role* to *DMZ*.
- For the interface connected to FortiAnalyzer, set the *IP/Network Mask* to *192.168.65.2/255.255.255.0*

c. Edit *port10*:

- Set *Role* to *LAN*.
- For the interface connected to the downstream FortiGate (Accounting), set the *IP/Network Mask* to *192.168.10.2/255.255.255.0*

d. Edit *port11*:

- Set *Role* to *LAN*.
- For the interface connected to the downstream FortiGate (Marketing), set the *IP/Network Mask* to *192.168.200.2/255.255.255.0*

2. Configure the Security Fabric settings:

a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.

b. Select the *Settings* tab, and set the *Security Fabric role* to *Serve as Fabric Root*.

c. Enter a *Fabric name*, such as *Office-Security-Fabric*.

d. Ensure *Allow other Security Fabric devices to join* is enabled and add *port10* and *port11*.

e. Click *OK*.

3. Configure the FortiAnalyzer logging settings:

a. Go to *Security Fabric > Fabric Connectors* and double-click the *Logging & Analytics* card.

b. Select the *Settings* tab, select the *FortiAnalyzer* tab, and set the *Status* to *Enabled*.

c. Enter the FortiAnalyzer IP in the *Server* field (*192.168.65.10*). The *Upload option* is automatically set to *Real Time*.

d. Click *Refresh*.

A warning message indicates that the FortiGate is not authorized on the FortiAnalyzer. The authorization is configured in a later step on the FortiAnalyzer.

e. Click *OK*. The FortiAnalyzer serial number is verified.

4. Create the address objects to use in the firewall policies:

a. Go to *Policy & Objects > Addresses*.

b. Click *Create New*.

- Set *Name* to *FAZ-addr*.
- Set *Type* to *Subnet*.
- Set *Subnet/IP Range* to *192.168.65.10/32*.
- Set *Interface* to *any*.

c. Click *OK*.

d. Click *Create New*.

- Set *Name* to *Accounting*.
- Set *Type* to *Subnet*.
- Set *Subnet/IP Range* to *192.168.10.10/32*.
- Set *Interface* to *any*.

e. Click *OK*.

5. Create a policy to allow the downstream FortiGate (Accounting) to access the FortiAnalyzer:

a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
- Set the *Name* to *Accounting-to-FAZ*.
- Set *srcintf* to *port10*.
- Set *dstintf* to *port16*.
- Set *srcaddr* to *Accounting-addr*.
- Set *dstaddr* to *FAZ-addr*.
- Set *Action* to *Accept*.
- Set *Schedule* to *Always*.
- Set *Service* to *All*.
- Enable *NAT*.
- Set *IP Pool Configuration* to *Use Outgoing Interface Address*.

b. Click *OK*.

6. Create a policy to allow the two downstream FortiGates (Marketing and Sales) to access the FortiAnalyzer:

a. In the root FortiGate (Edge), go to *Policy & Objects > Addresses* and click *Create New*.
- Set *Name* to *Marketing-addr*.
- Set *Type* to *Subnet*.
- Set *Subnet/IP Range* to *192.168.200.10/32*.
- Set *Interface* to *any*.

b. Click *OK*.

c. In the root FortiGate (Edge), go to *Policy & Objects > Firewall Policy* and click *Create New*.
- Set *Name* to *Marketing-to-FAZ*.
- Set *srcintf* to *port11*.
- Set *dstintf* to *port16*.
- Set *srcaddr* to *Marketing-addr*.
- Set *dstaddr* to *FAZ-addr*.
- Set *Action* to *Accept*.
- Set *Schedule* to *Always*.
- Set *Service* to *All*.
- Enable *NAT*.
- Set *IP Pool Configuration* to *Use Outgoing Interface Address*.

d. Click *OK*.

To configure the downstream FortiGate (Accounting):

1. Configure the interface:

a. Go to *Network > Interfaces*.

b. Edit interface *wan1*:
- Set *Role* to *WAN*.
- For the interface connected to root, set the *IP/Network Mask* to *192.168.10.10/255.255.255.0*

2. Configure the default static route to connect to the root FortiGate (Edge):

a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
- Set *Destination* to *0.0.0.0/0.0.0.0*.
- Set *Interface* to *wan1*.

- Set *Gateway Address* to *192.168.10.2*.

b. Click *OK*.

3. Configure the Security Fabric:
   a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. In the *Settings* tab, set the *Security Fabric role* to *Join Existing Fabric*.
   FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Accounting) connects to the root FortiGate (Edge).
   c. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.10.2* set in the previous step.
   d. Disable *Allow other Security Fabric devices to join*, because there is no downstream FortiGate connecting to it.
   e. Click *OK*.

To configure the downstream FortiGate (Marketing):

1. Configure the interface:
   a. Go to *Network > Interfaces*.
   b. Edit *port12*:
   - Set *Role* to *LAN*.
   - For the interface connected to the downstream FortiGate (Sales), set the *IP/Network Mask* to *192.168.135.11/255.255.255.0*.

   c. Edit *wan1*:
   - Set *Role* to *WAN*.
   - For the interface connected to the root FortiGate (Edge), set the *IP/Network Mask* to *192.168.200.10/255.255.255.0*.

2. Configure the default static route to connect to the root FortiGate (Edge):
   a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
   - Set *Destination* to *0.0.0.0/0.0.0.0*.
   - Set *Interface* to *wan1*.
   - Set *Gateway Address* to *192.168.200.2*.

   b. Click *OK*.
3. Configure the Security Fabric:
   a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. In the *Settings* tab, set the *Security Fabric role* to *Join Existing Fabric*.
   FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Marketing) connects to the root FortiGate (Edge).
   c. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.200.2* set in the previous step.
   d. Enable *Allow other Security Fabric devices to join* and add *port12*.
   e. Click *OK*.
4. Create the address objects to use in the firewall policies:
   a. Go to *Policy & Objects > Addresses* and click *Create New*.
   - Set *Name* to *FAZ-addr*.
   - Set *Type* to *Subnet*.

- Set *Subnet/IP Range* to *192.168.65.10/32*.
- Set *Interface* to *any*.

b. Click *OK*.

c. Click *Create New*.

- Set *Name* to *Sales-addr*.
- Set *Type* to *Subnet*.
- Set *Subnet/IP Range* to *192.168.135.10/32*.
- Set *Interface* to *any*.

d. Click *OK*.

5. Create a policy to allow another downstream FortiGate (Sales) going through FortiGate (Marketing) to access the FortiAnalyzer:

a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.

- Set *Name* to *Sales-to-FAZ*.
- Set *srcintf* to *port12*.
- Set *dstintf* to *wan1*.
- Set *srcaddr* to *Sales-addr*.
- Set *dstaddr* to *FAZ-addr*.
- Set *Action* to *Accept*.
- Set *Schedule* to *Always*.
- Set *Service* to *All*.
- Enable *NAT*.
- Set *IP Pool Configuration* to *Use Outgoing Interface Address*.

b. Click *OK*.

To configure the downstream FortiGate (Accounting):

1. Configure the interface:

a. Go to *Network > Interfaces*.

b. Edit interface *wan1*:

- Set *Role* to *WAN*.
- For the interface connected to root, set the *IP/Network Mask* to *192.168.10.10/255.255.255.0*

2. Configure the default static route to connect to the root FortiGate (Edge):

a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.

- Set *Destination* to *0.0.0.0/0.0.0.0*.
- Set *Interface* to *wan1*.
- Set *Gateway Address* to *192.168.10.2*.

b. Click *OK*.

3. Configure the Security Fabric:

a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.

b. In the *Settings* tab, set the *Security Fabric role* to *Join Existing Fabric*.

FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Accounting) connects to the root FortiGate (Edge).

c. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.10.2* set in the previous step.
d. Disable *Allow other Security Fabric devices to join*, because there is no downstream FortiGate connecting to it.
e. Click *OK*.

To configure the downstream FortiGate (Sales):

1. Configure the interface:
   a. Go to *Network > Interfaces*.
   b. Edit *wan2*:
      - Set *Role* to *WAN*.
      - For the interface connected to the upstream FortiGate (Marketing), set the *IP/Network Mask* to *192.168.135.10/255.255.255.0*.
2. Configure the default static route to connect to the upstream FortiGate (Marketing):
   a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
      - Set *Destination* to *0.0.0.0/0.0.0.0*.
      - Set *Interface* to *wan2*.
      - Set *Gateway Address* to *192.168.135.11*.
   b. Click *OK*.
3. Configure the Security Fabric:
   a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. In the *Settings* tab, set the *Security Fabric role* to *Join Existing Fabric*.
      FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Sales) connects to the root FortiGate (Edge).
   c. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.135.11* set in the previous step.
   d. Disable *Allow other Security Fabric devices to join*, because there is no downstream FortiGate connecting to it.
   e. Click *OK*.

To authorize downstream FortiGates (Accounting, Marketing, and Sales) on the root FortiGate (Edge):

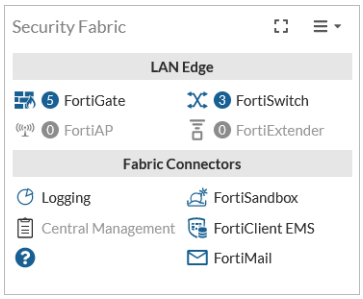
1. In the root FortiGate (Edge), go to *System > Firmware & Registration*.
   The table highlights two connected FortiGates with their serial numbers that are unauthorized.
2. Select the unauthorized device and click *Authorization > Authorize*.
   After they are authorized, the two downstream FortiGates (Accounting and Marketing) appear in the *Security Fabric* widget. This means that the two downstream FortiGates (Accounting and Marketing) have successfully joined the Security Fabric.
3. The table now highlights the Sales FortiGate with the serial number that is connected to the downstream Marketing FortiGate that is unauthorized.
4. Select the highlighted FortiGate and click *Authorization > Authorize*.
   After it is authorized, the downstream FortiGate (Sales) appears in the *Topology* tree in the *Security Fabric* widget. This means that the downstream FortiGates (Sales) has successfully joined the Security Fabric.

To use FortiAnalyzer to authorize all the Security Fabric FortiGates:

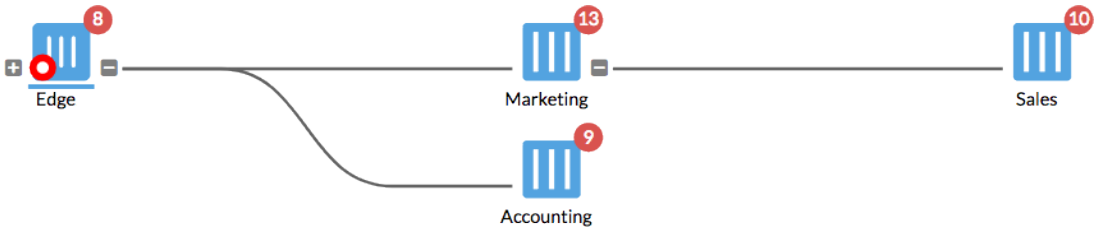
1. Authorize all the Security Fabric FortiGates on the FortiAnalyzer side:
   a. On the FortiAnalyzer, go to *System Settings* > *Network* > *All Interfaces*.
   b. Edit *port1* and set *IP Address/Netmask* to *192.168.65.10/255.255.255.0*.
   c. Go to *Device Manager* > *Unauthorized*. All of the FortiGates are listed as unauthorized.
      i. Select all the FortiGates and select *Authorize*. The FortiGates are now listed as authorized.
      After a moment, a warning icon appears beside the root FortiGate (Edge) because the FortiAnalyzer needs administrative access to the root FortiGate (Edge) in the Security Fabric.
      ii. Click the warning icon and enter the admin username and password of the root FortiGate (Edge).
2. Check FortiAnalyzer status on all the Security Fabric FortiGates:
   a. On each FortiGate, go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiAnalyzer Logging* card.
   b. Check that *Storage usage* information is shown.

To check Security Fabric deployment result:

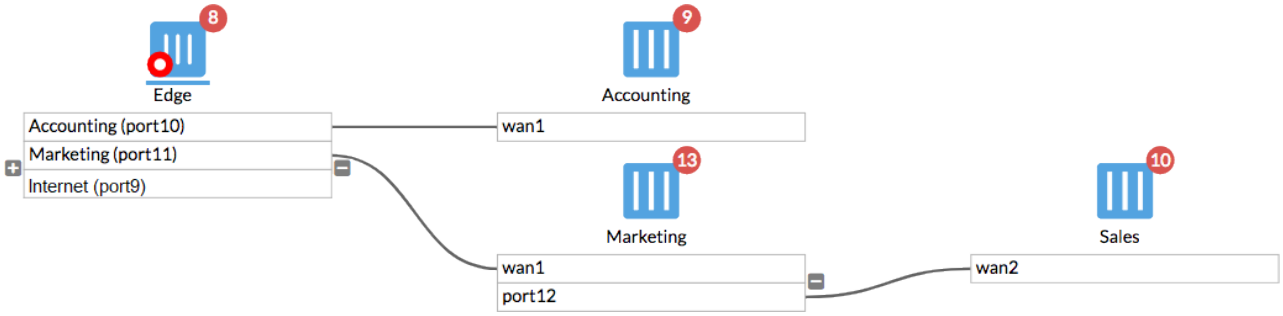
1. On FortiGate (Edge), go to *Dashboard* > *Status* and check the *Security Fabric* widget.



2. On FortiGate (Edge), go to *Security Fabric* > *Physical Topology*.
   This page shows a visualization of access layer devices in the Security Fabric.



3. On FortiGate (Edge), go to *Security Fabric* > *Physical Topology*.
   This dashboard shows information about the interfaces of each device in the Security Fabric.



To run diagnostics:

1. To view the downstream FortiGate pending authorization on the root FortiGate :

```
Edge # diagnose sys csf authorization pending-list
Serial                  IP Address      HA-Members    Path
--------------------------------------------------------------------------------
FG201ETK18902514        0.0.0.0                       FG3H1E5818900718:FG201ETK18902514
```

2. To view the downstream FortiGates after they join Security Fabric on the root or first level downstream FortiGate:

```
Edge # diagnose sys csf downstream
1:     FG201ETK18902514 (192.168.200.10) Management-IP: 0.0.0.0 Management-port:0 parent:
FG3H1E5818900718
        path:FG3H1E5818900718:FG201ETK18902514
        data received: Y downstream intf:wan1 upstream intf:port11 admin-port:443
        authorizer:FG3H1E5818900718
2:     FGT81ETK18002246 (192.168.10.10) Management-IP: 0.0.0.0 Management-port:0 parent:
FG3H1E5818900718
        path:FG3H1E5818900718:FGT81ETK18002246
        data received: Y downstream intf:wan1 upstream intf:port10 admin-port:443
        authorizer:FG3H1E5818900718
3:     FG101ETK18002187 (192.168.135.10) Management-IP: 0.0.0.0 Management-port:0 parent:
FG201ETK18902514
        path:FG3H1E5818900718:FG201ETK18902514:FG101ETK18002187
        data received: Y downstream intf:wan2 upstream intf:port12 admin-port:443
        authorizer:FG3H1E5818900718
```

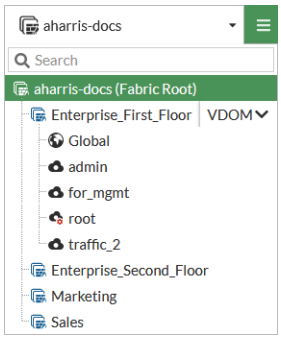
3. To view the upstream FortiGate after the downstream FortiGate joins Security Fabric:

```
Marketing # diagnose sys csf upstream
Upstream Information:
Serial Number:FG3H1E5818900718
IP:192.168.200.2
Connecting interface:wan1
Connection status:Authorized
```

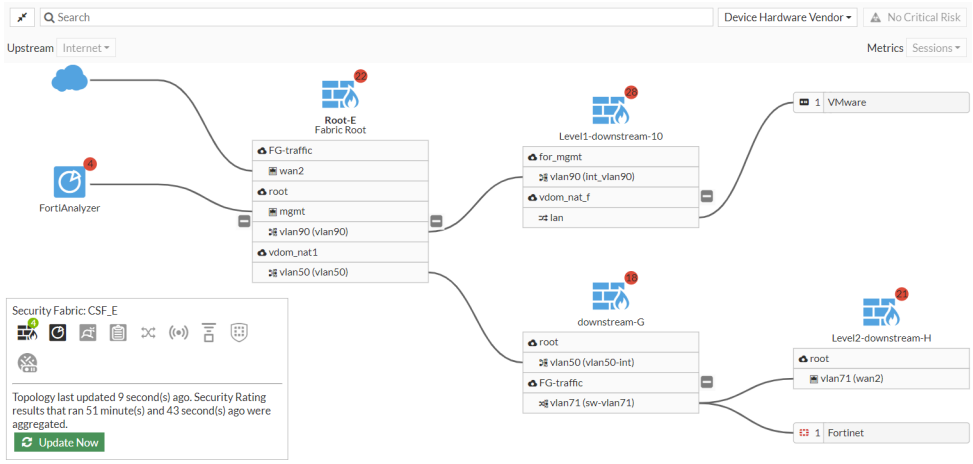
Deploying the Security Fabric in a multi-VDOM environment

A Security Fabric can be enabled in multi-VDOM environments. This allows access to all of the Security Fabric features, including automation, security rating, and topologies, across the VDOM deployment.

- Users can navigate to downstream FortiGate devices and VDOMs directly from the root FortiGate using the Fabric selection menu.



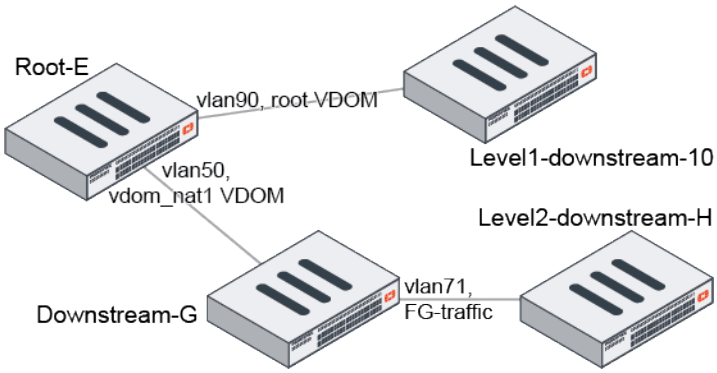
- The logical topology shows all of the configured VDOMs.



- Security rating reports include results for all of the configured VDOMs as well the entire Fabric.

Downstream FortiGate devices must connect to the upstream FortiGate from its management VDOM.

Topology



In this topology, there is a root FortiGate with three FortiGates connected through two different VDOMs. The root FortiGate is able to manage all devices running in multi-VDOM mode.

This example assumes multi-VDOM mode is already configured on each FortiGate, and that FortiAnalyzer logging is configured on the root FortiGate (see Configuring FortiAnalyzer on page 3711 and Configuring the root FortiGate and downstream FortiGates on page 3702 for more details).

To enable multi-VDOM mode:

```
config system global
    set vdom-mode multi-vdom
end
```

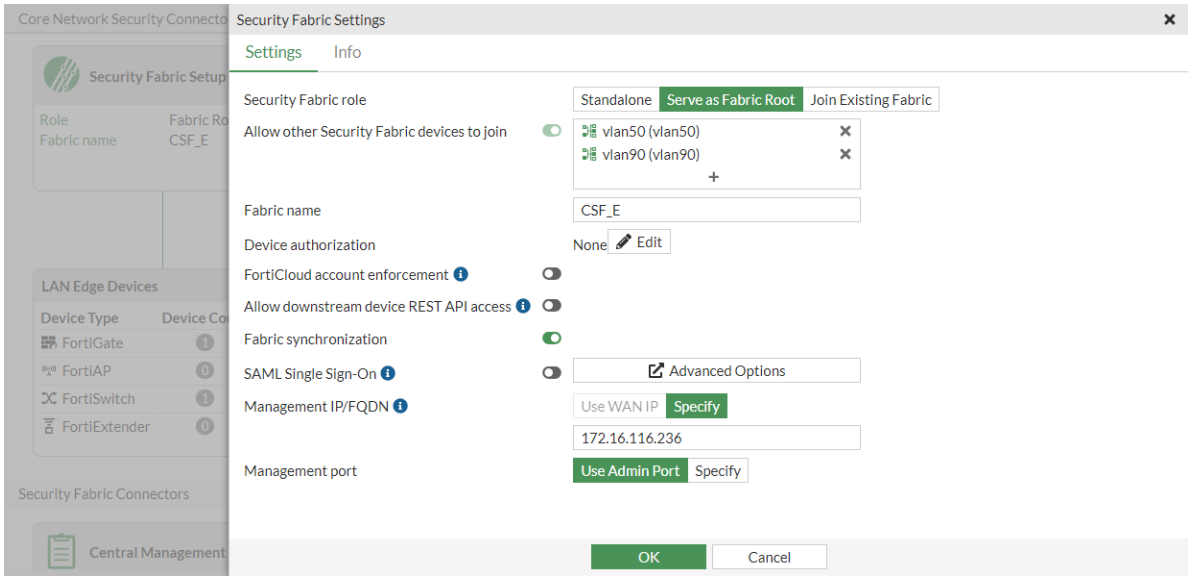
Device configurations

Root FortiGate (Root-E)

The Security Fabric is enabled, and configured so that downstream interfaces from all VDOMs can allow other Security Fabric devices to join.

To configure Root-E in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. Set the *Security Fabric role* to *Serve as Fabric Root*.
3. Enable *Allow other Security Fabric devices to join* and click the *+* to add the interfaces (vlan50 and vlan90) from the vdom_nat1 and root VDOMs.



4. Configure the other settings as needed.
5. Click *OK*.

To configure Root-E in the CLI:

1. Enable the Security Fabric:

```
config system csf
    set status enable
    set group-name "CSF_E"
end
```

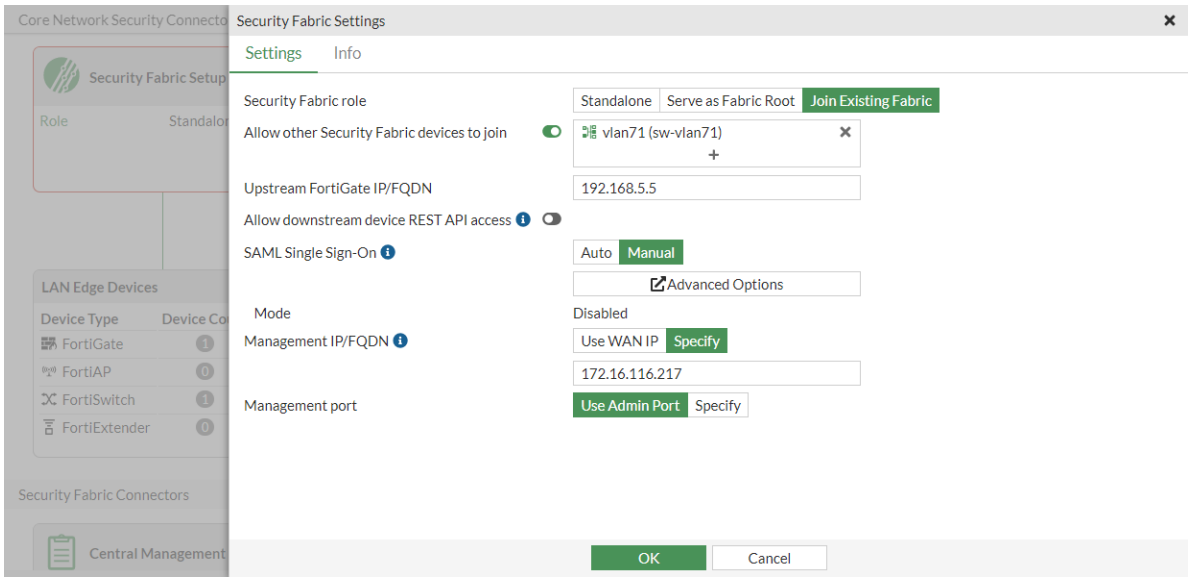
2. Configure the interfaces:

```
config system interface
    edit "vlan50"
        set vdom "vdom_nat1"
        ...
        set allowaccess ping https ssh http fgfm fabric
        ...
    next
    edit "vlan90"
        set vdom "root"
        ...
        set allowaccess ping https ssh http fgfm fabric
        ...
    next
end
```

Downstream FortiGate 1 (Downstream-G)

To configure Downstream-G in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. In the *Settings* tab, set the *Security Fabric role* to *Join Existing Fabric*.
3. Enter the *Upstream FortiGate IP*, which is the IP of the root FortiGate vdom_nat1 interface (192.168.5.5). Downstream-G must use the interface from the management VDOM to connect to the upstream FortiGate IP.
4. Enable *Allow other Security Fabric devices to join* and click the *+* to add the downstream interface (sw-vlan71) from the FG-traffic VDOM.



5. Configure the other settings as needed.
6. Click *OK*.

To configure Downstream-G in the CLI:

1. Enable the Security Fabric:

```
config system csf
    set status enable
    set upstream-ip 192.168.5.5
end
```

2. Configure the interfaces:

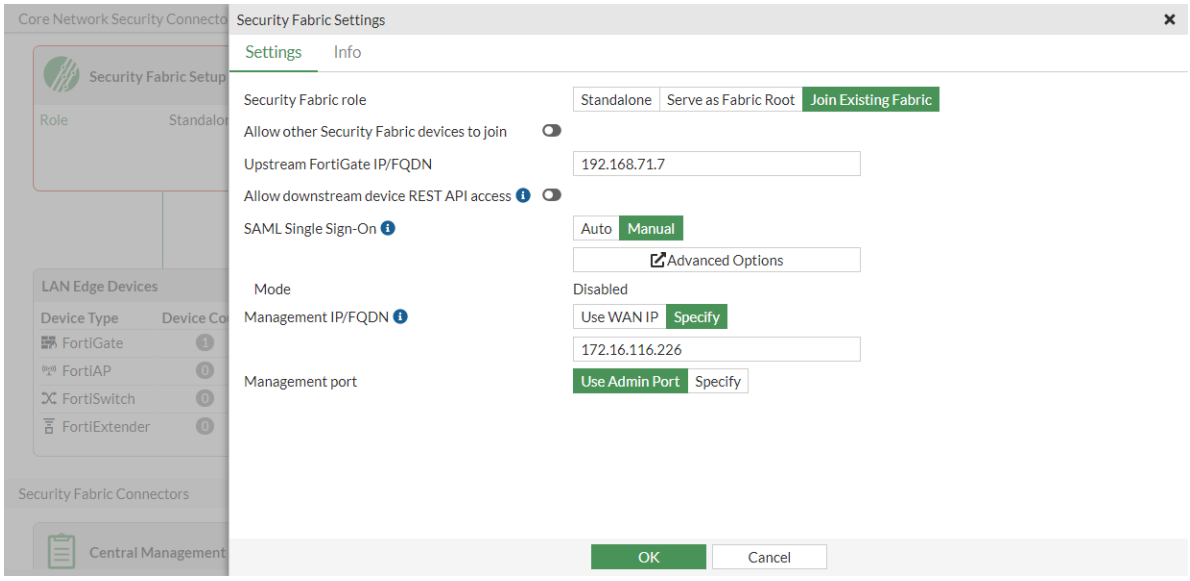
```
config system interface
    edit "sw-vlan71"
        set vdom "FG-traffic"
        ...
        set allowaccess ping https ssh http fgfm fabric
        ...
    next
end
```

Downstream FortiGate 2 (Level2-downstream-H)

To configure Level2-downstream-H in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. In the *Settings* tab, set the *Security Fabric role* to *Join Existing Fabric*.

3. Enter the *Upstream FortiGate IP*, which is the IP of the root VDOM on Downstream-G (192.168.71.7).



4. Configure the other settings as needed.
5. Click *OK*.

To configure Level2-downstream-H in the CLI:

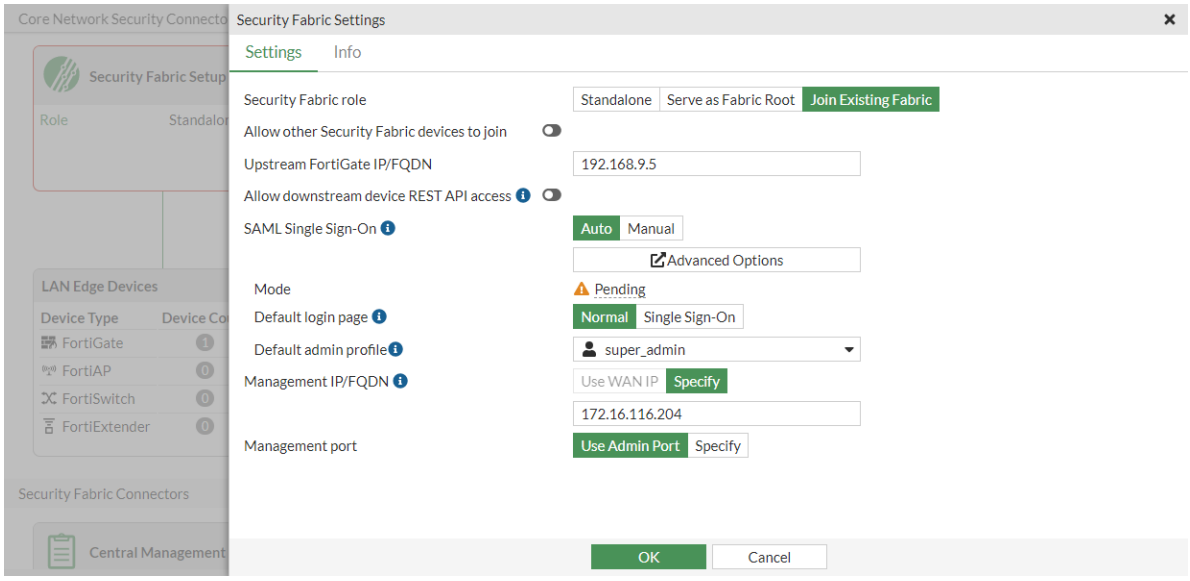
```
config system csf
    set status enable
    set upstream-ip 192.168.71.7
end
```

Downstream FortiGate 3 (Level1-downstream-10)

To configure Level1-downstream-10 in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. In the *Settings* tab, set the *Security Fabric role* to *Join Existing Fabric*.

3. Enter the *Upstream FortiGate IP*, which is the IP of the root VDOM on Root-E (192.168.9.5).



4. Configure the other settings as needed.
5. Click *OK*.

To configure Level1-downstream-10 in the CLI:

```
config system csf
    set status enable
    set upstream-ip 192.168.9.5
end
```

Device authorization and verification

To authorize the downstream devices on the root FortiGate:

1. On Root-E, go to *System* > *Firmware & Registration*.
2. Select the unauthorized device and click *Authorization* > *Authorize* for each downstream FortiGate. Once all the devices are authorized, the physical topology page shows the root and downstream FortiGates. The logical topology page shows the root and downstream FortiGates connected to interfaces in their corresponding VDOMs.

Other Security Fabric topics

The following topics provide instructions on configuring other Security Fabric use cases:

- Synchronizing objects across the Security Fabric on page 3824
- Group address objects synchronized from FortiManager on page 3831
- Security Fabric over IPsec VPN on page 3833
- Leveraging LLDP to simplify Security Fabric negotiation on page 3839

- Integrate user information from EMS and Exchange connectors in the user storeWhen a FortiClient endpoint is managed by EMS, logged in user and domain information is shared with FortiOS through the EMS connector. This information can be joined with the Exchange connector to produce more complete user information in the user store.The diagnose user-device-store device memory list command displays detailed device information.ExampleIn this example, the FortiClient PC user (test1) logs on to the AD domain (FORTINET-FSSO.COM), which is also the same domain as the Exchange server. The user information is pushed to the EMS server that the user is registered to. The FortiGate synchronizes the information from EMS, and at the same time looks up the user on the Exchange server under the Exchange connector. If the user exists on the Exchange server, additional information is fetched. These details are combined in the user store, which is visible in the FortiClient widget in the Status dashboard.To configure the Exchange server:config user exchange edit "exchange-140" set server-name "W2K8-SERV1" set domain-name "FORTINET-FSSO.COM" set username "Administrator" set password ******** next endTo configure the EMS server:config endpoint-control fctems edit 1 set status enable set name "ems133" set server "172.18.62.12" set certificate-fingerprint "4F:A6:76:E2:00:4F:A6:76:E2:00:4F:A6:76:E2:00:E0" next end To view the user information in the GUI:Go to Dashboard > Status.In the FortiClient widget, hover over a device or user name to view the information.To view the user information in the CLI:# diagnose user-device-store device memory list ... Record #13: device_info 'ipv4_address' = '10.1.100.185' 'mac' = '00:0c:29:11:5b:6b' 'hardware_vendor' = 'VMware' 'vdom' = 'root' 'os_name' = 'Microsoft' 'os_version' = 'Windows 7 Professional Edition, 32-bit Service Pack 1 (build 7601)' 'hostname' = 'win7-5' 'unauth_user' = 'Administrator' 'last_seen' = '1611356490' 'host_src' = 'forticlient' 'user_info_src' = 'forticlient' 'is_forticlient_endpoint' = 'true' 'unjoined_forticlient_endpoint' = 'false' 'is_forticlient_unauth_user' = 'true' 'avatar_source' = 'OS' 'domain' = 'Fortinet-FSSO.COM' 'forticlient_id' = '********************************' 'forticlient_username' = 'Administrator' 'forticlient_version' = '6.4.2' 'on_net' = 'true' 'quarantined_on_forticlient' = 'false' 'vuln_count' = '0' 'vuln_count_critical' = '0' 'vuln_count_high' = '0' 'vuln_count_info' = '0' 'vuln_count_low' = '0' 'vuln_count_medium' = '0' 'is_online' = 'true' interface_info 'ipv4_address' = '10.1.100.185' 'mac' = '00:0c:29:11:5b:6b' 'master_mac' = '00:0c:29:11:5b:6b' 'detected_interface' = 'port10' 'last_seen' = '1611356490' 'is_master_device' = 'true' 'is_detected_interface_role_wan' = 'false' 'detected_interface_fortitelemetry' = 'true' 'forticlient_gateway_interface' = 'port10' 'on_net' = 'true' 'is_online' = 'true' on page 1

Synchronizing objects across the Security Fabric

When the Security Fabric is enabled, various objects such as addresses, services, and schedules are synced from the upstream FortiGate to all downstream devices by default. FortiOS has the following settings for object synchronization across the Security Fabric:

- Set object synchronization (`fabric-object-unification`) to `default` or `local` on the root FortiGate.
- Set a per object option to toggle whether the specific Fabric object will be synchronized or not. After upgrading from 6.4.3, this option is disabled for supported Fabric objects. The synchronized Fabric objects are kept as locally created objects on downstream FortiGates.
- Define the number of task workers to handle synchronizations.

The firewall object synchronization wizard helps identify objects that are not synchronized and resolves any conflicts. A warning message appears in the topology tree if there is a conflict.

Summary of CLI commands

To configure object synchronization:

```
config system csf
    set fabric-object-unification {default | local}
    set configuration-sync {default | local}
    set fabric-workers <integer>
end
```

Parameter	Description
`fabric-object-unification`	*default*: Global CMDB objects will be synchronized in the Security Fabric. *local*: Global CMDB objects will not be synchronized to and from this device. This command is available on the root FortiGate. If set to local, the device does not synchronize objects from the root, but will send the synchronized objects downstream.
`configuration-sync`	*default*: Synchronize configuration for FortiAnalyzer, FortiSandbox, and Central Management to root node. *local*: Do not synchronize configuration with root node. If downstream FortiGates are set to local, the synchronized objects from the root to downstream are not applied locally. However, the downstream FortiGate will send the configuration to lower FortiGates.
`fabric-workers`	Define how many task worker process are created to handle synchronizations (1- 4, default = 2). The worker processes dies if there is no task to perform after 60 seconds.

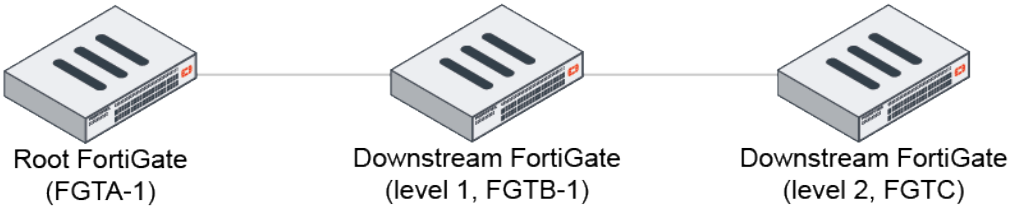
The per object setting can be configured on the root FortiGate as follows:

```
config firewall <object>
    edit <name>
        set fabric-object {enable | disable}
    next
end
```

Where:

- `<object>` is one of the following: `address`, `address6`, `addrgrp`, `addrgrp6`, `service category`, `service custom`, `service group`, `schedule group`, `schedule onetime`, or `schedule recurring`.
- Enabling `fabric-object` sets the object as a Security Fabric-wide global object that is synchronized to downstream FortiGates.
- Disabling `fabric-object` sets the object as local to this Security Fabric member.
- If a device in the Fabric is in multi-VDOM mode, the GUI will not display the Fabric synchronization option. Even if this is enabled in the CLI, the object will not be synchronized to any downstream devices.

Sample topology



In this Security Fabric, the root FortiGate (FGTA-1) has `fabric-object-unification` set to `default` so the Fabric objects can be synchronized to the downstream FortiGate. The level 1 downstream FortiGate (FGTB-1) has `configuration-sync` set to `local`, so it will not apply the synchronized objects locally. The level 2 downstream FortiGate (FGTC) has `configuration-sync` set to `default`, so it will apply the synchronized objects locally.

In this example, firewall addresses and address groups are used. Other supported Fabric objects have the same behaviors. The following use cases illustrate common synchronization scenarios:

- If no conflicts exist, firewall addresses and address groups can be synchronized to downstream FortiGates (see example below).
- If a conflict exists between the root and downstream FortiGates, it can be resolved with the conflict resolution wizard. After the conflict is resolved, the firewall addresses and address groups can be synchronized to downstream FortiGates (see example below).
- If `set fabric-object` (*Fabric synchronization* option in the GUI) is disabled for firewall addresses and address groups on the root FortiGate, they will not be synchronized to downstream FortiGates (see example below).

To configure the FortiGates used in this example:

```
FGTA-1 # config system csf
    set status enable
    set group-name "fabric"
    set fabric-object-unification default
    ...
end
```

```
FGTB-1 # config system csf
    set status enable
    set upstream-ip 10.2.200.1
    set configuration-sync local
    ...
end
```

```
FGTC # config system csf
    set status enable
    set upstream-ip 192.168.7.2
    set configuration-sync default
    ...
end
```

To synchronize a firewall address and address group in the Security Fabric:

1. Configure the firewall address on the root FortiGate:

```
FGTA-1 # config firewall address
    edit "add_subnet_1"
        set fabric-object enable
        set subnet 22.22.22.0 255.255.255.0
    next
end
```

2. Configure the address group on the root FortiGate:

```
FGTA-1 # config firewall addrgrp
    edit "group_subnet_1"
        set member "add_subnet_1"
        set fabric-object enable
    next
end
```

3. Check the firewall address and address group on the downstream FortiGates:

```
FGTB-1 # show firewall address add_subnet_1
entry is not found in table
```

```
FGTB-1 # show firewall addrgrp group_subnet_1
entry is not found in table
```

The synchronized objects are not applied locally on this FortiGate because `configuration-sync` is set to `local`.

```
FGTC # show firewall address add_subnet_1
config firewall address
    edit "add_subnet_1"
        set uuid 378a8094-34cb-51eb-ce40-097f298fcfdc
        set fabric-object enable
        set subnet 22.22.22.0 255.255.255.0
    next
end
```

```
FGTC # show firewall addrgrp group_subnet_1
config firewall addrgrp
    edit "group_subnet_1"
        set uuid 4d7a8a52-34cb-51eb-fce7-d93f76915319
        set member "add_subnet_1"
        set color 19
        set fabric-object enable
    next
end
```

The objects are synchronized on this FortiGate because `configuration-sync` is set to `default`.

To resolve a firewall address and address group conflict in the Security Fabric:

1. On FGTC, create a firewall address:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. Configure the following:

Name	sync_add_1
IP/Netmask	33.33.33.0 255.255.255.0

   d. Click *OK*.
2. On FGTA-1 (Fabric root), create the firewall address with same name but a different subnet:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. Configure the following:

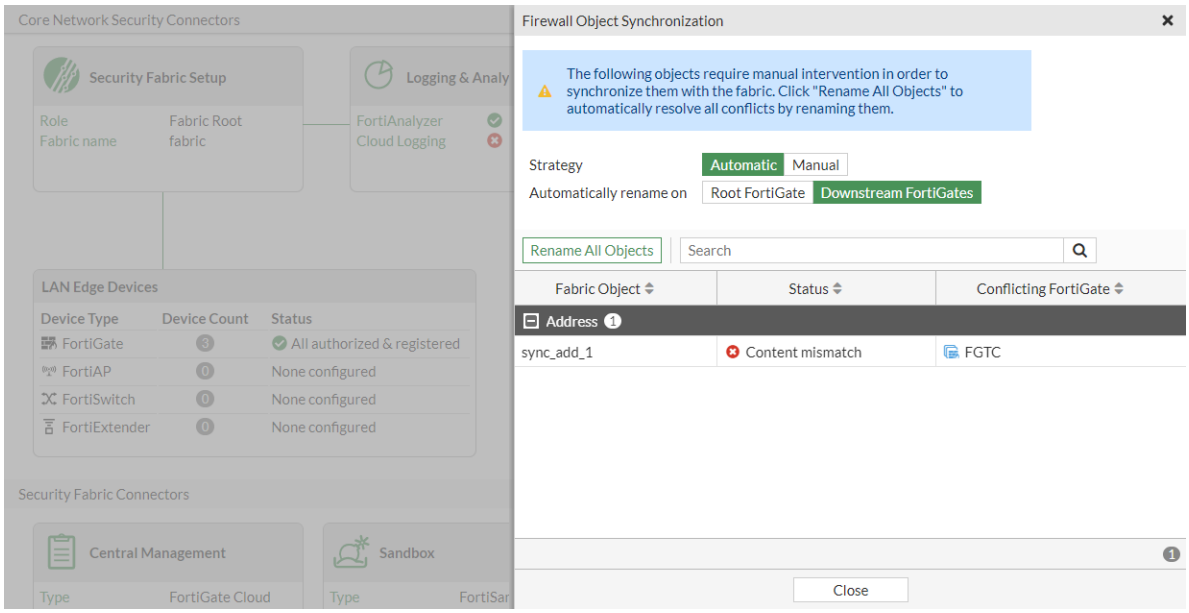
Name	sync_add_1
IP/Netmask	11.11.11.0 255.255.255.0
Fabric synchronization	Enable

   d. Click *OK*.
3. Add the address to a different address group than what is configured on FGTC:
   a. Go to *Policy & Objects* > *Addresses* and select *Address Group*.
   b. Click *Create new*.
   c. Configure the following:

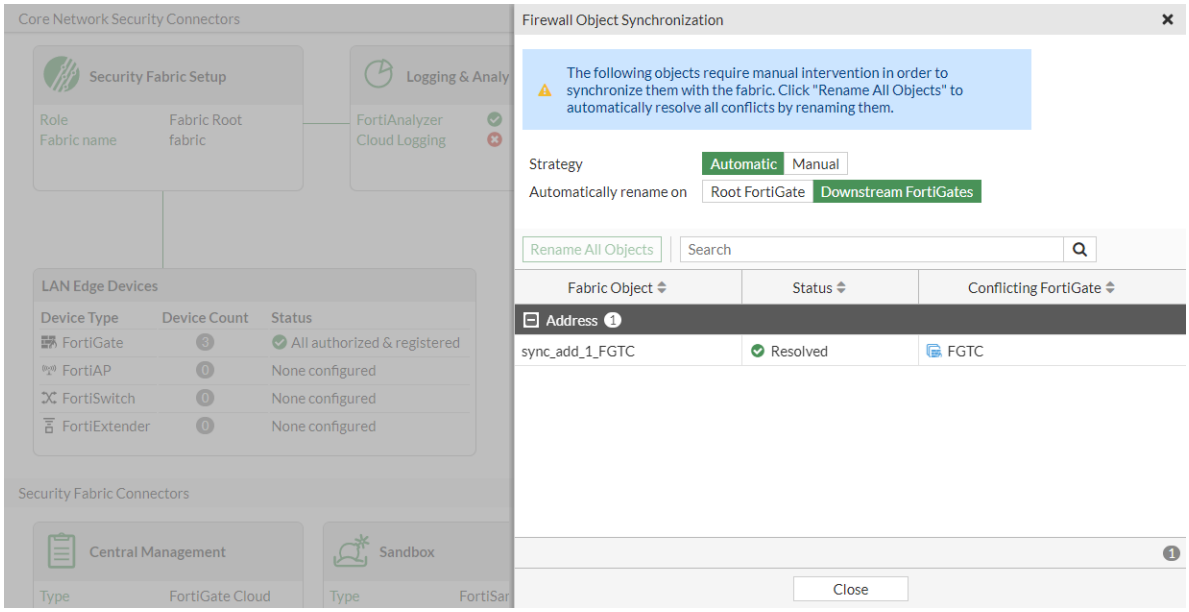
Name	sync_group4
Members	sync_add_1
Fabric synchronization	Enable

   d. Click *OK*.
4. Open the notification center drop dropdown. There is a message that *1 Firewall object is conflict with other FortiGates in the fabric*.

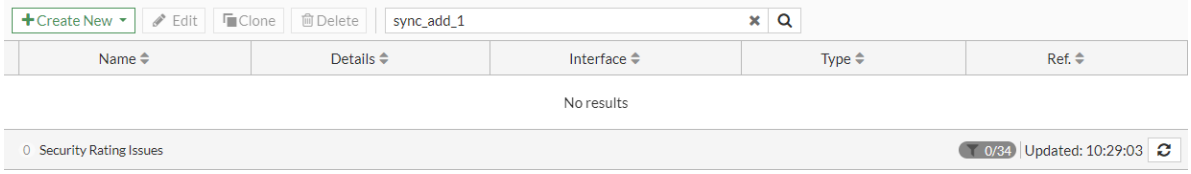
5. Resolve the conflict:
   a. Click the message in the notification center drop dropdown. The *Firewall Object Synchronization* pane opens.
   b. Click *Rename All Objects*. The conflicted object will be renamed on the downstream FortiGate.

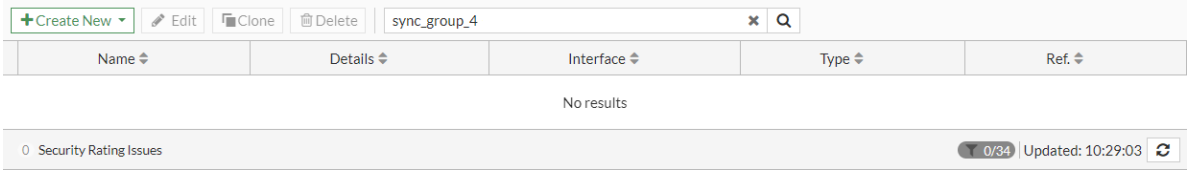


c. The conflict is resolved. Click *Close* to exit the *Firewall Object Synchronization* pane.



6. Verify the results on the downstream FortiGates:
   a. On FGTB-1, go to *Policy & Objects* > *Addresses*.
   b. Search for *sync_add_1* and *sync_group4* in the *Address* and *Group Address* pages, respectively. No results are found. The synchronized objects are not applied locally on this FortiGate because `configuration-sync` is set to `local`.





c. On FGTC, go to *Policy & Objects* > *Addresses*.

d. Search for *sync_add_1* in the *Address* page. The original firewall address *sync_add_1* was renamed to *sync_add_1_FGTC* by resolving the conflict on FGTA-1. The address *sync_add_1* and address group *sync_group4* are synchronized from FGTA-1.

To disable Fabric synchronization on the root FortiGate in the GUI:

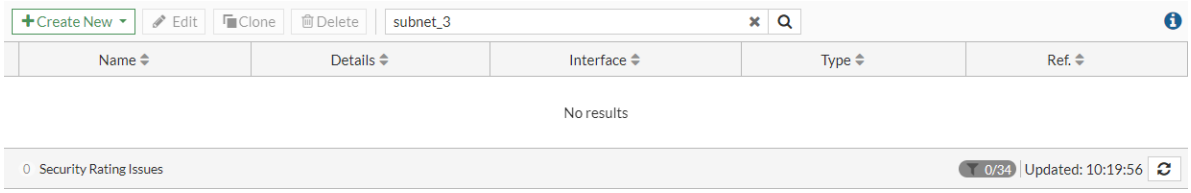
1. On FGTA-1, create a firewall address:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. Configure the following:

Name	add_subnet_3
IP/Netmask	33.33.33.0 255.255.255.0
Fabric synchronization	Disable

   d. Click *OK*.
2. Create the firewall address group and add the address:
   a. Go to *Policy & Objects* > *Addresses* and select *Address Group*.
   b. Click *Create new*.
   c. Configure the following:

Name	group_subnet_3
Members	add_subnet_3
Fabric synchronization	Disable

   d. Click *OK*.
3. On FGTB-1, go to *Policy & Objects* > *Addresses* and search for *subnet_3*. No results are found because Fabric synchronization is disabled on the root FortiGate (FGTA-1).



4. On FGTC, go to *Policy & Objects* > *Addresses* and search for *subnet_3*. No results are found because Fabric synchronization is disabled on the root FortiGate (FGTA-1).

To disable Fabric synchronization on the root FortiGate in the CLI:

1. Configure the firewall address on the root FortiGate:

```
FGTA-1 # config firewall address
    edit "add_subnet_3"
        set subnet 33.33.33.0 255.255.255.0
        set fabric-object disable
    next
end
```

2. Configure the address group on the root FortiGate:

```
FGTA-1 # config firewall addrgrp
    edit "group_subnet_3"
        set member "add_subnet_3"
        set fabric-object disable
    next
end
```

3. Check the firewall address and address group on the downstream FortiGates:

```
FGTB-1 # show firewall address add_subnet_3
entry is not found in table
```

```
FGTB-1 # show firewall addrgrp group_subnet_3
entry is not found in table
```

```
FGTC # show firewall address add_subnet_3
entry is not found in table
```

```
FGTC # show firewall addrgrp group_subnet_3
entry is not found in table
```

The objects are not synchronized from the root FortiGate (FGTA-1) because the `fabric-object` setting is disabled.

Group address objects synchronized from FortiManager

Address objects from external connectors that are learned by FortiManager are synchronized to FortiGate. These objects can be grouped together with the FortiGate CLI to simplify selecting connector objects in the FortiGate GUI. Multiple groups can be created.

This option is only available for objects that are synchronized from FortiManager.

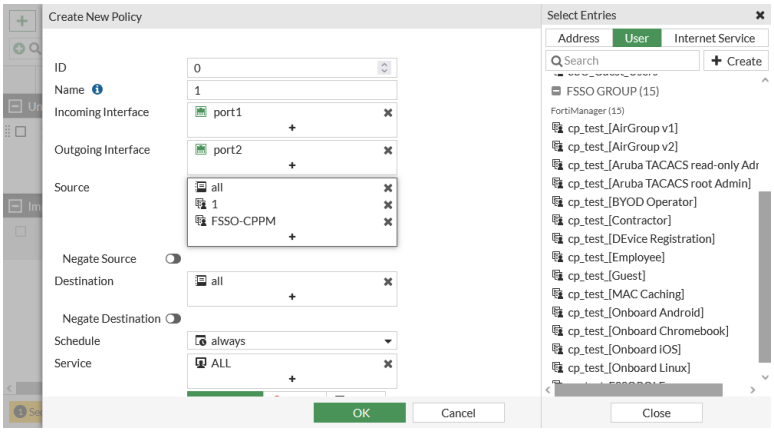
To add an object to a connector group:

```
config user adgrp
    edit <object_name>
        set server-name "FortiManager"
        set connector-source <group_name>
    next
end
```

Example

In this example, objects learned by the FortiManager from an Aruba ClearPass device are synchronized to the FortiGate. Some of the objects are then added to a group called *ClearPass* to make them easier to find in the object list when creating a firewall policy.

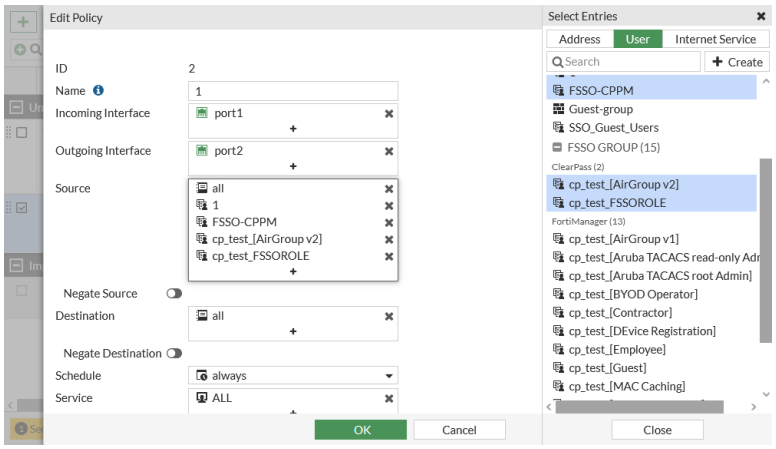
Prior to being grouped, the synchronized objects are listed under the FortiManager heading in the object lists.



To add some of the objects to a group:

```
config user adgrp
    edit "cp_test_FSSOROLE"
        set server-name "FortiManager"
        set connector-source "ClearPass"
    next
    edit "cp_test_[AirGroup v2]"
        set server-name "FortiManager"
        set connector-source "ClearPass"
    next
end
```

The objects are now listed under the *ClearPass* heading.

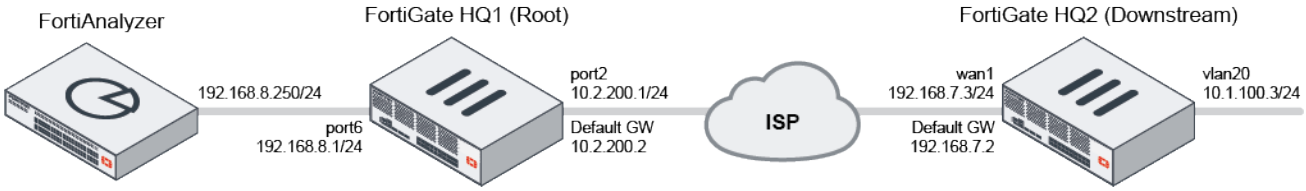


Security Fabric over IPsec VPN

This is an example of configuring Security Fabric over IPsec VPN.

Sample topology

This sample topology shows a downstream FortiGate (HQ2) connected to the root FortiGate (HQ1) over IPsec VPN to join Security Fabric.



Sample configuration

To configure the root FortiGate (HQ1):

1. Configure the interface:
   a. Go to *Network* > *Interfaces*.
   b. Edit *port2*:
      - Set *Role* to *WAN*.
      - For the interface connected to the internet, set the *IP/Network Mask* to *10.2.200.1/255.255.255.0*
   c. Edit *port6*:
      - Set *Role* to *DMZ*.
      - For the interface connected to FortiAnalyzer, set the *IP/Network Mask* to *192.168.8.250/255.255.255.0*
2. Configure the static route to connect to the internet:
   a. Go to *Network* > *Static Routes* and click *Create New* or *Create New* > *IPv4 Static Route*.
      - Set *Destination* to *0.0.0.0/0.0.0.0*.
      - Set *Interface* to *port2*.

- Set *Gateway Address* to *10.2.200.2*.

b. Click *OK*.

3. Configure the IPsec VPN:
   a. Go to *VPN > IPsec Wizard*.
   - Set *Name* to *To-HQ2*.
   - Set *Template Type* to *Custom*.
   - Click *Next*.
   - Set *Authentication* to *Method*.
   - Set *Pre-shared Key* to *123456*.

   b. Leave all other fields in their default values and click *OK*.
4. Configure the IPsec VPN interface IP address which will be used to form Security Fabric:
   a. Go to *Network > Interfaces*.
   b. Edit *To-HQ2*:
   - Set *Role* to *LAN*.
   - Set the *IP/Network Mask* to *10.10.10.1/255.255.255.255*.
   - Set *Remote IP/Network Mask* to *10.10.10.3/255.255.255.0*.

5. Configure the IPsec VPN local and remote subnets:
   a. Go to *Policy & Objects > Addresses*.
   b. Click *Create New*
   - Set *Name* to *To-HQ2_remote_subnet_2*.
   - Set *Type* to *Subnet*.
   - Set *IP/Network Mask* to *10.10.10.3/32*.

   c. Click *OK*.
   d. Click *Create New*
   - Set *Name* to *To-HQ2_local_subnet_1*.
   - Set *Type* to *Subnet*.
   - Set *IP/Network Mask* to *192.168.8.0/24*.

   e. Click *OK*.
   f. Click *Create New*
   - Set *Name* to *To-HQ2_remote_subnet_1*.
   - Set *Type* to *Subnet*.
   - Set *IP/Network Mask* to *10.1.100.0/24*.

   g. Click *OK*.
6. Configure the IPsec VPN static routes:
   a. Go to *Network > Static Routes*.
   b. Click *Create New* or *Create New > IPv4 Static Route*.
   - For *Named Address*, select *Type* and select *To-HQ2_remote_subnet_1*.
   - Set *Interface* to *To-HQ2*.

   Click *OK*.
   c. Click *Create New* or *Create New > IPv4 Static Route*.
   - For *Named Address*, select *Type* and select *To-HQ2_remote_subnet_1*.
   - Set *Interface* to *Blackhole*.

- Set *Administrative Distance* to *254*.

d. Click *OK*.

7. Configure the IPsec VPN policies:

a. Go to *Policy & Objects > Firewall Policy*

b. Click *Create New*.

- Set *Name* to *vpn_To-HQ2_local*.
- Set *Incoming Interface* to *port6*.
- Set *Outgoing Interface* to *To-HQ2*.
- Set *Source* to *To-HQ2_local_subnet_1*.
- Set *Destination* to *To-HQ2_remote_subnet_1*.
- Set *Schedule* to *Always*.
- Set *Service* to *All*.
- Disable *NAT*.

c. Click *OK*.

d. Click *Create New*.

- Set *Name* to *vpn_To-HQ2_remote*.
- Set *Incoming Interface* to *To-HQ2*.
- Set *Outgoing Interface* to *port6*.
- Set *Source* to *To-HQ2_remote_subnet_1, To-HQ2_remote_subnet_2*.
- Set *Destination* to *To-HQ2_local_subnet_1*.
- Set *Schedule* to *Always*.
- Set *Service* to *All*.
- Enable *NAT*.
- Set *IP Pool Configuration* to *Use Outgoing Interface Address*.

e. Click *OK*.

8. Configure the Security Fabric:

a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.

b. Select the *Settings* tab, and set the *Security Fabric role* to *Serve as Fabric Root*.

c. Enter a *Fabric name*, such as *Office-Security-Fabric*.

d. Ensure *Allow other Security Fabric devices to join* is enabled and add VPN interface *To-HQ2*.

e. Click *OK*.

9. Configure the FortiAnalyzer logging settings:

a. Go to *Security Fabric > Fabric Connectors* and double-click the *Logging & Analytics* card.

b. Select the *Settings* tab, select the *FortiAnalyzer* tab, and set the *Status* to *Enabled*.

c. Enter the FortiAnalyzer IP in the *Server* field (*192.168.8.250*). The *Upload option* is automatically set to *Real Time*.

d. Click *Refresh*. The FortiAnalyzer serial number is verified.

e. Click *OK*.

To configure the downstream FortiGate (HQ2):

1. Configure the interface:
   a. Go to *Network > Interfaces*.
   b. Edit interface *wan1*:
      - Set *Role* to *WAN*.
      - For the interface connected to the internet, set the *IP/Network Mask* to *192.168.7.3/255.255.255.0*.
   c. Edit interface *vlan20*:
      - Set *Role* to *LAN*.
      - For the interface connected to local endpoint clients, set the *IP/Network Mask* to *10.1.100.3/255.255.255.0*.
2. Configure the static route to connect to the internet:
   a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
      - Set *Destination* to *0.0.0.0/0.0.0.0*.
      - Set *Interface* to *wan1*.
      - Set *Gateway Address* to *192.168.7.2*.
   b. Click *OK*.
3. Configure the IPsec VPN:
   a. Go to *VPN > IPsec Wizard*.
      - Set *VPN Name* to *To-HQ1*.
      - Set *Template Type* to *Custom*.
      - Click *Next*.
      - In the *Network IP Address*, enter *10.2.200.1*.
      - Set *Interface* to *wan1*.
      - Set *Authentication* to *Method*.
      - Set *Pre-shared Key* to *123456*.
   b. Leave all other fields in their default values and click *OK*.
4. Configure the IPsec VPN interface IP address which will be used to form Security Fabric:
   a. Go to *Network > Interfaces*.
   b. Edit *To-HQ1*:
      - Set *Role* to *WAN*.
      - Set the *IP/Network Mask* to *10.10.10.3/255.255.255.255*.
      - Set *Remote IP/Network Mask* to *10.10.10.1/255.255.255.0.0*.
5. Configure the IPsec VPN local and remote subnets:
   a. Go to *Policy & Objects > Addresses*.
   b. Click *Create New*
      - Set *Name* to *To-HQ1_local_subnet_1*.
      - Set *Type* to *Subnet*.
      - Set *IP/Network Mask* to *10.1.100.0/24*.
   c. Click *OK*.
   d. Click *Create New*

- Set *Name* to *To-HQ1_remote_subnet_1*.
- Set *Type* to *Subnet*.
- Set *IP/Network Mask* to *192.168.8.0/24*.

e. Click *OK*.

6. Configure the IPsec VPN static routes:
   a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
   - For *Named Address*, select *Type* and select *To-HQ1_remote_subnet_1*.
   - Set *Interface* to *To-HQ1*.

   b. Click *OK*.
   c. Click *Create New* or *Create New > IPv4 Static Route*.
   - For *Named Address*, select *Type* and select *To-HQ1_remote_subnet_1*.
   - Set *Interface* to *Blackhole*.
   - Set *Administrative Distance* to *254*.

   d. Click *OK*.
7. Configure the IPsec VPN policies:
   a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
   - Set *Name* to *vpn_To-HQ1_local*.
   - Set *Incoming Interface* to *vlan20*.
   - Set *Outgoing Interface* to *To-HQ1*.
   - Set *Source* to *To-HQ1_local_subnet_1*.
   - Set *Destination* to *To-HQ1_remote_subnet_1*.
   - Set *Schedule* to *Always*.
   - Set *Service* to *All*.
   - Disable *NAT*.

   b. Click *OK*.
   c. Click *Create New*.
   - Set *Name* to *vpn_To-HQ1_remote*.
   - Set *Incoming Interface* to *To-HQ1*.
   - Set *Outgoing Interface* to *vlan20*.
   - Set *Source* to *To-HQ1_remote_subnet_1*.
   - Set *Destination* to *-HQ1_local_subnet_1*.
   - Set *Schedule* to *Always*.
   - Set *Service* to *All*.
   - Disable *NAT*.

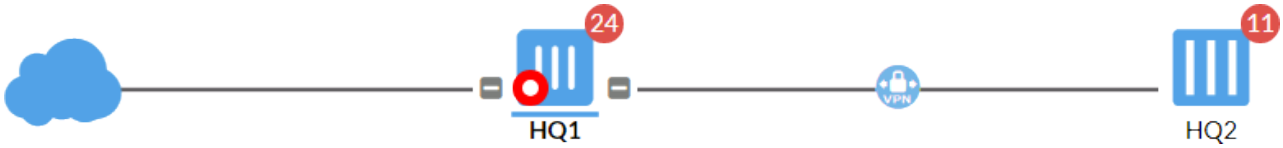
   d. Click *OK*.
8. Configure the Security Fabric:
   a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. In the *Settings* tab, set the *Security Fabric role* to *Join Existing Fabric*.
   FortiAnalyzer automatically enables logging. FortiAnalyzer settings will be retrieved when the downstream FortiGate connects to the root FortiGate.
   c. Set the *Upstream FortiGate IP* to *10.10.10.1*.
   d. Click *OK*.

To authorize the downstream FortiGate (HQ2) on the root FortiGate (HQ1):

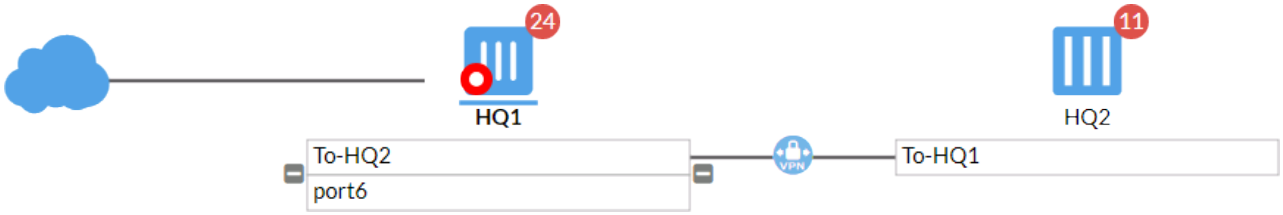
1. In the root FortiGate (HQ1), go to *System > Firmware & Registration*.
   The table highlights the connected FortiGate with its serial numbers that is unauthorized.
2. Select the unauthorized device and click *Authorization > Authorize*.
   After authorization, the downstream FortiGate (HQ2) appears in the *Security Fabric* widget. This means the downstream FortiGate (HQ2) has successfully joined the Security Fabric.

To check the Security Fabric over IPsec VPN:

1. On the root FortiGate (HQ1), go to *Security Fabric > Physical Topology*.
   The root FortiGate (HQ1) is connected by the downstream FortiGate (HQ2) with VPN icon in the middle.



2. On the root FortiGate (HQ1), go to *Security Fabric > Logical Topology*.
   The root FortiGate (HQ1) VPN interface *To-HQ2* is connected by downstream FortiGate (HQ2) VPN interface *To-HQ1* with VPN icon in the middle.



To run diagnostics:

1. To view the downstream FortiGate pending authorization on root FortiGate (HQ1):

```
HQ1 # diagnose sys csf authorization pending-list
Serial                  IP Address      HA-Members                                      Path
--------------------------------------------------------------------------------
FG101ETK18002187        0.0.0.0
FG3H1E5818900718:FG101ETK18002187
```

2. To view the downstream FortiGate (HQ2) after it joins the Security Fabric:

```
HQ1 # diagnose sys csf downstream
 1:     FG101ETK18002187 (10.10.10.3) Management-IP: 0.0.0.0 Management-port:0 parent:
FG3H1E5818900718
        path:FG3H1E5818900718:FG101ETK18002187
        data received: Y downstream intf:To-HQ1 upstream intf:To-HQ2 admin-port:443
        authorizer:FG3H1E5818900718
```

3. To view the root FortiGate (HQ1) on the downstream FortiGate (HQ2) after joining the Security Fabric:

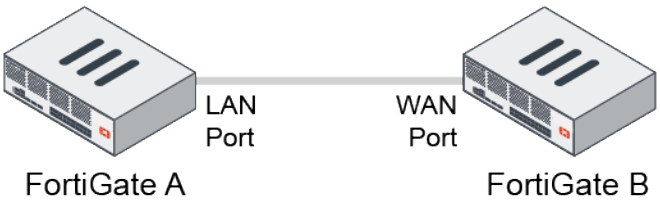
```
HQ2 # diagnose sys csf upstream
Upstream Information:
```

```
Serial Number:FG3H1E5818900718
IP:10.10.10.1
Connecting interface:To-HQ1
Connection status:Authorized
```

Leveraging LLDP to simplify Security Fabric negotiation

LLDP reception is enabled on WAN interfaces, which prompts FortiGates that are joining the Security Fabric if the upstream FortiGate asks.

- If the interface role is undefined, LLDP reception and transmission inherit settings from the VDOM.
- If the interface role is WAN, LLDP reception is enabled.
- If the interface role is LAN, LLDP transmission is enabled.

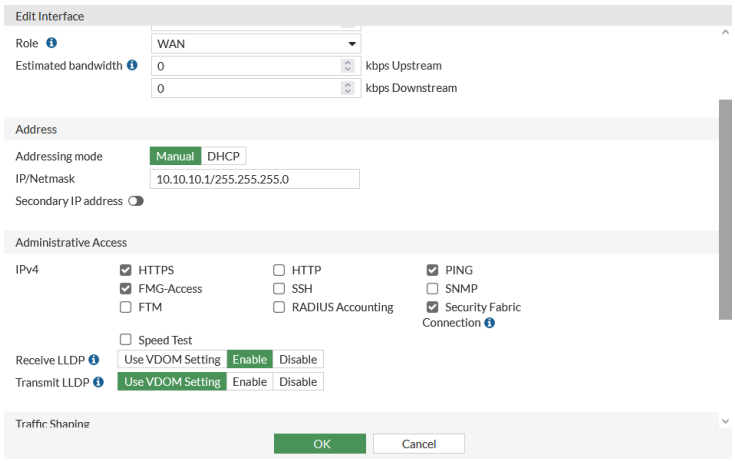


When a FortiGate B's WAN interface detects that FortiGate A's LAN interface is immediately upstream (through the default gateway), and FortiGate A has Security Fabric enabled, FortiGate B will show a notification on the GUI asking to join the Security Fabric.

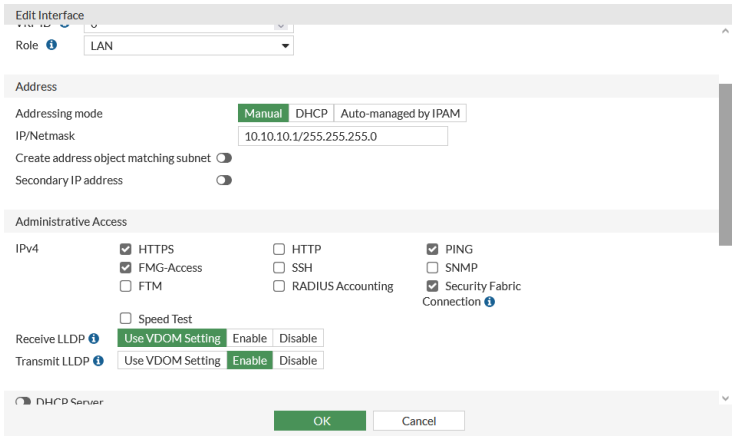
To configure LLDP reception and join a Security Fabric in the GUI:

1. On FortiGate A, go to *Network* > *Interfaces*.
2. Configure an interface:
   - If the interface's role is undefined, under *Administrative Access*, set *Receive LLDP* and *Transmit LLDP* to *Use VDOM Setting*.

   - If the interface's role is WAN, under *Administrative Access*, set *Receive LLDP* to *Enable* and *Transmit LLDP* to *Use VDOM Setting*.



- If the interface's role is LAN, under *Administrative Access*, set *Receive LLDP* to *Use VDOM Setting* and *Transmit LLDP* to *Enable*.



3. Click *OK*. A notification is shown on FortiGate B, *You can connect to a Security Fabric via an upstream FortiGate at 10.10.10.1*.
4. Click the notification. The *Security Fabric Settings* page opens. All the required settings automatically configured.
5. Click *OK* to apply the settings.

To configure LLDP reception and join a Security Fabric in the CLI:

1. Configure the interface on FortiGate A:
   - Undefined role

```
config system interface
    edit "port3"
        set lldp-reception vdom
        set lldp-transmission vdom
        set role undefined
        ...
    next
end
```

   - WAN role

```
config system interface
    edit "wan1"
        set lldp-reception enable
        set lldp-transmission vdom
        set role wan
        ...
    next
end
```

- LAN role

```
config system interface
    edit "port2"
        set lldp-reception vdom
        set lldp-transmission enable
        set role lan
        ...
    next
end
```

2. Edit the Security Fabric settings on FortiGate B:

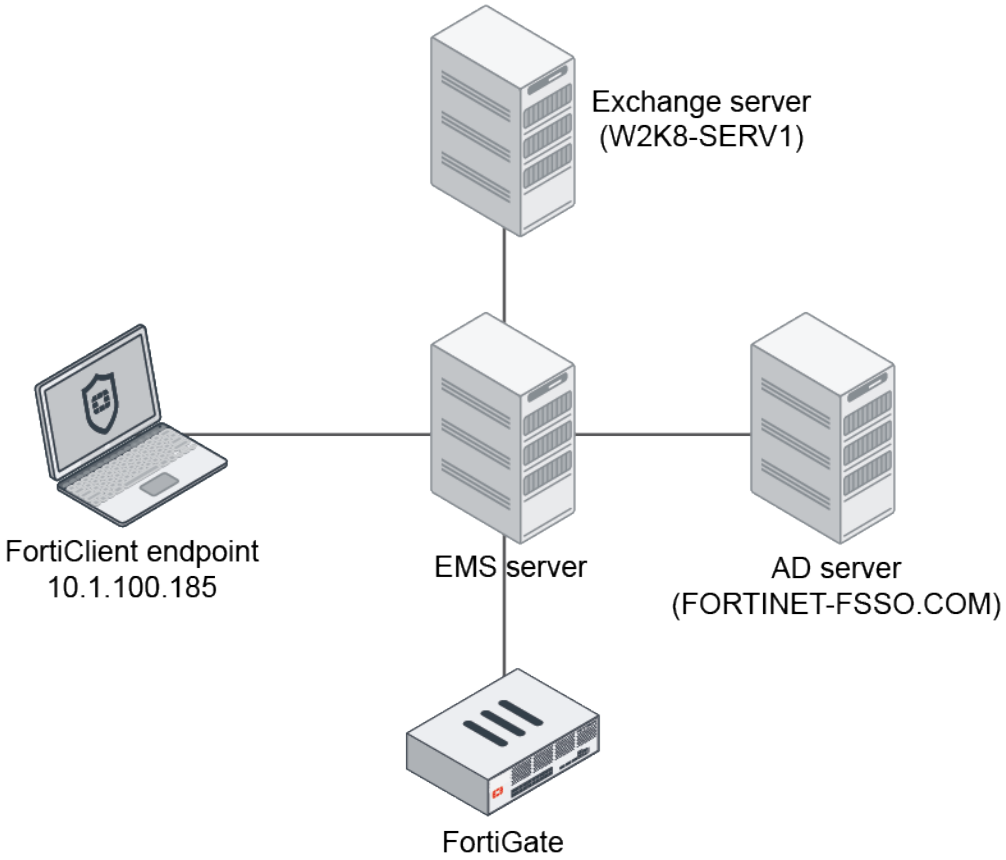
```
config system csf
    set status enable
    set upstream-ip 10.2.200.1
end
```

Integrate user information from EMS and Exchange connectors in the user store

When a FortiClient endpoint is managed by EMS, logged in user and domain information is shared with FortiOS through the EMS connector. This information can be joined with the Exchange connector to produce more complete user information in the user store.

The `diagnose user-device-store device memory list` command displays detailed device information.

Example



In this example, the FortiClient PC user (test1) logs on to the AD domain (FORTINET-FSSO.COM), which is also the same domain as the Exchange server. The user information is pushed to the EMS server that the user is registered to. The FortiGate synchronizes the information from EMS, and at the same time looks up the user on the Exchange server under the Exchange connector. If the user exists on the Exchange server, additional information is fetched. These details are combined in the user store, which is visible in the *FortiClient* widget in the *Status* dashboard.

To configure the Exchange server:

```
config user exchange
    edit "exchange-140"
        set server-name "W2K8-SERV1"
        set domain-name "FORTINET-FSSO.COM"
        set username "Administrator"
        set password ********
    next
end
```

To configure the EMS server:

config endpoint-control fctems edit 1 set status enable set name "ems133" set server "172.18.62.12" set certificate-fingerprint

"4F:A6:76:E2:00:4F:A6:76:E2:00:4F:A6:76:E2:00:E0" next end

To view the user information in the GUI:

1. Go to *Dashboard > Status*.
2. In the *FortiClient* widget, hover over a device or user name to view the information.

To view the user information in the CLI:

```
# diagnose user-device-store device memory list
...
Record #13:
        device_info
                'ipv4_address' = '10.1.100.185'
                'mac' = '00:0c:29:11:5b:6b'
                'hardware_vendor' = 'VMware'
                'vdom' = 'root'
                'os_name' = 'Microsoft'
                'os_version' = 'Windows 7 Professional Edition, 32-bit Service Pack 1  (build
7601)'
                'hostname' = 'win7-5'
                'unauth_user' = 'Administrator'
                'last_seen' = '1611356490'
                'host_src' = 'forticlient'
                'user_info_src' = 'forticlient'
                'is_forticlient_endpoint' = 'true'
                'unjoined_forticlient_endpoint' = 'false'
                'is_forticlient_unauth_user' = 'true'
                'avatar_source' = 'OS'
                'domain' = 'Fortinet-FSSO.COM'
                'forticlient_id' = '********************************'
                'forticlient_username' = 'Administrator'
                'forticlient_version' = '6.4.2'
                'on_net' = 'true'
                'quarantined_on_forticlient' = 'false'
                'vuln_count' = '0'
                'vuln_count_critical' = '0'
                'vuln_count_high' = '0'
                'vuln_count_info' = '0'
                'vuln_count_low' = '0'
                'vuln_count_medium' = '0'
                'is_online' = 'true'
        interface_info
                'ipv4_address' = '10.1.100.185'
                'mac' = '00:0c:29:11:5b:6b'
                'master_mac' = '00:0c:29:11:5b:6b'
                'detected_interface' = 'port10'
                'last_seen' = '1611356490'
                'is_master_device' = 'true'
                'is_detected_interface_role_wan' = 'false'
                'detected_interface_fortitelemetry' = 'true'
```

```
                'forticlient_gateway_interface' = 'port10'
                'on_net' = 'true'
                'is_online' = 'true'
```

Configuring the Security Fabric with SAML

Security Assertion Markup Language (SAML) is an open standard for exchanging authentication and authorization data between one Identity Provider (IdP) and one or more Service Providers (SP). Both parties exchange messages using the XML protocol as transport. FortiGate firewall devices can be configured as IdPs or SPs.

When the Security Fabric is enabled, you can configure the root FortiGate as the IdP. You can also configure downstream FortiGates to be automatically configured as SPs, with all links required for SAML communication, when added to the Security Fabric. Administrators must still be authorized on each device. Credentials are verified by the root FortiGate, and login credentials are shared between devices. Once authorized, an administrator can move between Fabric devices without logging in again.

Optionally, the downstream FortiGate can also be manually configured as an SP, and then linked to the root FortiGate.

The authentication service is provided by the root FortiGate using local system admin accounts for authentication. Any of the administrator account types can be used for SAML log in. After successful authentication, the administrator logs in to the first downstream FortiGate SP, and can then connect to other downstream FortiGates that have the SSO account properly configured, without needing to provide credentials again, as long as admins use the same browser session. In summary, the root FortiGate IdP performs SAML SSO authentication, and individual device administrators define authorization on FortiGate SPs by using security profiles.

Configuring single-sign-on in the Security Fabric

SAML SSO enables a single FortiGate device to act as the identify provider (IdP), while other FortiGate devices act as service providers (SP) and redirect logins to the IdP.

Only the root FortiGate can be the identity provider (IdP). The downstream FortiGates can be configured as service providers (SP).

The process is as follows:

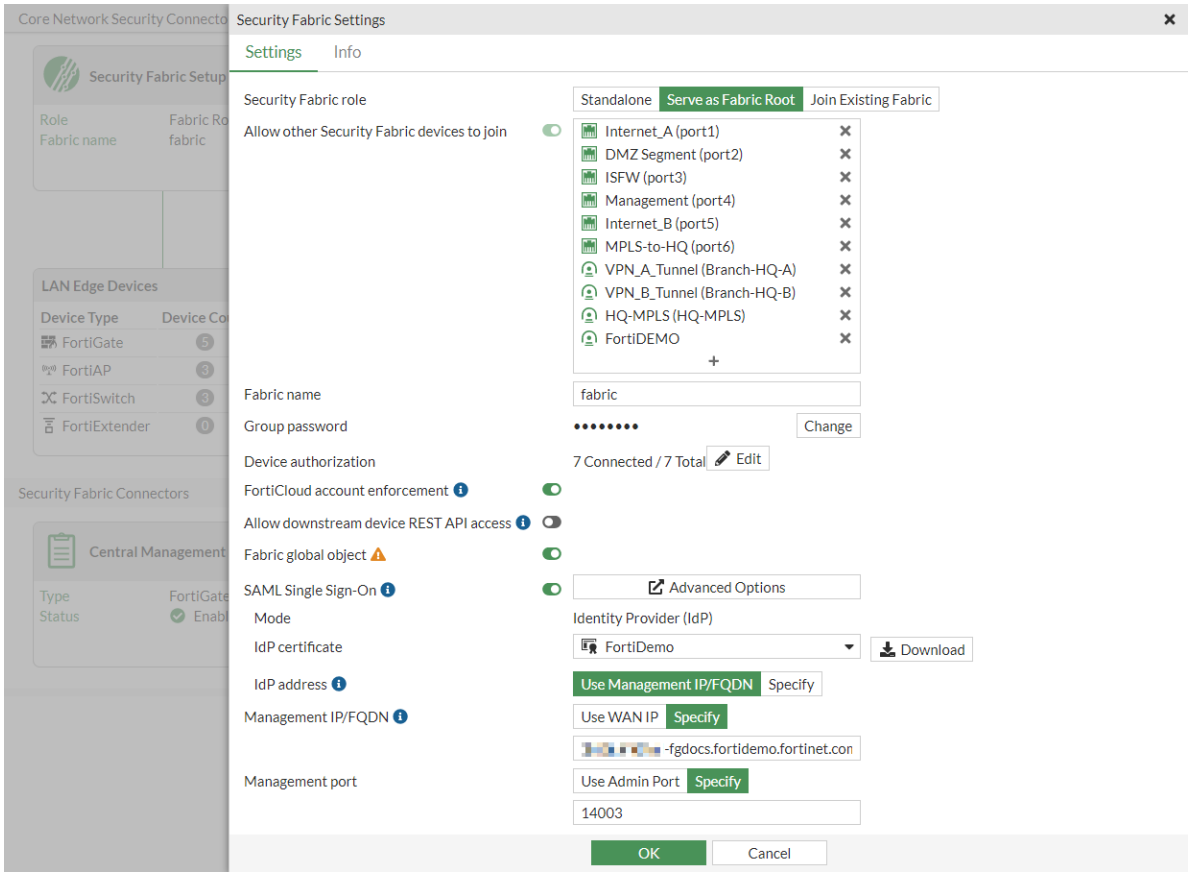
1. Configuring the root FortiGate as the IdP on page 3845
2. Configuring a downstream FortiGate as an SP on page 3845
3. Configuring certificates for SAML SSO on page 3847
4. Verifying the single-sign-on configuration on page 3849

You can also use the CLI. See CLI commands for SAML SSO on page 3849.

Configuring the root FortiGate as the IdP

To configure the root FortiGate as the IdP:

1. Log in to the root FortiGate.
2. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. Enable *SAML Single Sign-On*. The *Mode* field is automatically populated as *Identity Provider (IdP)*.
4. Enter an IP address in the *Management IP/FQDN* field.
5. Enter a management port in the *Management port* field.
   The *Management IP/FQDN* will be used by the SPs to redirect the login request. The *Management IP/FQDN* and *Management port* must be reachable from the user's device.
6. Select the *IdP certificate*.



7. Click *OK*.

Configuring a downstream FortiGate as an SP

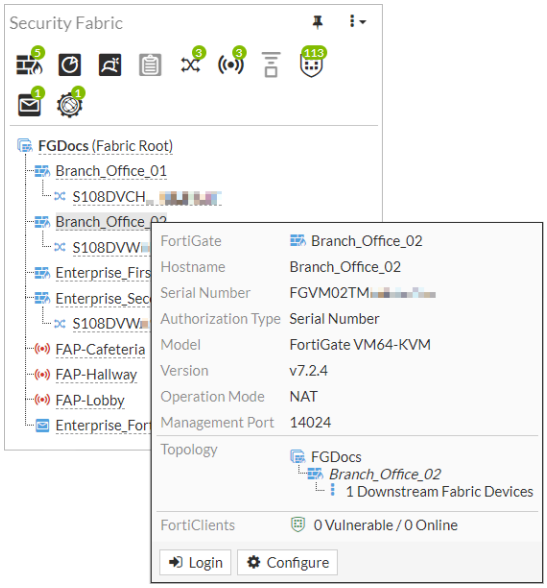
There are two ways to configure the downstream FortiGate:

- From the root FortiGate
- From within the downstream device

An SP must be a member of the Security Fabric before you configure it.

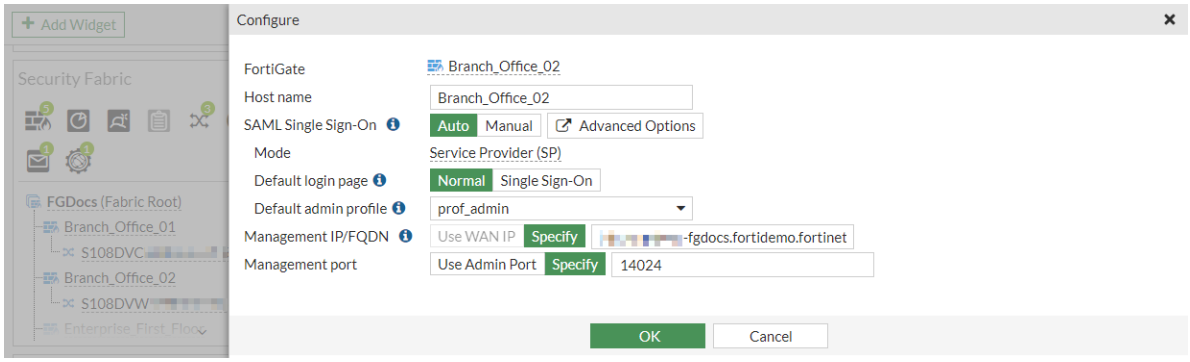
To configure the downstream FortiGate from the root FortiGate:

1. Log in to the root FortiGate.
2. Go to *Dashboard* > *Status* and locate the *Security Fabric* widget.
3. In the topology tree, hover over a FortiGate and click *Configure*.



The *Configure* pane opens.

4. Select a *SAML Single Sign-On* option. *Auto* sets the device to SP mode. *Manual* allows you to configure the SSO settings by clicking *Advanced Options*.
5. Select a *Default login page* option.
6. Select one of the following *Default admin profile* types: *prof_admin*, *super_admin*, or *super_admin_readonly*.
7. Enter an IP address in the *Management IP/FQDN* field.
8. Enter a management port in the *Management port* field.
   The *Management IP/FQDN* will be used by the IdP and so other SPs can redirect to each other. The *Management port* must be reachable from the user's device.
9. Click *OK*.



To configure the downstream FortiGate within the device:

1. Log in to the downstream FortiGate.
2. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. In the *Settings* tab, select a *SAML Single Sign-On* option. *Auto* sets the device to SP mode. *Manual* allows you to configure the SSO settings by clicking *Advanced Options*.
4. Select a *Default login page* option.
5. Select one of the following *Default admin profile* types: *prof_admin*, *admin_no_access*, *super_admin*, or *super_admin_readonly*.
6. Enter an IP address in the *Management IP/FQDN* field.
7. Enter a management port in the *Management port* field.
   The *Management IP/FQDN* will be used by the IdP and so other SPs can redirect to each other. The *Management port* must be reachable from the user's device.
8. Click *OK*.

Configuring certificates for SAML SSO

Because communication between the root FortiGate IdP and FortiGate SPs is secured, you must select a local server certificate in the *IdP certificate* option on the root FortiGate. When downstream SPs join the IdP (root FortiGate), the SP automatically obtains the certificate.

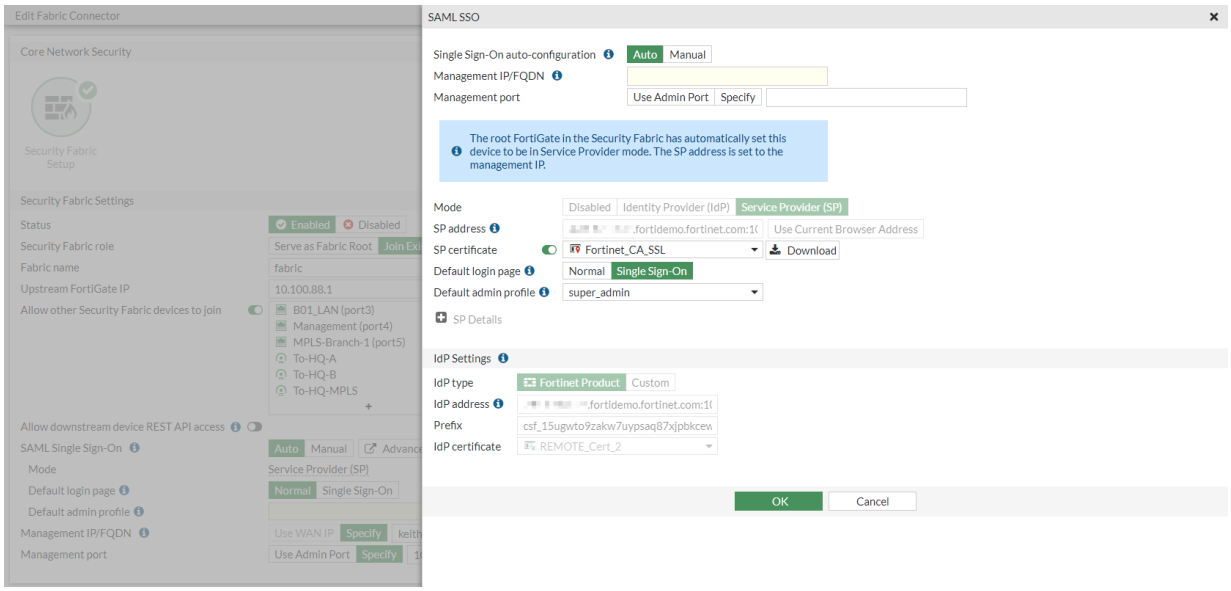
In the following SP example, the *IdP certificate* displays *REMOTE_Cert_2*, which is the root server certificate for the IdP:

It is possible to manually import a certificate from an SP to the IdP so it can be used for authentication.

To manually import an SP certificate to an IdP:

1. Add the certificate:
   a. On the SP, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. Click *Advanced Options*. The *SAML SSO* pane opens.
   c. Enable *SP certificate* and select a certificate from the dropdown box.
   d. Click *Download*. The certificate is downloaded on the local file system.
   e. Click *OK* to close the *SAML SSO* pane.

f. Click *OK* to close the *Security Fabric Setup* card.



2. Import the certificate:
   a. On the IdP, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. Click *Advanced Options*. The *SAML SSO* pane opens.
   c. In the *Service Providers* table, select the SP from step 1 and click *Edit*.
   d. Enable *SP certificate* and in the dropdown box, click *Import*.

   The *Upload Remote Certificate* window opens.
   e. Click *Upload* and select the certificate downloaded in step 1.
   f. Select *REMOTE_Cert_2*.
   g. Click *OK*. The certificate is imported.
   h. In the *IdP certificate* list, select the certificate that you imported.

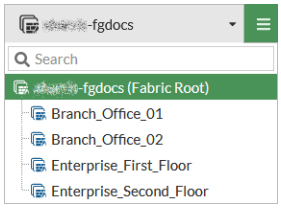
i. Click *OK* to close the *SAML SSO* pane.
j. Click *OK* to close the *Security Fabric Setup* card.

Verifying the single-sign-on configuration

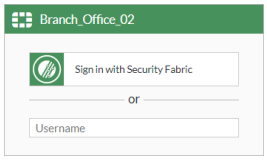
After you have logged in to a Security Fabric member using SSO, you can navigate between any Security Fabric member with SSO configured.

To navigate between Security Fabric members:

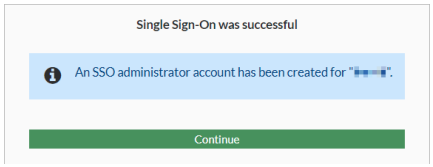
1. Log in to a Security Fabric member that is using SSO.
2. In the top banner, click the name of the device you are logged in to. A list of Security Fabric members displays.



3. Click a Security Fabric member. The login page appears. Click *Sign in with Security Fabric*.

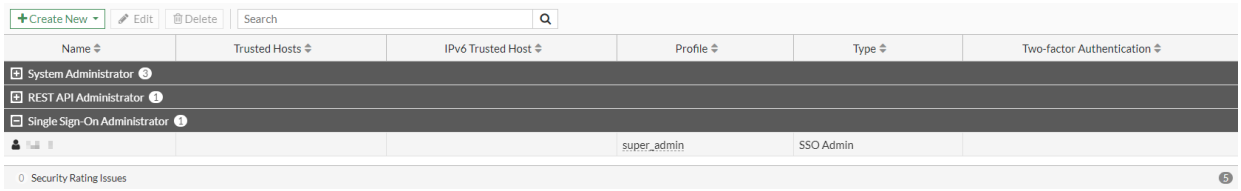


4. A prompt appears that an SSO administrator account has been created. Click *Continue*.



You are now logged in to the Security Fabric member with SSO. The letters "SSO" also display beside the user name in the top banner.

5. Go to *System* > *Administrators* > *Single-Sign-On Administrator* to view the list of SSO admins created.



CLI commands for SAML SSO

To enter a question mark (?) or a tab, Ctrl + V must be entered first. Question marks and tabs cannot be typed or copied into the CLI Console or some SSH clients.

To configure the IdP:

```
config system saml
    set status enable
    set role identity-provider
    set cert "Fortinet_Factory"
    set server-address "172.16.106.74"
    config service-providers
        edit "csf_172.16.106.74:12443"
            set prefix "csf_ngczjwqxujfsbhgr9ivhehwu37fml20"
            set sp-entity-id "http://172.16.106.74/metadata/"
            set sp-single-sign-on-url "https://172.16.106.74/saml/?acs"
            set sp-single-logout-url "https://172.16.106.74/saml/?sls"
            set sp-portal-url "https://172.16.106.74/saml/login/"
            config assertion-attributes
                edit "username"
                next
                edit "tdoc@fortinet.com"
                    set type email
                next
            end
        next
    end
end
```

To configure an SP:

```
config system saml
    set status enable
    set cert "Fortinet_Factory"
    set idp-entity-id "http://172.16.106.74/saml-idp/csf_
ngczjwqxujfsbhgr9ivhehwu37fml20/metadata/"
    set idp-single-sign-on-url "https://172.16.106.74/csf_
ngczjwqxujfsbhgr9ivhehwu37fml20/login/"
    set idp-single-logout-url "https://172.16.106.74/saml-idp/csf_
ngczjwqxujfsbhgr9ivhehwu37fml20/logout/"
    set idp-cert "REMOTE_Cert_1"
    set server-address "172.16.106.74:12443"
end
```

To configure an SSO administrator:

```
config system sso-admin
    edit "SSO-admin-name"
        set accprofile <SSO admin user access profile>
        set vdom <Virtual domain(s) that the administrator can access>
    next
end
```

SAML SSO with pre-authorized FortiGates

You can set up SAML SSO authentication in a Security Fabric environment by starting with a root FortiGate that has one or more pre-authorized FortiGates.

After the initial configuration, you can add more downstream FortiGates to the Security Fabric, and they are automatically configured with default values for a service provider.

To set up basic SAML SSO for the Security Fabric:

1. Log in to the root FortiGate of the Security Fabric.
2. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. Join two pre-authorized FortiGates to the root FortiGate (see Configuring the root FortiGate and downstream FortiGates on page 3702).
4. Configure the IdP (see Configuring the root FortiGate as the IdP on page 3845).
5. Configure the SPs (see Configuring a downstream FortiGate as an SP on page 3845).

Navigating between Security Fabric members with SSO

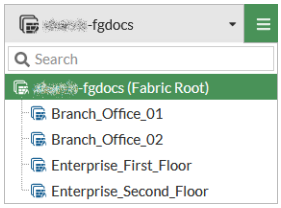
After you have logged in to a Security Fabric member by using SSO, you can navigate between any Security Fabric member with SSO configured. This can be done using the Security Fabric members dropdown menu or by logging in to a FortiGate SP from the root FortiGate IdP.

Security Fabric members dropdown

The Security Fabric members dropdown menu allows you to easily switch between all FortiGate devices that are connected to the Security Fabric. You can also use this menu to customize a FortiGate in the Security Fabric.

To navigate between Security Fabric members:

1. Log in to a Security Fabric member by using SSO.
2. In the top banner, click the name of the device you are logged into with SSO.
   A list of Security Fabric members is displayed.



3. Click the Security Fabric member.
   You are logged in to the Security Fabric member without further authentication.

To customize a FortiGate in the Security Fabric:

1. In the Security Fabric members dropdown menu, hover the cursor over a FortiGate so the tooltip is shown.
2. Click *Configure*. The *Configure* pane opens.

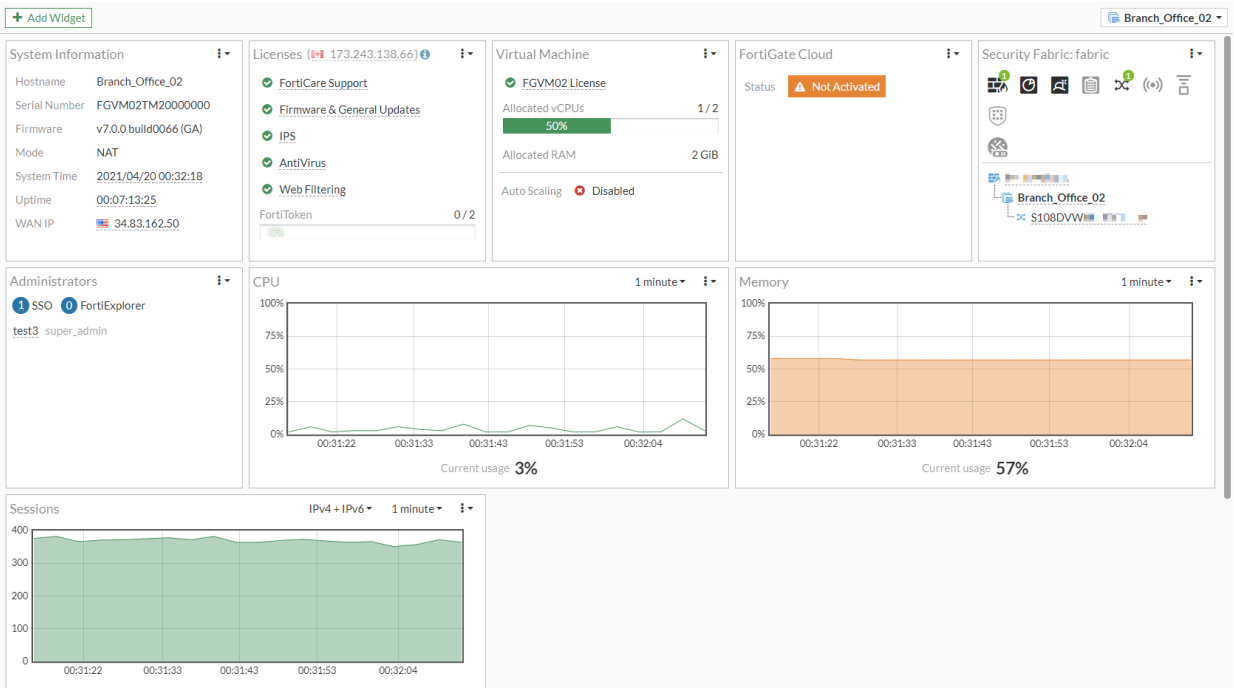
3. Edit the settings as required.
4. Click *OK*.

Logging in to an SP from the root IdP

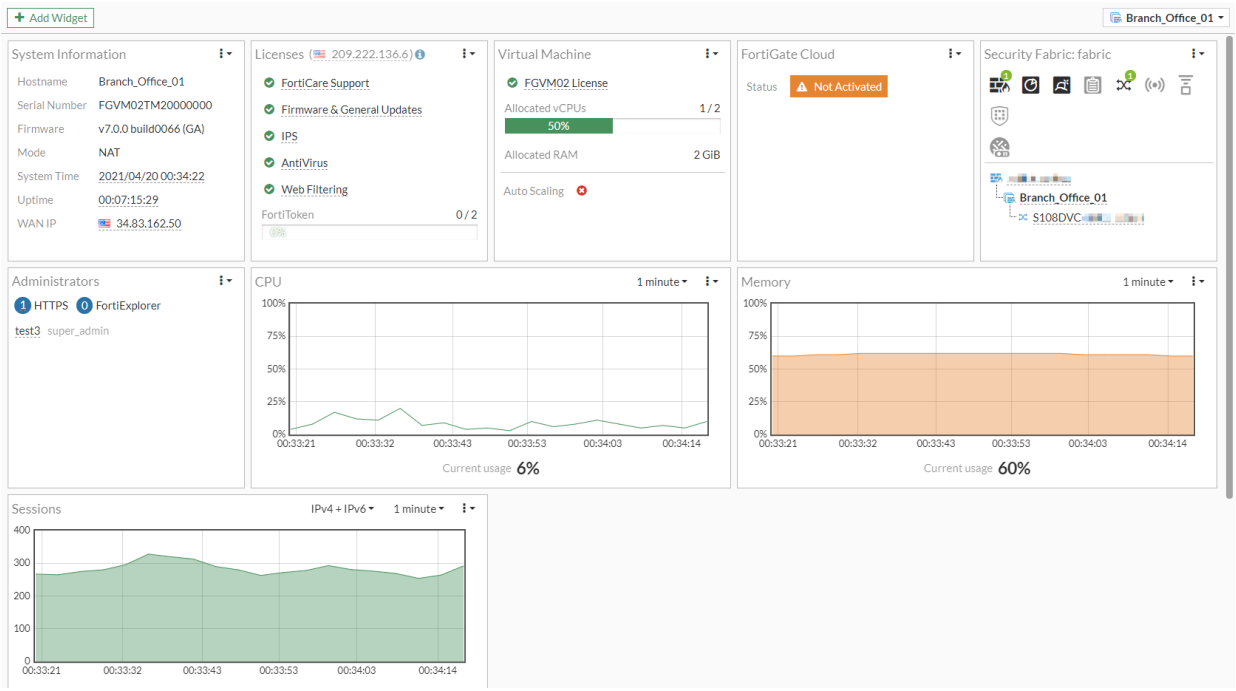
The following example describes how to log in to a root FortiGate IdP, and navigate to other FortiGate SPs in the Security Fabric without further authentication. The local administrator account is named *test3*. The local administrator account must also be available as an SSO administrator account on all downstream FortiGate SPs. Different tabs of the same browser are used to log in to the various FortiGates.

To log in to a FortiGate SP from a root FortiGate IdP:

1. Log in to the root FortiGate IdP by using the local administrator account.
   In this example, the local administrator account is named *test3*.
2. Go to *Dashboard* > *Status* and locate the *Security Fabric* widget.
3. In the topology tree, click one of the downstream FortiGate SPs, and select *Login to <name of FortiGate>*. The login screen is displayed.
4. In the login screen, select *Single Sign-On*.
   By using cookies in your local browser for the already-authenticated SSO administrator, FortiGate logs you in to the downstream FortiGate SP as the SSO administrator. In this example, the SSO administrator name is *test3*.



5. While still logged into the root FortiGate IdP in your browser, go to the browser tab for the root FortiGate IdP, and log in to another FortiGate SP that is displayed on the *Security Fabric* widget in the GUI.



SAML SSO login uses *SAML_IDP* session cookies of already authenticated admin users in your local browser cache to send to the root FortiGate IdP for authentication. If your browser cache is manually cleared, or you close your browser, you must authenticate again.

It is possible to log in to one downstream FortiGate SP in a Security Fabric, and then open another tab in your browser to connect to another FortiGate SP that is not a member of the Security Fabric.

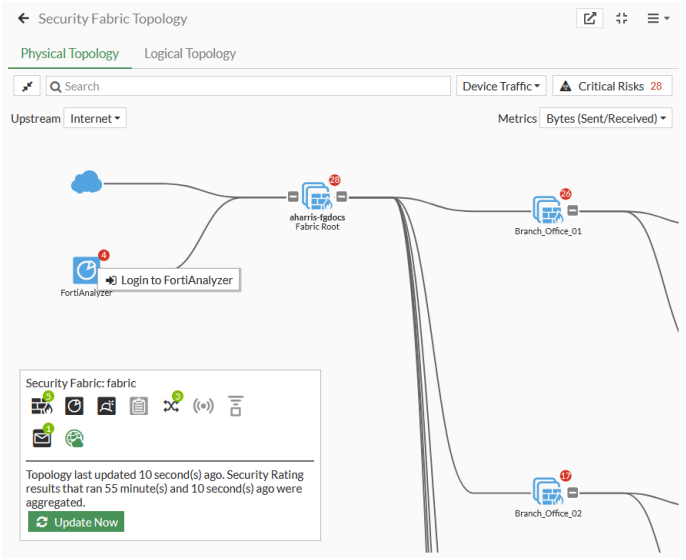
This is useful in cases where the SSO administrator and the local system administrator on the FortiGate SP both have the same login name, but are two different entities.

Integrating FortiAnalyzer management using SAML SSO

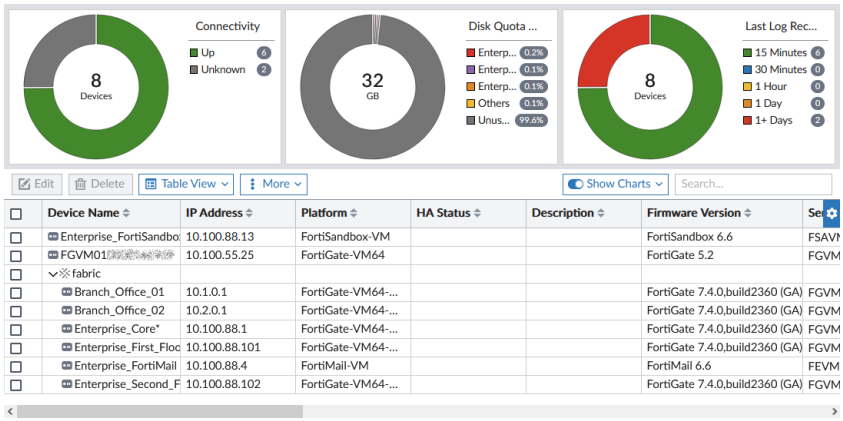
When a FortiGate acting as a Security Fabric root is configured as a SAML SSO identity provider (IdP), the FortiAnalyzer of the Security Fabric can register itself as a service provider (SP). This simplifies the configuration by enabling the setting in FortiAnalyzer to facilitate Fabric SSO access to the FortiAnalyzer once authenticated to the root FortiGate. When signed in using SSO, the FortiAnalyzer includes a Security Fabric navigation dropdown, which allows easy navigation to FortiGates in the Fabric.

To enable FortiAnalyzer as a Fabric SP in the GUI:

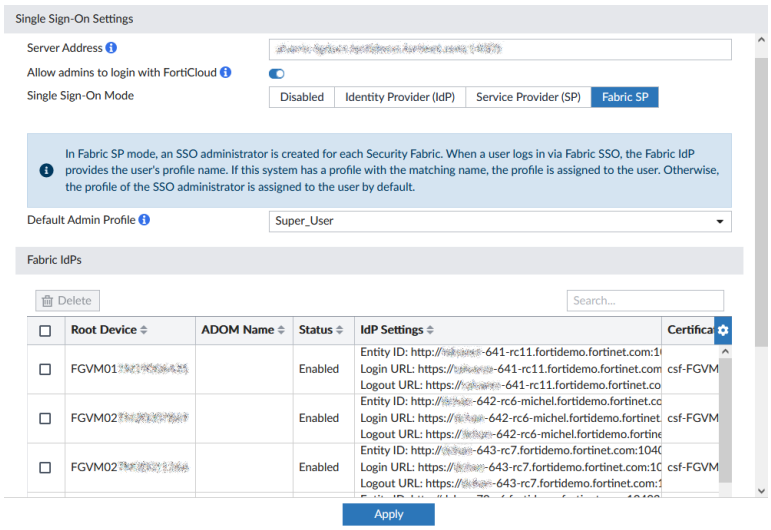
1. On the root FortiGate, go to *Security Fabric* > *Physical Topology* or *Logical Topology*.
2. In the topology, click the *FortiAnalyzer* icon and select *Login to FortiAnalyzer*.



3. Enter the credentials to log in. A Security Fabric must be configured with the Fabric devices listed under the Fabric name.
   a. Go to *Device Manager* to verify the Fabric setup. There is an asterisk beside the root FortiGate.

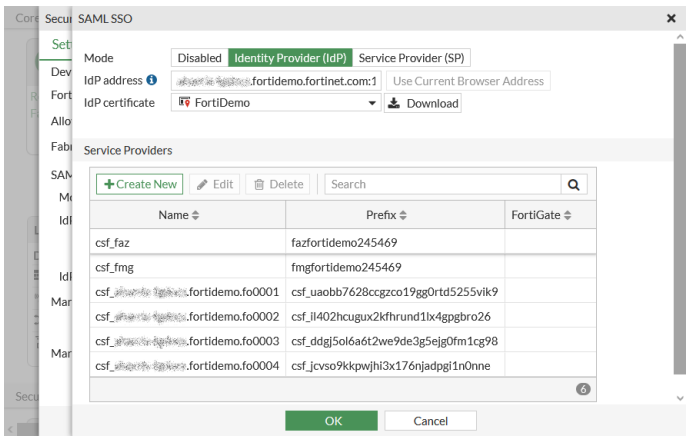


4. Edit the FortiAnalyzer SAML SSO settings:
   a. Go to *System Settings* > *SAML SSO*.
   b. For *Single Sign-On Mode*, select *Fabric SP* and enter the address to access the FortiAnalyzer in *Server Address*.

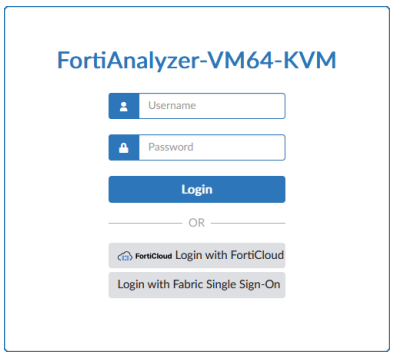


c. Click *Apply* and log out of the FortiAnalyzer. The FortiAnalyzer will automatically register itself on the FortiGate and is a visible appliance in the list of SPs.

5. Verify that the FortiAnalyzer registration was successful:
   a. In FortiOS, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. In the *SAML Single Sign-On* section click *Advanced Options*. There should be an entry for the FortiAnalyzer in the *Service Providers* table.



6. Log in to the FortiAnalyzer. There is a new option to *Login with Fabric Single Sign-On*.



7. Click *Login with Fabric Single Sign-On*. A dialog appears to select a Fabric IdP.

8. Select a FortiGate. The ADOM containing that FortiGate opens.

To enable FortiAnalyzer as a Fabric SP in the CLI:

1. In FortiAnalyzer, enable the device as a Fabric SP:

```
config system saml
    set status enable
    set role FAB-SP
    set server-address "192.168.1.99"
end
```

   FortiAnalyzer will register itself on the FortiGate as an appliance.
2. Verify the configuration in FortiOS:

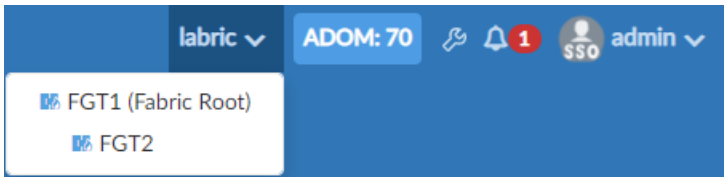
```
show system saml
config system saml
    set status enable
    set role identity-provider
    set cert "fortigate.domain.tld"
    set server-address "192.168.1.99"
    config service-providers
        edit "appliance_192.168.1.103"
            set prefix "csf_76sh0bm4e7hf1ty54w42yrrv88tk8uj"
            set sp-entity-id "http://192.168.1.103/metadata/"
            set sp-single-sign-on-url "https://192.168.1.103/saml/?acs"
            set sp-single-logout-url "https://192.168.1.103/saml/?sls"
            set sp-portal-url "https://192.168.1.103/saml/login/"
            config assertion-attributes
                edit "username"
                next
                edit "profilename"
                    set type profile-name
                next
            end
        next
    end
end
```

To navigate between devices using SAML SSO in FortiOS:

1. Log in to the root FortiGate.
2. Go to *Security Fabric > Physical Topology* or *Logical Topology*.
3. In the topology, click the *FortiAnalyzer* icon and select *Login to FortiAnalyzer*.

To navigate between devices using SAML SSO in FortiAnalyzer:

1. Log in to the FortiAnalyzer using SSO.
2. Navigate to the ADOM that contains the root FortiGate of the Security Fabric.
3. In the toolbar, click the Security Fabric name to display a dropdown a list of the Fabric FortiGates.

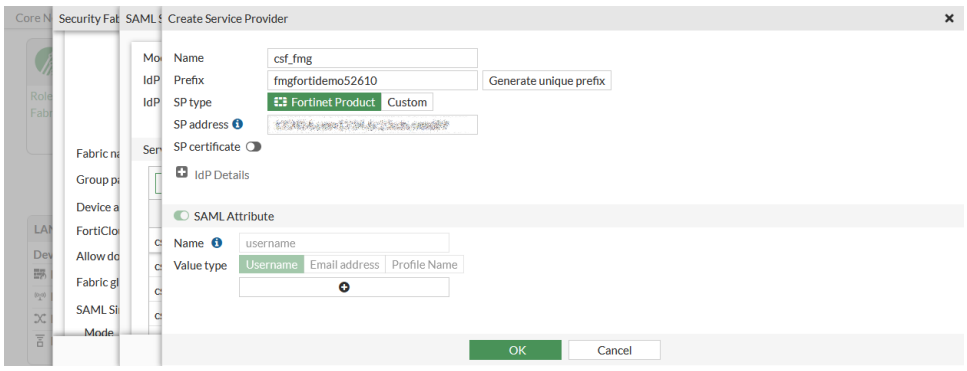


Integrating FortiManager management using SAML SSO

When a FortiGate is configured as the SAML SSO IdP, FortiManager can be added as an SP.

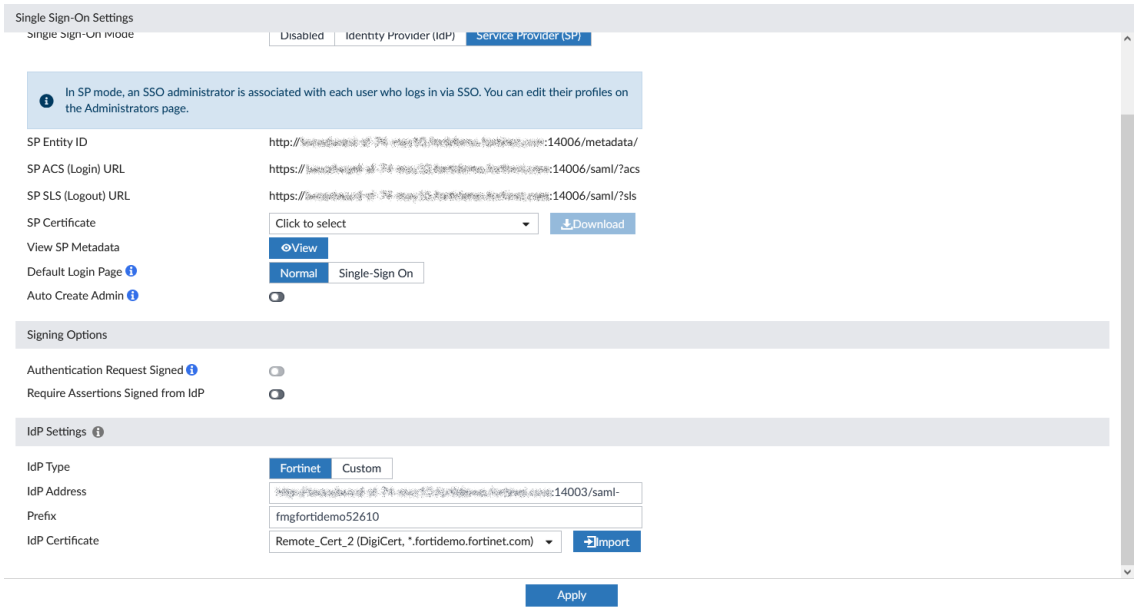
To configure FortiManager as a Fabric SP:

1. On the root FortiGate, go to *Security Fabric > Fabric Connectors*, and edit the *Security Fabric Setup* connector.
2. In the *SAML Single Sign-On* section, click *Advanced Options*.
3. In the *Service Providers* section, click *Create New*.
4. Enter a name and a prefix for the SP. FortiOS generates a unique prefix, but you can enter your own.
5. In *SP address*, enter the FortiManager address including the port number.

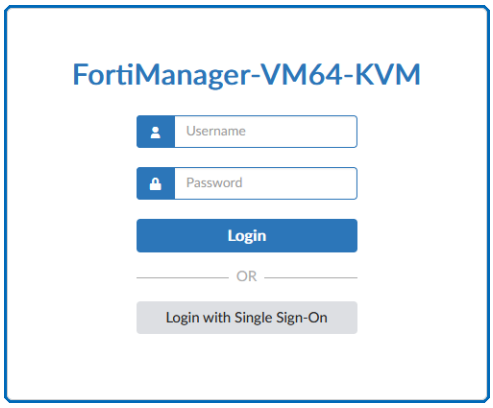


6. Click *OK*.
7. In FortiManager, go to *System Settings > SAML SSO* and in the *Single Sign-On Mode* section, click *Service Provider (SP)*.
8. Configure the *IdP Settings*:

a. For *IdP Type*, click *Fortinet*.
b. For *IdP Address*, enter the root FortiGate address including the port number.
c. Enter the *Prefix* of the SP.
d. For *IdP Certificate*, import the same certificate used on the root FortiGate.
e. Click *Apply*.



9. To verify that the configuration works, log out of FortiManager and log in using the *Login via Single-Sign-On* link.

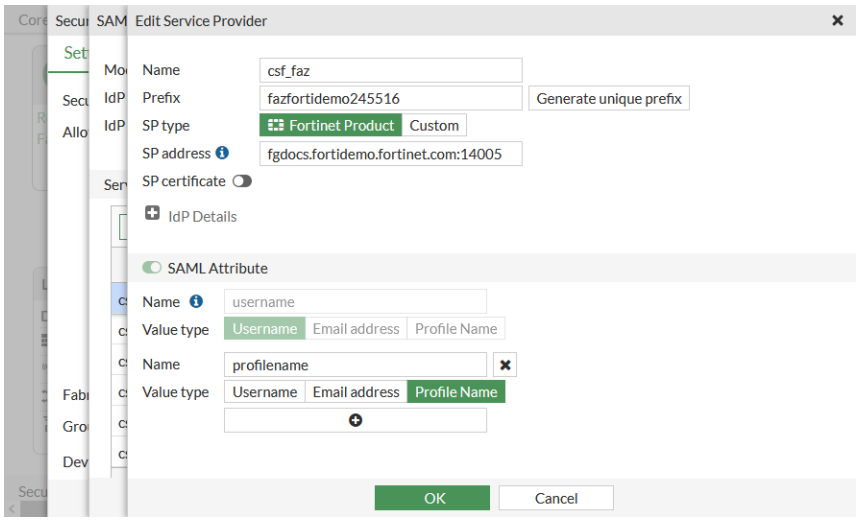


Advanced option - FortiGate SP changes

From a root FortiGate IdP, you can edit each of the FortiGate SPs. For example, you can edit a FortiGate SP to generate a new prefix, or you can add or modify SAML attributes. When you generate a new prefix value, it is propagated to the respective downstream FortiGates.

To edit an SP from the root FortiGate (IdP):

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. Click *Advanced Options*. The *SAML SSO* pane opens.
3. In the *Service Providers* table, select a device and click *Edit*. The *Edit Service Provider* pane opens.



4. Edit the settings as needed.
5. Click *OK*.

Security rating

The security rating uses real-time monitoring to analyze your Security Fabric deployment, identify potential vulnerabilities, highlight best practices that can be used to improve the security and performance of your network, and calculate Security Fabric scores.

The *Security Fabric* > *Security Rating* page contains the following tabs:

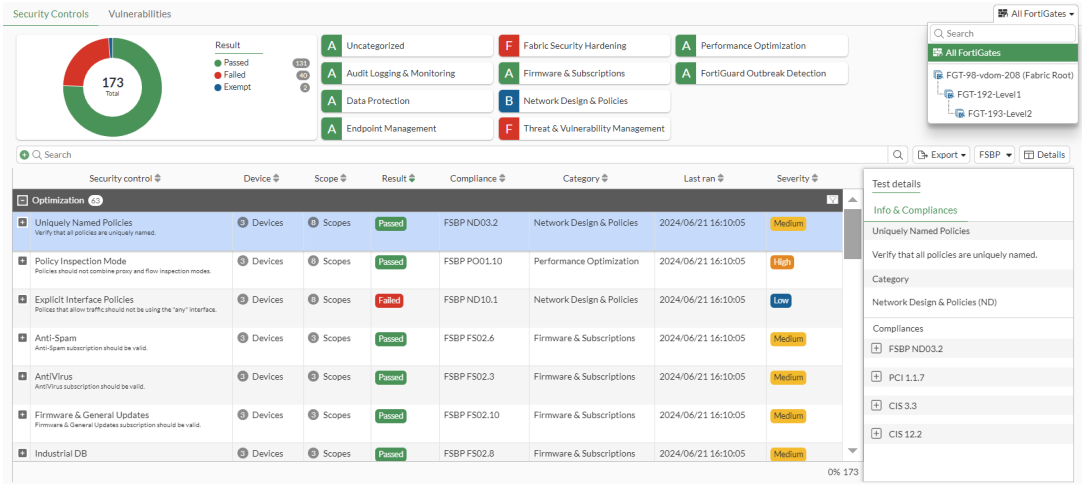
- Security Controls on page 3859
- Vulnerabilities on page 3864

This section also includes:

- Security Fabric score on page 3866
- Security rating insights on page 3867
- Logging the security rating on page 3869
- Security rating visibility on page 3869

Security Controls

On the *Security Fabric* > *Security Rating* page, the *Security Controls* tab displays the results for all security rating checks:

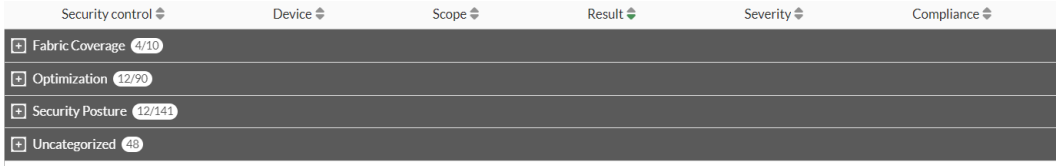


- A summary chart identifies of how many items passed, failed, or are exempt from security rating checks.
- Categories against which the security rating tests were run are identified (such as *Uncategorized*, *Audit Logging & Monitoring*, *Data Protection*, and so on) and the assigned grade for each category is displayed (such as *A*, *B*, *F*, and so on).

  The letter grade is calculated based on the percent of tests in a category that passed:

  - A = 90% and above
  - B = 80% to <90%
  - C = 70% to <80%
  - D = 60% to <70%
  - E = 50% to <60%
  - F = Less than 50%

  For example, if eight out of ten tests in a category passed, then 80% of the tests passed, and the category would be given a B grade.
- A report of details that is organized in the following security rating categories: *Fabric Coverage* (available for devices in a Security Fabric), *Optimization*, *Security Posture*, and *Uncategorized*. Expand each category to display rows of test details. Click each row to display the *Test Details* pane.



The following licensing options are available for security rating checks:

- A base set of free checks
- A licensed set that requires a FortiGuard Security Rating Service subscription

The base set can be run locally on any FortiGate and on all other devices in the Security Fabric. For a list of base and licensed security rating checks, see FortiGuard Security Rating Service.

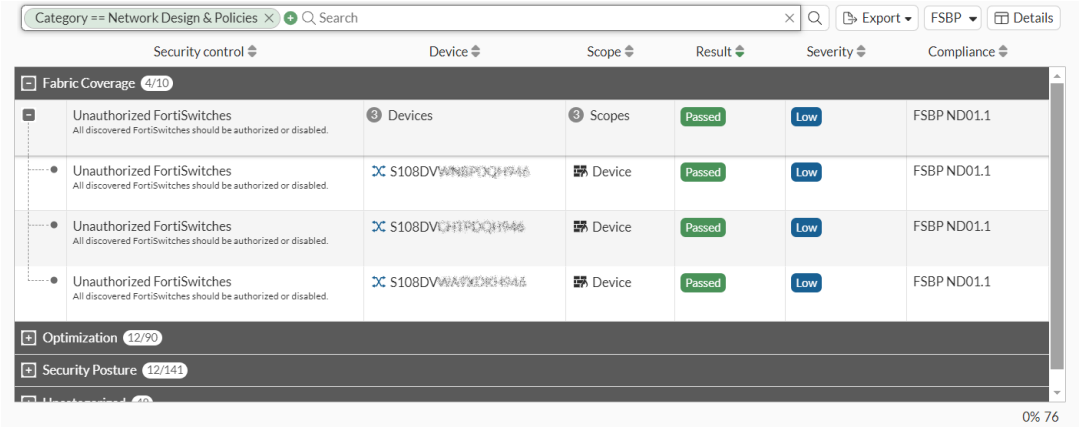
For more information about security ratings, and details about each of the checks that are performed, go to Security Best Practices & Security Rating Feature.

To view security controls:

1. On the root FortiGate, go to *Security Fabric > Security Rating*. The *Security Controls* pane opens.
2. For the graded test categories, hover the cursor over a test category to view the calculation breakdown.
3. For the summary chart, click the *Passed*, *Failed*, or *Exempt* words or associated colors in the chart to filter the report results.

   For example, click *Failed* to display only failed tests in the report.

   Click *Result* to remove the filter, or click the *X* beside the filter in the *Search* bar
4. Expand each security rating category in the report to view its details.

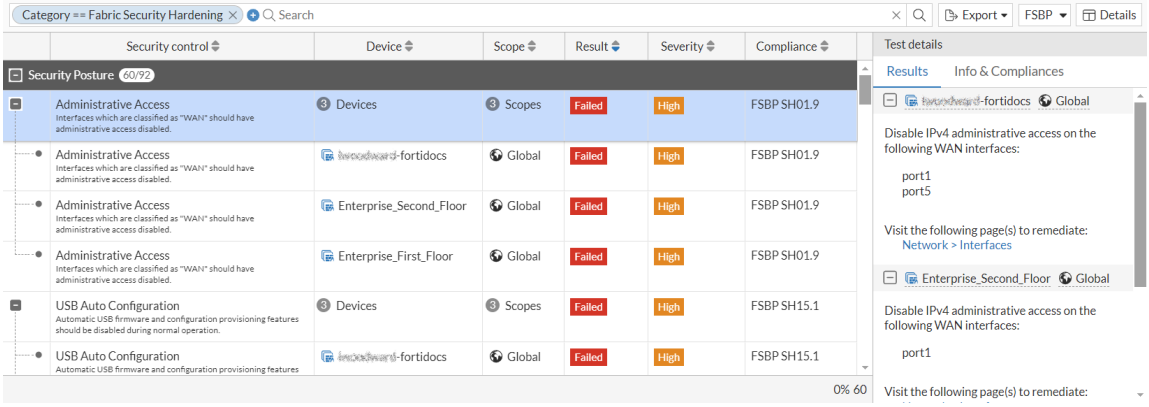


5. In the report, click each row to view its *Test details* pane, which includes two tabs: *Results* and *Info & Compliance*.

   Click *Details* to hide and display the *Test details* pane for a selected row in the report.

   If a test category failed, the *Results* section includes a link to the GUI page where you can resolve the problem.

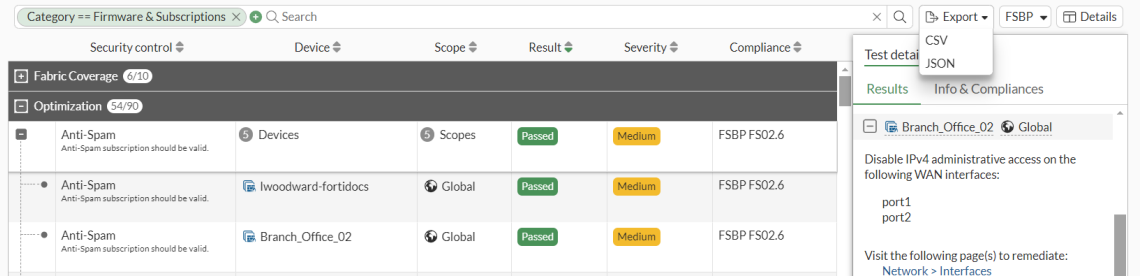
   The *Info & Compliance* tab includes the security controls used for the test and links to specific FSBP, PCI, or CIS compliance policies.



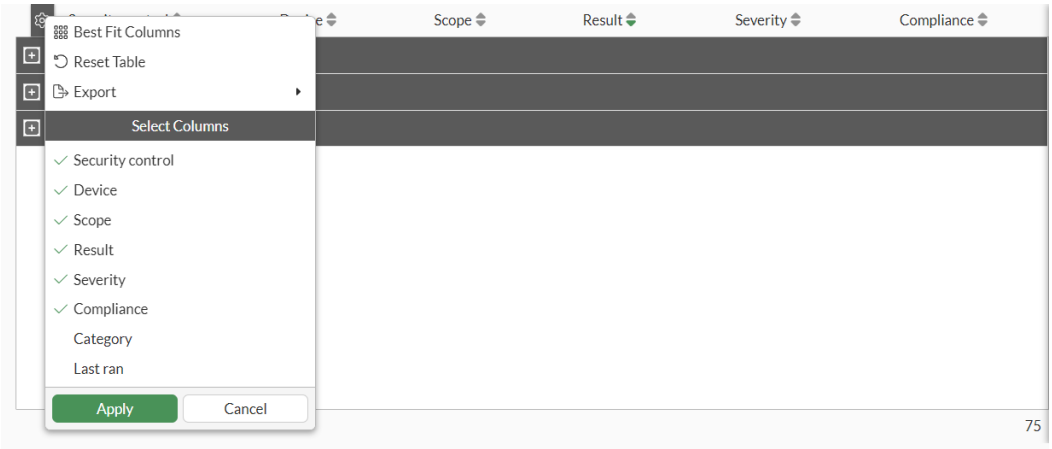
6. Select *FSBP*, *PCI*, or *CIS* to filter the report for the selected compliance policy.

The FortiGate must have a valid Attack Surface Security Rating license to view security ratings grouped by CIS.

7. Click *Export* to export the report to a CSV or JSON file.



8. Click the gear icon to customize the report table by adding more columns.



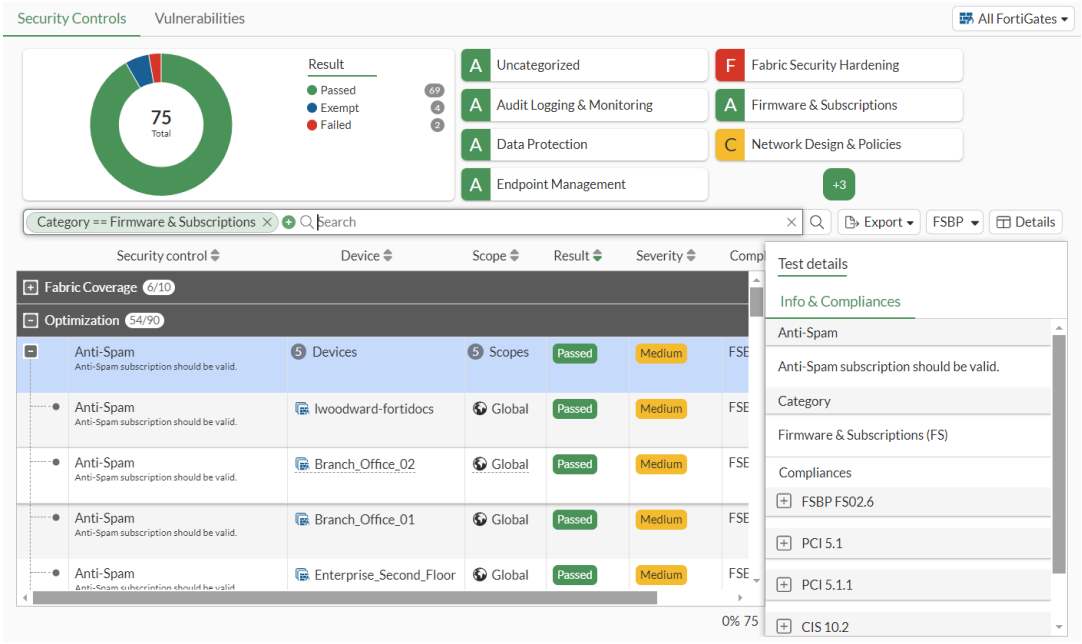
To exit the current view, click the x beside the search item to return to the summary view.

Multi-VDOM mode

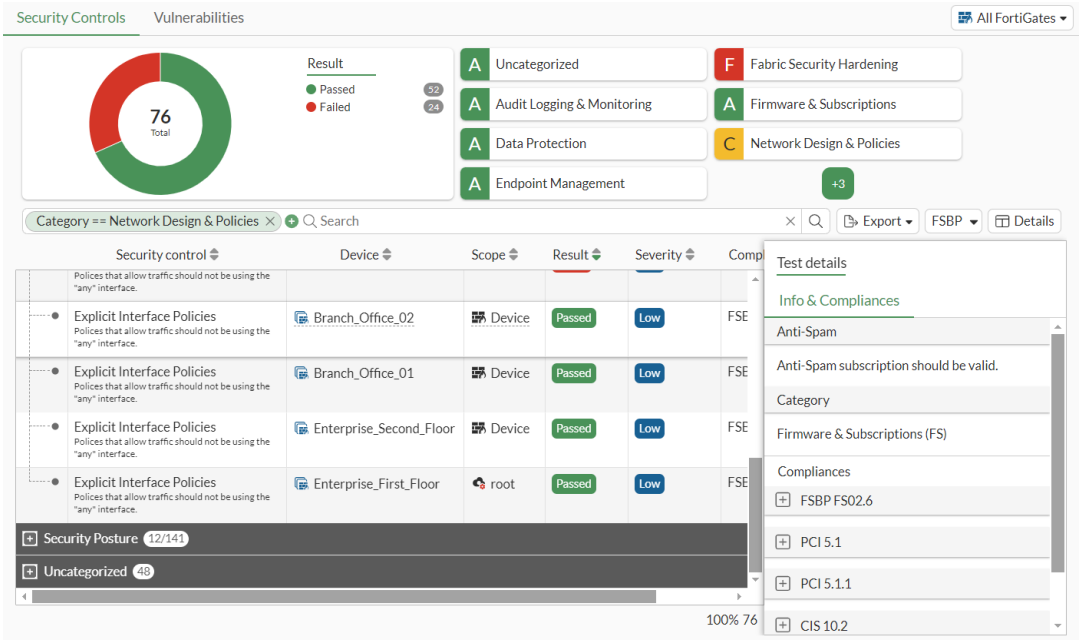
In multi-VDOM mode, security rating reports can be generated in the Global VDOM for all of the VDOMs on the device. Administrators with read/write access can run the security rating report in the Global VDOM. Administrators with read-only access can only view the report.

On the report scorecards, the *Scope* column shows the VDOMs that the check was run on.

Global scope:



VDOM scope:



The security rating event log is available on the root VDOM.

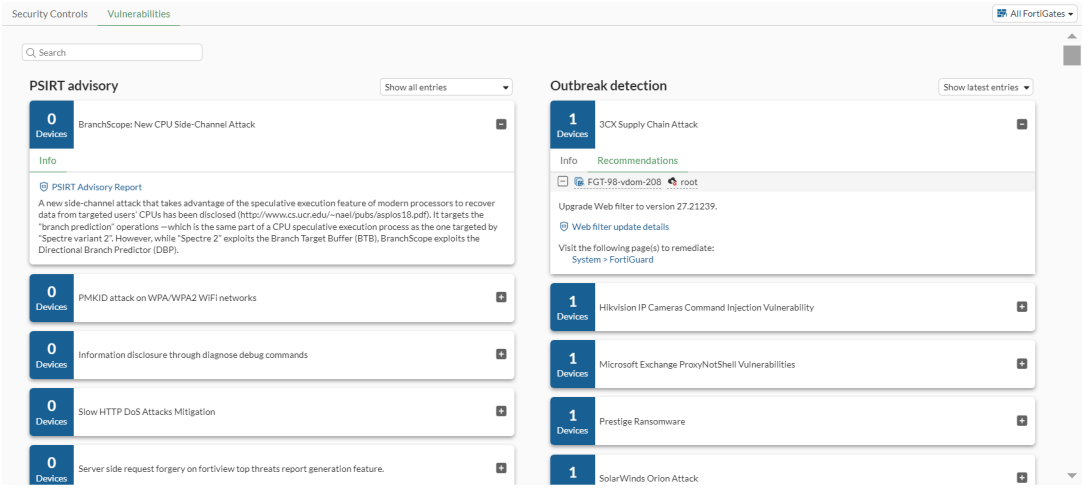
Security rating check scheduling

By default, security rating checks are scheduled to run automatically every eight hours.

The security rating also runs automatically for only the specific check when the relevant configuration changes are made.

Vulnerabilities

On the *Security Fabric > Security Rating* page, the *Vulnerabilities* tab displays *PSIRT advisory* and *Outbreak detection* entries that are included in the downloaded Security Rating package:

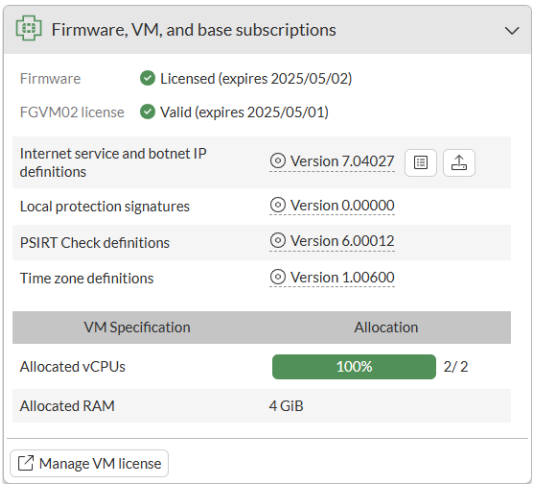


PSIRT-related notifications

On a FortiGate with a valid Firmware license, the separate Security Rating package downloaded from FortiGuard supports PSIRT vulnerabilities, which are highlighted in security rating results. PSIRT Package Definitions are part of the Firmware entitlement.

To verify the FortiGuard license entitlement in the GUI:

1. Go to *System > FortiGuard* and expand the *License Information* table.
2. Expand the *Firmware & General Updates* section.
3. Check that *PSIRT Check definitions* appears in the list and the license is valid.



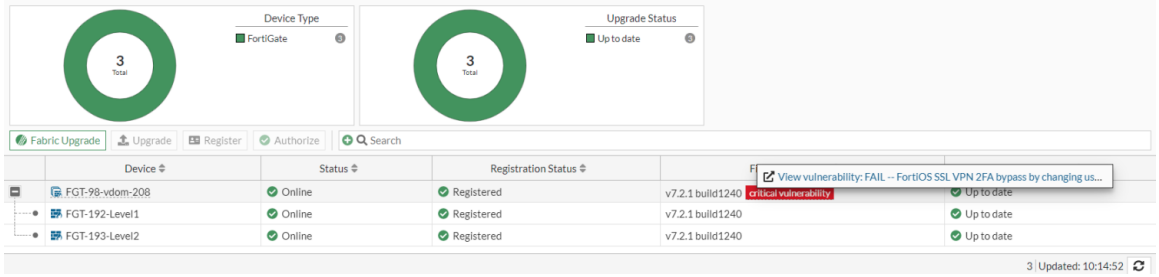
To verify the FortiGuard license entitlement in the CLI:

```
# diagnose autoupdate versions
...
Security Rating Data Package
---------
Version: 5.00022
Contract Expiry Date: Fri Nov 24 2023
Last Updated using scheduled update on Mon Sep 11 09:44:21 2023
Last Update Attempt: Tue Sep 12 16:29:10 2023
Result: No Updates
```

The following notifications are visible in the GUI.

- Warning message: if the security rating result indicates a vulnerability with a critical severity, then the FortiOS GUI displays a warning message in the header and a new notification under the bell icon. The *View Vulnerability* link appears in the header for global administrators.

  Clicking the warning message redirects to the *System > Firmware & Registration* page, where administrators are encouraged to update any affected Fortinet Fabric devices to the latest firmware releases to resolve the critical vulnerabilities.
- Tooltip: a tooltip for the *critical vulnerability* label on the *System > Firmware & Registration* page lists the vulnerability, and it links to the *Security Fabric > Security Rating* page where more details about the vulnerability are displayed.



To view vulnerability results after performing security rating scan:

```
# diagnose report-runner vuln-read
Index: 0
Name: FG-IR-23-001: FortiOS / FortiManager / FortiAnalyzer / FortiWeb / FortiProxy /
FortiSwitchManager - Heap buffer underflow in administrative interface
FortiGate Serial: FGVM02TM23000000
```

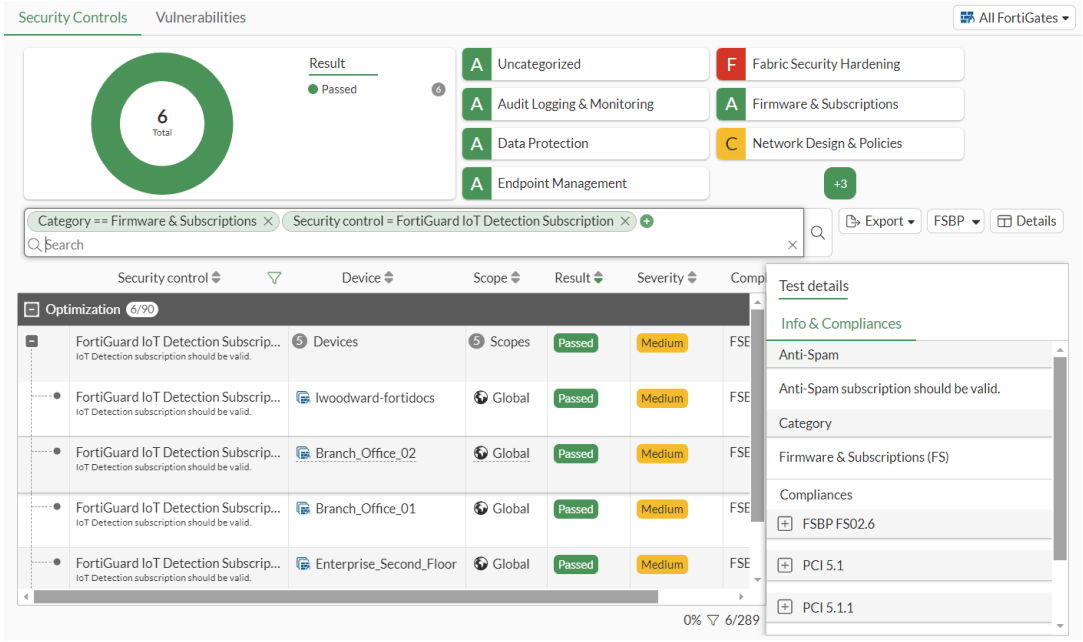
To clear the vulnerability result:

```
# diagnose report-runner vuln-clean
Deleted temporary critical vulnerability file
```

FortiGuard IoT vulnerability-related checks

There are two rating checks in the *Security Posture* report related to IoT vulnerabilities:

- The *FortiGuard IoT Detection Subscription* rating check will pass if the *System > FortiGuard* page shows that the *IoT Detection Definitions* (under the *Attack Surface Security Rating* entitlement) is licensed. In this example, the result is marked as *Passed* because the license is valid.



- The *FortiGuard IoT Vulnerability* rating check will fail if any IoT vulnerabilities are found.
  Hover over the device name to display the tooltip, which includes an option to *View IoT Vulnerabilities*.

To detect IoT vulnerabilities, the FortiGate must have a valid IoT Definitions license, device detection must be configured on a LAN interface used by IoT devices, and a firewall policy with an application control sensor must be configured.

Security Fabric score

The Security Fabric score is calculated when a security rating check is run, based on the severity level of the checks that are passed or failed. A higher scores represents a more secure network. Points are added for passed checks and removed for failed checks.

Severity level	Weight (points)
Critical	50
High	25
Medium	10
Low	5

To calculate the number of points awarded to a device for a passed check, the following equation is used:

$$\text{score} = \frac{\text{<severity level weight>}}{\text{<\# of FortiGates>}} \times \text{<secure FortiGate multiplier>}$$

The secure FortiGate multiplier is determined using logarithms and the number of FortiGate devices in the Security Fabric.

For example, if there are four FortiGate devices in the Security Fabric that all pass the compatible firmware check, the score for each FortiGate device is calculated with the following equation:

$$\frac{50}{4} \times 1.292 = 16.15 \text{ points}$$

All of the FortiGate devices in the Security Fabric must pass the check in order to receive the points. If any one of the FortiGate devices fails a check, the devices that passed are not awarded any points. For the device that failed the check, the following equation is used to calculated the number of points that are lost:

$$\text{score} = \text{<severity level weight>} \times \text{<secure FortiGate multiplier>}$$

For example, if the check finds two critical FortiClient vulnerabilities, the score is calculated with the following equation:

$$-50 \times 2 = -100 \text{ points}$$

Scores are not affected by checks that do not apply to your network. For example, if there are no FortiAP devices in the Security Fabric, no points will be added or subtracted for the FortiAP firmware version check.

Security rating insights

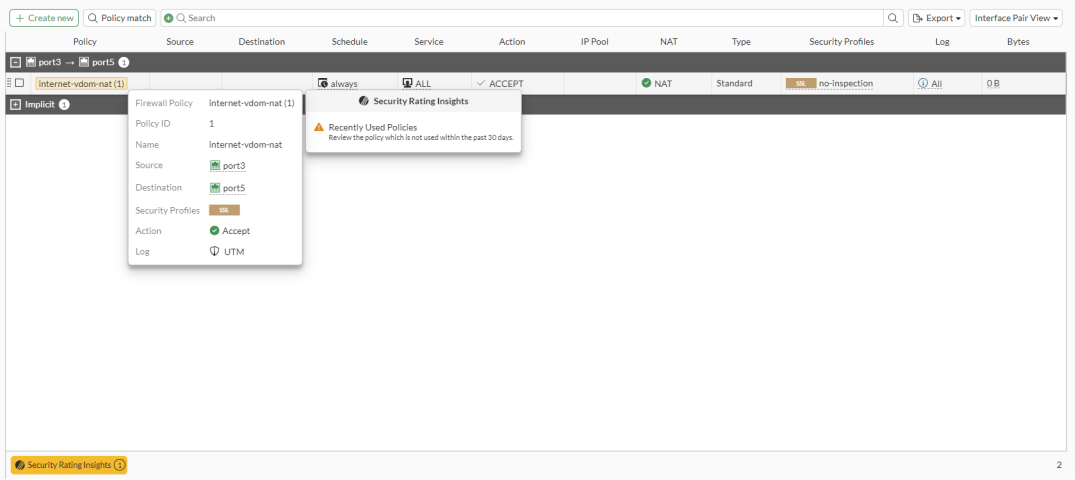
Objects, such as firewall policies or interfaces, with security rating recommendations are highlighted in the GUI. Hover over highlighted objects to display a *Security Rating Insights* tooltip. A *Security Rating Insights* button also displays at the bottom of the table.

Dismissed issues are unique for each administrator. Hashes for dismissed notifications are saved in local storage. If a user clears the local storage, all issues will show up again as not dismissed.

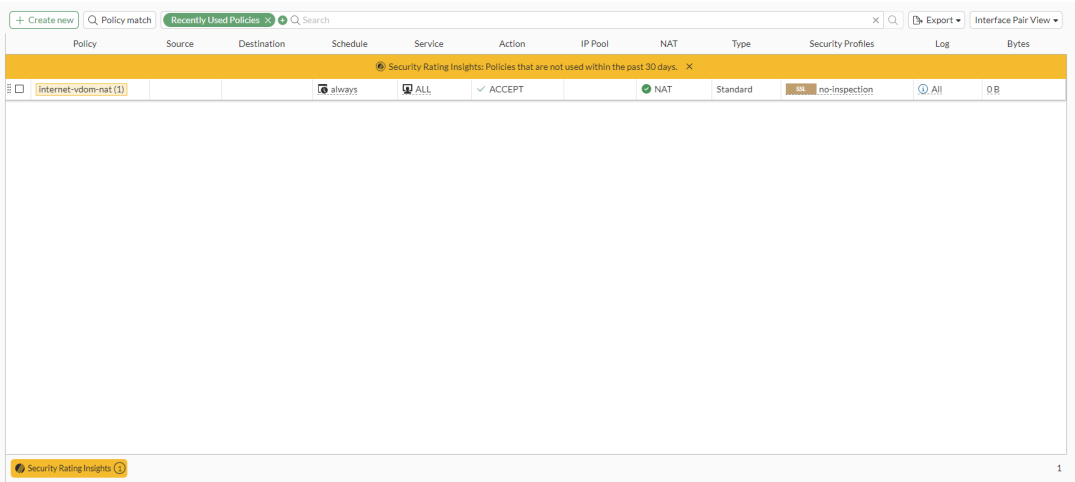
Once an issue is resolved, the notification disappears after the next security rating report runs.

To view security rating insights for firewall policies:

1. Go to *Policy & Objects* > *Firewall Policy*.
   Objects with security rating recommendations are highlighted.
2. Hover over any highlighted object to display a tooltip that shows *Security Rating Insights*:



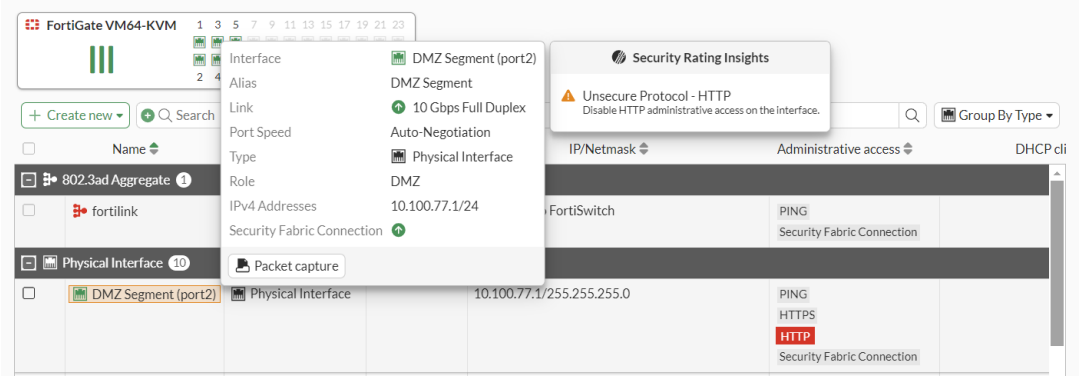
3. Below the table, click *Security Rating Insights* to display relevant issues.
4. Select an issue, such as *Unused Policies* to display a banner and filter that you can use to filter down to the applicable entries.



5. Click the *X* in the banner to close the issue.

To view security rating insights for network interfaces:

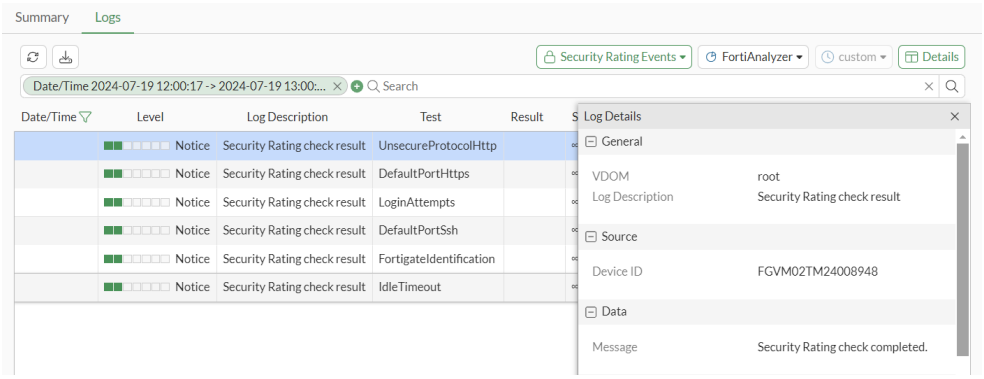
1. Go to *Network* > *Interfaces*.
   Objects with security rating recommendations are highlighted.
2. Hover over any highlighted object to display a tooltip that shows *Security Rating Insights*:



3. Below the table, click *Security Rating Insights* to display relevant issues.
4. Select an issue to display a banner and filter that you can use to filter down to the applicable entries.
5. Click the *X* in the banner to close the issue.

Logging the security rating

The results of past security checks are available on the *Log & Report* > *System Events* page. Click the *Security Rating Events* card to see the detailed log.



An event filter subtype can be created for the Security Fabric rating so event logs are created on the root FortiGate that summarize the results and show detailed information for the individual tests.

To configure security rating logging using the CLI:

```
config log eventfilter
    set security-rating enable
end
```

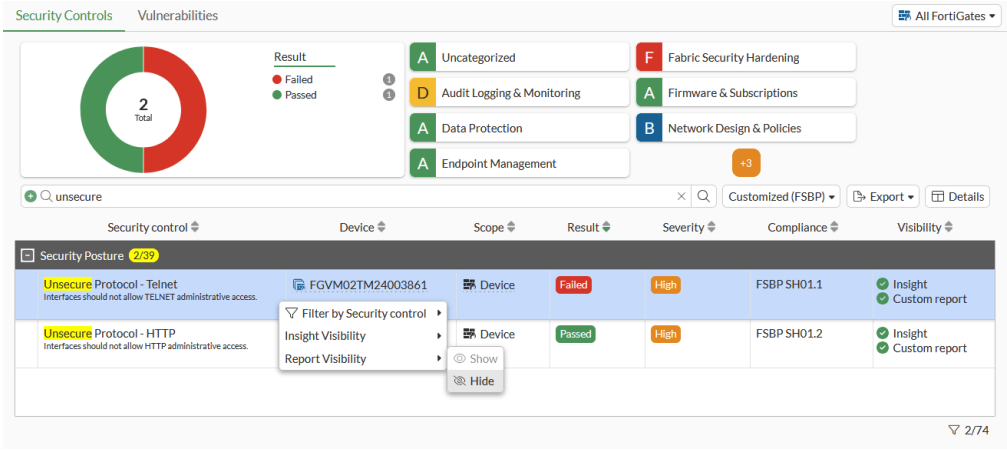
Security rating visibility

Security ratings tests that are not relevant can be hidden, streamlining the user experience by displaying only pertinent information.

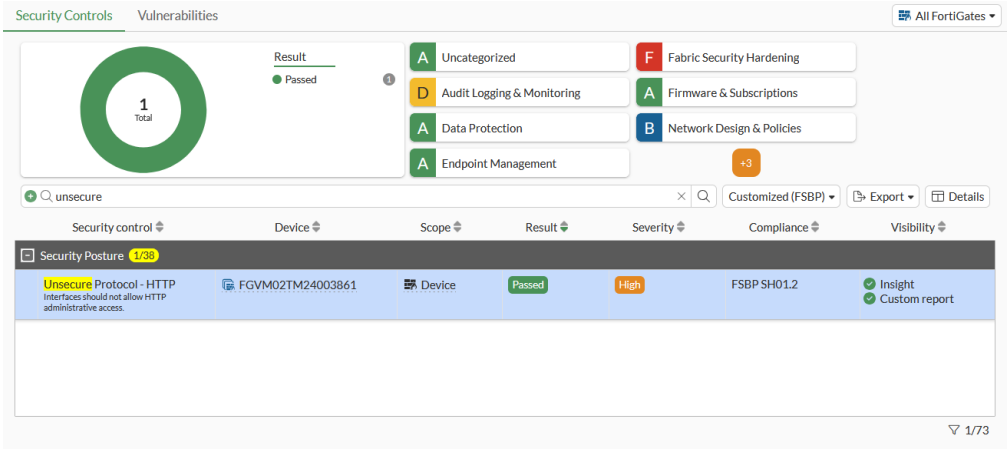
A Security Fabric is not required for this feature. If multiple FortiGates are in a Security Fabric, hidden security ratings can be synchronized from the root FortiGate device to downstream FortiGate devices, or overridden locally on the downstream devices.

To disable showing a security rating control in the default report:

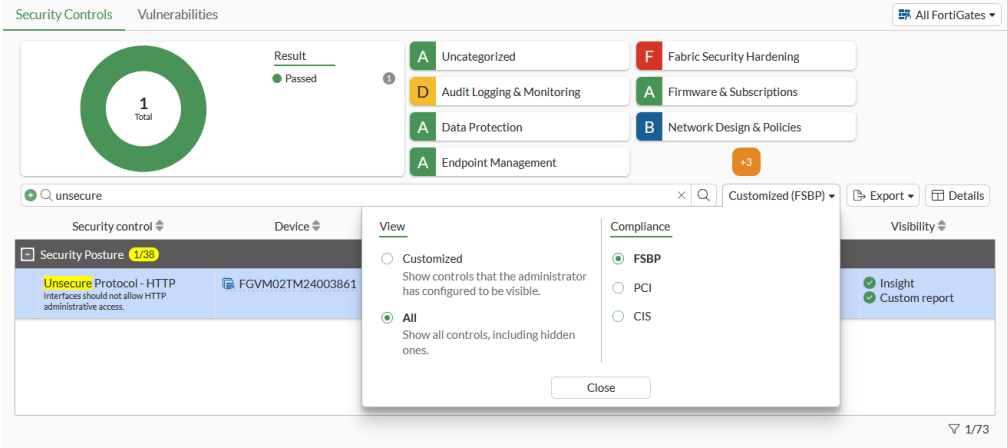
1. Go to *Security Fabric > Security Rating*.
2. Find *Unsecure Protocol - Telnet* in the table, right-click on it, and select *Report Visibility > Hide*.



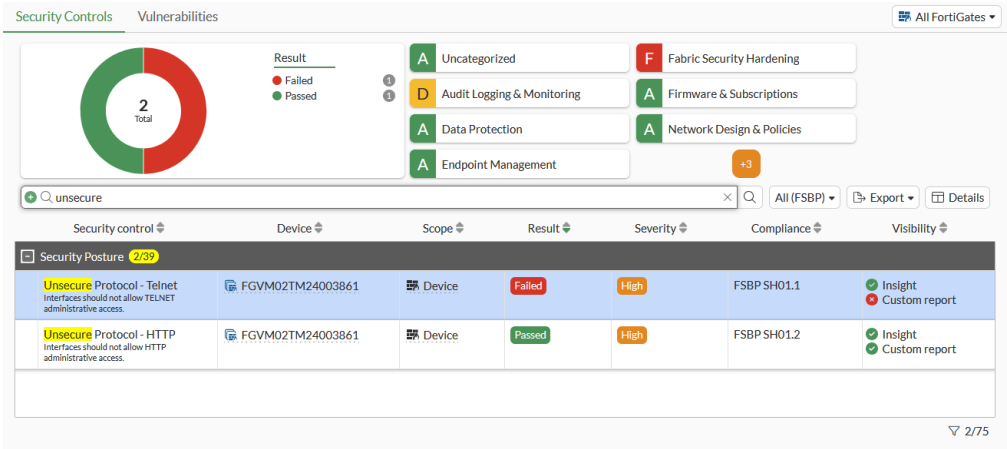
The *Unsecure Protocol - Telnet* control is no longer shown in the list.



3. Change the *View* to *All* to show the *Unsecure Protocol - Telnet* control in the table when *Report Visibility* is set to *Hide*.



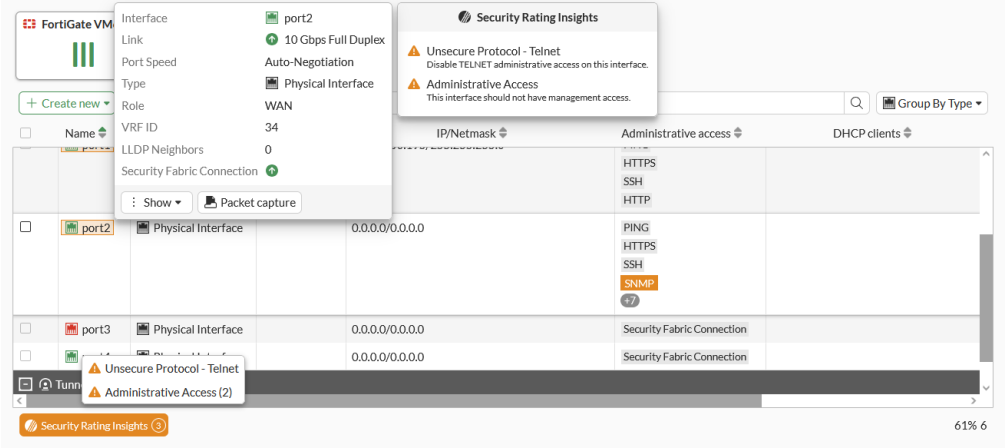
All hidden controls are then shown in the table.



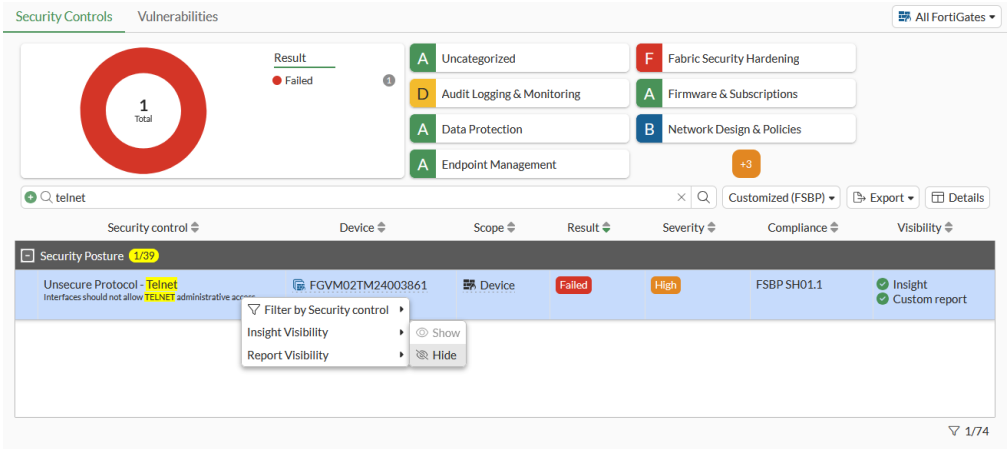
The *Visibility* column is not shown by default. Edit the column settings to show it in the table. See Column settings on page 46 for details.

To disable showing a security rating control as an insight across the GUI:

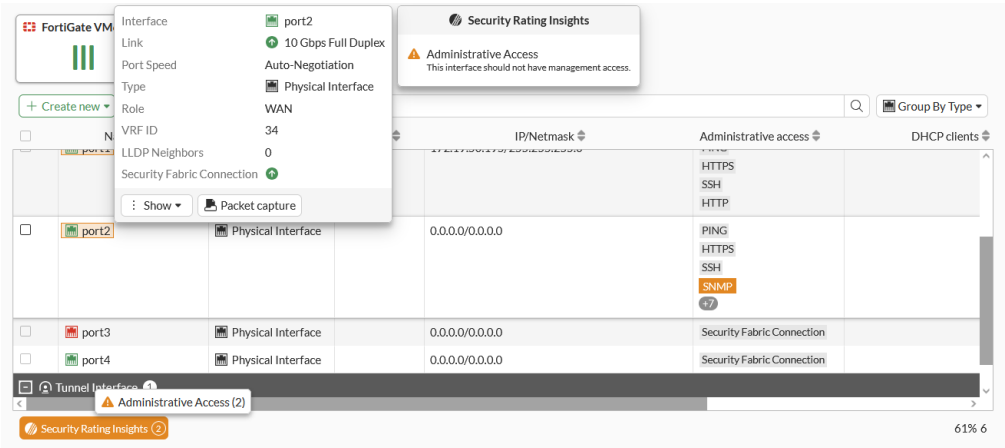
1. Go to *Network* > *Interfaces*.
2. Edit an interface to enable *TELNET* administrative access.
3. Click on the *Security Rating Insights*, or hover over the interface name to see the *Unsecure Protocol - Telnet* warning.



4. Go to *Security Fabric* > *Security Rating*.
5. Find *Unsecure Protocol - Telnet* in the table, right-click on it, and select *Insight Visibility* > *Hide*.



6. Go to *Network* > *Interfaces*.
7. Click on the *Security Rating Insights*, or hover over the interface name to see that the *Unsecure Protocol - Telnet* warning is no longer shown.



To configure security rating control in the CLI:

```
config system security-rating controls
   edit <control name>
      set display-report {enable | disable}
      set display-insight {enable | disable}
    next
end
```

Variable	Description
`display-report {enable | disable}`	Enable/disable displaying the Security Rating control in the default report (default = enable).
`display-insight {enable | disable}`	Enable/disable displaying the Security Rating control as an insight across the GUI (default = enable).

Security rating control names are hidden in the CLI until they are configured.

To configure synchronizing security rating visibility settings on downstream devices in a Security Fabric:

```
config system csf
    set configuration-sync {default | local}
end
```

```
config system security-rating settings
    set override-sync {enable | disable}
end
```

Variable	Description
`configuration-sync {default | local}`	Configuration sync mode. • `default`: Synchronize configuration for IPAM, FortiAnalyzer, FortiSandbox, and Central Management to root node (default). • `local`: Do not synchronize configuration with root node.
`override-sync {enable | disable}`	Enable/disable overriding Security Rating control settings that are synchronized from the Security Fabric's root FortiGate (default = disable).

When `configuration-sync` is set to `local`, the `system security-rating settings` command is not available.

Automation stitches

Automation stitches automate the activities between the different components in the Security Fabric, which decreases the response times to security events. Events from any source in the Security Fabric can be monitored, and action responses can be set up to any destination.

The automation settings can be synchronized within the Security Fabric, or can only apply to an individual FortiGate in the Security Fabric. Automation stitches can only be created on the root FortiGate in a Security Fabric.

To configure automation setting synchronization in a Security Fabric:

```
config automation setting
    set fabric-sync {enable | disable}
end
```

Automation stitches can also be used on FortiGates that are not part of a Security Fabric.

An automation stitch consists of two parts: the trigger and the actions. The trigger is the condition or event on the FortiGate that activates the action, for example, a specific log, or a failed log in attempt. The action is what the FortiGate does in response to the trigger.

Automation stitches that use cloud-based actions (AWS Lambda, Azure Function, Google Cloud Function, and AliCloud Function) have the option to delay an action after the previous action is completed.

Diagnose commands are available in the CLI to test, log, and display the stitch history and settings.

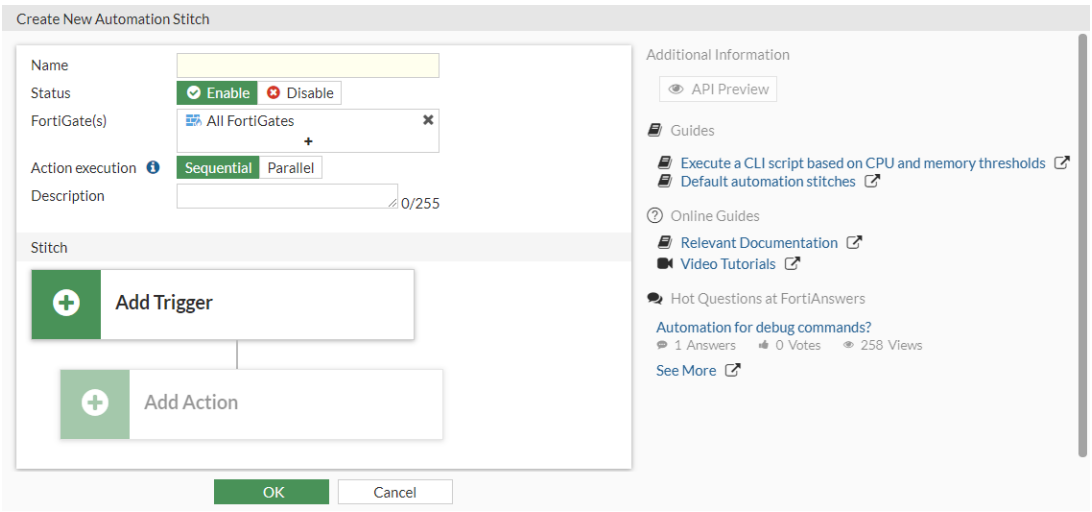
Creating automation stitches

To create an automation stitch, a trigger event and a response action or actions are selected. Automation stitches can be tested after they are created.

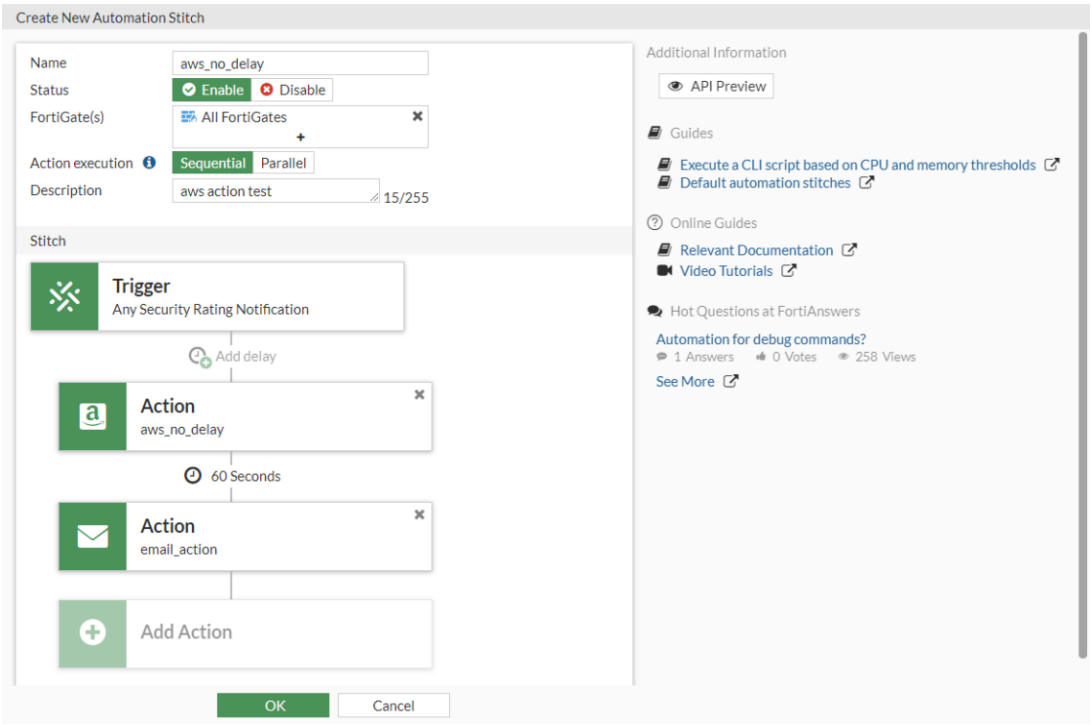
In the GUI, go to *Security Fabric > Automation* and click *Create New*. Automation stitches, actions, and triggers are configured in separate dialogs.

The stitch *Action execution* can be set to either *Sequential* or *Parallel*. In sequential execution, actions will execute one after another with a delay (if specified). If one action fails, then the action chain stops. This is the default setting. In parallel execution, all actions will execute immediately when the stitch is triggered.

When creating a stitch, clicking *Add Trigger* and *Add Action* displays a list of available triggers and actions, and the option to create a new one.



Once the stitch is configured, a process diagram of the trigger, actions, and delays is displayed. A delay can be added before an action if *Sequential* action execution is used. Executing the next action can be delayed by up to 3600 seconds (one hour).



Triggers and actions can be configured separately, and then added to an automation stitch.

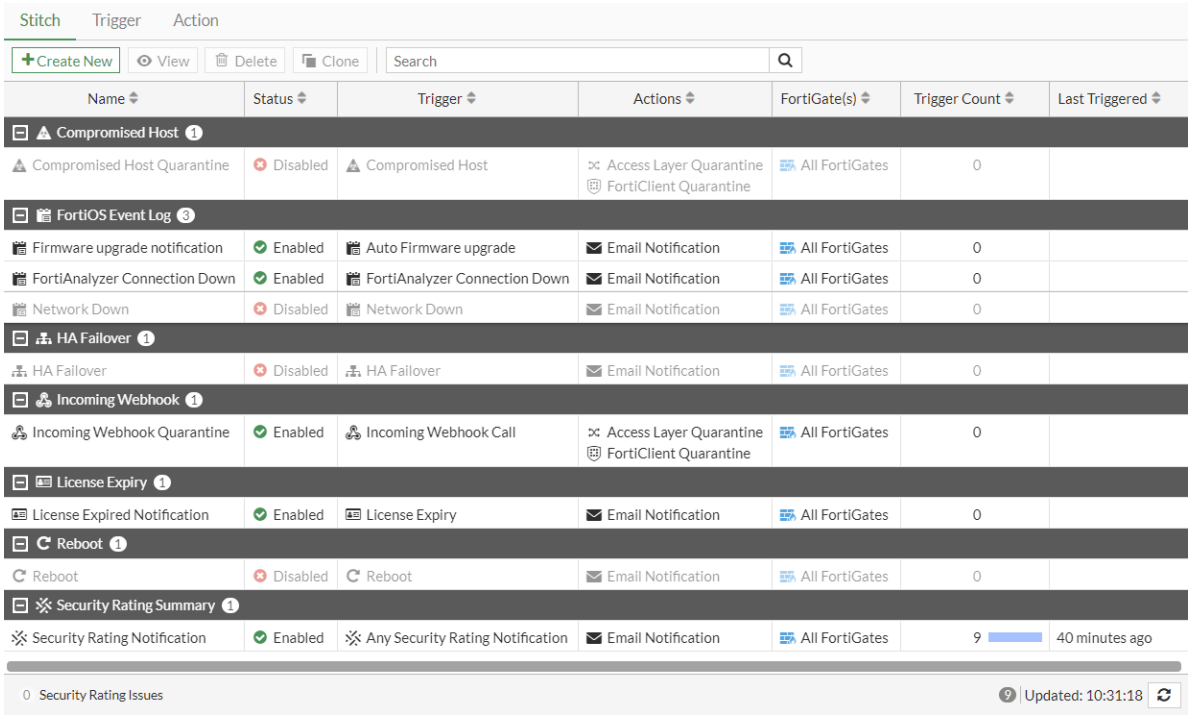
The maximum number of automation stitches that are allowed to run concurrently can be configured in the CLI (32 - 256, default = 128).

To configure the maximum number of concurrent automation stitches:

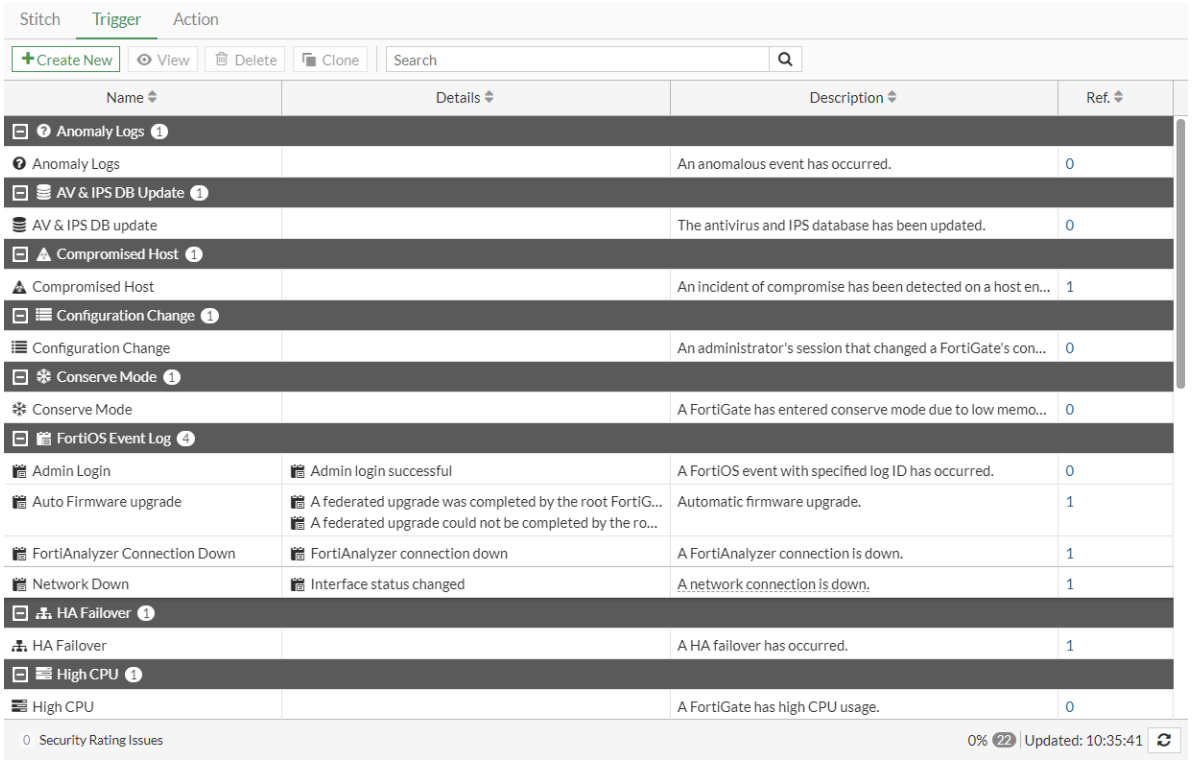
```
config automation setting
    set max-concurrent-stitches <integer>
end
```

Tabs on the Automation page

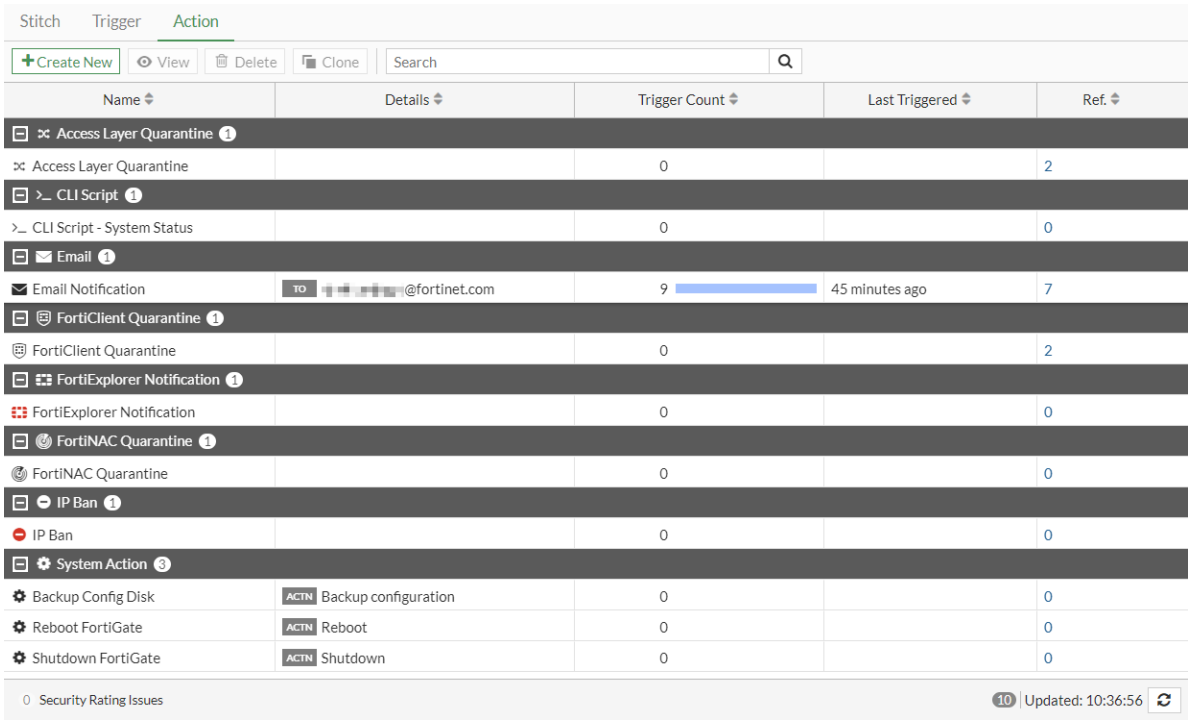
On the *Security Fabric > Automation* page, there are tabs for *Stitch*, *Trigger*, and *Action*. The *Stitch* tab is the default view that lists the trigger and actions used in each stitch. Individual triggers and actions can be created or edited in the corresponding tabs.



Click *Trigger* to view the list of triggers.



Click *Action* to view the list of actions.



Sample configuration

The following example shows how to configure an automation stitch with an Any Security Rating Notification trigger with AWS Lambda and Email actions. There is a 60-second delay before the Email action.

To configure the automation stitch in the GUI:

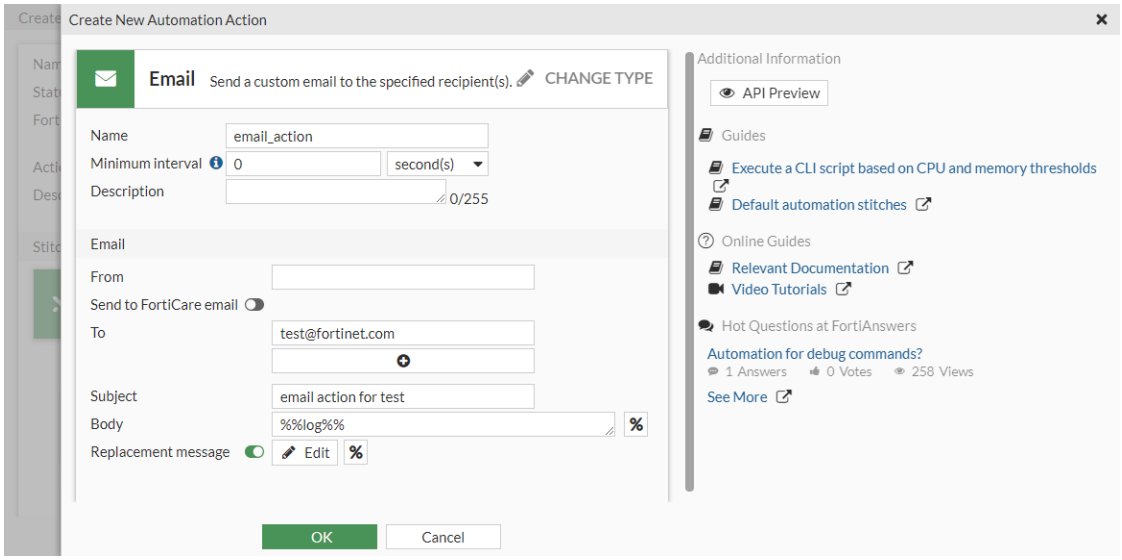
1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name and description.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Select *Any Security Rating Notification*.
   c. Click *Apply*.
4. Configure the AWS Lambda function action:
   a. Click *Add Action*.
   b. Click *Create* and select *AWS Lambda*.
   c. Enter the following:

Name	*aws_no_delay*
URL	Enter the request API URI
API key	Enter the API key
HTTP header	*header2 : header2_value*

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Configure the Email notification action:
   a. Click *Add Action*.
   b. Click *Create* and select *Email*.

c. Enter the following:

Name	*email_action*
To	Enter an email address
Subject	*email action for test*
Replacement message	Enable



d. Click *OK*.

e. Select the action in the list and click *Apply*.

6. Click the *Add delay* located between both actions. Enter *60* and click *OK*.
7. Click *OK*.

To configure the automation stitch in the CLI:

1. Configure the trigger:

```
config system automation-trigger
    edit "Any Security Rating Notification"
        set event-type security-rating-summary
        set report-type any
    next
end
```

2. Configure the actions:

```
config system automation-action
    edit "aws_no_delay"
        set action-type aws-lambda
        set aws-api-key xxxxxxxxxxxx
        set uri "xxxxxxxxxx.execute-api.us-east-1.amazonaws.com/xxxxxxxxxx"
        config http-headers
            edit 1
```

```
                set key "header2"
                set value "header2_value"
            next
        end
    next
    edit "email_action"
        set action-type email
        set email-to "test@fortinet.com"
        set email-subject "email action for test"
        set replacement-message enable
    next
end
```

3. Configure the stitch:

```
config system automation-stitch
    edit "aws_no_delay"
        set description "aws action test"
        set trigger "Any Security Rating Notification"
        config actions
            edit 1
                set action "aws_no_delay"
                set required enable
            next
            edit 2
                set action "email_action"
                set delay 60
                set required enable
            next
        end
    next
end
```

Testing automation stitches

In the GUI, go to *Security Fabric > Automation*, right-click on the automation stitch and select *Test Automation Stitch*.

In the CLI, enter `diagnose automation test <automation-stitch name>`.

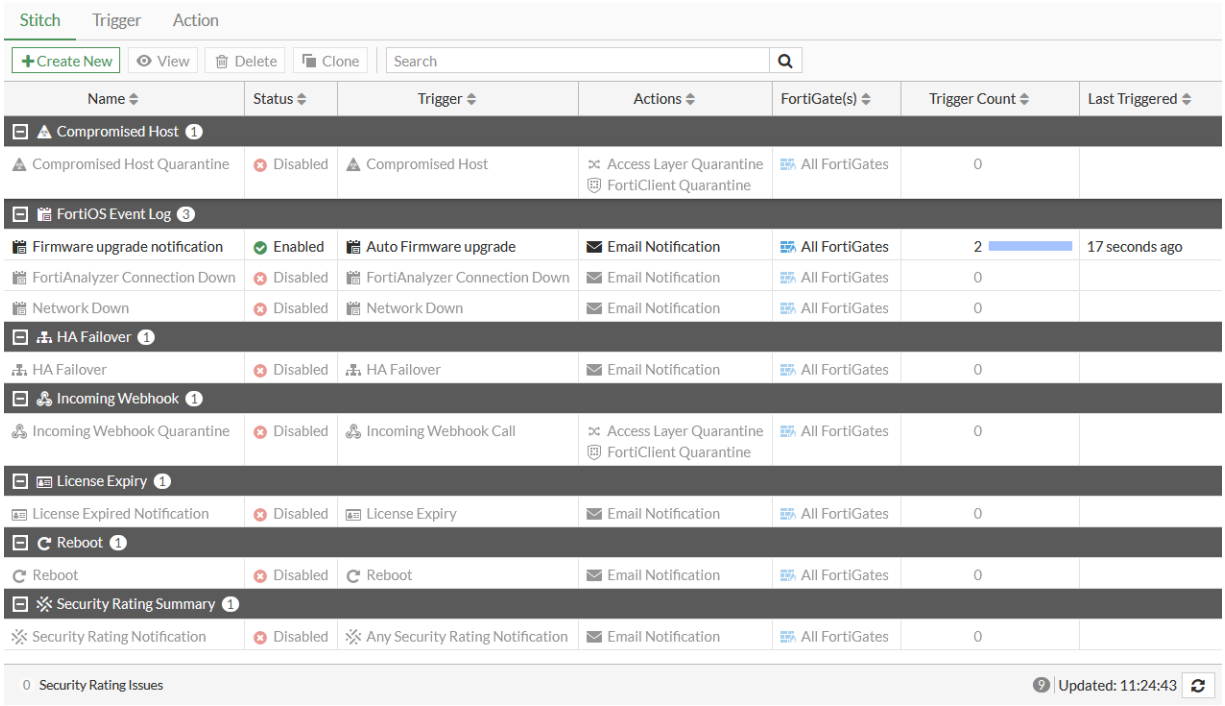
Default automation stitches

The following default automation stitches are included in FortiOS:

- Compromised Host Quarantine
- Firmware upgrade notification
- FortiAnalyzer Connection Down
- Network Down
- HA Failover
- Incoming Webhook Quarantine

- License Expired Notification
- Reboot
- Security Rating Notification

To view and edit the automation stitches in the GUI, go to *Security Fabric > Automation*.



CLI configurations

Compromised Host Quarantine

```
config system automation-action
    edit "Access Layer Quarantine"
        set description "Quarantine the MAC address on access layer devices (FortiSwitch and
FortiAP)."
        set action-type quarantine
    next
    edit "FortiClient Quarantine"
        set description "Use FortiClient EMS to quarantine the endpoint device."
        set action-type quarantine-forticlient
    next
end
```

```
config system automation-trigger
    edit "Compromised Host"
        set description "An incident of compromise has been detected on a host endpoint."
    next
end
```

```
config system automation-stitch
    edit "Compromised Host Quarantine"
        set description "Quarantine a compromised host on FortiAPs, FortiSwitches, and FortiClient
EMS."
        set status disable
        set trigger "Compromised Host"
        config actions
            edit 1
                set action "Access Layer Quarantine"
            next
            edit 2
                set action "FortiClient Quarantine"
            next
        end
    next
end
```

Firmware upgrade notification

```
config system automation-action
    edit "Email Notification"
        set description "Send a custom email to the specified recipient(s)."
        set action-type email
        set forticare-email enable
        set email-subject "%%log.logdesc%%"
        set message "%%log%%"
    next
end
```

```
config system automation-trigger
    edit "Auto Firmware upgrade"
        set description "Automatic firmware upgrade."
        set trigger-type event-based
        set event-type event-log
        set logid 22094 22095 32263
    next
end
```

```
config system automation-stitch
    edit "Firmware upgrade notification"
        set description "Automatic firmware upgrade notification."
        set status enable
        set trigger "Auto Firmware upgrade"
        config actions
            edit 1
                set action "Email Notification"
                set delay 0
                set required disable
            next
        end
```

```
   next
end
```

FortiAnalyzer Connection Down

```
config system automation-action
    edit "Email Notification"
        set description "Send a custom email to the specified recipient(s)."
        set action-type email
        set forticare-email enable
        set email-subject "%%log.logdesc%%"
        set message "%%log%%"
    next
end
```

```
config system automation-trigger
    edit "FortiAnalyzer Connection Down"
        set description "A FortiAnalyzer connection is down."
        set event-type event-log
        set logid 22902
    next
end
```

```
config system automation-stitch
    edit "FortiAnalyzer Connection Down"
        set description "Send a email notification when the connection to FortiAnalyzer is lost."
        set status disable
        set trigger "FortiAnalyzer Connection Down"
        config actions
            edit 1

        set report-type any
    next
end
```

```
config system automation-stitch
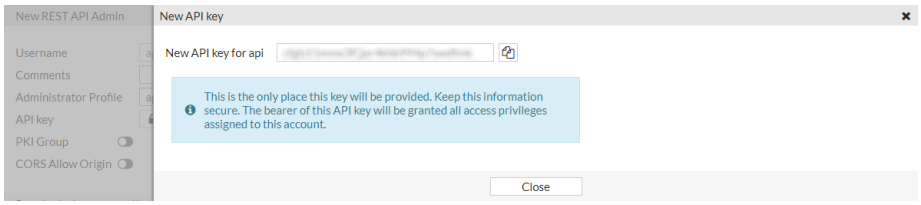
    edit "Security Rating Notification"
        set description "Send a email notification when a new Security Rating report is
available."
        set status disable
        set trigger "Any Security Rating Notification"
        config actions
            edit 1
                set action "Email Notification"
            next
        end
    next
end
```

Incoming Webhook Quarantine stitch

The Incoming Webhook Quarantine stitch for API calls to the FortiGate accepts multiple parameters (MAC address and FortiClient UUID) from an Incoming Webhook trigger, which enacts either the Access Layer Quarantine action (MAC address) or the FortiClient Quarantine action (FortiClient UUID). This is a default automation stitch included in FortiOS.

To trigger the Incoming Webhook Quarantine stitch in the GUI:

1. Create a new API user:
   a. Go to *System* > *Administrators*.
   b. Click *Create New* > *REST API Admin*.
   c. Configure the *New REST API Admin* settings, and copy the API key to the clipboard.



2. Enable the stitch:
   a. Go to *Security Fabric* > *Automation*.
   b. Under *Incoming Webhook*, right-click *Incoming Webhook Quarantine*, and select *Select Status* > *Enable*.
3. Get the sample cURL request:
   a. Click the *Trigger* trigger tab.
   b. Under *Incoming Webhook*, right-click *Incoming Webhook Call*, and select *Edit*.
   c. In the *API admin key* field, enter the API key you recorded previously. The *Sample cURL request* field updates.

   d. Copy the *Sample cURL request* to the clipboard.
   e. Click *OK*.
4. Execute the request:
   a. Edit the sample cURL request you just copied.
   b. Add parameters to the `data` field (`"mac"` and `"fctuid"`), and then execute the request.

```
root@pc:~# curl -k -X POST -H 'Authorization: Bearer cfgtct1mmx3fQxr4khb994p7swdfmk' --data
'{ "mac":"0c:0a:00:0c:ce:b0", "fctuid": "0000BB0B0ABD0D00B0D0A0B0E0F0B00B"}'
https://172.16.116.226/api/v2/monitor/system/automation-
stitch/webhook/Incoming%20Webhook%20Quarantine
{
   "http_method":"POST",
   "status":"success",
   "http_status":200,
   "serial":"FGT00E0Q00000000",
   "version":"v6.4.0",
   "build":1545
```

Encode spaces in the automation stitch name with `%20`. For example, `Incoming%20Webhook%20Quarantine`

Once the automation stitch is triggered, the MAC address is quarantined by the FortiGate, and an event log is created. The FortiClient UUID is quarantined on the EMS server side.

To trigger the Incoming Webhook Quarantine stitch in the CLI:

1. Create a new API user and note the API key:

```
config system api-user
```

2. Enable the automation stitch:

```
config system api-user
    edit "api"
        set api-key ************
        set accprofile "api_profile"
        set vdom "root"
        config trusthost
            edit 1
                set ipv4-trusthost 10.6.30.0 200.200.200.0
            next
        end
    next
end
```

3. Edit the cURL request to include parameters in the `data` field (`"mac"` and `"fctuid"`), then execute the request:

```
root@pc56:~# curl -k -X POST -H 'Authorization: Bearer cfgtct1mmx0fQxr4khb000p70wdfmk' --
data '{ "mac":"0c:0a:00:0c:ce:b0", "fctuid": "3000BB0B0ABD0D00B0D0A0B0E0F0B00B"}'
https://100.10.100.200/api/v2/monitor/system/automation-
stitch/webhook/Incoming%20Webhook%20Quarantine
{
   "http_method":"POST",
   "status":"success",
   "http_status":200,
   "serial":"FGT80E0Q00000000",
   "version":"v6.4.0",
   "build":1545
```

Encode spaces in the automation stitch name with `%20`. For example, `Incoming%20Webhook%20Quarantine`.

Once the automation stitch is triggered, the MAC address is quarantined by the FortiGate, and an event log is created. The FortiClient UUID is quarantined on the EMS server side.

Sample log

```
date=2020-02-14 time=15:37:48 logid="0100046600" type="event" subtype="system" level="notice"
vd="root" eventtime=1581723468644200712 tz="-0800" logdesc="Automation stitch triggered"
stitch="Incoming Webhook Quarantine" trigger="Incoming Webhook Quarantine"
stitchaction="Compromised Host Quarantine_quarantine,Compromised Host Quarantine_quarantine-
forticlient" from="log" msg="stitch:Incoming Webhook Quarantine is triggered."
```

Triggers

There are two types of automation triggers that can be configured in automation stitches: static and dynamic.

Static automation triggers are included in FortiOS by default. They require only a name, description, and one setting. Static automation triggers can be edited, but they cannot be deleted.

Dynamic automation triggers require multiple settings to be configured. Dynamic automation triggers can be created by clicking the *Create New* button on the *Trigger* tab, or clicking *Create* within the *Create Automation Stitch* page.

The following table outlines the available static triggers.

Trigger	Description
Anomaly Logs	An anomalous event has occurred. See Event log category triggers on page 3905 for an example.
Any Security Rating Notification	A summary is available for a recently run Security Rating report. The default report type is Any. Other available options include: • Security Posture • Fabric Coverage • Optimization
AV & IPS DB Update	The antivirus and IPS database is updating.
Compromised Host	An indicator of compromise (IoC) is detected on a host endpoint. Additional actions are available only for *Compromised Host* triggers: • Access Layer Quarantine • FortiClient Quarantine • VMware NSX Security Tag • IP Ban
Configuration Change	A FortiGate configuration change has occurred.

Trigger	Description
Conserve Mode	A FortiGate entered conserve mode due to low memory. See Execute a CLI script based on memory and CPU thresholds on page 3955 for an example.
FortiGate Cloud-Based IOC	IOC detection from the FortiGate Cloud IOC service. This option requires an IOC license, a web filter license, and FortiCloud logging must be enabled.
HA Failover	An HA failover is occurring.
High CPU	A FortiGate has high CPU usage. See Execute a CLI script based on memory and CPU thresholds on page 3955 for an example.
IPS Logs	An IPS event has occurred.
License Expiry	A FortiGuard license is expiring. The default license type is Any. Other available options include: The license type must be selected. Options include: • FortiCare Support • FortiGuard Web Filter • FortiGuard AntiSpam • FortiGuard AntiVirus • FortiGuard IPS • FortiGuard Management Service • FortiGate Cloud
Local Certificate Expiry	A local certificate is about to expire. See Certificate expiration trigger on page 3909 for an example.
Reboot	A FortiGate is rebooting.
SSH Logs	An SSH event has occurred.
Traffic Violation	A traffic policy has been violated.
Virus Logs	A virus event has occurred.
Web Filter Violation	A web filter policy has been violated.

The following table outlines the available dynamic triggers.

Category	Trigger	Description
Security Fabric		
	Fabric Connector Event	An event has occurred on a specific Fabric connector. See Fabric connector event trigger on page 3897 for details.
	FortiAnalyzer Event Handler	The specified FortiAnalyzer event handler has occurred. See FortiAnalyzer event handler trigger on page 3892 for details.
	FortiGate Cloud Event Handler	The specified FortiGate Cloud event handler has occurred. This option requires a FortiGate Cloud log retention license.

Category	Trigger	Description
Miscellaneous		
	FortiOS Event Log	The specified FortiOS log has occurred. Multiple event log IDs can be selected, and log field filters can be applied. See FortiOS event log trigger on page 3902 for an example.
	Incoming Webhook	An incoming webhook is triggered.
	Schedule	A scheduled monthly, weekly, daily, hourly, or one-time trigger. Set to occur on a specific minute of an specific hour on a specific day. When using the one-time trigger, set to occur on specific date and time in the future. See Schedule trigger on page 3911 for an example.

FortiAnalyzer event handler trigger

You can trigger automation stitches based on FortiAnalyzer event handlers. This allows you to define rules based on complex correlations across devices, log types, frequencies, and other criteria.

To set up a FortiAnalyzer event handler trigger:

1. Configure a FortiGate event handler on the FortiAnalyzer
2. Configure FortiAnalyzer logging on the FortiGate on page 3893
3. Configure an automation stitch that is triggered by a FortiAnalyzer event handler on page 3894

Configure a FortiGate event handler on the FortiAnalyzer

On the FortiAnalyzer, configure an event handler for the automation stitch. In this example, the event handler is triggered when an administrator logs in to the FortiGate. See Creating a custom event handler in the FortiAnalyzer Administration Guide for more information.

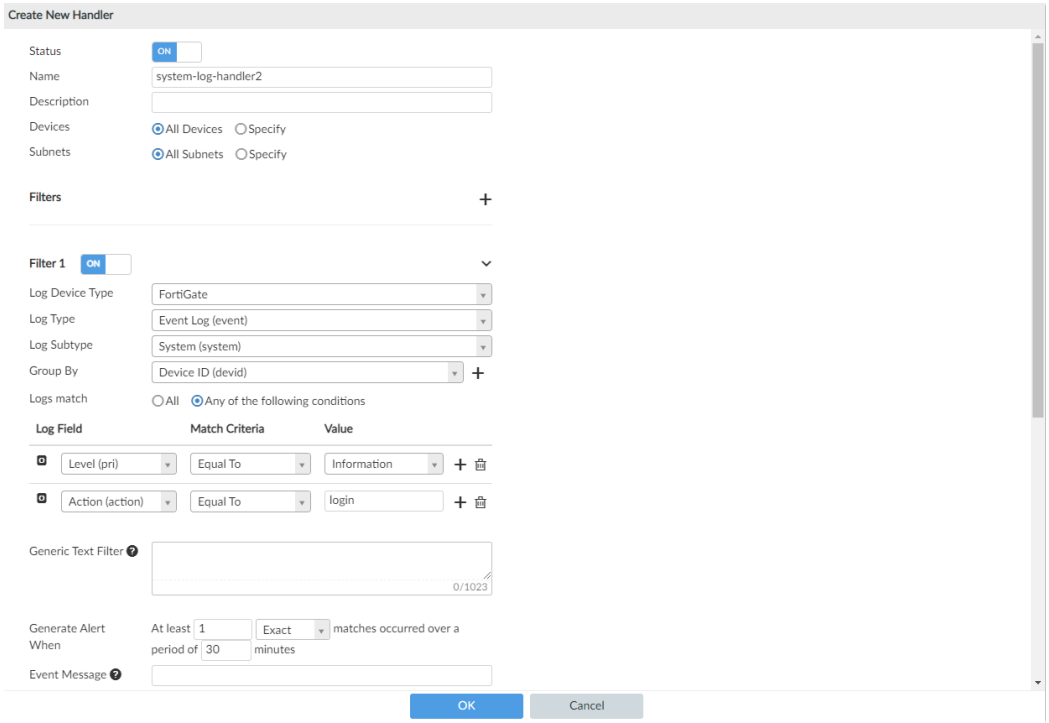
To configure an event handler on the FortiAnalyzer:

1. Go to *FortiSoC* > *Handlers* > *FortiGate Event Handlers*, and click *Create New*.
2. Configure an event handler with two conditions for the automation stitch:

Log Type	Event Log
Log Subtype	System
Group By	Device ID
Logs match	Any of the following conditions
Log Field	Level
Match Criteria	Equal To
Value	Information

Log Field	Action
Match Criteria	Equal To
Value	login

3. Configure the other settings as needed.



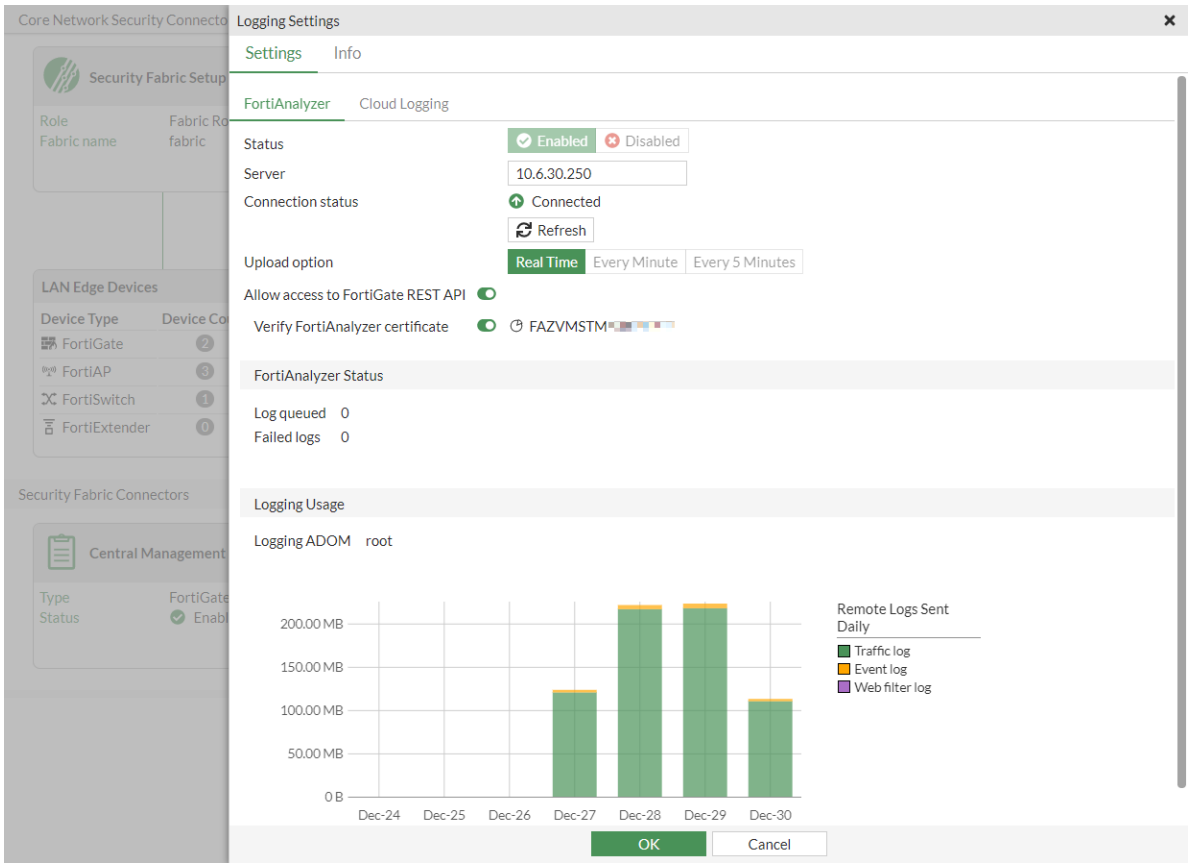
4. Click *OK*.

Configure FortiAnalyzer logging on the FortiGate

See Configuring FortiAnalyzer on page 3711 for more information.

To configure FortiAnalyzer logging in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiAnalyzer Logging* card.
2. In the *Settings* > *FortiAnalyzer* tab, ensure the *Status* is *Enabled*, and configure the settings as needed.



3. Click *OK*.

To configure FortiAnalyzer logging in the CLI:

```
config log fortianalyzer setting
    set status enable
    set server "10.6.30.250"
    set serial "FL-4HET000000000"
    set upload-option realtime
    set reliable enable
end
```

Configure an automation stitch that is triggered by a FortiAnalyzer event handler

When a FortiAnalyzer event handler is triggered, it sends a notification to the FortiGate automation framework, which generates a log and triggers the automation stitch.

To configure an automation stitch that is triggered by a FortiAnalyzer event handler in the GUI:

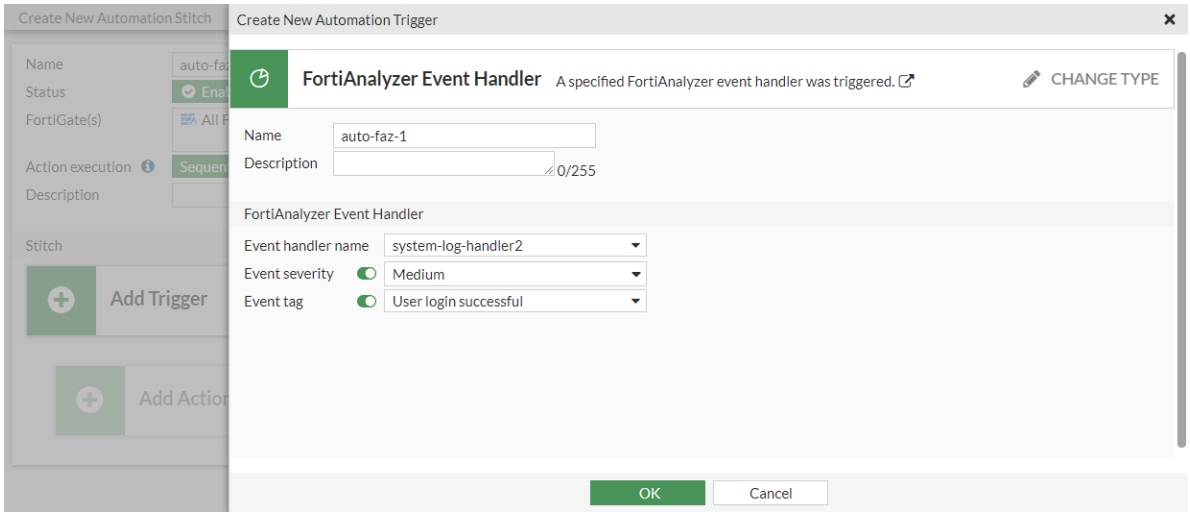
1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name, *auto-faz-1*.
3. Configure the trigger:

a. Click *Add Trigger*.

b. Click *Create* and select *FortiAnalyzer Event Handler*.

c. Enter the following:

Name	auto-faz-1
Event handler name	system-log-handler2
Event severity	Medium
Event tag	User login successful



d. Click *OK*.

e. Select the trigger in the list and click *Apply*.

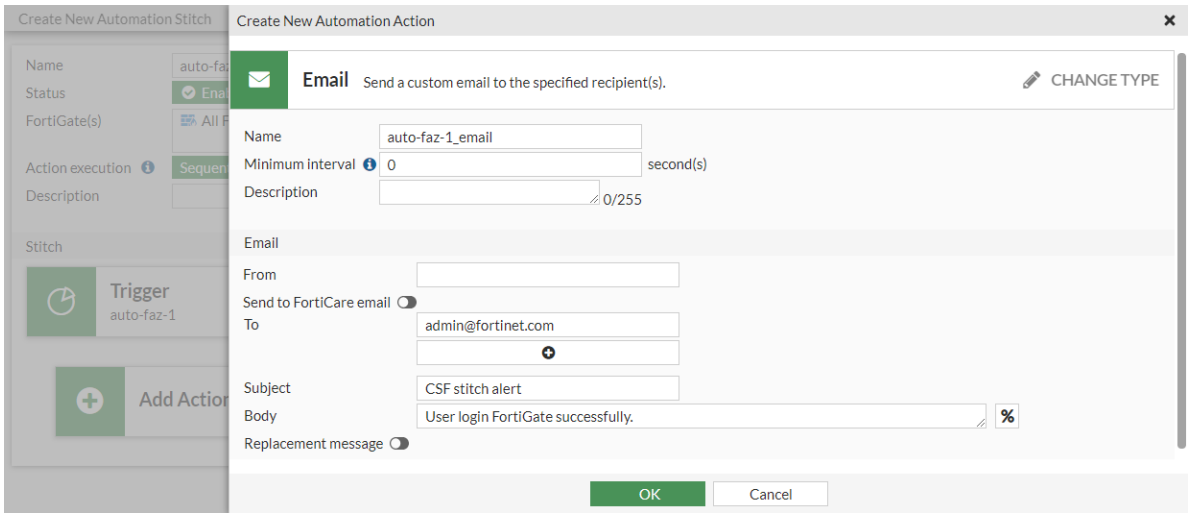
4. Configure the Email notification action:

a. Click *Add Action*.

b. Click *Create* and select *Email*.

c. Enter the following:

Name	auto-faz-1_email
To	Enter an email address
Subject	CSF stitch alert
Body	User login FortiGate successfully.



d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Click *OK*.

To configure an automation stitch that is triggered by a FortiAnalyzer event handler in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "auto-faz-1"
        set event-type faz-event
        set faz-event-name "system-log-handler2"
        set faz-event-severity "medium"
        set faz-event-tags "User log in successful"
    next
end
```

2. Create an automation action:

```
config system automation-action
    edit "auto-faz-1_email"
        set action-type email
        set email-to "admin@fortinet.com"
        set email-subject "CSF stitch alert"
        set message "User login FortiGate successfully."
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-faz-1"
        set trigger "auto-faz-1"
        config actions
            edit 1
                set action "auto-faz-1_email"
```

```
                set required enable
            next
        end
    next
end
```

View the trigger event log

To view the trigger event log in the GUI:

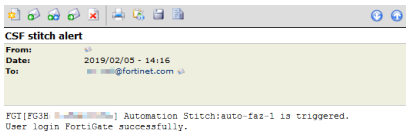
1. Log in to the FortiGate.
   The FortiAnalyzer sends a notification to the FortiGate automation framework, generates an event log on the FortiGate, and triggers the automation stitch.
2. Go to *Log & Report* > *System Events* and select *General System Events*. From the log location dropdown, select *FortiAnalyzer*.

To view the trigger event log in the CLI:

```
# execute log display
    ...
    date=2019-02-05 time=14:16:17 logid="0100046600" type="event" subtype="system" level="notice"
vd="root" eventtime=1549404977 logdesc="Automation stitch triggered" stitch="auto-faz-1"
trigger="auto-faz-1" from="log" msg="stitch:auto-faz-1 is triggered."
    ...
```

Sample email

The email sent by the action will look similar to the following:



Fabric connector event trigger

With the *Fabric Connector Event* trigger, any supported Fabric connector is able to trigger an automation stitch on the FortiGate based on a specific event defined on the Fabric connector. Currently, only FortiDeceptor 4.1 and later supports this trigger for the *Insider Threat*, *Notify Ban*, and *Notify Unban* events.

In the following example, an authorized FortiDeceptor in the Security Fabric deploys a decoy called ubuntu16 configured with SSH, SAMBA, HTTP, and HTTPS services.

This example assumes the Security Fabric is already configured. Refer to Configuring the root FortiGate and downstream FortiGates and FortiDeceptor for detailed configuration steps. On the root FortiGate, the *Allow downstream device REST API access* option must be enabled (`set downstream-access enable`). The minimum permission required for the selected *Administrator profile* is *Read/Write* for *User & Device* (`set authgrp read-write`).

Three stitches are configured, one for each FortiDeceptor trigger type:

Stitch name	Fabric connector event trigger	Actions
fortideceptor_threat	Insider threat	Email and IP ban
fortideceptor_ban	Notify ban	Email and IP ban
fortideceptor_unban	Notify unban	Email and CLI script

To configure stitches with the Fabric connector event trigger in the GUI:

1. Configure the triggers:
   a. Go to *Security Fabric > Automation*, select the *Trigger* tab, and click *Create New*.
   b. In the *Security Fabric* section, click *Fabric Connector Event* and enter the following:

Name	*fdc_Insider_Threat*
Description	*Insider_Threat*
Connector	Select the FortiDeceptor connector
Event Name	*Insider Threat*

   c. Click *OK*.
   d. Repeat these steps to create two more triggers with the following settings:

Name	*fdc_Notify_Ban*
Description	*Notify_Ban*
Connector	Select the FortiDeceptor connector
Event Name	*Notify Ban*

Name	*fdc_Notify_Unban*
Description	*Notify_Unban*
Connector	Select the FortiDeceptor connector
Event Name	*Notify Unban*

2. Configure the actions (the default *IP Ban* action will be added later to the stitch):
   a. Go to *Security Fabric > Automation*, select the *Action* tab, and click *Create New*.
   b. In the *Notifications* section, click *Email* and enter the following:

Name	*email_log*
To	Enter an email address
Subject	*CSF stitch alert*

   c. Click *OK*.
   d. Repeat these steps to create a *CLI Script* (in the *General* section) action with the following settings:

Name	*fdc_unban*

Script	*diagnose user banned-ip delete src4 %%log.srcip%%*
Administrator profile	*super_admin*

3. Configure the *fortideceptor_threat* stitch:
   a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *fortideceptor_threat*.
   c. Click *Add Trigger*. Select *fdc_Insider_Threat* and click *Apply*.
   d. Click *Add Action*. Select *email_log* and click *Apply*.
   e. Click *Add Action*. Select *IP Ban* and click *Apply*.
   f. Click the *Add delay* located between both actions. Enter *5* and click *OK*.
   g. Click *OK*.
4. Configure the *fortideceptor_ban* stitch:
   a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *fortideceptor_ban*.
   c. Click *Add Trigger*. Select *fdc_Notify_Ban* and click *Apply*.
   d. Click *Add Action*. Select *email_log* and click *Apply*.
   e. Click *Add Action*. Select *IP Ban* and click *Apply*.
   f. Click the *Add delay* located between both actions. Enter *5* and click *OK*.
   g. Click *OK*.
5. Configure the *fortideceptor_unban* stitch:
   a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *fortideceptor_unban*.
   c. Click *Add Trigger*. Select *fdc_Notify_Unban* and click *Apply*.
   d. Click *Add Action*. Select *email_log* and click *Apply*.
   e. Click *Add Action*. Select *fdc_unban* and click *Apply*.
   f. Click the *Add delay* located between both actions. Enter *5* and click *OK*.
   g. Click *OK*.

To configure stitches with the Fabric connector event trigger in the CLI:

1. Configure the triggers:

```
config system automation-trigger
    edit "fdc_Insider_Threat"
        set description "Insider_Threat"
        set event-type fabric-event
        set serial "FDC-VMTM210000**"
        set fabric-event-name "insider_threat"
    next
    edit "fdc_Notify_Ban"
        set description "Notify_Ban"
        set event-type fabric-event
        set serial "FDC-VMTM210000**"
        set fabric-event-name "notify_ban"
    next
    edit "fdc_Notify_Unban"
```

```
        set description "Notify_Unban"
        set event-type fabric-event
        set serial "FDC-VMTM210000**"
        set fabric-event-name "notify_unban"
    next
end
```

2. Configure the actions:

```
config system automation-action
    edit "IP Ban"
        set action-type ban-ip
    next
    edit "fdc_unban"
        set action-type cli-script
        set script "diagnose user banned-ip delete src4 %%log.srcip%%"
        set output-size 10
        set timeout 0
        set accprofile "super_admin"
    next
    edit "email_log"
        set action-type email
        set email-to "*******@fortinet.com"
        set email-subject "CSF stitch alert"
    next
end
```

3. Configure the stitches:

```
config system automation-stitch
    edit "fortideceptor_threat"
        set trigger "fdc_Insider_Threat"
        config actions
            edit 1
                set action "email_log"
                set required enable
            next
            edit 2
                set action "IP Ban"
                set delay 5
                set required enable
            next
        end
    next
    edit "fortideceptor_ban"
        set trigger "fdc_Notify_Ban"
        config actions
            edit 1
                set action "email_log"
                set required enable
            next
            edit 2
```

```
                set action "IP Ban"
                set delay 5
                set required enable
            next
        end
    next
    edit "fortideceptor_unban"
        set trigger "fdc_Notify_Unban"
        config actions
            edit 1
                set action "email_log"
                set required enable
            next
            edit 2
                set action "fdc_unban"
                set delay 5
                set required enable
            next
        end
    next
end
```

Verification

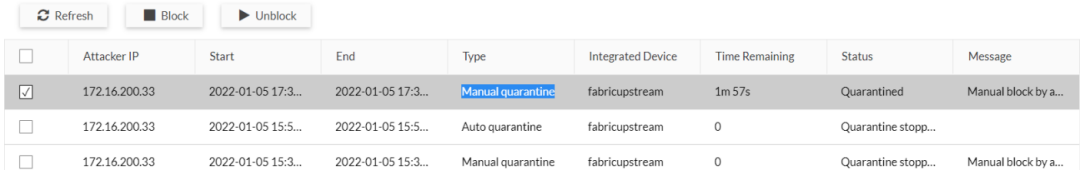
A device with IP 172.16.200.33 uses SSH to access the decoy (ubuntu16) deployed in the FortiDeceptor. The FortiDeceptor will detect the attacker IP 172.16.200.33, automatically quarantine it, and send the insider threat notification to the FortiGate. This notification will trigger the *fortideceptor_threat* stitch due to the insider threat event trigger, so an email alert is sent and the attacker IP (172.16.200.33) is banned.

In FortiDeceptor, if the attacker IP (172.16.200.33) is manually blocked or unblocked, the FortiDeceptor will send out the internal block or unblock notification to FortiGate (see Quarantine Status for more details). This notification will trigger the *fortideceptor_ban* or *fortideceptor_unban* stitch due the notify ban or unban event trigger. An email alert is sent, and based on the event, the IP is banned or the CLI script runs to unban the IP.

To view the quarantine details in FortiDeceptor:

1. Go to *Fabric* > *Quarantine Status*.
   a. Automatic quarantine:

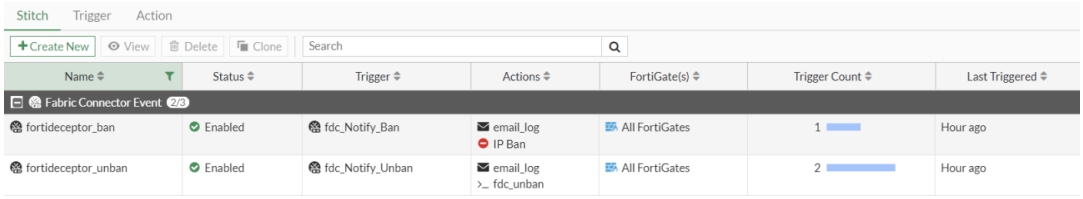
   b. Manual block or unblock:



To confirm that the stitch was triggered in the FortiOS GUI:

1. Go to *Security Fabric* > *Automation* and select the *Stitch* tab.
   a. Triggered insider threat:

   b. Triggered notify ban or unban:



To view the quarantined IP details in the FortiOS CLI:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
172.16.200.33     Wed Jan  5 15:57:41 2022 indefinite               Administrative
```

If the IP is unbanned by the stitch, the list will be empty:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
```

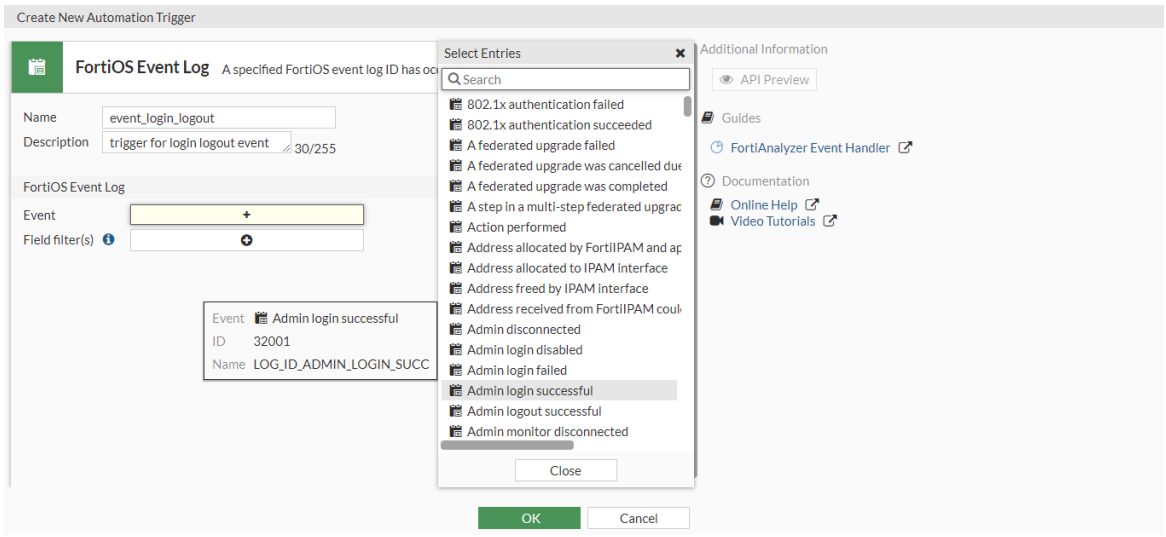
FortiOS event log trigger

You can configure a FortiOS event log trigger for when a specific event log ID occurs. You can select multiple event log IDs, and apply log field filters. FortiOS event log triggers can be configured from the *Security Fabric* > *Automation* > *Trigger* page, or by using the shortcut on the *Log & Report* > *System Events* > *Logs* page.

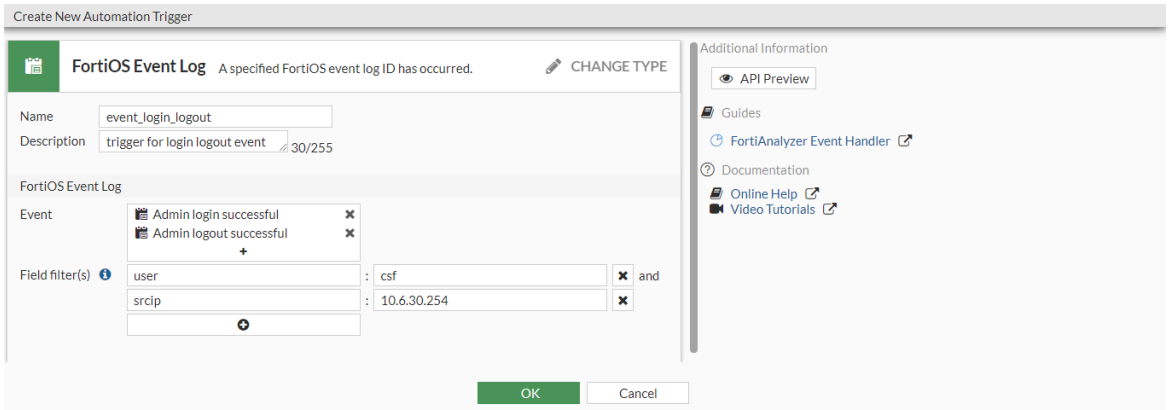
A maximum of 16 log IDs can be set as triggers for the event log.

To configure a FortiOS event log trigger in the GUI:

1. Go to *Security Fabric* > *Automation*, select the *Trigger* tab, and click *Create New*.
2. In the *Miscellaneous* section, click *FortiOS Event Log*.
3. Enter a name and description.
4. In the *Event* field, click the *+* to select multiple event log IDs.
   The *Event* options correspond to the *Message Meaning* listed in the FortiOS Log Message Reference. Hover over an entry to view the tooltip that includes the event ID and log name. In this example, the *Admin login successful* event in the GUI corresponds to log ID *32001*, which is *LOG_ID_ADMIN_LOGIN_SUCC*.



5. In the *Field filter(s)* field, click the + to add multiple field filters. The configured filters must match in order for the stitch to be triggered.
   a. To view the list of available fields for a log, refer to the FortiOS Log Message Reference by appending the log ID to the document URL (https://docs.fortinet.com/document/fortigate/7.6.2/fortios-log-message-reference/<log_ID>).



6. Click *OK*.

To configure a FortiOS event log trigger in the CLI:

```
config system automation-trigger
    edit "event_login_logout"
        set description "trigger for login logout event"
        set event-type event-log
        set logid 32001 32003
        config fields
            edit 1
                set name "user"
                set value "csf"
            next
            edit 2
                set name "srcip"
```

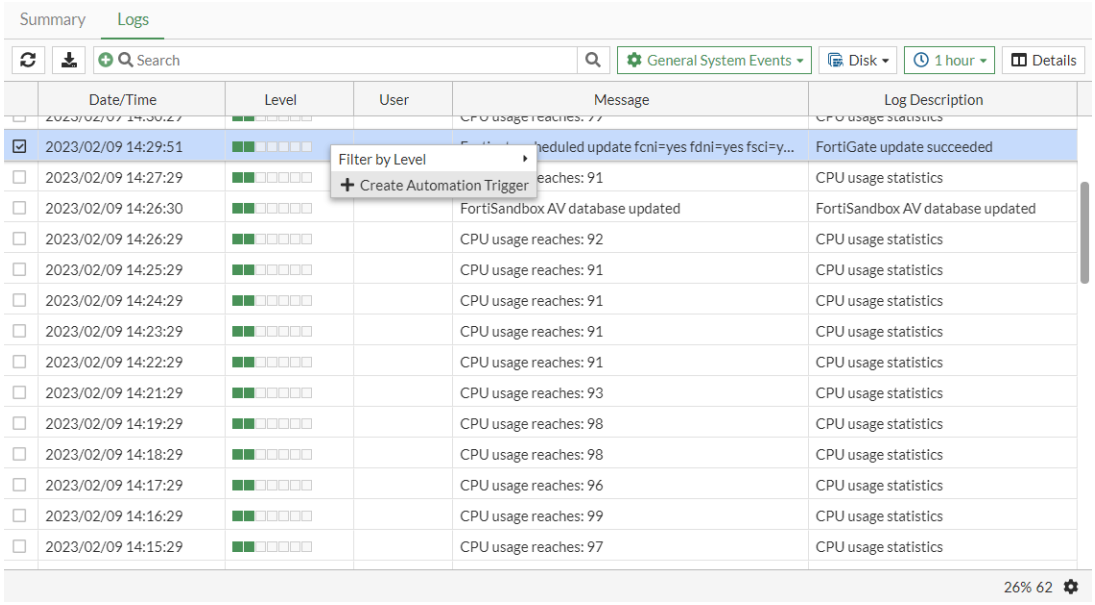
```
                set value "10.6.30.254"
            next
        end
    next
end
```

System Events page shortcut

A FortiOS Event Log trigger can be created using the shortcut on the *System Events > Logs* page. In this example, a trigger is created for a FortiGate update succeeded event log.

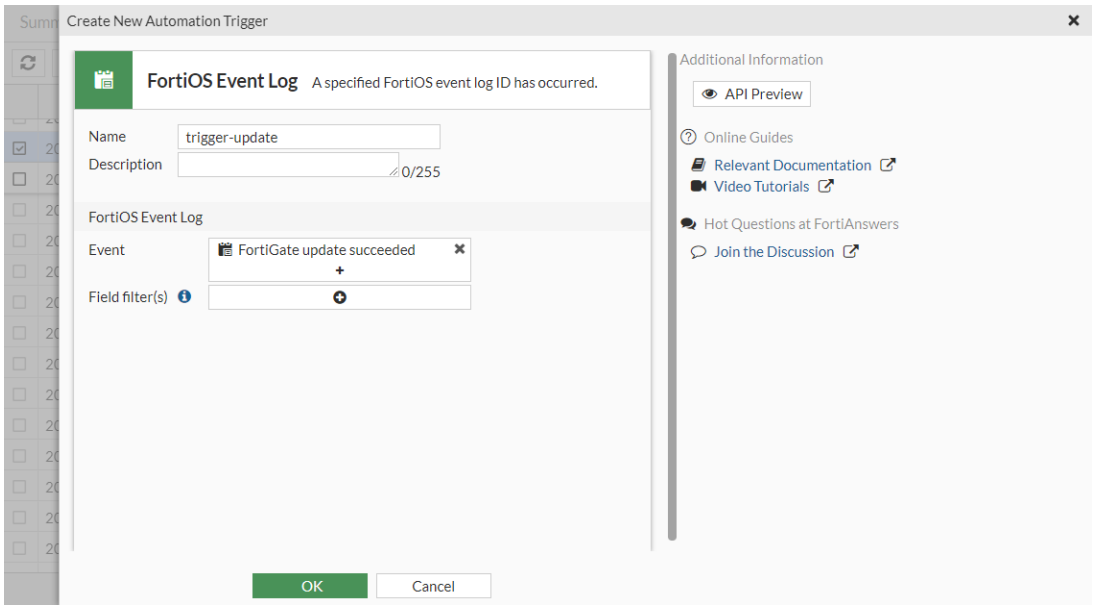
To configure a FortiOS Event Log trigger from the System Events page:

1. Go to *Log & Report > System Events* and select the *Logs* tab.
2. Select a log for a successful FortiGate update, then right-click and select *Create Automation Trigger*.

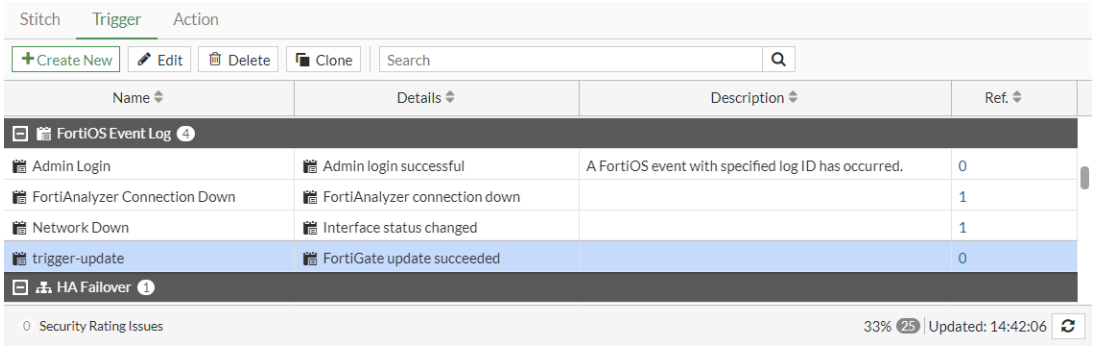


The *Create New Automation Trigger* pane opens to configure the FortiOS Event Log settings.

3. Enter a name (such as *trigger-update*). The *Event* field is already populated with *FortiGate update succeeded*.



4. Optionally in the *Field filter(s)* field, click the + to add multiple field filters. The configured filters must match in order for the stitch to be triggered.
5. Click *OK*. The trigger is now listed on the *Security Fabric > Automation > Trigger* page.



Event log category triggers

There are six default automation triggers based on event log categories:

- Anomaly logs
- IPS logs
- SSH logs
- Traffic violations
- Virus logs
- Web filter violations

When multi-VDOM mode is enabled, individual VDOMs can be specified so that the trigger is only applied to those VDOMs.

```
config system automation-trigger
    edit "Anomaly Logs"
```

```
        set trigger-type event-based
        set event-type anomaly-logs
        set vdom <name>
    next
    edit "IPS Logs"
        set trigger-type event-based
        set event-type ips-logs
        set vdom <name>
    next
    edit "SSH Logs"
        set trigger-type event-based
        set event-type ssh-logs
        set vdom <name>
    next
    edit "Traffic Violation"
        set trigger-type event-based
        set event-type traffic-violation
        set vdom <name>
    next
    edit "Virus Logs"
        set trigger-type event-based
        set event-type virus-logs
        set vdom <name>
    next
    edit "Webfilter Violation"
        set trigger-type event-based
        set event-type webfilter-violation
        set vdom <name>
    next
end
```

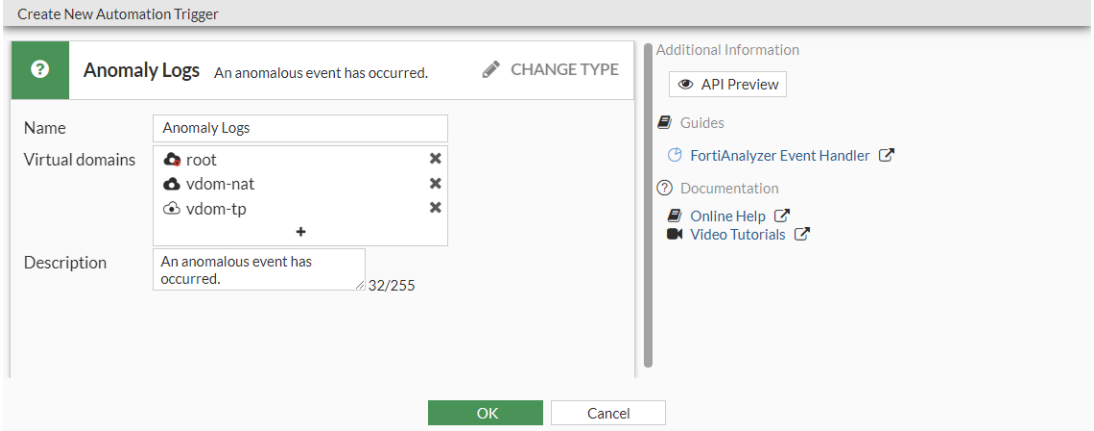
A maximum of 16 log IDs can be set as triggers for the event log.

Example

In this example, an automation stitch is created that uses the anomaly logs trigger and an email notification action. The trigger specifies which VDOMs should be used. There is a three-second delay between the trigger and action.

To configure an automation stitch with the anomaly logs trigger in the GUI:

1. Configure the trigger:
   a. Go to *Security Fabric > Automation*, select the *Trigger* tab.
   b. Edit the *Anomaly Logs* trigger.
   c. Add the required VDOMs (*root*, *vdom-nat*, *vdom-tp*).



d. Click *OK*.

2. Configure the action:
   a. Go to *Security Fabric > Automation*, select the *Action* tab, and click *Create New*.
   b. In the *Notifications* section, click *Email* and enter the following:

Name	*email_default_rep_message*
To	Enter an email address
Subject	*CSF stitch alert*
Replacement message	Enable

   c. Click *OK*.
3. Configure the stitch:
   a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *anomaly-logs-stitch*.
   c. Click *Add Trigger*. Select *Anomaly Logs* and click *Apply*.
   d. Click *Add Action*. Select *email_default_rep_message* and click *Apply*.
   e. Click *Add delay* (between the trigger and action). Enter *3* and click *OK*.
   f. Click *OK*.

To configure an automation stitch with the anomaly logs trigger in the CLI:

1. Configure the trigger:

```
config system automation-trigger
    edit "Anomaly Logs"
        set event-type anomaly-logs
        set vdom "root" "vdom-nat" "vdom-tp"
    next
end
```

2. Configure the action:

```
config system automation-action
    edit "email_default_rep_message"
```

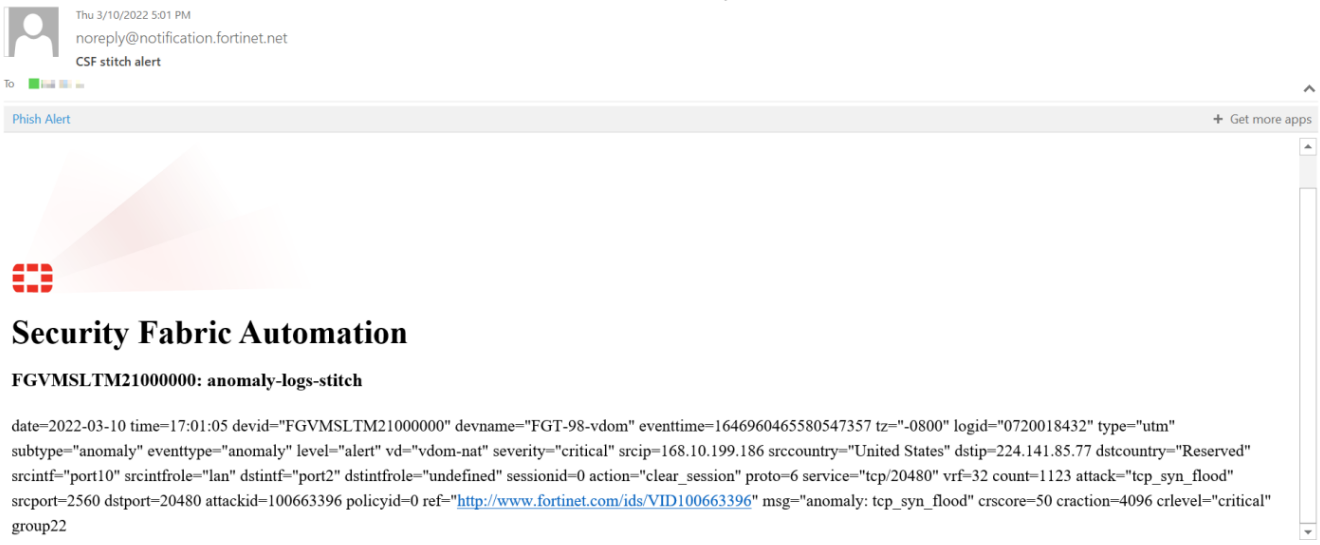
```
        set action-type email
        set email-to "admin@fortinet.com"
        set email-subject "CSF stitch alert"
        set replacement-message enable
    next
end
```

3. Configure the stitch:

```
config system automation-stitch
    edit "anomaly-logs-stitch"
        set description "anomaly-logs"
        set trigger "Anomaly Logs"
        config actions
            edit 1
                set action "email_default_rep_message"
                set delay 3
                set required enable
            next
        end
    next
end
```

Verification

Once the anomaly log is generated, the automation stitch is triggered end the email notification is sent.



To confirm that the stitch was triggered in the GUI:

1. Go to *Security Fabric* > *Automation* and select the *Stitch* tab.
2. Verify the *Last Triggered* column.

To confirm that the stitch was triggered in the CLI:

```
# diagnose test application autod 2
...
stitch: anomaly-logs-stitch
        destinations: all
        trigger: Anomaly Logs
                type:anomaly logs

                field ids:
                        (id:6)vd=root,vdom-nat,vdom-tp

        local hit: 1 relayed to: 0 relayed from: 0
        actions:
                email_default_rep_message type:email interval:0
                        delay:3 required:yes
                        subject: CSF stitch alert
                        body: %%log%%
                        sender:
                        mailto:admin@fortinet.com;
```

Certificate expiration trigger

The local certificate expiry trigger (`local-certificate-near-expiry`) can be used in an automation stitch if a user-supplied local certificate used for SSL VPN, deep inspection, or other purpose is about to expire. This trigger relies on a VPN certificate setting in the CLI configuration setting for the certificate log expiring warning threshold:

```
config vpn certificate setting
    set cert-expire-warning <integer>
end
```

`cert-expire-warning <integer>`	Set the certificate log expiring warning threshold, in days (0 - 100, default = 14).

Example

In this example, the default local certificate expiry trigger is used with an email notification action to remind an administrator to re-sign or load a new local certificate to avoid any service interruptions. The local certificate, fw-cert-30-days, will expire in 30 days. The certificate log expiring warning threshold is set to 31 days.

To configure the certificate log expiring warning threshold:

```
config vpn certificate setting
    set cert-expire-warning 31
end
```

To configure an automation stitch with the local certificate expiry trigger in the GUI:

1. Configure the action:
   a. Go to *Security Fabric > Automation*, select the *Action* tab, and click *Create New*.
   b. In the *Notifications* section, click *Email*, and enter the following:

Name	*email_no_rep_message*
To	Enter an email address.
Subject	*CSF stitch alert*

   c. Click *OK*.
2. Configure the stitch:
   a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *cert-expiry*.
   c. Click *Add Trigger*. Select *Local Certificate Expiry* and click *Apply*.
   d. Click *Add Action*. Select *email_no_rep_message* and click *Apply*.
   e. Click *OK*.

To configure an automation stitch with the local certificate expiry trigger in the CLI:

1. Configure the trigger:

```
config system automation-trigger
    edit "Local Certificate Expiry"
        set description "A local certificate is near expiration."
        set event-type local-cert-near-expiry
    next
end
```

2. Configure the action:

```
config system automation-action
    edit "email_no_rep_message"
        set action-type email
        set email-to "*******@fortinet.com"
        set email-subject "CSF stitch alert"
    next
end
```

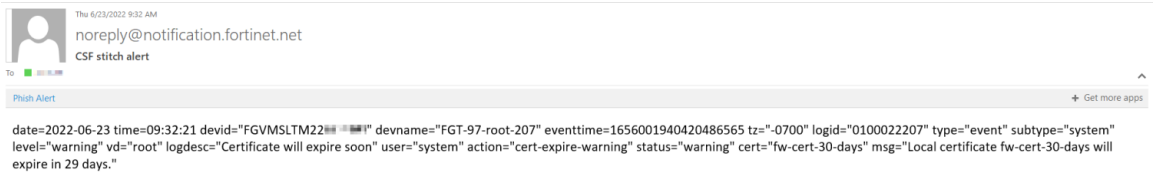
3. Configure the stitch:

```
config system automation-stitch
    edit "cert-expiry"
        set trigger "Local Certificate Expiry"
        config actions
            edit 1
                set action "email_no_rep_message"
                set required enable
            next
        end
```

```
    next
end
```

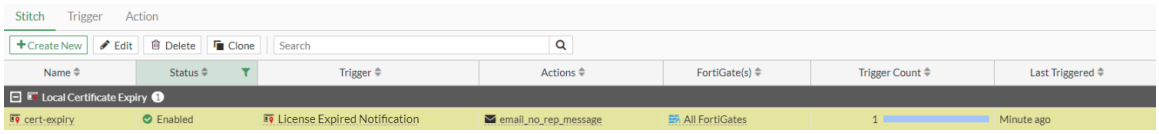
Verification

Once the event log is generated for the local certificate expiry, the automation stitch is triggered end the email notification is sent.



To confirm that the stitch was triggered in the GUI:

1. Go to *Security Fabric* > *Automation* and select the *Stitch* tab.
2. Verify the *Last Triggered* column.



To confirm that the stitch was triggered in the CLI:

```
# diagnose test application autod 3
alert mail log count: 0

stitch: cert-expiry

        local hit: 1 relayed to: 0 relayed from: 0
        last trigger:Thu Jun 23 09:32:21 2022
        last relay:
        actions:
                email_no_rep_message:
                        done: 1 relayed to: 0 relayed from: 0
                        last trigger:Thu Jun 23 09:32:21 2022
                        last relay:

logid to stitch mapping:
id:22207  local hit: 1 relayed hits: 0
        cert-expiry
```

Schedule trigger

The schedule automation trigger can be used for monthly, weekly, daily, hourly, or one-time triggers, including a one-time configuration backup to a disk, a reboot, or a shutdown.

```
config system automation-trigger
    edit <name>
        set trigger-type scheduled
        set trigger-frequency {hourly | daily | weekly | monthly | once}
        set trigger-hour <integer>
        set trigger-minute <integer>
        set trigger-weekday {sunday | monday | tuesday | wednesday | thursday | friday | saturday}
        set trigger-day <integer>
        set trigger-datetime <YYYY-MM-DD HH:MM:SS>
    next
end
```

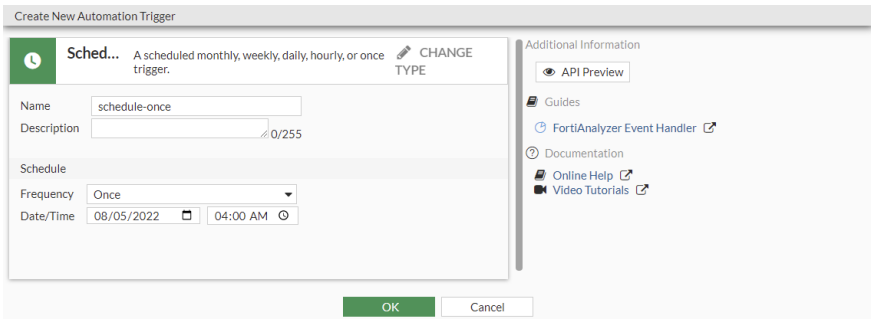
`trigger-frequency {hourly | daily | weekly | monthly | once}`	Set the scheduled trigger frequency (default = daily).
`trigger-hour <integer>`	Set the hour of the day on which to trigger (0 - 23, default = 1), available for daily, weekly, and monthly schedule.
`trigger-minute <integer>`	Set the minute of the hour on which to trigger (0 - 59, default = 0), available for hourly, daily, weekly, and monthly schedule.
`trigger-weekday {sunday | monday | tuesday | wednesday | thursday | friday | saturday}`	Set the day of the week to trigger, available for weekly schedule.
`trigger-day <integer>`	Set the day within a month to trigger, available for monthly schedule.
`trigger-datetime <YYYY-MM-DD HH:MM:SS>`	Set the trigger time in YYYY-MM-DD HH:MM:SS format for one-time triggers.

Example

In this example, an automation stitch is created to trigger a one-time configuration backup to a disk. The backup will occur August 5, 2022 at 4:00 AM.

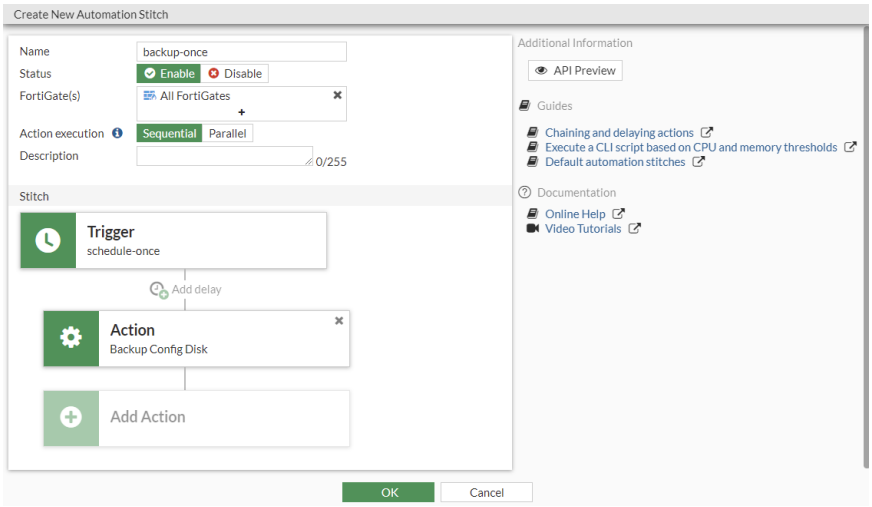
To schedule a one-time automation stitch in the GUI:

1. Configure the trigger:
   a. Go to *Security Fabric > Automation*, select the *Trigger* tab, and click *Create New*.
   b. In the *Miscellaneous* section, click *Schedule*.
   c. Enter a name (*schedule-once*) in the *Name* field.
   d. In the *Frequency* dropdown list, select *Once*.
   e. Select when the trigger will occur in the *Date/Time* fields.



f. Click *OK*.

2. Configure the stitch:
   a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *backup-once*.
   c. Click *Add Trigger*. Select *schedule-once* and click *Apply*.
   d. Click *Add Action*. Select *Backup Config Disk* and click *Apply*.



e. Click *OK*. The backup configuration will occur once at the date and time you set.

To schedule a one-time automation stitch in the CLI:

1. Configure the trigger:

```
config system automation-trigger
    edit "schedule-once"
        set trigger-type scheduled
        set trigger-frequency once
        set trigger-datetime 2022-08-05 04:00:00
    next
end
```

2. Configure the action:

```
config system automation-action
    edit "Backup Config Disk"
```

```
        set description "Backup the configuration on disk."
        set action-type system-actions
        set system-action backup-config
    next
end
```

3. Configure the stitch:

```
config system automation-stitch
    edit "backup-once"
        set trigger "schedule-once"
        config actions
            edit 1
                set action "Backup Config Disk"
                set required enable
            next
        end
    next
end
```

4. To view automation stitch information:

```
# diagnose test application autod 3
stitch: backup-once (scheduled)

        local hit: 0 relayed to: 0 relayed from: 0
        last trigger:   last relay:
        next scheduled trigger:Fri Aug  5 05:00:00 2022
        actions:
                Backup Config Dis:
                        done: 0 relayed to: 0 relayed from: 0
                        last trigger:                   last relay:

logid to stitch mapping:
id:0 (scheduled stitches) local hit: 0 relayed hits: 0
        backup-once
```

Actions

There are two types of automation actions that can be configured in automation stitches: static and dynamic.

Static automation actions are included in FortiOS by default. They require only a name, description, and one setting. Static automation actions can be edited, but they cannot be deleted.

Dynamic automation actions require multiple settings to be configured. Dynamic automation actions can be created by clicking the *Create New* button on the *Action* tab, or clicking *Create* within the *Create Automation Stitch* page.

Multiple actions can be added to an automation stitch. Actions can be reorganized in the *Edit Automation Stitch* page by dragging and dropping the actions in the diagram.

The following table outlines the available static actions.

Action	Description
Access Layer Quarantine	This option is only available for Compromised Host triggers. Quarantine the MAC address on access layer devices (FortiSwitch and FortiAP).
FortiClient Quarantine	This option is only available for Compromised Host triggers. Use FortiClient EMS to block all traffic from the source addresses that are flagged as compromised hosts. Quarantined devices are flagged on the Security Fabric topology views. Go to the *Dashboard* > *Assets & Identities* > *Quarantine* widget to view and manage quarantined IP addresses.
FortiNAC Quarantine	This option is only available for Compromised Host and Incoming Webhook triggers. Use FortiNAC to quarantine a client PC and disable its MAC address. See FortiNAC Quarantine action on page 3918 for details.
IP Ban	This option is only available for Compromised Host triggers. Block all traffic from the source addresses flagged by the IoC. Go to the *Dashboard* > *Assets & Identities* > *Quarantine* widget to view and manage quarantined IP addresses.
System Action > Backup Config Disk	Back up the FortiGate's configuration. The default minimum interval is 0 seconds. See System actions on page 3978 for an example.
System Action > Reboot FortiGate	Reboot the FortiGate. The default minimum interval is 5 minutes (300 seconds in the CLI). See System actions on page 3978 for an example.
System Action > Shutdown FortiGate	Shut down the FortiGate. The default minimum interval is 0 seconds.

The following table outlines the available dynamic actions.

Category	Action	Description
Security Response		
	VMware NSX Security Tag	This option is only available for Compromised Host triggers. If an endpoint instance in a VMware NSX environment is compromised, the configured security tag is assigned to the compromised endpoint. See VMware NSX security tag action on page 3921 and VMware NSX-T security tag action on page 3926 for details.
Notifications		
	Email	Send a custom email message to the selected recipients. At least one recipient and an email subject must be specified.

Category	Action	Description
		Enable *Send to FortiCare email* to send the message to the email address associated with the FortiCare Support entitlement. This is the FortiCloud email address visible on the *System > FortiGuard* page under the *FortiCare Support* license information. The email body can use parameters from logs or previous action results. Wrapping the parameter with %% will replace the expression with the JSON value for the parameter, for example: *%%results.source%%* is the source property from the previous action. Replacement messages can be enabled in the email body to create branded email alerts. See Replacement messages for email alerts on page 3930 for details.
	FortiExplorer Notification	Send push notifications to FortiExplorer Go for iOS. The FortiGate must be registered to FortiCare on the mobile app that will receive the notification.
	Slack Notification	Send a notification to a Slack channel. See Slack Notification action on page 3934 for details.
	Microsoft Teams Notification	Send a notification to channels in Microsoft Teams. See Microsoft Teams Notification action on page 3939 for details.
Cloud Compute		
	AWS Lambda	Send log data to an integrated AWS service. See AWS Lambda action on page 3944 for details.
	Azure Function	Send log data to an Azure function. See Azure Function action on page 3946 for details.
	Google Cloud Function	Send log data to a Google Cloud function. See Google Cloud Function action on page 3948 for details.
	AliCloud Function	Send log data to an AliCloud function. See AliCloud Function action on page 3949 for details.
General		
	CLI Script	Run one or more CLI scripts. See CLI script action on page 3951 for details. See Execute a CLI script based on memory and CPU thresholds on page 3955 for an example.
	Webhook	Send an HTTP request using a REST callback. See Webhook action on page 3960 for details, and Slack integration webhook on page 3974 and Microsoft Teams integration webhook on page 3976 for examples.
	Alert	Generate a FortiOS dashboard alert. This option is only available in the CLI.

Category	Action	Description
	Disable SSID	Disable the SSID interface. This option is only available in the CLI.

Variables in actions

A variable can be used to extract information from a trigger event, or the results of a previous action. When the variable is used within an action, the information can be inserted into the content of the new action.

For example, in an automation stitch where a trigger event is an event log and the action is an email notification, the email action can use the %%log%% variable to add the log into the email body. In an automation stitch which executes a webhook action followed by an email action, the email action can use the %%results%% variable to place the webhook results into the email body.

Both the %%log%% and %%results%% variables can use sub-variables to drill down on a portion of the source.

For instance, using the following trigger event log:

```
date=2025-02-06 time=18:32:21 devid="FGVM04TM2400xxxx" devname="FGDocs"
eventtime=1738895541338331122 tz="-0800" logid="0100032002" type="event" subtype="system"
level="alert" vd="root" logdesc="Admin login failed" sn="0" user="abc" ui="https(192.168.2.204)"
method="https" srcip=192.168.2.204 dstip=192.168.2.87 action="login" status="failed"
reason="passwd_invalid" msg="Administrator abc login failed from https(192.168.2.204) because of
invalid password"
```

- %%log.user%% returns abc
- %%log.status%% returns failed
- %%log.devname%% returns FGDocs
- Sub-variables are determined by the log format and output.

Conversely, %%results%% requires an input from a previous action that returns a valid JSON payload. For example, this could be a JSON payload from a webhook action:

```
{
    "x": "example content x",
    "y": "example content y",
    "results": {
        "port1": {
            "ip": "10.10.10.15",
            "allowaccess": "https"
        }
    },
    "speeds": [
        100,
        1000,
        10000
    ]
}
```

- %%results.result.port1.ip%% returns 10.10.10.15
- %%results.result.port1.allowaccess%% returns https

- `%%results.x%%` returns `example content x`
- `%%results[set_ip].y%%` returns the value of property `y` from a previous action called `set_ip`
- `%%results.speeds.1%%` returns the item in the array index 1 from the array `speeds`

FortiNAC Quarantine action

Users can configure an automation stitch with the FortiNAC Quarantine action with a Compromised Host or Incoming Webhook trigger. When the automation is triggered, the client PC will be quarantined and its MAC address is disabled in the configured FortiNAC.

In this example, the FortiNAC has been configured to join an enabled Security Fabric. See Configuring FortiNAC on page 3773 for more information.

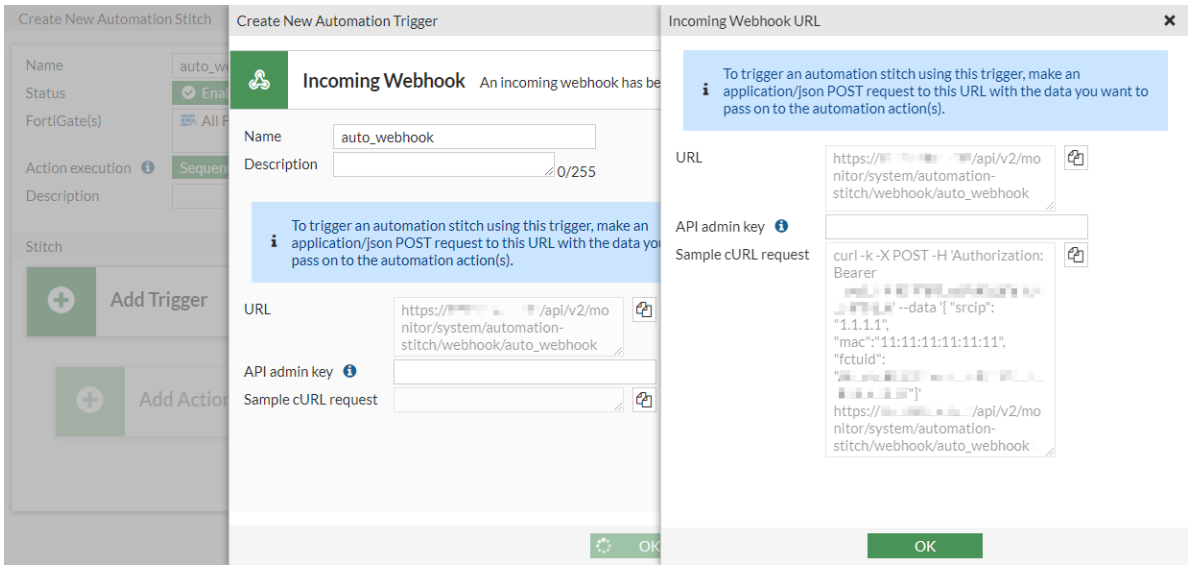
The FortiNAC must also be configured to isolate disabled hosts:

- Endpoints connecting to FortiWiFi or wired ports on FortiGate:
  - See the requisite *Configure FortiNAC* section in the FortiGate Endpoint Management Integration Guide.
- Endpoints connecting to FortiAP:
  - Set the *Dead End* VLAN. See Model configuration.
- Endpoints connecting to FortiSwitch:
  - Set the *Dead End* VLAN. See Model configuration.
  - Add the switch to the physical address filtering group. See Systems groups and Modify a group.

To configure an automation stitch with a FortiNAC quarantine action in the GUI:

1. Create a new API user and generate the API key:
   a. Go to *System* > *Administrators* and click *Create New* > *REST API Admin*.
   b. Configure the settings as needed.
   c. Click *OK*. The *New API key* window opens.
   d. Copy the key to the clipboard and click *Close*.

   e. Click *OK*.
2. Configure the automation stitch trigger:
   a. Go to *Security Fabric* > *Automation* and click *Create New*.
   b. Enter the stitch name (*auto_webhook*).
   c. Click *Add Trigger*.
   d. Click *Create* and select *Incoming Webhook*.
   e. Enter a name (*auto_webhook*).
   f. Click *OK*.
   g. Paste the key in the *API admin key* field.



h. Click *OK*.

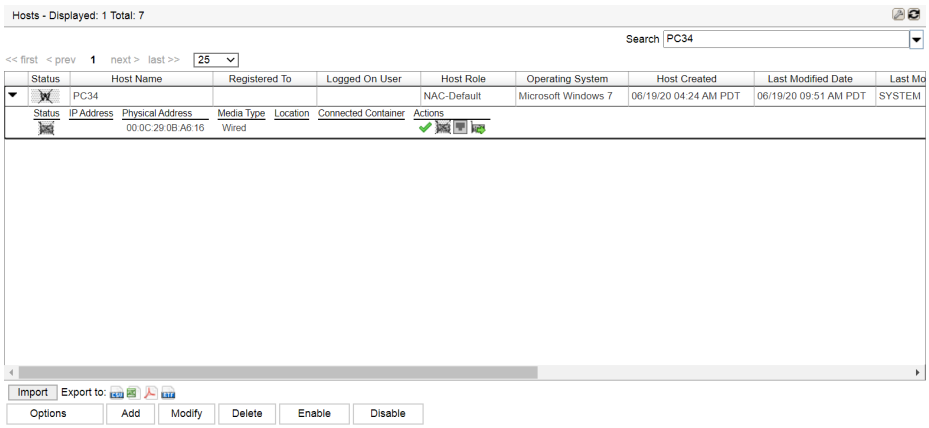
i. Select the trigger in the list and click *Apply*.

3. Configure the automation stitch action:
   a. Click *Add Action*.
   b. Select *FortiNAC Quarantine*.
   c. Click *Apply*.
   d. Click *OK*.
4. On a Linux PC accessible by the FortiGate, create a cURL request to trigger the automation stitch:

```
root@pc56:~# curl -k -X POST -H 'Authorization: Bearer ckx7d9xdzzx14Nztd1Ncr701dpwwy9' --data
'{ "srcip": "1.1.1.1", "mac":"00:0C:29:0B:A6:16", "fctuid":
"A8BA0B12DA694E47BA4ADF24F8358E2F"}'
https://172.17.48.225:4431/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
```

5. In FortiOS, verify the automation stitch is triggered and the action is executed:
   a. Go to *Log & Report* > *System Events* to confirm that the stitch was activated.
   b. Go to *Security Fabric* > *Automation* to see the last time that the stitch was triggered.

   In FortiNAC, the *Host View* shows the status of the client PC. It is quarantined and its MAC address is disabled.



To configure an automation stitch with a FortiNAC quarantine action in the CLI:

1. Create a new API user and generate the API key:

```
config system api-user
    edit "g-api-rw-user"
        set api-key ************
        set accprofile "super_admin"
        set vdom "root"
        config trusthost
            edit 1
                set ipv4-trusthost 10.6.30.0 255.255.255.0
            next
        end
    next
end
```

2. Configure the automation trigger:

```
config system automation-trigger
    edit "auto_webhook"
        set event-type incoming-webhook
    next
end
```

3. Configure the automation action:

```
config system automation-action
    edit "FortiNAC Quarantine"
        set action-type quarantine-fortinac
    next
end
```

4. Configure the automation stitch:

```
config system automation-stitch
    edit "auto_webhook"
        set trigger "auto_webhook"
```

```
        config actions
            edit 1
                set action "FortiNAC Quarantine"
                set required enable
            next
        end
    next
end
```

5. On a Linux PC accessible by the FortiGate, create a cURL request to trigger the automation stitch:

```
root@pc56:~# curl -k -X POST -H 'Authorization: Bearer ckx7d9xdzzx14Nztd1Ncr701dpwwy9' --data
'{ "srcip": "1.1.1.1", "mac":"00:0C:29:0B:A6:16", "fctuid":
"A8BA0B12DA694E47BA4ADF24F8358E2F"}'
https://172.17.48.225:4431/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
```

6. In FortiOS, verify that the automation stitch is triggered and the action is executed:

```
# diagnose test application autod 2
csf: enabled    root:yes
version:1592949233 sync time:Tue Jun 23 15:03:15 2020

total stitches activated: 1

stitch: auto_webhook
        destinations: all
        trigger: auto_webhook

                (id:15)service=auto_webhook

        local hit: 1 relayed to: 0 relayed from: 0
        actions:
                FortiNAC Quarantine type:quarantine-fortinac interval:0

msg="stitch:auto_webhook is triggered."
```

VMware NSX security tag action

If an endpoint instance in a VMware NSX environment is compromised, this action will assign the configured security tag to the compromised endpoint.

This action is only available when the automation trigger is set to compromised host.

To set up the NSX quarantine action, you need to:

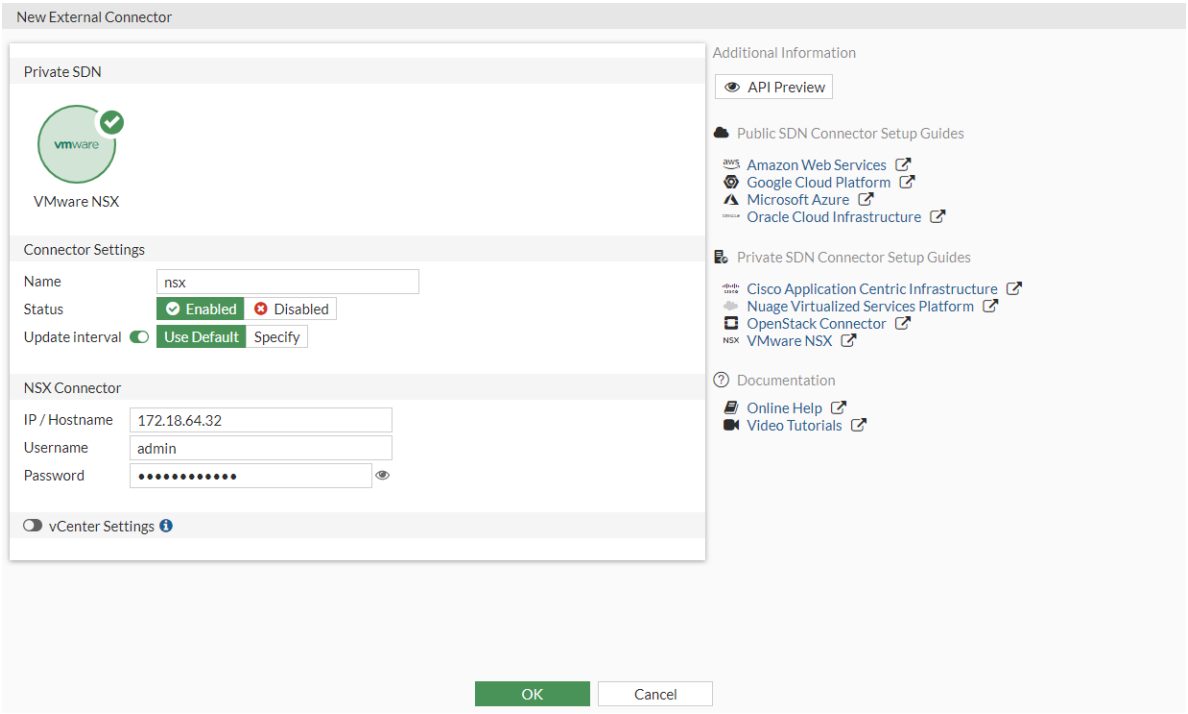
1. Configure a VMware NSX SDN connector
2. Configure an NSX security tag automation stitch
3. Configure FortiAnalyzer logging on the FortiGate

Configure a VMware NSX SDN connector

The FortiGate retrieves security tags from the VMware NSX server through the connector.

To configure a VMware NSX SDN connector in the GUI:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.
3. Select *VMware NSX*.
4. Configure the settings as needed.



5. Click *OK*.

To configure a VMware NSX SDN connector in the CLI:

```
config system sdn-connector
    edit "nsx"
        set type nsx
        set server "172.18.64.32"
        set username "admin"
        set password xxxxxxxxxxxx
    next
end
```

Configure an NSX security tag automation stitch

Security tags are retrieved from the VMware NSX server through the NSX SDN connector.

To configure an automation stitch with an NSX security tag in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name (*pcui-test*).
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Select *Compromised Host*.
   c. Click *Apply*.
4. Configure the VMware NSX Security Tag action:
   a. Click *Add Action*.
   b. Click *Create* and select *VMware NSX Security Tag*.
   c. Enter the following:

Name	pcui-test_quarantine-nsx
Specify NSX server(s)	Enable and select the SDN connector
Security tag	Select an existing tag, or create a new one

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure an automation stitch with an NSX security tag in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
    edit "Compromised Host"
```

```
    next
end
```

2. Create the automation action:

```
config system automation-action
    edit "pcui-test_quarantine-nsx"
        set action-type quarantine-nsx
        set security-tag "pcui-tag2"
        set sdn-connector "nsx"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "pcui-test"
        set trigger "Compromised Host"
        config actions
            edit 1
                set action "pcui-test_quarantine-nsx"
                set required enable
            next
        end
    next
end
```

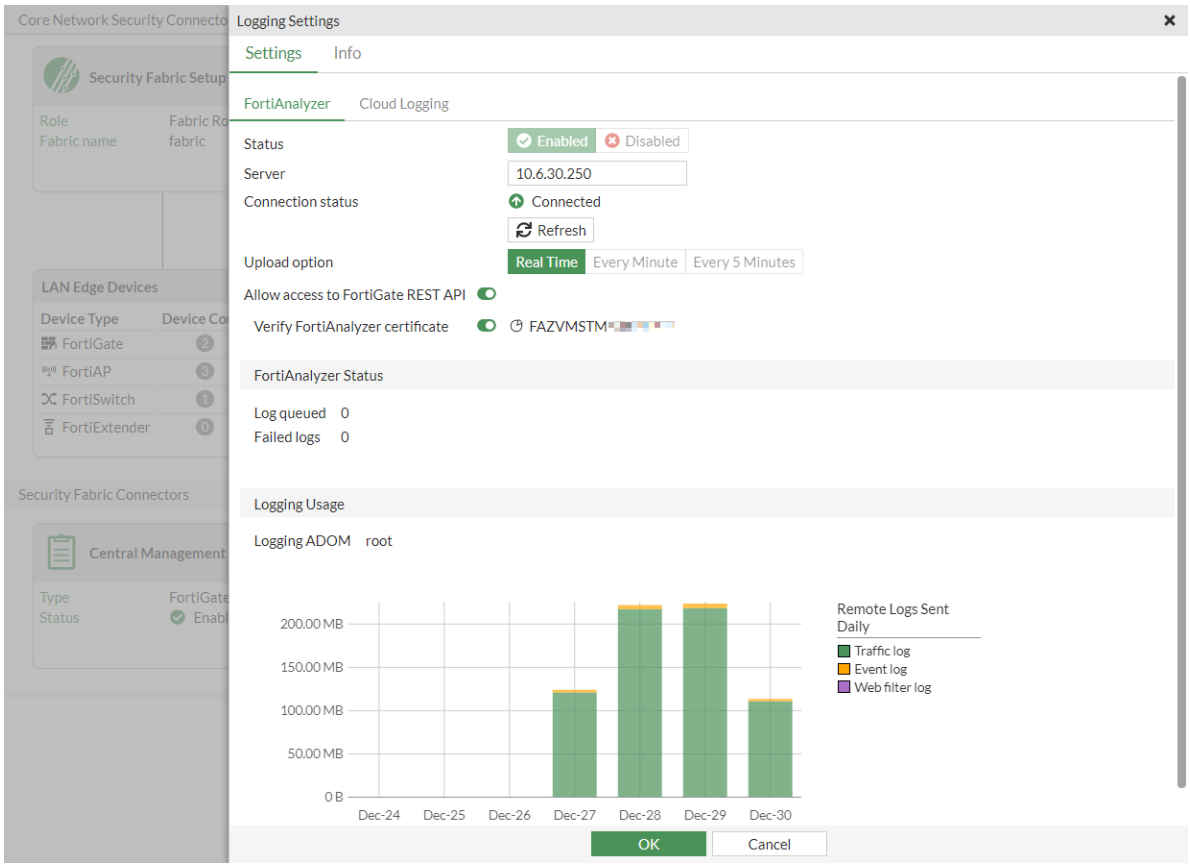
Configure FortiAnalyzer logging on the FortiGate

The FortiAnalyzer is used to send endpoint compromise notification to the FortiGate.

See Configuring FortiAnalyzer on page 3711 for more information.

To configure FortiAnalyzer logging in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Logging & Analytics* card.
2. In the *FortiAnalyzer* tab, ensure the *Status* is *Enabled*, and configure the settings as needed.



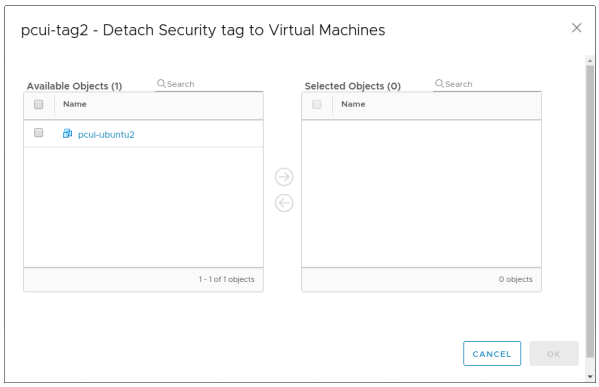
3. Click *OK*.

To configure FortiAnalyzer logging in the CLI:

```
config log fortianalyzer setting
    set status enable
    set server "172.18.64.234"
    set serial "FL-8HFT000000000"
    set upload-option realtime
    set reliable enable
end
```

When an endpoint instance is compromised

When an endpoint instance, such as *pcui-ubuntu2*, in the VMware NSX environment is compromised, the automation stitch is triggered. The FortiGate then assigns the configured security tag, *pcui-tag2* in this example, to the compromised NSX endpoint instance.



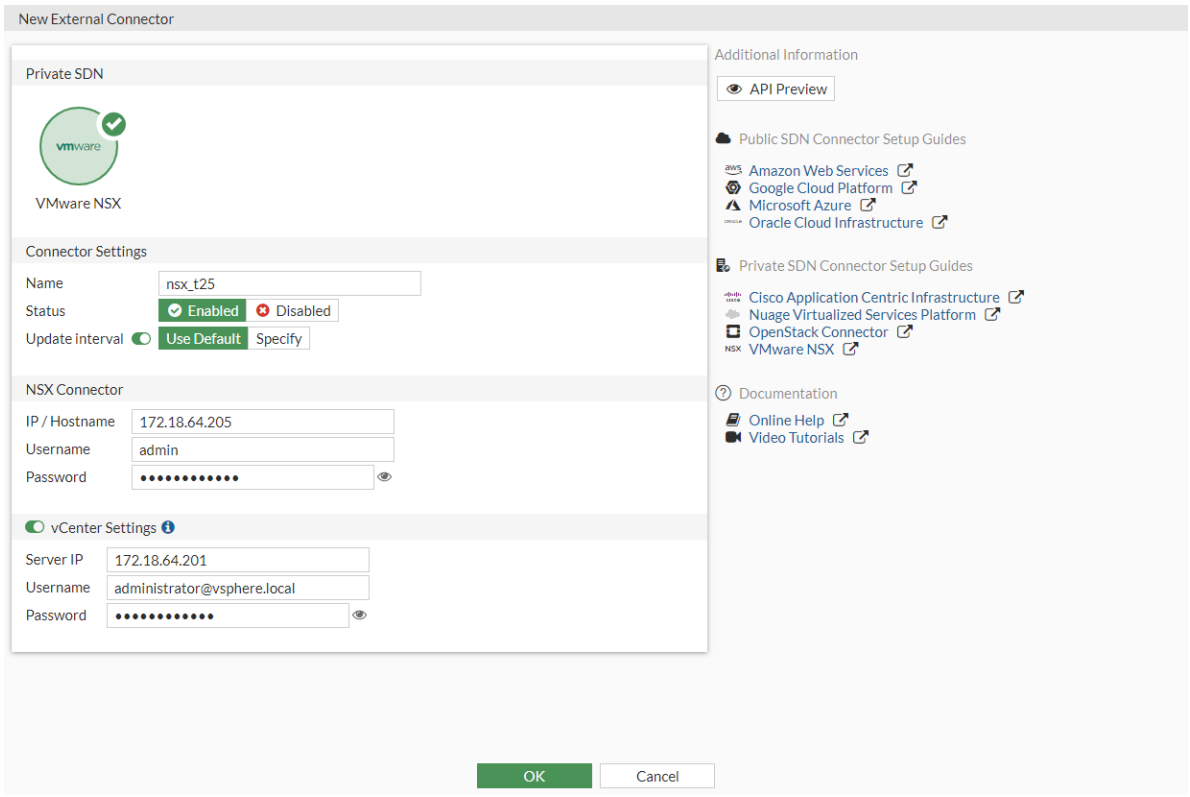
VMware NSX-T security tag action

VMware NSX SDN connectors' vCenter server and credentials can be configured so the FortiGate resolves NSX-T VMs. The FortiGate uses the VMWare NSX Security Tag automation action to assign a tag to the VM through an automation stitch.

The FortiGate is notified of a compromised host on the NSX-T network by an incoming webhook or other means, such as FortiGuard IOC. An automation stitch can be configured to process this trigger and action it by assigning a VMware NSX security tag on the VM instance.

To configure an automation stitch to assign a security tag to NSX-T VMs in the GUI:

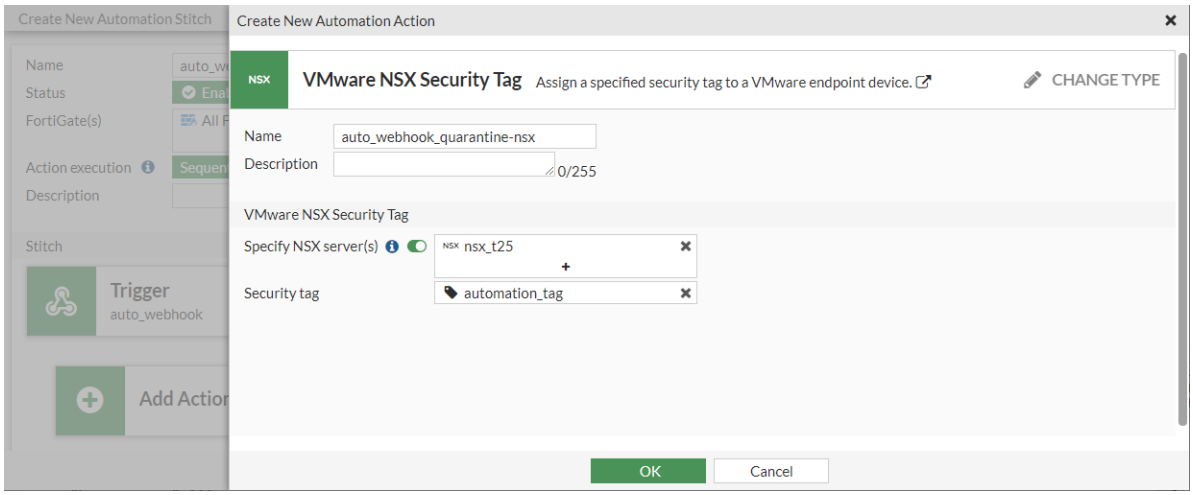
1. Configure the NSX SDN connector:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. Select *VMware NSX*.
   c. Configure the connector settings.
   d. Enable *vCenter Settings* and configure as needed.



e. Click *OK*.

2. Configure the automation stitch trigger:
   a. Go to *Security Fabric > Automation* and click *Create New*.
   b. Enter the stitch name (*auto_webhook*).
   c. Click *Add Trigger*.
   d. Click *Create* and select *Incoming Webhook*.
   e. Enter a name (*auto_webhook*).
   f. Click *OK* to close the *Incoming Webhook URL* prompt.
   g. Select the trigger in the list and click *Apply*.
3. Configure the automation stitch action:
   a. Click *Add Action*.
   b. Click *Create* and select *VMware NSX Security Tag*.
   c. Enter the following:

Name	auto_webhook_quarantine-nsx
Specify NSX server(s)	Enable and select the SDN connector
Security tag	Select an existing tag, or create a new one



d. Click *OK*.

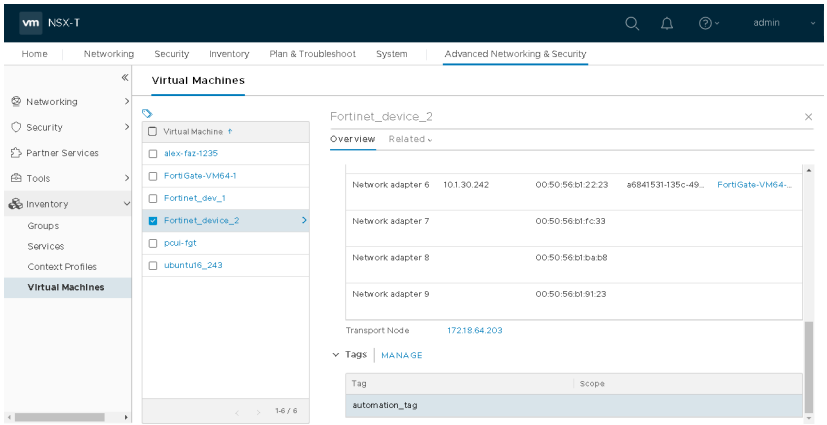
e. Select the action in the list and click *Apply*.

4. Click *OK*.

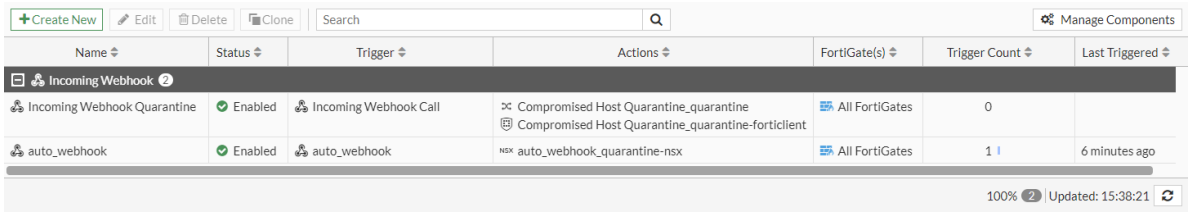
5. In NSX-T, create a cURL request to trigger the automation stitch on the FortiGate:

```
root@pc56:/home# curl -k -X POST -H 'Authorization: Bearer 3fdxNG08mgNg0fh4NQ51g1NQ1QHcxx' --
data '{ "srcip": "10.1.30.242"}' https://172.16.116.230/api/v2/monitor/system/automation-
stitch/webhook/auto_webhook
{
  "http_method":"POST",
  "status":"success",
  "http_status":200,
  "serial":"FGVM08TM20000000",
  "version":"v6.4.0",
  "build":1608
}
```

The automation stitch is triggered and the configured tag is added to the NSX-T VM.



In FortiOS, the *Security Fabric* > *Automation* page shows the last trigger time.



To configure an automation stitch to assign a security tag to NSX-T VMs in the CLI:

1. Configure the NSX SDN connector:

```
config system sdn-connector
    edit "nsx_t25"
        set type nsx
        set server "172.18.64.205"
        set username "admin"
        set password xxxxxxxxxxxx
        set vcenter-server "172.18.64.201"
        set vcenter-username "administrator@vsphere.local"
        set vcenter-password xxxxxxxxxxxx
    next
end
```

2. Configure the automation stitch:

```
config system automation-trigger
    edit "auto_webhook"
        set trigger-type event-based
        set event-type incoming-webhook
    next
end
```

```
config system automation-action
    edit "auto_webhook_quarantine-nsx"
        set action-type quarantine-nsx
        set security-tag "automation_tag"
        set sdn-connector "nsx_t25"
    next
end
```

```
config system automation-stitch
    edit "auto_webhook"
        set trigger "auto_webhook"
        config actions
            edit 1
                set action "auto_webhook_quarantine-nsx"
                set required enable
            next
        end
    next
end
```

3. In NSX-T, create a cURL request to trigger the automation stitch on the FortiGate:

```
root@pc56:/home# curl -k -X POST -H 'Authorization: Bearer 3fdxNG08mgNg0fh4NQ51g1NQ1QHcxx' --
data '{ "srcip": "10.1.30.242"}' https://172.16.116.230/api/v2/monitor/system/automation-
stitch/webhook/auto_webhook
{
  "http_method":"POST",
  "status":"success",
  "http_status":200,
  "serial":"FGVM08TM20000000",
  "version":"v6.4.0",
  "build":1608
}
```

To verify the automation stitch is triggered and the action is executed:

```
# diagnose test application autod 2

csf: enabled root:yes
version:1586883541 sync time:Tue Apr 14 11:04:05 2020

total stitches activated: 1

stitch: auto_webhook
destinations: all
trigger: auto_webhook

(id:15)service=auto_webhook

local hit: 1 relayed to: 0 relayed from: 0
actions:
auto_webhook_quarantine-nsx type:quarantine-nsx interval:0
security tag:automation_tag
sdn connector:
nsx_t25;
```

Replacement messages for email alerts

Automation stitches with an Email action can leverage the formatting options provided by replacement messages to create branded email alerts.

You can enable a replacement message and edit the message body or select a customized replacement message group when you configure the automation action. When the automation stitch is triggered, the FortiGate will send the email with the defined replacement message.

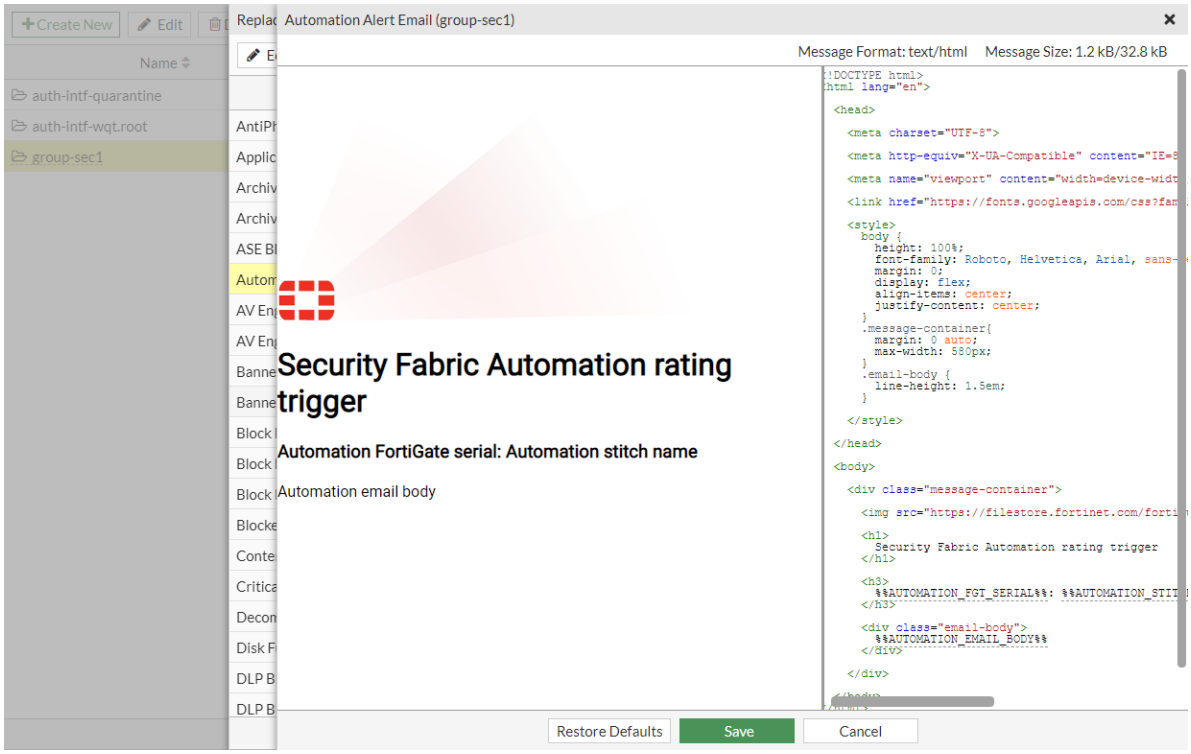
In this example, a Security Rating report triggers an Email notification action. The email uses a customized replacement message group.

To configure the replacement message group in the GUI:

1. Go to *System* > *Replacement Message Groups* and click *Create New*.
2. Enter the following:

Name	group-sec1
Group Type	Security

3. Click *OK*.
4. Select the group in the list and click *Edit*.
5. Select *Automation Alert Email* and click *Edit*.

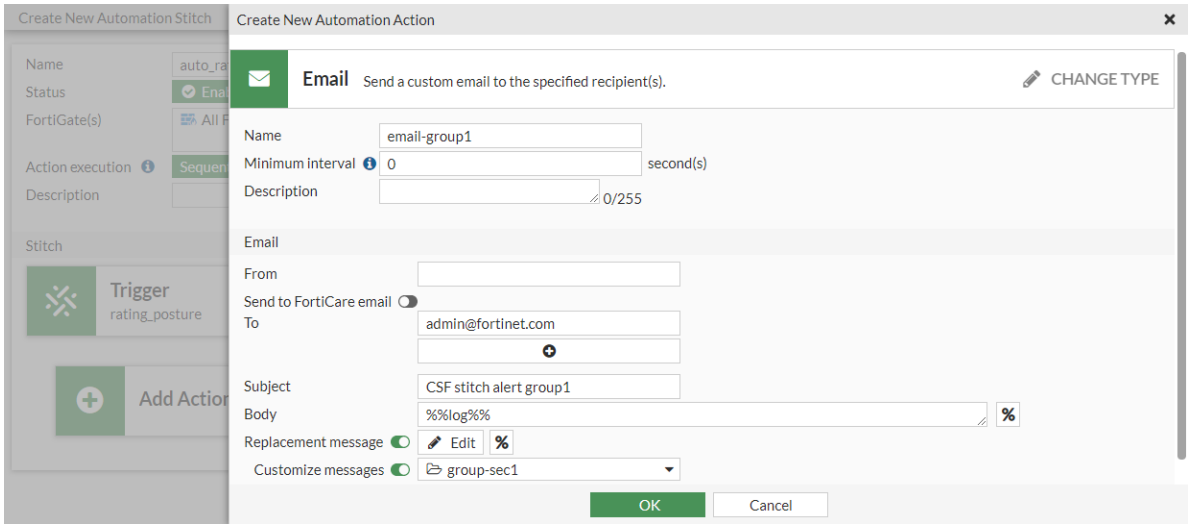


6. Edit the HTML code as needed, then click *Save*.

To configure the email action in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Select *Any Security Rating Notification*.
   c. Click *Apply*.
4. Configure the Email notification action:
   a. Click *Add Action*.
   b. Click *Create* and select *Email*.
   c. Enter the following:

Name	email-group1
To	Enter an email address
Subject	CSF stitch alert group1
Replacement message	Enable
Customize messages	Enable and select group-sec1 from the dropdown



d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Click *OK*.
6. Right-click the automation stitch, and click *Test Automation Stitch*.

   After the Security Rating report is finished, the automation is triggered, and the email is delivered with the customized replacement message in the email body.

To configure the replacement message group in the CLI:

```
config system replacemsg-group
    edit "group-sec1"
        set comment ""
```

```
        set group-type utm
        config automation
            edit "automation-email"
                set buffer "...<h1> Security Fabric Automation rating trigger </h1>..."
                ...
            next
        end
    next
end
```

To configure the email action in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
    edit "Any Security Rating Notification"
        set event-type security-rating-summary
        set report-type any
    next
end
```

2. Configure the automation action:

```
config system automation-action
    edit "email-group1"
        set action-type email
        set email-to "admin@fortinet.com"
        set email-subject "CSF stitch alert group1"
        set replacement-message enable
        set replacemsg-group "group-sec1"
    next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
    edit "auto_rating"
        set trigger "Any Security Rating Notification"
        config actions
            edit 1
                set action "email-group1"
                set required enable
            next
        end
    next
end
```

4. To view the automation stitch information after it is triggered:

```
# diagnose test application autod 3
stitch: auto_rating
        local hit: 1 relayed to: 0 relayed from: 0
```

```
        last trigger:Tue Mar 16 15:11:29 2021
        last relay:
        actions:
                email-group1:
                        done: 1 relayed to: 0 relayed from: 0
                        last trigger:Tue Mar 16 15:11:29 2021
                        last relay:

logid2stitch mapping:
id:52000  local hit: 1 relayed hits: 0
        auto_rating
```

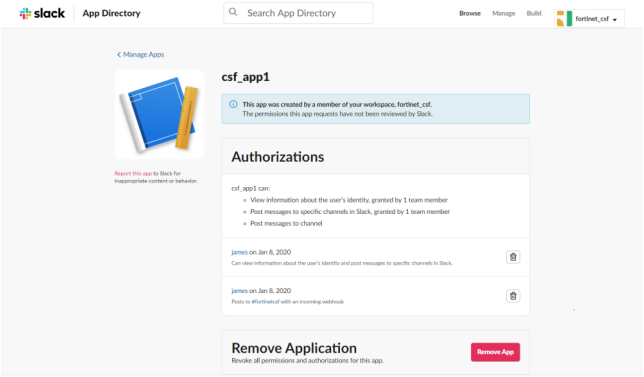
Slack Notification action

To configure an automation stitch with a Slack Notification action, you first need to configure an incoming webhook in Slack. Then you can enter the webhook URL when you configure the Slack Notification action.

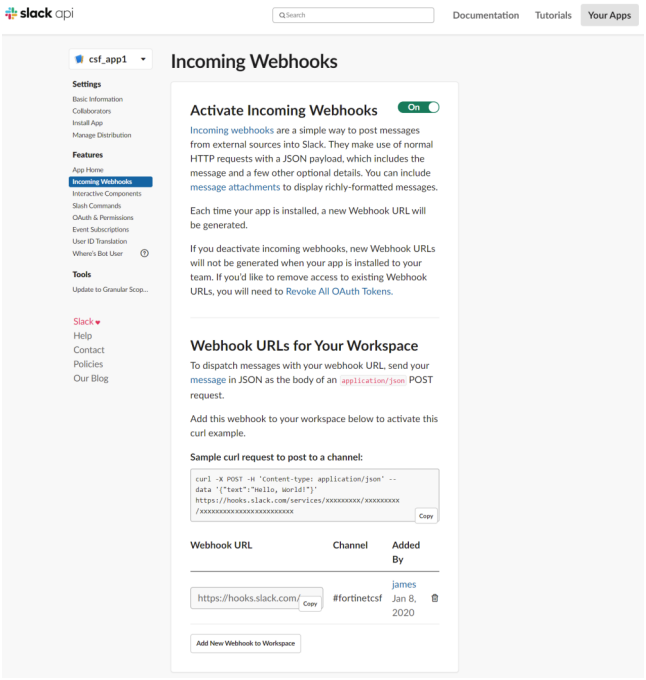
This example uses the default Any Security Rating Notification trigger in the automation stitch with two Slack Notification actions with different notification messages. One message is a custom message, and the other is for the Security Rating Summary log with a 90 second delay.

To create an Incoming Webhook in Slack:

1. Go to the Slack website, and create a workspace.
2. Create a Slack application for the workspace.



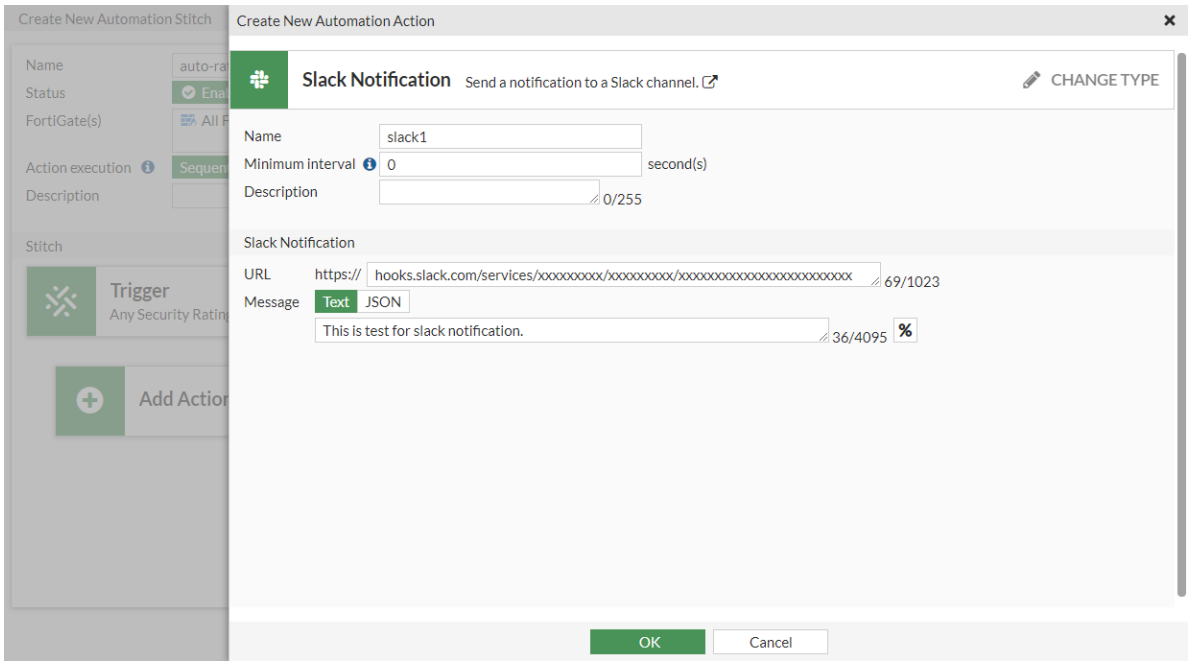
3. Add an Incoming Webhook to a channel in the workspace (see Sending messages using Incoming Webhooks for more details).
4. Activate the Incoming Webhook, and copy the *Webhook URL* to the clipboard.



To configure an automation stitch with Slack Notification actions in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Select *Any Security Rating Notification*.
   c. Click *Apply*.
4. Configure the first Slack Notification action:
   a. Click *Add Action*.
   b. Click *Create* and select *Slack Notification*.
   c. Enter the following:

Name	slack1
URL	Paste the webhook URL from the clipboard
Message	Text
Message text	This is test for slack notification.



d. Click *OK*.

e. Select the action in the list and click *Apply*.

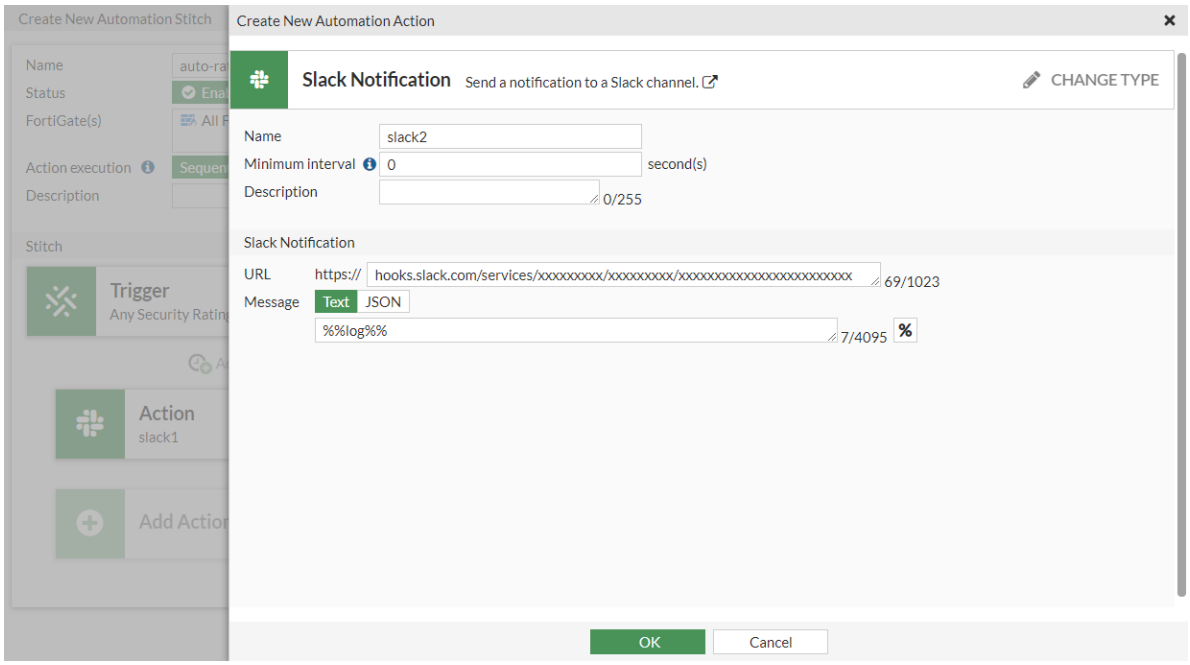
5. Configure the second Slack Notification action:

a. Click *Add Action*.

b. Click *Create* and select *Slack Notification*.

c. Enter the following:

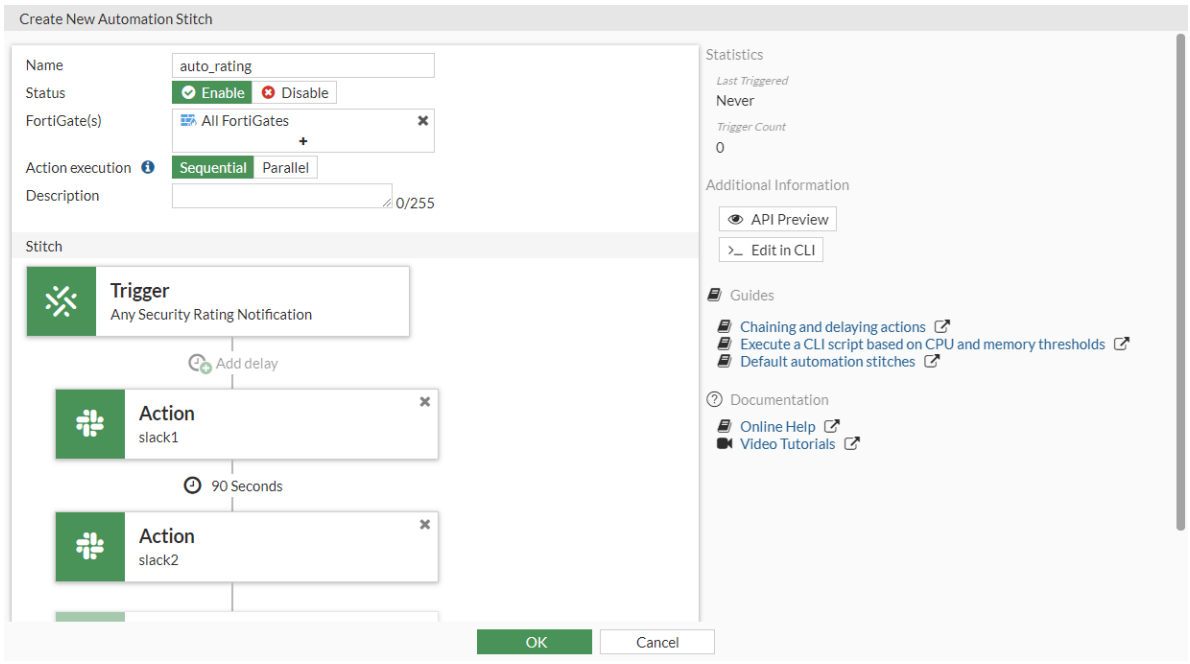
Name	slack2
URL	Paste the webhook URL from the clipboard
Message	Text
Message text	%%log%%



d. Click *OK*.

e. Select the action in the list and click *Apply*.

f. Click the *Add delay* located between both actions. Enter *90* and click *OK*.

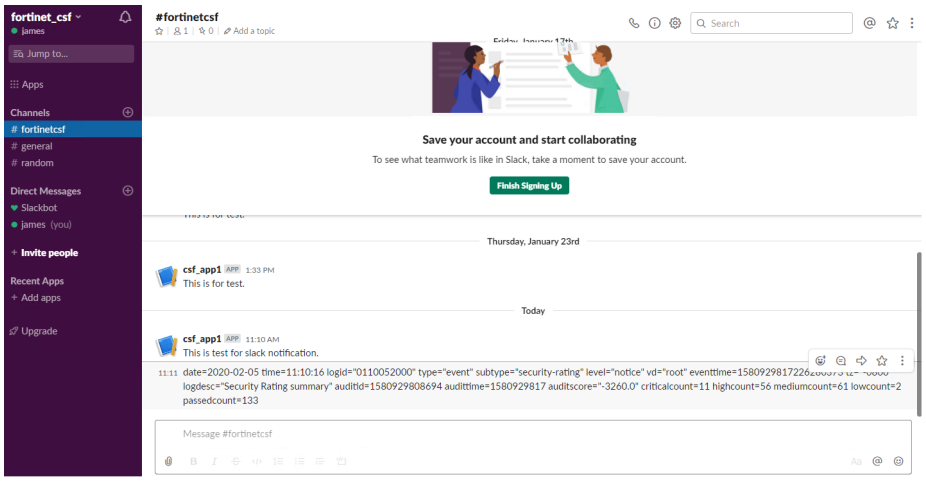


6. Click *OK*.

7. Trigger the automation stitch:

a. Right-click the automation stitch and select *Test Automation Stitch*.

After the Security Rating report is finished, the automation is triggered and an event log is created by the FortiGate. The two notifications are sent to the Slack channel.



To configure an automation stitch with Slack Notification actions in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
    edit "Any Security Rating Notification"
        set event-type security-rating-summary
        set report-type any
    next
end
```

2. Configure the automation actions:

```
config system automation-action
    edit "slack1"
        set action-type slack-notification
        set message "This is test for slack notification."
        set uri "hooks.slack.com/services/xxxxxxxxx/xxxxxxxxx/xxxxxxxxxxxxxxxxxxxxxxxx"
    next
    edit "slack2"
        set action-type slack-notification
        set uri "hooks.slack.com/services/xxxxxxxxx/xxxxxxxxx/xxxxxxxxxxxxxxxxxxxxxxxx"
    next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
    edit "auto_rating"
        set trigger "Any Security Rating Notification"
        config actions
            edit 1
                set action "slack1"
                set required enable
            next
            edit 2
                set action "slack2"
```

```
                set delay 90
                set required enable
            next
        end
    next
end
```

4. Verify that the automation action was triggered:

```
# diagnose test application autod 3
stitch: auto-rating
    local hit: 1 relayed to: 0 relayed from: 0
    last trigger:Wed Feb 05 11:10:23 2020
    last relay:
    actions:
        slack1:
            done: 1 relayed to: 0 relayed from: 0
            last trigger:Wed Feb 11:10:23 2020
            last relay:
        slack2:
            done: 1 relayed to: 0 relayed from: 0

```

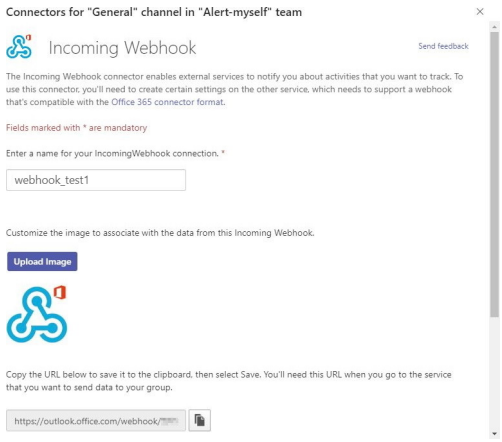
Microsoft Teams Notification action

Microsoft Teams Notification actions can be configured to send notifications to channels in Microsoft Teams. To trigger the notifications, you need to add an Incoming Webhook connector to a channel in Microsoft Teams, then you can configure the automation stitch with the webhook URL.

In the following example, you will configure an automation stitch with the default Any Security Rating Notification trigger and two Microsoft Teams Notification actions with different notification messages. One message is for the Security Rating Summary log, and the other is a custom message with a ten second delay.

To add the Incoming Webhook connector in a Microsoft Teams channel:

1. In Microsoft Teams, click the ... (*More options*) beside the channel name, and select *Connectors*.
2. Search for *Incoming Webhook* and click *Configure*.
3. Enter a name for the webhook, upload an image for the webhook, and click *Create*.
4. Copy the webhook to the clipboard and save it.

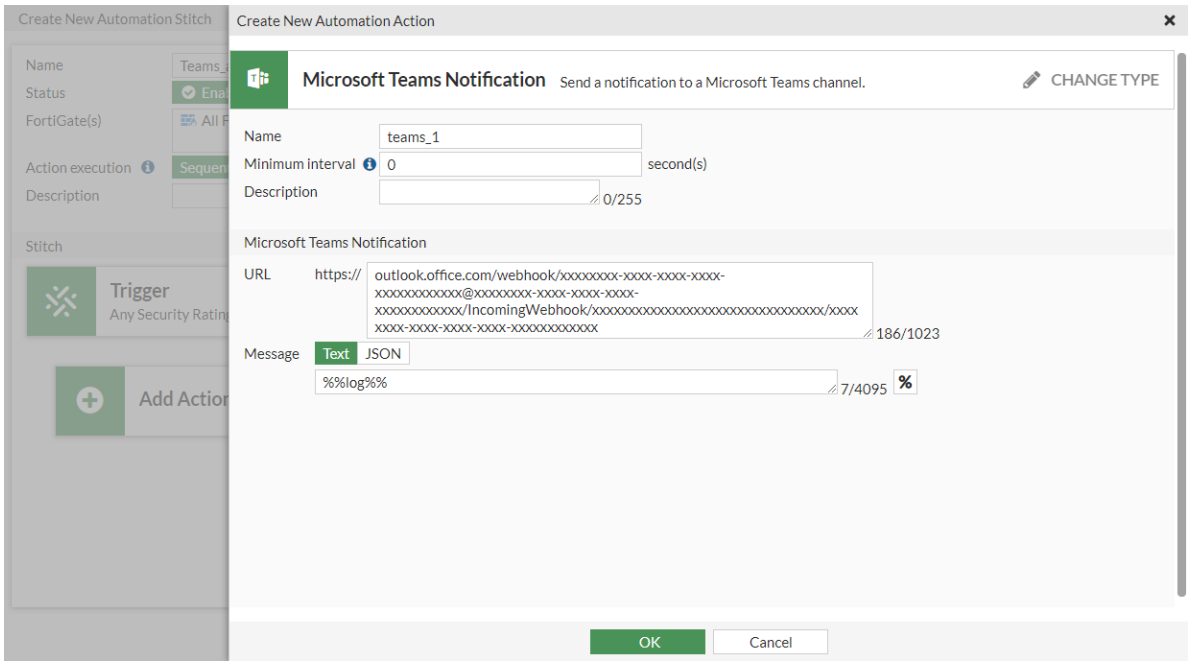


5. Click *Done*.

To configure an automation stitch with Microsoft Teams Notification actions in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Select *Any Security Rating Notification*.
   c. Click *Apply*.
4. Configure the first Microsoft Teams Notification action:
   a. Click *Add Action*.
   b. Click *Create* and select *Microsoft Teams Notification*.
   c. Enter the following:

Name	teams_1
URL	Paste the webhook URI from the clipboard
Message	Text
Message text	%%log%%



d. Click *OK*.

e. Select the action in the list and click *Apply*.

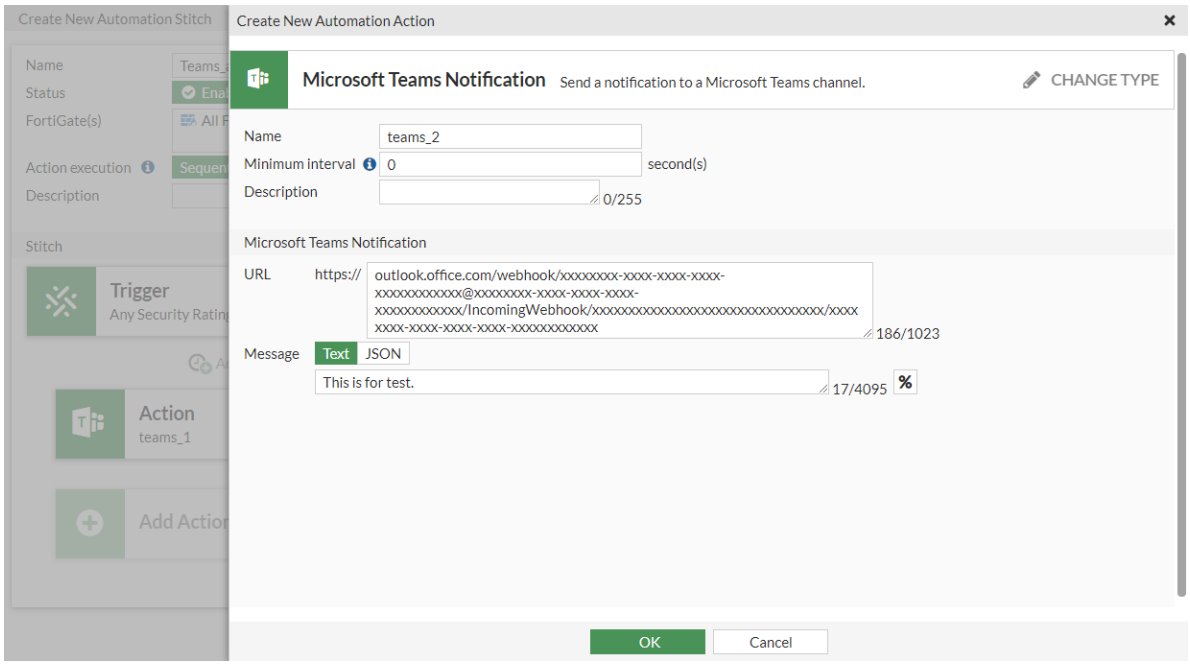
5. Configure the second Microsoft Teams Notification action:

a. Click *Add Action*.

b. Click *Create* and select *Microsoft Teams Notification*.

c. Enter the following:

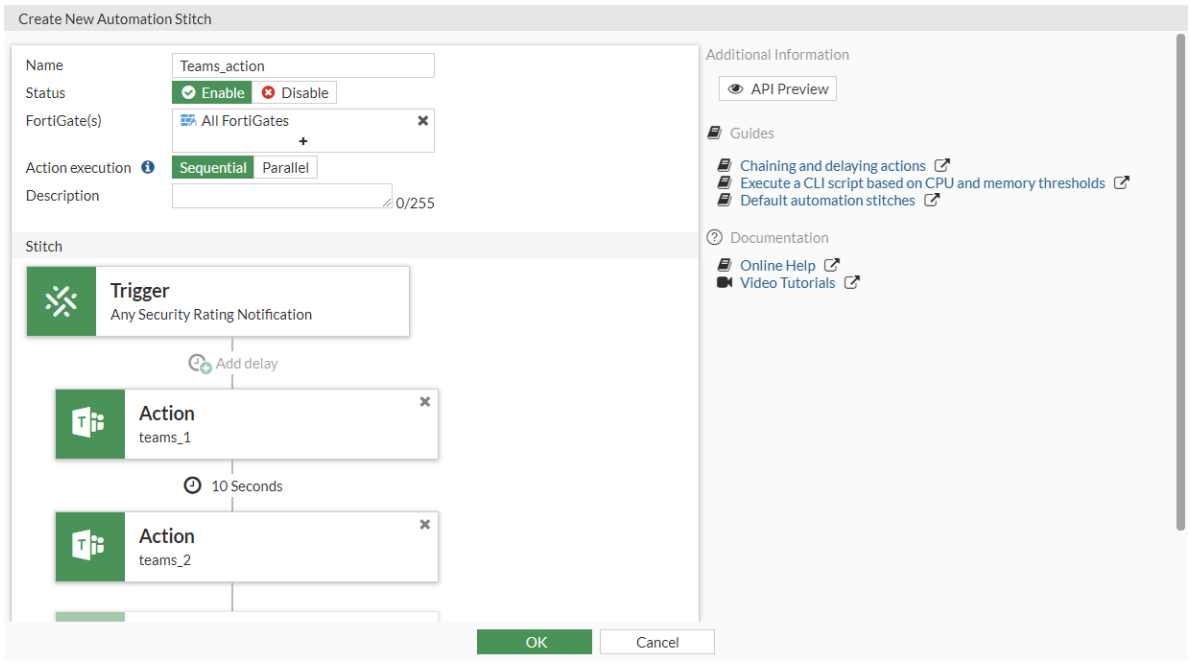
Name	teams_2
URL	Paste the webhook URI from the clipboard
Message	Text
Message text	This is for test.



d. Click *OK*.

e. Select the action in the list and click *Apply*.

f. Click the *Add delay* located between both actions. Enter *10* and click *OK*.

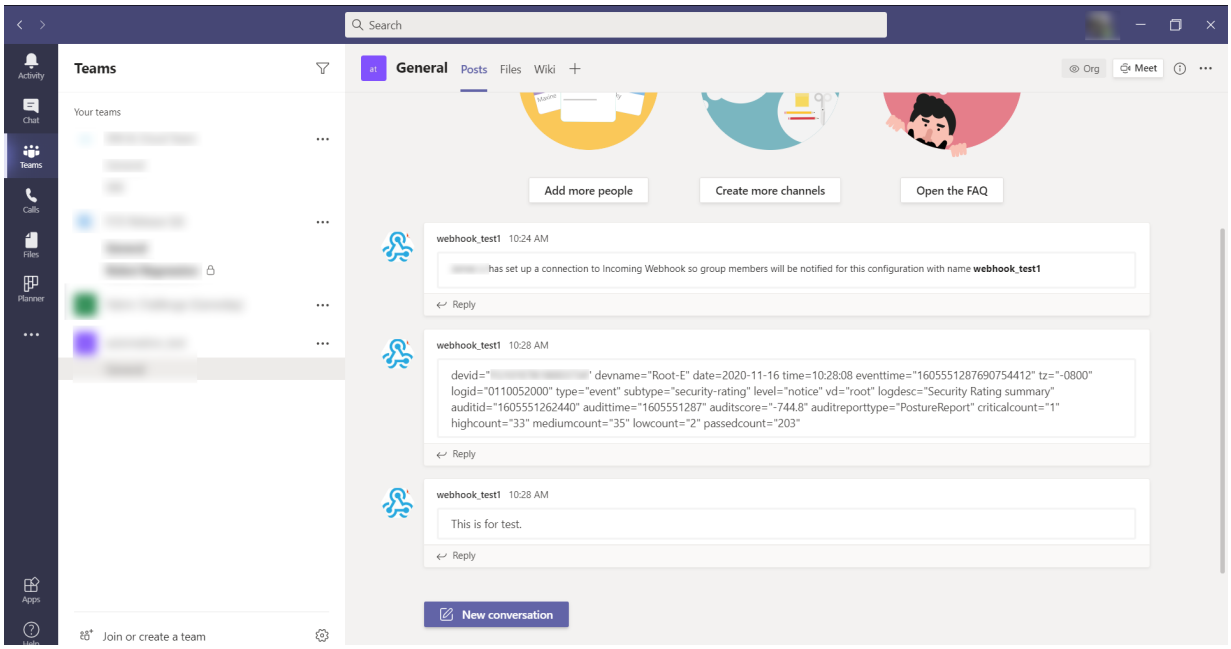


6. Click *OK*.

7. Trigger the automation stitch:

a. Right-click the automation stitch and select *Test Automation Stitch*.

After the Security Rating report is finished, the automation is triggered and an event log is created by the FortiGate. The two notifications are sent to the Microsoft Teams channel.



To configure an automation stitch with Microsoft Teams Notification actions in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
    edit "Any Security Rating Notification"
        set event-type security-rating-summary
        set report-type any
    next
end
```

2. Configure the automation actions:

```
config system automation-action
    edit "teams_1"
        set action-type microsoft-teams-notification
        set uri "outlook.office.com/webhook/xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx@xxxxxxxx-
xxxx-xxxx-xxxx-xxxxxxxxxxxx/IncomingWebhook/xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx/xxxxxxxx-xxxx-
xxxx-xxxx-xxxxxxxxxxxx"
    next
    edit "teams_2"
        set action-type microsoft-teams-notification
        set message "This is for test."
        set uri "outlook.office.com/webhook/xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx@xxxxxxxx-
xxxx-xxxx-xxxx-xxxxxxxxxxxx/IncomingWebhook/xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx/xxxxxxxx-xxxx-
xxxx-xxxx-xxxxxxxxxxxx"
    next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
    edit "Teams_action"
        set trigger "Any Security Rating Notification"
        config actions
            edit 1
                set action "teams_1"
                set required enable
            next
            edit 2
                set action "teams_2"
                set delay 10
                set required enable
            next
        end
    next
end
```

4. Verify that the automation action was triggered:

```
# diagnose test application autod 3
stitch: Teams_action
   local hit: 2 relayed to: 0 relayed from: 0
   last trigger:Mon Nov 16 10:28:08 2020
   last relay:

```

AWS Lambda action

AWS Lambda functions can be called when an automation stitch is triggered. This example uses the default Any Security Rating Notification trigger in the automation stitch.

To configure an AWS Lambda function automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Select *Any Security Rating Notification*.
   c. Click *Apply*.
4. Configure the AWS Lambda function action:

a. Click *Add Action*.
b. Click *Create* and select *AWS Lambda*.
c. Enter the following:

Name	aws-action-1
URL	Enter the request API URI
API key	Enter the API key
HTTP header	header2 : header2_value

d. Click *OK*.
e. Select the action in the list and click *Apply*.

5. Click *OK*.

To configure an AWS Lambda function automation stitch in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
    edit "Any Security Rating Notification"
        set event-type security-rating-summary
        set report-type any
    next
end
```

2. Create the automation action:

```
config system automation-action
    edit "aws-action-1"
        set action-type aws-lambda
        set aws-api-key *************
        set uri "0100000000.execute-api.us-east-2.amazonaws.com/default/xxxxx-autobatoon-XXX-
lambdaXXX"
        config http-headers
            edit 1
                set key "header2"
                set value "header2_value"
            next
        end
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-aws"
        set trigger "Any Security Rating Notification"
        config actions
            edit 1
                set action "aws-action-1"
                set required enable
```

```
            next
        end
    next
end
```

When the automation stitch is triggered, the *Security Fabric > Automation* page shows the stitch trigger time. In AWS, the log shows that the function was called, executed, and finished.

Azure Function action

Azure functions can be called when an automation stitch is triggered. This example uses the default Any Security Rating Notification trigger in the automation stitch.

To configure an Azure function automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Select *Any Security Rating Notification*.
   c. Click *Apply*.
4. Configure the Azure Function action:
   a. Click *Add Action*.
   b. Click *Create* and select *Azure Function*.
   c. Enter the following:

Name	azure_function
URL	Enter the request API URI
Authorization	Function
API key	Enter the API key
HTTP header	header1 : value1

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure an Azure function automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "Any Security Rating Notification"
        set event-type security-rating-summary
        set report-type any
```

```
    next
end
```

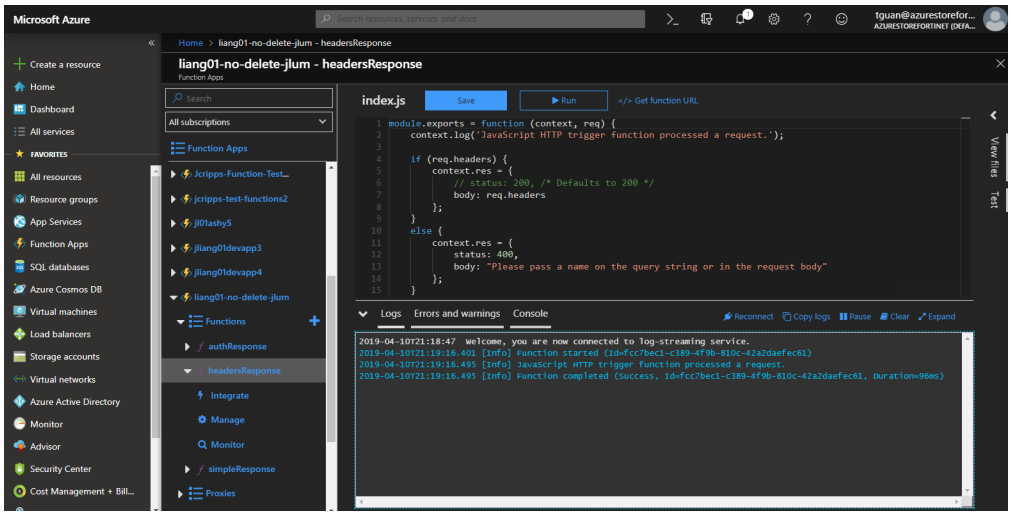
2. Create an automation action:

```
config system automation-action
    edit "azure_function"
        set action-type azure-function
        set azure-function-authorization function
        set azure-api-key **********
        set uri "xxxxx00-no-delete-xxxx.azurewebsites.net/api/headersResponse"
        config http-headers
            edit 1
                set key "header1"
                set value "value1"
            next
        end
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-azure"
        set trigger "Any Security Rating Notification"
        config actions
            edit 1
                set action "azure_function"
                set required enable
            next
        end
    next
end
```

When the automation stitch is triggered, the *Security Fabric > Automation* page shows the stitch trigger time. In Azure, the function log shows that the function was called, executed, and finished:



Google Cloud Function action

Google Cloud functions can be called when an automation stitch is triggered. This example uses the default Any Security Rating Notification trigger in the automation stitch.

To configure a Google Cloud function automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Select *Any Security Rating Notification*.
   c. Click *Apply*.
4. Configure the Google Cloud Function action:
   a. Click *Add Action*.
   b. Click *Create* and select *Google Cloud Function*.
   c. Enter the following:

Name	google-echo
URL	Enter the request API URI
HTTP header	echo-header : echo-value

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure a Google Cloud function automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "Any Security Rating Notification"
        set event-type security-rating-summary
        set report-type any
    next
end
```

2. Create an automation action:

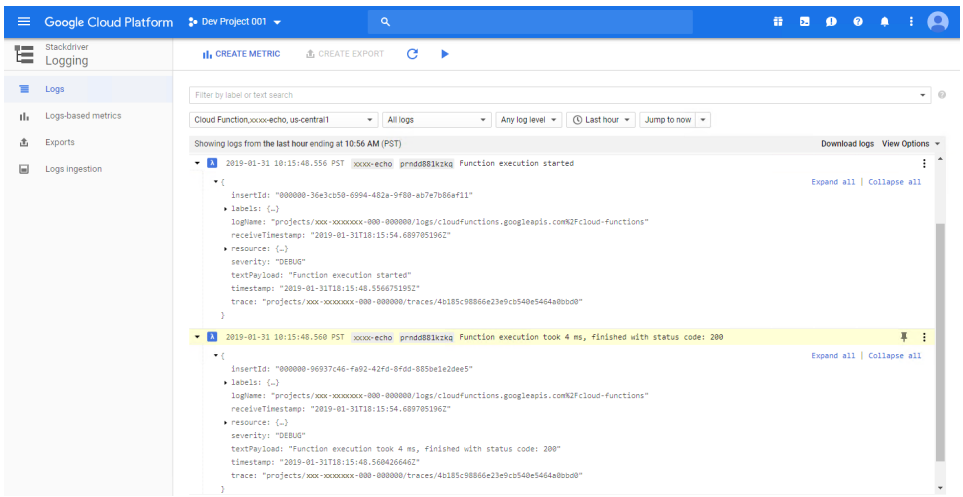
```
config system automation-action
    edit "google-echo"
        set action-type google-cloud-function
        set uri "us-central1-xxx-xxxxxxx-000-000000.cloudfunctions.net/xxxx-echo"
        config http-headers
            edit 1
                set key "echo-header"
                set value "echo-value"
            next
```

```
        end
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-google1"
        set trigger "Any Security Rating Notification"
        config actions
            edit 1
                set action "google-echo"
                set required enable
            next
        end
    next
end
```

When the automation stitch is triggered, the *Security Fabric > Automation* page shows the stitch trigger time. In Google Cloud, go to *Logs* to see the function log showing that the configured function was called, executed, and finished:



AliCloud Function action

AliCloud functions can be called when an automation stitch is triggered. This example uses the default Any Security Rating Notification trigger in the automation stitch.

To configure an AliCloud function automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Select *Any Security Rating Notification*.

c. Click *Apply*.

4. Configure the AliCloud Function action:
   a. Click *Add Action*.
   b. Click *Create* and select *AliCloud Function*.
   c. Enter the following:

Name	Ali-Action-1
URL	Enter the request API URI
Authorization	Function
AccessKey ID	Enter the access key ID
AccessKey Secret	Enter the access key secret

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure an AliCloud function automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "Any Security Rating Notification"
        set event-type security-rating-summary
        set report-type any
    next
end
```

2. Create an automation action:

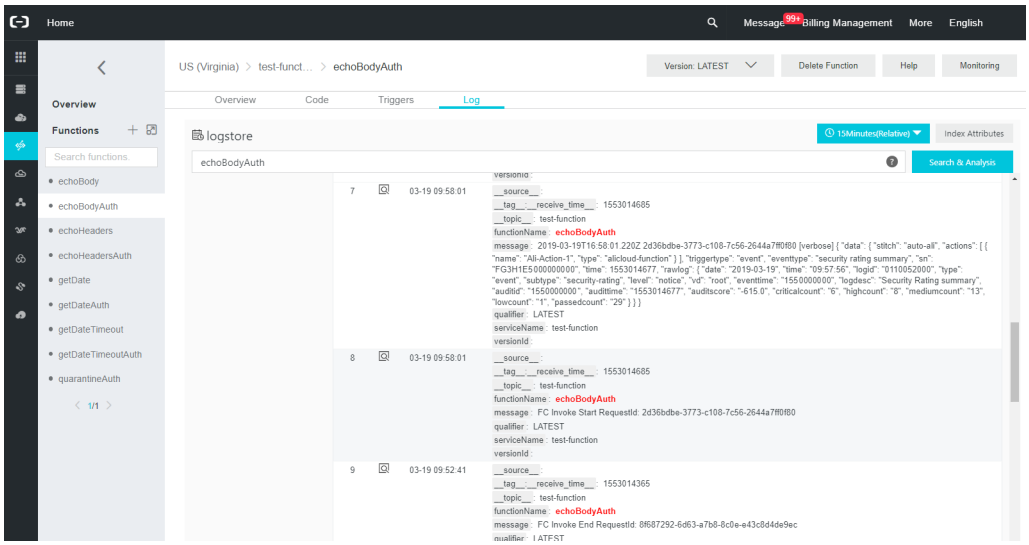
```
config system automation-action
    edit "Ali-Action-1"
        set action-type alicloud-function
        set alicloud-function-authorization function
        set alicloud-access-key-id "XXXXXxXXXXxxxxxx"
        set alicloud-access-key-secret xxxxxx
        set uri "0000000000000000.us-east-1.fc.aliyuncs.com/2099-99-99/proxy/test-
function/echoBodyAuth/"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-ali"
        set trigger "Any Security Rating Notification"
        config actions
            edit 1
                set action "Ali-Action-1"
                set required enable
```

```
            next
        end
    next
end
```

When the automation stitch is triggered, the *Security Fabric > Automation* page shows the stitch trigger time. In AliCloud, the function log shows that the function was called, executed, and finished:



CLI script action

The CLI script action can run when an automation stitch is triggered. It executes a series of commands in the CLI, as defined by the administrator. The scripts commands can be entered manually, uploaded as a file, or recorded in the CLI console. The output of the script can be fed as a variable (`%%results%%`) into the next action in the stitch. This could then be sent as an email using the email action, for example.

The CLI script action utilizes the *auto-script* feature to perform the execution of the script commands. The output size of the auto-script feature controls the size of the output for the script execution (10MB by default). This output is read into a buffer for use by the automation stitch action, and that buffer is limited to 192K characters for the email action. This means that the total allowable limit for CLI script output that is used in an email action is 192K characters. The buffer sizes for other actions may vary, for example the buffer to use the results in a webhook action could be a different size.

```
config system automation-action
    edit <name>
        set action-type cli-script
        set minimum-interval <integer>
        set script <string>
        set output-size <integer>
        set timeout <integer>
        set execute-security-fabric {enable | disable}
        set accprofile <profile>
```

```
    next
end
```

`minimum-interval <integer>`	Limit execution to no more than once in this interval, in seconds (0 - 2592000, 0 = no minimum, default = 0).
`script <string>`	The commands to be run by this CLI script action.
`output-size <integer>`	Set the size to limit the script output, in megabytes (1 - 1024, default = 10).
`timeout <integer>`	Set the maximum running time for this script, in seconds (0 - 300, 0 = no timeout, default = 0).
`execute-security-fabric {enable | disable}`	Enable/disable execution of CLI script on all or only one FortiGate unit in the Security Fabric. • `enable`: the action will run on all fabric devices. • `disable` (default): the action will run only on the device where the action was triggered.
`accprofile <profile>`	Access profile for CLI script action to access FortiGate features.

Certain diagnostic commands may not function as expected with CLI scripts and result in no output. For example, when used in a CLI script, the diagnostic command `dia test application dnsproxy 6` fails to produce any output because the cli-script feature does not support `daemon message()` prints.

Execute on Security Fabric (execute-security-fabric enable) can be used in a way where an event triggered on a device causes all devices to take the same action.

Some actions, such as `execute backup config ftp`, when taken on multiple devices could cause an overwrite on the FTP server when multiple devices run the same action at the same time.

Example

In this example, the script sets the idle timeout value to 479 minutes, and sends an email with the script output.

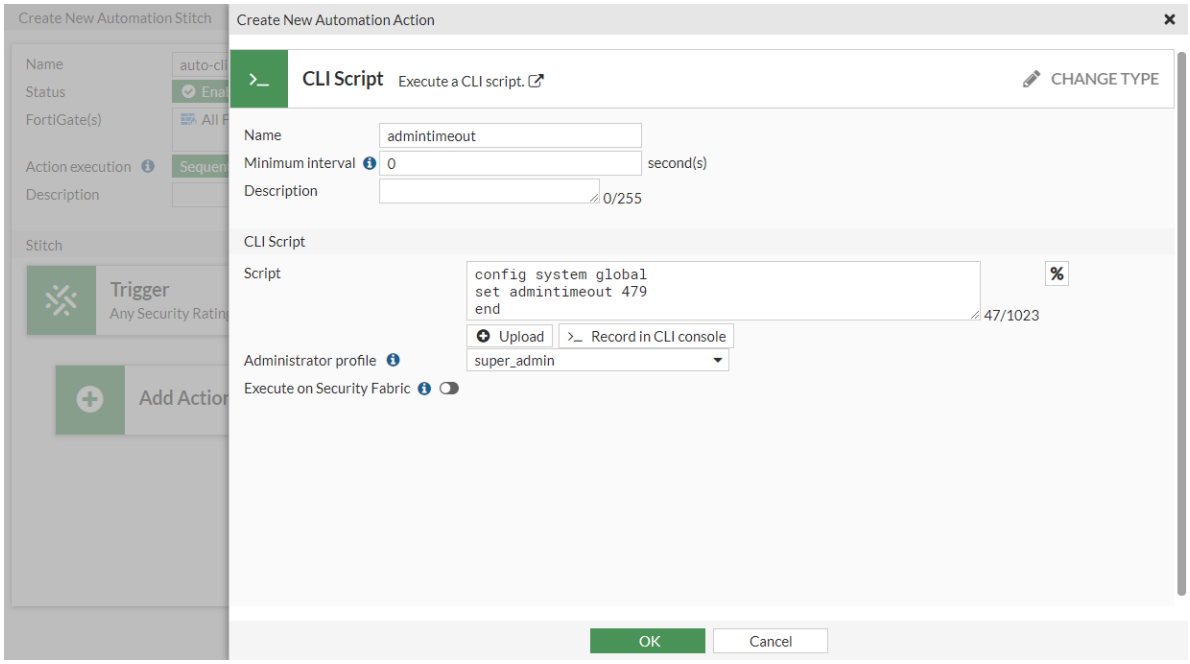
To configure a stitch with a CLI script action in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*auto-cli-1*).
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Select *Any Security Rating Notification*.
   c. Click *Apply*.
4. Configure the CLI Script action:
   a. Click *Add Action*.
   b. Click *Create* and select *CLI Script*.
   c. Enter the following:

Name	admintimeout

Script	`config system global`
	`    set admintimeout 479`
	`end`
	
	Alternatively, click *Upload* to upload a file, or click *>_Record in CLI console* and enter the CLI commands.

Administrator profile	Select a profile



d. Click *OK*.

e. Select the action in the list and click *Apply*.

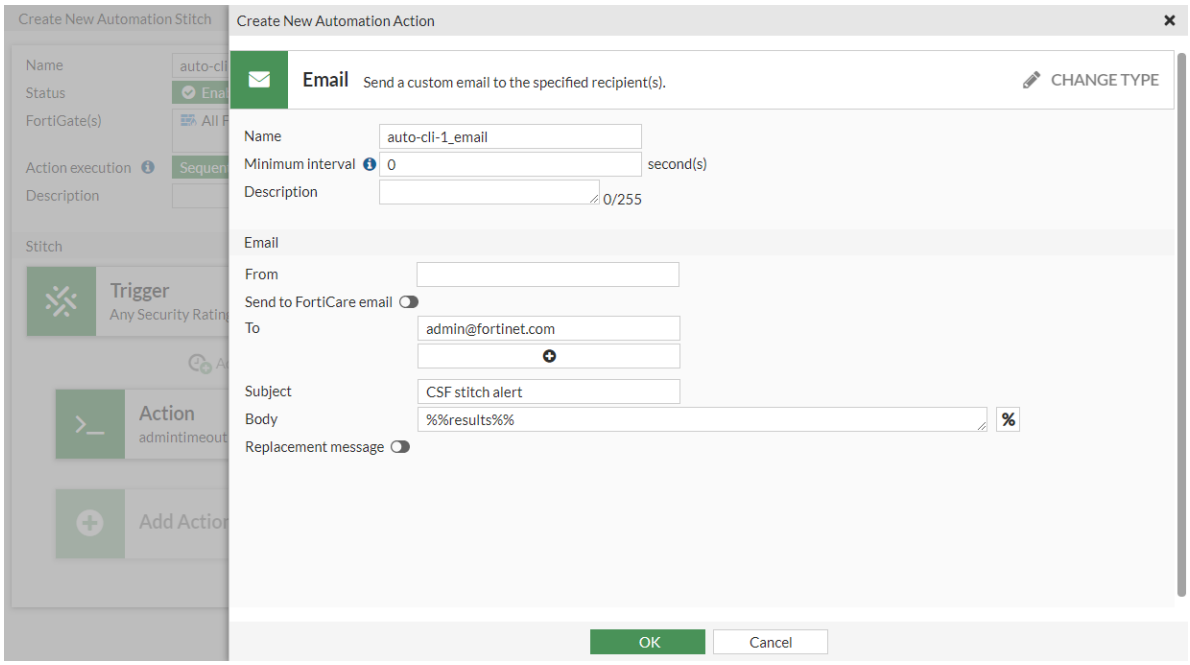
5. Configure the Email notification action:

a. Click *Add Action*.

b. Click *Create* and select *Email*.

c. Enter the following:

Name	auto-cli-1_email
To	Enter an email address
Subject	CSF stitch alert
Body	%%results%%



d. Click *OK*.

e. Select the action in the list and click *Apply*.

6. Click *OK*.

To configure a stitch with a CLI script action in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
    edit "Any Security Rating Notification"
        set event-type security-rating-summary
        set report-type any
    next
end
```

2. Create the automation actions:

```
config system automation-action
    edit "admintimeout"
        set action-type cli-script
        set script "config system global
            set admintimeout 479
            end"
        set output-size 10
        set timeout 0
        set accprofile "super_admin"
    next
    edit "auto-cli-1_email"
        set action-type email
        set email-to "admin@fortinet.com"
        set email-subject "CSF stitch alert"
```

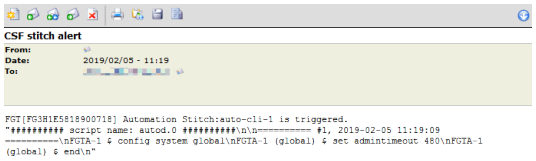
```
        set message "%%results%%"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-cli-1"
        set trigger "Any Security Rating Notification"
        config actions
            edit 1
                set action "admintimeout"
                set required enable
            next
            edit 2
                set action "auto-cli-1_email"
                set required enable
            next
        end
    next
end
```

Sample email

The email sent by the action will look similar to the following:



Execute a CLI script based on memory and CPU thresholds

Automation stitches can be created to run a CLI script and send an email message when memory or CPU usage exceeds specified thresholds.

CLI script action output that exceeds 64KB is sent as an attachment in the next email action.

To define memory and CPU usage thresholds:

```
config system global
    set cpu-use-threshold <percent>
    set memory-use-threshold-extreme <percent>
    set memory-use-threshold-green <percent>
    set memory-use-threshold-red <percent>
end
```

Where:

`cpu-use-threshold`	Threshold at which CPU usage is reported, in percent of total possible CPU utilization (default = 90).
`memory-use-threshold-extreme`	Threshold at which memory usage is considered extreme, and new sessions are dropped, in percent of total RAM (default = 95).
`memory-use-threshold-green`	Threshold at which memory usage forces the FortiGate to exit conserve mode, in percent of total RAM (default = 82).
`memory-use-threshold-red`	Threshold at which memory usage forces the FortiGate to enter conserve mode, in percent of total RAM (default = 88).

Configuring a high memory usage stitch

In this example, an automation stitch is created that runs a CLI script to collect debug information, and then email the results of the script to a specified email address when the memory usage causes the FortiGate to enter conserve mode.

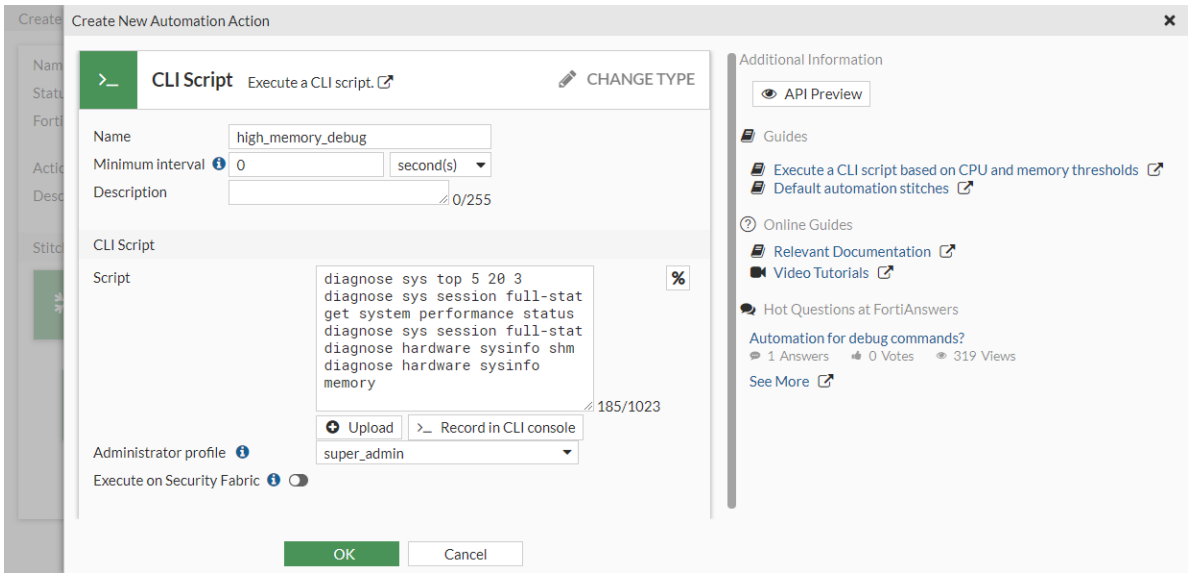
To create an automation stitch for high memory usage in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*auto_high_memory*).
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Select *Conserve Mode*.
   c. Click *Apply*.
4. Configure the CLI Script action:
   a. Click *Add Action*.
   b. Click *Create* and select *CLI Script*.
   c. Enter the following:

Name	high_memory_debug

Script	`diagnose sys top 5 20 3`
	`diagnose sys session full-stat`
	`get system performance status`
	`diagnose sys session full-stat`
	`diagnose hardware sysinfo shm`
	`diagnose hardware sysinfo memory`

Administrator profile	Select a profile



d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Configure the Email notification action:

a. Click *Add Action*.

b. Click *Create* and select *Email*.

c. Enter the following:

Name	auto_high_memory_email
To	Enter an email address
Subject	CSF stitch alert: high_memory
Body	%%results%%

d. Click *OK*.

e. Select the action in the list and click *Apply*.

6. Click *OK*.

To create an automation stitch for high memory usage in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
    edit "Conserve Mode"
        set event-type low-memory
    next
end
```

2. Create the automation actions:

```
config system automation-action
    edit "high_memory_debug"
        set action-type cli-script
```

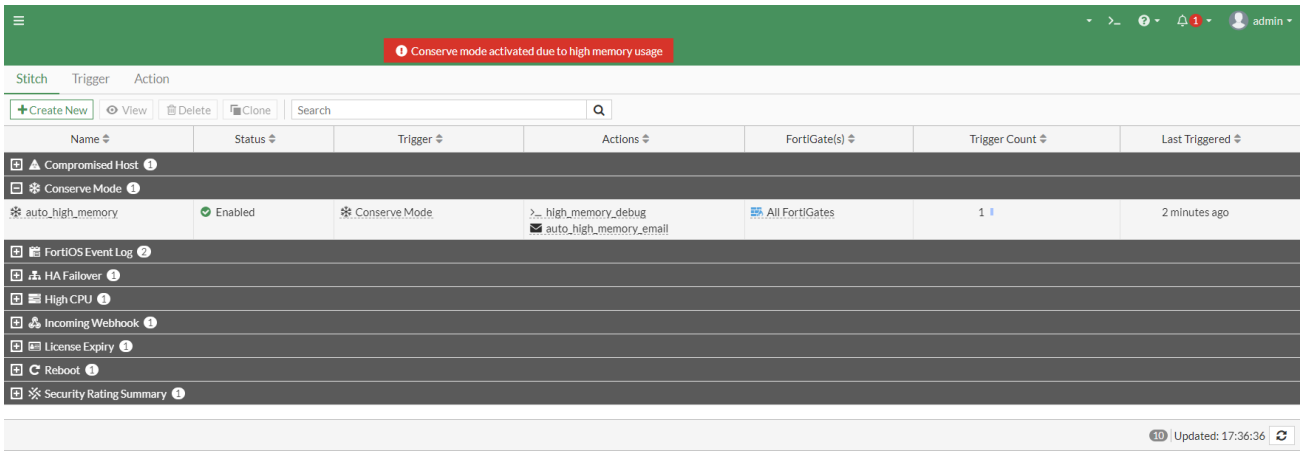
```
        set script "diagnose sys top 5 20 3
diagnose sys session full-stat
get system performance status
diagnose sys session full-stat
diagnose hardware sysinfo shm
diagnose hardware sysinfo memory"
        set output-size 10
        set timeout 0
        set accprofile "super_admin"
    next
    edit "auto_high_memory_email"
        set action-type email
        set email-to "person@fortinet.com"
        set email-subject "CSF stitch alert: high_memory"
        set message "%%results%%"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto_high_memory"
        set trigger "Conserve Mode"
        config actions
            edit 1
                set action "high_memory_debug"
                set required enable
            next
            edit 2
                set action "auto_high_memory_email"
                set required enable
            next
        end
    next
end
```

Results

When the FortiGate enters conserve mode due to the `memory-use-threshold-red` being exceeded, the GUI displays a notice, and the *auto_high_memory* automation stitch is triggered. This causes the CLI script to run and the script results are emailed to the specified address.



Here is sample text from the email message:

```
CSF stitch alert: high_memory

          httpsd     2573      S       0.0     2.4    0

...
```

Configuring a high CPU usage stitch

Similar to the previous example, an automation stitch can be created that runs a CLI script to collect debug information, and then email the results of the script to a specified email address when CPU usage threshold is exceeded (High CPU trigger).

The following commands are recommended for collecting debug information, but they are not the only options. Other commands can be used.

```
diagnose sys cmdb info
diagnose sys vd list | grep fib
diagnose sys top 5 20 2
diagnose sys session full-stat
diagnose sys session list | grep "\<dirty\>" -c
```

```
get system performance status
diagnose sys session full-stat
diagnose hardware sysinfo memory
diagnose sys cmdb info
diagnose sys vd list | grep fib
```

Webhook action

The webhook automation stitch action makes HTTP and HTTPS requests to a specified server, with custom headers, bodies, ports, and methods. It can be used to leverage the ubiquity of HTML requests and APIs to integrate with other tools.

The URI and HTTP body can use parameters from logs or previous action results. Wrapping the parameter with %% will replace the expression with the JSON value for the parameter, for example: *%%results.source%%* is the source property from the previous action.

In this example, a specific log message (failed administrator log in attempt) triggers the FortiGate to send the contents of the log to a server. The server responds with a generic reply. This example assumes that the server is already configured and able to communicate with the FortiGate.

To configure the webhook automation stitch in the GUI:

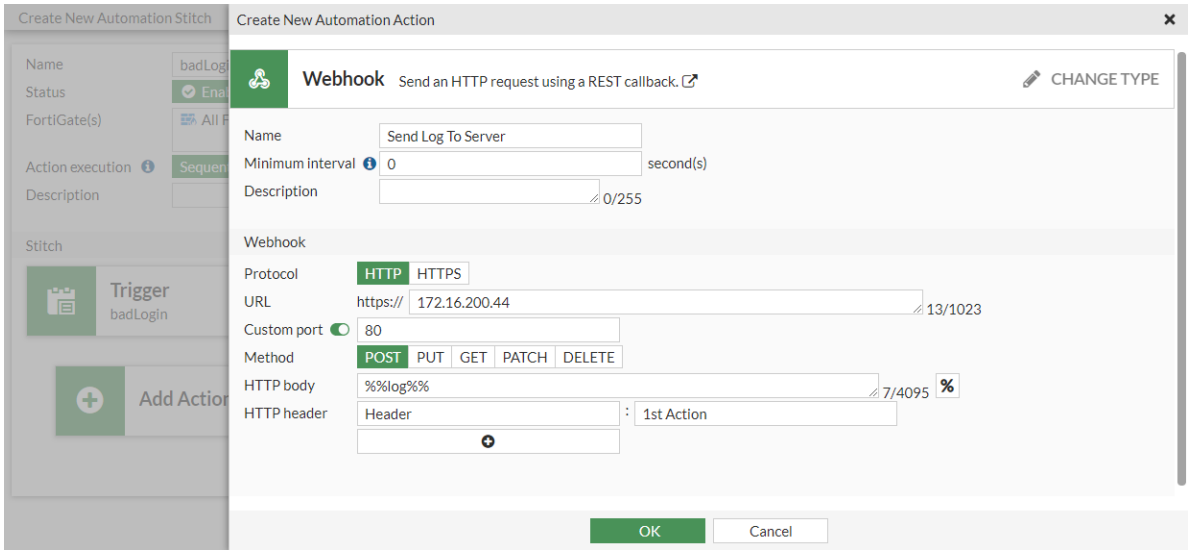
1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*badLogin*).
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *FortiOS Event Log*.
   c. Enter the following:

Name	badLogin
Event	Admin login failed

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the automation stitch action:
   a. Click *Add Action*.
   b. Click *Create* and select *Webhook*.
   c. Enter the following:

Name	Send Log To Server
Protocol	HTTP
URL	172.16.200.44
Custom port	Enable and enter 80

Method	POST
HTTP body	%%log%%
HTTP header	Header : 1st Action



d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Click *OK*.

To configure the webhook automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "badLogin"
        set event-type event-log
        set logid 32002
    next
end
```

2. Create the automation action:

```
config system automation-action
    edit "Send Log To Server"
        set action-type webhook
        set uri "172.16.200.44"
        set http-body "%%log%%"
        set port 80
        config http-headers
            edit 1
                set key "Header"
                set value "1st Action"
            next
        end
```

```
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "badLogin"
        set trigger "badLogin"
        config actions
            edit 1
                set action "Send Log To Server"
                set required enable
            next
        end
    next
end
```

To test the automation stitch:

1. Attempt to log in to the FortiGate with an incorrect username or password.
2. On the server, check the log to see that its contents were sent by the FortiGate.

   The body content is replaced with the log from the trigger.
3. On the FortiGate, go to *Log & Report* > *System Events* to confirm that the stitch was activated.
4. Go to *Security Fabric* > *Automation* to see the last time that the stitch was triggered.

Diagnose commands

To enable log dumping:

```
# diagnose test application autod 1
autod dumped total:1 logs, num of logids:1
autod log dumping is enabled

vdom:root(0) logid:32002 len:408 log:
date=2019-05-30 time=17:41:03 logid="0100032002" type="event" subtype="system" level="alert"
vd="root" eventtime=1559263263858888451 tz="-0700" logdesc="Admin login failed" sn="0"
user="admin" ui="http(10.6.30.254)" method="http" srcip=10.6.30.254 dstip=10.6.30.5 action="login"
status="failed" reason="passwd_invalid" msg="Administrator admin login failed from http
(10.6.30.254) because of invalid password"
autod log dumping is disabled
```

```
autod logs dumping summary:
        logid:32002 count:1

autod dumped total:1 logs, num of logids:1
```

To show the automation settings:

```
# diagnose test application autod 2
csf: enabled   root:yes
total stitches activated: 2

stitch: badLogin
       destinations: all
       trigger: badLogin

Webhook action with Twilio for SMS text messages

The FortiGate automation stitch framework can be used to interact with third-party services with webhooks to perform various tasks. A webhook action to Twilio can be used to automate tasks that send alerts and information to administrators by SMS text messages.

This topic includes two examples where the FortiGate uses webhooks to trigger Twilio to send SMS text messages to an administrator.

- Example 1: using an SD-WAN heath check to trigger a Twilio webhook action
- Example 2: using an incoming webhook to trigger a Twilio webhook action

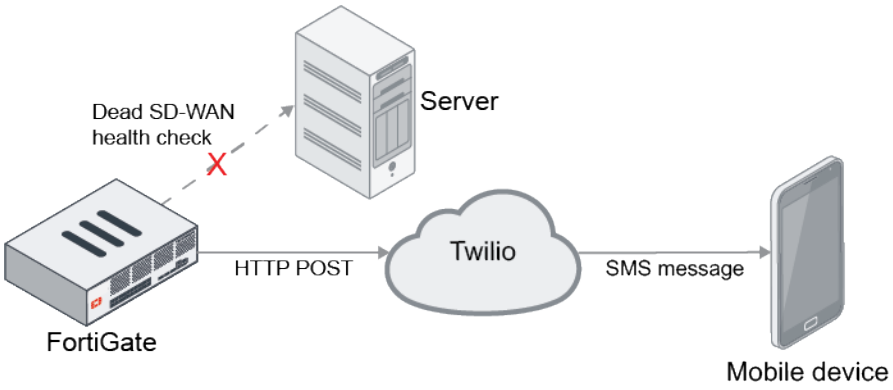
Prerequisites

- An active Twilio account with a virtual phone number that is able to send SMS text messages to the receiver in the desired region
- A valid Twilio Account SID and Auth token for sending SMS text messages

These examples assume that the Twilio account is already configured. For more information, see Creating or Updating Resources with the POST Method in the Twilio documentation.

Example 1: using an SD-WAN heath check to trigger a Twilio webhook action

In this example, an administrator wants to monitor the FortiGate's SD-WAN health, particularly when a dead health check is reported. An automation stitch will trigger the alert based on an SD-WAN log event (log ID 0113022931, SD-WAN SLA information warning) and perform a webhook action to inform Twilio to send an SMS message.



Sample SD-WAN log event

```
date=2023-01-13 time=10:39:26 eventtime=1673635167489361827 tz="-0800" logid="0113022931"
type="event" subtype="sdwan" level="warning" vd="root" logdesc="SDWAN SLA information warning"
eventtype="Health Check" healthcheck="Google" interface="VLAN1101" probeproto="ping"
oldvalue="alive" newvalue="dead" msg="SD-WAN health-check member changed state."
```

To configure the automation stitch in the GUI:

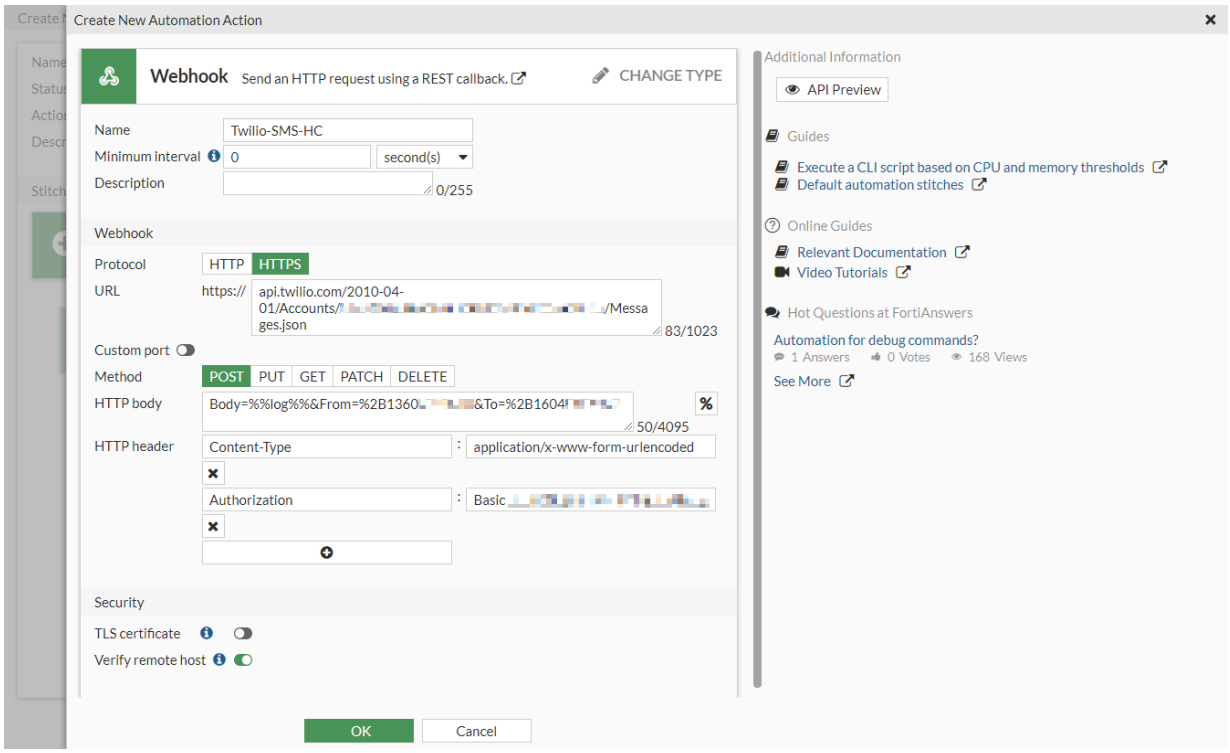
1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*SD-WAN-HC-Down-SMS*).
3. Configure the FortiOS event log trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *FortiOS Event Log*.
   c. Enter the following:

Name	*SD-WAN-HC-Down*
Event	*SDWAN SLA information warning*
Field filter(s)	Set *Field name* to *newvalue*. Set *Value* to *dead*.

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the webhook action:
   a. Click *Add Action*.
   b. Click *Create* and select *Webhook*.
   c. Enter the following:

Name	*Twilio-SMS-HC*
Protocol	*HTTPS*

URL	Enter the URL provided by Twilio for sending SMS messages using the POST method. The URL can be found in the cURL code sample in the following format: *https://api.twilio.com/2010-04-01/Accounts/<Twilio _Account_SID>/Messages.json*.
Method	*POST*
HTTP body	*Body=%%log%%&From=%2B1360x*******&To=%2B1604******* This string for the body text includes the SD-WAN log message, and the Twilio from and to phone numbers.
HTTP header	*Content-Type : application/x-www-form-urlencoded* *Authorization : Basic <Base64_encoded_authentication_code>*



d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Click *OK* to save the stitch.

To configure the automation stitch in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
    edit "SD-WAN-HC-Down"
        set event-type event-log
        set logid 22931
        config fields
            edit 1
```

```
                set name "newvalue"
                set value "dead"
            next
        end
    next
end
```

2. Configure the automation action:

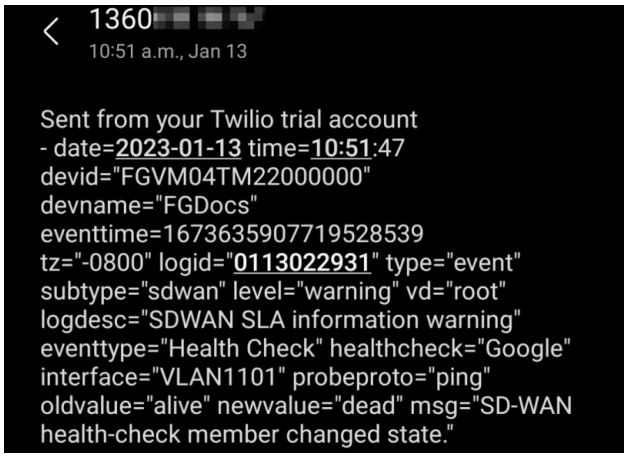
```
config system automation-action
    edit "Twilio-SMS-HC"
        set action-type webhook
        set protocol https
        set uri "api.twilio.com/2010-04-
01/Accounts/********************************/Messages.json"
        set http-body "Body=%%log%%&From=%2B1360*******&To=%2B1604*******"
        set port 443
        config http-headers
            edit 1
                set key "Content-Type"
                set value "application/x-www-form-urlencoded"
            next
            edit 2
                set key "Authorization"
                set value "Basic ************"
            next
        end
    next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
    edit "SD-WAN-HC-Down-SMS"
        set trigger "SD-WAN-HC-Down"
        config actions
            edit 1
                set action "Twilio-SMS-HC"
                set required enable
            next
        end
    next
end
```

Verification:

1. Simulate an SD-WAN health check failure to trigger the automation stitch.
2. Twilio sends an SMS message to the administrator.



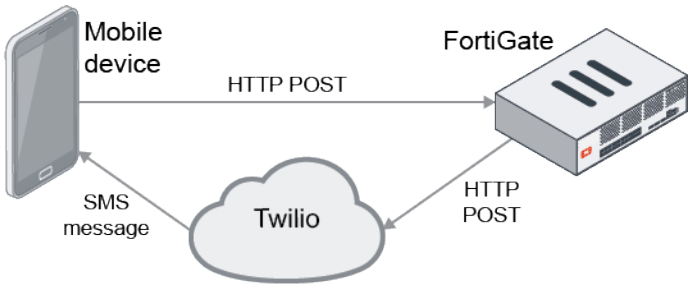
3. Go to *Security Fabric > Automation* and locate the *SD-WAN-HC-Down-SMS* stitch. The *Trigger Count* value has increased by one.

System log after the stitch was triggered:

```
date=2023-01-13 time=10:51:47 eventtime=1673635907720476287 tz="-0800" logid="0100046600"
type="event" subtype="system" level="notice" vd="root" logdesc="Automation stitch triggered"
stitch="SD-WAN-HC-Down-SMS" trigger="SD-WAN-HC-Down" stitchaction="Twilio-SMS-HC" from="log"
msg="stitch:SD-WAN-HC-Down-SMS is triggered."
```

Example 2: using an incoming webhook to trigger a Twilio webhook action

In this example, an administrator wants to trigger an automation stitch remotely to retrieve the device uptime with an SMS text message. An incoming webhook will be used to send an HTTP POST request to trigger the event to occur. Subsequently, the FortiGate performs a CLI action followed by a webhook action to inform Twilio to send an SMS text message.



A REST API administrator with write privileges must be configured to apply an API key to this incoming webhook. See REST API administrator on page 3196 for more information.

To configure the automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*Check-Uptime*).
3. Configure the incoming webhook trigger:

   a. Click *Add Trigger*.
   b. Click *Create* and select *Incoming Webhook*.
   c. Enter the trigger name (*Check-Uptime-Webhook*).
   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the CLI script action:
   a. Click *Add Action*.
   b. Click *Create* and select *CLI Script*.
   c. Enter the following:

Name	*Uptime*
Script	`get system performance status | grep Uptime`
Administrator profile	Select a profile with REST API write privileges (*prof_admin*)

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Configure the webhook action:
   a. Click *Add Action*.
   b. Click *Create* and select *Webhook*.
   c. Enter the following:

Name	*Twilio-SMS-Uptime*
Protocol	*HTTPS*
URL	Enter the URL provided by Twilio for sending SMS messages using the POST method. The URL can be found in the cURL code sample in the following format: *https://api.twilio.com/2010-04-01/Accounts/<Twilio_Account_SID>/Messages.json*.
Method	*POST*
HTTP body	*Body=%%results%%&From=%2B1360x*******&To=%2B1604******* This string for the body text includes the results from the preceding CLI script action.
HTTP header	*Content-Type : application/x-www-form-urlencoded* *Authorization : Basic <Base64_encoded_authentication_code>*

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
6. Click *OK* to save the stitch.

To configure the automation stitch in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
    edit "Check-Uptime-Webhook"
        set event-type incoming-webhook
    next
end
```

2. Configure the automation actions:

```
config system automation-action
    edit "Uptime"
        set action-type cli-script
        set script "get system performance status | grep Uptime"
        set accprofile "prof_admin"
    next
    edit "Twilio-SMS-Uptime"
        set action-type webhook
        set protocol https
        set uri "api.twilio.com/2010-04-
01/Accounts/********************************/Messages.json"
        set http-body "Body=%%results%%&From=%2B1360*******&To=%2B1604*******"
        set port 443
        config http-headers
            edit 1
                set key "Content-Type"
                set value "application/x-www-form-urlencoded"
            next
            edit 2
                set key "Authorization"
                set value "Basic ************"
            next
        end
    next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
    edit "Check-Uptime"
        set trigger "Check-Uptime-Webhook"
        config actions
            edit 1
                set action "Uptime"
                set required enable
            next
            edit 2
                set action "Twilio-SMS-Uptime"
                set required enable
            next
        end
```

```
    next
end
```

Verification:

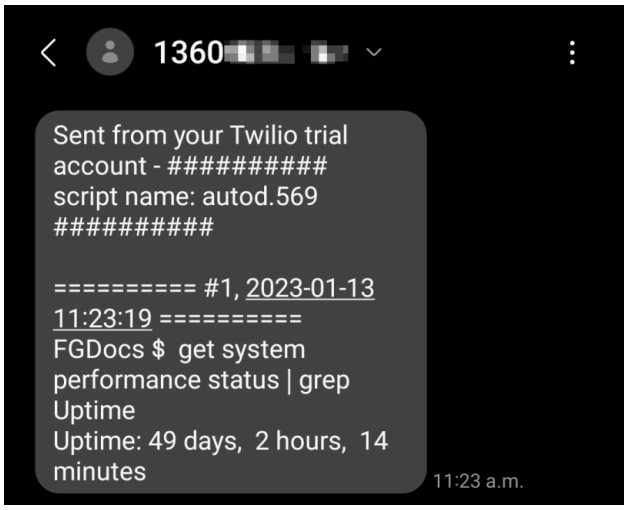
1. From a command prompt, issue the sample cURL command as recommended by the Check-Uptime-Webhook incoming webhook:

   ```
   >curl -k -X POST -H "Authorization: Bearer <API_token>" --data "{ 'srcip': '1.1.1.1',
   'mac':'11:11:11:11:11:11', 'fctuid': '********************************'}"
   https://x.x.x.x/api/v2/monitor/system/automation-stitch/webhook/Check-Uptime-Webhook
   ```

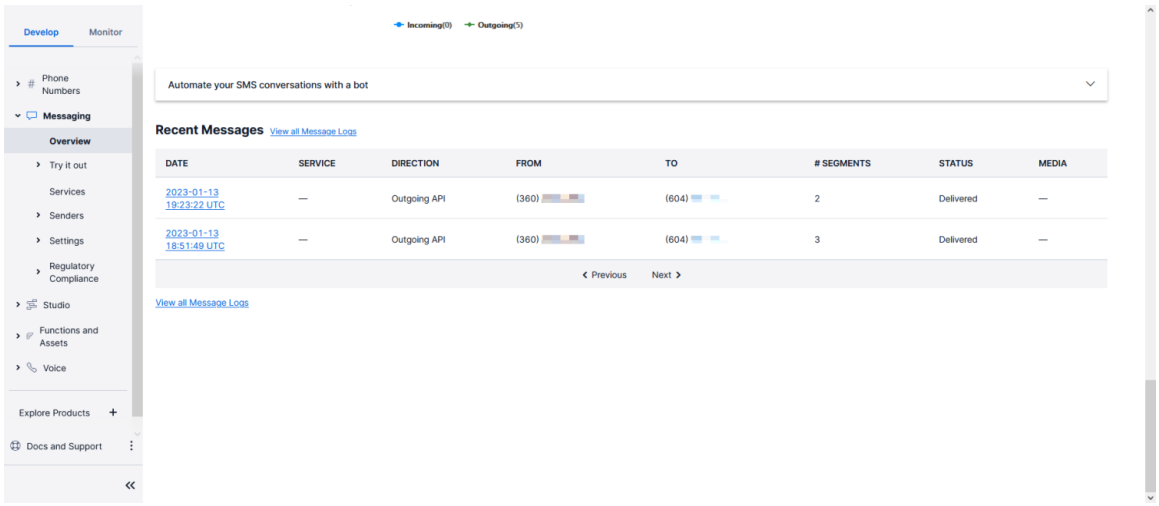
   Response:

   ```
   {
     "http_method":"POST",
     "status":"success",
     "http_status":200,
     "serial":"FGVM04TM20000000",
     "version":"v7.2.4",
     "build":1368
   }
   ```

2. This triggers the automation stitch on the FortiGate to send a HTTP POST request to Twilio. In response, Twilio sends an SMS text message to the recipient.

3. From the Twilio dashboard, go to *Messaging* > *Overview* and verify the *Recent Messages* section to confirm that the SMS text message was delivered.



To view automation stitch diagnostics:

```
# diagnose debug enable
# diagnose debug application autod -1
```

```

========== #1, 2023-01-13 11:23:19 ==========
FGDocs $  get system performance status | grep Uptime
Uptime: 49 days,  2 hours,  14 minutes
&From=%2B1360*******&To=%2B1604*******

2023-01-13 11:23:20 auto_generate_generic_curl_request()-550: Generic automation CURL request Host
header: api.twilio.com
2023-01-13 11:23:20 auto_generate_generic_curl_request()-553: Adding 2 user defined headers
2023-01-13 11:23:23 auto_curl_perform()-114: Failed to send curl request. http status code: 201
```

Although the final line in this debug output shows `Failed to send curl request. http status code: 201`, the HTTP status code 201 indicates that the request was successful and a response code was created.

Slack integration webhook

A webhook can be created to post messages and notifications to Slack.

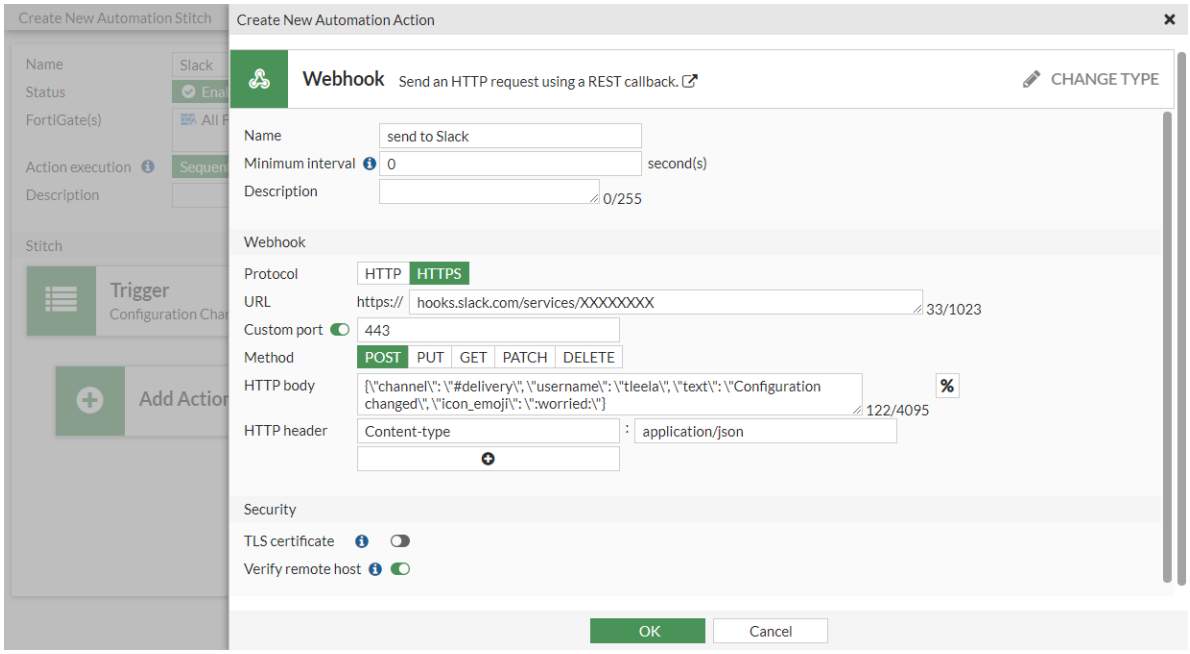
In this example, a configuration change triggers the FortiGate to post a message to Slack.

To create a webhook automation stitch for Slack integration in the GUI:

1. Create an incoming webhook in Slack. See Sending messages using Incoming Webhooks for more information.
2. Go to *Security Fabric > Automation* and click *Create New*.
3. Enter the stitch name.
4. Configure the trigger:
   a. Click *Add Trigger*.
   b. Select *Configuration Change*.
   c. Click *Apply*.
5. Configure the action:
   a. Click *Add Action*.
   b. Click *Create* and select *Webhook*.
   c. Enter the following:

Name	send to Slack
Protocol	HTTPS
URL	Enter the incoming webhook URL created in Slack
Custom port	Enable and enter 443
Method	POST

HTTP body	{\"channel\": \"#delivery\", \"username\": \"tleela\", \"text\": \"Configuration changed\", \"icon_emoji\": \":worried:\"}
HTTP header	Content-type : application/json



d. Click *OK*.

e. Select the action in the list and click *Apply*.

6. Click *OK*.

To create a webhook automation stitch for Slack integration in the CLI:

1. Create an incoming webhook in Slack. See Sending messages using Incoming Webhooks for more information.
2. Create the automation trigger:

```
config system automation-trigger
    edit "Configuration Change"
        set event-type config-change
    next
end
```

3. Create the automation action:

```
config system automation-action
    edit "send to Slack"
        set action-type webhook
        set protocol https
        set uri "hooks.slack.com/services/XXXXXXXX"
        set http-body "{\"channel\": \"#delivery\", \"username\": \"tleela\", \"text\":
\"Configuration changed\", \"icon_emoji\": \":worried:\"}"
        set port 443
```

```
        config http-headers
            edit 1
                set key "Content-type"
                set value "application/json"
            next
        end
    next
end
```

4. Create the automation stitch:

```
config system automation-stitch
    edit "Slack"
        set trigger "Configuration Change"
        config actions
            edit 1
                set action "send to Slack"
                set required enable
            next
        end
    next
end
```

Microsoft Teams integration webhook

A webhook can be created to post messages and notifications to Microsoft Teams.

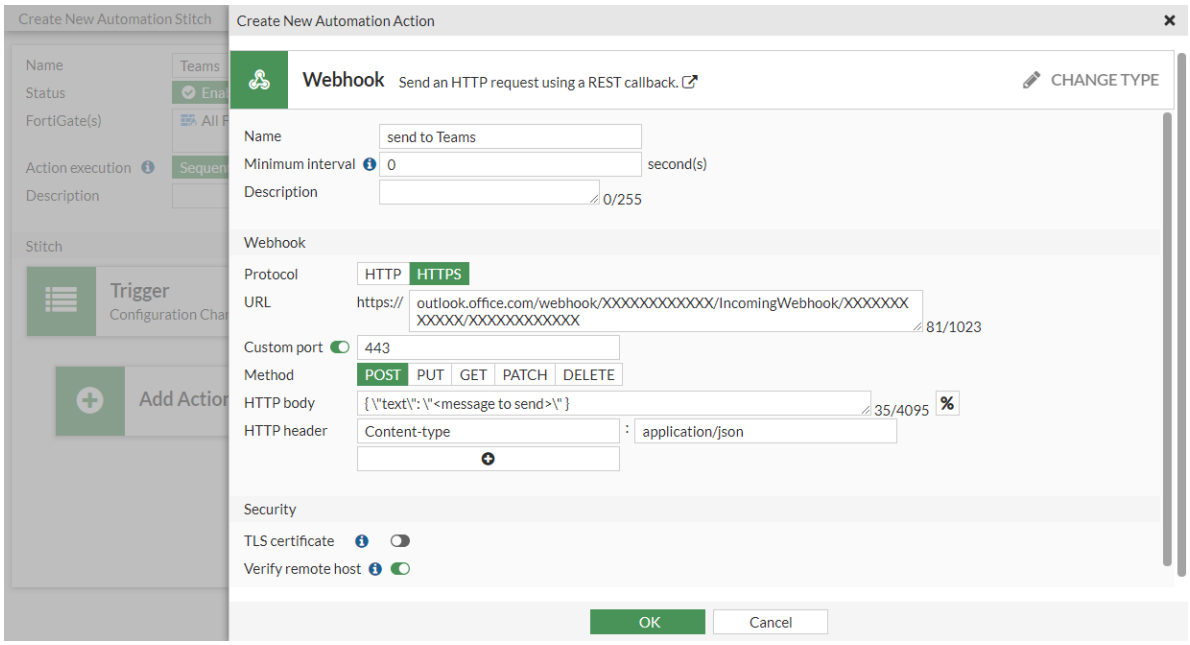
In this example, a configuration change triggers the FortiGate to post a message to Teams.

To create a webhook automation stitch for Teams integration in the GUI:

1. Create an incoming webhook in Teams. See Create an incoming webhook for information.
2. Go to *Security Fabric > Automation* and click *Create New*.
3. Enter the stitch name.
4. Configure the trigger:
   a. Click *Add Trigger*.
   b. Select *Configuration Change*.
   c. Click *Apply*.
5. Configure the action:
   a. Click *Add Action*.
   b. Click *Create* and select *Webhook*.
   c. Enter the following:

Name	send to Teams
Protocol	HTTPS
URL	Enter the incoming webhook URL created in Teams

Custom port	Enable and enter 443
Method	POST
HTTP body	{ \"text\": \"<message to send>\" }
HTTP header	Content-type : application/json



d. Click *OK*.

e. Select the action in the list and click *Apply*.

6. Click *OK*.

To create a webhook automation stitch for Teams integration in the CLI:

1. Create an incoming webhook in Teams. See Create an incoming webhook for information.
2. Create the automation trigger:

```
config system automation-trigger
    edit "Configuration Change"
        set event-type config-change
    next
end
```

3. Create the automation action:

```
config system automation-action
    edit "send to Teams"
        set action-type webhook
        set protocol https
        set uri
"outlook.office.com/webhook/XXXXXXXXXXXX/IncomingWebhook/XXXXXXXXXXXX/XXXXXXXXXXXX"
        set http-body "{ \"text\": \"<message to send>\" }"
```

```
        set port 443
        config http-headers
            edit 1
                set key "Content-type"
                set value "application/json"
            next
        end
    next
end
```

4. Create the automation stitch:

```
config system automation-stitch
    edit "Teams"
        set trigger "Configuration Change"
        config actions
            edit 1
                set action "send to Teams"
                set required enable
            next
        end
    next
end
```

For information about more advanced messages that can be configured and sent to the Teams incoming webhook, see Sending messages to connectors and webhooks.

System actions

The system actions can be used to back up the configuration of the FortiGate, reboot the FortiGate, or shut down the FortiGate.

These actions can occur even if the FortiGate is in conserve mode, and allows the automation stitch to bypass the CLI user confirmation prompts, which the CLI script action does not support.

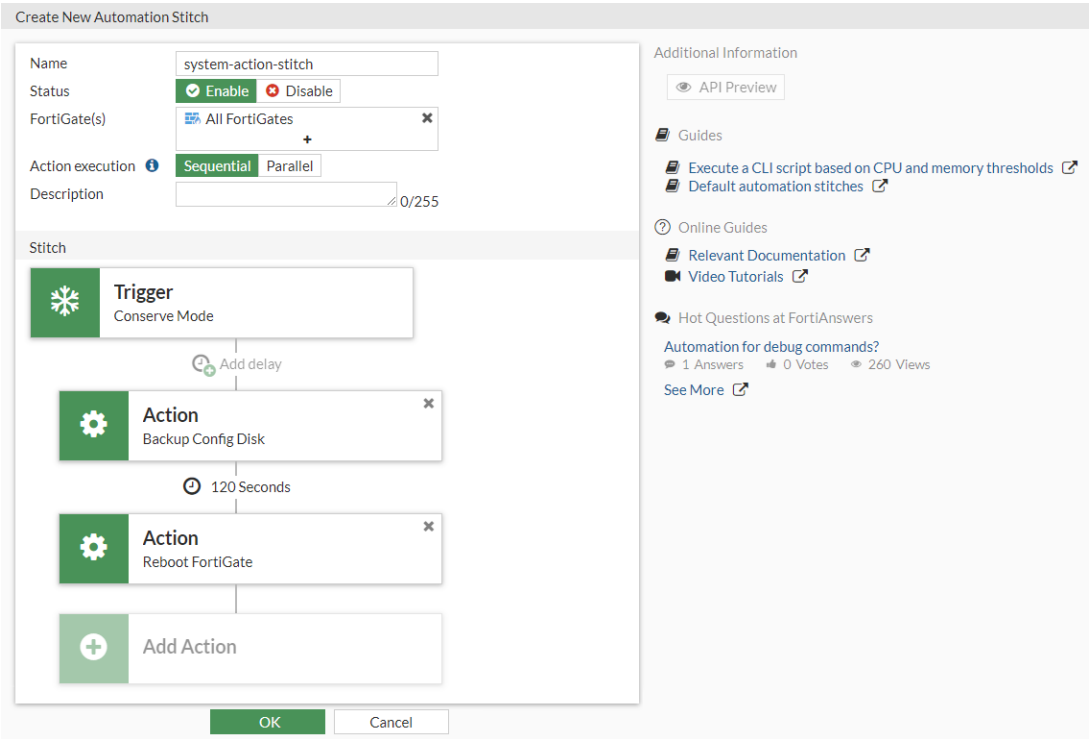
```
config system automation-action
    edit "Backup Config Disk"
        set action-type system-actions
        set system-action backup-config
    next
    edit "Reboot FortiGate"
        set action-type system-actions
        set system-action reboot
    next
    edit "Shutdown FortiGate"
        set action-type system-actions
        set system-action shutdown
    next
end
```

Example

In this example, an automation stitch is created that uses the Conserve Mode trigger, a Backup Config Disk action to back up the configuration to the FortiGate's disk (see Configuration backups and reset on page 3686 for more details), and then a Reboot FortiGate action. There is a 120-second delay between the two actions.

To configure an automation stitch with system actions in the GUI:

1. Go to *Security Fabric* > *Automation*, select the *Stitch* tab, and click *Create New*.
2. Enter the name, *system-action-stitch*.
3. Click *Add Trigger*. Select *Conserve Mode* and click *Apply*.
4. Click *Add Action*. Select *Backup Config Disk* and click *Apply*.
5. Click *Add Action*. Select *Reboot FortiGate* and click *Apply*.
6. Click *Add delay* (between the actions). Enter *120* and click *OK*.



7. Click *OK*.

To configure an automation stitch with system actions in the CLI:

1. Configure the trigger:

```
config system automation-trigger
    edit "Conserve Mode"
        set event-type low-memory
    next
end
```

2. Configure the back up and reboot actions:

```
config system automation-action
    edit "Backup Config Disk"
        set description "Backup the configuration on disk."
        set action-type system-actions
        set system-action backup-config
    next
    edit "Reboot FortiGate"
        set description "Reboot this FortiGate unit."
        set action-type system-actions
        set system-action reboot
        set minimum-interval 300
    next
end
```

3. Configure the stitch:

```
config system automation-stitch
    edit "system-action-stitch"
        set trigger "Conserve Mode"
        config actions
            edit 1
                set action "Backup Config Disk"
                set required enable
            next
            edit 2
                set action "Reboot FortiGate"
                set delay 120
                set required enable
            next
        end
    next
end
```

Verification

When the FortiGate enters conserve mode due to low memory, the automation stitch will be triggered and it will back up the configuration to the FortiGate disk, then reboot the FortiGate.

To confirm that the stitch was triggered in the GUI:

1. Go to *Security Fabric > Automation* and select the *Stitch* tab.
2. Verify the *Last Triggered* column.

To confirm that the stitch was triggered in the CLI:

```
# diagnose test application autod 3
alert mail log count: 0

stitch: system-action-stitch

    local hit: 1 relayed to: 0 relayed from: 0
```

```
    last trigger:Thu Jun 23 11:31:25 2022
    last relay:
    actions:
        Backup Config Disk:
            done: 1 relayed to: 0 relayed from: 0
            last trigger:Thu Jun 23 11:31:25 2022
            last relay:
        Reboot FortiGate:
            done: 0 relayed to: 0 relayed from: 0
            last trigger:Thu Jun 23 11:31:25 2022
            last relay:

logid to stitch mapping:
id:22011  local hit: 1 relayed hits: 0
    system-action-stitch

log category to stitch mapping:
```

To locate the backed up configuration in the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration* > *Revisions*.
2. Click the *+* in the table to expand and view more details.

To locate the backed up configuration in the CLI:

```
# execute revision list config
Last Firmware Version: V0.0.0-build000-REL0
1   2022-04-01 09:27:26    daemon_admin      V7.2.0-build1157-REL0      Automatic backup (upgrade)
2   2022-06-20 13:41:02    daemon_admin      V7.2.1-build1254-REL0      Automatic backup (upgrade)
3   2022-06-23 11:31:25    daemon_admin      V7.2.1-build1254-REL0      Autod backup config by
stitch: system-action-stitch
```

Public and private SDN connectors

Cloud SDN connectors provide integration and orchestration of Fortinet products with public and private cloud solutions. In a typical cloud environment, resources are dynamic and often provisioned and scaled on-demand. By using an SDN connector, you can ensure that changes to cloud environment attributes are automatically updated in the Security Fabric.

To protect the East-West or North-South traffic in these environments, the FortiGate uses the SDN connector to sync the dynamic addresses that these volatile environments use. You can then configure the dynamic address objects as sources or destinations for firewall policies. When you make changes to cloud environment resources, such as moving them to a new location or assigning different IP addresses to them, you do not need to modify the policy in FortiOS, as the SDN connector syncs changes to the cloud address objects.

These configurations consist of three primary steps:

1. Configure the cloud SDN connector to connect your FortiGate and public or private cloud account.
2. Create dynamic address objects to use the SDN connector. Use filters to sync only cloud address objects that you require.
3. Apply the dynamic address objects to your firewall policy to protect your traffic.

This chapter explores the steps in detail and describes how to connect to each currently supported cloud platform. This chapter does not discuss cloud account role-based or permission requirements. The respective cloud documents contain this information.

The following external connectors are available in the Security Fabric:

Category	Connector	Example configuration
Public SDN		
	Amazon Web Services (AWS)	AWS SDN connector using access keys on page 3989
	Microsoft Azure	Azure SDN connector using service principal on page 3995
	Google Cloud Platform (GCP)	GCP SDN connector using service account on page 4004
	Oracle Cloud Infrastructure (OCI)	OCI SDN connector using certificates on page 4029
	IBM Cloud	IBM Cloud SDN connector using API keys on page 4006
	AliCloud	AliCloud SDN connector using access key on page 3987
Private SDN		
	Kubernetes	Kubernetes (K8s) SDN connectors on page 4009
	VMware ESXi	VMware ESXi SDN connector using server credentials on page 4038
	VMware NSX	VMware NSX-T Manager SDN connector using NSX-T Manager credentials on page 4040
	OpenStack (Horizon)	OpenStack SDN connector using node credentials on page 4032
	Application Centric Infrastructure (ACI)	Cisco ACI SDN connector using a standalone connector on page 3997
	Nuage Virtualized Services Platform	Nuage SDN connector using server credentials on page 4025
	Nutanix	Nutanix SDN connector using server credentials on page 4027
	SAP	SAP SDN connector on page 4035
Endpoint/Identity		
	FSSO Agent on Windows AD	Fortinet single sign-on agent on page 4052

Category	Connector	Example configuration
	Symantec Endpoint Protection	Symantec endpoint connector on page 4054
	Poll Active Directory Server	Poll Active Directory server on page 4053
	RADIUS Single Sign-On Agent	RADIUS single sign-on agent on page 4061
	Exchange Server	Exchange Server connector on page 4065
External Feeds		
	FortiGuard Category	External feeds on page 4068
	IP Address	IP address external feed on page 4084
	Domain Name	Domain name external feed on page 4088
	MAC Address	MAC address external feed on page 4090
	Malware Hash	Malware hash external feed on page 4092
Generic Object Importer		
	Generic Address	Generic connector for importing addresses on page 4108

If VDOMs are enabled, SDN and External Feeds connectors are in the global settings, and Endpoint/Identity connectors are per VDOM.

Getting started with public and private SDN connectors

You can use SDN connectors to connect your FortiGate to public and private cloud solutions. By using an SDN connector, you can ensure that changes to cloud environment attributes are automatically updated in the Security Fabric. You can use SDN connector address objects to create policies that provide dynamic access control based on cloud environment attribute changes. There is no need to manually reconfigure addresses and policies whenever changes to the cloud environment occur.

There are four steps to creating and using an SDN connector:

1. Gather the required information. The required information depends on which public or private cloud solution SDN connector you are configuring.
2. Creating the SDN connector on page 3984
3. Creating an SDN connector address on page 3984
4. Adding the address to a firewall policy on page 3986

The following provides general instructions for creating an SDN connector and using the dynamic address object in a firewall policy. For instructions for specific public and private cloud solutions, see the relevant topic in this guide. For advanced scenarios regarding SDN connectors, see the appropriate FortiOS 7.6 cloud platform guide.

Creating the SDN connector

To create an SDN connector in the GUI:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.
3. Click the desired public or private cloud.
4. Enter the *Name*, *Status*, and *Update Interval* for the connector.
5. Enter previously collected information for the connector as needed.
6. Click *OK*.

To create an SDN connector in the CLI:

```
config system sdn-connector
    edit <name>
        set status {enable | disable}
        set type {connector type}
        ...
        set update-interval <integer>
    next
end
```

The available CLI commands vary depending on the selected SDN connector type.

Creating an SDN connector address

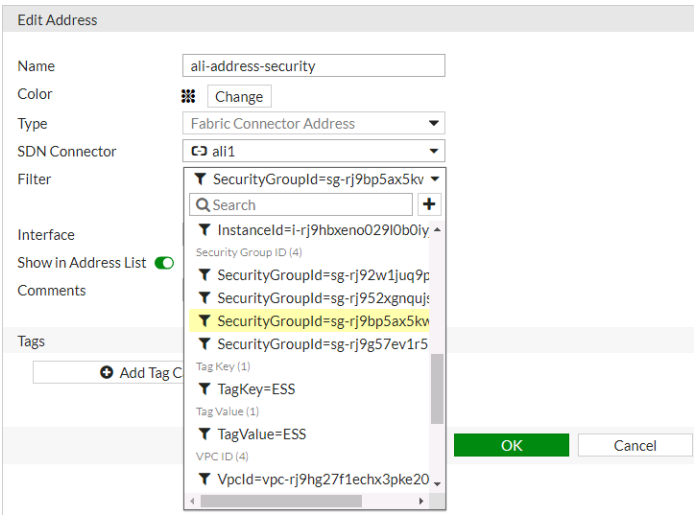
You can use an SDN connector address in the following ways:

- As the source or destination address for firewall policies.
- To automatically update changes to addresses in the public or private cloud environment, based on specified filters.
- To automatically apply changes to firewall policies that use the address, based on specified filters.

To create an SDN connector address in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Configure the address:
   a. Set the *Type* to *Dynamic*.
   b. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
   c. From the *SDN Connector* dropdown list, select the desired SDN connector.
   d. From the *Filter* dropdown list, configure the desired filter. The filters available depend on the selected SDN connector type. The SDN connector automatically populates and updates IP addresses only for

instances that satisfy the filter requirements. In this example, the address will automatically populate and update IP addresses only for AliCloud instances that belong to the specified security group:



You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

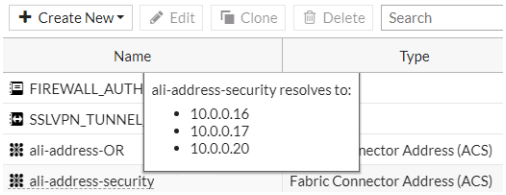
e. Configure other settings as desired.

f. Click *OK*.

4. Ensure that the SDN connector resolves dynamic firewall IP addresses as configured:

a. Go to *Policy & Objects* > *Addresses* and select *Address*.

b. Hover over the address that you created to see a list of IP addresses for instances that satisfy the filter that you configured. In this case, the IP addresses of instances that belong to the specified security group display:



To create an SDN connector address in the CLI:

1. Create the address:

```
config firewall address
   edit <name>
      set type dynamic
      set sdn <sdn_connector>
      set visibility enable
      set associated-interface <interface_name>
      set color <integer>
      ...
      set comment <comment>
      config tagging
         edit <name>
            set category <string>
            set tags <strings>
         next
```

```
        end
    next
end
```

2. Ensure that the SDN connector resolves dynamic firewall IP addresses as configured by running `show`. The following shows example output:

```
config firewall address
    edit "ali-address-security"
        set type dynamic
        config list
            edit "10.0.0.16"
            next
            edit "10.0.0.17"
            next
            edit "10.0.20.20"
            next
        end
        ...
    next
end
```

The available CLI commands vary depending on the selected SDN connector type.

Adding the address to a firewall policy

You can use an SDN connector address as the source or destination address in a policy.

To add the address to a firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Use the SDN connector address as the source or destination address.
4. Configure the remaining settings as needed.
5. Click *OK*.

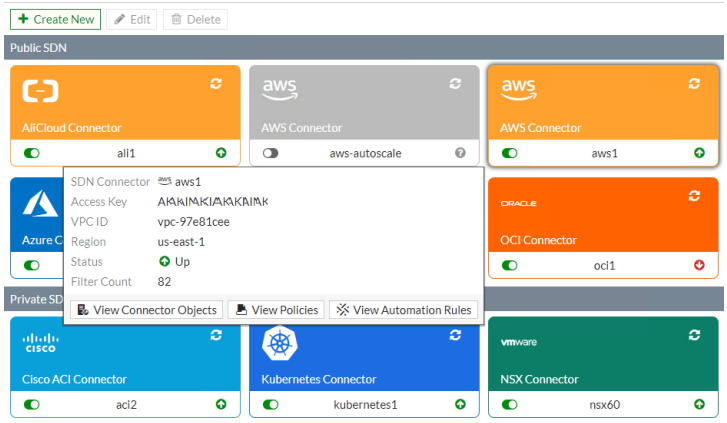
To add the address to a firewall policy in the CLI:

```
config firewall policy
    edit 0
        set name <name>
        set srcintf <port_name>
        set dstintf <port_name>
        set srcaddr <firewall_address>
        set dstaddr <firewall_address>
        set action accept
        set schedule <schedule>
        set service <service>
```

```
    next
end
```

Connector tooltips

In *Security Fabric > External Connectors*, hover over an SDN connector to view a tooltip that shows basic configuration information.



Three buttons provide additional information:

Button	Information
View Connector Objects	Connector's dynamic objects, such as filters and instances.
View Policies	List of policies that use the dynamic addresses from the connector.
View Automation Rules	List of automation actions that use the connector.

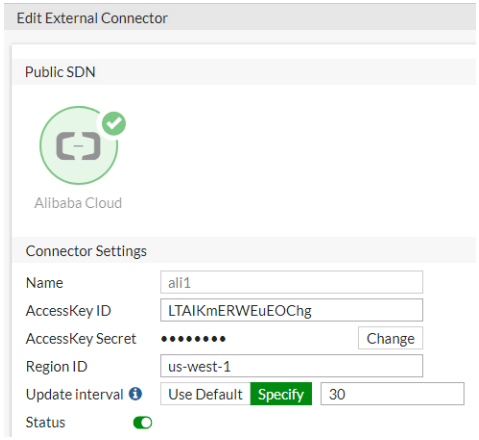
AliCloud SDN connector using access key

FortiOS automatically updates dynamic addresses for AliCloud using an AliCloud SDN connector, including mapping the following attributes from AliCloud instances to dynamic address groups in FortiOS:

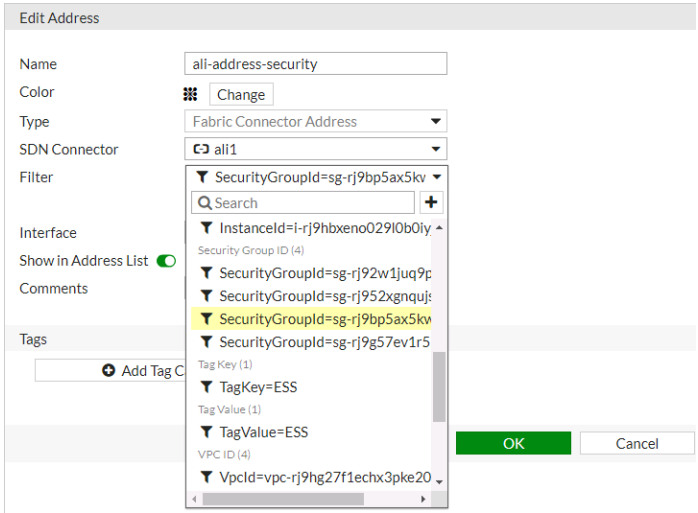
- ImageId
- InstanceId
- SecurityGroupId
- VpcId
- VSwitchId
- TagKey
- TagValue

To configure AliCloud SDN connector using the GUI:

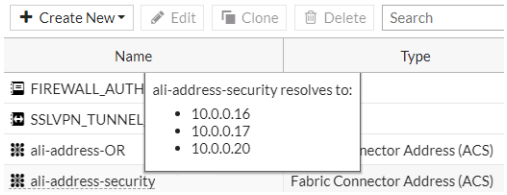
1. Configure the AliCloud SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *AliCloud*.
   c. Configure as shown, substituting the access key, secret, and region ID for your deployment. The update interval is in seconds.



2. Create a dynamic firewall address for the configured AliCloud SDN connector:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. Configure the address as shown, selecting the desired filter in the *Filter* dropdown list. In this example, the address will automatically populate and update IP addresses only for AliCloud instances that belong to the specified security group:



3. Ensure that the AliCloud SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the security group configured in step 2:



To configure AliCloud SDN connector using CLI commands:

1. Configure the AliCloud SDN connector:
```
config system sdn-connector
   edit "ali1"
      set type acs
      set access-key "LTAIKmERWEuEOChg"
      set secret-key xxxxx
      set region "us-west-1"
      set update-interval 30
   next
end
```
2. Create a dynamic firewall address for the configured AliCloud SDN connector with the supported AliCloud filter. In this example, the AliCloud SDN Connector will automatically populate and update IP addresses only for instances that belong to the specified security group:
```
config firewall address
   edit "ali-address-security"
      set type dynamic
      set sdn "ali1"
      set filter "SecurityGroupId=sg-rj9bp5ax5kwy3gqdizqb"
   next
end
```
3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:
```
config firewall address
   edit "ali-address-security"
      set type dynamic
      set sdn "ali1"
      set filter "SecurityGroupId=sg-rj9bp5ax5kwy3gqdizqb"
      config list
         edit "10.0.0.16"
         next
         edit "10.0.0.17"
         next
         edit "10.0.0.20"
         next
      end
   next
end
```

AWS SDN connector using access keys

FortiOS automatically updates dynamic addresses for AWS using an AWS SDN connector, including mapping attributes from AWS instances to dynamic address groups in FortiOS.

Configuring the SDN connector using the GUI, then checking the configuration using the CLI is recommended.

To configure an AWS SDN connector using the GUI:

1. Configure the AWS SDN connector:
   a. Go to *Security Fabric > External Connectors*.
   b. Click *Create New*, and select *Amazon Web Services (AWS)*.
   c. In the *Access key ID* field, enter the key created in the AWS management portal.
   d. In the *Secret access key* field, enter the secret access key accompanying the above access key.
   e. In the *Region name* field, enter the region name. Refer to AWS service endpoints for the desired region name.
   f. If desired, enable *VPC ID*. In the *VPC ID* field, enter the VPC ID within the specified region you desire to cover with the SDN connector.
   g. Click *OK*.
2. Check the configuration using the CLI:

```
config system sdn-connector
   edit "<connector-name>"
      show
```

The output resembles the following:

```
config system sdn-connector
   edit "<connector-name>"
      set access-key "<example-access-key>"
      set secret-key ENC <example-secret-key>
      set region "us-west-2"
      set vpc-id "vpc-e1e4b587"
      set update-interval 1
   next
end
```

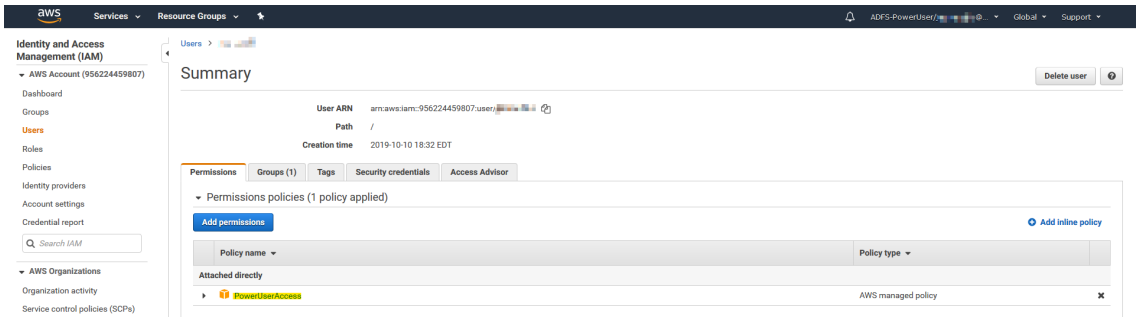
If you see that the SDN connector is disabled in *Security Fabric > External Connectors* in the GUI, run the following commands to enable the SDN connector:

```
diagnose debug application awsd -1
diagnose debug enable
```

The output may display an error like the following:

```
FGT # awsd sdn connector AWS_SDN prepare to update
awsd sdn connector AWS_SDN start updating
aws curl response err, 403
<?xml version="1.0" encoding="UTF-8"?>
<Response><Errors><Error><Code>UnauthorizedOperation</Code><Message>You are not authorized to
      perform this operation.</Message></Error></Errors><RequestID>8403cc11-b185-41da-ad6d-
      23bb4db7d00a</RequestID></Response>
awsd curl failed 403
awsd sdn connector AWS_SDN failed to get instance list
aws curl response err, 403
{"Message":"User: arn:aws:iam::956224459807:user/jcarcavallo is not authorized to perform:
      eks:ListClusters on resource: arn:aws:eks:us-east-1:956224459807:cluster/*"}
awsd sdn connector AWS_SDN get EKS cluster list failed
awsd sdn connector AWS_SDN list EKS cluster failed
awsd sdn connector AWS_SDN start updating IP addresses
awsd sdn connector AWS_SDN finish updating IP addresses
awsd reap child pid: 569
```

In this case, you must configure power user access for the current administrator in the AWS management console:



After configuring power user access, run the following commands:

```
diagnose debug application awsd -1
diagnose debug enable
```

The output should display without error, as follows:

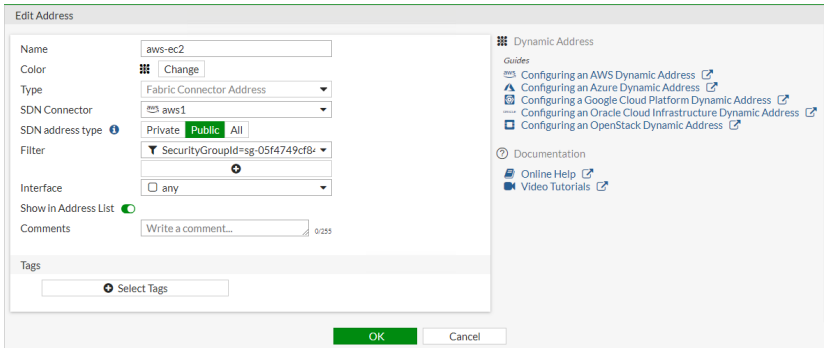
```
FGT # AWSD: update sdn connector AWS_SDN status to enabled
awsd sdn connector AWS_SDN prepare to update
awsd sdn connector AWS_SDN start updating
awsd get ec2 instance info successfully
awsd sdn connector AWS_SDN start updating IP addresses
awsd sdn connector AWS_SDN finish updating IP addresses
awsd reap child pid: 893
```

The AWS connector is now enabled.

3. Create a dynamic firewall address for the configured AWS SDN connector:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*, then select *Address*.
   c. From the *Type* dropdown list, select *Dynamic*.
   d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
   e. From the *SDN Connector* dropdown list, select the AWS connector that you created.
   f. In the *Filter* field, add the desired filters. The following filters are supported:

Description	Key	Example value
Architecture	architecture	x86
Autoscaling group	AutoScaleGroup	10703c-4f731e90-fortigate-payg-auto-scaling-group
AZ	placement.availabilityzone	us-east-1a
Endpoint DNS name	EndpointDNSName	vpce-06795... This filter spports the following ENI IP address types: • API gateway private endpoint • VPC endpoint for data API for Aurora • AWS PrivateLink for S3 • VPC endpoints for Lamdba

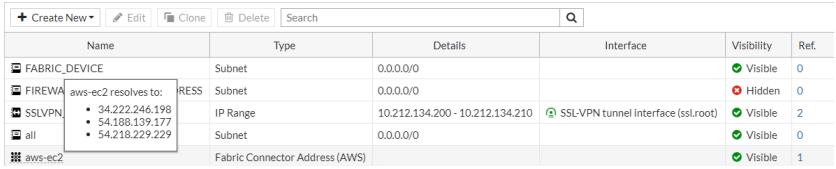
Description	Key	Example value
Group name	placement.groupname	
Image ID	imageId	ami-123456
Instance ID	instanceId	i-12345678
Instance type	instanceType	t2.micro
Key name	keyName	
Kubernetes (K8s) cluster	k8s_cluster	
K8s label and its name	k8s_label.Name	
K8s namespace	k8s_namespace	
K8s node name	k8s_nodename	
K8s pod name	k8s_podname	
K8s region	k8s_region	
K8s service name	k8s_servicename	
K8s zone	k8s_zone	
Private DNS name	privateDnsName	ip-172-31-10-211.us-west-2.compute.internal
Public DNS name	publicDnsName	ec2-54-202-168-254.us-west-2.compute.amazonaws.com
Security group ID	SecurityGroupId	
Subnet ID	subnetId	sub-123456
Tag and its name. This key supports a maximum of eight tags.	tag.Name	
Tenancy placement	placement.tenancy	
VPC ID	VpcId	



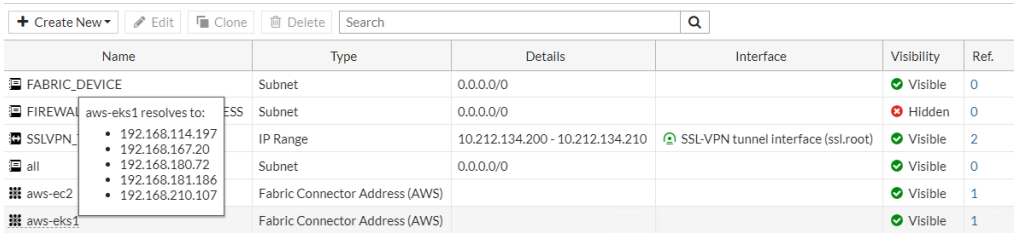
4. Ensure that the AWS SDN connector resolves dynamic firewall IP addresses:

a. Go to *Policy & Objects* > *Addresses*.

b. Hover over the address that you created to see a list of IP addresses for instances that belong to the configured security group. The following is an example for a public SDN address type:



The following is an example for a private SDN address type:



To configure AWS SDN connector using CLI commands:

1. Configure the AWS connector:

```
config system sdn-connector
   edit "<connector-name>"
      set access-key "<example-access-key>"
      set secret-key ENC <example-secret-key>
      set region "us-west-2"
      set vpc-id "vpc-e1e4b587"
      set update-interval 1
   next
end
```

2. Create a dynamic firewall address for the configured AWS SDN connector with the supported filter:

```
config firewall address
   edit "aws-ec2"
      set type dynamic
      set sdn "<connector-name>"
      set filter "SecurityGroupId=sg-05f4749cf84267548"
      set sdn-addr-type public
   next
   edit "aws-eks1"
      set type dynamic
      set sdn "<connector-name>"
      set filter "K8S_Region=us-west-2"
   next
end
```

3. Confirm that the AWS SDN connector resolves dynamic firewall IP addresses using the configured filter:

```
config firewall address
   edit "aws-ec2"
      set type dynamic
      set sdn "<connector-name>"
      set filter "SecurityGroupId=sg-05f4749cf84267548"
      set sdn-addr-type public
      config list
         edit "34.222.246.198"
```

```
            next
            edit "54.188.139.177"
            next
            edit "54.218.229.229"
            next
         end
      next
      edit "aws-eks1"
         set type dynamic
         set sdn "<connector-name>"
         set filter "K8S_Region=us-west-2"
         config list
            edit "192.168.114.197"
            next
            edit "192.168.167.20"
            next
            edit "192.168.180.72"
            next
            edit "192.168.181.186"
            next
            edit "192.168.210.107"
            next
         end
      next
   end
```

To add an EC2 instance to test automatic address population:

1. Assume that you want to boot up another instance with an IP address of 34.222.246.178, which is currently stopped. This instance belongs to the security group that the aws-ec2 address is filtering for. In the AWS management portal, start the instance.
2. Verify that the instance is running.
3. At this point, running `show` again shows the SDN connector has automatically populated and added the 34.222.246.178 instance:

   ```
   config firewall address
      edit "aws-ec2"
         set type dynamic
         set sdn "<connector-name>"
         set filter "SecurityGroupId=sg-05f4749cf84267548"
         set sdn-addr-type public
         config list
            edit "34.222.246.198"
            next
            edit "54.188.139.177"
            next
            edit "54.218.229.229"
            next
            edit "34.222.246.178"
            next
         end
      next
   end
   ```

   Therefore, administrators do not need to add this instance to the address manually. When you apply a firewall policy to this address, the policy automatically covers 34.222.246.178.

Azure SDN connector using service principal

FortiOS automatically updates dynamic addresses for Azure using Azure SDN connector, including mapping attributes from Azure instances to dynamic address groups in FortiOS.

To configure the Azure SDN connector using service principal:

1. Create an Azure SDN connector:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. Select *Microsoft Azure*.
   c. Configure the connector. See Azure SDN connector service principal configuration requirements:

   d. Click *OK*.
2. Create a dynamic firewall address for the Azure connector.
   a. Go to *Policy & Objects* > *Addresses* and select Address.
   b. Click *Create new*.
   c. From the *Type* dropdown list, select *Dynamic*.
   d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
   e. From the *SDN Connector* dropdown list, select the Azure SDN connector.
   f. In the *Filter* field, add filters as desired. The Azure SDN connector supports the following filters:
      - `vm=<VM name>`
      - `securitygroup=<nsg id>`
      - `vnet=<VNet id>`
      - `subnet=<subnet id>`
      - `vmss=<VM scale set>`
      - `tag.<key>=<value>`
      - `servicetag=<value>`
      - `tag.<key>=<value>`

g. Click *OK*.
h. Hover the cursor over the address name to see the dynamic IP addresses that the connector resolves.

Configuring SDN connector proxy via FortiManager

FortiOS Azure SDN connector API calls can be relayed through a FortiManager proxy. FortiManager 7.6 supports this feature. This is recommended for large-scale deployments.

To configure Azure SDN connector relay through FortiManager support:

1. Configure the FortiManager:
   a. Provision an FMG_VM64_AZURE 7.6 instance in Azure. See Creating a FortiManager-VM.
   b. License the FortiManager instance. See Connecting to FortiManager.
   c. In FortiManager, go to *System Settings* > *Administrators*.
   d. Create a new administrator or edit an existing one.
   e. For *JSON API Access*, select *Read-Write*.
   f. Configure other fields as desired, then click *OK*.
2. Provision a FGT_VM64_AZURE pay as you go instance in Azure.
3. Configure the FortiManager proxy in the CLI:

```
config system sdn-proxy
    edit "FMG_proxy"
        set type fortimanager
        set server "fmg.labs.ca"
        set server-port 443
        set username "admin"
        set password "-=redacted=-"
    next
end
```

4. Configure two SDN connectors:

```
config system sdn-connector
    edit "FMG_proxy"
        set type azure
        set proxy "FMG_proxy"
        set use-metadata-iam disable
        set tenant-id "<tenant ID>"
        set client-id "<client ID>"
        set client-secret "-=redacted=-"
        set subscription-id "<subscription ID>"
        set resource-group "<resource group >"
    next
end
config firewall address
    edit "FMG_proxy"
        set type dynamic
        set sdn "FMG_proxy"
```

```
        set filter "Vnet=VNET0"
        set sdn-addr-type all
    next
end
config system sdn-connector
    edit "AZURE"
        set type azure
        set use-metadata-iam disable
        set tenant-id "<tenant ID>"
        set client-id "<client ID>"
        set client-secret "-=redacted=-"
        set subscription-id "<subscription ID>"
        set resource-group "<resource group >"
    next
end
config firewall address
    edit "AZURE"
        set type dynamic
        set sdn "AZURE"
        set filter "Vnet=VNET0"
        set sdn-addr-type all
    next
end
```

5. Go to Security Fabric > External Connectors and confirm that the connectors were created.
6. Compare the resolved IP address list between the FMG_proxy and AZURE connectors and verify that the list is complete.

Cisco ACI SDN connector using a standalone connector

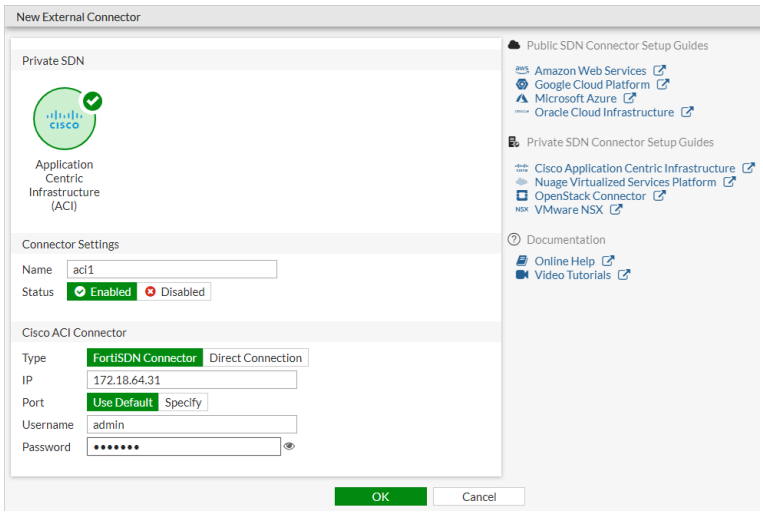
You can use Cisco ACI (Application Centric Infrastructure) SDN connectors in dynamic firewall addresses.

The Fortinet SDN Connector for Cisco ACI and Nuage Networks is a standalone connector that connects to SDN controllers within Cisco ACI and Nuage Networks. You must configure a connection to the Fortinet SDN connector in FortiOS to query the dynamic addresses.

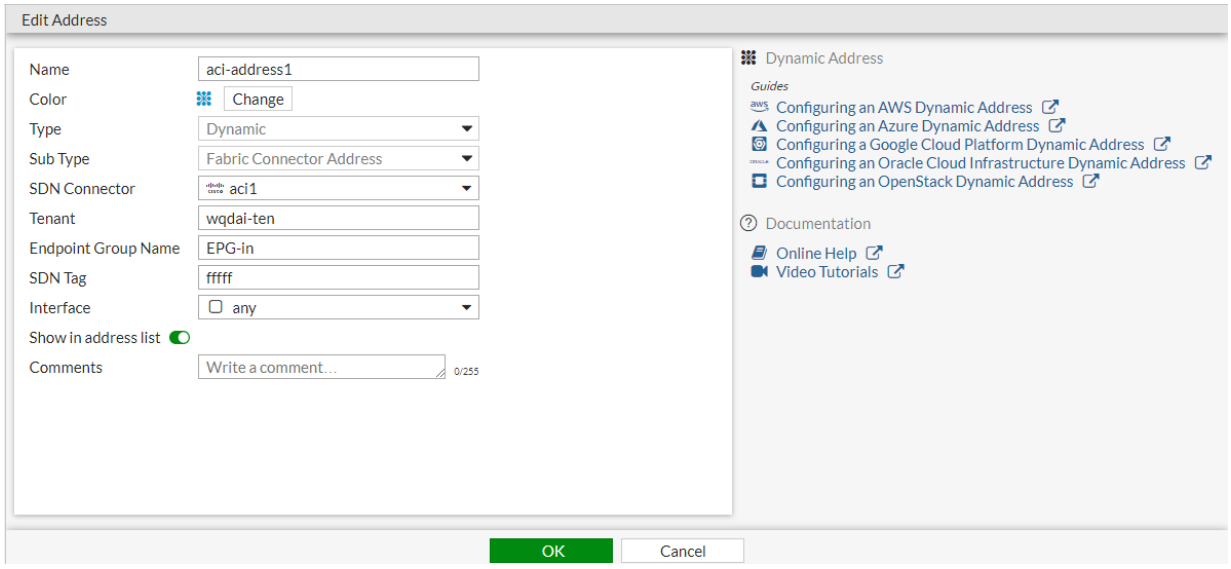
To configure a Cisco ACI connector in the GUI:

1. Create the Cisco ACI SDN connector:
   a. Go to *Security Fabric > External Connectors* and click *Create New*.
   b. In the *Private SDN* section, click *Application Centric Infrastructure (ACI)*.
   c. In the *Cisco ACI Connector* section, for *Type*, select *FortiSDN Connector* and configure the remaining settings as needed.

d. Click *OK*.



2. Create the dynamic firewall address for the connector:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. Configure the following settings:
      i. For *Type*, select *Dynamic*.
      ii. For *Sub Type*, select *Fabric Connector Address*.
      iii. For *SDN Connector*, select the first ACI connector.
      iv. Configure the remaining settings as needed.
   d. Click *OK*.



To verify the dynamic firewall IPs are resolved by the SDN connector in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. In the address table, hover over the address to view which IPs it resolves to.

To configure a Cisco ACI connector in the CLI:

1. Create the SDN connector:

```
config system sdn-connector
    edit "aci1"
        set type aci
        set server "172.18.64.31"
        set username "admin"
        set password xxxxxxx
    next
end
```

2. Create the dynamic firewall address for the connector:

```
config firewall address
    edit "aci-address1"
        set type dynamic
        set sdn "aci1"
        set color 17
        set tenant "wqdai-ten"
        set epg-name "EPG-in"
        set sdn-tag "fffff"
    next
end
```

To verify the dynamic firewall IPs are resolved by the SDN connector in the CLI:

```
# diagnose firewall dynamic list

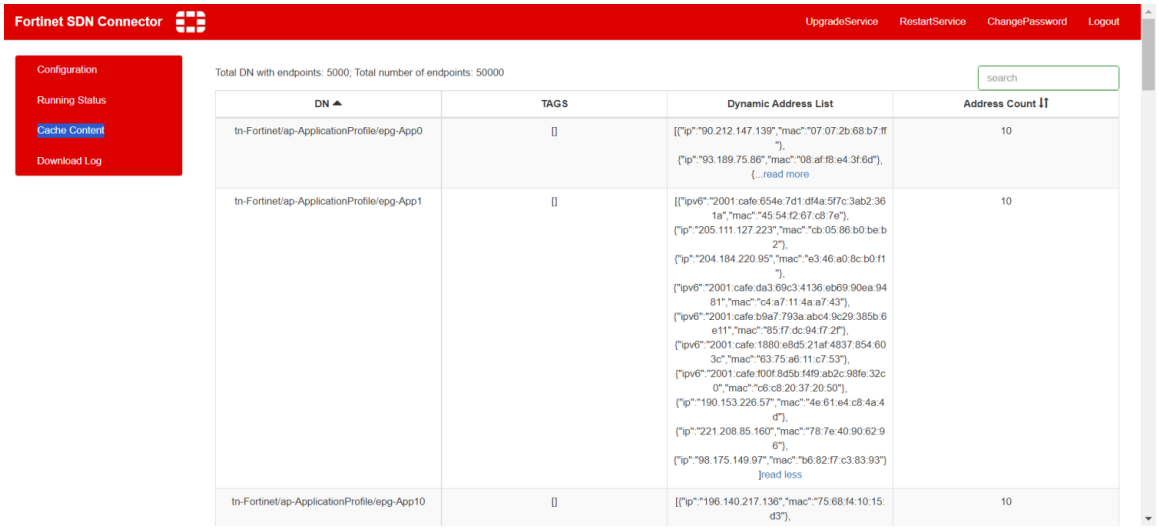
List all dynamic addresses:
aci1.aci.wqdai-ten.EPG-in.fffff: ID(171)
        ADDR(192.168.100.20)
```

Retrieve IPv6 dynamic addresses from Cisco ACI SDN connector

IPv6 dynamic addresses can be retrieved from Cisco ACI SDN connectors. IPv6 addresses imported from Cisco ACI to the Fortinet SDN Connector VM can be imported into the FortiGate as IPv6 dynamic addresses. The Fortinet SDN Connector VM must be running version 1.1.10 or later.

```
config firewall address6
    edit <name>
        set type dynamic
        set sdn <ACI_connector>
    next
end
```

The following example assumes the Fortinet SDN Connector VM has already connected to Cisco ACI and learned the IPv6 addresses. See Configuring the SDN Connector in the Cisco ACI Administration Guide for more information. The *Dynamic Address List* values for the DN with the filter *tn-Fortinet/ap-ApplicationProfile/epg-App1* is used in this example.



To configure the Cisco ACI connector and dynamic address:

1. Configure the Cisco ACI SDN connector:

```
config system sdn-connector
    edit "aci_64.115_115"
        set type aci
        set server-list "10.6.30.115"
        set server-port 5671
        set username "admin"
        set password xxxxxxx
    next
end
```

2. Verify that the SDN connector status is up:

```
# diagnose sys sdn status "aci_64.115_115"
SDN Connector                       Type        Status
------------------------------------------------------------
aci_64.115_115                      aci         Up
```

3. Configure the IPv6 dynamic firewall address (filters for tenant and endpoint group are used in this example):

```
config firewall address6
    edit "aci-add6-App1"
        set type dynamic
        set sdn "aci_64.115_115"
        set color 17
        set tenant "Fortinet"
        set epg-name "App1"
```

```
    next
end
```

4. Verify the list of resolved IPv6 addresses:

```
# diagnose firewall dynamic6 list "aci-add6-App1"
aci_64.115_115.aci.Fortinet.App1.*: ID(220)
        ADDR(2001:cafe:654e:7d1:df4a:5f7c:3ab2:361a)
        ADDR(2001:cafe:da3:69c3:4136:eb69:90ea:9481)
        ADDR(2001:cafe:b9a7:793a:abc4:9c29:385b:6e11)
        ADDR(2001:cafe:1880:e8d5:21af:4837:854:603c)
        ADDR(2001:cafe:f00f:8d5b:f4f9:ab2c:98fe:32c0)
```

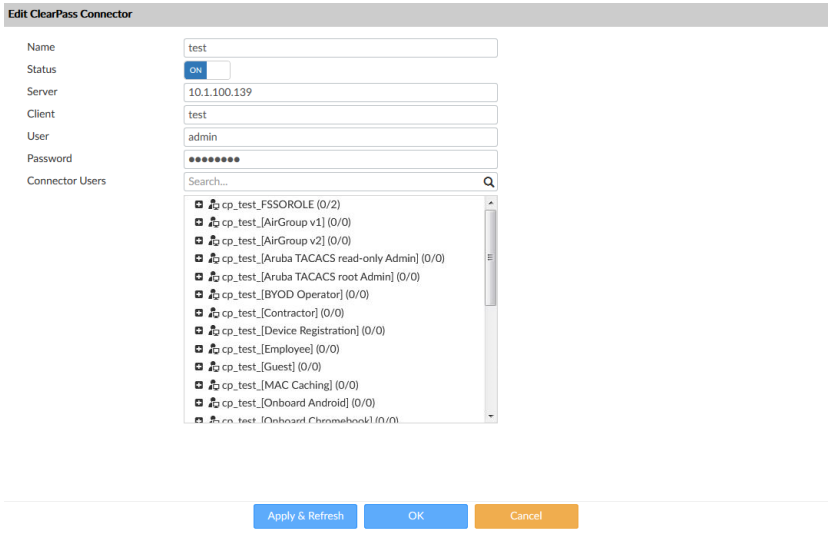
ClearPass endpoint connector via FortiManager

ClearPass Policy Manager (CPPM) is a network access system that can send information about authenticated users to third party systems, such as a FortiGate or FortiManager.

In this example, communications are established between CPPM and FortiManager, and then the FortiManager forwards information to a managed FortiGate. On the FortiGate, the user information can be used in firewall policies and added to FSSO dynamic addresses.

Configure the FortiManager

Establish communications between FortiManager and CPPM so that FortiManager can synchronize CPPM user groups. See Creating a ClearPass connector in the FortiManager Administration Guide.

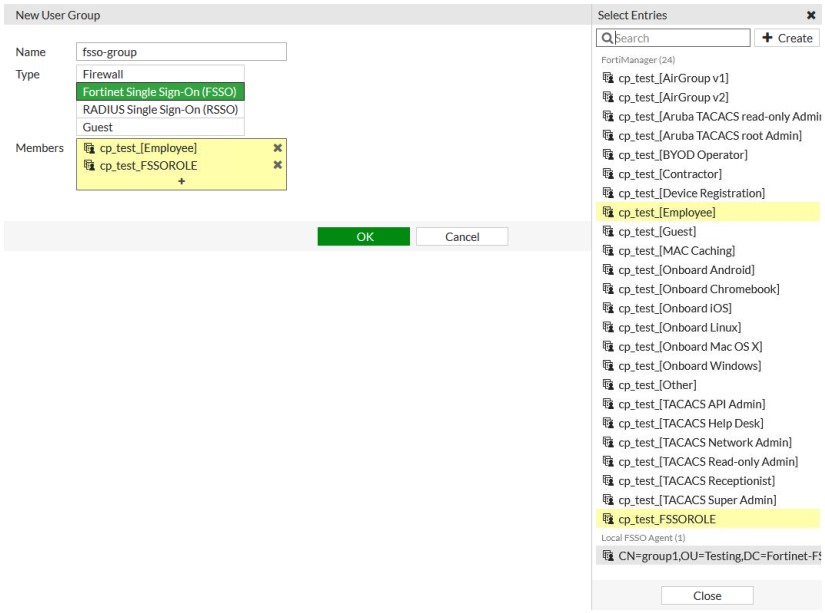


FortiManager forwards the group information to managed FortiGates.

Adding CPPM FSSO user groups to a local user group

To add CPPM user groups to a local user group in the GUI:

1. On the FortiGate, go to *User & Authentication* > *User Groups*.
2. Click *Create New*.
3. Enter a name for the group and set *Type* to *Fortinet Single Sign-On (FSSO)*.
4. Click the *Members* field, and add one or more FSSO groups.
   FSSO groups can come from multiple sources; CPPM FSSO groups are prefixed with *cp_* and are listed under the *FortiManager* heading.



5. Click *OK*.

To add CPPM user groups to a local user group in the CLI:

```
config user group
    edit fsso-group
        set group-type fsso-service
        set member "cp_test_[Employee]" "cp_test_FSSOROLE"
    next
end
```

Using the local FSSO user group in a firewall policy

To add the local FSSO user group to a firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a new policy, or edit an existing one.

3. Click in the *Source* field and add the *fsso-group* user group.

   CPPM user groups can also be added directly to the policy.
4. Click *OK*.

To add the local FSSO user group to a firewall policy in the CLI:

```
config firewall policy
    edit 1
        set name "pol1"
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set groups "fsso-group"
        set nat enable
    next
end
```

Verification

To verify that a user was added to the FSSO list on the FortiGate:

1. Log on to the client and authenticate with CPPM.
   After successful authentication, the user is added to the FSSO list on the FortiGate.
2. On the FortiGate, go to *Dashboard* > *Assets & Identities* and look at the *Firewall Users* widget to verify that the user was added.

The user group *cp_test_FSSOROLE* is listed separately because the user is a member of that group on the CPPM.

To verify that traffic can pass the firewall:

1. Log on to the client and browse to an external website.
2. On the FortiGate, go to *Dashboard* > *FortiView Sources*.
3. Double-click on the user and select the *Destinations* tab to verify that traffic is being passed by the firewall.

To verify the user address groups:

```
show user adgrp
    config user adgrp
        edit "cp_test_FSSOROLE"
            set server-name "FortiManager"
        next
        edit "cp_test_[AirGroup v1]"
            set server-name "FortiManager"
        next
        edit "cp_test_[AirGroup v2]"
            set server-name "FortiManager"
        next
        edit "cp_test_[Aruba TACACS read-only Admin]"
            set server-name "FortiManager"
        next
        edit "cp_test_[Aruba TACACS root Admin]"
            set server-name "FortiManager"
        next
        edit "cp_test_[BYOD Operator]"
            set server-name "FortiManager"
        next
        edit "cp_test_[Contractor]"
            set server-name "FortiManager"
        next
        edit "cp_test_[Device Registration]"
            set server-name "FortiManager"
        next
        ...
        edit "CN=group1,OU=Testing,DC=Fortinet-FSSO,DC=COM"
            set server-name "Local FSSO Agent"   <----- !!!
        next
    end
```

GCP SDN connector using service account

FortiOS automatically updates dynamic addresses for GCP using a GCP SDN connector, including mapping attributes from GCP instances to dynamic address groups in FortiOS.

To configure GCP connector using the GUI:

1. In FortiOS, go to *Security Fabric* > *External Connectors*.
2. Click *Create New*, and select *Google Cloud Platform (GCP)*.
   Note you can create only one SDN Connector per connector type. For example, you can create one entry for GCP.
3. Configure the connector as follows:
   a. *Project name*: Enter the name of the GCP project. The VMs whose IP addresses you want to populate should be running within this project.
   b. *Service account email*: Enter the email address associated with the service account that will call APIs to the GCP project specified above.
   c. *Private key*: Enter the private key statement as shown in the text box. For details, see Creating a GCP service account.

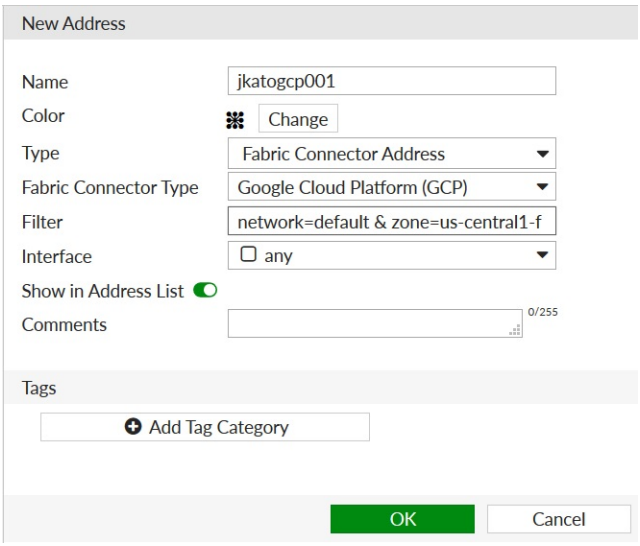
   Once the connector is successfully configured, a green indicator appears at the bottom right corner. If the indicator is red, the connector is not working. See Troubleshooting GCP SDN Connector.
4. Create a dynamic firewall address for the configured GCP SDN connector:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. Configure the address:
      i. *Name*: Enter the desired name.
      ii. *Type*: Select *Dynamic*.
      iii. *Fabric Connector Type*: Select *Google Cloud Platform (GCP)*.
      iv. *Filter*: The SDN connector automatically populates and updates only instances that match this filtering condition. Currently GCP supports the following filters:
         - `id=<instance id>` : This matches an VM instance ID.
         - `name=<instance name>` : This matches a VM instance name.
         - `zone=<gcp zones>` : This matches a zone name.
         - `network=<gcp network name>` : This matches a network name.

- `subnet=<gcp subnet name>` : This matches a subnet name.
- `tag=<gcp network tags>` : This matches a network tag.
- `label.<gcp label key>=<gcp label value>` : This matches a free form GCP label key and its value.

In the example, the filter is set as `'network=default & zone=us-central-1f'`. This configuration populates all IP addresses that belong to the default network in the zone us-central-1f.

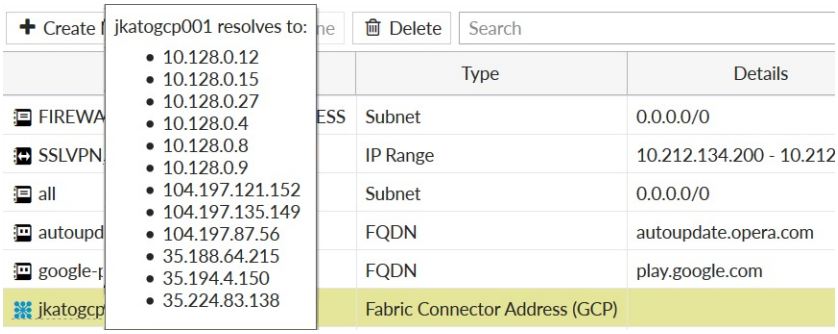
You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

Note that wildcards (such as the asterisk) are not allowed in filter values.



v. Click *OK*.

The address has been created. Wait for a few minutes before the setting takes effect. You will know that the address is in effect when the exclamation mark disappears from the address entry. When you hover over the address, you can see the list of populated IP addresses.



If the exclamation mark does not disappear, check the address settings.

IBM Cloud SDN connector using API keys

FortiOS can automatically update dynamic addresses for IBM Cloud using an SDN connector. For information on creating and managing the API key, see the IBM Cloud documentation.

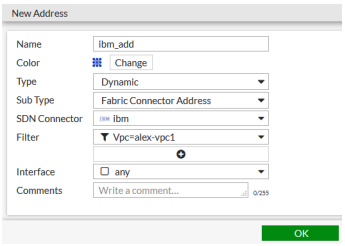
In 7.6.2, you do not need to specify the generation of IBM Compute Generation.

To configure an IBM Cloud SDN connector using the GUI:

1. Create an SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, then select *IBM Cloud*.
   c. In the *Name* field, enter the desired connector name.
   d. For *Status*, select *Enabled*.
   e. For *Update interval*, configure the desired update interval for dynamic object updates.
   f. From the *Region* dropdown list, select the IBM Cloud region.
   g. In the *API key* field, enter the IBM Cloud API key.

   h. Click *OK*.
2. Create dynamic firewall addresses for the configured connector:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. From the *Type* dropdown list, select *Dynamic*.
   d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
   e. From the *SDN Connector* dropdown list, select the IBM SDN connector.
   f. In the *Filter* field, add the desired filters. The following filters are supported:
      - <InstanceId>
      - <InstanceName>
      - <ImageId>

- <ImageName>
- <Architecture>
- <Profile>
- <Vpc>
- <Zone>
- <Subnet>
- <ResourceGroup>

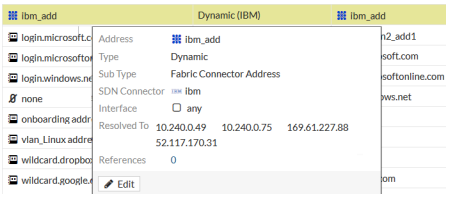


g. Click *OK*.

3. Ensure that the connector resolves dynamic firewall IP addresses:

a. Go to *Policy & Objects* > *Addresses*.

b. Hover over the addresses created in step 2 to see a list of IP addresses that the connector has resolved:



To configure an IBM Cloud SDN connector using the CLI:

1. Create SDN connector:

```
config system sdn-connector
    edit "ibm"
        set status enable
        set type ibm
        set api-key xxxxxx
        set ibm-region us-south
        set update-interval 60
    next
end
```

2. Create dynamic firewall addresses for the configured connector:

```
config firewall address
    edit "ibm_add"
        set type dynamic
        set sdn "ibm"
        set color 19
        set filter "Vpc=alex-vpc1"
```

```
    next
end
```

3. Ensure that the connector resolves dynamic firewall IP addresses:

```
# show firewall address ibm_add
config firewall address
    edit "ibm_gen1_add"
        set uuid 586841c4-7f46-51ea-dc66-dbf840af03d3
        set type dynamic
        set sdn "ibm"
        set color 19
        set filter "Vpc=alex-vpc1"
        config list
            edit "10.240.0.49"
            next
            edit "10.240.0.75"
            next
            edit "169.61.227.88"
            next
            edit "52.117.170.31"
            next
        end
    next
end
```

Kubernetes (K8s) SDN connectors

The following topics provide information about configuring Kubernetes SDN connectors:

- AliCloud Kubernetes SDN connector using access key on page 4009
- EKS SDN connector using access key on page 4012
- Azure Kubernetes (AKS) SDN connector using client secret on page 4014
- GCP Kubernetes (GKE) SDN connector using service account on page 4017
- Oracle Kubernetes (OKE) SDN connector using certificates on page 4020
- Private cloud K8s SDN connector using secret token on page 4022

AliCloud Kubernetes SDN connector using access key

When an AliCloud SDN connector is configured, dynamic address objects can support Kubernetes filters based on cluster, service, node, pod, and more.

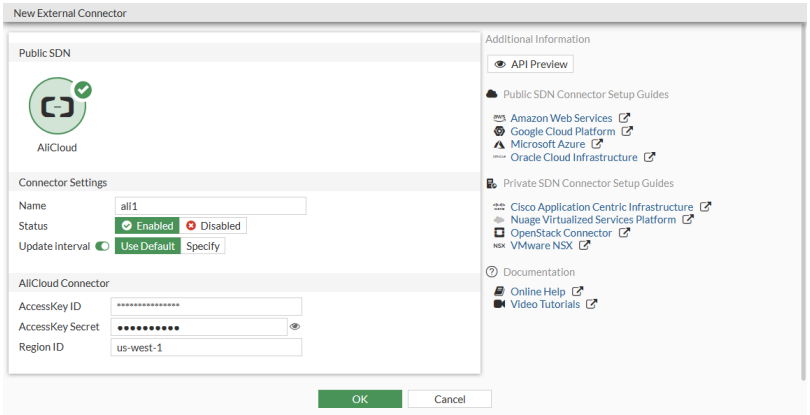
The following address filters can be applied:

- K8S_Cluster
- K8S_Namespace
- K8S_ServiceName
- K8S_NodeName

- K8S_PodName
- K8S_Region
- K8S_Zone
- K8S_Label

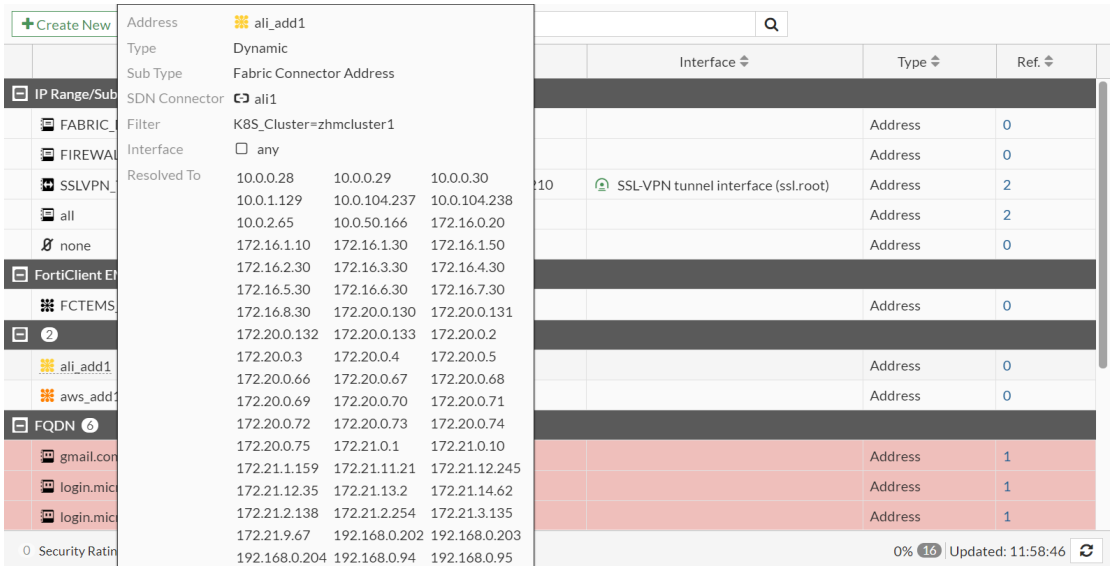
To configure an AliCloud SDN connector with a Kubernetes filter in the GUI:

1. Configure the AliCloud SDN connector:
   a. Go to *Security Fabric > External Connectors*.
   b. Click *Create New*, and select *AliCloud*.
   c. Configure the settings as needed and click *OK*.



2. Create a dynamic firewall address with the supported Kubernetes filter:
   a. Go to *Policy & Objects > Addresses* and select *Address*.
   b. Click *Create new* and enter a name.
   c. Configure the following settings:
      i. For *Type*, select *Dynamic*.
      ii. For *Sub Type*, select *Fabric Connector Address*.
      iii. For *SDN Connector*, select the connector created in step 1.
      iv. For *SDN address type*, select *Private*.
      v. For *Filter*, select *K8S_Cluster=zhmcluster*.
   d. Click *OK*.
   The corresponding IP addresses are dynamically updated and resolved after applying the Kubernetes filter.

3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. In the address table, hover over the address created in step 2 to view which IPs it resolves to:



To configure an AliCloud SDN connector with a Kubernetes filter in the CLI:

1. Configure the AliCloud SDN connector:

```
config system sdn-connector
    edit "ali1"
        set type alicloud
        set access-key "****************"
        set secret-key xxxxxxxx
        set region "us-west-1"
    next
end
```

2. Create a dynamic firewall address with the supported Kubernetes filter:

```
config firewall address
    edit "ali_add1"
        set type dynamic
        set sdn "ali1"
        set color 10
        set filter "K8S_Cluster=zhmcluster1"
    next
end
```

3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:

```
config firewall address
    edit "ali_add1"
        show
            config firewall address
```

```
                edit "ali_add1"
                    set uuid c48e4f00-5435-51eb-0547-aced5cf80f1f
                    set type dynamic
                    set sdn "ali1"
                    set color 10
                    set filter "K8S_Cluster=zhmcluster1"
                    config list
                        edit "10.0.0.28"
                        next
                        edit "10.0.0.29"
                        next
                        edit "10.0.0.30"
                        next
                        ...
                    end
                next
            end
    next
end
```

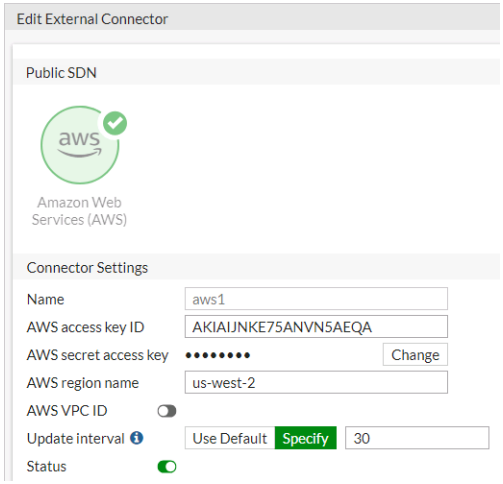
EKS SDN connector using access key

AWS SDN connectors support dynamic address groups based on AWS Kubernetes (EKS) filters.

If there is an authorization issue with the dynamic address resolution of Kubernetes (K8s) IP addresses and/or the K8s dynamic addresses fail to display, confirm that you have set the correct Identity & Access Management permissions or role assignments. For more information, see How do I provide access to other IAM users and roles after cluster creation in Amazon EKS?.

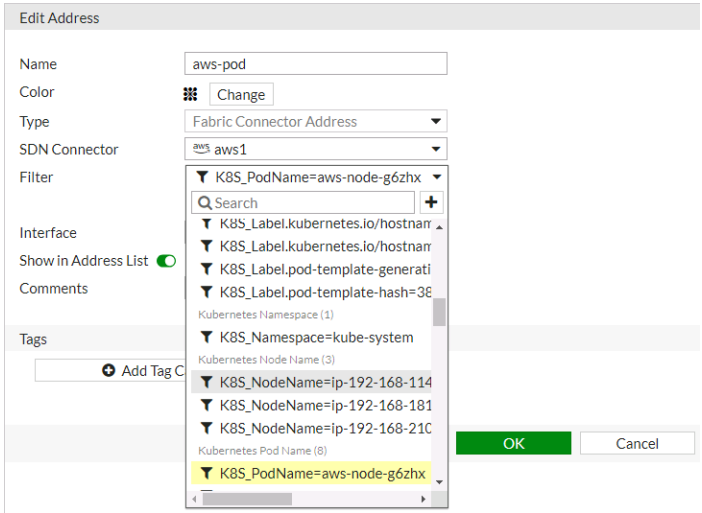
To enable an AWS SDN connector to fetch IP addresses from EKS:

1. Go to *Security Fabric > External Connectors*. Click *Create New*, then select *Amazon Web Services (AWS)*. Configure the SDN connector as desired. See AWS SDN connector using access keys on page 3989.

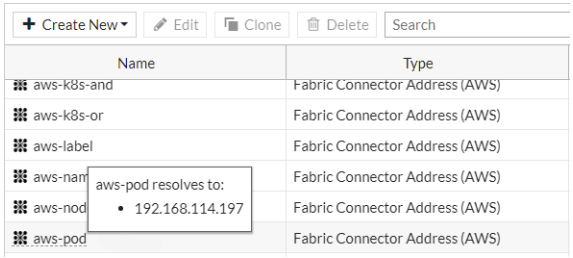


2. Go to *Policies & Objects* > *Addresses* and select *Address*.
3. Click *Create new* to create a dynamic firewall address for the configured SDN connector using the supported K8s filter.
4. From the *Type* dropdown list, select *Dynamic*.
5. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
6. From the *SDN Connector* dropdown list, select the desired SDN connector.
7. In the *Filter* field, add the desired filters. The following filters are supported:

Filter	Description
k8s_cluster	Name of K8s cluster.
k8s_namespace	Namespace of a K8s service or pod.
k8s_svcname	Name of a K8s service.
k8s_nodename	Name of a K8s node.
k8s_zone	Zone of a K8s node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/pod).



8. Configure the rest of the settings, then click *OK*.
9. Ensure that the SDN connector resolves the dynamic firewall address IP addresses by going to *Policy & Objects* > *Addresses* and hovering over the newly created address.



To configure an EKS SDN connector through the CLI:

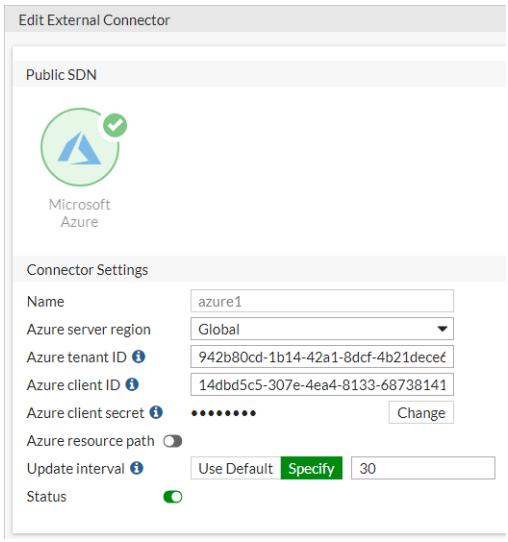
1. Configure the SDN connector:
```
config system sdn-connector
   edit "aws1"
      set type aws
      set access-key "AKIAIJNKE75ANVN5AEQA"
      set secret-key xxxxx
      set region "us-west-2"
      set update-interval 30
   next
end
```
2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter:
```
config firewall address
   edit "aws-pod"
      set type dynamic
      set sdn "aws1"
      set filter "K8S_PodName=aws-node-g6zhx"
   next
end
```
   The SDN connector resolves the dynamic firewall address IP address:
```
config firewall address
   edit "aws-pod"
      set type dynamic
      set sdn "aws1"
      set filter "K8S_PodName=aws-node-g6zhx"
      config list
         edit "192.168.114.197"
         next
      end
   next
end
```

Azure Kubernetes (AKS) SDN connector using client secret

Azure SDN connectors support dynamic address groups based on Azure Kubernetes (AKS) filters.

To enable an Azure SDN connector to fetch IP addresses from Azure Kubernetes:

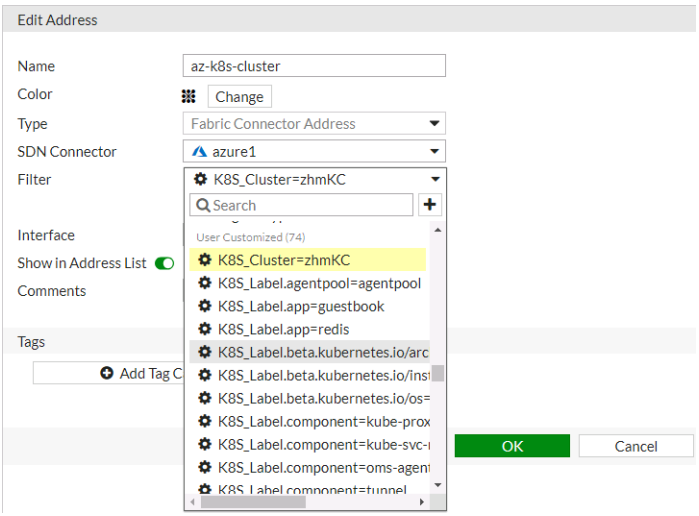
1. Configure the Azure SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *Azure*.
   c. Configure as shown substituting the region, tenant and client IDs, and client secret for your deployment. See Azure SDN connector service principal configuration requirements.



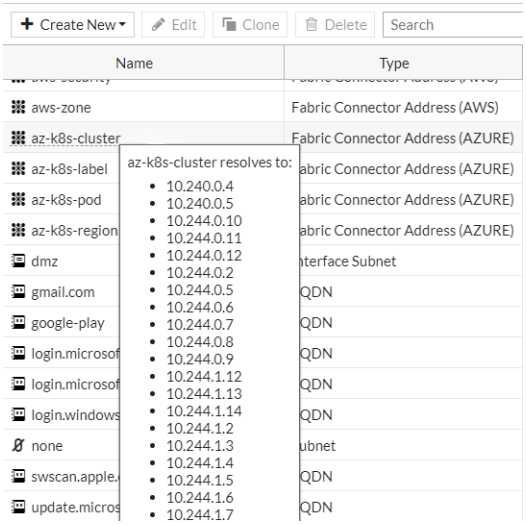
2. Create a dynamic firewall address for the configured K8s SDN connector:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. From the *Type* dropdown list, select *Dynamic*.
   d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
   e. From the *SDN Connector* dropdown list, select the desired SDN connector.
   f. In the *Filter* field, add the desired filter. The following filters are supported:

Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/pod).

In this example, the address is configured to automatically populate and update IP addresses only for instances that belong to the zhmKC cluster:



3. Ensure that the K8s SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the zhmKC cluster as configured in step 2:



To configure an Azure Kubernetes SDN connector through the CLI:

1. Configure the SDN connector:

```
config system sdn-connector
   edit "azure1"
      set type azure
      set tenant-id "942b80cd-1b14-42a1-8dcf-4b21dece61ba"
      set client-id "14dbd5c5-307e-4ea4-8133-68738141feb1"
      set client-secret xxxxx
      set update-interval 30
   next
end
```

2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter. In this example, the address will automatically populate and update IP addresses only for instances that belong to the zhmKC cluster:

```
config firewall address
   edit "az-k8s-cluster"
      set type dynamic
      set sdn "azure1"
      set filter "K8S_Cluster=zhmKC"
   next
end
```

3. Confirm that the Azure SDN connector resolves dynamic firewall IP addresses using the configured filter:

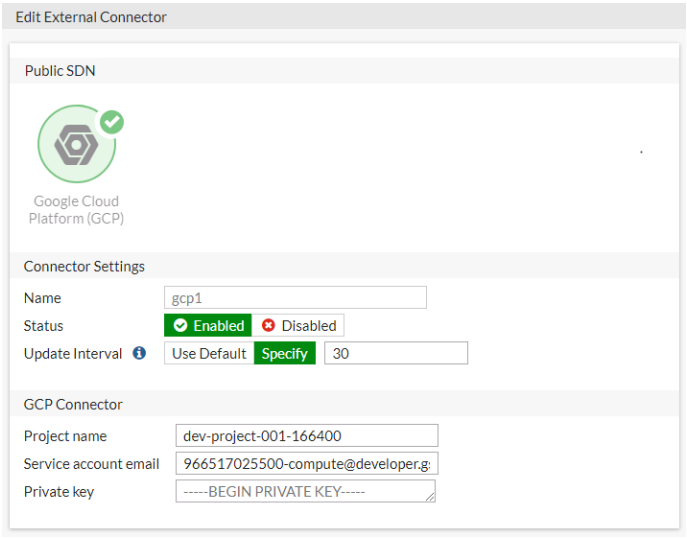
```
config firewall address
   edit "az-k8s-cluster"
      set type dynamic
      set sdn "azure1"
      set filter "K8S_Cluster=zhmKC"
      config list
         edit "10.240.0.4"
         next
         edit "10.240.0.5"
         next
         edit "10.244.0.10"
         next
      end
   next
end
```

GCP Kubernetes (GKE) SDN connector using service account

Google Cloud Platform (GCP) SDN connectors support dynamic address groups based on GCP Kubernetes Engine (GKE) filters.

To enable a GCP SDN connector to fetch IP addresses from GKE:

1. Go to *Security Fabric* > *External Connectors*, and configure an SDN connector for GCP.

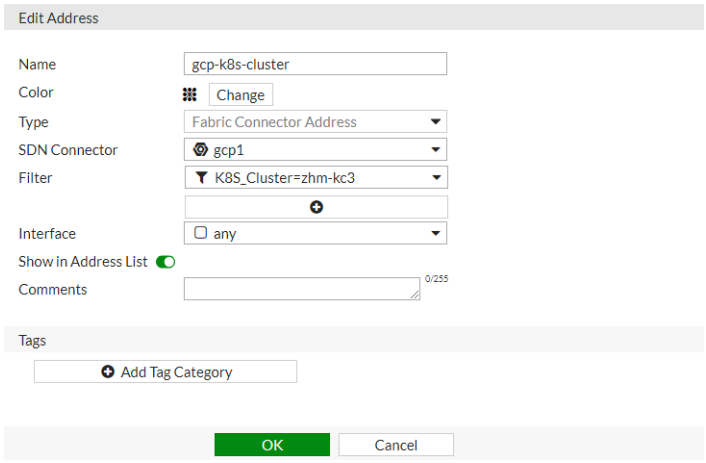


2. Go to *Policies & Objects* > *Addresses* and create a dynamic firewall address for the configured SDN connector using the supported Kubernetes filter.

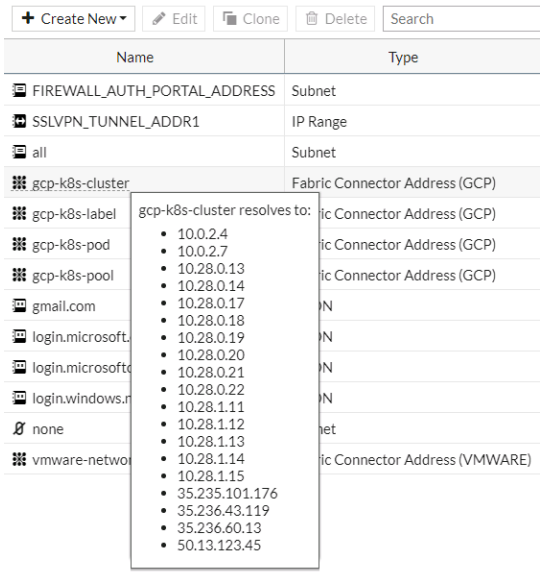
3. To filter out the Kubernetes IP addresses, select the address filter or filters. The following filters are supported:

Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/Pod).

In this example, the GCP SDN connector will automatically populate and update IP addresses only for instances that belong to the zhm-kc3 cluster:



4. Configure the rest of the settings, then click *OK*.
The dynamic firewall address IP is resolved by the SDN connector.



To configure a GCP Kubernetes SDN connector through the CLI:

1. Configure an SDN connector for Kubernetes:

```
config system sdn-connector
   edit "gcp1"
      set type gcp
      set gcp-project "dev-project-001-166400"
      set service-account "966517025500-compute@developer.gserviceaccount.com"
      set update-interval 30
   next
end
```

2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter:

```
config firewall address
   edit "gcp-k8s-cluster"
      set type dynamic
      set sdn "gcp1"
      set filter "K8S_Cluster=zhm-kc3"
   next
end
```

The dynamic firewall address IP is resolved by the SDN connector:

```
config firewall address
   edit "gcp-k8s-cluster"
      set type dynamic
      set sdn "gcp1"
      set filter "K8S_Cluster=zhm-kc3"
      config list
         edit "10.0.2.4"
         next
         edit "10.0.2.7"
         next
         edit "10.28.0.13"
         next
      end
   next
```

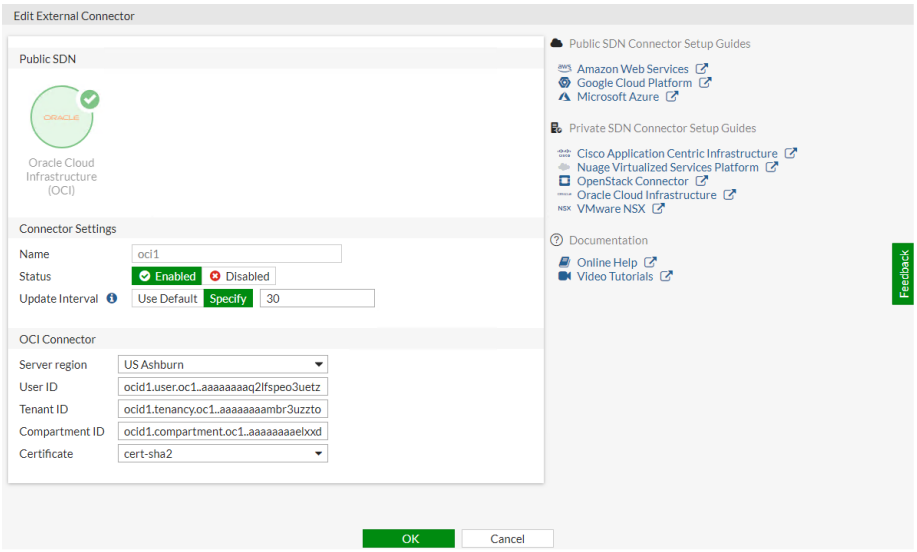
```
end
```

Oracle Kubernetes (OKE) SDN connector using certificates

OCI SDN connectors support dynamic address groups based on Oracle Kubernetes (OKE) filters.

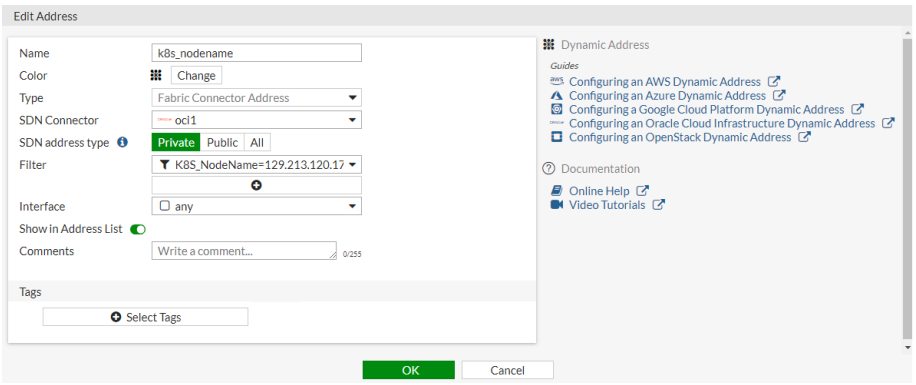
To enable an OCI SDN connector to fetch IP addresses from Oracle Kubernetes:

1. Configure the OCI SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *Oracle Cloud Infrastructure (OCI)*.
   c. Configure as shown substituting the region, tenant and client IDs, and client secret for your deployment. The update interval is in seconds.

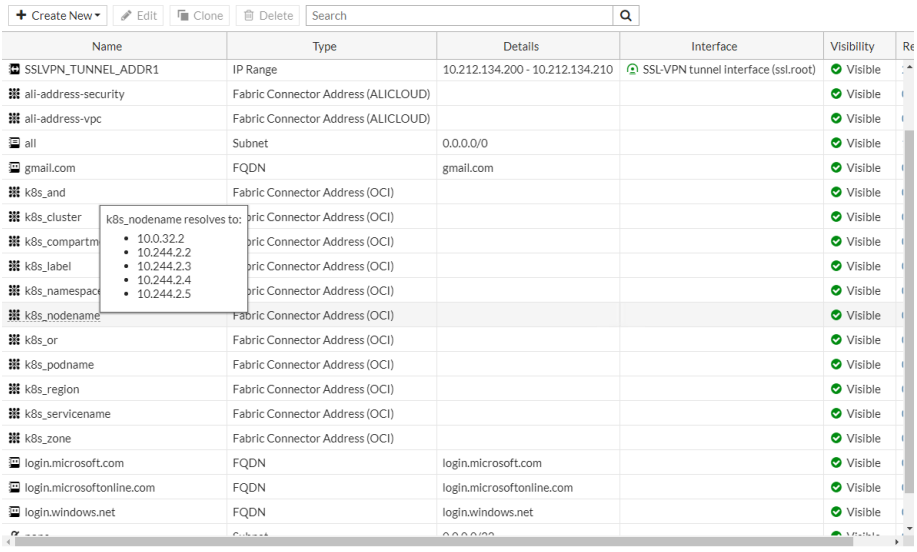


2. Create dynamic firewall addresses for the configured SDN connector with supported Kubernetes filter:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. In the *Filter* field, select the desired filters. The following filters are supported:

Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/Pod).



3. Confirm that the SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances:



To configure an SDN connector through the CLI:

1. Configure the OCI SDN connector:

```
config system sdn-connector
   edit "oci1"
      set type oci
      set tenant-id
            "ocid1.tenancy.oc1..aaaaaaaambr3uzztoyhweohbzqqdo775h7d3t54zpmzkp4b2cf35vs55cxxx"
      set user-id
            "ocid1.user.oc1..aaaaaaaaq2lfspeo3uetzbzpiv2pqvzzevozccnys347stwssvizqlatfxxx"
      set compartment-id
            "ocid1.compartment.oc1..aaaaaaaaelxxdjazqo7nzczpgypyiqcgkmytjry6nfq5345vw7eavpwnm
            xxx"
      set oci-region ashburn
      set oci-cert "cert-sha2"
      set update-interval 30
   next
end
```

2. Create dynamic firewall addresses for the configured SDN connector with supported Kubernetes filter:

```
config firewall address
```

```
      edit "k8s_nodename"
         set type dynamic
         set sdn "oci1"
         set filter "K8S_NodeName=129.213.120.172"
      next
   end
```

3. Confirm that the SDN connector resolves dynamic firewall IP addresses:

```
   config firewall address
      edit "k8s_nodename"
         set type dynamic
         set sdn "oci1"
         set filter "K8S_NodeName=129.213.120.172"
         config list
            edit "10.0.32.2"
            next
            edit "10.244.2.2"
            next
            edit "10.244.2.3"
            next
            edit "10.244.2.4"
            next
            edit "10.244.2.5"
            next
         end
      next
   end
```

Private cloud K8s SDN connector using secret token

FortiOS automatically updates dynamic and cluster IP addresses for Kubernetes (K8s) by using a K8s SDN connector, enabling FortiOS to manage K8s pods as global address objects, as with other connectors. This includes mapping the following attributes from K8s instances to dynamic address groups in FortiOS:

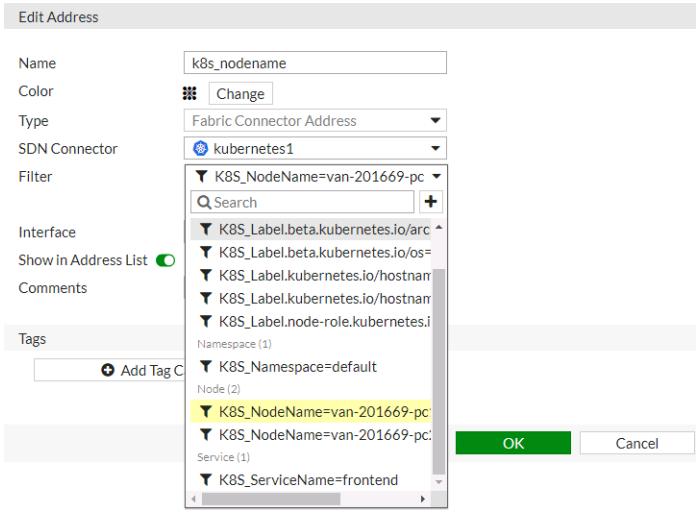
Filter	Description
Namespace	Filter service IP addresses in a given namespace.
ServiceName	Filter service IP addresses by the given service name.
NodeName	Filter node IP addresses by the given node name.
PodName	Filter IP addresses by the pod name.
Label.XXX	Filter service or node IP addresses with the given label XXX. For example: `K8S_Label.app=nginx`.

FortiOS 6.2.3 and later collect cluster IP addresses in addition to external IP addresses for exposed K8s services.

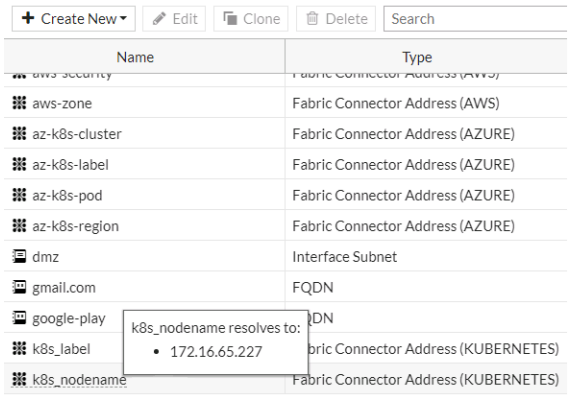
There is no maximum limit for the number of IP addresses populated with the filters.

To configure K8s SDN connector using the GUI:

1. Configure the K8s SDN connector:
   a. Go to *Security Fabric* > *External Connectors* > *Create New Connector*.
   b. Select *Kubernetes*.
   c. In the *IP* field, enter the IP address that you obtained in Obtaining the IP address, port, and secret token in Kubernetes.
   d. In the *Port* field, select *Specify*, then enter the port that you obtained in Obtaining the IP address, port, and secret token in Kubernetes.
   e. In the *Secret token* field, enter the token that you obtained in Obtaining the IP address, port, and secret token in Kubernetes.
   f. Configure the other fields as desired.
2. Create a dynamic firewall address for the configured K8S SDN connector:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. Configure the address as shown, selecting the desired filter in the *Filter* dropdown list. In this example, the K8s SDN connector will automatically populate and update IP addresses only for node instances that match the specified node name:



3. Ensure that the K8s SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for node instances that match the node name configured in step 2:



To configure K8s SDN connector using CLI commands:

1. Configure the K8s SDN connector:

```
config system sdn-connector
   edit "kubernetes1"
      set type kubernetes
      set server "<IP address obtained in Obtaining the IP address, port, and secret token in
         Kubernetes>"
      set server-port <Port obtained in Obtaining the IP address, port, and secret token in
         Kubernetes>
      set secret-token <Secret token obtained in Obtaining the IP address, port, and secret token
         in Kubernetes>
      set update-interval 30
   next
end
```

2. Create a dynamic firewall address for the configured K8s SDN connector with the supported K8s filter. In this example, the K8s SDN connector will automatically populate and update IP addresses only for node instances that match the specified node name:

```
config firewall address
   edit "k8s_nodename"
      set type dynamic
      set sdn "kubernetes1"
      set filter "K8S_NodeName=van-201669-pc1"
   next
end
```

3. Confirm that the K8s SDN connector resolves dynamic firewall IP addresses using the configured filter:

```
config firewall address
   edit "k8s_nodename"
      set type dynamic
      set sdn "kubernetes1"
      set filter "K8S_NodeName=van-201669-pc1"
      config list
         edit "172.16.65.227"
         next
      end
   next
end
```

To troubleshoot the connection:

1. In FortiOS, run the following commands:
   ```
   diagnose deb application kubed -1
   diagnose debug enable
   ```
2. Reset the connection on the web UI to generate logs and troubleshoot the issue. The following shows the output in the case of a failure:

```
fortigate # diagnose deb application kubed -1
Debug messages will be on for 30 minutes.

fortigate # diagnose debug enable

fortigate # k8s: update sdn connector kubernetes1 status to enabled
k8s: update sdn connector kubernetes2 status to disabled
kubed sdn connector kubernetes1 prepare to update
getting token
kubed sdn connector kubernetes1 start updating
kube url: https://172.17.215.10:6443/api/v1/services
kube host: 172.17.215.10:6443:172.17.215.10
{"kind":"Status","apiVersion":"v1","metadata":{},"status":"Failure","message":"s
ervices is forbidden: User \"system:serviceaccount:default:fortigateconnector\"

  10.184.0.1
kubed sdn connector kubernetes2 finish updating IP addresses
kubed reap child pid: 1252
```

Nuage SDN connector using server credentials

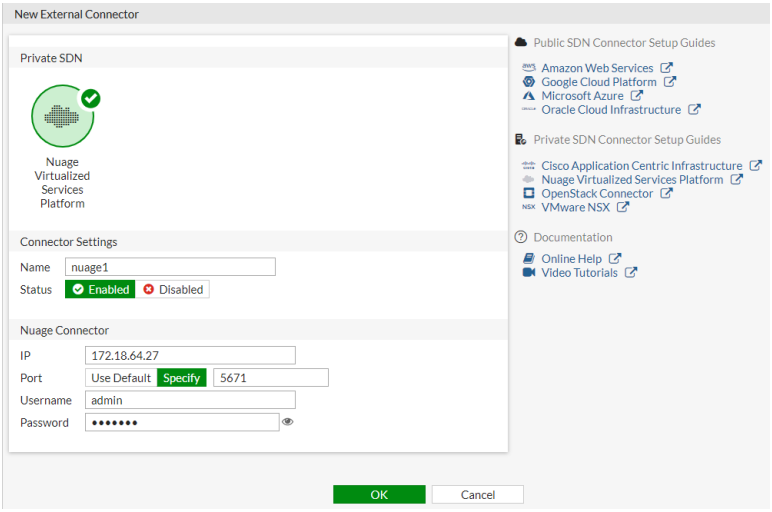
You can use Nuage SDN connectors in dynamic firewall addresses.

The Fortinet SDN Connector for Cisco ACI and Nuage Networks is a standalone connector that connects to SDN controllers within Cisco ACI and Nuage Networks. You must configure a connection to the Fortinet SDN connector in FortiOS to query the dynamic addresses.

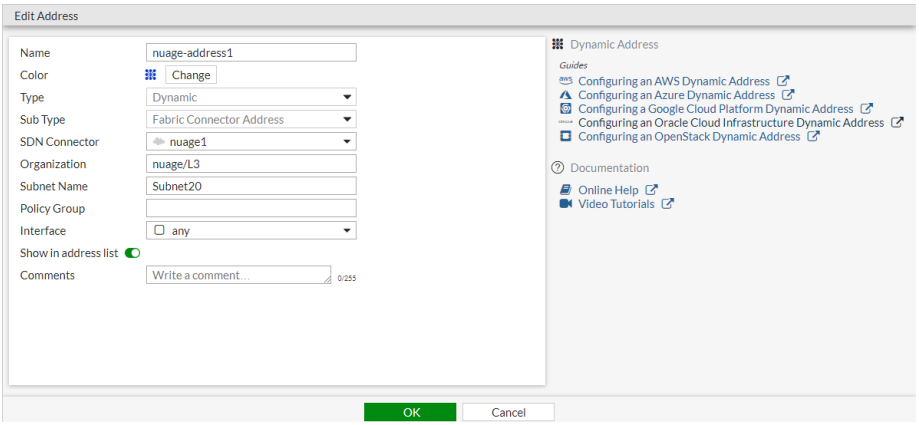
To configure a Nuage connector in the GUI:

1. Create the Nuage SDN connector:
   a. Go to *Security Fabric > External Connectors* and click *Create New*.
   b. In the *Private SDN* section, click *Nuage Virtualized Services Platform*.
   c. Configure the settings as needed.

d. Click *OK*.



2. Create the dynamic firewall address for the connector:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. Configure the following settings:
      i. For *Type*, select *Dynamic*.
      ii. For *Sub Type*, select *Fabric Connector Address*.
      iii. For *SDN Connector*, select the Nuage connector.
      iv. Configure the remaining settings as needed.
   d. Click *OK*.



To verify the SDN connector resolves the dynamic firewall IP addresses in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. In the address table, hover over an address to view which IP addresses it resolves to.

To configure a Nuage connector in the CLI:

1. Create the SDN connector:

```
config system sdn-connector
    edit "nuage1"
        set type nuage
        set server "172.18.64.27"
        set server-port 5671
        set username "admin"
        set password xxxxxxx
    next
end
```

2. Create the dynamic firewall address for the connector:

```
config firewall address
    edit "nuage-address1"
        set type dynamic
        set sdn "nuage1"
        set color 19
        set organization "nuage/L3"
        set subnet-name "Subnet20"
    next
end
```

To verify the SDN connector resolves the dynamic firewall IP addresses in the CLI:

```
# diagnose firewall dynamic list

List all dynamic addresses:
nuage1.nuage.nuage/L3.Subnet20.*: ID(196)
        ADDR(192.168.20.92)
        ADDR(192.168.20.240)
```

Nutanix SDN connector using server credentials

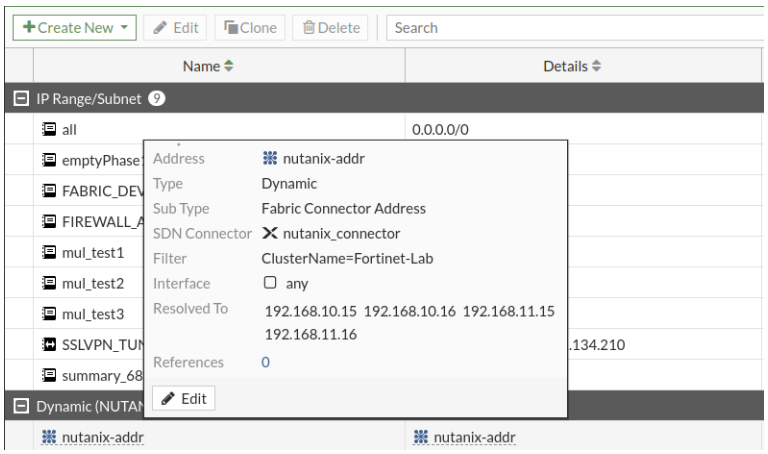
FortiOS automatically updates dynamic addresses for Nutanix using an Nutanix SDN connector, including mapping the following attributes from Nutanix instances to dynamic address groups in FortiOS:

- Cluster name
- Cluster UUID
- Description
- Host name
- Host UUID
- Hypervisor type
- Image name
- Image UUID
- Subnet name

- Subnet UUID
- VM name
- VM UUID

To configure a Nutanix connector using the GUI:

1. Configure the Nutanix SDN connector:
   a. Go to *Security Fabric > External Connectors*.
   b. Select *Nutanix*.
   c. In the *IP address* field, enter the IP address for your Nutanix environment.
   d. In the *Port* field, enter the desired port.
   e. In the *Username* and *Password* fields, enter the credentials for your Nutanix environment.
   f. Click *OK*.
2. Create a dynamic firewall address for the configured Nutanix SDN connector:
   a. Go to *Policy & Objects > Addresses* and select *Address*.
   b. Click *Create new*.
   c. From the *Type* dropdown list, select *Dynamic*.
   d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
   e. From the *SDN Connector* dropdown list, select the Nutanix connector.
   f. From the *Filter* dropdown list, select the desired filters.
   g. Click *OK*.
3. Ensure that the Nutanix SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects > Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that satisfy the filter requirements configured in step 2. In this example, the configured filter is "ClusterName=Fortinet-Lab":



To configure a Nutanix connector using the CLI:

1. Configure the Nutanix SDN connector:

```
config system sdn-connector
   edit "nutanix_connector"
      set status disable
      set type nutanix set server "172.18.33.59"
```

```
        set server-port 9440
        set username "admin"
        set password **********
        set update-interval 60
    next
end
```

2. Create a dynamic firewall address for the configured Nutanix SDN connector:

```
config firewall address
    edit "nutanix-addr"
        set uuid 382ceafe-8e72-51eb-7300-0807ee907946
        set type dynamic
        set sdn "nutanix_connector"
        set color 2
        set filter "ClusterName=Fortinet-Lab"
    next
end
```

3. Ensure that the Nutanix SDN connector resolves dynamic firewall IP addresses:

```
config firewall address
    edit "nutanix-addr"
        set uuid 382ceafe-8e72-51eb-7300-0807ee907946
        set type dynamic
        set sdn "nutanix_connector"
        set color 2
        set filter "ClusterName=Fortinet-Lab"
        config list
            edit "192.168.10.15"
            next
            edit "192.168.10.16"
            next
            edit "192.168.11.15"
            next
            edit "192.168.11.16"
            next
        end
    next
end
```

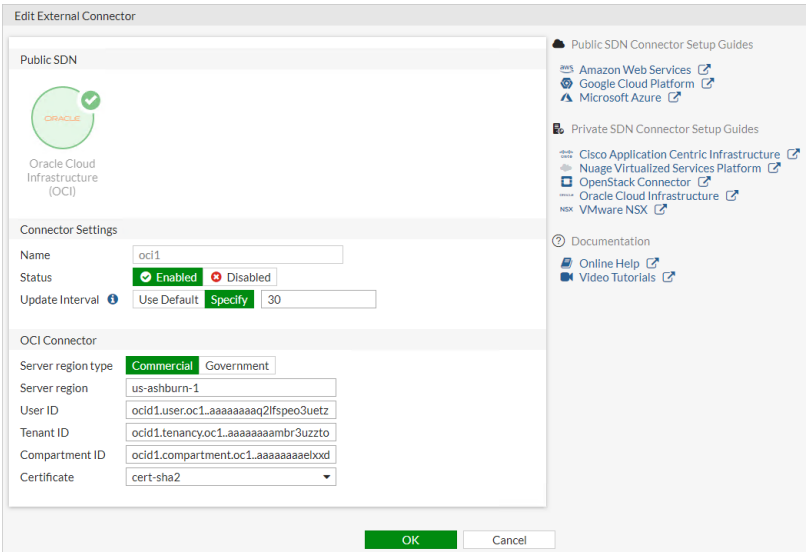
OCI SDN connector using certificates

You can configure SDN connector integration with Oracle Cloud Infrastructure (OCI).

To configure an OCI SDN connector in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Public SDN* section, select *Oracle Cloud Infrastructure (OCI)*.
3. Configure the connector as desired:
   a. *User ID*: Enter the OCID of the OCI user who belongs to the administrator group. See Certificate-based SDN connector requirements.
   b. For the *OCI Certificate* field, you must select a certificate that satisfies OCI key size limits. The minimum size is 2048 bits. Do one of the following:

i. Select the built-in default certificate called Fortinet_Factory.
ii. Follow steps 1-2 in Using custom certificates to configure a custom certificate.

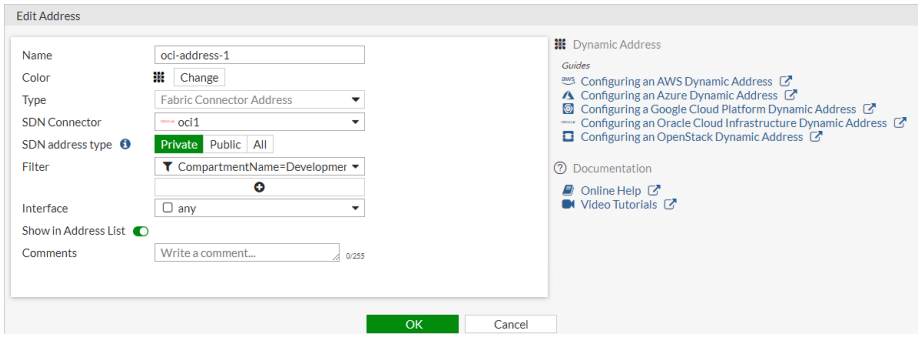


4. Click *OK*.
5. At this stage, you must register the certificate's fingerprint to the specified OCI user.
   a. Go to the OCI user, then *API Keys* > *Add Public Key*.
   b. If you selected the Fortinet_Factory certificate in step 2f, do the following:
      i. In FortiOS, go to *System* > *Certificate*. Select Fortinet_Factory, then click *Download*.
      ii. You now have the Fortinet_Factory.cer file. Create a public key file in PEM format from it, using a freely available tool of your choice such as OpenSSL.
   c. Copy and paste the content of the certificate PEM key file in the *Add Public Key* window in OCI. Click *Add*.
   d. You now see the fingerprint.

   You can configure the following for the fingerprint:
   1. *Update Interval*: The default value is 60 seconds. You can change the value to between 1 and 3600 seconds.
   2. *Status*: Green means that the connector is enabled. You can disable it at any time by toggling the switch.
   e. Click *OK*.
6. Go to *Policy & Objects* > *Addresses* and select *Address*.
7. Click *Create new*.
8. Configure the address as needed, selecting the OCI connector in the *SDN Connector* field. The following filters are supported:
   `'vm_name=<vm name>'`: matches VM instance name.
   `'instance_id=<instance id>'`: matches instance OCID.

'tag.<key>=<value>': matches freeform tag key and its value.

'definedtag.<namespace>.<key>=<value>': matches a tag namespace, tag key, and its value.



9. Click *OK*.

To configure an OCI SDN connector in the CLI:

1. Configure an SDN connector:

```
config system sdn-connector
    edit "oci1"
        set status enable
        set type oci
        set tenant-id
"ocid1.tenancy.oc1..aaaaaaaaaaa3aaaaaaaaaaaaaaaaaa77xxxxxx54bbbbbb4xxxx35xx55xxxx"
        set user-id
"ocid1.user.oc1..aaaaaaaaa2laaaaa3aaaaaaaaaabbbbbbbbbbcccc3ccccccccccxxxxxxxx"
        set compartment-id
"ocid1.compartment.oc1..aaaaaaaaaaaaaaaaaa7bbbbbbbbbbccccccccccc6xxx53xxxx7xxxxxxxxxx"
        set oci-region "us-ashburn-1"
        set oci-region-type commercial
        set oci-cert "cert-sha2"
        set update-interval 30
    next
end
```

2. Create a dynamic firewall address for the SDN connector with a supported filter:

```
config firewall address
    edit "oci-address-1"
        set type dynamic
        set sdn "oci1"
        set filter "CompartmentName=DevelopmentEngineering"
    next
end
```

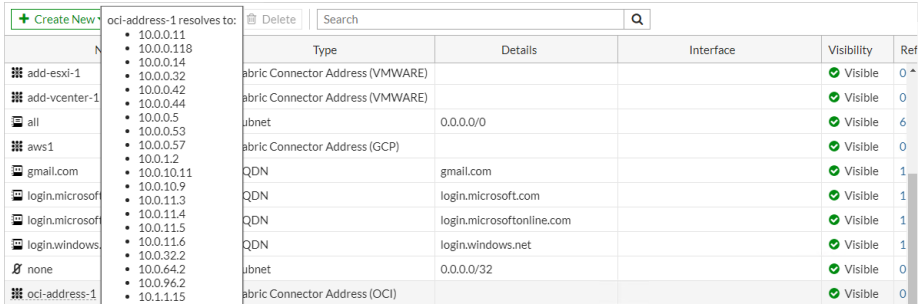
To confirm that dynamic firewall addresses are resolved by the SDN connector:

1. In the CLI, check that the addresses are listed:

```
config firewall address
    edit "oci-address-1"
```

```
        set type dynamic
        set sdn "oci1"
        set filter "CompartmentName=DevelopmentEngineering"
        config list
            edit "10.0.0.11"
            next
            edit "10.0.0.118"
            next
            ...
            next
        end
    next
end
```

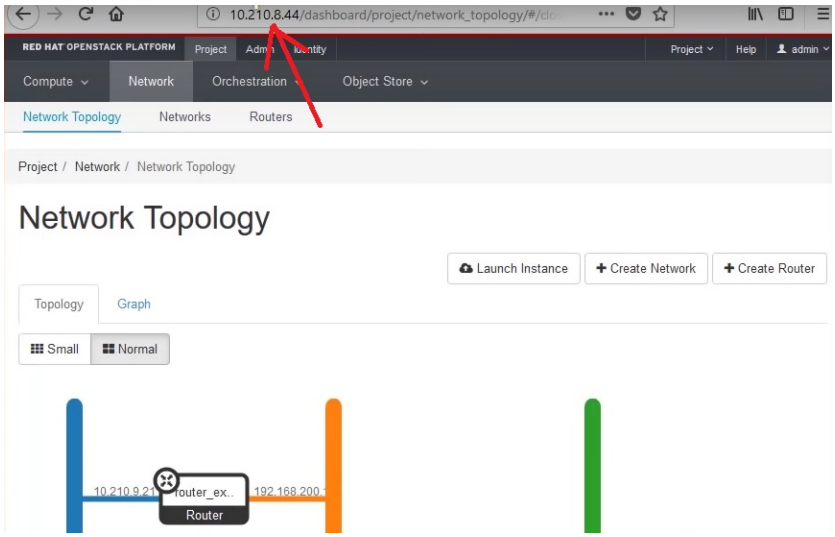
2. In the GUI, go to *Policy & Objects* > *Addresses* and hover the cursor over the address name.



OpenStack SDN connector using node credentials

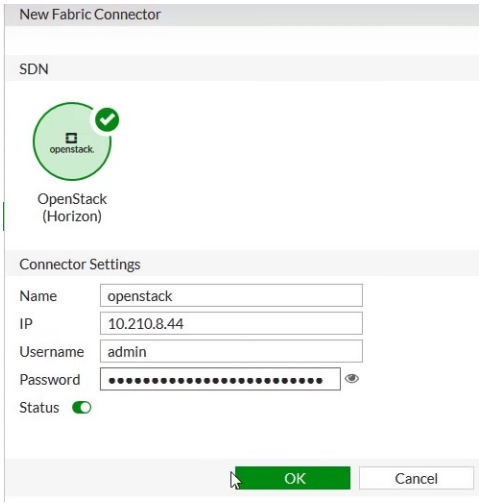
To configure OpenStack SDN connector using node credentials:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*, then select *OpenStack (Horizon)*.
3. Configure the fields as follows:
   a. *Name*: Name the connector as desired.
   b. *IP*: Enter the OpenStack management component's IP address. Generally you can find it in the OpenStack identity.



c. *User name*: Enter the specified node's administrator name.

d. *Password*: Enter the administrator password.



4. Click *OK*. The SDN connector is now configured.

To configure a dynamic firewall address:

The next step is to create an address that will be used as an address group or single address that acts as the source/destination for firewall policies. The address is based on IP addresses and contains VM instances' IP addresses.

No matter what changes occur to the instances, the SDN connector populates and updates the changes automatically based on the specified filtering condition so that administrators do not need to reconfigure the address content manually. Appropriate firewall policies using the address are applied to instances that are members of the address.

1. Go to *Policy & Objects* > *Address*. Click *Create New*, then select *Address*.

2. Configure the address as follows:

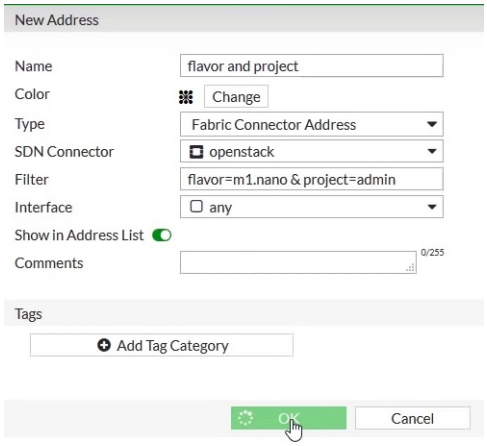
a. *Name*: Name the address as desired.

b. *Type*: Select *Dynamic*.

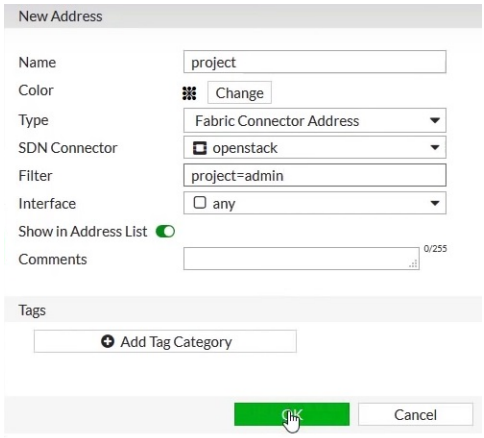
c. *Sub Type*: Select *Fabric Connector Address*.
d. *SDN Connector*: Select *openstack*.
e. *Filter*: The SDN connector automatically populates and updates only IP addresses belonging to the specified filter that matches the condition. OpenStack Horizon connectors support the following filters:
   i. `id=<instance id>`: This matches a VM instance ID.
   ii. name=<instance name>: This matches a VM instance name.
   iii. `flavor=<instance flavor name>`: This matches an instance flavor name.
   iv. `keypair=<key pair name>`: This matches a key pair name.
   v. `network=<net name>`: This matches a network name.
   vi. `project=<project name>`: This matches a project name.
   vii. `availabilityzone=<zone name>`: This matches an availability zone name.
   viii. `servergroup=<group name>`: This matches a server group name.
   ix. `securitygroup=<security group name>`: This matches a security group name.
   x. `metadata.<key>=<value>`: This matches metadata with its key and value pair.

You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

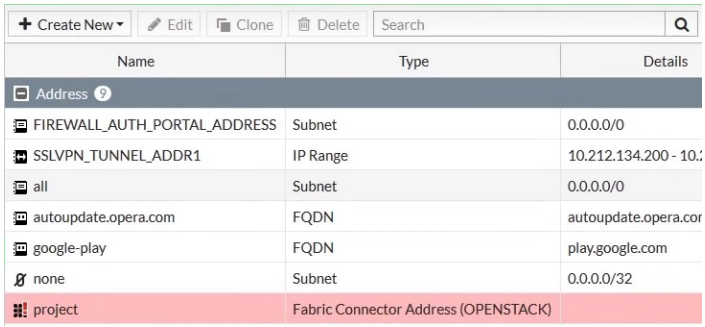
For example, you could enter `flavor=m1.nano&project=admin`. In this case, IP addresses of instances that match both the flavor name and project name are populated. Wildcards (asterisks) are not allowed in values.



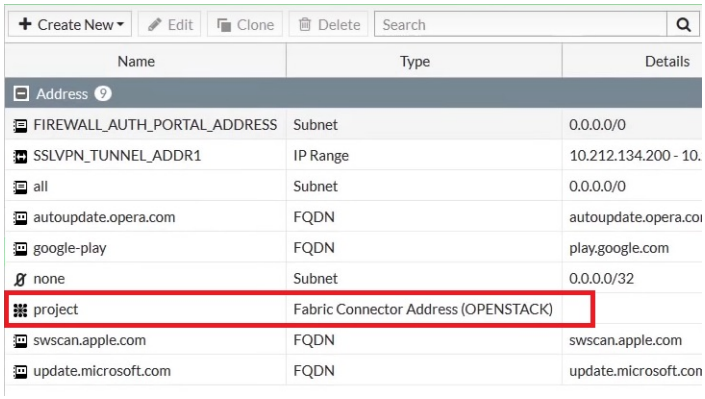
In this example, let's use project=admin, assuming the project name is admin.

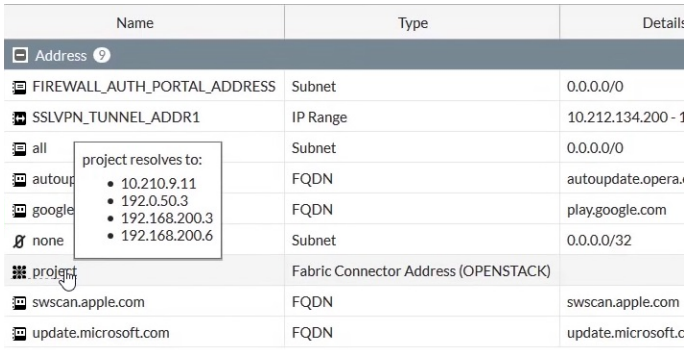


3. Click *OK* after completing all required fields.
4. Ensure that the address was created.



5. After a few minutes, the new address takes effect. Hover your cursor on the address to see a list of IP addresses and instances with the project name "admin".





SAP SDN connector

The SAP external Fabric connector allows the FortiGate to connect to an SAP instance to synchronize dynamic address objects and ports for SAP workloads. These address objects can be used in firewall policies to grant access control to dynamic SAP workloads.

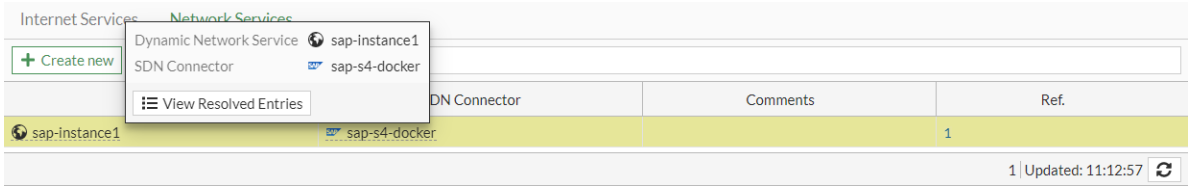
To configure an SAP connector in the GUI:

1. Configure the SAP SDN connector:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. In the *Private SDN* section, select *SAP*.
   c. Enter a *Name* (*sap-s4-docker*).
   d. Enter the *IP* for the SAP instance.
   e. Enter the *Username* and *Password*.

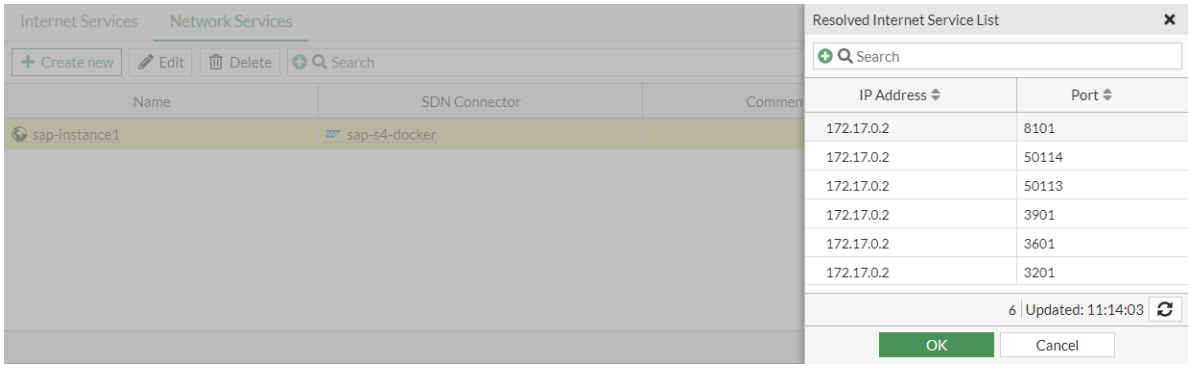
   f. Click *OK*.
2. Configure a network service associated with the configured SAP SDN connector:
   a. Go to *Policy & Objects* > *Internet Service Database*, select the *Network Services* tab, and click *Create New*.
   b. Enter a *Name* (*sap-instance1*).
   c. Set *SDN connector* to *sap-s4-docker*.
   d. Select a filter, such as *InstanceNumber=1*. The available filters are for HostName, InstanceNumber, and ServiceName.

   e. Click *OK*.
3. Ensure that the SAP SDN connector resolves dynamic network services:

a. Go to *Policy & Objects* > *Internet Service Database*, select the *Network Services* tab.
b. Hover over the *sap-instance1* and click *View Resolved Entries*.



A list of resolved internet services is displayed.



Click *OK* to close the list.

4. Configure a firewall policy with the resolved dynamic network service as the destination:
   a. Go to *Policy & Objects* >*Firewall Policy* and click *Create New*.
   b. Set the *Destination* to the *sap-instance1* network service.
   c. Configure the other settings as needed.
   d. Click *OK*.

To configure an SAP connector in the CLI:

1. Configure the SAP SDN connector:

```
config system sdn-connector
    edit "sap-s4-docker"
        set type sap
        set verify-certificate disable
        set server "20.124.134.109"
        set server-port 50014
        set username "a4hadm"
        set password ************
    next
end
```

2. Configure a network service associated with the configured SAP SDN connector (available filters are HostName, InstanceNumber, and ServiceName):

```
config firewall network-service-dynamic
    edit "sap-instance1"
        set sdn "sap-s4-docker"
        set filter "InstanceNumber=1"
```

```
    next
end
```

3. Ensure that the SAP SDN connector resolves dynamic network services:

```
# diagnose firewall network-service-dynamic list "sap-instance1"
List internet service in kernel(custom):
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=8101-8101
addr ip range(1): 172.17.0.2-172.17.0.2
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=50114-50114
addr ip range(1): 172.17.0.2-172.17.0.2
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=50113-50113
addr ip range(1): 172.17.0.2-172.17.0.2
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=3901-3901
addr ip range(1): 172.17.0.2-172.17.0.2
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=3601-3601
addr ip range(1): 172.17.0.2-172.17.0.2
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=3201-3201
addr ip range(1): 172.17.0.2-172.17.0.2
```

4. Configure a firewall policy with the resolved dynamic network service as the destination:

```
config firewall policy
    edit 2
        set name "FGT97-service-dynamic"
        set srcintf "port3"
        set dstintf "port10"
        set action accept
        set srcaddr "all"
        set internet-service enable
        set network-service-dynamic "sap-instance1"
        set schedule "always"
        set nat enable
    next
end
```

VMware ESXi SDN connector using server credentials

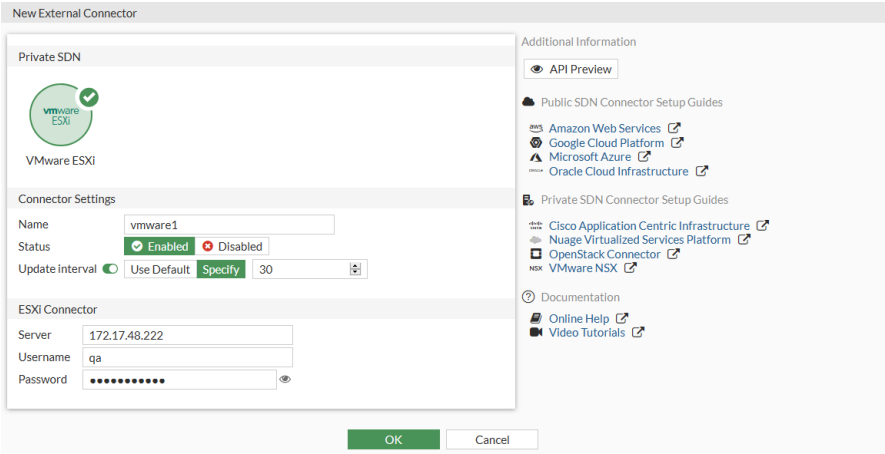
Dynamic addresses for VMware ESXi and vCenter servers can be automatically updated by using a VMware ESXi SDN connector, including mapping the following attributes from VMware ESXi and vCenter objects to dynamic address groups in FortiOS:

- vmid
- host
- name

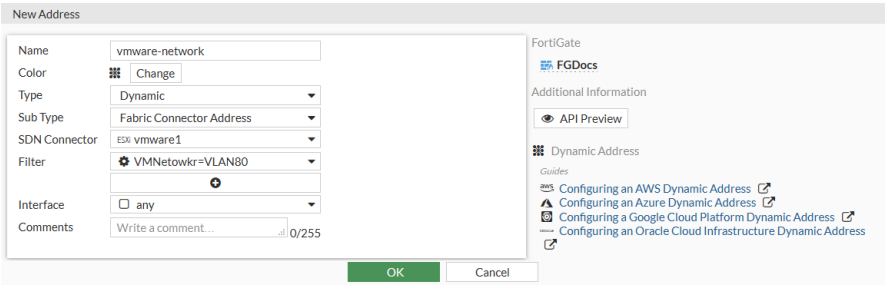
- uuid
- vmuuid
- vmnetwork
- guestid
- guestname
- annotation
- datacenter
- tag

To configure VMware ESXi SDN connector using the GUI:

1. Configure the VMware ESXi SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *VMware ESXi*.
   c. Configure as shown, substituting the server IP address, username, and password for your deployment. The update interval is in seconds. The password cannot contain single or double quotes.



2. Create a dynamic firewall address for the configured VMware ESXi SDN connector:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. Configure the address as shown, selecting the desired filter in the *Filter* dropdown list. In this example, the VMware ESXi fabric connector will automatically populate and update IP addresses only for instances that belong to VLAN80:



3. Ensure that the VMware ESXi SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to VLAN80 as configured in step 2:

To configure VMware ESXi SDN connector using CLI commands:

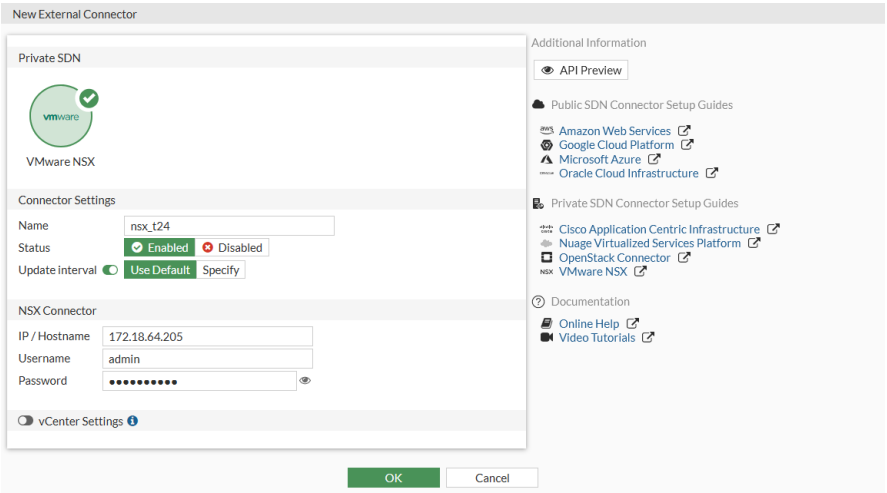
1. Configure the VMware ESXi SDN connector:
```
config system sdn-connector
   edit "vmware1"
      set type vmware
      set server "172.17.48.222"
      set username "example_username"
      set password xxxxx
      set update-interval 30
   next
end
```
2. Create a dynamic firewall address for the configured VMware ESXi SDN connector with the supported VMware ESXi filter. In this example, the VMware ESXi SDN connector will automatically populate and update IP addresses only for instances that belong to the specified VLAN:
```
config firewall address
   edit "vmware-network"
      set type dynamic
      set sdn "vmware1"
      set filter "vmnetwork=VLAN80"
   next
end
```
3. Confirm that the VMware ESXi SDN connector resolves dynamic firewall IP addresses using the configured filter:
```
config firewall address
   edit "vmware-network"
      set type dynamic
      set sdn "vmware1"
      set filter "vmnetwork=VLAN80"
      config list
         edit "192.168.8.240"
         next
      end
   next
end
```

VMware NSX-T Manager SDN connector using NSX-T Manager credentials

This feature provides SDN connector configuration for VMware NSX-T manager. You can import specific groups, or all groups from the NSX-T Manager.

To configure SDN connector for NSX-T Manager in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Private SDN* section, click *VMware NSX*.



3. Configure the settings and click *OK*.

To configure SDN connector for NSX-T Manager in the CLI:

```
config system sdn-connector
    edit "nsx_t24"
        set type nsx
        set server "172.18.64.205"
        set username "admin"
        set password xxxxxx
    next
end
```

To import a specific group from the NSX-T Manager:

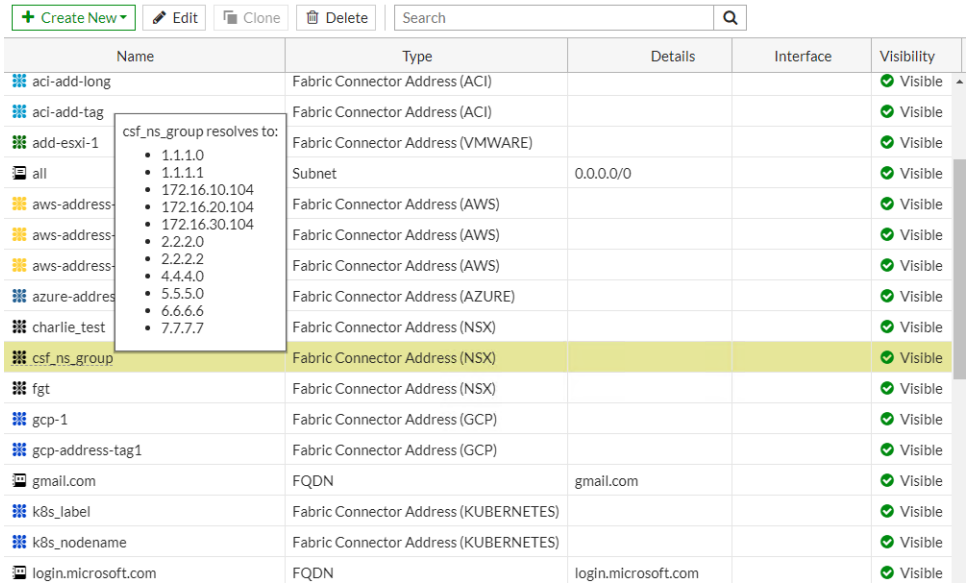
```
# execute nsx group import nsx_t24 root csf_ns_group
[1] 336914ba-0660-4840-b0f1-9320f5c5ca5e csf_ns_group:
  Name:csf_ns_group
  Address:1.1.1.0
  Address:1.1.1.1
  Address:172.16.10.104
  Address:172.16.20.104
  Address:172.16.30.104
  Address:2.2.2.0
  Address:2.2.2.2
  Address:4.4.4.0
  Address:5.5.5.0
  Address:6.6.6.6
  Address:7.7.7.7
```

To import all groups from NSX-T Manager:

```
# execute nsx group import nsx_t24 root
[1] 663a7686-b9a3-4659-b06f-b45c908349a0 ServiceInsertion_NSGroup:
  Name:ServiceInsertion_NSGroup
  Address:10.0.0.2
[2] 336914ba-0660-4840-b0f1-9320f5c5ca5e csf_ns_group:
  Name:csf_ns_group
  Address:1.1.1.0
  Address:1.1.1.1
  Address:172.16.10.104
  Address:172.16.20.104
  Address:172.16.30.104
  Address:2.2.2.0
  Address:2.2.2.2
  Address:4.4.4.0
  Address:5.5.5.0
  Address:6.6.6.6
  Address:7.7.7.7
[3] c462ec4d-d526-4ceb-aeb5-3f168cecd89d charlie_test:
  Name:charlie_test
  Address:1.1.1.1
  Address:2.2.2.2
  Address:6.6.6.6
  Address:7.7.7.7
[4] ff4dcb08-53cf-46bd-bef4-f7aeda9c0ad9 fgt:
  Name:fgt
  Address:172.16.10.101
  Address:172.16.10.102
  Address:172.16.20.102
  Address:172.16.30.103
[5] 3dd7df0d-2baa-44e0-b88f-bd21a92eb2e5 yongyu_test:
  Name:yongyu_test
  Address:1.1.1.0
  Address:2.2.2.0
  Address:4.4.4.0
  Address:5.5.5.0
```

To view the dynamic firewall IP addresses that are resolved by the SDN connector in the GUI:

1. Go to *Policy & Objects* > *Addresses* to view the IP addresses resolved by an SDN connector.



To view the dynamic firewall IP addresses that are resolved by the SDN connector in the CLI:

```
# show firewall address csf_ns_group
config firewall address
    edit "csf_ns_group"
        set uuid ee4a2696-bacd-51e9-f828-59457565b880
        set type dynamic
        set sdn "nsx_t24"
        set obj-id "336914ba-0660-4840-b0f1-9320f5c5ca5e"
        config list
            edit "1.1.1.0"
            next
            edit "1.1.1.1"
            next
            edit "172.16.10.104"
            next
            edit "172.16.20.104"
            next
            edit "172.16.30.104"
            next
            edit "2.2.2.0"
            next
            edit "2.2.2.2"
            next
            edit "4.4.4.0"
            next
            edit "5.5.5.0"
            next
            edit "6.6.6.6"
```

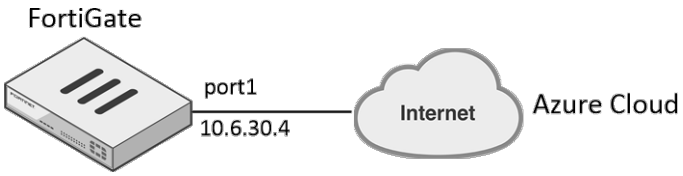
```
            next
            edit "7.7.7.7"
            next
        end
    next
end
```

Multiple concurrent SDN connectors

This guide shows how to configure SDN connectors and resolve dynamic firewall addresses through the configured SDN connector in FortiOS.

FortiOS supports multiple SDN connectors including public connectors (AWS, Azure, GCP, OCI, AliCloud) and private connectors (Kubernetes, VMware ESXi, VMware NSX, OpenStack, Cisco ACI, Nuage). FortiOS also supports multiple instances for each type of SDN connector.

This guide uses an Azure SDN connector as an example. The configuration procedure for all supported SDN connectors is the same. In the following topology, the FortiGate accesses the Azure public cloud through the Internet:



This process consists of the following:

1. Configure the interface.
2. Configure a static route to connect to the Internet.
3. Configure two Azure SDN connectors with different client IDs.
4. Check the configured SDN connectors.
5. Create two firewall addresses.
6. Check the resolved firewall addresses after the update interval.
7. Run diagnose commands.

To configure the interface:

1. In FortiOS, go to *Network* > *Interfaces*.
2. Edit port1:
   a. From the *Role* dropdown list, select *WAN*.
   b. In the *IP/Network Mask* field, enter 10.6.30.4/255.255.255.0 for the interface connected to the Internet.

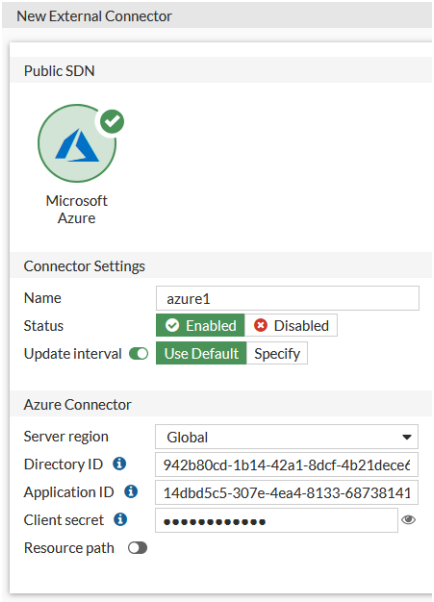
To configure a static route to connect to the Internet:

1. Go to *Network* > *Static Routes*. Click *Create New*.
2. In the *Destination* field, enter 0.0.0.0/0.0.0.0.
3. From the *Interface* dropdown list, select *port1*.

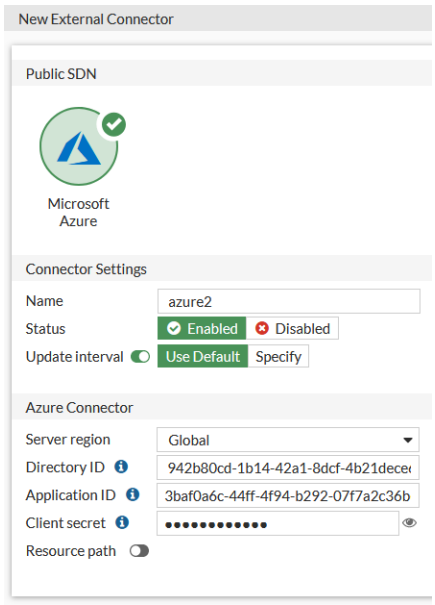
4. In the *Gateway Address* field, enter 10.60.30.254.

To configure two Azure SDN connectors with different client IDs:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*. Configure the first SDN connector:
   a. Select *Microsoft Azure*.
   b. In the *Name* field, enter azure1.
   c. In the *Status* field, select *Enabled*.
   d. From the *Server* region dropdown list, select *Global*.
   e. In the *Directory ID* field, enter the directory ID. In this example, it is 942b80cd-1b14-42a1-8dcf-4b21dece61ba.
   f. In the *Application ID* field, enter the application ID. In this example, it is 14dbd5c5-307e-4ea4-8133-68738141feb1.
   g. In the *Client secret* field, enter the client secret.
   h. Leave the *Resource path* disabled.
   i. Click *OK*.

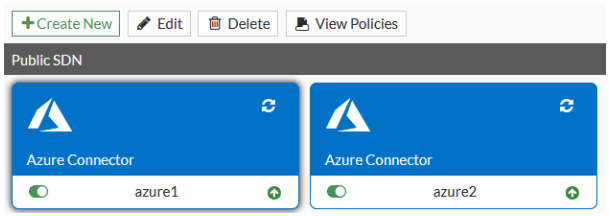


3. Click *Create New*. Configure the second SDN connector:
   a. Select *Microsoft Azure*.
   b. In the *Name* field, enter azure2.
   c. In the *Status* field, select *Enabled*.
   d. From the *Server* region dropdown list, select *Global*.
   e. In the *Directory ID* field, enter the directory ID. In this example, it is 942b80cd-1b14-42a1-8dcf-4b21dece61ba.
   f. In the *Application ID* field, enter the application ID. In this example, it is 3baf0a6c-44ff-4f94-b292-07f7a2c36be6.
   g. In the *Client secret* field, enter the client secret.
   h. Leave the *Resource path* disabled.
   i. Click *OK*.



To check the configured SDN connectors:

1. Go to *Security Fabric* > *External Connectors*.
2. Click the *Refresh* icon in the upper right corner of each configured SDN connector. A green up arrow appears in the lower right corner, meaning that both SDN connectors are connected to the Azure cloud using different client IDs.

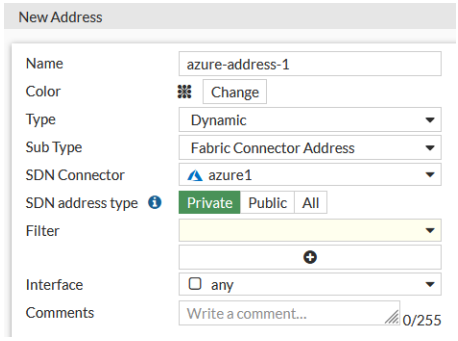


To create two firewall addresses:

This process creates two SDN connector firewall addresses to associate with the configured SDN connectors.

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*. Configure the first SDN connector firewall address:
   a. In the *Name* field, enter azure-address-1.
   b. From the *Type* dropdown list, select *Dynamic*.
   c. From the *Sub Type* dropdown list, select *Fabric Connector address*.
   d. From the *SDN Connector* dropdown list, select *azure1*.
   e. For *SDN address type*, select *Private*.
   f. From the *Filter* dropdown list, select the desired filter.
   g. For *Interface*, select *any*.

h. Click *OK*.

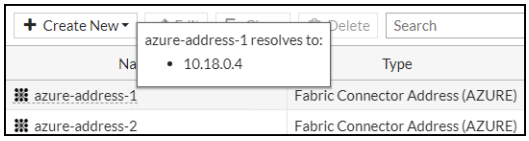


3. Click *Create new*. Configure the second SDN connector firewall address:
   a. In the *Name* field, enter azure-address-1.
   b. From the *Type* dropdown list, select *Dynamic*.
   c. From the *Sub Type* dropdown list, select *Fabric Connector address*.
   d. From the *SDN Connector* dropdown list, select *azure2*.
   e. For *SDN address type*, select *Private*.
   f. From the *Filter* dropdown list, select the desired filter.
   g. For *Interface*, select *any*.
   h. Click *OK*.

To check the resolved firewall addresses after the update interval:

By default, the update interval is 60 seconds.

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Hover over the created addresses. The firewall address that the configured SDN connectors resolved display.



To run diagnose commands:

Run the `show sdn connector status` command. Both SDN connectors should appear with a status of `connected`.

Run the `diagnose debug application azd -1` command. The output should look like the following:

```
Level2-downstream-D # diagnose debug application azd -1
...
azd sdn connector azure1 start updating IP addresses
azd checking firewall address object azure-address-1, vd 0
IP address change, new list:
10.18.0.4
...
```

To restart the Azure SDN connector daemon, run the `diagnose test application azd 99` command.

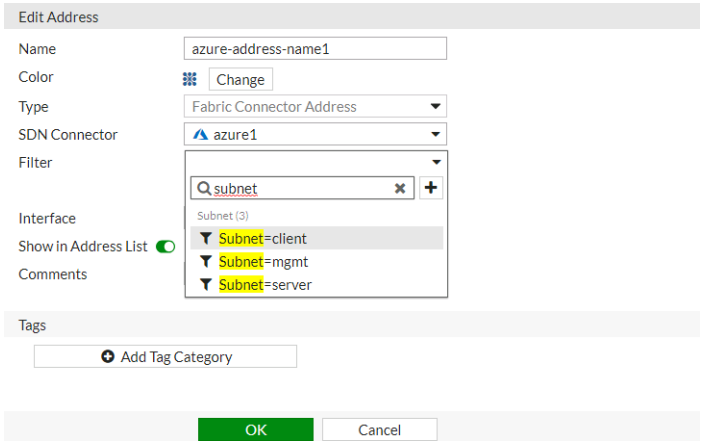
Filter lookup in SDN connectors

When configuring dynamic address mappings for filters in SDN connectors for Azure, GCP, OpenStack, Kubernetes, and AliCloud, FortiGate can query the filters automatically.

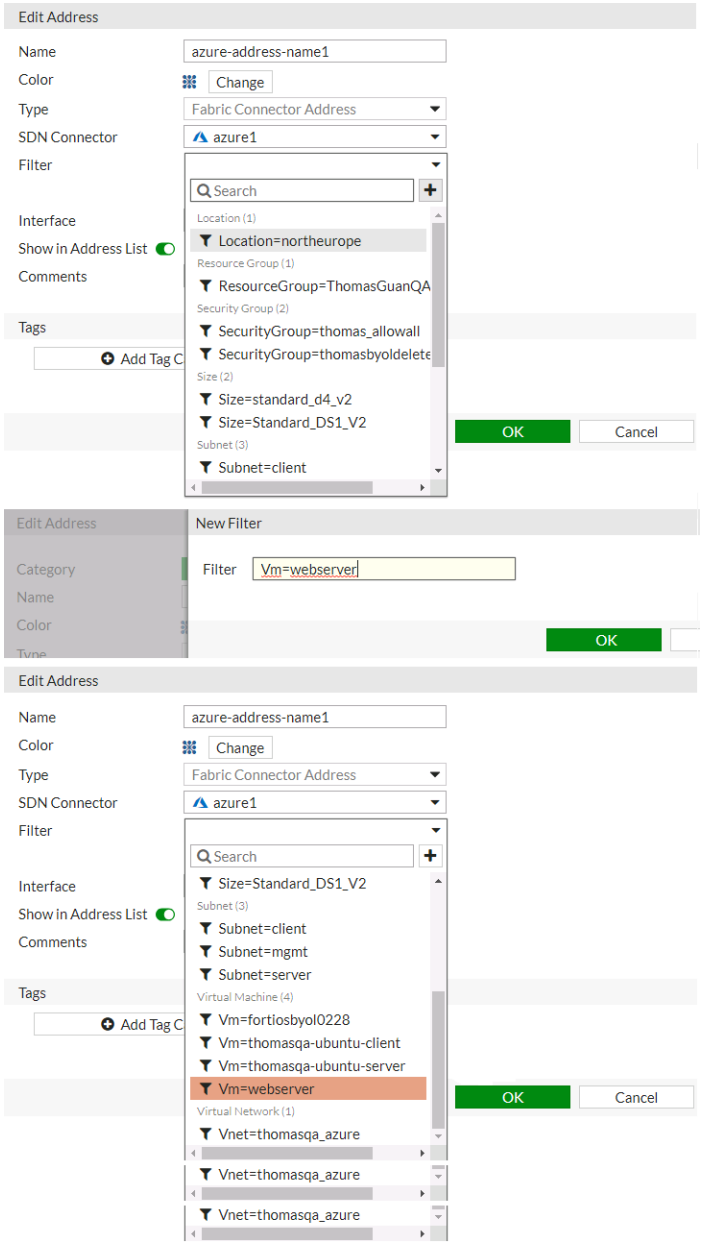
To use the filter lookup:

1. Navigate to *Policy & Objects* > *Addresses*.
2. Create or edit an SDN connector type dynamic IP address.
   Supported SDN connector types include: AWS, Azure, GCP, OpenStack, Kubernetes, and AliCloud. The example below is for an Azure SDN connector.
3. In the address *Filter* field, you can perform the following actions:
   - List all available filters.

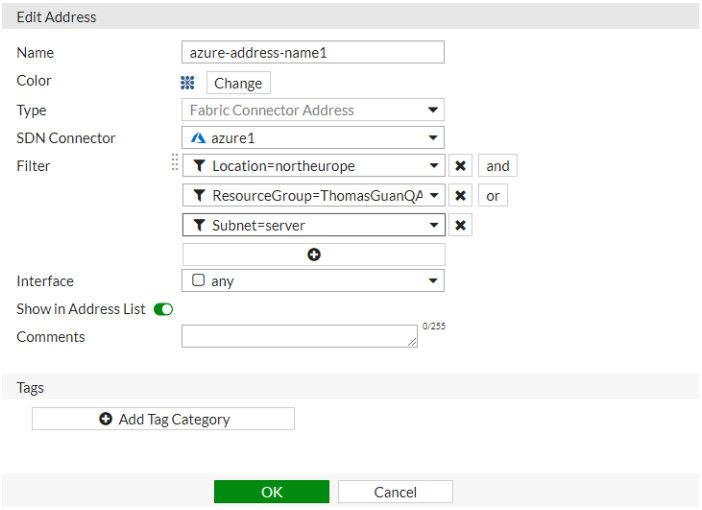
   - Search the available filters.



- Create custom filters.



- Set filter logic [and|or].



Support for wildcard SDN connectors in filter configurations

Wildcards are supported for SDN connectors when configuring dynamic address filters.

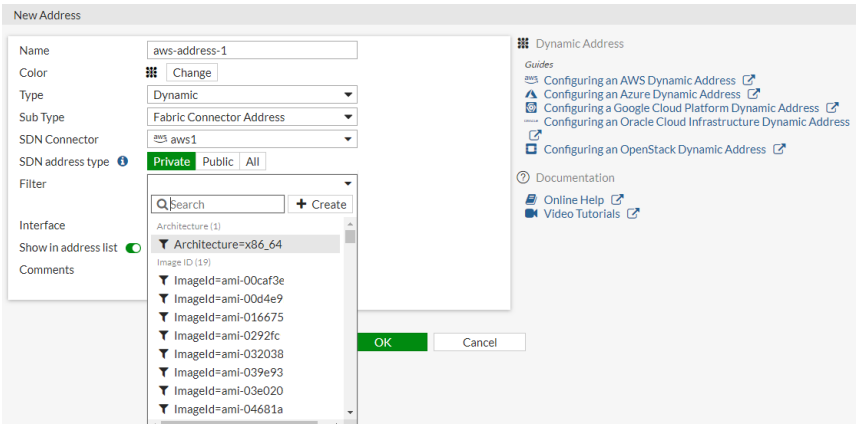
The following SDN connector types are currently supported:

- AWS
- Azure
- Google Cloud Platform
- Kubernetes
- OpenStack
- Oracle Cloud Infrastructure
- VMware ESXi

To configure a dynamic address filter for AWS in the GUI:

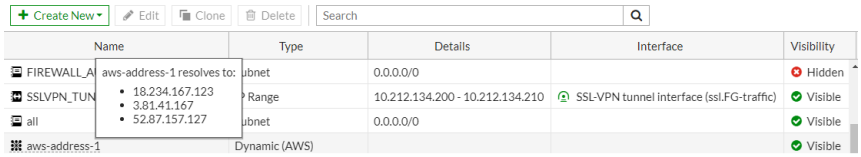
1. Create the SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*.
   c. In the *Public SDN* section, click *Amazon Web Services (AWS)*.
   d. Configure the settings as needed.
   e. Click *OK*.
2. Create the dynamic firewall address:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.

c. Enter a name for the address, then configure the following settings:
   - Set *Type* to *Dynamic*.
   - Set *Sub Type* to *Fabric Connector Address*.
   - Set *SDN Connector* to *aws1*.
   - Set *SDN address type* to *Private*.
   - For *Filter*, click *Create*, enter `Tag.Name=aws*`, the click *OK*.

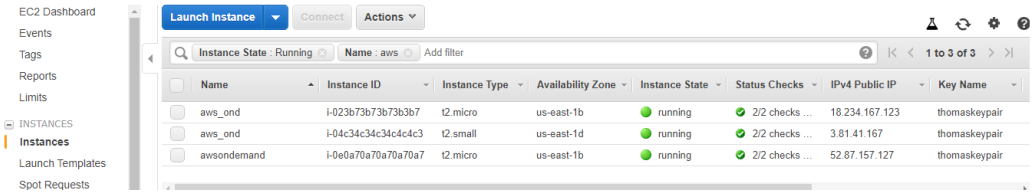


d. Click *OK*.

3. In the address table, hover over the address to view what IPs it resolves to.



4. In AWS, verify to confirm the IP addresses match.



To configure a dynamic address filter for AWS in the CLI:

1. Configure the SDN connector:

```
config firewall address
    edit "aws-address-1"
        set type dynamic
        set sdn "aws1"
        set filter "Tag.Name=aws*"
        set sdn-addr-type public
    next
end
```

2. Create the dynamic firewall address and verify where the IP addresses resolve to:

```
config firewall address
    edit "aws-address-1"
        set type dynamic
        set sdn "aws1"
        set filter "Tag.Name=aws*"
        set sdn-addr-type public
        config list
            edit "18.234.167.123"
            next
            edit "3.81.41.167"
            next
            edit "52.87.157.127"
            next
        end
    next
end
```

3. In AWS, verify that the IP addresses match.

Endpoint/Identity connectors

SSO fabric connectors integrate SSO authentication into the network. This allows users to enter their credentials only once, and have those credentials reused when accessing other network resources through the FortiGate.

The following fabric connectors are available:

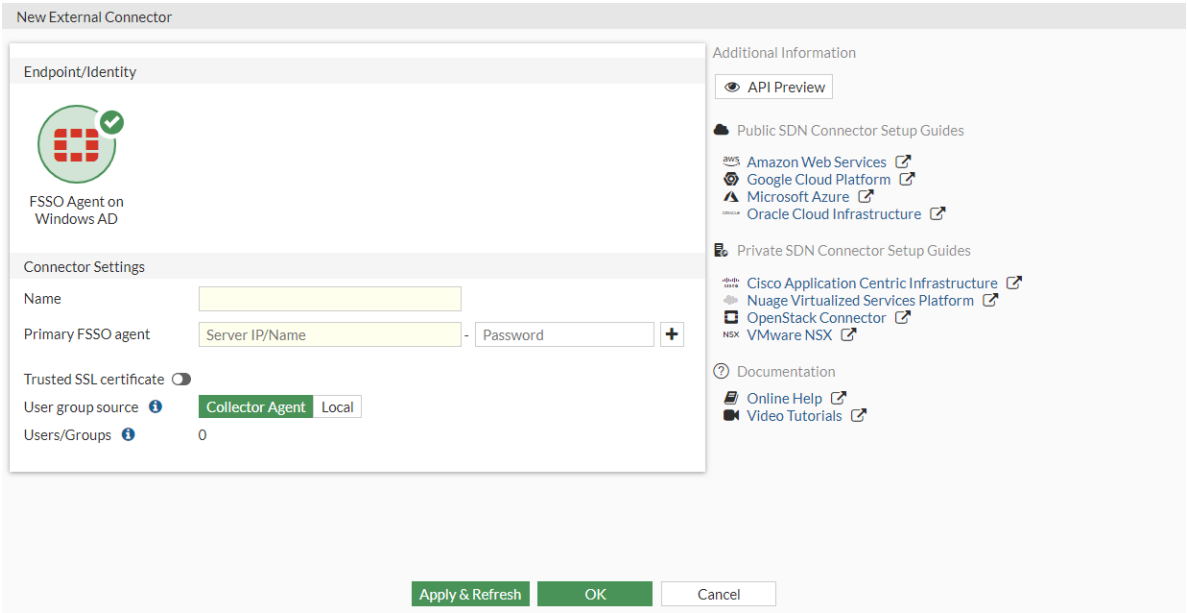
- Fortinet single sign-on agent on page 4052
- Poll Active Directory server on page 4053
- Symantec endpoint connector on page 4054
- RADIUS single sign-on agent on page 4061
- Exchange Server connector on page 4065

Fortinet single sign-on agent

To create an FSSO agent connector in the GUI:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.

3. In the *Endpoint/Identity* section, click *FSSO Agent on Windows AD*.



4. Fill in the *Name*, and *Primary FSSO Agent* server IP address or name and *Password*.
5. Optionally, add more FSSO agents by clicking the plus icon.
6. Optionally, enable *Trusted SSL certificate* and select or import a certificate.
7. Select the *User group source*:
   - *Collector Agent*: User groups will be pushed to the FortiGate from the collector agent. Click *Apply & Refresh* to fetch group filters from the collector agent.
   - *Local*: User groups will be specified in the FortiGate unit's configuration. Select the LDAP server from the list, then click *Edit* to select the *Users*, *Groups*, and *Organizational Units*. Optionally, enable *Proactively retrieve from LDAP server* and configure the *Search filter* and *Interval*.
8. Click *OK*.

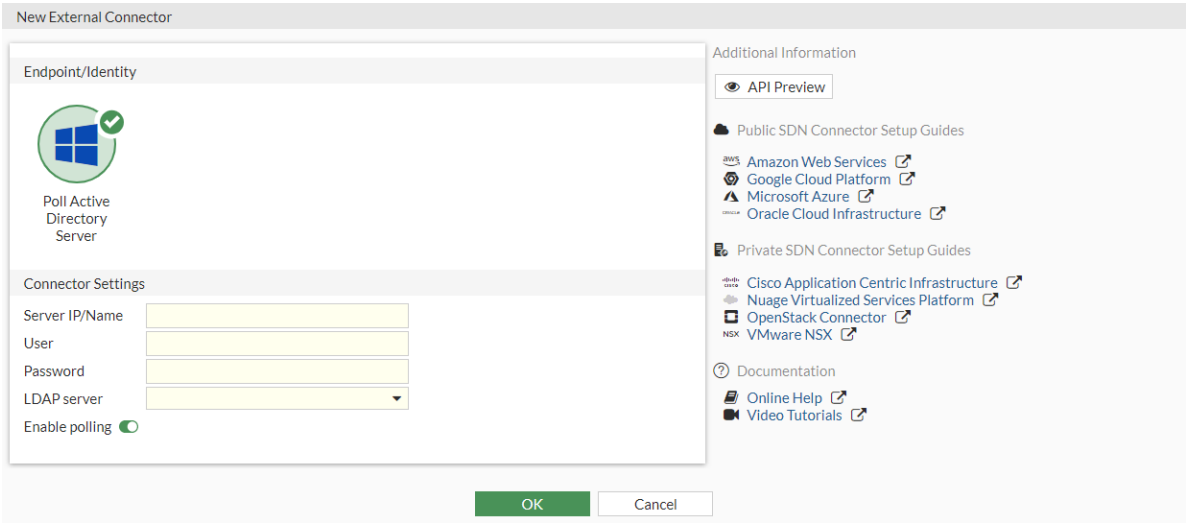
Poll Active Directory server

The FortiGate unit can authenticate users and allow them network access based on groups membership in Windows Active Directory (AD).

To create an AD server connector in the GUI:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.

3. In the *Endpoint/Identity* section, click *Poll Active Directory Server*.



4. Fill in the *Server IP/Name*, *User*, and *Password* for the AD server.
5. Select the LDAP server from the list.
6. If necessary, disable *Enable Polling*. This can be used to temporarily stop the FortiGate from polling security event logs on the Windows logon server, for troubleshooting purposes.
7. Click *OK*.

Symantec endpoint connector

With the Fabric connector for Symantec Endpoint Protection Manager (SEPM), you can use the client IP information from SEPM to assign to dynamic IP addresses on FortiOS.

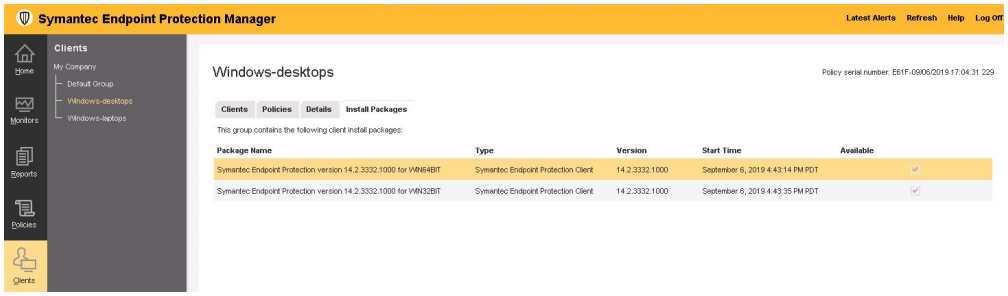
When communication between FortiGate and SEPM is established, FortiGate polls every minute for updates via TLS over port 8446. You can use the CLI to change the default one minute polling interval.

For example, you can create a dynamic Fabric Connector IP address subtype and use it in firewall policies as the source address. The dynamic IP address contains all IP addresses sent by SEPM.

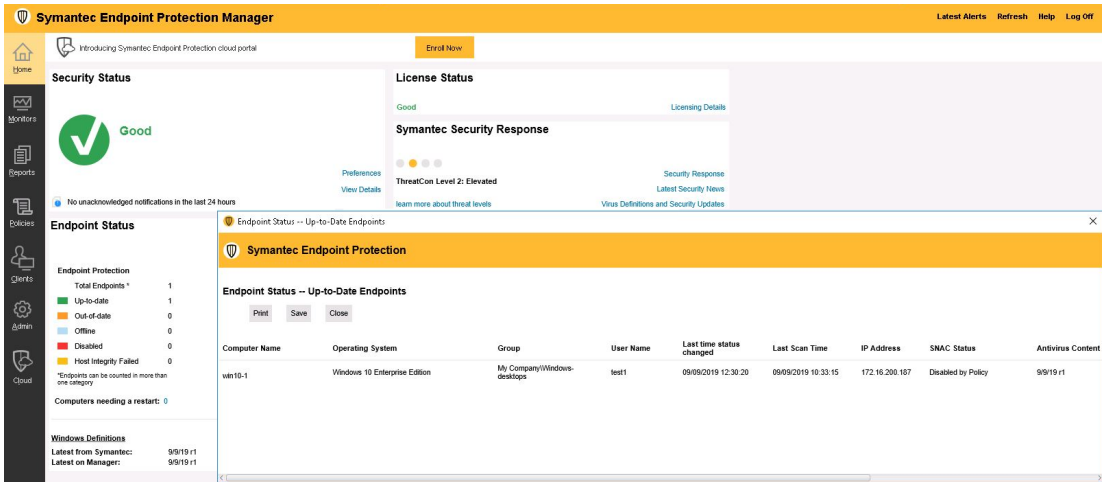
This example shows a dynamic IP address with SEPM and one client PC managed by SEPM using FortiGate as the default gateway.

To configure SEPM on a managed client PC:

1. In SEPM, create client packages for client hosts and group them into SEPM groups. You can install packages locally on clients or download them directly from SEPM.



2. When a package is installed on the client host, the host is considered managed by SEPM. Even if the host has multiple interfaces, only one IP per host is displayed.



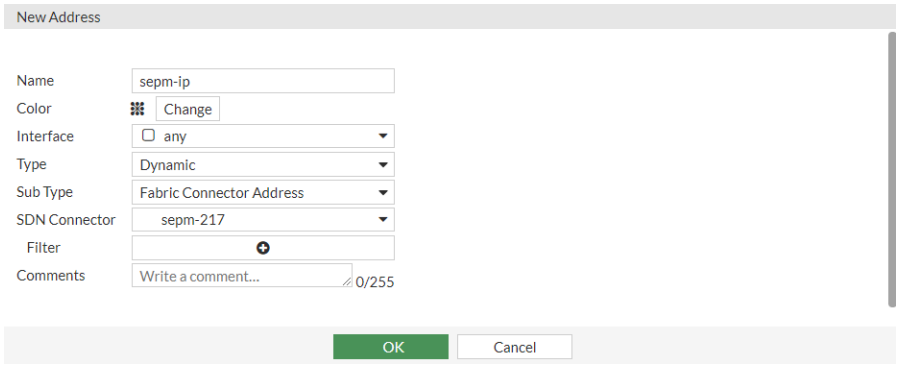
To configure Symantec endpoint connector on FortiGate in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*:
   a. In the *Endpoint/Identity* section, click *Symantec Endpoint Protection*.
   b. Fill in the *Name*, and set the *Status* and *Update Interval*.
   c. Set *Server* to the SEPM IP address.
   d. Enter the *Username* and *Password* for the server.
   e. To limit the domain or group that is monitored, enter them in the requisite fields.

   f. Click *OK*.
   When the connection is established, you can see a green up arrow in the bottom right of the card. You might need to refresh your browser to see the established connection.
2. Go to *Policy & Objects* > *Addresses* and select *Address*.
3. Click *Create new*:
   a. Fill in the address *Name*.
   b. Set *Type* to *Dynamic*.
   c. Set *Sub Type* to *Fabric Connector Address*.

d. Set *SDN Connector* to the fabric connector that you just created.

e. Add *Filters* as needed.

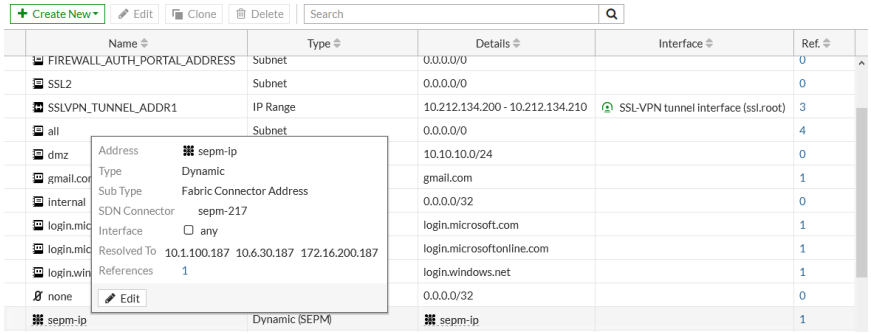


f. Click *OK*.

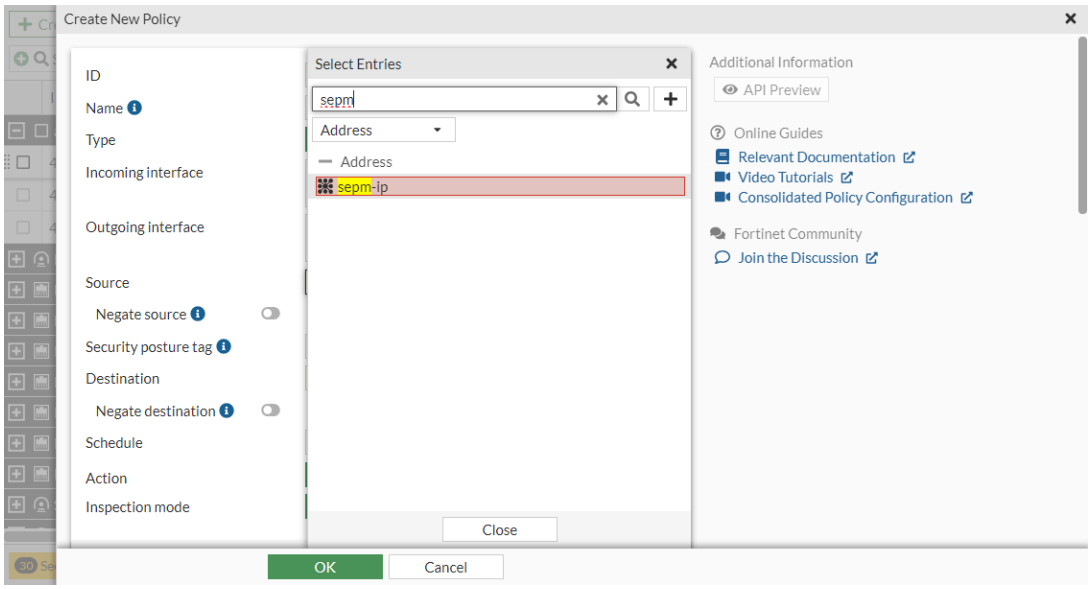
Filter options are only available for active computers that are configured and registered in SEPM. Free-form filters can be created manually by clicking *Create* and entering the filter, in the format: `filter_type=value`.

Possible manual filter types are: `GroupName`, `GroupID`, `ComputerName`, `ComputerUUID`, and `OSName`. For example: `GroupName=MyGroup`.

4. Go to *Policy & Objects* > *Addresses* and hover the cursor over the name of the new address to see the resolved IP addresses of the host.

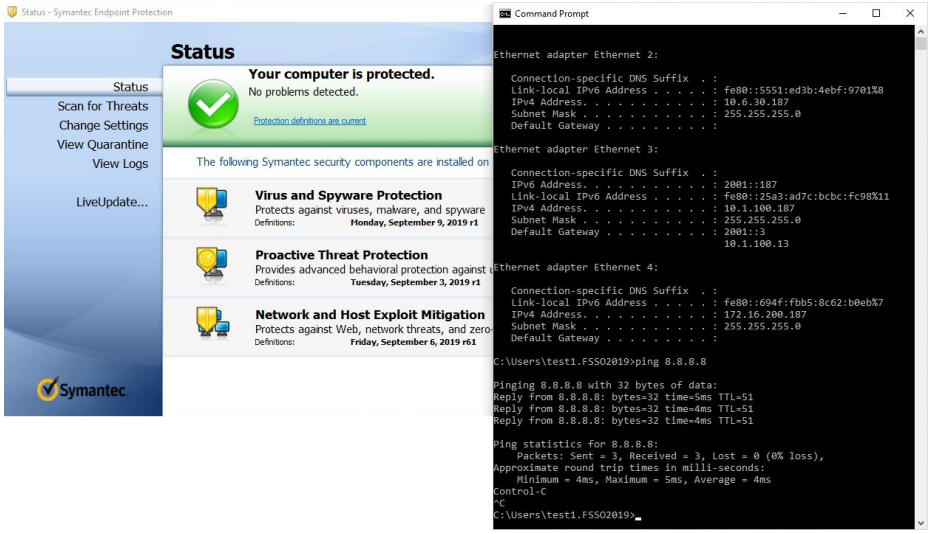


5. Go to *Policy & Objects* > *Firewall Policy*, click *Create New*, and add a policy that uses the dynamic IP address.

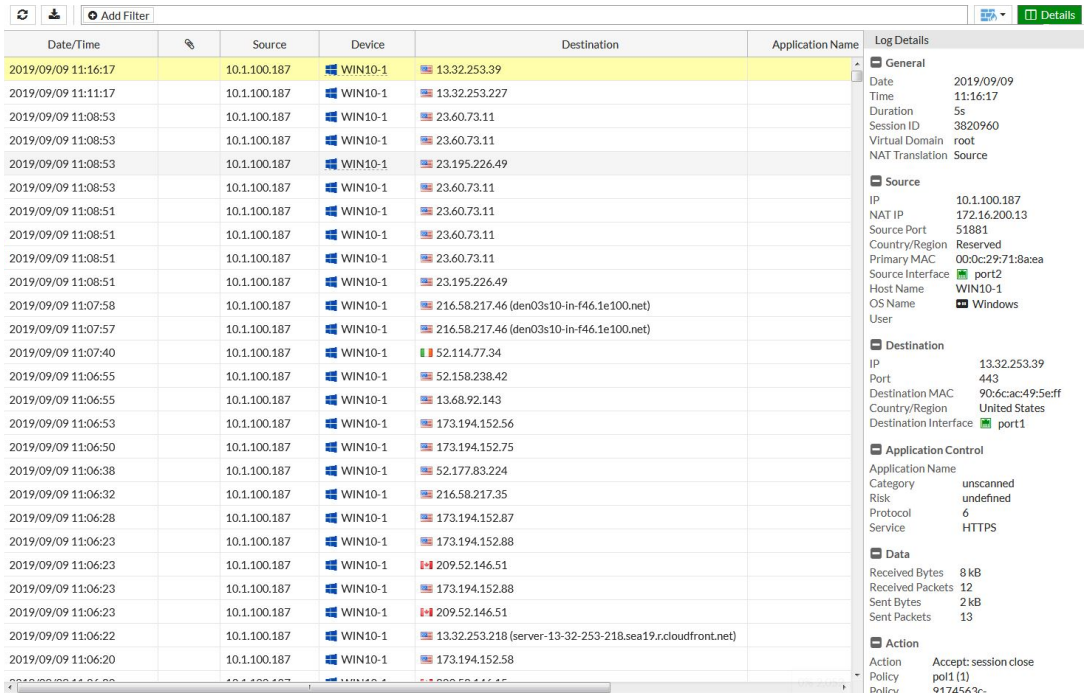


To verify the configuration:

1. On the client PC, check that it is managed by SEPM to access the Internet.



2. On the FortiGate, you can check in *Dashboard* > *FortiView Sources* and *Log & Report* > *Forward Traffic*.



Because this traffic is not authenticated traffic but is based on source IP address only, it is not shown in the GUI firewall monitor or in the `diagnose firewall auth list` CLI command.

To configure Symantec endpoint connector on FortiGate in the CLI:

1. Create the fabric connector:

```
config system sdn-connector
    edit "sepm-217"
        set type sepm
        set server "172.18.60.217"
        set username "admin"
        set password *********
        set status enable
    next
end
```

2. Create the dynamic IP address:

```
config firewall address
    edit "sepm-ip"
        set type dynamic
        set sdn "sepm-217"
        set filter "ComputerName=win10-1"
        config list
            edit "10.1.100.187"
```

```
            next
            edit "10.6.30.187"
            next
            edit "172.16.200.187"
            next
        end
    next
end
```

3. Add the dynamic IP address to the firewall policy:

```
config firewall policy
    edit 1
        set name "pol1"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "sepm-ip"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set av-profile "default"
        set logtraffic all
        set fsso disable
        set nat enable
    next
end
```

To troubleshoot Symantec SD connector in the CLI:

```
# diagnose debug application sepmd -1

Output is sent every minute (default). All IPv4 learned from SEPM. IPv6 also sent but not yet
supported.

2019-09-09 12:01:09 sepmd sdn connector sepm-217 start updating IP addresses

```

To list the SEPM daemon SDN connectors:

```
# diagnose test application sepmd 1
sepm SDN connector list:
  name: sepm-217, status: enabled, updater_interval: 60
```

To list the SEPM daemon SDN filters:

```
# diagnose test application sepmd 2
sepm SDN connector sepm-217 filter list:
  name: sepm-ip, vd 0, filter 'ComputerName=win10-1'
```

Using a self-signed certificate

Users can explicitly specify a certificate or series of certificates for FortiGate to trust during the connection to the Symantec Endpoint Protection Manager (SEPM) server. For example, a self-signed certificate without proper SAN.

The following new options are added in SEPM `sdn-connector`:

Option	Description
`server-cert`	Trust servers that contain this certificate only.
`server-ca-cert`	Trust only those servers whose certificate is directly or indirectly signed by this certificate.

When these options are enabled, only the specified certificate or series of certificates will be allowed for SEPM server connection ensuring some level of security by blocking off all unspecified certificates.

To specify SEPM certificates:

```
config system sdn-connector
    edit "sepm-217"
        set type sepm
        set server "172.18.60.217"
        set username "admin"
        set password *********
        set status enable
        set server-cert "REMOTE_Cert_1”
        set server-ca-cert "REMOTE_Cert_2”
    next
end
```

The `server-cert` and `server-ca-cert` options are independent of each other and can be set separately. However, when both options are set, both constraints are applied.

RADIUS single sign-on agent

With RADIUS single sign-on (RSSO), a FortiGate can authenticate users who have authenticated on a remote RADIUS server. Based on which user group the user belongs to, the security policy applies the appropriate UTM profiles.

The FortiGate does not interact with the remote RADIUS server; it only monitors RADIUS accounting records that the server forwards (originating from the RADIUS client). These records include the user IP address and user group. The remote RADIUS server sends the following accounting messages to the FortiGate:

Message	Action
Start	If the information in the start message matches the RSSO configuration on the FortiGate, the user is added to the local list of authenticated firewall users.
Stop	The user is removed from the local list of authenticated firewall users because the user session no longer exists on the RADIUS server.

You can configure an RSSO agent connector using the FortiOS GUI; however, in most cases, you will need to use the CLI. There are some default options you may need to modify that can only be done in the CLI.

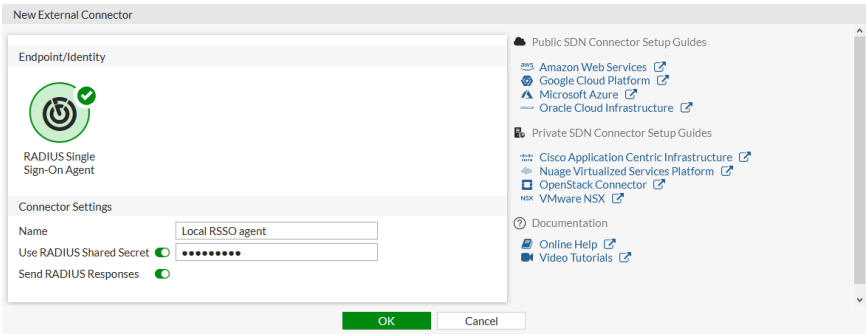
```
config user radius
    edit <name>
        set rsso enable
        set rsso-radius-response enable
        set rsso-secret <password>
        set rsso-endpoint-attribute <attribute>
        set sso-attribute <attribute>
        set delimiter {plus | comma}
    next
end
```

To configure an RSSO agent connector:

1. Create the new connector:
   a. Go to *Security Fabric > External Connectors*.
   b. Click *Create New*.
   c. In the *Endpoint/Identity* section, click *RADIUS Single Sign-On Agent*. The *New Fabric Connector* pane opens.
   d. Enter the connector name.
   e. Enable *Use RADIUS Shared Secret*.

   The value entered in *Use RADIUS Shared Secret* must be identical to what the remote RADIUS server uses to authenticate when it sends RADIUS accounting messages to the FortiGate.

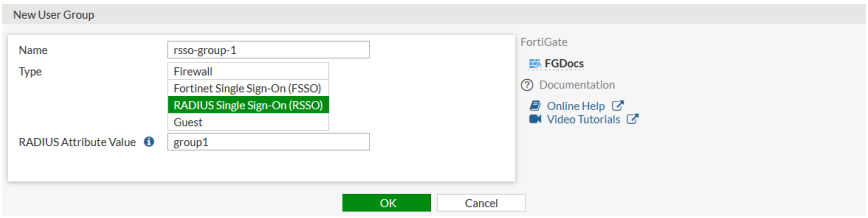
   f. Enable *Send RADIUS Responses*.



You should enable *Send RADIUS Responses* because some RADIUS servers continue to send the same RADIUS accounting message several times if there is no response.

g. Click *OK*.

2. Edit the network interface:
   a. Go to *Network* > *Interfaces*.
   b. Double-click the interface that will receive the RADIUS accounting messages. The *Edit Interface* pane opens.
   c. In the *Administrative Access* section, select the *RADIUS Accounting* checkbox. This will open listening for port 1813 on this interface. The FortiGate will then be ready to receive RADIUS accounting messages.
   d. Click *OK*.
3. Create a local RSSO user group:
   a. Go to *User & Authentication* > *User Groups*.
   b. Click *Create New*.
   c. Enter the group name.
   d. For the *Type* field, click *RADIUS Single-Sign-ON (RSSO)*.
   e. Enter a value for *RADIUS Attribute Value*.
   This value by default is the class attribute. The FortiGate uses the content of this attribute in RADIUS accounting start messages to map a user to a FortiGate group, which then can be used in firewall policies.
   In this example configuration, the FortiGate will only add a remote RADIUS user to the local firewall user list if the class attribute in the RADIUS accounting START message contains the value group1.



If your users are in multiple groups, you will need to add multiple local RSSO user group.

If the RADIUS attribute value used to map users to a local RSSO group is different than the RADIUS attribute in the RADIUS accounting messages forwarded by the server, you must change it in the CLI.

   f. Click *OK*.
4. Edit the local RSSO agent to modify default options using the CLI.
   For example, the default value for `rsso-endpoint-attribute` might work in common remote access scenarios where users are identified by their unique `Calling-Station-Id`, but in other scenarios the user name might be in a different attribute.

```
config user radius
    edit "Local RSSO Agent"
        set rsso-endpoint-attribute <attribute>
        set sso-attribute <attribute>
    next
end
```

5. Add the local RSSO user group to a firewall policy.

Verifying the RSSO configuration

Verification requires a working remote RADIUS server configured for RADIUS accounting forwarding and wireless or wired clients that use RADIUS for user authentication.

For a quick test, you can use one of the publicly available RADIUS test tools to send RADIUS accounting start and stop messages to the FortiGate. You can also use radclient.

To verify the RSSO configuration:

1. In radclient, enter the RADIUS attributes. These attributes are then executed with the FortiGate IP parameters (sends accounting messages to port 1813) and shared password you configured. `-x` is used for verbose output:

```
root@ControlPC:~# echo "Acct-Status-Type =Start,Framed-Ip-Address=10.1.100.185,User-
Name=test2,Acct-Session-Id=0211a4ef,Class=group1,Calling-Station-Id=00-0c-29-44-BE-B8" |
radclient -x 10.1.100.1 acct 123456
Sending Accounting-Request of id 180 to 10.1.100.1 port 1813
        Acct-Status-Type = Start
        Framed-IP-Address = 10.1.100.185
        User-Name = "test2"
        Acct-Session-Id = "0211a4ef"
        Class = 0x67726f757031
        Calling-Station-Id = "00-0c-29-44-BE-B8"
rad_recv: Accounting-Response packet from host 10.1.100.1 port 1813, id=180, length=20
root@ControlPC:~#
```

2. Verify that the user is in the local firewall user list with the correct type (`rsso`) and local firewall group (`rsso-group1`):

```
# diagnose firewall auth l

10.1.100.185, test2
        type: rsso, id: 0, duration: 5, idled: 5
        flag(10): radius
        server: vdom1
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 3
        group_name: rsso-group-1

----- 1 listed, 0 filtered ------
```

Exchange Server connector

FortiGate can collect additional information about authenticated users from corporate Microsoft Exchange Servers. After a user logs in, the additional information can be viewed in various parts of the GUI.

The Exchange connector must be mapped to the LDAP server that is used for authentication.

The following attributes are retrieved:

USER_INFO_FULL_NAME	USER_INFO_COMPANY	USER_INFO_CITY
USER_INFO_FIRST_NAME	USER_INFO_DEPARTMENT	USER_INFO_STATE
USER_INFO_LAST_NAME	USER_INFO_GROUP	USER_INFO_POSTAL_CODE
USER_INFO_LOGON_NAME	USER_INFO_TITLE	USER_INFO_COUNTRY
USER_INFO_TELEPHONE	USER_INFO_MANAGER	USER_INFO_ACCOUNT_EXPIRES
USER_INFO_EMAIL	USER_INFO_STREET	
USER_INFO_USER_PHOTO	USER_INFO_POST_OFFICE_BOX	

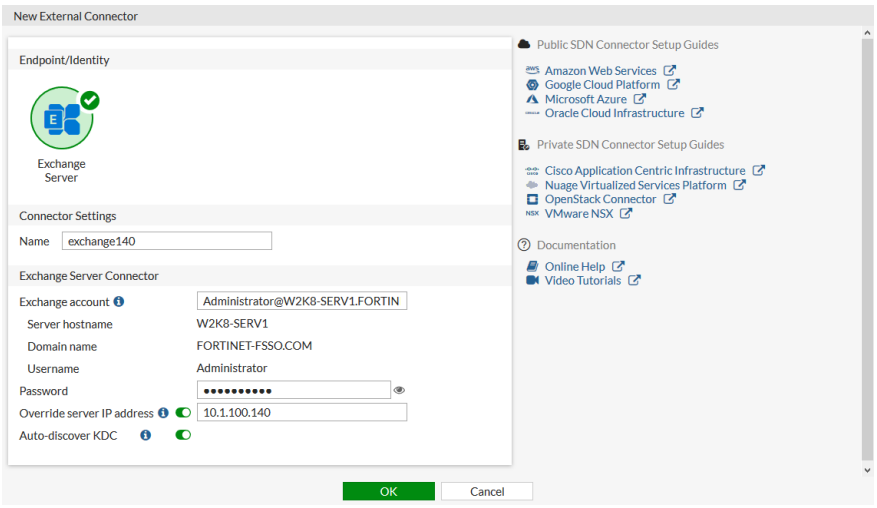
Kerberos Key Distribution Center (KDC) automatic discovery is enabled by default. The FortiGate must be able to use DNS to resolve the KDC IP addresses, otherwise the FortiGate will be unable to retrieve additional user information from the Exchange Server.

KDC automatic discovery can be disabled, and one or more internal IP addresses that the FortiGate can reach can be configured for KDC.

The Override server IP address is enabled when the IP address of the Exchange server cannot be resolved by DNS and must be entered manually.

To configure an Exchange connector in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Endpoint/Identity* section, click *Exchange Server*.
3. Set *Name* to *exchange140*.
4. Set *Exchange account* to *Administrator@W2K8-SERV1.FORTINET-FSSO.COM*.
   Administrator is the username, *W2K8-SERV1* is the exchange server name, and *FORTINET-FSSO.COM* is the domain name.
5. Set *Password* to the password.
6. Enable *Override server IP address* and set it to *10.1.100.140*.
7. Ensure that *Auto-discover KDC* is enabled.

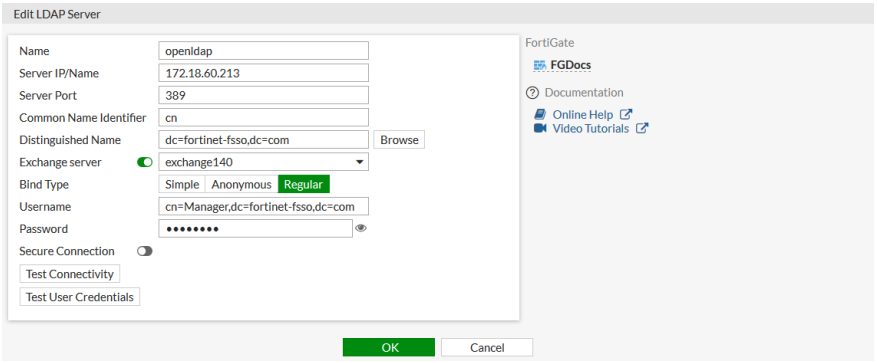


If *Auto-discover KDC* is disabled, one or more KDC IP addresses can be manually entered.

8. Click *OK*.

To link the connector to the LDAP server in the GUI:

1. Go to *User & Authentication* > *LDAP Servers*.
2. Edit an existing LDAP server, or click *Create New* to create a new one.
3. Enable *Exchange server*, and select the connector from the list.
4. Configure the remaining settings as required.



5. Click *OK*.

To configure an Exchange connector with automatic KDC discovery in the CLI:

```
config user exchange
    edit "exchange140"
        set server-name "W2K8-SERV1"
        set domain-name "FORTINET-FSSO.COM"
        set username "Administrator"
        set password **********
        set ip 10.1.100.140
        set auto-discover-kdc enable
    next
end
```

To link the connector to the LDAP server in the CLI:

```
config user ldap
    edit "openldap"
        set server "172.18.60.213"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Manager,dc=fortinet-fsso,dc=com"
        set password **********
        set group-member-check group-object
        set group-object-filter "(&(objectclass=groupofnames)(member=*))"
        set member-attr "member"
        set user-info-exchange-server "exchange140"
    next
end
```

Verification

To verify that KDC auto-discovery is working:

```
# diagnose wad debug enable category all
# diagnose wad debug enable level verbose
# diagnose debug enable
# diagnose wad user exchange test-auto-discover
```

```
wad_diag_session_acceptor(3115): diag socket 20 accepted.
__wad_fmem_open(557): fmem=0x12490bd8, fmem_name='cmem 9188 bucket', elm_sz=9188, block_sz=73728,
overhead=0, type=advanced
Starting auto-discover test for all configured user-exchanges.
[NOTE]: If any errors are returned, try manually configuring IPs for the reported errors.

Completed auto-discover test for all configured user-exchanges.
```

To check the collected information after the user has been authenticated:

1. In the GUI, go to *Dashboard* > *Assets & Identities*, expand the *Firewall Users* widget, and hover over the user name.
2. In the CLI, run the following diagnose command:

```
# diagnose wad user info 20 test1
'username' = 'test1'
'sourceip' = '10.1.100.185'
'vdom' = 'root'
'cn' = 'test1'
'givenName' = 'test1'
'sn' = 'test101'
'userPrincipalName' = 'test1@Fortinet-FSSO.COM'
'telephoneNumber' = '604-123456'
'mail' = 'test1@fortinet-fsso.com'
'thumbnailPhoto' = '/tmp/wad/user_info/76665fff62ffffffffffffffffffff75ff68fffffffffa'
'company' = 'Fortinet'
'department' = 'Release QA'
'memberOf' = 'CN=group321,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'memberOf' = 'CN=g1,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'memberOf' = 'CN=group21,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'memberOf' = 'CN=group1,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'manager' = 'CN=test6,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'streetAddress' = 'One Backend Street 1901'
'l' = 'Burnaby'
'st' = 'BC'
'postalCode' = '4711'
'co' = 'Canada'
'accountExpires' = '9223372036854
```

If the results are not as expected, verify what information FortiGate can collect from the Exchanger Server:

```
# diagnose test application wad 2500
# diagnose test application wad 162
```

External feeds

The FortiGate dynamically imports an external list from an HTTP/HTTPS server in the form of a plain text file. The imported list is then available as an external feed, which can be used to enforce special security

requirements, such as long-term policies to always allow or block access to certain websites, or short-term requirements to block access to known compromised locations. The external feeds are dynamically synchronized and are updated periodically so that any changes are immediately imported by FortiOS.

If the FortiGate loses connectivity with the external server, the external feed will continue to function despite the *Connection Status* error or reboot. However, the external feed will not be updated and no new entries will be added until the connection is re-established.

FortiOS also supports STIX/TAXII format. See STIX format for external feeds on page 4099 for more information.

There are five types of external feeds:

FortiGuard Category	The FortiGate dynamically imports a text file from an external server, which contains one URL per line. See FortiGuard category external feed on page 4081 for more information.
IP Address	The FortiGate dynamically imports a text file from an external server, which contains one IP/IP range/subnet per line. See IP address external feed on page 4084 for more information.
Domain Name	The FortiGate dynamically imports a text file from an external server, which contains one domain per line. Simple wildcards are supported. See Domain name external feed on page 4088 for more information.
MAC Address	The FortiGate dynamically imports a text file from an external server, which contains one MAC address, MAC range, or MAC OUI per line. See MAC address external feed on page 4090 for more information.
Malware Hash	The FortiGate dynamically imports a text file from an external server, which contains one hash per line in the format `<hex hash> [optional hash description]`. Each line supports MD5, SHA1, and SHA256 hex hashes. See Malware hash external feed on page 4092 for more information.

Additionally, the EMS external feed is integrated with FortiClient EMS, but it is not configured in the same way as the preceding feeds:

EMS External Feed	A FortiGate can pull malware external feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClient. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. See Malware external feed from EMS on page 1947 for an example.

FortiManager can host external feeds. See External resources in the FortiManager Administration Guide.

External resources file format

File format requirements for a HTTP/HTTPS external resources file:

- The file is in plain text format with each URL list, IP address, domain name, or malware hash occupying one line.

  Comments can be added by using the number sign, for example: `# This is a test`.

- The file is limited to a maximum size and entry limit, based on the device model; see External resource entry limit on page 4071.
- The external resources update period can be set to 1 minute, hourly, daily, weekly, or monthly (43200 min, 30 days).
- The external resources type as category (URL list) and domain (domain name list) share the category number range 192 to 221 (total of 30 categories).
- There is no duplicated entry validation for the external resources file (entry inside each file or inside different files).
- If the number of entries exceed the limit, a warning is displayed. Additional entries beyond the threshold will not be loaded.

For URL list (type = category):

- The scheme is optional, and will be truncated if found; https:// and http:// are not required.
- Wildcards are allowed at the beginning or end or the URL, for example: *.domain.com or domain.com.*.
- IDN and UTF encoding URL are supported .
- The URL can be an IPv4 or IPv6 address. An IPv6 URL must be in [ ] format.
- If using an IP address, it cannot be a private IP address.

For IP address list (type = address):

- The IP address can be a single IP address, subnet address, or address range. For example, 192.168.1.1, 192.168.10.0/24, or 192.168.100.1-192.168.100.254.
- The address can be an IPv4 or IPv6 address. An IPv6 address does not need to be in [ ] format.

For domain name list (type = domain):

- Simple wildcards are allowed in the domain name list, for example: *.test.com.
- IDN (international domain name) is supported.

For MAC address list (type = mac-address):

- The MAC address can be a single MAC address, MAC OUI, or MAC range. For example, 01:01:01:01:01:01, 8c:aa:b5, or 01:01:01:01:01:01-01:01:02:50:20:ff.
- The hexadecimal digits in MAC address must only be separated by colons.

For malware hash list (type = malware):

- The malware hash list follows a strict format in order for its contents to be valid. Malware hash signature entries must be separated into each line. A valid signature must follow this format:

```
# MD5 Entry with hash description
aa67243f746e5d76f68ec809355ec234  md5_sample1

# SHA1 Entry with hash description
a57983cb39e25ab80d7d3dc05695dd0ee0e49766  sha1_sample2

# SHA256 Entry with hash description
ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379  sha256_sample1

# Entry without hash description
0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521

# Invalid entries
```

```
7688499dc71b932feb126347289c0b8a_md5_sample2
7614e98badca10b5e2d08f8664c519b7a906fbd5180ea5d04a82fce9796a4b87sha256_sample3
```

To determine the external resource table size limit for your device:

```
# print tablesize
...
system.external-resource: 0 256 512 0
...
```

In this example, a FortiGate 60E has a global limit of 512 and a per-VDOM limit of 256. A FortiGate 60E can configure up to 512 feeds. The total number of feeds is limited by the available memory on the device.

External resource entry limit

The external resource entry limit is global, and file size restrictions change according to the device model. If VDOMs are enabled, global entries are counted first, then VDOM entries in alphabetical order based on the VDOMs' names.

If more than the maximum number of entries are added, the most recently added entries are truncated unless the order is manually changed. The entry order can be changed using the `move` CLI command. For example:

```
config system external-resource
    move "entry2" before "entry1"
end
```

The maximum number of each type of entry and the file size limit for each model range are as follows:

	High-End (Data Center)	Mid-Range (Campus)	Entry-Level (Branch)
Category	2 000 000	300 000	150 000
IP address	300 000	300 000	300 000
Domain	5 000 000	3 000 000	1 000 000
MAC	1 000 000	1 000 000	1 000 000
File size limit (MB)	128	64	32

For example, a FortiGate 601E, a mid-range device, is configured as follows:

- global VDOM: One external feed, g-category-push, with one entry.
- root VDOM: One external feed, r-category-push, with one entry.
- vd1 VDOM: Two external feeds, v-category-300000 with 300000 entries first, and v-category-push with one entry second.
- vd2 VDOM: One external feed, z-category-push, with one entry.

There are more than 300000 entries, so some of the entries will be truncated.

- The global VDOM is counted first, so its entry is kept:

```
FGT (global)# diagnose sys external-resource stats
name: g-category-push; uuid_idx: 606; type: category; update_method: push; total lines: 1;
valid lines: 1; error lines: 0; used: no; buildable: 1; total in count file: 1;
```

- The root VDOM is alphabetically before the vd1 and vd2 VDOMs, so its entry is kept:

```
FGT (root)# diagnose sys external-resource stats
name: g-category-push; uuid_idx: 606; type: category; update_method: push; total lines: 1;
valid lines: 1; error lines: 0; used: no; buildable: 1; total in count file: 1;
name: r-category-push; uuid_idx: 746; type: category; update_method: push; total lines: 1;
valid lines: 1; error lines: 0; used: no; buildable: 1; total in count file: 1;
```

- The vd1 VDOM is next alphabetically. The maximum number of entries is 300000, so 299998 entries from the v-category-3000000 external feed are kept, and no entries from the v-category-push feed:

```
FGT (vd1)# diagnose sys external-resource stats
name: g-category-push; uuid_idx: 606; type: category; update_method: push; total lines: 1;
valid lines: 1; error lines: 0; used: no; buildable: 1; total in count file: 1;
name: v-category-300000; uuid_idx: 863; type: category; update_method: feed; truncated total
lines: 300000; valid lines: 299999; error lines: 1; used: no; buildable: 299998; total in
count file: 300000;
name: v-category-push; uuid_idx: 868; type: category; update_method: push; total lines: 1;
valid lines: 1; error lines: 0; used: yes; buildable: 0; total in count file: 1;
```

- The vd2 VDOM is last alphabetically and the maximum number of entries has already been reached, so all of its entries are truncated:

```
FGT (vd2)# diagnose sys external-resource stats
name: g-category-push; uuid_idx: 606; type: category; update_method: push; total lines: 1;
valid lines: 1; error lines: 0; used: no; buildable: 1; total in count file: 1;
name: z-category-push; uuid_idx: 989; type: category; update_method: push; total lines: 1;
valid lines: 1; error lines: 0; used: no; buildable: 0; total in count file: 1;
```

Configuring an external feed

An external feed can be configured on the *Security Fabric > External Connectors* page. After clicking *Create New*, there are five external feed options available: *FortiGuard Category*, *IP Address*, *Domain Name*, *MAC Address*, and *Malware Hash*. When configuring the external feed settings, the *Update method* can be either a pull method (*External Feed*) or a push method (*PUSH API*).

This topic includes example external feed configurations:

- Configuring an external feed with an external feed update
- Configuring external feed authentication
- Configuring an external feed with a push API update
- Configuring mTLS client certification on page 4080

When multi-VDOM mode is enabled, external feed connectors can be defined in the global VDOM or within a VDOM. See External feed connectors per VDOM on page 4095 for example configurations.

Configuring an external feed with an external feed update

The external feed will periodically fetch entries from the URI using HTTP or HTTPS.

To configure the external feed in the GUI:

1. Go *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *External Feeds* section, select the required feed type.
3. Configure the connector settings:

Status	Enable/disable the connector.
Name	Enter a name for the external feed connector.
Update method	Select *External Feed*.
URL of external resource	Enter the link to the external resource file. HTTP, HTTPS, and STIX protocols are supported.
HTTP basic authentication	Enable/disable basic HTTP authentication. When enabled, enter the username and password in the requisite fields. See Configuring external feed authentication for more information.
Refresh Rate	The time interval to refresh the external resource, in minutes (1 - 43200, default = 5). The applicable external feed will be triggered to refresh between 0 minutes and the configured value. When the refresh is triggered, if another task is being processed be the schedule worker, the refresh task will be added to the queue.
Comments	Optionally, enter a description of the connector.

4. Click *OK*.

To configure the external feed in the CLI:

```
config system external-resource
    edit <name>
        set status {enable | disable}
        set type {category | address | domain | malware}

        set update-method {feed | push}
        set category <integer, 192-221>
        set username <string>
        set password <string>
        set client-cert-auth {enable | disable}
```

```
        set comments <string>
        *set resource <resource-uri>
        set user-agent <string>
        set server-identity-check {none | basic | full}
        *set refresh-rate <integer>
        set source-ip <ip address>
        set source-ip-interface <string>
        set interface-select-method {auto | sdwan | specify}
    next
end
```

The parameter marked with an asterisk (*) is mandatory and must be filled in. The `category` parameter must be set when the `type` is either `category` or `domain`. Other parameters have either default values or are optional.

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode.

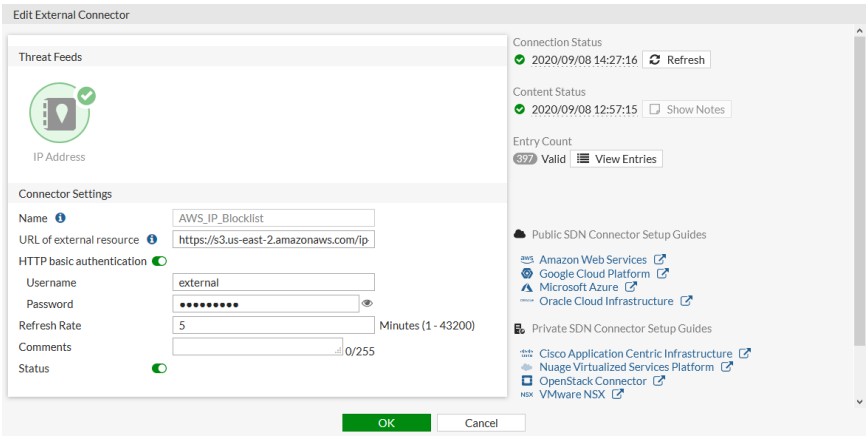
Configuring external feed authentication

External feed connectors support username and password authentication.

The *HTTP basic authentication* field is only visible when the *Update method* is set to *External Feed*.

To enable username and password authentication in an external feed connector:

1. Go *Security Fabric* > *External Connectors*.
2. Click *Create New*, or edit an existing external feed connector.
3. Enable *HTTP basic authentication*.
4. Enter the *Username* and *Password*.



5. Click *OK*.

HTTP header

Additional headers can be included in the `user-agent` field. Use `\r\n` to separate the URL headers, for example:

```
# set user-agent "Firefox\r\nheader1: test1\r\nheader2: test2"
```

Sample request:

```
HTTP request: http
GET /filetypes/test.tar.gz HTTP/1.1
Host: 172.17.219.10
User-Agent: Firefox
header1: test1
header2: test2
Accept: */*
Connection: close
```

External feed connectors use this functionality to support authentication using an API key. The API key authentication can only be configured in the CLI with the `set user-agent` command. The API key must be appended with user-agent in the following format: "`user-agent\r\nAPI-Key:SecretAPIkey`". API keys are typically used for programmatic access to the resource by an authorized requester. See What Is an API Key in the Fortinet Cyber Glossary for more information.

To enable API key authentication in an external feed connector:

1. Configure the external feed. See Configuring an external feed with an external feed update on page 4073.
2. Configure the user-agent with an API key:

```
config system external resources
    edit <name>
        set user-agent "Firefox\r\nAPI-Key:abcdef12345"
    next
end
```

See Using the AusCERT malicious URL feed with an API key on page 4101 for an example.

Configuring an external feed with a push API update

The external feed receives entry updates from webhook requests to the FortiGate REST API. This method provides the code samples needed to perform add, remove, and snapshot operations.

In the following example, a *FortiGuard Category* external feed is used to show the different API push options.

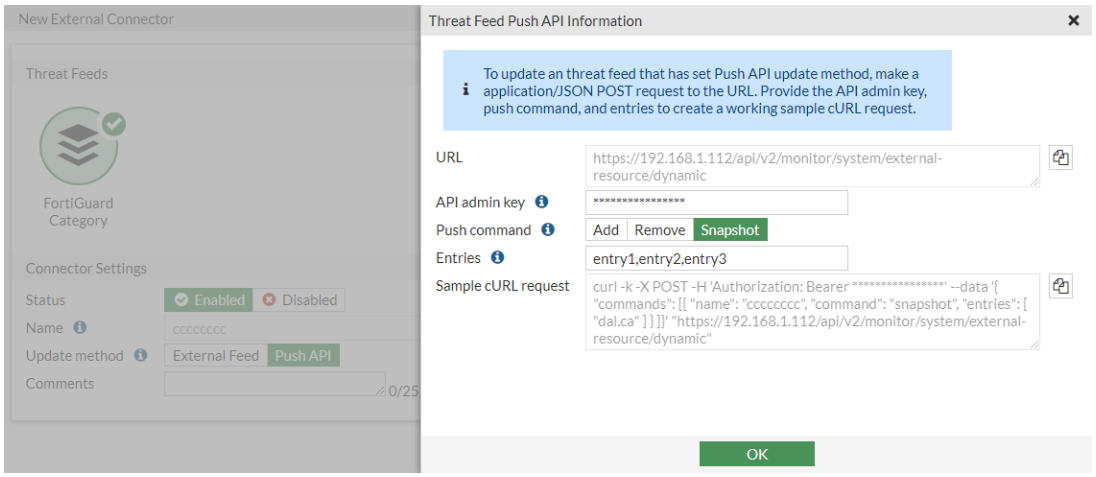
To configure the external feed in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *External Feeds* section, click *FortiGuard Category*.
3. Enter a name.
4. Set the *Update method* to *Push API*.
5. Click *OK*. The *External Feed Push API Information* pane opens that contains the following fields:

- *URL*: the FortiGate's API URL to call in order to perform the update.
- *API admin key*: when an API administrator user is configured on the FortiGate, an *API admin key* will be associated with the API administrator. Input the API key to see the final cURL request.
- *Push command*: select one of three push methods.
  - *Add*: add the specified entries to the external feed.

  - *Remove*: remove the specified entries from the external feed.

  - *Snapshot*: replace the external feed with all specified entries.



- *Entries*: enter the entries separated by a comma (,) to be applied to the FortiGuard Category external feed list.
- *Sample cURL request*: copy this cURL command to perform the push API update on the FortiGate against the list (*cccccccc*).

See REST API administrator on page 3196 for more information.

6. Copy the content in the *Sample cURL request* field (*Add* is used in this example).
7. Click *OK*.
8. On a client, generate the API request for the external feed.

To configure the external feed in the CLI:

```
config system external-resource
    edit "cccccccc"
        set update-method push
        set category 201
    next
end
```

To use the API in the CLI:

```
# diagnose system external-resource {push-add | push-remove | push-snapshot} <ext_name> <entry>
```

To use the API with a JSON file:

```
# diagnose sys external-resource push-api-json-commands
{
  "commands": [ <Array: Mandatory>
    { <Object: Mandatory>
         "name": <String: Mandatory, Example: "AWS_MALWARE_FEED">
      "command": <String: mandatory, Options: "add", "remove", "snapshot">,
      "entries": [ <Array: Mandatory>
        <String: Mandatory, Example: "10.100.1.1">
      ]
    }
```

```
  ]
}
```

Sample:

```
# diagnose sys external-resource push-api-json-commands '{"commands":
[{"name":"test","command":"add","entries":["10.10.10.1","10.10.10.2"]},
{"name":"test","command":"whatever","entries":["10.10.10.3","10.10.10.4"]}]}'
command returned: EXT_RESOURCE_PUSH_CMD_RETURN_OK
Returned json:
[
  {
    "name":"test",
    "command":"add",
    "status":"success"
  },
  {
    "name":"test",
    "command":"whatever",
    "error":"Invalid command.",
    "status":"error"
  }
]
```

To use the API with a Postman REST client:

1. Create an API administrator in FortiOS with write access.
2. Ensure the API token is generated.
3. Configure the external resource list as needed.
4. In the Postman client, create a new request, set the HTTP method to *POST*, enter the URL.
5. Configure the access token using one of the following methods:
   - To use the bearer token: click the *Authorization* tab, set the *Type* to *Bearer*, and enter the REST API administrator token.
   - To use the access_token parameter: click the *Params* tab and enter the access_token key-value pair (*access_token* and *<key>*).
6. Click the *Body* tab and configure the following:
   a. Select *raw* and set the input type to *JSON*.
   b. Insert the JSON data payload.
7. Click *Send* to send the POST request. If there is a response, the response body appears. For example,

```
POST https://172.18.52.153/api/v2/monitor/system/external-resource/dynamic?access_
token=g1mnfs8bzxk5hf8Qwcz4kx7yn3jHmG&vdom=vd1
Content-Type: application/json
User-Agent: PostmanRuntime/7.29.2
Accept: */*
Postman-Token: 04e10736-190e-4119-92e1-04e91bf99c10

```

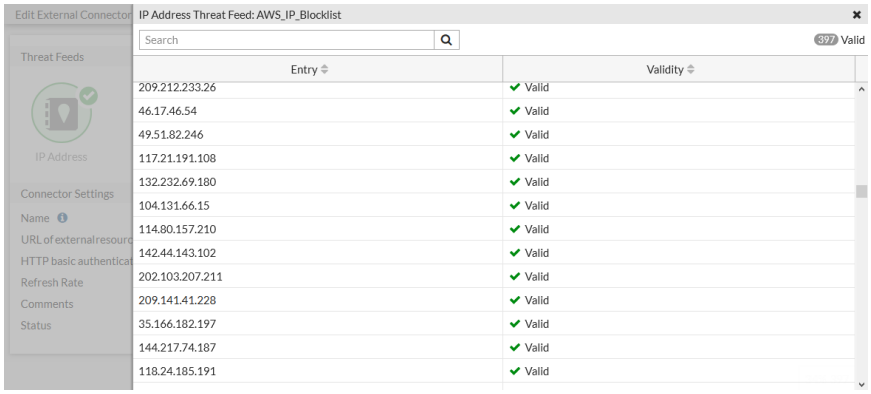
Viewing the update history

To review the update history of an external feed, go to *Security Fabric > External Connectors*, select a feed, and click *Edit*. The *Last Update* field shows the date and time that the feed was last updated.

Click *View Entries* to view the current entries in the list.



Configuring mTLS client certification

Administrators can configure and define a trusted client certificate for mutual TLS (mTLS) authentication in the CLI. This enhances security for the external feed server when connecting to an HTTPS external resource.

During configuration of external resources, a client certificate can be configured that is signed and trusted by a remote mTLS server. When the server asks for client certification upon connection, FortiOS will use the configured client certificate in the TLS handshake process and pass the mTLS authentication.

To configure client certification mTLS:

```
config system external-resource
    edit "mTLS"
        set type address
        set client-cert-auth enable
        set client-cert <mTLS_client>
        set resource <HTTPS external resource>
    next
end
```

If FortiOS cannot provide the correct certificate, the server may choose to deny or accept the connection based on its authentication protocol. Therefore, it is crucial to specify client certificate authentication when connecting to an mTLS server. This requirement does not apply if the server is not using mTLS.

FortiGuard category external feed

A FortiGuard category external feed is a dynamic list that contains URLs and is periodically updated from an external server. The list is stored in text file format on an external server. After the FortiGate imports this list, it becomes available as a category in the *Remote Categories* group of web filter profiles that can be used to block or monitor URLs matching this category. A category external feed can also be used solely or grouped with other categories to be used for exemptions within an SSL/SSH profile that performs full SSL inspection.

Multiple custom categories can be defined by creating a FortiGuard category external feed for each category.

Text file example:

```
http://example/com.url
https://example.com/url
http://example.com:8080/url
```

The file contains one URL per line. See External resources file format for more information about the URL list formatting style.

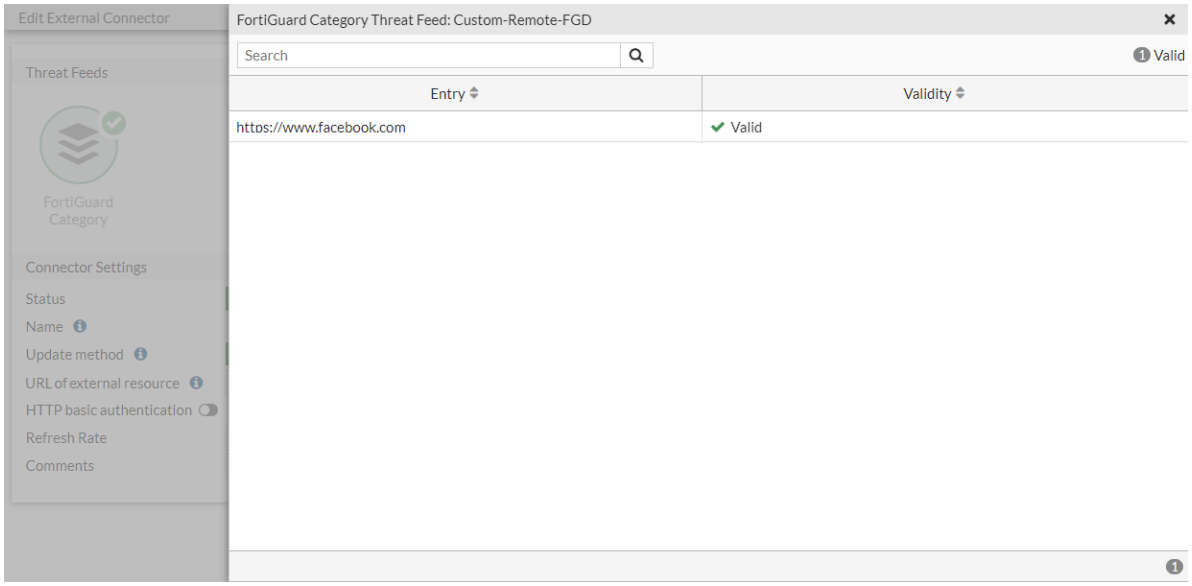
Example configuration

In this example, a list of URLs is imported using the FortiGuard category external feed. The newly created external feed is set to block in the web filter profile, and the web filter profile is applied to a firewall policy. Any traffic that passes through the FortiGate and matches the URLs in the external feed list will be dropped.

To configure a FortiGuard category external feed in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *External Feeds* section, click *FortiGuard Category*.
3. Set the *Name* to *Custom-Remote-FGD*.
4. Set the *Update method* to *External Feed*.

5. Set the *URL of external resource* to *https://192.168.10.13/Override_URLs.txt*.
6. Configure the remaining settings as needed, then click *OK*.
7. Edit the connector, then click *View Entries* to view the URL in the feed, which is https://www.facebook.com.



To configure a FortiGuard category external feed in the CLI:

```
config system external-resource
    edit "Custom-Remote-FGD"
        set type category
        set category 192
        set resource "https://192.168.10.13/Override_URLs.txt"
        set server-identity-check {none | basic | full}
    next
end
```

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode. By default, it is set to none.

To apply a FortiGuard category external feed in a web filter profile:

1. Go to *Security Profiles* > *Web Filter* and create a new web filter profile, or edit an existing one.
2. Enable *FortiGuard Category Based Filter*.
3. In the *Remote Categories* group, set the action for the *Custom-Remote-FGD* category to *Block*.
4. Configure the remaining settings as needed, then click *OK*.

Selecting the *Allow* action for the *FortiGuard Category Based Filter* does not actually allow the category. It merely implies that no filter has been applied.

We recommend avoid using the *Allow* action for remote categories, as it will not override the original action specified in the *FortiGuard Category Based Filter*.

The *Monitor* and *Block* actions for remote categories can override the original action specified in the *FortiGuard Category Based Filter*.

To apply the web filter profile in a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile used in the previous procedure.
4. Enable *Log Allowed Traffic*.
5. Click *OK*.

URLs that match the FortiGuard category external feed list are rated as the FortiGuard category external feed, overriding their original domain rating. Use the FortiGuard Web Filter Lookup to check the original category of a URL.

To view the web filer logs:

1. Go to *Log & Report* > *Security Events* and select *Web Filter*.
2. View the log details in the GUI, or download the log file:

```
1: date=2023-02-06 time=09:31:04 eventtime=1675704664795395841 tz="-0800" logid="0316013056"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="root" policyid=1
poluuid="e8b310ba-914f-51ed-9014-7b2a116f29ad" policytype="policy" sessionid=509983
srcip=172.20.120.13 srcport=54645 srccountry="Reserved" srcintf="port2"
srcintfrole="undefined" srcuuid="3342cb44-9140-51ed-5dbe-8e0787bedeec" dstip=157.240.3.35
dstport=443 dstcountry="United States" dstintf="port3" dstintfrole="wan" dstuuid="3342cb44-
9140-51ed-5dbe-8e0787bedeec" proto=6 httpmethod="GET" service="HTTPS"
hostname="www.facebook.com" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64)
AppleWebKit/537.36 (KHTML, like Gecko) Chrome/64.0.3282.140 Safari/537.36 Edge/18.17763"
profile="default" action="blocked" reqtype="referral" url="https://www.facebook.com/"
referralurl="https://www.google.com/url?url=https://www.facebook.com/&q=facebook&rct=j&sa=X&so
urce=suggest&ct=res&oi=suggest_nav&usg=AOvVaw3XzIKieZE-CH5KqZaBe775&oq=facebook&gs_l=heirloom-
hp..0.5j0i512i433i131i10l3j0i512i433i10l3j0i512i433i131i10l2j0i512i433i10.1716.3397.0.5824.8.8
.0.0.0.0.85.609.8.8.0....0...1ac.1.34.heirloom-hp..0.8.608.798UUeJkbN0" sentbyte=527
rcvdbyte=0 direction="outgoing" msg="URL belongs to a denied category in policy"
ratemethod="domain" cat=192 catdesc="Custom-Remote-FGD"
```

Note that facebook.com, which was originally in the Social Networking category with a default action set to allow in the *FortiGuard Category Based Filter*, has been overridden by the block action of the remote category.

Applying a FortiGuard category external feed in an SSL/SSH profile

A FortiGuard category external feed can be applied in an SSL/SSH profile where full SSL inspection mode is used. The external feed category can be selected in the exempt category list. HTTPS requests that match the URLs in the external feed list will be exempted from SSL deep inspection. This example uses the *Custom-Remote-FGD* external feed configured in the previous example.

To configure the SSL/SSH profile:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and create a new profile, or edit an existing one.
2. Set the *Inspection method* to *Full SSL Inspection*.
3. In the *Exempt from SSL Inspection* section, locate *Web categories*. Click the *+* and add *Custom-Remote-FGD* in the *FORTIGUARD CATEGORY EXTERNAL FEED* section.
4. Enable *Log SSL exemptions*.
5. Click *OK*.

To apply the SSL/SSH inspection profile in a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, set *SSL Inspection* to the profile used in the previous procedure.
4. Enable *Log Allowed Traffic*.
5. Click *OK*.

URLs that match the FortiGuard category external feed list are rated as the FortiGuard category external feed, overriding their original domain rating. Use the FortiGuard Web Filter Lookup to check the original category of a URL.

To view the SSL logs:

1. Go to *Log & Report* > *Security Events* and select *SSL*.
2. View the log details in the GUI, or download the log file:

```
1: date=2023-02-06 time=11:23:54 eventtime=1675711434094550877 tz="-0800" logid="1701062009"
type="utm" subtype="ssl" eventtype="ssl-exempt" level="notice" vd="root" action="exempt"
policyid=1 poluuid="e8b310ba-914f-51ed-9014-7b2a116f29ad" policytype="policy" sessionid=531331
service="SSL" profile="custom-deep-inspection" srcip=172.20.120.13 srcport=52805

msg="SSL connection is exempted based on user category rating.
```

IP address external feed

An IP address external feed is a dynamic list that contains IPv4 and IPv6 addresses, address ranges, and subnets. The list is periodically updated from an external server and stored in text file format on an external server. After the FortiGate imports this list, it can be used as a source or destination in firewall policies, proxy policies, local-in policies, and ZTNA rules. It can also be used as an external IP block list in DNS filter profiles.

Text file example:

```
192.168.2.100
172.200.1.4/16
```

```
172.16.1.2/24
172.16.8.1-172.16.8.100
2001:0db8::eade:27ff:fe04:9a01/120
2001:0db8::eade:27ff:fe04:aa01-2001:0db8::eade:27ff:fe04:ab01
```

The file contains one IPv4 or IPv6 address, address range, or subnet per line. See External resources file format for more information about the IP list formatting style.

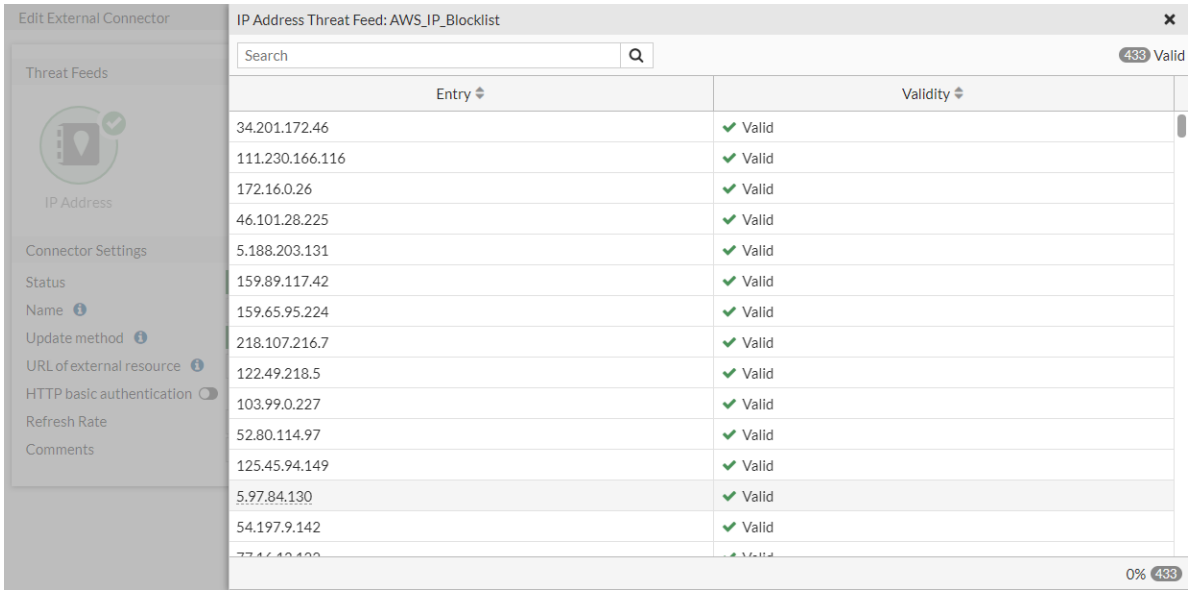
Example configuration

In this example, a list of destination IP addresses is imported using the IP address external feed. The newly created external feed is then used as a destination in a firewall policy with the action set to deny. Any traffic that passes through the FortiGate and matches the defined firewall policy will be dropped.

Please note that the URI provided in the example is solely for demonstration purposes and does not represent a reliable list of well-maintained IP addresses. It is recommended that you utilize a URI of a reputable external IP list that is regularly updated.

To configure an IP address external feed in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *External Feeds* section, click *IP Address*.
3. Set the *Name* to *AWS_IP_Blocklist*.
4. Set the *Update method* to *External Feed*.
5. Set the *URL of external resource* to *https://blocklist-example.com/ip-blocklist/ip.txt*.
6. Configure the remaining settings as required, then click *OK*.
7. Edit the connector, then click *View Entries* to view the IP addresses in the feed.



To configure an IP address external feed in the CLI:

```
config system external-resource
   edit "AWS_IP_Blocklist"
      set type address
      set resource "https://blocklist-example.com/ip-blocklist/ip.txt"
      set server-identity-check {none | basic | full}
   next
end
```

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode. By default, it is set to none.

To apply an IP address external feed in a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. In the *Destination* field, click the + and select *AWS_IP_Blocklist* from the list (in the *IP ADDRESS FEED* section).
4. Set *Action* to *DENY*.
5. Enable *Log Allowed Traffic*.
6. Click *OK*.

Applying an IP address external feed as an external IP block list in a DNS filter profile

An IP address external feed can be applied by enabling *External IP Block Lists* in a DNS filter profile. Any DNS query that passes through the FortiGate and resolves to any of the IP addresses in the external feed list will be dropped.

To configure the DNS filter profile:

1. Go to *Security Profiles* > *DNS Filter* and create a new profile, or edit an existing one.
2. Enable *External IP Block Lists*.
3. Click the + and select *AWS_IP_Blocklist* from the list.
4. Click *OK*.

To apply the DNS filter profile in a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *DNS Filter* and select the profile used in the previous procedure.
4. Enable *Log Allowed Traffic*.
5. Click *OK*.

IP addresses that match the IP address external feed list will be blocked.

To view the DNS query logs:

1. Go to *Log & Report > Security Events* and select *DNS Query*.
2. View the log details in the GUI, or download the log file:

```
1: date=2023-02-06 time=15:06:50 eventtime=1675724810452621179 tz="-0800" logid="1501054400"
type="utm" subtype="dns" eventtype="dns-response" level="warning" vd="root" policyid=0
sessionid=555999 srcip=172.20.120.13 srcport=59602 srccountry="Reserved" srcintf="port2"
srcintfrole="undefined" dstip=172.20.120.12 dstport=53 dstcountry="Reserved" dstintf="root"
dstintfrole="undefined" proto=17 profile="default" xid=24532 qname="dns.google" qtype="A"
qtypeval=1 qclass="IN" ipaddr="208.91.112.55" msg="Domain was blocked because it is in the
domain-filter list" action="redirect" domainfilteridx=0 domainfilterlist="AWS_IP_Block_list"
```

Applying an IP address external feed in a local-in policy

An IP address external feed can be applied as a source or destination in a local-in policy.

In this example, a previously created IP address external feed named *AWS_IP_Blocklist* is used as a source address in a local-in-policy. Any traffic originating from any of the IP addresses in the external feed list and destined for the FortiGate will be dropped.

To apply an IP address external feed in a local-in policy:

```
config firewall local-in-policy
    edit 1
        set intf "any"
        set srcaddr "AWS_IP_Blocklist"
        set dstaddr "all"
        set service "ALL"
        set schedule "always"
    next
end
```

To test the configuration:

1. From one of the IP addresses listed in IP address external feed (in this case 172.16.200.2), start a continuous ping to port1:

```
ping 172.16.200.1 –t
```

2. On the FortiGate, enable debug flow:

```
# diagnose debug flow filter addr 172.16.200.2
# diagnose debug flow filter proto 1
# diagnose debug enable
# diagnose debug flow trace start 10
```

3. The output of the debug flow shows that traffic is dropped by local-in policy 1:

```
id=65308 trace_id=11 func=print_pkt_detail line=5939 msg="vd-root:0 received a packet(proto=1,
172.16.200.2:0->172.16.200.1:2048) tun_id=0.0.0.0 from port1. type=8, code=0, id=0, seq=0."
id=65308 trace_id=11 func=init_ip_session_common line=6121 msg="allocate a new session-
0002f318, tun_id=0.0.0.0"
id=65308 trace_id=11 func=__vf_ip_route_input_rcu line=2012 msg="find a route: flag=80000000
gw-0.0.0.0 via root"
id=65308 trace_id=11 func=fw_local_in_handler line=545 msg="iprope_in_check() check failed on
policy 1, drop"
```

Domain name external feed

A domain name external feed is a dynamic list that contains domains and periodically updates from an external server. The list is stored in a text file format on an external server. After the FortiGate imports this list, it becomes available as a category in the *Remote Categories* group of DNS filter profiles that can be used to block or monitor domains matching this category. Multiple custom categories can be defined by creating a domain name external feed for each category.

Text file example:

```
mail.*.example.com
*-special.example.com
www.*example.com
example.com
```

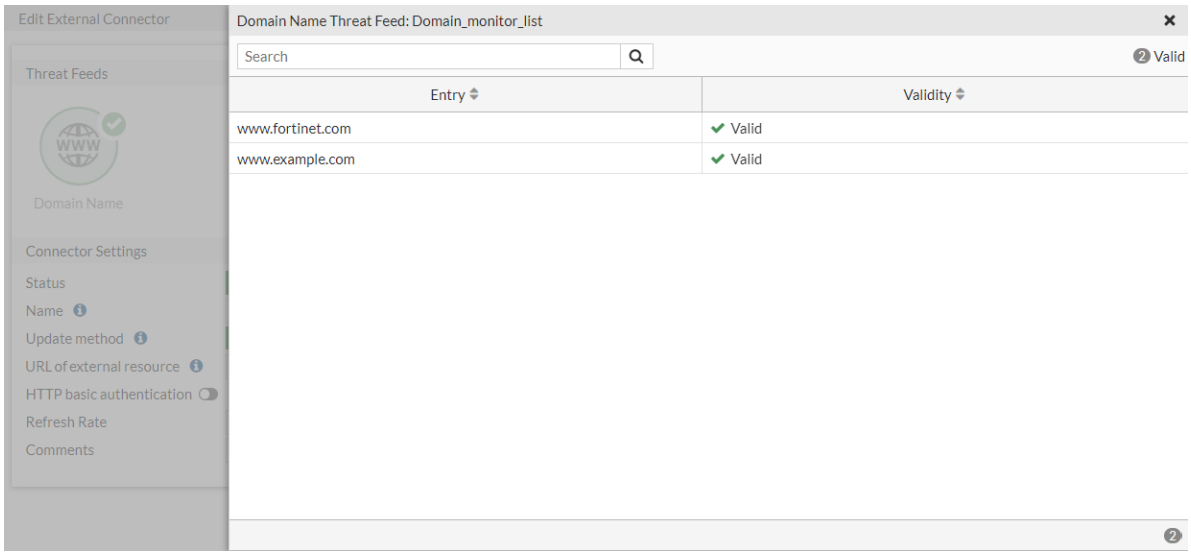
The file contains one domain name per line. See External resources file format for more information about the domain list formatting style.

Example configuration

In this example, a list of domain names is imported using the domain name external feed. The newly created external feed is set to monitor in the DNS filter profile, and the DNS filter profile is applied to a firewall policy. Any traffic that passes through the FortiGate and matches any of the domain names in the external feed list will be monitored.

To configure a domain name external feed in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *External Feeds* section, click *Domain Name*.
3. Set the *Name* to *Domain_monitor_list*.
4. Set the *Update method* to *External Feed*.
5. Set the *URL of external resource* to *https://192.168.10.13/external_domain_list.txt*.
6. Configure the remaining settings as required, then click *OK*.
7. Edit the connector, then click *View Entries* to view the domain names in the feed (fortinet.com and example.com).



To configure a domain name external feed in the CLI:

```
config system external-resource
    edit "Domain_monitor_list”
        set type domain
        set category 194
        set resource "http://192.168.10.13/external_domain_list.txt"
        set server-identity-check {none | basic | full}
    next
end
```

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode. By default, it is set to none.

To apply a domain name external feed in a DNS filter profile:

1. Go to *Security Profiles* > *DNS Filter* and create a new DNS filter profile, or edit an existing one.
2. Enable *FortiGuard Category Based Filter*.
3. In the *Remote Categories* group, set the action for the *Domain_monitor_list* category to *Monitor*.
4. Configure the remaining settings as needed, then click *OK*.

Selecting the *Allow* action for the *FortiGuard Category Based Filter* does not actually allow the category. It merely implies that no filter has been applied.

We recommend avoid using the *Allow* action for remote categories, as it will not override the original action specified in the *FortiGuard Category Based Filter*.

The *Monitor* and *Block* actions for remote categories can override the original action specified in the *FortiGuard Category Based Filter*.

To apply the DNS filter profile in a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *DNS Filter* and select the profile used in the previous procedure.
4. Enable *Log Allowed Traffic*.
5. Click *OK*.

Domains that match the domain external feed list are rated as domain external feed, overriding their original domain rating. Use the FortiGuard Secure DNS Service to check the original category of a domain name.

To view the DNS query logs:

1. Go to *Log & Report* > *Security Events* and select *DNS Query*.
2. View the log details in the GUI, or download the log file:

```
1: date=2023-02-03 time=10:44:16 eventtime=1675449856658521042 tz="-0800" logid="1501054802"
type="utm" subtype="dns" eventtype="dns-response" level="notice" vd="root" policyid=0
sessionid=265870 srcip=172.20.120.13 srcport=59662 srccountry="Reserved" srcintf="port2"
srcintfrole="undefined" dstip=172.20.120.12 dstport=53 dstcountry="Reserved" dstintf="root"
dstintfrole="undefined" proto=17 profile="default" xid=35624 qname="example.com" qtype="A"
qtypeval=1 qclass="IN" ipaddr="93.184.216.34" msg="Domain is monitored" action="pass" cat=194
catdesc="Domain_monitor_list"
```

```
2: date=2023-02-03 time=10:44:08 eventtime=1675449848683418535 tz="-0800" logid="1501054802"
type="utm" subtype="dns" eventtype="dns-response" level="notice" vd="root" policyid=0
sessionid=265537 srcip=172.20.120.13 srcport=57434 srccountry="Reserved" srcintf="port2"
srcintfrole="undefined" dstip=172.20.120.12 dstport=53 dstcountry="Reserved" dstintf="root"
dstintfrole="undefined" proto=17 profile="default" xid=31194 qname="fortinet.com" qtype="A"
qtypeval=1 qclass="IN" ipaddr="3.1.92.70, 52.220.222.172" msg="Domain is monitored"
action="pass" cat=194 catdesc="Domain_monitor_list"
```

Note that fortinet.com, which was originally in the Information Technology category with a default action set to allow in the *FortiGuard Category Based Filter*, has been overridden by the monitor action of the remote category.

MAC address external feed

A MAC address external feed is a dynamic list that contains MAC addresses, MAC ranges, and MAC OUIs. The list is periodically updated from an external server and stored in text file format on an external server. After the FortiGate imports this list, it can be used as a source in firewall policies, proxy policies, and ZTNA rules. For policies in transparent mode or virtual wire pair policies, the MAC address external feed can be used as a source or destination address.

Text file example:

```
01:01:01:01:01:01
01:01:01:01:01:01-01:01:02:50:20:ff
8c:aa:b5
```

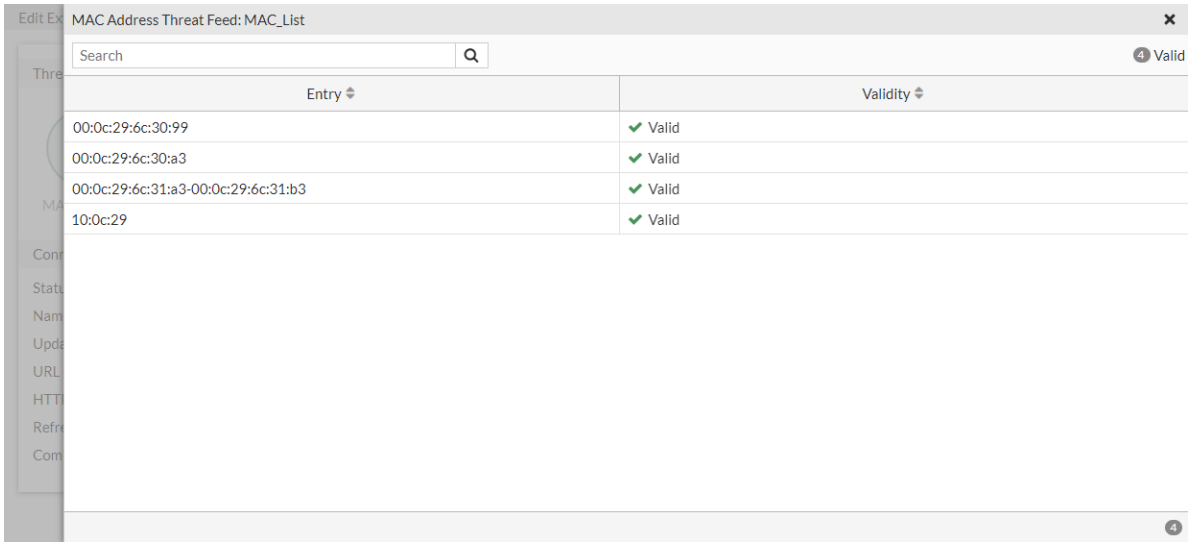
The file contains one MAC address, MAC range, or MAC OUI per line. See External resources file format for more information about the MAC list formatting style.

Example configuration

In this example, a list of MAC addresses is imported using the MAC address external feed. The newly created external feed is then used as a source in a firewall policy with the action set to accept. Any traffic from the client MAC addresses that match the defined firewall policy will be allowed.

To configure a MAC address external feed in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *External Feeds* section, click *MAC Address*.
3. Set the *Name* to *MAC_List*.
4. Set the *Update method* to *External Feed*.
5. Set the *URL of external resource* to *http://172.16.200.55/external-resources/Ext-Resource-Type-as-Address-mac-1.txt*.
6. Configure the remaining settings as required, then click *OK*.
7. Edit the connector, then click *View Entries* to view the MAC addresses in the feed.



To configure a MAC address external feed in the CLI:

```
config system external-resource
    edit "MAC_List"
        set type mac-address
        set resource "http://172.16.200.55/external-resources/Ext-Resource-Type-as-Address-mac-
1.txt"
        set server-identity-check {none | basic | full}
    next
end
```

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode. By default, it is set to none.

To apply a MAC address external feed in a firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. In the *Source* field, click the *+* and select *MAC_List* from the list (in the *MAC ADDRESS FEED* section).
4. Set *Action* to *ACCEPT*.
5. Click *OK*.

To apply a MAC address external feed in a firewall policy in the CLI:

```
config firewall policy
    edit 1
        set name "MAC-traffic"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "MAC_List"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set profile-protocol-options "protocol"
        set nat enable
    next
end
```

To verify the MAC addresses used in the firewall policy:

```
# diagnose sys external-mac-resource list MAC_List
MAC ranges of uuid-idx 574 (num=1)
be:d1:6b:0d:20:61-be:d1:6b:0d:20:61
```

Malware hash external feed

A malware hash external feed is a dynamic list that contains malware hashes and periodically updates from an external server. The list is stored in text file format on an external server. After the FortiGate imports this list, it is automatically used for virus outbreak prevention on antivirus profiles when *Use external malware block list* is enabled. Similar to FortiGuard outbreak prevention, the malware hash external feed is not supported in AV quick scan mode.

Text file example:

```
292b2e6bb027cd4ff4d24e338f5c48de
dda37961870ce079defbf185eeeef905 Trojan-Ransom.Win32.Locky.abfl
3fa86717650a17d075d856a41b3874265f8e9eab Trojan-Ransom.Win32.Locky.abfl
c35f705df9e475305c0984b05991d444450809c35dd1d96106bb8e7128b9082f Trojan-Ransom.Win32.Locky.abfl
```

The file contains one malware hash per line. See External resources file format for more information about the malware hash list formatting style.

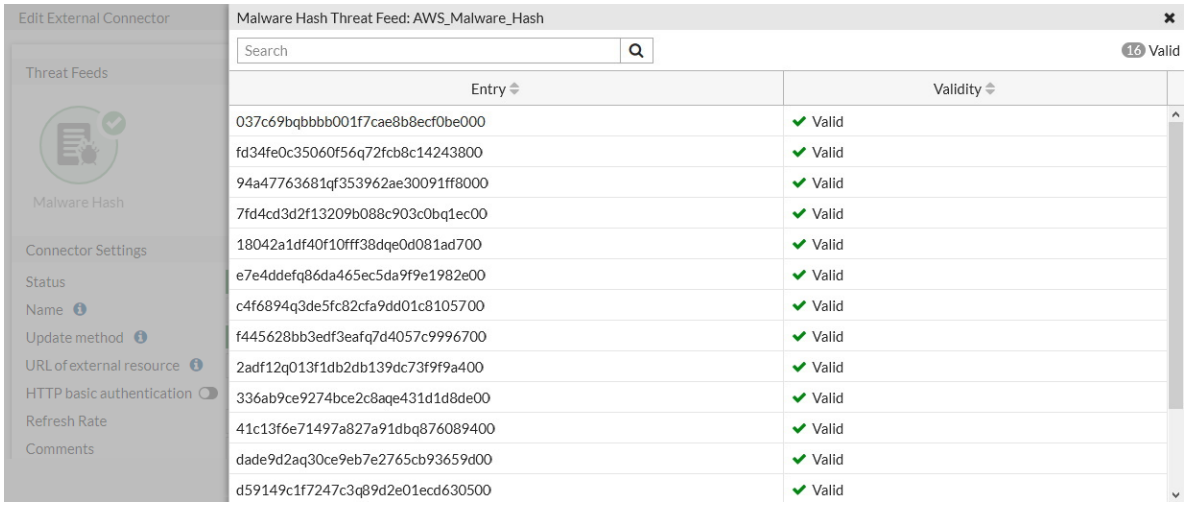
For optimal performance, do not mix different hashes in the list. Only use one MD5, SHA1, or SHA256.

Example configuration

In this example, a list of malware hashes is imported using the malware external feed. The newly created external feed is applied to an antivirus profile, and the antivirus profile is applied to a firewall policy. Any traffic that passes through the FortiGate and matches the malware hashes in the external feed list will be dropped.

To configure a malware hash external feed in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *External Feeds* section, click *Malware Hash*.
3. Set the *Name* to *AWS_Malware_Hash*.
4. Set the *Update method* to *External Feed*.
5. Set the *URL of external resource* to *https://s3.us-west-2.amazonaws.com/malware.txt*.
6. Configure the remaining settings as required, then click *OK*.
7. Edit the connector, then click *View Entries* to view the hash list.



To configure a malware hash external feed in the CLI:

```
config system external-resource
    edit "AWS_Malware_Hash"
        set type malware
        set resource "https://s3.us-west-2.amazonaws.com/malware.txt"
        set server-identity-check {none | basic | full}
    next
end
```

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode. By default, it is set to none.

To apply a malware hash external feed in an antivirus profile:

1. Go to *Security Profiles > AntiVirus* and create a new web filter profile, or edit an existing one.
2. Enable *Use external malware block list*.
3. Click the *+* and select *AWS_Malware_Hash* from the list.
4. Configure the remaining settings as needed, then click *OK*.

To apply the antivirus profile in a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *AntiVirus* and select the profile used in the previous procedure.
4. Set *SSL Inspection* to *deep-inspection* to inspect HTTPS traffic.
5. Enable *Log Allowed Traffic*.
6. Click *OK*.

To view the antivirus logs:

1. Go to *Log & Report > Security Events* and select *AntiVirus*.
2. View the log details in the GUI, or download the log file:

```
1: date=2023-02-03 time=15:42:41 eventtime=1675467761491047388 tz="-0800" logid="0207008212"
type="utm" subtype="virus" eventtype="malware-list" level="warning" vd="root" policyid=1
poluuid="e8b310ba-914f-51ed-9014-7b2a116f29ad" policytype="policy" msg="Blocked by local
malware list." action="blocked" service="HTTP" sessionid=293915 srcip=172.20.120.13
dstip=192.168.10.13 srcport=53515 dstport=80 srccountry="Reserved" dstcountry="Reserved"
srcintf="port2" srcintfrole="undefined" dstintf="port3" dstintfrole="wan" srcuuid="3342cb44-
9140-51ed-5dbe-8e0787bedeec" dstuuid="3342cb44-9140-51ed-5dbe-8e0787bedeec" proto=6
direction="incoming" filename="test.jpg" quarskip="Quarantine-disabled"
virus="a1a74a39788854b75d454dc9c83c612b" viruscat="File Hash" dtype="external-blocklist"
filehash="a1a74a39788854b75d454dc9c83c612b" filehashsrc="AWS_Malware_Hash"
url="http://192.168.10.13/test.jpg" profile="default" agent="curl/7.55.1" httpmethod="GET"
analyticssubmit="false" crscore=10 craction=2 crlevel="medium"
```

To verify the scanunit daemon:

```
# diagnose sys scanunit file-hash list
malware 'a1a74a39788854b75d454dc9c83c612b' vf_id 0 uuid 15752 profile 'AWS_Malware_Hash'
description ''
```

The list of external hashes has been updated.

External feed connectors per VDOM

When multi-VDOM mode is enabled, an external feed connector can be defined in global or within a VDOM. Global external feeds can be used in any VDOM, but cannot be edited within the VDOM. FortiGuard category and domain name-based external feeds have an added category number field to identify the external feed. The external feed name in global must start with `g-`. External feed names in VDOMs cannot start with `g-`.

FortiGuard category and domain name-based external feed entries must have a number assigned to them that ranges from 192 to 221. This number can be assigned to both external feed types. However, when a category number is used under a global entry, such as 192 with the name `g-cat-192`, this category number cannot be used in any other global or VDOM entries. If a category is used under a VDOM entry, such as 192 under VDOM1 with the name `cat-192`, the category 192 can be used in another VDOM or root with the name `cat-192`.

An external feed connector can only be used in profiles in the VDOM that it was created in. Global connectors can be used in all VDOMs.

Each VDOM can have a maximum of 256 external feed entries. But in total, a FortiGate can only have 511 external feed entries.

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode.

To configure a FortiGuard category external feed connector under global in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *External Feeds* section, click *FortiGuard Category*.
3. Enter a name that begins with `g-`.
4. Configure the other settings as needed.
5. Click *OK*.

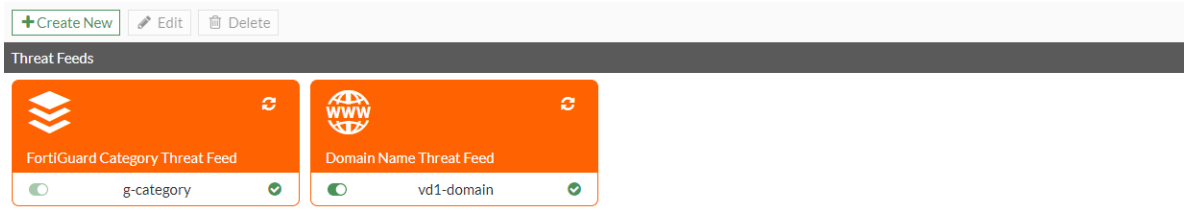
To configure a FortiGuard category external feed connector under global in the CLI:

```
config global
    config system external-resource
        edit "g-category"
            set status enable
            set type category
            set category 192
            set comments ''
            set resource "http://172.16.200.55/external-resource-test/513-FDGCategory.txt"
            set server-identity-check {none | basic | full}
            set refresh-rate 5
```

```
        next
    end
end
```

To configure a domain name external feed connector under a VDOM in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *External Feeds* section, click *Domain Name*.
3. Enter a name that does not begin with `g-`.
4. Configure the other settings as needed.
5. Click *OK*. The external feed connector created under global also appears, but it is not editable.



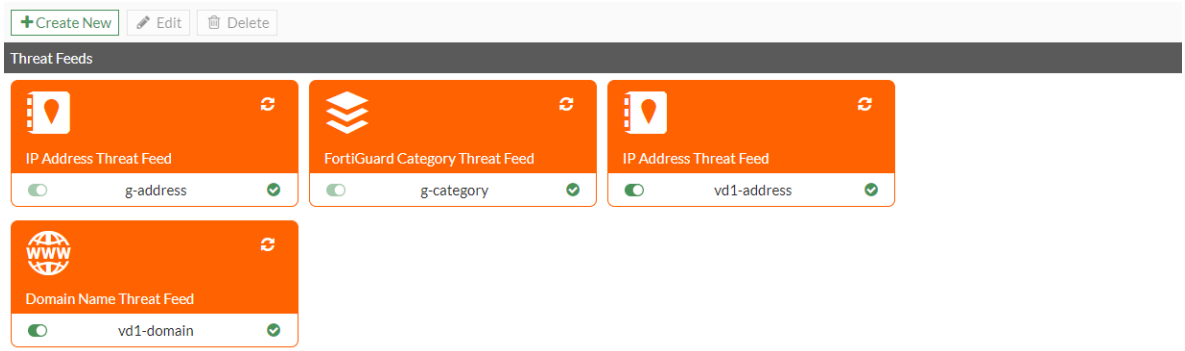
To configure a domain name external feed connector under a VDOM in the CLI:

```
config vdom
    edit vd1
        config system external-resource
            edit "vd1-domain"
                set status enable
                set type domain
                set category 193
                set comments ''
                set resource "http://172.16.200.55/external-resource-test/513-Domain.txt"
                set server-identity-check {none | basic | full}
                set refresh-rate 5
            next
        end
    next
end
```

To use an IP address external feed in a policy in the GUI:

1. Configure an IP address connector in global:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. In the *External Feeds* section, click *IP Address*.
   c. Enter a name that begins with `g-`.
   d. Configure the other settings as needed.
   e. Click *OK*.
2. Configure an IP address connector in the VDOM (vd1):
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. In the *External Feeds* section, click *IP Address*.

c. Enter a name that does not begin with g-.
d. Configure the other settings as needed.
e. Click *OK*. The external feed connectors created under global also appear, but they are not editable.



3. Configure the firewall policy in the VDOM (vd1):
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. For *Destination*, select *vd1-address*. Since this policy is configured under vd1, *g-address* can also be set as the destination.

   c. Configure the other settings as needed.
   d. Click *OK*.

To use an IP address external feed in a policy in the CLI:

1. Configure the IP address connectors:

```
config global
    config system external-resource
        edit "g-address"
            set status enable
            set type address
            set username ''
```

```
            set comments ''
            set resource "http://172.16.200.55/external-resource-test/513-IP.txt"
            set server-identity-check {none | basic | full}
            set refresh-rate 5
        next
    end
end
```

```
config vdom
    edit vd1
        config system external-resource
            edit "vd1-address"
                set status enable
                set type address
                set comments ''
                set resource "http://172.16.200.55/external-resource-test/513-IP.txt"
                set user-agent "curl/7.58.0"
                set server-identity-check {none | basic | full}
                set refresh-rate 5
            next
        end
    next
end
```

2. In the VDOM, configure a firewall policy with the external address as the destination address:

```
config vdom
    edit vd1
        config firewall policy
            edit 1
                set name "test"
                set srcintf "port10"
                set dstintf "port9"
                set srcaddr "all"
                set dstaddr "vd1-address"
                set action accept
                set schedule "always"
                set service "ALL"
                set profile-protocol-options "protocol"
                set nat enable
            next
        end
    next
end
```

Since this firewall policy is configured under `vd1`, `g-address` can also be set as the `dstaddr`.

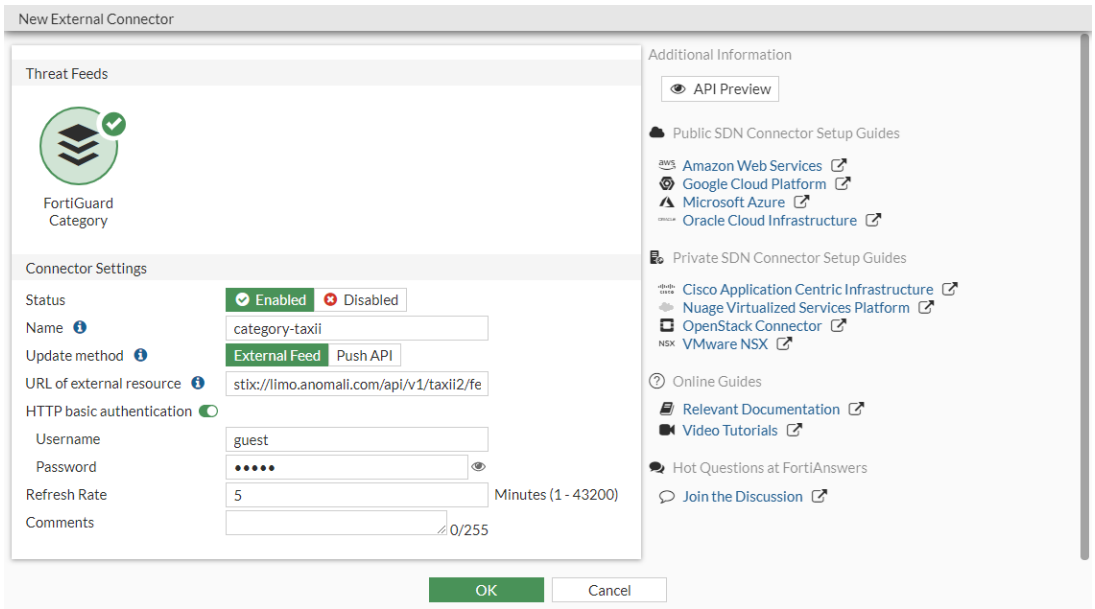
STIX format for external feeds

The FortiGate's external feeds support feeds that are in the STIX/TAXII format. Use the `stix://` prefix in the URI to denote the protocol.

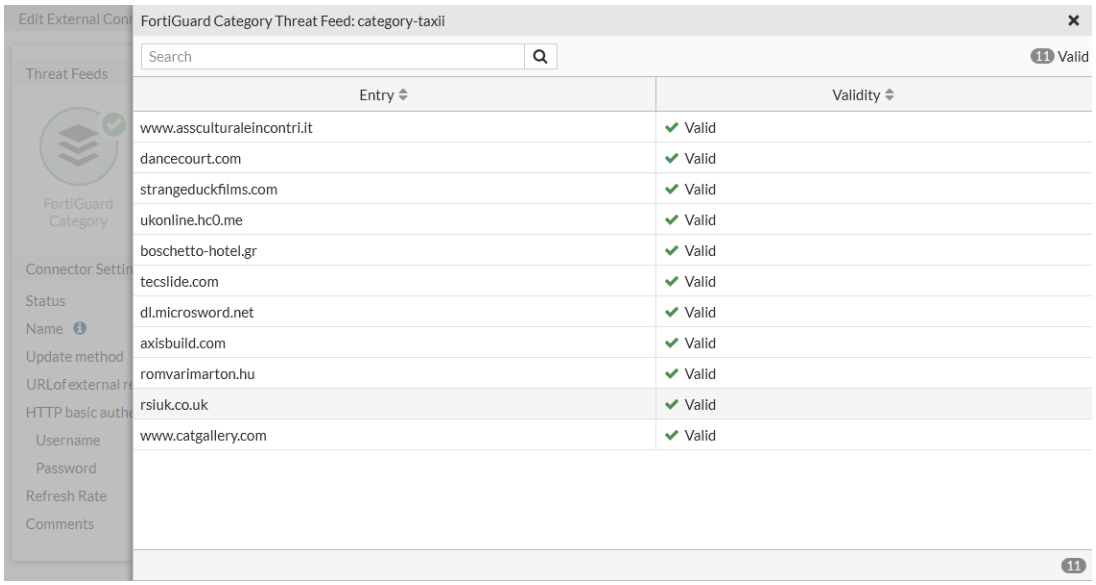
All external external feeds support the STIX format. In this example, a FortiGuard Category external feed in the STIX format is configured.

To configure a FortiGuard Category external feed in the STIX format in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. Select *FortiGuard Category* from the *External Feeds* section.
3. Configure the connector:
   - *Name*: *category-taxii*
   - *Update method*: *External Feed*
   - *URL of external resource*: *stix://limo.anomali.com/api/v1/taxii2/feeds/collections/200/objects/*
   - *HTTP basic authentication*: Enable and enter the username and password, such as *guest* and *guest*.



4. Click *OK*.
5. Edit the connector, and click *View Entries* in the right side bar to view the retrieved entries.



To configure a FortiGuard Category external feed in the STIX format in the CLI:

```
config system external-resource
    edit "category-taxii"
        set category 194
        set username "guest"
        set password guest
        set resource "stix://limo.anomali.com/api/v1/taxii2/feeds/collections/200/objects/"
        set server-identity-check {none| basic | full}
        set update-method feed
    next
end
```

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode. By default, `server-identity-check` is set to none.

If the connector is used in webfilter that blocks category 194, the traffic that matches the retrieved URLs, such as *rsiuk.co.uk*, is blocked:

```
1: date=2021-10-06 time=18:07:46 eventtime=1633568867163763708 tz="-0700" logid="0316013056"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="vd1" policyid=1
sessionid=174974 srcip=10.1.100.12 srcport=48284 srcintf="port2" srcintfrole="undefined"
srcuuid="c6753ba2-231b-51ec-1675-090f2b5f1384" dstip=78.129.255.151 dstport=443 dstintf="port1"
dstintfrole="undefined" dstuuid="c6753ba2-231b-51ec-1675-090f2b5f1384" proto=6 service="HTTPS"
hostname="rsiuk.co.uk" profile="test" action="blocked" reqtype="direct" url="https://rsiuk.co.uk/"
sentbyte=75 rcvdbyte=0 direction="outgoing" msg="URL belongs to a denied category in policy"
method="domain" cat=194 catdesc="category-taxii"
```

Using the AusCERT malicious URL feed with an API key

In this example, a list of malicious URLs is imported from AUSCERT, an Australian not for profit organization. See AUSCERT for more information.

The FortiGuard external feed is used to import the malicious URL feed by appending the API key to the user-agent. See HTTP header on page 4075 for more information. The newly created external feed is set to block in the web filter profile, and the web filter profile is applied to a firewall policy. Any traffic that passes through the FortiGate and matches the URLs in the external feed list will be dropped, and a replacement message will be shown.

To configure the FortiGuard category external feed in the GUI:

1. Go *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *External Feeds* section, select *FortiGuard Category*.
3. Configure the following settings:

Status	Enabled
Name	AusCERT_Feed
Update method	External Feed
URL of external resource	https://www.auscert.org.au/api/v1/malurl/combo-7-txt/

4. Click *OK*.
5. In the CLI, enter the following:

```
config system external-resource
    edit "AusCERT_Feed"
        set user-agent "Firefox\r\nAPI-Key:SECRETAPIKEY"
    next
end
```

6. In the GUI, edit the connector and configure the remaining settings as needed, then click *OK*.
7. Edit the connector again, and click *View Entries* in the right pane to view the URL list.

To configure the FortiGuard category external feed in the CLI:

```
config system external-resource
    edit "AusCERT_Feed"
        set category 194
        set resource "https://www.auscert.org.au/api/v1/malurl/combo-7-txt/"
        set user-agent "Firefox\r\nAPI-Key:SECRETAPIKEY"
    next
end
```

When configuring a FortiGuard category external feed in the GUI, the category is set automatically. When configuring an external feed in the CLI, the category must be set manually. The category must be unique and in the range of 192 - 221.

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) in either `basic` or `full` mode. By default, it is set to none.

To apply the FortiGuard category external feed to a web filter profile:

1. Go to *Security Profiles* > *Web Filter* and create a new web filter profile, or edit an existing one.
2. Enable *FortiGuard category based filter*.
3. In the *Remote Categories* group, set the action for the *AusCERT_Feed* category to *Block*.
4. Configure the remaining settings as needed, then click *OK*.

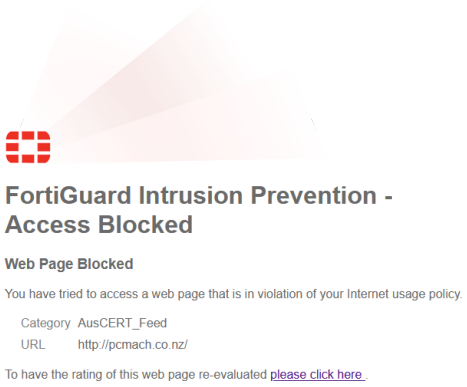
To apply the web filter profile in a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile used in the previous procedure.
4. Enable *Log Allowed Traffic*.
5. Click *OK*.

URLs that match the FortiGuard category external feed list are rated as the category matching the corresponding FortiGuard category external feed, overriding their original domain rating.

To verify that FortiGate is blocking URLs from the AusCERT feed list:

1. Visit one of the URLs from the AusCERT_Feed list.
   A replacement message should be shown.



2. Go to *Log & Report* > *Security Events* and select *Web Filter*.
3. View the log details in the GUI, or download the log file:

```
1: date=2023-04-11 time=14:18:02 eventtime=1681247882561766251 tz="-0700" logid="0316013056"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="root" policyid=1
poluuid="26540ed0-ae54-51ed-80eb-89af8af4d53f" policytype="policy" sessionid=3275
srcip=172.20.120.13 srcport=64151 srccountry="Reserved" srcintf="port2"
srcintfrole="undefined" srcuuid="3342cb44-9140-51ed-5dbe-8e0787bedeec" dstip=114.142.162.65

51ed-5dbe-8e0787bedeec" proto=6 httpmethod="GET" service="HTTP" hostname="pcmach.co.nz"
```

```
agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML, like Gecko)
Chrome/112.0.0.0 Safari/537.36" profile="default" action="blocked" reqtype="direct"
url="http://pcmach.co.nz/" sentbyte=427 rcvdbyte=0 direction="outgoing" msg="URL belongs to a
denied category in policy" ratemethod="domain" cat=194 catdesc="AusCERT_Feed"
```

Troubleshooting an external feed

In this example, the user entered the URL of external resource without the trailing slash. The following commands can be used to troubleshoot connectivity issues between a FortiGate and external resource:

```
diagnose debug app dnsproxy -1
diagnose debug app forticron -1
diagnose debug enable
```

This output shows that the DNS resolution is successful, indicating that the FortiGate has connectivity to the external server:

```
#diagnose debug app dnsproxy -1
[worker 0] dns_local_lookup()-2476: vfid=0, real_vfid=0, qname=www.auscert.org.au, qtype=1,
qclass=1, offset=36, map#=4 max_sz=512
[worker 0] dns_lookup_aa_zone()-608: vfid=0, fqdn=www.auscert.org.au
[worker 0] dns_send_request()-1398
[worker 0] dns_send_resol_request()-1234: orig id: 0xa002 local id: 0xa002
domain=www.auscert.org.au
[worker 0] dns_find_best_server()-595: found server: 96.45.46.46
…
id:0xa002 domain=www.auscert.org.au active
```

This output shows that the requested resource was missing a trailing slash:

```
#diagnose debug app forticron -1
fcron_timer_func()-23: Timer ext_upd fired
6745-before-init: fd=-1 name='ext-root.AusCERT_Feed' http_1=0 loc=0 state=send.body info=0-DNS
fail chunk=0 content-0=0 etag=0 csum=0 done=0 closed=0
    sync-0(len=0 note=0 err=0) buf-1(sz=8192 data=179 free=8013 pos=0 end=179 max=10485760)
6745-init-as: fd=-1 name='ext-root.AusCERT_Feed' http_1=0 loc=0 state=send.body info=0-None
chunk=0 content-0=0 etag=0 csum=0 done=0 closed=0
    sync-0(len=0 note=0 err=0) buf-1(sz=8192 data=0 free=8192 pos=0 end=0 max=10485760)
http_request_make()-2066: HTTP request: https

GET /api/v1/malurl/combo-7-txt HTTP/1.1
Host: www.auscert.org.au
User-Agent: Firefox
API-Key: <obfuscated>
Accept: */*
Connection: close
http_request_make()-2101: fcron_get_addr(www.auscert.org.au)
__update_ext()-187: Updating EXT 'AusCERT_Feed' with HTTP
fcron_update_ext_func()-611: update ver: 0
fcron_timer_func()-32: Timer ext_upd done
fcron_epoll_before_handle()-297: BEFORE READ fd 11 handle event 0x01 read 0xc55a40 epoll events
```

```
0x01
dns_parse_resp()-102: DNS www.auscert.org.au -> 54.253.78.74
dns_parse_resp()-102: DNS www.auscert.org.au -> 13.54.251.23
…
HTTP/1.1 301 Moved Permanently
…
Location: /api/v1/malurl/combo-7-txt/
```

After adding a trailing slash to the external resource URL, the connection is now working:

```
#diagnose debug app forticron -1
fcron_timer_func()-23: Timer ext_upd fired
2832-before-init: fd=-1 name='ext-root.AusCERT_Feed' http_1=0 loc=0 state=send.header info=0-None
chunk=0 content-0=0 etag=0 csum=0 done=0 closed=0
    sync-0(len=0 note=0 err=0) buf-0(sz=0 data=0 free=0 pos=0 end=0 max=10485760)
2832-init-as: fd=-1 name='ext-root.AusCERT_Feed' http_1=0 loc=0 state=send.header info=0-None

HTTP/1.1 200 OK
```

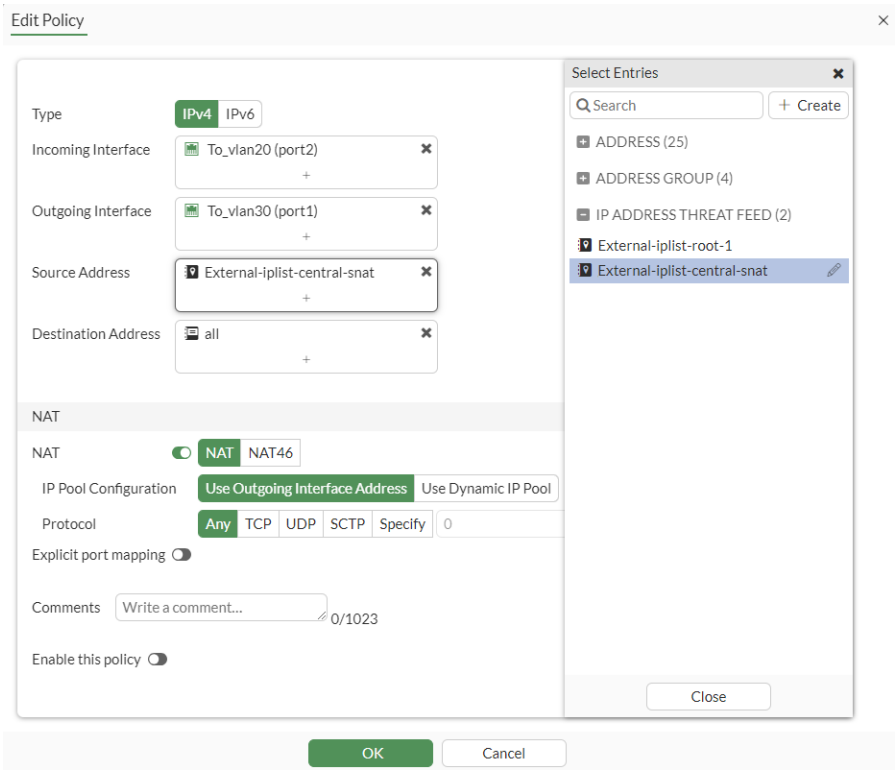
These troubleshooting commands can be used to resolve a variety of issues. they are not limited to this specific use case.

Apply external feed connectors as source addresses in central SNAT

FortiOS allows an IP address external feed to be applied as a source address in central SNAT. This enhancement allows for more dynamic and responsive network security configuration.

The IP address external feed can be applied in the GUI and the CLI:

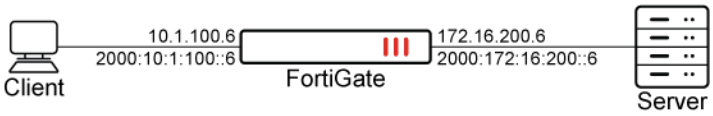
- In the GUI, select an external feed object from the *IP Address External Feed* section when creating and editing a policy.



- In the CLI, the IP address external feed connector can be applied when configuring the `central-snat-map`.

Example

In the following example, an external IP list external feed object will be created and used in a central SNAT map as the source address.



To apply an external feed connector in central SNAT:

1. Create an external feed IP list object:

```
config system external-resource
    edit "External-iplist-central-snat"
        set type address
        set resource "http://172.16.200.55/ip_list_test/test-external-iplist-central-snat.txt"
    next
end
```

The external feed list is as follows:

```
10.1.100.22
10.1.100.41
```

```
2000:10:1:100::22
2000:10:1:100::41
```

See IP address external feed on page 4084 for more information.

2. Apply the external feed connector in a central SNAT map as the source address:

```
config firewall central-snat-map
    edit 1
        set type ipv6
        set srcintf "port2"
        set dstintf "port1"
        set orig-addr6 "External-iplist-central-snat"
        set dst-addr6 "all"
    next
    edit 2
        set srcintf "port2"
        set dstintf "port1"
        set orig-addr "External-iplist-central-snat"
        set dst-addr "all"
    next
end
```

3. Verify that the external feed connector has been applied and taken effect:

```
# diagnose firewall iprope list 10000d
policy index=2 uuid_idx=8391 action=accept
flag (8041100): nat sport use_src pol_stats
flag3 (80): best-route
flag4 (200): port-preserve
schedule()
cos_fwd=0  cos_rev=0
group=0010000d av=00000000 au=00000000 split=00000000
host=0 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 8 -> zone(1): 7
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=8031,
source external ip pool(1): 8390
service(1):
        [0:0x0:0/(0,65535)->(0,65535)] flags:0 helper:auto

# diagnose firewall iprope6 list 10000d
policy id: 1, group: 0010000d, uuid_idx=8163
  action: accept, schedule:
  cos_fwd=0 cos_rev=0
  flag (08041100): nat sport use_src pol_stats
  flag3(00000080): best-route
  shapers: / per_ip=
  sub_groups: av 00000000 auth 00000000 split 00000000 misc 00000000
  app_list: 0 ips_view: 0
  vdom_id: 0
  zone_from(1): 8
  zone_to(1): 7
```

```
  address_dst(1):
      all uuid_idx=8045
  source external ip pool(1):
      8390
  service(1):
      [0:0x0:0/(0,65535)->(0,65535)] helper:auto
  nat(0):
  nat_64(0):
```

The source external IP pool is attached.

```
# diagnose sys external-address-resource list
List of external address resources:
name:External-iplist-central-snat, uuid-idx:8390, num of ipv4/ipv6 ranges:2/2, used:yes

# diagnose sys external-address-resource list External-iplist-central-snat
IPv4 ranges of uuid-idx 8390 (num=2)
10.1.100.22-10.1.100.22
10.1.100.41-10.1.100.41
IPv6 ranges of uuid-idx 8390 (num=2)
2000:10:1:100::22-2000:10:1:100::22
2000:10:1:100::41-2000:10:1:100::41
```

The external IP list UUID index matches.

4. Verify that sending packets from IP addresses included in the IP list will hit the central SNAT map and that SNAT will take effect:
   a. Send packets from an IPv4 address that is included in the IP list. In this example, the packets are sent from 10.1.100.41.

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
7.269689 port2 in 10.1.100.41 -> 172.16.200.55: icmp: echo request
7.269727 port1 out 172.16.200.6 -> 172.16.200.55: icmp: echo request
7.269850 port1 in 172.16.200.55 -> 172.16.200.6: icmp: echo reply
7.269861 port2 out 172.16.200.55 -> 10.1.100.41: icmp: echo reply
...
8 packets received by filter
0 packets dropped by kernel
```

   SNAT will take effect. The outgoing packet is SNAT'd to the IP address of the port1 interface.

   b. Send packets from an IPv4 address that is not included in the IP list. In this example, the packets are sent from 10.1.100.11.

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
2.323329 port2 in 10.1.100.11 -> 172.16.200.55: icmp: echo request
2.323362 port1 out 10.1.100.11 -> 172.16.200.55: icmp: echo request
...
```

```
4 packets received by filter
0 packets dropped by kernel
```

SNAT will not take effect.

c. Send packets from an IPv6 address that is included in the IP list. In this example, the packets are sent from 2000:10:1:100::41.

```
# diagnose sniffer packet any icmp6 4
interfaces=[any]
filters=[icmp6]
2.105798 port2 in 2000:10:1:100::41 -> 2000:172:16:200::55: icmp6: echo request seq 1
[flowlabel 0x204d4]
2.105844 port1 out 2000:172:16:200::6 -> 2000:172:16:200::55: icmp6: echo request seq 1
[flowlabel 0x204d4]
2.105959 port1 in 2000:172:16:200::55 -> 2000:172:16:200::6: icmp6: echo reply seq 1
[flowlabel 0xebd44]
2.105971 port2 out 2000:172:16:200::55 -> 2000:10:1:100::41: icmp6: echo reply seq 1
[flowlabel 0xebd44]
...
8 packets received by filter
0 packets dropped by kernel
```

SNAT will take effect. The outgoing packet is SNAT'd to the IPv6 address of the port1 interface.

d. Send packets from an IPv6 address that is not included in the IP list. In this example, the packets are sent from 2000:10:1:100::11.

```
# diagnose sniffer packet any icmp6 4
interfaces=[any]
filters=[icmp6]
1.917946 port2 in 2000:10:1:100::11 -> 2000:172:16:200::55: icmp6: echo request seq 1
1.917979 port1 out 2000:10:1:100::11 -> 2000:172:16:200::55: icmp6: echo request seq 1
...
8 packets received by filter
0 packets dropped by kernel
```

SNAT will not take effect.

Generic connector for importing addresses

This features allows for seamless integration with any third-party database using a JSON based REST API. Each JSON entry is converted into an address object on the FortiGate, which can be used in policies like any other address.

Each dynamic firewall address can parse up to 100,000 IP addresses and 3,000 MAC addresses. IPv6 addresses are not supported.

When VDOMs are enabled, a generic connector that is created in the Global VDOM must have *g-* prepended to it's name. The connector and imported addresses are synchronized to all VDOMs. A generic connector that is

created in a specific VDOM is not synchronized to other VDOMs, and the address objects are only imported to that VDOM.

When VDOMs are not enabled, generic connectors cannot use the *g-* prefix in their name.

External feed update method example

In this example, the FortiGate pulls updates from an external resource: a REST API interface created using JSONBIN.io.

To create the REST API interface:

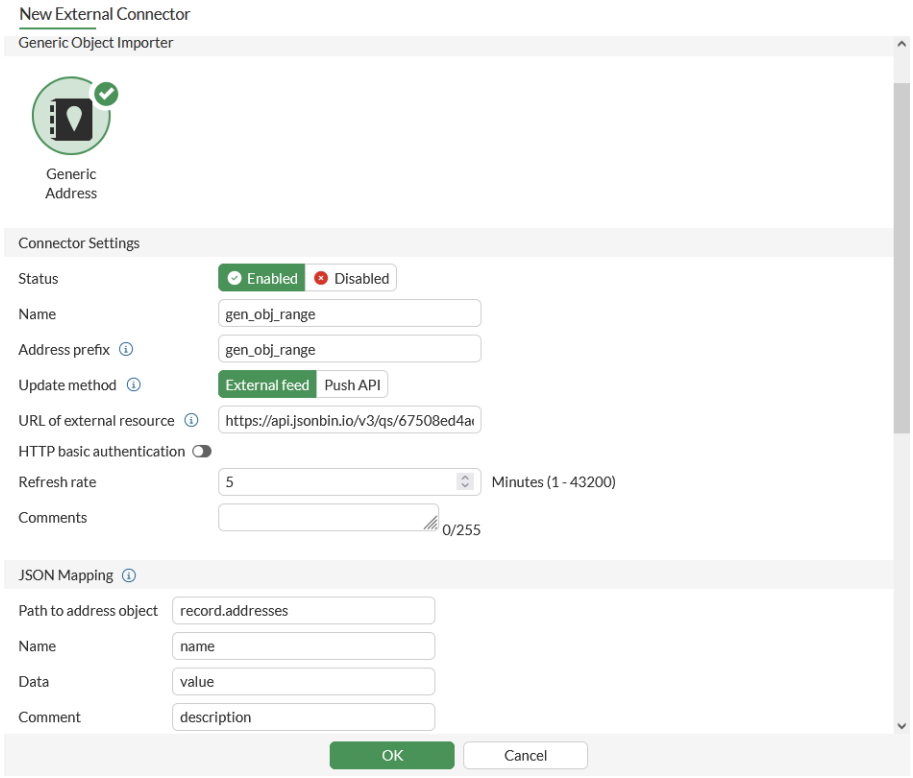
1. Go to JSONBIN.io and click Quick Create JSON.
2. Enter a name for the JSON file and select when it expires.
3. Copy in the following JSON then click *Create Bin*:

```
{
  "addresses": [
    {
      "name": "ip_address",
      "value": [
        "172.16.200.1-172.16.200.254",
        "192.168.4.1-192.168.4.254"
      ],
      "description": "generic object IP Address"
    },
    {
      "name": "mac_address",
      "value": [
        "00:0c:29:1b:40:c9",
        "00:0c:29:f6:0d:49",
        "00:0c:29:63:40:09"
      ],
      "description": "generic object MAC Address"
    }
  ]
}
```

4. Copy the generated *Access URL*.

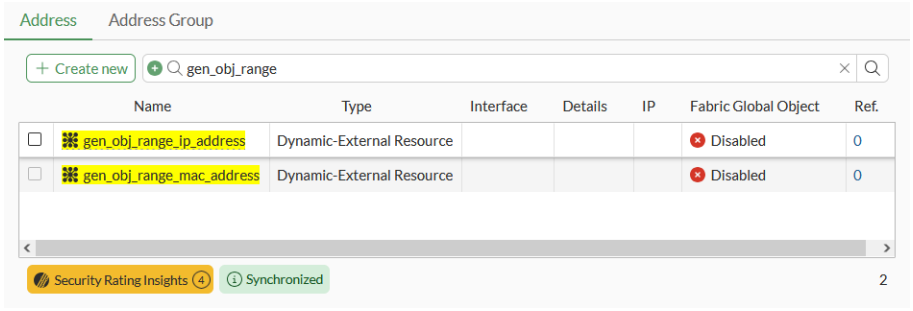
To create and test a generic connector that uses the external feed update method in the GUI:

1. On the FortiGate, go to *Security Fabric* > *External Connectors* and click *Create New*.
2. Enter a name for the connector, such as *gen_obj_range*.
3. Set *Update method* to *External feed*.
4. Set the *URL of external resource* to the Access URL copied from JSONBIN.io.
5. In the *JSON Mapping*, change the *Path to address object* to *record.addresses*.

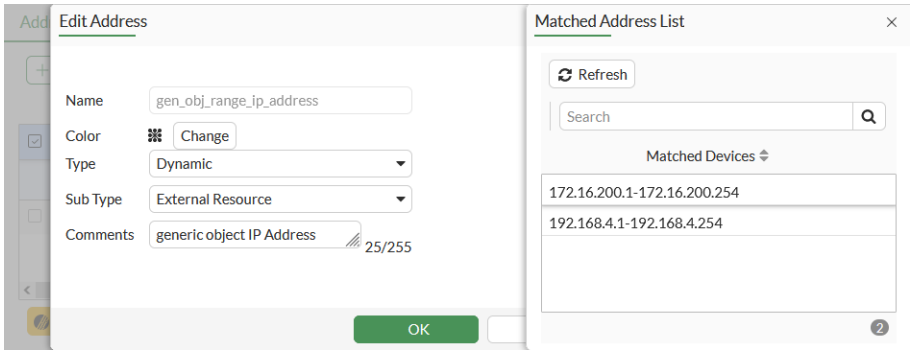


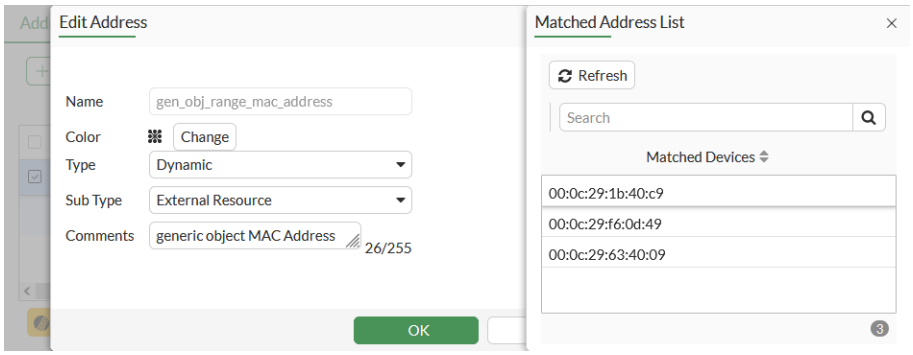
6. Click *OK*.

   The connector imports the IP and MAC addresses and automatically creates address objects on the FortiGate. The address object names are a combination of the connector name and the name of the content, for example *gen_obj_range_ip_address*.



7. Edit the address object then select *View Matched Addresses* from the right side bar, or hover over the object name then select *View Matched Addresses* in the popup message.





To create a generic connector that uses the external feed update method in the CLI:

1. Create the generic connector:

```
config system external-resource
    edit "gen_obj_range"
        set type generic-address
        set namespace "gen_obj_range"
        set object-array-path "$.record.addresses"
        set resource "https://api.jsonbin.io/v3/qs/6748a04dacd3cb34a8b09811"
    next
end
```

2. Check the matched IP addresses:

```
# show firewall address gen_obj_range_ip_address
config firewall address
    edit "gen_obj_range_ip_address"
        set uuid 711443a0-a6cc-51ef-9a0c-0db7194a28d7
        set type dynamic
        set sub-type external-resource
        set comment "generic object IP Address"
        set obj-tag "ip_address"
        set tag-type "classification"
    next
end
# diagnose firewall dynamic list gen_obj_range_ip_address
CMDB name: gen_obj_range_ip_address
gen_obj_range_ip_address: ID(88)
        RANGE(172.16.200.1-172.16.200.254)
        RANGE(192.168.4.1-192.168.4.254)
Total IP dynamic range blocks: 2.
Total IP dynamic addresses: 508.
```

3. Check the matched MAC addresses:

```
# show firewall address gen_obj_range_mac_address
config firewall address
    edit "gen_obj_range_mac_address"
        set uuid 7114802c-a6cc-51ef-c4d3-c98a769ccf33
        set type dynamic
```

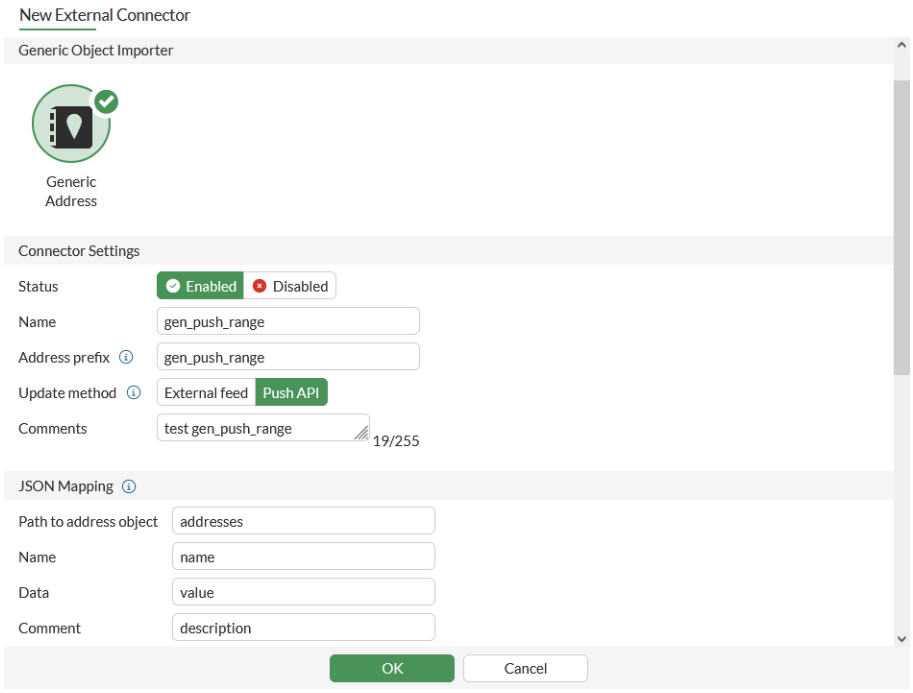
```
        set sub-type external-resource
        set comment "generic object MAC Address"
        set obj-tag "mac_address"
        set obj-type mac
        set tag-type "classification"
    next
end
# diagnose firewall dynamic list gen_obj_range_mac_address
CMDB name: gen_obj_range_mac_address
gen_obj_range_mac_address: ID(220)
        MAC(00:0c:29:1b:40:c9)
        MAC(00:0c:29:f6:0d:49)
        MAC(00:0c:29:63:40:09)
Total MAC dynamic addresses: 3.
```

Push API update method example

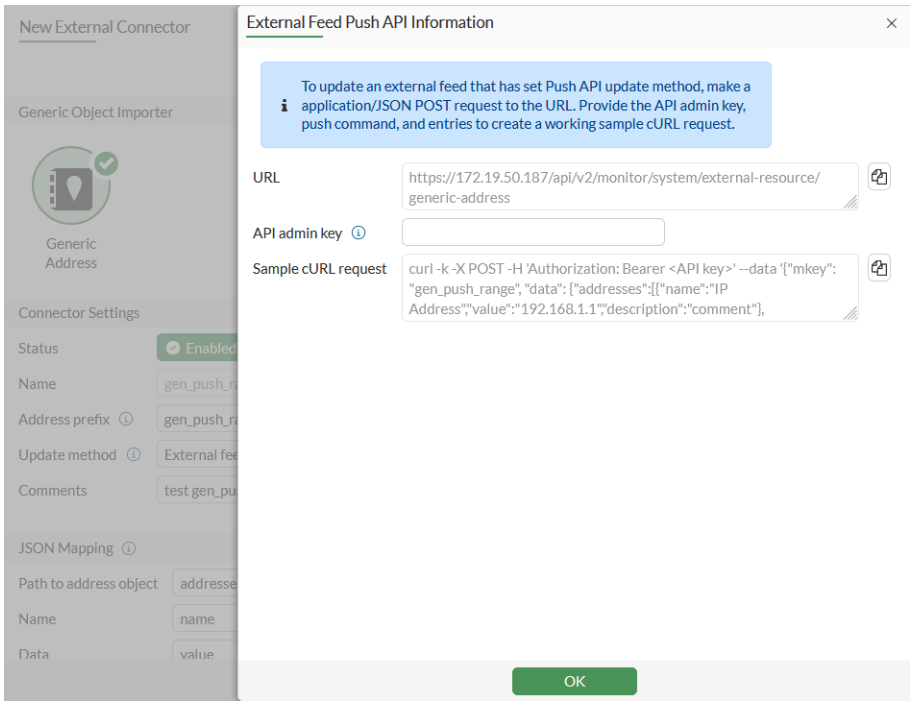
In this example, an external resource update is pushed to the FortiGate through the FortiGate's REST API. A Linux PC is connected to the FortiGate and used as the external resource.

To create and test a generic connector that uses the push API update method in the GUI:

1. On the FortiGate, go to *Security Fabric* > *External Connectors* and click *Create New*.
2. Enter a name for the connector, such as *gen_push_range*.
3. Set *Update method* to *Push API*.



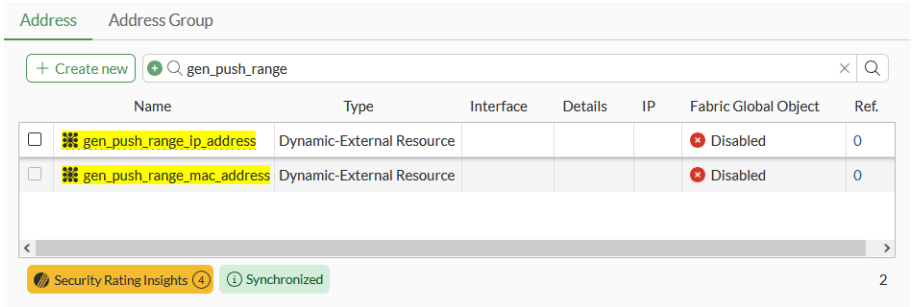
4. Click *OK*.
   The *External Feed Push API Information* pane opens.



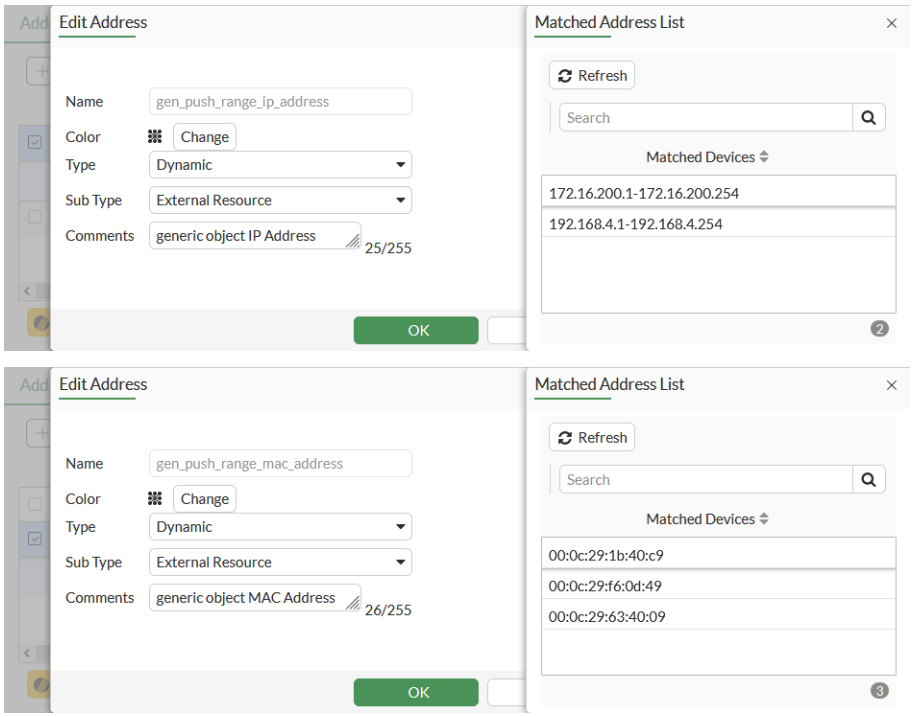
5. Copy the *Sample cURL request* and edit the entries, such as API key, IP Address, and son on.
   In this example, the cURL request is:

```
curl -k -X POST -H 'Authorization: Bearer xxxxxxxxxxx' --data '{"mkey": "gen_push_range",
"data": {"addresses":[{"name":"ip_address","value":["172.16.200.1-
172.16.200.254","192.168.4.1-192.168.4.254"],"description":"generic object IP Address"},
{"name":"mac_address","value":
["00:0c:29:1b:40:c9","00:0c:29:f6:0d:49","00:0c:29:63:40:09"],"description":"generic object
MAC Address"}]}}' "https://172.16.116.210:48182/api/v2/monitor/system/external-
resource/generic-address"
```

6. Send the JSON request to the FortiGate through the Linux PC.
   The connector imports the IP and MAC addresses and automatically creates address objects on the FortiGate. The address object names are a combination of the connector name and the name of the content, for example *gen_obj_push_ip_address*.



7. Edit the address object then select *View Matched Addresses* from the right side bar, or hover over the object name then select *View Matched Addresses* in the popup message.



To create and test a generic connector that uses the push API update method in the CLI:

1. Create the generic connector:

```
config system external-resource
    edit "gen_push_range"
        set type generic-address
        set namespace "gen_push_range"
        set update-method push
        set comments "test gen_push_range"
    next
end
```

2. Send the JSON request to the FortiGate through the Linux client used in this example.

```
curl -k -X POST -H 'Authorization: Bearer xxxxxxxxxxx' --data '{"mkey": "gen_push_range",
"data": {"addresses":[{"name":"ip_address","value":["172.16.200.1-
172.16.200.254","192.168.4.1-192.168.4.254"],"description":"generic object IP Address"},
{"name":"mac_address","value":
["00:0c:29:1b:40:c9","00:0c:29:f6:0d:49","00:0c:29:63:40:09"],"description":"generic object
MAC Address"}]}}' "https://172.16.116.210:48182/api/v2/monitor/system/external-
resource/generic-address"
```

3. Check the matched IP addresses:

```
# show firewall address gen_push_range_ip_address
config firewall address
    edit "gen_push_range_ip_address"
        set uuid b2012094-ac5e-51ef-354d-cd13120322c4
```

```
        set type dynamic
        set sub-type external-resource
        set comment "generic object IP Address"
        set obj-tag "ip_address"
        set tag-type "classification"
    next
end
# diagnose firewall dynamic list gen_push_range_ip_address
CMDB name: gen_push_range_ip_address
gen_push_range_ip_address: ID(254)
        RANGE(172.16.200.1-172.16.200.254)
        RANGE(192.168.4.1-192.168.4.254)
Total IP dynamic range blocks: 2.
Total IP dynamic addresses: 508.
```

4. Check the matched MAC addresses:

```
# show firewall address gen_push_range_mac_address
config firewall address
    edit "gen_push_range_mac_address"
        set uuid b2015c62-ac5e-51ef-75ef-8bc7586e5238
        set type dynamic
        set sub-type external-resource
        set comment "generic object MAC Address"
        set obj-tag "mac_address"
        set obj-type mac
        set tag-type "classification"
    next
end
# diagnose firewall dynamic list gen_push_range_mac_address
CMDB name: gen_push_range_mac_address
gen_push_range_mac_address: ID(98)
        MAC(00:0c:29:1b:40:c9)
        MAC(00:0c:29:f6:0d:49)
        MAC(00:0c:29:63:40:09)
Total MAC dynamic addresses: 3.
```

Troubleshooting

The following topics provide troubleshooting information for the Fortinet Security Fabric:

- Viewing a summary of all connected FortiGates in a Security Fabric on page 4116
- Diagnosing automation stitches on page 4118

Viewing a summary of all connected FortiGates in a Security Fabric

In downstream FortiGates, the `diagnose sys csf global` command shows a summary of all of the connected FortiGates in the Security Fabric.

To view a Security Fabric summary on a downstream FortiGate:

```
# diagnose sys csf global
Current vision:

Diagnosing automation stitches

Diagnose commands are available to:

- Test an automation stitch
- Enable or disable log dumping for automation stitches
- Display the settings of every automation stitch
- Display statistics on every automation stitch

To test an automation stitch:

```
diagnose automation test <automation-stitch-name>
```

Example:

```
# diagnose automation test HA-failover
automation test is done. stitch:HA-failover
```

To toggle log dumping:

```
diagnose test application autod 1
```

Examples:

```
# diagnose test application autod 1
autod log dumping is enabled
```

```
# diagnose test application autod 1
autod log dumping is disabled

autod logs dumping summary:
autod dumped total:7 logs, num of logids:4
```

To display the settings for all of the automation stitches:

```
diagnose test application autod 2
```

Example:

```
# diagnose test application autod 2
csf: enabled root:yes
total stitches activated: 3

stitch: Compromised-IP-Banned
        destinations: all
        trigger: Compromised-IP-Banned

       local hit: 0 relayed to: 0 relayed from: 0
        actions:
               Compromised-IP-Banned_ban-ip type:ban-ip interval:0

stitch: HA-failover
        destinations: HA-failover_ha-cluster_25;
        trigger: HA-failover

       local hit: 0 relayed to: 0 relayed from: 0
        actions:
```

```
               HA-failover_email type:email interval:0
               subject: HA Failover
               mailto:admin@example.com;

stitch: rebooot
       destinations: all
       trigger: reboot

       local hit: 0 relayed to: 0 relayed from: 0
       actions:
               action1 type:alicloud-function interval:0
                       delay:1 required:yes
                       Account ID: id
                       Region: region
                       Function domain: fc.aliyuncs.com

Log and Report

Logging and reporting are useful components to help you understand what is happening on your network, and to inform you about certain network activities, such as the detection of a virus, a visit to an invalid website, an intrusion, a failed log in attempt, and myriad others.

Logging records the traffic that passes through, starts from, or ends on the FortiGate, and records the actions the FortiGate took during the traffic scanning process. After this information is recorded in a log message, it is stored in a log file that is stored on a log device (a central storage location for log messages). FortiGate supports sending all log types to several log devices, including FortiAnalyzer, FortiAnalyzer Cloud, FortiGate Cloud, and syslog servers. Approximately 5% of memory is used for buffering logs sent to FortiAnalyzer. The FortiGate system memory and local disk can also be configured to store logs, so it is also considered a log device. See Log settings and targets on page 4138 for more information.

Reports show the recorded activity in a more readable format. A report gathers all the log information that it needs, then presents it in a graphical format with a customizable design and automatically generated charts showing what is happening on the network. Reports can be generated on FortiGate devices with disk logging and on FortiAnalyzer devices.

FortiView is a more comprehensive network reporting and monitoring tool. It integrates real-time and historical data into a single view in FortiOS. For more information, see FortiView monitors on page 142.

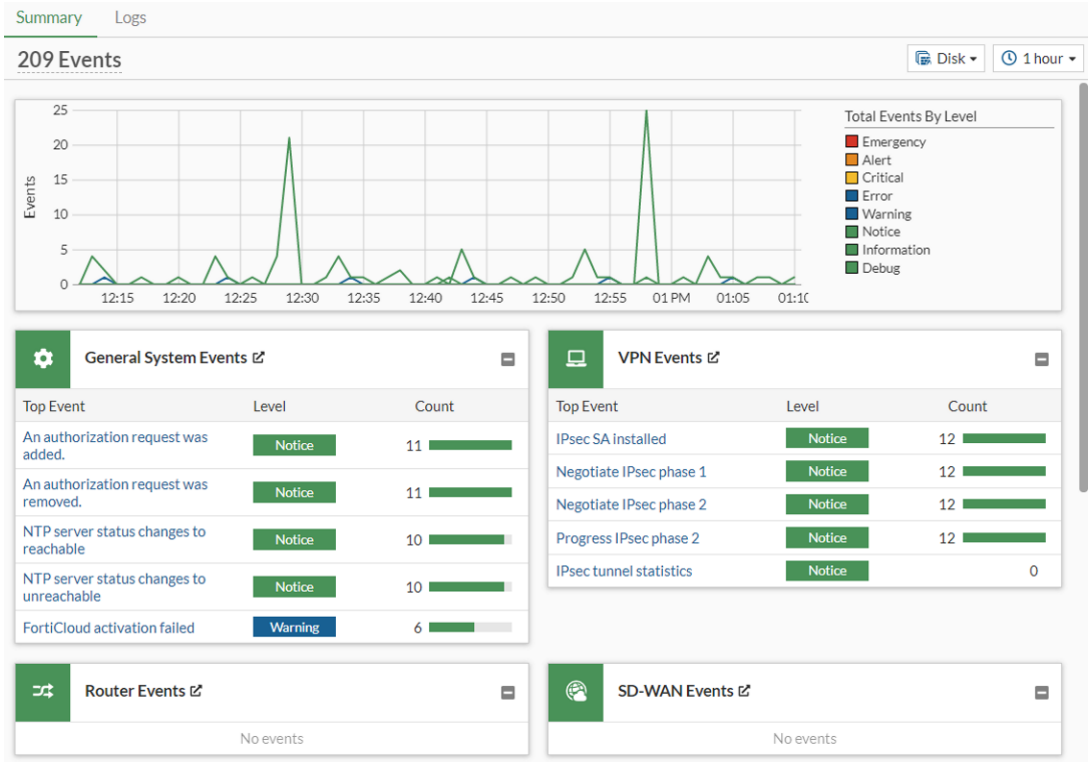
Performance statistics are not logged to disk. Performance statistics can be received by a syslog server or by FortiAnalyzer.

The following topics provide information about logging and reporting:

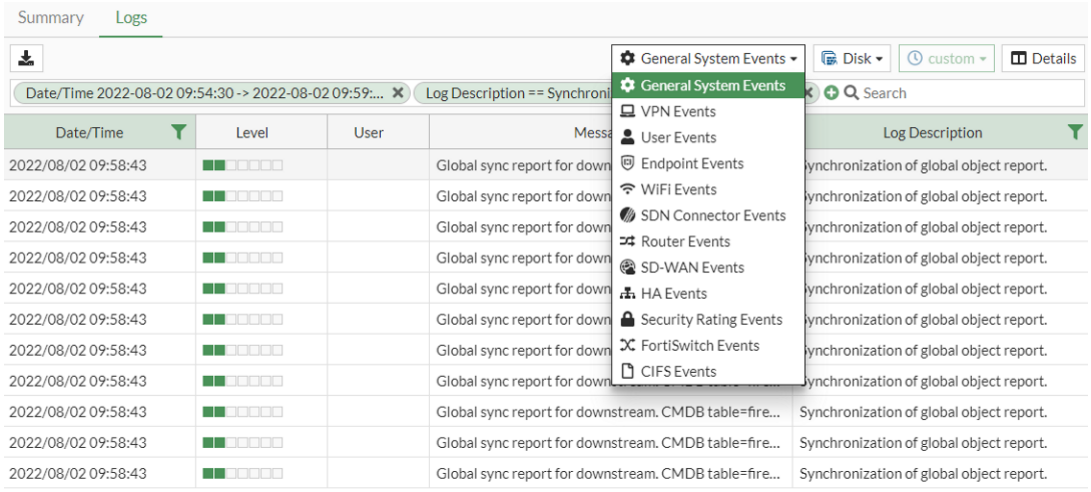
- Viewing event logs on page 4123
- System Events log page on page 4126
- Security Events log page on page 4131
- Reports page on page 4135
- Log settings and targets on page 4138
- Logging to FortiAnalyzer on page 4144
- Advanced and specialized logging on page 4155
- Sample logs by log type on page 4189
- Troubleshooting on page 4213

Viewing event logs

Event log subtypes are available on the *Log & Report > System Events* page. Not all of the event log subtypes are available by default. See System Events log page on page 4126 for more information.



When viewing event logs in the *Logs* tab, use the event log subtype dropdown list on the to navigate between event log types.



System Events	Always available.
Router Events	Always available.
VPN Events	Available when *VPN* is enabled in *System* > *Feature Visibility*.
SD-WAN Events	Always available.
User Events	Always available.

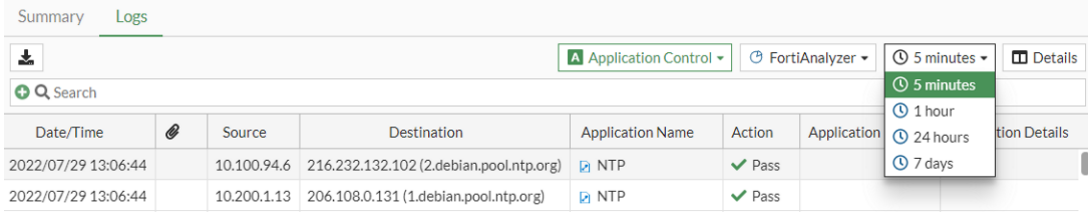
Endpoint Events	Available when *Endpoint Control* is enabled in *System > Feature Visibility*.
HA Events	Always available.
Security Rating Events	Always available, but logs are only generated when a Surface Attack Security Rating License is registered.
WAN Opt. & Cache Events	Available on devices with two hard disks by default. On devices with one hard disk, the disk usage must be set to `wanopt` and then *WAN Opt. & Cache* must be enabled in *System > Feature Visibility*.
WiFi Events	Available on hardware devices when *WiFi Controller* is enabled in *System > Feature Visibility*.
FortiExtender Events	Available when *FortiExtender* is enabled in *System > Feature Visibility*.
SDN Connector Events	Always available.
FortiSwitch Events	Available when *Switch Controller* is enabled in *System > Feature Visibility*.
CIFS Events	Always available.
REST API Events	Always available.

Logs can be filtered by date and time in the *Log & Report > System Events* page. The log viewer can be filtered with a custom range or with specific time frames.

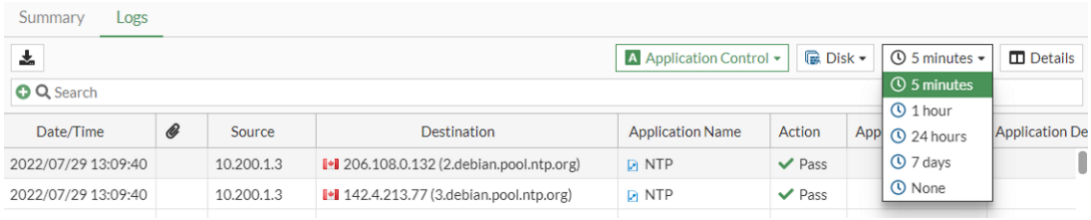
UTM logs can also be filtered by date and time in *Log & Report > Security Events*. See Security Events log page on page 4131.

The time frame available is dependent on the source:

- Logs sourced from FortiAnalyzer, FortiGate Cloud, and FortiAnalyzer Cloud have the same time frame options as FortiView (*5 minutes*, *1 hour*, *24 hours*, or *7 days*).

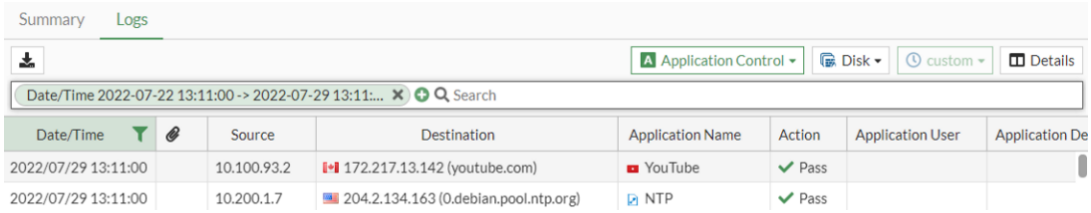


- Logs sourced from the Disk have the time frame options of *5 minutes*, *1 hour*, *24 hours*, *7 days*, or *None*.



- Logs source from Memory do not have time frame filters.

A custom time frame can be applied using the *Date/Time* filter. If the *Date/Time* filter is applied, the time frame will be disabled and set to *custom*.



Time frame settings for each *Log & Report* page are independent of each other. For example, if you change the time frame on the *System Events* page, the time frame will be different than that of the *Security Events* page unless it is also changed to match.

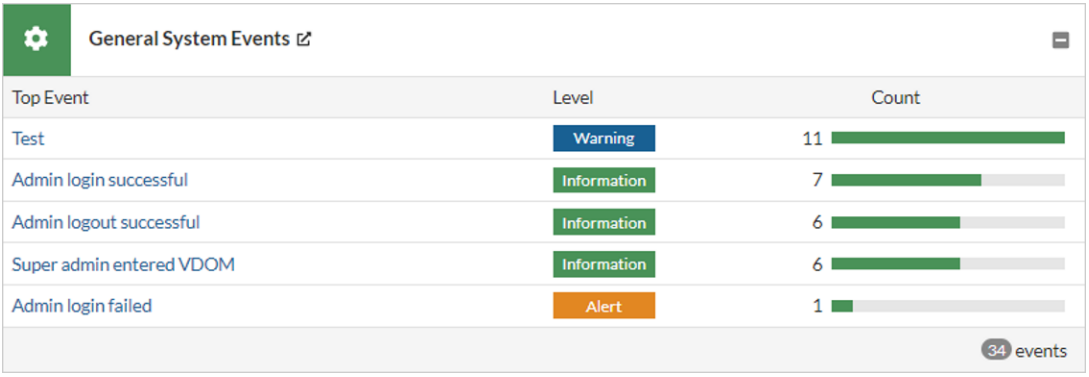
System Events log page

The *Log & Report* > *System Events* page includes:

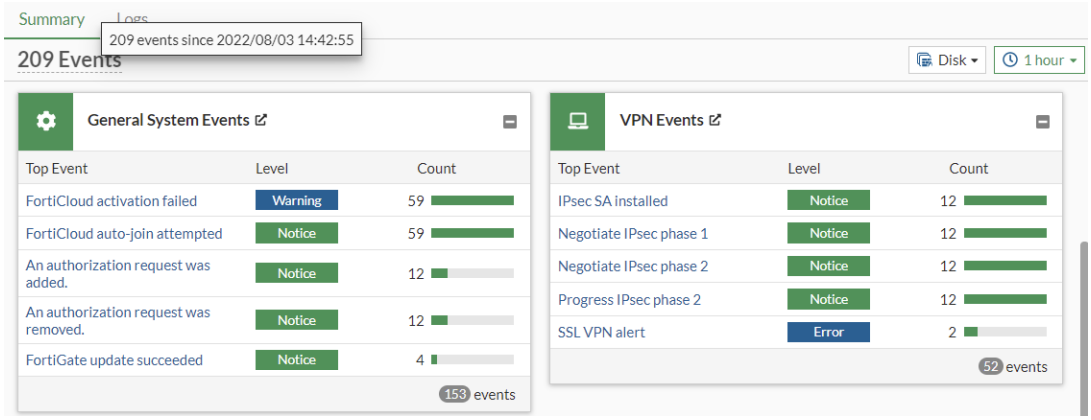
- A *Summary* tab that displays the top five most frequent events in each type of event log and a line chart to show aggregated events by each severity level. Clicking on a peak in the line chart will display the specific event count for the selected severity level.
- A *Logs* tab that displays individual, detailed log views for event type.

The *Summary* tab includes the following:

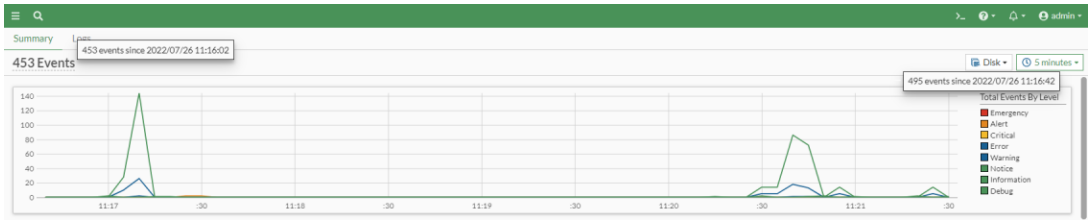
- Event list footers show a count of the events that relate to the type.



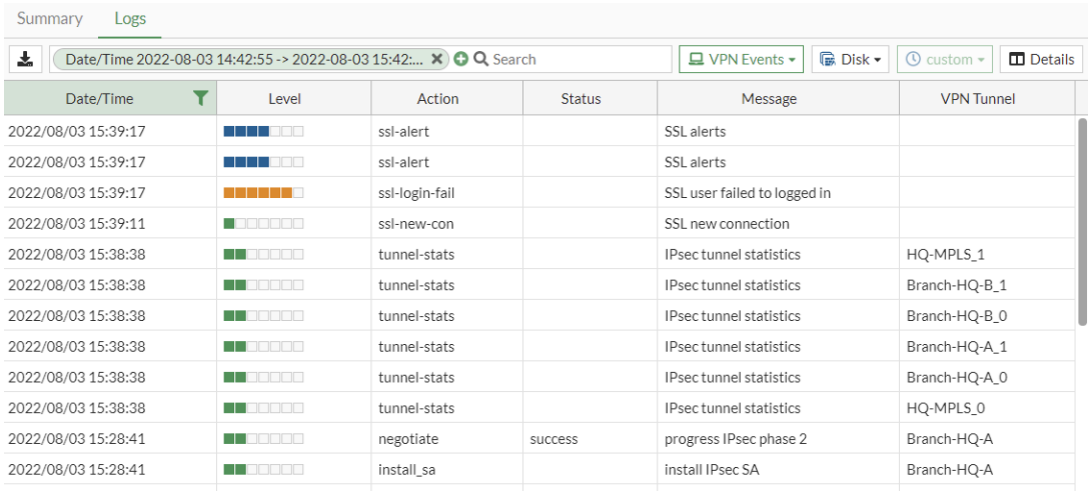
- A count of the total events is shown at the top of the *Summary*. Hovering over the count shows the number of events with a time stamp.



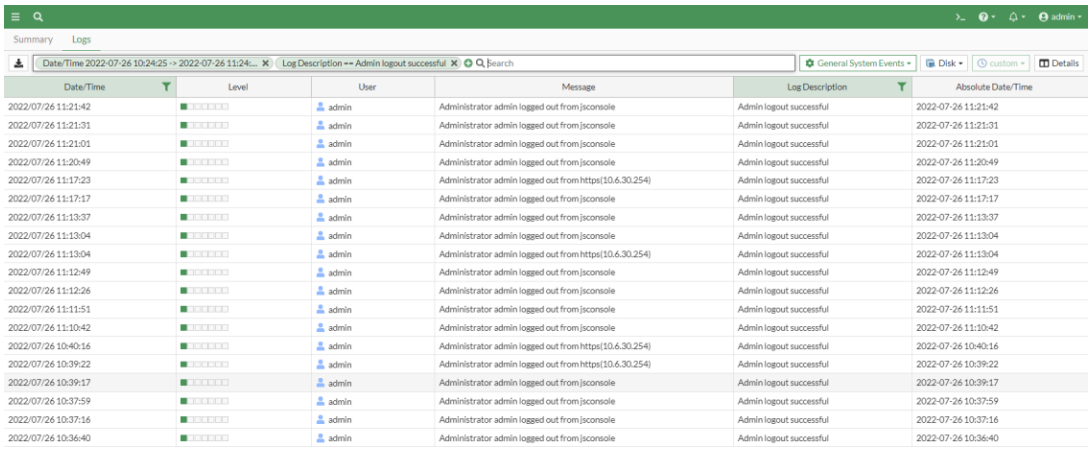
- Hovering over the *Total Events By Level* shows the shows the number of events with a time stamp.



- Clicking on any event type title opens the *Logs* page for that event type filtered by the selected time span.
  For example, clicking *VPN Events* opens the following page:



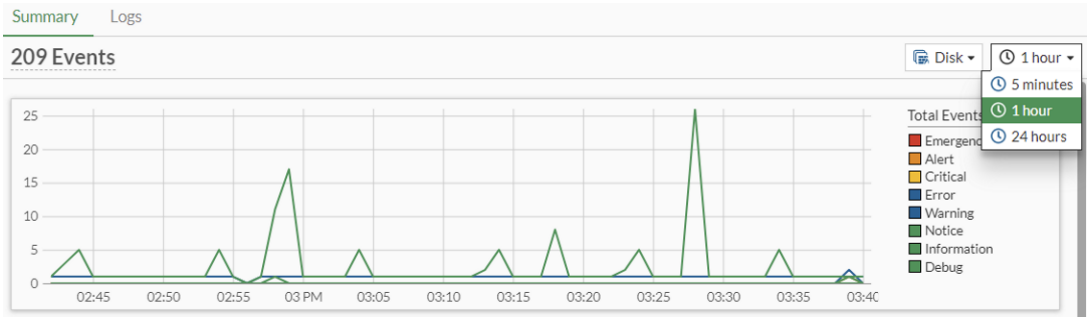
- Clicking on any event entry opens the *Logs* page for that event type filtered by the selected time span and log description.
  For example, in the *General System Events* box, clicking *Admin logout successful* opens the following page:



Disk logging and historical FortiView must be enabled for the *Summary* tab to display valid data. See Log settings and targets on page 4138 for more information.

A FortiOS Event Log trigger can be created using the shortcut on any *Logs* tab. Select a log, then right-click and select *Create Automation Trigger*. See System Events page shortcut on page 3904 for more information.

A time frame can be selected from the dropdown.



The line chart will display all of the system events, and the non-empty event cards will list up to five *Top Event* entries within the time frame set.

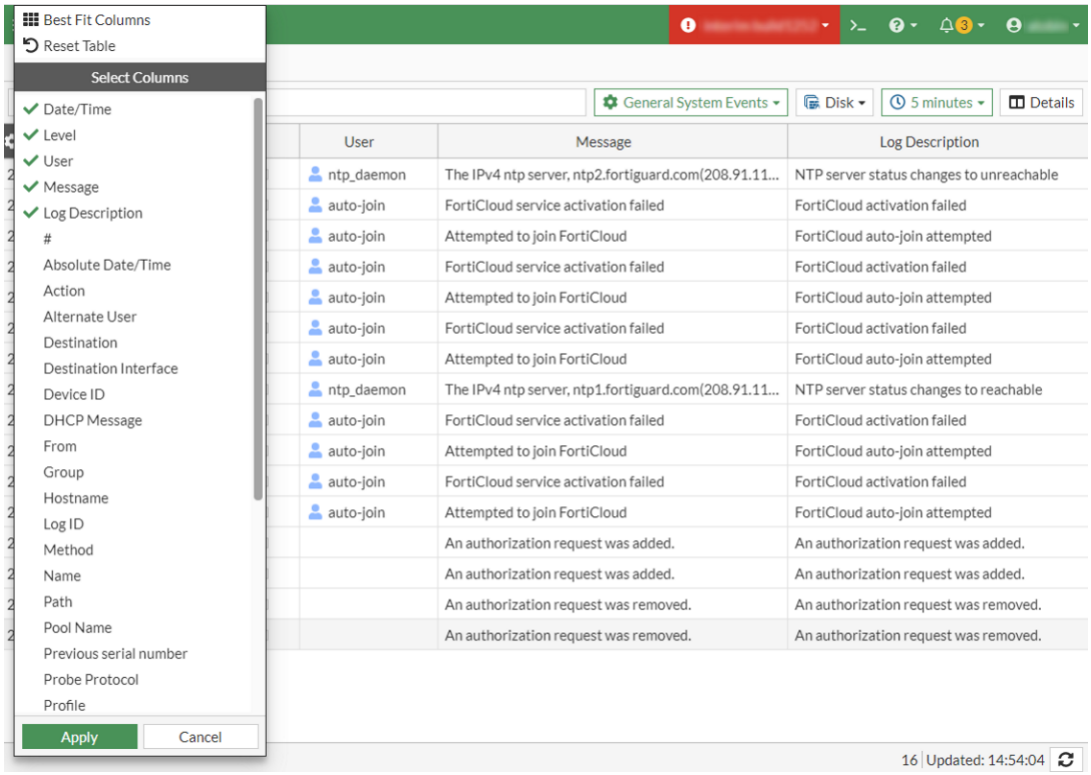
Data is retrieved from FortiView with the *5 minutes* range updated first. When selecting either the *1 hour* or *24 hours* time range, there may be a delay to update *Top Event* entries.

Up to 100 *Top Event* entries can be listed in the CLI using the `diagnose fortiview result event-log` command.

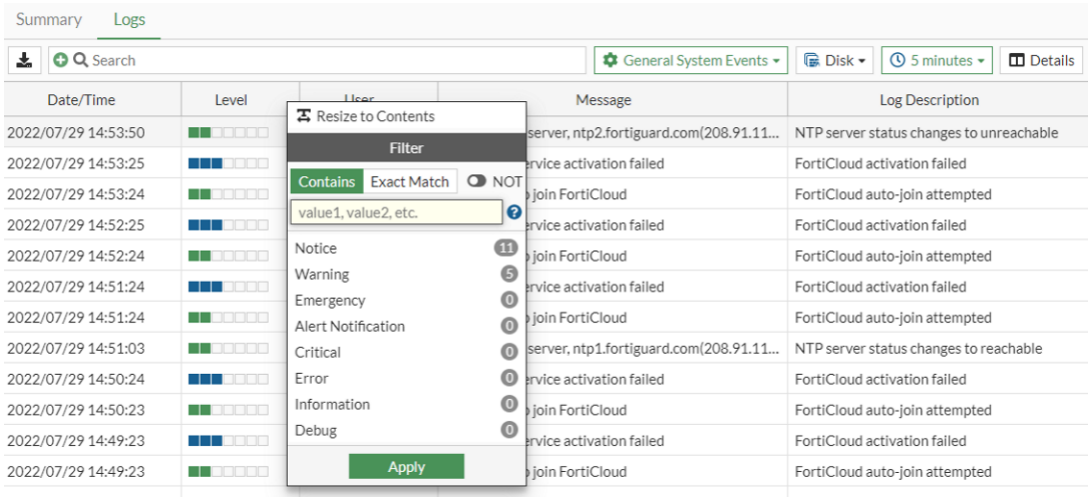
To view filtered log information:

1. Go to *Log & Report* > *System Events*.
2. Select the *Logs* tab.

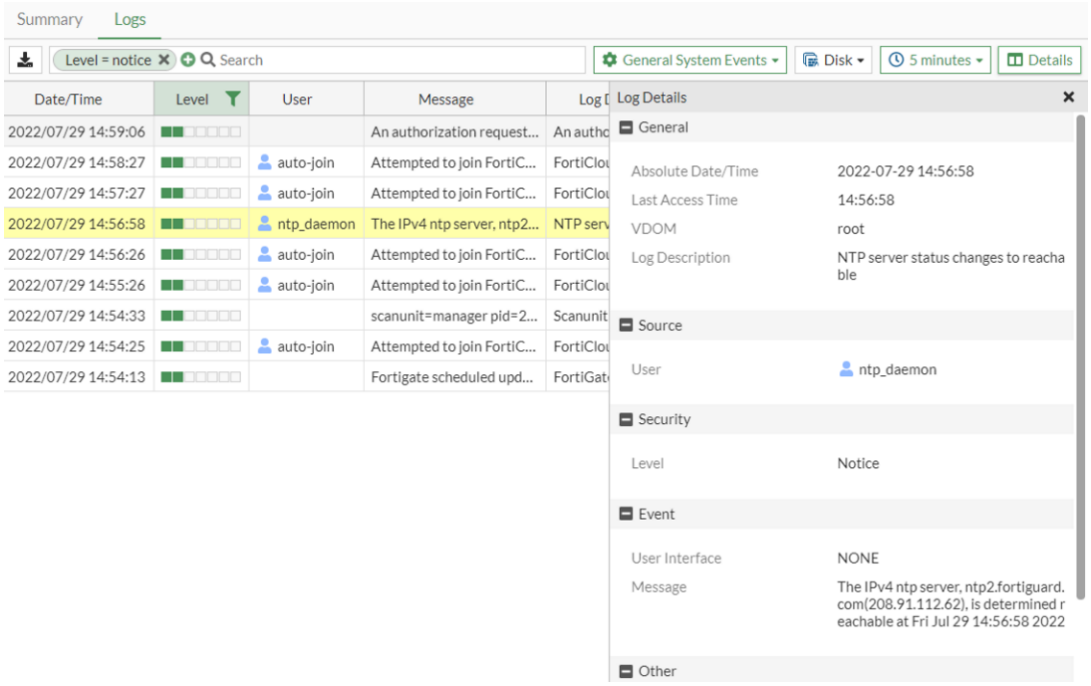
3. Hover over the leftmost column and click the gear icon. A list of column you can filter is displayed.



4. Select the columns you want displayed.
5. Click *Apply*. The selected columns are displayed.
6. Click the filter icon for the column you want to filter. The filter dialog is displayed and the number of logs for each filter type is listed.



7. Select the filters you want and click *Apply*. The logs that match the set filters are displayed and the filter is listed in the search bar.
8. Select the log you want to see more information on.
9. Click *Details*. The *Log Details* pane is displayed.



To list system events in the CLI:

```
# diagnose fortiview result event-log

    data(1646760000-1646846401):
    0). subtype-ha | eventname-HA device interface failed | level-warning | count-1 |
    1). subtype-system | eventname-DHCP statistics | level-information | count-40 |
    2). subtype-system | eventname-Super admin left VDOM | level-information | count-13 |
    3). subtype-system | eventname-Admin performed an action from GUI | level-warning | count-5 |
    4). subtype-system | eventname-Super admin entered VDOM | level-information | count-4 |
    5). subtype-system | eventname-Global setting changed | level-notice | count-3 |
    6). subtype-system | eventname-Attribute configured | level-information | count-2 |
    7). subtype-system | eventname-Clear active sessions | level-warning | count-2 |
    8). subtype-system | eventname-Disk log rolled | level-notice | count-2 |
    9). subtype-system | eventname-Log rotation requested by FortiCron | level-notice | count-1 |
    10). subtype-system | eventname-Report generated successfully | level-notice | count-1 |
    11). subtype-system | eventname-Test | level-warning | count-1 |
    12). subtype-system | eventname-VDOM added | level-notice | count-1 |
    13). subtype-user | eventname-Authentication failed | level-notice | count-1 |
    14). subtype-user | eventname-Authentication lockout | level-warning | count-1 |
    15). subtype-user | eventname-FortiGuard override failed | level-warning | count-1 |
```

The data is collected from FortiView for the last 24 hours by default. To specify a specific time range, customize the time filter using the `diagnose fortiview time` command.

To filter the time range of system events in the CLI:

```
# diagnose fortiview time <arg1> <arg2>
```

Where <arg1> is the start time in YYYY-MM-DD HH:MM:SS and <arg2> is the end time in YYYY-MM-DD HH:MM:SS.

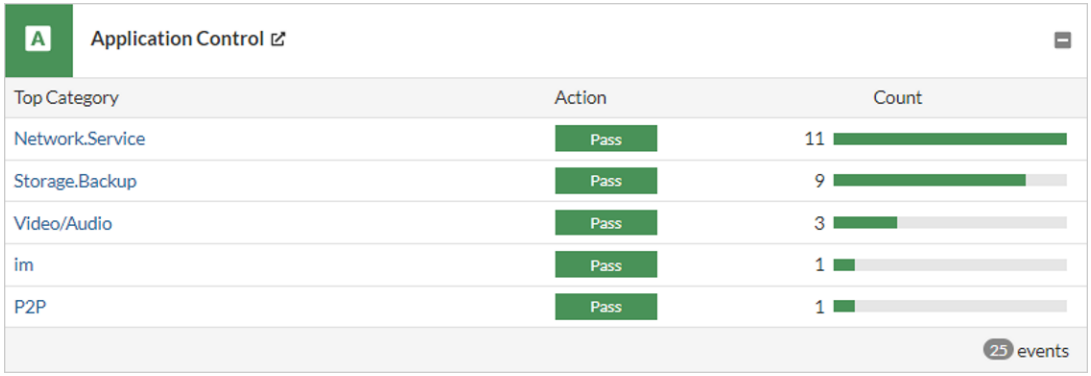
Security Events log page

The *Log & Report > Security Events* log page includes:

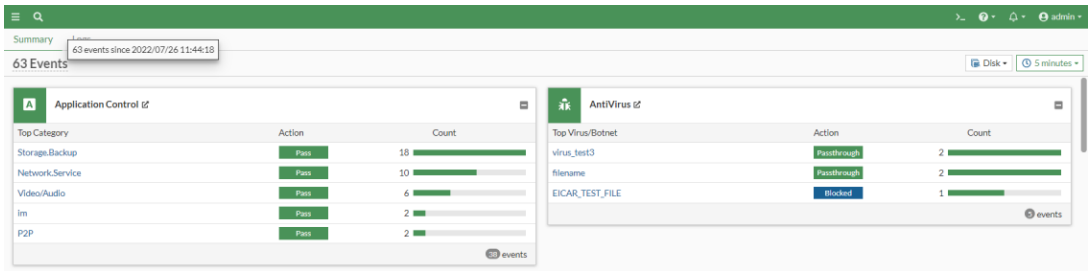
- A *Summary* tab that displays the five most frequent events for all of the enabled UTM security events.
- A *Logs* tab that displays individual, detailed logs for each UTM type.

The *Summary* tab includes the following:

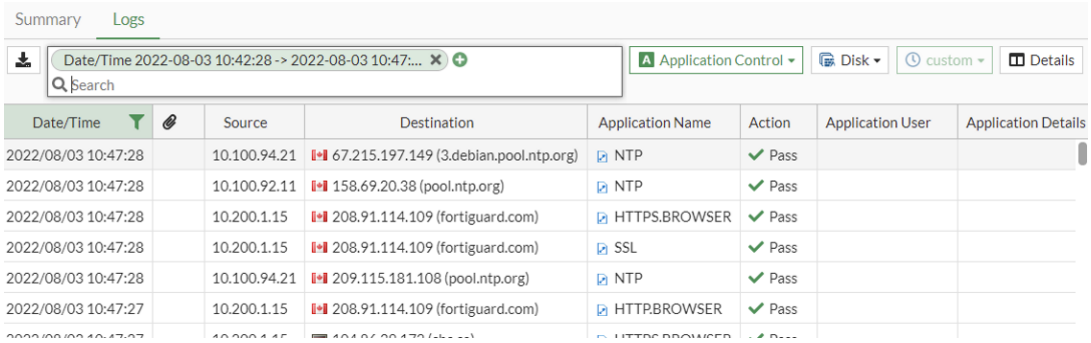
- Event list footers show a count of the events that relate to the type.



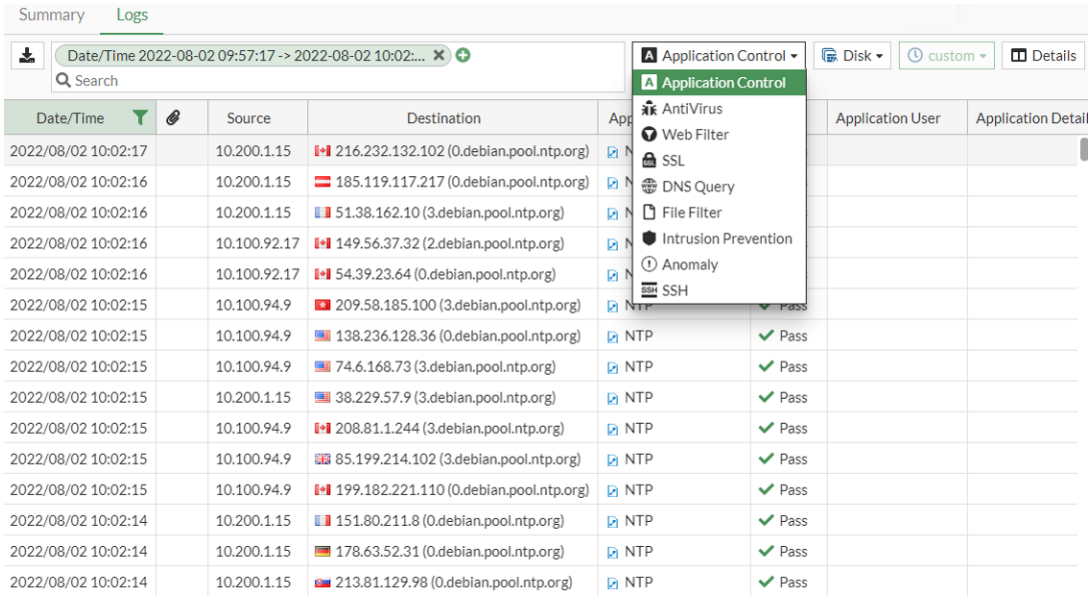
- A count of the total events is shown at the top of the *Summary*. Hovering over the count shows the number of events with a time stamp.



- Clicking on any event type title opens the *Logs* page for that event type filtered by the selected time span. For example, clicking *Application Control* opens the following page:

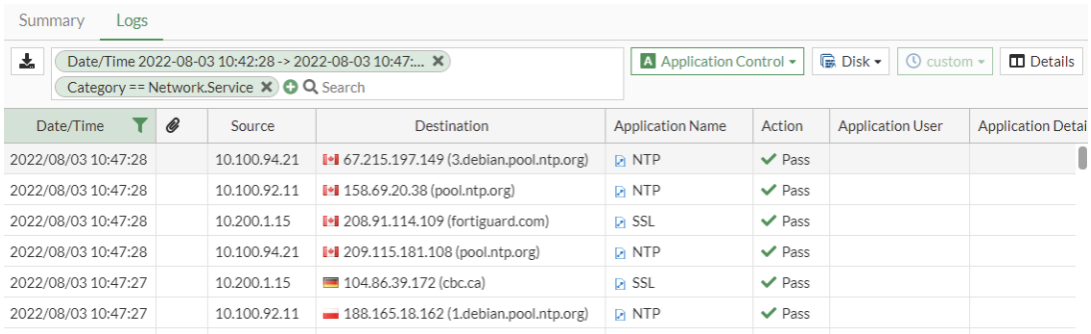


The security event type can be changed in the top-right dropdown list.



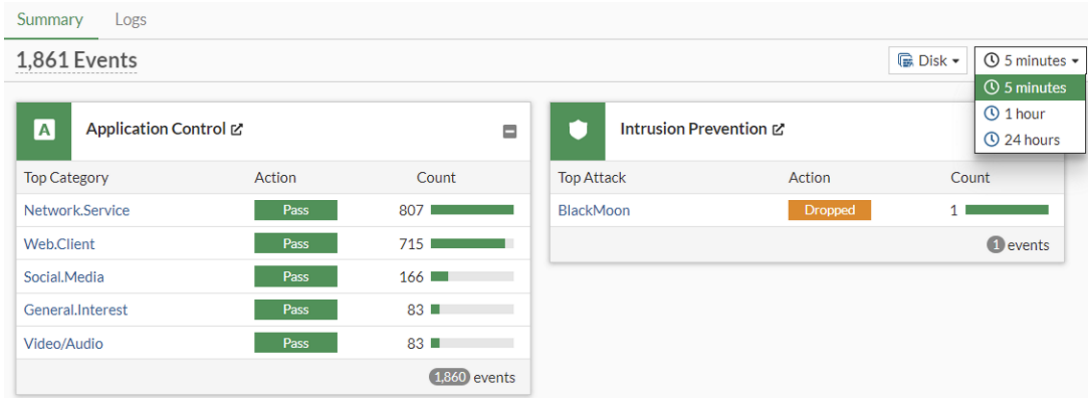
- Clicking on any event entry opens the *Logs* page for that event type filtered by the selected time span and log description.

  For example, in the *Application Control* box, clicking *Network.Service* opens the following page:



Disk logging and historical FortiView must be enabled for the *Summary* tab to display valid data. See Log settings and targets on page 4138 for more information.

A time frame can be selected from the dropdown.



The non-empty security event cards will list up to five top entries within the time range set.

Data is retrieved from FortiView with the *5 minutes* range updated first. When selecting either the *1 hour* or *24 hours* time range, there may be a delay to update top security event entries. Logs sourced from the Disk have different time frames available for filtering. See Viewing event logs on page 4123.

Up to 100 top security event entries can be listed in the CLI using the `diagnose fortiview result security-log` command.

To list security events in the CLI:

```
# diagnose fortiview result security-log [<filters>]
```

To list security events in the CLI with no filters applied:

```
# diagnose fortiview result security-log

Reports page

The *Log & Report* > *Reports* page consolidates FortiAnalyzer, FortiGate Cloud, and Local log reports. Administrators can generate, delete, and edit report schedules, and view and download generated reports. The *Reports* page is organized into dedicated tabs:

- FortiAnalyzer on page 4135
- FortiGate Cloud on page 4137
- Local on page 4137

FortiAnalyzer

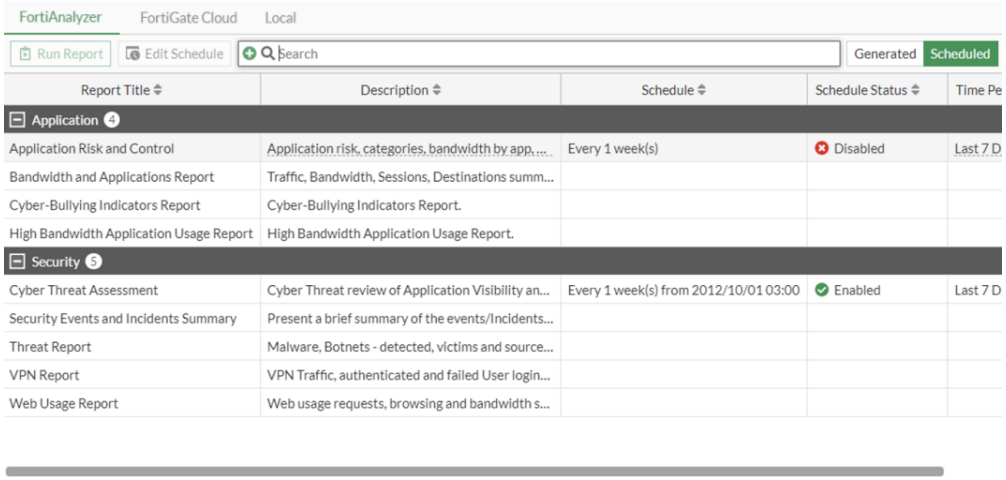
FortiAnalyzer reports can be viewed in the *FortiAnalyzer* tab.

FortiAnalyzer must be configured in FortiOS. If the FortiGate is unauthorized on FortiAnalyzer, or the connection to FortiAnalyzer is down, the *FortiAnalyzer* tab loads with *No results*.

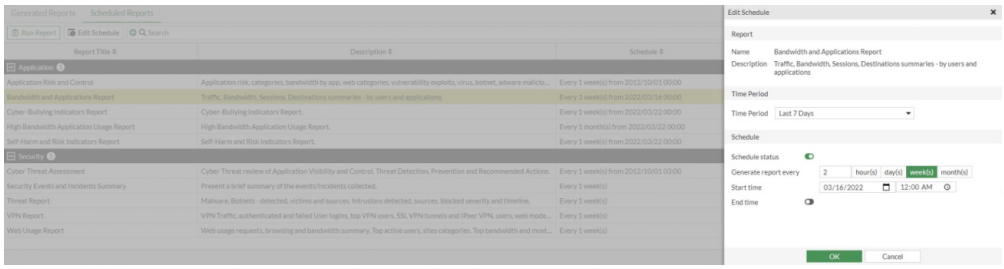
When the Security Fabric is enabled, only the root FortiGate can run, edit, and delete FortiAnalyzer reports. Downstream FortiGates can only view the generated reports.

To edit a report schedule:

1. Go to *Log & Report* > *Reports* and select the *FortiAnalyzer* tab.
2. Select *Scheduled*.

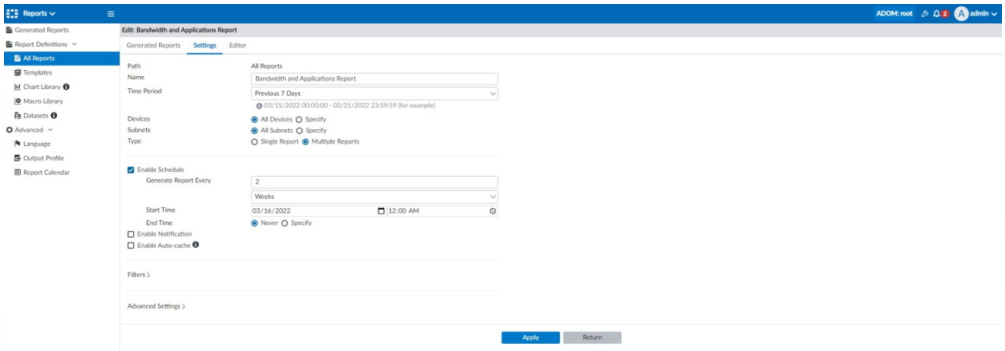


3. Select a report and click *Edit Schedule*. The *Edit Schedule* pane opens. In this example, the schedule for the Bandwidth and Applications report is changed to run from every week to every two weeks.
4. In the *Schedule* section, set the values for *Generate report every* to *2 week(s)*.



5. Click *OK*.

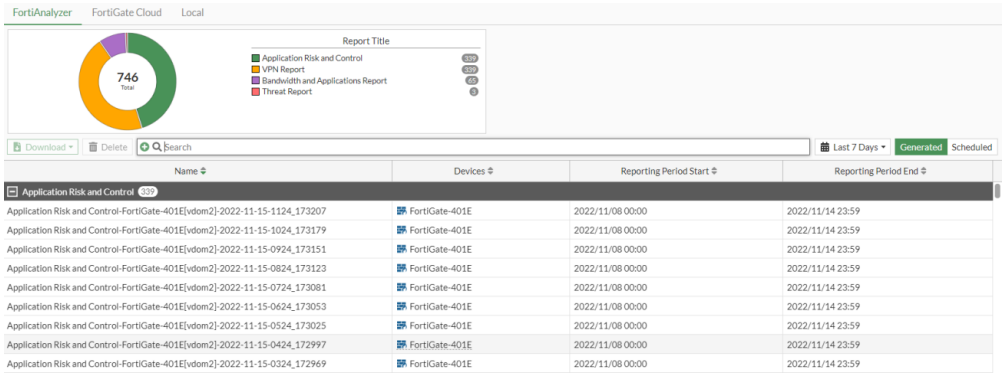
   The schedule is also updated automatically in FortiAnalyzer for the same report (go to *Reports* > *Report Definitions* > *All Reports* and edit the report to view the settings).



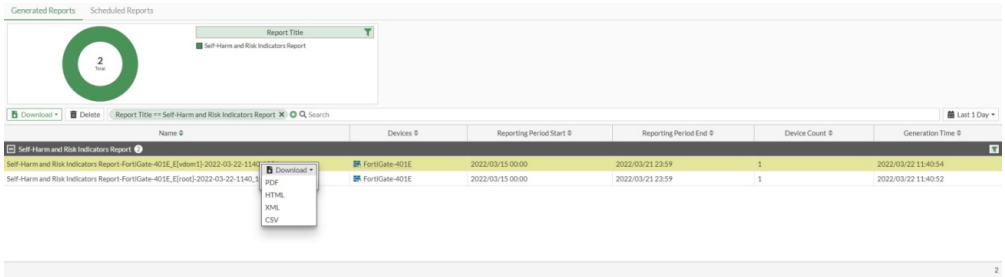
To view and download reports:

1. Go to *Log & Report* > *Reports* and select the *FortiAnalyzer* tab.

   A pie chart displays the total count of FortiAnalyzer reports, categorized by report title. Generated reports are listed below and arranged by title, which includes reports from all VDOMs.



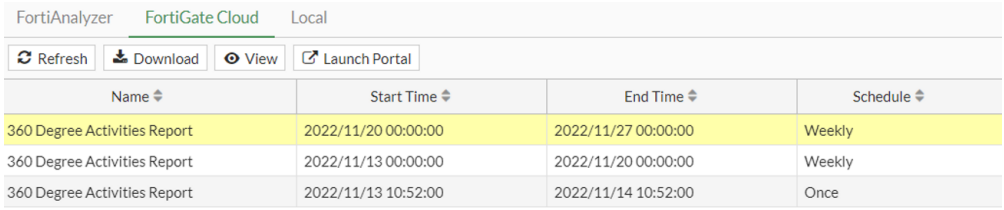
2. In the pie chart, click the a segment to filter reports.
3. In the filtered results, select the report. Right-click and select *Download*.



4. Select a file format. The report is saved to the default download location.

FortiGate Cloud

Reports can be viewed and downloaded from the *FortiGate Cloud* tab. Select *Refresh* to regenerate the available reports.



To download a report:

1. Go to *Log & Report* > *Reports* and select the *FortiGate Cloud* tab.
2. Select the report.
3. Click *Download*. The report is saved to the default download location.

To view a report:

1. Go to *Log & Report* > *Reports* and select the *FortiGate Cloud* tab.
2. Select the report.
3. Click *View*. The report is displayed.

You can launch the FortiGate Cloud portal from the *FortiGate Cloud* tab.

To launch the FortiGate Cloud portal:

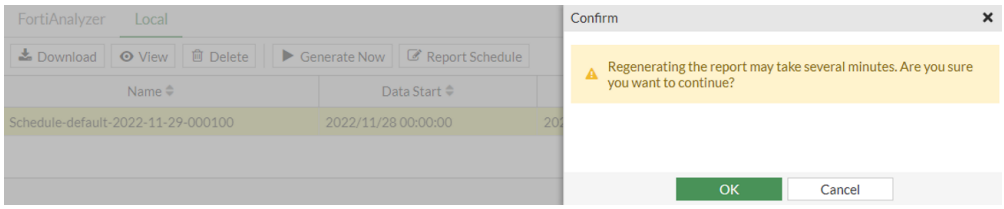
1. Go to *Log & Report* > *Reports* and select the *FortiGate Cloud* tab.
2. Select *Launch Portal*. The FortiGate Cloud landing page opens.

Local

Reports can be generated, scheduled, viewed, and downloaded in the *Local* tab.

To generate a report:

1. Go to *Log & Report* > *Reports* and select the *Local* tab.
2. Select *Generate Now*. The *Confirm* pane opens.



3. Click *OK*.

To view a report:

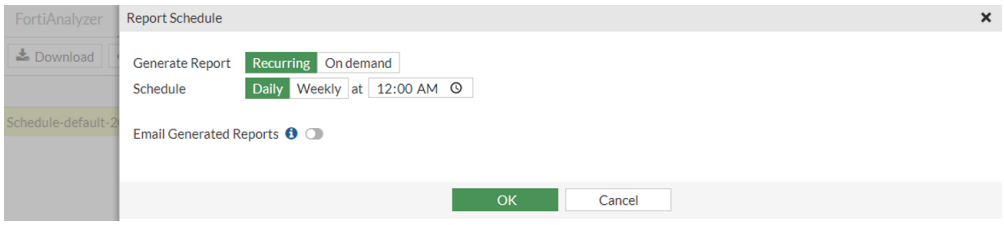
1. Go to *Log & Report* > *Reports* and select the *Local* tab.
2. Select the report.
3. Click *View*. The report is displayed.

To download a report:

1. Go to *Log & Report* > *Reports* and select the *Local* tab.
2. Select the report.
3. Click *Download*. The report is saved to the default download location.

To schedule reports:

1. Go to *Log & Report* > *Reports* and select the *Local* tab.
2. Click *Report Schedule*. The *Report Schedule* pane opens.



3. Set the schedule details.
4. Click *OK*.

Log settings and targets

Log settings determine what information is recorded in logs, where the logs are stored, and how often storage occurs. Log settings can be configured in the GUI and CLI. In the GUI, *Log & Report* > *Log Settings* provides the settings for local and remote logging.

Log & Report > *Log Settings* is organized into tabs:

- Global Settings on page 4139
- Local Logs on page 4139
- Threat Weight on page 4140

Global Settings

Settings available in the *Global Settings* tab include:

UUIDs in Traffic Log		
	Policy	Define the use of policy UUIDs in traffic logs: • *Enable*: Policy UUIDs are stored in traffic logs. UUIDs can be matched for each source and destination that match a policy in the traffic log. See Source and destination UUID logging on page 4159 for more information. • *Disable*: Policy UUIDs are excluded from the traffic logs.
	Address	Define the use of address UUIDs in traffic logs: • *Enable*: Address UUIDs are stored in traffic logs. When viewing *Forward Traffic* logs, a filter is automatically set based on UUID. • *Disable*: Address UUIDs are excluded from traffic logs.
Log Settings		
	Event Logging	Define the allowed set of event logs to be recorded: • *All*: All event logs will be recorded. • *Customize*: Select specific event log types to be recorded. Deselect all options to disable event logging.
	Local Traffic Logging	Define the allowed set of traffic logs to be recorded: • *All*: All traffic logs to and from the FortiGate will be recorded. • *Specify*: Select specific traffic logs to be recorded. Deselect all options to disable traffic logging. Local traffic logging is disabled by default due to the high volume of logs generated. Enable *Log local-in traffic* to log local traffic for local-in policies globally or per policy. See Local-in policy on page 1605.
GUI Preferences		
	Resolve Hostnames	Define the translation of IP addresses to host names: • *Enable*: IP addresses are translated to host names using reverse DNS lookup. If the DNS server is not available or is slow to reply, requests may time out. • *Disable*: IP addresses are not translated to host names.
	Resolve Unknown Applications	Define the resolution of unknown applications: • *Enable*: Unknown applications are resolved using the Internet Service Database. • *Disable*: Unknown applications are not resolved.

Local Logs

Settings available in the *Local Logs* tab include:

Local Logs	
Disk logging	Define local log storage on the FortiGate: • *Enable*: Logs will be stored on a local disk. Local disk logging is not available in the GUI if the Security Fabric is enabled. When the Security Fabric is enabled, disk logging can still be configured on the root FortiGate in the CLI but is not available for downstream FortiGates. • *Disable*: Logs will be stored remotely to FortiAnalyzer/FortiManager or to a Cloud logging device.
Local Reports	Define log reporting on the FortiGate: • *Enable*: Local reports will be available on the FortiGate. Reports can be reviewed in *Log & Report > Reports* in the *Local* tab. • *Disable*: Local reports will not be available on the FortiGate.
Historical FortiView	Define the presentation of log information on FortiView: • *Enable*: Historical log data will be available on a FortiView monitor. By default, logs older than seven days are deleted. Disk logging must be enabled. • *Disable*: Historical log data will not be available on FortiView.
Disk Usage	Presents the disk space used and the total disk space available on the disk.

Threat Weight

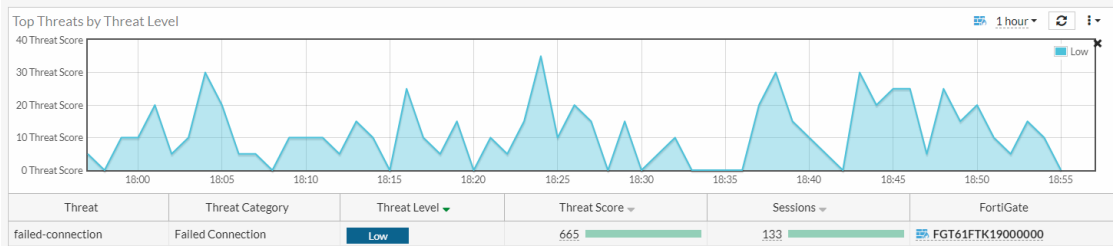
Threat weight helps aggregate and score threats based on user-defined severity levels. It adds several fields such as threat level (`crlevel`), threat score (`crscore`), and threat type (`craction`) to traffic logs. Threat weight logging is enabled by default and the settings can be customized. Threats can be viewed from the *Top Threats* FortiView dashboard.

To configure threat weight settings:

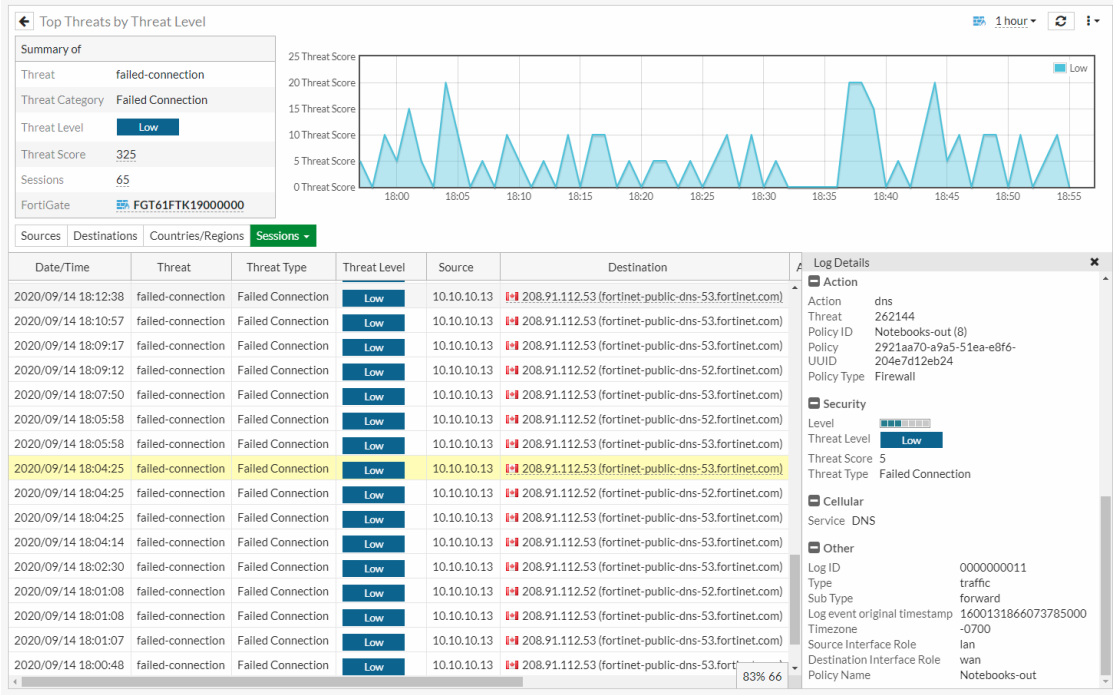
1. Go to *Log & Report > Log Settings* and select the *Threat Weight* tab.
2. Adjust the settings as needed, such as individual weights per threat type and risk level values.
3. Click *Apply*.

To add the Top Threats monitor to the dashboard:

1. In the tree menu, click *Dashboard* and in the FortiView section, click the + sign (*Add Monitor*).
2. In the *Security* section, enable *Show More* and click *Top Threats*.
3. Configure the settings as needed.
4. Click *Add Monitor*.
5. Go to *Dashboard > Top Threats*. The *Top Threats* monitor displays threats based on the scores in the traffic logs.



6. Double-click a threat to view the summary.
7. Click *Sources*, *Destinations*, *Countries/Regions*, or *Sessions* to view more information. Double-click an entry to view the log details.



Configuring logs in the CLI

The FortiGate can store logs locally to its system memory or a local disk. Logs can also be stored externally on a storage device, such as FortiAnalyzer, FortiAnalyzer Cloud, FortiGate Cloud, or a syslog server.

Disk logging

Disk logging must be enabled for logs to be stored locally on the FortiGate. By default, logs older than seven days are deleted from the disk. Log age can be configured in the CLI. Approximately 75% of disk space is available for log storage. Log storage space can be determined using the `diagnose sys logdisk usage` command.

To configure local disk logging:

```
config log disk setting
    set status enable
    set maximum-log-age <integer>
    set max-log-file-size <integer>
end
```

Remote logging

The process to configure FortiGate to send logs to FortiAnalyzer or FortiManager is identical. Remote logging to FortiAnalyzer and FortiManager can be configured using both the GUI and CLI. When using the CLI, use the `config log fortianalyzer setting` command for both FortiAnalyzer and FortiManager.

If VDOMs are configured on the FortiGate, multiple FortiAnalyzers and syslog servers can be added globally. See Configuring multiple FortiAnalyzers (or syslog servers) per VDOM on page 4147 and Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode on page 4148 for more information.

To configure remote logging to FortiAnalyzer:

```
config log fortianalyzer setting
    set status enable
    set server <server_IP>
    set upload option {store-and-upload | realtime | 1-minute | 5-minute}
end
```

Remote logging can also be configured to FortiCloud, FortiSIEM, and syslog servers. Up to four syslog servers or FortiSIEM devices can be configured using the `config log syslogd` command and can send logs to syslog in CSV and CEF formats.

To configure remote logging to FortiCloud:

```
config log fortiguard setting
    set status enable
    set source-ip <source IP used to connect FortiCloud>
end
```

To configure remote logging to a syslog server:

```
config log syslogd setting
    set status enable
    set server <syslog_IP>
    set format {default | csv | cef | rfc5424 | json}
end
```

Log filters

Log filter settings can be configured to determine which logs are recorded to the FortiAnalyzer, FortiManager, and syslog servers. This allows certain logging levels and types of logs to be directed to specific log devices.

To configure log filters for FortiAnalyzer:

```
config log fortianalyzer filter
    set severity <level>
    set forward-traffic {enable | disable}
    set local-traffic {enable | disable}
    set multicast-traffic {enable | disable}
    set sniffer-traffic {enable | disable}
end
```

To configure log filters for a syslog server:

```
config log syslogd filter
    set severity <level>
    set forward-traffic {enable | disable}
    set local-traffic {enable | disable}
    set multicast-traffic {enable | disable}
    set sniffer-traffic {enable | disable}
end
```

Email alerts

FortiGate events can be monitored at all times using email alerts. Email alerts send notifications to up to three recipients and can be triggered based on log event and severity level. Email alerts will be sent every five minutes by default but this can be configured in the CLI.

To configure email alerts:

```
config alertemail setting
    set username <name>
    set mailto1 <email>
    set filter-mode {category | threshold}
    set email-interval <integer>
    set IPS-logs {enable | disable}
    set HA-logs {enable | disable}
    set antivirus-logs {enable | disable}
    set webfilter-logs {enable | disable}
    set log-disk-usage-warning {enable | disable}
end
```

Logging to FortiAnalyzer

The following topics provide instructions on logging to FortiAnalyzer:

- FortiAnalyzer log caching on page 4144
- Configuring multiple FortiAnalyzers (or syslog servers) per VDOM on page 4147
- Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode on page 4148
- Switching to an alternate FortiAnalyzer if the main FortiAnalyzer is unavailable on page 4152

FortiAnalyzer log caching

Reliable logging to FortiAnalyzer prevents lost logs when the connection between FortiOS and FortiAnalyzer is disrupted. When reliable mode is enabled:

1. Logs are cached in a FortiOS memory queue.
2. FortiOS sends logs to FortiAnalyzer, and FortiAnalyzer uses `seq_no` to track received logs.
3. After FortiOS sends logs to FortiAnalyzer, logs are moved to a confirm queue in FortiOS.
4. FortiOS periodically queries FortiAnalyzer for the latest `seq_no` of the last log received, and clears logs from the confirm queue up to the `seq_no`.
5. If the connection between FortiOS and FortiAnalyzer is disrupted, FortiOS resends the logs in the confirm queue to FortiAnalyzer when the connection is reestablished.

FortiAnalyzer 7.2.0 and later is required.

To enable reliable mode:

```
config log fortianalyzer setting
    set reliable enable
end
```

To view the memory and confirm queues:

1. Verify that log synchronization is enabled for FortiAnalyzer:

```
# diagnose test application fgtlogd 1
vdom-admin=0
mgmt=root

fortilog:
faz: global , enabled
    server=172.16.200.251, realtime=1, ssl=1, state=connected
    server_log_status=Log is allowed.,
    src=, mgmt_name=FGh_Log_root_172.16.200.251, reliable=1, sni_prefix_type=none,
```

```
    required_entitlement=none, region=ca-west-1,,
    logsync_enabled:1, logsync_conn_id:65535, seq_no:790
...
```

2. When a network disruption disconnects FortiOS from FortiAnalyzer and FortiOS continues to generate logs, the logs are cached in the memory queue.
   - View the number of logs in the cache and queue:

```
# diagnose test application fgtlogd 41

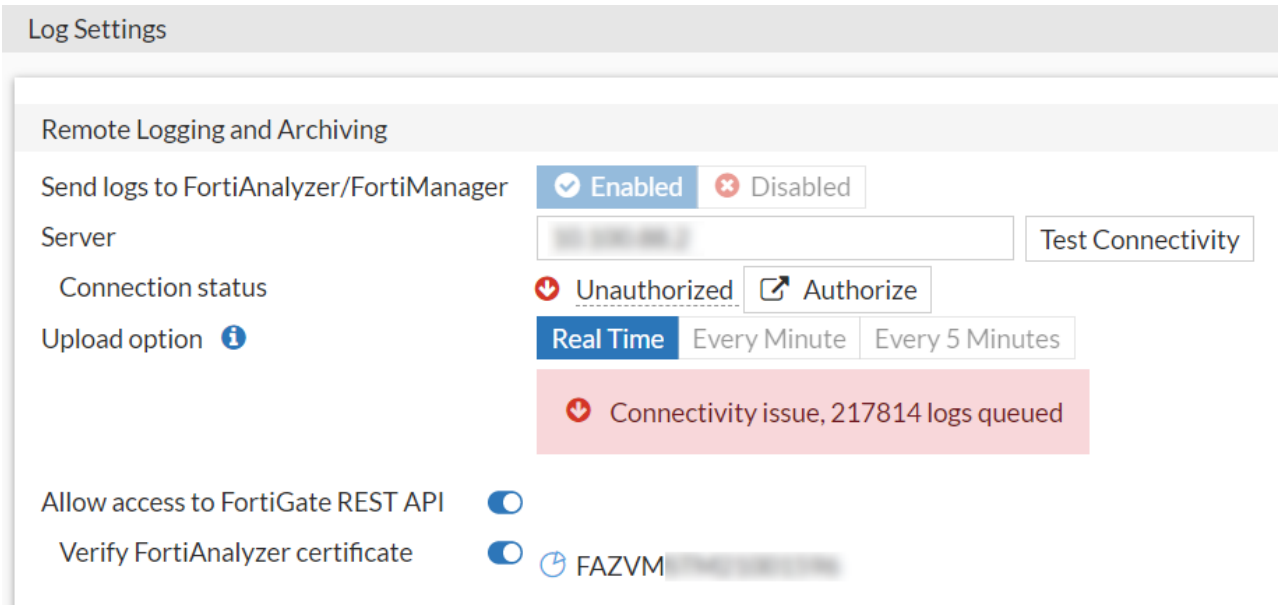
cache maximum: 189516595(180MB) objects: 40 used: 27051(0MB) allocated: 29568(0MB)

VDOM:root
Memory queue for: global-faz
    queue:
        num:9 size:6976(0MB) total size:26068(0MB) max:189516595(180MB) logs:28
Confirm queue for: global-faz
    queue:
        num:29 size:19092(0MB) total size:27051(0MB) max:189516595(180MB) logs:7
```

```
# diagnose test application fgtlogd 30
VDOM:root
Memory queue for: global-faz
        queue:
                num:9 size:6976(0MB) total size:26068(0MB) max:189516595(180MB)
                        type:3, cat=1, log_count=1, seq_no=0, data len=359 size:435
                        type:3, cat=1, log_count=1, seq_no=0, data len=307 size:383
                        ......
                        type:3, cat=0, log_count=4, seq_no=0, data len=1347 size:1423
                        type:3, cat=4, log_count=1, seq_no=0, data len=653 size:729
                'total log count':28,  'total data len':6292

Confirm queue for: global-faz
        queue:
                num:29 size:19092(0MB) total size:26068(0MB) max:189516595(180MB)
                        type:3, cat=1, log_count=1, seq_no=1, data len=290 size:366
                        type:3, cat=1, log_count=1, seq_no=2, data len=233 size:309
                        ......
                        type:3, cat=0, log_count=1, seq_no=28, data len=524 size:600
                        type:3, cat=1, log_count=1, seq_no=29, data len=307 size:383
                'total log count':76,  'total data len':16888
```

   There are nine OFTP items cached to the memory queue, and 29 OFTP items to send from FortiOS to FortiAnalyzer that are waiting for confirmation from FortiAnalyzer.
   - Go to *Log & Report > Log Settings* to view the queue in the GUI:



3. Re-establish the connection between FortiOS and FortiAnalyzer and confirm that the queue has cleared by checking the seq_no, which indicates the latest confirmation log from FortiAnalyzer:

```
# diagnose test application fgtlogd 30
VDOM:root
Memory queue for: global-faz
    queue:
        num:0 size:0(0MB) total size:0(0MB) max:189516595(180MB)
        'total log count':0,  'total data len':0

Confirm queue for: global-faz
    queue:
        num:0 size:0(0MB) total size:0(0MB) max:189516595(180MB)
        'total log count':0,  'total data len':0
```

The queue has been cleared, meaning that FortiOS received confirmation from FortiAnalyzer and cleared the confirm queue.

```
# diagnose test application fgtlogd 1
vdom-admin=0
mgmt=root

fortilog:
faz: global , enabled
        server=172.16.200.251, realtime=1, ssl=1, state=connected
        server_log_status=Log is allowed.,
        src=, mgmt_name=FGh_Log_root_172.16.200.251, reliable=1, sni_prefix_type=none,
        required_entitlement=none, region=ca-west-1,
        logsync_enabled:1, logsync_conn_id:65535, seq_no:67
            status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_verified=Y
            SNs: last sn update:38 seconds ago.
                Sn list:
```

```
            (FAZ-VMTM21000000,age=38s)
        queue: qlen=0.
```

OFTP items with a `seq_no` lower than 67 have been sent to FortiAnalyzer and were confirmed.

Configuring multiple FortiAnalyzers (or syslog servers) per VDOM

In a VDOM, multiple FortiAnalyzer and syslog servers can be configured as follows:

- Up to three override FortiAnalyzer servers
- Up to four override syslog servers

If the VDOM `faz-override` and/or `syslog-override` setting is enabled or disabled (default) before upgrading, the setting remains the same after upgrading.

If the override setting is disabled, the GUI displays the global FortiAnalyzer1 or syslog1 setting. If the override setting is enabled, the GUI displays the VDOM override FortiAnalyzer1 or syslog1 setting.

You can only use CLI to enable the override to support multiple log servers.

To enable FortiAnalyzer and syslog server override under VDOM:

```
config log setting
    set faz-override enable
    set syslog-override enable
end
```

When `faz-override` and/or `syslog-override` is enabled, the following CLI commands are available for configuring VDOM override:

To configure VDOM override for FortiAnalyzer:

1. Configure the FortiAnalyzer override settings:

```
config log fortianalyzer/fortianalyzer2/fortianalyzer3 override-setting
    set status enable
    set server "123.12.123.123"
    set reliable enable
end
```

2. Configure the override filters:

```
config log fortianalyzer/fortianalyzer2/fortianalyzer3 override-filter
    set severity information
    set forward-traffic enable
    set local-traffic enable
    set multicast-traffic enable
    set sniffer-traffic enable
    set anomaly enable
```

```
    set voip enable
    set dlp-archive enable
    set dns enable
    set ssh enable
    set ssl enable
end
```

To configure VDOM override for a syslog server:

1. Configure the syslog override settings:

```
config log syslogd/syslogd2/syslogd3/syslogd4 override-setting
    set status enable
    set server "123.12.123.12"
    set facility local1
end
```

2. Configure the override filters:

```
config log syslogd/syslogd2/syslogd3/syslogd4 override-filter
    set severity information
    set forward-traffic enable
    set local-traffic enable
    set multicast-traffic enable
    set sniffer-traffic enable
    set anomaly enable
    set voip enable
    set dns enable
    set ssh enable
    set ssl enable
end
```

Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode

This topic shows a sample configuration of multiple FortiAnalyzers on a FortiGate in multi-VDOM mode.

In this example:

- The FortiGate has three VDOMs:
  - Root (management VDOM)
  - VDOM1
  - VDOM2
- There are four FortiAnalyzers.
  These IP addresses are used as examples in the instructions below.
  - FAZ1: `172.16.200.55`
  - FAZ2: `172.18.60.25`
  - FAZ3: `192.168.1.253`

    - FAZ4: `192.168.1.254`
- Set up FAZ1 and FAZ2 under global.
    - These two collect logs from the root VDOM and VDOM2.
    - FAZ1 and FAZ2 must be accessible from management VDOM root.
- Set up FAZ3 and FAZ4 under VDOM1.
    - These two collect logs from VDOM1.
    - FAZ3 and FAZ4 must be accessible from VDOM1.

To set up FAZ1 as global FortiAnalyzer 1 from the GUI:

Prerequisite: FAZ1 must be reachable from the management root VDOM.

1. Go to *Global* > *Log & Report* > *Log Settings*.
2. Enable *Send logs to FortiAnalyzer/FortiManager*.
3. Enter the FortiAnalyzer IP.
   In this example: `172.16.200.55`.
4. For *Upload option*, select *Real Time*.
5. Click *Apply*.

To set up FAZ2 as global FortiAnalyzer 2 from the CLI:

Prerequisite: FAZ2 must be reachable from the management root VDOM.

```
config log fortianalyzer2 setting
    set status enable
    set server "172.18.60.25"
    set upload-option realtime
end
```

To set up FAZ3 and FAZ4 as VDOM1 FortiAnalyzer 1 and FortiAnalyzer 2:

Prerequisite: FAZ3 and FAZ4 must be reachable from VDOM1.

```
config log setting
   set faz-override enable
end

config log fortianalyzer override-setting
   set status enable
   set server "192.168.1.253"
   set upload-option realtime
end

config log fortianalyzer2 override-setting
   set status enable
   set server "192.168.1.254"
   set upload-option realtime
end
```

Checking FortiAnalyzer connectivity

To use the diagnose command to check FortiAnalyzer connectivity:

1. Check the global FortiAnalyzer status:

```
FGTA(global) # diagnose test application fgtlogd 1
vdom-admin=1
mgmt=root
faz: global , enabled
        server=172.16.200.55, realtime=1, ssl=1, state=connected
        server_log_status=Log is allowed.,
        src=, mgmt_name=FGh_Log_root_172.16.200.55, reliable=0, sni_prefix_type=none,
        required_entitlement=none, region=ca-west-1,
        logsync_enabled:1, logsync_conn_id:65535, seq_no:0
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_verified=Y
                SNs: last sn update:383 seconds ago.
                        Sn list:
                        (FAZ-VMTM2200****,age=383s)
                queue: qlen=0.
filter: severity=6, sz_exclude_list=0
         traffic virus webfilter ips emailfilter anomaly voip dlp app-ctrl waf dns ssh ssl
file-filter icap sctp-filter
subcategory:
        traffic: forward local multicast sniffer ztna
        anomaly:all subcategories are enabled.
        server: global, id=0, ready=1, name=172.16.200.55 addr=172.16.200.55:514
        oftp-state=connected
faz2: global , enabled
        server=172.18.60.25, realtime=3, ssl=1, state=connected
        server_log_status=Log is allowed.,
        src=, mgmt_name=FGh_Log_root_172.18.60.25, reliable=0, sni_prefix_type=none,
        required_entitlement=none, region=ca-west-1,
        logsync_enabled:1, logsync_conn_id:131071, seq_no:0
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_verified=Y
                SNs: last sn update:383 seconds ago.
                        Sn list:
                        (FAZ-VMTM2201****,age=383s)
                queue: qlen=0.
filter: severity=6, sz_exclude_list=0
         traffic virus webfilter ips emailfilter anomaly voip dlp app-ctrl waf dns ssh ssl
file-filter icap sctp-filter
subcategory:
        traffic: forward local multicast sniffer ztna
        anomaly:all subcategories are enabled.
        server: global, id=1, ready=1, name=172.18.60.25 addr=172.18.60.25:514
        oftp-state=connected
```

2. Check the VDOM1 override FortiAnalyzer status:

```
FGTA(global) # diagnose test application fgtlogd 3101
vdom VDOM1: id=3
```

```
event filter:
         event
system vpn user router wireless wanopt endpoint ha security-rating fortiextender connector
sdwan cifs-auth-fail switch-controller rest-api webproxy
faz: vdom, enabled, override
        server=192.168.1.253, realtime=3, ssl=1, state=connected
        server_log_status=Log is allowed.,
        src=, mgmt_name=FGh_Log_VDOM1_192.168.1.253, reliable=0, sni_prefix_type=none,
        required_entitlement=none, region=ca-west-1,
        logsync_enabled:1, logsync_conn_id:3, seq_no:0
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_verified=Y
                SNs: last sn update:16 seconds ago.
                        Sn list:
                        (FAZ-VMTM2200****,age=16s)

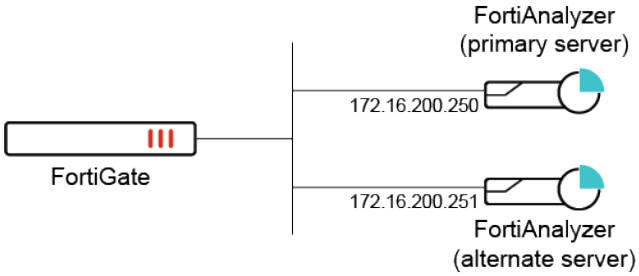
Switching to an alternate FortiAnalyzer if the main FortiAnalyzer is unavailable

FortiOS supports switching to an alternate FortiAnalyzer if the main FortiAnalyzer is unavailable. Once the connectivity is restored, it will automatically fall back to the primary FortiAnalyzer.

This feature can be used in multi-VDOM mode when FortiAnalyzer override settings are configured.



To configure switching to an alternate FortiAnalyzer when the main FortiAnalyzer is unavailable:

1. Configure primary and alternate FortiAnalyzer servers:

```
config log fortianalyzer setting
    set status enable
    set server "172.16.200.250"
    set alt-server "172.16.200.251"
    set fallback-to-primary enable
    set serial "FAZ-VMTM22000000" "FAZ-VMTM23000003"
end
```

2. Verify the primary and alternate FortiAnalyzer server IPs:

```
# diagnose test application fgtlogd 1
vdom-admin=1
mgmt=vdom1

fortilog:
faz: global , enabled
        server=172.16.200.250, alt-server=172.16.200.251, active-server=172.16.200.250,
realtime=3, ssl=1, state=connected
        server_log_status=Log is allowed.,
        src=, mgmt_name=FGh_Log_vdom1_172.16.200.250, reliable=0, sni_prefix_type=none,
        required_entitlement=none, region=ca-west-1,
        logsync_enabled:1, logsync_conn_id:65535, seq_no:0
        disconnect_jiffies:0
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_verified=Y
                SNs: last sn update:11 seconds ago.
```

```
                        Sn list:
                        (FAZ-VMTM22000000,age=11s)      (FAZ-VMTM23000003,age=12s)
                queue: qlen=0.
filter: severity=6, sz_exclude_list=0
         traffic virus webfilter ips emailfilter anomaly voip dlp app-ctrl waf dns ssh ssl
file-filter icap sctp-filter virtual-patch
subcategory:
        traffic: forward local multicast sniffer ztna
        virus:all subcategories are enabled.
        webfilter:all subcategories are enabled.

```

The 172.16.200.250 server is currently active and acting as the primary FortiAnalyzer.

3. Make the primary FortiAnalyzer server go down. The FortiGate will automatically connect to the alternate FortiAnalyzer server.
4. Verify the FortiAnalyzer server status information:

```
# diagnose  test application fgtlogd 1
vdom-admin=1
mgmt=vdom1

fortilog:
faz: global , enabled
        server=172.16.200.250, alt-server=172.16.200.251, active-server=172.16.200.251,
realtime=3, ssl=1, state=connected
        server_log_status=Log is allowed.,
        src=, mgmt_name=FGh_Log_vdom1_172.16.200.250, reliable=0, sni_prefix_type=none,
        required_entitlement=none, region=ca-west-1,
        logsync_enabled:1, logsync_conn_id:65535, seq_no:0
        disconnect_jiffies:0
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_verified=Y
                SNs: last sn update:30 seconds ago.
                        Sn list:
```

```
                        (FAZ-VMTM22000000,age=30s)      (FAZ-VMTM23000003,age=31s)
                queue: qlen=0.
filter: severity=6, sz_exclude_list=0
         traffic virus webfilter ips emailfilter anomaly voip dlp app-ctrl waf dns ssh ssl
file-filter icap sctp-filter virtual-patch
subcategory:
        traffic: forward local multicast sniffer ztna
        virus:all subcategories are enabled.

        ssh:all subcategories are enabled.
        ssl:all subcategories are enabled.
        file-filter:all subcategories are enabled.
        icap:all subcategories are enabled.
        sctp-filter:all subcategories are enabled.
        virtual-patch:all subcategories are enabled.

        server: global, id=0, ready=1, name=172.16.200.250 addr=172.16.200.250:514
        oftp-state=connected
        probe oftp status:null, 38
```

The 172.16.200.251 server is currently active and acting as the primary FortiAnalyzer.

5. Restore the connection to the 172.16.200.250 server. The FortiGate will automatically reconnect to this FortiAnalyzer server.
6. Verify the FortiAnalyzer server status information:

```
# diagnose test application fgtlogd 1
vdom-admin=1
mgmt=vdom1

fortilog:
faz: global , enabled
        server=172.16.200.250, alt-server=172.16.200.251, active-server=172.16.200.250,
realtime=3, ssl=1, state=connected
        server_log_status=Log is allowed.,
        src=, mgmt_name=FGh_Log_vdom1_172.16.200.250, reliable=0, sni_prefix_type=none,
        required_entitlement=none, region=ca-west-1,
        logsync_enabled:1, logsync_conn_id:65535, seq_no:0
        disconnect_jiffies:0
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_verified=Y
                SNs: last sn update:11 seconds ago.
                        Sn list:
                        (FAZ-VMTM22000000,age=58s)      (FAZ-VMTM23000003,age=59s)
                queue: qlen=0.
```

```

        icap:all subcategories are enabled.
        sctp-filter:all subcategories are enabled.
        virtual-patch:all subcategories are enabled.

        server: global, id=0, ready=1, name=172.16.200.250 addr=172.16.200.250:514
        oftp-state=connected
        primary oftp status:null
        probe oftp status:null, 530
```

The 172.16.200.250 server is currently active and acting as the primary FortiAnalyzer again.

To manually switch from the primary to alternate FortiAnalyzer (and vice-versa):

```
# execute log {fortianalyzer | fortianalyzer2 | fortianalyzer3} manual-failover
```

If the primary server is still up, the behavior resulting from running this command is based on the `fallback-to-primary` setting configured in the global FortiAnalyzer log settings.

- If `fallback-to-primary` is enabled (default), running `execute log fortianalyzer manual-failover` will switch to the alternate FortiAnalyzer, but it will switch back to the primary since it is not actually down.
- If `fallback-to-primary` is disabled, running `execute log fortianalyzer manual-failover` will switch to the alternate FortiAnalyzer, and it will not switch back to the primary.

Advanced and specialized logging

The following topics provide information on advanced and specialized logging:

- Logs for the execution of CLI commands on page 4156
- Log buffer on FortiGates with an SSD disk on page 4158
- Source and destination UUID logging on page 4159

- Configuring and debugging the free-style filter on page 4162
- Logging the signal-to-noise ratio and signal strength per client on page 4164
- RSSO information for authenticated destination users in logs on page 4166
- Destination user information in UTM logs on page 4169
- Message ID in UTM logs on page 4173
- Log fields for long-live sessions on page 4174
- Generate unique user name for anonymized logs on page 4176
- Configuring syslog overrides for VDOMs on page 4179
- Logging MAC address flapping events on page 4182
- Incorporating endpoint device data in the web filter UTM logs on page 4183
- Logging detection of duplicate IPv4 addresses on page 4184

Logs for the execution of CLI commands

The `cli-audit-log` option records the execution of CLI commands in system event logs (log ID 44548). In addition to `execute` and `config` commands, `show`, `get`, and `diagnose` commands are recorded in the system event logs.

The `cli-audit-log` data can be recorded on memory or disk, and can be uploaded to FortiAnalyzer, FortiGate Cloud, or a syslog server.

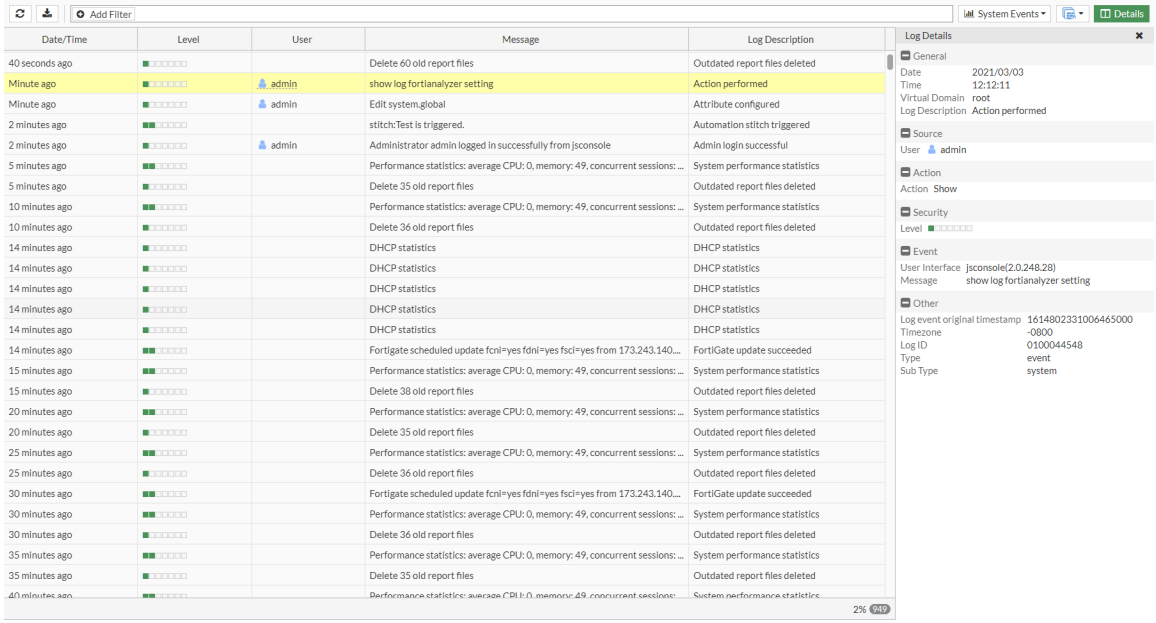
To enable the CLI audit log option:

```
config system global
    set cli-audit-log enable
end
```

To view system event logs in the GUI:

1. Run the command in the CLI (`# show log fortianalyzer setting`).
2. Go to *Log & Report* > *System Events*.
3. Select *General System Events*.

4. Select the log entry and click *Details*.



To display the logs:

```
# execute log filter device disk
```

```
# execute log filter category event
```

```
# execute log filter field subtype system
```

```
# execute log filter field logid 0100044548
```

```
# execute log display
```

Sample log:

```
1: date=2020-11-16 time=10:43:00 eventtime=1605552179970875703 tz="-0800" logid="0100044548"

type="event" subtype="system" level="information" vd="root" logdesc="Action performed"
user="admin" ui="jsconsole(2.0.228.202)" action="Diagnose" msg="diagnose log test"
```

Log buffer on FortiGates with an SSD disk

FortiGates with an SSD disk have a configurable log buffer. When the connection to FortiAnalyzer is unreachable, the FortiGate is able to buffer logs on disk if the memory log buffer is full. The logs queued on the disk buffer can be sent successfully once the connection to FortiAnalyzer is restored.

The queued logs are buffered to the memory first and then disk. If the total buffer is full, new logs will overwrite the old logs.

To configure the log buffer:

1. Allocate disk space (MB) to temporarily store logs to FortiAnalyzer:

```
config system global
    set faz-disk-buffer-size 200
end
```

2. Check the `fgtlogd` statistics. The 200 MB disk buffer has been set, and there are currently no logs buffered in memory or on disk when FortiAnalyzer is reachable:

```
# diagnose test application fgtlogd 41
cache maximum: 19569745(18MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
   VDOM:root
Memory queue for: global-faz
        queue:
                num:0 size:0(0MB) total size:0(0MB) max:15375441(14MB) logs:0
        queue disk total size:0MB, max size:200MB
                total items:0
                        devid:-1-13-0-0
                        buffer path:/var/log/log/qbuf/13.0/0
                        saved size:0MB, lost files: 0
                        save roll:0 restore roll:0
Confirm queue for: global-faz
        queue:
                num:0 size:0(0MB) total size:0(0MB) max:15375441(14MB) logs:0
```

3. Disable the connection between the FortiGate and FortiAnalyzer. For example, delete the FortiGate from the FortiAnalyzer authorized device list.
   Assuming a massive number of logs (~ 300000) are recorded during this downtime, the logs will be queued in the memory buffer first. If the memory buffer is full, then the remaining logs will be queued on the disk buffer.
4. Recheck the `fgtlogd` statistics. Currently, there are logs buffered in both memory and disk:

```
# diagnose test application fgtlogd 41
cache maximum: 19569745(18MB) objects: 14391 used: 10450754(9MB) allocated: 12089088(11MB)
   VDOM:root
Memory queue for: global-faz
        queue:
                num:14245 size:9306505(8MB) total size:10450754(9MB) max:15375441(14MB)
logs:14245
        queue disk total size:199MB, max size:200MB
```

```
                total items:321085
                        devid:-1-13-0-0
                        buffer path:/var/log/log/qbuf/13.0/0
                        saved size:199MB, lost files: 10
                        save roll:60 restore roll:10
Confirm queue for: global-faz
        queue:
                num:0 size:0(0MB) total size:10450754(9MB) max:15375441(14MB) logs:0
```

The overall `fgtlogd` statistics shows the total cached logs is the sum of the logs buffered in memory and on disk:

```
# diagnose test application fgtlogd 4
Queues in all miglogds: cur:1  total-so-far:727973
global log dev statistics:
faz=399411, faz_cloud=0, fds_log=399411
faz 0: sent=0, failed=0, cached=335480, dropped=0
Num of REST URLs: 0
```

5. Enable the connection between FortiAnalyzer and the FortiGate.
6. After a while, check the `fgtlogd` statistics to confirm that all buffered logs are being sent to FortiAnalyzer successfully:

```
# diagnose test application fgtlogd 4
Queues in all miglogds: cur:1  total-so-far:727973
global log dev statistics:
faz=399411, faz_cloud=0, fds_log=399411
faz 0: sent=335487, failed=0, cached=0, dropped=0
Num of REST URLs: 0
```

```
# diagnose test application fgtlogd 41
cache maximum: 19569745(18MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Memory queue for: global-faz
        queue:
                num:0 size:0(0MB) total size:0(0MB) max:15375441(14MB) logs:0
        queue disk total size:0MB, max size:200MB
                total items:0
                        devid:-1-13-0-0
                        buffer path:/var/log/log/qbuf/13.0/0
                        saved size:0MB, lost files: 10
                        save roll:60 restore roll:60
Confirm queue for: global-faz
        queue:
                num:0 size:0(0MB) total size:0(0MB) max:15375441(14MB) logs:0
```

Source and destination UUID logging

The traffic log setting includes three UUID fields: Source UUID (srcuuid), Destination UUID (dstuuid), and Policy UUID (poluuid). It also includes two `internet-service` name fields: *Source Internet Service* (`srcinetsvc`) and

Destination Internet Service (`dstinetsvc`).

Log UUIDs

All policy types have a UUID field that is auto-generated by FortiOS when the policy is created, and can be viewed in the CLI using the show command. For example:

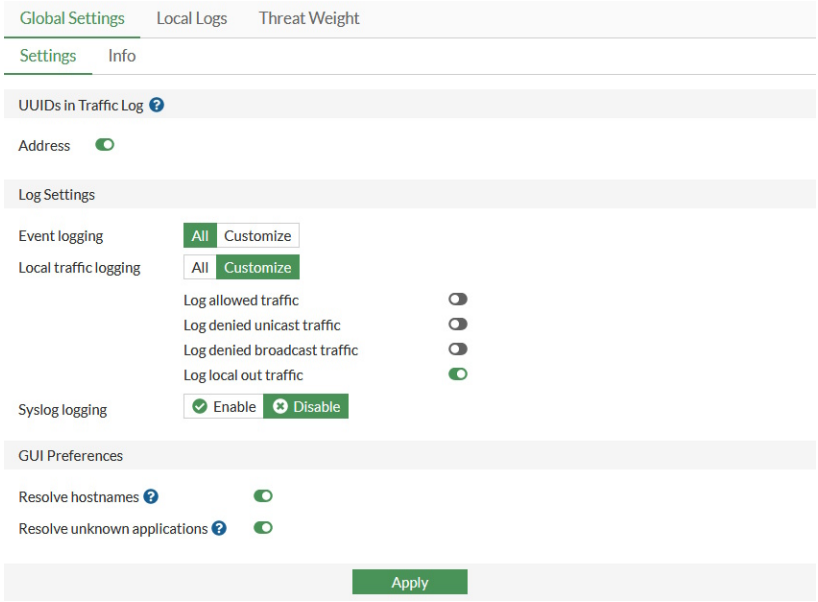
```
# show firewall policy 1
config firewall policy
    edit 1
        set name "client_yt_v4"
        set uuid f4fe48a4-938c-51ee-8856-3e84e3b24af4
        ...
    next
end
```

UUIDs can be matched for each source and destination that match a policy that is added to the traffic log. This allows the address objects to be referenced in log analysis and reporting.

As this may consume a significant amount of storage space, this feature is optional. By default, address UUID insertion is disabled.

To enable address UUID insertion in traffic logs in the GUI:

1. Go to *Log & Report* > *Log Settings*.
2. Under *UUIDs in Traffic Log*, enable *Address*.



3. Click *Apply*.

To enable address UUID insertion in traffic logs in the CLI:

```
config system global
   set log-uuid-address enable
end
```

Sample log

```
date=2019-01-25 time=11:32:55 logid="0000000013" type="traffic" subtype="forward" level="notice"
vd="vdom1" eventtime=1528223575srcip=192.168.1.183 srcname="PC24" srcport=33709 srcintf="lan"

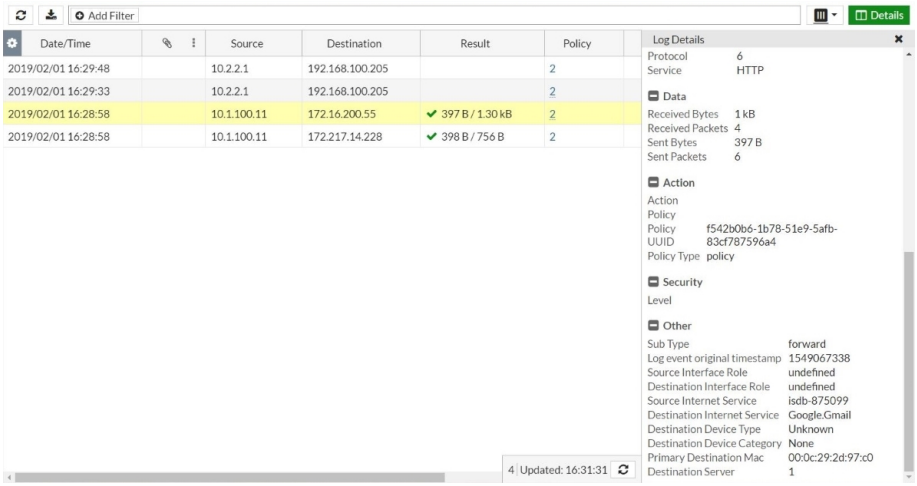
```

Internet service name fields

Traffic logs for `internet-service` include two fields: *Source Internet Service* and *Destination Internet Service*.

To view the internet service fields using the GUI:

1. Go to *Log & Report* > *Forward Traffic*.
2. Double-click on an entry to view the *Log Details*. The *Source Internet Service* and *Destination Internet Service* fields are visible in the *Log Details* pane.



Sample log

```
date=2019-01-25 time=14:17:04 logid="0000000013" type="traffic" subtype="forward" level="notice"
vd="vdom1" eventtime=1548454622
srcip=10.1.100.11 srcport=51112 srcintf="port3" srcintfrole="undefined" dstip=172.217.14.228

dstserver=0
```

Configuring and debugging the free-style filter

Free-style filters allow users to define a filter for logs that are captured to each individual logging device type. Filters can include log categories and specific log fields. The filters can be created as an inclusive list or exclusive list.

Free-style filters can also be used to filter logs that have been captured on logging devices already to narrow down the list of logs to view.

```
config log syslogd filter
    config free-style
        edit <id>
            set category <option>
            set filter <string>
            set filter-type {include | exclude}
        next
    end
end
```

`category <option>`	Set the log category. The following options are available: `traffic`, `event`, `virus`, `webfilter`, `attack`, `spam`, `anomaly`, `voip`, `dlp`, `app-ctrl`, `waf`, `dns`, `ssh`, `ssl`, `file-filter`, `icap`, and `ztna`.
`filter <string>`	Enter the filter criteria. Multiple values can be added, for example: `set filter "logid <id> <id>"`
`filter-type {include | exclude}`	Include/exclude logs that match the filter.

Use the following commands to view the results when multiple fields are used:

```
# execute log filter free-style "logid <id> <id>"
```

```
# execute log filter free-style "srcip <IP_address> <IP_address>"
```

```
# execute log filter free-style "(logid <id>) or (srcip <IP_address> <IP_address>)"
```

```
# execute log filter free-style "(srcip <IP_address>) and (dstip <IP_address>)"
```

In this example, the free-style filter is set to filter log IDs 0102043039 and 0102043040. The source IPs, 192.168.2.5 and 192.168.2.205, are also checked.

To configure the syslogd free-style filter with multiple values:

```
config log syslogd filter
    config free-style
        edit 1
            set category event
            set filter "logid 0102043039 0102043040"
        next
    end
end
```

To view the syslogd free-style filter results:

```
# execute log filter free-style "logid 0102043039 0102043040"
# execute log filter dump
category: event
device: disk
start-line: 1
view-lines: 10
max-checklines: 0
HA member:
log search mode: on-demand
pre-fetch-pages: 2
Filter: logid 0102043039 0102043040
Oftp search string: (and (or logid=="0102043039" not-exact logid=="0102043040" not-exact))
```

```
# execute log filter free-style "(logid 0102043039) or (srcip 192.168.2.5 192.168.2.205)"
# execute log filter dump
category: event
device: disk
start-line: 1
view-lines: 10
max-checklines: 0
HA member:
log search mode: on-demand
pre-fetch-pages: 2
Filter: (logid 0102043039) or (srcip 192.168.2.5 192.168.2.205)
Oftp search string: (or (or (or srcip==192.168.2.5) (or srcip==192.168.2.205)) (or
logid=="0102043039" not-exact))
```

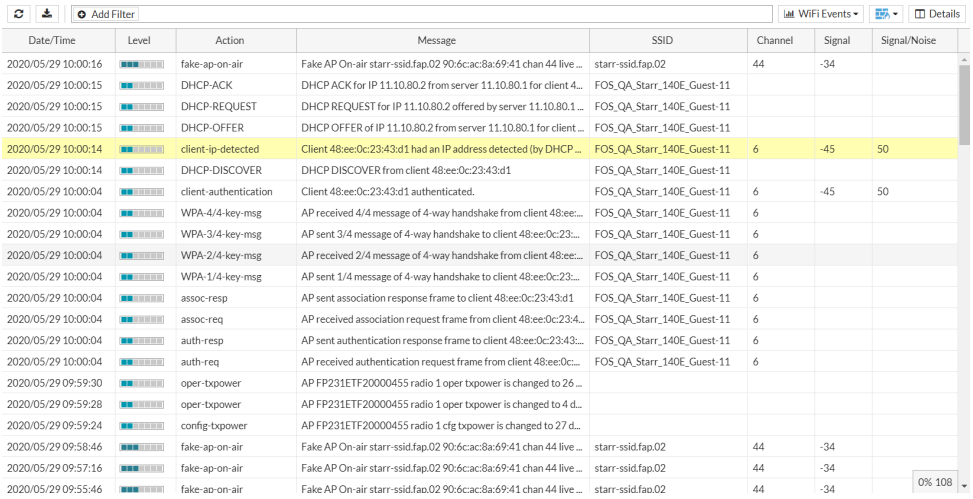
Logging the signal-to-noise ratio and signal strength per client

The signal-to-noise ratio (`snr`) and signal strength (`signal`) are logged per client in the WiFi event and traffic logs.

When a WiFi client connects to a tunnel or local-bridge mode SSID on an FortiAP that is managed by a FortiGate, signal-to-noise ratio and signal strength details are included in WiFi event logs for local-bridge traffic statistics and authentication, and in forward traffic logs for tunnel traffic. This allows you to store and view clients' historical signal strength and signal-to-noise ratio information.

To verify when a client is connecting to an SSID:

1. Go to *Log & Report* > *System Events* and select *WiFi Events*.
   The *Signal* and *Signal/Noise* columns show the signal strength and signal-to-noise ratio for each applicable client.



Date/Time	Level	Action	Message	SSID	Channel	Signal	Signal/Noise
2020/05/29 10:00:16		fake-ap-on-air	Fake AP On-air starr-ssid.fap.02 90:6c:ac:8a:69:41 chan 44 live ...	starr-ssid.fap.02	44	-34

```

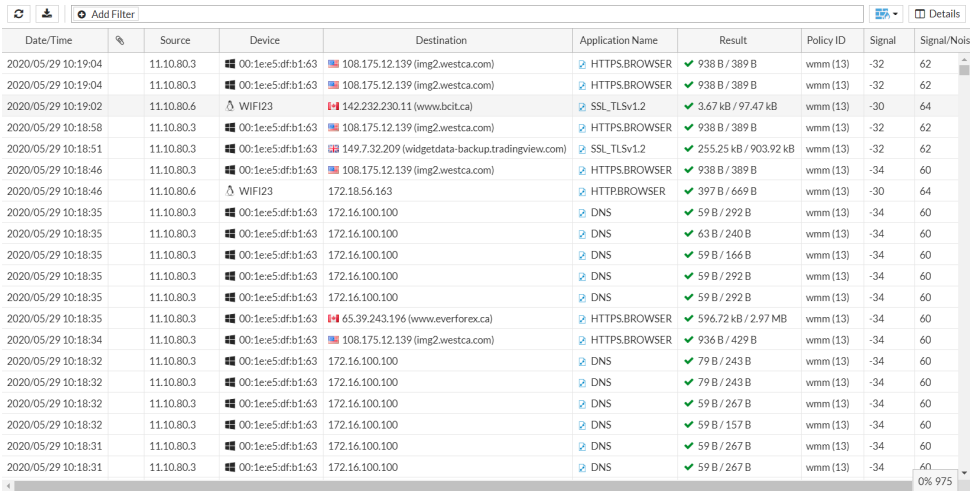
To verify tunnel traffic when a client is connecting to a tunnel mode SSID:

1. Go to *Log & Report* > *Forward Traffic*.
   The *Signal* and *Signal/Noise* columns show the signal strength and signal-to-noise ratio for each applicable client.



Date/Time	Source	Device	Destination	Application Name	Result	Policy ID	Signal	Signal/Nois

signal=-53 snr=52 sentbyte=8970016 rcvdbyte=985910 nextstat=300 action="sta-wl-bridge-traffic-
stats" msg="Traffic stats for bridge ssid client 00:1e:e5:df:b1:63"
```

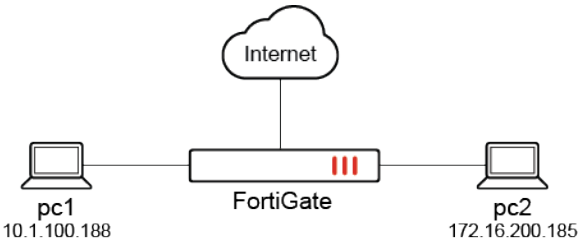
RSSO information for authenticated destination users in logs

FortiGate can use RSSO accounting information from authenticated RSSO users to populate destination users and groups, along with source users and groups.

RSSO user login information can be forwarded by the RADIUS server to the FortiGate that is listening for incoming RADIUS accounting start messages on the RADIUS accounting port. Accounting start messages usually contain the IP address, user name, and user group information. FortiGate uses this information in traffic logs, which include *dstuser* and *dstgroup* fields for user and group destination information .

For instructions on configuring RSSO, see RADIUS single sign-on agent on page 4061.

The three following scenarios show traffic between pc1 and the internet, and pc1 and pc2.



Scenario 1

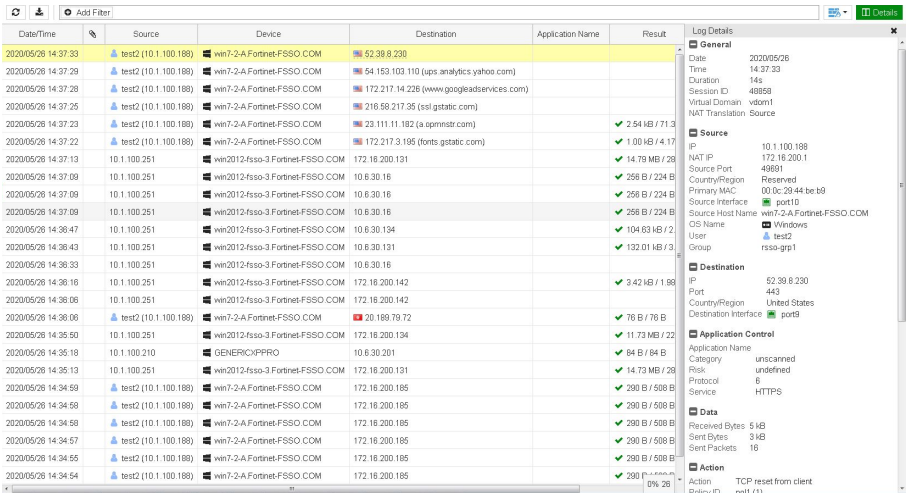
In this scenario, RSSO user *test2* in group *rsso-grp1* is authenticated on pc1. Traffic flows from pc1 to the internet.

Expected result:

In the logs, user *test2* is shown as the source user in the *rsso-grp1* group.

To verify the results:

1. In the GUI, go to *Log & Report* > *Forward Traffic* and view the details of an entry with test2 as the source.
2. In the *Source* section, *User* is *test2* and *Group* is the *rsso-grp1*.



3. The log message shows the user and group:

```
10: date=2020-05-25 time=15:34:43 logid="0000000013" type="traffic" subtype="forward"
level="notice" vd="vdom1" eventtime=1590446083718007055 tz="-0700" srcip=10.1.100.188
srcname="win7-2-A.Fortinet-FSSO.COM" srcport=56982 srcintf="port10" srcintfrole="undefined"
dstip=172.217.3.195 dstport=443 dstintf="port9" dstintfrole="undefined" srccountry="Reserved"
dstcountry="United States" sessionid=120651 proto=17 action="accept" policyid=1
policytype="policy" poluuid="d130f886-9ec6-51ea-206e-8c561c5244c6" policyname="pol1"
user="test2" group="rsso-grp1" authserver="vdom1" service="udp/443" trandisp="snat"
transip=172.16.200.1 transport=56982 duration=181 sentbyte=2001 rcvdbyte=1820 sentpkt=6
rcvdpkt=4 appcat="unscanned" sentdelta=0 rcvddelta=0 srchwvendor="VMware" osname="Windows"
srcswversion="7" mastersrcmac="00:0c:29:44:be:b9" srcmac="00:0c:29:44:be:b9" srcserver=0
```

Scenario 2

In this scenario, RSSO user *test2* is authenticated on pc1. Traffic is initialized on pc2 (172.16.200.185) going to pc1 (10.1.100.188).

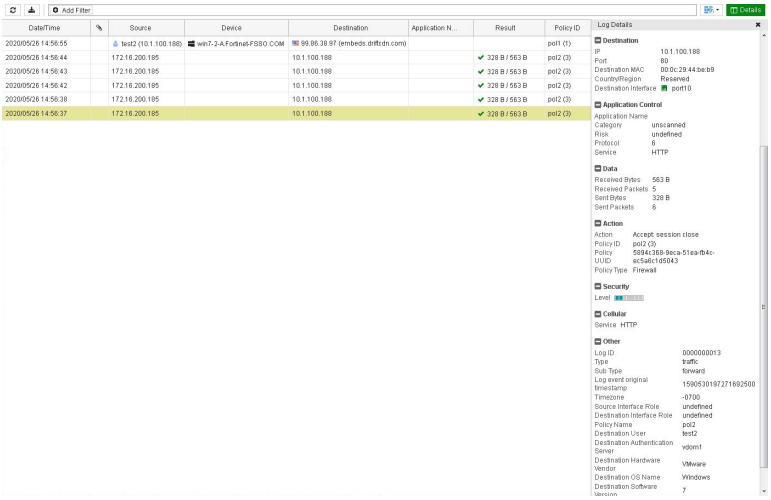
Expected result:

In the logs, user *test2* is shown as the destination user (`dstuser`). No destination group (`dstgroup`) is logged because no RSSO user is logged in on pc2, so the traffic from pc2 is unauthenticated.

To verify the results:

1. In the GUI, go to *Log & Report* > *Forward Traffic* and view the details of an entry with 172.16.200.185 (pc2) as the source.

2. In the *Other* section, *Destination User* is *test2* and no destination group is shown.



3. The log message shows the destination user:

```
1: date=2020-05-22 time=07:38:06 logid="0000000020" type="traffic" subtype="forward"
level="notice" vd="root" eventtime=1590158286585506922 tz="-0700" srcip=172.16.200.185
identifier=1 srcintf="port9" srcintfrole="undefined" dstip=10.1.100.188 dstintf="port10"
dstintfrole="undefined" srccountry="Reserved" dstcountry="Reserved" sessionid=4395 proto=1
action="accept" policyid=3 policytype="policy" poluuid="d4f18e1e-9c36-51ea-6ec0-3a354d5910ee"
policyname="pol2" dstuser="test2" dstauthserver="root" service="PING" trandisp="snat"
transip=10.1.100.1 transport=0 duration=128 sentbyte=7620 rcvdbyte=5220 sentpkt=127 rcvdpkt=87
appcat="unscanned" sentdelta=7620 rcvddelta=5220
```

Scenario 3

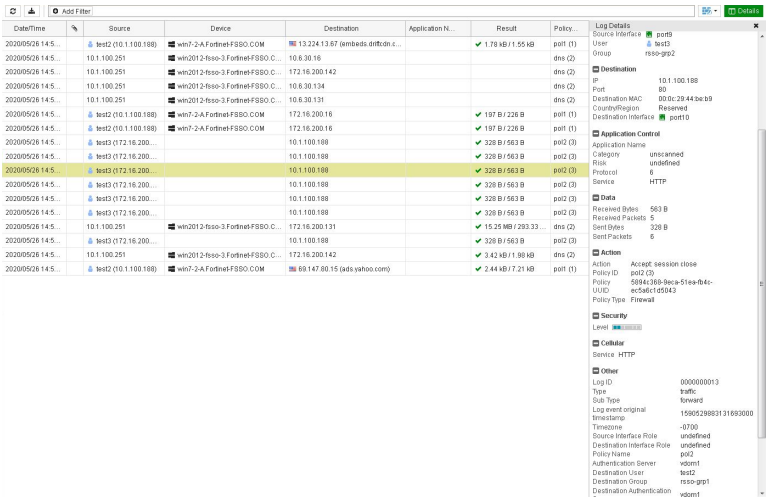
In this scenario, RSSO user *test2* in group *rsso-grp1* is authenticated on pc1, and user *test3* in group *rsso-grp2* is authenticated on pc2. Traffic flows from pc2 to pc1.

Expected result:

In the logs, user *test3* is shown as the source user in the *rsso-grp1* group. User *test2* is shown as destination user (`dstuser`) in the *rsso-grp1* destination group (`dstgroup`). The destination group is logged because an RSSO user is logged in to pc2.

To verify the results:

1. In the GUI, go to *Log & Report* > *Forward Traffic* and view the details of an entry with 172.16.200.185 (pc2) as the source.
2. In the *Source* section, *User* is *test3* and *Group* is the *rsso-grp2*. In the *Other* section, *Destination User* is *test2* and *Destination Group* is *rsso-grp1*.



3. The log message shows both the source and the destination users and groups:

```
8: date=2020-05-25 time=14:23:07 logid="0000000013" type="traffic" subtype="forward"
level="notice" vd="vdom1" eventtime=1590441786958007914 tz="-0700" srcip=172.16.200.185
srcport=64096 srcintf="port9" srcintfrole="undefined" dstip=10.1.100.188 dstport=80

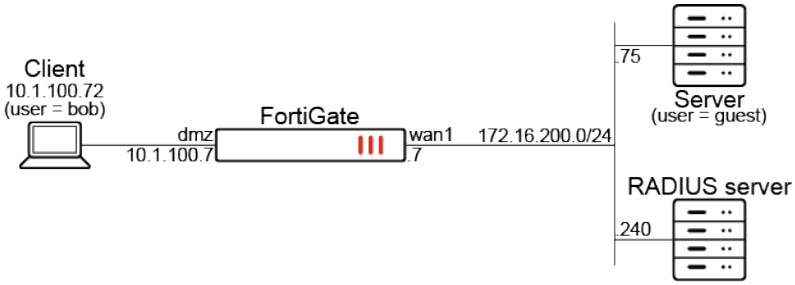
```

Destination user information in UTM logs

The `dstuser` field in UTM logs records the username of a destination device when that user has been authenticated on the FortiGate.

In the following example topology, the user, bob, is authenticated on a client computer. The user, guest, is authenticated on the server. Log are collected for AV and IPS in flow inspection mode. Logs are collected for application control and web filter in proxy mode.



To configure the RADIUS user and user groups:

1. Configure the RADIUS server:

```
config user radius
    edit "Ubuntu_docker"
        set server "172.16.200.240"
        set secret ************
    next
end
```

2. Configure the local user:

```
config user local
    edit "guest"
        set type password
        set passwd ************
    next
end
```

3. Configure the RADIUS user groups:

```
config user group
    edit "RADIUS_User_Group"
        set member "Ubuntu_docker"
    next
    edit "Local_User"
        set member "guest"
    next
end
```

Flow inspection mode

To verify AV and IPS logs in flow mode:

1. Configure the firewall policies:

```
config firewall policy
    edit 1
        set name "WAN_out"
        set srcintf "dmz"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "deep-inspection"
        set av-profile "g-default"
        set ips-sensor "sensor-11"
```

```
        set nat enable
        set groups "RADIUS_User_Group" "Local_User"
    next
    edit 3
        set name "WAN_in"
        set srcintf "wan1"
        set dstintf "dmz"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set groups "RADIUS_User_Group" "Local_User"
    next
end
```

2. Verify the AV log:

```
date=2021-09-14 time=16:37:25 eventtime=1631662646131356720 tz="-0700" logid="0211008192"
type="utm" subtype="virus" eventtype="infected" level="warning" vd="vdom1" policyid=1

```

Proxy inspection mode

To verify application control and web filter logs in proxy mode:

1. Configure the firewall policies:

```
config firewall policy
    edit 1
        set name "WAN_out"
        set srcintf "dmz"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set av-profile "g-default"
        set application-list "g-default"
        set webfilter-profile "1"
        set nat enable
        set groups "RADIUS_User_Group" "Local_User"
    next
    edit 3
        set name "WAN_in"
        set srcintf "wan1"
        set dstintf "dmz"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set logtraffic all
        set nat enable
        set groups "RADIUS_User_Group" "Local_User"
    next
end
```

2. Verify the application control log:

```
date=2021-09-14 time=17:05:45 eventtime=1631664345570951500 tz="-0700" logid="1059028704"

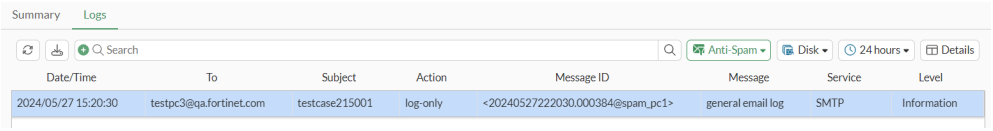
sentbyte=149 rcvdbyte=0 direction="outgoing" msg="URL was allowed because it is in the URL
filter list"
```

Message ID in UTM logs

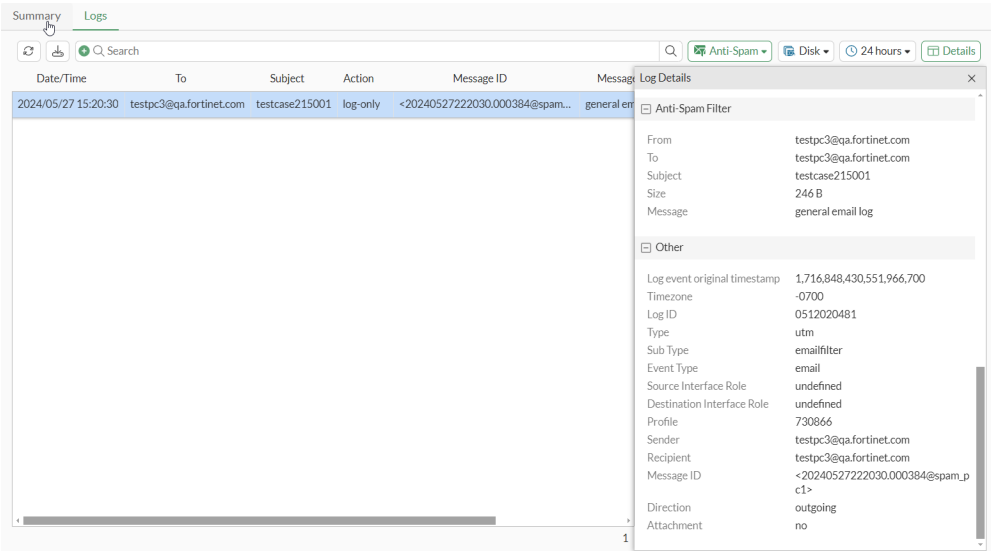
FortiOS logs the message ID (`messageid`) field in UTM logs under the email filter, file filter, and DLP subtypes. The message ID can be used with FortiMail to locate an undesired email. The message ID can also be used with FortiAnalyzer to trace the email and locate the device that sent the undesired traffic.

To view the message ID:

1. Go to *Log & Report* > *Security Events* and select *Logs*.
2. Set the filters to display the email filter, file filter, or DLP subtypes. In this example, the *Anti-Spam* and *Disk* filters are set to display an entry with the *Message ID* field.



3. Select the log, and click *Details*. The *Message ID* field is displayed.



Following are examples of the message ID (`messageid`) field in email filter, file filter, and DLP logs:

- Email filter logs:

```
1: date=2024-05-27 time=15:20:30 eventtime=1716848430551966694 tz="-0700" logid="0512020481"

```

Log fields for long-live sessions

Logging of long-live session statistics can be enabled or disabled in traffic logs.

```
config log setting
     set long-live-session-stat {enable | disable}
end
```

When enabled, traffic logs include the following fields of statistics for long-live sessions:

Duration delta (`durationdelta`)	Displays the time in seconds between the last session log and the current session log.
Sent packet delta (`sentpktdelta`)	Displays the number of sent packets. When the number of packets reported in the `sentpktdelta` field matches the number of bytes reported in the `sentpkt` field, it shows no missing logs.
Received packet delta (`rcvdpktdelta`)	Displays the number of received packets. When the number of packets reported in the `rcvdpktdelta` field matches the number of bytes reported in the `rcvdpkt` field, it shows no missing logs.

The long-live session fields enhance the granularity and accuracy of traffic longs to aid troubleshooting and analysis.

Example

In this example, logging is enabled for long-live session statistics. Log ID 20 includes the new fields for long-live sessions.

To log long-live session statistics:

1. Enable logging of long-live session statistics:

```
config log setting
     set long-live-session-stat enable
end
```

2. View information in the logs:

   In the following example, log fields are filtered for log ID 0000000020 to displays the new fields of data. The `sentpkt` field displays `205` bytes, and the `rcvdpkt` field displays `1130` bytes. The new fields (`sentpktdelta=205` and `rcvdpktdelta=1130`) display the same number of packets, which shows no logs have been lost. The `durationdelta` shows `120` seconds between the last session log and the current session log.

```
# execute log filter device Disk

# execute log filter category 0

# execute log filter field subtype forward

# execute log filter field logid 0000000020

# execute log display

1 logs found.

1 logs returned.

1: date=2023-12-07 time=14:19:59 eventtime=1701987599439429340 tz="-0800" logid="0000000020"
type="traffic" subtype="forward" level="notice" vd="vdom1" srcip=10.1.100.22 srcport=53540
```

```

```

Generate unique user name for anonymized logs

With the `anonymization-hash` option, user fields in logs can be anonymized by generating a hash based on the user name and salt value. The hash for the same user will generate the same hash value, allowing the anonymized user to be correlated between logs.

```
config log setting
    set user-anonymize enable
    set anonymization-hash <salt string>
end
```

Example

In this example, user names are encrypted in traffic and event logs using the `anonymization-hash` option.

To encrypt the user name for logs in the GUI:

1. Configure the hash anonymization in the CLI:

```
config log setting
    set user-anonymize enable
    set anonymization-hash "random"
end
```

2. Configure a firewall policy with a user as a source:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. For *Source*, select a user.
   c. In the *Security Profiles* section, enable *AntiVirus* and select a profile.
   d. Configure the other settings as needed.
   e. Click *OK*.
3. Verify the forward traffic log:
   a. Go to *Log & Report* > *Forward Traffic*.
   b. Select an entry and double-click to view the log details.
      The user name has a hashed value of e8557d12f6551b2d.
4. Verify the antivirus traffic log:
   a. Go to *Log & Report* > *AntiVirus*.
   b. Select an entry and double-click to view the log details.

The user name has the same hashed value. Hovering over the user name displays a *No user information* tooltip.

5. Verify the event log:
   a. Go to *Log & Report > Events > System Events*.
   b. Select an entry and double-click to view the log details.
      The administrative user has a hashed value of 6a4d668735f5517a.

To encrypt the user name for logs in the CLI:

1. Configure the hash anonymization:

```
config log setting
    set user-anonymize enable
    set anonymization-hash "random"
end
```

2. Configure a firewall policy with a user as a source:

```
config firewall policy
    edit 1
        set name "WAN_out"
        set srcintf "dmz"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set av-profile "g-default"
        set nat enable
        set users "bob"
    next
end
```

3. Verify the forward traffic log. The user name has a hashed value of e8557d12f6551b2d:

```
date=2021-09-09 time=15:24:52 eventtime=1631226292981803646 tz="-0700" logid="0000000013"

utmref=0-28
```

4. Verify the antivirus traffic log. The user name has the same hashed value:

```
date=2021-09-09 time=15:24:51 eventtime=1631226291945007723 tz="-0700" logid="0211008192"
type="utm" subtype="virus" eventtype="infected" level="warning" vd="vdom1" policyid=1
msg="File is infected." action="blocked" service="HTTP" sessionid=383 srcip=10.1.100.72
dstip=172.16.200.75 srcport=33250 dstport=80 srcintf="dmz" srcintfrole="undefined"
dstintf="wan1" dstintfrole="undefined" srcuuid="877d43a4-c2f9-51eb-f78f-e09794924d8a"
dstuuid="877d43a4-c2f9-51eb-f78f-e09794924d8a" proto=6 direction="incoming"
filename="eicar.com" quarskip="File-was-not-quarantined" virus="EICAR_TEST_FILE"
viruscat="Virus" dtype="av-engine" ref="http://www.fortinet.com/ve?vn=EICAR_TEST_FILE"
virusid=2172 url="http://172.16.200.75/eicar.com" profile="g-default" user="e8557d12f6551b2d"
dstuser="e8557d12f6551b2d" agent="Wget/1.17.1" analyticssubmit="false" crscore=50 craction=2
crlevel="critical"
```

5. Verify the event log. The administrative user has a hashed value of 6a4d668735f5517a:

```
date=2021-09-09 time=09:59:09 eventtime=1631206750109938510 tz="-0700" logid="0100032001"
type="event" subtype="system" level="information" vd="vdom1" logdesc="Admin login successful"
sn="**********" user="6a4d668735f5517a" ui="https(10.6.30.254)" method="https"
srcip=10.6.30.254 dstip=10.6.30.107 action="login" status="success" reason="none"
profile="super_admin" msg="Administrator 6a4d668735f5517a logged in successfully from https
(10.6.30.254)"
```

If `user-anonymize` is enabled in the log settings and `anonymization-hash` is left blank, the user name is displayed as anonymous in the logs.

Sample traffic log:

```
date=2021-09-09 time=11:27:44 eventtime=1631212064444723180 tz="-0700" logid="0000000013"

user="anonymous" ui="jsconsole" msg="Configuration is changed in the anonymous session"
```

Configuring syslog overrides for VDOMs

Logs can be sent from non-management VDOMs to both global and VDOM-override syslog servers.

```
config log syslogd override-setting
    set use-management-vdom {enable | disable}
end
```

`set use-management-vdom {enable | disable}`	Enable/disable use of management VDOM as source VDOM for logs sent to syslog server. • `enable`: Send logs through the management VDOM. • `disable`: Do not send logs through the management VDOM.

When `use-management-vdom` is enabled under non-management VDOM, only the management VDOM is used to forward logs to configured syslog servers. Non-management VDOM override syslog servers must be reachable through the management VDOM.

Example

This example covers the following scenarios:

- Non-management VDOM with use-management-vdom disabled on page 4180
- Non-management VDOM with use-management-vdom enabled on page 4180
- Non-management VDOM with mix of use-management-vdom enabled and disabled on page 4181

All scenarios use the following IP addresses:

- Global syslog server: 10.6.30.22
- Root VDOM gateway: 192.168.5.254
- Management VDOM (vdom1) gateway: 172.16.200.254

Non-management VDOM with use-management-vdom disabled

In this example, a global syslog server is enabled. For the root VDOM, an override syslog server is enabled with `use-management-vdom` disabled. For the management VDOM, an override syslog server is enabled. With this configuration, logs are sent to the following locations:

- All VDOMs, except the root and management VDOMs, send logs to the global syslog server (10.6.30.22).
- The root VDOM sends logs to its override syslog server at 192.168.5.44.
- The management VDOM sends logs to its override syslog server at 172.16.200.55.

To configure syslog servers:

1. Enable the global syslog server:

```
config log syslogd setting
    set status enable
    set server "10.6.30.22"
    set facility local6
end
```

2. For the root VDOM, enable an override syslog server and disable `use-management-vdom`:

```
config log syslogd override-setting
    set status enable
    set server "192.168.5.44"
    set use-management-vdom disable
    set facility local6
end
```

3. For the management VDOM (vdom1), enable an override syslog server:

```
config log syslogd override-setting
    set status enable
    set server "172.16.200.55"
    set facility local6
end
```

Non-management VDOM with use-management-vdom enabled

In this example, a global syslog server is enabled. For the root VDOM, an override syslog server and `use-management-vdom` are enabled. For the management VDOM, two override syslog servers are enabled. With this configuration, logs are sent to the following locations:

- All VDOMs, except root and management VDOMs, send logs to the global syslog server (10.6.30.22).
- The root VDOM cannot send logs to syslog servers because the servers are not reachable through the management VDOM.

  To send logs to 192.168.5.44, set *use-management-vdom* to *disable* for the root VDOM. Alternately, configure the root VDOM to use an override syslog server that is reachable through the management VDOM.
- The management VDOM sends logs to the override syslog server at 172.16.200.55.

To configure syslog servers:

1. Enable the global syslog server:

```
config log syslogd setting
    set status enable
    set server "10.6.30.22"
    set facility local6
end
```

2. For the root VDOM, enable an override syslog server and enable `use-management-vdom`:

```
config log syslogd override-setting
    set status enable
    set server "192.168.5.44"
    set use-management-vdom enable
    set facility local6
end
```

3. For the management VDOM, enable an override syslog server:

```
config log syslogd override-setting
    set status enable
    set server "172.16.200.55"
    set facility local6
end
```

Non-management VDOM with mix of use-management-vdom enabled and disabled

In this example, a global syslog server is enabled. For the root VDOM, three override syslog servers are enabled with a mix of `use-management-vdom` set to `enabled` and `disabled`. For the management VDOM, an override syslog server is enabled. With this configuration, logs are sent from non-management VDOMs to both global and VDOM-override syslog servers. The logs are sent to the following locations:

- All VDOMs, except the root and management VDOMs, send logs to the global syslog server (10.6.30.22).
- The root VDOM sends logs to the following syslog servers:
  - For syslogd, logs are sent to the root VDOM override server at 192.168.5.44 because `use-management-vdom` is disabled.
  - For syslogd2, logs are sent through the management VDOM to the root VDOM override server at 172.16.200.55 and to the syslog server reachable by the management VDOM because `use-management-vdom` is enabled.
  - For syslogd3, logs are sent through the management VDOM to the root VDOM override syslog server at 10.6.30.22 and to the syslog server reachable by the management VDOM because `use-management-vdom` is enabled.
- The management VDOM (vdom1) sends logs to the override syslog server at 172.16.200.55.

To configure syslog servers:

1. Enable the global syslog server:

```
config log syslogd setting
    set status enable
    set server "10.6.30.22"
    set facility local6
end
```

2. For root, configure three override syslog servers:
   a. For syslogd, enable an override syslog server and disable `use-management-vdom`:

```
config log syslogd override-setting
    set status enable
    set server "192.168.5.44"
    set use-management-vdom disable
    set facility local6
end
```

   b. For syslog2, enable an override syslog server and enable `use-management-vdom`:

```
config log syslogd2 override-setting
    set status enable
    set server "172.16.200.55"
    set use-management-vdom enable
    set facility local6
end
```

   c. For syslog3, enable an override syslog server and enable `use-management-vdom`:

```
config log syslogd3 override-setting
    set status enable
    set server "10.6.30.22"
    set use-management-vdom enable
end
```

3. For the management VDOM, configure an override syslog server:

```
config log syslogd override-setting
    set status enable
    set server "172.16.200.55"
    set facility local6
end
```

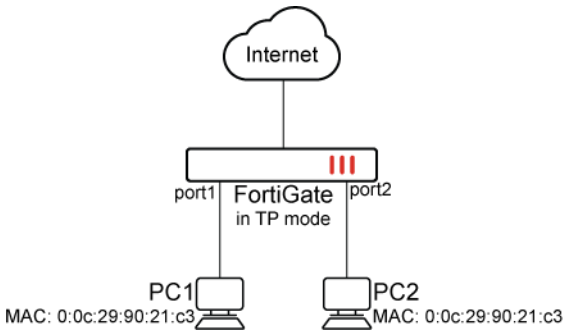
Logging MAC address flapping events

FortiOS logs MAC address flapping events when a device's MAC address is learned on different interfaces within the MAC address table in transparent mode. The log provides comprehensive details about the event, such as the specific MAC address involved, the ports where the flapping occurred, and the exact time of the

event. This enhancement assists network administrators in quickly identifying and addressing related issues, thereby enhancing network stability and performance.

Example

In this example, the end user initiates internet traffic from PC1, which has an authentic MAC address. Subsequently, the user generates internet traffic from PC2 using a packet manipulation tool, such as Scapy, but with the spoofed MAC address of PC1. This event is successfully identified and logged by FortiGate running in transparent (TP) mode.



To view the logs:

```
# execute log filter category 1
# execute log filter start-line 1
# execute log display

36 logs found.
10 logs returned.
1: date=2024-03-26 time=14:05:33 eventtime=1711487133347757075 tz="-0700" logid="0100022970"
type="event" subtype="system" level="information" vd="vdom1" logdesc="MAC flapping"
service="kernel" mac="00:0c:29:90:21:c3" src_int="port1" msg="The incoming port of MAC address
00:0c:29:90:21:c3 has been switched from port2 to port1"
```

Incorporating endpoint device data in the web filter UTM logs

Endpoint device data, including hostname and MAC address, have been incorporated in the web filter UTM logs. Endpoint device data can be incorporated in the logs using the following:

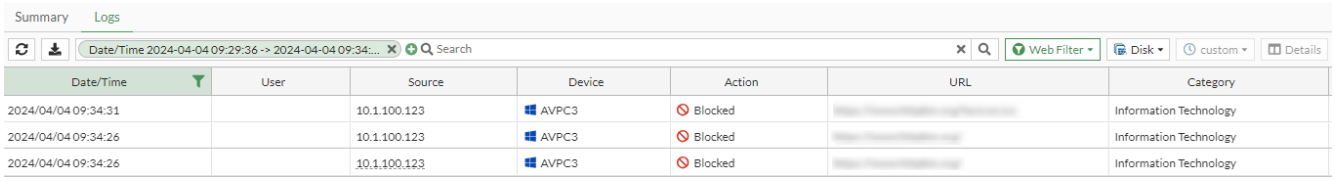
```
config log setting
    set extended-utm-log {enable | disable}
end
```

To incorporate endpoint device data in the web filter UTM logs, ensure a firewall policy with a web filter profile is configured and *Device detection* is configured on the interfaces. *Device detection* can be configured in *Network* > *Interfaces* and the CLI.

When this command is enabled, the `srcmac` and `srcname` fields are included in the web filter UTM logs:

```
1: date=2024-04-04 time=09:34:31 eventtime=1712248470720798942 tz="-0700" logid="0316013056"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="vdom1" policyid=1
poluuid="9f550138-ed67-51ee-b593-e4c9c3cd549f" policytype="policy" sessionid=20910
srcip=10.1.100.123 srcport=59705 srccountry="Reserved" srcintf="port2" srcintfrole="undefined"
srcuuid="04df25b6-ed67-51ee-3006-8c2d12813f90" srcmac="00:0c:29:06:7e:5b" srcname="AVPC3"
dstip=52.201.199.27 dstport=443 dstcountry="United States" dstintf="port1" dstintfrole="undefined"
dstuuid="04df25b6-ed67-51ee-3006-8c2d12813f90" proto=6 httpmethod="GET" service="HTTPS"
hostname="www.httpbin.org" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36
(KH" profile="webfilter" action="blocked" reqtype="referral"
url="https://www.httpbin.org/favicon.ico" referralurl="https://www.httpbin.org/" sentbyte=2088
rcvdbyte=5709 direction="outgoing" msg="URL belongs to a denied category in policy"
ratemethod="domain" cat=52 catdesc="Information Technology"
```

Likewise, the *Device* column is populated with the endpoint hostname information in the *Log & Report* > *Security Events* > *Logs* table:



When this command is disabled, the new fields are excluded from the web filter UTM logs and the *Device* column does not display the client hostname information. The command is disabled by default.

Logging detection of duplicate IPv4 addresses

FortiOS can log each detection of duplicate IPv4 addresses on physical interfaces and VLAN interfaces in the event log under the new log ID 32701.

```
config system global
    set ip-conflict-detection {enable | disable}
end
```

`set ip-conflict-detection {enable | disable}`	Enable/disable logging of IPv4 address conflict detection.

FortiOS uses the following methods to detect duplicate IPv4 addresses, and can generate a log for each detection:

Detection method	Description
Active	Detection of duplicate physical and VLAN IPv4 addresses on FortiGate is triggered when: • FortiOS starts • The miglogd daemon restarts

Detection method	Description
	• A new physical interface is created • A physical interface status changes to up • A physical interface configuration changes • The `diagnose test app miglogd 55` command is run
Passive	Detection of duplicate IPv4 address on a client is triggered when a device connected to FortiGate attempts to use an IPv4 address that is already in use. FortiOS identifies duplicate IPv4 addresses by monitoring the Gratuitous ARP packet. When the source IP in the Gratuitous ARP packet is duplicated in the cache, but the source MAC address is different, then the IP address is considered a duplicate. In addition to physical interfaces, passive detection is also valid for VLAN.

In addition, a packet can be sent to the SNMP host when the SNMP event is set to `interface`.

The `config system snmp community` command includes a new `interface` event:

```
config system snmp community
    edit 1
        set name "test"
        config hosts
            edit 1
                set ip 172.18.71.107 255.255.255.0
            next
        end
        config hosts6
            edit 1
            next
        end
        set events {interface}
    next
end
```

`set events {interface}`	Send a trap for interface events.

The following new debug commands are also available:

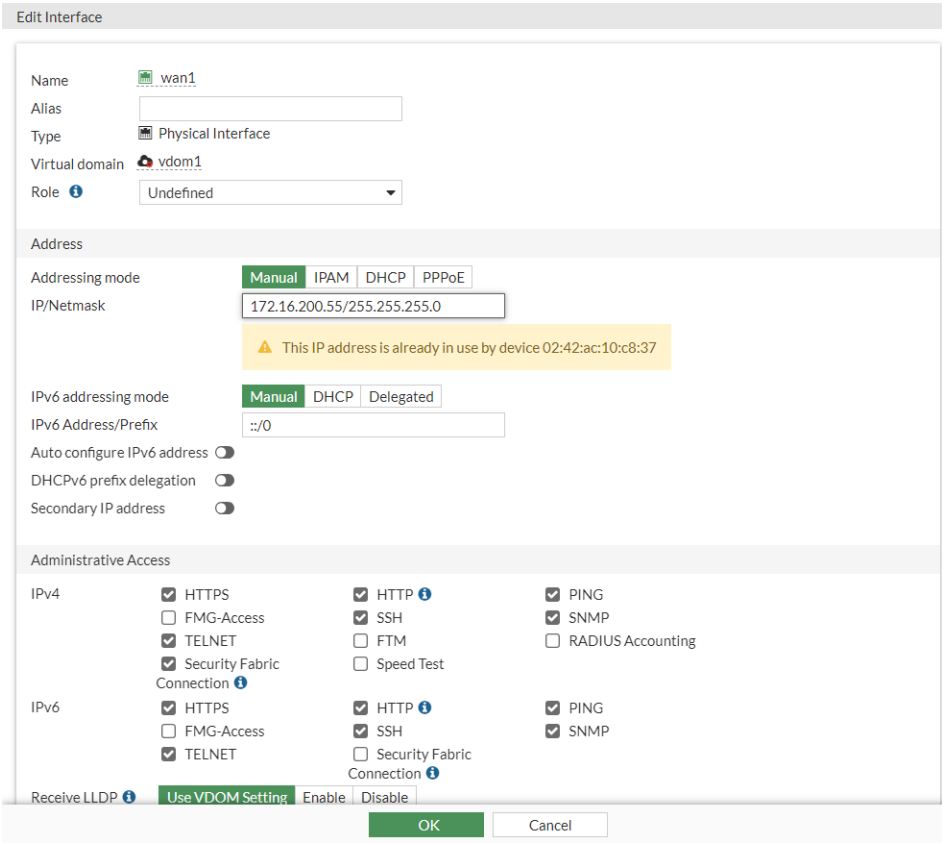
`diagnose test application miglogd 54`	Shows the cache for IPv4 address conflict detection.
`diagnose test application miglogd 55`	Executes a IPv4 address conflict detection.

To enable logging of IPv4 address conflicts:

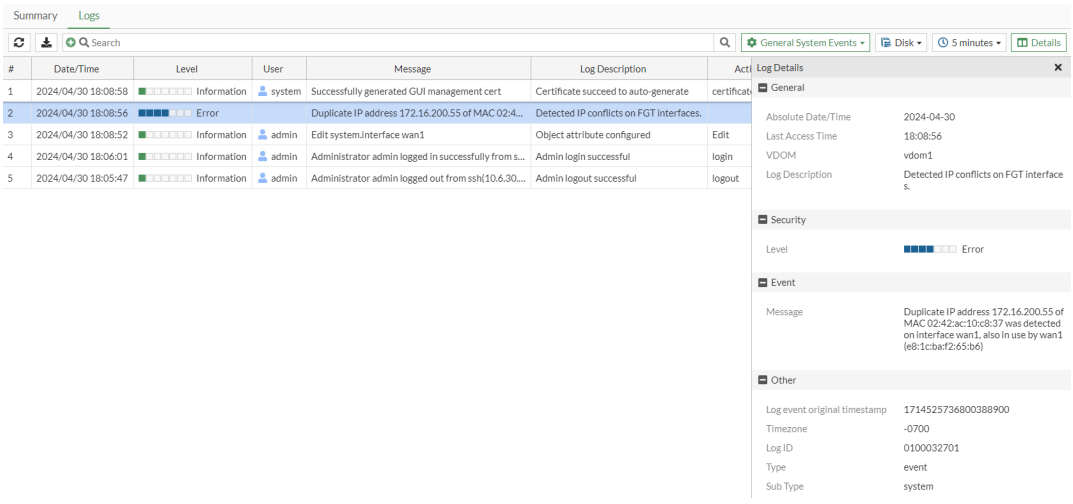
```
config system global
    set ip-conflict-detection enable
end
```

To trigger an active detection and log of IPv4 conflicts:

1. In FortiOS, go to *Network > Interfaces*, and double-click an interface, such as *wan1*, to open it for editing.
2. In the *IP/Netmask* box, change the IP address from *172.16.200.2/24* to *172.16.200.55/24*. The following warning is displayed: *This IP address is already in use by device <MAC address>*.



3. Go to *Log & Report > System Events*. A *Duplicate IP address* log entry is displayed.

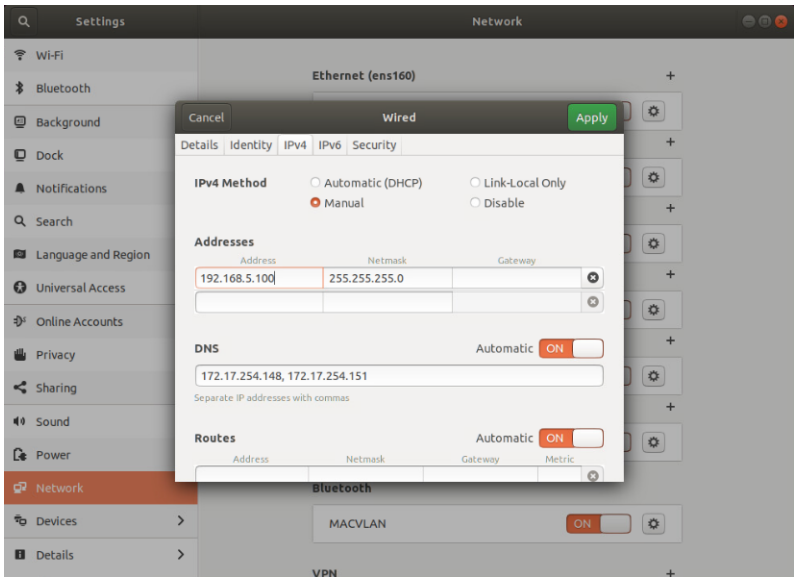


The same information is visible in the raw log

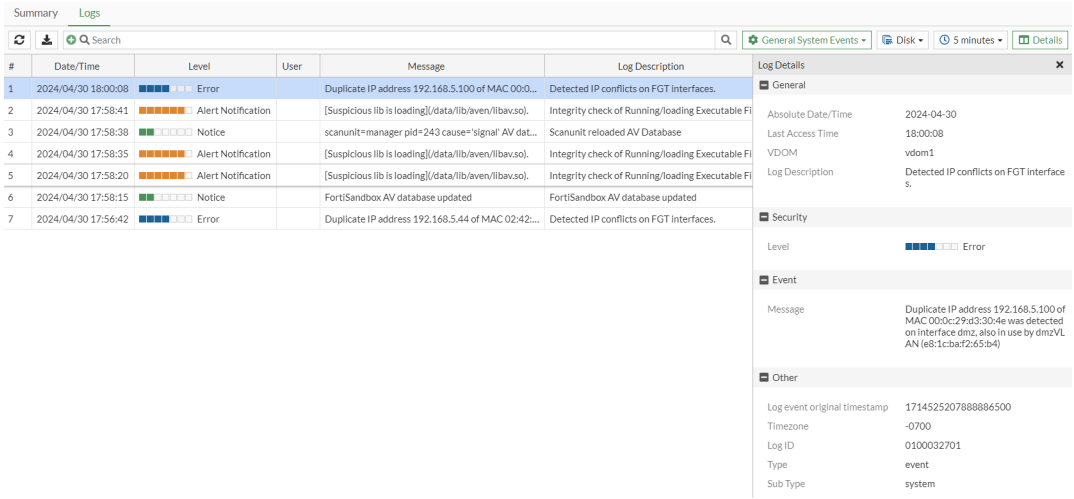
```
date=2024-04-30 time=18:08:56 eventtime=1714525736800388800 tz="-0700" logid="0100032701"
type="event" subtype="system" level="error" vd="vdom1" logdesc="Detected IP conflicts on FGT
interfaces." msg="Duplicate IP address 172.16.200.55 of MAC 02:42:ac:10:c8:37 was detected on
interface wan1, also in use by wan1 (e8:1c:ba:f2:65:b6)"
```

To trigger a passive detection and log of IPv4 conflicts:

1. On a client, change the interface. For example, change the interface from *192.168.5.44* to *192.168.5.100/24*.



2. Go to *Log & Report > System Events*. A *Duplicate IP address* log entry is displayed.



The same information is visible in the raw log

```
date=2024-04-30 time=18:00:08 eventtime=1714525207888886460 tz="-0700" logid="0100032701"
type="event" subtype="system" level="error" vd="vdom1" logdesc="Detected IP conflicts on FGT
interfaces." msg="Duplicate IP address 192.168.5.100 of MAC 00:0c:29:d3:30:4e was detected on
interface dmz, also in use by dmzVLAN (e8:1c:ba:f2:65:b4)"
```

To configure SNMP traps for interfaces:

1. Configure an SNMP host and set up an event trap for interface.

```
config system snmp community
    edit 1
        set name "test"
        config hosts
            edit 1
                set ip 172.16.200.55 255.255.255.0
            next
        end
        set events interface
    next
end
```

To show the IPv4 address conflict detection cache:

```
# diagnose test application miglogd 54
index   IPv4 address    MAC     dev     vlanid
50      10.10.100.2     00:00:00:00:00:00       Loopback2
58      192.168.5.44    e8:1c:ba:f2:65:b4       dmzVLAN 50
48      10.255.1.1      00:00:00:00:00:00       fortilink
51      10.1.10.3       00:00:00:00:00:00       Loopback3
8       10.1.100.2      e8:1c:ba:f2:65:b7       wan2
49      10.10.10.2      00:00:00:00:00:00       loopback
6       10.6.30.107     e8:1c:ba:f2:65:b5       mgmt
52      192.168.100.99  e8:1c:ba:f2:65:bb       lan
23      10.2.2.2        e8:1c:ba:f2:65:c6       x1
7       172.16.200.2    e8:1c:ba:f2:65:b6       wan1
```

To execute an IPv4 address conflict detection:

```
# diagnose test application miglogd 55
Sending probe for 10.10.100.2 via Loopback2.
Sending probe for 192.168.5.44 via dmzVLAN.
Sending probe for 10.255.1.1 via fortilink.
Sending probe for 10.1.10.3 via Loopback3.
Sending probe for 10.1.100.2 via wan2.
Sending probe for 10.10.10.2 via loopback.
Sending probe for 10.6.30.107 via mgmt.
Sending probe for 192.168.100.99 via lan.
Sending probe for 10.2.2.2 via x1.
Sending probe for 172.16.200.2 via wan1.
```

To verify the trap has been sent:

```
# diagnose debug application snmp -1
# diagnose debug enable
snmpd: queue is 2 entries long.
```

```
snmpd: queueing trap 8008000000000000@4295121097 (4295121097)
snmpd: queue is 3 entries long.
snmpd: dequeueing trap 8008000000000000@4295121097 (4295121097)
snmpd: sending to hosts: interface(1601)

Security Logs > SSH and Security Logs > SSL

Log configuration requirements

```
config ssh-filter profile
    edit "ssh-deepscan"
        set block shell
        set log shell
        set default-command-log disable
    next
end
```

```
config firewall policy
    edit 1
        set srcintf "port21"
        set dstintf "port23"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssh-filter-profile "ssh-deepscan"
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "ssl"
        set nat enable
    next
end
```

For SSL-Traffic-log, enable `logtraffic all`

```
config firewall policy
    edit 1
        set srcintf "dmz"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set logtraffic all
        set ssl-ssh-profile "deep-inspection"
        set nat enable
    next
end
```

For SSL-UTM-log

```
#EVENTTYPE="SSL-ANOMALIES"
```

By default, `ssl-anomaly-log` is enabled.

```
config firewall ssl-ssh-profile
    edit "deep-inspection"
        set comment "Read-only deep inspection profile."
        set server-cert-mode re-sign
        set caname "Fortinet_CA_SSL"
        set untrusted-caname "Fortinet_CA_Untrusted"
        set ssl-anomaly-log enable
        set ssl-exemption-log disable
        set ssl-negotiation-log disable
        set rpc-over-https disable
        set mapi-over-https disable
        set use-ssl-server disable
    next
end
```

```
# EVENTTYPE="SSL-EXEMPT"
```

Enable `ssl-exemption-log` to generate ssl-utm-exempt log.

```
config firewall ssl-ssh-profile
    edit "deep-inspection"
        set comment "Read-only deep inspection profile."
        set server-cert-mode re-sign
        set caname "Fortinet_CA_SSL"
        set untrusted-caname "Fortinet_CA_Untrusted"

Troubleshooting

The following topics provide information about troubleshooting logging and reporting:

- Log-related diagnostic commands on page 4213
- Backing up log files or dumping log messages on page 4219
- SNMP OID for logs that failed to send on page 4221

Log-related diagnostic commands

This topic contains examples of commonly used log-related diagnostic commands. Local logging is handled by the locallogd daemon, and remote logging is handled by the fgtlogd daemon.

Log search debugging

The `diagnose debug application miglogd 0x1000` command is used is to show log filter strings used by the log search backend. It also shows which log files are searched.

To run log search debugging:

```
# diagnose debug application miglogd 0x1000
Debug messages will be on for 28 minutes.
# diagnose debug enable

# Files to be searched:
file_no=65422, start line=0, end_line=805
```

```
file_no=65423, start line=0, end_line=221
session ID=2, total logs=1028
back ground search. process ID=2913, session_id=2
 start line=1 view line=10 pre-fetch-pages=2

back ground search. next log file roll number is: 65422

```

Log filtering

The `execute log filter` command can be used to define and display specific log messages based on the parameters entered.

To display all login system event logs:

```
# execute log filter device disk
# execute log filter category event
# execute log filter field action login
# execute log display

Files to be searched:

```

To check the FortiGate to FortiGate Cloud connection status:

```
# diagnose test application fgtlogd 20
Home log server:
    Address: 173.243.132.57:514
Alternative log server:
    Address: 173.243.132.121:514
FazCloud log server:
    Address:
    oftp status: connected
Debug zone info:
    Server IP:          173.243.132.57
    Server port:        514
    Server status:      up
    Server log status:  enabled
```

```
    Log quota:          500000000MB
    Log used:           599MB
    Daily volume:       1000000MB
    FDS arch pause:     0
    fams archive pause: 0
```

locallogd diagnostics

To check real-time log statistics by log type since the locallogd daemon start:

```
# diagnose test application locallogd 3
info for vdom: root
memory
traffic: logs=18289 len=15921725, Sun=0 Mon=18289 Tue=0 Wed=0 Thu=0 Fri=0 Sat=0
event: logs=286 len=115729, Sun=0 Mon=286 Tue=0 Wed=0 Thu=0 Fri=0 Sat=0
app-ctrl: logs=10018 len=7051278, Sun=0 Mon=10018 Tue=0 Wed=0 Thu=0 Fri=0 Sat=0

disk
traffic: logs=18289 len=15921725, Sun=0 Mon=18289 Tue=0 Wed=0 Thu=0 Fri=0 Sat=0 compressed=1620003
event: logs=280 len=112390, Sun=0 Mon=280 Tue=0 Wed=0 Thu=0 Fri=0 Sat=0 compressed=13157
app-ctrl: logs=10018 len=7051278, Sun=0 Mon=10018 Tue=0 Wed=0 Thu=0 Fri=0 Sat=0 compressed=836906
```

fgtlogd diagnostics

To check real-time log statistics by log type since the fgtlogd daemon start:

```
# diagnose test application fgtlogd 3
info for vdom: root
faz
traffic: logs=11763 len=6528820, Sun=2698 Mon=3738 Tue=0 Wed=0 Thu=0 Fri=2523 Sat=2804
compressed=1851354
event: logs=2190 len=891772, Sun=500 Mon=400 Tue=0 Wed=0 Thu=0 Fri=786 Sat=504 compressed=713129
app-ctrl: logs=1 len=692, Sun=0 Mon=0 Tue=0 Wed=0 Thu=0 Fri=1 Sat=0 compressed=384

faz-cloud
traffic: logs=11763 len=6528820, Sun=2698 Mon=3738 Tue=0 Wed=0 Thu=0 Fri=2523 Sat=2804
event: logs=2190 len=891772, Sun=500 Mon=400 Tue=0 Wed=0 Thu=0 Fri=786 Sat=504
app-ctrl: logs=1 len=692, Sun=0 Mon=0 Tue=0 Wed=0 Thu=0 Fri=1 Sat=0
```

To check the remote queue and see the maximum buffered memory size:

```
# diagnose test application fgtlogd 41
cache maximum: 19569745(18MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Memory queue for: global-faz
        queue:
                num:0 size:0(0MB) total size:0(0MB) max:19569745(18MB) logs:0
Confirm queue for: global-faz
```

```
        queue:
                num:0 size:0(0MB) total size:0(0MB) max:19569745(18MB) logs:0
Memory queue for: fds
        queue:
                num:0 size:0(0MB) total size:0(0MB) max:19569745(18MB) logs:0
Confirm queue for: fds
        queue:
                num:0 size:0(0MB) total size:0(0MB) max:19569745(18MB) logs:0
```

miglogd diagnostics

The miglogd daemon includes a publisher/subscriber framework that separates functions into different daemons. The miglogd daemon is responsible for building and publishing logs, while device-related details are managed by subscriber daemons.

To enable debugging the miglogd (log daemon) at the proper debug level:

```
# diagnose debug application miglogd <integer>
# diagnose debug enable
```

To display the status or statistics at the proper debug level:

```
# diagnose test application miglogd <integer>
# diagnose debug enable
```

When using the preceding commands, press `Enter` after `diagnose debug application miglogd` or `diagnose test application miglogd` to view the list of available levels.

To check log statistics to the local/remote log device since the miglogd daemon start:

```
# diagnose test application miglogd 6
mem=4288, disk=4070, alert=0, alarm=0, sys=5513, faz=4307, webt=0, fds=0
interface-missed=208
```

To check the miglogd daemon number:

```
# diagnose test application miglogd 15
Main miglogd: ID=0, children=2, active-children=2
        ID=1, duration=70465.
        ID=2, duration=70465.
```

To increase one miglogd child:

```
# diagnose test application miglogd 13
# diagnose test application miglogd 15
```

```
Main miglogd: ID=0, children=3, active-children=3
        ID=1, duration=70486.
        ID=2, duration=70486.
        ID=3, duration=1.
```

To decrease one miglogd child:

```
# diagnose test application miglogd 14
# diagnose test application miglogd 15
Main miglogd: ID=0, children=2, active-children=2
        ID=1, duration=70604.
        ID=2, duration=70604.
```

Backing up log files or dumping log messages

When a log issue is caused by a particular log message, it is very help to get logs from that FortiGate. This topic provides steps for using `execute log backup` or dumping log messages to a USB drive.

Backing up full logs using execute log backup

This command backs up all disk log files and is only available on FortiGates with an SSD disk.

Before running `execute log backup`, we recommend temporarily stopping `miglogd` and `reportd`.

To stop and kill miglogd and reportd:

```
diagnose sys process daemon-auto-restart disable miglogd
diagnose sys process daemon-auto-restart disable reportd
```

Or

1. Determine the process, or thread, ID (PID) of `miglogd` and `reportd`:

   ```
   # diagnose sys top 10 99
   ```

2. Kill each process:

   ```
   # diagnose sys kill 9 <PID>
   ```

To store the log file on a USB drive:

1. Plug in a USB drive into the FortiGate.
2. Run this command:

   ```
   execute log backup /usb/log.tar
   ```

To restart miglogd and reportd:

```
diagnose sys process daemon-auto-restart enable miglogd
diagnose sys process daemon-auto-restart enable reportd
```

Dumping log messages

To dump log messages:

1. Enable log dumping for `miglogd` daemon:

```
(global) # diagnose test application miglogd 26 1
miglogd(1) log dumping is enabled
```

2. Display all `miglogd` dumping status:

```
global) # diagnose test application miglogd 26 0 255
miglogd(0) log dumping is disabled
miglogd(1) log dumping is enabled
miglogd(2) log dumping is disabled
```

```
(global) # diagnose test application miglogd 26 2
miglogd(2) log dumping is enabled

(global) # diagnose test application miglogd 26 0
miglogd(0) log dumping is enabled

(global) # diagnose test application miglogd 26 0 255
miglogd(0) log dumping is enabled
miglogd(1) log dumping is enabled
miglogd(2) log dumping is enabled
```

3. Let the FortiGate run and collect log messages.
4. List the log dump files:

```
(global) # diagnose test application miglogd 33
2019-04-17 15:50:02          20828      log-1-0.dat
2019-04-17 15:48:31           4892      log-2-0.dat
```

5. Back up log dump files to the USB drive:

```
(global) # diagnose test application miglogd 34

Dumping file miglog1_index0.dat copied to USB disk OK.

Dumping file miglog2_index0.dat copied to USB disk OK.
```

6. Disable log dumping for `miglogd` daemon:

```
(global) # diagnose test application miglogd 26 0
miglogd(0) log dumping is disabled
```

```
(global) # diagnose test application miglogd 26 1
miglogd(1) log dumping is disabled

(global) # diagnose test application miglogd 26 2
miglogd(2) log dumping is disabled

(global) # diagnose test application miglogd 26 0 255
miglogd(0) log dumping is disabled
miglogd(1) log dumping is disabled
miglogd(2) log dumping is disabled
```

SNMP OID for logs that failed to send

When a syslog server encounters low-performance conditions and slows down to respond, the buffered syslog messages in the kernel might overflow after a certain number of retransmissions, causing the overflowed messages to be lost. OIDs track the lost messages or failed logs.

SNMP query OIDs include log statistics for global log devices:

- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDeviceNumber 1.3.6.1.4.1.12356.101.21.1.1
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceEntryIndex 1.3.6.1.4.1.12356.101.21.2.1.1.1
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceEnabled 1.3.6.1.4.1.12356.101.21.2.1.1.2
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceName 1.3.6.1.4.1.12356.101.21.2.1.1.3
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceSentCount 1.3.6.1.4.1.12356.101.21.2.1.1.4
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceRelayedCount 1.3.6.1.4.1.12356.101.21.2.1.1.5
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceCachedCount 1.3.6.1.4.1.12356.101.21.2.1.1.6
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceFailedCount 1.3.6.1.4.1.12356.101.21.2.1.1.7
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceDroppedCount 1.3.6.1.4.1.12356.101.21.2.1.1.8

Where:

- fgLogDeviceNumber is the number of devices in the table.
- fgLogDeviceEnabled is either 1 or 0, indicating whether the device is enabled.

- fgLogDeviceName is the name of the device.

A FortiGate connected to a syslog server or FortiAnalyzer generates statistics that can be seen using the `diagnose test application syslogd` command:

```
(global) # diagnose test application syslogd 4
syslog=437, nulldev=0, webtrends=0, localout_ioc=258, alarms=0
global log dev statistics:
syslog 0: sent=222, failed=0, cached=0, dropped=0
syslog 1: sent=215, failed=0, cached=0, dropped=0
syslog 2: sent=95, failed=0, cached=0, dropped=0
```

The same statistics are also available in `snmpwalk/snmpget` on the OID 1.3.6.1.4.1.12356.101.21.

```
snmpwalk -v2c -c REGR-SYS 172.16.200.1 1.3.6.1.4.1.12356.101.21

```

To get the type of logging device that is attached to the FortiGate:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1
1.3.6.1.4.1.12356.101.21.2.1.1.3
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.0 = STRING: "syslog"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.1 = STRING: "syslog2"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.2 = STRING: "syslog3"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.3 = STRING: "syslog4"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.4 = STRING: "faz"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.5 = STRING: "faz2"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.6 = STRING: "faz3"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.7 = STRING: "webtrends"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.8 = STRING: "fds"
```

To get the present state of the logging device that is attached to the FortiGate:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1
1.3.6.1.4.1.12356.101.21.2.1.1.2
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.0 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.1 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.2 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.3 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.4 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.5 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.6 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.7 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.8 = INTEGER: 0
```

To get the failed log count value:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1
1.3.6.1.4.1.12356.101.21.2.1.1.7
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.0 = Counter32: 139

FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.7 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.8 = Counter32: 0
```

WAN optimization

Many multi-location enterprise environments reduce costs and consolidate resources by centralizing applications or providing applications in the cloud. Applications that work fine on a local LAN, such as Windows File Sharing (CIFS), email exchange (MAPI), and many others, suffer from bandwidth limitations and latency issues when accessed over a WAN. This results in a loss of productivity and a perceived need for expensive network upgrades. WAN optimization reduces your network overhead and removes unnecessary traffic for a better overall performance experience and eliminates the need for costly WAN link upgrades between data centers and other expensive solutions for your network traffic growth.

FortiOS WAN optimization provides an inexpensive and comprehensive solution that maximizes your WAN performance and provides intelligent bandwidth management and unmatched consolidated security performance.

FortiOS includes license-free WAN optimization on most current FortiGate devices with internal storage that also support SSL offloading.

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 98 for more information.

Features

The following features are available through WAN optimization:

Protocol optimization

Protocol optimization is effective for applications designed for the LAN that do not function well on low bandwidth, high latency networks. See Protocol optimization on page 4233 for more information.

Byte caching

Byte caching improves caching by accelerating the transfer of similar, but not identical content. See Byte caching on page 4234 for more information.

SSL offloading

SSL is used by many organizations to keep WAN communications private. WAN optimization utilizes the SSL offloading capabilities of the FortiGate FortiASIC hardware to accelerate SSL traffic across the WAN. The

FortiGate unit handles SSL encryption and decryption for corporate servers providing SSL encrypted connections over the WAN. See SSL Offloading on page 4229 for more information.

WAN optimization and HA

You can configure WAN optimization on a FortiGate HA cluster. See HA on page 4238 for more information.

Secure tunneling

FortiOS WAN optimization supports secure SSL-encrypted tunnels between FortiGate units on the WAN. See Secure tunneling on page 4231 for more information.

Prerequisites

FortiGate WAN optimization is proprietary to Fortinet Inc.. It will not work with other vendors' WAN optimization or offloading features.

Before you begin to configure WAN optimization, please go through the following steps:

1. To use WAN optimization, your FortiGate unit must support it and not all FortiGate units do. In general, your FortiGate unit must include a hard disk to support these features. See Feature Platform Matrix.
2. If the physical FortiGate has only one hard disk, make sure it is selected for WAN optimization. See Disk usage on page 4227 for more information.
3. For FortiGate-VM, ensure you create two virtual disks besides the boot disk for WAN optimization to work.
4. To be able to configure WAN optimization from the GUI you should begin by going to *System* > *Feature Visibility* and turning on *WAN Opt. & Cache*.
5. If you enable virtual domains (VDOMs) on the FortiGate unit, WAN optimization is available separately for each VDOM.

At this stage, the following installation and configuration conditions are assumed:

- For WAN optimization you have already successfully installed two or more FortiGate units at various locations across your WAN.
- You have administrative access to the GUI or CLI.
- The FortiGate units are integrated into your WAN or other networks.
- The system time, DNS settings, administrator password, and network interfaces have been configured.
- Firmware, FortiGuard Antivirus, and FortiGuard Antispam updates are completed.
- Your Fortinet products have been registered. Register your Fortinet Inc. products at the Fortinet Technical Support website, https://support.fortinet.com.

Disk usage

Both logging and WAN optimization use hard disk space to save data. In FortiOS, you cannot use the same hard disk for both WAN optimization and logging.

- If the FortiGate has one hard disk, then it can be used for either disk logging or WAN optimization, but not both. By default, the hard disk is used for disk logging.

  Only physical FortiGate devices can switch between disk logging and WAN optimization in the case of a single hard disk. FortiGate-VM must have two virtual disks apart from the boot disk for WAN optimization to work.

- If the FortiGate has two hard disks, then one disk is always used for disk logging and the other disk is always used for WAN optimization.

On the FortiGate, go to *System* > *Settings* > *Disk Settings* to switch between *Local Log* and *WAN Optimization*.

You can also change disk usage from the CLI using the following command:

```
config system storage
    edit <name>
        set usage  {log | wanopt}
        set wanopt-mode {mix | wanopt | webcache}
    next
end
```

Option	Description
`wanopt-mode`	WAN optimization mode: • `mix`: This is the default mode. • `wanopt`: Recommended if only the WANopt feature is enabled. • `webcache`: Recommended if only the webcache feature is enabled. If only one of the two features is being used, using the applicable recommended mode will give a higher cache capacity and improve performance.

Enabling WAN optimization affects more than just disk logging. The following table shows other features affected by the FortiGate disk configuration.

Feature	1 hard disk	2 hard disks
Logging	Not supported	Supported
Report/Historical FortiView	Not supported	Supported
Firewall Packet Capture (Policy Capture and Interface Capture)	Not supported	Supported
AV Quarantine	Not supported	Supported

Feature	1 hard disk	2 hard disks
IPS Packet Capture	Not supported	Supported
DLP Archive	Not supported	Supported
Sandbox DB & Results	FortiSandbox database and results are also stored on disk, but will not be affected by this feature.	
Remote Logging	Remote logging (including logging to FortiAnalyzer and Syslog servers) is not affected by this features.	

Changing the disk setting formats the disk, erases current data stored on the disk, and disables either disk logging or WAN optimization.

The following sections provide information about WAN optimization:

- Overview on page 4228
- Example topologies on page 4240
- Configuration examples on page 4242

Overview

The following topics provide an overview on WAN optimization:

- Peers and authentication groups on page 4230
- Tunnels on page 4231
- Transparent mode on page 4232
- Protocol optimization on page 4233
- Cache service and video caching on page 4235
- Manual and active-passive on page 4235
- Monitoring performance on page 4236
- System and feature operation with WAN optimization on page 4237
- Best practices on page 4240

Client/server architecture

Traffic across a WAN typically consists of clients on a client network communicating across a WAN with a remote server network. The clients do this by starting communication sessions from the client network across a WAN to the server network. When you have FortiGates on each end, you can optimize these sessions by adding a WAN optimization profile.

To use WAN optimization, the FortiGate units can operate in either NAT or transparent mode. The client-side and server-side FortiGate units do not have to be operating in the same mode. The client-side FortiGate unit is

located between the client network and the WAN. The server-side FortiGate unit is located between the server network and the WAN.

WAN optimization profiles are only added to the client-side. The server-side FortiGate unit employs the WAN optimization settings set in the WAN optimization profile on the client-side FortiGate unit.

Profiles

Use WAN optimization profiles to apply WAN optimization techniques to traffic to be optimized. In a WAN optimization profile you can select the protocols to be optimized and for HTTP protocol. You can also enable SSL offloading (if supported), secure tunneling, byte caching, transparent mode, and optionally select an authentication group. You can edit the default WAN optimization profile or create new ones. See Configuration examples on page 4242 for sample configuration.

Transparent mode	Servers receiving packets after WAN optimization see different source addresses depending on whether or not you select *Transparent Mode*. See Transparent mode on page 4232 for more information.
Authentication group	Select this option and select an authentication group so that the client and server-side FortiGate units must authenticate with each other before starting the WAN optimization tunnel. See Peers and authentication groups on page 4230 for more information.
Protocol	Select CIFS, FTP, HTTP, MAPI or TCP to apply protocol optimization for the selected protocols. See Protocol optimization on page 4233 for more information.
SSL Offloading	Select to apply SSL offloading for HTTPS traffic. You can use SSL offloading to offload SSL encryption and decryption from one or more HTTP servers to the FortiGate unit. If you enable this option, you must also use one of the following option to achieve SSL offloading: • Enable ssl profile with *ssl deep-inspection* in the WAN optimization firewall policy on the client-side and use the CLI command `config firewall ssl-server` to add an SSL server on the server-side for each HTTP server that you want to offload SSL encryption and decryption for. • Enable ssl profile with *ssl deep-inspection* in the WAN optimization firewall policy on client-side and WAN optimization proxy policy on server-side to accept SSL encrypted traffic.
SSL Secure Tunneling	The WAN optimization tunnel is encrypted using SSL encryption. You must also add an authentication group to the profile. See Secure tunneling on page 4231 for more information.
Byte Caching	Select to apply WAN optimization byte caching to the sessions accepted by this rule. See Byte caching on page 4234 for more information.

Peers and authentication groups

The client-side and server-side FortiGate units are called WAN optimization peers. The client and server roles relate to how a session is started. Any FortiGate unit configured for WAN optimization can be a client-side and a server-side FortiGate unit at the same time, depending on the direction of the traffic. Client-side FortiGate units initiate WAN optimization sessions and server-side FortiGate units respond to the session requests.

During this process, the WAN optimization peers identify and optionally authenticate each other. The authentication group is optional unless the tunnel is a secure tunnel. You need to add authentication groups to support secure tunneling between WAN optimization peers.

Peer requirements

WAN optimization requires the following configuration on each peer:

- The peer must have a unique host ID.
- Unless authentication groups are used, peers authenticate each other using host ID values. Do not leave the local host ID at its default value.
- The peer must know the host IDs and IP addresses of all of the other peers that it can start WAN optimization tunnels with. This does not apply if you use authentication groups that accept all peers.
- If a FortiGate unit or VDOM is operating in transparent mode, WAN optimization uses the management IP address as the peer IP address of the FortiGate unit instead of the address of an interface.
- All peers must have the same local certificate installed on their FortiGate units if the units authenticate by local certificate. Furthermore, system time must be enabled to ensure that SSL/TLS certificate expiry can be validated. Similarly, if the units authenticate by pre-shared key (password), administrators must know the password. The type of authentication is selected in the authentication group. This applies only if you use authentication groups.

Tunnel requests for peer authentication

When a client-side FortiGate unit attempts to start a WAN optimization tunnel with a peer server-side FortiGate unit, the tunnel request includes the following information:

- The client-side host ID.
- The name of an authentication group, if included in the rule that initiates the tunnel.
- The authentication method it specifies (pre-shared key or certificate), if an authentication group is used.
- The type of tunnel (secure or not).

If the tunnel request does not include an authentication group, authentication will be based on the client-side host ID in the tunnel request.

If the tunnel request includes an authentication group, the authentication will be based on the settings of this group as follows:

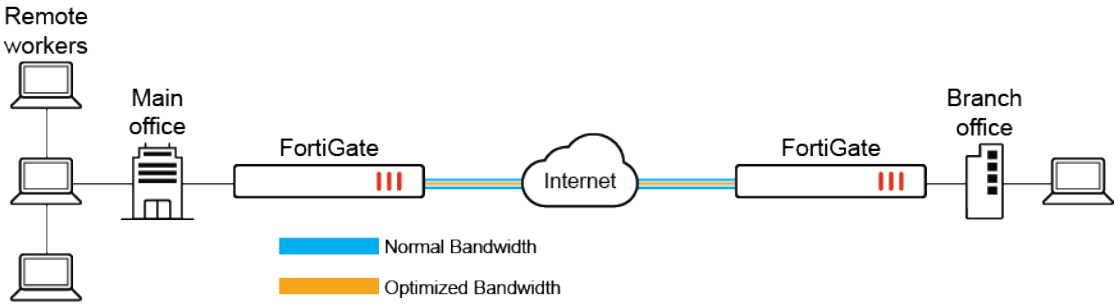
- The server-side FortiGate unit searches its own configuration for the name of the authentication group in the tunnel request. If no match is found, the authentication fails.
- If a match is found, the server-side FortiGate unit compares the authentication method in the client and server authentication groups. If the methods do not match, the authentication fails.

- If the authentication methods match, the server-side FortiGate unit tests the peer acceptance settings in its copy of the authentication group.
  - If the *Accept peer(s)* setting is *Any* , the authentication is successful.
  - If the *Accept peer(s)* setting is *One*, the server-side FortiGate unit compares the client-side host ID in the tunnel request with the peer name in the server-side authentication group. If the names match, authentication is successful. If a match is not found, authentication fails.
  - If the *Accept peer(s)* setting is *Defined Peers Only*, the server-side FortiGate unit compares the client-side host ID in the tunnel request with the server-side peer list. If a match is found, authentication is successful. If a match is not found, authentication fails.

After a tunnel is established, multiple WAN optimization sessions can start and stop between peers without restarting the tunnel.

Tunnels

All optimized traffic passes between the FortiGate units over a WAN optimization tunnel. Traffic in the tunnel can be sent in plain text or encrypted. Both plain text and the encrypted tunnels use TCP destination port 7810.



Secure tunneling

You can configure a WAN optimization profile to use SSL secure tunneling to encrypt the traffic in the WAN optimization tunnel using AES-128bit-CBC SSL. WAN optimization uses FortiASIC acceleration to accelerate SSL decryption and encryption of the secure tunnel. Secure tunneling can be enabled in both manual and active-passive WAN optimization configuration. See Manual and active-passive on page 4235 for more information.

To use secure tunneling, you must add an authentication group and enable *SSL Secure Tunneling* in a WAN optimization profile. The *Accept peers(s)* setting of the authentication group does not affect secure tunneling. See Secure tunneling configuration example on page 4253 for sample configuration.

Tunnel sharing

Tunnel sharing means multiple WAN optimization sessions share the same tunnel. It can improve performance by reducing the number of WAN optimization tunnels between FortiGate units. Having fewer tunnels means less data to manage. Also, tunnel setup requires more than one exchange of information between the ends of the tunnel. Once the tunnel is set up, each new session that shares the tunnel avoids tunnel setup delays.

Tunnel sharing also uses bandwidth more efficiently by reducing the chances that small packets will be sent down the tunnel. For example, suppose a FortiGate unit is processing five WAN optimization sessions and each session has 100 bytes to send. If these sessions use a shared tunnel, WAN optimization combines the packets from all five sessions into one 500-byte packet. If each session uses its own private tunnel, five 100-byte packets will be sent instead. Each packet also requires a TCP ACK reply. The combined packet in the shared tunnel requires one TCP ACK packet. The separate packets in the private tunnels require five.

Tunnel sharing is not always recommended and may not always be the best practice. For instance, aggressive and non-aggressive protocols should not share the same tunnel. An aggressive protocol can be defined as a protocol that is able to get more bandwidth than a non-aggressive protocol, for example, HTTP and FTP. If aggressive and non-aggressive protocols share the same tunnel, the aggressive protocols may take all of the available bandwidth. As a result, the performance of less aggressive protocols could be reduced.

To avoid this problem, rules for HTTP and FTP traffic should have their own tunnel. To do this, set `tunnel-sharing` to `private` for WAN optimization rules that accept HTTP or FTP traffic.

It is also useful to set `tunnel-sharing` to `express-shared` for applications, such as Telnet, that are very interactive but not aggressive.

Set `tunnel-sharing` to `shared` for applications that are not aggressive and are not sensitive to latency or delays.

Example configuration

To configure tunnel sharing for HTTP traffic in a WAN optimization profile:

```
config wanopt profile
    edit default
        config http
            set tunnel-sharing {express-shared | private | shared}
        end
    next
end
```

Transparent mode

WAN optimization is transparent to users. This means that with WAN optimization in place, clients connect to servers in the same way as they would without WAN optimization. However, servers receiving packets after WAN optimization see different source addresses depending on whether or not transparent mode is selected for WAN optimization. If transparent mode is selected, WAN optimization keeps the original source address of the packets, so servers appear to receive traffic directly from clients. Routing on the server network should be configured to route the traffic back to the client network.

Some protocols, for example CIFS, may not function as expected if transparent mode is not selected. In most cases, for CIFS WAN optimization you should select transparent mode and confirm the server network can route traffic as described to support transparent mode.

If transparent mode is not selected, the source address of the packets received by servers is changed to the address of the server-side FortiGate unit interface that sends the packets to the servers. So servers appear to

receive packets from the server-side FortiGate unit. Routing on the server network is simpler in this case because client addresses are not involved. All traffic appears to come from the server-side FortiGate unit and not from individual clients.

Do not confuse WAN optimization transparent mode with FortiGate transparent mode. WAN optimization transparent mode is similar to source NAT. FortiGate's transparent mode is a system setting that controls how the FortiGate unit (or a VDOM) processes traffic.

Configuring transparent mode

You can configure transparent mode by selecting *Transparent* in a WAN optimization profile. The profile is added to an active WAN optimization policy.

When you configure a passive WAN optimization policy you can accept or override the active policy transparent setting. From the GUI you can do this by setting the *Passive* option as follows:

- *Default*: Use the transparent setting in the WAN optimization profile added to the active policy (client-side configuration).
- *Transparent*: Override the active policy transparent mode setting and impose transparent mode. Packets exiting the FortiGate keep their original source addresses.
- *Non-transparent*: Override the active policy transparent mode setting and impose non-transparent mode. Packets exiting the FortiGate have their source address changed to the address of the server-side FortiGate unit interface that sends the packets to the servers.

To configure a passive wan optimization policy in the CLI:

```
config firewall policy
    edit <policy ID>
        set srcintf <Incoming interface>
        set wanopt-passive-opt {default | transparent | non-transparent}
    next
end
```

Protocol optimization

Protocol optimization techniques optimize bandwidth use across the WAN. These techniques can improve the efficiency of communication across the WAN optimization tunnel by reducing the amount of traffic required by communication protocols. You can apply protocol optimization to CIFS, FTP, HTTP, MAPI, and general TCP sessions. You can apply general TCP optimization to MAPI sessions.

FortiGate supports WAN optimization for SMBv1, SMBv2, and SMBv3 (unencrypted only) protocols.

For example, CIFS provides file access, record locking, read/write privileges, change notification, server name resolution, request batching, and server authentication. CIFS requires many background transactions to successfully transfer a single file. This is usually not a problem across a LAN. However, across a WAN, latency and bandwidth reduction can slow down CIFS performance.

When you select the CIFS protocol in a WAN optimization profile, the FortiGate units at both ends of the WAN optimization tunnel use a number of techniques to reduce the number of background transactions that occur over the WAN for CIFS traffic.

If a policy accepts a range of different types of traffic, you can set *Protocol* to *TCP* to apply general optimization techniques to TCP traffic. However, applying this TCP optimization is not as effective as applying more protocol-specific optimization to specific types of traffic. TCP protocol optimization uses techniques such as TCP SACK support, TCP window scaling and window size adjustment, and TCP connection pooling to remove TCP bottlenecks.

Byte caching

Byte caching breaks large units of application data (for example, a file being downloaded from a web page) into small chunks of data, labeling each chunk of data with a hash of the chunk and storing those chunks and their hashes in a database. The database is stored on a WAN optimization storage device. Then, instead of sending the actual data over the WAN tunnel, the FortiGate unit sends the hashes. The FortiGate unit at the other end of the tunnel receives the hashes and compares them with the hashes in its local byte caching database. If any hashes match, that data does not have to be transmitted over the WAN optimization tunnel. The data for any hashes that does not match is transferred over the tunnel and added to that byte caching database. Then the unit of application data (the file being downloaded) is reassembled and sent to its destination.

The stored byte caches are not application specific. Byte caches from a file in an email can be used to optimize downloading that same file or a similar file from a web page.

The result is less data transmitted over the WAN. Initially, byte caching may reduce performance until a large enough byte caching database is built up.

To enable byte caching, select *Byte Caching* in a WAN optimization profile.

Byte caching cannot determine whether or not a file is compressed (for example a zip file), and caches compressed and non-compressed versions of the same file separately.

Dynamic data chunking for byte caching

Dynamic data chunking can improve byte caching by improving detection of data chunks that are already cached in changed files or in data embedded in traffic using an unknown protocol. Dynamic data chunking can only be enabled from the CLI and is available for HTTP, CIFS and FTP.

Dynamic data chunking is disabled by default and `prefer-chunking` is set to `fix`.

To enable dynamic data chunking for HTTP in the default WAN optimization profile:

```
config wanopt profile
    edit default
        config http
            set prefer-chunking dynamic
        end
    next
end
```

Cache service and video caching

Two features that can only be configured in the CLI include cache service and video caching.

Cache service

The `config wanopt cache-service` command is used to configure cache-service clusters between multiple FortiGates. The result is that the cache-service daemons of the different FortiGates can collaborate for serving web cache entries.

See config wanopt cache-service in the CLI Reference guide for more configuration information.

Video caching

The `config wanopt content-delivery-network-rule` command configures web-caching, including the video-cache matching rules.

See config wanopt content-delivery-network-rule in the CLI Reference guide for more configuration information.

Manual and active-passive

You can create manual (peer-to-peer) and active-passive WAN optimization configurations.

There are a few key differences between manual and active-passive mode:

- For manual mode, the tunnels are always up which makes it more resource extensive as compared to active-passive.
- The performance of active-passive mode is lower than manual mode for the new connection.
- The active-passive mode can be used to deploy tunnel dynamically using *Authentication groups* set to accept *Any* peers which eliminates the need of defining peers manually. This is not possible with manual mode.

This setting is only recommended when you do not know the peer host IDs or IP addresses of the peers that will use this authentication group. This setting is most often used with FortiGate units that do not have static IP addresses, for example units that use DHCP.

- For manual mode, traffic shaping cannot be applied to traffic on the server-side. See Traffic shaping on page 4239 for more information.

Manual (peer to peer) configurations

Manual configurations allow for WAN optimization between one client-side FortiGate unit and one server-side FortiGate unit. Manual WAN optimization requires a manual WAN optimization firewall policy on the client-side FortiGate unit and a WAN optimization proxy policy on the server-side FortiGate unit.

In a manual mode configuration, the client-side peer can only connect to the named server side peer. When the client-side peer initiates a tunnel with the server-side peer, the packets that initiate the tunnel include extra information so that the server-side peer can determine that it is a peer-to-peer tunnel request. This extra information is required because the server-side peer does not require a WAN optimization firewall policy; however, you need to add the client peer host ID and IP address to the server-side FortiGate unit peer list. See Manual (peer-to-peer) WAN optimization configuration example on page 4243 for a sample configuration.

Active-passive configurations

Active-passive WAN optimization requires an active WAN optimization firewall policy on the client-side FortiGate unit and a passive WAN optimization firewall policy on the server-side FortiGate unit. The server-side FortiGate unit also requires a WAN optimization proxy policy.

You can use the passive policy to control WAN optimization address translation by specifying transparent mode or non-transparent mode. You can also use the passive policy to apply security profiles, web caching, and other FortiGate features at the server-side FortiGate unit. For example, if a server-side FortiGate unit is protecting a web server, the passive policy could enable web caching.

A single passive policy can accept tunnel requests from multiple FortiGate units as long as the server-side FortiGate unit includes their peer IDs and all of the client-side FortiGate units include the server-side peer ID. See Active-passive WAN optimization configuration example on page 4248 for a sample configuration.

The WAN optimization proxy policy can only be added from the CLI and policies with `proxy` set to `wanopt` do not appear on the GUI.

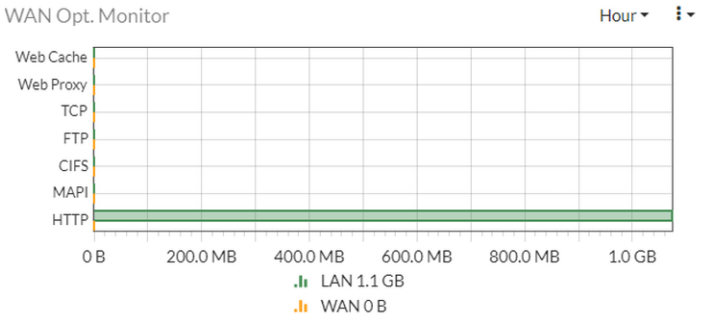
Monitoring performance

Using *WAN Opt. & Cache* widgets, you can confirm that a FortiGate unit is optimizing traffic and view estimates of the amount of bandwidth saved. These include peers manually added to the configuration as well as discovered peers.

To add *WAN Opt. & Cache* widgets go to *Dashboard* > *Status* > *Add Widget* > *WAN Opt. & Cache* and add *WAN Opt. Monitor* and *Peer Monitor*.

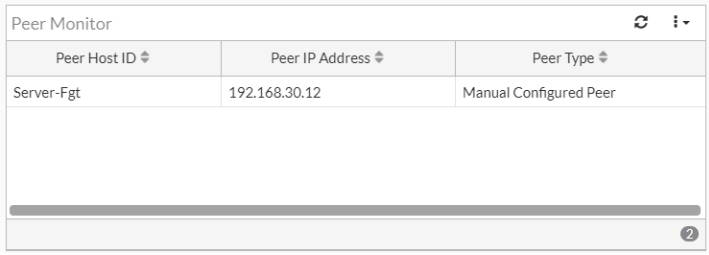
Wan Opt. Monitor

The *Wan Opt. Monitor* shows how WAN optimization is reducing the amount of traffic on the WAN for each WAN optimization protocol by showing the amount of WAN and LAN traffic. If WAN optimization is being effective, the amount of WAN traffic should be lower than the amount of LAN traffic.



Peer Monitor

The *Peer Monitor* lists all of the WAN optimization peers that a FortiGate unit can perform WAN optimization with.



System and feature operation with WAN optimization

This section contains the following information:

- HA on page 4238
- Memory usage on page 4238
- Distributing WAN optimization processing on page 4238
- Distributing WAN optimization to multiple CPU cores on page 4239
- Identity policies and load balancing on page 4239
- Traffic shaping on page 4239

HA

You can configure WAN optimization on a FortiGate HA cluster. The recommended best practice HA configuration for WAN optimization is active-passive mode. When the cluster is operating, all WAN optimization sessions are processed by the primary unit only. Even if the cluster is operating in active-active mode, HA does not load-balance WAN optimization sessions.

You can also form a WAN optimization tunnel between a cluster and a standalone FortiGate unit or between two clusters.

In a cluster, only the primary unit stores the byte cache database. This database is not synchronized to the subordinate units. So, after a failover, the new primary unit must rebuild its byte cache. Rebuilding the byte cache can happen relatively quickly because the new primary unit gets byte cache data from the other FortiGate unit that it is participating with in WAN optimization tunnels.

Memory usage

To accelerate and optimize disk access and to provide better throughput and less latency, FortiOS WAN optimization uses provisioned memory to reduce disk I/O and increase disk I/O efficiency. In addition, WAN optimization requires a small amount of additional memory per session for comprehensive flow control logic and efficient traffic forwarding.

When WAN optimization is enabled you will see a reduction in available memory. The reduction increases when more WAN optimization sessions are being processed. If you are thinking of enabling WAN optimization on an operating FortiGate unit, make sure its memory usage is not maxed out during high traffic periods.

In addition to using the system dashboard to see the current memory usage you can use the `get test wad 2` command to see how much memory is currently being used by WAN optimization.

Distributing WAN optimization processing

The `wad-worker` balancing algorithm supports a more balanced dispersal of traffic to the wad processes even if the bulk of the traffic is coming from a small set of sources or single source.

By default, dispatching traffic to WAD workers is based on source affinity. This may negatively affect performance when users have another explicit proxy in front of the FortiGate. Source affinity causes the FortiGate to process the traffic as if it originated from the single (or small set of) IP address of the outside proxy. This results in the use of one, or a small number, of WAD processes.

By disabling `wad-source-affinity` the traffic is balanced over all of the WAD processes. The WAD dispatcher will not assign the traffic based on the source IP address, but will assign the traffic to available workers in a round-robin fashion.

To configure WAD source affinity:

```
config system global
    set wad-source-affinity {enable | disable}
end
```

Handling the traffic by different WAD workers results in losing cached related benefits of using source affinity, as there is the memory cache on the current wad worker and if a new connection is handled by another worker, the cache will not be hit.

This is explained by the warning message that appears when it is disabled:

```
WARNING: Disabling this option results in some features to be unsupported. IP-
based user authentication, disclaimer messages, security profile override,
authentication cookies, MAPI scanning, and some video caches such as YouTube
are not supported.

Do you want to continue? (y/n)
```

Distributing WAN optimization to multiple CPU cores

By default WAN optimization is handled by half of the CPU cores in a FortiGate unit. For example, if your FortiGate unit has 4 CPU cores, by default two will be used for WAN optimization. You can use the following command to change the number of CPU cores that are used.

```
config system global
    set wad-worker-count <number>
end
```

The `wad-worker-count` can be between 1 and the total number of CPU cores in your FortiGate unit. Adding more cores may enhance WAN optimization but reduce the performance of other FortiGate systems.

Identity policies and load balancing

WAN optimization and firewall policies compatibility varies depending on the type of policy:

- WAN optimization is not compatible with firewall load balancing.
- WAN optimization is compatible with source and destination NAT options in firewall policies (including firewall virtual IPs). If a virtual IP is added to a policy, the traffic that exits the WAN optimization tunnel has its destination address changed to the virtual IPs mapped to IP address and port.
- WAN optimization is compatible with user identity-based and device identity security policies. If a session is allowed after authentication or device identification the session can be optimized.

Traffic shaping

Traffic shaping works for WAN optimization traffic that is not in a WAN optimization tunnel. So traffic accepted by a WAN optimization policy on a client-side FortiGate unit can be shaped on ingress. However, when the traffic enters the WAN optimization tunnel, traffic shaping is not applied.

In manual mode:

- Traffic shaping works as expected on the client-side FortiGate unit.
- Traffic shaping cannot be applied to traffic on the server-side FortiGate unit.

In active-passive mode:

- Traffic shaping works as expected on the client-side FortiGate unit.
- If transparent mode is enabled in the WAN optimization profile, traffic shaping also works as expected on the server-side FortiGate unit.
- If transparent mode is not enabled, traffic shaping works partially on the server-side FortiGate unit.

Best practices

WAN optimization and explicit proxy best practices include:

- WAN optimization tunnel sharing is recommended for similar types of WAN optimization traffic. However, tunnel sharing for different types of traffic is not recommended. For example, aggressive and non-aggressive protocols should not share the same tunnel.
- Active-passive HA is the recommended HA configuration for WAN optimization.
- Configure WAN optimization authentication with specific peers. Accepting any peer is not recommended as this can be less secure.

Example topologies

All FortiGate WAN optimization topologies consist of two FortiGate units operating as WAN optimization peers intercepting and optimizing traffic crossing the WAN between the private networks.

The following topics cover a few of the example topologies:

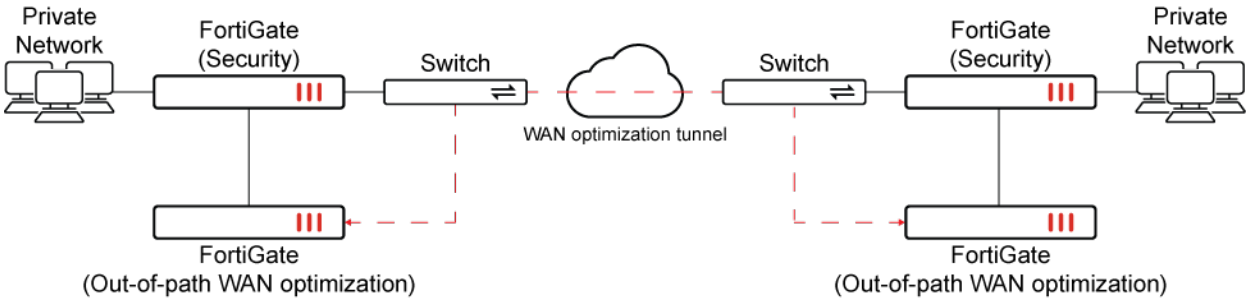
- In-path WAN optimization topology on page 4240
- Out-of-path WAN optimization topology on page 4241
- Topology for multiple networks on page 4241

In-path WAN optimization topology

FortiGate units can be deployed as typical security devices that protect private networks connected to the WAN and also perform WAN optimization. The WAN optimization configuration intercepts traffic to be optimized as it passes through the FortiGate unit and uses a WAN optimization tunnel with another FortiGate unit to optimize the traffic that crosses the WAN.

You can add web caching to any WAN optimization topology when users on a private network communicate with web servers located across the WAN on another private network.

Out-of-path WAN optimization topology

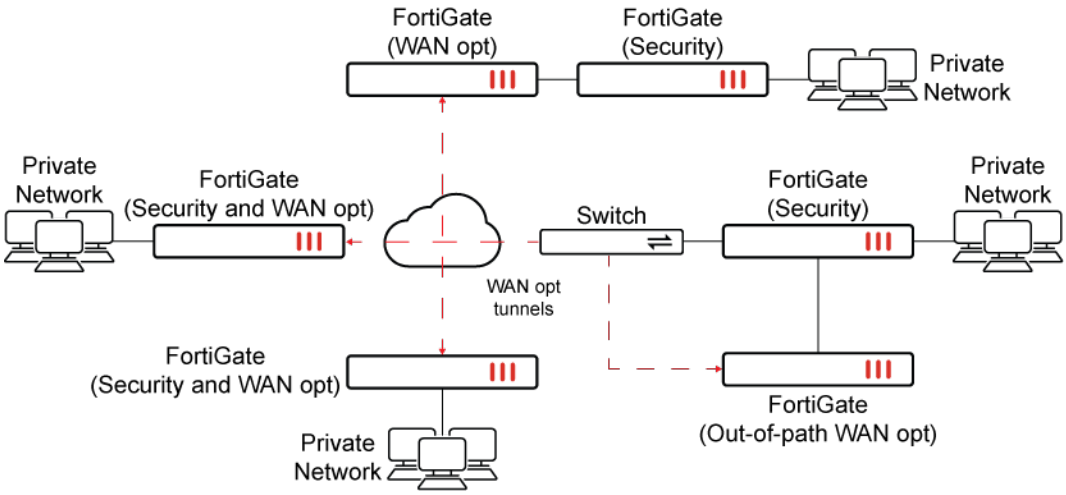


In an out-of-path topology, one or both of the FortiGate units configured for WAN optimization are not directly in the main data path. Instead, the out-of-path FortiGate unit is connected to FortiGate units in the data path, and the device is configured to redirect sessions to be optimized to the out-of-path FortiGate unit. The FortiGate units in the data path use a method such as policy routing to redirect traffic to be optimized to the out-of-path FortiGate units. The out-of-path FortiGate units establish a WAN optimization tunnel between each other and optimize the redirected traffic.

One of the benefits of out-of-path WAN optimization is that out-of-path FortiGate units only perform WAN optimization and do not have to process other traffic. An in-path FortiGate unit configured for WAN optimization also has to process other non-optimized traffic on the data path.

Topology for multiple networks

As shown below, you can create multiple WAN optimization configurations between many private networks. Whenever WAN optimization occurs, it is always between two FortiGate units, but you can configure any FortiGate unit to perform WAN optimization with any of the other FortiGate units that are part of your WAN.

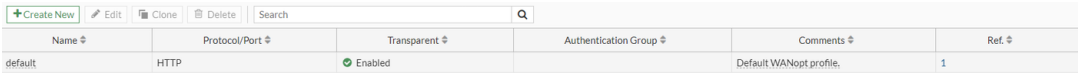


You can also configure WAN optimization between FortiGate units with different roles on the WAN. FortiGate units configured as security devices and for WAN optimization can perform WAN optimization as if they are single-purpose FortiGate units just configured for WAN optimization. The WAN optimization configuration is the same for FortiGate units deployed as security devices and for single-purpose WAN optimization FortiGate units. The only differences would result from the different network topologies.

Configuration examples

The following pages are used in the WAN optimization configuration examples demonstrated in the subsequent sections:

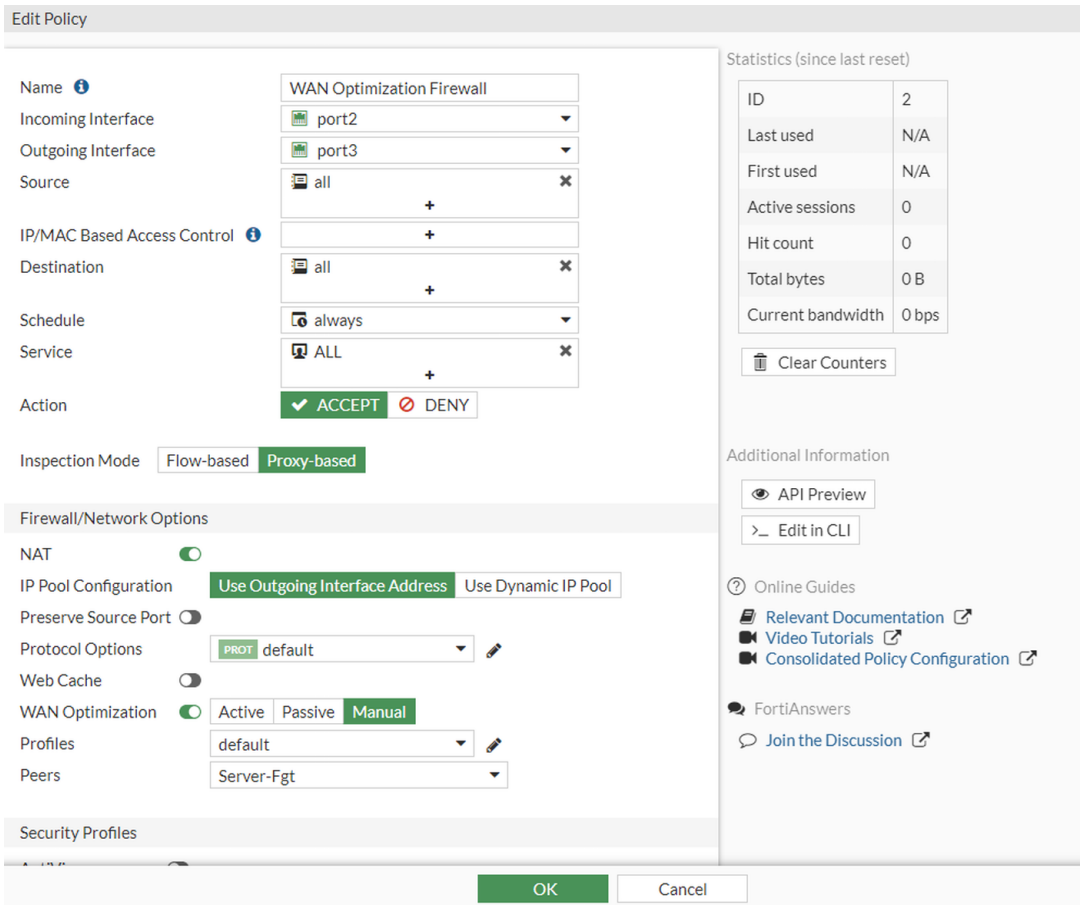
- *WAN Opt. & Cache* > *Profiles*: Configure the default WAN optimization profile to optimize HTTP traffic on client side.



- *WAN Opt. & Cache* > *Peers*: Change the *Host ID* and add *Peer Host ID* and *IP address* on both client and server side.

- *WAN Opt. & Cache* > *Authentication Groups*: Add an authentication group for the authentication purpose on both client and server side. (Optional)

- *Policy & Objects* > *Firewall Policy*: Add a WAN optimization firewall policy on the client side or on both client and server side depending on the WAN optimization configuration. See the examples for more information.



A WAN optimization firewall policy is a firewall policy running in *Proxy-based* inspection mode with *WAN Optimization* enabled. A WAN optimization firewall policy cannot be configured with inspection mode set to *Flow-based*.

The following topics provide instructions on different WAN optimization configuration examples:

- Manual (peer-to-peer) WAN optimization configuration example on page 4243
- Active-passive WAN optimization configuration example on page 4248
- Secure tunneling configuration example on page 4253
- Testing and troubleshooting the configuration on page 4259

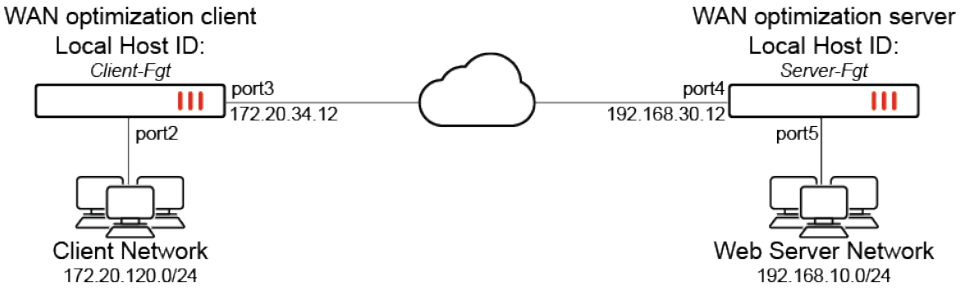
Manual (peer-to-peer) WAN optimization configuration example

Please ensure that the Prerequisites on page 4226 are met before proceeding with the configuration example.

See Manual (peer to peer) configurations on page 4236 for conceptual information.

This example configuration includes a client-side FortiGate unit called Client-Fgt with a WAN IP address of 172.20.34.12. This unit is in front of a network with IP address 172.20.120.0. The server-side FortiGate unit is called Server-Fgt with a WAN IP address of 192.168.30.12. This unit is in front of a web server network with IP address 192.168.10.0.

This example customizes the default WAN optimization profile on the client-side FortiGate unit and adds it to the WAN optimization firewall policy. You can also create a new WAN optimization profile.



General configuration steps

This section breaks down the configuration for this example into smaller procedures:

1. Configure the client-side FortiGate unit:
   - Add peers.
   - Configure the default WAN optimization profile to optimize HTTP traffic.
   - Add a manual WAN optimization firewall policy.
2. Configure the server-side FortiGate unit:
   - Add peers.
   - Add a WAN optimization proxy policy.

Configuring manual WAN optimization from the GUI

Use the following steps to configure the example configuration from the GUI:

To configure the client-side FortiGate unit:

1. Go to *WAN Opt. & Cache* > *Peers* and change the *Host ID* of the client-side FortiGate unit:
   a. Click *Change*. The *Host ID* pane opens.
   b. Enter a new *Host ID*:

Host ID	Client-Fgt

   c. Click *OK*.
2. Create the server-side FortiGate unit peer:
   a. Select *Create New*. The *New WAN Optimization Peer* opens.
   b. Configure the following settings:

Peer Host ID	Server-Fgt

IP address	192.168.30.12

c. Click *OK*.

3. Go to *WAN Opt. & Cache > Profiles* and edit the default profile:
   a. Select the default profile and click *Edit*.
   b. Under *Protocol Options*, edit *HTTP*.
   c. Set *Status* to *Enable* and click *Apply*.
   d. Click *OK*.
4. Go to *Policy & Objects > Firewall Policy* to add a manual WAN optimization firewall policy to the client-side FortiGate unit that accepts traffic to be optimized:
   a. Click *Create New*.
   b. Enter a *Name* and configure the following settings:

Incoming Interface	port2
Outgoing Interface	port3
Source	all
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT

   c. Set *Inspection Mode* to *Proxy-based*.
   d. Enable *WAN Optimization* and configure the following settings:

WAN Optimization	Manual
Profiles	default
Peers	Server-Fgt

   e. Click *OK* to save the policy.

To configure the server-side FortiGate unit:

1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the server-side FortiGate unit:
   a. Click *Change*. The *Host ID* pane opens.
   b. Enter a new *Host ID*:

Host ID	Server-Fgt

   c. Click *OK*.
2. Create the client-side FortiGate unit peer:
   a. Select *Create New*. The *New WAN Optimization Peer* opens.
   b. Configure the following settings:

Peer Host ID	Client-Fgt
IP address	172.20.34.12

c. Click *OK*.

3. Enter the following CLI command to add a WAN optimization proxy policy to accept WAN optimization tunnel connections:

```
config firewall proxy-policy
    edit 0
        set proxy wanopt
        set dstintf port5
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
end
```

Configuring basic WAN optimization from the CLI

Use the following steps to configure the example configuration from the CLI.

To configure the client-side FortiGate unit:

1. Change the Host ID of the client-side FortiGate:

```
config wanopt settings
    set host-id Client-Fgt
end
```

2. Add the Host ID of the server-side FortiGate:

```
config wanopt peer
    edit Server-Fgt
        set ip 192.168.30.12
    next
end
```

3. Edit the *default* WAN optimization profile and enable HTTP WAN optimization:

```
config wanopt profile
    edit default
        config http
            set status enable
        end
    next
end
```

4. Add a WAN optimization firewall policy to accept the traffic to be optimized:

```
config firewall policy
    edit 0
        set srcintf port2
        set dstintf port3
        set srcaddr all
        set dstaddr all
        set action accept
        set service ALL
        set schedule always
        set inspection-mode proxy
        set wanopt enable
        set wanopt-profile default
        set wanopt-detection off
        set wanopt-peer Server-Fgt
    next
end
```

When you set the detection mode to off, the policy becomes a manual mode WAN optimization firewall, which is reflected on the GUI.

To configure the server-side FortiGate unit:

1. Change the Host ID of the server-side FortiGate:

```
config wanopt settings
    set host-id Server-Fgt
end
```

2. Add the Host ID of the client-side FortiGate:

```
config wanopt peer
    edit Client-Fgt
        set ip 172.20.34.12
    next
end
```

3. Add a WAN optimization proxy policy:

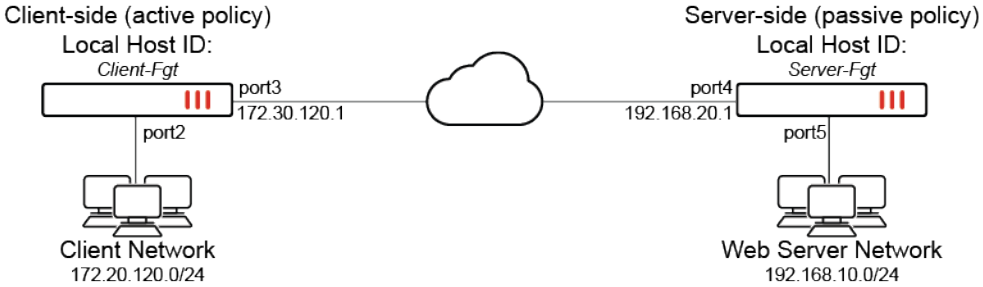
```
config firewall proxy-policy
    edit 0
        set proxy wanopt
        set dstintf port5
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
end
```

Active-passive WAN optimization configuration example

Please ensure that the Prerequisites on page 4226 are met before proceeding with the configuration example.

See Active-passive configurations on page 4236 for conceptual information.

This example configuration includes a client-side FortiGate unit called Client-Fgt with a WAN IP address of 172.30.120.1. This unit is in front of a network with IP address 172.20.120.0. The server-side FortiGate unit is called Server-Fgt and has a WAN IP address of 192.168.20.1. This unit is in front of a web server network with IP address 192.168.10.0.



General configuration steps

This section breaks down the configuration for this example into smaller procedures:

1. Configure the client-side FortiGate unit:
   - Add peers.
   - Add a WAN optimization profile to optimize CIFS, FTP, and HTTP traffic.
   - Add an active WAN optimization firewall policy.
2. Configure the server-side FortiGate unit:
   - Add peers.
   - Add a passive WAN optimization firewall policy.
   - Add a WAN optimization proxy policy.

Configuring active-passive WAN optimization from the GUI

Use the following steps to configure the example configuration from the GUI.

To configure the client-side FortiGate unit:

1. Go to *WAN Opt. & Cache* > *Peers* and change the *Host ID* of the client-side FortiGate unit:
   a. Click *Change*. The *Host ID* pane opens.
   b. Enter a new *Host ID*:

Host ID	Client-Fgt

c. Click *OK*.

2. Create the server-side FortiGate unit peer:
   a. Select *Create New*. The *New WAN Optimization Peer* opens.
   b. Configure the following settings:

Peer Host ID	Server-Fgt
IP address	192.168.20.1

   c. Click *OK*.
3. Go to *WAN Opt & Cache > Profiles* to add a WAN optimization profile to optimize CIFS, HTTP, and FTP traffic:
   a. Select *Create New*.
   b. Enter the profile name:

Name	Custom-wan-opt-pro

   c. In the *Protocol Options* section:
      i. Edit *CIFS*.
      ii. Set *Status* to *Enable*.
      iii. Click *Apply*.
      iv. Repeat these steps to edit and enable *FTP* and *HTTP*.
   d. Click *OK*.
4. Go to *Policy & Objects > Firewall Policy* to add an active WAN optimization firewall policy:
   a. Click *Create New*.
   b. Enter a *Name* and configure the following settings:

Incoming Interface	port2
Outgoing Interface	port3
Source	all
Destination	all
Schedule	always
Service	HTTP FTP SMB
Action	ACCEPT

   c. Set *Inspection Mode* to *Proxy-based*.
   d. Enable WAN optimization and configure the following settings:

WAN Optimization	Active
Profile	Custom-wan-opt-pro

e. Click *OK*.

To configure the server-side FortiGate unit:

1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the server-side FortiGate unit:
   a. Click *Change*. The *Host ID* pane opens.
   b. Enter a new *Host ID*:

Host ID	Server-Fgt

   c. Click *OK*.
2. Create the client-side FortiGate unit peer:
   a. Select *Create New*. The *New WAN Optimization Peer* opens.
   b. Configure the following settings:

Peer Host ID	Client-Fgt
IP address	172.30.120.1

   c. Click *OK*.
3. Go to *Policy & Objects > Firewall Policy* to add a passive WAN optimization firewall policy:
   a. Click *Create New*.
   b. Enter a *Name* and configure the following settings:

Incoming Interface	port4
Outgoing Interface	port5
Source	all
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT

   c. Set *Inspection Mode* to *Proxy-based*.
   d. Enable *WAN Optimization* and configure the following settings:

WAN Optimization	Passive
Passive Option	Default

   e. Click *OK*.
4. Add a WAN optimization proxy policy from the CLI:

```
config firewall proxy-policy
    edit 0
        set proxy wanopt
        set dstintf port5
        set srcaddr all
        set dstaddr all
```

```
        set action accept
        set schedule always
        set service ALL
    next
end
```

Configuring basic active-passive WAN optimization from the CLI

Use the following steps to configure the example configuration from the CLI.

To configure the client-side FortiGate unit:

1. Change the Host ID of the client-side FortiGate:

```
config wanopt settings
    set host-id Client-Fgt
end
```

2. Add the Host ID of the server-side FortiGate:

```
config wanopt peer
    edit Server-Fgt
        set ip 192.168.20.1
    next
end
```

3. Add a WAN optimization profile to optimize CIFS, HTTP, and FTP traffic:

```
config wanopt profile
    edit Custom-wan-opt-pro
        config cifs
            set status enable
        end
        config http
            set status enable
        end
        config ftp
            set status enable
        end
    next
end
```

4. Add an active WAN optimization firewall policy:

```
config firewall policy
    edit 0
        set srcintf port2
        set dstintf port3
        set srcaddr all
        set dstaddr all
        set action accept
```

```
        set service HTTP FTP SMB
        set schedule always
        set inspection-mode proxy
        set wanopt enable
        set wanopt-detection active
        set wanopt-profile Custom-wan-opt-pro
    next
end
```

To configure the server-side FortiGate unit:

1. Change the Host ID of the server-side FortiGate:

```
config wanopt settings
    set host-id Server-Fgt
end
```

2. Add the Host ID of the client-side FortiGate:

```
config wanopt peer
    edit Client-Fgt
        set ip 172.30.120.1
    next
end
```

3. Add a passive WAN optimization firewall policy:

```
config firewall policy
    edit 0
        set srcintf port4
        set dstintf port5
        set srcaddr all
        set dstaddr all
        set action accept
        set service ALL
        set schedule always
        set inspection-mode proxy
        set wanopt enable
        set wanopt-detection passive
        set wanopt-passive-opt default
    next
end
```

4. Add a WAN optimization proxy policy:

```
config firewall proxy-policy
    edit 0
        set proxy wanopt
        set dstintf port5
        set srcaddr all
        set dstaddr all
        set action accept
```

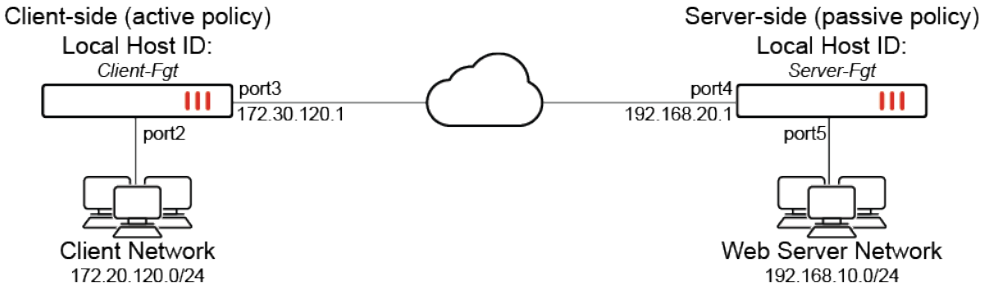
```
        set schedule always
        set service ALL
    next
end
```

Secure tunneling configuration example

Please ensure that the Prerequisites on page 4226 are met before proceeding with the configuration example.

See Secure tunneling on page 4231 for conceptual information.

This example configuration includes a client-side FortiGate unit called Client-Fgt with a WAN IP address of 172.30.120.1. This unit is in front of a network with IP address 172.20.120.0. The server-side FortiGate unit is called Server-Fgt and has a WAN IP address of 192.168.20.1. This unit is in front of a web server network with IP address 192.168.10.0.



General configuration steps

This section breaks down the configuration for this example into smaller procedures:

1. Configure the client-side FortiGate unit:
   - Add peers.
   - Add an authentication group.
   - Add an active WAN optimization firewall policy.
2. Configure the server-side FortiGate unit:
   - Add peers.
   - Add the same authentication group.
   - Add a passive WAN optimization firewall policy.
   - Add a WAN optimization proxy policy.

Configuring WAN optimization with secure tunneling from the GUI

Use the following steps to configure the example configuration from the GUI.

To configure the client-side FortiGate unit:

1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the client-side FortiGate unit:
   a. Click *Change*. The *Host ID* pane opens.
   b. Enter a new *Host ID*:

Host ID	Client-Fgt

   c. Click *OK*.
2. Create the server-side FortiGate unit peer:
   a. Select *Create New*. The *New WAN Optimization Peer* opens.
   b. Configure the following settings:

Peer Host ID	Server-Fgt
IP address	192.168.20.1

   c. Click *OK*.
3. Go to *WAN Opt. & Cache > Authentication Groups* to add the authentication group to be used for secure tunneling:
   a. Click *Create New* and configure the following settings:

Name	Auth-Secure-Tunnel
Authentication Method	Pre-shared key
Pre-shared key	********
Accept peer(s)	Defined Peers Only

   b. Click *OK*.
4. Go to *WAN Opt. & Cache > Profiles* to add a WAN optimization profile that enables secure tunneling and includes the authentication group:
   a. Click *Create New*.
   b. Enter a *Name*:

Name	Secure-wan-opt-pro

   c. Enable *Authentication group*:

Authentication group	Auth-Secure-Tunnel

   d. In the *Protocol Options* section, edit *HTTP*:
      i. Set *Status* to *Enable*.
      ii. Click *Apply*.
      iii. Set *SSL Secure Tunneling* to *Enable*.
      iv. Click *Apply*.
   e. Click *OK*.
5. Go to *Policy & Objects > Firewall Policy* to add an active WAN optimization firewall policy:
   a. Click *Create New*.
   b. Enter a *Name* and configure the following settings:

Incoming Interface	port2
Outgoing Interface	port3
Source	all
Destination	all
Schedule	always
Service	HTTP
Action	ACCEPT

c. Set *Inspection Mode* to *Proxy-based*.

d. Enable *WAN Optimization* and configure the following settings:

WAN Optimization	Active
Profile	Secure-wan-opt-pro

e. Click *OK*.

To configure the server-side FortiGate unit:

1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the server-side FortiGate unit:
   a. Click *Change*. The *Host ID* pane opens.
   b. Enter a new *Host ID*:

Host ID	Server-Fgt

   c. Click *OK*.
2. Create the client-side FortiGate unit peer:
   a. Select *Create New*. The *New WAN Optimization Peer* opens.
   b. Configure the following settings:

Peer Host ID	Client-Fgt
IP address	172.30.120.1

   c. Click *OK*.
3. Go to *WAN Opt. & Cache > Authentication Groups* to add the authentication group to be used for secure tunneling:
   a. Click *Create New* and configure the following settings:

Name	Auth-Secure-Tunnel
Authentication Method	Pre-shared key
Pre-shared key	********
Accept peer(s)	Defined Peers Only

   b. Click *OK*.
4. Go to *Policy & Objects > Firewall Policy* to add an passive WAN optimization firewall policy:

a. Click *Create New*.
b. Enter a *Name* and configure the following settings:

Incoming Interface	port4
Outgoing Interface	port5
Source	all
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT

c. Set *Inspection Mode* to *Proxy-based*.
d. Enable *WAN Optimization* and configure the following settings:

WAN Optimization	Passive
Passive Option	Default

e. Click *OK*.

5. Add a WAN optimization proxy policy from the CLI:

```
config firewall proxy-policy
    edit 0
        set proxy wanopt
        set dstintf port5
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
end
```

Configuring WAN optimization with secure tunneling from the CLI

Use the following steps to configure the example configuration from the CLI.

To configure the client-side FortiGate unit:

1. Change the Host ID of the client-side FortiGate:

```
config wanopt settings
    set host-id Client-Fgt
end
```

2. Add the Host ID of the server-side FortiGate:

```
config wanopt peer
    edit Server-Fgt
        set ip 192.168.20.1
    next
end
```

3. Add a new authentication group to be used for secure tunneling:

```
config wanopt auth-group
    edit Auth-Secure-Tunnel
        set auth-method psk
        set peer-accept defined
        set psk ********
    next
end
```

4. Add a WAN optimization profile that enabled secure tunneling and includes the authentication group, enables HTTP protocol optimization, and enables secure tunneling for HTTP traffic:

```
config wanopt profile
    edit Secure-wan-opt-pro
        set auth-group Auth-Secure-Tunnel
        config http
            set status enable
            set secure-tunnel enable
        end
    next
end
```

5. Add an active WAN optimization firewall policy that enables secure tunneling:

```
config firewall policy
    edit 0
        set srcintf port2
        set dstintf port3
        set srcaddr all
        set dstaddr all
        set action accept
        set service HTTP
        set schedule always
        set inspection-mode proxy
        set wanopt enable
        set wanopt-detection active
        set wanopt-profile Secure-wan-opt-pro
    next
end
```

To configure the server-side FortiGate unit:

1. Change the Host ID of the server-side FortiGate:

```
config wanopt settings
    set host-id Server-Fgt
end
```

2. Add the Host ID of the client-side FortiGate:

```
config wanopt peer
    edit Client-Fgt
        set ip 172.30.120.1
    next
end
```

3. Add an authentication group to be used for secure tunneling:

```
config wanopt auth-group
    edit Auth-Secure-Tunnel
        set auth-method psk
        set peer-accept defined
        set psk ********
    next
end
```

4. Add a passive WAN optimization firewall policy:

```
config firewall policy
    edit 0
        set srcintf port4
        set dstintf port5
        set srcaddr all
        set dstaddr all
        set action accept
        set service ALL
        set schedule always
        set inspection-mode proxy
        set wanopt enable
        set wanopt-detection passive
        set wanopt-passive-opt default
    next
end
```

5. Add a WAN optimization proxy policy:

```
config firewall proxy-policy
    edit 0
        set proxy wanopt
        set dstintf port5
        set srcaddr all
        set dstaddr all
        set action accept
```

```
        set schedule always
        set service ALL
    next
end
```

Testing and troubleshooting the configuration

To test the configuration attempt, start a web browsing session between the client network and the web server network. For example, from a PC on the client network browse to the IP address of a web server on the web server network, for example http://192.168.10.13. Even though this address is not on the client network, you should be able to connect to this web server over the WAN optimization tunnel.

If you can connect, the *WAN Opt. Monitor* widget should show the protocol that has been optimized (in this case HTTP) and the *Peer Monitor* widget displays the *Peer* information. To add the *WAN Opt. Monitor* and the *Peer Monitor*, go to *Dashboard > Status > Add Widget > WAN Opt. & Cache* and add *WAN Opt. Monitor* and *Peer Monitor*. See Monitoring performance on page 4236 for more information.

If you cannot connect, try the following to diagnose the problem:

- Review your configuration and make sure all details such as address ranges, peer names, and IP addresses are correct.
- Check routing on the FortiGate units and on the client and web server networks to make sure packets can be forwarded as required. The FortiGate units must be able to communicate with each other, routing on the client network must allow packets destined for the web server network to be received by the client-side FortiGate unit, and packets from the server-side FortiGate unit must be able to reach the web servers. See Routing concepts on page 470 for more information.

You can use `get` and `diagnose` commands to display information about how WAN optimization is operating.

Example output

The command output for the client-side FortiGate unit shows 10 tunnels all created by the manual WAN optimization configuration:

```
# diagnose wad tunnel list

Tunnel: id=100 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=100 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=348 bytes_out=384

Tunnel: id=99 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=99 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=348 bytes_out=384

Tunnel: id=98 type=manual
```

```
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=98 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=348 bytes_out=384

Tunnel: id=39 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=39 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1068 bytes_out=1104

Tunnel: id=7 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=7 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264

Tunnel: id=8 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=8 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264

Tunnel: id=5 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=5 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264

Tunnel: id=4 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=4 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264

Tunnel: id=1 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=1 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264

Tunnel: id=2 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=2 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264

Tunnels total=10 manual=10 auto=0
```

The command output shows three tunnels all created by the active-passive WAN optimization configuration:

```
# diagnose wad tunnel list
```

```
Tunnel: id=22 type=auto
    vd=0 shared=no uses=1 state=2
    peer name=Server-Fgt id=42 ip=192.168.20.1 (best guess)
    SSL-secured-tunnel=no auth-grp=
    bytes_in=56693 bytes_out=10831

Tunnel: id=24 type=auto
    vd=0 shared=no uses=1 state=2
    peer name=Server-Fgt id=44 ip=192.168.20.1 (best guess)
    SSL-secured-tunnel=no auth-grp=
    bytes_in=14833 bytes_out=3896

Tunnel: id=26 type=auto
    vd=0 shared=no uses=1 state=2
    peer name=Server-Fgt id=46 ip=192.168.20.1 (best guess)
    SSL-secured-tunnel=no auth-grp=
    bytes_in=481 bytes_out=176

Tunnels total=3 manual=0 auto=3
```

The command output shows a tunnel created by active passive WAN optimization configuration with secure tunneling:

```
# diagnose wad tunnel list

Tunnel: id=3 type=auto
    vd=0 shared=no uses=1 state=2
    peer name=Server-Fgt id=49 ip=192.168.20.1 (best guess)
    SSL-secured-tunnel=yes auth-grp=Auth-Secure-Tunnel
    bytes_in=95810 bytes_out=39597

Tunnels total=1 manual=0 auto=1
```

Unlike manual mode, for active-passive configurations, each session will negotiate an active-passive tunnel so an open session is required the display the corresponding output above.

For example, continuous data transfer such as uploading or downloading will display tunnel output in the active-passive configuration, which is in contrast to manual mode where tunnels are always open and ready to use.

VM

This section contains topics on deploying FortiGate-VM:

- Amazon Web Services on page 4262
- Microsoft Azure on page 4262
- Google Cloud Platform on page 4262
- OCI on page 4263
- AliCloud on page 4263
- Private cloud on page 4263
- VM license on page 4263
- Permanent trial mode for FortiGate-VM on page 4271
- Adding VDOMs with FortiGate v-series on page 4274
- PF and VF SR-IOV driver and virtual SPU support on page 4276
- Using OCI IMDSv2 on page 4278
- FIPS cipher mode for AWS, Azure, OCI, and GCP FortiGate-VMs on page 4281
- Cloud-init on page 4283
- TPM support for FortiGate-VM on page 4285

Amazon Web Services

See the FortiOS 7.6.2 AWS Administration Guide.

Microsoft Azure

See the FortiOS 7.6.2 Azure Administration Guide.

For Azure vWAN deployments, see:

- Azure vWAN NGFW Deployment Guide
- Azure vWAN SD-WAN NGFW Deployment Guide

Google Cloud Platform

See the 7.6.2 FortiOS GCP Administration Guide.

OCI

See the 7.6.2 FortiOS OCI Administration Guide.

AliCloud

See the 7.6.2 FortiOS AliCloud Administration Guide.

Private cloud

See FortiGate Private Cloud in the document library.

VM license

You can access *FortiGate VM License* from *Dashboard > Status* in the *Virtual Machine* widget. Click the device license and select *FortiGate VM License*.

FortiGate VM License displays the following information:

Field	Description
License status	Displays one of the following statuses: • *Valid*: VM can connect and validate the license against a FortiManager or FortiGuard server. All features are available. • *Validation overdue*: VM cannot connect and validate against a FortiManager or FortiGuard server. A check is made against how many days the warning status is continuous. If the number is less than 30 days, the status does not change. You may be seeing this status because the network environment does not allow the FortiGate-VM to connect to the FortiGuard server within 30 days. • *30 day Grace Period*: license is expired but within the 30-day grace period. Check the expiration date for evaluation or term-based licenses. • *Duplicate copy*: license is a duplicate copy. FortiGuard returns code 401 and FortiOS sets the license status as an invalid copy. FortiGate firewall policy continues to work during this state. If the FortiGate keeps the duplicate copy status for more than 24 hours, the status changes to invalid.

Field	Description

	As you cannot access *Dashboard > Status* in the *Virtual Machine* widget when the license is in one of the following statuses, they do not display in the *License status* field:
	• *Invalid*: VM cannot connect and validate against a FortiManager or FortiGuard server. A check is made against how many days the warning status is continuous. If the number is 30 days or more, the status changes to invalid. This status also occurs if the duplicate copy status persists for more than 24 hours. FortiOS restricts GUI access until you upload a valid license. Firewall policies do not work. FortiGuard downloads are unavailable. When the status is invalid, upon login, FortiOS redirects you to the VM license upload page.
	Reasons for having an invalid status include:
	  • The VM license is expired and has passed the grace period.
	  • Another VM has been already validated with FortiGuard using the same license. See Technical Note: VM License activation for details about duplicated VM instances.
	• *Pending*: temporary state where the VM attempts to validate its license. The GUI displays a loading page with the message *License is being validated by FortiGuard*.

Allocated vCPUs	Number of allocated and total allowable vCPUs
Allocated RAM	Amount of allocated RAM. There are no RAM restrictions.
Expires on	Expiry date (value depends on the type of license)

This information is visible in the CLI by running `get system status`. See CLI troubleshooting.

Uploading a license file

After you submit an order for a FortiGate-VM, Fortinet sends a license registration code to the email address that you entered in the order form. Use this code on the FortiCloud portal to register the FortiGate-VM.

Once you have registered the VM, you can download the license file in .LIC format. In *FortiGate VM License*, click *Upload*. The system prompts you to reboot and validate the license with the FortiGuard server. Once validated, your FortiGate-VM is fully functional.

The VM license window may also appear immediately after logging in if you are running a VM with an evaluation license that has expired.

In cases where the GUI is inaccessible, you can upload the license using secure copy (SCP).

For information about injecting FortiFlex licenses, see Injecting the FortiFlex license.

To upload the license using SCP:

1. Enable SCP:

```
config system global
    set admin-scp enable
end
```

2. Enable SSH in the administrative access for the interface where the transfer will take place:

```
config system interface
    edit <interface>
        append allowaccess ssh
    next
end
```

3. On your computer, upload the VM license. This example is for Linux:

```
scp <filename> <admin-user>@<FortiGate_IP>:vmlicense
```

VM license types

FortiGate-VM offers perpetual licensing (normal series and V-series) and annual subscription licensing (S-series). SKUs are based on the number of vCPUs (1, 2, 4, 8, 16, 32, or unlimited).

FortiGate-VM has a permanent trial license. See Permanent trial mode for FortiGate-VM on page 4271.

The FortiFlex program allows qualified enterprise and MSSP customers to create as many VM entitlements as required. Resource consumption is based upon predefined points that are calculated on a daily basis. See Program guide.

Feature	VM-Series	Trial	V-series	S-series	FortiFlex
Licensing and support	The VM base is perpetual. You must purchase separately FortiGuard and FortiCare services on an annual basis. See the price list for details.	Hardware configuration restrictions apply. Support is not available.	The VM base is perpetual. You must purchase separately FortiGuard and FortiCare services on an annual basis. See the price list for details.	Single annually contracted SKU that contains a VM base and a FortiCare/FortiGuard service bundle. Service bundles and a la carte services are available.	Annually contracted program to create multiple sets of a single entitlement per VM. Entitlements contain a VM base and FortiCare/FortiGuard bundle. Service bundles and a la carte services are available.

Feature	VM-Series	Trial	V-series	S-series	FortiFlex
vCPU number upgrade or downgrade	Not supported.	Not supported.	Not supported.	Supported via co-term. You can also upgrade the service bundle. Contact a Fortinet sales representative to upgrade.	Natively supported via the scale up/down feature.
VDOM support	By default, each CPU level supports up to a certain number of VDOMs. See the FortiGate-VM data sheet for default limits.	VDOMs are supported, but restricted by the CPU allowance for the trial license.		By default, all CPU levels do not support adding VDOMs, but you can add additional VDOMs via a subscription VDOM license.	By default, all CPU levels do not support adding VDOMs, but you can add additional VDOMs via the scale up/down feature.

Applying a FortiFlex token

You can apply a FortiFlex token in the *FortiGate VM License* page for the following VM instance types:

- Newly deployed or expired FortiGate-VM instances. After logging into the FortiOS GUI, a *FortiFlex token* option is available when the license popup appears.
- Already licensed FortiGate-VM instances. You can go to this page from the *Virtual Machine* dashboard widget or from *System* > *FortiGuard*. *FortiFlex token* option is available for migrating into FortiFlex.

Consuming a new vCPU

FortiGate-VM supports automatic vCPU hot-add/hot-remove to the limit of the license entitlement after activating an S-series license or a FortiFlex license. This enhancement removes the requirement of running the CLI command `execute cpu add` or performing a reboot when the FortiGate-VM has a lower number of vCPUs allocated than the licensed number of vCPUs.

CLI troubleshooting

In some cases, you can view more information from the CLI to diagnose issues with VM licensing. This is also useful when the GUI is inaccessible due to an invalid contract.

Before you begin, ensure your FortiGate has the proper routes to connect to the internet. Run all following debug commands for a full picture of the issue.

To view the license status, expiration date, and VM resources:

```
# get system status
Version: FortiGate-VM64-KVM v7.6.2,buildXXXX,200730 (GA)
...
Serial-Number: FGVM08**********
....
License Status: Valid
License Expiration Date: 2026-12-10
VM Resources: 1 CPU/8 allowed, 2010 MB RAM
...
```

To display license details:

```
# diagnose debug vm-print-license
SerialNumber: FGVM08**********
CreateDate: Tue Dec 10 00:57:32 2019
License expires: Thu Dec 10 00:00:00 2026
Expiry: 366
Key: yes
Cert: yes
Key2: yes
Cert2: yes
Model: 08 (11)
CPU: 8
MEM: 2147483647
```

To display license information from FortiGuard:

```
# diagnose hardware sysinfo vm full
UUID:     abbe**************************
valid:    1
status:   1
code:     200
warn:     0
copy:     0
received: 4604955037
warning:  4600905081
recv:     202009152207
dup:
```

Field	Value	Description
valid	0	Invalid
	1	Valid

Field	Value	Description
status	0	Startup
	1	Success
	2	Warning
	3	Error
	4	Invalid copy
	5	Evaluation license expired
	6	Grace period. For FortiFlex, there is a two-hour grace period to begin passing traffic upon retrieving the license from FortiCloud.
code	2xx, 3xx	Success
	200	Valid
	202	Accepted (treated as correct response code)
	4xx	Error
	400	Expired
	401	Duplicate
	5xx, 500	Warning
	502	Invalid. Cannot connect to FortiGuard distribution servers
	6xx	Evaluation license expired
	Other codes	Error

The following are examples of common combinations:

Combination	Indicates...
valid: 1 status: 1 code: 200	License is valid and functioning normally.
valid: 1 status: 4 code: 401	License is valid but running on a duplicate instance.
valid: 0 status: 2 code: 502	System cannot connect to FortiGuard.

Combination	Indicates...
valid: 0 status: 3 code: 400	License is expired and invalid.
valid: 0 status: 3 code: 0	VM is unlicensed.

For FortiFlex licenses, the following command allows you to enter the license token and proxy information:

```
# execute vm-license <token> https://<username>:<password>@<proxy IP address>:<proxy port>
```

FortiOS can receive the following error codes from the FortiCare server:

```
1 - Runtime error (server unhandled error on FortiCare sever)
57 - License Token is invalid
58 - License Token is already used and cannot be used again to retrieve license key
```

The FortiGate can generate the following error code:

```
60 - Failed to request forticare license. Failed to download VM license.
```

Contact Fortinet Support for assistance if your licensing issue persists.

Customizing the FortiFlex license token activation retry parameters

FortiOS supports the customization of the retries for FortiFlex license token activation. You can configure the token activation number of retries and the interval between each attempt using the following commands, respectively:

```
execute vm-license-options count <integer>
execute vm-license-options interval <interval length in seconds>
```

If you set `vm-license-options count` to zero, the token activation retries indefinitely until success.

To define the FortiFlex token activation parameters:

1. Set the number of retries allowed:

   ```
   execute vm-license-options count 4
   ```

2. Set the retry interval:

   ```
   execute vm-license-options interval 5
   ```

3. Activate the license. FortiOS requests the FortiFlex license token four times, with an interval of five seconds in between, as set.
   - If FortiOS cannot verify the license within the set amount of retries, the download fails:

     ```
     # execute vm-license F4FC697D65428013FAKE

     This operation will reboot the system !
     Do you want to continue? (y/n)y

     Requesting FortiCare license token: *******, proxy:(null)
     Requesting FortiCare license token: *******, proxy:(null)
     Requesting FortiCare license token: *******, proxy:(null)
     Requesting FortiCare license token: *******, proxy:(null)
     Failed to download VM license.
     ```

   - If FortiOS can verify the license within the set number of retries, FortiOS successfully installs the VM license:

     ```
     # execute vm-license 227602862F7E6E9XXXX

     This operation will reboot the system !
     Do you want to continue? (y/n)y

     Requesting FortiCare license token: *******, proxy:(null)
     VM license install succeeded. Rebooting firewall.
     ```

You can also define FortiFlex token activation parameters in an ISO file using the mime user-data.

To define the parameters in an ISO file:

1. Create a config drive ISO with a MIME file:

   ```
   Content-Type: text/plain; charset="us-ascii"
   MIME-Version: 1.0
   Content-Transfer-Encoding: 7bit
   Content-Disposition: attachment; filename="license.txt
   "LICENSE-TOKEN: 334ADF7B49F2FEC1XXXX INTERVAL: 5 COUNT: 4
   ```

   See Cloud-init using config drive for more information.
2. Attach the ISO config drive at boot time. See Cloud-init for more information.
3. Boot up the VM and verify the token activation parameters:

   ```
   # diagnose debug cloudinit show
    >> Found config drive /dev/sr0
    >> Successfully mount config drive
    >> MIME parsed preconfig script
    >> MIME parsed VM token
    >> MIME parsed config script
    >> Found metadata source: config drive
    >> Run preconfig script
    >> FortiGate-VM64  conf sys global
    …
   ```

```
>> Trying to install vmlicense ...
>> License-token:334ADF7B49F2FEC1XXXX INTERVAL:5 COUNT:4
>> Run config script
```

Permanent trial mode for FortiGate-VM

FortiGate-VM has a permanent evaluation VM license. The evaluation VM license applies to all private cloud (VMware ESXi, KVM, and so on) and all bring your own license (BYOL) public cloud instances.

When spinning up a new FortiGate-VM, you choose to log in to FortiCloud to activate the VM trial or upload a new license.

Limitations of the evaluation VM license include the following:

- Maximum of one free evaluation copy per FortiCloud account
- Support for low encryption operation only, except for GUI management access and FortiManager communications
- Maximum of 1 CPU and 2 GB of memory
- Maximum of three interfaces, firewall policies, and routes
- No FortiCare support
- No FortiGuard support
- Support for a maximum of two virtual domains (VDOM). When using multi-VDOM mode, the root VDOM must be an admin type and the other can be a traffic VDOM. See VDOM types on page 3299.

To obtain the permanent VM trial license from FortiCare using the CLI:

1. A newly deployed FortiGate-VM no longer has a valid evaluation license, even if the instance has only 1 CPU and 2 GB of memory. Run `get sys stat`. The following output is expected:
```
Version: FortiGate-VM64 v7.6.2,buildXXXX,220715 (interim)
...
Serial-Number: FGVMEVNXFLTGKOBC
License Status: Invalid
VM Resources: 1 CPU/1 allowed, 2007 MB RAM/2048 MB allowed
```
2. Obtain the permanent VM trial license from FortiCare:

```
execute vm-license-options account-id xxxx@fortinet.com
```

```
execute vm-license-options account-password xxxxxxx
```

```
execute vm-license
This VM is using the evaluation license. This license does not expire.
Limitations of the Evaluation VM license include:
  1.Support for low encryption operation only
  2.Maximum of 1 CPU and 2GiB of memory
  3.Maximum of three interfaces, firewall policies, and routes each
  4.No FortiCare Support
This operation will reboot the system !
```

```
Do you want to continue? (y/n)y

Connection to 10.6.30.74 closed.
```

3. You can run the following commands to check that the permanent VM trial license is valid:
   - `get system status`. The following output is expected:

     ```
     Version: FortiGate-VM64 v7.6.2,buildXXXX,220715 (interim)
     ...
     Serial-Number: FGVMEVNXFLTGKOBC
     License Status: Valid
     VM Resources: 1 CPU/1 allowed, 2007 MB RAM/2048 MB allowed
     ```

   - `diagnose hardware sysinfo vm full`. The following output is expected:

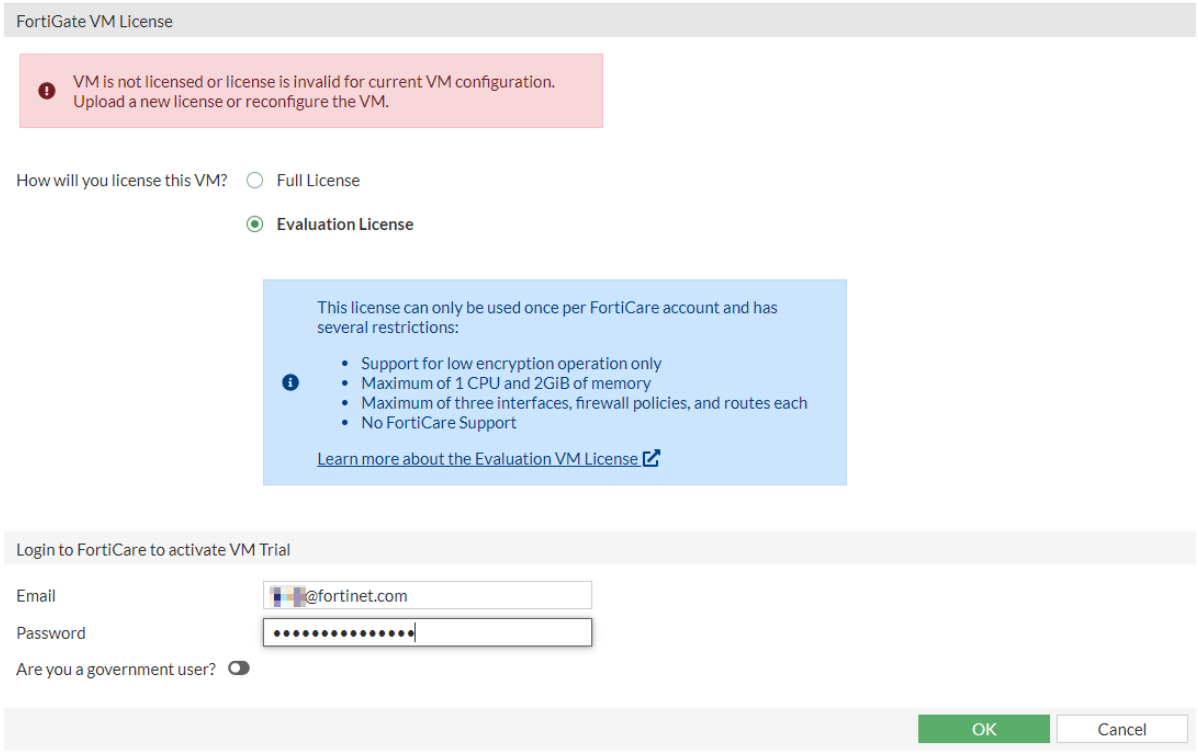
     ```
     UUID:     4213dbbc94f2520b0d75eeafe1b319c7
     valid:    1
     status:   1
     code:     0
     warn:     0
     copy:     0
     received: 4294939472
     warning:  4294939472
     recv:     202207162014
     dup:
     ```

   - `diagnose debug vm-print-license`. The following output is expected:

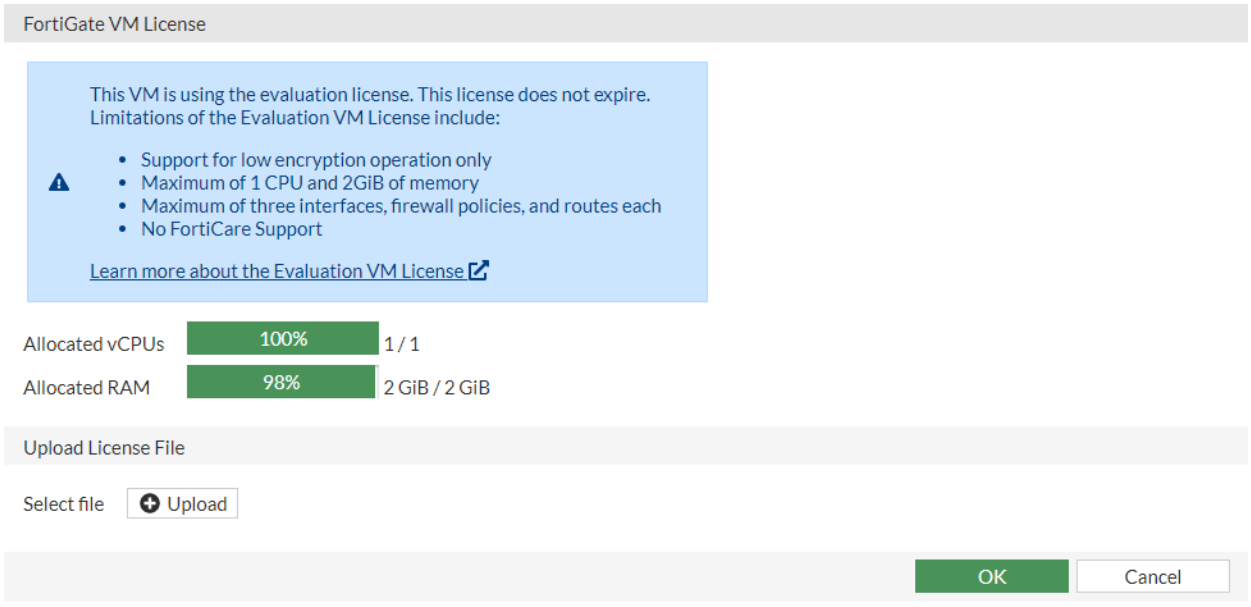
     ```
     SerialNumber: FGVMEVNXFLTGKOBC
     CreateDate: Sat Jul 16 20:11:15 2022
     UUID: 4213dbbc94f2520b0d75eeafe1b319c7
     Key: yes
     Cert: yes
     Key2: yes
     Cert2: yes
     Model: EVAL (1)
     CPU: 1
     MEM: 2048
     VDOM license:
       permanent: 2
       subscription: 0
     ```

To obtain the permanent VM trial license from FortiCare using the GUI:

1. When unlicensed, the FortiOS GUI allows you to download the permanent VM trial license from FortiCare with your FortiCare account credentials. In the FortiGate VM License page, for *How will you license this VM?*, select *Evaluation License*.



2. In the *Email* field, enter your FortiCare account email address.
3. In the *Password* field, enter your FortiCare account password.
4. Click *OK*. When a permanent VM trial license is applied, the FortiOS, the GUI shows a summary of the license limitations and allows you to upload a paid VM license.



To allow FortiManager to apply a license to an unlicensed FortiGate-VM instance:

1. Confirm that the FortiGate is unlicensed by running `get system status` in the FortiOS CLI. The following shows expected output for this command:

```
Version: FortiGate-VM64-AZURE v7.6.2,buildXXXX,220728 (interim)
...
Serial-Number: FGVMEVTN8UP4KIA6
License Status: Invalid
VM Resources: 1 CPU/1 allowed, 1945 MB RAM/2048 MB allowed
```

2. In the FortiOS CLI, configure the FortiManager as central management:

```
config system central-management
    set type fortimanager
    set fmg "<FortiManager IP address>"
end
```

3. In FortiManager, configure the VM license as Installing VM licenses on managed devices describes.

Adding VDOMs with FortiGate v-series

Each FortiGate-VM base license type allows a default number of virtual domains (VDOM). This topic provides sample procedures to add VDOMs beyond the default number using separately purchased VDOM licenses.

This topic consists of the following steps:

1. Activate the FortiGate-VM with the base license.
2. Add more VDOMs to the FortiGate-VM.

To activate the FortiGate-VM with the base license:

1. Purchase and register the FortiGate-VM base license in FortiCare:
   a. Purchase the FortiGate-VM base license from Fortinet or a Fortinet reseller.
   b. You receive a license certification with a registration code. Open the certification.
   c. Log in to Fortinet Customer Service & Support.
   d. Go to *Register Now* and enter the provided registration code.
   e. Follow the registration process. The serial number generates and displays on the *Registration Completion* page.
   f. Go to *Asset > Manage/View Products*. Click the serial number to download the license file.
2. Upload the FortiGate-VM base license file to FortiOS:
   a. Log in to the FortiGate-VM GUI.
   b. In *Dashboard > Status*, in the *Virtual Machine* widget, click *FortiGate VM License*.
   c. Click the *Upload* button.
   d. Select the FortiGate-VM base license file, then click *OK*. The FortiGate-VM reboots after applying the base license.
3. Verify the FortiGate-VM base license status and VDOM information:
   a. Log in to the FortiGate-VM GUI.
   b. In *Dashboard > Status*, in the *Virtual Machine* widget, ensure that there is a checkmark in front of the FortiGate-VM base license name. The checkmark indicates that the base license is valid.

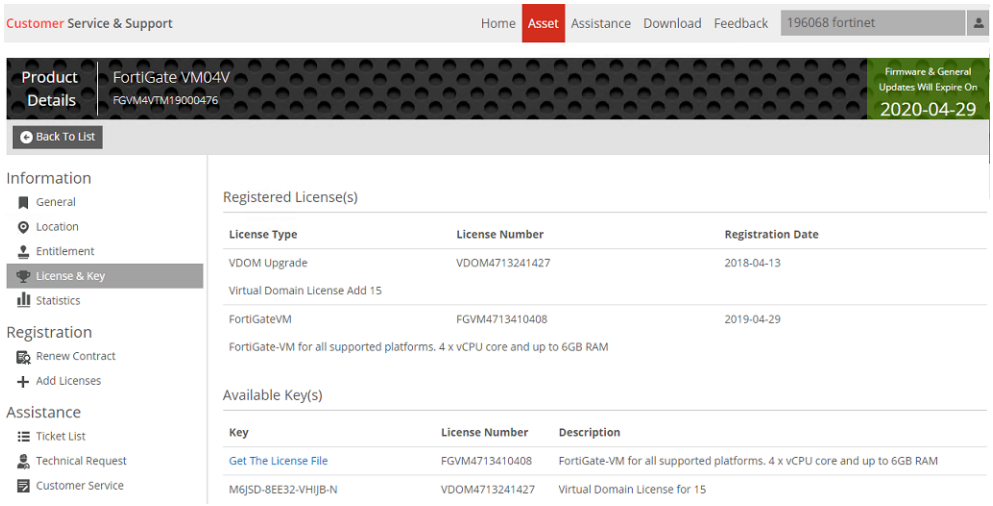
c. You can check VDOM information using the CLI. The following output shows that the maximum number of VDOMs is currently one. This is correct since the FortiGate-VM base license only supports the default root VDOM that the system uses.

To add more VDOMs to the FortiGate-VM:

You can repeat this procedure multiple times to stack multiple VDOM licenses on the same FortiGate-VM.

1. Purchase and register the FortiGate-VM upgrade license in FortiCare. This example adds 15 VDOMs:
   a. Purchase the FortiGate-VM upgrade license from Fortinet or a Fortinet reseller.
   b. You receive a license certification with a registration code. Open the certification.
   c. Log in to Fortinet Customer Service & Support.
   d. Go to *Asset* > *Register/Activate* and enter the provided registration code.
   e. On the *Specify License Confirmation Information* screen, enter the FortiGate-VM serial number to apply the VDOM upgrade license to the FortiGate-VM. In this example, the FortiGate-VM serial number is *FGVM4VTM19000476*.

   f. Follow the registration process.
   g. Go to *Asset* > *Manage/View Products* > . Select the desired product, then click *License & Key*. The VDOM upgrade license displays under *Registered License(s)*, and a key for adding 15 VDOMs (in this example *M6JSD-8EE32-VHIJB-N*) displays under *Available Key(s)*.



2. Apply the FortiGate-VM upgrade license key to FortiOS:
   a. Log in to the FortiGate-VM CLI in the local console or using SSH.
   b. Apply the VDOM upgrade license key:

```
FGVM4VTM19000476 # execute upd-vd-license M6JSD-8EE32-VHIJB-N
update vdom license succeeded
```

3. Verify the FortiGate-VM VDOM information:
   a. Log in to the FortiGate-VM CLI in the local console or using SSH.
   b. Check VDOM information using the CLI. The following output shows that the maximum number of VDOMs is currently 15. When you add VDOMs for the first time on a FortiGate-VM v-series instance, FortiOS does not count the default VDOM, as the default VDOM is the so-called root VDOM that the system uses and FortiOS does not treat it as a countable VDOM in terms of VDOM addition. Therefore, as in this example, if your FortiGate-VM had the default VDOM configuration, then you add 15 VDOMs, FortiOS displays the maximum VDOM number as 15, not 16.

```
# get system status

PF and VF SR-IOV driver and virtual SPU support

Physical function (PF) and virtual function (VF) PCI Passthrough and SR-IOV drivers in FortiGate guest VM are supported.

PF provides the ability for PCI Passthrough, but requires an entire Network Interface Card (NIC) for a VM. It can usually achieve greater performance than a Virtual Function (VF) based SR-IOV. PF is also expensive. While VF allows one NIC to be shared among multiple guests VMs, PF is allocated to one port on a VM.

The supported driver versions are:

Driver	Version	Hypervisor	PCI-Passthrough/SR-IOV	vSPU (In-guest DPDK)	Note
ixgbe	5.3.7	ESXi, KVM	Yes	Yes	
Ixgbevf	4.3.5				
i40e	2.12.6			Yes	
i40evf	3.6.15				Available in FortiOS 6.4.0 and earlier versions.
Iavf	4.5.3				Replaces i40evf in FortiOS 6.4.1 and later versions. Supports Intel E810-C 100G adapters.
Mlx5	24.04-0.6.6				Supports Nvidia ConnectX-5 and ConnectX-6 100G adapters.
Bnxt_en	1.10.1-216.0.416.1				Available in FortiOS 6.4.3 and later versions. Supports Broadcom P2100G 100G adapters.
Vmxnet3	1.4.16.0-k-NAPI	ESXi			The combination of VMware ESXi and NSX-T does not support virtual SPU (vSPU).
ICE	1.9.11	ESXi, KVM	Yes	Yes	Added support to Intel 25GbE E-810 card and its variants (E810-XXVDA2 and E810-XXVDA4)

Other hypervisors, such as Xen or Microsoft Hyper-V, may work with vSPU, although they are unverified.

All tools and software utilities for UEFI 1.X have been removed from 6.2.0 and later releases. Update to UEFI 2.x to use the UEFI tools or software utilities.

You perform the configuration to use PF or VF on the hypervisor, and do not configure it on the FortiGate.

To check what driver is being used on the FortiGate:

```
# diagnose hardware deviceinfo nic port2
Name:        port2
Driver:      i40e
Version:     2.4.10
Bus:         0000:03:00.0
Hwaddr:      3c:fd:fe:1e:98:02
Permanent Hwaddr:3c:fd:fe:1e:98:02
State:       up
Link:        up
Mtu:         1500
Supported:   auto 1000full 10000full
Advertised:  auto 1000full 10000full
Auto:        disabled
Rx packets:      0
Rx bytes:        0
Rx compressed:       0
...
```

Using OCI IMDSv2

OCI IMDSv2 offers increased security for accessing instance metadata compared to IMDSv1. IMDSv2 is used in OCI SDN connectors and on instance deployments with bootstrap metadata. When upgrading from previous FortiOS builds with legacy IMDSv1 endpoints, the endpoints will be updated to IMDSv2, and the same calls can be made.

The following use cases illustrate IMDSv2 support on the FortiGate-VM.

To configure the Oracle OCI instance to use IMDSv2:

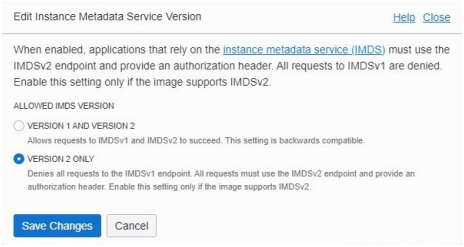
1. In OCI, deploy an instance using IMDSv2 with bootstrap metadata. There are two methods to enable IMDSv2 :
   - Use the OCI command line to deploy an instance using `user-data`. This example uses a MIME file that contains the license and configuration, as well as a JSON file that specifies to disable V1 metadata.

     ```
     oci compute instance launch
     --availability-domain wwwl:US-ASHBURN-AD-1
     --compartment-id
     ocid1.tenancy.oc1..aaaaaaaaaaa3aaaaaaaaaaaaaaaaa7xxxxxxx54aaaaaa4xxxxxxxx55xxxa
     --display-name fos-byol-v6.4.6-b2290-emulated
     --image-id
     ocid1.image.oc1.iad.aaaaaaaa6xxx43xxxxxxxxx7aaaaaaaaaaaaaaaaaaaa3xxxxxxxxxxxxxxx
     --subnet-id
     ocid1.subnet.oc1.iad.aaaaaaaaxxxxxxxxx2xxxxxxxxxxxxxxxxxxxxx5aaa4xxxxxxxxxxxx42aaa
     ```

```
--shape VM.Standard1.4
--assign-public-ip true
--user-data-file /home/oci/userdata/mime.txt
--ssh-authorized-keys-file /home/oci/userdata/myfirstkeypair.pub
--instance-options file://home/oci/scripts/metadatav2.json
```

```
root@mail:/home/oci/scripts# cat metadatav2.json
{
  "areLegacyImdsEndpointsDisabled": true
}
```

- While the instance is running, edit the instance metadata service version in the GUI ,and change the allowed IMDS version to *VERSION 2 ONLY* (see Getting Instance Metadata in the OCI documentation).

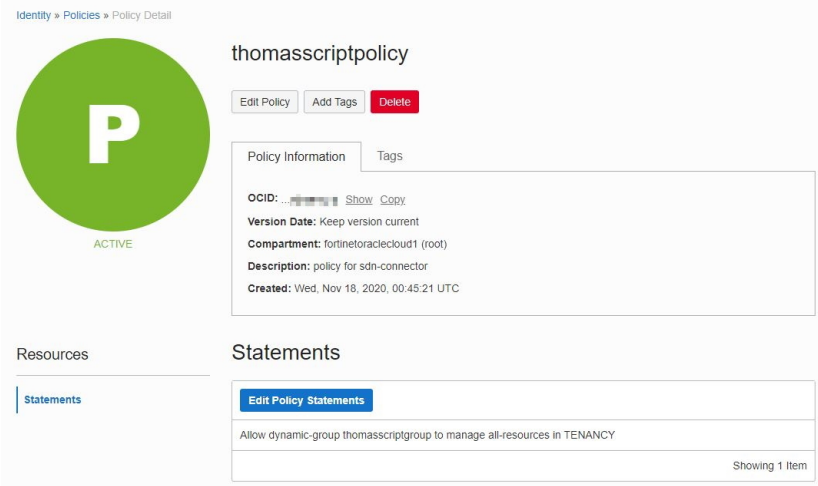


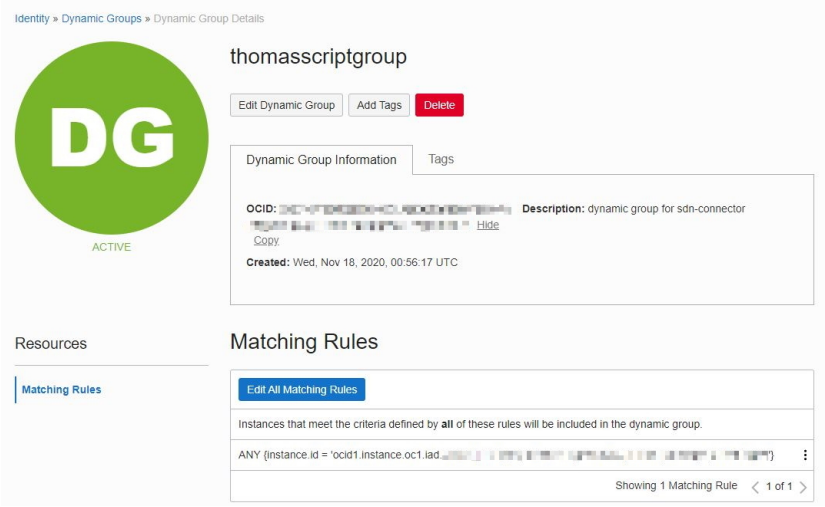
2. The FortiGate will use the metadata v2 endpoints to get the metadata bootstrap information. In FortiOS, verify this by running the following after bootup:

```
# diagnose debug cloudinit show
```

To configure an SDN connector with meta-IAM enabled and firewall addresses to obtain dynamic addresses:

1. Configure an IAM policy and dynamic group (see How Policies Work and Managing Dynamic Groups in the OCI documentation).





2. In FortiOS, configure the OCI Fabric connector (see OCI SDN connector using certificates on page 4029 for detailed instructions):
   a. Create the SDN connector.
   b. Verify that the OCI connector comes up (*Security Fabric > External Connectors* page indicates the status is up).
   c. Configure a dynamic firewall address with a filter.
   d. Verify the dynamic firewall address is resolved by the SDN connector.

To manually update the external IP:

```
# execute update-eip
instance: fos-byol-v6.4.6-b2290-emulated
    vnic0: fos-byol-v6.4.6-b2290-emulated
           10.0.0.58 (129.213.138.192)
port1: 10.0.0.58, eip: 129.213.138.192
EIP is updated successfully
```

To verify the OCI daemon debugs related to metadata:

```
# diagnose test application ocid 4
instance: fos-byol-v6.4.6-b2290-emulated
    vnic0: fos-byol-v6.4.6-b2290-emulated
           10.0.0.58
```

```
# diagnose test application ocid 5
Compartment Id:ocid1.tenancy.oc1..aaaaaaaaaaa3aaaaaaaaaaaaaaaaa7xxxxxxx54aaaaaa4xxxxxxxx55xxxa
Instance Id:ocid1.instance.oc1.iad.axxxxxxxxxxxxxxxxxxx4aaaaa5aaaaaaaaa4xxxxxxx2aaaaaaaa
Instance Name:fos-byol-v6.4.6-b2290-emulated
OCI Regarxiehlion:us-ashburn-1
```

```
# diagnose test application ocid 6
Instance Principal Token has been refreshed
```

FIPS cipher mode for AWS, Azure, OCI, and GCP FortiGate-VMs

AWS, Azure, OCI, and GCP FortiGate-VMs support FIPS cipher mode. You must remove all VPN configurations before you can enable FIPS CC mode.

FIPS cipher mode only allows a restricted set of ciphers for features that require encryption, such as SSH, IPsec and SSL VPN, and HTTPS. You cannot use insecure protocols such as Telnet, TFTP, and HTTP to access the FortiGate-VM.

You must perform a factory reset to disable `fips-ciphers` mode.

To enable fips-cipher mode:

```
config system fips-cc
    set status fips-ciphers
end
Warning: entering fips-ciphers mode. To exit this mode, factory reset is required.
Do you want to continue? (y/n) y
```

FIPS-CC cipher mode is silently enabled when configured via cloud-init.

The following behavior occurs when you enable FIPS cipher mode:

- You can restore a license, image, configuration, and so on from an FTP server.
- The following options are available:

SSH algorithms	• aes128-gcm@openssh.com • aes256-gcm@openssh.com • hmac-sha2-256 • hmac-sha2-512
IKE/IPsec phase1 proposals	• aes128-sha256 • aes128-sha256 • aes128-sha384 • aes128-sha384 • aes128-sha512 • aes128-sha512 • aes128gcm-prfsha256 • aes128gcm-prfsha256 • aes128gcm-prfsha384 • aes128gcm-prfsha384 • aes128gcm-prfsha512 • aes128gcm-prfsha512 • aes256-sha256 • aes256-sha256 • aes256-sha384

	• aes256-sha384 • aes256-sha512 • aes256-sha512 • aes256gcm-prfsha256 • aes256gcm-prfsha256 • aes256gcm-prfsha384 • aes256gcm-prfsha384 • aes256gcm-prfsha512 • aes256gcm-prfsha512
IKE/IPsec phase2 proposals	• aes128-sha256 • aes128-sha256 • aes128-sha384 • aes128-sha384 • aes128-sha512 • aes128-sha512 • aes128gcm • aes128gcm • aes256-sha256 • aes256-sha256 • aes256-sha384 • aes256-sha384 • aes256-sha512 • aes256-sha512 • aes256gcm • aes256gcm
IKE/IPsec DH groups	• Default = 19, or any three from 14 - 21, 27 - 32
HTTPS for admin and SSL VPN (with RSA server certificate) TLS suites	PFS: • TLS_AES_256_GCM_SHA384 • ECDHE-RSA-AES256-GCM-SHA384 • DHE-RSA-AES256-GCM-SHA384 • TLS_AES_128_GCM_SHA256 • ECDHE-RSA-AES128-GCM-SHA256 • DHE-RSA-AES128-GCM-SHA256 Elliptic curves: • prime256v1 • secp384r1 • secp521r1 DH group: • RFC3526/Oakley group 14 (2048 bits)
HTTPS for admin and SSL VPN (with ECC server certificate) TLS suites	PFS: • TLS_AES_256_GCM_SHA384 • ECDHE-ECDSA-AES256-GCM-SHA384 • TLS_AES_128_GCM_SHA256

- ECDHE-ECDSA-AES128-GCM-SHA256

Elliptic curves:

- prime256v1
- secp384r1
- secp521r1

- The FortiCare license is validated.
- FortiGuard databases and engines are updated.
- The DH-RSA-AES128-GCM-SHA256 and DH-RSA-AES256-GCM-SHA384 ciphers are not supported.

Cloud-init

You can use cloud-init to preconfigure a FortiGate-VM instance before bootup using a text file. For example, you can include a license or configuration information in the cloud-init file, so that the license and configuration is already present on the FortiGate-VM after initialization. All FortiGate-VM public and private cloud platforms support cloud-init. You can provide the cloud-init file when initializing the FortiGate-VM through the GUI of your desired cloud platform.

When providing FortiOS configuration in the cloud-init text file, you can include a full backed up FortiOS configuration or a partial configuration. For a partial configuration, provide the configuration in the form of CLI commands. The example in this topic includes a partial configuration that consists of the following CLI commands:

```
config system global
   set hostname mimecheck
   set admintimeout 480
end
```

config system admin

```
   edit admin
      set password 12345678
end
```

The following shows the content of an example cloud-init MIME file that includes the FortiGate-VM license and some configuration. The example omits most of the license file content for security purposes:

```
Content-Type: multipart/mixed; boundary="===============0740947994048919689=="
MIME-Version: 1.0

--===============0740947994048919689==
Content-Type: text/plain; charset="us-ascii"
MIME-Version: 1.0
Content-Transfer-Encoding: 7bit
Content-Disposition: attachment; filename="config"

config system global
set hostname mimecheck
set admintimeout 480
end
```

```
config system admin
edit admin
set password 12345678
end

--================0740947994048919689==
Content-Type: text/plain; charset="us-ascii"
MIME-Version: 1.0
Content-Transfer-Encoding: 7bit
Content-Disposition: attachment; filename="license"

-----BEGIN FGT VM LICENSE-----
QAAAAM9mmdw0/C5oquSAhgYYurEyOAeTChjuEt8NlvQZszsj6FMpzv9FFLl8DuV8
C7JSP1JqFSjTEeSLa/crtO84Df7gGQAAgZ3RwxjOeKPEgl4i4cQKpcECVcXM4hcb
...
uqoVJ7Nca1B4mZUE3v4BuO07fZZJCdO2
-----END FGT VM LICENSE-----

--================0740947994048919689==--
```

To debug the cloud-init configuration, use the `diagnose debug cloud-init show` command. The following shows example output for this command:

```
>> Checking metadata source config drive
>> Found config drive /dev/sr0
>> Successfully mount config drive
>> MIME parsed preconfig script
>> Found metadata source: config drive
>> Trying to install vmlicense ...
>> Run config script
>> FGVMULTM12345678 $
>> FGVMULTM12345678 $ config system global
>> FGVMULTM12345678 (global) $ set hostname vFGTvm00
>> FGVMULTM12345678 (global) $ end
>> vFGTvm00 $ config system admin
>> vFGTvm00 (admin) $ edit admin
>> vFGTvm00 (admin) $ set password 12345678
>> vFGTvm00 (admin) $ end
>> vFGTvm00 $
>> vFGTvm00 $ config system interface
>> vFGTvm00 (interface) $ edit port1
>> vFGTvm00 (port1) $ set mode static
>> vFGTvm00 (port1) $ set ip 10.6.30.169/24
>> vFGTvm00 (port1) $ set allowaccess ping https ssh snmp http telnet fgfm radius-acct probe-
     response ftm
>> vFGTvm00 (port1) $ next
>> vFGTvm00 (interface) $ edit port2
>> vFGTvm00 (port2) $ set mode static
>> vFGTvm00 (port2) $ set ip 10.1.100.169/24
>> vFGTvm00 (port2) $ set allowaccess ping https ssh snmp http telnet fgfm radius-acct probe-
     response ftm
>> vFGTvm00 (port2) $ next
>> vFGTvm00 (interface) $ edit port3
>> vFGTvm00 (port3) $ set mode static
>> vFGTvm00 (port3) $ set ip 172.16.200.169/24
```

```
>> vFGTvm00 (port3) $ set allowaccess ping https ssh snmp http telnet fgfm radius-acct probe-
     response ftm
>> vFGTvm00 (port3) $ next
>> vFGTvm00 (interface) $ end
>> vFGTvm00 $
>> vFGTvm00 $ config firewall policy
>> vFGTvm00 (policy) $ edit 0
>> vFGTvm00 (0) $ set srcintf "port2"
>> vFGTvm00 (0) $ set dstintf "port3"
>> vFGTvm00 (0) $ set srcaddr "all"
>> vFGTvm00 (0) $ set dstaddr "all"
>> vFGTvm00 (0) $ set action accept
>> vFGTvm00 (0) $ set schedule "always"
>> vFGTvm00 (0) $ set service "ALL"

>> vFGTvm00 (0) $ next
>> vFGTvm00 (policy) $ end
>> vFGTvm00 $
>> vFGTvm00 $ config router static
>> vFGTvm00 (static) $ edit 1
>> vFGTvm00 (1) $ set gateway 172.16.200.254
>> vFGTvm00 (1) $ set device "port3"
>> vFGTvm00 (1) $ next
>> The destination is set to 0.0.0.0/0 which means all IP addresses.
>> vFGTvm00 (static) $ end
>> vFGTvm00 $
>> Finish running config script
```

TPM support for FortiGate-VM

Using the TPM module, the FortiGate can generate, store, and authenticate cryptographic keys. When TPM is enabled on a FortiGate,a master-encryption-password is automatically generated to encrypt sensitive data on the FortiGate such as IPsec VPN preshared keys (PSK), and other passwords and keys as this document lists. In turn, a TPM-generated primary key, which is stored on the TPM, encrypts this master-encryption-passsword.

When the FortiGate backs up configurations to a configuration file, the master-encryption-password encrypts passwords and keys. The primary key also encrypts the master-encryption-password. Therefore, when restoring a config file, if the FortiGate unit does not have TPM enabled, or does not have the same master-encryption-key, you cannot upload the configuration file.

This enhancement adds TPM support to FGT-VM64 platforms. Hypervisors with software TPM emulator packages installed can support the TPM feature in FortiOS. This feature supports KVM/QEMU.

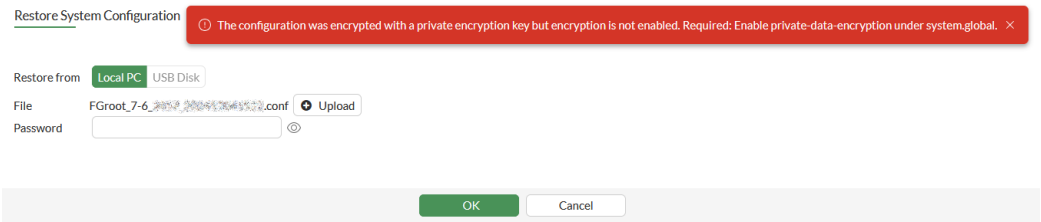
For information about TPM, see Trusted platform module support on page 3289.

Passwords and keys that the masterencryptionkey can encrypt include:

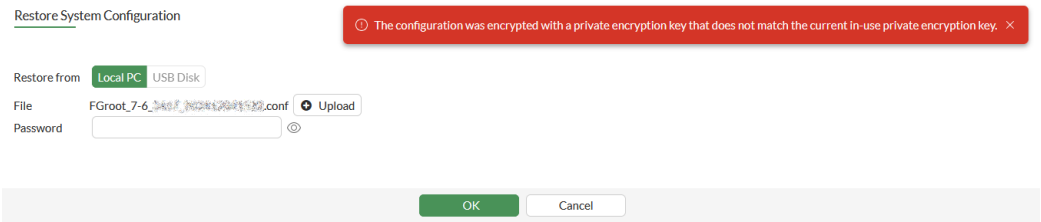
- Alert email user password
- BGP and other routing-related configurations
- External resource
- FortiGuard proxy password
- FortiToken/FortiToken Mobile seed

- High availability password
- Link Monitor server-side password
- IPsec VPN PSK
- Local certificate private key
- SDN connector server-side password
- Local, LDAP, RADIUS, FSSO, and other user category-related passwords
- Modem/PPPoE
- NST password
- NTP Password
- SNMP
- Wireless security-related password

You cannot restore a private key-encrypted configuration via the FortiOS GUI if `private-data-encryption` is disabled. The following shows the GUI in this scenario:



Also, if a configuration backup was taken while the private-data-encryption is enabled, then private-data-encryption is disabled and re-enabled again, the configuration backup will no longer be able to be restored.



To check if your FortiGate has a TPM:

1. Verify that the required packages are installed on the Linux KVM host:

```
packet@kvm-s01:~$ lsb_release -a
No LSB modules are available.
Distributor ID:        Ubuntu
Description:   Ubuntu 22.04.1 LTS
Release:       22.04
Codename:      jammy
packet@kvm-s01:~$
packet@kvm-s01:~$ apt list swtpm swtpm-tools qemu libvirt0 virtinst
Listing... Done
libvirt0/jammy-updates,jammy-updates,now 8.0.0-1ubuntu7.1 amd64 [installed,automatic]
qemu/jammy-updates,jammy-updates,now 1:6.2+dfsg-2ubuntu6.3 amd64 [installed]
swtpm-tools/jammy,jammy,now 0.6.3-0ubuntu3 amd64 [installed]
```

```
swtpm/jammy,jammy,now 0.6.3-0ubuntu3 amd64 [installed]
virtinst/jammy,jammy,jammy,jammy,now 1:4.0.0-1 all [installed]
```

2. Import a FGT_VM64_KVM VM to the host. You may want to change the following script to fit your setup:

```
UUID="$(uuid)"
SKU="FGT_VM64_KVM"
VER=7
NUM=0418
CPU=2
RAM=2048
CONTROLLER="type=ide,index=0"
BUS="ide"
MODEL="virtio"
RND_MAC() { printf '90:6C:AC:%02X:%02X\n' $((RANDOM%256)) $((RANDOM%256)) ;}
MACADDR=$(RND_MAC)
DOMAIN=$SKU-v$VER-b$NUM

qemu-img create -f qcow2 $DOMAIN-log.qcow2 1024M
qemu-img create -f qcow2 $DOMAIN-wanopt.qcow2 1024M

virt-install --connect qemu:///system \
       --name $DOMAIN \
       --uuid $UUID \
       --virt-type kvm \
       --arch=x86_64 \
       --hvm \
       --osinfo linux \
       --os-variant=generic \
       --graphics vnc,listen=0.0.0.0 --noautoconsole \
       --cpu host-passthrough \
       --vcpus=$CPU \
       --ram $RAM \
       --sysinfo host \
       --controller $CONTROLLER \
       --boot hd,menu=on \
       --disk fortios.qcow2,device=disk,bus=$BUS,format=qcow2,cache=none,io=native \
       --disk $DOMAIN-log.qcow2,device=disk,bus=$BUS,format=qcow2,cache=none,io=native \
       --disk $DOMAIN-wanopt.qcow2,device=disk,bus=$BUS,format=qcow2,cache=none,io=native \
       --features kvm_hidden=on,smm=on \
       --tpm backend.type=emulator,backend.version=2.0,model=tpm-tis \
       --network bridge=br1,model=$MODEL,mac=$MACADDR:01 \
       --network bridge=br2,model=$MODEL,mac=$MACADDR:02 \
       --network bridge=br3,model=$MODEL,mac=$MACADDR:03 \
       --network bridge=br4,model=$MODEL,mac=$MACADDR:04 \
       --import
```

Key pairs are created on the host when the VM with TPM is imported:

```
packet@kvm-s01:~$ sudo ls -al /var/lib/swtpm-localca/
total 56
drwxr-x---  2 swtpm root  4096 Sep 21 08:09 .
```

```

FGT_VM64_KVM # diagnose tpm SHA-1 1234567890abcdef1234567890abcdef
1234567890abcdef1234567890abcdef

TPM2_Hash of '1234567890abcdef1234567890abcdef' with SHA-1:

0x00000000:   62  0A  31  15  69  9A  42  2B
0x00000008:   D8  74  DE  31  D3  E6  91  1C
0x00000010:   58  3A  76  75
```

```
FGT_VM64_KVM # diagnose tpm SHA-256 1234567890abcdef1234567890abcdef
1234567890abcdef1234567890abcdef

TPM2_Hash of '1234567890abcdef1234567890abcdef' with SHA-256:

0x00000000:   C5  12  D9  2E  35  45  B2  F1
0x00000008:   22  2E  4B  4C  6A  F6  D3  30
0x00000010:   EC  30  02  A0  4B  CA  A4  1D
0x00000018:   F9  CC  2C  49  62  84  96  D6
```

4. Enable TPM and input the master encryption password. This is an example. Using 0123456789abcdef0123456789abcdef as your private key is not recommended:

```
FGT_VM64_KVM # exec private-encryption-key sample
Private encryption is not enabled.
Command fail. Return code 7
```

```
FGT_VM64_KVM # config system global
FGT_VM64_KVM (global) # set private-data-encryption enable
FGT_VM64_KVM (global) # end
This operation will generate a random private data encryption key!
Previous config files encrypted with the system default key cannot be restored after this
operation!
Do you want to continue? (y/n)y
Private data encryption key generation succeeded!
```

The following shows an example of a successful activation:

```
FGT_VM64_KVM # exec private-encryption-key sample
B64TEXT: u7oOx1iBjPFu4XLZVq5/RpoZrDJ9htRo6Jjhfts4BaI=
B64HMAC: FHmUhzSyT0IEfyoRnfdTFbY2l0o=
```

Note the B64TEXT and B64HMAC sample keys. Run the following to verify the feature:

```
FGT_VM64_KVM # exec private-encryption-key verify u7oOx1iBjPFu4XLZVq5/RpoZrDJ9htRo6Jjhfts4BaI=
FHmUhzSyT0IEfyoRnfdTFbY2l0o=
Verification passed.
```

5. Back up the config:

```
FGT_VM64_KVM # execute backup config tftp FGVM02TM12345678.conf 172.18.70.161
Please wait...
Connect to tftp server 172.18.70.161 ...
#
Send config file to tftp server OK.
```

6. Verify that the backup config has private-encryption-key:

```
packet@1804:/mnt/incoming$ less FGVM02TM12345678.conf
  #config-version=FGVMK6-7.0.8-FW-build0418-220920:opmode=0:vdom=0:user=admin
  #conf_file_ver=2079893748141389
  #buildno=0418
  #global_vdom=1
  #private-encryption-key=oY5GhQK3w0Ddn0EX+8hp6UYpjB4=
  config system global
      set admin-server-cert "Fortinet_Factory"
      set alias "FortiGate-VM64-KVM"
      set hostname "FGT_VM64_KVM"
      set private-data-encryption enable
      set timezone 04
  end
```

Hyperscale firewall

Hyperscale hardware and facilities can scale a distributed computing environment up to thousands of servers. It is about achieving massive scale in computing, typically for big data or cloud computing.

A hyperscale firewall secures hyperscale data centers and 5G networks.

See the Hyperscale Firewall Guide. For information about the difference between hyperscale and standard FortiOS CGNAT, see Hyperscale and standard FortiOS CGNAT feature comparison.

Troubleshooting

This section is intended for administrators with super_admin permissions who require assistance with basic and advanced troubleshooting. Administrators with other types of permissions may not be able to perform all of the tasks in this section.

This section contains the following troubleshooting topics:

- Troubleshooting methodologies on page 4296
- Connectivity Fault Management on page 4299
- Troubleshooting scenarios on page 4302
  - System date and time settings on page 4304
  - Checking the hardware connections on page 4305
  - Checking FortiOS network settings on page 4305
  - Checking CPU and memory resources on page 4308
  - FortiGuard server settings on page 4352
  - Troubleshooting high CPU usage on page 4310
  - Checking the modem status on page 4314
  - Running ping and traceroute on page 4315
  - Checking the logs on page 4320
  - Verifying routing table contents in NAT mode on page 4321
  - Verifying the correct route is being used on page 4322
  - Verifying the correct firewall policy is being used on page 4322
  - Checking the bridging information in transparent mode on page 4323
  - Checking wireless information on page 4324
  - Performing a sniffer trace or packet capture on page 4325
  - Debugging the packet flow on page 4327
  - Testing a proxy operation on page 4331
  - Displaying detail Hardware NIC information on page 4331
  - Performing a traffic trace on page 4334
  - Using a session table on page 4335
  - Finding object dependencies on page 4338
  - Diagnosing NPU-based interfaces on page 4339
  - Identifying the XAUI link used for a specific traffic stream on page 4340
  - Running the TAC report on page 4341
  - Using the process monitor on page 4342
  - Computing file hashes on page 4344
  - Other commands on page 4346
  - FortiGuard troubleshooting on page 4350
  - View open and in use ports on page 4355
  - IPS and AV engine version on page 4356
  - print tablesize on page 4356

- CLI troubleshooting cheat sheet on page 4357
- CLI error codes on page 4357
- Additional resources on page 4358

Troubleshooting methodologies

The sections in this topic provide an overview of how to prepare to troubleshoot problems in FortiGate. They include verifiying your user permissions, establishing a baseline, defining the problem, and creating a plan.

Verify user permissions

Before you begin troubleshooting, verify the following:

- You have administrator privileges for the FortiGate.
- The FortiGate is integrated into your network.
- The operation mode is configured.
- The system time, DNS settings, administrator password, and network interfaces are configured.
- Firmware, FortiGuard AntiVirus, FortiGuard Application Control, and FortiGuard IPS are up to date.

If you are using a FortiGate that has virtual domains (VDOMs) enabled, you can often troubleshoot within your own VDOM. However, you should inform the super_admin for the FortiGate that you will be performing troubleshooting tasks.

You may also need access to other networking equipment, such as switches, routers, and servers to carry out tests. If you do not have access to this equipment, contact your network administrator for assistance.

Establish a baseline

FortiGate operates at all layers of the OSI model. For this reason, troubleshooting can be complex. Establishing baseline parameters for your system before a problem occurs helps to reduce the complexity when you need to troubleshoot.

A best practice is to establish and record the normal operating status. Regular operation data shows trends, and allows you to see where changes occur when problems arise. You can gather this data by using logs and SNMP tools to monitor the system performance or by regularly running information gathering commands and saving the output.

You should back up your FortiOS configuration on a regular basis even when you are not troubleshooting. You can restore the backed up configuration as needed to save time recreating it from the factory default settings.

Use the following CLI commands to obtain normal operating data for a FortiGate:

`get system status`	Displays firmware versions and FortiGuard engine versions, and other system information.
`get system performance status`	Displays CPU and memory states, average network usage, average sessions and session setup rate, viruses caught, IPS attacks blocked, and uptime.
`get hardware memory`	Displays information about memory.
`get system session status`	Displays total number of sessions.
`get router info routing-table all`	Displays all the routes in the routing table, including their type, source, and other useful data.
`get ips session`	Displays memory used and maximum amount available to IPS as well as counts
`get webfilter ftgd-statistics`	Displays a list of FortiGuard related counts of status, errors, and other data.
`diagnose sys session list`	Displays the list of current detailed sessions.
`show sys dns`	Displays the configured DNS servers.
`diagnose sys ntp status`	Displays information about NTP servers.

You can run any commands that apply to your system for information gathering. For example, if you have active VPN connections, use the `get vpn` series of commands to get more information about them.

Use `execute tac report` to get an extensive snapshot of your system. This command runs many diagnostic commands for specific configurations. It also records the current state of each feature regardless of the features deployed on your FortiGate. If you need to troubleshoot later, you can run the same command again and compare the differences to identify any suspicious output.

Define the problem

The following questions are intended to compare the current behavior of the FortiGate with normal operations to help you define the problem. Be specific with your answers. After you define the problem, search for a solution in the troubleshooting scenarios section, and then create a plan to resolve it.

What is the problem?	The problem being observed may not be the actual problem. You should determine where the problem lies before starting to troubleshoot the FortiGate.
Was the device working before?	If the device never worked, it might be defective. For more information, see Troubleshooting your installation on page 40.
Can the problem be reproduced?	If the problem is intermittent, it may be dependent on system load. Intermittent problems are challenging to troubleshoot because they are difficult to reproduce.
What has changed?	Use the FortiGate event log to identify possible configuration changes.

	There may be changes in the operating environment. For example, there might be a gradual increase in load as more sites are forwarded through the firewall. If something has changed, roll back the change and assess the impact.
What is the scope of the problem?	After you isolate the problem, determine what applications, users, devices, and operating systems the problem affects. The following questions are intended to narrow the scope of the problem and identify what to check during troubleshooting. The more factors you can eliminate, the less you need to check. For this reason, be as specific and accurate as possible when gathering information. • What is not working? • Is more than one thing not working? • Is it partly working? If so, what parts are working? • Is it a connectivity issue for the entire device, or is there an application that isn't reaching the Internet? • Where did the problem occur? • When did the problem occur and to which users or groups of users? • What components are involved? • What applications are affected? • Can you use a packet sniffer to trace the problem? • Can you use system debugging or look in the session table to trace the problem? • Do any of the log files indicate a failure has occurred?

Create a troubleshooting plan

After you define the problem and its scope, develop a troubleshooting plan.

Create checklist	Make a list all the possible causes of the problem and how you can test for each cause. Create a checklist to keep track of what has been tried and what is left to test. Checklists are useful when more than one person is performing troubleshooting tasks.
Obtain the required equipment	Testing your solution may require additional networking equipment, computers, or other devices. Network administrators usually have additional networking equipment available to loan you, or a lab where you can bring the FortiGate unit to test. If you do not have access to equipment, check for shareware applications that can perform the same tasks. Often, there are software solutions you can use when hardware is too expensive.
Consult Fortinet troubleshooting resources	After the checklist is created, refer to the troubleshooting scenarios sections to assist with implementing your plan. See Troubleshooting scenarios on page 4302.

Gather information for technical support	If you still require technical assistance after the plan is implemented, be prepared to provide Fortinet technical support with following information: • Firmware build version (use the `get system status` command) • Network topology diagram • Recent configuration file • Recent debug log (optional) • Summary of troubleshooting steps you have taken and the results. Do not provide the output from the `execute tac` report unless the support team requests it. The output from this command is very large and is not required in many cases.
Contact technical support	Before contacting technical support, ensure you have login access (preferably with full read/write privileges) to all networking devices that could be relevant to troubleshooting. If you are using VMs, be prepared to have someone who can log in to the virtual hosting platform in case it is necessary to check and possibly modify resource allocation. For information about contacting technical support, go to FortiCare Support Service page.

Connectivity Fault Management

Some FortiGate hardware models support Connectivity Fault Management (CFM) technology. With CFM, administrators can easily diagnose and resolve issues in Ethernet networks. CFM provides tools for monitoring, testing, and verifying the connectivity and performance of network segments.

The following platforms support CFM:

FortiGate	FG-40F, FG-40F-3G4G, FG-60F, FG-61E, FG-61F, FG-81F, FG-90E-POE, FG-100F, FG-101F, FG-200E, FG-1100E
FortiWiFi	FWF-40F, FWF-60F, FWF-61F

Use the `config ethernet-oam cfm` command to configure the CFM protocol.

```
config ethernet-oam cfm
    edit <domain-id>
        set domain-name <string>
        set domain-level <integer>
        config service
            edit <service-id>
                set service-name <string>
                set interface "<string>"
                set mepid <integer>
                set message-interval <integer>
                set cos <integer>
```

```
                set sender-id Hostname {none | Hostname}
            next
        end
    next
end
```

`<domain-id>`	Specify the domain ID for the Ethernet layer operation, administration, and management (OAM) protocol. A unique domain ID is used to communicate with other peers under the same domain ID and domain level.
`domain-level <integer>`	Specify the OAM maintenance level (0 to 7, with 0 being the smallest and 7 being the largest). A unique domain level is used to communicate with other devices under the same domain ID and domain level.
`domain-name <string>`	Specify the OAM domain name or maintenance domain identifier (MDID). Other peer devices recognize the domain name. All devices in the same domain with the same service level can communicate with each other.

A domain can provide multiple services. Each service uses a special service ID. The following items describe a service:

`<service-id>`	Specify the ID for the service.
`service-name <string>`	Specify the name of the service.
`interface <string>`	Specify the name of the VLAN interface where the service is enabled. The service is associated with a particular VLAN network port and can't be accessed by other network ports.
`mepid <integer>`	Specify the unique ID of the maintenance association endpoints (MEP) (1 - 8191). The service is associated with a unique MEP ID and can't respond to other service requests of a different MEP ID.
`message interval <integer>`	Specify the continuity-check message frequency interval in milliseconds. Determines how long to send a continuity-check message to determine whether the service is alive.
`cos <integer>`	Specify the class of service (COS) bit for continuity-check messages (0 to 7). CoS is an optional, special bit in the packet of continuity-check messages.
`sender-id {none | hostname}`	Specify the type, length, value (TLV) sender ID: • `none`: indicates no sender ID. • `hostname`: uses the Fortinet production name of the device as the sender ID, for example, FortiGate-80F. The sender ID is an optional column that includes a hostname in the packet of continuity-check messages.

The following diagnose commands can be used with this feature:

`diagnose ethernet-oam cfmpeer`	Locate peers configured with `config ethernet-oam cfm` that are using the CFM Continuity Check Protocol (CCP) protocol to connect to the CCP daemon (CCD).
`diagnose debug application cfmd {enable | disable}`	Enable or disable debugging messages of the CFM protocol. • `enable`: enable debugging messages for the CFM protocol. Messages appear on the console. • `disable`: disable debugging messages.

The following execute commands can be used with this feature:

`execute ethernet ping`	Check if an interface has a peer with mac address and level available under CFM support.
`execute ethernet traceroute`	Check the Ethernet traceroute with the peer FortiGate. The traceroute is instructed to achieve a peer through an interface with mac_address and level available under CFM support.

Example

In this example, an interface (vlan101) connects FortiGate 81F to FortiGate 101F. CFM is configured for the interface (vlan101) on the FortiGate 81F. All steps are performed on the FortiGate 101F.

Because this feature is based on IEEE 802.1Q, an IP address is not needed to connect the interface.

To configure and use CFM :

1. Configure CFM for the interface named `vlan101`:

```
config ethernet-oam cfm
    edit 1
        set domain-name cfm-test
        set domain-level 1
        config service
            edit 1
                set service-name vlan-101
                set interface "vlan101"
                set mepid 101
                set message-interval 10000
                set cos 7
                set sender-id Hostname
            next
        end
    next
end
```

2. On the FortiGate 101F, show the peers connecting to the device:

```
# diagnose ethernet-oam cfmpeer
wait for the responses from CCD daemons ...
```

```
========                MEPs (pid 11251)               ========
======== domain_name: cfm-test service_name: vlan-101 mepid: 101 ========
1  MAC = e0:23:ff:9b:07:0a, state = UP, mdlevel = 1, domain_name = cfm-test, service_name =
vlan-101, mepid = 81, TLV_port_status = PsUP, TLV_interface_status = isUp
========                    END                    ========
```

3. On FortiGate 101F, check whether the interface has a peer under CFM support:

```
# execute ethernet ping vlan101 1 5 e0:23:ff:9b:07:0a
Sending CFM LBM to e0:23:ff:9b:07:0a
64 bytes from e0:23:ff:9b:07:0a, sequence 422603820, 1 ms
64 bytes from e0:23:ff:9b:07:0a, sequence 422603821, 1 ms
64 bytes from e0:23:ff:9b:07:0a, sequence 422603822, 1 ms
64 bytes from e0:23:ff:9b:07:0a, sequence 422603823, 1 ms
64 bytes from e0:23:ff:9b:07:0a, sequence 422603824, 1 ms
```

4. Execute the Ethernet traceroute:

```
# execute ethernet traceroute vlan101 1 e0:23:ff:9b:07:0a
Sending CFM LTM probe to e0:23:ff:9b:07:0a
ethtrace_main: flags = 0, usefdbonly = 0
ttl 1: LTM with id 984984516
cfm_matchltr - 384
cfm_matchltr - 404
        reply from e0:23:ff:9b:07:0a, id=984984516, ttl=0, RlyHit
```

Troubleshooting scenarios

The following table is intended to help you diagnose common problems and provides links to the corresponding troubleshooting topics:

Problem	Probable cause	Recommended action
Hardware connections	• Are all of the cables and interfaces connected properly? • Is the LED for the interface green?	Checking the hardware connections on page 4305
FortiOS network settings	• If you are having problems connecting to the management interface, is your protocol enabled on the interface for administrative access? • Does the interface have an IP address?	Checking FortiOS network settings on page 4305
CPU and memory resources	• Is the CPU running at almost 100 percent usage?	Checking CPU and memory resources on page 4308

Problem	Probable cause	Recommended action
	• Is your FortiGate running low on memory?	
Modem status	• Is the modem connected? • Are there PPP issues?	Checking the modem status on page 4314
Ping and traceroute	Is the FortiGate experiencing complete packet loss?	Running ping and traceroute on page 4315
Logs	Do you need to identify a problem?	Checking the logs on page 4320
Contents of the routing table (in NAT mode)	• Are there routes in the routing table for default and static routes? • Do all connected subnets have a route in the routing table? • Does a route have a higher priority than it should?	Verifying routing table contents in NAT mode on page 4321
Traffic routes	Is the traffic routed correctly?	Verifying the correct route is being used on page 4322
Firewall policies	Is the correct firewall policy applied to the expected traffic?	Verifying the correct firewall policy is being used on page 4322
Bridging information in transparent mode	Are you having problems in transparent mode?	Checking the bridging information in transparent mode on page 4323
Firewall session list	Are there active firewall sessions?	Using a session table on page 4335
Wireless Network	Is the wireless network working properly?	Checking wireless information on page 4324
FortiGuard connectivity	Is the FortiGate communicating properly with FortiGuard?	Verifying connectivity to FortiGuard on page 4350
Sniffer trace	• Is traffic entering the FortiGate? Does the traffic arrive on the expected interface? • Is the ARP resolution correct for the next-hop destination? • Is the traffic exiting the FortiGate to the destination as expected? • Is the FortiGate sending traffic back to the originator?	Performing a sniffer trace or packet capture on page 4325
Packet flow	Is traffic entering or leaving the FortiGate as expected?	Debugging the packet flow on page 4327
FortiGate is frozen or halted	The FortiGate may have experienced a kernel issue.	On supported models, use the NMI button to troubleshoot kernel issues.

System date and time settings

The system date and time are important for FortiGuard services, logging events, sending alerts, and certificates that have a time requirement to check for validity.

The wrong time makes the log entries confusing and difficult to use. If all devices have the same time, it helps to correlate log entries from different devices.

When possible, use Network Time Protocol (NTP) to set the date and time. This is an automatic method that does not require manual intervention. However, you must ensure that the port is allowed through the firewalls on your network. FortiToken synchronization requires NTP in many situations.

For information about setting the system date and time, see Setting the system time on page 3271.

To view and configure the date and time in the GUI:

1. Go to *Dashboard* > *Status*. The date and time are displayed in the *System Information* widget, next to *System Time*.
2. Go to *System* > *Settings*.
3. In the *System Time* section, select *NTP*, and then configure the *Time Zone*, and *Set Time* settings as required.

To view the date and time in the CLI:

```
# execute date
current date is: 2024-07-23
```

```
# execute time
current time is: 14:17:00
last ntp sync:Tue Jul 23 13:25:21 2024
```

To configure the date and time in the CLI:

Use the `set timezone ?` command to display a list of timezones and the integers that represent them.

```
config system global
    set timezone <integer>
end
config system ntp
    set type custom
    config ntpserver
        edit 1
            set server “ntp1.fortinet.net”
        next
        edit 2
            set server “ntp2.fortinet.net”
        next
    end
    set ntpsync enable
```

```
    set syncinterval 60
end
```

Checking the hardware connections

If traffic is not flowing from the FortiGate, there may be a problem with the hardware connection.

To check hardware connections:

1. Ensure the network cables are plugged into the interfaces.
2. Verify the LED connection lights for the network cables indicate there is a connection. The lights are typically green when there is a connection.
3. Change the cable when:
   - The cable or its connector are damaged.
   - You are unsure of the type or quality of the cable, such as straight through or crossover.
   - You see exposed wires at the connector.
4. Connect the FortiGate to different hardware.
5. Go to *Network* > *Interfaces* to ensure the link status for the interface is set to *Up*.
   The link status is based on the physical connection and cannot be set in FortiOS.

To enable an interface in the GUI:

You should still perform basic software connectivity tests to ensure complete connectivity even if there was a problem with the hardware connection. The interface might also be disabled, or its *Status* might be set to *Down*. See Interfaces on page 170.

1. Go to *Network* > *Interfaces*.
2. Select an interface, such as *Port1*, and click *Edit*.
3. In the *Miscellaneous* area, next to *Status*, click *Enabled*.
4. Click *OK*.

To enable an interface in the CLI:

```
config system interface
   edit port1
      set status up
   next
end
```

Checking FortiOS network settings

Check the FortiOS network settings if you have problems connecting to the management interface. FortiOS network settings include, interface settings, DNS Settings, and DHCP settings.

Interface settings

If you can access the FortiGate with the management cable only, you can view the interface settings in the GUI.

To view the interface settings in the GUI:

1. Go to *Network* > *Interfaces*.
2. Select an interface and click *Edit*.
3. Check the following interfaces to ensure they are not blocking traffic.

Setting	Description
Link Status	The status is *Up* when a valid cable is plugged in. The status is *Down* when an invalid cable is plugged in. The Link Status is shown physically by the connection LED for the interface. If the LED is green, the connection is good. If Link Status is *Down*, the interface does not work. Link status also appears in the *Network* > *Interfaces* page by default.
Addressing mode	Do not use *DHCP* if you do not have a DHCP server. You will not be able to log into an interface in DHCP mode as it will not have an IP address.
IP/Network Mask	An interface requires an IP address to connect to other devices. Ensure there is a valid IP address in this field. The one exception is when *DHCP* is enabled for this interface to get its IP address from an external DHCP server.
IPv6 address	The same protocol must be used by both ends to complete the connection. Ensure this interface and the remote connection are both using IPv4 or both are using IPv6 addresses.
Administrative access	If no protocols are selected, you will have to use the local management cable to connect to the unit. If you are using IPv6, configure the IPv6 administrative access protocols.
Status	Ensure the status is set to *Up* or the interface will not work.

To display the internal interface settings in the CLI:

```
FGT# show system interface <interface_name>
```

To view the list of possible interface settings:

```
config system interface
   edit <interface_name>
      get
end
```

DNS settings

To view DNS settings in the GUI:

Go to *Network* > *DNS*.

You can trace many networking problems back to DNS issues. Check the following items:

1. Are there values for both the *Primary DNS server* and *Secondary DNS server* fields.
2. Is the *Local Domain Name* correct?
3. Are you using IPv6 addressing? If so, are the IPv6 DNS settings correct?
4. Are you using Dynamic DNS (DDNS)? If so, is it using the correct server, credentials, and interface?
5. Can you contact both DNS servers to verify the servers are operational?
6. If an interface addressing mode is set to DHCP and is set to override the internal DNS, is that interface receiving a valid DNS entry from the DHCP server? Is it a reasonable address and can it be contacted to verify it is operational?
7. Are there any DENY security policies that need to allow DNS?
8. Can any internal device perform a successful traceroute to a location using the FQDN?

DHCP server settings

DHCP servers are common on internal and wireless networks. The DHCP server will cause problems if it is not configured correctly.

To view DHCP server settings in the GUI:

1. Go to *Network* > *Interfaces*.
2. Select an interface, and click *Edit*.

Check the following items:

1. Is the DHCP server enabled?
2. Is the DHCP server entry set to *Relay*? If so, verify there is another DHCP server to which requests can be relayed. Otherwise, set it to *Server*.
3. Does the DHCP server use a valid IP address range? Are other devices using the addresses? If one or more devices are using IP addresses in this range, you can use the IP reservation feature to ensure the DHCP server does not use these addresses. See DHCP servers and relays on page 445
4. Is there a gateway entry? If not, add a gateway entry to ensure that the server's clients have a default route.
5. Is the system DNS setting being used? A best practice is to avoid confusion by using the system DNS whenever possible. However, you can specify up to three custom DNS servers, and you should use all three entries for redundancy.

There are some situations, such as a new wireless interface, or during the initial FortiGate configuration, where interfaces override the system DNS entries. When this happens, it often shows up as intermittent Internet connectivity.

To fix the problem, go to *Network* > *DNS*, and enable *Use FortiGuard Servers*.

Checking CPU and memory resources

Check the CPU and memory resources when the FortiGate is not working, the network is slow, or there is a reduced firewall session setup rate. All processes share the system resources in FortiOS, including CPU and memory.

To view system resources in the GUI:

Go to *Dashboard* > *Status*.

The resource information is located in the *CPU* and *Memory* widgets. For information, see Dashboards and Monitors on page 102.

To view system resources in the CLI:

```
get system performance status
```

Sample output:

```
FGT# get system performance status
CPU states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU0 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU1 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU2 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU3 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
Memory: 4050332k total, 527148k used (13%), 3381312k free (83%), 141872k freeable (3%)
Average network usage: 41 / 28 kbps in 1 minute, 54 / 44 kbps in 10 minutes, 42 / 34 kbps in 30
      minutes
Average sessions: 33 sessions in 1 minute, 48 sessions in 10 minutes, 38 sessions in 30 minutes
Average session setup rate: 0 sessions per second in last 1 minute, 0 sessions per second in last
      10 minutes, 0 sessions per second in last 30 minutes
Virus caught: 0 total in 1 minute
IPS attacks blocked: 0 total in 1 minute
Uptime: 0 days, 22 hours, 59 minutes
```

The first line of the output shows the CPU usage by category:

```
CPU states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
```

The second line of the output shows the memory usage:

```
Memory: 4050332k total, 527148k used (13%), 3381312k free (83%), 141872k freeable (3%)
```

Memory usage should not exceed 90%. Using too much memory prevents some processes from functioning properly. For example, if the system is running low on memory, antivirus scanning enters into *failopen* mode where it drops connections or bypasses the antivirus system.

Other lines of output, such as `average network usage`, `average session setup rate`, `viruses caught`, and `IPS attacks blocked`, help determine why system resource usage is high.

For example:

- A high `average network usage` may indicate high traffic processing on the FortiGate,
- A very low or zero, `average session setup rate` may indicate the proxy is overloaded and unable to do its job.

Troubleshooting CPU and network resources

FortiGate has stopped working

If the FortiGate has stopped working, the first line of the output will look similar to this:

```
CPU states: 0% user 0% system 0% nice 100% idle
```

Network is slow

If your network is running slow, the first line of the output will look similar to this:

```
CPU states: 1% user 98% system 0% nice 1% idle
```

This example shows that all of the CPU is being used by system processes, and the FortiGate is overloaded. When overloading occurs, it is possible a process such as `scanunitid` is using all the resources to scan traffic. In this case you need to reduce the amount of traffic being scanned by blocking unwanted protocols, configuring more security policies to limit scanning to certain protocols, or similar actions.

It is also possible a hacker has accessed your network and is overloading it with malicious activity, such as running a spam server or using zombie PCs to attack other networks on the Internet.

You can use the following command to investigate the problem with the CPU:

```
get system performance top
```

This command shows all of the top processes that are running on the FortiGate and their CPU usage. The process names are on the left. If a process is using most of the CPU cycles, investigate it to determine whether the activity is normal.

Reduced firewall session setup rate

A reduced firewall session setup rate can be caused by a lack of system resources on the FortiGate, or reaching the session count limit for a VDOM.

As a best practice, administrators should record the session setup rate during normal operation to establish a baseline to help define a problem when your are troubleshooting.

The session setup rate appears in the `average sessions` section of the output.

A reduced firewall session setup rate will look similar to this:

```
Average sessions: 80 sessions in 1 minute, 30 sessions in 10 minutes, 42 sessions in 30 minutes
Average session setup rate: 3 sessions per second in last 1 minute, 0 sessions per second in last 10
      minutes, 0 sessions per second in last 30 minutes
```

In the example above, there were 80 sessions in 1 minute, or an average of 3 sessions per second.

The values for `10 minutes` and `30 minutes` allow you to take a longer average for a more reliable value if your FortiGate is working at maximum capacity. The smallest FortiGate can have 1,000 sessions established per second across the unit.

The session setup rate is a global command. If you have multiple VDOMs configured with many sessions in each VDOM, the session setup rate per VDOM will be slower than if there are no VDOMs configured.

High memory usage

As with any system, a FortiGate has limited hardware resources, such as memory, and all processes running on the FortiGate share the memory. Each process uses more or less memory, depending on its workload. For example, a process usually uses more memory in high traffic situations. If some processes use all of the available memory, other processes will not be able to run.

When high memory usage occurs, the services may freeze up, connections may be lost, or new connections may be refused.

If you see high memory usage in the *Memory* widget, the FotiGate may be handling high traffic volumes. Alternatively, the FortiGate may have problems with connection pool limits that are affecting a single proxy. If the FortiGate receives large volumes of traffic on a specific proxy, the unit may exceed the connection pool limit. If the number of free connections within a proxy connection pool reaches zero, issues may occur.

To view current memory usage information in the CLI:

```
diagnose hardware sysinfo memory
```

Sample output:

```
total: used: free: shared: buffers: cached: shm:
Mem: 2074185728 756936704 1317249024 0 20701184 194555904 161046528
Swap:             0             0             0
MemTotal:      2025572 kB
MemFree:       1286376 kB
MemShared:           0 kB
Buffers:           20216 kB
Cached:           189996 kB
SwapCached:        0 kB
Active:            56644 kB
Inactive:     153648 kB
HighTotal:           0 kB
HighFree:            0 kB
LowTotal:     2025572 kB
LowFree:      1286376 kB
SwapTotal:           0 kB
SwapFree:            0 kB
```

Troubleshooting high CPU usage

Connection-related problems may occur when FortiGate's CPU resources are over extended. This occurs when you deploy too many FortiOS features at the same time.

Examples of CPU intensive features:

- VPN high-level encryption
- Intensive scanning of all traffic
- Logging all traffic and packets
- Dashboard widgets that frequently perform data updates

For information on customizing the CPU use threshold, see Execute a CLI script based on memory and CPU thresholds on page 3955.

Determining the current level of CPU usage

You can view CPU usage levels in the GUI or CLI. For precise usage values for both overall usage and specific processes, use the CLI.

To view CPU usage in the GUI:

Go to *Dashboard* > *Status*. Real-time CPU usage information is located in the *CPU* widget.

To view CPU usage in the CLI:

- Show top processes information:
  ```
  diagnose sys top
  ```
- Show top threads information:
  ```
  diagnose sys top-all
  ```

Sample output:

```
Run Time: 86 days, 0 hours and 10 minutes
0U, 0N, 0S, 100I, 0WA, 0HI, 0SI, 0ST; 3040T, 2437F
      bcm.user 93 S < 3.1 0.4
      httpsd 18922 S 1.5 0.5
      httpsd 19150 S 0.3 0.5
      newcli 20195 R 0.1 0.1
      cmdbsvr 115 S 0.0 0.8
      pyfcgid 20107 S 0.0 0.6
      forticron 146 S 0.0 0.5
      httpsd 139 S 0.0 0.5
      cw_acd 166 S 0.0 0.5
      miglogd 136 S 0.0 0.5
      pyfcgid 20110 S 0.0 0.4
      pyfcgid 20111 S 0.0 0.4
      pyfcgid 20109 S 0.0 0.4
      httpsd 20192 S 0.0 0.4
      miglogd 174 S 0.0 0.4
      miglogd 175 S 0.0 0.4
      fgfmd 165 S 0.0 0.3
      newcli 20191 S 0.0 0.3
      initXXXXXXXXXXX 1 S 0.0 0.3
      httpsd 184 s 0.0 0.3
```

The following table explains the codes in the second line of the output:

Code	Description
U	Percentage of user space applications that are currently using the CPU
N	Percentage of time that the CPU spent on low priority processes since the last shutdown
S	Percentage of system processes (or kernel processes) that are using the CPU
I	Percentage of idle CPU resources
WA	Percentage of time that the CPU spent waiting on IO peripherals since the last shutdown
HI	Percentage of time that the CPU spent handling hardware interrupt routines since the last shutdown
SI	Percentage of time that the CPU spent handling software interrupt routines since the last shutdown
ST	Steal time: Percentage of time a virtual CPU waits for the physical CPU when the hypervisor is servicing another virtual processor
T	Total FortiOS system memory in MB
F	Free memory in MB

Each additional line of the command output displays information specific to processes or threads that are running on the FortiGate unit. For example, the sixth line of the output is: `newcli 20195 R 0.1 0.1`

The following table describes the data in the sixth line of the output:

Item	Description
newcli	The process (or thread) name. Duplicate process or thread names indicate that separate instances of that process or thread are running.
20195	The process or thread ID, which can be any number.
R	Current state of the process or thread. The process or thread state can be: • R - running • S - sleep • Z - zombie • D- disk sleep
0.1	The percentage of CPU capacity that the process or thread is using. CPU usage can range from 0.0 for a process or thread that is sleeping to higher values for a process or thread that's taking a lot of CPU time.
0.1	The amount of memory that the process or thread is using. Memory usage can range from 0.1 to 5.5 and higher.

You can use the following single-key commands when running `diagnose sys top` or `diagnose sys top-all`:

- `q` to quit and return to the normal CLI prompt.
- `p` to sort the processes by the amount of CPU that the processes are using.
- `m` to sort the processes by the amount of memory that the processes are using.

The output only displays the top processes or threads that are running. For example, if 20 are listed, they are the top 20 currently running, sorted by either CPU or memory usage. You can configure the number of processes or threads displayed, using the following CLI commands:

```
diagnose sys top <integer_seconds> <integer_maximum_lines>
diagnose sys top-all <integer_seconds> <integer_maximum_lines>
```

Where:

- `<integer_seconds>` is the delay in seconds (default is 5)
- `<integer_maximum_lines>` is the maximum number of lines (or processes) to list (default is 20)

Determining which features are using the most CPU resources

You can use the CLI to view the top few processes that are currently running and using the most CPU resources.

To view processes using the most CPU resources:

```
get system performance top
```

The entries at the top are using the most CPU resources. The second column from the right shows CPU usage by percentage. Note which processes are using the most resources and try to reduce their CPU load.

Processes you will see include:

- `ipsengine`: the IPS engine that scans traffic for intrusions
- `scanunitd`: antivirus scanner
- `httpsd`: secure HTTP
- `iked`: internet key exchange (IKE) in use with IPsec VPN tunnels
- `newcli`: active whenever you're accessing the CLI
- `sshd`: there are active secure socket connections
- `cmdbsrv`: the command database server application

Go to the features that are at the top of the list and look for evidence of CPU overuse. Generally, the monitor for a feature is a good place to start.

Checking for unnecessary CPU “wasters”

These are some best practices that will reduce your CPU usage, even if the FortiGate is not experiencing high CPU usage. Note that if the following information instructs you to turn off a feature that you require, disregard that part of the instructions.

- Use hardware acceleration wherever possible to offload tasks from the CPU. Offloading tasks, such as encryption, frees up the CPU for other tasks.
- Schedule antivirus, IPS, and firmware updates during off-peak hours. These updates do not usually consume CPU resources but they can disrupt normal operation.
- Check the log levels and which events are being logged. This is the severity of the messages that are recorded. Consider going up one level to reduce the amount of logging. Also, if there are events you do not need to monitor, remove them from the list.
- Log to FortiCloud instead of logging to memory or disk. Logging to memory quickly uses up resources and logging to local disk impacts overall performance and reduces the lifetime of the unit.

Fortinet recommends logging to FortiCloud to avoid using too much CPU.

- If the disk is almost full, transfer the logs or data off the disk to free up space. When a disk is almost full it consumes a lot of resources to find free space and organize the files.
- If packet logging is enabled on the FortiGate, consider disabling it. When packet logging is enabled, it records every packet that comes through that policy.
- Halt all sniffers and traces.
- Ensure the FortiGate isn't scanning traffic twice. Traffic does not need to be rescanned if it enters the FortiGate on one interface, goes out another, and then comes back in again. Doing so is a waste of resources. However, ensure that traffic truly is being scanned once.
- Reduce the session timers to close unused sessions faster. Enter the following CLI commands, which reduce the default values. Note that, by default, the system adds 10 seconds to `tcp-timewait`.

```
config system global
   set tcp-halfclose-timer 30
   set tcp-halfopen-timer 30
   set tcp-timewait-timer 0
   set udp-idle-timer 60
end
```

- Go to *System* > *Feature Visibility*, and enable only features that you need.

SNMP monitoring

When CPU usage is under control, use SNMP to monitor CPU usage. Alternatively, use logging to record CPU and memory usage every 5 minutes.

Once the system is back to normal, you should set up a warning system that sends alerts when CPU resources are used excessively. A common method to do this is using SNMP. SNMP monitors many values in FortiOS and allows you to set high water marks that generate events. You can run an application on your computer to watch for and record these events.

To enable SNMP:

1. Go to *System* > *SNMP*.
2. Configure an SNMP community.

See SNMP on page 3533.

You can use the *System Resources* widget to record CPU usage if SNMP is too complicated. However, the widget only records problems as they happen and will not send you alerts for problems.

Checking the modem status

You can use the CLI to troubleshoot a modem that is not working properly, or troubleshoot a FortiGate that does not detect the modem.

To diagnose modem issues in the CLI:

```
diagnose sys modem {cmd | com | detect | history | external-modem | query| reset}
```

You should always run the following command after you connect a USB modem to FortiGate:

```
diagnose sys modem detect
```

Use the following command to view the modem's configuration, vendor and custom product identification number:

```
get system modem
```

Use the following commands to resolve connectivity issues:

- `diagnose debug enable`: Activates the debug on the console
- `diagnose debug application modemd`: Dumps communication between the modem and the unit.
- `diagnose debug application ppp`: Dumps the PPP negotiating messages.
- `execute modem dial`: Displays modem debug output.

The modem diagnose output should not contain errors when initializing. You should also verify the number used to dial into your ISP.

Running ping and traceroute

Ping and traceroute are useful tools in network troubleshooting. Alone, either tool can determine network connectivity between two points. However, ping can be used to generate simple network traffic that you can view using `diagnose` commands in FortiGate. This combination can be very powerful when you are trying to locate network problems.

Ping and traceroute can also tell you if your computer or network device has access to a domain name server (DNS). Both tools can use IP addresses or device domain names to determine why particular services, such as email or web browsing, may not work properly.

If ping does not work, it may be disabled on at least one of the interface settings and security policies for that interface.

Both ping and traceroute require particular ports to be open on firewalls to function. Since you typically use these tools to troubleshoot, you can allow them in the security policies and on interfaces only when you need them. Otherwise, keep the ports disabled for added security.

Ping

The ping command sends a very small packet to a destination, and waits for a response. The response has a timer that expires when the destination is unreachable.

Ping is part of layer 3 on the OSI Networking Model. Ping sends Internet Control Message Protocol (ICMP) “echo request” packets to the destination, and listens for “echo response” packets in reply. However, many public networks block ICMP packets because ping can be used in a denial of service (DoS) attack (such as Ping of

Death or a smurf attack), or by an attacker to find active locations on the network. By default, FortiGate units have ping enabled while broadcast-forward is disabled on the external interface.

What ping can tell you

Beyond the basic connectivity information, ping can tell you the amount of packet loss (if any), how long it takes the packet to make the round trip, and the variation in that time from packet to packet.

If packet loss is detected, you should investigate the following:

- Possible ECMP, split horizon, or network loops.
- Cabling, to ensure there are no loose connections.
- Verify which security policy was used. To do this:
  Go to *Policy & Objects* > *Firewall Policy* and view the packet count column.

If there is total packet loss, you should investigate the following:

1. Ensure cabling is correct, and all equipment between the two locations is accounted for.
2. Ensure all IP addresses and routing information along the route is configured as expected.
3. Ensure all firewalls, including FortiGate security policies allow PING to pass through.

FortiGate ping options

Use the following CLI to view all the FortiGate ping options:

```
execute ping-options ?
adaptive-ping     Adaptive ping <enable|disable>.
data-size         Integer value to specify datagram size in bytes.
df-bit            Set DF bit in IP header <yes | no>.
interface         Auto | <outgoing interface>.
interval          Integer value to specify seconds between two pings.
pattern           Hex format of pattern, e.g. 00ffaabb.
repeat-count      Integer value to specify how many times to repeat PING.
reset             Reset settings.
source            Auto | <source interface IP>.
timeout           Integer value to specify timeout in seconds.
tos               IP type-of-service option.
ttl               Integer value to specify time-to-live.
use-sdwan         Use SD-WAN rules to get output interface <yes | no>.
validate-reply    Validate reply data <yes | no>.
view-settings     View the current settings for PING option.
```

`adaptive-ping {enable | disable}`	Enable or disable adaptive ping. FortiGate sends the next packet after the last response is received.
`data-size <integer>`	Specify the size of data in bytes. The size excludes ICMP header information. The data size allows you to control the ICMP datagram size to test the effects of different packet sizes on the connection. Enter an integer value from <0> to <65507>.
`df-bit {yes | no}`	Don't fragment bit. Prevent or allow the ICMP packet to fragment: • `yes`: Prevent the ICMP packet from being fragmented.

	• no: Allow the ICMP packet to be fragmented.
interface {auto | <outgoing interface>}	Specify the outgoing interface: • auto: Automatically select the interface based on the destination and routing table. • <outgoing interface>: Manually specify the interface to be used for ping. When source is specified, the IP address will be used as the ping source IP.
interval <integer>	Specify the time between pings in seconds. Enter an integer value from <1> to <2147483647>.
pattern <string>	Specify a pattern in hex format, for example, 00ffaabb, to be used in the data section of the ICMP packet.
repeat-count <integer>	Specify how many times to repeat the ping attempt. Enter an integer value from <1> to <2147483647>.
reset	Reset ping options to default values.
source {auto | <source interface IP>}	Specify the source IP address to use for sending out ping: • auto: Selects the primary IP address of the source interface. • <source interface ip>: Specify a source IP address for the interface used.
timeout <integer>	Specify in seconds how long to wait until the ping times out. Enter an integer value from <0> to <2147483647>.
tos	Set the type of service (ToS) field in the packet header to indicate the desired quality of service: • default: Defaults to 0. • lowcost: Minimize the cost. • lowdelay: Minimize the delay. • reliability: Maximize reliability. • throughput: Maximize throughput.
ttl <integer>	Specify the time to live. Time to live is the number of hops the ping packet should be allowed to make before being discarded or returned. Enter an integer value from <1> to <1255>.
use-sdwan {yes | no}	Specify whether to use SD-WAN rules and policy routes. • yes: The ping follows SD-WAN rules and policy routes. Usually used with other options, such as source, to match a specific SD-WAN rule that is based on a specific source address. • no: Do not follow SD-WAN rules and policy routes.
validate-reply {yes | no}	Specify whether to validate reply data: • yes: Validate reply data. • no: Do not validate reply data.
view-settings	Display the current ping option settings.

How to use ping

Ping syntax is the same for nearly every type of system on a network.

To ping from a FortiGate unit:

1. Go to *Dashboad*, and connect to the CLI through either telnet or the CLI widget.
2. Enter `execute ping 10.11.101.101` to send 5 ping packets to the destination IP address.
   To modify ping options, first apply your changes using the command `execute ping-options <option> <setting>`.

```
# execute ping 10.11.101.101
PING 10.11.101.101 (10.11.101.101): 56 data bytes
64 bytes from 10.11.101.101: icmp_seq=0 ttl=255 time=0.3 ms
64 bytes from 10.11.101.101: icmp_seq=1 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=2 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=3 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=4 ttl=255 time=0.2 ms

--- 10.11.101.101 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.2/0.2/0.3 ms
```

3. Enter the domain name to test name resolution.

```
# execute ping google.com
PING google.com (142.250.179.78): 56 data bytes
```

To ping from a Microsoft Windows PC:

1. Open a command window.
2. Enter `ping 10.11.101.100` to ping the default internal interface of the FortiGate with four packets.
   Other options include:
   - `-t` to send packets until you press `Ctrl+C`
   - `-a` to resolve addresses to domain names where possible
   - `-n X` to send X ping packets and stop

```
C:\>ping 10.11.101.101

Pinging 10.11.101.101 with 32 bytes of data:
Reply from 10.11.101.101: bytes=32 time=10ms TTL=255
Reply from 10.11.101.101: bytes=32 time<1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255

Ping statistics for 10.11.101.101:
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
Minimum = 0ms, Maximum = 10ms, Average = 3ms
```

To ping from a Linux PC:

1. Go to a shell prompt.
2. Enter “`ping 10.11.101.101`”.

Traceroute

Where ping will only tell you if it reached its destination and returned successfully, traceroute shows each step of the journey to its destination and how long each step takes. If ping finds an outage between two points, you can use traceroute to locate exactly where the problem is.

Traceroute works by sending ICMP packets to test each hop along the route. It sends three packets, and then increases the time to live (TTL) setting by one each time. This effectively allows the packets to go one hop farther along the route. This is why most traceroute commands display their maximum hop count before they start tracing the route, which is the maximum number of steps it takes before it declares the destination unreachable. Also, the TTL setting may result in steps along the route timing out due to slow responses. There are many possible reasons for this to occur.

By default, traceroute uses UDP datagrams with destination ports numbered from 33434 to 33534. The traceroute utility may also offer the option to select use of ICMP echo request (type 8) instead, which the Windows tracert utility uses. If you must, allow both protocols inbound through the FortiGate security policies (UDP with ports from 33434 to 33534 and ICMP type 8).

To track traceroute packets in the GUI:

Go to *Policy & Objects* > *Firewall Policy* and view the packet count column.

This allows you to verify the connection and confirm which security policy the traceroute packets are using.

What traceroute can tell you

Both ping and traceroute verify connectivity between two points. However, only traceroute shows you each step in the connection path. Also, ping and traceroute use different protocols and ports, so one may succeed where the other fails.

You can verify your DNS connection using traceroute. If you enter an FQDN instead of an IP address for the traceroute, DNS tries to resolve that domain name. If the name isn't resolved, you have DNS issues.

Using traceroute

The traceroute command varies slightly between operating systems. In Microsoft Windows, the command name is shortened to "`tracert`". Also, your output lists different domain names and IP addresses along your route.

To use traceroute on a Microsoft Windows PC:

1. Open a command window.
2. Enter `tracert fortinet.com` to trace the route from the PC to the Fortinet web site.

```
C:\>tracert fortinet.com
Tracing route to fortinet.com [208.70.202.225]
over a maximum of 30 hops:
1 <1 ms <1 ms <1 ms 172.20.120.2
2 66 ms 24 ms 31 ms 209-87-254-xxx.storm.ca [209.87.254.221]
3 52 ms 22 ms 18 ms core-2-g0-0-1104.storm.ca [209.87.239.129]
4 43 ms 36 ms 27 ms core-3-g0-0-1185.storm.ca [209.87.239.222]
5 46 ms 21 ms 16 ms te3-x.1156.mpd01.cogentco.com [38.104.158.69]
6 25 ms 45 ms 53 ms te8-7.mpd01.cogentco.com [154.54.27.249]
7 89 ms 70 ms 36 ms te3-x.mpd01.cogentco.com [154.54.6.206]
8 55 ms 77 ms 58 ms sl-st30-chi-.sprintlink.net [144.232.9.69]
```

```
9 53 ms 58 ms 46 ms sl-0-3-3-x.sprintlink.net [144.232.19.181]
10 82 ms 90 ms 75 ms sl-x-12-0-1.sprintlink.net [144.232.20.61]
11 122 ms 123 ms 132 ms sl-0-x-0-3.sprintlink.net [144.232.18.150]
12 129 ms 119 ms 139 ms 144.232.20.7
13 172 ms 164 ms 243 ms sl-321313-0.sprintlink.net [144.223.243.58]
14 99 ms 94 ms 93 ms 203.78.181.18
15 108 ms 102 ms 89 ms 203.78.176.2
16 98 ms 95 ms 97 ms 208.70.202.225
```

The first column on the left is the hop count, which cannot exceed 30 hops. When that number is reached, the traceroute ends.

The second, third, and fourth columns display how much time each of the three packets takes to reach this stage of the route. These values are in milliseconds and normally vary quite a bit. Typically a value of `<1ms` indicates a local connection.

The fifth column (farthest to the right) shows the domain name of the device and its IP address, or possibly only the IP address.

To perform a traceroute on a Linux PC:

1. Go to a command line prompt.
2. Enter "`traceroute fortinet.com`".
   The Linux traceroute output is very similar to the Windows `tracert` output.

To trace a route from a FortiGate to a destination IP address in the CLI:

```
# execute traceroute www.fortinet.com

traceroute to www.fortinet.com (66.171.121.34), 32 hops max, 84 byte packets
1 172.20.120.2 0.637 ms 0.653 ms 0.279 ms
2 209.87.254.221 <static-209-87-254-221.storm.ca> 2.448 ms 2.519 ms 2.458 ms
3 209.87.239.129 <core-2-g0-2.storm.ca> 2.917 ms 2.828 ms 9.324 ms
4 209.87.239.199 <core-3-bdi1739.storm.ca> 13.248 ms 12.401 ms 13.009 ms
5 216.66.41.113 <v502.core1.tor1.he.net> 17.181 ms 12.422 ms 12.268 ms
6 184.105.80.9 <100ge1-2.core1.nyc4.he.net> 21.355 ms 21.518 ms 21.597 ms
7 198.32.118.41 <ny-paix-gni.twgate.net> 83.297 ms 84.416 ms 83.782 ms
8 203.160.228.217 <217-228-160-203.TWGATE-IP.twgate.net> 82.579 ms 82.187 ms 82.066 ms
9 203.160.228.229 <229-228-160-203.TWGATE-IP.twgate.net> 82.055 ms 82.455 ms 81.808 ms
10 203.78.181.2 82.262 ms 81.572 ms 82.015 ms
11 203.78.186.70 83.283 ms 83.243 ms 83.293 ms
12 66.171.127.177 84.030 ms 84.229 ms 83.550 ms
13 66.171.121.34 <www.fortinet.com> 84.023 ms 83.903 ms 84.032 ms
14 66.171.121.34 <www.fortinet.com> 83.874 ms 84.084 ms 83.810 ms
```

Checking the logs

A log message records the traffic passing through FortiGate to your network and the action FortiGate takes when it scans the traffic. You should log as much information as possible when you first configure FortiOS. If FortiGate logs are too large, you can turn off or scale back the logging for features that are not in use.

It is difficult to troubleshoot logs without a baseline. Before you can determine if the logs indicate a problem, you need to know what logs result from normal operation.

When troubleshooting with log files

- Compare current logs to a recorded baseline of normal operation.
- If you need to, increase the level of logging (such as from Warning to Information) to obtain more information.
  When increasing logging levels, ensure that you configure email alerts and select both disk usage and log quota. This ensures that you will be notified if the increase in logging causes problems.

To configure the log settings in the GUI:

Go to *Log & Report* > *Log Settings*.

Determine the activities that generate the most log entries:

- Check all logs to ensure important information is not overlooked.
- Filter or order log entries based on different fields, such as level, service, or IP address, to look for patterns that may indicate a specific problem, such as frequent blocked connections on a specific port for all IP addresses.

Logs can help identify and locate any problems, but they do not solve them. The purpose of logs is to speed up your problem solving and save you time and effort.

For more information about logging and log reports, see Log and Report on page 4123.

Verifying routing table contents in NAT mode

Verify the contents of the routing table when a FortiGate has limited or no connectivity.

The routing table stores the routes currently in use for both static and dynamic protocols. Storing a route in the routing table saves time and resources performing a lookup. To ensure the most recently used routes remain in the table, old routes are bumped to make room for new ones. You cannot perform this task when FortiGate is in transparent mode.

If FortiGate is running in NAT mode, verify that all desired routes are in the routing table, including local subnets, default routes, specific static routes, and dynamic routing protocols.

To view the routing table in the CLI:

```
get router info routing-table all
```

Sample output:

```
FGT# get router info routing-table all
Codes:
   K - kernel, C - connected, S - static, R - RIP, B - BGP
   O - OSPF, IA - OSPF inter area
   N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
   E1 - OSPF external type 1, E2 - OSPF external type 2
   i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
   * - candidate default
S* 0.0.0.0/0 [10/0] via 172.20.120.2, wan1
C 10.31.101.0/24 is directly connected, internal
C 172.20.120.0/24 is directly connected, wan1
```

Verifying the correct route is being used

Run a trace route from a machine in the local area network (LAN) to ensure traffic is flowing as expected through the correct route when there is more than one default route.

In the following example output:

- The first hop contains the IP address `10.10.1.99`, which is the internal interface of the FortiGate.
- The second hop contains the IP address `172.20.120.2`, to which the wan1 interface of the FortiGate is connected.

This means the route through the wan1 interface is being used for this traffic.

```
C:\>tracert www.fortinet.com
Tracing route to www.fortinet.com [66.171.121.34]
over a maximum of 30 hops:
1 <1 ms <1 ms <1 ms 10.10.1.99
2 1 ms <1 ms <1 ms 172.20.120.2
3 3 ms 3 ms 3 ms static-209-87-254-221.storm.ca [209.87.254.221]
4 3 ms 3 ms 3 ms core-2-g0-2.storm.ca [209.87.239.129]
5 13 ms 13 ms 13 ms core-3-bdi1739.storm.ca [209.87.239.199]
6 12 ms 19 ms 11 ms v502.core1.tor1.he.net [216.66.41.113]
7 22 ms 22 ms 21 ms 100ge1-2.core1.nyc4.he.net [184.105.80.9]
8 84 ms 84 ms 84 ms ny-paix-gni.twgate.net [198.32.118.41]
9 82 ms 84 ms 82 ms 217-228-160-203.TWGATE-IP.twgate.net [203.160.22
8.217]
 10 82 ms 81 ms 82 ms 229-228-160-203.TWGATE-IP.twgate.net [203.160.22
8.229]
 11 82 ms 82 ms 82 ms 203.78.181.2
 12 84 ms 83 ms 83 ms 203.78.186.70
 13 84 ms * 85 ms 66.171.127.177
 14 84 ms 84 ms 84 ms fortinet.com [66.171.121.34]
 15 84 ms 84 ms 83 ms fortinet.com [66.171.121.34]
```

You can also see the route taken for each session by debugging the packet flow in the CLI. For more information, see Debugging the packet flow on page 4327.

Verifying the correct firewall policy is being used

If you have more than one firewall policy, you can check which policy is being used in the *Policy & Objects* module in the GUI.

To verify the firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Look in the *Count* column to see which policy is being used. The count must show traffic increasing.

Debugging the packet flow in the CLI shows the policy ID that's allowing the traffic. For information, see Debugging the packet flow on page 4327.

Checking the bridging information in transparent mode

Checking the bridging information is useful when you are experiencing connectivity problems. When FortiGate is set to transparent mode, it acts like a bridge and sends all incoming traffic out on the other interfaces. Each bridge is a link between interfaces.

When traffic is flowing between the interfaces, you can see the bridges listed in the CLI. If no bridges are listed, this is the likely cause of the connectivity issue. When investigating bridging information, check for the MAC address of the interface or device in question.

How to check the bridging information

To view the list of bridge instances in the CLI:

```
diagnose netlink brctl list
```

Sample output:

```
#diagnose netlink brctl list
list bridge information
1. root.b fdb: size=256 used=6 num=7 depth=2 simple=no
Total 1 bridges
```

How to display forwarding domain information

You can use forwarding domains, or collision domains, in routing to limit where packets are forwarded on the network. Layer 2 broadcasts are limited to the same group. By default, all interfaces are in group 0. For example, if the FortiGate has 12 interfaces, only two may be in the same forwarding domain, which limits packets that are broadcast to those two interfaces. This reduces traffic on the rest of the network.

Collision domains prevent the forwarding of ARP packets to all VLANs on an interface. Without collision domains, duplicate MAC addresses on VLANs may cause ARP packets to be duplicated. Duplicate ARP packets can cause some switches to reset. It's important to know what interfaces are part of which forwarding domains because this determines which interfaces can communicate with each other.

To manually configure forwarding domains in transparent mode in the CLI:

```
config system interface
   edit <interface_name>
      set forward-domain <integer>
   end
```

To display the forward domains information in the CLI:

```
diagnose netlink brctl domain <name> <id>
```

Where `<name>` is the name of the forwarding domain to display and `<id>` is the domain ID.

Sample output:

```
diagnose netlink brctl domain ione 101
```

```
show bridge root.b ione forward domain.
id=101 dev=trunk_1 6
```

To list the existing bridge MAC table in the CLI:

```
diagnose netlink brctl name host <name>
```

Sample output:

```
show bridge control interface root.b host.
fdb: size=256, used=6, num=7, depth=2, simple=no
Bridge root.b host table
```

port no	device	devname	mac addr	ttl	attributes
2	7	wan2	02:09:0f:78:69:00	0	Local Static
5	6	vlan_1	02:09:0f:78:69:01	0	Local Static
3	8	dmz	02:09:0f:78:69:01	0	Local Static
4	9	internal	02:09:0f:78:69:02	0	Local Static
3	8	dmz	00:80:c8:39:87:5a	194	
4	9	internal	02:09:0f:78:67:68	8	
1	3	wan1	00:09:0f:78:69:fe	0	Local Static

To list the existing bridge port list in the CLI:

```
diagnose netlink brctl name port <name>
```

Sample output:

```
show bridge root.b data port.
trunk_1 peer_dev=0
internal peer_dev=0
dmz peer_dev=0
wan2 peer_dev=0
wan1 peer_dev=0
```

Checking wireless information

Check wireless connections, stations, and interfaces when the problem is not caused by a physical interface.

Troubleshooting station connection issues

To check if a station entry is created on access control in the CLI:

```
FG600B3909600253 # diagnose wireless-controller wlac -d sta
* vf=0 wtp=70 rId=2 wlan=open ip=0.0.0.0 mac=00:09:0f:db:c4:03 rssi=0 idle=148 bw=0 use=2
 vf=0 wtp=70 rId=2 wlan=open ip=172.30.32.122 mac=00:25:9c:e0:47:88 rssi=-40 idle=0 bw=9 use=2
```

Enabling diagnostics for a specific station

This example uses the station MAC address to find where it is failing:

```
FG600B3909600253 # diagnose wireless-controller wlac sta_filter 00:25:9c:e0:47:88 1
Set filter sta 00:25:9c:e0:47:88 level 1
FG600B3909600253 # 71419.245 <ih> IEEE 802.11 mgmt::disassoc <== 00:25:9c:e0:47:88 vap open rId 1
      wId 0 00:09:0f:db:c4:03
71419.246 <dc> STA del 00:25:9c:e0:47:88 vap open rId 1 wId 0
71419.246 <cc> STA_CFG_REQ(34) sta 00:25:9c:e0:47:88 del ==> ws (0-192.168.35.1:5246) rId 1 wId 0
71419.246 <cc> STA del 00:25:9c:e0:47:88 vap open ws (0-192.168.35.1:5246) rId 1 wId 0
      00:09:0f:db:c4:03 sec open reason I2C_STA_DEL
71419.247 <cc> STA_CFG_RESP(34) 00:25:9c:e0:47:88 <== ws (0-192.168.35.1:5246) rc 0 (Success).
```

Performing a sniffer trace or packet capture

When you troubleshoot networks and routing in particular, it helps to look inside the headers of packets to determine if they are traveling the route that you expect them to take. Packet sniffing is also known as network tap, packet capture, or logic analyzing.

System event logs are generated when a packet capture is started or stopped in the GUI, and when a sniffer operation is started or stopped in the CLI.

For more information on controlling GUI packet captures in the CLI, see Using the packet capture tool on page 884.

For FortiGates with NP2, NP4, or NP6 interfaces that are offloading traffic, disable offloading on these interfaces before you perform a trace or it will change the sniffer trace.

Sniffing packets

To perform a sniffer trace in the CLI:

Before you start sniffing packets, you should prepare to capture the output to a file. A large amount of data may scroll by and you will not be able to see it without saving it first. One method is to use a terminal program like PuTTY to connect to the FortiGate CLI. Once the packet sniffing count is reached, you can end the session and analyze the output in the file.

The general form of the internal FortiOS packet sniffer command is:

```
# diagnose sniffer packet <interface_name> <'filter'> <verbose> <count> <tsformat>
```

To stop the sniffer, type CTRL+C.

<interface_name>	The name of the interface to sniff, such as port1 or internal. This can also be any to sniff all interfaces.
<'filter'>	What to look for in the information the sniffer reads. none indicates no filtering, and all packets are displayed as the other arguments indicate.

	The filter must be inside single quotes (‘).
<verbose>	The level of verbosity as one of: • 1 - print header of packets • 2 - print header and data from IP of packets • 3 - print header and data from Ethernet of packets • 4 - print header of packets with interface name • 5 - print header and data from IP of packets with interface name • 6 - print header and data from Ethernet of packets with interface name
<count>	The number of packets the sniffer reads before stopping. If you don't put a number here, the sniffer will run until you stop it with <CTRL+C>.
<tsformat>	The timestamp format. • a: absolute UTC time, yyyy-mm-dd hh:mm:ss.ms • l: absolute LOCAL time, yyyy-mm-dd hh:mm:ss.ms • otherwise: relative to the start of sniffing, ss.ms

Simple sniffing example:

```
# diagnose sniffer packet port1 none 1 3.
```

This displays the next three packets on the port1 interface using no filtering, and verbose level 1. At this verbosity level, you can see the source IP and port, the destination IP and port, action (such as ack), and sequence numbers.

In the output below, port 443 indicates these are HTTPS packets and that 172.20.120.17 is both sending and receiving traffic.

```
Head_Office_620b # diagnose sniffer packet port1 none 1 3
interfaces=[port1]
filters=[none]
0.545306 172.20.120.17.52989 -> 172.20.120.141.443: psh 3177924955 ack 1854307757
0.545963 172.20.120.141.443 -> 172.20.120.17.52989: psh 1854307757 ack 3177925808
0.562409 172.20.120.17.52988 -> 172.20.120.141.443: psh 4225311614 ack 3314279933
```

Using packet capture in a firewall policy

FortiGate can capture packets matching a firewall policy. You can enable `capture-packet` in the firewall policy.

To use packet capture, the FortiGate must have a disk and logging must be enabled in the firewall policy.

For information about using the packet capture tool in the GUI, see Using the packet capture tool on page 884.

To enable packet capture in a policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Enter a name for the policy and configure the required settings.
3. Enable *Log Allowed Traffic* and select *Security Events* or *All Sessions*.
4. Enable *Capture Packets*.

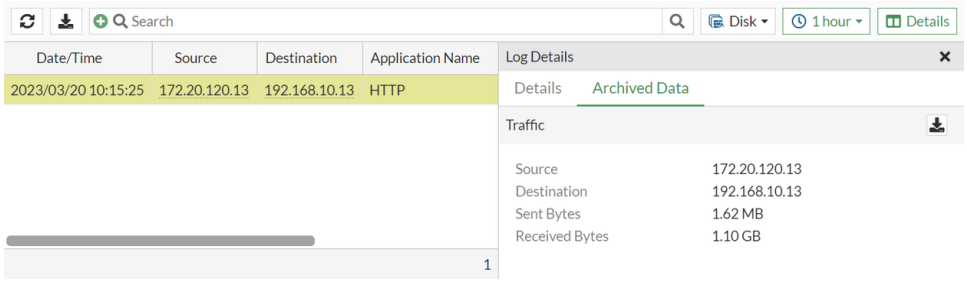
5. Click *OK*.

To enable packet capture in a policy in the CLI:

```
config firewall policy
    edit <id>
        set action accept
        set logtraffic {all | utm}
        set capture-packet enable
    next
end
```

To view the packet capture:

1. Go to *Log & Report* > *Forward Traffic* and select the log that matches the firewall policy.
2. Select *Details* > *Archived Data* and click on the download button.



3. Open the downloaded PCAP file in a packet analyzer tool, such as Wireshark.

Debugging the packet flow

Debug the packet flow when network traffic is not entering and leaving the FortiGate as expected. When debugging the packet flow in the CLI, each command configures a part of the debug action. The final command starts the debug.

For information about using the debug flow tool in the GUI, see Using the debug flow tool on page 889.

To trace the packet flow in the CLI:

```
# diagnose debug flow trace start
```

To follow packet flow by setting a flow filter:

```
# diagnose debug flow {filter | filter6} <option>
```

- Enter `filter` if your network uses IPv4.
- Enter `filter6` if your network uses IPv6.

Replace `<option>` with one of the following variables:

Variable	Description
addr	IPv4 or IPv6 address
clear	clear filter
daddr	destination IPv4 or IPv6 address
dport	destination port
negate	inverse IPv4 or IPv6 filter
port	port
proto	protocol number
saddr	source address
sport	source port
vd	index of virtual domain; -1 matches all

If FortiGate is connected to FortiAnalyzer or FortiCloud, the diagnose debug flow output will be recorded as event log messages and then sent to the devices. Do not run this command longer than necessary, as it generates a significant amount of data.

Flow monitoring does not work for traffic offloaded to NP6 or NP7 processors. To use the diagnose debug flow commands with sessions offloaded to NP6 or NP7 processors you can test the traffic flow using ICMP (ICMP traffic is not offloaded) or you can disable NP6 or NP7 offloading.

You can use the following command to temporarily disable NP6 offloading of all traffic:

```
diagnose npu {np6 | np6xlite | np6lite} fastpath disable
```

You must disable NP7 offloading in the firewall policy that accepts the traffic that you are tracing, see Tracing packet flow on FortiGates with NP7 processors.

You can also use the NP7 packet sniffer to sniff NP7 offloaded traffic without disabling NP7 offloading, see NP7 packet sniffer.

To start flow monitoring with a specific number of packets:

```
# diagnose debug flow trace start <N>
```

To stop flow tracing at any time:

```
# diagnose debug flow trace stop
```

The following example shows the flow trace for a device with an IP address of 203.160.224.97:

```
# diagnose debug enable
# diagnose debug flow filter addr 203.160.224.97
# diagnose debug flow show function-name enable
# diagnose debug flow trace start 100
```

Sample output: HTTP

To observe the debug flow trace, connect to the website at the following address:

```
https://www.fortinet.com
```

Comment: SYN packet received:

```
id=20085 trace_id=209 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

SYN sent and a new session is allocated:

```
id=20085 trace_id=209 func=resolve_ip_tuple line=2799
msg="allocate a new session-00000e90"
```

Lookup for next-hop gateway address:

```
id=20085 trace_id=209 func=vf_ip4_route_input line=1543
msg="find a route: gw-192.168.11.254 via port6"
```

Source NAT, lookup next available port:

```

msg="find SNAT: IP-192.168.11.59, port-31925"
direction“
```

Matched security policy. Check to see which policy this session matches:

```
id=20085 trace_id=209 func=fw_forward_handler line=317
msg="Allowed by Policy-3: SNAT"
```

Apply source NAT:

```
id=20085 trace_id=209 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

SYN ACK received:

```
id=20085 trace_id=210 func=resolve_ip_tuple_fast line=2700
msg="vd-root received a packet(proto=6, 203.160.224.97:80-
>192.168.11.59:31925) from port6."
```

Found existing session ID. Identified as the reply direction:

```
id=20085 trace_id=210 func=resolve_ip_tuple_fast line=2727
msg="Find an existing session, id-00000e90, reply direction"
```

Apply destination NAT to inverse source NAT action:

```
id=20085 trace_id=210 func=__ip_session_run_tuple
line=1516 msg="DNAT 192.168.11.59:31925-
>192.168.3.221:1487"
```

Lookup for next-hop gateway address for reply traffic:

```
id=20085 trace_id=210 func=vf_ip4_route_input line=1543
msg="find a route: gw-192.168.3.221 via port5"
```

ACK received:

```
id=20085 trace_id=211 func=resolve_ip_tuple_fast line=2700
msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

Match existing session in the original direction:

```
   id=20085 trace_id=211 func=resolve_ip_tuple_fast line=2727
   msg="Find an existing session, id-00000e90, original
direction"
```

Apply source NAT:

```
   id=20085 trace_id=211 func=__ip_session_run_tuple
   line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

Receive data from client:

```
   id=20085 trace_id=212 func=resolve_ip_tuple_fast
   line=2700 msg="vd-root received a packet(proto=6,
   192.168.3.221:1487->203.160.224.97:80) from port5."
```

Match existing session in the original direction:

```
   id=20085 trace_id=212 func=resolve_ip_tuple_fast
   line=2727 msg="Find an existing session, id-00000e90,
   original direction"
```

Apply source NAT:

```
   id=20085 trace_id=212 func=__ip_session_run_tuple
   line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

Receive data from server:

```
   id=20085 trace_id=213 func=resolve_ip_tuple_fast
   line=2700 msg="vd-root received a packet(proto=6,
   203.160.224.97:80->192.168.11.59:31925) from port6."
```

Match existing session in reply direction:

```
   id=20085 trace_id=213 func=resolve_ip_tuple_fast
   line=2727 msg="Find an existing session, id-00000e90,
   reply direction"
```

Apply destination NAT to inverse source NAT action:

```
   id=20085 trace_id=213 func=__ip_session_run_tuple
   line=1516 msg="DNAT 192.168.11.59:31925-
   >192.168.3.221:1487"
```

Sample output: IPsec (policy-based)

```
id=20085 trace_id=1 msg="vd-root received a packet(proto=1, 10.72.55.240:1->10.71.55.10:8) from
      internal."

```

Testing a proxy operation

To monitor proxy operations in the CLI:

```
diagnose test application <application> <option>
```

To display a list of available application values:

```
diagnose test application ?
```

To display a list of available option values:

```
diagnose test application <application> ?
```

The <option> value will depend on the application value used in the command.

For example, if the application is http, the CLI command that displays the <option> values is:

```
diagnose test application http ?
```

Displaying detail Hardware NIC information

Monitoring the hardware NIC is important because interface errors indicate data link or physical layer issues which may impact the performance of the FortiGate.

To monitor hardware network operations in the CLI:

```
diagnose hardware deviceinfo nic <interface>
```

or

```
diagnose netlink interface list <interface>
```

Sample output:

The following is sample output when the <interface> is set to port1:

```
# diagnose netlink interface list port1
```

```
if=port1 family=00 type=1 index=3 mtu=1500 link=0 master=0
flags=up broadcast run multicast
Qdisc=mq hw_addr=00:0c:29:fc:18:54 broadcast_addr=ff:ff:ff:ff:ff:ff
stat: rxp=61149 txp=81109 rxb=5839308 txb=52396373 rxe=0 txe=0 rxd=0 txd=0 mc=95 collision=0 @

re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
```

Field descriptions

The `diagnose hardware deviceinfo nic` and `diagnose netlink interface list` commands display lists of error names and values that are related to hardware.

The following table describes possible hardware errors:

Field	Description
Rx packets (rxp)	Number of received packets.
Tx packets (txp)	Number of transmitted packets.
Rx bytes (rxb)	Number of received bytes.
Tx bytes (txb)	Number of transmitted bytes.
Rx_Errors (rxe) = rx error count	Bad frame was marked as error by PHY.
Tx_Errors (txe) = Tx_Aborted_Errors	ECOL (Excessive Collisions Count); only valid in half-duplex mode.
Rx_CRC_Errors + Rx_Length_Errors - Rx_Align_Errors	This error is only valid in 10/100M mode.
Rx_Dropped (rxd) or Rx_No_Buffer_ Count	Running out of buffer space.
Tx_Dropped (txd)	Number of dropped packet.
Multicast (mc)	Number of multicast packets received.
Collisions	Total number of collisions experienced by the transmitter; valid in half-duplex mode.
Rx_Length_Errors (rxl)	Number of packets dropped due to invalid length.
Rx_Over_Errors (rxo)	Receive FIFO overflow event counter.
Rx_CRC_Errors (rxc)	Number of received packets with Frame CRC error.
Rx_Frame_Errors (rxf)	Same as Rx_Align_Errors. This error is only valid in 10/100M mode.
Rx_FIFO_Errors (rxfi)	Same as Rx_Missed_Errors - a missed packet count
Rx_Missed_Errors (rxm)	Equals Rx_FIFO_Errors + CEXTERR (Carrier Extension Error Count). Only valid in 1000M mode, which is marked by PHY.

Field	Description
Tx_Aborted_Errors (txa)	See Tx_Errors.
Tx_Carrier_Errors (txc)	The PHY should assert the internal carrier sense signal during every transmission. Failure to do so may indicate that the link has failed or the PHY has an incorrect link configuration. This register only increments if transmits are enabled. This register isn't valid in internal SerDes 1 mode (TBI mode for the 82544GC/EI) and is valid only when the Ethernet controller is operating at full duplex.
Tx_FIFO_Errors (txfi)	Number of Frame transmission error due to underflow.
Tx_Heartbeat_ Errors (txh)	Number of heartbeat error.
Tx_Window_Errors (txw)	Late Collisions (LATECOL) Count Late collisions are collisions that occur after 64-byte time into the transmission of the packet while working in 10 to 100 Mb/s data rate and 512-byte time into the transmission of the packet while working in the 1,000 Mb/s data rate. This register only increments if transmits are enabled and the device is in half-duplex mode.
Rx compressed (misc rxc)	Number of received compressed packets.
Tx compressed (misc txc)	Number of transmitted compressed packets.
Tx_Single_Collision_ Frames	Counts the number of times that a successfully transmitted packet encountered a single collision. The value increments only if transmits are enabled and the Ethernet controller is in half-duplex mode.
Tx_Multiple_ Collision_Frames	A Multiple Collision Count which indicates the number of times that a transmit encountered more than one collision, but less than 16. The value increments only if transmits are enabled and the Ethernet controller is in half-duplex mode.
Tx_Deferred	Counts defer events. A deferred event occurs when the transmitter cannot immediately send a packet due to: • The medium being busy because another device is transmitting. • The IPG timer has not expired. • Half-duplex deferral events are occurring. • XOFF frames are being received . • The link is not up. This register only increments if transmits are enabled. This counter does not increment for streaming transmits that are deferred due to TX IPG.
Rx_Frame_Too_ Longs	The Rx frame is oversized.

Field	Description
Rx_Frame_Too_ Shorts	The Rx frame is too short.
Rx_Align_Errors	This error is only valid in 10/100M mode.
Symbol Error Count	Counts the number of symbol errors (SYMERRS) between reads. The count increases for every bad symbol that's received, whether or not a packet is currently being received and whether or not the link is up. This register increments only in internal SerDes mode.

Performing a traffic trace

Traffic tracing allows you to follow a specific packet stream. This is useful when you want to confirm that packets are using the route you expect them to take on your network.

To view traffic sessions:

Use this command to view the characteristics of a traffic session though specific security policies.

```
diagnose sys session
```

To trace per-packet operations for flow tracing:

```
diagnose debug flow
```

To trace per-Ethernet frame:

```
diagnose sniffer packet
```

To trace a route from a FortiGate to a destination IP address:

```
# execute traceroute www.fortinet.com
traceroute to www.fortinet.com (66.171.121.34), 32 hops max, 84 byte packets
1 172.20.120.2 0.637 ms 0.653 ms 0.279 ms
2 209.87.254.221 <static-209-87-254-221.storm.ca> 2.448 ms 2.519 ms 2.458 ms
3 209.87.239.129 <core-2-g0-2.storm.ca> 2.917 ms 2.828 ms 9.324 ms

14 66.171.121.34 <www.fortinet.com> 83.874 ms 84.084 ms 83.810 ms
```

Using a session table

A session is a communication channel between two devices or applications across the network. Sessions allow FortiOS to inspect and act on a sequential group of packets in a session all at once instead of inspecting each packet individually. Each session has an entry in the session table that includes important information about the session.

You can view FortiGate session tables from the FortiGate GUI or CLI. The most useful troubleshooting data comes from the CLI. The session table in the GUI also provides useful summary information, particularly the current policy number that the session is using.

When to use a session table

Session tables are useful when verifying open connections. For example, if you have a web browser open to browse the Fortinet website, you would expect a session entry from your computer on port 80 to the IP address for the Fortinet website.

You can also use a session table to investigate why there are too many sessions for FortiOS to process.

GUI

To view session information in the GUI:

1. Go to *Security Fabric* > *Physical Topology*.
2. From the *Metrics* dropdown, select *Sessions*.

Finding the security policy for a specific connection

Every program and device on your network must have an open communication channel or session to pass information. FortiGate manages these sessions with features such as traffic shaping, antivirus scanning, and blocking known bad websites. Each session will have an entry in the session table.

If a secure web browser session is not working properly, you can check the session table to ensure the session is still active and going to the proper address. The session table can also tell you the security policy number it matches, so you can check what is happening in that policy.

1. Get the connection information.

You need to be able to identify the session you want. To do this, you will need:

- The source IP address (usually your computer)
- The destination IP address (if you have it)
- The port number which is determined by the program you are using. Common ports are:
  - Port 80 (HTTP for web browsing)
  - Port 443 (HTTPS for SSL encrypted web browsing)
  - Port 22 (SSH for Secure Shell)
  - Port 25 (SMTP for Mail Transfer)

2. Find the session and policy ID

Go to *Security Fabric > Physical Topology*. From the *Metrics* dropdown, select *Sessions*.

To find your session, search for your source IP address, destination IP address (if you have it), and port number. The policy ID is listed after the destination information.

3. Use filters to find a session

If there are multiple pages of sessions, you can use a filter to hide the sessions you do not need. To filter the sessions in the table, click *Add Filter*, and select an option from the list. You can filter the table by *Destination IP*, *Source IP*, or *Source Port*.

CLI

The session table output in the CLI is very large. The CLI command supports filters to show only the data you need.

To view session data in the CLI:

```
diagnose sys session list
```

An entry is placed in the session table for each traffic session passing through a security policy

To filter session data:

```
diagnose sys session filter <option>
```

The values for `<option>` include the following:

Value	Definition
`clear`	Clear session filter
`dintf`	Destination interface
`dport`	Destination port
`dst`	Destination IP address
`duration`	Duration of the session
`expire`	Expire
`negate`	Inverse filter
`nport`	NAT'd source port
`nsrc`	NAT'd source ip address
`policy`	Policy ID
`proto`	Protocol number
`proto-state`	Protocol state

Value	Definition
`session-state1`	Session state1
`session-state2`	Session state2
`sintf`	Source interface
`sport`	Source port
`src`	Source IP address
`vd`	Index of virtual domain, `-1` matches all

Even though UDP is a sessionless protocol, FortiGate keeps track of the following states:

- When UDP reply does not have a value of 0
- When UDP reply has a value of 1

The following table displays firewall session states from the session table:

State	Description
log	Session is being logged
local	Session is originated from or destined for local stack
ext	Session is created by a firewall session helper
may_dirty	Session is created by a policy For example, the session for `ftp control channel` will have this state but `ftp data channel` won't. This is also seen when NAT is enabled.
ndr	Session will be checked by IPS signature
nds	Session will be checked by IPS anomaly
br	Session is being bridged (TP) mode

Examining the firewall session list

The firewall session list displays all open sessions in FortiGate. Examine the list for strange patterns, such as no sessions apart from the internal network, or all sessions are only to one IP address.

When you examine the firewall session list in the CLI, you can use filters to reduce the output.

To examine the firewall session list in the CLI:

You can use a filter to limit the sessions displayed by source, destination address, port, or NAT'd address. To use more than one filter, enter a separate line for each value.

The following example filters the session list based on a source address of 10.11.101.112:

```
FGT# diagnose sys session filter src 10.11.101.112
FGT# diagnose sys session list
```

The following example filters the session list based on a destination address of 172.20.120.222.

```
FGT# diagnose sys session filter dst 172.20.120.222
```

```
FGT# diagnose sys session list
```

To clear all sessions corresponding to a filter:

```
FGT# diagnose sys session filter dst 172.20.120.222
FGT# diagnose sys session clear
```

Checking source NAT information

Checking source NAT is important when you are troubleshooting from the remote end of the connection outside the firewall.

To check the source NAT information in the CLI:

When you display the session list in the CLI, you can match the NAT'd source address (`nsrc`) and port (`nport`). This is useful when multiple internal IP addresses are NAT'd to a common external-facing source IP address.

```
FGT# diagnose sys session filter nsrc 172.20.120.122
FGT# diagnose sys session filter nport 8888
FGT# diagnose sys session list
```

Finding object dependencies

You may be prevented from deleting a configuration object when other configuration objects depend on it. You can use the GUI or CLI to identify objects which depend on, or make reference to the configuration you are trying to delete. Additionally, if you have a virtual interface with dependent objects, you will need to find and remove those dependencies before deleting the interface.

To remove interface object dependencies in the GUI:

1. Go to *Network* > *Interfaces*. The *Ref.* column displays the number of objects that reference this interface.
2. Select the number in the *Ref* . column for the interface. A window listing the dependencies appears.
3. Use these detailed entries to locate and remove object references to this interface. The trash can icon is enabled after all the object dependencies are removed.
4. Remove the interface by selecting the check box for the interface, and select *Delete*.

To find object dependencies in the CLI:

When running multiple VDOMs, use the following command in the global configuration only.

```
diagnose sys cmdb refcnt show <path.object.mkey>
```

The command searches for the named object in both the most recently used global and VDOM configurations.

Examples

To verify which objects a security policy with an ID of 1 refers to:

```
diagnose sys cmdb refcnt show firewall.policy.policyid 1
```

To check what is referred to by interface `port1`:

```
diagnose sys cmdb refcnt show system.interface.name port1
```

To show all dependencies for an interface:

```
diagnose sys cmdb refcnt show system.interface.name <interface name>
```

Sample output:

In this example , the interface has dependent objects, including four address objects, one VIP, and three security policies.

```
entry used by table firewall.address:name '10.98.23.23_host'
entry used by table firewall.address:name 'NAS'
entry used by table firewall.address:name 'all'
entry used by table firewall.address:name 'fortinet.com'
entry used by table firewall.vip:name 'TORRENT_10.0.0.70:6883'
entry used by table firewall.policy:policyid '21'
entry used by table firewall.policy:policyid '14'
entry used by table firewall.policy:policyid '19'
```

Diagnosing NPU-based interfaces

You can use the commands in this section to diagnose sessions offloaded to network processors (also called NPUs or NPs) in your FortiGate. Most FortiGates contain one or more of the following NPUs:

- NP7 or NP7Lite
- NP6, NP6XLite or NP6Lite

You can find your FortiGate unit in the Hardware Acceleration Guide to determine its NPU configuration.

Normally you can use the `diagnose debug flow` command to view sessions. However, this command only displays sessions processed by the CPU (also called software sessions). To view sessions offloaded to NPUs (also called hardware sessions), you must use the commands and techniques described in this section.

Alternatively, you can disable NPU offloading and then use the `diagnose debug flow` command. You should only disable the NPU functionality for troubleshooting purposes.

Diagnosing NP7 or NP7Lite sessions

Use the following command to list the NP7 processors in your FortiGate unit and the interfaces that they connect to:

```
diagnose npu np7 port-list
```

Use the following command to list the NP7Lite processors in your FortiGate unit and the interfaces that they connect to:

```
diagnose npu np7lite port-list
```

To use the NP7 packet sniffer

On FortiGates with NP7 and NP7Lite processors, you can use the following command to view sessions:

```
diagnose npu sniffer {start | stop | filter}
```

Here is a basic example to sniff offloaded TCP packets received by the port23 interface. In the following example:

- The first line clears the filter.
- The second line sets the sniffer to look for packets on port23.
- The third line looks for packets exiting the interface.
- The fourth line looks for TCP packets.
- The fifth line starts the sniffer.
- The sixth line starts displaying the packets on the CLI.

```
diagnose npu sniffer filter
diagnose npu sniffer filter intf port23
diagnose npu sniffer filter dir 1
diagnose npu sniffer filter protocol 6
diagnose npu sniffer start
diagnose sniffer packet npudbg
```

For more information, see NP7 packet sniffer or Tracing packet flow on FortiGates with NP7 processors.

See this Fortinet Community article for an NP7 packet sniffer example: Troubleshooting Tip: Collecting NP7 packet capture without disabling offload.

Diagnosing NP6, NP6XLite or NP6Lite sessions

Use either of the following commands to list the NP6 processors in your FortiGate unit and the interfaces that they connect to:

```
get hardware npu np6 port-list
diagnose npu np6 port-list
```

Use the following command to list the NP6XLite processors in your FortiGate unit:

```
get hardware npu np6xlite port-list
```

Use either of the following commands to list the NP6Lite processors in your FortiGate unit:

```
get hardware npu np6lite port-list
diagnose npu np6lite port-list
```

The output of all of these commands includes the device ID or `dev_id` of each NP processor. Only FortiGates with NP6 processors have multiple `dev_ids`. On FortiGates with one NP6, NP6Xlite, or NP6Lite processor, `dev_id` is always `0`.

To diagnose NP6, NP6XLite, or NP6 sessions, disable NPU offloading.

```
diagnose npu <processor> fastpath disable <dev_id>
```

Then use the `diagnose debug flow` command to view sessions.

Identifying the XAUI link used for a specific traffic stream

The `diagnose npu np6 xaui-hash` command takes a 6-tuple input of the traffic stream to identify the NP6 XAUI link that the traffic passes through.

This command is only available on the 38xxD, 39xxD, 34xxE, 36xxE, and 5001E series devices.

Syntax

```
diagnose npu np6 xaui-hash <interface> <proto> <src_ip> <dst_ip> <src_port> <dst_port>
```

Variable	Description
<interface>	The network interface that the packets are coming from.
<proto>	The proto number, 6 for TCP or 17 for UDP.
<src_ip>	The source IP address.
<dst_ip>	The destination IP address.
<src_port>	The source port.
<dst_port>	The destination port.

Examples

```
# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 80
 NP6_ID: 0, XAUI_LINK: 2
```

```
# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 200
NP6_ID: 6, XAUI_LINK: 2
```

```
# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 20
NP6_ID: 1, XAUI_LINK: 2
```

```
# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 23
NP6_ID: 1, XAUI_LINK: 1
```

The `NP6_ID` is the NP index of the model that is being used. It can be found with the `diagnose npu np6 port-list` command.

Running the TAC report

The Technical Assistance Center (TAC) report runs an exhaustive series of diagnostic commands. Some of the commands are only needed if you are using features, such as HA, VPN tunnels, or a modem. Fortinet support my ask you to use the report output to provide information about the current state of your FortiGate.

Due the amount of output generated, the report may take a few minutes to run. If you are logging CLI output to a file, you can run this command to familiarize yourself with the diagnostic commands.

To run the TAC report in the CLI:

```
execute tac report
```

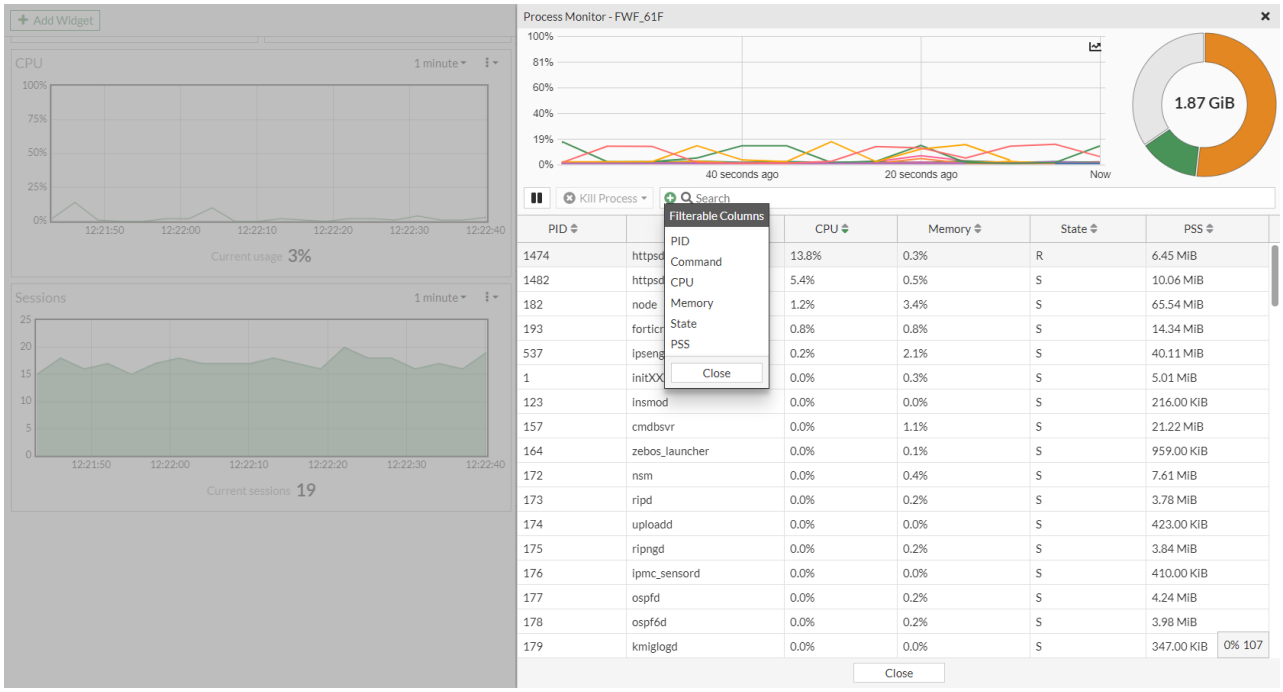
Using the process monitor

The *Process Monitor* displays running processes with their CPU and memory usage levels. Administrators can sort, filter, and terminate processes within the *Process Monitor* pane.

To access the process monitor:

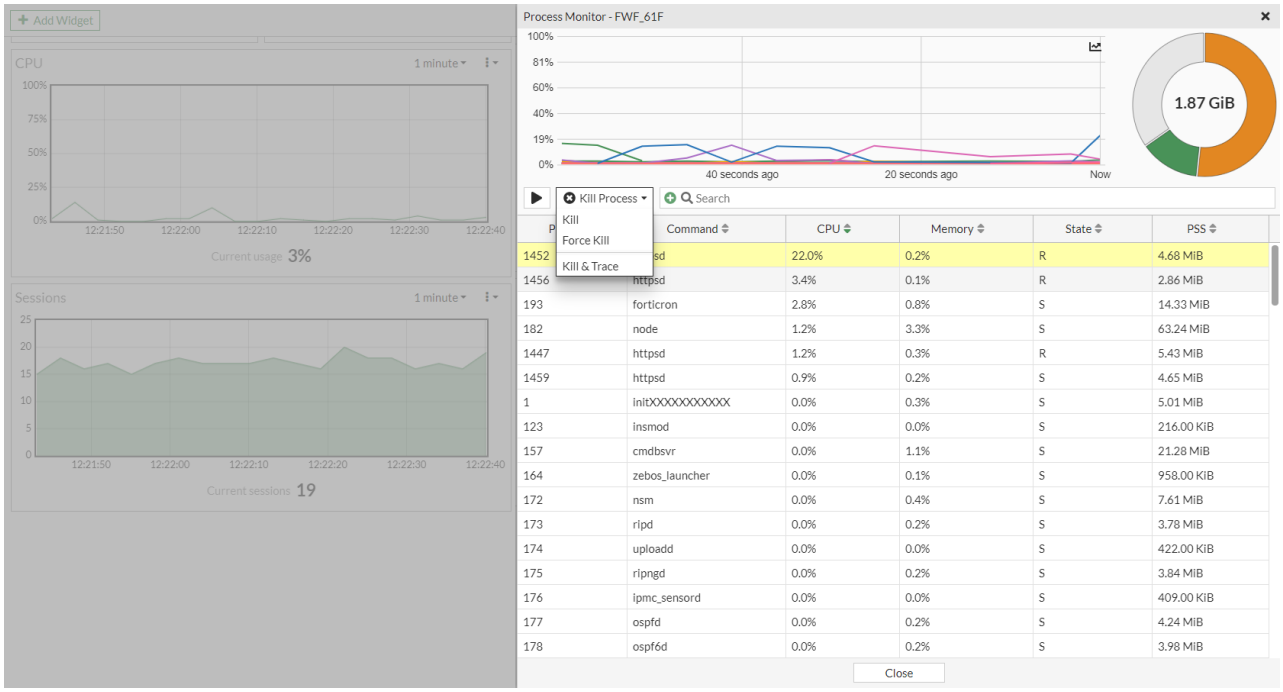
1. Go to *Dashboard* > *Status*:
   - Left-click in the *CPU* or *Memory* widget and select *Process Monitor*.
   - Click the user name in the upper right-hand corner of the screen, then go to *System* > *Process Monitor*.

   The *Process Monitor* appears, which includes a line graph, donut chart, and process list.
2. Click the + beside the search bar to view which columns can be filtered.

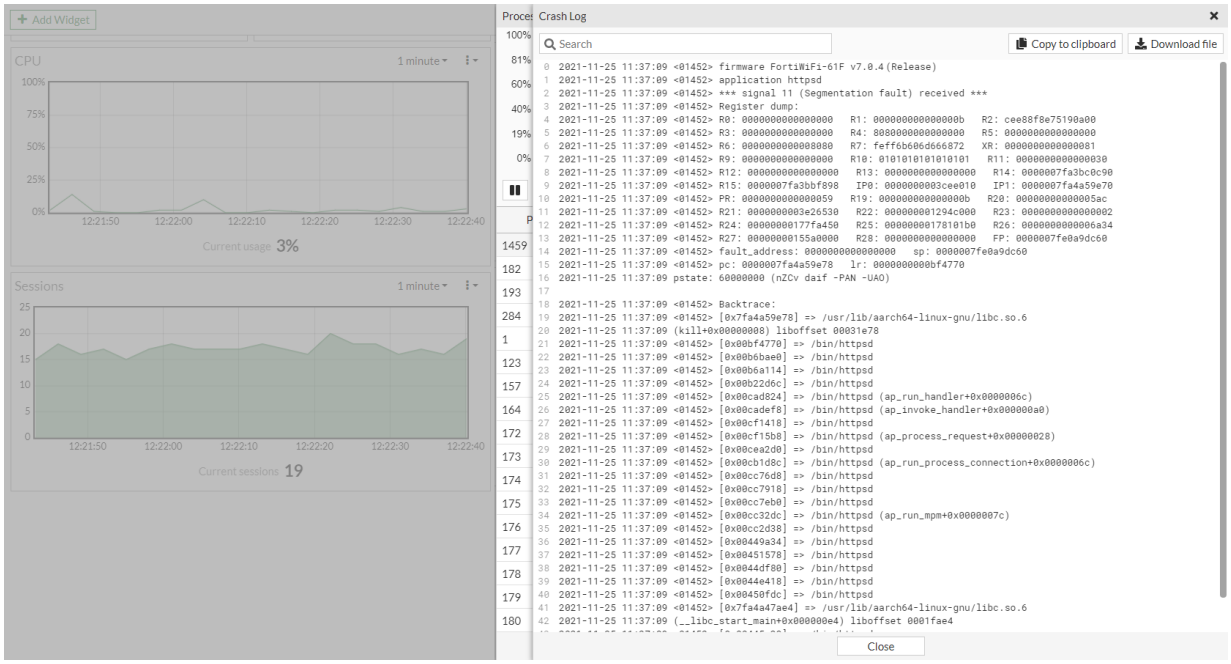


To kill a process within the process monitor:

1. Select a process.
2. Click the *Kill Process* dropdown.



3. Select one of the following options:
   - *Kill*: the standard kill option that produces one line in the crash log (`diagnose debug crashlog read`).
   - *Force Kill*: the equivalent to `diagnose sys kill 9 <pid>`. This can be viewed in the crash log.
   - *Kill & Trace*: the equivalent to `diagnose sys kill 11 <pid>`. This generates a longer crash log and backtrace. A crash log is displayed afterwards.



Computing file hashes

The following command computes the SHA256 file hashes for all of the files in a directory or directories:

```
# diagnose sys filesystem hash <paths> -d [depth]
```

<paths>	Add up to 25 paths to show only the hash for the files at those paths.
-d [depth]	Specify the maximum depth of the traversal.

This command can be used for troubleshooting and debugging the system. The file hashes of system files can be compared against known good system files to help identify any compromises made on the system files.

To hash all filesystems:

```
# diagnose sys filesystem hash
Hash contents: /bin
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b        /bin/syslogd -> /bin/init

...
```

To hash specific filesystem, add the name of the filesystem:

```
# diagnose  sys  filesystem  hash  /sbin
Hash contents: /sbin
c1f81e67a53bcf70720748fe31c2380e95b4c3dfdb96957fd116fcf702bd797b        /sbin/init
Filesystem hash complete. Hashed 1 files.
```

To hash multiple filesystems, add the names of the filesystems:

Up to 25 file systems can be added.

```
# diagnose sys filesystem hash /sbin /bin
Hash contents: /sbin
```

```
c1f81e67a53bcf70720748fe31c2380e95b4c3dfdb96957fd116fcf702bd797b        /sbin/init
Hash contents: /bin
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b        /bin/syslogd -> /bin/init

Filesystem hash complete. Hashed 25 files.
```

An error message is shown if an incorrect value is entered:

```
# diagnose sys filesystem hash /test-path
ERROR: Could not fetch info for path /test-path (No such file or directory)
Filesystem hash complete. Hashed 0 files.
```

```
# diagnose sys filesystem hash /bin -d 0
ERROR: depth must be greater than zero. (0)
Command fail. Return code -651
```

Other commands

You may be asked to provide the following information when you contact Fortinet support.

- ARP table on page 4346
- IP address on page 4350

ARP table

The ARP table is used to determine the destination MAC addresses of the network nodes, as well as the VLANs and ports that the nodes are reached from.

To view the ARP table:

```
# get system arp

Address           Age(min)   Hardware Addr      Interface
10.10.1.3         1          50:b7:c3:75:ea:dd internal7
```

```
192.168.0.190     0          28:f1:0e:03:2a:97 wan1
192.168.0.97      0          f4:f2:6d:37:b0:99 wan1
```

To view the ARP cache in the system:

```
# diagnose ip arp list

index=14 ifname=internal7 10.10.1.3 50:b7:c3:75:ea:dd state=00000004 use=2494 confirm=1995
update=374 ref=3
index=5 ifname=wan1 192.168.0.190 28:f1:0e:03:2a:97 state=00000002 use=88 confirm=86 update=977639
ref=2
index=22 ifname=internal 192.168.1.111 00:0c:29:c6:79:3d state=00000004 use=3724 confirm=9724
update=3724 ref=0
index=5 ifname=wan1 224.0.1.140 01:00:5e:00:01:8c state=00000040 use=924202 confirm=930202
update=924202 ref=1
index=5 ifname=wan1 192.168.0.97 f4:f2:6d:37:b0:99 state=00000002 use=78 confirm=486 update=614
ref=26
index=14 ifname=internal7 10.10.1.11 state=00000020 use=172 confirm=1037790 update=78 ref=2
```

To view a summary of the ARP table:

```
# diagnose sys device list root

list virtual firewall root info:
ip4 route_cache: table_size=65536 max_depth=2 used=31 total=34
arp: table_size=16 max_depth=2 used=5 total=6

vf=root dev=ssl.root vrf=0
...
vf=root dev=internal5 vrf=0
ses=0/0 ses6=0/0 rt=0/0 rt6=0/0
```

ARP request, cache, and reachable time

When FortiGate tries to communication with a new destination it must resolve the destination's MAC address. The resolution depends on the IP address of the destination:

- Directly connected destination: ARP request is sent for the destination IP address.
- Non-directly connected destination: ARP request is sent for the gateway IP address of the exit interface.

After the ARP request is sent and an ARP reply is received, the corresponding ARP entry is added to the ARP cache, allowing FortiOS to use the cached entries for subsequent traffic and reducing the sending of frequent ARP request.

Entries in the ARP cache are valid for a duration equal to the actual ARP reachable time. The actual ARP reachable time is a random number between 50% and 150% of the base reachable time. The default base reachable time is 30 seconds, so the actual ARP reachable time is from 15 to 45 seconds. The actual ARP

reachable time is recalculated and updated every five minutes. The frequency of ARP requests to populate the ARP cache and unicast ARP probes to refresh the ARP cache entries depend on the base ARP reachable time.

Each ARP entry in the ARP cache includes its state and the number of objects that are currently using it. For example:

```
index=5 ifname=wan1 224.0.1.140 01:00:5e:00:01:8c state=00000040 use=924202 confirm=930202
update=924202 ref=1
```

Based on the state assigned to the ARP entry, the ARP cache determines the validity of the entry. There are multiple possible states for an ARP entry, and the state-transition mechanism can be complex. Common states include the following:

State	Meaning	Description
000000002 or 0x02	REACHABLE	An ARP response was received
000000004 or 0x04	STALE	No ARP response within the expected time
000000008 or 0x08	DELAY	A transition state between STALE and REACHABLE before Probes are sent out
000000020 or 0x20	FAILED	Did not manage to resolve within the maximum configured number of probes
000000040 or 0x40	NOARP	Device does not support ARP, e.g. IPsec interface
000000080 or 0x80	PERMANENT	A statically defined ARP entry

Multiple factors affect the state-transition mechanism and whether an entry is used by other subsystems. ARP creation, ARP request/reply, neighbor lookup, routing, and others can cause an ARP entry to be in use or referenced. Regular and successful unicast ARP probes initiated by FortiGate help maintain an ARP entry in Reachable state. By default, FortiGate disables regular unicast ARP probes for the sessions that are offloaded to the network processor (NP).

To set the ARP reachable time on an interface:

```
config system interface
    edit port1
        set reachable-time <integer>
    next
end
```

reachable-time <integer>	The reachable time (30000 to 3600000, default = 30000).

ARP cache purging

An ARP cache entry that is in the STALE (0x04) or FAILED (0x20) states with no references to it (ref=0) is eligible to be removed from the ARP cache using the garbage collection mechanism. The garbage collection mechanism runs every 30 seconds, and checks and removes ARP entries that have been stale, failed, or unreferenced longer than 60 seconds. Garbage collection is also triggered when the number of ARP entries exceeds the configured threshold. If the threshold is exceeded, no entries can be added to the ARP table.

To set the maximum number of ARP entries threshold:

```
config system global
    set arp-max-entry <integer>
end
```

arp-max-entry <integer>	The maximum number of dynamically learned MAC addresses that can be added to the ARP table (131072 to 2147483647, default = 131072).

ARP/ICMP6 probing for offloaded sessions

By default, FortiOS does not regularly send ARP probes for sessions offloaded to the NP. This can cause issues in environments where a session is established and offloaded to the NP, but no traffic flows through the FortiGate for an extended period of time, causing ARP entries on the FortiGate to expire and the MAC address table of upstream or downstream devices, such as switches, to age out. When this happens, an ARP broadcast request is triggered for any subsequent traffic passing through the session that generates a broadcast ARP request within the upstream or downstream switch network. To mitigate this, enable sending regular ARP probes for offloaded sessions.

To enable sending ARP/ICMP6 probing packets to update neighbors for offloaded sessions:

```
config system global
       set npu-neighbor-update enable
end
```

The npu-neighbor-update option is disabled by default.

Manually adding and removing ARP cache entries

To add static ARP entries:

```
config system arp-table
    edit 1
        set interface "internal"
        set ip 192.168.50.8
        set mac bc:14:01:e9:77:02
    next
end
```

To delete a single ARP entry from the ARP table:

```
diagnose ip arp delete <interface name> <IP address>
```

To clear all of the entries in the ARP table:

```
execute clear system arp table
```

IP address

You may want to verify the IP addresses assigned to the FortiGate interfaces are what you expect them to be.

To verify IP addresses:

```
diagnose ip address list
```

The output lists the:

- IP address and mask (if available)
- `index` of the interface (a type of ID number)
- `devname` (the interface name)

While physical interface names are set, virtual interface names can vary. A good way to use this command is to list all of the virtual interface names. For `vsys_ha` and `vsys_fgfm`, the IP addresses are the local host, which are virtual interfaces that are used internally.

Sample output:

```
# diagnose ip address list
IP=10.31.101.100->10.31.101.100/255.255.255.0 index=3 devname=internal
IP=172.20.120.122->172.20.120.122/255.255.255.0 index=5 devname=wan1
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=8 devname=root
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=11 devname=vsys_ha
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=13 devname=vsys_fgfm
```

FortiGuard troubleshooting

The FortiGuard service provides updates to AntiVirus (AV), Antispam (AS), Intrusion Protection Services (IPS), Webfiltering (WF), and more. The FortiGuard Distribution System (FDS) consists of a number of servers across the world that provide updates to your FortiGate unit. Problems can occur with the connection to FDS and its configuration on your local FortiGate unit.

Some of the more common troubleshooting methods are listed here, including:

- Verifying connectivity to FortiGuard on page 4350
- Troubleshooting process for FortiGuard updates on page 4351
- FortiGuard server settings on page 4352
- FortiGuard error logs on page 4354

Verifying connectivity to FortiGuard

You can verify FortiGuard connectivity in the GUI and CLI.

To verify FortiGuard connectivity in the GUI:

1. Got to *Dashboard* > *Status*.
2. Check the *Licenses* widget. When FortiGate is connected to FortiGuard, licensed services are in green icons.

To verify FortiGuard connectivity in the CLI:

```
execute ping service.fortiguard.net
```

```
execute ping update.fortiguard.net
```

Sample output:

```
FG100D# execute ping service.fortiguard.net
PING guard.fortinet.net (208.91.112.196): 56 data bytes
64 bytes from 208.91.112.196: icmp_seq=0 ttl=51 time=61.0 ms
64 bytes from 208.91.112.196: icmp_seq=1 ttl=51 time=60.0 ms
64 bytes from 208.91.112.196: icmp_seq=2 ttl=51 time=59.6 ms
64 bytes from 208.91.112.196: icmp_seq=3 ttl=51 time=58.9 ms
64 bytes from 208.91.112.196: icmp_seq=4 ttl=51 time=59.2 ms

--- guard.fortinet.net ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 58.9/59.7/61.0 ms

FG100D# execute ping update.fortiguard.net
PING fds1.fortinet.com (208.91.112.68): 56 data bytes

Troubleshooting process for FortiGuard updates

The following process shows the logical steps you should take when troubleshooting problems with FortiGuard updates:

1. **Does the device have a valid license that includes these services?**
   Each device requires a valid FortiGuard license to access updates for some or all of these services. You can verify the status of the support contract for your devices at the Fortinet Support website.
2. **If the device is part of a high availability (HA) cluster, do all members of the cluster have the same level of support?**
   You can verify the status of the support contract for all of the devices in your HA cluster at the Fortinet Support website.
3. **Are services enabled on the device?**
   To see the FortiGuard information and status for a device in the GUI, go to *System* > *FortiGuard*.
   Use this page to verify the status of each component, and enable each service.

4. **Can the device communicate with FortiGuard servers?**
   Go to *System* > *FortiGuard* in the GUI, and try to update AntiVirus and IPS, or test the availability of Web Filtering and AS default and alternate ports.
5. **Is there proper routing to reach the FortiGuard servers?**
   Ensure there is a static or dynamic route that allows your FortiGate to reach the FortiGuard servers. Usually a generic default route to the internet is enough, but you may need to verify this if your network is complex.
6. **Are there issues with DNS?**
   An easy way to test this is to attempt a traceroute from behind the FortiGate to an external network using the Fully Qualified Domain Name (FQDN) for a location. If the traceroute FQDN name doesn't resolve, you have general DNS problems.
7. **Is there anything upstream that might be blocking FortiGuard traffic, either on the network or ISP side?**
   Many firewalls block all ports, by default, and ISPs often block ports that are low. There may be a firewall between the FortiGate and the FortiGuard servers that's blocking the traffic. By default, FortiGuard uses port 53. If that port is blocked you need to either open a hole for it or change the port it is using.
8. **Is there an issue with source ports?**
   It is possible that ports that FortiGate uses to contact FortiGuard are being changed before they reach FortiGuard or on the return trip before they reach FortiGate. A possible solution for this is to use a fixed-port at NAT'd firewalls to ensure the port remains the same. You can use packet sniffing to find more information about what's happening with ports.
9. **Are there security policies that include antivirus?**
   If none of the security policies include antivirus, the antivirus database will not be updated. If antivirus is included, only the database type that's used will be updated.

FortiGuard server settings

Your local FortiGate connects to remote FortiGuard servers to get updates to FortiGuard information, such as new viruses that may have been found or other new threats.

The default setting to reach FortiGuard is anycast. However, FortiGate can be configured to use unicast server. See FortiGuard on page 3562 for more information.

This section provides methods to display FortiGuard server information on your FortiGate, and how to use that information and update it to fix potential problems.

Displaying the server list

To get a list of FDS servers FortiGate uses to send web filtering requests:

```
get webfilter status
```

or

```
diagnose debug rating
```

Rating requests are only sent to the server at the top of the list in normal operation. Each server is probed for Round Trip Time (RTT) every two minutes. Rating may not be enabled on your FortiGate.

Optionally, you can add a refresh rate to the end of the command to determine how often the server list is refreshed.

Sample output:

```
Locale       : English

Service      : Web-filter
Status       : Enable
License      : Contract

Service      : Antispam
Status       : Disable

Service      : Virus Outbreak Prevention
Status       : Disable

Num. of servers : 2
Protocol        : https
Port            : 443
Anycast         : Disable
Default servers : Included

-=- Server List (Wed Nov 16 14:42:08 2022) -=-
IP                                            Weight    RTT Flags   TZ  FortiGuard-requests  Curr
Lost Total Lost             Updated Time
140.174.22.68                                     30    866         -5                    13
    0          0 Wed Nov 16 14:41:35 2022
12.34.97.18                                       30    878 DI      -5                    12
    0          0 Wed Nov 16 14:41:35 2022
```

Output details

The server list includes the IP addresses of alternate servers if the first entry cannot be reached. In this example, the IP addresses are not public addresses.

The following flags in `get webfilter status` indicate the server status:

Flag	Description
D	The server was found through the DNS lookup of the hostname. If the hostname returns more than one IP address, all of them are flagged with D and are used first for INIT requests before falling back to the other servers.
I	The server to which the last INIT request was sent
F	The server hasn't responded to requests and is considered to have failed
T	The server is currently being timed
S	Rating requests can be sent to the server. The flag is set for a server only in two cases: • The server exists in the servers list received from the FortiManager or any other INIT server. • The server list received from the FortiManager is empty so the FortiManager is the only server that the FortiGate knows and it should be used as the rating server.

Please note that the example output displays `Anycast` as `Disable` because the CLI commands above work with the FortiGuard unicast server case and not with the FortiGuard anycast servers case.

Also, in the example output above, the server 12.34.97.18 was found through a DNS lookup (`D` flag) and was sent the last INIT request (`I` flag).

Sorting the server list

The server list is sorted first by weight. The server with the smallest RTT appears at the top of the list, regardless of weight. When a packet is lost (there has been no response in 2 seconds), it is re-sent to the next server in the list. Therefore, the top position in the list is selected based on RTT, while the other positions are based on weight.

Calculating weight

The weight for each server increases with failed packets and decreases with successful packets. To lower the possibility of using a remote server, the weight isn't allowed to dip below a base weight. The base weight is calculated as the difference in hours between the FortiGate and the server multiplied by 10. The farther away the server is, the higher its base weight is and the lower it appears in the list.

FortiGuard error logs

Shortened log	Message	Error	Reason
logid="0318012800" type="utm" subtype="webfilter" eventtype="ftgd_err" level="error"... msg="A rating error occurs" error="rating timeout"	A rating error occurs	rating timeout	Occurs if urlfilter sends a request to FortiGuard but does not receive a response before the packet retransmission interval.
logid="0318012801" type="utm" subtype="webfilter" eventtype="ftgd_err" level="warning" ... msg="A rating error occurs" error="bad network connection"	A rating error occurs	bad network connection	Occurs if urlfilter sends a request to FortiGuard but does not receive a response before the packet re-transmission interval. The number of lost packets for a given FortiGuard server exceeds a threshold
logid="0318012800" type="utm" subtype="webfilter" eventtype="ftgd_err" level="error" ... msg="A rating error occurs" error="no correct FortiGuard information"	A rating error occurs	no correct FortiGuard information	Occurs when urlfilter tried to send a request but was not able to reach any of the FortiGuard servers in its server list. This may be because the list is empty, or urlfilter has already tried all servers but did not get any response.

Shortened log	Message	Error	Reason
logid="0318012800" type="utm" subtype="webfilter" eventtype="ftgd_err" level="error" ... msg="A rating error occurs" error="unknown"	A rating error occurs	unknown	Occurs when the wad daemon does not specify a reason in the log or there is an internal urlfilter daemon issue.
logid="0318012800" type="utm" subtype="webfilter" eventtype="ftgd_err" level="error" ... msg="A rating error occurs" error="invalid license"	A rating error occurs	invalid license	Occurs when urlfilter daemon receives "invalid license" error response from Fortiguard server side when it is doing rating request.
logid="0318012800" type="utm" subtype="webfilter" eventtype="ftgd_err" level="error" ... msg="A rating error occurs" error="no rating service is enabled"	A rating error occurs	no rating service is enabled	Occurs when urlfilter service is not found or enabled.

View open and in use ports

Traffic destined for the FortiGate itself, and not being passed through or dropped, is called local-in traffic. It can be from a variety of services, such as HTTPS for administrative access, or BGP for inter-router communication.

Local-in traffic is controlled by local-in policies. To enable viewing local-in policies in the GUI, go to *System* > *Feature Visibility* and enable *Local In Policy*.

The *Policy & Objects* > *Local In Policy* page shows a read-only list of the local policies, populated with default values, and values that are automatically enabled when the related service is enabled, for example, enabling BGP opens TCP port 179. For more information, see Local-in policy on page 1605.

To view ports that are being listened on, and active connections and the services or processes using them:

```
# diagnose sys tcpsock | grep 0.0.0.0
0.0.0.0:10400->0.0.0.0:0->state=listen err=0 socktype=4 rma=0 wma=0 fma=0 tma=0 inode=10621
process=142/authd
...
0.0.0.0:53->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=8067
process=177/dnsproxy
0.0.0.0:22->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=13390
process=225/sshd
0.0.0.0:541->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=13155
process=215/fgfmd
```

```
...
0.0.0.0:9980->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=5063
process=129/httpsd
0.0.0.0:179->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=10583
process=148/bgpd
...
```

For more information on incoming and outgoing ports, see the FortiOS Ports guide.

IPS and AV engine version

The IPS engine is an important module that processes traffic in policies configured with flow-based inspection, next generation firewall policies, as well as any policies that have IPS and application control defined. Just like its counterpart, the WAD daemon in proxy-based inspection, the IPS engine can invoke other daemons to perform additional processing such as certificate inspection, authentication, and other functions.

For each FortiOS release, an IPS engine is built into the firmware. You can find information about the IPS engine in its corresponding Release Notes.

When a FortiGate is configured for automatic FortiGuard updates and has policies configured to use the IPS engine, it downloads new releases of the IPS engine that are available through the FortiGuard Distribution Network. The IPS Engine package released to FortiGuard is unavailable for manual download.

The FortiGate supports manual upgrade/downgrade of the IPS engine in special cases, such as for troubleshooting or resolving a temporary issue that Technical Support deems necessary. In these cases, Technical Support distributes the IPS engine package.

Likewise, the AV engine is also built into the FortiOS firmware and available as an automatic update through FortiGuard. You can find information about the AV engine in its corresponding Release Notes.

Finally, for compatibility information between IPS and AV engines with FortiOS, see IPS Engine and AV Engine Support for FortiOS and FortiAPS

print tablesize

You can use the `print tablesize` command to view a list of the maximum values for your device. The four columns of values provide the following information, respectively:

1. Maximum number of variables allowed for this object type
2. Maximum number of objects of this type allowed per virtual domain (VDOM)
3. System global limit for maximum number of objects of this type
4. Current total number of objects of this type existing in FortiOS

A value of 0 indicates that there is no maximum value limit.

To check the maximum number of variables that you can append to all log messages:

```
# print tablesize
...
```

```
log.setting:custom-log-fields: 5 0 0 0
...
```

This means that you can add up to five variables:

```
config log setting
    set custom-log-fields <field_1>  <field_2>  <field_3>  <field_4>  <field_5>
end
```

To check the external resource table size limit for your device:

In this example, the device has a global limit of 512, a per-VDOM limit of 256, and there are currently no external resources existing in FortiOS. the available memory on the device limits the total number of feeds.

```
# print tablesize
...
system.external-resource: 0 256 512 0
...
```

To check the current total number of objects of this type existing in FortiOS:

```
# print tablesize
system.vdom: 0 0 10 3
system.datasource: 0 0 0 3
system.timezone: 0 0 0 597
system.accprofile: 0 0 10 5
system.np6xlite: 0 256 512 1
system.vdom-link: 0 0 0 3
...
```

CLI troubleshooting cheat sheet

See CLI troubleshooting cheat sheet.

CLI error codes

CLI error codes are shown in the command line if the command execution fails. The message includes a summary, followed by `Command fail. Return code -X`, where `-X` is the error code. For example:

```
# set test
Command parse error before 'test'
Command fail. Return code -61
```

The following table lists common error codes and their descriptions.

Return Code	Description
1	Generic CLI syntax error
-1	Invalid length of value.
-4	Maximum number of entries has been reached.
-5	A duplicate entry already exists.
-8	Invalid IP Address.
-37	Permission denied.
-56	Empty values are not allowed.
-61	Input not as expected.
-160	CFG_ER_GENERIC (common generic configuration error)
-553	Name conflicts with an interface, VDOM, switch-interface, zone, or interface name used for hardware switch interfaces.
-651	Input value is invalid.

Additional resources

To learn more about FortiGate and FortiOS, and for information about technical issues, refer to the following resources.

Fortinet Document Library

Installation Guides, Administration Guides, Quick Start Guides, and other technical documents are available online at the Fortinet Document Library.

Release notes

Issues that arise after the technical documentation has been published are often listed in the release notes. The release notes are available in the Fortinet Document Library.

Fortinet Video Library

The Fortinet Video Library hosts a collection of videos that provide valuable information about Fortinet products.

Fortinet Community

The Fortinet Community provides a place to collaborate, share insights and experiences, and get answers to questions. It incorporates the Fortinet Knowledge Base and technical discussion forums. You can access the Fortinet Community at https://community.fortinet.com.

Knowledge Base

The Fortinet Knowledge Base provides access to a variety of articles, white papers, and other documentation that provides technical insight into a range of Fortinet products. You can access the Knowledge Base at https://community.fortinet.com/t5/Knowledge-Base/ct-p/knowledgebase.

Fortinet technical discussion forums

The online technical forum allows administrators to contribute to discussions about issues related to their Fortinet products. Searching the forum can help an administrator identify if an issue has been experienced by another user. You can access the support forum at https://community.fortinet.com/t5/Fortinet-Forum/bd-p/fortinet-discussion.

Fortinet Training Institute

The Fortinet Training Institute hosts a collection of tutorials and training materials that you can use to increase your knowledge of Fortinet products. You can access these training resources at https://www.fortinet.com/training.html.

Fortinet Support

You defined your problem, researched a solution, put together a plan to find the solution, and executed that plan. At this point, if the problem has not been solved, contact Fortinet Support for assistance.
