DLP fingerprinting

DLP fingerprinting can be used to detect sensitive data. The file that the DLP profile filters is uploaded and the FortiGate generates and stores a checksum fingerprint. The FortiGate generates a fingerprint for all the files that are detected in network traffic, and compares all the checksums stored in its database. If a match is found, the configured action is taken. Any type of file can be detected by DLP fingerprinting, and fingerprints can be saved for each revision of a file as it is updated.

Using fingerprinting requires:
1. Selecting the files to be fingerprinted by targeting a document source.
2. Adding fingerprinting filters to DLP profiles.
3. Adding the profiles to firewall policies that accept traffic that the fingerprinting will be applied on.

The document fingerprint feature requires a FortiGate that has internal storage.

To configure a DLP fingerprint document:

```
config dlp fp-doc-source
edit <name>
    set server-type smb
    set server <string>
    set period {none | daily | weekly | monthly}
    set vdom {mgmt | current}
    set scan-subdirectories {enable | disable}
    set remove-deleted {enable | disable}
    set keep-modified {enable | disable}
    set username <string>
    set password <password>
    set file-path <string>
    set file-pattern <string>
    set sensitivity {Critical | Private | Warning}
    set tod-hour <integer>
    set tod-min <integer>
    set weekday {sunday | monday | tuesday | wednesday | thursday | friday | saturday}
    set date <integer>
next
end
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server-type smb</td>
<td>Set the protocol used to communicate with document server. Only Samba (SMB) servers are supported.</td>
</tr>
<tr>
<td>server &lt;string&gt;</td>
<td>Enter the IPv4 or IPv6 address of the server.</td>
</tr>
<tr>
<td>period {none</td>
<td>daily</td>
</tr>
<tr>
<td>vdom {mgmt</td>
<td>current}</td>
</tr>
<tr>
<td>scan-subdirectories {enable</td>

</tr>
<tr>
<td>keep-modified {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>username &lt;string&gt;</td>
<td>Enter the user name required to log into the file server.</td>
</tr>
<tr>
<td>password &lt;password&gt;</td>
<td>Enter the password required to log into the file server.</td>
</tr>
</tbody>
</table>
### Command | Description
--- | ---
file-path <string> | Enter the path on the server to the fingerprint files.
file-pattern <string> | Enter the pattern for matching files on the server to be fingerprinted.
sensitivity <Critical | Private | Warning> | Set the sensitivity or threat level for matches with this fingerprint database.
tod-hour <integer> | Set the hour of the day. This option is only available when period is not none.
tod-min <integer> | Set the minute of the hour. This option is only available when period is not none.
weekday {sunday | monday | tuesday | wednesday | thursday | friday | saturday} | Set the day of the week. This option is only available when period is weekly.
date <integer> | Set the day of the month. This option is only available when period is monthly.

**To configure a DLP fingerprint profile:**

```plaintext
config dlp profile
d   edit <name>
   config filter
d     edit <id>
        set proto {smtp | pop3 | imap http-get | http-post | ftp | nntp | mapi}
        set filter-by fingerprint
        set sensitivity {Critical | Private | Warning}
        set match-percentage <integer>
        set action {allow | log-only | block | ban | quarantine-ip}
     next
   end
end
```

### Command | Description
--- | ---
proto {smtp | pop3 | imap http-get | http-post | ftp | nntp | mapi} | Set the protocol to inspect.
filter-by fingerprint | Set to match against a fingerprint sensitivity.
sensitivity {Critical | Private | Warning} | Set the DLP file pattern sensitivity to match.
match-percentage <integer> | Set the percentage of the checksum required to match before the profile is triggered.
action {allow | log-only | block | ban | quarantine-ip} | Set the action to take with content that matches the DLP profile.
View the DLP fingerprint database on the FortiGate

Use `diagnose test application dlpfingerprint <integer>` to display the fingerprint information that is on the FortiGate.

<table>
<thead>
<tr>
<th>Integer</th>

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
VoIP solutions

You can configure VoIP profiles to allow SIP and SCCP traffic and to protect your network from SIP- and SCCP-based attacks.

FortiOS includes two preloaded VoIP profiles:

- **default**
- **strict**

You can customize these profiles, or you can create your own and add them to firewall policies that allow VoIP.

---

VoIP profiles cannot be used NGFW policy-based mode. See NGFW policy on page 773 for more information.

---

The following topics provide information about VoIP profiles:

- General use cases on page 1261
- NAT46 and NAT64 for SIP ALG on page 1265
- SIP message inspection and filtering on page 1273
- SIP pinholes on page 1275
- SIP over TLS on page 1277
- Voice VLAN auto-assignment on page 1278
- Scanning MSRP traffic on page 1280

General use cases

There are three scenarios in which the FortiOS session initiation protocol (SIP) solution is usually deployed:

1. The SIP server is in a private network that is protected from the internet by a FortiGate.
2. The SIP clients are in a private network that is protected from the internet by a FortiGate.
3. The SIP server is in a private network, such as a corporation's internal network or an ISP’s network, that is protected from the internet by a FortiGate. The SIP clients are in a remote private network, such as a SOHO network, and behind a NAT device that is not aware of SIP applications.

The following VIP, NAT, and HNT examples show configurations for these common scenarios.

VIP

A FortiGate with SIP Application Layer Gateway (ALG) or SIP session helper protects the SIP server from the internet, while SIP phones from the internet need to register to the SIP server and establish calls through it.
A VIP needs to be configured for the SIP server, and the VIP must be applied in a firewall policy for the phones to send REGISTER messages through the FortiGate from port1 to port2.

Only one firewall policy needs to be configured for all SIP phones on both the internet and private network to register to the SIP server through port1 and set up SIP calls. This example assumes either SIP ALG or SIP session helper is enabled.

**To configure the VIP for the SIP server:**

```plaintext
config firewall vip
  edit "VIP_for_SIP_Server"
    set extip 172.20.120.50
    set extintf "port1"
    set mappedip "10.11.101.50"
  next
end
```

**To configure the firewall policy:**

```plaintext
config firewall policy
  edit 1
    set srcintf "port1"
    set dstintf "port2"
    set srcaddr "all"
    set dstaddr "VIP_for_SIP_Server"
    set action accept
    set schedule "always"
    set service "SIP"
  next
end
```

Setting service to SIP and not all in the firewall policy can improve protection by restricting the data traffic passing through the FortiGate to the SIP call traffic only.
NAT

A FortiGate with SIP ALG or SIP session helper protects the SIP phones and the internal network from the internet, while SIP phones in the internal network need to register to the SIP server installed on the internet and establish calls through it.

One firewall policy needs to be configured with NAT enabled for SIP phones to send REGISTER messages through the FortiGate from port2 to port1. This example assumes either SIP ALG or SIP session helper is enabled.

To configure the firewall policy:

```plaintext
config firewall policy
edit 1
  set srcintf "port2"
  set dstintf "port1"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set schedule "always"
  set service "SIP"
  set nat enable
next
end
```

HNT

A FortiGate with SIP ALG protects the SIP server from the internet, while SIP phones are in remote private networks behind NAT devices that are not aware of the SIP application. This is only supported in proxy mode.

In this example, the SIP server is located in an ISP's service cloud that is protected by the FortiGate SIP ALG, and the SIP phones are installed in the home networks of the ISP's customers.
The SIP messages traversing the remote NAT devices might have their IP addresses translated by the NAT device at the network layer, but untranslated at the SIP application layer because those NAT devices are not aware of the SIP applications. This causes problems in a SIP session initiated process. Special configurations for the hosted NAT traversal (HNT) are required to resolve this issue.

To configure the FortiGate with HNT support for SIP phones A and B to set up calls with each other:

1. Identify port1 as the external interface:

   ```bash
   config system interface
   edit "port1"
   set external enable
   next
   end
   ```

2. Configure the VIP for the SIP server:

   ```bash
   config firewall vip
   edit "VIP_for_SIP_Server"
   set extip 10.21.101.10
   ```
set extintf "port1"
set mappedip "10.30.120.20"
next
end

3. Configure a VoIP profile with HNT enabled:

```plaintext
config voip profile
edit "hnt"
config sip
set hosted-nat-traversal enable
set hnt-restrict-source-ip enable
end
next
end
```

**hosted-nat-traversal must be enabled. hnt-restrict-source-ip does not have to be enabled, but can be enabled to restrict the RTP packets’ source IP to be the same as the SIP packets’ source IP.**

4. Apply the VoIP profile and VIP in a firewall policy for phone A and B to register and set up SIP calls through the FortiGate and SIP server:

```plaintext
config firewall policy
edit 1
set srcintf "port1"
set dstintf "port2"
set srcaddr "all"
set dstaddr "VIP_for_SIP_Server"
set action accept
set schedule "always"
set service "SIP"
set utm-status enable
set voip-profile "hnt"
set nat enable
next
end
```

**nat must be enabled in the firewall policy.**

---

**NAT46 and NAT64 for SIP ALG**

NAT46 and NAT64 are supported for SIP ALG. A mix of IPv4 and IPv6 networks can use SIP ALG, allowing for proper call handling.

**NAT46 example**

In this example, SIP phones on the internal network use IPv4, and the SIP server on an external network uses IPv6. NAT46 is used with SIP ALG to allow for seamless communication. A VoIP profile, `sip`, has already been created.
To configure the FortiGate:

1. Configure a firewall VIP with NAT46 enabled:

```fortigate
config firewall vip
edit "vip46_server_asterisk"
   set extip 10.1.100.100
   set nat44 disable
   set nat46 enable
   set extintf "port1"
   set ipv6-mappedip 2000:172:16:200::44
next
end
```

2. Configure an IPv6 pool:

```fortigate
config firewall ippool6
edit "client_server_nat46"
   set startip 2000:172:16:200::200
   set endip 2000:172:16:200::207
   set nat46 enable
next
end
```

3. Configure a firewall policy:

```fortigate
config firewall policy
edit 1
   set name "policy46-1"
   set srcintf "port1"
   set dstintf "port9"
   set action accept
   set nat46 enable
   set srcaddr "all"
   set dstaddr "vip46_server_asterisk"
   set srcaddr6 "all"
   set dstaddr6 "all"
   set schedule "always"
   set service "ALL"
   set utm-status enable
   set inspection-mode proxy
   set voip-profile "sip"
   set logtraffic all
   set auto-asic-offload disable
   set ippool enable
```
set poolname6 "client_server_nat46"
next
end

To check the SIP calls and session lists when the phones are registering to the SIP server:

1. View the SIP proxy SIP calls:

   # diagnose sys sip-proxy calls
   sip calls
   vdom 3 (vdom1) vrf 0 call 7f64bf044b00
call-id: 1513782757

NAT64 example

In this example, SIP phones on the internal network use IPv6, and the SIP server on an external network uses IPv4. NAT64 is used with SIP ALG to allow for seamless communication. A VoIP profile, sip, has already been created.

To configure the FortiGate:

1. Configure a firewall VIP with NAT64 enabled:

   ```
   config firewall vip
   edit "vip64-1-asterisk"
   set extip 2000:10:1:100::100
   set nat66 disable
   set nat64 enable
   set ipv4-mappedip 172.16.200.44
   next
   end
   ```

2. Configure an IP pool:

   ```
   config firewall ippool
   edit "client_server_nat46"
   set startip 172.16.200.2
   set endip 172.16.200.3
   set nat64 enable
   next
   end
   ```

3. Configure a firewall policy:

   ```
   config firewall policy
   edit 1
   set name "policy64-1"
   set srcintf "port1"
   set dstintf "port9"
   set action accept
   set nat64 enable
   set srcaddr "all"
   set dstaddr "all"
   set srcaddr6 "all"
   set dstaddr6 "vip64-1-asterisk"
   set schedule "always"
   set service "ALL"
   set utm-status enable
   set inspection-mode proxy
   ```
SIP message inspection and filtering

SIP ALG provides users with security features to inspect and control SIP messages that are transported through the FortiGate, including:

- Verifying the SIP message syntax.
- Blocking particular types of SIP requests.
- Restricting the rate of particular SIP requests.

These can be performed in both proxy-based or flow-based firewall policies. In 7.0, flow-based SIP inspection is done by the IPS engine. This optimizes memory and CPU usage when VoIP profiles with SIP inspection are configured with other UTM profiles in a flow-based firewall policy because inspection is done entirely by the IPS engine.

These features are configured in the VoIP profile:

```
config voip profile
edit <name>
   set feature-set {proxy | flow}
   config sip
   set ...
   ...
end
next
del
```

For more information, see `config voip profile` in the FortiOS CLI Reference.

The VoIP profile can then be applied to a firewall policy to process the SIP call traffic. The firewall policy’s inspection mode decides whether inspection happens on the SIP ALG proxy or on the IPS engine.

```
config firewall policy
edit <id>
   set inspection-mode {proxy | flow}
   set voip-profile <name>
next
del
```

SIP message syntax inspection

For syntax verification, the following attributes are available for configuration in the VoIP profile to determine what action is taken when a specific syntax error or attack based on invalid syntax is detected. For example, the action can be set to pass or discard it.
Security Profiles

malformed-request-line

SIP message blocking

The following options are available in the VoIP profile to block SIP messages:

block-long-lines
block-unknown
block-ack
block-bye
block-cancel
block-info
block-invite
block-message
block-notify
block-options
block-prack
block-publish
block-refer
block-register
block-subscribe
block-update
block-geo-red-options**

** = only available in proxy mode
**SIP message rate limiting**

The rate of certain types of SIP requests that are passing through the SIP ALG can be restricted:

- register-rate
- invite-rate
- subscribe-rate
- message-rate
- notify-rate
- refer-rate
- update-rate
- options-rate
- ack-rate
- prack-rate
- info-rate
- publish-rate
- bye-rate
- cancel-rate

Additionally, flow-based SIP supports the following rate tracking features:

- register-rate-track none
- invite-rate-track none
- subscribe-rate-track none
- message-rate-track none
- notify-rate-track none
- refer-rate-track none
- update-rate-track none
- options-rate-track none
- ack-rate-track none
- prack-rate-track none
- info-rate-track none
- publish-rate-track none
- bye-rate-track none
- cancel-rate-track none

**SIP pinholes**

When SIP ALG processes a SIP call, it usually opens pinholes for SIP signaling and RTP/RTCP packets. NAT usually takes place during the process at both the network and SIP application layers. SIP ALG ensures that, with NAT happening, corresponding SIP and RTP/RTCP pinholes are created during the process when it is necessary for call sessions to be established through FortiOS devices.

By default, SIP ALG manages pinholes automatically, but some special configurations can be used to restrict the pinholes if required.

**SIP pinhole restriction**

The `strict-register` attribute is enabled by default. When enabled, after a SIP endpoint registers to the SIP server through a firewall policy on the FortiGate, only the SIP messages sent from the same IP address as the SIP server are allowed to pass through the SIP pinhole that is created in the FortiGate to reach the SIP endpoints. If the attribute is disabled, SIP messages from any IP addresses can pass through the pinhole created after the registration.
SIP pinhole restriction is only supported by SIP ALG and in proxy mode.

To configure registrar connection ability:

```
config voip profile
  edit <name>
    config sip
      set strict-register {enable | disable}
    end
  next
end
```

**RTP/RTCP pinhole restriction**

The `nat-port-range` setting is used to specify a port range in the VoIP profile to restrict the NAT port range for Real-time Transport Protocol/Real-time Transport Control Protocol (RTP/RTCP) packets in a Session Initiation Protocol (SIP) call session that is handled by the SIP application layer gateway (ALG) in a FortiGate.

When NAT is enabled, or VIP is used in a firewall policy for SIP ALG to handle a SIP call session established through a FortiGate, the SIP ALG can perform NAT to translate the ports used for the RTP/RTCP packets when they are flowing through the device between the external and internal networks.

To edit the translated port range for RTP/RTCP packets:

```
config voip profile
  edit <name>
    config sip
      set nat-port-range <start_port_number>-<end_port_number>
    end
  next
end
```

Enter the NAT port range (minimum port number = 5117, default = 5117-65535).

**Example**

In this example, Phone 1 is in Subnet 1, and the SIP server and Phone 2 are in Subnet 2. All SIP signaling messages and RTP/RTCP packets go through the SIP server. The RTP/RTCP ports on Phone 1 are configured as 17078/17079.

The FortiGate administrator wants to use NAT for the port 17078/17079 to 30000/30001. If Phone 1 and Phone 2 are registered to the SIP server, and they establish a call session between them through the FortiGate and the SIP server, then the RTP/RTCP ports 17078/17079 of Phone 1 will be translated to ports 30000/30001. All RTP/RTCP packets going out of port2 have source ports of 30000/30001, and all RTP/RTCP packets going into port2 also have destination ports of 30000/30001.
To configure the custom port range:

1. Edit the VoIP profile:
   
   ```
   config voip profile
   edit "natPortRange"
   config sip
   set nat-port-range 30000-30001
   end
   next
   end
   ```
   
   It is best practice to configure the starting port as an even number and the ending port as an odd number.

2. Configure the firewall policy:
   
   ```
   config firewall policy
   edit 1
   set srcintf port1
   set dstintf port2
   set srcaddr all
   set dstaddr all
   set service SIP
   set action accept
   set schedule always
   set voip-profile natPortRange
   set nat enable
   next
   end
   ```

SIP over TLS

Some SIP phones and servers can communicate using TLS to encrypt the SIP signaling traffic. To allow SIP over TLS calls to pass through the FortiGate, the encrypted signaling traffic must be unencrypted and inspected. The FortiGate SIP ALG intercepts, unencrypts, and inspects the SIP packets, which are then re-encrypted and forwarded to their destination.

The SIP ALG only supports full mode TLS. This means that the SIP traffic between SIP phones and the FortiGate, and between the FortiGate and the SIP server, is always encrypted. The highest TLS version supported by SIP ALG is TLS 1.2.
Security Profiles

To enable SIP over TLS support, the SSL mode in the VoIP profile must be set to full. The SSL server and client certificates can be provisioned so that the FortiGate can use them to establish connections to SIP phones and servers, respectively.

This configuration is only supported in proxy mode.

To configure SIP over TLS:

1. Configure a VoIP profile with SSL enabled:

```plaintext
config voip profile
edit "tls"
config sip
  set ssl-mode full
  set ssl-client-certificate "ssl_client_cert"
  set ssl-server-certificate "ssl_server_cert"
end
next
end
```

The `ssl_server_cert`, `ssl_client_cert`, and key files can be generated using a certification tool, such as OpenSSL, and imported to the local certificate store of the FortiGate from System > Certificates in the GUI. Existing local certificates in the certificate store can also be used. As always for TLS connections, the certificates used must be verified and trusted at the other end of the connection when required.

For example, the CA certificate of the SIP server's certificate should be imported to the FortiGate as an external CA certification, so that the FortiGate can use it to verify the SIP server's certificate when setting up the TLS connection. The CA certificate configured as the `ssl_server_cert` should be installed as the trusted certificate on the SIP phones. The deployment of the certificates across the network depends on the SIP client and server devices that are used in the system.

2. Apply the profile to the firewall policy:

```plaintext
config firewall policy
edit 1
  set srcintf "port1"
  set dstintf "port2"
  set srcaddr "all"
  set dstaddr "vip_sip_server"
  set action accept
  set schedule "always"
  set service "SIP"
  set utm-status enable
  set voip-profile "tls"
next
end
```

Voice VLAN auto-assignment

You can leverage LLDP-MED to assign voice traffic to the desired voice VLAN. After detection and setup, the IP phone on the network is segmented to its own VLAN for policy, prioritization, and reporting. The LLDP reception capabilities in
Security Profiles

FortiOS include LLDP-MED assignment for voice, voice signaling, guest, guest voice signaling, softphone, video conferencing, streaming video, and video signaling.

You can configure VLAN auto-assignment using the following steps:

1. **Set up the VLAN for the voice device**
2. **Set up the DHCP server for the voice VLAN**
3. **Set up the LLDP network policy**
4. **Enable LLDP on the physical interface that the VLAN belongs to**
5. **Apply the LLDP network policy on the physical interface**
6. **Confirm that the VLAN was assigned**

**To set up the VLAN for the voice device:**

```bash
config system interface
    edit "vlan_100"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
        set alias "voice_vlan"
        set device-identification enable
        set role lan
        set snmp-index 25
        set interface "port10"
        set vlanid 100
next
end
```

**To set up the DHCP server for the voice VLAN:**

```bash
config system dhcp server
    edit 1
        set dns-service default
        set default-gateway 192.168.1.99
        set netmask 255.255.255.0
        set interface "vlan_100"
        config ip-range
            edit 1
                set start-ip 192.168.1.110
                set end-ip 192.168.1.210
        next
next
end
```

**To set up the LLDP network policy:**

```bash
config system lldp network-policy
    edit "1"
        config voice
            set status enable
            set tag dot1q
                set vlan 100
        end
next
end
```
To enable LLDP on the physical interface that the VLAN belongs to:

```bash
config system interface
edit "port10"
    set vdom "root"
    set type physical
    set lldp-reception enable
    set lldp-transmission enable
    set snmp-index 14
next
end
```

To apply the LLDP network policy on the physical interface:

```bash
config system interface
edit "port10"
    set lldp-network-policy "1"
next
end
```

To confirm that the VLAN was assigned as expected:

1. Connect an IP phone to the network.
2. Check the IP address on the phone.
   The IP address should belong to the voice VLAN.
3. Sniff on the FortiGate incoming interface to see if traffic from the IP phone has the desired VLAN tag.
   In this example, the voice traffic from the IP phone should be in VLAN 100.

### Scanning MSRP traffic

An MSRP (Message Session Relay Protocol) decoder in the IPS engine scans for IPS signatures against the application data. Malicious payload in the text message can be blocked. A VoIP profile using flow inspection mode must be configured in the firewall policy. An IPS profile must be configured in the firewall policy to inspect the payload.

```bash
config voip profile
edit <name>
    set feature-set flow
    config msrp
        set status {enable | disable}
        set log-violations {enable | disable}
        set max-msg-size <integer>
        set max-msg-size-action {pass | block | reset | monitor}
    end
next
end
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>log-violations {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>max-msg-size &lt;integer&gt;</td>
<td>Maximum allowable MSRP message size, in bytes (0 - 65535, default = 0).</td>
</tr>
</tbody>
</table>
max-msg-size-action {pass | block | reset | monitor}  

Action for violating maximum MSRP message size:
- **pass**: pass or allow matching traffic (default)
- **block**: block or drop matching traffic
- **reset**: reset sessions for matching traffic
- **monitor**: pass and log matching traffic

### Examples

![Diagram of a network setup](image)

In this first example, MSRP messages larger than 10 bytes will be blocked. The client sends an oversized MSRP message to the server. Message Automation & Protocol Simulation (MAPSTM) is used, and a client-server model was configured to use the software to send MSRP traffic from vlan843 (client) to vlan844 (server) with plain text placed in the message field. The software uses the content of the MsrpInputMessage.txt file located in the default folder, where anything in that file will be sent by MSRP. The following text is used:

GL's Message Automation & Protocol Simulation (MAPSTM) is a protocol simulation and conformance test tool that supports a variety of protocols such as SIP, MEGACO, MGCP, SS7, ISDN, GSM, MAP, CAS, LTE, UMTS, SS7 SIGTRAN, ISDN SIGTRAN, SIP I, GSM AoIP, Diameter and others. This message automation tool covers solutions for both protocol simulation and protocol analysis. The application includes various test plans and test cases to support the testing of real-time entities. Along with automation capability, the application gives users the unlimited ability to edit messages and control scenarios (message sequences).

### To configure MSRP traffic scanning:

1. **Configure the VoIP profile:**
   ```
   config voip profile
   edit msrp_test
     set feature-set flow
   config mssrp
     set status enable
     set log-violations enable
     set max-msg-size 10
     set max-msg-size-action block
   end
   next
   end
   ```

2. **Configure the firewall policy:**
   ```
   config firewall policy
   edit 1
     set name "vdom3"
   set srcintf "vlan843"
   ```
Security Profiles

set dstintf "vlan844"
set action accept
set srcaddr "all"
set dstaddr "all"
set schedule "always"
set service "ALL"
set utm-status enable
set ssl-ssh-profile "certificate-inspection"
set voip-profile "msrp_test"
set logtraffic all

end

3. Verify the log:

# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.

1: date=2021-06-10 time=17:21:19 eventtime=16237087984028165 tz="-0700"
logid="0419016384" type="utm" subtype="ips" eventtype="signature" level="alert"

dstip=192.168.12.213 srcintf="vlan843" srcintfrole="lan" dstintf="vlan844"
dstintfrole="lan" sessionid=27700 action="dropped" proto=6 service="MSRP" policyid=1
attack="MSRP.Max.Message.Size.Exceeded" srcport=20036 dstport=20036 direction="outgoing"
attackid=1000000 profile="g-default" ref="http://www.fortinet.com/ids/VID1000000"
incidentserialno=198792275 srcport=0 pdstport=0 msg="msrp_decoder:
MSRP.Max.Message.Size.Exceeded, msg_size=270 exceeds config maximum=10"

4. In MAPS, verify that the call was terminated:

In this second example, malicious files will be blocked. The client sends an EICAR test sample to the server in an MSRP message. Message Automation & Protocol Simulation (MAPSTM) is used, and a client-server model was configured to use the software to send MSRP traffic from vlan843 (client) to vlan844 (server) with a plain text EICAR file containing a virus in the message field. The following text is used:

X5O!P%@AP[4PZX54(P^)7CC)7]$EICAR-STANDARD-ANTIVIRUS-TEST-FILE!$H+H*

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
To configure MSRP traffic scanning:

1. Configure the VoIP profile:

   ```
   config voip profile
   edit msrp_test
   set feature-set flow
   config msrp
   set status enable
   set log-violations enable
   set max-msg-size 0
   set max-msg-size-action pass
   end
   next
   end
   ```

2. Configure the IPS profile:

   ```
   config ips sensor
   edit "msrp"
   set extended-log enable
   config entries
   edit 1
   set rule 7470 29844
   set status enable
   set action block
   next
   end
   next
   end
   ```

3. Configure the firewall policy:

   ```
   config firewall policy
   edit 1
   set name "vdom3"
   set srcintf "vlan843"
   set dstintf "vlan844"
   set action accept
   set srcaddr "all"
   set dstaddr "all"
   set schedule "always"
   set service "ALL"
   set utm-status enable
   set ssl-ssh-profile "certificate-inspection"
   set ips-sensor "msrp"
   set voip-profile "msrp_test"
   set logtraffic all
   next
   end
   ```

4. Verify the log:

   ```
   # execute log filter category 4
   # execute log display
   1 logs found.
   1 logs returned.

   1: date=2021-09-16 time=11:29:48 eventtime=1631816988947762597 tz="-0700"
   ```
ICAP

Internet Content Adaptation Protocol (ICAP) is an application layer protocol that is used to offload tasks from the firewall to separate, specialized servers. For more information see RFC 3507.

ICAP profiles can only be applied to policies that use proxy-based inspection. If you enable ICAP in a policy, HTTP and HTTPS (if HTTPS inspection is supported) traffic that is intercepted by the policy is transferred to the ICAP server specified by the selected ICAP profile. Responses from the ICAP server are returned to the FortiGate, and then forwarded to their destination.

By default, ICAP is not visible in the GUI. See Feature visibility on page 2165 for instructions on making it visible.

ICAP filter profiles cannot be used in NGFW policy-based mode. See NGFW policy on page 773 for more information.

To configure ICAP:

1. Set up your ICAP server.
2. On the FortiGate, add an ICAP server.
3. Create an ICAP profile.
4. Use the ICAP profile in a firewall policy that covers the traffic that needs to be offloaded to the ICAP server.

The following topics provide information about ICAP:

- ICAP configuration example on page 1285
- ICAP response filtering on page 1287
- Secure ICAP clients on page 1289
- ICAP scanning with SCP and FTP on page 1290

TCP connection pool for connections to ICAP server

A TCP connection pool can maintain local-out TCP connections to the external ICAP server due to a backend update in FortiOS. TCP connections will not be terminated once data has been exchanged with the ICAP server, but instead are reused in the next ICAP session to maximize efficiency.
For example, consider a scenario where an ICAP profile is used as a UTM profile in an explicit web proxy policy, and a client visits web servers through this proxy policy.

Once the WAD is initialized, when a HTTP request is sent from the client to the server through the FortiGate with an ICAP profile applied to the matched proxy policy, a TCP connection is established between the FortiGate and the ICAP server to exchange data.

When an ICAP session is finished, the TCP connection is kept in the WAD connection pool. When another ICAP session needs to be established, the WAD will check if there are any idle connections available in the connection pool. If an idle connection is available, then it will be reused; otherwise, a new TCP connection is established for the ICAP session. This process can be checked in the WAD debug log.

ICAP configuration example

In this example, the ICAP server performs proprietary content filtering on HTTP and HTTPS requests. If the content filter is unable to process a request, then the request is blocked. Streaming media is not considered by the filter, so it is allowed through and is not processed.

To configure the ICAP setup in the GUI:

1. Add the ICAP server:
   a. Go to Security Profiles > ICAP Servers and click Create New.
   b. In the Name field, enter a name for the ICAP server, such as content-filtration-server4.
   c. Select the IP Version.
   d. In the IP Address field, enter the IP address of the ICAP server.
   e. In the Port field, enter a new port number if required. The default value is 1344.
   f. Click OK.

The maximum number of concurrent connections to ICAP server can be configured in the CLI (set max-connections). The default setting is 100 connections.

2. Create the ICAP profile:
   a. Go to Security Profiles > ICAP and click Create New.
   b. In the Name field, enter a name for the ICAP profile, such as Prop-Content-Filtration.
   c. Enable Request Processing and set the following:
      • Server: select the ICAP server (content-filtration-server4).
      • Path: enter the path to the processing component on the server, such as /proprietary_code/content-filter/.
      • On Failure: select Error to block the request. If the message cannot be processed, it will not be blocked.
   d. Enable Response Processing and set the following:
      • Server: select the ICAP server (content-filtration-server4).
      • Path: enter the path to the processing component on the server, such as /proprietary_code/content-filter/.
      • On Failure: select Error to block the request. If the message cannot be processed, it will not be blocked.
Security Profiles

e. Enable *Streaming Media Bypass* to not offload streaming media to the ICAP server.

![ICAP Profile Interface](image)

f. Click OK.

3. Add the ICAP profile to a policy:
   a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
   b. Set *Inspection Mode* to *Proxy-based*.
   c. Under *Security Profiles*, enable ICAP and select the ICAP server.

![Firewall Policy Interface](image)

d. Configure the other settings as needed.

e. Click OK.

To configure the ICAP setup in the CLI:

1. Add the ICAP server:

```bash
config icap server
  edit "content-filtration-server4"
    set ip-version 4
    set ip-address 172.16.100.55
    set port 1344
    set max-connections 200
  next
end
```

2. Create the ICAP profile:

```bash
config icap profile
  edit "Prop-Content-Filtration"
    set request enable
    set response enable
    set streaming-content-bypass enable
    set request-server "content-filtration-server4"
    set response-server "content-filtration-server4"
```
ICAP response filtering

ICAP HTTP responses can be forwarded or bypassed based on the HTTP header value and status code.

When configuring the ICAP profile, if response is enabled, the `respmod-default-action` option can be configured:

- If `respmod-default-action` is set to forward, FortiGate will treat every HTTP response and send ICAP requests to the ICAP server.
- If `respmod-default-action` is set to bypass, FortiGate will only send ICAP requests if the HTTP response matches the defined rules, and the rule's action is set to forward.

When configuring a response rule:

- The `http-resp-status-code` option is configured to specific HTTP response codes. If the HTTP response has any one of the configured values, then the rule takes effect.
- Multiple header value matching groups can be configured. If the header value matches one of the groups, then the rule takes effect.
- If both status codes and header values are specified in a rule, the response must match at least one of each.

The UTM ICAP log category is used for logging actions when FortiGate encounters errors with the ICAP server, such as no service, unreachable, error response code, or timeout. If an error occurs, a traffic log and an associated UTM ICAP log will be created.
Example

The FortiGate acts as a gateway for the client PC and connects to a reachable ICAP server. The ICAP server can be in NAT, transparent, or proxy mode.

In this example, client request HTTP responses will be forwarded to the ICAP server from all hosts if they have an HTTP status code of 200, 301, or 302, and have `content-type: image/jpeg` in their header.

To configure an ICAP profile with HTTP response rules:

```plaintext
config icap profile
  edit "icap_profile2"
    set request disable
    set response enable
    set streaming-content-bypass disable
    set preview disable
    set response-server "icap_server1"
    set response-failure error
    set response-path ''
    set methods delete get head options post put trace other
    set response-req-hdr disable
    set respmod-default-action bypass
  config respmod-forward-rules
    edit "rule2"
      set host "all"
      set action forward
      set http-resp-status-code 200 301 302
  config header-group
    edit 2
      set header-name "content-type"
      set header "image/jpeg"
    next
  next
next
end
```
To view the logs if an error occurs:

1. View the traffic log:
   
   ```
   # execute log filter category 0
   # execute log display
   1 logs found.
   1 logs returned.
   ```
   
   ```
   1: date=2019-10-25 time=17:43:47 logid="0000000013" type="traffic" subtype="forward"
   level="notice" vd="vdom1" eventtime=1572050627037314464 tz="-0700" srcip=10.1.100.145
   srcport=47968 srctintf="port1" srctintfrole="undefined" dstip=172.16.200.46 dstport=80
   dstintf="port2" dstintfrole="undefined" poluid="a4d5324e-f6c3-51e9-ce2d-f360994fb547"
   sessionid=43549 proto=6 action="close" policyid=1 policytype="policy" service="HTTP"
   dstcountry="Reserved" srccountry="Reserved" trandisp="snat" transip=172.16.200.1
   transport=47968 duration=1 sentbyte=485 rcvdbyte=398 sentpkt=6 rcvdpkt=5
   appcat="unscanned" wanin=478 wanout=165 lanin=165 lanout=165 utmaacton="block"
   counticap=1 crscore=5 craction=262144 crlevel="low" utmref=65532-0
   ```

2. View the UTM ICAP log:
   
   ```
   # execute log filter category 20
   # execute log display
   1 logs found.
   1 logs returned.
   ```
   
   ```
   1: date=2019-10-25 time=17:43:46 logid="2000060000" type="utm" subtype="icap"
   eventtype="icap" level="warning" vd="vdom1" eventtime=1572050626010097145 tz="-0700"
   msg="Request blocked due to ICAP server error" service="HTTP" srcip=10.1.100.145
   dstip=172.16.200.46 srcport=47968 dstport=80 srcintf="port1" srcintfrole="undefined"
   dstintf="port2" dstintfrole="undefined" policyid=1 sessionid=43549 proto=6
   action="blocked" profile="icap_profile1" url="/icap_test/"
   ```
   
   The logs show that the ICAP services stopped before the access. When the client tried to access HTTP and ICAP took effect, the FortiGate sent the ICAP request to the ICAP server and received an error. The client sees a 502 Bad Gateway message, and FortiGate writes the two logs. In the GUI, the logged traffic is displayed as Result: Deny: UTM Blocked.

Secure ICAP clients

A secure SSL connection from the FortiGate to the ICAP server can be configured as follows:

```
config icap server
  edit <name>
    set secure {enable | disable}
    set ssl-cert <certificate>
  next
end
```

To configure a secure ICAP client:

1. Configure the ICAP server:

   ```
   config icap server
   edit "icap_server1"
   set ip-version 4
   set ip-address 192.168.10.2
   ```
Security Profiles

```
set port 11344
set max-connections 100
set secure enable
set ssl-cert "ACCVRAIZ1"
next
end
```

Port 11344 is the standard port for secure ICAP. This must be configured manually if the secure connection is enabled.

2. Configure the ICAP profile:

```
config icap profile
  edit "icap_profile1"
    set request enable
    set response enable
    set streaming-content-bypass enable
    set request-server "icap_server1"
    set response-server "icap_server1"
next
end
```

3. Configure the firewall policy:

```
config firewall policy
  edit 1
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "protocols"
    set icap-profile "icap_profile1"
next
end
```

ICAP scanning with SCP and FTP

A FortiGate can forward files transferred by SCP and FTP to an ICAP server for further scanning. Previously, only HTTP and HTTPS were supported for ICAP forwarding.

Example

The FortiGate used in this example is operating in transparent mode. The SSH client, 172.16.200.11, sends a file named `today` to the SSH server at 172.16.200.33 using SCP. Since SCP transfers are encrypted inside an SSH tunnel, for the FortiGate to scan the traffic, deep inspection must be enabled in the SSL SSH profile.
To configure ICAP scanning with SCP:

1. Configure the ICAP server settings:

   ```
   config icap server
   edit "icap_server1"
   set ip-address 172.16.200.44
   next
   end
   ```

2. Configure the ICAP profile for SSH:

   ```
   config icap profile
   edit "icap_profile1"
   set file-transfer ssh
   set file-transfer-server "icap_server1"
   set file-transfer-path "ssh_test"
   next
   end
   ```

   If the file transfer is over FTP, configure the profile as follows:

   ```
   config icap profile
   edit "icap_profile1"
   set file-transfer ftp
   set streaming-content-bypass enable
   set file-transfer-server "icap_server1"
   set file-transfer-path "ftp_test"
   next
   end
   ```

3. Configure the SSL SSH profile:
4. Configure the firewall policy:

```fortigate
config firewall policy
edit 1
   set name "ICAP"
   set srcintf "lan"
   set dstintf "mgmt"
   set action accept
   set srcaddr "all"
   set dstaddr "all"
   set schedule "always"
   set service "ALL"
   set utm-status enable
   set inspection-mode proxy
   set profile-protocol-options "protocol"
   set ssl-ssh-profile "protocols"
   set icap-profile "icap_profile1"
next
end
```

To test the configuration:

1. On a Linux client, copy a file named `today` to the SSH server using SCP:

   ```bash
   scp today fosqa@172.16.200.33:/home/fosqa/ssh_depot/
   ```

2. Capture a sniffer trace between the FortiGate and ICAP server, then verify the output from the ICAP protocol session.

   a. The client request and the file to be inspected:

   ```plaintext
   Icap_client REQMOD:
   172.0.16.200.200.13185-172.0.16.200.044.01344: REQMOD icap://172.16.200.44:1344/ssh_test ICAP/1.0
   Host: 172.16.200.44:1344
   X-Client-IP: 172.16.200.11
   X-Server-IP: 172.16.200.33
   X-Authenticated-User: TG9jYWw6Ly9hbhm9ueW1vdXM=
   X-Authenticated-Groups: TG9jYWw6Ly9sb2NhbGljYXRpb24=
   User-Agent: FortiOS v7.2.0
   Encapsulated: req-hdr=0, req-body=116

   PUT /scp/today HTTP/1.1
   Host: 172.16.200.11
   Content-Type: application/octet-stream
   Transfer-Encoding: chunked

   ad
   Tue Sep 20 04:01:50 UTC 2022
   ```
Where:

- X-Client-IP = the client sending the file
- X-Server-IP = the server receiving the file
- Tue Sep 20 04:01:50 UTC 2022 = the content of the file, which is in clear text after the FortiGate performs deep inspection

b. The ICAP server response that the file is cleared and allowed to pass without modifications:

```
Icap-server reply:
172.0.16.200.0.0.0.0.1344-172.0.16.200.0.0.0.13185: ICAP/1.0 200 OK
ISTag: "GreasySpoon-1.0.7-b03"
Host: 0.0.0.0.0:1344
Encapsulated: req-hdr=0, req-body=136
Connection: keep-alive

PUT /scp/today HTTP/1.1
Host: 172.16.200.11
Content-Type: application/octet-stream
Transfer-Encoding: chunked
Content-Length: 29

1d
Tue Sep 20 04:01:50 UTC 2022
```

3. On a Linux client, copy the file from the server locally using SCP:

```
scp fosqa@172.16.200.33:/home/fosqa/ssh_depot/today2/
```

4. Similar outputs are observed. The ICAP client request indicates that the file is copied from the SSH server:

```
PUT /scp/today2 HTTP/1.1
Host: 172.16.200.33
```

### Web application firewall

Web application firewall (WAF) profiles can detect and block known web application attacks. You can configure WAF profiles to use signatures and constraints to examine web traffic. You can also enforce an HTTP method policy, which controls the HTTP method that matches the specified pattern.

You can customize the default profile, or you can create your own profile to apply access rules and HTTP protocol constraints to traffic. You can apply WAF profiles to firewall policies when the inspection mode is set to proxy-based.

Web application firewall profiles cannot be used NGFW policy-based mode. See NGFW policy on page 773 for more information.

The following topic provides information about WAF profiles:

- Protecting a server running web applications on page 1294
Protecting a server running web applications

You can use a web application firewall profile to protect a server that is running a web application, such as webmail. Web application firewall profiles are created with a variety of options called signatures and constraints. Once these options are enabled, the action can be set to allow, monitor, or block. The severity can be set to high, medium, or low.

In the following example, the default profile will be targeted to block SQL injection attempts and generic attacks.

The web application firewall feature is only available when the policy inspection mode is proxy-based.

To protect a server running web applications:

1. Enable the web application firewall:
   a. Go to System > Feature Visibility.
   c. Click Apply.
2. Edit the default web application firewall profile (Trojans and Known Exploits are blocked by default):
   a. Go to Security Profiles > Web Application Firewall and edit the default profile signature.
   b. Select SQL Injection (Extended) and edit it so that it is enabled, the Action is set to Block, and the Severity is set to High.
   c. Click OK.
   d. Enable Generic Attacks (Extended) and edit it so that it is enabled, the Action is set to Block, and the Severity is set to High.
e. Click OK.

f. Click OK.

3. Apply the profile to a security policy:
   a. Go to Policy & Objects > Firewall Policy and edit the policy that allows access to the web server.
   b. For Firewall / Network Options, select the appropriate Protocol Option.
   c. For Security Profiles, enable Web Application Firewall and set it to use the default profile.
   d. Set the SSL Inspection to use the deep-inspection profile.
   e. Configure the other settings as needed.
   f. Click OK.

4. Verify that the web application firewall blocks traffic:
   a. Use the following URL to simulate an attack on your web server and substitute the IP address of your server:
      \[ http://<server IP>/index.php?username=1'\%20or\'1'\%20=%20\'1\&password=1'\%20or\'1'\%20=%20\'1\]
      An error message appears, stating that the web application firewall has blocked the traffic:

      **Offloading to a FortiWeb**

      If you have a FortiWeb, you may be able to offload the functions of the web application control to your FortiWeb. To find out if this option is available, refer to the FortiOS or FortiWeb Release Notes for information about device compatibility.

      **To offload to a FortiWeb:**

      2. Click Create New, and click Fabric Device.
3. Enter the following for the device:
   a. Name (FortiWeb)
   b. FortiWeb IP address
   c. HTTPS service port
4. Click Generate.
5. Enter your credentials to generate the access token.
6. Click OK.

SSL & SSH Inspection

Secure Sockets Layer (SSL) content scanning and inspection allows you to apply antivirus scanning, web filtering, and email filtering to encrypted traffic. You can apply SSL inspection profiles to firewall policies.

FortiOS includes four preloaded SSL/SSH inspection profiles, three of which are read-only and can be cloned:

- certificate-inspection
- deep-inspection
- no-inspection

The custom-deep-inspection profile can be edited, or you can create your own SSL/SSH inspection profiles.

Deep inspection (also known as SSL/SSH inspection) is typically applied to outbound policies where destinations are unknown. Depending on your policy requirements, you can configure the following:

- Which CA certificate will be used to decrypt the SSL encrypted traffic
- Which SSL protocols will be inspected
- Which ports will be associated with which SSL protocols for inspection
- Whether or not to allow invalid SSL certificates
- Whether or not SSH traffic will be inspected
- Which addresses or web category allowlists can bypass SSL inspection

The following topics provide information about SSL & SSH Inspection:

- Certificate inspection on page 1296
- Deep inspection on page 1298
- Protecting an SSL server on page 1301
- Handling SSL offloaded traffic from an external decryption device on page 1302
- SSH traffic file scanning on page 1304
- Redirect to WAD after handshake completion on page 1305
- HTTP/2 support in proxy mode SSL inspection on page 1306
- Define multiple certificates in an SSL profile in replace mode on page 1307
- Disabling the FortiGuard IP address rating on page 1309

Certificate inspection

FortiGate supports certificate inspection. The default configuration has a built-in certificate-inspection profile which you can use directly. When you use certificate inspection, the FortiGate only inspects the headers up to the SSL/TLS layer.
If you do not want to deep scan for privacy reasons but you want to control web site access, you can use certificate-inspection.

### SSL inspection options

The following options are available when configuring an SSL inspection profile (Security Profiles > SSL/SSH Inspection):

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Enable SSL inspection of</strong></td>
<td>Select <em>Multiple Clients Connecting to Multiple Servers</em>. This is normally used when inspecting outbound internet traffic.</td>
</tr>
<tr>
<td><strong>Inspection method</strong></td>
<td>Select <em>SSL Certificate Inspection</em>.</td>
</tr>
<tr>
<td><strong>CA certificate</strong></td>
<td>Use the default Fortinet_CA_SSL certificate.</td>
</tr>
<tr>
<td><strong>Blocked certificates</strong></td>
<td>The FortiGate receives botnet C&amp;C SSL connections from FortiGuard that contain SHA1 fingerprints of malicious certificates. By default, these certificates are blocked. Click View Blocked Certificates to see a detailed list.</td>
</tr>
<tr>
<td><strong>Untrusted SSL certificates</strong></td>
<td>Configure the action to take when a server certificate is not issued by a trusted CA.</td>
</tr>
<tr>
<td><strong>Server certificate SNI check</strong></td>
<td>Check the SNI in the hello message with the CN or SAN field in the returned server certificate.</td>
</tr>
</tbody>
</table>

#### Inspect non-standard HTTPS ports

The built-in certificate-inspection profile is read-only and only listens on port 443. If you want to make changes, you must create a new certificate inspection profile.

If you know the non-standard port that the web server uses, such as port 8443, you can add this port to the HTTPS field.

**To add a port to the inspection profile in the GUI:**

1. Go to Security Profiles > SSL/SSH Inspection.
2. Create a new profile, or clone the default profile.
3. If you do not know what port is used in the HTTPS web server, under Protocol Port Mapping, enable Inspect All Ports.

If you know the port, such as port 8443, then set HTTPS to 443,8443.
4. Configure the remaining setting as needed.
5. Click OK.

**Common options**

Invalid SSL certificates can be blocked, allowed, or a different actions can be configured for the different invalid certificates types:

<table>
<thead>
<tr>
<th>Invalid certificates</th>
<th>Action to take when the server certificate is expired. The default action is block.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expired certificates</td>
<td>Action to take when the server certificate is expired. The default action is block.</td>
</tr>
<tr>
<td>Revoked certificates</td>
<td>Action to take when the server certificate is revoked. The default action is block.</td>
</tr>
<tr>
<td>Validation timed-out certificates</td>
<td>Action to take when the server certificate validation times out. The default action is allow.</td>
</tr>
<tr>
<td>Validation failed certificates</td>
<td>Action to take when the server certificate validation fails. The default action is block.</td>
</tr>
</tbody>
</table>

By default, SSL anomalies logging is enabled. Logs are generated in the UTM log type under the SSL subtype when invalid certificates are detected.

**Deep inspection**

You can configure address and web category allowlists to bypass SSL deep inspection.

**Reasons for using deep inspection**

While Hypertext Transfer Protocol Secure (HTTPS) offers protection on the Internet by applying Secure Sockets Layer (SSL) encryption to web traffic, encrypted traffic can be used to get around your network's normal defenses.
For example, you might download a file containing a virus during an e-commerce session, or you might receive a phishing email containing a seemingly harmless download that, when launched, creates an encrypted session to a command and control (C&C) server and downloads malware onto your computer. Because the sessions in these attacks are encrypted, they might get past your network’s security measures.

When you use deep inspection, the FortiGate impersonates the recipient of the originating SSL session, then decrypts and inspects the content to find threats and block them. It then re-encrypts the content and sends it to the real recipient.

Deep inspection not only protects you from attacks that use HTTPS, it also protects you from other commonly-used SSL-encrypted protocols such as SMTPS, POP3S, IMAPS, and FTPS.

**Browser messages when using deep inspection**

When the FortiGate re-encrypts the content, it uses a stored certificate, such as *Fortinet_CA_SSL*, *Fortinet_CA_Untrusted*, or your own CA certificate that you uploaded.

Because there is no *Fortinet_CA_SSL* in the browser trusted CA list, the browser displays an untrusted certificate warning when it receives a FortiGate re-signed server certificate. To stop the warning messages, trust the FortiGate-trusted CA *Fortinet_CA_SSL* and import it into your browser.

If you still get messages about untrusted certificates after importing *Fortinet_CA_SSL* into your browser, it is due to *Fortinet_CA_Untrusted*. Never import the *Fortinet_CA_Untrusted* certificate into your browser.

**To import *Fortinet_CA_SSL* into your browser:**

1. On the FortiGate, go to Security Profiles > SSL/SSH Inspection and edit the deep-inspection profile. The default CA Certificate is *Fortinet_CA_SSL*.
2. Click Download and save the certificate to the management computer.
3. On the client PC, use the Certificate Import Wizard to install the certificate into the Trusted Root Certificate Authorities store.
   If a security warning appears, select Yes to install the certificate.
Exempt web sites from deep inspection

If you do not want to apply deep inspection for privacy or other reasons, you can exempt the session by address, category, or allowlist.

If you know the address of the server you want to exempt, you can exempt that address. You can exempt specific address type including IP address, IP address range, IP subnet, FQDN, wildcard-FQDN, and geography.

If you want to exempt all bank web sites, an easy way is to exempt the Finance and Banking category, which includes all finance and bank web sites identified in FortiGuard. For information about creating and using custom local and remote categories, see Web rating override on page 1320 and Threat feeds on page 2506.

SSL version support

There are two ways to limit which SSL versions deep inspection is applied to.

- In the global attributes:

  ```
  config system global
    set strong-crypto enable
  end
  ```

- In the protocol configuration of a deep inspection profile:

  ```
  config firewall ssl-ssh-profile
    edit <name>
      config {ssl | https | ftps}
        set min-allowed-ssl-version {ssl-3.0 | tls-1.0 | tls-1.1 | tls-1.2 | tls-1.3}
      end
    next
  end
  ```

  Enabling strong-crypto in the global attributes sets the min-allowed-ssl-version to tls-1.1 by default.

When a session is attempted using an SSL version below the minimum allowed version, the session can be blocked (default) or allowed.
To configure the action based on the SSL version used being unsupported:

```
config firewall ssl-ssh-profile
   edit <name>
      config {ssl | https | ftps | imaps | pop3s | smtps | dot}
         set unsupported-ssl-version {allow | block}
   next
end
```

Protecting an SSL server

You typically use the FortiGate Protecting SSL Server profile as an inbound policy for clients on the internet that access the server through the internal side of the FortiGate.

Protecting SSL Server uses a server certificate to protect a single server.

You can use Protecting SSL Server if you do not want a client on the internet to directly access your internal server, and you want the FortiGate to simulate your real server.

To upload a server certificate into FortiGate and use that certificate in the SSL/SSH inspection profile:

1. Go to System > Certificates.
2. Select Import > Local Certificate and upload the certificate.
3. Go to Security Profiles > SSL/SSH Inspection and edit or create a new profile.
4. For Enable SSL Inspection of, select Protecting SSL Server.
5. For Server Certificate, click the + and select the local certificate you imported.
6. Click OK.

When you apply the Protecting SSL Server profile in a policy, the FortiGate will send the server certificate to the client as your server does.
Handling SSL offloaded traffic from an external decryption device

In scenarios where the FortiGate is sandwiched between load-balancers and SSL processing is offloaded on the external load-balancers, the FortiGate can perform scanning on the unencrypted traffic by specifying the `ssl-offloaded` option in `firewall profile-protocol-options`. This option is supported in proxy and flow mode (previous versions only supported proxy mode).

If the FortiGate receives an AUTH TLS, PBSZ, or PROT command before receiving plain text traffic from a decrypted device, by default, it will expect encrypted traffic, determine that the traffic belongs to an abnormal protocol, and bypass the traffic.

When the `ssl-offloaded` command is enabled, the AUTH TLS command is ignored, and the traffic is treated as plain text rather than encrypted data. SSL decryption and encryption are performed by the external device.

Sample topology

In this example, the FortiGate is between two FortiADCs and in SSL offload sandwich mode. The FortiGate receives plain text from ADC1 and forwards plain text to ADC2. There is no encrypted traffic passing through the FortiGate.

The client sends HTTPS traffic to ADC1, which then decrypts the traffic and sends HTTP to the FortiGate. The FortiGate forwards HTTP to ADC2, and the ADC2 re-encrypts the traffic to HTTPS.

To configure SSL offloading:

```fortigate
config firewall profile-protocol-options
  edit "default-clone"
    config http
      set ports 80
      unset options
      unset post-lang
      set ssl-offloaded yes
    end
    config ftp
      set ports 21
      set options splice
    end
end
```
Security Profiles

```plaintext
set ssl-offloaded yes
end
config imap
  set ports 143
  set options fragmail
  set ssl-offloaded yes
end
config pop3
  set ports 110
  set options fragmail
  set ssl-offloaded yes
end
config smtp
  set ports 25
  set options fragmail splice
  set ssl-offloaded yes
end

next
end
```

Verifying the packet captures

The ADC1 incoming port capture shows that ADC1 receives HTTPS traffic:

```
<table>
<thead>
<tr>
<th>No.</th>
<th>Time</th>
<th>Source</th>
<th>Destination</th>
<th>Protocol</th>
<th>Length</th>
<th>Info</th>
</tr>
</thead>
<tbody>
<tr>
<td>20</td>
<td>13:10:59</td>
<td>98.1.168.98</td>
<td>172.16.200.97</td>
<td>TCP</td>
<td>1761</td>
<td>3917544053</td>
</tr>
<tr>
<td>21</td>
<td>13:10:59</td>
<td>98.1.168.98</td>
<td>172.16.200.97</td>
<td>TCP</td>
<td>1761</td>
<td>3917544053</td>
</tr>
<tr>
<td>22</td>
<td>13:10:59</td>
<td>98.1.168.98</td>
<td>172.16.200.97</td>
<td>TCP</td>
<td>1761</td>
<td>3917544053</td>
</tr>
<tr>
<td>23</td>
<td>13:10:59</td>
<td>98.1.168.98</td>
<td>172.16.200.97</td>
<td>TCP</td>
<td>1761</td>
<td>3917544053</td>
</tr>
<tr>
<td>24</td>
<td>13:10:59</td>
<td>98.1.168.98</td>
<td>172.16.200.97</td>
<td>TCP</td>
<td>1761</td>
<td>3917544053</td>
</tr>
</tbody>
</table>
```

The ADC1 outgoing port capture shows that ADC1 decrypts traffic and forwards HTTP traffic to the FortiGate:

```
<table>
<thead>
<tr>
<th>No.</th>
<th>Time</th>
<th>Source</th>
<th>Destination</th>
<th>Protocol</th>
<th>Length</th>
<th>Info</th>
</tr>
</thead>
<tbody>
<tr>
<td>20</td>
<td>13:10:59</td>
<td>98.1.168.98</td>
<td>172.16.200.97</td>
<td>TCP</td>
<td>1761</td>
<td>3917544053</td>
</tr>
<tr>
<td>21</td>
<td>13:10:59</td>
<td>98.1.168.98</td>
<td>172.16.200.97</td>
<td>TCP</td>
<td>1761</td>
<td>3917544053</td>
</tr>
<tr>
<td>22</td>
<td>13:10:59</td>
<td>98.1.168.98</td>
<td>172.16.200.97</td>
<td>TCP</td>
<td>1761</td>
<td>3917544053</td>
</tr>
<tr>
<td>23</td>
<td>13:10:59</td>
<td>98.1.168.98</td>
<td>172.16.200.97</td>
<td>TCP</td>
<td>1761</td>
<td>3917544053</td>
</tr>
<tr>
<td>24</td>
<td>13:10:59</td>
<td>98.1.168.98</td>
<td>172.16.200.97</td>
<td>TCP</td>
<td>1761</td>
<td>3917544053</td>
</tr>
</tbody>
</table>
```

The FortiGate’s incoming and outgoing port captures show that HTTP traffic passes through the FortiGate:

```
<table>
<thead>
<tr>
<th>No.</th>
<th>Time</th>
<th>Source</th>
<th>Destination</th>
<th>Protocol</th>
<th>Length</th>
<th>Info</th>
</tr>
</thead>
<tbody>
<tr>
<td>20</td>
<td>13:10:59</td>
<td>98.1.168.98</td>
<td>172.16.200.97</td>
<td>TCP</td>
<td>1761</td>
<td>3917544053</td>
</tr>
<tr>
<td>21</td>
<td>13:10:59</td>
<td>98.1.168.98</td>
<td>172.16.200.97</td>
<td>TCP</td>
<td>1761</td>
<td>3917544053</td>
</tr>
<tr>
<td>22</td>
<td>13:10:59</td>
<td>98.1.168.98</td>
<td>172.16.200.97</td>
<td>TCP</td>
<td>1761</td>
<td>3917544053</td>
</tr>
<tr>
<td>23</td>
<td>13:10:59</td>
<td>98.1.168.98</td>
<td>172.16.200.97</td>
<td>TCP</td>
<td>1761</td>
<td>3917544053</td>
</tr>
<tr>
<td>24</td>
<td>13:10:59</td>
<td>98.1.168.98</td>
<td>172.16.200.97</td>
<td>TCP</td>
<td>1761</td>
<td>3917544053</td>
</tr>
</tbody>
</table>
```

The ADC2 incoming port capture shows that the ADC2 receives HTTP traffic:
Security Profiles

The ADC2 outgoing port capture shows that ADC2 forwards HTTPS traffic to the server:

```
SSH traffic file scanning

FortiGates can buffer, scan, log, or block files sent over SSH traffic (SCP and SFTP) depending on the file size, type, or contents (such as viruses or sensitive content).

This feature is supported in proxy-based inspection mode. It is currently not supported in flow-based inspection mode.

You can configure the following SSH traffic settings in the CLI:

- Protocol options
- DLP profile
- Antivirus (profile and quarantine options)

To configure SSH protocol options:

```
config firewall profile-protocol-options
edit <name>
  config ssh
    set options {oversize clientcomfort servercomfort}
    set comfort-interval <1 - 900>
    set comfort-amount <1 - 65535>
    set oversize-limit <1 - 798>
    set uncompressed-oversize-limit <0 - 798>
    set uncompressed-nest-limit <2 - 100>
    set scan-bzip2 {enable | disable}
  next
end
```

To configure SCP block and log options:

```
config ssh-filter profile
edit <name>
  set block scp
```
set log scp
next
end

To configure the DLP profile:

```plaintext
config dlp profile
edit <name>
  set full-archive-proto ssh
  set summary-proto ssh
  config filter
    edit 1
      set proto ssh
    next
next
end
```

To configure the antivirus profile options:

```plaintext
config antivirus profile
edit <name>
  config ssh
    set av-scan {disable | block | monitor}
    set outbreak-prevention {disable | block | monitor}
    set external-blocklist {disable | block | monitor}
    set fortindr {disable | block | monitor}
    set quarantine {enable | disable}
    set archive-block {encrypted corrupted partiallycorrupted multipart nested mailbomb timeout unhandled}
    set archive-log {encrypted corrupted partiallycorrupted multipart nested mailbomb timeout unhandled}
    set emulator {enable | disable}
  next
next
end
```

To configure the antivirus quarantine options:

```plaintext
config antivirus quarantine
  set drop-infected ssh
  set store-infected ssh
  set drop-blocked ssh
  set store-blocked ssh
  set drop-machine-learning ssh
  set store-machine-learning ssh
end
```

Redirect to WAD after handshake completion

In a proxy-based policy, the TCP connection is proxied by the FortiGate. A TCP three-way handshake can be established with the client even though the server did not complete the handshake.
Security Profiles

This option uses IPS to handle the initial TCP three-way handshake. It rebuilds the sockets and redirects the session back to proxy only when the handshake with the server is established.

To enable proxy after a TCP handshake in an SSL/SSH profile:

```plaintext
config firewall ssl-ssh-profile
edit "test"
  config https
    set ports 443
    set status certificate-inspection
    set proxy-after-tcp-handshake enable
  end
next
end
```

To enable proxy after a TCP handshake in protocol options:

```plaintext
config firewall profile-protocol-options
edit "test"
  config http
    set ports 80
    set proxy-after-tcp-handshake enable
    unset options
    unset post-lang
  end
next
end
```

HTTP/2 support in proxy mode SSL inspection

Security profiles in proxy mode can perform SSL inspection on HTTP/2 traffic that is secured by TLS 1.2 or 1.3 using the Application-Layer Protocol Negotiation (ALPN) extension.

To set the ALPN support:

```plaintext
config firewall ssl-ssh-profile
edit <profile>
  set supported-alpn {all | http1-1 | http2 | none}
next
end
```

<table>
<thead>
<tr>
<th>ALPN</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>The FortiGate forwards ALPN extensions that use either HTTP/2 or HTTP/1.1. This is the default value.</td>
</tr>
<tr>
<td>http1-1</td>
<td>The FortiGate only forwards ALPN extensions that use HTTP/1.1. If the ALPN extension uses HTTP/2, then the FortiGate strips the ALPN header from the Client Hello.</td>
</tr>
<tr>
<td>http2</td>
<td>The FortiGate only forwards ALPN extensions that use HTTP/2. If the ALPN extension uses HTTP/1.1, then the FortiGate strips the ALPN header from the Client Hello.</td>
</tr>
<tr>
<td>none</td>
<td>The FortiGate always strips the ALPN header from the Client Hello when forwarding.</td>
</tr>
</tbody>
</table>
Security Profiles

For example, if supported-alpn is set to http2, but the extension uses HTTP/1.1, the ALPN header is stripped from the Client Hello:

- **Incoming packet capture:**

```
<table>
<thead>
<tr>
<th>Protocol</th>
<th>Source Port</th>
<th>Destination Port</th>
<th>Protocol Length</th>
<th>ALPN Headers</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP</td>
<td>10.1.2.3</td>
<td>123.4.5.6</td>
<td>2048</td>
<td>http2</td>
</tr>
<tr>
<td>TCP</td>
<td>10.1.2.3</td>
<td>123.4.5.6</td>
<td>2048</td>
<td>http2</td>
</tr>
</tbody>
</table>
```

- **Outgoing packet capture:**

```
<table>
<thead>
<tr>
<th>Protocol</th>
<th>Source Port</th>
<th>Destination Port</th>
<th>Protocol Length</th>
<th>ALPN Headers</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP</td>
<td>10.1.2.3</td>
<td>123.4.5.6</td>
<td>2048</td>
<td>http2</td>
</tr>
<tr>
<td>TCP</td>
<td>10.1.2.3</td>
<td>123.4.5.6</td>
<td>2048</td>
<td>http2</td>
</tr>
</tbody>
</table>
```

Define multiple certificates in an SSL profile in replace mode

Multiple certificates can be defined in an SSL inspection profile in replace mode (Protecting SSL Server). This allows multiple sites to be deployed on the same protected server IP address, and inspection based on matching the SNI in the certificate.

When the FortiGate receives the client and server hello messages, it will compare the server name identification (SNI) and the common name (CN) with the certificate list in the SSL profile, and use the matched certificate as a replacement. If there is no matched server certificate in the list, then the first server certificate in the list is used as a replacement.
To configure an SSL profile in replace mode with multiple certificates:

```
config firewall ssl-ssh-profile
  edit "multi-cert"
    set server-cert-mode replace
    set server-cert "bbb" "aaa"
  next
end
```

To configure a policy that uses the SSL profile:

```
config firewall policy
  edit 1
    set name "multi-cert"
    set srcintf "port6"
    set dstintf "port11"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "multi-cert"
    set av-profile "default"
    set webfilter-profile "default"
    set logtraffic all
    set nat enable
  next
end
```

Results

If the SNI matches the CN in the certificate list in the SSL profile, then the FortiGate uses the matched server certificate. In this example, when the client accesses www.aaa.com, the FortiGate will use the aaa certificate as a replacement.
Security Profiles

If the SNI does not match the CN in the certificate list in the SSL profile, then the FortiGate uses the first server certificate in the list. In this example, when the client accesses www.ccc.com, because there is no certificate for www.ccc.com, the FortiGate will use the bbb certificate as a replacement.

Disabling the FortiGuard IP address rating

The FortiGuard IP address rating for SSL exemptions and proxy addresses can be disabled using the `ssl-exemption-ip-rating` and `address-ip-rating` options.

To disable using the FortiGuard IP address rating for SSL exemptions:

```
config firewall ssl-ssh-profile
  edit <name>
    set ssl-exemption-ip-rating {enable | disable}
  next
end
```
To disable using the FortiGuard IP address rating for proxy addresses:

```plaintext
cfg firewall profile-protocol-options
   edit <name>
       config http
           set address-ip-rating {enable | disable}
   end
next
end
```

The `ssl-exemption-ip-rating` and `address-ip-rating` options are enabled by default, so when both a website domain and its IP address return different categories after being rated by FortiGuard, the IP address category takes precedence when evaluating SSL exemptions associated with the SSL inspection profile and proxy addresses associated with the proxy protocol options profile. SSL exemptions and the `ssl-exemption-ip-rating` option work in both inspection modes (proxy and flow).

When the categories associated with the website domain and IP address are different, disabling the FortiGuard IP rating ensures that the FortiGuard domain category takes precedence when evaluating the preceding objects. For most websites, the domain category is valid when its IP address is unrated by FortiGuard. Since being unrated is considered as not having a category, the FortiGate uses the domain category as the website category.

A website might have an IP category that differs from its domain category. If they are different, the FortiGate uses the rating weight of the IP address or domain name to determine the rating result and decision. The rating weight is hard-coded in the FortiGate and depending on the relative category weights, the FortiGate may use the IP category instead of the website category. If the `ssl-exemption-ip-rating` option is disabled in the SSL inspection profile, then the FortiGate uses the domain category as the website category, which ensures SSL exemption operation as intended.

The `address-ip-rating` option in a proxy protocol options profile functions the same way as the `ssl-exemption-ip-rating` option. If the `address-ip-rating` option is disabled in a profile that is used in an explicit proxy policy that also uses a web filter profile, for HTTP or HTTPS traffic to a website that has different IP and domain categories and that matches the policy, the FortiGate will use the domain category when it evaluates categories for the web filter.

### Custom signatures

You can create the following custom signatures and apply them to firewall policies:

- IPS signature
- Application signature
- Application group

The following topic provides information about custom signatures:

- Application groups in traffic shaping policies on page 1310
- Blocking applications with custom signatures on page 1314
- Filters for application control groups on page 1316

### Application groups in traffic shaping policies

Application groups can be configured in traffic shaping policies. In this example, there are two traffic shaping policies:
• Policy 1 is for traffic related to cloud applications and has high priority.
• Policy 2 is for other traffic and has low priority.

At least one firewall policy must have application control enabled for the applications to match any policy traffic.

To configure a traffic shaping policy to use an application group in the GUI:

1. Configure an application group for cloud applications:
   a. Go to Security Profiles > Application Signatures.
   c. Enter a name for the group, and for Type, select Application.
   d. Click the + to add the group the members.
   e. Click OK.

2. Create the shaping policy for the high priority cloud application traffic:
   b. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>For Cloud Traffic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>All</td>
</tr>
<tr>
<td>Destination</td>
<td>All</td>
</tr>
<tr>
<td>Service</td>
<td>All</td>
</tr>
<tr>
<td>Application</td>
<td>Add the Cloud.IT category and the cloud app group application group.</td>
</tr>
<tr>
<td>Outgoing interface</td>
<td>port1</td>
</tr>
<tr>
<td>Shared shaper</td>
<td>high-priority</td>
</tr>
<tr>
<td>Reverse shaper</td>
<td>high-priority</td>
</tr>
</tbody>
</table>
c. Click OK.

3. Create the shaping policy for the low priority other traffic:
a. Click Create New and enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>For Other Traffic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>All</td>
</tr>
<tr>
<td>Destination</td>
<td>All</td>
</tr>
<tr>
<td>Service</td>
<td>All</td>
</tr>
<tr>
<td>Outgoing interface</td>
<td>port1</td>
</tr>
<tr>
<td>Shared shaper</td>
<td>low-priority</td>
</tr>
<tr>
<td>Reverse shaper</td>
<td>low-priority</td>
</tr>
</tbody>
</table>

b. Click OK.

To configure a traffic shaping policy to use an application group in the CLI:

1. Configure an application group for cloud applications:

   ```
   config application group
   edit "cloud app group"
   set application 27210 36740 35944 43296 33048
   next
   end
   ```

2. Create the shaping policies for the high priority cloud application traffic and low priority other traffic:

   ```
   config firewall shaping-policy
   edit 1
   set name "For Cloud Traffic"
   set service "ALL"
   set app-category 30
   ```
set app-group "cloud app group"
set dstintf "port1"
set traffic-shaper "high-priority"
set traffic-shaper-reverse "high-priority"
set srcaddr "all"
set dstaddr "all"
next
edit 2
  set name "For Other Traffic"
  set service "ALL"
  set dstintf "port1"
  set traffic-shaper "low-priority"
  set traffic-shaper-reverse "low-priority"
  set srcaddr "all"
  set dstaddr "all"
next
end

Blocking applications with custom signatures

Custom signatures can be used in application control profiles to block web traffic from specific applications, such as out of support operating systems.

In this example, a custom signature is created to detect PCs running Windows NT 6.1 operating systems, including Windows 7 and Windows Server 2008 R2. The signature is added to an application control profile and the action is set to block. The profile is then used in a firewall policy so that web traffic matching the signature is blocked. The logs generated by this example can be used to help identify other computers that need to be blocked.

To make the settings visible in the GUI:

1. Go to System > Feature Visibility
2. In the Security Features section, enable Application Control.
3. Click Apply.

To create the custom application signature:

1. Go to Security Profiles > Application Signatures and click Create New > Custom Application Signature.
2. Enter a name for the custom signature, such as block_nt_6.1.
3. Enter the Signature. In this example:

   F-SBID( --attack_id 6483; --name "Windows.NT.6.1.Web.Surfing"; --default_action drop_session; --service HTTP; --protocol tcp; --app_cat 25; --flow from_client; --pattern !"FCT"; --pattern "Windows NT 6.1"; --no_case; --context header; --weight 40; )

This signature scans HTTP and HTTPS traffic that matches the pattern Windows NT 6.1 in its header. For blocking older versions of Windows, such as Windows XP, you would use the pattern Windows NT 5.1. An attack ID is automatically generated when the signature is created.
4. Click OK.

The signature is included in the Custom Application Signature section of the signature list.

To use the signature in an application control profile:

1. Go to Security Profiles > Application Control.
2. Create a new profile, or edit an existing one.
3. In the Application and Filter Overrides table, click Create New.
4. Set Type to Application and Action to Block.
5. Select the custom signature from the list, using the search feature if required, then click Add Selected.

6. Click OK.

The signature is added to the table.

7. Click OK.

To add the application control profile to a firewall policy:

1. Go to Policy & Objects > Firewall Policy.
2. Edit the policy that currently allows a connection from the internal network to the internet.
3. In the Security Profiles section, enable Application Control and select the profile.

   If deep inspection is not enabled, then only HTTP traffic will be scanned. To scan HTTPS traffic, set SSL Inspection
Security Profiles

to a profile that includes deep inspection. See SSL & SSH Inspection on page 1296 for more information.

4. Click OK.

Results

When a PC running one of the affected operating systems tries to connect to the internet using a web browser, a replacement message is shown. For information on customizing replacement messages, see Replacement messages on page 2136.

Go to Log & Report > Security Events to view the web traffic that is logged for the PC that is blocked by the application signature in the Application Control card.

Filters for application control groups

When defining application groups in NGFW policy or profile mode, the following group filters are available: protocols, risk, vendor, technology, behavior, popularity, and category.
config application group
   edit <name>
      set type filter
      set protocols <integer>
      set risk <integer>
      set vendor <id>
      set technology <id>
      set behavior <id>
      set popularity <integer>
      set category <id>
   next
end

<table>
<thead>
<tr>
<th>protocols &lt;integer&gt;</th>
<th>Application protocol filter (0 - 47, or all).</th>
</tr>
</thead>
<tbody>
<tr>
<td>risk &lt;integer&gt;</td>
<td>Risk or impact of allowing traffic from this application to occur (1 - 5; low (1), elevated (2), medium (3), high (4), and critical (5)).</td>
</tr>
<tr>
<td>vendor &lt;id&gt;</td>
<td>Application vendor filter (0 - 25, or all).</td>
</tr>
<tr>
<td>technology &lt;id&gt;</td>
<td>Application technology filter:</td>
</tr>
<tr>
<td></td>
<td>• all</td>
</tr>
<tr>
<td></td>
<td>• 0 (network-protocol)</td>
</tr>
<tr>
<td></td>
<td>• 1 (browser-based)</td>
</tr>
<tr>
<td></td>
<td>• 2 (client-server)</td>
</tr>
<tr>
<td></td>
<td>• 4 (peer-to-peer)</td>
</tr>
<tr>
<td>behavior &lt;id&gt;</td>
<td>Application behavior filter:</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>• 15 (network service)</td>
</tr>
<tr>
<td></td>
<td>• 17 (update)</td>
</tr>
<tr>
<td></td>
<td>• 21 (email)</td>
</tr>
<tr>
<td></td>
<td>• 22 (storage backup)</td>
</tr>
<tr>
<td></td>
<td>• 23 (social media)</td>
</tr>
<tr>
<td></td>
<td>• 25 (web client)</td>
</tr>
</tbody>
</table>
Sample configurations

In this example, a single filter (risk level 1) is configured in the application group in NGFW policy mode, so only signatures matching this filter will match the security policy.

To configure the application group:

```plaintext
config application group
  edit "risk_1"
    set type filter
    set risk 1
  next
end
```

To configure the security policy:

```plaintext
config firewall security-policy
  edit 1
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set status enable
    set schedule "always"
    set enforce-default-app-port disable
    set service "ALL"
    set app-group risk_1
    set logtraffic all
  next
end
```

In this example, the application group is configured so that only signatures matching both filters, category 5 (video/audio) and technology 1 (browser-based), will match the security policy. The application group can also be configured in a traffic shaping policy.

To configure the application group:

```plaintext
config application group
  edit "two"
    set type filter
    set category 5
    set technology 1
  next
end
```
To configure the security policy:

```plaintext
config firewall security-policy
edit 1
  set srcintf "port2"
  set dstintf "port1"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set status enable
  set schedule "always"
  set enforce-default-app-port disable
  set service "ALL"
  set app-group two
  set logtraffic all
next
end
```

To configure the traffic shaping policy:

```plaintext
config firewall shaping-policy
edit 1
  set ip-version 4
  set service "ALL"
  set app-group two
  set dstintf port1
  set traffic-shaper "max-100"
  set traffic-shaper-reverse "max-100"
  set srcaddr "all"
  set dstaddr "all"
next
end
```

Overrides

Web filter configuration can be separated into profile configuration and profile overrides.

You can also override web filter behavior based on the FortiGuard website categorization:

- Use alternate categories (web rating overrides): this method manually assigns a specific website to a different Fortinet category or a locally-created category.
- Use alternate profiles: configured users or IP addresses can use an alternative web filter profile when attempting to access blocked websites.

Some features of this functionality require a subscription to FortiGuard Web Filtering.

The following topics provide information about web overrides:

- Web rating override on page 1320
- Web profile override on page 1325
Web rating override

Web rating overrides allow you to add specific URLs to both FortiGuard and custom web ratings categories.

In a web filter profile, the action for each category can be configured. See FortiGuard filter on page 1130 for details. A web rating override in a custom category will not impact any web filters until the category's action is changed to Allow, Monitor (default), Block, Warning, or Authenticate in the specific web filter profile's settings. If a URL is in multiple enabled categories, the order of precedence is local categories, then remote categories, and then FortiGuard categories.

In SSL/SSH inspection profiles, custom categories must be explicitly selected to be exempt from SSL inspection. In proxy addresses, custom categories must be explicitly selected as URL categories for them to apply. In both settings, if a URL is in multiple selected categories, the order of precedence is local categories, then remote categories, and then FortiGuard categories.

Web rating override requires a FortiGuard license.

Web filter profiles

In this example, www.fortinet.com is added to both a custom, or local, category (Seriously) and an external threat feed, or remote, category (OnAworkComputer). The local category action is set to Monitor, while the remote category action is set to Block. When a user browses to www.fortinet.com, the local category action takes precedence over both the remote category and the FortiGuard category (Information Technology), so the Monitor action is taken.

To create a custom category in the GUI:

2. Click Custom Categories, then click Create New.
3. Enter a name for the category, and ensure the Status is set to Enable.
4. Click OK.

To create a web rating override in the GUI:

1. Go to Security Profiles > Web Rating Overrides and click Create New.
2. Enter the URL to override.
3. Optionally, click Lookup rating to see what its current rating is, if it has one.
4. For Category, select Custom Categories and for Sub-Category select the category previously created.

![Security Profiles](image1)

5. Click OK.

To create a new FortiGuard category threat feed in the GUI:

1. Go to Security Fabric > External Connectors and click Create New.
2. In the Threat Feeds section, click FortiGuard Category.
3. Enter a name for the threat feed, such as OnAworkComputer.
4. Enter the URI of external resource.

![Security Profiles](image2)

5. Configure the remaining settings as needed, then click OK.

To use the new categories in a web filter profile in the GUI:

1. Go to Security Profiles > Web Filter and create or edit a web filter profile. See FortiGuard filter on page 1130 for more information.
2. Enable FortiGuard category based filter
3. Set the action for the Seriously category in the Local Categories group to Monitor.
4. Set the action for the OnAworkComputer category in the Remote Categories group to Block.
Setting the custom category action to *Allow* is equivalent to setting the CLI action variable to *monitor* and log variable to *disable*.

5. Configure the remaining settings are required, then click *OK*.

**To use local and remote categories in a web filter profile in the CLI:**

1. Create the custom category and add a URL to it:

   ```
   config vdom
e   edit root
   config webfilter ftgd-local-cat
   edit "Seriously"
   set id 140
   next
   end
cfg webfilter ftgd-local-rating
   edit "www.fortinet.com"
   set rating 140
   next
   end
   end
   ```

2. Create a *FortiGuard Category Threat Feed* external connector to import an external blocklist.

   ```
   config global
   config system external-resource
   edit "OnAworkComputer"
   set category 192
   set resource "https://192.168.0.5/lists/blocklist.txt"
   next
   ```
3. Enable the new category in a web filter profile. See FortiGuard filter on page 1130 for details.
Custom local categories have an ID range of 140 to 191. Remote categories have an ID range of 192 to 221.

```
cfg vdom
    edit root
        config webfilter profile
            edit "WebFilter-1"
                set feature-set proxy
                config ftgd-wf
                    unset options
                config filters
                    edit 12
                        set category 12
                        set action warning
                        next
                    ...
                    edit 23
                        set action warning
                        next
                    edit 140
                        set category 140
                        next
                    edit 192
                        set category 192
                        set action block
                        next
                end
            end
        end
    end
end
```

When a filter is added for the local and remote categories (140 and 192 in this example), the default action is monitor with logging enabled.

**SSL/SSH inspection profiles**

To use local and remote categories in an SSL/SSH inspection profile to exempt them from SSL inspection in the GUI:

1. Go to Security Profiles > SSL/SSH Inspection.
2. Create a new profile or edit an existing one.
3. Ensure that Inspection method is Full SSL Inspection.
4. In the *Exempt from SSL Inspection* section, add the local and remote categories to the *Web categories* list.

![Exempt from SSL Inspection section of Security Profiles](image)

5. Configure the remaining settings as required, then click OK.

**To use local and remote categories in an SSL/SSH inspection profile to exempt them from SSL inspection in the CLI:**

```plaintext
config vdom
   edit root
      config firewall ssl-ssh-profile
         edit "SSL_Inspection"
            config https
               set ports 443
               set status deep-inspection
            end
            ...
         config ssl-exempt
            edit 1
               set fortiguard-category 140
            next
            edit 2
               set fortiguard-category 192
            next
      end
   end
```

**Proxy addresses**

**To use local and remote categories in a proxy address in the GUI:**

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*, or edit an existing proxy address.
2. Set *Category* to *Proxy Address*.
3. Set *Type* to *URL Category*. 
4. In the *URL Category*, add the local and remote categories.

![Image of the FortiGate proxy address configuration interface]

5. Configure the remaining settings as required, then click **OK**.

To use local and remote categories in a proxy address in the CLI:

```bash
config vdom
  edit root
    config firewall proxy-address
      edit "proxy_override"
        set type category
        set host "all"
        set category 140 192
        set color 23
      next
    end
  next
end
```

**Web profile override**

The following profile override methods are available:

- Administrative override
- Allow users to override blocked categories

**Administrative override**

Administrators can grant temporary access to sites that are otherwise blocked by a web filter profile. You can grant temporary access to a user, user group, or source IP address. You can set the time limit by selecting a date and time. The default is 15 minutes.

When the administrative web profile override is enabled, a blocked access page or replacement message does not appear, and authentication is not required.
Scope range

You can choose one of the following scope ranges:

- **User**: authentication for permission to override is based on whether or not the user is using a specific user account.
- **User group**: authentication for permission to override is based on whether or not the user account supplied as a credential is a member of the specified user group.
- **Source IP**: authentication for permission to override is based on the IP address of the computer that was used to authenticate. This would be used for computers that have multiple users. For example, if a user logs on to the computer, engages the override by using their credentials, and then logs off, anyone who logs on with an account on that computer would be using the alternate override web filter profile.

When you enter an IP address in the administrative override method, only individual IP addresses are allowed.

Differences between IP and identity-based scope

Using the IP scope does not require using an identity-based policy.

When using the administrative override method and IP scope, you might not see a warning message when you change from using the original web filter profile to using the alternate profile. There is no requirement for credentials from the user so, if allowed, the page will just appear in the browser.

Configuring a web profile administrative override

This example describes how to override the `webfilter` profile with the `webfilter_new` profile.

**To configure web profile administrative override using the GUI:**

1. Go to **Security Profiles > Web Profile Overrides** and click **Create New**.
2. Configure the administrative override:
   a. For **Scope Range**, click **Source IP**.
   b. In the **Source IP** field, enter the IP address for the client computer (10.1.100.11 in this example).
   c. In the **Original profile** dropdown, select **webfilter**.
   d. In the **New profile** dropdown, select **webfilter_new**.
      In the **Expires** field, the default 15 minutes appears, which is the desired duration for this example.
3. Click **OK**.
To configure web profile administrative override using the CLI:

```
config webfilter override
   edit 1
     set status enable
     set scope ip
     set old-profile "webfilter"
     set new-profile "webfilter_new"
     set expires 2021/07/30 10:14:00
     set initiator "admin"
     set ip 10.1.100.11
   next
end
```

Allow users to override blocked categories

For both override methods, the scope ranges (for specified users, user groups, or IP addresses) allow sites blocked by web filtering profiles to be overridden for a specified length of time.

But there is a difference between the override methods when the users or user group scope ranges are selected. In both cases, you would need to apply the user or user group as source in the firewall policy. With administrative override, if you do not apply the source in the firewall policy, the traffic will not match the override and will be blocked by the original profile. With the Allow users to override blocked categories setting, the traffic will also be blocked, but instead of displaying a blocking page, the following message appears:

```
FortiGuard Intrusion Prevention - Access Blocked
Web Filter Block Override
If you have been granted creation privileges by your administrator, you can enter your username and password here to gain immediate access to the blocked webpage. If you do not have these privileges, please contact your administrator to gain access to this webpage.
Only user-based overrides are allowed and you do not appear to be authenticated with the system. Please contact your administrator.

When you choose the user group scope, once one user overrides, it will affect the other users in the group when they attempt to override. For example, user1 and user2 both belong to the local_user group. Once user1 successfully overrides, this will generate an override entry for the local_user group instead of one specific user. This means that if user2 logs in from another PC, they can override transparently.
```

Other features

Besides the scope, there are some other features in Allow users to override blocked categories.
Apply to user groups

Individual users can not be selected. You can select one or more of the user groups recognized by the FortiGate. They can be local to the system or from a third party authentication device, such as an AD server through FSSO.

Switch duration

Administrative override sets a specified time frame that is always used for that override. The available options are:

- **Predefined:** the value entered is the set duration (length of time in days, hours, or minutes) that the override will be in effect. If the duration variable is set to 15 minutes, the length of the override will always be 15 minutes. The option will be visible in the override message page, but the setting will be grayed out.
- **Ask:** the user has the option to set the override duration once it is engaged. The user can set the duration in terms of days, hours, or minutes.

Creating a web profile users override

This example describes how to allow users in the local_group to override the webfilter_new profile.

**To allow users to override blocked categories using the GUI:**

2. Enter a name for the profile.
3. Enable Allow users to override blocked categories.
4. Configure the web filter profile:
   a. Click the Groups that can override field, and select a group (local_group in this example).
   b. Click the Profile Name field, and select the webfilter_new profile.
   c. For the Switch applies to field, click IP.
   d. For the Switch Duration field, click Predefined. The default 15 minutes appears, which is the desired duration for this example.
   e. Configure the rest of the profile as needed.

5. Click OK.

Using the ask feature

This option is only available in Allow users to override blocked categories is enabled. It configures the message page to have the user choose which scope they want to use. Normally on the message page, the scope options are grayed out.
and not editable. In the following example, the Scope is predefined with IP.

Web Filter Block Override

If you have been granted override creation privileges by your administrator, you can enter your username and password here to gain immediate access to the blocked web-page. If you do not have these privileges, please contact your administrator to gain access to the web-page.

When the ask option is enabled (through the Switch applies to field in the GUI), the Scope dropdown is editable. Users can choose one of the following:

- User
- User group
- IP

User and User Group are only available when there is a user group in the firewall policy. You must specify a user group as a source in the firewall policy so the scope includes User and User Group; otherwise, only the IP option will be available.
Virtual Private Network (VPN) technology lets remote users connect to private computer networks to gain access to their resources in a secure way. For example, an employee traveling or working at home can use a VPN to securely access the office network through the Internet.

Instead of remotely logging into a private network using an unencrypted and unsecured Internet connection, using a VPN ensures that unauthorized parties cannot access the office network and cannot intercept information going between the employee and the office. Another common use of a VPN is to connect the private networks of multiple offices.

Fortinet offers VPN capabilities in the FortiGate Unified Threat Management (UTM) appliance and in the FortiClient Endpoint Security suite of applications. You can install a FortiGate unit on a private network and install FortiClient software on the user’s computer. You can also use a FortiGate unit to connect to the private network instead of using FortiClient software.

The following sections provide information about VPN:

- IPsec VPNs on page 1330
- SSL VPN on page 1619

**IPsec VPNs**

The following sections provide instructions on configuring IPsec VPN connections in FortiOS 7.2.0.

- General IPsec VPN configuration on page 1330
- Site-to-site VPN on page 1360
- Remote access on page 1413
- Aggregate and redundant VPN on page 1457
- Overlay Controller VPN (OCVPN) on page 1501
- ADVPN on page 1532
- Other VPN topics on page 1566
- VPN IPsec troubleshooting on page 1611

**General IPsec VPN configuration**

The following sections provide instructions on general IPsec VPN configurations:

- Network topologies on page 1331
- Phase 1 configuration on page 1331
- Phase 2 configuration on page 1345
- VPN security policies on page 1349
- Blocking unwanted IKE negotiations and ESP packets with a local-in policy on page 1353
- Configurable IKE port on page 1354
- IPsec VPN IKE port assignments on page 1357
Network topologies

The topology of your network will determine how remote peers and clients connect to the VPN and how VPN traffic is routed.

<table>

</tbody>
</table>

Phase 1 configuration

Phase 1 configuration primarily defines the parameters used in IKE (Internet Key Exchange) negotiation between the ends of the IPsec tunnel. The local end is the FortiGate interface that initiates the IKE negotiations. The remote end is the remote gateway that responds and exchanges messages with the initiator. Hence, they are sometimes referred to as the initiator and responder. The purpose of phase 1 is to secure a tunnel with one bi-directional IKE SA (security association) for negotiating IKE phase 2 parameters.

The auto-negotiate and negotiation-timeout commands control how the IKE negotiation is processed when there is no traffic, and the length of time that the FortiGate waits for negotiations to occur.
IPsec tunnels can be configured in the GUI using the **VPN Creation Wizard**. Go to **VPN > IPsec Wizard**. The wizard includes several templates (site-to-site, hub and spoke, remote access), but a custom tunnel can be configured with the following settings.

The IPsec phase 1 interface type cannot be changed after it is configured. This is due to the tunnel ID parameter (`tun_id`), which is used to match routes to IPsec tunnels to forward traffic. If the IPsec phase 1 interface type needs to be changed, a new interface must be configured.

### Name
- **Phase 1 definition name.**
- The maximum length is 15 characters for an interface mode VPN and 35 characters for a policy-based VPN.
- For a policy-based VPN, the name normally reflects where the remote connection originates. For a route-based tunnel, the FortiGate also uses the name for the virtual IPsec interface that it creates automatically.

</tbody>
</table>
ESP (encapsulating security payload), the protocol for encrypting data in the VPN session, uses IP protocol 50 by default. However, it does not use any port numbers so when traversing a NAT device, the packets cannot be demultiplexed. Enabling NAT traversal encapsulates the ESP packet inside a UDP packet, thereby adding a unique source port to the packet. This allows the NAT device to map the packets to the correct session.

- **Enable**: a NAT device exists between the local FortiGate and the VPN peer or client. Outbound encrypted packets are wrapped inside a UDP IP header that contains a port number. The local FortiGate and the VPN peer or client must have the same NAT traversal setting (both selected or both cleared) to connect reliably. When in doubt, enable NAT traversal.
- **Disable**: disable the NAT traversal setting.
- **Forced**: the FortiGate will use a port value of zero when constructing the NAT discovery hash for the peer. This causes the peer to think it is behind a NAT device, and it will use UDP encapsulation for IPsec, even if no NAT is present. This approach maintains interoperability with any IPsec implementation that supports the NAT-T RFC.

### Keepalive Frequency

Keepalive frequency setting. This option is only available when NAT Traversal is set to Enable or Forced. The NAT device between the VPN peers may remove the session when the VPN connection remains idle for too long.

The value represents an interval in seconds where the connection will be maintained with periodic keepalive packets. The keepalive interval must be smaller than the session lifetime value used by the NAT device.

The keepalive packet is a 138-byte ISAKMP exchange.

### Dead Peer Detection

Reestablishes VPN tunnels on idle connections and cleans up dead IKE peers if required. This feature minimizes the traffic required to check if a VPN peer is available or unavailable (dead). The available options are:

- **Disable**: disable dead peer detection (DPD).
- **On Idle**: triggers DPD when IPsec is idle.
- **On Demand**: Passively sends DPD to reduce load on the firewall. Only triggers DPD when IPsec outbound packets are sent, but no reply is received from the peer. When there is no traffic and the last DPD-ACK has been received, IKE will not send DPDs periodically.

Notifications are received whenever a tunnel goes up or down, or to keep the tunnel connection open when no traffic is being generated inside the tunnel. For example, in scenarios where a dialup client or dynamic DNS peer connects from an IP address that changes periodically, traffic may be suspended while the IP address changes.

When Dead Peer Detection is selected, optionally specify a retry count and a retry interval using `dpd-retrycount` and `dpd-retryinterval`. See Dead peer detection on page 1338.

### Forward Error Correction

Enable on both ends of the tunnel to correct errors in data transmission by sending redundant data across the VPN.
**Device creation**  
Advanced option. When enabled, a dynamic interface (network device) is created for each dialup tunnel.

**Aggregate member**  
Advanced option. When enabled, the tunnel can be used as an aggregate member candidate.

### Authentication

<table>
<thead>
<tr>
<th><strong>Method</strong></th>
<th>Either <em>Pre-shared Key</em> or <em>Signature</em>.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pre-shared Key</strong></td>
<td>The pre-shared key that the FortiGate will use to authenticate itself to the remote peer or dialup client during phase 1 negotiations. The same key must be defined at the remote peer or client. See <a href="#">Pre-shared key</a>.</td>
</tr>
<tr>
<td><strong>Certificate Name</strong></td>
<td>The server certificate that the FortiGate will use to authenticate itself to the remote peer or dialup client during phase 1 negotiations. See <a href="#">Digital certificates</a>.</td>
</tr>
<tr>
<td><strong>IKE Version</strong></td>
<td>Either 1 or 2. See <a href="#">Choosing IKE version 1 and 2</a> on page 1339.</td>
</tr>
</tbody>
</table>

| **Mode** | This option is only available when IKEv1 is selected. The two available options are:  
- *Aggressive*: the phase 1 parameters are exchanged in a single message with unencrypted authentication information.  
- *Main (ID protection)*: the phase 1 parameters are exchanged in multiple rounds with encrypted authentication information.  
  
  When the remote VPN peer has a dynamic IP address and is authenticated by a pre-shared key, you must select *Aggressive* mode if there is more than one dialup phase 1 configuration for the interface IP address.  
  
  When the remote VPN peer has a dynamic IP address and is authenticated by a certificate, you must select *Aggressive* mode if there is more than one phase 1 configuration for the interface IP address and these phase 1 configurations use different proposals. |
| **Peer Options** | Options to authenticate VPN peers or clients depending on the *Remote Gateway* and *Authentication Method* settings. |
| **Any peer ID** | Accepts the local ID of any remote VPN peer or client. The FortiGate does not check identifiers (local IDs). *Mode* can be set to *Aggressive* or *Main*.  
  
  This option can be used with digital certificate authentication, but for higher security, use *Peer certificate*. |
| **Specific peer ID** | This option is only available when *Aggressive Mode* is enabled. Enter the identifier that is used to authenticate the remote peer. The identifier must match the local ID configured by the remote peer’s administrator.  
  
  If the remote peer is a FortiGate, the identifier is specified in the *Local ID* field of the *Phase 1 Proposal* settings.  
  
  If the remote peer is a FortiClient user, the identifier is specified in the *Local ID* field.  
  
  In circumstances where multiple remote dialup VPN tunnels exist, each tunnel must have a peer ID set. |
<table>
<thead>
<tr>
<th><strong>Peer certificate</strong></th>
<th>Define the CA certificate used to authenticate the remote peer when the authentication mode is <em>Signature</em>. If the FortiGate will act as a VPN client, and you are using security certificates for authentication, set the <em>Local ID</em> to the distinguished name (DN) of the local server certificate that the FortiGate unit will use for authentication purposes.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Peer ID from dialup group</strong></td>
<td>Authenticate multiple FortiGate or FortiClient dialup clients that use unique identifiers and unique pre-shared keys (or unique pre-shared keys only) through the same VPN tunnel. You must create a dialup user group for authentication purposes. Select the group from the list next to the <em>Peer ID from dialup group</em> option. You must set <em>Mode</em> to <em>Aggressive</em> when the dialup clients use unique identifiers and unique pre-shared keys. If the dialup clients use unique pre-shared keys only, you can set <em>Mode</em> to <em>Main</em> if there is only one dialup Phase 1 configuration for this interface IP address.</td>
</tr>
<tr>
<td><strong>Phase 1 Proposal</strong></td>
<td>The encryption and authentication algorithms used to generate keys for the IKE SA. There must be a minimum of one combination. The remote peer or client must be configured to use at least one of the proposals that you define.</td>
</tr>
</tbody>
</table>
| **Encryption** | The following symmetric-key encryption algorithms are available:  
  - *DES*: Digital Encryption Standard, a 64-bit block algorithm that uses a 56-bit key.  
  - *3DES*: triple-DES; plain text is encrypted three times by three keys.  
  - *AES128GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 128-bit key. Only available for IKEv2.  
  - *AES192*: a 128-bit block algorithm that uses a 192-bit key.  
  - *AES256*: a 128-bit block algorithm that uses a 256-bit key.  
  - *AES256GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 256-bit key. Only available for IKEv2.  
  - *CHACHA20POLY1305*: a 128-bit block algorithm that uses a 128-bit key and a symmetric cipher. Only available for IKEv2. See also HMAC settings. |
| **Authentication** | The following message digests that check the message authenticity during an encrypted session are available:  
  - *MD5*: message digest 5.  
  - *SHA1*: secure hash algorithm 1; a 160-bit message digest.  
  - *SHA256*: a 256-bit message digest.  
  - *SHA384*: a 384-bit message digest.  
  - *SHA512*: a 512-bit message digest. |
In IKEv2, encryption algorithms include authentication, but a PRF (pseudo random function) is still required (PRFSHA1, PRFSHA256, PRFSHA384, PRFSHA512). See also HMAC settings.

<table>
<thead>
<tr>
<th>Diffie-Hellman Groups</th>
<th>Asymmetric key algorithms used for public key cryptography. Select one or more from groups 1, 2, 5, and 14 through 32. At least one of the Diffie-Hellman Groups (DH) settings on the remote peer or client must match one the selections on the FortiGate. Failure to match one or more DH groups will result in failed negotiations.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key Lifetime</td>
<td>The time (in seconds) that must pass before the IKE encryption key expires. When the key expires, a new key is generated without interrupting service. The keylife can be from 120 to 172,800 seconds.</td>
</tr>
</tbody>
</table>
| Local ID              | Optional setting. This value must match the peer ID value given for the remote VPN peer’s Peer Options.  
  - If the FortiGate will act as a VPN client and you are using peer IDs for authentication purposes, enter the identifier that the FortiGate will supply to the VPN server during the phase 1 exchange.  
  - If the FortiGate will act as a VPN client and you are using security certificates for authentication, select the distinguished name (DN) of the local server certificate that the FortiGate will use for authentication purposes. |
| XAUTH                 | This option supports the authentication of dialup clients. It is only available for IKE version 1.  
  - Disable: do not use XAuth.  
  - Client: available only if the Remote Gateway is set to Static IP Address or Dynamic DNS. If the FortiGate is a dialup client, enter the user name and password for the FortiGate to authenticate itself to the remote XAuth server.  
  - PAP Server, CHAP Server, Auto Server: available only if Remote Gateway is set to Dialup User. Dialup clients authenticate as members of a dialup user group. A user group must be created first for the dialup clients that need access to the network behind the FortiGate. The FortiGate must be configured to forward authentication requests to an external RADIUS or LDAP authentication server. Select the server type based on the encryption method used between the FortiGate, the XAuth client, and the external authentication server. Then select the user group (Inherit from policy or Choose). See Using XAuth authentication on page 1343. |
| Username              | User name used for authentication. |
| Password              | Password used for authentication. |

**Additional CLI configurations**

The following phase 1 settings can be configured in the CLI:
### VXLAN over IPsec

Packets with a VXLAN header are encapsulated within IPsec tunnel mode.

**To configure VXLAN over IPsec:**

```plaintext
config vpn ipsec phase1-interface/phase1
  edit ipsec
    set interface <name>
    set encapsulation vxlan/gre
    set encapsulation-address ike/ipv4/ipv6
    set encap-local-gw4 xxx.xxx.xxx.xxx
    set encap-remote-gw xxx.xxx.xxx.xxx
  next
end
```

### IPsec tunnel idle timer

Define an idle timer for IPsec tunnels. When no traffic has passed through the tunnel for the configured `idle-timeout` value, the IPsec tunnel will be flushed.

**To configure IPsec tunnel idle timeout:**

```plaintext
config vpn ipsec phase1-interface
  edit pl
    set idle-timeout [enable | disable]
    set idle-timeoutinterval <integer> IPsec tunnel idle
  timeout in minutes (10 - 43200).
  next
end
```

### Monitor tunnel for failover

Monitor a site-to-site tunnel to guarantee operational continuity if the primary tunnel fails. Configure the secondary phase 1 interface to monitor the primary interface.

**To configure the monitor:**

```plaintext
config vpn ipsec phase1-interface
  edit <secondary phase1-interface>
    set monitor <primary phase1-interface>
  next
end
```

### Passive mode

Passive mode turns one side of the tunnel to be a responder only. It does not initiate VPN tunnels either by auto-negotiation, rekey, or traffic initiated behind the FortiGate.

**To configure passive mode:**

```plaintext
config vpn ipsec phase1-interface
  edit <example>
    set rekey {enable | disable}
    set passive-mode {enable | disable}
    set passive-tunnel-interface {enable | disable}
end
```
The network ID is a Fortinet-proprietary attribute that is used to select the correct phase 1 between IPsec peers, so that multiple IKEv2 tunnels can be established between the same local/remote gateway pairs.

In a dial-up VPN, network-id is in the first initiator message of an IKEv2 phase 1 negotiation. The responder (Hub) uses the network-id to match a phase 1 configuration with a matching network-id. The Hub can then differentiate multiple dial-up phase 1s that are bound to the same underlay interface and IP address. Without a network-id, the Hub cannot have multiple phase 1 dialup tunnels on the same interface.

In static phase 1 configurations, network-id is used with the pair of gateway IPs to negotiate the correct tunnel with a matching network-id. This allows IPsec peers to use the same pair of underlay IPs to establish multiple IPsec tunnels. Without it, only a single tunnel can be established over the same pair of underlay IPs.

To configure the network ID:

```
config vpn ipsec phase1-interface
  edit <example>
    set network-id <integer>
  next
end
```

Dead peer detection

By default, dead peer detection (DPD) sends probe messages every five seconds. If you are experiencing high network traffic, you can experiment with increasing the ping interval. However, longer intervals will require more traffic to detect dead peers, which will result in more traffic.

In a dynamic (dialup) connection, the On Idle option encourages dialup server configurations to more proactively delete tunnels if the peer is unavailable.

In the GUI, the dead peer detection option can be configured when defining phase 1 options. The following CLI commands support additional options for specifying a retry count and a retry interval.

For example, enter the following to configure DPD on the existing IPsec phase 1 configuration to use 15-second intervals and to wait for three missed attempts before declaring the peer dead and taking action.

To configure DPD:

```
config vpn ipsec phase1-interface
  edit <value>
    set dpd [disable | on-idle | on-demand]
    set dpd-retryinveral 15
    set dpd-retrycount 3
```
DPD scalability

On a dialup server, if many VPN connections are idle, the increased DPD exchange could negatively impact the performance/load of the daemon. The on-demand option in the CLI triggers DPD when IPsec traffic is sent, but no reply is received from the peer.

When there is no traffic and the last DPD-ACK had been received, IKE will not send DPDs periodically. IKE will only send out DPDs if there are outgoing packets to send, but no inbound packets have since been received.

HMAC settings

The FortiGate uses the HMAC based on the authentication proposal that is chosen in phase 1 or phase 2 of the IPsec configuration. Each proposal consists of the encryption-hash pair (such as 3des-sha256). The FortiGate matches the most secure proposal to negotiate with the peer.

To view the chosen proposal and the HMAC hash used:

```
# diagnose vpn ike gateway list
```

```
vd: root/0
name: MPLS
version: 1
interface: port1 3
addr: 192.168.2.5:500 -> 10.10.1.1:500

DPD sent/recv: 000001e1/00000000
```

Choosing IKE version 1 and 2

If you create a route-based VPN, you have the option of selecting IKE version 2. Otherwise, IKE version 1 is used.

IKEv2, defined in RFC 4306, simplifies the negotiation process that creates the security association (SA).

If you select IKEv2:
- There is no choice in phase 1 of aggressive or main mode.
- Extended authentication (XAUTH) is not available.
- You can utilize EAP and MOBIKE.
Revised authentication in IKEv2

This feature provides the option to control whether a device requires its peer to re-authenticate or whether re-key is sufficient. It does not influence the re-authentication or re-key behavior of the device itself, which is controlled by the peer (the default being to re-key). This solution is in response to RFC 4478. As described by the IETF, "the purpose of this is to limit the time that security associations (SAs) can be used by a third party who has gained control of the IPsec peer."

To configure IKE SA re-authentication:

```plaintext
config vpn ipsec phase1-interface
  edit pl
    set reauth [enable | disable]
  next
end
```

IKEv2 quick crash detection

There is support for IKEv2 quick crash detection (QCD) as described in RFC 6290.

RFC 6290 describes a method in which an IKE peer can quickly detect that the gateway peer it has and established an IKE session with has rebooted, crashed, or otherwise lost IKE state. When the gateway receives IKE messages or ESP packets with unknown IKE or IPsec SPIs, the IKEv2 protocol allows the gateway to send the peer an unprotected IKE message containing INVALID_IKE_SPI or INVALID_SPI notification payloads.

RFC 6290 introduces the concept of a QCD token, which is generated from the IKE SPIs and a private QCD secret, and exchanged between peers during the protected IKE AUTH exchange.

To configure QCD:

```plaintext
config system settings
  set ike-quick-crash-detect [enable | disable]
end
```

IKEv1 quick crash detection

Based on the IKEv2 QCD feature previously described, IKEv1 QCD is implemented using a new IKE vendor ID (Fortinet Quick Crash Detection) so both endpoints must be FortiGates. The QCD token is sent in the phase 1 exchange and must be encrypted, so this is only implemented for IKEv1 in main mode (aggressive mode is not supported as there is no available AUTH message to include the token). Otherwise, the feature works the same as in IKEv2 (RFC 6290).

IKEv1 fragmentation

UDP fragmentation can cause issues in IPsec when either the ISP or perimeter firewall(s) cannot pass or fragment the oversized UDP packets that occur when using a very large public security key (PSK). The result is that IPsec tunnels do not come up. The solution is IKE fragmentation.

For most configurations, enabling IKE fragmentation allows connections to automatically establish when they otherwise might have failed due to intermediate nodes dropping IKE messages containing large certificates, which typically push the packet size over 1500 bytes.

FortiOS will fragment a packet on sending if only all the following are true:

- Phase 1 contains set fragmentation enable.
- The packet is larger than the minimum MTU (576 for IPv4, 1280 for IPv6).
- The packet is being re-transmitted.
By default, IKE fragmentation is enabled.

**To configure IKEv1 fragmentation:**

```
config vpn ipsec phasel-interface
   edit 1
   set fragmentation [enable | disable]
next
end
```

**IKEv2 fragmentation**

RFC 7383 requires each fragment to be individually encrypted and authenticated. With IKEv2, a copy of the unencrypted payloads around for each outgoing packet would need to be kept in case the original single packet was never answered and would retry with fragments. With the following implementation, if the IKE payloads are greater than a configured threshold, the IKE packets are preemptively fragmented and encrypted.

**To configure IKEv2 fragmentation:**

```
config vpn ipsec phasel-interface
   edit ike
   set ike-version 2
   set fragmentation [enable|disable]
   set fragmentation-mtu <500-16000>
next
end
```

**IPsec global IKE embryonic limit**

When trying to establish thousands of tunnels simultaneously, a situation can arise where new negotiations starve other SAs from progressing to an established state in IKEv2. The IKE daemon can prioritize established SAs, offload groups 20 and 21 to CP9, and optimize the default embryonic limits for mid- and high-end platforms. The IKE embryonic limit can be configured in the CLI.

```
config system ike
   set embryonic-limit <integer>
end
```

**embryonic-limit <integer>**  
Set the maximum number of IPsec tunnels to negotiate simultaneously (50 - 20000, default = 1000).

**To configure an IKE embryonic limit of 50:**

```
config system ike
   set embryonic-limit 50
end
```

**Pre-shared key vs digital certificates**

A FortiGate can authenticate itself to remote peers or dialup clients using either a pre-shared key or a digital certificate.
Pre-shared key

Using a pre-shared key is less secure than using certificates, especially if it is used alone, without requiring peer IDs or extended authentication (XAuth). There also needs to be a secure way to distribute the pre-shared key to the peers.

If you use pre-shared key authentication alone, all remote peers and dialup clients must be configured with the same pre-shared key. Optionally, you can configure remote peers and dialup clients with unique pre-shared keys. On the FortiGate, these are configured in user accounts, not in the phase 1 settings.

The pre-shared key must contain at least six printable characters and should be known by network administrators. For optimum protection against currently known attacks, the key must consist of a minimum of 16 randomly chosen alphanumeric characters. The limit is 128 characters.

If you authenticate the FortiGate using a pre-shared key, you can require remote peers or dialup clients to authenticate using peer IDs, but not client certificates.

To authenticate the FortiGate using a pre-shared key:

1. Go to VPN > IPsec Tunnels and create a new tunnel, or edit an existing one.
2. Configure or edit the Network section as needed.
3. Configure or edit the Authentication settings as follows:

<table>
<thead>
<tr>
<th>Method</th>
<th>Pre-shared Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pre-shared Key</td>
<td>&lt;string&gt;</td>
</tr>
<tr>
<td>IKE Version</td>
<td>1 or 2</td>
</tr>
<tr>
<td>Mode</td>
<td>Aggressive or Main</td>
</tr>
<tr>
<td>Peer Options</td>
<td>Select an Accept Type and the corresponding peer. Options vary based on the Remote Gateway and Authentication Method settings in the Network section. Peer Options are only available in Aggressive mode.</td>
</tr>
</tbody>
</table>

4. For the Phase 1 Proposal section, keep the default settings unless changes are needed to meet your requirements.
5. Optionally, for authentication parameters for a dialup user group, define XAUTH parameters.
6. Click OK.

Digital certificates

To authenticate the FortiGate using digital certificates, you must have the required certificates installed on the remote peer and on the FortiGate. The signed server certificate on one peer is validated by the presence of the root certificate installed on the other peer. If you use certificates to authenticate the FortiGate, you can also require the remote peers or dialup clients to authenticate using certificates. See Site-to-site VPN with digital certificate on page 1365 for a detailed example.

To authenticate the FortiGate using a digital certificate:

1. Go to VPN > IPsec Tunnels and create a new tunnel, or edit an existing one.
2. Configure or edit the Network section as needed.
3. Configure or edit the **Authentication** settings as follows:

<table>
<thead>
<tr>
<th>Method</th>
<th>Signature</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Certificate Name</strong></td>
<td>Select the certificate used to identify this FortiGate. If there are no imported certificates, use <em>Fortinet_Factory</em>.</td>
</tr>
<tr>
<td><strong>IKE Version</strong></td>
<td>1 or 2</td>
</tr>
<tr>
<td><strong>Mode</strong></td>
<td>Aggressive is recommended.</td>
</tr>
<tr>
<td><strong>Peer Options</strong></td>
<td>For <strong>Accept Type</strong>, select <strong>Peer certificate</strong> and select the peer and the CA certificate used to authenticate the peer. If the other end is using the Fortinet_Factory certificate, then use the <em>Fortinet_CA</em> certificate here.</td>
</tr>
</tbody>
</table>

4. For the **Phase 1 Proposal** section, keep the default settings unless changes are needed to meet your requirements.

5. Optionally, for authentication parameters for a dialup user group, define **XAUTH** parameters.

6. Click **OK**.

**Using XAuth authentication**

Extended authentication (XAuth) increases security by requiring remote dialup client users to authenticate in a separate exchange at the end of phase 1. XAuth draws on existing FortiGate user group definitions and uses established authentication mechanisms such as PAP, CHAP, RADIUS, and LDAP to authenticate dialup clients. You can configure a FortiGate to function either as an XAuth server or client. If the server or client is attempting a connection using XAuth and the other end is not using XAuth, the failed connection attempts that are logged will not specify XAuth as the reason.

**XAuth server**

A FortiGate can act as an XAuth server for dialup clients. When the phase 1 negotiation completes, the FortiGate challenges the user for a user name and password. It then forwards the user’s credentials to an external RADIUS or LDAP server for verification.

If the user records on the RADIUS server have suitably configured Framed-IP-Address fields, you can assign client virtual IP addresses by XAuth instead of from a DHCP address range.

The authentication protocol you use for XAuth depends on the capabilities of the authentication server and the XAuth client:

- Select **PAP Server** whenever possible.
- You must select **PAP Server** for all implementations of LDAP and some implementations of Microsoft RADIUS.
- Select **Auto Server** when the authentication server supports **CHAP Server** but the XAuth client does not. The FortiGate will use PAP to communicate with the XAuth client and CHAP to communicate with the authentication server. You can also use **Auto Server** to allow multiple source interfaces to be defined in an IPsec/IKE policy.

Before you begin, create user accounts and user groups to identify the dialup clients that need to access the network behind the FortiGate dialup server. If password protection will be provided through an external RADIUS or LDAP server, you must configure the FortiGate dialup server to forward authentication requests to the authentication server.

**To configure XAuth to authenticate a dialup user group:**

1. On the FortiGate dialup server, go to **VPN > IPsec Tunnels** and create a new tunnel, or edit an existing one.
2. Configure or edit the **Network, Authentication, and Phase 1 Proposal** sections as needed.
3. In the XAUTH section, select the encryption method Type to use between the XAuth client, the FortiGate, and the authentication server.

4. For User Group:
   a. Click Inherit from policy for multiple user groups defined in the IPSec/IKE policy, or
   b. Click Choose and in the dropdown, select the user group that needs to access the private network behind the FortiGate.

   ![Tip]

   Only one user group may be defined for Auto Server.

5. Click OK.
6. Create as many policies as needed, specifying the source user(s) and destination address.

**XAuth client**

If the FortiGate acts as a dialup client, the remote peer, acting as an XAuth server, might require a username and password. You can configure the FortiGate as an XAuth client with its own username and password, which it provides when challenged.

**To configure the FortiGate dialup client as an XAuth client:**

1. On the FortiGate dialup client, go to VPN > IPSec Tunnels and create a new tunnel, or edit an existing one.
2. Configure or edit the Network, Authentication, and Phase 1 Proposal sections as needed.
3. In the XAUTH section, for Type, select Client.
4. For Username, enter the FortiGate PAP, CHAP, RADIUS, or LDAP user name that the FortiGate XAuth server will compare to its records when the FortiGate XAuth client attempts to connect.
5. Enter the Password for the user name.
6. Click OK.

**Dynamic IPSec route control**

You can add a route to a peer destination selector by using the add-route option, which is available for all dynamic IPSec phases 1 and 2, for both policy-based and route-based IPSec VPNs.

The add-route option adds a route to the FortiGate routing information base when the dynamic tunnel is negotiated. You can use the distance and priority options to set the distance and priority of this route. If this results in a route with the lowest distance, it is added to the FortiGate forwarding information base.

You can also enable add-route in any policy-based or route-based phase 2 configuration that is associated with a dynamic (dialup) phase 1. In phase 2, add-route can be enabled, disabled, or set to use the same route as phase 1.

The add-route option is enabled by default.

**To configure add-route in phase 1:**

```bash
cfg vpn ipsec
   edit <name>
      set type dynamic
      set add-route {enable | disable}
```
To configure add-route in phase 2:

```
config vpn ipsec {phase2 | phase2-interface}
  edit <name>
    set add-route {phase1 | enable | disable}
  next
end
```

**Blocking IPsec SA negotiation**

For interface-based IPsec, IPsec SA negotiation blocking can only be removed if the peer offers a wildcard selector. If a wildcard selector is offered, then the wildcard route will be added to the routing table with the distance/priority value configured in phase 1. If that is the route with the lowest distance, it will be installed into the forwarding information base. In this scenario, it is important to ensure that the distance value configured for phase 1 is set appropriately.

**Phase 2 configuration**

After phase 1 negotiations end successfully, phase 2 begins. In Phase 2, the VPN peer or client and the FortiGate exchange keys again to establish a secure communication channel. The phase 2 proposal parameters select the encryption and authentication algorithms needed to generate keys for protecting the implementation details of security associations (SAs). The keys are generated automatically using a Diffie-Hellman algorithm.

The basic phase 2 settings associate IPsec phase 2 parameters with the phase 1 configuration that specifies the remote end point of the VPN tunnel. In most cases, you need to configure only basic Phase 2 settings.

Some settings can be configured in the CLI. The following options are available in the VPN Creation Wizard after the tunnel is created:

<table>
<thead>
<tr>
<th>New Phase 2</th>
<th>Phase 2 definition name.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Local Address</strong></td>
<td>A value of 0.0.0.0/0 means all IP addresses behind the local VPN peer. Add a specific address or range to allow traffic from and to only this local address. See Quick mode selectors on page 1347.</td>
</tr>
<tr>
<td><strong>Remote Address</strong></td>
<td>Enter the destination IP address that corresponds to the recipients or network behind the remote VPN peer. A value of 0.0.0.0/0 means all IP addresses behind the remote VPN peer. See Quick mode selectors on page 1347.</td>
</tr>
<tr>
<td><strong>Advanced</strong></td>
<td>Select the encryption and authentication algorithms that will be proposed to the remote VPN peer. To establish a VPN connection, at least one of the proposals specified must match the configuration on the remote peer.</td>
</tr>
</tbody>
</table>
| **Encryption** | The following symmetric-key encryption algorithms are available:  
  - NULL: do not use an encryption algorithm.  
  - DES: Digital Encryption Standard, a 64-bit block algorithm that uses a |
56-bit key.

- **3DES**: triple-DES; plain text is encrypted three times by three keys.
- **AES128**: Advanced Encryption Standard, a 128-bit block algorithm that uses a 128-bit key.
- **AES128GCM**: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 128-bit key. Only available for IKEv2.
- **AES192**: a 128-bit block algorithm that uses a 192-bit key.
- **AES256**: a 128-bit block algorithm that uses a 256-bit key.
- **AES256GCM**: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 256-bit key. Only available for IKEv2.
- **CHACHA20POLY1305**: a 128-bit block algorithm that uses a 128-bit key and a symmetric cipher. Only available for IKEv2.

See [ChaCha20 and Poly1305 AEAD cipher](#) on page 1349, AES-GCM for IKEv2 phase 1 on page 1349, and HMAC settings.

### Authentication

The following message digests that check the message authenticity during an encrypted session are available:

- **NULL**: do not use a message digest.
- **MD5**: message digest 5.
- **SHA1**: secure hash algorithm 1; a 160-bit message digest.
- **SHA256**: a 256-bit message digest.
- **SHA384**: a 384-bit message digest.
- **SHA512**: a 512-bit message digest.

See also [HMAC settings](#).

### Enable Replay Detection

Replay attacks occur when an unauthorized party intercepts a series of IPsec packets and replays them back into the tunnel.

Replay detection allows the FortiGate to check all IPsec packets to see if they have been received before. If any encrypted packets arrive out of order, the FortiGate discards them.

Note that 64-bit extended sequence numbers (as described in RFC 4303, RFC 4304 as an addition to IKEv1, and RFC 5996 for IKEv2) are supported for IPsec when replay detection is enabled.

### Enable Perfect Forward Secrecy (PFS)

Perfect forward secrecy (PFS) improves security by forcing a new Diffie-Hellman exchange whenever keylife expires.

### Diffie-Hellman Group

Asymmetric key algorithms used for public key cryptography. Select one or more from groups 1, 2, 5, and 14 through 32. At least one of the Diffie-Hellman Groups (DH) settings on the remote peer or client must match one the selections on the FortiGate. Failure to match one or more DH groups will result in failed negotiations.

### Local Port

Enter the port number that the local VPN peer uses to transport traffic related to the specified service (protocol number). The range is from 0 to 65535. To specify all ports, select **All**, or enter 0.
Remote Port | Enter the port number that the remote VPN peer uses to transport traffic related to the specified service (protocol number). To specify all ports, select All, or enter 0.
--- | ---
Protocol | Enter the IP protocol number of the service. To specify all services, select All, or enter 0.
Auto-negotiate | Select this option for the tunnel to be automatically renegotiated when the it expires. See Auto-negotiate on page 1348.
Autokey Keep Alive | Select this option for the tunnel to remain active when no data is being processed.
Key Lifetime | Select the method for determining when the phase 2 key expires:
• Seconds
• Kilobytes
• Both
Enter a corresponding value for Seconds and/or Kilobytes in the text boxes. If Both is selected, the key expires when either the time has passed or the number of kilobytes have been processed.

Quick mode selectors

Quick mode selectors determine which IP addresses can perform IKE negotiations to establish a tunnel. By only allowing authorized IP addresses access to the VPN tunnel, the network is more secure.

The default settings are as broad as possible: any IP address or configured address object using any protocol on any port.

While the dropdown menus for specifying an address also show address groups, the use of address groups may not be supported on a remote endpoint device that is not a FortiGate.

When configuring a quick mode selector for Local Address and Remote Address, valid options include IPv4 and IPv6 single addresses, subnets, or ranges.

There are some configurations that require specific selectors:
• The VPN peer is a third-party device that uses specific phase2 selectors.
• The FortiGate connects as a dialup client to another FortiGate, in which case (usually) you must specify a local IP address, IP address range, or subnet. However, this is not required if you are using dynamic routing and mode-cfg.

With FortiOS VPNs, your network has multiple layers of security, with quick mode selectors being an important line of defense:
• Routes guide traffic from one IP address to another.
• Phase 1 and phase 2 connection settings ensure there is a valid remote end point for the VPN tunnel that agrees on the encryption and parameters.
• Quick mode selectors allow IKE negotiations only for allowed peers.
• Security policies control which IP addresses can connect to the VPN.
• Security policies also control what protocols are allowed over the VPN along with any bandwidth limiting.
If you are editing an existing phase 2 configuration, the local address and remote address fields are unavailable if the tunnel has been configured to use firewall addresses as selectors. This option exists only in the CLI.

**Using the add-route option**

Consider using the `add-route` option to add a route to a peer destination selector in phase 2 to automatically match the settings in phase 1.

**To configure add-route:**

```plaintext
config vpn ipsec (phase2 | phase2-interface)
   edit <name>
      set add-route (phase1 | enable | disable)
   next
end
```

**Auto-negotiate**

By default, the phase 2 security association (SA) is not negotiated until a peer attempts to send data. The triggering packet and some subsequent packets are dropped until the SA is established. Applications normally resend this data, so there is no loss, but there might be a noticeable delay in response to the user.

If the tunnel goes down, the auto-negotiate feature (when enabled) attempts to re-establish the tunnel. Auto-negotiate initiates the phase 2 SA negotiation automatically, repeating every five seconds until the SA is established.

Automatically establishing the SA can be important for a dialup peer. It ensures that the VPN tunnel is available for peers at the server end to initiate traffic to the dialup peer. Otherwise, the VPN tunnel does not exist until the dialup peer initiates traffic.

**To configure auto-negotiate:**

```plaintext
config vpn ipsec phase2
   edit <phase2_name>
      set auto-negotiate enable
   next
end
```

**Installing dynamic selectors via auto-negotiate**

The IPsec SA connect message generated is used to install dynamic selectors. These selectors can be installed via the auto-negotiate mechanism. When phase 2 has `auto-negotiate` enabled, and phase 1 has `mesh-selector-type` set to `subnet`, a new dynamic selector will be installed for each combination of source and destination subnets. Each dynamic selector will inherit the auto-negotiate option from the template selector and begin SA negotiation. Phase 2 selector sources from dialup clients will all establish SAs without traffic being initiated from the client subnets to the hub.

**DHCP**

The `dhcp-ipsec` option lets the FortiGate assign VIP addresses to FortiClient dialup clients through a DHCP server or relay. This option is only available if the remote gateway in the phase 1 configuration is set to dialup user, and it only works in policy-based VPNs.

With `dhcp-ipsec`, the FortiGate dialup server acts as a proxy for FortiClient dialup clients that have VIP addresses on the subnet of the private network behind the FortiGate. In this case, the FortiGate dialup server acts as a proxy on the
local private network for the FortiClient dialup client. A host on the network behind the dialup server issues an ARP request, corresponding to the device MAC address of the FortiClient host (when a remote server sends an ARP to the local FortiClient dialup client). The FortiGate then answers the ARP request on behalf of the FortiClient host, and then forwards the associated traffic to the FortiClient host through the tunnel.

Acting as a proxy prevents the VIP address assigned to the FortiClient dialup client from causing possible ARP broadcast problems—the normal and VIP addresses can confuse some network switches when two addresses have the same MAC address.

**ChaCha20 and Poly1305 AEAD cipher**

In IKEv2 to support RFC 7634, the ChaCha20 and Poly1305 crypto algorithms can be used together as a combined mode AEAD cipher (like AES-GCM) in the `crypto_ftnt cipher` in `cipher_chacha20poly1305.c`:

```c
config vpn ipsec phase2-interface
  edit <name>
    set phasename <name>
    set proposal chacha20poly1305
  next
end
```

**AES-GCM for IKEv2 phase 1**

In IKEv2 to support RFC 5282, the AEAD algorithm AES-GCM supports 128- and 256-bit variants:

```c
config vpn ipsec phase2-interface
  edit <name>
    set phasename <name>
    set proposal [aes128gcm | aes256gcm]
  next
end
```

**VPN security policies**

This section explains how to specify the source and destination IP addresses of traffic transmitted through an IPsec VPN, and how to define appropriate security policies.
Defining policy addresses

In a gateway-to-gateway, hub-and-spoke, dynamic DNS, redundant tunnel, or transparent configuration, you need to define a policy address for the private IP address of the network behind the remote VPN peer (for example, 192.168.10.0/255.255.255.0 or 192.168.10.0/24).

In a peer-to-peer configuration, you need to define a policy address for the private IP address of a server or host behind the remote VPN peer (for example, 172.16.5.1/255.255.255.255, 172.16.5.1/32, or 172.16.5.1).

For a FortiGate dialup server in a dialup-client or internet-browsing configuration, the source IP should reflect the IP addresses of the dialup clients:

Defining security policies

Policy-based and route-based VPNs require different security policies.
VPN

- A policy-based VPN requires an IPsec policy. You specify the interface to the private network, the interface to the remote peer and the VPN tunnel. A single policy can enable traffic inbound, outbound, or in both directions.
- A route-based VPN requires an accept policy for each direction. For the source and destination interfaces, you specify the interface to the private network and the virtual IPsec interface (phase 1 configuration) of the VPN. The IPsec interface is the destination interface for the outbound policy and the source interface for the inbound policy. One security policy must be configured for each direction of each VPN interface.

**Policy-based VPN**

An IPsec policy enables the transmission and reception of encrypted packets, specifies the permitted direction of VPN traffic, and selects the VPN tunnel. In most cases, a single policy is needed to control both inbound and outbound IP traffic through a VPN tunnel. For a detailed example, see Policy-based IPsec tunnel on page 1381. Be aware of the following before creating an IPsec policy.

**Allow traffic to be initiated from the remote site**

Policies specify which IP addresses can initiate a tunnel. By default, traffic from the local private network initiates the tunnel. When the Allow traffic to be initiated from the remote site option is selected, traffic from a dialup client, or a computer on a remote network, initiates the tunnel. Both can be enabled at the same time for bi-directional initiation of the tunnel.

**Outbound and inbound NAT**

When a FortiGate operates in NAT mode, you can enable inbound or outbound NAT. Outbound NAT may be performed on outbound encrypted packets or IP packets in order to change their source address before they are sent through the tunnel. Inbound NAT is performed to intercept and decrypt emerging IP packets from the tunnel.

By default, these options are not selected in security policies and can only be set through the CLI.

**Defining multiple IPsec policies for the same tunnel**

You must define at least one IPsec policy for each VPN tunnel. If the same remote server or client requires access to more than one network behind a local FortiGate, the FortiGate must be configured with an IPsec policy for each network. Multiple policies may be required to configure redundant connections to a remote destination or control access to different services at different times.

To ensure a secure connection, the FortiGate must evaluate policies with Action set to IPsec before ACCEPT and DENY. Because the FortiGate unit reads policies starting at the top of the list, you must move all IPsec policies to the top of the list, and be sure to reorder your multiple IPsec policies that apply to the tunnel so that specific constraints can be evaluated before general constraints. If you create two equivalent IPsec policies for two different tunnels, the system will select the correct policy based on the specified source and destination addresses.

If the policy that grants the VPN connection is limited to certain services, DHCP must be included, otherwise the client will not be able to retrieve a lease from the FortiGate’s (IPsec) DHCP server because the DHCP request (coming out of the tunnel) will be blocked.

---

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
Adding multiple IPsec policies for the same VPN tunnel can cause conflicts if the policies specify similar source and destination addresses, but have different settings for the same service. When policies overlap in this manner, the system may apply the wrong IPsec policy or the tunnel may fail.

**Route-based VPN**

When you define a route-based VPN, you create a virtual IPsec interface on the physical interface that connects to the remote peer. You create ordinary accept policies to enable traffic between the IPsec interface and the interface that connects to the private network. This makes configuration simpler than for policy-based VPNs.

**To configure policies for a route-based VPN:**

1. Go to Policy & Objects > Firewall Policy.
2. Click Create New and define an ACCEPT policy to permit communication between the local private network and the private network behind the remote peer and enter these settings in particular:

<table>
<thead>
<tr>
<th>Name</th>
<th>Enter a name for the security policy.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>Select the interface that connects to the private network behind this FortiGate.</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>Select the IPsec interface you configured.</td>
</tr>
<tr>
<td>Source</td>
<td>Select the address name you defined for the private network behind this FortiGate.</td>
</tr>
<tr>
<td>Destination</td>
<td>Select the address name you defined for the private network behind the remote peer.</td>
</tr>
<tr>
<td>Action</td>
<td>Select ACCEPT.</td>
</tr>
<tr>
<td>NAT</td>
<td>Disable NAT.</td>
</tr>
</tbody>
</table>

3. Click OK.

To permit the remote client to initiate communication, you need to define a security policy for communication in that direction.

4. Click Create New and enter these settings in particular:

<table>
<thead>
<tr>
<th>Name</th>
<th>Enter a name for the security policy.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>Select the IPsec interface you configured.</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>Select the interface that connects to the private network behind this FortiGate.</td>
</tr>
<tr>
<td>Source</td>
<td>Select the address name you defined for the private network behind the remote peer.</td>
</tr>
<tr>
<td>Destination</td>
<td>Select the address name you defined for the private network behind this FortiGate.</td>
</tr>
<tr>
<td>Action</td>
<td>Select ACCEPT.</td>
</tr>
<tr>
<td>NAT</td>
<td>Disable NAT.</td>
</tr>
</tbody>
</table>

5. Click OK.
Blocking unwanted IKE negotiations and ESP packets with a local-in policy

It is not unusual to receive IPsec connection attempts or malicious IKE packets from all over the internet. Malicious parties use these probes to try to establish an IPsec tunnel in order to gain access to your private network. A good way to prevent this is to use local-in policies to deny such traffic.

Sometimes there are malicious attempts using crafted invalid ESP packets. These invalid attempts are automatically blocked by the FOS IPsec local-in handler when it checks the SPI value against the SAs of existing tunnels. The IPsec local-in handler processes the packet instead of the firewall's local-in handler. So when these attempts are blocked, you will notice an unknown SPI message in your VPN logs instead of being silently blocked by your local-in policy. These log messages are rate limited.

Sample log and alert email

Message meets Alert condition

date=2020-08-11 time=09:28:40 devname=toSite1 devid=FGT60Fxxxxxxxxxx logid="0101037131" type="event" subtype="vpn" level="error" vd="root" eventtime=1597163320747963100 tz="-0700" logdesc="IPsec ESP" msg="IPsec ESP" action="error" remip=131.62.25.102 locip=192.157.116.88 remport=40601 locport=500 outintf="wan1" cookies="N/A" user="N/A" group="N/A" xauthuser="N/A" xauthgroup="N/A" assignip=N/A vpntunnel="N/A" status="esp_error" error_num="Received ESP packet with unknown SPI." spi="f6c9e2x1" seq="02000400"

Note that invalid SPIS may not always indicate malicious activity. For example, the SPI may not match during rekey, or when one unit flushes its tunnel SAs. Administrators should collect as much information as possible before making a conclusion.

To block undesirable IPsec connection attempts and IKE packets using a local-in policy:

1. Configure an address group that excludes legitimate IPs:

   ```
   config firewall addrgrp
   edit "All_exceptions"
   set member "all"
   set exclude enable
   set exclude-member "remote-vpn"
   next
   end
   ```

2. Create a local-in policy that blocks IKE traffic from the address group:

   ```
   config firewall local-in-policy
   edit 1
   set intf "wan1"
   set srcaddr "All_exceptions"
   set dstaddr "all"
   set service "IKE"
   set schedule "always"
   next
   end
   ```

   The default action is deny.
3. Verify the traffic blocked by the local-in policy:

```
# diagnose debug flow filter dport 500
# diagnose debug flow trace start 10
# diagnose debug enable

id=20085 trace_id=290 func=print_pkt_detail line=5588 msg="vd-root:0 received a packet (proto=17, 10.10.10.13:500->10.10.10.1:500) from wan1."
id=20085 trace_id=290 func=init_ip_session_common line=5760 msg="allocate a new session-003442e7"
id=20085 trace_id=290 func=init_ip_route_input_common line=2598 msg="find a route: flag=84000000 gw=10.10.10.1 via root"
    id=20085 trace_id=290 func=fw_local_in_handler line=430 msg="iprope_in_check() check failed on policy 1, drop"
```

**Configurable IKE port**

Some ISPs block UDP port 500 or UDP port 4500, preventing an IPsec VPN from being negotiated and established. To accommodate this, the IKE port can be changed.

**To set the IKE port:**

```
config system settings
    set ike-port <integer>
end
```

| ike-port | UDP port for IKE/IPsec traffic (1024 - 65535, default = 500). |

**Example 1: site-to-site VPN without NAT**

In this example, the IKE port is set to 6000 on the two site-to-site VPN gateways. There is no NAT between the VPN gateways, but the ISP has blocked UDP port 500. A site-to-site VPN is established using the defined IKE port.

**To set the IKE port:**

```
config system settings
    set ike-port 6000
end
```

**To configure and check the site-to-site VPN:**

1. Configure the phase1 and phase2 interfaces:

```
config vpn ipsec phase1-interface
    edit "s2s"
        set interface "port27"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384 chacha20poly1305-prfsha256
        set wizard-type static-fortigate
        set remote-gw 11.101.1.1
```
set psksecret **********
next
end

config vpn ipsec phase2-interface
edit "s2s"
   set phase1name "s2s"
   set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
   set src-addr-type name
   set dst-addr-type name
   set src-name "s2s_local"
   set dst-name "s2s_remote"
next
end

2. Check the IKE gateway list and confirm that the specified port is used:

   # diagnose vpn ike gateway list

   vd: root/0
   name: s2s
   version: 2
   interface: port27 17
   addr: 173.1.1.1:6000 -> 11.101.1.1:6000
   tun_id: 11.101.1.1
   remote_location: 0.0.0.0
   created: 194s ago
   PPK: no
   IKE SA: created 1/2 established 1/2 time 0/4500/9000 ms
   IPsec SA: created 1/2 established 1/2 time 0/4500/9000 ms
   ...

3. Check the VPN tunnel list:

   # diagnose vpn tunnel list
   list all ipsec tunnel in vd 0
   -----------
   name=s2s ver=2 serial=1 173.1.1.1:6000->11.101.1.1:6000 tun_id=11.101.1.1 dst_mtu=1500
dpd-link=on remote_location=0.0.0.0 weight=1
bound_if=17 lgwy=static/1 tun=tunnel/15 mode=auto/1 encap=none/520 options[0208]=npu
frag-rcf run_state=0 accept_traffic=1 overlay_id=0
   ...

Example 2: dialup VPN with NAT

In this example, the IKE port is set to 5000 on the VPN gateway and the dialup peer. The dialup peer is behind NAT, so NAT traversal (NAT-T) is used. The ISP blocks both UDP port 500 and UDP port 4500. The VPN connection is initiated on UDP port 5000 from the dialup VPN client and remains on port 5000 since NAT-T floating to 4500 is only required when the IKE port is 500.

To set the IKE port:

config system settings
   set ike-port 5000
end
To configure and check the dialup VPN with NAT:

1. Configure the phase1 and phase2 interfaces:

```plaintext
config vpn ipsec phase1-interface
edit "server"
   set type dynamic
   set interface "port27"
   set ike-version 2
   set peertype any
   set net-device disable
   set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
   chacha20poly1305-prfsha256
   set dpd on-idle
   set wizard-type static-fortigate
   set psksecret **********
   set dpd-retryinterval 60
next
end

config vpn ipsec phase2-interface
edit "server"
   set phosphasename "server"
   set proposal aes128-shal aes256-shal aes128-sha256 aes256-sha256 aes128gcm
   aes256gcm chacha20poly1305
   set src-addr-type name
   set dst-addr-type name
   set src-name "server_local"
   set dst-name "server_remote"
next
end
```

2. Check the IKE gateway list and confirm that the specified port is used:

```plaintext
# diagnose vpn ike gateway list

vd: root/0
name: server_0
version: 2
interface: port27 17
addr: 173.1.1.1:5000 -> 173.1.1.2:65416
tun_id: 173.1.1.2
remote_location: 0.0.0.0
created: 90s ago
nat: peer
PPK: no
IKE SA: created 1/1 established 1/1 time 0/0/0 ms
IPsec SA: created 1/1 established 1/1 time 0/0/0 ms
...
```

3. Check the VPN tunnel list:

```plaintext
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
---------------------------------------------
name=server_0 ver=2 serial=a 173.1.1.1:5000->173.1.1.2:65416 tun_id=173.1.1.2 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
bound_if=17 lgwy=static/1 tun=tunnel/15 mode=dial_inst/3 encap=none/904 options
```
IPsec VPN IP address assignments

When a user disconnects from a VPN tunnel, it is not always desirable for the released IP address to be used immediately. In IPsec VPN, IP addresses can be held for the specified delay interval before being released back into the pool for assignment. The first-available address assignment method is still used.

Example

In this example, two PCs connect to the VPN. The IP address reuse delay interval is used to prevent a released address from being reused for at least four minutes. After the interval elapses, the IP address becomes available to clients again. Dual stack address assignment (both IPv4 and IPv6) is used.

To configure IPsec VPN with an IP address reuse delay interval:

1. Configure the IPsec phase1 interface, setting the IP address reuse delay interval to 240 seconds:

```fortigate
config vpn ipsec phase1-interface
edit "FCT"
   set type dynamic
   set interface "port27"
   set mode aggressive
   set peertype any
   set net-device disable
   set mode-cfg enable
   set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
   set wizard-type dialup-forticlient
   set xauthtype auto
   set authusgrp "local-group"
   set ipv4-start-ip 10.20.1.1
   set ipv4-end-ip 10.20.1.100
   set dns-mode auto
   set ipv4-split-include "FCT_split"
   set ipv6-start-ip 2001::1
   set ipv6-end-ip 2001::2
   set ip-delay-interval 240
   set save-password enable
   set psksecret **********
next
end
```
2. Configure the IPsec phase2 interface:

```plaintext
config vpn ipsec phase2-interface
edit "FCT"
   set phaselname "FCT"
   set proposal aes256-sha1 aes256-sha1 aes256-sha256 aes256-sha256 aes256gcm
   aes256gcm chacha20poly1305
next
edit "FCT6"
   set phaselname "FCT"
   set proposal aes256-sha1 aes256-sha1 aes256-sha256 aes256-sha256 aes256gcm
   aes256gcm chacha20poly1305
   set src-addr-type subnet6
   set dst-addr-type subnet6
next
end
```

To test the results:

1. Connect to the VPN with FortiClient 1 on PC1 then check the assigned IP address:

   ```plaintext
   # diagnose vpn ike gateway list
   ```

   ```plaintext
   vd: root/0
   name: FCT_0
   version: 1
   interface: port27 17
   addr: 173.1.1.1:4500 -> 173.1.1.2:60417
   tun_id: 173.1.1.2
   remote_location: 0.0.0.0
   virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
   created: 14s ago
   xauth-user: userc
   2FA: no
   FortiClient UID: 7C0897D80C8E4B6DAC775DD6B0F93BAA
   assigned IPv4 address: 10.20.1.1/128
   assigned IPv6 address: 2001::1/128
   nat: peer
   IKE SA: created 1/1 established 1/1 time 100/100/100 ms
   IPsec SA: created 2/2 established 2/2 time 0/5/10 ms
   ```

2. Disconnect FortiClient 1 and connect with FortiClient 2. The IP address assigned to FortiClient 1 is not released to the pool, and a different IP address is assigned to FortiClient 2:

   ```plaintext
   # diagnose vpn ike gateway list
   ```

   ```plaintext
   vd: root/0
   name: FCT_0
   version: 1
   ```
interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:64916
tun_id: 173.1.1.2
remote_location: 0.0.0.0
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 6s ago
xauth-user: usera
2FA: no
FortiClient UID: EAF90E297393456AB546A041066C0720
assigned IPv4 address: 10.20.1.2/255.255.255.255
assigned IPv6 address: 2001::2/128
nat: peer
IKE SA: created 1/1 established 1/1 time 110/110/110 ms
IPsec SA: created 2/2 established 2/2 time 0/5/10 ms

id/spi: 3 b25141d5a915e67e/b32decdb8cf98318
direction: responder
status: established 6-6s ago = 110ms

DPD sent/recv: 00000000/000000a9
Instead of waiting for 240 seconds, you can instead use the `diagnose vpn ike gateway flush` command to release the previously used IP addresses back into the pool.

Site-to-site VPN

A site-to-site VPN connection lets branch offices use the Internet to access the main office's intranet. A site-to-site VPN allows offices in multiple, fixed locations to establish secure connections with each other over a public network such as the Internet.

The following sections provide instructions for configuring site-to-site VPNs:

- FortiGate-to-FortiGate on page 1360
- FortiGate-to-third-party on page 1388

FortiGate-to-FortiGate

This section contains the following topics about FortiGate-to-FortiGate VPN configurations:

- Basic site-to-site VPN with pre-shared key on page 1360
- Site-to-site VPN with digital certificate on page 1365
- Site-to-site VPN with overlapping subnets on page 1372
- GRE over IPsec on page 1376
- Policy-based IPsec tunnel on page 1381

Basic site-to-site VPN with pre-shared key

This is a sample configuration of IPsec VPN authenticating a remote FortiGate peer with a pre-shared key.

To configure IPsec VPN authenticating a remote FortiGate peer with a pre-shared key in the GUI:

1. Configure the HQ1 FortiGate.
   a. Go to `VPN > IPsec Wizard` and configure the following settings for `VPN Setup`:
      i. Enter a VPN name.
      ii. For `Template Type`, select `Site to Site`.
      iii. For `Remote Device Type`, select `FortiGate`.
      iv. For `NAT Configuration`, select `No NAT Between Sites`.
      v. Click `Next`.  

b. Configure the following settings for **Authentication**:
   i. For **Remote Device**, select IP Address.
   ii. For the IP address, enter **172.16.202.1**.
   iii. For **Outgoing interface**, enter **port1**.
   iv. For **Authentication Method**, select **Pre-shared Key**.
   v. In the **Pre-shared Key** field, enter **sample** as the key.
   vi. Click **Next**.

c. Configure the following settings for **Policy & Routing**:
   i. From the **Local Interface** dropdown menu, select the local interface.
   ii. Configure the **Local Subnets** as **10.1.100.0**.
   iii. Configure the **Remote Subnets** as **172.16.101.0**.
   iv. Click **Create**.

2. Configure the HQ2 FortiGate.
   a. Go to **VPN > IPsec Wizard** and configure the following settings for **VPN Setup**:
      i. Enter a **VPN name**.
      ii. For **Template Type**, select **Site to Site**.
      iii. For **Remote Device Type**, select **FortiGate**.
      iv. For **NAT Configuration**, select **No NAT Between Sites**.
      v. Click **Next**.
   b. Configure the following settings for **Authentication**:
      i. For **Remote Device**, select IP Address.
      ii. For the IP address, enter **172.16.2001**.
      iii. For **Outgoing interface**, enter **port25**.
      iv. For **Authentication Method**, select **Pre-shared Key**.
      v. In the **Pre-shared Key** field, enter **sample** as the key.
      vi. Click **Next**.
   c. Configure the following settings for **Policy & Routing**:
      i. From the **Local Interface** dropdown menu, select the local interface.
      ii. Configure **Local Subnets** as **172.16.101.0**.
      iii. Configure the **Remote Subnets** as **10.1.100.0**.
      iv. Click **Create**.

**To configure IPsec VPN authenticating a remote FortiGate peer with a pre-shared key using the CLI:**

1. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. The IPsec tunnel is established over the WAN interface.
   a. Configure HQ1.

```bash
config system interface
eedit "port1"
  set vdom "root"
  set ip 172.16.200.1 255.255.255.0
next
end
config router static
eedit 1
  set gateway 172.16.200.3
  set device "port1"
```
b. Configure HQ2.

```fortios```

```fortios```

2. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.

a. Configure HQ1.

```fortios```

```fortios```

b. Configure HQ2.

```fortios```

```fortios```

3. Configure the IPsec phase1-interface.

a. Configure HQ1.

```fortios```

```fortios```

b. Configure HQ2.

```fortios```

```fortios```
4. Configure the IPsec phase2-interface.
   a. Configure HQ1.

```
config vpn ipsec phase2-interface
  edit "to_HQ2"
    set phase1name "to_HQ2"
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set auto-negotiate enable
  next
end
```

b. Configure HQ2.

```
config vpn ipsec phase2-interface
  edit "to_HQ2"
    set phase1name "to_HQ1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
    aes256gcm chacha20poly1305
    set auto-negotiate enable
  next
end
```

5. Configure the static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.
   a. Configure HQ1.

```
config router static
  edit 2
    set dst 172.16.101.0 255.255.255.0
    set device "to_HQ2"
  next
  edit 3
    set dst 172.16.101.0 255.255.255.0
    set blackhole enable
    set distance 254
  next
end
```

b. Configure HQ2.

```
config router static
  edit 2
    set dst 10.1.100.0 255.255.255.0
    set device "to_HQ1"
  next
  edit 3
    set dst 10.1.100.0 255.255.255.0
    set blackhole enable
    set distance 254
  next
end
```
6. Configure two firewall policies to allow bidirectional IPsec traffic flow over the IPsec VPN tunnel.
   a. Configure HQ1.

```plaintext
config firewall policy
  edit 1
  set name "inbound"
  set srcintf "to_HQ2"
  set dstintf "dmz"
  set srcaddr "172.16.101.0"
  set dstaddr "10.1.100.0"
  set action accept
  set schedule "always"
  set service "ALL"
next
edit 2
  set name "outbound"
  set srcintf "dmz"
  set dstintf "to_HQ2"
  set srcaddr "10.1.100.0"
  set dstaddr "172.16.101.0"
  set action accept
  set schedule "always"
  set service "ALL"
next
end
```

b. Configure HQ2.

```plaintext
config firewall policy
  edit 1
  set name "inbound"
  set srcintf "to_HQ1"
  set dstintf "port9"
  set srcaddr "10.1.100.0"
  set dstaddr "172.16.101.0"
  set action accept
  set schedule "always"
  set service "ALL"
next
edit 2
  set name "outbound"
  set srcintf "port9"
  set dstintf "to_HQ1"
  set srcaddr "172.16.101.0"
  set dstaddr "10.1.100.0"
  set action accept
  set schedule "always"
  set service "ALL"
next
end
```

7. Run `diagnose` commands. The `diagnose debug application ike -l` command is the key to troubleshoot why the IPsec tunnel failed to establish. If the PSK failed to match, the following error shows up in the debug output:

```plaintext
ike 0:to_HQ2:15037: parse error
ike 0:to_HQ2:15037: probable pre-shared secret mismatch'
```

The following commands are useful to check IPsec phase1/phase2 interface status.
a. Run the `diagnose vpn ike gateway list` command on HQ1. The system should return the following:

```
vd: root/0
name: to_HQ2
version: 1
interface: port1 11
created: 5s ago
IKE SA: created 1/1 established 1/1 time 0/0/0 ms
IPsec SA: created 2/2 established 2/2 time 0/0/0 ms
id/spi: 12 6e8d0532e7fe8d84/3694ac323138a024
direction: responder
status: established 5-5s ago = 0ms
proposal: aes128-sha256
key: b3eb46dd0d385aff-7bb9ee241362ee8d
lifetime/rekey: 86400/86124
```

b. Run the `diagnose vpn tunnel list` command on HQ1. The system should return the following:

```
list all ipsec tunnel in vd 0
name=to_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0
bound_if=11 lgwy=static/1 tun intf/0 mode=auto/1 encap=none/528 options[0210]=create_dev frag-rcfaccept_traffic=1
proxyid_num=1 child_num=0 refcnt=11 ilast=7 olast=87 ad=/0
stat: rxp=0 txp=0 rxb=0 txb=0
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=0
natt: mode=none draft=0 interval=0 remote_port=0
proxyid=to_HQ2 proto=0 sa=1 ref=2 serial=1 auto-negotiate
src: 0:0:0:0/0.0.0.0:0
dst: 0:0:0:0/0.0.0.0:0
SA: ref=3 options=18227 type=00 soft=0 mtu=1438 expire=42927/0B replaywin=2048

dec:pkts/bytes=0/0, enc:pkts/bytes=0/0
```

**Site-to-site VPN with digital certificate**

This is a sample configuration of IPsec VPN authenticating a remote FortiGate peer with a certificate. The certificate on one peer is validated by the presence of the CA certificate installed on the other peer.
To configure IPsec VPN authenticating a remote FortiGate peer with a digital certificate in the GUI:

1. Import the certificate.
2. Configure user peers.
3. Configure the HQ1 FortiGate.
   a. Go to VPN > IPsec Wizard and configure the following settings for VPN Setup:
      i. Enter a VPN name.
      ii. For Template Type, select Site to Site.
      iii. For Remote Device Type, select FortiGate.
      iv. For NAT Configuration, select No NAT Between Sites.
      v. Click Next.
   b. Configure the following settings for Authentication:
      i. For Remote Device, select IP Address.
      ii. For the IP address, enter 172.16.202.1.
      iii. For Outgoing interface, enter port1.
      iv. For Authentication Method, select Signature.
      v. In the Certificate name field, select the imported certificate.
      vi. From the Peer Certificate CA dropdown list, select the desired peer CA certificate.
      vii. Click Next.
   c. Configure the following settings for Policy & Routing:
      i. From the Local Interface dropdown menu, select the local interface.
      ii. Configure the Local Subnets as 10.1.100.0.
      iii. Configure the Remote Subnets as 172.16.101.0.
      iv. Click Create.
4. Configure the HQ2 FortiGate.
   a. Go to VPN > IPsec Wizard and configure the following settings for VPN Setup:
      i. Enter a VPN name.
      ii. For Template Type, select Site to Site.
      iii. For Remote Device Type, select FortiGate.
      iv. For NAT Configuration, select No NAT Between Sites.
      v. Click Next.
   b. Configure the following settings for Authentication:
      i. For Remote Device, select IP Address.
      ii. For the IP address, enter 172.16.2001.
      iii. For Outgoing interface, enter port25.
      iv. For Authentication Method, select Signature.
      v. In the Certificate name field, select the imported certificate.
      vi. From the Peer Certificate CA dropdown list, select the peer CA certificate.
      vii. Click Next.
   c. Configure the following settings for Policy & Routing:
      i. From the Local Interface dropdown menu, select the local interface.
      ii. Configure Local Subnets as 172.16.101.0.
      iii. Configure the Remote Subnets as 10.1.100.0.
      iv. Click Create.
To configure IPsec VPN authenticating a remote FortiGate peer with a digital certificate using the CLI:

1. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. The IPsec tunnel is established over the WAN interface.
   a. Configure HQ1.
      
      ```
      config system interface
      edit "port1"
      set vdom "root"
      set ip 172.16.200.1 255.255.255.0
      next
      end
      config router static
      edit 1
      set gateway 172.16.200.3
      set device "port1"
      next
      end
      ```
   b. Configure HQ2.
      
      ```
      config system interface
      edit "port25"
      set vdom "root"
      set ip 172.16.202.1 255.255.255.0
      next
      end
      config router static
      edit 1
      set gateway 172.16.202.2
      set device "port25"
      next
      end
      ```

2. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.
   a. Configure HQ1.
      
      ```
      config system interface
      edit "dmz"
      set vdom "root"
      set ip 10.1.100.1 255.255.255.0
      next
      end
      ```
   b. Configure HQ2.
      
      ```
      config system interface
      edit "port9"
      set vdom "root"
      set ip 172.16.101.1 255.255.255.0
      next
      end
      ```

3. Configure the import certificate and its CA certificate information. The certificate and its CA certificate must be imported on the remote peer FortiGate and on the primary FortiGate before configuring IPsec VPN tunnels. If the built-in Fortinet_Factory certificate and the Fortinet_CA CA certificate are used for authentication, you can skip this step.
a. Configure HQ1.

```fortigate-config
config vpn certificate local
   edit "test1"
      ...  
      set range global
   next
end

config vpn certificate ca
   edit "CA_Cert_1"
      ...  
      set range global
   next
end
```

b. Configure HQ2.

```fortigate-config
config vpn certificate local
   edit "test2"
      ...  
      set range global
   next
end

config vpn certificate ca
   edit "CA_Cert_1"
      ...  
      set range global
   next
end
```

4. Configure the peer user. The peer user is used in the IPsec VPN tunnel peer setting to authenticate the remote peer FortiGate.

a. If not using the built-in Fortinet_Factory certificate and Fortinet_CA CA certificate, do the following:

i. Configure HQ1.

```fortigate-config
config user peer
   edit "peer1"
      set ca "CA_Cert_1"
   next
end
```

ii. Configure HQ2.

```fortigate-config
config user peer
   edit "peer2"
      set ca "CA_Cert_1"
   next
end
```

b. If the built-in Fortinet_Factory certificate and Fortinet_CA CA certificate are used for authentication, the peer user must be configured based on Fortinet_CA.

i. Configure HQ1.

```fortigate-config
config user peer
   edit "peer1"
      set ca "Fortinet_CA"
   next
end
```
ii. Configure HQ2.

```fortios```
```
config user peer
edit "peer2"
  set ca "Fortinet_CA"
next
end
```

5. Configure the IPsec phase1-interface.
   a. Configure HQ1.

```fortios```
```
config vpn ipsec phase1-interface
edit "to_HQ2"
  set interface "port1"
  set authmethod signature
  set net-device enable
  set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
  set remote-gw 172.16.202.1
  set certificate "test1"
  set peer "peer1"
next
end
```

b. Configure HQ2.

```fortios```
```
config vpn ipsec phase1-interface
edit "to_HQ1"
  set interface "port25"
  set authmethod signature
  set net-device enable
  set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
  set remote-gw 172.16.200.1
  set certificate "test2"
  set peer "peer2"
next
end
```

6. Configure the IPsec phase2-interface.
   a. Configure HQ1.

```fortios```
```
config vpn ipsec phase2-interface
edit "to_HQ2"
  set phaselname "to_HQ2"
  set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
  aes256gcm chacha20poly1305
  set auto-negotiate enable
next
end
```

b. Configure HQ2.

```fortios```
```
config vpn ipsec phase2-interface
edit "to_HQ1"
  set phaselname "to_HQ1"
  set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
  aes256gcm chacha20poly1305
  set auto-negotiate enable
next
end
```
7. Configure the static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.
   a. Configure HQ1.

   ```
   config router static
   edit 2
   set dst 172.16.101.0 255.255.255.0
   set device "to_HQ2"
   next
   edit 3
   set dst 172.16.101.0 255.255.255.0
   set blackhole enable
   set distance 254
   next
   end
   ```

   b. Configure HQ2.

   ```
   config router static
   edit 2
   set dst 10.1.100.0 255.255.255.0
   set device "to_HQ1"
   next
   edit 3
   set dst 10.1.100.0 255.255.255.0
   set blackhole enable
   set distance 254
   next
   end
   ```

8. Configure two firewall policies to allow bidirectional IPsec traffic flow over the IPsec VPN tunnel.
   a. Configure HQ1.

   ```
   config firewall policy
   edit 1
   set name "inbound"
   set srcintf "to_HQ2"
   set dstintf "dmz"
   set srcaddr "172.16.101.0"
   set dstaddr "10.1.100.0"
   set action accept
   set schedule "always"
   set service "ALL"
   next
   edit 2
   set name "outbound"
   set srcintf "dmz"
   set dstintf "to_HQ2"
   set srcaddr "10.1.100.0"
   set dstaddr "172.16.101.0"
   set action accept
   set schedule "always"
   set service "ALL"
   next
   end
   ```
b. Configure HQ2.

```plaintext
config firewall policy
   edit 1
      set name "inbound"
      set srcintf "to_HQ1"
      set dstintf "port9"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "outbound"
      set srcintf "port9"
      set dstintf "to_HQ1"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```

9. Run diagnose commands. The `diagnose debug application ike -l` command is the key to troubleshoot why the IPsec tunnel failed to establish. If the remote FortiGate certificate cannot be validated, the following error shows up in the debug output:

```plaintext
ike 0: to_HQ2:15314: certificate validation failed
```

The following commands are useful to check IPsec phase1/phase2 interface status.

a. Run the `diagnose vpn ike gateway list` command on HQ1. The system should return the following:

```plaintext
vd: root/0
name: to_HQ2
version: 1
interface: port1 11
created: 7s ago
peer-id: C = CA, ST = BC, L = Burnaby, O = Fortinet, OU = QA, CN = test2
peer-id-auth: yes
IKE SA: created 1/1 established 1/1 time 70/70/70 ms
IPsec SA: created 1/1 established 1/1 time 80/80/80 ms
id/spi: 15326 295be407fbdf5c13/7a5a52afa56ad34 direction: initiator status:
established 7-7s ago = 70ms proposal: aes128-sha256 key: 4aa06dbee359a4c7-43570710864bcf7b lifetime/rekey: 86400/86092 DPD sent/recv: 00000000/00000000 peer-
id: C = CA, ST = BC, L = Burnaby, O = Fortinet, OU = QA, CN = test2
```

b. Run the `diagnose vpn tunnel list` command on HQ1. The system should return the following:

```plaintext
list all ipsec tunnel in vd 0
name=to_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.200.1
bound_if=11 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/528 options[0210]=create_
dev frag-rfcaccept_traffic=1
proxyid_num=1 child_num=0 refcnt=14 ilast=19 olast=179 ad=/0
stat: rxp=0 txp=0 rxb=0 txb=0
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=0
```
Site-to-site VPN with overlapping subnets

This is a sample configuration of IPsec VPN to allow transparent communication between two overlapping networks that are located behind different FortiGates using a route-based tunnel with source and destination NAT.

In the following topology, both FortiGates (HQ and Branch) use 192.168.1.0/24 as their internal network, but both networks need to be able to communicate to each other through the IPsec tunnel.

New virtual subnets of equal size must be configured and used for all communication between the two overlapping subnets. The devices on both local networks do not need to change their IP addresses. However, the devices and users must use the new subnet range of the remote network to communicate across the tunnel.

Configuring the HQ FortiGate

To configure IPsec VPN:

1. Go to VPN > IPsec Wizard and select the Custom template.
2. Enter the name VPN-to-Branch and click Next.
3. For the IP Address, enter the Branch public IP address (172.25.177.46), and for Interface, select the HQ WAN interface (wan1).
4. For Pre-shared Key, enter a secure key. You will use the same key when configuring IPsec VPN on the Branch FortiGate.
5. In the Phase 2 Selectors section, enter the subnets for the Local Address (10.1.1.0/24) and Remote Address (10.2.2.0/24).
6. Optionally, expand Advanced and enable Auto-negotiate.
7. Click OK.

To configure the static routes:

1. Go to Network > Static Routes and click Create New.
2. In the Destination field, enter the remote address subnet (10.2.2.0/24).
3. For Interface, select the VPN tunnel you just created, VPN-to-Branch.
4. Click OK.
5. Create another route with the same Destination, but change the Administrative Distance to 200 and for Interface, select Blackhole. This is a best practice for route-based IPsec VPN tunnels because it ensures traffic for the remote FortiGate’s subnet is not sent using the default route in the event that the IPsec tunnel goes down.

To configure the address objects:

1. Go to Policy & Objects > Addresses and click Create New > Address.
2. For Name, enter HQ-original.
3. For IP/Netmask, enter the original LAN subnet of HQ (192.168.1.0/24).
4. For Interface, select the LAN-side interface (internal).
5. Click OK.
6. Create another address object named Branch-new, but for IP/Netmask, enter the new LAN subnet of Branch (10.2.2.0/24), and select the VPN interface (VPN-to-Branch).

To configure the IP pool:

1. Go to Policy & Objects > IP Pools and click Create New.
2. For Name, enter HQ-new.
3. For Type, select Fixed Port Range.
4. Enter the External IP address/range (10.1.1.1 – 10.1.1.254, the new HQ subnet) and Internal IP Range (192.168.1.1 – 192.168.1.254, the original HQ subnet).
5. Click OK.

To configure the VIP:

1. Go to Policy & Objects > Virtual IPs and click Create New > Virtual IP.
2. For Name, enter HQ-new-to-original.
3. For Interface, select the VPN interface (VPN-to-Branch).
4. Enter the External IP address/range (10.1.1.1 – 10.1.1.254, the new HQ subnet) and Map to IPv4 address/range (192.168.1.1 – 192.168.1.254, the original HQ subnet).
5. Click OK.

To configure the firewall policy for traffic from HQ to Branch:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. For Name, enter From-HQ-to-Branch.
3. For Incoming Interface, select the LAN-side interface (internal).
4. For Outgoing Interface, select the VPN tunnel interface (VPN-to-Branch).
For Source, select HQ-original.
6. For Destination, select Branch-new.
7. For Service, select ALL.
8. Enable NAT.
9. Select Use Dynamic IP Pool and select the HQ-new IP pool.
10. Click OK.

To configure the firewall policy for traffic from Branch to HQ:

1. Click Create New and for Name, enter From-Branch-to HQ.
2. For Incoming Interface, select the VPN tunnel interface (VPN-to-Branch).
3. For Outgoing Interface, select the LAN-side interface (internal).
4. For Source, select Branch-new.
5. For Destination, select the HQ-new-to-original VIP.
6. For Service, select ALL.
7. Disable NAT.
8. Click OK.

Configuring the Branch FortiGate

To configure IPsec VPN:

1. Go to VPN > IPsec Wizard and select the Custom template.
2. Enter the name VPN-to-HQ and click Next.
3. For the IP Address, enter the HQ public IP address (172.25.176.142), and for Interface, select the Branch WAN interface (wan1).
4. For Pre-shared Key, enter the matching secure key used in the VPN-to-Branch tunnel.
5. In the Phase 2 Selectors section, enter the subnets for the Local Address (10.2.2.0/24) and Remote Address (10.1.1.0/24).
6. Optionally, expand Advanced and enable Auto-negotiate.
7. Click OK.

To configure the static routes:

1. Go to Network > Static Routes and click Create New.
2. In the Destination field, enter the remote address subnet (10.1.1.0/24).
3. For Interface, select the VPN tunnel you just created, VPN-to-HQ.
4. Click OK.
5. Create another route with the same Destination, but change the Administrative Distance to 200 and for Interface, select Blackhole.

To configure the address objects:

1. Go to Policy & Objects > Addresses and click Create New > Address.
2. For Name, enter Branch-original.
3. For IP/Netmask, enter the original LAN subnet of Branch (192.168.1.0/24).
4. For Interface, select the LAN-side interface (lan).
5. Click OK.
6. Create another address object named HQ-new, but for IP/Netmask, enter the new LAN subnet of HQ (10.1.1.0/24), and select the VPN interface (VPN-to-HQ).

To configure the IP pool:

1. Go to Policy & Objects > IP Pools and click Create New.
2. For Name, enter Branch-new.
3. For Type, select Fixed Port Range.
4. Enter the External IP address/range (10.2.2.1 – 10.2.2.254, the new Branch subnet) and Internal IP Range (192.168.1.1 – 192.168.1.254, the original Branch subnet).
5. Click OK.

To configure the VIP:

1. Go to Policy & Objects > Virtual IPs and click Create New > Virtual IP.
2. For Name, enter Branch-new-to-original.
3. For Interface, select the VPN interface (VPN-to-HQ).
4. Enter the External IP address/range (10.2.2.1 – 10.2.2.254, the new Branch subnet) and Map to IPv4 address/range (192.168.1.1 – 192.168.1.254, the original Branch subnet).
5. Click OK.

To configure the firewall policy for traffic from Branch to HQ:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. For Name, enter From-Branch-to-HQ.
3. For Incoming Interface, select the LAN-side interface (lan).
4. For Outgoing Interface, select the VPN tunnel interface (VPN-to-HQ).
5. For Source, select Branch-original.
6. For Destination, select HQ-new.
7. For Service, select ALL.
8. Enable NAT.
10. Click OK.

To configure the firewall policy for traffic from HQ to Branch:

1. Click Create New and for Name, enter From-HQ-to-Branch.
2. For Incoming Interface, select the VPN tunnel interface (VPN-to-HQ).
3. For Outgoing Interface, select the LAN-side interface (lan).
4. For Source, select HQ-new.
5. For Destination, select the Branch-new-to-original VIP.
6. For Service, select ALL.
7. Disable NAT.
8. Click OK.
To verify the communication across the tunnel:

1. Go to Dashboard > Network and click the IPsec widget to expand to full screen view. The tunnels should be up on both FortiGates. If you did not enable Auto-negotiate in the IPsec VPN settings, you may have to select the tunnel and click Bring Up.

2. From a PC on the HQ network, ping a PC on the Branch network using the new IP for the Branch PC. The ping should be successful.

```
C:\Users\jheadley> ping 10.2.2.98
Pinging 10.2.2.98 with 32 bytes of data:
  Reply from 10.2.2.98: bytes=32 time=7ms TTL=62
  Reply from 10.2.2.98: bytes=32 time=1ms TTL=62
  Reply from 10.2.2.98: bytes=32 time=1ms TTL=62
  Reply from 10.2.2.98: bytes=32 time=1ms TTL=62
Ping statistics for 10.2.2.98:

```

**GRE over IPsec**

This is an example of GRE over an IPsec tunnel using a static route over GRE tunnel and `tunnel-mode` in the `phase2-interface` settings.
To configure GRE over an IPsec tunnel:

1. Enable subnet overlapping at both HQ1 and HQ2.
   
   ```
   config system settings
   set allow-subnet-overlap enable
   end
   ```

2. Configure the WAN interface and static route.
   
   a. HQ1.

   ```
   config system interface
   edit "port1"
   + set ip 172.16.200.1 255.255.255.0
   next
   edit "dmz"
   + set ip 10.1.100.1 255.255.255.0
   next
   end
   config router static
   edit 1
   + set gateway 172.16.200.3
   set device "port1"
   next
   end
   ```

   b. HQ2.

   ```
   config system interface
   edit "port25"
   + set ip 172.16.202.1 255.255.255.0
   next
   edit "port9"
   + set ip 172.16.101.1 255.255.255.0
   next
   end
   config router static
   edit 1
   + set gateway 172.16.202.2
   set device "port25"
   next
   end
   ```

   
   a. HQ1.

   ```
   config vpn ipsec phase1-interface
   edit "greipsec"
   + set interface "port1"
   set peer-type any
   set proposal aes128-sha256 aes256-sha256 aes128-shal aes256-shal
   set remote-gw 172.16.202.1
   set psksecret sample
   next
   end
   config vpn ipsec phase2-interface
   edit "greipsec"
   + set phase1name "greipsec"
   ```
set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
set protocol 47
next
end

b. HQ2.

cfg vpn ipsec phase1-interface
edit "greipsec"
set interface "port25"
set peertype any
set proposal aes128-sha256 aes256-sha256 aes128-sha256 aes256-sha1
set remote-gw 172.16.200.1
set psksecret sample
next
end

config vpn ipsec phase2-interface
edit "greipsec"
set phase1name "greipsec"
set proposal aes128-sha256 aes256-sha256 aes256-sha256 aes256-sha1
aes256gcm chacha20poly1305
set protocol 47
next
end

4. Configure IPsec tunnel interface IP address.
   a. HQ1.

cfg system interface
edit "greipsec"
set ip 10.10.10.1 255.255.255.255
set remote-ip 10.10.10.2 255.255.255.255
next
end

b. HQ2.

cfg system interface
edit "greipsec"
set ip 10.10.10.2 255.255.255.255
set remote-ip 10.10.10.1 255.255.255.255
next
end

5. Configure the GRE tunnel.
   a. HQ1.

cfg system gre-tunnel
edit "gre_to_HQ2"
set interface "greipsec"
set remote-gw 10.10.10.2
set local-gw 10.10.10.1
next
end
b. HQ2.

```plaintext
cfg config system gre-tunnel
    edit "gre_to_HQ1"
        set interface "greipsec"
        set remote-gw 10.10.10.1
        set local-gw 10.10.10.2
    next
end
```

6. Configure the firewall policy.

a. HQ1.

```plaintext
cfg config firewall policy
    edit 1
        set srcintf "dmz"
        set dstintf "gre_to_HQ2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "gre_to_HQ2"
        set dstintf "dmz"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 3
        set srcintf "greipsec"
        set dstintf "greipsec"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

b. HQ2.

```plaintext
cfg config firewall policy
    edit 1
        set srcintf "port9"
        set dstintf "gre_to_HQ1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "gre_to_HQ1"
        set dstintf "port9"
```
VPN

set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
next
edit 3
    set srcintf "greipsec"
    set dstintf "greipsec"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
next
end

7. Configure the static route.
   a. HQ1.

   config router static
       edit 2
           set dst 172.16.101.0 255.255.255.0
           set device "gre_to_HQ2"
       next
   end

   b. HQ2.

   config router static
       edit 2
           set dst 10.1.100.0 255.255.255.0
           set device "gre_to_HQ1"
       next
   end

To view the VPN tunnel list on HQ1:

Policy-based IPsec tunnel

This is an example of policy-based IPsec tunnel using site-to-site VPN between branch and HQ. HQ is the IPsec concentrator.

Sample topology

![Sample topology diagram]

Sample configuration

To configure a policy-based IPsec tunnel using the GUI:

- Configure the IPsec VPN at HQ.
- Configure the IPsec concentrator at HQ.
- Configure the firewall policy at HQ.
- Configure IPsec VPN at branch 1.
- Configure the firewall policy at branch 1.
- Configure IPsec VPN at branch 2.
- Configure the firewall policy at branch 2.

To configure the IPsec VPN at HQ:

1. Go to VPN > IPsec Wizard to set up branch 1.
   a. Enter a VPN Name. In this example, to_branch1.
   b. For Template Type, click Custom. Click Next.
   c. Uncheck Enable IPsec Interface Mode.
   d. For Remote Gateway, select Static IP Address.
e. Enter IP address, in this example, 15.1.1.2.

f. For Interface, select port9.

g. In the Authentication section, for Method, select Pre-shared Key and enter the Pre-shared Key.

h. Click OK.

2. Go to VPN > IPsec Wizard to set up branch 2.

a. Enter a VPN Name. In this example, to_branch2.

b. For Template Type, click Custom. Click Next.

c. Uncheck Enable IPsec Interface Mode.

d. For Remote Gateway, select Static IP Address.

e. Enter IP address, in this example, 13.1.1.2.

f. For Interface, select port9.

g. In the Authentication section, for Method, select Pre-shared Key and enter the Pre-shared Key.

h. Click OK.

To configure the IPsec concentrator at HQ:

1. Go to VPN > IPsec Concentrator and click Create New.

2. Enter a name. In this example, branch.

3. Add the Members to_branch1 and to_branch2.

4. Click OK.

To configure the firewall policy at HQ:

1. Go to Policy & Objects > Firewall Policy and click Create New.

2. Enter a policy Name.

3. For Incoming Interface, select port10.

4. For Outgoing Interface, select port9.

5. Select the Source, Destination, Schedule, Service, and set Action to IPsec.

6. Select the VPN Tunnel, in this example, Branch1/Branch2.

7. In this example, enable Allow traffic to be initiated from the remote site.

8. Click OK.

To configure IPsec VPN at branch 1:

1. Go to VPN > IPsec Wizard to set up branch 1.

2. Enter a VPN name. In this example, to_HQ.

3. For Template Type, click Custom. Click Next.

4. Uncheck Enable IPsec Interface Mode.

5. For Remote Gateway, select Static IP Address.

6. Enter IP address, in this example, 22.1.1.1.

7. For Interface, select wan1.

8. In the Authentication section, for Method, select Pre-shared Key and enter the Pre-shared Key.

9. Click OK.
To configure the firewall policy at branch 1:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Enter a policy Name.
3. Choose the Incoming Interface, in this example, internal.
4. Choose the Outgoing Interface, in this example, wan1.
5. Select the Source, Destination, Schedule, Service, and set Action to IPsec.
6. Select the VPN Tunnel, in this example, Branch1/Branch2.
7. In this example, enable Allow traffic to be initiated from the remote site.
8. Click OK.

To configure IPsec VPN at branch 2:

1. Go to VPN > IPsec Wizard to set up branch 1.
2. Enter a VPN name. In this example, to_HQ.
3. For Template Type, click Custom. Click Next.
4. Uncheck Enable IPsec Interface Mode.
5. For Remote Gateway, select Static IP Address.
6. Enter IP address, in this example, 22.1.1.1.
7. For Interface, select wan1.
8. In the Authentication section, for Method, select Pre-shared Key and enter the Pre-shared Key.
9. Click OK.

To configure the firewall policy at branch 2:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Enter a policy Name.
3. Choose the Incoming Interface, in this example, internal.
4. Choose the Outgoing Interface, in this example, wan1.
5. Select the Source, Destination, Schedule, Service, and set Action to IPsec.
6. Select the VPN Tunnel, in this example, to_HQ.
7. In this example, enable Allow traffic to be initiated from the remote site.
8. Click OK.

To configure a policy-based IPsec tunnel using the CLI:

1. Configure the HQ WAN interface and static route.

   ```
   config system interface
   edit "port9"
       set alias "WAN"
       set ip 22.1.1.1 255.255.255.0
   next
   edit "port10"
       set alias "Internal"
       set ip 172.16.101.1 255.255.255.0
   next
   end
   config router static
   ```
edit 1
   set gateway 22.1.1.2
   set device "port9"
next
end

2. Configure the HQ IPsec phase1 and phase2.

config vpn ipsec phase1
   edit "to_branch1"
      set interface "port9"
      set peertype any
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 15.1.1.2
      set psksecret sample
   next
   edit "to_branch2"
      set interface "port9"
      set peertype any
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 13.1.1.2
      set psksecret sample
   next
end

config vpn ipsec phase2
   edit "to_branch1"
      set phase1name "to_branch1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
   next
   edit "to_branch2"
      set phase1name "to_branch2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
      aes256gcm chacha20poly1305
   next
end

3. Configure the firewall policy at HQ.

config firewall policy
   edit 1
      set srcintf "port10"
      set dstintf "port9"
      set srcaddr "all"
      set dstaddr "10.1.100.0"
      set action ipsec
      set schedule "always"
      set service "ALL"
      set inbound enable
      set vpntunnel "to_branch1"
   next
   edit 2
      set srcintf "port10"
      set dstintf "port9"
      set srcaddr "all"
      set dstaddr "192.168.4.0"
      set action ipsec
set schedule "always"
set service "ALL"
set inbound enable
set vpntunnel "to_branch2"
next
end

4. Configure the IPsec concentrator at HQ.

config vpn ipsec concentrator
   edit "branch"
      set member "to_branch1" "to_branch2"
   next
end

5. Configure the branch WAN interface and static route.

   a. For branch 1.

      config system interface
         edit "wan1"
            set alias "primary_WAN"
            set ip 15.1.1.2 255.255.255.0
         next
         edit "internal"
            set ip 10.1.100.1 255.255.255.0
         next
      end
      config router static
         edit 1
            set gateway 15.1.1.1
            set device "wan1"
         next
      end

   b. For branch 2.

      config system interface
         edit "wan1"
            set alias "primary_WAN"
            set ip 13.1.1.2 255.255.255.0
         next
         edit "internal"
            set ip 192.168.4.1 255.255.255.0
         next
      end
      config router static
         edit 1
            set gateway 13.1.1.1
            set device "wan1"
         next
      end

6. Configure the branch IPsec phase1 and phase2.

   a. For branch 1.

      config vpn ipsec phase1
         edit "to_HQ"
            set interface "wan1"
VPN

set peertype any
set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
set remote-gw 22.1.1.1
set psksecret sample
next
end
config vpn ipsec phase2
edit "to_HQ"
set phaselnname "to_HQ"
set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
next
end
b. For branch 2.

config vpn ipsec phase1
edit "to_HQ"
set interface "wan1"
set peertype any
set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
set remote-gw 22.1.1.1
set psksecret sample
next
end
config vpn ipsec phase2
edit "to_HQ"
set phaselnname "to_HQ"
set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
next
end

7. Configure the branch firewall policy.
   a. For branch 1.

config firewall policy
edit 1
set srcintf "internal"
set dstintf "wan1"
set srcaddr "10.1.100.0"
set dstaddr "all"
set action ipsec
set schedule "always"
set service "ALL"
set inbound enable
set vpntunnel "to_HQ"
next
end
b. For branch 2.

config firewall policy
edit 1
set srcintf "internal"
set dstintf "wan1"
set srcaddr "192.168.4.0"
set dstaddr "all"
set action ipsec
set schedule "always"
set service "ALL"
set inbound enable
set vpntunnel "to_HQ"

next
eend

FortiGate-to-third-party

This section contains the following topics about FortiGate-to-third-party VPN configurations:
- IKEv2 IPsec site-to-site VPN to an AWS VPN gateway on page 1388
- IPsec VPN to Azure with virtual network gateway on page 1394
- IPsec VPN to an Azure with virtual WAN on page 1403
- IPSec VPN between a FortiGate and a Cisco ASA with multiple subnets on page 1407
- Cisco GRE-over-IPsec VPN on page 1407

IKEv2 IPsec site-to-site VPN to an AWS VPN gateway

This is a sample configuration of an IPsec site-to-site VPN connection between an on-premise FortiGate and an AWS virtual private cloud (VPC).

AWS uses unique identifiers to manipulate a VPN connection's configuration. Each VPN connection is assigned an identifier and is associated with two other identifiers: the customer gateway ID for the FortiGate and virtual private gateway ID.

This example includes the following IDs:
- VPN connection ID: vpn-07e988ccc1d46f749
- Customer gateway ID: cgw-0440c1aebed2f418a
- Virtual private gateway ID

This example assumes that you have configured VPC-related settings in the AWS management portal as described in Create a Secure Connection using AWS VPC.

This example includes creating and configuring two tunnels. You must configure both tunnels on your FortiGate.

To configure IKEv2 IPsec site-to-site VPN to an AWS VPN gateway:

1. Configure the first VPN tunnel:
   a. Configure Internet Key Exchange (IKE).
   b. Configure IPsec.
   c. Configure the tunnel interface.
   d. Configure border gateway protocol (BGP).
   e. Configure firewall policies.
2. Configure the second VPN tunnel:
   a. Configure Internet Key Exchange (IKE).
   b. Configure IPsec.
   c. Configure the tunnel interface.
   d. Configure BGP.
   e. Configure firewall policies.
To configure IKE for the first VPN tunnel:

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman (DH), lifetime, and key parameters. These sample configurations fulfill the minimum requirements for AES128, SHA1, and DH Group 2. Category VPN connections in the GovCloud AWS region have a minimum requirement of AES128, SHA2, and DH Group 14. To take advantage of AES256, SHA256, or other DH groups such as 14-18, 22, 23, and 24, you must modify these sample configuration files. Higher parameters are only available for VPNs of category "VPN", not for "VPN-Classic".

Your FortiGate's external interface's address must be static. Your FortiGate may reside behind a device performing NAT. To ensure NAT traversal can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, it is recommended to disable NAT traversal.

Begin configuration in the root VDOM. The interface name must be shorter than 15 characters. It is best if the name is shorter than 12 characters. IPsec dead peer detection (DPD) causes periodic messages to be sent to ensure a security association remains operational.

config vpn ipsec phase1-interface
  edit vpn-07e988ccc1d46f749-0
    set interface "wan1"
    set dpd enable
    set local-gw 35.170.66.108
    set dhgrp 2
    set proposal aes128-sha1
    set keylife 28800
    set remote-gw 3.214.239.164
    set psksecret iCelks0Uoob8z4SYIRM6zlx.rU2C3jth
    set dpd-retryinterval 10
  next
end

To configure IPsec for the first VPN tunnel:

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters.

config vpn ipsec phase2-interface
  edit "vpn-07e988ccc1d46f749-0"
    set phasename "vpn-07e988ccc1d46f749-0"
    set proposal aes128-sha1
    set dhgrp 2
    set pfs enable
    set keylifeseconds 3600
  next
end

To configure the tunnel interface for the first VPN tunnel:

You must configure a tunnel interface as the logical interface associated with the tunnel. All traffic routed to the tunnel interface must be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

You must configure the interface's address with your FortiGate's address. If the address changes, you must recreate the FortiGate and VPN connection with Amazon VPC.

The tcp-mss option causes the router to reduce the TCP packets' maximum segment size to prevent packet fragmentation.
config system interface
edit "vpn-07e988cc1d46ef749-0"
  set vdom "root"
  set ip 169.254.45.90 255.255.255.255
  set allowaccess ping
  set type tunnel
  set tcp-mss 1379
  set remote-ip 169.254.45.89
  set mtu 1427
  set interface "wan1"
next
end

To configure BGP for the first VPN tunnel:

BGP is used within the tunnel to exchange prefixes between the virtual private gateway and your FortiGate. The virtual private gateway announces the prefix according to your VPC.

The local BGP autonomous system number (ASN) (65000) is configured as part of your FortiGate. If you must change the ASN, you must recreate the FortiGate and VPN connection with AWS.

Your FortiGate may announce a default route (0.0.0.0/0) to AWS. This is done using a prefix list and route map in FortiOS.

config router bgp
  set as 65000
config neighbor
  edit 169.254.45.89
    set remote-as 64512
  end
end
config router bgp
  config neighbor
    edit 169.254.45.89
      set capability-default-originate enable
    end
end
config router prefix-list
  edit "default_route"
  config rule
    edit 1
      set prefix 0.0.0.0 0.0.0.0
    next
  end
end
config router route-map
  edit "routemap1"
  config rule
    edit 1
      set match-ip-address "default_route"
    next
next
end
To advertise additional prefixes to the Amazon VPC, add these prefixes to the network statement and identify the prefix you want to advertise. Ensure that the prefix is present in the routing table of the device with a valid next-hop. If you want to advertise 192.168.0.0/16 to Amazon, you would do the following:

```config
config router bgp
config network
  edit 1
    set prefix 192.168.0.0 255.255.0.0
  next
end
```

**To configure firewall policies for the first VPN tunnel:**

Create a firewall policy permitting traffic from your local subnet to the VPC subnet, and vice-versa.

This example policy permits all traffic from the local subnet to the VPC. First, view all existing policies using the `show firewall policy` command. Then, create a new firewall policy starting with the next available policy ID. In this example, running `show firewall policy` displayed policies 1, 2, 3, and 4, so you would proceed to create policy 5.

```config
config firewall policy
  edit 5
    set srcintf "vpn-07e988ccc1d46f749-0"
    set dstintf internal
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  next
end
config firewall policy
  edit 5
    set srcintf internal
    set dstintf "vpn-07e988ccc1d46f749-0"
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  next
end
```

**To configure IKE for the second VPN tunnel:**

A policy is established for the supported ISAKMP encryption, authentication, DH, lifetime, and key parameters. These sample configurations fulfill the minimum requirements for AES128, SHA1, and DH Group 2. Category VPN connections in the GovCloud AWS region have a minimum requirement of AES128, SHA2, and DH Group 14. To take advantage of AES256, SHA256, or other DH groups such as 14-18, 22, 23, and 24, you must modify these sample configuration files. Higher parameters are only available for VPNs of category "VPN", not for "VPN-Classic".

Your FortiGate's external interface's address must be static. Your FortiGate may reside behind a device performing NAT. To ensure NAT traversal can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, it is recommended to disable NAT traversal.
Begin configuration in the root VDOM. The interface name must be shorter than 15 characters. It is best if the name is shorter than 12 characters. IPsec DPD causes periodic messages to be sent to ensure a security association remains operational.

```plaintext
config vpn ipsec phase1-interface
   edit vpn-07e988ccc1d46f749-1
      set interface "wan1"
      set dpd enable
      set local-gw 35.170.66.108
      set dpgrp 2
      set proposal aes128-shal
      set keylife 28800
      set remote-gw 100.25.187.58
      set psksecret IjFzyDneUtDdAT4RNmQ85apUG3y4Akre
      set dpd-retryinterval 10
next
end
```

To configure IPsec for the second VPN tunnel:

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters.

```plaintext
config vpn ipsec phase2-interface
   edit "vpn-07e988ccc1d46f749-1"
      set phasename "vpn-07e988ccc1d46f749-1"
      set proposal aes128-shal
      set dpgrp 2
      set pfs enable
      set keylifeseconds 3600
next
end
```

To configure the tunnel interface for the second VPN tunnel:

You must configure a tunnel interface as the logical interface associated with the tunnel. All traffic routed to the tunnel interface must be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

You must configure the interface’s address with your FortiGate’s address. If the address changes, you must recreate the FortiGate and VPN connection with Amazon VPC.

The tcp-mss option causes the router to reduce the TCP packets’ maximum segment size to prevent packet fragmentation.

```plaintext
config system interface
   edit "vpn-07e988ccc1d46f749-1"
      set vdom "root"
      set ip 169.254.44.162 255.255.255.255
      set allowaccess ping
      set type tunnel
      set tcp-mss 1379
      set remote-ip 169.254.44.161
      set mtu 1427
      set interface "wan1"
next
end
```
To configure BGP for the second VPN tunnel:

BGP is used within the tunnel to exchange prefixes between the virtual private gateway and your FortiGate. The virtual private gateway announces the prefix according to your VPC.

The local BGP ASN (65000) is configured as part of your FortiGate. If you must change the ASN, you must recreate the FortiGate and VPN connection with AWS.

Your FortiGate may announce a default route (0.0.0.0/0) to AWS. This is done using a prefix list and route map in FortiOS.

```
config router bgp
set as 65000
config neighbor
edit 169.254.44.161
  set remote-as 64512
end
config router bgp
config neighbor
edit 169.254.44.161
  set capability-default-originate enable
end
end
config router prefix-list
edit "default_route"
config rule
edit 1
  set prefix 0.0.0.0 0.0.0.0
  next
end
end
config router route-map
edit "routemap1"
config rule
edit 1
  set match-ip-address "default_route"
  next
next
end
end
```

To advertise additional prefixes to the Amazon VPC, add these prefixes to the network statement and identify the prefix you want to advertise. Ensure that the prefix is present in the routing table of the device with a valid next-hop. If you want to advertise 192.168.0.0/16 to Amazon, you would do the following:

```
config router bgp
config network
  edit 1
    set prefix 192.168.0.0 255.255.0.0
  next
end
```

To configure firewall policies for the second VPN tunnel:

Create a firewall policy permitting traffic from your local subnet to the VPC subnet, and vice-versa.
This example policy permits all traffic from the local subnet to the VPC. First, view all existing policies using the `show firewall policy` command. Then, create a new firewall policy starting with the next available policy ID. In this example, running `show firewall policy` displayed policies 1, 2, 3, 4, and 5, so you would proceed to create policy 6.

```plaintext
config firewall policy
  edit 6
    set srcintf "vpn-07e988cc1d46f749-1"
    set dstintf internal
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  next
end
config firewall policy
  edit 6
    set srcintf internal
    set dstintf "vpn-07e988cc1d46f749-1"
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  next
end
```

**IPsec VPN to Azure with virtual network gateway**

This example shows how to configure a site-to-site IPsec VPN tunnel to Microsoft Azure. It shows how to configure a tunnel between each site, avoiding overlapping subnets, so that a secure tunnel can be established.

**Prerequisites**

- A FortiGate with an Internet-facing IP address
- A valid Microsoft Azure account

**Sample topology**
Sample configuration

This sample configuration shows how to:

1. Configure an Azure virtual network
2. Specify the Azure DNS server
3. Configure the Azure virtual network gateway
4. Configure the Azure local network gateway
5. Configure the FortiGate tunnel
6. Create the Azure firewall object
7. Create the FortiGate firewall policies
8. Create the FortiGate static route
9. Create the Azure site-to-site VPN connection
10. Check the results

To configure an Azure virtual network:

1. Log in to Azure and click New.
2. In Search the Marketplace, type Virtual network.
3. Click Virtual network to open the Virtual network pane.
4. At the bottom of the Virtual network pane, click the Select a deployment model dropdown list and select Resource Manager.
5. Click Create.

6. On the Create virtual network pane, enter your virtual network settings, and click Create.
To specify the Azure DNS server:

1. Open the virtual network you just created.
2. Click DNS servers to open the DNS servers pane.
3. Enter the IP address of the DNS server and click Save.

To configure the Azure virtual network gateway:

1. In the portal dashboard, go to New.
2. Search for Virtual Network Gateway and click it to open the Virtual network gateway pane.
3. Click Create Virtual network gateways and enter the settings for your virtual network gateway.
4. If needed, create a Public IP address.

5. Click Create.
Creating the virtual network gateway might take some time. When the provisioning is done, you'll receive a notification.

**Deployment in progress...**
Deployment to resource group 'techdocs' is in progress.

**Saved virtual network**
09:37 AM
Successfully saved DNS settings for virtual network 'klericus, VPN'.

**Deployments succeeded**
09:30 AM
Deployment to resource group 'techdocs' was successful.
To configure the Azure local network gateway:

1. In the portal dashboard, click All resources.
2. Click Add and then click See all.

3. In the Everything pane, search for Local network gateway and then click Create local network gateway.
4. For the IP address, enter the local network gateway IP address, that is, the FortiGate's external IP address.

5. Set the remaining values for your local network gateway and click Create.

To configure the FortiGate tunnel:

1. In the FortiGate, go to VPN > IP Wizard.
2. Enter a Name for the tunnel, click Custom, and then click Next.
3. Configure the Network settings.
   a. For Remote Gateway, select Static IP Address and enter the IP address provided by Azure.
   b. For Interface, select wan1.
   c. For NAT Traversal, select Disable,
   d. For Dead Peer Detection, select On Idle.
   e. In the Authentication section, select
4. Configure the Authentication settings.
   a. For Method, select Pre-shared Key and enter the Pre-shared Key.
   b. For IKE, select 2.
5. Configure the Phase 1 Proposal settings.
   a. Set the Encryption and Authentication combination to the three supported encryption algorithm combinations accepted by Azure.
      - AES256 and SHA1
      - 3DES and SHA1
- AES256 and SHA256
  
  b. For Diffie-Hellman Groups, select 2.
  
  c. Set Key Lifetime (seconds) to 28800.

6. In Phase 2 Selectors, expand the Advanced section to configure the Phase 2 Proposal settings.
   a. Set the Encryption and Authentication combinations:
      - AES256 and SHA1
      - 3DES and SHA1
      - AES256 and SHA256
   b. Uncheck Enable Perfect Forward Secrecy (PFS).
   c. Set Key Lifetime (seconds) to 27000.

7. Click OK.

To create the Azure firewall object:

1. In the FortiGate, go to Policy & Objects > Addresses.
2. Create a firewall object for the Azure VPN tunnel.

To create the FortiGate firewall policies:

1. In the FortiGate, go to Policy & Objects > Firewall Policy.
2. Create a policy for the site-to-site connection that allows outgoing traffic.
   a. Set the Source address and Destination address using the firewall objects you just created.
   b. Disable NAT.
3. Create another policy that allows incoming traffic.
   a. For this policy, reverse the Source address and Destination address.
4. We recommend limiting the TCP maximum segment size (MSS) being sent and received so as to avoid packet drops and fragmentation.
   To do this, use the following CLI commands on both policies.

   ```plaintext
   config firewall policy
   edit <policy-id>
       set tcp-mss-sender 1350
       set tcp-mss-receiver 1350
   next
   end
   ```

To create the FortiGate static route:

1. In the FortiGate, go to Network > Static Routes.
2. Create an IPv4 Static Route that forces outgoing traffic going to Azure to go through the route-based tunnel.
3. Set the Administrative Distance to a value lower than the existing default route value.
To create the Azure site-to-site VPN connection:

1. In the Azure portal, locate and select your virtual network gateway.
2. In the Settings pane, click Connections and then click Add.

![Azure portal screenshot](image)

3. Enter the settings for your connection. Ensure the Shared Key (PSK) matches the Pre-shared Key for the FortiGate tunnel.

To check the results:

1. In the FortiGate, go to Monitor > IPsec Monitor and check that the tunnel is up. If the tunnel is down, right-click the tunnel and select Bring Up.
2. In the FortiGate, go to Log & Report > System Events.
   a. Select an event card to view more information and verify the connection.
3. In the Azure portal dashboard, click All resources and locate your virtual network gateway.
   a. In your virtual network gateway pane, click Connections to see the status of each connection.

   b. Click a connection to open the Essentials pane to view more information about that connection.
      - If the connection is successful, the Status shows Connected.
      - See the ingress and egress bytes to confirm traffic flowing through the tunnel.

IPsec VPN to an Azure with virtual WAN

This is a sample configuration of an IPsec site-to-site VPN connection between an on-premise FortiGate and an Azure virtual network (VNet). This example uses Azure virtual WAN (vWAN) to establish the VPN connection.

- Azure must use IPsec v2 for this configuration.
- Azure uses overlapped subnet IP addresses for the IPsec interfaces.

To configure IKEv2 IPsec site-to-site VPN to an Azure VPN gateway:

1. In the Azure management portal, configure vWAN-related settings as described in Tutorial: Create a Site-to-Site connection using Azure Virtual WAN.
   
   If a custom BGP IP address is configured on Azure’s vWAN, such as 169.254.21.6 and 169.254.21.7, you must configure the FortiGate remote-IP to the corresponding Custom BGP IP Address value. If a custom BGP IP address is not configured, FortiGate remote-IPs should point to the Default BGP IP Address value.

2. Download the VPN configuration. The following shows an example VPN configuration:

   ```json
```
3. Configure the following on the FortiGate. Note for set proposal, you can select from several proposals.

```bash
config vpn ipsec phase1-interface
edit "toazure1"
    set interface "port1"
    set ike-version 2
    set keylife 28800
    set peertype any
    set proposal aes256-shal
    set dhgrp 2
    set remote-gw 52.180.90.47
    set psksecret **********
next
edit "toazure2"
    set interface "port1"
    set ike-version 2
    set keylife 28800
    set peertype any
    set proposal aes256-shal
    set dhgrp 2
    set remote-gw 52.180.89.94
    set psksecret **********
next
end
config vpn ipsec phase2-interface
edit "toazure1"
    set phase1name "toazure1"
    set proposal aes256-shal
    set dhgrp 2
    set keylifeseconds 3600
next
edit "toazure2"
    set phase1name "toazure2"
    set proposal aes256-shal
    set dhgrp 2
    set keylifeseconds 3600
next
end
config system settings
    set allow-subnet-overlap enable
end
config system interface
edit "toazure1"
    set vdom "root"
    set ip 169.254.24.25 255.255.255.255
    set type tunnel
    set remote-ip 10.1.0.7 255.255.255.255
    set snmp-index 4
    set interface "port1"
```
next
edit "toazure2"
    set vdom "root"
    set ip 169.254.24.25 255.255.255.255
    set type tunnel
    set remote-ip 10.1.0.6 255.255.255.255
    set snmp-index 5
    set interface "port1"
next
deroute bgp
    set as 7225
    set router-id 169.254.24.25
config neighbor
    edit "10.1.0.7"
        set remote-as 65515
next
edit "10.1.0.6"
    set remote-as 65515
next
config network
    edit 1
        set prefix 172.30.101.0 255.255.255.0
next
deroute redistribute "connected"
    set status enable
end
deroute redistribute "rip"
end
deroute redistribute "ospf"
end
deroute redistribute "static"
end
deroute redistribute "isis"
end
deroute redistribute6 "connected"
end
deroute redistribute6 "rip"
end
deroute redistribute6 "ospf"
end
deroute redistribute6 "static"
end
deroute redistribute6 "isis"
end
end

4. Run `diagnose vpn tunnel list`. If the configuration was successful, the output should resemble the following:

```
name=toazure1 ver=2 serial=3 172.30.1.83:4500->52.180.90.47:4500 tun_id=52.180.90.47

**IPSec VPN between a FortiGate and a Cisco ASA with multiple subnets**

When a Cisco ASA unit has multiple subnets configured, multiple phase 2 tunnels must be created on the FortiGate to allocate to each subnet (rather than having multiple subnets on one phase 2 tunnel).

The FortiGate uses the same SPI value to bring up the phase 2 negotiation for all of the subnets, while the Cisco ASA expects different SPI values for each of its configured subnets. Using multiple phase 2 tunnels on the FortiGate creates different SPI values for each subnet.

**To configure multiple phase 2 interfaces in route-based mode:**

```shell
config vpn ipsec phase2-interface
  edit "First subnet"
    set phasename "VPN to Cisco"
    set src-subnet 192.168.227.253 255.255.255.255
    set dst-subnet 10.142.0.0 255.255.254.0
  next
  edit "Second subnet"
    set phasename "VPN to Cisco"
    set src-subnet 192.168.227.253 255.255.255.255
    set dst-subnet 10.143.0.0 255.255.254.0
  next
end
```

**To configure multiple phase 2 interfaces in policy-based mode:**

```shell
config vpn ipsec phase2
  edit "First subnet"
    set phasename "VPN to Cisco"
    set src-subnet 192.168.227.253 255.255.255.255
    set dst-subnet 10.142.0.0 255.255.254.0
  next
  edit "Second subnet"
    set phasename "VPN to Cisco"
    set src-subnet 192.168.227.253 255.255.255.255
    set dst-subnet 10.143.0.0 255.255.254.0
  next
end
```

**Cisco GRE-over-IPsec VPN**

This is a sample configuration of a FortiGate VPN that is compatible with Cisco-style VPNs that use GRE in an IPsec tunnel. Cisco products with VPN support often use the GRE protocol tunnel over IPsec encryption. Cisco VPNs can use either transport mode or tunnel mode IPsec.

**Topology**

In this example, LAN1 users are provided with access to LAN2.
Configuring the FortiGate

There are five steps to configure GRE-over-IPsec with a FortiGate and Cisco router:

1. Enable overlapping subnets.
2. Configure a route-based IPsec VPN on the external interface.
3. Configure a GRE tunnel on the virtual IPsec interface.
4. Configure security policies.
5. Configure the static route.

Enabling overlapping subnets

Overlapping subnets are required because the IPsec and GRE tunnels will use the same addresses. By default, each FortiGate network interface must be on a separate network. This configuration assigns an IPsec tunnel endpoint and the external interface to the same network.

To enable overlapping subnets:

```
config system settings
  set allow-subnet-overlap enable
next
end
```
**Configuring a route-based IPsec VPN**

A route-based VPN that use encryption and authentication algorithms compatible with the Cisco router is required. Pre-shared key authentication is used in this configuration.

**To configure route-based IPsec in the GUI:**

1. Go to **VPN > IPsec Wizard** and select the **Custom** template.
2. Enter the tunnel name (**tocisco**) and click Next.
3. Enter the following:

<table>
<thead>
<tr>
<th>Remote Gateway</th>
<th>Static IP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>Cisco router public interface (192.168.5.113)</td>
</tr>
<tr>
<td>Interface</td>
<td>FortiGate public interface (172.20.120.141)</td>
</tr>
<tr>
<td>Authentication Method</td>
<td>Pre-shared Key</td>
</tr>
<tr>
<td>Pre-shared Key</td>
<td>Entry must match the pre-shared key on the Cisco router</td>
</tr>
<tr>
<td>Mode</td>
<td>Main (ID Protection)</td>
</tr>
<tr>
<td>Phase 1 Proposal</td>
<td>3DES-SHA1, AES128-SHA1 (at least one proposal must match the settings on the Cisco router)</td>
</tr>
<tr>
<td>Local Address</td>
<td>GRE local tunnel endpoint IP address (172.20.120.141)</td>
</tr>
<tr>
<td>Remote Address</td>
<td>GRE remote tunnel endpoint IP address (192.168.5.113)</td>
</tr>
<tr>
<td>Phase 2 Proposal</td>
<td>3DES-MD5 (at least one proposal must match the settings on the Cisco router)</td>
</tr>
<tr>
<td>Local Port</td>
<td>0</td>
</tr>
<tr>
<td>Remote Port</td>
<td>0</td>
</tr>
<tr>
<td>Protocol</td>
<td>47</td>
</tr>
</tbody>
</table>

4. Click **OK**.
5. If the Cisco router is configured to use transport mode IPsec, configure transport mode on the FortiGate:

   ```
   config vpn phase2-interface
   edit tocisco_p2
   set encapsulation transport-mode
   next
   end
   ```

**To configure route-based IPsec in the CLI:**

```
config vpn ipsec phase1-interface
edit tociaco
   set interface port1
   set proposal 3des-shal aes128-shal
   set remote-gw 192.168.5.113
   set psksecret xxxxxxxxxxxxxxxx
next
end
```
config vpn ipsec phase2-interface
    edit tocisco_p2
        set phase1name tocisco
        set proposal 3des-md5
        set encapsulation [tunnel-mode | transport-mode]
        set protocol 47
        set src-addr-type ip
        set dst-start-ip 192.168.5.113
        set src-start-ip 172.20.120.141
    next
end

To add the IPsec tunnel end addresses:

config system interface
    edit tocisco
        set ip 172.20.120.141 255.255.255.255
        set remote-ip 192.168.5.113
    next
end

Configuring the GRE tunnel

The local gateway and remote gateway addresses must match the local and remote gateways of the IPsec tunnel. The GRE tunnel runs between the virtual IPsec public interface on the FortiGate unit and the Cisco router.

To configure the GRE tunnel:

config system gre-tunnel
    edit gre1
        set interface tocisco
        set local-gw 172.20.120.141
        set remote-gw 192.168.5.113
        set keepalive-interval <integer>
        set keepalive-failtimes <integer>
    next
end

The Cisco router configuration requires an address for its end of the GRE tunnel, so you need to add the tunnel end addresses.

To add the tunnel end addresses:

config system interface
    edit gre1
        set ip 10.0.1.1 255.255.255.255
        set remote-ip 10.0.1.2
    next
end

Configuring the security policies

Two sets of security policies are required:
• Policies to allow traffic to pass in both directions between the GRE virtual interface and the IPsec virtual interface.
• Policies to allow traffic to pass in both directions between the protected network interface and the GRE virtual interface.

To configure security policies in the GUI:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Enter the following to allow traffic between the protected network and the GRE tunnel:

<table>
<thead>
<tr>
<th>Name</th>
<th>LANtoGRE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>Interface that connects to the private network behind the FortiGate (port2)</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>GRE tunnel virtual interface (gre1)</td>
</tr>
<tr>
<td>Source</td>
<td>All</td>
</tr>
<tr>
<td>Destination</td>
<td>All</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>Disable</td>
</tr>
</tbody>
</table>

3. Click OK.
4. Create a new policy and enter the following to allow traffic between the GRE tunnel and the protected network:

<table>
<thead>
<tr>
<th>Name</th>
<th>GREtoLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>GRE tunnel virtual interface (gre1)</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>Interface that connects to the private network behind the FortiGate (port2)</td>
</tr>
<tr>
<td>Source</td>
<td>All</td>
</tr>
<tr>
<td>Destination</td>
<td>All</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>Disable</td>
</tr>
</tbody>
</table>

5. Click OK.
6. Create a new policy and enter the following to allow traffic between the GRE virtual interface and the IPsec virtual interface:

<table>
<thead>
<tr>
<th>Name</th>
<th>GREtoIPsec</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>GRE tunnel virtual interface (gre1)</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>Virtual IPsec interface (tocisco)</td>
</tr>
<tr>
<td>Source</td>
<td>All</td>
</tr>
<tr>
<td>Destination</td>
<td>All</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>Disable</td>
</tr>
</tbody>
</table>

7. Click OK.
8. Create a new policy and enter the following to allow traffic between the IPsec virtual interface and the GRE virtual interface:

<table>
<thead>
<tr>
<th>Name</th>
<th>IPsectoGRE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>Virtual IPsec interface (tocisco)</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>GRE tunnel virtual interface (gre1)</td>
</tr>
<tr>
<td>Source</td>
<td>All</td>
</tr>
<tr>
<td>Destination</td>
<td>All</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>Disable</td>
</tr>
</tbody>
</table>

9. Click OK.

**To configure security policies in the CLI:**

```bash
config firewall policy
define 1
    set name LANtoGRE
    set srcintf port2
define 2
    set dstintf gre1
define 3
    set srcaddr all
define 4
    set dstaddr all
define 5
    set action accept
define 6
    set schedule always
define 7
    set service ALL
next
define 8
    set name GREtoLAN
define 9
    set srcintf gre1
next
define 10
    set dstintf port2
define 11
    set srcaddr all
define 12
    set dstaddr all
next
define 13
    set action accept
define 14
    set schedule always
next
define 15
    set service ALL
next
define 16
    set name GREtoIPsec
next
define 17
    set srcintf gre1
next
define 18
    set dstintf tocisco
define 19
    set srcaddr all
define 20
    set dstaddr all
next
define 21
    set action accept
define 22
    set schedule always
next
define 23
    set service ALL
next
define 24
    set name IPsectoGRE
next
define 25
    set srcintf tocisco
next
define 26
    set dstintf gre1
next
define 27
    set srcaddr all
define 28
    set dstaddr all
next
```
Remote access

Remote access lets users connect to the Internet using a dialup connection over traditional POTS or ISDN telephone lines. Virtual private network (VPN) protocols are used to secure these private connections.

The following topics provide instructions on configuring remote access:

- FortiGate as dialup client on page 1414
- FortiClient as dialup client on page 1420
- Add FortiToken multi-factor authentication on page 1424
- Add LDAP user authentication on page 1425
- iOS device as dialup client on page 1426
- IKE Mode Config clients on page 1430
- IPsec VPN with external DHCP service on page 1435
- L2TP over IPsec on page 1438
- Tunneled Internet browsing on page 1442
- Dialup IPsec VPN with certificate authentication on page 1448
- Restricting VPN access to rogue/non-compliant devices with Security Fabric

**FortiGate as dialup client**

This is a sample configuration of dialup IPsec VPN and the dialup client. In this example, a branch office FortiGate connects via dialup IPsec VPN to the HQ FortiGate.

You can configure dialup IPsec VPN with FortiGate as the dialup client using the **GUI** or **CLI**.

**To configure IPsec VPN with FortiGate as the dialup client in the GUI:**

1. Configure the dialup VPN server FortiGate:
   a. Go to **VPN > IPsec Wizard** and configure the following settings for **VPN Setup**:
      i. Enter a VPN name.
      ii. For **Template Type**, select **Site to Site**.
      iii. For **Remote Device Type**, select **FortiGate**.
      iv. For **NAT Configuration**, select **The remote site is behind NAT**.
      v. Click **Next**.
   b. Configure the following settings for **Authentication**:
      i. For **Incoming Interface**, select the incoming interface.
      ii. For **Authentication Method**, select **Pre-shared Key**.
      iii. In the **Pre-shared Key** field, enter your-psk as the key.
      iv. Click **Next**.
   c. Configure the following settings for **Policy & Routing**:
      i. From the **Local Interface** dropdown menu, select the local interface.
      ii. Configure the **Local Subnets** as 10.1.100.0/24.
      iii. Configure the **Remote Subnets** as 172.16.101.0/24.
      iv. Click **Create**.
2. Configure the dialup VPN client FortiGate:
   a. Go to **VPN > IPsec Wizard** and configure the following settings for **VPN Setup**:
      i. Enter a VPN name.
      ii. For **Template Type**, select **Site to Site**.
      iii. For **Remote Device Type**, select **FortiGate**.
      iv. For **NAT Configuration**, select **This site is behind NAT**.
      v. Click **Next**.
b. Configure the following settings for Authentication:
   i. For IP Address, enter 11.101.1.1.
   ii. For Outgoing Interface, select port13.
   iii. For Authentication Method, select Pre-shared Key.
   iv. In the Pre-shared Key field, enter your-psk as the key.
   v. Click Next.

c. Configure the following settings for Policy & Routing:
   i. From the Local Interface dropdown menu, select the local interface. In this example, it is port9.
   ii. Configure the Local Subnets as 172.16.101.0.
   iii. Configure the Remote Subnets as 10.1.100.0.
   iv. Click Create.

To configure IPsec VPN with FortiGate as the dialup client in the CLI:

1. In the CLI, configure the user, user group, and firewall address. Only the HQ dialup server FortiGate needs this configuration. The address is an IP pool to assign an IP address for the dialup client FortiGate.

   ```
   config user local
   edit "vpnuser1"
   set type password
   set passwd your-password
   next
   end
   config user group
   edit "vpngroup"
   set member "vpnuser1"
   next
   end
   config firewall address
   edit "client_range"
   set type iprange
   set start-ip 10.10.10.1
   set end-ip 10.10.10.200
   next
   end
   ```

2. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

   a. Configure the HQ FortiGate.

      ```
      config system interface
      edit "wan1"
      set vdom "root"
      set ip 11.101.1 255.255.255.0
      next
      end
      config router static
      edit 1
      set gateway 11.101.1.2
      set device "wan1"
      next
      end
      ```
b. Configure the branch office FortiGate.

```fortigate
config system interface
  edit "port13"
    set vdom "root"
    set ip 173.1.1.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 173.1.1.2
    set device "port13"
  next
end
```

3. Configure the internal interface and protected subnet. The internal interface connects to the internal network. Traffic from this interface will route out the IPsec VPN tunnel.

a. Configure the HQ FortiGate.

```fortigate
config system interface
  edit "dmz"
    set vdom "root"
    set ip 10.1.100.1 255.255.255.0
  next
end
config firewall address
  edit "10.1.100.0"
    set subnet 10.1.100.0 255.255.255.0
  next
end
```

b. Configure the branch office FortiGate.

```fortigate
config system interface
  edit "port9"
    set vdom "root"
    set ip 172.16.101.1 255.255.255.0
  next
end
config firewall address
  edit "172.16.101.0"
    set subnet 172.16.101.0 255.255.255.0
  next
end
```

4. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.

a. Configure the HQ FortiGate.

```fortigate
config vpn ipsec phase1-interface
  edit "for_Branch"
    set type dynamic
    set interface "wan1"
    set mode aggressive
    set peertype any
    set mode-cfg enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set add-route disable
```
set dpd on-idle
set xauthtype auto
set authusrgrp "vpngrp"
set net-device enable
set assign-ip-from name
set dns-mode auto
set ipv4-split-include "10.1.100.0"
set ipv4-name "client_range"
set save-password enable
set psksecret sample
set dpd-retryinterval 60
next
end

b. Configure the branch office FortiGate.

config vpn ipsec phase1-interface
edit "to_HQ"
set interface "port13"
set mode aggressive
set peer-type any
set mode-cfg enable
set proposal aes128-sha256 aes256-sha256 aes128-shal aes256-shal
set add-route disable
set xauthtype client
set authusr "vpngrp"
set authpasswd vpngrp-sample
set remote-gw 11.101.1.1
set psksecret sample
next
end

5. Configure the IPsec phase2-interface.

a. Configure the HQ FortiGate:

config vpn ipsec phase2-interface
edit "for_Branch_p2"
set phase1-name "for_Branch"
set proposal aes128-shal aes256-shal
set proposal aes128-sha256 aes256-sha256
aes128gcm chacha20poly1305
next
end

b. Configure the branch office FortiGate.

config vpn ipsec phase2-interface
edit "to_HQ_p2"
set phaselname "to_HQ"
set proposal aes128-shal aes256-shal
set proposal aes128-sha256 aes256-sha256
aes128gcm chacha20poly1305
next
end

6. Configure the static routes on the branch office FortiGate. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.

config router static
edit 2
7. Configure the firewall policy to allow the branch office to HQ network flow over the IPsec tunnel. This configuration only supports traffic from the branch office FortiGate to the HQ FortiGate. Traffic is dropped from the HQ FortiGate to the branch office FortiGate.

a. Configure the HQ FortiGate.

```fortigate
set dst 10.1.100.0 255.255.255.0
set device "to_QQ"
next
edit 3
set dst 10.1.100.0 255.255.255.0
set blackhole enable
set distance 254
next
end
```

b. Configure the branch office FortiGate.

```fortigate
config firewall policy
edit 1
set name "inbound"
set srcintf "for_Branch"
set dstintf "dmz"
set srcaddr "172.16.101.0"
set dstaddr "10.1.100.0"
set action accept
set schedule "always"
set service "ALL"
next
end
```

8. Run diagnose commands to check the IPsec phase1/phase2 interface status. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.

a. Run the `diagnose vpn ike gateway list` command on the HQ FortiGate. The system should return the following:

```
vd: root/0
name: for_Branch_0
interface: wanl 5
addr: 11.101.1.1:500 -> 173.1.1.1:500
created: 1972s ago
xauth-user: vpnuser1
assigned IPv4 address: 10.10.1.1/255.255.255.252
IKE SA: created 1/1 established 1/1 time 10/10/10 ms
```
VPN

IPsec SA: created 1/1 established 1/1 time 0/0/0 ms
id/spi: 184 5b1c59fab2029e43/bf517e686d3943d2
direction: responder
status: established 1972-1972s ago = 10ms
proposal: aes128-sha256
key: 8046488e92499247-fbbb4f6dfa4952d0
lifetime/rekey: 86400/84157
DPD sent/recv: 00000020/00000000

b. Run the `diagnose vpn tunnel list` command on the HQ FortiGate. The system should return the following:

```
list all ipsec tunnel in vd 0
name=for_Branch_0 ver=1 serial=9 11.101.1.1:0->173.1.1.1:1 tun_id=173.1.1.1
bound_if=5 lgwy=static/1 tun=intf/0 mode=dial_inst/3 encap=none/208 options [00d0]=create_dev no-sysctlrgwy-chg

**FortiClient as dialup client**

This is a sample configuration of dialup IPsec VPN with FortiClient as the dialup client.

![Diagram of dialup IPsec VPN with FortiClient as the dialup client](image)

You can configure dialup IPsec VPN with FortiClient as the dialup client using the GUI or CLI.

If multiple dialup IPsec VPNs are defined for the same dialup server interface, each phase1 configuration must define a unique peer ID to distinguish the tunnel that the remote client is connecting to. When a client connects, the first IKE message that is in aggressive mode contains the client's local ID. FortiGate matches the local ID to the dialup tunnel referencing the same Peer ID, and the connection continues with that tunnel.
To configure IPsec VPN with FortiClient as the dialup client on the GUI:

1. Configure a user and user group.
   a. Go to User & Authentication > User Definition to create a local user vpnuser1.
   b. Go to User & Authentication > User Groups to create a group vpngroup with the member vpnuser1.
2. Go to VPN > IPsec Wizard and configure the following settings for VPN Setup:
   a. Enter a VPN name.
   b. For Template Type, select Remote Access.
   c. For Remote Device Type, select Client-based > FortiClient.
   d. Click Next.
3. Configure the following settings for Authentication:
   a. For Incoming Interface, select wan1.
   b. For Authentication Method, select Pre-shared Key.
   c. In the Pre-shared Key field, enter your-psk as the key.
   d. From the User Group dropdown list, select vpngroup.
   e. Click Next.
4. Configure the following settings for Policy & Routing:
   a. From the Local Interface dropdown menu, select lan.
   b. Configure the Local Address as local_network.
   c. Configure the Client Address Range as 10.10.2.1-10.10.2.200.
   d. Keep the default values for the Subnet Mask, DNS Server, Enable IPv4 Split tunnel, and Allow Endpoint Registration.
   e. Click Next.
5. Adjust the Client Options as needed, then click Create.
6. Optionally, define a unique Peer ID in the phase1 configuration:
   a. Go to VPN > IPsec Tunnels and edit the just created tunnel.
   b. Click Convert To Custom Tunnel.
   c. In the Authentication section, click Edit.
   d. Under Peer Options, set Accept Types to Specific peer ID.
   e. In the Peer ID field, enter a unique ID, such as dialup1.
   f. Click OK.

To configure IPsec VPN with FortiClient as the dialup client using the CLI:

1. In the CLI, configure the user and group.
   ```
   config user local
   edit "vpnuser1"
     set type password
     set passwd your-password
   next
   end
   config user group
   edit "vpngroup"
     set member "vpnuser1"
   next
   end
   ```
2. Configure the internal interface. The LAN interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this
FortiGate causes traffic to this network group to go through the IPsec tunnel.

```
config system interface
    edit "lan"
        set vdom "root"
        set ip 10.10.111.1 255.255.255.0
    next
end
config firewall address
    edit "local_subnet_1"
        set subnet 10.10.111.0 255.255.255.0
    next
    edit "local_subnet_2"
        set subnet 10.10.112.0 255.255.255.0
    next
end
config firewall addrgrp
    edit "local_network"
        set member "local_subnet_1" "local_subnet_2"
    next
end
```

3. Configure the WAN interface. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

4. Configure the client address pool. You must create a firewall address to assign an IP address to a client from the address pool.

```
config firewall address
    edit "client_range"
        set type iprange
        set comment "VPN client range"
        set start-ip 10.10.2.1
        set end-ip 10.10.2.200
    next
end
```

5. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.

```
config vpn ipsec phase1-interface
    edit "for_client"
        set type dynamic
        set interface "wan1"
        set mode aggressive
        set peertype one
        set peerid "dialup1"
        set net-device enable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set xauthtype auto
```
6. **Configure the IPsec phase2-interface.**

```plaintext
cfg vpn ipsec phase2-interface
edit "for_client"
    set phase1name "for_client"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
    aes256gcm chacha20poly1305
next
end
```

7. **Configure the firewall policy to allow client traffic flow over the IPsec VPN tunnel.**

```plaintext
cfg firewall policy
edit 1
    set name "inbound"
    set srcintf "for_client"
    set dstintf "lan"
    set srcaddr "client_range"
    set dstaddr "local_network"
    set action accept
    set schedule "always"
    set service "ALL"
next
end
```

---

**To configure FortiClient:**

1. In FortiClient, go to Remote Access and click Add a new connection.
2. Set the VPN to IPsec VPN and the Remote Gateway to the FortiGate IP address.
3. Set the Authentication Method to Pre-Shared Key and enter the key.
4. Expand Advanced Settings > Phase 1 and in the Local ID field, enter dialup1.
5. Configure remaining settings as needed, then click Save.
6. Select the VPN, enter the username and password, then select Connect.

---

**Diagnose the connection**

Run `diagnose commands` to check the IPsec phase1/phase2 interface status. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.

1. Run the `diagnose vpn ike gateway list` command. The system should return the following:

```plaintext
vd: root/0
    name: for_client_0
    version: 1
    interface: port1 15
```
VPN

addr: 172.20.120.123:4500 ->172.20.120.254:64916

```

Add FortiToken multi-factor authentication

This configuration adds multi-factor authentication (MFA) to the FortiClient dialup VPN configuration (FortiClient as dialup client on page 1420). It uses one of the two free mobile FortiTokens that is already installed on the FortiGate.
To configure MFA using the GUI:

1. Edit the user:
   a. Go to User & Authentication > User Definition and edit local user vpnuser1.
   b. Enable Two-factor Authentication.
   c. For Authentication Type, click FortiToken and select one mobile Token from the list.
   d. Enter the user's Email Address.
   e. Enable Send Activation Code and select Email.
   f. Click Next and click Submit.

2. Activate the mobile token.
   a. When a FortiToken is added to user vpnuser1, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

To configure MFA using the CLI:

1. Edit the user and user group:
   ```
   config user local
   edit "vpnuser1"
   set type password
   set two-factor fortitoken
   set fortitoken <select mobile token for the option list>
   set email-to <user's email address>
   set passwd <user's password>
   next
   end
   ```

2. Activate the mobile token.
   a. When a FortiToken is added to user vpnuser1, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

Add LDAP user authentication

This configuration adds LDAP user authentication to the FortiClient dialup VPN configuration (FortiClient as dialup client on page 1420). You must have already generated and exported a CA certificate from your AD server.

To configure LDAP user authentication using the GUI:

1. Import the CA certificate into FortiGate:
   a. Go to System > Certificates.
      If the Certificates option is not visible, enable it in Feature Visibility. See Feature visibility on page 2165 for details.
   b. Click Import > CA Certificate.
   c. Set Type to File.
   d. Click Upload then find and select the certificate file.
   e. Click OK.
      The CA certificate now appears in the list of External CA Certificates. In this example, it is called CA_Cert_1.
f. Optionally, rename the system generated CA_Cert_1 to something more descriptive:

```plaintext
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

2. Configure the LDAP user:
   a. Go to User & Authentication > LDAP Servers and click Create New.
   b. Set Name to ldaps-server and specify Server IP/Name.
   c. Specify Common Name Identifier and Distinguished Name.
   d. Set Bind Type to Regular.
   e. Specify Username and Password.
   f. Enable Secure Connection and set Protocol to LDAPS.
   g. For Certificate, select LDAP server CA LDAPS-CA from the list.
   h. Click OK.

3. Add the LDAP user to the user group:
   a. Go to User & Authentication > User Groups and edit the vpngroup group.
   b. In Remote Groups, click Add to add the ldaps-server remote server.
   c. Click OK.

To configure LDAP user authentication using the CLI:

1. Import the CA certificate using the GUI.

2. Configure the LDAP user:

```plaintext
config user ldap
    edit "ldaps-server"
        set server "172.20.120.161"
        set cnid "cn"
        set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
        set type regular
        set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
        set password **********
        set group-member-check group-object
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
    next
end
```

3. Add the LDAP user to the user group:

```plaintext
config user group
    edit "vpngroup"
        append member "ldaps-server"
    next
end
```

**iOS device as dialup client**

This is a sample configuration of dialup IPsec VPN with an iPhone or iPad as the dialup client.
You can configure dialup IPsec VPN with an iOS device as the dialup client using the GUI or CLI.

To configure IPsec VPN with an iOS device as the dialup client on the GUI:

1. Go to VPN > IPsec Wizard and configure the following settings for VPN Setup:
   a. Enter a VPN name.
   b. For Template Type, select Remote Access.
   c. For Remote Device Type, select Native > iOS Native.
   d. For NAT Configuration, set No NAT Between Sites.
   e. Click Next.

2. Configure the following settings for Authentication:
   a. For Incoming Interface, select wan1.
   b. For Authentication Method, select Pre-shared Key.
   c. In the Pre-shared Key field, enter your-psk as the key.
   d. From the User Group dropdown list, select vpngroup.
   e. Deselect Require ‘Group Name’ on VPN client.
   f. Click Next.

3. Configure the following settings for Policy & Routing:
   a. From the Local Interface dropdown menu, select lan.
   b. Configure the Local Address as local_network.
   c. Configure the Client Address Range as 10.10.2.1-10.10.2.200.
   d. Keep the default values for the Subnet Mask, DNS Server, and Enable IPv4 Split tunnel.
   e. Click Create.

To configure IPsec VPN with an iOS device as the dialup client using the CLI:

1. In the CLI, configure the user and group.

```bash
config user local
  edit "vpnuser1"
    set type password
    set passwd your-password
  next
end
```
config user group
  edit "vpngroup"
    set member "vpnuser1"
  next
end

2. Configure the internal interface. The LAN interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this FortiGate causes traffic to this network group to go through the IPsec tunnel.

config system interface
  edit "lan"
    set vdom "root"
    set ip 10.10.111.1 255.255.255.0
  next
end

config firewall address
  edit "local_subnet_1"
    set ip 10.10.111.0 255.255.255.0
  next
end

config firewall address
  edit "local_subnet_2"
    set ip 10.10.112.0 255.255.255.0
  next
end

config firewall addrgrp
  edit "local_network"
    set member "local_subnet_1" "local_subnet_2"
  next
end

3. Configure the WAN interface. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end

4. Configure the client address pool. You must create a firewall address to assign an IP address to a client from the address pool.

config firewall address
  edit "client_range"
    set type iprange
    set comment "VPN client range"
    set start-ip 10.10.2.1
    set end-ip 10.10.2.200
  next
end

5. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.
config vpn ipsec phase1-interface
edit "for_ios_p1"
    set type dynamic
    set interface "wan1"
    set peertype any
    set net-device enable
    set mode-cfg enable
    set proposal aes256-sha256 aes256-md5 aes256-sha1
    set dpd on-idle
    set dhgrp 14 5 2
    set xauthtype auto
    set authusrgrp "vpngroup"
    set assign-ip-from name
    set ipv4-name "client_range"
    set dns-mode auto
    set ipv4-split-include "local_network"
    set dpd secret your-psk
    set dpd-retryinterval 60
next
end

6. Configure the IPsec phase2-interface.

config vpn ipsec phase2-interface
edit "for_ios_p2"
    set phasename "for_ios_p1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
    aes128gcm aes256gcm chacha20poly1305
    set pfs disable
    set keepalive enable
next
end

7. Configure the firewall policy to allow client traffic flow over the IPsec VPN tunnel.

config firewall policy
edit 1
    set name "ios_vpn"
    set srcintf "for_ios_p1"
    set dstintf "lan"
    set srcaddr "ios_range"
    set dstaddr "local_network"
    set action accept
    set schedule "always"
    set service "ALL"
next
end

8. Configure the iOS device.
   a. In the iOS device, go to Settings > General > VPN and select Add VPN Configuration.
   b. Set the Type to IPsec and enter a Description. Set the Server to the FortiGate's Internet-facing interface, and enter the username in Account. Enter the user password, the preshared IPsec VPN secret, then select Done.
   c. Ensure that the IPsec VPN configuration is highlighted (indicated by a checkmark), and select the Not Connected button. The IPsec VPN connects with the user's credentials and secret. The status changes to Connected, and a VPN icon appears at the top of the screen.

9. Run diagnose commands to check the IPsec phase1/phase2 interface status. The diagnose debug application ike -1 command is the key to troubleshoot why the IPsec tunnel failed to establish.
**a. Run the `diagnose vpn ike gateway list` command. The system should return the following:**

```plaintext
vd: root/0
name: for_ios_pl_0
version: 1
interface: port1 15
addr: 172.20.120.123:4500 -> 172.20.120.254:64916

```

**IKE Mode Config clients**

IKE Mode Config is an alternative to DHCP over IPsec. It allows dialup VPN clients to obtain virtual IP address, network, and DNS configurations amongst others from the VPN server. A FortiGate can be configured as either an IKE Mode Config server or client.

IKE Mode Config can configure the host IP address, domain, DNS addresses, and WINS addresses. IPsec parameters such as gateway address, encryption, and authentication algorithms must be configured. Several network equipment vendors support IKE Mode Config.
An IKE Mode Config server or client is configured using `config vpn ipsec phasel-interface` and involves the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ike-version {1</td>
<td>2}</td>
</tr>
<tr>
<td>mode-cfg {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>type {static</td>
<td>dynamic</td>
</tr>
<tr>
<td>assign-ip {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>interface &lt;interface_name&gt;</td>
<td>Specify the physical, aggregate, or VLAN interface to which the IPsec tunnel will be bound.</td>
</tr>
<tr>
<td>proposal &lt;encryption_combination&gt;</td>
<td>The encryption and authentication settings that the client will accept.</td>
</tr>
<tr>
<td>ip-version {4</td>
<td>6}</td>
</tr>
<tr>
<td>ipv4-split-include &lt;string&gt;</td>
<td>Mode Config server configuration. Applicable to IKEv1 and IKEv2. Specify the firewall address or address group that represents the subnets that the clients will have access to. This information is sent to the clients so that default traffic should not flow over the IPsec tunnel except for the specified subnets.</td>
</tr>
<tr>
<td>ipv6-split-include &lt;string&gt;</td>
<td>Mode Config server configuration. Applicable to IKEv1 and IKEv2. Specify the service or service group that represents the services that the clients will have access to. This information is sent to the clients so that default traffic should not flow over the IPsec tunnel except for the specified services.</td>
</tr>
<tr>
<td>split-include-service &lt;string&gt;</td>
<td>Mode Config server configuration. Applicable to IKEv1 and IKEv2. Specify the service or service group that represents the services that the clients will have access to. This information is sent to the clients so that default traffic should not flow over the IPsec tunnel except for the specified services.</td>
</tr>
<tr>
<td>ipv4-split-exclude &lt;string&gt;</td>
<td>Specify the subnets that should not be accessed over the IPsec tunnel. This information is sent to the clients so that all default traffic should flow over the IPsec tunnel except for the specified subnets.</td>
</tr>
<tr>
<td>ipv6-split-exclude &lt;string&gt;</td>
<td></td>
</tr>
</tbody>
</table>

Creating an IKE Mode Config client

In this example, the FortiGate connects to a VPN gateway with a static IP address that can be reached through port 1. Only the port, gateway, and proposal information needs to be configured. All other configuration information will come from the IKE Mode Config server.

To configure an IKE Mode Config client:

```plaintext
config vpn ipsec phasel-interface
edit vpn1
    set ip-version 4
    set type static
    set remote-gw <gw_address>
    set interface port1
    set proposal 3des-shal aes128-shal
    set mode-cfg enable
```
VPN

```
set assign-ip enable
next
end
```

**Split-exclude in IKEv1**

The split-exclude option specifies that default traffic flows over the IPsec tunnel except for specified subnets. This is the opposite of split-include, which specifies that default traffic should not flow over the IPsec tunnel except for specified subnets. The split-include and split-exclude options can be specified at the same time.

**To configure split-exclude:**

```
config vpn ipsec phasel-interface
   edit <name>
      set ike-version 1
      set type dynamic
      set mode-cfg enable
      set ipv4-split-exclude <string>
      set ipv6-split-exclude <string>
   next
end
```

**Creating an IKE Mode Config server**

**To configure IKE Mode config settings, the following must be configured first:**

```
config vpn ipsec phasel-interface
   edit "vpn-pl"
      set type dynamic
      set interface <interface_name>
      set ike-version < 1 | 2 >
      set mode-cfg enable
      set proposal <encryption_combination>
      set ip-version < 4 | 6 >
   next
end
```

In this example, the FortiGate assigns IKE Mode Config clients addresses in the range of 10.11.101.160 - 10.11.101.180. DNS and WINS server addresses are also provided. The public interface of the FortiGate unit is port1. When IKE Mode-Configuration is enabled, multiple server IPs can be defined in IPsec phase 1.

The ipv4-split-include parameter specifies a firewall address (OfficeLAN), which represents the networks that the clients will have access to. This destination IP address information is sent to the clients.

**To configure an IKE Mode Config server:**

```
config vpn ipsec phasel-interface
   edit "vpn-pl"
      set type dynamic
      set interface "wan1"
      set xauthtype auto
      set mode aggressive
      set mode-cfg enable
```
set proposal 3des-sha1 aes128-sha1
set dpd disable
set dhgrp 2
set authusrgrp "FG-Group1"
set ipv4-start-ip 10.10.10.10
set ipv4-end-ip 10.10.10.20
set ipv4-dns-server1 1.1.1.1
set ipv4-dns-server2 2.2.2.2
set ipv4-dns-server3 3.3.3.3
set ipv4-wins-server1 4.4.4.4
set ipv4-wins-server2 5.5.5.5
set domain "fgt1c-domain"
set banner "fgtl1c-banner"
set backup-gateway "100.100.100.1" "host1.com" "host2"
set ipv4-split-include OfficeLAN

next
end

Assigning IP addresses

Once the basic configuration is enabled, you can configure IP address assignment for clients, as well as DNS and WINS server assignments. Usually you will want to assign IP addresses to clients. The easiest way is to assign addresses from a specific range, similar to a DHCP server.

To assign an IP from an address range:

config vpn ipsec phase1-interface
  edit vpn1
    set ip-version 4
    set assign-ip enable
    set assign-ip-from range
    set ipv4-start-ip <range_start>
    set ipv4-end-ip <range_end>
    set ipv4-netmask <netmask>
  next
end

To assign an IP from a named firewall address or group:

config vpn ipsec phase1-interface
  edit vpn1
    set type dynamic
    set assign-ip-from name
    set ipv4-name <name>
    set ipv6-name <name>
  next
end

RADIUS server

If the client is authenticated by a RADIUS server, you can obtain the user’s IP address assignment from the Framed-IP-Address attribute. The user must be authenticated using XAuth.
The users must be authenticated by a RADIUS server and assigned to the FortiGate user group `<grp_name>`. Since the IP address is not static, type is set to dynamic and `mode-cfg` is enabled. With IKE Mode Config, compatible clients can configure themselves with settings provided by the FortiGate.

**To assign an IP from a RADIUS server:**

```
config vpn ipsec phasel-interface
   edit vpn1
       set type dynamic
       set mode-cfg enable
       set assign-ip enable
       set assign-ip-from usrgrp
       set xauthtype auto
       set authusrgrp <grp_name>
   next
end
```

**DHCP server**

IKE Mode Config can use a remote DHCP server to assign the client IP addresses. Up to eight server addresses can be selected for either IPv4 or IPv6. The DHCP proxy must be enabled first.

**To assign an IP from a DHCP server:**

```
config system settings
   set dhcp-proxy enable
   set dhcp-server-ip <address>
   set dhcp6-server-ip <address>
end

config vpn ipsec phasel-interface
   edit vpn1
       set mode-cfg enable
       set assign-ip-from dhcp
   next
end
```

**Certificate groups**

IKE certificate groups consisting of up to four RSA certificates can be used in IKE phase 1. Since CA and local certificates are global, the IKE daemon loads them once for all VDOMs and indexes them into trees based on subject and public key hash (for CA certificates), or certificate name (for local certificates). Certificates are linked together based on the issuer, and certificate chains are built by traversing these links. This reduces the need to keep multiple copies of certificates that could exist in multiple chains.

**To configure the IKE local ID:**

```
config vpn certificate local
   edit <name>
       set ike-localid <string>
       set ike-localid-type {asn1dn | fqdn}
   next
end
```
**Split-exclude in IKEv1**

The `split-exclude` setting specifies that default traffic flows over the IPsec tunnel except for specified subnets. This is the opposite of `split-include`, which specifies that default traffic should not flow over the IPsec tunnel except for specified subnets. The `split-include` and `split-exclude` settings can be specified at the same time.

**To configure split-exclude:**

```plaintext
config vpn ipsec phasel-interface
    edit <name>
        set ike-version 1
        set type dynamic
        set mode-cfg enable
        set ipv4-split-exclude <string>
        set ipv6-split-exclude <string>
    next
end
```

**IPsec VPN with external DHCP service**

You can use an external DHCP server to assign IP addresses to your IPsec VPN clients. This is a common scenario found in enterprises where all DHCP leases need to be managed centrally.

In this example, the DHCP server assigns IP addresses in the range of 172.16.6.100 to 172.16.6.120. The server is attached to internal2 on the FortiGate and has an IP address of 192.168.3.70.

**To configure a DHCP server to assign IP addresses to IPsec VPN clients:**

1. Create a user group for remote users:
   a. Go to User & Authentication > User Definition and click Create New.
   b. For User Type, select Local User.
   c. Complete the wizard, and click Submit.
   d. Go to User & Authentication > User Groups and click Create New.
   e. Create a Firewall user group for your remote users.
f. For Members, add the user you just created.
g. Click OK.

2. Add a firewall address for the local network and IPsec VPN client range:
   a. Go to Policy & Objects > Addresses.
   b. Create a new Subnet address for the LAN, including the IP mask and local interface (internal2).
   c. Click OK.
   d. Create a new IP Range address for the IPsec VPN client range (172.16.6.100–172.16.6.120).
   e. Click OK.

3. Configure the IPsec VPN using a VPN tunnel in the CLI:
   ```
   config vpn ipsec phase1-interface
   edit "dhcp_vpn"
     set type dynamic
     set interface "wan1"
     set mode aggressive
     set peertype any
     set net-device disable
     set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
     set dpd on-idle
     set dhgrp 5
     set xauthtype auto
     set authusrgrp "ipsecvpn"
     set psksecret ********
     set dpd-retryinterval 60
   next
   end

   config vpn ipsec phase2-interface
   edit "toclient"
     set phasename "dhcp_vpn"
     set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes256gcm chacha20poly1305
     set dhgrp 5
     set dhcp-ipsec enable
   next
   end
   ```

4. Configure the IPsec VPN interface:
   a. Go to Network > Interfaces and edit the newly created IPsec VPN interface.
   b. Enable the DHCP Server.
   c. Expand Advanced and change the Mode to Relay.
   d. Enter the external DHCP server IP address (192.168.3.70).
   e. Change the Type to IPsec.
   f. Click OK.

5. Create a security policy for access to the local network:
   a. Go to Policy & Objects > Firewall Policy and click Create New.
   b. Configure the following parameters:
      i. Set the Incoming Interface to the tunnel interface created in step 3 (dhcp_vpn).
      ii. Set the Outgoing Interface (internal2).
      iii. Set the Source to the IPsec VPN client range defined in step 2 (ipsecvpn_range).
      iv. Set the Destination to the subnet address defined in step 2 (Local LAN).
      v. Set the Service to ALL.
c. Click OK.
6. Configure FortiClient:
   a. In FortiClient, go to REMOTE ACCESS > Add a new connection.
   
   ![Image of FortiClient interface]

   b. Configure the following parameters:
      i. Set the VPN type to IPSec VPN.
      ii. Enter a connection name.
      iii. Set the Remote Gateway to the FortiGate external IP address.
      iv. Set the Authentication Method to Pre-shared key and enter the key below.
      v. Expand the Advanced Settings > VPN Settings and for Options, select DHCP over IPSec.
      vi. Click Save.

   ![Image of FortiClient configuration interface]

   c. Select the new connection, and enter the user name and password.
d. Click Connect.

Once the connection is established, the external DHCP server assigns the user an IP address and FortiClient displays the connection status, including the IP address, connection duration, and bytes sent and received.

Verification

1. In FortiOS, go to Monitor > IPsec Monitor and verify that the tunnel Status is Up.
2. Go to Log & Report > Forward Traffic and verify the Sent / Received column displays the traffic flow through the tunnel.

L2TP over IPsec

This is an example of L2TP over IPsec.

This example uses a locally defined user for authentication, a Windows PC or Android tablet as the client, and net-device is set to enable in the phase1-interface settings. If net-device is set to disable, only one device can establish an L2TP over IPsec tunnel behind the same NAT device.

To configure L2TP over an IPsec tunnel using the GUI:

1. Go to VPN > IPsec Wizard.
2. Enter a VPN Name. In this example, L2tpoIPsec.
3. Configure the following settings for VPN Setup:
   a. For Template Type, select Remote Access.
   b. For Remote Device Type, select Native and Windows Native.
   c. Click Next.
4. Configure the following settings for Authentication:
   a. For Incoming Interface, select port9.
   b. For Authentication Method, select Pre-shared Key.
   c. In the Pre-shared Key field, enter your-psk as the key.
   d. For User Group, select L2tpusergroup
   e. Click Next.
5. Configure the following settings for Policy & Routing:
   a. From the Local Interface dropdown menu, select port10.
   b. Configure the Local Address as 172.16.101.0.
   c. Configure the Client Address Range as 10.10.10.1-10.10.100.
   d. Leave the Subnet Mask at its default value.
   e. Click Create.

To configure L2TP over an IPsec tunnel using the CLI:

1. Configure the WAN interface and static route on HQ.
   ```
   config system interface
   edit "port9"
   set alias "WAN"
   set ip 22.1.1.1 255.255.255.0
   next
   edit "port10"
   set alias "Internal"
   set ip 172.16.101.1 255.255.255.0
   next
   end
   config router static
   edit 1
   set gateway 22.1.1.2
   set device "port9"
   next
   end
   ```
2. Configure IPsec phase1-interface and phase2-interface on HQ.
   ```
   config vpn ipsec phase1-interface
   edit "L2tpoIPsec"
   set type dynamic
   set interface "port9"
   set peertype any
   set proposal aes256-md5 3des-shal aes192-shal
   set dpd on-idle
   set dhgrp 2
   set net-device enable
   set psksecret sample
   set dpd-retryinterval 60
   next
   end
   ```
3. Configure a user and user group on HQ.

```fortigateconf
cfg user local
  edit "usera"
    set type password
    set passwd usera
  next
end

cfg user group
  edit "L2tpusergroup"
    set member "usera"
  next
end
```

4. Configure L2TP on HQ.

```fortigateconf
cfg vpn l2tp
  set status enable
  set eip 10.10.10.100
  set sip 10.10.10.1
  set usgrp "L2tpusergroup"
end
```

5. Configure a firewall address that is applied in L2TP settings to assign IP addresses to clients once the L2TP tunnel is established.

```fortigateconf
cfg firewall address
  edit "L2TPclients"
    set type iprange
    set start-ip 10.10.10.1
    set end-ip 10.10.10.100
  next
end
```

6. Configure a firewall policy.

```fortigateconf
cfg firewall policy
  edit 1
    set name "Bridge_IPsec_port9_for_l2tp_negotiation"
    set srcintf "L2tpoIPsec"
    set dstintf "port9"
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set action accept
  next
  edit 2
    set srcintf "L2tpoIPsec"
```
set dstintf "port10"
set srcaddr "L2TPclients"
set dstaddr "172.16.101.0"
set action accept
set schedule "always"
set service "ALL"
set nat enable

next
end

To view the VPN tunnel list on HQ:

# diagnose vpn tunnel list

list all ipsec tunnel in vd 0

name=L2tpoIPsec_0 ver=1 serial=8 22.1.1.1:0->10.1.100.15:0 tun_id=10.100.15

**Tunneled Internet browsing**

This is a sample configuration of tunneled internet browsing using a dialup VPN. To centralize network management and control, all branch office traffic is tunneled to HQ, including Internet browsing.
To configure a dialup VPN to tunnel Internet browsing using the GUI:

1. Configure the dialup VPN server FortiGate at HQ:
   a. Go to VPN > IPsec Wizard and configure the following settings for VPN Setup:
      i. Enter a VPN name, in this example, HQ.
      ii. For Template Type, select Site to Site.
      iii. For Remote Device Type, select FortiGate.
      iv. For NAT Configuration, select The remote site is behind NAT.
      v. Click Next.
   b. Configure the following settings for Authentication:
      i. For Incoming Interface, select port9.
      ii. For Authentication Method, select Pre-shared Key.
      iii. In the Pre-shared Key field, enter sample as the key.
      iv. Click Next.
   c. Configure the following settings for Policy & Routing:
      i. From the Local Interface dropdown menu, select port10.
      ii. Configure the Local Subnets as 172.16.101.0.
      iii. Configure the Remote Subnets as 0.0.0.0/0.
      iv. For Internet Access, select Share Local.
      v. For Shared WAN, select port9.
      vi. Click Create.

2. Configure the dialup VPN client FortiGate at a branch:
   a. Go to VPN > IPsec Wizard and configure the following settings for VPN Setup:
      i. Enter a VPN name, in this example, Branch1 or Branch2.
      ii. For Template Type, select Site to Site.
      iii. For Remote Device Type, select FortiGate.
      iv. For NAT Configuration, select The remote site is behind NAT.
      v. Click Next.
   b. Configure the following settings for Authentication:
      i. For IP Address, select Remote Device and enter 22.1.1.1.
      ii. For Outgoing Interface, select wan1.
      iii. For Authentication Method, select Pre-shared Key.
      iv. In the Pre-shared Key field, enter sample as the key.
      v. Click Next.
   c. Configure the following settings for Policy & Routing:
      i. From the Local Interface dropdown menu, select internal.
      ii. Configure the Local Subnets as 10.1.100.0/192.1684.0.
      iii. Configure the Remote Subnets as 0.0.0.0/0.
      iv. For Internet Access, select Use Remote.
      v. Configure the Local Gateway to 15.1.1.1/13.1.1.1.
      vi. Click Create.
To configure a dialup VPN to tunnel Internet browsing using the CLI:

1. Configure the WAN interface and static route on the FortiGate at HQ.

```fortigate
config system interface
  edit "port9"
    set alias "WAN"
    set ip 22.1.1.1 255.255.255.0
  next
  edit "port10"
    set alias "Internal"
    set ip 172.16.101.1 255.255.255.0
  next
end
cfg router static
  edit 1
    set gateway 22.1.1.2
    set device "port9"
  next
end
```

2. Configure IPsec phase1-interface and phase2-interface configuration at HQ.

```fortigate
config vpn ipsec phase1-interface
  edit "HQ"
    set type dynamic
    set interface "port9"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set dpd on-idle
    set psksecret sample
    set dpd-retryinterval 60
  next
end
config vpn ipsec phase2-interface
  edit "HQ"
    set phaselnname "HQ"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
    aes256gcm chacha20poly1305
  next
end
```

3. Configure the firewall policy at HQ.

```fortigate
config firewall policy
  edit 1
    set srcintf "HQ"
    set dstintf "port9" "port10"
    set srcaddr "10.1.100.0" "192.168.4.0"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
  next
end
```
4. Configure the WAN interface and static route on the FortiGate at the branches.
   a. Branch1.

   ```
   config system interface
   edit "wan1"
     set ip 15.1.1.2 255.255.255.0
   next
   edit "internal"
     set ip 10.1.100.1 255.255.255.0
   next
   end
   config router static
   edit 1
     set gateway 15.1.1.1
     set device "wan1"
   next
   end
   
   b. Branch2.

   ```

   ```
   config system interface
   edit "wan1"
     set ip 13.1.1.2 255.255.255.0
   next
   edit "internal"
     set ip 192.168.4.1 255.255.255.0
   next
   end
   config router static
   edit 1
     set gateway 13.1.1.1
     set device "wan1"
   next
   end
   
   5. Configure IPsec phase1-interface and phase2-interface configuration at the branches.
   a. Branch1.

   ```
   config vpn ipsec phase1-interface
   edit "branch1"
     set interface "wan1"
     set peertype any
     set net-device enable
     set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
     set dpd on-idle
     set remote-gw 22.1.1.1
     set psksecret sample
     set dpd-retryinterval 5
   next
   end
   config vpn ipsec phase2-interface
   edit "branch1"
     set phase1name "branch1"
     set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
     aes256gcm chacha20poly1305
     set auto-negotiate enable
     set src-subnet 10.1.100.0 255.255.255.0
   ```
next
end

b. Branch2.

config vpn ipsec phase1-interface
edit "branch2"
  set interface "wan1"
  set peertype any
  set net-device enable
  set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
  set dpd on-idle
  set remote-gw 22.1.1.1
  set psksecret sample
  set dpd-retryinterval 5
next
end

config vpn ipsec phase2-interface
edit "branch2"
  set phase1name "branch2"
  set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
  set auto-negotiate enable
  set src-subnet 192.168.4.0 255.255.255.0
next
end

6. Configure the firewall policy at the branches.
   a. Branch1.

config firewall policy
edit 1
  set name "outbound"
  set srcintf "internal"
  set dstintf "branch1"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set schedule "always"
  set service "ALL"
next
edit 2
  set name "inbound"
  set srcintf "branch1"
  set dstintf "internal"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set schedule "always"
  set service "ALL"
next
end

b. Branch2.

config firewall policy
edit 1
  set name "outbound"
set srcintf "internal"
set dstintf "branch2"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
next
edit 2
set name "inbound"
set srcintf "branch2"
set dstintf "internal"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
next
end

7. Configure the static routes at the branches.
   a. Branch1.

   config router static
   edit 2
   set dst 22.1.1.1/32
   set gateway 15.1.1.1
   set device "wan1"
   set distance 1
   next
   edit 3
   set device "branch1"
   set distance 5
   next
   end

   b. Branch2.

   config router static
   edit 2
   set dst 22.1.1.1/32
   set gateway 13.1.1.1
   set device "wan1"
   set distance 1
   next
   edit 3
   set device "branch2"
   set distance 5
   next
   end

8. Optionally, view the VPN tunnel list on a branch with the diagnose vpn tunnel list command:

   list all ipsec tunnel in vd 0
   ----
   name=branch1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1.1
   bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=None/536 options[0218]=npu create_dev frag-rfc accept_traffic=1
9. Optionally, view static routing table on a branch with the `get router info routing-table static` command:

```
Routing table for VRF=0
S*  0.0.0.0/0 [5/0] is directly connected, branch1
S*  22.1.1.1/32 [1/0] via 15.1.1.1, wan1
```

**Dialup IPsec VPN with certificate authentication**

In a dialup IPsec VPN setup, a company may choose to use X.509 certificates as their authentication solution for remote users. This method includes the option to verify the remote user using a user certificate, instead of a username and password. This method can be simpler for end users.

Administrators need to issue unique user certificates to each user for remote access management. The user certificate can be verified by the subject field, common name, or the principal name in the Subject Alternative Name (SAN) field.

**Subject field verification**

This is the basic method that verifies the subject string defined in the PKI user setting matches a substring in the subject field of the user certificate. For example:

```
config user peer
e   edit "tgerber"
     set ca "CA_Cert_2"
     set subject "CN=tgerber"
next
end
```

**Common name verification**

In this method, administrators can define the CN string to match the common name (CN) in the subject field of the certificate. For example:

```
config user peer
e   edit "tgerber"
     set ca "CA_Cert_2"
     set cn "tgerber"
```
The matching certificate looks like the following:

![Certificate](image)

A PKI user must be created on the FortiGate for each remote user that connects to the VPN with a unique user certificate.

**Principal name with LDAP integration**

In this method, the PKI user setting references an LDAP server. When `ldap-mode` is set to `principal-name`, the UPN in the user certificate's SAN field is used to look up the user in the LDAP directory. If a match is found, then authentication succeeds. For example:

```fortigate
config user peer
  edit "ldap-peer"
    set ca "CA_Cert_2"
    set ldap-server "WIN2K16-KLHOME-LDAPS"
    set ldap-mode principal-name
  next
end
```
The matching certificate looks like the following:

![Certificate](image)

This method is more scalable because only one PKI user needs to be created on the FortiGate. Remote users connect with their unique user certificate that are matched against users in the LDAP server.

**Certificate management**

Dialup IPsec VPN with certificate authentication requires careful certificate management planning. Assuming that a company’s private certificate authority (CA) is used to generate and sign all the certificates, the following certificates are needed:

<table>
<thead>
<tr>
<th>Certificate type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server certificate</td>
<td>The server certificate is used to identify the FortiGate IPsec dialup gateway. A CSR can be generated on the FortiGate and signed by the CA, or the CA can generate the private and public keys and export the certificate package to the FortiGate.</td>
</tr>
<tr>
<td>Certificate type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User certificate</td>
<td>The user certificate is generated and signed by the CA with unique CNs in the subject field and/or unique Principal Names in the SAN field. They are used to identify the user that is connecting to the VPN. User certificates must be installed on client machines.</td>
</tr>
<tr>
<td>CA certificate</td>
<td>The root CA certificate, and any subordinate CA that signed the actual user and server certificates, must be imported into the FortiGate and client machines. The CA certificate is used to verify the certificate chain of the server and user certificates.</td>
</tr>
</tbody>
</table>

**Example**

In this example, a dialup IPsec VPN tunnel is configured with certificate authentication using the subject field verification method and the LDAP integration method.

![Diagram](image)

The company CA, named root CA, signs all the server and user certificates. The user, tgerber@klhome.local, has a user certificate signed by root CA installed on their endpoint. The corresponding user account is also present under the company’s Active Directory.

There are five major steps to configure this example:

1. Importing the certificates
2. Configuring user authentication
3. Configuring the VPN
4. Configuring FortiClient and the endpoints
5. Testing and verifying the certificate authentication

**Importing the certificates**

The server certificate and CA certificate need to be imported into the FortiGate.
To import the server certificate:

1. Go to System > Certificates and select Import > Local Certificate.
2. For Type, select PKCS #12 Certificate.
3. Upload the key file exported from the CA and enter the password.
4. Click OK. The certificate now appears in the Local Certificate section.

To import the CA certificate:

1. Go to System > Certificates and select Import > CA Certificate.
2. For Type, select File.
3. Upload the CA certificate (usually a .CRT file). This certificate only contains the public key.
4. Click OK. The certificate now appears in the Remote CA Certificate section.

If any subordinate CA is involved in signing the certificates, you need to import its certificate.

Configuring user authentication

FortiGate PKI users do not appear in the GUI until at least one PKI user has been created in the CLI. The following instructions create the PKI users in the CLI.

To configure PKI users for subject field verification:

1. Create the PKI user and choose the CA certificate that was imported (if the certificate was signed by a subordinate CA, choose the subordinate CA’s certificate):

```fortran
config user peer
  edit "tgerber"
    set ca "CA_Cert_2"
    set subject "CN=tgerber"
  next
end
```

For an example of CN field matching, see Common name verification.

2. Create additional users as needed.
3. Place the users into a peer group:

```fortran
config user peergrp
  edit "pki-users"
    set member "tgerber" ... <user> ... <user>
  next
end
```

To configure PKI users for LDAP integration:

1. Configure the LDAP server that users connect to for authentication:

```fortran
config user ldap
  edit "WIN2K16-KLHOME-LDAPS"
    set server "192.168.20.6"
```
set cnid "sAMAccountName"
set dn "dc=KLHOME,dc=local"
set type regular
set username "KLHOME\Administrator"
set password ************
set secure ldaps
set ca-cert "CA_Cert_1"
set port 636
next
end

2. Configure the PKI user to reference the LDAP server using the CA certificate that was imported:

config user peer
   edit "ldap-peer"
      set ca "CA_Cert_2"
      set ldap-server "WIN2K16-KLHOME-LDAPS"
      set ldap-mode principal-name
   next
end

3. Place the user into a peer group:

config user peergrp
   edit "pki-ldap"
      set member "ldap-peer"
   next
end

Configuring the VPN

To configure the VPN, the address objects must be defined first so they can be used in the VPN and policy configurations. In this example, the VPN is configured in custom mode to define the authentication settings.

To configure the address objects:

1. Create the address range for the dialup clients:
   a. Go to Policy & Objects > Addresses and click Create New > Address.
   b. For Name, enter remote-user-range.
   c. For Type, select IP Range and enter 172.18.200.10-172.18.200.99 in the IP Range field.
   d. Click OK.
2. Create the address subnet for the destination 192.168.20.0/24:
   a. Click Create New > Address.
   b. For Name, enter 192.168.20.0.
   c. For Type, select Subnet and enter 192.168.20.0/24 in the IP/Netmask field.
   d. Click OK.

To configure the IPsec dialup tunnel:

1. Go to VPN > IPsec Tunnels and click Create New > IPsec Tunnel.
2. Enter a name for the tunnel, Dialup-cert_0.
3. For Template type, select Custom then click Next.
4. In the **Network** section, enter the following:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Gateway</td>
<td>Dialup User</td>
</tr>
<tr>
<td>Interface</td>
<td>port1</td>
</tr>
<tr>
<td>Mode Config</td>
<td>Enable</td>
</tr>
<tr>
<td>Assign IP From</td>
<td>Range</td>
</tr>
<tr>
<td>IPv4 mode config &gt; Client Address Range</td>
<td>172.18.200.10-172.18.200.99</td>
</tr>
<tr>
<td>Enable IPv4 Split Tunnel</td>
<td>Enable</td>
</tr>
<tr>
<td>Accessible Networks</td>
<td>192.168.20.0</td>
</tr>
</tbody>
</table>

5. In the **Authentication** section, enter the following:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Method</td>
<td>Signature</td>
</tr>
<tr>
<td>Certificate Name</td>
<td>Select the server certificate that was imported.</td>
</tr>
<tr>
<td>Mode</td>
<td>Aggressive</td>
</tr>
<tr>
<td>Peer Options &gt; Accept Types</td>
<td>Peer certificate group</td>
</tr>
<tr>
<td>Peer Options &gt; Peer certificate group</td>
<td>Select the group based on the preferred method:</td>
</tr>
<tr>
<td></td>
<td>• For subject verification, select <em>pki-users</em>.</td>
</tr>
<tr>
<td></td>
<td>• For LDAP integration, select <em>pki-ldap</em>.</td>
</tr>
</tbody>
</table>

When IKEv1 is used, aggressive mode should be selected so that the connecting endpoint will provide its peer ID in the first message of the IKE exchange. The peer identifier allows the FortiGate to match the correct tunnel when multiple dialup tunnels are defined.

6. For **Phase 2 Selectors**, leave the local and remote selectors as *0.0.0.0/0.0.0.0*.
7. Click **OK**.

**To configure the firewall policy:**

1. Go to **Policy & Objects > Firewall Policy** and click **Create New**.
2. Configure the following:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a policy name.</td>
</tr>
<tr>
<td>Incoming interface</td>
<td>Dialup-cert_0</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>port3</td>
</tr>
<tr>
<td>Source</td>
<td>remote-user-range</td>
</tr>
<tr>
<td>Destination</td>
<td>192.168.20.0</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
</tbody>
</table>
3. Configure the other settings as needed.
4. Click OK.

Configuring FortiClient and the endpoints

The following example is configured on a Windows PC with FortiClient 7.0.0. Other configurations may differ slightly.

The user certificate and CA certificate must be installed on the endpoint device. They may be pushed by the administrator through group policies or another method. This example assumes that the user certificate and CA certificate are already installed on the endpoint.

To verify the user and CA certificates:

1. Open the Windows certificate manager (certmgr):
   a. In the Control Panel, type Manage user certificate in the search box.
   b. Click the result, Manage user certificates.
2. Go to Personal > Certificate. The user certificate should be listed.

3. Go to Trusted Root Certification Authorities > Certificates. The company CA certificate should be listed.
To configure the FortiClient endpoint settings:

1. In FortiClient, click the Remote Access tab and add a new connection:
   a. If there are no existing connections, click Configure VPN.
   b. If there are existing connections, click the menu icon and select Add a new connection.
2. Configure the following:

<table>
<thead>
<tr>
<th>VPN</th>
<th>IPsec VPN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Dialup-cert_0</td>
</tr>
<tr>
<td>Remote Gateway</td>
<td>192.168.2.5</td>
</tr>
<tr>
<td>Authentication Method</td>
<td>X.509 Certificate</td>
</tr>
<tr>
<td>Authentication (XAuth)</td>
<td>Disable</td>
</tr>
</tbody>
</table>

Select the user certificate, tgerber/root CA, from the dropdown.

3. Click Save.

Testing and verifying the certificate authentication

1. On the client PC, open FortiClient and click the Remote Access tab.
2. Select the VPN tunnel, Dialup-cert_0, and click Connect.
   If the connection is successful, a FortiClient pop-up will appear briefly indicating that the IKE negotiation succeeded.
   The Remote Access window now displays VPN Connected and the associated VPN tunnel details.
3. On the FortiGate, go to Dashboard > Network and locate the IPsec widget to view the VPN tunnel monitor. Click the widget to expand to full view.
   The widget displays tunnel information, including the Peer ID containing the subject field of the user certificate.

4. Go to Log & Report > System Events and select the VPN Events card. Several tunnel related logs are recorded.
5. The same logs can be viewed in the CLI:

```
# execute log filter category 1
# execute log filter field subtype vpn
# execute log display
7: date=2021-08-23 time=15:53:08 eventtime=1629759188862005740 tz="-0700" logid="0101037138" type="event" subtype="vpn" level="notice" vd="root" logdesc="IPsec connection status changed" msg="IPsec connection status change" action="tunnel-up" remip=192.168.2.5 locip=192.168.2.1 remport=64916 locport=4500 outintf="port1" cookies="19f05ebc8c2f7a0d/7716190005538db5" user="C = CA, ST = British Columbia, L = Burnaby, O = FortiKeith, OU = TAC, CN = tgerber" group="pki-ldap" useralt="C = CA, ST = British Columbia, L = Burnaby, O = FortiKeith, OU = TAC, CN = tgerber" xauthuser="N/A" xauthgroup="N/A" assignip=172.18.200.10 vpntunnel="Dialup-cert_0" tunnelip=172.18.200.10 tunnelid=3418215253 tunneltype="ipsec" duration=0 sentbyte=0 rcvdbyte=0 nextstat=0
```
6. If any issues arise during the connection, run the following debug commands to troubleshoot the issue:

```
# diagnose debug application ike -l
# diagnose debug application fnbamd -l
# diagnose debug enable
```

**Aggregate and redundant VPN**

The following topics provide instructions on configuring aggregate and redundant VPNs:

- Manual redundant VPN configuration on page 1457
- OSPF with IPsec VPN for network redundancy on page 1461
- IPsec VPN in an HA environment on page 1468
- Packet distribution and redundancy for aggregate IPsec tunnels on page 1474
- Packet distribution for aggregate dial-up IPsec tunnels using location ID on page 1485
- Packet distribution for aggregate static IPsec tunnels in SD-WAN on page 1489
- Packet distribution for aggregate IPsec tunnels using weighted round robin on page 1494
- Redundant hub and spoke VPN on page 1495

**Manual redundant VPN configuration**

A FortiGate with two interfaces connected to the internet can be configured to support redundant VPNs to the same remote peer. Four distinct paths are possible for VPN traffic from end to end. If the primary connection fails, the FortiGate can establish a VPN using the other connection.
The redundant configuration in this example uses route-based VPNs. The FortiGates must operate in NAT mode and use auto-keying.

This example assumes the redundant VPNs are essentially equal in cost and capability. When the original VPN returns to service, traffic continues to use the replacement VPN until the replacement VPN fails. If the redundant VPN uses more expensive facilities, only use it as a backup while the main VPN is down.

A redundant configuration for each VPN peer includes:

- One phase 1 configuration for each path between the two peers with dead peer detection enabled
- One phase 2 definition for each phase 1 configuration
- One static route for each IPsec interface with different distance values to prioritize the routes
- Two firewall policies per IPsec interface, one for each direction of traffic

To configure the phase 1 and phase 2 VPN settings:

1. Go to VPN > IPsec Wizard and select the Custom template.
2. Enter the tunnel name and click Next.
3. Enter the following phase 1 settings for path 1:

<table>
<thead>
<tr>
<th>Remote Gateway</th>
<th>Static IP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>Enter the IP address of the primary interface of the remote peer.</td>
</tr>
<tr>
<td>Interface</td>
<td>Select the primary public interface of this peer.</td>
</tr>
<tr>
<td>Dead Peer Detection</td>
<td>On-Demand</td>
</tr>
</tbody>
</table>

4. Configure the remaining phase 1 and phase 2 settings as needed.
5. Click OK.
6. Repeat these steps for the remaining paths.

a. Path 2:

<table>
<thead>
<tr>
<th>Remote Gateway</th>
<th>Static IP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>Enter the IP address of the secondary interface of the remote peer.</td>
</tr>
<tr>
<td>Interface</td>
<td>Select the primary public interface of this peer.</td>
</tr>
<tr>
<td>Dead Peer Detection</td>
<td>On-Demand</td>
</tr>
</tbody>
</table>

b. Path 3:

<table>
<thead>
<tr>
<th>Remote Gateway</th>
<th>Static IP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>Enter the IP address of the primary interface of the remote peer.</td>
</tr>
<tr>
<td>Interface</td>
<td>Select the secondary public interface of this peer.</td>
</tr>
<tr>
<td>Dead Peer Detection</td>
<td>On-Demand</td>
</tr>
</tbody>
</table>

c. Path 4:

<table>
<thead>
<tr>
<th>Remote Gateway</th>
<th>Static IP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>Enter the IP address of the secondary interface of the remote peer.</td>
</tr>
<tr>
<td>Interface</td>
<td>Select the secondary public interface of this peer.</td>
</tr>
<tr>
<td>Dead Peer Detection</td>
<td>On-Demand</td>
</tr>
</tbody>
</table>

To configure the static routes:

1. Go to Network > Static Routes and click Create New.
2. In the Destination field, enter the subnet of the private network.
3. For Interface, select one of the IPsec interfaces on the local peer.
4. Enter a value for Administrative Distance.
5. Click OK.
6. Repeat these steps for the three remaining paths, and enter different values for Administrative Distance to prioritize the paths.
To configure the firewall policies:

1. Create the policies for the local primary interface:
   a. Go to Policy & Objects > Firewall Policy and click Create New.
   b. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>Enter a name for the policy.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>Select the local interface to the internal (private) network.</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>Select one of the virtual IPsec interfaces.</td>
</tr>
<tr>
<td>Source</td>
<td>All</td>
</tr>
<tr>
<td>Destination</td>
<td>All</td>
</tr>
<tr>
<td>Schedule</td>
<td>Always</td>
</tr>
<tr>
<td>Service</td>
<td>All</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
</tbody>
</table>

   c. Click OK.
   d. Click Create New and configure the policy for the other direction of traffic:

<table>
<thead>
<tr>
<th>Name</th>
<th>Enter a name for the policy.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>Select one of the virtual IPsec interfaces.</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>Select the local interface to the internal (private) network.</td>
</tr>
<tr>
<td>Source</td>
<td>All</td>
</tr>
<tr>
<td>Destination</td>
<td>All</td>
</tr>
<tr>
<td>Schedule</td>
<td>Always</td>
</tr>
<tr>
<td>Service</td>
<td>All</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
</tbody>
</table>

   e. In the policy list, drag the VPN policies above any other policies with similar source and destination addresses.

2. Repeat these steps to create the policies for the three remaining paths.

Creating a backup IPsec interface

A route-based VPN can be configured to act as a backup IPsec interface when the main VPN is out of service. This can only be configured in the CLI.

The backup feature works on interfaces with static addresses that have dead peer detection enabled. The `monitor` option creates a backup VPN for the specified phase 1 configuration.

To create a backup IPsec interface:

```
config vpn ipsec phasel-interface
edit main_vpn
   set dpd on-demand
   set interface port1
```
set nattraversal enable
set psksecret ********
set remote-gw 192.168.10.8
set type static
next
dao
edit backup_vpn
  set dpd on-demand
  set interface port2
  set monitor main_vpn
  set nattraversal enable
  set psksecret ********
  set remote-gw 192.168.10.8
  set type static
next
end

**OSPF with IPsec VPN for network redundancy**

This is a sample configuration of using OSPF with IPsec VPN to set up network redundancy. Route selection is based on OSPF cost calculation. You can configure ECMP or primary/secondary routes by adjusting OSPF path cost.

Because the GUI can only complete part of the configuration, we recommend using the CLI.

**To configure OSPF with IPsec VPN to achieve network redundancy using the CLI:**

1. Configure the WAN interface and static route.
   Each FortiGate has two WAN interfaces connected to different ISPs. The ISP1 link is for the primary FortiGate and the IPS2 link is for the secondary FortiGate.
   a. Configure HQ1.
      ```
      config system interface
      edit "port1"
        set alias to ISP1
        set ip 172.16.200.1 255.255.255.0
      next
      edit "port2"
        set alias to ISP2
        set ip 172.17.200.1 255.255.255.0
      next
      end
      config router static
      edit 1
      ```
b. Configure HQ2.

   config system interface
   edit "port25"
       set alias to_ISP1
       set ip 172.16.202.1 255.255.255.0
   next
   edit "port26"
       set alias to_ISP2
       set ip 172.17.202.1 255.255.255.0
   next
end

   config router static
   edit 1
       set gateway 172.16.202.2
       set device "port25"
   next
   edit 2
       set gateway 172.17.202.2
       set device "port26"
       set priority 100
   next
end

2. Configure the internal (protected subnet) interface.
   a. Configure HQ1.

       config system interface
       edit "dmz"
           set ip 10.1.100.1 255.255.255.0
       next
end

   b. Configure HQ2.

       config system interface
       edit "port9"
           set ip 172.16.101.1 255.255.255.0
       next
end

3. Configure IPsec phase1-interface and phase-2 interface. On each FortiGate, configure two IPsec tunnels: a primary and a secondary.
   a. Configure HQ1.

       config vpn ipsec phasel-interface
       edit "pri_HQ2"
           set interface "port1"
           set peertype any
           set net-device enable
           set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
           set remote-gw 172.16.202.1
           set psksecret sample1
nextedit "sec_HQ2"
    set interface "port2"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.17.202.1
    set psksecret sample2
next
dendiff

b. Configure HQ2.
config vpn ipsec phase2-interface
edit "pri_HQ2"
    set phaselname "pri_HQ2"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
    set auto-negotiate enable
dendiff

edifnext
edit "sec_HQ2"
    set phaselname "sec_HQ2"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
    set auto-negotiate enable
dendiff

end

config vpn ipsec phase1-interface
edit "pri_HQ1"
    set interface "port25"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.200.1
    set psksecret sample1
next
edit "sec_HQ1"
    set interface "port26"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.17.200.1
    set psksecret sample2
next
dendiff

config vpn ipsec phase2-interface
edit "pri_HQ1"
    set phaselname "pri_HQ1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
    set auto-negotiate enable
dendiff

edifnext
edit "sec_HQ1"
    set phaselname "sec_HQ1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
    set auto-negotiate enable
dendiff

end
4. Configure an inbound and outbound firewall policy for each IPsec tunnel.
   a. Configure HQ1.
      
      ```
      config firewall policy
      edit 1
        set name "pri_inbound"
        set srcintf "pri_HQ2"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
      next
      edit 2
        set name "pri_outbound"
        set srcintf "dmz"
        set dstintf "pri_HQ2"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
      next
      edit 3
        set name "sec_inbound"
        set srcintf "sec_HQ2"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
      next
      edit 4
        set name "sec_outbound"
        set srcintf "dmz"
        set dstintf "sec_HQ2"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
      next
      end
      ```

   b. Configure HQ2.
      
      ```
      config firewall policy
      edit 1
        set name "pri_inbound"
        set srcintf "pri_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
      next
      ```
edit 2
  set name "pri_outbound"
  set srcintf "port9"
  set dstintf "pri_HQ1"
  set srcaddr "10.1.100.0"
  set dstaddr "172.16.101.0"
  set action accept
  set schedule "always"
  set service "ALL"
next
edit 3
  set name "sec_inbound"
  set srcintf "sec_HQ1"
  set dstintf "port9"
  set srcaddr "10.1.100.0"
  set dstaddr "172.16.101.0"
  set action accept
  set schedule "always"
  set service "ALL"
next
edit 4
  set name "sec_outbound"
  set srcintf "port9"
  set dstintf "sec_HQ1"
  set srcaddr "172.16.101.0"
  set dstaddr "10.1.100.0"
  set action accept
  set schedule "always"
  set service "ALL"
next
end

5. Assign an IP address to the IPsec tunnel interface.
   a. Configure HQ1.
      config system interface
        edit "pri_HQ2"
          set ip 10.10.10.1 255.255.255.255
          set remote-ip 10.10.10.2 255.255.255.255
        next
        edit "sec_HQ2"
          set ip 10.10.11.1 255.255.255.255
          set remote-ip 10.10.11.2 255.255.255.255
        next
      end
   b. Configure HQ2.
      config system interface
        edit "pri_HQ1"
          set ip 10.10.10.2 255.255.255.255
          set remote-ip 10.10.10.1 255.255.255.255
        next
        edit "sec_HQ1"
          set ip 10.10.11.2 255.255.255.255
          set remote-ip 10.10.11.1 255.255.255.255
        next
      end
6. Configure OSPF.
   a. Configure HQ1.
      ```
      config router ospf
      set router-id 1.1.1.1
      config area
      edit 0.0.0.0
      next
      end
      config ospf-interface
      edit "pri_HQ2"
      set interface "pri_HQ2"
      set cost 10
      set network-type point-to-point
      next
      edit "sec_HQ2"
      set interface "sec_HQ2"
      set cost 20
      set network-type point-to-point
      next
      end
      config network
      edit 1
      set prefix 10.10.10.0 255.255.255.0
      next
      edit 2
      set prefix 10.10.11.0 255.255.255.0
      next
      edit 3
      set prefix 10.1.100.0 255.255.255.0
      next
      end
      end
      ```
   b. Configure HQ2.
      ```
      config router ospf
      set router-id 2.2.2.2
      config area
      edit 0.0.0.0
      next
      end
      config ospf-interface
      edit "pri_HQ1"
      set interface "pri_HQ1"
      set cost 10
      set network-type point-to-point
      next
      edit "sec_HQ1"
      set interface "sec_HQ1"
      set cost 20
      set network-type point-to-point
      next
      end
      config network
      edit 1
      set prefix 10.10.10.0 255.255.255.0
      next
      edit 2
      ```
To check VPN and OSPF states using diagnose and get commands:

1. Run the `HQ1 # diagnose vpn ike gateway list command`. The system should return the following:
   ```
   vd: root/0
   name: pri_HQ2
   version: 1
   interface: port1 11
   virtual-interface-addr: 10.10.10.1 -> 10.10.10.2
   created: 1024s ago

3. Run the `HQ1 # get router info ospf neighbor` command. The system should return the following:
   OSPF process 0, VRF 0:
   Neighbor ID Pri State Dead Time Address Interface
   2.2.2.2 1. Full/ 00:00:37 10.10.10.2 pri_HQ2
   2.2.2.2 1. Full/ 00:00:32 10.10.11.2 sec_HQ2

4. Run the `HQ1 # get router info routing-table ospf` command. The system should return the following:
   Routing table for VRF=0
   O 172.16.101.0/24 [110/20] via 10.10.10.2, pri_HQ2 , 00:03:21
   In case the primary tunnel is down after route convergence.

5. Run the `HQ1 # get router info routing-table ospf` command. The system should return the following:
   Routing table for VRF=0
   O 172.16.101.0/24 [110/110] via 10.10.11.2, sec_HQ2 , 00:00:01

**IPsec VPN in an HA environment**

This is a sample configuration of site-to-site IPsec VPN in an HA environment.

For this example, set up HA as described in the HA topics. When setting up HA, enable the following options to ensure IPsec VPN traffic is not interrupted during an HA failover:

- `session-pickup` under HA settings.
- `ha-sync-esp-seqno` under IPsec phase1-interface settings.

You can configure IPsec VPN in an HA environment using the **GUI** or **CLI**.

In this example, the VPN name for HQ1 is "to_HQ2", and the VPN name for HQ2 is "to_HQ1".
To configure IPsec VPN in an HA environment in the GUI:

1. Set up IPsec VPN on HQ1 (the HA cluster):
   a. Go to VPN > IPsec Wizard and configure the following settings for VPN Setup:
      i. Enter a VPN name.
      ii. For Template Type, select Site to Site.
      iii. For Remote Device Type, select FortiGate.
      iv. For NAT Configuration, set No NAT between sites.
      v. Click Next.
   b. Configure the following settings for Authentication:
      i. For Remote Device, select IP Address.
      ii. In the IP address field, enter 172.16.202.1.
      iii. For Outgoing Interface, select port1.
      iv. For Authentication Method, select Pre-shared Key.
      v. In the Pre-shared Key field, enter an example key.
      vi. Click Next.
   c. Configure the following settings for Policy & Routing:
      i. From the Local Interface dropdown menu, select the local interface.
      ii. Configure the Local Subnets as 10.1.100.0/24.
      iii. Configure the Remote Subnets as 172.16.101.0/24.
      iv. Click Create.
2. Set up IPsec VPN on HQ2:
   a. Go to VPN > IPsec Wizard and configure the following settings for VPN Setup:
      i. Enter a VPN name.
      ii. For Template Type, select Site to Site.
      iii. For Remote Device Type, select FortiGate.
      iv. For NAT Configuration, set No NAT between sites.
      v. Click Next.
   b. Configure the following settings for Authentication:
      i. For Remote Device, select IP Address.
      ii. In the IP address field, enter 172.16.200.1.
      iii. For Outgoing Interface, select port13.
      iv. For Authentication Method, select Pre-shared Key.
      v. In the Pre-shared Key field, enter an example key.
      vi. Click Next.
   c. Configure the following settings for Policy & Routing:
      i. From the Local Interface dropdown menu, select the desired local interface. In this example, it is port9.
      ii. Configure the Local Subnets as 172.16.101.0.
      iii. Configure the Remote Subnets as 10.1.100.0
      iv. Click Create.

To configure IPsec VPN in an HA environment using the CLI:

1. Configure HA. In this example, two FortiGates work in active-passive mode. The HA heartbeat interfaces are WAN1 and WAN2:
   ```
   config system ha
   ```
VPN

set group-name "FGT-HA"
set mode a-p
set password sample
set hbdev "wan1" 50 "wan2" 50
set session-pickup enable
set priority 200
set override-wait-time 10
end

2. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.
   a. Configure HQ1:
      config system interface
         edit "port1"
            set vdom "root"
            set ip 172.16.200.1 255.255.255.0
         next
      end
      config router static
         edit 1
            set gateway 172.16.200.3
            set device "port1"
         next
      end
   b. Configure HQ2:
      config system interface
         edit "port25"
            set vdom "root"
            set ip 172.16.202.1 255.255.255.0
         next
      end
      config router static
         edit 1
            set gateway 172.16.202.2
            set device "port25"
         next
      end

3. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.
   a. Configure HQ1:
      config system interface
         edit "dmz"
            set vdom "root"
            set ip 10.1.100.1 255.255.255.0
         next
      end
   b. Configure HQ2:
      config system interface
         edit "port9"
            set vdom "root"
            set ip 172.16.101.1 255.255.255.0
         next
      end

4. Configure the IPsec phase1-interface. This example uses PSK as the authentication method. You can also use signature authentication.
a. Configure HQ1:

```fortios
config vpn ipsec phase1-interface
edit "to_HQ2"
    set interface "port1"
    set peertype any
    set net-device enable
    set ha-sync-esp-seqno enable
    set proposal aes128-sha256 aes256-sha256 aes128-shal aes256-shal
    set remote-gw 172.16.202.1
    set psksecret sample
next
end
```

b. Configure HQ2:

```fortios
config vpn ipsec phase1-interface
edit "to_HQ1"
    set interface "port25"
    set peertype any
    set net-device enable
    set ha-sync-esp-seqno enable
    set proposal aes128-sha256 aes256-sha256 aes128-shal aes256-shal
    set remote-gw 172.16.200.1
    set psksecret sample
next
end
```

5. Configure the IPsec phase2-interface:

a. Configure HQ1:

```fortios
config vpn ipsec phase2-interface
edit "to_HQ2"
    set phasename "to_HQ2"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
    aes256gcm chacha20poly1305
    set auto-negotiate enable
next
end
```

b. Configure HQ2:

```fortios
config vpn ipsec phase2-interface
edit "to_HQ1"
    set phasename "to_HQ1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
    aes256gcm chacha20poly1305
    set auto-negotiate enable
next
end
```

6. Configure static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure IPsec traffic does not match the default route when the IPsec tunnel is down.

a. Configure HQ1:

```fortios
config router static
edit 2
    set dst 172.16.101.0 255.255.255.0
    set device "to_HQ2"
next
edit 3
    set dst 172.16.101.0 255.255.255.0
    set blackhole enable
    set distance 254
next
```
b. Configure HQ2:

```fortigate-config
config router static
edit 2
    set dst 10.1.100.0 255.255.255.0
    set device "to_HQ1"
next
edit 3
    set dst 10.1.100.0 255.255.255.0
    set blackhole enable
    set distance 254
next
end
```

7. Configure two firewall policies to allow bi-directional IPsec traffic flow over the IPsec tunnel:

a. Configure HQ1:

```fortigate-config
config firewall policy
edit 1
    set name "inbound"
    set srcintf "to_HQ2"
    set dstintf "dmz"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
edit 2
    set name "outbound"
    set srcintf "dmz"
    set dstintf "to_HQ2"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
end
```

b. Configure HQ2:

```fortigate-config
config firewall policy
edit 1
    set name "inbound"
    set srcintf "to_HQ1"
    set dstintf "port9"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
edit 2
    set name "outbound"
    set srcintf "port9"
    set dstintf "to_HQ1"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
```
8. Use the following \texttt{diagnose} commands to check IPsec phase1/phase2 interface status including the sequence number on the secondary FortiGate. The \texttt{diagnose debug application ike -1} command is the key to troubleshoot why the IPsec tunnel failed to establish.

a. Run the \texttt{HQ1 \# diagnose vpn ike gateway list} command. The system should return the following:

- \texttt{vd: root/0}
- \texttt{name: to_HQ2}
- \texttt{version: 1}
- \texttt{interface: port1 11}
- \texttt{created: 5s ago}
- \texttt{IKE SA: created 1/1 established 1/1 time 0/0/0 ms}
- \texttt{IPsec SA: created 2/2 established 2/2 time 0/0/0 ms}

b. Run the \texttt{HQ1 \# diagnose vpn tunnel list} command. The system should return the following:

- \texttt{list all ipsec tunnel in vd 0}
- \texttt{name=to_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1}
- \texttt{bound_if=11 lgw=static/1 tun=intf/0 mode=auto/1 encap=none/528 options[0210]=create_
  dev frag/rfc accept_traffic=1}
- \texttt{proxyid_num=1 child_num=0 refcnt=11 ilast=13 olast=274 ad=/0}
- \texttt{stat: rxp=0 txp=0 rxb=0 txb=0}
- \texttt{dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=0}
- \texttt{natt: mode=none draft=0 interval=0 remote_port=0}
- \texttt{proxyid=to_HQ2 proto=0 sa=1 ref=2 serial=1 auto-negotiate}

ESP seqno synced to primary FortiGate every five minutes, and big gap between primary and secondary to ensure that no packet is dropped after HA failover caused by tcp-replay. Check ESP sequence number synced on secondary FortiGate.

c. Run the \texttt{HQ1 \# execute ha manage 0 admin command}.

d. Run the \texttt{HQ1-Sec \# diagnose vpn tunnel list} command. The system should return the following:

- \texttt{list all ipsec tunnel in vd 0}
- \texttt{name=to_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1}
- \texttt{bound_if=11 lgw=static/1 tun=intf/0 mode=auto/1 encap=none/528 options[0210]=create_
  dev frag/rfc accept_traffic=1}
- \texttt{proxyid_num=1 child_num=0 refcnt=11 ilast=13 olast=274 ad=/0}
- \texttt{stat: rxp=0 txp=0 rxb=0 txb=0}
- \texttt{dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=0}
- \texttt{natt: mode=none draft=0 interval=0 remote_port=0}
- \texttt{proxyid=to_HQ2 proto=0 sa=1 ref=2 serial=1 auto-negotiate}
Packet distribution and redundancy for aggregate IPsec tunnels

This is a sample configuration of a multiple site-to-site IPsec VPN that uses an IPsec aggregate interface to set up redundancy and traffic load-balancing. The VPN tunnel interfaces must have net-device disabled in order to be members of the IPsec aggregate.

Each FortiGate has two WAN interfaces connected to different ISPs. OSPF runs over the IPsec aggregate in this configuration.

The supported load balancing algorithms are: L3, L4, round-robin (default), weighted round-robin, and redundant. The first four options allow traffic to be load-balanced, while the last option (redundant) uses the first tunnel that is up for all traffic.

Dynamic routing can run on the aggregate interface, and it can be a member interface in SD-WAN (not shown in this configuration).

Configuring the HQ1 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. Create the IPsec tunnels.
2. Create the IPsec aggregate.
3. Configure the firewall policies.
4. Configure the aggregate VPN interface IPs.
5. Configure OSPF.

To create the IPsec tunnels:

1. Go to VPN > IPsec Wizard and select the Custom template.
2. For Name, enter pri_HQ2 and click Next.
3. Enter the following:
### Phase 1
<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>172.16.202.1</td>
</tr>
<tr>
<td>Interface</td>
<td>port1</td>
</tr>
<tr>
<td>Device creation</td>
<td>Disabled</td>
</tr>
<tr>
<td>Aggregate member</td>
<td>Enabled</td>
</tr>
<tr>
<td>Authentication Method</td>
<td>Pre-shared Key</td>
</tr>
<tr>
<td>Pre-shared Key</td>
<td>Enter the secure key</td>
</tr>
<tr>
<td>IKE Mode</td>
<td>Aggressive</td>
</tr>
<tr>
<td>Peer Options Accept Types</td>
<td>Any peer ID</td>
</tr>
</tbody>
</table>

### Phase 2
- Auto-negotiate: Enable

4. Configure the other settings as needed.
5. Click OK.
6. Create another tunnel named sec_HQ2 with the following settings:

### Phase 1
<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>172.17.202.1</td>
</tr>
<tr>
<td>Interface</td>
<td>port2</td>
</tr>
<tr>
<td>Device creation</td>
<td>Disabled</td>
</tr>
<tr>
<td>Aggregate member</td>
<td>Enabled</td>
</tr>
<tr>
<td>Authentication Method</td>
<td>Pre-shared Key</td>
</tr>
<tr>
<td>Pre-shared Key</td>
<td>Enter the secure key</td>
</tr>
<tr>
<td>IKE Mode</td>
<td>Aggressive</td>
</tr>
<tr>
<td>Peer Options Accept Types</td>
<td>Any peer ID</td>
</tr>
</tbody>
</table>

### Phase 2
- Auto-negotiate: Enable

**To create the IPsec aggregate:**

1. Go to VPN > IPsec Tunnels and click Create New > IPsec Aggregate.
2. For Name, enter agg_HQ2.
3. Select a load balancing algorithm.
4. From the Tunnel dropdown, select the tunnels that you created previously (pri_HQ2 and sec_HQ2). If required, enter weights for each tunnel.
5. Click OK.
To configure the firewall policies:

1. Go to Policy & Objects > Firewall Policy.
2. Create an inbound traffic policy with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>inbound</td>
</tr>
<tr>
<td>Incoming Interface</td>
<td>agg_HQ2</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>dmz</td>
</tr>
<tr>
<td>Source</td>
<td>172.16.101.0</td>
</tr>
<tr>
<td>Destination</td>
<td>10.1.100.0</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
</tbody>
</table>

3. Click OK.
4. Create an outbound traffic policy with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>outbound</td>
</tr>
<tr>
<td>Incoming Interface</td>
<td>dmz</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>agg_HQ2</td>
</tr>
<tr>
<td>Source</td>
<td>10.1.100.0</td>
</tr>
<tr>
<td>Destination</td>
<td>172.16.101.0</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
</tbody>
</table>

To configure the aggregate VPN interface IPs:

1. Go to Network > Interfaces and edit agg_HQ2.
2. For IP, enter 10.10.10.1.
3. For Remote IP/Netmask, enter 10.10.10.2 255.255.255.255.
4. Click OK.

To configure OSPF:

1. Go to Network > OSPF.
2. For Router ID, enter 1.1.1.1.
3. In the Areas table, click Create New.
   a. For Area ID, enter 0.0.0.0.
   b. Click OK.
4. In the Networks table, click Create New.
   a. Set the Area to 0.0.0.0.
   b. For IP/Netmask, enter 10.1.100.0/24.
   c. Click OK.
   d. Click Create New.
   e. For IP/Netmask, enter 10.10.10.0/24.
   f. Click OK.
5. Click Apply.

Configuring the HQ2 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. Create the IPsec tunnels.
2. Create the IPsec aggregate.
3. Configure the firewall policies.
4. Configure the aggregate VPN interface IPs.
5. Configure OSPF.

To create the IPsec tunnels:

1. Go to VPN > IPsec Wizard and select the Custom template.
2. For Name, enter pri_HQ1 and click Next.
3. Enter the following:

<table>
<thead>
<tr>
<th>Phase 1</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>172.16.200.1</td>
</tr>
<tr>
<td>Interface</td>
<td>port25</td>
</tr>
<tr>
<td>Device creation</td>
<td>Disabled</td>
</tr>
<tr>
<td>Aggregate member</td>
<td>Enabled</td>
</tr>
<tr>
<td>Authentication Method</td>
<td>Pre-shared Key</td>
</tr>
<tr>
<td>Pre-shared Key</td>
<td>Enter the secure key</td>
</tr>
<tr>
<td>IKE Mode</td>
<td>Aggressive</td>
</tr>
<tr>
<td>Peer Options Accept Types</td>
<td>Any peer ID</td>
</tr>
</tbody>
</table>

4. Configure the other settings as needed.
5. Click OK.
6. Create another tunnel named sec_HQ1 with the following settings:

<table>
<thead>
<tr>
<th>Phase 1</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto-negotiate</td>
<td>Enable</td>
</tr>
</tbody>
</table>
To create the IPsec aggregate:

1. Go to VPN > IPsec Tunnels and click Create New > IPsec Aggregate.
2. For Name, enter agg_HQ1.
3. Select a load balancing algorithm.
4. From the Tunnel dropdown, select the tunnels that you created previously (pri_HQ1 and sec_HQ1). If required, enter weights for each tunnel.
5. Click OK.

To configure the firewall policies:

1. Go to Policy & Objects > Firewall Policy.
2. Create an inbound traffic policy with the following settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>inbound</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>agg_HQ1</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>port9</td>
</tr>
<tr>
<td>Source</td>
<td>10.1.100.0</td>
</tr>
<tr>
<td>Destination</td>
<td>172.16.101.0</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
</tbody>
</table>

3. Click OK.
4. Create an outbound traffic policy with the following settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>outbound</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>port9</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>agg_HQ1</td>
</tr>
<tr>
<td>-------------------</td>
<td>--------</td>
</tr>
<tr>
<td>Source</td>
<td>172.16.101.0</td>
</tr>
<tr>
<td>Destination</td>
<td>10.1.100.0</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
</tbody>
</table>

**To configure the aggregate VPN interface IPs:**

1. Go to Network > Interfaces and edit agg_HQ1.
2. For IP, enter 10.10.10.2.
3. For Remote IP/Netmask, enter 10.10.10.1 255.255.255.255.
4. Click OK.

**To configure OSPF:**

1. Go to Network > OSPF.
2. For Router ID, enter 2.2.2.2.
3. In the Areas table, click Create New.
   a. For Area ID, enter 0.0.0.0.
   b. Click OK.
4. In the Networks table, click Create New.
   a. Set the Area to 0.0.0.0.
   b. For IP/Netmask, enter 172.16.101.0/24.
   c. Click OK.
   d. Click Create New.
   e. For IP/Netmask, enter 10.10.0.0/24.
   f. Click OK.
5. Click Apply.

**Monitoring the traffic in the GUI**

**To monitor the traffic:**

1. Go to Dashboard > Network, hover over the IPsec widget, then click Expand to Full Screen.
2. Expand the aggregate tunnel in the table to view statistics for each aggregate member.

**Configuring the HQ1 FortiGate in the CLI**

There are six steps to configure the FortiGate:

1. Configure the interfaces.
2. Configure two IPsec phase 1 and phase 2 interfaces.
3. Configure the IPsec aggregate.
4. Configure the firewall policies.
5. Configure the aggregate VPN interface IPs.
6. Configure OSPF.

To configure the interfaces:

1. Configure port1, port2, and dmz as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```plaintext
config vpn ipsec phase1-interface
  edit "pri_HQ2"
    set interface "port1"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes128-sha256 aes256-sha256 aes128-shal aes256-shal
    set remote-gw 172.16.202.1
    set psksecret sample1
  next
  edit "sec_HQ2"
    set interface "port2"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes128-sha256 aes256-sha256 aes128-shal aes256-shal
    set remote-gw 172.17.202.1
    set psksecret sample2
next
end
config vpn ipsec phase2-interface
  edit "pri_HQ2"
    set phasename "pri_HQ2"
    set proposal aes128-shal aes256-shal aes128-sha256 aes256-sha256 aes128gcm aes256gcm
      chacha20poly1305
    set auto-negotiate enable
next
  edit "sec_HQ2"
    set phasename "sec_HQ2"
    set proposal aes128-shal aes256-shal aes128-sha256 aes256-sha256 aos128gcm aos256gcm
      chacha20poly1305
    set auto-negotiate enable
next
end

To configure the IPsec aggregate:

```plaintext
config system ipsec-aggregate
  edit "agg_HQ2"
    set member "pri_HQ2" "sec_HQ2"
next
end
```

To configure the firewall policies:

```plaintext
config firewall policy
  edit 1
```
VPN

    set name "inbound"
    set srcintf "agg_HQ2"
    set dstintf "dmz"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
edit 2
    set name "outbound"
    set srcintf "dmz"
    set dstintf "agg_HQ2"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
end

To configure the aggregate VPN interface IPs:

    config system interface
      edit "agg_HQ2"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.2 255.255.255.255
    next
end

To configure OSPF:

    config router ospf
      set router-id 1.1.1.1
    config area
      edit 0.0.0.0
    next
end
    config network
      edit 1
        set prefix 10.1.100.0 255.255.255.0
        next
      edit 2
        set prefix 10.10.10.0 255.255.255.0
        next
    end
end

Configuring the HQ2 FortiGate in the CLI

There are six steps to configure the FortiGate:

1. Configure the interfaces.
2. Configure two IPsec phase 1 and phase 2 interfaces.
3. Configure the IPsec aggregate.
4. Configure the firewall policies.
5. Configure the aggregate VPN interface IPs.
6. Configure OSPF.

To configure the interfaces:

1. Configure port25, port26, and port9 as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```plaintext
config vpn ipsec phase1-interface
edit "pri_HQ1"
  set interface "port25"
  set peertype any
  set net-device disable
  set aggregate-member enable
  set proposal aes128-sha256 aes256-sha256 aes128-shal aes256-shal
  set remote-gw 172.16.200.1
  set psksecret sample1
next
edit "sec_HQ1"
  set interface "port26"
  set peertype any
  set net-device disable
  set aggregate-member enable
  set proposal aes128-sha256 aes256-sha256 aes128-shal aes256-shal
  set remote-gw 172.17.200.1
  set psksecret sample2
nextend
config vpn ipsec phase2-interface
edit "pri_HQ1"
  set phase1name "pri_HQ1"
  set proposal aes128-shal aes256-shal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
  set auto-negotiate enable
next
edit "sec_HQ1"
  set phase1name "sec_HQ1"
  set proposal aes128-shal aes256-shal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
  set auto-negotiate enable
nextend

To configure the IPsec aggregate:

```plaintext
config system ipsec-aggregate
edit "agg_HQ1"
  set member "pri_HQ1" "sec_HQ1"
nextend

To configure the firewall policies:

```plaintext
config firewall policy
edit 1
```
set name "inbound"
set srcintf "agg_HQ1"
set dstintf "port9"
set srcaddr "10.1.100.0"
set dstaddr "172.16.101.0"
set action accept
set schedule "always"
set service "ALL"
next
edit 2
set name "outbound"
set srcintf "port9"
set dstintf "agg_HQ1"
set srcaddr "172.16.101.0"
set dstaddr "10.1.100.0"
set action accept
set schedule "always"
set service "ALL"
next
end

To configure the aggregate VPN interface IPs:

config system interface
edit "agg_HQ1"
set ip 10.10.10.2 255.255.255.255
set remote-ip 10.10.10.1 255.255.255.255
next
end

To configure OSPF:

config router ospf
set router-id 2.2.2.2
config area
edit 0.0.0.0
next
end
config network
edit 1
set prefix 172.16.101.0 255.255.255.0
next
edite 2
set prefix 10.10.10.0 255.255.255.0
next
end
end

Monitoring the traffic in the CLI

To view debugging information:

1. Verify the status of the phase 1 IKE SAs:
   # diagnose vpn ike gateway list
   vd: root/0
name: pri_HQ2
version: 1
interface: port1 11
tun_id: 172.16.202.1
created: 1520s ago
IKE SA: created 1/2 established 1/1 time 10/10/10 ms
IPSec SA: created 2/2 established 1/1 time 0/0/0 ms

id/spi: 173 dcede154681579b/e32f4c48c6349f0c0 direction: responder status: established
1498-1498s ago = 10ms proposal: aes128-sha256 key: d7230a68d7b83def-588b94495c9f4d38 lifetime/rekey: 86400/8631 DPD sent/recv: 0000000d/00000006

vd: root/0
name: sec_HQ2
version: 1
interface: port2 12
created: 1520s ago
IKE SA: created 1/2 established 1/1 time 10/10/10 ms
IPSec SA: created 2/2 established 1/1 time 0/0/0 ms

id/spi: 174 a567bd7bf02a04b5/4251b6254660aee2 direction: responder status: established
1498-1498s ago = 10ms proposal: aes128-sha256 key: 9f44f500c28d8de6-febaae9d1e6a164c lifetime/rekey: 86400/8631 DPD sent/recv: 00000008/0000000c

2. Verify the phase 2 IPSec tunnel SAs:

# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
name=sec_HQ2 ver=1 serial=2 172.17.200.1:0-172.17.202.1:0
tun_id=172.17.202.1

3. Debug the IPsec aggregation list:
   # diagnose sys ipsec-aggregate list
   agg_HQ2 algo=RR member=2 run_tally=2
   members:
     pri_HQ2
     sec_HQ2

4. Verify the OSPF neighbor information:
   # get router info ospf neighbor
   OSPF process 0, VRF 0:
   Neighbor ID Pri State Dead Time Address Interface
   2.2.2.2 1. Full/ - 00:00:34 10.10.10.2 agg1_HQ2

5. Verify the OSPF routing table:
   # get router info routing-table ospf
   Routing table for VRF=0
   O 172.16.101.0/24 [110/20] via 10.10.10.2, agg1_HQ2 , 00:18:43

Packet distribution for aggregate dial-up IPsec tunnels using location ID

To support per-packet load balancing on aggregate dial-up IPsec tunnels between sites, each spoke must be configured with a location ID. On the hub, per-packet load balancing is performed on the tunnels in the IPsec aggregate that have the same location ID.

Multiple dial-up VPN tunnels from the same location can be aggregated on the VPN hub and load balanced based on the configured load balance algorithm.

IPsec traffic cannot be offloaded to the NPU.

Example

In this example, an IPsec aggregate tunnel is formed between two dial-up IPsec tunnels in order to support per-packet load balancing.
To configure the client FortiGate (FGT-A):

1. Configure the IPsec tunnels:

```plaintext
config vpn ipsec phase1-interface
   edit "client1"
      set interface "port1"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.200.4
      set psksecret **********
   next

   edit "client2"
      set interface "wan1"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 173.1.1.1
      set psksecret **********
   next
end

2. Configure an aggregate of the IPsec tunnels:

```plaintext
config system ipsec-aggregate
   edit "agg1"
      set member "client1" "client2"
   next
end
```

3. Configure the location ID:

```plaintext
config system settings
   set location-id 1.1.1.1
end
```

To configure the server FortiGate (FGT-B):

1. Configure the IPsec tunnels:

```plaintext
config vpn ipsec phase1-interface
   edit "server1"
      set type dynamic
      set interface "mgmt1"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set dpd on-idle
      set psksecret **********
      set dpd-retryinterval 60
   next

   edit "server2"
      set type dynamic
      set interface "port27"
end
```
set peertype any
set net-device disable
set aggregate-member enable
set proposal aes128-sha256 aes256-sha256 aes128-shal aes256-shal
set dpd on-idle
set psksecret **********
set dpd-retryinterval 60
next
end
config vpn ipsec phase2-interface
edit "server1"
  set phasename "server1"
  set proposal aes128-shal aes256-shal aes128-sha256 aes256-sha256 aes128gcm
  aes256gcm chacha20poly1305
next
edit "server2"
  set phasename "server2"
  set proposal aes128-shal aes256-shal aes128-sha256 aes256-sha256 aes128gcm
  aes256gcm chacha20poly1305
next
end

2. Configure an aggregate of the IPsec tunnels:

config system ipsec-aggregate
edit "server"
  set member "server1" "server2"
next
end

3. Configure a firewall policy:

config firewall policy
edit 1
  set srcintf "server"
  set dstintf "port9"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set schedule "always"
  set service "ALL"
next
end

To check the IPsec tunnel and aggregate state:

1. List all of the VPN tunnels:

    FGDocs # diagnose vpn tunnel list
    list all ipsec tunnel in vd 0
    -----------------------------------------
    name=server1 ver=1 serial=1 172.16.200.4:500->>0.0.0.0:500 tun_id=1.0.0.0 dst_mtu=0 dpd-

  dec: spi=0aef2a0a esp=aes key=16 4b7a17ba9d239e4ae5fe95ec100fca8b
2. List the IPsec aggregate members:

```bash
# diagnose sys ipsec-aggregate list
server
members(3):
server1_1
server1_0
server2_0
```

3. In the GUI, go to Dashboard > Network and expand the IPsec widget to review the traffic distributed over the aggregate members:

![IPsec Aggregate Dashboard](image)

**Packet distribution for aggregate static IPsec tunnels in SD-WAN**

This is a sample configuration of aggregating IPsec tunnels by using per-packet load-balancing.

For example, a customer has two ISP connections, wan1 and wan2. On each FortiGate, two IPsec VPN interfaces are created. Next, an ipsec-aggregate interface is created and added as an SD-WAN member.
Configuring FortiGate 1

To create two IPsec VPN interfaces:

```plaintext
config vpn ipsec phase1-interface
  edit "vd1-p1"
    set interface "wan1"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes256-sha256
    set dhgrp 14
    set remote-gw 172.16.201.2
    set psksecret ftnt1234
  next
  edit "vd1-p2"
    set interface "wan2"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes256-sha256
    set dhgrp 14
    set remote-gw 172.16.202.2
    set psksecret ftnt1234
  next
end
config vpn ipsec phase2-interface
  edit "vd1-p1"
    set phasename "vd1-p1"
  next
  edit "vd1-p2"
    set phasename "vd1-p2"
  next
end

To create an IPsec aggregate interface:

config system ipsec-aggregate
  edit "agg1"
    set member "vd1-p1" "vd1-p2"
```

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
set algorithm L3
next
end

cfg system interface
edit "agg1"
   set vdom "root"
   set ip 172.16.11.1 255.255.255.255
   set allowaccess ping
   set remote-ip 172.16.11.2 255.255.255.255
end

**To configure the firewall policy:**

cfg firewall policy
edit 1
   set name "1"
   set srcintf "dmz"
   set dstintf "virtual-wan-link"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set nat enable
next
end

**To configure SD-WAN:**

cfg system sdwan
   set status enable
   cfg members
      edit 1
         set interface "agg1"
         set gateway 172.16.11.2
      next
   end

**Configuring FortiGate 2**

**To create two IPsec VPN interfaces:**

cfg vpn ipsec phase1-interface
edit "vd2-p1"
   set interface "wan1"
   set peertype any
   set net-device disable
   set proposal aes256-sha256
   set dhgrp 14
   set remote-gw 172.16.200.1
   set psksecret ftnt1234
next
edit "vd2-p2"
set interface "wan2"
set peertype any
set net-device disable
set proposal aes256-sha256
set dhgrp 14
set remote-gw 172.16.203.1
set psksecret ftnt1234
next
end

config vpn ipsec phase2-interface
edit "vd2-p1"
    set phase1name "vd2-p1"
next
edit "vd2-p2"
    set phase1name "vd2-p2"
next
end

To create an IPsec aggregate interface:

config system ipsec-aggregate
edit "agg2"
    set member "vd2-p1" "vd2-p2"
    set algorithm L3
next
end

config system interface
edit "agg2"
    set vdom "root"
    set ip 172.16.11.2 255.255.255.255
    set allowaccess ping
    set remote-ip 172.16.11.1 255.255.255.255
next
end

To configure the firewall policy:

config firewall policy
edit 1
    set name "1"
    set srcintf "dmz"
    set dstintf ""virtual-wan-link"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
next
end
To configure SD-WAN:

```fortigate
config system sdwan
    set status enable
config members
    edit 1
        set interface "agg2"
        set gateway 172.16.11.1
    next
end
end
```

**Related diagnose commands**

**To display aggregate IPsec members:**

```bash
# diagnose sys ipsec-aggregate list
agg1 algo=L3 member=2 run_tally=2
members:
    vd1-p1
    vd1-p2
```

**To check the VPN status:**

```bash
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0

---
name=vd1-p1 ver=1 serial=2 172.16.200.1:0->172.16.201.2:0 tun_id=172.16.201.2 dst_mtu=0

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
Packet distribution for aggregate IPsec tunnels using weighted round robin

A weighted round robin algorithm can be used for IPsec aggregate tunnels to distribute traffic by the weight of each member tunnel.

In this example, the FortiGate has two IPsec tunnels put into IPsec aggregate. Traffic is distributed among the members, with one third over tunnel1, and two thirds over tunnel2. To achieve this, the weighted round robin algorithm is selected, tunnel1 is assigned a weight of 10, and tunnel2 is assigned a weight of 20.

To create the IPsec aggregate in the GUI:

1. Go to VPN > IPsec Tunnels and click Create New > IPsec Tunnel.
2. Complete the wizard to create the tunnel1 and tunnel2 custom IPsec tunnels. Ensure that Aggregate member is Enabled for each tunnel under the Network > Advanced section.
3. Go to VPN > IPsec Tunnels and click Create New > IPsec Aggregate.
4. Enter a name for the aggregate, such as agg1, and ensure that Algorithm is Weighted Round Robin.
5. Add tunnel1 as an aggregate members, and set Weight to 10.
6. Add tunnel2 as a second aggregate members, and set its Weight to 20.
7. Click OK.
8. To view and monitor the aggregate tunnel statistics, go to the **IPsec** widget on the *Network* dashboard.

![VPN](image)

**To create the IPsec aggregate in the CLI:**

1. Create the *tunnel1* and *tunnel2* custom IPsec tunnels with aggregate-member enabled and aggregate-weight set for both tunnels:

   ```bash
   config vpn ipsec phase1-interface
   edit "tunnel1"
   ...  
   set aggregate-member enable
   set aggregate-weight 10  
   ...  
   next
   edit "tunnel2"
   ...  
   set aggregate-member enable
   set aggregate-weight 20  
   ...  
   next
   end
   ```

2. Create the IPsec aggregate:

   ```bash
   config system ipsec-aggregate
   edit "agg1"
   set member "tunnel1" "tunnel2"
   set algorithm weighted-round-robin
   next
   end
   ```

**Redundant hub and spoke VPN**

A redundant hub and spoke configuration allows VPN connections to radiate from a central FortiGate unit (the hub) to multiple remote peers (the spokes). Traffic can pass between private networks behind the hub and private networks behind the remote peers. Traffic can also pass between remote peer private networks through the hub.

This is a sample configuration of hub and spoke IPsec VPN. The following applies for this scenario:

- The spokes have two WAN interfaces and two IPsec VPN tunnels for redundancy.
- The secondary VPN tunnel is up only when the primary tunnel is down by dead peer detection.
Because the GUI can only complete part of the configuration, we recommend using the CLI.

**To configure redundant hub and spoke VPN using the FortiOS CLI:**

1. Configure the hub.
   a. Configure the WAN, internal interface, and static route.
      ```
      config system interface
      edit "port13"
      set alias "WAN"
      set ip 172.16.202.1 255.255.255.0
      next
      edit "port9"
      set alias "Internal"
      set ip 172.16.101.1 255.255.255.0
      next
      end
      config router static
      edit 1
      set gateway 172.16.202.2
      set device "port13"
      next
      end
      ```
   b. Configure the IPsec phase1-interface and phase2-interface.
      ```
      config vpn ipsec phase1-interface
      edit "hub"
      set type dynamic
      set interface "port13"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-shal aes256-shal
      set dpd on-idle
      set psksecret sample
      set dpd-retryinterval 60
      next
      end
      config vpn ipsec phase2-interface
      edit "hub"
      set phasename "hub"
      ```
set proposal aes128-shal aes256-shal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305

next
end

c. Configure the firewall policy.
config firewall policy
edit 1
set name "spoke-hub"
set srcintf "hub"
set dstintf "port9"
set srcaddr "all"
set dstaddr "172.16.101.0"
set action accept
set schedule "always"
set service "ALL"
next
edit 2
set name "spoke-spoke"
set srcintf "hub"
set dstintf "hub"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
next
end

2. Configure the spokes.
a. Configure the WAN, internal interface, and static route.
   i. Configure Spoke1.
      config system interface
      edit "port1"
      set ip 172.16.200.1 255.255.255.0
next
      edit "wan1"
      set mode dhcp
      set distance 10
      set priority 100
next
      edit "dmz"
      set ip 10.1.100.1 255.255.255.0
next
end
config router static
edit 1
set gateway 172.16.200.2
set device "port1"
next
end

ii. Configure Spoke2.
    config system interface
    edit "wan1"
    set ip 172.16.200.3 255.255.255.0
next
    edit "wan2"
    set mode dhcp
VPN

set distance 10
set priority 100
next
edit "lan1"
    set ip 192.168.4.1 255.255.255.0
next
cfg router static
edit 1
    set gateway 172.16.200.2
    set device "wan1"
next
cfg

b. Configure IPsec phase1-interface and phase2-interface.

i. Configure Spoke1.

cfg vpn ipsec phase1-interface
edit "primary"
    set interface "port1"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-shal aes256-shal
    set remote-gw 172.16.202.1
    set psksecret sample
next
edit "secondary"
    set interface "wan1"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-shal aes256-shal
    set remote-gw 172.16.202.1
    set monitor "primary"
    set psksecret sample
next
cfg vpn ipsec phase2-interface
edit "primary"
    set phasename "primary"
    set proposal aes128-shal aes256-shal aes128-sha256 aes256-sha256 aes128gcm
        aes256gcm chacha20poly1305
    set auto-negotiate enable
    set src-subnet 10.1.100.0 255.255.255.0
next
edit "secondary"
    set phasename "secondary"
    set proposal aes128-shal aes256-shal aes128-sha256 aes256-sha256 aes128gcm
        aes256gcm chacha20poly1305
    set auto-negotiate enable
    set src-subnet 10.1.100.0 255.255.255.0
next

ii. Configure Spoke2.

cfg vpn ipsec phase1-interface
edit "primary"
    set interface "wan1"
    set peertype any
    set net-device enable

VPN

set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
set remote-gw 172.16.202.1
set psksecret sample
next
edit "secondary"
set interface "wan2"
set peertype any
set net-device enable
set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
set remote-gw 172.16.202.1
set monitor "primary"
set psksecret sample
next
end

config vpn ipsec phase2-interface
edit "primary"
set phasename "primary"
set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
set auto-negotiate enable
set src-subnet 192.168.4.0 255.255.255.0
next
edit "secondary"
set phasename "secondary"
set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
set auto-negotiate enable
set src-subnet 192.168.4.0 255.255.255.0
next
end

c. Configure the firewall policy.

i. Configure Spoke1.

config firewall policy
edit 1
set srcintf "dmz"
set dstintf "primary" "secondary"
set srcaddr "10.1.100.0"
set dstaddr "172.16.101.0"
set action accept
set schedule "always"
set service "ALL"
next
end

ii. Configure Spoke2.

config firewall policy
edit 1
set srcintf "lan1"
set dstintf "primary" "secondary"
set srcaddr "192.168.4.0"
set dstaddr "172.16.101.0"
set action accept
set schedule "always"
set service "ALL"
next
end
d. Configure the static route.

i. Configure Spoke1.

```bash
config router static
edit 3
   set dst 172.16.101.0 255.255.255.0
   set distance 1
   set device "primary"
next
edit 4
   set dst 172.16.101.0 255.255.255.0
   set distance 3
   set device "secondary"
next
end
```

ii. Configure Spoke2.

```bash
config router static
edit 3
   set dst 172.16.101.0 255.255.255.0
   set distance 1
   set device "primary"
next
edit 4
   set dst 172.16.101.0 255.255.255.0
   set distance 3
   set device "secondary"
next
end
```

3. Run `diagnose and get commands`.

a. Run the `Spoke1 # diagnose vpn tunnel list` command. The system should return the following:

```
name=primary ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
b. Run the Spoke1 # get router info routing-table static command. The system should return the following:
Routing table for VRF=0
................
S 172.16.101.0/24 [1/0] is directly connected, primary

Overlay Controller VPN (OCVPN)

Overlay Controller VPN (OCVPN) is a cloud based solution to simplify IPsec VPN setup. When OCVPN is enabled, IPsec phase1-interfaces, phase2-interfaces, static routes, and firewall policies are generated automatically on all FortiGates that belong to the same community network. A community network is defined as all FortiGates registered to FortiCare using the same FortiCare account.

If the network topology changes on any FortiGates in the community (such as changing a public IP address in DHCP mode, adding or removing protected subnets, failing over in dual WAN), the IPsec-related configuration for all devices is updated with Cloud assistance in self-learning mode. No intervention is required.

The following topics provide instructions on configuring OCVPN:

- Full mesh OCVPN on page 1501
- Hub-spoke OCVPN with ADVPN shortcut on page 1506
- Hub-spoke OCVPN with inter-overlay source NAT on page 1510
- OCVPN portal on page 1514
- SD-WAN integration with OCVPN on page 649
- Allow FortiClient to join OCVPN on page 1515
- Troubleshooting OCVPN on page 1519

Full mesh OCVPN

This example shows how to configure a full mesh Overlay Controller VPN (OCVPN), establishing full mesh IPsec tunnels between all of the FortiGates.

License

- Free license: Three devices full mesh, 10 overlays, 16 subnets per overlay.
- Full License: Maximum of 16 devices, 10 overlays, 16 subnets per overlay.

Prerequisites

- All FortiGates must be running FortiOS 6.2.0 or later.
- All FortiGates must have Internet access.
- All FortiGates must be registered on FortiCare using the same FortiCare account.

Restrictions

- Non-root VDOMs do not support OCVPN.
- FortiOS 6.2.x is not compatible with FortiOS 6.0.x.
**Terminology**

<table>
<thead>
<tr>
<th>Poll-interval</th>
<th>How often FortiGate tries to fetch OCVPN-related data from OCVPN Cloud.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Role</td>
<td>The device OCVPN role of spoke, primary-hub, or secondary-hub.</td>
</tr>
<tr>
<td>Overlay</td>
<td>Defines network overlays and bind to subnets.</td>
</tr>
<tr>
<td>Subnet</td>
<td>Internal network subnet (IPsec protected subnet). Traffic to or from this subnet enters the IPsec tunnel encrypted by IPsec SA.</td>
</tr>
</tbody>
</table>

**Sample topology**

The following example shows three FortiGate units registered on FortiCare using the same FortiCare account. Each FortiGate unit has one internal subnet, and no NAT exists between the units.

![Sample topology diagram](image)

**Sample configuration**

The following overlays and subnets are used:

- **Branch1:**
  - Overlay name: QA. Local subnets: 10.1.100.0/24
  - Overlay name: PM. Local subnets: 10.2.100.0/24

- **Branch2:**
  - Overlay name: QA. Local interfaces: lan1
  - Overlay name: PM. Local interfaces: lan2

- **Branch3:**
  - Overlay name: QA. Local subnets: 172.16.101.0/24
  - Overlay name: PM. Local subnets: 172.16.102.0/24

The overlay names on each device must be the same for local and remote selector pairs to be negotiated.
To register FortiGates on FortiCare:

1. Go to System > FortiGuard.
2. In the License Information section, click Login to FortiCare. The registration pane opens.
3. Enter the required information (email address, password, country/region, reseller).
4. Optionally, enable Sign in to FortiGate Cloud using the same account.
5. Click OK.

To enable OCVPN in the GUI:

1. Go to VPN > Overlay Controller VPN.
2. Create the first overlay by setting the following options:
   a. For Status, click Enabled.
   b. For Role, click Spoke.
   c. In the Overlays section, click Create New to create a network overlay.

3. Specify the Name, Local subnets, and/or Local interfaces.
   The local subnet must be routable and interfaces must have IP addresses.
4. Click OK.

5. Click Apply to commit the configuration.

6. Repeat this procedure to create all the overlays.

To enable OCVPN in the CLI:

1. Configure Branch1:

```plaintext
config vpn ocvpn
    set status enable
    set multipath disable
config overlays
    edit 1
        set name "QA"
        config subnets
            edit 1
                set subnet 10.1.100.0 255.255.255.0
            next
        next
    next
    edit 2
        set name "PM"
        config subnets
            edit 1
                set subnet 10.2.100.0 255.255.255.0
            next
        end
```
2. **Configure Branch2:**

```plaintext
config vpn ovpn
    set status enable
    set multipath disable
    config overlays
        edit 1
            set name "QA"
            config subnets
                edit 1
                    set type interface
                    set interface "lan1"
                next
            next
        next
        edit 2
            set name "PM"
            config subnets
                edit 1
                    set type interface
                    set interface "lan2"
                next
            next
        next
end
end
```

3. **Configure Branch3:**

```plaintext
config vpn ovpn
    set status enable
    set multipath disable
    config overlays
        edit 1
            set name "QA"
            config subnets
                edit 1
                    set subnet 172.16.101.0 255.255.255.0
                next
            next
        next
        edit 1
            set name "PM"
            config subnets
                edit 1
                    set subnet 172.16.102.0 255.255.255.0
                next
            next
        next
end
end
```
**Hub-spoke OCVPN with ADVPN shortcut**

This topic shows a sample configuration of a hub-spoke One-Click VPN (OCVPN) with an Auto Discovery VPN (ADVPN) shortcut. OCVPN automatically detects the network topology based on members' information. To form a hub-spoke OCVPN, at least one device must announce its role as the primary hub, another device can work as the secondary hub (for redundancy), while others function as spokes.

**License**

- Free license: Hub-spoke network topology not supported.
- Full license: Maximum of 2 hubs, 10 overlays, 64 subnets per overlay; 1024 spokes, 10 overlays, 16 subnets per overlay.

**Prerequisites**

- All FortiGates must be running FortiOS 6.2.0 or later.
- All FortiGates must have Internet access.
- All FortiGates must be registered on FortiCare using the same FortiCare account.

**Restrictions**

- Non-root VDOMs do not support OCVPN.
- FortiOS 6.2.x is not compatible with FortiOS 6.0.x.

**OCVPN device roles**

- Primary hub.
- Secondary hub.
- Spoke (OCVPN default role).

**Sample topology**
Sample configuration

The steps below use the following overlays and subnets for the sample configuration:

- **Primary hub:**
  - Overlay name: QA. Local subnets: 172.16.101.0/24
  - Overlay name: PM. Local subnets: 172.16.102.0/24

- **Secondary hub:**
  - Overlays are synced from primary hub.

- **Spoke1:**
  - Overlay name: QA. Local subnets: 10.1.100.0/24
  - Overlay name: PM. Local subnets: 10.2.100.0/24

- **Spoke2:**
  - Overlay name: QA. Local interfaces: lan1
  - Overlay name: PM. Local interfaces: lan2

The overlay names on each device must be the same for local and remote selector pairs to be negotiated.

To register FortiGates on FortiCare:

1. Go to System > FortiGuard.
2. In the License Information section, click Login to FortiCare. The registration pane opens.
3. Enter the required information (email address, password, country/region, reseller).
4. Optionally, enable Sign in to FortiGate Cloud using the same account.
5. Click OK.

To enable hub-spoke OCVPN in the GUI:

1. Go to VPN > Overlay Controller VPN.
2. Configure the OCVPN primary hub by setting the following options:
   a. For Status, click Enabled.
   b. For Role, click Primary Hub.
   c. In the Overlays section, click Create New to create a network overlay.
d. Specify the Name, Local subnets, and/or Local interfaces. Then click OK.

e. Click Apply to commit the configuration.

3. Configure the OCVPN secondary hub:
   Overlays are synced from the primary hub and cannot be defined in the secondary hub.
   a. In the Overlay Controller VPN pane, select Secondary Hub for the Role.
   b. Select Apply to commit the configuration.

4. Configure the OCVPN spokes:
   a. In the Overlay Controller VPN pane, select Spoke for the Role.
   b. In the Overlays section, click Create New to create a network overlay.
   c. Specify the Name, Local subnets, and/or Local interfaces.
      The local subnet must be routable and interfaces must have IP addresses.
d. Click OK and then click Apply to commit the configuration.

To enable hub-spoke OCVPN in the CLI:

1. Configure the OCVPN primary hub:
   ```
   config vpn ocvpn
   set status enable
   set role primary-hub
   config overlays
   edit 1
       set name "QA"
   config subnets
   edit 1
       set subnet 172.16.101.0 255.255.255.0
   next
   next
   edit 2
   set name "PM"
   config subnets
   edit 1
       set subnet 172.16.102.0 255.255.255.0
   next
   next
   end
   end
   end
   ```

2. Configure the OCVPN secondary hub:
   ```
   config vpn ocvpn
   set status enable
   set role secondary-hub
   end
   ```

3. Configure the OCVPN spoke1:
   ```
   config vpn ocvpn
   set status enable
   config overlays
   ```
edit 1
  set name "QA"
  config subnets
    edit 1
      set subnet 10.1.100.0 255.255.255.0
    next
  end
next
edit 2
  set name "PM"
  config subnets
    edit 1
      set subnet 10.2.100.0 255.255.255.0
    next
  end
next
end
end

4. Configure the OCVPN spoke 2:

  config vpn ocvpn
  set status enable
  config overlays
    edit 1
      set name "QA"
      config subnets
        edit 1
          set subnet 192.168.4.0 255.255.255.0
        next
      end
    end
    edit 2
      set name "PM"
      config subnets
        edit 1
          set subnet 192.168.5.0 255.255.255.0
        next
      end
    end
end

**Hub-spoke OCVPN with inter-overlay source NAT**

This topic shows a sample configuration of hub-spoke OCVPN with inter-overlay source NAT. OCVPN isolates traffic between overlays by default. With NAT enabled on spokes and assign-ip enabled on hub, you can have inter-overlay communication.

Inter-overlay communication means devices from any source addresses and any source interfaces can communicate with any devices in overlays' subnets when the overlay option assign-ip is enabled.

You must first disable auto-discovery before you can enable NAT.
**License**

- Free license: Hub-spoke network topology not supported.
- Full License: Maximum of 2 hubs, 10 overlays, 64 subnets per overlay; 1024 spokes, 10 overlays, 16 subnets per overlay.

**Prerequisites**

- All FortiGates must be running FortiOS 6.2.0 or later.
- All FortiGates must have Internet access.
- All FortiGates must be registered on FortiCare using the same FortiCare account.

**Restrictions**

- Non-root VDOMs do not support OCVPN.
- FortiOS 6.2.x is not compatible with FortiOS 6.0.x.

**OCVPN device roles**

- Primary hub.
- Secondary hub.
- Spoke (OCVPN default role).

**Sample topology**

You can only configure this feature using the CLI.

---

The overlay names on each device must be the same for local and remote selector pairs to be negotiated.
To enable inter-overlay source NAT in the CLI:

1. Configure the primary hub, enable overlay QA, and configure assign-ip and IP range:

   ```
   config vpn ocvpn
   set status enable
   set role primary-hub
   config overlays
   edit 1
   set name "QA"
   set assign-ip enable
   set ipv4-start-ip 172.16.101.100
   set ipv4-end-ip 172.16.101.200
   config subnets
   edit 1
   set subnet 172.16.101.0 255.255.255.0
   next
   next
   edit 2
   set name "PM"
   set assign-ip enable
   config subnets
   edit 1
   set subnet 172.16.102.0 255.255.255.0
   next
   next
   end
   end
   ```

2. Configure the secondary hub:

   ```
   config vpn ocvpn
   set status enable
   set role secondary-hub
   end
   ```

3. Configure spoke1 and enable NAT on the spoke:

   ```
   config vpn ocvpn
   set status enable
   set auto-discovery disable
   set nat enable
   config overlays
   edit 1
   set name "QA"
   config subnets
   edit 1
   set subnet 10.1.100.0 255.255.255.0
   next
   next
   edit 2
   set name "PM"
   config subnets
   edit 1
   set subnet 10.2.100.0 255.255.255.0
   ```
next
end
next
end
end

4. Configure spoke2 and enable NAT on the spoke:

```fortigate-config
config vpn ovpn
  set status enable
  set auto-discovery disable
  set nat enable
  config overlays
    edit 1
      set name "QA"
      config subnets
        edit 1
          set subnet 192.168.4.0 255.255.255.0
        next
      end
    next
  end
  edit 2
    set name "PM"
    config subnets
      edit 1
        set subnet 192.168.5.0 255.255.255.0
      next
    end
  end
end

A firewall policy with NAT is generated on the spoke:

```fortigate-config
edit 9
  set name "_OCVPN2-1.1_nat"
  set uuid 3f7a84b8-3d36-51e9-ee97-8f418c91e666
  set srcintf "any"
  set dstintf "_OCVPN2-1.1"
  set srcaddr "all"
  set dstaddr "_OCVPN2-1.1_remote_networks"
  set action accept
  set schedule "always"
  set service "ALL"
  set comments "Generated by OVPN Cloud Service."
  set nat enable
next
```
OCVPN portal

When you log into the OCVPN portal, the OCVPN license type and device information display. The device information includes the device serial number, OCVPN role, hostname, public IP address, port number, and overlays.

You can unregister an OCVPN device from the OCVPN portal under Device on the right pane.
Use the OCVN Diagram to show the OCVN network topology.

Allow FortiClient to join OCVN

Administrators can configure remote access for FortiClient within an OCVN hub. This provides simple configurations to allow a user group access to an overlay network.
To configure remote FortiClient access to an OCVPN hub in the GUI:

1. On the primary hub, configure the users and user groups required for the FortiClient dialup user authentication and authorization. In this example, there are two user groups (dev_grp and qa_grp).
2. Go to VPN > Overlay Controller VPN and in the Overlays section, click Create New.
3. Enter a name and the local subnet (174.16.101.0/24 for dev and 22.202.2.0/24 for qa).
4. Enable FortiClient Access.
5. In the Access Rules section, click Create New.
6. Enter a name, and select the authentication groups and overlays. The authentication groups will be used by the IPSec phase 1 interface for authentication, and by firewall policies for authorization. The overlay allows access to the resource.
7. Click OK.
8. Create more rules if needed.
9. Click Apply.

To view the tunnel status and activity in the GUI:

1. Go to Dashboard > Network.
2. Click the IPSec widget to expand to full screen view.

To configure remote FortiClient access to an OCVPN hub in the CLI:

```
config vpn ovpn
  set status enable
  set role primary-hub
  set wan-interface "mgmt1"
  set ip-allocation-block 10.254.0.0 255.255.0.0
config overlays
  edit "dev"
    config subnets
      edit 1
        set subnet 174.16.101.0 255.255.255.0
      next
    end
next
```
edit "qa"
  config subnets
  edit 1
    set subnet 22.202.2.0 255.255.255.0
  next
  next
end

config forticlient-access
set status enable
set psksecret xxxxxxxx
config auth-groups
  edit "dev"
    set auth-group "dev_grp"
    set overlays "dev"
  next
  edit "qa"
    set auth-group "qa_grp"
    set overlays "qa"
  next
end
end

To view the tunnel status and activity in the CLI:

```
# diagnose vpn ike gateway list
```

Troubleshooting OCCVPN

This document includes troubleshooting steps for the following OCCVPN network topologies:

- Full mesh OCCVPN.
- Hub-spoke OCCVPN with ADVPN shortcut.
- Hub-spoke OCCVPN with inter-overlay source NAT.

For OCCVPN configurations in other network topologies, see the other OCCVPN topics.

Troubleshooting full mesh network topology

- Branch_1# diagnose vpn occvpn status

ADVPN

Auto-Discovery VPN (ADVPN) allows the central hub to dynamically inform spokes about a better path for traffic between two spokes.

The following topics provide instructions on configuring ADVPN:

- IPsec VPN wizard hub-and-spoke ADVPN support on page 1532
- ADVPN with BGP as the routing protocol on page 1536
- ADVPN with OSPF as the routing protocol on page 1545
- ADVPN with RIP as the routing protocol on page 1554
- UDP hole punching for spokes behind NAT on page 1563

IPsec VPN wizard hub-and-spoke ADVPN support

When using the IPsec VPN wizard to create a hub and spoke VPN, multiple local interfaces can be selected. At the end of the wizard, changes can be reviewed, real-time updates can be made to the local address group and tunnel interface, and easy configuration keys can be copied for configuring the spokes.

When editing a VPN tunnel, the Hub & Spoke Topology section provides access to the easy configuration keys for the spokes, and allows you to add more spokes.

This example shows the configuration of a hub with two spokes.
To configure the hub:

1. Go to VPN > IPsec Wizard.
2. Go through the steps of the wizard:
   a. **VPN Setup:**
      
      | Name       | hub       |
      |------------|-----------|
      | Template Type | Hub-and-Spoke |
      | Role   | Hub       |

   ![VPN Configuration Wizard](image)

   b. **Authentication:**
      
      | Incoming Interface | port1 |
      | Authentication method | Pre-shared Key |
      | Pre-shared key | <key> |

   c. **Tunnel Interface:**
      
      | Tunnel IP | 10.10.1.1 |
      | Remote IP/netmask | 10.10.1.2/24 |

   d. **Policy & Routing:**
      
      Multiple local interfaces and subnets can be configured.
      
      | Local AS | 65400 |
      | Local interface | port3  
      |                  | port4  |
      | Local subnets   | 174.16.101.0/24  
      |                  | 173.1.1.0/24  |
      | Spoke #1 tunnel IP | 10.10.1.3 |
      | Spoke #2 tunnel IP | 10.10.1.4 |
e. **Review Settings:**
   Confirm that the settings look correct, then click *Create*.

3. The summary shows details about the set up hub:
   - The *Local address group* and *Tunnel interface* can be edited directly on this page.
   - Spoke easy configuration keys can be used to quickly configure the spokes.

4. Click *Show Tunnel List* to go to VPN > IPsec Tunnels.
5. Edit the VPN tunnel to add more spokes and to copy the spokes’ easy configuration keys.
To configure the spokes:

1. Go to **VPN > IPsec Wizard**.
2. On the **VPN Setup** page of the wizard, enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>spoke1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template Type</td>
<td>Hub-and-Spoke</td>
</tr>
<tr>
<td>Role</td>
<td>Spoke</td>
</tr>
</tbody>
</table>

3. In the *Easy configuration key* field, paste the *Spoke #1* key from the hub FortiGate, click *Apply*, then click *Next*.

4. Adjust the *Authentication* settings as required, enter the *Pre-shared key*, then click *Next*.
5. Adjust the *Tunnel Interface* settings as required, then click *Next*.
6. Configure the *Policy & Routing* settings, then click *Next*:

<table>
<thead>
<tr>
<th>Local interface</th>
<th>wan2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local subnets</td>
<td>10.1.100.0/24</td>
</tr>
</tbody>
</table>

7. Review the settings, then click *Create*.
8. The summary shows details about the set up spoke. The *Local address group* and *Tunnel interface* can be edited directly on this page.
9. Follow the same steps to configure the second spoke.

**To check that the tunnels are created and working:**

1. On the hub FortiGate, go to **Dashboard > Network** and expand the IPsec widget. The tunnels to the spokes are established.
2. On a spoke, go to Dashboard > Network and expand the IPsec widget. The tunnel to the hub and the spoke to spoke shortcut are established.

**ADVPN with BGP as the routing protocol**

This is a sample configuration of ADVPN with BGP as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface net-device disable must be run.
- IBGP must be used between the hub and spoke FortiGates.
- bgp neighbor-group/neighbor-range must be reused.

To configure ADVPN with BGP as the routing protocol using the CLI:

1. Configure hub FortiGate WAN interface, internal interface, and a static route:

```bash
config system interface
  edit "port9"
    set alias "WAN"
    set ip 22.1.1.1 255.255.255.0
next
  edit "port10"
    set alias "Internal"
    set ip 172.16.101.1 255.255.255.0
```
next
end
config router static
edit 1
    set gateway 22.1.1.2
    set device "port9"
next
end

2. Configure the hub FortiGate:

a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```plaintext
config vpn ipsec phase1-interface
edit "advpn-hub"
    set type dynamic
    set interface "port9"
    set peertype any
    set net-device disable
    set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-shal aes256-shal
    3des-shal
    set add-route disable
    set dpd on-idle
    set auto-discovery-sender enable
    set psksecret sample
    set dpd-retryinterval 5
next
end
config vpn ipsec phase2-interface
edit "advpn-hub"
    set phase1name "advpn-hub"
    set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256
    3des-sha256
next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```plaintext
config firewall policy
edit 1
    set name "spoke2hub"
    set srcintf "advpn-hub"
    set dstintf "port10"
    set srcaddr "all"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
edit 2
    set name "spoke2spoke"
    set srcintf "advpn-hub"
```
c. **Configure the hub FortiGate's IPsec tunnel interface IP address:**

```
config system interface
  edit "advpn-hub1"
    set ip 10.10.10.254 255.255.255.255
    set remote-ip 10.10.10.253 255.255.255.0
  next
end
```

d. **Configure the hub FortiGate's BGP:**

```
config router bgp
  set as 65412
  config neighbor-group
    edit "advpn"
      set link-down-failover enable
      set remote-as 65412
      set route-reflector-client enable
    next
  end
  config neighbor-range
    edit 1
      set prefix 10.10.10.0 255.255.255.0
      set neighbor-group "advpn"
    next
  end
  config network
    edit 1
      set prefix 172.16.101.0 255.255.255.0
    next
  end
end
```

3. **Configure the spoke FortiGates:**

   a. **Configure the spoke FortiGates' WAN, internal interfaces, and static routes:**

      i. **Configure Spoke1:**

        ```
        config system interface
          edit "wan1"
            set alias "primary_WAN"
            set ip 15.1.1.2 255.255.255.0
          next
          edit "wan2"
            set alias "secondary_WAN"
            set ip 12.1.1.2 255.255.255.0
          next
          edit "internal"
            set ip 10.1.100.1 255.255.255.0
        ```
VPN

next
end
config router static
edit 1
  set gateway 12.1.1.1
  set device "wan2"
  set distance 15
next
edit 2
  set gateway 15.1.1.1
  set device "wan1"
next
end

ii. Configure the Spoke2:

config system interface
edit "wan1"
  set alias "primary_WAN"
  set ip 13.1.1.2 255.255.255.0
next
edit "wan2"
  set alias "secondary_WAN"
  set ip 17.1.1.2 255.255.255.0
next
edit "internal"
  set ip 192.168.4.1 255.255.255.0
next
end
config router static
edit 1
  set gateway 17.1.1.1
  set device "wan2"
  set distance 15
next
edit 2
  set gateway 13.1.1.1
  set device "wan1"
next
end

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

config vpn ipsec phase1-interface
edit "spoke1"
  set interface "wan1"
  set peertype any
  set net-device enable
  set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
  set add-route disable
  set dpd on-idle
  set auto-discovery-receiver enable
  set remote-gw 22.1.1.1
  set psksecret sample
  set dpd-retryinterval 5
next
edit "spoke1_backup"
  set interface "wan2"
  set peertype any
  set net-device enable
  set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
  set add-route disable
  set dpd on-idle
  set auto-discovery-receiver enable
  set remote-gw 22.1.1.1
  set monitor "spoke1"
  set psksecret sample
  set dpd-retryinterval 5
next
end

cfg vpn ipsec phase2-interface
edit "spoke1"
  set phasename "spoke1"
  set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
  aes128gcm aes256gcm chacha20poly1305
  set auto-negotiate enable
next
edit "spoke1_backup"
  set phasename "spoke1_backup"
  set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
  aes128gcm aes256gcm chacha20poly1305
  set auto-negotiate enable
next
end

ii. Configure Spoke2:

cfg vpn ipsec phase1-interface
edit "spoke2"
  set interface "wan1"
  set peertype any
  set net-device enable
  set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
  set add-route disable
  set dpd on-idle
  set auto-discovery-receiver enable
  set remote-gw 22.1.1.1
  set psksecret sample
  set dpd-retryinterval 5
next
edit "spoke2_backup"
  set interface "wan2"
  set peertype any
  set net-device enable
  set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
  set add-route disable
  set dpd on-idle
  set auto-discovery-receiver enable
  set remote-gw 22.1.1.1
  set monitor "spoke2"
  set psksecret sample
  set dpd-retryinterval 5
next
end
config vpn ipsec phase2-interface
   edit "spoke2"
      set phasename "spoke2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
        aes128gcm aes256gcm chacha20poly1305
      set auto-negotiate enable
   next
   edit "spoke2_backup"
      set phasename "spoke2_backup"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
        aes128gcm aes256gcm chacha20poly1305
      set auto-negotiate enable
   next
end

c. Configure the spoke FortiGates' firewall policies:
   i. Configure Spoke1:

   config firewall policy
      edit 1
         set name "outbound_advpn"
         set srcintf "internal"
         set dstintf "spoke1" "spoke1_backup"
         set srcaddr "all"
         set dstaddr "all"
         set action accept
         set schedule "always"
         set service "ALL"
      next
      edit 2
         set name "inbound_advpn"
         set srcintf "spoke1" "spoke1_backup"
         set dstintf "internal"
         set srcaddr "all"
         set dstaddr "all"
         set action accept
         set schedule "always"
         set service "ALL"
      next
   end

   ii. Configure Spoke2:

   config firewall policy
      edit 1
         set name "outbound_advpn"
         set srcintf "internal"
         set dstintf "spoke2" "spoke2_backup"
         set srcaddr "all"
         set dstaddr "all"
         set action accept
         set schedule "always"
         set service "ALL"
      next
      edit 2
         set name "inbound_advpn"
set srcintf "spoke2" "spoke2_backup"
set dstintf "internal"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
next
end

d. Configure the spoke FortiGates' tunnel interface IP addresses:
   i. Configure Spoke1:

```
config system interface
   edit "spoke1"
       set ip 10.10.10.1 255.255.255.255
       set remote-ip 10.10.10.254 255.255.255.0
   next
   edit "spoke1_backup"
       set ip 10.10.10.2 255.255.255.255
       set remote-ip 10.10.10.254 255.255.255.0
   next
end
```

ii. Configure Spoke2:

```
config system interface
   edit "spoke2"
       set ip 10.10.10.3 255.255.255.255
       set remote-ip 10.10.10.254 255.255.255.0
   next
   edit "spoke2_backup"
       set ip 10.10.10.4 255.255.255.255
       set remote-ip 10.10.10.254 255.255.255.0
   next
end
```

e. Configure the spoke FortiGates' BGP:
   i. Configure Spoke1:

```
config router bgp
   set as 65412
   config neighbor
       edit "10.10.10.254"
           set advertisement-interval 1
           set link-down-failover enable
           set remote-as 65412
       next
   end
   config network
       edit 1
           set prefix 10.1.100.0 255.255.255.0
       next
   end
```

ii. Configure Spoke2:
VPN

```
config router bgp
  set as 65412
config neighbor
  edit "10.10.10.254"
    set advertisement-interval 1
    set link-down-failover enable
    set remote-as 65412
next
end
config network
  edit 1
    set prefix 192.168.4.0 255.255.255.0
next
end

4. Run `diagnose` and `get` commands on Spoke1 to check VPN and BGP states:

a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

    list all ipsec tunnel in vd 0
    ----
    name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1
    bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu
    create_dev frag-rfc accept_traffic=1

    proxyid_num=1 child_num=1 refcnt=19 ilast=1 olast=1 ad=r/2

    enc: spi=6e3633fc esp=aes key=16 la0da3f4deed3d16becc9dda57537355
    ah=shal key=20 368544044bd9b82592d72476ff93d5055056da8d
    dec:spi/bytes=1/16364, enc:spi/bytes=160/19168
    npu_flag=03 npu_rgw=22.1.1.1 npu_lgw=15.1.1.2 npu_selid=1 dec_npid=1 enc_npid=1
    ----
    name=spoke1_backup ver=1 serial=1 12.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1
    bound_if=6 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu
    create_dev frag-rfc accept_traffic=0

    proxyid_num=1 child_num=0 refcnt=11 ilast=0 olast=0 ad=/0
    stat: rxp=0 txp=0 rxb=0 txb=0
    dpd: mode=on-idle on=0 idle=5000ms retry=3 count=0 seqno=0
    natt: mode=none draft=0 interval=0 remote_port=0
    proxyid=spoke1_backup proto=0 sa=0 ref=2 serial=1 auto-negotiate adr
    src: 0:0.0.0.0/0.0.0.0:0
    dst: 0:0.0.0.0/0.0.0.0:0

b. Run the `get router info bgp summary` command on Spoke1. The system should return the following:
```
BGP router identifier 7.7.7.7, local AS number 65412
BGP table version is 2
1 BGP AS-PATH entries
0 BGP community entries

<table>
<thead>
<tr>
<th>Neighbor</th>

</tr>
</tbody>
</table>

Total number of neighbors 1

c. Run the `get router info routing-table bgp` command on Spoke1. The system should return the following:

```
Routing table for VRF=0
B 172.16.101.0/24 [200/0] via 10.10.10.254, spoke1, 00:23:57
B 192.168.4.0/24 [200/0] via 10.10.10.254, spoke1, 00:22:03
```

d. Generate traffic between the spokes and check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
---
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

**ADVPN with OSPF as the routing protocol**

This is a sample configuration of ADVPN with OSPF as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface net-device enable must be run.
- OSPF must be used between the hub and spoke FortiGates.
To configure ADVPN with OSPF as the routing protocol using the CLI:

1. Configure hub FortiGate's WAN, internal interface, and static route:

```
config system interface
  edit "port9"
    set alias "WAN"
    set ip 22.1.1.1 255.255.255.0
  next
  edit "port10"
    set alias "Internal"
    set ip 172.16.101.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 22.1.1.2
    set device "port9"
  next
end
```

2. Configure the hub FortiGate:

   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phasel-interface
  edit "advpn-hub"
    set type dynamic
    set interface "port9"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-shal aes256-shal
    3des-shal
    set add-route disable
    set dpd on-idle
    set auto-discovery-sender enable
    set psksecret sample
    set dpd-retryinterval 5
  next
end
config vpn ipsec phase2-interface
  edit "advpn-hub"
    set phasename "advpn-hub"
    set proposal aes128-shal aes256-shal 3des-shal aes128-sha256 aes256-sha256
    3des-sha256
  next
end
```

b. Configure the hub FortiGate firewall policy:

```
config firewall policy
  edit 1
    set name "spoke2hub"
```

When net-device is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The tunnel-search option is removed in FortiOS 7.0.0 and later.
VPN

set srcintf "advpn-hub"
set dstintf "port10"
set srcaddr "all"
set dstaddr "172.16.101.0"
set action accept
set schedule "always"
set service "ALL"
next
edit 2
set name "spoke2spoke"
set srcintf "advpn-hub"
set dstintf "advpn-hub"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
next
end

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

config system interface
edit "advpn-hub1"
set ip 10.10.10.254 255.255.255.255
set remote-ip 10.10.10.253 255.255.255.0
next
end

d. Configure the hub FortiGate's OSPF:

config router ospf
set router-id 1.1.1.1
config area
edit 0.0.0.0
next
end
config network
edit 1
set prefix 10.10.10.0 255.255.255.0
next
edit 2
set prefix 172.16.101.0 255.255.255.0
next
end

3. Configure the spoke FortiGates:
   a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:
      i. Configure Spoke1:

         config system interface
         edit "wan1"
         set alias "primary_WAN"
         set ip 15.1.1.2 255.255.255.0
         next
         edit "wan2"
set alias "secondary_WAN"
set ip 12.1.1.2 255.255.255.0
next
edit "internal"
set ip 10.1.100.1 255.255.255.0
next
drop

ii. Configure the Spoke2:

config system interface
edit "wan1"
    set alias "primary_WAN"
    set ip 13.1.1.2 255.255.255.0
next
edit "wan2"
    set alias "secondary_WAN"
    set ip 17.1.1.2 255.255.255.0
next
edit "internal"
    set ip 192.168.4.1 255.255.255.0
next
drop

config router static
edit 1
    set gateway 12.1.1.1
    set device "wan2"
    set distance 15
next
edit 2
    set gateway 15.1.1.1
    set device "wan1"
next
drop

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

config vpn ipsec phase1-interface
edit "spoke1"
    set interface "wan1"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set add-route disable
    set dpd on-idle
set auto-discovery-receiver enable
set remote-gw 22.1.1.1
set psksecret sample
set dpd-retryinterval 5

next
edit "spoke1_backup"
set interface "wan2"
set peertype any
set net-device enable
set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
set add-route disable
set dpd on-idle
set auto-discovery-receiver enable
set remote-gw 22.1.1.1
set monitor "spoke1"
set psksecret sample
set dpd-retryinterval 5

next
dao
config vpn ipsec phase2-interface
edit "spoke1"
set phasename "spoke1"
set proposal aes128-sha1 aes256-sha1 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
set auto-negotiate enable

next
edit "spoke1_backup"
set phasename "spoke1_backup"
set proposal aes128-sha1 aes256-sha1 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
set auto-negotiate enable

next
dao
ii. Configure Spoke2:

cconfig vpn ipsec phase1-interface
edit "spoke2"
set interface "wan1"
set peertype any
set net-device enable
set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
set add-route disable
set dpd on-idle
set auto-discovery-receiver enable
set remote-gw 22.1.1.1
set psksecret sample
set dpd-retryinterval 5

next
edit "spoke2_backup"
set interface "wan2"
set peertype any
set net-device enable
set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
set add-route disable
set dpd on-idle
set auto-discovery-receiver enable
VPN

```
set remote-gw 22.1.1.1
set monitor "spoke2"
set psksecret sample
set dpd-retryinterval 5
next
end
config vpn ipsec phase2-interface
edit "spoke2"
  set phasename "spoke2"
  set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
  aes128gcm aes256gcm chacha20poly1305
  set auto-negotiate enable
next
edit "spoke2_backup"
  set phasename "spoke2_backup"
  set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
  aes128gcm aes256gcm chacha20poly1305
  set auto-negotiate enable
next
end
c. Configure the spoke FortiGates' firewall policies:
   i. Configure Spoke1:

config firewall policy
edit 1
  set name "outbound_advpn"
  set srcintf "internal"
  set dstintf "spoke1" "spoke1_backup"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set schedule "always"
  set service "ALL"
next
edit 2
  set name "inbound_advpn"
  set srcintf "spoke1" "spoke1_backup"
  set dstintf "internal"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set schedule "always"
  set service "ALL"
next
end
   ii. Configure Spoke2:

config firewall policy
edit 1
  set name "outbound_advpn"
  set srcintf "internal"
  set dstintf "spoke2" "spoke2_backup"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
```
d. Configure the spoke FortiGates' tunnel interface IP addresses:
   i. Configure Spoke1:

   ```
   config system interface
   edit "spoke1"
   set ip 10.10.10.1 255.255.255.255
   set remote-ip 10.10.10.254 255.255.255.0
   next
   edit "spoke1_backup"
   set ip 10.10.10.2 255.255.255.255
   set remote-ip 10.10.10.254 255.255.255.0
   next
   end
   ```

   ii. Configure Spoke2:

   ```
   config system interface
   edit "spoke2"
   set ip 10.10.10.3 255.255.255.255
   set remote-ip 10.10.10.254 255.255.255.0
   next
   edit "spoke2_backup"
   set ip 10.10.10.4 255.255.255.255
   set remote-ip 10.10.10.254 255.255.255.0
   next
   end
   ```

e. Configure the spoke FortiGates' OSPF:
   i. Configure Spoke1:

   ```
   config router ospf
   set router-id 7.7.7.7
   config area
   edit 0.0.0.0
   next
   end
   config network
   edit 1
   set prefix 10.10.10.0 255.255.255.0
   next
   edit 2
   set prefix 10.1.100.0 255.255.255.0
   next
   ```
VPN

end
end

ii. Configure Spoke2:

```config
router ospf
    set router-id 8.8.8.8
config
    edit 0.0.0.0
    next
end
config network
    edit 1
    set prefix 10.10.10.0 255.255.255.0
    next
    edit 2
    set prefix 192.168.4.0 255.255.255.0
    next
end
```

4. Run `diagnose` and `get` commands on Spoke1 to check VPN and OSPF states:

   a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```plaintext
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1

create_dev no-sysctl rgwy-chg frag-rfc accept_traffic=0
e. Run the `get router info routing-tale ospf` command. The system should return the following:

Routing table for VRF=0
0  172.16.101.0/24 [110/110] via 10.10.10.254, spoke1, 00:27:14
0  192.168.4.0/24 [110/110] via 10.10.10.3, spoke1_0, 00:26:26

**ADVVPN with RIP as the routing protocol**

This is a sample configuration of ADVVPN with RIP as routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface net-device disable must be run.
- RIP must be used between the hub and spoke FortiGates.
- `split-horizon-status enable` must be run on the hub FortiGate.
To configure ADVPN with RIP as the routing protocol using the CLI:

1. In the CLI, configure FortiGate's WAN, internal interface, and static route:

   ```
   config system interface
   edit "port9"
   set alias "WAN"
   set ip 22.1.1.1 255.255.255.0
   next
   edit "port10"
   set alias "Internal"
   set ip 172.16.101.1 255.255.255.0
   next
   end
   config router static
   edit 1
   set gateway 22.1.1.2
   set device "port9"
   next
   end
   ```

2. Configure the hub FortiGate:
   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

   ```
   config vpn ipsec phase1-interface
   edit "advpn-hub"
   set type dynamic
   set interface "port9"
   set peertype any
   set net-device disable
   set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-shal aes256-shal
   3des-sha1
   set add-route disable
   set dpd on-idle
   set auto-discovery-sender enable
   set psksecret sample
   set dpd-retryinterval 5
   next
   end
   config vpn ipsec phase2-interface
   edit "advpn-hub"
   set phasename "advpn-hub"
   set proposal 3des-sha1 3des-sha256 aes128-sha256 aes256-sha1 3des-sha256
   3des-sha256
   next
   end
   ```

   When net-device is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The tunnel-search option is removed in FortiOS 7.0.0 and later.

   b. Configure the hub FortiGate firewall policy:

   ```
   config firewall policy
   edit 1
   set name "spoke2hub"
   ```
set srcintf "advpn-hub"
set dstintf "port10"
set srcaddr "all"
set dstaddr "172.16.101.0"
set action accept
set schedule "always"
set service "ALL"

next
edit 2
set name "spoke2spoke"
set srcintf "advpn-hub"
set dstintf "advpn-hub"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"

next
end

3. Configure the spoke FortiGates:
   a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:
      i. Configure Spoke1:

         config system interface
         edit "wan1"
         set alias "primary_WAN"
         set ip 15.1.1.2 255.255.255.0
         next
i. Configure the Spoke:

```plaintext
config system interface
edit "wan1"
    set alias "primary_WAN"
    set ip 13.1.1.2 255.255.255.0
next
edit "wan2"
    set alias "secondary_WAN"
    set ip 17.1.1.2 255.255.255.0
next
edit "internal"
    set ip 192.168.4.1 255.255.255.0
next
end
```

```plaintext
config router static
edit 1
    set gateway 17.1.1.1
    set device "wan2"
    set distance 15
next
edit 2
    set gateway 13.1.1.1
    set device "wan1"
next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```plaintext
config vpn ipsec phase1-interface
edit "spoke1"
    set interface "wan1"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set add-route disable
```
set dpd on-idle
set auto-discovery-receiver enable
set remote-gw 22.1.1.1
set psksecret sample
set dpd-retryinterval 5
next
edit "spoke1_backup"
set interface "wan2"
set peertype any
set net-device enable
set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
set add-route disable
set dpd on-idle
set auto-discovery-receiver enable
set remote-gw 22.1.1.1
set monitor "spoke1"
set psksecret sample
set dpd-retryinterval 5
next
end
config vpn ipsec phase2-interface
edit "spoke1"
set phasename "spoke1"
set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
set auto-negotiate enable
next
edit "spoke1_backup"
set phasename "spoke1_backup"
set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
set auto-negotiate enable
next
end

ii. Configure Spoke2:

config vpn ipsec phase1-interface
edit "spoke2"
set interface "wan1"
set peertype any
set net-device enable
set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
set add-route disable
set dpd on-idle
set auto-discovery-receiver enable
set remote-gw 22.1.1.1
set psksecret sample
set dpd-retryinterval 5
next
edit "spoke2_backup"
set interface "wan2"
set peertype any
set net-device enable
set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
set add-route disable
set dpd on-idle
set auto-discovery-receiver enable
set remote-gw 22.1.1.1
set monitor "spoke2"
set psksecret sample
set dpd-retryinterval 5
next
end
config vpn ipsec phase2-interface
edit "spoke2"
set phasename "spoke2"
set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
set auto-negotiate enable
next
edit "spoke2_backup"
set phasename "spoke2_backup"
set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
set auto-negotiate enable
next
end
c. Configure the spoke FortiGates' firewall policies:
   i. Configure Spoke1:

   config firewall policy
   edit 1
   set name "outbound_advpn"
   set srcintf "internal"
   set dstintf "spoke1" "spoke1_backup"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   next
   edit 2
   set name "inbound_advpn"
   set srcintf "spoke1" "spoke1_backup"
   set dstintf "internal"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   next
   end

   ii. Configure Spoke2:

   config firewall policy
   edit 1
   set name "outbound_advpn"
   set srcintf "internal"
   set dstintf "spoke2" "spoke2_backup"
   set srcaddr "all"
   set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"

next
edit 2
set name "inbound_advpn"
set srcintf "spoke2" "spoke2_backup"
set dstintf "internal"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"

next
end

d. Configure the spoke FortiGates' tunnel interface IP addresses:
   i. Configure Spoke1:

   config system interface
   edit "spoke1"
     set ip 10.10.10.1 255.255.255.255
     set remote-ip 10.10.10.254 255.255.255.0
   next
   edit "spoke1_backup"
     set ip 10.10.10.2 255.255.255.255
     set remote-ip 10.10.10.254 255.255.255.0
   next
   end

   ii. Configure Spoke2:

   config system interface
   edit "spoke2"
     set ip 10.10.10.3 255.255.255.255
     set remote-ip 10.10.10.254 255.255.255.0
   next
   edit "spoke2_backup"
     set ip 10.10.10.4 255.255.255.255
     set remote-ip 10.10.10.254 255.255.255.0
   next
   end

   e. Configure the spoke FortiGates' RIP:
      i. Configure Spoke1:

      config router rip
      config network
      edit 1
        set prefix 10.10.10.0 255.255.255.0
      next
      edit 2
        set prefix 10.1.100.0 255.255.255.0
      next
      end

      ii. Configure Spoke2:
4. Run **diagnose** and **get commands** on Spoke1:
   a. Run the **diagnose vpn tunnel list** command on Spoke1. The system should return the following:

   ```
   list all ipsec tunnel in vd 0
   ----
   name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

   src: 0:0:0.0/0.0.0.0:0
dst: 0:0:0.0/0.0.0.0:0
   ```

   b. Run the **get router info rip database** command on Spoke1. The system should return the following:

   ```
   Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel,
   C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP
   
   Network      Next Hop     Metric From     If       Time
   Rc 10.1.100.0/24   1.          internal
   Rc 10.10.10.2/32  1.              spoke1
   ```
c. Run the `get router info routing-table rip` command on Spoke1. The system should return the following:

```
Routing table for VRF=0
R  172.16.101.0/24 [120/2] via 10.10.10.254, spoke1, 00:08:38
R  192.168.4.0/24 [120/3] via 10.10.10.254, spoke1, 00:08:38
```

d. Generate traffic between the spokes, then check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1 bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu create_dev frag-rcf accept_traffic=1
proxyid_num=1 child_num=0 refcnt=19 ilast=3 olast=3 ad=r/2
stat: rxp=1 txp=78 rxb=200 txb=5546
dpd: mode=on-idle on=1 idle=5000ms retry=3 count=0 seqno=1039
natt: mode=none draft=0 interval=0 remote_port=0
proxyid=spoke1 proto=0 sa=1 ref=5 serial=1 auto-negotiate adr
src: 0:0:0:0/0.0.0.0:0
dst: 0:0:0:0/0.0.0.0:0
SA: ref=7 options=1a227 type=0 soft=0 mtu=1438 expire=1807/0B replaywin=1024
seqno=4e esp=0 esp options=1a227
life: type=01 bytes=0/0 timeout=2370/2400
dec: spi=16b54e32d54d039196a74d96d1cf14 esp=aes
enc: spi=6e36349d esp=aes
dec:spi=c53a8f60 esp=aes
enc:spi=6e36349d esp=aes
```

```
e. Run the `get router info routing-tale rip` command. The system should return the following:

```
Routing table for VRF=0
R  172.16.101.0/24 [120/2] via 10.10.10.254, spoke1, 00:09:04
R  192.168.4.0/24 [120/2] via 10.10.10.3, spoke1_0, 00:00:02
```

**UDP hole punching for spokes behind NAT**

UDP hole punching allows ADVPN shortcuts to be established through a UDP hole on a NAT device. The NAT device must support RFC 4787 Endpoint-Independent Mapping.

In the following example, device 10.1.100.11 behind Spoke1 needs to reach device 192.168.4.33 behind Spoke2. Spoke1 and Spoke2 are behind NAT devices and have established IPsec tunnels to the Hub. The hole punching creates a shortcut between Spoke1 and Spoke2 that bypasses the Hub.

To verify the ADVPN shortcut is established between both spokes behind NAT:

```
# diagnose debug enable
# diagnose debug application ike -1
ike 0: comes 22.1.1.1:4500->12.1.1.2:4500,ifindex=6....

- FQDN support for remote gateways on page 1596
- Windows IKEv2 native VPN with user certificate on page 1598

VPN and ASIC offload

This topic provides a brief introduction to VPN traffic offloading.

IPsec traffic processed by NPU

1. Check the device ASIC information. For example, a FortiGate 900D has an NP6 and a CP8.

   # get hardware status
   Model name: [[QualityAssurance62/FortiGate]]-900D
   ASIC version: CP8
   ASIC SRAM: 64M
   CPU: Intel(R) Xeon(R) CPU E3-1225 v3 @ 3.20GHz
   Number of CPUs: 4
   RAM: 16065 MB
   Compact Flash: 1925 MB /dev/sda
2. **Check port to NPU mapping.**

```bash
# diagnose npu np6 port-list
```

<table>
<thead>
<tr>
<th>Chip</th>
<th>XAUI Ports</th>
<th>Max Cross-chip Speed</th>
<th>Offloading</th>
</tr>
</thead>
<tbody>
<tr>

| 1. port14 | 1G | Yes |            |
| 1. portA | 10G | Yes |            |

3. **Configure the option in IPsec phase1 settings to control NPU encrypt/decrypt IPsec packets (enabled by default).**

```bash
config vpn ipsec phase1/phase1-interface
edit "vpn_name"
    set npu-offload enable/disable
```
4. Check NPU offloading. The NPU encrypted/decrypted counter should tick. The \texttt{npu\_flag \ 03} flag means that the traffic processed by the NPU is bi-directional.

```bash
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0

name=test ver=2 serial=1 173.1.1.1:0->11.101.1.1:0 tun_id=11.101.1.1

5. If traffic cannot be offloaded by the NPU, the CP will try to encrypt/decrypt the IPsec packets.

**IPsec traffic processed by CP**

1. Check the NPU flag and CP counter.

```

**SOFTWARE:**

**Encryption (encrypted/decrypted)**

null : 0   1.
des  : 0   1.
2. Two options are used to control if the CP processes packets. If disabled, packets are processed by the CPU.

```
config system global
set ipsec-asic-offload disable
set ipsec-hmac-offload disable
end
```

**IPsec traffic processed by CPU**

IPsec traffic might be processed by the CPU for the following reasons:

- Some low end models do not have NPUs.
- NPU offloading and CP IPsec traffic processing manually disabled.
- Some types of proposals - SEED, ARIA, chacha20poly1305 - are not supported by the NPU or CP.
- NPU flag set to 00 and software encrypt/decrypt counter ticked.

Encryption algorithms

This topic provides a brief introduction to IPsec phase 1 and phase 2 encryption algorithms and includes the following sections:

- IKEv1 phase 1 encryption algorithm
- IKEv1 phase 2 encryption algorithm
- IKEv2 phase 1 encryption algorithm
- IKEv2 phase 2 encryption algorithm
- HMAC settings

IKEv1 phase 1 encryption algorithm

The default encryption algorithm is:

aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1

DES is a symmetric-key algorithm, which means the same key is used for encrypting and decrypting data. FortiOS supports:

- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

3DES applies the DES algorithm three times to each data. FortiOS supports:

- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512
VPN

AES is a symmetric-key algorithm with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512

The ARIA algorithm is based on AES with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

SEED is a symmetric-key algorithm. FortiOS supports:

- seed128-md5
- seed128-sha1
- seed128-sha256
- seed128-sha384
- seed128-sha512

Suite-B is a set of AES encryption with ICV in GCM mode. FortiOS supports Suite-B on new kernel platforms only. IPsec traffic cannot offload to NPU. CP9 supports Suite-B offloading, otherwise packets are encrypted and decrypted by software. FortiOS supports:

- suite-b-gcm-128
- suite-b-gcm-256
The default encryption algorithm is:

aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305

With null encryption, IPsec traffic can offload NPU/CP. FortiOS supports:

- null-md5
- null-sha1
- null-sha256
- null-sha384
- null-sha512

With the DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- des-null
- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

With the 3DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- 3des-null
- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

With the AES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- aes128-null
- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-null
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-null
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512
With the AESGCM encryption algorithm, IPsec traffic cannot offload NPU/CP. FortiOS supports:

- aes128gcm
- aes256gcm

With the chacha20poly1305 encryption algorithm, IPsec traffic cannot offload NPU/CP. FortiOS supports:

- chacha20poly1305

With the ARIA encryption algorithm, IPsec traffic cannot offload NPU/CP. FortiOS supports:

- aria128-null
- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-null
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-null
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

With the SEED encryption algorithm, IPsec traffic cannot offload NPU/CP. FortiOS supports:

- seed-null
- seed-md5
- seed-sha1
- seed-sha256
- seed-sha384
- seed-sha512

**IKEv2 phase 1 encryption algorithm**

The default encryption algorithm is:

aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384 chacha20poly1305-prfsha256

DES is a symmetric-key algorithm, which means the same key is used for encrypting and decrypting data. FortiOS supports:

- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

3DES applies the DES algorithm three times to each data. FortiOS supports:
- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

AES is a symmetric-key algorithm with different key lengths (128, 192, and 256 bits). FortiOS supports:
- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes128gcm-prfsha1
- aes128gcm-prfsha256
- aes128gcm-prfsha384
- aes128gcm-prfsha512
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512
- aes256gcm-prfsha1
- aes256gcm-prfsha256
- aes256gcm-prfsha384
- aes256gcm-prfsha512

The ARIA algorithm is based on AES with different key lengths (128, 192, and 256 bits). FortiOS supports:
- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
• aria256-md5
• aria256-sha1
• aria256-sha256
• aria256-sha384
• aria256-sha512

With the chacha20poly1305 encryption algorithm, FortiOS supports:
• chacha20poly1305-prfsha1
• chacha20poly1305-prfsha256
• chacha20poly1305-prfsha384
• chacha20poly1305-prfsha512

SEED is a symmetric-key algorithm. FortiOS supports:
• seed128-md5
• seed128-sha1
• seed128-sha256
• seed128-sha384
• seed128-sha512

Suite-B is a set of AES encryption with ICV in GCM mode. FortiOS supports Suite-B on new kernel platforms only. IPsec traffic cannot offload to NPU. CP9 supports Suite-B offloading, otherwise packets are encrypted and decrypted by software. FortiOS supports:
• suite-b-gcm-128
• suite-b-gcm-256

**IKEv2 phase 2 encryption algorithm**

The default encryption algorithm is:
aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305

With null encryption, IPsec traffic can offload NPU/CP. FortiOS supports:
• null-md5
• null-sha1
• null-sha256
• null-sha384
• null-sha512

With the DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:
• des-null
• des-md5
• des-sha1
• des-sha256
• des-sha384
• des-sha512

With the 3DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:
• 3des-null
• 3des-md5
• 3des-sha1
• 3des-sha256
• 3des-sha384
• 3des-sha512

With the AES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:
  • aes128-null
  • aes128-md5
  • aes128-sha1
  • aes128-sha256
  • aes128-sha384
  • aes128-sha512
  • aes192-null
  • aes192-md5
  • aes192-sha1
  • aes192-sha256
  • aes192-sha384
  • aes192-sha512
  • aes256-null
  • aes256-md5
  • aes256-sha1
  • aes256-sha256
  • aes256-sha384
  • aes256-sha512

With the AESGCM encryption algorithm, IPsec traffic cannot offload NPU. CP9 supports AESGCM offloading. FortiOS supports:
  • aes128gcm
  • aes256gcm

With the chacha20poly1305 encryption algorithm, IPsec traffic cannot offload NPU/CP. FortiOS supports:
  • chacha20poly1305

With the ARIA encryption algorithm, IPsec traffic cannot offload NPU/CP. FortiOS supports:
  • aria128-null
  • aria128-md5
  • aria128-sha1
  • aria128-sha256
  • aria128-sha384
  • aria128-sha512
  • aria192-null
  • aria192-md5
  • aria192-sha1
  • aria192-sha256
  • aria192-sha384
  • aria192-sha512
  • aria256-null
With the SEED encryption algorithm, IPsec traffic cannot offload NPU/CP. FortiOS supports:

- seed-null
- seed-md5
- seed-sha1
- seed-sha256
- seed-sha384
- seed-sha512

**HMAC settings**

The FortiGate uses the HMAC based on the authentication proposal that is chosen in phase 1 or phase 2 of the IPsec configuration. Each proposal consists of the encryption-hash pair (such as 3des-sha256). The FortiGate matches the most secure proposal to negotiate with the peer.

**To view the chosen proposal and the HMAC hash used:**

```
# diagnose vpn ike gateway list
```

```
v: root/0
name: MPLS
version: 1
interface: port1 3
addr: 192.168.2.5:500 -> 10.10.10.1:500
tun_id: 10.10.10.1
tunnel-addr: 172.31.0.2 -> 172.31.0.1
created: 1015820s ago

DPD sent/recv: 000001e1/00000000
```

**Fragmenting IP packets before IPsec encapsulation**

The `ip-fragmentation` command controls packet fragmentation before IPsec encapsulation, which can benefit packet loss in some environments.

The following options are available for the `ip-fragmentation` variable.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pre-encapsulation</td>
<td>Fragment before IPsec encapsulation.</td>
</tr>
<tr>
<td>post-encapsulation (default value)</td>
<td>Fragment after IPsec encapsulation (RFC compliant).</td>
</tr>
</tbody>
</table>

**To configure packet fragmentation using the CLI:**

```plaintext
config vpn ipsec phase1-interface
edit "demo"
    set interface "port1"
    set authmethod signature
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set ip-fragmentation pre-encapsulation
    set remote-gw 172.16.200.4
    set certificate "Fortinet_Factory"
next
end
```

**Configure DSCP for IPsec tunnels**

Configuring the differentiated services (DiffServ) code in phase2 of an IPsec tunnel allows the tag to be applied to the Encapsulating Security Payload (ESP) packet.

- If `diffserv` is disabled in the IPsec phase2 configuration, then the ESP packets' DSCP value is copied from the inner IP packet DSCP.
- If `diffserv` is enabled in the IPsec phase2 configuration, then ESP packets' DSCP value is set to the configured value.

---

**Offloading traffic to the NPU must be disabled for the tunnel.**

---

In this example, NPU offloading is disabled, `diffserv` is enabled, and the `diffserv` code is set to 000111 on FGT-A. Only one side of the tunnel needs to have `diffserv` enabled.
VPN

To configure IPsec on FGT-A:

1. Configure the phase1-interface:

   ```
   config vpn ipsec phase1-interface
   edit "s2s"
   set interface "wan1"
   set peertype any
   set net-device disable
   set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
   set npu-offload disable
   set dhgrp 14 5
   set wizard-type static-fortigate
   set remote-gw 173.1.1.1
   set psksecret ************
   next
   end
   ```

2. Configure the phase2-interface:

   ```
   config vpn ipsec phase2-interface
   edit "s2s"
   set phase1name "s2s"
   set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
   aes128gcm chacha20poly1305
   set dhgrp 14 5
   set diffserv enable
   set diffservcode 000111
   set src-addr-type name
   set dst-addr-type name
   set src-name "s2s_local"
   set dst-name "s2s_remote"
   next
   end
   ```

3. Check the state of the IPsec tunnel:

   ```
   FGT-A # diagnose vpn tunnel list
   list all ipsec tunnel in vd 0
   -----------------------------------------------------------------------------
   name=s2s ver=1 serial=1 11.101.1.1:0->173.1.1.1:0 tun_id=173.1.1.1 dst_mtu=1500
   bound_if=17 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/512 options[0200]=frag-rfc
   run_state=0 accept_traffic=1 overlay_id=0
   proxyid_num=1 child_num=0 refcnt=11 ilast=12 olast=2978 ad=/0
   stat: rxp=4 txp=4 rxb=608 txb=336
   dpd: mode=on-demand on=1 idle=2000ms retry=3 count=0 seqno=0
   nat: mode=none draft=0 interval=0 remote_port=0
   proxyid=s2s proto=0 sa=1 ref=2 serial=2 dscp
   src: 0:10.1.100.0/255.255.255.0:0
   dst: 0:174.16.101.0/255.255.255.0:0
   SA: ref=3 options=110226 type=00 soft=0 mtu=1438 expire=39916/0B replaywin=2048
   seqno=5 esp=0 replaywin_lastseq=00000005 itn=0 qat=0 hash_search_len=1
   life: type=01 bytes=0/0 timeout=42899/43200
   dec: spi=43bce1e esp=aes key=16 8a02875b80b884d961af227fe8b5cdee
   ah=sha1 key=20 fc9760b79e79dbbeef630ec0c5dca74777976208
   enc: spi=43bce1e esp=aes key=16 851117af24212da89e466d8bea9632bb
   ah=sha1 key=20 0807cc0af2dc4ea049a6b1a4af410ccc71e2156d
   ```
4. Use a packet analyzer, or sniffer, to check the ESP packets:

```
npu_flag=00 npu_rgwy=173.1.1.1 npu_lgwy=11.101.1.1 npu_selid=1 dec_npid=0 enc_npid=0
run_tally=1
```

**VXLAN over IPsec tunnel with virtual wire pair**

In this example, a site-to-site VPN tunnel is formed between two FortiGates. Multiple VLANs are configured that match on each FortiGate. Host1 and Host2 are connected to VLAN10 on the switches.

To configure FGT-A in the CLI:

1. Configure the system WAN interface:

   ```
   config system interface
   edit "wan1"
   set vdom "root"
   set ip 11.11.11.11 255.255.255.0
   set allowaccess ping https ssh http fgfm
   set type physical
   set role wan
   set snmp-index 1
   ```
2. Configure a static route to send all traffic out the WAN interface:

```text
config router static
edit 1
   set gateway 11.11.11.1
   set device "wan1"
next
end
```

3. Configure the IPsec tunnel:

```text
config vpn ipsec phase1-interface
edit "ipsec"
   set interface "wan1"
   set peertype any
   set proposal aes256-shal
   set remote-gw 22.22.22.22
   set psksecret **********
next
end
config vpn ipsec phase2-interface
edit "ipsec"
   set phasename "ipsec"
   set proposal aes256-shal
   set auto-negotiate enable
next
end
```

4. Configure the VXLAN interface and bind it to the IPsec interface:

```text
config system vxlan
edit "vxlan"
   set interface "ipsec"
   set vni 10
   set remote-ip "22.22.22.22"
next
end
```

The remote IP address is the peer side WAN IP address.

5. Configure a virtual wire pair with the LAN and VXLAN interfaces as members:

```text
config system virtual-wire-pair
edit "vwp"
   set member "port1" "vxlan"
   set wildcard-vlan enable
next
end
```

The interfaces added to the virtual wire pair cannot be part of a switch, such as the default internal interface. By enabling wildcard VLANs on the virtual wire pair, all VLAN tagged traffic that is allowed by the virtual wire pair firewall policies passes through the pair.

6. Configure a firewall policy to allow traffic between the LAN and VXLAN interfaces:

```text
config firewall policy
edit 4
```
set name "vwp-pol"
set srcintf "port1" "vxlan"
set dstintf "port1" "vxlan"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"

To configure FGT-B in the CLI:

1. Configure the WAN interface:

   config system interface
   edit "wan1"
      set vdom "root"
      set ip 22.22.22.22 255.255.255.0
      set allowaccess ping https ssh http fgfm
      set type physical
      set role wan
      set snmp-index 1
   next
   end

2. Configure a static route to send all traffic out the WAN interface:

   config router static
   edit 1
      set gateway 22.22.22.2
      set device "wan1"
   next
   end

3. Configure the IPsec tunnel:

   config vpn ipsec phase1-interface
   edit "ipsec"
      set interface "wan1"
      set peertype any
      set proposal aes256-sha1
      set remote-gw 11.11.11.11
      set psksecret **********
   next
   end
   config vpn ipsec phase2-interface
   edit "ipsec"
      set phasename "ipsec"
      set proposal aes256-sha1
      set auto-negotiate enable
   next
   end

4. Configure the VXLAN interface and bind it to the IPsec interface:

   config system vxlan
   edit "vxlan"
The remote IP address is the peer side WAN IP address.

5. Configure a virtual wire pair with the LAN and VXLAN interfaces as members:

```plaintext
config system virtual-wire-pair
edit "vwp"
  set member "port1" "vxlan"
  set wildcard-vlan enable
next
end
```

6. Configure a firewall policy to allow traffic between the LAN and VXLAN interfaces:

```plaintext
config firewall policy
edit 4
  set name "vwp-pol"
  set srcintf "port1" "vxlan"
  set dstintf "port1" "vxlan"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set schedule "always"
  set service "ALL"
next
end
```

**Test the configuration**

To test the configuration, ping Host2 (VLAN10: 192.168.10.2/24) from Host1 (VLAN10: 192.168.10.1/24):

```plaintext
C:\>ping 192.168.10.2
```

```
Pinging 192.168.10.2 with 32 bytes of data:
  Reply from 192.168.10.2: bytes=32 time=8ms TTL=56
  Reply from 192.168.10.2: bytes=32 time=8ms TTL=56
  Reply from 192.168.10.2: bytes=32 time=8ms TTL=56
  Reply from 192.168.10.2: bytes=32 time=11ms TTL=56

Ping statistics for 192.168.10.2:
  Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
  Approximate round trip times in milli-seconds:
    Minimum = 8ms, Maximum = 11ms, Average = 8ms
```

**VXLAN over IPsec using a VXLAN tunnel endpoint**

This example describes how to implement VXLAN over IPsec VPN using a VXLAN tunnel endpoint (VTEP).
This example shows a specific configuration that uses a hub-and-spoke topology. However, the same logic can be applied to a static VPN with or without XAuth. In this hub-and-spoke topology, dialup VPN is convenient because it uses a single phase 1 dialup definition on the hub FortiGate. Additional spoke tunnels are added without any changes to the hub, other than adding a user account for each additional spoke. Spoke-to-spoke communication is established through the hub. This example assumes the authentication users and user groups have already been created.

IPsec tunnel interfaces are used to support VXLAN tunnel termination. An IP address is set for each tunnel interface. Ping access is allowed for troubleshooting purposes.

VTEPs are created on each of the hub and spokes in order to forward VXLAN traffic through the IPsec tunnels. VXLAN encapsulates OSI layer 2 Ethernet frames within layer 3 IP packets. You will need to either combine the internal port and VXLAN interface into a soft switch, or create a virtual wire pair so that devices behind port1 have direct layer 2 access to remote peers over the VXLAN tunnel. This example uses a switch interface on the hub and a virtual wire pair on the spokes to demonstrate the two different methods.

Finally, in order to apply an IPsec VPN interface on the VXLAN interface setting, `net-device` must be disabled in the IPsec VPN phase 1 settings. All VXLAN interfaces in this example share the same VXLAN network ID (`vni`).

**To configure the hub FortiGate:**

1. Configure the phase 1 and phase 2 interfaces:

   ```bash
   config vpn ipsec phase1-interface
   edit "SPOKES"
       set type dynamic
       set interface "port2"
       set mode aggressive
       set peertype one
   ```
set net-device disable
set proposal aes256-sha256
set xauthtype auto
set authusrgrp "SPOKES"
set peerid "SPOKES"
set psksecret <secret>
next
end
cfg vpn ipsec phase2-interface
edit "SPOKES"
set phasename "SPOKES"
set proposal aes128-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
next
end

2. Configure the IPsec VPN policy that allows VXLAN traffic between spokes:

config firewall policy
edit 1
set name "VXLAN_SPOKE_to_SPOKE"
set srcintf "SPOKES"
set dstintf "SPOKES"
set srcaddr "NET_192.168.255.0"
set dstaddr "NET_192.168.255.0"
set action accept
set schedule "always"
set service "UDP_4789"
set logtraffic all
set fsso disable
next
end

3. Configure the IPsec tunnel interfaces (the remote IP address is not used, but it is necessary for this configuration):

config system interface
edit "SPOKES"
set vdom "root"
set ip 192.168.255.1 255.255.255.255
set allowaccess ping
set type tunnel
set remote-ip 192.168.255.254 255.255.255.0
set snmp-index 12
set interface "port2"
next
end

4. Configure the VXLAN interface (the remote IP is the tunnel interfaces IPs of the spokes):

config system VXLAN
edit "SPOKES_VXLAN"
set interface "SPOKES"
set vni 1
set remote-ip "192.168.255.2" "192.168.255.3"
next
end
To configure the spoke FortiGates:

1. Configure the phase 1 and phase 2 interfaces:
   
   ```
   config vpn ipsec phase1-interface
   edit "HUB"
   set interface "port2"
   set mode aggressive
   set peertype any
   set net-device disable
   set proposal aes256-sha256
   set localid "SPOKES"
   set xauthtype client
   set authusr "SPOKE1"
   set authpasswd <secret>
   set remote-gw <hub public IP>
   set psksecret <secret>
   next
   end
   
   config vpn ipsec phase2-interface
   edit "HUB"
   set phasename "HUB"
   set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
   aes256gcm chacha20poly1305
   set auto-negotiate enable
   set src-subnet 192.168.255.2 255.255.255.255
   next
   end
   
   The hub FortiGate inserts a reverse route pointing to newly established tunnel interfaces for any of the subnets that the spoke FortiGate’s source quick mode selectors provides. This is why you should set the tunnel IP address here.
   ```

2. Configure the IPsec VPN policy:
   
   ```
   config firewall policy
   edit 1
   set name "VTEP_IPSEC_POLICY"
   set srcintf "HUB"
   set dstintf "HUB"
   set srcaddr "none"
   set dstaddr "none"
   set action accept
   set schedule "always"
   set service "PING"
   set logtraffic disable
   set fsso disable
   next
   end
   ```

3. Configure the IPsec tunnel interfaces:
   
   ```
   config system interface
   edit "HUB"
   set vdom "root"
   set ip 192.168.255.2 255.255.255.255
   set allowaccess ping
   ```
4. Configure the VXLAN interface (the remote IP is the tunnel interface IP of the hub):

```fortios
config system VXLAN
  edit "HUB_VXLAN"
    set interface "HUB"
    set vni 1
    set remote-ip "192.168.255.1"
  next
end
```

To establish a VXLAN tunnel between spokes, you can add a spoke’s tunnel IP address in `remote-ip`.

To add more remote IP addresses to a VXLAN interface, the interface cannot be in use. You may want to provision future spokes’ remote IP addresses at this point to avoid traffic disruption. Otherwise, you must delete the reference (the policy in this example) before adding remote IP addresses.

To bind the VXLAN interface to the internal interface:

1. Configure a switch interface on the hub:

```fortios
config system switch-interface
  edit "SW"
    set vdom "root"
    set member "port1" "SPOKES_VXLAN"
    set intra-switch-policy {implicit | explicit}
  next
end
```

Allowing intra-switch traffic is implicitly allowed by default. Use `set intra-switch-policy explicit` to require firewall policies to allow traffic between switch interfaces.

2. Configure a virtual wire pair on the spokes:

```fortios
config system virtual-wire-pair
  edit "VWP"
    set member "HUB_VXLAN" "port1"
  next
end
```

The virtual wire pair requires an explicit policy to allow traffic between interfaces.
To test the configuration:

1. Ping the hub FortiGate from the spoke FortiGate:

   ```
   user@pc-spoke1:~$ ping 192.168.1.1 -c 3PING 192.168.1.1 (192.168.1.1) 56(84) bytes of data.
   64 bytes from 192.168.1.1: icmp_seq=1 ttl=64 time=1.24 ms

   ```

Defining gateway IP addresses in IPsec with mode-config and DHCP

For an IPsec tunnel, the gateway IP address (giaddr) can be defined on a DHCP relay agent. Both IPv4 and IPv6 addresses are supported. An IPsec tunnel with mode-config and DHCP relay cannot specify a DHCP subnet range to the DHCP server.

The DHCP server assigns an IP address based on the giaddr set on the IPSec phase1 interface and sends an offer to this subnet. The DHCP server must have a route to the specified subnet giaddr.
**Example**

To define the gateway IP address on the DHCP relay server:

1. Configure the VPN IPsec phase1 interface:
   ```
   config vpn ipsec phase1-interface
   edit "ipv4"
   set type dynamic
   set interface "port2"
   set peertype any
   set net-device disable
   set mode-cfg enable
   set proposal des-md5 des-shal
   set dpd on-idle
   set dhgrp 5
   set assign-ip-from dhcp
   set dhcp-ra-giaddr 11.11.11.1
   set psksecret ***********
   set dpd-retryinterval 60
   next
   end
   ```

   IPv6 could also be configured:
   ```
   config vpn ipsec phase1-interface
   edit "ipv6"
   set type dynamic
   set interface "port2"
   set peertype any
   set net-device disable
   set mode-cfg enable
   set proposal des-md5 des-shal
   set dpd on-idle
   ```
FortiOS 7.2.0 Administration Guide
Fortinet Inc.

VPN

```plaintext
set dhgrp 5
set assign-ip-from dhcp
set dhcp6-ra-linkaddr 2000:11:11:11::1
set psksecret **********
set dpd-retryinterval 60
next end
```

2. Enable DHCP proxy and configure the DHCP server IP address:

```plaintext
config system settings
set dhcp-proxy enable
set dhcp-server-ip "10.1.1.1"
end
```

3. Repeat the above steps for FGT_C and subnet B.

**FQDN support for remote gateways**

FortiGate supports FQDN when defining an IPsec remote gateway with a dynamically assigned IPv6 address. When FortiGate attempts to connect to the IPv6 device, FQDN will resolve the IPv6 address even when the address changes.

Using FQDN to configure the remote gateway is useful when the remote end has a dynamic IPv6 address assigned by their ISP or DHCPv6 server.

**To set the VPN to DDNS and configure FQDN:**

```plaintext
config vpn ipsec phase1-interface
edit "ddns6"
    set type ddns
    set interface "agg1"
    set ip-version 6
    set ike-version 2
    set peertype any
    set net-device disable
    set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
    chacha20poly1305-prfsha256
    set dpd on-idle
    set remotegw-ddns "rgwa61.vpnlab.org"
    set psksecret **********
next end
```

```plaintext
config vpn ipsec phase2-interface
edit "ddns6"
    set phasename "ddns6"
    set proposal aes128-shal aes256-shal aes128-sha256 aes256-sha256 aes128gcm aes256gcm
    chacha20poly1305
    set src-addr-type subnet6
    set dst-addr-type subnet6
    set src-subnet6 2003:1:1:1::/64
next end
```
FQDN resolves the IPv6 address

# diagnose test application dnsproxy 7
vfid=0, name=rgwa61.vpnlab.org, ttl=3600:3547:1747
   2003:33:1:1::22 (ttl=3600)

FortiGate uses FQDN to connect to the IPv6 device

# diagnose vpn tunnel list name ddns6

Windows IKEv2 native VPN with user certificate

In this example, IKEv2 with Extensible Authentication Protocol – Transport Layer Security (EAP-TLS) using mutual certificate authentication is configured. Mutual certificate authentication means that both the client and server use certificates to identify themselves. EAP uses RADIUS, which is handled by the Network Policy Server (NPS) on the Windows server. Certificates are generated and distributed through Active Directory Certificate Services (AD CS). An additional certificate is used to identify the IPsec gateway.

This example assumes that the following Windows server roles are installed and available:

- NPS (RADIUS)
- AD CS with a generated CA
- Group Policy Management
- DNS server

It is also assumed that a connection is established between the NPS and FortiGate, and a DNS entry exists for the NPS that the FortiGate can resolve.

Certificates

The following certificates are required:
- CA certificate for EAP-TLS to sign the client and server certificates.
  The CA certificate must be able to sign other certificates. It is created after AD CSs CA role installation. It is named lab-local-CA, as lab.local is the domain that is used in this example. The CA certificate is automatically installed on the server that is hosting the AD CS role. In this example, that server is also hosting the NPS and DNS server. The Key Usage specifies Certificate Signing.
- Client certificate for EAP-TLS used by the windows client.
  The client certificate is stored in the personal user certificate store and is used to authenticate the user. The certificate has Client Authentication and a SAN of the user's FQDN, and is signed by the CA. The CA is stored in Current User > Trusted Root Certification Authorities.
- Server certificate for EAP-TLS used by the server providing RADIUS authentication.
  The NPS certificate must be in the hosting server's certificate store so that the NPS can access it. It has Server Authentication and a SAN DNS name to match the server's IP address. The user must use the FQDN to connect to the VPN. If the IP address that the name resolves to is used, the certificate will not be considered valid.
- VPN certificate used to identify the FortiGate dialup gateway.
  The VPN certificate and private key are installed to the FortiGate using a CSR generated by the FortiGate

**Configure the Windows server**

The Windows server includes AD-CS, a RADIUS server, and a DNS server.

After the AD CS role has been installed and configured, the CA is ready to sign certificates.

Users and groups are defined first. The groups are configured to automatically receive certificates and relay membership to the FortiGate for granular access control through group matching in policies.

RADIUS is used to authorize connecting users. The RADIUS server returns users’ groups with the access-accept response, to indicate to the FortiGate what groups the users belong to.

**To create security groups and users:**

1. Open Active Directory Users and Computers.
2. Create two groups, Group1 and Group2.
3. Create two users, User1 and User2.
4. Add User1 to Group1 and User2 to Group2.

**To create a certificate template to enable automatic enrollment for the user groups:**

1. Open Certificate Authority.
2. In the navigation pane, expand the new CA, right-click Certificate Template and click Manage.
3. Configure a new certificate template:
   a. Right-click the User template and click Duplicate Template.
   b. On the General tab, enter a Template display name, such as User Auto Enroll.
   c. Enable Publish certificate in Active Directory and Do not automatically reenroll....
d. Configure the remaining settings as required, then go to the Request Handling tab.
e. Disable Allow private key to be exported and select Enroll subject without requiring any user input.
f. On the Security tab, in Group or user name, click Add.
g. Add Group1 and Group2.
h. Select each group and, under Permissions, enable Read, Enroll, and Autoenroll.
i. On the Extensions tab, click Application Policies then click Edit.
j. Remove all of the policies expect for Client Authentication.
k. Click OK then close the Certificate Templates console.

4. In the navigation pane, right-click Certificate Template and click New > Certificate Template to Issue.
5. Select the new certificate template, User Auto Enroll, then click OK.

To create a group policy to enable automatic enrollment:

1. Open the Group Policy Management console.
2. In the navigation pane, go to Forest:lab.local > Domains > lab.local, and then click Group Policy Objects.
3. Click Action, and then click New.
4. Set a Name for the new GPO then click OK.
5. Right-click the new GPO and click Edit.
6. In the Group Policy Management Editor navigation pane, go to User configuration > Windows Settings > Security Settings > Public Key Policies.
7. In the content pane, double-click Certificate Services Client - Auto-Enrollment.
8. Set Configuration Model to Enabled.
9. Enable Renew expired certificates... and Update certificates....
10. Click OK.

To verify that users are receiving certificates:

1. Log into an endpoint with a domain user.
2. On the server, open Certification Authority.
3. Expand the CA and select Issued Certificates.
4. Verify that the user logged into the endpoint is listed under Requested Name. You can also check the local user certificate store on the endpoint.

To generate and sign a CSR and import the signed certificate to the FortiGate:

1. On the FortiGate and go to System > Certificates and click Create/Import > Generate CSR.
2. Configure the CSR:

<table>
<thead>
<tr>
<th>Certificate Name</th>
<th>vpn.lab.local</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID Type</td>
<td>Domain Name</td>
</tr>
<tr>
<td>Domain Name</td>
<td>vpn.lab.local</td>
</tr>
<tr>
<td>Subject Alternative Name</td>
<td>DNS:vpn.lab.local</td>
</tr>
</tbody>
</table>

3. Configure the remaining settings as required, then click OK.
4. Download the CSR to a location that is accessible to the CA server, in this example: C:\CSR\ 
5. Sign the CSR with the previously created CA:
   a. Open the command prompt as an administrator and enter the following:
      
      ```
      certreq -submit -attrib "CertificateTemplate:WebServer" C:\CSR\vpn.lab.local.csr
      ```
      
      The Certification Authority List window opens.
   b. Select the CA and click OK.
   c. Save the signed certificate with a .cer file extension to a location that is accessible from the FortiGate.
6. Import the signed certificate to the FortiGate:
   a. On the FortiGate, go to System > Certificates and click Create/Import > Certificate.
   b. Click Import Certificate.
   c. Set Type to Local Certificate.
   d. Click Upload and locate and select the signed certificate.
   e. Click Create then click OK.

To configure network policies on the RADIUS server:

1. Open the Network Policy Server and, in the console tree, expand Policies.
2. Right-click on Network Policies and click New.
3. Enter a Policy name, such as VPN-Group1, then click Next.
4. Under Condition description click Add:
   a. Select User Groups, then click Add.
   b. Click Add Groups.
   c. Enter the group name, Group1, click Check Names to confirm the group.
   d. Click OK in both windows.
5. Click Next.
6. Make sure that Access granted is selected, then click Next.
7. On the Configure Authentication Methods page, click Add and add the EAP type Microsoft: Smart Care or other certificate.
8. Edit the EAP type, select the previously generated certificate, then click OK.

9. Deselect all of the Less secure authentication methods then click Next.
10. Configure constraints as needed, then click Next.
11. On the Configure Settings page, under RADIUS Attributes, select Vendor Specific, then click Add:
a. In the Attributes list, select Vendor-Specific, then click Add.

![Vendor-Specific Attribute Information](image)

b. In the Attribute Information window, click Add.

c. In the Vendor-Specific Attribute Information window, enter the Vendor Code, 12356, and select Yes. It conforms.

d. Click Configure Attribute and configure the following:

<table>
<thead>
<tr>
<th>Vendor-assigned attribute number</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute format</td>
<td>String</td>
</tr>
<tr>
<td>Attribute value</td>
<td>Group</td>
</tr>
</tbody>
</table>

![Vendor-assigned attribute number](image)

e. Click OK on all three windows and on the Add Vendor Specific Attribute window click Close.

12. Click Next.
13. On the Completing New Network Policy page, review the configuration, then click Finish.
14. Duplicate the policy for Group2, and call the new policy VPN-Group2.
15. Reorder the policies so that VPN-Group1 and VPN-Group2 are one and two in the processing order.

**To add the FortiGate as a RADIUS client:**

1. Open the Network Policy Server and, in the console tree, expand RADIUS Clients and Servers.
2. Right-click on RADIUS Clients and click New.
3. Add the FortiGate as a RADIUS client:

| Friendly name | FGT1 |
4. Click OK.

**To create a DNS entry for the VPN connection:**

1. Open the DNS Manager.
2. Go to DC > Forward Lookup Zones and select lab.local.
3. Right click in the content pane and select *New Host (A or AAAA)*.
4. Enter the VPN name. The FQDN should be auto-filled with *vpn.lab.local*.

5. Enter an IP address.
6. Click *Add Host*.
Configure the FortiGate

An IPsec VPN tunnel is configured to connect to the NPS (RADIUS) server for EAP authentication. For information about IPsec VPN, see IPsec VPNs on page 1330.

A RADIUS server is added to relay VPN authentication requests to the NPS server. For information about RADIUS servers, see RADIUS servers on page 1820.

Three groups are created that point to the RADIUS server for authentication: one group each for user group Group1, user group Group2, and the remote server. For information about groups, see User groups on page 1794.

Three firewall policies are created to test the functionality of the three user groups (see Policies on page 759):

- Policy 1 allows VPN clients to communicate with each other.
- Policy 2 allows VPN clients in the Group1 user group to communicate with Server1 and Server3.
- Policy 3 allows VPN clients in the Group2 user group to communicate with Server1 and Server2.

**To configure IPsec VPN in the GUI:**

1. Go to VPN > IPsec Wizard.
2. Enter a name for the VPN, such as VPN1.
3. Set Template type to Custom, then click Next.
4. In the Network section, configure the following:

<table>
<thead>
<tr>
<th>Remote Gateway</th>
<th>Dialup User</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>port1</td>
</tr>
<tr>
<td>Mode Config</td>
<td>Enable</td>
</tr>
<tr>
<td>Assign IP From</td>
<td>Range</td>
</tr>
<tr>
<td>Client Address Range</td>
<td>10.58.58.1-10.58.58.10</td>
</tr>
<tr>
<td>DNS Server</td>
<td>192.168.1.100</td>
</tr>
<tr>
<td>Enable IPv4 Split Tunnel</td>
<td>Enable</td>
</tr>
<tr>
<td>Accessible Networks</td>
<td>Select the networks that VPN users will have access to.</td>
</tr>
</tbody>
</table>

5. In the Authentication section, configure the following:

<table>
<thead>
<tr>
<th>Method</th>
<th>Signature</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certificate Name</td>
<td>vpn.lab.local</td>
</tr>
<tr>
<td>Version</td>
<td>2</td>
</tr>
<tr>
<td>Accept Types</td>
<td>Any peer ID</td>
</tr>
</tbody>
</table>

6. In the Phase 1 Proposal section, configure the following:

<table>
<thead>
<tr>
<th>Encryption / Authentication</th>
<th>AES128 / SHA256</th>
</tr>
</thead>
<tbody>
<tr>
<td>Encryption / Authentication</td>
<td>AES256 / SHA256</td>
</tr>
<tr>
<td>Encryption / Authentication</td>
<td>AES128 / SHA1</td>
</tr>
<tr>
<td>Diffie-Hellman Groups</td>
<td>14, 5, 2</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>Local ID</td>
<td>vpn.lab.local</td>
</tr>
</tbody>
</table>

7. In the *Phase 2 Selectors* section, configure the following:

<table>
<thead>
<tr>
<th>Local Address</th>
<th>Named Address - all</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Address</td>
<td>Named Address - all</td>
</tr>
<tr>
<td>Encryption / Authentication</td>
<td>AES128 / SHA256</td>
</tr>
<tr>
<td>Encryption / Authentication</td>
<td>AES256 / SHA256</td>
</tr>
<tr>
<td>Encryption / Authentication</td>
<td>AES128 / SHA1</td>
</tr>
<tr>
<td>Enable Perfect Forward Secrecy (PFS)</td>
<td>Disable</td>
</tr>
<tr>
<td>Autokey Keep Alive</td>
<td>Enable</td>
</tr>
</tbody>
</table>

8. Enable EAP settings in the CLI:

```bash
config vpn ipsec phase1-interface
edit VPN1
   set eap enable
   set eap-identity send-request
next
end
```

To configure IPsec VPN in the CLI:

```bash
config vpn ipsec phase1-interface
edit "VPN1"
   set type dynamic
   set interface "port1"
   set ike-version 2
   set authmethod signature
   set peertype any
   set net-device disable
   set mode-cfg enable
   set ipv4-dns-server1 192.168.1.100
   set proposal aes128-sha256 aes256-sha256 aes128-sha1
   set localid "vpn.lab.local"
   set dpd on-idle
   set dhgrp 14 5 2
   set eap enable
   set eap-identity send-request
   set certificate "vpn.lab.local"
   set ipv4-start-ip 10.58.58.1
   set ipv4-end-ip 10.58.58.10
   set ipv4-split-include "10/8_net"
   set dpd-retryinterval 60
next
end
config vpn ipsec phase2-interface
edit "VPN1"
   set phasename "VPN1"
```
set proposal aes128-sha256 aes256-sha256 aes128-sha1
set pfs disable
set keepalive enable
set src-addr-type name
set dst-addr-type name
set src-name "all"
set dst-name "all"

To add the RADIUS server in the GUI:
1. Go to User & Authentication > RADIUS Servers and click Create New.
2. Enter a name for the server, such as NPS.
3. Enter the Primary Server IP/Name and Secret.
   The Test User Credentials option will not work, as it does not use certificates for the test.
4. Click OK.

To add the RADIUS server in the CLI:

config user radius
  edit "NPS"
    set server <ip>
    set secret *********
  end

To configure the user groups in the GUI:
1. Go to User & Authentication > User Groups and click Create New.
2. Enter a name for the group, such as Group1.
3. In the Remote Groups table, click Add:
   a. Set Remote Server to the just created RADIUS server, NPS.
   b. Set Groups to Specify and enter Group1.
   c. Click OK.
4. Click OK.
5. Create a second group called Group2 with the same Remote Server and Group Name set to Group2.
6. Create a third group called RADIUS with the same Remote Server but no Group Name.

To configure the user groups in the CLI:

config user group
  edit "Group1"
    set member "NPS"
  config match
    edit 1
      set server-name "NPS"
      set group-name "Group1"
    next
  end
next
edit "Group2"
    set member "NPS"
    config match
        edit 1
            set server-name "NPS"
            set group-name "Group2"
        next
    end
next
edit "RADIUS"
    set member "NPS"
next
end

To configure the policies in the GUI:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Configure policy 1:

<table>
<thead>
<tr>
<th>Name</th>
<th>VPN-VPN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>VPN1</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>VPN1</td>
</tr>
<tr>
<td>Source</td>
<td>all, RADIUS</td>
</tr>
<tr>
<td>Destination</td>
<td>all</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>NAT</td>
<td>Disable</td>
</tr>
</tbody>
</table>

3. Click OK.
4. Click Create New again and configure policy 2:

<table>
<thead>
<tr>
<th>Name</th>
<th>VPN Group1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>VPN1</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>Server1, Server3</td>
</tr>
<tr>
<td>Source</td>
<td>all, Group1</td>
</tr>
<tr>
<td>Destination</td>
<td>10.10.0.1, 10.10.0.3</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>NAT</td>
<td>Disable</td>
</tr>
</tbody>
</table>

5. Click OK.
6. Click Create New again and configure policy 3:

<table>
<thead>
<tr>
<th>Name</th>
<th>VPN Group2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>VPN1</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>Server1, Server2</td>
</tr>
<tr>
<td>Source</td>
<td>all, Group2</td>
</tr>
<tr>
<td>Destination</td>
<td>10.10.0.1, 10.10.0.2</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>NAT</td>
<td>Disable</td>
</tr>
</tbody>
</table>

7. Click OK.

To configure the policies in the CLI:

```bash
config firewall policy
edit 1
    set name "VPN-VPN"
    set srcintf "VPN1"
    set dstintf "VPN1"
    set action accept
    set srcaddr "all" "RADIUS"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set nat disable
next
edit 2
    set name "VPN Group1"
    set srcintf "VPN1"

```
### Configure the Windows client

The configuration is done on a Windows 10 Enterprise endpoint.

**To add VPN connection and configure a VPN interface:**

1. Open the *Settings* page and go to *Network & Internet > VPN*.
2. Click *Add a VPN connection*.
3. Configure the following:

<table>
<thead>
<tr>
<th><strong>VPN provider</strong></th>
<th>Windows (built-in)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Connection name</strong></td>
<td>vpn.lab.local</td>
</tr>
<tr>
<td><strong>Server name or address</strong></td>
<td>vpn.lab.local</td>
</tr>
<tr>
<td><strong>VPN type</strong></td>
<td>IKEv2</td>
</tr>
<tr>
<td><strong>Type of sign-in info</strong></td>
<td>Certificate</td>
</tr>
</tbody>
</table>

4. Click *Save*.
5. Go to *Network & Internet > Status* and, under *Advanced network settings*, click *Change adapter options*.
6. Select the VPN connection then click *Change settings of this connection*, or right-click on the connection and select *Properties*:
   a. Go to the *Settings* tab and, in the *Authentication* section, click *Properties*.
   b. Select *Use a certificate on this computer* and enable *Use simple certification selection*.
   c. Enable *Verify the server's identity by validating the certificate*.
   d. Optionally, enable *Connect to these servers* and enter your NPS server's FQDN, in this case *DC.lab.local*.
   e. In the *Trusted Root Certificate Authorities* list, select the CA *lab-local-CA*. 
f. Click OK, then click OK again.

To test the connection:

1. Log in to the Windows endpoint as user1.
2. Open the network settings and connect to the vpn.lab.local VPN.
3. Ping each of the three servers to confirm that you can connect to server1 (10.10.0.1) and server3 (10.10.0.3), but not server2 (10.10.0.2).
4. Log out of the Windows endpoint, then log back in as user2.
5. Open the network settings and connect to the vpn.lab.local VPN.
6. Ping each of the three servers to confirm that you can connect to server1 (10.10.0.1) and server2 (10.10.0.2), but not server3 (10.10.0.3).

VPN IPsec troubleshooting

See the following IPsec troubleshooting examples:

- Understanding VPN related logs
- IPsec related diagnose commands on page 1613

Understanding VPN related logs

This section provides some IPsec log samples.

IPsec phase1 negotiating

- SSL VPN to IPsec VPN on page 1738
- SSL VPN protocols on page 1745
- Configuring OS and host check on page 1747
- FortiGate as SSL VPN Client on page 1753
- Dual stack IPv4 and IPv6 support for SSL VPN on page 1762
- Disable the clipboard in SSL VPN web mode RDP connections on page 1773
- SSL VPN IP address assignments on page 1778
- SSL VPN troubleshooting on page 1780
- Restricting SSL VPN access to rogue/non-compliant devices with Security Fabric

SSL VPN best practices

Securing remote access to network resources is a critical part of security operations. SSL VPN allows administrators to configure, administer, and deploy a remote access strategy for their remote workers. When not in use, SSL VPN can be disabled.

Choosing the correct mode of operation and applying the proper levels of security are integral to providing optimal performance and user experience, and keeping your user data safe.

The below guidelines outline selecting the correct SSL VPN mode for your deployment and employing best practices to ensure that your data are protected.

Information about SSL VPN throughput and maximum concurrent users is available on your device's datasheet; see Next-Generation Firewalls Models and Specifications.
**Tunnel mode**

In tunnel mode, the SSL VPN client encrypts all traffic from the remote client computer and sends it to the FortiGate through an SSL VPN tunnel over the HTTPS link between the user and the FortiGate.

The FortiGate establishes a tunnel with the client, and assigns a virtual IP (VIP) address to the client from a range reserved addresses. While the underlying protocols are different, the outcome is very similar to a IPsec VPN tunnel. All client traffic is encrypted, allowing the users and networks to exchange a wide range of traffic, regardless of the application or protocols.

Use this mode if you require:

- A wide range of applications and protocols to be accessed by the remote client.
- No proxying is done by the FortiGate.
- Straightforward configuration and administration, as traffic is controlled by firewall policies.
- A transparent experience for the end user. For example, a user that needs to RDP to their server only requires a tunnel connection; they can then use the usual client application, like Windows Remote Desktop, to connect.

Full tunneling forces all traffic to pass through the FortiGate (see SSL VPN full tunnel for remote user on page 1629). Split tunneling only routes traffic to the designated network through the FortiGate (see SSL VPN split tunnel for remote user on page 1622).

**Limitations**

Tunnel mode requires that the FortiClient VPN client be installed on the remote end. The standalone FortiClient VPN client is free to use, and can accommodate SSL VPN and IPsec VPN tunnels. For supported operating systems, see the FortiClient Technical Specifications.

**Web mode**

Web-only mode provides clientless network access using a web browser with built-in SSL encryption. Users authenticate to FortiGate's SSL VPN Web Portal, which provides access to network services and resources, including HTTP/HTTPS, Telnet, FTP, SMB/CIFS, VNC, RDP, and SSH. When a user starts a connection to a server from the web portal, FortiOS proxies this communication with the server. All communication between the FortiGate and the user continues to be over HTTPS, regardless of the service that is being accessed.

The clipboard can be disabled for SSL VPN web mode RDP/VNC connections, see Disable the clipboard in SSL VPN web mode RDP connections on page 1773.

Use this mode if you require:

- A clientless solution in which all remote services are access through a web portal.
- Tight control over the contents of the web portal.
- Limited services provided to the remote users.

**Limitations**

- Multiple applications and protocols are not supported.
- VNC and RDP access might have limitations, such as certain shortcut keys not being supported.
- In some configurations RDP can consume a significant amount of memory and CPU time.
- Firewall performance might decrease as remote usage increases.
- Highly customized web pages might not render correctly.
**Security best practices**

**Integrate with authentication servers**

For networks with many users, integrate your user configuration with existing authentication servers through LDAP, RADIUS, or FortiAuthenticator.

By integrating with existing authentication servers, such as Windows AD, there is a lower change of making mistakes when configuring local users and user groups. Your administration effort is also reduced.

See SSL VPN with LDAP user authentication on page 1649 for more information.

**Use a non-factory SSL certificate for the SSL VPN portal**

Your certificate should identify your domain so that a remote user can recognize the identity of the server or portal that they are accessing through a trusted CA.

The default Fortinet factory self-signed certificates are provided to simplify initial installation and testing. If you use these certificates you are vulnerable to man-in-the-middle attacks, where an attacker spoofs your certificate, compromises your connection, and steals your personal information. It is highly recommended that you purchase a server certificate from a trusted CA to allow remote users to connect to SSL VPN with confidence. See Procuring and importing a signed SSL certificate on page 2175 for more information.

Enabling the Do not Warn Invalid Server Certificate option on the client disables the certificate warning message, potentially allowing users to accidentally connect to untrusted servers. Disabling invalid server certificate warnings is not recommended.

**Use multi-factor authentication**

Multi-factor authentication (MFA) ensures that the end-user is who they claim to be by requiring at least two factors - a piece of information that the user knows (password), and an asset that the user has (OTP). A third factor, something a user is (fingerprint or face), may be enabled as well. FortiToken Mobile is typically used for MFA.

FortiGate comes with two free FortiTokens, and more can be purchased from the FortiToken Mobile iOS app or through Fortinet partners.

See SSL VPN with FortiToken mobile push authentication on page 1678 for more information.

2FA, a subset of MFA, can also be set up with email tokens. See Email Two-Factor Authentication on FortiGate for information.

**Deploy user certificates for remote SSL VPN users**

This method of 2FA uses a user certificate as the second authentication factor. This is more secure, as it identifies the end user using a certificate. The configuration and administration of this solution is significantly more complicated, and requires administrators with advanced knowledge of the FortiGate and certificate deployment.

See SSL VPN with certificate authentication on page 1660 for more information.

**Define your minimum supported TLS version and cipher suites**

Minimum and maximum supported TLS version can be configured in the FortiGate CLI. The cipher algorithm can also be customized.

See How to control the SSL version and cipher suite for SSL VPN for more information.
**VPN**

**Properly administer firewall policies and profiles against only the access level required for the remote user**

Users do not all require the same access. Access should only be granted after careful considerations. Typically, users are placed in groups, and each group is allowed access to limited resources.

Using SSL VPN realms simplifies defining the control structure for mapping users and groups to the appropriate resources.

See SSL VPN multi-realm on page 1725 for more information.

**Disable SSL VPN**

After the SSL VPN settings have been configured, SSL VPN can be disabled when not in use.

**To disable SSL VPN in the GUI:**

1. Go to **VPN > SSL-VPN Settings**.
2. Disable **Enable SSL-VPN**.
3. Click **Apply**.

**To disable SSL VPN in the CLI:**

```bash
config vpn ssl settings
    set status disable
end
```

**SSL VPN quick start**

The following topics provide introductory instructions on configuring SSL VPN:

- SSL VPN split tunnel for remote user on page 1622
- Connecting from FortiClient VPN client on page 1625
- Set up FortiToken multi-factor authentication on page 1627
- Connecting from FortiClient with FortiToken on page 1628

**SSL VPN split tunnel for remote user**

This is a sample configuration of remote users accessing the corporate network and internet through an SSL VPN by tunnel mode using FortiClient but accessing the Internet without going through the SSL VPN tunnel.
Sample topology

![Sample topology diagram]

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to Network > Interfaces and edit the wan1 interface.
   b. Set IP/Network Mask to 172.20.120.123/255.255.255.0.
   c. Edit port1 interface and set IP/Network Mask to 192.168.1.99/255.255.255.0.
   d. Click OK.
   e. Go to Policy & Objects > Address and create an address for internal subnet 192.168.1.0.
2. Configure user and user group.
   a. Go to User & Authentication > User Definition to create a local user sslvpnuser1.
   b. Go to User & Authentication > User Groups to create a group sslvpnuser1.
3. Configure SSL VPN web portal.
   a. Go to VPN > SSL-VPN Portals to create a tunnel mode only portal my-split-tunnel-portal.
   b. Enable Split Tunneling.
   c. Select Routing Address to define the destination network that will be routed through the tunnel. Leave undefined to use the destination in the respective firewall policies.
4. Configure SSL VPN settings.
   a. Go to VPN > SSL-VPN Settings.
   b. For Listen on Interface(s), select wan1.
   c. Set Listen on Port to 10443.
   d. Choose a certificate for Server Certificate. The default is Fortinet.Factory.
   e. In Authentication/Portal Mapping All Other Users/Groups, set the Portal to tunnel-access.
5. Configure SSL VPN firewall policy.
   a. Go to Policy & Objects > Firewall Policy.
   b. Fill in the firewall policy name. In this example, sslvpn split tunnel access.
   c. Incoming interface must be SSL-VPN tunnel interface(ssl.root).
   d. Choose an Outgoing Interface. In this example, port1.
   e. Set the Source to all and group to sslvpngroup.
   f. In this example, the Destination is all.
   g. Set Schedule to always, Service to ALL, and Action to Accept.
   h. Click OK.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

   config system interface
   edit "wan1"
     set vdom "root"
     set ip 172.20.120.123 255.255.255.0
   next
end

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

   config system interface
   edit "port1"
     set vdom "root"
     set ip 192.168.1.99 255.255.255.0
   next
end

   config firewall address
   edit "192.168.1.0"
     set subnet 192.168.1.0 255.255.255.0
   next
end

3. Configure user and user group.

   config user local
   edit "sslvpnuser1"
     set type password
     set passwd your-password
   next
end

   config user group
   edit "sslvpngroup"
     set member "sslvpnuser1"
   next
end

4. Configure SSL VPN web portal.

   config vpn ssl web portal
   edit "my-split-tunnel-portal"
     set tunnel-mode enable
     set split-tunneling enable
5. Configure SSL VPN settings.

```conf
config vpn ssl settings
  set servercert "Fortinet_Factory"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPV6_ADDR1"
  set source-interface "wan1"
  set source-address "all"
  set source-address6 "all"
  set default-portal "full-access"
config authentication-rule
  edit 1
    set groups "sslvpngroup"
    set portal "my-split-tunnel-portal"
next
end
```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

```conf
config firewall policy
  edit 1
    set name "sslvpn split tunnel access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "sslvpngroup"
    set action accept
    set schedule "always"
    set service "ALL"
next
end
```

**Connecting from FortiClient VPN client**

For FortiGate administrators, a free version of FortiClient VPN is available which supports basic IPsec and SSL VPN and does not require registration with EMS. This version does not include central management, technical support, or some advanced features.

**Downloading and installing the standalone FortiClient VPN client**

You can download the free VPN client from [FNDN](#) or [FortiClient.com](#).

When the free VPN client is run for the first time, it displays a disclaimer. You cannot configure or create a VPN connection until you accept the disclaimer and click *I accept*.
Configuring an SSL VPN connection

To configure an SSL VPN connection:

1. On the Remote Access tab, click on the settings icon and then Add a New Connection.

   ![Add a New Connection](image)

2. Select SSL-VPN, then configure the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>SSLVPNtoHQ</td>
</tr>
<tr>
<td>Description</td>
<td>(Optional)</td>
</tr>
<tr>
<td>Remote Gateway</td>
<td>172.20.120.123</td>
</tr>
<tr>
<td>Customize port</td>
<td>10443</td>
</tr>
<tr>
<td>Client Certificate</td>
<td>Prompt on connect or the certificate from the dropdown list.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Select Prompt on login for a prompt on the connection screen</td>
</tr>
</tbody>
</table>

3. Click Save to save the VPN connection.
Connecting to SSL VPN

To connect to SSL VPN:

1. On the Remote Access tab, select the VPN connection from the dropdown list. Optionally, you can right-click the FortiTray icon in the system tray and select a VPN configuration to connect.
2. Enter your username and password.
3. Click the Connect button.
4. After connecting, you can now browse your remote network. Traffic to 192.168.1.0 goes through the tunnel, while other traffic goes through the local gateway. FortiClient displays the connection status, duration, and other relevant information.
5. Click the Disconnect button when you are ready to terminate the VPN session.

Checking the SSL VPN connection

To check the SSL VPN connection using the GUI:

1. On the FortiGate, go to VPN > Monitor > SSL-VPN Monitor to verify the list of SSL users.
2. On the FortiGate, go to Log & Report > Forward Traffic to view the details of the SSL entry.

To check the tunnel log in using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
Index User     Auth Type Timeout From    HTTP in/out HTTPS in/out
  0 sslvpnuser1 1(1)     291   10.1.100.254 0/0       0/0

SSL VPN sessions:
Index User     Source IP Duration I/O Bytes Tunnel/Dest IP
  0 sslvpnuser1 10.1.100.254    9  22099/43228      10.212.134.200
```

Set up FortiToken multi-factor authentication

This configuration adds multi-factor authentication (MFA) to the split tunnel configuration (SSL VPN split tunnel for remote user on page 1622). It uses one of the two free mobile FortiTokens that is already installed on the FortiGate.

To configure MFA using the GUI:

1. Configure a user and user group:
   a. Go to User & Authentication > User Definition and edit local user sslvpnuser1.
   b. Enable Two-factor Authentication.
   c. For Authentication Type, click FortiToken and select one mobile Token from the list.
   d. Enter the user's Email Address.
   e. Enable Send Activation Code and select Email.
   f. Click Next and click Submit.
2. Activate the mobile token.
   When a FortiToken is added to user sslvpnuser1, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.
To configure MFA using the CLI:

1. Configure a user and user group:
   ```
   config user local
   edit "sslvpnuser1"
   set type password
   set two-factor fortitoken
   set fortitoken <select mobile token for the option list>
   set email-to <user's email address>
   set passwd <user's password>
   next
   end
   config user group
   edit "sslvpngroup"
   set member "sslvpnuser1"
   next
   end
   
   2. Activate the mobile token.
   When a FortiToken is added to user sslvpnuser1, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

Connecting from FortiClient with FortiToken

To activate your FortiToken:

1. On your device, open FortiToken Mobile. If this is your first time opening the application, it may prompt you to create a PIN for secure access to the application and tokens.

2. You should have received your notification via email, select + and use the device camera to scan the token QR code in your email.

3. FortiToken Mobile provisions and activates your token and generates token codes immediately. To view the OTP's digits, select the eye icon. After you open the application, FortiToken Mobile generates a new six-digit OTP every 30 seconds.

264364 🕵️‍♂️
To connect to SSL VPN:

1. On the Remote Access tab, select the VPN connection from the dropdown list. Optionally, you can right-click the FortiTray icon in the system tray and select a VPN configuration to connect.
2. Enter your username and password.
3. Click the Connect button.
4. A Token field will appear, prompting you for the FortiToken code. Enter the FortiToken code from your Mobile device.
5. After connecting, you can now browse your remote network. Traffic to 192.168.1.0 goes through the tunnel, while other traffic goes through the local gateway. FortiClient displays the connection status, duration, and other relevant information.
6. Click the Disconnect button when you are ready to terminate the VPN session.

SSL VPN tunnel mode

The following topics provide instructions on configuring SSL VPN tunnel mode:

- SSL VPN full tunnel for remote user
- SSL VPN tunnel mode host check
- SSL VPN split DNS on page 1635

SSL VPN full tunnel for remote user

This is a sample configuration of remote users accessing the corporate network and internet through an SSL VPN by tunnel mode using FortiClient.

Sample topology

![Sample topology diagram](image)

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address:
   a. Go to Network > Interfaces and edit the wan1 interface.
   b. Set IP/Network Mask to 172.20.120.123/255.255.255.0.
   c. Edit port1 interface and set IP/Network Mask to 192.168.1.99/255.255.255.0.
   d. Click OK.
2. Configure user and user group:
   a. Go to User & Authentication > User Definition to create a local user sslvpnuser1.
   b. Go to User & Authentication > User Groups to create a group sslvpnuser1 with the member sslvpnuser1.
3. Configure SSL VPN web portal:
   a. Go to User & Authentication > User Groups to create a group sslvpnuser1.
   b. Disable Split Tunneling.
4. Configure SSL VPN settings:
   a. Go to User & Authentication > User Groups to create a group sslvpnus
   b. For Listen on Interface(s), select wan1.
   c. Set Listen on Port to 10443.
   d. Choose a certificate for Server Certificate. The default is Fortinet_Factory.
   e. In Authentication/Portal Mapping All Other Users/Groups, set the Portal to tunnel-access.
   f. Create new Authentication/Portal Mapping for group sslvpnuser1 mapping portal my-full-tunnel-portal.
5. Configure SSL VPN firewall policies to allow remote user to access the internal network:
   a. Go to Policy & Objects > Firewall Policy and click Create New.
   b. Set Name to sslvpn tunnel mode access.
   c. Set Incoming Interface to SSL-VPN tunnel interface(ssl.root).
   d. Set Outgoing Interface to port1.
   e. Set the Source Address to all and User to sslvpnuser1.
   f. Set Destination to all, Schedule to always, Service to ALL, and Action to Accept.
   g. Click OK.
   h. Click Create New.
   i. Set Name to sslvpn tunnel mode outgoing.
   j. Configure the same settings as the previous policy, except set Outgoing Interface to wan1.
   k. Click OK.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

   ```
   config system interface
   edit "wan1"
   set vdom "root"
   set ip 172.20.120.123 255.255.255.0
   next
   end
   ```

2. Configure the internal interface and protected subnet, then connect the port1 interface to the internal network.

   ```
   config system interface
   edit "port1"
   set vdom "root"
   set ip 192.168.1.99 255.255.255.0
   next
   end
   ```

3. Configure user and user group.

   ```
   config user local
   edit "sslvpnuser1"
   set type password
   ```
set passwd your-password
next
end

config user group
  edit "sslvpngroup"
    set member "sslvpnuser1"
  next
end

4. Configure SSL VPN web portal and predefine RDP bookmark for windows server.

config vpn ssl web portal
  edit "my-full-tunnel-portal"
    set tunnel-mode enable
    set split-tunneling disable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
  next
end

5. Configure SSL VPN settings.

config vpn ssl settings
  set servercert "Fortinet_Factory"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPV6_ADDR1"
  set source-interface "wan1"
  set source-address "all"
  set source-address6 "all"
  set default-portal "full-access"
config authentication-rule
  edit 1
    set groups "sslvpngroup"
    set portal "my-full-tunnel-portal"
  next
end
end

6. Configure SSL VPN firewall policies to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

config firewall policy
  edit 1
    set name "sslvpn tunnel mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set groups "sslvpngroup"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "sslvpn tunnel mode outgoing"
    set srcintf "ssl.root"
    set dstintf "wan1"
    set srcaddr "all"
To see the results:

2. Open the FortiClient Console and go to Remote Access.
3. Add a new connection:
   - Set VPN Type to SSL VPN.
   - Set Remote Gateway to the IP of the listening FortiGate interface, in this example, 172.20.120.123.
4. Select Customize Port and set it to 10443.
5. Save your settings.
6. Use the credentials you’ve set up to connect to the SSL VPN tunnel.
7. After connection, all traffic except the local subnet will go through the tunnel FGT.
8. Go to VPN > Monitor > SSL-VPN Monitor to verify the list of SSL users.
9. On the FortiGate, go to Log & Report > Forward Traffic and view the details for the SSL entry.

SSL VPN tunnel mode host check

This is a sample configuration of remote users accessing the corporate network through an SSL VPN by tunnel mode using FortiClient with AV host check.

Sample topology

![Sample topology diagram]

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

💡 The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.
To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to Network > Interfaces and edit the wan1 interface.
   b. Set IP/Network Mask to 172.20.120.123/255.255.255.0.
   c. Edit port1 interface and set IP/Network Mask to 192.168.1.99/255.255.255.0.
   d. Click OK.
   e. Go to Policy & Objects > Address and create an address for internet subnet 192.168.1.0.

2. Configure user and user group.
   a. Go to User & Authentication > User Definition to create a local user sslvpnuser1.
   b. Go to User & Authentication > User Groups to create a group sslvpngroup with the member sslvpnuser1.

3. Configure SSL VPN web portal.
   a. Go to VPN > SSL-VPN Portals to create a tunnel mode only portal my-split-tunnel-portal.
   b. Enable Tunnel Mode and Enable Split Tunneling.
   c. Select Routing Address.

4. Configure SSL VPN settings.
   a. Go to VPN > SSL-VPN Settings.
   b. For Listen on Interface(s), select wan1.
   c. Set Listen on Port to 10443.
   d. Choose a certificate for Server Certificate.

   It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the SSL VPN best practices on page 1619 and learn how to Procuring and importing a signed SSL certificate on page 2175.

   e. In Authentication/Portal Mapping All Other Users/Groups, set the Portal to tunnel-access.

5. Configure SSL VPN firewall policy.
   a. Go to Policy & Objects > Firewall Policy.
   b. Fill in the firewall policy name. In this example, sslvpn tunnel access with av check.
   c. Incoming interface must be SSL-VPN tunnel interface(ssl.root).
   d. Choose an Outgoing Interface. In this example, port1.
   e. Set the Source to all and group to sslvpngroup.
   f. In this example, the Destination is all.
   g. Set Schedule to always, Service to ALL, and Action to Accept.
   h. Click OK.

6. Use CLI to configure SSL VPN web portal to enable the host to check for compliant antivirus software on the user’s computer.

   ```
   config vpn ssl web portal
       edit my-split-tunnel-access
           set host-check av
       next
   end
   ```
To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

   ```
   config system interface
   edit "wan1"
   set vdom "root"
   set ip 172.20.120.123 255.255.255.0
   next
   end
   ```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

   ```
   config system interface
   edit "port1"
   set vdom "root"
   set ip 192.168.1.99 255.255.255.0
   next
   end
   ```

   ```
   config firewall address
   edit "192.168.1.0"
   set subnet 192.168.1.0 255.255.255.0
   next
   end
   ```

3. Configure user and user group.

   ```
   config user local
   edit "sslvpnuser1"
   set type password
   set passwd your-password
   next
   end
   ```

   ```
   config user group
   edit "sslvpngroup"
   set member "vpnuser1"
   next
   end
   ```

4. Configure SSL VPN web portal.

   ```
   config vpn ssl web portal
   edit "my-split-tunnel-portal"
   set tunnel-mode enable
   set split-tunneling enable
   set split-tunneling-routing-address "192.168.1.0"
   set ip-pools "SSLVPN_TUNNEL_ADDR1"
   next
   end
   ```

5. Configure SSL VPN settings.

   ```
   config vpn ssl settings
   set servercert "Fortinet_Factory"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
   set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPV6_ADDR1"
   set source-interface "wan1"
   set source-address "all"
   ```
set source-address6 "all"
set default-portal "full-access"
config authentication-rule
  edit 1
    set groups "sslvpngroup"
    set portal "my-split-tunnel-portal"
  next
end

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

config firewall policy
  edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "sslvpngroup"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end

7. Configure SSL VPN web portal to enable the host to check for compliant antivirus software on the user’s computer:

config vpn ssl web portal
  edit my-split-tunnel-access
    set host-check av
  next
end

To see the results:

2. Open the FortiClient Console and go to Remote Access.
3. Add a new connection:
   - Set VPN Type to SSL VPN.
   - Set Remote Gateway to the IP of the listening FortiGate interface, in this example, 172.20.120.123.
4. Select Customize Port and set it to 10443.
5. Save your settings.
6. Use the credentials you’ve set up to connect to the SSL VPN tunnel.
   If the user’s computer has antivirus software, a connection is established; otherwise FortiClient shows a compliance warning.
7. After connection, traffic to 192.168.1.0 goes through the tunnel. Other traffic goes through local gateway.
8. On the FortiGate, go to VPN > Monitor > SSL-VPN Monitor to verify the list of SSL users.
9. On the FortiGate, go to Log & Report > Forward Traffic and view the details for the SSL entry.

SSL VPN split DNS

SSL VPN clients in tunnel mode can enable the following settings to split DNS traffic:
- Resolve DNS requests for a specific domain, or suffix, using specific DNS servers.
- Resolve all other DNS requests using a DNS server configured in the SSL VPN settings. This DNS server can be the same as the client system DNS server, or another DNS server.

Administrators typically configure SSL VPN clients to use DNS servers that are behind the FortiGate on the internal network. This will require DNS traffic to traverse the SSL VPN tunnel.

**Configuring SSL VPN DNS servers to use DNS suffixes**

The `dns-suffix` setting under `config vpn ssl settings` is used to specify domains for SSL VPN DNS servers in the tunnel mode configuration. This setting can only be configured in the CLI.

The DNS servers and suffixes configured under `config vpn ssl settings` have a global scope, and apply only to SSL VPN portals that do not have their own DNS server configuration.

**To configure DNS servers for all SSL VPN portals:**

```plaintext
config vpn ssl settings
   set dns-suffix domain1.com
   set dns-server1 10.10.10.10
   set dns-server2 10.10.10.11
end
```

SSL VPN portals configured with their own DNS servers and suffixes under `config vpn ssl web portal override the settings configured under config vpn ssl settings`.

**To configure DNS servers for a specific SSL VPN portal in split tunnel mode:**

```plaintext
config vpn ssl web portal
   edit "full-access"
      set dns-suffix domain2.com
      set dns-server1 10.10.10.12
      set dns-server2 10.10.10.13
      set split-tunneling enable
   next
end
```

Only DNS requests that match DNS suffixes use the DNS servers configured in the VPN. Due to iOS limitations, the DNS suffixes are not used for searching as in Windows. Using short (non-FQDN) names may not be possible.

**Configuring SSL VPN DNS servers for tunnel mode using DNS split tunneling**

The DNS split tunneling setting can be used to configure domains that apply to a specific SSL VPN portal by specifying primary and secondary DNS servers to be used to resolve specific suffixes. This setting can be configured in the GUI and CLI. In the following example, DNS split tunneling is configured on the default tunnel-access portal with two DNS entries.

**To configure DNS split tunneling in the GUI:**

1. Go to **VPN > SSL-VPN Portals** and double-click **tunnel-access** to edit the portal.
2. In the **Tunnel Mode Client Options** section, enable **DNS Split Tunneling**.
3. In the Split DNS table, click Create New. The New DNS Entry pane opens.

4. Configure the first DNS entry:
   a. For Domains, enter domain1.com.
   b. Set the Primary DNS Server to 10.10.10.10.
   c. Set the Secondary DNS Server to 10.10.10.11.
   d. Click OK.

5. Configure the second DNS entry:
   a. Click Create New.
   b. For Domains, enter domain2.com.
   c. Set the Primary DNS Server to 10.10.10.12.
   d. Set the Secondary DNS Server to 10.10.10.13.
   e. Click OK.

6. Click OK to save the portal settings.
To configure DNS split tunneling in the CLI:

cfg vpn ssl web portal
  edit "tunnel-access"
    set dns-suffix "domain0.com"
    set dns-server1 10.10.10.8
    set dns-server2 10.10.10.9
    set split-tunneling enable
  config split-dns
    edit 1
      set domains "domain1.com"
      set dns-server1 10.10.10.10
      set dns-server2 10.10.10.11
    next
    edit 2
      set domains "domain2.com"
      set dns-server1 10.10.10.12
      set dns-server2 10.10.10.13
    next
  end
end

SSL VPN web mode for remote user

This is a sample configuration of remote users accessing the corporate network through an SSL VPN by web mode using a web browser.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.
To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to Network > Interfaces and edit the wan1 interface.
   b. Set IP/Network Mask to 172.20.120.123/255.255.255.0.
   c. Edit port1 interface and set IP/Network Mask to 192.168.1.99/255.255.255.0.
   d. Click OK.
   e. Go to Policy & Objects > Address and create an address for internet subnet 192.168.1.0.

2. Configure user and user group.
   a. Go to User & Authentication > User Definition to create a local user sslvpnuser1.
   b. Go to User & Authentication > User Groups to create a group sslvpngroup with the member sslvpnuser1.

3. Configure SSL VPN web portal.
   a. Go to VPN > SSL-VPN Portals to create a web mode only portal my-web-portal.
   b. Set Predefined Bookmarks for Windows server to type RDP.

4. Configure SSL VPN settings.
   a. Go to VPN > SSL-VPN Settings.
   b. For Listen on Interface(s), select wan1.
   c. Set Listen on Port to 10443.
   d. Choose a certificate for Server Certificate.

   It is HIGHLY recommended that you acquire a signed certificate for your installation. Please review the SSL VPN best practices on page 1619 and learn how to Procuring and importing a signed SSL certificate on page 2175.

   e. In Authentication/Portal Mapping All Other Users/Groups, set the Portal to web-access.

5. Configure SSL VPN firewall policy.
   a. Go to Policy & Objects > Firewall Policy.
   b. Fill in the firewall policy name. In this example, sslvpn web mode access.
   c. Incoming interface must be SSL-VPN tunnel interface(ssl.root).
   d. Choose an Outgoing Interface. In this example, port1.
   e. Set the Source to all and group to sslvpngroup.
   f. In this example, the Destination is the internal protected subnet 192.168.1.0.
   g. Set Schedule to always, Service to ALL, and Action to Accept.
   h. Click OK.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```plaintext
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```
2. Configure the internal interface and protected subnet, then connect the port1 interface to the internal network.

```fortigate-config
config system interface
edit "port1"
   set vdom "root"
   set ip 192.168.1.99 255.255.255.0
next
end

config firewall address
edit "192.168.1.0"
   set subnet 192.168.1.0 255.255.255.0
next
end
```

3. Configure user and user group.

```fortigate-config
config user local
   edit "sslvpnuser1"
      set type password
      set passwd your-password
next
end

config user group
   edit "sslvpngroup"
      set member "vpnuser1"
next
end
```

4. Configure SSL VPN web portal and predefined RDP bookmark for windows server.

```fortigate-config
config vpn ssl web portal
   edit "my-web-portal"
      set web-mode enable
      config bookmark-group
         edit "gui-bookmarks"
            config bookmarks
               edit "Windows Server"
                  set apptype rdp
                  set host "192.168.1.114"
                  set port 3389
                  set logon-user "your-windows-server-user-name"
                  set logon-password your-windows-server-password
next
end
next
end
```

5. Configure SSL VPN settings.

```fortigate-config
config vpn ssl settings
   set servercert "Fortinet.Factory"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
   set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPV6_ADDR1"
   set source-interface "wan1"
   set source-address "all"
   set source-address6 "all"
```
set default-portal "full-access"
config authentication-rule
  edit 1
    set groups "sslvpngroup"
    set portal "my-web-portal"
  next
end
end

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network. Traffic is dropped from internal to remote client

config firewall policy
  edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "sslvpngroup"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end

To see the results:

1. In a web browser, log into the portal https://172.20.120.123:10443 using the credentials you've set up.
2. In the portal with the predefined bookmark, select the bookmark to begin an RDP session. If there are no predefined bookmarks, the Quick Connection tool can be used; see Quick Connection tool on page 1641 for more information.
3. Go to VPN > Monitor > SSL-VPN Monitor to verify the list of SSL users.
4. Go to Log & Report > Forward Traffic to view the details for the SSL entry.

Quick Connection tool

The Quick Connection tool allows a user to connect to a resource when it is not a predefined bookmark. The tool allows the user to specify the type of server and the URL or IP address of the host.

To connect to a resource:

1. Select the connection type.
2. Enter the required information, such as the IP address or URL of the host.
3. **Click Launch.**

![VPN Interface](image)

In a VNC session, to send Ctrl+Alt+Del, press F8 then select *Send Ctrl-Alt-Delete*.

---

### RDP sessions

Some Windows servers require that a specific security be set for RDP sessions, as opposed to the standard RDP encryption security. For example, Windows 10 requires that TLS be used.

You can specify a location option if the remote computer does not use the same keyboard layout as your computer by appending it to the Host field using the following format: `<IP address> -m <locale>

The available options are:

<table>
<thead>
<tr>
<th></th>
<th>Arabic</th>
<th>fr-be</th>
<th>Belgian French</th>
<th>no</th>
<th>Norwegian</th>
</tr>
</thead>
<tbody>
<tr>
<td>ar</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>da</td>
<td>Danish</td>
<td>fr-ca</td>
<td>Canadian French</td>
<td>pl</td>
<td>Polish</td>
</tr>
<tr>
<td>de</td>
<td>German</td>
<td>fr-ch</td>
<td>Swiss French</td>
<td>pt</td>
<td>Portuguese</td>
</tr>
<tr>
<td>de-ch</td>
<td>Swiss German</td>
<td>hr</td>

</tr>
</tbody>
</table>
Customizing the RDP display size

The RDP display size (width and height settings) can be customized for SSL VPN web mode when creating a new connection or bookmark. Administrators can also specify the display size when preconfiguring bookmarks.

To configure the default window dimensions in an RDP web portal:

```
config vpn ssl web portal
  edit <name>
    set default-window-width <integer>
    set default-window-height <integer>
  next
end
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-window-width</td>
<td>Set the default RDP screen width, in pixels (0 - 65535, default = 1024).</td>
</tr>
<tr>
<td>default-window-height</td>
<td>Set the default RDP screen height, in pixels (0 - 65535, default = 768).</td>
</tr>
</tbody>
</table>

Example

In this example, a user has a monitor with a resolution of 1920 × 1080. The user creates two bookmarks for RDP servers with different resolutions:

- Windows 7: 1360 × 768
- Ubuntu 20.04: 800 × 600

To customize the RDP bookmark display size:

1. Log in to the SSL VPN web portal.
2. Create a new RDP bookmark (+ New Bookmark), or hover over an existing bookmark and click the edit (pencil) icon.
3. Set the Screen Width and Screen Height fields as required.
   a. Windows 7: 1360 width and 768 height.

   ![Edit Bookmark]

   b. Ubuntu 20.04: 800 width and 600 height.

   ![Edit Bookmark]

4. Click Save.

Verification:

When the user connects to the RDP servers using the bookmarks, the customized screen resolutions are applied regardless of the client PC's screen resolution (1920 × 1080).

Windows 7:
VPN

Ubuntu 20.04:

To view the bookmarks created by the user:

```
show vpn ssl web user-bookmark
config vpn ssl web user-bookmark
```
edit "rdp_user#"
config bookmarks
edit "RDP_win7"
    set apptype rdp
    set host "172.18.58.94"
    set port 3389
    set logon-user "fosqa"
    set logon-password ********
    set color-depth 32
    set width 1360
    set height 768
next
edit "RDP_ubuntu"
    set apptype rdp
    set host "172.18.58.109"
    set port 3389
    set logon-user "auto"
    set logon-password ********
    set color-depth 32
    set width 800
    set height 600
next
end

Showing the SSL VPN portal login page in the browser's language

By default, the browser's language preference is automatically detected and used by the SSL VPN portal login page. The system language can still be used by changing the settings on the SSL-VPN Settings page of the GUI, or disabling browser-language-detection in the CLI:

```
config vpn ssl settings
    set browser-language-detection disable
end
```

In this example, the sslvpnadmin user account is used for SSL VPN connections on the testportal1 SSL VPN portal. The account is shared by users from different countries that use different browsers and different languages in their browsers. The user on PC1 uses Chrome in English, and the user on PC2 uses Edge in Simplified Chinese. When a user logs in to the SSL VPN web portal, all of the pages are shown in the same language as their browser.
To configure the SSL VPN portal to use the client's browser language:

1. Configure the SSL VPN portal:
   a. Go to VPN > SSL-VPN Portals and edit the SSL VPN portal.
      For information about configuring SSL VPN portals, see SSL VPN on page 1619.
   b. Enable Web Mode.
   c. Click OK.

2. Set the language preference:
   a. Go to VPN > SSL-VPN Settings.
   c. Click Apply.

3. Add the sslvnpadmin user to the policy used by the SSL VPN portal.

4. Confirm that the configuration works:
   • When the user on PC1 logs in to the SSL VPN portal using Chrome in English, all of the pages are shown in English.
• When the user on PC2 logs in to the SSL VPN portal using Edge in Simplified Chinese, all of the pages are shown in Simplified Chinese.

SSL VPN authentication

The following topics provide instructions on configuring SSL VPN authentication:

- SSL VPN with LDAP user authentication on page 1649
- SSL VPN with LDAP user password renew on page 1654
- SSL VPN with certificate authentication on page 1660
- SSL VPN with LDAP-integrated certificate authentication on page 1665
- SSL VPN for remote users with MFA and user sensitivity on page 1670
- SSL VPN with FortiToken mobile push authentication on page 1678
- SSL VPN with RADIUS on FortiAuthenticator on page 1684
- SSL VPN with RADIUS and FortiToken mobile push on FortiAuthenticator on page 1688
- SSL VPN with RADIUS password renew on FortiAuthenticator on page 1693
- SSL VPN with RADIUS on Windows NPS on page 1697
- SSL VPN with multiple RADIUS servers on page 1702
- SSL VPN with local user password policy on page 1711
- Dynamic address support for SSL VPN policies on page 1716
- SSL VPN multi-realm on page 1725
- NAS-IP support per SSL-VPN realm on page 1730
- SSL VPN with Okta as SAML IdP on page 1732
- SSL VPN with Azure AD SSO integration on page 1738

**SSL VPN with LDAP user authentication**

This is a sample configuration of SSL VPN for LDAP users. In this example, the LDAP server is a Windows 2012 AD server. A user `lduf1` is configured on Windows 2012 AD server.

You must have generated and exported a CA certificate from the AD server and then have imported it as an external CA certificate into the FortiGate.
Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network:
   a. Go to Network > Interfaces and edit the wan1 interface.
   b. Set IP/Network Mask to 172.20.120.123/255.255.255.0.
   c. Edit port1 interface and set IP/Network Mask to 192.168.1.99/255.255.255.0.
   d. Click OK.
   e. Go to Policy & Objects > Address and create an address for internet subnet 192.168.1.0.

2. Import CA certificate into FortiGate:
   a. Go to System > Features Visibility and ensure Certificates is enabled.
   b. Go to System > Certificates and select Import > CA Certificate.
   c. Select Local PC and then select the certificate file.
      The CA certificate now appears in the list of External CA Certificates. In this example, it is called CA_Cert_1.
   d. If you want, you can use CLI commands to rename the system-generated CA_Cert_1 to be more descriptive:
      
      ```
      config vpn certificate ca
      rename CA_Cert_1 to LDAPS-CA
      end
      ```
3. Configure the LDAP user:
   a. Go to User & Authentication > LDAP Servers and click Create New.
   b. Specify Name and Server IP/Name.
   c. Specify Common Name Identifier and Distinguished Name.
   d. Set Bind Type to Regular.
   e. Specify Username and Password.
   f. Enable Secure Connection and set Protocol to LDAPS.
   g. For Certificate, select LDAP server CA LDAPS-CA from the list.

4. Configure user group:
   a. Go to User & Authentication > User Groups to create a user group.
   b. Enter a Name.
   c. In Remote Groups, click Add to add ldaps-server.

5. Configure SSL VPN web portal:
   a. Go to VPN > SSL-VPN Portals to edit the full-access portal.
      This portal supports both web and tunnel mode.
   b. Disable Enable Split Tunneling so that all SSL VPN traffic goes through the FortiGate.

6. Configure SSL VPN settings:
   a. Go to VPN > SSL-VPN Settings.
   b. Select the Listen on Interface(s), in this example, wan1.
   c. Set Listen on Port to 10443.
   d. Set Server Certificate to the authentication certificate.
   e. Under Authentication/Portal Mapping, set default Portal web-access for All Other Users/Groups.
   f. Create new Authentication/Portal Mapping for group ldaps-group mapping portal full-access.

7. Configure SSL VPN firewall policy:
   a. Go to Policy & Objects > Firewall Policy.
   b. Fill in the firewall policy name, in this example, sslvpn certificate auth.
   c. Incoming interface must be SSL-VPN tunnel interface(ssl.root).
   d. Set the Source Address to all and Source User to ldaps-group.
   e. Set the Outgoing Interface to the local network interface so that the remote user can access the internal network, in this example, port1.
   f. Set Destination Address to the internal protected subnet 192.168.1.0.
   g. Set Schedule to always, Service to ALL, and Action to Accept.
   h. Enable NAT.
   i. Configure any remaining firewall and security options as desired.
   j. Click OK.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
edit "wan1"
   set vdom "root"
   set ip 172.20.120.123 255.255.255.0
next
end
```
2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```plaintext
cfg system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end

cfg firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Import CA certificate into FortiGate:
   a. Go to System > Features Visibility and ensure Certificates is enabled.
   b. Go to System > Certificates and select Import > CA Certificate.
   c. Select Local PC and then select the certificate file.
      The CA certificate now appears in the list of External CA Certificates. In the example, it is called CA_Cert_1.
   d. If you want, you can use CLI commands to rename the system-generated CA_Cert_1 to be more descriptive:

```plaintext
cfg vpn certificate ca
  rename CA_Cert_1 to LDAPS-CA
end
```

4. Configure the LDAP server:

```plaintext
cfg user ldap
  edit "ldap-server"
    set server "172.20.120.161"
    set cnid "cn"
    set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
    set type regular
    set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
    set password ************
    set group-member-check group-object
    set secure ldaps
    set ca-cert "LDAPS-CA"
    set port 636
  next
end
```

5. Configure user group:

```plaintext
cfg user group
  edit "ldapgs-group"
    set member "ldap-server"
  next
end
```

6. Configure SSL VPN web portal:

```plaintext
cfg vpn ssl web portal
  edit "full-access"
    set tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling disable
```
7. Configure SSL VPN settings:

```fortigate
config vpn ssl settings
set servercert "server_certificate"
set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
set source-interface "wan1"
set source-address "all"
set default-portal "web-access"
config authentication-rule
edit 1
    set groups "ldaps-group"
    set portal "full-access"
next
end
```

8. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```fortigate
config firewall policy
edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "ldaps-group"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal `http://172.20.120.123:10443`
2. Enter the `ldu1` user credentials, then click Login.
3. Go to Dashboard > Network and expand the SSL-VPN widget to verify the user’s connection.

To see the results of tunnel connection:

1. Download FortiClient from `www.forticlient.com`
2. Open the FortiClient Console and go to Remote Access > Configure VPN.
3. Add a new connection:
   a. Set the connection name.
   b. Set Remote Gateway to the IP of the listening FortiGate interface, in this example, `172.20.120.123`.
   c. Select Customize Port and set it to `10443`.
4. Save your settings.
5. Log in using the `ldu1` credentials.
To check the SSL VPN connection using the GUI:

1. Go to Dashboard > Network and expand the SSL-VPN widget to verify the user’s connection.
2. Go to Log & Report > System Events and select the VPN Events card to view the details of the SSL VPN connection event log.
3. Go to Log & Report > Forward Traffic to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index  User  Auth Type  Timeout  From            HTTP in/out  HTTPS in/out
0      ldu1   1(1)      229       10.1.100.254    0/0            0/0

SSL VPN sessions:
  Index  User  Source IP  Duration  I/O Bytes  Tunnel/Dest IP

# get vpn ssl monitor
SSL VPN Login Users:
  Index  User  Auth Type  Timeout  From            HTTP in/out  HTTPS in/out
0      ldu1   1(1)      291       10.1.100.254    0/0            0/0

SSL VPN sessions:
  Index  User  Source IP  Duration  I/O Bytes  Tunnel/Dest IP
0      ldu1   10.1.100.254  9        22099/43228  10.212.134.200
```

To check the tunnel login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index  User  Auth Type  Timeout  From            HTTP in/out  HTTPS in/out
0      ldu1   1(1)      229       10.1.100.254    0/0            0/0

SSL VPN sessions:
  Index  User  Source IP  Duration  I/O Bytes  Tunnel/Dest IP
0      ldu1   10.1.100.254  9        22099/43228  10.212.134.200
```

SSL VPN with LDAP user password renew

This is a sample configuration of SSL VPN for LDAP users with *Force Password Change on next logon*. In this example, the LDAP server is a Windows 2012 AD server. A user *ldu1* is configured on Windows 2012 AD server with *Force password change on next logon*.

You must have generated and exported a CA certificate from the AD server and then have imported it as an external CA certificate into the FortiGate.
Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to Network > Interfaces and edit the wan1 interface.
   b. Set IP/Network Mask to 172.20.120.123/255.255.255.0.
   c. Edit port1 interface and set IP/Network Mask to 192.168.1.99/255.255.255.0.
   d. Click OK.
   e. Go to Policy & Objects > Address and create an address for internet subnet 192.168.1.0.

2. Import CA certificate into FortiGate:
   a. Go to System > Features Visibility and ensure Certificates is enabled.
   b. Go to System > Certificates and select Import > CA Certificate.
   c. Select Local PC and then select the certificate file.
      The CA certificate now appears in the list of External CA Certificates. In this example, it is called CA_Cert_1.
   d. If you want, you can use CLI commands to rename the system-generated CA_Cert_1 to be more descriptive:
3. **Configure the LDAP user:**

   The LDAP user must either be an administrator, or have the proper permissions delegated to it, to be able to change passwords of other registered users on the LDAP server.

   a. Go to **User & Authentication > LDAP Servers** and click **Create New**.
   b. Specify **Name** and **Server IP/Name**.
   c. Specify **Common Name Identifier** and **Distinguished Name**.
   d. Set **Bind Type** to **Regular**.
   e. Specify **Username** and **Password**.
   f. Enable **Secure Connection** and set **Protocol** to **LDAPS**.
   g. For **Certificate**, select **LDAP server CA LDAPS-CA** from the list.
   h. To enable the **password-renew** option, use these CLI commands.

   ```
   config user ldap
   edit "ldaps-server"
   set password-expiry-warning enable
   set password-renewal enable
   next
   end
   ```

4. **Configure user group:**

   a. Go to **User & Authentication > User Groups** to create a user group.
   b. Enter a **Name**.
   c. In **Remote Groups**, click **Add** to add **ldaps-server**.

5. **Configure SSL VPN web portal:**

   a. Go to **VPN > SSL-VPN Portals** to edit the **full-access** portal.
   b. Disable **Enable Split Tunneling** so that all SSL VPN traffic goes through the FortiGate.

6. **Configure SSL VPN settings:**

   a. Go to **VPN > SSL-VPN Settings**.
   b. Select the **Listen on Interface(s)**, in this example, **wan1**.
   c. Set **Listen on Port** to **10443**.
   d. Set **Server Certificate** to the authentication certificate.
   e. Under **Authentication/Portal Mapping**, set default Portal **web-access** for **All Other Users/Groups**.
   f. Create new **Authentication/Portal Mapping** for group **ldaps-group** mapping portal **full-access**.

7. **Configure SSL VPN firewall policy:**

   a. Go to **Policy & Objects > Firewall Policy**.
   b. Fill in the firewall policy name, in this example, **sslvpn certificate auth**.
   c. Incoming interface must be **SSL-VPN tunnel interface(ssl.root)**.
   d. Set the **Source Address** to **all** and **Source User** to **ldaps-group**.
e. Set the **Outgoing Interface** to the local network interface so that the remote user can access the internal network, in this example, `port1`.

f. Set **Destination Address** to the internal protected subnet `192.168.1.0`.

g. Set **Schedule** to *always*, **Service** to *ALL*, and **Action** to *Accept*.

h. Enable **NAT**.

i. Configure any remaining firewall and security options as desired.

j. Click **OK**.

**To configure SSL VPN using the CLI:**

1. **Configure the interface and firewall address:**

   ```plaintext
cfg\n    system interface
      edit "wan1"
      set vdom "root"
      set ip 172.20.120.123 255.255.255.0
      next
    end

cfg\n    firewall address
      edit "192.168.1.0"
      set subnet 192.168.1.0 255.255.255.0
      next
    end
```

2. **Configure internal interface and protected subnet, then connect the port1 interface to the internal network:**

   ```plaintext
cfg\n    system interface
      edit "port1"
      set vdom "root"
      set ip 192.168.1.99 255.255.255.0
      next
    end

cfg\n    firewall address
      edit "192.168.1.0"
      set subnet 192.168.1.0 255.255.255.0
      next
    end
```

3. **Import CA certificate into FortiGate:**

   a. Go to **System > Features Visibility** and ensure **Certificates** is enabled.

   b. Go to **System > Certificates** and select **Import > CA Certificate**.

   c. Select **Local PC** and then select the certificate file.

      The CA certificate now appears in the list of **External CA Certificates**. In the example, it is called `CA_Cert_1`.

   d. If you want, you can use CLI commands to rename the system-generated `CA_Cert_1` to be more descriptive:

      ```plaintext
      cfg\n      vpn certificate ca
        rename CA_Cert_1 to LDAPS-CA
      end
      ```

4. **Configure the LDAP server:**

   ```plaintext
   cfg\n   user ldap
     edit "ldaps-server"
     set server "172.20.120.161"
   ```

   **The LDAP user must either be an administrator, or have the proper permissions delegated to it, to be able to change passwords of other registered users on the LDAP server.**
Configure user group:

```bash
cfg user group
edit "ldaps-group"
    set member "ldaps-server"
next
end
```

Configure SSL VPN web portal:

```bash
cfg vpn ssl web portal
edit "full-access"
    set tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling disable
next
end
```

Configure SSL VPN settings:

```bash
cfg vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    cfg authentication-rule
        edit 1
            set groups "ldaps-group"
            set portal "full-access"
next
end
```

Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```bash
cfg firewall policy
edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "ldaps-group"
```
VPN

set action accept
set schedule "always"
set service "ALL"
set nat enable
next
end

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal http://172.20.120.123:10443.
2. Log in using the ldu1 credentials.
   Use a user that is configured on FortiAuthenticator with Force password change on next logon.
3. Click Login. You are prompted to enter a new password. The prompt will timeout after 90 seconds.
4. Go to Dashboard > Network and expand the SSL-VPN widget to verify the user’s connection.

To see the results of tunnel connection:

2. Open the FortiClient Console and go to Remote Access > Configure VPN.
3. Add a new connection:
   a. Set the connection name.
   b. Set Remote Gateway to the IP of the listening FortiGate interface, in this example, 172.20.120.123.
   c. Select Customize Port and set it to 10443.
4. Save your settings.
5. Log in using the ldu1 credentials.
   You are prompted to enter a new password. The prompt will timeout after 90 seconds.

To check the SSL VPN connection using the GUI:

1. Go to Dashboard > Network and expand the SSL-VPN widget to verify the user’s connection.
2. Go to Log & Report > System Events and select the VPN Events card to view the details of the SSL VPN connection event log.
3. Go to Log & Report > Forward Traffic to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
Index User Auth Type Timeout From HTTP in/out HTTPS in/out
0 ldu1 1(1) 229 10.1.100.254 0/0 0/0
```

To check the tunnel login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
Index User Auth Type Timeout From HTTP in/out HTTPS in/out
0 ldu1 1(1) 291 10.1.100.254 0/0 0/0
```
SSL VPN with certificate authentication

This is an example configuration of SSL VPN that requires users to authenticate using a client certificate. The client certificate is issued by the company Certificate Authority (CA). Each user is issued a certificate with their username in the subject.

There are two ways to configure certificate authentication:

1. **Using PKI users**
2. **Configuring the SSL VPN settings to require a client certificate**

In this example, the server and client certificates are signed by the same Certificate Authority (CA).

Self-signed certificates are provided by default to simplify initial installation and testing. It is HIGHLY recommended that you acquire a signed certificate for your installation. Continuing to use these certificates can result in your connection being compromised, allowing attackers to steal your information, such as credit card details.

For more information, please review the Use a non-factory SSL certificate for the SSL VPN portal on page 1621 and learn how to Procuring and importing a signed SSL certificate on page 2175.

Using PKI users

When using PKI users, the FortiGate authenticates the user based on there identity in the subject or the common name on the certificate. The certificate must be signed by a CA that is known by the FortiGate, either through the default CA certificates or through importing a CA certificate.

The user can either match a static subject or common name defined in the PKI user settings, or match an LDAP user in the LDAP server defined in the PKI user settings. Multi-factor authentication can also be enabled with the password as the second factor.

Configuring the SSL VPN settings to require a client certificate

Using this method, the user is authenticated based on their regular username and password, but SSL VPN will still require an additional certificate check. The client certificate only needs to be signed by a known CA in order to pass authentication.

This method can be configured by enabling **Require Client Certificate** (reqclientcert) in the SSL-VPN settings.
VPN

**Configuration**

In the following example, SSL VPN users are authenticated using the first method. A PKI user is configured with multi-factor authentication

Pre-requisites:

- The CA has already issued a client certificate to the user.
- The CA has issued a server certificate for the FortiGate’s SSL VPN portal.
- The CA certificate is available to be imported on the FortiGate.

**To configure SSL VPN in the GUI:**

1. Install the server certificate. The server certificate allows the clients to authenticate the server and to encrypt the SSL VPN traffic.
   
   a. Go to System > Feature Visibility and ensure Certificates is enabled.
   
   b. Go to System > Certificates and select Import > Local Certificate.
      
      - Set Type to Certificate.
      - Choose the Certificate file and the Key file for your certificate, and enter the Password.
      - If required, you can change the Certificate Name.

   The server certificate now appears in the list of Certificates.

2. Install the CA certificate.
   
   The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users.
   
   a. Go to System > Certificates and select Import > CA Certificate.
   
   b. Select Local PC and then select the certificate file.

   The CA certificate now appears in the list of External CA Certificates. In this example, it is called CA_Cert_1.

3. Configure PKI users and a user group.
   
   To use certificate authentication, use the CLI to create PKI users.

   ```
   config user peer
   edit pki01
     set ca CA_Cert_1
     set subject "CN=User01"
   next
   end
   ```

   Ensure that the subject matches the name of the user certificate. In this example, User01.

4. After you have create a PKI user, a new menu is added to the GUI:
   
   a. Go to User & Authentication > PKI to see the new user.
   
   b. Edit the user account.
   
   c. Enable Two-factor authentication and set a password for the account.
   
   d. Go to User & Authentication > User Groups and create a group called sslvpn group.
   
   e. Add the PKI user pki01 to the group.

5. Configure SSL VPN web portal.
   
   a. Go to VPN > SSL-VPN Portals to edit the full-access portal.
      
      This portal supports both web and tunnel mode.
   
   b. Disable Enable Split Tunneling so that all SSL VPN traffic goes through the FortiGate.
6. Configure SSL VPN settings.
   a. Go to VPN > SSL-VPN Settings and enable SSL-VPN.
   b. Set the Listen on Interface(s) to wan1.
   c. Set Listen on Port to 10443.
   d. Set Server Certificate to the local certificate that was imported.
   e. Under Authentication/Portal Mapping, set default Portal web-access for All Other Users/Groups.
   f. Create new Authentication/Portal Mapping for group sslvpn_group mapping portal full-access.

7. Configure SSL VPN firewall policy.
   a. Go to Policy & Objects > Firewall Policy.
   b. Fill in the firewall policy name. In this example, sslvpn_certificate_auth.
   c. Incoming interface must be SSL-VPN tunnel interface(ssl.root).
   d. Set the Source Address to all and Source User to sslvpn_group.
   e. Set the Outgoing Interface to the local network interface so that the remote user can access the internal network. In this example, port1.
   f. Set Destination Address to the internal protected subnet 192.168.1.0.
   g. Set Schedule to always, Service to ALL, and Action to Accept.
   h. Enable NAT.
   i. Configure any remaining firewall and security options as needed.
   j. Click OK.

To configure SSL VPN in the CLI:

1. Configure the protected subnet:

   ```
   config firewall address
   edit "192.168.1.0"
     set subnet 192.168.1.0 255.255.255.0
   next
   end
   ```

2. Install the server certificate:

   The server certificate allows the clients to authenticate the server and to encrypt the SSL VPN traffic. While it is easier to install the server certificate in the GUI, the CLI can be used to import a p12 certificate from a TFTP server.

   To import a p12 certificate, put the certificate `server_certificate.p12` on your TFTP server, then run following command on the FortiGate:

   ```
   execute vpn certificate local import tftp server_certificate.p12 <your tftp_server> p12 <your password for PKCS12 file>
   ```

   To check that the server certificate is installed:

   ```
   show vpn certificate local server_certificate
   ```

3. Install the CA certificate:

   The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users. While it is easier to install the CA certificate from GUI, the CLI can be used to import a CA certificates from a TFTP server.

   To import a CA certificate, put the CA certificate on your TFTP server, then run following command on the FortiGate:

   ```
   execute vpn certificate ca import tftp <your CA certificate name> <your tftp server>
   ```
VPN

To check that a new CA certificate is installed:

show vpn certificate ca

4. **Configure PKI users and a user group:**

   config user peer
   edit pki01
     set ca CA_Cert_1
     set subject "CN=User01"
     set two-factor enable
     set passwd **********
   next
   end

   config user group
   edit "sslvpngroup"
     set member "pki01"
   next
   end

5. **Configure SSL VPN web portal:**

   config vpn ssl web portal
   edit "full-access"
     set tunnel-mode enable
     set web-mode enable
     set ip-pools "SSLVPN_TUNNEL_ADDR1"
     set split-tunneling disable
   next
   end

6. **Configure SSL VPN settings:**

   config vpn ssl settings
   set servercert "server_certificate"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
   set source-interface "wan1"
   set source-address "all"
   set default-portal "web-access"
   config authentication-rule
     edit 1
     set groups "sslvpngroup"
     set portal "full-access"
   next
   end

7. **Configure one SSL VPN firewall policy to allow remote user to access the internal network:**

   config firewall policy
   edit 1
     set name "sslvpn web mode access"
     set srcintf "ssl.root"
     set dstintf "port1"
     set srcaddr "all"
     set dstaddr "192.168.1.0"
     set groups "sslvpngroup"
     set action accept
     set schedule "always"
set service "ALL"
set nat enable
next
end

**Installation**

To use the user certificate, you must first install it on the user’s PC. When the user tries to authenticate, the user certificate is checked against the CA certificate to verify that they match.

Every user should have a unique user certificate. This allows you to distinguish each user and revoke a specific user’s certificate, such as if a user no longer has VPN access.

**To install the user certificate on Windows 7, 8, and 10:**

1. Double-click the certificate file to open the *Import Wizard*.
2. Use the *Import Wizard* to import the certificate into the *Personal store* of the current user.

**To install the user certificate on Mac OS X:**

1. Open the certificate file, to open *Keychain Access*.
2. Double-click the certificate.
3. Expand *Trust* and select *Always Trust*.

**To see the results of tunnel connection:**

1. Download FortiClient from [www.forticlient.com](http://www.forticlient.com).
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
   - Set *VPN Type* to SSL VPN.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Enable *Client Certificate* and select the authentication certificate.
6. Save your settings.
7. Use the credentials you’ve set up to connect to the SSL VPN tunnel.
   - If the certificate is correct, you can connect.

**To see the results of web portal:**

1. In a web browser, log into the portal [http://172.20.120.123:10443](http://172.20.120.123:10443).
   - A message requests a certificate for authentication.
2. Select the user certificate.
3. Enter your user credentials.
   - If the certificate is correct, you can connect to the SSL VPN web portal.

**To check the SSL VPN connection using the GUI:**

1. Go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
2. Go to *Log & Report > System Events* and select the *VPN Events* card to view the details for the SSL connection log.
To check the SSL VPN connection using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
  Index  User      Auth Type  Timeout  From          HTTP in/out  HTTPS in/out
  0      pki01,cn=User01  1(1)         229  10.1.100.254  0/0       0/0
  1      pki01,cn=User01  1(1)         291  10.1.100.254  0/0       0/0

SSL VPN sessions:
  Index  User      Source IP  Duration  I/O Bytes  Tunnel/Dest IP
  0      pki01,cn=User01  10.1.100.254  9          22099/43228  10.212.134.200
```

SSL VPN with LDAP-integrated certificate authentication

This is a sample configuration of SSL VPN that requires users to authenticate using a certificate with LDAP UserPrincipalName checking.

This sample uses Windows 2012R2 Active Directory acting as both the user certificate issuer, the certificate authority, and the LDAP server.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.
In this sample, the *User Principal Name* is included in the subject name of the issued certificate. This is the user field we use to search LDAP in the connection attempt.

To use the user certificate, you must first install it on the user's PC. When the user tries to authenticate, the user certificate is checked against the CA certificate to verify that they match.

Every user should have a unique user certificate. This allows you to distinguish each user and revoke a specific user's certificate, such as if a user no longer has VPN access.

**To install the server certificate:**

The server certificate is used for authentication and for encrypting SSL VPN traffic.

1. Go to *System > Feature Visibility* and ensure *Certificates* is enabled.
2. Go to *System > Certificates* and select *Import > Local Certificate*.
3. Set Type to *Certificate*.
4. Choose the *Certificate file* and the *Key file* for your certificate, and enter the *Password*.
5. If required, change the *Certificate Name*.
   The server certificate now appears in the list of *Certificates*.

**To install the CA certificate:**

The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users.

1. Go to *System > Certificates* and select *Import > CA Certificate*.
2. Select *Local PC* and then select the certificate file.
   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.

**To configure SSL VPN using the GUI:**

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network > Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to 172.20.120.123/255.255.255.0.
   c. Edit *port1* interface and set *IP/Network Mask* to 192.168.1.99/255.255.255.0.
   d. Click OK.
   e. Go to *Policy & Objects > Address* and create an address for internet subnet 192.168.1.0.
2. Configure the LDAP server:
   a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
   b. Specify *Name* and *Server IP/Name*.
   c. Set *Distinguished Name* to *dc=fortinet-fsso,dc=com*.
   d. Set *Bind Type* to *Regular*.
   e. Set *Username* to *cn=admin,ou=testing,dc=fortinet-fsso,dc=com*.
   f. Set *Password*.
   g. Click OK.
3. Configure PKI users and a user group:
   To use certificate authentication, use the CLI to create PKI users.

```bash
config user peer
edit user1
```
set ca CA_Cert_1
set ldap-server "ldap-AD"
set ldap-mode principal-name
next
end

When you have create a PKI user, a new menu is added to the GUI:

a. Go to User & Authentication > PKI to see the new user.
b. Go to User & Authentication > User > User Groups and create a group sslvpn-group.

c. Add the PKI peer object you created as a local member of the group.
d. Add a remote group on the LDAP server and select the group of interest.
   You need these users to be members using the LDAP browser window.

4. Configure SSL VPN web portal:
   a. Go to VPN > SSL-VPN Portals to edit the full-access portal.
      This portal supports both web and tunnel mode.
   b. Disable Enable Split Tunneling so that all SSL VPN traffic goes through the FortiGate.

5. Configure SSL VPN settings:
   a. Go to VPN > SSL-VPN Settings.
   b. Select the Listen on Interface(s), in this example, wan1.
   c. Set Listen on Port to 10443.
   d. Set Server Certificate to the authentication certificate.
   e. Under Authentication/Portal Mapping, set default Portal web-access for All Other Users/Groups.
   f. Create new Authentication/Portal Mapping for group sslvpn-group mapping portal full-access.

6. Configure SSL VPN firewall policy:
   a. Go to Policy & Objects > Firewall Policy.
   b. Fill in the firewall policy name. In this example, sslvpn certificate auth.
   c. Incoming interface must be SSL-VPN tunnel interface(ssl.root).
   d. Set the Source Address to all and Source User to sslvpn-group.
   e. Set the Outgoing Interface to the local network interface so that the remote user can access the internal network. In this example, port1.
   f. Set Destination Address to the internal protected subnet 192.168.1.0.
   g. Set Schedule to always, Service to ALL, and Action to Accept.
   h. Enable NAT.
   i. Configure any remaining firewall and security options as desired.
   j. Click OK.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

   config system interface
   edit "wan1"
   set vdom "root"
   set ip 172.20.120.123 255.255.255.0
   next
   end
2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```fortigate
config system interface
   edit "port1"
      set vdom "root"
      set ip 192.168.1.99 255.255.255.0
   next
end
config firewall address
   edit "192.168.1.0"
      set subnet 192.168.1.0 255.255.255.0
   next
end
```

3. Configure the LDAP server:

```fortigate
config user ldap
   edit "ldap-AD"
      set server "172.18.60.206"
      set cnid "cn"
      set dn "dc=fortinet-fsso,dc=com"
      set type regular
      set username "cn=admin,ou=testing,dc=fortinet-fsso,dc=com"
      set password ldap-server-password
   next
end
```

4. Configure PKI users and a user group:

```fortigate
config user peer
   edit user1
      set ca CA_Cert_1
      set ldap-server "ldap-AD"
      set ldap-mode principal-name
   next
end
config user group
   edit "sslvpn-group"
      set member "ldap-AD" "user1"
   config match
      edit 1
         set server-name "ldap-AD"
         set group-name "CN=group3,OU=Testing,DC=Fortinet-FSSO,DC=COM"
      next
      next
end
```

5. Configure SSL VPN web portal:

```fortigate
config vpn ssl web portal
   edit "full-access"
      set tunnel-mode enable
      set web-mode enable
      set ip-pools "SSLVPN_TUNNEL_ADDR1"
      set split-tunneling disable
   next
end
```
6. Configure SSL VPN settings:

```config
config vpn ssl settings
set servercert "server_certificate"
set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
set source-interface "wan1"
set source-address "all"
set default-portal "web-access"
config authentication-rule
  edit 1
    set groups "sslvpn-group"
    set portal "full-access"
  next
end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```config
config firewall policy
  edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "sslvpn-group"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
  next
end
```

**To see the results of tunnel connection:**

1. Download FortiClient from [www.forticlient.com](http://www.forticlient.com).
2. Open the FortiClient Console and go to Remote Access > Configure VPN.
3. Add a new connection.
   a. Set the connection name.
   b. Set Remote Gateway to the IP of the listening FortiGate interface, in this example, 172.20.120.123.
   c. Select Customize Port and set it to 10443.
   d. Enable Client Certificate and select the authentication certificate.
4. Save your settings.
   Connecting to the VPN only requires the user’s certificate. It does not require username or password.

**To see the results of web portal:**

1. In a web browser, log into the portal `http://172.20.120.123:10443`.
   A message requests a certificate for authentication.
2. Select the user certificate.
   You can connect to the SSL VPN web portal.
To check the SSL VPN connection using the GUI:

1. Go to Dashboard > Network and expand the SSL-VPN widget to verify the user’s connection.
2. Go to Log & Report > VPN Events to view the details of the SSL VPN connection event log.
3. Go to Log & Report > Forward Traffic to view the details of the SSL VPN traffic.

To check the SSL VPN connection using the CLI:

Below is a sample output of `diagnose debug application fnbamd -1` while the user connects. This is a shortened output sample of a few locations to show the important parts. This sample shows lookups to find the group memberships (three groups total) of the user and that the correct group being found results in a match.

```
[1148] fnbamd_ldap_recv-Response len: 16, svr: 172.18.60.206
[829] fnbamd_ldap_parse_response-Got one MESSAGE. ID:4, type:search-result
[864] fnbamd_ldap_parse_response-ret=0
[1386] fnbamd_ldap_primary_grp_next/Auth accepted
[910] fnbamd_ldap_next-Change state to 'Done'
[843] fnbamd_ldap_next-state 23(Done)
[925] fnbamd_ldap_send-sending 7 bytes to 172.18.60.206
[937] fnbamd_ldap_send-Request is sent. ID 5
[753] fnbamd_ldap_stop-svr 'ldap-AD'
[53] ldap_dn_list_del_all-Del CN=test3,OU=Testing,DC=Fortinet-FSSO,DC=COM
[399] ldap_copy_grp_list-copied CN=group3,OU=Testing,DC=Fortinet-FSSO,DC=COM
[399] ldap_copy_grp_list-copied CN=Domain Users,CN=Users,DC=Fortinet-FSSO,DC=COM
[2088] fnbamd_auth_cert_check-Matching group 'sslvpn-group'
[2007] match_ldap_group-Matching server 'ldap-AD' - 'ldap-AD'
[2015] match_ldap_group-Matching group 'CN=group3,OU=Testing,DC=Fortinet-FSSO,DC=COM' - 'CN=group3,OU=Testing,DC=Fortinet-FSSO,DC=COM'
[2091] fnbamd_auth_cert_check-Group 'sslvpn-group' matched
[2120] fnbamd_auth_cert_result-Result for ldap svr[0] 'ldap-AD' is SUCCESS
[2126] fnbamd_auth_cert_result-matched user 'test3', matched group 'sslvpn-group'
```

You can also use `diagnose firewall auth list` to validate that a firewall user entry exists for the SSL VPN user and is part of the right groups.

**SSL VPN for remote users with MFA and user sensitivity**

By default, remote LDAP and RADIUS user names are case sensitive. When a remote user object is applied to SSL VPN authentication, the user must type the exact case that is used in the user definition on the FortiGate.

Case sensitivity and accents can be ignored by disabling the `username-sensitivity` CLI command, allowing the remote user object to match any case or accents that the end user types in.

In this example, a remote user is configured with multi-factor authentication (MFA). The user group includes the LDAP user and server, and is applied to SSL VPN authentication and the policy.
**Topology**

![Topology Diagram]

**Example configuration**

**To configure the LDAP server:**

1. Generate and export a CA certificate from the AD server.
2. Import the CA certificate into FortiGate:
   a. Go to System > Features Visibility and ensure Certificates is enabled.
   b. Go to System > Certificates and select Import > CA Certificate.
   c. Select Local PC and then select the certificate file.
      The CA certificate now appears in the list of External CA Certificates. In this example, it is called CA_Cert_1.
   d. If you want, you can use CLI commands to rename the system-generated CA_Cert_1 to be more descriptive:

   ```
   config vpn certificate ca
   rename CA_Cert_1 to LDAPS-CA
   end
   ```

3. Configure the LDAP user:
   a. Go to User & Authentication > LDAP Servers and click Create New.
   b. Configure the following options for this example:

<table>
<thead>
<tr>
<th>Name</th>
<th>WIN2K16-KLHOME</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server IP/Name</td>
<td>192.168.20.6</td>
</tr>
<tr>
<td>Server Port</td>
<td>636</td>
</tr>
</tbody>
</table>
Common Name Identifier | sAMAccountName
---|---
Distinguished Name | dc=KLHOME,dc=local
Bind Type | Regular
Username | KLHOME\Administrator
Password | *********
Secure Connection | Enable
Protocol | LDAPS
Certificate | CA_Cert_1
This is the CA certificate that you imported in step 2.

c. Click OK.

To configure an LDAP user with MFA:

1. Go to User & Authentication > User Definition and click Create New.
2. Select Remote LDAP User, then click Next.
3. Select the just created LDAP server, then click Next.
4. Right click to add the selected user, then click Submit.
5. Edit the user that you just created.
   The username will be pulled from the LDAP server with the same case as it has on the server.
6. Set the Email Address to the address that FortiGate will send the FortiToken to.
7. Enable Two-factor Authentication.
8. Set Authentication Type to FortiToken.
9. Set **Token** to a FortiToken device. See for more information.

10. Click **OK**.

To disable case and accent sensitivity on the remote user:

This can only be configured in the CLI.

```
config user local
  edit "fgdocs"
    set type ldap
    set two-factor fortitoken
    set fortitoken "FTXMOBxxxxxxxxxx"
    set email-to "fgdocs@fortinet.com"
    set username-sensitivity disable
    set ldap-server "WIN2K16-KLHOME"
next
end
```

To configure a user group with the remote user and the LDAP server:

1. Go to **User & Authentication > User Groups** and click **Create New**.
2. Set the **Name** to **LDAP-USERGRP**.
3. Set **Members** to the just created remote user.
4. In the **Remote Groups** table, click **Add**:
   a. Set **Remote Server** to the LDAP server.
   b. Set the group or groups that apply, and right click to add them.
   c. Click **OK**.
5. Click OK.

To apply the user group to the SSL VPN portal:

1. Go to VPN > SSL-VPN Settings.
2. In the Authentication/Portal Mapping table, click Create New.
   a. Set Users/Groups to the just created user group.
   b. Configure the remaining settings as required.
   c. Click OK.

3. Click Apply.

To apply the user group to a firewall policy:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Configure the following:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>SSLVPNtoInternal</td>
</tr>
<tr>
<td>Incoming Interface</td>
<td>SSL-VPN tunnel interface (ssl.root)</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>port3</td>
</tr>
<tr>
<td>Source</td>
<td>Address - SSLVPN_TUNNEL_ADDR1</td>
</tr>
<tr>
<td></td>
<td>User - LDAP-USERGRP</td>
</tr>
<tr>
<td>Destination</td>
<td>The address of the internal network.</td>
</tr>
<tr>
<td></td>
<td>In this case: 192.168.20.0.</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>Enabled</td>
</tr>
</tbody>
</table>
3. Configuring the remaining settings as required.
4. Click OK.

To configure this example in the CLI:

1. Configure the LDAP server:

   ```
   config user ldap
   edit "WIN2K16-KLHOME"
   set server "192.168.20.6"
   set cnid "sAMAccountName"
   set dn "dc=KLHOME,dc=local"
   set type regular
   set username "KLHOME\Administrator"
   set password *********
   set secure ldaps
   set ca-cert "CA_Cert_1"
   set port 636
   next
   end
   ```

2. Configure an LDAP user with MFA and disable case and accent sensitivity on the remote user:

   ```
   config user local
   edit "fgdocs"
   set type ldap
   set two-factor fortitoken
   set fortitoken "FTKMOBxxxxxxxxxx"
   set email-to "fgdocs@fortinet.com"
   set username-sensitivity disable
   set ldap-server "WIN2K16-KLHOME"
   next
   end
   ```

3. Configure a user group with the remote user and the LDAP server:

   ```
   config user group
   edit "LDAP-USERGRP"
   set member "fgdocs" "WIN2K16-KLHOME"
   ```
next
end

4. Apply the user group to the SSL VPN portal:

```c
config vpn ssl settings
  set servercert <server_certificate>
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set source-interface "port1"
  set source-address "all"
  set default-portal "web-access"
config authentication-rule
  edit 1
    set groups "LDAP-USERGRP"
    set portal "full-access"
next
end
```

5. Apply the user group to a firewall policy:

```c
config firewall policy
  edit 5
    set name "SSLVPNtoInternal"
    set srcintf "ssl.root"
    set dstintf "port3"
    set srcaddr "SSLVPN_TUNNEL_ADDR1"
    set dstaddr "192.168.20.0"
    set action accept
    set schedule "always"
    set service "ALL"
    set groups "LDAP-USERGRP"
    set nat enable
next
end
```

Verification

To setup the VPN connection:

2. Open the FortiClient Console and go to Remote Access.
3. Add a new connection:
   a. Set the connection name.
   b. Set Remote Gateway to the IP of the listening FortiGate interface.
   c. If required, set the Customize Port.
4. Save your settings.

To test the connection with case sensitivity disabled:

1. Connect to the VPN:
   a. Log in to the tunnel with the username, using the same case that it is on the FortiGate.
   b. When prompted, enter your FortiToken code.
      You should now be connected.
2. Check the web portal log in using the CLI:

   # get vpn ssl monitor
   SSL VPN Login Users:
   Index   User      Group      Auth Type  Timeout  From    HTTP in/out  HTTPS in/out
   0       fgdocs    LDAP-USERGRP 16 (1)  289 192.168.2.202 0/0

   SSL VPN sessions:
   Index   User      Group      Source IP   Duration   I/O Bytes Tunnel/Dest IP
   0       fgdocs    LDAP-USERGRP 192.168.2.202 45 99883/5572

3. Disconnect from the VPN connection.

4. Reconnect to the VPN:
   a. Log in to the tunnel with the username, using a different case than on the FortiGate.
   b. When prompted, enter your FortiToken code.
      You should now be connected.

5. Check the web portal log in using the CLI:

   # get vpn ssl monitor
   SSL VPN Login Users:
   Index   User      Group      Auth Type  Timeout  From    HTTP in/out  HTTPS in/out
   0       FGDOCS    LDAP-USERGRP 16 (1)  289 192.168.2.202 0/0

   SSL VPN sessions:
   Index   User      Group      Source IP   Duration   I/O Bytes Tunnel/Dest IP
   0       FGDOCS    LDAP-USERGRP 192.168.2.202 45 99883/5572

In both cases, the remote user is matched against the remote LDAP user object and prompted for multi-factor authentication.

To test the connection with case and accent sensitivity enabled:

1. Enable case and accent sensitivity for the user:

   config user local
   edit "fgdocs"
     set username-sensitivity enable
   next
   end

2. Connect to the VPN
   a. Log in to the tunnel with the username, using the same case that it is on the FortiGate.
   b. When prompted, enter your FortiToken code.
      You should now be connected.

3. Check the web portal log in using the CLI:

   # get vpn ssl monitor
   SSL VPN Login Users:
   Index   User      Group      Auth Type  Timeout  From    HTTP in/out  HTTPS in/out
   0       FGDOCS    LDAP-USERGRP 16 (1)  289 192.168.2.202 0/0

   SSL VPN sessions:
   Index   User      Group      Source IP   Duration   I/O Bytes Tunnel/Dest IP
   0       FGDOCS    LDAP-USERGRP 192.168.2.202 45 99883/5572
0 | **fgdocs** | LDAP-USERGRP | 16 (1) | 289 | 192.168.2.202 | 0/0

**SSL VPN sessions:**

<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Group</th>
<th>Source IP</th>
<th>Duration</th>
<th>I/O Bytes</th>
<th>Tunnel/Dest IP</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td><strong>fgdocs</strong></td>
<td>LDAP-USERGRP</td>
<td>192.168.2.202</td>
<td>45</td>
<td>9988/5572</td>
<td></td>
</tr>
<tr>
<td>10.212.134.200</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

1. Disconnect from the VPN connection.
2. Reconnect to the VPN:
   a. Log in to the tunnel with the username, using a different case than on the FortiGate.
      You will not be prompted for your FortiToken code. You should now be connected.
3. Check the web portal log in using the CLI:

   ```
   # get vpn ssl monitor
   SSL VPN Login Users:
   Index | User     | Group       | Auth Type | Timeout | From | HTTP in/out | HTTPS in/out |
  -------|----------|-------------|-----------|---------|------|-------------|--------------|
   0     | **FGdocs** | LDAP-USERGRP | 16 (1) | 289 | 192.168.2.202 | 0/0 |
   0/0 |
   ```

   SSL VPN sessions:

<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Group</th>
<th>Source IP</th>
<th>Duration</th>
<th>I/O Bytes</th>
<th>Tunnel/Dest IP</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td><strong>FGdocs</strong></td>
<td>LDAP-USERGRP</td>
<td>192.168.2.202</td>
<td>45</td>
<td>9988/5572</td>
<td></td>
</tr>
<tr>
<td>10.212.134.200</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In this case, the user is allowed to log in without a FortiToken code because the entered user name did not match the name defined on the remote LDAP user object. Authentication continues to be evaluated against the LDAP server though, which is not case sensitive.

**SSL VPN with FortiToken mobile push authentication**

This is a sample configuration of SSL VPN that uses FortiToken mobile push two-factor authentication. If you enable push notifications, users can accept or deny the authentication request.
Sample topology

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to Network > Interfaces and edit the wan1 interface.
   b. Set IP/Network Mask to 172.20.120.123/255.255.255.0.
   c. Edit port1 interface and set IP/Network Mask to 192.168.1.99/255.255.255.0.
   d. Click OK.
   e. Go to Policy & Objects > Address and create an address for internet subnet 192.168.1.0.

2. Register FortiGate for FortiCare Support:
   To add or download a mobile token on FortiGate, FortiGate must be registered for FortiCare Support. If your FortiGate is registered, skip this step.
   a. Go to Dashboard > Licenses.
   b. Hover the pointer on FortiCare Support to check if FortiCare registered. If not, click it and select Register.

3. Add FortiToken mobile to FortiGate:
   If your FortiGate has FortiToken installed, skip this step.
   a. Go to User & Authentication > FortiTokens and click Create New.
   b. Select Mobile Token and type in Activation Code.
   c. Every FortiGate has two free mobile tokens. Go to User & Authentication > FortiTokens and click Import Free Trial Tokens.

4. Enable FortiToken mobile push:
   To use FTM-push authentication, use CLI to enable FTM-Push on the FortiGate.
a. Ensure server-ip is reachable from the Internet and enter the following CLI commands:

```plaintext
config system ftm-push
  set server-ip 172.20.120.123
  set status enable
end
```

b. Go to Network > Interfaces.

c. Edit the wan1 interface.

d. Under Administrative Access > IPv4, select FTM.

e. Click OK.

5. Configure user and user group:

a. Go to User & Authentication > User Definition to create a local user sslvpnuser1.

b. Enter the user's Email Address.

c. Enable Two-factor Authentication and select one mobile Token from the list,

d. Enable Send Activation Code and select Email.

e. Click Next and click Submit.

f. Go to User & Authentication > User Groups to create a group sslvpnuser1 mapping portal full-access.

6. Activate the mobile token:

a. When the user sslvpnuser1 is created, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

7. Configure SSL VPN settings:

a. Go to Policy & Objects > Firewall Policy.

b. Fill in the firewall policy name. In this example, sslvpn certificate auth.

c. Enable Two-factor Authentication and select one mobile Token from the list,

d. Enable Send Activation Code and select Email.

e. Click Next and click Submit.

f. Go to User & Authentication > User Groups to create a group sslvpnuser1 mapping portal full-access.

9. Configure SSL VPN firewall policy:

a. Go to Policy & Objects > Firewall Policy.

b. Fill in the firewall policy name. In this example, sslvpn certificate auth.

c. Incoming interface must be SSL-VPN tunnel interface(ssl.root).

d. Set the Source Address to all and Source User to sslvpnuser1.

e. Set the Outgoing Interface to the local network interface so that the remote user can access the internal network. In this example, port1.

f. Set Destination Address to the internal protected subnet 192.168.1.0.

g. Set Schedule to always, Service to ALL, and Action to Accept.

h. Enable NAT.

i. Configure any remaining firewall and security options as desired.

j. Click OK.
To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

   ```
   config system interface
   edit "wan1"
       set vdom "root"
       set ip 172.20.120.123 255.255.255.0
   next
   end
   ```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

   ```
   config system interface
   edit "port1"
       set vdom "root"
       set ip 192.168.1.99 255.255.255.0
   next
   end
   ```

   ```
   config firewall address
   edit "192.168.1.0"
       set subnet 192.168.1.0 255.255.255.0
   next
   end
   ```

3. Register FortiGate for FortiCare Support.
   To add or download a mobile token on FortiGate, FortiGate must be registered for FortiCare Support. If your FortiGate is registered, skip this step.

   ```
   diagnose forticare direct-registration product-registration -a "your account@xxx.com" -p "your password" -T "Your Country/Region" -R "Your Reseller" -e 1
   ```

4. Add FortiToken mobile to FortiGate:

   ```
   execute fortitoken-mobile import <your FTM code>
   ```

   If your FortiGate has FortiToken installed, skip this step.
   Every FortiGate has two free mobile Tokens. You can download the free token.

   ```
   execute fortitoken-mobile import 0000-0000-0000-0000-0000
   ```

5. Enable FortiToken mobile push:

   a. To use FTM-push authentication, ensure server-ip is reachable from the Internet and enable FTM-push in the FortiGate:

      ```
      config system ftm-push
      set server-ip 172.20.120.123
      set status enable
      end
      ```

   b. Enable FTM service on WAN interface:

      ```
      config system interface
      edit "wan1"
          append allowaccess ftm
      next
      end
      ```
6. Configure user and user group:

```plaintext
config user local
   edit "sslvpnuser1"
      set type password
      set two-factor fortitoken
      set fortitoken "select mobile token for the option list"
      set email-to "user's email address"
      set passwd "user's password"
next
end
config user group
   edit "sslvpngroup"
      set member "sslvpnuser1"
next
end
```

7. Activate the mobile token.
   When the user `sslvpnuser1` is created, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

8. Configure SSL VPN web portal:

```plaintext
config vpn ssl web portal
   edit "full-access"
      set tunnel-mode enable
      set web-mode enable
      set ip-pools "SSLVPN_TUNNEL_ADDR1"
      set split-tunneling disable
next
end
```

9. Configure SSL VPN settings:

```plaintext
config vpn ssl settings
   set servercert "server_certificate"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
   set source-interface "wan1"
   set source-address "all"
   set default-portal "web-access"
config authentication-rule
   edit 1
      set groups "sslvpngroup"
      set portal "full-access"
next
end
```

10. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```plaintext
config firewall policy
   edit 1
      set name "sslvpn web mode access"
      set srcintf "ssl.root"
      set dstintf "port1"
      set srcaddr "all"
      set dstaddr "192.168.1.0"
      set groups "sslvpngroup"
      set action accept
```
To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal http://172.20.120.123:10443.
2. Log in using the sslvpnuser1 credentials.
   The FortiGate pushes a login request notification through the FortiToken mobile application.
3. Check your mobile device and select Approve.
   When the authentication is approved, sslvpnuser1 is logged into the SSL VPN portal.
4. On the FortiGate, go to Dashboard > Network and expand the SSL-VPN widget to verify the user's connection.

To see the results of tunnel connection:

2. Open the FortiClient Console and go to Remote Access > Configure VPN.
3. Add a new connection:
   a. Set the connection name.
   b. Set Remote Gateway to the IP of the listening FortiGate interface, in this example, 172.20.120.123.
   c. Select Customize Port and set it to 10443.
4. Save your settings.
5. Log in using the sslvpnuser1 credentials and click FTM Push.
   The FortiGate pushes a login request notification through the FortiToken mobile application.
6. Check your mobile device and select Approve.
   When the authentication is approved, sslvpnuser1 is logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to Dashboard > Network and expand the SSL-VPN widget to verify the user's connection.
2. Go to Log & Report > Forward Traffic to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
  Index  User     Auth Type  Timeout  From          HTTP in/out HTTPS in/out
  0      sslvpnuser1 1(1)      229  10.1.100.254  0/0          0/0

SSL VPN sessions:
  Index  User  Source IP  Duration  I/O Bytes  Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
  Index  User     Auth Type  Timeout  From          HTTP in/out HTTPS in/out
  0      sslvpnuser1 1(1)      291  10.1.100.254  0/0          0/0
```

Fortinet Inc.
SSL VPN with RADIUS on FortiAuthenticator

This is a sample configuration of SSL VPN that uses FortiAuthenticator as a RADIUS authentication server.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure FortiAuthenticator using the GUI:

1. Create a user on the FortiAuthenticator.
   a. On the FortiAuthenticator, go to Authentication > User Management > Local Users to create a user sslvpnuser1.
   b. Enable Allow RADIUS authentication and click OK to access additional settings.
   c. Go to Authentication > User Management > User Groups to create a group sslvpgroup.
   d. Add sslvpnuser1 to the group by moving the user from Available users to Selected users.
2. Create the RADIUS client (FortiGate) on the FortiAuthenticator.
   a. On the FortiAuthenticator, go to Authentication > RADIUS Service > Clients to add the FortiGate as a RADIUS client OfficeServer).
   b. Enter the FortiGate IP address and set a Secret.
      The secret is a pre-shared secure password that the FortiGate uses to authenticate to the FortiAuthenticator.
   c. Set Realms to local | Local users.
To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to Network > Interfaces and edit the wan1 interface.
   b. Set IP/Network Mask to 172.20.120.123/255.255.255.0.
   c. Edit port1 interface and set IP/Network Mask to 192.168.1.99/255.255.255.0.
   d. Click OK.
   e. Go to Policy & Objects > Addresses and create an address for internal subnet 192.168.1.0.

2. Create a RADIUS user and user group.
   a. On the FortiGate, go to User & Authentication > RADIUS Servers to create a user to connect to the RADIUS server (FortiAuthenticator).
   b. For Name, use FAC-RADIUS.
   c. Enter the IP address of the FortiAuthenticator, and enter the Secret created above.
   d. Click Test Connectivity to ensure you can connect to the RADIUS server.
   e. Select Test User Credentials and enter the credentials for ss1vpnuser1.
      The FortiGate can now connect to the FortiAuthenticator as the RADIUS client.
   f. Go to User & Authentication > User Groups and click Create New to map authenticated remote users to a user group on the FortiGate.
   g. For Name, use SSLVPNGroup.
   h. In Remote Groups, click Add.
      i. In the Remote Server dropdown list, select FAC-RADIUS.
      j. Leave the Groups field blank.

3. Configure SSL VPN web portal.
   a. Go to VPN > SSL-VPN Portals to edit the full-access portal.
      This portal supports both web and tunnel mode.
   b. Disable Enable Split Tunneling so that all SSL VPN traffic goes through the FortiGate.

4. Configure SSL VPN settings.
   a. Go to VPN > SSL-VPN Settings.
   b. Select the Listen on Interface(s), in this example, wan1.
   c. Set Listen on Port to 10443.
   d. Set Server Certificate to the authentication certificate.
   e. Under Authentication/Portal Mapping, set default Portal web-access for All Other Users/Groups.
   f. Create new Authentication/Portal Mapping for group sslvpnuser1 mapping portal full-access.

5. Configure SSL VPN firewall policy.
   a. Go to Policy & Objects > Firewall Policy.
   b. Fill in the firewall policy name. In this example, sslvpn certificate auth.
   c. Incoming Interface must be SSL-VPN tunnel interface(ssl.root).
   d. Set the Outgoing Interface to the local network interface so that the remote user can access the internal network. In this example: port1.
   e. Set the Source > Address to all and Source > User to sslvpnuser1.
   f. Set Destination > Address to the internal protected subnet 192.168.1.0.
   g. Set Schedule to always, Service to ALL, and Action to Accept.
   h. Enable NAT.
   i. Configure the remaining options as required.
   j. Click OK.
To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.
   
   ```
   config system interface
   edit "wan1"
   set vdom "root"
   set ip 172.20.120.123 255.255.255.0
   next
   end
   ```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

   ```
   config system interface
   edit "port1"
   set vdom "root"
   set ip 192.168.1.99 255.255.255.0
   next
   end
   
   config firewall address
   edit "192.168.1.0"
   set subnet 192.168.1.0 255.255.255.0
   next
   end
   ```

3. Create a RADIUS user and user group.

   ```
   config user radius
   edit "FAC-RADIUS"
   set server "172.20.120.161"
   set secret <FAC client secret>
   next
   end
   
   config user group
   edit "sslvpngrp"
   set member "FAC-RADIUS"
   next
   end
   ```

4. Configure SSL VPN web portal.

   ```
   config vpn ssl web portal
   edit "full-access"
   set tunnel-mode enable
   set web-mode enable
   set ip-pools "SSLVPN_TUNNEL_ADDR1"
   set split-tunneling disable
   next
   end
   ```

5. Configure SSL VPN settings.

   ```
   config vpn ssl settings
   set servercert "server_certificate"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
   set source-interface "wan1"
   set source-address "all"
   set default-portal "web-access"
   ```
config authentication-rule
edit 1
    set groups "sslvpngroup"
    set portal "full-access"
next
end

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

config firewall policy
edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "sslvpngroup"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
next
end

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal http://172.20.120.123:10443.
2. Log in using the sslvpnuser1 credentials.
3. On the FortiGate, go to Dashboard > Network and expand the SSL-VPN widget to verify the user's connection.

To see the results of tunnel connection:

2. Open the FortiClient Console and go to Remote Access > Configure VPN.
3. Add a new connection.
   - Set the connection name.
   - Set Remote Gateway to 172.20.120.123.
4. Select Customize Port and set it to 10443.
5. Save your settings.
6. Log in using the sslvpnuser1 credentials and check that you are logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to Dashboard > Network and expand the SSL-VPN widget to verify the user's connection.
2. Go to Log & Report > Forward Traffic to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

get vpn ssl monitor
SSL VPN Login Users:

<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Auth Type</th>
<th>Timeout</th>

SSL VPN with RADIUS and FortiToken mobile push on FortiAuthenticator

This is a sample configuration of SSL VPN that uses FortiAuthenticator as a RADIUS authentication server and FortiToken mobile push two-factor authentication. If you enable push notifications, users can accept or deny the authentication request.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.
To configure FortiAuthenticator using the GUI:

1. On the FortiAuthenticator, go to System > Administration > System Access and configure a Public IP/FQDN for FortiToken Mobile. If the FortiAuthenticator is behind a firewall, the public IP/FQDN will be an IP/port forwarding rule directed to one of the FortiAuthenticator interfaces. The interface that receives the approve/deny FTM push responses must have the FortiToken Mobile API service enabled.

2. Add a FortiToken mobile license on the FortiAuthenticator:
   a. Go to Authentication > User Management > FortiTokens.
   b. Click Create New.
   c. Set Token type to FortiToken Mobile and enter the FortiToken Activation codes.

3. Create the RADIUS client (FortiGate) on the FortiAuthenticator:
   a. Go to Authentication > RADIUS Service > Clients to add the FortiGate as a RADIUS client OfficeServer).
   b. Enter the FortiGate IP address and set a Secret.
      The secret is a pre-shared secure password that the FortiGate uses to authenticate to the FortiAuthenticator.
   c. Set Authentication method to Enforce two-factor authentication.
   d. Select Enable FortiToken Mobile push notifications authentication.
   e. Set Realms to local | Local users.

4. Create a user and assign FortiToken mobile to the user on the FortiAuthenticator:
   a. Go to Authentication > User Management > Local Users to create a user sslvpnuser1.
   b. Enable Allow RADIUS authentication and click OK to access additional settings.
   c. Enable Token-based authentication and select to deliver the token code by FortiToken.
   d. Select the FortiToken added from the FortiToken Mobile dropdown menu.
   e. Set Delivery method to Email and fill in the User Information section.
   f. Go to Authentication > User Management > User Groups to create a group sslvpnuser1.
   g. Add sslvpnuser1 to the group by moving the user from Available users to Selected users.

5. Install the FortiToken mobile application on your Android or iOS smartphone.
   The FortiAuthenticator sends the FortiToken mobile activation to the user’s email address.

6. Activate the FortiToken mobile through the FortiToken mobile application by entering the activation code or scanning the QR code.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to Network > Interfaces and edit the wan1 interface.
   b. Set IP/Network Mask to 172.20.120.123/255.255.255.0.
   c. Edit port1 interface and set IP/Network Mask to 192.168.1.99/255.255.255.0.
   d. Click OK.
   e. Go to Policy & Objects > Address and create an address for internet subnet 192.168.1.0.

2. Create a RADIUS user and user group:
   a. On the FortiGate, go to User & Authentication > RADIUS Servers to create a user to connect to the RADIUS server (FortiAuthenticator).
   b. For Name, use FAC-RADIUS.
   c. Enter the IP address of the FortiAuthenticator, and enter the Secret created above.
   d. Click Test Connectivity to ensure you can connect to the RADIUS server.
   e. Select Test User Credentials and enter the credentials for sslvpnuser1.
      The FortiGate can now connect to the FortiAuthenticator as the RADIUS client.
f. Go to User & Authentication > User Groups and click Create New to map authenticated remote users to a user group on the FortiGate.
g. For Name, use SSLVPNGroup.
h. In Remote Groups, click Add.
i. In the Remote Server dropdown list, select FAC-RADIUS.
j. Leave the Groups field blank.

3. Configure SSL VPN web portal:
a. Go to VPN > SSL-VPN Portals to edit the full-access portal. This portal supports both web and tunnel mode.
b. Disable Enable Split Tunneling so that all SSL VPN traffic goes through the FortiGate.

4. Configure SSL VPN settings:
a. Go to VPN > SSL-VPN Settings.
b. Select the Listen on Interface(s), in this example, wan1.
c. Set Listen on Port to 10443.
d. Set Server Certificate to the authentication certificate.
e. Under Authentication/Portal Mapping, set default Portal web-access for All Other Users/Groups.
f. Create new Authentication/Portal Mapping for group ss lvpngroup mapping portal full-access.

5. Configure SSL VPN firewall policy:
a. Go to Policy & Objects > Firewall Policy.
b. Fill in the firewall policy name. In this example, ss lvpn certificate auth.
c. Incoming interface must be SSL-VPN tunnel interface(ssl.root).
d. Set the Source Address to all and Source User to ss lvpngroup.
e. Set the Outgoing Interface to the local network interface so that the remote user can access the internal network. In this example: port1.
f. Set Destination Address to the internal protected subnet 192.168.1.0.
g. Set Schedule to always, Service to ALL, and Action to Accept.
h. Enable NAT.
i. Configure any remaining firewall and security options as desired.
j. Click OK.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

   ```
   config system interface
   edit "wan1"
      set vdom "root"
      set ip 172.20.120.123 255.255.255.0
   next
   end
   ```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

   ```
   config system interface
   edit "port1"
      set vdom "root"
      set ip 192.168.1.99 255.255.255.0
   next
   end
   ```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end

3. Create a RADIUS user and user group:

config user radius
    edit "FAC-RADIUS"
        set server "172.20.120.161"
        set secret <FAC client secret>
    next
end
config user group
    edit "sslvpngroup"
        set member "FAC-RADIUS"
    next
end

4. Configure SSL VPN web portal:

config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end

5. Configure SSL VPN settings:

config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
config authentication-rule
    edit 1
        set groups "sslvpngroup"
        set portal "full-access"
    next
end

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpngroup"
        set action accept
set schedule "always"
set service "ALL"
set nat enable
next
end

To see the results of web portal:
1. From a remote device, use a web browser to log into the SSL VPN web portal http://172.20.120.123:10443.
2. Log in using the sslvpnuser1 credentials.
   The FortiAuthenticator pushes a login request notification through the FortiToken Mobile application.
3. Check your mobile device and select Approve.
   When the authentication is approved, sslvpnuser1 is logged into the SSL VPN portal.
4. On the FortiGate, go to Dashboard > Network and expand the SSL-VPN widget to verify the user's connection.

To see the results of tunnel connection:
2. Open the FortiClient Console and go to Remote Access > Configure VPN.
3. Add a new connection:
   a. Set the connection name.
   b. Set Remote Gateway to the IP of the listening FortiGate interface, in this example: 172.20.120.123.
   c. Select Customize Port and set it to 10443.
4. Save your settings.
5. Log in using the sslvpnuser1 credentials and click FTM Push.
   The FortiAuthenticator pushes a login request notification through the FortiToken Mobile application.
6. Check your mobile device and select Approve.
   When the authentication is approved, sslvpnuser1 is logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:
1. Go to Dashboard > Network and expand the SSL-VPN widget to verify the user’s connection.
2. Go to Log & Report > Forward Traffic to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

get vpn ssl monitor
SSL VPN Login Users:

<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Auth Type</th>
<th>Timeout</th>
<th>From</th>
<th>HTTP in/out</th>
<th>HTTPS in/out</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>sslvpnuser1</td>

SSL VPN with RADIUS password renew on FortiAuthenticator

This is a sample configuration of SSL VPN for RADIUS users with *Force Password Change on next logon*. In this example, the RADIUS server is a FortiAuthenticator. A user `test1` is configured on FortiAuthenticator with *Force password change on next logon*.

Sample topology

![SSL VPN topology diagram](image)

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network > Interfaces* and edit the `wan1` interface.
   b. Set *IP/Network Mask* to `172.20.120.123/255.255.255.0`.
   c. Edit `port1` interface and set *IP/Network Mask* to `192.168.1.99/255.255.255.0`.
   d. Click OK.
   e. Go to *Policy & Objects > Address* and create an address for internet subnet `192.168.1.0`.

SSL VPN sessions:

<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Source IP</th>
<th>Duration</th>
<th>I/O Bytes</th>
<th>Tunnel/Dest IP</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>sslvpnuser1</td>
<td>10.1.100.254</td>
<td>9</td>
<td>22099/43228</td>
<td>10.212.134.200</td>
</tr>
</tbody>
</table>
2. Create a RADIUS user.
   a. Go to User & Authentication > RADIUS Servers to create a user.
   b. Set Authentication method to MS-CHAP-v2.
   c. Enter the IP/Name and Secret.
   d. Click Create.

   Password renewal only works with the MS-CHAP-v2 authentication method.

   e. To enable the password-renew option, use these CLI commands.

   ```
   config user radius
   edit "fac"
      set server "172.20.120.161"
      set secret <fac radius password>
      set auth-type ms_chap_v2
      set password-renewal enable
   next
   end
   ```

3. Configure user group.
   a. Go to User & Authentication > User Groups to create a user group.
   b. For the Name, enter fac-group.
   c. In Remote Groups, click Add to add Remote Server you just created.

4. Configure SSL VPN web portal.
   a. Go to VPN > SSL-VPN Portals to edit the full-access portal.
      This portal supports both web and tunnel mode.
   b. Disable Enable Split Tunneling so that all SSL VPN traffic goes through the FortiGate.

5. Configure SSL VPN settings.
   a. Go to VPN > SSL-VPN Settings.
   b. Select the Listen on Interface(s), in this example, wan1.
   c. Set Listen on Port to 10443.
   d. Set Server Certificate to the authentication certificate.
   e. Under Authentication/Portal Mapping, set default Portal web-access for All Other Users/Groups.
   f. Create new Authentication/Portal Mapping for group fac-group mapping portal full-access.

6. Configure SSL VPN firewall policy.
   a. Go to Policy & Objects > Firewall Policy.
   b. Fill in the firewall policy name, in this example, sslvnp certificate auth.
   c. Incoming interface must be SSL-VPN tunnel interface(ssl.root).
   d. Set the Source Address to all and Source User to fac-group.
   e. Set the Outgoing Interface to the local network interface so that the remote user can access the internal network, in this example, port1.
   f. Set Destination Address to the internal protected subnet 192.168.1.0.
   g. Set Schedule to always, Service to ALL, and Action to Accept.
   h. Enable NAT.
   i. Configure any remaining firewall and security options as desired.
   j. Click OK.
To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

   ```
   config system interface
   edit "wan1"
   set vdom "root"
   set ip 172.20.120.123 255.255.255.0
   next
   end
   ```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

   ```
   config system interface
   edit "port1"
   set vdom "root"
   set ip 192.168.1.99 255.255.255.0
   next
   end
   ```

   ```
   config firewall address
   edit "192.168.1.0"
   set subnet 192.168.1.0 255.255.255.0
   next
   end
   ```

3. Configure the RADIUS server.

   ```
   config user radius
   edit "fac"
   set server "172.18.58.107"
   set secret <fac radius password>
   set auth-type ms_chap_v2
   set password-renewal enable
   next
   end
   ```

4. Configure user group.

   ```
   config user group
   edit "fac-group"
   set member "fac"
   next
   end
   ```

5. Configure SSL VPN web portal.

   ```
   config vpn ssl web portal
   edit "full-access"
   set tunnel-mode enable
   set web-mode enable
   set ip-pools "SSLVPN_TUNNEL_ADDR1"
   set split-tunneling disable
   next
   end
   ```

6. Configure SSL VPN settings.

   ```
   config vpn ssl settings
   set servercert "server_certificate"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
   ```
7. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```
config firewall policy
edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "fac-group"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal http://172.20.120.123:10443.
2. Log in using the test1 credentials.
   Use a user which is configured on FortiAuthenticator with Force password change on next logon.
3. Click Login. You are prompted to enter a new password.
4. On the FortiGate, go to Dashboard > Network and expand the SSL-VPN widget to verify the user’s connection.

To see the results of tunnel connection:

2. Open the FortiClient Console and go to Remote Access > Configure VPN.
3. Add a new connection.
   - Set the connection name.
   - Set Remote Gateway to the IP of the listening FortiGate interface, in this example, 172.20.120.123.
4. Select Customize Port and set it to 10443.
5. Save your settings.
6. Log in using the test1 credentials.
   You are prompted to enter a new password.

To check the SSL VPN connection using the GUI:

1. Go to Dashboard > Network and expand the SSL-VPN widget to verify the user’s connection.
2. Go to Log & Report > System Events and select the VPN Events card to view the details of the SSL VPN connection.
To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
Index  User  Auth Type  Timeout  From       HTTP in/out  HTTPS in/out
  0  test1  1(1)       229  10.1.100.254  0/0         0/0
SSL VPN sessions:
Index  User  Source IP  Duration  I/O Bytes  Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
Index  User  Auth Type  Timeout  From       HTTP in/out  HTTPS in/out
  0  test1  1(1)       291  10.1.100.254  0/0         0/0
SSL VPN sessions:
Index  User  Source IP  Duration  I/O Bytes  Tunnel/Dest IP
  0  test1  10.1.100.254  9       22099/43228  10.212.134.200
```

SSL VPN with RADIUS on Windows NPS

This is an example configuration of SSL VPN that uses Windows Network Policy Server (NPS) as a RADIUS authentication server.

The NPS must already be configured to accept the FortiGate as a RADIUS client and the choice of authentication method, such as MS-CHAPv2. A shared key must also have been created.

Example
The user is connecting from their PC to the FortiGate's port1 interface. RADIUS authentication occurs between the FortiGate and the Windows NPS, and the SSL-VPN connection is established once the authentication is successful.

**Configure SSL-VPN with RADIUS on Windows NPS in the GUI**

**To configure the internal and external interfaces:**

1. Go to *Network > Interfaces*
2. Edit the *port1* interface and set *IP/Network Mask* to 192.168.2.5/24.
3. Edit the *port2* interface and set *IP/Network Mask* to 192.168.20.5/24.
4. Click OK.

**To create a firewall address:**

1. Go to *Policy & Objects > Addresses* and click *Create New > Address.*
2. Set *Name* to 192.168.20.0.
3. Leave *Type* as *Subnet*
4. Set *IP/Netmask* to 192.168.20.0/24.
5. Click OK.

**To add the RADIUS server:**

1. Go to *User & Authentication > RADIUS Servers* and click *Create New.*
2. Set *Name* to *rad-server.*
3. Leave *Authentication method* set to *Default.* The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server,* set *IP/Name* to 192.168.20.6 and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful.*
6. Optionally, click *Test User Credentials* to test user credentials. Testing from the GUI is limited to PAP.
7. Click OK.

**To configure a user group:**

1. Go to *User & Authentication > User Groups* and click *Create New.*
2. Set *Name* to *rad-group.*
3. Under Remote Groups, click Add and add the rad-server.

4. Click OK.

**To configure SSL VPN settings:**

1. Go to VPN > SSL-VPN Settings.
2. Select the Listen on Interface(s), in this example, port1.
3. Set Listen on Port to 10443.
4. If you have a server certificate, set Server Certificate to the authentication certificate.
5. Under Authentication/Portal Mapping:
   a. Edit All Other Users/Groups and set Portal to web-access.
   b. Click Create New and create a mapping for the rad-group user group with Portal set to full-access.
   c. Click OK.
6. Click Apply.

**To configure an SSL VPN firewall policy:**

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Set the policy name, in this example, ssvpn-radius.
3. Set Incoming Interface to SSL-VPN tunnel interface(ssl.root).
4. Set Outgoing Interface to the local network interface so that the remote user can access the internal network. In this example, port2.
5. Set the Source > Address to all and Source > User to rad-group.
6. Set Destination > Address to the internal protected subnet 192.168.20.0.
7. Set Schedule to always, Service to ALL, and Action to Accept.
8. Enable **NAT**.

9. Configure the remaining options as required.

10. Click **OK**.

**Configure SSL-VPN with RADIUS on Windows NPS in the CLI**

To configure SSL VPN using the CLI:

1. Configure the internal and external interfaces:

   ```plaintext
   config system interface
   edit "port1"
       set vdom "root"
       set ip 192.168.2.5 255.255.255.0
       set alias internal
   next
   edit "port2"
       set vdom "root"
       set ip 192.168.20.5 255.255.255.0
       set alias external
   next
   end
   ```

2. Configure the firewall address:

   ```plaintext
   config firewall address
   edit "192.168.20.0"
       set subnet 192.168.20.0 255.255.255.0
   next
   end
   ```

3. Add the RADIUS server:

   ```plaintext
   config user radius
   edit "rad-server"
       set server "192.168.20.6"
       set secret ********
   next
   end
   ```

4. Create a user group and add the RADIUS server to it:

   ```plaintext
   config user group
   edit "rad-group"
       set member "rad-server"
   next
   end
   ```
5. Configure SSL VPN settings:

    ```
    config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
        set groups "rad-group"
        set portal "full-access"
        next
    end
    end
    ```

6. Configure an SSL VPN firewall policy to allow remote user to access the internal network.

    ```
    config firewall policy
    edit 1
        set name "sslvpn-radius"
        set srcintf "ssl.root"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "192.168.20.0"
        set groups "rad-group"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        next
    end
    ```

Results

To connect with FortiClient in tunnel mode:

1. Download FortiClient from [www.forticlient.com](http://www.forticlient.com).
2. Open the FortiClient Console and go to Remote Access > Configure VPN.
3. Add a new connection:
   a. Set the connection name.
   b. Set Remote Gateway to 192.168.2.5.
   c. Select Customize Port and set it to 10443.
4. Save your settings.
5. Log in using the RADIUS user credentials.

To check the SSL VPN connection using the GUI:

1. Go to Dashboard > Network and expand the SSL-VPN widget to verify the user’s connection.
2. Go to Log & Report > System Events and select the VPN Events card to view the details of the SSL VPN connection event log.
3. Go to Log & Report > Forward Traffic to view the details of the SSL VPN traffic.
To check the login using the CLI:

```bash
# get vpn ssl monitor
SSL VPN Login Users:
Index  User      Group     Auth Type  Timeout  From     HTTP in/out HTTPS in/out
 0  radkeith  rad-group  2(1)        295  192.168.2.202  0/0  0/0

SSL VPN sessions:
Index  User      Group     Source IP  Duration  I/O Bytes  Tunnel/Dest IP
 0  radkeith  rad-group  192.168.2.202  18  28502/4966
      10.212.134.200
```

SSL VPN with multiple RADIUS servers

When configuring two or more RADIUS servers, you can configure a Primary and Secondary server within the same RADIUS server configurations for backup purposes. You can also configure multiple RADIUS servers within the same User Group to service the access request at the same time.

---

A tertiary server can be configured in the CLI.

---

Sample topology

---

Sample configurations

- Configure a Primary and Secondary server for backup on page 1702
- Authenticating to two RADIUS servers concurrently on page 1706

Configure a Primary and Secondary server for backup

When you define a Primary and Secondary RADIUS server, the access request will always be sent to the Primary server first. If the request is denied with an Access-Reject, then the user authentication fails. However, if there is no response from the Primary server after another attempt, the access request will be sent to the Secondary server.
In this example, you will use a Windows NPS server as the Primary server and a FortiAuthenticator as the Secondary server. It is assumed that users are synchronized between the two servers.

To configure the internal and external interfaces:
1. Go to Network > Interfaces.
2. Edit the port1 interface and set IP/Network Mask to 192.168.2.5/24.
3. Edit the port2 interface and set IP/Network Mask to 192.168.20.5/24.
4. Click OK.

To create a firewall address:
1. Go to Policy & Objects > Addresses and click Create New > Address.
2. Set Name to 192.168.20.0.
3. Leave Type as Subnet
4. Set IP/Netmask to 192.168.20.0/24.
5. Click OK.

To add the RADIUS servers:
1. Go to User & Authentication > RADIUS Servers and click Create New.
2. Set Name to PrimarySecondary.
3. Leave Authentication method set to Default. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under Primary Server, set IP/Name to 192.168.20.6 and Secret to the shared secret configured on the RADIUS server.
5. Click Test Connectivity to test the connection to the server, and ensure that Connection status is Successful.
6. Under Secondary Server, set IP/Name to 192.168.2.71 and Secret to the shared secret configured on the RADIUS server.
7. Click Test Connectivity to test the connection to the server, and ensure that Connection status is Successful.
8. Click OK.

To configure the user group:
1. Go to User & Authentication > User Groups and click Create New.
2. In the Name field, enter PrimarySecondaryGroup.
3. In the Remote Groups area, click Add, and from the Remote Server dropdown, select PrimarySecondary.
4. Click OK, and then click OK again.

To configure the SSL VPN settings:
1. Go to VPN > SSL-VPN Settings.
2. From the Listen on Interface(s) dropdown select port1.
3. In the Listen on Port field enter 10443.
4. Optionally, from the Server Certificate dropdown, select the authentication certificate if you have one for this SSL VPN portal.
5. Under Authentication/Portal Mapping, set the default portal web-access.
   a. Select All Other Users/Groups and click Edit.
   b. From the Portal dropdown, select web-access.
c. Click OK.

6. Create a web portal for **PrimarySecondaryGroup**.
   a. Under Authentication/Portal Mapping, click **Create New**.
   b. Click **Users/Groups** and select **PrimarySecondaryGroup**.
   c. From the Portal dropdown, select **full-access**.
   d. Click OK.

**To configure SSL VPN firewall policy:**

1. Go to **Policy & Objects > Firewall Policy**.
2. Click **Create New** to create a new policy, or double-click an existing policy to edit it and configure the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Enter a name for the policy.</td>
</tr>
<tr>
<td><strong>Incoming Interface</strong></td>
<td>SSL-VPN tunnel interface (ssl.root)</td>
</tr>
<tr>
<td><strong>Outgoing Interface</strong></td>
<td>Set to the local network interface so that the remote user can access the internal network. For this example, select port3.</td>
</tr>
<tr>
<td><strong>Source</strong></td>
<td>In the Address tab, select <strong>SSLVPN_TUNNEL_ADDR1</strong>.</td>
</tr>
<tr>
<td><strong>Destination</strong></td>
<td>Select the internal protected subnet <strong>192.168.20.0</strong>.</td>
</tr>
<tr>
<td><strong>Schedule</strong></td>
<td><strong>always</strong></td>
</tr>
<tr>
<td><strong>Service</strong></td>
<td><strong>All</strong></td>
</tr>
<tr>
<td><strong>Action</strong></td>
<td><strong>Accept</strong></td>
</tr>
<tr>
<td><strong>NAT</strong></td>
<td><strong>Enable</strong></td>
</tr>
</tbody>
</table>

3. Configure any remaining firewall and security options as required.
4. Click OK.

**To configure SSL VPN using the CLI:**

1. Configure the internal interface and firewall address:
   ```
   config system interface
   edit "port3"
   set vdom "root"
   set ip 192.168.20.5 255.255.255.0
   set alias "internal"
   next
   end
   config firewall address
   edit "192.168.20.0"
   set uuid cc41eec2-9645-51ea-d481-5c5317f865d0
   set subnet 192.168.20.0 255.255.255.0
   next
   end
   ```

2. Configure the RADIUS server:
   ```
   config user radius
   ```
edit "PrimarySecondary"
  set server "192.168.20.6"
  set secret <secret>
  set secondary-server "192.168.2.71"
  set secondary-secret <secret>
next
end

3. Add the RADIUS user to the user group:
   config user group
   edit "PrimarySecondaryGroup"
   set member "PrimarySecondary"
next
end

4. Configure SSL VPN settings:
   config vpn ssl settings
   set servercert "server_certificate"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
   set source-interface "port1"
   set source-address "all"
   set default-portal "web-access"
   config authentication-rule
   edit 1
     set groups "PrimarySecondaryGroup"
   set portal "full-access"
next
end

5. Configure one SSL VPN firewall policy to allow remote users to access the internal network:
   config firewall policy
   edit 1
     set name "sslvpn-radius"
   set srcintf "ssl.root"
   set dstintf "port3"
   set srcaddr "all"
   set dstaddr "192.168.20.0"
   set groups "PrimarySecondaryGroup"
   set action accept
   set schedule "always"
   set service "ALL"
   set nat enable
next
end

To verify the connection:

User radkeith is a member of both the NPS server and the FAC server.

When the Primary server is up, it will connect to the SSL VPN tunnel using FortiClient.

# diagnose sniffer packet any 'port 1812' 4 0 1
interfaces=[any]
filters=[port 1812]
The access request is sent to the Primary NPS server 192.168.20.6, and the connection is successful.

```bash
# get vpn ssl monitor
SSL VPN Login Users:
Index User Group Auth Type Timeout From HTTP
in/out HTTPS in/out
0 radkeith PrimarySecondaryGroup 2(1) 285 192.168.2.202
0/0 0/0
SSL VPN sessions:
Index User Group Source IP Duration I/O Bytes
Tunnel/Dest IP
0 radkeith PrimarySecondaryGroup 192.168.2.202 62 132477/4966
10.212.134.200
```

When the Primary server is down, and the Secondary server is up, the connection is made to the SSLVPN tunnel again:

```bash
# diagnose sniffer packet any 'port 1812' 4 0 1
interfaces=[any]
filters=[port 1812]
```

Access request is sent to the Primary NPS server 192.168.20.6, but there was no response. RADIUS authentication falls through to the Secondary FortiAuthenticator 192.168.2.71, and the authentication was accepted. The VPN connection is established.

```bash
# get vpn ssl monitor
SSL VPN Login Users:
Index User Group Auth Type Timeout From HTTP
in/out HTTPS in/out
0 radkeith PrimarySecondaryGroup 2(1) 287 192.168.2.202
0/0 0/0
SSL VPN sessions:
Index User Group Source IP Duration I/O Bytes
Tunnel/Dest IP
0 radkeith PrimarySecondaryGroup 192.168.2.202 48 53544/4966
10.212.134.200
```

**Authenticating to two RADIUS servers concurrently**

There are times where users are located on separate RADIUS servers. This may be the case when migrating from an old server to a new one for example. In this scenario, a Windows NPS server and a FortiAuthenticator are configured in the same User Group. The access-request is sent to both servers concurrently. If FortiGate receives an access-accept from either server, authentication is successful.

**To configure the internal and external interfaces:**

1. Go to `Network > Interfaces`.
2. Edit the `port1` interface and set `IP/Network Mask` to `192.168.2.5/24`. 
3. Edit the port2 interface and set IP/Network Mask to 192.168.20.5/24.
4. Click OK.

To create a firewall address:

1. Go to Policy & Objects > Addresses and click Create New > Address.
2. Set Name to 192.168.20.0.
3. Leave Type as Subnet
4. Set IP/Netmask to 192.168.20.0/24.
5. Click OK.

To configure the first RADIUS server:

1. Go to User & Authentication > RADIUS Servers and click Create New.
2. Set Name to win2k16.
3. Leave Authentication method set to Default. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under Primary Server, set IP/Name to 192.168.20.6 and Secret to the shared secret configured on the RADIUS server.
5. Click Test Connectivity to test the connection to the server, and ensure that Connection status is Successful.
6. Click OK.

To configure the second RADIUS server:

1. Go to User & Authentication > RADIUS Servers and click Create New.
2. Set Name to fac.
3. Leave Authentication method set to Default. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under Primary Server, set IP/Name to 192.168.2.71 and Secret to the shared secret configured on the RADIUS server.
5. Click Test Connectivity to test the connection to the server, and ensure that Connection status is Successful.
6. Click OK.

To configure the user group:

1. Go to User & Authentication > User Groups and click Create New.
2. In the Name field, enter dualPrimaryGroup.
3. In the Remote Groups area, click Add, and from the Remote Server dropdown, select fac.
4. Click Add again. From the Remote Server dropdown select win2k16 and click OK.
5. Click OK, and then click OK again.

To configure the SSL VPN settings:

1. Go to VPN > SSL-VPN Settings.
2. From the Listen on Interface(s) dropdown select port1.
3. In the Listen on Port field enter 10443.
4. Optionally, from the Server Certificate dropdown, select the authentication certificate if you have one for this SSL VPN portal.
5. **Under Authentication/Portal Mapping**, set the default portal web-access.
   a. Select **All Other Users/Groups** and click **Edit**.
   b. From the **Portal** dropdown, select **web-access**.
   c. Click **OK**.

6. Create a web portal for **PrimarySecondaryGroup**.
   a. **Under Authentication/Portal Mapping**, click **Create New**.
   b. Click **Users/Groups** and select **dualPrimaryGroup**.
   c. From the **Portal** dropdown, select **full-access**.
   d. Click **OK**.

---

**To configure SSL VPN firewall policy:**

1. Go to **Policy & Objects > Firewall Policy**.
2. Click **Create New** to create a new policy, or double-click an existing policy to edit it.

<table>
<thead>
<tr>
<th>Name</th>
<th>Enter a name for the policy.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Incoming Interface</strong></td>
<td>SSL-VPN tunnel interface (ssl.root)</td>
</tr>
<tr>
<td><strong>Outgoing interface</strong></td>
<td>Set to the local network interface so that the remote user can access the internal network. For this example, select port3.</td>
</tr>
<tr>
<td><strong>Source</strong></td>
<td>In the <strong>Address</strong> tab, select SSLVPN_TUNNEL_ADDR1 In the <strong>User</strong> tab, select dualPrimaryGroup</td>
</tr>
<tr>
<td><strong>Destination</strong></td>
<td>Select the internal protected subnet 192.168.20.0.</td>
</tr>
<tr>
<td><strong>Schedule</strong></td>
<td>always</td>
</tr>
<tr>
<td><strong>Service</strong></td>
<td>All</td>
</tr>
<tr>
<td><strong>Action</strong></td>
<td>Accept</td>
</tr>
<tr>
<td><strong>NAT</strong></td>
<td>Enable</td>
</tr>
</tbody>
</table>

3. Configure any remaining firewall and security options as required.
4. Click **OK**.

---

**To configure SSL VPN using the CLI:**

1. **Configure the internal interface and firewall address:**
   ```
   config system interface
   edit "port3"
   
   set vdom "root"
   set ip 192.168.20.5 255.255.255.0
   set alias "internal"
   
   next
   end
   config firewall address
   edit "192.168.20.0"
   
   set uuid cc41ec2-9645-51ea-d481-5c5317f865d0
   set subnet 192.168.20.0 255.255.255.0
   
   next
   end
   ```
2. Configure the RADIUS server:
   ```
   config user radius
   edit "win2k16"
   set server "192.168.20.6"
   set secret <secret>
   next
   edit "fac"
   set server "192.168.2.71"
   set secret <secret>
   next
   end
   
   3. Add the RADIUS user to the user group:
   ```
   ```
   config user group
   edit "dualPrimaryGroup"
   set member "win2k16" "fac"
   next
   end
   
   4. Configure SSL VPN settings:
   ```
   config vpn ssl settings
   set servercert "server_certificate"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
   set source-interface "port1"
   set source-address "all"
   set default-portal "web-access"
   config authentication-rule
   edit 1
   set groups "dualPrimaryGroup"
   set portal "full-access"
   next
   end
   end
   ```

   5. Configure one SSL VPN firewall policy to allow remote users to access the internal network:
   ```
   config firewall policy
   edit 1
   set name "sslvpn-radius"
   set srcintf "ssl.root"
   set dstintf "port3"
   set srcaddr "all"
   set dstaddr "192.168.20.0"
   set groups "dualPrimaryGroup"
   set action accept
   set schedule "always"
   set service "ALL"
   set nat enable
   next
   end
   ```

   **To verify the connection:**

   User `fackeith` is a member of the FortiAuthenticator server only.
   User `radkeith` is a member of both the NPS server and the FortiAuthenticator server, but has different passwords on each server.
Case 1: Connect to the SSLVPN tunnel using FortiClient with user FacAdmin:

```bash
# diagnose sniffer packet any 'port 1812' 4 0 1
interfaces=[any]
filters=[port 1812]
```

Access is denied by the NPS server because the user does not exist. However, access is accepted by FortiAuthenticator. The end result is the authentication is successful.

```bash
# get vpn ssl monitor
SSL VPN Login Users:

<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Group</th>
<th>Auth Type</th>
<th>Timeout</th>
<th>From</th>
<th>HTTP in/out</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>fackeith</td>
<td>dualPrimaryGroup</td>
<td>2(1)</td>
<td>292</td>
<td>192.168.2.202</td>
<td>0/0</td>
</tr>
</tbody>
</table>

SSL VPN sessions:

<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Group</th>
<th>Source IP</th>
<th>Duration</th>
<th>I/O Bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>fackeith</td>
<td>dualPrimaryGroup</td>
<td>192.168.2.202</td>
<td>149</td>
<td>70236/4966</td>
</tr>
<tr>
<td>10.212.134.200</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

Case 2: Connect to the SSLVPN tunnel using FortiClient with user radkeith:

```bash
# diagnose sniffer packet any 'port 1812' 4 0 1
interfaces=[any]
filters=[port 1812]
2020-05-15 17:26:07.335791 port1 out 192.168.2.5.17988 -> 192.168.2.71.1812: udp 118
```

There is a password mismatch for this user on the Secondary RADIUS server. However, even though the authentication was rejected by FortiAuthenticator, it was accepted by Windows NPS. Therefore, the end result is authentication successful.

```bash
# get vpn ssl monitor
SSL VPN Login Users:

<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Group</th>
<th>Auth Type</th>
<th>Timeout</th>
<th>From</th>
<th>HTTP in/out</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>radkeith</td>
<td>dualPrimaryGroup</td>
<td>2(1)</td>
<td>290</td>
<td>192.168.2.202</td>
<td>0/0</td>
</tr>
</tbody>
</table>
```

FortiOS 7.2.0 Administration Guide 1710
Fortinet Inc.
SSL VPN with local user password policy

This is a sample configuration of SSL VPN for users with passwords that expire after two days. Users are warned after one day about the password expiring. The password policy can be applied to any local user password. The password policy cannot be applied to a user group or a local remote user such as LDAP/RADIUS/TACACS+.

In FortiOS 6.2, users are warned after one day about the password expiring and have one day to renew it. If the password expires, the user cannot renew the password and must contact the administrator for assistance.

In FortiOS 6.0/5.6, users are warned after one day about the password expiring and have to renew it. If the password expires, the user can still renew the password.

Sample topology
Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to Network > Interfaces and edit the wan1 interface.
   b. Set IP/Network Mask to 172.20.120.123/255.255.255.0.
   c. Edit port1 interface and set IP/Network Mask to 192.168.1.99/255.255.255.0.
   d. Click OK.
   e. Go to Policy & Objects > Address and create an address for internet subnet 192.168.1.0.

2. Configure user and user group.
   a. Go to User & Authentication > User Definition to create a local user.
   b. Go to User & Authentication > User Groups to create a user group and add that local user to it.

3. Configure and assign the password policy using the CLI.
   a. Configure a password policy that includes an expiry date and warning time. The default start time for the password is the time the user was created.

   ```
   config user password-policy
   edit "pwpolicy1"
   set expire-days 2
   set warn-days 1
   next
   end
   ```

   b. Assign the password policy to the user you just created.

   ```
   config user local
   edit "sslvpnuser1"
   set type password
   set passwd-policy "pwpolicy1"
   next
   end
   ```

4. Configure SSL VPN web portal.
   a. Go to VPN > SSL-VPN Portals to edit the full-access portal. This portal supports both web and tunnel mode.
   b. Disable Enable Split Tunneling so that all SSL VPN traffic goes through the FortiGate.

5. Configure SSL VPN settings.
   a. Go to VPN > SSL-VPN Settings.
   b. Select the Listen on Interface(s), in this example, wan1.
   c. Set Listen on Port to 10443.
   d. Set Server Certificate to the authentication certificate.
   e. Under Authentication/Portal Mapping, set default Portal web-access for All Other Users/Groups.
   f. Create new Authentication/Portal Mapping for group sslvpngroup mapping portal full-access.

6. Configure SSL VPN firewall policy.
   a. Go to Policy & Objects > Firewall Policy.
   b. Fill in the firewall policy name. In this example, sslvpn certificate auth.
   c. Incoming interface must be SSL-VPN tunnel interface(ssl.root).
d. Set the Source Address to all and Source User to sslvpngroup.
e. Set the Outgoing Interface to the local network interface so that the remote user can access the internal network. In this example, port1.
f. Set Destination Address to the internal protected subnet 192.168.1.0.
g. Set Schedule to always, Service to ALL, and Action to Accept.
h. Enable NAT.
i. Configure any remaining firewall and security options as desired.
j. Click OK.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

   ```
   config system interface
   edit "wan1"
   set vdom "root"
   set ip 172.20.120.123 255.255.255.0
   next
   end
   ```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

   ```
   config system interface
   edit "port1"
   set vdom "root"
   set ip 192.168.1.99 255.255.255.0
   next
   end
   config firewall address
   edit "192.168.1.0"
   set subnet 192.168.1.0 255.255.255.0
   next
   end
   ```

3. Configure user and user group.

   ```
   config user local
   edit "sslvpngroup"
   set type password
   set passwd your-password
   next
   end
   config user group
   edit "sslvpngroup"
   set member "vpnuser1"
   next
   end
   ```

4. Configure and assign the password policy.
   
a. Configure a password policy that includes an expiry date and warning time. The default start time for the password is the time the user was created.

   ```
   config user password-policy
   edit "pwpolicy1"
   set expire-days 2
   set warn-days 1
   ```
 assigns the password policy to the user you just created.

```plaintext
config user local
edit "sslvpuser1"
   set type password
   set passwd-policy "pwpolicy1"
next
end
```

5. **Configure SSL VPN web portal.**

```plaintext
config vpn ssl web portal
edit "full-access"
   set tunnel-mode enable
   set web-mode enable
   set ip-pools "SSLVPN_TUNNEL_ADDR1"
   set split-tunneling disable
next
end
```

6. **Configure SSL VPN settings.**

```plaintext
config vpn ssl settings
   set servercert "server_certificate"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
   set source-interface "wan1"
   set source-address "all"
   set default-portal "web-access"
config authentication-rule
   edit 1
   set groups "sslvpngroup"
   set portal "full-access"
next
end
```

7. **Configure one SSL VPN firewall policy to allow remote user to access the internal network.**

```plaintext
config firewall policy
edit 1
   set name "sslvpn web mode access"
   set srcintf "ssl.root"
   set dstintf "port1"
   set srcaddr "all"
   set dstaddr "192.168.1.0"
   set groups "sslvpngroup"
   set action accept
   set schedule "always"
   set service "ALL"
   set nat enable
next
end
```
To see the results of web portal:
1. From a remote device, use a web browser to log into the SSL VPN web portal http://172.20.120.123:10443.
2. Log in using the sslvpnuser1 credentials.
   When the warning time is reached, the user is prompted to enter a new password.
   In FortiOS 6.2, when the password expires, the user cannot renew the password and must contact the administrator.
   In FortiOS 6.0/5.6, when the password expires, the user can still renew the password.
3. On the FortiGate, go to Dashboard > Network and expand the SSL-VPN widget to verify the user's connection.

To see the results of tunnel connection:
2. Open the FortiClient Console and go to Remote Access > Configure VPN.
3. Add a new connection.
   - Set the connection name.
   - Set Remote Gateway to the IP of the listening FortiGate interface, in this example, 172.20.120.123.
4. Select Customize Port and set it to 10443.
5. Save your settings.
6. Log in using the sslvpnuser1 credentials.
   When the warning time is reached, the user is prompted to enter a new password.

To check the SSL VPN connection using the GUI:
1. Go to Dashboard > Network and expand the SSL-VPN widget to verify the user's connection.
2. Go to Log & Report > Forward Traffic to view the details of the SSL VPN traffic.

To check that login failed due to password expired on GUI:
1. Go to Log & Report > System Events and select the VPN Events card to see the SSL VPN alert labeled ssl-login-fail.
2. Click Details to see the log details about the Reason sslvpn_login_password_expired.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Auth Type</th>
<th>Timeout</th>
<th>From</th>
<th>HTTP in/out</th>
<th>HTTPS in/out</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>sslvpnuser1</td>
<td>1(1)</td>
<td>229</td>
<td>10.1.100.254</td>
<td>0/0</td>
<td>0/0</td>
</tr>
</tbody>
</table>

SSL VPN sessions:
<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Source IP</th>
<th>Duration</th>
<th>I/O Bytes</th>
<th>Tunnel/Dest IP</th>
</tr>
</thead>
</table>
```

To check the tunnel login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Auth Type</th>
<th>Timeout</th>
<th>From</th>
<th>HTTP in/out</th>
<th>HTTPS in/out</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>sslvpnuser1</td>
<td>1(1)</td>
<td>291</td>
<td>10.1.100.254</td>
<td>0/0</td>
<td>0/0</td>
</tr>
</tbody>
</table>
```
SSL VPN sessions:

<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Source IP</th>
<th>Duration</th>
<th>I/O Bytes</th>
<th>Tunnel/Dest IP</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>sslvpnuser1</td>
<td>10.1.100.254</td>
<td>9</td>
<td>22099/43228</td>
<td>10.212.134.200</td>
</tr>
</tbody>
</table>

To check the FortiOS 6.2 login password expired event log:

FG201E4Q17901354 # execute log filter category event

FG201E4Q17901354 # execute log filter field subtype vpn

FG201E4Q17901354 # execute log filter field action ssl-login-fail

FG201E4Q17901354 # execute log display

1: date=2019-02-15 time=10:57:56 logid="0101039426" type="event" subtype="vpn" level="alert" vd="root" eventtime=1550257076 logdesc="SSL VPN login fail" action="ssl-login-fail" tunneltype="ssl-web" tunnelid=0 remip=10.1.100.254 user="u1" group="g1" dst_host="N/A" reason="sslvpn_login_password_expired" msg="SSL user failed to logged in"

Dynamic address support for SSL VPN policies

Dynamic SSO user groups can be used in place of address objects when configuring SSL VPN policies. This allows dynamic IP addresses to be used in SSL VPN policies. A remote user group can be used for authentication while an FSSO group is separately used for authorization. Using a dummy policy for remote user authentication and a policy for FSSO group authorization, FSSO can be used with SSL VPN tunnels.

This image shows the authentication and authorization flow:
In this example, FortiAuthenticator is used as a RADIUS server. It uses a remote AD/LDAP server for authentication, then returns the authentication results to the FortiGate. This allows the client to have a dynamic IP address after successful authentication.

First, on the LDAP server, create two users each in their own group, user142 in group pc_group1, and user143 in group pc_group2.

**Configure the FortiAuthenticator**

**To add a remote LDAP server and users on the FortiAuthenticator:**

1. Go to Authentication > Remote Auth. Servers > LDAP.
2. Click Create New.
3. Set the following:
   - Name: ad_ladp_60
   - Primary server name/IP: 172.16.200.60
   - Base distinguished name: dc=fsso-qa,dc=com
   - Bind type: Regular
   - Username: cn=administrator,cn=User
   - Password: <enter a password>
4. Click OK.
5. Edit the new LDAP server.
6. Import the remote LDAP users.
7. Edit each user to confirm that they have the RADIUS attribute Acct-Interim-Interval. This attribute is used by
To create a RADIUS client for FortiGate as a remote authentication server:

1. Go to Authentication > RADIUS Service > Clients.
2. Click Create New.
3. Set the following:
   - Name: fsso_ldap
   - Client address: Range 172.16.200.1~172.16.200.10
   - Secret: <enter a password>
4. In the Realms table, set the realm to the LDAP server that was just added: ad_ldap_60.
5. Click OK.
   FortiAuthenticator can now be used as a RADIUS server, and the authentication credentials all come from the DC/LDAP server.

Fortinet Single Sign-On Collector Agent

To configure the Fortinet Single Sign-On Collector Agent:

1. Select Require authenticated connection from FortiGate and enter a Password.
2. Click Advanced Settings.
3. Select the RADIUS Accounting tab.
4. Select *Enable RADIUS accounting server* and set the *Shared secret.*

5. Click *OK,* then click *Save&close.*

   The collector agent can now accept accounting requests from FortiGate, and retrieve the IP addresses and usernames of SSL VPN client from the FortiGate with accounting request messages.

**Configure the FortiGate**

**To configure the FortiGate in the CLI:**

1. Create a Fortinet Single Sign-On Agent fabric connector:
   ```
   config user fso
     edit "AD_CollectAgent"
       set server "172.16.200.60"
       set password 123456
     next
   end
   ```

2. Add the RADIUS server:
   ```
   config user radius
   edit "rad150"
     set server "172.16.200.150"
     set secret 123456
     set acct-interim-interval 600
   config accounting-server
   edit 1
     set status enable
     set server "172.16.200.60"
     set secret 123456
   next
   next
   end
   ```

3. Create a user group for the RADIUS server:
   ```
   config user group
   edit "rad_group"
     set member "rad150"
   next
   end
   ```
4. Create user groups for each of the FSSO groups:

   config user group
   edit "fsso_group1"
       set group-type fsso-service
       set member "CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM"
   next
   edit "fsso_group2"
       set group-type fsso-service
       set member "CN=PC_GROUP2,OU=TESTING,DC=FSSO-QA,DC=COM"
   next
end

5. Create an SSL VPN portal and assign the RADIUS user group to it:

   config vpn ssl web portal
   edit "testportal"
       set tunnel-mode enable
       set ipv6-tunnel-mode enable
       set web-mode enable
   ...
   next
end
config vpn ssl settings
...
set default-portal "full-access"
config authentication-rule
edit 1
  set groups "rad_group"
  set portal "testportal"
next
end

6. Create firewall addresses:

   config firewall address
   edit "none"
       set subnet 0.0.0.0 255.255.255.255
   next
   edit "pc4"
       set subnet 172.16.200.44 255.255.255.255
   next
   edit "pc5"
       set subnet 172.16.200.55 255.255.255.255
   next
end

7. Create one dummy policy for authentication only, and two normal policies for authorization:

   config firewall policy
   edit 1
      set name "sslvpn_authentication"
      set srcintf "ssl.vdom1"
      set dstintf "port1"
      set srcaddr "all"
      set dstaddr "none"
      set action accept
      set schedule "always"
set service "ALL"
set logtraffic all
set groups "rad_group"
set nat enable
next
edit 3
set name "sslvpn_authorization1"
set srcintf "ssl.vdom1"
set dstintf "port1"
set srcaddr "all"
set dstaddr "pc4"
set action accept
set schedule "always"
set service "ALL"
set logtraffic all
set groups "fsso_group1"
set nat enable
next
edit 4
set name "sslvpn_authorization2"
set srcintf "ssl.vdom1"
set dstintf "port1"
set srcaddr "all"
set dstaddr "pc5"
set action accept
set schedule "always"
set service "ALL"
set logtraffic all
set groups "fsso_group2"
set nat enable
next
end

To create an FSSO agent fabric connector in the GUI:

1. Go to Security Fabric > External Connectors.
2. Click Create New.
3. Click FSSO Agent on Windows AD.
4. Enter the name and Primary FSSO agent information.

5. Click Apply & Refresh. The FSSO groups are retrieved from the collector agent.

To add the RADIUS server in the GUI:

2. Click Create New.
3. Enter a name for the server.
4. Enter the IP/Name and Secret for the primary server.
5. Click Test Connectivity to ensure that there is a successful connection.

6. Click OK.
7. Configure an accounting server with the following CLI command:

```
config user radius
   edit rad150
       set acct-interim-interval 600
   config accounting-server
       edit 1
        set status enable
        set server 172.16.200.60
        set secret ********
       next
   end
next
end
```

To create a user group for the RADIUS server in the GUI:

2. Click Create New.
3. Enter a name for the group and set the Type to Firewall.
4. Add the RADIUS server as a remote group.

![User Group Configuration in GUI](image)

5. Click OK.

To create user groups for each of the FSSO groups in the GUI:

2. Click Create New.
3. Enter a name for the group and set the Type to Fortinet Single Sign-On (FSSO).
4. Add PC_GROUP1 as a member:
   `CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM`
5. Click OK.
6. Add a second user group with PC_GROUP2 as a member:
   `CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM`
7. Click OK.
To create an SSL VPN portal and assign the RADIUS user group to it in the GUI:

1. Go to VPN > SSL VPN Portals.
2. Click Create New.
3. Configure the portal, then click OK.
4. Go to VPN > SSL VPN Settings.
5. Configure the required settings.
6. Create an Authentication/Portal Mapping table entry:
   a. Click Create New.
   b. Set User/Groups to rad_group.
   c. Set Portal to testportal.
   d. Click OK.
7. Click OK.

To create policies for authentication and authorization in the GUI:

1. Go to Policy & Objects > Firewall Policy.
2. Configure a dummy policy for authentication. Set the destination to none so that traffic is not allowed through the FortiGate, and add rad_group as a source.
3. Configure two authorization policies, with the FSSO groups as sources.

Confirmation

On Client 1, log in to FortiClient using user142. Traffic can go to pc4 (172.16.200.44), but cannot go to pc5 (172.16.200.55).

On Client 2, log in to FortiClient using user143. Traffic can go to pc5 (172.16.200.55), but cannot go to pc4 (172.16.200.44).

On the FortiGate, check the authenticated users list and the SSL VPN status:

```
# diagnose firewall auth list

10.212.134.200, USER142

SSL VPN multi-realm

This sample shows how to create a multi-realm SSL VPN that provides different portals for different user groups.

Sample topology

![SSL VPN topology diagram]

Remote user using FortiClient

Remote user

SSL

WAN1 172.20.120.123

Port 1 192.168.199/24

FortiGate

Internal network
Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to Network > Interfaces and edit the wan1 interface.
   b. Set IP/Network Mask to 172.20.120.123/255.255.255.0.
   c. Edit port1 interface and set IP/Network Mask to 192.168.1.99/255.255.255.0.
   d. Click OK.
   e. Go to Policy & Objects > Address and create an address for internet QA_subnet with subnet 192.168.1.0/24 and HR_subnet with subnet 10.1.100.0/24.

2. Configure user and user group.
   a. Go to User & Authentication > User Definition to create local users qa-user1 and hr-user1.
   b. Go to User & Authentication > User Groups to create separate user groups for web-only and full-access portals:
      - QA_group with member qa-user1.
      - HR_group with the member hr-user1.

3. Configure SSL VPN web portal.
   a. Go to VPN > SSL-VPN Portals to create portal qa-tunnel.
   b. Enable Tunnel Mode.
   c. Create a portal hr-web with Web Mode enabled.

4. Configure SSL VPN realms.
   a. Go to System > Feature Visibility to enable SSL-VPN Realms.
   b. Go to VPN > SSL-VPN Realms to create realms for qa and hr.
   c. (Optional) To access each realm with FQDN instead of the default URLs https://172.20.120.123:10443/hr and https://172.20.120.123:10443/qa, you can configure a virtual-host for the realm in the CLI.

```
config vpn ssl web realm
edit hr
    set virtual-host hr.mydomain.com
next
edit qa
    set virtual-host qa.mydomain.com
next
end
```

Where mydomain.com is the name of your domain. Ensure FQDN resolves to the FortiGate wan1 interface and that your certificate is a wildcard certificate.

5. Configure SSL VPN settings.
   a. Go to VPN > SSL-VPN Settings.
   b. For Listen on Interface(s), select wan1.
   c. Set Listen on Port to 10443.
   d. Choose a certificate for Server Certificate. The default is Fortinet_Factory.
e. In Authentication/Portal Mapping All Other Users/Groups, set the Portal to web-access.

f. Create new Authentication/Portal Mapping for group QA_group mapping portal qa-tunnel.

g. Specify the realm qa.

h. Add another entry for group HR_group mapping portal hr-web.

i. Specify the realm hr.

6. Configure SSL VPN firewall policy.

   a. Go to Policy & Objects > Firewall Policy.

   b. Create a firewall policy for QA access.

   c. Fill in the firewall policy name. In this example, QA sslvpn tunnel mode access.

   d. Incoming interface must be SSL-VPN tunnel interface(ssl.root).

   e. Choose an Outgoing Interface. In this example, port1.

   f. Set the Source to all and group to QA_group.

   g. In this example, the Destination is the internal protected subnet QA_subnet.

   h. Set Schedule to always, Service to ALL, and Action to Accept.

   i. Click OK.

   j. Create a firewall policy for HR access.

   k. Fill in the firewall policy name. In this example, HR sslvpn web mode access.

   l. Incoming interface must be SSL-VPN tunnel interface(ssl.root).

   m. Choose an Outgoing Interface. In this example, port1.

   n. Set the Source to all and group to HR_group.

   o. In this example, the Destination is the internal protected subnet HR_subnet.

   p. Set Schedule to always, Service to ALL, and Action to Accept.

   q. Click OK.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

   ```
   config system interface
   edit "wan1"
     set vdom "root"
     set ip 172.20.120.123 255.255.255.0
   next
   end
   ```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

   ```
   config system interface
   edit "port1"
     set vdom "root"
     set ip 192.168.1.99 255.255.255.0
   next
   end

   config firewall address
   edit "QA_subnet"
     set subnet 192.168.1.0 255.255.255.0
   next
   edit "HR_subnet"
     set subnet 10.1.100.0 255.255.255.0
   ```
3. **Configure user and user group.**

```plaintext
config user local
edit "qa_user1"
    set type password
    set passwd your-password
next
end
config user group
edit "QA_group"
    set member "qa_user1"
next
end
config user local
edit "hr_user1"
    set type password
    set passwd your-password
next
end
config user group
edit "HR_group"
    set member "hr_user1"
next
end
```

4. **Configure SSL VPN web portal.**

```plaintext
config vpn ssl web portal
edit "qa-tunnel"
    set tunnel-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling enable
    set split-tunneling-routing-address "QA_subnet"
next
end
config vpn ssl web portal
edit "hr-web"
    set web-mode enable
next
end
```

5. **Configure SSL VPN realms.**

```plaintext
config vpn ssl web realm
edit hr
    set virtual-host hr.mydomain.com
next
edit qa
    set virtual-host qa.mydomain.com
next
end
```

The set virtual-host setting is optional. For example:

```plaintext
config vpn ssl web realm
edit hr
next
```
6. Configure SSL VPN settings.

   edit qa
   next
   end

   config vpn ssl settings
   set servercert "Fortinet_Factory"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
   set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPV6_ADDR1"
   set source-interface "wan1"
   set source-address "all"
   set source-address6 "all"
   set default-portal "full-access"
   config authentication-rule
     edit 1
     set groups "QA_group"
     set portal "qa-tunnel"
     set realm qa
     next
     edit 2
     set groups "HR_group"
     set portal "hr-web"
     set realm hr
     next
   end

   7. Configure two SSL VPN firewall policies to allow remote QA user to access internal QA network and HR user to access HR network.

   config firewall policy
   edit 1
     set name "QA sslvpn tunnel access"
     set srcintf "ssl.root"
     set dstintf "port1"
     set srcaddr "all"
     set dstaddr "QA_subnet"
     set groups "QA_group"
     set action accept
     set schedule "always"
     set service "ALL"
     next
   edit 2
     set name "HR sslvpn web access"
     set srcintf "ssl.root"
     set dstintf "port1"
     set srcaddr "all"
     set dstaddr "HR_subnet"
     set groups "HR_group"
     set action accept
     set schedule "always"
     set service "ALL"
     next
   end
To see the results for QA user:

2. Open the FortiClient Console and go to Remote Access.
3. Add a new connection.
   - Set VPN Type to SSL VPN.
   - Set Remote Gateway to https://172.20.120.123:10443/qa..
   - If a virtual-host is specified, use the FQDN defined for the realm (qa.mydomain.com).
4. Select Customize Port and set it to 10443.
5. Save your settings.
6. Use the credentials you've set up to connect to the SSL VPN tunnel.
   - If the user's computer has antivirus software, a connection is established; otherwise FortiClient shows a compliance warning.
7. After connection, traffic to subnet 192.168.1.0 goes through the tunnel.
8. On the FortiGate, go to Dashboard > Network and expand the SSL-VPN widget to verify the list of SSL users.
9. On the FortiGate, go to VPN > Monitor > SSL-VPN Monitor to verify the list of SSL users.
10. On the FortiGate, go to Log & Report > Forward Traffic and view the details of the traffic.

To see the results for HR user:

1. In a web browser, log into the portal https://172.20.120.123:10443/hr using the credentials you've set up.
2. Alternatively, if a virtual-host is specified, use the FQDN defined for the realm (hr.mydomain.com).
3. On the FortiGate, go to Dashboard > Network and expand the SSL-VPN widget to verify the list of SSL users.
4. Go to Log & Report > Forward Traffic and view the details of the traffic.

**NAS-IP support per SSL-VPN realm**

For RADIUS authentication and authorization, the RADIUS client (the FortiGate) passes the username, password, and NAS-IP to the RADIUS server in its access request. The RADIUS server authenticates and authorizes based on this information. Each RADIUS server can be configured with multiple NAS-IPs for authenticating different groups and NAS clients.

On the FortiGate, configuring the NAS-IP in the realm settings overrides the RADIUS server setting, allowing multiple NAS-IPs to be mapped to the same RADIUS server.

![Diagram of SSL-VPN Client, FortiGate, and RADIUS server]

In this example, the user wants to present one FortiGate VDOM with different NAS-IPs to a single RADIUS server based on specific rules.
To configure the SSL-VPN to use the NAS-IP in the realm settings:

1. Configure a RADIUS user and add it to a group:

```
config user radius
edit "fac150"
    set server "172.16.200.150"
    set secret ********
    set nas-ip 172.16.200.2
config accounting-server
    edit 1
        set status enable
        set server "172.16.200.150"
        set secret ********
    next
end
end
config user group
    edit "radgrp"
        set member "fac150"
    next
end
```

2. Configure a realm for the user with a different NAS-IP:

```
config vpn ssl web realm
    edit "realm1"
        set login-page '........'
        set radius-server "fac150"
        set nas-ip 10.1.100.2
    next
end
```

3. Configure SSL-VPN with an authentication rule that includes the user group and the realm:

```
config vpn ssl settings
    ... 
    config authentication-rule
        edit 1
            set groupd "radgrp"
            set portal "testportal1"
            set realm "realm1"
        next
end
```

4. Create a firewall policy:

```
config firewall policy
    edit 1
        set name "sslvpn1"
        ... 
        set srcintf "ssl.vdom1"
        set groups "radgrp"
    next
end
```

Because the RADIUS server and NAS-IP are specified in realm1, its NAS-IP is used for authentication.
SSL VPN with Okta as SAML IdP

In this configuration, the FortiGate acts as a SAML service provider (SP) requesting authentication from Okta, which acts as a SAML identity provider (IdP). The following shows the topology in this configuration:

The authentication process is as follows in this deployment:

1. The user initiates an SSL VPN request to the FortiGate.
2. The FortiGate sends the browser POST redirect to FortiClient.
3. FortiClient redirects the SAML authentication request to Okta.
4. The user authenticates with Okta using their credentials.
5. Okta sends a SAML assertion that contains the user and group authentication in a POST redirect to the SSL VPN login page.
6. FortiClient sends the redirected Okta request that contains the SAML assertion to the FortiGate.
7. The FortiGate consumes the assertion and provides the user with access to resources based on the defined firewall security policy.
The example assumes that you already have an Okta account. This example uses users locally defined within the Okta directory and does not include LDAP mapping. The instructions describe the steps that you take if using the free Okta developer edition.

To configure Okta for SSL VPN with FortiOS:

1. Log in to the Okta portal as the registered admin user.
2. Add the FortiGate application:
   a. Go to Applications.
   b. Click Applications, then click Create App Integration.
   c. Click SAML 2.0, then Next.
   d. Configure SAML settings:
      i. Proceed through the application creation wizard. In the Single sign on URL field, enter https://<FortiGate IP address>:<port>/remote/saml/login/. In this example, it is https://10.0.3.254:10443/remote/saml/login/.
      ii. Enable Use this for Recipient URL and Destination URL.
      iii. In the Audience URI (SP Entity ID) field, enter the https://<FortiGate IP address>:<port>/remote/saml/metadata/. In this example, it is https://10.0.3.254:10443/remote/saml/metadata/.
     iv. Click Download Okta Certificate to download the Okta certificate to your machine. You provide this certificate to the FortiGate.
     v. Click Show Advanced Settings. From the Response dropdown list, select Signed.
     vi. From the Assertion Signature dropdown list, select Signed.
     vii. In the Single Logout URL field, enter https://<FortiGate IP address>:<port>/remote/saml/logout/. In this example, it is https://10.0.3.254:10443/remote/saml/logout/.
     viii. In the SP Issuer field, enter https://<FortiGate IP address>:<port>/remote/saml/metadata/. In this example, it is https://10.0.3.254:10443/remote/saml/metadata/.
     ix. In the Signature Certificate field, first download the Fortinet.Factory certificate by logging into FortiOS, going to System > Local Certificate, then browsing to and uploading the FortiGate certificate. Okta uses
this to authenticate the SAML SP.

![VPN Configuration](image)

e. Under **ATTRIBUTE STATEMENTS** and **GROUP ATTRIBUTE STATEMENTS**, define attribute mappings for Okta to use in SAML assertion. In this example, the following is entered as a attribute statement and a group attribute statement, respectively:

- **username**, with value `user.login`
- **group**, with **Matches regex filter**

![Attribute Statements](image)

f. On the **Feedback** step, select *I'm an Okta customer adding an internal app.*

g. Select *This is an internal app that we have created.*

h. Click **Finish**.

3. Go to **Directory > People**.
4. Click **Add Person**.
5. Enter the person's details as desired. Click Save.

6. Add a group:
   a. Go to Directory > Groups.
   b. Click Add Group.
   c. Enter the desired name, then click Add Group. In this example, the name is corporate-saml.
   d. Select the newly added group, then click Assign People.
   e. Add the person that you created as a member of the new group. Click Save.

7. Assign the group to the FortiGate application:
   a. Go to Applications > FortiGate application > Assignments.
   b. From the Assign dropdown list, select Assign to Groups.
   c. Assign the group that you created to the FortiGate application.

8. To view the SAML setup instructions, do the following:
   a. Click the newly created application's name.
   b. Click Sign On.

9. Download the Okta certificate and upload it to FortiOS:
   a. From View SAML Setup Instructions, download the certificate.
   b. In FortiOS, go to System > Certificates.
   c. From the Create/Import dropdown list, select Remote Certificate.
   d. Click Upload and upload the downloaded Okta certificate.

To configure the FortiGate:

1. Configure the FortiGate SP to be a SAML user:
   ```
   config user saml
   ```
edit "okta-idp"
    set cert "Fortinet_Factory"
    set entity-id "https://10.0.3.254:10443/remote/saml/metadata/"
    set single-sign-on-url "https://10.0.3.254:10443/remote/saml/login"
    set single-logout-url "https://10.0.3.254:10443/remote/saml/logout"
    set idp-entity-id "http://www.okta.com/exk103foxaa8gk5qy4x7"
    set idp-single-sign-on-url "https://fortinet01.okta.com/app/fortinetorg878484_fortigate_1/exk103foxaa8gk5qy4x7/sso/saml"
    set idp-single-logout-url "https://fortinet01.okta.com/app/fortinetorg878484_fortigate_1/exk103foxaa8gk5qy4x7/slo/saml"
    set idp-cert "Okta-IDP_Certificate"
    set user-name "username"
    set group-name "group"
next
end

2. Configure user group assertion on Okta as part of the SAML assertion attributes. It is important that the group attribute value received is locally matched with the group-name value:
   config user group
      edit "corporate-saml"
      set member "okta-idp"
      config match
         edit 1
            set server-name "okta-idp"
            set group-name "corporate-saml"
         next
      next
   end

3. Go to VPN > SSL-VPN Settings. Configure VPN settings as desired. When testing the VPN solution, starting with a web-based configuration, then moving to a tunnel-based configuration is recommended. Web-based testing can help in troubleshooting.

4. Configure a local or RADIUS user as a backup. This setting also provides a login web user with a choice of local or SSO login.

5. Go to Policy and Objects > Firewall Policies. Configure a policy as desired.

6. Increase the global authentication timeout period to allow users to fill in their credentials in time. The default timeout is five seconds:
   config system global
      set remoteauthtimeout 60
   end

To configure EMS:

1. In EMS, go to Endpoint Profiles > Manage Profiles. Edit a VPN profile.
2. Under VPN Tunnels, click Add Tunnel.
3. In the Remote Gateway field, enter the FortiGate IP address. In this example, it is 10.0.3.254.
4. In the Port field, enter the port number. In this example, it is 10443.

5. In Advanced Settings, enable Enable SAML Login.

6. Click Add Tunnel.

7. Save the profile.

8. After the policy synchronizes to the endpoint, the SAML Login button is visible on the Remote Access tab in FortiClient.

To test the configuration:

1. Test web-based SSL VPN authentication using Firefox with the SAML tracer plugin enabled. Install the SAML-tracer plugin to Firefox.
2. In Firefox, go to the FortiOS SSL VPN login page. In this example, this is https://10.0.3.254:10443.
3. Open the SAML tracer.
4. The browser redirects to the Okta SAML login page. Enter the Okta credentials, then click Sign in.
5. Upon successful authentication, the browser redirects to the authenticated SSL VPN page. If authentication does not succeed, review the SAML tracer to confirm the SAML assertion attributes that are passed during the authentication session. Select the POST message with the SAML information. On the SAML tab, confirm the username and group attributes.
6. To test tunnel mode, go to the Remote Access tab in FortiClient. Click the SAML Login button.
7. A FortiAuthenticator web login page opens within FortiClient. Enter the Okta credentials, then log in to connect to the VPN tunnel.

To troubleshoot the configuration:

You can view FortiOS event logs in Log & Report > Events to verify successful authentication and user group allocation.

You can also run the `diagnose debug application samld -1` command to verify that the SAML IdP sent the correct information. The following shows example output for this scenario:

```
\[saml\]_comm_negot: [0x0] 112421824 [0x0]
\[saml\]_comm_negot: [0x0] 112421824 [0x0]
\[saml\]_comm_negot: [0x0] 112421824 [0x0]
\[saml\]_comm_negot: [0x0] 112421824 [0x0]
\[saml\]_comm_negot: [0x0] 112421824 [0x0]
\[saml\]_comm_negot: [0x0] 112421824 [0x0]
\[saml\]_comm_negot: [0x0] 112421824 [0x0]
\[saml\]_comm_negot: [0x0] 112421824 [0x0]

```

SSL VPN with Azure AD SSO integration

You can use SAML single sign on to authenticate against Azure Active Directory with SSL VPN SAML user via tunnel and web modes. See:

- Configuring SAML SSO login for SSL VPN with Azure AD acting as SAML IdP
- Tutorial: Azure AD SSO Integration with FortiGate SSL VPN

SSL VPN to IPsec VPN

This is a sample configuration of site-to-site IPsec VPN that allows access to the remote endpoint via SSL VPN.
This example uses a pre-existing user group, a tunnel mode SSL VPN with split tunneling, and a route-based IPsec VPN between two FortiGates. All sessions must start from the SSL VPN interface.

If you want sessions to start from the FGT_2 subnet, you need more policies. Also, if the remote subnet is beyond FGT_2 (if there are multiple hops), you need to include the SSL VPN subnet in those routers as well.

**Sample topology**

SSL VPN IP address pool: 20.2.200.0/24

**Sample configuration**

**To configure the site-to-site IPsec VPN on FGT_1:**

1. Go to **VPN > IPsec Wizard**.
2. In the **VPN Setup pane**:
   a. Specify the VPN connection **Name** as **to_FGT_2**.
   b. Select **Site to Site**.
   c. Click **Next**.
3. In the **Authentication pane**:
   a. Enter the **IP Address** to the Internet-facing interface.
   b. For **Authentication Method**, click **Pre-shared Key** and enter the **Pre-shared Key**.
c. Click Next.

4. In the Policy & Routing pane:
   a. Set the Local Interface to the internal interface.
   b. Set the Local Subnets to include the internal and SSL VPN subnets for FGT_1.
   c. Set Remote Subnets to include the internal subnet for FGT_2.

   ![Image of Policy & Routing pane]

   d. Click Next.

5. Review the VPN settings and click Create.
A confirmation screen shows a summary of the configuration including the firewall address groups for both the local and remote subnets, static routes, and security policies.

To configure SSL VPN settings:

1. Go to VPN > SSL-VPN Settings.
2. Set Listen on Interface(s) to wan1.
3. To avoid port conflicts, set Listen on Port to 10443.
4. Set Restrict Access to Allow access from any host.
5. In the Tunnel Mode Client Settings section, select Specify custom IP ranges and include the SSL VPN subnet range created by the IPSec Wizard.
6. In the Authentication/Portal Mapping section, add the VPN user group to the tunnel-access Portal. Set All Other Users/Groups to the web-access Portal.
It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the SSL VPN best practices on page 1619 and learn how to Procuring and importing a signed SSL certificate on page 2175.

7. **Click Apply.**

**To configure SSL VPN portal:**

1. Go to **VPN > SSL-VPN Portals**.
2. Select **tunnel-access** and click **Edit**.
3. Turn on **Enable Split Tunneling** so that only traffic intended for the local or remote networks flow through FGT_1 and follows corporate security profiles.
4. For **Routing Address**, add the local and remote IPsec VPN subnets created by the **IPsec Wizard**.
5. For **Source IP Pools**, add the SSL VPN subnet range created by the **IPsec Wizard**.
To add policies to FGT_1:

1. Go to Policy & Objects > Firewall Policy.
2. Click Create New to create a policy that allows SSL VPN users access to the IPsec VPN tunnel.
3. For Incoming Interface, select ssl.root.
4. For Outgoing Interface, select the IPsec tunnel interface to_FGT_2.
5. Set the Source to all and the VPN user group.
6. Set Destination to the remote IPsec VPN subnet.
7. Specify the Schedule.
8. Set the Service to ALL.
9. In the Firewall/Network Options section, disable NAT.

10. Click OK.

To configure the site-to-site IPsec VPN on FGT_2:

1. Go to VPN > IPsec Wizard.
2. In the VPN Setup pane:
   a. Specify the VPN connection Name as to_FGT_1.
   b. Select Site to Site.
c. Click Next.

3. In the **Authentication** pane:
   a. Enter the **IP Address** to the Internet-facing interface.
   b. For **Authentication Method**, click **Pre-shared Key** and enter the **Pre-shared Key** of the FGT_1.
   c. Click Next.

4. In the **Policy & Routing** pane:
   a. Set the **Local Interface** to the internal interface.
   b. Set the **Local Subnets** to include the internal and SSL VPN subnets for FGT_2.
   c. Set **Remote Subnets** to include the internal subnet for FGT_1.
   d. Click Create.

A confirmation screen shows a summary of the configuration including the firewall address groups for both the local and remote subnets, static routes, and security policies.

**To check the results:**

1. Go to **Dashboard > Network** and click the **IPsec** widget to expand to full screen view.
2. Select the tunnel and click **Bring Up**.

3. Verify that the **Status** changes to **Up**.
4. Configure the SSL VPN connection on the user's FortiClient and connect to the tunnel.

5. On the user's computer, send a ping though the tunnel to the remote endpoint to confirm access:

```
C:\>ping 172.16.200.55
Pinging 172.16.200.55 with 32 bytes of data:
Replay from 172.16.200.55: bytes=32 times=2ms TTL=62
Replay from 172.16.200.55: bytes=32 times=1ms TTL=62
Replay from 172.16.200.55: bytes=32 times=1ms TTL=62
Replay from 172.16.200.55: bytes=32 times=1ms TTL=62
```

Ping statistics for 172.16.200.55:
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip time in milliseconds:
Minimum = 1ms, Maximum = 2ms, Average = 1ms

6. In FortiOS, go to the following pages for further verification:
   a. Go to Dashboard > Network and click the Routing widget to verify the IPsec and SSL VPNs are added.
   b. Go to VPN > SSL-VPN Clients to verify the connected users.
   c. Go to VPN > VPN Location Map to view the connection activity.
   d. Go to Log & Report > System Events and select the VPN Events card to view tunnel statistics.
   e. Go to Dashboard > FortiView Policies to view the policy usage.

Troubleshooting

To troubleshoot on FGT_1, use the following CLI commands:

```plaintext
diagnose debug reset
diagnose debug flow show function-name enable
diagnose debug flow show ioprope enable
diagnose debug flow filter addr 172.16.200.55
diagnose debug flow filter proto 1
diagnose debug flow trace start 2
diagnose debug enable
```

To troubleshoot using ping:

1. Send a ping through the SSL VPN tunnel to 172.16.200.55 and analyze the output of the debug.
2. Disable the debug output with: `diagnose debug disable`.

If traffic is entering the correct VPN tunnel on FGT_1, then run the same commands on FGT_2 to check whether the traffic is reaching the correct tunnel. If it is reaching the correct tunnel, confirm that the SSL VPN tunnel range is configured in the remote side quick mode selectors.

To troubleshoot using a sniffer command:

```plaintext
diagnose sniff packet any "host 172.16.200.44 and icmp" 4
```

To troubleshoot IPsec VPN issues, use the following commands on either FortiGate:

```plaintext
diagnose debug reset
diagnose vpn ike gateway clear
diagnose debug application ike -1
diagnose debug enable
```

SSL VPN protocols

The following topics provide information about SSL VPN protocols:

- TLS 1.3 support on page 1746
- SMBv2 support on page 1746
**TLS 1.3 support**

FortiOS supports TLS 1.3 for SSL VPN.

TLS 1.3 support requires IPS engine 4.205 or later and endpoints running FortiClient 6.2.0 or later.

**To establish a client SSL VPN connection with TLS 1.3 to the FortiGate:**

1. Enable TLS 1.3 support using the CLI:
   ```
   config vpn ssl setting
   set ssl-max proto-ver tls1-3
   set ssl-min proto-ver tls1-3
   end
   ```

2. Configure the SSL VPN and firewall policy:
   a. Configure the SSL VPN settings and firewall policy as needed.

3. For Linux clients, ensure OpenSSL 1.1.1a is installed:
   a. Run the following commands in the Linux client terminal:
      ```
      root@PC1:~/tools# openssl
      OpenSSL> version
      OpenSSL 1.1.1a 20 Nov 2018
      ```

4. For Linux clients, use OpenSSL with the TLS 1.3 option to connect to SSL VPN:
   a. Run the following command in the Linux client terminal:
      ```
      # openssl s_client -connect 10.1.100.10:10443 -tls1_3
      ```

5. Ensure the SSL VPN connection is established with TLS 1.3 using the CLI:
   ```
   # diagnose debug application sslvpn -1
   # diagnose debug enable
   ```
   The system displays a response like the following:
   ```
   [207:root:1d] SSL established: TLSv1.3 TLS_AES_256_GCM_SHA384
   ```

**Deep inspection (flow-based)**

FortiOS supports TLS 1.3 for policies that have the following security profiles applied:

- Web filter profile with flow-based inspection mode enabled.
- Deep inspection SSL/SSH inspection profile.

For example, when a client attempts to access a website that supports TLS 1.3, FortiOS sends the traffic to the IPS engine. The IPS engine then decodes TLS 1.3 and the client is able to access the website.

**SMBv2 support**

On all FortiGate models, SMBv2 is enabled by default for SSL VPN. Client PCs can access the SMBv2 server using SSL VPN web-only mode.
To configure SMBv2:

1. Set the minimum and maximum SMB versions.
   
   ```
   config vpn ssl web portal
   edit portal-name
   set smb-min-version smbv2
   set smb-max-version smbv3
   next
   end
   ```

2. Configure SSL VPN and firewall policies as usual.
3. Connect to the SSL VPN web portal and create an SMB bookmark for the SMBv2 server.
4. Click the bookmark to connect to the SMBv2 server.
5. On the FortiGate, use package capture to verify that SMBv2 works:

<table>
<thead>
<tr>
<th>Source IP</th>
<th>Destination IP</th>
<th>Protocol</th>
<th>Source Port</th>
<th>Destination Port</th>
<th>Protocol Request</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.440735802.3.0.1</td>
<td>172.16.209.10</td>
<td>SMB2</td>
<td>252</td>
<td>139</td>
<td>Negotiate Protocol Request</td>
</tr>
<tr>
<td>8.440735802.3.0.1</td>
<td>172.16.209.94</td>
<td>SMB2</td>
<td>252</td>
<td>139</td>
<td>Negotiate Protocol Response</td>
</tr>
</tbody>
</table>

**Configuring OS and host check**

Beyond the basics of setting up the SSL VPN, you can configure a number of other options that can help to ensure your internal network is secure and can limit the possibility of attacks and viruses entering the network from an outside source. These include verifying OS and performing host checks on software running on the remote device.

**Verifying remote user OS**

To verify that remote users are using devices with up-to-date Operating Systems to connect to your network, you can configure a host check for Windows and Mac OS. You can configure an OS host check for specific OS versions, such as Windows 7, 8.1, 10, and 11.

**To configure an OS host check for specific OS versions:**

1. Go to `VPN > SSL-VPN`.
2. Click `Create New`.
3. Enable `Restrict to Specific OS Versions`.
4. Select an OS version and click `Edit` to change the action.
5. Select the action:
   - `Allow`: The selected OS version is allowed to connect. This is the default action.
   - `Block`: The selected OS version is not allowed to connect.
   - `Check up to date`: Specify a Tolerance and Latest patch level that is allowed for the selected OS version.
6. Click `OK`.
7. Configure other parameters as needed.
8. Click `OK`.

**Host check**

Host check verifies whether the client device has AntiVirus, firewall, both, or other custom security software enabled on their Windows device. Admins may also define their own custom host check software, which supports Windows and Mac.
To configure host checking:

1. Go to VPN > SSL-VPN Portal.
2. Click Create New.
3. Enable Host Check.
4. Set the Type:
   - *Realtime AntiVirus*: Checks that AntiVirus software recognized by Windows Security Center is enabled.
   - *Firewall*: Checks that firewall software recognized by Windows Security Center is enabled.
   - *Enable both*: Checks that both *Realtime AntiVirus* and *Firewall* are enabled.
   - Custom: Not configurable from the GUI. See CLI settings below.
5. Configure other parameters as needed.
6. Click OK.

You can configure the full-access portal to perform a custom host check for FortiClient Host Security AV and firewall software.

To configure custom host checking:

```config
config vpn ssl web portal
  edit full-access
    set host-check custom
    set host-check-policy FortiClient-AV FortiClient-FW
  next
end
```

Many other security software can also be configured. Use `set host-check-policy ?` to see a list of software.

### Replacing the host check error message

You can add your own host security check error message using either the GUI or the CLI. The default message reads:

> Your PC does not meet the host checking requirements set by the firewall. Please try again in a few minutes. If the issue persists check that your OS version meets the minimum requirements, that your antivirus and firewall applications are installed and running properly, and that you have the correct network interface.

To replace the host check error message in the GUI:

1. Go to System > Replacement Messages.
2. Select Extended View in the upper right corner.
3. Scroll down to SSL-VPN and select Hostcheck Error Message.
4. Click Edit. The Hostcheck Error Message pane opens.
5. Edit the text in the right-hand column.
6. Click Save.

If you are unhappy with the new message, you can restore the message to its default by selecting Restore Defaults instead of Save.

MAC address check

Aside from OS and Host check, FortiGate can also perform a MAC address check on the remote host.

To configure a MAC address check on the remote host in the CLI:

```
config vpn ssl web portal
  edit <portal_name>
    set mac-addr-check enable
  config mac-addr-check-rule
    edit <rule_name>
      set mac-addr-list <address> [address]
      set mac-addr-mask <mask between 1-48>
    next
    set set mac-addr-action {allow | deny}
  next
end
```

Creating a custom host check list

You can add your own software requirements to the host check list using the CLI. Host integrity checking is only possible with client computers running Microsoft Windows platforms.

To add software requirements to the host check list:

```
config vpn ssl web host-check-software
  edit <software_name>
    set os-type {windows | macos}
    set type {av | fw}
    set version <version_number>
    set guid <guid_value>
    config check-item-list
      edit <ID>
        set action {require | deny}
        set type {file | registry | process}
        set target <target string>
        set version <version string>
        set md5s <hext string>
      next
    end
```
If known, enter the Globally Unique Identifier (GUID) for the host check application. Windows uses GUIDs to identify applications in the Windows Registry. The GUID can be found in the Windows registry in the HKEY_CLASSES_ROOT section.

To obtain the exact versioning, in Windows, right-click on the .EXE file of the application and select Properties, then select the Version tab.

**Example: Tunnel Mode Host Check - Registry Key Check**

The following example configuration checks if a required registry key is present on a Windows device.

```fortigate
config vpn ssl web host-check-software
  edit <computer_name>
    config check-item-list
      edit 1
        set target "HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\ComputerName\ActiveComputerName:ComputerName=WINXP32SP3B62"
        set type registry
      next
    next
  next
end
```

**Example: Tunnel Mode Host Check - Application Running Check**

The following example configuration checks if a required application is installed and/or running:

```fortigate
config vpn ssl web host-check-software
  edit "calc"
    config check-item-list
      edit 1
        set target "calc.exe"
        set type process
      next
    next
end
```

**Example: Mac OS host check and process check**

The os-type option is available under vpn ssl web host-check-software;if os-type is macos, then type, version and guid are hidden. Furthermore, type in check-item-list can only be set to file or process.

```fortigate
config vpn ssl web portal
  edit <portal_name>
    set os-check enable
    config os-check-list macos-bigsur-11
      set action {allow | deny | check-up-to-date}
      set tolerance <value>
      set latest-patch-level <value>
    end
  next
```
Example: Configuring Windows OS Check with patch version

The Windows patch check enables you to define the minimum Windows version and patch level allowed when connecting to the SSL VPN portal. When the user attempts to connect to the web portal, FortiOS performs a query on the version of Windows the user has installed. If it does not match the minimum requirement, the connection is denied. The Windows patch check is configured in the CLI.

To specify the acceptable patch level, you set the latest-patch-level and the tolerance. The lowest acceptable patch level is latest-patch-level minus tolerance. In this case, latest-patch-level is three and tolerance is one, so two is the lowest acceptable patch level.

To configure OS check:

```plaintext
config vpn ssl web portal
  edit <portal_name>
    set os-check enable
    config os-check-list <windows OS version>
      set action {allow | check-up-to-date | deny}
      set latest-patch-level {disable | 0 - 255}
      set tolerance <tolerance_num>
    end
  end
end
```

Example: Host check for Windows firewall

The Windows built-in firewall does not have a GUID in root\securitycenter or root\securitycenter2, but you can use a registry value to detect the firewall status.

If Windows firewall is on, the following registry value will be set to one:

- **KeyName**: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\FirewallPolicy\StandardProfile
- **ValueName**: EnableFirewall

In FortiOS, use the `registry-value-check` feature to define the Windows firewall software.

To define the Windows firewall software:

```plaintext
config vpn ssl web host-check-software
  edit "Microsoft-Windows-Firewall"
    set type fw
```

config check-item-list
  edit 1
    set target "HKLM\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\FirewallPolicy\StandardProfile:EnableFirewall==1"
    set type registry
    next
  edit 2
    set target "HKLM\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\FirewallPolicy\PublicProfile:EnableFirewall==1"
    set type registry
    next
  edit 3
    set target "HKLM\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\FirewallPolicy\DomainProfile:EnableFirewall==1"
    set type registry
    next
end
next
cfg vpn ssl web portal
  edit <portal_name>
    set host-check custom
    set host-check-policy Microsoft-Windows-Firewall
  next
end

Troubleshooting

To troubleshoot OS and host check, enable the following real-time debugs from the CLI:

```
# diagnose debug app sslvpn -1
# diagnose debug enable
```

From the remote client, connect to SSL VPN. Look for debug output similar to the following:

```
```

To interpret the above output:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host check result: 4</td>
<td>This is the hex number of portal's host check value:</td>
</tr>
<tr>
<td></td>
<td>• 0: None</td>
</tr>
<tr>
<td></td>
<td>• 1: Check antivirus</td>
</tr>
<tr>
<td></td>
<td>• 2: Check firewall</td>
</tr>
<tr>
<td></td>
<td>• 3: Check antivirus and firewall</td>
</tr>
<tr>
<td></td>
<td>• 4: Custom check</td>
</tr>
<tr>
<td>0100</td>
<td>The 4 bytes shows the result of host check checking in the FortiGate Settings. Position counts from left to right, zero to three:</td>
</tr>
<tr>

<td>84:1b:77:3a:95:84</td>
</tr>
</tbody>
</table>

**FortiGate as SSL VPN Client**

The FortiGate can be configured as an SSL VPN client, using an SSL-VPN **Tunnel** interface type. When an SSL VPN client connection is established, the client dynamically adds a route to the subnets that are returned by the SSL VPN server. Policies can be defined to allow users that are behind the client to be tunneled through SSL VPN to destinations on the SSL VPN server.

FortiOS can be configured as an SSL VPN server that allows IP-level connectivity in tunnel mode, and can act as an SSL VPN client that uses the protocol used by the FortiOS SSL VPN server. This allows hub-and-spoke topologies to be configured with FortiGates as both the SSL VPN hub and spokes.

For an IP-level VPN between a device and a VPN server, this can be useful to avoid issues caused by intermediate devices, such as:

- ESP packets being blocked.
- UDP ports 500 or 4500 being blocked.
- Fragments being dropped, causing IKE negotiation that uses large certificates to fail if the peer does not support IKE fragmentation.

If the client specified destination is **all**, a default route is effectively dynamically created on the SSL VPN client, and the new default route is added to the existing default route in the form of ECMP. Some examples how to configure routing are:

- To make all traffic default to the SSL VPN server and still have a route to the server's listening interface, on the SSL VPN client set a lower distance for the default route that is learned from the server.
- To include both default routes in the routing table, with the route learned from the SSL VPN server taking priority, on the SSL VPN client set a lower distance for the route learned from the server. If the distance is already zero, then increase the priority on the default route.
- To avoid a default being learned on the SSL VPN client, on the SSL VPN server define a specific destination.

**Example**

In this example, the home FortiGate (FGT-A) is configured as an SSL VPN client, and the company FortiGate (FGT-B) is configured as an SSL VPN server. After FGT-A connects to FGT-B, the devices that are connected to FGT-A can access the resources behind FGT-B.
The SSL VPN server has a custom server certificate defined, and the SSL VPN client user uses PSK and a PKI client certificate to authenticate. The FortiGates must have the proper CA certificate installed to verify the certificate chain to the root CA that signed the certificate.

Split tunneling is used so that only the destination addresses defined in the server's firewall policies are routed to the server, and all other traffic is connected directly to the internet.

Configure the SSL VPN server

To create a local user in the GUI:

1. Go to User & Authentication > User Definition and click Create New.
2. Use the wizard to create a local user named client2.

To create a PKI user in the GUI:

The PKI menu is only available in the GUI after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.

1. Go to User & Authentication > PKI and click Create New.
2. Set the Name to pki.
3. Set CA to the CA certificate that is used to verify the client certificate.
4. Click OK.
5. In the CLI, specify the CN that must be matched. If no CN is specified, then any certificate that is signed by the CA will be valid and matched.

```
config user peer
edit "pki"
  set cn "*.fos.automation.com"
next
end
```

To create an SSL VPN portal in the GUI:

1. Go to VPN > SSL-VPN Portals and click Create New.
2. Set the Name to testportal2.
3. Set Enable Split Tunneling to Enabled Based on Policy Destination.
5. Click OK.

To configure SSL VPN settings in the GUI:

1. Go to VPN > SSL-VPN Settings and enable Enable SSL-VPN.
2. Set Listen on Interface(s) to port2.
3. Set Listen on Port to 1443.
5. In the Authentication/Portal Mapping table click Create New:
   a. Set Users/Groups to client2.
   b. Set Portal to testportal2.
   c. Click OK.
6. Click OK.
7. In the CLI, enable SSL VPN client certificate restrictive and set the user peer to pki:

```
config vpn ssl settings
  config authentication-rule
    edit 1
    set client-cert enable
    set user-peer "pki"
next
end
```

To create a firewall address in the GUI:

1. Go to Policy & Objects > Addresses and click Create New > Address.
2. Set the Name to bing.com.
3. Set Type to FQDN.
5. Click OK.
To create a firewall policy in the GUI:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Configure the policy:

<table>
<thead>
<tr>
<th>Name</th>
<th>sslvpn2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>SSL-VPN tunnel interface (ssl.root)</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>port1</td>
</tr>
<tr>
<td>Source</td>
<td>Address: all</td>
</tr>
<tr>
<td></td>
<td>User: client2</td>
</tr>
<tr>
<td>Destination</td>
<td>bing.com: This FQDN resolves to 13.107.21.200 and 204.79.197.200. Traffic to these addresses is directed to the SSL VPN, while other traffic is routed to the remote devices' default adapters or interfaces. mantis</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>Accept</td>
</tr>
</tbody>
</table>

3. Click OK.

To configure the SSL VPN server (FGT-B) in the CLI:

1. Create a local user:

   ```
   config user local
   edit "client2"
       set passwd **********
   next
   end
   ```

2. Create a PKI user:

   ```
   config user peer
   edit "pki"
       set ca "CA_Cert_3"
       set cn "*.fos.automation.com"
   next
   end
   ```

3. Create a new SSL VPN portal:

   ```
   config vpn ssl web portal
   edit "testportal2"
       set tunnel-mode enable
       set ipv6-tunnel-mode enable
       set ip-pools "SSLVPN_TUNNEL_ADDR1"
       set split-tunneling enable
       set ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
       set ipv6-split-tunneling enable
   ```
4. Configure SSL VPN settings, including the authentication rule for user mapping:

```fortigate-config
config vpn ssl settings
  set ssl-min-proto-ver tls1-1
  set servercert "fgt_gui_automation"
  set auth-timeout 0
  set login-attempt-limit 10
  set login-timeout 180
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPV6_ADDR1"
  set dns-suffix "sslvpn.com"
  set port 1443
  set source-interface "port2"
  set source-address "all"
  set source-address6 "all"
  set default-portal "testportal1"
config authentication-rule
  edit 1
    set users "client2"
    set portal "testportal2"
    set client-cert enable
    set user-peer "pki"
  next
end
```

5. Create a firewall address and policy. The destination addresses used in the policy are routed to the SSL VPN server.

```fortigate-config
config firewall address
  edit "bing.com"
    set type fqdn
    set fqdn "www.bing.com"
  next
end

config firewall policy
  edit 2
    set name "sslvpn2"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "mantis" "bing.com"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
    set users "client2"
  next
end
```
Configure the SSL VPN client

To create a PKI user in the GUI:

The PKI menu is only available in the GUI after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.

1. Go to User & Authentication > PKI and click Create New.
2. Set the Name to fgt_gui_automation.
3. Set CA to the CA certificate. The CA certificate allows the FortiGate to complete the certificate chain and verify the server’s certificate, and is assumed to already be installed on the FortiGate.
4. Click OK.
5. In the CLI, specify the CN of the certificate on the SSL VPN server:

   ```
   config user peer
   edit "ftg_gui_automation"
   set cn "*.fos.automation.com"
   next
   end
   ```

To create an SSL VPN client and virtual interface in the GUI:

1. Go to VPN > SSL-VPN Clients and click Create New.
2. Expand the Interface drop down and click Create to create a new virtual interface:
   a. Set the Name to sslclient_port1.
   b. Set Interface to port1.
   c. Under Administrative Access, select HTTPS and PING.
   d. Click OK.
3. Configure the SSL VPN client:

<table>
<thead>
<tr>
<th>Name</th>
<th>sslclientTo9</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>sslclient_port1</td>
</tr>
<tr>
<td>Server</td>
<td>172.16.200.9</td>
</tr>
<tr>
<td>Port</td>
<td>1443</td>
</tr>
<tr>
<td>Username</td>
<td>client2</td>
</tr>
<tr>
<td>Pre-shared Key</td>
<td>**********</td>
</tr>
<tr>
<td>Client Certificate</td>
<td>fgtb_gui_automation</td>
</tr>
<tr>
<td>Peer</td>
<td>fgt_gui_automation</td>
</tr>
<tr>
<td>Administrative Distance</td>
<td>Configure as needed.</td>
</tr>
<tr>
<td>Priority</td>
<td>Configure as needed.</td>
</tr>
<tr>
<td>Status</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

4. Click OK.

To create a firewall policy in the GUI:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Configure the policy:

<table>
<thead>
<tr>
<th>Name</th>
<th>policy_to_sslvpn_tunnel</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>port2</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>sslclient_port1</td>
</tr>
<tr>
<td>Source</td>
<td>all</td>
</tr>
<tr>
<td>Destination</td>
<td>all</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>Accept</td>
</tr>
</tbody>
</table>

3. Click OK.

To configure the SSL VPN client (FGT-A) in the CLI:

1. Create the PKI user. Use the CA that signed the certificate fgt_gui_automation, and the CN of that certificate on the SSL VPN server.

```fortios
config user peer
   edit "fgt_gui_automation"
```
2. Create the SSL interface that is used for the SSL VPN connection:

```text
set ca "GUI_CA"
set cn "*.fos.automation.com"
next
end
```

3. Create the SSL VPN client to use the PKI user and the client certificate *fgtb_gui_automation*:

```text
config vpn ssl client
edit "sslclientTo9"
set interface "sslclient_port1"
set user "client2"
set psk 123456
set peer "fgt_gui_automation"
set server "172.16.200.9"
set port 1443
set certificate "fgtb_gui_automation"
next
end
```

4. Create a firewall policy:

```text
config firewall policy
edit 1
set name "policy_to_sslvpn_tunnel"
set srcintf "port2"
set dstintf "sslclient_port1"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set nat enable
next
end
```

**Verification**

After the tunnel is established, the route to 13.107.21.200 and 204.79.197.200 on FGT-A connects through the SSL VPN virtual interface `sslclient_port1`.

**To check the routing table details:**

```bash
(vdom1) # get router info routing-table details
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
```
VPN

0 - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
* - candidate default

Routing table for VRF=0
S* 0.0.0.0/0 [10/0] via 172.16.200.254, port1
C 10.0.1.0/24 is directly connected, link_11
C 10.1.100.0/24 is directly connected, port2
C 10.212.134.200/32 is directly connected, sslclient_port1
S 10.1.100.126/32 [10/0] is directly connected, sslclient_port1
C 192.168.100.126/32 [10/0] is directly connected, sslclient_port1
S 204.79.197.200/32 [10/0] is directly connected, sslclient_port1

To check the added routing for an IPv6 tunnel:

(vdom1) # get router info6 routing-table database
IPv6 Routing Table
Codes: K - kernel route, C - connected, S - static, R - RIP, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
* - selected route, * - FIB route, p - stale info
Timers: Uptime

S  * > ::/0 [10/0] via 2000:172:16:200::254, port1, 00:00:01, [1024/0]
   * > [10/0] via ::, sslclient_port1, 00:00:01, [1024/0]
C  * > ::/128 via ::, vdoml, 03:26:35
C  * > 2000:10:0:1::64 via ::, link_11, 03:26:35
C  * > 2000:10:1:100::64 via ::, port2, 03:26:35
C  * > 2000:172:16:200::64 via ::, port1, 03:26:35
C  * > 2001:1::1/128 via ::, sslclient_port1, 00:00:01
C  * > fe80::/64 via ::, port2, 03:26:35

To check the connection in the GUI:

1. On the SSL VPN server FortiGate (FGT-B), go to Dashboard > Network and expand the SSL-VPN widget.

![SSL VPN Dashboard](image)

2. On the SSL VPN client FortiGate (FGT-A), go to VPN > SSL-VPN Clients to see the tunnel list.

![SSL VPN Clients](image)
Dual stack IPv4 and IPv6 support for SSL VPN

Dual stack IPv4 and IPv6 support for SSL VPN servers and clients enables a client to establish a dual stack tunnel to allow both IPv4 and IPv6 traffic to pass through. FortiGate SSL VPN clients also support dual stack, which allows it to establish dual stack tunnels with other FortiGates.

Users connecting in web mode can connect to the web portal over IPv4 or IPv6. They can access bookmarks in either IPv4 or IPv6, depending on the preferred DNS setting of the web portal.

Example

In this example, FortiGate B works as an SSL VPN server with dual stack enabled. A test portal is configured to support tunnel mode and web mode SSL VPN.

FortiGate A is an SSL VPN client that connects to FortiGate B to establish an SSL VPN tunnel connection. It attempts to access www.bing.com and www.apple.com via separate IPv4 and IPv6 connections. Two addresses are configured on FortiGate B:

- bing.com uses IPv4 FQDN and resolves to 13.107.21.200 and 204.79.197.200.
- apple_v6 uses IPv6 FQDN and resolves to 2600:140a:c000:385::1aca and 2600:140a:c000:398::1aca.

The server certificate used is fgt_gui_automation, and the CN is *.fos.automation.com.

A PC serves as a client to connect to FortiGate B in SSL VPN web mode. The PC can connect to the SSL VPN server over IPv4 or IPv6. Based on the preferred DNS setting, it will access the destination website over IPv4 or IPv6.

To configure an SSL VPN server in tunnel and web mode with dual stack support in the GUI:

1. Create a local user:
   a. Go to User & Authentication > User Definition and click Create New. The Users/Groups Creation Wizard opens.
   b. Set the User Type to Local User and click Next.
   c. Enter the Username (client2) and password, then click Next.
   d. Optionally, configure the contact information and click Next.
   e. Click Submit.
2. Configure the addresses:
a. Go to Policy & Objects > Addresses and click Create New > Address.
b. Enter the following for the IPv4 address:

<table>
<thead>
<tr>
<th>Category</th>
<th>Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>bing.com</td>
</tr>
<tr>
<td>Type</td>
<td>FQDN</td>
</tr>
<tr>
<td>FQDN</td>
<td><a href="http://www.bing.com">www.bing.com</a></td>
</tr>
</tbody>
</table>

c. Click OK.
d. Click Create New > Address and enter the following for the IPv6 address:

<table>
<thead>
<tr>
<th>Category</th>
<th>IPv6 Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>apple_v6</td>
</tr>
<tr>
<td>Type</td>
<td>FQDN</td>
</tr>
<tr>
<td>FQDN</td>
<td><a href="http://www.apple.com">www.apple.com</a></td>
</tr>
</tbody>
</table>

e. Click OK.

3. Configure the SSL VPN portal:
   a. Go to VPN > SSL-VPN Portals and click Create New.
   b. Enter a name (testportal1).
   c. Enable Tunnel Mode and for Enable Split Tunneling, select Enable Based on Policy Destination.
   d. For Source IP Pools, add SSLVPN_TUNNEL_ADDR1.
   e. Enable IPv6 Tunnel Mode and for Enable Split Tunneling, select Enable Based on Policy Destination.
   g. Enable Enable Web Mode.
h. Click OK.

4. Configure the SSL VPN settings:
a. Go to VPN > SSL-VPN Settings and configure the following:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Listen on Interface(s)</td>
<td>port1</td>
</tr>
<tr>
<td>Listen on Port</td>
<td>1443</td>
</tr>
<tr>
<td>Restrict Access</td>
<td>Allow access from any host</td>
</tr>
<tr>
<td>Server Certificate</td>
<td>fgt_gui_automation</td>
</tr>
<tr>
<td>Address Range</td>
<td>Automatically assign addresses</td>
</tr>
<tr>
<td>DNS Server</td>
<td>Same as client system DNS</td>
</tr>
<tr>
<td>Authentication/Portal Mapping</td>
<td>Edit the All Other Users/Groups entry to use testportal1.</td>
</tr>
</tbody>
</table>

b. Click Apply.

c. Enable dual stack in the CLI:

```
config vpn ssl settings
  set dual-stack-mode enable
end
```

5. Configure the firewall policy:

a. Go to Policy & Objects > Firewall Policy and click Create New.

b. Enter the following:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>sslvpn</td>
</tr>
<tr>
<td>Incoming Interface</td>
<td>ssl.root</td>
</tr>
<tr>
<td><strong>Outgoing Interface</strong></td>
<td>port2</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------</td>
</tr>
<tr>
<td><strong>Source</strong></td>
<td>all (IPv4), all (IPv6), client2</td>
</tr>
<tr>
<td><strong>Destination</strong></td>
<td>bing.com, apple_v6</td>
</tr>
<tr>
<td><strong>Schedule</strong></td>
<td>Always</td>
</tr>
<tr>
<td><strong>Service</strong></td>
<td>All</td>
</tr>
<tr>
<td><strong>NAT</strong></td>
<td>Enabled</td>
</tr>
</tbody>
</table>

c. Click OK.

**To configure FortiGate A as an SSL VPN client in the GUI:**

1. **Create a peer to verify the server certificate:**

   The PKI menu is only available in the GUI (User & Authentication > PKI) after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.
   If the CA is not known or is public, import the CA that signed the server certificate.

   a. Go to User & Authentication > PKI and click Create New.
   b. Set the Name to fgt_gui_automation.
   c. Set CA to the CA certificate that is used to verify the server certificate.
   d. Click OK.
   e. In the CLI, specify the CN that must be matched:

      ```
      config user peer
      edit "fgt_gui_automation"
      set ca "GUI_CA"
      set cn "*.fos.automation.com"
      next
      end
      ```

2. **Configure the SSL VPN client:**

   a. Go to VPN > SSL-VPN Clients and click Create New.
   b. In the Interface dropdown, click Create.
      i. Enter a Name (sslclient_port2).
      ii. Set Interface to port2.
      iii. Set Role to LAN.
iv. Click OK.

c. Configure the SSL VPN client:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>sslclientTo9</td>
</tr>
<tr>
<td>Interface</td>
<td>sslclient_port2</td>
</tr>
<tr>
<td>Server</td>
<td>Either IPv4 address 10.1.100.9 or IPv6 address 2000:10:1:100::9 can be used and will have the same results.</td>
</tr>
<tr>
<td>Port</td>
<td>1443</td>
</tr>
<tr>
<td>Username</td>
<td>client2</td>
</tr>
<tr>
<td>Pre-shared Key</td>
<td>******</td>
</tr>
<tr>
<td>Peer</td>
<td>fgt_gui_automation</td>
</tr>
<tr>
<td>Status</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

To configure FortiClient and connect to the VPN:

1. On the Remote Access tab and click Configure VPN, or if other connections have already been configured, click the sandwich icon and select Add a new connection.
2. Set Connection Name to FGT2500E, and Remote Gateway to 10.1.100.9.
3. Enable Customize port and enter the port number 1443.
4. Set Username to client2.
5. Enable Enable Dual-stack IPv6/IPv6 address.
6. Click Save.
7. Enter the password, then click Connect.

To configure an SSL VPN server in tunnel and web mode with dual stack support in the CLI:

1. Create a local user:

   ```
   config user local
   edit "client1"
   set type password
   set passwd *****
   next
   end
   ```

2. Configure the addresses:

   ```
   config firewall address
   edit "bing.com"
   set type fqdn
   set fqdn "www.bing.com"
   next
   end

   config firewall address6
   edit "apple_v6"
   set type fqdn
   set fqdn "www.apple.com"
   next
   end
   ```

3. Configure the SSL VPN portal:

   ```
   config vpn ssl web portal
   edit "testportal1"
   set tunnel-mode enable
   set ipv6-tunnel-mode enable
   set webmode enable
   set ip-pools "SSLVPN_TUNNEL_ADDR1"
   set ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
   ```
set split-tunneling enable
set ipv6-split-tunneling enable
next
end

4. Configure the SSL VPN settings:

```plaintext
config vpn ssl settings
  set servercert "ftg_gui_automation"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPV6_ADDR1"
  set port 1443
  set source-interface "port1"
  set source-address "all"
  set source-address6 "all"
  set default-portal "testportal1"
  set dual-stack-mode enable
end
```

5. Configure the firewall policy:

```plaintext
config firewall policy
  edit 1
    set name "sslvpn"
    set srcintf "ssl.root"
    set dstintf "port2"
    set srcaddr "all"
    set dstaddr "bing.com"
    set srcaddr6 "all"
    set dstaddr6 "apple_v6"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
    set users "client2"
next
end
```

To configure FortiGate A as an SSL VPN client in the CLI:

1. Create a peer to verify the server certificate:

```plaintext
config user peer
  edit "ftg_gui_automation"
    set ca "GUI_CA"
    set cn "*.fos.automation.com"
next
end
```

2. Configure the interface:

```plaintext
config system interface
  edit "sslclient_port2"
    set vdom "vdom1"
    set type ssl
    set role lan
    set snmp-index 46
    set interface "port2"
```
3. Configure the SSL VPN client. Either IPv4 address 10.1.100.9 or IPv6 address 2000:10:1:100::9 can be used and will have the same results:

```fortigate
config vpn ssl client
edit "sslclientTo9"
    set interface "sslclient_port2"
    set user "client2"
    set psk *****
    set peer "fgt_gui_automation"
    set server {10.1.100.9 | 2000:10:1:100::9}
    set port 1443
end
```

**Testing dual stack with tunnel mode**

**To verify the SSL VPN tunnel connection in the GUI:**

1. On FortiGate B, go to Dashboard > Network.
2. Expand the SSL-VPN widget.

![SSL VPN widget](image)

**To verify the SSL VPN tunnel connection in the CLI:**

1. On FortiGate B, verify that the client is assigned with both IPv4 and IPv6 addresses:

```
(root) # get vpn ssl monitor
SSL VPN Login Users:
Index User Group Auth Type Timeout Auth-Timeout From HTTP
  0 client2 1(1) 292 2147483647 10.1.100.2
  0/0 0/0 0

SSL VPN sessions:
Index User Group Source IP Duration I/O Bytes Tunnel/Dest IP
  0 client2 10.1.100.2 5427 1756/1772
  10.212.134.200,fdff:ffff::1
```

2. On FortiGate A, verify the routing tables.
   a. IPv4 with resolved addresses for www.bing.com:

```
(vdom1) # get router info routing-table database
... Routing table for VRF=0
```
To test the address connections using ping:

1. On FortiGate A, ping www.bing.com using IPv4 ping:
   # execute ping www.bing.com
   64 bytes from 13.107.21.200: icmp_seq=0 ttl=117 time=1.8 ms
   ...

2. On FortiGate B, sniff for IPv4 ICMP packets and observe the results:
   # diagnose sniffer packet any icmp 4
   interfaces=[any]
   filters=[icmp]
   ...

3. On FortiGate A, ping www.apple.com using IPv6 ping:
   # execute ping6 www.apple.com
   PING www.apple.com (2600:140a:c000:385::1aca): 56 data bytes
   64 bytes from 2600:140a:c000:385::1aca: icmp_seq=1 ttl=52 time=1.88 ms
   ...

4. On FortiGate B, sniff for IPv6 ICMP packets and observe the results:
   # diagnose sniffer packet any icmp6 4
   interfaces=[any]
   filters=[icmp6]
   3.564296 ssl.root in fdff:ffff::1 -> 2600:140a:c000:385::1aca: icmp6: echo request seq 1
   3.564435 port2 out 2000:172:16:200::9 -> 2600:140a:c000:385::1aca: icmp6: echo request seq 1
Testing dual stack with web mode

In SSL VPN web mode, users can access both IPv4 and IPv6 bookmarks in the portal. The attribute, `prefer-ipv6-dns` can be enabled to prefer querying IPv6 DNS first, or disabled to prefer querying IPv4.

To test an IPv4 connection to the web portal and access www.bing.com over IPv6:

1. On FortiGate B, prioritize resolving IPv6 addresses:
   ```
   config vpn ssl web portal
   edit "testportal1"
   set prefer-ipv6-dns enable
   next
   end
   ```

2. Log in to the web portal in the browser over the IPv4 address 10.1.100.9.
4. Click the `bing` bookmark. The bing page will open over IPv6.

To test an IPv6 connection to the web portal and access www.apple.com over IPv4:

1. On FortiGate B, prioritize resolving IPv4 addresses:
   ```
   config vpn ssl web portal
   edit "testportal1"
   set prefer-ipv6-dns disable
   next
   end
   ```

2. Log in to the web portal in the browser over the IPv6 address [2000:10:1:100::9].
4. Click the *apple* bookmark. The apple page will open over IPv4.

Disable the clipboard in SSL VPN web mode RDP connections

In web portal profiles, the clipboard can be disabled for SSL VPN web mode RDP/VNC connections. User will not be able to copy and paste content to or from the internal server.

**Example**

In this example, two groups of users are using SSL VPN web mode to access internal servers with RDP/VNC. One group is allowed to copy and paste content to and from the internal server using the clipboard, while the other is not.

**To configure the SSL VPN portals in the GUI:**

1. Go to **VPN > SSL-VPN Portals** and click **Create New**.
2. Enter a name for the portal, such as *testportal1*.
3. Enable **Enable Web Mode** and enable **RDP/VNC clipboard** to allow copying and pasting.
4. Configure the remaining settings as needed.
5. Click **OK**.
6. Click Create New again.
7. Enter a name for the portal, such as testportal2.
8. Enable Enable Web Mode and disable RDP/VNC clipboard to prevent copying and pasting.
9. Configure the remaining settings as needed.

To configure the SSL VPN settings in the GUI:

1. Go to VPN > SSL-VPN Settings.
2. Set Listen on Interface to port2.
3. In the Authentication/Portal Mapping table, add the users to each of the portals:
   a. Click Create New.
   b. Set Users/Groups to u1 and Portal to testportal1.
   c. Click OK, then click Create New again.
   d. Set Users/Groups to u2 and Portal to testportal2.
   e. Click OK.
4. Configure the remaining settings as needed.
5. Click Apply.
To configure a firewall policy for SSL VPN in the GUI:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Set a name for the policy, such as policy_to_sslvpn_tunnel.
3. Set Incoming Interface to the SSL VPN tunnel interface and Outgoing Interface to port1.
4. Set Source to the users, u1 and u2, and all addresses.
5. Set Destination to all addresses.
6. Set Schedule to always, Service to All, and Action to Accept.
7. Configure the remaining settings as needed.
8. Click OK.

To test if the users can use the clipboard:

1. On the PC, open a web browser and log in to the web portal as user u1.
2. Access the internal server using RDP/VNC.
3. The clipboard is available and you can copy and paste content to and from the remote server.
4. Log out of the web portal, then log back in as user u2 and access the internal server using RDP/VNC. The clipboard is disabled.

To configure the SSL-VPN portals and settings in the CLI:

1. Configure the SSL VPN portals:

```fortioscli
config vpn ssl web portal
edit "testportal1"
   set web-mode enable
   set clipboard enable
   ...
next
edit "testportal2"
   set web-mode enable
   set clipboard disable
   ...
next
end
```

2. Configure the SSL VPN settings:

```fortioscli
config vpn ssl settings
set port 1443
set source-interface "port2"
set source-address "all"
set source-address6 "all"
set default-portal "tunnel-access"
config authentication-rule
   edit 1
```
3. Configure a firewall policy for SSL VPN:

```
config firewall policy
edit 1
  set name "policy_to_sslvpn_tunnel"
  set srcintf "ssl.vdom1"
  set dstintf "port1"
  set action accept
  set srcaddr "all"
  set dstaddr "all"
  set srcaddr6 "all"
  set dstaddr6 "all"
  set schedule "always"
  set service "ALL"
  set nat enable
  set users "u1" "u2"
next
end
```

4. On the PC, open a web browser, log in to the web portal as user u1, access the internal server using RDP/VNC, and use the clipboard.

5. Check the SSL VPN session monitor:

```
# get vpn ssl monitor
SSL-VPN Login Users:
<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Group</th>
<th>Auth Type</th>
<th>Timeout</th>
<th>Auth-Timeout</th>
<th>From</th>
<th>HTTP in/out</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>u1</td>
<td></td>
<td></td>
<td>1(1)</td>
<td>N/A</td>
<td>10.1.100.146</td>
<td>0/0/364</td>
</tr>
</tbody>
</table>

SSL-VPN sessions:
<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Group</th>
<th>Source IP</th>
<th>Duration</th>
<th>I/O Bytes</th>
<th>Tunnel/Dest IP</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>u1</td>
<td></td>
<td>10.1.100.146</td>
<td>64</td>
<td>0/700</td>
<td>172.18.58.109</td>
</tr>
</tbody>
</table>
```

6. On the PC, open a web browser, log in to the web portal as user u2, access the internal server using RDP/VNC, and note that the clipboard is not available.

7. Check the SSL VPN session monitor:

```
# get vpn ssl monitor
SSL-VPN Login Users:
<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Group</th>
<th>Auth Type</th>
<th>Timeout</th>
<th>Auth-Timeout</th>
<th>From</th>

<td>10.1.100.146</td>
<td>7</td>
<td>0/553</td>
<td>172.18.58.109</td>
</tr>
</tbody>
</table>
```
SSL VPN IP address assignments

When a user disconnects from a VPN tunnel, it is not always desirable for the released IP address to be used immediately. In SSL VPN, IP addresses can be assigned from the pool in a round robin fashion, instead of the default first-available address method.

Example

![Diagram of two PCs connecting to a FortiGate through an SSL VPN tunnel]

In this example, two PCs connect to the VPN. SSL VPN is configured to use round robin IP address assignment. Dual stack address assignment (both IPv4 and IPv6) is used.

After a tunnel is disconnected, freeing a low IP address, the next client that connects gets the next address in the round robin instead of the lowest address.

To configure SSL VPN with round robin and dual stack:

1. Create IPv4 and IPv6 address ranges:

   ```
   config firewall address
   edit "sslvpn_ipv4_pool"
   set type iprange
   set start-ip 173.10.1.1
   set end-ip 173.10.1.3
   next
   end
   config firewall address6
   edit "sslvpn_ipv6_pool"
   set type iprange
   set start-ip 2000::ad0a:101
   set end-ip 2000::ad0a:103
   next
   end
   ```

2. Set the address ranges as IP pools in the SSL VPN settings:

   ```
   config vpn ssl settings
   set tunnel-ip-pools "sslvpn_ipv4_pool"
   set tunnel-ipv6-pools "sslvpn_ipv6_pool"
   end
   ```
When round-robin is used, any address pools defined in the web portal are ignored and the tunnel IPv4 and IPv6 pool addresses in the SSL VPN settings are used. Only one set of IP pool addresses can be applied.

3. Enable round-robin and dual stack in the SSL VPN settings:

```fortigate
config vpn ssl settings
    set dual-stack-mode enable
    set tunnel-addr-assigned-method round-robin
end
```

By default, the IP pool assignment follows the first available rule.

4. Create two users and assign them to an SSL VPN policy:

```fortigate
config user local
    edit "u1"
        set type password
        set passwd **********
    next
    edit "u2"
        set type password
        set passwd **********
    next
end
config firewall policy
    edit 1
        set name "sslvpnd"
        set srcintf "ssl.vdom1"
        set dstintf "link_11" "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "u1" "u2"
    next
end
```

To test the results:

1. Log in to the SSL VPN on PC1 using user u1 and then check its assigned IP address:

```fortigate
# get vpn ssl monitor
SSL-VPN Login Users:

<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Group</th>
<th>Auth Type</th>
<th>Two-factor Auth</th>
<th>Timeout</th>
<th>Auth-Timeout</th>
<th>From</th>
<th>HTTP</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>ul</td>
<td>1</td>
<td>N/A</td>
<td>10.1.100.145</td>
<td>0/0</td>
<td>0/0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

SSL-VPN sessions:

<table>
<thead>
<tr>
<th>Index</th>
<th>User</th>
<th>Group</th>
<th>Source IP</th>
<th>Duration</th>
<th>I/O Bytes</th>
<th>Tunnel/Dest IP</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>ul</td>
<td>1</td>
<td>10.1.100.145</td>
<td>13</td>
<td>49935/35251</td>
<td>173.10.1.1,2000::ad0a:101</td>
</tr>
</tbody>
</table>
```

2. Log in to the SSL VPN on PC1 using user u2 and then check its assigned IP address:
SSL VPN troubleshooting

The following topics provide information about SSL VPN troubleshooting:

- Debug commands on page 1780
- Troubleshooting common issues on page 1781

Debug commands

SSL VPN debug command

Use the following diagnose commands to identify SSL VPN issues. These commands enable debugging of SSL VPN with a debug level of -1 for detailed results.

diagnose debug application sslvpn -1
diagnose debug enable

The CLI displays debug output similar to the following:

FGT60C3G10002814 # [282:root]SSL state:before/accept initialization (172.20.120.12)
[282:root]SSL state:SSLv3 read client hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write server hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write change cipher spec A (172.20.120.12)
[282:root]SSL state:SSLv3 write finished B (172.20.120.12)
[282:root]SSL state:SSLv3 flush data (172.20.120.12)
[282:root]SSL state:SSLv3 read finished A:system lib(172.20.120.12)
[282:root]SSL state:SSLv3 read finished A (172.20.120.12)
[282:root]SSL state:SSL negotiation finished successfully (172.20.120.12)
[282:root]SSL established: DHE-RSA-AES256-SHA SSLv3 Kx=DH Au=RSA Enc=AES(256) Mac=SHA1

To disable the debug:

diagnose debug disable
diagnose debug reset

Remote user authentication debug command

Use the following diagnose commands to identify remote user authentication issues.

diagnose debug application fnbamd -1
diagnose debug reset

Troubleshooting common issues

To troubleshoot getting no response from the SSL VPN URL:

1. Go to VPN > SSL-VPN Settings.
   a. Confirm that SSL VPN is enabled.
   b. Check the SSL VPN port assignment.
   c. Check the Restrict Access setting to ensure the host you are connecting from is allowed.

2. Go to Policy > Firewall Policy.
   a. Check that the policy for SSL VPN traffic is configured correctly.
   b. Check the URL you are attempting to connect to. It should follow this pattern:
      https://<FortiGate IP>:<Port>
   c. Check that you are using the correct port number in the URL. Ensure FortiGate is reachable from the computer.
      ping <FortiGate IP>
   d. Check the browser has TLS 1.1, TLS 1.2, and TLS 1.3 enabled.

To troubleshoot FortiGate connection issues:

1. Check the Release Notes to ensure that the FortiClient version is compatible with your version of FortiOS.
2. FortiClient uses IE security setting, In IE Internet options > Advanced > Security, check that Use TLS 1.1 and Use TLS 1.2 are enabled.
3. Check that SSL VPN ip-pools has free IPs to sign out. The default ip-poolsSSLVPN_TUNNEL_ADDR1 has 10 IP addresses.
4. Export and check FortiClient debug logs.
   a. Go to File > Settings.
   b. In the Logging section, enable Export logs.
   c. Set the Log Level to Debug and select Clear logs.
   d. Try to connect to the VPN.
   e. When you get a connection error, select Export logs.
To troubleshoot SSL VPN hanging or disconnecting at 98%:

1. A new SSL VPN driver was added to FortiClient 5.6.0 and later to resolve SSL VPN connection issues. If your FortiOS version is compatible, upgrade to use one of these versions.

2. Latency or poor network connectivity can cause the login timeout on the FortiGate. In FortiOS 5.6.0 and later, use the following commands to allow a user to increase the SSL VPN login timeout setting.

   ```
   config vpn ssl settings
   set login-timeout 180 (default is 30)
   set dtls-hello-timeout 60 (default is 10)
   end
   ```

To troubleshoot tunnel mode connections shutting down after a few seconds:

This might occur if there are multiple interfaces connected to the Internet, for example, SD-WAN. This can cause the session to become “dirty”. To allow multiple interfaces to connect, use the following CLI commands.

If you are using a FortiOS 6.0.1 or later:

   ```
   config system interface
   edit <name>
   set preserve-session-route enable
   next
   end
   ```

If you are using a FortiOS 6.0.0 or earlier:

   ```
   config vpn ssl settings
   set route-source-interface enable
   end
   ```

To troubleshoot users being assigned to the wrong IP range:

1. Go to VPN > SSL-VPN Portals and VPN > SSL-VPN Settings and ensure the same IP Pool is used in both places. Using the same IP Pool prevents conflicts. If there is a conflict, the portal settings are used.

To troubleshoot slow SSL VPN throughput:

Many factors can contribute to slow throughput.

This recommendation tries to improve throughput by using the FortiOS Datagram Transport Layer Security (DTLS) tunnel option, available in FortiOS 5.4 and above.

DTLS allows SSL VPN to encrypt traffic using TLS and uses UDP as the transport layer instead of TCP. This avoids retransmission problems that can occur with TCP-in-TCP.

FortiClient 5.4.0 to 5.4.3 uses DTLS by default. FortiClient 5.4.4 and later uses normal TLS, regardless of the DTLS setting on the FortiGate.

To use DTLS with FortiClient:

1. Go to File > Settings and enable Preferred DTLS Tunnel.

To enable DTLS tunnel on FortiGate, use the following CLI commands:

   ```
   config vpn ssl settings
   set dtls-tunnel enable
   end
   ```
User & Authentication

In *User & Authentication*, you can control network access for different users and devices in your network. FortiGate authentication controls system access by user group. By assigning individual users to the appropriate user groups you can control each user’s access to network resources. You can define local users and peer users on the FortiGate unit. You can also define user accounts on remote authentication servers and connect them to FortiOS.

You can control network access for different device types in your network by doing the following:

- Identifying and monitoring the types of devices connecting to your network
- Using MAC address based access control to allow or deny individual devices
- Using Telemetry data received from FortiClient endpoints to construct a policy to deny access to endpoints with known vulnerabilities or to quarantine compromised endpoints

The following sections provide information about users and devices:

- Endpoint control and compliance on page 1783
- User definition and groups on page 1792
- LDAP servers on page 1805
- RADIUS servers on page 1820
- TACACS+ servers on page 1852
- SAML on page 1854
- Authentication settings on page 1882
- FortiTokens on page 1884
- PKI on page 1902
- Configuring the maximum log in attempts and lockout period on page 1902
- Configuring firewall authentication on page 1906
- FSSO on page 1913
- Authentication policy extensions on page 1923
- Configuring the FortiGate to act as an 802.1X supplicant on page 1924
- Include usernames in logs on page 1926

Endpoint control and compliance

The section contains the following topics:

- Per-policy disclaimer messages on page 1783
- Compliance on page 1786
- FortiGuard distribution of updated Apple certificates on page 1788
- Integrate user information from EMS and Exchange connectors in the user store on page 1789

Per-policy disclaimer messages

FortiOS supports a customizable captive portal to direct users to install or enable required software.
Per-policy custom disclaimers in each VDOM are supported. For example, you may want to configure three firewall policies, each of which matches traffic from endpoints with different FortiClient statuses:

<table>
<thead>
<tr>
<th>Endpoint status</th>
<th>FortiOS behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint does not have FortiClient installed.</td>
<td>Traffic matches a firewall policy that displays an in-browser warning to install FortiClient from the provided link.</td>
</tr>
<tr>
<td>Endpoint has FortiClient installed, registered to EMS, and connected to the FortiGate.</td>
<td>Traffic matches a dynamic firewall policy which allows the endpoint to reach its destination via this policy.</td>
</tr>
<tr>
<td>Endpoint is deregistered from EMS and disconnected from the FortiGate.</td>
<td>Traffic matches another dynamic firewall policy that displays warning to register FortiClient to EMS.</td>
</tr>
</tbody>
</table>

The replacement message groups and policy disclaimer settings must be enabled.

To enable per-policy disclaimer messages in the GUI:

1. Go to System > Feature Visibility.
2. Enable Replacement Message Groups and Policy Disclaimer.
3. Click Apply.

To enable per-policy disclaimer messages in the CLI:

```fortios
config system global
    set gui-replacement-message-groups enable
end

config system settings
    set gui-policy-disclaimer enable
end
```

To configure per-policy disclaimers in the GUI:

1. Ensure the per-policy disclaimer messages option is enabled.
2. Go to Policy & Objects > Firewall Policy.
3. Edit the policy that applies when an endpoint does not have FortiClient installed.
5. Add a replacement message group:
   a. Select an existing replacement message group from the dropdown and click Edit Disclaimer Message.
   b. Click Create, enter a name, and click OK. Select the replacement message group and click Edit
6. Edit the message to warn users to install FortiClient, and provide the FortiClient download link.
7. Click Save.
8. Repeat the above steps for each policy that requires a custom disclaimer message.

To configure per-policy disclaimers in the CLI:

```plaintext
cfg firewall policy
  edit 1
    set name "111"
    set srcintf "port12"
    set dstintf "port11"
    set srcaddr "all"
    set dstaddr "pc155_address"
    set action accept
    set schedule "always"
    set service "ALL"
    set wss disable
    set groups "ems_03_group"
    set disclaimer enable
    set replacemsg-override-group "test"
    set nat enable
next
  edit 4
    set name "44"
    set srcintf "port12"
    set dstintf "port11"
    set srcaddr "all"
    set dstaddr "pc5-address"
    set action accept
```
set schedule "always"
set service "ALL"
set wssd disable
set groups "ems_03_group"
set disclaimer enable
set replacemsg-override-group "test2"
set nat enable

next

edit 6

set name "66"
set srcintf "port12"
set dstintf "port11"
set srcaddr "all"
set dstaddr "all"
set status disable
set schedule "always"
set service "ALL"
set logtraffic all
set fssd disable
set block-notification enable
set replacemsg-override-group "endpoint-override"

next

end

Compliance

The following topics provide information about compliance in FortiOS.

- FortiGate VM unique certificate on page 1786
- Running a file system check automatically on page 1787

FortiGate VM unique certificate

To safeguard against certificate compromise, FortiGate VM and FortiAnalyzer VM use the same deployment model as FortiManager VM where the license file contains a unique certificate tied to the serial number of the virtual device.

A hardware appliance usually comes with a BIOS certificate with a unique serial number that identifies the hardware appliance. This built-in BIOS certificate is different from a firmware certificate. A firmware certificate is distributed in all appliances with the same firmware version.

Using a BIOS certificate with a built-in serial number provides a high trust level for the other side in X.509 authentication.

Since a VM appliance has no BIOS certificate, a signed VM license can provide an equivalent of a BIOS certificate. The VM license assigns a serial number in the BIOS equivalent certificate. This gives the certificate an abstract access ability, which is similar to a BIOS certificate with the same high trust level.

This feature is only supported in new, registered VM licenses.
Sample configurations

Depending on the firmware version and VM license, the common name (CN) on the certificate will be configured differently.

<table>
<thead>
<tr>
<th>License</th>
<th>6.0</th>
<th>6.2</th>
<th>6.4</th>
<th>7.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>CN = FortiGate</td>
<td>CN = FortiGate</td>
<td>CN = FortiGate</td>
<td>CN = FortiGate</td>
</tr>
<tr>
<td>6.2</td>
<td>CN = FortiGate</td>
<td>CN = serial number</td>
<td>CN = serial number</td>
<td>CN = serial number</td>
</tr>
<tr>
<td>6.4</td>
<td>CN = FortiGate</td>
<td>CN = serial number</td>
<td>CN = serial number</td>
<td>CN = serial number</td>
</tr>
<tr>
<td>7.0</td>
<td>CN = FortiGate</td>
<td>CN = serial number</td>
<td>CN = serial number</td>
<td>CN = serial number</td>
</tr>
</tbody>
</table>

To view validated certificates:

1. Go to System > Certificates.
2. Double-click on a VM certificate. There are two VM certificates:
   - Fortinet.Factory
   - Fortinet.Factory_Backup
   The Certificate Detail Information window displays.

Running a file system check automatically

There is an option in FortiOS to enable automatic file system checks if the FortiGate shuts down ungracefully.

By default, the automatic file system check is disabled. When an administrator logs in after an ungraceful shutdown, a warning message appears advising them to manually run a file system check. A warning also appears in the CLI:

WARNING: File System Check Recommended! Unsafe reboot may have caused inconsistency in disk drive.
It is strongly recommended that you check file system consistency before proceeding.
Please run 'execute disk scan 17'

Note: The device will reboot and scan during startup. This may take up to an hour

Enabling automatic file system checks

You can enable automatic file system checks in both the GUI and CLI.

To enable automatic file system checks in the GUI:

1. Go to System > Settings.
2. In the Start Up Settings section, enable Auto file system check.
3. Click Apply.

To enable automatic file system checks using the CLI:

```
config system global
    set autorun-log-fsck enable
end
```

FortiGuard distribution of updated Apple certificates

Push notifications for iPhone (for the purpose of two-factor authentication) require a TLS server certificate to authenticate to Apple. As this certificate is only valid for one year, a service extension allows FortiGuard to distribute updated TLS server certificates to FortiGate when needed.

FortiGuard update service updates local Apple push notification TLS server certificates when the local certificate is expired. FortiGuard update service also reinstalls certificates when the certificates are lost.

You can verify that the feature is working on the FortiGate by using the CLI shell.

To verify certificate updates:

1. Using FortiOS CLI shell, verify that all certificates are installed:

   ```
   /data/etc/apns # ls -al
   drwxr-xr-x  2 0 0 Tue Jan 15 08:42:39 2019 1024 .
   drwxr-xr-x 12 0 0 Tue Jan 15 08:45:00 2019 2048 ..
   -rw-r--r--  1 0 0 Sat Jan 12 00:06:30 2019 2377 apn-dev-cert.pem
   -rw-r--r--  1 0 0 Sat Jan 12 00:06:30 2019 1859 apn-dev-key.pem
   -rw-r--r--  1 0 0 Sat Jan 12 00:06:30 2019 8964 apn-dis-cert.pem
   -rw-r--r--  1 0 0 Sat Jan 12 00:06:30 2019 4482 apn-dis-key.pem
   ```

2. Rename all current Apple certificates. Apple push notification no longer works after you rename the certificates.

   ```
   /data/etc/apns # mv apn-dis-cert.pem apn-dis-cert.pem.save
   /data/etc/apns # mv apn-dev-cert.pem apn-dev-cert.pem.save
   /data/etc/apns # mv apn-dev-key.pem apn-dev-key.pem.save
   /data/etc/apns # ls -al
   ```
3. Run a FortiGuard update, and verify that all certificates are installed again:

```
/data/etc/apns # ls -al
```

```
-rw-r--r- 1 0 0 Sat Jan 12 00:06:30 2019 2377 apn-dev-cert.pem.save
-rw-r--r- 1 0 0 Sat Jan 12 00:06:30 2019 1859 apn-dev-key.pem.save
-rw-r--r- 1 0 0 Sat Jan 12 00:06:30 2019 8964 apn-dis-cert.pem.save
-rw-r--r- 1 0 0 Sat Jan 12 00:06:30 2019 4482 apn-dis-key.pem.save
```

**Integrate user information from EMS and Exchange connectors in the user store**

When a FortiClient endpoint is managed by EMS, logged in user and domain information is shared with FortiOS through the EMS connector. This information can be joined with the Exchange connector to produce more complete user information in the user store.

The `diagnose user-device-store device memory list` command displays detailed device information.
In this example, the FortiClient PC user (test1) logs on to the AD domain (FORTINET-FSSO.COM), which is also the same domain as the Exchange server. The user information is pushed to the EMS server that the user is registered to. The FortiGate synchronizes the information from EMS, and at the same time looks up the user on the Exchange server under the Exchange connector. If the user exists on the Exchange server, additional information is fetched. These details are combined in the user store, which is visible in the FortiClient widget in the Status dashboard.

**To configure the Exchange server:**

```plaintext
config user exchange
edit "exchange-140"
    set server-name "W2K8-SERV1"
    set domain-name "FORTINET-FSSO.COM"
    set username "Administrator"
    set password ********
next
end
```

**To configure the EMS server:**

```plaintext
config endpoint-control fctems
edit "ems133"
    set server "172.18.62.12"
    set certificate-fingerprint "4F:A6:76:E2:00:4F:A6:76:E2:00:4F:A6:76:E2:00:E0"
```
To view the user information in the GUI:

1. Go to Dashboard > Status.
2. In the FortiClient widget, hover over a device or user name to view the information.

To view the user information in the CLI:

# diagnose user-device-store device memory list
...
Record #13:

device_info
  'ipv4_address' = '10.1.100.185'
  'mac' = '00:0c:29:11:5b:6b'

User & Authentication

User definition and groups

FortiGate authentication controls system access by user groups. By assigning individual users to the appropriate user groups, this controls each user’s access to network resources. The user groups members are user accounts, of which there are several types. Local and peer users are defined in FortiOS. User accounts can also be defined on remote authentication servers.

This section contains information about configuring the following:

- Users on page 1792
- User groups on page 1794
- Retail environment guest access on page 1801
- User and user group timeouts on page 1804

For information about configuring authentication servers, see the LDAP servers on page 1805, RADIUS servers on page 1820, TACACS+ servers on page 1852, and SAML on page 1854 sections.

Users

A user is a user account consisting of a username, password, and sometimes other information, that is configured in FortiOS or on an external authentication server. There are several types of user accounts with slightly different methods of authentication.

<table>
<thead>
<tr>
<th>User type</th>
<th>Authentication method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local</td>
<td>The username and password must match a user account stored in FortiOS. Authentication is done by a firewall policy.</td>
</tr>
<tr>
<td>Remote</td>
<td>Remote users consist of usernames defined in FortiOS that are authenticated by a remote server. For example, RADIUS, TACACS+, LDAP, or FortiNAC. The server must be configured in FortiOS before creating a user.</td>
</tr>
<tr>
<td>FSSO</td>
<td>Users on a Microsoft Windows, Citrix, or Novell network can use their network authentication to access resources through the FortiGate. Access is controlled through FSSO user groups, which contain Windows, Citrix, or Novell user groups as members. The FSSO agent must be configured in FortiOS before creating a user (see FSSO on page 1913).</td>
</tr>
<tr>
<td>PKI or peer</td>
<td>A PKI or peer user is a digital certificate holder that authenticates using a client certificate. No password is required, unless two-factor authentication is enabled. In the GUI, the User &amp; Authentication &gt; PKI menu is only available after a PKI user is configured in the CLI (see Configuring a PKI user on page 1903).</td>
</tr>
</tbody>
</table>

Some user types have an option to enable multi-factor authentication using FortiToken or FortiToken Cloud. In some cases, the user must be defined first, and then can be edited to add multi-factor authentication. See FortiTokens on page 1884 for more information.

To create a user:

1. Go to User Authentication > User Definition and click Create New. The Users/Groups Creation Wizard appears.
2. Select a User Type and click Next.
3. The remaining wizard steps depend on the user type:
   - **Local User**:
     i. Enter a Username and Password, then click Next.
     ii. Optionally, enable Two-factor Authentication and configure the following:

     | Authentication Type | Select FortiToken Cloud or FortiToken. |
     |---------------------|----------------------------------------|
     | Token               | If using FortiToken to authenticate, select a token. |
     | Email Address       | Enter an email address. |
     | SMS                 | Enable to send an SMS message to activate the token. |
     | Country Dial Code   | Select the country code. |
     | Phone Number        | Enter a phone number. |

     iii. Click Next, then click Submit.

   - **Remote LDAP User**:
     i. Select an LDAP Server, then click Next.
     ii. Select the users to add from the LDAP server. If the user ID matches an existing configured username, it cannot be added.

     | User ID | Qualifier | Base DN | Search Filter | Result Count |
     |---------|-----------|---------|---------------|--------------|
     | Admin   | Local     | dc=lab,dc=local | | 0 |
     | martin  | 0         |         |               | 0 |
     | jim     | 0         |         |               | 0 |
     | kkk     | 0         |         |               | 0 |
     | krztg   | 0         |         |               | 0 |
     | omar    | 0         |         |               | 0 |
     | stanley | 0         |         |               | 0 |
     | tobby   | 0         |         |               | 0 |

     iii. Click Submit.

   - **Remote RADIUS User and Remote TACACS+ User**:
     i. Enter a Username and select the server.
     ii. Click Next.
     iii. Optionally, enable Two-factor Authentication and configure the settings as needed.
     iv. Click Next, then click Submit.
FSSO:
   i. Select an FSSO Agent, click the + to add AD Groups, then click Next.
   ii. Select an FSSO group to add the AD Groups to. If an FSSO group already exists (see Configuring FSSO user groups on page 1798), click Choose Existing and select the group. Otherwise, click Create New, enter a name, and click OK.
   iii. Click Submit.

User groups

A user group is a list of user identities. A user identity can be a:

- Local user account (username/password) stored on the FortiGate
- Remote user account (password stored on a RADIUS, LDAP, or TACACS+ server)
- PKI user account with a digital client authentication certificate stored on the FortiGate
- RADIUS, LDAP, or TACACS+ server, optionally specifying particular user groups on that server
- User group defined on an FSSO server

User groups provide the ability to combine users that require the same permissions so they can be referenced at once, which enables consistency in configurations. User groups allow for remote servers to be referenced by leveraging the pre-existing user accounts, instead of redefining them on the FortiGate.

For example, when a new employee joins a department, they can be added to their respective group, whether in the remote authentication server or local group, and be subject to the same access as their colleagues in the same department. In FortiOS, user groups can be used when configuring firewall policies, traffic shaping policies, proxy policies, SSL VPN portals, IPsec VPN XAUTH, ZTNA, wireless networks (SSID), web filtering profiles, identity-based routing, and system administrators with remote authentication.

In most cases, the FortiGate authenticates users by requesting their username and password. The FortiGate checks local user accounts first. If a match is not found, the FortiGate checks the RADIUS, LDAP, or TACACS+ servers that belong to the user group. Authentication succeeds when a matching username and password are found. If the user belongs to multiple groups on a server, those groups will also be matched.

Four types of user groups can be configured:

- Firewall
- FSSO
- RSSO
- Guest

Configuring firewall user groups

Firewall user groups are used locally as part of authentication. For example, when a firewall policy allows access only to specified user groups, users must authenticate before matching the policy. If the user authenticates successfully and is a member of one of the permitted groups, the policy is applied to the user. A firewall user group may contain local users (defined locally or authenticated remotely), PKI users, or authentication servers.

There are two options to add users in a firewall group configuration: members or remote groups. Members are the individual users who have been defined in FortiOS. Remote groups are remote server that users may authenticate to. One or more user groups can be specified within that server to limit which users can authenticate to the firewall user group. Both options may be used at the same time. The FortiGate attempts to authenticate users in the members list first, and then the remote groups if the initial authentication does not succeed.
When adding remote groups to user groups, FortiTokens cannot be applied to the users. To use remote authentication servers and FortiToken for multi-factor authentication, a remote user type must be created and then added as a user group member.

The following user group configuration examples have local members and a remote authentication server user group. There are two LDAP users, but the principle applies to other remote authentication server types.

Both LDAP users (shudson and tflenderson) belong to the primary group, Domain Users. The user, shudson belongs to the Sales group; tflenderson belongs to the HR group.

**Example 1: Adding multiple remote groups to a user group**

In this example, two remote groups (HR and Sales) are added to a firewall group called SSL_VPN_ACCESS.

**To add multiple remote groups to a user group:**

1. Go to User & Authentication > User Groups and click Create New. Firewall is selected as the default Type.
2. Enter the group name, SSL_VPN_ACCESS.
3. In the Remote Groups Section, click Add.
4. Set Remote Server to the LDAP server (ldap).
5. In the Groups table, select Sales, then right-click and select Add Selected.
6. Select HR, then right-click and select Add Selected.

7. Click OK.
Both user group paths are specified under the Group Name.

8. Click OK.
In this configuration, shudson and tflenderson would be able to authenticate to this group.
Example 2: combining remote groups and local users in a user group

In this example, the firewall group (SSL_VPN_ACCESS) is configured to contain the HR remote group and a local LDAP user (shudson) with multi-factor authentication.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Two-factor Authentication</th>
<th>Groups</th>
<th>Status</th>
<th>Ref.</th>
</tr>
</thead>
<tbody>
<tr>
<td>shudson</td>
<td>LDAP</td>
<td></td>
<td>Enabled</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Administrator</td>
<td>LDAP</td>
<td></td>
<td>Enabled</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Guest</td>
<td>LDAP</td>
<td></td>
<td>Enabled</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>Mandrews</td>
<td>LDAP</td>
<td></td>
<td>Enabled</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

To combine remote groups and local users in a user group:

1. Go to User & Authentication > User Groups and click Create New. Firewall is selected as the default Type.
2. Enter the group name, SSL_VPN_ACCESS.
3. In the Remote Groups Section, click Add.
4. Set Remote Server to the LDAP server (ldap).
5. In the Groups table, select HR, then right-click and select Add Selected.
6. Click OK.
7. In the Members field, click the + and add shudson.

8. Click OK.

In this configuration, shudson, tflenderson, and any members of the HR LDAP group would be able to authenticate to the user group. Other users in the Sales group are not allowed.

Example 3: adding a user as a member and their group as a remote groups

This example uses a combination of the previous examples. The HR and Sales groups are added as remote groups similar to example 1. The local LDAP user, shudson (using a FortiToken), from example 2 is added as a group member.

This example is for demonstration only. It may cause unwanted results, so this configuration is not advised.
To add a user as a member and their group as a remote groups:

1. Refer to example 1 to configure the two remote groups.
2. In the Members field, click the + and add shudson.
3. Click OK.

One unwanted scenario from this configuration is that a user might be able to bypass multi-factor authentication on LDAP by changing the username case (see the related PSIRT advisory). By default, the username of the remote LDAP user is case sensitive. This means the username has to match what is configured (shudson). If a user types shudson, for example, this will not match the user shudson, so it falls through to remote group authentication. It will match the Sales group in this example. To prevent this, disable username case sensitivity (see SSL VPN for remote users with MFA and user sensitivity on page 1670 for more details).

To disable case sensitivity on the remote user:

```
config user local
  edit <name>
    set type ldap
    set two-factor fortitoken
    set fortitoken "FTKMOBxxxxxxxxxx"
    set email-to <email_address>
    set username-sensitivity disable
    set ldap-server <server_name>
  next
end
```

There is another unwanted scenario from this configuration than can occur to bypass multi-factor authentication. The LDAP server, ldap, has a user named shudson. Another LDAP server, ldap2, also has a user named shudson, but with a different password. If the ldap and ldap2 servers are added to the user group in addition to the remote shudson user, if a user tries to log in using shudson and the password on the ldap2 server, they would be able to bypass multi-factor authentication.

**Configuring FSSO user groups**

FSSO user groups contain only Windows, Citrix, and Novell network users. Information about these user groups and their member logon activities are provided by the corresponding FSSO connector. See the FSSO on page 1913 section for more information.

Configuring RSSO user groups

RADIUS single sign-on user groups leverage a RADIUS server to authenticate connecting users. This requires users to log in to their computer using their RADIUS account. The FortiGate does not interact with the remote RADIUS server. It only monitors RADIUS accounting records that the server forwards (originating from the RADIUS client). These records include the user IP address and user group. See RADIUS single sign-on agent on page 2500 for more information.

Configuring guest user groups

In some scenarios, an administrator might need to create temporary user accounts with a defined expiry time to access network resources. For example, if there is a large conference and may attendees require temporary network access for a few days. Guest Management can be used to combine many guest users into a group. Many guest accounts can be created at once using randomly-generated user IDs and passwords.

A guest group must be configured first. The guest user account user ID can be an email address, a randomly generated string, or an ID that the assigned by the administrator. The password can be assigned by the administrator or randomly generated. The guest group configuration determines the fields that are provided when creating guest user accounts in Guest Management.

To create a guest user group:

2. Enter a name, and set the Type to Guest.
### 3. Configure the following:

| **Batch Guest Account Creation** | Create multiple accounts automatically. When enabled:  
|  | • The user ID and password are automatically generated.  
|  | • The accounts only have user ID, password, and expiration fields. The expiration field is editable in the GUI in the *Start Countdown and Time* settings.  
|  | • An administrator can print the account information.  
|  | • Users do not receive an email or SMS notification. |

| **User ID** | Select one of the following:  
|  | • *Email*: use the user's email address  
|  | • *Auto Generate*: FortiOS creates a random user ID  
|  | • *Specify*: the administrator assigns a user ID |

| **Maximum Accounts** | Enable to set a maximum number of guest accounts that can be created for this group (disabled = unlimited). |

### Guest Details

| **Enable Name** | If enabled, the user form has a field to enter a name. |
| **Enable Email** | If enabled, the user is notified by email. |
| **Enable SMS** | If enabled, the user is notified by SMS. |

| **Password** | Select one of the following:  
|  | • *Auto Generate*: FortiOS creates a random password  
|  | • *Specify*: the administrator assigns a password  
|  | If the setting is disabled, no password is used. |

| **Sponsor** | If enabled, the user form has a field to enter a sponsor (*Optional*). Select *Required* if the sponsor field is mandatory. |

| **Company** | If enabled, the user form has a field to enter a company (*Optional*). Select *Required* if the company field is mandatory. |

### Expiration

| **Start Countdown** | Select one of the following:  
|  | • *On Account Creation*: the countdown starts from the time the account is created  
|  | • *After First Login*: the countdown starts from the time the first time the user logs in |

| **Time** | Set the expiry time. There are fields to enter values for *Days, Hours, Minutes, and Seconds*. |

### 4. Click OK.
To manually create a guest user account:

2. If more than one guest user group is configured, select the group from the dropdown beside the search box.
3. Click Create New and enter the information in the Create User pane. The fields are based on the guest group configuration. Optional fields can be left blank, such as Sponsor in this example.
4. Click OK.

To automatically create multiple guest user accounts:

2. If more than one guest user group is configured, select the group from the dropdown beside the search box. The group must have Batch Guest Account Creation enabled.
3. Click Create New > Multiple Users and enter the Number of Accounts.
4. Optionally, edit the Expiration date and time.
5. Click OK.

Retail environment guest access

Businesses such as coffee shops provide free Internet access for customers. In this scenario, you do not need to configure guest management, as customers can access the WiFi access point without logon credentials.

However, consider that the business wants to contact customers with promotional offers to encourage future patronage. You can configure an email collection portal to collect customer email addresses for this purpose. You can configure a firewall policy to grant network access only to users who provide a valid email address. The first time a customer’s device
User & Authentication

attempts WiFi connection, FortiOS requests an email address, which it validates. The customers' subsequent connections go directly to the Internet without interruption.

This configuration consists of the following steps:
1. Creating an email collection portal on page 1802
2. Creating a firewall policy on page 1802
3. Checking for collected emails on page 1803

Creating an email collection portal

The customer's first contact with your network is a captive portal that presents a webpage requesting an email address. When FortiOS has validated the email address, the customer's device MAC address is added to the collected emails device group.

This example modifies the freewifi WiFi interface to present an email collection captive portal.

To configure the freewifi SSID to use an email collection portal in the GUI:

1. Enable email collection:
   a. Go to System > Feature Visibility.
   b. In the Additional Features section, enable Email Collection.
   c. Click Apply.
2. Edit the freewifi SSID:
   a. Go to WiFi & Switch Controller > SSIDs and edit the freewifi SSID.
   b. In the Security Mode Settings section, set the Security mode to Captive Portal.
   c. Set the Portal type to Email Collection.
   d. Click OK.

To configure the freewifi SSID to use an email collection portal in the CLI:

```bash
config wireless-controller vap
edit freewifi
   set security captive-portal
   set portal-type email-collect
next
end
```

Creating a firewall policy

You must configure a firewall policy that allows traffic to flow from the WiFi SSID to the internet interface only for members of the collected emails device group. This policy must be listed first. Unknown devices are not members of the collected emails device group, so they do not match the policy.

To create a firewall policy:

```bash
config firewall policy
edit 3
   set srcintf "freewifi"
   set dstintf "wan1"
   set srcaddr "all"
   set dstaddr "all"
```
User & Authentication

set action accept  
set schedule "always"  
set service "ALL"  
set nat enable  
set email-collect enable

next
end

Checking for collected emails

When a WiFi user connects to the freewifi SSID, they are presented with a captive portal to enter their email address.

Once the user enters their email and clicks Continue, they will have access to the Internet. The collected emails can be verified in FortiOS.

To check for collected emails in the GUI:

1. Go to Dashboard > Users & Devices and click Add Widget.
2. In the User & Authentication section, select Collected Email and click Add Widget.
3. Click Close.
4. Click the Collected Email to expand to full view. The list of emails is displayed.

5. Optionally, click Export to export the data as a CSV or JSON file.
To check for collected emails in the CLI:

```bash
# diagnose firewall auth mac list

72:4d:e1:**:**:**, admin@fortinet.com
  type: email, id: 0, duration: 937, idled: 19
  expire: 863980, allow-idle: 864000
  flag(1000): src_idle
  packets: in 4753 out 4592, bytes: in 2662403 out 2458644

----- 1 listed, 0 filtered -----
```

User and user group timeouts

Authenticated user groups can have timeout values per group in addition to FortiGate-wide timeouts. Three types of group timeouts can be configured: idle, hard, and session. These are in addition to any external timeouts, such as those on RADIUS servers.

To configure the timeout type for authenticated users:

```bash
config user setting
  set auth-timeout-type {idle-timeout | hard-timeout | new-session}
  set auth-timeout <integer>
end
```

Timeouts are measured in minutes (1 - 1440, default = 5). If VDOMs are enabled, the global level `auth-timeout` user setting is the default all VDOMs inherit.

<table>
<thead>
<tr>
<th>Timeout type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Idle</td>
<td>This is the default setting. The idle timer starts when a user initiates a session. As long as data is transferred in this session, the timer continually resets. If the data flow stops, the timer is allowed to advance until it reaches its limit. When the user has been idle for too long, the user must re-authenticate before traffic is allowed to continue in that session.</td>
</tr>
<tr>
<td>Hard</td>
<td>The hard timer starts when a user initiates a session. When the timeout is reached, all the sessions for that user must be re-authenticated. This timeout is not affected by any events.</td>
</tr>
<tr>
<td>Session</td>
<td>The session timer starts when a user initiates a session. When the timeout is reached, existing sessions may continue. New sessions are not allowed until the user re-authenticates. This timeout is not affected by any events.</td>
</tr>
</tbody>
</table>

To configure the authentication timeout for a user group:

```bash
config user group
  edit <name>
    set auth-timeout <integer>
    next
end
```

Timeouts are measured in minutes (0 - 43200). A value of zero (the default) means the global timeout is used.
If a user belongs to multiple RADIUS groups, the group auth-timeout values are ignored. The global auth-timeout value is used instead (under config user setting).

**LDAP servers**

The following topics provide information about LDAP servers:

- Configuring an LDAP server on page 1805
- Enabling Active Directory recursive search on page 1807
- Configuring LDAP dial-in using a member attribute on page 1808
- Configuring wildcard admin accounts on page 1809
- Configuring least privileges for LDAP admin account authentication in Active Directory on page 1810
- Tracking users in each Active Directory LDAP group on page 1811
- Tracking rolling historical records of LDAP user logins on page 1814
- Configuring client certificate authentication on the LDAP server on page 1817

**Configuring an LDAP server**

FortiOS can be configured to use an LDAP server for authentication.

**To configure an LDAP server on the FortiGate:**

1. Go to User & Authentication > LDAP Servers.
2. Click Create New.
3. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>This connection name is for reference within the FortiGate only.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server IP/Name</td>
<td>LDAP server IP address or FQDN resolvable by the FortiGate.</td>
</tr>
<tr>
<td>Server Port</td>
<td>By default, LDAP uses port 389 and LDAPS uses 636. Use this field to specify a custom port if necessary.</td>
</tr>
</tbody>
</table>
| Common Name Identifier | Attribute field of the object in LDAP that the FortiGate uses to identify the connecting user. The identifier is case sensitive. Common attributes are:  
  - cn (Common Name)  
  - sAMAccountName (SAMAccountName)  
  - uid (User ID) |
| Distinguished Name    | Used to look up user account entries on the LDAP server. It reflects the hierarchy of LDAP database object classes above the CN identifier in which you are doing the lookup. Enter dc=COMPANY,dc=com to specify the root of the domain to include all objects. |
Enter `ou=VPN-Users,dc=COMPANY,dc=com` to look up users under a specific organization unit.

**Exchange server**
Enable to specify the exchange server connector to collect information about authenticated users from a corporate exchange server. See Exchange Server connector on page 2503 for more details.

**Bind Type**
Select one of the following options:
- **Simple**: bind using simple password authentication using the client name. The LDAP server only looks up against the distinguished name (DN), but does not search on the subtree.
- **Anonymous**: bind using an anonymous user, and search starting from the DN and recurse over the subtrees. Many LDAP servers do not allow this.
- **Regular**: bind using the username and password provided, and search starting from the DN and recurse over the subtrees.

**Username**
If using regular bind, enter a username with sufficient privileges to access the LDAP server. The following formats are supported:
- `username\administrator`
- `administrator@domain`
- `cn=administor,cn=users,dc=domain,dc=com`

**Password**
If using regular bind, enter the password associated with the username.

**Secure Connection**
Enable to apply security to the LDAP connection through STARTTLS or LDAPS.

**Protocol**
If Secure Connection is enabled, select STARTTLS or LDAPS. Selecting STARTTLS changes the port to 389 and selecting LDAPS changes the port to 636.

**Certificate**
Enable and select the certificate so the FortiGate will only accept a certificate from the LDAP server that is signed by this CA.

**Server identity check**
Enable to verify the server domain or IP address against the server certificate. This option is enabled by default and it is recommended to leave it enabled for a secure configuration.

---

When specifying a secure connection, there are some considerations for the certificate used by LDAP to secure the connection. The FortiGate checks the certificate presented by the LDAP server for the IP address or FQDN as specified in the Server IP/Name field with the following logic:
- If there is a Subject Alternative Name (SAN), it will ignore any Common Name (CN) value and look for a match in any of the SAN fields.
- If there is no SAN, it will check the CN for a match.

4. Optionally, click Test User Credentials to ensure that the account has sufficient access rights.
5. Click OK.
   The FortiGate checks the connection and updates the Connection Status.
Enabling Active Directory recursive search

By default, nested groups (groups that are members or other groups) are not searched in Windows Active Directory (AD) LDAP servers because this can slow down the group membership search. There is an option in FortiOS to enable the searching of nested groups for user group memberships on AD LDAP servers.

This option is not available for other LDAP servers, such as OpenLDAP-based servers.

The default behavior does not include nested groups:

```bash
config user ldap
  edit "ldap-ad"
    set server "10.1.100.131"
    set cnid "cn"
    set dn "dc=fortinet-fsso,dc=com"
    set type regular
    set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
    set password XXXXXXXXXXXXXXXXXXXXXXXXXXX
  next
end
```

The default search results only show groups that have the user as member, and no groups that have groups as members:

```bash
diagnose test authserver ldap ldap-ad nuser nuser
  authenticate 'nuser' against 'ldap-ad' succeeded!
  Group membership(s) - CN=nested3,OU=Testing,DC=Fortinet-FSSO,DC=COM
                       CN=Domain Users,CN=Users,DC=Fortinet-FSso,DC=COM
```

To enable recursive search to include nested groups in the results:

```bash
config user ldap
  edit "ldap-ad"
    set server "10.1.100.131"
    set cnid "cn"
    set dn "dc=fortinet-fsso,dc=com"
    set type regular
    set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
    set password XXXXXXXXXXXXXXXXXXXXXXXXXXX
    set search-type recursive
  next
end
```

The search results now include groups that have other groups as members:

```bash
diagnose test authserver ldap ldap-ad nuser nuser
  authenticate 'nuser' against 'ldap-ad' succeeded!
  Group membership(s) - CN=nested3,OU=Testing,DC=Fortinet-FSSO,DC=COM
                       CN=Domain Users,CN=Users,DC=Fortinet-FSso,DC=COM
                       CN=nested2,OU=Testing,DC=Fortinet-FSSO,DC=COM
                       CN=nested1,OU=Testing,DC=Fortinet-FSSO,DC=COM
```

The group nested3 is a member of the group nested2, which is a member of the group nested1.
Configuring LDAP dial-in using a member attribute

In this configuration, users defined in Microsoft AD can set up a VPN connection based on an attribute that is set to TRUE, instead of their user group. You can activate the Allow Dialin property in AD user properties, which sets the msNPAllowDialin attribute to TRUE. You can use this procedure for other member attributes as your system requires.

This configuration consists of the following steps:

1. Ensure that the AD server has the msNPAllowDialin attribute set to TRUE for the desired users.
2. Configure user LDAP member attribute settings.
3. Configure LDAP group settings.
4. Ensure that you configured the settings correctly.

To configure user LDAP member attribute settings:

```plaintext
config user ldap
  edit "ldap_server"
    set server "192.168.201.3"
    set cnid "sAMAccountName"
    set dn "DC=fortilabanz,DC=com,DC=au"
    set type regular
    set username "fortigate@sample.com"
    set password ******
    set member-attr "msNPAllowDialin"
  next
end
```

To configure LDAP group settings:

```plaintext
config user group
  edit "ldap_grp"
    set member "ldap_server"
    config match
      edit 1
        set server-name "ldap_server"
        set group-name "TRUE"
      next
    next
end
```

To ensure that you configured the settings correctly:

Users that are members of the ldap_grp user group should be able to authenticate. The following shows sample diagnose debug output when the Allow Dial-in attribute is set to TRUE:

```plaintext
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-attr='msNPAllowDialin', val[0] = 'TRUE'
fnbamd_ldap_get_result=Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Passed group matching
```

If the attribute is not set to TRUE but is expected, you may see the following output:
Configuring wildcard admin accounts

To avoid setting up individual admin accounts in FortiOS, you can configure an admin account with the wildcard option enabled, allowing multiple remote admin accounts to match one local admin account. This way, multiple LDAP admin accounts can use one FortiOS admin account.

Benefits include:

- Fast configuration of the FortiOS admin account to work with your LDAP network, saving effort and avoiding potential errors incurred when setting up multiple admin accounts.
- Reduced ongoing maintenance. As long as LDAP users belong to the same group and you do not modify the wildcard admin account in FortiOS, you do not need to configure changes on the LDAP accounts. If you add or remove a user from the LDAP group, you do not need to perform changes in FortiOS.

Potential issues include:

- Multiple users may be logged in to the same account simultaneously. This may cause issues if both users make changes simultaneously.
- Security is reduced since multiple users have login access to the same account, as opposed to an account for each user.

Wildcard admin configuration also applies to RADIUS. If configuring for RADIUS, configure the RADIUS server and RADIUS user group instead of LDAP. When using the GUI, wildcard admin is the only remote admin account that does not require you to enter a password on account creation. That password is normally used when the remote authentication server is unavailable during authentication.

This example uses default values where possible. If a specific value is not mentioned, the example sets it to its default value.

---

You can configure an admin account in Active Directory for LDAP authentication to allow an admin to perform lookups and reset passwords without being a member of the Account Operators or Domain Administrators built-in groups. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 1810.

---

To configure the LDAP server:

The important parts of this configuration are the username and group lines. The username is the domain administrator account. The group binding allows only the GRP group access.

This example uses an example domain name. Configure as appropriate for your own network.

```
config user ldap
  edit "ldap_server"
    set server "192.168.201.3"
```
set cnid "sAMAccountName"
set dn "DC=example,DC=com,DC=au"
set type regular
set username "CN=Administrator,CN=Users,DC=example,DC=COM"
set password *
set group-member-check group-object
set group-object-filter (&
  (objectcategory=group)member="CN=GRP,OU=training,DC=example,DC=COM")
next
end

To configure the user group and add the LDAP server:

config user group
edit "ldap_group"
  set member "ldap_server"
  config match
    edit 1
      set server-name "ldap_server"
      set group-name "CN=GRP,OU=training,DC=example,DC=COM"
    next
  next
end
end

To configure the wildcard admin account:

config system admin
edit "test"
  set remote-auth enable
  set accprofile "super_admin"
  set wildcard enable
  set remote-group "ldap_group"
next
end

Configuring least privileges for LDAP admin account authentication in Active Directory

An administrator should only have sufficient privileges for their role. In the case of LDAP admin bind, you can configure an admin account in Active Directory for LDAP authentication to allow an admin to perform lookups and reset passwords without being a member of the Account Operators or Domain Administrators built-in groups.

For information about Active Directory, see the product documentation.

To configure account privileges for LDAP authentication in Active Directory:

1. In the Active Directory Users and Computers administrative console, right-click the Organizational Unit (OU) or the top-level domain you want to configure and select Delegate Control.
2. In the Delegation of Control Wizard dialog, click Next.
3. In the Users or Groups dialog, click Add... and search Active Directory for the users or groups.

4. Click OK and then click Next.

5. In the Tasks to Delegate dialog, select Create a custom task to delegate and click Next.

6. Select Only the following objects in the folder and scroll to the bottom of the list. Select User objects and click Next.

7. In the Permissions dialog, select General.

8. From the Permissions list, select the following:
   - Change password
   - Reset password

10. From the Permissions list, select the following:
    - Write lockoutTime
    - Read lockoutTime
    - Write pwdLastSet
    - Read pwdLastSet
    - Write UserAccountControl
    - Read UserAccountControl

11. Click Next and click Finish.

**Tracking users in each Active Directory LDAP group**

When LDAP users log on through firewall authentication, the active users per Active Directory LDAP group is counted and displayed in the Firewall Users widget and the CLI.
Example

The Active Directory LDAP server, FORTINET-FSSO.com, is configured with two groups that contain two users each: group1 consists of users test1 and test3; group2 consists of users test2 and test4.

To configure AD LDAP user groups in the GUI:

1. Configure the Active Directory LDAP server, FORTINET-FSSO:
   a. Go to User & Authentication > LDAP Servers and click Create New.
   b. Enter the following:
      
      | Name        | FORTINET-FSSO                  |
      |-------------|-------------------------------|
      | Server IP/Name | 10.1.100.131              |
      | Distinguished Name | dc=FORTINET-FSSO,dc=com |
      | Bind Type      | Regular                       |
      | Username       | cn=administrator,cn=users,dc=FORTINET-FSSO,dc=com |
      | Password       | Enter the password.          |
   
   c. Click OK.

2. Configure the LDAP user groups:
   a. Go to User & Authentication > User Groups and click Create New.
   b. Enter the name, ldap1.
c. In the Remote Groups table, click Add. The Add Group Match pane opens.

d. For Remote Server, select FORTINET-FSSO.

e. In the search box, enter group1, and select the result in the table.

f. Click OK.

g. Repeat these steps to configure ldap2 with the FORTINET-FSSO group2.

h. Click OK.

3. Configure a firewall policy with both LDAP groups:
   a. Go to Policy & Objects > Firewall Policy and click Create New.
   b. For Source, select ldap1 and ldap2.
   c. Configure the other settings as needed.
   d. Click OK.

4. Get users test1 and test2 to log in.

5. In FortiOS, go to Dashboard > Users & Devices and click the Firewall Users widget to expand to full screen view. Hover over a group in the User Group donut chart to view how many users are logged on from that group, and the number of users as a percentage of all logged on users. The chart shows that two users are logged in.

6. Get users test3 and test4 to log in, and refresh the Firewall Users widget. Each LDAP group has two users logged in, with a total of four active users.
7. Get user test2 to log out, and refresh the Firewall Users widget. There is a total of three active users, and the ldap2 group only has one user that is logged in.

To verify the user group count in the CLI:

```
# diagnose user-device-store user-count list <integer>
# diagnose user-device-store user-count query <FQDN of AD group>
```

**Tracking rolling historical records of LDAP user logins**

Authenticated LDAP users can be tracked by logging the users' group memberships, logon timestamps, and logout timestamps into local files on a log disk over a rolling four-week period. The historical records can be queried from the CLI. This feature is only enabled on FortiGate models with a log disk.

**To view active user logged information:**

```
# diagnose user-device-store user-stats query <yyyy-mm-dd> <range_in_days>
```

**Example**

In this example, the FortiGate is configured with an explicit web proxy and an LDAP server. When an LDAP user is authenticated by an IP-based authentication method in WAD, the WAD user is considered to be in an active logon
status. This WAD user is listed in the `diagnose wad user list` output. If the user is removed from WAD as an authenticated, such as when the IP-based authentication expires, then the user is considered to become inactive (logout status). The user is no longer listed in the `diagnose wad user list` output.

The WAD user’s group membership information and their logon and logout timestamps are written into local files on the FortiGate’s disk. There is one log file for each day, and the FortiGate can maintain up to 28 log files over a rolling period of 28 days (four weeks). This means after 28 days with 28 files stored, on the 29th day, the first file will be removed and a new file will be created for the 29th day.

To configure the FortiGate:

1. Enable the explicit web proxy on port1:

   ```plaintext
   config system interface
   edit "port1"
   set explicit-web-proxy enable
   set explicit-ftp-proxy enable
   set snmp-index 3
   next
   end
   ```

2. Configure the LDAP server:

   ```plaintext
   config user ldap
   edit "ldap-test"
   set server "172.16.200.98"
   set cnid "cn"
   set dn "dc=fortinetqa,dc=local"
   set type regular
   set username "CN=root,CN=Users,DC=fortinetqa,DC=local"
   set password **********
   next
   end
   ```
3. Configure the authentication scheme:

```plaintext
config authentication scheme
edit "basic-ldap"
    set method basic
    set user-database "ldap-test"
next
end
```

4. Configure the authentication rule:

```plaintext
config authentication rule
edit "basic-ldap"
    set srcaddr "all"
    set active-auth-method "basic-ldap"
    set web-portal disable
next
end
```

5. Configure the user group:

```plaintext
config user group
edit "ldap-group"
    set member "ldap" "ldap-test"
next
end
```

6. Configure the proxy policy:

```plaintext
config firewall proxy-policy
edit 1
    set proxy explicit-web
    set dstintf "port3"
    set srcaddr "all"
    set dstaddr "all"
    set service "web"
    set action accept
    set schedule "always"
    set groups "ldap-group"
    set utm-status enable
    set ssl-ssh-profile "deep-custom"
    set av-profile "av"
next
end
```

When users pass through the explicit proxy and log in and out through LDAP, their login and logout records will be logged to the disk.

In this example, there are two LDAP users, test1 and test3, with the following activity:

1. test3 logs on at 22:30:22 on February 23, 2022, then logs out at 22:31:09 on the same day.
2. test1 logs on at 23:55:02 on February 23, 2022, then logs out at 00:05:02 on February 24, 2022.
3. test3 logs on at 16:29:44 on February 24, 2022, then logs out at 16:39:44 on the same day.

The logon and logout timestamp information, and the group membership information for users test1 and test3 will be logged into two local files on the log disk.
To view the active user logged information for two days back from February 24, 2022:

`# diagnose user-device-store user-stats query 2022-02-24 2`

Record #0:
- `username` = 'test3'
- `groupname` = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
- `groupname` = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
- `logon` = '2022-02-23 22:30:22'
- `logout` = '2022-02-23 22:31:09'

Record #1:
- `username` = 'test1'
- `groupname` = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
- `groupname` = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
- `groupname` = 'CN=mytest-grp,OU=QA,DC=FORTINETQA,DC=local'
- `logon` = '2022-02-23 23:55:02'

Record #2:
- `username` = 'test1'
- `groupname` = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
- `groupname` = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
- `groupname` = 'CN=mytest-grp,OU=QA,DC=FORTINETQA,DC=local'
- `logon` = '2022-02-23 23:55:02'
- `logout` = '2022-02-24 00:05:02'

Record #3:
- `username` = 'test3'
- `groupname` = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
- `groupname` = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
- `logon` = '2022-02-24 16:29:44'
- `logout` = '2022-02-24 16:39:44'

Returned 4 records.

There is one record (logon) for test1 on 2022-02-23 because they remained active after midnight (until 00:05:02). There is another record for 2022-02-24 with logon and logout timestamps for test1.

Configuring client certificate authentication on the LDAP server

Administrators can configure a FortiGate client certificate in the LDAP server configuration when the FortiGate connects to an LDAPS server that requires client certificate authentication.

```
config user ldap
  edit <ldap_server>
    set client-cert-auth {enable | disable}
    set client-cert <source>
  next
end
```

Example

In this example, the FortiGate is configured as an explicit web proxy. It connects to the Windows AD server through LDAPS, where the Windows server requires a client certificate to connect. The client certificate is configured in the CLI.
The endpoint PC connecting to the web server will first need to authenticate to the explicit web proxy before accessing the server.

While this example demonstrates an LDAP client certificate for an explicit proxy configuration, LDAP client certificates can be used in firewall authentication, transparent proxy, ZTNA, and wherever LDAP configurations are used on the FortiGate.

**To configure a client certificate on the LDAP server:**

1. **Enable the explicit web proxy on port2:**
   ```
   config system interface
   edit "port2"
     set explicit-web-proxy enable
   next
   end
   ```

2. **Upload the client certificate to the FortiGate:**
   ```
   config vpn certificate local
   edit "Zach"
     set password **********
     set private-key <private key>
     set certificate <certificate>
   next
   end
   ```

3. **Configure the LDAP server settings:**
   ```
   config user ldap
   edit "ldaps"
     set server "172.16.200.57"
     set server-identity-check disable
     set cnid "CN"
     set dn "CN=Users,DC=ftnt,DC=com"
     set secure ldaps
     set port 636
     set client-cert-auth enable
     set client-cert "Zach"
   next
   end
   ```

4. **Configure the authentication scheme:**
config authentication scheme
edit "1"
    set method basic
    set user-database "ldaps"
next
end

5. Configure the authentication rule:

config authentication rule
edit "1"
    set srcintf "port2"
    set srcaddr "all"
    set dstaddr "all"
    set active-auth-method "1"
next
end

6. Configure the user group:

config user group
edit "test"
    set member "ldaps"
next
end

7. Configure the proxy policy with the user group:

config firewall proxy-policy
edit 1
    set proxy explicit-web
    set dstintf "port3"
    set srcaddr "all"
    set dstaddr "all"
    set service "webproxy"
    set action accept
    set schedule "always"
    set srcaddr6 "all"
    set dstaddr6 "all"
    set groups "test"
    set utm-status enable
    set ssl-ssh-profile "deep-inspection-clone"
    set av-profile "av"
next
end

Testing and verification

When traffic from the endpoint PC matches a policy and triggers authentication, the FortiGate starts the LDAPS TLS connection handshake with the Windows AD. The LDAPS server requests a client certificate to identify the FortiGate as a client. The FortiGate provides a configured client certificate, issued to zach.com, to the LDAPS server.

The following communication between the FortiGate and the LDAPS server shows the client certificate is sent by the FortiGate:
Remote Authentication and Dial-In User Service (RADIUS) is a broadly supported client-server protocol that provides centralized authentication, authorization, and accounting functions. RADIUS clients are built into gateways that allow access to networks such as a VPN server, network access server (NAS), and a network switch or firewall that uses authentication.

RADIUS servers use UDP packets to communicate with the RADIUS clients on the network to authenticate users before allowing them access to the network, authorize access to resources by appropriate users, and account or bill for those resources that are used. RADIUS servers are currently defined by RFC 2865 (RADIUS) and RFC 2866 (RADIUS Accounting), and listen on either UDP ports 1812 (authentication) and 1813 (accounting), or ports 1645 (authentication) and 1646 (accounting) requests. RADIUS servers exist for all major operating systems.

The RADIUS server must be configured to accept the FortiGate as a client so it can use the authentication and accounting functions of the RADIUS server.

RADIUS authentication with a FortiGate requires the following:

- Configuring one or more RADIUS server profiles on the FortiGate.
- Assigning the RADIUS server profile to a user or user group.
- Applying the user or user group to a firewall policy.

RADIUS authentication can be applied to many FortiGate functions, such as firewall authentication, SSL and IPsec VPNs, administrator profiles, ZTNA, explicit proxy, wireless, 802.1X, and more.

The RADIUS server uses a shared secret key with MD5 hashing to encrypt information passed between RADIUS servers and clients. Typically, only user credentials are encrypted. Additional security can be configured through IPsec tunnels by placing the RADIUS server behind another VPN gateway.

The following topics provide more information about RADIUS servers:

- Configuring a RADIUS server on page 1821
- Using multiple RADIUS servers on page 1822
- RADIUS AVPs and VSAs on page 1825
User & Authentication

- Restricting RADIUS user groups to match selective users on the RADIUS server on page 1827
- Configuring RADIUS SSO authentication on page 1828
- RSA ACE (SecurID) servers on page 1834
- Support for Okta RADIUS attributes filter-Id and class on page 1838
- Sending multiple RADIUS attribute values in a single RADIUS Access-Request on page 1840
- Traffic shaping based on dynamic RADIUS VSAs on page 1841
- RADIUS Termination-Action AVP in wired and wireless scenarios on page 1848

Configuring a RADIUS server

A RADIUS server can be configured in the GUI by going to User & Authentication > RADIUS Servers, or in the CLI under config user radius.

Basic configuration

The following table summarizes the common RADIUS settings that can be configured in the GUI and CLI.

<table>
<thead>
<tr>
<th>GUI field</th>
<th>CLI setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>edit &lt;name&gt;</td>
<td>Define the RADIUS server object within FortiOS.</td>
</tr>
<tr>
<td>Authentication method</td>
<td>set auth-type {auto</td>
<td>ms_chap_v2</td>
</tr>
<tr>
<td>NAS IP</td>
<td>set nas-ip &lt;IPv4_address&gt;</td>
<td>Optional setting, also known as Calling-Station-Id. Specify the IP address the FortiGate uses to communicate with the RADIUS server. If left unconfigured, the FortiGate will use the IP address of the interface that communicates with the RADIUS server.</td>
</tr>
<tr>
<td>Include in every user group</td>
<td>set all-usergroup {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>Primary Server</td>
<td></td>
<td></td>
</tr>
<tr>
<td>IP/Name</td>
<td>set server &lt;string&gt;</td>
<td>Enter the IP address or resolvable FQDN of the RADIUS server.</td>
</tr>
<tr>
<td>Secret</td>
<td>set secret &lt;password&gt;</td>
<td>Enter the password used to connect to the RADIUS server.</td>
</tr>
</tbody>
</table>

There is an option in the GUI to configure a second server, and a third server can be configured in the CLI (see Using multiple RADIUS servers on page 1822).

Advanced settings

Advanced settings for RADIUS servers can be configured in the CLI. The following are some commonly used settings.
To edit the port used to connect with the RADIUS server:

```
config system global
  set radius-port <integer>
end
```

To edit the default setting for password encoding and username case sensitivity:

```
config user radius
  edit <name>
    set password-encoding {auto | ISO-8859-1}
    set username-case-sensitive {enable | disable}
  next
end
```

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>password-encoding</td>
<td>Set the password encoding to use the original encoding or ISO-8859-1 (default = auto). The auth-type must be auto or pap to change this setting.</td>
</tr>
<tr>
<td>username-case-sensitive</td>
<td>Enable/disable case sensitive usernames (default = disable).</td>
</tr>
</tbody>
</table>

**Using multiple RADIUS servers**

There are several ways to implement multiple RADIUS servers, and each has a different effect on user authentication. The three main options available are:

- Add a second (or third) RADIUS server in the same profile.
- Add a second RADIUS server profile, and add both to the same user group.
- Use two RADIUS server profiles for two user groups (one for each).

**Adding a second server in a RADIUS profile**

A second RADIUS server can be configured in the same RADIUS profile so in the event the first RADIUS server does not respond, the second server can be checked. If the first RADIUS server responds with an Access-Reject, no further servers are queried.

**To add a second server in a RADIUS profile:**

1. Go to User & Authentication > RADIUS Servers and click Create New.
2. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>RADIUS_with_2ndary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication method</td>
<td>Default</td>
</tr>
<tr>
<td>Primary Server</td>
<td></td>
</tr>
<tr>
<td>IP/Name</td>
<td>1.1.1.1</td>
</tr>
<tr>
<td>Secret</td>
<td>Enter the password used to connect to the RADIUS server.</td>
</tr>
<tr>
<td>Secondary Server</td>
<td></td>
</tr>
</tbody>
</table>
3. Click OK.

Adding two RADIUS server profiles in the same user group

When two separate RADIUS profiles are added to a user group, the FortiGate sends an Access-Request simultaneously to both RADIUS servers, and authentication succeeds if either server sends back an Access-Accept. This example includes the settings from the previous example where one or more of the RADIUS server profiles has a secondary server configured. In this case, the secondary server profile, RADIUS_with_2ndary, is only checked if the primary server of this profile times out and the fac_radius_server profile does not return an Access-Accept.

To add two RADIUS server profiles in the same user group:

1. Go to User & Authentication > RADIUS Servers, click Create New, and configure the RADIUS servers as needed (refer to the previous example).
2. Go to User & Authentication > User Groups and click Create New.
3. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>RADIUS_GROUP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Firewall</td>
</tr>
</tbody>
</table>

4. In the Remote Groups table, click Add.
5. Select RADIUS_with_2ndary and click OK.
6. Click Add, select `fac_radius_server`, then click OK.

   ![Image of User & Authentication]

7. Click OK.

**Using separate RADIUS server profiles for separate user groups**

In this example, the FortiGate first evaluates if the user belongs to the first listed group (radius_group) in the policy. If the user fails to authenticate to this group, then the FortiGate checks if the user can successfully authenticate to the second user group (radius_group_2). Refer to the first and second examples for detailed instructions.

**To use separate RADIUS server profiles for separate user groups:**

1. Configure the RADIUS server profiles:
   a. Go to User & Authentication > RADIUS Servers and click Create New.
   b. Configure two RADIUS servers, `fac_radius_server` and `RADIUS_with_2ndary`, as needed (refer to the previous example).

2. Configure the firewall groups:
   a. Go to User & Authentication > User Groups and click Create New.
   b. Configure two firewall groups, one named `radius_group` with remote server member `fac_radius_server`, and one named `radius_group_2` with remote server member `RADIUS_with_2ndary` (refer to the previous example).

   ![Image of Group Configuration]

3. Configure the firewall policy:
   a. Go to Policy & Objects > Firewall Policy and click Create New.
   b. For Source, click User then select `radius_group` and `radius_group_2`. Click Address and select LAN address.
   c. Configure the other settings as needed.
   d. Click OK.
RADIUS AVPs and VSAs

This topic describes RADIUS Attribute Value Pairs (AVPs) and Vendor-Specific Attributes (VSAs).

AVPs

RADIUS packets include a set of AVPs to identify information about the user, their location, and other information. The IETF defined a set of 255 standard attributes, which are well known and come in the form of Type, Length, Value (for more details, refer to RFC 2865). Of the standard 255, the FortiGate sends the following RADIUS attributes:

<table>
<thead>
<tr>
<th>RADIUS attribute number</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>User-Name</td>
<td>Name of the user being authenticated by the RADIUS server.</td>
</tr>
<tr>
<td>4</td>
<td>NAS-IP-Address</td>
<td>IP address of the network access server (NAS) that is requesting authentication. The NAS is the FortiGate.</td>
</tr>
<tr>
<td>8</td>
<td>Framed-IP-Address</td>
<td>IP address to be configured for the user, by sending the IP address of a user to the RADIUS server in the Access-Request packet.</td>
</tr>
<tr>
<td>25</td>
<td>Class</td>
<td>Used in accounting packets and requests for firewall, WiFi, and proxy authentication. The attribute is returned in the Access-Accept message and added to all accounting packets.</td>
</tr>
<tr>
<td>26</td>
<td>Fortinet-VSA</td>
<td>See VSAs.</td>
</tr>
<tr>
<td>32</td>
<td>NAS-Identifier</td>
<td>Identifier or IP address of the NAS that is requesting authentication. The NAS is the FortiGate.</td>
</tr>
<tr>
<td>42</td>
<td>Acct-Input-Octets</td>
<td>Number of octets received from the port over the course of this service being provided. Used to charge the user for the amount of traffic they used.</td>
</tr>
<tr>
<td>43</td>
<td>Acct-Output-Octets</td>
<td>Number of octets sent to the port while delivering this service. Used to charge the user for the amount of traffic they used.</td>
</tr>
<tr>
<td>44</td>
<td>Acct-Session-Id</td>
<td>Unique number assigned to each start and stop record to make it easy to match them, and to eliminate duplicate records.</td>
</tr>
<tr>
<td>55</td>
<td>Event-Timestamp</td>
<td>Records the time that the event occurred on the NAS. The timestamp is measured in seconds since January 1, 1970 00:00 UTC. Before the Event-Timestamp attribute can be sent in a packet, make sure that the correct time is set on the FortiGate.</td>
</tr>
</tbody>
</table>

VSAs

Some vendors want or need to send attributes that do not match any of the defined IETF attributes. This can be accomplished by using RADIUS attribute type 26, which allows a vendor to encapsulate their own specific attributes in this standard AVP.

In order to support VSAs, the RADIUS server requires a dictionary to define the VSAs. This dictionary is typically supplied by the client or server vendor.
The Fortinet RADIUS vendor ID is 12356 and contains the following attributes:

<table>
<thead>
<tr>
<th>Attribute name</th>
<th>Attribute number</th>
<th>Attribute value format</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fortinet-Group-Name</td>
<td>1</td>
<td>String</td>
</tr>
<tr>
<td>Fortinet-Client-IP-Address</td>
<td>2</td>
<td>IP address</td>
</tr>
<tr>
<td>Fortinet-Vdom-Name</td>
<td>3</td>
<td>String</td>
</tr>
<tr>
<td>Fortinet-Client-IPv6-Address</td>
<td>4</td>
<td>Octets</td>
</tr>
<tr>
<td>Fortinet-Interface-Name</td>
<td>5</td>
<td>String</td>
</tr>
<tr>
<td>Fortinet-Access-Profile</td>
<td>6</td>
<td>String</td>
</tr>
<tr>
<td>Fortinet-SSID</td>

Restricting RADIUS user groups to match selective users on the RADIUS server

When a user group is configured in FortiOS to authenticate against a RADIUS server, it will allow any valid user account on the RADIUS server to match that user group. Sometimes you might want to specify which users on the RADIUS server should match a particular user group on the FortiGate. This can be accomplished using the RADIUS attribute value pair (AVP) 26, known as a Vendor-Specific Attribute (VSA). This attribute allows the Fortinet-Group-Name VSA to be included in the RADIUS response. In FortiOS, the user group must be configured to specifically match this group.

In the following example, a RADIUS Network Policy Server (NPS) has been configured to have the Fortinet-Group-Name be IT, and assumes that the user group, RADIUS_IT has been created, which authenticates to the RADIUS_NPS server.

To configure specific group matching in the GUI:

1. Go to User & Authentication > User Groups and edit the RADIUS_IT group.
2. In the Remote Groups table, select the RADIUS_NPS server and click Edit. The Add Group Match pane opens.
3. For Groups, select Specify and enter the group name configured on the RADIUS server (IT).
4. Click OK.

5. Click OK.

To configure specific group matching in the CLI:

```
config user group
  edit "RADIUS_IT"
    set member "RADIUS_NPS"
  config match
    edit 1
      set server-name "RADIUS_NPS"
      set group-name "IT"
    next
  next
end
```

To change the matching back to any group, under config match, enter delete 1. Changing the group-name to "Any" will cause the FortiGate to match the Fortinet-GroupName with the literal string, Any.

Configuring RADIUS SSO authentication

A common RADIUS SSO (RSSO) topology involves a medium-sized company network of users connecting to the Internet through the FortiGate and authenticating with a RADIUS server. The following describes how to configure FortiOS for this scenario. The example makes the following assumptions:

- VDOMs are not enabled.
- The super_admin account is used for all FortiGate configuration.
- A RADIUS server is installed on a server or FortiAuthenticator and uses default attributes.
- BGP is used for any dynamic routing.
- You have configured authentication event logging under Log & Report.

Example.com has an office with 20 users on the internal network who need access to the Internet. The office network is protected by a FortiGate-60C with access to the Internet through the wan1 interface, the user network on the internal
interface, and all servers are on the DMZ interface. This includes an Ubuntu sever running FreeRADIUS. This example configures two users:

<table>
<thead>
<tr>
<th>User</th>
<th>Account</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pat Lee</td>
<td><a href="mailto:plee@example.com">plee@example.com</a></td>
</tr>
<tr>
<td>Kelly Green</td>
<td><a href="mailto:kgreen@example.com">kgreen@example.com</a></td>
</tr>
</tbody>
</table>

Configuring this example consists of the following steps:

1. Configure RADIUS.
2. Configure FortiGate interfaces.
3. Configure a RSSO agent.
4. Create a RSSO user group.
5. Configure security policies.
6. Test the configuration.

To configure RADIUS:

Configuring RADIUS includes configuring a RADIUS server such as FreeRADIUS on user's computers and configuring users in the system. In this example, Pat and Kelly belong to the exampledotcom_employees group. After completing the configuration, you must start the RADIUS daemon. The users have a RADIUS client installed on their PCs that allow them to authenticate through the RADIUS server.

For any problems installing FreeRADIUS, see the FreeRADIUS documentation.

To configure FortiGate interfaces:

You must define a DHCP server for the internal network, as this network type typically uses DHCP. The wan1 and dmz interfaces are assigned static IP addresses and do not need a DHCP server. The following table shows the FortiGate interfaces used in this example:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Subnet</th>
<th>Act as DHCP server</th>
<th>Devices</th>
</tr>
</thead>
<tbody>
<tr>
<td>wan1</td>
<td>172.20.120.141</td>
<td>No</td>
<td>Internet service provider</td>
</tr>
<tr>
<td>dmz</td>
<td>10.11.101.100</td>
<td>No</td>
<td>Servers including RADIUS server</td>
</tr>
<tr>
<td>internal</td>
<td>10.11.102.100</td>
<td>Yes: x.x.x.110-250</td>
<td>Internal user network</td>
</tr>
</tbody>
</table>
1. Go to Network > Interfaces.
2. Edit wan1:

<table>
<thead>
<tr>
<th>Alias</th>
<th>Internet</th>
</tr>
</thead>
<tbody>
<tr>
<td>Addressing Mode</td>
<td>Manual</td>
</tr>
<tr>
<td>IP/Network Mask</td>
<td>172.20.120.141/255.255.255.0</td>
</tr>
<tr>
<td>Administrative Access</td>
<td>HTTPS, SSH</td>
</tr>
<tr>
<td>Enable DHCP Server</td>
<td>Not selected</td>
</tr>
<tr>
<td>Comments</td>
<td>Internet</td>
</tr>
<tr>
<td>Administrative Status</td>
<td>Up</td>
</tr>
</tbody>
</table>

3. Click OK.
4. Edit dmz:

<table>
<thead>
<tr>
<th>Alias</th>
<th>Servers</th>
</tr>
</thead>
<tbody>
<tr>
<td>Addressing Mode</td>
<td>Manual</td>
</tr>
<tr>
<td>IP/Network Mask</td>
<td>10.11.101.100/255.255.255.0</td>
</tr>
<tr>
<td>Administrative Access</td>
<td>HTTPS, SSH, PING, SNMP</td>
</tr>
<tr>
<td>Enable DHCP Server</td>
<td>Not selected</td>
</tr>
<tr>
<td>Listen for RADIUS Accounting Messages</td>
<td>Select</td>
</tr>
<tr>
<td>Comments</td>
<td>Servers</td>
</tr>
<tr>
<td>Administrative Status</td>
<td>Up</td>
</tr>
</tbody>
</table>

5. Click OK.
6. Edit internal:

<table>
<thead>
<tr>
<th>Alias</th>
<th>Internal network</th>
</tr>
</thead>
<tbody>
<tr>
<td>Addressing Mode</td>
<td>Manual</td>
</tr>
<tr>
<td>IP/Network Mask</td>
<td>10.11.102.100/255.255.255.0</td>
</tr>
<tr>
<td>Administrative Access</td>
<td>HTTPS, SSH, PING</td>
</tr>
<tr>
<td>Enable DHCP Server</td>
<td>Select</td>
</tr>
<tr>
<td>Address Range</td>
<td>10.11.102.110 - 10.11.102.250</td>
</tr>
<tr>
<td>Netmask</td>
<td>255.255.255.0</td>
</tr>
<tr>
<td>Default Gateway</td>
<td>Same as Interface IP</td>
</tr>
<tr>
<td>Comments</td>
<td>Internal network</td>
</tr>
<tr>
<td>Administrative Status</td>
<td>Up</td>
</tr>
</tbody>
</table>
To create a RADIUS SSO agent:

1. Go to Security Fabric > External Connectors.
2. Click Create New.
4. Enable Use RADIUS Shared Secret. Enter the RADIUS server's shared secret.
5. Enable Send RADIUS Responses. Click OK.

To create a RADIUS SSO user group:

2. Click Create New.
3. For Type, select RADIUS Single Sign-On (RSSO).
4. In RADIUS Attribute Value, enter the name of the RADIUS user group that this local user group represents.
5. Click OK.

Configuring security policies

The following security policies are required for RADIUS SSO:

<table>
<thead>
<tr>
<th>Sequence Number</th>
<th>From</th>
<th>To</th>
<th>Type</th>
<th>Schedule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>internal</td>
<td>wan1</td>
<td>RADIUS SSO</td>
<td>Business hours</td>
<td>Authenticate outgoing user traffic</td>
</tr>
<tr>
<td>2</td>
<td>internal</td>
<td>wan1</td>
<td>Regular</td>
<td>Always</td>
<td>Allow essential network services and VoIP</td>
</tr>
<tr>
<td>3</td>
<td>dmz</td>
<td>wan1</td>
<td>Regular</td>
<td>Always</td>
<td>Allow servers to access the Internet</td>
</tr>
<tr>
<td>4</td>
<td>internal</td>
<td>dmz</td>
<td>Regular</td>
<td>Always</td>
<td>Allow users to access servers</td>
</tr>
<tr>
<td>5</td>
<td>any</td>
<td>any</td>
<td>Deny</td>
<td>Always</td>
<td>Implicit policy denying all traffic that has not been matched</td>
</tr>
</tbody>
</table>

You must place the RADIUS SSO policy at the top of the policy list so that it is matched first. The only exception to this is if you have a policy to deny access to a list of banned users. In this case, you must put that policy at the top so that the RADIUS SSO does not mistakenly match a banned user or IP address.

You must configure lists before creating security policies.

Schedule

You must configure a business_hours schedule. You can configure a standard Monday to Friday 8 AM to 5 PM schedule, or whatever days and hours covers standard work hours at the company.

Address groups

You must configure the following address groups:
Service groups

You must configure the service groups. The services listed are suggestions and you may include more or less as required:

<table>
<thead>
<tr>
<th>Name</th>
<th>Interface</th>
<th>Description of services to be included</th>
</tr>
</thead>
<tbody>
<tr>
<td>essential_network_services</td>
<td>internal</td>
<td>Any network protocols required for normal network operation such as DNS, NTP, BGP</td>
</tr>
<tr>
<td>essential_server_services</td>
<td>dmz</td>
<td>All the protocols required by the company servers such as BGP, HTTP, HTTPS, FTP, IMAP, POP3, SMTP, IKE, SQL, MYSQL, NTP, TRACEROUTE, SOCKs, and SNMP</td>
</tr>
<tr>
<td>user_services</td>
<td>internal</td>
<td>Any protocols required by users such as HTTP, HTTPS, FTP</td>
</tr>
</tbody>
</table>

The following security policy configurations are basic and only include logging and default AV and IPS. These policies allow or deny access to non-RADIUS SSO traffic. These are essential as network services including DNS, NTP, and FortiGuard require access to the Internet.

To configure security policies:

1. Go to Policy & Objects > Firewall Policy.
2. Click Create New.
3. Configure the policy as follows, then click OK:

<table>
<thead>
<tr>
<th>Incoming Interface</th>
<th>Internal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Address</td>
<td>internal_network</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>wan1</td>
</tr>
<tr>
<td>Destination Address</td>
<td>all</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>essential_network_services</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>ON</td>
</tr>
<tr>
<td>Security Profiles</td>
<td>ON: AntiVirus, IPS</td>
</tr>
<tr>
<td>Log Allowed Traffic</td>
<td>ON</td>
</tr>
</tbody>
</table>
Comments: Essential network services

4. Click Create New, and configure the new policy as follows, then click OK:

- **Incoming Interface**: dmz
- **Source Address**: company_servers
- **Outgoing Interface**: wan1
- **Destination Address**: all
- **Schedule**: always
- **Service**: essential_server_services
- **Action**: ACCEPT
- **NAT**: ON
- **Security Profiles**: ON: AntiVirus, IPS
- **Log Allowed Traffic**: enable
- **Comments**: Company servers accessing the Internet

5. Click Create New, and configure the new policy as follows, then click OK:

- **Incoming Interface**: Internal
- **Source Address**: internal_network
- **Outgoing Interface**: dmz
- **Destination Address**: company_servers
- **Schedule**: always
- **Service**: all
- **Action**: ACCEPT
- **NAT**: ON
- **Security Profiles**: ON: AntiVirus, IPS
- **Log Allowed Traffic**: enable
- **Comments**: Access company servers

6. Click Create New, and configure the RADIUS SSO policy as follows, then click OK. This policy allows access for members of specific RADIUS groups.

- **Incoming Interface**: Internal
- **Source Address**: internal_network
- **Source User(s)**: Select the user groups that you created for RSSO.
- **Outgoing Interface**: wan1
Destination Address | all
---|---
Schedule | business_hours
Service | ALL
Action | ACCEPT
NAT | ON
Security Profiles | ON: AntiVirus, Web Filter, IPS, and Email Filter. In each case, select the default profile.

7. Place the RSSO policy higher in the security policy list than more general policies for the same interfaces. Click OK.

To test the configuration:

Once configured, a user only needs to log in to their PC using their RADIUS account. After that, when they attempt to access the Internet, the FortiGate uses their session information to get their RADIUS information. Once the user is verified, they can access the website.

1. The user logs on to their PC and tries to access the Internet.
2. The FortiGate contacts the RADIUS server for the user's information. Once confirmed, the user can access the Internet. Each step generates logs that enable you to verify that each step succeeded.
3. If a step does not succeed, confirm that your configuration is correct.

### RSA ACE (SecurID) servers

SecurID is a two-factor system produced by the company RSA that uses one-time password (OTP) authentication. This system consists of the following:

- Portable tokens that users carry
- RSA ACE/Server
- Agent host (the FortiGate)
When using SecurID, users carry a small device or "token" that generates and displays a pseudo-random password. According to RSA, each SecurID authenticator token has a unique 64-bit symmetric key that is combined with a powerful algorithm to generate a new code every 60 seconds. The token is time-synchronized with the SecurID RSA ACE/Server.

The RSA ACE/Server is the SecurID system's management component. It stores and validates the information about the SecurID tokens allowed on your network. Alternately, the server can be an RSA SecurID 130 appliance.

The agent host is the server on your network. In this case, this is the FortiGate, which intercepts user logon attempts. The agent host gathers the user ID and password entered from the SecurID token and sends the information to the RSA ACE/Server for validation. If valid, the RSA ACE/Server returns a reply indicating that it is a valid logon and FortiOS allows the user access to the network resources specified in the associated security policy.

Configuring SecurID with FortiOS consists of the following:

1. Configure the RSA and RADIUS servers to work with each other. See RSA server documentation.
2. Do one of the following:
   a. Configure the RSA SecurID 130 appliance.
   b. Configure the FortiGate as an agent host on the RSA ACE/Server.
3. Configure the RADIUS server in FortiOS.
4. Create a SecurID user group.
5. Create a SecurID user.
6. Configure authentication with SecurID.

The following instructions are based on RSA ACE/Server 5.1 and RSA SecurID 130 appliance. They assume that you have successfully completed all external RSA and RADIUS server configuration.

In this example, the RSA server is on the internal network and has an IP address of 192.128.100.000. The FortiOS internal interface address is 192.168.100.3. The RADIUS shared secret is fortinet123, and the RADIUS server is at IP address 192.168.100.202.

To configure the RSA SecurID 130 appliance:

1. Log on to the SecurID IMS console.
2. Go to RADIUS > RADIUS clients, then select Add New.

<table>
<thead>
<tr>
<th>RADIUS Client Basics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client Name</td>
</tr>
<tr>
<td>Associated RSA Agent</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>RADIUS Client Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
</tr>
<tr>
<td>Make / Model</td>
</tr>
<tr>
<td>Shared Secret</td>
</tr>
<tr>
<td>Accounting</td>
</tr>
<tr>
<td>Client Status</td>
</tr>
</tbody>
</table>

3. Configure your FortiGate as a SecurID client:
4. Click Save.
To configure the FortiGate as an agent host on the RSA ACE/Server:

1. On the RSA ACE/Server, go to Start > Programs > RSA ACE/Server, then Database Administration - Host Mode.
2. From the Agent Host menu, select Add Agent Host.
3. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>FortiGate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network Address</td>
<td>Enter the FortiOS internal interface. In this example, it is 192.168.100.3.</td>
</tr>
<tr>
<td>Secondary Nodes</td>
<td>You can optionally enter other IP addresses that resolve to the FortiGate.</td>
</tr>
</tbody>
</table>

For more information, see the RSA ACE/Server documentation.

To configure the RADIUS server in FortiOS:

1. Go to User & Authentication > RADIUS Servers, then click Create New.
2. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>RSA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication method</td>
<td>Select Default.</td>
</tr>
<tr>
<td>Primary Server</td>
<td>192.168.100.102. You can click Test to ensure the IP address is correct and that FortiOS can contact the RADIUS server.</td>
</tr>
<tr>
<td>Secret</td>
<td>fortinet123</td>
</tr>
</tbody>
</table>

3. Click OK.

To create a SecurID user group:

2. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>RSA_group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Firewall</td>
</tr>
</tbody>
</table>

3. In Remote Groups, click Add, then select the RSA server.
4. Click OK.

To create a SecurID user:

1. Go to User & Authentication > User Definition. Click Create New.
2. Configure the following:

<table>
<thead>
<tr>
<th>User Type</th>
<th>Remote RADIUS User</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>wlloman</td>
</tr>
<tr>
<td>RADIUS Server</td>
<td>RSA</td>
</tr>
</tbody>
</table>
Contact Info (Optional) Enter email or SMS information.
User Group RSA_group

3. Click Create.

You can test the configuration by entering the `diagnose test authserver radius RSA auto wloman 1111111111` command. The series of 1s is the OTP that your RSA SecurID token generates that you enter for access.

**Configuring authentication with SecurID**

You can use the SecurID user group in several FortiOS features that authenticate by user group:

- Security policy on page 1837
- IPsec VPN XAuth on page 1838
- PPTP VPN on page 1838
- SSL VPN

Unless stated otherwise, the following examples use default values.

**Security policy**

The example creates a security policy that allows HTTP, FTP, and POP3 traffic from the internal interface to WAN1. If these interfaces are not available in FortiOS, substitute other similar interfaces.

**To configure a security policy with SecurID authentication:**

1. Go to Policy & Objects > Firewall Policy.
2. Click Create New.
3. Configure the following:

<table>
<thead>
<tr>
<th><strong>Incoming Interface</strong></th>
<th>internal</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Source Address</strong></td>
<td>all</td>
</tr>
<tr>
<td><strong>Source User(s)</strong></td>
<td>RSA_group</td>
</tr>
<tr>
<td><strong>Outgoing Interface</strong></td>
<td>wan1</td>
</tr>
<tr>
<td><strong>Destination Address</strong></td>
<td>all</td>
</tr>
<tr>
<td><strong>Schedule</strong></td>
<td>always</td>
</tr>
<tr>
<td><strong>Service</strong></td>
<td>HTTP, FTP, POP3</td>
</tr>
<tr>
<td><strong>Action</strong></td>
<td>ACCEPT</td>
</tr>
<tr>
<td><strong>NAT</strong></td>
<td>On</td>
</tr>
<tr>
<td><strong>Shared Shaper</strong></td>
<td>If you want to limit traffic or guarantee minimum bandwidth for traffic that uses the SecurID security policy, enable and use the default shaper, guarantee-100kbps.</td>
</tr>
<tr>
<td><strong>Log Allowed Traffic</strong></td>
<td>Enable if you want to generate usage reports on traffic that this policy has authenticated.</td>
</tr>
</tbody>
</table>

4. Click OK.
IPsec VPN XAuth

In VPN > IPsec Wizard, select the SecurID user group on the Authentication page. The SecurID user group members must enter their SecurID code to authenticate.

PPTP VPN

When configuring PPTP in the CLI, set usrgrp to the SecurID user group.

SSL VPN

You must map the SecurID user group to the portal that will serve SecurID users and include the SecurID user group in the security policy's Source User(s) field.

To map the SecurID group to an SSL VPN portal:

1. Go to VPN > SSL-VPN Settings.
3. Configure the following:

<table>
<thead>
<tr>
<th>Users/Groups</th>
<th>RSA_group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portal</td>
<td>Select the desired portal.</td>
</tr>
</tbody>
</table>

4. Click OK.

Support for Okta RADIUS attributes filter-Id and class

RADIUS user group membership information can be returned in the filter-Id (11) and class (25) attributes in RADIUS Access-Accept messages. The group membership information can be used for group matching in FortiGate user groups in firewall policies and for FortiGate wildcard administrators with remote RADIUS authentication.

In this example, a FortiAuthenticator is used as the RADIUS server. A local RADIUS user on the FortiAuthenticator is configure with two groups in the filter-Id attribute: okta-group1 and okta-group2.
To create the RADIUS user and set the attribute type to override group information:

```
config user radius
  edit "FAC193"
    set server "10.1.100.189"
    set secret **********
    set group-override-attr-type filter-Id
  next
end
```

FortiOS will only use the configured filter-Id attribute, even if the RADIUS server sends group names in both class and filter-id attributes. To return group membership information from the class attribute instead, set `group-override-attr-type to class`.

To configure group match in the user group:

2. Click Create New.
3. Enter a name for the group, and set Type to Firewall.
4. In the Remote Groups table, click Add.
5. Set Remote Server to the just created RADIUS server, `FAC193`.
6. Set Groups to Specify, and enter the group name, `okta-group2`. The string must match the group name configured on the RADIUS server for the filter-Id attribute.

   ![User Group Configuration](image)

7. Click OK.
   The remote server is added to the Remote Groups table.
8. Click OK.
9. Add the new user group to a firewall policy and generate traffic on the client PC that requires firewall authentication, such as connecting to an external web server.
10. After authentication, on the FortiGate, verify that traffic is authorized in the traffic log:
    b. Verify that the traffic was authorized.

To use the remote user group with group match in a system wildcard administrator configuration:

1. Go to `System > Administrators`.
2. Edit an existing administrator, or create a new one.
3. Set Type to `Match all users in a remote server group`.
4. Set Remote User Group to the remote server.

5. Configure the remaining settings as required.
6. Click OK.
7. Log in to the FortiGate using the remote user credentials on the RADIUS server.
   If the correct group name is returned in the filter-Id attribute, administrative access is allowed.

Sending multiple RADIUS attribute values in a single RADIUS Access-Request

A managed FortiSwitch can be configured to send multiple RADIUS attribute values in a single RADIUS Access-Request. This option is configured per RADIUS user, and is set to none by default.

The available service type options are:

<table>
<thead>
<tr>
<th>Service Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>login</td>
<td>User should be connected to a host.</td>
</tr>
<tr>
<td>framed</td>
<td>User use Framed Protocol.</td>
</tr>
<tr>
<td>callback-login</td>
<td>User disconnected and called back.</td>
</tr>
<tr>
<td>callback-framed</td>
<td>User disconnected and called back, then a Framed Protocol.</td>
</tr>
<tr>
<td>outbound</td>
<td>User granted access to outgoing devices.</td>
</tr>
<tr>
<td>administrative</td>
<td>User granted access to the administrative unsigned interface.</td>
</tr>
<tr>
<td>nas-prompt</td>
<td>User provided a command prompt on the NAS.</td>
</tr>
<tr>
<td>authenticate-only</td>
<td>Authentication requested, and no authentication information needs to be</td>
</tr>
<tr>
<td></td>
<td>returned.</td>
</tr>
<tr>
<td>callback-nas-prompt</td>
<td>User disconnected and called back, then provided a command prompt.</td>
</tr>
<tr>
<td>call-check</td>
<td>Used by the NAS in an Access-Request packet, Access-Accept to answer the</td>
</tr>
<tr>
<td></td>
<td>call.</td>
</tr>
<tr>
<td>callback-administrative</td>
<td>User disconnected and called back, granted access to the admin unsigned</td>
</tr>
<tr>
<td></td>
<td>interface.</td>
</tr>
</tbody>
</table>

To configure a managed FortiSwitch to the RADIUS attributes login, framed, and authenticate-only all at the same time:

```
config user radius
   edit "Radius_Server"
   set switch-controller-service-type-type login framed authenticate-only
```
Traffic shaping based on dynamic RADIUS VSAs

A FortiGate can use the WISPr-Bandwidth-Max-Down and WISPr-Bandwidth-Max-Up dynamic RADIUS VSAs (vendor-specific attributes) to control the traffic rates permitted for a certain device. The FortiGate can apply different traffic shaping to different users who authenticate with RADIUS based on the returned RADIUS VSA values. When the same user logs in from an additional device, the RADIUS server will send a CoA (change of authorization) message to update the bandwidth values to \( \frac{1}{N} \) of the total values, where \( N \) is the number of logged in devices from the same user.

This feature is not supported on NP hardware. NP offloading is automatically disabled on the policy if this feature is enabled.

When a user logs in to two devices through RADIUS authentication. The authentication and authorization flow is as follows:

1. The user logs in to a device and the authentication is sent to the FortiGate.
2. The FortiGate sends the Access-Request message to the RADIUS server.
3. The RADIUS server sends the Access-Accept message to the FortiGate. The server also returns the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs.
4. Based on the VSA values, the FortiGate applies traffic shaping for the upload and download speeds based on its IP.
5. The user logs in to a second device and the authentication is sent to the FortiGate.
6. The FortiGate sends the Access-Request message to the RADIUS server.
7. The RADIUS server sends the Access-Accept message to the FortiGate. The server also returns the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs at half the value from the first device.
8. Based on the VSA values, the FortiGate applies traffic shaping for the upload and download speeds on the second device based on its IP.
9. The RADIUS server sends a CoA message and returns WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs for the first device at half the value.
10. Based on the VSA values, the FortiGate updates traffic shaping for the upload and download speeds on the first device based on its IP.

Example

In this example, the FortiGate is configured to dynamically shape user traffic based on the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs returned by the RADIUS server when the user logs in through firewall authentication.

To configure traffic shaping based on dynamic RADIUS VSAs:

1. Configure the RADIUS server users file to identify WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down:

The WISPr-Bandwidth is measured in bps, and the FortiOS dynamic shaper is measured in Bps.

WISPr-Bandwidth-Max-Up = 1004857,
WISPr-Bandwidth-Max-Down = 504857,

2. In FortiOS, configure the RADIUS server:

config user radius
  edit "rad1"
    set server "172.16.200.44"
    set secret ************
    set radius-coa enable
    set acct-all-servers enable
    config accounting-server
      edit 1
      set status enable
      set server "172.16.200.44"
      set secret ************
    next
  next
end

3. Configure the RADIUS user group:

config user group
  edit "group_radius"
    set member "rad1"
next
end
4. Configure the firewall policy with dynamic shaping and the RADIUS group:

```bash
config firewall policy
  edit 2
    set srcintf "port2"
    set dstintf "wan1"
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "all6"
    set dstaddr6 "all6"
    set action accept
    set schedule "always"
    set service "ALL"
    set dynamic-shaping enable
    set groups "group_radius"
    set nat enable
next
end
```

**Verification**

After a client PC is authenticated by the RADIUS server, dynamic shaping is applied to the client based on the IP address.

Use the following commands to monitor the dynamic shaper:

```bash
# diagnose firewall shaper dynamic-shaper stats
# diagnose firewall shaper dynamic-shaper list {ip | ipv6 | user} <address or username>
```

**Use case 1**

User1 is paying for rate plan A that limits their maximum bandwidth to 10 Mbps download and 5 Mbps upload. User2 is paying for rate plan B that limits their maximum bandwidth to 5 Mbps download and 5 Mbps upload. The speeds in both plans are provided by best effort, so there is no guaranteed minimum bandwidth.

User1 logs in to pc1 with RADIUS authentication and IP-based dynamic shaping is applied. User2 logs in to pc2 with RADIUS authentication and IP-based dynamic shaping is applied.

**To verify the dynamic shaping:**

1. On pc1, verify the bandwidth and transfer speed:

   ```bash
   root@pc1:~# iperf -c 172.16.200.44 -u -t 25 -b 20M
   -----------------------------------------------
   Client connecting to 172.16.200.44, UDP port 5001
   Sending 1470 byte datagrams
   UDP buffer size: 208 KByte (default)
   -----------------------------------------------
   [ 3] local 10.1.100.11 port 50510 connected with 172.16.200.44 port 5001
   [ ID] Interval     Transfer    Bandwidth
   [ 3] 0.0-25.0 sec  59.6 MBytes 20.0 Mbits/sec
   [ 3] Sent 42518 datagrams
   [ 3] Server Report:
   [ 3] 0.0-25.3 sec  30.1 MBytes  9.99 Mbits/sec 15.651 ms 21058/42518 (50%)
   ```
2. On pc2, verify the bandwidth and transfer speed:

```bash
root@pc2:~# iperf -c 172.16.200.44 -u -t 25 -b 20M
Client connecting to 172.16.200.44, UDP port 5001
Sending 1470 byte datagrams
UDP buffer size: 208 KByte (default)
```

---

```bash
[ 3] local 10.1.100.22 port 52814 connected with 172.16.200.44 port 5001
[ ID] Interval     Transfer     Bandwidth
[ 3] 0.0-25.0 sec  59.6 MBytes  20.0 Mbits/sec
[ 3] Sent 42518 datagrams
[ 3] Server Report:
[ 3] 0.0-25.3 sec  15.1 MBytes  5.03 Mbits/sec  15.652 ms 31710/42514 (75%)
```

3. In FortiOS, check the authentication list:

```bash
# diagnose firewall auth list
10.1.100.11, test-shaper1
  src_mac: **:****:**:**:**:**:**
  type: fw, id: 0, duration: 38, idled: 16
  expire: 562
  flag(814): hard radius no_idle
  server: rad1
  packets: in 8207 out 3999, bytes: in 12306164 out 226963
  group_id: 3
  group_name: group_radius

10.1.100.22, test-shaper2
  src_mac: **:****:**:**:**:**:**
  type: fw, id: 0, duration: 24, idled: 24
  expire: 156, max-life: 35976
  flag(814): hard radius no_idle
  server: rad1
  packets: in 0 out 5, bytes: in 0 out 300
  group_id: 3
  group_name: group_radius

----- 2 listed, 0 filtered  -----
```

4. Check the dynamic shaper list:

```bash
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
  bandwidth(original/reply): 1250000 Bps/625000 Bps
  current bandwidth(original/reply): 1237072 Bps/0 Bps
  allow packets(original/reply): 38524/14
  allow bytes(original/reply): 55270378/11285
  drop packets(original/reply): 10136/0
  drop bytes(original/reply): 13516198/0
  life: 441
  idle: 0/40
  idle time limit: 600 s

addr: 10.1.100.22
  bandwidth(original/reply): 625000 Bps/625000 Bps
  current bandwidth(original/reply): 622909 Bps/0 Bps
  allow packets(original/reply): 3232/3
  allow bytes(original/reply): 4841536/243
  drop packets(original/reply): 2753/0
```
drop bytes(original/reply): 4123994/0
life: 10
idle: 0/10
idle time limit: 36000 s

5. Check the session list:

# diagnose sys session list
session info: proto=6 proto_state=05 duration=3 expire=116 timeout=3600 flags=00000004

service(1):
[0:0x0:0/(0,65535)->(0,65535)] helper:auto

Use case 2

A user logs in to a device (pc1, 10.1.100.11) and has a maximum bandwidth of 10 Mbps download and 5 Mbps upload. The same user logs in to a second device (pc2, 10.1.100.22) and the RADIUS server sends a CoA request with the WISPr-Bandwidth-Max to pc1. The maximum bandwidth on pc1 changes to 5 Mbps download and 2.5Mbps upload. On pc2, the maximum bandwidth is also 5 Mbps download and 2.5Mbps upload.

When the user logs out from pc1, the RADIUS server sends CoA request with the new WISPr-Bandwidth-Max for pc2. The FortiGate updates the authentication user list and dynamic shaper for pc2. The maximum bandwidth on pc2 changes to 10 Mbps download and 5 Mbps upload.

To verify the dynamic shaping:

1. Check the dynamic shaper list after the user logs in to pc1:

   # diagnose firewall shaper dynamic-shaper list
   addr: 10.1.100.11
   bandwidth(original/reply): 1250000 Bps/625000 Bps
   current bandwidth(original/reply): 0 Bps/0 Bps
   allow packets(original/reply): 0/3
   allow bytes(original/reply): 0/243
   drop packets(original/reply): 0/0
   drop bytes(original/reply): 0/0
   life: 491
   idle: 4/4
   idle time limit: 86400 s

2. Check the dynamic shaper list after the user logs in to pc2:

   # diagnose firewall shaper dynamic-shaper list
   addr: 10.1.100.11
   bandwidth(original/reply): 625000 Bps/312500 Bps
   current bandwidth(original/reply): 0 Bps/0 Bps
   allow packets(original/reply): 0/0
   allow bytes(original/reply): 0/0
   drop packets(original/reply): 0/0
   drop bytes(original/reply): 0/0
   life: 652
   idle: 5/5
   idle time limit: 600 s

   addr: 10.1.100.22
   bandwidth(original/reply): 625000 Bps/312500 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/3
allow bytes(original/reply): 0/243
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 3
idle: 3/3
idle time limit: 86400 s

3. Check the authentication list:

```
# diagnose firewall auth list
10.1.100.11, test
  src_mac: **:**:**:**:**:**:**
  type: fw, id: 0, duration: 171, idled: 11
  expire: 589, max-life: 589
  flag(814): hard radius no_idle
  server: rad1
  packets: in 0 out 0, bytes: in 0 out 0
  group_id: 15
  group_name: group_radius

10.1.100.22, test
  src_mac: **:**:**:**:**:**:**
  type: fw, id: 0, duration: 9, idled: 9
  expire: 86391
  flag(814): hard radius no_idle
  server: rad1
  packets: in 0 out 0, bytes: in 0 out 0
  group_id: 15
  group_name: group_radius
```

----- 2 listed, 0 filtered -----

4. Check the dynamic shaper list after the user logs out from pc1:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.22
bandwidth(original/reply): 1250000 Bps/625000 Bps
```

5. Check the authentication list again:

```
# diagnose firewall auth list
10.1.100.22, test
  src_mac: **:**:**:**:**:**:**
  type: fw, id: 0, duration: 453, idled: 49
  expire: 551, max-life: 551
  flag(814): hard radius no_idle
  server: rad1
  packets: in 0 out 0, bytes: in 0 out 0
  group_id: 15
```
RADIUS Termination-Action AVP in wired and wireless scenarios

When authenticating with RADIUS in a wired or wireless scenario, the FortiGate can support proper handling of the Termination-Action AVP.

In a wired scenario, a hardware switch configured with 802.1X security authentication can read the Termination-Action attribute value from the RADIUS Access-Accept response. If the Termination-Action is 1, the FortiGate will initiate re-authentication when the session time has expired. During re-authentication, the port stays authorized. If the Termination-Action is 0, the session will be terminated.

In a wireless scenario, when a virtual AP is configured with WPA2-Enterprise security with RADIUS and has CoA enabled, it processes the RADIUS CoA request immediately upon receiving it and re-authenticates when the Termination-Action is 1.

Wired example

This example has a FortiGate configured with a hardware switch with two ports: port3 and port5. The hardware switch is enabled with 802.1X security and assigned to a RADIUS user group. Upon a successful authentication, the RADIUS server responds with an Access-Accept containing the authentication Session-Timeout and Termination-Action attributes. In this example, the Termination-Action value is 1, which informs the client to re-authenticate when the session time expires. During this time, the FortiGate keeps the client/port authorized while it initiates the re-authentication with the RADIUS server.

The message exchange is as follows:
To configure the RADIUS server and the FortiGate to handle the Termination-Action AVP:

1. On the RADIUS server, configure the Termination-Action AVP with the value `RADIUS-Request (1)` to indicate that re-authentication should occur upon expiration of the Session-Time.

2. On the FortiGate, configure the RADIUS server:

   ```conf
   config user radius
   edit "rad1"
     set server "172.18.60.203"
     set secret ENC **********
     set radius-coa enable
   config accounting-server
     edit 1
       set status enable
       set server "172.18.60.203"
       set secret ENC **********
     next
   end
   next
   end
   
   3. Configure the RADIUS user group:

   ```conf
   config user group
   edit "group_radius"
     set member "rad1"
4. Configure the hardware switch with 802.1X enabled.
   a. Configure the virtual switch settings:
      
      ```
      config system virtual-switch
      edit hw2
          set physical-switch "sw0"
      config port
      edit port3
          next
      edit port5
          next
      end
      next
      end
      ```
   
   WARNING: Changing 802.1X could interrupt network connectivity on affected interfaces.
   Do you want to continue? (y/n)y

   b. Configure the interface settings:
      
      ```
      config system interface
      edit hw2
          set vdom vdom1
          set ip 6.6.6.1 255.255.255.0
          set allowaccess ping https ssh
          set stp enable
          set security-mode 802.1X
          set security-groups "group_radius"
      next
      ```

5. On the client device, initiate 802.1X authentication, then verify that the switch port shows as authorized:

   ```
   # diagnose sys 802-1x status
   Virtual switch 'hw2' (default mode) 802.1x member status:
   port3: Link up, 802.1X state: unauthorized
   port5: Link up, 802.1X state: authorized
   ```

6. After successful authentication, wait for the session to timeout.

7. The FortiGate will keep the 802.1X port authenticated, and initiate re-authentication with the same Acct-Session-Id to the RADIUS server. The 802.1X status of the port remains unchanged:

   ```
   # diagnose sys 802-1x status
   Virtual switch 'hw2' (default mode) 802.1x member status:
   port3: Link up, 802.1X state: unauthorized
   port5: Link up, 802.1X state: authorized
   ```

### Wireless example

In this example, a virtual AP is configured with WPA2-Enterprise security with RADIUS and has CoA enabled. After a wireless user authenticates and connects to the wireless SSID, the RADIUS server triggers a CoA event with AVPs Session-timeout and a Termination-Action of 1. This signals the FortiGate to trigger re-authentication of the client, which the client immediately performs to stay connected to the wireless SSID.

The message exchange is as follows:
To configure the FortiGate to handle the Termination-Action AVP:

1. Configure the RADIUS server:

   ```bash
   config user radius
   edit "peap"
       set server "172.16.200.55"
       set secret **********
       set radius-coa enable
   next
   end
   ```

2. Configure the VAP:

   ```bash
   config wireless-controller vap
   edit "wifi"
       set ssid "FWF-60E-coa"
       set security wpa2-only-enterprise
       set auth radius
       set radius-server "peap"
       set schedule "always"
   next
   end
   ```
3. Verify that the wireless station connects to the SSID:

```bash
# diagnose wireless-controller wlac -d sta online
vf=0 wtp=1 rId=1 wlan=wifi vlan_id=0 ip=10.10.80.2 ip6=: mac=**:**:**:**:**:**: vci=
host=wifi-qa-01 user=test1 group=group1 signal=-28 noise=-95 idle=1 bw=0 use=6 chan=149
radio_type=11AC security=wpa2_only_enterprise mpsk= encrypt=aes cp_authed=no online=yes
mimo=2
```

4. From the RADIUS server, manually trigger a RADIUS CoA event.
   a. RADIUS CoA sent to the FortiGate:

      ```
      Sent CoA-Request Id 7 from 0.0.0.0:54158 to 172.16.200.201:3799 length 39
      User-Name = "test1"
      Session-Timeout = 120
      Termination-Action = RADIUS-Request
      ```

   b. RADIUS CoA-ACK received from the FortiGate:

      ```
      Received CoA-ACK Id 7 from 172.16.200.201:3799 to 0.0.0.0:0 length 44
      Event-Timestamp = "Jan 5 2022 14:43:12 PST"
      Message-Authenticator = 0x3311ba3b763d68da653ab34351b0308
      ```

5. On the wireless station console, verify that the re-authentication happens immediately:

   ```
   root@wifi-qa-01:/home/wpa-test# wlan1: CTRL-EVENT-EAP-STARTED EAP authentication started
   wlan1: CTRL-EVENT-EAP-PROPOSED-METHOD vendor=0 method=25
   wlan1: CTRL-EVENT-EAP-METHOD EAP vendor 0 method 25 (PEAP) selected
   EAP-TLV: TLV Result - Success - EAP-TLV/Phase2 Completed
   wlan1: CTRL-EVENT-EAP-SUCCESS EAP authentication completed successfully
   wlan1: PMKSA-CACHE-REMOVED **:**:**:**:**:**:**:**:**:** 0
   wlan1: PMKSA-CACHE-ADDED **:**:**:**:**:**:**:**:**:** 0
   wlan1: WPA: Key negotiation completed with **:**:**:**:**:**:**:**:**:** [PTK=CCMP GTK=CCMP]
   ```

---

**TACACS+ servers**

TACACS+ is a remote authentication protocol that provides access control for routers, network access servers, and other network devices through one or more centralized servers.

FortiOS sends the following proprietary TACACS+ attributes to the TACACS+ server during authorization requests:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service=&lt;name&gt;</td>
<td>User must be authorized to access the specified service.</td>
</tr>
<tr>
<td>memberof</td>
<td>Group that the user belongs to.</td>
</tr>
<tr>
<td>admin_prof</td>
<td>Administrator profile (admin access only).</td>
</tr>
</tbody>
</table>

Only memberof and admin_prof attributes are parsed in authentication replies.

You can configure up to ten remote TACACS+ servers in FortiOS. You must configure at least one server before you can configure remote users.
To configure TACACS+ authentication in the CLI:

1. Configure the TACACS+ server entry:

```plaintext
config user tacacs+
   edit "TACACS-SERVER"
      set server <IP address>
      set key <string>
      set authen-type ascii
      set source-ip <IP address>
   next
end
```

2. Configure the remote user group:

```plaintext
config user group
   edit "TACACS-GROUP"
      set group-type firewall
      set member "TACACS-SERVER"
   next
end
```

3. Configure the remote user:

```plaintext
config system admin
   edit TACACS-USER
      set remote-auth enable
      set accprofile "super_admin"
      set vdom "root"
      set wildcard enable
      set remote-group "TACACS-GROUP"
   next
end
```

To configure a TACACS+ server in the GUI:

1. Go to User & Authentication > TACACS+ Servers.
2. Click Create New.
3. Configure the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the TACACS+ server name.</td>
</tr>
<tr>
<td>Authentication Type</td>
<td>Select the authentication type used for the TACACS+ server. Selecting Auto tries PAP, MSCHAP, and CHAP, in that order.</td>
</tr>
<tr>
<td>Server IP/Name</td>
<td>Enter the domain name or IP address for the primary server.</td>
</tr>
<tr>
<td>Server Secret</td>
<td>Enter the key to access the primary server.</td>
</tr>
</tbody>
</table>

4. Click OK.
The following topics provide information about SAML:

- Outbound firewall authentication for a SAML user on page 1854
- SAML SP for VPN authentication on page 1855
- Using a browser as an external user-agent for SAML authentication in an SSL VPN connection on page 1857
- SAML authentication in a proxy policy on page 1861
- Configuring SAML SSO in the GUI on page 1865
- Outbound firewall authentication with Azure AD as a SAML IdP on page 1871

Outbound firewall authentication for a SAML user

When you configure a FortiGate as a service provider (SP), you can create an authentication profile that uses SAML for firewall authentication.

You must use the identity provider’s (IdP) remote certificate on the SPs.

The following example uses a FortiGate as an SP and FortiAuthenticator as the IdP server:

To configure firewall authentication:

1. Configure the FortiGate SP to be a SAML user:

```config
config user saml
edit "fac-firewall"
set entity-id "http://10.2.2.1000/saml/metadata/"
single-sign-on-url "http://10.2.2.1003/saml/login/
set single-sign-on-url "https://10.2.2.1003/saml/login/"
set idp-entity-id "http://172.18.58.93:443/saml-idp/bbbbbb/metadata/"
set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/bbbbbb/login/"
set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/bbbbbb/login/"
set idp-cert "REMOTE_Cert_3"
set user-name "username"
set group-name "group"
```
next
end

2. Add the SAML user to the user group (optionally, you can configure group matching):

   config user group
   edit "saml_firewall"
   set member "fac-firewall"
   config match
     edit 1
     set server-name "fac-firewall"
     set group-name "user_group1"
   next
end

3. Add the SAML user group to a firewall policy:

   config firewall policy
   edit 2
     set srcintf "port3"
     set dstintrf "port1"
     set srcaddr "all"
     set dstaddr "pc4"
     set action accept
     set schedule "always"
     set service "ALL"
     set logtraffic all
     set fsso disable
     set groups "saml_firewall" "group_local"
     set users "first"
     set nat enable
   next
end

4. Configure the FortiAuthenticator IdP as needed.

5. Run HTTP/HTTPS authentication for a remote user. The SAML login page appears:

   [Image: SAML login page]

SAML SP for VPN authentication

When you configure a FortiGate as a service provider (SP), you can create an authentication profile that uses SAML for SSL VPN web portal authentication.

The following example uses a FortiGate as an SP and FortiAuthenticator as the IdP server:
To configure SSL VPN web portal authentication:

1. **Configure the FortiGate SP to be a SAML user:**

   ```
   config user
   edit "fac-sslvpn"
   set entity-id "https://10.2.2.2:10443/remote/saml/metadata/"
   set single-sign-on-url "https://10.2.2.2:10443/remote/saml/login/"
   set single-sign-out-url "https://10.2.2.2:10443/remote/saml/logout/"
   set idp-entity-id "http://172.18.58.93:443/saml-idp/ssssss/metadata/"
   set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/ssssss/login/"
   set idp-single-sign-out-url "https://172.18.58.93:443/saml-idp/ssssss/logout/"
   set idp-cert "REMOTE_Cert_3"
   set user-name "username"
   next
   end
   ```

2. **Add the SAML user to the user group (group matching may also be configured):**

   ```
   config user group
   edit "saml_sslvpn"
   set member "fac-sslvpn"
   next
   end
   ```

3. **Configure SSL VPN:**

   ```
   config vpn ssl settings
   set servercert "Fortinet Factory"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
   set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPV6_ADDR1"
   set source-interface "port3"
   set source-address "all"
   set source-address6 "all"
   set default-portal "full-access"
   config authentication-rule
   edit 1
   set groups "saml_sslvpn"
   set portal "full-access"
   next
   end
   ```
4. Add the SAML user group to a firewall policy:

```plaintext
config firewall policy
edit 0
  set srcintf "ssl.vdom1"
  set dstintf "port1"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set schedule "always"
  set service "ALL"
  set groups "local" "saml_sslvpn"
  set nat enable
end
```

5. Configure the FortiAuthenticator IdP as needed.

To connect from the SSL VPN web portal:

1. In a web browser, enter the portal address. The SAML login page appears:

2. Enter the user name and password.
3. Click Login, or if SSO has been configured, click Single-Sign-On. Once authenticated, the web portal opens.

Using a browser as an external user-agent for SAML authentication in an SSL VPN connection

FortiClient can use a browser as an external user-agent to perform SAML authentication for SSL VPN tunnel mode, instead of the FortiClient embedded log in window. If a user has already done SAML authentication in the default browser, they do not need to authenticate again in the FortiClient built-in browser. FortiClient 7.0.1 and later is required.

The following CLI is used to set the SAML local redirect port on the FortiClient endpoint after successful SAML authentication:

```plaintext
config vpn ssl settings
  set saml-redirect-port <port>
end
```

Example

In this example, a user wants to use their default browser to connect to IdP for SAML authentication, without needing to separately authenticate in the FortiClient built-in browser. After authenticating in the browser, FortiClient obtains the authentication cookie directly from the browser.
The authentication process proceeds as follows:

1. The remote client uses FortiClient to connect to the FortiGate SSL VPN on 172.16.58.92:1443 with the *Use external browser as user-agent for saml user authentication* option enabled.
2. The SSL VPN redirects FortiClient to complete SAML authentication using the Identity Provider (IdP).
3. FortiClient opens the default browser to authenticate the IdP server.
4. After a successful authentication, the browser redirects to localhost:<port>, where the port is defined by the `saml-redirect-port` variable on the FortiGate.
5. FortiClient reads the authentication ID passed by the successful authentication, then requests that the SAML authentication process continues on the FortiGate with this ID.
6. The FortiGate continues with the remaining SSL-VPN host-check and other steps until it receives the authentication cookie. It then allows the SSL VPN user to connect using tunnel mode.

**To configure the VPN:**

1. **Configure a SAML user:**

   ```
   config user saml
   edit "su1"
   set cert "fgt_gui_automation"
   set entity-id "http://172.18.58.92:1443/remote/saml/metadata/"
   set single-sign-on-url "https://172.18.58.92:1443/remote/saml/login/"
   set single.logout-url "https://172.18.58.92:1443/remote/saml/logout/"
   set idp-entity-id "http://172.18.58.93:443/saml-idp/222222/metadata/"
   set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/222222/login/"
   set idp-single.logout-url "https://172.18.58.93:443/saml-idp/222222/logout/"
   set idp-cert "REMOTE_Cert_1"
   set user-name "Username"
   set group-name "Groupname"
   set digest-method sha1
   next
   end
   ```

2. **Add the SAML user to a user group:**

   ```
   config user group
   edit "saml grp"
   set member "su1"
   ```
3. Create an SSL VPN web portal:

```bash
config vpn ssl web portal
  edit "testportal1"
    set tunnel-mode enable
    set ipv6-tunnel-mode enable
    set web-mode enable
  ... 
next 
end 
```

4. Configure the SSL VPN:

```bash
config vpn ssl settings
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
  set port 1443
  set source-interface "port2"
  set source-address "all"
  set source-address6 "all"
  set default-portal "testportal1"
  ... 
end 
```

5. Configure a firewall policy for the SSL VPN and assign the SAML group and a local user to it:

```bash
config firewall policy
  edit 1
    set name "policy_to_sslvpn_tunnel"
    set srcintf "ssl.root"
    set dstintf "port1"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "all"
    set dstaddr6 "all"
    set schedule "always"
    set service "ALL"
    set nat enable
    set groups "saml_grp"
    set users "u1"
next 
end 
```

6. Enable the SAML redirect port:

```bash
config vpn ssl settings
  set saml-redirect-port 8020 
end 
```

To connect to the VPN using FortiClient:

1. Configure the SSL VPN connection:
   a. Open FortiClient and go to the Remote Access tab and click Configure VPN.
   b. Enter a name for the connection.
c. Set the **Remote Gateway** to the FortiGate port 172.18.58.92.

d. Enable **Customize port** and set the port to 1443.

e. Enable **Enable Single Sign On (SSO) for VPN Tunnel** and **Use external browser as user-agent for saml user authentication**.

f. Click **Save**.

2. On the **Remote Access** tab select the **FGT401E_SSO VPN connection** from the dropdown list.

3. Click **SAML Login**.

   The default browser opens to the IdP authentication page.

4. Enter the username and password, then click **Login**.

   The authenticated result is sent back to FortiClient and the connection is established.
To check the connection on the FortiGate:

```
# get vpn ssl monitor
SSL-VPN Login Users:
Index User Group Auth Type Timeout Auth-Timeout From HTTP in/out
HTTPS in/out Two-factor Auth
1 fac3 saml_grp 256(1) N/A 10.1.100.254 0/0 0/0 0

SSL-VPN sessions:
Index User Group Source IP Duration I/O Bytes Tunnel/Dest IP
0 fac3 saml_grp 10.1.100.254 5 9990/8449

group_name: saml_grp
```

**SAML authentication in a proxy policy**

SAML user authentication can be used in explicit web proxies and transparent web proxies with the FortiGate acting as a SAML SP. SAML can be used as an authentication method for an authentication scheme that requires using a captive portal.
In this configuration, SAML authentication is used with an explicit web proxy. The IdP is a Windows 2016 server configured with ADFS. The LDAP and IdP servers are on the same server. The LDAP server is used as the user backend for the IdP to perform authentication; however, they are not required to be on the same server.

The authentication and authorization flow is as follows:

2. The browser is redirected by the web proxy the captive portal.
3. The request is redirected to the IdP's sign-in page.
4. If the user signs in, the IdP authenticates the user and sends back a SAML assertion message to the user's browser with the user group information.
5. The browser forwards the SAML assertion response as a HTTP POST to the FortiGate SAML assertion consumer service URL (https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/login/).
6. If the FortiGate authentication scheme has a user database configured, the FortiGate will query the LDAP server for the user group information and ignore the user group information from the SAML message.
7. The user group information is returned. The FortiGate matches the user group information against the LDAP group in the proxy policy group settings. If there is a match, the request is authorized and the proxy policy is matched.
8. If all policy criteria match successfully, then the webpage is returned to the client.
To configure SAML authentication with an explicit web proxy:

1. Enable the web proxy:
   
   ```
   config web-proxy explicit
   set status enable
   set http-incoming-port 8080
   end
   ```

2. Enable the proxy captive portal:
   
   ```
   config system interface
   edit "port10"
   set vdom "vdom1"
   set ip 10.1.100.1 255.255.255.0
   set allowaccess ping https ssh snmp http telnet
   set type physical
   set explicit-web-proxy enable
   set explicit-ftp-proxy enable
   set proxy-captive-portal enable
   set snmp-index 12
   next
   ```

3. Configure the LDAP server:
   
   ```
   config user ldap
   edit "ldap-10.1.100.198"
   set server "10.1.100.198"
   set cnid "cn"
   set dn "dc=myqalab,dc=local"
   set type regular
   set username "cn=fosqal,cn=users,dc=myqalab,dc=local"
   set password ************
   set group-search-base "dc=myqalab,dc=local"
   next
   ```

4. Configure the user group:
   
   ```
   config user group
   edit "ldap-group-saml"
   set member "ldap-10.1.100.198"
   next
   ```

5. Configure SAML:
   
   ```
   config user saml
   edit "saml_user"
   set cert "Fortinet_CA_SSL"
   set idp-entity-id "http://MYQALAB.LOCAL/adfs/services/trust"
   set idp-single-sign-on-url "https://myqalab.local/adfs/ls"
   set idp-single-sign-out-url "https://myqalab.local/adfs/ls"
   set idp-cert "REMOTE_Cert_4"
   set digest-method sha256
   ```
set adfs-claim enable
set user-claim-type name
set group-claim-type group
next
end

6. Configure the authentication scheme, rule, and setting:

config authentication scheme
edit "saml"
   set method saml
   set saml-server "saml_user"
   set user-database "ldap-10.1.100.198"
next
end
config authentication rule
edit "saml"
   set srcaddr "all"
   set active-auth-method "saml"
next
end
config authentication setting
   set captive-portal "fgt9.myqalab.local"
end

7. Configure the proxy policy:

config firewall proxy-policy
edit 3
   set proxy explicit-web
   set dstintf "port9"
   set srcaddr "all"
   set dstaddr "all"
   set service "webproxy"
   set action accept
   set schedule "always"
   set logtraffic all
   set groups "ldap-group-saml"
   set utm-status enable
   set profile-protocol-options "protocol"
   set ssl-ssh-profile "deep-custom"
   set av-profile "av"
next
end

When a user goes to www.google.com in a browser that is configured to use the FortiGate as a proxy, the IdP sign-in page appears.
Sample log

7: date=2021-03-16 time=21:11:19 eventtime=161594279072391030 tz=-0700 logid=0000000010 type=traffic subtype=forward level=notice vd=vdom1 srcip=10.1.100.143 srcport=53544 srcintf=port10 srcintfrole=undefined dstcountry=United States srccountry=Reserved dstip=173.194.219.99 dstport=443 dstintf=port9 dstintfrole=undefined sessionid=1751272387 service=HTTPS wanoptapptype=web-proxy proto=6 action=accept policyid=3 policytype=proxy-policy poluuid=052ae158-7d40-51eb-c1d8-19235c4500c2 trandisp=snat transip=172.16.200.1 transport=14844 duration=268 user=test1@MYQALAB.local group=ldap-group-saml authserver=ldap-10.1.100.198 wanin=345633 rcvdbyte=345633 wanout=13013 lanin=5098 sentbyte=5098 lanout=340778 appcat=unscanned

Configuring SAML SSO in the GUI

SAML single sign-on can be configured in the GUI under User & Authentication > User Groups. The GUI wizard helps generate the service provider (SP) URLs based on the supplied SP address. The SAML object that is created can be selected when defining new user groups.
In this example, FortiGate AA is the inside firewall (172.16.200.101). The other FortiGate is the outside firewall that only does port forwarding from 172.16.116.151:55443 to 172.16.200.101:443. FortiGate AA is configured to allow full SSL VPN access to the network in port2. This SSL VPN portal allows users from the user group saml_grp and SAML server saml_test to log in. In this topology, a FortiAuthenticator acts as the SAML identity provider (IdP), while the FortiGate is the SAML SP. External users are directed to the FortiAuthenticator IdP login URL to authenticate. For more information about configuring a FortiAuthenticator as an IdP, see Service providers.

The FortiAuthenticator in this example has the following configuration:
To configure FortiGate AA as an SP:

1. Create a new SAML server entry:
   b. Enter a name (saml_test). The other fields will automatically populate based on the FortiGate's WAN IP and port.
Click the icon beside the SP entity ID, SP single sign-on URL, and SP single logout URL fields to copy the text.

c. Click Next.
d. Enter the FortiAuthenticator IdP details:

<table>
<thead>
<tr>
<th><strong>IdP address</strong></th>
<th>172.18.58.93:443</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Prefix</strong></td>
<td>43211234</td>
</tr>
<tr>
<td><strong>IdP certificate</strong></td>
<td>REMOTE_Cert_1</td>
</tr>
</tbody>
</table>

e. Enter the additional SAML attributes that will be used to verify authentication attempts:

<table>
<thead>
<tr>
<th>Attribute used to identify users</th>
<th>Username</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute used to identify groups</td>
<td>Group</td>
</tr>
</tbody>
</table>

The IdP must be configured to include these attributes in the SAML attribute statement. In FortiAuthenticator, this is configured in the Assertion Attributes section.
f. Click Submit.
The following is created in the backend:

```
config user saml
   edit "saml_test"
      set cert "fgt_gui_automation"
      set idp-entity-id "http://172.18.58.93:443/saml-idp/43211234/metadata/"
      set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/43211234/login/"
      set idp-single-logout-url "https://172.18.58.93:443/saml-idp/43211234/logout/"
      set idp-cert "REMOTE_Cert_1"
      set user-name "Username"
      set group-name "Group"
      set digest-method sha1
next
end
```

2. Create the SAML group:
   a. Go to User & Authentication > User Groups and click Create New.
   b. Enter a name, saml_grp.
   c. In the Remote Groups table, click Add.
d. In the Remote Server dropdown, select saml_test and click OK.

![Remote Server dropdown]

```
config user group
  edit "saml_grp"
    set member "saml_test"
next
end
```

3. Add the SAML group in the SSL VPN settings:
   a. Go to VPN > SSL-VPN Settings.
   b. In the Authentication/Portal Mapping table, click Create New.
   c. For Users/Groups, click the + and select saml_grp.
   d. Select the Portal (testportal1).
   e. Click OK.

![SSL VPN Settings]

User & Authentication

4. Configure the firewall policy:
   a. Go to Policy & Objects > Firewall Policy and click Create New.
   b. Enter the following:

<table>
<thead>
<tr>
<th>Incoming Interface</th>
<th>ssl.root</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outgoing Interface</td>
<td>port2</td>
</tr>
<tr>
<td>Source</td>
<td>all, saml_grp, saml_test</td>
</tr>
</tbody>
</table>

c. Configure the other settings as needed.

d. Click OK.

5. On the client, log in with SAML using the SSL VPN web portal.

   If you are using FortiClient for tunnel mode access, enable Enable Single Sign On (SSO) for VPN Tunnel in the SSL-VPN connection settings to use the SAML log in. See Configuring an SSL VPN connection for more information.

6. In FortiOS, go to Dashboard > Network and click the SSL-VPN widget to expand to full view and verify the connection information.

### Outbound firewall authentication with Azure AD as a SAML IdP

In this example, users are managed through Microsoft Azure Active Directory (AD). The FortiGate is configured for SSO firewall authentication for outbound traffic, with authentication performed by the Azure AD as a SAML identity provider (IdP).

The SAML interaction occurs as follows:

1. The user initiates web traffic to the internet.
2. The FortiGate redirects to the local captive portal port (default is 1003), then redirects the user to the SAML IdP.
3. The user connects to the Microsoft log in page for the SAML authentication request.
4. The SAML IdP sends the SAML assertion containing the user and group.
5. The browser forwards the SAML assertion to the SAML SP.
6. If the user and group are allowed by the FortiGate, the user is allowed to access the internet.
In this example environment, a user is added in the Azure AD belonging to the security group called Firewall.

- Username: John Locus
- User login: jlocus@azure.kldocs.com
- Group: Firewall (ID 62b699ce-4f80-48c0-846e-c1dfde2dc667)

The goal is to allow users in the Firewall group to access the internet after passing firewall authentication.

### Configuring the Azure AD

The following Azure AD configuration demonstrates how to add the FortiGate as an enterprise non-gallery application. This application provides SAML SSO connectivity to the Azure AD IdP. Some steps are performed concurrently on the FortiGate.

This example is configured with an Azure AD free-tier directory. There may be limitations to managing users in Azure in this tier that are not limited in other tiers. Consult the Microsoft Azure AD documentation for more information.

There are three steps to configure the Azure AD:

1. Create a new enterprise application.
2. Configure the SAML SSO settings on the application and FortiGate.
3. Assign Azure AD users and groups to the application.

**To create a new enterprise application:**

1. Log in to the Azure portal.
2. In the Azure portal menu, click Azure Active Directory.
3. In the left-side menu go Manage > Enterprise applications.
4. Click New application.

5. Click Create your own application.

6. Enter a name for the application (SAML-FW-Auth) and select Integrate any other application you don't find in the gallery (Non-gallery).

7. Click Create.

To configure the SAML SSO settings on the application and FortiGate:

- This procedure requires going back and forth between Azure and the FortiGate GUI. Leave the FortiGate GUI open for the entire procedure.

1. On the Enterprise Application Overview page, go to Manage > Single sign-on and select SAML as the single sign-on method.
2. Under the SAML Signing Certificate section, download the Base64 certificate.

3. Import the certificate from Azure on the FortiGate as the IdP certificate:
   a. Go to System > Certificates and click Create/Import > Remote Certificate.
   b. Upload the certificate from Azure and click OK. The new certificate appears under the Remote Certificate section with the name REMOTE_Cert_(N).
   c. Optionally, rename the certificate in the CLI to give it a more recognizable name:

```
config vpn certificate remote
  rename REMOTE_Cert_3 to AZURE_AD_SAML_FW
end
```

4. The Basic SAML Configuration section in Azure describes the SAML SP entity and links that Azure will reference. Configure these settings on the FortiGate by creating a new SAML server object and defining the SP address. The SP (IP or FQDN) address should be accessible by the user who is authenticating against the firewall. The port used should match the port used by the FortiGate firewall authentication captive portal. By default, this is port 1003 for HTTPS. A captive portal does not need to be configured separately.
   b. Enter a Name for the SAML object, Azure-AD-SAML.
c. Enter the SP address, 10.1.0.1:1003. The three SP URLs are automatically populated.

5. In Azure on the Set up Single Sign-On with SAML page, copy the following URLs from the FortiGate to the Basic SAML Configuration section:

<table>
<thead>
<tr>
<th>From FortiGate</th>
<th>To Azure field</th>
</tr>
</thead>
<tbody>
<tr>
<td>SP entity ID (<a href="http://10.1.0.1:1003/remote/saml/metadata/">http://10.1.0.1:1003/remote/saml/metadata/</a>)</td>
<td>Identifier (Entity ID), set to Default</td>
</tr>
<tr>
<td>SP single sign-on URL (<a href="https://10.1.0.1:1003/remote/saml/login//">https://10.1.0.1:1003/remote/saml/login//</a>)</td>
<td>Reply URL and Sign on URL</td>
</tr>
<tr>
<td>SP single logout URL (<a href="https://10.1.0.1:1003/remote/saml/logout/">https://10.1.0.1:1003/remote/saml/logout/</a>)</td>
<td>Logout URL</td>
</tr>
</tbody>
</table>

6. Click Save.

7. In the Set up <application name> section, copy the URLs from Azure to the FortiGate in the IdP Details section:

<table>
<thead>
<tr>
<th>From Azure</th>
<th>To FortiGate field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Azure AD Identifier</td>
<td>IdP entity ID</td>
</tr>
<tr>
<td>Login URL</td>
<td>IdP single sign-on URL</td>
</tr>
<tr>
<td>Logout URL</td>
<td>IdP single logout URL</td>
</tr>
</tbody>
</table>

a. On the FortiGate, click Next.

b. For IdP type, select Custom and copy the following from Azure to the corresponding field:
c. For IdP certificate, select the remote certificate imported earlier.

8. In Azure, edit the User Attributes & Claims section. The attributes are returned in the SAML assertion, which the FortiGate uses to verify the user and group. Configuring group matching is optional.
   a. Click Add new claim, name it username, and set the Source attribute to user.displayname. The source attribute can be any of the related username fields. The value of the username returned to the FortiGate will be used in logs and monitors to identify the user.
   b. Click Save.
   c. Click Add a group claim and in the Group Claims pane, select All groups.
   d. In Advanced Options, select Customize the name of the group claim. Set the name to group.

```
Group Claims
Manage the group claims used by Azure AD to populate SAML tokens issued to your app
```

```
Advanced options
- Customize the name of the group claim
  - Name (required)
    - group

```

e. Click Save. The User Attributes & Claims section displays the update settings.

```
User Attributes & Claims
```

givenName
surName
emailAddress
name
username
group
```

9. On the FortiGate, update the Additional SAML Attributes section with the username and group created in Azure:
   a. For Attribute used to identify users, enter username.
   b. For Attribute used to identify groups, enter group.
To assign Azure AD users and groups to the application:

1. In Azure, go to Manage > Users and groups and click Add user/group.
2. Click Users to select the users or groups (John Locus is selected in this example).
3. Click Assign to add the assignment.

Configuring the FortiGate

The user group, user authentication settings, and firewall policies must be configured on the FortiGate.

Configuring the user group

A user group named Azure-FW-Auth is created with the member Azure-AD-SAML.
Configuring group matching is optional, and the Object ID from Azure is needed for the config match settings. In the Azure default directory, go to Manage > Groups and locate the Object ID for the Firewall group.

To configure the user group:

```forti-config
config user group
    edit "Azure-FW-Auth"
        set member "Azure-AD-SAML"
    config match
        edit 1
            set server-name "Azure-AD-SAML"
            set group-name "62b699ce-4f80-48c0-846e-c1dfde2dc667"
        next
    next
end
```

**Configuring the user authentication setting**

When a user initiates traffic, the FortiGate will redirect the user to the firewall authentication captive portal before redirecting them to the SAML IdP portal. After the SAML IdP responds with the SAML assertion, the user is again redirected to the firewall authentication captive portal. If the firewall portal’s certificate is not trusted by the user, they will receive a certificate warning. Use a custom certificate that the user trusts to avoid the certificate warning.

**To configure a custom certificate:**

2. For Certificate, select the custom certificate. The custom certificate’s SAN field should have the FQDN or IP from the SP URL.

Alternatively, assigning a CA certificate allows the FortiGate to automatically generate and sign a certificate for the portal page. This will override any assigned server certificate. In this example, the built-in Fortinet_CA_SSL is used.

**To assign a CA certificate:**

1. Edit the user setting:

```forti-config
config user setting
    set auth-ca-cert "Fortinet_CA_SSL"
end
```
2. Go to System > Certificates and download the certificate.
3. Install the certificate into the client’s certificate store.

**Configuring the firewall policies**

Firewall policies must be configured to apply user authentication and still allow users behind the FortiGate to access the Microsoft log in portal without authentication.

**To configure the firewall policies:**

1. Configure a policy to allow traffic to the Microsoft Azure internet service:
   a. Go to Policy & Objects > Firewall Policy and click Create New.
   b. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>LAN-to-AuthPortal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>port3</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>Underlay</td>
</tr>
<tr>
<td>Source</td>
<td>all</td>
</tr>
<tr>
<td>Destination</td>
<td>Microsoft-Azure (under Internet Service)</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>Enable and select NAT.</td>
</tr>
<tr>
<td>Log Allowed Traffic</td>
<td>Enable and select All Sessions.</td>
</tr>
</tbody>
</table>

c. Configure the other settings as needed.
d. Click OK.
2. Configure a policy to apply user authentication:
   a. Click Create New and enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>LAN-auth-policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>port3</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>Underlay</td>
</tr>
<tr>
<td>Source</td>
<td>all, Azure-FW-Auth</td>
</tr>
<tr>
<td>Destination</td>
<td>all</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>Enable and select NLog Allowed Traffic</td>
</tr>
</tbody>
</table>

   b. Configure the other settings as needed.
   c. Click OK.

**Connecting from the client**

When the client connects to the internet from a browser, they will be redirected to the Microsoft log in page to authenticate against the Azure AD. The FortiGate’s authentication portal certificate should be installed on the client.

**To connect from the client:**

1. On the client, open a browser (such as Firefox) and go to a website. The user is redirected to the Microsoft log in page.
2. Enter the user credentials.
3. If the log in attempt is successful, the user is allowed to access the internet
Viewing logs and diagnostics

To verify user logins, go to the Dashboard > Users & Devices > Firewall Users widget, or enter the following in the CLI:

```
# diagnose firewall auth list
10.1.0.100, John Locus
  src_mac: 02:09:0f:00:03:03
type: fw, id: 0, duration: 152, idled: 7
expire: 292, allow-idle: 300
server: Azure-AD-SAML
packets: in 2097 out 932, bytes: in 2208241 out 143741
group_id: 2
group_name: Azure-FW-Auth
----- 1 listed, 0 filtered -----
```

To verify user login logs, go to Log & Report > System Events and select the User Events card, or enter the following in the CLI:

```
# execute log filter category event
# execute log filter field subtype user
# execute log display
17 logs found.
10 logs returned.
7: date=2021-09-30 time=09:49:25 eventtime=1633020565577584390 tz="-0700" logid="0102043039"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication logon"
srcip=10.1.0.100 user="John Locus" authserver="Azure-AD-SAML" action="auth-logon"
status="logon" msg="User John Locus added to auth logon"
```

```
8: date=2021-09-30 time=09:49:25 eventtime=1633020565577075629 tz="-0700" logid="0102043008"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication success"
srcip=10.1.0.100 dstip=10.1.0.1 policyid=11 interface="port3" user="John Locus"
group="Azure-FW-Auth" authproto="HTTPS(10.1.0.100)" action="authentication" status="success"
reason="N/A" msg="User John Locus succeeded in authentication"
```

If user authentication is successful in Azure AD, but their group does not match the one defined in the FortiGate user group, the user will receive a **Firewall Authentication Failed** message in the browser. A log is also recorded:

```
# execute log filter category event
# execute log filter field subtype user
# execute log display
1: date=2021-09-30 time=10:39:35 eventtime=1633023575381139214 tz="-0700" logid="0102043009"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication failed"
srcip=10.1.0.100 dstip=10.1.0.1 policyid=11 interface="port3" user="Adam Thompson"
group="N/A" authproto="HTTPS(10.1.0.100)" action="authentication" status="failure"
reason="No matched SAML user or group name in auth resp" msg="User Adam Thompson failed in authentication"
```

If a user receives the following error message, this means the user is not assigned to the enterprise application **SAML-FW-Auth** in Azure.
To troubleshoot SAML issues:

# diagnose debug application samld -l
# diagnose debug enable

Authentication settings

You can configure general authentication settings, including timeout, protocol support, and certificates.

You cannot customize FTP and Telnet authentication replacement messages.
To configure authentication settings using the GUI:

2. Configure the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication Timeout</td>
<td>Enter the desired timeout in minutes. You can enter a number between 1 and 1440 (24 hours). The authentication timeout controls how long an authenticated connection can be idle before the user must reauthenticate. The default value is 5.</td>
</tr>
</tbody>
</table>
| Protocol Support      | Select the protocols to challenge during firewall user authentication. When you enable user authentication within a security policy, the authentication challenge is normally issued for any of four protocols, depending on the connection protocol:  
  • HTTP (you can set this to redirect to HTTPS)  
  • HTTPS  
  • FTP  
  • Telnet  
The protocols selected here control which protocols support the authentication challenge. Users must connect with a supported protocol first so they can subsequently connect with other protocols. If HTTPS is selected as a protocol support method, it allows the user to authenticate with a customized local certificate. When you enable user authentication within a security policy, FortiOS challenges the security policy user to authenticate. For user ID and password authentication, the user must provide their username and password. For certificate authentication (HTTPS or HTTP redirected to HTTPS only), you can install customized certificates on the unit and the user can also install customized certificates on their browser. Otherwise, users see a warning message and must accept a default Fortinet certificate. The network user’s web browser may deem the default certificate invalid. |
| Certificate           | If using HTTPS protocol support, select the local certificate to use for authentication. This is available only if HTTPS and/or Redirect HTTP Challenge to a Secure Channel (HTTPS) are selected. |

To configure authentication settings using the CLI:

```
config user setting
  set auth-timeout 5
  set auth-type ftp http https telnet
  set auth-cert Fortinet_Factory
end
```
**FortiTokens**

FortiTokens are security tokens used as part of a multi-factor authentication (MFA) system on FortiGate and FortiAuthenticator. A security token is a 6-digit or 8-digit (configurable) one-time password (OTP) that is used to authenticate one's identity electronically as a prerequisite for accessing network resources. FortiToken is available as either a mobile or a physical (hard) token. Mobile tokens can be purchased as a license, or consumed with points as part of the FortiToken Cloud service.

FortiToken Mobile and physical FortiTokens store their encryption seeds on the cloud. FortiToken Mobile seeds are generated dynamically when the token is provisioned. They are always encrypted whether in motion or at rest.

You can only register FortiTokens to a single FortiGate or FortiAuthenticator for security purposes. This prevents malicious third parties from making fraudulent requests to hijack your FortiTokens by registering them on another FortiGate or FortiAuthenticator. If re-registering a FortiToken Mobile or Hard Token on another FortiGate is required, you must contact Fortinet Customer Support.

Common usage for FortiTokens includes:

- Applying MFA to a VPN dialup user connecting to the corporate network
- Applying MFA to FortiGate administrators
- Applying MFA to firewall authentication and captive portal authentication

The MFA process commonly involves:

- **Something you know**: User password
- **Something you have**: The FortiToken OTP

A third factor of authentication is added to the authentication process:

- **Something you are**: Your fingerprint or face

To enable the third factor, refer to the Activating FortiToken Mobile on a mobile phone on page 1888 section.

The following illustrates the FortiToken MFA process:

1. The user attempts to access a network resource.
2. FortiOS matches the traffic to an authentication security policy and prompts the user for their username and password.
3. The user enters their username and password.
4. FortiOS verifies their credentials. If valid, it prompts the user for the FortiToken code.
5. The user views the current code on their FortiToken. They enter the code at the prompt.
6. FortiOS verifies the FortiToken code. If valid, it allows the user access to network resources.

If the FortiToken has drifted, the following must take place for the FortiToken to resynchronize with FortiOS:

1. FortiOS prompts the user to enter a second code to confirm.
2. The user gets the next code from the FortiToken. They enter the code at the prompt.
3. FortiOS uses both codes to update its clock to match the FortiToken.
This section includes the following topics to quickly get started with FortiTokens:

- FortiToken Mobile quick start on page 1885
- FortiToken Cloud on page 1893
- Registering hard tokens on page 1893
- Managing FortiTokens on page 1895
- FortiToken Mobile Push on page 1897
- Troubleshooting and diagnosis on page 1899

FortiToken Mobile quick start

FortiToken Mobile is an OATH compliant, event- and time-based one-time password (OTP) generator for mobile devices. It provides an easy and flexible way to deploy and provision FortiTokens to your end users through mobile devices. FortiToken Mobile produces its OTP codes in an application that you can download onto your Android or iOS mobile device without the need for a physical token.

You can download the free FortiToken Mobile application for Android from the Google Play Store, and for iOS from the Apple App Store.

This section focuses on quickly getting started and setting up FortiToken Mobile for use on a FortiGate:

- Registering FortiToken Mobile on page 1885
- Provisioning FortiToken Mobile on page 1886
- Activating FortiToken Mobile on a mobile phone on page 1888
- Applying multi-factor authentication on page 1892

Registering FortiToken Mobile

To deploy FortiToken Mobile for your end users, you must first register the tokens on your FortiGate. After registering the tokens, you can assign them to your end users.
Each FortiGate comes with two free FortiToken Mobile tokens. These tokens should appear under User & Authentication > FortiTokens. If no tokens appear, you may import them. Ensure that your FortiGate is registered and has internet access to connect to the FortiToken servers to import the tokens.

**To import FortiTokens from the FortiGate GUI:**

1. Go to User & Authentication > FortiTokens.
2. Click the Import Free Trial Tokens icon at the top. The two free tokens are imported.

**To import FortiTokens from the FortiGate CLI:**

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
# show user fortitoken
```

If only one free token appears, you can first delete that token and then follow the procedure to import the two free tokens from either the GUI or the CLI.

If you have the FortiToken Mobile redemption certificate, you can register FortiToken Mobile on a FortiGate.

**To register FortiToken Mobile from the FortiGate GUI:**

2. For the Type field, select Mobile Token.
3. Locate the 20-digit code on the redemption certificate and type it in the Activation Code field.
4. Click OK. The token is successfully registered.

If you attempt to add invalid FortiToken serial numbers, there is no error message. FortiOS does not add invalid serial numbers to the list.

**To register FortiToken Mobile from the FortiGate CLI:**

```
# execute fortitoken-mobile import <20-digit activation code>
# show user fortitoken
```

FortiToken Mobile stores its encryption seeds on the cloud. You can only register it to a single FortiGate or FortiAuthenticator.

**Provisioning FortiToken Mobile**

Once registered, FortiTokens need to be provisioned for users before they can be activated. In this example, you will provision a mobile token for a local user. Similar steps can be taken to assign FortiTokens to other types of users.
To create a local user and assign a FortiToken in the FortiGate GUI:

1. Go to User & Authentication > User Definition, and click Create New. The Users/Groups Creation Wizard appears.
2. In the User Type tab, select Local User, and click Next.

3. In the Login Credentials tab, enter a Username and Password for the user, and click Next.

4. In the Contact Info tab:
   a. Enable the Two-factor Authentication toggle.
   b. Select FortiToken for Authentication Type.
   c. Select a Token to assign to the user from the drop-down list.
   d. Enter the user's email address in the Email Address field. This is the email where the user will receive the QR code for activation of the FortiToken.
   e. Click Next.

5. In the Extra Info tab, make sure the User Account Status field is set to Enabled. You can also optionally assign the user to a user group by enabling the User Group toggle.
6. Click Submit. An activation code should be sent to the created user by email or SMS, depending upon the delivery method configured above.

FortiGate has the Email Service setting configured using the server notifications.fortinet.net by default. To see configuration, go to System > Settings > Email Service.

The activation code expires if not activated within the 3-day time period by default. However, the expiry time period is configurable.

To configure the time period (in hours) for FortiToken Mobile, using the CLI:

```
config system global
  set two-factor-ftm-expiry <1-168>
end
```

To resend the email or SMS with the activation code, refer to the Managing FortiTokens on page 1895 section.

### Activating FortiToken Mobile on a mobile phone

After your system administrator provisions your token, you receive a notification with an activation code and expiry date via SMS or email. If you do not activate your token by the expiry date, you must contact your system administrator so that they can reassign your token for activation.

Platforms that support FortiToken Mobile:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Device and firmware support</th>
</tr>
</thead>
<tbody>
<tr>
<td>iOS</td>
<td>iPhone, iPad, and iPod Touch with iOS 6.0 and later.</td>
</tr>
<tr>
<td>Android</td>
<td>Phones and tablets with Android Jellybean 4.1 and later.</td>
</tr>
<tr>
<td>Windows</td>
<td>Windows 10 (desktop and mobile), Windows Phone 8.1, and Windows Phone 8.</td>
</tr>
</tbody>
</table>

FortiToken is a Windows Universal Platform (UWP) application. To download FortiToken for Windows 10 desktop and mobile platforms, see FortiToken for Windows on the Microsoft Store.

The following instructions describe procedures when using FortiToken Mobile for iOS on an iPhone. Procedures may vary depending on your device and firmware.
To activate FortiToken Mobile on iOS:

1. On your iOS device, tap on the FortiToken application icon to open the application. If this is your first time opening the application, it may prompt you to create a PIN for secure access to the application and tokens.

2. Tap on the + icon. The Scan Barcode screen appears.

3. If you received the QR code via email, locate and scan the QR code in your email. OR If you received the activation key via SMS, tap on Enter Manually at the bottom of the screen, and tap on Fortinet.

Enter your email address in the Name field, the activation key in the Key field, and tap Done.
4. FortiToken Mobile activates your token, and starts generating OTP digits immediately. To view or hide the OTP digits, tap the eye icon.

After you open the application, FortiToken Mobile generates a new 6-digit OTP every 30 seconds. All configured tokens display on the application homescreen.

The FortiToken Mobile activation process described above caters to the MFA process that involves two factors (password and OTP) of the authentication process. A third factor (fingerprint or face) can be enabled as well.

**To enable Touch/Face ID on iOS for FortiToken Mobile:**

1. Open the FortiToken application and tap on *Info.*
2. Tap on **Touch/Face ID & PIN**.

3. Enable and set up a 4-digit **PIN** for the application. The **PIN** is required to be enabled before you can enable **Touch/Face ID**.
4. Enable Touch/Face ID.

You cannot enable Touch/Face ID for FortiToken if Touch/Face ID is not set up and enabled for device unlock (iPhone Unlock in this case) on iOS. You must first set up and enable Touch/Face ID from Settings on your iOS device.

5. When prompted by iOS, allow the FortiToken application to use Touch/Face ID by tapping on OK in the prompt.

Applying multi-factor authentication

Multi-factor authentication (MFA) may also be set up for SSL VPN users, administrators, firewall policy, wireless users, and so on. The following topics explain more about how you may use the newly created user in such scenarios:

- **MFA for SSL VPN**: Set up FortiToken multi-factor authentication on page 1627
- **MFA for IPsec VPN**: Add FortiToken multi-factor authentication on page 1424
- **MFA for Administrators**: Administrator account options on page 1943
- **MFA with Captive Portal**
- MFA for wireless users via Captive Portal
- Configuring firewall authentication on page 1906

FortiToken Cloud

FortiToken Cloud is an Identity and Access Management as a Service (IDaaS) cloud service offering by Fortinet. It enables FortiGate and FortiAuthenticator customers to add MFA for their respective users, through the use of Mobile tokens or Hard tokens. It protects local and remote administrators as well as firewall and VPN users.

For information, see Getting started—FGT-FTC users in the FortiToken Cloud Administration Guide.

Registering hard tokens

Registering FortiTokens consists of the following steps:

1. Adding FortiTokens to FortiOS.
2. Activating FortiTokens.
3. Associating FortiTokens with user accounts.

Adding FortiTokens to FortiOS

You can add FortiTokens to FortiOS in the following ways:

- Add FortiToken serial numbers using the GUI
- Add FortiToken serial numbers using the CLI
- Import FortiTokens using a serial number or seed file using the GUI

To manually add single hard token to FortiOS using the GUI:

1. Go to User & Authentication > FortiTokens.
2. Click Create New.
3. For Type, select Hard Token.
4. In the Serial Number field, enter one or more FortiToken serial numbers.
5. Click OK.

To add multiple FortiTokens to FortiOS using the CLI:

```
config user fortitoken
edit <serial_number>
next
edit <serial_number2>
next
```
To import multiple FortiTokens to FortiOS using the GUI:

1. Go to User & Authentication > FortiTokens.
2. Click Create New.
3. For Type, select Hard Token.
4. Click Import. The Import Tokens section slides in on the screen.
5. Select Serial Number File.

Seed files are only used with FortiToken-200CD. These are special hardware tokens that come with FortiToken seeds on a CD. See the FortiToken Comprehensive Guide for details.

6. Click Upload.
7. Browse to the file's location on your local machine, select the file, then click OK.
8. Click OK.

Activating FortiTokens

You must activate the FortiTokens before starting to use them. FortiOS requires connection to FortiGuard servers for FortiToken activation. During activation, FortiOS queries FortiGuard servers about each token's validity. Each token can only be used on a single FortiGate or FortiAuthenticator. If tokens are already registered, they are deemed invalid for re-activation on another device. FortiOS encrypts the serial number and information before sending for added security.

To activate a FortiToken using the GUI:

1. Go to User & Authentication > FortiTokens.
2. Select the desired FortiTokens that have an Available status.
3. Click Activate from the menu above.
4. Click Refresh. The selected FortiTokens are activated.

To activate a FortiToken using the CLI:

```
config user fortitoken
  edit <token_serial_num>
    set token_serial_num
  next
end
```
 Associating FortiTokens with user accounts

You can associate FortiTokens with local user or administrator accounts.

To associate a FortiToken to a local user account using the GUI:

1. Ensure that you have successfully added your FortiToken serial number to FortiOS and that its status is Available.
2. Go to User & Authentication > User Definition. Edit the desired user account.
3. Enable Two-factor Authentication.
4. From the Token dropdown list, select the desired FortiToken serial number.
5. In the Email Address field, enter the user's email address.
6. Click OK.

To associate a FortiToken to a local user account using the CLI:

```
config user local
  edit <username>
    set type password
    set passwd "myPassword"
    set two-factor fortitoken
    set fortitoken <serial_number>
    set email-to "username@example.com"
    set status enable
  next
end
```

Before you can use a new FortiToken, you may need to synchronize it due to clock drift.

To associate a FortiToken to an administrator account, refer to the Administrator account options on page 1943 section.

Managing FortiTokens

This section focuses on the following:

- Resending an activation email on page 1895
- Locking/unlocking FortiTokens on page 1896
- Managing FortiTokens drift on page 1896
- Deactivating FortiTokens on page 1896
- Moving FortiTokens to another device on page 1897

Resending an activation email

To resend an activation email/SMS for a mobile token on a FortiGate:

1. Go to User & Authentication > User Definition and edit the user.
2. Click Send Activation Code Email from the Two-factor Authentication section.
**Locking/unlocking FortiTokens**

To change FortiToken status to active or to lock:

```
config user fortitoken
    edit <token_serial_num>
        set status <active | lock>
    next
end
```

A user attempting to log in using a locked FortiToken cannot successfully authenticate.

**Managing FortiTokens drift**

If the FortiToken has drifted, the following must take place for the FortiToken to resynchronize with FortiOS:

1. FortiOS prompts the user to enter a second code to confirm.
2. The user gets the next code from the FortiToken. They enter the code at the prompt.
3. FortiOS uses both codes to update its clock to match the FortiToken.

If you still experience clock drift, it may be the result of incorrect time settings on your mobile device. If so, make sure that the mobile device clock is accurate by confirming the network time and the correct timezone.

If the device clock is set correctly, the issue could be the result of the FortiGate and FortiTokens being initialized prior to setting an NTP server. This will result in a time difference that is too large to correct with the synchronize function. To avoid this, selected Tokens can be manually drift adjusted.

**To show current drift and status for each FortiToken:**

```
diagnose fortitoken info
FORTITOKEN DRIFT STATUS
FTK200XXXXXXXXX: 0 token already activated, and seed won't be returned
FTK200XXXXXXXXX: 0 token already activated, and seed won't be returned
FTKMOBXXXXXXXXA: 0 provisioned
FTKMOBXXXXXXXXX4: 0 new
Total activated token: 0
Total global activated token: 0
Token server status: reachable
```

This command lists the serial number and drift for each configured FortiToken. You can check if it is necessary to synchronize the FortiGate and any particular FortiTokens.

**To adjust Mobile FortiToken for drift:**

```
# execute fortitoken sync <FortiToken_ID> <token_code1> <next_token_code2>
```

**Deactivating FortiTokens**

**To deactivate FortiToken on a FortiGate:**

1. Go to User & Authentication > User Definition.
2. Select and edit the user for which you want to deactivate the token.
3. Disable the Two-factor Authentication toggle.
4. Click OK. The token will be removed from the user's Two-factor Authentication column. The user will also be removed from the token’s User column under User & Authentication > FortiTokens.

**Moving FortiTokens to another device**

FortiTokens can only be activated on a single FortiGate or FortiAuthenticator. To move FortiTokens to another device, you would first have to reset the registered FortiTokens on a device and then reactivate them on another device.

To reset Hard tokens registered to a FortiGate appliance (non-VM model), you can reset all hardware FTK200 tokens from the Support Portal, or during RMA transfer. See the Migrating users and FortiTokens to another FortiGate KB article, for more information.

The above process will reset all Hard tokens and you cannot select individual tokens to reset.

To reset FortiToken Mobile, a single Hard token, a Hard token registered to a VM, and so on, an administrator must contact Customer Support and/or open a ticket on the Support Portal.

Once reset, the FortiTokens can be activated on another FortiGate or FortiAuthenticator.

**FortiToken Mobile Push**

FortiToken Mobile Push allows authentication requests to be sent as push notifications to the end user's FortiToken Mobile application.

The FortiToken Mobile push service operates as follows:

1. FortiGate sends a DNS query to the FortiToken Mobile Push proxy server (push.fortinet.com).
2. FortiGate connects to the proxy server via an encrypted connection over TCP/443.
3. The proxy server handles the notification request by making a TLS connection with either Apple (for iOS) or Google (for Android) notification servers. Notification data may include the recipient, session, FortiGate callback IP and port, and so on.
4. The notification service from either Apple or Google notifies the user's mobile device of the push request.
5. The FortiToken Mobile application on the user's mobile displays a prompt for the user to either Approve or Deny the
To configure FortiToken Mobile push services using the CLI:

```bash
config system ftm-push
  set status enable
  set server-ip <ip-address>
  set server-port [1-65535]
end
```

The default server port is 4433.

The server IP address is the public IP address of the FortiOS interface that FortiToken Mobile calls back to. FortiOS uses this IP address for incoming FortiToken Mobile calls.

If an SSL VPN user authenticates with their token, then logs out and attempts to reauthenticate within a minute, a *Please wait x seconds to login again* message displays. This replaces a previous error/permission denied message. The `x` value depends on the calculation of how much time is left in the current time step.

```bash
config system interface
  edit "guest"
    set allowaccess ftm
  next
end
```
FortiOS supports FortiAuthenticator-initiated FortiToken Mobile Push notifications for users attempting to authenticate through an SSL VPN and/or RADIUS server (with FortiAuthenticator as the RADIUS server).

Troubleshooting and diagnosis

This section contains some common scenarios for FortiTokens troubleshooting and diagnosis:

- FortiToken Statuses on page 1899
- Recovering trial FortiTokens on page 1900
- Recovering lost Administrator FortiTokens on page 1900
- SSL VPN with multi-factor authentication expiry timers on page 1901

FortiToken Statuses

When troubleshooting FortiToken issues, it is important to understand different FortiToken statuses. FortiToken status may be retrieved either from the CLI or the GUI, with a slightly different naming convention.

Before you begin, verify that the FortiGate has Internet connectivity and is also connected to both the FortiGuard and registration servers:

```
# execute ping fds1.fortinet.com
# execute ping directregistration.fortinet.com
# execute ping globalftm.fortinet.net
```

The `globalftm.fortinet.net` server is the Fortinet Anycast server added in FortiOS 6.4.2.

If there are connectivity issues, retrieving FortiToken statuses or performing FortiToken activation could fail. Therefore, troubleshoot connectivity issues before continuing.

To retrieve FortiToken statuses:

- In the CLI:
  ```
  # diagnose fortitoken info
  ```
- In the GUI:
  Go to `User & Authentication > FortiTokens`.

Various FortiToken statuses in either the CLI or the GUI may be described as follows:

<table>
<thead>
<tr>
<th>CLI</th>
<th>GUI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new</td>
<td>Available</td>
<td>Newly added, not pending, not activated, not yet assigned.</td>
</tr>
<tr>
<td>active</td>
<td>Assigned</td>
<td>Assigned to a user, hardware token.</td>
</tr>
<tr>
<td>provisioning</td>
<td>Pending</td>
<td>Assigned to a user and waiting for activation on the FortiToken Mobile app.</td>
</tr>
<tr>
<td>provisioned</td>
<td>Assigned</td>
<td>Assigned to user and activated on the FortiToken Mobile app.</td>
</tr>
</tbody>
</table>
User & Authentication

<table>
<thead>
<tr>
<th>CLI</th>
<th>GUI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>provision</td>
<td></td>
<td>Token provided to user but not activated on the FortiToken Mobile app. To fix, the token needs to be re-provisioned and activated in time.</td>
</tr>
<tr>
<td>timeout</td>
<td></td>
<td></td>
</tr>
<tr>
<td>token already</td>
<td>Error</td>
<td>Token is locked by FortiGuard FDS. The hardware token was already activated on another device and locked by FDS.</td>
</tr>
<tr>
<td>activated, and</td>
<td></td>
<td></td>
</tr>
<tr>
<td>seed won't be</td>
<td></td>
<td></td>
</tr>
<tr>
<td>returned locked</td>
<td></td>
<td>Either manually locked by an Administrator (set status lock), or locked automatically, for example, when the token is unassigned and the FortiCare FTM provisioning server was unreachable to process that change.</td>
</tr>
</tbody>
</table>

**Recovering trial FortiTokens**

You can recover trial FortiTokens if deleted from a FortiGate, or if stuck in a state where it is not possible to provision to a user.

When a token is stuck in an unusual state or with errors, delete the FortiTokens from the unit and proceed to recover trial FortiTokens.

**To recover trial tokens via the GUI:**

1. Go to *User & Authentication > FortiTokens*.
2. Click the *Import Free Trial Tokens* button at the top. The two free trial tokens are recovered.

**To recover trial tokens via the CLI:**

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
```

- Before attempting to recover the trial tokens, both the tokens should be deleted from the unit first.
- If VDOMs are enabled, trial tokens are in the management VDOM *(root by default)*.

**Following error codes might come up in the CLI:**

- If the device is not registered:
  
  ```
  # execute fortitoken-mobile import 0000-0000-0000-0000-0000
  import fortitoken license error: -7571
  ```

- If the serial number format is incorrect:

  ```
  # execute fortitoken-mobile import 0000-0000-0000-0000-00
  import fortitoken license error: -7566
  ```

**Recovering lost Administrator FortiTokens**

If an Administrator loses their FortiToken or the FortiToken is not working, they will not be able to log into the admin console through the GUI or the CLI. If there is another Administrator that can log into the device, they may be able to reset the two-factor settings configured for the first Administrator, or create a new Admin user for them. Note that a super_admin user will be able to edit other admin user settings, but a prof_admin user will not be able to edit super_admin settings.
In the case where there are no other administrators configured, the only option is to flash format the device and reload a backup config file. You must have console access to the device in order to format and flash the device. It is recommended to be physically on site to perform this operation.

The process of resetting an Admin user password using the maintainner account cannot be used to reset or disable two-factor authentication.

Before formatting the device, verify that you have a backup config file. You may or may not have the latest config file backed up, though you should consider using a backed up config file, and reconfigure the rest of the recent changes manually. Otherwise, you may need to configure your device starting from the default factory settings.

To recover lost Administrator FortiTokens:

1. If you have a backed up config file:
   a. Open the config file and search for the specific admin user. For representational purposes we will use Test in our example:

   ```
   # edit "Test"
   set accprofile "super_admin"
   set vdom "root"
   set two-factor fortitoken
   set fortitoken "FTKXXXXXXXXXX"
   set email-to "admin@email.com"
   set password ********
   next
   end
   
   b. Once you find the settings for the Test user, delete the fortitoken-related settings:

   ```
   # edit "Test"
   set accprofile "super_admin"
   set vdom "root"
   set password ********
   next
   end
   ```

2. Format the boot device during a maintenance window and reload the firmware image using instructions in the Formatting and loading FortiGate firmware image using TFTP KB article.

3. Once the reload is complete, log into the admin console from the GUI using the default admin user credentials, and go to Configuration > Restore from the top right corner to reload your config file created in Step 1 above.

4. Once the FortiGate reboots and your configuration is restored, you can log in with your admin user credentials.

SSL VPN with multi-factor authentication expiry timers

When SSL VPN is configured with multi-factor authentication (MFA), sometimes you may require a longer token expiry time than the default 60 seconds.

To configure token expiry timers using the CLI:

```
config system global
  set two-factor-ftk-expiry <number of seconds>
  set two-factor-ftm-expiry <number of seconds>
  set two-factor-sms-expiry <number of seconds>
  set two-factor-fac-expiry <number of seconds>
```
set two-factor-email-expiry <number of seconds>
end

These timers apply to the tokens themselves and remain valid for as long as configured above. However, SSL VPN does not necessarily accept tokens for the entire duration they are valid. To ensure SSLVPN accepts the token for longer durations, you need to configure the remote authentication timeout setting accordingly.

To configure the remote authentication timeout:

config system global
    set remoteauthtimeout <1-300 seconds>
end

SSL VPN waits for a maximum of five minutes for a valid token code to be provided before closing down the connection, even if the token code is valid for longer.

The remoteauthtimeout setting shows how long SSL VPN waits not only for a valid token to be provided before closing down the connection, but also for other remote authentication like LDAP, RADIUS, and so on.

Configuring the maximum log in attempts and lockout period

Failed log in attempts can indicate malicious attempts to gain access to your network. To prevent this security risk, you can limit the number of failed log in attempts. After the configured maximum number of failed log in attempts is reached, access to the account is blocked for the configured lockout period.

To configure number of maximum log in attempts:

This example sets the maximum number of log in attempts to five.

config user setting
    set auth-lockout-threshold 5
end

To configure the lockout period in seconds:

This example sets the lockout period to five minutes (300 seconds).

config user setting
    set auth-lockout-duration 300
end

PKI

The following topics include information about public key infrastructure (PKI):

- Configuring a PKI user on page 1903
- SSL VPN with certificate authentication on page 1660
SSL VPN with LDAP-integrated certificate authentication on page 1665

Configuring a PKI user

PKI users are users who are identified by a digital certificate they hold. Defining a PKI user in FortiOS specifies:

- Which CA certificate to use to validate the user’s certificate
- The field and value of the user’s certificate that FortiOS will check to verify a user

These peer users can then be used in a FortiGate user group, or as a peer certificate group used for IPsec VPN configurations that accept RSA certificate authentication.

Example X.509 certificate

The following certificate demonstrates which FortiGate settings can be used to match on different fields.

Subject:

Subject Alternative Name:

Certification path:
To configure a PKI user:

```
config user peer
edit <name>
  set ca <string>
  set mandatory-ca-verify {enable | disable}
  set subject <string>
  set cn <string>
  set cn-type {string | email | FQDN | ipv4 | ipv6}
  set ldap-server <string>
  set ldap-username <string>
  set ldap-password <string>
  set ldap-mode {password | principal-name}
next
end
```

**ca <string>**
Specify which certificate on the FortiGate is used to validate the client’s certificate. This can be any CA in the client’s certificate chain. You may need to upload a CA certificate to the FortiGate specifically to identify PKI peer users (see Uploading a certificate using the GUI on page 2166).

**mandatory-ca-verify {enable | disable}**
Control the action if the CA certificate used to sign the client’s certificate is not installed on the FortiGate (default = enable). Disabling this setting makes the FortiGate consider any certificate presented by the peer as valid.
In the example certificate, the certification path shows that VF_CA signed jcarrey’s certificate.

**subject <string>**
Enter the peer certificate name constraints.

**cn <string>**
Enter the peer certificate common name.

**cn-type {string | email | FQDN | ipv4 | ipv6}**
Set the peer certificate common name type: string, email, FQDN, IPv4 address, or IPv6 address. See CN on page 1906 for more details.

**ldap-server <string>**
Enter the name of an LDAP server defined under config user ldap for performing client access rights checks. See LDAP servers on page 1805 for more details.
Identifying users based on their client certificate

When the client's certificate is valid, or mandatory-ca-verify is disabled, the FortiGate can then inspect the certificate to check specific fields for matching values. There are three ways of specifying which certificate field to verify: by subject, CN, or LDAP. All string comparisons are case sensitive.

Subject

This basic method verifies that the subject string defined in the PKI user setting matches a value or substring in the subject field of the user certificate. Further matching is controlled in the following VPN certificate settings.

```config
cfg vpn certificate setting
  set subject-match {substring | value}
  set subject-set {superset | subset}
  set cn-match {substring | value}
  set cn-allow-multi {enable | disable}
end
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| subject-match {substring | value} | Control how to do relative distinguished name (RDN) value matching with the certificate subject name:  
  - substring: find a match if any string in the certificate subject name matches the name being searched for (such as set subject jcarrey).  
  - value: find a match if any attribute value string in a certificate subject name is an exact match with the name being searched for (such as set subject "OU=TAC" or set subject "C=CA, CN=jcarrey, OU=TAC"). |
| set subject-set {superset | subset} | Control how to do RDN value matching with the certificate subject name:  
  - superset: a certificate only passes verification if it contains all the RDNs defined in the subject settings (such as set subject "E = jcarrey@fortinet.com, CN = jcarrey, OU = TAC, O = Fortinet, L = Burnaby, S = British Columbia, C = CA").  
  - subset: a certificate passes verification if the RDN is a subset of the certificate subject (such as set subject "CN = jcarrey, OU = TAC"). |
| cn-match {substring | value} | Control how to do CN value matching with the certificate subject name:  
  - substring: find a match if any string in the certificate subject name matches the name being searched for.  
  - value: find a match if any attribute value string in a certificate subject name is an exact match with the name being searched for. |
| cn-allow-multi {enable | disable} | Enable/disable allowing multiple CN entries with the certificate subject name (default = enable). |
CN

Common name (CN) certificate verification compares the CN in the subject field with the configured string (such as `set cn "jcarrey"`). The following logic is used when configuring different CN types:

<table>
<thead>
<tr>
<th>Type</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>Based on the <code>cn-match</code> setting, perform a substring or exact match in the certificate subject.</td>
</tr>
<tr>
<td>email</td>
<td>Look for a match in the certificate subject.</td>
</tr>
<tr>
<td>FQDN</td>
<td>Look for a match in the certificate subject, then compare the mapped IP and client IP. The FQDN is only retrieved from the CN.</td>
</tr>
<tr>
<td>ipv4</td>
<td>Look for a match in the certificate subject, then compare the IP.</td>
</tr>
<tr>
<td>ipv6</td>
<td>Look for a match in the certificate subject, then compare the IP.</td>
</tr>
</tbody>
</table>

The CN type also controls the format checking of the CN string. In this example, if the CN type is set to email, the CN must be in email format (`set cn "jcarrey@fortinet.com"`).

LDAP

LDAP-integrated user authentication allows the FortiGate to check the connecting user against an LDAP server in two ways: through a username and password, or the certificate’s principal name. The `password` method requires the username and password of each authenticating user to be entered, so it is not recommended when configuring PKI users. The `principal-name` method is recommended.

The UPN in the user certificate’s Subject Alternative Name field is used to look up the user in the LDAP directory. If a match is found, then authentication succeeds. This type of configuration scales well since only one PKI user needs to be created on the FortiGate. Connecting clients use their unique user certificate to match within the configured LDAP server.

Configuring firewall authentication

In this example, a Windows network is connected to the FortiGate on port 2, and another LAN, Network_1, is connected on port 3.
All Windows network users authenticate when they log on to their network. Engineering and Sales groups members can access the Internet without reentering their authentication credentials. The example assumes that you have already installed and configured FSSO on the domain controller.

LAN users who belong to the Internet_users group can access the Internet after entering their username and password. The example shows two users: User1, authenticated by a password stored in FortiOS; and User 2, authenticated on an external authentication server. Both users are local users since you create the user accounts in FortiOS.

1. Create a locally authenticated user account.
2. Create a RADIUS-authenticated user account.
3. Create an FSSO user group.
4. Create a firewall user group.
5. Define policy addresses.
6. Create security policies.

**Creating a locally authenticated user account**

User1 is authenticated by a password stored in FortiOS.

To create a locally authenticated user account in the GUI:

1. Go to User & Authentication > User Definition and click Create New.
2. Configure the following settings:

<table>
<thead>
<tr>
<th>User Type</th>
<th>Local User</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Name</td>
<td>User1</td>
</tr>
<tr>
<td>Password</td>
<td>hardtogo1ss1@@1</td>
</tr>
<tr>
<td>User Account Status</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

3. Click Submit.

To create a locally authenticated user account in the CLI:

```
config user local
edit user1
    set type password
    set passwd hardtogo1ss1@@1
next
end
```

**Creating a RADIUS-authenticated user account**

You must first configure FortiOS to access the external authentication server, then create the user account.
To create a RADIUS-authenticated user account in the GUI:

1. Go to User & Authentication > RADIUS Servers and click Create New.
2. Configure the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>OurRADIUSsrv</td>
</tr>
<tr>
<td>Authentication method</td>
<td>Default</td>
</tr>
<tr>
<td>Primary Server</td>
<td>10.11.101.15</td>
</tr>
<tr>
<td>Secret</td>
<td>OurSecret</td>
</tr>
</tbody>
</table>

3. Click OK.
4. Go to User & Authentication > User Definition and click Create New.
5. Configure the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Type</td>
<td>Remote RADIUS User</td>
</tr>
<tr>
<td>User Name</td>
<td>User2</td>
</tr>
<tr>
<td>RADIUS Server</td>
<td>OurRADIUSsrv</td>
</tr>
<tr>
<td>User Account Status</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

6. Click Submit.

To create a RADIUS-authenticated user account in the CLI:

```plaintext
cfg user radius
edit OurRADIUSsrv
   set server 10.11.102.15
   set secret OurSecret
   set auth-type auto
next
end
cfg user local
edit User2
   set name User2
   set type radius
   set radius-server OurRADIUSsrv
next
end
```

Creating an FSSO user group

This example assumes that you have already set up FSSO on the Windows network and that it used advanced mode, meaning that it uses LDAP to access user group information. You must do the following:

- Configure LDAP access to the Windows AD global catalog
- Specify the collector agent that sends user log in information to FortiOS
- Select Windows user groups to monitor
- Select and add the Engineering and Sales groups to an FSSO user group
To create an FSSO user group in the GUI:

1. Configure LDAP for FSSO:
   a. Go to User & Authentication > LDAP Servers and click Create New.
   b. Configure the following settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>ADserver</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server Name / IP</td>
<td>10.11.101.160</td>
</tr>
<tr>
<td>Distinguished Name</td>
<td>dc=office,dc=example,dc=com</td>
</tr>
<tr>
<td>Bind Type</td>
<td>Regular</td>
</tr>
<tr>
<td>Username</td>
<td>cn=FSSO_Admin,cn=users,dc=office,dc=example,dc=com</td>
</tr>
<tr>
<td>Password</td>
<td>Enter a secure password.</td>
</tr>
</tbody>
</table>

e. Leave other fields as-is. Click OK.

2. Specify the collector agent for FSSO:
   a. Go to Security Fabric > External Connectors and click Create New.
   b. Under Endpoint/Identity, select FSSO Agent on Windows AD.
   c. Configure the following settings:

   | Name          | Enter the Windows AD server name. This name appears in the Windows AD server list when you create user groups. In this example, the name is WinGroups. |
   | Server IP/Name | Enter the IP address or name of the server where the agent is installed. The maximum name length is 63 characters. In this example, the IP address is 10.11.101.160. |
   | Password       | Enter the password of the server where the agent is installed. You only need to enter a password for the collector agent if you configured the agent to require authenticated access. If the TCP port used for FSSO is not the default, 8000, you can run the config user fsso command to change the setting in the CLI. |
   | Collector Agent AD access mode | Advanced |
   | LDAP Server    | Select the previously configured LDAP server. In this example, it is ADserver. |
   | User/Groups/Organization Units | Select the users, groups, and OUs to monitor. |

d. Click OK.

3. Create the FSSO_Internet_users user group:
   a. Go to User & Authentication > User Groups and click Create New.
   b. Configure the following settings:

   | Name          | FSSO_Internet_users |
To create an FSSO user group in the CLI:

```plaintext
cfg user ldap
  edit "ADserver"
    set server "10.11.101.160"
    set dn "cn=users,dc=office,dc=example,dc=com"
    set type regular
    set username "cn=administrator,cn=users,dc=office,dc=example,dc=com"
    set password set_a_secure_password
next
end
cfg user fss
  edit "WinGroups"
    set ldap-server "ADserver"
    set password ********
    set server "10.11.101.160"
next
end
cfg user group
  edit FSSO_Internet_users
    set group-type fss-service
    set member CN=Engineering,cn=users,dc=office,dc=example,dc=com
    CN=Sales,cn=users,dc=office,dc=example,dc=com
next
end
```

Creating a firewall user group

This example shows a firewall user group with only two users. You can add additional members.

To create a firewall user group in the GUI:

1. Go to User & Authentication > User Groups and click Create New.
2. Configure the following settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>Internet_users</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Firewall</td>
</tr>
<tr>
<td>Members</td>
<td>User1, User2</td>
</tr>
</tbody>
</table>

3. Click OK.

To create a firewall user group in the CLI:

```plaintext
cfg user group
  edit Internet_users
    set group-type firewall
    set member User1 User2
```
Defining policy addresses

To define policy addresses:

1. Go to Policy & Objects > Addresses.
2. Click Create New > Address.
3. Configure the following settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>Internal_net</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Subnet</td>
</tr>
<tr>
<td>IP/Netmask</td>
<td>10.11.102.0/24</td>
</tr>
<tr>
<td>Interface</td>
<td>Port 3</td>
</tr>
</tbody>
</table>

4. Click OK.
5. Create another new address by repeating steps 2-4 using the following settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>Windows_net</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Subnet</td>
</tr>
<tr>
<td>IP/Netmask</td>
<td>10.11.101.0/24</td>
</tr>
<tr>
<td>Interface</td>
<td>Port 2</td>
</tr>
</tbody>
</table>

Creating security policies

You must create two security policies: one for the firewall group connecting through port 3, and one for the FSSO group connecting through port 2.

To create security policies using the GUI:

1. Go to Policy & Objects > Firewall Policy.
2. Click Create New.
3. Configure the following settings:

<table>
<thead>
<tr>
<th>Incoming Interface</th>
<th>Port2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Address</td>
<td>Windows_net</td>
</tr>
<tr>
<td>Source User(s)</td>
<td>FSSO_Internet_users</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>Port1</td>
</tr>
<tr>
<td>Destination Address</td>
<td>all</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
</tbody>
</table>
NAT | Enabled.
---|---
Security Profiles | You can enable security profiles as desired.

4. Click OK.

5. Create another new policy by repeating steps 2-4 using the following settings:

<table>
<thead>
<tr>
<th><strong>Incoming Interface</strong></th>
<th>Port3</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Source Address</strong></td>
<td>Internal_net</td>
</tr>
<tr>
<td><strong>Source User(s)</strong></td>
<td>Internet_users</td>
</tr>
<tr>
<td><strong>Outgoing Interface</strong></td>
<td>Port1</td>
</tr>
<tr>
<td><strong>Destination Address</strong></td>
<td>all</td>
</tr>
<tr>
<td><strong>Schedule</strong></td>
<td>always</td>
</tr>
<tr>
<td><strong>Service</strong></td>
<td>ALL</td>
</tr>
<tr>
<td><strong>NAT</strong></td>
<td>Enabled.</td>
</tr>
<tr>
<td><strong>Security Profiles</strong></td>
<td>You can enable security profiles as desired.</td>
</tr>
</tbody>
</table>

6. Click OK.

**To create security policies using the CLI:**

```
config firewall policy
  edit 0
    set srcintf port2
    set dstintf port1
    set srcaddr Windows_net
    set dstaddr all
    set action accept
    set groups FSSO_Internet_users
    set schedule always
    set service ANY
    set nat enable
  next
end
config firewall policy
  edit 0
    set srcintf port3
    set dstintf port1
    set srcaddr internal_net
    set dstaddr all
    set action accept
    set schedule always
    set groups Internet_users
    set service ANY
    set nat enable
  next
end
```
FSSO

FortiOS can provide single sign-on capabilities to Windows AD, Citrix, VMware Horizon, Novell eDirectory, and Microsoft Exchange users with the help of agent software installed on these networks. The agent software sends information about user logons to the FortiGate unit. With user information such as IP address and user group memberships from the network, FortiGate security policies can allow authenticated network access to users who belong to the appropriate user groups without requesting their credentials again.

Fortinet Single Sign-On (FSSO), through agents installed on the network, monitors user logons and passes that information to the FortiGate unit. When a user logs on at a workstation in a monitored domain, FSSO:

- Detects the logon event and records the workstation name, domain, and user,
- Resolves the workstation name to an IP address,
- Determines which user groups the user belongs to,
- Sends the user logon information, including IP address and groups list, to the FortiGate unit, and
- Creates one or more log entries on the FortiGate unit for this logon event as appropriate.

When the user tries to access network resources, the FortiGate unit selects the appropriate security policy for the destination. If the user belongs to one of the permitted user groups associated with that policy then the connection is allowed, otherwise the connection is denied.

Agent-based FSSO

Several different FSSO agents can be used in an FSSO implementation:

- Domain Controller (DC) agent
- eDirectory agent
- Citrix/Terminal Server (TS) agent
- Collector Agent

Consult the latest FortiOS Release Notes for operating system compatibility information.

Domain Controller agent

The Domain Controller (DC) agent must be installed on every domain controller when you use DC Agent mode. The DC agents monitor user logon events and pass the information to the Collector agent, which stores the information and sends it to the FortiGate unit.

eDirectory agent

The eDirectory agent is installed on a Novell network to monitor user logons and send the required information to the FortiGate unit. It functions much like the Collector agent on a Windows AD domain controller. The agent can obtain information from the Novell eDirectory using either the Novell API or LDAP.

Terminal Server agent

The Terminal Server (TS) agent can be installed on a Citrix, VMware Horizon 7.4, or Windows Terminal Server to monitor user logons in real time. It functions much like the DC Agent on a Windows AD domain controller.
**Collector agent**

The Collector Agent (CA) is installed as a service on a server in the Windows AD network to monitor user logons and send the required information to the FortiGate unit. The Collector agent can collect information from a DC agent (Windows AD) and TS agent (Citrix or VMware Horizon Terminal Server).

In a Windows AD network, the Collector agent can optionally obtain logon information by polling the AD domain controllers. In this case, DC agents are not needed.

The CA is responsible for DNS lookups, group verification, workstation checks, and updating FortiGates on logon records. The FSSO CA sends Domain Local Security Group and Global Security Group information to FortiGate units. The CA communicates with the FortiGate over TCP port 8000 and it listens on UDP port 8002 for updates from the DC agents.

The FortiGate device can have up to five CAs configured for redundancy. If the first CA on the list is unreachable, the next is attempted, and so on down the list until one is contacted.

All DC agents must point to the correct CA port number and IP address on domains with multiple DCs.

---

A FortiAuthenticator device can act much like a CA, collecting Windows AD user logon information and sending it to the FortiGate device. It is particularly useful in large installations with several FortiGate units. For more information, see the FortiAuthenticator Administration Guide.

---

**Agentless FSSO**

For Windows AD networks, FortiGate devices can also provide SSO capability by directly polling Windows Security Event log entries on Windows DC for user log in information. This configuration does not require a CA or DC agent.

**FortiGate configuration**

To configure FSSO on a FortiGate, go to Security Fabric > External Connectors.

When creating a new connector, several options for connectors are available under Endpoint/Identity:

- **Fortinet single sign-on agent on page 2492**
  
  For most FSSO Agent-based deployments, this connector option will be used. Specify either Collector Agent or Local as User Group Source to collect user groups from the Collector Agent, or to match users to user groups from a LDAP server.

- **Poll Active Directory server on page 2493**
  
  This connection option directly polls Windows Security Event log entries on Windows DC for user log in information.

- **RADIUS single sign-on agent on page 2500**
  
  FortiGate can authenticate users who have authenticated on a remote RADIUS server by monitoring the RADIUS accounting records forwarded by the RADIUS server to the FortiGate.

- **Exchange Server connector on page 2503**
  
  FortiGate collects information about authenticated users from corporate Microsoft Exchange Servers.

- **Symantec endpoint connector on page 2494**
  
  This connector uses client IP information from Symantec Endpoint Protection Manager (SEPM) to assign dynamic IP addresses on FortiOS.
Since FSSO is commonly associated with Agent-based FSSO and Agentless FSSO, this chapter will primarily focus on the first two Security Fabric External Connector options.

**FSSO polling connector agent installation**

This topic gives an example of configuring a local FSSO agent on the FortiGate. The agent actively pools Windows Security Event log entries on Windows Domain Controller (DC) for user log in information. The FSSO user groups can then be used in a firewall policy.

This method does not require any additional software components, and all the configuration can be done on the FortiGate.

**To configure a local FSSO agent on the FortiGate:**

1. Configure an LDAP server on the FortiGate on page 1915
2. Configure a local FSSO polling connector on page 1915
3. Add the FSSO groups to a policy on page 1916

**Configure an LDAP server on the FortiGate**

Refer to Configuring an LDAP server on page 1805. The connection must be successful before configuring the FSSO polling connector.

**Configure a local FSSO polling connector**

**To configure a local FSSO polling connector:**

1. Go to Security Fabric > External Connectors and click Create New.
2. In the Endpoint/Identity section, select Poll Active Directory Server.
3. Fill in the required information.
4. For LDAP Server, select the server you just created.
5. Configure the group settings:
   a. For Users/Groups, click Edit. The structure of the LDAP tree is shown in the Users/Groups window.
   b. Click the Groups tab.
   c. Select the required groups, right-click on them, and select Add Selected. Multiple groups can be selected at one time by holding the CTRL or SHIFT keys. The groups list can be filtered or searched to limit the number of groups that are displayed.
   d. Click the Selected tab and verify that the required groups are listed. To remove a group, right-click and select Remove Selected.
   e. Click OK to save the group settings.
6. Click OK to save the connector settings.
8. There should be two new connectors:

- The **Local FSSO Agent** is the backend process that is automatically created when the first FSSO polling connector is created.
- The **Active Directory Connector** is the front end connector that can be configured by FortiGate administrators.

To verify the configuration, hover the cursor over the top right corner of the connector; a popup window will show the currently selected groups. A successful connection is also shown by a green up arrow in the lower right corner of the connector.

If you need to get log in information from multiple DCs, then you must configure other Active Directory connectors for each additional DC to be monitored.

**Add the FSSO groups to a policy**

FSSO groups can be used in a policy by either adding them to the policy directly, or by adding them to a local user group and then adding the group to a policy.

**To add the FSSO groups to a local user group:**

1. Go to **User & Authentication > User Groups** and click **Create New**.
2. Enter a name for the group in the **Name** field.
3. Set the **Type** to **Fortinet Single Sign-On (FSSO)**.
4. In the **Members** field, click the + and add the FSSO groups.
5. Click **OK**.
6. Add the local FSSO group to a policy.

**To add the FSSO groups directly to a firewall policy:**

1. Go to **Policy & Objects > Firewall Policy** and click **Create New**.
2. In the **Source** field, click the +. In the **Select Entries** pane, select the **User** tab.
3. Select the FSSO groups.
4. Configure the remaining settings as required.
5. Click **OK**.
Troubleshooting

If an authenticated AD user cannot access the internet or pass the firewall policy, verify the local FSSO user list:

```
# diagnose debug authd fsso list
----FSSO logons----
IP: 10.1.100.188 User: test2 Groups: CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM
Workstation: MemberOf: CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM
Total number of logons listed: 1, filtered: 0
----end of FSSO logons----
```

1. Check that the group in MemberOf is allowed by the policy.
2. If the expected AD user is not in list, but other users are, it means that either:
   - The FortiGate missed the log in event, which can happen if many users log in at the same time, or
   - The user's workstation is unable to connect to the DC, and is currently logged in with cached credentials, so there is no entry in the DC security event log.
3. If there are no users in the local FSSO user list:
   a. Ensure that the local FSSO agent is working correctly:
```
   # diagnose debug enable
   # diagnose debug authd fsso server-status
   
   Server Name | Connection Status | Version | Address
   ------------ | ----------------- | ------- | -------
   FGT_A (vdom1) | Local FSSO Agent | connected | FSAE server 1.1 127.0.0.1
```
   The connection status must be connected.
   b. Verify the Active Directory connection status:
```
   # diagnose debug fsso-polling detail 1
   AD Server Status (connected):
   ID=1, name(10.1.100.131),ip=10.1.100.131,source(security),users(0)
   port=auto username=Administrator
   read log eof=1, latest logon timestamp: Fri Jul 26 10:36:20 2019
   
   polling frequency: every 10 second(s) success(274), fail(0)
   LDAP query: success(0), fail(0)
   LDAP max group query period(seconds): 0
   LDAP status: connected
   
   Group Filter: CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM
```
   If the polling frequency shows successes and failures, that indicates sporadic network problems or a very busy DC. If it indicates no successes or failures, then incorrect credentials could be the issue.
   If the LDAP status is connected, then the FortiGate can access the configured LDAP server. This is required for AD group membership lookup of authenticated users because the Windows Security Event log does not include group membership information. The FortiGate sends an LDAP search for group membership of authenticated users to the configure LDAP server.
   FortiGate adds authenticated users to the local FSSO user list only if the group membership is one of the groups in Group Filter.
4. If necessary, capture the output of the local FortiGate daemon that polls Windows Security Event logs:
```
   # diagnose debug application fssod -l
```
This output contains a lot of detailed information which can be captured to a text file.

**Limitations**

- NTLM based authentication is not supported.
- If there are a large number of user log ins at the same time, the FSSO daemon may miss some. Consider using FSSO agent mode if this will be an issue. See Public and private SDN connectors on page 2428 for information.
- The FSSO daemon does not support all of the security log events that are supported by other FSSO scenarios. For example, only Kerberos log in events 4768 and 4769 are supported.

**FSSO using Syslog as source**

This example describes how to configure Fortinet Single Sign-On (FSSO) agent on Windows using syslog as the source and a custom syslog matching rule.

The FSSO collector agent must be build 0291 or later, and in advanced mode (see How to switch FSSO operation mode from Standard Mode to Advanced Mode).

**To configure the FSSO agent on Windows:**

1. Open the FSSO agent on Windows.
2. Click Advanced Settings.
3. Go to the Syslog Source List tab.
4. Select Enable this feature.
5. Set Syslog Listening Port, or use the default port.
6. Click Manage Rule.
7. Create a new syslog rule:
   a. Click Add.
   b. Configure the rule:

<table>
<thead>
<tr>
<th>Trigger</th>
<th>722051</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logon</td>
<td>assigned to session</td>
</tr>
</tbody>
</table>
Username Field  
User <{:username}>{:login}

Client IPv4 Field  
IPv4 Address <{:client_ip}>{:login}

Client IPv6 Field  
IPv6 Address <{:client_ipv6}>{:login}

Group Field  
Group <{:group}>

Groups List Separator  
,

---

**c.** To test the rule, enter a sample log line, then click Test.

**d.** Click OK.

---

**8.** Create a new syslog source:

a. On the Advanced Settings window, click Add.

b. Configure the source:

```
<table>
<thead>
<tr>
<th>Name</th>
<th>VPN-Connection</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>192.168.100.12</td>
</tr>
<tr>
<td>Matching Rule</td>
<td>VPN</td>
</tr>
</tbody>
</table>
| User Type   | External: Users are not defined on the CA and user groups come from the source. Remote User: Users are defined on a remote LDAP server and user groups are retrieved from the specified LDAP server. Any group from the syslog messages are ignored. See Connect to a remote LDAP server on page 1920.
```

c. Click OK.

---

**9.** Click OK.
**Connect to a remote LDAP server**

This section describes how to connect to a remote LDAP server to match the user identity from the syslog server with an LDAP server.

**To connect to a remote LDAP server:**

1. Open the FSSO agent on Windows.
2. Click **Advanced Settings**.
3. Go to the **Syslog Source List** tab.
4. Click **Manage LDAP Server**.
5. Click **Add** and configure the LDAP server settings:

![LDAP Server Configuration](image1)

6. Click **OK**.
7. Select the syslog source and click **Edit**.

![Syslog Source Settings](image2)

8. Set **User Type** to **Remote User**, and select the LDAP server from the drop-down list.

![Syslog Source Settings](image3)

9. Click **OK**.
Configuring the FSSO timeout when the collector agent connection fails

The logon-timeout option is used to manage how long authenticated FSSO users on the FortiGate will remain on the list of authenticated FSSO users when a network connection to the collector agent is lost.

```config
config user fssoedit <name>
    set server <string>
    set password <string>
    set logon-timeout <integer>
next
end
```

*logon-timeout <integer>* Enter the interval to keep logons after the FSSO server is down, in minutes (1 - 2880, default = 5).

**Example**

In this example, the logon timeout is set for four minutes.

**To configure the FSSO logon timeout:**

1. Set the timeout value:

```config
config user fssoedit "ad"
    set server "10.1.100.141"
    set password ********
    set logon-timeout 4
next
end
```

2. Log on to a PC with a valid FSSO user account.
3. Enable real-time debugging and check for authd polling collector agent information. During this time, the connection to the collector agent is lost:
After about three minutes, check that the FSSO user is still in the list of authenticated users and can connect to the internet:

```
# diagnose firewall auth l
10.1.100.188, TEST1
   type: fsso, id: 0, duration: 229, idled: 229
   server: ad
   packets: in 0 out 0, bytes: in 0 out 0
   user_id: 16777219
   group_id: 3 33554433
   group_name: ad CN=GROUP1,OU=TESTING,DC=FORTINET-FSSO,DC=COM

----- 1 listed, 0 filtered -----  
```

After four minutes, check the debugs again. Note that the FSSO users are cleared:

```
... 
2021-06-10 16:24:57 authd_timer_run: 3 expired
2021-06-10 16:24:57 authd_epoll_work: timeout 60000
2021-06-10 16:24:59 [fsae_db_logoff:248]: vfid 0, ip 10.1.100.188, id(0), port_range_sz (0) 
2021-06-10 16:24:59 [authd_fp_notify_logoff:444]: vfid 0, ip 10.1.100.188, id 0
2021-06-10 16:24:59 [authd_fp_on_user_logoff:412]: vfid 0, ip 10.1.100.188
2021-06-10 16:24:59 [authd_fp_on_user_logoff:412]: vfid 0, ip 10.1.100.188
2021-06-10 16:24:59 [authd_fp_on_user_logoff:412]: vfid 0, ip 10.1.100.188
2021-06-10 16:24:59 [authd_fp_on_user_logoff:412]: vfid 0, ip 10.1.100.188
2021-06-10 16:24:59 [authd_fp_on_user_logoff:412]: vfid 0, ip 10.1.100.188
2021-06-10 16:24:59 authd_epoll_work: timeout 21990

# diagnose firewall auth l 

----- 0 listed, 0 filtered -----  
```

After the connection to the collector agent is restored, all users remain in the list of authenticated users and are synchronized to the FortiGate. The users do not need to log in again for authentication.
Authentication policy extensions

By default, unauthenticated traffic is permitted to fall to the next policy. This means that unauthenticated users are only forced to authenticate against a policy when there are no other matching policies. To avoid this, you can force authentication to always take place.

To set that authentication requirement:

```
config user setting
    set auth-on-demand {always | implicitly}
end
```

Where:

<table>
<thead>
<tr>
<th>always</th>
<th>Always trigger firewall authentication on demand.</th>
</tr>
</thead>
<tbody>
<tr>
<td>implicitly (default)</td>
<td>Implicitly trigger firewall authentication on demand. This is the default setting (and the behavior in FortiOS 6.0 and earlier).</td>
</tr>
</tbody>
</table>

In the following example, authentication is required; traffic that would otherwise be allowed by the second policy is instead blocked by the first policy.

To use forced authentication:

```
config user setting
    set auth-on-demand always
end
config firewall policy
    edit 1
        set name "QA to Database"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "QA_subnet"
        set dstaddr "Database"
        set action accept
        set schedule "always"
        set service "ALL"
        set fsso disable
        set groups "qa_group"
        set nat enable
    next
    edit 2
        set name "QA to Internet"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "QA_subnet"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set fsso disable
        set nat enable
```
Configuring the FortiGate to act as an 802.1X supplicant

The FortiGate can be configured to act as a 802.1X supplicant. The settings can be enabled on the network interface in the CLI. The EAP authentication method can be either PEAP or TLS using a user certificate.

```
config system interface
  edit <interface>
    set eap-suppliant {enable | disable}
    set eap-method {peap | tls}
    set eap-identity <identity>
    set eap-password <password>
    set eap-ca-cert <CA_cert>
    set eap-user-cert <user_cert>
  next
end
```

Example

In this example, the FortiGate connects to an L3 switch that is not physically secured. All devices that connect to the internet must be authenticated with 802.1X by either a username and password (PEAP), or a user certificate (TLS). Configuration examples for both EAP authentication methods on port33 are shown.

To configure EAP authentication with PEAP:

1. Configure the interface:

```
config system interface
  edit "port33"
    set vdom "vdom1"
    set ip 7.7.7.2 255.255.255.0
    set allowaccess ping https ssh snmp http telnet fgfm radius-acct probe-response
fabric
```
set stpforward enable
set type physical
set snmp-index 42
set eap-suppliant enable
set eap-method peap
set eap-identity "test1"
set eap-password **********

next
end

2. Verify the interface’s PEAP authentication details:

# diagnose test app eap_supp 2
Interface: port33
status:Authorized
method: PEAP
identity: test1
cacert:
client_cert:
private_key:
last_eapol_src =70:4c:a5:3b:0b:c6

Traffic is able to pass because the status is authorized.

To configure EAP authentication with TLS:

1. Configure the interface:

config system interface
edit "port33"
    set vdom "vdom1"
    set ip 7.7.7.2 255.255.255.0
    set allowaccess ping https ssh snmp http telnet fgfm radius-acct probe-response
fabric
    set stpforward enable
    set type physical
    set snmp-index 42
    set eap-suppliant enable
    set eap-method tls
    set eap-identity "test2@fortiqa.net"
    set eap-ca-cert "root_G_CA_Cert_1.cer"
    set eap-user-cert "root_eap_client_global.cer"

next
end

2. Verify the interface’s TLS authentication details:

# diagnose test application eap_supp 2
Interface: port33
status:Authorized
method: TLS
identity: test2@fortiqa.net
cacert: /etc/cert/ca/root_G_CA_Cert_1.cer
client_cert: /etc/cert/local/root_eap_client_global.cer
private_key: /etc/cert/local/root_eap_client_global.key
last_eapol_src =70:4c:a5:3b:0b:c6

Traffic is able to pass because the status is authorized.
Include usernames in logs

Usernames can be included in logs, instead of just IP addresses. The benefits of doing this include:

- FortiOS monitors and FortiAnalyzer reports display usernames instead of IP addresses, allowing you to quickly determine who the information pertains to. Without the usernames, it is difficult to correlate the IP addresses with specific users.
- User activity can be correlated across multiple IP addresses.
  
  For example, if DHCP is used a user might receive different IP addresses every day, making it difficult to track a specific user by specifying an IP address as the match criterion.

In this example, a collector agent (CA) is installed on a Windows machine to poll a domain controller (DC) agent (see FSSO on page 1913 for more information). On the FortiGate, an external connector to the CA is configured to receive user groups from the DC agent. The received group or groups are used in a policy, and some examples of the usernames in logs, monitors, and reports are shown.

Install and configure FSSO Agent

To download the FSSO agent:

1. Sign in to your FortiCloud account.
2. Go to Support > Firmware Download and select the Download tab.
3. Browse to the appropriate directory for the version of the FSSO agent that you need to download.

4. Click HTTPS to download the appropriate FSSO_Setup file.
To install the FSSO agent:

1. Run the FSSO_Setup file with administrator privileges.
2. Click Next, accept the terms of the license agreement, and click Next again.
3. Select the installation directory, or use the default location, then click Next.
4. Enter the User Name and Password, then click Next.

5. On the Install Options, select Advanced, then click Next.

6. Click Install.
7. After the FSSO Agent installs, run Install DC Agent.
8. Update the Collector Agent IP address and listening port as needed, then click Next.

9. Select the domain, in this example LAB:lab.local, then click Next.
10. Set the Working Mode to DC Agent Mode, then click Next to install the agent.
11. After the DC agent mode installation finishes, Reboot the DC to complete the setup.

To configure the FSSO agent:

1. Open the FSSO agent.
2. Enable *Require authentication from FortiGate* and enter a password for FortiGate authentication.
3. Click *Set Group Filters*, and create a default group filter to limit the groups that are sent to the FortiGate.
4. Click *Save&close*.

**Configure the FortiGate**

Create an external connector to the FSSO agent to receive the AD user groups. Add the user group or groups as the source in a firewall policy to include usernames in traffic logs. Enable security profiles, such as web filter or antivirus, in the policy to include the usernames in UTM logs.

Event logs include usernames when the log is created for a user action or interaction, such as logging in or an SSL VPN connection.
To create an external connector:

1. On the FortiGate, go to Security Fabric > External Connectors.
2. Click Create New and select FSSO Agent on Windows AD.
3. Set the Primary FSSO agent to the previously configured Collector Agent IP address and authentication password.

4. Click OK
   The connector shows a green arrow when the connection is established, and a number in the top right indicating the number of AD groups received from the DC agent. Edit the connector to view the user groups.

To configure a policy with an imported user group and web filter in the GUI:

1. Go to Policy & Objects > Firewall Policy.
2. Edit an existing policy, or create a new one. See Firewall policy on page 760 for information.
3. Add the FSSO groups or groups as sources:
   a. Click in the Source field.
   b. Select the User tab.
   c. Select the group or groups.
d. Click Close.

4. Under Security Profiles, enable Web Filter and select a profile that monitors or blocks traffic, such as the monitor-all profile. See Web filter on page 1124 for information.

5. Click OK.

To configure a policy with an imported user group and web filter in the CLI:

```
config firewall policy
  edit 0
    set name "LAN to WAN"
    set srcintf "port5"
    set dstintf "port1"
    set action accept
    set srcaddr "LAN"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "certificate-inspection"
    set webfilter-profile "monitor-all"
    set logtraffic all
    set nat enable
    set fss0-groups "CN=USERS,DC=LAB,DC=LOCAL"
next
end
```

Log, monitor, and report examples

For more information about logs, see the FortiOS Log Message Reference.

Traffic logs:

Without a web filter profile applied:

```
date=2022-05-24 time=13:50:47 eventtime=1653425447 time=13:50:47...218a843c5b5"
```
policyname="LAN to WAN" user="USER2" authserver="Corp_Users" service="PING" trandisp="snat" transip=192.168.2.99 transport=0 duration=0 sentbyte=0 rcvdbyte=0 sentpkt=0 rcvdpkt=0 appcat="unscanned"

With a web filter profile applied:

FortiOS monitors:

The FortiView Web Sites by Bytes monitor shows a list of visited websites. Double click a specific domain (or manually create a filter), such as microsoft.com, to see a breakdown of the usernames and IP addresses that visited that domain. See Monitors on page 106 for more information.
FortiAnalyzer reports:

The User Detailed Browsing Log report require a username or IP address to run. If a username is used, the report includes logs related to that user regardless of their IP address. For example, the following report show two source IP addresses:

The Web Usage report includes all usernames and IP addresses that match the specified conditions, like most visited categories.
See Reports in the FortiAnalyzer Administration guide for more information.
Wireless configuration

See the FortiWiFi and FortiAP Configuration Guide.
Switch Controller

Use the Switch Controller function, also known as FortiLink, to remotely manage FortiSwitch units. In the commonly-used layer 2 scenario, the FortiGate that is acting as a switch controller is connected to distribution FortiSwitch units. The distribution FortiSwitch units are in the top tier of stacks of FortiSwitch units and connected downwards with Convergent or Access layer FortiSwitch units. To leverage CAPWAP and the Fortinet proprietary FortiLink protocol, set up data and control planes between the FortiGate and FortiSwitch units.

FortiLink allows administrators to create and manage different VLANs, and apply the full-fledged security functions of FortiOS to them, such as 802.1X authentication and firewall policies. Most of the security control capabilities on the FortiGate are extended to the edge of the entire network, combining FortiGate, FortiSwitch, and FortiAP devices, and providing secure, seamless, and unified access control to users.

See FortiSwitch devices managed by FortiOS.
System

This topic contains information about FortiGate administration and system configuration that you can do after installing the FortiGate in your network.

Basic system settings

Administrators

By default, FortiGate has an administrator account with the username admin and no password. See Administrators on page 1939 for more information.

Administrator profiles

An administrator profile defines what the administrator can see and do on the FortiGate. See Administrator profiles on page 1951 for more information.

Password policy

Set up a password policy to enforce password criteria and change frequency. See Password policy on page 1948 for more information.

Interfaces

Physical and virtual interface allow traffic to flow between internal networks, and between the internet and internal networks. See Interfaces on page 135 for more information.

Advanced system settings

SNMP

The simple network management protocol (SNMP) allows you to monitor hardware on your network. See SNMP on page 2126 for more information.

DHCP server

You can configure one or more DHCP servers on any FortiGate interface. See DHCP server on page 287 for more information.
VDOM

You can use virtual domains (VDOMs) to divide a FortiGate into multiple virtual devices that function independently. See Virtual Domains on page 1996 for more information.

High availability

You can configure multiple FortiGate devices, including private and public cloud VMs, in HA mode. See High Availability on page 2032 for more information.

Certificates

You can manage certificates on the FortiGate. See Certificates on page 2166 for more information.

Operating modes

A FortiGate or VDOM (in multi-vdom mode) can operate in either NAT/route mode or transparent mode.

NAT/route mode

The FortiGate or VDOM is installed as a gateway or router between multiple networks, such as a private network and the internet. One function of NAT/route mode is to allow the FortiGate to hide the IP addresses on the private network using NAT. NAT/route mode can also be used to connect to multiple ISPs in an SD-WAN setup, and to route traffic between different networks.

By default, new VDOMs are set to NAT/route operation mode.

Transparent mode

The FortiGate or VDOM operates in layer 2 to forward traffic between network devices such as routers, firewalls, and switches. For example, it can be installed inline between a router and a switch to perform security scanning without changing the network topology or modifying the IP addresses. When you add a FortiGate that is in transparent mode to a network, it only needs to be provided with a management IP address in order to access the device. It is recommended that a dedicated interface is used to connect to the management network in transparent mode.

The following topology is an example of a transparent mode FortiGate inserted inline between a router and a switch:
Using transparent mode VDOMs is recommended when multiple VLANs pass through the FortiGate. Otherwise, they must be separated into different forwarding domains within the same VDOM.

Changing modes

The following is a sample configuration for changing from NAT/route operation mode to transparent operation mode in the CLI:

```
config system settings
  set opmode transparent
  set manageip <IP_address>
  set gateway <gateway_address>
end
```

The gateway setting is optional. However, once the operation mode is changed from NAT/route to transparent, the gateway configuration is found under the static router settings:

```
config router static
  edit <seq-num>
    set gateway <IP_address>
  next
end
```

The following is a sample configuration for changing from transparent operation to NAT/route operation mode in the CLI:

```
config system settings
  set opmode nat
  set ip <IP_address>
  set device <interface>
  set gateway <gateway_address>
end
```
The IP and device settings are mandatory. Once the operation mode is changed from transparent to NAT/route, the IP address configuration is found under the corresponding interface settings:

```plaintext
cfg system interface
edit <interface>
    set ip <IP_address>
next
end
```

The gateway setting is optional. However, once the operation mode is changed, the gateway configuration is found under the static router settings:

```plaintext
cfg router static
edit <seq-num>
    set gateway <IP_address>
    device <interface>
next
end
```

---

**Administrators**

By default, FortiGate has an administrator account with the username `admin` and no password. To prevent unauthorized access to the FortiGate, this account must be protected with a password. Additional administrators can be added for various functions, each with a unique username, password, and set of access privileges.

The following topics provide information about administrators:

- Local authentication on page 1939
- Remote authentication for administrators on page 1940
- Administrator account options on page 1943
- REST API administrator on page 1945
- SSO administrators on page 1947
- FortiCloud SSO on page 1947
- Password policy on page 1948
- Public key SSH access on page 1950

**Local authentication**

By default, FortiGate has one super admin named `admin`. You can create more administrator accounts with different privileges.

**To create an administrator account in the GUI:**

1. Go to `System > Administrators`.
2. Select `Create New > Administrator`. 
3. Specify the Username.

Do not use the characters < > ( ) # " ' in the administrator username.
Using these characters in an administrator username might have a cross site scripting (XSS) vulnerability.

4. Set Type to Local User.
5. Set the password and other fields.
6. Click OK.

To create an administrator account in the CLI:

```
config system admin
  edit <admin_name>
    set accprofile <profile_name>
    set vdom <vdom_name>
    set password <password for this admin>
  next
end
```

Remote authentication for administrators

Administrators can use remote authentication, such as LDAP, RADIUS, and TACACS+ to connect to the FortiGate.

Configuring remote authentication with an LDAP server is shown. For more information about configuring LDAP, see Configuring an LDAP server on page 1805.

For information about configuring RADIUS or TACACS+ servers, see Configuring a RADIUS server on page 1821 and TACACS+ servers on page 1852. To use a RADIUS or TACACS+ server for remote authentication, configure the server, and then add it to the user group instead of the LDAP server.

Local logins can also be restricted when remote authentication servers are available, see Restricting logins from local administrator accounts when remote servers are available on page 1943.

Configuring remote authentication for administrators using LDAP includes the following steps:

1. Configuring the LDAP server on page 1940
2. Adding the LDAP server to a user group on page 1941
3. Configuring the administrator account on page 1941

Configuring the LDAP server

To configure the LDAP server in the GUI:

1. Go to User & Authentication > LDAP Servers and click Create New.
2. Enter the server Name and Server IP/Name.
3. Enter the Common Name Identifier and Distinguished Name.
4. Set the Bind Type to Regular and enter the Username and Password.
5. Click OK.
To configure the LDAP server in the CLI:

cfg user ldap
  edit <name>
    set server <server_ip>
    set cnid "cn"
    set dn "dc=XYZ,dc=fortinet,dc=COM"
    set type regular
    set username "cn=Administrator,dc=XYA, dc=COM"
    set password <password>
  next
end

Adding the LDAP server to a user group

After configuring the LDAP server, create a user group that includes that LDAP server.

To create a user group in the GUI:

1. Go to User & Authentication > User Groups and click Create New.
2. Enter a Name for the group.
3. In the Remote groups section, select Create New.
4. Select the Remote Server from the dropdown list.
5. Click OK.

To create a user group in the CLI:

cfg user group
  edit <name>
    set member <ldap_server_name>
  next
end

Configuring the administrator account

After configuring the LDAP server and adding it to a user group, create a new administrator. For this administrator, instead of entering a password, use the new user group for authentication.

A remote authentication server can allow authentication of either a single user or any user from a specified group.

Public key infrastructure (PKI) administrator authentication requires a PKI user instead of a remote server. For information about creating a PKI user, see Configuring a PKI user on page 1903.

To create an administrator to match a single user in the GUI:

1. Go to System > Administrators and click Create New > Administrator.
2. Specify the Username.
   This username is used when the administrator logs in, and is what FortiOS sends to the remote authentication server for authorization.
3. Set Type to Match a user on a remote server group.
4. In Remote User Group, select the user group that you created.
5. Select an Administrator Profile.
6. Enter a Backup Password, to be used if the remote authentication server is unreachable.
7. Click OK.

To create an administrator match a single user in the CLI:

```
config system admin
  edit <name>
    set remote-auth enable
    set accprofile super_admin
    set remote-group <ldap_group_name>
    set password **********
  next
end
```

To create an administrator to match all users in a remote server group in the GUI:
1. Go to System > Administrators and click Create New > Administrator.
2. Specify the Username.
   This username is only used to identify this administrator group. Administrators can log in with any username in the remote user group.
3. Set Type to Match all users in a remote server group.
4. In Remote User Group, select the user group that you created.
5. Select an Administrator Profile.
6. Click OK.

To create an administrator to match all users in a remote server group in the CLI:

```
config system admin
  edit <name>
    set remote-auth enable
    set accprofile super_admin
    set wildcard enable
    set remote-group <ldap_group_name>
  next
end
```

To create an administrator that uses a PKI group in the GUI:
1. Go to System > Administrators and click Create New > Administrator.
2. Specify the Username.
3. Set Type to Use public key infrastructure (PKI) group.
4. In Remote User Group, select the user group that you created.
5. Select an Administrator Profile.
6. Click OK.
To create an administrator that uses a PKI group in the CLI:

```plaintext
config system admin
    edit <name>
        set remote-auth enable
        set accprofile super_admin
        set peer-group <pki_group_name>
    next
end
```

Restricting logins from local administrator accounts when remote servers are available

Logins from local administrator accounts can be restricted when remote servers are available. When enabled, FortiOS will check if all of the remote servers used by administrators are down before allowing a local administrator to log in. This option is applied globally, and is disabled by default.

To restrict local administrator authentication when a remote authentication server available:

```plaintext
config system global
    set admin-restrict-local enable
end
```

Administrator account options

Options to further define the access and abilities of an administrator account include:

- Multi-factor authentication on page 1943
- Restricting logins to trusted hosts on page 1945
- Restricting administrators to guest account provisioning on page 1945
- Global and VDOM administrators on page 1945

Multi-factor authentication

Multi-factor authentication (MFA) requires authenticating administrators to supply more than one factor to identify themselves in addition to their password, such as a FortiToken.

Before enabling MFA, it is recommended that you create second administrator account that is configured to guarantee administrator access to the FortiGate if you are unable to authenticate on the main account for any reason.

Multi-factor authentication options include:

- FortiToken
- FortiToken Cloud
- Email
- SMS

**FortiToken**

**To associate a FortiToken to an administrator account using the GUI:**

1. Ensure that you have successfully added your FortiToken serial number to FortiOS and that its status is *Available*.
2. Go to System > Administrators. Edit the admin account. This example assumes that the account is fully configured except for MFA.
3. Enable *Two-factor Authentication* and for *Authentication Type*, select *FortiToken*.
4. From the *Token* dropdown list, select the FortiToken serial number.
5. In the *Email Address* field, enter the administrator's email address.
6. Click OK.

For a mobile token, click *Send Activation Code* to send the activation code to the configured email address. The admin uses this code to activate their mobile token. You must have configured an email service in *System > Settings* to send the activation code.

**To associate a FortiToken to an administrator account using the CLI:**

```
config system admin
edit <username>
  set password "myPassword"
  set two-factor fortitoken
  set fortitoken <serial_number>
  set email-to "username@example.com"
next
end
```

The *fortitoken* keyword is not visible until you select *fortitoken* for the *two-factor* option.

Before you can use a new FortiToken, you may need to synchronize it due to clock drift.

---

**FortiToken Cloud**

FortiToken Cloud is an Identity and Access Management as a Service (IDaaS) cloud service provided by Fortinet. It enables FortiGate and FortiAuthenticator customers to add MFA for their users using Mobile or Hard tokens.

For more information, see Getting started—FGT-FTC users in the FortiToken Cloud Administration Guide.

**Email**

Enter an email address to send an MFA code to that address.

**SMS**

Enable SMS then select the *Country Dial Code* and enter the *Phone Number* (*sms-phone* in the CLI) to send an MFA code to.

SMS messages can also be sent to the FortiGuard SMS server or a custom server.
config system admin
   edit "admin"
   ...
   set sms-server {fortiguard | custom}
   set sms-server-custom <string>
   ...
next
end

**Restricting logins to trusted hosts**

Administrator accounts can be configured to only be accessible to a user using a trusted host. You can set a specific IP address for the trusted host, or use a subnet. Up to ten trusted hosts can be specified for an administrator.

When trusted hosts are defined for all of the administrators on the FortiGate, the administrative access on each interface will be restricted to the trusted hosts that are defined for the administrator, except for ping. If ping is enabled on an interface, it works regardless of the trusted hosts.

**Restricting administrators to guest account provisioning**

To simplify guest account creation, an administrator account can be created exclusively for guest user management. This allows new accounts to be created without requiring full administrative access to FortiOS.

When enabling this option, a guest group must be specified for the administrator to provision new accounts to. See Configuring guest user groups on page 1799 for information about creating such a group.

**Global and VDOM administrators**

When a FortiGate is in multi VDOM mode, it can be managed by either global or per-VDOM administrators. Each type of administrator will have a different view of the GUI that corresponds to their role. For more information, see Administrator roles and views on page 1998.

For information about configuring per-VDOM administrators, see Create per-VDOM administrators on page 2005.

**REST API administrator**

REST API administrator accounts are used for automated configuration, backup creation, and monitoring of the FortiGate.

For more information about the REST API, see the Fortinet Development Network (FNDN). Note that an account is required to access the FNDN.

**To create a REST API admin in the GUI:**

1. Go to System > Administrators.
2. Select Create New > REST API Admin.
3. Configure the administrator:

<table>
<thead>
<tr>
<th>Username</th>
<th>The username of the administrator.</th>
</tr>
</thead>
</table>

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
Do not use the characters `< > ( ) # " '` in the administrator username. Using these characters in an administrator username might have a cross site scripting (XSS) vulnerability.

<table>
<thead>
<tr>
<th>Administrator Profile</th>
<th>Where permissions for the REST API administrator are defined. A REST API administrator should have the minimum permissions required to complete the request.</th>
</tr>
</thead>
<tbody>
<tr>
<td>PKI Group</td>
<td>Certificate matching is supported as an extra layer of security. Both the client certificate and token must match to be granted access to the API.</td>
</tr>
<tr>
<td>CORS Allow Origin</td>
<td>Cross Origin Resource Sharing (CORS) allows third-party web apps to make API requests to the FortiGate using the token.</td>
</tr>
<tr>
<td>Trusted Hosts</td>
<td>The following can be used to restrict access to FortiGate API: • Multiple trusted hosts/subnets can be configured • IPv6 hosts are supported • Allow all (0.0.0.0/0) is not allowed You need your Source Address to create the trusted host.</td>
</tr>
</tbody>
</table>

4. Click OK.

An API token is generated. Make note of the token, as it is only shown once.

To create a REST API admin in the CLI:

1. Create the REST API administrator:

   ```
   config system api-user
   edit "api-admin"
   set comments <string>
   set api-key ************
   set accprofile "API profile"
   set vdom "root"
   config trusthost
   edit 1
   set ipv4-trusthost <class_ip&net_netmask>
   next
   ...
   end
   next
   end
   ```

2. Generate the API token:

   ```
   execute api-user generate-key <API username>
   ```

   Make note of the token, as it is only shown once.

---

By default, The SSO administrator account can only be assigned the `admin_no_access` or `super_admin_readonly` profile. You can define a new administrator profile with the required permissions for the account. For example, you could use a specific API user to query the FortiGate for just their own status. In that case, the profile would be configured as read-only.
SSO administrators

SSO administrators are automatically created when the FortiGate acts as a SAML service provider (SP) with SAML Single Sign-On enabled in the Security Fabric settings.

On the system login page, an administrator can log in with their username and password against the root FortiGate acting as the identity provider (IdP) in the Security Fabric. After the first successful log in, this user is added to the administrators table (System > Administrators under Single Sign-On Administrator). The default profile selected is based on the SP settings (Default admin profile). See Configuring a downstream FortiGate as an SP on page 2321 for more information.

SSO administrators can be manually configured in FortiOS.

To manually configure an SSO administrator in the GUI:

1. Go to System > Administrators and click Create New > SSO Admin.
2. Enter the username.
3. Select an administrator profile.
4. Click OK.

To manually configure an SSO administrator in the CLI:

```
config system sso-admin
edit <name>
    set accprofile <profile>
    set vdom <vdom>
next
end
```

FortiCloud SSO

By default, the FortiGate is configured to allow administrators to log in using FortiCloud single sign-on. Both IAM and non-IAM users on the FortiCloud support portal are supported. Non-IAM users must be the FortiCloud account that the FortiGate is registered to.

To configure an IAM user in FortiCloud:

1. Log in to your FortiCloud account at support.fortinet.com.
2. Select Services > IAM and click Add IAM user.
3. See Adding an IAM user in the FortiCloud Identity & Access Management (IAM) guide for more information. The Portal Permissions for SupportSite, IAMPortal, and FortiOS SSO must be configured to allow portal access for administrators.

To manually enable FortiCloud single sign-on in the GUI:

1. Log in to the FortiGate and go to System > Settings.
2. In the Administration Settings section, enable Allow administrative login using FortiCloud SSO.
3. Click Apply.
To manually enable FortiCloud single sign-on in the CLI:

```
config system global
    set admin-forticloud-sso-login {enable | disable}
end
```

To log in to the FortiGate with the FortiCloud user:

1. Go to the FortiGate log in screen.
2. Click Sign in with FortiCloud. The FortiCloud log in page opens.
3. Enter the FortiCloud account credentials and click Login.
   You are logged in to the FortiOS GUI. The SSO username is shown in the top right corner of the GUI.

Password policy

Brute force password software can launch more than just dictionary attacks. It can discover common passwords where a letter is replaced by a number. For example, if `p4ssw0rd` is used as a password, it can be cracked.

Using secure passwords is vital for preventing unauthorized access to your FortiGate. When changing the password, consider the following to ensure better security:

- Do not use passwords that are obvious, such as the company name, administrator names, or other obvious words or phrases.
- Use numbers in place of letters, for example: `pass0rd`.
- Administrator passwords can be up to 64 characters.
- Include a mixture of numbers, symbols, and upper and lower case letters.
- Use multiple words together, or possibly even a sentence, for example: `correcthorsebatterystaple`.
- Use a password generator.
- Change the password regularly and always make the new password unique and not a variation of the existing password. For example, do not change from `password` to `password1`.
- Make note of the password and store it in a safe place away from the management computer, in case you forget it; or ensure at least two people know the password in the event one person becomes unavailable. Alternatively, have two different admin logins.
FortiGate allows you to create a password policy for administrators and IPsec pre-shared keys. With this policy, you can enforce regular changes and specific criteria for a password policy, including:

- The minimum length, between 8 and 64 characters.
- If the password must contain uppercase (A, B, C) and/or lowercase (a, b, c) characters.
- If the password must contain numbers (1, 2, 3).
- If the password must contain special or non-alphanumeric characters: !, @, #, $, %, ^, &, *, (, and )
- Where the password applies (admin or IPsec or both).
- The duration of the password before a new one must be specified.
- The minimum number of unique characters that a new password must include.

If you add a password policy or change the requirements on an existing policy, the next time that administrator logs into the FortiGate, the administrator is prompted to update the password to meet the new requirements before proceeding to log in.

For information about setting passwords, see Default administrator password on page 1976.

**To create a system password policy the GUI:**

1. Go to **System > Settings**.
2. In the **Password Policy** section, change the **Password scope** to **Admin**, **IPsec**, or **Both**.
3. Configure the password policy options.

![System Settings](image)

4. Click **Apply**.

**To create a system password policy the CLI:**

```
config system password-policy
  set status {enable | disable}
  set apply-to {admin-password | ipsec-preshared-key}
  set minimum-length <8-128>
  set min-lower-case-letter <0-128>
  set min-upper-case-letter <0-128>
  set min-non-alphanumeric <0-128>
  set min-number <0-128>
  set min-change-characters <0-128>
  set expire-status {enable | disable}
  set expire-day <1-999>
  set reuse-password {enable | disable}
end
```
## Public key SSH access

Public-private key pairs can be used to authenticate administrators connecting to the CLI using an SSH client. These keys can be RSA, ECDSA, or EdDSA.

Weigh the pros and cons of using key-pair authentication, versus passwords, when considering their use:

<table>
<thead>
<tr>
<th>Pros</th>
<th>Key-pair</th>
<th>Password</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>More secure (higher complexity)</td>
<td>Easy to remember</td>
</tr>
<tr>
<td></td>
<td>Restricts logon to hosts that have the private key</td>
<td>Easy to update</td>
</tr>
<tr>
<td></td>
<td>Never sent to the FortiGate</td>
<td>Can log in from any system</td>
</tr>
<tr>
<td></td>
<td>Can add a password in addition to the key</td>
<td></td>
</tr>
<tr>
<td>Cons</td>
<td>More complex to implement</td>
<td>Might be guessable or brute forced</td>
</tr>
<tr>
<td></td>
<td>The private key is only as secure as the system storing it</td>
<td>Could be reused and compromised on another system</td>
</tr>
<tr>
<td></td>
<td>More complicated to train users and administrators to use keys</td>
<td>Might be stored in plain text on an authenticating device (This does not apply to FortiGates)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Can be phished or observed if written down</td>
</tr>
</tbody>
</table>

Key-pair authentication is often implemented when connecting to the FortiGate without any human interaction, such as when using a script. The script can leverage existing mechanisms to secure private keys, instead of trying to develop a way to securely store a username and password.

### Generating the key pair

Key pairs can be generated and added in multiple different ways. This example shows generating a key pair using **PuTTY Key Generator** and adding the private key to the endpoint using **PuTTY Pageant**.

#### To create the key pair using PuTTY:

1. Download and install PuTTY.
2. Run *PuTTYgen.exe*.
3. Set *Type of key to generate* to *RSA, ECDSA, or EdDSA*.
4. Click *Generate*, then move the mouse cursor around in the blank space to generate randomness while the keys are generated.
5. Save both the public and private keys. Optionally, a key passphrase can be entered to protect the private key.

#### To add the public key to the FortiGate:

1. Delete the *Key comment*, then copy the public key from the *PuTTY Key Generator*.
   
   Conversely, you can also open the saved public key in Notepad, remove the line breaks from the key, then remove extraneous lines:
--- BEGIN SSH2 PUBLIC KEY -----
Comment: "rsa-key-2022XXXX"
--- END SSH2 PUBLIC KEY -----

2. Add the key to the FortiGate:

    config system admin
    edit <admin>
    set ssh-public-key1 "<key_type> <key_value>"
    next
    end

Where `<key_value>` is the copied key, and `<key_type>` depends on the type of key that was generated:

<table>
<thead>
<tr>
<th>Key Type</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSA</td>

</tr>
</tbody>
</table>

To add the private key to the endpoint:

1. Open PuTTY Pageant.
2. Click Add Key or Add Key (encrypted) and select the previously saved private key.
3. Click Close.

You can now log in to the FortiGate on an SSH connection without using a password.

If using PuTTY, the username can be entered under Connection > Data in the Auto-login username field.

---

The generated keys can also be used in a certificate to authenticate with the FortiGate. See Administrative access using certificates on page 2187 for information about generating and using certificates for administrative authentication.

---

**Administrator profiles**

Administrator profiles define what the administrator can do when logged into the FortiGate. When you set up an administrator account, you also assign an administrator profile which dictates what the administrator sees. Depending on the nature of the administrator’s work, access level or seniority, you can allow them to view and configure as much or as little as is required. Access to CLI diagnose commands can also be disabled for global and VDOM level administrators.

By default, the FortiGate has an `admin` administrator account that uses the `super_admin` profile.
super_admin profile

This profile has access to all components of FortiOS, including the ability to add and remove other system administrators. For certain administrative functions, such as backing up and restoring the configuration, super_admin access is required. To ensure that there is always a method to administer the FortiGate, the super_admin profile cannot be deleted or modified.

💡 Lower level administrator profiles cannot backup or restore the FortiOS configuration.

The super_admin profile is used by the default admin account. It is recommended that you add a password and rename this account once you have set up your FortiGate. In order to rename the default account, a second admin account is required.

Creating customized profiles

To create a profile in the GUI:

1. Go to System > Admin Profiles and click Create New.
2. Configure the following settings:
   - Name
   - Access permissions
   - Usage of CLI diagnose commands
   - Override idle timeout
3. Click OK.

To create a profile in the CLI:

```bash
config system accprofile
edit <name>
    set secfabgrp {none | read | read-write}
    set ftviewgrp {none | read | read-write}
    set authgrp {none | read | read-write}
    set sysgrp {none | read | read-write}
    set netgrp {none | read | read-write}
    set loggrp {none | read | read-write}
    set fwgrp {none | read | read-write}
    set vpngrpv {none | read | read-write}
    set utmgrpv {none | read | read-write}
    set wanoptgrpv {none | read | read-write}
    set wifi {none | read | read-write}
    set admintimeout-override {enable | disable}
    set system-diagnostics {enable | disable}
next
end
```
Edit profiles

To edit a profile in the GUI:

1. Go to System > Admin Profiles.
2. Select the profile to be edited and click Edit.
3. Make the required changes.
4. Click OK to save any changes.

To edit a profile in the CLI:

```bash
config system accprofile
  edit "sample"
    set secfabgrp read
    next
end
```

Delete profiles

To delete a profile in the GUI:

1. Go to System > Admin Profiles.
2. Select the profile to be deleted and click Delete.
3. Click OK.

To delete a profile in the CLI:

```bash
config system accprofile
  delete "sample"
end
```

Fabric Management

The Fabric Management page allows administrators to manage the firmware running on each FortiGate, FortiAP, and FortiSwitch in the Security Fabric, and to authorize and register these Fabric devices.

The Fabric Management page displays a summary of devices in the Security Fabric that includes:

- Total number of devices in the Fortinet Security Fabric and the types of devices
- Upgrade status
- Device name
- Device status
- Registration status
- Firmware version and maturity level
- Upgrade status

From the Fabric Management page, administrators can perform the following actions:
### Upgrade

Use to upgrade firmware for the selected device.

The *Upgrade* option uses released firmware images from FortiGuard. Alternately you can download a firmware file from the Fortinet Customer Service & Support website, and upload it for the upgrade process.

See Upgrading individual device firmware on page 1957 and Upgrading individual device firmware by following the upgrade path (federated update) on page 1959.

### Fabric Upgrade

Use to upgrade firmware for the root FortiGate as well as all Fabric devices. You can also use this option to upgrade firmware for a non-Security Fabric FortiGate with managed FortiSwitch and FortiAP devices.

The *Fabric Upgrade* option uses released firmware images from FortiGuard.

See Upgrading all device firmware on page 1960 and Upgrading all device firmware by following the upgrade path (federated update) on page 1962.

### Register

Use the *Register* option to register a selected device to FortiCare.

The FortiGate, and then its service contract, must be registered to have full access to Fortinet Customer Service and Support, and FortiGuard services. The FortiGate can be registered in either the FortiGate GUI or the FortiCloud support portal. The service contract can be registered from the FortiCloud support portal.

See also Registration on page 55.

### Authorize

Use the *Authorize* option to authorize a selected device for use. See Authorizing devices on page 1965.

Before you upgrade FortiGate firmware, it is recommended to learn about firmware updates and firmware maturity levels. See About firmware installations on page 1954 and Firmware maturity levels on page 1955.

This section also includes the following topics:

- Firmware upgrade notifications on page 1967
- Downloading a firmware image on page 1968
- Testing a firmware version on page 1970
- Installing firmware from system reboot on page 1971
- Restoring from a USB drive on page 1973
- Using controlled upgrades on page 1973
- Downgrading individual device firmware on page 1974

---

**About firmware installations**

Fortinet periodically updates the FortiGate firmware to include new features and resolve important issues. After you have registered your FortiGate unit, firmware updates are available from FortiGuard and from the Fortinet Customer Service & Support website.

Installing a new firmware image replaces the current antivirus and attack definitions, along with the definitions included with the firmware release that is being installing. After you install new firmware, make sure that the antivirus and attack definitions are up to date.

It is recommended to back up your configuration before making any firmware changes. You will be prompted to back up your configuration as part of the upgrade process. See also Configuration backups on page 65.
Before you install any new firmware, follow the below steps:

1. Understand the maturity level of the current and target firmware releases to help you determine whether to upgrade. See Firmware maturity levels on page 1955.
3. Review the Supported Upgrade Paths.
4. Download a copy of the currently installed firmware, in case you need to revert to it. See Downloading a firmware image on page 1968 and Downgrading individual device firmware on page 1974 for details.
5. Have a plan in place in case there is a critical failure, such as the FortiGate not coming back online after the update. This could include having console access to the device (Connecting to the CLI on page 29), ensuring that your TFTP server is working (Installing firmware from system reboot on page 1971), and preparing a USB drive (Restoring from a USB drive on page 1973).
6. Back up the current configuration, including local certificates. The upgrade process prompts you to back up the current configuration. See also Configuration backups on page 65 for details.
7. Test the new firmware until you are satisfied that it applies to your configuration. See Testing a firmware version on page 1970 and Using controlled upgrades on page 1973 for details.

Installing new firmware without reviewing release notes or testing the firmware may result in changes to settings and unexpected issues.

Only FortiGate admin users and administrators whose access profiles contain system read and write privileges can change the FortiGate firmware.

Firmware maturity levels

Starting with FortiOS 7.2.0, released FortiOS firmware images use tags to indicate the following maturity levels:

- The Feature tag indicates that the firmware release includes new features.
- The Mature tag indicates that the firmware release includes no new, major features. Mature firmware will contain bug fixes and vulnerability patches where applicable.

Administrators can use the tags to identify the maturity level of the current firmware in the GUI or CLI.

Administrators can view the maturity level of each firmware image that is available for upgrade on the Fabric Management page. When upgrading from mature firmware to feature firmware, a warning message is displayed.

To demonstrate the functionality of this feature, this example uses FortiGates that are running fictitious build numbers.

To view maturity levels for firmware in the GUI:

1. Go to Dashboard > Status. The Firmware field in the System Information widget displays the version with build number and either (Mature) or (Feature).
   
The following is an example of firmware with the (Mature) tag:
The following is an example of firmware with the (Feature) tag:

2. Go to System > Fabric Management. The Firmware Version column displays the version with build number and either (Mature) or (Feature).

The following is an example of firmware with the (Feature) tag:

3. Select a device, and click Upgrade. The FortiGate Upgrade pane is displayed.

4. Click the Latest tab to view the latest available firmware version with its maturity level.

In the following example, the latest firmware version is mature:

5. Click the All Upgrades tab to view all available firmware versions and their maturity levels.

A gray box around the version number and the label Feature identifies feature firmware version. A green box around the version with the label Mature identifies a mature firmware version.
6. Select a version and click Confirm and Backup Config.
   When the firmware version is a feature release, a warning is displayed.

To view maturity levels for firmware in the CLI:

```
# get system status
Version: FortiGate-301E v7.4.0,build0810,220307 (GA.F)
...
```

In this example, the Version field includes .F to indicate that the maturity level is feature.

```
# get system status
Version: FortiGate-301E v7.2.2,build0610,220304 (GA.M)
...
```

In this example, the Version field includes .M to indicate that the maturity level is mature.

**Upgrading individual device firmware**

To upgrade individual device firmware in the GUI:

1. Log into the FortiGate GUI as the admin administrative user.
2. Go to System > Fabric Management.
3. Select the FortiGate, and click Upgrade. The FortiGate Upgrade pane opens.
4. Click the following tabs to view the available firmware:

   | Latest | Displays the latest, available firmware from FortiGuard. |

**FortiOS 7.2.0 Administration Guide**

Fortinet Inc.
To upgrade individual device firmware in the CLI:

1. Make sure that the TFTP server is running.
2. Copy the new firmware image file to the root directory of the TFTP server.
3. Log in to the CLI.
4. Ping the TFTP server to ensure that the FortiGate can connect to it:
   ```
   execute ping <tftp_ipv4>
   ```
5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:
   ```
   execute restore image tftp <filename> <tftp_ipv4>
   ```
   The FortiGate unit responds with the message:
   ```
   This operation will replace the current firmware version!
   Do you want to continue? (y/n)
   ```
6. Type y. The FortiGate unit uploads the firmware image file, verifies the signature of the firmware image, and determines the firmware maturity level.
   When you are upgrading to a feature firmware image, you are asked to confirm whether to continue with the upgrade.
   When you proceed with the upgrade, the upgrade image is installed and FortiGate restarts. This process takes a few minutes.

   Please wait...
   Connect to tftp server 172.16.200.55 ...
   ##########################################################################
   Get image from tftp server OK.
   Verifying the signature of the firmware image.

   Warning: Upgrading to an image with Feature maturity notation.
   Image file uploaded is marked as a Feature image, are you sure you want to upgrade?
   Do you want to continue? (y/n)y
   Please confirm again. Are you sure you want to upgrade using uploaded file?
   Do you want to continue? (y/n)y
   Checking new firmware integrity ... pass
   Please wait for system to restart.
   Firmware upgrade in progress ...
   Done.
   The system is going down NOW !!

7. Reconnect to the CLI.
8. Update the antivirus and attack definitions:
   `execute update-now`

Upgrading individual device firmware by following the upgrade path (federated update)

When upgrading a FortiGate to firmware that requires multiple builds in the upgrade path, FortiGate can follow the upgrade path to complete the upgrade automatically. This process is sometimes called a federated update. A federated update can be performed immediately or during a scheduled time.

To upgrade individual device firmware by following the upgrade path in the GUI:

1. Log into the FortiGate GUI as the admin administrative user.
2. Go to System > Fabric Management. The Firmware Version column displays the version and either (Feature) or (Mature).
3. Select the FortiGate, and click Upgrade. The FortiGate Upgrade pane opens.
4. Click All Upgrades. The available firmware versions are displayed.
   In this example, the firmware is available for 7.2 and 7.0.

5. Select the target firmware, and view the upgrade options.
   You can instruct FortiOS to follow the upgrade path (referred to as a federated upgrade) or upgrade directly to the selected firmware version.
   In this example, the target firmware is 7.2.0 build 1157(GA), and Follow upgrade path is selected. According to the upgrade path, the device can be automatically upgraded to v7.0.5, but not all the way to 7.2.0.
In the following example, the Directly update to v7.2.0 option is selected.

6. Select Follow upgrade path, and click Confirm and Backup Config. A warning message is displayed.
7. Click Continue to initiate the upgrade.
   The FortiGate unit backs up the current configuration to the management computer, uploads the firmware image file, upgrades to the new firmware version, and restarts. This process takes a few minutes.

Upgrading all device firmware

Use the Fabric Upgrade process to select a firmware version from FortiGuard for the FortiGate. When part of a Security Fabric, the select target firmware is for the root FortiGate.

The target firmware version is used to automatically upgrade firmware for all FortiGate, FortiAP, and FortiSwitch devices. Fabric members or managed devices download the chosen firmware directly from FortiGuard.

A Fabric Upgrade can be performed immediately or during a scheduled time.
To upgrade all device firmware:

1. Log into the FortiGate GUI as the admin administrative user.
2. Go to **System > Fabric Management** and click **Fabric Upgrade**. The **Fabric Upgrade** pane opens, and the following tabs are available:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Latest</td>
<td>Displays the latest, available firmware from FortiGuard.</td>
</tr>
<tr>
<td>All Upgrades</td>
<td>Displays all available firmware from FortiGuard.</td>
</tr>
</tbody>
</table>

3. Select **Latest** or **All Upgrades**, select a target firmware version, and then click **Next**. In this example, **All Upgrades** is selected.

4. Select an upgrade schedule, either **Immediate** or **Custom**. If using **Custom**, enter an upgrade date and time (**Custom** is used in this example).

In a custom upgrade, the configuration backups are saved when the administrator schedules the upgrade. If the scheduled upgrade occurs after further configuration changes are made, the latest changes will not be saved in a new backup configuration file.

5. Click **Next** and review the update schedule. For FortiSwitch, a message appears because no firmware upgrade is currently available.
6. Click **Confirm and Backup Config**. The pane goes into a loading state to wait for all FortiGate configurations to save. Once completed, the pane closes and the device list refreshes to reflect the latest changes.

**Upgrading all device firmware by following the upgrade path (federated update)**

When performing a Fabric upgrade or non-Fabric upgrade under **System > Fabric Management** and choosing a firmware that requires multiple builds in the upgrade path, the FortiGate can follow the upgrade path to complete the upgrade automatically. This process is sometimes called a **federated update**. A federated update can be performed immediately or during a scheduled time.

To demonstrate the functionality of this feature, this example uses FortiGates that are running and upgrading to fictitious build numbers. FortiAPs and FortiSwitches currently cannot follow the upgrade path. They upgrade directly to the target version.

**Example**

In this example, the Security Fabric consists of a root FortiGate (FGT_101E) and a downstream FortiGate (GA_A_1). The FortiGates are currently running FortiOS 7.2.1 (build 0510). The administrator wants to upgrade the firmware to version 7.4.0 (build 0810). When upgrading the firmware on the **Fabric Management** page, the FortiGate is able to display the upgrade path, 7.2.1 > 7.2.2 > 7.4.0, and perform all of the upgrades in sequence (with multiple reboots).
To upgrade the FortiGate firmware:

2. In the Select Firmware section, select All Upgrades.
3. Select the 7.4.0 version. Upgrade options appear.
4. Select Follow upgrade path. The upgrade path is displayed: v7.2.1 > v7.2.2 > v7.4.0.

- If Directly upgrade to v7.4.0 is selected, a warning message appears that this may result in the loss of configuration.
5. Click Next.

6. Select an upgrade schedule, either Immediate or Custom. If using Custom, enter an upgrade date and time. (Custom is used in this example.)

7. Click Next and review the update schedule.

8. Click Confirm and Backup Config.

The Upgrade Status for both FortiGates indicated when the scheduled upgrade will take place. In this example, the first upgrade in the path is to version 7.2.2. The FortiGates will reboot and then upgrade to 7.4.0 as per the upgrade path.
Once the upgrades are complete and both FortiGates are running the desired firmware (7.4.0), the Upgrade Status changes to *Up to date*.

**CLI commands**

The following options are available in `execute federated-upgrade <option>`:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cancel</td>
<td>Cancel the currently configured upgrade.</td>
</tr>
<tr>
<td>initialize</td>
<td>Set up a federated upgrade.</td>
</tr>
<tr>
<td>status</td>
<td>Show the current status of a federated upgrade.</td>
</tr>
</tbody>
</table>

**Authorizing devices**

If there are any notifications in the top banner dropdown for unauthorized devices or devices that require authorization, clicking the notification redirects the user to the *System > Fabric Management* page. In this example, two devices require authorization.

On the *Fabric Management* page, the unauthorized devices (a downstream FortiGate and a FortiAP) are grayed out, and their status is *Waiting for authorization*. 
To authorize a Security Fabric device from the Fabric Management page:

1. Go to **System > Fabric Management**, and select an unauthorized device.
2. Click **Authorize** (below the donut charts), or right-click and select **Authorize**.

A notification appears in the bottom-right corner once the device is authorized.
3. Click the subsequent notification to refresh the page. The device's status is now *Online.*

To deauthorize a Security Fabric device from the Fabric Management page:

1. Go to the System > Fabric Management page, and select a device.
2. Right-click and select *Deauthorize.*
3. Click the subsequent notification to refresh the page.

**Firmware upgrade notifications**

FortiGates with a firmware upgrade license that are connected to FortiGuard display upgrade notifications in the setup window, banner, and FortiGuard menu. The firmware notifications are enabled by default.

To configure firmware notifications in the CLI:

```
config system global
    set gui-firmware-upgrade-warning {enable | disable}
end
```
To use the firmware upgrade notifications in the GUI:

1. When you log in to FortiGate, the FortiGate Setup window includes an Upgrade firmware step. Click Begin.

2. Follow the steps in the Setup Progress, then click Review Firmware Upgrade.

   The System > Fabric Management page opens.

3. Notifications appear below the Notification icon in the banner, and beside Fabric Management in the tree menu.

Downloading a firmware image

Firmware images for all FortiGate units are available on the Fortinet Customer Service & Support website.

To download firmware:

1. Log into the support site with your user name and password.
2. Go to Support > Firmware Download.
   
   A list of Release Notes is shown. If you have not already done so, download and review the Release Notes for the firmware version that you are upgrading your FortiGate unit to.
3. Select the Download tab.
4. Navigate to the folder for the firmware version that you are upgrading to.
5. Find your device model on the list. FortiWiFi devices have file names that start with FWF.
6. Click HTTPS in the far right column to download the firmware image to your computer.

   Firmware can also be downloaded using FTP, but as FTP is not an encrypted file transferring protocol, HTTPS downloading is recommended.

FortiOS image signing and verification

Official FortiOS firmware images are signed by the Fortinet CA. The BIOS checks the validity of an image when it is uploaded to the device. If the image is not signed by the Fortinet CA, warning messages appear in the GUI in several locations and in the CLI when the uploaded firmware fails the signature validation.
Warning message after an administrator logs in to the GUI:

![ Installed Firmware is Not Signed by Fortinet ]

Click *I Understand the Risk* to continue.

Sample GUI warnings

*Dashboard > Status page:*

![ Dashboard > Status page ]

*Banner:*

![ Banner ]

*System > Firmware page:*

![ System > Firmware page ]

Warning message after updating the firmware in the CLI:

```
# execute restore image tftp FGT_100F-v7-build0197-FORTINET.out 172.16.200.55
This operation will replace the current firmware version!
Do you want to continue? (y/n)y
```
Please wait...
Connect to tftp server 172.16.200.55 ...

Get image from tftp server OK.

Verifying the signature of the firmware image.

*****WARNING: This firmware failed signature validation.*****

Fortinet cannot verify the authenticity of this firmware and therefore there may be a risk that the firmware contains code unknown to Fortinet. In short, Fortinet cannot validate the firmware and makes no warranties or representations concerning the firmware.

Please continue only if you understand and are willing to accept the risks.
Do you want to continue? (y/n)y

Checking new firmware integrity ... pass
Please wait for system to restart.

Firmware upgrade in progress ...
Done.

Testing a firmware version

The integrity of firmware images downloaded from Fortinet's support portal can be verified using a file checksum. A file checksum that does not match the expected value indicates a corrupt file. The corruption could be caused by errors in transfer or by file modification. A list of expected checksum values for each build of released code is available on Fortinet's support portal.

Image integrity is also verified when the FortiGate is booting up. This integrity check is done through a cyclic redundancy check (CRC). If the CRC fails, the FortiGate unit will encounter an error during the boot process.

Firmware images are signed and the signature is attached to the code as it is built. When upgrading an image, the running OS will generate a signature and compare it with the signature attached to the image. If the signatures do not match, the new OS will not load.

Testing before installation

FortiOS lets you test a new firmware image by installing the firmware image from a system reboot and saving it to system memory. After completing this procedure, the FortiGate unit operates using the new firmware image with the current configuration. The new firmware image is not permanently installed. The next time the FortiGate unit restarts, it operates with the originally installed firmware image using the current configuration. If the new firmware image operates successfully, you can install it permanently using the procedure explained in Upgrading individual device firmware.

For this procedure, you must install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

To test the new firmware version:

1. Connect to the CLI using an RJ-45 to USB (or DB-9) or null modem cable.
2. Ensure that the TFTP server is running.
3. Copy the new firmware image file to the root directory on the TFTP server.
4. Ensure that the FortiGate unit can connect to the TFTP server using the execute ping command.
5. Restart the FortiGate unit: execute reboot. The following message is shown:
   This operation will reboot the system!
   Do you want to continue? (y/n)
6. Type y. As the FortiGate unit starts, a series of system startup messages appears.

7. When the following messages appears:

```
Press any key to display configuration menu...........
```

Immediately press any key to interrupt the system startup.

You have only three seconds to press any key. If you do not press a key during this time, the FortiGate will reboot, and you will have to log in and repeat the `reboot` command.

If you successfully interrupt the startup process, the following messages appears:

```
[G]: Get firmware image from TFTP server.
[F]: Format boot device.
[B]: Boot with backup firmware and set as default
[C]: Configuration and information
[Q]: Quit menu and continue to boot with default firmware.
[H]: Display this list of options.
```

Enter G, F, Q, or H:

8. Type G to get the new firmware image from the TFTP server. The following message appears: Enter TFTP server address [192.168.1.168]:

9. Type the address of the TFTP server, then press Enter. The following message appears: Enter Local Address [192.168.1.188]:

10. Type the IP address of the FortiGate unit to connect to the TFTP server.

| The IP address must be on the same network as the TFTP server. |
| Make sure that you do not enter the IP address of another device on this network. |

The following message appears:

```
Enter File Name [image.out]:
```

11. Enter the firmware image file name then press Enter. The TFTP server uploads the firmware image file to the FortiGate unit and the following message appears:

```
Save as Default firmware/Backup firmware/Run image without saving: [D/B/R]
```

12. Type R. The FortiGate image is installed to system memory and the FortiGate unit starts running the new firmware image, but with its current configuration.

Test the new firmware image as required. When done testing, reboot the FortiGate unit, and the it will resume using the firmware that was running before you installed the test firmware.

### Installing firmware from system reboot

In the event that the firmware upgrade does not load properly and the FortiGate unit will not boot, or continuously reboots, it is best to perform a fresh install of the firmware from a reboots using the CLI. If configured, the firmware can also be automatically installed from a USB drive; see **Restoring from a USB drive on page 1973** for details.

This procedure installs a firmware image and resets the FortiGate unit to factory default settings. You can use this procedure to upgrade to a new firmware version, revert to an older firmware version, or re-install the current firmware.

To use this procedure, you must connect to the CLI using the FortiGate console port and a RJ-45 to USB (or DB-9), or null modem cable. You must also install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

Before beginning this procedure, ensure that you backup the FortiGate unit configuration. See **Configuration backups on page 65** for details. If you are reverting to a previous FortiOS version, you might not be able to restore the previous configuration from the backup configuration file.
Installing firmware replaces your current antivirus and attack definitions, along with the definitions included with the firmware release you are installing. After you install new firmware, make sure that antivirus and attack definitions are up to date.

To install firmware from a system reboot:

1. Connect to the CLI using the RJ-45 to USB (or DB-9) or null modem cable.
2. Ensure that the TFTP server is running.
3. Copy the new firmware image file to the root directory of the TFTP server.
4. Ensure that the FortiGate unit can connect to the TFTP server using the `execute ping` command.
5. Restart the FortiGate unit: `execute reboot`. The following message is shown:
   
   This operation will reboot the system!
   Do you want to continue? (y/n)

6. Type `y`. As the FortiGate unit starts, a series of system startup messages appears.
7. When the following messages appears:
   
   Press any key to display configuration menu...........

   Immediately press any key to interrupt the system startup.

   You have only three seconds to press any key. If you do not press a key during this time, the FortiGate will reboot, and you will have to log in and repeat the `execute reboot` command.

   If you successfully interrupt the startup process, the following messages appears:

   
   [C]: Configure TFTP parameters.
   [R]: Review TFTP parameters.
   [T]: Initiate TFTP firmware transfer.
   [F]: Format boot device.
   [I]: System information.
   [B]: Boot with backup firmware and set as default.
   [Q]: Quit menu and continue to boot.
   [H]: Display this list of options.

   Enter C,R,T,F,I,B,Q,or H:

8. If necessary, type `C` to configure the TFTP parameters, then type `Q` to return to the previous menu:

   [P]: Set firmware download port.
   [D]: Set DHCP mode.
   [I]: Set local IP address.
   [S]: Set local subnet mask.
   [G]: Set local gateway.
   [V]: Set local VLAN ID.
   [T]: Set remote TFTP server IP address.
   [F]: Set firmware file name.
   [E]: Reset TFTP parameters to factory defaults.
   [R]: Review TFTP parameters.
   [N]: Diagnose networking (ping).
   [Q]: Quit this menu.
   [H]: Display this list of options.

   Enter P,D,I,S,G,V,T,F,E,R,N,Q,or H:

---

The IP address must be on the same network as the TFTP server.
Make sure that you do not enter the IP address of another device on this network.
9. Type `get` to get the new firmware image from the TFTP server. The FortiGate unit loads the firmware.

10. Save the firmware as the default (D) or backup (B) firmware image, or run the image without saving it (R). The FortiGate unit installs the new firmware image and restarts. The installation might take a few minutes to complete.

**Restoring from a USB drive**

The FortiGate firmware can be manually restored from a USB drive, or installed automatically from a USB drive after a reboot.

**To restore the firmware from a USB drive:**

1. Copy the firmware file to the root directory on the USB drive.
2. Connect the USB drive to the USB port of the FortiGate device.
3. Connect to the FortiGate CLI using the RJ-45 to USB (or DB-9) or null modem cable.
4. Enter the following command:
   ```
   execute restore image usb <filename>
   ```
   The FortiGate unit responds with the following message:
   ```
   This operation will replace the current firmware version! Do you want to continue? (y/n)
   ```
5. Type `y`. The FortiGate unit restores the firmware and restarts. This process takes a few minutes.
6. Update the antivirus and attack definitions:
   ```
   execute update-now
   ```

**To install firmware automatically from a USB drive:**

1. Go to System > Settings.
2. In the Start Up Settings section, enable Detect firmware and enter the name of the firmware file.
3. Copy the firmware file to the root directory on the USB drive.
4. Connect the USB drive to the USB port of the FortiGate device.
5. Reboot the FortiGate device.

**Using controlled upgrades**

Using a controlled upgrade, you can upload a new version of the FortiOS firmware to a separate partition in the FortiGate memory for later upgrade. The FortiGate unit can be configured so that when it is rebooted, it will automatically load the new firmware. Using this option, you can stage multiple FortiGate units to upgrade simultaneously using FortiManager or a script.

**To load the firmware for later installation:**

```
execute restore secondary-image {ftp | tftp | usb} <filename_str>
```

**To set the FortiGate unit so that when it reboots, the new firmware is loaded:**

```
execute set-next-reboot {primary | secondary}
```

where {primary | secondary} is the partition with the preloaded firmware.
**Downgrading individual device firmware**

Downgrading the firmware is not recommended.

This procedure downgrades the FortiGate to a previous firmware version. After downgrading, you may be unable to restore the backup configuration.

**To downgrade to a previous firmware version in the GUI:**

1. Log into the FortiGate GUI as the admin administrative user.
2. Go to System > Fabric Management. The Firmware Version column displays the version and either (Feature) or (Mature).
3. Select the FortiGate, and click Upgrade. The FortiGate Upgrade pane opens.
4. Click one of the following tabs to select a downgrade method:

   - **All Downgrades**: Click the All Downgrades tab to view and select all firmware versions that are available from FortiGuard for downgrade.
   - **File Upload**: Click the File Upload tab to upload a firmware file that you previously downloaded from the Fortinet Customer Service & Support website.

   1. See Downloading a firmware image on page 1968.

In this example, the All Downgrades tab is selected.
5. Select a firmware version and click Confirm and Backup Config. A warning message is displayed.

6. Click Continue to continue with the downgrade.
   The FortiGate unit backs up the current configuration to the management computer, uploads the firmware image file, downgrades to the firmware version, and restarts. This process takes a few minutes.

To downgrade to a previous firmware version in the CLI:

1. Make sure that the TFTP server is running.
2. Copy the new firmware image file to the root directory of the TFTP server.
3. Log into the CLI.
4. Ping the TFTP server to ensure that the FortiGate can connect to it:
   ```bash
   execute ping <tftp_ipv4>
   ```
5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:
   ```bash
   execute restore image tftp <filename> <tftp_ipv4>
   ```
   The FortiGate unit responds with the message:
   ```
   This operation will replace the current firmware version!
   Do you want to continue? (y/n)
   ```
6. Type y. The FortiGate unit uploads the firmware image file, then a message similar to the following is shown:
   ```
   Get image from tftp server OK.
   Check image OK.
   This operation will downgrade the current firmware version!
   Do you want to continue? (y/n)
   ```
7. Type y. The FortiGate unit downgrades to the old firmware version and restarts. This process takes a few minutes.
8. Reconnect to the CLI.
9. Update the antivirus and attack definitions:
   ```bash
   execute update-now
   ```

Settings

The default administrator password should be configured immediately after the FortiGate is installed, see Default administrator password on page 1976.
After that, there are several system settings that should also be configured in System > Settings:

- Changing the host name on page 1977
- Setting the system time on page 1978
- Configuring ports on page 1981
- Setting the idle timeout time on page 1982
- Setting the password policy on page 1983
- Changing the view settings on page 1983
- Setting the administrator password retries and lockout time on page 1984
- TLS configuration on page 1984
- Controlling return path with auxiliary session on page 1985
- Email alerts on page 1989
- Using configuration save mode on page 1993
- Trusted platform module support on page 1994

**Default administrator password**

By default, your FortiGate has an administrator account set up with the username `admin` and no password. In order to prevent unauthorized access to the FortiGate, it is highly recommended that you add a password to this account.

---

Adding a password to the `admin` administrator is mandatory. You will be prompted to configured it the first time you log in to the FortiGate using that account, after a factory reset, and after a new image installation.

---

**To change the default password in the GUI:**

1. Go to System > Administrators.
2. Edit the `admin` account.
3. Click Change Password.
4. If applicable, enter the current password in the Old Password field.
5. Enter a password in the New Password field, then enter it again in the Confirm Password field.

If the password does not conform to the password policy, an error is shown:

If the password conforms to the password policy, no error message is shown:
6. Click OK.

To change the default password in the CLI:

```sh
config system admin
    edit admin
        set password <old password> <old password>
New password must conform to the password policy enforced on this device:
minimum-length=8; the new password must have at least 1 unique character(s) which don't exist in the old password.; must not be same as last two passwords

node_check_object fail! for password *

value parse error before '**'
Command fail. Return code -49
    set password <new password> <old password>
next
end
```

It is also recommended that you change the user name of this account; however, since you cannot change the user name of an account that is currently in use, a second administrator account must be created in order to do this.

Changing the host name

The FortiGate host name is shown in the Hostname field in the System Information widget on a dashboard, as the command prompt in the CLI, as the SNMP system name, as the device name on FortiGate Cloud, and other places. If the FortiGate is in an HA cluster, use a unique host name to distinguish it from the other devices in the cluster.

An administrator requires System > Configuration read/write access to edit the host name. See Administrator profiles on page 1951 for details.

To change the host name in the GUI:

1. Go to System > Settings.
2. In the Host name field, enter a new name.
3. Click Apply.
To change the host name in the CLI:

```
config system global
    set hostname <hostname>
end
```

**Setting the system time**

You can either manually set the FortiOS system time, or configure the device to automatically keep its system time correct by synchronizing with a Network Time Protocol (NTP) or Precision Time Protocol (PTP) server.

Daylight savings time is enabled by default, and can only be configured in the CLI.

---

For many features to work, including scheduling, logging, and SSL-dependent features, the FortiOS system time must be accurate.

---

**To configure the date and time in the GUI:**

1. Go to System > Settings.
2. In the System Time section, configure the following settings to either manually set the time or use an NTP server:

<table>
<thead>
<tr>
<th>Time Zone</th>
<th>Select a time zone from the list. This should be the time zone that the FortiGate is in.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set Time</td>
<td>Select either NTP, PTP, or Manual settings.</td>
</tr>
<tr>
<td>NTP</td>
<td>To use an NTP server other than FortiGuard, the CLI must be used. In the Sync interval field, enter how often, in minutes, that the device synchronizes its time with the NTP server.</td>
</tr>
<tr>
<td>PTP</td>
<td>• Set the Mode to Multicast or Hybrid.</td>
</tr>
<tr>
<td></td>
<td>• Select the Delay mechanism: E2E or P2P.</td>
</tr>
<tr>
<td></td>
<td>• Set the Request interval, in seconds.</td>
</tr>
<tr>
<td></td>
<td>• Select the Interface.</td>
</tr>
<tr>
<td>Manual settings</td>
<td>Manually enter the Date, and Time.</td>
</tr>
</tbody>
</table>

   Setup device as local NTP server
   Enable to configure the FortiGate as a local NTP server. This option is not available if Set Time is PTP.
   In the Listen on Interfaces field, set the interface or interfaces that the FortiGate will listen for NTP requests on.

3. Click Apply.

---

**To configure the date and time in the CLI:**

1. Configure the timezone and daylight savings time:

   ```
   config system global
   set timezone <integer>
   ```
set dst {enable | disable}
end

2. Either manually configure the date and time, or configure an NTP or PTP server:
   - Manual:
     execute date <yyyy-mm-dd>
     execute time <hh:mm:ss>
   - NTP server:
     config system ntp
     set ntpsync enable
     set type {fortiguard | custom}
     set syncinterval <integer>
     set source-ip <ip_address>
     set source-ip6 <ip6_address>
     set server-mode {enable | disable}
     set interface <interface>
     set authentication {enable | disable}
     set key-type {MD5 | SHA1}
     set key <password>
     set key-id <integer>
     config ntpserver
     edit <server_id>
       set server <ip_address or hostname>
       set ntpv3 {enable | disable}
       set authentication {enable | disable}
       set interface-select-method {auto | sdwan | specify}
       set key <password>
       set key-id <integer>
     next
     end
     end
   - PTP server:
     config system ptp
     set status enable
     set mode {multicast | hybrid}
     set delay-mechanism {E2E | P2P}
     set request-interval <integer>
     set interface <string>
     end

SHA-1 authentication support (for NTPv4)

SHA-1 authentication support allows the NTP client to verify that servers are known and trusted and not intruders masquerading (accidentally or intentionally) as legitimate servers. In cryptography, SHA-1 is a cryptographic hash algorithmic function.

SHA-1 authentication support is only available for NTP clients, not NTP servers.
To configure authentication on a FortiGate NTP client:

```
config system ntp
    set ntpsync enable
    set type custom
    set syncinterval 1
config ntpserver
    edit "883502"
        set server "10.1.100.11"
        set authentication enable
        set key ********
        set key-id 1
    next
end
end
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>authentication &lt;enable</td>
<td>Enable/disable MD5/SHA1 authentication (default = disable).</td>
</tr>
<tr>
<td>disable&gt;</td>
<td></td>
</tr>
<tr>
<td>key &lt;passwd&gt;</td>
<td>Key for MD5/SHA1 authentication. Enter a password value.</td>
</tr>
<tr>
<td>key-id &lt;integer&gt;</td>
<td>Key ID for authentication. Enter an integer value from 0 to 4294967295.</td>
</tr>
</tbody>
</table>

To confirm that NTP authentication is set up correctly:

```
# diagnose sys ntp status
synchronized: yes, ntpsync: enabled, server-mode: disabled
ipv4 server(10.1.100.11) 10.1.100.11 -- reachable(0xff) S:4 T:6 selected
    server-version=4, stratum=3
```

If NTP authentication is set up correctly, the server version is equal to 4.

**PTPv2**

Precision time protocol (PTP) is used to synchronize network clocks. It is best suited to situations where time accuracy is of the utmost importance, as it supports accuracy in the sub-microsecond range. Conversely, NTP accuracy is in the range of milliseconds or tens of milliseconds.

The following CLI commands are available:

```
config system ptp
    set status {enable | disable}
    set mode {multicast | hybrid}
    set delay-mechanism {E2E | P2P}
    set request-interval <integer>
    set interface <interface>
end
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>mode {multicast</td>
<td>hybrid}</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>delay-mechanism {E2E</td>
<td>P2P}</td>
</tr>
<tr>
<td>request-interval &lt;integer&gt;</td>
<td>The logarithmic mean interval between the delay request messages sent by the client to the server in seconds (default = 1).</td>
</tr>
<tr>
<td>interface &lt;interface&gt;</td>
<td>The interface that the PTP client will reply through.</td>
</tr>
</tbody>
</table>

Sample configuration

This example uses the following topology:

To configure a FortiGate to act as a PTP client that synchronizes itself with a Linux PTP server:

1. Enable debug messages:

   ```
   # diagnose debug application ptpd -l
   ```

   This command will provide details to debug the PTP communication with the server.

2. Check the system date:

   ```
   # execute date
   current date is: 2021-04-01
   ```

3. Configure PTP in global mode:

   ```
   config system ptp
   set status enable
   set interface wan2
   end
   ```

4. Check the system date again after synchronization with the PTP server:

   ```
   # execute date
   current date is: 2021-04-27
   ```

Configuring ports

To improve security, the default ports for administrative connections to the FortiGate can be changed. Port numbers must be unique. If a conflict exists with a particular port, a warning message is shown.

When connecting to the FortiGate after a port has been changed, the port number be included, for example:

`https://192.168.1.99:100`
To configure the ports in the GUI:

1. Go to System > Settings.
2. In the Administration Settings section, set the HTTP, HTTPS, SSH, and Telnet ports.
3. Enable Redirect to HTTPS to prevent HTTP from being used by administrators.
4. Click Apply.

To configure the ports in the CLI:

config system global
    set admin-port <port>
    set admin-sport <port>
    set admin-https-redirect {enable | disable}
    set admin-ssh-port <port>
    set admin-telnet-port <port>
end

Custom default service port range

The default service port range can be customized using the following CLI command:

config system global
    set default-service-source-port <port range>
end

Where <port range> is the new default service port range, that can have a minimum value of 0 and a maximum value up to 65535. The default value is 1 to 65535.

This change effects the TCP/UDP protocol.

Setting the idle timeout time

The idle timeout period is the amount of time that an administrator will stay logged in to the GUI without any activity. This is to prevent someone from accessing the FortiGate if the management PC is left unattended. By default, it is set to five minutes.

A setting of higher than 15 minutes will have a negative effect on a security rating score. See Security rating on page 2337 for more information.

To change the idle timeout in the GUI:

1. Go to System > Settings.
2. In the Administration Settings section, set the Idle timeout to up to 480 minutes.
3. Click Apply.
To change the idle timeout in the CLI:

```
config system global
    set admintimeout <1-480>
end
```

**Setting the password policy**

A password policy can be created for administrators and IPsec pre-shared keys. See Password policy on page 1948 for information.

**Changing the view settings**

The view settings change the look and language of the FortiOS GUI.

**To change the view settings in the GUI:**

1. Go to System > Settings.
2. In the View Settings section, configure the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Language</strong></td>
<td>Set the GUI language: English, French, Spanish, Portuguese, Japanese, Traditional Chinese, Simplifies Chinese, Korean.</td>
</tr>
<tr>
<td><strong>Theme</strong></td>
<td>Set the theme color: Jade, Neutrino, Mariner, Graphite, Melongene, Retro, Dark Matter, Onyx, or Eclipse.</td>
</tr>
<tr>
<td><strong>Date/Time Display</strong></td>
<td>Set the date and time to display using the FortiGate’s or the browser’s timezone.</td>
</tr>
<tr>
<td><strong>NGFW Mode</strong></td>
<td>Set the NGFW mode to either Profile-based (default) or Policy-based.</td>
</tr>
<tr>
<td><strong>Central SNAT</strong></td>
<td>Optionally, enable central SNAT. This option is only available in Profile-based mode.</td>
</tr>
</tbody>
</table>

3. Click Apply.

**To change the view settings in the CLI:**

```
config system global
    set language {english | french | spanish | portuguese | japanese | trach | simch | korean}
    set gui-theme {jade | neutrino | mariner | graphite | melongene | retro | dark-matter | onyx | eclipse}
    set gui-date-time-source {system | browser}
end
config system settings
    set ngfw-mode {profile-based | policy-based}
    set central-nat {enable | disable}
end
```
System Setting the administrator password retries and lockout time

By default, the number of password retry attempts is set to three, allowing the administrator a maximum of three attempts at logging in to their account before they are locked out for a set amount of time (by default, 60 seconds).

The number of attempts and the default wait time before the administrator can try to enter a password again can be configured using the CLI.

A maximum of ten retry attempts can be configured, and the lockout period can be 1 to 2,147,483,647 seconds (over 68 years). The higher the retry attempts, the higher the risk that someone might be able to guess the password.

To configure the lockout options:

```
cfg system global
  set admin-lockout-threshold <failed_attempts>
  set admin-lockout-duration <seconds>
end
```

For example, to set the number of retry attempts to 1, and the lockout time to 5 minutes:

```
cfg system global
  set admin-lockout-threshold 1
  set admin-lockout-duration 300
end
```

If the time span between the first failed log in attempt and the lockout threshold failed attempt is less than lockout time, the lockout will be triggered.

TLS configuration

The minimum TLS version that is used for local out connections from the FortiGate can be configured in the CLI:

```
cfg system global
  set ssl-min-proto-version {SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2 | TLSv1-3}
end
```

By default, the minimum version is TLSv1.2. The FortiGate will try to negotiate a connection using the configured version or higher. If the server that FortiGate is connecting to does not support the version, then the connection will not be made. Some FortiCloud and FortiGuard services do not support TLSv1.3.

Minimum SSL/TLS versions can also be configured individually for the following settings, not all of which support TLSv1.3:

<table>
<thead>
<tr>
<th>Setting</th>
<th>CLI</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email server</td>
<td><code>config system email-server</code></td>
</tr>
<tr>
<td>Certificate</td>
<td><code>config vpn certificate setting</code></td>
</tr>
<tr>
<td>FortiSandbox</td>
<td><code>config system fortisandbox</code></td>
</tr>
<tr>
<td>FortiGuard</td>
<td><code>config log fortiguard setting</code></td>
</tr>
</tbody>
</table>
### System Setting

<table>
<thead>
<tr>
<th>Setting</th>
<th>CLI</th>
</tr>
</thead>
<tbody>
<tr>
<td>FortiAnalyzer</td>
<td>config log fortianalyzer setting</td>
</tr>
<tr>
<td>Syslog</td>
<td>config log syslogd setting</td>
</tr>
<tr>
<td>User Authentication</td>
<td>config user setting</td>
</tr>
<tr>
<td>LDAP server</td>
<td>config user ldap</td>
</tr>
<tr>
<td>POP3 server</td>
<td>config user pop3</td>
</tr>
<tr>
<td>Exchange server</td>
<td>config user exchange</td>
</tr>
</tbody>
</table>

A minimum \(\text{ssl-min-proto-ver}\) and a maximum \(\text{ssl-max-proto-ver}\) version can be configured for SSL VPN. See TLS 1.3 support on page 1746

## Controlling return path with auxiliary session

When multiple incoming or outgoing interfaces are used in ECMP or for load balancing, changes to routing, incoming, or return traffic interfaces impacts how an existing sessions handles the traffic. Auxiliary sessions can be used to handle these changes to traffic patterns.

- In FortiOS 6.0 and earlier, the auxiliary session feature is not supported.
- In FortiOS 6.2.0 to 6.2.2, the auxiliary session feature is permanently enabled.
- In FortiOS 6.2.3 and later, the auxiliary session feature is disabled by default, and can be enabled if required.

### To enable or disable the auxiliary session feature:

```plaintext
config system settings
    set auxiliary-session {enable | disable*}
end
```

When enabling auxiliary sessions, consider the impact of routing in both traffic directions. In topologies such as SD-WAN hub and spoke or ADVPN deployments, the symmetry of the return traffic is important for maintaining the stability of the session. It is expected that the spoke selects the outbound interface and path, and the other nodes obey and reply symmetrically. It is recommended to disable auxiliary in these scenarios, and others where incoming and return traffic symmetry is expected.
Scenarios

Incoming traffic is from the client to the server. Return traffic is from the server to the client.

Scenario 1 - Return traffic returns on the original outgoing interface

In this scenario, a session is established between port1 and port3. When the return traffic hits port3:

Auxiliary sessions disabled:

The reply to the client egresses on the original incoming interface, port1. If policy routes or SD-WAN rules are configured, the next hop gateway is applied if the output device is the same as the original incoming interface.

Auxiliary sessions enabled:

The reply to the client egresses on the best route in the routing table:

- If the best route is port1, then it will egress on port1.
- If the best route is port2, then it will egress on port2.

If policy routes or SD-WAN rules are configured, they must be matched to determine the egress interface. If both are configured, policy routes have higher priority.

Scenario 2 - Return traffic returns on an interfaces other than the original outgoing interfaces

In this scenario, a session is established between port1 and port3. When the return traffic hits port4:

Auxiliary sessions disabled:

- The session is dirtied and then gets refreshed, and interfaces on the session are updated.
- If there is a high traffic volume or flapping between the interfaces, the CPU usage increases.

Auxiliary sessions enabled:

An auxiliary session is created for the existing session, and traffic returns to the client as normal on the auxiliary session.

Scenario 3 - Incoming traffic enters on an interfaces other than the original incoming interfaces

In this scenario, a session is established between port1 and port3. When the incoming traffic hits port2:
**Auxiliary sessions disabled:**

The session is dirtied and then gets refreshed, and interfaces on the session are updated.

**Auxiliary sessions enabled:**

An auxiliary session is created for the existing session, and traffic is forwarded to the server as normal on the auxiliary session.

**Scenario 4 - the routing table is changed**

In this scenario, a session has been established between port1 and port3, when a new route on port4 is updated as the route to the server.

**Auxiliary sessions disabled:**

As long as there is a route to the destination, the session will not be dirtied or refreshed. Even though there is a better route, traffic continues on the original path between port1 and port3.

**Auxiliary sessions enabled:**

The session is dirtied and then gets refreshed, and interfaces on the session are updated.

**Effect on NPU offloading sessions**

When the auxiliary session feature is disabled, there is always one session. If the incoming or return interface changes, the FortiGate marks the session as dirty and updates the session's interfaces. This cannot be done by the NPU, so the session is not offloaded to the NPU, and is processed by the CPU instead. If Equal-Cost Multi-Path (ECMP) causes the interface to keep changing, then it will use significant CPU resources.

When the auxiliary session feature is enabled and the incoming or return interface changes, it creates an auxiliary session, and all traffic can continue to be processed by the NPU.

**Verification**

When an auxiliary, or reflect, session is created, it will appear as a reflect session below the existing session:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=111 expire=175 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=4
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty npu
statistic(bytes/packets/allow_err): org=131/4/1 reply=0/0/0 tuples=2
tx speed(Rps/kbps): 0/0 rx speed(Rps/kbps): 0/0

```
Email alerts

Alert emails are used to notify administrators about events on the FortiGate device, allowing a quick response to any issues.

There are two methods that can be used to configure email alerts:

- Automation stitches on page 1990
- Alert emails on page 1993

The FortiGate has a default SMTP server, notification.fortinet.net, that provides secure mail service with SMTPS. It is used for all emails that are sent by the FortiGate, including alert emails, automation stitch emails, and FortiToken Mobile activations. You can also configure a custom email service.

To configure a custom email service in the GUI:

1. Go to System > Settings.
2. In the Email Service section, enable Use custom settings.
3. Configure the following settings:

<table>
<thead>
<tr>
<th>SMTP Server</th>
<th>Enter the address or name of the SMTP server, such as smtp.example.com.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>If required, select Specify and enter a specific port number. The default is port 465.</td>
</tr>
<tr>
<td>Authentication</td>
<td>If required by the email server, enable authentication. If enabled, enter the Username and Password.</td>
</tr>
<tr>
<td>Security Mode</td>
<td>Set the security mode: None, SMTPS, or STARTTLS.</td>
</tr>
<tr>
<td>Default Reply To</td>
<td>Optionally, enter the reply to email address, such as <a href="mailto:noreply@example.com">noreply@example.com</a>. This address will override the from address that is configured for an alert email.</td>
</tr>
</tbody>
</table>
4. Click Apply.

To configure a custom email service in the CLI:

```bash
config system email-server
set reply-to "noreply@example.com"
set server "smtp.fortinet.net"
set port 465
set authenticate enable
set username "fortigate"
set password **********
set security smtps
end
```

**Automation stitches**

Automation stitches can be configured to send emails based on a variety of triggers, giving you control over the events that cause an alert, and who gets alerted. For more information, see [Automation stitches on page 2344](#).

In this example, the default mail service sends an email to two recipients when an Admin login failed event occurs or there is a configuration change.

**To configure the automation stitch in the GUI:**

1. On the root FortiGate, go to Security Fabric > Automation and click Create New.
2. Enter a name for the stitch, such as Admin Fail.
3. Configure the trigger:
   a. Click Add Trigger.
   b. Click Create and select FortiOS Event Log.
   c. Enter a name for the trigger, such as Admin Fail.
   d. Click in the Event field, and in the slide out pane, search for and select Admin login failed.
e. Click OK.

f. Select the trigger in the list and click **Apply**.

4. Configure the action:
   a. Click **Add Action**.
   b. Click **Create** and select **Email**.
   c. Configure the following settings:
      - **Name**: Enter a name for the action, such as *Admin Fail_email*.
      - **To**: Enter the two email recipients’ addresses, such as *admin@example.com* and *manager@example.com*.
      - **Subject**: Enter an subject, such as *Admin log in failed*.
      - **Body**: Edit as required. By default, the email body will include all the fields from the log event that triggered the stitch.

   d. Click OK.
   e. Select the action in the list and click **Apply**.

5. Click **OK**.
6. Create a second stitch with Configuration Change as the trigger, and an email action with a different subject line (such as Configuration Change Detected).

To configure the automation stitch in the CLI:

1. Create the automation triggers:
   ```
   config system automation-trigger
   edit "Admin Fail"
       set event-type event-log
       set logid 32002
   next
   edit "Config Change"
       set event-type config-change
   next
   end
   ```

2. Create automation actions to send the email messages:
   ```
   config system automation-action
   edit "Admin Fail_email"
       set action-type email
       set email-to "admin@example.com" "manager@example.com"
       set email-subject "Admin log in failed"
   next
   edit "Config Change_email"
       set action-type email
       set email-to "admin@example.com" "manager@example.com"
       set email-subject "Configuration Change Detected"
   next
   end
   ```

3. Create the automation stitches:
   ```
   config system automation-stitch
   edit "Admin Fail"
       set trigger "Admin Fail"
   config actions
       edit 1
           set action "Admin Fail_email"
           set required enable
       next
   end
   next
   edit "Config Change"
       set trigger "Config Change"
   config actions
       edit 1
           set action "Config Change_email"
           set required enable
       next
   end
   ```
Alert emails

When configuring an alert email, you can define the threshold when an issue becomes critical and requires attention. When the threshold is reached, an email is sent to up to three recipients on the configured schedule to notify them of the issue.

Alert email messages can be configured in the CLI. For more information on the available CLI commands, see Configure alert email settings.

IPS, SSH, violation traffic, antivirus, and web filter logs are supported as triggers in automation stitches. For more information, see Event log category triggers on page 2372.

In this example, the FortiGate is configured to send email messages to two addresses, admin@example.com and manager@example.com, every two minutes when multiple intrusions, administrator log in or out events, or configuration changes occur.

To configure an alert email:

```
config alertemail setting
    set username fortigate@example.com
    set mailto1 admin@example.com
    set mailto2 manager@example.com
    set filter-mode category
    set email-interval 2
    set IPS-logs enable
    set configuration-changes-logs enable
    set admin-login-logs enable
end
```

Using configuration save mode

Administrators can use configuration save mode set to Workplace to implement strict change control by requiring changes to be manually committed to the flash. To configure the setting in the GUI, go to System > Settings.

When Configuration save mode is set to Automatic (default), configuration changes are automatically saved to both memory and flash.

When Configuration save mode is set to Workplace, configuration changes are saved to memory, but not to flash. The changes take effect immediately, but must be manually saved to flash. Unsaved changes are reverted when the device is rebooted. If Revert upon timeout is enabled, the system might be unresponsive for a short time after the configured timeout while it reverts the changes back to the previous save point. Prior to the timeout expiring, a pop-up warning gives
you the option to postpone the reboot by one minute, revert the configuration immediately, or save the configuration changes.

In workspace mode, a warning is shown in the banner when there are unsaved changes. Click the warning to save, view, or revert the changes. When you click Reboot and revert changes, the system might be unresponsive for a short time while it reverts the changes back to the previous save point.

Clicking View Unsaved Changes opens a pane highlighting the changes that have not been committed.

This feature is also available in the CLI:

```
config system global
  set cfg-save {automatic | manual | revert}
  set cfg-revert-timeout <integer>
end

# execute cfg {reload | save}
```

### Trusted platform module support

On supported FortiGate hardware devices, the Trusted Platform Module (TPM) can be used to protect your password and key against malicious software and phishing attacks. The dedicated module hardens the FortiGate by generating, storing, and authenticating cryptographic keys. To help prevent tampering, the chip is soldered on the motherboard to reduce the risk of data transaction interceptions from attackers.

By default, the TPM is disabled. To enable it, you must set the 32 hexadecimal digit master-encryption-password which encrypts sensitive data on the FortiGate using AES128-CBC. With the password, TPM generates a 2048-bit primary key.
to secure the master-encryption-password through RSA-2048 encryption. The master-encryption-password protects the data. The primary key protects the master-encryption-password.

The TPM module does not encrypt the disk drive of eligible FortiGates.

The primary key binds the encrypted configuration file to a specific FortiGate unit and never leaves the TPM. When backing up the configuration, the TPM uses the primary key to encrypt the master-encryption-password in the configuration file. When restoring a configuration that includes a TPM protected master-encryption-password:

- If TPM is disabled, then the configuration cannot be restored.
- If TPM is enabled but has a different master-encryption-password than the configuration file, then the configuration cannot be restored.
- If TPM is enabled and the master-encryption-password is the same in the configuration file, then the configuration can be restored.

For information on backing up and restoring the configuration, see Configuration backups on page 65.

Passwords and keys that can be encrypted by the master-encryption-key include:

- Alert email user’s password
- BGP and other routing related configurations
- External resource
- FortiGuard proxy password
- FortiToken/FortiToken Mobile’s seed
- HA password
- IPsec pre-shared key
- Link Monitor, server side password
- Local certificate’s private key
- Local, LDAP, RADIUS, FSSO, and other user category related passwords
- Modem/PPPoE
- NST password
- NTP Password
- SDN connector, server side password
- SNMP
- Wireless Security related password

In HA configurations, each cluster member must use the same master-encryption-key so that the HA cluster can form and its members can synchronize their configurations.

To check if your FortiGate device has a TPM:

Verify all the following commands exist. Otherwise, the platform does not support it.

```bash
# diagnose hardware test info
List of test cases:
```
bios: sysid
bios: checksum
bios: license
bios: detect

# diagnose hardware deviceinfo tpm
TPM capability information of fixed properties:
============================================================================
TPM_PT_FAMILY_INDICATOR: 2.0
TPM_PT_LEVEL: 0
TPM_PT_REVISION: 138
TPM_PT_DAY_OF_YEAR: 8
TPM_PT_YEAR: 2018
TPM_PT_MANUFACTURER: NTC
# diagnose hardware test tpm
============ Fortinet Hardware Test Report ==============
TPM
TPM Device Detection........................................ PASS
============ Fortinet Hardware Test PASSED ==============
# diagnose tpm
get-property Get TPM properties.  [Take 0-1 arg(s)]
get-var-property Get TPM var properties.
read-clock Read TPM internal clock.
shutdown-prepare Prepare for TPM power cycle.
seltest Perform self tests.
generate-random-number Generate a 4-byte random number
SHA-1 HASH a sequence of num with SHA-1 algo
SHA-256 HASH a sequence of num with SHA-256 algo

To enable TPM and input the master-encryption-password:

config system global
  set private-data-encryption enable
end
Please type your private data encryption key (32 hexadecimal numbers):
*******************************************************************************
Please re-enter your private data encryption key (32 hexadecimal numbers) again:
*******************************************************************************
Your private data encryption key is accepted.

Virtual Domains

Virtual Domains (VDOMs) are used to divide a FortiGate into two or more virtual units that function independently. VDOMs can provide separate security policies and, in NAT mode, completely separate configurations for routing and VPN services for each connected network.

Multiple VDOMs can be created and managed as independent units in multi VDOM mode.

By default, most FortiGate units support 10 VDOMs, and many FortiGate models support purchasing a license key to increase the maximum number. Some exceptions may apply.

The following topics provide an overview of VDOM concepts, topologies, best practices, and the general configurations involved when working with multi VDOM mode:
The following topics provide examples of configuring VDOMs:

- Inter-VDOM routing configuration example: Internet access on page 2009
- Inter-VDOM routing configuration example: Partial-mesh VDOMs on page 2019

VDOM overview

The following sections provide conceptual information on VDOMs:

- Multi VDOM mode on page 1997
- Global settings on page 1997
- Global and per-VDOM resources on page 1997
- Management VDOM on page 1998
- VDOM types on page 1998
- Administrator roles and views on page 1998
- Inter-VDOM routing on page 1999

The following sections provide information on methods of VDOM configuration:

- Topologies on page 1999
- Best practices on page 2001

Multi VDOM mode

In multi VDOM mode, the FortiGate can have multiple VDOMs that function as independent units. When multi VDOM mode is first enabled, all VDOM configurations will move to the root VDOM by default. The root VDOM cannot be deleted, and remains in the configuration even if it is not processing any traffic. New VDOMs can be created, up to the VDOM limit allowable on your device.

Global settings

Global settings are configured outside of a VDOM. They effect the entire FortiGate, and include settings such as interfaces, firmware, DNS, some logging and sandboxing options, and so on. Global settings should only be changed by top level administrators.

Global and per-VDOM resources

Global and per-VDOM resources can be configured when the FortiGate is in multi VDOM mode. Global resources apply to resources that are shared by the whole FortiGate, while per-VDOM resources are specific to each VDOM.

By default, all per-VDOM resource settings are set to have no limits. This means that any single VDOM can use all of the FortiGate device's resources. This could deprive other VDOMs of the resources that they require, to the point that could be unable to function. We recommend setting maximum values on the resources that are vital to you.
Management VDOM

The management VDOM refers to the specific role that must be designated to one of the VDOMs. By default, the root VDOM is the management VDOM, and management-related services such as FortiGuard updates and other local out (self-originating) traffic such as logs to remote servers originate from the management VDOM. The management VDOM cannot be deleted. See Management VDOM on page 2003 for configuration details.

VDOM types

When a FortiGate is in multi VDOM mode, a VDOM can be configured as an Admin or Traffic type VDOM.

When the VDOM type is set to Admin, the VDOM is used to administer and manage the FortiGate. Usually, the Admin VDOM resides in a management network which is only accessible by administrators. Global and VDOM administrators can log in to the FortiGate using SSH, HTTPS, and so on but traffic cannot pass through this Admin VDOM. A FortiGate does not need to have an Admin VDOM and, at most, there can only be one Admin VDOM per FortiGate.

When VDOM type is set to Traffic, the VDOM can pass traffic like a regular firewall. Most VDOMs will be Traffic type VDOMs. Network interfaces on a Traffic VDOM can also enable SSH, HTTPS, and so on for administrative and management purposes.

In general, an Admin VDOM has a subset of a Traffic VDOM’s capabilities.

FortiGate-VM supports having at least two VDOMs; one that supports an administrative VDOM and another that supports a traffic VDOM.

See Configure an administrative VDOM type on page 2005 for configuration details.

Administrator roles and views

When a FortiGate has been configured in multi VDOM mode, the device can be managed by global administrators and per-VDOM administrators. Each type of administrator will have a different view of the GUI in multi VDOM mode which corresponds to their role.

Global administrators

Global administrators have complete visibility and access because the scope of their role is to manage the entire physical FortiGate device. An example of a global administrator is an administrator working for a managed security services provider (MSSP) providing the FortiGate as a multi-tenant environment to its clients.

When global administrators log into the GUI, from the VDOM: Global view they will see all pages for global settings shared between VDOMs, and VDOM-specific settings.

To create a global administrator that has access to all VDOMs and access to global settings, it must be created at the global level and must use the super_admin administrator profile.

See Administrator profiles on page 1951 and Local authentication on page 1939 for configuration details.
**VDOM administrators**

VDOM administrators will be unable to view global settings or VDOMs not assigned to them because the scope of their role is restricted to managing specific VDOMs only. An example of a VDOM administrator is the administrator working for a company which is a client, or tenant, of an MSSP’s multi-tenant FortiGate.

When VDOM administrators log into the GUI, from the VDOM:<VDOM> view they will see pages for settings specific to the VDOM they have been configured to administer such as interfaces, routes, firewall policies, and security profiles.

See **Create per-VDOM administrators on page 2005** for configuration details.

**Inter-VDOM routing**

VDOM links are virtual interfaces that allow VDOMs to communicate internally without using additional physical interfaces. A VDOM link contains a pair of interfaces, each one connected to a VDOM to form each end of the inter-VDOM connection. Inter-VDOM routing can be configured in order to communicate between one VDOM to another.

When VDOMs are configured on your FortiGate unit, configuring inter-VDOM routing and VDOM links is similar to creating a VLAN interface. VDOM links can be managed in either the CLI or in the network interface list in the GUI.

See **Inter-VDOM routing configuration example: Internet access on page 2009** for more information.

**Topologies**

These are the main configuration types in multi VDOM mode:

- **Independent VDOMs**

  Multiple, completely separate VDOMs are created. Any VDOM can be the management VDOM, as long as it has Internet access to connect to FortiGuard services and other management resources. There are no inter-VDOM links, and each VDOM is independently managed.
In the Internet access VDOM configuration, Internet access is provided primarily by a single VDOM; for example, the management VDOM (depicted as root VDOM in the preceding diagram). Each tenant connects to the management VDOM via an inter-VDOM link. The management VDOM has complete control over Internet access, including the types of traffic that are allowed in both directions. This can improve security, as there is only one point of ingress and egress. There is no communication between the other VDOMs.

Meshed VDOMs

VDOMs can communicate with inter-VDOM links. In full-mesh configurations, all the VDOMs are interconnected. In partial-mesh configurations, only some of the VDOMs are interconnected.

In this configuration, inter-vdom links between tenants are created by the global administrator, but each tenant controls the firewall policies to allow access to other tenants.

See Inter-VDOM routing on page 2007 and Inter-VDOM routing configuration example: Internet access on page 2009 for configuration details.
Administrative VDOM on a management network

The administrative VDOM type can be used to limit administrative access to the FortiGate using SSH, HTTPS and so on to administrators working from a management network. Administrators may be limited to management settings or may have global privileges to access other VDOMs. The user or tenant network (depicted as Network A in the diagram) uses a traffic type VDOM, which allows traffic to pass through it like a regular firewall and allows configuration of firewall-related settings. This configuration can improve security if the management network is a closed network and administrative access is not enabled on any interfaces on the traffic VDOM.

Best practices

VDOMs can provide separate firewall policies and, in NAT mode, completely separate configurations for routing and VPN services for each connected network or organization. This section provides a list of best practices for configuring VDOMs.

Per-VDOM resource setting

All per-VDOM resource settings are set to no limit by default. To ensure proper functionality of all VDOMs, it is recommended that you set some maximum values for the most vital resources. See Global and per-VDOM resources on page 2003 for configuration details.

Virtual domains in NAT mode

Once the virtual domains have been enabled and one or more VDOMs have been created, they must be configured. The following steps provide a general overview of the configuration process.

To configure VDOMs:

1. Change the management virtual domain.
2. Configure FortiGate interfaces for your VDOMs in NAT mode.
3. Configure VDOM routing.
4. Configure security policies for VDOMs in NAT mode.
5. Configure UTM profiles for VDOMs in NAT mode.
6. Test the configuration.
While you may not require all of the steps for your network topology, it is recommended that you perform them in the order given.

See General configurations on page 2002 for configuration details.

**Virtual clustering**

Virtual clustering is an extension of FGCP HA that provides failover protection between two instances of one or more VDOMs operating on two FortiGates that are in a virtual cluster. A standard virtual cluster consists of FortiGates that are operating in active-passive HA mode with multiple VDOMs enabled. See HA virtual cluster setup on page 2041 for more details.

Typically, virtual clustering is configured with override enabled and uses device priorities to distribute traffic between the primary and secondary FortiGates.

If you decide to disable override for clustering, as a result of persistent renegotiating, you should disable it for both cluster units.

**General configurations**

VDOMs can be configured in the GUI and the CLI. To ensure that no VDOMs are accidentally configured in the CLI, prompts can be enabled. These prompts will display to ask for confirmation that the VDOM is meant to be configured in the CLI.

**To configure confirmation prompts:**

```
config system global
    set edit-vdom-prompt enable
end
```

The following topics provide information on general VDOM configurations:

- Enable multi VDOM mode on page 2002
- Management VDOM on page 2003
- Global and per-VDOM resources on page 2003
- Create per-VDOM administrators on page 2005
- Configure an administrative VDOM type on page 2005
- Assign interfaces to a VDOM on page 2006
- Inter-VDOM routing on page 2007
- Allow FortiGuard services and updates to initiate from a traffic VDOM on page 2008

**Enable multi VDOM mode**

Enable multi VDOM mode and create the VDOMs in the GUI and CLI.

On FortiGate 90 series models and lower, VDOMs can only be enabled using the CLI.
To enable VDOMs in the GUI:

1. Go to System > Settings.
2. In the System Operation Settings sections, enable Virtual Domains.
3. Click OK.

To enable VDOMs in the CLI:

```plaintext
config system global
    set vdom-mode multi-vdom
end
```

You will be logged out of the device when the VDOM mode is enabled.

Management VDOM

By default, the management VDOM is root. The management VDOM can be manually assigned from the GUI or the CLI.

To assign the management VDOM in the GUI:

1. In the Global VDOM, go to System > VDOM.
2. Select the VDOM you want to assign as the management VDOM.
3. Click Switch Management.
4. Click OK.

To assign the management VDOM in the CLI:

```plaintext
config global
    config system global
        set management-vdom <vdom>
    end
end
```

Only one management VDOM can exist at a time. It is strongly recommended that the management VDOM have Internet access otherwise management-related services, such as FortiGuard updates and queries, will not work.

Global and per-VDOM resources

Global resources apply to resources that are shared by the whole FortiGate, while per-VDOM resources are specific to each VDOM.

To configure global resources:

1. In the Global VDOM, go to System > Global Resources.
2. Enable the resource's override in the Override Maximum column, then enter the override value.
3. Click Apply.
   To reset all of the override values, click Reset All.

To configure per-VDOM resources:

1. In the Global VDOM, go to System > VDOM.
2. Select the VDOM whose resources need to be configured and click Edit.
3. Enable the resource's override in the Override Maximum column, then enter the override value.
4. Optionally, enter a value in the Guaranteed column.

5. Click OK.
   To reset all of the override values, click Reset All.
Create per-VDOM administrators

Per-VDOM administrators can be created that can access only the administrative or traffic VDOM. These administrators must use either the prof_admin administrator profile, or a custom profile.

A per-VDOM administrator can only access the FortiGate through a network interface that is assigned to the VDOM that they are assigned to. The interface must also be configured to allow management access. They can also connect to the FortiGate using the console port.

To assign an administrator to multiple VDOMs, they must be created at the global level. When creating an administrator at the VDOM level, the super_admin administrator profile cannot be used.

To create a per-VDOM administrator in the GUI:

1. On the FortiGate, connect to the Global VDOM.
2. Go to System > Administrators and click Create New > Administrator.
3. Fill in the required information, setting the Type as Local User.
4. In the Virtual Domains field, add the VDOM that the administrator will be assigned to, and if necessary, remove the other VDOM from the list.
5. Click OK.

To create a per-VDOM administrator using the CLI:

```
config global
    config system admin
        edit <name>
            set vdom <VDOM_name>
                set password <password>
                set accprofile <admin_profile>
            next
        end
    end
```

Configure an administrative VDOM type

Individual VDOMs can be configured as an administrative type in multi VDOM mode.

💡 Only one administrative VDOM can exist at a time and cannot be set on a FortiWifi. A VDOM cannot be an administrative type and in transparent mode at the same time.
To configure an administrative VDOM in the GUI:

1. Go to System > VDOM.
2. Click Create New.
3. Enter a Virtual Domain name and set the Type to Admin.
4. Click OK.
5. Click OK in the confirmation pane. The administrative VDOM is created.

To configure the VDOM type in the CLI:

```
config system settings
   set vdom-type {traffic | admin}
end
```

Assign interfaces to a VDOM

An interface can only be assigned to one of the VDOMs. An interface cannot be moved if it is referenced in an existing configuration.

In the GUI, the interface list Ref. column shows if the interface is referenced in an existing configuration, and allows you to quickly access and edit those references.

To assign an interface to a VDOM in the GUI:

1. In the Global VDOM, go to Network > Interfaces.
2. Select the interface that will be assigned to a VDOM and click Edit.
3. Select the VDOM that the interface will be assigned to from the Virtual Domain list.
4. Click OK.

To assign an interface to a VDOM using the CLI:

```plaintext
config global
    config system interface
        edit <interface>
            set vdom <VDOM_name>
        next
    end
end
```

**Inter-VDOM routing**

VDOM links allow VDOMs to communicate internally without using additional physical interfaces.

VDOM link does not support traffic offload. If you want to use traffic offload, use NPU-VDOM-LINK. See Configuring inter-VDOM link acceleration with NP6 processors in the Hardware Acceleration guide for details.

**To configure a VDOM link in the GUI:**

1. In the Global VDOM, go to Network > Interfaces.
2. Click Create New > VDOM Link.
3. Configure the fields, including the Name, Virtual Domain, IP information, Administrative Access, and so on, then click OK.

By default, VDOM links are created as point-to-point (ppp) links. If required, the link type can be changed in the CLI.

For example, when running OSPF in IPv6, a link-local address is required in order to communicate with OSPF neighbors. For a VDOM link to obtain a link-local address, its type must be set to ethernet.

**To configure a VDOM link in the CLI:**

```plaintext
config global
    config system vdom-link
```
edit "<vdom-link-name>"
    set type {ppp | ethernet}
next
end
config system interface
edit "<vdom-link-name0>"
    set vdom "<VDOM Name>"
    set type vdom-link
next
edit "<vdom-link-name1>"
    set vdom "<VDOM Name>"
    set type vdom-link
next
end
end

To delete a VDOM link in the GUI:

1. In the Global VDOM, go to Network > Interfaces.
2. Select a VDOM Link and click Delete.

To delete a VDOM link in the CLI:

config global
    config system vdom-link
        delete <VDOM-LINK-Name>
    end
end

Allow FortiGuard services and updates to initiate from a traffic VDOM

In multi VDOM mode, users can choose from which VDOM FortiGuard services and updates are initiated from, instead of being locked to the management VDOM. This allows deployment scenarios where the management VDOM resides in a closed management network.

![Diagram of FortiGate, Management VDOM, and Closed/Internal Network](image)

When the management VDOM resides in a closed network, it does not have internet access. FortiGuard services (FortiGuard updates, web filters, DNS proxy, DDNS, and so on) must be configured in a VDOM with Internet access in order to work. Therefore, in the example above, change the FortiGuard settings to initiate from the root VDOM.
To configure FortiGuard services on a traffic VDOM:

1. Set up a traffic VDOM for FortiGuard services:
   ```
   config global
   config system fortiguard
   set vdom "root"
   end
   end
   ``

2. Ensure the traffic VDOM has the correct gateway to reach the internet:
   ```
   config vdom
   edit root
   config router static
   edit 1
     set gateway 172.16.200.254
     set device "wan1"
   next
   end
   next
   end
   ``

3. Configure the DNS servers to ensure the FortiGuard services can resolve the server name through the traffic VDOM:
   ```
   config vdom
   edit root
   config system vdom-dns
   set vdom-dns enable
   set primary 208.91.112.53
   set secondary 208.91.112.52
   end
   next
   end
   ```

Inter-VDOM routing configuration example: Internet access

This example shows how to configure a FortiGate unit to use inter-VDOM routing to route outgoing traffic from individual VDOMs to a root VDOM with Internet access. See Inter-VDOM routing on page 2007 for more information.

Two departments of a company, Accounting and Sales, are connected to one FortiGate. The company uses a single ISP to connect to the Internet. This is an example of the Internet access configuration. See Topologies on page 1999 for details.
This example assumes that the interfaces of the FortiGate have already been configured with the IP addresses depicted in the preceding diagram.

**General steps for this example**

This example includes the following general steps. We recommend following the steps in the order below:

1. Enable multi VDOM mode and create the VDOMs on page 2010
2. Assign interfaces to VDOMs on page 2011
3. Configure the VDOM links on page 2011
4. Configure inter-VDOM routing on page 2013
5. Configure the firewall policies on page 2014
6. Test the configuration on page 2015

This example demonstrates how to configure these steps first using the GUI and then, at the end of the section, using the CLI. See Configuration with the CLI on page 2016 for details.

**Enable multi VDOM mode and create the VDOMs**

Create the Accounting and Sales VDOMs.

**To enable VDOMs in the GUI:**

1. Go to System > Settings.
2. In the System Operation Settings section, enable Virtual Domains.
3. Click OK.

On FortiGate 90 series models and lower, VDOMs can only be enabled using the CLI.

**To create the Sales and Accounting VDOMs in the GUI:**

1. In the Global VDOM, go to System > VDOM.
2. Click Create New.
3. In the Virtual Domain field, enter Sales.
4. If required, set the NGFW Mode. If the NGFW Mode is Profile-based, Central SNAT can be enabled.
5. Click OK to create the VDOM.
6. Repeat the above steps for Accounting.

**Assign interfaces to VDOMs**

This example uses three interfaces on the FortiGate unit: port2 (AccountingLocal), port3 (SalesLocal), and port1 (WAN). Port2 and port3 interfaces each have a department’s network connected. Port1 is for all traffic to and from the Internet and uses DHCP to configure its IP address, which is common with many ISPs.

**To assign interfaces to VDOMs in the GUI:**

1. In the Global VDOM, go to Network > Interfaces.
2. Select port2 and click Edit.
3. From the Virtual domain list, select Accounting.

![](image)

4. Click OK.
5. Repeat the preceding steps to assign port3 to the Sales VDOM.
6. Repeat the preceding steps to assign port1 to the root VDOM.

**Configure the VDOM links**

To complete the connection between each VDOM and the management VDOM, add the two VDOM links. One pair is the Accounting — management link and the other is the Sales — management link. Each side of these links will be assigned IP addresses since they will be handy in configuring inter-VDOM routing in the next step.

**To configure the Accounting and management VDOM link in the GUI:**

1. In the Global VDOM, go to Network > Interfaces.
2. Select Create New > VDOM Link.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Name</th>
<th>AccountVlnk</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface 0</td>
<td></td>
</tr>
<tr>
<td>Virtual Domain</td>
<td>Accounting</td>
</tr>
<tr>
<td>IP/Netmask</td>
<td>11.11.11.2/255.255.255.252</td>
</tr>
<tr>
<td>Administrative Access</td>
<td>HTTPS, PING, SSH</td>
</tr>
<tr>
<td>Comment</td>
<td>Accounting side of the VDOM link</td>
</tr>
<tr>
<td>Interface 1</td>
<td></td>
</tr>
<tr>
<td>Virtual Domain</td>
<td>root</td>
</tr>
<tr>
<td>IP/Netmask</td>
<td>11.11.11.1/255.255.255.252</td>
</tr>
<tr>
<td>Administrative Access</td>
<td>HTTPS, PING, SSH</td>
</tr>
<tr>
<td>Comment</td>
<td>Management side of the VDOM link</td>
</tr>
</tbody>
</table>

4. Click OK.

**To configure the Sales and management VDOM link in the GUI:**

1. In the Global VDOM, go to Network > Interfaces.
2. Select Create New > VDOM link.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Name</th>
<th>SalesVlnk</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface 0</td>
<td></td>
</tr>
<tr>
<td>Virtual Domain</td>
<td>Sales</td>
</tr>
<tr>
<td>IP/Netmask</td>
<td>12.12.12.2/255.255.255.252</td>
</tr>
<tr>
<td>Administrative Access</td>
<td>HTTPS, PING, SSH</td>
</tr>
<tr>
<td>Comment</td>
<td>Accounting side of the VDOM link</td>
</tr>
<tr>
<td>Interface 1</td>
<td></td>
</tr>
<tr>
<td>Virtual Domain</td>
<td>root</td>
</tr>
<tr>
<td>IP/Netmask</td>
<td>12.12.12.1/255.255.255.252</td>
</tr>
<tr>
<td>Administrative Access</td>
<td>HTTPS, PING, SSH</td>
</tr>
<tr>
<td>Comment</td>
<td>Management side of the VDOM link</td>
</tr>
</tbody>
</table>

4. Click OK.
Configure inter-VDOM routing

A default static route can be configured on each VDOM to provide Internet access. In other words, this static route would provide inter-VDOM routing between each department VDOM and the root VDOM.

For this static route, these settings are used:

- Default Gateway: IP address of the management side of the VDOM link
  - Accounting VDOM: 11.11.11.1
  - Sales VDOM: 12.12.12.1
- Interface: Interface on the department VDOM side of the VDOM link
  - Accounting VDOM: AccountVlnk0
  - Sales VDOM: SalesVlnk0
- IP address: 0.0.0.0/0.0.0.0 (default)

To configure the default static route to the Internet in the Accounting VDOM:

1. In the Accounting VDOM, go to Network > Static Routes.
2. Click on Create New and select the version you need.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Destination</th>
<th>Subnet</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>0.0.0.0/0.0.0.0</td>
</tr>
<tr>
<td>Gateway</td>
<td>11.11.11.1</td>
</tr>
<tr>
<td>Interface</td>
<td>AccountVlnk0</td>
</tr>
<tr>
<td>Administrative Distance</td>
<td>10</td>
</tr>
</tbody>
</table>

4. Click OK.

To configure the default static route to the Internet in the Sales VDOM:

1. In the Sales VDOM, go to Network > Static Routes.
2. Click on Create New and select the version you need.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Destination</th>
<th>Subnet</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>0.0.0.0/0.0.0.0</td>
</tr>
<tr>
<td>Gateway</td>
<td>12.12.12.1</td>
</tr>
<tr>
<td>Interface</td>
<td>SalesVlnk0</td>
</tr>
<tr>
<td>Administrative Distance</td>
<td>10</td>
</tr>
</tbody>
</table>

4. Click OK.
Configure the firewall policies

With the VDOMs, physical interfaces, VDOM links, and static routes configured, the firewall must now be configured to allow the proper traffic. Firewalls are configured per-VDOM, and firewall objects and routes must be created for each VDOM separately.

To configure the firewall policies from AccountingLocal to Internet in the GUI:

1. In the Accounting VDOM, go to Policy & Objects > Firewall Policy.
2. Click Create New.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Name</th>
<th>Account-Local-to-Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>port2</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>AccountVlnk0</td>
</tr>
<tr>
<td>Source</td>
<td>All</td>
</tr>
<tr>
<td>Destination</td>
<td>All</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>enabled</td>
</tr>
</tbody>
</table>

4. Click OK.
5. In the root VDOM, go to Policy & Objects > Firewall Policy.
6. Click Create New.
7. Enter the following information:

<table>
<thead>
<tr>
<th>Name</th>
<th>Account-VDOM-to-Internet</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>AccountVlnk1</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>port1</td>
</tr>
<tr>
<td>Source</td>
<td>All</td>
</tr>
<tr>
<td>Destination</td>
<td>All</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>enabled</td>
</tr>
</tbody>
</table>

8. Click OK.
To configure the firewall policies from SalesLocal to Internet in the GUI:

1. In the Sales VDOM, go to Policy & Objects > Firewall Policy.
2. Click Create New.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Name</th>
<th>Sales-Local-to-Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>port3</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>SalesVlnk0</td>
</tr>
<tr>
<td>Source</td>
<td>All</td>
</tr>
<tr>
<td>Destination</td>
<td>All</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>enabled</td>
</tr>
</tbody>
</table>

4. Click OK.
5. In the root VDOM, go to Policy & Objects > Firewall Policy.
6. Click Create New.
7. Enter the following information:

<table>
<thead>
<tr>
<th>Name</th>
<th>Sales-VDOM-to-Internet</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>SalesVlnk1</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>port1</td>
</tr>
<tr>
<td>Source</td>
<td>All</td>
</tr>
<tr>
<td>Destination</td>
<td>All</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>enabled</td>
</tr>
</tbody>
</table>

8. Click OK.

**Test the configuration**

When the inter-VDOM routing has been configured, test the configuration to confirm proper operation. Testing connectivity ensures that physical networking connections, FortiGate unit interface configurations, and firewall policies are properly configured.

The easiest way to test connectivity is to use the `ping` and `traceroute` commands on hosts in the Accounting and Sales networks, respectively, to confirm the connectivity of different routes on the network. Test connectivity with hosts...
connected to port2 (AccountingLocal) in the Accounting VDOM to the internet and hosts connected to port3 (SalesLocal) in the Sales VDOM to the internet.

**Configuration with the CLI**

The example can also be configured in the CLI.

**To configure inter-VDOM routing in the CLI:**

1. **Enable multi VDOM mode:**

   ```
   config system global
   set vdom-mode multi-vdom
   end
   
   You will be logged out of the device when VDOM mode is enabled.
   ```

2. **Create the Sales and Accounting VDOMs:**

   ```
   config vdom
   edit Accounting
   next
   edit Sales
   next
   end
   ```

3. **Assign interfaces to the VDOMs:**

   ```
   config global
   config system interface
   edit port2
   set vdom Accounting
   next
   edit port3
   set vdom Sales
   next
   edit port1
   set vdom root
   next
   end
   ```

4. **Configure the Accounting and management VDOM link:**

   ```
   config global
   config system vdom-link
   edit AccountVlnk
   next
   end
   config system interface
   edit AccountVlnk0
   set vdom Accounting
   set ip 11.11.11.2 255.255.255.252
   set allowaccess https ping ssh
   set description "Accounting side of the VDOM link"
   next
   edit AccountVlnk1
set vdom root
set ip 11.11.11.1 255.255.255.252
set allowaccess https ping ssh
set description "Management side of the VDOM link"
next
end

5. Configure the Sales and management VDOM link:

config global
    config system vdom-link
        edit SalesVlnk
            next
    end
    config system interface
        edit SalesVlnk0
            set vdom Sales
            set ip 12.12.12.2 255.255.255.252
            set allowaccess https ping ssh
            set description "Sales side of the VDOM link"
        next
        edit SalesVlnk1
            set vdom root
            set ip 12.12.12.1 255.255.255.252
            set allowaccess https ping ssh
            set description "Management side of the VDOM link"
        next
    end
end

6. Configure the default static route to the Internet in the Accounting VDOM:

config vdom
    edit Accounting
        config router static
            edit 1
                set gateway 11.11.11.1
                set device "AccountVlnk0"
            next
        end
end

7. Configure the default static route to the Internet in the Sales VDOM:

config vdom
    edit Sales
        config router static
            edit 1
                set gateway 12.12.12.1
                set device "SalesVlnk0"
            next
        end
end

8. Configure the firewall policies from AccountingLocal to the Internet:

config vdom
    edit Accounting
config firewall policy
edit 1
set name "Accounting-Local-to-Management"
set srcintf port2
set dstintf AccountVlnk0
set srcaddr all
set dstaddr all
set action accept
set schedule always
set service ALL
set nat enable
next
end
next
edit root
cfg config firewall policy
edit 2
set name "Accounting-VDOM-to-Internet"
set srcintf AccountVlnk1
set dstintf port1
set srcaddr all
set dstaddr all
set action accept
set schedule always
set service ALL
set nat enable
next
end
next
end

9. Configure the firewall policies from SalesLocal to the Internet:

cfg config vdom
edit Sales
cfg config firewall policy
edit 3
set name "Sales-local-to-Management"
set srcintf port3
set dstintf SalesVlnk0
set srcaddr all
set dstaddr all
set action accept
set schedule always
set service ALL
set nat enable
next
end
next
cfg edit root
cfg config firewall policy
edit 4
set name "Sales-VDOM-to-Internet"
set srcintf SalesVlnk1
set dstintf port1
set srcaddr all
set dstaddr all
Inter-VDOM routing configuration example: Partial-mesh VDOMs

This example shows how to configure a FortiGate unit to use inter-VDOM routing to route traffic between an internal network and FTP server that are each behind separate VDOMs. See Inter-VDOM routing on page 2007 for more information.

The following example shows how to configure per-VDOM settings, such as operation mode, routing, and firewall policies, in a network that includes the following VDOMs:

- VDOM-A: allows the internal network to access the Internet.
- VDOM-B: allows external connections to an FTP server.
- root: the management VDOM.

You can use VDOMs in either NAT or transparent mode on the same FortiGate. By default, VDOMs operate in NAT mode. In this example, both VDOM-A and VDOM-B use NAT mode. An inter-VDOM link is created and inter-VDOM routes configured to allow users on the internal network to access the FTP server.

This is an example of the partial-mesh VDOMs configuration since only VDOM-A is connected to VDOM-B but neither of those VDOMs are connected to the root VDOM. See Topologies on page 1999 for details.

This example assumes that the interfaces of the FortiGate have already been configured with the IP addresses depicted in the preceding diagram.

General steps for this example

This configuration requires the following general steps:

1. Enable Multi VDOM mode and create the VDOMs on page 2020
2. Assign interfaces to VDOMs on page 2020
3. Configure VDOM-A on page 2021
4. Configure VDOM-B on page 2022
5. Configure the VDOM link on page 2024
6. Configure inter-VDOM routing on page 2024
7. Configure firewall policies using the VDOM link on page 2026

This example demonstrates how to configure these steps first using the GUI and then, at the end of the section, using the CLI. See Configuration with the CLI on page 2027 for details.

Enable Multi VDOM mode and create the VDOMs

Multi VDOM mode can be enabled in the GUI or CLI. Enabling it does not require a reboot, but does log you out of the device. The current configuration is assigned to the root VDOM.

On FortiGate 90 series models and lower, VDOMs can only be enabled using the CLI.

To enable multi VDOM mode in the GUI:
1. On the FortiGate, go to System > Settings.
2. In the System Operation Settings section, enable Virtual Domains.
3. Click OK.

To create the VDOMs in the GUI:
1. In the Global VDOM, go to System > VDOM. Click Create New.
2. In the Virtual Domain field, enter VDOM-A.
3. If required, set the NGFW Mode. If the NGFW Mode is Profile-based, Central SNAT can be enabled.
4. Click OK to create the VDOM.
5. Repeat the above steps for VDOM-B.

Assign interfaces to VDOMs

This example uses three interfaces on the FortiGate unit: port1 (internal network), port2 (FTP server), wan1 (WAN link for VDOM-A), and wan2 (WAN link for VDOM-B). The port1 and port2 interfaces are connected to the internal network and FTP server, respectively. The wan1 and wan2 interfaces are static assigned with IP addresses and default gateways provided by the ISPs for those WAN links.
To assign interfaces to VDOMs in the GUI:

1. In the Global VDOM, go to Network > Interfaces.
2. Select port1 and click Edit.
3. From the Virtual domain list, select VDOM-A.
4. Click OK.
5. Repeat the preceding steps to assign port2 to VDOM-B.
6. Repeat the preceding steps to assign wan1 to VDOM-A.
7. Repeat the preceding steps to assign wan2 to VDOM-B.

Configure VDOM-A

VDOM-A allows connections from devices on the internal network to the Internet. WAN1 and port1 are assigned to this VDOM.

The per-VDOM configuration for VDOM-A includes the following:

- A firewall address for the internal network
- A static route to the ISP gateway
- A firewall policy allowing the internal network to access the Internet

All procedures in this section require you to connect to VDOM-A, either using a global or per-VDOM administrator account.

To add the firewall addresses in the GUI:

1. Go to Policy & Objects > Addresses.
2. Click Create New > Address.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Name</th>
<th>internal-network</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Subnet</td>
</tr>
<tr>
<td>IP/Netmask</td>
<td>192.168.10.0/255.255.255.0</td>
</tr>
<tr>
<td>Interface</td>
<td>port1</td>
</tr>
</tbody>
</table>
4. Click OK.
To add a default route in the GUI:

1. Go to Network > Static Routes and create a new route.
2. Enter the following information:

<table>
<thead>
<tr>
<th>Destination</th>
<th>Subnet</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>0.0.0.0/0.0.0.0</td>
</tr>
<tr>
<td>Gateway</td>
<td>172.20.201.254</td>
</tr>
<tr>
<td>Interface</td>
<td>wan1</td>
</tr>
<tr>
<td>Administrative Distance</td>
<td>10</td>
</tr>
</tbody>
</table>

3. Click OK.

To add the firewall policy in the GUI:

1. Go to Policy & Objects > Firewall Policy.
2. Click Create New.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Name</th>
<th>VDOM-A-Internet</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>port1</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>wan1</td>
</tr>
<tr>
<td>Source</td>
<td>internal-network</td>
</tr>
<tr>
<td>Destination</td>
<td>all</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>enabled</td>
</tr>
</tbody>
</table>

4. Click OK.

**Configure VDOM-B**

VDOM-B allows external connections to reach an internal FTP server. WAN2 and port2 are assigned to this VDOM.

The per-VDOM configuration for VDOM-B includes the following:

- A firewall address for the FTP server
- A virtual IP address for the FTP server
- A static route to the ISP gateway
- A firewall policy allowing external traffic to reach the FTP server

The procedures described above require you to connect to VDOM-B, either using a global or per-VDOM administrator account.
To add the firewall addresses in the GUI:

1. Go to Policy & Objects > Addresses.
2. Click Create New > Address.
3. Enter the following information:
   
<table>
<thead>
<tr>
<th>Name</th>
<th>FTP-server</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Subnet</td>
</tr>
<tr>
<td>IP/Netmask</td>
<td>192.168.10.0/255.255.255.255</td>
</tr>
<tr>
<td>Interface</td>
<td>port2</td>
</tr>
</tbody>
</table>

4. Click OK.

To add the virtual IP address in the GUI:

1. Go to Policy & Objects > Virtual IPs.
2. Click Create New > Virtual IP.
3. Enter the following information:
   
<table>
<thead>
<tr>
<th>Name</th>
<th>FTP-server-VIP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>wan2</td>
</tr>
<tr>
<td>External IP address/range</td>
<td>172.20.10.2</td>
</tr>
<tr>
<td>Map To</td>
<td>192.168.20.10</td>
</tr>
</tbody>
</table>

4. Click OK.

To add a default route in the GUI:

1. Go to Network > Static Routes and create a new route.
2. Enter the following information:
   
<table>
<thead>
<tr>
<th>Destination</th>
<th>Subnet</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>0.0.0.0/0.0.0.0</td>
</tr>
<tr>
<td>Gateway</td>
<td>172.20.201.254</td>
</tr>
<tr>
<td>Interface</td>
<td>wan2</td>
</tr>
<tr>
<td>Administrative Distance</td>
<td>10</td>
</tr>
</tbody>
</table>

3. Click OK.

To add the firewall policy in the GUI:

1. Go to Policy & Objects > Firewall Policy.
2. Click Create New.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Name</th>
<th>Access-server</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>wan2</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>port2</td>
</tr>
<tr>
<td>Source</td>
<td>all</td>
</tr>
<tr>
<td>Destination</td>
<td>FTP-server-VIP</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>FTP</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>enabled</td>
</tr>
</tbody>
</table>

4. Click OK.

**Configure the VDOM link**

The VDOM link allows connections from VDOM-A to VDOM-B. The VDOM link interface configured in this step will be used for inter-VDOM routing.

This step requires you to connect to the global VDOM using a global administrator account.

**To add the VDOM link in the GUI:**

1. In the Global VDOM, go to Network > Interfaces.
2. Create New > VDOM link.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Name</th>
<th>VDOM-link</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface 0</td>
<td></td>
</tr>
<tr>
<td>Virtual Domain</td>
<td>VDOM-A</td>
</tr>
<tr>
<td>IP/Netmask</td>
<td>11.11.1.1/255.255.255.252</td>
</tr>
<tr>
<td>Interface 1</td>
<td></td>
</tr>
<tr>
<td>Virtual Domain</td>
<td>VDOM-B</td>
</tr>
<tr>
<td>IP/Netmask</td>
<td>11.11.1.2/255.255.255.252</td>
</tr>
</tbody>
</table>

4. Click OK.

**Configure inter-VDOM routing**

Inter-VDOM routing allows users on the internal network to route traffic to the FTP server through the FortiGate.

The configuration of inter-VDOM routing includes the following:

- Firewall addresses for the FTP server on VDOM-A and for the internal network on VDOM-B
- Inter-VDOM routing using static routes for the FTP server on VDOM-A and for the internal network on VDOM-B
• Policies allowing traffic using the VDOM link

The procedures described above require you to connect to both VDOM-A and VDOM-B, either using a global or per-VDOM administrator account.

To add the firewall address on VDOM-A in the GUI:

1. In the VDOM-A VDOM, go to Policy & Objects > Addresses.
2. Click Create New > Address.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Name</th>
<th>FTP-server</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Subnet</td>
</tr>
<tr>
<td>IP/Netmask</td>
<td>192.168.20.10/32</td>
</tr>
<tr>
<td>Interface</td>
<td>VDOM-link2</td>
</tr>
<tr>
<td>Static route configuration</td>
<td>enabled</td>
</tr>
</tbody>
</table>

4. Click OK.

To add the static route on VDOM-A in the GUI:

1. Connect to VDOM-A.
2. Go to Network > Static Routes and create a new route.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Destination</th>
<th>Named Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Named Address</td>
<td>FTP-server</td>
</tr>
<tr>
<td>Gateway</td>
<td>11.11.11.2</td>
</tr>
<tr>
<td>Interface</td>
<td>VDOM-link0</td>
</tr>
</tbody>
</table>

4. Click OK.

To add the firewall address on VDOM-B in the GUI:

1. In the VDOM-B VDOM, go to Policy & Objects > Addresses.
2. Click Create New > Address.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Name</th>
<th>internal-network</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Subnet</td>
</tr>
<tr>
<td>IP/Netmask</td>
<td>192.168.10.0/24</td>
</tr>
<tr>
<td>Interface</td>
<td>VDOM-link1</td>
</tr>
<tr>
<td>Static route configuration</td>
<td>enabled</td>
</tr>
</tbody>
</table>

4. Click OK.
To add the static route on VDOM-B in the GUI:

1. In the VDOM-B VDOM, go to Network > Static Routes and create a new route.
2. Enter the following information:

<table>
<thead>
<tr>
<th>Destination</th>
<th>Named Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Named Address</td>
<td>internal-network</td>
</tr>
<tr>
<td>Gateway</td>
<td>11.11.11.1</td>
</tr>
<tr>
<td>Interface</td>
<td>VDOM-link1</td>
</tr>
</tbody>
</table>

3. Click OK.

**Configure firewall policies using the VDOM link**

Firewall policies using the VDOM link allows users on the internal network to access the FTP server through the FortiGate.

Configuring policies allowing traffic using the VDOM link require you to connect to both VDOM-A and VDOM-B, respectively, either using a global or per-VDOM administrator account.

To add the firewall policy on VDOM-A in the GUI:

1. In the VDOM-A VDOM, go to Policy & Objects > Firewall Policy.
2. Click Create New.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Name</th>
<th>Access-FTP-server</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>port1</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>VDOM-link0</td>
</tr>
<tr>
<td>Source</td>
<td>internal-network</td>
</tr>
<tr>
<td>Destination</td>
<td>FTP-server</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>FTP</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>disabled</td>
</tr>
</tbody>
</table>

4. Click OK.

To add the firewall policy on VDOM-B in the GUI:

1. In the VDOM-B VDOM, go to Policy & Objects > Firewall Policy.
2. Click Create New.
3. Enter the following information:

<table>
<thead>
<tr>
<th>Name</th>
<th>Internal-server-access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>VDOM-link1</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>port2</td>
</tr>
<tr>
<td>Source</td>
<td>internal-network</td>
</tr>
<tr>
<td>Destination</td>
<td>FTP-server</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>FTP</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>disabled</td>
</tr>
</tbody>
</table>

4. Click OK.

Configuration with the CLI

The example can also be configured in the CLI.

To configure the two VDOMs:

1. Enable multi VDOM mode:

   ```
   config system global
       set vdom-mode multi-vdom
   end
   ```

   You will be logged out of the device when VDOM mode is enabled.

2. Create the VDOMs:

   ```
   config vdom
       edit VDOM-A
       next
       edit VDOM-B
       next
   end
   ```

3. Assign interfaces to the VDOMs:

   ```
   config global
       config system interface
           edit port1
               set vdom VDOM-A
           next
           edit port2
               set vdom VDOM-B
           next
           edit wan1
               set vdom VDOM-A
           next
           edit wan2
   ```
4. Add the firewall addresses to VDOM-A:

```fortios```
config vdom
edit VDOM-A
config firewall address
edit internal-network
set associated-interface port1
set subnet 192.168.10.0 255.255.255.0
next
next
end
```fortios```

5. Add a default route to VDOM-A:

```fortios```
config vdom
edit VDOM-A
config router static
edit 0
set gateway 172.20.201.254
set device wan1
next
next
end
```fortios```

6. Add the firewall policy to VDOM-A:

```fortios```
config vdom
edit VDOM-A
config firewall policy
edit 1
set name "VDOM-A-Internet"
set srcintf "port1"
set dstintf "wan1"
set srcaddr "internal-network"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set nat enable
next
next
end
```fortios```

7. Add the firewall addresses to VDOM-B:

```fortios```
config vdom
edit VDOM-B
config firewall address
edit FTP-server
set associated-interface port2
set subnet 192.168.20.10 255.255.255.255
8. Add the virtual IP address to VDOM-B:

```fortigate
config vdom
edit VDOM-B
  config firewall vip
    edit FTP-server-VIP
      set extip 172.20.10.2
      set extintf wan2
      set mappedip 192.168.20.10
    next
  next
next
end
end
```

9. Add a default route to VDOM-B:

```fortigate
config vdom
edit VDOM-B
  config router static
    edit 0
      set gateway 172.20.10.254
      set device wan2
    next
  next
end
end
```

10. Add the firewall policy to VDOM-B:

```fortigate
config vdom
edit VDOM-B
  config firewall policy
    edit 1
      set name "Access-server"
      set srcintf "wan2"
      set dstintf "port2"
      set srcaddr "all"
      set dstaddr "FTP-server-VIP"
      set action accept
      set schedule "always"
      set service "FTP"
      set nat enable
    next
  next
end
end
```

To configure the VDOM link:

1. Configure the VDOM link:

```fortigate
config global
  config system vdom-link
```

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
2. Configure the firewall addresses on VDOM-A:

```fortigate-config
config vdom
  edit VDOM-A
    config firewall address
      edit "FTP-server"
        set associated-interface "VDOM-link0"
        set allow-routing enable
        set subnet 192.168.20.10 255.255.255.255
      next
    end
next
end
```

3. Add the firewall policy to VDOM-B:

```fortigate-config
config vdom
  edit VDOM-B
    config firewall policy
      edit 1
        set name "Access-server"
        set srcintf "wan2"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "FTP-server-VIP"
        set action accept
        set schedule "always"
        set service "FTP"
        set nat enable
      next
    end
next
end
```

4. Add the static route on VDOM-A:

```fortigate-config
config vdom
  edit VDOM-A
    config router static
```
5. Configure the firewall addresses on VDOM-B:

```plaintext
cfg vdom
edit VDOM-B
config firewall address
edit internal-network
  set associated-interface VDOM-link1
  set allow-routing enable
  set subnet 192.168.10.0 255.255.255.0
next
end
next
end
```

6. Add the static route on VDOM-B:

```plaintext
cfg vdom
edit VDOM-B
config router static
edit 0
  set device VDOM-link1
  set dstaddr internal-network
  set gateway 11.11.11.1
next
end
next
end
```

7. Add the security policy on VDOM-A:

```plaintext
cfg vdom
edit VDOM-A
config firewall policy
edit 0
  set name Access-FTP-server
  set srcintf port1
  set dstintf VDOM-link0
  set srcaddr internal-network
  set dstaddr FTP-server
  set action accept
  set schedule always
  set service FTP
next
end
next
end
```

8. Add the firewall policy on VDOM-B:
High Availability

Whether your FortiGate is used as a security gateway, an internal segmentation firewall, in the cloud, or in an MSSP environment, as long as there is critical traffic passing through it, there is risk of it being a single point of failure. Physical outages can occur due to power failures, physical link failures, transceiver failures, or power supply failures. Non-physical outages can be caused by routing, resource issues, or kernel panic.

Network outages cause disruptions to business operations, downtime, and frustration for users and in some situations may have financial setbacks. In designing your network and architecture, it is important to weigh the risks and consequences associated with unexpected outages.

There are many ways to build redundancy and resiliency. In a switching network, you can accomplish this by adding redundant links and switches in partial or full mesh topologies. Using redundant and aggregate links, you can avoid a single link failure causing a network to go down. Using SD-WAN, you can build redundant and intelligent WAN load balancing and failover architectures.

FortiGate HA offers several solutions for adding redundancy in the case where a failure occurs on the FortiGate, or is detected by the FortiGate through monitored links, routes, and other health checks. These solutions support fast failover to avoid lengthy network outages and disruptions to your traffic.

FortiGate Clustering Protocol (FGCP)

FGCP provides a solution for two key requirements of critical enterprise networking components: enhanced reliability and increased performance. Enhanced reliability is achieved through device failover protection, link failover protection, and remote link failover protection. Session failover protection for most IPv4 and IPv6 sessions also contributes to enhanced reliability. Increased performance is achieved though active-active HA load balancing.

FortiGate Session Life Support Protocol (FGSP)

In a network that already includes load balancing (either with load balancers or routers) for traffic redundancy, two entities (either standalone FortiGates or FGCP clusters) can be integrated into the load balancing configuration using the FortiGate Session Life Support Protocol (FGSP). The external load balancers or routers can distribute sessions among
the FortiGates and the FGSP performs session synchronization of IPv4 and IPv6 TCP, SCTP, UDP, ICMP, expectation, and NAT sessions to keep the session tables of both entities synchronized. In the event of a failure, the load balancer can detect the failed unit and failover the sessions to other active members to continue processing the traffic.

**VRRP**

FortiGates can function as primary or backup Virtual Router Redundancy Protocol (VRRP) routers. The FortiGates can quickly and easily integrate into a network that has already deployed VRRP. A FortiGate can be integrated into a VRRP group with any third-party VRRP devices, and VRRP can provide redundancy between multiple FortiGates. FortiOS supports VRRP version 2 and 3.

The following topics provide more information about each HA solution and other HA related topics:

- FGCP on page 2033
- FGSP on page 2088
- Standalone configuration synchronization on page 2109
- VRRP on page 2114

**FGCP**

High availability (HA) is usually required in a system where there is high demand for little downtime. There are usually hot-swaps, backup routes, or standby backup units and as soon as the active entity fails, backup entities will start functioning. This results in minimal interruption for the users.

The FortiGate Clustering Protocol (FGCP) is a proprietary HA solution whereby FortiGates can find other member FortiGates to negotiate and create a cluster. A FortiGate HA cluster consists of at least two FortiGates (members) configured for HA operation. All FortiGates in the cluster must be the same model and have the same firmware installed. Cluster members must also have the same hardware configuration (such as the same number of hard disks). All cluster members share the same configurations except for their host name and priority in the HA settings. The cluster works like a device but always has a hot backup device.

**Critical cluster components**

The following are critical components in an HA cluster:
- Heartbeat connections: members will use this to communicate with each other. In general, a two-member cluster is most common. We recommend double back-to-back heartbeat connections.
- Identical connections for internal and external interfaces: as demonstrated in the topology, we recommend similar connections from each member to the switches for the cluster to function properly.

**General operation**

The following are best practices for general cluster operation:

- Ensure that heartbeat communication is present.
- Enable the session synchronization option in daily operation (see FGSP basic peer setup on page 2090).
- Monitor traffic flowing in and out of the interfaces.

**Failover**

FGCP provides failover protection in the following scenarios:

- The active device loses power.
- A monitored interface loses a connection.

After failover occurs, the user will not notice any difference, except that the active device has changed. See Failover protection on page 2035 for more information.

**Synchronizing the configuration**

FGCP uses a combination of incremental and periodic synchronization to make sure that the configuration of all cluster units is synchronized to that of the primary unit.

The following settings are not synchronized between cluster units:

- The FortiGate host name
- GUI Dashboard widgets
- HA override
- HA device priority
- The virtual cluster priority
- The HA priority setting for a ping server (or dead gateway detection) configuration
- The system interface settings of the HA reserved management interface
- The HA default route for the reserved management interface, set using the `ha-mgmt-interface-gateway` option of the `config system ha` command

Most subscriptions and licenses are not synchronized, as each FortiGate must be licensed individually. FortiToken Mobile is an exception; they are registered to the primary unit and synchronized to the secondary units.

The primary unit synchronizes all other configuration settings, including the other HA configuration settings.

All synchronization activity takes place over the HA heartbeat link using TCP/703 and UDP/703 packets.

The following topics provide more information about FGCP:

- Troubleshoot an HA formation on page 2086

**Failover protection**

The FortiGate Clustering Protocol (FGCP) provides failover protection, meaning that a cluster can provide FortiGate services even when one of the devices in the cluster encounters a problem that would result in the complete loss of connectivity for a stand-alone FortiGate unit. Failover protection provides a backup mechanism that can be used to reduce the risk of unexpected downtime, especially in mission-critical environments.

FGCP supports failover protection in four ways:

1. If a link fails.
2. If a device loses power.
3. If an SSD fails.
4. If memory utilization exceeds the threshold for a specified amount of time.

When session-pickup is enabled in the HA settings, existing TCP session are kept, and users on the network are not impacted by downtime as the traffic can be passed without reestablishing the sessions.

**When and how the failover happens**

1. **Link fails**

Before triggering a failover when a link fails, the administrator must ensure that monitor interfaces are configured. Normally, the internal interface that connects to the internal network, and an outgoing interface for traffic to the internet or outside the network, should be monitored. Any of those links going down will trigger a failover.

2. **Loss of power for active unit**

When an active (primary) unit loses power, a backup (secondary) unit automatically becomes the active, and the impact on traffic is minimal. There are no settings for this kind of fail over.
3. SSD failure

An HA failover can be triggered by an SSD failure.

To enable an SSD failure triggering HA failover:

```
config system ha
  set ssd-failover enable
end
```

4. Memory utilization

An HA failover can be triggered when memory utilization exceeds the threshold for a specific amount of time.

Memory utilization is checked at the configured sample rate (memory-failover-sample-rate). If the utilization is above the threshold (memory-failover-threshold) every time that it is sampled for the entire monitor period (memory-failover-monitor-period), then a failover is triggered.

If the FortiGate meets the memory utilization conditions to cause failover, but the last memory triggered failover happened within the timeout period (memory-failover-flip-timeout), then the failover does not occur. Other HA cluster members can still trigger memory based failovers if they meet the criteria and have not already failed within the timeout period.

After a memory based failover from FortiGate A to FortiGate B, if the memory usage on FortiGate A goes down below the threshold but the memory usage on FortiGate B is still below the threshold, then a failover is not triggered, as the cluster is working normally using FortiGate B as the primary device.

When you disable memory based failover, a new HA primary selection occurs to determine the primary device.

To configure memory based HA failover:

```
config system ha
  set memory-based-failover {enable | disable}
  set memory-failover-threshold <integer>
  set memory-failover-monitor-period <integer>
  set memory-failover-sample-rate <integer>
  set memory-failover-flip-timeout <integer>
end
```

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>memory-based-failover {enable</td>
<td>Enable/disable memory based failover (default = disable).</td>
</tr>
<tr>
<td>disable}</td>
<td></td>
</tr>
<tr>
<td>memory-failover-threshold</td>
<td>The memory usage threshold to trigger a memory based failover, in percentage (0 - 95, 0 = use the conserve mode threshold, default = 0).</td>
</tr>
<tr>
<td>&lt;integer&gt;</td>
<td></td>
</tr>
<tr>
<td>memory-failover-monitor-period</td>
<td>The duration of the high memory usage before a memory based failover is</td>
</tr>
<tr>
<td>&lt;integer&gt;</td>
<td>triggered, in seconds (1 - 300, default = 60).</td>
</tr>
<tr>
<td>memory-failover-sample-rate</td>
<td>The rate at which memory usage is sampled in order to measure memory usage,</td>
</tr>
<tr>
<td>&lt;integer&gt;</td>
<td>in seconds (1 - 60, default = 1).</td>
</tr>
<tr>
<td>memory-failover-flip-timeout</td>
<td>The time to wait between subsequent memory based failovers, in minutes (6 - 2147483647, default = 6).</td>
</tr>
<tr>
<td>&lt;integer&gt;</td>
<td></td>
</tr>
</tbody>
</table>
**Configuring HA failover time**

On supported models, the HA heartbeat interval unit can be changed from the 100ms default to 10ms. This allows for a failover time of less than 50ms, depending on the configuration and the network.

```plaintext
config system ha
    set hb-interval-in-milliseconds {100ms | 10ms}
end
```

In this example, the HA heartbeat interval unit is changed from 100ms to 10ms. As the default heartbeat interval is two, this means that a heartbeat is sent every 20ms. The number of lost heartbeats that signal a failure is also changed to two. So, after two consecutive heartbeats are lost, a failover will be detected in 40ms.

### To configure the HA failover time:

```plaintext
config system ha
    set group-id 240
    set group-name "300D"
    set mode a-p
    set hbdev "port3" 50 "port5" 100
    set hb-interval 2
    set hb-interval-in-milliseconds 10ms
    set hb-lost-threshold 2
    set override enable
    set priority 200
end
```

**HA active-passive cluster setup**

An HA Active-Passive (A-P) cluster can be set up using the GUI or CLI.

This example uses the following network topology:
To set up an HA A-P cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Go to System > HA and set the following options:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Active-Passive</td>
</tr>
<tr>
<td>Device priority</td>
<td>128 or higher</td>
</tr>
<tr>
<td>Group name</td>
<td>Example_cluster</td>
</tr>
<tr>
<td>Heartbeat interfaces</td>
<td>ha1 and ha2</td>
</tr>
</tbody>
</table>

Except for the device priority, these settings must be the same on all FortiGates in the cluster.

4. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
5. Click OK.

The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate’s interfaces.

6. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat steps 1 to 5, omitting setting the device priority, to join the cluster.
To set up an HA A-P cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Change the hostname of the FortiGate:
   ```
   config system global
   set hostname Example1_host
   end
   ```
   Changing the host name makes it easier to identify individual cluster units in the cluster operations.
4. Enable HA:
   ```
   config system ha
   set mode a-p
   set group-name Example_cluster
   set hbdev ha1 10 ha2 20
   end
   ```
5. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
6. Repeat steps 1 to 5 on the other FortiGate devices to join the cluster, giving each device a unique hostname.

**HA active-active cluster setup**

An HA Active-Active (A-A) cluster can be set up using the GUI or CLI.

---

FGCP in Active-Active mode cannot load balance any sessions that traverse NPU VDOM links or regular VDOM links. If Active-Active session load balancing between VDOMs is required, use an external router to handle the inter-VDOM routing.

---

This example uses the following network topology:

![Network Topology Diagram]

To set up an HA A-A cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Go to System > HA and set the following options:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Active-Active</td>
</tr>
<tr>
<td>Device priority</td>
<td>128 or higher</td>
</tr>
<tr>
<td>Group name</td>
<td>Example_cluster</td>
</tr>
<tr>
<td>Heartbeat interfaces</td>
<td>ha1 and ha2</td>
</tr>
</tbody>
</table>

Except for the device priority, these settings must be the same on all FortiGates in the cluster.

4. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.

5. Click OK.

The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate’s interfaces.

6. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat steps 1 to 5, omitting setting the device priority, to join the cluster.

To set up an HA A-A cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.

2. Log into one of the FortiGates.

3. Change the hostname of the FortiGate:

   ```
   config system global
   set hostname Example1_host
   end
   ```

   Changing the host name makes it easier to identify individual cluster units in the cluster operations.

4. Enable HA:

   ```
   config system ha
   set mode a-a
   set group-name Example_cluster
   set hbdev ha1 10 ha2 20
   end
   ```

5. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.

6. Repeat steps 1 to 5 on the other FortiGate devices to join the cluster.
HA virtual cluster setup

Virtual clustering is an extension of FGCP HA that provides failover protection between two instances of one or more VDOMs operating on two FortiGates that are in a virtual cluster. A standard virtual cluster consists of FortiGates that are operating in active-passive HA mode with multiple VDOMs enabled. The following custom settings can be configured per cluster:

```fortigate
config system ha
    set vcluster-status enable
    config vcluster
        edit <id>
            set override {enable | disable}
            set priority <integer>
            set vdom <vdom_1>, ... [vdom_n]
            set monitor <interface_1>, ... [interface_n]
            set pingserver-monitor-interface <interface_1>, ... [interface_n]
        next
    end
end
```

| override (enable | disable) | Enable/disable override and increase the priority of the unit that should always be the primary. |
| priority <integer> | Increase the priority to select the primary unit (0 - 255, default = 128). |
| vdom <vdom_1>, ... [vdom_n] | Set the virtual domains in the virtual cluster. |
| monitor <interface_1>, ... [interface_n] | Set the interfaces to check for port monitoring (or link failure). |
| pingserver-monitor-interface <interface_1>, ... [interface_n] | Set the interfaces to check for remote IP monitoring. |

Active-passive virtual clustering uses VDOM partitioning to send traffic for some VDOMs to the primary FortiGate and traffic for other VDOMs to the secondary FortiGates. Traffic distribution between FortiGates can potentially improve throughput. If a failure occurs and only one FortiGate continues to operate, all traffic fails over to that FortiGate, similar to normal HA. If the failed FortiGates rejoin the cluster, the configured traffic distribution is restored.

In an active-passive virtual cluster of two FortiGates, the primary and secondary FortiGates share traffic processing according to the VDOM partitioning configuration. If you add a third or fourth FortiGate, the primary and first secondary FortiGate process all traffic and the other one or two FortiGates operate in standby mode. If the primary or first secondary FortiGate fails, one of the other FortiGates becomes the new primary or secondary FortiGate and begins processing traffic.

Separation of VDOM traffic

Virtual clustering creates a cluster between instances of each VDOM on the two FortiGates in the virtual cluster. All traffic to and from a given VDOM is sent to one of the FortiGates where it stays within its VDOM and is only processed by that VDOM. One FortiGate is the primary FortiGate for each VDOM and one FortiGate is the secondary FortiGate for each VDOM. The primary FortiGate processes all traffic for its VDOMs; the secondary FortiGate processes all traffic for its VDOMs.
Virtual clustering and heartbeat interfaces

The HA heartbeat provides the same HA services in a virtual clustering configuration as in a standard HA configuration. One set of HA heartbeat interfaces provides HA heartbeat services for all of the VDOMs in the cluster. You do not have to add a heartbeat interface for each VDOM.

Special considerations for NPU-based VLANs in a virtual cluster

In an FGCP cluster, the primary FortiGate uses virtual MAC addresses when forwarding traffic, and the secondary uses the physical MAC addresses when forwarding traffic. In a virtual cluster, packets are sent with the cluster’s virtual MAC addresses. However, in the case of NPU offloading on a non-root VDOM, traffic that leaves an NPU-based VLAN will use the physical MAC address of its parent interface rather than the virtual MAC address. If this behavior is not desired, disable auto-asic-offload in the firewall policy where the VLAN interface is used.

Support up to 30 virtual clusters

FortiOS supports up to 30 virtual clusters, which allows more VDOMs to be spread across different virtual clusters without overlapping. Each virtual cluster supports its own failover conditions. Prior to 7.2.0, only two virtual clusters were supported.

When configuring virtual clusters, the group-id is limited to a value from 0 to 7. If the HA group-id is greater than 7, use the command line first to change the group-id before enabling virtual clusters.

```
config system ha
    set group-id <integer>
end
```

⚠️ When upgrading from 7.0 or earlier, old virtual clusters will be lost if the group-id is larger than 7.

Basic configuration

This example shows a virtual cluster configuration consisting of two FortiGates. The virtual cluster has two VDOMs, root and eng_vdm.
The root VDOM can only be associated with virtual cluster 1. The VDOM that is assigned as the management VDOM can also only be associated with virtual cluster 1.

**To set up an HA virtual cluster using the GUI:**

1. Make all the necessary connections as shown in the topology diagram.
2. Configure a regular A-P cluster:
   a. Log in to one of the FortiGates.
   b. Go to System > HA and set the following options:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Active-Passive</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device priority</td>
<td>128 or higher</td>
</tr>
<tr>
<td>Group name</td>
<td>Example_cluster</td>
</tr>
<tr>
<td>Heartbeat interfaces</td>
<td>ha1 and ha2</td>
</tr>
</tbody>
</table>

   Except for the device priority, these settings must be the same on all FortiGates in the cluster.
   c. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
   d. Click OK.
   The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate’s interfaces.
   e. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat step 2 (omitting setting the device priority) to join the cluster.
3. On the primary FortiGate, go to System > Settings and enable Virtual Domains.
4. Click Apply. You will be logged out of the FortiGate.
5. Log back in to the FortiGate, and ensure that you are in the global VDOM.

6. Create the eng_vdm VDOM:
   a. Go to System > VDOM and click Create New. The New Virtual Domain pane opens.
   b. Enter the name in the Virtual Domain field, then click OK.

7. Implement a virtual cluster by moving the new VDOM to virtual cluster 2:
   a. Go to System > HA and enable VDOM Partitioning.
   b. In the table, click Create New. The New Virtual Cluster pane opens.
   c. Click the + and add the eng_vdm VDOM.
   d. Click OK to save the virtual cluster.
   e. Click OK to save the HA configuration.

To set up an HA virtual cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Configure a regular A-P cluster. See HA active-passive cluster setup on page 2037.
3. Enable VDOMs:
   
   ```
   config system global
   set vdom-mode multi-vdom
   end
   
   You will be logged out of the FortiGate.
   ```
4. Create the eng_vdm VDOM:
   
   ```
   config vdom
   edit eng_vdm
   next
   end
   ```
5. Reconfigure the HA settings to be a virtual cluster:

```bash
config system ha
    set vclustr-status enable
config vclustr
    edit 1
        set vdom root
        set override disable
    next
    edit 2
        set vdom eng_vdm
        set override disable
    next
end
end
```

**Configuration with 30 virtual clusters**

In this example, there are 30 customers managed by an MSSP on an HA cluster, and each customer VDOM needs to failover independently of other customer VDOMs. Each customer is assigned to a different virtual cluster with its own virtual cluster configurations. This may include different monitored interfaces, ping servers, and priority for the primary and secondary cluster members. Each virtual cluster will fail over according to their own virtual cluster configurations.

This example assumes an A-P cluster and VDOMs have already been configured. See HA active-passive cluster setup on page 2037 and Virtual Domains on page 1996 for more information.

For each virtual cluster, this example assumes that unit 1 has an HA priority of 200, while unit 2 has an HA priority of 100. By default, unit 1 will be the primary cluster member of all the virtual clusters.

**To configure multiple virtual clusters in the GUI:**

1. Go to `System > HA` and enable VDOM Partitioning.
2. Create a virtual cluster:
   a. In the table, click `Create New`. The New Virtual Cluster pane opens.
   b. Set the `Device priority` to 200.
   c. Click the `+` and add the `Virtual domains`.
   d. Optionally, click the `+` and add the `Monitor interfaces`.
   e. Click OK.
3. Repeat step 2 to create the remaining virtual clusters.
4. Click OK to save the HA configuration. The HA page summary displays the multiple virtual clusters, each with a Primary and Secondary HA member.
5. Edit the priority settings for the secondary members to be 100:
   a. Select the Secondary member in the table, and click `Edit`.
   b. Set the `Priority` to 100.
   c. Click OK.
6. Repeat step 5 for the remaining secondary members.
To configure multiple virtual clusters in the CLI:

1. Configure the primary FortiGate:

   ```
   config system ha
   set vcluster-status enable
   config vcluster
   edit 1
       set override disable
       set priority 200
       set vdom "vdom1"
   next
   edit 2
       set override disable
       set priority 200
       set vdom "vdom2"
   next
   ...
   edit 30
       set override disable
       set priority 200
       set vdom "vdom30"
   next
   end
   end
   
   2. Configure the secondary FortiGate:

   ```
   config system ha
   set vcluster-status enable
   config vcluster
   edit 1
       set override disable
       set priority 100
       set vdom "vdom1"
   next
   edit 2
       set override disable
       set priority 100
       set vdom "vdom2"
   next
   ...
   edit 30
       set override disable
       set priority 100
       set vdom "vdom30"
   next
   end
   end
   
Check HA synchronization status

The HA synchronization status can be viewed in the GUI through either a widget on the Dashboard or on the System > HA page. It can also be confirmed through the CLI. When a cluster is out of synchronization, administrators should correct the issue as soon as possible as it affects the configuration integrity and can cause issues to occur.
When units are out of synchronization in an HA cluster, the GUI will compare the HA checksums and display the tables that caused HA to be out of synchronization. This can be visualized on the HA monitor page and in the HA status widget.

**HA synchronization status in the GUI**

Following HA setup, the *HA Status* widget can be added to the *Dashboard* that shows the HA synchronization statuses of the members.

A green checkmark is shown next to each member that is in synchronization.

![HA Status Widget](image)

A member that is out of synchronization is highlighted in red. Hover the cursor over the unsynchronized device to see the tables that are out of synchronization and the checksum values.

![Unsynchronized Member](image)

You can also go to *System > HA* to see the synchronization statuses of the members. A member that is out of synchronization will have a red icon next to its name. Hover the cursor over the unsynchronized device to see the tables that are out of synchronization and the checksum values.

**Synchronized:**

![Synchronized Members](image)

**Unsynchronized:**

![Unsynchronized Members](image)
HA synchronization status in the CLI

In the CLI, run the `get system ha status` command to see if the cluster is in synchronization. The synchronization status is reported under `Configuration Status`.

When both members are in synchronization:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-VM64
Mode: HA A-P
Group: 0
Debug: 0
Cluster Uptime: 0 days 0:52:39
Cluster state change time: 2021-04-29 13:17:03
Primary selected using:
  <2021/04/29 13:17:03> FGVMEV00000000002 is selected as the primary because its uptime is larger than peer member FGVMEV70000000005.
  <2021/04/29 12:37:17> FGVMEV00000000002 is selected as the primary because it's the only member in the cluster.
ses_pickup: disable
override: disable
Configuration Status:
  FGVMEV00000000002 (updated 3 seconds ago): in-sync

```

When one of the members is out of synchronization:
Out-of-band management with reserved management interfaces

As part of an HA configuration, you can reserve up to four management interfaces to provide direct management access to all cluster units. For each reserved management interface, you can configure a different IP address, administrative access, and other interface settings, for each cluster unit. By connecting these interfaces to your network, you can separately manage each cluster unit from different IP addresses.
Reserved management interfaces provide direct management access to each cluster unit, and give each cluster unit a different identity on your network. This simplifies using external services, such as SNMP, to monitor separate cluster units.

Reserved management interfaces are not assigned HA virtual MAC addresses. They retain the permanent hardware address of the physical interface, unless you manually change it using the `config system interface` command.

Reserved management interfaces and their IP addresses should not be used for managing a cluster using FortiManager. To manage a FortiGate HA cluster with FortiManager, use the IP address of one of the cluster unit interfaces.

Configuration changes to a reserved management interface are not synchronized to other cluster units. Other configuration changes are automatically synchronized to all cluster units.

---

You can configure an in-band management interface for a cluster unit. See In-band management on page 2055 for information. In-band management does not reserve the interface exclusively for HA management.

---

**Management interface**

Enable HTTPS or HTTP administrative access on the reserved management interfaces to connect to the GUI of each cluster unit. On secondary units, the GUI has the same features as the primary unit, except for unit specific information, for example:

- The System Information widget on the Status dashboard shows the secondary unit's serial number.
- In the cluster members list at System > HA, you can change the HA configuration of the unit that you are logged into. You can only change the host name and device priority of the primary and other secondary units.
- The system events logs show logs for the device that you are logged into. Use the HA device drop down to view the log messages for other cluster units, including the primary unit.

Enable SSH administrative access on the reserved management interfaces to connect to the CLI of each cluster unit. The CLI prompt includes the host of the cluster unit that you are connected to. Use the `execute ha manage` command to connect to other cluster unit CLIs.

Enable SNMP administrative access on a reserved management interface to use SNMP to monitor each cluster unit using the interface's IP address. Direct management of cluster members must also be enabled, see Configuration examples on page 2051.

Reserved management interfaces are available in both NAT and transparent mode, and when the cluster is operating with multiple VDOMs.

**FortiCloud, FortiSandbox, and other management services**

By default, management services such as FortiCloud, FortiSandbox, SNMP, remote logging, and remote authentication, use a cluster interface. This means that communication from each cluster unit will come from a cluster interface of the primary unit, and not from the individual cluster unit's interface.

You can configure HA reserved management interfaces to be used for communication with management services by enabling the `ha-direct` option. This separates management traffic for each cluster unit, and allows each unit to be individually managed. This is especially useful when cluster units are in different physical locations.

The following management features will then use the HA reserved management interface:
- Remote logging, including syslog, FortiAnalyzer, and FortiCloud
- Remote authentication and certificate verification
- Communication with FortiSandbox
- Netflow and sflow, see Routing NetFlow data over the HA management interface on page 2069 for information.
- SNMP queries and traps

Syntax for HA reserved management interfaces is as follows:

```plaintext
config system ha
  set ha-direct enable
  set ha-mgmt-status enable
  config ha-mgmt-interfaces
    edit 1
      set interface <interface>
      set dst <destination IP>
      set gateway <IPv4 gateway>
      set gateway6 <IPv6 gateway>
    next
  end
end
```

The `ha-direct` option is a pre-requisite for allowing communication on each HA reserved management interface for various management services listed above. Once enabled, all `source-ip` settings will be unset from log related, netflow and sflow management services. SNMP requires `ha-direct` to be configured under SNMP settings only. See below for more configuration options.

### Configuration examples

The configuration examples below will use the following topology:

![Configuration examples](image)

Two FortiGate units are already operating in a cluster. On each unit, port 8 is connected to the internal network through a switch and configured as an out-of-band reserved management interface.
Administrative access and default route for HA management interface

To configure the primary unit's reserved management interface, configure an IP address and management access on port8. Then, configure the necessary HA settings to enable the HA reserved management interface and its route. To configure the secondary unit's reserved management interface, access the unit's CLI through the primary unit, and configure an IP address, management access on port8, and the necessary HA settings. Configuration changes to the reserved management interface are not synchronized to other cluster units.

To configure the primary unit reserved management interface to allow HTTPS, SSH, and ICMP access:

1. From a computer on the internal network, connect to the CLI at 10.11.101.100 on port2.
2. Change the port8 IP address and management access:
   
   ```
   config system interface
   edit port8
   set ip 10.11.101.101/24
   set allowaccess https ping ssh
   next
   end
   ```

3. Configure the HA settings for the HA reserved management interface by defining a default route to route to the gateway 10.11.101.2:
   
   ```
   config system ha
   set ha-mgmt-status enable
   config ha-mgmt-interfaces
   edit 1
   set interface port8
   set gateway 10.11.101.2
   next
   end
   end
   ```

You can now log into the primary unit's GUI by browsing to https://10.11.101.101. You can also log into the primary unit's CLI by using an SSH client to connect to 10.11.101.101.

To configure secondary unit reserved management interfaces to allow HTTPS, SSH, and ICMP access:

1. From a computer on the internal network, connect to the primary unit's CLI.
2. Connect to the secondary unit with the following command:
   
   ```
   execute ha manage <unit id> <username> <password>
   ```

3. Change the port8 IP address and management access:
   
   ```
   config system interface
   edit port8
   set ip 10.11.101.102/24
   set allowaccess https ping ssh
   ```
4. Configure the HA settings for the HA reserved management interface by defining a default route to route to the gateway 10.11.101.2:

```plaintext
config system ha
    set ha-mgmt-status enable
config ha-mgmt-interfaces
    edit 1
        set interface port8
        set gateway 10.11.101.2
    next
end
end
```

You can now log into the secondary unit’s GUI by browsing to https://10.11.101.102. You can also log into the secondary unit’s CLI by using an SSH client to connect to 10.11.101.102.

**SNMP monitoring**

The SNMP server can get status information from the cluster members. To use the reserved management interfaces, you must add at least one HA direct management host to an SNMP community. If the SNMP configuration includes SNMP users with user names and passwords, HA direct management must be enabled for the users.

**To configure the cluster for SNMP management using the reserved management interfaces in the CLI:**

1. **Allow SNMP on port8 on both primary and secondary units:**

```plaintext
config system interface
    edit port8
        append allowaccess snmp
    next
end
```

2. **Add an SNMP community with a host for the reserved management interface of each cluster member. The host includes the IP address of the SNMP server.**

```plaintext
config system snmp community
    edit 1
        set name "Community"
        config hosts
            edit 1
                set ip 10.11.101.20 255.255.255.255
                set ha-direct enable
            next
        next
end
```

Enabling `ha-direct` in a non-HA environment will make SNMP unusable.
3. Add an SNMP user for the reserved management interface:

```bash
config system snmp user
   edit "1"
      set notify-hosts 10.11.101.20
      set ha-direct enable
   next
end
```

The SNMP configuration is synchronized to all cluster units.

To get CPU, memory, and network usage information from the SNMP manager for each cluster unit using the reserved management IP addresses:

1. Connect to the SNMP manager CLI.
2. Get resource usage information for the primary unit using the MIB fields:

   ```bash
   snmpget -v2c -c Community 10.11.101.101 fgHaStatsCpuUsage
   snmpget -v2c -c Community 10.11.101.101 fgHaStatsMemUsage
   snmpget -v2c -c Community 10.11.101.101 fgHaStatsNetUsage
   ```

3. Get resource usage information for the primary unit using the OIDs:

   ```bash
   snmpget -v2c -c Community 10.11.101.101.1.3.6.1.4.1.12356.101.13.2.1.1.3.1
   snmpget -v2c -c Community 10.11.101.101.1.3.6.1.4.1.12356.101.13.2.1.1.4.1
   snmpget -v2c -c Community 10.11.101.101.1.3.6.1.4.1.12356.101.13.2.1.1.5.1
   ```

4. Get resource usage information for the secondary unit using the MIB fields:

   ```bash
   snmpget -v2c -c Community 10.11.101.102 fgHaStatsCpuUsage
   snmpget -v2c -c Community 10.11.101.102 fgHaStatsMemUsage
   snmpget -v2c -c Community 10.11.101.102 fgHaStatsNetUsage
   ```

5. Get resource usage information for the primary unit using the OIDs:

   ```bash
   snmpget -v2c -c Community 10.11.101.102.1.3.6.1.4.1.12356.101.13.2.1.1.3.1
   snmpget -v2c -c Community 10.11.101.102.1.3.6.1.4.1.12356.101.13.2.1.1.4.1
   snmpget -v2c -c Community 10.11.101.102.1.3.6.1.4.1.12356.101.13.2.1.1.5.1
   ```

**Firewall local-in policies for the reserved management interface**

Enabling `ha-mgmt-intf-only` applies the local-in policy only to the VDOM that contains the reserved management interface. The incoming interface is set to match any interface in the VDOM.

To add local-in policies for the reserved management interface:

```bash
config firewall local-in-policy
   edit 0
      set ha-mgmt-intf-only enable
      set intf any
      set srcaddr internal-net
      set dstaddr mgmt-int
      set action accept
      set service HTTPS
```
**NTP over reserved management interfaces**

When NTP is enabled in an HA cluster, the primary unit will always be the unit to contact the NTP server and synchronize system time to the secondary units over the HA heartbeat interface. However, in the event that the primary should contact the NTP server over the HA reserved management interface, then the `ha-direct` option should be enabled under the config system ha settings.

```bash
config system interface
  edit port5
    set ip 172.16.79.46 255.255.255.0
  next
end
config system ha
  set group-name FGT-HA
  set mode a-p
  set ha-mgmt-status enable
config ha-mgmt-interfaces
  edit 1
    set interface port5
    set gateway 172.16.79.1
  next
end
  set ha-direct enable
end
config system ntp
  set ntpsync enable
  set syncinterval 5
end
```

**In-band management**

In-band management IP addresses are an alternative to reserved HA management interfaces, and do not require reserving an interface exclusively for management access. They can be added to multiple interfaces on each cluster unit.

The in-band management IP address is accessible from the network that the cluster interface is connected to. It should be in the same subnet as the interface that you are adding it to. It cannot be in the same subnet as other interface IP addresses.

In-band management interfaces support ping, HTTP, HTTPS, and SNMP administrative access options.

Primary and secondary units send packets differently from an interface with a management IP address configured:

- On the primary unit, packets are sent to destinations based on routing information.
- On secondary units, packets can only be sent to destinations with the same management IP address segment.

---

In-band management IP address configuration is not synchronized to other cluster units.
To add an in-band management IP address to port23 with HTTPS, SSH, and SNMP access:

```plaintext
config system interface
  edit port23
    set management-ip 172.25.12.5/24
    set allowaccess https ssh snmp
  next
end
```

Upgrading FortiGates in an HA cluster

You can upgrade the firmware on an HA cluster in the same way as on a standalone FortiGate. During a firmware upgrade, the cluster upgrades the primary unit and all of the subordinate units to the new firmware image.

Before upgrading a cluster, back up your configuration (Configuration backups on page 65), schedule a maintenance window, and make sure that you are using a supported upgrade path (https://docs.fortinet.com/upgrade-tool).

Uninterrupted upgrade

An uninterrupted upgrade occurs without interrupting communication in the cluster.

To upgrade the cluster firmware without interrupting communication, the following steps are followed. These steps are transparent to the user and the network, and might result in the cluster selecting a new primary unit.

1. The administrator uploads a new firmware image using the GUI or CLI. See Upgrading individual device firmware on page 1957 for details.
2. The firmware is upgraded on all of the subordinate units.
3. A new primary unit is selected from the upgraded subordinates.
4. The firmware is upgraded on the former primary unit.
5. Primary unit selection occurs, according to the standard primary unit selection process.

If all of the subordinate units crash or otherwise stop responding during the upgrade process, the primary unit will continue to operate normally, and will not be upgraded until at least one subordinate rejoins the cluster.

Interrupted upgrade

An interrupted upgrade upgrades all cluster members at the same time. This takes less time than an uninterrupted upgrade, but it interrupts communication in the cluster. Interrupted upgrade is disabled by default.

To enable interrupted upgrade:

```plaintext
config system ha
  set uninterruptible-upgrade disable
end
```

HA between remote sites over managed FortiSwitches

In a multi-site FortiGate HA topology that uses managed FortiSwitches in a multi-chassis link aggregation group (MCLAG) to connect between sites, HA heartbeat signals can be sent through the switch layer of the FortiSwitches,
instead of through back-to-back links between the heartbeat interfaces. This means that two fiber connections can be used, instead of four (two back-to-back heartbeat fiber connections and two connections for the FortiSwitches). The FortiSwitches can be different models, but must all support MCLAG and be running version 6.4.2 or later.

This example shows how to configure heartbeat VLANs to assign to the access ports that the heartbeat interfaces connect to, passing over the trunk between the FortiSwitches on the two sites.

FortiGate HA is with two FortiGates in separate locations and the switch layer connection between the FortiSwitches is used for the heartbeat signal.

To configure the example:

1. Disconnect the physical connections between Site 1 and Site 2:
   - Disconnect the cable on Site 1 FSW-1 port 12.
   - Disconnect the cable on Site 1 FSW-2 port 10.
2. Configure Site 1:
a. On the FortiGate, go to **WiFi & Switch Controller > FortiLink Interface** and configure FortiLink:

![FortiLink Interface Configuration](image)

b. Go to **System > HA** and configure HA:
   i. Set the heartbeat ports to the ports that are connected to FortiSwitch.
   ii. Adjust the priority and enable override so that this FortiGate becomes the primary.

![High Availability Configuration](image)

c. Go to **WiFi & Switch Controller > FortiSwitch VLANs** and create switch VLANs that are dedicated to each FortiGate HA heartbeat interface between the two FortiGates: Heartbeat VLAN 1000 and Heartbeat VLAN 1100.

![Switch VLANs Configuration](image)
d. Assign the native VLAN of the switch ports that are connected to the heartbeat ports to the created VLAN. Each HA heartbeat should be in its own VLAN.
   i. Go to WiFi & Switch Controller > FortiSwitch Ports.
   ii. In the Native VLAN column for the heartbeat port that is connected to FSW-1, click the edit icon and select the Heartbeat VLAN.

   ![Native VLAN Table]

   iii. In the Native VLAN column for the heartbeat port that is connected to FSW-2, click the edit icon and select the Heartbeat2 VLAN.

   e. On each FortiSwitch, enable MCLAG-ICL on the trunk port:

   ```
   config switch trunk
   edit D243217000032-0
       set mclag-icl enable
   next
   end
   ```

3. Configure Site 2 the same as Site 1, except set the HA priority so that the FortiGate becomes the secondary.

4. Disconnect the physical connections for FortiGate HA and FortiLink interfaces on Site 2:
   - Disconnect the cable on Site 2 FSW-1 ports 47 and 48.
   - Disconnect the cable on Site 2 FSW-2 ports 47 and 48.

5. Connect cables between the FortiSwitch MCLAG in Site 1 and Site 2:
   - Connect a cable from Site 1 FSW-1 port 12 to Site 2 FSW-1 port 22.
   - Connect a cable from Site 1 FSW-2 port 10 to Site 2 FSW-2 port 20.

6. On all of the FortiSwitches, configure the auto-isl-port-group. The group must match on both sides.
   a. Site 1 FSW-1:
      Set members to the port that is connected to Site 2 FSW-1:
      ```
      config switch auto-isl-port-group
      edit 1
          set members port12
      next
      end
      ```
   b. Site 1 FSW-2:
      Set members to the port that is connected to Site 1 FSW-1:
config switch auto-isl-port-group
   edit 1
   set members port22
   next
end
c. Site 2 FSW-1:
Set members to the port that is connected to Site 2 FSW-2:
config switch auto-isl-port-group
   edit 1
   set members port10
   next
end
d. Site 2 FSW-2:
Set members to the port that is connected to Site 1 FSW-2:
config switch auto-isl-port-group
   edit 1
   set members port20
   next
end

7. Connect the FortiGate HA and FortiLink interface connections on Site 2.
8. Configure a firewall policy and route for traffic so that the client can reach the internet.
9. Wait for HA to finish synchronizing and for all of the FortiSwitches to come online, then on FortiGate-1, go to WiFi & Switch Controller > Managed FortiSwitches and select the Topology view from the drop-down on the right.

The page should look similar to the following:
To test the configuration to confirm what happens when there is a failover:

1. On both PC-1 and PC-2, access the internet and monitor traffic. The traffic should be going through the primary FortiGate.
2. Perform a continuous ping to an outside IP address, then reboot any one of the FortiSwitches.
   Traffic from both Site 1 and Site 2 to the internet should be recovered in approximately five seconds.
3. Perform a continuous ping to an outside IP address, then force an HA failover (see Force HA failover for testing and demonstrations on page 2071).
   Traffic from both Site 1 and Site 2 to the internet should be recovered in approximately five seconds.
4. After an HA failover, on the new primary FortiGate, go to WiFi & Switch Controller > Managed FortiSwitch.
   The switch layer tiering will be changed so that the directly connected FortiSwitches are at the top of the topology.

HA using a hardware switch to replace a physical switch

Using a hardware switch to replace a physical switch is not recommended, as it offers no redundancy or interface monitoring.

- If one FortiGate loses power, all of the clients connected to that FortiGate device cannot go to another device until that FortiGate recovers.
- A hardware switch cannot be used as a monitor interface in HA. Any incoming or outgoing link failures on hardware member interfaces will not trigger failover; this can affect traffic.

Examples

The examples use the following topology:

Traffic between hardware switches

When using Hardware switch in HA environment, a client device connected to the hardware switch on the primary FortiGate can communicate with client devices connected to the hardware switch on secondary FortiGates as long as there is a direct connection between the two switches.

No configuration is required after setting up the hardware switches. If a client connected to both of the hardware switches needs to reach destinations outside of the cluster, the firewall must be configured for it.
To configure the FortiGate devices:

1. Connect the devices as shown in the topology diagram.
2. On each FortiGate, configure HA:
   ```
   config system ha
   set mode a-a
   set group-name Example_cluster
   set hbdev ha1 10 ha2 20
   end
   ```
3. On the primary FortiGate, configure the hardware switch:
   ```
   config system virtual-switch
   edit Hardware-SW
   set physical-switch sw0
   config port
   edit port3
   next
   edit port5
   next
   end
   next
   end
   ```
4. On each FortiGate, configure the IP addresses on the hardware switches:
   ```
   config system interface
   edit Hardware-SW
   set ip 6.6.6.1 255.255.255.0
   set allowaccess ping ssh http https
   next
   end
   ```

After configuring the hardware switches, PC1 and PC2 can now communicate with each other.

Traffic passes through FortiGate

If client device needs to send traffic through the FortiGate, additional firewall configuration on the FortiGate is required.

All traffic from the hardware switches on either the primary or secondary FortiGate reaches the primary FortiGate first. The traffic is then directed according to the HA mode and firewall configuration.

To configure the FortiGate devices:

1. Connect the devices as shown in the topology diagram.
2. On each FortiGate, configure HA:
   ```
   config system ha
   set mode a-a
   set group-name Example_cluster
   set hbdev ha1 10 ha2 20
   end
   ```
3. On the primary FortiGate, configure the hardware switch:
   ```
   config system virtual-switch
   edit Hardware-SW
   ```
set physical-switch sw0
cfg port
  edit port3
  next
  edit port5
  next
end
next
edit Hardware-SW2
  set physical-switch sw0
  cfg port
  edit port1
  next
end
end

4. On each FortiGate, configure the IP addresses on the hardware switch:

  config system interface
  edit Hardware-SW
    set ip 6.6.6.1 255.255.255.0
    set allowaccess ping ssh http https
next
edit Hardware-SW2
  set ip 172.16.200.1 255.255.255.0
  set allowaccess ping ssh http https
next
end

5. On each FortiGate, configure a firewall policy:

  config firewall policy
  edit 1
    set srcintf Hardware-SW
    set dstintf Hardware-SW2
    set srcaddr all
    set dstaddr all
    set service ALL
    set action accept
    set schedule always
    set nat enable
next
end

6. On each FortiGate, configure a static route:

  config router static
  edit 1
    set device Hardware-SW2
    set gateway 172.16.200.254
next
end

Traffic from PC1 and PC2 can now reach destinations outside of the FortiGate cluster.
VDOM exceptions

VDOM exceptions are settings that can be selected for specific VDOMs or all VDOMs that are not synchronized to other HA members. This can be required when cluster members are not in the same physical location, subnets, or availability zones in a cloud environment.

Some examples of possible use cases include:

- You use different source IP addresses for FortiAnalyzer logging from each cluster member. See Override FortiAnalyzer and syslog server settings on page 2065 for more information.
- You need to keep management interfaces that have specific VIPs or local subnets that cannot transfer from being synchronized.
- In a unicast HA cluster in the cloud, you use NAT with different IP pools in different subnets, so IP pools must be exempt.

When a VDOM exception is configured, the object will not be synchronized between the primary and secondary devices when the HA forms. Different options can be configured for every object.

When VDOM mode is disabled, the configured object is excluded for the entire device. To define a scope, VDOM mode must be enabled and the object must be configurable in a VDOM.

VDOM exceptions are synchronized to other HA cluster members.

To configure VDOM exceptions:

```plaintext
config global
    config system vdom-exception
        edit 1
            set object <object name>
            set scope [all* | inclusive | exclusive]
            set vdom <vdom name>
        next
    end
end
```

| object | The name of the configuration object that can be configured independently for some or all of the VDOMs. See Objects on page 2064 for a list of available settings and resources. |
| scope  | Determine if the specified object is configured independently for all VDOMs or a subset of VDOMs. |
|        | • all: Configure the object independently on all VDOMs. |
|        | • inclusive: Configure the object independently only on the specified VDOMs. |
|        | • exclusive: Configure the object independently on all of the VDOMs that are not specified. |
| vdom   | The names of the VDOMs that are included or excluded. |

Objects

The following settings and resources can be exempt from synchronization in an HA cluster:
Override FortiAnalyzer and syslog server settings

In an HA cluster, secondary devices can be configured to use different FortiAnalyzer devices and syslog servers than the primary device. VDOMs can also override global syslog server settings.

Configure a different syslog server on a secondary HA device

```
log.fortianalyzer.setting                  user.radius
log.fortianalyzer.override-setting        system.interface
log.fortianalyzer2.setting                vpn.ipsec.phase1-interface
log.fortianalyzer2.override-setting      vpn.ipsec.phase2-interface
log.fortianalyzer3.setting               router.bgp
log.fortianalyzer3.override-setting      router.route-map
log.fortianalyzer-cloud.setting          router.prefix-list
log.fortianalyzer-cloud.override-setting firewall.ippool
log.syslogd.setting                     firewall.ippool6
log.syslogd.override-setting             router.static
log.syslogd2.setting                     router.static6
log.syslogd2.override-setting            firewall.vip
log.syslogd3.setting                     firewall.vip6
log.syslogd3.override-setting            system.sdwan
log.syslogd4.setting                     system.saml
log.syslogd4.override-setting            router.policy
system.central-management                router.policy6
system.csf
```
To configure the primary HA device:

1. Configure a global syslog server:
   
   ```
   config global
   config log syslog setting
   set status enable
   set server 172.16.200.44
   set facility local6
   set format default
   end
   end
   ```

2. Set up a VDOM exception to enable setting the global syslog server on the secondary HA device:
   
   ```
   config global
   config system vdom-exception
   edit 1
   set object log.syslogd.setting
   next
   end
   end
   ```

To configure the secondary HA device:

1. Configure a global syslog server:
   
   ```
   config global
   config log syslogd setting
   set status enable
   set server 172.16.200.55
   set facility local5
   end
   end
   ```

2. After the primary and secondary device synchronize, generate logs on the secondary device.

To confirm that logs are been sent to the syslog server configured on the secondary device:

1. On the primary device, retrieve the following packet capture from the secondary device's syslog server:

   ```
   # diagnose sniffer packet any "host 172.16.200.55" 6
   interfaces=[any]
   filters=[host 172.16.200.55]
   ```

   ```
   266.859494 port2 out 172.16.200.2.7434 -> 172.16.200.55.514: udp 278

   ```
Configure a different syslog server in the root VDOM on a secondary HA device

To configure the primary HA device:

1. Configure a global syslog server:
   ```
   config global
   config log syslog setting
   set status enable
   set server 172.16.200.44
   set facility local6
   set format default
   end
   end
   ```

2. Set up a VDOM exception to enable syslog-override in the secondary HA device root VDOM:
   ```
   config global
   config system vdom-exception 
   edit 1
   set object log.syslogd.override-setting
   set scope inclusive
   set vdom root
   next
   end
   ```
3. In the VDOM, enable `syslog-override` in the log settings, and set up the override syslog server:

```bash
config root
    config log setting
        set syslog-override enable
    end
config log syslog override-setting
    set status enable
    set server 172.16.200.44
    set facility local6
    set format default
end
```

After `syslog-override` is enabled, an override syslog server must be configured, as logs will not be sent to the global syslog server.

To configure the secondary HA device:

1. Configure an override syslog server in the root VDOM:

```bash
config root
    config log syslogd override-setting
        set status enable
        set server 172.16.200.55
        set facility local5
        set format default
    end
```

2. After the primary and secondary device synchronize, generate logs in the root VDOM on the secondary device.

To confirm that logs are been sent to the syslog server configured for the root VDOM on the secondary device:

1. On the primary device, retrieve the following packet capture from the syslog server configured in the root VDOM on the secondary device:

```
# diagnose sniffer packet any "host 172.16.200.55" 6
interfaces=[any]
filters=[host 172.16.200.55]

Routing NetFlow data over the HA management interface

In an HA environment, the ha-direct option allows data from services such as syslog, FortiAnalyzer, SNMP, and NetFlow to be routed over the outgoing interface.

The following example shows how NetFlow data can be routed over the HA management interface mgmt1.

To route NetFlow data over the HA management interface:

1. On the primary unit (FortiGate A), configure the HA and mgmt1 interface settings:

   (global) # config system ha
   set group-name "test-ha"
   set mode a-p
   set password ********
   set hbdev "port6" 50
   set hb-interval 4
   set hb-lost-threshold 10
   set session-pickup enable
   set ha-mgmt-status enable
   config ha-mgmt-interfaces
     edit 1
       set interface "mgmt1"
     next
   end
   set override enable
   set priority 200
   set ha-direct enable
   end

   (global) # config system interface
   edit "mgmt1"
     set ip 10.6.30.111 255.255.255.0
     set allowaccess ping https ssh http telnet fgfm
     set type physical
     set dedicated-to management
     set role lan
     set snmp-index 1
     next
   end

2. On the secondary unit (FortiGate B), configure the HA and mgmt1 interface settings:

   (global) # config system ha
   set group-name "test-ha"
   set mode a-p
   set password ********
   set hbdev "port6" 50
   set hb-interval 4
set hb-lost-threshold 10
set session-pickup enable
set ha-mgmt-status enable
config ha-mgmt-interfaces
  edit 1
    set interface "mgmt1"
  next
end
set override enable
set priority 100
set ha-direct enable
end

(global) # config system interface
  edit "mgmt1"
    set ip 10.6.30.112 255.255.255.0
    set allowaccess ping https ssh http telnet fgfm
    set type physical
    set dedicated-to management
    set role lan
    set snmp-index 1
  next
end

3. On the primary unit (FortiGate A), configure the NetFlow setting:

   (global) # config system netflow
     set collector-ip 10.6.30.59
end

4. Verify that NetFlow uses the mgmt1 IP:

   (global) # diagnose test application sflowd 3

5. Verify that the NetFlow packets are being sent by the mgmt1 IP:

   (vdom1) # diagnose sniffer packet any 'udp and port 2055' 4
   interfaces=[any]
   filters=[udp and port 2055] 8.397265 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 60
   23.392175 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 188
   23.392189 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 60
   ...
   3 packets received by filter
   0 packets dropped by kernel

6. On the secondary device (FortiGate B), change the priority so that it becomes the primary:

   (global) # config system ha
     set priority 250
end

7. Verify the NetFlow status on FortiGate A, which is using the new primary's mgmt1 IP:

   (global) # diagnose test application sflowd 3

8. Verify that the NetFlow packets use the new source IP on FortiGate B:

   (vdom1) # diagnose sniffer packet any 'udp and port 2055' 4
   interfaces=[any]
   filters=[udp and port 2055]
7.57974 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 60
22.58183 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 60
29.03833 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 1140
^C
3 packets received by filter
0 packets dropped by kernel

Force HA failover for testing and demonstrations

This command should only be used for testing, troubleshooting, maintenance, and demonstrations.
Do not use it in a live production environment outside of an active maintenance window.

HA failover can be forced on an HA primary device. The device will stay in a failover state regardless of the conditions.
The only way to remove the failover status is by manually turning it off.

Syntax

execute ha failover set <cluster_id>
execute ha failover unset <cluster_id>

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cluster_id&gt;</td>
<td>The cluster ID is 1 for any cluster that is not in virtual cluster mode, and can be 1 or 2 if virtual cluster mode is enabled.</td>
</tr>
</tbody>
</table>

Example

To manually force an HA failover:

```
# execute ha failover set 1
Caution: This command will trigger an HA failover.
It is intended for testing purposes.
Do you want to continue? (y/n)y
```

To view the failover status:

```
# execute ha failover status
failover status: set
```

To view the system status of a device in forced HA failover:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-300D
Mode: HA A-P
Group: 240
Debug: 0
Cluster Uptime: 0 days 2:11:46
Cluster state change time: 2020-03-12 17:38:04
Primary selected using:
```
<2020/03/12 17:38:04> FGT3HD3914800153 is selected as the primary because it has EXE_FAIL_OVER flag set.
<2020/03/12 15:27:26> FGT3HD3914800069 is selected as the primary because it has the largest value of override priority.

ses_pickup: disable
override: enable

Configuration Status:
  FGT3HD3914800069 (updated 4 seconds ago): in-sync
  FGT3HD3914800153 (updated 3 seconds ago): in-sync

System Usage stats:
  FGT3HD3914800069 (updated 4 seconds ago):
    sessions=5, average-cpu-user/nice/system/idle=0%/0%/0%/100%, memory=30%
  FGT3HD3914800153 (updated 3 seconds ago):

Disabling stateful SCTP inspection

There is an option in FortiOS to disable stateful SCTP inspection. This option is useful when FortiGates are deployed in a high availability (HA) cluster that uses the FortiGate Clustering Protocol (FGCP) and virtual clustering in a multihoming topology. In this configuration, the primary stream control transmission protocol (SCTP) path traverses the primary FortiGate node by using its active VDOM (for example, VDOM1), and the backup SCTP path traverses the other passive FortiGate node by using its active VDOM (for example, VDOM2).

When stateful SCTP inspection is enabled, SCTP heartbeat traffic fails by means of the backup path because the primary path goes through a different platform and VDOM. Since there is no state sharing between VDOMs, the passive FortiGate is unaware of the original SCTP session and drops the heartbeats because of no associated sessions. When stateful SCTP inspection is disabled, the passive node permits the SCTP heartbeats to pass.

When set to enable, SCTP session creation without SCTP INIT is enabled. When set to disable, SCTP session creation without SCTP INIT is disabled (this is the default setting):

cfg system settings
  set sctp-session-without-init {enable | disable}
end

The following is an example topology and scenario:
In this example, FGT_A and FGT_B are in HA a-p mode with two virtual clusters. Two primaries exist on different FortiGate units. PC1 eth1 can access PC5 eth1 through VDOM1, and PC1 eth2 can access PC5 eth2 through VDOM2.

On PC5, to listen for an SCTP connection:
```
sctp_darn -H 172.16.200.55 -B 172.17.200.55 -P 2500 -l
```

On PC1, to start an SCTP connection:
```
sctp_darn -H 10.1.100.11 -B 20.1.100.11 -P 2600 -c 172.16.200.55 -c 172.17.200.55 -p 2500 -s
```

An SCTP four-way handshake is on one VDOM, and a session is created on that VDOM. With the default configuration, there is no session on any other VDOM, and the heartbeat on another path (another VDOM) is dropped. After enabling `sctp-session-without-init`, the other VDOM creates the session when it receives the heartbeat, and the heartbeat is forwarded:
```
config system settings
  set sctp-session-without-init enable
end
```

**Resume IPS scanning of ICCP traffic after HA failover**

After HA failover occurs, the IPS engine will resume processing ICCP sessions and keep the traffic going on the new primary unit. `session-pickup` must be enabled in an active-passive cluster to pick up the ICCP sessions.

**Example**

The following example uses an active-passive cluster. See HA active-passive cluster setup on page 2037 for more information.

**To configure HA:**

```
config system ha
  set group-name "HA-APP"
  set mode a-p
  set password ************
  set hbdev "port3" 100
  set session-pickup enable
  set override enable
end
```
**Session states before failover**

When HA is working, the ICCP session information is stored in the HA session cache on the secondary FortiGate.

**To verify the HA session cache on the secondary FortiGate:**

```
# diagnose ips share list
HA Session Cache
 client=10.1.100.178:57218 server=172.16.200.177:102
   service=39, ignore_app_after=0, last_app=76919, buffer_len=32
 stock tags: nr=981, hash=e68dc8120970448
 custom tags: nr=0, hash=1a4b996b6a42aa2
tags [count=2]: s-737, s-828,
```

The ICCP session information can be found in the IPS session list and the session table on the primary FortiGate.

**To verify the IPS session information on the primary FortiGate:**

```
# diagnose ips session list
SESSION id:1 serial:35487 proto:6 group:6 age:134 idle:1 flag:0x800012a6

```

Session states after failover

After HA failover, the IPS engine on the new primary picks up the related ICCP sessions and continues passing the traffic. The HA session cache disappears on the new primary. The ICCP session now appears on the IPS session list and session table on the new primary.

To verify the IPS session information on the new primary FortiGate:

```
# diagnose ips session list
SESSION id:1 serial:35487 proto:6 group:6 age:90 idle:2 flag:0x820012a3
    feature:0x4 encap:0 ignore:1,0 ignore_after:204800,0
tunnel:0 children:0 flag:.....-.....-i.
C-10.1.100.178:57218, S-172.16.200.177:102
state: C-ESTABLISHED/9114/0/0/0, S-ESTABLISHED/0/0/0/0 pause:0, paws:0
expire: 28
app: unknown:0 last:44684 unknown-size:0
```

The server and client IPs, ports, and protocols remain the same.

To verify the system information on the primary FortiGate:

```
# diagnose sys session list
socktype=0 sockport=0 av_idx=0 use=5
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty ndr npu syn_ses app_valid
statistic(bytes/packets/allow_err): org=38629/308/1 reply=160484/483/1 tuples=3
 tx speed(Bps/kbps): 158/1 rx speed(Bps/kbps): 1139/9
origin->sink: org pre->post, reply pre->post dev=10->9/9->10 gwy=172.16.200.177/10.1.100.178
hook=pre dir=org act=snat 10.1.100.178:57218->172.16.200.177:102(172.16.200.4:57218)
hook=pre dir=Reply act=dnat 172.16.200.177:102->172.16.200.4:57218(10.1.100.178:57218)
hook=post dir=reply act=noop 172.16.200.177:102->10.1.100.178:57218(0.0.0.0:0)
 pos/(before,after) 0/0, 0/0, 0/0,
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=1
serial=00008a9f tos=ff/ff app_list=2003 app=44684 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
```
The server and client IPs, ports, and NPU state remain the same.

**Sample log on new primary FortiGate:**

```
# execute log display
653 logs found.
10 logs returned.
65.8% of logs has been searched.
```

1: date=2021-06-04 time=17:05:20 eventtime=1622851521364635480 tz="-0700" logid="1059028704" type="utm" subtype="app-ctrl" eventtype="signature" level="information" vd="vdl" appid=44684 srcip=10.1.100.178 dstip=172.16.200.177 srcport=57218 dstport=102 srcintf="port2" dstintf="undefined" proto=6 service="tcp/102" direction="incoming" policyid=2 sessionid=35487 aplllist="test" action="pass" appcat="Industrial" app="ICCP_Transfer.Reporting" incidentserialno=198181218 msg="Industrial: ICCP_Transfer.Reporting," apprisk="elevated"
```

**Querying autoscale clusters for FortiGate VM**

When a FortiGate VM secondary device is added to a cluster, the new secondary member can query the cluster about its autoscale environment. FortiManager can then run this query on the new secondary member to update its autoscale record.

**To view cluster information from a secondary member:**

```
# diagnose sys ha checksum autoscale-cluster
```

**Cluster information sample**

**Sample cloud topology:**

```
FGT_BYOL; primary; 10.0.0.6; FGVM04TM00000066
FGT_BYOL; secondary; 10.0.0.7; FGVM00000000056
FGT_PAYG; secondary; 10.0.0.4; FGTAZ000000000CD
FGT_PAYG; secondary; 10.0.0.5; FGTAZ0000000003D
```

From the secondary device, you can see cluster checksums and the primary device:

```
# diagnose sys ha checksum autoscale-cluster
================== FGTAZ000000000CD =================
is Autoscale_master()=0
debugzone
global: 56 49 b3 02 f2 b7 5b 82 ec 2d c2 1a ff 80 8c 79
root: bf 18 cf 83 le 04 c3 04 4c e4 66 bc 38 fe 3a dc
all: 77 06 d0 89 6e 06 c0 86 17 98 53 72 33 85 ae ff
checksum
global: 56 49 b3 02 f2 b7 5b 82 ec 2d c2 1a ff 80 8c 79
root: bf 18 cf 83 le 04 c3 04 4c e4 66 bc 38 fe 3a dc
all: 77 06 d0 89 6e 06 c0 86 17 98 53 72 33 85 ae ff
================== FGVM04TM00000066 =================
```
To get ha sync information from the secondary device:

```
# get test hasync 50
autoscale_count=69. current_jiffies=41235125
  10.0.0.6, timeo=31430, serial_no=FGVM04TM19001766
  10.0.0.7, timeo=31430, serial_no=FGVM04TM19008156
  10.0.0.5, timeo=31430, serial_no=FGTAZ2R7UZRRKNR3D
```

**Cluster virtual MAC addresses**

In a cluster, the FGCP assigns virtual MAC addresses (VMACs) to each primary device interface. HA uses VMAC addresses so that if a failover occurs, the new primary device interfaces will have the same VMAC addresses and IP addresses as the failed primary device. As a result, most network equipment will identify the new primary device as the same device as the failed primary device and still be able to communicate with the cluster.

If a cluster is operating in NAT mode, the FGCP assigns a different VMAC address to each primary device interface. VLAN subinterfaces are assigned the same VMAC address as the physical interface that the VLAN subinterface is added to. Redundant or 802.3ad aggregate interfaces are assigned the VMAC address of the first interface in the redundant or aggregate list.

If a cluster is operating in transparent mode, the FGCP assigns a VMAC address to the primary device's management IP address. Since you can connect to the management IP address from any interface, all FortiGate interfaces appear to have the same VMAC address.
The MAC address of a reserved management interface does not change to a VMAC address; it keeps its original MAC address.

Subordinate device MAC addresses do not change. Use `diagnose hardware deviceinfo nic <interface>` on the subordinate device to display the MAC addresses of each interface.

A MAC address conflict can occur when two clusters are operating on the same network using the same group ID (see [Diagnosing packet loss](#)). It is recommended that each cluster in the same network and broadcast domain uses a unique group ID.

**Failover**

When the new primary device is selected after a failover, the primary device sends gratuitous ARP packets to update the devices connected to the cluster interfaces (usually layer 2 switches) with the VMAC addresses. This is sometimes called using gratuitous ARP packets (or GARP packets) to train the network. The gratuitous ARP packets sent from the primary unit are intended to make sure that the layer 2 switch forwarding databases (FDBs) are updated as quickly as possible.

Sending gratuitous ARP packets is not a requirement because connected devices will eventually learn of the new ports to forward the packets to. However, many network switches will update their FDBs more quickly after a failover if the new primary device sends gratuitous ARP packets.

**Configuring ARP packet settings**

The following settings can be configured.

```plaintext
config system ha
    set arps <integer>
    set arps-interval <integer>
    set gratuitous-arps {enable | disable}
    set link-failed-signal {enable | disable}
end
```

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arps &lt;integer&gt;</td>
<td>Set the number of gratuitous ARPs; lower the value to reduce failover time (1 - 60, default = 5).</td>
</tr>
<tr>
<td>arps-interval &lt;integer&gt;</td>
<td>Set the time between gratuitous ARPs; lower the value to reduce failover time, and increase the value to reduce traffic, in seconds (1 - 20, default = 8).</td>
</tr>
<tr>
<td>gratuitous-arps {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>link-failed-signal {enable</td>
<td>disable}</td>
</tr>
</tbody>
</table>

If you disable sending gratuitous ARP packets, it is recommended to enable the `link-failed-signal` setting. The `linked-fail-signal` alerts the connected switches of a failed link, which triggers them to react immediately to the changes.

For more information about gratuitous ARP packets see [RFC 826](https://tools.ietf.org/html/rfc826) and [RFC 3927](https://tools.ietf.org/html/rfc3927).
**Determining VMAC addresses**

A VMAC address is determined based on following formula:

\[ \text{<group-prefix>}:\text{<group-id\_hex}>:(\text{<vcluster\_integer>} + \text{<idx>}) \]

The \text{<group-prefix>} is determined by the following set of group IDs:
- Set 1: group IDs 0 - 255: group prefix 00:09:0f:09
- Set 2: group IDs 256 - 511: group prefix e0:23:ff:fc
- Set 3: group IDs 512 - 767: group prefix e0:23:ff:fd
- Set 4: group IDs 768 - 1023: group prefix e0:23:ff:fe

The \text{<group-id\_hex>} is determined by the group ID \% 256, converted to hexadecimal. For example:

<table>
<thead>
<tr>
<th>Group ID</th>
<th>Hexadecimal ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>0: 0 % 256 = 0</td>
<td>00</td>
</tr>
<tr>
<td>255: 255 % 256 = 255</td>
<td>ff</td>
</tr>
<tr>
<td>256: 256 % 256 = 0</td>
<td>00</td>
</tr>
<tr>
<td>511: 511 % 256 = 255</td>
<td>ff</td>
</tr>
<tr>
<td>512: 512 % 256 = 0</td>
<td>00</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
</tr>
</tbody>
</table>

The \text{<vcluster\_integer>} is 00 for virtual cluster 1, and 20 for virtual cluster 2. If VDOMs are not enabled, HA sets the virtual cluster to 1 and by default all interfaces are in the root VDOM. Including virtual cluster and VDOM factors in the VMAC address formula means that the same formula can be used whether or not VDOMs and virtual clustering are enabled.

The \text{<idx>} is the index number of the interface. Interfaces are numbered from 0 to x (where x is the number of interfaces). Interfaces are numbered according to their map order. The first interface has an index of 0. The second interface in the list has an index of 1, and so on.

The following table compares the VMAC addresses for interfaces with an unchanged HA group ID (0) with VDOMs not enabled and interfaces when the group ID is changed to 34:

<table>
<thead>
<tr>
<th>Interface</th>
<th>VMAC address with unchanged group ID (0)</th>
<th>VMAC address with changed group ID (34)</th>
</tr>
</thead>
<tbody>
<tr>
<td>port5</td>
<td>00-09-0f-09-00-0a</td>
<td>00-09-0f-09-22-0a</td>
</tr>
<tr>
<td>port6</td>
<td>00-09-0f-09-00-0b</td>
<td>00-09-0f-09-22-0b</td>
</tr>
<tr>
<td>port7</td>
<td>00-09-0f-09-00-0c</td>
<td>00-09-0f-09-22-0c</td>
</tr>
<tr>
<td>port8</td>
<td>00-09-0f-09-00-0d</td>
<td>00-09-0f-09-22-0d</td>
</tr>
</tbody>
</table>

Using the same interfaces, a cluster with VDOMs is enabled and the group ID changes to 35. The root VDOM contains port5 and port6 (virtual cluster 1), and vdom_1 contains port7 and port8 (virtual cluster 2). The interfaces have the following VMAC addresses:
### Displaying VMAC addresses

Each FortiGate physical interface has two MAC addresses: the permanent and current hardware addresses. The permanent hardware address cannot be changed, as it is the actual MAC address of the interface hardware. The current hardware address can be changed, as it is the address seen by the network.

**To change the current hardware address on a FortiGate not operating in HA:**

```
config system interface
  edit <name>
    set macaddr <address>
  next
end
```

In an operating cluster, the current hardware address of each cluster device interface is changed to the HA virtual MAC address by the FGCP. The `macaddr` option is not available for a functioning cluster.

**To display MAC addresses on a FortiGate operating in HA:**

```
# diagnose hardware deviceinfo nic port1
...
Current_HWaddr 00:09:0f:09:ff:02
Permanent_HWaddr 08:5b:0e:72:3b:b2
```

### Diagnosing packet loss

A network can experience packet loss when two FortiGate HA clusters are deployed in the same broadcast domain due to MAC address conflicts. You can resolve the MAC address conflict by changing the HA group ID (or cluster ID) configuration of the two clusters.
You can diagnose packet loss by pinging from one cluster to the other, or by pinging both of the clusters from a device within the broadcast domain.

**To check for a MAC address conflict in a HA cluster:**

1. On Cluster_1 and Cluster_2, check the VMAC address (Current_HWaddr) used in an interface on the primary device:

   ```
   # diagnose hardware deviceinfo nic <interface>
   ```

   If the group prefix and group hexadecimal ID are identical, there will be MAC address conflicts.

2. Change one of the clusters to use a different group ID:

   ```
   config system ha
   set group-id <integer>
   end
   ```

**Abbreviated TLS handshake after HA failover**

TLS sessions that pass through an HA A-A or A-P cluster can use an abbreviated TLS handshake instead of a full TLS handshake upon failover from a primary HA unit to a secondary HA unit. This reduces session pickup delays by reducing the time needed to renegotiate the TLS session, given that the TLS session ticket can be re-used.

To accomplish this, FortiOS uses the web proxy global `ssl-ca-cert` to generate the key used in the TLS session ticket:

```
config web-proxy global
   set ssl-ca-cert "Fortinet_CA_SSL"
end
```

The certificate can be synchronized to the secondary HA unit, which allows the secondary unit to generate the same session key for a TLS session. When a TLS session reconnects after HA failover using the same session ticket as the first session, the new primary unit is able to generate the same key matching that session ticket and allow an abbreviated handshake.
**Example**

In this example, OpenSSL is used to create a TLS session between the client and the server through the primary FortiGate. The session ticket is outputted and saved. Upon failover, the same session ticket is reused to create a TLS session through the new primary unit. Because the new primary unit uses the same certificate to generate the key for the TLS session ticket, it allows the connection to be made using an abbreviated TLS handshake.

1. On the client using OpenSSL, open a new session to 172.16.200.44:443 and output the session ticket to a file called aaa.txt. This session will pass through the current HA primary unit:
   
   ```
   # openssl s_client -connect 172.16.200.44:443 -sess_out aaa.txt
   ```

2. Fail over the primary unit to the secondary unit. The HA secondary unit starts handling the traffic.

3. On the client, try connecting to 172.16.200.44:443 using the same saved session ticket as before (aaa.txt):
   
   ```
   # openssl s_client -connect 172.16.200.44:443 -sess_in aaa.txt
   ```

4. Verify whether the session succeeds in using the original session ticket:

   **Reused, TLSv1.3, Cipher is TLS_AES_256_GCM_SHA384**
   
   Server public key is 4096 bit
   Secure Renegotiation IS NOT supported
   Compression: NONE
   Expansion: NONE
   No ALPN negotiated
   Early data was not sent
   Verify return code: 19 (self signed certificate in certificate chain)
   ...

   If the session is established using the same ticket, **Reused, TLSv1.3, Cipher is <name>** is displayed. If session is established using a new ticket, **New, TLSv1.3, Cipher is <name>** is displayed.

   The new primary is able to use the web proxy global `ssl-ca-cert` to generate the same key as the old primary that was used in the session ticket. So, the second TLS connection that reuses the TLS session ticket from the first session can complete an abbreviated TLS handshake.
Session synchronization during HA failover for ZTNA proxy sessions

User information and TLS sessions are synchronized between HA members for ZTNA proxy sessions. When a failover occurs, the new primary unit will continue allowing sessions from the logged in users without asking for the client certificate and re-authentication again.

Example

In this example, a FortiGate HA pair is acting as a ZTNA access proxy. Clients that are trying to access the web server on qa.test.com are proxied by the ZTNA access proxy. Remote clients must be registered to the EMS server, and pass a client certificate check and user authentication in order to connect. Upon HA member failure, a failover occurs and the new primary unit will continue to allow connections without requesting client certificate check and user authentication for existing users and devices.

This example assumes ZTNA and EMS server settings are already configured.

To configure the HA settings:

```
config system ha
  set group-name "501E"
  set mode a-p
  set password **********
  set hbdev "ha" 0
  set session-pickup enable
  set override disable
  set monitor "port1" "port2"
end
```

To verify that the proxy sessions are synchronized between HA members:

1. On the client, access the web server. The ZTNA access proxy challenges the user for a client certificate and user authentication.
2. On the primary FortiGate, verify that the user information and TLS sessions are synchronized between HA members.

   a. Verify the list of proxy users:

```
501E-primary # diagnose wad user list
ID: 1, VDOM: root, IPv4: 10.1.100.22
   user name : localuser1
   worker : 0
   duration : 8
   auth_type : IP
   auth_method : Basic
   pol_id : 1
   g_id : 0
   user_based : 1
   expire : 597
LAN:
   bytes_in=2093 bytes_out=5753
WAN:
   bytes_in=2024 bytes_out=1235
```

   b. Apply a filter to WAD debug to diagnose the wad informer process:

```
501E-primary # diagnose test application wad 2400
Set diagnosis process: type=informer index=0 pid=305
```

   c. Show the user cache from the WAD informer. Verify that the localuser1 entry exists:

```
501E-primary # diagnose test application wad 110
users:
[1]  localuser1@10.1.100.22:0 upn_domain= from:worker worker:6 vf:0 ref:1 stale=0
       ntlm:0, has_fsae:0, guest:0
          user_node:(0x7fe18dfc0048) user:1[max=65536](0x7fe18dd08048) ip:1
            (0x7fe18dd00048) scheme:0 outofsync:0(0) id:1
...
```

   d. Verify using WAD real-time debugs on the secondary FortiGate. The user information is synchronized to the secondary FortiGate:

```
501E-secondary # diagnose wad debug enable category all
501E-secondary # diagnose wad debug enable level verbose
501E-secondary # diagnose debug enable
[I][p:296]  wad_proc_informer_ha_dgram_on_read:2811  Got HA msg: type=0, sizeof(msg)=8, dlen=80, sz=88
[I][p:296]  wad_proc_informer_on_ha_user_add :1493  reader: ip=10.1.100.22:45852 vf=0 seq=0 grp_type=0 scheme=0 is_ntlm=0 has_fsae=0 concur_user=65536 domain=''
[I][p:296]  wad_informer_update_user_ext :782
   ip=10.1.100.22:45852 name=localuser1 from=worker
```
3. Verify the user cache from the WAD informer:

    501E-secondary # diagnose test application wad 110
    users:
        [1]   localuser1@10.1.100.22:0 upn_domain= from:worker worker:-126 vf:0 ref:1 stale=0
              ntlm:0, has_fsae:0, guest:0
              user_node:0x7fc1c84dd048, user_ip:0x7fc1c84ed048(0), user:0x7fc1c84f5048(0).

If the client tries to access the web server again after failover occurs, the client certificate check and authentication prompt does not appear. ZTNA allows the traffic to pass.

The ZTNA logs for both FortiGates contain the same user information.

**Troubleshoot an HA formation**

The following are requirements for setting up an HA cluster or FGSP peers.

Cluster members must have:

- The same model.
- The same hardware configuration.
The same connections.
The same generation.

The requirement to have the same generation is done as a best practice as it avoids issues that can occur later on. If you are unsure if the FortiGates are from the same generation, please contact customer service.

Troubleshooting common HA formation errors

One member keeps shutting down during HA setup (hard drive failure):

If one member has a hard drive failure but the other does not, the one with the hard drive failure will be shut down during HA setup. In this case, RMA the member to resolve the issue.

Split brain scenario:

A split brain scenario occurs when two or more members of a cluster cannot communicate with each other on the heartbeat interface, causing each member to think it is the primary. As a result, each member assumes the primary HA role and applies the same IP and virtual MAC addresses on its interfaces. This causes IP and MAC conflicts on the network, and causes flapping on L2 devices when they learn the same MAC address on ports connected to different FortiGates.

A split brain scenario is usually caused by a complete lost of the heartbeat link or links. This can be a physical connectivity issue, or less commonly, something blocking the heartbeat packets between the HA members. Another cause is congestion and latency in the heartbeat links that exceeds the heartbeat lost intervals and thresholds.

The following are common symptoms of a split brain scenario:

- The connections to the FortiGates in the cluster work intermittently when trying to connect with administrative access.
- Sessions cannot be established through the FortiGate, and the traffic drops.
- When logging in to the FortiGates using the `console`, `get system ha status` shows each FortiGate as the primary.

To resolve a split brain scenario:

- Be physically on-site with the FortiGates (recommended). If this is not possible, connect to the FortiGates using console access.
- Identify the heartbeat ports, and verify that they are physically connected and up.
- Verify that heartbeat packets are being sent and received on the heartbeat ports.
- Verify that the HA configurations match between the HA members. The HA `mode`, `group-name`, `group-id`, and `password` settings should be the same. Different `group-id` values will result in different virtual MAC addresses, which might not cause a MAC conflict. However, an IP conflict can still occur.
- If everything seems to be in working order, run `get system ha status` to verify that HA has formed successfully.

To avoid a split brain scenario:

- In a two-member HA configuration, use back-to-back links for heartbeat interface instead of connecting through a switch.
- Use redundant HA heartbeat interfaces.
• In a configuration where members are in different locations, ensure the heartbeat lost intervals and thresholds are longer than the possible latency in the links.

**FGSP**

Standalone FortiGates or FGCP clusters can be integrated into the load balancing configuration using the FortiGate Session Life Support Protocol (FGSP) in a network where traffic is load balanced by an upstream load balancer and scanned by downstream FortiGates. FGSP can perform session synchronization of IPv4 and IPv6 TCP, SCTP, UDP, ICMP, expectation, and NAT sessions to keep the session tables synchronized on all entities. If one of the FortiGates fails, the upstream load balancer should detect the failed member and stop distributing sessions to it. Session failover occurs and active sessions fail over to the peers that are still operating. Traffic continues to flow on the new peer without data loss because the sessions are synchronized.

The FortiGates in FGSP operate as peers that process traffic and synchronize sessions. An FGSP deployment can include two to 16 standalone FortiGates, or two to 16 FortiGate FGCP clusters of two members each. Adding more FortiGates increases the CPU and memory required to keep all of the FortiGates synchronized, and it increases network synchronization traffic. Exceeding the numbers of members is not recommended and may reduce overall performance. By default, FGSP synchronizes all IPv4 and IPv6 TCP sessions, and IPsec tunnels. You can optionally add filters to control which sessions are synchronized, such as synchronizing packets from specific source and destination addresses, source and destination interfaces, or services.

---

**FGSP is also compatible with FortiGate VRRP.**

---

FGSP is primarily used instead of FGCP when external load balancers are part of the topology, and they are responsible for distributing traffic amongst the downstream FortiGates. FGSP provides the means to synchronize sessions between the FortiGate peers without needing a primary member to distribute the sessions like in FGCP active-active mode. If the external load balancers direct all sessions to one peer, the effect is similar to active-passive FGCP HA. If external load balancers balance traffic to both peers, the effect is similar to active-active FGCP HA. The load balancers should be configured so that all packets for any given session are processed by the same peer, including return packets whenever possible.
Session pickup

Session pickup is an optional setting that can be enabled to synchronize connectionless (UDP and ICMP) sessions, expectation sessions, and NAT sessions. If session pickup is not enabled, the FGSP does not share session tables for the particular session type, and sessions do not resume after a failover. All sessions are interrupted by the failover and must be re-established at the application level. Many protocols can successfully restart sessions with little, or no, loss of data. Others may not recover as easily. Enable session pickup for sessions that may be difficult to reestablish. Since session pickup requires FortiGate memory and CPU resources, only enable this feature for sessions that need to synchronize.

Session synchronization link

The session synchronization link is an optional configuration that allows peers to synchronize sessions over a dedicated interface instead of the interface in which the peer IP is routed. In this configuration, communications occur over L2 instead of L3. Configuring session synchronization links is recommended when you want to minimize traffic over the peering interface when there are many sessions that need to be synchronized.

Expectation sessions

FortiOS session helpers keep track of the communication of layer 7 protocols, such as FTP and SIP, that have control sessions and expectation sessions. The control sessions establish the link between the server and client, and negotiate the ports and protocols that will be used for data communications. The session helpers then create expectation sessions through the FortiGate for the ports and protocols negotiated by the control session.

The expectation sessions are the sessions that actually communicate data. For FTP, the expectation sessions transmit files being uploaded or downloaded. For SIP, the expectation sessions transmit voice and video data. Expectation sessions usually have a timeout value of 30 seconds. If the communication from the server is not initiated within 30 seconds, the expectation session times out and traffic will be denied.

By default, FGSP does not synchronize expectation sessions; if a failover occurs, the sessions will have to be restarted.

To synchronize expectation sessions so they continue after a failover:

```config system ha
  set session-pickup enable
  set session-pickup-expectation enable
end```

- FGSP session synchronization between different FortiGate models or firmware versions on page 2108
**FGSP basic peer setup**

The FortiGate Session Life Support Protocol (FGSP) is a proprietary HA solution for only sharing sessions between entities based on peer-to-peer communications. The entities could be standalone FortiGates or an FGCP cluster. This example uses two peer FortiGates. The load balancer is configured to send all sessions to Peer_1, and if Peer_1 fails, all traffic is sent to Peer_2.

![Topology Diagram](image)

**To configure a basic FGSP peer setup:**

These instructions assume that all FortiGates have been factory reset.

1. Make all the necessary connections as shown in the topology diagram.
2. On Peer_1, configure the peer IP in which this device will peer with:

   ```
   config system cluster-sync
   edit 1
   set peerip 10.10.10.2
   next
   end
   ```

   If there are multiple peer IPs from the same peer, enter them as separate entries. If there are multiple peers, enter the IP of each peer in separate entries. See [Optimizing FGSP session synchronization and redundancy](#) on page 2101 for an example.

   Sessions by default will be synchronized over layer 3 on the interface in which the current unit connects to the peer’s IP.

3. On Peer_2, configure session synchronization:

   ```
   config system cluster-sync
   edit 1
   set peerip 10.10.10.1
   next
   end
   ```

4. Configure identical firewall policies on each peer, such as for traffic going from the same incoming interface (port1) to the outgoing interface (port2).
To test the FGSP peer setup:

1. Initiate TCP traffic (like HTTP access) to go through Peer_1.
2. Check the session information:
   
   ```
   # diagnose sys session filter src <IP_address>
   # diagnose sys session list
   ```
3. Enter the same commands on Peer_2 to verify if the same session information appears.

Optional filters

Filters can be added to synchronize certain types of sessions that meet the filter criteria.

To add filters for session synchronization:

```fortiosconfig
config system cluster-sync
edit <id>
   config session-sync-filter
      set srcintf <interface>
      set dstintf <interface>
      set srcaddr <IPv4_address>
      set dstaddr <IPv4_address>
      set srcaddr6 <IPv6_address>
      set dstaddr6 <IPv6_address>
   end
next
end
```

Filter examples

To synchronize only sessions with a particular source subnet:

```fortiosconfig
config system cluster-sync
edit 1
   config session-sync-filter
      set srcaddr 192.168.20.0/24
   end
next
end
```

To synchronize only sessions with a particular source address range:

```fortiosconfig
config system cluster-sync
edit 1
   config session-sync-filter
      set srcaddr 192.168.20.10 192.168.20.20
   end
next
end
```
To synchronize only sessions with a particular destination address range:

```
config system cluster-sync
  edit 1
    config session-sync-filter
      set dstaddr 2001:db8:0:2::/64
    end
  next
end
```

**Session pickup**

You can enable this setting to synchronize connectionless (UDP and ICMP) sessions, expectation sessions, and NAT sessions. If session pickup is not enabled, the FGSP does not share session tables for the particular session type, and sessions do not resume after a failover.

**To enable UDP and ICMP session synchronization:**

```
config system ha
  set session-pickup enable
  set session-pickup-connectionless enable
end
```

**Session synchronization**

You can specify interfaces used to synchronize sessions in L2 instead of L3 using the `session-sync-dev` setting. For more information about using session synchronization, see Session synchronization interfaces in FGSP on page 2094.

**To configure session synchronization over redundant L2 connections:**

```
config system standalone-cluster
  set session-sync-dev <interface 1> [<interface 2>] ... [<interface n>]
end
```

**VDOM synchronization**

When multi-VDOM mode is enabled, you can specify the peer VDOM and the synchronized VDOMs. The peer VDOM contains the session synchronization link interface on the peer unit. The synchronized VDOMs' sessions are synchronized using this session synchronization configuration.

**To synchronize between VDOMs:**

```
config system cluster-sync
  edit 1
    set peerip <IP address>
    set peervd <vdom>
    set syncvd <vdom 1> [<vdom 2>] ... [<vdom n>]
  next
end
```
Synchronizing sessions between FGCP clusters

Synchronizing sessions between FGCP clusters is useful when data centers in different locations are used for load balancing, and traffic must be shared and flow freely based on demand.

There are some limitations when synchronizing sessions between FGCP clusters:

- All FortiGates must have the same model and generation, hardware configuration, and FortiOS version.
- A total of 16 clusters can share sessions.

To configure session synchronization between two clusters:

1. Configure the two clusters (see HA active-passive cluster setup on page 2037 or HA active-active cluster setup on page 2039).
2. On cluster A, configure the peer IP for the interface:

```plaintext
config system interface
   edit "port5"
      set vdom "root"
      set ip 10.10.10.1 255.255.255.0
      set allowaccess ping https ssh snmp http telnet
   next
end
```

In this example, cluster A uses port5 and its IP address, 10.10.10.1, is reachable from another cluster.
3. On cluster A, configure cluster and session synchronization:

```conf
config system cluster-sync
edit 1
  set peerip 10.10.10.2
next
end
```

4. On cluster A, configure additional FGSP attributes as needed:

```conf
config system standalone-cluster
  set standalone-group-id 1
  set group-member-id 0
  set session-sync-dev <interface>
end
```

The `standalone-group-id` must match between FGSP members. The `group-member-id` is unique for each FGCP cluster. `session-sync-dev` is an optional command to specify the interfaces to sync sessions.

5. On cluster B, configure the peer IP for the interface:

```conf
config system interface
edit "port5"
  set vdom "root"
  set ip 10.10.10.2 255.255.255.0
  set allowaccess ping https ssh snmp http telnet
next
end
```

In this example, cluster B uses port5 and its IP address, 10.10.10.2, is reachable from another cluster.

6. On cluster B, configure cluster and session synchronization:

```conf
config system cluster-sync
edit 1
  set peerip 10.10.10.1
next
end
```

7. On cluster B, configure additional FGSP attributes as needed:

```conf
config system standalone-cluster
  set standalone-group-id 1
  set group-member-id 1
  set session-sync-dev <interface>
end
```

**Session synchronization interfaces in FGSP**

When peering over FGSP, by default, the FortiGates or FGCP clusters share information over L3 between the interfaces that are configured with Peer IP addresses. When a session synchronization interface is configured and FGSP peers are directly connected on this interface, then session synchronization is done over L2, only falling back to L3 if the session synchronization interface becomes unavailable.

When using a session synchronization interface, the synchronization process is offloaded to the kernel. A fast, dedicated, and stable L2 connection should be used for the session synchronization interface between the FGSP peers. For redundancy, multiple synchronization interfaces can be configured.

To provide full redundancy, FGCP clusters can be used in FGSP peering. This is called FGCP over FGSP.
To configure session-sync interfaces:

```plaintext
config system standalone-cluster
    set session-sync-dev <interface 1> [<interface 2>] ... [<interface n>]
    set layer2-connection {available | unavailable}
    set encryption {enable | disable}
end
```

The `layer2-connection` setting is for forwarded traffic between FGSP peers. Set it to `available` if the peer interface user for traffic forwarding is directly connected and supports L2 forwarding. See UTM inspection on asymmetric traffic in FGSP on page 2096 for more information.

**Session synchronization in FGCP over FGSP**

The following topology uses multiple session synchronization interfaces with a full mesh backbone to prevent any single point of failure.

![Session Synchronization Diagram]

The state diagram summarizes the session synchronization of a TCP session. It assumes that the session is connected over FGCP Cluster 1 and processed entirely by the primary unit, Cluster-1A.
1. The session starts with the Client SYN packet.
2. As the session is established, Cluster-1A synchronizes the session with Cluster-1B over the heartbeat interface, and with Cluster-2A over the session synchronization interface.
3. Cluster-2A then synchronizes the session with Cluster-2B over its heartbeat interface.
4. The process then repeats as it transitions to different states.

Session synchronization if links fail

In the previous topology, if any single session synchronization link fails on the primary member of each cluster, session synchronization will continue on the second link from the pair of session of session synchronization interfaces.

If the second link on the primary member of the same cluster then fails, L2 session synchronization over the session synchronization interface stops, and synchronization fails over to L3 between the peer IP links.

If the Peer IP link then fails, the FGSP peers are effectively disconnected, and no session synchronization will occur.

UTM inspection on asymmetric traffic in FGSP

When traffic passes asymmetrically through FGSP peers, UTM inspection can be supported by always forwarding traffic back to the session owner for processing. The session owner is the FortiGate that receives the first packet of the session.

In this example, traffic from the internal network first hits FGT_1, but the return traffic is routed to FGT_2. Consequently, traffic bounces from FGT_2 port1 to FGT_1 port1 using FGT_1’s MAC address. Traffic is then inspected by FGT_1.
This example requires the following settings:

- The internal and outgoing interfaces of both FortiGates in the FGSP pair are in the same subnet.
- Both peers have layer 2 access with each other.

To configure FTG_1:

1. Configure the cluster, setting the peer IP to the IP address of FGT_2:

   ```
   config system cluster-sync
   edit 1
   set peerip 10.2.2.2
   next
   end
   ```

2. Configure FGSP cluster attributes:

   ```
   config system standalone-cluster
   set standalone-group-id 1
   set group-member-id 0
   set layer2-connection available
   unset session-sync-dev
   end
   ```

3. Configure the firewall policy:

   ```
   config firewall policy
   edit 1
   set srcintf "port2"
   set dstintf "port1"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set utm-status enable
   set av-profile "default"
   set logtraffic all
   set nat enable
   ```
To configure FTG_2:

1. Configure the cluster, setting the peer IP to the IP address of FGT_1:
   
   ```
   config system cluster-sync
   edit 1
   set peerip 10.2.2.1
   next
   end
   ```

2. Configure FGSP cluster attributes:
   
   ```
   config system standalone-cluster
   set standalone-group-id 1
   set group-member-id 1
   set layer2-connection available
   unset session-sync-dev
   end
   ```

3. Configure the firewall policy:
   
   ```
   config firewall policy
   edit 1
   set srcintf "port2"
   set dstintf "port1"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set utm-status enable
   set av-profile "default"
   set logtraffic all
   set nat enable
   next
   end
   ```

Results

Capture packets on FGT_2 to see that traffic bounced from FGT_2 to FGT_1 over the traffic interface.

```
FGT_2 # diagnose sniffer packet any 'host 10.1.100.15 and host 172.6.200.55' 4
interfaces=[any]
filters=[host 10.1.100.15 and host 172.16.200.55]
91.803816 port1 in 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
92.800480 port1 in 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279

92.800818 port1 out 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
```

UTM inspection on asymmetric traffic on L3

When traffic passes asymmetrically through FGSP peers, UTM inspection can be supported by always forwarding traffic back to the session owner for processing. The session owner is the FortiGate that receives the first packet of the
session.

For networks where L2 connectivity is not available, such as cloud environments, traffic bound for the session owner are forwarded through the peer interface using a UDP connection.

In this example, traffic from the internal network first hits FGT_1, but the return traffic is routed to FGT_2. Consequently, return traffic is packed and sent from FGT_2 to FGT_1 using UDP encapsulation between two peer interfaces (port 3). Traffic is then inspected by FGT_1.

To configure FGT_1:

1. Configure the cluster, setting the peer IP to the IP address of FGT_2:
   ```
   config system cluster-sync
   edit 1
   set peerip 10.2.2.2
   next
   end
   ```

2. Configure FGSP cluster attributes:
   ```
   config system standalone-cluster
   set standalone-group-id 1
   set group-member-id 0
   set layer2-connection unavailable
   unset session-sync-dev
   end
   ```

3. Configure the firewall policy:
   ```
   config firewall policy
   edit 1
   set srcintf "port2"
   set dstintf "port1"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set utm-status enable
   set av-profile "default"
   ```
To configure FTG_2:

1. Configure the cluster, setting the peer IP to the IP address of FGT_1:
   ```
   config system cluster-sync
   edit 1
   set peerip 10.2.2.1
   next
   end
   ```

2. Configure FGSP cluster attributes:
   ```
   config system standalone-cluster
   set standalone-group-id 1
   set group-member-id 1
   set layer2-connection unavailable
   unset session-sync-dev
   end
   ```

3. Configure the firewall policy:
   ```
   config firewall policy
   edit 1
   set srcintf "port2"
   set dstintf "port1"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set utm-status enable
   set av-profile "default"
   set logtraffic all
   set nat enable
   next
   end
   ```

Encryption for L3 on asymmetric traffic in FGSP

In scenarios where asymmetric routing between FGSP members occurs, the return traffic can be encrypted and routed back to the session owner on Layer 3 (L3).

To encrypt L3 traffic in FGSP:

1. Run the following on both FortiGates:
   ```
   config system standalone-cluster
   set encryption enable
   set psksecret xxxxxxxxxx
   end
   ```
Optimizing FGSP session synchronization and redundancy

By using `session-sync-dev` to offload session synchronization processing to the kernel, FGSP session synchronization can be supported to handle heavy loads.

Topology

In this topology, there are three FGSP peer groups for each FortiGate. Sessions are synchronized between each FortiGate and its peer groups. Redundancy is achieved by using two dedicated session sync device links for each peer setup. There are a total of six IPs for each session synchronization device link in each FGSP peer. When one link is fails, session synchronization is not affected.

For optimization, `sync-packet-balance` is enabled to distribute synchronization packets processing to multiple CPUs. The session synchronization process is offloaded to the kernel, and sessions are synchronized over layer 2 over the connected interfaces (set `session-sync-dev "port5" "port6"`). Jumbo frame MTU 9216 is configured on each session synchronization device link to reduce the number of packets; however, setting MTU to 9216 is entirely optional.

To configure FGT_A:

1. Configure HA:
   ```
   config system ha
     set sync-packet-balance enable
     set session-pickup enable
     set session-pickup-connectionless enable
     set session-pickup-connectionless enable
     set session-pickup-connectionless enable
     set session-pickup-nat enable
   end
   ```

2. Configure the layer 2 session synchronization links:
   ```
   config system standalone-cluster
     set session-sync-dev "port5" "port6"
   end
   ```
3. Configure the session TTL default timeout:

```
config system session-ttl
  set default 300
end
```

4. Configure the interfaces:

```
config system interface
  edit port5
    set ip 10.1.1.1/24
    set mtu-override enable
    set mtu 9216
  next
  edit port6
    set ip 10.2.2.1/24
    set mtu-override enable
    set mtu 9216
  next
end
```

5. Configure FGSP session synchronization:

```
config system cluster-sync
  edit 1
    set peerip 10.1.1.2
  next
  edit 2
    set peerip 10.2.2.2
  next
  edit 3
    set peerip 10.1.1.3
  next
  edit 4
    set peerip 10.2.2.3
  next
  edit 5
    set peerip 10.1.1.4
  next
  edit 6
    set peerip 10.2.2.4
  next
end
```

To configure FGT_B:

1. Configure HA:

```
config system ha
  set sync-packet-balance enable
  set session-pickup enable
  set session-pickup-connectionless enable
  set session-pickup-expectation enable
  set session-pickup-nat enable
end
```
2. Configure the layer 2 session synchronization links:
   
   ```
   config system standalone-cluster
       set session-sync-dev "port5" "port6"
   end
   ```

3. Configure the session TTL default timeout:
   
   ```
   config system session-ttl
       set default 300
   end
   ```

4. Configure the interfaces:
   
   ```
   config system interface
       edit port5
           set ip 10.1.1.2/24
           set mtu-override enable
           set mtu 9216
       next
       edit port6
           set ip 10.2.2.2/24
           set mtu-override enable
           set mtu 9216
       next
   end
   ```

5. Configure FGSP session synchronization:
   
   ```
   config system cluster-sync
       edit 1
           set peerip 10.1.1.1
       next
       edit 2
           set peerip 10.2.2.1
       next
       edit 3
           set peerip 10.1.1.3
       next
       edit 4
           set peerip 10.2.2.3
       next
       edit 5
           set peerip 10.1.1.4
       next
       edit 6
           set peerip 10.2.2.4
       next
   end
   ```

To configure FGT_C:

1. Configure HA:

   ```
   config system ha
       set sync-packet-balance enable
       set session-pickup enable
       set session-pickup-connectionless enable
       set session-pickup-expectation enable
   ```
set session-pickup-nat enable
end

2. **Configure the layer 2 session synchronization links:**

```plaintext
cfg system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. **Configure the session TTL default timeout:**

```plaintext
cfg system session-ttl
    set default 300
end
```

4. **Configure the interfaces:**

```plaintext
cfg system interface
    edit port5
        set ip 10.1.1.3/24
        set mtu-override enable
    set mtu 9216
    next
    edit port6
        set ip 10.2.2.3/24
        set mtu-override enable
    set mtu 9216
    next
end
```

5. **Configure FGSP session synchronization:**

```plaintext
cfg system cluster-sync
    edit 1
        set peerip 10.1.1.1
    next
    edit 2
        set peerip 10.2.2.1
    next
    edit 3
        set peerip 10.1.1.2
    next
    edit 4
        set peerip 10.2.2.2
    next
    edit 5
        set peerip 10.1.1.4
    next
    edit 6
        set peerip 10.2.2.4
    next
end
```

**To configure FGT_D:**

1. **Configure HA:**

```plaintext
cfg system ha
    set sync-packet-balance enable
```
set session-pickup enable
set session-pickup-connectionless enable
set session-pickup-expectation enable
set session-pickup-nat enable
end

2. Configure the layer 2 session synchronization links:

   config system standalone-cluster
   set session-sync-dev "port5" "port6"
   end

3. Configure the session TTL default timeout:

   config system session-ttl
   set default 300
   end

4. Configure the interfaces:

   config system interface
   edit port5
      set ip 10.1.1.4/24
      set mtu-override enable
      set mtu 9216
   next
   edit port6
      set ip 10.2.2.4/24
      set mtu-override enable
      set mtu 9216
   next
   end

5. Configure FGSP session synchronization:

   config system cluster-sync
   edit 1
      set peerip 10.1.1.1
   next
   edit 2
      set peerip 10.2.2.1
   next
   edit 3
      set peerip 10.1.1.2
   next
   edit 4
      set peerip 10.2.2.2
   next
   edit 5
      set peerip 10.1.1.3
   next
   edit 6
      set peerip 10.2.2.3
   next
   end
IKE monitor for FGSP

Split-brain situations occur in a scenario where session synchronization is down between two FGSP peers. This can have an effect if IKE fails over from one unit to another, causing the tunnel to be invalid due to the IKE session and role being out of sync, and ESP anti-replay detection. In split-brain situations, the IKE monitor provides a mechanism to maintain the integrity of the state tables and primary/secondary roles for each VPN gateway. It continues to provide fault tolerance by keeping track of the timestamp of the latest received traffic, and it uses the ESP sequence number jump ahead value to preserve the sequence number per gateway. Once the link is up, the cluster resolves the role and synchronizes the session and IKE data. During this process, if the IKE fails over from one unit to another, the tunnel will remain valid and traffic continues to flow.

The IKE monitor only works with 2 peers in FGSP.

To configure the IKE monitor:

```
config system cluster-sync
   edit <id>
   set peerip <address>
   set ike-monitor {enable | disable}
   set ike-monitor-interval <integer>
   set ike-heartbeat-interval <integer>
   set ike-seqjump-speed <integer>
next
end
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ike-monitor {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>ike-monitor-interval &lt;integer&gt;</td>
<td>Set the monitoring interval for determining how fast the cluster members detect split-brain mode, in seconds (10 - 300, default = 15).</td>
</tr>
<tr>
<td>ike-heartbeat-interval &lt;integer&gt;</td>
<td>Set the heartbeat message interval for sending the heartbeat per gateway to the other peers, in seconds (1 - 60, default = 3).</td>
</tr>
<tr>
<td>ike-seqjump-speed &lt;integer&gt;</td>
<td>Set the ESP jump ahead factor, in packets per second equivalent (1 - 10, default = 10). A value of 10 means it is the factor for a 10G interface.</td>
</tr>
</tbody>
</table>

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
Example

In this example, FortiGate A and FortiGate B are FGSP peers with port3 as the session synchronization link. The FortiGates act as IPsec dial-up servers and PCs on the 10.1.100.0 subnet are the IPsec dial-up clients. Router A acts as the external load balancer for IKE sessions between the FortiGates. Dynamic routing OSPF is configured for the FortiGates and routers.

When PC2 and other clients form IPsec dial-up tunnels to the FGSP peers, these tunnels terminate on either FortiGate A or FortiGate B, not both. For each tunnel, one FortiGate is the primary and the other is the secondary.

When the session synchronization link goes down, the FGSP split-brain scenario occurs. Without using the IKE monitor mechanism, the IKE and ESP information becomes out of sync between the two FortiGates. The secondary FortiGate for a tunnel does not receive any information about updated tunnel status. If there is a failover and tunnel traffic begins to flow to the secondary FortiGate, the tunnel will be invalidated because its state tables for that session are out of sync.

By using the IKE monitor when a split-brain scenario occurs, each unit starts periodically monitoring traffic flows and managing the sequence number jump ahead on standby units. Using a combination of timers with ESP sequence number jump ahead lets the units maintain integrity of the shared SA runtime state table, including ESP anti-replay sequence numbers.

Once the session synchronization link is up, the FGSP peers synchronize the state tables and resume regular operations.

To configure the IKE monitor:

```
config system cluster-sync
  edit 1
    set peerip 10.10.10.2
    set ike-monitor enable
    set ike-monitor-interval 12
    set ike-heartbeat-interval 2
    set ike-seqjump-speed 2
  next
end
```
**Firmware upgrades in FGSP**

The following steps are recommended to upgrade the firmware of FortiGates in an FGSP deployment. Follow these steps whether or not you have enabled standalone configuration synchronization.

This example FGSP deployment has two FortiGates, FGT-1 and FGT-2.

**To upgrade the firmware in an FGSP deployment:**

1. Switch all traffic to FGT-1:
   a. Configure the load balancer or router that distributes traffic between the FortiGates to send all traffic to FGT-1.
2. Disconnect FGT-2 from the network.
   Make sure to also disconnect the interfaces that allow heartbeat and synchronization communication with FGT-1. This is to prevent FGT-2 from communicating with FGT-1.
3. Upgrade the firmware on FGT-2.
4. Reconnect the traffic interfaces on FGT-2, but not the interfaces used for heartbeat and synchronization communication with FGT-1.
5. Switch all traffic to the newly upgraded FGT-2:
   a. Configure the load balancer or router that distributes traffic between the FortiGates to send all traffic to FGT-2.
6. Upgrade the firmware on FGT-1 (while heartbeat and synchronization communication with FGT-2 remains disconnected).
7. Reconnect the FGT-2 interfaces that allow heartbeat and synchronization communication between FGT-1 and FGT-2.
8. Restore the original traffic distribution between FGT-1 and FGT-2:
   a. Configure the load balancer or router to distribute traffic to both FortiGates in the FGSP deployment.

**FGSP session synchronization between different FortiGate models or firmware versions**

FGSP HA deployments are generally meant for interoperating between FortiGates with the same model and firmware version. However, situations may arise where individual members or FGCP clusters running over FGSP use different models or firmware versions. For example, to avoid downtime while upgrading the members, some FGSP members or clusters may be upgraded first and then re-join the FGSP peers after a successful upgrade. Or while performing maintenance, sessions may need to be offloaded to a temporary member or FGCP cluster of a different model.

Being able to perform FGSP session synchronization between members of different models or firmware versions is helpful to transition the traffic smoothly and causes minimal disruptions. This topic outlines requirements to be aware of before assessing whether FGSP session synchronization may work between members with different models or firmware versions.

**Different FortiGate models**

The general guideline is to only use FortiGate models in a similar tier and family. Vastly different models have different performance and capabilities, which may not be compatible. The goal is for two models to have similar capabilities so that data structures used in session synchronization will match, and are capable of delivering similar performance.

When considering FGSP session synchronization between two FortiGates, ensure that:

- The FortiGates use the same 32-bit kernel or 64-bit kernel.
- The FortiGates use the same type of CPU (such as ARM or x86).
For network interfaces:
- The same type of physical interface should be used on each member.
- The physical interfaces should be capable of the same speeds.
- The device memory should be similar in size. If the FortiGates have vastly different memory sizes, their performance may be different if one device supports more sessions than the other.
- The configurations related to session tables should match. For example, the logical names used in firewall policies, IPsec interface names, VDOM names, firewall policy tables, and so on.

Virtual clusters and asymmetric routing are not supported.

Different firmware versions

When operating in FGSP, the firmware needs to have compatible data structures and session synchronization packet headers. The firmware is generally able to handle different data structures between old and new FortiOS sessions. Session synchronization packets are typically the same between versions.

Note the following exceptions and guidelines when assessing FGSP session synchronization compatibility between different firmware versions:
- FortiOS 7.0.2 added support for widening the HA virtual MAC address range. This change updated the session synchronization packet header structure.
  - FortiGates running 7.0.2 or later, and FortiGates running 7.0.1 or earlier will not accept session synchronization packets from each other.
- If the traffic uses a new feature only available in a newer FortiOS version, it may not work when synchronized to an older FortiOS version.
  - For example, PFCP (Packet Forwarding Control Protocol) support was added in 7.0.1, and a PFCP profile name was added to the sessions. When the sessions are synchronized to an older firmware version, the PFCP profile name will be lost and the sessions will not be able to handle the traffic as they would in 7.0.1.

Session synchronization interfaces

Session synchronization between FGSP members uses an L3 connection over the peer IP by default.

Session synchronization between FGSP members uses an L2 connection when a session synchronization interface (session-sync-dev) is used. The synchronization process is also offloaded to the kernel.

FGSP is also compatible with FortiGate VRRP.

Standalone configuration synchronization

You can configure synchronization from one standalone FortiGate to another standalone FortiGate (standalone-config-sync). With the exception of some configurations that do not sync (settings that identify the FortiGate to the network), the rest of the configurations are synced, such as firewall policies, firewall addresses, and UTM profiles.
This option is useful in situations when you need to set up FGSP peers, or when you want to quickly deploy several FortiGates with the same configurations. You can set up `standalone-config-sync` for multiple members.

`standalone-config-sync` is an independent feature and should be used with caution as there are some limitations. We recommend disabling it once the configurations have been synced over.

### Limitations

When standalone configuration synchronization is enabled, there are some limitations, including but not limited to the following:

- Network interruptions occur during firmware upgrades: when upgrading the firmware, all members in the `standalone-config-sync` group are upgraded simultaneously. This creates downtime if the FortiGates are the only outgoing gateway in the network. We recommend disabling the option before upgrading firmware.
- Some unwanted configurations might be synced: the current design and implementation of `standalone-config-sync` is based on requirements from specific customers. Thus, some users may find that unwanted parts of the configurations are synced. Should this occur, we recommend disabling the option and modifying those configurations manually.
- The wrong primary device might be selected accidentally: `standalone-config-sync` is derived from the HA primary unit selection mechanism. All members in the group will join the selection process in the same way as a the HA cluster selection process. It is important to select the correct device as the primary, otherwise the wrong device could be selected and existing configurations could be overwritten.

### Setting up standalone configuration synchronization

Two or more standalone FortiGates should be connected to each other with one or more heartbeat interfaces, either back-to-back or via a switch. In the following example, the device supplying the configurations is called "conf-prim," and the devices receiving the configurations are called "conf-secos."

![HA Synchronization Diagram](image)

To set up standalone configuration synchronization:

1. Configure the conf-prim device for the group:
   ```fortios
   config system ha
   set hbdev ha1 50 ha2 100
   set priority 255
   set override enable
   set standalone-config-sync enable
   end
   ```

2. Configure the conf-prim device as needed to be functional.
3. Configure the other group members as conf-secos:
   ```fortios
   config system ha
   set standalone-config-sync enable
   end
   ```
4. Wait 10–15 minutes for the configurations to sync over.
5. Verify the synchronization status:

```bash
# get system ha status
path=sys, objname=ha, tablename=(null), size=5912
HA Health Status:
  WARNING: FG201E4Q17900771 has hbdev down;

Primary: FG201ETK19900991, HA operating index = 0

If all members are in-sync, this means all members share the same configurations, except those that should not be synced. If any members are out-of-sync, this means the member failed to sync with the primary device.

Debugging is similar when a cluster is out of sync.

The following topic provides more information about standalone configuration synchronization:

- Layer 3 unicast standalone configuration synchronization on page 2112
Layer 3 unicast standalone configuration synchronization

Unicast standalone configuration synchronization is supported on layer 3, allowing peers to be synchronized in cloud environments that do not support layer 2 networking. Configuring a unicast gateway allows peers to be in different subnets.

Example

In this example, two FortiGates in different subnets are connected through a unicast gateway. Both cluster members use the same port for the heartbeat interface.

To configure unicast synchronization between peers:

1. Configure FortiGate A:

   ```fortios
   config system ha
   set group-name "testcs"
   set hbdev "port3" 50
   set standalone-config-sync enable
   config unicast-peers
   edit 1
     set peer-ip 10.1.100.72
   end
   set override enable
   set priority 200
   set unicast-status enable
   set unicast-gateway 172.16.200.74
   end
   ```

2. Configure FortiGate B:

   ```fortios
   config system ha
   set group-name "testcs"
   set hbdev "port3" 50
   set standalone-config-sync enable
   config unicast-peers
   edit 1
     set peer-ip 172.16.200.71
   end
   set override enable
   set priority 100
   set unicast-status enable
   set unicast-gateway 10.1.100.74
   end
   ```

3. Check the HA status on FortiGate A:
# get system ha status
HA Health Status: OK
Model: FortiGate-VM64

Mode: ConfigSync
Group: 0
Debug: 0
Cluster Uptime: 2 days 3:40:25
Cluster state change time: 2021-03-08 12:00:38
Primary selected using:
  <2021/03/08 12:00:38> FGVMSLTM000000001 is selected as the primary because its
override priority is larger than peer member FGVMSLTM000000002.
  <2021/03/06 11:50:35> FGVMSLTM000000001 is selected as the primary because it's the
only member in the cluster.
ses_pickup: disable
override: enable

Configuration Status:

Secondary: FGT-72, FGVMSLTM000000002, HA cluster index = 0

number of vcluster: 1
vcluster 1: work 0.0.0.0

Primary: FGVMSLTM000000001, HA operating index = 0
Secondary: FGVMSLTM000000002, HA operating index = 1

4. Check the HA checksums on FortiGate A:

    # diagnose sys ha checksum cluster

    =========== FGVMSLTM000000001 ===========

    is_manage_primary()=1, is_root_primary()=1

debugzone
    global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee
    root: 16 af 5d a4 ac cf a5 4b b7 22 93 ce f9 02 68 bc
    all: 6e 28 7f 8a 74 f7 37 43 8f 32 73 68 1e d6 ca cd

checksum
    global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee
    root: 16 af 5d a4 ac cf a5 4b b7 22 93 ce f9 02 68 bc
    all: 6e 28 7f 8a 74 f7 37 43 8f 32 73 68 1e d6 ca cd

    =========== FGVMSLTM000000002 ===========

    is_manage_primary()=0, is_root_primary()=1
5. Verify that configuration changes on the primary FortiGate are synchronized to the secondary FortiGate:
   a. Adjust the administrator timeout value on FortiGate A:
      ```
      config system global
      set admintimeout 100
      end
      ```
   
   b. Check the debug messages on FortiGate B:
      ```
      # diagnose debug cli 7
      Debug messages will be on for 30 minutes.
      # diagnose debug enable

      create pid=15639, clictxno=0, last=1615246288
      0: conf sys global
      0: set admintimeout 100
      0: end
      ```

**VRRP**

A Virtual Router Redundancy Protocol (VRRP) configuration can be used as a high availability solution to ensure that a network maintains connectivity with the internet (or with other networks) even if the default router for the network fails. If a router or a FortiGate fails, all traffic to this device transparently fails over to another router or FortiGate that takes over the role of the failed device. If the failed device is restored, it will take over processing the network traffic.

FortiOS supports VRRP versions 2 and 3. VRRP domains can be created, which can include multiple FortiGates and other VRRP-compatible routers. Different FortiGate models can be added to the same VRRP domain.

FortiOS supports IPv4 and IPv6 VRRP. so IPv4 and IPv6 VRRP virtual routers can be added to the same interface. FortiGates can quickly and easily integrate into a network that has already deployed VRRP.

**Basic VRRP configuration**

The most common VRRP application is to provide redundant default routers between an internal network and the internet. The default routers can be FortiGates or any routers that support VRRP.

Two or more FortiGate interfaces or routers must be configured with the same virtual router ID and IP address so they can automatically join the same VRRP domain. Priorities must be assigned to each FortiGate interface or router in the VRRP domain. All of the routers in the VRRP domain should have different priorities. One FortiGate interface or router must have the highest priority to become the primary router. The other FortiGates or routers in the domain are assigned lower priorities and become backups. If the primary router fails, VRRP automatically fails over to the router in the domain with the next highest priority.
To configure VRRP:

1. Add a virtual VRRP router to the internal interface of each FortiGate and/or router. This adds the FortiGates and routers to the same VRRP domain.
2. Set the VRRP IP address of the domain to the internal network default gateway IP address.
3. Set the priorities.

See Adding IPv4 and IPv6 virtual routers to an interface on page 2115 Single-domain VRRP example on page 2122, and Multi-domain VRRP example on page 2123 for configuration examples.

During normal operations, all traffic from the internal network to the internet passes through the primary VRRP router. The primary router also sends VRRP advertisement messages to the backup routers. A backup router will not attempt to become a primary router while receiving these messages. If the primary router fails, the backup router with the highest priority becomes the new primary router after a short delay. All packets sent to the default route are now sent to the new primary router. If the new primary router is a FortiGate, the network continues to benefit from FortiOS security features. If the new primary router is just a router, traffic continues to flow, but FortiOS security features are unavailable until the FortiGate is back online.

If the backup router is a FortiGate, during a VRRP failover as the FortiGate begins operating as the new primary router, it will not have session information for all of the failed over in-progress sessions. So, it would normally not be able to forward in-progress session traffic.

Adding IPv4 and IPv6 virtual routers to an interface

This topic describes to how to add IPv4 and IPv6 virtual routers to an interface. VRRP can only be configured on physical or VLAN interfaces. VRRP cannot be configured on hardware switch interfaces where multiple physical interfaces are combined into a hardware switch interface.

IPv4 virtual router

In this example, an IPv4 VRRP router is added to port10 on the FortiGate. The VRRP virtual router has a virtual router ID of 200, uses IP address 10.31.101.200, and has a priority of 255. Since this is the highest priority in the configuration, this interface is configured to be the primary router of the VRRP domain.
To configure the interface settings:

```plaintext
cfg system interface
  edit port10
    config vrrp
      edit 200
        set vrip 10.31.101.200
        set priority 255
      next
    end
  next
end
```

**IPv6 virtual router**

In this example, an IPv6 VRRP router is added to port20 on the FortiGate. The VRRP virtual router has a virtual router ID of 220, uses IP address 2001:db8:1::12, and has a priority of 255. Since this is the highest priority in the configuration, this interface is configured to be the primary router of the VRRP domain.

To configure the interface settings:

```plaintext
cfg system interface
  edit port20
    config ipv6
      set vrip6_link_local <IPv6_address>
    config vrrp6
      edit 220
        set vrip 2001:db8:1::12
        set priority 255
      next
    end
  next
end
```

**VRRP failover**

VRRP routers in a VRRP domain periodically send VRRP advertisement messages to all routers in the domain to maintain one router as the primary router and the others as backup routers. The primary router has the highest priority. If the backup routers stop receiving these packets from the primary router, the backup router with the highest priority becomes the new primary router.

The primary router stops sending VRRP advertisement messages if it fails or becomes disconnected. Up to two VRRP destination addresses can be configured to be monitored by the primary router. As a best practice, the destination addresses should be remote addresses. If the primary router is unable to connect to these destination addresses, it stops sending VRRP advertisement messages, and the backup router with the highest priority becomes the primary router.

To configure IPv4 VRRP with two destination addresses for monitoring:

```plaintext
cfg system interface
  edit port14
    config vrrp
```
To configure IPv6 VRRP with one destination address for monitoring:

```plaintext
config system interface
date port23
  config ipv6
    config vrrp6
      edit 223
        set vrdst 1001:db8:1::12
      next
    end
  end
next
end
```

### IPv4 VRRP active failover

The `vrdst-priority` option can be used to reduce IPv4 VRRP failover times. This option causes the primary router to actively signal to the backup routers when the primary router cannot reach its configured destination addresses. The primary router sends a lower priority for itself in the VRRP advertisement messages. The backup router with the highest priority becomes the new primary router and takes over traffic processing.

In this example, the primary router is configured to have a priority of 255, so it should always become the primary router. The `vrdst-priority` is set to 10. If the primary router cannot connect to the 10.10.10.1 destination address, then the primary router informs the VRRP group that its priority is now 10.

To set the priority of the virtual router when the destination address is unreachable:

```plaintext
config system interface
date port10
  config vrrp
    edit 12
      set vrip 10.31.101.200
      set priority 255
      set vrdst 10.10.10.1
      set vrdst-priority 10
    next
  end
next
end
```

### IPv4 VIP and IP pool failover

The `proxy-arp` option can be used to map VIPs and IP pool address ranges to each router's VMAC (virtual MAC). After failover, the IP or ranges configured in the VRRP settings are routed to the new primary router's VMAC. In this example, a single IP and an address range are added for proxy ARP.
To configure the IP addresses for proxy ARP:

```plaintext
config system interface
   edit port5
      set vrrp-virtual-mac enable
   config vrrp
      edit 1
         config proxy-arp
            edit 1
               set ip 192.168.62.100-192.168.62.200
               next
            edit 2
               set ip 192.168.62.225
               next
         end
      end
   end
end
```

Changing the advertisement message interval

By default, VRRP advertisement messages are sent once every second. The frequency can be changed with the `adv-interval` option to change the frequency of sending these messages (1 - 255 seconds).

The `adv-interval` also affects the period of time that a backup VRRP router waits before assuming the primary router has failed. The waiting period is three times the `adv-interval`. For example, if the `adv-interval` is set to 5, then the backup router waits for up to 15 seconds to receive a VRRP advertisement from the current primary router before taking over the role as the primary router.

To configure IPv4 VRRP to send advertisement messages every 10 seconds:

```plaintext
config system interface
   edit port14
      config vrrp
         edit 12
            set adv-interval 10
            next
         end
   end
end
```

To configure IPv6 VRRP to send advertisement messages every 20 seconds:

```plaintext
config system interface
   edit port23
      config ipv6
         config vrrp6
            edit 223
               set adv-interval 20
               next
         end
   end
end
```
Changing the VRRP startup time

The VRRP startup time is the time a backup or primary VRRP router waits before sending or receiving VRRP advertisements before potentially changing state (start-time in seconds, 1 - 255, default = 3). This timer is mainly visible when VRRP-monitored interfaces become up after previously been down. When this occurs, the device will wait for the time period before considering, and potentially changing its status.

There are some instances when the advertisement messages might be delayed. For example, some switches with spanning tree enabled may delay some of the advertisement message packets. If backup routers are attempting to become primary routers even though the primary router has not failed, extend the start time to ensure that the backup routers wait long enough for the advertisement messages.

To configure the IPv4 VRRP startup time to 10 seconds:

```
config system interface
    edit port14
        config vrrp
            edit 12
                set start-time 10
            next
        next
    next
end
```

To configure the IPv6 VRRP startup time to 15 seconds:

```
config system interface
    edit port23
        config ipv6
            config vrrp6
                edit 223
                    set start-time 15
                next
        next
    next
end
```

VRRP groups

If VRRP routers are added to multiple interfaces of the same FortiGate, each router will be in a different VRRP domain. If one of the VRRP routers fails, it is useful if all of the VRRP routers added to the FortiGate also fail.

VRRP can only check the routers' status in a single VRRP domain and cannot track the status of routers in other domains. For multiple VRRP domains on a single FortiGate, only one can switch to being a backup, and the others remain operating normally. Using VRRP groups resolves this issue.

All the VRRP virtual routers on the FortiGate can be added to a VRRP group. If one of the virtual routers in a VRRP group switches to the backup, the VRRP group forces all members to switch to backups. All VRRP traffic being processed by the FortiGate fails over to other devices in the network.

💡 The status of the virtual routers in a VRRP group only changes when one or more of the virtual routers in the group changes status. A VRRP group should not be used to manually change the status of the virtual routers in the group.
To configure two IPv4 VRRP routers in a VRRP group:

```plaintext
cfg sys int
  edit port1
    config vrrp
      edit 200
        set vrip 10.31.101.200
        set priority 255
        set vrgrp 10
      next
    end
  next
  edit port20
    config vrrp
      edit 100
        set vrip 10.23.1.223
        set priority 20
        set vrgrp 10
      next
    end
  end
end
eend
```

To configure two IPv6 VRRP routers in a VRRP group:

```plaintext
cfg sys int
  edit port1
    config ipv6
      set vrip6_link_local <IPv6_address>
    config vrrp6
      edit 220
        set vrip 2001:db8:1::12
        set priority 255
        set vrgrp 90
      next
    end
  next
  edit port12
    config ipv6
      set vrip6_link_local <IPv6_address>
    config vrrp6
      edit 220
        set vrip 2001:db8:1::14
        set priority 100
        set vrgrp 90
      next
    end
  end
end
eend
```
VRRP virtual MACs

The VRRP virtual MAC address (or virtual router MAC address) is a shared MAC address adopted by the primary router. If the primary router fails, the same virtual MAC address is picked up by the new primary router, allowing all devices on the network to transparently connect to the default route using the same virtual MAC address. This feature must be enabled on all members in a VRRP domain.

Each VRRP router has its own virtual MAC address. The last part octet is based on the VRRP router ID using the following format:

```
00-00-5E-00-01-<VRID_hex>
```

Where `<VRID_hex>` is the VRRP router ID in hexadecimal format in internet standard bit-order. For more information about virtual MAC formatting, see RFC 3768.

For example:

- If the VRRP router ID is 10, then the virtual MAC is `00-00-5E-00-01-0a`.
- If the VRRP router ID is 200, then the virtual MAC is `00-00-5E-00-01-c8`.

If the VRRP virtual MAC address feature is disabled (the default setting), the VRRP domain uses the MAC address of the primary router. On a FortiGate VRRP virtual router, this is the MAC address of the FortiGate interface that the VRRP router is added to. If the primary fails, when the new primary takes over, it sends gratuitous ARPs to associate the VRRP router IP address with the MAC address of the new primary (or the FortiGate interface that became the new primary).

When a VRRP virtual MAC address is enabled, the new primary uses the same MAC address as the old primary.

Since devices on the LAN do not have to learn a new MAC address for a new VRRP router in the event of a failover, this feature can improve network efficiency, especially in large and complex networks.

To enable virtual MAC addresses in IPv4 VRRP:

```
config system interface
  edit <name>
    set vrrp-virtual-mac enable
  next
end
```

To enable virtual MAC addresses in IPv6 VRRP:

```
config system interface
  edit <name>
    config ipv6
      set vrrp-virtual-mac6 enable
    end
  next
end
```

Preempt mode

When preempt mode is enabled (the default setting), a higher priority backup router can preempt a lower priority primary router. This can happen if the primary router fails, the backup router becomes the primary router, and the failed primary router restarts. Since the restarted router has a higher priority, if preempt mode is enabled, the restarted router replaces the current primary router becoming the new primary router. If preempt mode is disabled, a restarted router that has a higher priority would not take over as the primary router.
To configure preempt mode in IPv4 VRRP:

```
config system interface
  edit <name>
    config vrrp
      edit <vrid>
        set preempt {enable | disable}
      next
    next
next
end
```

To configure preempt mode in IPv6 VRRP:

```
config system interface
  edit <name>
    config ipv6
    config vrrp6
      edit <vrid>
        set preempt {enable | disable}
      next
    end
  end
next
end
```

**Single-domain VRRP example**

This example consists of a VRRP domain with two FortiGates that connect an internal network to the internet. The FortiGate port2 interfaces connect to the internal network, and a VRRP virtual router is added to each port2 interface with VRRP virtual MAC addresses enabled. The internal network default route is 10.31.101.120. Each FortiGate port2 interface has an IP address that is different from the virtual router IP address. Since `vrrp-virtual-mac` is enabled, upon failover, the new primary VRRP router will use the same VMAC as the previous router.

```
To configure the primary FortiGate:

config system interface
  edit port2
    set vrrp-virtual-mac enable
```
To configure the backup FortiGate:

```plaintext
cfg sys int edit port2
  set vrrp-vmac enable
  cfg vrrp
    edit 5
      set vrip 10.31.101.120
      set priority 50
    next
  next
end
```

Multi-domain VRRP example

This example consists of two VRRP domains, and both FortiGates participate in the domains that connect an internal network to the internet. One FortiGate is the primary router of one domain and the other FortiGate is the primary router of the other domain. The network distributes traffic between two different default routes (10.31.101.120 and 10.31.101.130). One VRRP domain is configured with one of the default route IP addresses and the other VRRP domain gets the other default route IP address. During normal operation, both FortiGates process traffic, and the VRRP domains are used to load balance the traffic between the two FortiGates.

If one of the FortiGates fails, the remaining FortiGate becomes the primary router of both VRRP domains. The network sends all traffic for both default routes to this FortiGate. The result is a configuration that (under normal operational load) balances traffic between two FortiGates, but if one of the FortiGates fails, all traffic fails over to the FortiGate that is still operating.

VRRP virtual MAC address are enabled on both FortiGates' port2 interfaces so that the VRRP domains use their VRRP virtual MAC addresses.
### VRRP on EMAC-VLAN interfaces

Virtual Router Redundancy Protocol (VRRP) can be configured on EMAC-VLAN interfaces.

<table>
<thead>
<tr>
<th>Device</th>
<th>VRRP primary</th>
<th></th>
<th>VRRP backup</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Virtual router IP</td>
<td>ID</td>
<td>Priority</td>
<td>Virtual router IP</td>
</tr>
<tr>
<td>FortiGate A</td>
<td>10.31.101.120</td>
<td>50</td>
<td>255</td>
<td>10.31.101.130</td>
</tr>
<tr>
<td>FortiGate B</td>
<td>10.31.101.130</td>
<td>100</td>
<td>255</td>
<td>10.31.101.120</td>
</tr>
</tbody>
</table>

To configure FortiGate A:

```plaintext
config system interface
  edit port2
    set vrrp-virtual-mac enable
    config vrrp
      edit 50
        set vrip 10.31.101.120
        set priority 255
      next
      edit 100
        set vrip 10.31.101.130
        set priority 50
      next
    end
  next
end
```

To configure FortiGate B:

```plaintext
config system interface
  edit port2
    set vrrp-virtual-mac enable
    config vrrp
      edit 50
        set vrip 10.31.101.120
        set priority 50
      next
      edit 100
        set vrip 10.31.101.130
        set priority 255
      next
    end
  next
end
```
To configure the interfaces:

1. Configure FortiGate A:

```fortigate
config system interface
edit "emac"
    set vdom "root"
    set ip 172.16.209.1 255.255.255.0
    set allowaccess ping https snmp http telnet fgfm
    set type emac-vlan
    set vrrp-virtual-mac enable
config vrrp
    edit 1
        set vrip 172.16.209.111
        set priority 200
    next
end
set snmp-index 61
set interface "port1"
next
end
```

2. Configure FortiGate B:

```fortigate
config system interface
edit "emac"
    set vdom "root"
    set ip 172.16.209.2 255.255.255.0
    set allowaccess ping https snmp http telnet fgfm
    set type emac-vlan
    set vrrp-virtual-mac enable
config vrrp
    edit 1
        set vrip 172.16.209.111
        set priority 222
    next
end
set snmp-index 32
set interface "port1"
next
end
```
Check the VRRP information on the FortiGates:

Because FortiGate B has a higher priority, it is the primary device and FortiGate A is the backup.

1. FortiGate A:

```
# get router info vrrp
Interface: emac, primary IP address: 172.16.209.1
  UseVMAC: 1, SoftSW: 0, EmacVlan: 1 BrPortIdx: 0, PromiscCount: 0
  HA mode: primary (0:0:1) VRRP master number: 0
  VRID: 1 verion: 2
  vrip: 172.16.209.111, priority: 200 (200,0), state: BACKUP
  adv_interval: 1, preempt: 1, ignore_dft: 0 start_time: 3
  master_adv_interval: 100, accept: 1
  vrmac: 00:00:5e:00:01:01
  vrdst: vrgrp: 0
```

2. FortiGate B:

```
# get router info vrrp
Interface: emac, primary IP address: 172.16.209.2
  UseVMAC: 1, SoftSW: 0, EmacVlan: 1 BrPortIdx: 0, PromiscCount: 1
  HA mode: primary (0:0:1) VRRP master number: 1
  VRID: 1 verion: 2
  vrip: 172.16.209.111, priority: 222 (222,0), state: PRIMARY
  adv_interval: 1, preempt: 1, ignore_dft: 0 start_time: 3
  master_adv_interval: 100, accept: 1
  vrmac: 00:00:5e:00:01:01
  vrdst: vrgrp: 0
```

SNMP

SNMP enables you to monitor hardware on your network. You can configure the hardware, such as the FortiGate SNMP agent, to report system information and send traps (alarms or event messages) to SNMP managers. SNMP traps alert you to events that happen, such as when a log disk is full or a virus is detected.

The FortiGate SNMP implementation is read-only. SNMP v1/v2c, and v3 compliant SNMP managers have read-only access to FortiGate system information through queries, and can receive trap messages from the FortiGate unit.

- Interface access on page 2127
- MIB files on page 2127
- SNMP agent on page 2128
- SNMP v1/v2c communities on page 2128
- SNMP v3 users on page 2130
- Access control for SNMP on page 2131
- Important SNMP traps on page 2133
- SNMP traps and query for monitoring DHCP pool on page 2135
**Interface access**

Before a remote SNMP manager can connect to the FortiGate SNMP agent, you must configure one or more FortiGate interfaces to accept SNMP connections.

**To configure a FortiGate interface to accept SNMP connections in the GUI:**

1. Go to *Network > Interfaces*.
2. Edit the interface.
3. In the *Administrative Access* options, enable *SNMP*.
4. Click *OK*.

**To configure a FortiGate interface to accept SNMP connections in the CLI:**

```plaintext
cfg system interface
  edit <interface>
    append allowaccess snmp
    set snmp-index <integer>
    config ipv6
      append ip6-allowaccess snmp
    end
  next
end
```

**MIB files**

The FortiGate SNMP agent supports Fortinet proprietary MIBs, as well as the parts of RFC 2665 and RFC 1213 that apply to FortiGate unit configuration.

Your SNMP manager may already include standard and private MIBs in a compiled database that is ready to use. You must add the Fortinet proprietary MIBs to this database to have access to Fortinet specific information.

<table>
<thead>
<tr>
<th>MIB file or RFC</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FORTINET-CORE-MIB.mib</td>
<td>The Fortinet core MIB includes all system configuration and trap information that is common to all Fortinet products. Your SNMP manager requires this information to monitor Fortinet device settings and receive traps from the FortiGate SNMP agent.</td>
</tr>
<tr>
<td>FORTINET-FORTIGATE-MIB.mib</td>
<td>The FortiGate MIB includes all system configuration information and trap information that is specific to FortiGate units. Your SNMP manager requires this information to monitor FortiGate settings and receive traps from the FortiGate SNMP agent.</td>
</tr>
</tbody>
</table>
| RFC-1213 (MIB II) | The FortiGate SNMP agent supports MIB II groups with the following exceptions:  
  • No support for the EGP group from MIB II (RFC 1213, section 3.11 and 6.10).  
  • Protocol statistics returned for MIB II groups (IP/ICMP/TCP/UDP/etc.) do not accurately capture all Fortinet traffic activity. More accurate information can be obtained from the information reported by the FortiGate MIB. |
| RFC-2665 (Ethernet-like MIB) | The FortiGate SNMP agent supports Ethernet-like MIB information. |
To download the MIB files:

1. Go to System > SNMP.
2. Click Download FortiGate MIB File and save the file to the management computer.
3. Click Download Fortinet Core MIB File and save the file to the management computer.

SNMP agent

The SNMP agent sends SNMP traps originating on the FortiGate to an external monitoring SNMP manager defined in an SNMP community. The SNMP manager can monitor the FortiGate system to determine if it is operating properly, or if any critical events occurring.

The description, location, and contact information for this FortiGate system will be part of the information that the SNMP manager receives. This information is useful if the SNMP manager is monitoring many devices, and enables faster responses when the FortiGate system requires attention.

To configure the SNMP agent in the GUI:

1. Go to System > SNMP.
2. Enable SNMP Agent.
3. Enter a description of the agent.
4. Enter the location of the FortiGate unit.
5. Enter a contact or administrator for the SNMP Agent or FortiGate unit.
6. Click Apply.

To configure the SNMP agent in the CLI:

```
config system snmp sysinfo
   set status enable
   set description <string>
   set contact-info <string>
   set location <string>
end
```

SNMP v1/v2c communities

An SNMP community is a grouping of equipment for network administration purposes. A single device can belong to multiple communities.

You must add an SNMP community to the FortiGate so that the SNMP manager can receive traps and system information. Up to three communities can be added.
To create a SNMP v1/v2c community in the GUI:

1. Go to System > SNMP.
2. In the SNMP v1/v2c table, click Create New.
3. Enter a Community Name and enable the community.
4. In the Hosts section, enter the IP Address and select the Host Type for each SNMP manager.
5. In the Queries section, enable or disable v1 and v2c queries, then enter the port numbers that the SNMP managers in this community use for them.
6. In the Traps section, enable or disable v1 and v2c traps, then enter the local and remote port numbers that the SNMP managers in this community use for them.
7. In the SNMP Events section, enable or disable the events that activate traps in this community.
8. Click OK.

To create a SNMP v1/v2c community in the CLI:

```
config system snmp community
    edit 2
        set name <string>
        set status {enable | disable}
        config hosts
            edit <host_id>
                set ip <ip/mask>
                set source-ip <class_ip>
                set ha-direct {enable | disable}
                set host-type {any | query | trap}
            next
        end
        set query-v1-port <port_number>
        set query-v1-status {enable | disable}
        set query-v2c-port <port_number>
        set query-v2c-status {enable | disable}
        set trap-v1-lport <port_number>
```
set trap-v1-rport <port_number>
set trap-v1-status {enable | disable}
set trap-v2c-lport <port_number>
set trap-v2c-rport <port_number>
set trap-v2c-status {enable | disable}
set events <events>

### SNMP v3 users

Authentication is used to ensure the identity of users. Privacy allows for encryption of SNMP v3 messages to ensure confidentiality of data. These protocols provide a higher level of security than is available in SNMP v1 and v2c, which use community strings for security. Both authentication and privacy are optional.

**To create a SNMP v3 user in the GUI:**

1. Go to **System > SNMP**.
2. In the SNMP v3 table, click **Create New**.
3. Enter a **User Name** and enable the user.
4. In the **Security Level** section, configure the security level:
   - **No Authentication**: No authentication or encryption.
   - **Authentication**: Select the authentication algorithm and password.
   - **Authentication and Private**: Select both the authentication and encryption algorithms and password.
5. In the **Hosts** section, enter the **IP Address** for each SNMP manager.
6. In the **Queries** section, enable or disable queries, then enter the port number that the SNMP managers use for them.
7. In the **Traps** section, enable or disable traps, then enter the local and remote port numbers that the SNMP managers use for them.
8. In the **SNMP Events** section, enable or disable the events that activate traps.

9. Click OK.

**To create an SNMP v3 user in the CLI:**

```
cFG sYstem snmp user
  edit <user>
    set status {enable | disable}
    set trap-status {enable | disable}
    set trap-lport <port_number>
    set trap-rport <port_number>
    set queries {enable | disable}
    set query-port <port_number>
    set notify-hosts <class_ip> ... <class_ip>
    set source-ip <class_ip>
    set ha-direct {enable | disable}
    set events <events>
    set security-level {no-auth-no-priv | auth-no-priv | auth-priv}
    set auth-proto {md5 | sha | sha224 | sha256 | sha384 | sha512}
    set auth-pwd <password>
    set priv-proto {aes | des | aes256 | aes256cisco}
    set priv-pwd <password>
  next
end
```  

**Access control for SNMP**

Administrators can provide access control to SNMP users and communities based on restricting a MIB view to specific OID subtrees. They can also define access based on the VDOM. This allows multi-tenant FortiGate deployments to provide restricted access per VDOM.

- **MIB view access control** allows the SNMP clients to query specific OIDs that are filtered by the MIB view settings.
- **VDOM access control** allows the SNMP clients to query data from specific VDOMs that are filtered by the VDOM settings.

When access control is enabled, the users can only access the information that is allowed by the access control, and all other information is inaccessible. Administrators have granular control, and can easily restrict specific information based on access control.

**To configure MIB views:**

```
cFG system snmp mib-view
  edit <name>
    set include <OIDs>
    set exclude <OIDs>
  next
end
```  

<table>
<thead>
<tr>
<th>include &lt;OIDs&gt;</th>
<th>Enter the OID subtrees to be included in the view. A maximum of 16 subtrees can be added.</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude &lt;OIDs&gt;</td>
<td>Enter the OID subtrees to be excluded in the view. A maximum of 64 subtrees can be added.</td>
</tr>
</tbody>
</table>
To configure access control based on MIB views and VDOMs for SNMP users and communities:

```
config system snmp user
edit <user>
    set mib-view <view>
    set vdoms <vdoms>
next
end
config system snmp community
edit <community>
    set mib-view <view>
    set vdoms <vdoms>
next
end
```

<table>
<thead>
<tr>
<th>mib-view &lt;view&gt;</th>
<th>Set the SNMP access control MIB view.</th>
</tr>
</thead>
<tbody>
<tr>
<td>vdoms &lt;vdoms&gt;</td>
<td>Set the SNMP access control VDOMs.</td>
</tr>
</tbody>
</table>

**Example**

In this example, two MIB views are created and, with VDOMs, used to control access for SNMP users and communities.

**To configure access control for SNMP users and communities:**

1. **Configure two MIB views:**

   ```
   config system snmp mib-view
   edit "view1"
       set include "1.3.6.1.2"
   next
   edit "view2"
       set include "1.3.6.1.2.1"
       set exclude "1.3.6.1.2.1.2.1" "1.3.6.1.2.1.4.31" "1.3.6.1.2.1.1.9.1"
   next
   end
   ```

2. **Add the MIB view and VDOM restrictions to SNMP users:**

   ```
   config system snmp user
   edit "v3user"
       set mib-view "view1"
   next
   edit "v3user1"
       set vdom "vdom1"
   next
   edit "v3user2"
       set mib-view "view1"
       set vdoms "root" "vdom1"
   next
   end
   ```

3. **Add the MIB view and VDOM restrictions to SNMP communities:**
 Important SNMP traps

Link Down and Link Up traps

This trap is sent when a FortiGate port either goes down or is brought up.

For example, the following traps are generated when the state of port34 is set to down using `set status down`, and then brought up using `set status up`:

```
NET-SNMP version 5.7.3 2019-01-31 14:11:48 10.1.100.1(via UDP: [10.1.100.1]:162->[10.1.100.11]:162) TRAP, SNMP v1, community REGR-SYS SNMPv2-MIB::snmpTraps Link Down Trap (0) Uptime: 0:14:44.95 IF-MIB::ifIndex.42 = INTEGER: 42 IF-MIB::ifAdminStatus.42 = INTEGER: down(2) IF-MIB::ifOperStatus.42 = INTEGER: down(2)
SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE
```

```
2019-01-31 14:11:48 <UNKNOWN> [UDP: [10.1.100.1]:162->[10.1.100.11]:162]: DISMAN-EVENT-MIB::sysUpTimeInstance = Timeticks: (88495) 0:14:44.95 SNMPv2-MIB::snmpTrapOID.0 = OID: IF-MIB::linkDown IF-MIB::ifIndex.42 = INTEGER: 42 IF-MIB::ifAdminStatus.42 = INTEGER: down(2) IF-MIB::ifOperStatus.42 = INTEGER: down(2)
SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE 2019-01-31 14:12:01 10.1.100.1(via UDP: [10.1.100.1]:162->[10.1.100.11]:162) TRAP, SNMP v1, community REGR-SYS SNMPv2-MIB::snmpTraps Link Up Trap (0) Uptime: 0:14:57.98 IF-MIB::ifIndex.42 = INTEGER: 42 IF-MIB::ifAdminStatus.42 = INTEGER: up(1) IF-MIB::ifOperStatus.42 = INTEGER: up(1)
```

fgFmTrapIfChange trap

This trap is sent when any changes are detected on the interface. The change can be very simple, such as giving an IPV4 address.
For example, the user has given the IP address of 1.2.3.4/24 to port 1 and the EMS Manager has detected the following trap:

```
DISMAN-EXPRESSION-MIB::sysUpTimeInstance = Timeticks: (7975058) 22:09:10.58 SNMPv2-MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgFmTrapIfChange FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 IF-MIB::ifName.45 = STRING: port1 FORTINET-FORTIGATE-MIB::fgManIfIp.0 = IpAddress: 1.2.3.4 FORTINET-FORTIGATE-MIB::fgManIfMask.0 = IpAddress: 255.255.255.0 FORTINET-FORTIGATE-MIB::fgManIfIp6.0 = STRING: 0:0:0:0:0:0:0:0
```

**entConfigChange trap**

The change to the interface in the previous example has also triggered the *ConfChange Trap* which is sent along with the *fgFmTrapIfChange* trap:

```
```

**fgTrapDeviceNew trap**

This trap is triggered when a new device, like a FortiSwitch, is connected to the FortiGate.

For example, the following scenario has given the device a new trap for adding FortiAP on a PoE interface a FortiGate 140D-POE. The trap has important information about the device name, device MAC address, and when it was last seen.

```
```

```
2018-11-15 11:17:43 FGT_A [UDP: [172.16.200.1]:162-][172.16.200.55]:162]: DISMAN-EXPRESSION-MIB::sysUpTimeInstance = Timeticks: (520817) 1:26:48.17 SNMPv2-MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgTrapDeviceNew FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FGT_A IF-MIB::ifIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-MIB::fgDeviceCreated.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceLastSeen.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceMacAddress.0 = STRING: 90:6c:ac:f9:97:a0
```

**fgTrapAvOversize trap**

The *fgTrapAvOversize* trap is generated when the antivirus scanner detects an oversized file:

```
019-01-31 13:22:04 10.1.100.1 via UDP: [10.1.100.1]:162->[10.1.100.11]:162] TRAP, SNMP v1, community REGR-SYS FORTINET-FORTIGATE-MIB::fgt140P Enterprise Specific Trap (602) Uptime: 1 day, 3:41:10.31 FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FGT-A IF-MIB::ifIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-MIB::fgDeviceCreated.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceLastSeen.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceMacAddress.0 = STRING: 90:6c:ac:f9:97:a0
```

```
019-01-31 13:22:04 10.1.100.1 via UDP: [10.1.100.1]:162->[10.1.100.11]:162] TRAP, SNMP v1, community REGR-SYS FORTINET-FORTIGATE-MIB::fgt140P Enterprise Specific Trap (602) Uptime: 1 day, 3:41:10.31 FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FGT-A IF-MIB::ifIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-MIB::fgDeviceCreated.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceLastSeen.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceMacAddress.0 = STRING: 90:6c:ac:f9:97:a0
```

FortiOS 7.2.0 Administration Guide 2134
Fortinet Inc.
SNMP traps and query for monitoring DHCP pool

The SNMP DHCP event contains three traps and one query.

Traps are sent when:

- DHCP server IP pool usage reaches 90%
- DHCP server detect an IP address that is already in use
- DHCP client receives DHCP NAK

SNMP queries are accepted for DHCP lease usage information (OID = 1.3.6.1.4.1.12356.101.23). The query result is based on the leased out percentage.

To enable the SNMP DHCP event in the GUI:

1. Go to System > SNMP.
2. Click Create New in either the SNMP v1/v2c table or SNMP v3 table, or edit an existing community or user.
3. Configure the settings as required.
4. In the SNMP Events list, enable DHCP addresses at limit.

   ![SNMP Events Configuration](image)

5. Click OK.

To enable the SNMP DHCP event in the CLI:

```bash
config system snmp community
   edit 1
      set name "REGR-SYS"
   config hosts
      edit 1
         set ip 10.1.100.11 255.255.255.255
      next
      edit 2
         set ip 172.16.200.55 255.255.255.255
      next
   end
   set events dhcp
next
end
config system snmp user
   edit "1"
      set notify-hosts 172.10.1.0 172.20.1.0
```
System

```
set events dhcp
set security-level auth-priv
set auth-proto sha384
set auth-pwd *********************
set priv-proto aes256
set priv-pwd *********************
next
end
```

Replacement messages

FortiOS has replacement messages that are HTML and text files. These messages can be customized to meet user requirements. The content can be modified, and images can be added.

Modifying replacement messages

The Replacement Messages page has two views. Simple View (the default view) shows the most commonly used replacement messages. Extended View shows the entire list and all replacement message categories.

To modify a replacement message in the GUI:

1. Go to System > Replacement Messages.
2. Select a replacement message and click Edit.
   If the message you want to edit is not visible, click Extended View in the upper right-hand corner of the top menu.
3. Edit the HTML code.
   The message is visible on the left alongside the HTML code on the right. The message view updates in real-time as you edit the content.
   When adding a variable to the code, right-click and select Insert Tag or type `%%` to view a list of the available variables, or start typing the variable name then press Enter or TAB to auto-complete the variable name.
4. Click Save.

Click Restore Defaults to return to the original message and code base.

To modify a replacement message in the CLI:

For example, to modify the Traffic Quota Limit Exceeded Page message:

```
config system replacemsg traffic-quota "per-ip-shaper-block"
set buffer "<html>
<head>
<title>
Traffic Quota Control
</title>
</head>
<body>
<font size=2>
<table width="100%">
<tr>
<td bgcolor=#3300cc align="center" colspan=2>
<font color=#ffffff>
<b>
Traffic blocked because exceeded session quota
</b>
</font>
</td>
</tr>
</table>
<br>
Traffic blocked because it exceeded the per IP shaper session quota. Please contact the system administrator.
<br>
%%QUOTA_INFO%%
<br>
<br>
```
Replacement message images

Images can be added to replacement messages on:

- Disclaimer pages
- Login pages
- Declined disclaimer pages
- Login failed pages
- Login challenge pages
- Keepalive pages

The supported image formats are GIF, JPEG, TIFF, and PNG. The maximum file size supported is 24 KB.

Adding images to replacement messages

To add images to replacement messages in the GUI:

1. Go to System > Replacement Messages.
2. In the top menu, click Manage Images.
3. Click Create New.
4. Enter a name for the image.
5. Click Upload Image and locate the file.
6. Click OK.
   The file is now visible in the list.
7. Return to the replacement message list and edit a message.
8. Right-click in the message code where you want to add the image, and select Insert Image.
9. Select the image from the list then press Enter, or double-click on the image to add it to the message.
10. Click Save.

To add images to replacement messages in the CLI:

1. Add the image to the FortiGate:
   ```
   config system replacemsg-image
   edit <image_name>
   set image-type {gif | jpg | tiff | png}
   set image-base64 <string>
   next
   end
   ```
2. Edit the replacement message, and include `%%IMAGE:<image_name>%%` in the code to add the image.

Replacement message groups

Replacement message groups allow users to customize replacement messages for individual policies and profiles.

There are two types of replacement message groups:

<table>
<thead>
<tr>
<th>Type</th>
<th>Usage</th>
<th>Customizable categories</th>
</tr>
</thead>
</table>
| utm  | Used with UTM settings in firewall policies. | • admin
• alertmail
• custom-message
• fortiguard-wf
• ftp
• http
• icap
• mail
• nac-quar
• spam |
The messages added to a group do not need to be customized. The message body content, header type, and format will use the default values if not customized.

To make replacement message groups visible in the GUI:

```
config system settings
  set gui-replacement-message-groups enable
end
```

In the following example, two replacement message groups are created. The UTM message group includes custom mail-related messages and is assigned to an email filter profile. The authentication message group has a custom authentication success message that is applied to a proxy-based firewall policy that has an assigned email filter profile.

To create replacement message groups in the GUI:

1. Create the Security replacement message group:
   a. Go to System > Replacement Message Groups.
   b. Click Create New.
   c. For Name, enter newutm.
   d. In the Comments field, enter UTM message group.
   e. For Group Type, select Security.
   f. Click OK.

2. Customize the replacement messages in the newutm group:
   a. Go to System > Replacement Message Groups.
   b. Edit the newutm group.
c. Select the **Partial Email Block Message**.

d. Edit the message and click **Save**.
e. Select the **ASE Block Message**.
f. Edit the message and click **Save**.

3. **Create the Authentication replacement message group:**
   a. Go to **System > Replacement Message Groups**.
   b. Click **Create New**.
   c. For **Name**, enter **newauth**.
   d. In the **Comments** field, enter **Authentication message group**.
   e. For **Group Type**, select **Authentication**.
   f. Click **OK**.

4. **Apply the newutm replacement message group to an email filter profile in the CLI:**
   ```
   config emailfilter profile
   edit "newmsgs"
   set replacemsg-group "newutm"
   next
   end
   ```

5. **Apply the newauth replacement message group and the email filter profile to a firewall policy in the CLI:**
   ```
   config firewall policy
   edit 1
   ...  
   set replacemsg-override-group "newauth"
   set inspection-mode proxy
   set emailfilter-profile "newmsgs"
   ...  
   next
   end
   ```
To create replacement message groups in the CLI:

1. Create the replacement message groups:

   config system replacemsg-group
   edit "newutm"
      set comment "UTM message group"
      set group-type utm
   config mail
      edit "partial"
      set buffer "Fragmented emails are blocked, sorry."
   next
   end
   config spam
   edit "smtp-spam-ase"
   set buffer "This message has been blocked because ASE reports it as spam. You\'re welcome."
   next
   end
   next
   edit "newauth"
   set comment 'Authentication message group'
   set group-type auth
   config auth
      edit "auth-success-msg"
      set buffer "Welcome to the firewall. Your authentication has been accepted, please reconnect."
   next
   end
   next
   end

2. Apply the message group to the email filter:

   config emailfilter profile
   edit "newmsgs"
   set replacemsg-group "newutm"
   next
   end

3. Apply the email filter and message group to the policy:

   config firewall policy
   edit 1
   ... 
   set replacemsg-override-group "newauth"
   set inspection-mode proxy
   set emailfilter-profile "newmsgs"
   ... 
   next
   end
FortiGuard services can be purchased and registered to your FortiGate unit. The FortiGate must be connected to the Internet in order to automatically connect to the FortiGuard Distribution Network (FDN) to validate the license and download FDN updates.

The FortiGuard subscription update services include:

- Antivirus (AV)
- Intrusion Protection Service (IPS)
- Application Control
- Antispam
- Web Filtering
- Web Application Firewall (WAF)

AV and IPS packages are signed by the Fortinet CA, and automatic updates will validate whether a package is signed.

To view FDN support contract information, go to System > FortiGuard. The License Information table shows the status of your FortiGate’s support contract.

- Licensing in air-gap environments on page 2163

**Configuring FortiGuard updates**

To configure FortiGuard updates:

1. Go to System > FortiGuard
2. Scroll down to the FortiGuard Updates section.
3. Configure the options for connecting and downloading definition files:
Immediately download updates

The option can be enabled on 2U and larger hardware models when the FortiGuard are servers are connected in anycast mode. The FortiGate forms a secure, persistent connection with FortiGuard to get notifications of new updates through an HTTPS connection. The FortiGate uses the fds_notify daemon to wait for the notification, then makes another connection to the FortiGuard server to download the updates.

Scheduled Updates

Enable to schedule updates to be sent to the FortiGate at the specified time or automatically. See Scheduled updates on page 2148 and Automatic updates on page 2147.

Improve IPS quality

Enable to send information to the FortiGuard servers when an attack occurs. This can help keep the FortiGuard database current as attacks evolve, and improve IPS signatures.

Use extended IPS signature package

Enable to use the extended IPS database, that includes protection from legacy attacks, along with the regular IPS database that protects against the latest common and in-the-wild attacks.

AntiVirus PUP/PUA

Enable antivirus grayware checks for potentially unwanted applications.

Update server location

The FortiGuard update server location. See Update server location on page 2149 for details.

4. Click Apply.

Configuring a proxy server for FortiGuard updates

You can configure FortiOS to use a proxy server to connect to the FortiGuard Distribution Network (FDN).

Proxy tunneling is supported only for registration, AV, and IPS updates. For FortiGate virtual machines, proxy tunneling can also be used for license validation. For web filtering or spam filtering, UDP protocol is used on ports 53 or 8888. UDP protocol traffic cannot be directed over a proxy server, even if you are using versions of FortiOS that support web filtering over port 443.

Consider the following before configuring FortiOS to use a proxy server to connect to FDN:
System

- FortiOS connects to the proxy server using the HTTP CONNECT method. For information about the HTTP CONNECT method, see RFC 2616.
- The proxy server must not inspect the HTTPS traffic used for FortiOS communication.
- FortiOS sends to the proxy server an HTTP CONNECT request that specifies the IP address and port required for the FDN connection. Authentication information is optional for the request.
- FortiOS must be configured to use DNS servers that resolve the addresses of FDN servers to support AV and IPS updates.
- The proxy server establishes the connection to FDN and passes information between FortiOS and FDN.

Use the following syntax to configure a proxy server in the CLI:

```
config system autoupdate tunneling
  set address <proxy_address>
  set port <proxy_port>
  set username <username>
  set password <password>
  set status {enable | disable}
end
```

In the following example, a proxy server with IP address 10.1.1.1 is configured to listen on port TCP/3128 without authentication.

**To configure a proxy server:**

```
config system autoupdate tunneling
  set address 10.1.1.1
  set port 3128
  set status enable
end
```

In a closed network without direct internet connection for web filtering or spam filtering, you can use FortiManager as a FortiGuard server. FortiManager supports proxy for both updates and rating, and FortiOS retrieves its updates and ratings through FortiManager. See Using FortiManager as a local FortiGuard server on page 2155.

**Manual updates**

When needed, FortiGuard Distribution Network (FDN) updates can be manually uploaded.

**To manually update the signature definitions files:**

1. Log in to the Fortinet Support website.
2. Go to Support > Service Updates.
3. Select your OS Version from the dropdown list.
4. Locate your device in the table, and download the signature definitions files.
5. On the FortiGate, go to System > FortiGuard.
6. In the License Information table, locate and expand the definitions that you are updating.
7. From the Actions menu in the rightmost column, select Upgrade Database.
8. In the pane that opens, click Upload, locate the downloaded definitions file on your computer, then click Open. The download may take a few minutes to complete.
9. Click OK.

**AV and IPS manual updates**

AV and IPS packages are signed by the Fortinet CA to ensure authenticity of the packages. During manual package updates, signed and validated packages will be accepted. If a package is not signed, the following applies:

- Level-0: accept the new package even if it is unsigned.
- Level-1: display a warning and request a user confirmation to accept.
- Level-2: display an error and reject the image.
- If no level is configured, apply Level-1.

Security levels are pre-configured on the BIOS.

To execute the update:

```
# execute restore ips tftp nids-720-19.261.pkg 172.16.200.55
```

To verify the manual AV and IPS package updates:

```
# diagnose debug app updated -1
# diagnose debug enable
```

**Manual update of an unsigned package with level-1 configured**

A warning message is displayed in the console, and requests a user confirmation to accept the update of an unsigned package.

To execute the update:

```
# execute restore ips tftp nids-720-19.261.pkg 172.16.200.55
This operation will overwrite the current IPS package!
Do you want to continue? (y/n)y
```

Please wait...

Connect to tftp server 172.16.200.55 ...
```
##
```
Get IPS database from tftp server OK.
*****WARNING: This package file has no signature for validation.*****
Fortinet cannot verify the authenticity of this package and therefore...
there may be a risk that the package contains code unknown to Fortinet. In short, Fortinet cannot validate the package and makes no warranties or representations concerning the package. Please continue only if you understand and are willing to accept the risks. Do you want to continue? (y/n)y

**Manual update of an unsigned package with level-2 configured**

A warning message is displayed in the console, and the image is rejected.

**To execute the update:**

```
# execute restore ips tftp nids-720-19.261.pkg 172.16.200.55
This operation will overwrite the current IPS package!
Do you want to continue? (y/n)y
```

Please wait...

Connect to tftp server 172.16.200.55 ...
```
##
Get IPS database from tftp server OK.
```

**Automatic updates**

The default auto-update schedule for FortiGuard packages is automatic. The update interval is calculated based on the model and percentage of valid subscriptions, within one hour.

For example, if a FortiGate 501E has 78% valid contracts, then based on this device model, the update schedule is calculated to be every 10 minutes. If you verify the system event logs (ID 0100041000), they are generated approximately every 10 minutes.

**To configure automatic updates in the GUI:**

1. Go to System > FortiGuard
2. In the FortiGuard Updates section, enable Scheduled Updates and select Automatic.

3. Click Apply.
To configure scheduled updates in the CLI:

```
config system autoupdate schedule
    set status enable
    set frequency automatic
end
```

**Scheduled updates**

Scheduling updates ensures that the virus and IPS definitions are downloaded to your FortiGate on a regular basis. Updating definitions can cause a brief disruption in traffic that is currently being scanned while the FortiGate unit applies the new signature database. Updates should be scheduled during off-peak hours when network usage is at a minimum to ensure that network activity will not be affected by downloading the definitions files.

A schedule of once a week means any urgent updates will not be pushed until the scheduled time. If an urgent update is required, click the *Update Licenses & Definitions Now* button to manually update the definitions.

To configure scheduled updates in the GUI:

1. Go to *System > FortiGuard*
2. In the *FortiGuard Updates* section, enable *Scheduled Updates*.
3. Configure the update schedule:

   ![FortiGuard Updates GUI](image)

   4. Click *Apply*.

To configure scheduled updates in the CLI:

```
config system autoupdate schedule
    set status enable
    set frequency {every | daily | weekly}
    set time <hh:mm>
    set day <day_of_week>
end
```
Sending malware statistics to FortiGuard

FortiGate devices periodically send encrypted antivirus, IPS, botnet IP list, and application control statistics to FortiGuard. Included with these data is the IP address and serial number of the FortiGate, and the country that it is in. This information is never shared with external parties, Fortinet Privacy Policy.

The malware statistics are used to improve various aspects of FortiGate malware protection. For example, antivirus data allow FortiGuard to determine what viruses are currently active. Signatures for those viruses are kept in the Active AV Signature Database that is used by multiple Fortinet products. Inactive virus signatures are moved to the Extended AV Signature Database (see Configuring FortiGuard updates on page 2143). When events for inactive viruses start appearing in the malware data, the signatures are moved back into the AV Signature Database.

The FortiGate and FortiGuard servers go through a 2-way SSL/TLS 1.2 authentication before any data is transmitted. The certificates used in this process must be trusted by each other and signed by the Fortinet CA server.

The FortiGate only accepts data from authorized FortiGuard servers. Fortinet products use DNS to find FortiGuard servers and periodically update their FortiGate server list. All other servers are provided by a list that is updated through the encrypted channel.

Malware statistics are accumulated and sent every 60 minutes by default.

To configure sharing this information, use the following CLI command:

```
config system global
    set fds-statistics {enable | disable}
    set fds-statistics-period <minutes>
end
```

The submission of malware data is in accordance with the Fortinet Privacy Policy. There is no sensitive or personal information included in these submissions. Only malware statistics are sent.

Fortinet uses the malware statistics collected in this manner to improve the performance of the FortiGate services and to display statistics on the Fortinet Support website for customers registered FortiGate devices.

Fortinet may also publish or share statistics or results derived from this malware data with various audiences. The malware statistics shared in this way do not include any customer data.

Update server location

Administrators can specify the location of the FortiGuard update server used by FortiGate. You can set the location to only servers in the USA, only servers in the European Union (EU), or to servers with the lowest latency.

In EU locations, it can be required that certain traffic is only handled by servers located in the EU. By setting the update server location to EU only, the FortiGate will use EU domains to resolve to EU servers for FortiGuard traffic to update, URL rating, and IoT servers.

<table>
<thead>
<tr>
<th>Server location</th>
<th>Anycast domain name</th>
<th>Non-Anycast FQDN addresses</th>
</tr>
</thead>
<tbody>
<tr>
<td>EU only</td>
<td>euupdate.fortinet.net</td>
<td>euguardservice.fortinet.net</td>
</tr>
</tbody>
</table>
### System

<table>
<thead>
<tr>
<th>Server location</th>
<th>Anycast domain name</th>
<th>Non-Anycast FQDN addresses</th>
</tr>
</thead>
<tbody>
<tr>
<td>US only</td>
<td>usupdate.fortinet.net</td>
<td>usupdate.fortiguard.net</td>
</tr>
<tr>
<td></td>
<td>usguardservice.fortinet.net</td>
<td>UDP: usservice.fortiguard.net</td>
</tr>
<tr>
<td></td>
<td></td>
<td>HTTPS: ussecurewf.fortiguard.net</td>
</tr>
<tr>
<td>Lowest latency (automatic)</td>
<td>globalupdate.fortinet.net</td>
<td>update.fortiguard.net</td>
</tr>
<tr>
<td></td>
<td>globalguardservice.fortinet.net</td>
<td>UDP: service.fortiguard.net</td>
</tr>
<tr>
<td></td>
<td></td>
<td>HTTPS: securewf.fortiguard.net</td>
</tr>
</tbody>
</table>

On hardware FortiGate devices, the default is *Lowest latency locations*. On VM devices, the default is *US only*.

**To configure the update server location in the GUI:**

1. Go to **System > FortiGuard**
2. In the **FortiGuard Updates** section, set **Update server location** to *Lowest latency locations* or *Restrict to*.
3. If *Restrict to* is selected, choose *US only* or *EU only*.

4. Click **Apply**.

**To configure the update server location in the CLI:**

```
config system fortiguard
    set update-server-location {automatic | usa | eu}
end
```

**Filtering**

Web filtering is used to block access to harmful, inappropriate, and dangerous web sites (see FortiGuard filter on page 1130).

Email filtering is used to detect and block spam messages (see FortiGuard-based filters on page 1242).

**To configure filtering in the GUI:**

1. Go to **System > FortiGuard**
2. Scroll down to the **Filtering** section.
3. Configure the settings as needed:

<table>
<thead>
<tr>
<th>Web Filter Cache</th>
<th>Enable/disable web filter cache, and set the amount of time that the FortiGate will store a blocked IP address or URL locally. After the time expires, the FortiGate contacts the FDN to verify the address.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Filter Cache</td>
<td>Enable/disable email filter cache, and set the amount of time that the FortiGate will store an email address locally.</td>
</tr>
<tr>
<td>FortiGuard filtering services</td>
<td>The protocol and port used to contact the FortiGuard servers. These options can be changed in the CLI.</td>
</tr>
<tr>
<td>Filtering service availability</td>
<td>The status of the filtering service. Click Test Connectivity if the filtering service is not available.</td>
</tr>
<tr>
<td>Request re-evaluation of a URL's category</td>
<td>Click to re-evaluate a URL category rating on the FortiGuard web filter service.</td>
</tr>
</tbody>
</table>

4. Click Apply.

To configure filtering in the CLI:

```
config system fortiguard
  set protocol {https | udp}
  set port {443 | 53 | 8888}
  set antispam-force-off {enable | disable}
  set antispam-cache {enable | disable}
  set antispam-cache-ttl <integer>
  set antispam-cache-mpercent <percent>
  set antispam-timeout <integer>
  set webfilter-force-off {enable | disable}
  set webfilter-cache {enable | disable}
  set webfilter-cache-ttl <integer>
  set webfilter-timeout <integer>
end
```

When anycast is enabled (by default) the protocol is HTTPS and the port is 443.
Online security tools

FortiGuard Labs provides a number of online security tools, including but not limited to:

- **URL lookup**
  Enter a website address to see if it has been rated and what category and classification it is filed as. If you find a site that has been wrongly categorized, use this page to request that the site be re-evaluated: https://www.fortiguard.com/webfilter

- **Threat Encyclopedia**
  Browse FortiGuard Labs extensive encyclopedia of threats. Search for viruses, botnet C&C, IPS, endpoint vulnerabilities, and mobile malware: https://www.fortiguard.com/encyclopedia

- **Application Control**
  Browse FortiGuard Labs extensive encyclopedia of applications: https://www.fortiguard.com/appcontrol

FortiGuard anycast and third-party SSL validation

Anycast optimizes routing performance to FortiGuard servers. It is the default FortiGuard access mode.

Using Fortinet DNS servers, the FortiGate receives a single IP address for the domain name of each FortiGuard service. BGP routing optimization is transparent to the FortiGate. The domain name of each FortiGuard service is the common name in that service's certificate, which is signed by a third-party intermediate CA. The FortiGuard server uses third-party certificate verification and the Online Certificate Status Protocol (OCSP) stapling check, so that the FortiGate can always validate the FortiGuard server certificate efficiently.

FortiGate will only complete the TLS handshake with an anycast server that has a good OCSP status for its certificate. Any other status will result in a failed SSL connection. OCSP stapling is reflected on the signature interval so that good means that the certificate is not revoked at that timestamp. The FortiGuard servers query the CA's OCSP responder every four hours and update its OCSP status. If the FortiGuard is unable to reach the OCSP responder, it will keep the last known OCSP status for up to seven days. This cached OCSP status will be sent out immediately when a client connection request is made, optimizing the response time.

FortiGuard represents all cloud based servers; see Anycast and unicast services for details.

The anycast server has one IP address to match its domain name. The FortiGate connects with a single server address, using HTTPS and port 443, regardless of where the FortiGate is located.
To configure the anycast FortiGuard access mode:

```
config system fortiguard
    set fortiguard-anycast {enable | disable}
    set fortiguard-anycast-source {fortinet | aws}
end
```

**Connection process**

The following process is used to connect to an anycast server:
1. The FortiGate embeds the CA_bundle certificate, which includes the root CA with CRL list and third-party intermediate CA, in the root CA level.

2. The FortiGate finds the FortiGuard IP address from its domain name from DNS.

3. The FortiGate starts a TLS handshake with the FortiGuard IP address. The client hello includes an extension of the status request.

4. The FortiGuard servers provide a certificate with its OCSP status: good, revoked, or unknown.

5. The FortiGate verifies the CA chain against the root CA in the CA_bundle.

6. The FortiGate verifies the intermediate CA's revoke status against the root CA's CRL.

7. The FortiGate verifies the FortiGuard certificate's OCSP status:

   OCSP Response Data:
   
   OCSP Response Status: successful (0x0)
   Response Type: Basic OCSP Response
   Version: 1 (0x0)
   Responder Id: 3DD350A5D6A0ADEEF34A600A65D321D4F8F8D60F
   Produced At: Aug 20 07:50:58 2019 GMT
   Responses:
   Certificate ID:
   Hash Algorithm: sha1
   Issuer Name Hash: 49F4BD8A18BF760698C5DE402D683B716AE4E686
   Issuer Key Hash: 3DD350A5D6A0ADEEF34A600A65D321D4F8F8D60F
   Serial Number: 02555C9F3901B799DF1873402FA9392D
   Cert Status: good
   This Update: Aug 20 07:50:58 2019 GMT
   Next Update: Aug 27 07:05:58 2019 GMT

   Abort conditions include:
   - The CN in the server's certificate does not match the domain name resolved from the DNS.
   - The OCSP status is not good.
   - The issuer-CA is revoked by the root-CA.

8. Once the SSL handshake is established, the FortiGate can engage the server.
Using FortiManager as a local FortiGuard server

FortiManager can provide a local FortiGuard server with port 443 access. Anycast FortiGuard settings force the rating process to use port 443, even with an override server. Using a unique address in the same subnet as the FortiManager access IP address, the FortiManager can provide local FortiGuard updates and rating access with a dedicated IP address and port 443.

To use a FortiManager as a local FortiGuard server in the GUI:

1. Go to System > FortiGuard
2. In the Override FortiGuard Servers table, click Create New. The Create New Override FortiGuard Server pane opens.
3. Select the server address type: IPv4, IPv6, or FQDN.
4. Enter the FortiManager address in the Address field.
5. Select the type of server: AntiVirus & IPS Updates, Filtering, or Both.
6. Click OK.
7. Click Create New again to add a second override FortiManager for filtering.
8. Click OK, then click Apply.
To use a FortiManager as a local FortiGuard server in the CLI:

```plaintext
config system central-management
  set type fortimanager
  set fmg "172.18.37.148"
config server-list
  edit 1
    set server-type update
    set server-address 172.18.37.150
  next
  edit 2
    set server-type rating
    set server-address 172.18.37.149
  next
end
set fmg-update-port 443
set include-default-servers enable
end
```

When `fmg-update-port` is set to 443, the update process will use port 443 to connect to the override update server, which is the local FortiGuard server in the FortiManager. If this is not set, the update process will use port 8890, and the server address setting has to be the FortiManager access IP address. Override FortiGuard services come from the server list that is the local FortiGuard server in the FortiManager, and use the traditional, non-OCSP TLS handshake. If override servers in the FortiManager are not available, the default FortiGuard servers are connected, and the anycast OCSP TLS handshake is used.

### Cloud service communication statistics

Fortinet service communications statistics are displayed on the FortiGuard page. The statistics correspond with the output from `diagnose sys service-communication`. The traffic volume values in the GUI are the sums of data from the last 24 hours.

#### To view Fortinet service communications statistics:

1. Go to System > FortiGuard.
   The Fortinet Service Communications statistics are displayed on the right side of the screen:
2. Enter the following CLI command:

   ```bash
   # diagnose sys service-communication
   FortiCare:
   The last 1 hour (in bytes): 0 0 0 0 0 0 0 0 0 0 0 0
   The last 24 hours (in bytes): 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0
   The last 7 days (in bytes): 0 0 0 0 0 0 0
   FortiGuard Download:
   The last 1 hour (in bytes): 0 0 0 0 336 1992 0 0 0 0 0 0
   The last 24 hours (in bytes): 0 2328 6752 4450632 0 33696 0 5666528 0 49712 0 28840 0 28840 0 4185832 0 31488 0 76424 0 4226808 0 173880

IoT detection service

Internet of Things (IoT) detection is a subscription service that allows FortiGate to detect unknown devices in FortiGuard that are not detected by the local Device Database (CIDB). When the service is activated, FortiGate can send device information to the FortiGuard collection server. When a new device is detected, FortiGate queries the results from the FortiGuard query for more information about the device.

This feature requires an IoT Detection Service license.

FortiGate device requirements:

The FortiGate device must be:

- Registered with FortiCare
- Connected to an anycast FortiGuard server

How the service works:

1. Enable Device Detection on an interface.
2. FortiGate uses the interface to detect device traffic flow.
3. Upon detecting traffic from an unknown device, FortiGate sends the device data to the FortiGuard collection server.
4. The collection server returns data about the new device to the FortiGuard query server.
5. If the device signature does not appear in the local Device Database (CIDB) or some fields are not complete, FortiGate queries FortiGuard for more information about the device.

To view the latest device information in the GUI, go to Dashboard > Users & Devices and expand the Device Inventory widget.
To debug the daemon in the CLI:

1. Disable the local device database in order to force all queries to go to FortiGuard.
   
   ```bash
   # diagnose cid sigs disable
   ```

2. Enable iotd debugs.

   ```bash
   # diagnose debug application iotd -1
   # diagnose debug enable
   ```

FortiGate sends the device data to the FortiGuard collection server.

```
FortiWiFi-60E # [iotd] recv request from caller size:61
[iotd] service:collect hostname: ip: fd:-1 request tlv_len:41
[iotd] txt(......y...w......Jasons-iPhone6....579=23..)
[iotd] hex
   (02010007017903060f77fc0203000e4a61736f6e732d6950686536020400083537393d323330cf)
[iotd] service:collect hostname:qadevcollect.fortinet.net ip: fd:-1 got server hostname
[iotd] service:collect hostname:qadevcollect.fortinet.net ip:192.168.100.133 fd:-1 got server ip
[iotd] fd:13 monitor event:pollout
```

The FortiGuard collection server returns new device data to the FortiGuard query server.

```
FortiWiFi-60E # [iotd] recv request from caller size:61
```
FortiAP query to FortiGuard IoT service to determine device details

A FortiAP collects packets from devices and queries FortiGuard with the help of the FortiGate. Device detection results are reported back to the FortiGate where this information is displayed. Querying the FortiGuard service requires an IoT Detection Service license.

The following attributes can be configured in `wireless-controller setting`:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>device-weight</td>
<td>Set the device upper limit of confidence (0 - 255, default = 1, 0 = disable).</td>
</tr>
<tr>
<td>device-holdoff</td>
<td>Set the device lower limit of creation time, in minutes (0 - 60, default = 5).</td>
</tr>
<tr>
<td>device-idle</td>
<td>Set the device upper limit of idle time, in minutes (0 - 14400, default = 1440).</td>
</tr>
</tbody>
</table>

To query the FortiGuard IoT service:

```
config wireless-controller setting
...
set device-weight 1
set device-holdoff 5
set device-idle 1440
```
FortiGate Cloud / FDN communication through an explicit proxy

Explicit proxy communication to FortiGate Cloud and FortiGuard servers from FortiGate is enabled. A proxy server can be configured in the FortiGuard settings so that all FortiGuard connections under the forticldd process can be established through the proxy server.

Not all FortiGuard services are supported by these proxy settings. For example, web filter service traffic to FortiGuard will not be directed to the configured proxy.

To configure a proxy server and communicate with FortiGate Cloud though it:

1. Configure FortiGate B as a proxy server:

   ```
   config firewall proxy-policy
   edit 1
     set proxy explicit-web
     set dstintf "wan1"
     set srcaddr "all"
     set dstaddr "all"
     set service "webproxy"
     set action accept
     set schedule "always"
     set logtraffic all
     set users "guest1"
   next
   end
   config user local
   edit "guest1"
     set type password
     set passwd 123456
   next
   end
   config authentication scheme
   edit "local-basic"
   ```
set method basic
set user-database "local-user-db"
end

config authentication rule
edit "local-basic-rule"
set srcaddr "all"
set ip-based disable
set active-auth-method "local-basic"
end

2. Configure a firewall policy on FortiGate B to allow FortiGate A to get DNS resolution:

config firewall policy
edit 1
set name "dns"
set srcintf "port18"
set dstintf "wan1"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "DNS"
set fss disable
set nat enable
end

3. Configure the FortiGuard proxy settings on FortiGate A:

config system fortiguard
set proxy-server-ip 10.2.2.2
set proxy-server-port 8080
set proxy-username "guest1"
set proxy-password 123456
end

4. On FortiGate A, log in to FortiGate Cloud to activate the logging service:

execute fortiguard-log login <username> <password>

5. On FortiGate A, view the fortic1dd debug message to see the connection to the log controller through the proxy server:

# diagnose test application fortic1dd 1

FDS-only ISDB package in firmware images

FortiOS firmware images include Fortinet objects in the built-in Internet Service Database (ISDB).

# diagnose firewall internet-service list
List internet service in kernel(global):
Internet Service Database Kernel Table: size 14974 bytes, Entry size 5844 bytes, number of index entries 165 number of IP range entries 0

Group(0): Weight(15), number of entries(162)
......
System

This lightweight ISDB package allows firewall rules and policy routes that use ISDB to access FortiGuard servers to continue working after upgrading FortiOS. For example, the following policy will work after an upgrade:

```bash
config firewall policy
edit 440
    set name "Fortinet Updates"
    set srcintf "port25"
    set dstintf "port1"
    set srcaddr "FortiAnalyzer" "FortiAuthenticator" "Tesla Management Interface" "BackupFortinet" "SipFW" "ConnectVPNmgmt"
    set internet-service enable
    set internet-service-id 1245187 1245326 1245324 1245325 1245193 1245192 1245190
1245185
    set action accept
    set schedule "always"
    set logtraffic all
    set fsso disable
next
end
```

After the FortiGate reboots after a firmware update, an automatic update will run in five minutes so that the FortiGate can get the ISDB, whether or not scheduled update is enabled.

```
# diagnose autoupdate versions | grep Internet -A 6

Internet-service Full Database
----------
Version: 7.02217 signed
Contract Expiry Date: n/a
Last Updated using manual update on Thu Mar 10 12:06:58 2022
Last Update Attempt: Thu Mar 10 12:07:27 2022
```

**Licensing in air-gap environments**

In the Operational Technology industry, industrial equipment is critical and must not be connected to the internet. However, the equipment is still required to be protected by a firewall in this air-gap environment. Without a gateway to FortiGuard in air-gap environments, FortiGuard packages, such as AntiVirus and IPS, must be manually uploaded to the FortiGate. FortiGate licenses can be downloaded from FortiCloud and uploaded manually to the FortiGate.

---

Manual licensing for air-gap environments is supported only on FortiGate hardware appliances, for both rugged and non-rugged models running FortiOS 7.2.0 or later. Manual licensing is currently not supported on FortiGate virtual machine (VM) appliances.

---

**To manually upload FortiGate licenses in the GUI:**

1. Register the FortiGuard license on FortiCloud. See Registration in the FortiOS Administration Guide for more information.
2. Download the product entitlement file in FortiCloud:
   a. Go to Products > Product List.
   b. Select the serial number of the FortiGate. The product page opens.
c. In the License & Key section, click Get The License File. The file downloads to your device in the format FG201E*********ProductEntitlement.lic.

3. In FortiOS, go to System > FortiGuard. Currently, the status for all services is Pending.

4. Click Upload License File. The file explorer opens.
5. Navigate to the product entitlement file and click Open.
   The license file uploads to the FortiGate. Once the upload is complete, the FortiGate shows that it is registered and licensed.

6. Click Apply.

To manually upgrade the AntiVirus Database in the GUI:

1. Download the static upgrade file from FortiCloud:
   a. Go to support.fortinet.com.
   b. Go to Download > Download FortiGuard Service Updates > FortiGate.
   c. Select the FortiOS version from the OS Version dropdown.
   d. Select the file from the appropriate FortiGate product model section. The file downloads to your device.
2. In FortiOS, go to System > FortiGuard and expand the AntiVirus section to view the current licenses.
3. Click **Upgrade Database**. The Anti-Virus Database Upgrade pane opens.
4. Click **Upload**. The file explorer opens.
5. Navigate to the static upgrade file and click **Open**.
6. Click **OK**.
7. Click **Apply**.
   The AntiVirus Database is upgraded.

To manually upload FortiGate licenses in the CLI:

```
# execute restore manual-license {ftp | tftp} <license file name> <server> [args]
```

**Feature visibility**

Feature visibility is used to control which features are visible in the GUI. This allows features that are not in use to be hidden. Some features are also invisible by default and must be made visible before they can be configure in the GUI.

The visibility of a feature does not affect its functionality or configuration. Invisible features can still be configured using the CLI.

To change the visibility of features:

1. Go to **System > Feature Visibility**.
2. Change the visibility of the features as required.
   For information about what settings each option affects, click on the + icon to the right of the feature name.
   Changes are listed on the right side of the content pane.
3. Click **Apply**.
**Certificates**

FortiOS leverages certificates in multiple areas, such as VPNs, administrative access, and deep packet inspection. This section contains topics about uploading certificates and provides examples of how certificates may be used to encrypt and decrypt communications, and represent the identity of the FortiGate. This sections assumes the reader has a high level understanding of the public key infrastructure (PKI) system, particularly how entities leverage trusted certificate authorities (CAs) to verify the authenticating party, and how public and private certificate keys work to secure communications.

The certificates feature is hidden by default in FortiOS. In the GUI, go to System > Feature Visibility and enable Certificates.

The following topics provide an overview of how to add certificates to the FortiGate:

- Uploading a certificate using the GUI on page 2166
- Uploading a certificate using the CLI on page 2169
- Uploading a certificate using an API on page 2170

The following topics provide examples of how to use certificates:

- Site-to-site VPN with digital certificate on page 1365
- Procuring and importing a signed SSL certificate on page 2175
- Microsoft CA deep packet inspection on page 2178
- ACME certificate support on page 2183
- Administrative access using certificates on page 2187
- Creating certificates with XCA on page 2188
- Configuring FortiClient EMS on page 2236
- SSL VPN with certificate authentication on page 1660
- SSL VPN with LDAP-integrated certificate authentication on page 1665
- Configuring certificates for SAML SSO on page 2323
- Protecting an SSL server on page 1301

**Uploading a certificate using the GUI**

On the System > Certificates page, there are two options to add a certificate: Generate (use a certificate signing request) and Import.

**Generate certificate signing request**

Certificate signing requests (CSRs) are used to generate a certificate which is then signed by a CA to create a chain of trust. The CSR includes details of the FortiGate (see table below) and its public key. A CSR is not strictly necessary; some CAs allow you to provide the details of the FortiGate manually, but a CSR helps streamline the process. Selecting Generate takes you the Generate Certificate Signing Request page to enter the following information:

<table>
<thead>
<tr>
<th>Certificate Name</th>
<th>Enter the certificate name; this is how it will appear in the Local Certificates list.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subject Information</td>
<td>Specify an ID type: host IP address, domain name (FQDN), or email address.</td>
</tr>
</tbody>
</table>
### Optional Information

Although listed as optional, we recommended entering the information for each field in this section.

If you are generating a CSR for a third-party CA, you need to insure that these values reflect those listed for your company or organization at said certificate authority. If you are generating a certificate for a Microsoft CA, you need to check with the administrator regarding these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Organization Unit</strong></td>
<td>Enter the name of the organizational unit under which the certificate will be issued.</td>
</tr>
<tr>
<td><strong>Organization</strong></td>
<td>Enter the overall name of the organization.</td>
</tr>
<tr>
<td><strong>Locality(City)</strong></td>
<td>Enter the city where the SSL certificate is located.</td>
</tr>
<tr>
<td><strong>State / Province</strong></td>
<td>Some issuers will reject a CSR that has an abbreviated state or province, so enter the full name of the state or province.</td>
</tr>
<tr>
<td><strong>Country / Region</strong></td>
<td>Enable the option and select the country from the dropdown.</td>
</tr>
<tr>
<td><strong>E-Mail</strong></td>
<td>Enter the email address of the technical contact for the SSL certificate that is being requested.</td>
</tr>
<tr>
<td><strong>Subject Alternative Name</strong></td>
<td>This field allows multiple domains to be used in an SSL certificate. Select from email addresses, IP addresses, URIs, DNS names, and so on.</td>
</tr>
<tr>
<td><strong>Password for private key</strong></td>
<td>If supplied, this is used as an encryption password for the private key file.</td>
</tr>
<tr>
<td><strong>Key Type</strong></td>
<td>Select RSA or Elliptic Curve.</td>
</tr>
<tr>
<td><strong>Key Size</strong></td>
<td>When Key Type is RSA, select 1024, 1536, 2048, or 4096 for bit-size/strength. We recommend using at least 2048 if your CA can issue certificates of that size.</td>
</tr>
<tr>
<td><strong>Curve Name</strong></td>
<td>When Key Type is Elliptic Curve, select the elliptic curve type: secp256r1, secp384r1, or secp521r1.</td>
</tr>
</tbody>
</table>
| **Enrollment Method**  | Select one of the following methods that determines how the CSR will be signed. • *File Based:* this will generate a certificate in the certificate menu under Local Certificate, which differs from the existing ones because it has no Subject, Comments, Issuer, or Expires values in the table. It will also show a Pending status because it is only a CSR at the moment and cannot function as a certificate just yet. You can download the CSR to provide to a CA for signing. If you open the CSR file, it should look similar to this:  

```
-----BEGIN CERTIFICATE REQUEST-----
MIIC7jCCAdYCAQAwg2UxCzAJBgNVBAYT... )HEKjDX+Hg==
-----END CERTIFICATE REQUEST------
```

Next, the CSR file is supplied to a CA for signing and the returned file from the CA should be in .CER format. This file is then uploaded to the FortiGate by going to System > Certificates > Import > Local Certificate and uploading the CERT file.

• *Online SCEP:* the Simple Certificate Enrollment Protocol (SCEP) allows... |
There is no field to upload a key with this option. Use this option when you have created a CSR on the FortiGate, as the key is generated as part of the CSR process and remains on the FortiGate. You will need to upload a .CER file.

This option takes a specific certificate file type that contains the private key. The certificate will be encrypted and a password must be supplied with the certificate file.

This option is intended for certificates that were generated without using the FortiGate’s CSR. Since the certificate private key is being uploaded, a password is required. This can be done two ways:
- Certificate file and key file (typically .CER and .PEM)
- Certificate and key bundle file (typically .PFX)

This option allows you to configure the Automated Certificate Management Environment (ACME), which allows you to request and use trusted certificates signed by Let’s Encrypt (see ACME certificate support on page 2183 for configuration details).

FortiGates come with many CA certificates from well-known certificate authorities pre-installed, just as most modern operating systems like Windows and MacOS. Use this option to add private CA certificates to the FortiGate so that certificates signed by this private CA are trusted by the FortiGate.

For example, a private CA can be used when two FortiGates are establishing a site-to-site VPN tunnel using a certificate not signed by a public or trustworthy CA, or for your LDAPS connection to your corporate AD server that also uses a
certificate signed with a private CA in your domain. It is very common to upload a private CA when using PKI user authentication, since most PKI user certificates will be signed by an internal CA.

When selecting CA Certificate, two type options appear in the Import CA Certificate pane:

<table>
<thead>
<tr>
<th>Online SCEP</th>
<th>The FortiGate contacts an SCEP server to request the CA certificate.</th>
</tr>
</thead>
<tbody>
<tr>
<td>File</td>
<td>The CA certificate is uploaded directly to the FortiGate.</td>
</tr>
</tbody>
</table>

Remote certificate

Remote certificates are public certificates and contain only the public key. They are used to identify a remote device. For example, when configuring your FortiGate for SAML authentication with the FortiGate as an identity provider (IdP), you can optionally specify the service provider (SP) certificate. However, when configuring your FortiGate as a SP, you must specify the certificate used by the IdP. Both these certificates can be uploaded to the FortiGate as a remote certificate, since the private key is not necessary for its implementation.

CRL

Since it is not possible to recall a certificate, the CRL (certificate revocation list) list details certificates signed by valid CAs that should no longer be trusted. Certificates may be revoked for many reasons, such as if the certificate was issued erroneously, or if the private key of a valid certificate has been compromised. When selecting CRL, two import methods are available:

<table>
<thead>
<tr>
<th>File Based</th>
<th>CAs publish a file containing the list of certificates that should no longer be trusted.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Online Updating</td>
<td>This is the preferred way to keep the list of revoked certificates up to date. Three protocols are offered: HTTP, LDAP, and SCEP.</td>
</tr>
</tbody>
</table>

Uploading a certificate using the CLI

Generate certificate signing request

The generated CSR must be signed by a CA then loaded to the FortiGate. See Generate certificate signing request on page 2166 for more details.

To generate a CSR:

```
# execute vpn certificate local generate cmp <certificate_name> <key_size> <server> <path> <server_certificate> <auth_certificate> <user> <password> <subject> [SANs] [options]
# execute vpn certificate local generate default-ssl-ca
# execute vpn certificate local generate default-ssl-key-certs
# execute vpn certificate local generate default-ssl-serv-key
# execute vpn certificate local generate ec <certificate_name> <curve_name> <subject> <country> <state/province> <city> <organization> <OU> <email> [SANs] [options]
# execute vpn certificate local generate rsa <certificate_name> <key_size> <subject> <country> <state/province> <city> <organization> <OU> <email> [SANs] [options]
```
Generate a certificate request over CMPv2.

Generate the default CA certificate used by SSL Inspection.

Generate the default untrusted CA certificate used by SSL Inspection.

Generate the default RSA, DSA and ECDSA key certs for ssl resign.

Generate the default server key used by SSL Inspection.

Generate an elliptic curve certificate request.

Generate a RSA certificate request.

Import

Any certificate uploaded to a VDOM is only accessible to that VDOM. Any certificate uploaded to the Global VDOM is globally accessible by all VDOMs.

A signed certificate that is created using a CSR that was generated by the FortiGate does not include a private key, and can be imported to the FortiGate from a TFTP file server.

To import a certificate that does not require a private key:

# execute vpn certificate local import tftp <file_name> <server_address> <cert_type> [password]

To import a certificate that requires a private key to a VDOM, or when VDOMs are disabled:

config vpn certificate {local | ca | remote | ocsp-server | crl}

Refer to the FortiOS CLI Reference for detailed options for each certificate type (local, CA, remote, OSCP server, CRL).

To import a global certificate that requires a private key when VDOMs are enabled:

config certificate {local | ca | remote | crl}

This command is only available when VDOMs are enabled. For details, see the FortiOS CLI Reference.

Uploading a certificate using an API

There are several API methods to upload a certificate based on the type and purpose of the certificate. The parameters of each method are available options, and some methods do not require all parameters to upload the certificate.

When uploading a certificate to the FortiGate using API, the certificate must be provided to the FortiGate in Base64 encoding. You must create a REST API user to authenticate to the FortiGate and use the generated API token in the request.

    "file_content": "string"}
"scope": "[vdom*|global]"

Example

In this example, a PKCS 12 certificate is uploaded as a local certificate using Postman as the API client. PowerShell is used for the Base64 encoding.

To upload a PKCS 12 certificate using an API:

1. In PowerShell, encode the PKCS 12 certificate to Base64:

```powershell
cd C:\users\username\desktop
$pkcs12cert = get-content 'C:\users\path\to\certificate\certificatename.p12' -Encoding Byte [System.Convert]::ToBase64String($pkcs12cert) | Out-File 'base12encodedcert.txt'
```

These three lines of code do the following:

a. Changes to working directory to the location where the encoded certificate will be created. In this example, it is the desktop.

b. Creates a variable called $pkcs12cert and defines it as the certificate file by specifying the full path to the certificate.

c. Creates a text file called `base12encodedcert` at the location specified in the first step. You will copy and paste the contents of this as file_content later in Postman.

2. Generate an API token on the FortiGate by creating a REST API user. See Generate an API token on the Fortinet Developer Network. A subscription to the Fortinet Developer Network is required to view this topic.

3. Open Postman and create a new request:

   a. Click the +.

   b. Click the Authorization tab and in the Type dropdown, select API Key.

   c. For Key, enter access_token and enter the Value for the API user.
d. **For Add to, select Query Params.**

4. In the HTTP request dropdown, change the request from **GET** to **POST**, and enter the FortiGate’s IP address and the URL of the API call.

5. Click the **Body** tab, and copy and paste the API parameters.

6. Remove unnecessary parameters (ACME related parameters and `key_file_content`) and enter the correct settings for your certificate. Copy and paste the contents of the file generated by PowerShell earlier into `file_content`. 
7. **Click Send.** The lower window will return the results.
8. In FortiOS, go to System > Certificates and verify that the uploaded certificate is shown in the table (api_crt).

To debug using the HTTPS daemon:

```
# diagnose debug reset
# diagnose debug enable
# diagnose debug application httpsd -l
<output>
# diagnose debug disable
```

**Procuring and importing a signed SSL certificate**

A signed SSL certificate can be used when configuring SSL VPN, for administrator GUI access, and for other functions that require a certificate.

Before creating a certificate, you must have a registered domain. With a valid FortiGuard subscription, FortiDDNS can be used to register a domain; see DDNS on page 208 for more information.

Follow these instructions to purchase, import, and use a signed SSL certificate:

- Obtain, setup, and download an SSL certificate package from a certificate authority
- Generate a CSR
- Import the signed certificate into your FortiGate
- Configure your FortiGate to use the signed certificate

**Obtain, setup, and download an SSL certificate package from a certificate authority**

SSL certificate packages can be purchased from any Certificate Authority (CA), such as DigiCert, GoDaddy, or GlobalSign.
Let's Encrypt can be used to generate a free, trusted SSL certificate.

A third party CA might not sign a certificate with an intranet name or IP address. For details, see Can I request a certificate for an intranet name or IP address?

The process for purchasing, setting up, and downloading a certificate will vary depending on the CA that is used, and if a CSR must be generated on the FortiGate.

**To purchase a certificate package:**

1. Create an account with your chosen vendor, or use the account that you used to purchase your domain.
2. Locate the SSL Certificates page.
3. Purchase a basic SSL certificate for domain validation only. If required, a more secure SSL certificate can be purchased.
4. If required, load the CSR, either by uploaded the text file or copying and pasting the contents into the requisite text box. See Generate a CSR on page 2176 for information on generating the CSR on the FortiGate.
5. If required, set the server type to Other.
6. Verify the certificate per the requirements of the CA.
7. Download the signed certificate to your computer.
8. Import the signed certificate into your FortiGate; see Import the signed certificate into your FortiGate on page 2178.

**Generate a CSR**

Some CAs can auto-generate the CSR during the signing process, or provide tools for creating CSRs. If necessary, a CSR can be created in your FortiGate device’s GUI.

**To generate a CSR on your FortiGate:**

1. Go to System > Certificates. By default, the Certificates option is not visible, see Feature visibility on page 2165 for information.
2. Click Generate. The Generate Certificate Signing Request page opens.

3. Configure the CSR request:
   - Ensure that the certificate has a unique name.
   - Set the ID Type to Domain Name and enter a Domain Name.
   - An email address is required.
   - Ensure that the Key Size is set to 2048 Bit.
   - Set the Enrollment Method to File Based.

4. Click OK. The CSR will be added to the certificate list with a status of PENDING.

5. In the certificate list, select the new CSR then click Download to save the CSR to your computer. The CSR file can be opened in any text editor, and will resemble the following:

```
-----BEGIN CERTIFICATE REQUEST-----
MIICCaECBADQAwSzEcMBiGbGAUEAxMzczLm9ydGlzLz4xL2cG5kZW1vLmNvbTErMCkG

-----END CERTIFICATE REQUEST-----
```
**Import the signed certificate into your FortiGate**

**To import the signed certificate into your FortiGate:**

1. Unzip the file downloaded from the CA. There should be two CRT files: a CA certificate with `bundle` in the file name, and a local certificate.
2. Log in to your FortiGate unit and go to System > Certificates.
3. Click Import > Local Certificate.
4. Upload the local certificate file, then click OK.
5. The status of the certificate will change from PENDING to OK.
6. Click Import > CA Certificate.
7. Set the Type to File, upload the CA certificate file, then click OK.
   *The CA certificate will be listed in the CA Certificates section of the certificates list.*

**Configure your FortiGate to use the signed certificate**

After the signed certificates have been imported, you can use it when configuring SSL VPN, for administrator GUI access, and for other functions that require a certificate.

**To configure your FortiGate to use the signed certificate for SSL VPN:**

1. Go to VPN > SSL-VPN Settings.
2. Set Server Certificate to the new certificate.
3. Configure other settings as needed.
4. Click Apply.

For more information on configuring SSL VPN, see SSL VPN on page 1619 and the Setup SSL VPN video in the Fortinet Video Library.

**To configure using the certificate for administrator GUI access in the CLI:**

```
config system global
  set admin-server-cert fortisslvpndemo
end
```

**To change the certificate that is used for administrator GUI access in the GUI:**

1. Go to System > Settings.
2. In the Administration Settings section, change HTTPS server certificate as needed.
3. Click Apply. You will be logged out of FortiOS.

**Microsoft CA deep packet inspection**

In most production environments, you want to use a certificate issued by your own PKI for deep packet inspection (DPI).

An existing Microsoft root CA can be used to issue a subordinate CA (sub CA) certificate that is installed as a DPI certificate on the FortiGate.

Complete the following steps to create your own sub CA certificate and use it for DPI:
1. Create a Microsoft sub CA certificate
2. Export the certificate and private key
3. Import the certificate and private key into the FortiGate
4. Configure a firewall policy for DPI
5. Verify that the sub CA certificate is being used for DPI

The FortiGate firewall uses information in the original web server certificate, then issues a new certificate signed by the Microsoft DPI certificate. The FortiGate then sends this certificate with the issuing DPI certificate to the client’s web browser when the SSL session is being established.

The browser verifies that the certificate was issued by a valid CA, then looks for the issuing CA of the Microsoft DPI certificate in its local trusted root CA store to complete the path to trusted root CA.

The Microsoft CA root certificate is normally deployed to all client PCs in the Windows domain, so the client can complete the certificate path up to a trusted root CA. The FortiGate now controls and can inspect the two HTTPS sessions: one with the external web server, and one with the client PC.

Create a Microsoft sub CA certificate

A Microsoft sub CA certificate can be created on a Microsoft CA server, or remotely using a web browser.

Creating a certificate remotely requires that the web enrollment option is configured on the Microsoft CA server. Remote certificate requests require HTTPS; requests are not allowed with HTTP.

To create a Microsoft sub CA certificate remotely:

1. Open a web browser and go to one of the following URLs:
   - https://<FQDN-CA-server>/CertSrv
2. Log in to a domain administrator account that has web enrollment rights.
3. Click Request a certificate.
4. Click advanced certificate request.
5. Click Create and submit a request to this CA, then click Yes in the Web Access Confirmation warning.
6. For the Certificate Template, select Subordinate Certification Authority.
7. Enable Mark keys as exportable.
8. Fill out the remaining information according to your security policy.

9. Submit the request.

10. Click Yes in the Web Access Confirmation warning.

11. Click Install this certificate.
    The certificate and private key are located in the current user's certificate store.

**Export the certificate and private key**

**To export the certificate and private key:**

1. Open the Microsoft Management Console (MMC) and add the Certificate Snap-in.

2. Go to the user's certificate store to locate the sub CA certificate that you just installed.

3. Right-click the certificate and select All Tasks > Export.

4. Click Next to start the Microsoft Certificate Export Wizard.

5. Follow the steps in the wizard:
   - When asked, select Yes, export the private key.
   - Only the PKCS #12 (.PFX) format is available, and it requires a password.
   - When selecting the encryption type, select TripleDES-SHA1 if you are using an older version of FortiOS (5.6.9
and earlier. Otherwise, select AES256-SHA256.

6. Complete the wizard, and save the DPI certificate to a local folder.

**Import the certificate and private key into the FortiGate**

The certificate can be imported from the local computer using the GUI, or from a TFTP server using the CLI. After importing the certificate, you can view it in the GUI to verify that it was successfully imported.

**To import the certificate and private key into the FortiGate in the GUI:**

1. Go to System > Certificates.
2. Select Import > Local Certificate.
3. Set Type to PKCS #12 Certificate.
4. Click Upload and locate the certificate file.
5. Enter the Password.
6. Optionally, modify the Certificate Name.
7. Click OK.

**To import the certificate and private key into the FortiGate in the CLI:**

execute vpn certificate local import <certificate file name> <tftp ip address> <password>

**To verify that the certificate was imported:**

1. Go to System > Certificates. By default, the Certificate option is not visible, see Feature visibility on page 2165 for information.
2. Locate the newly imported certificate in the table.
3. Select the certificate and click View Details to view the certificate details.
Configure a firewall policy for DPI

The certificate is used in an SSL/SSH inspection profile that is then used in a firewall policy.

To configure a firewall policy for DPI:

1. Go to Security Profiles > SSL/SSH Inspection and click Create New.
2. Configure the inspection profile, selecting the new certificate

3. Click Apply.
4. Go to Policy & Objects > Firewall Policy.
5. Create a new policy, or edit an existing policy.
6. In the SSL Inspection field, select the new SSL inspection profile.

7. Configure the remaining settings as needed.
8. Click OK.

Verify that the sub CA certificate is being used for DPI

You can verify that the certificate is being used for resigning web server certificates when a user connects to an external HTTPS website.
To verify that the certificate is being used:

1. On a client PC that is behind the FortiGate, go to an external HTTPS website. When connecting to the website, no certificate warning should be shown.
2. In your web browser, view the certificate and certificate path. The methods for doing this vary depending on the browser. See your browsers documentation for information.

ACME certificate support

The Automated Certificate Management Environment (ACME), as defined in RFC 8555, is used by the public Let's Encrypt certificate authority (https://letsencrypt.org) to provide free SSL server certificates. The FortiGate can be configured to use certificates that are managed by Let's Encrypt, and other certificate management services, that use the ACME protocol. The server certificates can be used for secure administrator log in to the FortiGate.

ACME certificates do not support loopback interfaces.

- The FortiGate must have a public IP address and a hostname in DNS (FQDN) that resolves to the public IP address.
- The configured ACME interface must be public facing so that the FortiGate can listen for ACME update requests. It must not have any VIPs, or port forwarding on port 80 (HTTP) or 443 (HTTPS).
- The Subject Alternative Name (SAN) field is automatically filled with the FortiGate DNS hostname. It cannot be edited, wildcards cannot be used, and multiple SANs cannot be added.

This example shows how to import an ACME certificate from Let's Encrypt, and use it for secured remote administrator access to the FortiGate.

To configure certificates in the GUI, go to System > Feature Visibility and enable Certificates.

To import an ACME certificate in the GUI:

1. Go to System > Certificates and click Import > Local Certificate.
2. Set Type to Automated.
3. Set Certificate name to an appropriate name for the certificate.
4. Set Domain to the public FQDN of the FortiGate.
5. Set Email to a valid email address. The email is not used during the enrollment process.
6. Ensure that ACME service is set to Let's Encrypt.
7. Configure the remaining settings as required, then click OK.

8. If this is the first time enrolling a server certificate with Let's Encrypt on this FortiGate, the Set ACME Interface pane opens. Select the interface that the FortiGate communicates with Let's Encrypt on, then click OK.

The ACME interface can later be changed in System > Settings.

9. The new server certificate is added to the Local Certificate list. Click View Details to verify that the FortiGate's FQDN is in the certificate's Subject: Common Name (CN).

The Remote CA Certificate list includes the issuing Let's Encrypt intermediate CA, issued by the public CA ISRG Root X1 from Digital Signature Trust Company.
To exchange the default FortiGate administration server certificate for the new public Let’s Encrypt server certificate in the GUI:

1. Go to System > Settings.
2. Set HTTPS server certificate to the new certificate.
3. Click Apply.
4. Log in to the FortiGate using an administrator account from any internet browser. There should be no warnings related to non-trusted certificates, and the certificate path should be valid.

To import an ACME certificate in the CLI:

1. Set the interface that the FortiGate communicates with Let’s Encrypt on:
   ```
   config system acme
   set interface "port1"
   end
   ```
2. Make sure that the FortiGate can contact the Let’s Encrypt enrollment server:
# execute ping acme-v02.api.letsencrypt.org
PING ca80a1adb12a4fbdac5ffcbc944e9a61.pacloudflare.com (172.65.32.248): 56 data bytes
64 bytes from 172.65.32.248: icmp_seq=0 ttl=60 time=2.0 ms
64 bytes from 172.65.32.248: icmp_seq=1 ttl=60 time=1.7 ms
64 bytes from 172.65.32.248: icmp_seq=2 ttl=60 time=1.7 ms
64 bytes from 172.65.32.248: icmp_seq=3 ttl=60 time=2.1 ms
64 bytes from 172.65.32.248: icmp_seq=4 ttl=60 time=2.0 ms
--- ca80a1adb12a4fbdac5ffcbc944e9a61.pacloudflare.com ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 1.7/1.9/2.1 ms

3. Configure the local certificate request:

```
config vpn certificate local
edit "acme-test"
   set enroll-protocol acme2
   set acme-domain "test.ftntlab.de"
   set acme-email "techdoc@fortinet.com"
next
By enabling this feature you declare that you agree to the Terms of Service at https://acme-v02.api.letsencrypt.org/directory
Do you want to continue? (y/n) y
end
```

4. Verify that the enrollment was successful:

```bash
# get vpn certificate local details acme-test
path=vpn.certificate, objname=local, tablename=(null), size=2632
== [ acme-test ]
   Name:   acme-test
   Subject: CN = test.ftntlab.de
   Issuer: C = US, O = Let's Encrypt, CN = R3
   Valid from: 2021-03-11 17:43:04 GMT
   Valid to: 2021-06-09 17:43:04 GMT

   ACME details:
   Status: The certificate for the managed domain has been renewed successfully and can be used (valid since Thu, 11 Mar 2021 17:43:04 GMT).
   Staging status: Nothing in staging
```

5. Check the ACME client full status log for the CN domain:

```json
# diagnose sys acme status-full test.ftntlab.de

"name": "test.ftntlab.de",
"finished": true,
"notified": false,
"last-run": "Thu, 11 Mar 2021 18:43:02 GMT",
"valid-from": "Thu, 11 Mar 2021 17:43:04 GMT",
"errors": 0,
"last": {
   "status": 0,
   "detail": "The certificate for the managed domain has been renewed successfully and can be used (valid since Thu, 11 Mar 2021 17:43:04 GMT). A graceful server restart now is recommended.",
   "valid-from": "Thu, 11 Mar 2021 17:43:04 GMT"
```
To exchange the default FortiGate administration server certificate for the new public Let's Encrypt server certificate in the CLI:

```
config system global
    set admin-server-cert "acme-test"
end
```

When you log in to the FortiGate using an administrator account there should be no warnings related to non-trusted certificates, and the certificate path should be valid.

**Administrative access using certificates**

Certificates can be used for administrative authentication.

Generated key pairs can also be used for this authentication. See [Public key SSH access on page 1950](#) for information about generating a key pair.

**To log in to the FortiGate with a certificate private key:**

1. On the PC, generate a certificate.
2. In FortiOS, import the PEM file for the remote certificate:
   ```
   # execute vpn certificate remote import tftp certificate.pem 172.16.200.55
   ```
3. Display the imported remote certificate:
   ```
   config certificate remote
       edit "REMOTE_Cert_1"
   next
   end
   ```
4. Apply the remote certificate to the administrative user:
   ```
   config system admin
       edit "admin1"
       set accprofile "prof_admin"
       set vdom "root"
       set ssh-certificate "REMOTE_Cert_1"
       set password ************
   ```
5. On the PC, verify that the administrator can log in to the FortiGate with the SSH certificate:

```
root@PC05:~# ssh -i certificate-private.pem admin@172.16.200.1
FortiGate-101F $ get system status
Version: FortiGate-101F v7.0.2,build0234,211019 (GA)
```

Creating certificates with XCA

This topic explains how to generate various certificates to be used in conjunction with a FortiGate, including:

- CA certificate
  - Signing server and client certificates
  - Issuing subordinate CAs for deep inspection
- Server certificate
  - SSL/TLS web administration authentication
  - VPN authentication
  - Internal SSL server protection
- Client certificate
  - End user authentication for SSL or IPsec VPN

XCA is an x509 certificate generation tool that handles RSA, DSA, and EC keys, as well as certificate signing requests (PKCS #10) and CRLs.

There are several options for generating and managing certificates. This topic covers basic certificate generation for XCA. It is not a comprehensive guide to its application and does not explore all options available when generating a certificate.

Creating the XCA database

Before creating any certificates, you must create an XCA database to group the certificates in. You should use a different database for each PKI you create.

To create the database:

1. Go to File > New Database.
2. Select a directory to store the created certificates and keys.
3. Enter a name. The provided password encrypts the private keys and is used to access the XCA database in the future.

The remaining procedures in this topic assume you are using this XCA database.

Creating a CA certificate

A CA certificate marks the root of a certificate chain. If this CA certificate is trusted by an end entity, any certificates signed by the CA certificate are also trusted.
To create a CA certificate:

1. Click the Certificates tab, then click New Certificate.
2. Edit the Source tab:
   a. Set Template for the new certificate to [default] CA.
   b. Click Apply extensions.

3. Edit the Subject tab:
   a. Enter an Internal Name to reference this certificate within XCA.
   b. Enter a commonName.
   c. Optionally, click Add to add other distinguished name fields.
   d. Since this XCA database does not contain any keys yet, click Generate a new key. The Private key field is now
4. Optionally, edit the Extensions tab:
   a. Adjust the Time range if needed.
   b. Click Apply.
5. Click OK.

Issuing a subordinate CA certificate for deep inspection

Subordinate CA certificates are similar to CA certificates because they are used to sign other certificates to establish trust of the signed certificate's content. This trust of the signed certificate is only valid if the subordinate CA is also trusted by the client.

When performing deep inspection on a FortiGate, the FortiGate proxies the connection between the endpoint and the server. This is done transparently so that the end user believes they are communicating with the server, and the server with the client. To do this, when the webpage is requested by a client, the FortiGate must present a certificate that matches the requested website and is trusted by the client.

The certificate presented by the FortiGate is generated on-demand to match the requested website and is signed by this subordinate CA to establish trust with the requesting endpoint. The subordinate CA must be installed on the FortiGate (with the private key) and on the client device (without the private key).

A subordinate CA is used in place of a CA so that it may be revoked as necessary. This is critical since the subordinate CA's private key is exported and becomes susceptible of being compromised. If the CA private key becomes compromised, you would be forced to re-create your entire PKI with a new root CA because root CAs cannot be revoked. See Microsoft CA deep packet inspection on page 2178 for more information about using subordinate CA certificates.
To issue a subordinate CA certificate for deep inspection:

1. Click the Certificates tab, then click New Certificate.
2. Edit the Source tab:
   a. Set Use this Certificate for signing to the CA created previously.
   b. Set Template for the new certificate to [default] CA.
   c. Click Apply extensions.
3. Edit the Subject tab:
   a. Enter an Internal Name to reference this certificate within XCA.
   b. Enter a commonName.
   c. Optionally, click Add to add other distinguished name fields.
   d. Click Generate a new key to create a new private key for the subordinate CA.
4. Optionally, edit the Extensions tab:
   a. Adjust the Time range if needed.
   b. Click Apply.
5. Click OK.

Creating a server host certificate

When a CA signs a host certificate, that CA is vouching for the credentials in the certificate. These credentials are what identifies the host.

Some endpoints can generate a certificate signing request (CSR). A CSR is a certificate outline that specifies the details of the endpoint, including its public key. This allows the CA to review the details and sign the request if they are true. This request is then returned or uploaded to the generating endpoint to be used.

Since some endpoints cannot generate their own CSR, you can create the certificate manually in XCA. If you already have a CSR, use the Certificate signing requests tab to import and then sign it.
To create a server host certificate:

1. Click the Certificates tab, then click New Certificate.
2. Edit the Source tab:
   a. Set Template for the new certificate to [default] TLS_server.
   b. Click Apply extensions.
   c. In the Signing section, select Use this Certificate for signing and select the subordinate CA certificate.
3. Edit the Subject tab:
   a. Enter an Internal Name to reference this certificate within XCA.
   b. Enter the distinguished name fields as needed.
   c. Click Generate a new key.
4. Edit the Extensions tab:
   a. For X509v3 Subject Alternative Name, enter email:user@domain.tld.
5. Click OK.
6. Click the **Certificates** tab to view the certificate.

![Certificate Management Interface](image)

This certificate may be used to identify an SSL or TLS server by uploading the certificate and key pair to the server, such as when the FortiGate presents the administrative webpage or for SSL VPN authentication (see [Configure your FortiGate to use the signed certificate on page 2178](#)). Another use case for a server host certificate is to enable SSL server protection so the FortiGate simulates the real server and brokers the connection (see [Protecting an SSL server on page 1301](#)).

**Creating a client host certificate**

A client host certificate is used to identify an end entity in a more secure way than a username and password. Once the client host certificate is generated, see [SSL VPN with certificate authentication on page 1660](#) for more information about using the certificate.

**To create a client host certificate:**

1. Click the **Certificates** tab, then click **New Certificate**.
2. Edit the **Source** tab:
   a. In the **Signing** section, select **Use this Certificate for signing** and select the CA or subordinate CA.
   b. Set **Template for the new certificate** to **[default] TLS_client**.
   c. Click **Apply extensions**.
3. Edit the **Subject** tab:
   a. Enter an **Internal Name** to reference this certificate within XCA.
   b. Enter the distinguished name fields as needed.
c. Click **Generate a new key**.

![Generate a new key](image)

4. Click **OK**.

5. Click the **Certificates** tab. The FortiGate and client certificates are listed under the signing CA certificate and are ready to be exported.

![Certificates tab](image)

6. Select a certificate and click **Export**.

7. Enter the file name and select an export format.

8. Click **OK**.

**Certificate formats**

Certificate file formats indicate what is contained in the file, how it is formatted, and how it is encoded. See **Uploading a certificate using the GUI** on page 2166 for more information about which formats the FortiGate expects for a given certificate type.
Configuration scripts

Configuration scripts are text files that contain CLI command sequences. They can be created using a text editor or copied from a CLI console, either manually or using the Record CLI Script function.

Scripts can be used to run the same task on multiple devices. For example, if your devices use the same security policies, you can enter or record the commands to create those policies in a script, and then run the script on each device. You could also create the policies in the GUI, and then copy and paste the CLI commands from the CLI Console using the show command.

If the FortiGate is managed by FortiManager, scripts can be uploaded to FortiManager and then run on any other FortiGates that are managed by that FortiManager. See Scripts in the FortiManager Administration Guide.

A comment line in a script starts with the number sign (#). Comments are not executed.

To run a script using the GUI:

1. Click on your username and select Configuration > Scripts.
2. Click Run Script.
3. Select the text file containing the script on your management computer, then click OK.
   The script runs immediately, and the Script Execution History table is updated, showing if the script ran successfully.

Workspace mode

Workspace mode allows administrators to make a batch of changes that are not implemented until the transaction is committed. Prior to committing, the changes can be reverted or edited as needed without impacting current operations.

When an object is edited in workspace mode it is locked, preventing other administrators from editing that object. A warning message will be shown to let the administrator know that the object is currently being configured in another transaction.

All administrators can use workspace mode; their permissions in workspace mode are the same as defined in their account profile.

A workspace mode transaction times out after five minutes if there is no activity. When a transaction times out, all changes are discarded. A warning message will be shown to let the administrator know that a timeout is imminent, or has already happened:
config transaction id=1 will expire in 30 seconds
config transaction id=1 will expire in 20 seconds
config transaction id=1 will expire in 10 seconds
config transaction id=1 has expired

The following commands are not changeable in a workspace transaction:

- config system console
- config system resource-limits
- config system elbc
- config system global
  - set split-port
  - set vdom-admin
  - set management-vdom
  - set wireless-mode
  - set internal-switch-mode
- config system settings
  - set opmode
- config system npu
- config system np6
- config system wireless
  - set mode
- config system vdom-property
- config system storage

The `execute batch` command cannot be used in or to start workspace mode.

**To use workspace mode:**

1. **Start workspace mode:**
   
   `execute config-transaction`

   Once in workspace mode, the administrator can make configuration changes, all of which are made in a local CLI process that is not viewable by other processes.

2. **Commit configuration changes:**

   `execute config-transaction commit`

   After performing the commit, the changes are available for all other processes, and are also made in the kernel.

3. **Abort configuration changes:**

   `execute config-transaction abort`

   If changes are aborted, no changes are made to the current configuration or the kernel.

**Diagnose commands**

`diagnose sys config-transaction showtxn-meta`

Show config transaction meta information. For example:

```
# diagnose sys config-transaction showtxn-meta
txn_next_id=8,txn_nr=2
```

`diagnose sys config-transaction showtxn-info`

Show config transaction information. For example:

```
# diagnose sys config-transaction showtxn-info
current_jiffies=680372
```
txn_id=6, expire_jiffies=706104, clicmd_fpath='/dev/cmdb/txn/6_EiLl9G.conf'
txn_id=7, expire_jiffies=707427, clicmd_fpath='/dev/cmdb/txn/7_UXX6wY.conf'

diagnose sys config-transaction show txn-entity
Show config transaction entity. For example:
# diagnose sys config-transaction show txn-entity
   vd='global', cli-node-oid=37(system.vdom), txn_id=7. location: fileid=0, storeid=0,
      pgnr=0, pgidx=0
   vd='global', cli-node-oid=46(system.interface), txn_id=7. location: fileid=3,
      storeid=0, pgnr=0, pgidx=0

diagnose sys config-transaction show txn-lock
Show transaction lock status. For example:
# diagnose sys config-transaction show txn-lock
type=-1, refcnt=0, value=256, pid=128

diagnose sys config-transaction status
Show the transaction status in the current CLI.

Custom languages

Custom languages can be uploaded and used for SSL VPN web portals. Custom languages must be enabled before they can be added in the GUI.

To enable custom languages:

config system global
    set gui-custom-language enable
end

To configure a custom language in the GUI:

1. Go to System > Custom Languages and click Create New.
2. Enter the name of the language.
3. Optionally, enter a comment.
4. Click Upload and upload the language JSON file from your management computer.
5. Click OK.
To configure a language in an SSL VPN web portal in the GUI:

1. Go to **VPN > SSL-VPN Portals**.
2. Edit an existing portal, or click **Create New** to create a new one.
3. Enable **Enable Web Mode**, then select the language from the **Language** field.
4. Click **OK**.

To configure a custom language in the CLI:

```
config system custom-language
  edit <language>
    set filename <file>
  next
end
```

To configure a language in an SSL VPN web portal in the GUI:

```
config vpn ssl web portal
  edit <portal>
    set web-mode enable
    set custom-lang <language>
  next
end
```

**RAID**

Most FortiGate devices with multiple disk drives (SSD or HHD) can be configured to use RAID.

---

⚠️ Enabling or disabling RAID, and changing the RAID level, erases all data on the log disk and reboots the device.

---

To verify that the FortiGate has multiple disks:

- List disk devices and partitions:
  
  ```
  # execute disk list
  
  Disk SSD1 ref: 255 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sda
  ```
partition ref: 1 220.1GiB, 219.0GiB free mounted: Y label: LOGUSEDXA707476A dev: /dev/sda1 start: 2048

Disk SSD2 ref: 16 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sdb
  partition ref: 17 62.7GiB, 62.4GiB free mounted: Y label: WANOPTXX1FEBBFA1 dev: /dev/sdb1 start: 2048
  partition ref: 18 63.7GiB, 63.7GiB free mounted: N label: dev: /dev/sdb2 start: 133625856
  partition ref: 19 85.0GiB, 85.0GiB free mounted: N label: dev: /dev/sdb3 start: 267249664

- Display information about all of the disks:

  # diagnose hardware deviceinfo disk

  Disk SSD1 ref: 255 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sda
    partition ref: 1 220.1GiB, 219.0GiB free mounted: Y label: LOGUSEDXA707476A dev: /dev/sda1 start: 2048

  Disk SSD2 ref: 16 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sdb
    partition ref: 17 62.7GiB, 62.4GiB free mounted: Y label: WANOPTXX1FEBBFA1 dev: /dev/sdb1 start: 2048
    partition ref: 18 63.7GiB, 63.7GiB free mounted: N label: dev: /dev/sdb2 start: 133625856
    partition ref: 19 85.0GiB, 85.0GiB free mounted: N label: dev: /dev/sdb3 start: 267249664

  Disk SYSTEM(boot) 14.9GiB type: SSD [ATA 16GB SATA Flash] dev: /dev/sdc
    partition 247.0MiB, 155.0MiB free mounted: N label: dev: /dev/sdcl(boot) start: 1
    partition 247.0MiB, 154.0MiB free mounted: Y label: dev: /dev/sdc2(boot) start: 524289
    partition ref: 35 14.2GiB, 14.0GiB free mounted: Y label: dev: /dev/sdc3 start: 1048577

  Disk USB-6(user-usb) ref: 48 28.6GiB type: USB [SanDisk Ultra] dev: /dev/sdd
  <<<<<<===this info for usb disk because i have usb disk on FGT301E
    partition ref: 49 28.6GiB, 28.6GiB free mounted: Y label: dev: /dev/sdd1 start: 0

  Total available disks: 4
  Max SSD disks: 2 Available storage disks: 2

To check the RAID status:

- RAID enabled:

  # execute disk raid status
  RAID Level: Raid-1
  RAID Status: OK (Background-Synchronizing) (9%)  
  RAID Size: 239GB

  Disk 1: OK Used 228GB
  Disk 2: OK Used 228GB

- RAID disabled:

  # execute disk raid status
  RAID Level: Unavailable
  RAID Status: Unavailable
  RAID Size: 0GB
Disk 1: OK Not-Used 228GB
Disk 2: OK Not-Used 228GB

To enable RAID:

# execute disk raid enable
This will erase all data on the log disk, and system will reboot!
Do you want to continue? (y/n)y

Dependent storage SSD2 removed.
Dependent storage SSD1 removed.
Raid-0 created with 2 disks.

Performing raid on the requested disk(s) and rebooting, please wait...

Configuring raid...
- unmounting /data2 : ok
- unmounting /var/log : ok
- unmounting /usb : ok
- unmounting /var/storage/SSD2-WANOPTXX0EA0EF17 : ok

Formatting the disk...
- unmounting /usb : ok
Formatting /dev/md0 ... done

The system is going down NOW !!

Please stand by while rebooting the system.
Restarting system.

To rebuild the RAID:

# execute disk raid rebuild

To rebuild the RAID to another level:

1. Check the supported RAID levels:
   # execute disk raid rebuild-level
   <RAID level> supported: Raid-0, Raid-1

2. Rebuild the RAID to the required level:
   # execute disk raid rebuild-level Raid-1
   This will erase all data on the log disk, and system will reboot!
   Do you want to continue? (y/n)y

   Dependent storage RAID removed.
   Raid-1 created with 2 disks.

   Performing raid on the requested disk(s) and rebooting, please wait...

   Configuring raid...
   - unmounting /data2 : ok
   - unmounting /var/log : ok
- unmounting /usb : ok
Formatting the disk...
- unmounting /usb : ok
Formatting /dev/md0 ... done

The system is going down NOW !!

Please stand by while rebooting the system.
Restarting system.

To disable RAID:

# execute disk raid disable
This will erase all data on the log disk, and system will reboot!
Do you want to continue? (y/n)y

Dependent storage RAID removed.

Performing format on the requested disk(s) and rebooting, please wait...

Configuring raid...
- unmounting /data2 : ok
- unmounting /var/log : ok
- unmounting /usb : ok

Formatting the disk...
Partitioning and formatting /dev/sda label LOGUSEDX3D36836D ... done
Partitioning and formatting /dev/sdb label WANOPTXX1FEBBFA1 ...
Sending request for partno=0 start=2048 stop=133624230
Sending request for partno=1 start=133625856 stop=267248460
Sending request for partno=2 start=267249664 stop=445414150
done

The system is going down NOW !!

Please stand by while rebooting the system.
Restarting system.

Reading boot image 3017355 bytes.
Initializing firewall...
System is starting...

FortiGate encryption algorithm cipher suites

FortiGates use SSL/TLS encryption for HTTPS and SSH administrative access, and SSL VPN remote access. When establishing an SSL/TLS or SSH connection, you can control the encryption level and the ciphers that are used in order to control the security level.
HTTPS access

HTTP administrative access encryption is controlled using the following commands:

```
config system global
    set strong-crypto {enable | disable}
    set admin-https-ssl-versions {tlsv1-1 tlsv1-2 tlsv1-3}
    set admin-https-ssl-ciphersuites {<cipher_1> ... <cipher_n>}
    set admin-https-ssl-banned-ciphers {<cipher_1> ... <cipher_n>}
end
```

When strong encryption is enabled, only TLS 1.2 and TLS 1.3 are allowed. If strong encryption is then disabled, TLS 1.1 has to be manually enabled.

Setting `admin-https-ssl-ciphersuites` controls which cipher suites are offered in TLS 1.3. TLS 1.2 and lower are not affected by this command. To disable all TLS 1.3 cipher suites, remove TLS1-3 from `admin-https-ssl-versions`.

Setting `admin-https-ssl-banned-ciphers` controls which cipher technologies will not be offered for TLS 1.2 and lower.

Specific cipher suites are supported by each TLS version:

<table>
<thead>
<tr>
<th>TLS version</th>
<th>Supported Cipher Suites</th>
</tr>
</thead>
<tbody>
<tr>
<td>TLS 1.1</td>
<td>ECDHE-RSA-AES256-SHA⁴</td>
</tr>
<tr>
<td></td>
<td>AES256-SHA¹</td>
</tr>
<tr>
<td></td>
<td>ECDHE-RSA-AES128-SHA⁴</td>
</tr>
<tr>
<td></td>
<td>AES128-SHA¹</td>
</tr>
<tr>
<td>TLS 1.2</td>
<td>ECDHE-RSA-AES256-GCM-SHA384</td>
</tr>
<tr>
<td></td>
<td>AES256-GCM-SHA384¹</td>
</tr>
<tr>
<td></td>
<td>ECDHE-RSA-AES128-GCM-SHA256</td>
</tr>
<tr>
<td></td>
<td>AES128-GCM-SHA256¹</td>
</tr>
<tr>
<td></td>
<td>ECDHE-RSA-CHACHA20-POLY1305</td>
</tr>
<tr>
<td></td>
<td>AES256-SHA256</td>
</tr>
<tr>
<td></td>
<td>ECDHE-RSA-AES256-SHA384</td>
</tr>
<tr>
<td></td>
<td>AES128-SHA256</td>
</tr>
<tr>
<td></td>
<td>ECDHE-RSA-AES128-SHA256</td>
</tr>
<tr>
<td></td>
<td>AES256-SHA¹</td>
</tr>
<tr>
<td></td>
<td>ECDHE-RSA-AES256-SHA¹</td>
</tr>
<tr>
<td></td>
<td>AES128-SHA¹</td>
</tr>
<tr>
<td></td>
<td>ECDHE-RSA-AES128-SHA¹</td>
</tr>
<tr>
<td>TLS 1.3</td>
<td>TLS-AES-128-GCM-SHA256</td>
</tr>
<tr>
<td></td>
<td>TLS-AES-128-CCM-8-SHA256</td>
</tr>
<tr>
<td></td>
<td>TLS-AES-256-GCM-SHA384</td>
</tr>
<tr>
<td></td>
<td>TLS-CHACHA20-POLY1305-SHA256</td>
</tr>
<tr>
<td></td>
<td>TLS-AES-128-CCM-SHA256</td>
</tr>
</tbody>
</table>

⁴ Disabled if strong encryption (`strong-crypto`) is enabled.

SSH access

SSH access encryption is controlled using the following command:

```
config system global
    set admin-ssh-v1 {enable | disable}
```
set strong-crypto {enable | disable}
set ssh-enc-algo <algo_1> [<algo_2> ... <algo_n>]
end

The algorithms available when configuring `set ssh-enc-algo` are affected by `set strong-crypto` as follows:

<table>
<thead>
<tr>
<th>Encryption</th>
<th>Supported Ciphers</th>
</tr>
</thead>
<tbody>
<tr>
<td>Strong</td>
<td><a href="mailto:chacha20-poly1305@openssh.com">chacha20-poly1305@openssh.com</a></td>
</tr>
<tr>
<td></td>
<td>aes128-ctr</td>
</tr>
<tr>
<td></td>
<td>aes128-cbc</td>
</tr>
<tr>
<td></td>
<td>aes192-ctr</td>
</tr>
<tr>
<td></td>
<td>aes192-cbc</td>
</tr>
<tr>
<td></td>
<td>aes256-cbc</td>
</tr>
<tr>
<td></td>
<td>3des-cbc</td>
</tr>
<tr>
<td></td>
<td>blowfish-cbc</td>
</tr>
<tr>
<td>Weak</td>
<td>arcfour256</td>
</tr>
<tr>
<td></td>
<td>arcfour128</td>
</tr>
<tr>
<td></td>
<td>aes256-cbc</td>
</tr>
<tr>
<td></td>
<td><a href="mailto:rijndael-cbc@lysator.liu.se">rijndael-cbc@lysator.liu.se</a></td>
</tr>
</tbody>
</table>

**SSL VPN**

For SSL VPN connections, the TLS versions and cipher suites are controlled using the following commands:

```fortigate-config
config vpn ssl setting
  set algorithm {high | medium | low}
  set ssl-maxproto-ver {tls1-0 | tls1-1 | tls1-2 | tls1-3}
  set ssl-minproto-ver {tls1-0 | tls1-1 | tls1-2 | tls1-3}
  set ciphersuite (TLS-AES-128-GCM-SHA256 TLS-AES-256-GCM-SHA384 TLS-CHACHA20-POLY1305-SHA256 TLS-AES-128-CCM-SHA256 TLS-AES-128-CCM-8-SHA256)
end
```

Cipher suites (`ciphersuite`) can only be selected when the SSL maximum version is TLS 1.3.

When the SSL VPN security level (`algorithm`) is set to high, only high levels are allowed. When it is set to medium, high and medium levels are allowed. When it is set to low, any level is allowed.

The strong encryption (`strong-crypto`) command has no effect on the SSL VPN encryption level or ciphers.

Specific cipher suites are supported by each TLS version:
<table>
<thead>
<tr>
<th>TLS version</th>
<th>Supported Cipher Suites</th>
</tr>
</thead>
<tbody>
<tr>
<td>TLS 1.0</td>
<td></td>
</tr>
<tr>
<td></td>
<td>ECDHE-RSA-AES256-SHA</td>
</tr>

</table>

1 This cipher is not available when the SSL VPN security level (algorithm) is set to high.
Fortinet Security Fabric

The Fortinet Security Fabric provides an intelligent architecture that interconnects discrete security solutions into an integrated whole to detect, monitor, block, and remediate attacks across the entire attack surface. It delivers broad protection and visibility into every network segment and device, be they hardware, virtual, or cloud based.

- The physical topology view shows all connected devices, including access layer devices. The logical topology view shows information about the interfaces that each device is connected to.
- Security rating checks analyze the Security Fabric deployment to identify potential vulnerabilities and highlight best practices to improve the network configuration, deploy new hardware and software, and increase visibility and control of the network.
- Fabric connectors provide integration with multiple SDN, cloud, and partner technology platforms to automate the process of managing dynamic security updates without manual intervention.
- Automation pairs an event trigger with one or more actions to monitor the network and take the designated actions automatically when the Security Fabric detects a threat.

Security Fabric settings and usage

This section contains information about how to configure the following devices as part of the Fortinet Security Fabric:

- Components on page 2207
- Configuring the root FortiGate and downstream FortiGates
- Configuring FortiAnalyzer
- Configuring FortiGate Cloud on page 2219
- Configuring FortiAnalyzer Cloud service on page 2223
- Configuring FortiManager on page 2227
- Configuring FortiManager Cloud service on page 2229
- Configuring Sandboxing on page 2230
- Configuring FortiClient EMS on page 2236
- Synchronizing FortiClient ZTNA tags on page 2249
- Configuring FortiNAC on page 2252
- Configuring FortiAP and FortiSwitch on page 2254
- Configuring FortiMail on page 2255
- Configuring FortiNDR on page 2257
- Configuring FortiDeceptor on page 2261
- Configuring FortiWeb on page 2264
- Configuring FortiTester on page 2266
- Configuring FortiMonitor on page 2269
- Configuring FortiVoice on page 2271
- Using the Security Fabric
- Deploying the Security Fabric on page 2290
- Deploying the Security Fabric in a multi-VDOM environment on page 2298
- Synchronizing objects across the Security Fabric on page 2303
Security Fabric

- Security Fabric over IPsec VPN on page 2310
- Leveraging LLDP to simplify Security Fabric negotiation on page 2316

**System requirements**

To set up the Security Fabric, the devices that you want to include must meet the Product Integration and Support requirements in the FortiOS Release Notes.

Some features of the Security Fabric are only available in certain firmware versions and models. Not all FortiGate models can run the FortiGuard Security Rating Service if they are the root FortiGate in a Security Fabric. For more information, see the Special Notices in the FortiOS Release Notes.

**Prerequisites**

- If devices are not already installed in your network, complete basic installation and configuration tasks by following the instructions in the device documentation.
- FortiGate devices must be operating in NAT mode.

**Components**

The Fortinet Security Fabric consists of different components that work together to secure your network.

The following devices are required to create a Security Fabric:

<table>
<thead>
<tr>
<th>Device</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>FortiGate</strong></td>
<td>FortiGates are the core of the Security Fabric and can have one of the following roles:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Root</strong>: the root FortiGate is the main component in the Security Fabric. It is typically located on the edge of the network and connects the internal devices and networks to the internet through your ISP. From the root FortiGate, you can see information about the entire Security Fabric on the Physical and Logical Topology pages in the GUI.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Downstream</strong>: after a root FortiGate is installed, all other FortiGate devices in the Security Fabric act as Internal Segmentation Firewalls (ISFWs), located at strategic points in your internal network, rather than on the network edge. This allows extra security measures to be taken around key network components, such as servers that contain valuable intellectual property. ISFW FortiGates create network visibility by sending traffic and information about the devices that are connected to them to the root FortiGate.</td>
</tr>
<tr>
<td></td>
<td>See Configuring the root FortiGate and downstream FortiGates on page 2210 for more information about adding FortiGate devices in the Security Fabric.</td>
</tr>
<tr>
<td></td>
<td>FortiGate documentation: <a href="https://docs.fortinet.com/product/fortigate">https://docs.fortinet.com/product/fortigate</a></td>
</tr>
<tr>
<td><strong>FortiAnalyzer</strong></td>
<td>FortiAnalyzer gives you increased visibility into your network, centralized monitoring, and awareness of threats, events, and network activity by collecting and correlating logs from all Security Fabric devices. This gives you a deeper and more comprehensive view across the entire Security Fabric.</td>
</tr>
<tr>
<td></td>
<td>See Configuring FortiAnalyzer on page 2217 for more information about adding FortiAnalyzer devices in the Security Fabric.</td>
</tr>
<tr>
<td>Device</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>FortiAnalyzer documentation: <a href="https://docs.fortinet.com/product/fortianalyzer">https://docs.fortinet.com/product/fortianalyzer</a></td>
<td></td>
</tr>
</tbody>
</table>
| **Cloud Logging** | There are two options for cloud logging: FortiAnalyzer Cloud and FortiGate Cloud. Either can be used to enable the Security Fabric root device; however, if using FortiGate Cloud, all downstream devices must belong to the same FortiCloud account.  
   See [Configuring FortiGate Cloud on page 2219](https://docs.fortinet.com/product/fortigate-cloud) for more information about configuring a Security Fabric with FortiGate Cloud.  
   FortiGate Cloud documentation: [https://docs.fortinet.com/product/fortigate-cloud](https://docs.fortinet.com/product/fortigate-cloud) |

* FortiAnalyzer or Cloud Logging is a required component for the Security Fabric. Either FortiAnalyzer, FortiAnalyzer Cloud, or FortiGate Cloud can be used to met this requirement.

The following devices are recommended:

<table>
<thead>
<tr>
<th>Device</th>
<th>Description</th>
</tr>
</thead>
</table>
| FortiNDR        | FortiNDR (formerly FortiAI) uses artificial neural networks (ANN) that can deliver sub-second malware detection and a verdict. Add FortiNDR to your Security Fabric to automatically quarantine attacks.  
   See [Configuring FortiNDR on page 2257](https://docs.fortinet.com/product/fortindr) for more information about adding FortiNDR devices in the Security Fabric.  
   FortiNDR documentation: [https://docs.fortinet.com/product/fortindr](https://docs.fortinet.com/product/fortindr) |
   See [Configuring FortiAP and FortiSwitch on page 2254](https://docs.fortinet.com/product/fortiap) for more information about adding FortiAP devices in the Security Fabric.  
   FortiAP documentation: [https://docs.fortinet.com/product/fortiap](https://docs.fortinet.com/product/fortiap) |
| FortiClient     | FortiClient adds endpoint control to devices that are located in the Security Fabric, allowing only traffic from compliant devices to flow through the FortiGate. FortiClient compliance profiles are applied by the first FortiGate that a device’s traffic flows through. Device registration and on-net status information for a device that is running FortiClient appears only on the FortiGate that applies the FortiClient profile to that device.  
   FortiClient documentation: [https://docs.fortinet.com/product/forticlient](https://docs.fortinet.com/product/forticlient) |
| FortiDeceptor   | FortiDeceptor automatically lays out a layer of decoys and lures, which helps conceal sensitive and critical assets behind a fabricated deception surface to confuse and redirect attackers while revealing their presence on your network.  
   See [Configuring FortiDeceptor on page 2261](https://docs.fortinet.com/product/fortideceptor) for more information about adding FortiDeceptor devices in the Security Fabric.  
   FortiDeceptor documentation: [https://docs.fortinet.com/product/fortideceptor](https://docs.fortinet.com/product/fortideceptor) |
| FortiClient EMS | FortiClient EMS is used in the Security Fabric to provide visibility across your network, securely share information, and assign security profiles to endpoints.  
   See [Configuring FortiClient EMS on page 2236](https://docs.fortinet.com/product/forticlient) for more information about adding FortiClient EMS devices in the Security Fabric.

**Configuring the root FortiGate and downstream FortiGates**

The following procedures include configuration steps for a typical Security Fabric implementation, where the edge FortiGate is the root FortiGate with other FortiGates that are downstream from the root FortiGate.

For information about the recommended number of downstream FortiGates, see the *FortiOS Best Practices*.

**Prerequisite**

- The FortiGates must be operating in NAT mode.

**Configuring the root FortiGate**

The edge FortiGate is typically configured as the root FortiGate, as this allows you to view the full topology of the Security Fabric from the top down.

The following steps describe how to add the FortiGate to serve as the root device, and how to configure FortiAnalyzer logging.

**To configure the root FortiGate:**

1. On the root FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. For *Status*, click *Enable*.
3. Set the *Security Fabric role* to *Serve as Fabric Root*. FortiAnalyzer logging is automatically enabled and the settings can be configured in the slide-out pane.
When neither FortiAnalyzer Logging nor Cloud Logging are enabled, if the FortiGate detects that a FortiAnalyzer Cloud entitlement is available on this FortiGate, the slide-out pane will display Cloud Logging configurations. Otherwise, if Cloud Logging is enabled, the slide-out pane will display the Cloud Logging page. If Cloud Logging is disabled but FortiAnalyzer is enabled, then it will display the FortiAnalyzer Logging page.

In the Cloud Logging card, there are two options available, FortiGate Cloud and FortiAnalyzer Cloud. If there are multiple services enrolled on the FortiGate, the preference is: Cloud Logging (FortiAnalyzer Cloud), FortiAnalyzer Logging, then Cloud Logging (FortiGate Cloud).

4. Enter the FortiAnalyzer IP and select the Upload option.
5. In the FortiAnalyzer Logging section, in the IP address field, enter the IP address of the FortiAnalyzer.
6. If required, enable Allow access to FortiGate REST API and, optionally, Verify FortiAnalyzer certificate. The REST API accesses the FortiGate topology and shares data and results. The FortiGate will verify the FortiAnalyzer by retrieving its serial number and checking it against the FortiAnalyzer certificate. When verified, the FortiAnalyzer serial number is stored in the FortiGate configuration. When authorizing the FortiGate on the FortiAnalyzer, the FortiGate admin credentials do not need to be entered.
7. Click Test Connectivity.
   If you select Test Connectivity and this is the first time that you are connecting the FortiGate to the FortiAnalyzer, you will receive a warning message because the FortiGate has not yet been authorized on the FortiAnalyzer. You can configure this authorization when you configure the FortiAnalyzer. See Configuring FortiAnalyzer on page 2217.
8. Click OK. The FortiAnalyzer serial number is verified.
9. Enter a Fabric name.
10. Ensure Allow other Security Fabric devices to join is enabled.
11. Select the interfaces that will be listening for device join requests. Enabling an interface here has the same effect as going to Network > Interfaces, editing an interface, and enabling Security Fabric Connection under Administrative Access.
12. Click OK.

Using the root FortiGate with disk to store historic user and device information

This backend implementation allows the root FortiGate in a Security Fabric to store historic user and device information in a database on its disk. This will allow administrators to visualize users and devices over a period of time.

The daemon, user_info_history, stores this data on the disk. The information source for the historical data will be the user_info daemon, which would be recorded on the disk when user_info notifies user_info_history that a user has logged out or the device is no longer connected.

Adding downstream devices

Downstream device serial numbers can be pre-authorized from the root FortiGate, or allowed to join by request. New authorization requests include the device serial number, IP address, and HA members. HA members can include up to four serial numbers and is used to ensure that, in the event of a fail over, the secondary FortiGate is still authorized.

A downstream device's certificate can also be used to authorize the device by uploading the certificate to the root FortiGate.

Pre-authorizing the downstream FortiGate

When a downstream Fortinet device's serial number or certificate is added to the trusted list on the root FortiGate, the device can join the Security Fabric as soon as it connects. After the new device is authorized, connected FortiAP and FortiSwitch devices are automatically included in the topology, where they can be authorized with one click.

The interface that connects to the downstream FortiGate must have Security Fabric Connection enabled.

To pre-authorize a FortiGate:

1. On the root FortiGate, go to Security Fabric > Fabric Connectors and double-click the Security Fabric Setup card.
3. Click Create New to add a new device for pre-authorization.
4. Enter the device name in the Name field.
5. Select the Authorization type, either Serial Number or Certificate.
6. If Certificate is selected, click Browse to upload the downstream device's certificate from the management computer.
7. Select the Action, either Accept or Deny.
8. Click OK and add more devices as required.
9. Click OK.
To configure a downstream FortiGate to connect to an upstream FortiGate:

1. Configure the downstream FortiGate:
   a. On the downstream FortiGate, go to Security Fabric > Fabric Connectors and double-click the Security Fabric Setup card.
   b. Set Status to Enable.
   c. Set Security Fabric role to Join Existing Fabric.
   d. Enter the IP address of the root FortiGate in the Upstream FortiGate IP field.
   e. Click OK.

2. On the root FortiGate, go to Security Fabric > Physical Topology and verify that the downstream FortiGate that you added appears in the Security Fabric topology.

Authorizing a downstream FortiGate

When you log in to an unauthorized downstream FortiGate, the log in prompt includes the option to authorize the device on the root FortiGate.

To authorize a downstream FortiGate:

1. Log in to the unauthorized, downstream device.

2. In the Fabric Setup step, click Review authorization on root FortiGate. A pop-up window opens to a log in screen for the root FortiGate.

3. Enter the log in credentials for the root FortiGate, then click Login. A list of pending authorizations is shown.
4. Select **Allow** and then click **OK** to authorize the downstream FortiGate. You can also select **Deny** to reject the authorization, or **Later** to postpone the decision to the next time that you log in. When authorization is allowed, the pop-up window closes, and the log in prompt shows that the downstream FortiGate has been authorized.

5. Click **Done** to log in to the downstream FortiGate.

**Triggering authorization from the Fabric Connectors page**

To authorize a downstream device from the Fabric Connectors page:

1. Go to **Security Fabric > Fabric Connectors**.
2. In the gutter on the right side of the screen, click **Review authorization on root FortiGate**.

The root FortiGate pop-up window shows the state of the device authorization.

**Authorizing the downstream FortiGate from the root**

In this example, a downstream FortiGate is unauthorized and it is not registered to a FortiCloud account.

To authorize the downstream FortiGate from the root:

1. Log in to the root FortiGate and go to **Security Fabric > Fabric Connectors**. Devices requiring authorization are highlighted in the **Topology** tree (right-side gutter).
2. Click on a highlighted device and select Authorize. The Authorize Devices pane opens.
4. The FortiGate is now authorized, so click Register to register the device to a FortiCloud account.

The FortiCloud Account pane opens.

5. Enter the required information (password, country/region, reseller). On the Fabric Connectors page, the same account name is implied for registration.

6. Click Submit. The Registration Summary pane opens.
7. Click Close.

You can use IPAM to automatically assign subnets to downstream FortiGates to prevent duplicate IP addresses from overlapping within the same Security Fabric. See Configure IPAM locally on the FortiGate on page 143.

### CLI commands

Use the following commands to view, accept, and deny authorization requests, to view upstream and downstream devices, and to list or test Fabric devices:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diagnose sys csf authorization pending-list</td>
<td>View pending authorization requests on the root FortiGate.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>diagnose sys csf authorization accept &lt;serial number&gt;</td>
<td>Authorize a device to join the Security Fabric.</td>
</tr>
<tr>
<td>diagnose sys csf authorization deny &lt;serial number&gt;</td>
<td>Deny a device from joining the Security Fabric.</td>
</tr>
<tr>
<td>diagnose sys csf downstream</td>
<td>Show connected downstream devices.</td>
</tr>
<tr>
<td>diagnose sys csf upstream</td>
<td>Show connected upstream devices.</td>
</tr>
<tr>
<td>diagnose sys csf fabric-device list</td>
<td>List all known Fabric devices.</td>
</tr>
</tbody>
</table>

**Desynchronizing settings**

By default, the settings for FortiAnalyzer logging, central management, sandbox inspection, and FortiClient EMS are synchronized between all FortiGates in the Security Fabric.

**To disable automatic synchronization:**

```
config system csf
    set configuration-sync local
end
```

**Deauthorizing a device**

A device can be deauthorized to remove it from the Security Fabric.

**To deauthorize a device:**

1. On the root FortiGate, go to Security Fabric > Fabric Connectors.
2. In the topology tree, click the device and select Deauthorize.

After a device is deauthorized, the serial number is saved in a trusted list that can be viewed in the CLI using the show system csf command. For example, this result shows a deauthorized FortiSwitch:

```
show system csf
config system csf
    set status enable
    set group-name "Office-Security-Fabric"
    set group-password ************
config trusted-list
    edit "FGT6HD391800000"
    next
    edit "S248DF3X1700000"
    set action deny
    next
end
```
Configuring FortiAnalyzer

FortiAnalyzer or Cloud Logging is a required component for the Security Fabric. Either FortiAnalyzer, FortiAnalyzer Cloud, or FortiGate Cloud can be used to meet this requirement.

FortiAnalyzer allows the Security Fabric to show historical data for the Security Fabric topology and logs for the entire Security Fabric. For more information about using FortiAnalyzer, see the FortiAnalyzer Administration Guide.

FortiAnalyzer 7.0.1 is used for this configuration example.

To authorize a FortiAnalyzer in the Security Fabric:

1. In FortiAnalyzer, configure the authorization address and port:
   a. Go to System Settings > Admin > Admin Settings.
   b. In the Fabric Authorization section, enter an Authorization Address and Authorization Port. This is used to access the FortiAnalyzer login screen.

   ![FortiAnalyzer Admin Settings](image)

   c. Click Apply.

2. In FortiOS, go to Security Fabric > Fabric Connectors and double-click the FortiAnalyzer Logging card.
3. Enter the FortiAnalyzer IP.
4. Click OK. The FortiAnalyzer Status (in the right-side gutter) is Unauthorized.

5. Click Authorize. You are redirected to a login screen.
6. Enter the username and password, then click Login.

![Login Screen](image)

The authorization dialog opens.

7. Select Approve and click OK to authorize the FortiGate.

![Authorization Dialog](image)

8. In FortiOS, refresh the FortiAnalyzer Logging page. The FortiAnalyzer Status is Authorized.

![FortiAnalyzer Logging Status](image)
**Sending traffic logs to FortiAnalyzer Cloud**

FortiGates with a FortiCloud Premium subscription (AFAC) for Cloud-based Central Logging & Analytics, can send traffic logs to FortiAnalyzer Cloud in addition to UTM logs and event logs. After the Premium subscription is registered through FortiCare, FortiGuard will verify the purchase and authorize the AFAC contract. Once the contract is verified, FortiGuard will deliver the contract to FortiGate.

FortiGates with a Standard FortiAnalyzer Cloud subscription (FAZC) can only send UTM and event logs. FortiGates with a Premium subscription will send the UTM and event logs even if the Standard subscription has expired.

For information about cloud logging, see Configuring FortiAnalyzer Cloud service on page 2223

FortiAnalyzer Cloud does not support DLP/IPS archives at this time.

---

**To verify the status a FortiCloud subscription with the CLI:**

```
# diagnose test update info
```

The **FAZC** and **AFAC** fields display the subscription expiration date. The **Support contract** field displays the FortiCare account information. The **User ID** field displays the ID for FortiAnalyzer-Cloud instance.

```
... 
FAZC,Tue Sep 24 16:00:00 2030 
AFAC,Mon Nov 29 16:00:00 2021 
... 
Support contract: pending_registration=255 got_contract_info=1 
account_id=[****@fortinet.com] company=[Fortinet] industry=[Technology] 
User ID: 979090
```

---

**Configuring FortiGate Cloud**

FortiGate Cloud is a hosted security management and log retention service for FortiGate devices. It provides centralized reporting, traffic analysis, configuration management, and log retention without the need for additional hardware or software.

FortiGate Cloud offers a wide range of features:

- **Simplified central management**
  FortiGate Cloud provides a central GUI to manage individual or aggregated FortiGate and FortiWiFi devices. Adding a device to the FortiGate Cloud management subscription is straightforward. FortiGate Cloud has detailed traffic and application visibility across the whole network.

- **Hosted log retention with large default storage allocated**
  Log retention is an integral part of any security and compliance program, but administering a separate storage system is onerous. FortiGate Cloud takes care of this automatically and stores the valuable log information in the cloud. Different types of logs can be stored, including Traffic, System Events, Web, Applications, and Security Events.

- **Monitoring and alerting in real time**
  Network availability is critical to a good end-user experience. FortiGate Cloud enables you to monitor your FortiGate network in real time with different alerting mechanisms to pinpoint potential issues. Alerting mechanisms can be delivered via email.
Customized or pre-configured reporting and analysis tools
Reporting and analysis are your eyes and ears into your network’s health and security. Pre-configured reports are available, as well as custom reports that can be tailored to your specific reporting and compliance requirements. The reports can be emailed as PDFs, and can cover different time periods.

Maintain important configuration information uniformly
The correct configuration of the devices within your network is essential for maintaining optimum performance and security posture. In addition, maintaining the correct firmware (operating system) level allows you to take advantage of the latest features.

Service security
All communication (including log information) between the devices and the cloud is encrypted. Redundant data centers are always used to give the service high availability. Operational security measures have been put in place to make sure your data is secure — only you can view or retrieve it.

For more information about FortiGate Cloud, see the FortiGate Cloud documentation.

Registration and activation

Before you can activate a FortiGate Cloud account, you must first register your device.

FortiGate Cloud accounts can be registered manually through the FortiGate Cloud website, https://www.forticloud.com, or you can easily register and activate your account directly from your FortiGate.

To activate your FortiGate Cloud account:

1. On your device, go to Dashboard > Status.
2. In the FortiGate Cloud widget, click the Not Activated > Activate button in the Status field.
3. A pane will open asking you to register your FortiGate Cloud account. Click Create Account, enter your information, view and accept the terms and conditions, and then click OK.
4. A second dialogue window open, asking you to enter your information to confirm your account. This sends a confirmation email to your registered email. The dashboard widget then updates to show that confirmation is required.
5. Open your email, and follow the confirmation link it contains. A FortiGate Cloud page will open, stating that your account has been confirmed. The Activation Pending message on the dashboard will change to state the type of account you have, and will provide a link to the FortiGate Cloud portal.

Enabling logging to FortiGate Cloud

To enable logging to FortiGate Cloud:

2. Enable Cloud Logging.
3. Select an upload option: Realtime, Every Minute, or Every 5 Minutes (default).
4. Click Apply.
**Logging into the FortiGate Cloud portal**

Once logging has been configured and you have registered your account, you can log into the FortiGate Cloud portal and begin viewing your logging results. There are two methods to reach the FortiGate Cloud portal:

- **If you have direct network access to the FortiGate:**
  a. Go to Dashboard > Status.
  b. In the FortiGate Cloud widget, in the Status field, click Activated > Launch Portal, or, in the Licenses widget, click FortiCare Support > Launch Portal.

- **If you do not have access to the FortiGate’s interface,** visit the FortiGate Cloud website ([https://www.forticloud.com](https://www.forticloud.com)) and log in remotely, using your email and password. It will ask you to confirm the FortiGate Cloud account you are connecting to and then you will be granted access.

**Configuring a Security Fabric with FortiGate Cloud logging**

A Security Fabric can be created on the root device using FortiGate Cloud for cloud logging. When the FortiCloud account enforcement is enabled (by default), members joining the Fabric must be registered to the same FortiCloud account. Devices that are not activated with FortiCloud are also allowed.

For example, the root FortiGate (FGT_10_101F) is configured with FortiGate Cloud logging. In the Security Fabric settings, the FortiCloud account enforcement option is enabled by default. The downstream FortiGate, FGT-F-VM, with the same FortiCloud account ID is able to join the Fabric.

**To configure a Security Fabric with FortiCloud logging in the GUI:**

1. **On the root FortiGate, configure FortiCloud logging:**
   a. Go to Security Fabric > Fabric Connectors and double-click the Cloud Logging card.
   b. Set the Type to FortiGate Cloud.
   c. Set the Upload option to Real Time.
   d. Click OK.

2. **Configure the Security Fabric settings** (see Configuring the root FortiGate and downstream FortiGates on page 2210). The FortiCloud account enforcement setting is enabled by default.
3. On the FGT-F-VM, check the FortiCloud logging settings:
   a. Go to Security Fabric > Fabric Connectors and double-click the Cloud Logging card. The settings are automatically retrieved from the root and the Account is the same.

4. Configure the FGT-F-VM to join the Security Fabric:
   b. Set the Security Fabric role to Join Existing Fabric.
c. Click OK. The FortiGate is authorized and successfully joins the Security Fabric.

To configure a Security Fabric with FortiCloud logging in the CLI:

```plaintext
config log fortiguard setting
  set status enable
  set upload-option realtime
end
```

The FortiCloud account enforcement setting is enabled by default in the Security Fabric settings:

```plaintext
show system csf
  config system csf
    set status enable
    set group-name "CSF_101"
    set forticloud-account-enforcement enable
  end
```

Cloud sandboxing

FortiGate Cloud can be used for automated sample tracking, or sandboxing, for files from a FortiGate. This allows suspicious files to be sent to be inspected without risking network security. If the file exhibits risky behavior, or is found to contain a virus, a new virus signature is created and added to the FortiGuard antivirus signature database.

See Configuring Sandboxing on page 2230 for instructions to configure FortiGate Cloud Sandbox. Sandboxing results are shown on the Sandbox tab in the FortiGate Cloud portal.

Configuring FortiAnalyzer Cloud service

The FortiAnalyzer Cloud service can be used for event logging.

Traffic logs are not currently supported by FortiAnalyzer Cloud without a FortiCloud Premium subscription (AFAC). For information, see Configuring FortiAnalyzer on page 2217.
When FortiAnalyzer Cloud is licensed and enabled (see Deploying FortiAnalyzer Cloud for more information), all event logs are sent to FortiAnalyzer Cloud by default. All traffic logs, security logs, and archive files are not sent to FortiAnalyzer Cloud.

FortiAnalyzer Cloud differs from FortiAnalyzer in the following ways:

- You cannot enable FortiAnalyzer Cloud in `vdom override-setting` when global FortiAnalyzer Cloud is disabled.
- You must use the CLI to retrieve and display logs sent to FortiAnalyzer Cloud. The FortiOS GUI is not supported.
- You cannot enable FortiAnalyzer Cloud and FortiGate Cloud at the same time.

In the Security Fabric > Fabric Connectors > Cloud Logging card settings, FortiAnalyzer Cloud is grayed out when you do not have a FortiAnalyzer Cloud entitlement. When you have a FortiAnalyzer Cloud entitlement, FortiAnalyzer Cloud is available and you can authenticate by the certificate.

You can also view the FortiAnalyzer Cloud settings in the Log & Report > Log Settings page.

In FortiAnalyzer Cloud, you can view logs from FortiOS in the Event > All Types page.

To configure FortiAnalyzer Cloud logging in the GUI:

1. Go to Security Fabric > Fabric Connectors and double-click the Cloud Logging card.
2. Set the Type to FortiAnalyzer Cloud.
3. Click OK. A prompt appears to verify the FortiAnalyzer Cloud serial number.
4. Click Accept.
5. The verified FortiAnalyzer Cloud certificate appears in the settings.

To enable FortiAnalyzer Cloud logging in the CLI:

1. Configure the FortiAnalyzer Cloud settings:

   ```
   config log fortianalyzer-cloud setting
   set status enable
   set ips-archive disable
   set certificate-verification enable
   set serial "FAZVCLTM19000000"
   set access-config enable
   set enc-algorithm high
   set ssl-min-proto-version default
   set conn-timeout 10
   set monitor-keepalive-period 5
   set monitor-failure-retry-period 5
   set upload-option realtime
   end
   ```

2. Configure the FortiAnalyzer Cloud filters:

   ```
   config log fortianalyzer-cloud filter
   set severity information
   set forward-traffic disable
   set local-traffic disable
   set multicast-traffic disable
   set sniffer-traffic disable
   set anomaly disable
   set voip disable
   set dlp-archive disable
   end
   ```

To disable FortiAnalyzer Cloud logging for a specific VDOM in the CLI:

1. Enable override FortiAnalyzer in the general log settings:

   ```
   config log setting
   set faz-override enable
   end
   ```
2. Disable the override FortiAnalyzer Cloud setting:
   ```
   config log fortianalyzer-cloud override-setting
   set status disable
   end
   ```

To set FortiAnalyzer Cloud logging to filter for a specific VDOM in the CLI:

1. Enable override FortiAnalyzer in the general log settings:
   ```
   config log setting
   set faz-override enable
   end
   ```

2. Enable the override FortiAnalyzer Cloud setting:
   ```
   config log fortianalyzer-cloud override-setting
   set status enable
   end
   ```

3. Configure the override filters for FortiAnalyzer Cloud:
   ```
   config log fortianalyzer-cloud override-filter
   set severity information
   set forward-traffic disable
   set local-traffic disable
   set multicast-traffic disable
   set sniffer-traffic disable
   set anomaly disable
   set voip disable
   set dlp-archive disable
   end
   ```

To display FortiAnalyzer Cloud logs in the CLI:

# execute log filter device fortianalyzer-cloud
# execute log filter category event
# execute log display

Sample log

```plaintext
date=2019-05-01 time=17:57:45 idseq=60796052214644736 bid=100926 dvid=1027 itime="2019-05-01 17:57:48" euid=3 epid=3 dsteuid=0 dstepid=3 logver=602000890 logid=0100032002 type="event" subtype="system" level="alert" srcip=10.6.30.254 dstip=10.6.30.9 action="login" msg="Administrator ddd login failed from 10.6.30.254 because of invalid user name" logdesc="Admin login failed" sn="0" user="ddd" ui="https(10.6.30.254)" status="failed" reason="name_invalid" method="https" eventtime=1556758667847129245 devid="FG5H1E5818900000" vd="root" dt ime="2019-05-01 17:57:45" itime_t=1556758668 devname="FortiGate-501E"

```

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
## Configuring FortiManager

When a FortiManager device is added to the Security Fabric, it automatically synchronizes with any connected downstream devices.

To add a FortiManager to the Security Fabric, configure it on the root FortiGate. The root FortiGate then pushes this configuration to downstream FortiGate devices. The FortiManager provides remote management of FortiGate devices over TCP port 541. The FortiManager must have internet access for it to join the Security Fabric.

Once configured, the FortiGate can receive antivirus and IPS updates, and allows remote management through FortiManager or the FortiGate Cloud service. The FortiGate management option must be enabled so that the FortiGate can accept management updates to its firmware and FortiGuard services.

Adding a FortiManager device to the Security Fabric requires the following steps in FortiOS:

- Specify the FortiManager IP address or domain name.
- Approve the FortiManager serial number that is returned by the provided IP address or domain name.

You can complete the steps in FortiOS by using the GUI or CLI.

After you complete the steps in FortiOS, go to FortiManager to complete the process by authorizing the FortiGate.

### To add a FortiManager to the Security Fabric using the CLI:

1. Provide FortiManager connection information:
   ```
   config system central-management
   set type fortimanager
   set fmg {<IP_address> | <Domain name>}
   end
   ```

2. Approve the returned FortiManager serial number:
   When configuring the FortiManager connection from the CLI, no prompt is available to approve the returned FortiManager serial number. Therefore you must provide the following command:
   ```
   execute central-mgmt <fmg-serial-no> <PSK>
   ```
   ![Tip]
   If you have not previously configured a model device in FortiManager and leveraged a pre-shared key for registration, you can enter any character for the PSK field in the `execute central-mgmt command`.

3. Go to FortiManager and authorize the FortiGate. See Authorizing the FortiGate in FortiManager on page 2228.

### To add a FortiManager to the Security Fabric using the GUI:

1. On the root FortiGate, go to Security Fabric > Fabric Connectors and double-click the FortiManager card. The FortiManager card is used to configure the FortiManager connection information.

2. For Status, click Enable.
3. For **Type**, click **On-Premise**.

![Edit Fabric Connector](image)

4. Enter the **IP/Domain Name** of the FortiManager.
5. Click **OK**.
   
   The **Confirm** pane appears.

![Confirm Panel](image)

6. Review the serial number, and click **OK**.
7. Go to FortiManager and authorize the FortiGate. See [Authorizing the FortiGate in FortiManager on page 2228](#).

**Authorizing the FortiGate in FortiManager**

After completing the GUI or CLI steps in FortiOS, go to FortiManager to authorize the FortiGate, which completes the process.

**To authorize the FortiGate in FortiManager:**

1. On FortiManager, go to **Device Manager** and find the FortiGate in the **Unauthorized Devices** list.
   
   The unauthorized device list is located in the root ADOM, regardless of the firmware version of the root ADOM or FortiOS.
2. Select the FortiGate device or devices, and click **Authorize** in the toolbar.
3. In the **Authorize Device** pop-up, adjust the device names as needed, select the appropriate ADOM (if applicable), and click **OK**.

For more information about using FortiManager, see the [FortiManager Administration Guide](#).
**Configuring FortiManager Cloud service**

This cloud-based SaaS management service is available through FortiManager. This service is included in FortiCloud accounts with a FortiManager Cloud account level subscription (ALCI).

**Configuring a per-device license**

Once the FortiGate has acquired a contract named FortiManager Cloud, FortiCloud creates a cloud-based FortiManager instance under the user account. You can launch the portal for the cloud-based FortiManager from FortiCloud, and its URL starts with the User ID.

You can use a FortiGate with a contract for FortiManager Cloud to configure central management by using the FQDN of fortimanager.forticloud.com. A FortiGate-FortiManager tunnel is established between FortiGate and the FortiManager instance.

After the tunnel is established, you can execute FortiManager functions from the cloud-based FortiManager portal.

**To configure FortiManager Cloud central management:**

1. **Enable FortiManager Cloud.**
   a. Go to Security Fabric > Fabric Connectors and double-click the FortiManager card.
   b. For Status, click Enable.
   c. For Type, click FortiManager Cloud.
   d. Click OK.

   The FortiManager Cloud button can only be selected if you have a FortiManager Cloud product entitlement.

2. In the FortiManager Cloud instance, go to Device Manager and authorize the FortiGate. See Authorizing devices for more information.
   When using the FortiGate to enable FortiManager Cloud, the FortiGate appears as an unauthorized device. After authorizing the FortiGate, it becomes a managed device.
In FortiOS, the Security Fabric > Fabric Connectors page now displays green arrow in the FortiManager card because FortiManager Cloud is registered.

Diagnostics

To verify the contract information:

```
# diagnose test update info contract
... System contracts:
    ... Account contracts:
        FMGC, Thu Dec 2 16:00:00 2021
...
```

To verify the FortiManager Cloud instance has launched and the FortiGate is registered:

```
# diagnose fdsm central-mgmt-status
Connection status: Up
Registration status: Registered
```

Configuring Sandboxing

The Security Fabric supports the following FortiSandbox deployments.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>FortiGate Cloud Sandbox</td>
<td>Files are sent to Fortinet’s Cloud Sandbox cluster for processing.</td>
<td>• The FortiGate must have a valid AV license.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The FortiCloud account provides access to a portal to view submissions. This is not required for the Security Fabric.</td>
</tr>
<tr>
<td>FortiSandbox Cloud</td>
<td>Files are sent to a dedicated FortiCloud hosted instance of FortiSandbox for processing.</td>
<td>• FortiCloud premium license</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• FortiSandbox Cloud entitlement</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The FortiGate and FortiCloud license are registered to the same account.</td>
</tr>
<tr>
<td>FortiSandbox appliance</td>
<td>Files are sent to a physical appliance or VM, typically residing on premise, for processing.</td>
<td>• None</td>
</tr>
</tbody>
</table>
To apply sandboxing in a Security Fabric, connect one of the FortiSandbox deployments, then configure an antivirus profile to submit files for dynamic analysis. The submission results supplement the AV signatures on the FortiGate. FortiSandbox inspection can also be used in web filter profiles.

In a Security Fabric environment, sandbox settings are configured on the root FortiGate. Once configured, the root FortiGate pushes the settings to other FortiGates in the Security Fabric.

**FortiGate Cloud Sandbox**

FortiGate Cloud Sandbox allows users to take advantage of FortiSandbox features without having to purchase, operate, and maintain a physical appliance. It also allows you to control the region where your traffic is sent to for analysis. This allows you to meet your country's compliance needs regarding data storage locations.

Users are not required to have a FortiCloud account to use FortiGate Sandbox Cloud.

The submission to the cloud with a valid FortiGuard Antivirus (AVDB) license is rate limited per FortiGate model. Refer to the Service Description for details. For those without any AVDB license, the submission is limited to only 100 per day.

To configure FortiGate Cloud Sandbox, you must first activate the connection from the CLI. Note that FortiGate Cloud Sandbox is decoupled from FortiGate Cloud logging, so you do not need to have a FortiCloud account or have cloud logging enabled.

**To activate the FortiGate Cloud Sandbox connection:**

```plaintext
# execute forticloud-sandbox region
0  Europe
1  Global
2  Japan
3  US
Please select cloud sandbox region[0-3]:3
```

After a region is selected, the following configuration is added:

```plaintext
config system fortiguard
    set sandbox-region {0 | 1 | 2 | 3}
end
```

Alternatively, using the `execute forticloud-sandbox update` command also works.

**To obtain or renew a FortiGuard antivirus license:**

1. See the [How to Purchase or Renew FortiGuard Services](#) video for FortiGuard antivirus license purchase instructions.
2. Once a FortiGuard license is purchased and activated, users are provided with a paid FortiSandbox Cloud license.
   a. Go to Dashboard > Status to view the FortiSandbox Cloud license indicator.

   ![Dashboard Status](image)

   b. Alternatively, go to System > FortiGuard to view the FortiSandbox Cloud license indicator.

To enable FortiGate Cloud Sandbox in the GUI:

1. Go to Security Fabric > Fabric Connectors and double-click the Cloud Sandbox card.
2. Set Status to Enable.
3. For Type, select FortiGate Cloud.
4. Select a Region from the dropdown.

   ![Fabric Connectors](image)

5. Click OK.

**FortiSandbox Cloud**

FortiSandbox Cloud offers more features and better detection capability. Connecting to FortiSandbox Cloud will automatically use the cloud user ID of the FortiGate to connect to the dedicated FortiSandbox Cloud instance. The
FortiGate automatically detects if there is a valid entitlement.

The following items are required to initialize FortiSandbox Cloud:

- A FortiCloud premium account.
- A valid FortiSandbox Cloud contract on the FortiGate. To view contract information in the CLI, enter `diagnose test update info`. The User ID at the end of the output shows FortiCloud which FortiSandbox Cloud account the FortiGate is connected to.
- A provisioned FortiSandbox Cloud. See Deploying FortiSandbox Cloud for information.

To configure FortiSandbox Cloud in the GUI:

1. Go to Security Fabric > Fabric Connectors and double-click the Cloud Sandbox card.
2. Set Status to Enable.
3. For Type, select FortiSandbox Cloud.

   If the FortiSandbox Cloud option is grayed out or not visible, enter the following in the CLI:

   ```
   config system global
   set gui-fortigate-cloud-sandbox enable
   end
   ```

4. Click OK.

To configure FortiSandbox Cloud in the CLI:

```fortigate
config system fortisandbox
set status enable
set forticloud enable
set server <string>
end
```

If the FortiGate does not detect the proper entitlement, a warning is displayed and the CLI configuration will not save.

If the FortiSandbox Cloud is running version 4.0.0 and later, the FortiGate will automatically connect to fortisandboxcloud.com, and then discover the specific region and server to connect to based on which region the customer selected to deploy their FortiSandbox Cloud instance. The FortiGate must have a FortiCloud premium account license and a FortiSandbox Cloud VM license for this functionality.

**FortiSandbox appliance**

FortiSandbox appliance is the on-premise option for a full featured FortiSandbox. Connecting to a FortiSandbox appliance requires that Cloud Sandbox is disabled.

To switch from Cloud Sandbox to FortiSandbox in the Security Fabric:

1. Go to Security Fabric > Fabric Connectors and double-click the Cloud Sandbox card.
2. Set Status to Disabled.
3. Click OK.
To enable FortiSandbox appliance in the GUI:

1. Go to Security Fabric > Fabric Connectors and double-click the FortiSandbox card.
2. Set Status to Enable.
3. In the Server field, enter the FortiSandbox device’s IP address.
4. Optionally, enter a Notifier email.
5. Click OK.

To enable FortiSandbox appliance in the CLI:

```
config system fortisandbox
    set status enable
    set forticloud disable
    set server <address>
end
```

Authorizing the FortiGate from FortiSandbox Cloud and a FortiSandbox appliance

Once the FortiGate makes a connection to the FortiSandbox Cloud or appliance, the FortiGate must be authorized.

To authorize a FortiGate from FortiSandbox:

1. In the FortiSandbox GUI, go to Scan Input > Device in 3.2 or Security Fabric > Device in 4.0.
2. Search using the FortiGate serial number to locate the FortiGate. In the Auth column, click the link icon to authorize the FortiGate.
3. Repeat this step to authorize the VDOMs if required.

The link icon changes from an open to a closed link, which indicates that the FortiGate is authorized.

4. In the FortiGate GUI, go to Security Fabric > Fabric Connectors and double-click the FortiSandbox card.
5. Click Test connectivity. The FortiGate is now authorized and the status displays as Connected.

Antivirus profiles

An antivirus profile must be configured to send files to the sandbox. Once submitted, sandbox inspection is performed on the file to detect malicious activities. The FortiGate can use the dynamic malware detection database from the sandbox to supplement the AV signature database. See Using FortiSandbox post-transfer scanning with antivirus on page 1113 for more information.
FortiSandbox inline scanning is supported on FortiSandbox appliances in proxy inspection mode. When inline scanning is enabled, the client’s file is held while it is sent to FortiSandbox for inspection. Once a verdict is returned, the appropriate action is performed on the held file. If there is an error or timeout on the FortiSandbox, the FortiGate’s configuration determines what to do with the held file. See Using FortiSandbox inline scanning with antivirus on page 1115 for more information.

Inline scanning requires a FortiSandbox appliance running version 4.2 or later. This feature is not supported on FortiSandbox Cloud or FortiGate Cloud Sandbox.

Web filter profiles

Sandbox inspection can be used in web filter profiles. The FortiGate uses URL threat detection database from the sandbox to block malicious URLs. See Block malicious URLs discovered by FortiSandbox on page 1148 for more information.

Top FortiSandbox Files FortiView monitor

In the Top FortiSandbox Files FortiView monitor, users can select a submitted file and drill down to view its static and dynamic file analysis. The full FortiSandbox report can be downloaded in PDF format. This feature works with FortiGate Cloud Sandbox, FortiSandbox Cloud, and FortiSandbox appliance. FortiSandbox must be running version 3.2.1 and later.

Prerequisites:

1. Add FortiSandbox to the Security Fabric.
2. Configure an AV profile with Send files to FortiSandbox for inspection enabled (see Using FortiSandbox post-transfer scanning with antivirus on page 1113).
3. Configure a firewall policy with the AV profile that allows traffic to the internet.
4. Add the Top FortiSandbox Files FortiView monitor (see Adding FortiView monitors on page 108).
5. On a client PC, attempt to download a suspicious file.

To view the FortiSandbox analysis and download the PDF:

1. Go to Dashboard > Top FortiSandbox Files. The entry appears in the table, but the analysis is not available yet.

2. After about five to ten minutes, refresh the table. The analysis is available.

3. Select the entry, then right-click and select Drill Down to Details.
4. In the dropdown, select Static File Analysis to view the static file analysis.

5. In the dropdown, select the client device to view the dynamic file analysis.

6. Click Download full report to download the detailed PDF report. The reports contains FortiSandbox job information, detailed file information, static analysis results, and dynamic analysis results.

Configuring FortiClient EMS

The FortiGate Security Fabric root device can link to FortiClient Endpoint Management System (EMS) and FortiClient EMS Cloud (a cloud-based EMS solution) for endpoint connectors and automation. Up to three EMS servers can be added to the Security Fabric, including a FortiClient EMS Cloud server. EMS settings are synchronized between all fabric members.

To enable cloud-based EMS services, the FortiGate must be registered to FortiCloud with an appropriate user account. The following examples presume that the EMS certificate has already been configured.

To add an on-premise FortiClient EMS server to the Security Fabric in the GUI:

1. On the root FortiGate, go to System > Feature Visibility and enable Endpoint Control.
2. Go to Security Fabric > Fabric Connectors and double-click the FortiClient EMS card.
3. For Type, click FortiClient EMS.
4. Optionally, enable EMS Threat Feed. See Malware threat feed from EMS on page 1103 for more information about using this setting in an AV profile.
Enter a name and IP address or FQDN. When connecting to a multitenancy-enabled EMS, Fabric connectors must use an FQDN to connect to EMS, where the FQDN hostname matches a site name in EMS (including "Default"). The following are examples of FQDNs to provide when configuring the connector to connect to the default site and to a site named SiteA, respectively: default.ems.yourcompany.com, sitea.ems.yourcompany.com. See Multitenancy.

Click OK.
A window appears to verify the EMS server certificate:

Click Accept.
The FortiClient EMS Status section displays a Successful connection and an Authorized certificate:

If the device is not authorized, log in to the FortiClient EMS to authorize the FortiGate under Administration > Fabric Devices.
To add a FortiClient EMS Cloud server to the Security Fabric in the GUI:

FortiClient EMS Cloud can only be configured when the FortiGate is registered to FortiCloud and the EMS Cloud entitlement is verified. If the FortiCloud account does not pass the FortiClient EMS Cloud entitlement check, the option is not selectable in the FortiClient EMS connector settings.

1. Go to Security Fabric > Fabric Connectors and double-click the FortiClient EMS card.
2. Set Type to FortiClient EMS Cloud.
3. Enter a name.
4. Click OK.
   A window appears to verify the EMS server certificate.
5. Click Accept.
   The FortiClient EMS Status section displays a Successful connection and an Authorized certificate.

To test connectivity with the EMS server:

1. Go to Security Fabric > Fabric Connectors and double-click the FortiClient EMS or FortiClient EMS Cloud card.
2. In the FortiClient EMS Status section under Connection, click Refresh.

To add an on-premise FortiClient EMS server to the Security Fabric in the CLI:

```
config endpoint-control fctems
edit <ems_name>
   set server <ip_address>
   set certificate <string>
   set https-port <integer>
   set source-ip <ip_address>
next
end
```

The https-port is the EMS HTTPS access port number, and the source-ip is the REST API call source IP address.

To add a FortiClient EMS Cloud server to the Security Fabric in the CLI:

```
config endpoint-control fctems
edit <name>
   set fortinet-one-cloud-authentication enable
   set certificate <string>
next
end
```

To verify the EMS Cloud entitlement in the CLI:

```
# diagnose test update info
```

To verify an EMS certificate in the CLI:

```
# execute fctems verify ems137
```

EMS configuration needs user to confirm server certificate.
Do you wish to add the above certificate to trusted remote certificates? (y/n)y

Troubleshooting

Certificate not trusted

When configuring a new connection to an EMS server, the certificate might not be trusted.
When you click Authorize, a warning displays: *The server certificate cannot be authenticated with installed CA certificates. Please install its CA certificates on this FortiGate.*

In the CLI, an error message displays when you try to verify the certificate:

```
# execute fctems verify Win2K16-EMS
certificate not configured/verified: 2
Could not verify server certificate based on current certificate authorities.
Error 1--92-60-0 in get SN call: EMS Certificate is not signed by a known CA.
```

The default FortiClient EMS certificate that is used for the SDN connection is signed by the CA certificate that is saved on the Windows server when FortiClient EMS is first installed. You can manually export and install it on the FortiGate.

**To manually export and install the certificate on to the FortiGate:**

1. Export the EMS certificate on the server that EMS is installed on:
   a. On the Windows server that EMS is installed on, go to *Settings > Manage computer certificates.*
   b. In the certificate management module, go to *Trusted Root Certification Authorities > Certificates.*
   c. Right click on the certificate issued by FortiClient Enterprise Management Server and select *All Tasks > Export.*
   d. The *Certificate Export Wizard* opens. Click *Next.*
   e. Select *Base-64 encoded X.509,* then click *Next.*
   f. Enter a file name for the certificate and click *Browse* to select the folder where it will be located, then click *Next.*
   g. Review the settings, then click *Finish.* The certificate is downloaded to the specified folder.
2. On the FortiGate, import the certificate:
   a. Go to *System > Certificate.* By default, the *Certificate* option is not visible, see Feature visibility on page 2165 for information.
   b. Click *Import > CA Certificate.*
   c. Set Type to *File,* and click *Upload* to import the certificate from the management computer.
   d. Click *OK.* The imported certificate is shown in the *Remote CA Certificate* section of the certificate table.
3. Try to authorize the certificate on the FortiGate:
   a. Go to *Security Fabric > Fabric Connectors* and edit the FortiClient EMS connector. The connection status should now say that the certificate is not authorized.
b. Click Authorize. The following warning is shown:

The warning can also be seen in the CLI:

```
# execute fctems verify Win2K16-EMS
failure in certificate configuration/verification: -4
Could not verify EMS. Error 1--94-0-401 in get SN call: Authentication denied.
```

4. Authorize the FortiGate on EMS:
   a. Log in to the EMS server console and go to Administration > Fabric Devices.
   b. Select the serial number of the FortiGate device, then click Authorize.
5. Try to authorize the certificate on the FortiGate again:
   a. On the FortiGate, go to Security Fabric > Fabric Connectors and edit the FortiClient EMS connector.
   b. Click Authorize.
   c. When presented with the EMS server certificate, click Accept to accept the certificate.

   Your connection should now be successful and authorized.

   d. Click OK.

Using EMS silent approval in the Security Fabric

FortiClient EMS with Fabric authorization and silent approval capabilities can approve the root FortiGate in a Security Fabric once, and then silently approve remaining downstream FortiGates in the Fabric. Similarly in an HA scenario, an approval only needs to be made once to the HA primary unit. The remaining cluster members are approved silently.

To use EMS silent approval:

1. Configure the EMS entry on the root FortiGate or HA primary:

```
config endpoint-control fctems
   edit "ems139"
      set fortinetone-cloud-authentication disable
      set server "172.16.200.139"
      set https-port 443
      set source-ip 0.0.0.0
      set pull-sysinfo enable
      set pull-vulnerabilities enable
      set pull-avatars enable
      set pull-tags enable
      set pull-malware-hash enable
      unset capabilities
      set call-timeout 30
      set websocket-override disable
   next
end
```
When the entry is created, the capabilities are unset by default.

2. Authenticate the FortiGate with EMS:

```
# execute fctems verify ems_139
...```

The FortiGate will enable the Fabric authorization and silent approval based on the EMS supported capabilities.

```
config endpoint-control fctems
  edit "ems139"
    set server "172.18.62.12"
    set capabilities fabric-auth silent-approval websocket
  next
end```

3. Configure a downstream device in the Security Fabric (see Configuring the root FortiGate and downstream FortiGates on page 2210 for more details). The downstream device will be silently approved.

4. Configure a secondary device in an HA system (see HA active-passive cluster setup on page 2037 and HA active-active cluster setup on page 2039 for more details). The secondary device will be silently approved.

Allowing deep inspection certificates to be synchronized to EMS and distributed to FortiClient

On FortiClient EMS versions that support push CA certs capability, the FortiGate will push CA certificates used in SSL deep inspection (see Deep inspection on page 1298 for more details) to the EMS server. On the EMS server, the CA certificates can be selected in the managed endpoint profiles so they can be installed on managed endpoints. FortiClient EMS 7.0.1 and later is required to use this feature.

To configure deep inspection certificate synchronization to EMS:

1. Configure the EMS Fabric connector:

```
config endpoint-control fctems
  edit "ems138"
    set fortinetone-cloud-authentication disable
    set server "172.16.200.138"
    set https-port 443
    set source-ip 0.0.0.0
    set pull-sysinfo enable
    set pull-vulnerabilities enable
    set pull-avatars enable
    set pull-tags enable
    set pull-malware-hash enable
    set capabilities fabric-auth silent-approval websocket websocket-malware push-ca-certs
      set call-timeout 30
      set websocket-override disable
      set preserve-ssl-session disable
  next
end```

2. Apply the certificate to an SSL/SSH profile for deep inspection:

```
config firewall ssl-ssh-profile
  edit "deep-inspection"```
set comment "Read-only deep inspection profile."

config https
    set ports 443
    set status deep-inspection
end

set server-cert-mode re-sign
    set caname "Fortinet_CA_SSL"
    set untrusted-caname "Fortinet_CA_Untrusted"
next
end

The default deep inspection profile, CA certificate, and untrusted CA certificates are used in this example.

3. Configure the firewall policy:

    config firewall policy
    edit 1
        set name "deep-inspection"
        set srcintf "port14"
        set dstintf "port13"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set av-profile "default"
        set nat enable
    next
end

4. In EMS, verify that the CA certificate was pushed to EMS:
   a. Go to Endpoint Policy & Components > CA Certificates.

   b. Verify the certificate table to see that the EMS server received the CA certification from the different FortiGates.

5. Select the CA certificate in the endpoint profile:
   a. Go to Endpoint Profiles > Manage Profiles and edit a profile. The default profile is used in this example.
   b. Click Advanced in the top right corner and click the System Settings tab.
   c. In the Other section, enable Install CA Certificate on Client and select the Fortinet_CA_SSL certificate for the desired endpoint.
d. Click Save. Once the FortiClient endpoint is registered, it receives the CA certificate. When the FortiClient endpoint tries to access the internet through the FortiGate with the firewall policy that has deep inspection, no warning message is displayed. The server certificate is trusted with the installed CA certificate to complete the certificate chain.

Verification

Before configuring deep inspection certificate synchronization, a warning message is displayed when a FortiClient endpoint accesses the internet through the FortiGate with the firewall policy that has deep inspection. The FortiClient certificate store does not have the FortiGate's CA that is used in the deep inspection SSL/SSH profile.

For example, accessing https://www.facebook.com in Chrome shows a warning. In the address bar, clicking Not secure > Certificate opens the Certificate dialog, which indicates that Windows does not have enough information to verify the certificate.
After the EMS profile is pushed to FortiClient endpoint, the expected FortiGate's certificate is shown in its certificate store.
To verify the deep inspection certificate synchronization:

1. In Chrome, go to Settings > Privacy and security and open Manage certificates.
2. Click the Trusted Root Certification Authorities tab. The FortiGate's certificate appears in the list.
4. In the address bar, click the padlock, then click Certificate. The dialog displays the valid certificate information.

Diagnostics

Use the `diagnose endpoint fctems json deep-inspect-cert-sync` command in FortiOS to verify the certificate information. In the following example, there are multiple VDOMs with FortiGates in HA mode.

To verify the primary FortiGate:

```json
FGT_EC_Primary (global) # diagnose endpoint fctems json deep-inspect-cert-sync
JSON:

"fortigates": [
  "FG2K5E39169*****",
  "FG2K5E39169*****"
],
"vdoms": [
  "vdom":"root",
  "certs": [
    "name":"Fortinet_CA_SSL",
    "cert": "-----BEGIN CERTIFICATE-----
\nMIID5jCCAesg...Sfu+Q8zE8Crmh6LlX/bv+q\n-----END CERTIFICATE-----"
  ]
]"
To verify the secondary FortiGate:

```json
FGT_EC_Secondary(global) # diagnose endpoint fctems json deep-inspect-cert-sync
JSON:

"fortigates": [
  "FG2K5E39169*****",
  "FG2K5E39169*****"
],
"vdoms": [
  
  "vdom": "root",
  "certs": [
    "name": "Fortinet_CA_SSL",
    "cert": "-----BEGIN CERTIFICATE-----\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X/bv+q\n--END CERTIFICATE-----\n"
  ],
  
  "vdom": "vdom1",
  "certs": [
    "name": "Fortinet_CA_SSL",
    "cert": "-----BEGIN CERTIFICATE-----\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X/bv+q\n--END CERTIFICATE-----\n"
  ]
]
"vdom": "vdom1",
"certs": [
  "name": "Fortinet_CA_Untrusted",
  "cert": "-----BEGIN CERTIFICATE-----\nMIID8DCCAtig...3zBbfzP+nVUpC\n--END CERTIFICATE-----"
],
"vdom": "vdom1",

```
Synchronizing FortiClient ZTNA tags

ZTNA tags (formerly FortiClient EMS tags in FortiOS 6.4 and earlier) are tags synchronized from FortiClient EMS as dynamic address objects on the FortiGate. FortiClient EMS uses zero-trust tagging rules to automatically tag managed endpoints based on various attributes detected by the FortiClient. When the FortiGate establishes a connection with the FortiClient EMS server via the EMS Fabric connector, it pulls zero-trust tags containing device IP and MAC addresses and converts them to read-only dynamic address objects. It also establishes a persistent WebSocket connection to monitor for changes in zero-trust tags, which keeps the device information current. These ZTNA tags can then be used in ZTNA rules, firewall rules, and NAC policies to perform security posture checks. ZTNA tags are displayed in the Device Inventory widget, FortiClient widget, and Asset Identity Center page.

When using WebSocket, EMS pushes notifications to the corresponding FortiGate when there are updates to tags or other monitored attributes. The FortiGate then fetches the updated information using the REST API over TCP/8013. When WebSocket is not used (due to an override or unsupported EMS version), updates are triggered on demand from the FortiGate side over the REST API.

If the WebSocket capability is detected, the capabilities setting will automatically display the WebSocket option. You can use the `diagnose test application fcnacd 2` command to view the status of the WebSocket connection.

In the following example, the FortiGate connects to and retrieves ZTNA tags from a FortiClient EMS configured with tagging rules. It is assumed that zero-trust tags and rules are already created on the FortiClient EMS. For more information, see the Zero Trust Tags section of the EMS Administration Guide.
To verify zero-trust tags in FortiClient EMS:

1. Go to Zero Trust Tags > Zero Trust Tagging Rules to view the tags.

2. Go to Zero Trust Tags > Zero Trust Tag Monitor to view the registered users who match the defined tag.

To configure the EMS Fabric connector to synchronize ZTNA tags in the GUI:

1. Configure the EMS Fabric connector:
   a. On the root FortiGate, go to Security Fabric > Fabric Connectors.
   b. Click Create New and click FortiClient EMS.
   c. Enable Synchronize firewall addresses.
d. Configure the other settings as needed and validate the certificate.

e. Click OK.

2. Enable ZTNA:
   a. Go to System > Feature Visibility and enable Zero Trust Network Access.
   b. Click Apply.

3. Go to Policy & Objects > ZTNA and select the ZTNA Tags tab. You will see the ZTNA IP and ZTNA MAC tags synchronized from the FortiClient EMS.

To configure the EMS Fabric connector to synchronize ZTNA tags in the CLI:

1. Configure the EMS Fabric connector on the root FortiGate:

   ```
   config endpoint-control fctems
   edit "WIN10-EMS"
     set server "192.168.20.10"
     set https-port 443
     set pull-sysinfo enable
     set pull-vulnerabilities enable
     set pull-avatars enable
     set pull-tags enable
     set pull-malware-hash enable
     set capabilities fabric-auth silent-approval websocket
   next
   end
   ```

2. Verify which IPs the dynamic firewall address resolves to:

   ```
   # diagnose firewall dynamic list
   List all dynamic addresses:
   FCTEMS0000100000_all_registered_clients: ID(51)
     ADDR(172.17.194.209)
     ADDR(10.10.10.20)
   ...
   FCTEMS0000100000_Low: ID(78)
   ```
Configuring FortiNAC

A FortiNAC device can be added to the Security Fabric on the root FortiGate. After the device has been added and authorized, you can log in to the FortiNAC from the FortiGate topology views.

Adding a FortiNAC to the Security Fabric requires a FortiNAC with a license issued in the year 2020 or later that includes an additional certificate. The device cannot be added if it has an older license. Use the licensetool in the FortiNAC CLI to determine if your license includes the additional certificate.

The FortiNAC tags connector under Security Fabric > Fabric Connectors has been deprecated. It was replaced with a REST API (in FortiNAC and FortiOS) that is used by FortiNAC to send user logon and logoff information to the FortiGate. The FortiNAC tag dynamic firewall address type is used to store the device IP, FortiNAC firewall tags, and FortiNAC group information sent from FortiNAC by the REST API when user logon and logoff events are registered (see FortiNAC tag dynamic address on page 893 for more information).

For upgrade support, the FSSO FortiNAC user type can still be configured in the CLI.

To add a FortiNAC to the Security Fabric:

2. On the root FortiGate, authorize the FortiNAC.
3. Verify the connection status in the topology views.

To authorize the FortiNAC on the root FortiGate in the GUI:

2. The FortiNAC device will be highlighted in the topology list in the right panel with the status Waiting for Authorization.
3. Click on the highlighted FortiNAC and select Authorize.

Optionally, you can also deny authorization to the FortiNAC to remove it from the list.

To authorize the FortiNAC on the root FortiGate in the CLI:

```plaintext
cfg system csf
cfg trusted-list
edit "FNVMCATM20000306"
   set action accept
next
end
end
```

To verify the connection status:

1. After the FortiNAC is authorized, go to Security Fabric > Physical Topology and confirm that it is included in the topology.

2. Go to Security Fabric > Logical Topology and confirm the FortiNAC is also displayed there.

3. Run the following command in the CLI to view information about the FortiNAC device's status:

   ```bash
   # diagnose sys csf downstream-devices fortinac
   {
   "path":"FGSH1E5818900126:FNVMCATM20000306",
   "mgmt_ip_str":"10.1.100.197",
   ```
To log in to the FortiNAC from the FortiGate:

2. Click on the FortiNAC and select Login to <serial_number>.

A new tab will open to the FortiNAC log in page.
3. Enter the username and password to log in to the FortiNAC.

Configuring FortiAP and FortiSwitch

FortiAP and FortiSwitch devices can be authorized in the Security Fabric with one click. After connecting a FortiAP or FortiSwitch device to an authorized FortiGate, it will automatically be listed in the topology tree.

If the default auto-auth-extension-device settings on the FortiAP or FortiSwitch have been modified, manual authorization in the Security Fabric may not be required.

For more information about configuring FortiAPs, see Configuring the FortiGate interface to manage FortiAP units and Discovering, authorizing, and deauthorizing FortiAP units.

For more information about configuring FortiSwitches, see Using the FortiGate GUI.

To authorize FortiAP and FortiSwitch devices:

1. Connect the FortiAP or FortiSwitch device to a FortiGate.
2. On the root FortiGate, go to Security Fabric > Fabric Connectors. The new device is shown in the Topology tree.
3. Click the device and select Authorize.

![Diagram of FortiMail within Security Fabric]

### Configuring FortiMail

FortiMail can be authorized into the Security Fabric using either the gutter on the Fabric Connectors page, or by pre-authorizing using the FortiMail serial number or certificate.

#### To join the Security Fabric from FortiMail:

1. Go to System > Customization and click the Corporate Security Fabric tab (or the Corporate Security Fabric tab in FortiMail 6.4.2 and earlier).
2. Click the toggle to enable the Fabric.
3. Enter the Upstream IP Address (root FortiGate) and the Management IP of the FortiMail.
4. Click Apply.

#### Authorizing using FortiOS

If the FortiMail was added to the Security Fabric but not pre-authorized, you can authorize it in FortiOS on the Fabric Connectors page.
To authorize FortiMail:

2. In the topology tree, hover over the FortiMail and click Authorize.

3. Verify the certificate is correct, then click Accept.

Pre-authorizing using the FortiMail certificate

FortiMail can be pre-authorized using its serial number or certificate. When you pre-authorize, the FortiMail can join at any time, and you will not need to authorize it FortiOS. In this example, FortiMail is pre-authorized using a certificate.

To pre-authorize FortiMail using a third-party or default certificate:

1. Log in to FortiMail.
2. Download the certificate. For example, in Chrome:
   a. In the left side of the address bar, click the icon to view the site information.
   b. Click Certificate.
   c. Click the Details tab, then click Copy to File.
   d. The Certificate Export Wizard opens. Click Next to continue.
For the file format, select *Base-64 encoded X.509 (.CER)*, then click *Next.*

Browse to the folder location and enter a file name, then click *Next.*

Click *Finish,* then click *OK* to close the dialog box.

3. In FortiOS, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.

4. Beside *Device authorization,* click *Edit* and configure the following:
   a. Enter the FortiMail serial number.
   b. For *Authorization type,* select *Serial Number.*
   c. For *Certificate,* upload the .CER file you saved previously.
   d. Click *OK.*

**Configuring FortiNDR**

FortiNDR (formerly FortiAI) can be added to the Security Fabric so it appears in the topology views and the dashboard widgets.

To add FortiNDR to the Security Fabric in the GUI:

1. Enable the Security Fabric and configure the interface to allow other Security Fabric devices to join (see Configuring the root FortiGate and downstream FortiGates on page 2210).
2. Install the FortiNDR appliance and activate the product with a valid license (see Registering products in the Asset Management Guide). A license file is provided after the product is registered.

3. In FortiNDR, go to System > FortiGuard and verify that the pre-trained models (engines) are up to date. Refer to the FortiGuard website for the latest FortiNDR ANN versions.

4. Configure and authorize the FortiGate in the FortiNDR GUI to join the Security Fabric:
   b. Click the toggle to Enable Security Fabric.
c. Enter the IP addresses for the root FortiGate and the FortiNDR.

![Fortinet Security Fabric Configuration Screen]

d. Click OK. The FortiNDR is now authorized.

5. Authorize the FortiNDR in FortiOS:
   b. In the topology tree, click the highlighted serial number and select Authorize.
c. Click Accept to verify the device certificate.

The Security Fabric widget on the dashboard also updates when the FortiNDR is authorized.

To add FortiNDR to the Security Fabric in the CLI:

1. Configure the interface to allow other Security Fabric devices to join:
   ```
   config system interface
   edit "port1"
   ... set allowaccess ping https ssh http fgfm fabric ...
   next
   end
   ```

2. Enable the Security Fabric:
   ```
   config system csf
   set status enable
   set group-name "fabric-ai"
   end
   ```

3. In FortiNDR, configure the device to join the Security Fabric:
   ```
   config system csf
   set status enable
   set upstream-ip 10.6.30.14
   ```
set management-ip 10.6.30.251
end

4. Authorize the FortiNDR in FortiOS:

```plaintext
config system csf
  set status enable
  set group-name "fabric-ai"
config trusted-list
  edit "FAIVSTM21000000"
  set authorization-type certificate
  set certificate "***************"
next
end
end
```

### Configuring FortiDeceptor

FortiDeceptor can be added to the Security Fabric so it appears in the topology views and the dashboard widgets.

#### To add FortiDeceptor to the Security Fabric in the GUI:

1. Enable the Security Fabric (see Configuring the root FortiGate and downstream FortiGates on page 2210 for more details) with the following settings:
   a. Configure the interface to allow other Security Fabric devices to join.
   b. Enable *Allow downstream device REST API access* so the FortiDeceptor can communicate with the FortiGate, and select an *Administrator profile*. The minimum permission required for the selected *Administrator profile* is *Read/Write for User & Device* (set authgrp read-write).

2. In FortiDeceptor, integrate the device:
   a. Go to Fabric > Integration Devices.
   b. Click Quarantine Integration With New Device.
   c. Click the toggle to enable the device.
   d. For *Upstream IP Address*, enter the root FortiGate's management IP address.

   ![Quarantine Integration With New Device](image)

   e. Click Apply.
3. Authorize the FortiDeceptor in FortiOS:
   a. Go to Security Fabric > Fabric Connectors.
   b. In the topology tree, click the highlighted FortiDeceptor serial number and select Authorize.

   The authorized device appears in the topology tree. Hover over the device name to view the tooltip.

   The Security Fabric widget on the dashboard also updates when the FortiDeceptor is authorized.

   Physical topology view:

   Logical topology view:
To add FortiDeceptor to the Security Fabric in the CLI:

1. Configure the interface to allow other Security Fabric devices to join:
   ```
   config system interface
   edit "wan1"
   ... set allowaccess ping https ssh snmp http fabric ... next
   end
   ```

2. Enable the Security Fabric:
   ```
   config system csf
   set status enable
   set group-name "csf-d"
   set downstream-access enable
   set downstream-accprofile "super_admin"
   end
   ```

3. In FortiDeceptor, integrate the device:
   a. Go to Fabric > Integration Devices.
   b. Click Quarantine Integration With New Device.
   c. Click the toggle to enable the device.
   d. For Upstream IP Address, enter the root FortiGate's management IP address.
   e. Click Apply.

4. Authorize the FortiDeceptor in FortiOS:
   ```
   config system csf
   set status enable
   set group-name "csf-d"
   config trusted-list
   edit "FDC-VMTM21000000"
   set serial "FDC-VMTM21000000"
   next
   ```
Configuring FortiWeb

A FortiWeb can be configured to join a Security Fabric through the root or downstream FortiGate. There are two methods to add a FortiWeb to the Security Fabric:

- Trigger the authorization on the FortiWeb side and authorize from the FortiOS side.
- Pre-authorize the FortiWeb from the FortiOS side.

Once the FortiWeb joins the Fabric, the following features are available:

- View the FortiWeb on topology pages.
- Create a dashboard Fabric Device widget to view FortiWeb data.
- Configure single sign-on using SAML.

Triggering the authorization in FortiWeb

In this example, a FortiWeb triggers the authorization process, and then the device is approved in FortiOS. This example assumes the Security Fabric has already been configured.

To trigger the Security Fabric authorization in FortiWeb:

1. Edit the FortiGate Fabric Connector settings in FortiWeb (see Fabric Connector: Single Sign On with FortiGate). The Connection Status is currently Authorize pending.
2. In FortiOS, go to Security Fabric > Fabric Connectors.
3. In the topology tree, hover over the FortiWeb and click Authorize.
4. Verify that the certificate is correct, then click Accept.
5. In FortiWeb, verify that the FortiGate Connection Status is now Authorized.

Pre-authorizing the FortiWeb in FortiOS

In this example, a FortiWeb is pre-authorized on the root FortiGate using certificate authorization. This example assumes the Security Fabric has already been configured.

To authorize a FortiWeb to join the Security Fabric in FortiOS:

2. Beside Device authorization, click Edit. The Device authorization pane opens.
3. Add the FortiWeb:
   a. Click Create New and enter a device name.
   b. For Authorization type, select Certificate.
   c. Click Browse to upload the certificate.
   d. For Action, select Accept.
e. Click OK. The FortiWeb appears in the table.

Physical topology view:

Logical topology view:
Configuring FortiTester

FortiTester can be added to the Security Fabric and authorized from the Security Fabric topology views. Once added, the FortiTester will appear in the Security Fabric widget on the dashboard. A FortiTester can be added to the dashboard as a Fabric device widget.

To add FortiTester to the Security Fabric in the GUI:

1. Enable the Security Fabric and configure the interface to allow other Security Fabric devices to join (see Configuring the root FortiGate and downstream FortiGates on page 2210).
2. In FortiTester, enable the Security Fabric:
   b. Click the toggle to enable the device (Enable Security Fabric).
   c. Enter the FortiGate Root IP Address.
   d. Click Apply.

3. Authorize the FortiTester in FortiOS:
   a. Go to Security Fabric > Fabric Connectors.
   b. In the topology tree, click the highlighted FortiTester serial number and select Authorize.

   The authorized device appears in the topology tree. Hover over the device name to view the tooltip.

   The Security Fabric widget on the dashboard also updates when the FortiTester is authorized.

   Physical topology view:
To add FortiTester to the Security Fabric in the CLI:

1. Configure the interface to allow other Security Fabric devices to join:

   ```
   config system interface
   edit "port8"
   ... set allowaccess ping https ssh http fgfm fabric ...
   next
   ```
2. Enable the Security Fabric:

   config system csf
   set status enable
   set group-name "CSF_F"
   end

3. In FortiTester, enable the Security Fabric:

   config system csf
   set ip 172.16.116.230
   set port 8013
   set status enable
   end

4. Authorize the FortiTester in FortiOS:

   config system csf
   set status enable
   set group-name "CSF_F"
   config trusted-list
     edit "FTSV3200000200000"
     set authorization-type certificate
     set certificate "***************"
   next
   end
   end

Configuring FortiMonitor

FortiMonitor can be added to the Security Fabric. When a FortiMonitor joins the Security Fabric and is authorized, it appears in the Fabric topology pages.

To add FortiMonitor to the Security Fabric:

1. Enable the Security Fabric (see Configuring the root FortiGate and downstream FortiGates on page 2210) with the following settings:
   a. Configure the interface to allow other Security Fabric devices to join.
   b. Enable Allow downstream device REST API access and select an Administrator profile.
2. In FortiMonitor, start configuring the device to join the Security Fabric (see Enable Security Fabric monitoring for detailed instructions):
a. Complete the *Discovery Details page.*

![Discovery Details page](image1)

3. Authorize the FortiMonitor in FortiOS:
   a. Go to *Security Fabric > Fabric Connectors.*
   b. In the topology tree, click the highlighted FortiMonitor and select *Authorize.*

![Topology tree with FortiMonitor](image2)

The authorized device appears in the topology tree. Hover over the device name to view the tooltip.

4. Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information.

Physical topology view:
5. In FortiMonitor, complete the device configuration (see Enable Security Fabric monitoring for detailed instructions).

### Configuring FortiVoice

A FortiVoice can be added to the Security Fabric on the root FortiGate. Once the FortiVoice is added and authorized, you can log in to the device from the Security Fabric topology pages or the topology tree. A FortiVoice can be authorized in FortiOS, or can be pre-authorized with its serial number or certificate. A FortiVoice can be added to the dashboard as a Fabric device widget.

#### Authorizing using the FortiOS GUI

To authorize a FortiVoice to join the Security Fabric:

2. On the root FortiGate, go to *Security Fabric > Fabric Connectors*. The FortiVoice is highlighted in the topology list in the right panel with the status *Waiting for Authorization*.
3. Click the highlighted FortiVoice and select *Authorize*. 
4. Verify that the certificate is correct, then click Accept.

Pre-authorizing using the FortiVoice certificate

A FortiVoice can be pre-authorized using its serial number or certificate. When pre-authorizing, the FortiVoice can join at any time, and it will not need to be authorized in FortiOS. In the following example, the FortiVoice is pre-authorized using a certificate.

To pre-authorize a FortiVoice using a third-party or default certificate in the GUI:

1. Log in to the FortiVoice.
2. Download the certificate. For example, in Chrome:
   a. In the left side of the address bar, click the icon to view the site information.
   b. Click Certificate.
   c. In the Certificate window, click the Details tab, then click Copy to File.
The Certificate Export Wizard opens. Click Next.

Set the format to Base-64 encoded X.509 (.CER), then click Next.

Browse to the folder location, enter a file name, then click Next.

Click Finish, then click OK to close the wizard.

3. In FortiOS, go to Security Fabric > Fabric Connectors and double-click the Security Fabric Setup card.
4. Beside Device authorization, click Edit.
5. Click Create New and enter the following:
   a. In the Name field, enter the FortiVoice serial number.
   b. Set the Authorization type to Certificate.
   c. Upload the .CER file.
   d. Click OK, then close the Device authorization pane.

To pre-authorize a FortiVoice using a third-party or default certificate in the CLI:

```plaintext
config system csf
   config trusted-list
      edit "FOV-300E"
         set action accept
         set authorization-type certificate
         set certificate "-----BEGIN CERTIFICATE-----
...<encrypted_certificate_data>
...-----END CERTIFICATE-----"
      next
   end
end
```

To verify the connection status:

1. After the FortiVoice is authorized, go to Security Fabric > Physical Topology and confirm that it is included in the topology.
2. Go to Security Fabric > Logical Topology and confirm the FortiVoice is also displayed there.

Logging in to the FortiVoice using the Security Fabric

To log in using a topology page:

2. Click on the FortiVoice and select Login to <serial_number>.

To log in using the Fabric Connectors page:

2. In the topology tree, click the FortiVoice and select Login to <serial_number>.

Using the Security Fabric

Dashboard widgets

Security Fabric widgets can be added to FortiGate dashboards, including:

- Security Fabric status on page 2276
- Fabric Device on page 2276
- FortiGate Cloud on page 2277
Security Fabric status

Hover the cursor over the top icons to view pop-ups showing the statuses of the devices in the fabric.

The device tree shows devices that are connected, or could be connected, to your Security Fabric, according to the following color scheme:

- Blue: connected to the network
- Gray: not configured or not detected
- Red: no longer connected or not authorized

Hover over a device in the tree to view details about the device, such as its serial number, operation mode, IP address, CPU and memory usage, and others, depending on the device type.

Unauthorized FortiAP and FortiSwitch devices are highlighted in the list, and can be authorized by clicking on the device name.

Fabric Device

A Fabric Device widget shows statistics and system information about the selected fabric device. Widgets can be added for various Fabric devices including FortiMail, FortiNDR (formerly FortiAI), and FortiDeceptor.

For a FortiMail device, the widget can show:

- Mail Statistics: a chart of the total messages and total spam messages over time.
- Statistics Summary: a pie chart summarizes mail statistics.
- System Information: The FortiMail System Information widget
- System Usage: System usage information, such as CPU, memory, and disk usage, as well as the number of active
sessions.

FortiGate Cloud

The FortiGate Cloud widget shows the FortiGate Cloud status and information. If your account is not activated, you can activate it from the widget.

To activate your FortiGate Cloud account:

1. Click on the Not Activated button and select Activate. The Activate FortiGate Cloud pane opens.
2. If you already have an account:
   a. Fill in your email address, password, country or region, and reseller.
   b. Click OK.
3. If you are creating an account:
   a. In the FortiCloud field select Create Account.
   b. Fill in all of the required information.
   c. Click OK.

Topology

The full Security Fabric topology can be viewed on the root FortiGate. Downstream FortiGate devices' topology views do not include upstream devices.
The **Physical Topology** page shows the physical structure of your network, including all connected devices and the connections between them. The **Logical Topology** page shows information about the interfaces that connect devices to the Security Fabric.

In both topology pages, you can use filtering and sorting options to control the information that is shown. Hover the cursor over a device icon, port number, or endpoint to open a tooltip that shows information about that specific device, port, or endpoint. Right-click on a device to log into, configure, or deauthorize it. Right-click on an endpoint to perform various tasks, such as drilling down for more details in FortiView, quarantining the host, and banning the IP address.

The small number that might be shown in the top right corner of a device icon is the number of security ratings recommendations or warnings for that device. The circle color indicates the severity of the highest security rating check that failed. Clicking it opens the **Security Rating** page. See Security rating on page 2337 for more information.

**Views**

From the dropdown list beside the search bar, select one of the following views:

- **Device Traffic**: organize devices by traffic.
- **Device Count**: organize devices by the number of devices connected to it.
- **Device Operating System**: organize devices by operating system.
- **Device Hardware Vendor**: organize devices by hardware vendor.
- **Risk**: only include devices that have endpoints with medium, high, or critical risk values of the specified type: All, Compromised Host, Vulnerability, or Threat Score.
- **No Devices**: do not show endpoints.

**Endpoint groups**

The **Device Traffic** and **Device Count** views display endpoint groups as donut charts, with the total number of endpoints in the group in the center of the chart. Each sector of the donut chart represents a different endpoint operating system.
To zoom in on a donut chart, click any chart sector. Each sector represents a different endpoint OS. Hovering over each sector allows you to see the OS that the sector represents and the number of endpoints that have that OS installed.

In this example, the endpoint group contains a total of nine endpoints, with the following OSes installed:

<table>
<thead>
<tr>
<th>Donut sector color</th>
<th>OS</th>
<th>Number of endpoints</th>
</tr>
</thead>
<tbody>
<tr>
<td>Orange</td>
<td>Linux</td>
<td>2</td>
</tr>
<tr>
<td>Green</td>
<td>FortiMail</td>
<td>1</td>
</tr>
<tr>
<td>Red</td>
<td>FortiManager</td>
<td>1</td>
</tr>
<tr>
<td>Blue</td>
<td>Other</td>
<td>5</td>
</tr>
</tbody>
</table>

To view the endpoint group in a bubble pack display, click the + button in the center of the donut chart. You can view each individual endpoint in the bubble pack view.

**FortiAP and FortiSwitch devices**

Newly discovered FortiAP and FortiSwitch devices are initially shown in the topologies with gray icons to indicate that they have not been authorized. To authorize a device, click on the device icon or name and select Authorize. Once authorized, the device icon will turn blue.

Right-click on an authorized FortiAP device to Deauthorize or Restart the device. Right-click on a FortiSwitch device to Deauthorize, Restart, or Upgrade the device, or to Connect to the CLI.

FortiAP and FortiSwitch links are enhanced to show link aggregation groups for the inter-switch link (ISL-LAG). To differentiate them from physical links, ISL-LAG links are shown with a thicker line. The endpoint circles can also be used as a reference to identify ISL-LAG groups that have more than two links.

**Managed clients connected over a VPN**

When managed clients are connected over a VPN, EMS collects user information about these registered clients, such as the VPN connection information. The FortiGate can synchronize this user information from EMS and display it in the logical topology view to provide a detailed picture of clients and their associated VPN interfaces.
Client using an IPsec VPN interface:

Client using an SSL VPN interface:

**Critical risks**

Click the *Critical Risks* button to see a list of endpoints that are deemed critical risks, organized by threat severity. These are the red endpoints in the current topology view.

For each endpoint, the user's photo, name, IP address, email address, and phone number are shown. The number of vulnerabilities of each severity is shown, and if the IoC verdict is that the endpoint is compromised.

If applicable, the endpoint's host can be quarantined (click *Quarantine Host*) or their IP address can be banned (click *Ban IP*).

The dropdown menu also provides options to drill down to more information on compromised hosts or endpoint vulnerabilities.
**Consolidated risk view**

The consolidated *Risk* view mode displays different risks within the Security Fabric topology. You can use the *Risk* view mode to filter threats by *Compromised Hosts*, *Vulnerability*, and *Threat Score*.

**To access the consolidated risk view mode:**

1. On one of the topology pages, in the view option dropdown list beside the search bar, select *Risk*.

   ![View Options Dropdown](image1)

   - **Risk**
   - **Critical Risks**
   - **Device Traffic**
   - **Device Count**
   - **Device Operating System**
   - **Device Hardware Vendor**
   - **Risk**
   - **No Devices**

2. Select one of the following options from the *Risk Type* dropdown menu:
   - **All**
   - **Compromised Hosts**
   - **Vulnerability**
   - **Threat Score**

3. When devices fit into the risk metric, they will appear in the endpoint groups. Click the + in the endpoint group to display the devices in a bubble chart.
**Viewing and controlling network risks in topology view**

On the physical and logical topology pages, you can view and control compromised hosts. Compromised hosts behind a FortiSwitch or FortiAP can be quarantined.

**To view a compromised endpoint host:**

1. Test that FortiGate detects a compromised endpoint host by opening a browser on the endpoint host and entering a malicious website URL. The browser displays a *Web Page Blocked!* warning and does not allow access to the website.
2. On the root FortiGate, go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology*. Expand the endpoint group connected to a FortiSwitch or FortiAP. The endpoint host connected to the switch is highlighted in red. Mouse over the endpoint host to view a tooltip that shows the IoC verdict. The endpoint host is compromised.

**To quarantine a compromised endpoint host:**

1. On the *Physical Topology* or *Logical Topology* page, right-click the endpoint host and select *Quarantine Host*. A dialog displays the FortiGate, host MAC address, and description of the host to be quarantined. Quarantine entries for each MAC address will be created on the FortiGate that the FortiSwitch or FortiAP is connected to.
2. Click OK.
3. Go to *Dashboard > User & Devices* and click the *Quarantine* widget to expand it.
4. In the top-right corner, use the dropdown to select the FortiGate in which this host was quarantined. In this example, it is the Enterprise_Second_Floor FortiGate.
5. On the endpoint host, open a browser and visit a website such as https://www.fortinet.com/. If the website cannot be accessed, this confirms that the endpoint host is quarantined.

To show the quarantined device from the CLI:

1. Log in to the downstream device where the host was quarantined (Enterprise_Section_Floor).
2. Enter the following show command:

   ```
   Enterprise_Section_Floor # show user quarantine
   config user quarantine
   set firewall-groups "QuarantinedDevices"
   config targets
   edit "Erin Malone PC"
   set description "Manually quarantined"
   config macs
   edit **:**:**:**:**:**:**:**
   set description "manual-qtn Hostname: Erin Malone PC"
   next
   next
   end
   end
   ```

Asset Identity Center page

The Asset Identity Center page unifies information from detected addresses, devices, and users into a single page, while building a data structure to store the user and device information in the backend. Asset view groups information by Device, while Identity view groups information by User. Hover over a device or a user in the GUI to perform different actions relevant to the object, such as adding a firewall device address, adding an IP address, banning the IP, quarantining the host, and more.

To view the Asset Identity Center page:

1. Go to Security Fabric > Asset Identity Center.
2. Click Asset to view information by device. The default columns are Device, Software OS, Hardware, FortiClient User, User, Status, Vulnerabilities, Endpoint Tags, and Last Seen. The optional columns are Address, Firewall Address, Hostname, IP Address, and Server.
3. Click **Identity** to view information by user. The default columns are **User**, **Device**, and **Properties**. The optional columns are **IP Address**, **Logoff Time**, and **Logon Time**.

Each view has a dropdown option to view the information within different time frames (Latest, 1 hour, 24 hours, and 7 days). Vulnerability information is displayed when applicable. The page displays user and device relationships, such as which users are logged in to multiple devices or if multiple users are logged in to single devices.

4. Hover over a device in the list to view the tooltip and possible actions. In this example, the available actions are add firewall device address, add firewall IP address, and ban the IP.
Diagnostics for the unified user device store

The following options are available for `diagnose user-device-store unified <option>`:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>device-memory-query</td>
<td>Get device records and associated user records from memory.</td>
</tr>
<tr>
<td>device-query</td>
<td>Get device records and associated user records from memory and disk.</td>
</tr>
<tr>
<td>user-memory-query</td>
<td>Get user records and associated device records from memory.</td>
</tr>
<tr>
<td>user-query</td>
<td>Get user records and associated device records from memory and disk.</td>
</tr>
<tr>
<td>re-query</td>
<td>Retrieve query by <code>&lt;query-id&gt; &lt;iteration-start&gt; &lt;iteration-count&gt;</code> (takes 0-3 arguments).</td>
</tr>
<tr>
<td>list</td>
<td>List unified queries.</td>
</tr>
<tr>
<td>clear</td>
<td>Delete all unified queries.</td>
</tr>
<tr>
<td>dump</td>
<td>Dump unified query stats by <code>&lt;query-id&gt;</code> (takes 0-1 arguments).</td>
</tr>
<tr>
<td>delete</td>
<td>Delete unified query by <code>&lt;query-id&gt;</code> (takes 0-1 arguments).</td>
</tr>
<tr>
<td>stats</td>
<td>Get statistics for unified queries.</td>
</tr>
<tr>
<td>debug</td>
<td>Enable/disable debug logs for unified queries.</td>
</tr>
</tbody>
</table>

**OT asset visibility and network topology**

When the *Operational Technology (OT)* feature is enabled, tabs are added in the Asset Identity Center page to view the OT asset list and OT network topology using Purdue Levels. This feature is available regardless of whether a Security
Fabric is enabled.

**To enable the OT features in the GUI:**

1. Go to **System > Feature Visibility**.
2. In the **Additional Features** section, enable **Operational Technology (OT)**.
3. Click **Apply**.

**To enable the OT features in the CLI:**

```
config system settings
    set gui-ot enable
end
```

Once enabled, the **Security Fabric > Asset Identity Center** page displays an **Asset Identity List** tab and an **OT View** tab.

- The **Asset Identity List** tab includes a configurable **Purdue Level** column and a **Show in OT View** option for selected devices in the table.

```
<table>
<thead>
<tr>
<th>Device</th>
<th>Software OS</th>
<th>Other identified device</th>
<th>Forti</th>
<th>FortiOS User</th>
<th>User</th>
<th>Status</th>
<th>Vulnerabilities</th>
<th>Endpoint Tags</th>
<th>Purdue Level</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>2</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>2</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>3</td>
</tr>
</tbody>
</table>
```

- The **OT View** tab shows a topology of detected components and connections mapped to Purdue Levels. The default view is locked, but devices can be dragged and dropped to other Purdue Levels if the view is unlocked.

FortiGates and managed FortiSwitches are statically assigned Purdue Level 2 and cannot be changed. Other detected devices are assigned Purdue Level 3 by default and can be changed (except to level S, 0, or external).

The following diagram lists the Purdue Levels based on OT network topologies:
To change the Purdue Level in the Asset Identity List tab:

1. Go to Security Fabric > Asset Identity Center and select the Asset Identity List tab.
2. Add the Purdue Level column to the table:
   a. Hover over the table header and click the gear icon (Configure Table).
   b. Select Purdue Level.
   c. Click Apply.
3. Select a device and hover over the Purdue Level value.
4. Click the pencil icon to edit the level.
5. Select a value from the dropdown.
6. Click Apply.

To change the Purdue Level in the OT View tab:

1. Go to Security Fabric > Asset Identity Center and select the OT View tab.
2. Click Unlock View.
3. Select a device.

4. Drag the device icon to another level row.
5. Optionally, click *Lock View* to revert to the locked view.

**To change the Purdue Level in the CLI:**

```
# diagnose user-device-store device memory ot-purdue-set <mac> <ip> <level>
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>mac</strong></td>
<td>Enter the MAC address of the device.</td>
</tr>
<tr>
<td><strong>ip</strong></td>
<td>Enter the IPv4 address of the device.</td>
</tr>
<tr>
<td><strong>level</strong></td>
<td>Enter the Purdue Level: 1, 1.5, 2, 2.5, 3, 3.5, 4, 5, 5.5.</td>
</tr>
</tbody>
</table>

**WebSocket for Security Fabric events**

With the WebSocket for Security Fabric events, subscribers to the WebSocket (such as the *Fabric Management* page) are updated upon new Fabric events and alert users to reload the page.

**Example**

**To deauthorize a downstream FortiGate:**

1. Go to *System > Fabric Management* and select a downstream FortiGate in the table.
2. Right-click on the device and select *Deauthorize*.
3. An alert appears in the bottom-right corner of the page. Click *Reload Now* to refresh the page.

The deauthorized FortiGate is removed from the table.
Deploying the Security Fabric

This topic provides an example of deploying Security Fabric with three downstream FortiGates connecting to one root FortiGate. To deploy Security Fabric, you need a FortiAnalyzer running firmware version 6.2 or later.

The following shows a sample network topology with three downstream FortiGates (Accounting, Marketing, and Sales) connected to the root FortiGate (Edge).
To configure the root FortiGate (Edge):

1. Configure interfaces:
   a. In the root FortiGate (Edge), go to Network > Interfaces.
   b. Edit port16:
      - Set Role to DMZ.
      - For the interface connected to FortiAnalyzer, set the IP/Network Mask to 192.168.65.2/255.255.255.0
   c. Edit port10:
      - Set Role to LAN.
      - For the interface connected to the downstream FortiGate (Accounting), set the IP/Network Mask to 192.168.10.2/255.255.255.0
   d. Edit port11:
      - Set Role to LAN.
      - For the interface connected to the downstream FortiGate (Marketing), set the IP/Network Mask to 192.168.200.2/255.255.255.0

2. Configure Security Fabric:
   a. In the root FortiGate (Edge), go to Security Fabric > Fabric Connectors and double-click the Security Fabric Setup card.
   b. For Status, click Enable.
   c. Set the Security Fabric role to Serve as Fabric Root. The FortiAnalyzer settings can be configured.
   d. Enter the FortiAnalyzer IP (192.168.65.10) and select and Upload option (the default is Real Time).
   e. Click Test Connectivity.
      A warning message indicates that the FortiGate is not authorized on the FortiAnalyzer. The authorization is configured in a later step on the FortiAnalyzer.
   f. Click OK. The FortiAnalyzer serial number is verified.
   g. Enter a Fabric name, such as Office-Security-Fabric.
   h. Ensure Allow other Security Fabric devices to join is enabled and add port10 and port11.
   i. Click OK.

3. Create a policy to allow the downstream FortiGate (Accounting) to access the FortiAnalyzer:
   a. In the root FortiGate (Edge), go to Policy & Objects > Addresses.
   b. Click Create New.
      - Set Name to FAZ-addr.
      - Set Type to Subnet.
      - Set Subnet/IP Range to 192.168.65.10/32.
      - Set Interface to any.
   c. Click OK.
   d. Click Create New.
      - Set Name to Accounting.
      - Set Type to Subnet.
      - Set Subnet/IP Range to 192.168.10.10/32.
      - Set Interface to any.
   e. Click OK.
   f. In the root FortiGate (Edge), go to Policy & Objects > Firewall Policy and click Create New.
      - Set Name to Accounting-to-FAZ.
      - Set srcintf to port10.
      - Set dstintf to port16.
- Set `srcaddr` to `Accounting-addr`.
- Set `dstaddr` to `FAZ-addr`.
- Set `Action` to `Accept`.
- Set `Schedule` to `Always`.
- Set `Service` to `All`.
- Enable `NAT`.
- Set `IP Pool Configuration` to `Use Outgoing Interface Address`.

4. Create a policy to allow the two downstream FortiGates (Marketing and Sales) to access the FortiAnalyzer:
   a. In the root FortiGate (Edge), go to `Policy & Objects > Addresses` and click `Create New`.
      - Set `Name` to `Marketing-addr`.
      - Set `Type` to `Subnet`.
      - Set `Subnet/IP Range` to `192.168.200.10/32`.
      - Set `Interface` to any.
   b. Click `OK`.
   c. In the root FortiGate (Edge), go to `Policy & Objects > Firewall Policy` and click `Create New`.
      - Set `Name` to `Marketing-to-FAZ`.
      - Set `srcintf` to `port11`.
      - Set `dstintf` to `port16`.
      - Set `srcaddr` to `Marketing-addr`.
      - Set `dstaddr` to `FAZ-addr`.
      - Set `Action` to `Accept`.
      - Set `Schedule` to `Always`.
      - Set `Service` to `All`.
      - Enable `NAT`.
      - Set `IP Pool Configuration` to `Use Outgoing Interface Address`.
   d. Click `OK`.

To configure the downstream FortiGate (Accounting):

1. Configure interface:
   a. In the downstream FortiGate (Accounting), go to `Network > Interfaces`.
   b. Edit interface `wan1`:
      - Set `Role` to `WAN`.
      - For the interface connected to root, set the `IP/Network Mask` to `192.168.10.10/255.255.255.0`.

2. Configure the default static route to connect to the root FortiGate (Edge):
   a. In the downstream FortiGate (Accounting), go to `Network > Static Routes` and click `Create New` or `Create New > IPv4 Static Route`.
      - Set `Destination` to `0.0.0.0/0.0.0.0`.
      - Set `Interface` to `wan1`.
      - Set `Gateway Address` to `192.168.10.2`.
   b. Click `OK`.

3. Configure Security Fabric:
   a. In the downstream FortiGate (Accounting), go to `Security Fabric > Fabric Connectors` and double-click the `Security Fabric Setup` card.
b. For Status, click Enable. FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Accounting) connects to the root FortiGate (Edge).

c. Set the Security Fabric role to Join Existing Fabric.

d. Upstream FortiGate IP is filled in automatically with the default static route Gateway Address of 192.168.10.2 set in the previous step.

e. Disable Allow other FortiGates to join, because there is no downstream FortiGate connecting to it.

f. Click OK.

To configure the downstream FortiGate (Marketing):

1. Configure interface:
   a. In the downstream FortiGate (Marketing), go to Network > Interfaces.
   b. Edit port12:
      - Set Role to LAN.
      - For the interface connected to the downstream FortiGate (Sales), set the IP/Network Mask to 192.168.135.11/255.255.255.0.
   c. Edit wan1:
      - Set Role to WAN.
      - For the interface connected to the root FortiGate (Edge), set the IP/Network Mask to 192.168.200.10/255.255.255.0.

2. Configure the default static route to connect to the root FortiGate (Edge):
   a. In the downstream FortiGate (Marketing), go to Network > Static Routes and click Create New or Create New > IPv4 Static Route.
      - Set Destination to 0.0.0.0/0.0.0.0.
      - Set Interface to wan1.
      - Set Gateway Address to 192.168.200.2.
   b. Click OK.

3. Configure Security Fabric:
   a. In the downstream FortiGate (Marketing), go to Security Fabric > Fabric Connectors and double-click the Security Fabric Setup card.
   b. For Status, click Enable.
      - FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Marketing) connects to the root FortiGate (Edge).
   c. Set the Security Fabric role to Join Existing Fabric.
   d. Upstream FortiGate IP is filled in automatically with the default static route Gateway Address of 192.168.200.2 set in the previous step.
   e. Enable Allow other FortiGates to join and add port12.
   f. Click OK.

4. Create a policy to allow another downstream FortiGate (Sales) going through FortiGate (Marketing) to access the FortiAnalyzer:
   a. In the downstream FortiGate (Marketing), go to Policy & Objects > Addresses and click Create New.
      - Set Name to FAZ-addr.
      - Set Type to Subnet.
      - Set Subnet/IP Range to 192.168.65.10/32.
      - Set Interface to any.
   b. Click OK.
c. Click Create New.
   - Set Name to Sales.addr.
   - Set Type to Subnet.
   - Set Subnet/IP Range to 192.168.135.10/32.
   - Set Interface to any.

d. Click OK.

e. In the downstream FortiGate (Marketing), go to Policy & Objects > Firewall Policy and click Create New.
   - Set Name to Sales-to-FAZ.
   - Set srcintf to port12.
   - Set dstintf to wan1.
   - Set srcaddr to Sales addr.
   - Set dstaddr to FAZ addr.
   - Set Action to Accept.
   - Set Schedule to Always.
   - Set Service to All.
   - Enable NAT.
   - Set IP Pool Configuration to Use Outgoing Interface Address.

f. Click OK.

To configure the downstream FortiGate (Accounting):

1. Configure interface:
   a. In the downstream FortiGate (Accounting), go to Network > Interfaces.
   b. Edit interface wan1:
      - Set Role to WAN.
      - For the interface connected to root, set the IP/Network Mask to 192.168.10.10/255.255.255.0

2. Configure the default static route to connect to the root FortiGate (Edge):
   a. In the downstream FortiGate (Accounting), go to Network > Static Routes and click Create New or Create New > IPv4 Static Route.
      - Set Destination to 0.0.0.0/0.0.0.0.
      - Set Interface to wan1.
      - Set Gateway Address to 192.168.10.2.

   b. Click OK.

3. Configure Security Fabric:
   a. In the downstream FortiGate (Accounting), go to Security Fabric > Fabric Connectors and double-click the Security Fabric Setup card.
   b. For Status, click Enable.
      FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Accounting) connects to the root FortiGate (Edge).
   c. Set the Security Fabric role to Join Existing Fabric.
   d. Upstream FortiGate IP is filled in automatically with the default static route Gateway Address of 192.168.10.2 set in the previous step.
   e. Disable Allow other FortiGates to join, because there is no downstream FortiGate connecting to it.

   f. Click OK.
To configure the downstream FortiGate (Sales):

1. Configure interface:
   a. In the downstream FortiGate (Sales), go to Network > Interfaces.
   b. Edit wan2:
      - Set Role to WAN.
      - For the interface connected to the upstream FortiGate (Marketing), set the IP/Network Mask to 192.168.135.10/255.255.255.0.

2. Configure the default static route to connect to the upstream FortiGate (Marketing):
   a. In the downstream FortiGate (Sales), go to Network > Static Routes and click Create New or Create New > IPv4 Static Route.
      - Set Destination to 0.0.0.0/0.0.0.0.
      - Set Interface to wan2.
      - Set Gateway Address to 192.168.135.11.
   b. Click OK.

3. Configure Security Fabric:
   a. In the downstream FortiGate (Sales), go to Security Fabric > Fabric Connectors and double-click the Security Fabric Setup card.
   b. For Status, click Enable.
      FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Sales) connects to the root FortiGate (Edge).
   c. Set the Security Fabric role to Join Existing Fabric.
   d. Upstream FortiGate IP is filled in automatically with the default static route Gateway Address of 192.168.135.11 set in the previous step.
   e. Disable Allow other FortiGates to join, because there is no downstream FortiGate connecting to it.
   f. Click OK.

To authorize downstream FortiGates (Accounting, Marketing, and Sales) on the root FortiGate (Edge):

1. In the root FortiGate (Edge), go to Security Fabric > Fabric Connectors and double-click the Security Fabric Setup card.
   The Topology tree highlights two connected FortiGates with their serial numbers and asks you to authorize the highlighted devices.

2. Select the highlighted FortiGates and select Authorize.
   After they are authorized, the two downstream FortiGates (Accounting and Marketing) appear in the Topology tree in the Security Fabric > Fabric Connectors > Security Fabric Setup page. This means that the two downstream FortiGates (Accounting and Marketing) have successfully joined the Security Fabric.

3. The Topology tree now highlights the FortiGate with the serial number that is connected to the downstream FortiGate (Marketing) and asks you to authorize the highlighted device.

4. Select the highlighted FortiGates and select Authorize.
   After it is authorized, the downstream FortiGate (Sales) appears in the Topology tree in the Security Fabric > Fabric Connectors > Security Fabric Setup page. This means that the downstream FortiGates (Sales) has successfully joined the Security Fabric.
To use FortiAnalyzer to authorize all the Security Fabric FortiGates:

1. Authorize all the Security Fabric FortiGates on the FortiAnalyzer side:
   a. On the FortiAnalyzer, go to System Settings > Network > All Interfaces.
   b. Edit port1 and set IP Address/Netmask to 192.168.65.10/255.255.255.0.
   c. Go to Device Manager > Unauthorized. All of the FortiGates are listed as unauthorized.
      i. Select all the FortiGates and select Authorize. The FortiGates are now listed as authorized.
      After a moment, a warning icon appears beside the root FortiGate (Edge) because the FortiAnalyzer needs administrative access to the root FortiGate (Edge) in the Security Fabric.
      ii. Click the warning icon and enter the admin username and password of the root FortiGate (Edge).

2. Check FortiAnalyzer status on all the Security Fabric FortiGates:
   a. On each FortiGate, go to Security Fabric > Fabric Connectors and double-click the FortiAnalyzer Logging card.
   b. Check that Storage usage information is shown.

To check Security Fabric deployment result:

1. On FortiGate (Edge), go to Dashboard > Status. The Security Fabric widget displays all the FortiGates in the Security Fabric.

2. On FortiGate (Edge), go to Security Fabric > Physical Topology. This page shows a visualization of access layer devices in the Security Fabric.
3. On FortiGate (Edge), go to Security Fabric > Physical Topology. This dashboard shows information about the interfaces of each device in the Security Fabric.

To run diagnose commands:

1. Run the `diagnose sys csf authorization pending-list` command in the root FortiGate to show the downstream FortiGate pending for root FortiGate authorization:

   ```
   Edge # diagnose sys csf authorization pending-list
   Serial IP Address HA-Members Path
   ---------------------------------------------
   FG201ETK18902514 0.0.0.0 FG3H1E5818900718:FG201ETK18902514
   ```

2. Run the `diagnose sys csf downstream` command in the root or middle FortiGate to show the downstream FortiGates after they join Security Fabric:

   ```
   Edge # diagnose sys csf downstream
   1: FG201ETK18902514 (192.168.200.10) Management-IP: 0.0.0.0 Management-port:0 parent: FG3H1E5818900718
      path:FG3H1E5818900718:FG201ETK18902514
      data received: Y downstream intf:wan1 upstream intf:port11 admin-port:443
      authorizer:FG3H1E5818900718
   2: FGT81ETK18002246 (192.168.10.10) Management-IP: 0.0.0.0 Management-port:0 parent: FG3H1E5818900718
      path:FG3H1E5818900718:FGT81ETK18002246
      data received: Y downstream intf:wan1 upstream intf:port10 admin-port:443
      authorizer:FG3H1E5818900718
   3: FG101ETK18002187 (192.168.135.10) Management-IP: 0.0.0.0 Management-port:0 parent: FG201ETK18902514
      path:FG3H1E5818900718:FG201ETK18902514:FG101ETK18002187
      data received: Y downstream intf:wan2 upstream intf:port12 admin-port:443
      authorizer:FG3H1E5818900718
   ```

3. Run the `diagnose sys csf upstream` command in any downstream FortiGate to show the upstream FortiGate after downstream FortiGate joins Security Fabric:

   ```
   Marketing # diagnose sys csf upstream
   Upstream Information:
   Serial Number:FG3H1E5818900718
   IP:192.168.200.2
   Connecting interface:wan1
   Connection status:Authorized
   ```
Deploying the Security Fabric in a multi-VDOM environment

A Security Fabric can be enabled in multi-VDOM environments. This allows access to all of the Security Fabric features, including automation, security rating, and topologies, across the VDOM deployment.

- Users can navigate to downstream FortiGate devices and VDOMs directly from the root FortiGate using the Fabric selection menu.

- The logical topology shows all of the configured VDOMs.

- Security rating reports include results for all of the configured VDOMs as well the entire Fabric.

Downstream FortiGate devices must connect to the upstream FortiGate from its management VDOM.
**Topography**

In this topology, there is a root FortiGate with three FortiGates connected through two different VDOMs. The root FortiGate is able to manage all devices running in multi-VDOM mode.

This example assumes multi-VDOM mode is already configured on each FortiGate, and that FortiAnalyzer logging is configured on the root FortiGate (see Configuring FortiAnalyzer on page 2217 and Configuring the root FortiGate and downstream FortiGates on page 2210 for more details).

**To enable multi-VDOM mode:**

```plaintext
config system global
set vdom-mode multi-vdom
end
```

**Device configurations**

**Root FortiGate (Root-E)**

The Security Fabric is enabled, and configured so that downstream interfaces from all VDOMs can allow other Security Fabric devices to join.

**To configure Root-E in the GUI:**

2. Ensure that the Status is Enabled and the Security Fabric role is set to Serve as Fabric Root.
3. Enable Allow other Security Fabric devices to join and click the + to add the interfaces (vlan50 and vlan90) from the vdom_nat1 and root VDOMs.
4. Configure the other settings as needed.
5. Click OK.

To configure Root-E in the CLI:

1. Enable the Security Fabric:
   
   ```
   config system csf
       set status enable
       set group-name "CSF_E"
   end
   ```

2. Configure the interfaces:
   
   ```
   config system interface
       edit "vlan50"
           set vdom "vdom_nat1"
           ... set allowaccess ping https ssh http fgfm fabric ...
        next
       edit "vlan90"
           set vdom "root"
           ... set allowaccess ping https ssh http fgfm fabric ...
        next
   end
   ```

Downstream FortiGate 1 (Downstream-G)

To configure Downstream-G in the GUI:

2. For Status, select Enabled and set the role to Join Existing Fabric.
3. Enter the Upstream FortiGate IP, which is the IP of the root FortiGate vdom_nat1 interface (192.168.5.5). Downstream-G must use the interface from the management VDOM to connect to the upstream FortiGate IP.
4. Enable Allow other Security Fabric devices to join and click the + to add the downstream interface (sw-vlan71) from the FG-traffic VDOM.
5. Configure the other settings as needed.
6. Click OK.

To configure Downstream-G in the CLI:

1. Enable the Security Fabric:
   ```
   config system csf
       set status enable
       set upstream-ip 192.168.5.5
   end
   ```

2. Configure the interfaces:
   ```
   config system interface
       edit "sw-vlan71"
           set vdom "FG-traffic"
           ... set allowaccess ping https ssh http fgfm fabric
           ... next
   end
   ```

**Downstream FortiGate 2 (Level2-downstream-H)**

To configure Level2-downstream-H in the GUI:

2. For `Status`, select `Enabled` and set the role to `Join Existing Fabric`. 
3. Enter the *Upstream FortiGate IP*, which is the IP of the root VDOM on Downstream-G (192.168.71.7).

4. Configure the other settings as needed.

5. Click **OK**.

**To configure Level2-downstream-H in the CLI:**

```plaintext
cfg system csf
    set status enable
    set upstream-ip 192.168.71.7
end
```

**Downstream FortiGate 3 (Level1-downstream-10)**

**To configure Level1-downstream-10 in the GUI:**

1. Go to **Security Fabric > Fabric Connectors** and double-click the **Security Fabric Setup card**.
2. For **Status**, select **Enabled** and set the role to **Join Existing Fabric**.
3. Enter the *Upstream FortiGate IP*, which is the IP of the root VDOM on Root-E (192.168.9.5).

4. Configure the other settings as needed.

5. Click **OK**.

**To configure Level1-downstream-10 in the CLI:**

```plaintext
cfg system csf
  set status enable
  set upstream-ip 192.168.9.5
end
```

**Device authorization and verification**

**To authorize the downstream devices on the root FortiGate:**

1. On Root-E, go to *Security Fabric > Fabric Connectors*.
2. In the topology tree, click the highlighted serial number and select **Authorize** for each downstream FortiGate. Once all the devices are authorized, the physical topology page shows the root and downstream FortiGates. The logical topology page shows the root and downstream FortiGates connected to interfaces in their corresponding VDOMs.

**Synchronizing objects across the Security Fabric**

When the Security Fabric is enabled, various objects such as addresses, services, and schedules are synced from the upstream FortiGate to all downstream devices by default. FortiOS has the following settings for object synchronization across the Security Fabric:

- Set object synchronization (*fabric-object-unification*) to **default** or **local** on a downstream device.
- Set a per object option to toggle whether the specific Fabric object will be synchronized or not. After upgrading from **6.4.3**, this option is disabled for supported Fabric objects. The synchronized Fabric objects are kept as locally created objects on downstream FortiGates.
- Define the number of task workers to handle synchronizations.
The firewall object synchronization wizard helps identify objects that are not synchronized and resolves any conflicts. A warning message appears in the topology tree if there is a conflict.

**Summary of CLI commands**

**To configure object synchronization:**

```plaintext
config system csf
    set fabric-object-unification {default | local}
    set configuration-sync {default | local}
    set fabric-workers <integer>
end
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| fabric-object-unification  | **default**: Global CMDB objects will be synchronized in the Security Fabric.  
|                            | **local**: Global CMDB objects will not be synchronized to and from this device.  
|                            | This command is available on the root FortiGate. If set to local, the device does not synchronize objects from the root, but will send the synchronized objects downstream. |
| configuration-sync         | **default**: Synchronize configuration for FortiAnalyzer, FortiSandbox, and Central Management to root node.  
|                            | **local**: Do not synchronize configuration with root node.  
|                            | If downstream FortiGates are set to local, the synchronized objects from the root to downstream are not applied locally. However, the downstream FortiGate will send the configuration to lower FortiGates. |
| fabric-workers             | Define how many task worker process are created to handle synchronizations (1-4, default = 2). The worker processes dies if there is no task to perform after 60 seconds. |

The per object setting can be configured on the root FortiGate as follows:

```plaintext
config firewall <object>
    edit <name>
        set fabric-object {enable | disable}
    next
end
```

Where:

- `<object>` is one of the following: `address, address6, addrgrp, addrgrp6, service category, service custom, service group, schedule group, schedule onetime, or schedule recurring.`
- **Enabling fabric-object** sets the object as a Security Fabric-wide global object that is synchronized to downstream FortiGates.
- **Disabling fabric-object** sets the object as local to this Security Fabric member.
- If a device in the Fabric is in multi-VDOM mode, the GUI will not display the Fabric synchronization option. Even if this is enabled in the CLI, the object will not be synchronized to any downstream devices.
Sample topology

In this Security Fabric, the root FortiGate (FGTA-1) has `fabric-object-unification set to default` so the Fabric objects can be synchronized to the downstream FortiGate. The level 1 downstream FortiGate (FGTB-1) has `configuration-sync set to local`, so it will not apply the synchronized objects locally. The level 2 downstream FortiGate (FGTC) has `configuration-sync set to default`, so it will apply the synchronized objects locally.

In this example, firewall addresses and address groups are used. Other supported Fabric objects have the same behaviors. The following use cases illustrate common synchronization scenarios:

- If no conflicts exist, firewall addresses and address groups can be synchronized to downstream FortiGates (see example below).
- If a conflict exists between the root and downstream FortiGates, it can be resolved with the conflict resolution wizard. After the conflict is resolved, the firewall addresses and address groups can be synchronized to downstream FortiGates (see example below).
- If `set fabric-object` (Fabric synchronization option in the GUI) is disabled for firewall addresses and address groups on the root FortiGate, they will not be synchronized to downstream FortiGates (see example below).

To configure the FortiGates used in this example:

FGTA-1 # config system csf
  set status enable
  set group-name "fabric"
    set fabric-object-unification default
  ...
end
FGTB-1 # config system csf
  set status enable
  set upstream-ip 10.2.200.1
  set configuration-sync local
  ...
end
FGTC # config system csf
  set status enable
  set upstream-ip 192.168.7.2
  set configuration-sync default
  ...
end

To synchronize a firewall address and address group in the Security Fabric:

1. Configure the firewall address on the root FortiGate:

   FGTA-1 # config firewall address
   edit "add_subnet_1"
set fabric-object enable
set subnet 22.22.22.0 255.255.255.0
next
end

2. Configure the address group on the root FortiGate:

FGTA-1 # config firewall addrgrp
  edit "group_subnet_1"
    set member "add_subnet_1"
    set fabric-object enable
  next
end

3. Check the firewall address and address group on the downstream FortiGates:

FGTB-1 # show firewall address add_subnet_1
entry is not found in table

FGTB-1 # show firewall addrgrp group_subnet_1
entry is not found in table

The synchronized objects are not applied locally on this FortiGate because configuration-sync is set to local.

FGTC # show firewall address add_subnet_1
config firewall address
  edit "add_subnet_1"
    set uuid 378a8094-34cb-51eb-ce40-097f298fcdc
    set fabric-object enable
    set subnet 22.22.22.0 255.255.255.0
  next
end

FGTC # show firewall addrgrp group_subnet_1
config firewall addrgrp
  edit "group_subnet_1"
    set uuid 4d7a8a52-34cb-51eb-fce7-d93f76915319
    set member "add_subnet_1"
    set color 19
    set fabric-object enable
  next
end

The objects are synchronized on this FortiGate because configuration-sync is set to default.

To resolve a firewall address and address group conflict in the Security Fabric:

1. On FGTC, create a firewall address:
   a. Go to Policy & Objects > Addresses and click Create New > Address.
   b. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>sync_add_1</th>
<th>IP/Netmask</th>
</tr>
</thead>
<tbody>
<tr>
<td>sync_add_1</td>
<td></td>
<td>33.33.33.0 255.255.255.0</td>
</tr>
</tbody>
</table>

   c. Click OK.
2. On FGTA-1 (Fabric root), create the firewall address with same name but a different subnet:
   a. Go to Policy & Objects > Addresses and click Create New > Address.
   b. Configure the following:
      - Name: sync_add_1
      - IP/Netmask: 11.11.11.0 255.255.255.0
      - Fabric synchronization: Enable
   c. Click OK.
3. Add the address to a different address group than what is configured on FGTC:
   a. Go to Policy & Objects > Addresses and click Create New > Address Group.
   b. Configure the following:
      - Name: sync_group4
      - Members: sync_add_1
      - Fabric synchronization: Enable
   c. Click OK.
4. Go to Security Fabric > Fabric Connectors. In the topology tree, there is a message that Firewall objects are in conflict with other FortiGates in the fabric.
5. Resolve the conflict:
   a. Click Review firewall object conflicts. The Firewall Object Synchronization pane opens.
   b. Click Rename All Objects. The conflicted object will be renamed on the downstream FortiGate.
c. The conflict is resolved. Click Close to exit the Firewall Object Synchronization pane.

![Firewall Object Synchronization](image)

6. Verify the results on the downstream FortiGates:
   a. On FGTB-1, go to Policy & Objects > Addresses.
   b. Search for sync_add_1 and sync_group4. No results are found. The synchronized objects are not applied locally on this FortiGate because configuration-sync is set to local.

![Policy & Objects](image)

   c. On FGTC, go to Policy & Objects > Addresses.
   d. Search for sync_add_1. The original firewall address sync_add_1 was renamed to sync_add_1_FGTC by resolving the conflict on FGTA-1. The address sync_add_1 and address group sync_group4 are synchronized
To disable Fabric synchronization on the root FortiGate in the GUI:

1. On FGTA-1, create a firewall address:
   a. Go to Policy & Objects > Addresses and click Create New > Address.
   b. Configure the following:
      
      | Name          | add_subnet_3 |
      |---------------|-------------|
      | IP/Netmask    | 33.33.33.0 255.255.255.0 |
      | Fabric
      synchronization | Disable |
   c. Click OK.

2. Create the firewall address group and add the address:
   a. Go to Policy & Objects > Addresses and click Create New > Address Group.
   b. Configure the following:
      
      | Name          | group_subnet_3 |
      |---------------|---------------|
      | Members       | add_subnet_3  |
      | Fabric
      synchronization | Disable |
   c. Click OK.

3. On FGTB-1, go to Policy & Objects > Addresses and search for subnet_3. No results are found because Fabric synchronization is disabled on the root FortiGate (FGTA-1).

4. On FGTC, go to Policy & Objects > Addresses and search for subnet_3. No results are found because Fabric
synchronization is disabled on the root FortiGate (FGTA-1).

To disable Fabric synchronization on the root FortiGate in the CLI:

1. Configure the firewall address on the root FortiGate:

   FGTA-1 # config firewall address
   edit "add_subnet_3"
   set subnet 33.33.33.0 255.255.255.0
   set fabric-object disable
   next
   end

2. Configure the address group on the root FortiGate:

   FGTA-1 # config firewall addrgrp
   edit "group_subnet_3"
   set member "add_subnet_3"
   set fabric-object disable
   next
   end

3. Check the firewall address and address group on the downstream FortiGates:

   FGTB-1 # show firewall address add_subnet_3
   entry is not found in table

   FGTB-1 # show firewall addrgrp group_subnet_3
   entry is not found in table

   FGTC # show firewall address add_subnet_3
   entry is not found in table

   FGTC # show firewall addrgrp group_subnet_3
   entry is not found in table

   The objects are not synchronized from the root FortiGate (FGTA-1) because the fabric-object setting is disabled.

Security Fabric over IPsec VPN

This is an example of configuring Security Fabric over IPsec VPN.
Sample topology

This sample topology shows a downstream FortiGate (HQ2) connected to the root FortiGate (HQ1) over IPsec VPN to join Security Fabric.

Sample configuration

To configure the root FortiGate (HQ1):

1. Configure interface:
   a. In the root FortiGate (HQ1), go to Network > Interfaces.
   b. Edit port2:
      • Set Role to WAN.
      • For the interface connected to the Internet, set the IP/Network Mask to 10.2.200.1/255.255.255.0
   c. Edit port6:
      • Set Role to DMZ.
      • For the interface connected to FortiAnalyzer, set the IP/Network Mask to 192.168.8.250/255.255.255.0

2. Configure the static route to connect to the Internet:
   a. Go to Network > Static Routes and click Create New or Create New > IPv4 Static Route.
      • Set Destination to 0.0.0.0/0.0.0.0.
      • Set Interface to port2.
      • Set Gateway Address to 10.2.200.2.
   b. Click OK.

3. Configure IPsec VPN:
   a. Go to VPN > IPsec Wizard.
      • Set Name to To-HQ2.
      • Set Template Type to Custom.
      • Click Next.
      • Set Authentication to Method.
      • Set Pre-shared Key to 123456.
   b. Leave all other fields in their default values and click OK.

4. Configure the IPsec VPN interface IP address which will be used to form Security Fabric:
   a. Go to Network > Interfaces.
   b. Edit To-HQ2:
      • Set Role to LAN.
      • Set the IP/Network Mask to 10.10.10.255/255.255.255.255.
      • Set Remote IP/Network Mask to 10.10.10.3/255.255.255.0.
5. Configure IPsec VPN local and remote subnet:
   a. Go to Policy & Objects > Addresses.
   b. Click Create New
      - Set Name to To-HQ2_remote_subnet_2.
      - Set Type to Subnet.
      - Set IP/Network Mask to 10.10.10.3/32.
   c. Click OK.
   d. Click Create New
      - Set Name to To-HQ2_local_subnet_1.
      - Set Type to Subnet.
      - Set IP/Network Mask to 192.168.8.0/24.
   e. Click OK.
   f. Click Create New
      - Set Name to To-HQ2_remote_subnet_1.
      - Set Type to Subnet.
      - Set IP/Network Mask to 10.1.100.0/24.
   g. Click OK.

6. Configure IPsec VPN static routes:
   a. Go to Network > Static Routes
   b. Click Create New or Create New > IPv4 Static Route.
      - For Named Address, select Type and select To-HQ2_remote_subnet_1.
      - Set Interface to To-HQ2.
      - Click OK.
   c. Click Create New or Create New > IPv4 Static Route.
      - For Named Address, select Type and select To-HQ2_remote_subnet_1.
      - Set Interface to Blackhole.
      - Set Administrative Distance to 254.
   d. Click OK.

7. Configure IPsec VPN policies:
   a. Go to Policy & Objects > Firewall Policy
   b. Click Create New.
      - Set Name to vpn_To-HQ2_local.
      - Set Incoming Interface to port6.
      - Set Outgoing Interface to To-HQ2.
      - Set Source to To-HQ2_local_subnet_1.
      - Set Destination to To-HQ2_remote_subnet_1.
      - Set Schedule to Always.
      - Set Service to All.
      - Disable NAT.
   c. Click OK.
   d. Click Create New.
      - Set Name to vpn_To-HQ2_remote.
      - Set Incoming Interface to To-HQ2.
      - Set Outgoing Interface to port6.
      - Set Source to To-HQ2_remote_subnet_1, To-HQ2_remote_subnet_2.
To configure the downstream FortiGate (HQ2):

1. Configure interface:
   a. Go to Network > Interfaces.
   b. Edit interface wan1:
      - Set Role to WAN.
      - For the interface connected to the Internet, set the IP/Network Mask to 192.168.7.3/255.255.255.0.
   c. Edit interface vlan20:
      - Set Role to LAN.
      - For the interface connected to local endpoint clients, set the IP/Network Mask to 10.1.100.3/255.255.255.0.

2. Configure the static route to connect to the Internet:
   a. Go to Network > Static Routes and click Create New or Create New > IPv4 Static Route.
      - Set Destination to 0.0.0.0/0.0.0.0.
      - Set Interface to wan1.
      - Set Gateway Address to 192.168.7.2.
   b. Click OK.

3. Configure IPsec VPN:
   a. Go to VPN > IPsec Wizard.
      - Set VPN Name to To-HQ1.
      - Set Template Type to Custom.
      - Click Next.
      - In the Network IP Address, enter 10.2.200.1.
      - Set Interface to wan1.
      - Set Authentication to Method.
      - Set Pre-shared Key to 123456.
   b. Leave all other fields in their default values and click OK.

- Set Destination to To-HQ2_local_subnet_1.
- Set Schedule to Always.
- Set Service to All.
- Enable NAT.
- Set IP Pool Configuration to Use Outgoing Interface Address.

e. Click OK.

8. Configure Security Fabric:
   b. For Status, click Enable.
      After FortiGate Telemetry is enabled, FortiAnalyzer automatically enables Logging and Upload is set to Real Time.
   c. Set the Security Fabric role to Serve as Fabric Root. The FortiAnalyzer settings can be configured.
   d. Enter the FortiAnalyzer IP (192.168.8.250).
   e. Click OK. The FortiAnalyzer serial number is verified.
   f. Enter a Fabric name, such as Office-Security-Fabric.
   g. Ensure Allow other Security Fabric devices to join is enabled and add VPN interface To-HQ2.
   h. Click OK.
4. Configure the IPsec VPN interface IP address which will be used to form Security Fabric:
   a. Go to Network > Interfaces.
   b. Edit To-HQ1:
      - Set Role to WAN.
      - Set the IP/Network Mask to 10.10.10.3/255.255.255.255.
      - Set Remote IP/Network Mask to 10.10.1/255.255.255.0.0.

5. Configure IPsec VPN local and remote subnet:
   a. Go to Policy & Objects > Addresses.
   b. Click Create New
      - Set Name to To-HQ1_local_subnet_1.
      - Set Type to Subnet.
      - Set IP/Network Mask to 10.1.100.0/24.
   c. Click OK.
   d. Click Create New
      - Set Name to To-HQ1_remote_subnet_1.
      - Set Type to Subnet.
      - Set IP/Network Mask to 192.168.8.0/24.
   e. Click OK.

6. Configure IPsec VPN static routes:
   a. Go to Network > Static Routes and click Create New or Create New > IPv4 Static Route.
      - For Named Address, select Type and select To-HQ1_remote_subnet_1.
      - Set Interface to To-HQ1.
   b. Click OK.
   c. Click Create New or Create New > IPv4 Static Route.
      - For Named Address, select Type and select To-HQ1_remote_subnet_1.
      - Set Interface to Blackhole.
      - Set Administrative Distance to 254.
   d. Click OK.

7. Configure IPsec VPN policies:
   a. Go to Policy & Objects > Firewall Policy and click Create New.
      - Set Name to vpn_To-HQ1_local.
      - Set Incoming Interface to vlan20.
      - Set Outgoing Interface to To-HQ1.
      - Set Source to To-HQ1_local_subnet_1.
      - Set Destination to To-HQ1_remote_subnet_1.
      - Set Schedule to Always.
      - Set Service to All.
      - Disable NAT.
   b. Click OK.
   c. Click Create New.
      - Set Name to vpn_To-HQ1_remote.
      - Set Incoming Interface to To-HQ1.
      - Set Outgoing Interface to vlan20.
      - Set Source to To-HQ1_remote_subnet_1.
      - Set Destination to HQ1_local_subnet_1.
- Set \textit{Schedule} to \textit{Always}.
- Set \textit{Service} to \textit{All}.
- Disable \textit{NAT}.

d. Click OK.

8. Configure Security Fabric:
   a. Go to \textit{Security Fabric > Fabric Connectors} and double-click the \textit{Security Fabric Setup} card.
   b. For \textit{Status}, click \textit{Enable}.
      FortiAnalyzer automatically enables logging. FortiAnalyzer settings will be retrieved when the downstream FortiGate connects to the root FortiGate.
   c. Set the \textit{Security Fabric role} to \textit{Join Existing Fabric}.
   d. Set the \textit{Upstream FortiGate IP} to 10.10.10.1.
   e. Click OK.

To authorize the downstream FortiGate (HQ2) on the root FortiGate (HQ1):

1. In the root FortiGate (HQ1), go to \textit{Security Fabric > Fabric Connectors} and double-click the \textit{Security Fabric Setup} card.
   The \textit{Topology} tree highlights the connected FortiGate (HQ2) with the serial number and asks you to authorize the highlighted device.
2. Select the highlighted FortiGates and select \textit{Authorize}.
   After authorization, the downstream FortiGate (HQ2) appears in the \textit{Topology} tree in the \textit{Security Fabric > Fabric Connectors > Security Fabric Setup} page. This means the downstream FortiGate (HQ2) has successfully joined the Security Fabric.

To check Security Fabric over IPsec VPN:

1. On the root FortiGate (HQ1), go to \textit{Security Fabric > Physical Topology}.
   The root FortiGate (HQ1) is connected by the downstream FortiGate (HQ2) with VPN icon in the middle.

```
   HQ1 ---HQ2
```

2. On the root FortiGate (HQ1), go to \textit{Security Fabric > Logical Topology}.
   The root FortiGate (HQ1) VPN interface \textit{To-HQ2} is connected by downstream FortiGate (HQ2) VPN interface \textit{To-HQ1} with VPN icon in the middle.

```
   HQ1 ------HQ2
```

To run diagnose commands:

1. Run the \texttt{diagnose sys csf authorization pending-list} command in the root FortiGate (HQ1) to show the downstream FortiGate pending for root FortiGate authorization:
Fortinet Security Fabric

2. Run the `diagnose sys csf downstream` command in the root FortiGate (HQ1) to show the downstream FortiGate (HQ2) after it joins Security Fabric:

   HQ1 # diagnose sys csf downstream
   Serial Number:FG101ETK18002187 (10.10.10.3) Management-IP: 0.0.0.0 Management-port:0 parent:
   path:FG3H1E5818900718:FG101ETK18002187
data received: Y downstream intf:To-HQ1 upstream intf:To-HQ2 admin-port:443
   authorizer:FG3H1E5818900718

3. Run the `diagnose sys csf upstream` command in the downstream FortiGate (HQ2) to show the root FortiGate (HQ1) after the downstream FortiGate joins Security Fabric:

   HQ2 # diagnose sys csf upstream
   Upstream Information:
   Serial Number:FG3H1E5818900718
   IP:10.10.10.1
   Connecting interface:To-HQ1
   Connection status:Authorized

Leveraging LLDP to simplify Security Fabric negotiation

LLDP reception is enabled on WAN interfaces, which prompts FortiGates that are joining the Security Fabric if the upstream FortiGate asks.

- If the interface role is undefined, LLDP reception and transmission inherit settings from the VDOM.
- If the interface role is WAN, LLDP reception is enabled.
- If the interface role is LAN, LLDP transmission is enabled.

![Diagram of two FortiGates](image)

When a FortiGate B’s WAN interface detects that FortiGate A’s LAN interface is immediately upstream (through the default gateway), and FortiGate A has Security Fabric enabled, FortiGate B will show a notification on the GUI asking to join the Security Fabric.

To configure LLDP reception and join a Security Fabric in the GUI:

1. On FortiGate A, go to Network > Interfaces.
2. Configure an interface:
   - If the interface’s role is undefined, under Administrative Access, set Receive LLDP and Transmit LLDP to Use VDOM Setting.
- If the interface’s role is WAN, under Administrative Access, set Receive LLDP to Enable and Transmit LLDP to Use VDOM Setting.

- If the interface’s role is LAN, under Administrative Access, set Receive LLDP to Use VDOM Setting and Transmit LLDP to Enable.
3. Click OK. A notification is shown on FortiGate B. You can connect to a Security Fabric via an upstream FortiGate at 10.2.200.1.

4. Click the notification. The Core Network Security page with the Security Fabric settings opens. All the required settings automatically configured.

5. Click OK to apply the settings.

To configure LLDP reception and join a Security Fabric in the CLI:

1. Configure the interface on FortiGate A:
   - Undefined role

   ```
   config system interface
   edit "port3"
   set lldp-reception vdom
   set lldp-transmission vdom
   set role undefined
   ```
• WAN role

```
config system interface
edit "wan1"
    set lldp-reception enable
    set lldp-transmission vdom
    set role wan
...  
next
end
```

• LAN role

```
config system interface
edit "port2"
    set lldp-reception vdom
    set lldp-transmission enable
    set role lan
...  
next
end
```

2. Edit the Security Fabric settings on FortiGate B:

```
config system csf
    set status enable
    set upstream-ip 10.2.200.1
end
```

**Configuring the Security Fabric with SAML**

Security Assertion Markup Language (SAML) is an open standard for exchanging authentication and authorization data between one Identity Provider (IdP) and one or more Service Providers (SP). Both parties exchange messages using the XML protocol as transport. FortiGate firewall devices can be configured as IdPs or SPs.

When the Security Fabric is enabled, you can configure the root FortiGate as the IdP. You can also configure downstream FortiGates to be automatically configured as SPs, with all links required for SAML communication, when added to the Security Fabric. Administrators must still be authorized on each device. Credentials are verified by the root FortiGate, and login credentials are shared between devices. Once authorized, an administrator can move between fabric devices without logging in again.

Optionally, the downstream FortiGate can also be manually configured as an SP, and then linked to the root FortiGate.

The authentication service is provided by the root FortiGate using local system admin accounts for authentication. Any of the administrator account types can be used for SAML log in. After successful authentication, the administrator logs in to the first downstream FortiGate SP, and can then connect to other downstream FortiGates that have the SSO account properly configured, without needing to provide credentials again, as long as admins use the same browser session. In summary, the root FortiGate IdP performs SAML SSO authentication, and individual device administrators define authorization on FortiGate SPs by using security profiles.
Configuring single-sign-on in the Security Fabric

SAML SSO enables a single FortiGate device to act as the identity provider (IdP), while other FortiGate devices act as service providers (SP) and redirect logins to the IdP.

Only the root FortiGate can be the identity provider (IdP). The downstream FortiGates can be configured as service providers (SP).

The process is as follows:

1. Configuring the root FortiGate as the IdP on page 2320
2. Configuring a downstream FortiGate as an SP on page 2321
3. Configuring certificates for SAML SSO on page 2323
4. Verifying the single-sign-on configuration on page 2325

You can also use the CLI. See CLI commands for SAML SSO on page 2326.

Configuring the root FortiGate as the IdP

To configure the root FortiGate as the IdP:

1. Log in to the root FortiGate.
2. Go to Security Fabric > Fabric Connectors and double-click the Security Fabric Setup card.
3. Enable SAML Single Sign-On. The Mode field is automatically populated as Identity Provider (IdP).
4. Enter an IP address in the Management IP/FQDN box.
5. Enter a management port in the Management port box.
   The Management IP/FQDN will be used by the SPs to redirect the login request. The Management IP/FQDN and Management port must be reachable from the user’s device.
6. Select the IdP certificate.
7. Click OK.

Configuring a downstream FortiGate as an SP

There are two ways to configure the downstream FortiGate:

- From the root FortiGate
- From within the downstream device

An SP must be a member of the Security Fabric before you configure it.

To configure the downstream FortiGate from the root FortiGate:

1. Log in to the root FortiGate.
2. Go to Security Fabric > Fabric Connectors and double-click the Security Fabric Setup card.
3. In the Topology tree, hover over a FortiGate and click Configure.

![Topology tree with FortiGate configuration options]

The Configure pane opens.

4. Select a SAML Single Sign-On option. Auto sets the device to SP mode. Manual allows you to configure the SSO settings by clicking Advanced Options.

5. Select a Default login page option.

6. Select one of the following Default admin profile types: prof_admin, super_admin, or super_admin_readonly.

7. Enter an IP address in the Management IP/FQDN box.

8. Enter a management port in the Management port box.

   The Management IP/FQDN will be used by the IdP and so other SPs can redirect to each other. The Management port must be reachable from the user's device.
9. Click OK.

To configure the downstream FortiGate within the device:

1. Log in to the downstream FortiGate.
2. Go to Security Fabric > Fabric Connectors and double-click the Security Fabric Setup card.
3. Select a SAML Single Sign-On option. Auto sets the device to SP mode. Manual allows you to configure the SSO settings by clicking Advanced Options.
4. Select a Default login page option.
5. Select one of the following Default admin profile types: prof_admin, super_admin, or super_admin_readonly.
6. Enter an IP address in the Management IP/FQDN box.
7. Enter a management port in the Management port box.
   The Management IP/FQDN will be used by the IdP and so other SPs can redirect to each other. The Management port must be reachable from the user's device.
8. Click OK.

Configuring certificates for SAML SSO

Because communication between the root FortiGate IdP and FortiGate SPs is secured, you must select a local server certificate in the IdP certificate option on the root FortiGate. When downstream SPs join the IdP (root FortiGate), the SP automatically obtains the certificate.

In the following SP example, the IdP certificate displays REMOTE_Cert_2, which is the root server certificate for the IdP:
It is possible to manually import a certificate from an SP to the IdP so it can be used for authentication.

To manually import an SP certificate to an IdP:

1. Add the certificate:
   a. On the SP, go to Security Fabric > Fabric Connectors and double-click the Security Fabric Setup card.
   b. Click Advanced Options. The SAML SSO pane opens.
   c. Enable SP certificate and select a certificate from the dropdown box.
   d. Click Download. The certificate is downloaded on the local file system.
   e. Click OK.

2. Import the certificate:
   b. Click Advanced Options. The SAML SSO pane opens.
   c. In the Service Providers table, select the SP from step 1 and click Edit.
d. Enable SP certificate and in the dropdown box, click Import.

The Upload Remote Certificate window opens.
e. Click Upload and select the certificate downloaded in step 1.
f. Click OK. The certificate is imported.
g. Click OK.
h. In the IdP certificate list, select the certificate that you imported.
i. Click OK.

Verifying the single-sign-on configuration

After you have logged in to a Security Fabric member using SSO, you can navigate between any Security Fabric member with SSO configured.

To navigate between Security Fabric members:

1. Log in to a Security Fabric member that is using SSO.
2. In the top banner, click the name of the device you are logged in to. A list of Security Fabric members displays.

4. A prompt appears that an SSO administrator account has been created. Click **Continue**.

![Image of a successful SSO login]

You are now logged in to the Security Fabric member with SSO. The letters "SSO" also display beside the user name in the top banner.

5. Go to **System > Administrators > Single-Sign-On Administrator** to view the list of SSO admins created.

![Image of the Administrators screen]

**CLI commands for SAML SSO**

To enter a question mark (\?) or a tab, Ctrl + V must be entered first. Question marks and tabs cannot be typed or copied into the CLI Console or some SSH clients.

**To configure the IdP:**

```bash
config system saml
    set status enable
    set role identity-provider
    set cert "Fortinet_Factory"
    set server-address "172.16.106.74"
config service-providers
    edit "csf_172.16.106.74:12443"
        set prefix "csf_ngrczjqxujfshgr9ivhehwu37fml20"
        set sp-entity-id "http://172.16.106.74/metadata/
        set sp-single-sign-on-url "https://172.16.106.74/saml/?acs"
        set sp-single-logout-url "https://172.16.106.74/saml/?sls"
        set sp-portal-url "https://172.16.106.74/saml/login/"
config assertion-attributes
    edit "username"
        next
    edit "tdoc@fortinet.com"
        next
        set type email
        next
end
end
```

**To configure an SP:**

```bash
config system saml
    set status enable
    set cert "Fortinet_Factory"
    set idp-entity-id "http://172.16.106.74/saml-idp/csf_
```
To configure an SSO administrator:

    config system sso-admin
    edit "SSO-admin-name"
        set accprofile <SSO admin user access profile>
        set vdom <Virtual domain(s) that the administrator can access>
    next
    end

SAML SSO with pre-authorized FortiGates

You can set up SAML SSO authentication in a Security Fabric environment by starting with a root FortiGate that has one or more pre-authorized FortiGates.

After the initial configuration, you can add more downstream FortiGates to the Security Fabric, and they are automatically configured with default values for a service provider.

To set up basic SAML SSO for the Security Fabric:

1. Log in to the root FortiGate of the Security Fabric.
2. Go to Security Fabric > Fabric Connectors and double-click the Security Fabric Setup card.
3. Join two pre-authorized FortiGates to the root FortiGate (see Configuring the root FortiGate and downstream FortiGates on page 2210).
4. Configure the IdP (see Configuring the root FortiGate as the IdP on page 2320).
5. Configure the SPs (see Configuring a downstream FortiGate as an SP on page 2321).

Navigating between Security Fabric members with SSO

After you have logged in to a Security Fabric member by using SSO, you can navigate between any Security Fabric member with SSO configured. This can be done using the Security Fabric members dropdown menu or by logging in to a FortiGate SP from the root FortiGate IdP.

Security Fabric members dropdown

The Security Fabric members dropdown menu allows you to easily switch between all FortiGate devices that are connected to the Security Fabric. You can also use this menu to customize a FortiGate in the Security Fabric.

To navigate between Security Fabric members:

1. Log in to a Security Fabric member by using SSO.
2. In the top banner, click the name of the device you are logged into with SSO. A list of Security Fabric members is displayed.
3. Click the Security Fabric member. You are logged in to the Security Fabric member without further authentication.
To customize a FortiGate in the Security Fabric:

1. In the Security Fabric members dropdown menu, hover the cursor over a FortiGate so the tooltip is shown.
2. Click Configure. The Configure pane opens.
3. Edit the settings as required.
4. Click OK.

Logging in to an SP from the root IdP

The following example describes how to log in to a root FortiGate IdP, and navigate to other FortiGate SPs in the Security Fabric without further authentication. The local administrator account is named test3. The local administrator account must also be available as an SSO administrator account on all downstream FortiGate SPs. Different tabs of the same browser are used to log in to the various FortiGates.

To log in to a FortiGate SP from a root FortiGate IdP:

1. Log in to the root FortiGate IdP by using the local administrator account. In this example, the local administrator account is named test3.
2. Go to Security Fabric > Fabric Connectors and double-click the Security Fabric Setup card.
3. In the Topology tree, click one of the downstream FortiGate SPs, and select Login to <name of FortiGate>. The login screen is displayed.
4. In the login screen, select Single Sign-On.

By using cookies in your local browser for the already-authenticated SSO administrator, FortiGate logs you in to the downstream FortiGate SP as the SSO administrator. In this example, the SSO administrator name is test3.

5. While still logged into the root FortiGate IdP in your browser, go to the browser tab for the root FortiGate IdP, and log in to another FortiGate SP that is displayed on the Security Fabric widget in the GUI.
SAML SSO login uses SAML_IDP session cookies of already authenticated admin users in your local browser cache to send to the root FortiGate IdP for authentication. If your browser cache is manually cleared, or you close your browser, you must authenticate again.

It is possible to log in to one downstream FortiGate SP in a Security Fabric, and then open another tab in your browser to connect to another FortiGate SP that is not a member of the Security Fabric.

This is useful in cases where the SSO administrator and the local system administrator on the FortiGate SP both have the same login name, but are two different entities.

Integrating FortiAnalyzer management using SAML SSO

When a FortiGate acting as a Security Fabric root is configured as a SAML SSO identity provider (IdP), the FortiAnalyzer of the Security Fabric can register itself as a service provider (SP). This simplifies the configuration by enabling the setting in FortiAnalyzer to facilitate Fabric SSO access to the FortiAnalyzer once authenticated to the root FortiGate. When signed in using SSO, the FortiAnalyzer includes a Security Fabric navigation dropdown, which allows easy navigation to FortiGates in the Fabric.
To enable FortiAnalyzer as a Fabric SP in the GUI:

1. On the root FortiGate, go to Security Fabric > Physical Topology or Logical Topology.
2. In the topology, click the FortiAnalyzer icon and select Login to FortiAnalyzer.
3. Enter the credentials to log in. A Security Fabric must be configured with the Fabric devices listed under the Fabric name.
   a. Go to Device Manager to verify the Fabric setup. There is an asterisk beside the root FortiGate.
4. Edit the FortiAnalyzer SAML SSO settings:
   a. Go to System Settings > Admin > SAML SSO.
   b. For Single Sign-On Mode, select Fabric SP and enter the address to access the FortiAnalyzer in Server Address.
   c. Click Apply and log out of the FortiAnalyzer. The FortiAnalyzer will automatically register itself on the FortiGate and is a visible appliance in the list of SPs.
5. Verify that the FortiAnalyzer registration was successful:
   a. In FortiOS, go to Security Fabric > Fabric Connectors and double-click the Security Fabric Setup card.
   b. In the SAML Single Sign-On section click Advanced Options. There should be an entry for the FortiAnalyzer in the Service Providers table (appliance_192.168.1.103).

6. Log in to the FortiAnalyzer. There is a new option to Login with Fabric Single Sign-On.
7. Click *Login with Fabric Single Sign-On*. A dialog appears to select a Fabric IdP.

8. Select a FortiGate. The ADOM containing that FortiGate opens.

**To enable FortiAnalyzer as a Fabric SP in the CLI:**

1. In FortiAnalyzer, enable the device as a Fabric SP:
   ```
   config system saml
   set status enable
   set role FAB-SP
   set server-address "192.168.1.99"
   end
   
   FortiAnalyzer will register itself on the FortiGate as an appliance.
   
2. Verify the configuration in FortiOS:
   ```
   show system saml
   config system saml
   set status enable
   set role identity-provider
   set cert "fortigate.domain.tld"
   set server-address "192.168.1.99"
   config service-providers
   edit "appliance_192.168.1.103"
   set prefix "csf_76sh0bm4e7hf1ty54w42yrrv88tk8uj"
   set sp-entity-id "http://192.168.1.103/metadata/"
   set sp-single-sign-on-url "https://192.168.1.103/saml/?acs"
   set sp-single-logout-url "https://192.168.1.103/saml/?sis"
   set sp-portal-url "https://192.168.1.103/saml/login/"
   config assertion-attributes
   edit "username"
   next
   edit "profilenamer"
   set type profile-name
   next
   ```
To navigate between devices using SAML SSO in FortiOS:

1. Log in to the root FortiGate.
2. Go to Security Fabric > Physical Topology or Logical Topology.
3. In the topology, click the FortiAnalyzer icon and select Login to FortiAnalyzer.

To navigate between devices using SAML SSO in FortiAnalyzer:

1. Log in to the FortiAnalyzer using SSO.
2. Navigate to the ADOM that contains the root FortiGate of the Security Fabric.
3. In the toolbar, click the Security Fabric name to display a dropdown a list of the Fabric FortiGates.

Integrating FortiManager management using SAML SSO

When a FortiGate is configured as the SAML SSO IdP, FortiManager can be added as an SP.

To configure FortiManager as a Fabric SP:

2. In the Security Fabric Settings section, click Advanced Options.
3. In the Service Providers section, click Create New.
4. Enter a name and a prefix for the SP. FortiOS generates a unique prefix, but you can enter your own.
5. In **SP address**, enter the FortiManager address including the port number.

   ![Create Service Provider](image)

   - **Name**: cdf_fmg
   - **Prefix**: fmgfortidemo52610
   - **SP type**: Fortinet Product
   - **SP address**: [Input Field]
   - **SP certificate**: [Input Field]

   ![SAML Attribute](image)

   - **Name**: username
   - **Type**: Username

   ![OK Cancel](image)

6. Click **OK**.

7. In FortiManager, go to **System Settings > Admin > SAML SSO** and in the **Single Sign-On Mode** section, click **Service Provider (SP)**.

8. Configure the **IdP Settings**:
   
a. For **IdP Type**, click **Fortinet**.
b. For **IdP Address**, enter the root FortiGate address including the port number.
c. Enter the **Prefix** of the SP.
d. For **IdP Certificate**, import the same certificate used on the root FortiGate.
e. Click **Apply**.
9. To verify that the configuration works, log out of FortiManager and log in using the Login via Single-Sign-On link.

**Advanced option - FortiGate SP changes**

From a root FortiGate IdP, you can edit each of the FortiGate SPs. For example, you can edit a FortiGate SP to generate a new prefix, or you can add or modify SAML attributes. When you generate a new prefix value, it is propagated to the respective downstream FortiGates.

**To edit an SP from the root FortiGate (IdP):**

2. Click Advanced Options. The SAML SSO pane opens.
3. In the Service Providers table, select a device and click Edit. The Edit Service Provider pane opens.
4. Edit the settings as needed.
5. Click OK.
Security rating

The security rating uses real-time monitoring to analyze your Security Fabric deployment, identify potential vulnerabilities, highlight best practices that can be used to improve the security and performance of your network, and calculate Security Fabric scores.

To view the security rating, go to Security Fabric > Security Rating on the root FortiGate.

The Security Rating page is separated into three major scorecards: Security Posture, Fabric Coverage, and Optimization, which provide an executive summary of the three largest areas of security focus in the Security Fabric.

The scorecards show an overall letter grade and breakdown of the performance in sub-categories. Clicking a scorecard drills down to a detailed report of itemized results and compliance recommendations. The point score represents the net score for all passed and failed items in that area. In the drill down report, hover the cursor over a score to view the calculation breakdown.

The report includes the security controls that were tested against, linking to specific FSBP or PCI compliance policies. Click the FSBP and PCI buttons to reference the corresponding standard. Users can search or filter the report results. If there is a failed check on the scorecard, there is a link in the Recommendations section that takes you to the page to resolve the problem.
Certain remediations marked with an EZ symbol represent configuration recommendations that support Easy Apply. In the panel on the right, in the Recommendations section, click Apply to apply the changes to resolve the failed security control.

The report table can be customized by adding more columns, such as Category, to view, filter, or sort the results based on scorecard categories. Click the gear icon to customize the table.
Users can also export the reports as CSV or JSON files by clicking the Export dropdown.

To exit the current view, click the icon beside the scorecard title to return to the summary view.

For more information about security ratings, and details about each of the checks that are performed, go to Security Best Practices & Security Rating Feature.

The following licensing options are available for security rating checks:

- A base set of free checks
- A licensed set that requires a FortiGuard Security Rating Service subscription

The base set can be run locally on any FortiGate and on all other devices in the Security Fabric. For a list of base and licensed security rating checks, see FortiGuard Security Rating Service.

Security rating notifications

Security rating notifications are shown on settings pages, which list configuration issues determined by the security rating report. You can open the recommendations to see which items need to be fixed. Notifications can be dismissed in the GUI. Dismissed issues are unique for each administrator. Hashes for dismissed notifications are saved in local storage. If a user clears the local storage, all issues will show up again as not dismissed.

Notification locations

On the System > Settings page, there is a Security Rating Issues section in the right-side gutter. To dismiss a notification, hover over the issue and click the X beside it. To view dismissed notifications, enable Show Dismissed.
On the Network > Interfaces page, there is a Security Rating Issues section in the table footer. Click Security Rating Issues to view the list of issues. To dismiss a notification, click the X beside it. To view dismissed notifications, click Show Dismissed.

Notification pop-ups

When you click a security rating notification, a pop-up appears and the related setting is highlighted in the GUI. The pop-up contains a description of the problem and a timestamp of when the issue was found.
Once an issue is resolved, the notification disappears after the next security rating report runs.

**Security rating check scheduling**

Security rating checks by default are scheduled to run automatically every four hours.

**To disable automatic security checks using the CLI:**

```bash
config system global
    security-rating-run-on-schedule disable
end
```

**To manually run a report using the CLI:**

```
# diagnose report-runner trigger
```

**Logging the security rating**

The results of past security checks are available on the *Log & Report > System Events* page. Click the *Security Rating Events* card to see the detailed log.
An event filter subtype can be created for the Security Fabric rating so event logs are created on the root FortiGate that summarize the results and show detailed information for the individual tests.

**To configure security rating logging using the CLI:**

```plaintext
config log eventfilter
    set security-rating enable
end
```

**Multi VDOM mode**

In multi VDOM mode, security rating reports can be generated in the Global VDOM for all of the VDOMs on the device. Administrators with read/write access can run the security rating report in the Global VDOM. Administrators with read-only access can only view the report.

On the report scorecards, the *Scope* column shows the VDOMs that the check was run on. On checks that support *Easy Apply*, the remediation can be run on all of the associated VDOMs.

Global scope:
VDOM scope:

The security rating event log is available on the root VDOM.

Security Fabric score

The Security Fabric score is calculated when a security rating check is run, based on the severity level of the checks that are passed or failed. A higher scores represents a more secure network. Points are added for passed checks and removed for failed checks.

<table>
<thead>
<tr>
<th>Severity level</th>
<th>Weight (points)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical</td>
<td>50</td>
</tr>
<tr>
<td>High</td>
<td>25</td>
</tr>
<tr>
<td>Medium</td>
<td>10</td>
</tr>
<tr>
<td>Low</td>
<td>5</td>
</tr>
</tbody>
</table>
To calculate the number of points awarded to a device for a passed check, the following equation is used:

\[
\text{score} = \frac{\text{<severity level weight>}}{\text{<# of FortiGates>}} \times \text{<secure FortiGate multiplier>}
\]

The secure FortiGate multiplier is determined using logarithms and the number of FortiGate devices in the Security Fabric.

For example, if there are four FortiGate devices in the Security Fabric that all pass the compatible firmware check, the score for each FortiGate device is calculated with the following equation:

\[
\frac{50}{4} \times 1.292 = 16.15 \text{ points}
\]

All of the FortiGate devices in the Security Fabric must pass the check in order to receive the points. If any one of the FortiGate devices fails a check, the devices that passed are not awarded any points. For the device that failed the check, the following equation is used to calculated the number of points that are lost:

\[
\text{score} = \frac{\text{<severity level weight>}}{\text{<# of FortiGates>}} \times \text{<secure FortiGate multiplier>}
\]

For example, if the check finds two critical FortiClient vulnerabilities, the score is calculated with the following equation:

\[
-50 \times 2 = -100 \text{ points}
\]

Scores are not affected by checks that do not apply to your network. For example, if there are no FortiAP devices in the Security Fabric, no points will be added or subtracted for the FortiAP firmware version check.

**Automation stitches**

Automation stitches automate the activities between the different components in the Security Fabric, which decreases the response times to security events. Events from any source in the Security Fabric can be monitored, and action responses can be set up to any destination.

Automation stitches can also be used on FortiGate devices that are not part of a Security Fabric.

An automation stitch consists of two parts: the trigger and the actions. The trigger is the condition or event on the FortiGate that activates the action, for example, a specific log, or a failed log in attempt. The action is what the FortiGate does in response to the trigger.

Automation stitches that use cloud-based actions (AWS Lambda, Azure Function, Google Cloud Function, and AliCloud Function) have the option to delay an action after the previous action is completed.

Diagnose commands are available in the CLI to test, log, and display the stitch history and settings.

Automation stitches can only be created on the root FortiGate in a Security Fabric.
Creating automation stitches

To create an automation stitch, a trigger event and a response action or actions are selected. Automation stitches can be tested after they are created.

In the GUI, go to Security Fabric > Automation and click Create New. Automation stitches, actions, and triggers are configured in separate dialogs.

The stitch Action execution can be set to either Sequential or Parallel. In sequential execution, actions will execute one after another with a delay (if specified). If one action fails, then the action chain stops. This is the default setting. In parallel execution, all actions will execute immediately when the stitch is triggered.

When creating a stitch, clicking Add Trigger and Add Action displays a list of available triggers and actions, and the option to create a new one.

Once the stitch is configured, a process diagram of the trigger, actions, and delays is displayed. A delay can be added before an action if Sequential action execution is used. Executing the next action can be delayed by up to 3600 seconds (one hour).
Triggers and actions can be configured separately, and then added to an automation stitch.

The maximum number of automation stitches that are allowed to run concurrently can be configured in the CLI (32 - 256, default = 128).

**To configure the maximum number of concurrent automation stitches:**

```
config automation setting
   set max-concurrent-stitches <integer>
end
```

**Tabs on the Automation page**

On the Security Fabric > Automation page, there are tabs for Stitch, Trigger, and Action. The Stitch tab is the default view that lists the trigger and actions used in each stitch. Individual triggers and actions can be created or edited in the corresponding tabs.
Click **Trigger** to view the list of triggers.

Click **Action** to view the list of actions.
Sample configuration

The following example shows how to configure a Security Rating Summary automation stitch with AWS Lambda and Email actions. There is a 60-second delay before the Email action.

To configure the automation stitch in the GUI:

2. Enter the stitch name and description.
3. Configure the trigger:
   a. Click Add Trigger.
   b. Click Create and select Security Rating Summary.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>aws_no_delay</th>
</tr>
</thead>
<tbody>
<tr>
<td>Report</td>
<td>Security Posture</td>
</tr>
</tbody>
</table>
d. Click OK.
e. Select the trigger in the list and click Apply.

4. Configure the AWS Lambda function action:
   a. Click Add Action.
   b. Click Create and select AWS Lambda.
   c. Enter the following:

      | Name         | aws_no_delay |
      | URL          | Enter the request API URI |
      | API key      | Enter the API key |
      | HTTP header  | header2: header2_value |

      | Name         | aws_no_delay |
      | Minimum interval | 0 second(s) |
      | Description   | |
      | URL           | Enter the request API URI |
      | API key       | Enter the API key |
      | HTTP header   | header2: header2_value |

   d. Click OK.
e. Select the action in the list and click Apply.
5. Configure the Email notification action:
   a. Click Add Action.
   b. Click Create and select Email.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>email_action</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>Enter an email address</td>
</tr>
<tr>
<td>Subject</td>
<td>email action for test</td>
</tr>
<tr>
<td>Replacement message</td>
<td>Enable</td>
</tr>
</tbody>
</table>

   d. Click OK.
   e. Select the action in the list and click Apply.

6. Click the Add delay located between both actions. Enter 60 and click OK.
7. Click OK.

To configure the automation stitch in the CLI:

1. Configure the trigger:

   ```
   config system automation-trigger
   edit "aws_no_delay"
     set event-type security-rating-summary
   next
   end
   ```

2. Configure the actions:

   ```
   config system automation-action
   edit "aws_no_delay"
     set action-type aws-lambda
     set aws-api-key xxxxxxxxxx
     set uri "xxxxxxxxxx.execute-api.us-east-1.amazonaws.com/xxxxxxxxxx"
     set headers "header2:header2_value"
   ```
next
edit "email_action"
    set action-type email
    set email-to "test@fortinet.com"
    set email-subject "email action for test"
    set replacement-message enable
next
end

3. Configure the stitch:

    config system automation-stitch
    edit "aws_no_delay"
        set description "aws action test"
        set trigger "aws_no_delay"
        config actions
            edit 1
                set action "aws_no_delay"
                set required enable
            next
            edit 2
                set action "email_action"
                set delay 60
                set required enable
            next
        end
    end
next
end

Testing automation stitches

In the GUI, go to Security Fabric > Automation, right-click on the automation stitch and select Test Automation Stitch.

In the CLI, enter `diagnose automation test <automation-stitch name>`.

Default automation stitches

The following default automation stitches are included in FortiOS:

- Compromised Host Quarantine
- Incoming Webhook Quarantine
- HA Failover
- Network Down
- Reboot
- FortiAnalyzer Connection Down
- License Expired Notification
- Security Rating Notification

To view and edit the automation stitches in the GUI, go to Security Fabric > Automation.
CLI configurations

Compromised Host Quarantine

```bash
config system automation-action
    edit "Quarantine on FortiSwitch + FortiAP"
        set description "Default automation action configuration for quarantining a MAC address on FortiSwitches and FortiAPs."
        set action-type quarantine
    next
    edit "Quarantine FortiClient EMS Endpoint"
        set description "Default automation action configuration for quarantining a FortiClient EMS endpoint device."
        set action-type quarantine-forticlient
    next
end

config system automation-trigger
    edit "Compromised Host - High"
        set description "Default automation trigger configuration for when a high severity compromised host is detected."
    next
end

config system automation-stitch
    edit "Compromised Host Quarantine"
        set description "Default automation stitch to quarantine a high severity compromised host on FortiAPs, FortiSwitches, and FortiClient EMS."
        set status disable
        set trigger "Compromised Host - High"
    config actions
        edit 1
            set action "Quarantine on FortiSwitch + FortiAP"
    next
```
edit 2
    set action "Quarantine FortiClient EMS Endpoint"
next
end
next
end

FortiAnalyzer Connection Down

config system automation-action
    edit "FortiExplorer Notification"
    set description "Default automation action configuration for sending a notification
to any FortiExplorer mobile application."
    set action-type fortixplorer-notification
next
end
config system automation-trigger
    edit "FortiAnalyzer Connection Down"
    set description "Default automation trigger configuration for when the FortiAnalyzer
connection is lost."
    set event-type event-log
    set logid 22902
next
end
config system automation-stitch
    edit "FortiAnalyzer Connection Down"
    set description "Default automation stitch to send a FortiExplorer notification when
the connection to FortiAnalyzer is lost."
    set trigger "FortiAnalyzer Connection Down"
    config actions
        edit 1
            set action "FortiExplorer Notification"
next
next
end

Network Down

config system automation-action
    edit "Default Email"
    set description "Default automation action configuration for sending an email with
basic information on the log event."
    set action-type email
    set email-subject "%%log.logdesc%%"
next
end
config system automation-trigger
    edit "Network Down"
    set description "Default automation trigger configuration for when a network
connection goes down."
    set event-type event-log
    set logid 20099
    config fields
edit 1
    set name "status"
    set value "DOWN"
next
end
next
disable

config system automation-stitch
    edit "Network Down"
        set description "Default automation stitch to send an email when a network goes down."
        set status disable
        set trigger "Network Down"
    config actions
        edit 1
        set action "Default Email"
    next
end

HA Failover

config system automation-action
    edit "Default Email"
        set description "Default automation action configuration for sending an email with basic information on the log event."
        set action-type email
        set email-subject "%%log.logdesc%%"
next
end

config system automation-trigger
    edit "HA Failover"
        set description "Default automation trigger configuration for when an HA failover occurs."
        set event-type ha-failover
next
end

config system automation-stitch
    edit "HA Failover"
        set description "Default automation stitch to send an email when a HA failover is detected."
        set status disable
        set trigger "HA Failover"
    config actions
        edit 1
        set action "Default Email"
    next
end
next
end
Incoming Webhook Quarantine

config system automation-action
  edit "Quarantine on FortiSwitch + FortiAP"
    set description "Default automation action configuration for quarantining a MAC address on FortiSwitches and FortiAPs."
    set action-type quarantine
  next
  edit "Quarantine FortiClient EMS Endpoint"
    set description "Default automation action configuration for quarantining a FortiClient EMS endpoint device."
    set action-type quarantine-forticlient
  next
end

config system automation-trigger
  edit "Incoming Webhook Call"
    set description "Default automation trigger configuration for an incoming webhook."
    set event-type incoming-webhook
  next
end

config system automation-stitch
  edit "Incoming Webhook Quarantine"
    set description "Default automation stitch to quarantine a provided MAC address on FortiAPs, FortiSwitches, and FortiClient EMS using an Incoming Webhook."
    config actions
      edit 1
        set action "Quarantine on FortiSwitch + FortiAP"
      next
      edit 2
        set action "Quarantine FortiClient EMS Endpoint"
      next
    end
  next
end

License Expired Notification

config system automation-action
  edit "FortiExplorer Notification"
    set description "Default automation action configuration for sending a notification to any FortiExplorer mobile application."
    set action-type fortiexplorer-notification
  next
end

config system automation-trigger
  edit "License Expired Notification"
    set description "Default automation trigger configuration for when a license is near expiration."
    set event-type license-near-expiry
    set license-type any
  next
end
config system automation-stitch
    edit "License Expired Notification"
    set description "Default automation stitch to send a FortiExplorer notification when
    a license is near expiration."
    set trigger "License Expired Notification"
    config actions
        edit 1
        set action "FortiExplorer Notification"
        next
    end
next
end

Reboot

config system automation-action
    edit "Default Email"
    set description "Default automation action configuration for sending an email with
    basic information on the log event."
    set action-type email
    set email-subject "%%log.logdesc%%"
    next
end

config system automation-trigger
    edit "Reboot"
    set description "Default automation trigger configuration for when a FortiGate is
    rebooted."
    set event-type reboot
    next
end

config system automation-stitch
    edit "Reboot"
    set description "Default automation stitch to send an email when a FortiGate is
    rebooted."
    set status disable
    set trigger "Reboot"
    config actions
        edit 1
        set action "Default Email"
        next
    end
next
end

Security Rating Notification

config system automation-action
    edit "FortiExplorer Notification"
    set description "Default automation action configuration for sending a notification
    to any FortiExplorer mobile application."
    set action-type fortiexplorer-notification
    next
end
config system automation-trigger
   edit "Security Rating Notification"
      set description "Default automation trigger configuration for when a new Security Rating report is available."
      set event-type security-rating-summary
      set report-type any
   next
end

config system automation-stitch
   edit "Security Rating Notification"
      set description "Default automation stitch to send a FortiExplorer notification when a new Security Rating report is available."
      set trigger "Security Rating Notification"
      config actions
         edit 1
            set action "FortiExplorer Notification"
   next
next
end

Incoming Webhook Quarantine stitch

The Incoming Webhook Quarantine stitch for API calls to the FortiGate accepts multiple parameters (MAC address and FortiClient UUID) from an Incoming Webhook trigger, which enacts either the Access Layer Quarantine action (MAC address) or the FortiClient Quarantine action (FortiClient UUID). This is a default automation stitch included in FortiOS.

To trigger the Incoming Webhook Quarantine stitch in the GUI:

1. Create a new API user:
   a. Go to System > Administrators.
   b. Click Create New > REST API Admin.
   c. Configure the New REST API Admin settings, and copy the API key to the clipboard.

2. Enable the stitch:
   b. Under Incoming Webhook, right-click Incoming Webhook Quarantine, and select Select Status > Enable.

3. Get the sample cURL request:
   a. Click the Trigger trigger tab.
   b. Under Incoming Webhook, right-click Incoming Webhook Call, and select Edit.
c. In the API admin key field, enter the API key you recorded previously. The Sample cURL request field updates.

d. Copy the Sample cURL request to the clipboard.
e. Click OK.

4. Execute the request:
a. Edit the sample cURL request you just copied.
b. Add parameters to the data field ("mac" and "fctuid"), and then execute the request.

```bash
root@pc:~# curl -k -X POST -H 'Authorization: Bearer cftctimx3fQxr4khb994p7swdfmk' --data '{ "mac":"0c:0a:00:0c:ce:b0", "fctuid": "0000BB0B0A0B0D0A0B0E0F0B00B"}' https://172.16.116.226/api/v2/monitor/system/automation-stitch/webhook/Incoming%20Webhook%20Quarantine
```

Once the automation stitch is triggered, the MAC address is quarantined by the FortiGate, and an event log is created. The FortiClient UUID is quarantined on the EMS server side.

To trigger the Incoming Webhook Quarantine stitch in the CLI:

1. Create a new API user and note the API key:

```bash
cfgtctimx3fQxr4khb994p7swdfmk
```

Encode spaces in the automation stitch name with %20. For example, "Incoming%20Webhook%20Quarantine"
2. Enable the automation stitch:

```bash
config system api-user
  edit "api"
    set api-key *************
    set accprofile "api_profile"
    set vdom "root"
  config trusthost
    edit 1
      set ipv4-trusthost 10.6.30.0 200.200.200.0
    next
  end
end
```

3. Edit the cURL request to include parameters in the `data` field ("mac" and "fctuid"), then execute the request:

```bash
root@pc56:~# curl -k -X POST -H 'Authorization: Bearer
cfgtctlmmx0fQxr0kbb000p70wdfmk' --data '{ "mac":"0c:0a:00:0c:ce:b0", "fctuid": "3000B8B0DBD000B0D0A0B0E0B00B"}'
https://100.10.100.200/api/v2/monitor/system/automation-stitch/webhook/Incoming%20Webhook%20Quarantine
```

```json
{
  "http_method":"POST",
  "status":"success",
  "http_status":200,
  "serial":"FGT80E0Q00000000",
  "version":"v6.4.0",
  "build":1545
}
```

Encode spaces in the automation stitch name with `%20`. For example, `Incoming%20Webhook%20Quarantine`.

Once the automation stitch is triggered, the MAC address is quarantined by the FortiGate, and an event log is created. The FortiClient UUID is quarantined on the EMS server side.

**Sample log**

```plaintext
date=2020-02-14 time=15:37:48 logid="0100046600" type="event" subtype="system"
level="notice" vd="root" eventtime=1581723468644200712 tz="-0800" logdesc="Automation stitch triggered" stitch="Incoming Webhook Quarantine" trigger="Incoming Webhook Quarantine" stitchaction="Compromised Host Quarantine_quarantine,Compromised Host Quarantine_quarantine-forticlient" from="log" msg="stitch:Incoming Webhook Quarantine is triggered."
```

**Triggers**

The following table outlines the available triggers.

<table>
<thead>
<tr>
<th>Category</th>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Fabric</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Category</td>
<td>Trigger</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Compromised Host    |                                | An indicator of compromise (IoC) is detected on a host endpoint. The threat level must be selected and can be Medium or High. If Medium is selected, both medium and high level threats are included. Additional actions are available only for Compromised Host triggers:  
  • Access Layer Quarantine  
  • FortiClient Quarantine  
  • VMware NSX Security Tag  
  • IP Ban |
| Security Rating Summary |                                | A summary is available for a recently run Security Rating report. Options include:  
  • Security Posture  
  • Fabric Coverage  
  • Optimization  
  • Any |
|                     | FortiAnalyzer Event Handler    | The specified FortiAnalyzer event handler has occurred. See FortiAnalyzer event handler trigger on page 2361 for details. |
|                     | FortiGate Cloud Event Handler  | The specified FortiGate Cloud event handler has occurred. This option requires a FortiGate Cloud log retention license. |
|                     | Fabric Connector Event         | An event has occurred on a specific Fabric connector. See Fabric connector event trigger on page 2366 for details. |
|                     | FortiGate Cloud-Based IOC      | IOC detection from the FortiGate Cloud IOC service. This option requires an IOC license, a web filter license, and FortiCloud logging must be enabled. |
| System              |                                |                                                                                                                                 |
| Reboot              |                                | A FortiGate is rebooting.                                                                                                                                 |
| HA Failover         |                                | An HA failover is occurring.                                                                                                                                 |
| Conserve Mode       |                                | A FortiGate entered conserve mode due to low memory. See Execute a CLI script based on CPU and memory thresholds on page 2412 for an example. |
| Configuration Change|                                | A FortiGate configuration change has occurred.                                                                                                                                 |
| License Expiry      |                                | A FortiGuard license is expiring. The license type must be selected. Options include:  
  • FortiCare Support  
  • FortiGuard Web Filter  
  • FortiGuard AntiSpam  
  • FortiGuard AntiVirus  
  • FortiGuard IPS  
  • FortiGuard Management Service  
  • FortiGate Cloud |
<table>

<tr>
<td>Schedule</td>
<td></td>
<td>A scheduled monthly, weekly, daily, or hourly trigger. Set to occur on a specific minute of an specific hour on a specific day.</td>
</tr>
</tbody>
</table>

**FortiAnalyzer event handler trigger**

You can trigger automation stitches based on FortiAnalyzer event handlers. This allows you to define rules based on complex correlations across devices, log types, frequencies, and other criteria.

To set up a FortiAnalyzer event handler trigger:

1. Configure a FortiGate event handler on the FortiAnalyzer
2. Configure FortiAnalyzer logging on the FortiGate on page 2362
3. Configure an automation stitch that is triggered by a FortiAnalyzer event handler on page 2363

**Configure a FortiGate event handler on the FortiAnalyzer**

On the FortiAnalyzer, configure an event handler for the automation stitch. In this example, the event handler is triggered when an administrator logs in to the FortiGate. See Creating a custom event handler in the FortiAnalyzer Administration Guide for more information.
To configure an event handler on the FortiAnalyzer:

1. Go to FortiSoC > Handlers > FortiGate Event Handlers, and click Create New.
2. Configure an event handler with two conditions for the automation stitch:

<table>
<thead>
<tr>
<th>Log Type</th>
<th>Event Log</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log Subtype</td>
<td>System</td>
</tr>
<tr>
<td>Group By</td>
<td>Device ID</td>
</tr>
<tr>
<td>Logs match</td>
<td>Any of the following conditions</td>
</tr>
<tr>
<td>Log Field</td>
<td>Level</td>
</tr>
<tr>
<td>Match Criteria</td>
<td>Equal To</td>
</tr>
<tr>
<td>Value</td>
<td>Information</td>
</tr>
<tr>
<td>Log Field</td>
<td>Action</td>
</tr>
<tr>
<td>Match Criteria</td>
<td>Equal To</td>
</tr>
<tr>
<td>Value</td>
<td>login</td>
</tr>
</tbody>
</table>

3. Configure the other settings as needed.

4. Click OK.

**Configure FortiAnalyzer logging on the FortiGate**

See Configuring FortiAnalyzer on page 2217 for more information.
To configure FortiAnalyzer logging in the GUI:

1. Go to Security Fabric > Fabric Connectors and double-click the FortiAnalyzer Logging card.
2. Ensure the Status is Enabled, and configure the settings as needed.

3. Click OK.

To configure FortiAnalyzer logging in the CLI:

```bash
config log fortianalyzer setting
  set status enable
  set server "10.6.30.250"
  set serial "FL-4HET000000000"
  set upload-option realtime
  set reliable enable
end
```

Configure an automation stitch that is triggered by a FortiAnalyzer event handler

When a FortiAnalyzer event handler is triggered, it sends a notification to the FortiGate automation framework, which generates a log and triggers the automation stitch.

To configure an automation stitch that is triggered by a FortiAnalyzer event handler in the GUI:

2. Enter the stitch name, auto-faz-1.
3. Configure the trigger:
   a. Click Add Trigger.
   b. Click Create and select FortiAnalyzer Event Handler.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>auto-faz-1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event handler name</td>
<td>system-log-handler2</td>
</tr>
<tr>
<td>Event severity</td>
<td>Medium</td>
</tr>
</tbody>
</table>
4. Configure the Email notification action:
   a. Click Add Action.
   b. Click Create and select Email.
   c. Enter the following:
      - **Name**: auto-faz-1_email
      - **To**: Enter an email address
      - **Subject**: CSF stitch alert
      - **Body**: User login FortiGate successfully.

d. Click OK.
e. Select the action in the list and click Apply.

5. Click OK.
To configure an automation stitch that is triggered by a FortiAnalyzer event handler in the CLI:

1. Create an automation trigger:

   ```
   config system automation-trigger
   edit "auto-faz-1"
   set event-type faz-event
   set faz-event-name "system-log-handler2"
   set faz-event-severity "medium"
   set faz-event-tags "User log in successful"
   next
   end
   ```

2. Create an automation action:

   ```
   config system automation-action
   edit "auto-faz-1_email"
   set action-type email
   set email-to "admin@fortinet.com"
   set email-subject "CSF stitch alert"
   set message "User login FortiGate successfully."
   next
   end
   ```

3. Create the automation stitch:

   ```
   config system automation-stitch
   edit "auto-faz-1"
   set trigger "auto-faz-1"
   config actions
   edit 1
   set action "auto-faz-1_email"
   set required enable
   next
   end
   ```

**View the trigger event log**

To view the trigger event log in the GUI:

1. Log in to the FortiGate.
   The FortiAnalyzer sends a notification to the FortiGate automation framework, generates an event log on the FortiGate, and triggers the automation stitch.

2. Go to Log & Report > System Events and select General System Events. From the log location dropdown, select FortiAnalyzer.

To view the trigger event log in the CLI:

```
# execute log display
```

```text
date=2019-02-05 time=14:16:17 logid="0100046600" type="event" subtype="system"
level="notice" vd="root" eventtime=1549404977 logdesc="Automation stitch triggered"
stitch="auto-faz-1" trigger="auto-faz-1" from="log" msg="stitch:auto-faz-1 is triggered."
```
Sample email

The email sent by the action will look similar to the following:

Fabric connector event trigger

With the Fabric Connector Event trigger, any supported Fabric connector is able to trigger an automation stitch on the FortiGate based on a specific event defined on the Fabric connector. Currently, only FortiDeceptor 4.1 supports this trigger for the Insider Threat, Notify Ban, and Notify Unban events.

In the following example, an authorized FortiDeceptor in the Security Fabric deploys a decoy called ubuntu16 configured with SSH, SAMBA, HTTP, and HTTPS services.

This example assumes the Security Fabric is already configured. Refer to Configuring the root FortiGate and downstream FortiGates and FortiDeceptor for detailed configuration steps. On the root FortiGate, the Allow downstream device REST API access option must be enabled (set downstream-access enable). The minimum permission required for the selected Administrator profile is Read/Write for User & Device (set authgrp read-write).

Three stitches are configured, one for each FortiDeceptor trigger type:

<table>
<thead>
<tr>
<th>Stitch name</th>
<th>Fabric connector event trigger</th>
<th>Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>fortideceptor_threat</td>
<td>Insider threat</td>
<td>Email and IP ban</td>
</tr>
<tr>
<td>fortideceptor_ban</td>
<td>Notify ban</td>
<td>Email and IP ban</td>
</tr>
<tr>
<td>fortideceptor_unban</td>
<td>Notify unban</td>
<td>Email and CLI script</td>
</tr>
</tbody>
</table>

To configure stitches with the Fabric connector event trigger in the GUI:

1. Configure the triggers:
   a. Go to Security Fabric > Automation, select the Trigger tab, and click Create New.
   b. In the Security Fabric section, click Fabric Connector Event and enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>fdc_Insider_Threat</td>
</tr>
<tr>
<td>Description</td>
<td>Insider_Threat</td>
</tr>
<tr>
<td>Connector</td>
<td>Select the FortiDeceptor connector</td>
</tr>
<tr>
<td>Event Name</td>
<td>Insider Threat</td>
</tr>
</tbody>
</table>
   c. Click OK.
   d. Repeat these steps to create two more triggers with the following settings:

<table>
<thead>
<tr>
<th>Name</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>fdc_Notify_Ban</td>
</tr>
<tr>
<td>Description</td>
<td>Notify_Ban</td>
</tr>
</tbody>
</table>
2. Configure the actions:
   a. Go to Security Fabric > Automation, select the Action tab, and click Create New.
   b. In the Security Response section, click IP Ban and enter the name, fdc_ban-ip.
   c. Click OK.
   d. Repeat these steps to create an Email (in the Notifications section) and a CLI Script (in the General section) action with the following settings:

   **Email**
   - **Name**: email_log
   - **To**: Enter an email address
   - **Subject**: CSF stitch alert

   **CLI Script**
   - **Name**: fdc_unban
   - **Script**: diagnose user quarantine delete src4 %%log.srcip%%
   - **Administrator profile**: super_admin

3. Configure the fortideceptor_threat stitch:
   a. Go to Security Fabric > Automation, select the Stitch tab, and click Create New.
   b. Enter the name, fortideceptor_threat.
   c. Click Add Trigger. Select fdc_Insider_Threat and click Apply.
   d. Click Add Action. Select email_log and click Apply.
   e. Click Add Action. Select fdc_ban-ip and click Apply.
   f. Click the Add delay located between both actions. Enter 5 and click OK.
   g. Click OK.

4. Configure the fortideceptor_ban stitch:
   a. Go to Security Fabric > Automation, select the Stitch tab, and click Create New.
   b. Enter the name, fortideceptor_ban.
   c. Click Add Trigger. Select fdc_Notify_Ban and click Apply.
   d. Click Add Action. Select email_log and click Apply.
   e. Click Add Action. Select fdc_ban-ip and click Apply.
   f. Click the Add delay located between both actions. Enter 5 and click OK.
   g. Click OK.
5. Configure the `fortideceptor_unban` stitch:
   a. Go to Security Fabric > Automation, select the Stitch tab, and click Create New.
   b. Enter the name, `fortideceptor_unban`.
   c. Click Add Trigger. Select `fdc_Notify_Unban` and click Apply.
   d. Click Add Action. Select `email_log` and click Apply.
   e. Click Add Action. Select `fdc_unban` and click Apply.
   f. Click the Add delay located between both actions. Enter 5 and click OK.
   g. Click OK.

To configure stitches with the Fabric connector event trigger in the CLI:

1. Configure the triggers:

   ```
   config system automation-trigger
   edit "fdc_Insider_Threat"
   set description "Insider_Threat"
   set event-type fabric-event
   set serial "FDC-VMTM210000***"
   set fabric-event-name "insider_threat"
   next
   edit "fdc_Notify_Ban"
   set description "Notify_Ban"
   set event-type fabric-event
   set serial "FDC-VMTM210000***"
   set fabric-event-name "notify_ban"
   next
   edit "fdc_Notify_Unban"
   set description "Notify_Unban"
   set event-type fabric-event
   set serial "FDC-VMTM210000***"
   set fabric-event-name "notify_unban"
   next
   end
   ```

2. Configure the actions:

   ```
   config system automation-action
   edit "fdc_ban-ip"
   set action-type ban-ip
   next
   edit "fdc_unban"
   set action-type cli-script
   set script "diagnose user quarantine delete src4 %%log.srcip%%"
   set output-size 10
   set timeout 0
   set accprofile "super_admin"
   next
   edit "email_log"
   set action-type email
   set email-to "*******@fortinet.com"
   set email-subject "CSF stitch alert"
   next
   end
   ```
3. Configure the stitches:

```plaintext
config system automation-stitch
  edit "fortideceptor_threat"
    set trigger "fdc_Insider_Threat"
  config actions
    edit 1
      set action "email_log"
      set required enable
    next
    edit 2
      set action "fdc_ban-ip"
      set delay 5
      set required enable
    next
  end
next
edit "fortideceptor_ban"
  set trigger "fdc_Notify_Ban"
  config actions
    edit 1
      set action "email_log"
      set required enable
    next
    edit 2
      set action "fdc_ban-ip"
      set delay 5
      set required enable
    next
  end
next
edit "fortideceptor_unban"
  set trigger "fdc_Notify_Unban"
  config actions
    edit 1
      set action "email_log"
      set required enable
    next
    edit 2
      set action "fdc_unban"
      set delay 5
      set required enable
    next
  end
next
end
```

**Verification**

A device with IP 172.16.200.33 uses SSH to access the decoy (ubuntu16) deployed in the FortiDeceptor. The FortiDeceptor will detect the attacker IP 172.16.200.33, automatically quarantine it, and send the insider threat notification to the FortiGate. This notification will trigger the `fortideceptor_threat` stitch due to the insider threat event trigger, so an email alert is sent and the attacker IP (172.16.200.33) is banned.

In FortiDeceptor, if the attacker IP (172.16.200.33) is manually blocked or unblocked, the FortiDeceptor will send out the internal block or unblock notification to FortiGate (see Quarantine Status for more details). This notification will trigger
the *fortideceptor_ban* or *fortideceptor_unban* stitch due the notify ban or unban event trigger. An email alert is sent, and based on the event, the IP is banned or the CLI script runs to unban the IP.

To view the quarantine details in FortiDeceptor:

1. Go to *Fabric > Quarantine Status*.
   a. Automatic quarantine:
   
      ![Automatic Quarantine Table]

   b. Manual block or unblock:
   
      ![Manual Block or Unblock Table]

To confirm that the stitch was triggered in the FortiOS GUI:

1. Go to *Security Fabric > Automation* and select the *Stitch* tab.
   a. Triggered insider threat:
   
      ![Triggered Insider Threat]

   b. Triggered notify ban or unban:
   
      ![Triggered Notify Ban or Unban]

To view the quarantined IP details in the FortiOS CLI:

```
# diagnose user quarantine list
src-ip-addr  created      expires       cause
```

If the IP is unbanned by the stitch, the list will be empty:

```
# diagnose user quarantine list
src-ip-addr  created      expires       cause
```
FortiOS event log trigger

You can configure a FortiOS event log trigger for when a specific event log ID occurs. You can select multiple event log IDs, and apply log field filters.

To configure a FortiOS event log trigger in the GUI:

1. Go to Security Fabric > Automation, select the Trigger tab, and click Create New.
2. In the Miscellaneous section, click FortiOS Event Log.
3. Enter a name and description.
4. In the Event field, click the + to select multiple event log IDs.
   The Event options correspond to the Message Meaning listed in the FortiOS Log Message Reference. Hover over an entry to view the tooltip that includes the event ID and log name. In this example, the Admin login successful event in the GUI corresponds to log ID 32001, which is LOG_ID_ADMIN_LOGIN_SUCC.

![FortiOS Event Log Trigger GUI](image)

5. In the Field filter(s) field, click the + to add multiple field filters. The configured filters must match in order for the stitch to be triggered.
   a. To view the list of available fields for a log, refer to the FortiOS Log Message Reference by appending the log ID to the document URL (https://docs.fortinet.com/document/fortigate/7.2.0/fortios-log-message-reference/<log_ID>).

![Field Filters](image)

6. Click OK.
To configure a FortiOS event log trigger in the CLI:

```bash
config system automation-trigger
  edit "event_login_logout"
    set description "trigger for login logout event"
    set event-type event-log
    set logid 32001 32003
  config fields
    edit 1
      set name "user"
      set value "csf"
    next
    edit 2
      set name "srcip"
      set value "10.6.30.254"
    next
  next
end
```

**Event log category triggers**

There are six automation triggers based on event log categories:

- Anomaly logs
- IPS logs
- SSH logs
- Traffic violations
- Virus logs
- Web filter violations

When multi VDOM mode is enabled, individual VDOMs can be specified so that the trigger is only applied to those VDOMs.

```bash
config system automation-trigger
  edit <name>
    set event-type {ips-logs | anomaly-logs | virus-logs | ssh-logs | webfilter-violation | traffic-violation}
    set vdom <name>
  next
end
```

**Example**

In this example, an automation stitch is created that uses an anomaly logs trigger and an email notification action. The trigger specifies which VDOMs should be used. There is a three-second delay between the trigger and action.

**To configure an automation stitch with the anomaly logs trigger in the GUI:**

1. Configure the trigger:
   a. Go to Security Fabric > Automation, select the Trigger tab, and click Create New.
   b. In the Event Log Category section, click Anomaly Logs.
   c. Enter a name (anomaly-logs) and add the required VDOMs (root, vdom-nat, vdom-tp).
d. Click OK.

2. Configure the action:
   a. Go to Security Fabric > Automation, select the Action tab, and click Create New.
   b. In the Notifications section, click Email and enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>email_default_rep_message</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>Enter an email address</td>
</tr>
<tr>
<td>Subject</td>
<td>CSF stitch alert</td>
</tr>
<tr>
<td>Replacement message</td>
<td>Enable</td>
</tr>
</tbody>
</table>

   c. Click OK.

3. Configure the stitch:
   a. Go to Security Fabric > Automation, select the Stitch tab, and click Create New.
   b. Enter the name, anomaly-logs-stitch.
   c. Click Add Trigger. Select anomaly-logs and click Apply.
   d. Click Add Action. Select email_default_rep_message and click Apply.
   e. Click Add delay (between the trigger and action). Enter 3 and click OK.
   f. Click OK.

To configure an automation stitch with the anomaly logs trigger in the CLI:

1. Configure the trigger:
   ```
   config system automation-trigger
   edit "anomaly-logs"
   set event-type anomaly-logs
   set vdom "root" "vdom-nat" "vdom-tp"
   next
   end
   ```

2. Configure the action:
   ```
   config system automation-action
   edit "email_default_rep_message"
   set action-type email
   set email-to "admin@fortinet.com"
   ```
3. Configure the stitch:

```plaintext
set email-subject "CSF stitch alert"
set replacement-message enable
next
end
```

```plaintext
config system automation-stitch
edit "anomaly-logs-stitch"
set description "anomaly-logs"
set trigger "anomaly-logs"
config actions
   edit 1
      set action "email_default_rep_message"
      set delay 3
      set required enable
   next
next
end
```

**Verification**

Once the anomaly log is generated, the automation stitch is triggered and the email notification is sent.

To confirm that the stitch was triggered in the GUI:

1. Go to Security Fabric > Automation and select the Stitch tab.
2. Verify the Last Triggered column.

To confirm that the stitch was triggered in the CLI:

```
# diagnose test application autod 2
...
stitch: anomaly-logs-stitch
destinations: all
trigger: anomaly-logs
```
type: anomaly logs

field ids:
  (id:6) vd=root, vdom-nat, vdom-tp

local hit: 1 related to: 0 related from: 0

actions:
  email_default_rep_message type: email interval: 0
delay: 3 required: yes
subject: CSF stitch alert
body: %%log%%
sender: mailto:admin@fortinet.com;

Actions

The following table outlines the available actions. Multiple actions can be added to an automation stitch. Actions can be reorganized in the Edit Automation Stitch page by dragging and dropping the actions in the diagram.

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Security Response</strong></td>
<td><strong>Access Layer Quarantine</strong></td>
<td>This option is only available for Compromised Host triggers. Quarantine the MAC address on access layer devices (FortiSwitch and FortiAP).</td>
</tr>
<tr>
<td></td>
<td><strong>FortiClient Quarantine</strong></td>
<td>This option is only available for Compromised Host triggers. Use FortiClient EMS to block all traffic from the source addresses that are flagged as compromised hosts. Quarantined devices are flagged on the Security Fabric topology views. Go to the Dashboard &gt; Users &amp; Devices &gt; Quarantine widget to view and manage quarantined IP addresses.</td>
</tr>
<tr>
<td></td>
<td><strong>FortiNAC Quarantine</strong></td>
<td>This option is only available for Compromised Host and Incoming Webhook triggers. Use FortiNAC to quarantine a client PC and disable its MAC address. See FortiNAC Quarantine action on page 2377 for details.</td>
</tr>
<tr>
<td></td>
<td><strong>VMware NSX Security Tag</strong></td>
<td>This option is only available for Compromised Host triggers. If an endpoint instance in a VMware NSX environment is compromised, the configured security tag is assigned to the compromised endpoint. See VMware NSX security tag action on page 2380 and VMware NSX-T security tag action on page 2384 for details.</td>
</tr>
<tr>
<td></td>
<td><strong>IP Ban</strong></td>
<td>This option is only available for Compromised Host triggers. Block all traffic from the source addresses flagged by the IoC. Go to the Dashboard &gt; Users &amp; Devices &gt; Quarantine widget to view and manage quarantined IP addresses.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Notifications</td>
<td>Email</td>
<td>Send a custom email message to the selected recipients. At least one recipient and an email subject must be specified. The email body can use parameters from logs or previous action results. Wrapping the parameter with %% will replace the expression with the JSON value for the parameter, for example: %%results.source%% is the source property from the previous action. Replacement messages can be enabled in the email body to create branded email alerts. See Replacement messages for email alerts on page 2388 for details.</td>
</tr>
<tr>
<td></td>
<td>FortiExplorer Notification</td>
<td>Send push notifications to FortiExplorer. The FortiGate must be registered to FortiCare on the mobile app that will receive the notification.</td>
</tr>
<tr>
<td></td>
<td>Slack Notification</td>
<td>Send a notification to a Slack channel. See Slack Notification action on page 2392 for details.</td>
</tr>
<tr>
<td></td>
<td>Microsoft Teams Notification</td>
<td>Send a notification to channels in Microsoft Teams. See Microsoft Teams Notification action on page 2397 for details.</td>
</tr>
<tr>
<td>Cloud Compute</td>
<td>AWS Lambda</td>
<td>Send log data to an integrated AWS service. See AWS Lambda action on page 2402 for details.</td>
</tr>
<tr>
<td></td>
<td>Azure Function</td>
<td>Send log data to an Azure function. See Azure Function action on page 2404 for details.</td>
</tr>
<tr>
<td></td>
<td>Google Cloud Function</td>
<td>Send log data to a Google Cloud function. See Google Cloud Function action on page 2405 for details.</td>
</tr>
<tr>
<td>General</td>
<td>CLI Script</td>
<td>Run one or more CLI scripts. See CLI script action on page 2409 for details. See Execute a CLI script based on CPU and memory thresholds on page 2412 for an example.</td>
</tr>
<tr>
<td></td>
<td>Webhook</td>
<td>Send an HTTP request using a REST callback. See Webhook action on page 2420 for details, and Slack integration webhook on page 2424 and Microsoft Teams integration webhook on page 2426 for examples.</td>
</tr>
<tr>
<td></td>
<td>Alert</td>
<td>Generate a FortiOS dashboard alert. This option is only available in the CLI.</td>
</tr>
<tr>
<td></td>
<td>Disable SSID</td>
<td>Disable the SSID interface. This option is only available in the CLI.</td>
</tr>
</tbody>
</table>
FortiNAC Quarantine action

Users can configure an automation stitch with the FortiNAC Quarantine action with a Compromised Host or Incoming Webhook trigger. When the automation is triggered, the client PC will be quarantined and its MAC address is disabled in the configured FortiNAC.

In this example, the FortiNAC has been configured to join an enabled Security Fabric. See Configuring FortiNAC on page 2252 for more information.

The FortiNAC must also be configured to isolate disabled hosts:

- Endpoints connecting to FortiWiFi or wired ports on FortiGate:
  - See the requisite Configure FortiNAC section in the FortiGate Endpoint Management Integration Guide.
- Endpoints connecting to FortiAP:
  - Set the Dead End VLAN. See Model configuration.
- Endpoints connecting to FortiSwitch:
  - Set the Dead End VLAN. See Model configuration.
  - Add the switch to the physical address filtering group. See Systems groups and Modify a group.

To configure an automation stitch with a FortiNAC quarantine action in the GUI:

1. Create a new API user and generate the API key:
   a. Go to System > Administrators and click Create New > REST API Admin.
   b. Configure the settings as needed.
   c. Click OK. The New API key window opens.
   d. Copy the key to the clipboard and click Close.
   e. Click OK.

2. Configure the automation stitch trigger:
   a. Go to Security Fabric > Automation and click Create New.
   b. Enter the stitch name (auto_webhook).
   c. Click Add Trigger.
   d. Click Create and select Incoming Webhook.
   e. Enter a name (auto_webhook).
   f. Click OK.
g. Paste the key in the API admin key field.

![Image of automated stitch configuration](image)

h. Click OK.

i. Select the trigger in the list and click **Apply**.

3. Configure the automation stitch action:

   a. Click **Add Action**.
   b. Click **Create** and select **FortiNAC Quarantine**.
   c. Enter an action name (**auto_webhook_quarantine-fortinac**) and click **OK**.
   d. Select the action in the list and click **Apply**.
   e. Click **OK**.

4. On a Linux PC accessible by the FortiGate, create a cURL request to trigger the automation stitch:

```
```

5. In FortiOS, verify the automation stitch is triggered and the action is executed:

   a. Go to **Log & Report > System Events** to confirm that the stitch was activated.
   b. Go to **Security Fabric > Automation** to see the last time that the stitch was triggered.

   In FortiNAC, the **Host View** shows the status of the client PC. It is quarantined and its MAC address is disabled.
To configure an automation stitch with a FortiNAC quarantine action in the CLI:

1. Create a new API user and generate the API key:

   ```
   config system api-user
   edit "g-api-rw-user"
       set api-key ************
       set accprofile "super_admin"
       set vdom "root"
   config trusthost
       edit 1
           set ipv4-trusthost 10.6.30.0 255.255.255.0
       next
   next
   end
   ```

2. Configure the automation trigger:

   ```
   config system automation-trigger
   edit "auto_webhook"
       set event-type incoming-webhook
   next
   end
   ```

3. Configure the automation action:

   ```
   config system automation-action
   edit "auto_webhook_quarantine-fortinac"
       set action-type quarantine-fortinac
   next
   end
   ```

4. Configure the automation stitch:

   ```
   config system automation-stitch
   edit "auto_webhook"
       set trigger "auto_webhook"
   config actions
       edit 1
           set action "auto_webhook_quarantine-fortinac"
       set required enable
   next
   next
   end
   ```

5. On a Linux PC accessible by the FortiGate, create a cURL request to trigger the automation stitch:

   ```bash
   ```

6. In FortiOS, verify that the automation stitch is triggered and the action is executed:

   ```bash
   # diagnose test application autod 2
csf: enabled  root=yes
version:1592949233 sync time:Tue Jun 23 15:03:15 2020
   ```
total stitches activated: 1

stitch: auto_webhook
    destinations: all
    trigger: auto_webhook

    (id:15)service=auto_webhook

    local hit: 1 relayed to: 0 relayed from: 0
    actions:
        auto_webhook_quarantine-fortinac type:quarantine-fortinac interval:0

date=2020-06-23 time=15:25:44 logdesc="Internal Message" path="system" name="automation-stitch" action="webhook" mkey="auto_webhook" srcip="1.1.1.1" mac="00:0C:29:0B:A6:16"
    fctuid="A8BA0B12DA694E47BA4ADF24F8358E2F" vdom="root" service="auto_webhook"

date=2020-06-23 time=15:25:44 logid="0100046600" type="event" subtype="system"
    level="notice" vd="root" eventtime=1592951144401490054 tz="-0700" logdesc="Automation stitch triggered" stitch="auto_webhook" trigger="auto_webhook" stitchaction="auto_webhook_quarantine-fortinac" from="log" msg="stitch: auto_webhook is triggered."

**VMware NSX security tag action**

If an endpoint instance in a VMware NSX environment is compromised, this action will assign the configured security tag to the compromised endpoint.

This action is only available when the automation trigger is set to compromised host.

To set up the NSX quarantine action, you need to:

1. Configure a VMware NSX SDN connector
2. Configure an NSX security tag automation stitch
3. Configure FortiAnalyzer logging on the FortiGate

**Configure a VMware NSX SDN connector**

The FortiGate retrieves security tags from the VMware NSX server through the connector.

To configure a VMware NSX SDN connector in the GUI:

1. Go to Security Fabric > External Connectors.
2. Click Create New.
3. Select VMware NSX.
4. Configure the settings as needed.

5. Click OK.

**To configure a VMware NSX SDN connector in the CLI:**

```bash
config system sdn-connector
edit "nsx"
    set type nsx
    set server "172.18.64.32"
    set username "admin"
    set password xxxxxxxxxxxxx
next
end
```

**Configure an NSX security tag automation stitch**

Security tags are retrieved from the VMware NSX server through the NSX SDN connector.

**To configure an automation stitch with an NSX security tag in the GUI:**

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name *(pcui-test)*.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Compromised Host*.
   c. Enter the following:

<table>
<thead>
<tr>
<th></th>
<th>pcui-test</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>pcui-test</td>
</tr>
<tr>
<td>Threat level threshold</td>
<td>High</td>
</tr>
</tbody>
</table>
3. Click OK.
4. **Configure the VMware NSX Security Tag action:**
   a. Click **Add Action**.
   b. Click **Create** and select **VMware NSX Security Tag**.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>pcui-test_quarantine-nsx</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify NSX server(s)</td>
<td>Enable and select the SDN connector</td>
</tr>
<tr>
<td>Security tag</td>
<td>Select an existing tag, or create a new one</td>
</tr>
</tbody>
</table>

   d. Click OK.
   e. Select the action in the list and click **Apply**.

5. Click OK.

**To configure an automation stitch with an NSX security tag in the CLI:**

1. **Create an automation trigger:**

   ```
   config system automation-trigger
   edit "pcui-test"
       set ioc-level high
   next
   end
   ```

2. **Create an automation action:**

   ```
   config system automation-action
   edit "pcui-test_quarantine-nsx"
       set action-type quarantine-nsx
       set security-tag "pcui-tag2"
       set sdn-connector "nsx"
   next
   end
   ```
3. Create the automation stitch:

```plaintext
config system automation-stitch
    edit "pcui-test"
        set trigger "pcui-test"
    config actions
        edit 1
            set action "pcui-test_quarantine-nsx"
            set required enable
        next
    next
end
```

**Configure FortiAnalyzer logging on the FortiGate**

The FortiAnalyzer is used to send endpoint compromise notification to the FortiGate.

See [Configuring FortiAnalyzer on page 2217](#) for more information.

**To configure FortiAnalyzer logging in the GUI:**

1. Go to Security Fabric > Fabric Connectors and double-click the FortiAnalyzer Logging card.
2. Ensure the Status is Enabled, and configure the settings as needed.

![FortiAnalyzer GUI Configuration](#)

3. Click Apply.

**To configure FortiAnalyzer logging in the CLI:**

```plaintext
config log fortianalyzer setting
    set status enable
    set server "172.18.64.234"
    set serial "FL-8HFT000000000"
    set upload-option realtime
    set reliable enable
end
```
When an endpoint instance is compromised

When an endpoint instance, such as `pcui-ubuntu2`, in the VMware NSX environment is compromised, the automation stitch is triggered. The FortiGate then assigns the configured security tag, `pcui-tag2` in this example, to the compromised NSX endpoint instance.

VMware NSX-T security tag action

VMware NSX SDN connectors’ vCenter server and credentials can be configured so the FortiGate resolves NSX-T VMs. The FortiGate uses the VMWare NSX Security Tag automation action to assign a tag to the VM through an automation stitch.

The FortiGate is notified of a compromised host on the NSX-T network by an incoming webhook or other means, such as FortiGuard IOC. An automation stitch can be configured to process this trigger and action it by assigning a VMware NSX security tag on the VM instance.

To configure an automation stitch to assign a security tag to NSX-T VMs in the GUI:

1. Configure the NSX SDN connector:
   a. Go to Security Fabric > External Connectors and click Create New.
   b. Select VMware NSX.
   c. Configure the connector settings.
d. Enable vCenter Settings and configure as needed.

![Automation Stitch Settings]

<table>
<thead>
<tr>
<th>Name</th>
<th>auto_webhook_quarantine-nsx</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify NSX server(s)</td>
<td>Enable and select the SDN connector</td>
</tr>
<tr>
<td>Security tag</td>
<td>Select an existing tag, or create a new one</td>
</tr>
</tbody>
</table>

e. Click OK.

2. Configure the automation stitch trigger:
   a. Go to Security Fabric > Automation and click Create New.
   b. Enter the stitch name (auto_webhook).
   c. Click Add Trigger.
   d. Click Create and select Incoming Webhook.
   e. Enter a name (auto_webhook).
   f. Click OK to close the Incoming Webhook URL prompt.
   g. Select the trigger in the list and click Apply.

3. Configure the automation stitch action:
   a. Click Add Action.
   b. Click Create and select VMware NSX Security Tag.
   c. Enter the following:

```markdown
<table>
<thead>
<tr>
<th>Name</th>
<th>auto_webhook_quarantine-nsx</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify NSX server(s)</td>
<td>Enable and select the SDN connector</td>
</tr>
<tr>
<td>Security tag</td>
<td>Select an existing tag, or create a new one</td>
</tr>
</tbody>
</table>
```
d. Click OK.
e. Select the action in the list and click Apply.

4. Click OK.

5. In NSX-T, create a cURL request to trigger the automation stitch on the FortiGate:

```bash
root@pc56:/home# curl -k -X POST -H 'Authorization: Bearer 3fdxMG08mgNg0fh4NQ51g1NQ1QHcxx' --data '{ "srcip": "10.1.30.242"}' https://172.16.116.230/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
{
  "http_method":"POST",
  "status":"success",
  "http_status":200,
  "serial":"FGVM08TM20000000",
  "version":"v6.4.0",
  "build":1608
}
```

The automation stitch is triggered and the configured tag is added to the NSX-T VM.

In FortiOS, the Security Fabric > Automation page shows the last trigger time.
To configure an automation stitch to assign a security tag to NSX-T VMs in the CLI:

1. Configure the NSX SDN connector:

   ```
   config system sdn-connector
   edit "nsx_t25"
       set type nsx
       set server "172.18.64.205"
       set username "admin"
       set password xxxxxxxxxxx
       set vcenter-server "172.18.64.201"
       set vcenter-username "administrator@vsphere.local"
       set vcenter-password xxxxxxxxxxx
   next
   end
   ```

2. Configure the automation stitch:

   ```
   config system automation-trigger
   edit "auto_webhook"
       set trigger-type event-based
       set event-type incoming-webhook
   next
   end

   config system automation-action
   edit "auto_webhook_quarantine-nsx"
       set action-type quarantine-nsx
       set security-tag "automation_tag"
       set sdn-connector "nsx_t25"
   next
   end

   config system automation-stitch
   edit "auto_webhook"
       set trigger "auto_webhook"
       config actions
           edit 1
           set action "auto_webhook_quarantine-nsx"
           set required enable
       next
   next
   end
   ```

3. In NSX-T, create a cURL request to trigger the automation stitch on the FortiGate:

   ```
   root@pc56:/home# curl -k -X POST -H 'Authorization: Bearer
   3fdxNG08mgNg0fh4NQ51g1NQ1QHcxR' --data '{ "srcip": "10.1.30.242"}'
   ```
To verify the automation stitch is triggered and the action is executed:

```bash
# diagnose test application autod 2
csf: enabled root:yes
version:1586883541 sync time:Tue Apr 14 11:04:05 2020
total stitches activated: 1
stitch: auto_webhook
destinations: all
trigger: auto_webhook
(id:15)service=auto_webhook
local hit: 1 relayed to: 0 relayed from: 0
actions:
auto_webhook_quarantine-nsx type:quarantine-nsx interval:0
security_tag:automation_tag
sdn_connector:
nsx_t25;
```

Replacement messages for email alerts

Automation stitches with an Email action can leverage the formatting options provided by replacement messages to create branded email alerts.

You can enable a replacement message and edit the message body or select a customized replacement message group when you configure the automation action. When the automation stitch is triggered, the FortiGate will send the email with the defined replacement message.

In this example, a Security Rating report triggers an Email notification action. The email uses a customized replacement message group.

To configure the replacement message group in the GUI:

1. Go to System > Replacement Message Groups and click Create New.
2. Enter the following:
   
<table>
<thead>
<tr>
<th>Name</th>
<th>group-sec1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Type</td>
<td>Security</td>
</tr>
</tbody>
</table>
   
3. Click OK.
4. Select the group in the list and click Edit.
5. Select Automation Alert Email and click Edit.

6. Edit the HTML code as needed, then click Save.

To configure the email action in the GUI:

2. Enter the stitch name.
3. Configure the trigger:
   a. Click Add Trigger.
   b. Click Create and select Security Rating Summary.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>rating_posture</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>rating test</td>
</tr>
<tr>
<td>Report</td>
<td>Security Posture</td>
</tr>
</tbody>
</table>
4. Configure the Email notification action:
   a. Click Add Action.
   b. Click Create and select Email.
   c. Enter the following:

   - **Name**: email-group1
   - **To**: Enter an email address
   - **Subject**: CSF stitch alert group1
   - **Replacement message**: Enable
   - **Customize messages**: Enable and select group-sec1 from the dropdown

5. Click OK.
6. Right-click the automation stitch, and click Test Automation Stitch. After the Security Rating report is finished, the automation is triggered, and the email is delivered with the customized replacement message in the email body.

![Image of Security Fabric Automation rating trigger]

To configure the replacement message group in the CLI:

```plaintext
cfg system replacemsg-group
  edit "group-secl"
    set comment ""
    set group-type utm
  config automation
    edit "automation-email"
    set buffer "...<h1> Security Fabric Automation rating trigger </h1>...
    ...
  next
next
end
```

To configure the email action in the CLI:

1. Configure the automation trigger:

```plaintext
cfg system automation-trigger
  edit "rating_posture"
    set description "rating test"
    set event-type security-rating-summary
  next
end
```

2. Configure the automation action:

```plaintext
cfg system automation-action
  edit "email-group1"
    set action-type email
    set email-to "admin@fortinet.com"
    set email-subject "CSF stitch alert group1"
    set replacement-message enable
```
3. **Configure the automation stitch:**

   ```plaintext
   set replacemsg-group "group-secl"
   next
   end
   
   config system automation-stitch
   edit "auto_rating"
   set trigger "rating_posture"
   config actions
   edit 1
   set action "email-group1"
   set required enable
   next
   next
   end
   end
   
   4. To view the automation stitch information after it is triggered:

   ```plaintext
   # diagnose test application autod 3
   stitch: auto_rating
   local hit: 1 relayed to: 0 relayed from: 0
   last trigger: Tue Mar 16 15:11:29 2021
   last relay:
   actions:
   email-group1:
   done: 1 relayed to: 0 relayed from: 0
   last trigger: Tue Mar 16 15:11:29 2021
   last relay:
   
   logid2stitch mapping:
   id:52000 local hit: 1 relayed hits: 0
   auto_rating
   ```

**Slack Notification action**

To configure an automation stitch with a Slack Notification action, you first need to configure an incoming webhook in Slack. Then you can enter the webhook URL when you configure the Slack Notification action.

This example uses a Security Rating Summary trigger in the automation stitch with two Slack Notification actions with different notification messages. One message is a custom message, and the other is for the Security Rating Summary log with a 90 second delay.
To create an Incoming Webhook in Slack:

1. Go to the Slack website, and create a workspace.
2. Create a Slack application for the workspace.
3. Add an Incoming Webhook to a channel in the workspace (see Sending messages using Incoming Webhooks for more details).
4. Activate the Incoming Webhook, and copy the Webhook URL to the clipboard.

To configure an automation stitch with Slack Notification actions in the GUI:

2. Enter the stitch name.
3. Configure the Security Rating Summary trigger:
   a. Click Add Trigger.
   b. Click Create and select Security Rating Summary.
c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>auto-rating</th>
</tr>
</thead>
<tbody>
<tr>
<td>Report</td>
<td>Security Posture</td>
</tr>
</tbody>
</table>

d. Click OK.
e. Select the trigger in the list and click Apply.

4. Configure the first Slack Notification action:
a. Click Add Action.
b. Click Create and select Slack Notification.
c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>slack1</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Paste the webhook URL from the clipboard</td>
</tr>
<tr>
<td>Message</td>
<td>Text</td>
</tr>
<tr>
<td>Message text</td>
<td>This is test for slack notification.</td>
</tr>
</tbody>
</table>

d. Click OK.
e. Select the action in the list and click Apply.

5. Configure the second Slack Notification action:
a. Click Add Action.
b. Click Create and select Slack Notification.
c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>slack2</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Paste the webhook URL from the clipboard</td>
</tr>
</tbody>
</table>
d. Click OK.

e. Select the action in the list and click Apply.

f. Click the Add delay located between both actions. Enter 90 and click OK.

6. Click OK.
7. Trigger the automation stitch:
   a. Right-click the automation stitch and select *Test Automation Stitch.*
   After the Security Rating report is finished, the automation is triggered and an event log is created by the FortiGate. The two notifications are sent to the Slack channel.

To configure an automation stitch with Slack Notification actions in the CLI:

1. Configure the automation trigger:
   ```fortios
   config system automation-trigger
   edit "auto-rating"
       set event-type security-rating-summary
   next
   end
   ```

2. Configure the automation actions:
   ```fortios
   config system automation-action
   edit "slack1"
       set action-type slack-notification
       set message "This is test for slack notification."
       set uri "hooks.slack.com/services/xxxxxxxxx/xxxxxxxxx/xxxxxxxxxxxxxxxxxxxxxxxxxx"
   next
   edit "slack2"
       set action-type slack-notification
       set uri "hooks.slack.com/services/xxxxxxxxx/xxxxxxxxx/xxxxxxxxxxxxxxxxxxxxxxxxxx"
   next
   end
   ```

3. Configure the automation stitch:
   ```fortios
   config system automation-stitch
   edit "auto_rating"
       set trigger "auto-rating"
   config actions
       edit 1
           set action "slack1"
           set required enable
   next
       edit 2
           set action "slack2"
   ```
4. Verify that the automation action was triggered:

```plaintext
set delay 90
set required enable
next
end
next
end
```

Microsoft Teams Notification action

Microsoft Teams Notification actions can be configured to send notifications to channels in Microsoft Teams. To trigger the notifications, you need to add an Incoming Webhook connector to a channel in Microsoft Teams, then you can configure the automation stitch with the webhook URL.

In the following example, you will configure an automation stitch with a Security Rating Summary trigger and two Microsoft Teams Notification actions with different notification messages. One message is for the Security Rating Summary log, and the other is a custom message with a ten second delay.

To add the Incoming Webhook connector in a Microsoft Teams channel:

1. In Microsoft Teams, click the ... (More options) beside the channel name, and select Connectors.
2. Search for Incoming Webhook and click Configure.
3. Enter a name for the webhook, upload an image for the webhook, and click Create.
4. Copy the webhook to the clipboard and save it.
5. Click Done.

To configure an automation stitch with Microsoft Teams Notification actions in the GUI:

2. Enter the stitch name.
3. Configure the Security Rating Summary trigger:
   a. Click Add Trigger.
   b. Click Create and select Security Rating Summary.
   c. Enter a name, and for Report, select Security Posture.
   d. Click OK.
   e. Select the trigger in the list and click Apply.
4. Configure the first Microsoft Teams Notification action:
   a. Click Add Action.
   b. Click Create and select Microsoft Teams Notification.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>teams_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Paste the webhook URI from the clipboard</td>
</tr>
<tr>
<td>Message</td>
<td>Text</td>
</tr>
<tr>
<td>Message text</td>
<td>%%log%%</td>
</tr>
</tbody>
</table>
d. Click OK.
e. Select the action in the list and click Apply.

5. Configure the second Microsoft Teams Notification action:
   a. Click Add Action.
   b. Click Create and select Microsoft Teams Notification.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>teams_2</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Paste the webhook URI from the clipboard</td>
</tr>
<tr>
<td>Message</td>
<td>Text</td>
</tr>
<tr>
<td>Message text</td>
<td>This is for test.</td>
</tr>
</tbody>
</table>
d. Click OK.
e. Select the action in the list and click Apply.
f. Click the Add delay located between both actions. Enter 10 and click OK.

6. Click OK.

7. Trigger the automation stitch:
   a. Right-click the automation stitch and select Test Automation Stitch.
      After the Security Rating report is finished, the automation is triggered and an event log is created by the FortiGate. The two notifications are sent to the Microsoft Teams channel.
To configure an automation stitch with Microsoft Teams Notification actions in the CLI:

1. Configure the automation trigger:

   ```
   config system automation-trigger
   edit "Teams_action"
       set event-type security-rating-summary
   next
   end
   ```

2. Configure the automation actions:

   ```
   config system automation-action
   edit "teams_1"
       set action-type microsoft-teams-notification
       set uri "outlook.office.com/webhook/xxxxxxxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxxx/IncomingWebhook/xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx/xxxxxxxxxxxxx"
       next
   edit "teams_2"
       set action-type microsoft-teams-notification
       set message "This is for test."
       set uri "outlook.office.com/webhook/xxxxxxxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxxx/IncomingWebhook/xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx/xxxxxxxxxxxxx"
   next
   end
   ```

3. Configure the automation stitch:

   ```
   config system automation-stitch
   edit "Teams_action"
       set trigger "Teams_action"
   ```
config actions
edit 1
        set action "teams_1"
        set required enable
next
edit 2
        set action "teams_2"
        set delay 10
        set required enable
next
end
next
end

4. Verify that the automation action was triggered:

```
# diagnose test application autod 3
stitch: Teams_action
        local hit: 2 relayed to: 0 relayed from: 0
        last trigger: Mon Nov 16 10:28:08 2020
        last relay:
        actions:
                teams_1:
                done: 2 relayed to: 0 relayed from: 0
                        last trigger: Mon Nov 16 10:28:08 2020
                        last relay:
                teams_2:
                done: 2 relayed to: 0 relayed from: 0
                        last trigger: Mon Nov 16 10:28:08 2020
                        last relay:
logid2stitch mapping:
id:52000 local hit: 22 relayed hits: 0
Teams_action
```

**AWS Lambda action**

AWS Lambda functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

**To configure an AWS Lambda function automation stitch in the GUI:**

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter the following:
      
      | Name     | auto-aws |
      |----------|----------|
      | Report   | Security Posture |

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*. 
4. Configure the AWS Lambda function action:
   a. Click Add Action.
   b. Click Create and select AWS Lambda.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>aws-action-1</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the request API URI</td>
</tr>
<tr>
<td>API key</td>
<td>Enter the API key</td>
</tr>
<tr>
<td>HTTP header</td>
<td>header2:header2_value</td>
</tr>
</tbody>
</table>
   
   d. Click OK.
   e. Select the action in the list and click Apply.

5. Click OK.

To configure an AWS Lambda function automation stitch in the CLI:

1. Create the automation trigger:
   ```bash
   config system automation-trigger
   edit "auto-aws"
     set event-type security-rating-summary
   next
   end
   ```

2. Create the automation action:
   ```bash
   config system automation-action
   edit "aws-action-1"
     set action-type aws-lambda
     set aws-api-key *************
     set uri "0100000000.execute-api.us-east-2.amazonaws.com/default/xxxxx-autobatoon-XXX-lambdaXXX"
     set headers "header2:header2_value"
   next
   end
   ```

3. Create the automation stitch:
   ```bash
   config system automation-stitch
   edit "auto-aws"
     set trigger "auto-aws"
     config actions
       edit 1
         set action "aws-action-1"
         set required enable
       next
     end
   next
   end
   ```

When the automation stitch is triggered, the Security Fabric > Automation page shows the stitch trigger time. In AWS, the log shows that the function was called, executed, and finished.
**Azure Function action**

Azure functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

**To configure an Azure function automation stitch in the GUI:**

2. Enter the stitch name.  
3. Configure the trigger:  
   a. Click Add Trigger.  
   b. Click Create and select Security Rating Summary.  
   c. Enter the following:  
      | Name       | auto-azure   | Report | Security Posture |
      |-----------|--------------|--------|------------------|
   d. Click OK.  
   e. Select the trigger in the list and click Apply.  
4. Configure the Azure Function action:  
   a. Click Add Action.  
   b. Click Create and select Azure Function.  
   c. Enter the following:  
      | Name       | azure_function | URL        | Enter the request API URI |
      |-----------|----------------|------------|--------------------------|
      | Authorization | Function       | API key    | Enter the API key         |
      | HTTP header | header1 : value1|            |                          |
   d. Click OK.  
   e. Select the action in the list and click Apply.  
5. Click OK.

**To configure an Azure function automation stitch in the CLI:**

1. Create an automation trigger:  
   ```bash  
   config system automation-trigger  
   edit "auto-azure"  
   set event-type security-rating-summary  
   next  
   end  
   ```
2. Create an automation action:  
   ```bash  
   config system automation-action  
   edit "azure_function"  
   set action-type azure-function  
   ```
set azure-function-authorization function
set azure-api-key ***********
set uri "xxxxx00-no-delete-xxxx.azurewebsites.net/api/headersResponse"
set headers "header1:value1"
next
end

3. Create the automation stitch:

   config system automation-stitch
   edit "auto-azure"
   set trigger "auto-azure"
   config actions
     edit 1
     set action "azure_function"
     set required enable
   next
next
end

When the automation stitch is triggered, the Security Fabric > Automation page shows the stitch trigger time. In Azure, the function log shows that the function was called, executed, and finished:

Google Cloud Function action

Google Cloud functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

To configure a Google Cloud function automation stitch in the GUI:

2. Enter the stitch name.
3. Configure the trigger:
   a. Click Add Trigger.
   b. Click Create and select Security Rating Summary.
c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>auto-google1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Report</td>
<td>Security Posture</td>
</tr>
</tbody>
</table>

d. Click OK.

e. Select the trigger in the list and click Apply.

4. Configure the Google Cloud Function action:
   a. Click Add Action.
   b. Click Create and select Google Cloud Function.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>google-echo</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the request API URI</td>
</tr>
<tr>
<td>HTTP header</td>
<td>echo-header : echo-value</td>
</tr>
</tbody>
</table>

d. Click OK.

e. Select the action in the list and click Apply.

5. Click OK.

To configure a Google Cloud function automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
edit "auto-google1"
   set event-type security-rating-summary
next
end
```

2. Create an automation action:

```
config system automation-action
edit "google-echo"
   set action-type google-cloud-function
   set uri "us-central1-xxx-xxxxxxx-000-000000.cloudfunctions.net/xxxx-echo"
   set headers "echo-header:echo-value"
next
end
```

3. Create the automation stitch:

```
config system automation-stitch
edit "auto-google1"
   set trigger "auto-google1"
config actions
   edit 1
      set action "google-echo"
      set required enable
next
end
end
```
When the automation stitch is triggered, the Security Fabric > Automation page shows the stitch trigger time. In Google Cloud, go to Logs to see the function log showing that the configured function was called, executed, and finished:

![Function log in Google Cloud](image)

**AliCloud Function action**

AliCloud functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

**To configure an AliCloud function automation stitch in the GUI:**

2. Enter the stitch name.
3. Configure the trigger:
   a. Click Add Trigger.
   b. Click Create and select Security Rating Summary.
   c. Enter the following:
      
      | Name | auto-ali |
      |------|---------|
      | Report | Security Posture |

   d. Click OK.
   e. Select the trigger in the list and click Apply.
4. Configure the AliCloud Function action:
   a. Click Add Action.
   b. Click Create and select AliCloud Function.
   c. Enter the following:
      
      | Name | Ali-Action-1 |
      |------|-------------|
      | URL | Enter the request API URI |
      | Authorization | Function |
      | AccessKey ID | Enter the access key ID |
d. Click OK.

e. Select the action in the list and click Apply.

5. Click OK.

To configure an AliCloud function automation stitch in the CLI:

1. Create an automation trigger:

```plaintext
config system automation-trigger
  edit "auto-ali"
    set event-type security-rating-summary
  next
end
```

2. Create an automation action:

```plaintext
config system automation-action
  edit "Ali-Action-1"
    set action-type alicloud-function
    set alicloud-function-authorization function
    set alicloud-access-key-id "XXXXXXXXXXXXXXXXX"
    set alicloud-access-key-secret xxxxxx
    set uri "0000000000000000.us-east-1.fc.aliyuncs.com/2099-99-99/proxy/test-function/echoBodyAuth/"
  next
end
```

3. Create the automation stitch:

```plaintext
config system automation-stitch
  edit "auto-ali"
    set trigger "auto-ali"
  config actions
    edit 1
      set action "Ali-Action-1"
      set required enable
    next
  next
end
```

When the automation stitch is triggered, the Security Fabric > Automation page shows the stitch trigger time. In AliCloud, the function log shows that the function was called, executed, and finished:
CLI script action

CLI scripts can run when an automation stitch is triggered. The scripts can be entered manually, uploaded as a file, or recorded in the CLI console. The output of the script can be sent as an email action.

The maximum length of the CLI script action output is 16 thousand characters. The CLI script can be configured in the GUI and CLI; however, the output size and timeout settings can only be configured in the CLI.

```
config system automation-action
  edit <name>
    set action-type cli-script
    set output-size <integer>
    set timeout <integer>
  next
end
```

<table>
<thead>
<tr>
<th><code>output-size &lt;integer&gt;</code></th>
<th>Set the size to limit the script output, in megabytes (1 - 1024, default = 10).</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>timeout &lt;integer&gt;</code></td>
<td>Set the maximum running time for this script, in seconds (0 - 300, 0 = no timeout).</td>
</tr>
</tbody>
</table>

Example

In this example, the script sets the idle timeout value to 479 minutes, and sends an email with the script output.

To configure a stitch with a CLI script action in the GUI:

2. Enter the stitch name (`auto-cli-1`).
3. Configure the trigger:
   a. Click Add Trigger.
   b. Click Create and select Security Rating Summary.
c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>auto-cli-1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Report</td>
<td>Security Posture</td>
</tr>
</tbody>
</table>

d. Click OK.
e. Select the trigger in the list and click Apply.

4. Configure the CLI Script action:
   a. Click Add Action.
   b. Click Create and select CLI Script.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>admintimeout</th>
</tr>
</thead>
</table>
| Script       | config system global  
              |   set admintimeout 479
              | end                |

Alternatively, click Upload to upload a file, or click > Record in CLI console and enter the CLI commands.

5. Configure the Email notification action:
   a. Click Add Action.
   b. Click Create and select Email.
   c. Enter the following:
c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>auto-cli-1_email</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>Enter an email address</td>
</tr>
<tr>
<td>Subject</td>
<td>CSF stitch alert</td>
</tr>
<tr>
<td>Body</td>
<td>%%results%%</td>
</tr>
</tbody>
</table>

d. Click OK.

e. Select the action in the list and click Apply.

6. Click OK.

To configure a stitch with a CLI script action in the CLI:

1. Create the automation trigger:

   ```
   config system automation-trigger
   edit "auto-cli-1"
       set event-type security-rating-summary
   next
   end
   ```

2. Create the automation actions:

   ```
   config system automation-action
   edit "admintimeout"
       set action-type cli-script
       set script "config system global
                     set admintimeout 479
                     end"
       set output-size 10
       set timeout 0
       set accprofile "super_admin"
   ```
next
define action-type email
  set email-to "admin@fortinet.com"
  set email-subject "CSF stitch alert"
  set message "%%results%%"
definition

3. Create the automation stitch:

config system automation-stitch
define "auto-cli-1"
  set trigger "auto-cli-1"
  config actions
define 1
  set action "admintimeout"
  set required enable
definition
  define 2
  set action "auto-cli-1_email"
  set required enable
definition
definition

Sample email

The email sent by the action will look similar to the following:

Execute a CLI script based on CPU and memory thresholds

Automation stitches can be created to run a CLI script and send an email message when CPU or memory usage exceeds specified thresholds.

In this example, two automation stitches are created that run a CLI script to collect debug information, and then email the results of the script to a specified email address when the CPU usage threshold is exceeded, or memory usage causes the FortiGate to enter conserve mode.

The maximum size of the CLI script action output is 16K characters.
To define CPU and memory usage thresholds:

```
config system global
    set cpu-use-threshold <percent>
    set memory-use-threshold-extreme <percent>
    set memory-use-threshold-green <percent>
    set memory-use-threshold-red <percent>
end
```

Where:

<table>
<thead>
<tr>
<th>Threshold Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cpu-use-threshold</td>
<td>Threshold at which CPU usage is reported, in percent of total possible CPU</td>
</tr>
<tr>
<td>memory-use-threshold-extreme</td>
<td>Threshold at which memory usage is considered extreme, and new sessions are</td>
</tr>
<tr>
<td></td>
<td>dropped, in percent of total RAM (default = 95).</td>
</tr>
<tr>
<td>memory-use-threshold-green</td>
<td>Threshold at which memory usage forces the FortiGate to exit conserve mode,</td>
</tr>
<tr>
<td></td>
<td>in percent of total RAM (default = 82).</td>
</tr>
<tr>
<td>memory-use-threshold-red</td>
<td>Threshold at which memory usage forces the FortiGate to enter conserve mode,</td>
</tr>
<tr>
<td></td>
<td>in percent of total RAM (default = 88).</td>
</tr>
</tbody>
</table>

Configuring the automation stitches

High CPU usage stitch

To create an automation stitch for high CPU usage in the GUI:

2. Enter the stitch name (auto_high_cpu).
3. Configure the trigger:
   a. Click Add Trigger.
   b. Click Create and select High CPU.
   c. Enter the name, auto_high_cpu.
   d. Click OK.
   e. Select the trigger in the list and click Apply.
4. Configure the CLI Script action:
   a. Click Add Action.
   b. Click Create and select CLI Script.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>high_cpu_debug</th>
</tr>
</thead>
</table>
| Script       | diagnose debug cli 8
               | diagnose debug console timestamp enable
               | diagnose debug enable
               | diagnose debug crashlog read
               | get system performance status
               | get system session status
d. Click OK.
e. Select the action in the list and click Apply.

5. Configure the Email notification action:
   a. Click Add Action.
   b. Click Create and select Email.
   c. Enter the following:

   **Name**  auto_high_cpu_email
To create an automation stitch for high CPU usage in the CLI:

1. Create the automation trigger:

```fortigate
config system automation-trigger
  edit "auto_high_cpu"
    set event-type high-cpu
  next
end
```

2. Create the automation actions:

```fortigate
config system automation-action
  edit "high_cpu_debug"
    set action-type cli-script
    set script "diagnose debug console timestamp enable
diagnose debug enable
diagnose debug crashlog read
get system performance status
get system session status
diagnose sys session full-stat
diagnose firewall iprope state
diagnose sys flash list
diagnose hardware sysinfo memory
diagnose hardware sysinfo slab
diagnose hardware sysinfo shm
diagnose hardware deviceinfo disk
get system arp
diagnose ip arp list
diagnose ip address list
get router info routing-table all
get router info kernel
diagnose ip rtcache list
diagnose sys top-summary
diagnose sys top 9 99"
    set output-size 10
    set timeout 0
    set accprofile "super_admin"
  next
  edit "auto_high_cpu_email"
    set action-type email
    set email-to "person@fortinet.com"
    set email-subject "CSF stitch alert: high_cpu"
    set message "%%results%%"
  next
end
```
3. Create the automation stitch:

```bash
config system automation-stitch
edit "auto_high_cpu"
    set trigger "auto_high_cpu"
    config actions
        edit 1
            set action "high_cpu_debug"
            set required enable
        next
        edit 2
            set action "auto_high_cpu_email"
            set required enable
        next
    end
next
end
```

**High memory usage stitch**

**To create an automation stitch for high memory usage in the GUI:**

2. Enter the stitch name *(auto_high_memory)*.
3. Configure the trigger:
   a. Click Add Trigger.
   b. Click Create and select Conserve Mode.
   c. Enter the name, *auto_high_memory*.
   d. Click OK.
   e. Select the trigger in the list and click Apply.
4. Configure the CLI Script action:
   a. Click Add Action.
   b. Click Create and select CLI Script.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>high_memory_debug</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Script</strong></td>
<td></td>
</tr>
<tr>
<td>diagnose debug cli 8</td>
<td></td>
</tr>
<tr>
<td>diagnose debug console timestamp enable</td>
<td></td>
</tr>
<tr>
<td>diagnose debug enable</td>
<td></td>
</tr>
<tr>
<td>diagnose debug crashlog read</td>
<td></td>
</tr>
<tr>
<td>get system performance status</td>
<td></td>
</tr>
<tr>
<td>get system session status</td>
<td></td>
</tr>
<tr>
<td>diagnose sys session full-stat</td>
<td></td>
</tr>
<tr>
<td>diagnose firewall iprope state</td>
<td></td>
</tr>
<tr>
<td>diagnose sys flash list</td>
<td></td>
</tr>
<tr>
<td>diagnose hardware sysinfo memory</td>
<td></td>
</tr>
<tr>
<td>diagnose hardware sysinfo slab</td>
<td></td>
</tr>
<tr>
<td>diagnose hardware sysinfo shm</td>
<td></td>
</tr>
<tr>
<td>diagnose hardware deviceinfo disk</td>
<td></td>
</tr>
<tr>
<td>get system arp</td>
<td></td>
</tr>
</tbody>
</table>
d. Click OK.
e. Select the action in the list and click Apply.

5. Configure the Email notification action:
   a. Click Add Action.
   b. Click Create and select Email.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>auto_high_memory_email</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>Enter an email address</td>
</tr>
<tr>
<td>Subject</td>
<td>CSF stitch alert: high_memory</td>
</tr>
<tr>
<td>Body</td>
<td>%%results%%</td>
</tr>
</tbody>
</table>

d. Click OK.
e. Select the action in the list and click Apply.

6. Click OK.
To create an automation stitch for high memory usage in the CLI:

1. Create the automation trigger:

   ```
   config system automation-trigger
   edit "auto_high_memory"
       set event-type low-memory
   next
   end
   ```

2. Create the automation actions:

   ```
   config system automation-action
   edit "high_memory_debug"
       set action-type cli-script
       set script "diagnose debug cli 8
diagnose debug console timestamp enable
diagnose debug enable
diagnose debug crashlog read
get system performance status
get system session status
diagnose sys session full-stat
diagnose firewall iprope state
diagnose sys flash list
diagnose hardware sysinfo memory
diagnose hardware sysinfo slab
diagnose hardware sysinfo shm
diagnose hardware deviceinfo disk
get system arp
diagnose ip arp list
diagnose ip address list
get router info routing-table all
get router info kernel
diagnose ip rtcache list
diagnose sys top-summary
diagnose sys top 9 99"
       set output-size 10
       set timeout 0
       set accprofile "super_admin"
   next
   edit "auto_high_memory_email"
       set action-type email
       set email-to "person@fortinet.com"
       set email-subject "CSF stitch alert: high_memory"
       set message "%%results%%"
   next
   end
   ```

3. Create the automation stitch:

   ```
   config system automation-stitch
   edit "auto_high_memory"
       set trigger "auto_high_memory"
   config actions
       edit 1
       set action "high_memory_debug"
       set required enable
   next
   ```
edit 2
  set action "auto_high_memory_email"
  set required enable
next
end
next
end

Results

When the FortiGate enters conserve mode due to the memory-use-threshold-red being exceeded, the GUI displays a notice, and the auto_high_memory automation stitch is triggered. This causes the CLI script to run and the script results are emailed to the specified address.

Here is sample text from the email message:

CSF stitch alert: high_memory
noreply@notification.fortinet.net
Thu 11/21/2019 11:06 AM
John Doe
FGT[FGVM16TM19000000] Automation Stitch:auto_high_memory is triggered.

...
Webhook action

The webhook automation stitch action makes HTTP and HTTPS requests to a specified server, with custom headers, bodies, ports, and methods. It can be used to leverage the ubiquity of HTML requests and APIs to integrate with other tools.

The URI and HTTP body can use parameters from logs or previous action results. Wrapping the parameter with %% will replace the expression with the JSON value for the parameter, for example: %%results.source%% is the source property from the previous action.

In this example, a specific log message (failed administrator log in attempt) triggers the FortiGate to send the contents of the log to a server. The server responds with a generic reply. This example assumes that the server is already configured and able to communicate with the FortiGate.

To configure the webhook automation stitch in the GUI:

2. Enter the stitch name (badLogin).
3. Configure the trigger:
   a. Click Add Trigger.
   b. Click Create and select FortiOS Event Log.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>badLogin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event</td>
<td>Admin login failed</td>
</tr>
</tbody>
</table>

   d. Click OK.
   e. Select the trigger in the list and click Apply.

4. Configure the automation stitch action:
   a. Click Add Action.
   b. Click Create and select Webhook.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>Send Log To Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protocol</td>
<td>HTTP</td>
</tr>
<tr>
<td>URL</td>
<td>172.16.200.44</td>
</tr>
<tr>
<td>Custom port</td>
<td>Enable and enter 80</td>
</tr>
<tr>
<td>Method</td>
<td>POST</td>
</tr>
<tr>
<td>HTTP body</td>
<td>%%log%%</td>
</tr>
<tr>
<td>HTTP header</td>
<td>Header : 1st Action</td>
</tr>
</tbody>
</table>
To configure the webhook automation stitch in the CLI:

1. **Create an automation trigger:**

   ```
   config system automation-trigger
   edit "badLogin"
       set event-type event-log
       set logid 32002
   next
   end
   ```

2. **Create the automation action:**

   ```
   config system automation-action
   edit "Send Log To Server"
       set action-type webhook
       set uri "172.16.200.44"
       set http-body "%%log%%"
       set port 80
       set headers "Header:1st Action"
   next
   end
   ```

3. **Create the automation stitch:**

   ```
   config system automation-stitch
   edit "badLogin"
       set trigger "badLogin"
   config actions
   edit 1
       set action "Send Log To Server"
       set required enable
   next
   end
   ```
To test the automation stitch:

1. Attempt to log in to the FortiGate with an incorrect username or password.
2. On the server, check the log to see that its contents were sent by the FortiGate.

   The body content is replaced with the log from the trigger.

3. On the FortiGate, go to Log & Report > System Events to confirm that the stitch was activated.
4. Go to Security Fabric > Automation to see the last time that the stitch was triggered.

Diagnose commands

To enable log dumping:

```
# diagnose test application autod 1
autod dumped total:1 logs, num of logids:1
autod log dumping is enabled

vdom:root(0) logid:32002 len:408 log:
   date=2019-05-30 time=17:41:03 logid="0100032002" type="event" subtype="system" level="alert"

}
```

**Slack integration webhook**

A webhook can be created to post messages and notifications to Slack.

In this example, a configuration change triggers the FortiGate to post a message to Slack.

**To create a webhook automation stitch for Slack integration in the GUI:**

1. Create an incoming webhook in Slack. See Sending messages using Incoming Webhooks for more information.
2. Go to Security Fabric > Automation and click Create New.
3. Enter the stitch name.
4. Configure the trigger:
   a. Click Add Trigger.
   b. Click Create and select Configuration Change.
Fortinet Security Fabric
c. Enter a name (config change).
d. Click OK.
e. Select the trigger in the list and click Apply.
5. Configure the action:
a. Click Add Action.
b. Click Create and select Webhook.
c. Enter the following:
Name

send to Slack

Protocol

HTTPS

URL

Enter the incoming webhook URL created in Slack

Custom port

Enable and enter 443

Method

POST

HTTP body

{\"channel\": \"#delivery\", \"username\": \"tleela\", \"text\": \"Configuration
changed\", \"icon_emoji\": \":worried:\"}

HTTP header

Content-type : application/json

d. Click OK.
e. Select the action in the list and click Apply.
6. Click OK.

FortiOS 7.2.0 Administration Guide
Fortinet Inc.

2425


To create a webhook automation stitch for Slack integration in the CLI:

1. Create an incoming webhook in Slack. See Sending messages using Incoming Webhooks for more information.
2. Create the automation trigger:

   ```
   config system automation-trigger
   edit "config change"
   set event-type config-change
   next
   end
   ```

3. Create the automation action:

   ```
   config system automation-action
   edit "send to Slack"
   set action-type webhook
   set protocol https
   set uri "hooks.slack.com/services/xxxxxxx"
   set http-body "{
   \"channel\": \"#delivery\", \"username\": \"tleela\", \"text\": \"Configuration changed\", \"icon_emoji\": \":worried:\"\"
   }
   set port 443
   set headers "Content-type:application/json"
   next
   end
   ```

4. Create the automation stitch:

   ```
   config system automation-stitch
   edit "Slack"
   set trigger "config change"
   config actions
   edit 1
   set action "send to Slack"
   set required enable
   next
   end
   next
   end
   ```

**Microsoft Teams integration webhook**

A webhook can be created to post messages and notifications to Microsoft Teams.

In this example, a configuration change triggers the FortiGate to post a message to Teams.

To create a webhook automation stitch for Teams integration in the GUI:

2. Go to Security Fabric > Automation and click Create New.
3. Enter the stitch name.
4. Configure the trigger:
   a. Click Add Trigger.
   b. Click Create and select Configuration Change.
   c. Enter a name (Teams).
d. Click OK.
e. Select the trigger in the list and click Apply.

5. Configure the action:
   a. Click Add Action.
   b. Click Create and select Webhook.
   c. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>send to Teams</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protocol</td>
<td>HTTPS</td>
</tr>
<tr>
<td>URL</td>
<td>Enter the incoming webhook URL created in Teams</td>
</tr>
<tr>
<td>Custom port</td>
<td>Enable and enter 443</td>
</tr>
<tr>
<td>Method</td>
<td>POST</td>
</tr>
<tr>
<td>HTTP body</td>
<td>{&quot;text&quot;: &quot;&lt;message to send&gt;&quot;}</td>
</tr>
<tr>
<td>HTTP header</td>
<td>Content-type : application/json</td>
</tr>
</tbody>
</table>

   d. Click OK.
e. Select the action in the list and click Apply.

6. Click OK.

To create a webhook automation stitch for Teams integration in the CLI:

2. Create the automation trigger:

   ```
   config system automation-trigger
   edit "Teams"
   set event-type config-change
   ```
3. Create the automation action:

```fortran
config system automation-action
    edit "send to Teams"
    set action-type webhook
    set protocol https
    set uri "outlook.office.com/webhook/XXXXXXXXXXXXX/IncomingWebhook/XXXXXXXXXXXXX/XXXXXXXXXXXXXX"
    set http-body "{ "text": "<message to send>" }"
    set port 443
    set headers "Content-type: application/json"
next
end
```

4. Create the automation stitch:

```fortran
config system automation-stitch
    edit "Teams"
    set trigger "Teams"
    config actions
        edit 1
        set action "send to Teams"
        set required enable
next
next
end
```

For information about more advanced messages that can be configured and sent to the Teams incoming webhook, see Sending messages to connectors and webhooks.

Public and private SDN connectors

Cloud SDN connectors provide integration and orchestration of Fortinet products with public and private cloud solutions. In a typical cloud environment, resources are dynamic and often provisioned and scaled on-demand. By using an SDN connector, you can ensure that changes to cloud environment attributes are automatically updated in the Security Fabric.

To protect the East-West or North-South traffic in these environments, the FortiGate uses the SDN connector to sync the dynamic addresses that these volatile environments use. You can then configure the dynamic address objects as sources or destinations for firewall policies. When you make changes to cloud environment resources, such as moving them to a new location or assigning different IP addresses to them, you do not need to modify the policy in FortiOS, as the SDN connector syncs changes to the cloud address objects.

These configurations consist of three primary steps:

1. Configure the cloud SDN connector to connect your FortiGate and public or private cloud account.
2. Create dynamic address objects to use the SDN connector. Use filters to sync only cloud address objects that you
3. Apply the dynamic address objects to your firewall policy to protect your traffic.

This chapter explores the steps in detail and describes how to connect to each currently supported cloud platform. This chapter does not discuss cloud account role-based or permission requirements. The respective cloud documents contain this information.

The following external connector categories are available in the Security Fabric: Public SDN, Private SDN, Endpoint/Identity, and Threat Feeds.

### Public SDN
- Amazon Web Services (AWS)
- Microsoft Azure
- Google Cloud Platform (GCP)
- Oracle Cloud Infrastructure (OCI)
- IBM Cloud
- AliCloud

### Private SDN
- Kubernetes
- VMware ESXi
- VMware NSX
- OpenStack (Horizon)
- AgileCentric Infrastructure (ACI)
- Nuage Virtualized Services Platform
- Nutanix

### Endpoint/Identity
- FSSO Agent on Windows AD
- Symantec Endpoint Protection
- Dell Active Directory Server
- RADIUS Single Sign-On Agent
- Exchange Server

### Threat Feeds
- FortiGuard Category
- IP Address
- Domain Name
- Malware Hash

If VDOMs are enabled, SDN and Threat Feeds connectors are in the global settings, and Endpoint/Identity connectors are per VDOM.

---

**Getting started with public and private SDN connectors**

You can use SDN connectors to connect your FortiGate to public and private cloud solutions. By using an SDN connector, you can ensure that changes to cloud environment attributes are automatically updated in the Security Fabric. You can use SDN connector address objects to create policies that provide dynamic access control based on cloud environment attribute changes. There is no need to manually reconfigure addresses and policies whenever changes to the cloud environment occur.

There are four steps to creating and using an SDN connector:
1. Gather the required information. The required information depends on which public or private cloud solution SDN connector you are configuring.

2. Creating the SDN connector on page 2430
3. Creating an SDN connector address on page 2430
4. Adding the address to a firewall policy on page 2432

The following provides general instructions for creating an SDN connector and using the dynamic address object in a firewall policy. For instructions for specific public and private cloud solutions, see the relevant topic in this guide. For advanced scenarios regarding SDN connectors, see the appropriate FortiOS 7.2 cloud platform guide.

Creating the SDN connector

To create an SDN connector in the GUI:

1. Go to Security Fabric > External Connectors.
2. Click Create New.
3. Click the desired public or private cloud.
4. Enter the Name, Status, and Update Interval for the connector.
5. Enter previously collected information for the connector as needed.
6. Click OK.

To create an SDN connector in the CLI:

```
config system sdn-connector
edit <name>
    set status {enable | disable}
    set type {connector type}
    ... set update-interval <integer>
next
end
```

The available CLI commands vary depending on the selected SDN connector type.

Creating an SDN connector address

You can use an SDN connector address in the following ways:

- As the source or destination address for firewall policies.
- To automatically update changes to addresses in the public or private cloud environment, based on specified filters.
- To automatically apply changes to firewall policies that use the address, based on specified filters.

To create an SDN connector address in the GUI:

1. Go to Policy & Objects > Addresses.
2. Click Create New > Address.
3. Configure the address:
   a. Set the *Type* to *Dynamic*.
   b. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
   c. From the *SDN Connector* dropdown list, select the desired SDN connector.
   d. From the *Filter* dropdown list, configure the desired filter. The filters available depend on the selected SDN connector type. The SDN connector automatically populates and updates IP addresses only for instances that satisfy the filter requirements. In this example, the address will automatically populate and update IP addresses only for AliCloud instances that belong to the specified security group:

   ![Edit Address](image)

   You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

   e. Configure other settings as desired.
   f. Click OK.

4. Ensure that the SDN connector resolves dynamic firewall IP addresses as configured:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address that you created to see a list of IP addresses for instances that satisfy the filter that you configured. In this case, the IP addresses of instances that belong to the specified security group display:

   ![Addresses](image)

To create an SDN connector address in the CLI:

1. Create the address:
   ```
   config firewall address
   edit <name>
   set type dynamic
   set sdn <sdn_connector>
   set visibility enable
   set associated-interface <interface_name>
   set color <integer>
   ```
... set comment <comment>
config tagging
    edit <name>
        set category <string>
        set tags <strings>
    next
    end
next
end

The available CLI commands vary depending on the selected SDN connector type.

Adding the address to a firewall policy

You can use an SDN connector address as the source or destination address in a policy.

To add the address to a firewall policy in the GUI:

1. Go to Policy & Objects > Firewall Policy.
2. Click Create New.
3. Use the SDN connector address as the source or destination address.
4. Configure the remaining settings as needed.
5. Click OK.

To add the address to a firewall policy in the CLI:

```
config firewall policy
    edit 0
        set name <name>
        set srcintf <port_name>
        set dstintf <port_name>
        set srcaddr <firewall_address>
```
set dstaddr <firewall_address>
set action accept
set schedule <schedule>
set service <service>
next
end

Connector tooltips

In Security Fabric > External Connectors, hover over an SDN connector to view a tooltip that shows basic configuration information.

Three buttons provide additional information:

<table>
<thead>
<tr>
<th>Button</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Connector Objects</td>
<td>Connector's dynamic objects, such as filters and instances.</td>
</tr>
<tr>
<td>View Policies</td>
<td>List of policies that use the dynamic addresses from the connector.</td>
</tr>
<tr>
<td>View Automation Rules</td>
<td>List of automation actions that use the connector.</td>
</tr>
</tbody>
</table>

AliCloud SDN connector using access key

FortiOS automatically updates dynamic addresses for AliCloud using an AliCloud SDN connector, including mapping the following attributes from AliCloud instances to dynamic address groups in FortiOS:

- ImageId
- InstanceId
- SecurityGroupId
- VpcId
- VSwitchId
- TagKey
- TagValue
To configure AliCloud SDN connector using the GUI:

1. Configure the AliCloud SDN connector:
   a. Go to Security Fabric > External Connectors.
   b. Click Create New, and select AliCloud.
   c. Configure as shown, substituting the access key, secret, and region ID for your deployment. The update interval is in seconds.

2. Create a dynamic firewall address for the configured AliCloud SDN connector:
   a. Go to Policy & Objects > Addresses.
   b. Click Create New, then select Address.
   c. Configure the address as shown, selecting the desired filter in the Filter dropdown list. In this example, the address will automatically populate and update IP addresses only for AliCloud instances that belong to the specified security group:

3. Ensure that the AliCloud SDN connector resolves dynamic firewall IP addresses:
   a. Go to Policy & Objects > Addresses.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the security
group configured in step 2:

To configure AliCloud SDN connector using CLI commands:

1. Configure the AliCloud SDN connector:
   ```fortigate-config
   config system sdn-connector
   edit "ali1"
   set type acs
   set access-key "LTAIKmERWEuEOChg"
   set secret-key xxxxx
   set region "us-west-1"
   set update-interval 30
   next
   end
   ```

2. Create a dynamic firewall address for the configured AliCloud SDN connector with the supported AliCloud filter. In this example, the AliCloud SDN Connector will automatically populate and update IP addresses only for instances that belong to the specified security group:
   ```fortigate-config
   config firewall address
   edit "ali-address-security"
   set type dynamic
   set sdn "ali1"
   set filter "SecurityGroupId=sg-rj9bp5ax5kwy3gqdzqb"
   next
   end
   ```

3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:
   ```fortigate-config
   config firewall address
   edit "ali-address-security"
   set type dynamic
   set sdn "ali1"
   set filter "SecurityGroupId=sg-rj9bp5ax5kwy3gqdzqb"
   config list
   edit "10.0.0.16"
   next
   edit "10.0.0.17"
   next
   edit "10.0.0.20"
   next
   end
   next
   end
   ```

AWS SDN connector using certificates

FortiOS automatically updates dynamic addresses for AWS using an AWS SDN connector, including mapping attributes from AWS instances to dynamic address groups in FortiOS.
Configuring the SDN connector using the GUI, then checking the configuration using the CLI is recommended.

To configure an AWS SDN connector using the GUI:

1. Configure the AWS SDN connector:
   a. Go to Security Fabric > External Connectors.
   b. Click Create New, and select Amazon Web Services (AWS).
   c. In the Access key ID field, enter the key created in the AWS management portal.
   d. In the Secret access key field, enter the secret access key accompanying the above access key.
   e. In the Region name field, enter the region name. Refer to AWS Regions and Endpoints for the desired region name.
   f. In the VPC ID field, enter the VPC ID within the specified region you desire to cover with the SDN connector.
   g. Click OK.

2. Check the configuration using the CLI:
   config system sdn-connector
   edit "<connector-name>"
   show
   The output resembles the following:
   config system sdn-connector
   edit "<connector-name>"
   set access-key "<example-access-key>"
   set secret-key ENC <example-secret-key>
   set region "us-west-2"
   set vpc-id "vpc-e1e4b587"
   set update-interval 1
   next
   end
   If you see that the SDN connector is not enabled in Security Fabric > External Connectors in the GUI, run the following commands to enable the SDN connector:
   diagnose deb application awsd -1
diagnose debug enable
   The output may display an error like the following:
   FGT # awsd sdn connector AWS_SDN prepare to update
   awsd sdn connector AWS_SDN start updating
   aws curl response err, 403
   <?xml version="1.0" encoding="UTF-8"?>
   <Response><Errors><Error><Code>UnauthorizedOperation</Code><Message>You are not authorized to perform this operation.</Message></Error></Errors><RequestID>8403cc11-b185-41da-ad6d-23bb4db7d00a</RequestID></Response>
   awsd curl failed 403
   awsd sdn connector AWS_SDN failed to get instance list
   aws curl response err, 403
   awsd sdn connector AWS_SDN get EKS cluster list failed
   awsd sdn connector AWS_SDN list EKS cluster failed
   awsd sdn connector AWS_SDN start updating IP addresses
   awsd sdn connector AWS_SDN finish updating IP addresses
   awsd reap child pid: 569
   In this case, you must configure power user access for the current administrator in the AWS management console:
After configuring power user access, run the following commands:

diagnose deb application awsd -l

diagnose debug enable

The output should display without error, as follows:

FGT # AWSD: update sdn connector AWS_SDN status to enabled
awsd sdn connector AWS_SDN prepare to update
awsd sdn connector AWS_SDN start updating
awsd get ec2 instance info successfully
awsd sdn connector AWS_SDN start updating IP addresses
awsd sdn connector AWS_SDN finish updating IP addresses
awsd reap child pid: 893

The AWS connector is now enabled.

3. Create a dynamic firewall address for the configured AWS SDN connector:
   a. Go to Policy & Objects > Addresses.
   b. Click Create New, then select Address.
   c. From the Type dropdown list, select Dynamic.
   d. From the Sub Type dropdown list, select Fabric Connector Address.
In the *Filter* field, add the desired filters. The following filters are supported:

<table>
<thead>
<tr>
<th>Description</th>
<th>Key</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Architecture</td>
<td>architecture</td>
<td>x86</td>
</tr>
<tr>
<td>Autoscaling group</td>
<td>AutoScaleGroup</td>
<td>10703c-4f731e90-fortigate-payg-auto-scaling-group</td>
</tr>
<tr>
<td>AZ</td>
<td>placement.availabilityzone</td>
<td>us-east-1a</td>
</tr>
<tr>
<td>Group name</td>
<td>placement.groupname</td>
<td></td>
</tr>
<tr>
<td>Image ID</td>
<td>imageld</td>
<td>ami-123456</td>
</tr>
<tr>
<td>Instance ID</td>
<td>instanceId</td>
<td>i-12345678</td>
</tr>
<tr>
<td>Instance type</td>
<td>instanceType</td>
<td>t2.micro</td>
</tr>
<tr>
<td>Key name</td>
<td>keyName</td>
<td></td>
</tr>
<tr>
<td>Kubernetes cluster</td>
<td>k8s_cluster</td>
<td></td>
</tr>
<tr>
<td>Kubernetes label and its name</td>
<td>k8s_label.Name</td>
<td></td>
</tr>
<tr>
<td>Kubernetes namespace</td>
<td>k8s_namespace</td>
<td></td>
</tr>
<tr>
<td>Kubernetes node name</td>
<td>k8s_nodename</td>
<td></td>
</tr>
<tr>
<td>Kubernetes pod name</td>
<td>k8s_podname</td>
<td></td>
</tr>
<tr>
<td>Kubernetes region</td>
<td>k8s_region</td>
<td></td>
</tr>
<tr>
<td>Kubernetes service name</td>
<td>k8s_servicename</td>
<td></td>
</tr>
<tr>
<td>Kubernetes zone</td>
<td>k8s_zone</td>
<td></td>
</tr>
<tr>
<td>Private DNS name</td>
<td>privateDnsName</td>
<td>ip-172-31-10-211.us-west-2.compute.internal</td>
</tr>
<tr>
<td>Public DNS name</td>
<td>publicDnsName</td>
<td>ec2-54-202-168-254.us-west-2.compute.amazonaws.com</td>
</tr>
<tr>
<td>Security group ID</td>
<td>SecurityGroupId</td>
<td></td>
</tr>
<tr>
<td>Subnet ID</td>
<td>subnetId</td>
<td>sub-123456</td>
</tr>
<tr>
<td>Tag and its name. This key supports a maximum of eight tags.</td>
<td>tag.Name</td>
<td></td>
</tr>
<tr>
<td>Tenancy placement</td>
<td>placement.tenancy</td>
<td></td>
</tr>
<tr>
<td>VPC ID</td>
<td>VpcId</td>
<td></td>
</tr>
</tbody>
</table>
4. Ensure that the AWS SDN connector resolves dynamic firewall IP addresses:
   a. Go to Policy & Objects > Addresses.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the security group configured in step 2.

   The following is an example for a public SDN address type:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Details</th>
<th>Interface</th>
<th>Visibility</th>
<th>Ref</th>
</tr>
</thead>
<tbody>
<tr>
<td>aws-ec2</td>
<td>Subnet</td>
<td>0.0.0.0</td>
<td></td>
<td>Visible 0</td>
<td></td>
</tr>
<tr>
<td>all</td>
<td>Subnet</td>
<td>0.0.0.0</td>
<td></td>
<td>Hidden 0</td>
<td></td>
</tr>
</tbody>
</table>

   The following is an example for a private SDN address type:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Details</th>
<th>Interface</th>
<th>Visibility</th>
<th>Ref</th>
</tr>
</thead>
<tbody>
<tr>
<td>aws-ec1</td>
<td>Subnet</td>
<td>0.0.0.0</td>
<td></td>
<td>Visible 0</td>
<td></td>
</tr>
<tr>
<td>all</td>
<td>Subnet</td>
<td>0.0.0.0</td>
<td></td>
<td>Visible 0</td>
<td></td>
</tr>
</tbody>
</table>

   To configure AWS SDN connector using CLI commands:

   1. Configure the AWS connector:
      ```
      config system sdn-connector
      edit "<connector-name>"
      set access-key "<example-access-key>"
      set secret-key ENC <example-secret-key>
      set region "us-west-2"
      set vpc-id "vpc-ele4b587"
      set update-interval 1
      next
      end
      ```

   2. Create a dynamic firewall address for the configured AWS SDN connector with the supported filter:
      ```
      config firewall address
      edit "aws-ec2"
      set type dynamic
      set sdn "<connector-name>"
      set filter "SecurityGroupId=sg-05f4749cf84267548"
      set sdn-addr-type public
      ```
next
edit "aws-eks1"
    set type dynamic
    set sdn "<connector-name>"
    set filter "K8S_Region=us-west-2"
next
end

3. Confirm that the AWS SDN connector resolves dynamic firewall IP addresses using the configured filter:

   config firewall address
   edit "aws-ec2"
       set type dynamic
       set sdn "<connector-name>"
       set filter "SecurityGroupId=sg-05f4749cf84267548"
       set sdn-addr-type public
   config list
       edit "34.222.246.198"
       next
       edit "54.188.139.177"
       next
       edit "54.218.229.229"
       next
   end
next
edit "aws-eks1"
    set type dynamic
    set sdn "<connector-name>"
    set filter "K8S_Region=us-west-2"
config list
    edit "192.168.114.197"
    next
    edit "192.168.167.20"
    next
    edit "192.168.180.72"
    next
    edit "192.168.181.186"
    next
    edit "192.168.210.107"
    next
end
next
end

To add an EC2 instance to test automatic address population:

1. Assume that you want to boot up another instance with an IP address of 34.222.246.178, which is currently stopped. This instance belongs to the security group that the aws-ec2 address is filtering for. In the AWS management portal, start the instance.

2. Verify that the instance is running.

3. At this point, running show again shows the SDN connector has automatically populated and added the 34.222.246.178 instance.

   config firewall address
   edit "aws-ec2"
       set type dynamic
       set sdn "<connector-name>"
       set filter "SecurityGroupId=sg-05f4749cf84267548"
Fortinet Security Fabric

set sdn-addr-type public
config list
  edit "34.222.246.198"
  next
  edit "54.188.139.177"
  next
  edit "54.218.229.229"
  next
  edit "34.222.246.178"
  next
end
next
end

Therefore, administrators do not need to add this instance to the address manually. When a firewall policy is applied to this address, 34.222.246.178 is automatically covered.

Azure SDN connector using service principal

FortiOS automatically updates dynamic addresses for Azure using Azure SDN connector, including mapping attributes from Azure instances to dynamic address groups in FortiOS.

To configure the Azure SDN connector using service principal:

1. Create an Azure SDN connector:
   a. Go to Security Fabric > External Connectors and click Create New.
   b. Select Microsoft Azure.
   c. Configure the connector. See Azure SDN connector service principal configuration requirements:

   ![Azure SDN connector settings](image)

   d. Click OK.

2. Create a dynamic firewall address for the Azure connector.
   a. Go to Policy & Objects > Addresses and click Create New > Address.
   b. From the Type dropdown list, select Dynamic.
   c. From the Sub Type dropdown list, select Fabric Connector Address.
d. From the **SDN Connector** dropdown list, select the Azure SDN connector.

e. In the **Filter** field, add filters as desired. The Azure SDN connector supports the following filters:
   - `vm=<VM name>`
   - `securitygroup=<nsg id>`
   - `vnet=<VNet id>`
   - `subnet=<subnet id>`
   - `vmss=<VM scale set>`
   - `tag.<key>=<value>`
   - `servicetag=<value>`
   - `tag.<key>=<value>`

f. Click **OK**.

g. Hover the cursor over the address name to see the dynamic IP addresses that the connector resolves.

**Cisco ACI SDN connector using a standalone connector**

Cisco ACI (Application Centric Infrastructure) SDN connectors can be used in dynamic firewall addresses.

The Fortinet SDN Connector for Cisco ACI and Nuage Networks is a standalone connector that connects to SDN controllers within Cisco ACI and Nuage Networks. You must configure a connection to the Fortinet SDN connector in FortiOS to query the dynamic addresses.

**To configure a Cisco ACI connector in the GUI:**

1. Create the Cisco ACI SDN connector:
   a. Go to **Security Fabric > External Connectors** and click **Create New**.
   b. In the **Private SDN** section, click **Application Centric Infrastructure (ACI)**.
   c. In the **Cisco ACI Connector** section, for **Type**, select **Fortinet SDN Connector** and configure the remaining settings as needed.
   d. Click **OK**.
2. Create the dynamic firewall address for the connector:
   a. Go to Policy & Objects > Addresses and click Create New > Address.
   b. Configure the following settings:
      i. For Type, select Dynamic.
      ii. For Sub Type, select Fabric Connector Address.
      iii. For SDN Connector, select the first ACI connector.
      iv. Configure the remaining settings as needed.
   c. Click OK.

To verify the dynamic firewall IPs are resolved by the SDN connector in the GUI:

1. Go to Policy & Objects > Addresses.
2. In the address table, hover over the address to view which IPs it resolves to.

To configure a Cisco ACI connector in the CLI:

1. Create the SDN connector:

   ```
   config system sdn-connector
   edit "acil"
   set type aci
   set server "172.18.64.31"
   set username "admin"
   set password xxxxxxxxx
   next
   end
   ```

2. Create the dynamic firewall address for the connector:

   ```
   config firewall address
   edit "aci-address1"
   set type dynamic
   set sdn "acil"
   set color 17
   set tenant "wqdai-ten"
   ```
set epg-name "EPG-in"
  set sdn-tag "fffff"
next
end

To verify the dynamic firewall IPs are resolved by the SDN connector in the CLI:

# diagnose firewall dynamic list

List all dynamic addresses:
aci1.aci.wqdai-ten.EPG-in.fffff: ID(171) ADDR(192.168.100.20)

ClearPass endpoint connector via FortiManager

ClearPass Policy Manager (CPPM) is a network access system that can send information about authenticated users to third party systems, such as a FortiGate or FortiManager.

In this example, communications are established between CPPM and FortiManager, and then the FortiManager forwards information to a managed FortiGate. On the FortiGate, the user information can be used in firewall policies and added to FSSO dynamic addresses.

Configure the FortiManager

Establish communications between FortiManager and CPPM so that FortiManager can synchronize CPPM user groups. See Creating a ClearPass connector in the FortiManager Administration Guide.

FortiManager forwards the group information to managed FortiGates.
Adding CPPM FSSO user groups to a local user group

To add CPPM user groups to a local user group in the GUI:

1. On the FortiGate, go to User & Authentication > User Groups.
2. Click Create New.
3. Enter a name for the group and set Type to Fortinet Single Sign-On (FSSO).
4. Click the Members field, and add one or more FSSO groups.
   FSSO groups can come from multiple sources; CPPM FSSO groups are prefixed with cp_ and are listed under the FortiManager heading.

5. Click OK.

To add CPPM user groups to a local user group in the CLI:

```bash
config user group
  edit fsso-group
    set group-type fsso-service
    set member "cp_test_[Employee]" "cp_test_FSSOROLE"
  next
end
```

Using the local FSSO user group in a firewall policy

To add the local FSSO user group to a firewall policy in the GUI:

1. Go to Policy & Objects > Firewall Policy.
2. Create a new policy, or edit an existing one.
3. Click in the Source field and add the fsso-group user group.

![Image of the Source field addition](image)

CPPM user groups can also be added directly to the policy.

4. Click OK.

To add the local FSSO user group to a firewall policy in the CLI:

```plaintext
config firewall policy
edit 1
   set name "pol1"
   set srcintf "port2"
   set dstintf "port3"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set logtraffic all
   set groups "fsso-group"
   set nat enable
next
end
```

**Verification**

To verify that a user was added to the FSSO list on the FortiGate:

1. Log on to the client and authenticate with CPPM. After successful authentication, the user is added to the FSSO list on the FortiGate.
2. On the FortiGate, go to Dashboard > Users & Devices and look at the Firewall Users widget to verify that the user was added.

![Image of Firewall Users widget](image)

The user group cp_test_FSSOROLE is listed separately because the user is a member of that group on the CPPM.
To verify that traffic can pass the firewall:

1. Log on to the client and browse to an external website.
2. On the FortiGate, go to Dashboard > FortiView Sources.
3. Double-click on the user and select the Destinations tab to verify that traffic is being passed by the firewall.

To verify the user address groups:

```
show user adgrp
config user adgrp
  edit "cp_test_FSSOROLE"
    set server-name "FortiManager"
    next
  edit "cp_test_[AirGroup v1]"
    set server-name "FortiManager"
    next
  edit "cp_test_[AirGroup v2]"
    set server-name "FortiManager"
    next
  edit "cp_test_[Aruba TACACS read-only Admin]"
    set server-name "FortiManager"
    next
  edit "cp_test_[Aruba TACACS root Admin]"
    set server-name "FortiManager"
    next
  edit "cp_test_[BYOD Operator]"
    set server-name "FortiManager"
    next
  edit "cp_test_[Contractor]"
    set server-name "FortiManager"
    next
  edit "cp_test_[Device Registration]"
    set server-name "FortiManager"
    next
  ...
  edit "CN=group1,OU=Testing,DC=Fortinet-FSSO,DC=COM"
    set server-name "Local FSSO Agent"  <<--- !!!!
  next
end
```

**GCP SDN connector using service account**

FortiOS automatically updates dynamic addresses for GCP using a GCP SDN connector, including mapping attributes from GCP instances to dynamic address groups in FortiOS.

To configure GCP connector using the GUI:

1. In FortiOS, go to Security Fabric > External Connectors.
2. Click Create New, and select Google Cloud Platform (GCP).
   Note you can create only one SDN Connector per connector type. For example, you can create one entry for GCP.
3. Configure the connector as follows:
   a. *Project name*: Enter the name of the GCP project. The VMs whose IP addresses you want to populate should be running within this project.
   b. *Service account email*: Enter the email address associated with the service account that will call APIs to the GCP project specified above.
   c. *Private key*: Enter the private key statement as shown in the text box. For details, see *Creating a GCP service account*.

Once the connector is successfully configured, a green indicator appears at the bottom right corner. If the indicator is red, the connector is not working. See *Troubleshooting GCP SDN Connector*.

4. Create a dynamic firewall address for the configured GCP SDN connector:
   a. Go to *Policy & Objects > Addresses*. Click *Create New*, then select *Address*.
   b. Configure the address:
      i. *Name*: Enter the desired name.
      ii. *Type*: Select *Dynamic*.
      iii. *Fabric Connector Type*: Select *Google Cloud Platform (GCP)*.
      iv. *Filter*: The SDN connector automatically populates and updates only instances that match this filtering condition. Currently GCP supports the following filters:
          - `id=<instance id>`: This matches an VM instance ID.
          - `name=<instance name>`: This matches a VM instance name.
          - `zone=<gcp zones>`: This matches a zone name.
          - `network=<gcp network name>`: This matches a network name.
          - `subnet=<gcp subnet name>`: This matches a subnet name.
          - `tag=<gcp network tags>`: This matches a network tag.
          - `label.<gcp label key>=<gcp label value>`: This matches a free form GCP label key and its value.

      In the example, the filter is set as 'network=default & zone=us-central-1f'. This configuration populates all IP addresses that belong to the default network in the zone us-central-1f.
      You can set filtering conditions using multiple entries with AND ('&') or OR ('|'). When both AND and OR are specified, AND is interpreted first, then OR.
Note that wildcards (such as the asterisk) are not allowed in filter values.

v. Click OK.
The address has been created. Wait for a few minutes before the setting takes effect. You will know that the address is in effect when the exclamation mark disappears from the address entry. When you hover over the address, you can see the list of populated IP addresses.

If the exclamation mark does not disappear, check the address settings.

**IBM Cloud SDN connector using API keys**

FortiOS can automatically update dynamic addresses for IBM Cloud using an SDN connector.

**To configure IBM Cloud SDN connectors using the GUI:**

1. Create SDN connectors for compute generation 1 and 2:
   a. Go to Security Fabric > External Connectors.
   b. Click Create New, then select IBM Cloud.
c. Configure the connector for computer generation 1:

\[\text{Configure the connector for computer generation 1:}\]

\[\text{Click OK.}\]

\[\text{Click Create New, then select IBM Cloud.}\]

\[\text{Configure the connector for computer generation 2:}\]

\[\text{Click OK.}\]

2. Create dynamic firewall addresses for the configured connectors:

\[\text{Go to Policy & Objects > Addresses.}\]

\[\text{Click Create New > Address.}\]

\[\text{From the Type dropdown list, select Dynamic.}\]

\[\text{From the Sub Type dropdown list, select Fabric Connector Address.}\]

\[\text{From the SDN Connector dropdown list, select the IBM SDN connector.}\]

\[\text{In the Filter field, add the desired filters. The following filters are supported:}\]

\[\text{<InstanceId>}\]

\[\text{<InstanceName>}\]

\[\text{<ImageId>}\]

\[\text{<ImageName>}\]

\[\text{<Architecture>}\]

\[\text{<Profile>}\]

\[\text{<Vpc>}\]

\[\text{<Zone>}\]

\[\text{<Subnet>}\]

\[\text{<ResourceGroup>}\]

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
g. Click OK.
h. Click Create New > Address.
i. Repeat the process for computer generation 2:

j. Click OK.

3. Ensure that the connectors resolve dynamic firewall IP addresses:
   a. Go to Policy & Objects > Addresses.
   b. Hover over the addresses created in step 2 to see a list of IP addresses that the connector has resolved:

To configure IBM Cloud SDN connectors using the CLI:

1. Create SDN connectors for compute generation 1 and 2:

   config system sdn-connector
   edit "ibm_gen1"
       set status enable
       set type ibm
       set api-key xxxxxx
       set compute-generation 1
       set ibm-region us-south
       set update-interval 60
   next
   edit "ibm_gen2"
       set status enable
       set type ibm
set api-key xxxxxxx
set compute-generation 2
set ibm-region us-east
set update-interval 60
next
end

2. Create dynamic firewall addresses for the configured connectors:

config firewall address
edit "ibm_gen1_add1"
    set type dynamic
    set sdn "ibm_gen1"
    set color 19
    set filter "Vpc=alex-vpc1"
next
edit "ibm_gen2_add1"
    set type dynamic
    set sdn "ibm_gen2"
    set color 19
    set filter "ResourceGroup=alex-grp2"
next
end

3. Ensure that the connectors resolve dynamic firewall IP addresses:

    # show firewall address ibm_gen1_add1
config firewall address
edit "ibm_gen1_add1"
    set uuid 586841c4-7f46-51ea-dc66-dbf840af6033
    set type dynamic
    set sdn "ibm_gen1"
    set color 19
    set filter "Vpc=alex-vpc1"
cfg config list
    edit "10.240.0.49"
next
    edit "10.240.0.75"
next
    edit "169.61.227.88"
next
    edit "52.117.170.31"
next
next
end

    # show firewall address ibm_gen2_add1
config firewall address
edit "ibm_gen2_add1"
    set uuid 586841c4-7f46-51ea-2b79-b5170fbd4a8
    set type dynamic
    set sdn "ibm_gen2"
    set color 19
    set filter "ResourceGroup=alex-grp2"
cfg config list
    edit "10.241.128.4"
next
Kubernetes (K8s) SDN connectors

The following topics provide information about configuring Kubernetes SDN connectors:

- AliCloud Kubernetes SDN connector using access key on page 2453
- AWS Kubernetes (EKS) SDN connector using access key on page 2455
- Azure Kubernetes (AKS) SDN connector using client secret on page 2458
- GCP Kubernetes (GKE) SDN connector using service account on page 2460
- Oracle Kubernetes (OKE) SDN connector using certificates on page 2463
- Private cloud K8s SDN connector using secret token on page 2465

AliCloud Kubernetes SDN connector using access key

When an AliCloud SDN connector is configured, dynamic address objects can support Kubernetes filters based on cluster, service, node, pod, and more.

The following address filters can be applied:

- K8S_Cluster
- K8S_Namespace
- K8S_ServiceName
- K8S_NodeName
- K8S_PodName
- K8S_Region
- K8S_Zone
- K8S_Label

To configure an AliCloud SDN connector with a Kubernetes filter in the GUI:

1. Configure the AliCloud SDN connector:
   a. Go to Security Fabric > External Connectors.
   b. Click Create New, and select AliCloud.
c. Configure the settings as needed and click OK.

2. Create a dynamic firewall address with the supported Kubernetes filter:
   a. Go to Policy & Objects > Addresses.
   b. Click Create New > Address and enter a name.
   c. Configure the following settings:
      i. For Type, select Dynamic.
      ii. For Sub Type, select Fabric Connector Address.
      iii. For SDN Connector, select the connector created in step 1.
      iv. For SDN address type, select Private.
      v. For Filter, select K8S_Cluster=zhmcluster.
   d. Click OK.
      The corresponding IP addresses are dynamically updated and resolved after applying the Kubernetes filter.

3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:
   a. Go to Policy & Objects > Addresses.
   b. In the address table, hover over the address created in step 2 to view which IPs it resolves to:
To configure an AliCloud SDN connector with a Kubernetes filter in the CLI:

1. Configure the AliCloud SDN connector:

```fortigate
config system sdn-connector
dit "ali1"
    set type alicloud
    set access-key "**************"
    set secret-key xxxxxxx
    set region "us-west-1"
next
dit end
```

2. Create a dynamic firewall address with the supported Kubernetes filter:

```fortigate
config firewall address
dit "ali_add1"
    set type dynamic
    set sdn "ali1"
    set color 10
    set filter "K8S_Cluster=zhmcluster1"
next
dit end
```

3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:

```fortigate
config firewall address
dit "ali_add1"
    show
cconfig firewall address
dit "ali_add1"
    set uuid c48e4f00-5435-51eb-0547-aced5cf80f1f
    set type dynamic
    set sdn "ali1"
    set color 10
    set filter "K8S_Cluster=zhmcluster1"
cconfig list
    edit "10.0.0.28"
    next
    edit "10.0.0.29"
    next
    edit "10.0.0.30"
    next
    ...
next
dit end
dit end
dit end
```

**AWS Kubernetes (EKS) SDN connector using access key**

AWS SDN connectors support dynamic address groups based on AWS Kubernetes (EKS) filters.
To enable an AWS SDN connector to fetch IP addresses from AWS Kubernetes:

1. Go to Security Fabric > External Connectors. Click Create New, then select Amazon Web Services (AWS). Configure the SDN connector as desired. See AWS SDN connector using certificates on page 2435

2. Go to Policies & Objects > Addresses. Click Create New > Address to create a dynamic firewall address for the configured SDN connector using the supported Kubernetes filter.

3. From the Type dropdown list, select Dynamic.

4. From the Sub Type dropdown list, select Fabric Connector Address.

5. From the SDN Connector dropdown list, select the desired SDN connector.

6. In the Filter field, add the desired filters. The following filters are supported:

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>k8s_cluster</td>
<td>Name of Kubernetes cluster.</td>
</tr>
<tr>
<td>k8s_namespace</td>
<td>Namespace of a Kubernetes service or pod.</td>
</tr>
<tr>
<td>k8s_svcname</td>
<td>Name of a Kubernetes service.</td>
</tr>
<tr>
<td>k8s_nodename</td>
<td>Name of a Kubernetes node.</td>
</tr>
<tr>
<td>k8s_zone</td>
<td>Zone of a Kubernetes node.</td>
</tr>
<tr>
<td>k8s_region</td>
<td>Region of a Kubernetes node.</td>
</tr>
<tr>
<td>k8s_podname</td>
<td>Name of a Kubernetes pod.</td>
</tr>
<tr>
<td>k8s_label.xxx</td>
<td>Name of label of a Kubernetes resource (cluster/service/node/pod).</td>
</tr>
</tbody>
</table>
7. Configure the rest of the settings, then click OK.
8. Ensure that the SDN connector resolves the dynamic firewall address IP addresses by going to Policy & Objects > Addresses and hovering over the newly created address.

To configure an AWS Kubernetes SDN connector through the CLI:

1. Configure the SDN connector:
   ```
   config system sdn-connector
   edit "aws1"
       set type aws
       set access-key "AKIAIJNKE75ANV5APEQA"
       set secret-key xxxxx
       set region "us-west-2"
       set update-interval 30
   next
   end
   ```

2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter:
   ```
   config firewall address
   edit "aws-pod"
       set type dynamic
       set sdn "aws1"
       set filter "K8S_PodName=aws-node-g6zhx"
   next
   end
   ```

   The SDN connector resolves the dynamic firewall address IP address:
   ```
   config firewall address
   edit "aws-pod"
       set type dynamic
       set sdn "aws1"
   ```
set filter "K8S_PodName=aws-node-g6zhx"
config list
    edit "192.168.114.197"
    next
end
next
end

Azure Kubernetes (AKS) SDN connector using client secret

Azure SDN connectors support dynamic address groups based on Azure Kubernetes (AKS) filters.

To enable an Azure SDN connector to fetch IP addresses from Azure Kubernetes:

1. Configure the Azure SDN connector:
   a. Go to Security Fabric > External Connectors.
   b. Click Create New, and select Azure.
   c. Configure as shown substituting the region, tenant and client IDs, and client secret for your deployment. See Azure SDN connector service principal configuration requirements.

2. Create a dynamic firewall address for the configured K8s SDN connector:
   a. Go to Policy & Objects > Addresses.
   b. Click Create New, then select Address.
   c. From the Type dropdown list, select Dynamic.
   d. From the Sub Type dropdown list, select Fabric Connector Address.
   e. From the SDN Connector dropdown list, select the desired SDN connector.
   f. In the Filter field, add the desired filter. The following filters are supported:

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>k8s_cluster</td>
<td>Name of Kubernetes cluster.</td>
</tr>
<tr>
<td>k8s_namespace</td>
<td>Namespace of a Kubernetes service or pod.</td>
</tr>
</tbody>
</table>
### Filter | Description
--- | ---
k8s_svcname | Name of a Kubernetes service.
k8s_nodename | Name of a Kubernetes node.
k8s_zone | Zone of a Kubernetes node.
k8s_region | Region of a Kubernetes node.
k8s_podname | Name of a Kubernetes pod.
k8s_label.xxx | Name of label of a Kubernetes resource (cluster/service/node/pod).

In this example, the address is configured to automatically populate and update IP addresses only for instances that belong to the zhmKC cluster:

3. Ensure that the K8s SDN connector resolves dynamic firewall IP addresses:
   a. Go to Policy & Objects > Addresses.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the zhmKC cluster as configured in step 2:
To configure an Azure Kubernetes SDN connector through the CLI:

1. **Configure the SDN connector:**
   ```
   config system sdn-connector
   edit "azure1"
   set type azure
   set tenant-id "942b80cd-1b14-42a1-8dcf-4b21dece61ba"
   set client-id "14dbd5c5-307e-4ea4-8133-68738141febl"
   set client-secret xxxxx
   set update-interval 30
   next
   end
   ```

2. **Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter.** In this example, the address will automatically populate and update IP addresses only for instances that belong to the zhmKC cluster:
   ```
   config firewall address
   edit "az-k8s-cluster"
   set type dynamic
   set sdn "azure1"
   set filter "K8S_Cluster=zhmKC"
   next
   end
   ```

3. **Confirm that the Azure SDN connector resolves dynamic firewall IP addresses using the configured filter:**
   ```
   config firewall address
   edit "az-k8s-cluster"
   set type dynamic
   set sdn "azure1"
   set filter "K8S_Cluster=zhmKC"
   config list
   edit "10.240.0.4"
   next
   edit "10.240.0.5"
   next
   edit "10.244.0.10"
   next
   end
   next
   end
   ```

**GCP Kubernetes (GKE) SDN connector using service account**

Google Cloud Platform (GCP) SDN connectors support dynamic address groups based on GCP Kubernetes Engine (GKE) filters.
To enable a GCP SDN connector to fetch IP addresses from GKE:

1. Go to Security Fabric > External Connectors, and configure an SDN connector for GCP.

   ![Edit External Connector](image)

   - **Name**: gcp1
   - **Status**: Enabled
   - **Update Interval**: Specify 30
   - **Project name**: dev-project-001-166400
   - **Service account email**: 766517025500-compute@developer.g
   - **Private key**: BEGIN PRIVATE KEY...

2. Go to Policies & Objects > Addresses and create a dynamic firewall address for the configured SDN connector using the supported Kubernetes filter.

3. To filter out the Kubernetes IP addresses, select the address filter or filters. The following filters are supported:

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>k8s_cluster</td>
<td>Name of Kubernetes cluster.</td>
</tr>
<tr>
<td>k8s_namespace</td>
<td>Namespace of a Kubernetes service or pod.</td>
</tr>
<tr>
<td>k8s_svcname</td>
<td>Name of a Kubernetes service.</td>
</tr>
<tr>
<td>k8s_nodename</td>
<td>Name of a Kubernetes node.</td>
</tr>
<tr>
<td>k8s_zone</td>
<td>Zone of a Kubernetes node.</td>
</tr>
<tr>
<td>k8s_region</td>
<td>Region of a Kubernetes node.</td>
</tr>
<tr>
<td>k8s_podname</td>
<td>Name of a Kubernetes pod.</td>
</tr>
<tr>
<td>k8s_label.xxx</td>
<td>Name of label of a Kubernetes resource (cluster/service/node/Pod).</td>
</tr>
</tbody>
</table>

   In this example, the GCP SDN connector will automatically populate and update IP addresses only for instances that belong to the zhm-kc3 cluster:
4. Configure the rest of the settings, then click OK. The dynamic firewall address IP is resolved by the SDN connector.

To configure a GCP Kubernetes SDN connector through the CLI:

1. Configure an SDN connector for Kubernetes:
   ```plaintext
   config system sdn-connector
   edit "gcp1"
   set type gcp
   set gcp-project "dev-project-001-166400"
   set service-account "966517025500-compute@developer.gserviceaccount.com"
   set update-interval 30
   next
   end
   ```

2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter:
   ```plaintext
   config firewall address
   edit "gcp-k8s-cluster"
   set type dynamic
   set sdn "gcp1"
   ```
The dynamic firewall address IP is resolved by the SDN connector:

```plaintext
set filter "K8S_Cluster=zhm-kc3"
next
end
```

Oracle Kubernetes (OKE) SDN connector using certificates

OCI SDN connectors support dynamic address groups based on Oracle Kubernetes (OKE) filters.

To enable an OCI SDN connector to fetch IP addresses from Oracle Kubernetes:

1. Configure the OCI SDN connector:
   a. Go to Security Fabric > External Connectors.
   b. Click Create New, and select Oracle Cloud Infrastructure (OCI).
   c. Configure as shown substituting the region, tenant and client IDs, and client secret for your deployment. The update interval is in seconds.

   ![OCI SDN Connector Configuration](image)

2. Create dynamic firewall addresses for the configured SDN connector with supported Kubernetes filter:
   a. Go to Policy & Objects > Addresses.
   b. Click Create New, then select Address.
c. In the *Filter* field, select the desired filters. The following filters are supported:

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>k8s_cluster</td>
<td>Name of Kubernetes cluster.</td>
</tr>
<tr>
<td>k8s_namespace</td>
<td>Namespace of a Kubernetes service or pod.</td>
</tr>
<tr>
<td>k8s_svcname</td>
<td>Name of a Kubernetes service.</td>
</tr>
<tr>
<td>k8s_nodeName</td>
<td>Name of a Kubernetes node.</td>
</tr>
<tr>
<td>k8s_zone</td>
<td>Zone of a Kubernetes node.</td>
</tr>
<tr>
<td>k8s_region</td>
<td>Region of a Kubernetes node.</td>
</tr>
<tr>
<td>k8s_podname</td>
<td>Name of a Kubernetes pod.</td>
</tr>
<tr>
<td>k8s_label.xxx</td>
<td>Name of label of a Kubernetes resource (cluster/service/node/Pod).</td>
</tr>
</tbody>
</table>

3. Confirm that the SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects > Addresses.*
   b. Hover over the address created in step 2 to see a list of IP addresses for instances:
To configure an SDN connector through the CLI:

1. Configure the OCI SDN connector:
   ```fortioscli
cfg system sdn-connector
   edit "oci1"
   set type oci
   set tenant-id "ocid1.tenancy.oc1..aaaaaaaambr3uzztoyhweohbzqqdof775h7d3t54zpmzkp4b2cf35vs55cxxx"
   set user-id "ocid1.user.oc1..aaaaaaaaq2lfspeo3uetzbzpiv2pqvzeozccnys347stwssvzqlatfxxx"
   set compartment-id "ocid1.compartment.oc1..aaaaaaaaelxxdjazqo7nznztpgypiqckkmytjry6nfq5345vw7eavpwnmxx"
   set oci-region ashburn
   set oci-cert "cert-sha2"
   set update-interval 30
next
end
```

2. Create dynamic firewall addresses for the configured SDN connector with supported Kubernetes filter:
   ```fortioscli
cfg firewall address
   edit "k8s_nodename"
   set type dynamic
   set sdn "oci1"
   set filter "K8S_NodeName=129.213.120.172"
next
end
```

3. Confirm that the SDN connector resolves dynamic firewall IP addresses:
   ```fortioscli
cfg firewall address
   edit "k8s_nodename"
   set type dynamic
   set sdn "oci1"
   set filter "K8S_NodeName=129.213.120.172"
   config list
   edit "10.0.32.2"
next
edit "10.244.2.2"
next
edit "10.244.2.3"
next
edit "10.244.2.4"
next
edit "10.244.2.5"
next
end
next
end
```

Private cloud K8s SDN connector using secret token

FortiOS automatically updates dynamic and cluster IP addresses for Kubernetes (K8s) by using a K8s SDN connector, enabling FortiOS to manage K8s pods as global address objects, as with other connectors. This includes mapping the following attributes from K8s instances to dynamic address groups in FortiOS:
<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Namespace</td>
<td>Filter service IP addresses in a given namespace.</td>
</tr>
<tr>
<td>ServiceName</td>
<td>Filter service IP addresses by the given service name.</td>
</tr>
<tr>
<td>NodeName</td>
<td>Filter node IP addresses by the given node name.</td>
</tr>
<tr>
<td>PodName</td>
<td>Filter IP addresses by the pod name.</td>
</tr>
</tbody>
</table>
| Label.XXX  | Filter service or node IP addresses with the given label XXX. For example: K8S_
|            | Label.app=nginx.                                                           |

FortiOS 6.2.3 and later collect cluster IP addresses in addition to external IP addresses for exposed K8s services.

There is no maximum limit for the number of IP addresses populated with the filters.

To configure K8s SDN connector using the GUI:

1. Configure the K8s SDN connector:
   a. Go to Security Fabric > External Connectors > Create New Connector.
   b. Select Kubernetes.
   c. In the IP field, enter the IP address that you obtained in Obtaining the IP address, port, and secret token in Kubernetes.
   d. In the Port field, select Specify, then enter the port that you obtained in Obtaining the IP address, port, and secret token in Kubernetes.
   e. In the Secret token field, enter the token that you obtained in Obtaining the IP address, port, and secret token in Kubernetes.
   f. Configure the other fields as desired.

2. Create a dynamic firewall address for the configured K8S SDN connector:
   a. Go to Policy & Objects > Addresses.
   b. Click Create New, then select Address.
   c. Configure the address as shown, selecting the desired filter in the Filter dropdown list. In this example, the K8s SDN connector will automatically populate and update IP addresses only for node instances that match
the specified node name:

3. Ensure that the K8s SDN connector resolves dynamic firewall IP addresses:
   a. Go to Policy & Objects > Addresses.
   b. Hover over the address created in step 2 to see a list of IP addresses for node instances that match the node name configured in step 2:

To configure K8s SDN connector using CLI commands:

1. Configure the K8s SDN connector:
   ```
   config system sdn-connector
   edit "kubernetes1"
   set type kubernetes
   set server "<IP address obtained in Obtaining the IP address, port, and secret token in Kubernetes>"
   set server-port <Port obtained in Obtaining the IP address, port, and secret token in Kubernetes>
   set secret-token <Secret token obtained in Obtaining the IP address, port, and secret token in Kubernetes>
   set update-interval 30
   next
   end
   ```

2. Create a dynamic firewall address for the configured K8s SDN connector with the supported K8s filter. In this example, the K8s SDN connector will automatically populate and update IP addresses only for node instances that match the specified node name:
To troubleshoot the connection:

1. In FortiOS, run the following commands:
   ```shell
diagnose deb application kubed -l
diagnose debug enable
   ```

2. Reset the connection on the web UI to generate logs and troubleshoot the issue. The following shows the output in the case of a failure:

   ```shell
   Fortigate & diagnose deb application kubed -l
   debug messages will be on for 30 minutes.
   ```

   The following shows the output in the case of a success:

   ```shell
   kube-system
   k8s pod ip: 10.180.0.3, podname: myapp-deployment-c6b80565b-9a5d5, namespace: my
   k8s pod ip: 10.180.0.14, podname: myapp-deployment-c6b80565b-9a5d5, namespace: my
   k8s pod ip: 10.180.0.15, podname: myapp-deployment-c6b80565b-9a5d5, namespace: my
   k8s pod ip: 10.180.0.16, podname: myapp-deployment-c6b80565b-9a5d5, namespace: my
   k8s pod ip: 10.180.0.17, podname: myapp-deployment-c6b80565b-9a5d5, namespace: my
   k8s pod ip: 10.180.0.18, podname: myapp-deployment-c6b80565b-9a5d5, namespace: my
   ```
Nuage SDN connector using server credentials

You can use Nuage SDN connectors in dynamic firewall addresses.

The Fortinet SDN Connector for Cisco ACI and Nuage Networks is a standalone connector that connects to SDN controllers within Cisco ACI and Nuage Networks. You must configure a connection to the Fortinet SDN connector in FortiOS to query the dynamic addresses.

To configure a Nuage connector in the GUI:

1. Create the Nuage SDN connector:
   a. Go to Security Fabric > External Connectors and click Create New.
   b. In the Private SDN section, click Nuage Virtualized Services Platform.
   c. Configure the settings as needed.
   d. Click OK.

2. Create the dynamic firewall address for the connector:
   a. Go to Policy & Objects > Addresses and click Create New > Address.
   b. Configure the following settings:
      i. For Type, select Dynamic.
      ii. For Sub Type, select Fabric Connector Address.
      iii. For SDN Connector, select the Nuage connector.
      iv. Configure the remaining settings as needed.
c. Click OK.

To verify the SDN connector resolves the dynamic firewall IP addresses in the GUI:

1. Go to Policy & Objects > Addresses.
2. In the address table, hover over an address to view which IP addresses it resolves to.

To configure a Nuage connector in the CLI:

1. Create the SDN connector:

   ```
   config system sdn-connector
   edit "nuagel"
   set type nuage
   set server "172.18.64.27"
   set server-port 5671
   set username "admin"
   set password xxxxxxx
   next
   end
   ```

2. Create the dynamic firewall address for the connector:

   ```
   config firewall address
   edit "nuage-address1"
   set type dynamic
   set sdn "nuagel"
   set color 19
   set organization "nuage/L3"
   set subnet-name "Subnet20"
   next
   end
   ```

To verify the SDN connector resolves the dynamic firewall IP addresses in the CLI:

```
# diagnose firewall dynamic list

List all dynamic addresses:
uagel.nuage.nuage/L3.Subnet20.*: ID(196)
   ADDR(192.168.20.92)
   ADDR(192.168.20.240)
```
Nutanix SDN connector using server credentials

FortiOS automatically updates dynamic addresses for Nutanix using an Nutanix SDN connector, including mapping the following attributes from Nutanix instances to dynamic address groups in FortiOS:

- Cluster name
- Cluster UUID
- Description
- Host name
- Host UUID
- Hypervisor type
- Image name
- Image UUID
- Subnet name
- Subnet UUID
- VM name
- VM UUID

To configure a Nutanix connector using the GUI:

1. Configure the Nutanix SDN connector:
   a. Go to Security Fabric > External Connectors.
   b. Select Nutanix.
   c. In the IP address field, enter the IP address for your Nutanix environment.
   d. In the Port field, enter the desired port.
   e. In the Username and Password fields, enter the credentials for your Nutanix environment.
   f. Click OK.

2. Create a dynamic firewall address for the configured Nutanix SDN connector:
   a. Go to Policy & Objects > Addresses.
   b. Click Create New, then select Address.
   c. From the Type dropdown list, select Dynamic.
   d. From the Sub Type dropdown list, select Fabric Connector Address.
   e. From the SDN Connector dropdown list, select the Nutanix connector.
   f. From the Filter dropdown list, select the desired filters.
   g. Click OK.

3. Ensure that the Nutanix SDN connector resolves dynamic firewall IP addresses:
   a. Go to Policy & Objects > Addresses.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that satisfy the filter
requirements configured in step 2. In this example, the configured filter is "ClusterName=Fortinet-Lab":

To configure a Nutanix connector using the CLI:

1. Configure the Nutanix SDN connector:
   ```
   config system sdn-connector
   edit "nutanix_connector"
   set status disable
   set type nutanix set server "172.18.33.59"
   set server-port 9440
   set username "admin"
   set password **********
   set update-interval 60
   next
   end
   ```

2. Create a dynamic firewall address for the configured Nutanix SDN connector:
   ```
   config firewall address
   edit "nutanix-addr"
   set uuid 382ceafe-8e72-51eb-7300-0807ee907946
   set type dynamic
   set sdn "nutanix_connector"
   set color 2
   set filter "ClusterName=Fortinet-Lab"
   next
   end
   ```

3. Ensure that the Nutanix SDN connector resolves dynamic firewall IP addresses:
   ```
   config firewall address
   edit "nutanix-addr"
   set uuid 382ceafe-8e72-51eb-7300-0807ee907946
   set type dynamic
   set sdn "nutanix_connector"
   set color 2
   set filter "ClusterName=Fortinet-Lab"
   config list
   edit "192.168.10.15"
   next
   edit "192.168.10.16"
   next
   edit "192.168.11.15"
   next
   edit "192.168.11.16"
   ```
OCI SDN connector using certificates

You can configure SDN connector integration with Oracle Cloud Infrastructure (OCI).

To configure an OCI SDN connector in the GUI:

1. Go to Security Fabric > External Connectors and click Create New.
2. In the Public SDN section, select Oracle Cloud Infrastructure (OCI).
3. Configure the connector as desired:
   a. **User ID**: Enter the OCID of the OCI user who belongs to the administrator group. See Certificate-based SDN connector requirements.
   b. For the **OCI Certificate** field, you must select a certificate that satisfies OCI key size limits. The minimum size is 2048 bits. Do one of the following:
      i. Select the built-in default certificate called Fortinet_Factory.
      ii. Follow steps 1-2 in Using custom certificates to configure a custom certificate.

4. Click OK.
5. At this stage, you must register the certificate's fingerprint to the specified OCI user.
   a. Go to the OCI user, then API Keys > Add Public Key.
   b. If you selected the Fortinet_Factory certificate in step 2f, do the following:
      i. In FortiOS, go to System > Certificate. Select Fortinet_Factory, then click Download.
      ii. You now have the Fortinet_Factory.cer file. Create a public key file in PEM format from it, using a freely available tool of your choice such as OpenSSL.
   c. Copy and paste the content of the certificate PEM key file in the Add Public Key window in OCI. Click Add.
d. You now see the fingerprint.

API Keys

You can configure the following for the fingerprint:

1. **Update Interval**: The default value is 60 seconds. You can change the value to between 1 and 3600 seconds.

2. **Status**: Green means that the connector is enabled. You can disable it at any time by toggling the switch.

e. Click OK.

6. Go to **Policy & Objects > Addresses** and click **Create New > Address**.

7. Configure the address as needed, selecting the OCI connector in the **SDN Connector** field. The following filters are supported:

   - `'vm_name=<vm name>`: matches VM instance name.
   - `'instance_id=<instance id>`: matches instance OCID.
   - `'tag.<key>=<value>`: matches freeform tag key and its value.
   - `'definedtag.<namespace>.<key>=<value>`: matches a tag namespace, tag key, and its value.

8. Click OK.

To configure an OCI SDN connector in the CLI:

1. Configure an SDN connector:

   ```
   config system sdn-connector
   edit "oci1"
   set status enable
   set type oci
   set tenant-id "ocid1.tenancy.oc1..aaaaaaaaaaa3aaaaaaaaaaaaaa77xxxxx54bbbbbb4xxxx35xx55xxxx"
   set user-id "ocid1.user.oc1..aaaaaaaaa2llaaaaa3aaaaaaaaaabbbbbbbbbccccccccccxxxxxxyxx"
   set compartment-id "ocid1.compartment.oc1..aaaaaaaaaaaaaaa7bbbbbbbbbbccccccccc6xxxx35xxxx7xxxxxxxxxx"
   set oci-region "us-ashburn-1"
   ```
set oci-region-type commercial
set oci-cert "cert-sha2"
set update-interval 30
next
end

2. Create a dynamic firewall address for the SDN connector with a supported filter:

```
config firewall address
  edit "oci-address-1"
  set type dynamic
  set sdn "oci1"
  set filter "CompartmentName=DevelopmentEngineering"
next
end
```

To confirm that dynamic firewall addresses are resolved by the SDN connector:

1. In the CLI, check that the addresses are listed:

```
config firewall address
  edit "oci-address-1"
  set type dynamic
  set sdn "oci1"
  set filter "CompartmentName=DevelopmentEngineering"
config list
  edit "10.0.0.11"
  next
  edit "10.0.0.118"
  next
  ...
  next
  ...
next
end
```

2. In the GUI, go to Policy & Objects > Addresses and hover the cursor over the address name.

OpenStack SDN connector using node credentials

To configure OpenStack SDN connector using node credentials:

1. Go to Security Fabric > External Connectors.
2. Click Create New, then select OpenStack (Horizon).
3. Configure the fields as follows:
   a. **Name**: Name the connector as desired.
   b. **IP**: Enter the OpenStack management component's IP address. Generally you can find it in the OpenStack identity.
   c. **User name**: Enter the specified node's administrator name.
   d. **Password**: Enter the administrator password.

4. Click OK. The SDN connector is now configured.

**To configure a dynamic firewall address:**

The next step is to create an address that will be used as an address group or single address that acts as the source/destination for firewall policies. The address is based on IP addresses and contains VM instances' IP addresses.

No matter what changes occur to the instances, the SDN connector populates and updates the changes automatically based on the specified filtering condition so that administrators do not need to reconfigure the address content manually. Appropriate firewall policies using the address are applied to instances that are members of the address.
1. Go to Policy & Objects > Address. Click Create New, then select Address.
2. Configure the address as follows:
   a. **Name**: Name the address as desired.
   b. **Type**: Select Dynamic.
   c. **Sub Type**: Select Fabric Connector Address.
   d. **SDN Connector**: Select openstack.
   e. **Filter**: The SDN connector automatically populates and updates only IP addresses belonging to the specified filter that matches the condition. OpenStack Horizon connectors support the following filters:
      i. **id=<instance id>**: This matches a VM instance ID.
      ii. **name=<instance name>**: This matches a VM instance name.
      iii. **flavor=<instance flavor name>**: This matches an instance flavor name.
      iv. **keypair=<key pair name>**: This matches a key pair name.
      v. **network=<net name>**: This matches a network name.
      vi. **project=<project name>**: This matches a project name.
      vii. **availabilityzone=<zone name>**: This matches an availability zone name.
      viii. **servergroup=<group name>**: This matches a server group name.
      ix. **securitygroup=<security group name>**: This matches a security group name.
      x. **metadata.<key>=<value>**: This matches metadata with its key and value pair.
   You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

   For example, you could enter `flavor=m1.nano & project=admin`. In this case, IP addresses of instances that match both the flavor name and project name are populated. Wildcards (asterisks) are not allowed in values.

   ![Address Configuration](image)

   In this example, let's use project=admin, assuming the project name is admin.
3. Click OK after completing all required fields.

4. Ensure that the address was created.

5. After a few minutes, the new address takes effect. Hover your cursor on the address to see a list of IP addresses and instances with the project name "admin".
VMware ESXi SDN connector using server credentials

Dynamic addresses for VMware ESXi and vCenter servers can be automatically updated by using a VMware ESXi SDN connector, including mapping the following attributes from VMware ESXi and vCenter objects to dynamic address groups in FortiOS:

- vmid
- host
- name
- uuid
- vmuuid
- vmnetwork
- guestid
- guestname
- annotation
- datacenter
- tag

To configure VMware ESXi SDN connector using the GUI:

1. Configure the VMware ESXi SDN connector:
   a. Go to Security Fabric > External Connectors.
   b. Click Create New, and select VMware ESXi.
   c. Configure as shown, substituting the server IP address, username, and password for your deployment. The update interval is in seconds. The password cannot contain single or double quotes.

2. Create a dynamic firewall address for the configured VMware ESXi SDN connector:
   a. Go to Policy & Objects > Addresses and click Create New > Address.
   b. Configure the address as shown, selecting the desired filter in the Filter dropdown list. In this example, the VMware ESXi fabric connector will automatically populate and update IP addresses only for instances that
belong to VLAN80:

3. Ensure that the VMware ESXi SDN connector resolves dynamic firewall IP addresses:
   a. Go to Policy & Objects > Addresses.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to VLAN80 as configured in step 2:

To configure VMware ESXi SDN connector using CLI commands:

1. Configure the VMware ESXi SDN connector:
   ```
   config system sdn-connector
   edit "vmware1"
   set type vmware
   set server "172.17.48.222"
   set username "example_username"
   set password xxxxx
   set update-interval 30
   next
   end
   ```

2. Create a dynamic firewall address for the configured VMware ESXi SDN connector with the supported VMware ESXi filter. In this example, the VMware ESXi SDN connector will automatically populate and update IP addresses only for instances that belong to the specified VLAN:
   ```
   config firewall address
   edit "vmware-network"
   set type dynamic
   set sdn "vmware1"
   set filter "vmnetwork=VLAN80"
   next
   end
   ```

3. Confirm that the VMware ESXi SDN connector resolves dynamic firewall IP addresses using the configured filter:
   ```
   config firewall address
   edit "vmware-network"
   set type dynamic
   set sdn "vmware1"
   set filter "vmnetwork=VLAN80"
   config list
   edit "192.168.8.240"
   next
   end
   next
   end
   ```
VMware NSX-T Manager SDN connector using NSX-T Manager credentials

This feature provides SDN connector configuration for VMware NSX-T manager. You can import specific groups, or all groups from the NSX-T Manager.

To configure SDN connector for NSX-T Manager in the GUI:

1. Go to Security Fabric > External Connectors and click Create New.
2. In the Private SDN section, click VMware NSX.

3. Configure the settings and click OK.

To configure SDN connector for NSX-T Manager in the CLI:

```
config system sdn-connector
edit "nsx_t24"
   set type nsx
   set server "172.18.64.205"
   set username "admin"
   set password xxxxxxx
next
end
```

To import a specific group from the NSX-T Manager:

```
# execute nsx group import nsx_t24 root csf_ns_group
[1] 336914ba-0660-4840-b0f1-9320f5c5ca5e csf_ns_group:
   Name:csf_ns_group
   Address:1.1.1.0
   Address:1.1.1.1
   Address:172.16.10.104
   Address:172.16.20.104
   Address:172.16.30.104
   Address:2.2.2.0
   Address:2.2.2.2
   Address:4.4.4.0
   Address:5.5.5.0
```
To import all groups from NSX-T Manager:

# execute nsx group import nsx_t24 root

[1] 663a7686-b9a3-4659-b06f-b45c908349a0 ServiceInsertion_NSGroup:
   Name:ServiceInsertion_NSGroup
   Address:10.0.0.2

[2] 336914ba-0660-4840-b0f1-9320f5c5ca5e csf_ns_group:
   Name:csf_ns_group
   Address:1.1.1.0
   Address:1.1.1.1
   Address:172.16.10.104
   Address:172.16.20.104
   Address:172.16.30.104
   Address:2.2.2.0
   Address:2.2.2.2
   Address:4.4.4.0
   Address:5.5.5.0
   Address:6.6.6.6
   Address:7.7.7.7

[3] c462ec4d-d526-4ceb-aeb5-3f168ceed9d charlie_test:
   Name:charlie_test
   Address:1.1.1.1
   Address:2.2.2.2
   Address:6.6.6.6
   Address:7.7.7.7

[4] ff4dcb08-53cf-46bd-bef4-f7aeda9c0ad9 fgt:
   Name:fgt
   Address:172.16.10.101
   Address:172.16.10.102
   Address:172.16.20.102
   Address:172.16.30.103

[5] 3dd7df0d-2baa-44e0-b88f-bd21a92eb2e5 yongyu_test:
   Name:yongyu_test
   Address:1.1.1.10
   Address:2.2.2.0
   Address:4.4.4.0
   Address:5.5.5.0
To view the dynamic firewall IP addresses that are resolved by the SDN connector in the GUI:

1. Go to Policy & Objects > Addresses to view the IP addresses resolved by an SDN connector.

<table>

```
Multiple concurrent SDN connectors

This guide shows how to configure SDN connectors and resolve dynamic firewall addresses through the configured SDN connector in FortiOS.

FortiOS supports multiple SDN connectors including public connectors (AWS, Azure, GCP, OCI, AliCloud) and private connectors (Kubernetes, VMware ESXi, VMware NSX, OpenStack, Cisco ACI, Nuage). FortiOS also supports multiple instances for each type of SDN connector.

This guide uses an Azure SDN connector as an example. The configuration procedure for all supported SDN connectors is the same. In the following topology, the FortiGate accesses the Azure public cloud through the Internet:

![FortiGate to Azure Cloud diagram]

This process consists of the following:

1. Configure the interface.
2. Configure a static route to connect to the Internet.
3. Configure two Azure SDN connectors with different client IDs.
4. Check the configured SDN connectors.
5. Create two firewall addresses.
6. Check the resolved firewall addresses after the update interval.
7. Run diagnose commands.

To configure the interface:

1. In FortiOS, go to Network > Interfaces.
2. Edit port1:
   a. From the Role dropdown list, select WAN.
   b. In the IP/Network Mask field, enter 10.6.30.4/255.255.255.0 for the interface connected to the Internet.

To configure a static route to connect to the Internet:

1. Go to Network > Static Routes. Click Create New.
2. In the Destination field, enter 0.0.0.0/0.0.0.0.
3. From the Interface dropdown list, select port1.
4. In the Gateway Address field, enter 10.60.30.254.
To configure two Azure SDN connectors with different client IDs:

1. Go to Security Fabric > External Connectors.
2. Click Create New. Configure the first SDN connector:
   a. Select Microsoft Azure.
   b. In the Name field, enter azure1.
   c. In the Status field, select Enabled.
   d. From the Server region dropdown list, select Global.
   e. In the Directory ID field, enter the directory ID. In this example, it is 942b80cd-1b14-42a1-8dcf-4b21dece61ba.
   f. In the Application ID field, enter the application ID. In this example, it is 14dbd5c5-307e-4ea4-8133-68738141feb1.
   g. In the Client secret field, enter the client secret.
   h. Leave the Resource path disabled.
   i. Click OK.

3. Click Create New. Configure the second SDN connector:
   a. Select Microsoft Azure.
   b. In the Name field, enter azure2.
   c. In the Status field, select Enabled.
   d. From the Server region dropdown list, select Global.
   e. In the Directory ID field, enter the directory ID. In this example, it is 942b80cd-1b14-42a1-8dcf-4b21dece61ba.
   f. In the Application ID field, enter the application ID. In this example, it is 3ba0a6c-4ff-4f94-b292-07f7a2c36be6.
   g. In the Client secret field, enter the client secret.
   h. Leave the Resource path disabled.
To check the configured SDN connectors:

1. Go to Security Fabric > External Connectors.
2. Click the Refresh icon in the upper right corner of each configured SDN connector. A green up arrow appears in the lower right corner, meaning that both SDN connectors are connected to the Azure cloud using different client IDs.

To create two firewall addresses:

This process creates two SDN connector firewall addresses to associate with the configured SDN connectors.

1. Go to Policy & Objects > Addresses.
2. Click Create New > Address. Configure the first SDN connector firewall address:
   a. In the Name field, enter azure-address-1.
   b. From the Type dropdown list, select Dynamic.
   c. From the Sub Type dropdown list, select Fabric Connector address.
   d. From the SDN Connector dropdown list, select azure1.
   e. For SDN address type, select Private.
   f. From the Filter dropdown list, select the desired filter.
   g. For Interface, select any.
h. Click OK.

3. Click Create New > Address. Configure the second SDN connector firewall address:
   a. In the Name field, enter azure-address-1.
   b. From the Type dropdown list, select Dynamic.
   c. From the Sub Type dropdown list, select Fabric Connector address.
   d. From the SDN Connector dropdown list, select azure2.
   e. For SDN address type, select Private.
   f. From the Filter dropdown list, select the desired filter.
   g. For Interface, select any.
   h. Click OK.

To check the resolved firewall addresses after the update interval:

By default, the update interval is 60 seconds.

1. Go to Policy & Objects > Addresses.
2. Hover over the created addresses. The firewall address that the configured SDN connectors resolved display.

To run diagnose commands:

Run the `show sdn connector status` command. Both SDN connectors should appear with a status of connected.

Run the `diagnose debug application azd -1` command. The output should look like the following:

```
Level2-downstream-D # diagnose debug application azd -1
...
azd sdn connector azure1 start updating IP addresses
azd checking firewall address object azure-address-1, vd 0
IP address change, new list: 10.18.0.4
...
```

To restart the Azure SDN connector daemon, run the `diagnose test application azd 99` command.
Filter lookup in SDN connectors

When configuring dynamic address mappings for filters in SDN connectors for Azure, GCP, OpenStack, Kubernetes, and AliCloud, FortiGate can query the filters automatically.

To use the filter lookup:

1. Navigate to Policy & Objects > Addresses.
2. Create or edit an SDN connector type dynamic IP address.
   Supported SDN connector types include: AWS, Azure, GCP, OpenStack, Kubernetes, and AliCloud. The example below is for an Azure SDN connector.
3. In the address Filter field, you can perform the following actions:
   - List all available filters.
   - Search the available filters.
Create custom filters.
Support for wildcard SDN connectors in filter configurations

Wildcards are supported for SDN connectors when configuring dynamic address filters. The following SDN connector types are currently supported:

- AWS
- Azure
- Google Cloud Platform
- Kubernetes
- OpenStack
- Oracle Cloud Infrastructure
- VMware ESXi

To configure a dynamic address filter for AWS in the GUI:

1. Create the SDN connector:
   a. Go to Security Fabric > External Connectors.
   b. Click Create New.
   c. In the Public SDN section, click Amazon Web Services (AWS).
   d. Configure the settings as needed.
   e. Click OK.

2. Create the dynamic firewall address:
   a. Go to Policy & Objects > Addresses.
   b. Click Create New > Address
   c. Enter a name for the address, then configure the following settings:
      - Set Type to Dynamic.
      - Set Sub Type to Fabric Connector Address.
      - Set SDN Connector to aws1.
      - Set SDN address type to Private.
For Filter, click Create, enter Tag.Name=aws*, the click OK.

d. Click OK.

3. In the address table, hover over the address to view what IPs it resolves to.

4. In AWS, verify to confirm the IP addresses match.

To configure a dynamic address filter for AWS in the CLI:

1. Configure the SDN connector:

   ```
   config firewall address
   edit "aws-address-1"
   set type dynamic
   set sdn "aws1"
   set filter "Tag.Name=aws*"
   set sdn-addr-type public
   next
   end
   ```

2. Create the dynamic firewall address and verify where the IP addresses resolve to:

   ```
   config firewall address
   edit "aws-address-1"
   set type dynamic
   set sdn "aws1"
   set filter "Tag.Name=aws*"
   set sdn-addr-type public
   config list
   edit "18.234.167.123"
   ```
In AWS, verify that the IP addresses match.

**Endpoint/Identity connectors**

SSO fabric connectors integrate SSO authentication into the network. This allows users to enter their credentials only once, and have those credentials reused when accessing other network resources through the FortiGate.

The following fabric connectors are available:

- Fortinet single sign-on agent on page 2492
- Poll Active Directory server on page 2493
- Symantec endpoint connector on page 2494
- RADIUS single sign-on agent on page 2500
- Exchange Server connector on page 2503

**Fortinet single sign-on agent**

To create an FSSO agent connector in the GUI:

1. Go to Security Fabric > External Connectors.
2. Click Create New.
3. In the **Endpoint/Identity** section, click **FSSO Agent on Windows AD**.

![FSSO Agent on Windows AD](image)

4. Fill in the **Name**, and **Primary FSSO Agent** server IP address or name and **Password**.
5. Optionally, add more FSSO agents by clicking the plus icon.
6. Optionally, enable **Trusted SSL certificate** and select or import a certificate.
7. Select the **User group source**:
   - **Collector Agent**: User groups will be pushed to the FortiGate from the collector agent. Click **Apply & Refresh** to fetch group filters from the collector agent.
   - **Local**: User groups will be specified in the FortiGate unit's configuration. Select the LDAP server from the list, then click **Edit** to select the **Users, Groups, and Organizational Units**. Optionally, enable **Proactively retrieve from LDAP server** and configure the **Search filter** and **Interval**.
8. Click **OK**.

**Poll Active Directory server**

The FortiGate unit can authenticate users and allow them network access based on groups membership in Windows Active Directory (AD).

**To create an AD server connector in the GUI:**

1. Go to **Security Fabric > External Connectors**.
2. Click **Create New**.
3. In the **Endpoint/Identity** section, click **Poll Active Directory Server.**

4. Fill in the **Server IP/Name**, **User**, and **Password** for the AD server.
5. Select the LDAP server from the list.
6. If necessary, disable **Enable Polling**. This can be used to temporarily stop the FortiGate from polling security event logs on the Windows logon server, for troubleshooting purposes.
7. Click **OK**.

### Symantec endpoint connector

With the Fabric connector for Symantec Endpoint Protection Manager (SEPM), you can use the client IP information from SEPM to assign to dynamic IP addresses on FortiOS.

When communication between FortiGate and SEPM is established, FortiGate polls every minute for updates via TLS over port 8446. You can use the CLI to change the default one minute polling interval.

For example, you can create a dynamic Fabric Connector IP address subtype and use it in firewall policies as the source address. The dynamic IP address contains all IP addresses sent by SEPM.

This example shows a dynamic IP address with SEPM and one client PC managed by SEPM using FortiGate as the default gateway.

**To configure SEPM on a managed client PC:**

1. In SEPM, create client packages for client hosts and group them into SEPM groups. You can install packages locally on clients or download them directly from SEPM.
2. When a package is installed on the client host, the host is considered managed by SEPM. Even if the host has multiple interfaces, only one IP per host is displayed.

To configure Symantec endpoint connector on FortiGate in the GUI:

1. Go to Security Fabric > External Connectors and click Create New:
   a. In the Endpoint/Identity section, click Symantec Endpoint Protection.
   b. Fill in the Name, and set the Status and Update Interval.
   c. Set Server to the SEPM IP address.
   d. Enter the Username and Password for the server.
   e. To limit the domain or group that is monitored, enter them in the requisite fields.
   
   f. Click OK.

   When the connection is established, you can see a green up arrow in the bottom right of the card. You might need to refresh your browser to see the established connection.

2. Go to Policy & Objects > Addresses and click Create New > Address:
   a. Fill in the address Name.
   b. Set Type to Dynamic.
   c. Set Sub Type to Fabric Connector Address.
   d. Set SDN Connector to the fabric connector that you just created.
e. Add Filters as needed.

![Filter options](image1)

f. Click OK.

Filter options are only available for active computers that are configured and registered in SEPM. Free-form filters can be created manually by clicking Create and entering the filter, in the format: `filter_type=value`.

Possible manual filter types are: `GroupName`, `GroupID`, `ComputerName`, `ComputerUUID`, and `OSName`. For example: `GroupName=MyGroup`.

3. Go to Policy & Objects > Addresses and hover the cursor over the name of the new address to see the resolved IP addresses of the host.

![Address Group](image2)

4. Go to Policy & Objects > Firewall Policy, click Create New, and add a policy that uses the dynamic IP address.
To verify the configuration:

1. On the client PC, check that it is managed by SEPM to access the Internet.

2. On the FortiGate, you can check in Dashboard > FortiView Sources and Log & Report > Forward Traffic.

Because this traffic is not authenticated traffic but is based on source IP address only, it is not shown in the GUI firewall monitor or in the diagnose firewall auth list CLI command.
To configure Symantec endpoint connector on FortiGate in the CLI:

1. Create the fabric connector:

   ```
   config system sdn-connector
   edit "sepm-217"
   set type sepm
   set server "172.18.60.217"
   set username "admin"
   set password *********
   set status enable
   next
   end
   ```

2. Create the dynamic IP address:

   ```
   config firewall address
   edit "sepm-ip"
   set type dynamic
   set sdn "sepm-217"
   set filter "ComputerName=win10-1"
   config list
   edit "10.1.100.187"
   next
   edit "10.6.30.187"
   next
   edit "172.16.200.187"
   next
   end
   next
   end
   ```

3. Add the dynamic IP address to the firewall policy:

   ```
   config firewall policy
   edit 1
   set name "pol1"
   set srcintf "port2"
   set dstintf "port1"
   set srcaddr "sepm-ip"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set utm-status enable
   set ssl-ssh-profile "certificate-inspection"
   set av-profile "default"
   set logtraffic all
   set fsso disable
   set nat enable
   next
   end
   ```

To troubleshoot Symantec SD connector in the CLI:

```
# diagnose debug application sepmd -1
```

Output is sent every minute (default). All IPv4 learned from SEPM. IPv6 also sent but not
yet supported.

2019-09-09 12:01:09 sepmd sdn connector sepm-217 start updating IP addresses

  name: sepm-ip, vd 0, filter 'ComputerName=win10-1'
```

**RADIUS single sign-on agent**

With RADIUS single sign-on (RSSO), a FortiGate can authenticate users who have authenticated on a remote RADIUS server. Based on which user group the user belongs to, the security policy applies the appropriate UTM profiles.

The FortiGate does not interact with the remote RADIUS server; it only monitors RADIUS accounting records that the server forwards (originating from the RADIUS client). These records include the user IP address and user group. The remote RADIUS server sends the following accounting messages to the FortiGate:

<table>
<thead>
<tr>
<th>Message</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start</td>
<td>If the information in the start message matches the RSSO configuration on the FortiGate, the user is added to the local list of authenticated firewall users.</td>
</tr>
<tr>
<td>Stop</td>
<td>The user is removed from the local list of authenticated firewall users because the user session no longer exists on the RADIUS server.</td>
</tr>
</tbody>
</table>

You can configure an RSSO agent connector using the FortiOS GUI; however, in most cases, you will need to use the CLI. There are some default options you may need to modify that can only be done in the CLI.

```
config user radius
  edit <name>
    set rsso enable
    set rsso-radius-response enable
    set rsso-secret <password>
    set rsso-endpoint-attribute <attribute>
    set sso-attribute <attribute>
    set delimiter {plus | comma}
  next
end
```

**To configure an RSSO agent connector:**

1. Create the new connector:
   a. Go to Security Fabric > External Connectors.
   b. Click Create New.
   d. Enter the connector name.
e. Enable Use RADIUS Shared Secret.

The value entered in Use RADIUS Shared Secret must be identical to what the remote RADIUS server uses to authenticate when it sends RADIUS accounting messages to the FortiGate.

f. Enable Send RADIUS Responses.

You should enable Send RADIUS Responses because some RADIUS servers continue to send the same RADIUS accounting message several times if there is no response.

g. Click OK.

2. Edit the network interface:
   a. Go to Network > Interfaces.
   b. Double-click the interface that will receive the RADIUS accounting messages. The Edit Interface pane opens.
   c. In the Administrative Access section, select the RADIUS Accounting checkbox. This will open listening for port 1813 on this interface. The FortiGate will then be ready to receive RADIUS accounting messages.
   d. Click OK.

3. Create a local RSSO user group:
   a. Go to User & Authentication > User Groups.
   b. Click Create New.
   c. Enter the group name.
   d. For the Type field, click RADIUS Single-Sign-ON (RSSO).
   e. Enter a value for RADIUS Attribute Value.

This value by default is the class attribute. The FortiGate uses the content of this attribute in RADIUS accounting start messages to map a user to a FortiGate group, which then can be used in firewall policies. In this example configuration, the FortiGate will only add a remote RADIUS user to the local firewall user list if the class attribute in the RADIUS accounting START message contains the value group1.
If your users are in multiple groups, you will need to add multiple local RSSO user group.

If the RADIUS attribute value used to map users to a local RSSO group is different than the RADIUS attribute in the RADIUS accounting messages forwarded by the server, you must change it in the CLI.

4. Edit the local RSSO agent to modify default options using the CLI.
   For example, the default value for rsso-endpoint-attribute might work in common remote access scenarios where users are identified by their unique Calling-Station-Id, but in other scenarios the user name might be in a different attribute.

   ```
   config user radius
   edit "Local RSSO Agent"
   set rsso-endpoint-attribute <attribute>
   set sso-attribute <attribute>
   next
   end
   ```

5. Add the local RSSO user group to a firewall policy.

**Verifying the RSSO configuration**

Verification requires a working remote RADIUS server configured for RADIUS accounting forwarding and wireless or wired clients that use RADIUS for user authentication.

For a quick test, you can use one of the publicly available RADIUS test tools to send RADIUS accounting start and stop messages to the FortiGate. You can also use radclient.

**To verify the RSSO configuration:**

1. In radclient, enter the RADIUS attributes. These attributes are then executed with the FortiGate IP parameters (sends accounting messages to port 1813) and shared password you configured. `-x` is used for verbose output:

   ```
   root@ControlPC:~# echo "Acct-Status-Type =Start,Framed-IP-Address=10.1.100.185,User-Name=test2,Acct-Session-Id=0211a4ef,Class=group1,Calling-Station-Id=00-0c-29-44-BE-B8" | radclient -x 10.1.100.1 acct 123456
   Sending Accounting-Request of id 180 to 10.1.100.1 port 1813
   Acct-Status-Type = Start
   Framed-IP-Address = 10.1.100.185
   User-Name = "test2"
   Acct-Session-Id = "0211a4ef"
   Class = 0x67726f757031
   Calling-Station-Id = "00-0c-29-44-BE-B8"
   rad_recv: Accounting-Response packet from host 10.1.100.1 port 1813, id=180, length=20
   root@ControlPC:~#
   ```

2. Verify that the user is in the local firewall user list with the correct type (`rsso`) and local firewall group(`rsso-group1`):
Fortinet Security Fabric

# diagnose firewall auth 1

10.1.100.185, test2
  type: rsso, id: 0, duration: 5, idled: 5
  flag(10): radius
  server: vdom1
  packets: in 0 out 0, bytes: in 0 out 0
  group_id: 3
  group_name: rsso-group-1

----- 1 listed, 0 filtered ------

Exchange Server connector

FortiGate can collect additional information about authenticated users from corporate Microsoft Exchange Servers. After a user logs in, the additional information can be viewed in various parts of the GUI.

The Exchange connector must be mapped to the LDAP server that is used for authentication.

The following attributes are retrieved:

- USER_INFO_FULL_NAME
- USER_INFO_FIRST_NAME
- USER_INFO_LAST_NAME
- USER_INFO_LOGON_NAME
- USER_INFO_TELEPHONE
- USER_INFO_EMAIL
- USER_INFO_USER_PHOTO
- USER_INFO_COMPANY
- USER_INFO_DEPARTMENT
- USER_INFO_GROUP
- USER_INFO_TITLE
- USER_INFO_MANAGER
- USER_INFO_STREET
- USER_INFO_POSTAL_CODE
- USER_INFO_COUNTRY
- USER_INFO_ACCOUNT_EXPIRES
- USER_INFO_POST_OFFICE_BOX

Kerberos Key Distribution Center (KDC) automatic discovery is enabled by default. The FortiGate must be able to use DNS to resolve the KDC IP addresses, otherwise the FortiGate will be unable to retrieve additional user information from the Exchange Server.

KDC automatic discovery can be disabled, and one or more internal IP addresses that the FortiGate can reach can be configured for KDC.

The Override server IP address is enabled when the IP address of the Exchange server cannot be resolved by DNS and must be entered manually.

To configure an Exchange connector in the GUI:

1. Go to Security Fabric > External Connectors and click Create New.
2. In the Endpoint/Identity section, click Exchange Server.
3. Set Name to exchange140.
4. Set Exchange account to Administrator@W2K8-SERV1.FORTINET-FSSO.COM.
   Administrator is the username, W2K8-SERV1 is the exchange server name, and FORTINET-FSSO.COM is the domain name.
5. Set Password to the password.
6. Enable Override server IP address and set it to 10.1.100.140.
7. Ensure that *Auto-discover KDC* is enabled.

8. Click OK.

To link the connector to the LDAP server in the GUI:

1. Go to *User & Authentication > LDAP Servers.*
2. Edit an existing LDAP server, or click *Create New* to create a new one.
3. Enable *Exchange server,* and select the connector from the list.
4. Configure the remaining settings as required.

5. Click OK.

To configure an Exchange connector with automatic KDC discovery in the CLI:

```plaintext
config user exchange
edit "exchange140"
    set server-name "W2K8-SERV1"
    set domain-name "FORTINET-FSSO.COM"
    set username "Administrator"
    set password **********
    set ip 10.1.100.140
    set auto-discover-kdc enable
next
end
```
To link the connector to the LDAP server in the CLI:

```plaintext
cfg user ldap
  edit "openldap"
    set server "172.18.60.213"
    set cnid "cn"
    set dn "dc=fortinet-fsso,dc=com"
    set type regular
    set username "cn=Manager,dc=fortinet-fsso,dc=com"
    set password **********
    set group-member-check group-object
    set group-object-filter "(&(objectclass=groupofnames)(member=")
    set member-attr "member"
    set user-info-exchange-server "exchange140"
next
end
```

Verification

To verify that KDC auto-discovery is working:

```plaintext
# diagnose wad debug enable category all
# diagnose wad debug enable level verbose
# diagnose debug enable
# diagnose wad user exchange test-auto-discover

wad_diag_session_acceptor(3115): diag socket 20 accepted.
__wad_fmem_open(557): fmem=0x12490bd8, fmem_name='cmem 9188 bucket', elm_sz=9188, block_sz=73728, overhead=0, type=advanced
Starting auto-discover test for all configured user-exchanges.
[NOTE]: If any errors are returned, try manually configuring IPs for the reported errors.

(0x7f938dfe8050) query(_kerberos._udp.FORTINET-FSSO.COM) n_rsp(3)
```
Completed auto-discover test for all configured user-exchanges.

To check the collected information after the user has been authenticated:

1. In the GUI, go to Dashboard > Users & Devices, expand the Firewall Users widget, and hover over the user name.
2. In the CLI, run the following diagnose command:

   ```
   # diagnose wad user info 20 test1
   'username' = 'test1'
   'sourceip' = '10.1.100.185'
   'vdom' = 'root'
   'cn' = 'test1'
   'givenName' = 'test1'
   'sn' = 'test101'
   'userPrincipalName' = 'test1@Fortinet-FSSO.COM'
   'telephoneNumber' = '604-123456'
   'mail' = 'test1@fortinet-fsso.com'
   'thumbnailPhoto' = '/tmp/wad/user_info/76665fff62ffffffffffffffffffff75ff68fffffffffa'
   'company' = 'Fortinet'
   'department' = 'Release QA'
   'memberOf' = 'CN=group321,OU=Testing,DC=Fortinet-FSSO,DC=COM'
   'memberOf' = 'CN=g1,OU=Testing,DC=Fortinet-FSSO,DC=COM'
   'memberOf' = 'CN=group21,OU=Testing,DC=Fortinet-FSSO,DC=COM'
   'memberOf' = 'CN=group1,OU=Testing,DC=Fortinet-FSSO,DC=COM'
   'manager' = 'CN=test6,OU=Testing,DC=Fortinet-FSSO,DC=COM'
   'streetAddress' = 'One Backend Street 1901'
   'l' = 'Burnaby'
   'st' = 'BC'
   'postalCode' = '4711'
   'co' = 'Canada'
   'accountExpires' = '9223372036854'
   ```

   If the results are not as expected, verify what information FortiGate can collect from the Exchanger Server:

   ```
   # diagnose test application wad 2500
   # diagnose test application wad 162
   ```

**Threat feeds**

Threat feeds dynamically import an external block list from an HTTP server in the form of a plain text file, or from a STIX/TAXII server. Block lists can be used to enforce special security requirements, such as long term policies to always block access to certain websites, or short term requirements to block access to known compromised locations. The lists are dynamically imported, so that any changes are immediately imported by FortiOS.

There are four types of threat feeds:

<table>
<thead>
<tr>
<th><strong>FortiGuard Category</strong></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The file contains one URL per line. It is available as a Remote Category in Web Filter profiles, SSL inspection exemptions, and proxy addresses. See Web rating override on page 1320 for more information. Example:</td>
<td></td>
</tr>
</tbody>
</table>
The file contains one IP/IP range/subnet per line. It is available as an *External IP Block List* in DNS Filter profiles, and as a *Source/Destination* in IPv4, IPv6, and proxy policies.

**Example:**

- 192.168.2.100
- 172.200.1.4/16
- 172.16.1.2/24
- 172.16.8.1-172.16.8.100
- 2001:0db8::eade:27ff:fe04:9a01/120
- 2001:0db8::eade:27ff:fe04:aa01-2001:0db8::eade:27ff:fe04:ab01

**Domain Name**
The file contains one domain per line. Simple wildcards are supported. It is available as a *Remote Category* in DNS Filter profiles. See External resources for DNS filter on page 2513 for more information.

**Example:**

- mail.*.example.com
- *-special.example.com
- www.*example.com
- example.com

**Malware Hash**
The file contains one hash per line in the format `<hex hash> [optional hash description]`. Each line supports MD5, SHA1, and SHA256 hashes. It is automatically used for virus outbreak prevention on antivirus profiles with external-blocklist enabled.

**Note:** For optimal performance, do not mix different hashes in the list. Only use one of MD5, SHA1, or SHA256.

**Example:**

- 292b2e6bb027cd4ff4d24e338f5c48de
- dda37961870ce079defbf185eeeef905 Trojan-Ransom.Win32.Locky.abfl
- 3fa86717650a17d075d856a41b3874265f8e9eab Trojan-Ransom.Win32.Locky.abfl
- c35f705df9e475305c0984b05991d444450809c35dd1d96106bb8e7128b9082f Trojan-Ransom.Win32.Locky.abfl

See External malware block list on page 1100 for an example.

### External resources file format

File format requirements for a HTTP/HTTPS external resources file:

- The file is in plain text format with each URL list, IP address, domain name, or malware hash occupying one line.
- The file is limited to 10 MB or 128 × 1024 (131072) entries, whichever limit is hit first.
- The entry limit also follows the table size limitation defined by CMDB per model.
- The external resources update period can be set to 1 minute, hourly, daily, weekly, or monthly (43200 min, 30 days).
- The external resources type as category (URL list) and domain (domain name list) share the category number range 192 to 221 (total of 30 categories).
- There is no duplicated entry validation for the external resources file (entry inside each file or inside different files).
- If the number of entries exceed the limit, a warning is displayed. Additional entries beyond the threshold will not be loaded.
For domain name list (type = domain):
- Simple wildcards are allowed in the domain name list, for example: *.test.com.
- IDN (international domain name) is supported.

For IP address list (type = address):
- The IP address can be a single IP address, subnet address, or address range. For example, 192.168.1.1, 192.168.10.0/24, or 192.168.100.1-192.168.100.254.
- The address can be an IPv4 or IPv6 address. An IPv6 address does not need to be in [ ] format.

For URL list (type=category):
- The scheme is optional, and will be truncated if found; https:// and http:// are not required.
- Wildcards are allowed at the beginning or end or the URL, for example: *.domain.com or domain.com.*.
- IDN and UTF encoding URL are supported.
- The URL can be an IPv4 or IPv6 address. An IPv6 URL must be in [ ] format.

To determine the external resource table size limit for your device:

```
# print tablesize
...
system.external-resource: 0 256 512
...
```

For this device, a FortiGate 60E, the global limit is 512 and the limit per VDOM is 256.

### Create a threat feed

**To create a threat feed in the GUI:**

1. Go to Security Fabric > External Connectors.
2. Click Create New.
3. In the Thread Feeds section, click on the required feed type.
4. Configure the connector settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>Enter a name for the threat feed connector.</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI of external resource</td>
<td>Enter the link to the external resource file. HTTP, HTTPS, and STIX protocols are supported.</td>
</tr>
<tr>
<td>HTTP basic authentication</td>
<td>Enable/disable basic HTTP authentication. When enabled, enter the username and password in the requisite fields.</td>
</tr>
<tr>
<td>Refresh Rate</td>
<td>The time interval to refresh the external resource, in minutes (1 - 43200, default = 5).</td>
</tr>
<tr>
<td></td>
<td>The applicable threat feed will be triggered to refresh between 0 minutes and the configured value. When the refresh is triggered, if another task is being processed by the schedule worker, the refresh task will be added to the queue.</td>
</tr>
<tr>
<td>Comments</td>
<td>Optionally, enter a description of the connector.</td>
</tr>
<tr>
<td>Status</td>
<td>Enable/disable the connector.</td>
</tr>
</tbody>
</table>

5. Click OK.
To create a threat feed in the CLI:

```
config system external-resource
  edit <name>
    set status {enable | disable}
    set type {category | address | domain | malware}
    set category <integer>
    set username <string>
    set password <string>
    set comments <string>
    *set resource <resource-uri>
    set user-agent <string>
    *set refresh-rate <integer>
    set source-ip <ip address>
    set interface-select-method {auto | sdwan | specify}
next
end
```

Parameters marked with an asterisk (*) are mandatory and must be filled in. Other parameters either have default values or are optional.

When multi VDOM mode is enabled, threat feed external connectors can be defined in the global VDOM or within a VDOM. See Threat feed connectors per VDOM on page 2517 for example configurations.

Update history

To review the update history of a threat feed, go to Security Fabric > External Connectors, select a feed, and click Edit. The Last Update field shows the date and time that the feed was last updated.

Click View Entries to view the current entries in the list.

EMS threat feed

A FortiGate can pull malware threat feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. See Malware threat feed from EMS on page 1103 for an example.
External blocklist policy

You can use the external blocklist (threat feed) for web filtering, DNS, and in firewall policies.

Sample configuration

In this example, an IP address blocklist connector is created so that it can be used in a firewall policy.

To configure an external block list connector in the GUI:

1. Go to Security Fabric > External Connectors and click Create New.
2. In the Threat Feeds section, click IP Address.
3. Set Name to AWS_IP_Blocklist.
5. Configure the remaining settings as required, then click OK.
6. Edit the connector, then click View Entries to view the IP addresses in the feed.

The blocklist can now be used in web filter and DNS profiles, and in firewall policies.

To configure an external block list connector in the CLI:

```
config system external-resource
    edit "AWS_IP_Blocklist"
        set status enable
        set type address
        set username ''
        set password ********
```
set comments ''
set resource "https://s3.us-east-2.amazonaws.com/ip-blocklist/ip.txt"
set refresh-rate 15
next
end

To apply an external block list to a firewall policy in the CLI:

config firewall policy
def 1
    set name "policyid-1"
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
    set dstaddr "AWS_IP_Blocklist"
    set action accept
    set schedule "always"
    set service "ALL"
    set logtraffic all
    set auto-asic-offload disable
    set nat enable
next
def

External blocklist authentication

Thread feed external connectors support username and password authentication.

To enable username and password authentication in a thread feed connector:

1. Go to Security Fabric > External Connectors.
2. Edit an existing Threat Feed or create a new one by selecting Create New.
3. Enable HTTP basic authentication
4. Enter the Username and Password.

5. Click OK.
External blocklist file hashes

The malware hash threat feed connector supports a list of file hashes that can be used as part of virus outbreak prevention.

This example retrieves a malware hash from an Amazon S3 bucket, and then enables malware block lists in an antivirus profile.

To configure a malware hash connector in the GUI:

1. Go to Security Fabric > External Connectors and click Create New.
2. In the Threat Feeds section, click Malware Hash.
3. Set Name to AWS_Malware_Hash.
5. Click OK.
6. Edit the connector, then click View Entries to view the hash list.
7. Go to Security Profiles > AntiVirus and create a new profile, or edit an existing one.
8. Enable Use external malware block list.
9. Click the + and select AWS_Malware_Hash from the list.
10. Click OK.

To configure a malware hash connector in the CLI:

```
config system external-resource
  edit "AWS_Malware_Hash"
```
set type malware
set resource "https://s3.us-west-2.amazonaws.com/malware-hash-feeds/fortinet-malware-hash-list"
next
end

config antivirus profile
edit "av-profile"
    set external-blocklist-enable all disable
    set external-blocklist "AWS_Malware_Hash"
end
next
end

Logs

The `filehash` and `filehashsrc` are included in outbreak prevention detection event logs.

This example shows the log generated when a file is detected by external malware hash list outbreak prevention:

```
1: date=2018-07-30 time=13:59:41 logid="0207008212" type="utm" subtype="virus"
eventtype="malware-list" level="warning" vd="root" eventtime=1532984381 msg="Blocked by local malware list." action="blocked" service="HTTP" sessionid=174963 srcip=192.168.101.20 dstip=172.16.67.148 srcport=37045 dstport=80 srcintf="lan" srcintfrole="lan" dstintf="wan1" dstintfrole="wan" policyid=1 proto=6 direction="incoming" checksum="90f0cb57" quarskip="No-skip" virus="mhash_block.com" filehash="93bdd30bd381b018b9d1b89e8e6d8753" filehashsrc="test_list" url="http://172.16.67.148/mhash_block.com" profile="mhash_test" agent="Firefox/43.0" analyticssubmit="false"
```

External resources for DNS filter

External resources provides the ability to dynamically import an external block list into an HTTP server. This feature enables the FortiGate to retrieve a dynamic URL, domain name, IP address, or malware hash list from an external HTTP server periodically. The FortiGate uses these external resources as the web filter's remote categories, DNS filter's remote categories, policy address objects, or antivirus profile's malware definitions. If external resources are updated, FortiGate objects are also updated dynamically.

External resource is divided into four types:

- URL list (type = category)
- Domain name list (type = domain)
- IP address list (type = address)
- Malware hash list (type = malware)

Remote categories and external IP block list

The DNS filter profile can use two types of external resources: `domain type` (domain name list) and `address type` (IP address list).

When a `domain type` external resource is configured, it is treated as a remote category in the DNS filter profile. If the domain name in DNS query matches the entry in this external resource file, it is treated as the remote category and follows the action configured for this category in DNS filter profile.
When an address type external resource is configured, it can be enabled as external-ip-blocklist in DNS filter profile. If a DNS resolved IP address in DNS response matches the entry in the external-ip-blocklist, this DNS query is blocked by the DNS filter.

For external resources file format and limits, see External resources file format on page 2507.

Configuring external resources in the CLI

In the CLI, you can configure external resources files in an external HTTP server. Under global, configure the external resources file location and specify the resource type.

To configure external resources:

```
config system external-resource
  edit "Ext-Resource-Type-as-Domain-1"
    set type domain
    set category 194
    set resource "http://172.16.200.66/external-resources/Ext-Resource-Type-as-Domain-1.txt"
    set refresh-rate 1
next
edit "Ext-Resource-Type-as-Address-1"
  set status enable
  set type address
  set username ''
  set password ********
  set comments ''
  set resource "http://172.16.200.66/external-resources/Ext-Resource-Type-as-Address-1.txt"
  set refresh-rate 1
next
end
```

In each VDOM, the domain type external resource can be used in the DNS filter as remote category. In this example, the domain name list in the Ext-Resource-Type-as-Domain-1.txt file is treated as a remote category (category ID 194). The IP address list in the Ext-Resource-Type-as-Address-1.txt file can be applied in the DNS filter as an external-ip-blocklist. If the DNS resolved IP address matches any entry in the list in that file, the DNS query is blocked.

To configure the external IP block list and apply it to a policy:

```
config dnsfilter profile
  edit "default"
    set comment "Default dns filtering."
  config ftgd-dns
    config filters
      edit 1
        set category 194
        set action block
      next
    edit 2
      set category 12
    next
    edit 3
  next
```

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
end
end
set block-botnet enable
    set external-ip-blocklist "Ext-Resource-Type-as-Address-1"
next
end

config firewall policy
    edit 1
        set name "DNSFilter"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set logtraffic all
        set dnsfilter-profile "default"
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set nat enable
next
end

Configuring external resources in the GUI

To configure, edit, or view the entries for external resources in the GUI:

1. Go to Global > Security Fabric > External Connectors.
2. Click Create New.
3. In the Threat Feeds section, select Domain Name or IP Address.
4. Enter the Resource Name, URL, location of the resource file, resource authentication credentials, and Refresh Rate.
5. Click OK.
6. Double-click the Threat Feeds Object you just configured to open the Edit page.
7. Click View Entries to view the entry list in the external resources file.

8. Go to VDOM > Security Profiles > DNS Filter and open a DNS filter profile. The configured external resources displays, and you can apply it in each DNS filter profile (remote category or external IP block lists).

Log sample

Remote categories

Go to VDOM > Log & Report > Security Events and select the DNS Query card. Some domains that match the remote category list are rated as remote category, overriding their original domain rating.
Log example:

1: date=2019-01-18 time=13:49:12 logid="1501054802" type="utm" subtype="dns" eventtype="dns-response" level="notice" vd="vdom1" eventtime=1547848151 policyid=1 sessionid=82998 srcip=10.1.100.18 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16 dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="default" xid=38234 qname="www.example.com" qtype="A" qtypeval=1 qclass="IN" ipaddr="93.184.216.34" msg="Domain is monitored" action="pass" cat=196 catdesc="Ext-Resource-Type-as-Domain-3"

2: date=2019-01-18 time=13:49:12 logid="1500054000" type="utm" subtype="dns" eventtype="dns-query" level="information" vd="vdom1" eventtime=1547848151 policyid=1 sessionid=82998 srcip=10.1.100.18 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16 dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="default" xid=38234 qname="www.example.com" qtype="A" qtypeval=1 qclass="IN"

External IP block lists

Go to VDOM > Log & Report > Security Events and select the DNS Query card. If the DNS query resolved IP address matches the entry in the external-ip-blocklist, the DNS query is blocked.

Log example:

1: date=2019-01-18 time=13:50:53 logid="1501054400" type="utm" subtype="dns" eventtype="dns-response" level="warning" vd="vdom1" eventtime=1547848253 policyid=1 sessionid=8206 srcip=10.1.100.18 srcport=47281 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16 dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="default" xid=7501 qname="www.example.com" qtype="A" qtypeval=1 qclass="IN" msg="Domain was blocked because it is in the domain-filter list" action="redirect" domainfilteridx=0 domainfilterlist="Ext-Resource-Type-as-Address-1"

2: date=2019-01-18 time=13:50:53 logid="1500054000" type="utm" subtype="dns" eventtype="dns-query" level="information" vd="vdom1" eventtime=1547848253 policyid=1 sessionid=8206 srcip=10.1.100.18 srcport=47281 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16 dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="default" xid=7501 qname="www.example.com" qtype="A" qtypeval=1 qclass="IN"

Threat feed connectors per VDOM

When multi-VDOM mode is enabled, a threat feed external connector can be defined in global or within a VDOM. Global threat feeds can be used in any VDOM, but cannot be edited within the VDOM. FortiGuard category and domain name-based external feeds have an added category number field to identify the threat feed. The threat feed name in global must start with g-. Threat feed names in VDOMs cannot start with g-.
FortiGuard category and domain name-based external feed entries must have a number assigned to them that ranges from 192 to 221. This number can be assigned to both external feed types. However, when a category number is used under a global entry, such as 192 with the name `g-cat-192`, this category number cannot be used in any other global or VDOM entries. If a category is used under a VDOM entry, such as 192 under `VDOM1` with the name `cat-192`, the category 192 can be used in another VDOM or root with the name `cat-192`.

A thread feed connector can only be used in profiles in the VDOM that it was created in. Global connectors can be used in all VDOMs.

Each VDOM can have a maximum of 256 thread feed entries. But in total, a FortiGate can only have 511 thread feed entries.

To configure an external threat feed connector under global in the GUI:

1. Go to Security Fabric > External Connectors and click Create New.
2. In the Threat Feeds section, click FortiGuard Category.
3. Enter a name that begins with `g-`.
4. Configure the other settings as needed.
5. Click OK.

To configure an external threat feed connector under global in the CLI:

```
config global
    config system external-resource
        edit "g-category"
            set status enable
            set type category
            set category 192
            set comments ''
            set refresh-rate 5
        end
    end
end
```

To configure an external threat feed connector under a VDOM in the GUI:

1. Go to Security Fabric > External Connectors and click Create New.
2. In the Threat Feeds section, click Domain Name.
3. Enter a name that does not begin with `g-`.
4. Configure the other settings as needed.
5. Click OK. The threat feed connector created under global also appears, but it is not editable.
To configure an external threat feed connector under a VDOM in the CLI:

```plaintext
config vdom
  edit vd1
    config system external-resource
      edit "vd1-domain"
        set status enable
        set type domain
        set category 193
        set comments ''
        set refresh-rate 5
      next
    end
  next
end
```

To use an IP address threat feed in a policy in the GUI:

1. Configure an IP address connector in global:
   a. Go to Security Fabric > External Connectors and click Create New.
   b. In the Threat Feeds section, click IP Address.
   c. Enter a name that begins with g-.
   d. Configure the other settings as needed.
   e. Click OK.

2. Configure an IP address connector in the VDOM (vd1):
   a. Go to Security Fabric > External Connectors and click Create New.
   b. In the Threat Feeds section, click IP Address.
   c. Enter a name that does not begin with g-.
   d. Configure the other settings as needed.
   e. Click OK. The threat feed connectors created under global also appear, but they are not editable.

   ![Threat Feeds](image)

3. Configure the firewall policy in the VDOM (vd1):
   a. Go to Policy & Objects > Firewall Policy and click Create New.
   b. For Destination, select vd1-address. Since this policy is configured under vd1, g-address can also be set as the destination.

   ![Firewall Policy](image)
c. Configure the other settings as needed.
d. Click OK.

To use an IP address threat feed in a policy in the CLI:

1. Configure the IP address connectors:

```
config global
  config system external-resource
    edit "g-address"
      set status enable
      set type address
      set username ''
      set comments ''
      set refresh-rate 5
    next
  end
end

config vdom
  edit vdl
    config system external-resource
      edit "vdl-address"
        set status enable
        set type address
        set comments ''
        set user-agent "curl/7.58.0"
        set refresh-rate 5
      next
    end
  next
end
```
2. In the VDOM, configure a firewall policy with the external address as the destination address:

```fortios
config vdom
    edit vdl
        config firewall policy
            edit 1
                set name "test"
                set srcintf "port10"
                set dstintf "port9"
                set srcaddr "all"
                set dstaddr "vd1-address"
                set action accept
                set schedule "always"
                set service "ALL"
                set profile-protocol-options "protocol"
                set nat enable
            next
        end
    end
```

Since this firewall policy is configured under `vd1`, `g-address` can also be set as the `dstaddr`.

### STIX format for external threat feeds

The FortiGate's external threat feeds support feeds that are in the STIX/TAXII format. Use the `stix://` prefix in the URI to denote the protocol.

All external threat feeds support the STIX format. In this example, a FortiGuard Category threat feed in the STIX format is configured.

**To configure a FortiGuard Category threat feed in the STIX format in the GUI:**

1. Go to `Security Fabric > External Connectors` and click `Create New`.
2. Select `FortiGuard Category` from the `Threat Feeds` section.
3. Configure the connector:
   - **Name**: `category-taxii`
   - **URI of external resource**: `stix://limo.anomali.com/api/v1/taxii2/feeds/collections/200/objects/`
   - **HTTP basic authentication**: Enable and enter the username and password, such as `guest` and `guest`. 
4. Click OK.
5. Edit the connector, and click View Entries in the right side bar to view the retrieved entries.

To configure a FortiGuard Category threat feed in the STIX format in the CLI:

```bash
config system external-resource
  edit "category-taxii"
    set category 194
    set username "guest"
    set password guest
    set resource "stix://limo.anomali.com/api/v1/taxii2/feeds/collections/200/objects/"
next
end
```

If the connector is used in webfilter that blocks category 194, the traffic that matches the retrieved URLs, such as `rsiuk.co.uk`, is blocked:

```plaintext
1: date=2021-10-06 time=18:07:46 eventtime=1633568867163763708 tz="-0700" logid="0316013056" type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="vd1" policyid=1 sessionid=174974 srcip=10.1.100.12 srcport=48284 srcintf="port2" srcintfrole="undefined" srcu=0x1f5d srcu=0x1f5d dstip=78.129.255.151 dstport=443 dstintf="port1" dstintfrole="undefined" dstu=0x1f5d dstu=0x1f5d proto=6 service="HTTPS" hostname="rsiuk.co.uk" profile="test" action="blocked" reqtype="direct" url="https://rsiuk.co.uk/" sentbyte=75 rcvbyte=0 direction="outgoing"
```
Monitoring the Security Fabric using FortiExplorer for Apple TV

FortiExplorer for Apple TV allows you to use a TV screen to monitor your entire Security Fabric.

FortiExplorer for Apple TV is an analysis tool that provides easy to use NOC and SOC monitoring capabilities. The app features real-time data traffic, visual alerts, as well as a general overview of hardware devices, operating systems, and interfaces. The monitor also provides a wireless health summary of your entire network across multiple buildings. If an access point goes offline, you will be notified about the network’s health. After the issues are resolved, you will immediately see the health update on your screen.

Getting started with FortiExplorer for Apple TV

Download FortiExplorer for Apple TV from the app store on Apple TV. After the app is installed, add devices using the Apple TV remote or by sharing a login profile with FortiExplorer. Once the devices are added, you can use FortiExplorer for Apple TV to view real-time data in the Network Operations Center, Security Operations Center, and Software-Defined Branch.

To get started with FortiExplorer for Apple TV:

1. Download the app and add devices to FortiExplorer for Apple TV.
   You can add devices by sharing a login profile with FortiExplorer or logging into the device directly on FortiExplorer for Apple TV.
2. View the physical topology of the Fabric to identify risks
3. View the Fabric components as seen on the root FortiGate.
4. View an executive summary of the three largest areas of security focus in the Security Fabric.
5. View data collected by FortiAnalyzer on the endpoints on your network.
6. View vulnerability data collected by FortiClient EMS.
7. Use the Software-Defined Branch module to monitor interface SD-WAN usage and associated service level agreements.

NOC and SOC example

In this example, you have configured your FortiGates, FortiAnalyzer and other devices in your Security Fabric. Now you want to use FortiExplorer for Apple TV to display the status of the devices on a TV in your Network Operation Center or Security Operation Center.

Topology

This topology has a Headquarter and two Branches. Within the Headquarter is the Enterprise Core and two FortiGates acting as ISFWs. In addition, an on-premise FortiAnalyzer collects all logging information from the fabric devices. The FortiClient EMS manages all the endpoints within the topology.

The two branches are configured with SD-WAN with VPN overlays to the Enterprise Core. Traffic is steered towards the overlays and underlays based on SD-WAN Rules.

Using FortiExplorer for Apple TV, you will be able to monitor the different components in this topology.

To take advantage of the views in the FortiExplorer for Apple TV, you should configure:

- Security Fabric on all FortiGates. See Configuring the root FortiGate and downstream FortiGates on page 2210.
- FortiAnalyzer Logging. See Configuring FortiAnalyzer on page 2217.
- FortiClient EMS. See Configuring FortiClient EMS on page 2236
Adding the root FortiGate to FortiExplorer for Apple TV

By adding the root FortiGate, you can view the entire topology and navigate to branch FortiGates in the SD-WAN view. If you are already using FortiExplorer on a mobile device, you can connect the same FortiGate device to Apple TV by sharing the login credentials on both devices. Alternatively, you can manually connect to your root FortiGate directly from the app.

To share login credentials between FortiExplorer and FortiExplorer for Apple TV:

1. Connect the FortiExplorer and FortiExplorer for Apple TV devices to the same network.
2. On FortiExplorer for Apple TV, click New FortiGate.
3. In FortiExplorer, go to My Fabric.
4. Swipe right on the device you want to share, and tap Share Login Profile.
5. Tap *Share to Apple TV.*

6. On Apple TV, click *Accept.* FortiExplorer for Apple TV confirms the request and proceeds to the device main menu.
To add devices to FortiExplorer for Apple TV:

1. In the Devices menu, click New FortiGate. The Login to FortiGate dialog box is displayed.
2. In the IP Address/Host Name field, take one of the following actions:
   - Enter the device IP address and port, if not using the default admin port 443
   - Enter the full host name including the domain. Enter port if not using the default admin port 443.

3. Enter the Username and Password for the FortiGate device.
4. Click Remember to save time entering the login credentials later.
5. Click Login. The device is added to FortiExplorer for Apple TV.

If the IP or hostname is not defined in the CN or SAN field of your certificate, you will receive a prompt that "Your connection is not private". You may choose to continue with your connection.
Viewing the Fabric Topology monitor

Use the Fabric Topology monitor to view the physical topology of the Fabric to identify risks. FortiGate devices with version 6.4. and above can drilldown further to see additional information for devices such as FortiGates, FortiAPs, and FortiSwitches.

To view the Fabric Topology monitor, go to Network Operations Center > Fabric Topology. This monitor displays the same information as the Physical Topology on the FortiGate

Use your remote to navigate through the devices in the Fabric topology. Click a device to view the drilldown information. To return to the default view, click the Menu button.

Viewing the Fabric Overview monitor

Use the Fabric Overview monitor to view the Fabric components as seen on the Dashboard of the Fabric Root FortiGate in the example topology. Each device must be authorized and be part of the Fabric.

For information about configuring the Security Fabric, see Fortinet Security Fabric on page 2206

To view the Fabric Overview monitor, go to Network Operations Center > Fabric Overview.
The Security Fabric monitor has multiple panes. To see data populated on the panes, ensure that proper configurations are applied on the Fabric devices:

<table>
<thead>
<tr>
<th>Pane</th>
<th>Description</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fabric Connectors</td>
<td>Displays external SDN connectors that are enabled.</td>
<td>Configure Security Fabric &gt; External Connectors.</td>
</tr>
<tr>
<td>Attack Surface</td>
<td>Displays devices detected by the FortiGate with a server tag.</td>
<td>Ensure Device Detection is configured on the interfaces(s). Go to Network &gt; Interfaces.</td>
</tr>
<tr>
<td>Device Inventory</td>
<td>Displays devices based on Hardware Vendor and detected OS</td>
<td>Ensure Device Detection is configured on the interface(s). Go to Network &gt; Interfaces.</td>
</tr>
<tr>
<td>Endpoint Coverage</td>
<td>Displays the number of online devices and the percentage of Unscanned, Vulnerable, and Secured devices.</td>
<td>Ensure Device Detection is configured on the interface(s). Vulnerability scan results come from FortiClient EMS. Go to Network &gt; Interfaces.</td>
</tr>
</tbody>
</table>

Device related information only corresponds to devices local to the FortiGate. Device information from downstream FortiGates do not propagate to the Upstream FortiGate.
**Viewing the Security Rating monitor**

The Security Rating monitor is separated into three major scorecards: **Security Posture**, **Fabric Coverage**, and **Optimization**, which provide an executive summary of the three largest areas of security focus in the Security Fabric.

To see the Security Rating summary, the root FortiGate and all FortiGates within the Fabric should have the proper FortiGuard Security Rating license. Security rating is performed on the root FortiGate. Its reports are generated periodically.

To view the Security Rating monitor, go to *Network Operations Center > Security Rating*.

The scorecards show an overall score of the performance and sub-categories. The point score represents the net score for all passed and failed items in that area.

For more information about the Security Rating score, see *Security Fabric score on page 2343*.

**Viewing the Compromised Hosts monitor**

The Compromised Hosts monitor leverages the data collected by FortiAnalyzer on the endpoints on your network. To see compromised hosts, the FortiAnalyzer must have a FortiGuard Indicators of Compromise license. The IOC service helps identify compromised hosts based on infected websites that it may have visited.

This monitor captures the same information as seen on the *Compromised Hosts monitor* on the FortiGate.
To view the Compromised Hosts monitor:

2. In the left-hand pane, scroll through the user list. The monitor displays three panes:
   - The User Information pane displays the user's contact information and IP address.
   - The Topology View pane displays the user's location in the topology.
   - The Verdict View pane displays the Malware, Detected Method, and Security Action.

Viewing the Vulnerability Monitor

The Vulnerability Monitor obtains data from FortiClient EMS. It displays vulnerabilities detected by the FortiClient endpoint, categorized into Critical, High, Medium and Low risk. In this example, an on-premise FortiClient EMS is connected on the root FortiGate's Fabric Connector.

This monitor captures the same information as seen on the Top Vulnerable Endpoint Devices monitor on the FortiGate.
To view the Vulnerability Monitor:

1. Go to Security Operations Center > Vulnerability Monitor. The monitor displays a user list and their vulnerabilities.
2. Use your remote to scroll through the user list. The vulnerability details are displayed on the right side of the monitor.

   - The User Information pane displays the user's contact details and IP address.
   - The Vulnerability Summary pane displays the number of vulnerabilities categorized into Critical, High, Medium and Low risk.
   - The Topology View pane displays the user's location in the topology.
   - The Top Vulnerabilities pane displays the top vulnerabilities by severity.

Using the SD-WAN monitor

In the example topology, the branches are configured to use SD-WAN. You can use the top-right navigation menu in the SD-WAN monitor to navigate to the Branch FortiGate to display information about the SD-WAN.

To view the SD-WAN monitor, go to Software-Defined Branch > SD-WAN Monitor.

The SD-WAN monitor summarizes the SD-WAN members, Zones, SD-WAN Rules and health checks deployed on the FortiGate. It shows the interface member's SD-WAN usage and its associated service level agreements. The monitor contains a chart that shows if the ports are meeting the SLA target for bandwidth, jitter and latency per the health check in use in each SD-WAN Rule.
Some of the SD-WAN statistics are only available in FOS 6.4.1 and higher.

To view SD-WAN usage charts:

1. In the SD-WAN Overview area, Use your remote to select the SD-WAN Usage pane.
2. Scroll left and right to view Bandwidth, Volume and Sessions charts for the VIRTUAL-WAN-LINK and Underlay interfaces in the SD-WAN Zones pane.

To view SLA targets:

1. In the SD-WAN Rules area, use your remote to scroll the rules pane at the left-side of the monitor.
   - The Destinations pane displays the destination details.
   - The Performance SLA pane displays the SLA targets for the rule.
   - The SD-WAN Active Interface pane displays a checkmark next to the active interface.
2. Use your remote to navigate between the *Latency*, *Jitter*, and *Packet Loss* charts.

![Screen shot of Fortinet Security Fabric interface]

To view a branch in the topology:

1. Use your remote to swipe to the top navigation in the monitor. Wait for the topology to load.
2. At the top-right of the monitor, select the current device.

![Screen shot of Fortinet Security Fabric interface showing branch Office Office_01]

3. Select the device you want to view.

**Troubleshooting**

The following topics provide troubleshooting information for the Fortinet Security Fabric:
Viewing a summary of all connected FortiGates in a Security Fabric

In downstream FortiGates, the `diagnose sys csf global` command shows a summary of all of the connected FortiGates in the Security Fabric.

To view a Security Fabric summary on a downstream FortiGate:

```plaintext
# diagnose sys csf global
Current vision:

Diagnosing automation stitches

Diagnose commands are available to:

- Test an automation stitch
- Enable or disable log dumping for automation stitches
- Display the settings of every automation stitch
- Display statistics on every automation stitch

To test an automation stitch:

diagnose automation test <automation-stitch-name>

Example:
To toggle log dumping:

diagnose test application autod 1

Examples:

# diagnose test application autod 1
autod log dumping is enabled

# diagnose test application autod 1
autod log dumping is disabled

autod logs dumping summary:
autod dumped total:7 logs, num of logids:4

To display the settings for all of the automation stitches:

diagnose test application autod 2

Example:

# diagnose test application autod 2
csf: enabled root:yes
total stitches activated: 3

stitch: Compromised-IP-Banned
destinations: all
trigger: Compromised-IP-Banned

local hit: 0 relayed to: 0 relayed from: 0
actions:

Log and Report

Logging and reporting are useful components to help you understand what is happening on your network, and to inform you about certain network activities, such as the detection of a virus, a visit to an invalid website, an intrusion, a failed log in attempt, and myriad others.

Logging records the traffic that passes through, starts from, or ends on the FortiGate, and records the actions the FortiGate took during the traffic scanning process. After this information is recorded in a log message, it is stored in a log file that is stored on a log device (a central storage location for log messages). FortiGate supports sending all log types to several log devices, including FortiAnalyzer, FortiAnalyzer Cloud, FortiGate Cloud, and syslog servers. Approximately 5% of memory is used for buffering logs sent to FortiAnalyzer. The FortiGate system memory and local disk can also be configured to store logs, so it is also considered a log device. See Log settings and targets on page 2549 for more information.

Reports show the recorded activity in a more readable format. A report gathers all the log information that it needs, then presents it in a graphical format with a customizable design and automatically generated charts showing what is happening on the network. Reports can be generated on FortiGate devices with disk logging and on FortiAnalyzer devices.

FortiView is a more comprehensive network reporting and monitoring tool. It integrates real-time and historical data into a single view in FortiOS. For more information, see FortiView monitors and widgets on page 107.

Performance statistics are not logged to disk. Performance statistics can be received by a syslog server or by FortiAnalyzer.

The following topics provide information about logging and reporting:

- Viewing event logs on page 2541
- System Events log page on page 2543
- Security Events log page on page 2546
- Log settings and targets on page 2549
- Threat weight on page 2554
- Logging to FortiAnalyzer on page 2555
- Advanced and specialized logging on page 2566
- Sample logs by log type on page 2583
- Troubleshooting on page 2604

Viewing event logs

Event log subtypes are available on the Log & Report > System Events page. Not all of the event log subtypes are available by default. See System Events log page on page 2543 for more information.
When viewing event logs in the Details tab, use the event log subtype dropdown list on the to navigate between event log types.

<table>
<thead>
<tr>

</table>

### System Events log page

The `Log & Report > Events` page is now renamed `System Events`. The `System Events` page includes:

- A `Summary` tab that displays the top five most frequent events in each type of event log and a line chart to show aggregated events by each severity level. Clicking on a peak in the line chart will display the specific event count for the selected severity level.
- A `Details` tab that displays individual, detailed log views for event type.

Clicking on an event in the `Summary` tab will automatically bring users to the `Details` tab with the appropriate filters applied.

---

Disk logging and historical FortiView must be enabled for the `Summary` tab to display valid data. See Log settings and targets on page 2549 for more information.

---

### To review system events in the GUI:

2. On the right-side of the screen, select the time range from the dropdown list.
   The line chart will display all of the system events, and the non-empty event cards will list up to five `Top Event` entries within the time range set.

---

Data is retrieved from FortiView with the 5 minutes range updated first. When selecting either the 1 hour or 24 hours time range, there may be a delay to update `Top Event` entries.
3. Review the details of system events:
   - Click the event card name.
   
   The Details tab displays all event entries for the selected type of event log. The type of event log can be changed in the top-right, dropdown list.
Click a *Top Event* entry in an event card.

The *Details* tab displays system events with filters for the selected event entry and time range. The type of event log can be changed in the top-right, dropdown list.

Up to 100 *Top Event* entries can be listed in the CLI using the `diagnose fortiview result event-log` command.

To list system events in the CLI:

```bash
# diagnose fortiview result event-log

data(1646760000-1646846401):
  0). subtype-ha | eventname-HA device interface failed | level-warning | count-1 |
  1). subtype-system | eventname-DHCP statistics | level-information | count-40 |
  2). subtype-system | eventname-Super admin left VDOM | level-information | count-13 |
  3). subtype-system | eventname-Admin performed an action from GUI | level-warning | count-5 |
  4). subtype-system | eventname-Super admin entered VDOM | level-information | count-4 |
  5). subtype-system | eventname-Global setting changed | level-notice | count-3 |
  6). subtype-system | eventname-Attribute configured | level-information | count-2 |
  7). subtype-system | eventname-Clear active sessions | level-warning | count-2 |
  8). subtype-system | eventname-Disk log rolled | level-notice | count-2 |
  9). subtype-system | eventname-Log rotation requested by FortiCron | level-notice | count-1 |
 10). subtype-system | eventname-Report generated successfully | level-notice | count-1 |
 11). subtype-system | eventname-Test | level-warning | count-1 |
 12). subtype-system | eventname-VDOM added | level-notice | count-1 |
 13). subtype-user | eventname-VDOM added | level-notice | count-1 |
 14). subtype-user | eventname-Authentication lockout | level-warning | count-1 |
 15). subtype-user | eventname-FortiGuard override failed | level-warning | count-1 |
```
Log and Report

The data is collected from FortiView for the last 24 hours by default. To specify a specific time range, customize the time filter using the **diagnose fortiview time** command.

**To filter the time range of system events in the CLI:**

```bash
# diagnose fortiview time <arg1> <arg2>
```

Where `<arg1>` is the start time in `YYYY-MM-DD HH:MM:SS` and `<arg2>` is the end time in `YYYY-MM-DD HH:MM:SS`.

### Security Events log page

The Log & Report UTM log subtypes have been combined into the Security Events log page. The Security Events log page includes:

- A **Summary** tab that displays the five most frequent events for all of the enabled UTM security events.
- A **Details** tab that displays individual, detailed logs for each UTM type.

Clicking on an event in the **Summary** tab will bring users to the **Details** tab with the appropriate filters automatically applied.

---

**Tip**

Disk logging and historical FortiView must be enabled for the **Summary** tab to display valid data. See Log settings and targets on page 2549 for more information.

---

**To review security events in the GUI:**

   
   The **Summary** tab displays up to five top events for each enabled, non-empty security event cards.

2. On the right-side of the screen, select the time range from the dropdown list.
   
   The non-empty security event cards will list up to five top entries within the time range set.

---

**Tip**

Data is retrieved from FortiView with the 5 minutes range updated first. When selecting either the 1 hour or 24 hours time range, there may be a delay to update top security event entries.
3. Review the details of security events:
   - Click the security event card name.
     The Details tab displays all event entries for the selected type of security event. The security event type can be changed in the top-right dropdown list.

   - Click a top event entry in a security event card.
     The Details tab displays security events with filters for the selected event entry and time filter. The security event type can be changed in the top-right dropdown list.

Up to 100 top security event entries can be listed in the CLI using the `diagnose fortiview result security-log` command.

**To list security events in the CLI:**
```bash
# diagnose fortiview result security-log [<filters>]
```

**To list security events in the CLI with no filters applied:**
```bash
# diagnose fortiview result security-log

data(1646862300-1646948701):

```

FortiOS 7.2.0 Administration Guide
Fortinet Inc. 2548
Log settings and targets

Log settings determine what information is recorded in logs, where the logs are stored, and how often storage occurs. Log settings can be configured in the GUI and CLI. In the GUI, Log & Report > Log Settings provides the settings for local and remote logging.

<table>
<thead>
<tr>
<th>Local Log</th>
<th>Define local log storage on the FortiGate:</th>
<th>Define local log storage on the FortiGate:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disk</td>
<td>• Enable: Logs will be stored on a local disk. Local disk logging is not available in the GUI if the Security Fabric is enabled. When the Security Fabric is enabled, disk logging can still be configured on the root FortiGate in the CLI but is not available for downstream FortiGates.</td>
<td>• Enable: Logs will be stored on a local disk. Local disk logging is not available in the GUI if the Security Fabric is enabled. When the Security Fabric is enabled, disk logging can still be configured on the root FortiGate in the CLI but is not available for downstream FortiGates.</td>
</tr>
<tr>
<td></td>
<td>• Disable: Logs will be stored remotely to FortiAnalyzer/FortiManager or to a Cloud logging device.</td>

</tr>
<tr>
<td>Upload option</td>
<td>Real Time: Logs are sent to the Cloud device in real time.</td>
</tr>
<tr>
<td>Every Minute</td>
<td>Logs are sent to the Cloud device once every minute. This option is unavailable if the Security Fabric Connection is enabled.</td>
</tr>
</tbody>
</table>
Every 5 Minutes: Logs are sent to the Cloud device once every five minutes. This is the default option. This option is unavailable if the Security Fabric Connection is enabled.

Allow access to FortiGate REST API
Define access to FortiGate REST API:
- **Enable**: The REST API accesses the FortiGate topology and shares data and results.
- **Disable**: The REST API does not share data and results.

Verify FortiAnalyzer Cloud certificate
Define the FortiAnalyzer Cloud certificate verification process:
- **Enable**: The FortiGate will verify the FortiAnalyzer serial number against the FortiAnalyzer certificate. When verified, the serial number is stored in the FortiGate configuration.
- **Disable**: The FortiGate will not verify the FortiAnalyzer certificate against the serial number.

UUIDs in Traffic Log

**Policy**
Define the use of policy UUIDs in traffic logs:
- **Enable**: Policy UUIDs are stored in traffic logs. UUIDs can be matched for each source and destination that match a policy in the traffic log. See Source and destination UUID logging on page 2571 for more information.
- **Disable**: Policy UUIDs are excluded from the traffic logs.

**Address**
Define the use of address UUIDs in traffic logs:
- **Enable**: Address UUIDs are stored in traffic logs. When viewing Forward Traffic logs, a filter is automatically set based on UUID.
- **Disable**: Address UUIDs are excluded from traffic logs.

Log Settings

**Event Logging**
Define the allowed set of event logs to be recorded:
- **All**: All event logs will be recorded.
- **Customize**: Select specific event log types to be recorded. Deselect all options to disable event logging.

**Local Traffic Log**
Define the allowed set of traffic logs to be recorded:
- **All**: All traffic logs to and from the FortiGate will be recorded.
- **Customize**: Select specific traffic logs to be recorded. Deselect all options to disable traffic logging. Local traffic logging is disabled by default due to the high volume of logs generated.

GUI Preferences

**Resolve Hostnames**
Define the translation of IP addresses to host names:
- **Enable**: IP addresses are translated to host names using reverse DNS lookup. If the DNS server is not available or is slow to reply, requests may time out.
- **Disable**: IP addresses are not translated to host names.
Resolve Unknown Applications

Define the resolution of unknown applications:

- **Enable**: Unknown applications are resolved using the Internet Service Database.
- **Disable**: Unknown applications are not resolved.

Configuring logs in the CLI

The FortiGate can store logs locally to its system memory or a local disk. Logs can also be stored externally on a storage device, such as FortiAnalyzer, FortiAnalyzer Cloud, FortiGate Cloud, or a syslog server. See Sending traffic logs to FortiAnalyzer Cloud on page 2560 for more information on Premium (AFAC) and Standard (FAZC) subscriptions.

Disk logging

Disk logging must be enabled for logs to be stored locally on the FortiGate. By default, logs older than seven days are deleted from the disk. Log age can be configured in the CLI. Approximately 75% of disk space is available for log storage. Log storage space can be determined using the `diagnose sys logdisk usage` command.

To configure local disk logging:

```
config log disk setting
  set status enable
  set maximum-log-age <integer>
  set max-log-file-size <integer>
end
```

Remote logging

The process to configure FortiGate to send logs to FortiAnalyzer or FortiManager is identical. Remote logging to FortiAnalyzer and FortiManager can be configured using both the GUI and CLI. When using the CLI, use the `config log fortianalyzer setting` command for both FortiAnalyzer and FortiManager.

If VDOMs are configured on the FortiGate, multiple FortiAnalyzers and syslog servers can be added globally. See Configuring multiple FortiAnalyzers (or syslog servers) per VDOM on page 2562 and Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode on page 2564 for more information.

To configure remote logging to FortiAnalyzer:

```
config log fortianalyzer setting
  set status enable
  set server <server_IP>
  set upload option {store-and-upload | realtime | 1-minute | 5-minute}
end
```

Remote logging can also be configured to FortiCloud, FortiSIEM, and syslog servers. Up to four syslog servers or FortiSIEM devices can be configured using the `config log syslogd` command and can send logs to syslog in CSV and CEF formats.
To configure remote logging to FortiCloud:

```
cfg log fortiguard setting
  set status enable
  set source-ip <source IP used to connect FortiCloud>
end
```

To configure remote logging to a syslog server:

```
cfg log syslogd setting
  set status enable
  set server <syslog_IP>
  set format {default | cev | cef}
end
```

**Log filters**

Log filter settings can be configured to determine which logs are recorded to the FortiAnalyzer, FortiManager, and syslog servers. This allows certain logging levels and types of logs to be directed to specific log devices.

To configure log filters for FortiAnalyzer:

```
cfg log fortianalyzer filter
  set severity <level>
  set forward-traffic {enable | disable}
  set local-traffic {enable | disable}
  set multicast-traffic {enable | disable}
  set sniffer-traffic {enable | disable}
end
```

To configure log filters for a syslog server:

```
cfg log syslogd filter
  set severity <level>
  set forward-traffic {enable | disable}
  set local-traffic {enable | disable}
  set multicast-traffic {enable | disable}
  set sniffer-traffic {enable | disable}
end
```

**Email alerts**

FortiGate events can be monitored at all times using email alerts. Email alerts send notifications to up to three recipients and can be triggered based on log event and severity level. Email alerts will be sent every five minutes by default but this can be configured in the CLI.

To configure email alerts:

```
cfg alertemail setting
  set username <name>
  set mailto1 <email>
  set filter-mode {category | threshold}
```
Threat weight

Threat weight helps aggregate and score threats based on user-defined severity levels. It adds several fields such as threat level (crlevel), threat score (crscore), and threat type (craction) to traffic logs. Threat weight logging is enabled by default and the settings can be customized. Threats can be viewed from the Top Threats FortiView dashboard.

To configure threat weight settings:

1. Go to Log & Report > Threat Weight.
2. Adjust the settings as needed, such as individual weights per threat type and risk level values.
3. Click Apply.

To add the Top Threats monitor to the dashboard:

1. In the tree menu, click Dashboard and in the FortiView section, click the + sign (Add Monitor).
2. In the Security section, enable Show More and click Top Threats.
3. Configure the settings as needed.
4. Click Add Monitor.
5. Go to Dashboard > Top Threats. The Top Threats monitor displays threats based on the scores in the traffic logs.

6. Double-click a threat to view the summary.
7. Click Sources, Destinations, Countries/Regions, or Sessions to view more information. Double-click an entry to
Log and Report

view the log details.

Logging to FortiAnalyzer

The following topics provide instructions on logging to FortiAnalyzer:

- FortiAnalyzer Reports page in the GUI on page 2555
- FortiAnalyzer log caching on page 2557
- Sending traffic logs to FortiAnalyzer Cloud on page 2560
- Configuring multiple FortiAnalyzers (or syslog servers) per VDOM on page 2562
- Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode on page 2564

FortiAnalyzer Reports page in the GUI

FortiAnalyzer reports can be viewed in the GUI on the Log & Report > FortiAnalyzer Reports page. Administrators can generate, delete, and edit report schedules, and view and download generated reports.

FortiAnalyzer must be configured in FortiOS. If the FortiGate is unauthorized on FortiAnalyzer, or the connection to FortiAnalyzer is down, the FortiAnalyzer Reports page loads with No results.

When the Security Fabric is enabled, only the root FortiGate can run, edit, and delete FortiAnalyzer reports. Downstream FortiGates can only view the generated reports.
To edit a report schedule:

1. Go to Log & Report > FortiAnalyzer Reports and select the Scheduled Reports tab.

2. Select a report and click Edit Schedule. The Edit Schedule pane opens. In this example, the schedule for the Bandwidth and Applications report is changed to run from every week to every two weeks.

3. In the Schedule section, set the values for Generate report every to 2 week(s).

4. Click OK.

The schedule is also updated automatically in FortiAnalyzer for the same report (go to Reports > Report Definitions > All Reports and edit the report to view the settings).

To view and download reports:

1. Go to Log & Report > FortiAnalyzer Reports and select the Generated Reports tab.

A pie chart displays the total count of FortiAnalyzer reports, categorized by report title. Generated reports are listed below and arranged by title, which includes reports from all VDOMs.
In this example, the Self-Harm and Risk Indicators reports are filtered, and the report for vdom1 is downloaded.

2. In the pie chart, click the green segment to filter the Self-Harm and Risk Indicators reports.

3. In the filtered results, select the report for vdom1. Right-click and select Download.

4. Select a file format. The report is saved to the default download location.

**FortiAnalyzer log caching**

Reliable logging to FortiAnalyzer prevents lost logs when the connection between FortiOS and FortiAnalyzer is disrupted. When reliable mode is enabled:

1. Logs are cached in a FortiOS memory queue.
2. FortiOS sends logs to FortiAnalyzer, and FortiAnalyzer uses seq_no to track received logs.
3. After FortiOS sends logs to FortiAnalyzer, logs are moved to a confirm queue in FortiOS.
4. FortiOS periodically queries FortiAnalyzer for the latest seq_no of the last log received, and clears logs from the confirm queue up to the seq_no.
5. If the connection between FortiOS and FortiAnalyzer is disrupted, FortiOS resends the logs in the confirm queue to FortiAnalyzer when the connection is reestablished.

FortiAnalyzer 7.2.0 and later is required.
To enable reliable mode:

```
config log fortianalyzer setting
    set reliable enable
end
```

To view the memory and confirm queues:

1. Verify that log synchronization is enabled for FortiAnalyzer:

```
# diagnose test application fgtlogd 1
vdom-admin=0
mgmt=root

fortilog:
    faz: global, enabled
    server=172.16.200.251, realtime=1, ssl=1, state=connected
    server_log_status=Log is allowed,
    src=, mgmt_name=FGr_Log_root_172.16.200.251, reliable=1, sni_prefix_type=none,
    required_entitlement=none, region=ca-west-1,
    logsync_enabled=1, logsync_conn_id:65535, seq_no:790
```

2. When a network disruption disconnects FortiOS from FortiAnalyzer and FortiOS continues to generate logs, the logs are cached in the memory queue.

   • View the number of logs in the cache and queue:

```
# diagnose test application fgtlogd 41

cache maximum: 189516595(180MB) objects: 40 used: 27051(0MB) allocated: 29568(0MB)

    'total log count':28, 'total data len':6292

Confirm queue for: global-faz
    num:29 size:19092(0MB) total size:26068(0MB) max:189516595(180MB)
        type:3, cat=1, log_count=1, seq_no=1, data len=290 size:366
        type:3, cat=1, log_count=1, seq_no=2, data len=233 size:309
        ......
There are nine OFTP items cached to the memory queue, and 29 OFTP items to send from FortiOS to FortiAnalyzer that are waiting for confirmation from FortiAnalyzer.

- Go to Log & Report > Log Settings to view the queue in the GUI:

3. Re-establish the connection between FortiOS and FortiAnalyzer and confirm that the queue has cleared by checking the seq_no, which indicates the latest confirmation log from FortiAnalyzer:

```
# diagnose test application fgtlogd 30
VDOM: root
Memory queue for: global-faz
  queue:
    num:0 size:0(0MB) total size:0(0MB) max:189516595(180MB)
    'total log count':0, 'total data len':0

Confirm queue for: global-faz
  queue:
    num:0 size:0(0MB) total size:0(0MB) max:189516595(180MB)
    'total log count':0, 'total data len':0
```

The queue has been cleared, meaning that FortiOS received confirmation from FortiAnalyzer and cleared the confirm queue.

```
# diagnose test application fgtlogd 1
vdom-admin=0
mgmt=root

fortilog:
  faz: global , enabled
    server=172.16.200.251, realtime=1, ssl=1, state=connected
    server_log_status=Log is allowed.
    src=, mgmt_name=FGr_Log_root_172.16.200.251, reliable=1, sni_prefix_type=None,
    required_entitlement=None, region=ca-west-1,
```
Sending traffic logs to FortiAnalyzer Cloud

FortiGates with a FortiCloud Premium subscription (AFAC) for Cloud-based Central Logging & Analytics, can send traffic logs to FortiAnalyzer Cloud in addition to UTM logs and event logs. After the Premium subscription is registered through FortiCare, FortiGuard will verify the purchase and authorize the AFAC contract. Once the contract is verified, FortiGuard will deliver the contract to FortiGate.

FortiGates with a Standard FortiAnalyzer Cloud subscription (FAZC) can only send UTM and event logs. FortiGates with a Premium subscription will send the UTM and event logs even if the Standard subscription has expired.

FortiAnalyzer Cloud does not support DLP/IPS archives at this time.

Example

In the following example, you will configure a FortiGate with a valid Premium subscription (AFAC) and expired Standard subscription (FAZC) to send traffic logs to FortiAnalyzer Cloud.

1. Configure the log delivery.
   ```
   config log fortianalyzer-cloud setting
   set status enable
   set ips-archive disable
   set access-config enable
   set enc-algorithm high
   set ssl-min-proto-version default
   set conn-timeout 10
   set monitor-keepalive-period 5
   set monitor-failure-retry-period 5
   set certificate ''
   set source-ip ''
   set interface-select-method auto
   set upload-option realtime
   set priority default
   set max-log-rate 0
   end
   ```

2. Verify the status of the FortiCloud Premium subscription (AFAC) and standard FortiAnalyzer Cloud subscription (FAZC).
   ```
   The FAZC and AFAC fields display the subscription expiration date. The Support contract field displays the FortiCare account information. The User ID field displays the ID for FortiAnalyzer-Cloud instance.
   # diagnose test update info
   ...
   FAZC,Tue Sep 24 16:00:00 2030
   ```
Support contract: pending_registration=255 got_contract_info=1
account_id=[****@fortinet.com] company=[Fortinet] industry=[Technology]
User ID: 979090

The FAZC and AFAC subscriptions are valid (date of verification is November 29, 2020).

3. Check the status of FortiAnalyzer Cloud.
   
   # execute log fortianalyzer-cloud test-connectivity
   FortiAnalyzer Host Name: FAZVM64-VIO-CLOUD
   FortiAnalyzer Adom Name: root
   FortiGate Device ID: FG101FTK19000000
   Registration: registered
   Connection: allow
   Adom Disk Space (Used/Allocated): 50351453B/53687091200B
   Analytics Usage (Used/Allocated): 41368925B/37580963840B
   Analytics Usage (Data Policy Days Actual/Configured): 60/60 Days
   Archive Usage (Used/Allocated): 8982528B/16106127360B
   Archive Usage (Data Policy Days Actual/Configured): 235/365 Days
   Log: Tx & Rx (log not received)
   IPS Packet Log: Tx & Rx
   Content Archive: Tx & Rx
   Quarantine: Tx & Rx
   Certificate of Fortianalyzer valid and serial number is:FAZVCLTM20000000

4. When the FortiCloud Premium (AFAC) and standard FortiAnalyzer Cloud (FAZC) subscriptions are valid, the FortiGate sends the traffic, event, and UTM logs to the remote FortiAnalyzer Cloud.

Traffic:
   
   # execute log filter device fortianalyzer-cloud
   # execute log filter category traffic
   # execute log filter dump

Event:
   # execute log filter device fortianalyzer-cloud
   # execute log filter category event
   # execute log filter dump
5. When the FortiGate has a valid Premium FortiCloud subscription (AFAC) and an expired Standard FortiCloud subscription (FAZC), the FortiGate still sends the logs to the remote FortiAnalyzer Cloud.

**Configuring multiple FortiAnalyzers (or syslog servers) per VDOM**

In a VDOM, multiple FortiAnalyzer and syslog servers can be configured as follows:

- Up to three override FortiAnalyzer servers
- Up to four override syslog servers

If the VDOM faz-override and/or syslog-override setting is enabled or disabled (default) before upgrading, the setting remains the same after upgrading.

If the override setting is disabled, the GUI displays the global FortiAnalyzer1 or syslog1 setting. If the override setting is enabled, the GUI displays the VDOM override FortiAnalyzer1 or syslog1 setting.
You can only use CLI to enable the override to support multiple log servers.

**To enable FortiAnalyzer and syslog server override under VDOM:**

```plaintext
config log setting
    set faz-override enable
    set syslog-override enable
end
```

When `faz-override` and/or `syslog-override` is enabled, the following CLI commands are available for configuring VDOM override:

**To configure VDOM override for FortiAnalyzer:**

1. **Configure the FortiAnalyzer override settings:**
   ```plaintext
   config log fortianalyzer/fortianalyzer2/fortianalyzer3 override-setting
       set status enable
       set server "123.12.123.123"
       set reliable enable
   end
   ```

2. **Configure the override filters:**
   ```plaintext
   config log fortianalyzer/fortianalyzer2/fortianalyzer3 override-filter
       set severity information
       set forward-traffic enable
       set local-traffic enable
       set multicast-traffic enable
       set sniffer-traffic enable
       set anomaly enable
       set voip enable
       set dlp-archive enable
       set dns enable
       set ssh enable
       set ssl enable
   end
   ```

**To configure VDOM override for a syslog server:**

1. **Configure the syslog override settings:**
   ```plaintext
   config log syslogd/syslogd2/syslogd3/syslogd4 override-setting
       set status enable
       set server "123.12.123.123"
       set facility local1
   end
   ```

2. **Configure the override filters:**
   ```plaintext
   config log syslogd/syslogd2/syslogd3/syslogd4 override-filter
       set severity information
       set forward-traffic enable
       set local-traffic enable
       set multicast-traffic enable
       set sniffer-traffic enable
       set anomaly enable
   ```
Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode

This topic shows a sample configuration of multiple FortiAnalyzers on a FortiGate in multi-VDOM mode.

In this example:

- The FortiGate has three VDOMs:
  - Root (management VDOM)
  - VDOM1
  - VDOM2
- There are four FortiAnalyzers.
  These IP addresses are used as examples in the instructions below.
  - FAZ1: 172.16.200.55
  - FAZ2: 172.18.60.25
  - FAZ3: 192.168.1.253
  - FAZ4: 192.168.1.254
- Set up FAZ1 and FAZ2 under global.
  - These two collect logs from the root VDOM and VDOM2.
  - FAZ1 and FAZ2 must be accessible from management VDOM root.
- Set up FAZ3 and FAZ4 under VDOM1.
  - These two collect logs from VDOM1.
  - FAZ3 and FAZ4 must be accessible from VDOM1.

To set up FAZ1 as global FortiAnalyzer 1 from the GUI:

Prerequisite: FAZ1 must be reachable from the management root VDOM.

2. Enable Send logs to FortiAnalyzer/FortiManager.
3. Enter the FortiAnalyzer IP.
   In this example: 172.16.200.55.
4. For Upload option, select Real Time.
5. Click Apply.

To set up FAZ2 as global FortiAnalyzer 2 from the CLI:

Prerequisite: FAZ2 must be reachable from the management root VDOM.

```
config log fortianalyzer2 setting
    set status enable
    set server "172.18.60.25"
    set upload-option realtime
end
```
To set up FAZ3 and FAZ4 as VDOM1 FortiAnalyzer 1 and FortiAnalyzer 2:

Prerequisite: FAZ3 and FAZ4 must be reachable from VDOM1.

```
config log setting
  set faz-override enable
end

config log fortianalyzer override-setting
  set status enable
  set server "192.168.1.253"
  set upload-option realtime
end

config log fortianalyzer2 override-setting
  set status enable
  set server "192.168.1.254"
  set upload-option realtime
end
```

Checking FortiAnalyzer connectivity

To use the diagnose command to check FortiAnalyzer connectivity:

1. Check the global FortiAnalyzer status:

   ```
   FGTA(global) # diagnose test application miglogd 1
   faz: global , enabled
       server=172.16.200.55, realtime=3, ssl=1, state=connected, src=, mgmt_name=FGh_
   Log_root_172.16.200.55, reliable=1
       status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
   verified=N
       SNs: last sn update:1369 seconds ago.
       Sn list:

       queue: qlen=0.
   filter: severity=6, sz_exclude_list=0
   voip dns ssh ssl
   subcategory:
       traffic: forward local multicast sniffer
       anomaly: anomaly

       server: global, id=0, fd=90, ready=1, ipv6=0, 172.16.200.55/514
       oftp-state=5
   faz2: global , enabled
       server=172.18.60.25, realtime=1, ssl=1, state=connected, src=, mgmt_name=FGh_
   Log_root_172.18.60.25, reliable=0
       status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
   verified=N
       SNs: last sn update:1369 seconds ago.
       Sn list:

       queue: qlen=0.
   filter: severity=6, sz_exclude_list=0
   voip dns ssh ssl
   subcategory:
```
Log and Report

traffic: forward local multicast sniffer
anomaly: anomaly
server: global, id=1, fd=95, ready=1, ipv6=0, 172.18.60.25/514
oftp-state=5

2. Check the VDOM1 override FortiAnalyzer status:

FGTA (global) # diagnose test application miglogd 3101
faz: vdom, enabled, override
server=192.168.1.253, realtime=1, ssl=1, state=connected, src=, mgmt_name=FGh_
Log_root_192.168.1.253, reliable=1
status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=N
SNs: last sn update:1369 seconds ago.
Sn list:
(FA2-VM0000000001,age=17s)
queue: qlen=0.
filter: severity=6, sz_exclude_list=0
voip dns ssh ssl
subcategory:
traffic: forward local multicast sniffer
anomaly: anomaly
server: vdom, id=0, fd=72, ready=1, ipv6=0, 192.168.1.253/514
oftp-state=5
faz2: vdom, enabled, override
server=192.168.1.254, realtime=1, ssl=1, state=connected, src=, mgmt_name=FGh_
Log_root_192.168.1.254, reliable=0
status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=N
SNs: last sn update:1369 seconds ago.
Sn list:
(FL-KET318000008,age=17s)
queue: qlen=0.
filter: severity=6, sz_exclude_list=0
voip dns ssh ssl
subcategory:
traffic: forward local multicast sniffer
anomaly: anomaly
server: vdom, id=1, fd=97, ready=1, ipv6=0, 192.168.1.254/514
oftp-state=5
faz3: vdom, disabled, override

Advanced and specialized logging

The following topics provide information on advanced and specialized logging:

- Logs for the execution of CLI commands on page 2567
- Log buffer on FortiGates with an SSD disk on page 2568
- Source and destination UUID logging on page 2571
- Configuring and debugging the free-style filter on page 2572
• Logging the signal-to-noise ratio and signal strength per client on page 2574
• RSSO information for authenticated destination users in logs on page 2576
• Destination user information in UTM logs on page 2579

Logs for the execution of CLI commands

The cli-audit-log option records the execution of CLI commands in system event logs (log ID 44548). In addition to execute and config commands, show, get, and diagnose commands are recorded in the system event logs.

The cli-audit-log data can be recorded on memory or disk, and can be uploaded to FortiAnalyzer, FortiGate Cloud, or a syslog server.

To enable the CLI audit log option:

```
config system global
set cli-audit-log enable
end
```

To view system event logs in the GUI:

1. Run the command in the CLI (# show log fortianalyzer setting).
2. Go to Log & Report > System Events.
3. Select General System Events.
4. Select the log entry and click Details.

To display the logs:

```
# execute log filter device disk
# execute log filter category event
# execute log filter field subtype system
```
Log and Report

# execute log filter field logid 0100044548
# execute log display

Sample log:

1: date=2020-11-16 time=10:43:00 eventtime=1605551799970875703 tz=-0800 logid=0100044548

2: date=2020-11-16 time=10:42:43 eventtime=1605551635020003054 tz=-0800 logid=0100044548
type="event" subtype="system" level="information" vd="root" logdesc="Action performed"
user="admin" ui="jsconsole(2.0.225.112)" action="Get" msg="get sys status"

3: date=2020-11-16 time=09:47:04 eventtime=1605548824762387718 tz=-0800 logid=0100044548
type="event" subtype="system" level="information" vd="root" logdesc="Action performed"
user="admin" ui="jsconsole(2.0.228.202)" action="Diagnose" msg="diagnose log test"

Log buffer on FortiGates with an SSD disk

FortiGates with an SSD disk have a configurable log buffer. When the connection to FortiAnalyzer is unreachable, the FortiGate is able to buffer logs on disk if the memory log buffer is full. The logs queued on the disk buffer can be sent successfully once the connection to FortiAnalyzer is restored.

The number of logs queued on the disk buffer is visible in the Log & Report > Log Settings page:

![Log Settings](image)

The queued logs are buffered to the memory first and then disk. Main miglogd handles the disk buffering job, while miglogd-children handles the memory buffering. Disk buffer statistics only appear under Main miglogd, and memory buffer statistics only appears under miglogd-children. If the total buffer is full, new logs will overwrite the old logs.

To configure the log buffer:

1. Allocate disk space (MB) to temporarily store logs to FortiAnalyzer:
   
   ```
   config system global
   set faz-disk-buffer-size 200
   end
   ```

2. Check the Main miglogd and miglogd-children statistics. The 200 MB disk buffer has been set, and there are currently no logs buffered in memory or on disk when FortiAnalyzer is reachable:
Log and Report

# diagnose test application miglogd 41 0
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Queue for: global-faz

    memory queue:
    num:0 size:0(0MB) max:101906636(97MB) logs:0

    disk max queue size:200MB total:0MB
totol items:0
disk queue agents:
devid:-l-10-0-1
    buffer path:/var/log/qbuf/10.0/1
    saved size:0MB cached size:0
    save roll:0 restore roll:0
    restore id:0 space:0MB

# diagnose test application miglogd 41 1
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Queue for: global-faz

    memory queue:
    num:0 size:0(0MB) max:101906636(97MB) logs:0

    disk queue client:
    devid:-l-10-0-1 status:buffering
    Total in cache:0 size:0 (0MB) max:4MB logs:0

3. Disable the connection between the FortiGate and FortiAnalyzer. For example, delete the FortiGate from the FortiAnalyzer authorized device list.
   Assuming a massive number of logs (~ 300000) are recorded during this downtime, the logs will be queued in the memory buffer first. If the memory buffer is full, then the remaining logs will be queued on the disk buffer.

4. Check the Main miglogd and miglogd-children statistics again. All 97 MB of the memory buffer is occupied, and 76 of the 200 MB has been taken from the disk buffer:

# diagnose test application miglogd 41 0
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Queue for: global-faz

    memory queue:
    num:0 size:0(0MB) max:101906636(97MB) logs:0

    disk max queue size:200MB total:76MB
totol items:128917
disk queue agents:
devid:-l-10-0-1
    buffer path:/var/log/qbuf/10.0/1
    saved size:76MB cached size:3324984
    save roll:19 restore roll:0
    restore id:0 space:0MB
Log and Report

VDOM:root
Queue for: global-faz

memory queue:
  num:165718 size:101906500(97MB) max:101906636(97MB) logs:165718

disk queue client:
  devid:-1-10-0-1 status:restoring
  restore id:1267 space:0MB
  Total in cache:3 size:1858(0MB) max:4MB logs:3

The overall miglogd statistics shows the total cached logs is the sum of the logs buffered in memory and on disk:

# diagnose test application miglogd 6
mem=0, disk=11, alert=0, alarm=0, sys=0, faz=300053, faz-cloud=0, webt=0, fds=0
interface-missed=44
Queues in all miglogds: cur:165718 total-so-far:165718
global log dev statistics:
  faz 0: sent=0, failed=0, cached=300053, dropped=0 , relayed=0
  Num of REST URLs: 0

5. Enable the connection between FortiAnalyzer and the FortiGate.
6. After a while, check the miglogd statistics to confirm that all buffered logs are being sent to FortiAnalyzer successfully:

# diagnose test application miglogd 41
mem=0, disk=11, alert=0, alarm=0, sys=0, faz=300058, faz-cloud=0, webt=0, fds=0
interface-missed=44
Queues in all miglogds: cur:4294832957 total-so-far:165726
global log dev statistics:
  faz 0: sent=300058, failed=0, cached=0, dropped=0 , relayed=0
  Num of REST URLs: 15

# diagnose test application miglogd 41 0
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root

Source and destination UUID logging

The log-uuid setting in system global is split into two settings: log-uuid-address and log-uuid policy.

The traffic log includes two internet-service name fields: Source Internet Service (srcinetsvc) and Destination Internet Service (dstinetsvc).

Log UUIDs

UUIDs can be matched for each source and destination that match a policy that is added to the traffic log. This allows the address objects to be referenced in log analysis and reporting.

As this may consume a significant amount of storage space, this feature is optional. By default, policy UUID insertion is enabled and address UUID insertion is disabled.

To enable address and policy UUID insertion in traffic logs using the GUI:

2. Under UUIDs in Traffic Log, enable Policy and/or Address.
3. Click Apply.

To enable address and policy UUID insertion in traffic logs using the CLI:

config system global
  set log-uuid-address enable
  set log-uuid-policy enable
end

Sample log

date=2019-01-25 time=11:32:55 logid="0000000013" type="traffic" subtype="forward"

Internet service name fields

Traffic logs for internet-service include two fields: Source Internet Service and Destination Internet Service.

To view the internet service fields using the GUI:

2. Double-click on an entry to view the Log Details. The Source Internet Service and Destination Internet Service fields are visible in the Log Details pane.

Sample log

date=2019-01-25 time=14:17:04 logid="00000000013" type="traffic" subtype="forward" level="notice" vd="vdom1" eventtime=1548454622 srcip=10.1.100.11 srcport=51112 srcintf="port3" srcintfrole="undefined" dstip=172.217.14.228 dstport=80 dstintf="port1" dstintfrole="undefined" poluuid="af519380-2094-51e9-391c-b78e8edbd9f1" srcinetsvc="isdb-875099" dstinetsvc="Google.Gmail" sessionid=6930 proto=6 action="close" policyid=2 policytype="policy" service="HTTP" dstcountry="United States" srccountry="Reserved" trandisp="snat" transip=172.16.200.2 transport=51112 duration=11 sentbyte=398 rcvbyte=756 sentpkt=6 rcvdpkt=4 appcat="unscanned" devtype="Router/NAT Device" devcategory="Fortinet Device" mastersrcmac="90:6c:ac:41:7a:24" srsrcmac="90:6c:ac:41:7a:24" srcserver=0 dstdevtype="Unknown" dstdevcategory="Fortinet Device" masterdstmac="08:5b:0e:1f:ed:ed" dstmac="08:5b:0e:1f:ed:ed" dstserver=0

Configuring and debugging the free-style filter

Free-style filters allow users to define a filter for logs that are captured to each individual logging device type. Filters can include log categories and specific log fields. The filters can be created as an inclusive list or exclusive list.

Free-style filters can also be used to filter logs that have been captured on logging devices already to narrow down the list of logs to view.
Log and Report

config log syslogd filter
  config free-style
    edit <id>
      set category <option>
      set filter <string>
        set filter-type {include | exclude}
      next
    end
  end

Set the log category. The following options are available: traffic, event, virus, webfilter, attack, spam, anomaly, voip, dip, app-ctrl, waf, dns, ssh, ssl, file-filter, icap, and ztna.

filter <string>
Enter the filter criteria. Multiple values can be added, for example:
set filter "logid <id> <id>"

filter-type {include | exclude}
Include/exclude logs that match the filter.

Use the following commands to view the results when multiple fields are used:

# execute log filter free-style "logid <id> <id>"
# execute log filter free-style "srcip <IP_address> <IP_address>"
# execute log filter free-style "(logid <id>) or (srcip <IP_address> <IP_address>)"
# execute log filter free-style "(srcip <IP_address>) and (dstip <IP_address>)"

In this example, the free-style filter is set to filter log IDs 0102043039 and 0102043040. The source IPs, 192.168.2.5 and 192.168.2.205, are also checked.

To configure the syslogd free-style filter with multiple values:

config log syslogd filter
  config free-style
    edit 1
      set category event
      set filter "logid 0102043039 0102043040"
    next
  end

To view the syslogd free-style filter results:

# execute log filter free-style "logid 0102043039 0102043040"
# execute log filter dump
category: event
device: disk
start-line: 1
view-lines: 10
max-checklines: 0
HA member:
log search mode: on-demand
pre-fetch-pages: 2
Filter: logid 0102043039 0102043040
Oftp search string: (and (or logid="0102043039" not-exact logid="0102043040" not-exact))

# execute log filter free-style "(logid 0102043039) or (srcip 192.168.2.5 192.168.2.205)"
# execute log filter dump
category: event
device: disk
start-line: 1
view-lines: 10
max-checklines: 0
HA member:
log search mode: on-demand
pre-fetch-pages: 2
Filter: (logid 0102043039) or (srcip 192.168.2.5 192.168.2.205)
Oftp search string: (or (or srcip==192.168.2.5) (or srcip==192.168.2.205)) (or logid="0102043039" not-exact))

Logging the signal-to-noise ratio and signal strength per client

The signal-to-noise ratio (snr) and signal strength (signal) are logged per client in the WiFi event and traffic logs. When a WiFi client connects to a tunnel or local-bridge mode SSID on an FortiAP that is managed by a FortiGate, signal-to-noise ratio and signal strength details are included in WiFi event logs for local-bridge traffic statistics and authentication, and in forward traffic logs for tunnel traffic. This allows you to store and view clients' historical signal strength and signal-to-noise ratio information.

To verify when a client is connecting to an SSID:

1. Go to Log & Report > System Events and select WiFi Events.
   The Signal and Signal/Noise columns show the signal strength and signal-to-noise ratio for each applicable client.
2. WiFi event log messages include the signal and snr values:

```
2020-05-27 11:26:28 logid="0104043579" type="event" subtype="wireless" level="notice" logdesc="Wireless client IP assigned" sn="FP231ETF20000455" ap="FP231ETF20000455" vap="stability3" ssid="FOS_QA_Starr_140E_Guest-11" radioid=1 user="N/A" group="N/A" stamac="1c:87:2c:b6:a8:49" srcip=11.10.80.2 channel=6 radioband="802.11n,g-only" signal=-45 snr=50 security="WPA2 Personal" encryption="AES" action="client-ip-detected" reason="Reserved 0" mpsk="N/A" msg="Client 1c:87:2c:b6:a8:49 had an IP address detected (by DHCP packets)."
```

```
2020-05-27 11:26:11 logid="0104043573" type="event" subtype="wireless" level="notice" logdesc="Wireless client authenticated" sn="FP231ETF20000455" ap="FP231ETF20000455" vap="stability3" ssid="FOS_QA_Starr_140E_Guest-11" radioid=1 user="N/A" group="N/A" stamac="1c:87:2c:b6:a8:49" srcip=0.0.0.0 channel=6 radioband="802.11n,g-only" signal=-45 snr=50 security="WPA2 Personal" encryption="AES" action="client-authentication" reason="Reserved 0" mpsk="N/A" msg="Client 1c:87:2c:b6:a8:49 authenticated.""
```

To verify tunnel traffic when a client is connecting to a tunnel mode SSID:

   The Signal and Signal/Noise columns show the signal strength and signal-to-noise ratio for each applicable client.
2. Forward traffic log messages include the signal and snr values:

date=2020-05-27 time=11:30:26 logid=00000000013 type="traffic" subtype="forward" level="notice" vd=vdom1 eventtime=1590604226533016978 tz=-0700 srcip=11.10.80.2 srcmac="802.11n,g-only" signal=31 snr=64 dstip=91.189.91.157 dstport=123

To verify local-bridge traffic statistics when a client is connecting to a local-bridge mode SSID:

1. Go to Log & Report > System Events and select WiFi Events.
   The Signal and Signal/Noise columns show the signal strength and signal-to-noise ratio for each applicable client.

2. WiFi event log messages include the signal and snr values:

RSSO information for authenticated destination users in logs

FortiGate can use RSSO accounting information from authenticated RSSO users to populate destination users and groups, along with source users and groups.

RSSO user login information can be forwarded by the RADIUS server to the FortiGate that is listening for incoming RADIUS accounting start messages on the RADIUS accounting port. Accounting start messages usually contain the IP address, user name, and user group information. FortiGate uses this information in traffic logs, which include dstuser and dstgroup fields for user and group destination information.

For instructions on configuring RSSO, see RADIUS single sign-on agent on page 2500.

The three following scenarios show traffic between pc1 and the internet, and pc1 and pc2.
Scenario 1

In this scenario, RSSO user test2 in group rsso-grp1 is authenticated on pc1. Traffic flows from pc1 to the internet.

Expected result:

In the logs, user test2 is shown as the source user in the rsso-grp1 group.

To verify the results:

1. In the GUI, go to Log & Report > Forward Traffic and view the details of an entry with test2 as the source.
2. In the Source section, User is test2 and Group is the rsso-grp1.
3. The log message shows the user and group:

   10: date=2020-05-25 time=15:34:43 logid="0000000013" type="traffic" subtype="forward" level="notice" vd="vd01" eventtime=1590446083718007055 tz="-0700" srcip=10.1.100.188 srcname="win7-2-A Fortinet-FSSO.COM" srcport=56982 srcintf="port10" 
   srcintfrole="undefined" dstip=172.217.3.195 dstport=443 dstintf="port9" 
   dstintfrole="undefined" srccountry="Reserved" dstcountry="United States" 
   sessionid=120651 proto=17 action="accept" policyid=1 policytype="policy"
Log and Report

Scenario 2

In this scenario, RSSO user test2 is authenticated on pc1. Traffic is initialized on pc2 (172.16.200.185) going to pc1 (10.1.100.188).

Expected result:

In the logs, user test2 is shown as the destination user (dstuser). No destination group (dstgroup) is logged because no RSSO user is logged in on pc2, so the traffic from pc2 is unauthenticated.

To verify the results:

1. In the GUI, go to Log & Report > Forward Traffic and view the details of an entry with 172.16.200.185 (pc2) as the source.
2. In the Other section, Destination User is test2 and no destination group is shown.

3. The log message shows the destination user:

```
1: date=2020-05-22 time=07:38:06 logid="0000000020" type="traffic" subtype="forward" level="notice" vd="root" eventtime=1590158286585506922 tz="-0700" srcip=172.16.200.185 identifier=1 srcintf="port9" srcintfrole="undefined" dstip=10.1.100.188 dstintf="port10" dstintfrole="undefined" srccountry="Reserved" dstcountry="Reserved" sessionid=4395 proto=1 action="accept" policyid=3 policytype="policy" poluidd="d4f18e1e-9c36-51ea-6ec0-3a354d5910e8" policyname="pol2" dstusers="test2" dstauthserver="root" service="PING" trandisp="snat" transip=10.1.100.1 transport=0 duration=128 sentbyte=7620 rcvdbyte=5220 sentpkt=127 rcvdpkt=87 appcat="unscanned" sentdelta=7620 rcvddelta=5220
```
**Scenario 3**

In this scenario, RSSO user test2 in group rsso-grp1 is authenticated on pc1, and user test3 in group rsso-grp2 is authenticated on pc2. Traffic flows from pc2 to pc1.

**Expected result:**

In the logs, user test3 is shown as the source user in the rsso-grp1 group. User test2 is shown as destination user (dstuser) in the rsso-grp1 destination group (dstgroup). The destination group is logged because an RSSO user is logged in to pc2.

**To verify the results:**

1. In the GUI, go to Log & Report > Forward Traffic and view the details of an entry with 172.16.200.185 (pc2) as the source.
2. In the Source section, User is test3 and Group is the rsso-grp2. In the Other section, Destination User is test2 and Destination Group is rsso-grp1.

3. The log message shows both the source and the destination users and groups:

```
8: date=2020-05-25 time=14:23:07 logid="0000000013" type="traffic" subtype="forward" level="notice" vd="vdom1" eventtime=1590441786958007914 tz="-0700" srcip=172.16.200.185 srcport=64096 srcintf="port9" srcintfrole="undefined" dstip=10.1.100.188 dstport=80 dstintf="port10" dstintfrole="undefined" srccountry="Reserved" srccountry="Reserved" sessionid=112445 proto=6 action="close" policyid=3 policytype="policy" poluuid="5894c368-9eca-51ea-fb4c-ec5a6c1d5043" polycname="po12" user="test3" group="rsso-grp2" authserver="vdom1" dstuser="test2" dstgroup="rsso-grp1" dstauthserver="vdom1" service="HTTP" transdisp="snat" transip=10.1.100.1 transport=64096 duration=1 sentbyte=328 rcvbyte=563 sentpkt=6 rcvdpkt=5 appcat="unscanned" dsthwvendor="VMware" dstosname="Windows" dstswversion="7" masterdstmac="00:0c:29:44:be:b9" dstmac="00:0c:29:44:be:b9" dstserver=0
```

**Destination user information in UTM logs**

The dstuser field in UTM logs records the username of a destination device when that user has been authenticated on the FortiGate.
In the following example topology, the user, bob, is authenticated on a client computer. The user, guest, is authenticated on the server. Log are collected for AV and IPS in flow inspection mode. Logs are collected for application control and web filter in proxy mode.

To configure the RADIUS user and user groups:

1. Configure the RADIUS server:
   ```
   config user radius
   edit "Ubuntu_docker"
     set server "172.16.200.240"
     set secret ************
   next
   end
   ```

2. Configure the local user:
   ```
   config user local
   edit "guest"
     set type password
     set passwd ************
   next
   end
   ```

3. Configure the RADIUS user groups:
   ```
   config user group
   edit "RADIUS_User_Group"
     set member "Ubuntu_docker"
   next
   edit "Local_User"
     set member "guest"
   next
   end
   ```
Flow inspection mode

To verify AV and IPS logs in flow mode:

1. Configure the firewall policies:

   ```
   config firewall policy
   edit 1
   set name "WAN_out"
   set srcintf "dmz"
   set dstintf "wan1"
   set action accept
   set srcaddr "all"
   set dstaddr "all"
   set schedule "always"
   set service "ALL"
   set utm-status enable
   set ssl-ssh-profile "deep-inspection"
   set av-profile "g-default"
   set ips-sensor "sensor-11"
   set nat enable
   set groups "RADIUS_User_Group" "Local_User"
   next
   edit 3
   set name "WAN_in"
   set srcintf "wan1"
   set dstintf "dmz"
   set action accept
   set srcaddr "all"
   set dstaddr "all"
   set schedule "always"
   set service "ALL"
   set logtraffic all
   set nat enable
   set groups "RADIUS_User_Group" "Local_User"
   next
   end
   ```

2. Verify the AV log:

   ```
   date=2021-09-14 time=16:37:25 eventtime=1631662646131356720 tz="-0700"
   logid="0211008192" type="utm" subtype="virus" eventtype="infected" level="warning"
   vd="vdom1" policyid=1 msg="File is infected." action="blocked" service="HTTP"
   sessionid=4613 srcip=10.1.100.72 dstip=172.16.200.75 srcport=80 dstport=80
   srcintf="dmz" srcintfrole="undefined" dstintf="wan1" dstintfrole="undefined"
   srcuuid="877d43a4-c2f9-51eb-f78f-e0979492d8a" dstuuid="877d43a4-c2f9-51eb-f78f-
   e0979492d8a" proto=6 direction="incoming" filename="eicar.com" quarskip="Quarantine-
   disabled" virus="EICAR_TEST_FILE" viruscat="Virus" dtype="av-engine"
   ref="http://www.fortinet.com/ve?vn=EICAR_TEST_FILE" virusid=2172
   url="http://172.16.200.75/eicar.com" profile="g-default" user="bob" group="RADIUS_User_"
   Group" authserver="Ubuntu_docker" dstuser="guest" agent="Wget/1.17.1"
   analyticscksum="275a021bbf6489e54d471899f7db9d1663fc695ec2fe2a2c4538aaf651fd0f"
   analyticssubmit=false crscore=50 craction=2 crlevel="critical"
   ```
3. Verify the IPS log:

```
date=2021-09-14  time=16:56:06  eventtime=1631663765992499880  tz=-0700
logid="0419016384"  type="utm"  subtype="ips"  eventtype="signature"  level="alert"
vd="vdom1"  severity="info"  srcip=10.1.100.72  srccountry="Reserved"  dstip=172.16.200.75
srcintf="dmz"  srcintfrole="undefined"  dstintf="wan1"  dstintfrole="undefined"
sessionid=7881  action="dropped"  proto=6  service="HTTP"  policyid=1
attack="Eicar.Virus.Test.File"  srcport=60092  dstport=80  direction="incoming"
attackid=29844  profile="sensor-11"  ref="http://www.fortinet.com/ids/VID29844"  user="bob"
group="RADIUS_User_Group"  authserver="Ubuntu_docker"  dstuser="guest"
``` 

### Proxy inspection mode

To verify application control and web filter logs in proxy mode:

1. Configure the firewall policies:

```fortigateconfig
config firewall policy
    edit 1
        set name "WAN_out"
        set srcintf "dmz"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set av-profile "g-default"
        set application-list "g-default"
        set webfilter-profile "1"
        set nat enable
        set groups "RADIUS_User_Group" "Local_User"
    next

    edit 3
        set name "WAN_in"
        set srcintf "wan1"
        set dstintf "dmz"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set logtraffic all
        set nat enable
        set groups "RADIUS_User_Group" "Local_User"
    next
end
```
2. Verify the application control log:

```plaintext
date=2021-09-14 time=17:05:45 eventtime=1631664345570951500 tz=-0700
logid="1059028704" type="utm" subtype="app-ctrl" eventtype="signature"
level="information" vd="vdom1" appid=38783 user="bob" group="RADIUS_User_Group"
authserver="Ubuntu_docker" dstuser="guest" srcip=10.1.100.72 dstip=172.16.200.75
srcport=60098 dstport=80 srcintf="dmz" srcintfrole="undefined" dstintf="wan1"
dstintfrole="undefined" proto=6 service="HTTP" direction="outgoing" policyid=1

Troubleshooting

The following topics provide information about troubleshooting logging and reporting:
Log-related diagnose commands

This topic shows commonly used examples of log-related diagnose commands.

Use the following diagnose commands to identify log issues:

- The following commands enable debugging log daemon (miglogd) at the proper debug level:
  
  diagnose debug application miglogd x
  diagnose debug enable

- The following commands display different status/statistics of miglogd at the proper level:
  
  diagnose test application miglogd x
  diagnose debug enable

To get the list of available levels, press Enter after diagnose test/debug application miglogd. The following are some examples of commonly use levels.

If the debug log display does not return correct entries when log filter is set:

diagnose debug application miglogd 0x1000

For example, use the following command to display all login system event logs:

execute log filter device disk
execute log filter category event
execute log filter field action login
execute log display

You can check and/or debug the FortiGate to FortiAnalyzer connection status.

To show connect status with detailed information:

diagnose test application migルド 1

faz: global , enabled
server=172.18.64.234, realtime=3, ssl=1, state=connected, src=, mgmt_name=FGeo_Log_vdom1_172.18.64.234, reliable=0, sni_prefix_type=none, required_entitlement=none
status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_verified=Y
SNs: last sn update:107 seconds ago.
Sn list:
(FL-8HFT718900132,age=107s)
queue: qlen=0.
filter: severity=6, sz_exclude_list=0
voip dns ssh ssl cifs
subcategory:
traffic: forward local multicast sniffer
anomaly: anomaly
server: global, id=0, fd=132, ready=1, ipv6=0, 172.18.64.234/514
oftp-state=5

To collect debug information when FortiAnalyzer is enabled:

diagnose debug application migルドd 0x100

To check log statistics to the local/remote log device since the miglogd daemon start:

diagnose test application miglogd 6 1  <<< 1 means the first child daemon

diagnose test application miglogd 6 2  <<< 2 means the second child daemon
To check the miglogd daemon number and increase/decrease miglogd daemon:

diagnose test application miglogd 15 <<< Show miglog ID

diagnose test application miglogd 13 <<< Increase one miglogd child

diagnose test application miglogd 14 <<< Decrease one miglogd child

To check the remote queue and see the maximum buffered memory size:

```
diagnose test application miglogd 41

cache maximum: 105405644(100MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
```

```
VDOM:root
Queue for: global-faz

  memory queue:
      num:0 size:0(0MB) max:105405644(100MB) logs:0

Queue for: fds

  memory queue:
      num:0 size:0(0MB) max:97852620(93MB) logs:0
```

**Backing up log files or dumping log messages**

When a log issue is caused by a particular log message, it is very helpful to get logs from that FortiGate. This topic provides steps for using `execute log backup` or dumping log messages to a USB drive.
Backing up full logs using execute log backup

This command backs up all disk log files and is only available on FortiGates with an SSD disk.
Before running execute log backup, we recommend temporarily stopping miglogd and reportd.

To stop and kill miglogd and reportd:

diagnose sys process daemon-auto-restart disable miglogd
diagnose sys process daemon-auto-restart disable reportd

Or

1. Determine the process, or thread, ID (PID) of miglogd and reportd:
   
   # diagnose sys top 10 99

2. Kill each process:
   
   # diagnose sys kill 9 <PID>

To store the log file on a USB drive:

1. Plug in a USB drive into the FortiGate.
2. Run this command:
   
   execute log backup /usb/log.tar

To restart miglogd and reportd:

   diagnose sys process daemon-auto-restart enable miglogd
diagnose sys process daemon-auto-restart enable reportd

Dumping log messages

To dump log messages:

1. Enable log dumping for miglogd daemon:

   (global) # diagnose test application miglogd 26 1
   miglogd(1) log dumping is enabled

2. Display all miglogd dumping status:

   (global) # diagnose test application miglogd 26 0 255
   miglogd(0) log dumping is disabled
   miglogd(1) log dumping is enabled
   miglogd(2) log dumping is disabled

   (global) # diagnose test application miglogd 26 2
   miglogd(2) log dumping is enabled

   (global) # diagnose test application miglogd 26 0
   miglogd(0) log dumping is enabled

   (global) # diagnose test application miglogd 26 0 255
   miglogd(0) log dumping is enabled
3. Let the FortiGate run and collect log messages.
4. List the log dump files:
   (global)  # diagnose test application miglogd 33
   2019-04-17 15:50:02  20828  log-1-0.dat
   2019-04-17 15:48:31  4892  log-2-0.dat

5. Back up log dump files to the USB drive:
   (global)  # diagnose test application miglogd 34

   Dumping file miglog1_index0.dat copied to USB disk OK.
   Dumping file miglog2_index0.dat copied to USB disk OK.

6. Disable log dumping for miglogd daemon:
   (global)  # diagnose test application miglogd 26 0
   miglogd(0) log dumping is disabled
   (global)  # diagnose test application miglogd 26 1
   miglogd(1) log dumping is disabled
   (global)  # diagnose test application miglogd 26 2
   miglogd(2) log dumping is disabled
   (global)  # diagnose test application miglogd 26 0 255
   miglogd(0) log dumping is disabled
   miglogd(1) log dumping is disabled
   miglogd(2) log dumping is disabled

SNMP OID for logs that failed to send

When a syslog server encounters low-performance conditions and slows down to respond, the buffered syslog messages in the kernel might overflow after a certain number of retransmissions, causing the overflowed messages to be lost. OIDs track the lost messages or failed logs.

SNMP query OIDs include log statistics for global log devices:

- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDeviceNumber 1.3.6.1.4.1.12356.101.21.1.1
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceEntryIndex 1.3.6.1.4.1.12356.101.21.1.1.1
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceEnabled 1.3.6.1.4.1.12356.101.21.2.1.1.2
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceName 1.3.6.1.4.1.12356.101.21.2.1.1.3
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceSentCount 1.3.6.1.4.1.12356.101.21.2.1.1.4
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceRelayedCount
  1.3.6.1.4.1.12356.101.21.2.1.1.5
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceCachedCount
  1.3.6.1.4.1.12356.101.21.2.1.1.6
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceFailedCount
  1.3.6.1.4.1.12356.101.21.2.1.1.7
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceDroppedCount
  1.3.6.1.4.1.12356.101.21.2.1.1.8

Where:
- fgLogDeviceNumber is the number of devices in the table.
- fgLogDeviceEnabled is either 1 or 0, indicating whether the device is enabled.
- fgLogDeviceName is the name of the device.

A FortiGate connected to a syslog server or FortiAnalyzer generates statistics that can be seen using the `diagnose test application miglogd` command:

```sh
(global) # diagnose test application miglogd 6
mem=404, disk=657, alert=0, alarm=0, sys=920, faz=555, webt=0, fds=0
interface-missed=460
Queues in all miglogds: cur:0 total-so-far:526
global log dev statistics:
syslog 0: sent=254, failed=139, relayed=0
syslog 1: sent=220, failed=139, relayed=0
syslog 2: sent=95, failed=73, relayed=0
faz 0: sent=282, failed=0, cached=0, dropped=0 , relayed=0
Num of REST URLs: 3
/api/v2/monitor/system/csf/ : 0 : 300
/api/v2/cmdb/system/interface/ : 394.0.673.15877729363538323653.1547149763 : 1200
/api/v2/monitor/system/ha-checksums/ : 0 : 1200
faz 1: sent=272, failed=0, cached=0, dropped=0 , relayed=0
Num of REST URLs: 2
/api/v2/monitor/system/csf/ : 0 : 300
/api/v2/cmdb/system/interface/ : 394.0.673.15877729363538323653.1547149763 : 1200
```

The same statistics are also available in `snmpwalk/snmpget` on the OID 1.3.6.1.4.1.12356.101.21.
To get the type of logging device that is attached to the FortiGate:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1.3.6.1.4.1.12356.101.21.2.1.1.3
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.0 = STRING: "syslog"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.1 = STRING: "syslog2"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.2 = STRING: "syslog3"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.3 = STRING: "syslog4"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.4 = STRING: "faz"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.5 = STRING: "faz2"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.6 = STRING: "faz3"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.7 = STRING: "webtrends"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.8 = STRING: "fds"
```

To get the present state of the logging device that is attached to the FortiGate:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1.3.6.1.4.1.12356.101.21.2.1.1.2
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.0 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.1 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.2 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.3 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.4 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.5 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.6 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.7 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.8 = INTEGER: 0
```

To get the failed log count value:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1.3.6.1.4.1.12356.101.21.2.1.1.7
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.0 = Counter32: 139
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.1 = Counter32: 139
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.2 = Counter32: 73
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.3 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.4 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.5 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.6 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.7 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.8 = Counter32: 0
```

Amazon Web Services

See the FortiOS 7.2.0 AWS Administration Guide.

Microsoft Azure

See the FortiOS 7.2.0 Azure Administration Guide.

Google Cloud Platform

See the 7.2.0 FortiOS GCP Administration Guide.

Oracle OCI

See the 7.2.0 FortiOS OCI Administration Guide.
**AliCloud**

See the [7.2.0 FortiOS AliCloud Administration Guide](#).

**Private cloud**

See [FortiGate Private Cloud](#) in the document library.

**VM license**

You can access the *FortiGate VM License* page from the *Dashboard > Status* page in the *Virtual Machine* widget. Click the device license and select *FortiGate VM License*.

The *FortiGate VM License* page displays the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>License status</td>
<td>Displays one of the following statuses:</td>
</tr>
<tr>
<td></td>
<td>- Valid: VM can connect and validate the license against a FortiManager or FortiGuard server. All features are available.</td>
</tr>
<tr>
<td></td>
<td>- Warning: VM cannot connect and validate against a FortiManager or FortiGuard server. A check is made against how many days the warning status is continuous. If the number is less than 30 days, the status does not change.</td>
</tr>
<tr>
<td></td>
<td>- Invalid: VM cannot connect and validate against a FortiManager or FortiGuard server. A check is made against how many days the warning status is continuous. If the number is 30 days or more, the status changes to invalid. GUI access is restricted until a valid license is uploaded. Firewall policies do not work. FortiGuard downloads are unavailable.</td>
</tr>
<tr>
<td></td>
<td>- Pending: temporary state where the VM attempts to validate its license.</td>
</tr>
<tr>
<td></td>
<td>Reasons for having a warning or invalid status include:</td>
</tr>
<tr>
<td></td>
<td>- The network environment does not allow FortiGate-VM to connect to the FortiGuard server.</td>
</tr>
<tr>
<td></td>
<td>- The license may be expired. Check the expiration date for evaluation or term-based licenses.</td>
</tr>
<tr>
<td></td>
<td>- Another VM has been already validated with FortiGuard using the same license. See <a href="#">VM license activation</a> for details about duplicated VM instances.</td>
</tr>
</tbody>
</table>

Allocated vCPUs Number of allocated and total allowable vCPUs

Allocated RAM Amount of allocated RAM. There are no RAM restrictions.

Expires on Expiry date (value depends on the type of license)

This information is visible in the CLI by running `get system status` (see [CLI troubleshooting](#)).
Uploading a license file

After you submit an order for a FortiGate-VM, Fortinet sends a license registration code to the email address that you entered in the order form. Use this code on the FortiCloud portal to register the FortiGate-VM.

Once the VM is registered, you can download the license file in .LIC format. On the FortiGate VM License page, click Upload. The system prompts you to reboot and validate the license with the FortiGuard server. Once validated, your FortiGate-VM is fully functional.

The VM license window may also appear immediately after logging in if you are running a VM with an evaluation license that has expired.

In cases where the GUI is not accessible, you can upload the license using secure copy (SCP).

---

For information about injecting FortiFlex license tokens, see Injecting tokens into FortiGate-VM in the Flex VM Deployment Guide.

---

To upload the license using SCP:

1. Enable SCP:
   ```
   config system global
   set admin-scp enable
   end
   ```

2. Enable SSH in the administrative access for the interface where the transfer will take place:
   ```
   config system interface
   edit <interface>
   append allowaccess ssh
   next
   end
   ```

3. On your computer, upload the VM license. This example is for Linux:
   ```
   scp <filename> <admin-user>@<FortiGate_IP>:vmlicense
   ```

Types of VM licenses

FortiGate-VM offers perpetual licensing (normal series and V-series) and annual subscription licensing (S-series). SKUs are based on the number of vCPUs (1, 2, 4, 8, 16, 32, or unlimited).

The FortiFlex program allows qualified enterprise and MSSP customers to create as many VM entitlements as required. Resource consumption is based upon predefined points that are calculated on a daily basis. For information, see the FortiFlex Program Guide in the Fortinet document library.
### Licensing and support

<table>
<thead>
<tr>
<th>Feature</th>
<th>Normal series</th>
<th>V-series</th>
<th>S-series</th>
<th>FortiFlex</th>
</tr>
</thead>
</table>
|                               | The VM base is perpetual. You must separately contract support services on an annual basis. See the price list for details. | Single annually contracted SKU that contains a VM base and a FortiCare service bundle. Four support service bundle types are available:  
- Only FortiCare  
- UTM  
- Enterprise  
- ATP | An annually contracted program to create multiple sets of a single entitlement per VM. Entitlements contain a VM base and FortiCare bundle. Four support service bundle types are available:  
- Only FortiCare  
- UTM  
- Enterprise  
- ATP | |

#### vCPU number upgrade during contracted term

- Normal series: Not supported.
- V-series: Supported. You can also upgrade the support service bundle. Contact a Fortinet sales representative to upgrade.
- S-series: Supported. You can apply different VM entitlement configurations in the FortiFlex portal. API is not supported at this time.

#### vCPU number downgrade during contracted term

- Normal series: Not supported.
- V-series: Not supported.
- S-series: By default, all CPU levels do not support adding VDOMs. S-series VM instances do not support the subscription VDOM license.

#### VDOM support

- Normal series: By default, each CPU level supports up to a certain number of VDOMs. Refer to the FortiGate-VM data sheet for default limits.
- V-series: By default, all CPU levels do not support adding VDOMs.
- S-series: By default, all CPU levels do not support adding VDOMs.

---

### Consuming a new vCPU

In a scenario where you have not allocated all the vCPUs allotted by your VM entitlement, you can add additional vCPUs to your FortiGate VM. The vCPU allocation can be verified in the GUI and CLI.

#### To confirm the vCPU allocation in the GUI:

1. Go to Dashboard > Status, and locate the Virtual Machine widget.
2. Verify the Allocate vCPUs field, which displays the number and percentage of allocated vCPUs.
To confirm the vCPU allocation in the CLI:

```
# get system status | grep "VM Resources"
VM Resources: 1 CPU/4 allowed, 2006 MB RAM
```

You can increase the number of vCPUs on running FortiGate VM models that support hot-adding. Once the hot-adding is complete, perform one of the following for FortiOS to recognize the new CPUs:

- Enter `execute cpu add <number_of_new_vCPUs>.
- Reboot the FortiGate.

**CLI troubleshooting**

In some cases, you can view more information from the CLI to diagnose issues with VM licensing. This is also useful when the GUI is inaccessible due to an invalid contract.

Before you begin, ensure your FortiGate has the proper routes to connect to the internet. Run all following debug commands for a full picture of the issue.

To view the license status, expiration date, and VM resources:

```
# get system status
Version: FortiGate-VM64-KVM v6.4.2,build1723,200730 (GA)
...
Serial-Number: FGVM08**********
....
License Status: Valid
License Expiration Date: 2020-12-10
VM Resources: 1 CPU/8 allowed, 2010 MB RAM
...
```

To display license details:

```
# diagnose debug vm-print-license
SerialNumber: FGVM08**********
CreateDate: Tue Dec 10 00:57:32 2019
License expires: Thu Dec 10 00:00:00 2020
Expiry: 366
Key: yes
Cert: yes
Key2: yes
Cert2: yes
Model: 08 (11)
CPU: 8
MEM: 2147483647
```

To display license information from FortiGuard:

```
# diagnose hardware sysinfo vm full
UUID: abbe*************************
valid: 1
status: 1
code: 200
warn: 0
```

</tr>
</tbody>
</table>

Other codes - Error

The following are examples of common combinations:

This combination indicates the license is valid and functioning normally:

```plaintext
valid: 1  
status: 1  
code: 200
```

This combination indicates the license itself is valid, but is running on a duplicate instance:

```plaintext
valid: 1  
status: 4  
code: 401
```

This combination indicates the system cannot connect to FortiGuard:

```plaintext
valid: 0  
status: 2  
code: 502
```

This combination indicates the license is expired and invalid:
valid: 0
status: 3
code: 400

This combination indicates the VM is unlicensed:
valid: 0
status: 3
code: 0

For FortiFlex licenses, the following command allows you to enter the license token and proxy information:

```
# execute vm-license <token> https://<username>:<password>@<proxy IP address>:<proxy port>
```

FortiOS can receive the following error codes from the FortiCare server:
1 - Runtime error (server unhandled error on FortiCare sever)
57 - License Token is invalid
58 - License Token is already used and cannot be used again to retrieve license key

The FortiGate can generate the following error code:
60 - Failed to request forticare license. Failed to download VM license.

Contact Fortinet Support for assistance if your licensing issue persists.

## Adding VDOMs with FortiGate v-series

Each FortiGate-VM base license type allows a default number of virtual domains (VDOM). This topic provides sample procedures to add VDOMs beyond the default number using separately purchased VDOM licenses.

This topic consists of the following steps:

1. **Activate the FortiGate-VM with the base license.**
2. **Add more VDOMs to the FortiGate-VM.**

### To activate the FortiGate-VM with the base license:

1. Purchase and register the FortiGate-VM base license in FortiCare:
   a. Purchase the FortiGate-VM base license from Fortinet or a Fortinet reseller.
   b. You receive a license certification with a registration code. Open the certification.
   c. Log in to Fortinet Customer Service & Support.
   d. Go to Register Now and enter the provided registration code.
   e. Follow the registration process. The serial number generates and displays on the Registration Completion page.
   f. Go to Asset > Manage/View Products. Click the serial number to download the license file.
2. **Upload the FortiGate-VM base license file to FortiOS:**
   a. Log in to the FortiGate-VM GUI.
   b. In Dashboard > Status, in the Virtual Machine widget, click FortiGate VM License.
   c. Click the Upload button.
   d. Select the FortiGate-VM base license file, then click OK. The FortiGate-VM reboots after applying the base license.
3. Verify the FortiGate-VM base license status and VDOM information:
   a. Log in to the FortiGate-VM GUI.
   b. In Dashboard > Status, in the Virtual Machine widget, ensure that there is a checkmark in front of the FortiGate-VM base license name. The checkmark indicates that the base license is valid.
   c. You can check VDOM information using the CLI. The following output shows that the maximum number of VDOMs is currently one. This is correct since the FortiGate-VM base license only supports the default root VDOM that the system uses.

To add more VDOMs to the FortiGate-VM:

You can repeat this procedure multiple times to stack multiple VDOM licenses on the same FortiGate-VM.

1. Purchase and register the FortiGate-VM upgrade license in FortiCare. This example adds 15 VDOMs:
   a. Purchase the FortiGate-VM upgrade license from Fortinet or a Fortinet reseller.
   b. You receive a license certification with a registration code. Open the certification.
   c. Log in to Fortinet Customer Service & Support.
   d. Go to Asset > Register/Activate and enter the provided registration code.
   e. On the Specify License Confirmation Information screen, enter the FortiGate-VM serial number to apply the VDOM upgrade license to the FortiGate-VM. In this example, the FortiGate-VM serial number is FGVM4VTM19000476.
   f. Follow the registration process.
   g. Go to Asset > Manage/View Products > . Select the desired product, then click License & Key. The VDOM upgrade license displays under Registered License(s), and a key for adding 15 VDOMs (in this example M6JSD-8EE32-VHIJB-N) displays under Available Key(s).
2. Apply the FortiGate-VM upgrade license key to FortiOS:
   a. Log in to the FortiGate-VM CLI in the local console or using SSH.
   b. Apply the VDOM upgrade license key:
      `FGVM4VTM19000476 # execute upd-vd-license M6JSD-8EE32-VHIJB-N`
      update vdom license succeeded

3. Verify the FortiGate-VM VDOM information:
   a. Log in to the FortiGate-VM CLI in the local console or using SSH.
   b. Check VDOM information using the CLI. The following output shows that the maximum number of VDOMs is currently 15. When you add VDOMs for the first time on a FortiGate-VM v-series instance, FortiOS does not count the default VDOM, as the default VDOM is the so-called root VDOM that the system uses and FortiOS does not treat it as a countable VDOM in terms of VDOM addition. Therefore, as in this example, if your FortiGate-VM had the default VDOM configuration, then you add 15 VDOMs, FortiOS displays the maximum VDOM number as 15, not 16.

      # get system status

**Terraform: FortiOS as a provider**

Fortinet's Terraform support provides customers with more ways to efficiently deploy, manage, and automate security across physical FortiGate appliances and virtual environments. You can use Terraform to automate various IT infrastructure needs, thereby diminishing mistakes from repetitive manual configurations.

For example, if Fortinet is releasing a new FortiOS version, your organization may require you to test a new functionality to determine how it may impact the environment before globally deploying the new version. In this case, the ability to...
rapidly stand up environments and test these functions prior to production environment integration provides a resource-efficient and fault-tolerant approach.

The following example demonstrates how to use the Terraform FortiOS provider to perform simple configuration changes on a FortiGate unit. It requires the following:

- FortiOS 6.0 or later
- FortiOS Provider: This example uses terraform-provider-fortios 1.0.0.
- Terraform: This example uses Terraform 0.11.14.
- REST API administrator created on the FortiGate with the API key

For more information, see the Terraform FortiOS Provider at https://www.terraform.io/docs/providers/fortios/index.html.

**To create a REST API administrator:**

1. On the FortiGate, go to System > Administrators and click Create New > REST API Admin.
2. Enter the Username and, optionally, enter Comments.
3. Select an Administrator Profile.
4. We recommend that you create a new profile with minimal privileges for this terraform script:
   a. In the Administrator Profile drop down click Create New.
   b. Enter a name for the profile.
   c. Configure the Access Permissions:
      - *None*: The REST API is not permitted access to the resource.
      - *Read*: The REST API can send read requests (HTTP GET) to the resource.
      - *Read/Write*: The REST API can send read and write requests (HTTP GET/POST/PUT/DELETE) to the resource.
   d. Click OK.
5. Enter Trusted Hosts to specify the devices that are allowed to access this FortiGate.
6. Click OK.
   An API key is displayed. This key is only shown once, so you must copy and store it securely.

**To configure FortiGate with Terraform Provider module support:**

1. Download the terraform-provider-fortios file to a directory on the management computer.
2. Create a new file with the .tf extension for configuring your FortiGate:
   root@mail:/home/terraform# ls
terraform-provider-fortios_v1.0.0_x4 test.tf
3. Edit the test.tf Terraform configuration file:
   In this example, the FortiGate's IP address is 10.6.30.5, and the API user token is 17b**************63ck. Your provider information must also be changed.

   # Configure the FortiOS Provider
   provider "fortios" {
     hostname = "10.6.30.5"
     token = "17b**************63ck"
   }

4. Create the resources for configuring your DNS object and adding a static route:

   resource "fortios_system_setting_dns" "test1" {
     primary = "172.16.95.16"
     secondary = "8.8.8.8"
5. Save your Terraform configuration file.

6. In the terminal, enter `terraform init` to initialize the working directory.
   It reads the provider if the name follows the convention `terraform-provider-[name]`:
   ```
   root@mail:/home/terraform# terraform init
   Initializing the backend...
   Terraform has been successfully initialized!
   You may now begin working with Terraform. Try running "terraform plan" to see any changes that are required for your infrastructure. All Terraform commands should now work.
   If you ever set or change modules or backend configuration for Terraform, rerun this command to reinitialize your working directory. If you forget, other commands will detect it and remind you to do so if necessary.
   ```

7. Run `terraform -v` to verify the version of loaded provider module:
   ```
   root@mail:/home/terraform# terraform -v
   Terraform v0.11.14
   + provider.fortios v1.0.0
   ```

8. Enter `terraform plan` to parse the configuration file and read from the FortiGate configuration to see what Terraform changes:
   This example create a static route and updates the DNS address. You can see that Terraform reads the DNS addresses from the FortiGate and then lists them.
   ```
   root@mail:/home/terraform# terraform plan
   Refreshing Terraform state in-memory prior to plan...
   The refreshed state will be used to calculate this plan, but will not be persisted to local or remote state storage.
   fortios_networking_route_static.test1: Refreshing state... (ID: 2)
   fortios_system_setting_dns.test1: Refreshing state... (ID: 96.45.45.45)
   --------------------------------------------------------------
   An execution plan has been generated and is shown below.
   Resource actions are indicated with the following symbols:
   + create
   - update in-place
   Terraform will perform the following actions:
   + fortios_networking_route_static.test1
   id: <computed>
   blackhole: "disable"
   comment: "Terraform test"
   device: "port2"
   distance: "22"
   dst: "110.2.2.122/32"
   gateway: "2.2.2.2"
   ```
priority: "3"
weight: "3"

~ fortios_system_setting_dns.test1
primary: "96.45.45.45" => "172.16.95.16"
secondary: "208.91.112.22" => "8.8.8.8"

Plan: 1 to add, 1 to change, 0 to destroy.

Note: You didn't specify an "-out" parameter to save this plan, so Terraform can't guarantee that exactly these actions will be performed if "terraform apply" is subsequently run.

If you are running terraform-provider-fortios 1.1.0, you may see the following error:
   Error: Error getting CA Bundle, CA Bundle should be set when insecure is false.
   In this case, add the following line to the FortiOS provider configuration in the test.tf file:
       insecure = "true"

9. Enter `terraform apply` to continue the configuration:

```bash
root@mail:/home/terraform# terraform apply
fortios_system_setting_dns.test1: Refreshing state... (ID: 96.45.45.45)
fortios_networking_route_static.test1: Refreshing state... (ID: 2)
An execution plan has been generated and is shown below.
Resource actions are indicated with the following symbols:
+ create
~ update in-place
Terraform will perform the following actions:
+ fortios_networking_route_static.test1
  id: <computed>
  blackhole: "disable"
  comment: "Terraform test"
  device: "port2"
  distance: "22"
  dst: "110.2.2.122/32"
  gateway: "2.2.2.2"
  priority: "3"
  weight: "3"
~ fortios_system_setting_dns.test1
  primary: "96.45.45.45" => "172.16.95.16"
  secondary: "208.91.112.22" => "8.8.8.8"
Plan: 1 to add, 1 to change, 0 to destroy.
Do you want to perform these actions?
Terraform will perform the actions described above.
Only 'yes' will be accepted to approve.
Enter a value: yes
fortios_networking_route_static.test1: Creating...
  blackhole: "" => "disable"
  comment: "" => "Terraform test"
  device: "" => "port2"
  distance: "" => "22"
  dst: "" => "110.2.2.122/32"
  gateway: "" => "2.2.2.2"
  priority: "" => "3"
  weight: "" => "3"
fortios_system_setting_dns.test1: Modifying... (ID: 96.45.45.45)
```
primary: "96.45.45.45" => "172.16.95.16"
secondary: "208.91.112.22" => "8.8.8.8"
fortios_networking_route_static.test1: Creation complete after 0s (ID: 2)
fortios_system_setting_dns.test1: Modifications complete after 0s (ID: 172.16.95.16)
Apply complete! Resources: 1 added, 1 changed, 0 destroyed.

The FortiGate is now configured according to the configuration file.

10. To change or delete something in the future, edit the configuration file and then apply it again. In supported cases, it deletes, adds, or updates new entries as configured. For instance, in this example you can remove the static route and revert the DNS address to its original configuration by changing the .tf file:

a. Edit the configuration file:

```terraform
# Configure the FortiOS Provider
provider "fortios" {
  hostname = "10.6.30.5"
  token = "17b***************63ck"
}

resource "fortios_system_setting_dns" "test1" {
  primary = "96.45.45.45"
  secondary = "208.91.112.22"
}

#resource "fortios_networking_route_static" "test1" {
  # dst = "110.2.2.122/32"
  # gateway = "2.2.2.2"
  # blackhole = "disable"
  # distance = "22"
  # weight = "3"
  # priority = "3"
  # device = "port2"
  # comment = "Terraform test"
#}

b. Entering `terraform apply` deletes the static route that is commented out of the configuration file, and reverts the DNS address to the old address:

root@mail:/home/terraform# terraform apply
fortios_system_setting_dns.test1: Refreshing state... (ID: 172.16.95.16)
fortios_networking_route_static.test1: Refreshing state... (ID: 2)

An execution plan has been generated and is shown below.
Resource actions are indicated with the following symbols:
~ update in-place
- destroy
Terraform will perform the following actions:
- fortios_networking_route_static.test1
  ~ fortios_system_setting_dns.test1
  primary: "172.16.95.16" => "96.45.45.45"
  secondary: "8.8.8.8" => "208.91.112.22"
Plan: 0 to add, 1 to change, 1 to destroy.
Do you want to perform these actions?
Terraform will perform the actions described above.
Only 'yes' will be accepted to approve.
Enter a value: yes
fortios_networking_route_static.test1: Destroying... (ID: 2)
fortios_system_setting_dns.test1: Modifying... (ID: 172.16.95.16)
primary: "172.16.95.16" => "96.45.45.45"
secondary: "8.8.8.8" => "208.91.112.22"
fortios_networking_route_static.test1: Destruction complete after 0s
fortios_system_setting_dns.test1: Modifications complete after 0s (ID: 96.45.45.45)
Apply complete! Resources: 0 added, 1 changed, 1 destroyed.

Troubleshooting

Use the HTTPS daemon debug to begin troubleshooting why a configuration was not accepted:

```bash
# diagnose debug enable
# diagnose debug application httpsd -l
```

The REST API 403 error means that your administrator profile does not have sufficient permissions.
The REST API 401 error means that you do not have the correct token or trusted host.

PF and VF SR-IOV driver and virtual SPU support

Physical Function (PF) and Virtual Function (VF) PCI Passthrough and SR-IOV drivers in FortiGate guest VM are supported.

PF provides the ability for PCI Passthrough, but requires an entire Network Interface Card (NIC) for a VM. It can usually achieve greater performance than a Virtual Function (VF) based SR-IOV. PF is also expensive. While VF allows one NIC to be shared among multiple guests VMs, PF is allocated to one port on a VM.

The supported driver versions are:

<table>
<thead>
<tr>
<th>Driver</th>
<th>Version</th>
<th>Hypervisor</th>
<th>PCI-Passthrough/SR-IOV</th>
<th>vSPU (In-guest DPDK)</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>ixgbe</td>
<td>5.6.5</td>
<td>ESXi, KVM</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>Ixgbevf</td>
<td>4.6.3</td>
<td>ESXi, KVM</td>
<td>Yes</td>
<td></td>
<td></td>
</tr>
<tr>
<td>i40e</td>
<td>2.10.19.82</td>
<td>ESXi, KVM</td>

<td></td>
</tr>
<tr>
<td>i40evf</td>
<td>3.6.15</td>
<td>ESXi, KVM</td>
<td>Yes</td>
<td>Yes</td>
<td>Available in FortiOS 6.4.0 and earlier versions.</td>
</tr>
<tr>
<td>Iavf</td>
<td>4.1.1</td>
<td>ESXi, KVM</td>
<td>Yes</td>
<td>Yes</td>
<td>Replaces i40evf in FortiOS 6.4.1 and later versions. Supports Intel E810-C 100G adapters.</td>
</tr>
<tr>
<td>Mlx5</td>
<td>4.6-1.0.1</td>
<td>ESXi, KVM</td>
<td>Yes</td>
<td>Yes</td>
<td>Supports Nvidia ConnectX-5 and ConnectX-6 100G adapters.</td>
</tr>
</tbody>
</table>
Other hypervisors, such as Xen or Microsoft Hyper-V, may work with vSPU, although they are unverified.

All tools and software utilities for UEFI 1.X have been removed from 6.2.0 and later releases. Update to UEFI 2.x to use the UEFI tools or software utilities.

You perform the configuration to use PF or VF on the hypervisor, and do not configure it on the FortiGate.

To check what driver is being used on the FortiGate:

```bash
# diagnose hardware deviceinfo nic port2
Name: port2
Driver: i40e
Version: 2.4.10
Bus: 0000:03:00.0
Hwaddr: 3c:fd:fe:1e:98:02

Rx bytes: 0
Rx compressed: 0
...
```

Using OCI IMDSv2

OCI IMDSv2 offers increased security for accessing instance metadata compared to IMDSv1. IMDSv2 is used in OCI SDN connectors and on instance deployments with bootstrap metadata. When upgrading from previous FortiOS builds
with legacy IMDSv1 endpoints, the endpoints will be updated to IMDSv2, and the same calls can be made.

The following use cases illustrate IMDSv2 support on the FortiGate-VM.

**To configure the Oracle OCI instance to use IMDSv2:**

1. In OCI, deploy an instance using IMDSv2 with bootstrap metadata. There are two methods to enable IMDSv2:
   - Use the OCI command line to deploy an instance using user-data. This example uses a MIME file that contains the license and configuration, as well as a JSON file that specifies to disable V1 metadata.

   ```
   oci compute instance launch
   --availability-domain www1:US-ASHBURN-AD-1
   --compartment-id ocid1.tenancy.oc1..aaaaaaaaaaa3aaaaaaaaaaaaaaaaaaaa7xxxxxxxxx54aaaaaaa4xxxxxxxxx55xxxa
   --display-name fos-byol-v6.4.6-b2290-emulated
   --image-id ocid1.image.oc1.iad.aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa3xxxxxxxxxxxxxxxx
   --subnet-id ocid1.subnet.oc1.iad.aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa3xxxxxxxxxxxxxxxx
   --shape VM.Standard1.4
   --assign-public-ip true
   --user-data-file /home/oci/userdata/mime.txt
   --ssh-authorized-keys-file /home/oci/userdata/myfirstkeypair.pub
   --instance-options file:///home/oci/scripts/metadatav2.json
   root@mail:/home/oci/scripts# cat metadatav2.json
   {
   "areLegacyImdsEndpointsDisabled": true
   }
   ```
   - While the instance is running, edit the instance metadata service version in the GUI, and change the allowed IMDS version to VERSION 2 ONLY (see Getting Instance Metadata in the OCI documentation).

2. The FortiGate will use the metadata v2 endpoints to get the metadata bootstrap information. In FortiOS, verify this by running the following after bootup:

   ```
   # diagnose debug cloudinit show
   ```

   **To configure an SDN connector with meta-IAM enabled and firewall addresses to obtain dynamic addresses:**

2. In FortiOS, configure the OCI Fabric connector (see OCI SDN connector using certificates on page 2473 for detailed instructions):
   a. Create the SDN connector.
   b. Verify that the OCI connector comes up (Security Fabric > External Connectors page indicates the status is up).
   c. Configure a dynamic firewall address with a filter.
   d. Verify the dynamic firewall address is resolved by the SDN connector.

To manually update the external IP:

```
# execute update-eip
instance: fos-byol-v6.4.6-b2290-emulated
   vnic0: fos-byol-v6.4.6-b2290-emulated
      10.0.0.58 (129.213.138.192)
   port1: 10.0.0.58, eip: 129.213.138.192
EIP is updated successfully
```
To verify the OCI daemon debugs related to metadata:

```
# diagnose test application ocid 4
instance: fos-byol-v6.4.6-b2290-emulated
    vnic0: fos-byol-v6.4.6-b2290-emulated
    10.0.0.58
# diagnose test application ocid 5
Compartment
    Id:ocid1.tenancy.oc1..aaaaaaaaaaa3aaaaaaaaaaaaaaaaa7xxxxxxxx54aaaaaa4xxxxxxxx55xxa
    Instance ID:ocid1.instance.oc1.iad.axxxxxxxxxxxxxxxxxxx4aaaaa5aaaaaaaaa4xxxxxxx2aaaaaa
    Instance Name:fos-byol-v6.4.6-b2290-emulated
    OCI Region:us-ashburn-1
# diagnose test application ocid 6
Instance Principal Token has been refreshed
```

FIPS cipher mode for AWS, Azure, OCI, and GCP FortiGate-VMs

AWS, Azure, OCI, and GCP FortiGate-VMs support FIPS cipher mode. You must remove all VPN configurations before you can enable FIPS CC mode.

FIPS cipher mode only allows a restricted set of ciphers for features that require encryption, such as SSH, IPsec and SSL VPN, and HTTPS. You cannot use insecure protocols such as Telnet, TFTP, and HTTP to access the FortiGate-VM.

You must perform a factory reset to disable fips-ciphers mode.

To enable fips-ciphers mode:

```
config system fips-cc
    set status fips-ciphers
end
```

Warning: entering fips-ciphers mode. To exit this mode, factory reset is required.

Do you want to continue? (y/n) y

The following behavior occurs when you enable FIPS cipher mode:

- You can restore a license, image, configuration, and so on from an FTP server.
- The following options are available:

<table>
<thead>

- The FortiCare license is validated.
- FortiGuard databases and engines are updated.
- The DH-RSA-AES128-GCM-SHA256 and DH-RSA-AES256-GCM-SHA384 ciphers are not supported.
Troubleshooting

This section is intended for administrators with super_admin permissions who require assistance with basic and advanced troubleshooting. Administrators with other types of permissions may not be able to perform all of the tasks in this section.

This section contains the following troubleshooting topics:

- Troubleshooting methodologies on page 2637
- Troubleshooting scenarios on page 2640
  - Checking the system date and time on page 2641
  - Checking the hardware connections on page 2642
  - Checking FortiOS network settings on page 2643
  - Troubleshooting CPU and network resources on page 2646
  - FortiGuard server settings on page 2681
  - Troubleshooting high CPU usage on page 2647
  - Checking the modem status on page 2651
  - Running ping and traceroute on page 2652
  - Checking the logs on page 2655
  - Verifying routing table contents in NAT mode on page 2656
  - Verifying the correct route is being used on page 2657
  - Verifying the correct firewall policy is being used on page 2657
  - Checking the bridging information in transparent mode on page 2658
  - Checking wireless information on page 2659
  - Performing a sniffer trace or packet capture on page 2660
  - Debugging the packet flow on page 2661
  - Testing a proxy operation on page 2664
  - Displaying detail Hardware NIC information on page 2665
  - Performing a traffic trace on page 2667
  - Using a session table on page 2668
  - Finding object dependencies on page 2671
  - Diagnosing NPU-based interfaces on page 2672
  - Identifying the XAUI link used for a specific traffic stream on page 2673
  - Running the TAC report on page 2674
  - Using the process monitor on page 2675
  - Other commands on page 2677
  - FortiGuard troubleshooting on page 2680
  - View open and in use ports on page 2683
- Additional resources on page 2684
Troubleshooting methodologies

The sections in this topic provide an overview of how to prepare to troubleshoot problems in FortiGate. They include verifying your user permissions, establishing a baseline, defining the problem, and creating a plan.

Verify user permissions

Before you begin troubleshooting, verify the following:

- You have administrator privileges for the FortiGate.
- The FortiGate is integrated into your network.
- The operation mode is configured.
- The system time, DNS settings, administrator password, and network interfaces are configured.
- Firmware, FortiGuard AntiVirus, FortiGuard Application Control, and FortiGuard IPS are up to date.

If you are using a FortiGate that has virtual domains (VDOMs) enabled, you can often troubleshoot within your own VDOM. However, you should inform the super_admin for the FortiGate that you will be performing troubleshooting tasks.

You may also need access to other networking equipment, such as switches, routers, and servers to carry out tests. If you do not have access to this equipment, contact your network administrator for assistance.

Establish a baseline

FortiGate operates at all layers of the OSI model. For this reason, troubleshooting can be complex. Establishing baseline parameters for your system before a problem occurs helps to reduce the complexity when you need to troubleshoot.

A best practice is to establish and record the normal operating status. Regular operation data shows trends, and allows you to see where changes occur when problems arise. You can gather this data by using logs and SNMP tools to monitor the system performance or by regularly running information gathering commands and saving the output.

You should back up your FortiOS configuration on a regular basis even when you are not troubleshooting. You can restore the backed up configuration as needed to save time recreating it from the factory default settings.

Use the following CLI commands to obtain normal operating data for a FortiGate:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>get system status</td>
<td>Displays firmware versions and FortiGuard engine versions, and other system information.</td>
</tr>
<tr>
<td>get system performance status</td>
<td>Displays CPU and memory states, average network usage, average sessions and session setup rate, viruses caught, IPS attacks blocked, and uptime.</td>
</tr>
<tr>
<td>get hardware memory</td>
<td>Displays information about memory.</td>
</tr>
</tbody>
</table>

You can run any commands that apply to your system for information gathering. For example, if you have active VPN connections, use the `get vpn` series of commands to get more information about them.

Use `execute tac report` to get an extensive snapshot of your system. This command runs many diagnostic commands for specific configurations. It also records the current state of each feature regardless of the features deployed on your FortiGate. If you need to troubleshoot later, you can run the same command again and compare the differences to identify any suspicious output.

**Define the problem**

The following questions are intended to compare the current behavior of the FortiGate with normal operations to help you define the problem. Be specific with your answers. After you define the problem, search for a solution in the troubleshooting scenarios section, and then create a plan to resolve it.

<table>
<thead>
<tr>
<th>What is the problem?</th>
<th>The problem being observed may not be the actual problem. You should determine where the problem lies before starting to troubleshoot the FortiGate.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Was the device working before?</td>
<td>If the device never worked, it might be defective. For more information, see Troubleshooting your installation on page 74.</td>
</tr>
<tr>
<td>Can the problem be reproduced?</td>
<td>If the problem is intermittent, it may be dependent on system load. Intermittent problems are challenging to troubleshoot because they are difficult to reproduce.</td>
</tr>
<tr>
<td>What has changed?</td>
<td>Use the FortiGate event log to identify possible configuration changes. There may be changes in the operating environment. For example, there might be a gradual increase in load as more sites are forwarded through the firewall. If something has changed, roll back the change and assess the impact.</td>
</tr>
<tr>
<td>What is the scope of the problem?</td>
<td>After you isolate the problem, determine what applications, users, devices, and operating systems the problem affects. The following questions are intended to narrow the scope of the problem and identify what to check during troubleshooting. The more factors you can eliminate, the less you need to check. For this reason, be as specific and accurate as possible when gathering information.</td>
</tr>
<tr>
<td></td>
<td>• What is not working?</td>
</tr>
</tbody>
</table>
Troubleshooting

- Is more than one thing not working?
- Is it partly working? If so, what parts are working?
- Is it a connectivity issue for the entire device, or is there an application that isn’t reaching the Internet?
- Where did the problem occur?
- When did the problem occur and to which users or groups of users?
- What components are involved?
- What applications are affected?
- Can you use a packet sniffer to trace the problem?
- Can you use system debugging or look in the session table to trace the problem?
- Do any of the log files indicate a failure has occurred?

Create a troubleshooting plan

After you define the problem and its scope, develop a troubleshooting plan.

<table>
<thead>
<tr>
<th>Create checklist</th>
<th>Make a list all the possible causes of the problem and how you can test for each cause. Create a checklist to keep track of what has been tried and what is left to test. Checklists are useful when more than one person is performing troubleshooting tasks.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Obtain the required equipment</td>
<td>Testing your solution may require additional networking equipment, computers, or other devices. Network administrators usually have additional networking equipment available to loan you, or a lab where you can bring the FortiGate unit to test. If you do not have access to equipment, check for shareware applications that can perform the same tasks. Often, there are software solutions you can use when hardware is too expensive.</td>
</tr>
<tr>
<td>Consult Fortinet troubleshooting resources</td>
<td>After the checklist is created, refer to the troubleshooting scenarios sections to assist with implementing your plan. See Troubleshooting scenarios on page 2640.</td>
</tr>
</tbody>
</table>
| Gather information for technical support | If you still require technical assistance after the plan is implemented, be prepared to provide Fortinet technical support with following information:
  - Firmware build version (use the `get system status` command)
  - Network topology diagram
  - Recent configuration file
  - Recent debug log (optional)
  - Summary of troubleshooting steps you have taken and the results. |

Do not provide the output from the `execute tac` report unless the support team requests it. The output from this command is very large and is not required in many cases.
Before contacting technical support, ensure you have login access (preferably with full read/write privileges) to all networking devices that could be relevant to troubleshooting.

If you are using VMs, be prepared to have someone who can log in to the virtual hosting platform in case it is necessary to check and possibly modify resource allocation.

For information about contacting technical support, go to FortiCare Support Service page.

### Troubleshooting scenarios

The following table is intended to help you diagnose common problems and provides links to the corresponding troubleshooting topics:

<table>
<thead>
<tr>
<th>Problem</th>
<th>Probable cause</th>
<th>Recommended action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Hardware connections</strong></td>
<td>• Are all of the cables and interfaces connected properly?</td>

</tbody>
</table>

### Checking the system date and time

The system date and time are important for FortiGuard services, logging events, and sending alerts. The wrong time makes the log entries confusing and difficult to use.

When possible, use Network Time Protocol (NTP) to set the date and time. This is an automatic method that does not require manual intervention. However, you must ensure that the port is allowed through the firewalls on your network. FortiToken synchronization requires NTP in many situations.

For information about setting the system date and time, see Setting the system time on page 1978.

**To view and configure the date and time in the GUI:**

1. Go to Dashboard > Status. The date and time are displayed in the System Information widget, next to System Time.
2. Go to System > Settings.
3. In the System Time section, select NTP, and then configure the Time Zone, and Set Time settings as required.

**To view the date and time in the CLI:**

```bash
execute date
execute time
```
Troubleshooting

To configure the date and time in the CLI:

Use the `set timezone ?` command to display a list of timezones and the integers that represent them.

```
config system global
    set timezone <integer>
end
config system ntp
    set type custom
        config ntpserver
            edit 1
                set server “ntp1.fortinet.net”
            next
            edit 2
                set server “ntp2.fortinet.net”
            next
        end
    set ntpsync enable
    set syncinterval 60
end
```

Checking the hardware connections

If traffic is not flowing from the FortiGate, there may be a problem with the hardware connection.

To check hardware connections:

1. Ensure the network cables are plugged into the interfaces.
2. Verify the LED connection lights for the network cables indicate there is a connection. The lights are typically green when there is a connection.
3. Change the cable when:
   - The cable or its connector are damaged.
   - You are unsure of the type or quality of the cable, such as straight through or crossover.
   - You see exposed wires at the connector.
4. Connect the FortiGate to different hardware.
5. Go to Network > Interfaces to ensure the link status for the interface is set to Up. The link status is based on the physical connection and cannot be set in FortiOS.

To enable an interface in the GUI:

You should still perform basic software connectivity tests to ensure complete connectivity even if there was a problem with the hardware connection. The interface might also be disabled, or its Status might be set to Down. See Interfaces on page 135.

1. Go to Network > Interfaces.
2. Select an interface, such as Port1, and click Edit.
3. In the Miscellaneous area, next to Status, click Enabled.
4. Click OK.

To enable an interface in the CLI:

```
config system interface
```
Checking FortiOS network settings

Check the FortiOS network settings if you have problems connecting to the management interface. FortiOS network settings include, interface settings, DNS Settings, and DHCP settings.

Interface settings

If you can access the FortiGate with the management cable only, you can view the interface settings in the GUI.

To view the interface settings in the GUI:

1. Go to Network > Interfaces.
2. Select an interface and click Edit.
3. Check the following interfaces to ensure they are not blocking traffic.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link Status</td>
<td>The status is <em>Up</em> when a valid cable is plugged in. The status is <em>Down</em> when an invalid cable is plugged in. The Link Status is shown physically by the connection LED for the interface. If the LED is green, the connection is good. If Link Status is <em>Down</em>, the interface does not work. Link status also appears in the Network &gt; Interfaces page by default.</td>
</tr>
<tr>
<td>Addressing mode</td>
<td>Do not use DHCP if you do not have a DHCP server. You will not be able to log into an interface in DHCP mode as it will not have an IP address.</td>
</tr>
<tr>
<td>IP/Network Mask</td>
<td>An interface requires an IP address to connect to other devices. Ensure there is a valid IP address in this field. The one exception is when DHCP is enabled for this interface to get its IP address from an external DHCP server.</td>
</tr>
<tr>
<td>IPv6 address</td>
<td>The same protocol must be used by both ends to complete the connection. Ensure this interface and the remote connection are both using IPv4 or both are using IPv6 addresses.</td>
</tr>
<tr>
<td>Administrative access</td>
<td>If no protocols are selected, you will have to use the local management cable to connect to the unit. If you are using IPv6, configure the IPv6 administrative access protocols.</td>
</tr>
<tr>
<td>Status</td>
<td>Ensure the status is set to <em>Up</em> or the interface will not work.</td>
</tr>
</tbody>
</table>

To display the internal interface settings in the CLI:

```plaintext
FGT# show system interface <interface_name>
```
To view the list of possible interface settings:

```bash
config system interface
  edit <interface_name>
    get
end
```

**DNS settings**

To view DNS settings in the GUI:

Go to `Network > DNS`.

You can trace many networking problems back to DNS issues. Check the following items:

1. Are there values for both the *Primary DNS server* and *Secondary DNS server* fields.
2. Is the *Local Domain Name* correct?
3. Are you using IPv6 addressing? If so, are the IPv6 DNS settings correct?
4. Are you using Dynamic DNS (DDNS)? If so, is it using the correct server, credentials, and interface?
5. Can you contact both DNS servers to verify the servers are operational?
6. If an interface addressing mode is set to DHCP and is set to override the internal DNS, is that interface receiving a valid DNS entry from the DHCP server? Is it a reasonable address and can it be contacted to verify it is operational?
7. Are there any DENY security policies that need to allow DNS?
8. Can any internal device perform a successful traceroute to a location using the FQDN?

**DHCP server settings**

DHCP servers are common on internal and wireless networks. The DHCP server will cause problems if it is not configured correctly.

To view DHCP server settings in the GUI:

1. Go to `Network > Interfaces`.
2. Select an interface, and click `Edit`.

Check the following items:

1. Is the DHCP server enabled?
2. Is the DHCP server entry set to *Relay*? If so, verify there is another DHCP server to which requests can be relayed. Otherwise, set it to *Server*.
3. Does the DHCP server use a valid IP address range? Are other devices using the addresses? If one or more devices are using IP addresses in this range, you can use the IP reservation feature to ensure the DHCP server does not use these addresses. See [DHCP server on page 287](#)
4. Is there a gateway entry? If not, add a gateway entry to ensure that the server's clients have a default route.
5. Is the system DNS setting being used? A best practice is to avoid confusion by using the system DNS whenever possible. However, you can specify up to three custom DNS servers, and you should use all three entries for redundancy.
Troubleshooting

There are some situations, such as a new wireless interface, or during the initial FortiGate configuration, where interfaces override the system DNS entries. When this happens, it often shows up as intermittent Internet connectivity. To fix the problem, go to Network > DNS, and enable Use FortiGuard Servers.

Checking CPU and memory resources

Check the CPU and memory resources when the FortiGate is not working, the network is slow, or there is a reduced firewall session setup rate. All processes share the system resources in FortiOS, including CPU and memory.

To view system resources in the GUI:

Go to Dashboard > Status.
The resource information is located in the CPU and Memory widgets. For information, see Dashboards and Monitors on page 76.

To view system resources in the CLI:

get system performance status

Sample output:

FGT# get system performance status
CPU states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU0 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU1 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU2 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU3 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
Memory: 4050332k total, 527148k used (13%), 3381312k free (83%), 141872k freeable (3%)
Average network usage: 41 / 28 kbps in 1 minute, 54 / 44 kbps in 10 minutes, 42 / 34 kbps in 30 minutes
Average sessions: 33 sessions in 1 minute, 48 sessions in 10 minutes, 38 sessions in 30 minutes
Average session setup rate: 0 sessions per second in last 1 minute, 0 sessions per second in last 10 minutes, 0 sessions per second in last 30 minutes
Virus caught: 0 total in 1 minute
IPS attacks blocked: 0 total in 1 minute
Uptime: 0 days, 22 hours, 59 minutes

The first line of the output shows the CPU usage by category:

CPU states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq

The second line of the output shows the memory usage:

Memory: 4050332k total, 527148k used (13%), 3381312k free (83%), 141872k freeable (3%) Memory usage should not exceed 90%. Using too much memory prevents some processes from functioning properly. For example, if the system is running low on memory, antivirus scanning enters into failopen mode where it drops connections or bypasses the antivirus system.

Other lines of output, such as average network usage, average session setup rate, viruses caught, and IPS attacks blocked, help determine why system resource usage is high.

For example:
A high average network usage may indicate high traffic processing on the FortiGate,
A very low or zero, average session setup rate may indicate the proxy is overloaded and unable to do its job.

Troubleshooting CPU and network resources

FortiGate has stopped working

If the FortiGate has stopped working, the first line of the output will look similar to this:

```
CPU states: 0% user 0% system 0% nice 100% idle
```

Network is slow

If your network is running slow, the first line of the output will look similar to this:

```
CPU states: 1% user 98% system 0% nice 1% idle
```

This example shows that all of the CPU is being used by system processes, and the FortiGate is overloaded. When overloading occurs, it is possible a process such as scanunitid is using all the resources to scan traffic. In this case you need to reduce the amount of traffic being scanned by blocking unwanted protocols, configuring more security policies to limit scanning to certain protocols, or similar actions.

It is also possible a hacker has accessed your network and is overloading it with malicious activity, such as running a spam server or using zombie PCs to attack other networks on the Internet.

You can use the following command to investigate the problem with the CPU:

```
get system performance top
```

This command shows all of the top processes that are running on the FortiGate and their CPU usage. The process names are on the left. If a process is using most of the CPU cycles, investigate it to determine whether the activity is normal.

Reduced firewall session setup rate

A reduced firewall session setup rate can be caused by a lack of system resources on the FortiGate, or reaching the session count limit for a VDOM.

```
As a best practice, administrators should record the session setup rate during normal operation to establish a baseline to help define a problem when your are troubleshooting.
```

The session setup rate appears in the average sessions section of the output.

A reduced firewall session setup rate will look similar to this:

```
Average sessions: 80 sessions in 1 minute, 30 sessions in 10 minutes, 42 sessions in 30 minutes
Average session setup rate: 3 sessions per second in last 1 minute, 0 sessions per second in last 10 minutes, 0 sessions per second in last 30 minutes
```

In the example above, there were 80 sessions in 1 minute, or an average of 3 sessions per second.
The values for 10 minutes and 30 minutes allow you to take a longer average for a more reliable value if your FortiGate is working at maximum capacity. The smallest FortiGate can have 1,000 sessions established per second across the unit.

The session setup rate is a global command. If you have multiple VDOMs configured with many sessions in each VDOM, the session setup rate per VDOM will be slower than if there are no VDOMs configured.

High memory usage

As with any system, a FortiGate has limited hardware resources, such as memory, and all processes running on the FortiGate share the memory. Each process uses more or less memory, depending on its workload. For example, a process usually uses more memory in high traffic situations. If some processes use all of the available memory, other processes will not be able to run.

When high memory usage occurs, the services may freeze up, connections may be lost, or new connections may be refused.

If you see high memory usage in the Memory widget, the FortiGate may be handling high traffic volumes. Alternatively, the FortiGate may have problems with connection pool limits that are affecting a single proxy. If the FortiGate receives large volumes of traffic on a specific proxy, the unit may exceed the connection pool limit. If the number of free connections within a proxy connection pool reaches zero, issues may occur.

To view current memory usage information in the CLI:

```
diagnose hardware sysinfo memory
```

Sample output:

```
total: used: free: shared: buffers: cached: shm:
Mem: 2074185728 756936704 1317249024 0 20701184 194555904 161046528
Swap: 0 0 0
MemTotal: 2025572 kB
MemFree: 1286376 kB
MemShared: 0 kB
Buffers: 20216 kB
Cached: 189996 kB
SwapCached: 0 kB
Active: 56644 kB
Inactive: 153648 kB
HighTotal: 0 kB
HighFree: 0 kB
LowTotal: 2025572 kB
LowFree: 1286376 kB
SwapTotal: 0 kB
SwapFree: 0 kB
```

Troubleshooting high CPU usage

Connection-related problems may occur when FortiGate's CPU resources are over extended. This occurs when you deploy too many FortiOS features at the same time.
**Examples of CPU intensive features:**

- VPN high-level encryption
- Intensive scanning of all traffic
- Logging all traffic and packets
- Dashboard widgets that frequently perform data updates

For information on customizing the CPU use threshold, see Execute a CLI script based on CPU and memory thresholds on page 2412.

**Determining the current level of CPU usage**

You can view CPU usage levels in the GUI or CLI. For precise usage values for both overall usage and specific processes, use the CLI.

**To view CPU usage in the GUI:**

Go to *Dashboard > Status*. Real-time CPU usage information is located in the *CPU widget*.

**To view CPU usage in the CLI:**

- Show top processes information:
  ```bash
diagnose sys top
  ```
- Show top threads information:
  ```bash
diagnose sys top-all
  ```

**Sample output:**

Run Time: 86 days, 0 hours and 10 minutes
0U, 0N, 0S, 100I, 0WA, 0HI, 0SI, 0ST; 3040T, 2437F
  bcn.user 93 S < 3.1 0.4
  httpsd 18922 S 1.5 0.5
  httpsd 19150 S 0.3 0.5
  newcli 20195 R 0.1 0.1
  cmdbsvr 115 S 0.0 0.8
  pyfcqid 20107 S 0.0 0.6
  forticron 146 S 0.0 0.5
  httpsd 139 S 0.0 0.5

  miglogd 175 S 0.0 0.4
  fgfmd 165 S 0.0 0.3
  newcli 20191 S 0.0 0.3
  initXXXXXXXXXX 1 S 0.0 0.3
  httpsd 184 s 0.0 0.3

The following table explains the codes in the second line of the output:
<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>U</td>
<td>Percentage of user space applications that are currently using the CPU</td>
</tr>
<tr>
<td>N</td>
<td>Percentage of time that the CPU spent on low priority processes since the last shutdown</td>
</tr>
<tr>
<td>S</td>
<td>Percentage of system processes (or kernel processes) that are using the CPU</td>
</tr>
<tr>
<td>I</td>
<td>Percentage of idle CPU resources</td>
</tr>
<tr>
<td>WA</td>
<td>Percentage of time that the CPU spent waiting on IO peripherals since the last shutdown</td>
</tr>
<tr>
<td>HI</td>
<td>Percentage of time that the CPU spent handling hardware interrupt routines since the last shutdown</td>
</tr>
<tr>
<td>SI</td>
<td>Percentage of time that the CPU spent handling software interrupt routines since the last shutdown</td>
</tr>
<tr>
<td>ST</td>
<td>Steal time: Percentage of time a virtual CPU waits for the physical CPU when the hypervisor is servicing another virtual processor</td>
</tr>
<tr>
<td>T</td>
<td>Total FortiOS system memory in MB</td>
</tr>
<tr>
<td>F</td>
<td>Free memory in MB</td>
</tr>
</tbody>
</table>

Each additional line of the command output displays information specific to processes or threads that are running on the FortiGate unit. For example, the sixth line of the output is: newcli 20195 R 0.1 0.1

The following table describes the data in the sixth line of the output:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>newcli</td>
<td>The process (or thread) name. Duplicate process or thread names indicate that separate instances of that process or thread are running.</td>
</tr>
<tr>
<td>20195</td>
<td>The process or thread ID, which can be any number.</td>
</tr>
<tr>
<td>R</td>
<td>Current state of the process or thread. The process or thread state can be:</td>
</tr>
<tr>
<td></td>
<td>• R- running</td>
</tr>
<tr>
<td></td>
<td>• S- sleep</td>
</tr>
<tr>
<td></td>
<td>• Z- zombie</td>
</tr>
<tr>
<td></td>
<td>• D- disk sleep</td>
</tr>
<tr>
<td>0.1</td>
<td>The percentage of CPU capacity that the process or thread is using. CPU usage can range from 0.0 for a process or thread that is sleeping to higher values for a process or thread that’s taking a lot of CPU time.</td>
</tr>
<tr>
<td>0.1</td>
<td>The amount of memory that the process or thread is using. Memory usage can range from 0.1 to 5.5 and higher.</td>
</tr>
</tbody>
</table>

You can use the following single-key commands when running `diagnose sys top` or `diagnose sys top-all`:

- `q` to quit and return to the normal CLI prompt.
- `p` to sort the processes by the amount of CPU that the processes are using.
- `m` to sort the processes by the amount of memory that the processes are using.
The output only displays the top processes or threads that are running. For example, if 20 are listed, they are the top 20 currently running, sorted by either CPU or memory usage. You can configure the number of processes or threads displayed, using the following CLI commands:

diagnose sys top <integer_seconds> <integer_maximum_lines>
diagnose sys top-all <integer_seconds> <integer_maximum_lines>

Where:

- `<integer_seconds>` is the delay in seconds (default is 5)
- `<integer_maximum_lines>` is the maximum number of lines (or processes) to list (default is 20)

### Determining which features are using the most CPU resources

You can use the CLI to view the top few processes that are currently running and using the most CPU resources.

**To view processes using the most CPU resources:**

```
get system performance top
```

The entries at the top are using the most CPU resources. The second column from the right shows CPU usage by percentage. Note which processes are using the most resources and try to reduce their CPU load.

Processes you will see include:

- `ipsengine`: the IPS engine that scans traffic for intrusions
- `scanunitd`: antivirus scanner
- `httpsd`: secure HTTP
- `iked`: internet key exchange (IKE) in use with IPsec VPN tunnels
- `newcli`: active whenever you're accessing the CLI
- `sshd`: there are active secure socket connections
- `cmdbserv`: the command database server application

Go to the features that are at the top of the list and look for evidence of CPU overuse. Generally, the monitor for a feature is a good place to start.

### Checking for unnecessary CPU “wasters”

These are some best practices that will reduce your CPU usage, even if the FortiGate is not experiencing high CPU usage. Note that if the following information instructs you to turn off a feature that you require, disregard that part of the instructions.

- Use hardware acceleration wherever possible to offload tasks from the CPU. Offloading tasks, such as encryption, frees up the CPU for other tasks.
- Avoid the use of GUI widgets that require computing cycles, such as the *Top Sessions* widget. These widgets constantly poll the system for information, which uses CPU and other resources.
- Schedule antivirus, IPS, and firmware updates during off-peak hours. These updates do not usually consume CPU resources but they can disrupt normal operation.
- Check the log levels and which events are being logged. This is the severity of the messages that are recorded. Consider going up one level to reduce the amount of logging. Also, if there are events you do not need to monitor, remove them from the list.
Troubleshooting

- Log to FortiCloud instead of logging to memory or disk. Logging to memory quickly uses up resources and logging to local disk impacts overall performance and reduces the lifetime of the unit. Fortinet recommends logging to FortiCloud to avoid using too much CPU.
- If the disk is almost full, transfer the logs or data off the disk to free up space. When a disk is almost full it consumes a lot of resources to find free space and organize the files.
- If packet logging is enabled on the FortiGate, consider disabling it. When packet logging is enabled, it records every packet that comes through that policy.
- Halt all sniffers and traces.
- Ensure the FortiGate isn’t scanning traffic twice. Traffic does not need to be rescanned if it enters the FortiGate on one interface, goes out another, and then comes back in again. Doing so is a waste of resources. However, ensure that traffic truly is being scanned once.
- Reduce the session timers to close unused sessions faster. Enter the following CLI commands, which reduce the default values. Note that, by default, the system adds 10 seconds to tcp-timewait.
  
  ```
  config system global
  set tcp-halfclose-timer 30
  set tcp-halfopen-timer 30
  set tcp-timewait-timer 0
  set udp-idle-timer 60
  end
  ```
- Go to System > Feature Visibility, and enable only features that you need.

SNMP monitoring

When CPU usage is under control, use SNMP to monitor CPU usage. Alternatively, use logging to record CPU and memory usage every 5 minutes.

Once the system is back to normal, you should set up a warning system that sends alerts when CPU resources are used excessively. A common method to do this is using SNMP. SNMP monitors many values in FortiOS and allows you to set high water marks that generate events. You can run an application on your computer to watch for and record these events.

**To enable SNMP:**

1. Go to System > SNMP.
2. Configure an SNMP community.

See SNMP on page 2126.

You can use the System Resources widget to record CPU usage if SNMP is too complicated. However, the widget only records problems as they happen and will not send you alerts for problems.

Checking the modem status

You can use the CLI to troubleshoot a modem that is not working properly, or troubleshoot a FortiGate that does not detect the modem.

**To diagnose modem issues in the CLI:**

```
diagnose sys modem {cmd | com | detect | history | external-modem | query | reset}
```
Troubleshooting

You should always run the following command after you connect a USB modem to FortiGate:

diagnose sys modem detect

Use the following command to view the modem’s configuration, vendor and custom product identification number:

get system modem

Use the following commands to resolve connectivity issues:

- diagnose debug enable: Activates the debug on the console
- diagnose debug application modem: Dumps communication between the modem and the unit.
- diagnose debug application ppp: Dumps the PPP negotiating messages.
- execute modem dial: Displays modem debug output.

The modem diagnose output should not contain errors when initializing. You should also verify the number used to dial into your ISP.

Running ping and traceroute

Ping and traceroute are useful tools in network troubleshooting. Alone, either tool can determine network connectivity between two points. However, ping can be used to generate simple network traffic that you can view using diagnose commands in FortiGate. This combination can be very powerful when you are trying to locate network problems.

Ping and traceroute can also tell you if your computer or network device has access to a domain name server (DNS). Both tools can use IP addresses or device domain names to determine why particular services, such as email or web browsing, may not work properly.

If ping does not work, it may be disabled on at least one of the interface settings and security policies for that interface.

Both ping and traceroute require particular ports to be open on firewalls to function. Since you typically use these tools to troubleshoot, you can allow them in the security policies and on interfaces only when you need them. Otherwise, keep the ports disabled for added security.

Ping

The ping command sends a very small packet to a destination, and waits for a response. The response has a timer that expires when the destination is unreachable.

Ping is part of layer 3 on the OSI Networking Model. Ping sends Internet Control Message Protocol (ICMP) “echo request” packets to the destination, and listens for “echo response” packets in reply. However, many public networks block ICMP packets because ping can be used in a denial of service (DoS) attack (such as Ping of Death or a smurf attack), or by an attacker to find active locations on the network. By default, FortiGate units have ping enabled while broadcast-forward is disabled on the external interface.

What ping can tell you

Beyond the basic connectivity information, ping can tell you the amount of packet loss (if any), how long it takes the packet to make the round trip, and the variation in that time from packet to packet.

If packet loss is detected, you should investigate the following:
Troubleshooting

- Possible ECMP, split horizon, or network loops.
- Cabling, to ensure there are no loose connections.
- Verify which security policy was used. To do this: 
  Go to Policy & Objects > Firewall Policy and view the packet count column.

If there is total packet loss, you should investigate the following:

1. Ensure cabling is correct, and all equipment between the two locations is accounted for.
2. Ensure all IP addresses and routing information along the route is configured as expected.
3. Ensure all firewalls, including FortiGate security policies allow PING to pass through.

How to use ping

Ping syntax is the same for nearly every type of system on a network.

To ping from a FortiGate unit:

1. Go to Dashboard, and connect to the CLI through either telnet or the CLI widget.
2. Enter execute ping 10.11.101.101 to send 5 ping packets to the destination IP address. There are no options for this command.

   Head_Office_620b # execute ping 10.11.101.101
   PING 10.11.101.101 (10.11.101.101): 56 data bytes
   64 bytes from 10.11.101.101: icmp_seq=0 ttl=255 time=0.3 ms
   64 bytes from 10.11.101.101: icmp_seq=1 ttl=255 time=0.2 ms
   64 bytes from 10.11.101.101: icmp_seq=2 ttl=255 time=0.2 ms
   64 bytes from 10.11.101.101: icmp_seq=3 ttl=255 time=0.2 ms
   64 bytes from 10.11.101.101: icmp_seq=4 ttl=255 time=0.2 ms

   --- 10.11.101.101 ping statistics ---
   5 packets transmitted, 5 packets received, 0% packet loss
   round-trip min/avg/max = 0.2/0.2/0.3 ms

To ping from a Microsoft Windows PC:

1. Open a command window.
2. Enter ping 10.11.101.100 to ping the default internal interface of the FortiGate with four packets.

   Other options include:
   - -t to send packets until you press Ctrl+C
   - -a to resolve addresses to domain names where possible
   - -n X to send X ping packets and stop

   C:\>ping 10.11.101.101

   Pinging 10.11.101.101 with 32 bytes of data:
   Reply from 10.11.101.101: bytes=32 time=10ms TTL=255
   Reply from 10.11.101.101: bytes=32 time=1ms TTL=255
   Reply from 10.11.101.101: bytes=32 time=1ms TTL=255
   Reply from 10.11.101.101: bytes=32 time=1ms TTL=255

   Ping statistics for 10.11.101.101:
   Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
   Approximate round trip times in milli-seconds:
   Minimum = 0ms, Maximum = 10ms, Average = 3ms
To ping from a Linux PC:

1. Go to a shell prompt.
2. Enter “ping 10.11.101.101”.

Traceroute

Where ping will only tell you if it reached its destination and returned successfully, traceroute shows each step of the journey to its destination and how long each step takes. If ping finds an outage between two points, you can use traceroute to locate exactly where the problem is.

Traceroute works by sending ICMP packets to test each hop along the route. It sends three packets, and then increases the time to live (TTL) setting by one each time. This effectively allows the packets to go one hop farther along the route. This is why most traceroute commands display their maximum hop count before they start tracing the route, which is the maximum number of steps it takes before it declares the destination unreachable. Also, the TTL setting may result in steps along the route timing out due to slow responses. There are many possible reasons for this to occur.

By default, traceroute uses UDP datagrams with destination ports numbered from 33434 to 33534. The traceroute utility may also offer the option to select use of ICMP echo request (type 8) instead, which the Windows tracert utility uses. If you must, allow both protocols inbound through the FortiGate security policies (UDP with ports from 33434 to 33534 and ICMP type 8).

To track traceroute packets in the GUI:

Go to Policy & Objects > Firewall Policy and view the packet count column.
This allows you to verify the connection and confirm which security policy the traceroute packets are using.

What traceroute can tell you

Both ping and traceroute verify connectivity between two points. However, only traceroute shows you each step in the connection path. Also, ping and traceroute use different protocols and ports, so one may succeed where the other fails.

You can verify your DNS connection using traceroute. If you enter an FQDN instead of an IP address for the traceroute, DNS tries to resolve that domain name. If the name isn't resolved, you have DNS issues.

Using traceroute

The traceroute command varies slightly between operating systems. In Microsoft Windows, the command name is shortened to “tracert”. Also, your output lists different domain names and IP addresses along your route.

To use traceroute on a Microsoft Windows PC:

1. Open a command window.
2. Enter tracert fortinet.com to trace the route from the PC to the Fortinet web site.
   C:\>tracert fortinet.com
   Tracing route to fortinet.com [208.70.202.225]
   over a maximum of 30 hops:
   1   <1 ms <1 ms <1 ms 172.20.120.2
   2   66 ms 24 ms 31 ms 209-87-254-xxx.storm.ca [209.87.254.221]
   3   52 ms 22 ms 18 ms core-2-g0-0-1104.storm.ca [209.87.239.129]
   4   43 ms 36 ms 27 ms core-3-g0-0-1185.storm.ca [209.87.239.222]
   5   46 ms 21 ms 16 ms tel3-x.1156.mpd01.cogentco.com [38.104.158.69]
Checking the logs

A log message records the traffic passing through FortiGate to your network and the action FortiGate takes when it scans the traffic. You should log as much information as possible when you first configure FortiOS. If FortiGate logs are too large, you can turn off or scale back the logging for features that are not in use.
It is difficult to troubleshoot logs without a baseline. Before you can determine if the logs indicate a problem, you need to know what logs result from normal operation.

**When troubleshooting with log files**

- Compare current logs to a recorded baseline of normal operation.
- If you need to, increase the level of logging (such as from Warning to Information) to obtain more information. When increasing logging levels, ensure that you configure email alerts and select both disk usage and log quota. This ensures that you will be notified if the increase in logging causes problems.

**To configure the log settings in the GUI:**

Go to Log & Report > Log Settings.

Determine the activities that generate the most log entries:

- Check all logs to ensure important information is not overlooked.
- Filter or order log entries based on different fields, such as level, service, or IP address, to look for patterns that may indicate a specific problem, such as frequent blocked connections on a specific port for all IP addresses.

Logs can help identify and locate any problems, but they do not solve them. The purpose of logs is to speed up your problem solving and save you time and effort.

For more information about logging and log reports, see Log and Report on page 2541.

**Verifying routing table contents in NAT mode**

Verify the contents of the routing table when a FortiGate has limited or no connectivity.

The routing table stores the routes currently in use for both static and dynamic protocols. Storing a route in the routing table saves time and resources performing a lookup. To ensure the most recently used routes remain in the table, old routes are bumped to make room for new ones. You cannot perform this task when FortiGate is in transparent mode.

If FortiGate is running in NAT mode, verify that all desired routes are in the routing table, including local subnets, default routes, specific static routes, and dynamic routing protocols.

**To view the routing table in the CLI:**

get router info routing-table all

**Sample output:**

```plaintext
FGT# get router info routing-table all  
Codes:  
K - kernel, C - connected, S - static, R - RIP, B - BGP  
O - OSPF, IA - OSPF inter area  
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2  
E1 - OSPF external type 1, E2 - OSPF external type 2  
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area  
* - candidate default  
S* 0.0.0.0/0 [10/0] via 172.20.120.2, wan1  
C 10.31.101.0/24 is directly connected, internal  
C 172.20.120.0/24 is directly connected, wan1
```
Troubleshooting

Verifying the correct route is being used

Run a trace route from a machine in the local area network (LAN) to ensure traffic is flowing as expected through the correct route when there is more than one default route.

In the following example output:

- The first hop contains the IP address 10.10.1.99, which is the internal interface of the FortiGate.
- The second hop contains the IP address 172.20.120.2, to which the wan1 interface of the FortiGate is connected.

This means the route through the wan1 interface is being used for this traffic.

```
C:\>tracert www.fortinet.com
Tracing route to www.fortinet.com [66.171.121.34]
over a maximum of 30 hops:
1 <1 ms <1 ms <1 ms 10.10.1.99
2 1 ms <1 ms <1 ms 172.20.120.2
3 3 ms 3 ms 3 ms static-209-87-254-221.storm.ca [209.87.254.221]
4 3 ms 3 ms 3 ms core-2-g0-2.storm.ca [209.87.239.129]
5 13 ms 13 ms 13 ms core-3-bdi1739.storm.ca [209.87.239.199]
6 12 ms 19 ms 11 ms v502.core1.tor1.he.net [216.66.41.113]
7 22 ms 22 ms 21 ms 100ge1-2.core1.nyc4.he.net [184.105.80.9]
8 84 ms 84 ms 84 ms 203.78.181.2
9 82 ms 82 ms 82 ms 203.78.186.70
10 84 ms 84 ms 84 ms 203.78.186.70
11 82 ms 82 ms 82 ms 203.78.181.2
12 84 ms 84 ms 84 ms 203.78.186.70
13 84 ms * 85 ms 66.171.127.177
14 * * * fortinet.com [66.171.121.34]
15 * * * fortinet.com [66.171.121.34]
```

You can also see the route taken for each session by debugging the packet flow in the CLI. For more information, see Debugging the packet flow on page 2661.

Verifying the correct firewall policy is being used

If you have more than one firewall policy, you can check which policy is being used in the Policy & Objects module in the GUI.

To verify the firewall policy in the GUI:

1. Go to Policy & Objects > Firewall Policy.
2. Look in the Count column to see which policy is being used. The count must show traffic increasing.

Debugging the packet flow in the CLI shows the policy ID that's allowing the traffic. For information, see Debugging the packet flow on page 2661.
Troubleshooting

Checking the bridging information in transparent mode

Checking the bridging information is useful when you are experiencing connectivity problems. When FortiGate is set to transparent mode, it acts like a bridge and sends all incoming traffic out on the other interfaces. Each bridge is a link between interfaces.

When traffic is flowing between the interfaces, you can see the bridges listed in the CLI. If no bridges are listed, this is the likely cause of the connectivity issue. When investigating bridging information, check for the MAC address of the interface or device in question.

How to check the bridging information

To view the list of bridge instances in the CLI:

```bash
diagnose netlink brctl list
```

Sample output:

```bash
#diagnose netlink brctl list
list bridge information
1. root.b fdb: size=256 used=6 num=7 depth=2 simple=no
Total 1 bridges
```

How to display forwarding domain information

You can use forwarding domains, or collision domains, in routing to limit where packets are forwarded on the network. Layer 2 broadcasts are limited to the same group. By default, all interfaces are in group 0. For example, if the FortiGate has 12 interfaces, only two may be in the same forwarding domain, which limits packets that are broadcast to those two interfaces. This reduces traffic on the rest of the network.

Collision domains prevent the forwarding of ARP packets to all VLANs on an interface. Without collision domains, duplicate MAC addresses on VLANs may cause ARP packets to be duplicated. Duplicate ARP packets can cause some switches to reset. It's important to know what interfaces are part of which forwarding domains because this determines which interfaces can communicate with each other.

To manually configure forwarding domains in transparent mode in the CLI:

```bash
config system interface
  edit <interface_name>
    set forward-domain <integer>
  end
```

To display the forward domains information in the CLI:

```bash
diagnose netlink brctl domain <name> <id>
```

Where `<name>` is the name of the forwarding domain to display and `<id>` is the domain ID.

Sample output:

```bash
diagnose netlink brctl domain ione 101
show bridge root.b ione forward domain.
```
id=101 dev=trunk_1 6

To list the existing bridge MAC table in the CLI:

diagnose netlink brctl name host <name>

Sample output:

show bridge control interface root.b host.
fdb: size=256, used=6, num=7, depth=2, simple=no
Bridge root.b host table

<table>
<thead>
<tr>
<th>port no</th>

<tr>
<td>1</td>
<td>3</td>
<td>wan1</td>
<td>00:09:0f:78:69:fe</td>
<td>0</td>
<td>Local Static</td>
</tr>
</tbody>
</table>

To list the existing bridge port list in the CLI:

diagnose netlink brctl name port <name>

Sample output:

show bridge root.b data port.
trunk_1 peer_dev=0
internal peer_dev=0
dmz peer_dev=0
wan2 peer_dev=0
wan1 peer_dev=0

Checking wireless information

Check wireless connections, stations, and interfaces when the problem is not caused by a physical interface.

Troubleshooting station connection issues

To check if a station entry is created on access control in the CLI:

FG600B3909600253 # diagnose wireless-controller wlc -d sta
* vf=0 wtp=70 rId=2 wlan=open ip=0.0.0.0 mac=00:09:0f:db:c4:03 rssi=0 idle=148 bw=0 use=2
  vf=0 wtp=70 rId=2 wlan=open ip=172.30.32.122 mac=00:25:9c:e0:47:88 rssi=-40 idle=0 bw=9 use=2

Enabling diagnostics for a specific station

This example uses the station MAC address to find where it is failing:
Troubleshooting

Performing a sniffer trace or packet capture

When you troubleshoot networks and routing in particular, it helps to look inside the headers of packets to determine if they are traveling the route that you expect them to take. Packet sniffing is also known as network tap, packet capture, or logic analyzing.

For FortiGates with NP2, NP4, or NP6 interfaces that are offloading traffic, disable offloading on these interfaces before you perform a trace or it will change the sniffer trace.

Sniffing packets

To perform a sniffer trace in the CLI:

Before you start sniffing packets, you should prepare to capture the output to a file. A large amount of data may scroll by and you will not be able to see it without saving it first. One method is to use a terminal program like puTTY to connect to the FortiGate CLI. Once the packet sniffing count is reached, you can end the session and analyze the output in the file.

The general form of the internal FortiOS packet sniffer command is:

```bash
# diagnose sniffer packet <interface_name> <'filter'> <verbose> <count> <tsformat>
```

To stop the sniffer, type CTRL+C.

| `<interface_name>` | The name of the interface to sniff, such as port1 or internal. This can also be any to sniff all interfaces. |
| `<'filter'>` | What to look for in the information the sniffer reads. none indicates no filtering, and all packets are displayed as the other arguments indicate. The filter must be inside single quotes ('). |
| `<verbose>` | The level of verbosity as one of:  
  - 1 - print header of packets  
  - 2 - print header and data from IP of packets  
  - 3 - print header and data from Ethernet of packets  
  - 4 - print header of packets with interface name |
| `<count>` | The number of packets the sniffer reads before stopping. If you don't put a number here, the sniffer will run until you stop it with <CTRL+C>. |
Troubleshooting

The timestamp format.

- a: absolute UTC time, yyyy-mm-dd hh:mm:ss.ms
- l: absolute LOCAL time, yyyy-mm-dd hh:mm:ss.ms
- otherwise: relative to the start of sniffing, ss.ms

Simple sniffing example:

```bash
# diagnose sniffer packet port1 none 1 3
```

This displays the next three packets on the port1 interface using no filtering, and verbose level 1. At this verbosity level, you can see the source IP and port, the destination IP and port, action (such as ack), and sequence numbers.

In the output below, port 443 indicates these are HTTPS packets and that 172.20.120.17 is both sending and receiving traffic.

```
Head_Office_620b # diagnose sniffer packet port1 none 1 3
interfaces=[port1]
filters=[none]
0.545306 172.20.120.17.52989 -> 172.20.120.141.443: psh 3177924955 ack 1854307757
0.545963 172.20.120.141.443 -> 172.20.120.17.52989: psh 1854307757 ack 3177925808
0.562409 172.20.120.17.52988 -> 172.20.120.141.443: psh 4225311614 ack 3314279933
```

Using packet capture

To use packet capture, the FortiGate must have a disk. You can enable capture-packet in the firewall policy.

To enable packet capture in the CLI:

```bash
config firewall policy
edit <id>
    set capture-packet enable
next
end
```

For information about using the packet capture tool in the GUI, see Using the packet capture tool on page 475.

Debugging the packet flow

Debug the packet flow when network traffic is not entering and leaving the FortiGate as expected. When debugging the packet flow in the CLI, each command configures a part of the debug action. The final command starts the debug.

For information about using the debug flow tool in the GUI, see Using the debug flow tool on page 479.

To trace the packet flow in the CLI:

```bash
# diagnose debug flow trace start
```

To follow packet flow by setting a flow filter:

```bash
# diagnose debug flow [filter | filter6] <option>
```
Troubleshooting

- Enter `filter` if your network uses IPv4.
- Enter `filter6` if your network uses IPv6.

Replace `<option>` with one of the following variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>addr</td>
<td>IPv4 or IPv6 address</td>
</tr>
<tr>
<td>clear</td>
<td>clear filter</td>
</tr>
<tr>
<td>daddr</td>
<td>destination IPv4 or IPv6 address</td>
</tr>
<tr>
<td>dport</td>
<td>destination port</td>
</tr>
<tr>
<td>negate</td>
<td>inverse IPv4 or IPv6 filter</td>
</tr>
<tr>
<td>port</td>
<td>port</td>
</tr>
<tr>
<td>proto</td>
<td>protocol number</td>
</tr>
<tr>
<td>saddr</td>
<td>source address</td>
</tr>
<tr>
<td>sport</td>
<td>source port</td>
</tr>
<tr>
<td>vd</td>
<td>index of virtual domain; -1 matches all</td>
</tr>
</tbody>
</table>

If FortiGate is connected to FortiAnalyzer or FortiCloud, the `diagnose debug flow` output will be recorded as event log messages and then sent to the devices. Do not run this command longer than necessary, as it generates a significant amount of data.

FortiASIC NP4 or NP6 interface pairs that offload traffic will change the packet flow. Before debugging any NP4 or NP6 interfaces, disable offloading on those interfaces.

To do this, enter `diagnose npu <interface pair> fastpath disable, where interface pair is np4, np6, np4lite, or np6lite`.

To start flow monitoring with a specific number of packets:

```
# diagnose debug flow trace start <N>
```

To stop flow tracing at any time:

```
# diagnose debug flow trace stop
```

The following example shows the flow trace for a device with an IP address of 203.160.224.97:

```
# diagnose debug enable
# diagnose debug flow filter addr 203.160.224.97
# diagnose debug flow show function-name enable
# diagnose debug flow trace start 100
```

**Sample output: HTTP**

To observe the debug flow trace, connect to the website at the following address:

https://www.fortinet.com
Comment: SYN packet received:

```
id=20085 trace_id=209 func=resolve_ip_tuple_fast line=2700 msg="vd-root received a packet (proto=6, 192.168.3.221:1487->203.160.224.97:80) from port5."
```

SYN sent and a new session is allocated:

```
id=20085 trace_id=209 func=resolve_ip_tuple line=2799 msg="allocate a new session-00000e90"
```

Lookup for next-hop gateway address:

```
id=20085 trace_id=209 func=vf_ip4_route_input line=1543 msg="find a route: gw-192.168.11.254 via port6"
```

Source NAT, lookup next available port:

```
id=20085 trace_id=209 func=get_new_addr line=1219 msg="find SNAT: IP-192.168.11.59, port-31925"
direction"
```

Matched security policy. Check to see which policy this session matches:

```
id=20085 trace_id=209 func=fw_forward_handler line=317 msg="Allowed by Policy-3: SNAT"
```

Apply source NAT:

```
id=20085 trace_id=209 func=_ip_session_run_tuple line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

SYN ACK received:

```

Testing a proxy operation

To monitor proxy operations in the CLI:

diagnose test application <application> <option>
Troubleshooting

To display a list of available application values:

diagnose test application ?

To display a list of available option values:

diagnose test application <application> ?

The <option> value will depend on the application value used in the command.

For example, if the application is http, the CLI command that displays the <option> values is:

diagnose test application http ?

Displaying detail Hardware NIC information

Monitoring the hardware NIC is important because interface errors indicate data link or physical layer issues which may impact the performance of the FortiGate.

To monitor hardware network operations in the CLI:

diagnose hardware deviceinfo nic <interface>

Sample output:

The following is sample output when the <interface> is set to lan:

System_Device_Name lan
Current_HWaddr 00:09:0f:68:35:60
Permanent_HWaddr 00:09:0f:68:35:60
State up
Link up
Speed 100
Duplex full
[......]
Rx_Packets=5685708
Tx_Packets=4107073
Rx_Bytes=617908014
Tx_Bytes=1269751248
Rx_Errors=0
Tx_Errors=0
Rx_Dropped=0
Tx_Dropped=0
[......]

Error descriptions

The diagnose hardware deviceinfo nic command displays a list of error names and values that are related to hardware.

The following table describes possible hardware errors:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rx_Errors = rx error count</td>
<td>Bad frame was marked as error by PHY</td>
</tr>
<tr>
<td>Rx_CRC_Errors + Rx_Length_Errors - Rx_Align_Errors</td>
<td>This error is only valid in 10/100M mode</td>
</tr>
<tr>
<td>Rx_Dropped or Rx_No_Buffer_Count</td>
<td>Running out of buffer space</td>
</tr>
<tr>
<td>Rx_Missed_Errors</td>
<td>Equals Rx_FIFO_Errors + CEXTERR (Carrier Extension Error Count); only valid in 1000M mode, which is marked by PHY</td>
</tr>
<tr>
<td>Tx_Errors = Tx_Aborted_Errors</td>
<td>ECOL (Excessive Collisions Count); only valid in half-duplex mode</td>
</tr>
<tr>
<td>Tx_Window_Errors</td>
<td>Late Collisions (LATECOL) Count</td>
</tr>
<tr>
<td></td>
<td>Late collisions are collisions that occur after 64-byte time into the transmission of the packet while working in 10 to 100 Mb/s data rate and 512-byte time into the transmission of the packet while working in the 1,000 Mb/s data rate. This register only increments if transmits are enabled and the device is in half-duplex mode.</td>
</tr>
<tr>
<td>Rx_Dropped</td>
<td>See Rx_Errors</td>
</tr>
<tr>
<td>Tx_Dropped</td>
<td>Not defined</td>
</tr>
<tr>
<td>Collisions</td>
<td>Total number of collisions experienced by the transmitter; valid half-duplex mode</td>
</tr>
<tr>
<td>Rx_Length_Errors</td>
<td>Transmission length error</td>
</tr>
<tr>
<td>Rx_Over_Errors</td>
<td>Not defined</td>
</tr>
<tr>
<td>Rx_CRC_Errors</td>
<td>Frame CRC error</td>
</tr>
<tr>
<td>Rx_Frame_Errors</td>
<td>Same as Rx_Align_Errors</td>
</tr>
<tr>
<td></td>
<td>This error is only valid in 10/100M mode.</td>
</tr>
<tr>
<td>Rx_FIFO_Errors</td>
<td>Same as Rx_Missed_Errors - a missed packet count</td>
</tr>
<tr>
<td>Tx_Aborted_Errors</td>
<td>See Tx_Errors</td>
</tr>
<tr>
<td>Tx_Carrier_Errors</td>
<td>The PHY should assert the internal carrier sense signal during every transmission. Failure to do so may indicate that the link has failed or the PHY has an incorrect link configuration. This register only increments if transmits are enabled. This register isn't valid in internal SerDes 1 mode (TBI mode for the 82544GC/EI) and is valid only when the Ethernet controller is operating at full duplex.</td>
</tr>
<tr>
<td>Tx_FIFO_Errors</td>
<td>Not defined</td>
</tr>
<tr>
<td>Tx_Heartbeat_Errors</td>
<td>Not defined</td>
</tr>
<tr>
<td>Tx_Window_Errors</td>
<td>See LATECOL</td>
</tr>
</tbody>
</table>
# Troubleshooting

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tx_Single_Collision_Frames</td>
<td>Counts the number of times that a successfully transmitted packet encountered a single collision. The value increments only if transmits are enabled and the Ethernet controller is in half-duplex mode.</td>
</tr>
<tr>
<td>Tx_Multiple_Collision_Frames</td>
<td>A Multiple Collision Count which indicates the number of times that a transmit encountered more than one collision, but less than 16. The value increments only if transmits are enabled and the Ethernet controller is in half-duplex mode.</td>
</tr>
</tbody>
</table>
| Tx_Deferred        | Counts defer events. A deferred event occurs when the transmitter cannot immediately send a packet due to:  
  • The medium being busy because another device is transmitting  
  • The IPG timer hasn't expired  
  • Half-duplex deferral events are occurring  
  • XOFF frames are being received  
  • the link is not up.  
  This register only increments if transmits are enabled. This counter does not increment for streaming transmits that are deferred due to TX IPG. |
| Rx_Frame_Too_LONGs | The Rx frame is oversized                                                                                                                   |
| Rx_Frame_Too_SHORTs | The Rx frame is too short                                                                                                                   |
| Rx_Axial_Errors     | This error is only valid in 10/100M mode                                                                                                     |
| Symbol Error Count  | Counts the number of symbol errors between reads - SYMERRS.  
  The count increases for every bad symbol that's received, whether or not a packet is currently being received and whether or not the link is up. This register increments only in internal SerDes mode. |

## Performing a traffic trace

Traffic tracing allows you to follow a specific packet stream. This is useful when you want to confirm that packets are using the route you expect them to take on your network.

**To view traffic sessions:**

Use this command to view the characteristics of a traffic session though specific security policies.

```
diagnose sys session
```

**To trace per-packet operations for flow tracing:**

```
diagnose debug flow
```

**To trace per-Ethernet frame:**

```
diagnose sniffer packet
```
To trace a route from a FortiGate to a destination IP address:

```bash
# execute traceroute www.fortinet.com
traceroute to www.fortinet.com (66.171.121.34), 32 hops max, 84 byte packets
1  172.20.120.2  0.637 ms  0.653 ms  0.279 ms
2  209.87.254.221 <static-209-87-254-221.storm.ca>  2.448 ms  2.519 ms  2.458 ms
3  209.87.239.129 <core-2-g0-2.storm.ca>  2.917 ms  2.828 ms  9.324 ms
4  209.87.239.199 <core-3-bdi1739.storm.ca>  13.248 ms  12.401 ms  13.009 ms
5  216.66.41.113 <v502.core1.tor1.he.net>  17.181 ms  12.422 ms  12.268 ms
6  184.105.80.9 <100gel-2.core1.nyc4.he.net>  21.355 ms  21.518 ms  21.597 ms
7  198.32.118.41 <ny-paix-gni.twgate.net>  83.297 ms  84.416 ms  83.782 ms
8  203.160.228.217 <217-228-160-203.TWGATE-IP.twgate.net>  82.579 ms  82.187 ms  82.066 ms
9  203.160.228.229 <229-228-160-203.TWGATE-IP.twgate.net>  82.055 ms  82.455 ms  81.808 ms
10 203.78.181.2  82.262 ms  81.572 ms  82.015 ms
11 203.78.186.70  83.283 ms  83.243 ms  83.293 ms
12 66.171.127.177  84.030 ms  84.229 ms  83.550 ms
13 66.171.121.34 <www.fortinet.com>  84.023 ms  83.903 ms  84.032 ms
14 66.171.121.34 <www.fortinet.com>  83.874 ms  84.084 ms  83.810 ms
```

Using a session table

A session is a communication channel between two devices or applications across the network. Sessions allow FortiOS to inspect and act on a sequential group of packets in a session all at once instead of inspecting each packet individually. Each session has an entry in the session table that includes important information about the session.

You can view FortiGate session tables from the FortiGate GUI or CLI. The most useful troubleshooting data comes from the CLI. The session table in the GUI also provides useful summary information, particularly the current policy number that the session is using.

When to use a session table

Session tables are useful when verifying open connections. For example, if you have a web browser open to browse the Fortinet website, you would expect a session entry from your computer on port 80 to the IP address for the Fortinet website.

You can also use a session table to investigate why there are too many sessions for FortiOS to process.

GUI

To view session information in the GUI:

2. From the Metrics dropdown, select Sessions.

Finding the security policy for a specific connection

Every program and device on your network must have an open communication channel or session to pass information. FortiGate manages these sessions with features such as traffic shaping, antivirus scanning, and blocking known bad websites. Each session will have an entry in the session table.
If a secure web browser session is not working properly, you can check the session table to ensure the session is still active and going to the proper address. The session table can also tell you the security policy number it matches, so you can check what is happening in that policy.

1. Get the connection information.

You need to be able to identify the session you want. To do this, you will need:

- The source IP address (usually your computer)
- The destination IP address (if you have it)
- The port number which is determined by the program you are using. Common ports are:
  - Port 80 (HTTP for web browsing)
  - Port 443 (HTTPS for SSL encrypted web browsing)
  - Port 22 (SSH for Secure Shell)
  - Port 25 (SMTP for Mail Transfer)

2. Find the session and policy ID

Go to Security Fabric > Physical Topology. From the Metrics dropdown, select Sessions.

To find your session, search for your source IP address, destination IP address (if you have it), and port number. The policy ID is listed after the destination information.

3. Use filters to find a session

If there are multiple pages of sessions, you can use a filter to hide the sessions you do not need. To filter the sessions in the table, click Add Filter, and select an option from the list. You can filter the table by Destination IP, Source IP, or Source Port.

CLI

The session table output in the CLI is very large. The CLI command supports filters to show only the data you need.

To view session data in the CLI:

```
diagnose sys session list
```

An entry is placed in the session table for each traffic session passing through a security policy

To filter session data:

```
diagnose sys session filter <option>
```

The values for `<option>` include the following:

<table>
<thead>
<tr>
<th>Value</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear</td>
<td>Clear session filter</td>
</tr>
<tr>
<td>dintf</td>
<td>Destination interface</td>
</tr>
<tr>
<td>dport</td>
<td>Destination port</td>
</tr>
</tbody>
</table>
### Value | Definition
---|---
dst | Destination IP address
duration | Duration of the session
expire | Expire
negate | Inverse filter
nport | NAT'd source port
nsrc | NAT'd source ip address
policy | Policy ID
proto | Protocol number
proto-state | Protocol state
session-state1 | Session state1
session-state2 | Session state2
sintf | Source interface
sport | Source port
src | Source IP address
vd | Index of virtual domain, -1 matches all

Even though UDP is a sessionless protocol, FortiGate keeps track of the following states:

- When UDP reply does not have a value of 0
- When UDP reply has a value of 1

The following table displays firewall session states from the session table:

### State | Description
---|---
log | Session is being logged
local | Session is originated from or destined for local stack
ext | Session is created by a firewall session helper
may_dirty | Session is created by a policy
    | For example, the session for \texttt{ftp control channel} will have this state but \texttt{ftp data channel} won't. This is also seen when NAT is enabled.
ndr | Session will be checked by IPS signature
nds | Session will be checked by IPS anomaly
br | Session is being bridged (TP) mode
Troubleshooting

Examining the firewall session list

The firewall session list displays all open sessions in FortiGate. Examine the list for strange patterns, such as no sessions apart from the internal network, or all sessions are only to one IP address.

When you examine the firewall session list in the CLI, you can use filters to reduce the output.

To examine the firewall session list in the CLI:

You can use a filter to limit the sessions displayed by source, destination address, port, or NAT'd address. To use more than one filter, enter a separate line for each value.

The following example filters the session list based on a source address of 10.11.101.112:

FGT# diagnose sys session filter src 10.11.101.112
FGT# diagnose sys session list

The following example filters the session list based on a destination address of 172.20.120.222.

FGT# diagnose sys session filter dst 172.20.120.222
FGT# diagnose sys session list

To clear all sessions corresponding to a filter:

FGT# diagnose sys session filter dst 172.20.120.222
FGT# diagnose sys session clear

Checking source NAT information

Checking source NAT is important when you are troubleshooting from the remote end of the connection outside the firewall.

To check the source NAT information in the CLI:

When you display the session list in the CLI, you can match the NAT'd source address (nsrc) and port (nport). This is useful when multiple internal IP addresses are NAT’d to a common external-facing source IP address.

FGT# diagnose sys session filter nsrc 172.20.120.122
FGT# diagnose sys session filter nport 8888
FGT# diagnose sys session list

Finding object dependencies

You may be prevented from deleting a configuration object when other configuration objects depend on it. You can use the GUI or CLI to identify objects which depend on, or make reference to the configuration you are trying to delete. Additionally, if you have a virtual interface with dependent objects, you will need to find and remove those dependencies before deleting the interface.

To remove interface object dependencies in the GUI:

1. Go to Network > Interfaces. The Ref. column displays the number of objects that reference this interface.
2. Select the number in the Ref. column for the interface. A window listing the dependencies appears.
3. Use these detailed entries to locate and remove object references to this interface. The trash can icon is enabled.
after all the object dependencies are removed.

4. Remove the interface by selecting the check box for the interface, and select **Delete**.

**To find object dependencies in the CLI:**

When running multiple VDOMs, use the following command in the global configuration only.

diagnose sys cmdb refcnt show <path.object.mkey>

The command searches for the named object in both the most recently used global and VDOM configurations.

**Examples**

To verify which objects a security policy with an ID of 1 refers to:

diagnose sys cmdb refcnt show firewall.policy.policyid 1

To check what is referred to by interface `port1`:

diagnose sys cmdb refcnt show system.interface.name port1

To show all dependencies for an interface:

diagnose sys cmdb refcnt show system.interface.name <interface name>

**Sample output:**

In this example, the interface has dependent objects, including four address objects, one VIP, and three security policies.

```plaintext
entry used by table firewall.address:name '10.98.23.23_host'
entry used by table firewall.address:name 'NAS'
entry used by table firewall.address:name 'all'
entry used by table firewall.address:name 'fortinet.com'
entry used by table firewall.vip:name 'TORRENT_10.0.0.70:6883'
entry used by table firewall.policy:policyid '21'
entry used by table firewall.policy:policyid '14'
entry used by table firewall.policy:policyid '19'
```

**Diagnosing NPU-based interfaces**

Some Fortinet products contain network processors, such as NP4, NP6Lite, or NP6. Offloading requirements will vary depending on the model.

**To view the initial session setup for NPU-based interfaces:**

diagnose debug flow

- If the session is programmed into the ASIC (fastpath) correctly, the command will not detect the packets that arrive at the CPU.
- If the NPU functionality is disabled, the CPU detects all the packets. However, you should only disable the NPU functionality for troubleshooting purposes.
To diagnose NPU-based interfaces:

1. Get the NPx or NPU ID and port numbers.
   
   ```bash
diagnose npu <processor> list
   ```
   
   The output will look like this:
   
<table>
<thead>
<tr>
<th>ID</th>
<th>Model</th>
<th>Slot</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>On-board</td>
<td>1</td>
<td>fabric1 fabric3 fabric5</td>
</tr>
<tr>
<td>1</td>
<td>On-board fabric2</td>
<td>2</td>
<td>base2 fabric4</td>
</tr>
</tbody>
</table>

2. Disable the NPU functionality.
   
   ```bash
diagnose npu <processor> fastpath disable <dev_id>
   ```

   The `dev_id` is the NPx ID number.

3. Analyze the packets.
   
   ```bash
diagnose npu <processor> fastpath-sniffer enable port1
   ```

   These commands only apply to NP4 and NP6 interfaces.

   The output will look similar to:

   ```
   NP4 Fast Path Sniffer on port1 enabled
   This causes traffic on port1 of the network processor to be sent to the CPU. This means you can perform a standard sniffer trace and use other diagnostic commands, if it is a standard CPU-driven port.
   ```

Identifying the XAUI link used for a specific traffic stream

The `diagnose npu np6 xauui-hash` command takes a 6-tuple input of the traffic stream to identify the NP6 XAUI link that the traffic passes through.

This command is only available on the 38xxD, 39xxD, 34xxE, 36xxE, and 5001E series devices.

**Syntax**

```bash
diagnose npu np6 xauui-hash <interface> <proto> <src_ip> <dst_ip> <src_port> <dst_port>
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;interface&gt;</td>
<td>The network interface that the packets are coming from.</td>
</tr>
<tr>
<td>&lt;proto&gt;</td>
<td>The proto number, 6 for TCP or 17 for UDP.</td>
</tr>
<tr>
<td>&lt;src_ip&gt;</td>
<td>The source IP address.</td>
</tr>
<tr>
<td>&lt;dst_ip&gt;</td>
<td>The destination IP address.</td>
</tr>
<tr>
<td>&lt;src_port&gt;</td>
<td>The source port.</td>
</tr>
<tr>
<td>&lt;dst_port&gt;</td>
<td>The destination port.</td>
</tr>
</tbody>
</table>

**Examples**

```bash
# diagnose npu np6 xauui-hash port1 6 1.1.1.1 2.2.2.1 4567 80
NP6_ID: 0, XAUI_LINK: 2
```
Troubleshooting

# diagnose npu np6 xau-hash port1 6 1.1.1.1 2.2.2.1 4567 200
NP6_ID: 6, XAUI_LINK: 2
# diagnose npu np6 xau-hash port1 6 1.1.1.1 2.2.2.1 4567 20
NP6_ID: 1, XAUI_LINK: 2
# diagnose npu np6 xau-hash port1 6 1.1.1.1 2.2.2.1 4567 23
NP6_ID: 1, XAUI_LINK: 1

The NP6_ID is the NP index of the model that is being used. It can be found with the diagnose npu np6 port-list command.

Date and time settings

Fortinet support may ask you to check the date and time settings for log message timestamp synchronization and for certificates that have a time requirement to check for validity.

To check time settings:

execute time

To check date settings:

execute date

If all devices have the same time, it helps to correlate log entries from different devices.

execute time
current time is: 12:40:48
last ntp sync:Thu Mar 16 12:00:21 2006
execute date
current date is: 2006-03-16

To force synchronization with an NTP server:

config system ntp
  set ntpsync {enable | disable}
end

If all devices have the same time, it helps to correlate log entries from different devices.

Running the TAC report

The Technical Assistance Center (TAC) report runs an exhaustive series of diagnostic commands. Some of the commands are only needed if you are using features, such as HA, VPN tunnels, or a modem. Fortinet support may ask you to use the report output to provide information about the current state of your FortiGate.

Due the amount of output generated, the report may take a few minutes to run. If you are logging CLI output to a file, you can run this command to familiarize yourself with the diagnostic commands.

To run the TAC report in the CLI:

execute tac report
Using the process monitor

The Process Monitor displays running processes with their CPU and memory usage levels. Administrators can sort, filter, and terminate processes within the Process Monitor pane.

To access the process monitor:

1. Go to Dashboard > Status:
   - Left-click in the CPU or Memory widget and select Process Monitor.
   - Click the user name in the upper right-hand corner of the screen, then go to System > Process Monitor.

   The Process Monitor appears, which includes a line graph, donut chart, and process list.

2. Click the + beside the search bar to view which columns can be filtered.
To kill a process within the process monitor:

1. Select a process.
2. Click the Kill Process dropdown.
3. Select one of the following options:
   - **Kill**: the standard kill option that produces one line in the crash log (diagnose debug crashlog read).
   - **Force Kill**: the equivalent to `diagnose sys kill 9 <pid>`. This can be viewed in the crash log.
   - **Kill & Trace**: the equivalent to `diagnose sys kill 11 <pid>`. This generates a longer crash log and backtrace. A crash log is displayed afterwards.
Troubleshooting

Other commands

You may be asked to provide the following information when you contact Fortinet support.

- ARP table on page 2677
- IP address on page 2679

ARP table

The ARP table is used to determine the destination MAC addresses of the network nodes, as well as the VLANs and ports from where the nodes are reached.

To view the ARP table:

```
# get system arp
```

<table>
<thead>
<tr>
<th>Address</th>
<th>Age(min)</th>
<th>Hardware Addr</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.10.1.3</td>
<td>1</td>
<td>50:b7:c3:75:ea:dd</td>
<td>internal7</td>
</tr>
<tr>
<td>192.168.0.190</td>
<td>0</td>
<td>28:f1:0e:03:2a:97</td>
<td>wan1</td>
</tr>
<tr>
<td>192.168.0.97</td>
<td>0</td>
<td>f4:f2:6d:37:b0:99</td>
<td>wan1</td>
</tr>
</tbody>
</table>

To view the ARP cache in the system:

```
# diagnose ip arp list
```

<table>
<thead>
<tr>
<th>index=14 ifname=internal7 10.10.1.3 50:b7:c3:75:ea:dd state=00000004 use=2494 confirm=1995 update=374 ref=3</th>
</tr>
</thead>
<tbody>
<tr>
<td>index=5 ifname=wan1 192.168.0.190 28:f1:0e:03:2a:97 state=00000002 use=88 confirm=86 update=977639 ref=2</td>
</tr>
<tr>
<td>index=22 ifname=internal 192.168.1.111 00:0c:29:c6:79:3d state=00000004 use=3724 confirm=9724 update=3724 ref=0</td>
</tr>
<tr>
<td>index=5 ifname=wan1 224.0.1.140 01:00:5e:00:01:8c state=00000040 use=924202 confirm=930202 update=924202 ref=1</td>
</tr>
<tr>
<td>index=5 ifname=wan1 192.168.0.97 f4:f2:6d:37:b0:99 state=00000002 use=78 confirm=486 update=614 ref=26</td>
</tr>
<tr>
<td>index=14 ifname=internal7 10.10.1.11 state=00000020 use=172 confirm=1037790 update=78 ref=2</td>
</tr>
</tbody>
</table>

ARP request and cache

The FortiGate must make an ARP request when it tries to reach a new destination. The base ARP reachable value determines how often an ARP request it sent; the default is 30 seconds. The actual ARP reachable time is a random number between half and three halves of the base reachable time, or 15 to 45 seconds. The random number is updated every five minutes.

ARP entries in the ARP cache are updated based on the state of the ARP entry and the objects that are using it, as highlighted in the following output sample:

```
index=5 ifname=wan1 224.0.1.140 01:00:5e:00:01:8c state=00000040 use=924202 confirm=930202 update=924202 ref=1
```

There are multiple possible states for an ARP entry, and the state-transition mechanism can be complex. Common states include the following:
<table>
<thead>
<tr>
<th>State</th>
<th>Meaning</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000000002 or 0x02</td>
<td>REACHABLE</td>
<td>An ARP response was received</td>
</tr>
<tr>
<td>0000000004 or 0x04</td>
<td>STALE</td>
<td>No ARP response within the expected time</td>
</tr>
<tr>
<td>0000000008 or 0x08</td>
<td>DELAY</td>
<td>A transition state between STALE and REACHABLE before Probes are sent out</td>
</tr>
<tr>
<td>0000000020 or 0x20</td>
<td>FAILED</td>
<td>Did not manage to resolve within the maximum configured number of probes</td>
</tr>
<tr>
<td>0000000040 or 0x40</td>
<td>NOARP</td>
<td>Device does not support ARP, e.g. IPsec interface</td>
</tr>
<tr>
<td>0000000080 or 0x80</td>
<td>PERMANENT</td>
<td>A statically defined ARP entry</td>
</tr>
</tbody>
</table>

An entry that is in the STALE (0x04) or FAILED (0x20) states with no references to it (ref=0) can be deleted. Many factors affect the state-transmit mechanism and if an entry is used by other subsystems. For example, ARP creation, ARP request/reply, neighbor lookup, routing, and others can cause an ARP entry to be in use or referenced.

The garbage collection mechanism runs every 30 seconds, and checks and removes stale and unreferenced entries if they have been stale for longer than 60 seconds. Garbage collection will also be triggered when the number of ARP entries exceeds the configured threshold. If the threshold is exceeded, no entries can be added to the ARP table.

**To set the maximum number of ARP entries threshold:**

```
config system global
    set arp-max-entry <integer>
end

arp-max-entry <integer>  The maximum number of dynamically learned MAC addresses that can be added to the ARP table (131072 to 2147483647, default = 131072).
```

**To set the ARP reachable time on an interface:**

```
config system interface
    edit port1
        set reachable-time <integer>
        next
end

reachable-time <integer>  The reachable time (30000 to 3600000, default = 30000).
```

**To clear all of the entries in the ARP table:**

```
execute clear system arp table
```

**To delete a single ARP entry from the ARP table:**

```
diagnose ip arp delete <interface name> <IP address>
```
Troubleshooting

To add static ARP entries:

```config
config system arp-table
  edit 1
    set interface "internal"
    set ip 192.168.50.8
    set mac bc:14:01:e9:77:02
  next
end
```

To view a summary of the ARP table:

```
# diagnose sys device list root

list virtual firewall root info:
ip4 route_cache: table_size=65536 max_depth=2 used=31 total=34
  arp: table_size=16 max_depth=2 used=5 total=6
  proxy_arp: table_size=256 max_depth=0 used=0 total=0
  arp6: table_size=32 max_depth=1 used=3 total=3
  proxy_arp6: table_size=256 max_depth=0 used=0 total=0
local table version=00000000 main table version=0000002b
vf=root dev=root vrf=0
vf=root dev=ssl.root vrf=0
...vf=root dev=internal5 vrf=0
ses=0/0 ses6=0/0 rt=0/0 rt6=0/0
```

IP address

You may want to verify the IP addresses assigned to the FortiGate interfaces are what you expect them to be.

To verify IP addresses:

```
diagnose ip address list
```

The output lists the:
- IP address and mask (if available)
- index of the interface (a type of ID number)
- devname (the interface name)

While physical interface names are set, virtual interface names can vary. A good way to use this command is to list all of the virtual interface names. For vsys_ha and vsys_fqfm, the IP addresses are the local host, which are virtual interfaces that are used internally.

Sample output:

```
# diagnose ip address list
IP=10.31.101.100->10.31.101.100/255.255.255.0 index=3 devname=internal
IP=172.20.120.122->172.20.120.122/255.255.255.0 index=5 devname=wan1
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=8 devname=internal
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=11 devname=vsys_ha
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=13 devname=vsys_fqfm
```
FortiGuard troubleshooting

The FortiGuard service provides updates to AntiVirus (AV), Antispam (AS), Intrusion Protection Services (IPS), Webfiltering (WF), and more. The FortiGuard Distribution System (FDS) consists of a number of servers across the world that provide updates to your FortiGate unit. Problems can occur with the connection to FDS and its configuration on your local FortiGate unit.

Some of the more common troubleshooting methods are listed here, including:

- Troubleshooting process for FortiGuard updates on page 2681
- FortiGuard server settings on page 2681
- FortiGuard server settings on page 2681

Verifying connectivity to FortiGuard

You can verify FortiGuard connectivity in the GUI and CLI.

To verify FortiGuard connectivity in the GUI:

1. Go to Dashboard > Status.
2. Check the Licenses widget. When FortiGate is connected to FortiGuard, a green check mark appears next to the available FortiGuard services.

To verify FortiGuard connectivity in the CLI:

execute ping service.fortiguard.net
execute ping update.fortiguard.net

Sample output:

FG100D# execute ping service.fortiguard.net
PING guard.fortinet.net (208.91.112.196): 56 data bytes
64 bytes from 208.91.112.196: icmp_seq=0 ttl=51 time=61.0 ms
64 bytes from 208.91.112.196: icmp_seq=1 ttl=51 time=60.0 ms
64 bytes from 208.91.112.196: icmp_seq=2 ttl=51 time=59.6 ms
64 bytes from 208.91.112.196: icmp_seq=3 ttl=51 time=58.9 ms
64 bytes from 208.91.112.196: icmp_seq=4 ttl=51 time=59.2 ms

--- guard.fortinet.net ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 58.9/61.0 ms

FG100D# execute ping update.fortiguard.net
PING fds1.fortinet.com (208.91.112.68): 56 data bytes
64 bytes from 208.91.112.68: icmp_seq=0 ttl=53 time=62.0 ms
64 bytes from 208.91.112.68: icmp_seq=1 ttl=53 time=61.8 ms
64 bytes from 208.91.112.68: icmp_seq=2 ttl=53 time=61.3 ms
64 bytes from 208.91.112.68: icmp_seq=3 ttl=53 time=61.9 ms
64 bytes from 208.91.112.68: icmp_seq=4 ttl=53 time=61.8 ms
Troubleshooting process for FortiGuard updates

The following process shows the logical steps you should take when troubleshooting problems with FortiGuard updates:

1. **Does the device have a valid license that includes these services?**
   Each device requires a valid FortiGuard license to access updates for some or all of these services. You can verify the status of the support contract for your devices at the Fortinet Support website.

2. **If the device is part of a high availability (HA) cluster, do all members of the cluster have the same level of support?**
   You can verify the status of the support contract for all of the devices in your HA cluster at the Fortinet Support website.

3. **Are services enabled on the device?**
   To see the FortiGuard information and status for a device in the GUI, go to System > FortiGuard.
   Use this page to verify the status of each component, and enable each service.

4. **Can the device communicate with FortiGuard servers?**
   Go to System > FortiGuard in the GUI, and try to update AntiVirus and IPS, or test the availability of Web Filtering and AS default and alternate ports.

5. **Is there proper routing to reach the FortiGuard servers?**
   Ensure there is a static or dynamic route that allows your FortiGate to reach the FortiGuard servers. Usually a generic default route to the internet is enough, but you may need to verify this if your network is complex.

6. **Are there issues with DNS?**
   An easy way to test this is to attempt a traceroute from behind the FortiGate to an external network using the Fully Qualified Domain Name (FQDN) for a location. If the traceroute FQDN name doesn't resolve, you have general DNS problems.

7. **Is there anything upstream that might be blocking FortiGuard traffic, either on the network or ISP side?**
   Many firewalls block all ports, by default, and ISPs often block ports that are low. There may be a firewall between the FortiGate and the FortiGuard servers that's blocking the traffic. By default, FortiGuard uses port 53. If that port is blocked you need to either open a hole for it or change the port it is using.

8. **Is there an issue with source ports?**
   It is possible that ports that FortiGate uses to contact FortiGuard are being changed before they reach FortiGuard or on the return trip before they reach FortiGate. A possible solution for this is to use a fixed-port at NAT’d firewalls to ensure the port remains the same. You can use packet sniffing to find more information about what’s happening with ports.

9. **Are there security policies that include antivirus?**
   If none of the security policies include antivirus, the antivirus database will not be updated. If antivirus is included, only the database type that’s used will be updated.

FortiGuard server settings

Your local FortiGate connects to remote FortiGuard servers to get updates to FortiGuard information, such as new viruses that may have been found or other new threats.

This section provides methods to display FortiGuard server information on your FortiGate, and how to use that information and update it to fix potential problems.
Displaying the server list

To get a list of FDS servers FortiGate uses to send web filtering requests:

get webfilter status

or
diagnose debug rating

Rating requests are only sent to the server at the top of the list in normal operation. Each server is probed for Round Trip Time (RTT) every two minutes. Rating may not be enabled on your FortiGate.

Optionally, you can add a refresh rate to the end of the command to determine how often the server list is refreshed.

Sample output:

Locale : english
License : Contract
Expiration : Thu Oct 9 02:00:00 2011

<table>
<thead>
<tr>
<th>IP</th>
<th>Weight</th>
<th>RTT</th>
<th>Flags</th>

<td>12072</td>
<td>0</td>
<td>178</td>
</tr>
</tbody>
</table>

Output details

The server list includes the IP addresses of alternate servers if the first entry cannot be reached. In this example, the IP addresses are not public addresses.

The following flags in get webfilter status indicate the server status:

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>D</td>
<td>The server was found through the DNS lookup of the hostname. If the hostname returns more than one IP address, all of them are flagged with D and are used first for INIT requests before falling back to the other servers.</td>
</tr>
<tr>
<td>I</td>
<td>The server to which the last INIT request was sent</td>
</tr>
<tr>
<td>F</td>
<td>The server hasn't responded to requests and is considered to have failed</td>
</tr>
<tr>
<td>T</td>
<td>The server is currently being timed</td>
</tr>
<tr>
<td>S</td>
<td>Rating requests can be sent to the server. The flag is set for a server only in two cases:</td>
</tr>
<tr>
<td></td>
<td>• The server exists in the servers list received from the FortiManager or any other INIT server.</td>
</tr>
<tr>
<td></td>
<td>• The server list received from the FortiManager is empty so the FortiManager is the only server that the FortiGate knows and it should be used as the rating server.</td>
</tr>
</tbody>
</table>
Troubleshooting

Sorting the server list

The server list is sorted first by weight. The server with the smallest RTT appears at the top of the list, regardless of weight. When a packet is lost (there has been no response in 2 seconds), it is re-sent to the next server in the list. Therefore, the top position in the list is selected based on RTT, while the other positions are based on weight.

Calculating weight

The weight for each server increases with failed packets and decreases with successful packets. To lower the possibility of using a remote server, the weight isn't allowed to dip below a base weight. The base weight is calculated as the difference in hours between the FortiGate and the server multiplied by 10. The farther away the server is, the higher its base weight is and the lower it appears in the list.

View open and in use ports

Traffic destined for the FortiGate itself, and not being passed through or dropped, is called local-in traffic. It can be from a variety of services, such as HTTPS for administrative access, or BGP for inter-router communication.

Local-in traffic is controlled by local-in policies. To enable viewing local-in policies in the GUI, go to System > Feature Visibility and enable Local In Policy.

The Policy & Objects > Local In Policy page shows a read-only list of the local policies, populated with default values, and values that are automatically enabled when the related service is enabled, for example, enabling BGP opens TCP port 179. For more information, see Local-in policy on page 789.

To view ports that are being listened on, and active connections and the services or processes using them:

```bash
# diagnose sys tcpsock | grep 0.0.0.0
0.0.0.0:0:10400->0.0.0.0:0->state=listen err=0 socktype=4 rma=0 wma=0 fma=0 tma=0 inode=10621
process=142/authd
...
0.0.0.0:53->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=8067
process=177/dnsproxy
0.0.0.0:22->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=13390
process=225/ssh
0.0.0.0:541->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=13155
process=215/fgfm
...
0.0.0.0:9980->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=5063
process=129/httpsd
0.0.0.0:179->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=10583
process=148/bgp
...
```

For more information on incoming and outgoing ports, see the FortiOS Ports guide.
Additional resources

To learn more about FortiGate and FortiOS, as well information about technical issues, please refer to the following resources:

Technical documentation

Installation, Administration, and Quick Start Guides, as well as other technical documents, are available online at the Fortinet Document Library.

Fortinet video library

The Fortinet Video Library hosts a collection of video which provide valuable information about Fortinet products.

Release notes

Issues that arise after the technical documentation has been published will often be listed in the Release Notes. To find these, go to the Fortinet Document Library.

Fortinet Community

The Fortinet Community provides a place to collaborate, share insights and experiences, and get answers to questions. It incorporates the Fortinet Knowledge Base and technical discussion forums. You can access the community at: https://community.fortinet.com/.

Knowledge base

The Fortinet Knowledge Base provides access to a variety of articles, white papers, and other documentation that provides technical insight into a range of Fortinet products. The Knowledge Base is available online at: https://community.fortinet.com/t5/Knowledge-Base/ct-p/knowledgebase.

Fortinet technical discussion forums

An online technical forum allows administrators to contribute to discussions about issues that relate to their Fortinet products. Searching the forum can help an administrator identify if an issue has been experienced by another user. You can access the support forums at: https://forum.fortinet.com/

Fortinet training services online campus

The Fortinet Training Services Online Campus hosts a collection of tutorials and training materials which you can use to increase your knowledge of Fortinet products. https://www.fortinet.com/training.html
Troubleshooting

Fortinet Support

You defined your problem, researched a solution, put together a plan to find the solution, and executed that plan. At this point, if the problem hasn't been solved, it's time to contact Fortinet Support for assistance.
