FortiOS 7.2.0 Administration Guide
Fortinet Inc.
WAN optimization SSL proxy chaining ......................................................... 267
Agentless NTLM authentication for web proxy ........................................... 275
Multiple LDAP servers in Kerberos keytabs and agentless NTLM domain controllers 278
Learn client IP addresses ............................................................................ 279
Explicit proxy authentication over HTTPS .................................................. 280
mTLS client certificate authentication ......................................................... 282
DHCP server .......................................................................................... 287
Configure a DHCP server on an interface ................................................. 288
Configure a DHCP relay on an interface .................................................. 288
Configure a DHCP server and relay on an interface ................................. 289
DHCP options ....................................................................................... 290
IP address assignment with relay agent information option ................. 291
DHCP client options .............................................................................. 293
Static routing ......................................................................................... 294
Routing concepts .................................................................................... 295
Policy routes ............................................................................................ 307
Equal cost multi-path ............................................................................. 309
Dual internet connections ......................................................................... 313
Dynamic routing .................................................................................... 318
RIP ........................................................................................................... 320
OSPF ........................................................................................................ 339
BGP ......................................................................................................... 356
BFD .......................................................................................................... 389
Multicast ................................................................................................. 398
Multicast routing and PIM support ............................................................ 398
Configuring multicast forwarding ........................................................... 399
FortiExtender .......................................................................................... 402
WAN extension mode .............................................................................. 402
LAN extension mode .............................................................................. 402
Adding a FortiExtender .......................................................................... 403
Direct IP support for LTE/4G ..................................................................... 405
Sample LTE interface .............................................................................. 406
Limitations ............................................................................................... 407
LLDP reception ....................................................................................... 408
Virtual routing and forwarding ................................................................. 410
Implementing VRF .................................................................................. 411
VRF routing support ................................................................................ 412
Route leaking between VRFs with BGP .................................................... 416
Route leaking between multiple VRFs ...................................................... 418
VRF with IPv6 ........................................................................................ 429
IBGP and EBGP support in VRF ............................................................. 433
NetFlow .................................................................................................... 435
Verification and troubleshooting ............................................................... 436
NetFlow templates .................................................................................. 436
NetFlow on FortiExtender and tunnel interfaces ...................................... 449
sFlow ........................................................................................................ 453
Configuring sFlow .................................................................................. 453
Link monitor ............................................................................................ 456
### Link monitor with route updates
Enable or disable updating policy routes when link health monitor fails
Add weight setting on each link health monitor server
SLA link monitoring for dynamic IPsec and SSL VPN tunnels

IPv6
IPv6 tunneling
IPv6 tunnel inherits MTU based on physical interface
Configuring IPv4 over IPv6 DS-Lite service

### Diagnostics
Using the packet capture tool
Using the debug flow tool

### SD-WAN
SD-WAN overview
SD-WAN components
SD-WAN designs and architectures
SD-WAN designs principles
SD-WAN quick start
Configuring the SD-WAN interface
Adding a static route
Selecting the implicit SD-WAN algorithm
Configuring firewall policies for SD-WAN
Link monitoring and failover
Results
Configuring SD-WAN in the CLI

### SD-WAN zones
Specify an SD-WAN zone in static routes and SD-WAN rules

### Performance SLA
Link health monitor
Factory default health checks
Health check options
Link monitoring example
SLA targets example
Passive WAN health measurement
Passive health-check measurement by internet service and application
Health check packet DSCP marker support
Manual interface speedtest
Scheduled interface speedtest
Monitor performance SLA
SLA monitoring using the REST API
Mean opinion score calculation and logging in performance SLA health checks

### SD-WAN rules
Overview
Implicit rule
Automatic strategy
Manual strategy
Best quality strategy
Lowest cost (SLA) strategy
Maximize bandwidth (SLA) strategy

      Administrator account options .................................................................... 1943
      REST API administrator .............................................................................. 1945
      SSO administrators ..................................................................................... 1947
      FortiCloud SSO ............................................................................................ 1947
      Password policy ............................................................................................. 1948
      Public key SSH access .................................................................................. 1950
   Administrator profiles ....................................................................................... 1951
      super_admin profile ..................................................................................... 1952
      Creating customized profiles ....................................................................... 1952
      Edit profiles .................................................................................................. 1953
      Delete profiles ............................................................................................... 1953
   Fabric Management ............................................................................................ 1953
      About firmware installations ....................................................................... 1954
      Firmware maturity levels ............................................................................. 1955
      Upgrading individual device firmware .......................................................... 1957
      Upgrading individual device firmware by following the upgrade path (federated update) .......................................................... 1959
      Upgrading all device firmware ..................................................................... 1960
      Upgrading all device firmware by following the upgrade path (federated update) .......................................................... 1962
      Authorizing devices ....................................................................................... 1965
      Firmware upgrade notifications .................................................................... 1967
Downloading a firmware image ................................................. 1968
Testing a firmware version .................................................. 1970
Installing firmware from system reboot ................................. 1971
Restoring from a USB drive ............................................... 1973
Using controlled upgrades ............................................... 1973
Downgrading individual device firmware ............................... 1974

Settings .............................................................................. 1975
Default administrator password ........................................... 1976
Changing the host name ..................................................... 1977
Setting the system time ...................................................... 1978
Configuring ports .............................................................. 1981
Setting the idle timeout time .............................................. 1982
Setting the password policy .............................................. 1983
Changing the view settings ............................................... 1983
Setting the administrator password retries and lockout time .... 1984
TLS configuration .............................................................. 1984
Controlling return path with auxiliary session ...................... 1985
Email alerts ..................................................................... 1989
Using configuration save mode ........................................... 1993
Trusted platform module support ...................................... 1994

Virtual Domains .................................................................... 1996
VDOM overview .................................................................. 1997
General configurations ....................................................... 2002
Inter-VDOM routing configuration example: Internet access ... 2009
Inter-VDOM routing configuration example: Partial-mesh VDOMs 2019

Troubleshooting

Troubleshooting methodologies
- Verify user permissions
- Establish a baseline
- Create a troubleshooting plan

Troubleshooting scenarios
- Checking the system date and time
- Checking the hardware connections
- Checking FortiOS network settings
- Troubleshooting CPU and network resources
- Troubleshooting high CPU usage
- Checking the modem status
- Running ping and traceroute
- Checking the logs
- Verifying routing table contents in NAT mode
- Verifying the correct route is being used
- Verifying the correct firewall policy is being used
- Checking the bridging information in transparent mode
- Checking wireless information
- Performing a sniffer trace or packet capture
- Debugging the packet flow
- Testing a proxy operation
- Displaying detail Hardware NIC information
- Performing a traffic trace
- Using a session table
- Finding object dependencies
- Diagnosing NPU-based interfaces
- Identifying the XAUI link used for a specific traffic stream
- Date and time settings

</tr>
<tr>
<td>2022-05-27</td>
<td>Added VIP groups on page 897.</td>
</tr>
<tr>
<td></td>
<td>Updated ZTNA TCP forwarding access proxy example on page 1003.</td>
</tr>
<tr>
<td>2022-05-31</td>
<td>Added SSL VPN with Azure AD SSO integration on page 1738.</td>
</tr>
<tr>
<td>2022-06-02</td>
<td>Added Physical interface on page 162 and Loopback interface on page 183.</td>
</tr>
<tr>
<td>Date</td>
<td>Change Description</td>
</tr>
<tr>
<td>--------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>2022-06-10</td>
<td>Updated Out-of-band management with reserved management interfaces on page 2049, ZTNA proxy access with SAML authentication example on page 1014, DDNS on page 208, and Proxy mode stream-based scanning on page 1092.</td>
</tr>
<tr>
<td>2022-06-15</td>
<td>Updated Restricted SaaS access on page 251.</td>
</tr>
<tr>
<td>2022-06-17</td>
<td>Updated Health check options on page 513.</td>
</tr>
<tr>
<td>2022-06-20</td>
<td>Updated Phase 1 configuration on page 1331, and IKE Mode Config clients on page 1430.</td>
</tr>
<tr>
<td>2022-06-30</td>
<td>Added Troubleshooting BGP on page 385.</td>
</tr>
<tr>
<td>2022-07-11</td>
<td>Added SSL VPN split DNS on page 1635. Updated HA active-active cluster setup on page 2039.</td>
</tr>
<tr>
<td>2022-07-12</td>
<td>Added Captive portals on page 160.</td>
</tr>
<tr>
<td>2022-07-15</td>
<td>Updated Configure FortiGate with FortiExplorer using BLE on page 48.</td>
</tr>
<tr>
<td>2022-07-20</td>
<td>Added LEDs on page 69.</td>
</tr>
<tr>
<td>2022-07-22</td>
<td>Added SSL VPN with Okta as SAML IdP on page 1732.</td>
</tr>
<tr>
<td>2022-07-27</td>
<td>Added Disabling the FortiGuard IP address rating on page 1309. Updated Administrators on page 1939.</td>
</tr>
<tr>
<td>2022-07-28</td>
<td>Added BFD on page 389 and BFD for multihop path for BGP on page 394.</td>
</tr>
<tr>
<td>2022-08-04</td>
<td>Updated System Events log page on page 2543 and Security Events log page on page 2546.</td>
</tr>
<tr>
<td>2022-09-27</td>
<td>Added ICAP scanning with SCP and FTP on page 1290.</td>
</tr>
<tr>
<td>2022-11-04</td>
<td>Updated Enhanced hashing for LAG member selection on page 181 and Access control lists on page 798.</td>
</tr>
<tr>
<td>2022-12-13</td>
<td>Updated NetFlow templates on page 436.</td>
</tr>
</tbody>
</table>
Getting started

This section explains how to get started with a FortiGate.

Differences between models

Not all FortiGates have the same features, particularly entry-level models (models 30 to 90). A number of features on these models are only available in the CLI.

Consult your model's QuickStart Guide, hardware manual, or the Feature / Platform Matrix for further information about features that vary by model.

FortiGate models differ principally by the names used and the features available:

- Naming conventions may vary between FortiGate models. For example, on some models the hardware switch interface used for the local area network is called *lan*, while on other units it is called *internal*.
- Certain features are not available on all models. Additionally, a particular feature may be available only through the CLI on some models, while that same feature may be viewed in the GUI on other models.

If you believe your FortiGate model supports a feature that does not appear in the GUI, go to *System > Feature Visibility* and confirm that the feature is enabled. For more information, see Feature visibility on page 2165.

Low encryption models

Some FortiGate models support a low encryption (LENC) license. With an LENC license, FortiGate devices are considered low encryption models and are identified by *LENC*, for example FG-100E-LENC.

LENC models cannot use or inspect high encryption protocols, such as 3DES and AES. LENC models only use 56-bit DES encryption to work with SSL VPN and IPsec VPN, and they are unable to perform SSL inspection.

For a list of FortiGate models that support an LENC license, see FortiGate LENC Models.

Using the GUI

This section presents an introduction to the graphical user interface (GUI) on your FortiGate.

The following topics are included in this section:

- Connecting using a web browser
- Menus
- Tables
Connecting using a web browser

In order to connect to the GUI using a web browser, an interface must be configured to allow administrative access over HTTPS or over both HTTPS and HTTP. By default, an interface has already been set up that allows HTTPS access with the IP address 192.168.1.99.

Browse to https://192.168.1.99 and enter your username and password. If you have not changed the admin account’s password, use the default user name, admin, and leave the password field blank.

The GUI will now display in your browser, and you will be required to provide a password for the administrator account.

To use a different interface to access the GUI:

1. Go to Network > Interfaces and edit the interface you wish to use for access. Take note of its assigned IP address.
2. In Administrative Access, select HTTPS, and any other protocol you require. You can also select HTTP, although this is not recommended as the connection will be less secure.
3. Click OK.
4. Browse to the IP address using your chosen protocol.
   The GUI will now be displayed in your browser.

Menus

If you believe your FortiGate model supports a menu that does not appear in the GUI, go to System > Feature Visibility and ensure the feature is enabled. For more information, see Feature visibility on page 2165.

The GUI contains the following main menus, which provide access to configuration options for most FortiOS features:

<table>
<thead>
<tr>
<th>Menu</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dashboard</td>
<td>The dashboard displays various widgets that display important system information and allow you to configure some system options. For more information, see Dashboards and Monitors on page 76.</td>
</tr>
<tr>
<td>Network</td>
<td>Options for networking, including configuring system interfaces and routing options. For more information, see Network on page 135.</td>
</tr>
<tr>
<td>Policy &amp; Objects</td>
<td>Configure firewall policies, protocol options, and supporting content for policies, including schedules, firewall addresses, and traffic shapers. For more information, see Policy and Objects on page 759.</td>
</tr>
<tr>
<td>Security Profiles</td>
<td>Configure your FortiGate’s security features, including Antivirus, Web Filter, and Application Control.</td>
</tr>
</tbody>
</table>
For more information, see Security Profiles on page 1085.

VPN Configure options for IPsec and SSL virtual private networks (VPNs).
For more information, see IPsec VPNs on page 1330 and SSL VPN on page 1619.

User & Authentication Configure user accounts, groups, and authentication methods, including external authentication and single sign-on (SSO).

WiFi & Switch Controller Configure the unit to act as a wireless network controller, managing the wireless Access Point (AP) functionality of FortiWiFi and FortiAP units. On certain FortiGate models, this menu has additional features allowing for FortiSwitch units to be managed by the FortiGate.
For more information, see Wireless configuration on page 1934 and Switch Controller on page 1935.

System Configure system settings, such as administrators, HA, FortiGuard, and certificates.
For more information, see System on page 1936.

Security Fabric Access the physical topology, logical topology, automation, and settings of the Fortinet Security Fabric.
For more information, see Fortinet Security Fabric on page 2206.

Log & Report Configure logging and alert email as well as reports.
For more information, see Log and Report on page 2541.

Tables

Many GUI pages contain tables of information that can be filtered and customized to display specific information in a specific way. Some tables allow content to be edited directly on that table, or rows to be copied and pasted.

Navigation

Some tables contain information and lists that span multiple pages. Navigation controls will be available at the bottom of the page.

Filters

Filters are used to locate a specific set of information or content in a table. They can be particularly useful for locating specific log entries. The filtering options vary, depending on the type of information in the log.

Depending on the table content, filters can be applied using the filter bar, using a column filter, or based on a cell's content. Some tables allow filtering based on regular expressions.

Administrators with read and write access can define filters. Multiple filters can be applied at one time.
To manually create a filter:

1. Click Add Filter at the top of the table. A list of the fields available for filtering is shown.
2. Select the field to filter by.
3. Enter the value to filter by, adding modifiers as needed.
4. Press Enter to apply the filter.

To create a column filter:

1. Click the filter icon on the right side of the column header
2. Choose a filter type from the available options.
3. Enter the filter text, or select from the available values.
4. Click Apply.

To create a filter based on a cell's content:

1. Right click on a cell in the table.
2. Select a filtering option from the menu.

Column settings

Columns can be rearranged, resized, and added or removed from tables.

To add or remove columns:

1. Right a column header, or click the gear icon on the left side of the header row that appears when hovering the cursor over the headers.
2. Select columns to add or remove.
3. Click Apply.

To rearrange the columns in a table:

1. Click and drag the column header.

To resize a column:

1. Click and drag the right border of the column header.

To resize a column to fit its contents:

1. Click the dots or filter icon on the right side of the column header and select Resize to Contents.

To resize all of the columns in a table to fit their content:

1. Right a column header, or click the gear icon on the left side of the header row that appears when hovering the cursor over the headers.
2. Click Best Fit All Columns.
Getting started

To reset a table to its default view:

1. Right a column header, or click the gear icon on the left side of the header row that appears when hovering the cursor over the headers.
2. Click Reset Table.
   Resetting a table does not remove filters.

Editing objects

In some tables, parts of a configuration can be edited directly in the table. For example, security profiles can be added to an existing firewall policy by clicking the edit icon in a cell in the Security Profiles column.

Copying rows

In some tables, rows can be copied and pasted using the right-click menu. For example, a policy can be duplicated by copying and pasting it.

Entering values

Numerous fields in the GUI and CLI require text strings or numbers to be entered when configuring the FortiGate. When entering values in the GUI, you will be prevented from entering invalid characters, and a warning message will be shown explaining what values are not allowed. If invalid values are entered in a CLI command, the setting will be rejected when you apply it.

- Text strings on page 26
- Numbers on page 27

Text strings

Text strings are used to name entities in the FortiGate configuration. For example, the name of a firewall address, administrator, or interface are all text strings.

The following characters cannot be used in text strings, as they present cross-site scripting (XSS) vulnerabilities:

- " - double quotes
- ' - single quote
- > - greater than
- < - less than

Most GUI text fields prevent XSS vulnerable characters from being added.

VDOM names and hostnames can only use numbers (0-9), letters (a-z and A-Z), dashes, and underscores.

The tree CLI command can be used to view the number of characters allowed in a name field. For example, entering the following commands show that a firewall address name can contain up to 80 characters, while its FQDN can contain 256 characters:
Getting started

```
tree firewall address
-- [address] --*name  (80)
|  |uuid
|  |subnet
|  |type
|  |sub-type
|  |clearpass-spt
|  |[macaddr] --*macaddr  (128)
|  |start-ip
|  |end-ip
|  |fqdn  (256)
|  |country  (3)
|  |wildcard-fqdn  (256)
|  |cache-ttl  (0,86400)
|  |wildcard
|  |sdn  (36)
|  |[fsso-group] --*name  (512)
|  |interface  (36)
|  |tenant  (36)
|  |organization  (36)
|  |egp-name  (256)
|  |subnet-name  (256)
|  |sdn-tag  (16)
|  |policy-group  (16)
|  |obj-tag  (256)
|  |obj-type
|  |tag-detection-level  (16)
|  |tag-type  (64)
|  |dirty
|  |comment
|  |associated-interface  (36)
|  |color  (0,32)
|  |filter
|  |sdn-addr-type
|  |node-ip-only
|  |obj-id
|  |[list] --*ip  (36)
|  |  |obj-id  (128)
|  |  |+-- net-id  (128)
|  |  |[tagging] --*name  (64)
|  |  |  |category  (64)
|  |  |  |+-- [tags] --*name  (80)
|  |  |allow-routing
|  |  |+-- fabric-object
```

Numbers

Numbers are used to set sizes, rated, addresses, port numbers, priorities, and other such numeric values. They can be entered as a series of digits (without commas or spaces), in a dotted decimal format (such as IP addresses), or separated by colons (such as MAC addresses). Most numeric values use base 10 numbers, while some use hexadecimal values.

Most GUI and CLI fields prevent invalid numbers from being entered. The CLI help text includes information about the range of values allowed for applicable settings.
**GUI-based global search**

The global search option in the GUI allows users to search for keywords appearing in objects and navigation menus to quickly access the object and configuration page. Click the magnifying glass icon in the top-left corner of the banner to access the global search.

The global search includes the following features:

- Keep a history of frequent and recent searches
- Sort results alphabetically by increasing or decreasing order, and relevance by search weight
- Search by category
- Search in Security Fabric members (accessed by the Security Fabric members dropdown menu in the banner)

**Examples**

In this example, searching for the word ZTNA yields the following results:

- Firewall policy object 9, which contains ZTNA in the property value, *Name*. The name of the policy is ZTNA-TCP.
- ZTNA server object ZTNA-webserver, which contains ZTNA in the property value, *Name*.
- ZTNA navigation menu item under *Policy & Objects > ZTNA*.

Since CMDB objects have a higher search weight (50) than navigation objects (20), the navigation menu result appears at the bottom.

In this example, searching for the address 10.88.0.1 yields the following results:

- Address object *EMS* that has a subnet of 10.88.0.1/32, which matches the search term.
- Virtual IP object *Telemetry-VIP* that has a mapped IP range of 10.88.0.1, which matches the search term.
- Address objects *all, FIREWALL_AUTH_PORTAL_ADDRESS*, and *FABRICDEVICE* that have IP subnets of 0.0.0.0/0, which the searched term falls into.
- Address group object *All_Grp* that contains members addresses that have IP subnets of 0.0.0.0/0, which the searched term falls into.

Sorting by *Relevance* will display address objects that are more closely matched at the top (10.88.0.1), and more loosely matched at the bottom (0.0.0.0).
Loading artifacts from a CDN

To improve GUI performance, loading static GUI artifacts cached in CDN (content delivery network) servers closer to the user instead of the FortiGate can be enabled. This allows the GUI to load more quickly with less latency for administrators who are accessing the FortiGate remotely. Upon failure, the files fall back to loading from the FortiGate. The CDN is only used after successful administrator logins.

To configure loading static GUI files from a CDN:

```
config system global
  set gui-cdn-usage {enable | disable}
end
```

Using the CLI

The Command Line Interface (CLI) can be used in lieu of the GUI to configure the FortiGate. Some settings are not available in the GUI, and can only be accessed using the CLI.

This section briefly explains basic CLI usage. For more information about the CLI, see the FortiOS CLI Reference.

- Connecting to the CLI on page 29
- CLI basics on page 32
- Command syntax on page 38
- Subcommands on page 41
- Permissions on page 43

Connecting to the CLI

You can connect to the CLI using a direct console connection, SSH, the FortiExplorer app on your iOS device, or the CLI console in the GUI.

You can access the CLI outside of the GUI in three ways:
- **Console connection**: Connect your computer directly to the console port of your FortiGate.
- **SSH access**: Connect your computer through any network interface attached to one of the network ports on your FortiGate.
- **FortiExplorer**: Connect your device to the FortiExplorer app on your iOS device to configure, manage, and monitor your FortiGate. See FortiExplorer management on page 43 for details.

To open a CLI console, click the > icon in the top right corner of the GUI. The console opens on top of the GUI. It can be minimized and multiple consoles can be opened.

To edit policies and objects directly in the CLI, right-click on the element and select *Edit in CLI*.

**Console connection**

A direct console connection to the CLI is created by directly connecting your management computer or console to the FortiGate using its DB-9 or RJ-45 console port.

Direct console access to the FortiGate may be required if:

- You are installing the FortiGate for the first time and it is not configured to connect to your network.
- You are restoring the firmware using a boot interrupt. Network access to the CLI will not be available until after the boot process has completed, making direct console access the only option.

To connect to the FortiGate console, you need:

- A console cable to connect the console port on the FortiGate to a communications port on the computer. Depending on your device, this is one of:
  - null modem cable (DB-9 to DB-9)
  - DB-9 to RJ-45 cable (a DB-9-to-USB adapter can be used)
  - USB to RJ-45 cable
- A computer with an available communications port
- Terminal emulation software

**To connect to the CLI using a direct console connection:**

1. Using the console cable, connect the FortiGate unit’s console port to the serial communications (COM) port on your management computer.
2. Start a terminal emulation program on the management computer, select the COM port, and use the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits per second</td>
<td>9600</td>
</tr>
<tr>
<td>Data bits</td>
<td>8</td>
</tr>
<tr>
<td>Parity</td>
<td>None</td>
</tr>
<tr>
<td>Stop bits</td>
<td>1</td>
</tr>
<tr>
<td>Flow control</td>
<td>None</td>
</tr>
</tbody>
</table>

3. Press *Enter* on the keyboard to connect to the CLI.
4. Log in to the CLI using your username and password (default: *admin* and no password). You can now enter CLI commands, including configuring access to the CLI through SSH.
SSH access

SSH access to the CLI is accomplished by connecting your computer to the FortiGate using one of its network ports. You can either connect directly, using a peer connection between the two, or through any intermediary network.

If you do not want to use an SSH client and you have access to the GUI, you can access the CLI through the network using the CLI console in the GUI.

SSH must be enabled on the network interface that is associated with the physical network port that is used.

If your computer is not connected either directly or through a switch to the FortiGate, you must also configure the FortiGate with a static route to a router that can forward packets from the FortiGate to the computer. This can be done using a local console connection, or in the GUI.

To connect to the FortiGate CLI using SSH, you need:

- A computer with an available serial communications (COM) port and RJ-45 port
- An appropriate console cable
- Terminal emulation software
- A network cable
- Prior configuration of the operating mode, network interface, and static route.

To enable SSH access to the CLI using a local console connection:

1. Using the network cable, connect the FortiGate unit’s port either directly to your computer’s network port, or to a network through which your computer can reach the FortiGate.
2. Note the number of the physical network port.
3. Using direct console connection, connect and log into the CLI.
4. Enter the following command:

```bash
config system interface
   edit <interface_str>
      append allowaccess ssh
   next
end
```

Where `<interface_str>` is the name of the network interface associated with the physical network port, such as `port1`.

5. Confirm the configuration using the following command to show the interface’s settings:

```bash
show system interface <interface_str>
```

For example:

```bash
show system interface port1
   config system interface
      edit "port1"
      set vdom "root"
      set ip 192.168.1.99 255.255.255.0
      set allowaccess ping https ssh
      set type hard-switch
      set stp enable
      set role lan
```
Connecting using SSH

Once the FortiGate is configured to accept SSH connections, use an SSH client on your management computer to connect to the CLI.

The following instructions use PuTTY. The steps may vary in other terminal emulators.

To connect to the CLI using SSH:

1. On your management computer, start PuTTY.
2. In the Host Name (or IP address) field, enter the IP address of the network interface that you are connected to and that has SSH access enabled.
3. Set the port number to 22, if it is not set automatically.
4. Select SSH for the Connection type.
5. Click Open. The SSH client connect to the FortiGate.
   The SSH client may display a warning if this is the first time that you are connecting to the FortiGate and its SSH key is not yet recognized by the SSH client, or if you previously connected to the FortiGate using a different IP address or SSH key. This is normal if the management computer is connected directly to the FortiGate with no network hosts in between.
6. Click Yes to accept the FortiGate's SSH key.
   The CLI displays the log in prompt.
7. Enter a valid administrator account name, such as admin, then press Enter.
8. Enter the administrator account password, then press Enter.
   The CLI console shows the command prompt (FortiGate hostname followed by a #). You can now enter CLI commands.

If three incorrect log in or password attempts occur in a row, you will be disconnected. If this occurs, wait for one minute, then reconnect and attempt to log in again.

CLI basics

Basic features and characteristics of the CLI environment provide support and ease of use for many CLI tasks.

Help

Press the question mark (?) key to display command help and complete commands.

- Press the question mark (?) key at the command prompt to display a list of the commands available and a description of each command.
- Enter a command followed by a space and press the question mark (?) key to display a list of the options available for that command and a description of each option.
- Enter a command followed by an option and press the question mark (?) key to display a list of additional options available for that command option combination and a description of each option.
• Enter a question mark after entering a portion of a command to see a list of valid complete commands and their descriptions. If there is only one valid command, it will be automatically filled in.

**Shortcuts and key commands**

<table>
<thead>
<tr>
<th>Shortcut key</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>?</td>
<td>List valid complete or subsequent commands.</td>
</tr>
<tr>
<td></td>
<td>If multiple commands can complete the command, they are listed with their descriptions.</td>
</tr>
<tr>
<td>Tab</td>
<td>Complete the word with the next available match.</td>
</tr>
<tr>
<td></td>
<td>Press multiple times to cycle through available matches.</td>
</tr>
<tr>
<td>Up arrow or Ctrl + P</td>
<td>Recall the previous command.</td>
</tr>
<tr>
<td></td>
<td>Command memory is limited to the current session.</td>
</tr>
<tr>
<td>Down arrow, or Ctrl + N</td>
<td>Recall the next command.</td>
</tr>
<tr>
<td>Left or Right arrow</td>
<td>Move the cursor left or right within the command line.</td>
</tr>
<tr>
<td>Ctrl + A</td>
<td>Move the cursor to the beginning of the command line.</td>
</tr>
<tr>
<td>Ctrl + E</td>
<td>Move the cursor to the end of the command line.</td>
</tr>
<tr>
<td>Ctrl + B</td>
<td>Move the cursor backwards one word.</td>
</tr>
<tr>
<td>Ctrl + F</td>
<td>Move the cursor forwards one word.</td>
</tr>
<tr>
<td>Ctrl + D</td>
<td>Delete the current character.</td>
</tr>
<tr>
<td>Ctrl + C</td>
<td>Abort current interactive commands, such as when entering multiple lines.</td>
</tr>
<tr>
<td></td>
<td>If you are not currently within an interactive command such as <code>config</code> or <code>edit</code>, this closes the CLI connection.</td>
</tr>
<tr>
<td>\ then Enter</td>
<td>Continue typing a command on the next line for a multiline command.</td>
</tr>
<tr>
<td></td>
<td>For each line that you want to continue, terminate it with a backslash (). To complete the command, enter a space instead of a backslash, and then press <code>Enter</code>.</td>
</tr>
</tbody>
</table>

**Command tree**

Enter `tree` to display the CLI command tree. To capture the full output, connect to your device using a terminal emulation program and capture the output to a log file. For some commands, use the `tree` command to view all available variables and subcommands.

**Command abbreviation**

You can abbreviate words in the command line to their smallest number of non-ambiguous characters.

For example, the command `get system status` could be abbreviated to `g sy stat.`
**Adding and removing options from lists**

When configuring a list, the `set` command will remove the previous configuration.

For example, if a user group currently includes members A, B, and C, the command `set member D` will remove members A, B, and C. To avoid removing the existing members from the group, the command `set members A B C D` must be used.

To avoid this issue, the following commands are available:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>append</code></td>
<td>Add an option to an existing list.</td>
</tr>
<tr>
<td></td>
<td>For example, <code>append member D</code> adds user D to the user group without removing any of the existing members.</td>
</tr>
<tr>
<td><code>select</code></td>
<td>Clear all of the options except for those specified.</td>
</tr>
<tr>
<td></td>
<td>For example, <code>select member B</code> removes all member from the group except for member B.</td>
</tr>
<tr>
<td><code>unselect</code></td>
<td>Remove an option from an existing list.</td>
</tr>
<tr>
<td></td>
<td>For example, <code>unselect member C</code> removes only member C from the group, without affecting the other members.</td>
</tr>
</tbody>
</table>

**Environment variables**

The following environment variables are support by the CLI. Variable names are case-sensitive.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>$USERFROM</code></td>
<td>The management access type (<code>ssh</code>, <code>jsconsole</code>, and so on) and the IPv4 address of the administrator that configured the item.</td>
</tr>
<tr>
<td><code>$USERNAME</code></td>
<td>The account name of the administrator that configured the item.</td>
</tr>
<tr>
<td><code>$SerialNum</code></td>
<td>The serial number of the FortiGate.</td>
</tr>
</tbody>
</table>

For example, to set a FortiGate device's host name to its serial number, use the following CLI command:

```plaintext
config system global
  set hostname $SerialNum
end
```

**Special characters**

The following characters cannot be used in most CLI commands: `<`, `>`, `,`, `#`, `\`, and "

If one of those characters, or a space, needs to be entered as part of a string, it can be entered by using a special command, enclosing the entire string in quotes, or preceding it with an escape character (backslash, `\`).

To enter a question mark (?) or a tab, `Ctrl + V` or `Ctrl + Shift + +` must be entered first.

---

Question marks and tabs cannot be copied into the CLI Console or some SSH clients. They must be typed in.
### Character Keys

- **?**  
  Ctrl + V or Ctrl + Shift + then ?

- **Tab**  
  Ctrl + V then Tab

- **Space**  
  Enclose the string in single or double quotation marks: "Security Administrator" or 'Security Administrator'.
  Precede the space with a backslash: Security\ Administrator.

- **'**  
  (as part of a string value, not to begin or end the string)

- **"**  
  (as part of a string value, not to begin or end the string)

- **\**  
  (as part of a string value, not to end the string)

- **\**  
  (as part of a string value, not to begin or end the string)

### Using `grep` to filter command output

The `get`, `show`, and `diagnose` commands can produce large amounts of output. The `grep` command can be used to filter the output so that it only shows the required information.

The `grep` command is based on the standard UNIX `grep`, used for searching text output based on regular expressions.

For example, the following command displays the MAC address of the internal interface:

```bash
get hardware nic internal | grep Current_HWaddr
Current_HWaddr 00:09:0f:cb:c2:75
```

The following command will display all TCP sessions that are in the session list, including the session list line number in the output:

```bash
get system session list | grep -n tcp
```

The following command will display all of the lines in the HTTP replacement message that contain `URL` or `url`:

```bash
show system replacemsg http | grep -i url
```

The following options can also be used:

- `-A <num>` After
- `-B <num>` Before
- `-C <num>` Context

The `-f` option is available to support contextual output, in order to show the complete configuration. The following example shows the difference in the output when `-f` is used versus when it is not used:

**Without `-f`:**

- `show` | `grep ldap-group1`
- `edit "ldap-group1"`
- `set groups "ldap-group1"

**With `-f`:**

- `show` | `grep -f ldap-group1`
- `config user group`
- `edit "ldap-group1"`
set member "pc40-LDAP"
next
end
config firewall policy
edit 2
set srcintf "port31"
set dstintf "port32"
set srcaddr "all"
set action accept
set identity-based enable
set nat enable
config identity-based-policy
edit 1
set schedule "always"
set groups "ldap-group1"
set dstaddr "all"
set service "ALL"
next
end
next
end

Language support and regular expressions

Characters such as ñ and é, symbols, and ideographs are sometimes acceptable input. Support varies depending on the type of item that is being configured. CLI commands, objects, field names, and options must use their exact ASCII characters, but some items with arbitrary names or values can be input using your language of choice. To use other languages in those cases, the correct encoding must be used.

Input is stored using Unicode UTF-8 encoding, but is not normalized from other encodings into UTF-8 before it is stored. If your input method encodes some characters differently than in UTF-8, configured items may not display or operate as expected.

Regular expressions are especially impacted. Matching uses the UTF-8 character values. If you enter a regular expression using a different encoding, or if an HTTP client sends a request in a different encoding, matches may not be what is expected.

For example, with Shift-JIS, backslashes could be inadvertently interpreted as the symbol for the Japanese yen (¥), and vice versa. A regular expression intended to match HTTP requests containing monetary values with a yen symbol may not work if the symbol is entered using the wrong encoding.

For best results:
- use UTF-8 encoding, or
- use only characters whose numerically encoded values are the same in UTF-8, such as the US-ASCII characters that are encoded using the same values in ISO 8859-1, Windows code page 1252, Shift-JIS, and other encoding methods, or
- for regular expressions that must match HTTP requests, use the same encoding as your HTTP clients.
HTTP clients may send requests in encodings other than UTF-8. Encodings usually vary based on the client’s operating system or input language. If the client's encoding method cannot be predicted, you might only be able to match the parts of the request that are in English, as the values for English characters tend to be encoded identically, regardless of the encoding method.

If the FortiGate is configured to use an encoding method other than UTF-8, the management computer's language may need to be changed, including the web browse and terminal emulator. If the FortiGate is configured using non-ASCII characters, all the systems that interact with the FortiGate must also support the same encoding method. If possible, the same encoding method should be used throughout the configuration to avoid needing to change the language settings on the management computer.

The GUI and CLI client normally interpret output as encoded using UTF-8. If they do not, configured items may not display correctly. Exceptions include items such as regular expression that may be configured using other encodings to match the encoding of HTTP requests that the FortiGate receives.

**To enter non-ASCII characters in a terminal emulator:**

1. On the management computer, start the terminal client.
2. Configure the client to send and receive characters using UTF-8 encoding.
   Support for sending and receiving international characters varies by terminal client.
3. Log in to the FortiGate.
4. At the command prompt, type your command and press Enter.
   Words that use encoded characters may need to be enclosed in single quotes (’).
   Depending on your terminal client’s language support, you may need to interpret the characters into character codes before pressing Enter. For example, you might need to enter: `edit \743\601\613\743\601\652`
5. The CLI displays the command and its output.

**Screen paging**

By default, the CLI will pause after displaying each page worth of text when a command has multiple pages of output. this can be useful when viewing lengthy outputs that might exceed the buffer of terminal emulator.

When the display pauses and shows --More--, you can:

- Press Enter to show the next line,
- Press Q to stop showing results and return to the command prompt,
- Press an arrow key, Insert, Home, Delete, End, Page Up, or Page Down to show the next few pages,
- Press any other key to show the next page, or
- Wait for about 30 seconds for the console to truncate the output and return to the command prompt.

When pausing the screen is disabled, press Ctrl + C to stop the output and log out of the FortiGate.

**To disable pausing the CLI output:**

```
config system console
  set output standard
end
```
Getting started

To enable pausing the CLI output:

```bash
cfg system console
  set output more
end
```

**Changing the baud rate**

The baud rate of the local console connection can be changed from its default value of 9600.

**To change the baud rate:**

```bash
cfg system console
  set baudrate {9600 | 19200 | 38400 | 57600 | 115200}
end
```

**Editing the configuration file**

The FortiGate configuration file can be edited on an external host by backing up the configuration, editing the configuration file, and then restoring the configuration to the FortiGate.

Editing the configuration file can save time is many changes need to be made, particularly if the plain text editor that you are using provides features such as batch changes.

**To edit the configuration file:**

1. Backup the configuration. See Configuration backups on page 65 for details.
2. Open the configuration file in a plain text editor that supports UNIX-style line endings.
3. Edit the file as needed.

   ![](warning_icon.png)
   Do not edit the first line of the configuration file. This line contains information about the firmware version and FortiGate model. If you change the model number, the FortiGate will reject the configuration when you attempt to restore it.

4. Restore the modified configuration to the FortiGate. See Configuration backups on page 65 for details.
   The FortiGate downloads the configuration file and checks that the model information is correct. If it is correct, the configuration file is loaded and each line is checked for errors. If a command is invalid, that command is ignored. If the configuration file is valid, the FortiGate restarts and loads the downloaded configuration.

**Command syntax**

When entering a command, the CLI console requires that you use valid syntax and conform to expected input constraints. It rejects invalid commands. Indentation is used to indicate the levels of nested commands.

Each command line consists of a command word, usually followed by configuration data or a specific item that the command uses or affects.
**Notation**

Brackets, vertical bars, and spaces are used to denote valid syntax. Constraint notations, such as `<address_ipv4>`, indicate which data types or string patterns are acceptable value input.

All syntax uses the following conventions:

<table>
<thead>
<tr>
<th>Notation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Angle brackets <code>&lt; &gt;</code></strong></td>
<td>Indicate a variable of the specified data type.</td>
</tr>
<tr>
<td><strong>Curly brackets {}</strong></td>
<td>Indicate that a variable or variables are mandatory.</td>
</tr>
<tr>
<td><strong>Square brackets []</strong></td>
<td>Indicate that the variable or variables are optional.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td><code>show system interface [&lt;name_str&gt;]</code></td>
</tr>
<tr>
<td></td>
<td>To show the settings for all interfaces, you can enter <code>show system interface</code></td>
</tr>
<tr>
<td></td>
<td>To show the settings for the Port1 interface, you can enter <code>show system interface port1</code></td>
</tr>
<tr>
<td>**Vertical bar</td>
<td>**</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td>`set protocol {ftp</td>
</tr>
<tr>
<td></td>
<td>You can enter either <code>set protocol ftp</code> or <code>set protocol sftp</code>.</td>
</tr>
<tr>
<td><strong>Space</strong></td>
<td>A space separates non-mutually exclusive options.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td><code>set allowaccess {ping https ssh snmp http fgfm radius-acct probe-response capwap ftm}</code></td>
</tr>
<tr>
<td></td>
<td>You can enter any of the following:</td>
</tr>
<tr>
<td></td>
<td><code>set allowaccess ping</code></td>
</tr>
<tr>
<td></td>
<td><code>set allowaccess https ping ssh</code></td>
</tr>
<tr>
<td></td>
<td><code>set allowaccess http https snmp ssh ping</code></td>
</tr>
<tr>
<td></td>
<td>In most cases, to make changes to lists that contain options separated by spaces, you need to retype the entire list, including all the options that you want to apply and excluding all the options that you want to remove.</td>
</tr>
</tbody>
</table>

**Optional values and ranges**

Any field that is optional will use square-brackets. The overall config command will still be valid whether or not the option is configured.

Square-brackets can be used is to show that multiple options can be set, even intermixed with ranges. The following example shows a field that can be set to either a specific value or range, or multiple instances:

```plaintext
config firewall service custom
    set iprange <range1> [<range2> <range3> ...]
end
```

**next**

The `next` command is used to maintain a hierarchy and flow to CLI commands. It is at the same indentation level as the preceding `edit` command, to mark where a table entry finishes.
The following example shows the next command used in the subcommand entries:

```
config dlp filepattern
   edit <1>
     set name <name>
     set comment [comment]
     config entries
       edit <2>
       | set filter-type {pattern | type}
       next
     <--
```

After configuring table entry <2> then entering next, the <2> table entry is saved and the console returns to the entries prompt:

```
FGT60E1Q23456789 (entries) #
```

You can now create more table entries as needed, or enter end to save the table and return to the filepattern table element prompt.

```
end
```

The end command is used to maintain a hierarchy and flow to CLI commands.

The following example shows the same command and subcommand as the next command example, except end has been entered instead of next after the subcommand:

```
config dlp filepattern
   edit <1>
     set name <name>
     set comment [comment]
     config entries
       edit <2>
       | set filter-type {pattern | type}
       end
     <--
```

Entering end will save the <2> table entry and the table, and exit the entries subcommand entirely. The console returns to the filepattern table element prompt:

```
FGT60E1Q23456789 (1) #
```
Subcommands

Subcommands are available from within the scope of some commands. When you enter a subcommand level, the command prompt changes to indicate the name of the current command scope. For example, after entering:

```
config system admin
```

the command prompt becomes:

```
(admin)#
```

Applicable subcommands are available until you exit the command, or descend an additional level into another subcommand. Subcommand scope is indicated by indentation.

For example, the `edit` subcommand is only available in commands that affects tables, and the `next` subcommand is available only in the `edit` subcommand:

```
config system interface
  edit port1
  set status up
next
end
```

The available subcommands vary by command. From a command prompt under the `config` command, subcommands that affect tables and fields could be available.

Table subcommands

| `edit <table_row>` | Create or edit a table value. In objects such as security policies, `<table_row>` is a sequence number. To create a new table entry without accidentally editing an existing entry, enter `edit 0`. The CLI will confirm that creation of entry 0, but will assign the next unused number when the entry is saved after entering `end` or `next`. For example, to create a new firewall policy, enter the following commands:

```
config firewall policy
  edit 0
  ....
next
end
```

To edit an existing policy, enter the following commands:

```
config firewall policy
  edit 27
  ....
next
end
```
The `edit` subcommand changes the command prompt to the name of the table value that is being edited.

| `delete <table_row>` | Delete a table value. For example, to delete firewall policy 30, enter the following commands:

```
config firewall policy
  delete 30
end
```
### Getting started

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>purge</code></td>
<td>Clear all table values. The <code>purge</code> command cannot be undone. To restore purged table values, the configuration must be restored from a backup.</td>
</tr>
<tr>
<td><code>move</code></td>
<td>Move an ordered table value. In the firewall policy table, this equivalent to dragging a policy into a new position. It does not change the policy's ID number. For example, to move policy 27 to policy 30, enter the following commands: <code>config firewall policy move 27 to 30</code> end The <code>move</code> subcommand is only available in tables where the order of the table entries matters.</td>
</tr>
<tr>
<td><code>clone &lt;table_row&gt; to &lt;table_row&gt;</code></td>
<td>Make a clone of a table entry. For example, to create firewall policy 30 as a clone of policy 27, enter the following commands: <code>config firewall policy clone 27 to 30</code> end The <code>clone</code> subcommand may not be available for all tables.</td>
</tr>
<tr>
<td><code>rename &lt;table_row&gt; to &lt;table_row&gt;</code></td>
<td>Rename a table entry. For example to rename an administrator from Flank to Frank, enter the following commands: <code>config system admin rename Flank to Frank</code> end The <code>rename</code> subcommand is only available in tables where the entries can be renamed.</td>
</tr>
<tr>
<td><code>get</code></td>
<td>List the current table entries. For example, to view the existing firewall policy table entries, enter the following commands: <code>config firewall policy get</code></td>
</tr>
<tr>
<td><code>show</code></td>
<td>Show the configuration. Only table entries that are not set to default values are shown.</td>
</tr>
<tr>
<td><code>end</code></td>
<td>Save the configuration and exit the current <code>config</code> command.</td>
</tr>
</tbody>
</table>

Purging the `system`, `interface` or `system admin` tables does not reset default table values. This can result in being unable to connect to or log in to the FortiGate, requiring the FortiGate to be formatted and restored.

### Field subcommands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>set &lt;field&gt; &lt;value&gt;</code></td>
<td>Modify the value of a field.</td>
</tr>
</tbody>
</table>
For example, the command `set fsso enable` sets the `fsso` field to the value `enable`.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unset</td>
<td>Set the field to its default value.</td>
</tr>
<tr>
<td>select</td>
<td>Clear all of the options except for those specified. For example, if a group contains members A, B, C, and D, to remove all members except for B, use the command <code>select member B</code>.</td>
</tr>
<tr>
<td>unselect</td>
<td>Remove an option from an existing list. For example, if a group contains members A, B, C, and D, to remove only member B, use the command <code>unselect member B</code>.</td>
</tr>
<tr>
<td>append</td>
<td>Add an option to an existing multi-option table value.</td>
</tr>
<tr>
<td>clear</td>
<td>Clear all the options from a multi-option table value.</td>
</tr>
<tr>
<td>get</td>
<td>List the configuration of the current table entry, including default and customized values.</td>
</tr>
<tr>
<td>show</td>
<td>Show the configuration. Only values that are not set to default values are shown.</td>
</tr>
<tr>
<td>next</td>
<td>Save changes to the table entry and exit the <code>edit</code> command so that you can configure the next table entry.</td>
</tr>
<tr>
<td>abort</td>
<td>Exit the command without saving.</td>
</tr>
<tr>
<td>end</td>
<td>Save the configuration and exit the current <code>config</code> command.</td>
</tr>
</tbody>
</table>

**Permissions**

Administrator (or access) profiles control what CLI commands an administrator can access by assigning read, write, or no access to each area of FortiOS. For information, see Administrator profiles on page 1951.

Read access is required to view configurations. Write access is required to make configuration changes. Depending on your account's profile, you may not have access to all CLI commands. To have access to all CLI commands, an administrator account with the `super_admin` profile must be used, such as the `admin` account.

Accounts assigned the `super_admin` profile are similar to the root administrator account. They have full permission to view and change all FortiGate configuration options, including viewing and changing other administrator accounts.

To increase account security, set strong passwords for all administrator accounts, and change the passwords regularly.

**FortiExplorer management**

FortiExplorer for iOS is a user-friendly application that helps you to rapidly provision, deploy, and monitor Security Fabric components from your iOS device.
FortiExplorer for iOS requires iOS 10.0 or later and is compatible with iPhone, iPad, and Apple TV. It is supported by FortiOS 5.6 and later, and is available on the App Store for iOS devices.

FortiExplorer is also available for support on Android on the Google Play Store. Steps for configuring FortiExplorer for Android may differ from what is included in the guide.

Advanced features are available with the purchase of FortiExplorer Pro. Paid features include the ability to add more than two devices, and firmware upgrades for devices with active licenses.

Up to six members can use this app with 'Family Sharing' enabled in the App Store.

Firmware upload requires a valid firmware license. Users can download firmware for models with a valid support contract.

Getting started with FortiExplorer

If your FortiGate is accessible on a wireless network, you can connect to it using FortiExplorer provided that your iOS device is on the same network. See Connecting FortiExplorer to a FortiGate with WIFI. If your 200F series or 80F series FortiGate is in close proximity, you can connect to it using FortiExplorer using Bluetooth Low Energy (BLE). See Configure FortiGate with FortiExplorer using BLE on page 48. Otherwise, you will need to physically connect your iOS device to the FortiGate using a USB cable.

To connect and configure a FortiGate with FortiExplorer using a USB connection:

1. Connect your iOS device to your FortiGate USB A port. If prompted on your iOS device, Trust this computer.
2. Open FortiExplorer and select your FortiGate from the FortiGate Devices list. A blue USB icon will indicate that you are connected over a USB connection.
3. On the Login screen, select USB.
4. Enter the default Username (admin) and leave the Password field blank.
5. Optionally, select Remember Password.
6. Tap Done when you are ready.

FortiExplorer opens the FortiGate management interface to the Device Status page:

7. Go to Network > Interfaces and configure the WAN interface or interfaces.
8. The wan1 interface Address mode is set to DHCP by default. Set it to Manual and enter its Address, Netmask, and Default Gateway, and then Apply your changes.

9. Optionally, configure Administrative Access to allow HTTPS access. This will allow administrators to access the FortiGate GUI using a web browser.
10. Go to Network > Interfaces and configure the local network (internal) interface.
11. Set the Address mode as before and configure Administrative Access if required.
12. Configure a DHCP Server for the internal network subnet.
13. Return to the internal interface using the < button at the top of the screen.
14. Go to Network > Static Routes and configure the static route to the gateway.
15. Go to Policy & Objects > Firewall Policy and edit the Internet access policy. Enter a Name for the policy, enable the required Security Profiles, configure Logging Options, then tap OK.
Getting started

Connecting FortiExplorer to a FortiGate with WiFi

You can wirelessly connect to the FortiGate if your iOS device and the FortiGate are both connected to the same wireless network.
To connect and configure a FortiGate with FortiExplorer wirelessly:

1. Open the FortiExplorer app and tap Add on the Devices page.
2. On the Add Device By page, tap HTTPS.
3. Enter the Host information, Username, and Password.
4. If required, change the default Port number, and optionally enable Remember Password.
5. Tap Done.
6. If the FortiGate device identity cannot be verified, tap Connect at the prompt.
   FortiExplorer opens the FortiGate management interface to the Device Status page.

Configure FortiGate with FortiExplorer using BLE

FortiGate 200F series and 80F series devices can be initially configured in FortiExplorer using Bluetooth Low Energy (BLE).
The state of the status LED on the device shows if BLE is enabled. See the device QuickStart guides for more information about LED states: FortiGate 200F Series QuickStart Guide and FortiGate 80F Series QuickStart Guide.

---

When the status LED is flashing green, pressing and holding the reset button for five seconds or longer will reset the device to factory default settings.

---

**BLE is enabled or disabled in the following scenarios after the FortiGate boots up:**

- **In factory default settings:**
  - After the FortiGate has finished booting up (when the console login prompt is shown), the status LED will be flashing amber or red to indicate that BLE is enabled.
  - If the FortiGate is configured without using BLE, BLE will immediately be disabled and the status LED will turn solid green.
  - If the FortiGate is configured using BLE, the LED will continue flashing until the configuring device disconnects from BLE, after which BLE is disabled and the status LED turns solid green.

- **Not in factory default configuration:**
  - One minute after the FortiGate has finished booting up (when the console login prompt is shown), the status LED will turn solid green. Press and hold the reset button for one second. The status LED will start flashing to indicate that BLE is enabled.
  - If no BLE connection is made with the FortiGate, BLE will be disabled after one minute and the status LED will turn solid green.
  - If the FortiGate is configured without using BLE, BLE will immediately be disabled and the status LED will turn solid green.
  - If the FortiGate is configured using BLE, the LED will continue flashing until the configuring device disconnects from BLE, after which BLE is disabled and the status LED turns sold green.

**To enable BLE for one minute when the FortiGate is running and not in factory default configuration:**

```
# diagnose bluetooth enable 1
```

**To connect to and configure a FortiGate with FortiExplorer using BLE:**

1. Ensure that BLE is enabled on the FortiGate device.
2. Enable Bluetooth on your iOS device and open the FortiExplorer app.
   - If the app has detected the FortiGate device, the device's serial number will be shown.
3. Log into the FortiGate in the app using the default credentials: admin and no password.
4. If this is the first time logging into the device, set a password.
5. Optionally, register with FortiCare.
6. Configure the FortiGate, including the WAN and internal interfaces, static routes, and other required settings.
After configuring the FortiGate and disconnecting, BLE is disabled.

**To check the status of BLE on the FortiGate:**

diagnose hardware test ble

diagnose bluetooth status

diagnose bluetooth get_bt_version

diagnose bluetooth clean_bt_mode

**Running a security rating**

After configuring your network, run a security rating check to identify vulnerabilities and highlight best practices that could improve your network's security and performance.

Go to Security Fabric > Security Rating and follow the steps to determine the score. See Security rating on page 2337 for more information.
Upgrading to FortiExplorer Pro

FortiExplorer Pro allows you to add unlimited devices, and download firmware images for devices with active licenses.

To upgrade to FortiExplorer Pro:

1. In FortiExplorer, go to Settings.
2. Tap Manage Subscription.
3. Follow the on-screen prompts.

Basic administration

This section contains information about basic FortiGate administration that you can do after you installing the unit in your network.

- Basic configuration on page 53
- Registration on page 55
- FortiCare and FortiGate Cloud login on page 60
- Transfer a device to another FortiCloud account on page 62
- Configuration backups on page 65
Basic configuration

This topic will help you configure a few basic settings on the FortiGate as described in the Using the GUI on page 22 and Using the CLI on page 29 sections, including:

- Configuring an interface on page 53
- Configuring the hostname on page 53
- Configuring the default route on page 54
- Ensuring internet and FortiGuard connectivity on page 54

Configuring an interface

It is unlikely the default interface configuration will be appropriate for your environment and typically requires some effort of the administrator to use these settings, such as being physically near the FortiGate to establish a serial connection. Therefore, the first step is to configure an interface that can be used to complete the FortiGate configuration.

To configure an interface in the GUI:

1. Go to Network > Interfaces. Select an interface and click Edit.
2. Enter an Alias.
3. In the Address section, enter the IP/Netmask.
4. In Administrative Access section, select the access options as needed (such as PING, HTTPS, and SSH).
5. Optionally, enable DHCP Server and configure as needed.
6. Click OK.

To configure an interface in the CLI:

```plaintext
config system interface
  edit "port2"
    set ip 203.0.113.99 255.255.255.0
    set allowaccess ping https ssh
    set alias "Management"
  next
end
```

Configuring the hostname

Setting the FortiGate’s hostname assists with identifying the device, and it is especially useful when managing multiple FortiGates. Choose a meaningful hostname as it is used in the CLI console, SNMP system name, device name for FortiGate Cloud, and to identify a member of an HA cluster.

To configure the hostname in the GUI:

1. Go to System > Settings.
2. Enter a name in the Host name field.
3. Click Apply.
To configure the hostname in the CLI:

```
config system global
    set hostname 200F_YVR
end
```

**Configuring the default route**

Setting the default route enables basic routing to allow the FortiGate to return traffic to sources that are not directly connected. The gateway address should be your existing router or L3 switch that the FortiGate is connected to. If you are directly connecting to the FortiGate, you may choose your endpoint’s IP address as the gateway address. Set the interface to be the interface the gateway is connected to.

To configure the default route in the GUI:

1. Go to *Network > Static Routes* and click *Create New*.
2. Leave the destination subnet as *0.0.0.0/0.0.0.0*. This is known as a default route, since it would match any IPv4 address.
3. Enter the *Gateway Address*.
4. Select an *Interface*.
5. Click *OK*.

To configure the default route in the CLI:

```
config router static
    edit 0
        set gateway 192.168.1.254
        set device port1
    next
end
```

**Ensuring internet and FortiGuard connectivity**

This step is not necessary for the configuration; however, it is necessary in order to keep your FortiGate up to date against the latest threats. Updates are provided to FortiGates that are registered and make a request to the FortiGuard network to verify if there are any more recent definitions.

Use `execute ping <domain.tld>` to ensure the DNS resolution is able to resolve the following FortiGuard servers:

- `fds1.fortinet.com`
- `service.fortiguard.net`
- `update.fortiguard.net`

You also need to ensure the necessary ports are permitted outbound in the event your FortiGate is behind a filtering device. Refer to the *Ports and Protocols* document for more information.
Registration

The FortiGate, and then its service contract, must be registered to have full access to Fortinet Customer Service and Support, and FortiGuard services. The FortiGate can be registered in either the FortiGate GUI or the FortiCloud support portal. The service contract can be registered from the FortiCloud support portal.

The service contract number is needed to complete registrations on the FortiCloud support portal. You can find this 12-digit number in the email that contains your service registration document (sent from do-not-reply-contract@fortinet.com) in the service entitlement summary.

To register your FortiGate in the GUI:

1. Connect to the FortiGate GUI. A dialog box appears, which indicates the steps you should take to complete the setup of your FortiGate. These steps include:
   a. Specify Hostname
   b. Change Your Password
   c. Dashboard Setup
   d. Upgrade Firmware

   If you completed the Basic configuration on page 53, the hostname and password steps are already marked as complete (checkmark). If you chose to deploy the latest firmware, the Upgrade Firmware step is marked as complete.

2. Click Begin to complete the dashboard setup. Two options appear (Optimal and Comprehensive).

3. Select the desired setting and click OK. The Dashboard > Status page opens. Note that the licenses are grayed out because the device or virtual machine is not registered.

4. Go to System > FortiGuard and click Enter Registration Code.

5. Enter the contract registration code from your service registration document.

6. Click OK.

To register the FortiGate on the FortiCloud support portal:

1. Go to support.fortinet.com and log in using your FortiCloud account credentials. If you do not have an account, click Register to create one.

2. In the left-side menu, click Register Product.

3. Enter the product serial number or license certificate number for a VM, select an end user type, then click Next.
4. Enter the Support Contract number and FortiCloud Key (optionally, enter a product description), then click Next.

5. Review the product entitlement information, select the checkbox to accept the terms, then click Confirm.
6. Go to Products > Product List. The FortiGate is now visible in the product list.

FortiCare Register button

The FortiCare Register button is displayed in the GUI on various Fabric and device related pages and widgets available for FortiGates.

There are two methods to access the Register button:

- Right-click on a device in a topology.

  Security Fabric > Physical Topology page:
Getting started

- Hover over a device to display the tooltip.

  Security Fabric > Logical Topology page:

  System > HA page:
Getting started

The Register button is also accessible from tooltips for devices on the Managed FortiAPs and Managed FortiSwitches pages.

Clicking Register opens the Device Registration pane. If a device is already registered, the pane still opens and displays the device information.

Primary and secondary HA members can be registered to FortiCare at the same time from the primary unit by using the Register button. The secondary unit will register through the HA proxy. In this example, a HA member is registered from the Physical Topology page.

To register a HA member to FortiCare:

1. On the primary unit, go to Security Fabric > Physical Topology.
2. Hover over the HA member and click Register. The Device Registration pane opens.
3. Select the device and click Register.
4. Enter the required FortiCloud account information (password, country or region, reseller) and click Submit.
5. Once the registration is complete, click Close.
FortiCare and FortiGate Cloud login

With FortiCloud, FortiOS supports a unified login to FortiCare and FortiGate Cloud. The FortiGate Cloud setup is a subset of the FortiCare setup.

- If the FortiGate is not registered, activating FortiGate Cloud will force you to register with FortiCare.
- If a FortiGate is registered in FortiCare using a FortiCloud account, then only that FortiCloud account can be used to activate FortiGate Cloud.
- If a different FortiCloud account was already used to activate FortiGate Cloud, then a notification asking you to migrate to FortiCloud is shown in the GUI after upgrading FortiOS.

The CLI can be used to activate FortiGate Cloud without registration, or with a different FortiCloud account.

To activate FortiGate Cloud and register with FortiCare at the same time:

1. Go to Dashboard > Status.
2. In the FortiGate Cloud widget, click Not Activated > Activate.
   You must register with FortiCare before activating FortiGate Cloud.
3. Enter your FortiCare Email address and Password.
4. Select your Country/Region and Reseller.
5. Enable Sign in to FortiGate Cloud using the same account.
6. Click OK.

To activate FortiGate Cloud on an already registered FortiGate:

1. Go to Dashboard > Status.
2. In the FortiGate Cloud widget, click Not Activated > Activate.
3. Enter the password for the account that was used to register the FortiGate.

4. Click OK.
   The FortiGate Cloud widget now shows the activated FortiCloud account.

To migrate from the activated FortiGate Cloud account to the registered FortiCloud account:

1. Go to System > FortiGuard.
2. In the FortiCare Support row, click Actions > Transfer FortiGate to Another Account.
3. Enter the Password of the current FortiCloud account.
4. Enter the target FortiCloud Account name and Password, then click Next.
5. Review the information in the From and To fields, then click Transfer.

To activate FortiGate Cloud using an account that is not used for registration:

1. Enter the following with the credentials for the account being used to activate FortiGate Cloud:
   
   ```bash
   # execute fortiguard-log login <account_id> <password>
   
   # diagnose fdsm contract-controller-update
   
   Result=Success
   ```

   A FortiCloud account that is not used for the support portal account cannot be used to register FortiGate. Attempting to activate FortiGate Cloud with this type of account will fail.

Transfer a device to another FortiCloud account

Master account users can transfer a device from one FortiCloud/FortiCare account to another. Users can transfer a device up to three times within a twelve-month time period. If more transfers are required within the twelve-month time period, contact Technical Support to request the transfer.

Requirements:

To transfer an account, you must:

- Have access to the FortiGate, as well as both the FortiCloud and FortiCare accounts.
- Be a master account user.

To verify if you are the master account user, log in to support.fortinet.com. Click the username, then select My Account.
Getting started

The Account Profile page opens.

To transfer an account in the GUI:

1. Go to Dashboard > Status.
2. In the Licenses widget, click the FortiCare Support link, then click Transfer FortiGate to Another Account.

You can also transfer an account from System > FortiGuard.
3. In the *Current FortiCloud Account* fields, enter the username and password for the current account. In the *Target FortiCloud Account* fields, enter the new username and password.

4. Click *Next*.

5. Review the information, then click *Transfer*.

After the transfer is complete, the new the FortiCloud account is displayed in the *Licenses* widget.
Configuration backups

Once you successfully configure the FortiGate, it is extremely important that you back up the configuration. You can use the GUI or CLI to back up the configuration in FortiOS format, or you can use the CLI to back up the configuration in YAML format. In some cases, you may need to reset the FortiGate to factory defaults or perform a TFTP upload of the firmware, which will erase the existing configuration. In these instances, the configuration on the device will have to be recreated, unless a backup can be used to restore it. You should also back up the local certificates, as the unique SSL inspection CA and server certificates that are generated by your FortiGate by default are not saved in a system backup.

We also recommend that you back up the configuration after any changes are made, to ensure you have the most current configuration available. Also, back up the configuration before any upgrades of the FortiGate’s firmware. Should anything happen to the configuration during the upgrade, you can easily restore the saved configuration.

Always back up the configuration and store it on the management computer or off-site. You have the option to save the configuration file in FortiOS format to various locations including the local PC, USB key, FTP, and TFTP server. FTP and TFTP are only configurable through the CLI. In YAML format, configuration files can be backed up or restored on an FTP or TFTP server through the CLI.

If you have VDOMs, you can back up the configuration of the entire FortiGate or only a specific VDOM. Note that if you are using FortiManager or FortiGate Cloud, full backups are performed and the option to back up individual VDOMs will not appear.

---

You can also back up and restore your configuration using Secure File Copy (SCP). See How to download/upload a FortiGate configuration file using secure file copy (SCP).

You enable SCP support using the following command:

```
config system global
    set admin-scp enable
end
```

For more information about this command and about SCP support, see `config system global`.

---

Backing up the configuration

To back up the configuration in FortiOS format using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select Configuration > Backup.
2. Direct the backup to your Local PC or to a USB Disk.
   - The USB Disk option will not be available if no USB drive is inserted in the USB port. You can also back up to FortiManager using the CLI.
3. If VDOMs are enabled, indicate whether the scope of the backup is the entire FortiGate configuration (Global) or only a specific VDOM configuration (VDOM).
   - If backing up a VDOM configuration, select the VDOM name from the list.
4. Enable Encryption. Encryption must be enabled on the backup file to back up VPN certificates.
5. Enter a password, and enter it again to confirm it. This password will be required to restore the configuration.
6. Click OK.
7. When prompted, select a location on the PC or USB disk to save the configuration file. The configuration file will have a .conf extension.

To back up the configuration in FortiOS format using the CLI:

Use one of the following commands:
Getting started

execute backup config management-station <comment>

or:
execute backup config usb <backup_filename> [<backup_password>]

or for FTP, note that port number, username are optional depending on the FTP site:
execute backup config ftp <backup_filename> <ftp_server>[<ftp_port>] [<user_name>] [<password>] [<backup_password>]

or for TFTP:
execute backup config tftp <backup_filename> <tftp_servers> [<backup_password>]

or for SFTP:
execute backup config sftp <backup_filename> <sftp_server>[<sftp_port>] <user> <password> [<backup_password>]

Use the same commands to backup a VDOM configuration by first entering the commands:
config vdom
   edit <vdom_name>

In FortiOS format, the configuration can be backed up to IPv4 and IPv6 FTP, TFTP, and SFTP servers. The configuration can be restored from IPv4 and IPv6 FTP and TFTP servers.

To back up the configuration in YAML format using the CLI:

# execute backup yaml-config {ftp | tftp} <filename> <server> [username] [password]

For example:

# execute backup yaml-config tftp 301E.yaml 172.16.200.55
Please wait...
Connect to tftp server 172.16.200.55 ...
# Send config file to tftp server OK.

In YAML format, the configuration can be backed up to and restored from an FTP or TFTP server.

Restoring a configuration

To restore the FortiGate configuration in FortiOS format using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select Configuration > Restore.
2. Identify the source of the configuration file to be restored: your Local PC or a USB Disk. The USB Disk option will not be available if no USB drive is inserted in the USB port. You can restore from the FortiManager using the CLI.
3. Click Upload, locate the configuration file, and click Open.
4. Enter the password if required.
5. Click OK.
To restore the FortiGate configuration in FortiOS format using the CLI:

```
execute restore config management-station normal 0
```

or:

```
execute restore config usb <backup_filename> [backup_password]
```

or for FTP, note that port number, username are optional depending on the FTP site:

```
execute restore config ftp <backup_filename> <ftp_server>[<:port>] [<user_name>] [password] [backup_password]
```

or for TFTP:

```
execute restore config tftp <backup_filename> <tftp_server> [backup_password]
```

The FortiGate will load the configuration file and restart. Once the restart has completed, verify that the configuration has been restored.

To restore configuration files in YAML format:

```
# execute restore yaml-config {ftp | tftp} <filename> <server> [username] [password]
```

For example:

```
# execute restore yaml-config ftp 301E-1.yaml 172.16.200.55 root sys@qa123456
This operation will overwrite the current setting and could possibly reboot the system!
Do you want to continue? (y/n) y
Please wait...
Connect to ftp server 172.16.200.55 ...
Get config file from ftp server OK.
File check OK.
#
The system is going down NOW !!
```

Troubleshooting

When restoring a configuration, errors may occur, but the solutions are usually straightforward.

<table>
<thead>
<tr>
<th>Error message</th>
<th>Reason and Solution</th>
</tr>
</thead>
</table>
| Configuration file error | This error occurs when attempting to upload a configuration file that is incompatible with the device. This may be due to the configuration file being for a different model or being saved from a different version of firmware.  
**Solution:** Upload a configuration file that is for the correct model of FortiGate device and the correct version of the firmware. |
| Invalid password    | When the configuration file is saved, it can be protected by a password. The password entered during the upload process is not matching the one associated with the configuration file.  
**Solution:** Use the correct password if the file is password protected. |

Configuration revision

You can manage multiple versions of configuration files on models that have a 512MB flash memory and higher. Revision control requires either a configured central management server or the local hard drive, if your FortiGate has this
feature. Typically, configuration backup to local drive is not available on lower-end models.

The central management server can either be a FortiManager unit or FortiGate Cloud.

If central management is not configured on your FortiGate unit, a message appears instructing you to either

- Enable central management, or
- Obtain a valid license.

When revision control is enabled on your FortiGate unit, and configuration backups have been made, a list of saved revisions of those backed-up configurations appears.

Configuration revisions are viewed by clicking on the user name in the upper right-hand corner of the screen and selecting Configuration > Revisions.

**Back up and restore the local certificates**

This procedure exports a server (local) certificate and private key together as a password protected PKCS12 file. The export file is created through a customer-supplied TFTP server. Ensure that your TFTP server is running and accessible to the FortiGate before you enter the command.

**To back up the local certificates:**

Connect to the CLI and use the following command:

```
execute vpn certificate local export tftp <cert_name> <filename> <tftp_ip>
```

where:

- `<cert_name>` is the name of the server certificate.
- `<filename>` is a name for the output file.
- `<tftp_ip>` is the IP address assigned to the TFTP server host interface.

**To restore the local certificates using the GUI:**

1. Move the output file from the TFTP server location to the management computer.
2. Go to System > Certificates and click Import > Local.
3. Select the certificate type, then click Upload in the Certificate file field.
4. On the management computer, browse to the file location, select it, and click Open.
5. If the Type is Certificate, upload the Key file as well.
6. If required, enter the Password that is required to upload the file or files.
7. Click OK.

**To restore the local certificates using the CLI:**

Connect to the CLI and use the following command:

```
execute vpn certificate local import tftp <filename> <tftp_ip>
```

**Restore factory defaults**

There may be a need to reset the FortiGate to its original defaults; for example, to begin with a fresh configuration. There are two options when restoring factory defaults. The first resets the entire device to the original out-of-the-box configuration.
Getting started

You can reset the device with the following CLI command:

```
execute factoryreset
```

When prompted, type `y` to confirm the reset.

Alternatively, in the CLI you can reset the factory defaults but retain the interface and VDOM configuration with the following command:

```
execute factoryreset2
```

**LEDs**

Check your device's QuickStart guide for specific LED information: FortiGate QuickStart Guides.

The following faceplates show where the LEDs are typically found on FortiGate models:

<table>
<thead>

</table>

**Alarm levels**

**Minor alarm**

Also called an IPMI non-critical (NC) alarm, it indicates a temperature or power level outside of the normal operating range that is not considered a problem. For a minor temperature alarm, the system could respond by increasing the fan speed. A non-critical threshold can be an upper non-critical (UNC) threshold (for example, a high temperature or a high power level) or a lower non-critical (LNC) threshold (for example, a low power level).

**Major alarm**

Also called an IPMI critical or critical recoverable (CR) alarm, it indicates that the system is unable to correct the cause of the alarm, and that intervention is required. For example, the cooling system cannot provide enough cooling to reduce the temperature. It can also mean that the conditions are approaching the outside limit of the allowed operating range. A critical threshold can also be an upper critical (UC) threshold (such as a high temperature or high power level) or a lower critical (LC) threshold (such as a low power level).

**Critical alarm**

Also called an IPMI non-recoverable (NR) alarm, it indicates that the system has detected a temperature or power level that is outside of the allowed operating range and physical damage is possible.
Troubleshooting your installation

If your FortiGate does not function as desired after installation, try the following troubleshooting tips:

1. **Check for equipment issues**
   Verify that all network equipment is powered on and operating as expected. Refer to the QuickStart Guide for information about connecting your FortiGate to the network.

2. **Check the physical network connections**
   Check the cables used for all physical connections to ensure that they are fully connected and do not appear damaged, and make sure that each cable connects to the correct device and the correct Ethernet port on that device.

3. **Verify that you can connect to the internal IP address of the FortiGate**
   Connect to the GUI from the FortiGate's internal interface by browsing to its IP address. From the PC, try to ping the internal interface IP address; for example, `ping 192.168.1.99`. If you cannot connect to the internal interface, verify the IP configuration of the PC. If you can ping the interface but can't connect to the GUI, check the settings for administrative access on that interface. Alternatively, use SSH to connect to the CLI, and then confirm that HTTPS has been enabled for Administrative Access on the interface.

4. **Check the FortiGate interface configurations**
   Check the configuration of the FortiGate interface connected to the internal network (under Network > Interfaces) and check that Addressing mode is set to the correct mode.

5. **Verify the security policy configuration**
   Go to Policy & Objects > Firewall Policy and verify that the internal interface to Internet-facing interface security policy has been added and is located near the top of the policy list. Check the Active Sessions column to ensure that traffic has been processed (if this column does not appear, right-click on the table header and select Active Sessions). If you are using NAT mode, check the configuration of the policy to make sure that NAT is enabled and that Use Outgoing Interface Address is selected.

6. **Verify the static routing configuration**
   Go to Network > Static Routes and verify that the default route is correct. Go to Monitor > Routing Monitor and verify that the default route appears in the list as a static route. Along with the default route, you should see two routes shown as Connected, one for each connected FortiGate interface.

7. **Verify that you can connect to the Internet-facing interface’s IP address**
   Ping the IP address of the Internet-facing interface of your FortiGate. If you cannot connect to the interface, the FortiGate is not allowing sessions from the internal interface to Internet-facing interface. Verify that PING has been enabled for Administrative Access on the interface.

8. **Verify that you can connect to the gateway provided by your ISP**
   Ping the default gateway IP address from a PC on the internal network. If you cannot reach the gateway, contact your ISP to verify that you are using the correct gateway.

9. **Verify that you can communicate from the FortiGate to the Internet**
   Access the FortiGate CLI and use the command `execute ping 8.8.8.8`. You can also use the `execute traceroute 8.8.8.8` command to troubleshoot connectivity to the Internet.

10. **Verify the DNS configurations of the FortiGate and the PCs**
    Check for DNS errors by pinging or using traceroute to connect to a domain name; for example: `ping www.fortinet.com`.
    If the name cannot be resolved, the FortiGate or PC cannot connect to a DNS server and you should confirm that the DNS server IP addresses are present and correct.
11. Confirm that the FortiGate can connect to the FortiGuard network

Once the FortiGate is on your network, you should confirm that it can reach the FortiGuard network. First, check the License Information widget to make sure that the status of all FortiGuard services matches the services that you have purchased. Go to System > FortiGuard, and, in the Filtering section, click Test Connectivity. After a minute, the GUI should indicate a successful connection. Verify that your FortiGate can resolve and reach FortiGuard at service.fortiguard.net by pinging the domain name. If you can reach this service, you can then verify the connection to FortiGuard servers by running the command diagnose debug rating. This displays a list of FortiGuard IP gateways you can connect to, as well as the following information:

- **Weight**: Based on the difference in time zone between the FortiGate and this server
- **RTT**: Return trip time
- **Flags**: D (IP returned from DNS), I (Contract server contacted), T (being timed), F (failed)
- **TZ**: Server time zone
- **Curr Lost**: Current number of consecutive lost packets
- **Total Lost**: Total number of lost packets

12. Consider changing the MAC address of your external interface

Some ISPs do not want the MAC address of the device connecting to their network cable to change. If you have added a FortiGate to your network, you may have to change the MAC address of the Internet-facing interface using the following CLI command:

```plaintext
config system interface
edit <interface>
end
end
```

13. Check the FortiGate bridge table (transparent mode)

When a FortiGate is in transparent mode, the unit acts like a bridge sending all incoming traffic out on the other interfaces. The bridge is between interfaces on the FortiGate unit. Each bridge listed is a link between interfaces. Where traffic is flowing between interfaces, you expect to find bridges listed. If you are having connectivity issues and there are no bridges listed, that is a likely cause. Check for the MAC address of the interface or device in question. To list the existing bridge instances on the FortiGate, use the following CLI command:

```plaintext
diagnose netlink brctl name host root.b
show bridge control interface root.b host.
fdb: size=2048, used=25, num=25, depth=1
Bridge root.b host table
port no device devname mac addr ttl attributes
  3 4 wan1 00:09:0f:cb:c2:77 88
  3 4 wan1 00:26:2d:24:b7:d3 0
  3 4 wan1 00:13:72:38:72:21 98
  4 3 internal 00:1a:a0:2f:bc:c6 6
  1 6 dmz 00:09:0f:dc:90:69 0 Local Static
  3 4 wan1 c4:2c:03:0d:3a:38 81
  3 4 wan1 00:09:0f:15:05:46 89
  3 4 wan1 c4:2c:03:1d:1b:10 0
  2 5 wan2 00:09:0f:dc:90:68 0 Local Static
```

14. Use FortiExplorer if you cannot connect to the FortiGate over Ethernet

If you cannot connect to the FortiGate GUI or CLI, you may be able to connect using FortiExplorer. Refer to the QuickStart Guide or see the section on FortiExplorer for more details.

15. Either reset the FortiGate to factory defaults or contact Fortinet Support for assistance

To reset the FortiGate to factory defaults, use the CLI command `execute factoryreset`. When prompted, type `y` to confirm the reset.

If you require further assistance, visit the Fortinet Support website.
Dashboards and Monitors

FortiOS includes predefined dashboards so administrators can easily monitor device inventory, security threats, traffic, and network health. You can customize the appearance of a default dashboard to display data pertinent to your Security Fabric or combine widgets to create custom dashboards. Many dashboards also allow you to switch views between fabric devices.

Each dashboard contains a set of widgets that allow you to view drilldown data and take actions to prevent threats. Use widgets to perform tasks such as viewing device inventory, creating and deleting DHCP reservations, and disconnecting dial-up users. You can add or remove widgets in a dashboard or save a widget as a standalone monitor.

Monitors display information in both text and visual format. Use monitors to change views, search for items, view drilldown information, or perform actions such as quarantining an IP address. FortiView monitors for the top categories are located below the dashboards. All of the available widgets can be added to the tree menu as a monitor.

Using dashboards

You can combine widgets to create custom dashboards. You can also use the dropdown in the tree menu to switch to another device in the Security Fabric.

To create a new dashboard:

1. Under Dashboard, click the Add Dashboard button. The Add Dashboard window opens.

2. Enter a name in the Name field and click OK. The new dashboard opens.
Dashboards and Monitors

To add a widget to a dashboard:

1. In the tree menu, select a dashboard.
2. In the banner, click Add Widget. The Add Dashboard Widget pane opens.
3. Click the Add button next to the widget. You can use the Search field to search for a widget. Enable Show More to view more widgets in a category.
4. Configure the widget settings, then click Add Widget.
5. Click Close.
6. (Optional) Click and drag the widget to the desired location in the dashboard.

To edit a dashboard:

1. Click the Actions menu next to the dashboard and select Edit Dashboard.
2. Edit the dashboard and click OK.

To delete a dashboard:

1. Click the Actions menu next to the dashboard and select Delete Dashboard.
2. Click Delete Dashboard. The Confirm dialog opens.
3. Click OK.

You cannot delete the Status dashboard.

To switch to another device in the Security Fabric:

1. In the tree menu, click the device name and select a fabric device from dropdown.

Using widgets

You can convert a widget to a standalone monitor, change the view type, configure tables, and filter data.
Dashboards and Monitors

To save a dashboard widget as a monitor:

1. Hover over the widget and click Expand to full screen.

   ![Full screen mode is not supported in all widgets.]

2. In the widget, click Save as Monitor. The Add Monitor window opens.

3. (Optional) Enter a new name for the monitor in the Name field.
4. Click OK.

To view the widget settings:

1. Click the menu dropdown at the right side of the widget and select Settings.

2. Configure the widget settings and click OK.

   ![The settings will vary depending on the widget.]

To configure a table in the widget:

1. Hover over the left side of the table header and click Configure Table.
2. Configure the table options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Best Fit All Columns</td>
<td>Resizes all of the columns in a table to fit their content.</td>
</tr>
<tr>
<td>Reset Table</td>
<td>Resets the table to the default view.</td>
</tr>
<tr>
<td>Select Columns</td>
<td>Adds or removes columns from the view.</td>
</tr>
</tbody>
</table>

3. Click Apply.

To filter or configure a column in a table:

1. Hover over a column heading, and click Filter/Configure Column.

2. Configure the column options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resize to Contents</td>
<td>Resizes the column to fit the content.</td>
</tr>
<tr>
<td>Group by this Column</td>
<td>Groups the table rows by the contents in the selected column.</td>
</tr>
</tbody>
</table>

3. Click Apply.

4. To filter a column, enter a value in the Filter field, and click Apply.

 Filtering is not supported in all widgets.

Widgets

Dashboards are created per VDOM when VDOM mode is enabled. For information about VDOM mode, see Virtual Domains on page 1996.

Some dashboards and widgets are not available in Multi-VDOM mode.

The following table lists the available widgets in VDOM mode:

<table>
<thead>
<tr>
<th>Category</th>
<th>Widgets</th>
</tr>
</thead>
<tbody>
<tr>
<td>FortiView</td>
<td>• FortiView Application Bandwidth FortiView</td>
</tr>
</tbody>
</table>
## Dashboards and Monitors

**Viewing device dashboards in the Security Fabric**

Use the device dropdown to view the dashboards in downstream fabric devices. You can also create dedicated device dashboards or log in and configure fabric devices.

To view the dashboards in fabric devices, click the device dropdown at the left side of the page, and select a device from the list.
The device dropdown is available in the Status, Security, Network, Users & Devices, and WiFi dashboards. You can also enable the dropdown when you create a dashboard.

To log in to or configure a fabric device, hover over the device name until the device dialog opens and then select Login or Configure.

Creating a fabric system and license dashboard

Create a dashboard summary page to monitor all the fabric devices in a single view. You can use this dashboard to monitor aspects of the devices such as system information, VPN and routing.

Example

The following image is an example of a Fabric System & License dashboard to monitor the System Information, Licenses, and Memory usage for Branch_Office_01 and Branch_Office_02.
To create a system dashboard:

1. Click the Add Dashboard button. The Add Dashboard window opens.

2. In the Name field, enter a name such as Fabric System & Licenses, and click OK. The new dashboard appears.

3. In the banner, click Add Widget. The Add Dashboard Widget window opens. You can use the Search field to search for a specific widget (for example, License Status, System Information, and Memory Usage).

4. Click the Add button next to widget. The Add Dashboard Widget window opens.

5. In the Fabric member area, select Specify and select a device in the Security Fabric.

6. Click Add Widget. The widget is added to the dashboard. Repeat this step for all the devices you want to view in the dashboard.

7. (Optional) Arrange the widgets in the dashboard by fabric device.

Dashboards

A dashboard is a collection of widgets that show the status of your devices, network, and Security Fabric at a glance. Widgets are condensed monitors that display a summary of the key details about your FortiGate pertaining to routing, VPN, DHCP, devices, users, quarantine, and wireless connections.

The following dashboards are included in the dashboard templates:

<table>
<thead>
<tr>
<th>Dashboard</th>
<th>Default Template</th>
<th>Use these widgets to:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>• Comprehensive</td>
<td>• View the device serial number, licenses, and administrators</td>
</tr>
<tr>
<td></td>
<td>• Optimal</td>
<td>• View the status of devices in the security fabric</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Monitor CPU and Memory usage</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Monitor IPv4 and IPv6 sessions</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• View VMs and Cloud devices</td>
</tr>
<tr>
<td>Security</td>
<td>• Optimal</td>
<td>• View compromised hosts and host scan summary</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• View top threats and vulnerabilities</td>
</tr>
<tr>
<td>Network</td>
<td>• Optimal</td>
<td>• Monitor DHCP clients</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Monitor IPsec VPN connections</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Monitor current routing table</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Monitor SD-WAN status</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Monitor SSL-VPN connections</td>
</tr>
</tbody>
</table>
Dashboards and Monitors

</tr>
</tbody>
</table>

**Resetting the default dashboard template**

You can use the GUI to change the default dashboard template. The *Optimal* template contains a set of popular default dashboards and FortiView monitors. The *Comprehensive* template contains a set of default dashboards as well as all of the FortiView monitors.

Resetting the default template will delete any custom dashboards and monitors, and reset the widget settings.

**To reset all dashboards:**

1. Click the *Actions* menu next to *Add Dashboard* or *Add Monitor* and click *Reset All Dashboards*. The *Dashboard Setup* window opens.

2. Select *Optimal* or *Comprehensive* and click *OK*.

**Status dashboard**

The *Status* dashboard provides an overview of your FortiGate device and the devices in your Security Fabric. If your FortiGate is a Virtual Machine, information about the Virtual Machine is also displayed in the dashboard.
Dashboards and Monitors

Updating system information

The System Information widget contains links to the Settings module where you can update the System Time, Uptime, and WAN IP.

A notification will appear in the Firmware field when a new version of FortiOS is released. Click Update firmware in System > Firmware to view the available versions and update FortiOS.

Viewing fabric devices

The Security Fabric widget provides a visual overview of the devices connected to the fabric and their connection status. Hover of a device icon to view more information about the device.

Click a device in the fabric to:

- View the device in the physical or logical topology
- Register, configure, deauthorize, or log in to the device
- Open Diagnostics and Tools
- View the FortiClient Monitor

These options will vary depending on the device.

Click Expand & Pin hidden content to view all the devices in the fabric at once.
Dashboards and Monitors

Viewing administrators

The *Administrators* widget displays the active administrators and their access interface. Click the username to view the *Active Administrator Sessions* monitor. You can use the monitor to end an administrator's session.

Resource widgets

The resource widgets show the current usage statistics for *CPU*, *Memory*, and *Sessions*. Click the *CPU* monitor to show the per core CPU usage.

You can switch between *IPv4*, *IPv6*, or *IPv4+IPv6* in the *Sessions* monitor.

Security dashboard

The widgets in the *Security* dashboard provide a snapshot of the current threats and vulnerabilities targeting your Security Fabric.
The Security dashboard contains the following widgets:

<table>
<thead>
<tr>
<th>Widget</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compromised Hosts by Verdict</td>
<td>Shows the session information for a compromised host. See Viewing session information for a compromised host on page 87.</td>
</tr>
<tr>
<td>Top Threats by Threat Level</td>
<td>Shows the top traffic sessions aggregated by threat. You can expand the widget to view drilldown information about the Threat, Threat Category, Threat Level, Threat Score and Sessions.</td>
</tr>
<tr>
<td>FortiClient Detected Vulnerabilities</td>
<td>Shows a summary of vulnerabilities detected by FortiClient. FortiClient must be enabled.</td>
</tr>
<tr>
<td>Host Scan Summary</td>
<td>Shows a summary of hosts scanned. Hover over a color in the chart to view the number of hosts by category. Click the chart to view the FortiClient Monitor or Device Inventory monitor.</td>
</tr>
<tr>
<td>Top Vulnerable Endpoint Devices by Detected Vulnerabilities</td>
<td>Shows a summary devices aggregated by vulnerabilities. Expand the widget to view drilldown information about the Device, Source and Detected Vulnerabilities.</td>
</tr>
</tbody>
</table>

Viewing session information for a compromised host

You can use the Compromised Hosts by Verdict widget to view the session information for a compromised host.

To view session information for a compromised host in the GUI:

1. Go to Dashboard > Security and expand the Compromised Hosts by Verdict widget.

2. Double-click a compromised host to view the session information. You can also right-click a compromised host, and select View Sessions.
3. Double-click a session, or right-click the session and select View Sessions to view the information.

Network dashboard

The widgets in the Network dashboard show information related to networking for this FortiGate and other devices connected to your Security Fabric. Use this dashboard to monitor the status of Routing, DHCP, SD-WAN, IPsec and SSL VPN tunnels. All of the widgets in the Network dashboard can be expanded to full screen and saved as a monitor.

The Network dashboard contains the following widgets:

<table>
<thead>
<tr>
<th>Widget</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Static &amp; Dynamic Routing</td>
<td>Shows the static and dynamic routes currently active in your routing table. The widget also includes policy routes, BGP neighbors and paths, and OSPF neighbors. See Static &amp; Dynamic Routing monitor on page 89.</td>
</tr>
<tr>
<td>DHCP</td>
<td>Shows the addresses leased out by FortiGate's DHCP servers. See DHCP monitor on page 92.</td>
</tr>
<tr>
<td>SD-WAN</td>
<td>Shows a summary of the SD-WAN status, including ADVPN shortcut information.</td>
</tr>
<tr>
<td>IPsec</td>
<td>Shows the connection statuses of your IPsec VPN site to site and dial-up tunnels. See IPsec monitor on page 93.</td>
</tr>
<tr>
<td>SSL-VPN</td>
<td>Shows a summary of remote active users and the connection mode. See SSL-VPN monitor on page 95.</td>
</tr>
</tbody>
</table>
## Widget and Description

<table>
<thead>
<tr>
<th>Widget</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Pool Utilization</td>
<td>Shows IP pool utilization.</td>
</tr>
</tbody>
</table>

### Static & Dynamic Routing Monitor

The *Static & Dynamic Routing Monitor* displays the routing table on the FortiGate, including all static and dynamic routing protocols in IPv4 and IPv6. You can also use this monitor to view policy routes, BGP neighbors and paths, and OSPF neighbors.

![Routing Monitor Screenshot](image)

To view the routing monitor in the GUI:

1. Go to *Dashboard > Network*.
2. Hover over the *Routing* widget, and click *Expand to Full Screen*. The *Routing* monitor is displayed.
3. To view neighbors and paths, click the monitors dropdown at the top of the page.

#### BGP Neighbors

![BGP Neighbors Screenshot](image)

#### BGP Paths

![BGP Paths Screenshot](image)
4. To filter the *Interfaces* and *Type* columns:
   a. Click the *Static & Dynamic* tab.
   b. Hover over the column heading, and click the *Filter/Configure Column* icon.
   c. Click *Group By This Column*, then click *Apply*. 
5. (Optional) Click Save as Monitor to save the widget as monitor.

To look up a route in the GUI:

1. Click Route Lookup.
2. Enter an IP address in the Destination field, then click Search. The matching route is highlighted on the Routing monitor.

To view the routing table in the CLI:

```
# get route info routing-table all
```

Sample output:

```
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
* - candidate default

Routing table for VRF=0
S* 0.0.0.0/0 [1/0] via 10.0.10.1, To-HQ-A
[1/0] via 10.0.12.1, To-HQ-MPLS
[1/0] via 10.10.11.1, To-HQ-B
[1/0] via 10.100.67.1, port1
[1/0] via 10.100.67.9, port2
C 10.0.10.0/24 is directly connected, To-HQ-A
C 10.0.10.2/32 is directly connected, To-HQ-A
C 10.0.11.0/24 is directly connected, To-HQ-B
C 10.0.11.2/32 is directly connected, To-HQ-B
C 10.0.12.0/24 is directly connected, To-HQ-MPLS
C 10.0.12.2/32 is directly connected, To-HQ-MPLS
C 10.1.0.0/24 is directly connected, port3
C 10.1.0.2/32 is directly connected, port3
C 10.1.0.3/32 is directly connected, port3
C 10.1.100.0/24 is directly connected, vsw.port6
```

To look up a firewall route in the CLI:

```
# diagnostic firewall proute list
```

Sample output:

```
list route policy info(vf=root):

To view neighbors and paths

**DHCP monitor**

The DHCP monitor shows all the addresses leased out by FortiGate’s DHCP servers. You can use the monitor to revoke an address for a device, or create, edit, and delete address reservations.

![DHCP Monitor Screenshot]

To view the DHCP monitor:

1. Go to *Dashboard > Network*.
2. Hover over the *DHCP* widget, and click *Expand to Full Screen*.

To filter or configure a column in the table, hover over the column heading and click *Filter/Configure Column*.

To revoke a lease:

1. Select a device in the table.
2. In the toolbar, click *Revoke*, or right-click the device, and click *Revoke Lease(s)*. The Confirm page is displayed.
3. Click *OK*.

A confirmation window opens only if there is an associated address reservation. If there is no address, the lease will be removed immediately upon clicking *Revoke*. 

---

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
To create a DHCP reservation:

1. Select a server in the table.
2. In the toolbar, click Reservation, or right-click the device and click Create DHCP Reservation. The Create New DHCP Reservation page is displayed.
3. Configure the DHCP reservation settings.

![Create New DHCP Reservation](image)

4. Click OK.

To view top sources by bytes:

1. Right-click a device in the table and click Show in FortiView. The FortiView Sources by Bytes widget is displayed.

To view the DHCP lease list in the CLI:

```
# execute dhcp lease-list
```

**IPsec monitor**

The IPsec monitor displays all connected Site to Site VPN, Dial-up VPNs, and ADVPN shortcut tunnel information. You can use the monitor to bring a phase 2 tunnel up or down or disconnect dial-up users. A notification appears in the monitor when users have not enabled two-factor authentication.

![IPsec Monitor](image)

To view the IPsec monitor in the GUI:

1. Go to Dashboard > Network.
2. Hover over the IPsec widget, and click Expand to Full Screen. A warning appears when an unauthenticated user is detected.

To filter or configure a column in the table, hover over the column heading and click Filter/Configure Column.

3. Hover over a record in the table. A tooltip displays the Phase 1 and Phase 2 interfaces. A warning appears next to a user who has not enabled two-factor authentication.
To reset statistics:

1. Select a tunnel in the table.
2. In the toolbar, click Reset Statistics or right-click the tunnel, and click Reset Statistics. The Confirm dialog is displayed.
3. Click OK.

To bring a tunnel up:

1. Select a tunnel in the table.
2. Click Bring Up, or right-click the tunnel, and click Bring Up. The Confirm dialog is displayed.
3. Click OK.

To bring a tunnel down:

1. Select a tunnel in the table.
2. Click Bring Down, or right-click the tunnel, and click Bring Down. The Confirm dialog is displayed.
3. Click OK.

To locate a tunnel on the VPN Map:

1. Select a tunnel in the table.
2. Click Locate on VPN Map, or right-click the tunnel, and click Locate on VPN Map. The VPN Location Map is displayed.
3. Click OK.

To view the IPsec monitor in the CLI:

```
# diagnose vpn tunnel list
```

Sample output:

```
list all ipsec tunnel in vd 0
------------------------------------------------------------------
name=fct-dialup  ver=1  serial=4  10.100.67.5:0->0.0.0.0:0  tun_id=0.0.0.0  dst_mtu=0

```
SSL-VPN monitor

The SSL-VPN monitor displays remote user logins and active connections. You can use the monitor to disconnect a specific connection. The monitor will notify you when VPN users have not enabled two-factor authentication.

To view the SSL-VPN monitor in the GUI:

1. Go Dashboard > Network.
2. Hover over the SSL-VPN widget, and click Expand to Full Screen. The Duration and Connection Summary charts are displayed at the top of the monitor.

   To filter or configure a column in the table, hover over the column heading and click Filter/Configure Column.

To disconnect a user:

1. Select a user in the table.
2. In the table, right-click the user, and click End Session. The Confirm window opens.
3. Click OK.
To monitor SSL-VPN users in the CLI:

```
# get vpn ssl monitor
```

Sample output

SSL VPN Login Users:
Index User Group Auth Type Timeout From HTTP in/out HTTPS in/out
0 amitchell TAC 1(1) 296 10.100.64.101 3838502/11077721 0/0

SSL VPN sessions:
Index User Group Source IP Duration I/O Bytes Tunnel/Dest IP

Users & Devices

The Users & Devices dashboard shows the current status of users and devices connected to your network. All of the widgets can be expanded to view as monitor. In monitor view, you can create firewall addresses, deauthenticate a user, or remove a device from the network.

The User & Devices dashboard contains the following widgets:

<table>
<thead>
<tr>
<th>Widget</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device Inventory</td>
<td>Shows a summary of the hardware and software that is connected to the network.</td>
</tr>
<tr>
<td></td>
<td>See Device inventory on page 96.</td>
</tr>
<tr>
<td>FortiClient</td>
<td>Shows a summary of the FortiClient endpoints.</td>
</tr>
<tr>
<td>Firewall Users</td>
<td>Shows a summary of the users logged into the network.</td>
</tr>
<tr>
<td>Quarantine</td>
<td>Shows a summary of quarantined devices.</td>
</tr>
<tr>
<td>FortiSwitch NAC VLANs</td>
<td>Shows a summary of VLANs assigned to devices by FortiSwitch NAC policies.</td>
</tr>
</tbody>
</table>

Device inventory

You can enable device detection to allow FortiOS to monitor your networks and gather information about devices operating on those networks, including:

- MAC address
- IP address
- Operating system
- Hostname
- Username
- Endpoint tags
- When FortiOS detected the device and on which interface

You can enable device detection separately on each interface in Network > Interfaces.

Device detection is intended for devices directly connected to your LAN and DMZ ports. The widget is only available when your Interface Role is LAN, DMZ or Undefined. It is not available when the role is WAN.
You can also manually add devices to Device Inventory to ensure that a device with multiple interfaces displays as a single device.

**To view the device inventory monitor:**

1. Go to Dashboard > Users & Devices.
   If you are using the Comprehensive dashboard template, go to Dashboard > Device Inventory Monitor.
2. Hover over the Device Inventory widget, and click Expand to Full Screen. The Device Inventory monitor is displayed.

To filter or configure a column in the table, hover over the column heading, and click Filter/Configure Column. See Device inventory and filtering on page 97.

**Device inventory and filtering**

The Device Inventory widget contains a series of summary charts that provide an overview of the hardware, operating system, status, and interfaces. You can use these clickable charts to simplify filtering among your devices.

**To view the device inventory and apply a filter:**

1. Go to Dashboard > Users & Devices.
   If you are using the Comprehensive dashboard template, go to Dashboard > Device Inventory Monitor. See .
2. Hover over the Device Inventory widget, and click Expand to Full Screen. The Device Inventory monitor is displayed.
3. To filter the order of the charts by operating system, click the dropdown in the top menu bar and select Software OS.
4. To filter a chart, click an item in the legend or chart area. The table displays the filter results.
5. To combine filters, hover over a column heading and click *Filter/Configure Column*.

6. Click the filter icon in the top-right corner of the chart to remove the filter.

**Filter examples**

**To filter all offline devices:**

1. In the *Status* chart, click *Offline* in the legend or on the chart itself.

![Status chart example](image)

**To filter all devices discovered on port3:**

1. In the *Interfaces* chart, click *port3*.

![Interfaces chart example](image)

**Adding MAC-based addresses to devices**

Assets detected by device detection appear in the *Device Inventory* widget. You can manage policies around devices by adding a new device object (MAC-based address) to a device. Once you add the MAC-based address, the device can be used in address groups or directly in policies.

**To add a MAC-based address to a device:**

1. Go to *Dashboard > Users & Devices*.
   If you are using the Comprehensive dashboard template, go to *Dashboard > Device Inventory Monitor*. See .
2. Hover over the Device Inventory widget, and click Expand to Full Screen. The Device Inventory monitor is displayed.

3. Click a device, then click Firewall Device Address. The New Address dialog is displayed.

4. In the Name field, give the device a descriptive name so that it is easy to in the Device column.

5. Configure the MAC Address.

6. Click OK, then refresh the page. The MAC address icon appears in the Address column next to the device name.

Firewall Users monitor

The Firewall Users monitor displays all firewall users currently logged in. You can use the monitor to diagnose user-related logons or to highlight and deauthenticate a user.
To view the firewall monitor:

1. Go to Dashboard > Users & Devices.
   If you are using the Comprehensive dashboard template, go to Dashboard > Firewall User Monitor. See .
2. Hover over the Firewall Users widget, and click Expand to Full Screen.
3. To show FSSO logons, click Show all FSSO Logons at the top right of the page.

To filter or configure a column in the table, hover over the column heading and click Filter/Configure Column.

To deauthenticate a user:

1. Go to Dashboard > Users & Devices.
2. Hover over the Firewall Users widget, and click Expand to Full Screen.
3. (Optional) Use the Search field to search for a specific user.
4. In the toolbar, click Deauthenticate, or right-click the user, and click Deauthenticate. The Confirm dialog is displayed.
5. Click OK.

To view firewall users in the CLI:

```
# diagnose firewall auth list
```

WiFi dashboard

The WiFi dashboard provides an overview of your WiFi network's performance, including FortiAP status, channel utilization, WiFi clients and associated information, login failures, and signal strength.
To access the WiFi dashboard, go to Dashboard > WiFi.

The WiFi dashboard can be customized per your requirements. To learn more about using and modifying dashboards and widgets, see Dashboards and Monitors on page 76.

This section describes the following monitors available for the WiFi Dashboard:

- FortiAP Status monitor on page 101
- Clients by FortiAP monitor on page 103

**FortiAP Status monitor**

The *FortiAP Status* monitor displays the status and the channel utilization of the radios of FortiAP devices connected to a FortiGate. It also provides access to tools to diagnose and analyze connected APs.

To view the *FortiAP Status* monitor:

1. Go to Dashboard > WiFi.
2. Hover over the *FortiAP Status* widget, and click *Expand to Full Screen*. The *FortiAP Status* monitor opens.
3. (Optional) Click **Save as Monitor** to save the widget as monitor.

**To view the Diagnostics and Tools menu:**

1. Right-click an **Access Point** in the table, and click **Diagnostics and Tools**. The **Diagnostics and Tools** dialog opens.

![Diagnostics and Tools dialog](image)

2. To monitor and analyze the FortiAP device, click on the tabs in the **Diagnostics and Tools** dialog, such as **Clients**, **Spectrum Analysis**, **VLAN Probe**, and so on.

![Diagnostics and Tools](image)
The *Diagnostics and Tools* dialog is similar to the device dialog from *WiFi & Switch Controller > Managed FortiAPs*. To learn more about the various tabs and their functions, see *Spectrum analysis of FortiAP E models, VLAN probe report, and Standardize wireless health metrics.*

**Clients by FortiAP monitor**

The *Clients by FortiAP* monitor allows you to view detailed information about the health of individual WiFi connections in the network. It also provides access to tools to diagnose and analyze connected wireless devices.

To view the *Clients by FortiAP* monitor:

1. Go to *Dashboard > WiFi*.
2. Hover over the *Clients by FortiAP* widget, and click *Expand to Full Screen*. The *Clients by FortiAP* monitor opens.
3. (Optional) Click *Save as Monitor* to save the widget as monitor.

To view the summary page for a wireless client:

1. Right-click a client in the table and select *Diagnostics and Tools*. The *Diagnostics and Tools - <device> page* is displayed.
2. (Optional) Click Quarantine to quarantine the client,
3. (Optional) Click Disassociate to disassociate the client.

**Health status**

The *Status* section displays the overall health for the wireless connection. The overall health of the connection is:

- Good if the value range for all three conditions are *Good*
- Fair or poor if one of the three conditions is *Fair* or *Poor* respectively.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Value Range</th>

**Monitors**

FortiGate supports both FortiView and Non-FortiView monitors. FortiView monitors are driven by traffic information captured from logs and real-time data. Non-FortiView monitors capture information from various real-time state tables on the FortiGate.

**Non-FortiView monitors**

Non-FortiView monitors capture information on various state tables, such as the routes in the routing table, devices in the device inventory, DHCP leases in the DHCP lease table, connected VPNs, clients logged into the wireless network, and much more. These monitors are useful when troubleshooting the current state of the FortiGate, and to identify whether certain objects are in the state table or not. For more information, see Dashboards on page 83.

**FortiView monitors**

FortiView is the FortiOS log view tool and comprehensive monitoring system for your network. FortiView integrates real-time and historical data into a single view on your FortiGate. It can log and monitor network threats, keep track of administration activities, and more.

Use FortiView monitors to investigate traffic activity such as user uploads and downloads, or videos watched on YouTube. You can view the traffic on the whole network by user group or by individual. FortiView displays the information in both text and visual format, giving you an overall picture of your network traffic activity so that you can quickly decide on actionable items.

FortiView is integrated with many UTM functions. For example, you can quarantine an IP address directly in FortiView or create custom devices and addresses from a FortiView entry.
The logging range and depth will depend on the FortiGate model.

The *Optimal* template contains a set of popular default dashboards and FortiView monitors. The *Comprehensive* template contains a set of default dashboards as well as all of the FortiView monitors. See [Dashboards on page 83](#).

**FortiView monitors and widgets**

FortiView monitors are available in the tree menu under *Dashboards*. The menu contains several default monitors for the top categories. Additional FortiView monitors are available as widgets that can be added to the dashboards. You can also add FortiView monitors directly to the tree menu with the Add (+) button.
Dashboards and Monitors

Core FortiView monitors

The following default monitors are available in the tree menu:

<table>
<thead>
<tr>
<th>Dashboard</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>FortiView Sources</td>
<td>Displays Top Sources by traffic volume and drilldown by Source.</td>
</tr>
<tr>
<td>FortiView Destinations</td>
<td>Displays Top Destinations by traffic volume and drilldown by Destination.</td>
</tr>
<tr>
<td>FortiView Applications</td>
<td>Displays Top Applications by traffic volume and drilldown by Application.</td>
</tr>
<tr>
<td>FortiView Web Sites</td>
<td>Displays Top Websites by session count and drilldown by Domain.</td>
</tr>
<tr>
<td>FortiView Policies</td>
<td>Displays Top Policies by traffic volume and drilldown by Policy number</td>
</tr>
<tr>
<td>FortiView Sessions</td>
<td>Displays Top Sessions by traffic source and can be used to end sessions.</td>
</tr>
</tbody>
</table>

Usage is based on default settings. The pages may be customized further and sorted by other fields.

You can quarantine a host and ban an IP from all of the core FortiView monitors.

Adding FortiView monitors

Non-core FortiView monitors are available in the Add monitor pane. You can add a FortiView widget to a dashboard or the tree menu as a monitor.
To add a monitor to the tree menu:

1. In the tree menu, under the monitors section, click *Add Monitor (+)*. The *Add Monitor* window opens.

2. Click *Add* next to a monitor. You can use the *Search* field to search for a specific monitor.

3. In the *FortiGate* area, select *All FortiGates or Specify* to select a FortiGate device in the security fabric.

4. (Optional) In the *Data Source* area, select *Specify* and select a source device.

5. From the *Time Period* dropdown, select the time period. This option is not available in all monitors.

6. In the *Visualization* area, select *Table View* or *Bubble Chart*.

7. From the *Sort By* dropdown, select the sorting method.

8. Click *Add Monitor*. The monitor is added to the tree menu.

**Monitors by category**

Usage is based on the default settings. The monitors may be customized further and sorted by other fields.

**LANDMARK**

</tr>
</tbody>
</table>

A maximum of 25 interfaces can be monitored at one time on a device.

**Using the FortiView interface**

Use the FortiView interface to customize the view and visualizations within a monitor to find the information you are looking for. The tools in the top menu bar allow you to change the time display, refresh or customize the data source, and filter the results. You can also right-click a table in the monitor to view drilldown information for an item.

**Real-time and historical charts**

Use the *Time Display* dropdown to select the time period to display on the current monitor. Time display options vary depending on the monitor and can include real-time information (*now*) and historical information (*1 hour*, *24 hours*, and *7 days*).

Disk logging or remote logging must be enabled to view historical information.

You can create a custom time range by selecting an area in table with your cursor.

The icon next to the time period identifies the data source (FortiGate Disk, FortiAnalyzer, or FortiGate Cloud). You can hover over the icon to see a description of the device.
Data source

FortiView gathers information from a variety of data sources. If there are no log disk or remote logging configured, the data will be drawn from the FortiGate's session table, and the Time Period is set to Now.

Other data sources that can be configured are:

- FortiGates (disk)
- FortiAnalyzer
- FortiGate Cloud

When Data Source is set to Best Available Device, FortiAnalyzer is selected when available, then FortiGate Cloud, and then FortiGate Disk.

Drilldown information

Double-click or right-click an entry in a FortiView monitor and select Drill Down to Details to view additional details about the selected traffic activity. Click the Back icon in the toolbar to return to the previous view.

You can group drilldown information into different drilldown views. For example, you can group the drilldown information in the FortiView Destinations monitor by Sources, Applications, Threats, Policies, and Sessions.

Double-click an entry to view the logs in Sessions view. Double-click a session to view the logs.
Dashboards and Monitors

The graph shows the bytes sent/received in the time frame. Real time does not include a chart.

- Users can customize the time frame by selecting a time period within the graph.

Summary of

- Shows information such as the user/avatar, avatar/source IP, bytes, and sessions total for the time period.
- Can quarantine host (access layer quarantine) if they are behind a FortiSwitch or FortiAP.
- Can ban IP addresses, adds the source IP address into the quarantine list.

Tabs

- Drilling down entries in any of these tabs (except sessions tab) will take you to the underlying traffic log in the sessions tab.
- Applications shows a list of the applications attributed to the source IP. This can include scanned applications (using Application Control in a firewall policy or unscanned applications).
  
  ```
  config log gui-display
  set fortiview-unscanned-apps enable
  end
  ```

- Destinations shows destinations grouped by IP address/FQDN.
- Threats lists the threats caught by UTM profiles. This can be from antivirus, IPS, Web Filter, Application Control, etc.
- Web Sites contains the websites which were detected either with webfilter, or through FQDN in traffic logs.
- Web Categories groups entries into their categories as dictated by the Web Filter Database.
- Policies groups the entries into which polices they passed through or were blocked by.
- Sessions shows the underlying logs (historical) or sessions (real time). Drilldowns from other tabs end up showing the underlying log located in this tab.
- Search Phrases shows entries of search phrases captured by a Web Filter UTM profile, with deep inspection enabled in firewall policy.
- More information can be shown in a tooltip while hovering over these entries.

To view matching logs or download a log, click the Security tab in the Log Details.
Enabling FortiView from devices

You can enable FortiView from SSD disk, FortiAnalyzer and FortiGate Cloud.

FortiView from disk

FortiView from disk is available on all FortiGates with an SSD disk.

Restrictions

<table>
<thead>
<tr>
<th>Model</th>
<th>Supported view</th>
</tr>
</thead>
<tbody>
<tr>
<td>Desktop models (100 series) with SSD</td>
<td>Five minutes and one hour</td>
</tr>
<tr>
<td>Medium models with SSD</td>
<td>Up to 24 hours</td>
</tr>
<tr>
<td>Large models (1500D and above) with SSD</td>
<td>Up to seven days</td>
</tr>
</tbody>
</table>

To enable seven days view:

```bash
config log setting
  set fortiview-weekly-data enable
end
```

Configuration

A firewall policy needs to be in place with traffic logging enabled. For optimal operation with FortiView, internal interface roles should be clearly defined as LAN. DMZ and internet facing or external interface roles should be defined as WAN.

To configure logging to disk:

```bash
config log disk setting
  set status enable
end
```

To include sniffer traffic and local-deny traffic when FortiView from Disk:

```bash
config report setting
  set report-source forward-traffic sniffer-traffic local-deny-traffic
end
```
This feature is only supported through the CLI.

**Troubleshooting**

Use `execute report flush-cache` and `execute report recreate-db` to clear up any irregularities that may be caused by upgrading or cache issues.

**Traffic logs**

**To view traffic logs from disk:**

1. Go to Log & Report, and select either the Forward Traffic, Local Traffic, or Sniffer Traffic views.
2. In the top menu bar, click Log location and select Disk.

**FortiView from FortiAnalyzer**

Connect FortiGate to a FortiAnalyzer to increase the functionality of FortiView. Adding a FortiAnalyzer is useful when adding monitors such as the Compromised Hosts. FortiAnalyzer also allows you to view historical information for up to seven days.

**Requirements**

- A FortiGate or FortiOS
- A compatible FortiAnalyzer (see Compatibility with FortiOS)

To configure logging to the FortiAnalyzer, see Configuring FortiAnalyzer on page 2217

**To enable FortiView from FortiAnalyzer:**

1. Go to Dashboard > FortiView Sources.
2. Select a time range other than Now from the dropdown list to view historical data.
3. In top menu, click the dropdown, and select Settings. The Edit Dashboard Widget dialog is displayed.
   a. In the Data Source area, click Specify.
   b. From the dropdown, select FortiAnalyzer, and click OK.

All the historical information now comes from the FortiAnalyzer.

---

When *Data Source* is set to *Best Available Device*, FortiAnalyzer is selected when available, then FortiGate Cloud, and then FortiGate Disk.
FortiView from FortiGate Cloud

This function requires a FortiGate that is registered and logged into a compatible FortiGate Cloud. When using FortiGate Cloud, the Time Period can be set to up to 24 hours.

To configure logging to FortiGate Cloud, see Configuring FortiGate Cloud on page 2219.

To enable FortiView with log source as FortiGate Cloud:

1. Go to Dashboard > FortiView Sources.
2. In the top menu, click the dropdown, and select Settings. The Edit Dashboard Widget window opens.
   a. In the Data Source area, click Specify.
   b. From the dropdown, select FortiGate Cloud, then click OK.

You can select FortiGate Cloud as the data source for all available FortiView pages and widgets.

FortiView sources

The FortiView Sources monitor displays top sources sorted by Bytes, Sessions or Threat Score. The information can be displayed in real time or historical views. You can use the monitor to create or edit a firewall device address or IP address definitions, and temporarily or permanently ban IPs.

To add a firewall device address:

1. In the Device column, hover over the device MAC address. An information window opens.
2. Click Firewall Device Address. The New Address dialog opens.
3. Configure the address settings, and click Return.

Use the Name field to assign a descriptive name to a device so it is easier to find it in the Device column. After you finish configuring the device, refresh the page to see the new name in the monitor.
To add a firewall IP address:

1. In the Device column, hover over the device MAC address. An information window opens.
2. Click Firewall IP Address. The New Address window opens.
3. Configure the address settings, and click Return.

Use the Name field to assign a descriptive name to a device so it is easier to find it in the Device column. After you finish configuring the device, refresh the page to see the new name in the monitor.

To ban an IP address:

1. In the Device column, hover over the device MAC address. An information window opens.
2. Click Ban IP. The Ban IP dialog is displayed.
3. Configure the ban IP settings, and click OK.

FortiView Sessions

The FortiView Sessions monitor displays Top Sessions by traffic source and can be used to end sessions.

To view the FortiView Sessions dashboard, go to Dashboard > FortiView Sessions.
The session table displayed on the FortiView Sessions monitor is useful when verifying open connections. For example, if you have a web browser open to browse the Fortinet website, you would expect a session entry from your computer on port 80 to the IP address for the Fortinet website. You can also use a session table to investigate why there are too many sessions for FortiOS to process.

You can filter the sessions displayed in the session table by setting up the available filtering options.

**To filter sessions in the session table:**

1. Click on the *Add Filter* button at the top of the session table.

2. Select the required filtering option. The session table updates to the filter selection.

3. You may add one or more filters depending upon your requirements. To add more filters, repeat the above steps for a different set of filters.
You can be very specific with how you use filters and target sessions based on different filter combinations. For example, you may want to view all sessions from a device with a particular IP by adding the Source IP filter. Similarly, you may need to target all the sessions having a particular Destination IP and Destination Port, and so on.

You may also view the session data in the CLI.

**To view session data using the CLI:**

```
# diagnose sys session list
```

The session table output in the CLI is very large. You can use the supported filters in the CLI to show only the data you need.

**To view session data with filters using the CLI:**

```
# diagnose sys session filter <option>
```

See to learn more about using the supported filters in the CLI.

You may also decide to end a particular session or all sessions for administrative purposes.

**To end sessions from the GUI:**

1. Select the session you want to end. To select multiple sessions, hold the Ctrl or Shift key on your keyboard while clicking the sessions.

2. Right-click on the selected sessions, click on **End Session(s)** or **End All Sessions**.

3. Click OK in the confirmation dialog.

**FortiView Top Source and Top Destination Firewall Objects monitors**

The FortiView Source Firewall Objects and FortiView Destination Firewall Objects monitors leverage UUID to resolve firewall object address names for improved usability.

**Requirements**

To have a historical Firewall Objects-based view, address objects’ UUIDs need to be logged.

**To enable address object UUID logging in the CLI:**

```
config system global
  set log-uuid-address enable
```
To add a firewall object monitor in the GUI:

2. In the Search field, type Destination Firewall Objects and click the Add button next to the dashboard name.

3. In the FortiGate area, select the FortiGate(s) from the dropdown.

4. In the Data Source area, select Best Available Device or Specify. For information, see Using the FortiView interface on page 111.

5. From the Time Period dropdown, select the time period. Select now for real-time information, or (1 hour, 24 hours, and 7 days) for historical information.

6. In the Visualization area, select Table View or Bubble Chart.

7. From the Sort By dropdown, select Bytes, Sessions, Bandwidth, or Packets.

8. Click Add Monitor. The monitor is added to the tree menu.

To drill down Firewall Objects:

1. Open the FortiView Source Firewall Objects or FortiView Destination Firewall Objects monitor.

2. Right-click on any Source or Destination Object and click Drill Down to Details.

3. Click the tabs to sort the sessions by Application, Destinations, Web Sites, or Policies.

4. To view signatures, click the entry in the Category column.

5. To view sessions, right-click an entry and click View Sessions, or click the Sessions tab.

6. To end a session, right-click an entry in the Sessions tab and select End Sessions or End All Sessions.
Viewing top websites and sources by category

You can use FortiGuard web categories to populate the category fields in various FortiView monitors such as FortiView Web Categories, FortiView Websites or FortiView Sources. To view the categories in a monitor, the web filter profile must be configured to at least monitor for a FortiGuard category based on a web filter and applied to a firewall policy for outbound traffic.

To verify the web filter profile is monitor-only:

2. Double-click a web filter that is applied to an outbound traffic firewall policy. The Edit Web Filter Profile window opens.
3. Ensure FortiGuard category based filter is enabled. In the image below, the General Interest - Business categories are monitor-only.

To create a Web categories monitor:

2. In the Search field, type FortiView Web Categories and click the Add button next to the monitor name.
3. In the FortiGate area, select the FortiGate(s) from the dropdown.
4. In the Data Source area, click Best Available Device or Specify to select a device in the security fabric.
5. From the Time Period dropdown, select a time period greater than Now.
6. From the Sort By dropdown, select Bytes, Sessions, Bandwidth, or Packets.
7. Click Add Monitor. The widget is added to the tree menu.
Dashboards and Monitors

Viewing the web filter category

The web filter category name appears in the Category column of the dashboard.

Click an entry in the table. The category name appears at the top of the Summary of box.

Click the Web Sites tab. The category name appears in the Category column.
Click the Sessions tab. The category name appears in the Category Description column.

The category name also appears in the Category column in the FortiView Websites and FortiView Sources monitors.
Cloud application view

To see different cloud application views, set up the following:

- A FortiGate with a firewall policy that uses the Application Control security profile.
- A FortiGate with log data from the local disk or FortiAnalyzer.
- Optional but highly recommended: SSL Inspection set to deep-inspection in the related firewall policies.

Viewing cloud applications

Cloud applications

All cloud applications require SSL Inspection set to deep-inspection on the firewall policy. For example, Facebook File.Download can monitor Facebook download behavior which requires SSL deep-inspection to parse the deep information in the network packets.

To view cloud applications:

1. Go to Security Profiles > Application Control.
2. Select a relative Application Control profile used by the firewall policy and click Edit.
3. On the Edit Application Sensor page, click View Application Signatures.
4. Hover over a column heading or the Application Signature bar. In the right gutter area, click the filter icon to filter the applications.
Dashboards and Monitors

Cloud applications have a cloud icon beside them.
The lock icon indicates that the application requires SSL deep inspection.

5. Hover over an item to see its details.
This example shows Gmail_Attachment.Download, a cloud application signature based sensor which requires SSL deep inspection. If any local network user behind the firewall logs into Gmail and downloads a Gmail attachment, that activity is logged.

Applications with cloud behavior

Applications with cloud behavior is a superset of cloud applications.
Some applications do not require SSL deep inspection, such as Facebook, Gmail, and YouTube. This means that if any traffic trigger application sensors for these applications, there is a FortiView cloud application view for that traffic.
Other applications require SSL deep inspection, such as Gmail attachment, Facebook_Workplace, and so on.
To view applications with cloud behavior:

1. In the Application Signature page, ensure the Behavior column is displayed. If necessary, add the Behavior column.
   a. Hover over the left side of the table column headings to display the Configure Table icon.
   b. Click Configure Table and select Behavior.
   c. Click Apply.

2. Click the filter icon in the Behavior column and select Cloud to filter by Cloud. Then click Apply.

3. The Application Signature page displays all applications with cloud behavior.
4. Use the Search box to search for applications. For example, you can search for `youtube`.

5. Hover over an item to see its details.
   This example shows an application sensor with no lock icon which means that this application sensor does not require SSL deep inspection. If any local network user behind the firewall tries to navigate to the YouTube website, that activity is logged.

**Configuring the Cloud Applications monitor**

On the `Edit Application Sensor` page in the `Categories` section, the eye icon next to a category means that category is monitored and logged.
To add the Cloud Applications monitor in the GUI:

1. Click Add Monitor. The Add monitor window opens.

2. In the Search field, enter FortiView Cloud Applications and click the Add button next to the monitor.

3. In the FortiGate area, select the FortiGate(s) from the dropdown.

4. In the Data Source area, click Best Available Device or Specify to select a device in the security fabric.

5. From the Time Period dropdown, select a time period greater than Now.

6. From the Sort By dropdown, select Bytes, Sessions, or Files (Up/Down).

7. Click Add Monitor. The monitor is added to the tree menu.

8. Open the monitor. If SSL deep inspection is enabled in the related firewall policy, then the monitor shows the additional details that are logged, such as Files (Up/Down) and Videos Played.
   - For YouTube, the Videos Played column is triggered by the YouTube_Video_Play cloud application sensor. This shows the number of local network users who logged into YouTube and played YouTube videos.
   - For Dropbox, the Files (Up/Down) column is triggered by Dropbox_File.Download and Dropbox_File.Upload cloud application sensors. This shows the number of local network users who logged into Dropbox and uploaded or downloaded files.
Using the Cloud Applications monitor

To see additional information in the Cloud Applications monitor:

1. In the tree menu, click the *FortiView Cloud Applications* monitor to open it.

2. For details about a specific entry, double-click the entry or right-click the entry and select *Drill Down to Details*.

3. To see all the sessions for an application, click *Sessions*.

   In this example, the *Application Name* column shows all applications related to YouTube.
4. To view log details, double-click a session to display the Log Details pane. Sessions monitored by SSL deep inspection (in this example, Youtube_Video.Play) captured deep information such as Application User, Application Details, and so on. The Log Details pane also shows additional deep information such as application ID, Message, and so on. Sessions not monitored by SSL deep inspection (YouTube) did not capture the deep information.

5. To display a specific time period, select and drag in the timeline graph to display only the data for that time period.

Top application: YouTube example

Monitoring network traffic with SSL deep inspection

This example describes how to monitor network traffic for YouTube using FortiView Applications view with SSL deep inspection.

To monitor network traffic with SSL deep inspection:

1. Create a firewall policy with the following settings:
   - Application Control is enabled.
   - SSL Inspection is set to deep-inspection.
Dashboards and Monitors

- Log Allowed Traffic is set to All Sessions.

2. Go to Security Profiles > Application Control.
3. Select a relative Application Control profile used by the firewall policy and click Edit.
4. Because YouTube cloud applications are categorized into Video/Audio, ensure the Video/Audio category is monitored. Monitored categories are indicated by an eye icon.
5. Click View Application Signatures and hover over YouTube cloud applications to view detailed information about YouTube application sensors.
6. Expand YouTube to view the Application Signatures associated with the application.

<table>
<thead>
<tr>
<th>Application Signature</th>
<th>Description</th>
<th>ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>YouTube_Video.Access</td>
<td>An attempt to access a video on YouTube.</td>
<td>16420</td>

<td>An attempt to access YouTube. This application sensor does not depend on SSL deep inspection so it does not have a cloud or lock icon.</td>
<td>31077</td>
</tr>
<tr>
<td>YouTube_Channel.Access</td>
<td>An attempt to access a video on a specific channel on YouTube.</td>
<td>41598</td>
</tr>
</tbody>
</table>

To view the application signature description, click the ID link in the information window.

7. On the test PC, log into YouTube and play some videos.
8. On the FortiGate, go to Log & Report > Security Events and look for log entries for browsing and playing YouTube videos in the Application Control card.
In this example, note the Application User and Application Details. Also note that the Application Control ID is 38569 showing that this entry was triggered by the application sensor YouTube_Video.Play.

<table>

Monitoring network traffic without SSL deep inspection

This example describes how to monitor network traffic for YouTube using FortiView cloud application view without SSL deep inspection.

To monitor network traffic without SSL deep inspection:

1. Create a firewall policy with the following settings.
   - **Application Control** is enabled.
   - **SSL Inspection** is set to certificate-inspection.

9. Go to Dashboard > FortiView Applications.
10. In the FortiView Applications monitor, double-click YouTube to view the drilldown information.
11. Select the Sessions tab to see all the entries for the videos played. Check the sessions for YouTube_Video.Play with the ID 38569.
Dashboards and Monitors

- **Log Allowed Traffic** is set to **All Sessions**.

2. On the test PC, log into YouTube and play some videos.

3. On the FortiGate, go to **Log & Report > Security Events** and look for log entries for browsing and playing YouTube videos in the **Application Control** card.

   In this example, the log shows only applications with the name YouTube. The log cannot show YouTube application sensors which rely on SSL deep inspection.

4. Go to **Dashboard > FortiView Applications**.

   The **FortiView Application** by Bytes monitor shows the YouTube cloud application without the video played information that requires SSL deep inspection.
5. Double-click *YouTube* and click the *Sessions* tab. These sessions were triggered by the application sensor *YouTube* with the ID 31077. This is the application sensor with cloud behavior which does not rely on SSL deep inspection.

- IPv6 on page 466
- Diagnostics on page 475

Interfaces

Physical and virtual interfaces allow traffic to flow between internal networks, and between the internet and internal networks. FortiOS has options for configuring interfaces and groups of sub-networks that can scale as your organization grows. The following table lists commonly used interface types.

<table>
<thead>
<tr>
<th>Interface type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical</td>
<td>A physical interface can be connected to with either Ethernet or optical cables. Depending on the FortiGate model, there is a varying number of Ethernet or optical physical interfaces. Some FortiGates have a grouping of interfaces labeled as lan that have a built-in switch functionality. See Physical interface on page 162 for more information.</td>
</tr>
<tr>
<td>VLAN</td>
<td>A virtual local area network (VLAN) logically divides a local area network (LAN) into distinct broadcast domains using IEEE 802.1Q VLAN tags. A VLAN interface supports VLAN tagging and is associated with a physical interface that can be connected to a device, such as a switch or a router that supports these tags. VLANs can be used on a FortiGate in NAT or transparent mode, and the FortiGate functions differently depending on the operation mode. See VLAN on page 163 for more information.</td>
</tr>
<tr>
<td>Interface type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Aggregate</td>
<td>An aggregate interface uses a link aggregation method to combine multiple physical interfaces to increase throughput and to provide redundancy. FortiOS supports a link aggregation (LAG) interface using the Link Aggregation Control Protocol (LACP) based on IEEE 802.3ad. See Aggregation and redundancy on page 179 for more information.</td>
</tr>
<tr>
<td>Redundant</td>
<td>A redundant interface combines multiple physical interfaces where traffic only uses one of the interfaces at a time. Its primary purpose is to provide redundancy. This interface is typically used with a fully-meshed HA configuration. See Aggregation and redundancy on page 179 for more information.</td>
</tr>
<tr>
<td>Loopback</td>
<td>A loopback interface is a logical interface that is always up because it has no physical link dependency, and the attached subnet is always present in the routing table. It can be accessed through several physical or VLAN interfaces. See Loopback interface on page 183 for more information.</td>
</tr>
<tr>
<td>Software switch</td>
<td>A software switch is a virtual switch interface implemented in firmware that allows member interfaces to be added to it. Devices connected to member interfaces communicate on the same subnet, and packets are processed by the FortiGate’s CPU. A software switch supports adding a wireless SSID as a member interface. See Software switch on page 183 for more information.</td>
</tr>
<tr>
<td>Hardware switch</td>
<td>A hardware switch is a virtual switch interface implemented at the hardware level that allows member interfaces to be added to it. Devices connected to member interfaces communicate on the same subnet. A hardware switch relies on specific hardware to optimize processing and supports the Spanning Tree Protocol (STP). See Hardware switch on page 185 for more information.</td>
</tr>
<tr>
<td>Zone</td>
<td>A zone is a logical group containing one or more physical or virtual interfaces. Grouping interfaces in zones can simplify firewall policy configurations. See Zone on page 189 for more information.</td>
</tr>
<tr>
<td>Virtual wire pair</td>
<td>A virtual wire pair (VWP) is an interface that acts like a virtual wire consisting of two interfaces, with an interface at each of the wire. No IP addressing is configured on a VWP, and communication is restricted between the two interfaces using firewall policies. See Virtual wire pair on page 191 for more information.</td>
</tr>
<tr>
<td>FortiExtender WAN extension</td>
<td>A FortiExtender WAN extension is a managed interface that allows a connected FortiExtender to provide WAN connectivity to the FortiGate. See FortiExtender on page 402 for more information.</td>
</tr>
<tr>
<td>FortiExtender LAN extension</td>
<td>A FortiExtender LAN extension is a managed interface that allows a connected FortiExtender to provide LAN connectivity to the FortiGate. See FortiExtender on page 402 for more information.</td>
</tr>
</tbody>
</table>
### Interface type

<table>
<thead>
<tr>
<th>Interface type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enhanced MAC VLAN | An enhanced media access control (MAC) VLAN, or EMAC VLAN, interface allows a physical interface to be virtually subdivided into multiple virtual interfaces with different MAC addresses. In FortiOS, the EMAC VLAN functionality acts like a bridge.  
See Enhanced MAC VLAN on page 195 for more information. |
| VXLAN | A Virtual Extensible LAN (VXLAN) interface encapsulates layer 2 Ethernet frames within layer 3 IP packets and is used for cloud and data center networks.  
See VXLAN on page 198 for more information. |
| Tunnel | A tunnel virtual interface is used for IPsec interface-based or GRE tunnels and are created when configuring IPsec VPN and GRE tunnels, respectively. The tunnel interface can be configured with IP addresses on both sides of the tunnel since this is a requirement when using a tunnel interface with a dynamic routing protocol.  
See OSPF with IPsec VPN for network redundancy on page 1461, GRE over IPsec on page 1376, and Cisco GRE-over-IPsec VPN on page 1407 for more information. |
| WiFi SSID | A WiFi SSID interface is used to control wireless network user access to a wireless local radio on a FortiWiFi or to a wireless access point using a FortiAP. The SSID is created using the WiFi & Switch Controller > SSIDs page, and it appears in the Network > Interfaces page once it is created.  
See Defining a wireless network interface (SSID) in the FortiWiFi and FortiAP Configuration Guide for more information. |
| VDOM link | A VDOM link allows VDOMs to communicate internally without using additional physical interfaces.  
See Inter-VDOM routing for more information. |

### Interface settings

Administrators can configure both physical and virtual FortiGate interfaces in Network > Interfaces. There are different options for configuring interfaces when FortiGate is in NAT mode or transparent mode.

The available options will vary depending on feature visibility, licensing, device model, and other factors. The following list is not comprehensive.

**To configure an interface in the GUI:**

1. Go to Network > Interfaces.
2. Click Create New > Interface.
3. Configure the interface fields:

<p>| Interface Name | Physical interface names cannot be changed. |</p>
<table>
<thead>
<tr>
<th>Alias</th>
<th>Enter an alternate name for a physical interface on the FortiGate unit. This field appears when you edit an existing physical interface. The alias does not appear in logs. The maximum length of the alias is 25 characters.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>The configuration type for the interface, such as VLAN, Software Switch, 802.3ad Aggregate, and others.</td>
</tr>
<tr>
<td>Interface</td>
<td>This field is available when Type is set to VLAN. Select the name of the physical interface that you want to add a VLAN interface to. Once created, the VLAN interface is listed below its physical interface in the Interface list. You cannot change the physical interface of a VLAN interface.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>This field is available when Type is set to VLAN. Enter the VLAN ID. The VLAN ID can be any number between 1 and 4094 and must match the VLAN ID added by the IEEE 802.1Q-compliant router or switch that is connected to the VLAN subinterface. The VLAN ID can be edited after the interface is added.</td>
</tr>
<tr>
<td>VRF ID</td>
<td>Virtual Routing and Forwarding (VRF) allows multiple routing table instances to coexist on the same router. One or more interface can have a VRF, and packets are only forwarded between interfaces with the same VRF.</td>
</tr>
<tr>
<td>Virtual Domain</td>
<td>Select the virtual domain to add the interface to. Only administrator accounts with the super_admin profile can change the Virtual Domain.</td>
</tr>
</tbody>
</table>
| Interface Members | This section can have different formats depending on the Type. Members can be selected for some interface types:  
  - Software Switch or Hardware Switch: Specify the physical and wireless interfaces joined into the switch.  
  - 802.3ad Aggregate or Redundant Interface: This field includes the available and selected interface lists. |
| Role | Set the role setting for the interface. Different settings will be shown or hidden when editing an interface depending on the role:  
  - LAN: Used to connected to a local network of endpoints. It is default role for new interfaces.  
  - WAN: Used to connected to the internet. When WAN is selected, the Estimated bandwidth setting is available, and the following settings are not: DHCP server, Create address object matching subnet, Device detection, Security mode, One-arm sniffer, Dedicate to extension/fortiap modes, and Admission Control. and will show Estimated Bandwidth settings.  
  - DMZ: Used to connected to the DMZ. When selected, DHCP server and Security mode are not available.  
  - Undefined: The interface has no specific role. When selected, Create address object matching subnet is not available. |
| Estimated bandwidth | The estimated WAN bandwidth. |
The values can be entered manually, or saved from a speed test executed on the interface. The values can be used in SD-WAN rules that use the Maximize Bandwidth or Best Quality strategy.

<table>
<thead>
<tr>
<th>Traffic mode</th>
<th>This option is only available when Type is WiFi SSD.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Tunnel: Tunnel to wireless controller</td>
</tr>
<tr>
<td></td>
<td>Bridge: Local bridge with FortiAP's interface</td>
</tr>
<tr>
<td></td>
<td>Mesh: Mesh downlink</td>
</tr>
</tbody>
</table>

### Address

<table>
<thead>
<tr>
<th>Addressing mode</th>
<th>Select the addressing mode for the interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manual</td>
<td>Add an IP address and netmask for the interface. If IPv6 configuration is enabled, you can add both an IPv4 and an IPv6 address.</td>
</tr>
<tr>
<td>DHCP</td>
<td>Get the interface IP address and other network settings from a DHCP server.</td>
</tr>
<tr>
<td>Auto-managed by IPAM</td>
<td>Assign subnets to prevent duplicate IP addresses from overlapping within the same Security Fabric. See Configure IPAM locally on the FortiGate on page 143.</td>
</tr>
<tr>
<td>PPPoE</td>
<td>Get the interface IP address and other network settings from a PPPoE server. This option is only available on the low-end FortiGate models.</td>
</tr>
<tr>
<td>One-Arm Sniffer</td>
<td>Set the interface as a sniffer port so it can be used to detect attacks. See One-arm sniffer on page 151.</td>
</tr>
</tbody>
</table>

| IP/Netmask | If Addressing Mode is set to Manual, enter an IPv4 address and subnet mask for the interface. FortiGate interfaces cannot have multiple IP addresses on the same subnet. |

<table>
<thead>
<tr>
<th>IPv6 addressing mode</th>
<th>Select the addressing mode for the interface:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manual</td>
<td>Add an IP address and netmask for the interface.</td>
</tr>
<tr>
<td>DHCP</td>
<td>Get the interface IP address and other network settings from a DHCP server.</td>
</tr>
<tr>
<td>Delegated</td>
<td>Select an IPv6 upstream interface that has DHCPv6 prefix delegation enabled, and enter an IPv6 subnet if needed. The interface will get the IPv6 prefix from the upstream DHCPv6 server that is connected to the IPv6 upstream interface, and form the IPv6 address with the subnet configured on the interface.</td>
</tr>
</tbody>
</table>

| IPv6 Address/Prefix | If Addressing Mode is set to Manual and IPv6 support is enabled, enter an IPv6 address and subnet mask for the interface. A single interface can have an IPv4 address, IPv6 address, or both. |

<table>
<thead>
<tr>
<th>Auto configure IPv6 address</th>
<th>Automatically configure an IPv6 address using Stateless Address Auto-configuration (SLAAC).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This option is available when IPv6 addressing mode is set to Manual.</td>
</tr>
</tbody>
</table>

| DHCPv6 prefix delegation | Enable/disable DHCPv6 prefix delegation, which can be used to delegate IPv6 prefixes from an upstream DHCPv6 server to another interface or downstream device. |
When enabled, there is an option to enable a **DHCPv6 prefix hint** that helps the DHCPv6 server provide the desired prefix.

**Create address object matching subnet**  
This option is available when **Role** is set to **LAN or DMZ**. Enable this option to automatically create an address object that matches the interface subnet.

**Secondary IP Address**  
Add additional IPv4 addresses to this interface.

**Administrative Access**  
**IPv4 Administrative Access**  
Select the types of administrative access permitted for IPv4 connections to this interface. See [Configure administrative access to interfaces on page 141](#).

**IPv6 Administrative Access**  
Select the types of administrative access permitted for IPv6 connections to this interface. See [Configure administrative access to interfaces on page 141](#).

**DHCP Server**  
Enable a DHCP server for the interface. See [DHCP server on page 287](#).

**Stateless Address Auto-configuration (SLAAC)**  
Enable to provide IPv6 addresses to connected devices using SLAAC.

**DHCPv6 Server**  
Select to enable a DHCPv6 server for the interface. When enabled, you can configure DNS service settings: Delegated (delegate the DNS received from the upstream server), Same as System DNS, or Specify (up to four servers).

You can also enable Stateful server to configure the DHCPv6 server to be stateful. Manually enter the IP range, or use Delegated mode to delegate IP prefixes from an upstream DHCPv6 server connected to the upstream interface.

**Device Detection**  
Enable/disable passively gathering device identity information about the devices on the network that are connected to this interface.

**Security Mode**  
Enable/disable captive portal authentication for this interface. After enabling captive portal authentication, you can configure the authentication portal, user and group access, custom portal messages, exempt sources and destinations/services, and redirect after captive portal.

**DSL Settings**  
**Physical mode**  
Set to **ADSL or VDSL**.

**Transfer mode**  
Set to **PTM or ATM**.

If the **Transfer mode** is set to **ATM**, the **Virtual channel identification**, **Virtual path identification**, **ATM protocol**, and **MUX type** can be configured.

**Traffic Shaping**  
**Outbound shaping profile**  
Enable/disable traffic shaping on the interface. This allows you to enforce bandwidth limits on individual interfaces. See [Interface-based traffic shaping profile on page 954](#) for more information.

**Miscellaneous**  

To configure an interface in the CLI:

```plaintext
cfg system interface
   edit <name>
      set vdom <VDOM_name>
      set mode {static | dhcp | pppoe}
      set ip <IP_address/netmask>
      set security-mode {none | captive-portal | 802.1X}
      set egress-shaping-profile <profile>
      set device-identification {enable | disable}
      set allowaccess (ping https ssh http snmp telnet fgfm radius-acct probe-response fabric ftm)
      set eap-supplicant {enable | disable}
      set eap-method {peap | tls}
      set eap-identity <identity>
      set eap-password <password>
      set eap-ca-cert <CA_cert>
      set eap-user-cert <user_cert>
      set secondary-IP enable
   config secondaryip
      edit 1
         set ip 9.1.1.2 255.255.255.0
         set allowaccess ping https ssh snmp http
      next
   next
end
```

**Configure administrative access to interfaces**

You can configure the protocols that administrators can use to access interfaces on the FortiGate. This helps secure access to the FortiGate by restricting access to a limited number of protocols. It helps prevent users from accessing interfaces that you don’t want them to access, such as public-facing ports.

As a best practice, you should configure administrative access when you’re setting the IP address for a port.

**To configure administrative access to interfaces in the GUI:**

1. Go to *Network > Interfaces*.
2. Create or edit an interface.
3. In the *Administrative Access* section, select which protocols to enable for *IPv4* and *IPv6 Administrative Access*.

<table>
<thead>
<tr>
<th>Speed Test</th>
<th>Allow this interface to listen to speed test sender requests.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>To allow the FortiGate to be configured as speed test server, configure the following:</td>
</tr>
</tbody>
</table>
FEC implementations on 10G, 25G, 40G, and 100G interfaces

Only supported FEC (forward error correction) implementations are allowed to be configured on 10G, 25G, 40G, and 100G interfaces based on the speed that is selected.

- For 1000M, 10G, or 40G interfaces, FEC is not supported and the option is disabled.
- For 25G and 100G interfaces, FEC is automatically set to cl91-rs-fec by default.

To configure an interface for FEC:

```fortigate
config system interface
    edit <name>
      set speed {10000full | 1000full | 100Gauto | 100Gfull | 25000auto | 25000full | 40000full}
      set mediatype {sr4 | lr4 | cr4}
      set forward-error-correction {disable | cl91-rs-fec | cl74-fc-fec}
    next
end
```
To change the interface speed from 40G to 100G:

```
config system interface
   edit port26
      set speed 100Gfull
   next
end
```

The speed/mediatype/FEC of port26 will be changed from 40000full/sr4/disable to 100Gfull/sr4/cl91-rs-fec.

Do you want to continue? (y/n) y

Since the speed changed to 1000G, the mediastype setting automatically changes to sr4, and the forward-error-correction setting automatically changes to cl91-rs-fec. When the speed was 40G, the forward-error-correction setting was disabled.

**Configure IPAM locally on the FortiGate**

IPAM (IP address management) is available locally on the FortiGate. A standalone FortiGate, or a Fabric root in the Security Fabric, can act as the IPAM server. Interfaces configured to be auto-managed by IPAM will receive an address from the IPAM server’s address/subnet pool. DHCP Server is automatically enabled in the GUI, and the address range is populated by IPAM. Users can customize the address pool subnet and the size of a subnet that an interface can request.

**To configure IPAM settings:**

```
config system ipam
   set pool-subnet <class IP and netmask>
   set status {enable | disable}
end
```
**Network**

<table>
<thead>
<tr>
<th>pool-subnet &lt;class IP and netmask&gt;</th>
<th>Set the IPAM pool subnet, class A or class B subnet.</th>
</tr>
</thead>
<tbody>
<tr>
<td>status {enable</td>
<td>disable}</td>
</tr>
</tbody>
</table>

In previous FortiOS versions, the `set fortiiipam-integration` option was configured under `config system global`.

The following options are available for allocating the subnet size:

```
config system interface
  set managed-subnetwork-size {32 | 64 | 128 | 256 | 512 | 1024 | 2048 | 4096 | 8192 | 16384 | 32768 | 65536}
end
```

**Example**

In this example, FGT_AA is the Security Fabric root with IPAM enabled. FGT_BB and FGT_CC are downstream Fabric devices and retrieve IPAM information from FGT_AA. The Fabric interface on all FortiGates is port2. FGT_AA acts as the DHCP server, and FGT_BB acts as the DHCP client.

To configure IPAM locally in the Security Fabric:

1. On the root FortiGate, go to Network > Interfaces and edit port3.
2. For Addressing Mode, select Auto-Managed by IPAM. DHCP Server is automatically enabled.
3. In this example, IPAM is not enabled yet. Click *Enable IPAM*. The *Edit Fabric Connector* pane opens.
4. Enter the **Pool subnet** (only class A and B are allowed) and click **OK**. The root FortiGate is now the IPAM server in the Security Fabric. The following is configured in the backend:

```fortigate
config system interface
  edit "port3"
    set vdom "root"
    set ip 172.31.0.1 255.255.255.0
    set type physical
    set device-identification enable
    set snmp-index 5
    set ip-managed-by-fortiipam enable
  end
next
end
config system ipam
  set status enable
end
```

IPAM is managing a 172.31.0.0/16 network and assigned port3 a /24 network by default. The **IP/Netmask** field in the **Address** section has been automatically assigned a class C IP by IPAM. The **Address range** and **Netmask** fields in the **DHCP Server** section have also been automatically configured by IPAM.
5. Click OK.
6. Log in to FGT-BB and set the Addressing Mode of port4 to Auto-Managed by IPAM. The subnet assigned from the pool on the root is 172.31.1.1/24.
7. Log in to FG_CC and set the Addressing Mode of port34 to Auto-Managed by IPAM. The subnet assigned from the pool on the root is 172.31.2.1/24.

Any interface on a downstream FortiGate can be managed by the IPAM server. The interface does not have to be directly connected to the Fabric root FortiGate.

To edit the IPAM subnet:
1. Go to Security Fabric > Fabric Connectors and double-click the IP Address Management (IPAM) card.
2. Edit the pool subnet if needed.
3. In the right-side pane, click View Allocated IP Addresses to view the subnet allocations (port34, port3, and port3) and DHCP lease information. On FGT_BB, port3 is a DHCP client and the DHCP server interface (FGT_AA port3) is managed by IPAM, so it is displayed in the Manually Configured section.

The same allocated IP address information is available in the IP Address Management (IPAM) widget that can be added to the Dashboard > Status page.

4. Click OK.

On downstream FortiGates, the settings on the IP Address Management (IPAM) card cannot be changed if IPAM is enabled on the root FortiGate.
Diagnostics

Use the following commands to view IPAM related diagnostics.

To view the largest available subnet size:

```bash
# diagnose sys ipam largest-available-subnet
Largest available subnet is a /17.
```

To verify IPAM allocation information:

```bash
# diagnose sys ipam dump-ipams-entries
IPAM Entries: (an, vdom, interface, subnet/mask, flag)
F140EP4Q17000000 root port3 172.31.2.1/24 0
FG5H1E5818900001 root port3 172.31.0.1/24 0
FG5H1E5818900002 root port4 172.31.1.1/24 0
FG5H1E5818900003 root port3 172.31.0.2/24 1
```

To verify the available subnets:

```bash
# diagnose sys ipam dump-ipams-free-subnets
IPAM free subnets: (subnet/mask)
  172.31.3.0/24
  172.31.4.0/22
  172.31.8.0/21
  172.31.16.0/20
  172.31.32.0/19
  172.31.64.0/18
  172.31.128.0/17
```

To remove a device from IPAM in the Security Fabric:

```bash
# diagnose sys ipam delete-device-from-ipams F140EP4Q17000000
Successfully removed device F140EP4Q17000000 from ipam
**Interface MTU packet size**

Changing the maximum transmission unit (MTU) on FortiGate interfaces changes the size of transmitted packets. Most FortiGate device's physical interfaces support jumbo frames that are up to 9216 bytes, but some only support 9000 or 9204 bytes.

To avoid fragmentation, the MTU should be the same as the smallest MTU in all of the networks between the FortiGate and the destination. If the packets sent by the FortiGate are larger than the smallest MTU, then they are fragmented, slowing down the transmission. Packets with the DF flag set in the IPv4 header are dropped and not fragmented.

On many network and endpoint devices, the path MTU is used to determine the smallest MTU and to transmit packets within that size.

- ASIC accelerated FortiGate interfaces, such as NP6, NP7, and SOC4 (np6xlite), support MTU sizes up to 9216 bytes.
- FortiGate VMs can have varying maximum MTU sizes, depending on the underlying interface and driver.
- Virtual interfaces, such as VLAN interfaces, inherit their MTU size from their parent interface.

**To verify the supported MTU size:**

```fortigate
config system interface
   edit <interface>
      set mtu-override enable
      set mtu <integer>
   next
end
```

**To change the MTU size:**

```fortigate
config system interface
   edit <interface>
      set mtu-override enable
      set mtu <max bytes>
   next
end
```

**Maximum MTU size on a path**

To manually test the maximum MTU size on a path, you can use the ping command on a Windows computer.

For example, you can send ICMP packets of a specific size with a DF flag, and iterate through increasing sizes until the ping fails.

- The `-f` option specifies the Do not Fragment (DF) flag.
- The `-l` option specifies the length, in bytes, of the Data field in the echo Request messages. This does not include the 8 bytes for the ICMP header and 20 bytes for the IP header. Therefore, if the maximum MTU is 1500 bytes, then the maximum supported data size is: \(1500 - 8 - 20 = 1472\) bytes.

**To determine the maximum MTU size on a path:**

1. In Windows command prompt, try a likely MTU size:

   ```cmd
   ping 4.2.2.1 -l 1472 -f
   Pinging 4.2.2.1 with 1472 bytes of data:
   ```
Network

Reply from 4.2.2.1: bytes=1472 time=41ms TTL=52
Reply from 4.2.2.1: bytes=1472 time=42ms TTL=52
Reply from 4.2.2.1: bytes=1472 time=103ms TTL=52
Reply from 4.2.2.1: bytes=1472 time=38ms TTL=52

Ping statistics for 4.2.2.1:
   Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
   Minimum = 38ms, Maximum = 103ms, Average = 56ms

2. Increase the size and try the ping again:

   > ping 4.2.2.1 -l 1473 -f
   Pinging 4.2.2.1 with 1473 bytes of data:
   Request timed out.

   Ping statistics for 4.2.2.1:
   Packets: Sent = 1, Received = 0, Lost = 1 (100% loss),

   The second test fails, so the maximum MTU size on the path is 1472 bytes + 8-byte ICMP header + 20-byte IP
   header = 1500 bytes

Maximum segment size

The TCP maximum segment size (MSS) is the maximum amount of data that can be sent in a TCP segment. The MSS is
the MTU size of the interface minus the 20 byte IP header and 20 byte TCP header. By reducing the TCP MSS, you can
effectively reduce the MTU size of the packet.

The TCP MSS can be configured in a firewall policy (see Configurations in the CLI on page 766), or directly on an
interface.

To configure the MSS on an interface:

   config system interface
   edit "wan2"
      set vdom "root"
      set mode dhcp
      set allowaccess ping fgfm
      set type physical
      set tcp-mss 1448
      set role wan
   next
   end

One-arm sniffer

You can use a one-arm sniffer to configure a physical interface as a one-arm intrusion detection system (IDS). Traffic
sent to the interface is examined for matches to the configured security profile. The matches are logged, and then all
received traffic is dropped. Sniffing only reports on attacks; it does not deny or influence traffic.

You can also use the one-arm sniffer to configure the FortiGate to operate as an IDS appliance to sniff network traffic for
attacks without actually processing the packets. To configure a one-arm IDS, enable sniffer mode on a physical interface
and connect the interface to the SPAN port of a switch or a dedicated network tab that can replicate the traffic to the
FortiGate.
If the one-arm sniffer option is not available, this means the interface is in use. Ensure that the interface is not selected in any firewall policies, routes, virtual IPs, or other features where a physical interface is specified. The option also does not appear if the role is set to WAN. Ensure the role is set to LAN, DMZ, or undefined.

The following table lists some of the one-arm sniffer settings you can configure:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Security Profiles</strong></td>
<td>The following profiles are configurable in the GUI and CLI:</td>
</tr>
<tr>
<td></td>
<td>• Antivirus</td>
</tr>
<tr>
<td></td>
<td>• Web filter</td>
</tr>
<tr>
<td></td>
<td>• Application control</td>
</tr>
<tr>
<td></td>
<td>• IPS</td>
</tr>
<tr>
<td></td>
<td>• File filter</td>
</tr>
<tr>
<td></td>
<td>The following profiles are only configurable in the CLI:</td>
</tr>
<tr>
<td></td>
<td>• Email filter</td>
</tr>
<tr>
<td></td>
<td>• DLP</td>
</tr>
<tr>
<td></td>
<td>• IPS DoS</td>
</tr>
</tbody>
</table>

**CPU usage and packet loss**

Traffic scanned on the one-arm sniffer interface is processed by the CPU, even if there is an SPU, such as NPU or CP, present. The one-arm sniffer may cause higher CPU usage and perform at a lower level than traditional inline scanning, which uses NTurbo or CP to accelerate traffic when present.

The absence of high CPU usage does not indicate the absence of packet loss. Packet loss may occur due to the capacity of the TAP devices hitting maximum traffic volume during mirroring, or on the FortiGate when the kernel buffer size is exceeded and it is unable to handle bursts of traffic.

**Example configuration**

The following example shows how to configure a file filter profile that blocks PDF and RAR files used in a one-arm sniffer policy.

**To configure a one-arm sniffer policy in the GUI:**

1. Go to *Network > Interfaces* and double-click a physical interface to edit it.
2. For *Role*, select either LAN, DMZ, or Undefined.
3. For *Addressing Mode*, select One-Arm Sniffer.

5. In the Rules table, click Create New.
6. Configure the rule:
   a. For File types, click the + and select pdf and rar.
   b. For Action, select Block.
   c. Click OK to save the rule.
7. Click OK to save the file filter profile.
8. Click OK to save the interface settings.

To configure a one-arm sniffer policy in the CLI:

1. Configure the interface:
   
   ```
   config system interface
   edit "s1"
   set vdom "root"
   set ips-sniffer-mode enable
   set type physical
   set role undefined
   set snmp-index 31
   next
   end
   ```

2. Configure the file filter profile:
   
   ```
   config file-filter profile
   edit "sniffer-profile"
   set comment "File type inspection."
   config rules
   edit "1"
   set protocol http ftp smtp imap pop3 cifs
   ```
set action block
set file-type "pdf" "rar"
next
data
next
end

3. Configure the firewall sniffer policy:

```
config firewall sniffer
edit 1
set interface "sl"
set file-filter-profile-status enable
set file-filter-profile "sniffer-profile"
next
end
```

4. View the log:

```
# execute log filter category 19
# execute log display
1 logs found.
1 logs returned.

1: date=2020-12-29 time=09:14:46 eventtime=1609262086871379250 tz="-0800"

```

**Interface migration wizard**

The *Integrate Interface* option on the *Network > Interfaces* page helps migrate a physical port into another interface or interface type such as aggregate, software switch, redundant, zone, or SD-WAN zone. The FortiGate will migrate object references either by replacing the existing instance with the new interface, or deleting the existing instance based on the user's choice. Users can also change the VLAN ID of existing VLAN sub-interface or FortiSwitch VLANs.

---

The interface migration wizard does not support turning an aggregate, software switch, redundant, zone, or SD-WAN zone interface back into a physical interface.

---

**Integrating an interface**

In this example, a DHCP server interface is integrated into a newly created redundant interface, which transfers the DHCP server to a redundant interface.

**To integrate an interface:**

1. Go to *Network > Interfaces* and select an interface in the list.
2. Click *Integrate Interface*. The wizard opens.
Alternatively, select an interface in the list. Then right-click and select `Integrate Interface`.

3. Select `Migrate to Interface` and click `Next`.

4. Select `Create an Interface`. Enter a name `(rd1)` and set the `Type` to `Redundant`.

5. Click `Next`. The `References` sections lists the associated services with options to Replace Instance or Delete Entry.

6. For the DHCP server `Action`, select `Replace Instance` and click `Create`.
7. The migration occurs automatically and the statuses for the object and reference change to *Updated entry*. Click *Close*.

![Network interface configuration](image)

### Changing the VLAN ID

In this example, the VLAN ID of *InternalVLAN* is changed from 11 to 22.

**To change the VLAN ID:**

1. Go to *Network > Interfaces* and edit an existing interface.
2. Beside the *VLAN ID* field, click *Edit*. The *Update VLAN ID* window opens.

![Update VLAN ID window](image)

3. Enter the new ID (22) and click *Next*. 

![Updated VLAN ID](image)
4. Verify the changes, then click **Update** and **OK**.

5. The target object status changes to **Updated entry**. Click **Close**.

In the interface settings, the ID displays as 22.
Captive portals

A captive portal is used to enforce authentication before web resources can be accessed. Until a user authenticates successfully, any HTTP request returns the authentication page. After successfully authenticating, a user can access the requested URL and other web resources, as permitted by policies. The captive portal can also be configured to only allow access to members of specific user groups.

Captive portals can be hosted on the FortiGate or an external authentication server. They can be configured on any network interface, including VLAN and WiFi interfaces. On a WiFi interface, the access point appears open, and the client can connect to access point with no security credentials, but then sees the captive portal authentication page. See Captive Portal Security, in the FortiWiFi and FortiAP Configuration Guide for more information.

All users on the interface are required to authenticate. Exemption lists can be created for devices that are unable to authenticate, such as a printer that requires access to the internet for firmware upgrades.

To configure a captive portal in the GUI:

1. Go to Network > Interfaces and edit the interface that the users connect to. The interface Role must be LAN or Undefined.
2. Enable Security mode.

3. Configure the following settings, then click OK.

<table>
<thead>
<tr>
<th>Authentication Portal</th>
<th>Configure the location of the portal:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local: the portal is hosted on the FortiGate unit.</td>
<td></td>
</tr>
</tbody>
</table>
- **External**: enter the FQDN or IP address of external portal.

### User access
Select if the portal applies to all users, or selected user groups:
- **Restricted to Groups**: restrict access to the selected user groups. The Login page is shown when a user tries to log in to the captive portal.
- **Allow all**: all users can log in, but access will be defined by relevant policies. The Disclaimer page is shown when a user tried to log in to the captive portal.

### Customize portal messages
Enable to use custom portal pages, then select a replacement message group. See Custom captive portal pages on page 162.

### Exempt sources
Select sources that are exempt from the captive portal.
Each exemption is added as a rule in an automatically generated exemption list.

### Exempt destinations/services
Select destinations and services that are exempt from the captive portal.
Each exemption is added as a rule in an automatically generated exemption list.

### Redirect after Captive Portal
Configure website redirection after successful captive portal authentication:
- **Original Request**: redirect to the initially browsed to URL.
- **Specific URL**: redirect to the specified URL.

### To configure a captive portal in the CLI:

1. If required, create a security exemption list:

   ```
   config user security-exempt-list
   edit <list>
   config rule
   edit 1
   set srcaddr <source(s)>
   set dstaddr <source(s)>
   set service <service(s)>
   next
   edit 2
   set srcaddr <source(s)>
   set dstaddr <source(s)>
   set service <service(s)>
   next
   end
   next
   end
   ```

2. Configure captive portal authentication on the interface:

   ```
   config system interface
   edit <interface>
   set security-mode {none | captive-portal}
   set security-external-web <string>
   set replacemsg-override-group <group>
   set security-redirect-url <string>
   set security-exempt-list <list>
   set security-groups <group(s)>
   ```
Custom captive portal pages

Portal pages are HTML files that can be customized to meet user requirements.

Most of the text and some of the HTML in the message can be changed. Tags are enclosed by double percent signs (%%); most of them should not be changed because they might carry information that the FortiGate unit needs. For information about customizing replacement messages, see Modifying replacement messages on page 2136.

The images on the pages can be replaced. For example, your organization's logo can replace the Fortinet logo. For information about uploading and using new images in replacement messages, see Replacement message images on page 2138.

The following pages are used by captive portals:

<table>
<thead>
<tr>
<th>Login Page</th>
<th>Requests user credentials.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The %%%QUESTION%%% tag provides the Please enter the required information to continue. text.</td>
</tr>
<tr>
<td></td>
<td>This page is shown to users that are trying to log in when User access is set to Restricted to Groups.</td>
</tr>
<tr>
<td>Login Failed Page</td>
<td>Reports that incorrect credentials were entered, and requests correct credentials.</td>
</tr>
<tr>
<td></td>
<td>The %%%FAILED_MESSAGE%%% tag provides the Firewall authentication failed. Please try again. text.</td>
</tr>
<tr>
<td>Disclaimer Page</td>
<td>A statement of the legal responsibilities of the user and the host organization that the user must agree to before proceeding. This page is shown users that are trying to log in when User access is set to Allow all.</td>
</tr>
<tr>
<td>Declined Disclaimer Page</td>
<td>Shown if the user does not agree to the statement on the Disclaimer page. Access is denied until the user agrees to the disclaimer.</td>
</tr>
</tbody>
</table>

Physical interface

A FortiGate has several physical interfaces that can connect to Ethernet or optical cables. Depending on the FortiGate model, it can have a varying combination of Ethernet, small form-factor pluggable (SFP), and enhanced small form-factor pluggable (SFP+) interfaces.

The port names, as labeled on the FortiGate, appear in the interfaces list on the Network > Interfaces page. Hover the cursor over a port to view information, such as the name and the IP address.

Refer to Configuring an interface for basic GUI and CLI configuration steps.

Displaying transceiver status information for SFP and SFP+ interfaces

Transceiver status information for SFP and SFP+ interfaces installed on the FortiGate can be displayed in the GUI and CLI. For example, the type, vendor name, part number, serial number, and port name. The CLI output includes additional information that can be useful for diagnosing transmission problems, such as the temperature, voltage, and optical transmission power.
To view transceiver status information in the GUI:

1. Go to **Network > Interfaces**. The **Transceiver** column is visible in the table, which displays the transceiver vendor name and part number.
2. Hover the cursor over a transceiver to view more information.

To view transceiver status information in the CLI:

```
# get system interface transceiver
```

```
Interface port9 - SFP/SFP+
Vendor Name : FINISAR CORP.
Part No. : FCLF-8521-3
Serial No. : PMS***
```

```
Interface port10 - Transceiver is not detected.
```

```
Interface port11 - SFP/SFP+
Vendor Name : QNC
Part No. : LCP-1250RJ3SRQN
Serial No. : QNDT****
```

```
Interface port12 - SFP/SFP+
Vendor Name : QNC
Part No. : LCP-1250RJ3SRQN
Serial No. : QNDT****
```

```
Interface s1 - SFP/SFP+
Vendor Name : JDSU
Part No. : PLRXPLCS4322N
Serial No. : CB26U****
```

```
Interface s2 - SFP/SFP+
Vendor Name : JDSU
Part No. : PLRXPLCS4321N
Serial No. : CS825U****
```

```
Interface vw1 - Transceiver is not detected.
```

```
Interface vw2 - Transceiver is not detected.
```

```
Interface x1 - SFP/SFP+
Vendor Name : Fortinet
Part No. : LCP-10GRJ3SRFN
Serial No. : 19090910*****
```

```
Interface x2 - Transceiver is not detected.
```

<table>

**VLAN**

Virtual local area networks (VLANs) multiply the capabilities of your FortiGate and can also provide added network security. VLANs use ID tags to logically separate devices on a network into smaller broadcast domains. These smaller
domains forward packets only to devices that are part of that VLAN domain. This reduces traffic and increases network security.

**VLANs in NAT mode**

In NAT mode, the FortiGate unit functions as a layer-3 device. In this mode, the FortiGate unit controls the flow of packets between VLANs and can also remove VLAN tags from incoming VLAN packets. The FortiGate unit can also forward untagged packets to other networks such as the Internet.

In NAT mode, the FortiGate unit supports VLAN trunk links with IEEE 802.1Q-compliant switches or routers. The trunk link transports VLAN-tagged packets between physical subnets or networks. When you add VLAN subinterfaces to the FortiGate’s physical interfaces, the VLANs have IDs that match the VLAN IDs of packets on the trunk link. The FortiGate unit directs packets with VLAN IDs to subinterfaces with matching IDs.

You can define VLAN subinterfaces on all FortiGate physical interfaces. However, if multiple virtual domains are configured on the FortiGate unit, you only have access to the physical interfaces on your virtual domain. The FortiGate unit can tag packets leaving on a VLAN subinterface. It can also remove VLAN tags from incoming packets and add a different VLAN tag to outgoing packets.

Normally in VLAN configurations, the FortiGate unit’s internal interface is connected to a VLAN trunk, and the external interface connects to an Internet router that is not configured for VLANs. In this configuration, the FortiGate unit can apply different policies for traffic on each VLAN interface connected to the internal interface, which results in less network traffic and better security.

**Sample topology**

In this example, two different internal VLAN networks share one interface on the FortiGate unit and share the connection to the Internet. This example shows that two networks can have separate traffic streams while sharing a single interface. This configuration can apply to two departments in a single company or to different companies.

There are two different internal network VLANs in this example. VLAN_100 is on the 10.1.1.0/255.255.255.0 subnet, and VLAN_200 is on the 10.1.2.0/255.255.255.0 subnet. These VLANs are connected to the VLAN switch.

The FortiGate internal interface connects to the VLAN switch through an 802.1Q trunk. The internal interface has an IP address of 192.168.110.126 and is configured with two VLAN subinterfaces (VLAN_100 and VLAN_200). The external interface has an IP address of 172.16.21.2 and connects to the Internet. The external interface has no VLAN subinterfaces.

When the VLAN switch receives packets from VLAN_100 and VLAN_200, it applies VLAN ID tags and forwards the packets of each VLAN both to local ports and to the FortiGate unit across the trunk link. The FortiGate unit has policies that allow traffic to flow between the VLANs, and from the VLANs to the external network.
Sample configuration

In this example, both the FortiGate unit and the Cisco 2950 switch are installed and connected and basic configuration has been completed. On the switch, you need access to the CLI to enter commands. No VDOMs are enabled in this example.

General configuration steps include:

1. Configure the external interface.
2. Add two VLAN subinterfaces to the internal network interface.
3. Add firewall addresses and address ranges for the internal and external networks.
4. Add security policies to allow:
   - the VLAN networks to access each other.
   - the VLAN networks to access the external network.

To configure the external interface:

```plaintext
config system interface
  edit external
    set mode static
    set ip 172.16.21.2 255.255.255.0
  next
end
```

To add VLAN subinterfaces:

```plaintext
config system interface
  edit VLAN_100
    set vdom root
    set interface internal
    set type vlan
```
Network

```
set vlanid 100
set mode static
set ip 10.1.1.1 255.255.255.0
set allowaccess https ping
next
edit VLAN_200
set vdom root
set interface internal
set type vlan
set vlanid 200
set mode static
set ip 10.1.2.1 255.255.255.0
set allowaccess https ping
next
done
```

To add the firewall addresses:

```
config firewall address
edit VLAN_100_Net
set type ipmask
set subnet 10.1.1.0 255.255.255.0
next
edit VLAN_200_Net
set type ipmask
set subnet 10.1.2.0 255.255.255.0
next
done
```

To add security policies:

Policies 1 and 2 do not need NAT enabled, but policies 3 and 4 do need NAT enabled.

```
config firewall policy
edit 1
set srcintf VLAN_100
set srcaddr VLAN_100_Net
set dstintf VLAN_200
set dstaddr VLAN_200_Net
set schedule always
set service ALL
set action accept
set nat disable
set status enable
next
edit 2
set srcintf VLAN_200
set srcaddr VLAN_200_Net
set dstintf VLAN_100
set dstaddr VLAN_100_Net
set schedule always
set service ALL
set action accept
set nat disable
set status enable
next
```
edit 3
  set srcintf VLAN_100
  set srcaddr VLAN_100.Net
  set dstintf external
  set dstaddr all
  set schedule always
  set service ALL
  set action accept
  set nat enable
  set status enable
next
eedit 4
  set srcintf VLAN_200
  set srcaddr VLAN_200.Net
  set dstintf external
  set dstaddr all
  set schedule always
  set service ALL
  set action accept
  set nat enable
  set status enable
next
eend

VLANs in transparent mode

In transparent mode, the FortiGate unit behaves like a layer-2 bridge but can still provide services such as antivirus scanning, web filtering, spam filtering, and intrusion protection to traffic. Some limitations of transparent mode is that you cannot use SSL VPN, PPTP/L2TP VPN, DHCP server, or easily perform NAT on traffic. The limits in transparent mode apply to IEEE 802.1Q VLAN trunks passing through the unit.

You can insert the FortiGate unit operating in transparent mode into the VLAN trunk without making changes to your network. In a typical configuration, the FortiGate unit internal interface accepts VLAN packets on a VLAN trunk from a VLAN switch or router connected to internal network VLANs. The FortiGate external interface forwards VLAN-tagged packets through another VLAN trunk to an external VLAN switch or router and on to external networks such as the Internet. You can configure the unit to apply different policies for traffic on each VLAN in the trunk.

To pass VLAN traffic through the FortiGate unit, you add two VLAN subinterfaces with the same VLAN ID, one to the internal interface and the other to the external interface. You then create a security policy to permit packets to flow from the internal VLAN interface to the external VLAN interface. If required, create another security policy to permit packets to flow from the external VLAN interface to the internal VLAN interface. Typically in transparent mode, you do not permit packets to move between different VLANs. Network protection features such as spam filtering, web filtering, and anti-virus scanning, are applied through the UTM profiles specified in each security policy, enabling very detailed control over traffic.

When the FortiGate unit receives a VLAN-tagged packet on a physical interface, it directs the packet to the VLAN subinterface with the matching VLAN ID. The VLAN tag is removed from the packet and the FortiGate unit then applies security policies using the same method it uses for non-VLAN packets. If the packet exits the FortiGate unit through a VLAN subinterface, the VLAN ID for that subinterface is added to the packet and the packet is sent to the corresponding physical interface.
Sample topology

In this example, the FortiGate unit is operating in transparent mode and is configured with two VLANs: one with an ID of 100 and the other with ID 200. The internal and external physical interfaces each have two VLAN subinterfaces, one for VLAN_100 and one for VLAN_200.

The IP range for the internal VLAN_100 network is 10.100.0.0/255.255.0.0, and for the internal VLAN_200 network is 10.200.0.0/255.255.0.0.

The internal networks are connected to a Cisco 2950 VLAN switch which combines traffic from the two VLANs onto one in the FortiGate unit's internal interface. The VLAN traffic leaves the FortiGate unit on the external network interface, goes on to the VLAN switch, and on to the Internet. When the FortiGate units receives a tagged packet, it directs it from the incoming VLAN subinterface to the outgoing VLAN subinterface for that VLAN.

In this example, we create a VLAN subinterface on the internal interface and another one on the external interface, both with the same VLAN ID. Then we create security policies that allow packets to travel between the VLAN_100_int interface and the VLAN_100_ext interface. Two policies are required: one for each direction of traffic. The same is required between the VLAN_200_int interface and the VLAN_200_ext interface, for a total of four security policies.

Sample configuration

There are two main steps to configure your FortiGate unit to work with VLANs in transparent mode:

1. Add VLAN subinterfaces.
2. Add security policies.

You can also configure the protection profiles that manage antivirus scanning, web filtering, and spam filtering.

To add VLAN subinterfaces:

```
config system interface
edit VLAN_100_int
  set type vlan
```
set interface internal
set vlanid 100
next
edit VLAN_100_ext
set type vlan
set interface external
set vlanid 100
next
dict VLAN_200_int
set type vlan
set interface internal
set vlanid 200
next
edit VLAN_200_ext
set type vlan
set interface external
set vlanid 200
next
dict

To add security policies:

config firewall policy
edit 1
    set srcintf VLAN_100_int
    set srcaddr all
    set dstintf VLAN_100_ext
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
next
edit 2
    set srcintf VLAN_100_ext
    set srcaddr all
    set dstintf VLAN_100_int
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
next
edit 3
    set srcintf VLAN_200_int
    set srcaddr all
    set dstintf VLAN_200_ext
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
next
edit 4
    set srcintf VLAN_200_ext
    set srcaddr all
    set dstintf VLAN_200_int
    set dstaddr all
    set action accept
Virtual VLAN switch

The hardware switch ports on FortiGate models that support virtual VLAN switches can be used as a layer 2 switch. Virtual VLAN switch mode allows 802.1Q VLANs to be assigned to ports, and the configuration of one interface as a trunk port.

The following FortiGate series are supported in FortiOS 7.2: 60F, 80F, 100E, 100F, 140E, 200F, 300E, 400E, and 1100E.

The virtual-switch-vlan option must be enabled in the CLI to configure VLAN switch mode from the GUI or CLI.

To enable VLAN switches:

```
config system global
    set virtual-switch-vlan enable
end
```

After this setting is enabled, any previously configured hardware switches will appear in the Network > Interfaces page under VLAN Switch.

To enable VLAN switch mode in the GUI:

1. Go to System > Settings.
2. In the View Settings section, enable VLAN switch mode.
3. Click Apply.

Basic configurations

Hardware switch ports can be configured as either a VLAN switch port or a trunk port. The available interfaces and allowable VLAN IDs that can be used depend on the FortiGate model. It is recommended to remove ports from the default VLAN switch before you begin configurations.

To create a new VLAN and assign ports in the GUI:

1. Go to Network > Interfaces and click Create New > Interface.
2. Enter a name and configure the following:
   a. Set the Type to VLAN Switch.
   b. Enter a VLAN ID.
   c. Click the + and add the Interface Members.
   d. Configure the Address and Administrative Access settings as needed.
3. Click OK.
To create a new VLAN and assign ports in the CLI:

1. Configure the VLAN:

```plaintext
config system virtual-switch
   edit "VLAN10"
      set physical-switch "sw0"
      set vlan 10
      config port
         edit "internal1"
         next
         edit "internal2"
         next
      end
   next
end
```

2. Configure the VLAN switch interface addressing:

```plaintext
config system interface
   edit "VLAN10"
      set vdom "root"
      set ip 192.168.10.99 255.255.255.0
      set allowaccess ping https ssh snmp http fgfm
      set type hard-switch
   next
end
```

To designate an interface as a trunk port:

```plaintext
config system interface
   edit internal5
      set trunk enable
   next
end
```

**Example 1: HA using a VLAN switch**

In this example, two FortiGates in an HA cluster are connected to two ISP routers. Instead of connecting to external L2 switches, each FortiGate connects to each ISP router on the same hardware switch port on the same VLAN. A trunk port connects the two FortiGates to deliver the 802.1Q tagged traffic to the other. A full mesh between the FortiGate cluster and the ISP routers is achieved where no single point of failure will cause traffic disruptions.
This example assumes that the HA settings are already configured. The interface and VLAN switch settings are identical between cluster members and synchronized. See HA using a hardware switch to replace a physical switch on page 2061 for a similar example that does not use a VLAN switch.

**To configure the VLAN switches:**

1. Configure the ISP interfaces with the corresponding VLAN IDs:

   ```
   config system virtual-switch
   edit "ISP1"
   set physical-switch "sw0"
   set vlan 2951
   config port
   edit "port1"
   next
   end
   next
   edit "ISP2"
   set physical-switch "sw0"
   set vlan 2952
   config port
   edit "port2"
   next
   end
   end
   ```

2. Configure the VLAN switch interface addressing:

   ```
   config system interface
   edit "ISP1"
   set vdom "root"
   set ip 192.168.10.99 255.255.255.0
   set allowaccess ping
   set type hard-switch
   next
   edit "ISP2"
   set vdom "root"
   ```
set ip 192.168.20.99 255.255.255.0
set allowaccess ping
set type hard-switch
next
end

3. Designate port15 as the trunk port:
   config system interface
   edit port15
   set trunk enable
   next
   end

4. Configure firewall policies to allow outgoing traffic on the ISP1 and ISP2 interfaces:
   config firewall policy
   edit 1
   set srcintf "port11"
   set dstintf "ISP1"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set nat enable
   next
   edit 2
   set srcintf "port11"
   set dstintf "ISP2"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set nat enable
   next
   end

Example 2: LAN extension

In this example, two hardware switch ports are assigned VLAN10, and two ports are assigned VLAN20 on FortiGate B. The wan2 interface is designated as the trunk port, and is connected to the upstream FortiGate A. The corresponding VLAN subinterfaces VLAN10 and VLAN20 on the upstream FortiGate allow further access to other networks.
To configure FortiGate B:

1. Configure the VLAN interfaces:

   ```
   config system virtual-switch
   edit "VLAN10"
     set physical-switch "sw0"
     set vlan 10
     config port
       edit "internal1"
       next
       edit "internal2"
       next
     end
   next
   edit "VLAN20"
     set physical-switch "sw0"
     set vlan 20
     config port
       edit "internal3"
       next
       edit "internal4"
       next
     end
   end
   ```

2. Configure the VLAN switch interface addressing:

   ```
   config system interface
   edit "VLAN10"
     set vdom "root"
     set ip 192.168.10.99 255.255.255.0
     set allowaccess ping https ssh snmp http fgfm
   ```

The available interfaces and VLAN IDs varies between FortiGate models. The FortiGate B in this example is a 60F model.
set type hard-switch
next
edit "VLAN20"
  set vdom "root"
  set ip 192.168.20.99 255.255.255.0
  set allowaccess ping https ssh snmp http fgfm
  set type hard-switch
next
end

3. Designate wan2 as the trunk port:
   
   config system interface
   edit wan2
     set trunk enable
next
end

To configure FortiGate A:

1. Configure the VLAN subinterfaces:
   
   config system interface
   edit "VLAN10"
     set ip 192.168.10.98 255.255.255.0
     set allowaccess ping https ssh
     set role lan
     set interface "dmz"
     set vlanid 10
next
edit "VLAN20"
  set ip 192.168.20.98 255.255.255.0
  set allowaccess ping https ssh
  set role lan
  set interface "dmz"
  set vlanid 20
next
end

2. Configure the DHCP server on VLAN10:
   
   config system dhcp server
   edit 0
     set dns-service default
     set default-gateway 192.168.10.98
     set netmask 255.255.255.0
     set interface "VLAN10"
   config ip-range
     edit 1
       set start-ip 192.168.10.100
       set end-ip 192.168.10.254
next
end
set timezone-option default
next
end
3. Configure firewall policies that allow traffic from the VLAN10 and VLAN20 interfaces to the internet:

```plaintext
config firewall policy
    edit 0
        set name "VLAN10-out"
        set srcintf "VLAN10"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
    edit 0
        set name "VLAN20-out"
        set srcintf "VLAN20"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

**To test the connection:**

1. Connect a PC to internal1 on FortiGate B.
2. Verify that it receives an IP address from FortiGate A’s DHCP server.
3. From the PC, ping FortiGate B on 192.168.10.99.
4. Ping FortiGate A on 192.168.10.98.
5. Connect to the internet. Traffic is allowed by the VLAN10-out policy.

**QinQ 802.1Q in 802.1ad**

QinQ (802.1ad) allows multiple VLAN tags to be inserted into a single frame, and can be configured on supported FortiGate devices.

In this example, the customer connects to a provider that uses 802.1ad double-tagging to separate their customer VLANs. The FortiGate connecting to the provider double-tags its frames with an outer provider-tag (S-Tag) and an inner customer-tag (C-Tag).

<table>
<thead>
<tr>
<th>Preamble &amp; Start 8-byte</th>
<th>Destination MAC 6-byte</th>
<th>Source MAC 6-byte</th>
<th>VLAN S-Tag (EtherType 0x8100) 4-byte</th>
<th>VLAN C-Tag (EtherType 0x88a8) 4-byte</th>
<th>Ether Type 2-byte</th>
<th>Payload 4-byte</th>
<th>CRC 4-byte</th>
</tr>
</thead>
</table>

The customer identifies itself with the provider-tag (S-Tag) 232 and uses the customer-tag (C-Tag) 444 for traffic to its VLAN.
To configure the interfaces:

1. Configure the interface to the provider that uses the outer tag (S-Tag):

   ```
   config system interface
   edit "vlan-8021ad"
   set vdom "root"
   set vlan-protocol 8021ad
   set device-identification enable
   set role lan
   set snmp-index 47
   set interface "PORT"
   set vlanid 232
   next
   end
   ```

2. Configure a dynamic VLAN interface that uses the inner tag (C-Tag):

   ```
   config system interface
   edit "DVLAN"
   set vdom "vdom1"
   set device-identification enable
   set role lan
   set snmp-index 48
   set interface "vlan-8021ad"
   set vlanid 444
   next
   end
   ```

**QinQ 802.1Q in 802.1Q**

QinQ (802.1Q in 802.1Q) is supported for FortiGate VM models, where multiple VLAN tags can be inserted into a single frame.

<table>
<thead>
<tr>
<th>Preamble &amp; SfS</th>
<th>Destination MAC</th>
<th>Source MAC</th>
<th>VLAN Outer Tag (Ether Type 0x88a8)</th>
<th>VLAN Inner Tag (Ether Type 0x88a8)</th>
<th>Ether Type</th>
<th>Payload</th>
<th>CRC 4 byte</th>
</tr>
</thead>
</table>

In this example, the FortiGate VM is connected to a provider vSwitch and then a customer switch. The FortiGate encapsulates the frame with an outer 802.1Q tag of VLAN 100 and an inner 802.1Q tag of VLAN 200; port5 is used as the physical port. The provider vSwitch strips the outer tag and forwards traffic to the appropriate customer. Then the customer switch strips the inner tag and forwards the packet to the appropriate customer VLAN.
To configure the interfaces:

1. Configure the interface to the provider that uses the outer tag:

   config system interface
e   edit "vlan-8021q"
     set vdom "root"
     set device-identification enable
     set role lan
     set interface "port5"
     set vlan-protocol 8021q
     set vlanid 100
   next
end

2. Configure the interface to the provider that uses the inner tag:

   config system interface
e   edit "vlan-qinq8021q"
     set vdom "root"
     set ip 1.1.1.71 255.255.255.0
     set allowaccess ping https ssh snmp http
     set device-identification enable
     set role lan
     set interface "vlan-8021q"
     set vlanid 200
   next
end

To verify the traffic:

1. From the FortiGate, ping 1.1.1.72:

   # execute ping 1.1.1.72
   PING 1.1.1.72 (1.1.1.72): 56 data bytes
   64 bytes from 1.1.1.72: icmp_seq=0 ttl=255 time=0.2 ms
   64 bytes from 1.1.1.72: icmp_seq=1 ttl=255 time=0.1 ms
   64 bytes from 1.1.1.72: icmp_seq=2 ttl=255 time=0.1 ms
   64 bytes from 1.1.1.72: icmp_seq=3 ttl=255 time=0.1 ms
   ^C
   --- 1.1.1.72 ping statistics ---
   4 packets transmitted, 4 packets received, 0% packet loss
   round-trip min/avg/max = 0.1/0.1/0.2 ms

2. Verify the packet capture frame header output captured from the FortiGate's port5:

   Frame 2: 106 bytes on wire (848 bits), 106 bytes captured (848 bits)
   Ethernet II, Src: VMware_93:ae:8f (00:50:56:93:ae:8f), Dst: VMware_93:e3:72
   (00:50:56:93:e3:72)
   Destination: VMware_93:e3:72 (00:50:56:93:e3:72)
   Source: VMware_93:ae:8f (00:50:56:93:ae:8f)
   Type: 802.1Q Virtual LAN (0x8100)
   802.1Q Virtual LAN, PRI: 0, DEI: 0, ID: 100
   0000 0000 0000 0000 = Priority: Best Effort (default) (0)
   0000 0000 0000 0000 = DEI: Ineligible
   0000 0110 0100 = ID: 100
   Type: 802.1Q Virtual LAN (0x8100)
   802.1Q Virtual LAN, PRI: 0, DEI: 0, ID: 200
000. ..... ..... = Priority: Best Effort (default) (0)
...0 ..... ..... = DEI: Ineligible
.... 0000 1100 1000 = ID: 200
Type: IPv4 (0x0800)
Internet Protocol Version 4, Src: 1.1.1.71, Dst: 1.1.1.72
Internet Control Message Protocol

The outer tag (first tag) is an 802.1Q tag with VLAN ID 100. The inner tag (second tag) is also an 802.1Q tag with VLAN ID 200.

Aggregation and redundancy

Link aggregation (IEEE 802.3ad) enables you to bind two or more physical interfaces together to form an aggregated (combined) link. This new link has the bandwidth of all the links combined. If a link in the group fails, traffic is transferred automatically to the remaining interfaces. The only noticeable effect is reduced bandwidth.

This feature is similar to redundant interfaces. The major difference is a redundant interface group only uses one link at a time, where an aggregate link group uses the total bandwidth of the functioning links in the group, up to eight (or more).

An interface is available to be an aggregate interface if:

- It is a physical interface and not a VLAN interface or subinterface.
- It is not already part of an aggregate or redundant interface.
- It is in the same VDOM as the aggregated interface. Aggregate ports cannot span multiple VDOMs.
- It does not have an IP address and is not configured for DHCP or PPPoE.
- It is not referenced in any security policy, VIP, IP Pool, or multicast policy.
- It is not an HA heartbeat interface.
- It is not one of the FortiGate-5000 series backplane interfaces.

When an interface is included in an aggregate interface, it is not listed on the Network > Interfaces page. Interfaces still appear in the CLI although configuration for those interfaces do not take affect. You cannot configure the interface individually and it is not available for inclusion in security policies, VIPs, IP pools, or routing.

Example configuration

This example creates an aggregate interface on a FortiGate-140D POE using ports 3-5 with an internal IP address of 10.1.1.123, as well as the administrative access to HTTPS and SSH.

To create an aggregate interface in the GUI:

1. Go to Network > Interfaces and select Create New > Interface.
2. Set Name to aggregate.
3. Set Type to 802.3ad Aggregate.
4. Set Interface members to port4, port5, and port6.
7. For Administrative Access, select HTTPS and SSH.
8. Click OK.
To create an aggregate interface in the CLI:

```
config system interface
  edit "aggregate"
    set vdom "root"
    set ip 10.1.1.123 255.255.255.0
    set allowaccess https ssh
    set type aggregate
    set member "port4" "port5" "port6"
    set snmp-index 45
next
end
```

Redundancy

In a redundant interface, traffic only goes over one interface at any time. This differs from an aggregated interface where traffic goes over all interfaces for increased bandwidth. This difference means redundant interfaces can have more robust configurations with fewer possible points of failure. This is important in a fully-meshed HA configuration.

An interface is available to be in a redundant interface if:

- It is a physical interface and not a VLAN interface.
- It is not already part of an aggregated or redundant interface.
- It is in the same VDOM as the redundant interface.
- It does not have an IP address and is not configured for DHCP or PPPoE.
- It has no DHCP server or relay configured on it.
- It does not have any VLAN subinterfaces.
- It is not referenced in any security policy, VIP, or multicast policy.
- It is not monitored by HA.
- It is not one of the FortiGate-5000 series backplane interfaces.

When an interface is included in a redundant interface, it is not listed on the Network > Interfaces page. You cannot configure the interface individually and it is not available for inclusion in security policies, VIPs, or routing.

Example configuration

To create a redundant interface in the GUI:

1. Go to Network > Interfaces and select Create New > Interface.
2. Set Name to redundant.
3. Set Type to Redundant Interface.
4. Set Interface members to port4, port5, and port6.
7. For Administrative Access, select HTTPS and SSH.
8. Click OK.

To create a redundant interface in the CLI:

```
config system interface
  edit "redundant"
```
set vdom "root"
set ip 10.13.101.100 255.255.255.0
set allowaccess https http
set type redundant
set member "port4" "port5" "port6"
set snmp-index 9

Enhanced hashing for LAG member selection

FortiGate models that have an internal switch that supports modifying the distribution algorithm can use enhanced hashing to help distribute traffic evenly, or load balance, across links on the Link Aggregation (LAG) interface.

The enhanced hashing algorithm is based on a 5-tuple of the IP protocol, source IP address, destination IP address, source port, and destination port.

Different computation methods allow for more variation in the load balancing distribution, in case one algorithm does not distribute traffic evenly between links across different XAUls. The available methods are:

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xor16</td>
<td>Use the XOR operator to make a 16 bit hash.</td>
</tr>
<tr>
<td>xor8</td>
<td>Use the XOR operator to make an 8 bit hash.</td>
</tr>
<tr>
<td>xor4</td>
<td>Use the XOR operator to make a 4 bit hash.</td>
</tr>
<tr>
<td>crc16</td>
<td>Use the CRC-16-CCITT polynomial to make a 16 bit hash.</td>
</tr>
</tbody>
</table>

The following NP6 non-service FortiGate models support this feature: 1500D, 1500DT, 3000D, 3100D, 3200D, 3700D, and 5001D.

To configure the enhanced hashing:

```fortigate
config system npu
    set lag-out-port-select {enable | disable}
    config sw-eh-hash
        set computation {xor4 | xor8 | xor16 | crc16}
        set ip-protocol {include | exclude}
        set source-ip-upper-16 {include | exclude}
        set source-ip-lower-16 {include | exclude}
        set destination-ip-upper-16 {include | exclude}
        set destination-ip-lower-16 {include | exclude}
        set source-port {include | exclude}
        set destination-port {include | exclude}
        set netmask-length {0 - 32}
    end
end
```

For example, to use XOR16 and include all of the fields in the 5-tuple to compute the link in the LAG interface that the packet is distributed to:

```fortigate
config system npu
    set lag-out-port-select enable
```
config sw-eh-hash
    set computation xor16
    set ip-protocol include
    set source-ip-upper-16 include
    set source-ip-lower-16 include
    set destination-ip-upper-16 include
    set destination-ip-lower-16 include
    set source-port include
    set destination-port include
    set netmask-length 32
end
end

Failure detection for aggregate and redundant interfaces

When an aggregate or redundant interface goes down, the corresponding fail-alert interface changes to down. When an aggregate or redundant interface comes up, the corresponding fail-alert interface changes to up.

Fail-detect for aggregate and redundant interfaces can be configured using the CLI.

To configure an aggregate interface so that port3 goes down with it:

    config system interface
    edit "agg1"
      set vdom "root"
      set fail-detect enable
      set fail-alert-method link-down
      set fail-alert-interfaces "port3"
      set type aggregate
      set member "port1" "port2"
    next
    end

To configure a redundant interface so that port4 goes down with it:

    config system interface
    edit "red1"
      set vdom "root"
      set fail-detect enable
      set fail-alert-method link-down
      set fail-alert-interfaces "port4"
      set type redundant
      set member "port1" "port2"
    next
    end
Loopback interface

A loopback interface is a logical interface that is always up. Its IP address does not depend on one specific physical port, and the attached subnet is always present in the routing table. Therefore, it can be accessed through several physical or VLAN interfaces.

Typically, a loopback interface can be used with management access, BGP peering, PIM rendezvous points, and SD-WAN.

Loopback interfaces require appropriate firewall policies to allow traffic to and from the interfaces. Multiple loopback interfaces can be configured in either non-VDOM mode or in each VDOM.

Dynamic routing protocols can be enabled on loopback interfaces. For example, loopback interfaces are a good practice for OSPF. To make it easier to troubleshoot OSPF, set the OSPF router ID to the same value as the loopback IP address to access a specific FortiGate using that IP address and SSH.

A loopback interface is configured using similar steps as a physical interface (see Configuring an interface).

Software switch

A software switch is a virtual switch that is implemented at the software or firmware level and not at the hardware level. A software switch can be used to simplify communication between devices connected to different FortiGate interfaces. For example, using a software switch, you can place the FortiGate interface connected to an internal network on the same subnet as your wireless interfaces. Then devices on the internal network can communicate with devices on the wireless network without any additional configuration on the FortiGate unit, such as additional security policies.

A software switch can also be useful if you require more hardware ports for the switch on a FortiGate unit. For example, if your FortiGate unit has a 4-port switch, WAN1, WAN2, and DMZ interfaces, and you need one more port, you can create a soft switch that can include the four-port switch and the DMZ interface, all on the same subnet. These types of applications also apply to wireless interfaces, virtual wireless interfaces, and physical interfaces such as those in FortiWiFi and FortiAP units.

Similar to a hardware switch, a software switch functions like a single interface. It has one IP address and all the interfaces in the software switch are on the same subnet. Traffic between devices connected to each interface are not regulated by security policies, and traffic passing in and out of the switch are controlled by the same policy.

When setting up a software switch, consider the following:

- Ensure that you have a back up of the configuration.
- Ensure that you have at least one port or connection, such as the console port, to connect to the FortiGate unit. If you accidentally combine too many ports, you need a way to undo errors.
- The ports that you include must not have any link or relation to any other aspect of the FortiGate unit, such as DHCP servers, security policies, and so on.
- For increased security, you can create a captive portal for the switch to allow only specific user groups access to the resources connected to the switch.

Some of the difference between software and hardware switches are:
<table>
<thead>
<tr>
<th>Feature</th>
<th>Software switch</th>
<th>Hardware switch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processing</td>
<td>Packets are processed in software by the CPU.</td>
<td>Packets are processed in hardware by the hardware switch controller, or SPU where applicable.</td>
</tr>
<tr>
<td>STP</td>
<td>Not Supported</td>
<td>Supported</td>
</tr>
<tr>
<td>Wireless SSIDs</td>
<td>Supported</td>
<td>Not Supported</td>
</tr>
<tr>
<td>Intra-switch traffic</td>
<td>Allowed by default. Can be explicitly set to require a policy.</td>
<td>Allowed by default.</td>
</tr>
</tbody>
</table>

**To create a software switch in the GUI:**

1. Go to **Network > Interfaces**.
2. Click **Create New > Interface**.
3. Set **Type** to **Software Switch**.
4. Configure the **Name**, **Interface members**, and other fields as required.
   - To add an interface to a software switch, it cannot be referenced by an existing configuration and its IP address must be set to 0.0.0.0/0.0.0.0.
5. Click **OK**.

**To create a software switch in the CLI:**

```
config system switch-interface
  edit <interface>
    set vdom <vdom>
    set member <interface_list>
    set type switch
  next
end
config system interface
  edit <interface>
    set vdom <vdom>
    set type switch
    set ip <ip_address>
    set allowaccess https ssh ping
  next
end
```

To add an interface to a software switch, it cannot be referenced by an existing configuration and its IP address must be set to 0.0.0.0/0.0.0.0.

**Example**

For this example, the wireless interface (WiFi) needs to be on the same subnet as the DMZ1 interface to facilitate wireless synchronizing from an iPhone and a local computer. Because synchronizing between two subnets is problematic, putting both interfaces on the same subnet allows the synchronizing will work. The software switch will accomplish this.
1. Clear the interfaces and back up the configuration:
   a. Ensure the interfaces are not used for other security policy or for other use on the FortiGate unit.
   b. Check the WiFi and DMZ1 ports to ensure that DHCP is not enabled and that there are no other dependencies on these interfaces.
   c. Save the current configuration so that it can be recovered if something goes wrong.

2. Merge the WiFi port and DMZ1 port to create a software switch named synchro with an IP address of 10.10.21.12 and administrative access for HTTPS, SSH and PING:

```plaintext
config system switch-interface
   edit synchro
      set vdom "root"
      set type switch
      set member dmz1 wifi
   next
end
config system interface
   edit synchro
      set ip 10.10.21.12 255.255.255.0
      set allowaccess https ssh ping
   next
end
```

After the switch is set up, you add security policies, DHCP servers, and any other settings that are required.

**Hardware switch**

A hardware switch is a virtual switch interface that groups different ports together so that the FortiGate can use the group as a single interface. Supported FortiGate models have a default hardware switch called either internal or lan. The hardware switch is supported by the chipset at the hardware level.

Ports that are connected to the same hardware switch behave like they are on the same physical switch in the same broadcast domain. Ports can be removed from a hardware switch and assigned to another switch or used as standalone interfaces.

Some of the difference between hardware and software switches are:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Hardware switch</th>
<th>Software switch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processing</td>
<td>Packets are processed in hardware by the hardware switch controller, or SPU where applicable.</td>
<td>Packets are processed in software by the CPU.</td>
</tr>
<tr>
<td>STP</td>
<td>Supported</td>
<td>Not Supported</td>
</tr>
<tr>
<td>Wireless SSIDs</td>
<td>Not Supported</td>
<td>Supported</td>
</tr>
<tr>
<td>Intra-switch traffic</td>
<td>Allowed by default.</td>
<td>Allowed by default. Can be explicitly set to require a policy.</td>
</tr>
</tbody>
</table>
To change the ports in a hardware switch in the GUI:

1. Go to Network > Interface and edit the hardware switch.
2. Click inside the Interface members field.

![GUI screenshot showing the Interface members field]

3. Select interfaces to add or remove them from the hardware switch, then click Close.
   To add an interface to a hardware switch, it cannot be referenced by an existing configuration and its IP address must be set to 0.0.0.0/0.0.0.0.
4. Click OK.
   Removed interfaces will now be listed as standalone interfaces in the Physical Interface section.

To remove ports from a hardware switch in the CLI:

```
config system virtual-switch
  edit "internal"
    config port
      delete internal2
      delete internal7
      ...
    next
  end
end
```

To add ports to a hardware switch in the CLI:

```
config system virtual-switch
  edit "internal"
    set physical-switch "sw0"
    config port
      edit "internal3"
      next
      edit "internal5"
      next
      edit "internal4"
      next
      edit "internal6"
      next
    end
  next
end
```
To add an interface to a hardware switch, it cannot be referenced by an existing configuration and its IP address must be set to 0.0.0.0/0.0.0.0.

**Using 802.1X on virtual switches for certain NP6 platforms**

802.1X is supported under the hardware switch interface on the following NP6 platforms: FG-30xE, FG-40xE, and FG-110xE.

In this example, port3 and port4 are part of a hardware switch interface. The hardware switch acts as a virtual switch so that devices can connect directly to these ports and perform 802.1X authentication on the port.

![Diagram showing a hardware switch acting as a virtual switch](image)

**Prerequisites:**

1. Configure a RADIUS server (see RADIUS servers on page 1820).
2. Define a user group named test to use the remote RADIUS server and for 802.1X authentication (see User definition and groups on page 1792).
3. Configure a hardware switch (named 18188) with port3 and port4 as the members.
4. Configure a firewall policy that allows traffic from the 18188 hardware switch to go to the internet.
5. Enable 802.1X authentication on the client devices.

**To configure 802.1X authentication on a hardware switch in the GUI:**

1. Go to Network > Interfaces and edit the hardware switch.
2. In the Network section, enable Security mode and select 802.1X.
3. Click the + to add the User group.

4. Click OK.

To configure 802.1X authentication on a hardware switch in the CLI:

1. Configure the virtual hardware switch interfaces:
   
   ```fortios
   config system virtual-switch
   edit "18188"
   set physical-switch "sw0"
   config port
   edit "port3"
   next
   edit "port4"
   next
   ```
2. Configure 802.1X authentication:

```
config system interface
edit "18188"
    set vdom "vdom1"
    set ip 1.1.1.1 255.255.255.0
    set allowaccess ping https ssh snmp fgfm ftm
    set type hard-switch
    set security-mode 802.1X
    set security-groups "test"
    set device-identification enable
    set lldp-transmission enable
    set role lan
    set snmp-index 52
end
```

To verify that the 802.1X authentication was successful:

1. Get a client connected to port3 to authenticate to access the internet.
2. In FortiOS, verify the 802.1X authentication port status:

```
# diagnose sys 802-1x status

Virtual switch '18188' (default mode) 802.1x member status:
    port3: Link up, 802.1X state: authorized
    port4: Link up, 802.1X state: unauthorized
```

### Zone

Zones are a group of one or more physical or virtual FortiGate interfaces that you can apply firewall policies to for controlling inbound and outbound traffic. Grouping interfaces and VLAN subinterfaces into zones simplifies creating firewall policies where a number of network segments can use the same policy settings and protection profiles.

When you add a zone, you select the names of the interfaces and VLAN subinterfaces to add to the zone. Each interface still has its own address. Routing is still done between interfaces, that is, routing is not affected by zones. You can use firewall policies to control the flow of intra-zone traffic.

For example, in the sample configuration below, the network includes three separate groups of users representing different entities on the company network. While each group has its own set of ports and VLANs in each area, they can all use the same firewall policy and protection profiles to access the Internet. Rather than the administrator making nine separate firewall policies, he can make administration simpler by adding the required interfaces to a zone and creating three policies.

### Example configuration

You can configure policies for connections to and from a zone but not between interfaces in a zone. For this example, you can create a firewall policy to go between zone 1 and zone 3, but not between WAN2 and WAN1, or WAN1 and DMZ1.
To create a zone in the GUI:

1. Go to Network > Interfaces.

   If VDOMs are enabled, go to the VDOM to create a zone.

2. Click Create New > Zone.
3. Configure the Name and add the Interface Members.
4. Enable or disable Block intra-zone traffic as required.
5. Click OK.

To configure a zone to include the internal interface and a VLAN using the CLI:

```bash
config system zone
   edit zone_1
      set interface internal VLAN_1
      set intrazone {deny | allow}
   next
end
```

Using zone in a firewall policy

To configure a firewall policy to allow any interface to access the Internet using the CLI:

```bash
config firewall policy
   edit 2
      set name "2"
      set srcintf "Zone_1"
      set dstintf "port15"
      set srcaddr "all"
      set dstaddr "all"
      set action accept
      set schedule "always"
      set service "ALL"
      set nat enable
   next
end
```
Network

Intra-zone traffic

In the zone configuration you can set intrazone deny to prohibit the different interfaces in the same zone to talk to each other.

For example, if you have ten interfaces in your zone and the intrazone setting is deny. You now want to allow traffic between a very small number of networks on different interfaces that are part of the zone but you do not want to disable the intra-zone blocking.

In this example, the zone VLANs are defined as: 192.168.1.0/24, 192.168.2.0/24, ..., 192.168.10.0/24.

This policy allows traffic from 192.168.1.x to 192.168.2.x even though they are in the same zone and intra-zone blocking is enabled. The intra-zone blocking acts as a default deny rule and you have to specifically override it by creating a policy within the zone.

To enable intra-zone traffic, create the following policy:

<table>
<thead>
<tr>
<th>Source Interface</th>
<th>Zone-name, e.g., Vlans</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Address</td>
<td>192.168.1.0/24</td>
</tr>
<tr>
<td>Destination</td>
<td>Zone-name (same as Source Interface, i.e., Vlans)</td>
</tr>
<tr>
<td>Destination Address</td>
<td>192.168.2.0/24</td>
</tr>
</tbody>
</table>

Virtual wire pair

A virtual wire pair consists of two interfaces that do not have IP addressing and are treated like a transparent mode VDOM. All traffic received by one interface in the virtual wire pair can only be forwarded to the other interface, provided a virtual wire pair firewall policy allows this traffic. Traffic from other interfaces cannot be routed to the interfaces in a virtual wire pair. Redundant and 802.3ad aggregate (LACP) interfaces can be included in a virtual wire pair.

Virtual wire pairs are useful for a typical topology where MAC addresses do not behave normally. For example, port pairing can be used in a Direct Server Return (DSR) topology where the response MAC address pair may not match the request’s MAC address pair.

Example

In this example, a virtual wire pair (port3 and port4) makes it easier to protect a web server that is behind a FortiGate operating as an Internal Segmentation Firewall (ISFW). Users on the internal network access the web server through the ISFW over the virtual wire pair.

Interfaces used in a virtual wire pair cannot be used to access the ISFW FortiGate. Before creating a virtual wire pair, make sure you have a different port configured to allow admin access using your preferred protocol.
To add a virtual wire pair using the GUI:

1. Go to Network > Interfaces.
2. Click Create New > Virtual Wire Pair.
3. Enter a name for the virtual wire pair.
4. Select the Interface Members to add to the virtual wire pair (port3 and port4).
   These interfaces cannot be part of a switch, such as the default LAN/internal interface.
5. If required, enable Wildcard VLAN and set the VLAN Filter.
6. Click OK.

To add a virtual wire pair using the CLI:

```
config system virtual-wire-pair
edit "VWP-name"
   set member "port3" "port4"
   set wildcard-vlan disable
next
end
```

To create a virtual wire pair policy using the GUI:

1. Go to Policy & Objects > Firewall Virtual Wire Pair Policy.
2. Click Create New.
3. In the Virtual Wire Pair field, click the + to add the virtual wire pair.
4. Select the direction (arrows) that traffic is allowed to flow.
5. Configure the other settings as needed.
6. Click OK.

To create a virtual wire pair policy using the CLI:

```
config firewall policy
edit 1
   set name "VWP-Policy"
   set srcintf "port3" "port4"
   set dstintf "port3" "port4"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set utm-status enable
   set fssc disable
```
Configuring multiple virtual wire pairs in a virtual wire pair policy

You can create a virtual wire pair policy that includes different virtual wire pairs in NGFW profile and policy mode. This reduces overhead to create multiple similar policies for each VWP. In NGFW policy mode, multiple virtual wire pairs can be configured in a Security Virtual Wire Pair Policy and Virtual Wire Pair SSL Inspection & Authentication policy.

The virtual wire pair settings must have wildcard VLAN enabled. When configuring a policy in the CLI, the virtual wire pair members must be entered in srcintf and dstintf as pairs.

To configure multiple virtual wire pairs in a policy in the GUI:

1. Configure the virtual wire pairs:
   a. Go to Network > Interfaces and click Create New > Virtual Wire Pair.
   b. Create a pair with the following settings:
      
      | Name              | test-vwp-1          |
      |-------------------|---------------------|
      | Interface members | wan1, wan2          |
      | Wildcard VLAN     | Enable              |

   c. Click OK.
   d. Click Create New > Virtual Wire Pair and create another pair with the following settings:
      
      | Name              | test-vwp-2          |
      |-------------------|---------------------|
      | Interface members | port19, port20      |
      | Wildcard VLAN     | Enable              |

   e. Click OK.

2. Configure the policy:
   a. Go to Policy & Objects > Firewall Virtual Wire Pair Policy and click Create New.
   b. In the Virtual Wire Pair field, click the + to add test-vwp-1 and test-vwp-2. Select the direction for each of the selected virtual wire pairs.
c. Configure the other settings as needed.
d. Click OK.

To configure multiple virtual wire pairs in a policy in the CLI:

1. Configure the virtual wire pairs:
   ```
   config system virtual-wire-pair
   edit "test-vwp-1"
       set member "wan1" "wan2"
           set wildcard-vlan enable
   next
   edit "test-vwp-2"
       set member "port19" "port20"
           set wildcard-vlan enable
   next
   end
   ```

2. Configure the policy:
   ```
   config firewall policy
   edit 1
       set name "vwp12-policy"
       set srcintf "port19" "wan1"
       set dstintf "port20" "wan2"
       set srcaddr "all"
       set dstaddr "all"
       set action accept
       set schedule "always"
       set service "ALL"
       set logtraffic all
   next
   end
   ```
PRP handling in NAT mode with virtual wire pair

PRP (Parallel Redundancy Protocol) is supported in NAT mode for a virtual wire pair. This preserves the PRP RCT (redundancy control trailer) while the packet is processed by the FortiGate.

To configure PRP handling on a device in NAT mode:

1. Enable PRP in the VDOM settings:
   ```
   (root) # config system settings
     set prp-trailer-action enable
   end
   ```

2. Enable PRP in the NPU attributes:
   ```
   (global) # config system npu
     set prp-port-in "port15"
     set prp-port-out "port16"
   end
   ```

3. Configure the virtual wire pair:
   ```
   (root) # config system virtual-wire-pair
   edit "test-vwp-1"
     set member "port15" "port16"
   next
   end
   ```

Enhanced MAC VLAN

The Media Access Control (MAC) Virtual Local Area Network (VLAN) feature in Linux allows you to configure multiple virtual interfaces with different MAC addresses (and therefore different IP addresses) on a physical interface.

FortiGate implements an enhanced MAC VLAN consisting of a MAC VLAN with bridge functionality. Because each MAC VLAN has a unique MAC address, virtual IP addresses (VIPs) and IP pools are supported, and you can disable Source Network Address Translation (SNAT) in policies.

MAC VLAN cannot be used in a transparent mode virtual domain (VDOM). In a transparent mode VDOM, a packet leaves an interface with the MAC address of the original source instead of the interface’s MAC address. FortiGate implements an enhanced version of MAC VLAN where it adds a MAC table in the MAC VLAN which learns the MAC addresses when traffic passes through.

If you configure a VLAN ID for an enhanced MAC VLAN, it won’t join the switch of the underlying interface. When a packet is sent to this interface, a VLAN tag is inserted in the packet and the packet is sent to the driver of the underlying interface. When the underlying interface receives a packet, if the VLAN ID doesn’t match, it won’t deliver the packet to this enhanced MAC VLAN interface.

When using a VLAN ID, the ID and the underlying interface must be a unique pair, even if the belong to different VDOMs. This is because the underlying, physical interface uses the VLAN ID as the identifier to dispatch traffic among the VLAN and enhanced MAC VLAN interfaces.

If you use an interface in an enhanced MAC VLAN, do not use it for other purposes such as a management interface, HA heartbeat interface, or in Transparent VDOMs.

If a physical interface is used by an EMAC VLAN interface, you cannot use it in a Virtual Wire Pair.
In high availability (HA) configurations, enhanced MAC VLAN is treated as a physical interface. It’s assigned a unique physical interface ID and the MAC table is synchronized with the secondary devices in the same HA cluster.

**Example 1: Enhanced MAC VLAN configuration for multiple VDOMs that use the same interface or VLAN**

In this example, a FortiGate is connected, through port 1 to a router that’s connected to the Internet. Three VDOMs share the same interface (port 1) which connects to the same router that’s connected to the Internet. Three enhanced MAC VLAN interfaces are configured on port 1 for the three VDOMs. The enhanced MAC VLAN interfaces are in the same IP subnet segment and each have unique MAC addresses.

The underlying interface (port 1) can be a physical interface, an aggregate interface, or a VLAN interface on a physical or aggregate interface.

![Diagram of network configuration](image)

**To configure enhanced MAC VLAN for this example in the CLI:**

```fortran
config system interface
  edit port1.emacvlan1
    set vdom VDOM1
    set type emac-vlan
    set interface port1
  next
  edit port1.emacvlan2
    set vdom VDOM2
    set type emac-vlan
    set interface port1
  next
  edit port1.emacvlan3
    set vdom VDOM3
    set type emac-vlan
    set interface port1
  next
end
```
**Example 2: Enhanced MAC VLAN configuration for shared VDOM links among multiple VDOMs**

In this example, multiple VDOMs can connect to each other using enhanced MAC VLAN on network processing unit (NPU) virtual link (Vlink) interfaces.

FortiGate VDOM links (NPU-Vlink) are designed to be peer-to-peer connections and VLAN interfaces on NPU Vlink ports use the same MAC address. Connecting more than two VDOMs using NPU Vlinks and VLAN interfaces is not recommended.

To configure enhanced MAC VLAN for this example in the CLI:

```plaintext
config system interface
  edit npu0_vlink0.emacvlan1
    set vdom VDOM1
    set type emac-vlan
    set interface npu0_vlink0
  next
  edit npu0_vlink0.emacvlan2
    set vdom VDOM3
    set type emac-vlan
    set interface npu0_vlink0
  next
  edit npu0_vlink1.emacvlan1
    set vdom VDOM2
    set type emac-vlan
    set interface npu0_vlink1
  next
end
```

**Example 3: Enhanced MAC VLAN configuration for unique MAC addresses for each VLAN interface on the same physical port**

Some networks require a unique MAC address for each VLAN interface when the VLAN interfaces share the same physical port. In this case, the enhanced MAC VLAN interface is used the same way as normal VLAN interfaces.
To configure this, use the set vlanid command for the VLAN tag. The VLAN ID and interface must be a unique pair, even if they belong to different VDOMs.

**To configure enhanced MAC VLAN:**

```
config system interface
  edit <interface-name>
    set type emac-vlan
    set vlanid <VLAN-ID>
    set interface <physical-interface>
  next
end
```

**VXLAN**

Virtual Extensible LAN (VXLAN) is a network virtualization technology used in large cloud computing deployments. It encapsulates layer 2 Ethernet frames within layer 3 IP packets using the standard destination port 4789. VXLAN endpoints that terminate VXLAN tunnels can be virtual or physical switch ports, and are known as VXLAN tunnel endpoints (VTEPs). For more information about VXLAN, see RFC 7348.

The following topics provide information about VXLAN:

- VLAN inside VXLAN on page 198
- Virtual wire pair with VXLAN on page 200

**VLAN inside VXLAN**

VLANs can be assigned to VXLAN interfaces. In a data center network where VXLAN is used to create an L2 overlay network and for multitenant environments, a customer VLAN tag can be assigned to VXLAN interface. This allows the VLAN tag from VLAN traffic to be encapsulated within the VXLAN packet.

**To configure VLAN inside VXLAN on HQ1:**

1. Configure VXLAN:

   ```
   config system vxlan
   edit "vxlan1"
     set interface port1
     set vni 1000
     set remote-ip 173.1.1.1
   next
   end
   ```
2. Configure system interface:

```
config system interface
  edit vlan100
    set vdom root
    set vlanid 100
    set interface dmz
  next
  edit vxlan100
    set type vlan
    set vlanid 100
    set vdom root
    set interface vxlan1
  next
end
```

3. Configure software-switch:

```
config system switch-interface
  edit sw1
    set vdom root
    set member vlan100 vxlan100
    set intra-switch-policy implicit
  next
end
```

The default `intra-switch-policy implicit` behavior allows traffic between member interfaces within the switch. Therefore, it is not necessary to create firewall policies to allow this traffic.

Instead of creating a software-switch, it is possible to use a virtual-wire-pair as well. See Virtual wire pair with VXLAN on page 200.

### To configure VLAN inside VXLAN on HQ2:

1. Configure VXLAN:

```
config system vxlan
  edit "vxlan2"
    set interface port25
    set vni 1000
    set remote-ip 173.1.1.2
  next
end
```

2. Configure system interface:

```
config system interface
  edit vlan100
    set vdom root
    set vlanid 100
    set interface port20
  next
  edit vxlan100
    set type vlan
    set vlanid 100
    set vdom root
```
set interface vxlan2
next
end

3. Configure software-switch:
   config system switch-interface
   edit sw1
        set vdom root
        set member vlan100 vxlan100
   next
   end

To verify the configuration:

Ping PC1 from PC2.

The following is captured on HQ2:

This captures the VXLAN traffic between 172.1.1.1 and 172.1.1.2 with the VLAN 100 tag inside.

**Virtual wire pair with VXLAN**

Virtual wire pairs can be used with VXLAN interfaces.

In this example, VXLAN interfaces are added between FortiGate HQ1 and FortiGate HQ2, a virtual wire pair is added in HQ1, and firewall policies are created on both HQ1 and HQ2.

![Diagram of network setup with FortiGate HQ1 and HQ2 connected through a virtual wire pair]

To create VXLAN interface on HQ1:

config system interface
   edit "port11"
        set vdom "root"
        set ip 10.2.2.1 255.255.255.0
set allowaccess ping https ssh snmp telnet
next
end
config system vxlan
edit "vxlan1"
   set interface "port11"
   set vni 1000
   set remote-ip "10.2.2.2"
next
end

To create VXLAN interface on HQ2:

config system interface
edit "port11"
   set vdom "root"
   set ip 10.2.2.2 255.255.255.0
   set allowaccess ping https ssh snmp http
next
end
config system vxlan
edit "vxlan1"
   set interface "port11"
   set vni 1000
   set remote-ip "10.2.2.1"
next
end
config system interface
edit "vxlan1"
   set vdom "root"
   set ip 10.1.100.2 255.255.255.0
   set allowaccess ping https ssh snmp
next
end

To create a virtual wire pair on HQ1:

config system virtual-wire-pair
edit "vwp1"
   set member "port10" "vxlan1"
next
end

To create a firewall policy on HQ1:

config firewall policy
edit 5
   set name "vxlan-policy"
   set srcintf "port10" "vxlan1"
   set dstintf "port10" "vxlan1"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set utm-status enable
Network

set ssl-ssh-profile "certificate-inspection"
set av-profile "default"
set webfilter-profile "default"
set dnsfilter-profile "default"
set ips-sensor "default"
set application-list "default"
set fsso disable

next
end

To create a firewall policy on HQ2:

config firewall policy
edit 5
set name "1"
set srcintf "port13"
set dstintf "vxlan1"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set fsso disable
set nat enable
next
end

DNS

Domain name system (DNS) is used by devices to locate websites by mapping a domain name to a website’s IP address.

A FortiGate can serve different roles based on user requirements:

- A FortiGate can control what DNS server a network uses.
- A FortiGate can function as a DNS server.

FortiGuard Dynamic DNS (DDNS) allows a remote administrator to access a FortiGate’s Internet-facing interface using a domain name that remains constant even when its IP address changes.

FortiOS supports DNS configuration for both IPv4 and IPv6 addressing. When a user requests a website, the FortiGate looks to the configured DNS servers to provide the IP address of the website in order to know which server to contact to complete the transaction.

The FortiGate queries the DNS servers whenever it needs to resolve a domain name into an IP address, such as for NTP or web servers defined by their domain names.

The following topics provide information about DNS:

- Important DNS CLI commands on page 203
- DNS domain list on page 204
- FortiGate DNS server on page 206
- DDNS on page 208
- DNS latency information on page 212
Important DNS CLI commands

DNS settings can be configured with the following CLI command:

```
config system dns
   set primary <ip_address>
   set secondary <ip_address>
   set protocol {cleartext dot doh}
   set ssl-certificate <string>
   set server-hostname <hostname>
   set domain <domains>
   set ip6-primary <ip6_address>
   set ip6-secondary <ip6_address>
   set timeout <integer>
   set retry <integer>
   set dns-cache-limit <integer>
   set dns-cache-ttl <integer>
   set cache-notfound-responses {enable | disable}
   set interface-select-method {auto | sdwan | specify}
   set interface <interface>
   set source-ip <class_ip>
end
```

For a FortiGate with multiple logical CPUs, you can set the DNS process number from 1 to the number of logical CPUs. The default DNS process number is 1.

```
config system global
   set dnsproxy-worker-count <integer>
end
```

DNS protocols

The following DNS protocols can be enabled:

- **cleartext**: Enable clear text DNS over port 53 (default).
- **dot**: Enable DNS over TLS.
- **doh**: Enable DNS over HTTPS.

For more information, see DNS over TLS and HTTPS on page 214.

**cache-notfound-responses**

When enabled, any DNS requests that are returned with NOT FOUND can be stored in the cache. The DNS server is not asked to resolve the host name for NOT FOUND entries. By default, this option is disabled.
**dns-cache-limit**

Set the number of DNS entries that are stored in the cache (0 to 4294967295, default = 5000). Entries that remain in the cache provide a quicker response to requests than going out to the Internet to get the same information.

**dns-cache-ttl**

The duration that the DNS cache retains information, in seconds (60 to 86400 (1 day), default = 1800).

**VDOM DNS**

When the FortiGate is in multi-vdom mode, DNS is handled by the management VDOM. However in some cases, administrators may want to configure custom DNS settings on a non-management VDOM. For example, in a multi-tenant scenario, each VDOM might be occupied by a different tenant, and each tenant might require its own DNS server.

**To configure a custom VDOM within a non-management VDOM:**

```
config vdom
edit <vdom>
config system vdom-dns
    set vdom-dns enable
    set primary <primary_DNS>
    set secondary <secondary_DNS>
    set protocol {cleartext dot doh}
    set ip6-primary <primary_IPv6_DNS>
    set ip6-secondary <secondary_IPv6_DNS>
    set source-ip <IP_address>
    set interface-select-method {auto | sdwan | specify}
end
```

**DNS domain list**

You can configure up to eight domains in the DNS settings using the GUI or the CLI.

When a client requests a URL that does not include an FQDN, FortiOS resolves the URL by traversing through the DNS domain list and performing a query for each domain until the first match is found.

By default, FortiGate uses FortiGuard's DNS servers:

- Primary: 96.45.45.45
- Secondary: 96.45.46.46

You can also customize the DNS timeout time and the number of retry attempts.

**To configure a DNS domain list in the GUI:**

1. Go to *Network > DNS*.
2. Set *DNS Servers to Specify*.
3. Configure the primary and secondary DNS servers as needed.
4. In the Local Domain Name field, enter the first domain (sample.com in this example).
5. Click the + to add more domains (example.com and domainname.com in this example). You can enter up to eight domains.
6. Configure additional DNS protocol and IPv6 settings as needed.

7. Click Apply.

To configure a DNS domain list in the CLI:

```
config system dns
  set primary 96.45.45.45
  set secondary 96.45.46.46
  set domain "sample.com" "example.com" "domainname.com"
end
```

**Verify the DNS configuration**

In the following example, the local DNS server has the entry for host1 mapped to the FQDN of host1.sample.com, and the entry for host2 is mapped to the FQDN of host2.example.com.

**To verify that the DNS domain list is configured:**

1. Open Command Prompt.
2. Enter `ping host1`.
   The system returns the following response:
   ```
   PING host1.sample.com (1.1.1.1): 56 data bytes
   As the request does not include an FQDN, FortiOS traverses the configured DNS domain list to find a match.
   Because host1 is mapped to the host1.sample.com, FortiOS resolves host1 to sample.com, the first entry in the domain list.
   ```
3. Enter `ping host2`.
   The system returns the following response:
   ```
   PING host2.example.com (2.2.2.2): 56 data bytes
   FortiOS traverses the domain list to find a match. It first queries sample.com, the first entry in the domain list, but does not find a match. It then queries the second entry in the domain list, example.com. Because host2 is mapped
to the FQDN of host2.example.com, FortiOS resolves host2 to example.com.

DNS timeout and retry settings

The DNS timeout and retry settings can be customized using the CLI.

```
config system dns
  set timeout <integer>
  set retry <integer>
end
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The DNS query timeout interval, in seconds (1 - 10, default = 5).</td>
</tr>
<tr>
<td>retry</td>
<td>The number of times to retry the DNS query (0 - 5, default = 2).</td>
</tr>
</tbody>
</table>

FortiGate DNS server

You can create local DNS servers for your network. Depending on your requirements, you can either manually maintain your entries (primary DNS server), or use it to refer to an outside source (secondary DNS server).

A local, primary DNS server requires that you to manually add all URL and IP address combinations. Using a primary DNS server for local services can minimize inbound and outbound traffic, and access time. Making it authoritative is not recommended, because IP addresses can change, and maintaining the list can become labor intensive.

A secondary DNS server refers to an alternate source to obtain URL and IP address combinations. This is useful when there is a primary DNS server where the entry list is maintained.

FortiGate as a DNS server also supports TLS and HTTPS connections to a DNS client. See DNS over TLS and HTTPS on page 214 for details.

By default, DNS server options are not available in the FortiGate GUI.

To enable DNS server options in the GUI:

1. Go to System > Feature Visibility.
2. Enable DNS Database in the Additional Features section.
3. Click Apply.

Example configuration

This section describes how to create an unauthoritative primary DNS server. The interface mode is recursive so that, if the request cannot be fulfilled, the external DNS servers will be queried.

To configure FortiGate as a primary DNS server in the GUI:

1. Go to Network > DNS Servers.
2. In the DNS Database table, click Create New.
3. Set Type to Primary.
4. Set View to Shadow. The View setting controls the accessibility of the DNS server. If you select Public, external users can access or use the DNS server. If you select Shadow, only internal users can use it.

5. Enter a DNS Zone, for example, WebServer.

6. Enter the Domain Name of the zone, for example, fortinet.com.

7. Enter the Hostname of the DNS server, for example, Corporate.

8. Enter the Contact Email Address for the administrator, for example, admin@example.com.

10. Add DNS entries:
    a. In the DNS Entries table, click Create New.
    b. Select a Type, for example Address (A).
    c. Set the Hostname, for example web.example.com.
    d. Configure the remaining settings as needed. The options vary depending on the selected Type.
    e. Click OK.

11. Add more DNS entries as needed.

12. Click OK.

13. Enable DNS services on an interface:
    a. Go to Network > DNS Servers.
    b. In the DNS Service on Interface table, click Create New.
    c. Select the Interface for the DNS server, such as wan2.
d. Set the Mode to Recursive.

To configure FortiGate as a primary DNS server in the CLI:

```text
config system dns-database
edit WebServer
    set domain example.com
    set type master
    set view shadow
    set ttl 86400
    set primary-name corporate
    set contact admin@example.com
    set authoritative disable
config dns-entry
    edit 1
        set status enable
        set hostname web.example.com
        set type A
        set ip 192.168.21.12
next
next
end
end
config system dns-server
edit wan2
    set mode recursive
next
end
```

DDNS

If your external IP address changes regularly and you want a static domain name, you can configure the external interface to use a dynamic DNS (DDNS) service. This ensures that external users and customers can always connect to your company firewall. You can configure FortiGuard as the DDNS server using the GUI or CLI.

A license or subscription is not required to use the DDNS service, but configuring DDNS in the GUI is not supported if:

- The FortiGate model is a 1000-series or higher.
- The FortiGate is a VM.
- The DNS server is not using FortiGuard as the DNS.

FortiGate does not support DDNS when in transparent mode.
Sample topology

In this example, FortiGuard DDNS is enabled and the DDNS server is set to float-zone.com. Other DDNS server options include fortiddns.com and fortidyndns.com.

To configure FortiGuard DDNS service as a DDNS server in the GUI:

1. Go to **Network > DNS**.
2. Enable **FortiGuard DDNS**.
3. Select the **Interface** with the dynamic connection.
4. Select the **Server** that you have an account with.
5. Enter your **Unique Location**.
6. Click **Apply**.

To configure the FortiGuard DDNS service as an IPv4 DDNS server in the CLI:

```
config system ddns
   edit 1
       set ddns-server FortiGuardDDNS
       set server-type ipv4
       set ddns-domain "branch.float-zone.com"
       set addr-type ipv4
```
Network

    set use-public-ip enable
    set monitor-interface "wan1"
next
end

To configure the FortiGuard DDNS service as an IPv6 DDNS server in the CLI:

config system ddns
    edit 1
        set ddns-server FortiGuardDDNS
        set server-type ipv6
        set ddns-domain "fgtatest001.float-zone.com"
        set addr-type ipv6
        set monitor-interface "wan1"
    next
end

DDNS servers other than FortiGuard

If you do not have a FortiGuard subscription, or want to use a different DDNS server, you can configure a DDNS server for each interface. Only the first configure port appears in the GUI.

The available commands vary depending on the selected DDNS server.

To configure DDNS servers other than FortiGuard in the CLI:

config system ddns
    edit <DDNS_ID>
        set monitor-interface <external_interface>
        set ddns-server <ddns_server_selection>
        set server-type {ipv4 | ipv6}
        set ddns-server-addr <address>
        set addr-type ipv6 {ipv4 | ipv6}
    next
end

To configure an IPv6 DDNS client with generic DDNS on port 3 in the CLI:

config system ddns
    edit 1
        set ddns-server genericDDNS
        set server-type ipv6
        set ddns-server-addr "2004:16:16:16::2" "16.16.16.2" "ddns.genericddns.com"
        set ddns-domain "test.com"
        set addr-type ipv6
        set monitor-interface "port3"
    next
end

Refresh DDNS IP addresses

When using a public IP that is not assigned to the FortiGate, the FortiGate cannot trigger an update when the IP address changes. The FortiGate can be configured to refresh DDNS IP addresses by periodically checking the DDNS server at
an update interval.

To configure FortiGate to refresh DDNS IP addresses in the CLI:

```plaintext
cfg system ddns
  edit 1
    set use-public-ip enable
    set update-interval <seconds>
  next
end
```

When `update-interval` is set to 0:
- For FortiGuard DDNS, the interval is 300 seconds.
- For third part DDNS servers, the interval is assigned by the DDNS server.

**Disable cleartext**

When `clear-text` is disabled, FortiGate uses the SSL connection to send and receive DDNS updates.

To disable cleartext and set the SSL certificate in the CLI:

```plaintext
cfg system ddns
  edit 2
    set clear-text disable
    set ssl-certificate <cert_name>
  next
end
```

**DDNS update override**

A DHCP server has an override command option that allows DHCP server communications to go through DDNS to perform updates for the DHCP client. This enforces a DDNS update of the A field every time even if the DHCP client does not request it. This allows support for the `allow`, `ignore`, and `deny client-updates` options.

To enable DDNS update override in the CLI:

```plaintext
cfg system dhcp server
  edit 1
    set ddns-update enable
    set ddns-update-override enable
    set ddns-server-ip <ddns_server_ip>
    set ddns-zone <ddns_zone>
  next
end
```
Troubleshooting

To debug DDNS:

# diagnose debug application ddnsd -l
# diagnose debug enable

To check if a DDNS server is available:

# diagnose test application ddnsd 3

Not available:

FortiDDNS status:
  ddns_ip=0.0.0.0, ddns_ip6=:,, ddns_port=443 svr_num=0 domain_num=0

Available:

FortiDDNS status:
  ddns_ip=208.91.113.230, ddns_ip6=:,, ddns_port=443 svr_num=1 domain_num=3
  svr[0]= 208.91.113.230
domain[0]= fortiddns.com
domain[1]= fortidyndns.com
domain[2]= float-zone.com

DNS latency information

High latency in DNS traffic can result in an overall sluggish experience for end-users. In the DNS Settings pane, you can quickly identify DNS latency issues in your configuration.

Go to Network > DNS to view DNS latency information in the right side bar. If you use FortiGuard DNS, latency information for DNS, DNS filter, web filter, and outbreak prevention servers is also visible. Hover your pointer over a latency value to see when it was last updated.
To view DNS latency information using the CLI:

```
# diagnose test application dnsproxy 2
worker idx: 0
worker: count=1 idx=0
retry_interval=500 query_timeout=1495
DNS latency info:
vfid=0 server=2001::1 latency=1494 updated=73311
vfid=0 server=96.45.46.46 latency=1405 updated=2547
vfid=0 server=8.8.8.8 latency=19 updated=91
SDNS latency info:
vfid=0 server=173.243.140.53 latency=1 updated=707681
DNS_CACHE: alloc=35, hit=26
RATING_CACHE: alloc=1, hit=49
DNS UDP: req=66769 res=63438 fwd=83526 alloc=0 cmp=0 retrans=16655 to=3233
          cur=111 switched=882347 num_switched=294 v6_cur=80 v6_switched=769041 num_v6_
          switched=6
          ftg_res=8 ftg_fwd=8 ftg_retrans=0
DNS TCP: req=0, res=0, fwd=0, retrans=0 alloc=0, to=0
FQDN: alloc=45 nl_write_cnt=9498 nl_send_cnt=21606 nl_cur_cnt=0
Botnet: searched=57 hit=0 filtered=57 false_positive=0
```

To view the latency from web filter and outbreak protection servers using the CLI:

```
# diagnose debug rating
Locale : english
Service : Web-filter
Status : Enable
License : Contract
Service : Antispam
Status : Disable
Service : Virus Outbreak Prevention
Status : Disable
```

```

DNS over TLS and HTTPS

DNS over TLS (DoT) is a security protocol for encrypting and encapsulating DNS queries and responses over the TLS protocol. DoT increases user privacy and security by preventing eavesdropping and manipulation of DNS data via man-in-the-middle attacks. Similarly, DNS over HTTPS (DoH) provides a method of performing DNS resolution over a secure HTTPS connection. DoT and DoH are supported in explicit mode where the FortiGate acts as an explicit DNS server that listens for DoT and DoH requests. Local-out DNS traffic over TLS and HTTPS is also supported.

Basic configurations for enabling DoT and DoH for local-out DNS queries

Before enabling DoT or DoH, ensure that they are supported by the DNS servers. The legacy FortiGuard DNS servers (208.91.112.53 and 208.91.112.52) do not support DoT or DoH queries, and will drop these packets. At times, the latency status of the DNS servers might also appear high or unreachable.

Disabling DoT and DoH is recommended when they are not supported by the DNS servers.

To enable DoT and DoH DNS in the GUI:

1. Go to Network > DNS.
2. Enter the primary and secondary DNS server addresses.
3. In the *DNS Protocols* section, enable TLS (TCP/853) and HTTPS (TCP/443).

4. Configure the other settings as needed.

5. Click *Apply*.

**To enable DoT and DoH DNS in the CLI:**

```plaintext
config system dns
    set primary 1.1.1.1
    set secondary 1.0.0.1
    set protocol { cleartext doh }
end
```

**To enable DoH on the DNS server in the GUI:**

1. Go to *Network > DNS Servers*.
2. In the *DNS Service on Interface* section, edit an existing interface, or create a new one.
3. Select a *Mode*, and *DNS Filter profile*.
4. Enable *DNS over HTTPS*.

5. Click *OK*.

**To enable DoH on the DNS server in the CLI:**

```plaintext
config system dns-server
    edit "port1"
    set dnsfilter-profile "dnsfilter"
```
```
set doh enable
next
end
```

**Examples**

The following examples demonstrate how configure DNS settings to support DoT and DoH queries made to the FortiGate.

**DoT**

The following example uses a DNS filter profile where the education category is blocked.

To enable scanning DoT traffic in explicit mode with a DNS filter:

1. Configure the DNS settings:
   ```
   config system dns
   set primary 1.1.1.1
   set secondary 1.0.0.1
   set protocol dot
   end
   ```

2. Configure the DNS filter profile:
   ```
   config dnsfilter profile
   edit "dnfilter"
   config ftgd-dns
   config filters
   edit 1
   set category 30
   set action block
   next
   end
   next
   end
   ```
3. Configure the DNS server settings:

```plaintext
config system dns-server
   edit "port1"
      set dnsfilter-profile "dnsfilter"
   next
end
```

4. Send a DNS query over TLS (this example uses `kdig` on an Ubuntu client) using the FortiGate as the DNS server. The `www.ubc.ca` domain belongs to the education category:

```plaintext
root@client:/tmp# kdig -d @10.1.100.173 +tls +header +all www.ubc.ca
;; DEBUG: Querying for owner(www.ubc.ca.), class(1), type(1), server(10.1.100.173), port (853), protocol(TCP)
;; DEBUG: TLS, received certificate hierarchy:
;; DEBUG:  #1, C=US,ST=California,L=Sunnyvale,O=Fortinet,OU=FortiGate,CN=FG3H1E5818903681,EMAIL=support@fortinet.com
;; DEBUG:     SHA-256 PIN: Xhkpv9ABEhxDLtWG+1GEndNrBR7B1xjRY1Gn21t1kb8=
;; DEBUG:  #2, C=US,ST=California,L=Sunnyvale,O=Fortinet,OU=Certificate Authority,CN=fortinet-subca2001,EMAIL=support@fortinet.com
;; DEBUG:     SHA-256 PIN: 3T8EqFBjpRsxxQNFagjUNeEUghXOEYp904RO1JM8yo=
;; DEBUG:  #3, C=US,ST=California,L=Sunnyvale,O=Fortinet,OU=Certificate Authority,CN=fortinet-ca2,EMAIL=support@fortinet.com
;; DEBUG:     SHA-256 PIN: /QfV4N3kxoQR55RhtW/rbn/HrHgKpMN0DEaeXY5yPg=
;; DEBUG: TLS, skipping certificate PIN check
;; DEBUG: TLS, skipping certificate verification
;; TLS session (TLS1.2)-(ECDHE-RSA-SECP256R1)-(AES-256-GCM)
;; -->>HEADER<<- opcode: QUERY; status: NOERROR; id: 56719
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.ubc.ca.  IN  A

;; ANSWER SECTION:
www.ubc.ca. 60 IN A 208.91.112.55

;; Received 44 B
;; Time 2021-03-12 23:11:27 PST
;; From 10.1.100.173@853(TCP) in 0.2 ms
root@client:/tmp#

The IP returned by the FortiGate for ubc.ca belongs to the FortiGuard block page, so the query was blocked successfully.

DoH

The following example uses a DNS filter profile where the education category is blocked.

To configure scanning DoH traffic in explicit mode with a DNS filter:

1. Configure the DNS settings:

```plaintext
config system dns
   set primary 1.1.1.1
   set secondary 1.0.0.1
```
2. **Configure the DNS filter profile:**

```
set protocol doh
end
```

```
config dnsfilter profile
dnsfilter
edit "ftgd-dns"
cfg dnsfilter-profile "ftgd-dns"
edit filters
edit 1
category 30
next
end
next
end
```

3. **Configure the DNS server settings:**

```
config system dns-server
edit "port1"
dnsfilter-profile "ftgd-dns"
doh enable
next
end
```

4. In your browser, enable DNS over HTTPS.

5. On your computer, edit the TCP/IP settings to use the FortiGate interface address as the DNS server.

6. In your browser, go to a website in the education category (www.ubc.ca). The website is redirected to the block page.

   ![Web Page Blocked!](https://example.com)

### DNS troubleshooting

The following `diagnose` command can be used to collect DNS debug information. If you do not specify `worker ID`, the default `worker ID` is 0.

```
# diagnose test application dnsproxy
worker idx: 0
1. Clear DNS cache
2. Show stats
3. Dump DNS setting
4. Reload FQDN
5. Requery FQDN
6. Dump FQDN
7. Dump DNS cache
8. Dump DNS DB
9. Reload DNS DB
10. Dump secure DNS policy/profile
11. Dump Botnet domain
12. Reload Secure DNS setting
```
13. Show Hostname cache
14. Clear Hostname cache
15. Show SDNS rating cache
16. Clear SDNS rating cache
17. DNS debug bit mask
18. DNS debug obj mem
99. Restart dnsproxy worker

To view useful information about the ongoing DNS connection:

```
# diagnose test application dnsproxy 3
worker idx: 0
vdom: root, index=0, is primary, vdom dns is disabled, mip-169.254.0.1 dns_log=1 tls=0 cert=
dns64 is disabled
vdom: vdom1, index=1, is primary, vdom dns is enabled, mip-169.254.0.1 dns_log=1 tls=0 cert=
dns64 is disabled

```

Important fields include:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tls</td>
<td>1 if the connection is TLS, 0 if the connection is not TLS.</td>
</tr>
<tr>
<td>rt</td>
<td>The round trip time of the DNS latency.</td>
</tr>
<tr>
<td>probe</td>
<td>The number of probes sent.</td>
</tr>
</tbody>
</table>

To dump the second DNS worker's cache:

diagnose test application dnsproxy 7 1
To enable debug on the second worker:

diagnose debug application dnsproxy -1 1

To enable debug on all workers by specifying -1 as worker ID:

diagnose debug application dnsproxy -1 -1

Explicit and transparent proxies

This section contains instructions for configuring explicit and transparent proxies.

- Explicit web proxy on page 220
- Transparent proxy on page 224
- FTP proxy on page 223
- Proxy policy addresses on page 227
- Proxy policy security profiles on page 233
- Explicit proxy authentication on page 238
- Transparent web proxy forwarding on page 244
- Upstream proxy authentication in transparent proxy mode on page 247
- Multiple dynamic header count on page 249
- Restricted SaaS access on page 251
- Explicit proxy and FortiGate Cloud Sandbox on page 260
- Proxy chaining on page 262
- WAN optimization SSL proxy chaining on page 267
- Agentless NTLM authentication for web proxy on page 275
- Multiple LDAP servers in Kerberos keytabs and agentless NTLM domain controllers on page 278
- Learn client IP addresses on page 279
- Explicit proxy authentication over HTTPS on page 280
- mTLS client certificate authentication on page 282

Explicit web proxy

Explicit web proxy can be configured on FortiGate for proxying HTTP and HTTPS traffic.

To deploy explicit proxy, individual client browsers can be manually configured to send requests directly to the proxy, or they can be configured to download proxy configuration instructions from a Proxy Auto-Configuration (PAC) file.

When explicit proxy is configured on an interface, the interface IP address can be used by client browsers to forward requests directly to the FortiGate. FortiGate also supports PAC file configuration.

To configure explicit web proxy in the GUI:

1. Enable and configure explicit web proxy:
   a. Go to Network > Explicit Proxy.
   b. Enable Explicit Web Proxy.
c. Select port2 as the **Listen on Interfaces** and set the **HTTP Port** to **8080**.
d. Configure the remaining settings as needed.

![Network Configuration](image)
e. **Click Apply.**

2. Create an explicit web proxy policy:
   a. Go to **Policy & Objects > Proxy Policy**.
   b. **Click Create New.**
   c. **Set Proxy Type** to **Explicit Web** and **Outgoing Interface** to **port1**.
   d. Also set **Source** and **Destination** to all, **Schedule** to **always**, **Service** to **webproxy**, and **Action** to **ACCEPT**.

![Proxy Policy Configuration](image)
e. **Click OK to create the policy.**
This example creates a basic policy. If required, security profiles can be enabled, and deep SSL inspection can be selected to inspect HTTPS traffic.

3. Configure a client to use the FortiGate explicit proxy:
   Set the FortiGate IP address as the proxy IP address in the browser, or use an automatic configuration script for the PAC file.

To configure explicit web proxy in the CLI:

1. Enable and configure explicit web proxy:
   ```
   config web-proxy explicit
   set status enable
   set ftp-over-http enable
   set socks enable
   set http-incoming-port 8080
   set ipv6-status enable
   set unknown-http-version best-effort
   end
   config system interface
   edit "port2"
   set vdom "vdom1"
   set ip 10.1.100.1 255.255.255.0
   set allowaccess ping https snmp http telnet
   set type physical
   set explicit-web-proxy enable
   set snmp-index 12
   end
   next
   end
   ```

2. Create an explicit web proxy policy:
   ```
   config firewall proxy-policy
   edit 1
   set name "proxy-policy-explicit"
   set proxy explicit-web
   set dstintf "port1"
   set srcaddr "all"
   set dstaddr "all"
   set service "webproxy"
   set action accept
   set schedule "always"
   set logtraffic all
   next
   end
   ```

This example creates a basic policy. If required, security profiles can be enabled, and deep SSL inspection can be selected to inspect HTTPS traffic.
3. Configure a client to use the FortiGate explicit web proxy:
   Set the FortiGate IP address as the proxy IP address in the browser, or use an automatic configuration script for the PAC file.

**FTP proxy**

FTP proxies can be configured on the FortiGate so that FTP traffic can be proxied. When the FortiGate is configured as an FTP proxy, FTP client applications should be configured to send FTP requests to the FortiGate.

**To configure explicit FTP proxy in the GUI:**

1. Enable and configure explicit FTP proxy:
   a. Go to *Network > Explicit Proxy*.
   b. Enable *Explicit FTP Proxy*.
   c. Select *port2* as the *Listen on Interfaces* and set the *HTTP Port* to *21*.
   d. Configure the *Default Firewall Policy Action* as needed.

   ![Explicit FTP Proxy GUI](attachment:image.png)

   e. Click *Apply*.

2. Create an explicit FTP proxy policy:
   a. Go to *Policy & Objects > Proxy Policy*.
   b. Click *Create New*.
   c. Set *Proxy Type* to *FTP* and *Outgoing Interface* to *port1*.
   d. Also set *Source* and *Destination* to *all*, *Schedule* to *always*, and *Action* to *ACCEPT*.

   ![New Proxy Policy GUI](attachment:image.png)
e. Click OK to create the policy.

This example creates a basic policy. If required, security profiles can be enabled.

3. Configure the FTP client application to use the FortiGate IP address.

To configure explicit FTP proxy in the CLI:

1. Enable and configure explicit FTP proxy:

```plaintext
config ftp-proxy explicit
    set status enable
    set incoming-port 21
end
config system interface
    edit "port2"
        set vdom "vdom1"
        set ip 10.1.100.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
        set type physical
        set explicit-ftp-proxy enable
        set snmp-index 12
next
end
```

2. Create an explicit FTP proxy policy:

```plaintext
config firewall proxy-policy
    edit 4
        set name "proxy-policy-ftp"
        set proxy ftp
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
next
end
```

This example creates a basic policy. If required, security profiles can be enabled.

3. Configure the FTP client application to use the FortiGate IP address.

Transparent proxy

In a transparent proxy deployment, the user’s client software, such as a browser, is unaware that it is communicating with a proxy.
Users request internet content as usual, without any special client configuration, and the proxy serves their requests. FortiGate also allows users to configure in transparent proxy mode.

To redirect HTTPS traffic, SSL inspection is required.

**To configure transparent proxy in the GUI:**

1. Configure a regular firewall policy with HTTP redirect:
   a. Go to Policy & Objects > Firewall Policy.
   b. Click Create New.
   c. Name the policy appropriately, set the Incoming Interface to port2, and set the Outgoing Interface to port1.
   d. Also set Source and Destination to all, Schedule to always, Service to ALL, and Action to ACCEPT.
   e. Set Inspection Mode to Proxy-based and SSL Inspection to deep-inspection.

   ![Proxy Policy Configuration](image)

   f. Configure the remaining settings as needed.
   g. Click OK.

2. Configure a transparent proxy policy:
   a. Go to Policy & Objects > Proxy Policy.
   b. Click Create New.
   c. Set Proxy Type to Transparent Web, set the Incoming Interface to port2, and set the Outgoing Interface to port1.
   d. Also set Source and Destination to all, Schedule to always, Service to webproxy, and Action to ACCEPT.
e. Configure the remaining settings as needed.
f. Click OK to create the policy.

3. No special configuration is required on the client to use FortiGate transparent proxy. As the client is using the FortiGate as its default gateway, requests will first hit the regular firewall policy, and then be redirected to the transparent proxy policy.

To configure transparent proxy in the CLI:

1. Configure a regular firewall policy with HTTP redirect:

```
config firewall policy
edit 1
set name "LAN To WAN"
set srcintf "port2"
set dstintf "port1"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set inspection-mode proxy
set http-policy-redirect enable
set fsso disable
set ssl-ssh-profile "deep-inspection"
set nat enable
next
end
```

2. Configure a transparent proxy policy:

```
config firewall proxy-policy
edit 5
set name "proxy-policy-transparent"
set proxy transparent-web
set srcintf "port2"
set dstintf "port1"
set srcaddr "all"
set dstaddr "all"
set service "webproxy"
set action accept
set schedule "always"
```
This example creates a basic policy. If required, security profiles can be enabled, and deep SSL inspection can be selected to inspect HTTPS traffic.

3. No special configuration is required on the client to use FortiGate transparent proxy. As the client is using the FortiGate as its default gateway, requests will first hit the regular firewall policy, and then be redirected to the transparent proxy policy.

### Proxy policy addresses

Proxy addresses are designed to be used only by proxy policies. The following address types are available:

- Host regex match on page 227
- URL pattern on page 228
- URL category on page 229
- HTTP method on page 230
- HTTP header on page 230
- User agent on page 231
- Advanced (source) on page 232
- Advanced (destination) on page 233

### Fast policy match

The fast policy match function improves the performance of IPv4 explicit and transparent web proxies on FortiGate devices.

When enabled, after the proxy policies are configured, the FortiGate builds a fast searching table based on the different proxy policy matching criteria. When fast policy matching is disabled, web proxy traffic is compared to the policies one at a time from the beginning of the policy list.

Fast policy matching is enabled by default, and can be configured with the following CLI command:

```bash
config web-proxy global
    set fast-policy-match {enable | disable}
end
```

### Host regex match

In this address type, a user can create a hostname as a regular expression. Once created, the hostname address can be selected as a destination of a proxy policy. This means that a policy will only allow or block requests that match the regular expression.

This example creates a host regex match address with the pattern qa.[a-z]*.com.
To create a host regex match address in the GUI:

1. Go to Policy & Objects > Addresses.
2. Click Create New > Address.
3. Set the following:
   - Category to Proxy Address,
   - Name to Host Regex,
   - Type to Host Regex Match, and
   - Host Regex Pattern to qa.[a-z]*.com.
4. Click OK.

To create a host regex match address in the CLI:

```bash
config firewall proxy-address
edit "Host Regex"
set type host-regex
  set host-regex "qa.[a-z]*.com"
next
end
```

**URL pattern**

In this address type, a user can create a URL path as a regular expression. Once created, the path address can be selected as a destination of a proxy policy. This means that a policy will only allow or block requests that match the regular expression.

This example creates a URL pattern address with the pattern `/filetypes/`.

To create a URL pattern address in the GUI:

1. Go to Policy & Objects > Addresses.
2. Click Create New > Address.
3. Set the following:
   - Category to Proxy Address,
   - Name to URL Regex,
   - Type to URL Pattern,
   - Host to all, and
   - URL Path Regex to `/filetypes/`.
4. Click OK.

To create a URL pattern address in the CLI:

```plaintext
cfg firewall proxy-address
    edit "URL Regex"
        set type url
        set host "all"
        set path "/filetypes/"
    next
end
```

**URL category**

In this address type, a user can create a URL category based on a FortiGuard URL ID. Once created, the address can be selected as a destination of a proxy policy. This means that a policy will only allow or block requests that match the URL category.

The example creates a URL category address for URLs in the *Education* category. For more information about categories, see [https://fortiguard.com/webfilter/categories](https://fortiguard.com/webfilter/categories).

For information about creating and using custom local and remote categories, see Web rating override on page 1320 and Threat feeds on page 2506.

To create a URL category address in the GUI:

1. Go to Policy & Objects > Addresses.
2. Click Create New > Address.
3. Set the following:
   - Category to Proxy Address,
   - Name to url-category,
   - Type to URL Category,
   - Host to all, and
   - URL Category to Education.
4. Click OK.

To create a URL category address in the CLI:

```config
cfg firewall proxy-address
edit "url-category"
   set type category
   set host "all"
   set category 30
next
end
```

To see a list of all the categories and their numbers, when editing the address, enter `set category ?`.

**HTTP method**

In this address type, a user can create an address based on the HTTP request methods that are used. Multiple method options are supported, including: CONNECT, DELETE, GET, HEAD, OPTIONS, POST, PUT, and TRACE. Once created, the address can be selected as a source of a proxy policy. This means that a policy will only allow or block requests that match the selected HTTP method.

The example creates a HTTP method address that uses the GET method.

To create a HTTP method address in the GUI:

1. Go to Policy & Objects > Addresses.
2. Click Create New > Address.
3. Set the following:
   - **Category** to Proxy Address,
   - **Name** to `method_get`,
   - **Type** to HTTP Method,
   - **Host** to `all`, and
   - **Request Method** to GET.
4. Click OK.

To create a HTTP method address in the CLI:

```config
cfg firewall proxy-address
edit "method_get"
   set type method
   set host "all"
   set method get
next
end
```

**HTTP header**

In this address type, a user can create a HTTP header as a regular expression. Once created, the header address can be selected as a source of a proxy policy. This means that a policy will only allow or block requests where the HTTP header matches the regular expression.
This example creates a HTTP header address with the pattern Q[A-B].

To create a HTTP header address in the GUI:

1. Go to Policy & Objects > Addresses.
2. Click Create New > Address.
3. Set the following:
   - Category to Proxy Address,
   - Name to HTTP-header,
   - Type to HTTP Header,
   - Host to all,
   - Header Name to Header_Test, and
   - Header Regex to Q[A-B].
4. Click OK.

To create a HTTP header address in the CLI:

```
config firewall proxy-address
edit "method_get"
   set type header
   set host "all"
   set header-name "Header_Test"
   set header "Q[A-B]"
next
end
```

User agent

In this address type, a user can create an address based on the names of the browsers that are used as user agents. Multiple browsers are supported, such as Chrome, Firefox, Internet Explorer, and others. Once created, the address can be selected as a source of a proxy policy. This means that a policy will only allow or block requests from the specified user agent.

This example creates a user agent address for Google Chrome.

To create a user agent address in the GUI:

1. Go to Policy & Objects > Addresses.
2. Click Create New > Address.
3. Set the following:
   - Category to Proxy Address,
   - Name to UA-Chrome,
   - Type to User Agent,
   - Host to all, and
   - User Agent to Google Chrome.
4. Click OK.
To create a user agent address in the CLI:

```plaintext
config firewall proxy-address
  edit "UA-Chrome"
    set type ua
    set host "all"
    set ua chrome
  next
end
```

**Advanced (source)**

In this address type, a user can create an address based on multiple parameters, including HTTP method, User Agent, and HTTP header. Once created, the address can be selected as a source of a proxy policy. This means that a policy will only allow or block requests that match the selected address.

This example creates an address that uses the get method, a user agent for Google Chrome, and an HTTP header with the pattern \(Q[A-B]\).

**To create an advanced (source) address in the GUI:**

1. Go to Policy & Objects > Addresses.
2. Click Create New > Address.
3. Set the following:
   - **Category** to Proxy Address,
   - **Name** to advanced_src,
   - **Type** to Advanced (Source),
   - **Host** to all,
   - **Request Method** to GET,
   - **User Agent** to Google Chrome, and
   - **HTTP header** to Header_Test : \(Q[A-B]\).
4. Click OK.

**To create an advanced (source) address in the CLI:**

```plaintext
config firewall proxy-address
  edit "advance_src"
    set type src-advanced
    set host "all"
    set method get
    set ua chrome
    config header-group
      edit 1
        set header-name "Header_Test"
        set header "Q[A-B]"
      next
    end
next
end
```
Advanced (destination)

In this address type, a user can create an address based on URL pattern and URL category parameters. Once created, the address can be selected as a destination of a proxy policy. This means that a policy will only allow or block requests that match the selected address.

This example creates an address with the URL pattern /about that are in the Education category. For more information about categories, see https://fortiguard.com/webfilter/categories.

To create an advanced (destination) address in the GUI:

1. Go to Policy & Objects > Addresses.
2. Click Create New > Address.
3. Set the following:
   - Category to Proxy Address,
   - Name to Advanced-dst,
   - Type to Advanced (Destination),
   - Host to all,
   - URL Path Regex to /about, and
   - URL Category to Education.

4. Click OK.

To create an advanced (destination) address in the CLI:

```plaintext
config firewall proxy-address
edit "Advanced-dst"
   set type dst-advanced
   set host "ubc"
   set path "/about"
   set category 30
next
end
```

Proxy policy security profiles

Web proxy policies support most security profile types.

Security profiles must be created before they can be used in a policy, see Security Profiles on page 1085 for information.
Explicit web proxy policy

The security profiles supported by explicit web proxy policies are:

- AntiVirus
- Web Filter
- Video Filter
- Application Control
- IPS
- DLP Profile
- ICAP
- Web Application Firewall
- File Filter
- SSL Inspection

To configure security profiles on an explicit web proxy policy in the GUI:

1. Go to Policy & Objects > Proxy Policy.
2. Click Create New.
3. Set the following:

<table>
<thead>
<tr>
<th>Proxy Type</th>
<th>Explicit Web</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outgoing Interface</td>
<td>port1</td>
</tr>
<tr>
<td>Source</td>
<td>all</td>
</tr>
<tr>
<td>Destination</td>
<td>all</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>webproxy</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
</tbody>
</table>

4. In the Firewall / Network Options section, set Protocol Options to default.
5. In the Security Profiles section, make the following selections (for this example, these profiles have all already been created):

<table>
<thead>
<tr>
<th>Security Profile</th>
<th>Selection</th>
</tr>
</thead>
<tbody>
<tr>
<td>AntiVirus</td>
<td>av</td>
</tr>
<tr>
<td>Web Filter</td>
<td>urlfiler</td>
</tr>
<tr>
<td>Application Control</td>
<td>app</td>
</tr>
<tr>
<td>IPS</td>
<td>Sensor-1</td>
</tr>
<tr>
<td>DLP Profile</td>
<td>dlp</td>
</tr>
<tr>
<td>ICAP</td>
<td>default</td>
</tr>
<tr>
<td>Web Application Firewall</td>
<td>default</td>
</tr>
<tr>
<td>SSL Inspection</td>
<td>deep-inspection</td>
</tr>
</tbody>
</table>

6. Click OK to create the policy.
To configure security profiles on an explicit web proxy policy in the CLI:

```plaintext
config firewall proxy-policy
edit 1
    set proxy explicit-web
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set service "web"
    set action accept
    set schedule "always"
    set utm-status enable
    set av-profile "av"
    set webfilter-profile "urlfilter"
    set dlp-profile "dlp"
    set ips-sensor "sensor-1"
    set application-list "app"
    set icap-profile "default"
    set waf-profile "default"
    set ssl-ssh-profile "deep-inspection"
next
end
```

**Transparent proxy**

The security profiles supported by transparent proxy policies are:

- AntiVirus
- Web Filter
- Video Filter
- Application Control
- IPS
- DLP Profile
- ICAP
- Web Application Firewall
- File Filter
- SSL Inspection

To configure security profiles on a transparent proxy policy in the GUI:

1. Go to Policy & Objects > Proxy Policy.
2. Click Create New.
3. Set the following:

<table>
<thead>
<tr>
<th>Proxy Type</th>
<th>Transparent Web</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>port2</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>port1</td>
</tr>
<tr>
<td>Source</td>
<td>all</td>
</tr>
</tbody>
</table>
Network

<table>
<thead>
<tr>
<th>Destination</th>
<th>all</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>webproxy</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
</tbody>
</table>

4. In the *Firewall / Network Options* section, set *Protocol Options* to *default*.

5. In the *Security Profiles* section, make the following selections (for this example, these profiles have all already been created):

<table>
<thead>
<tr>
<th>AntiVirus</th>
<th>av</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web Filter</td>
<td>urlfilter</td>
</tr>
<tr>
<td>Application Control</td>
<td>app</td>
</tr>
<tr>
<td>IPS</td>
<td>Sensor-1</td>
</tr>
<tr>
<td>DLP Profile</td>
<td>dlp</td>
</tr>
<tr>
<td>ICAP</td>
<td>default</td>
</tr>
<tr>
<td>Web Application Firewall</td>
<td>default</td>
</tr>
<tr>
<td>SSL Inspection</td>
<td>deep-inspection</td>
</tr>
</tbody>
</table>

6. Click OK to create the policy.

To configure security profiles on a transparent proxy policy in the CLI:

```
cfg firewall proxy-policy
   edit 2
       set proxy transparent-web
       set srcintf "port2"
       set dstintf "port1"
       set srcaddr "all"
       set dstaddr "all"
       set service "webproxy"
       set action accept
       set schedule "always"
       set utm-status enable
       set av-profile "av"
       set webfilter-profile "urlfilter"
       set dlp-profile "dlp"
       set ips-sensor "sensor-1"
       set application-list "app"
       set icap-profile "app"
       set waf-profile "default"
       set ssl-ssh-profile "certificate-inspection"
   next
end
```
**FTP proxy**

The security profiles supported by FTP proxy policies are:

- AntiVirus
- Application Control
- IPS
- File Filter
- DLP Profile

To configure security profiles on an FTP proxy policy in the GUI:

1. Go to Policy & Objects > Proxy Policy.
2. Click Create New.
3. Set the following:

<table>
<thead>
<tr>
<th>Proxy Type</th>
<th>FTP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outgoing Interface</td>
<td>port1</td>
</tr>
<tr>
<td>Source</td>
<td>all</td>
</tr>
<tr>
<td>Destination</td>
<td>all</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
</tbody>
</table>

4. In the Firewall / Network Options section, set Protocol Options to default.
5. In the Security Profiles section, make the following selections (for this example, these profiles have all already been created):

<table>
<thead>
<tr>
<th>Profile Type</th>
<th>Profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>AntiVirus</td>
<td>av</td>
</tr>
<tr>
<td>Application Control</td>
<td>app</td>
</tr>
<tr>
<td>IPS</td>
<td>Sensor-1</td>
</tr>
<tr>
<td>DLP Profile</td>
<td>dlp</td>
</tr>
</tbody>
</table>

6. Click OK to create the policy.

To configure security profiles on an FTP proxy policy in the CLI:

```bash
config firewall proxy-policy
edit 3
    set proxy ftp
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set utm-status enable
    set av-profile "av"
    set dlp-profile "dlp"
```
Explicit proxy authentication

FortiGate supports multiple authentication methods. This topic explains using an external authentication server with Kerberos as the primary and NTLM as the fallback.

To configure Explicit Proxy with authentication:
1. Enable and configure the explicit proxy on page 238.
2. Configure the authentication server and create user groups on page 239.
4. Create an explicit proxy policy and assign a user group to the policy on page 242.
5. Verify the configuration on page 242.

Enable and configure the explicit proxy

To enable and configure explicit web proxy in the GUI:
1. Go to Network > Explicit Proxy.
2. Enable Explicit Web Proxy.
3. Select port2 as the Listen on Interfaces and set the HTTP Port to 8080.
4. Configure the remaining settings as needed.
5. Click Apply.

To enable and configure explicit web proxy in the CLI:

```
config web-proxy explicit
  set status enable
  set ftp-over-http enable
  set socks enable
  set http-incoming-port 8080
  set ipv6-status enable
  set unknown-http-version best-effort
end

config system interface
  edit "port2"
    set vdom "vdom1"
    set ip 10.1.100.1 255.255.255.0
    set allowaccess ping https ssh snmp http telnet
    set type physical
    set explicit-web-proxy enable
    set snmp-index 12
end
next
end
```
Configure the authentication server and create user groups

Since we are using an external authentication server with Kerberos authentication as the primary and NTLM as the fallback, Kerberos authentication is configured first and then FSSO NTLM authentication is configured.

For successful authorization, the FortiGate checks if user belongs to one of the groups that is permitted in the security policy.

To configure an authentication server and create user groups in the GUI:

1. Configure Kerberos authentication:
   a. Go to User & Authentication > LDAP Servers.
   b. Click Create New.
   c. Set the following:
      
      | Name       | ldap-kerberos |
      |------------|---------------|
      | Server IP  | 172.18.62.220 |
      | Server Port| 389           |
      | Common Name Identifier | cn         |
      | Distinguished Name | dc=fortinetqa,dc=local |
   d. Click OK

2. Define Kerberos as an authentication service. This option is only available in the CLI. For information on generating a keytab, see Generating a keytab on a Windows server on page 243.

3. Configure FSSO NTLM authentication:
   FSSO NTLM authentication is supported in a Windows AD network. FSSO can also provide NTLM authentication service to the FortiGate unit. When a user makes a request that requires authentication, the FortiGate initiates NTLM negotiation with the client browser, but does not process the NTLM packets itself. Instead, it forwards all the NTLM packets to the FSSO service for processing.
   a. Go to Security Fabric > External Connectors.
   b. Click Create New and select FSSO Agent on Windows AD from the Endpoint/Identity category.
   c. Set the Name to FSSO, Primary FSSO Agent to 172.16.200.220, and enter a password.
   d. Click OK.

4. Create a user group for Kerberos authentication:
   a. Go to User & Authentication > User Groups.
   b. Click Create New.
   c. Set the Name to Ldap-Group, and Type to Firewall.
   d. In the Remote Groups table, click Add, and set the Remote Server to the previously created ldap-kerberos server.
   e. Click OK.

5. Create a user group for NTLM authentication:
   a. Go to User & Authentication > User Groups.
   b. Click Create New.
   c. Set the Name to NTLM-FSSO-Group, Type to Fortinet Single Sign-On (FSSO), and add FORTINETQA/FSSO
To configure an authentication server and create user groups in the CLI:

1. Configure Kerberos authentication:

```plaintext
cfg user ldap
  ed "ldap-kerberos"
    se server "172.18.62.220"
    se cnid "cn"
    se dn "dc=fortinetqa,dc=local"
    se type regular
    se username "CN=root,CN=Users,DC=fortinetqa,DC=local"
    se password ********
  ng
end
```

2. Define Kerberos as an authentication service:

```plaintext
cfg user krb-keytab
  ed "http_service"
    se pac-data disable
    se principal "HTTP/FGT.FORTINETQA.LOCAL@FORTINETQA.LOCAL"
    se ldap-server "ldap-kerberos"
    se keytab
"BQIAAABFAIAIEZPUI1JTkVUUUEuTE9DQUwABEHUUFaAFEEZHC5GT1JUSU5FVFBBLkxPQ0FMAAABAAAQAEBAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAAAABAA
Create an authentication scheme and rules

Explicit proxy authentication is managed by authentication schemes and rules. An authentication scheme must be created first, and then the authentication rule.

To create an authentication scheme and rules in the GUI:

1. Create an authentication scheme:
   a. Go to Policy & Objects > Authentication Rules.
   b. Click Create New > Authentication Schemes.
   c. Set the Name to Auth-scheme-Negotiate and select Negotiate as the Method.
   d. Click OK.

2. Create an authentication rule:
   a. Go to Policy & Objects > Authentication Rules.
   b. Click Create New > Authentication Rules.
   c. Set the Name to Auth-Rule, Source Address to all, and Protocol to HTTP.
   d. Enable Authentication Scheme, and select the just created Auth-scheme-Negotiate scheme.
   e. Click OK.

To create an authentication scheme and rules in the CLI:

1. Create an authentication scheme:

   ```
   config authentication scheme
   edit "Auth-scheme-Negotiate"
   set method negotiate <<< Accepts both Kerberos and NTLM as fallback
   next
   end
   ```

2. Create an authentication rule:

   ```
   config authentication rule
   edit "Auth-Rule"
   set status enable
   set protocol http
   set srcaddr "all"
   set ip-based enable
   set active-auth-method "Auth-scheme-Negotiate"
   set comments "Testing"
   next
   end
   ```
Create an explicit proxy policy and assign a user group to the policy

To create an explicit proxy policy and assign a user group to it in the GUI:

1. Go to Policy & Objects > Proxy Policy.
2. Click Create New.
3. Set Proxy Type to Explicit Web and Outgoing Interface to port1.
4. Set Source to all, and the just created user groups NTLM-FSSO-Group and Ldap-Group.
5. Also set Destination to all, Schedule to always, Service to webproxy, and Action to ACCEPT.
6. Click OK.

To create an explicit proxy policy and assign a user group to it in the CLI:

```plaintext
config firewall proxy-policy
    edit 1
       set proxy explicit-web
       set dstintf "port1"
       set srcaddr "all"
       set dstaddr "all"
       set service "web"
       set action accept
       set schedule "always"
       set logtraffic all
       set groups "NTLM-FSSO-Group" "Ldap-Group"
       set av-profile "av"
       set ssl-ssh-profile "deep-custom"
next
end
```

Verify the configuration

Log in using a domain and system that would be authenticated using the Kerberos server, then enter the `diagnose wad user list` CLI command to verify:

```plaintext
# diagnose wad user list
ID: 8, IP: 10.1.100.71, VDOM: vdom1
user name : test1@FORTINETQA.LOCAL
duration  : 389
auth_type : IP
auth_method : Negotiate
pol_id    : 1
g_id      : 1
user_based : 0
expire    : no
LAN:
    bytes_in=4862 bytes_out=11893
WAN:
    bytes_in=7844 bytes_out=1023
```

Log in using a system that is not part of the domain. The NTLM fallback server should be used:

```plaintext
# diagnose wad user list
ID: 2, IP: 10.1.100.202, VDOM: vdom1
```
Generating a keytab on a Windows server

A keytab is used to allow services that are not running Windows to be configured with service instance accounts in the Active Directory Domain Service (AD DS). This allows Kerberos clients to authenticate to the service through Windows Key Distribution Centers (KDCs).

For an explanation of the process, see https://docs.microsoft.com/en-us/windows-server/administration/windows-commands/ktpass.

To generate a keytab on a Windows server:

1. On the server, create a user for the FortiGate:
   - The service name is the FQDN for the explicit proxy interface, such as the hostname in the client browser proxy configuration. In this example, the service name is FGT.
   - The account only requires domain users membership.
   - The password must be very strong.
   - The password is set to never expire.

2. Add the FortiGate FQDN in to the Windows DNS domain, as well as in-addr.arpa.

3. Generate the Kerberos keytab using the ktpass command on Windows servers and many domain workstations:

   ```bash
   # ktpass -princ HTTP/<domain name of test fgt>@realm -mapuser <user> -pass <password> -crypto all -ptype KRB5_NT_PRINCIPAL -out fgt.keytab
   ```

   For example:

   ```bash
   ktpass -princ HTTP/FGT.FORTINETQA.LOCAL@FORTINETQA.LOCAL -mapuser FGT -pass ********** -crypto all -ptype KRB5_NT_PRINCIPAL -out fgt.keytab
   ```

4. Encode the keytab to base64 in a text file:
   - On Windows: `certutil -encode fgt.keytab tmp.b64 & & findstr /v /c:- tmp.b64 > fgt.txt`
   - On Linux: `base64 fgt.keytab > fgt.txt`
   - On MacOS: `base64 -i fgt.keytab -o fgt.txt`

5. Use the code in fgt.txt as the keytab parameter when configuring the FortiGate.
**Transparent web proxy forwarding**

In FortiOS, there is an option to enable proxy forwarding for transparent web proxy policies and regular firewall policies for HTTP and HTTPS.

In previous versions of FortiOS, you could forward proxy traffic to another proxy server (proxy chaining) with explicit proxy. Now, you can forward web traffic to the upstream proxy without having to reconfigure your browsers or publish a proxy auto-reconfiguration (PAC) file.

Once configured, the FortiGate forwards traffic generated by a client to the upstream proxy. The upstream proxy then forwards it to the server.

**To configure proxy forwarding:**

1. Configure the web proxy forwarding server:
   ```
   config web-proxy forward-server
   edit "upStream_proxy_1"
   set ip 172.16.200.20
   set healthcheck enable
   set monitor "http://www.google.ca"
   next
   end
   ```

2. Append the web proxy forwarding server to a firewall policy:
   ```
   config firewall policy
   edit 1
   set name "LAN To WAN"
   set srcintf "port10"
   set dstintf "port9"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set utm-status enable
   set logtraffic all
   set webproxy-forward-server "upStream_proxy_1"
   set fsso disable
   set av-profile "av"
   set ssl-ssh-profile "deep-custom"
   set nat enable
   next
   end
   ```

**Selectively forward web requests to a transparent web proxy**

Web traffic over HTTP/HTTPS can be forwarded selectively by the FortiGate’s transparent web proxy to an upstream web proxy to avoid overwhelming the proxy server. Traffic can be selected by specifying the proxy address, which can be based on a FortiGuard URL category.

---

The FortiGuard web filter service must be enabled on the downstream FortiGate.
Forwarding behavior

The forward server will be ignored if the proxy policy matching for a particular session needs the FortiGate to see authentication information inside the HTTP (plain text) message. For example, assume that user authentication is required and a forward server is configured in the transparent web proxy, and the authentication method is an active method (such as basic). When the user or client sends the HTTP request over SSL with authentication information to the FortiGate, the request cannot be forwarded to the upstream proxy. Instead, it will be forwarded directly to the original web server (assuming deep inspection and http-policy-redirect are enabled in the firewall policy).

The FortiGate will close the session before the client request can be forwarded if all of the following conditions are met:

- The certificate inspection is configured in the firewall policy that has the http-policy-redirect option enabled.
- A previously authenticated IP-based user record cannot be found by the FortiGate’s memory during the SSL handshake.
- Proxy policy matching needs the FortiGate to see the HTTP request authentication information.

This means that in order to enable user authentication and use webproxy-forward-server in the transparent web proxy policy at the same time, the following best practices should be followed:

- In the firewall policy that has the http-policy-redirect option enabled, set ssl-ssh-profile to use the deep-inspection profile.
- Use IP-based authentication rules; otherwise, the webproxy-forward-server setting in the transparent web proxy policy will be ignored.
- Use a passive authentication method such as FSSO. With FSSO, once the user is authenticated as a domain user by a successful login, the web traffic from the user’s client will always be forwarded to the upstream proxy as long as the authenticated user remains unexpired. If the authentication method is an active authentication method (such as basic, digest, NTLM, negotiate, form, and so on), the first session containing authentication information will bypass the forward server, but the following sessions will be connected through the upstream proxy.
Sample configuration

On the downstream FortiGate proxy, there are two category proxy addresses used in two separate transparent web proxy policies as the destination address:

- In the policy with `upstream_proxy_1` as the forward server, the proxy address `category_infotech` is used to match URLs in the information technology category.
- In the policy with `upstream_proxy_2` as the forward server, the proxy address `category_social` is used to match URLs in the social media category.

To configure forwarding requests to transparent web proxies:

1. Configure the proxy forward servers:

   ```
   config web-proxy forward-server
   edit "upStream_proxy_1"
     set ip 172.16.200.20
   next
   edit "upStream_proxy_2"
     set ip 172.16.200.46
   next
   end
   ```

2. Configure the web proxy addresses:

   ```
   config firewall proxy-address
   edit "category_infotech"
     set type category
     set host "all"
     set category 52
   next
   edit "category_social"
     set type category
     set host "all"
     set category 37
   next
   end
   ```

3. Configure the firewall policy:

   ```
   config firewall policy
   edit 1
     set srcintf "port10"
     set dstintf "port9"
     set srcaddr "all"
     set dstaddr "all"
     set action accept
     set schedule "always"
     set service "ALL"
     set utm-status enable
     set inspection-mode proxy
     set http-policy-redirect enable
     set ssl-ssh-profile "deep-inspection"
     set av-profile "av"
     set nat enable
   next
   end
   ```
4. Configure the proxy policies:

```plaintext
config firewall proxy-policy
edit 1
    set proxy transparent-web
    set srcintf "port10"
    set dstintf "port9"
    set srcaddr "all"
    set dstaddr "category_infotech"
    set service "webproxy"
    set action accept
    set schedule "always"
    set logtraffic all
    set webproxy-forward-server "upStream_proxy_1"
    set utm-status enable
    set ssl-ssh-profile "deep-inspection"
    set av-profile "av"
next
edit 2
    set proxy transparent-web
    set srcintf "port10"
    set dstintf "port9"
    set srcaddr "all"
    set dstaddr "category_social"
    set service "webproxy"
    set action accept
    set schedule "always"
    set logtraffic all
    set webproxy-forward-server "upStream_proxy_2"
    set utm-status enable
    set ssl-ssh-profile "deep-inspection"
    set av-profile "av"
next
end
```

**Upstream proxy authentication in transparent proxy mode**

A downstream proxy FortiGate that needs to be authenticated by the upstream web proxy can use the basic authentication method to send its username and password, in the base64 format, to the upstream web proxy for authentication. If the authentication succeeds, web traffic that is forwarded from the downstream proxy FortiGate to the upstream proxy can be accepted and forwarded to its destinations.

In this example, a school has a FortiGate acting as a downstream proxy that is configured with firewall policies for each user group (students and staff). In each policy, a forwarding server is configured to forward the web traffic to the upstream web proxy.

The username and password that the upstream web proxy uses to authenticate the downstream proxy are configured on the forwarding server, and are sent to the upstream web proxy with the forwarded HTTP requests.

<table>
<thead>
<tr>
<th>Username</th>
<th>Password</th>
</tr>
</thead>
<tbody>
<tr>
<td>student.proxy.local:8080</td>
<td>students</td>
</tr>
<tr>
<td>staff.proxy.local:8081</td>
<td>staff</td>
</tr>
</tbody>
</table>
On the downstream FortiGate, configure forwarding servers with the usernames and passwords for authentication on the upstream web proxy, then apply those servers to firewall policies for transparent proxy. For explicit web proxy, the forwarding servers can be applied to proxy policies.

When the transparent proxy is configured, clients can access websites without configuring a web proxy in their browser. The downstream proxy sends the username and password to the upstream proxy with forwarded HTTP requests to be authenticated.

**To configure the forwarding server on the downstream FortiGate:**

```bash
config web-proxy forward-server
  edit "Student_Upstream_WebProxy"
    set addr-type fqdn
    set fqdn "student.proxy.local"
    set port 8080
    set username "student"
    set password ABC123
  next
  edit "Staff_Upstream_WebProxy"
    set addr-type fqdn
    set fqdn "staff.proxy.local"
    set port 8081
    set username "staff"
    set password 123456
  next
end
```

**To configure firewall policies for transparent proxy:**

```bash
config firewall policy
  edit 1
    set srcintf "Vlan_Student"
    set dstintf "port9"
    set srcaddr "Student_Subnet"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "deep-inspection"
    set av-profile "av"
    set webproxy-forward-server "Student_Upstream_WebProxy"
    set nat enable
  next
  edit 2
    set srcintf "Vlan_Staff"
    set dstintf "port9"
    set srcaddr "Staff_Subnet"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "deep-inspection"
```
Multiple dynamic header count

Multiple dynamic headers are supported for web proxy profiles, as well as Base64 encoding and the append/new options.

Administrators only have to select the dynamic header in the profile. The FortiGate will automatically display the corresponding static value. For example, if the administrator selects the $client-ip header, the FortiGate will display the actual client IP address.

The supported headers are:

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$client-ip</td>
<td>Client IP address</td>
</tr>
<tr>
<td>$user</td>
<td>Authentication user name</td>
</tr>
<tr>
<td>$domain</td>
<td>User domain name</td>
</tr>
<tr>
<td>$local_grp</td>
<td>Firewall group name</td>
</tr>
<tr>
<td>$remote_grp</td>
<td>Group name from authentication server</td>
</tr>
<tr>
<td>$proxy_name</td>
<td>Proxy realm name</td>
</tr>
</tbody>
</table>

To configure dynamic headers using the CLI:

Since authentication is required, FSSO NTLM authentication is configured in this example.

1. Configure LDAP:

```bash
cfg user ldap
edit "ldap-kerberos"
   set server "172.18.62.220"
   set cnid "cn"a
   set dn "dc=fortinetqa,dc=local"
   set type regular
   set username "CN=root,CN=Users,DC=fortinetqa,DC=local"
   set password ********
next
end
```

2. Configure FSSO:

```bash
cfg user fssol
edit "1"
   set server "172.18.62.220"
   set password ********
next
end
```

3. Configure a user group:
config user group
   edit "NTLM-FSSO"
      set group-type fsso-service
      set member "FORTINETQA/FSSO"
   next
end

4. Configure an authentication scheme:

config authentication scheme
   edit "au-sch-ntlm"
      set method ntlm
   next
end

5. Configure an authentication rule:

config authentication rule
   edit "au-rule-fsso"
      set srcaddr "all"
      set active-auth-method "au-sch-ntlm"
   next
end

6. Create a web proxy profile that adds a new dynamic and custom Via header:

config web-proxy profile
   edit "test"
      set log-header-change enable
      config headers
         edit 1
            set name "client-ip"
            set content "$client-ip"
         next
         edit 2
            set name "Proxy-Name"
            set content "$proxy_name"
         next
         edit 3
            set name "user"
            set content "$user"
         next
         edit 4
            set name "domain"
            set content "$domain"
         next
         edit 5
            set name "local_grp"
            set content "$local_grp"
         next
         edit 6
            set name "remote_grp"
            set content "$remote_grp"
         next
         edit 7
            set name "Via"
            set content "Fortigate-Proxy"
         next
      end
   next
end
7. In the proxy policy, append the web proxy profile created in the previous step:

    config firewall proxy-policy
    edit 1
      set proxy explicit-web
      set dstintf "port1"
      set srcaddr "all"
      set dstaddr "all"
      set service "web"
      set action accept
      set schedule "always"
      set logtraffic all
      set groups "NTLM-FSSO"
      set webproxy-profile "test"
      set utm-status enable
      set av-profile "av"
      set webfilter-profile "content"
      set ssl-ssh-profile "deep-custom"
    next
  end

8. Once traffic is being generated from the client, look at the web filter logs to verify that it is working.

The corresponding values for all the added header fields are shown in the Web Filter card at Log & Report > Security Events, in the Change headers section at the bottom of the Log Details pane.

```
1: date=2019-02-07 time=13:57:24 logid="0344013632" type="utm" subtype="webfilter"
  eventtype="http_header_change" level="notice" vd="vdom1" eventtime=1549576642 policyid=1
  transid=50331689 sessionid=1712788383 user="TEST21@FORTINETQA" group="NTLM-FSSO"
  profile="test" srcip=10.1.100.116 srcport=53278 dstip=172.16.200.46 dstport=80
  service="HTTP" url="http://172.16.200.46/" agent="curl/7.22.0" chgheaders="Added=client-ip:10.1.100.116|Proxy-Name: 1.1 100D.qa|user: TEST21|domain: FORTINETQA|local_grp: NTLM-FSSO|remote_grp: FORTINETQA/FSSO|Via: Fortigate-Proxy"
```

### Restricted SaaS access

Large organizations may want to restrict SaaS access to resources like Microsoft Office 365, Google Workspace, and Dropbox by tenant to block non-company login attempts and secure the users from accessing non-approved cloud resources. Many cloud vendors enable this by applying tenant restrictions for access control. For example, users accessing Microsoft 365 applications with tenant restrictions through the corporate proxy will only be allowed to log in as the company’s tenant and access the organization’s applications.

To implement this, access requests from the clients pass through the company’s web proxy, which inserts headers to notify the SaaS service to apply tenant restrictions with the permitted tenant list. Users are redirected the SaaS service login page, and are only allowed to log in if they belong to the permitted tenant list.

For more information, refer to the vendor-specific documentation:

- **Office 365**: [Restrict access to a tenant](#)
- **Google Workspace**: [Block access to consumer accounts](#)
- **Dropbox**: [Network control](#)
Basic configuration

A web proxy profile can specify access permissions for Microsoft Office 365, Google Workspace, and Dropbox by inserting vendor-defined headers that restrict access to the specific accounts. Custom headers can also be inserted for any destination. The web proxy profile can then be applied to a firewall policy to control the header's insertion.

To implement Office 365 tenant restriction, Google Workspace account access control, and Dropbox network access control:

1. Configure a web proxy profile according to the vendors' specifications:
   a. Set the header name (defined by the service provider).
   b. Set the traffic destination (the service provider).
   c. Set the HTTP header content to be inserted into the traffic (defined by your settings).

   ```
   config web-proxy profile
   edit <name>
      config headers
      edit <id>
         set name <string>
         set dstaddr <address>
         set action add-to-request
         set base64-encoding disable
         set add-option new
         set protocol https http
         set content <string>
      next
   next
   end
   end
   ```

2. Apply the web proxy profile to a policy. SSL deep inspection must be used in the firewall policy:

The following table lists the vendor-specific `config headers` settings that must be configured in the web proxy profile (`config web-proxy profile`):

<table>
<thead>
<tr>
<th>Setting</th>
<th>Microsoft Office 365</th>
<th>Google Workspace</th>
<th>Dropbox</th>
</tr>
</thead>
<tbody>
<tr>
<td>name &lt;string&gt;</td>
<td>• Restrict-Access-To-Tenants</td>
<td>• X-GoogApps-Allowed-Domains</td>
<td>• X-Dropbox-allowed-Team-Ids</td>
</tr>
<tr>
<td></td>
<td>• Restrict-Access-Context</td>
<td></td>
<td></td>
</tr>
<tr>
<td>dstaddr &lt;address&gt;</td>
<td>• Use the built-in Microsoft Office 365 address.</td>
<td>• Use the built-in G Suite address.</td>
<td>• Use the built-in wildcard.dropbox.com address.</td>
</tr>
<tr>
<td>content &lt;string&gt;</td>
<td>• Enter the domain for Restrict-Access-To-</td>
<td>• Enter the domain.</td>
<td>• Enter the Dropbox team ID.</td>
</tr>
</tbody>
</table>
Due to vendors’ changing requirements, these settings may no longer comply with the vendors’ official guidelines. See the vendor documentation for more details.

**Microsoft Office 365 example**

In this example, a web proxy profile is created to control permissions for Microsoft Office 365 to allow corporate domains and deny personal accounts, such as Hotmail and Outlook that are accessed through login.live.com.

1. When a user attempts to access login.microsoftonline.com, login.microsoft.com, or login.windows.net, the traffic will match a proxy inspection mode firewall policy with the assigned web proxy profile.
2. The web proxy profile adds new headers to the customer tenant, indicating the allowed domain and restricted access for personal accounts. Next, the FortiGate starts a new connection with the Microsoft Office 365 domain controller including the new headers.
3. The Microsoft Office 365 domain controller assesses this data and will allow or deny this access, then sends a reply to the FortiGate.
4. The FortiGate sends a reply to the client.

The FortiGate will only indicate the correct domains to be allowed or denied through the headers to Microsoft. The custom sign-in portal in the browser is generated by Microsoft.

**Configuration summary**

The following must be configured in FortiOS:

- An FQDN address for login.live.com
- An SSL inspection profile that uses deep inspection with an exemption for login.live.com

---

Ensure that the firewall certificate is installed on the client machines. A company certificate signed by an internal CA is recommended.

- A web filter profile in proxy mode with static URL filters for the SNI URLs
- A web proxy profile that adds new headers to the customer tenant
A firewall policy using proxy mode inspection that applies the configured SSL inspection, web filter, and web proxy profiles.

The Restrict-Access-To-Tenants and Restrict-Access-Context headers are inserted for incoming requests to: login.microsoftonline.com, login.microsoft.com, and login.windows.net, which are part of the Microsoft Office 365 address group.

To restrict access to personal accounts using the login.live.com domain, the sec-Restrict-Tenant-Access-Policy header is inserted and uses restrict-msa as the header content.

Before configuring the FortiGate, collect the information related to the company domain in the Office 365 contract.

- Restrict-Access-To-Tenants: your <domain.com>
- Restrict-Access-Context: Directory ID

To find the Directory ID related to the domain, locate it in the Azure portal, or use the whatismytenantid.com open tool.

To configure the FortiGate:

1. Add the FQDN address for login.live.com:

```fortigate
config firewall address
edit "login.live.com"
  set type fqdn
  set fqdn "login.live.com"
next
end
```

2. Configure the SSL inspection profile. In this example, the deep-inspection profile is cloned, and the live.com FQDN is removed from the exemption list.
   a. Clone the deep-inspection profile:

   ```fortigate
   config firewall ssl-ssh-profile
   clone "deep-inspection" to "Tenant"
end
   ```
   b. Edit the Tenant profile and remove live.com from the config ssl-exempt list.

3. Configure the URL filter list:

```fortigate
config webfilter urlfilter
edit 1
  set name "Auto-webfilter-urlfilter"
  config entries
  edit 1
    set url "login.microsoftonline.com"
    set action allow
    next
  edit 2
    set url "login.microsoft.com"
    set action allow
    next
  edit 3
    set url "login.windows.net"
    set action allow
```
4. Configure the web filter profile:

```plaintext
config webfilter profile
edit "Tenant"
    set comment "Office 365"
    set feature-set proxy
    config web
        set urlfilter-table 1
    end
next
end
```

5. Configure the web proxy profile (enter the header names exactly as shown):

```plaintext
config web-proxy profile
edit "SaaS-Tenant-Restriction"
    set header-client-ip pass
    set header-via-request pass
    set header-via-response pass
    set header-x-forwarded-for pass
    set header-x-forwarded-client-cert pass
    set header-front-end-https pass
    set header-x-authenticated-user pass
    set header-x-authenticated-groups pass
    set strip-encoding disable
    set log-header-change disable
    config headers
        edit 1
            set name "Restrict-Access-To-Tenants"
            set dstaddr "login.microsoft.com" "login.microsoftonline.com"
            "login.windows.net"
            set action add-to-request
            set base64-encoding disable
            set add-option new
            set protocol https http
            set content <domain>
        next
        edit 2
            set name "Restrict-Access-Context"
            set dstaddr "login.microsoftonline.com" "login.microsoft.com"
            "login.windows.net"
            set action add-to-request
            set base64-encoding disable
            set add-option new
            set protocol https http
            set content <directory_ID>
```

next
edit 3
set name "sec-Restict-Tenant-Access-Policy"
set dstaddr "login.live.com"
set action add-to-request
set base64-encoding disable
set add-option new
set protocol https http
set content "restrict-msa"
next
next
end

6. Configure the firewall policy:

config firewall policy
  edit 10
    set name "Tenant"
    set srcintf "port2"
    set dstintf "port1"
    set action accept
    set srcaddr "users-lan"
    set dstaddr "login.microsoft.com" "login.microsoftonline.com"
    "login.windows.net" "login.live.com"
    set schedule "always"
    set service "HTTP" "HTTPS"
    set utm-status enable
    set inspection-mode proxy
    set webproxy-profile "SaaS-Tenant-Restricion"
    set ssl-ssh-profile "Tenant"
    set webfilter-profile "Tenant"
    set logtraffic all
    set nat enable
next
end
Testing the access

To test the access to corporate domains and personal accounts:

1. Get a client to log in with their corporate email using the login.microsoftonline.com domain.

2. The client is able to enter their credentials and log in successfully.
3. Get a client to log in to their personal Outlook account.

4. After the client enters their credentials, a message appears that they cannot access this resource because it is restricted by the cross-tenant access policy.
Verifying the header insertion

To verify the header insertion for corporate domains and personal accounts:

1. On the FortiGate, start running the WAD debugs:

   # diagnose wad debug enable category http
   # diagnose wad debug enable level info
   # diagnose debug enable

2. After a client attempts to access corporate domains, verify that the header information is sent to the Microsoft Active Directory:

   [I][p:234][s:2481][r:33]  wad_dump_fwd_http_req :2567  hreq=0x7fc75f0cd468

   Forward request to server:
   POST /common/GetCredentialType?mkt=en-US HTTP/1.1
   Host: login.microsoftonline.com
   Connection: keep-alive
   Content-Length: 1961
   sec-ch-ua: " Not A;Brand";v="99", "Chromium";v="101", "Google Chrome";v="101"
   hpgrequestid: d7f706a8-1143-4cdd-ad52-1cc69dc7bb00
   sec-ch-ua-mobile: ?0
   User-Agent: Mozilla/5.0 (Windows NT 6.3; Win64; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/101.0.4951.54 Safari/537.36
   client-request-id: 5c3d196d-5939-45cc-a45b-232b9ed13f

   Restrict-Access-To-Tenants: fortinet-us.com
   Restrict-Access-Context: *******-****-452f-8535-************

3. After a client attempts to access a personal account, verify that the header information is sent to the Microsoft Active Directory:

   [I][p:234][s:2519][r:34]  wad_dump_fwd_http_req :2567  hreq=0x7fc75f0ce6a8

   Forward request to server:
   GET /oauth20_authorize.srf?client_id=4765445b-32c6-49b0-83e6-1d93765276ca&scope=openid+profile+https%3a%2f%2fwww.office.com%2fv2%2fOfficeHome.All&redirect_uri=https%3a%2f%2fwww.office.com%2flandingv2&response_type=code+id_token&state=7tAtndYhcA3132S-UOTyLVEtyIzs8FgndTpeYM9mJ1Eea-X5nfqrSalnnPH41cHxHfGug6N5cbliK676v6xZgszhH_ JARVKrpt2wBvj12cbN24mtYNWdK1FT1bEtu5VBjgtBOX2u6v3F_ 9g7Ul1kCpGThBRghvO2pyTndT3EEyAHv9LsKRxty3xncxe8dqKfkiidJLcc3q-01r4rpm5x2xZSBwG_ Kkn3kCRq9ulFEOziHACpvcnuKmzGWBKnBH4sJJKxMrEfiXwCg4nsOjg&response_mode=form_post&nonce=637877163655610380.MjNjZmM4Nz4otU5M5y000GZ1Ltk0NTItTm9Ndu2YjVloDjNjJ1VlOTqWym Uto0T1m502hY5LtyN2MtN2QyMjgwNjcxY2Uz&x-client-SKU=ID_NETSTANDARD2_0&x-client-Ver=6.12.1.0&uaid=5c3d196d593945cca45b232b9ed13f&msproxy=1&issuer=msosantem=common&u_i_locales=en-US&epct=AQABAAADAD--DLAV0V7Qrdgg37WervfA6SLaDsJUcjb1B90KimF3d_ lfnJxzdA1H5sh1JdUSGejBElqsko-A7JX67PzaGeDlJJo1IGa37VhJzGTBZ-KgARte9FhssNnLiM_ dojr0dAtB3xPdhiqQT2N-UcYdpcP2s3vPainF7Nqes5ecXRoE9Vw9-s7NjfaS0kPFWW03a16buz0niAbV860Y0D9b98vdJWPgkW--euDr6n8_ zI5hAAqjhs=0&username=**********%40outlook.com&login_hint=********%40outlook.com HTTP/1.1

   Host: login.live.com
   Connection: keep-alive
   ...
Explicit proxy and FortiGate Cloud Sandbox

Explicit proxy connections can leverage FortiGate Cloud Sandbox for advanced threat scanning and updates. This allows FortiGates behind isolated networks to connect to FortiCloud services.

To configure FortiGuard services to communicate with an explicit proxy server:

```
config system fortiguard
    set proxy-server-ip 172.16.200.44
    set proxy-server-port 3128
    set proxy-username "test1"
    set proxy-password ********
end
```

To verify the explicit proxy connection to FortiGate Cloud Sandbox:

```
# diagnose debug application forticldd -1
Debug messages will be on for 30 minutes.
# diagnose debug enable
[2942] fds_handle_request: Received cmd 23 from pid-2526, len 0
[40] fds_queue_task: req-23 is added to Cloud-sandbox-controller
[178] fds_svr_default_task_xmit: try to get IPs for Cloud-sandbox-controller

Proxy chaining

For the explicit web proxy you can configure web proxy forwarding servers to use proxy chaining to redirect web proxy sessions to other proxy servers. Proxy chaining can be used to forward web proxy sessions from the FortiGate unit to one or more other proxy servers on your network or on a remote network. You can use proxy chaining to integrate the FortiGate explicit web proxy with a web proxy solution that you already have in place.

A FortiGate unit can forward sessions to most web proxy servers including a remote FortiGate unit with the explicit web proxy enabled. No special configuration of the explicit web proxy on the remote FortiGate unit is required.

You can deploy the explicit web proxy with proxy chaining in an enterprise environment consisting of small satellite offices and a main office. If each office has a FortiGate unit, users at each of the satellite offices can use their local FortiGate unit as an explicit web proxy server. The satellite office FortiGate units can forward explicit web proxy sessions to an explicit web proxy server at the central office. From here the sessions can connect to web servers on the Internet.

FortiGate proxy chaining does not support web proxies in the proxy chain authenticating each other.

The following examples assume explicit web proxy has been enabled.
**To enable explicit web proxy in the GUI:**

1. Go to System > Feature Visibility.
2. In the Security Features column, enable Explicit Proxy.
3. Configure the explicit web proxy settings. See Explicit web proxy on page 220.

**To add a web proxy forwarding server in the GUI:**

2. In the Web Proxy Forwarding Servers section, click Create New.
3. Configure the server settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>Enter the name of the forwarding server.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy Address Type</td>
<td>Select the type of IP address of the forwarding server. A forwarding server can have an FQDN or IP address.</td>
</tr>
<tr>
<td>Proxy Address</td>
<td>Enter the IP address of the forwarding server.</td>
</tr>
<tr>
<td>Port</td>
<td>Enter the port number on which the proxy receives connections. Traffic leaving the FortiGate explicit web proxy for this server has its destination port number changed to this number.</td>
</tr>
<tr>
<td>Server Down Action</td>
<td>Select the action the explicit web proxy will take if the forwarding server is down.</td>
</tr>
<tr>
<td></td>
<td>• Block: Blocks the traffic if the remote server is down.</td>
</tr>
<tr>
<td></td>
<td>• Use Original Server: Forwards the traffic from the FortiGate to its destination as if no forwarding server is configured.</td>
</tr>
<tr>
<td>Health Monitor</td>
<td>Select to enable health check monitoring.</td>
</tr>
<tr>
<td>Health Check Monitor Site</td>
<td>Enter the address of a remote site.</td>
</tr>
</tbody>
</table>

4. Click OK.

**Example**

The following example adds a web proxy forwarding server named fwd-srv at address proxy.example.com and port 8080.

**To add a web proxy forwarding server in the CLI:**

```
config  web-proxy forward-server
   edit fwd-srv
      set addr-type fqdn
      set fqdn proxy.example.com
      set port 8080
   next
end
```
Web proxy forwarding server monitoring and health checking

By default, a FortiGate unit monitors a web proxy forwarding server by forwarding a connection to the remote server every 10 seconds. The remote server is assumed to be down if it does not respond to the connection. FortiGate continues checking the server. The server is assumed to be back up when the server sends a response. If you enable health checking, the FortiGate unit attempts to get a response from a web server every 10 seconds by connecting through the remote forwarding server.

You can configure health checking for each remote server and specify a different website to check for each one. If the remote server is found to be down you can configure the FortiGate unit to block sessions until the server comes back up or to allow sessions to connect to their destination, bypassing the remote forwarding server. You cannot configure the FortiGate unit to fail over to another remote forwarding server.

To configure proxy server monitor and health checking in the GUI:

2. In the Web Proxy Forwarding Servers section, edit a server.

<table>
<thead>
<tr>
<th>Server Down Action</th>
<th>Select the action the explicit web proxy will take if the forwarding server is down.</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Block: Blocks the traffic if the remote server is down.</td>
<td></td>
</tr>
<tr>
<td>• Use Original Server: Forwards the traffic from the FortiGate to its destination as if no forwarding server configured.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Health Monitor</th>
<th>Select to enable health check monitoring.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Health Check Monitor Site</th>
<th>Enter the address of a remote site.</th>
</tr>
</thead>
</table>

4. Click OK.

Example

The following example enables health checking for a web proxy forwarding server and sets the server down option to bypass the forwarding server if it is down.

To configure proxy server monitor and health checking in the CLI:

```bash
config web-proxy forward-server
  edit fwd-srv
    set healthcheck enable
    set monitor http://example.com
    set server-down-option pass
  next
end
```

Grouping forwarding servers and load balancing traffic to the servers

You can add multiple web proxy forwarding servers to a forwarding server group and then add the server group to an explicit web proxy policy instead of adding a single server. Forwarding server groups are created from the FortiGate CLI but can be added to policies from the web-based manager (or from the CLI).
When you create a forwarding server group you can select a load balancing method to control how sessions are load balanced to the forwarding servers in the server group. Two load balancing methods are available:

- **Weighted** load balancing sends more sessions to the servers with higher weights. You can configure the weight for each server when you add it to the group.
- **Least-session** load balancing sends new sessions to the forwarding server that is processing the fewest sessions.

When you create a forwarding server group you can also enable **affinity**. Enable affinity to have requests from the same client processed by the same server. This can reduce delays caused by using multiple servers for a single multi-step client operation. Affinity takes precedence over load balancing.

You can also configure the behavior of the group if all of the servers in the group are down. You can select to block traffic or you can select to have the traffic pass through the FortiGate explicit proxy directly to its destination instead of being sent to one of the forwarding servers.

**Example**

The following example adds a forwarding server group that uses weighted load balancing to load balance traffic to three forwarding servers. Server weights are configured to send most traffic to `server2`. The group has **affinity** enabled and blocks traffic if all of the forward servers are down.

**To configure load balancing in the CLI:**

``` FortiOS
config web-proxy forward-server
  edit server_1
    set ip 172.20.120.12
    set port 8080
  next
  edit server_2
    set ip 172.20.120.13
    set port 8000
  next
  edit server_3
    set ip 172.20.120.14
    set port 8090
  next
end

config web-proxy forward-server-group
  edit New-fwd-group
    set affinity enable
    set ldb-method weighted
    set group-down-option block
  config server-list
    edit server_1
      set weight 10
    next
    edit server_2
      set weight 40
    next
    edit server_3
      set weight 10
    next
  end
next
end
```
Adding proxy chaining to an explicit web proxy policy

You can enable proxy chaining for web proxy sessions by adding a web proxy forwarding server or server group to an explicit web proxy policy. In a policy you can select one web proxy forwarding server or server group. All explicit web proxy traffic accepted by this security policy is forwarded to the specified web proxy forwarding server or server group.

To add an explicit web proxy forwarding server in the GUI:

1. Go to Policy & Objects > Proxy Policy and click Create New.
2. Configure the policy settings:

<table>
<thead>
<tr>
<th>Proxy Type</th>
<th>Explicit Web</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outgoing Interface</td>
<td>wan1</td>
</tr>
<tr>
<td>Source</td>
<td>Internal_subnet</td>
</tr>
<tr>
<td>Destination</td>
<td>all</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>webproxy</td>
</tr>
<tr>
<td>Action</td>
<td>Accept</td>
</tr>
</tbody>
</table>

3. Enable Web Proxy Forwarding Server and select the forwarding server, (for example, fwd-srv).
4. Click OK.

Example

The following example adds a security policy that allows all users on the 10.31.101.0 subnet to use the explicit web proxy for connections through the wan1 interface to the Internet. The policy forwards web proxy sessions to a remote forwarding server named fwd-srv.

To add an explicit web proxy forwarding server in the CLI:

```
config firewall proxy-policy
edit 0
  set proxy explicit-web
  set dstintf "wan1"
  set srcaddr "Internal_subnet"
  set dstaddr "all"
  set service "webproxy"
  set action accept
  set schedule "always"
  set webproxy-forward-server "fwd-srv"
next
end
```

Using TLS 1.3 with web proxy forward servers

A FortiGate can handle TLS 1.3 traffic in both deep and certificate inspection modes.
Example

The following example demonstrates that the Squid server and the FortiGate can handle TLS 1.3 traffic.

The following output from the Squid server demonstrates that the FortiGate supports TLS 1.3 traffic and forwards the hello retry request back to the client PC. The client PC then sends the client hello again, and the connection is successfully established.

<table>
<thead>
<tr>
<th>No.</th>
<th>Time</th>
<th>Source</th>
<th>Destination</th>
<th>Protocol</th>
<th>Length (Bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>17:00</td>
<td>10.1.100.66</td>
<td>172.16.200.8</td>
<td>TCP</td>
<td>859</td>
</tr>
<tr>
<td>2</td>
<td>17:00</td>
<td>10.1.100.7</td>
<td>172.16.200.8</td>
<td>TCP</td>
<td>859</td>
</tr>
</tbody>
</table>

WAN optimization SSL proxy chaining

An SSL server does not need to be defined for WAN optimization (WANOpt) SSL traffic offloading (traffic acceleration). The server side FortiGate uses an SSL profile to resign the HTTP server's certificate, both with and without an external proxy, without an SSL server configured. GCM and ChaCha ciphers can also be used in the SSL connection.

Examples

In these examples, HTTPS traffic is accelerated without configuring an SSL server, including with a proxy in between, and when the GCM or ChaCha ciphers are used.

Example 1

In this example, the server certificate is resigned by the server side FortiGate, and HTTPS traffic is accelerated without configuring an SSL server.
HTTPS traffic with the GCM or ChaCha cipher can pass through WANopt tunnel.

To configure FGT_A:

1. Configure the hard disk to perform WANOpt:

   ```
   config system storage
   edit "HDD2"
   set status enable
   set usage wanopt
   set wanopt-mode mix
   next
   end
   ```

2. Configure the WANOpt peer and profile:

   ```
   config wanopt peer
   edit "FGT-D"
   set ip 120.120.120.172
   next
   end
   ```

   ```
   config wanopt profile
   edit "test"
   config http
   set status enable
   set ssl enable
   end
   ```

3. Create an SSL profile with deep inspection on HTTPS port 443:

   ```
   config firewall ssl-ssh-profile
   edit "ssl"
   config https
   set ports 443
   set status deep-inspection
   ```

4. Configure a firewall policy in proxy mode with WANOpt enabled and the WANOpt profile selected:

   ```
   config firewall policy
   edit 1
   set name "WANOPT-A"
   ```
to configure FGT_D:

1. Configure the hard disk to perform WANOpt:

```plaintext
config system storage
edit "HDD2"
  set status enable
  set usage wanopt
  set wanopt-mode mix
next
end
```

2. Configure the WANOpt peer:

```plaintext
config wanopt peer
edit "FGT-A"
  set ip 110.110.110.171
next
end
```

3. Create an SSL profile with deep inspection on HTTPS port 443. The default Fortinet_CA_SSL certificate is used to resign the server certificate:

```plaintext
config firewall ssl-ssh-profile
edit "ssl"
  config https
    set ports 443
    set status deep-inspection
  end
next
end
```

4. Configure a firewall policy in proxy mode with WANOpt enabled and passive WANOpt detection:

```plaintext
config firewall policy
edit 1
  set name "WANOPT-B"
  set srcintf "port27"
  set dstintf "port23"
  set action accept
  set srcaddr "all"
next
end
```
set dstaddr "all"
set schedule "always"
set service "ALL"
set utm-status enable
set inspection-mode proxy
set wanopt enable
set wanopt-detection passive
set nat enable

next
end

5. Configure a proxy policy to apply the SSL profile:

config firewall proxy-policy
edit 100
  set proxy wanopt
  set dstintf "port23"
  set srcaddr "all"
  set dstaddr "all"
  set service "ALL"
  set action accept
  set schedule "always"
  set utm-status enable
  set profile-protocol-options "protocol"
  set ssl-ssh-profile "ssl"
next
end

To confirm that traffic is accelerated:

1. On the client PC, curl a 10MB test sample for the first time:

    root@client:/tmp# curl -k https://172.16.200.144/test_10M.pdf -O
    % Total    % Received % Xferd  Average Speed   Time    Time     Time  Time
    100 9865k  100 9865k   0     0  663k  0:00:14  0:00:15 --:--:-- 1526k

    It takes 15 seconds to finish the download.

2. On FGT_A, check the WAD statistics:

    # diagnose wad stats worker.tunnel
    comp.n_in_raw_bytes  10155840
    comp.n_in_comp_bytes  4548728
    comp.n_out_raw_bytes  29624
    comp.n_out_comp_bytes  31623

    # diagnose wad stats worker.protos.http
    wan.bytes_in  0
    wan.bytes_out  0
    lan.bytes_in  760
    lan.bytes_out  10140606
    tunnel.bytes_in  4548728
    tunnel.bytes_out  31623

3. Curl the same test sample a second time:

    root@client:/tmp# curl -k https://172.16.200.144/test_10M.pdf -O
    % Total    % Received % Xferd  Average Speed   Time    Time     Time  Time

Network

<table>
<thead>
<tr>
<th>Dload</th>
<th>Upload</th>
<th>Total</th>
<th>Spent</th>
<th>Left</th>
<th>Speed</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>9865k</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>663k</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>0:00:01</td>
<td>0:00:01</td>
<td>--:--:--</td>
</tr>
</tbody>
</table>

It now takes less than one second to finish the download.

4. On FGT_A, check the WAD statistics again:

```
# diagnose wad stats worker.tunnel
comp.n_in_raw_bytes: 10181157
comp.n_in_comp_bytes: 4570331
comp.n_out_raw_bytes: 31627
comp.n_out_comp_bytes: 34702

# diagnose wad stats worker.protos.http
wan.bytes_in: 0
wan.bytes_out: 0
lan.bytes_in: 1607
lan.bytes_out: 20286841
tunnel.bytes_in: 4570331
tunnel.bytes_out: 34702
```

The tunnel bytes are mostly unchanged, but the LAN bytes are doubled. This means that the bytes of the second curl come from the cache, showing that the traffic is accelerated.

To confirm that a curl using the GCM cipher is accepted and accelerated:

1. On the client PC, curl a 10MB test sample with the GCM cipher:

```
root@client:/tmp# curl -v -k --ciphers DHE-RSA-AES128-GCM-SHA256 https://172.16.200.144/test_10M.pdf -O
* Trying 172.16.200.144...
* TCP_NODELAY set
% Total  % Received % Xferd Average Speed Time Time Time Current
  0      0  0 00:00:01  0 00:00:01  0 00:00:01  0
Connected to 172.16.200.144 (172.16.200.144) port 443 (#0)
* ALPN, offering h2
* ALPN, offering http/1.1
* Cipher selection: DHE-RSA-AES128-GCM-SHA256
* successfully set certificate verify locations:
*   CAfile: /etc/ssl/certs/ca-certificates.crt
*   CPath: none
} [5 bytes data]
* TLSv1.3 (OUT), TLS handshake, Client hello (1):
} [512 bytes data]
* TLSv1.3 (IN), TLS handshake, Server hello (2):
} [100 bytes data]
* TLSv1.2 (IN), TLS handshake, Certificate (11):
} [1920 bytes data]
* TLSv1.2 (IN), TLS handshake, Server key exchange (12):
} [783 bytes data]
* TLSv1.2 (IN), TLS handshake, Server finished (14):
} [4 bytes data]
* TLSv1.2 (OUT), TLS handshake, Client key exchange (16):
} [262 bytes data]
* TLSv1.2 (OUT), TLS change cipher, Change cipher spec (1):
} [1 bytes data]
* TLSv1.2 (OUT), TLS handshake, Finished (20):
```
To confirm that a curl using the ChaCha cipher is accepted and accelerated:

1. On the client PC, curl a 10MB test sample with the ChaCha cipher:

   root@client:/tmp# curl -v -k --ciphers ECDHE-RSA-CHACHA20-POLY1305 https://172.16.200.144/test.doc -O

   * Trying 172.16.200.144...
   * TCP_NODELAY set
   % Total    % Received % Xferd Average Speed Time Time Time Current
   Dload Upload Total Spent Left Speed
   0 0 0 0 0 0 0 0 0 --:--:-- --:--:-- --:--:-- --:--:--

   Connected to 172.16.200.144 (172.16.200.144) port 443 (#0)
   * ALPN, offering h2
   * ALPN, offering http/1.1
   * Cipher selection: ECDHE-RSA-CHACHA20-POLY1305
   * successfully set certificate verify locations:
     * CAfile: /etc/ssl/certs/ca-certificates.crt
     * CPath: none
   ) [5 bytes data]
   * TLSv1.3 (OUT), TLS handshake, Client hello (1):
Example 2

In this example, an external proxy is added to the configuration in Example 1.
To reconfigure FGT_A:

```
config firewall profile-protocol-options
  edit "protocol"
    config http
      set ports 80 8080
      unset options
      unset post-lang
    end
  end
next
end
```

To reconfigure FGT_D:

1. Configure a new firewall policy for traffic passing from port27 to port29:

```
config firewall policy
  edit 1
    set name "WANOPT-B"
    set srcintf "port27"
    set dstintf "port29"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set wanopt enable
    set wanopt-detection passive
    set nat enable
next
end
```

2. Configure a proxy policy for traffic on destination interface port29:

```
config firewall proxy-policy
  edit 100
    set proxy wanopt
    set dstintf "port29"
    set srcaddr "all"
    set dstaddr "all"
    set service "ALL"
    set action accept
```
Network

set schedule "always"
set profile-protocol-options "protocol"
set ssl-ssh-profile "ssl"
next
end

To confirm that HTTPS traffic is still being accelerated:

1. On the client PC, curl the same 10MB test sample through the explicit proxy:

   ```bash
   root@client:/tmp# curl -x 100.100.100.174:8080 -v -k https://172.16.200.144/test_10M.pdf
   -O
   % Total  % Received % Xferd  Average Speed   Time    Time  Time     Time  Current
   Dload  Upload Total Spent  Left  Speed
   100  9865k  100  9865k   0      0  663k  0 0:00:01  0:00:01 --:--:-- 1526k
   ``

   It takes less than a second to finish the download.

Agentless NTLM authentication for web proxy

Agentless Windows NT LAN Manager (NTLM) authentication includes support for the following items:

- Multiple servers
- Individual users

You can use multiple domain controller servers for the agentless NTLM. They can be used for load balancing and high service stability.

You can also use user-based matching in groups for Kerberos and agentless NTLM. In these scenarios, FortiOS matches the user's group information from an LDAP server.

To support multiple domain controllers for agentless NTLM using the CLI:

1. Configure an LDAP server:

   ```bash
   config user ldap
   edit "ldap-kerberos"
   set server "172.18.62.177"
   set cnid "cn"
   set dn "dc=fortinetqa,dc=local"
   set type regular
   set username "CN=root,CN=Users,DC=fortinetqa,DC=local"
   set password **********
   next
   end
   ```

2. Configure multiple domain controllers:

   ```bash
   config user domain-controller
   edit "dcl"
   set ip-address 172.18.62.177
   config extra-server
   edit 1
   set ip-address 172.18.62.220
   next
   end
   ```
3. Create an authentication scheme and rule:

```plaintext
config authentication scheme
edit "au-ntlm"
set method ntlm
set domain-controller "dc1"
next
end
config authentication rule
edit "ru-ntlm"
set srcaddr "all"
set ip-based disable
set active-auth-method "au-ntlm"
next
end
```

4. In the proxy policy, append the user group for authorization:

```plaintext
config firewall proxy-policy
edit 1
set proxy explicit-web
set dstintf "port1"
set srcaddr "all"
set dstaddr "all"
set service "web"
set action accept
set schedule "always"
set groups "ldap-group"
set utm-status enable
set av-profile "av"
set ssl-ssh-profile "deep-custom"
next
end
```

This configuration uses a round-robin method. When the first user logs in, the FortiGate sends the authentication request to the first domain controller. Later when another user logs in, the FortiGate sends the authentication request to another domain controller.

5. Verify the behavior after the user successfully logs in:

```plaintext
# diagnose wad user list
ID: 1825, IP: 10.1.100.71, VDOM: vdom1
user name : test1
duration : 497
auth_type : Session
auth_method : NTLM
pol_id : 1  g_id : 5
user_based : 0  e
expire : 103
LAN:
  bytes_in=2167 bytes_out=7657
WAN:
  bytes_in=3718 bytes_out=270
```
To support individual users for agentless NTLM using the CLI:

1. Configure an LDAP server:
   ```
   config user ldap
   edit "ldap-kerberos"
   set server "172.18.62.177"
   set cnid "cn"
   set dn "dc=fortinetqa,dc=local"
   set type regular
   set username "CN=root,CN=Users,DC=fortinetqa,DC=local"
   set password *********
   next
   end
   ```

2. Configure the user group and allow user-based matching:
   ```
   config user group
   edit "ldap-group"
   set member "ldap" "ldap-kerberos"
   config match
   edit 1
   set server-name "ldap-kerberos"
   set group-name "test1"
   next
   end
   ```

3. Create an authentication scheme and rule:
   ```
   config authentication scheme
   edit "au-ntlm"
   set method ntlm
   set domain-controller "dcl"
   next
   end
   ```
   ```
   config authentication rule
   edit "ru-ntlm"
   set srcaddr "all"
   set ip-based disable
   set active-auth-method "au-ntlm"
   next
   end
   ```

4. In the proxy policy, append the user group for authorization:
   ```
   config firewall proxy-policy
   edit 1
   set proxy explicit-web
   set dstintf "port1"
   set srcaddr "all"
   set dstaddr "all"
   set service "web"
   set action accept
   set schedule "always"
   set groups "ldap-group"
   set utm-status enable
   ```
set av-profile "av"
set ssl-ssh-profile "deep-custom"
next
end

This implementation lets you configure a single user instead of a whole group. The FortiGate will now allow the user named test1.

To verify the configuration using the CLI:

diagnose wad user list
  ID: 1827, IP: 10.1.15.25, VDOM: vdom1
  user name : test1
  duration   : 161
  auth_type  : Session
  auth_method: NTLM
  pol_id     : 1
  g_id       : 5
  user_based : 0
  expire     : 439

LAN:
  bytes_in=1309 bytes_out=4410
WAN:
  bytes_in=2145 bytes_out=544

Multiple LDAP servers in Kerberos keytabs and agentless NTLM domain controllers

Multiple LDAP servers can be configured in Kerberos keytabs and agentless NTLM domain controllers for multi-forest deployments.

To use multiple LDAP servers in Kerberos keytabs and agentless NTLM domain controllers:

1. Add multiple LDAP servers:

   config user ldap
     edit "ldap-kerberos"
       set server "172.16.200.98"
       set cnid "cn"
       set dn "dc=fortinetqa,dc=local"
       set type regular
       set username "CN=root,CN=Users,DC=fortinetqa,DC=local"
       set password xxxxxxxxxxx
     next
     edit "ldap-two"
       set server "172.16.106.128"
       set cnid "cn"
       set dn "OU=Testing,DC=ad864r2,DC=com"
       set type regular
       set username "cn=Testadmin,cn=users,dc=AD864R2,dc=com"
       set password xxxxxxxxxxx
     next
   end

2. Configure a Kerberos keytab entry that uses both LDAP servers:
config user krb-keytab
   edit "http_service"
      set pac-data disable
      set principal "HTTP/FGT.FORTINETQA.LOCAL@FORTINETQA.LOCAL"
      set ldap-server "ldap-kerberos" "ldap-two"
      set keytab xxxxxxxxx
   next
end

3. Configure a domain controller that uses both LDAP servers:

config user domain-controller
   edit "dcl"
      set ip-address 172.16.200.98
      set ldap-server "ldap-two" "ldap-kerberos"
   next
end

Learn client IP addresses

Learning the actual client IP addresses is imperative for authorization. This function identifies the real client IP address when there is a NATing device between the FortiGate and the client.

config web-proxy global
   set learn-client-ip {enable | disable}
   set learn-client-ip-from-header {true-client-ip | x-real-ip | x-forwarded-for}
   set learn-client-ip-srcaddr <address> ... <address>
end

| learn-client-ip {enable | disable} | Enable/disable learning the client's IP address from headers. |
|------------------------------------|----------------------------------------------------------|
| learn-client-ip-from-header {true-client-ip | x-real-ip | x-forwarded-for} | Learn client IP addresses from the specified headers. |
| learn-client-ip-srcaddr <address> ... <address> | The source address names. |

Example

In this example, the real client IP address is used to match a policy for FSSO authentication.

To enable learning the client IP address:

config web-proxy global
   set proxy-fqdn "default.fqdn"
   set webproxy-profile "default"
   set learn-client-ip enable
      set learn-client-ip-from-header x-forwarded-for
      set learn-client-ip-srcaddr "all"
end
To configure the proxy policy:

```bash
config firewall proxy-policy
   edit 1
      set proxy explicit-web
      set dstintf "mgmt1"
      set srcaddr "all"
      set dstaddr "all"
      set service "w"
      set action accept
      set schedule "always"
      set groups "fssol"
      set utm-status enable
      set av-profile "default"
      set dlp-profile "default"
      set profile-protocol-options "default"
      set ssl-ssh-profile "deep-inspection"
   next
end
```

To configure the authentication scheme and rule:

```bash
config authentication scheme
   edit "schemel"
      set method fsso
   next
end

config authentication rule
   edit "rule1"
      set srcaddr "all"
      set sso-auth-method "schemel"
   next
end
```

Explicit proxy authentication over HTTPS

When a HTTP request requires authentication in an explicit proxy, the authentication can be redirected to a secure HTTPS captive portal. Once authentication is complete, the client can be redirected back to the original destination over HTTP.

Example

A user visits a website via HTTP through the explicit web proxy on a FortiGate. The user is required to authenticate by either basic or form IP-based authentication for the explicit web proxy service. The user credentials need to be transmitted over the networks in a secured method over HTTPS rather than in plain text. The user credentials are protected by redirecting the client to a captive portal of the FortiGate over HTTPS for authentication where the user credentials are encrypted and transmitted over HTTPS.
In this example, explicit proxy authentication over HTTPS is configured with form IP-based authentication. Once configured, you can enable authorization for an explicit web proxy by configuring users or groups in the firewall proxy policy.

**To configure explicit proxy authentication over HTTPS:**

1. **Configure the authentication settings:**

   ```
   config authentication setting
   set captive-portal-type fqdn
   set captive-portal "fgt-cp"
   set auth-https enable
   end
   ```

2. **Configure the authentication scheme:**

   ```
   config authentication scheme
   edit "form"
   set method form
   set user-database "local-user-db"
   next
   end
   ```

3. **Configure the authentication rule:**

   ```
   config authentication rule
   edit "form"
   set srcaddr "all"
   set active-auth-method "form"
   next
   end
   ```

   **If a session-based basic authentication method is used, enable web-auth-cookie.**

4. **Configure the firewall address:**

   ```
   config firewall address
   edit "fgt-cp"
   set type fqdn
   set fqdn "fgt.fortinetqa.local"
   next
   end
   ```

5. **Configure the interface:**
Network

config system interface
edit "port10"
    set ip 10.1.100.1 255.255.255.0
    set explicit-web-proxy enable
    set proxy-captive-portal enable
next
end

6. Configure a firewall proxy policy with users or groups (see Explicit web proxy on page 220).

Verification

When a client visits a HTTP website, the client will be redirected to the captive portal for authentication by HTTPS. For example, the client could be redirected to a URL by a HTTP 303 message similar to the following:

HTTP/1.1 303 See Other

Connection: close

Content-Type: text/html

Cache-Control: no-cache

Location: https://fgt.fortinetqa.local:7831/XX/YY/ZZ/cpauth?scheme=http&4Tmthd=0&host=172.16.200.46&port=80&rule=75&uri=Lw==

Content-Length: 0

The captive portal URL used for authentication is https://fgt.fortinetqa.local:7831/... Once the authentication is complete with all user credentials protected by HTTPS, the client is redirected to the original HTTP website they intended to visit.

mTLS client certificate authentication

FortiGate supports client certificate authentication used in mutual Transport Layer Security (mTLS) communication between a client and server. Clients are issued certificates by the CA, and an access proxy configured on the FortiGate uses the new certificate method in the authentication scheme to identify and approve the certificate provided by the client when they try to connect to the access proxy. The FortiGate can also add the HTTP header X-Forwarded-Client-Cert to forward the certificate information to the server.

Examples

In these examples, the access proxy VIP IP address is 10.1.100.200.
Example 1

In this example, clients are issued unique client certificates from your CA. The FortiGate authenticates the clients by their user certificate before allowing them to connect to the access proxy. The access server acts as a reverse proxy for the web server that is behind the FortiGate.

This example assumes that you have already obtained the public CA certificate from your CA, the root CA of the client certificate has been imported (CA_Cert_1), and the client certificate has been distributed to the endpoints.

To configure the FortiGate:

1. Configure user authentication. Both an authentication scheme and rule must be configured, as the authentication is applied on the access proxy:

   ```
   config authentication scheme
   edit "mtls"
   set method cert
   set user-cert enable
   next
   end
   
   config authentication rule
   edit "mtls"
   set srcintf "port2"
   set srcaddr "all"
   set dstaddr "all"
   set active-auth-method "mtls"
   next
   end
   ```

2. Select the CA or CAs used to verify the client certificate:

   ```
   config authentication setting
   set user-cert-ca "CA_Cert_1"
   end
   ```

3. Configure the users. Users can be matched based on either the common-name on the certificate or the trusted issuer.

   - Verify the user based on the common name on the certificate:

     ```
     config user certificate
     edit "single-certificate"
     set type single-certificate
     set common-name "client.fortinet.com"
     next
     end
     ```

   - Verify the user based on the CA issuer:

     ```
     config user certificate
     edit "trusted-issuer"
     set type trusted-issuer
     set issuer "CA_Cert_1"
     next
     end
     ```

4. Configure the access proxy VIP. The SSL certificate is the server certificate that is presented to the user as they connect:
Network

```plaintext
config firewall vip
  edit "mTLS"
    set type access-proxy
    set extip 10.1.100.200
    set extintf "port2"
    set server-type https
    set extport 443
    set ssl-certificate "Fortinet_CA_SSL"
  next
end

5. Configure the access proxy policy, including the real server to be mapped. To request the client certificate for authentication, client-cert is enabled:

```plaintext
config firewall access-proxy
  edit "mTLS-access-proxy"
    set vip "mTLS"
    set client-cert enable
    set empty-cert-action accept
    config api-gateway
      edit 1
        config realservers
          edit 1
            set ip 172.16.200.44
          next
        end
      next
    end
end

6. Configure the proxy policy to apply authentication and the security profile, selecting the appropriate user object depending on the user type:

```plaintext
config firewall proxy-policy
  edit 3
    set proxy access-proxy
    set access-proxy "mTLS-access-proxy"
    set srcintf "port2"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set users {"single-certificate" | "trusted-issuer"}
    set utm-status enable
    set ssl-ssh-profile "deep-inspection-clone"
    set av-profile "av"
  next
end

To verify the results:

1. In a web browser, access the VIP address. This example uses Chrome.
2. When prompted, select the client certificate, then click OK.
3. Click **Certificate information** to view details about the certificate.

4. On the FortiGate, check the traffic logs.
   - If client certificate authentication passes:
     
     ```
     1: date=2021-06-03 time=15:48:36 eventtime=1622760516866635697 tz="-0700"
     logid="0000000010" type="traffic" subtype="forward" level="notice" vd="vdom1"
     srcip=10.1.100.11 srcport=45532 srcintf="port2" srcintfrole="undefined"
     dstcountry="Reserved" srccountry="Reserved" dstip=172.16.200.44 dstport=443
     dstintf="vdom1" dstintfrole="undefined" sessionid=154900 service="HTTPS"
     wanoptapptype="web-proxy" proto=6 action="accept" policyid=3 policytype="proxy-
     policy" poluuid="af5e2df2-c321-51eb-7d5d-42fa58868dcb" duration=0 user="single-
     certificate" wanin=2550 rcvdbyte=2550 wanout=627 lanin=4113 sentbyte=4113 lanout=2310
     appcat="unscanned"
     ```
   
   - If the CA issuer is used to verify the client:
     
     ```
     1: date=2021-06-03 time=15:43:02 eventtime=1622760420443776037 tz="-0700"
     logid="0000000010" type="traffic" subtype="forward" level="notice" vd="vdom1"
     srcip=10.1.100.11 srcport=45514 srcintf="port2" srcintfrole="undefined"
     dstcountry="Reserved" srccountry="Reserved" dstip=10.1.100.200 dstport=443
     dstintf="vdom1" dstintfrole="undefined" sessionid=153884 service="HTTPS"
     ```
If the client certificate authentication fails, and the traffic is blocked:

```
1: date=2021-06-03 time=15:45:53 eventtime=1622760353789703671 tz="-0700"
logid="0000000013" type="traffic" subtype="forward" level="notice" vd="vdom1"
srcip=10.1.100.11 srcport=45518 srcintf="port2" srcintfrole="undefined"
dstip=172.16.200.44 dstport=443 dstintf="vdom1" dstintfrole="undefined"
srccountry="Reserved" dstcountry="Reserved" sessionid=154431 proto=6 action="deny"
policyid=0 policytype="proxy-policy" user="single-certificate" service="HTTPS"
trandisp="noop" url="https://10.1.100.200/" agent="curl/7.68.0"
duration=0 sentbyte=0 rcvdpkt=0 appcat="unscanned" crscore=30 craction=131072
crlevel="high" msg="Traffic denied because of explicit proxy policy"
```

Example 2

In this example, the same configuration as in Example 1 is used, with a web proxy profile added to enable adding the client certificate to the HTTP header X-Forwarded-Client-Cert. The header is then forwarded to the server.

To configure the FortiGate:

1. Repeat steps 1 to 6 of Example 1, using the common name on the certificate to verify the user.
2. Configure a web proxy profile that adds the HTTP x-forwarded-client-cert header in forwarded requests:
   ```
   config web-proxy profile
   edit "mtls"
   set header-x-forwarded-client-cert add
   next
   end
   
   config firewall proxy-policy
   edit 3
   set uuid af5e2df2-c321-51eb-7d5d-42fa58868dc8
   set proxy access-proxy
   set access-proxy "mTLS-access-proxy"
   set srcintf "port2"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set logtraffic all
   set users "single-certificate"
   set webproxy-profile "mtls"
   set utm-status enable
   set ssl-ssh-profile "deep-inspection-clone"
   set av-profile "av"
   next
   end
   ```
To verify the results:

The WAD debug shows that the FortiGate adds the client certificate information to the HTTP header. The added header cannot be checked using the sniffer, because the FortiGate encrypts the HTTP header to forward it to the server.

1. Enable WAD debug on all categories:
   
   ```
   # diagnose wad debug enable category all
   ```

2. Set the WAD debug level to verbose:
   
   ```
   # diagnose wad debug enable level verbose
   ```

3. Enable debug output:
   
   ```
   # diagnose debug enable
   ```

4. Check the debug output.
   - When the FortiGate receives the client HTTP request:
     
     ```
     [0x7fc8d4bc4910] Received request from client: 10.1.100.11:45544
     ```
     
     ```
     GET / HTTP/1.1
     Host: 10.1.100.200
     User-Agent: curl/7.68.0
     Accept: */*
     ```

   - When the FortiGate adds the client certificate in to the HTTP header and forwards the client HTTP request:
     
     ```
     [0x7fc8d4bc4910] Forward request to server:
     GET / HTTP/1.1
     Host: 172.16.200.44
     User-Agent: curl/7.68.0
     Accept: */*
     X-Forwarded-Client-Cert: -----BEGIN CERTIFICATE-----
     MIIFxzCCA0egAwI...aCFDH1R+wb39s=
     -----END CERTIFICATE-----
     -----BEGIN CERTIFICATE-----
     MIIPcTCCA4gAwI...OtDtetkNoFLvb
     -----END CERTIFICATE-----
     ```

**DHCP server**

A DHCP server leases IP addresses from a defined address range to clients on the network that request dynamically assigned addresses.

A DHCP server can be in server or relay mode. In server mode, you can define one or more address ranges it assigns addresses from, and options such as the default gateway, DNS server, lease time, and other advanced options. In relay mode, the interface forwards DHCP requests from DHCP clients to an external DHCP server and returns the responses to the DHCP clients. The DHCP server must have appropriate routing so that its response packets to the DHCP clients arrive at the unit.

- DHCP options on page 290
- IP address assignment with relay agent information option on page 291
- DHCP client options on page 293
Configure a DHCP server on an interface

To configure a DHCP server in the GUI:

1. Go to Network > Interfaces.
2. Edit an interface.
3. Enable the DHCP Server option and configure the settings.
4. Click OK.

To configure a DHCP server in the CLI:

```bash
config system dhcp server
  edit 1
    set dns-service default
    set default-gateway 192.168.1.2
    set netmask 255.255.255.0
    set interface "port1"
    config ip-range
      edit 1
        set start-ip 192.168.1.1
        set end-ip 192.168.1.1
      next
      edit 2
        set start-ip 192.168.1.3
        set end-ip 192.168.1.254
      next
    end
  set timezone-option default
  set tftp-server "172.16.1.2"
next
end
```

Configure a DHCP relay on an interface

To configure a DHCP relay in the GUI:

1. Go to Network > Interfaces.
2. Edit an interface.
3. Enable the DHCP Server option and set DHCP status to Disabled.
4. Expand the Advanced section and set Mode to Relay.
5. Enter the DHCP Server IP.
6. Click OK.

To configure a DHCP relay in the CLI:

1. Configure the interface:

```bash
config system interface
  edit "port2"
    set vdom "root"
    set dhcp-relay-service enable
```
2. On the DHCP server settings for the interface, set the status to disable:

```bash
config system dhcp server
  edit 17
    set status disable
    set dns-service default
    set default-gateway 10.1.1.5
    set netmask 255.255.255.0
    set interface "port2"
  next
end
```

## Configure a DHCP server and relay on an interface

A FortiGate interface can be configured to work in DHCP server mode to lease out addresses, and at the same time relay the DHCP packets to another device, such as a FortiNAC to perform device profiling.

The DHCP message to be forwarded to the relay server under the following conditions:

- `dhcp-relay-request-all-server` is enabled
- Message type is either DHCPDISCOVER or DHCPINFORM
- Client IP address in client message is 0
- Server ID is NULL in the client message
- Server address is a broadcast address (255.255.255.255)
- Server address is 0

### To configure a DHCP server and relay in the GUI:

1. Go to **Network > Interfaces**.
2. Edit an interface.
3. Enable the **DHCP Server** option and set **DHCP status** to **Enabled**.
4. Edit the address range as required.
5. Expand the **Advanced** section and set **Mode to Relay**.
6. Enter the **DHCP Server IP**.
7. Click **OK**.
8. In the **CLI**, enable `dhcp-relay-request-all-server`.

### To configure a DHCP server and relay in the CLI:

1. Configure the interface:

```bash
config system interface
  edit "port2"
    set vdom "root"
```
set dhcp-relay-service enable
set ip 10.1.1.5 255.255.255.0
set allowaccess ping https ssh fabric
set type physical
set snmp-index 4
set dhcp-relay-ip "192.168.20.10"

set dhcp-relay-request-all-server enable

2. Configure the DHCP server settings:

config system dhcp server
edit 17
set status enable
set dns-service default
set default-gateway 10.1.1.5
set netmask 255.255.255.0
set interface "port2"

DHCP options

When adding a DHCP server, you can include DHCP codes and options. The DHCP options are BOOTP vendor information fields that provide additional vendor-independent configuration parameters to manage the DHCP server. For example, you might need to configure a FortiGate DHCP server that gives out a separate option as well as an IP address, such as an environment that needs to support PXE boot with Windows images.

The option numbers and codes are specific to the application. The documentation for the application indicates the values to use. The option is a value between 1 and 255.

For detailed information about DHCP options, see RFC 2132, DHCP Options and BOOTP Vendor Extensions.

Option 82

The DHCP relay agent information option (option 82 in RFC 3046) helps protect the FortiGate against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation.

This option is disabled by default. However, when dhcp-relay-service is enabled, dhcp-relay-agent-option becomes enabled.

To configure the DHCP relay agent option using the CLI:

config system interface
edit <interface>
set vdom root
set dhcp-relay-service enable
set dhcp-relay-ip <ip>
set dhcp-relay-agent-option enable
set vlanid <id>

See IP address assignment with relay agent information option on page 291 for an example.
**Option 42**

This option specifies a list of the NTP servers available to the client by IP address.

```
config system dhcp server
eedit 2
   set ntp-service {local | default | specify}
   set ntp-server1 <class_ip>
   set ntp-server2 <class_ip>
   set ntp-server3 <class_ip>
next
```

The NTP service options include:

- **local**: The IP address of the interface that the DHCP server is added to becomes the client's NTP server IP address.
- **default**: Clients are assigned the FortiGate's configured NTP servers.
- **specify**: Specify up to three NTP servers in the DHCP server configuration.

**IP address assignment with relay agent information option**

Option 82 (DHCP relay information option) helps protect the FortiGate against attacks such as spoofing (or forging) of IP and MAC addresses, and DHCP IP address starvation.

The following CLI variables are included in the `config system dhcp server > config reserved-address` command:

| circuit-id-type {hex | string} | DHCP option type; hex or string (default). |
|---------------------------------|-------------------------------------------|
| circuit-id <value>              | Option 82 circuit ID of the client that will get the reserved IP address. Format: `vlan-mod-port` |
|                                 | • `vlan`: VLAN ID (2 bytes)              |
|                                 | • `mod`: 1 = snoop, 0 = relay (1 byte)   |
|                                 | • `port`: port number (1 byte)          |
| remote-id-type {hex | string}  | DHCP option type; hex or string (default). |
| remote-id <value>               | Option 82 remote ID of the client that will get the reserved IP address. Format: the MAC address of the client. |
| type {mac | option82}             | The DHCP reserved address type; mac (default) or option82. |
To create an IP address assignment rule using option 82 in the GUI:

1. Go to Network > Interfaces.
2. Edit an existing port, or create a new one.

![The port Role must be LAN or Undefined.]

3. Enable DHCP Server.
4. Configure the address ranges and other settings as needed.
5. Click + to expand the Advanced options.

7. Configure the new rule:
   a. For the Type, select DHCP Relay Agent.
   b. Enter the Circuit ID and Remote ID.
   c. Enter the IP address that will be reserved.
8. Click OK.

To create an IP address assignment rule using option 82 with the CLI:

```bash
config system dhcp server
dedit 1
 set netmask 255.255.255.0
 set interface "port4"
config ip-range
dedit 1
 set start-ip 100.100.100.1
 set end-ip 100.100.100.99
next
dedit 2
 set start-ip 100.100.100.101
 set end-ip 100.100.100.254
next
dend
config reserved-address
dedit 1
 set type option82
 set ip 100.100.100.12
 set circuit-id-type hex
 set circuit-id "00010102"
 set remote-id-type hex
 set remote-id "704ca5e477d6"
next
dend
```

**DHCP client options**

When an interface is in DHCP addressing mode, DHCP client options can be configured in the CLI. For example, a vendor class identifier (usually DHCP client option 60) can be specified so that a request can be matched by a specific DHCP offer.

Multiple options can be configured, but any options not recognized by the DHCP server are discarded.
To configure client option 60 - vendor class identifier:

```
config system interface
  edit port1
    set vdom vdom1
    set mode dhcp
    config client-options
      edit 1
        set code 60
        set type hex
        set value aabbccdd
      next
    end
  set type physical
  set snmp-index 4
next
```

<table>

</tbody>
</table>

### Static routing

Static routing is one of the foundations of firewall configuration. It is a form of routing in which a device uses manually-configured routes. In the most basic setup, a firewall will have a default route to its gateway to provide network access. In a more complex setup with dynamic routing, ADVPN, or SD-WAN involved, you would still likely find static routes being deployed.

This section explores concepts in using static routing and provides examples in common use cases:

- Routing concepts on page 295
- Policy routes on page 307
- Equal cost multi-path on page 309
- Dual internet connections on page 313

The following topics include additional information about static routes:

- Deploying the Security Fabric on page 2290
- Security Fabric over IPsec VPN on page 2310
- Adding a static route on page 490
- IPsec VPN in an HA environment on page 1468
- IPsec VPN to Azure with virtual network gateway on page 1394
- FortiGate as dialup client on page 1414
ADVPN is the address negotiation protocol for IP with BGP (Border Gateway Protocol) as the routing protocol.

ADVPN with BGP as the routing protocol on page 1536
ADVPN with OSPF as the routing protocol on page 1545
ADVPN with RIP as the routing protocol on page 1554
Basic site-to-site VPN with pre-shared key on page 1360
Site-to-site VPN with digital certificate on page 1365
Site-to-site VPN with overlapping subnets on page 1372
Tunneled Internet browsing on page 1442
Multiple concurrent SDN connectors on page 2484
Packet distribution and redundancy for aggregate IPsec tunnels on page 1474
Use MAC addresses in SD-WAN rules and policy routes on page 564
Using BGP tags with SD-WAN rules on page 609

Routing concepts

This section contains the following topics:

- Default route on page 295
- Adding or editing a static route on page 296
- Configuring FQDNs as a destination address in static routes on page 296
- Routing table on page 297
- Viewing the routing database on page 299
- Kernel routing table on page 300
- Route cache on page 301
- Route look-up on page 302
- Blackhole routes on page 303
- Reverse path look-up on page 303
- Asymmetric routing on page 304
- Routing changes on page 306

Default route

The default route has a destination of 0.0.0.0/0.0.0.0, representing the least specific route in the routing table. It is a catch-all route in the routing table when traffic cannot match a more specific route. Typically, this is configured with a static route with an administrative distance of 10. In most instances, you will configure the next hop interface and the gateway address pointing to your next hop. If your FortiGate is sitting at the edge of the network, your next hop will be your ISP gateway. This provides internet access for your network.

Sometimes the default route is configured through DHCP. On some desktop models, the WAN interface is preconfigured in DHCP mode. Once the WAN interface is plugged into the network modem, it will receive an IP address, default gateway, and DNS server. FortiGate will add this default route to the routing table with a distance of 5, by default. This will take precedence over any default static route with a distance of 10. Therefore, take caution when you are configuring an interface in DHCP mode, where Retrieve default gateway from server is enabled. You may disable it and/or change the distance from the Network > Interfaces page when you edit an interface.
Adding or editing a static route

To add a static route using the GUI:

1. Go to Network > Static Routes and click Create New.
2. Enter the following information:

<table>
<thead>
<tr>
<th>Dynamic Gateway</th>
<th>When enabled, a selected DHCP/PPPoE interface will automatically retrieve its dynamic gateway.</th>
</tr>
</thead>
</table>
| Destination     | • Subnet  
|                  | Enter the destination IP address and netmask. A value of 0.0.0.0/0.0.0.0 creates a default route.  
|                  | • Named Address  
|                  | Select an address or address group object. Only addresses with static route configuration enabled will appear on the list. This means a geography type address cannot be used.  
|                  | • Internet Service  
|                  | Select an Internet Service. These are known IP addresses of popular services across the Internet. |
| Interface       | Select the name of the interface that the static route will connect through. |
| Gateway Address | Enter the gateway IP address. When selecting an IPsec VPN interface or SD-WAN creating a blackhole route, the gateway cannot be specified. |
| Administrative Distance | Enter the distance value, which will affect which routes are selected first by different protocols for route management or load balancing. The default is 10. |
| Advanced Options | Optionally, expand Advanced Options and enter a Priority. When two routes have an equal distance, the route with a lower priority number will take precedence. The default is 1. |

3. Click OK.

Configuring FQDNs as a destination address in static routes

You can configure FQDN firewall addresses as destination addresses in a static route, using either the GUI or the CLI.

In the GUI, to add an FQDN firewall address to a static route in the firewall address configuration, enable the Static Route Configuration option. Then, when you configure the static route, set Destination to Named Address.

To configure an FQDN as a destination address in a static route using the CLI:

```
cfg firewall address
   edit 'Fortinet-Documentation-Website'
      set type fqdn
      set fqdn docs.fortinet.com
      set allow-routing enable
   next
end
```
config router static
edit 0
    set dstaddr Fortinet-Documentation-Website
...
next
end

Routing table

A routing table consists of only the best routes learned from the different routing protocols. The most specific route always takes precedence. If there is a tie, then the route with a lower administrative distance will be injected into the routing table. If administrative distances are also equal, then all the routes are injected into the routing table, and Cost and Priority become the deciding factors on which a route is preferred. If these are also equal, then FortiGate will use Equal cost multi-path on page 309 to distribute traffic between these routes.

Viewing the routing table in the GUI

You can view routing tables in the FortiGate GUI under Dashboard > Network > Static & Dynamic Routing by default. Expand the widget to see the full page. Additionally, if you want to convert the widget into a dashboard, click on the Save as Monitor icon on the top right of the page.

You can also monitor policy routes by toggling from Static & Dynamic to Policy on the top right corner of the page. The active policy routes include policy routes that you created, SD-WAN rules, and Internet Service static routes. It also supports downstream devices in the Security Fabric.

The following figure show an example of the static and dynamic routes in the Routing Monitor:

To view more columns, right-click on the column header to select the columns to be displayed:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Version</td>
<td>Shows whether the route is IPv4 or IPv6.</td>
</tr>
<tr>
<td>Network</td>
<td>The IP addresses and network masks of destination networks that the FortiGate can reach.</td>
</tr>
<tr>
<td>Gateway IP</td>
<td>The IP addresses of gateways to the destination networks.</td>
</tr>
<tr>
<td>Interfaces</td>
<td>The interface through which packets are forwarded to the gateway of the destination network.</td>
</tr>
</tbody>
</table>
### Field Description

**Distance**  The administrative distance associated with the route. A lower value means the route is preferable compared to other routes to the same destination.

**Type**  The type values assigned to FortiGate routes (Static, Connected, RIP, OSPF, or BGP):

- **Connected**: All routes associated with direct connections to FortiGate interfaces
- **Static**: The static routes that have been added to the routing table manually
- **RIP**: All routes learned through RIP
- **RIPNG**: All routes learned through RIP version 6 (which enables the sharing of routes through IPv6 networks)
- **BGP**: All routes learned through BGP
- **OSPF**: All routes learned through OSPF
- **OSPF6**: All routes learned through OSPF version 6 (which enables the sharing of routes through IPv6 networks)
- **IS-IS**: All routes learned through IS-IS
- **HA**: RIP, OSPF, and BGP routes synchronized between the primary unit and the subordinate units of a high availability (HA) cluster. HA routes are maintained on subordinate units and are visible only if you're viewing the router monitor from a virtual domain that is configured as a subordinate virtual domain in a virtual cluster.

**Metric**  The metric associated with the route type. The metric of a route influences how the FortiGate dynamically adds it to the routing table. The following are types of metrics and the protocols they are applied to:

- **Hop count**: Routes learned through RIP
- **Relative cost**: Routes learned through OSPF
- **Multi-Exit Discriminator (MED)**: Routes learned through BGP. By default, the MED value associated with a BGP route is zero. However, the MED value can be modified dynamically. If the value was changed from the default, the Metric column displays a non-zero value.

**Priority**  In static routes, priorities are 0 by default. When two routes have an equal distance, the route with the lower priority number will take precedence.

**VRF**  Virtual routing and forwarding (VRF) allows multiple routing table instances to co-exist. VRF can be assigned to an Interface. Packets are only forwarded between interfaces with the same VRF.

**Up Since**  The total accumulated amount of time that a route learned through RIP, OSPF, or BGP has been reachable.

---

**Viewing the routing table in the CLI**

Viewing the routing table using the CLI displays the same routes as you would see in the GUI.

If VDOMs are enabled on the FortiGate, all routing-related CLI commands must be run within a VDOM and not in the global context.

**To view the routing table using the CLI:**

```
# get router info routing-table all
```

Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP

</tr>
</tbody>
</table>

Viewing the routing database

The routing database consists of all learned routes from all routing protocols before they are injected into the routing table. This likely lists more routes than the routing table as it consists of routes to the same destinations with different distances. Only the best routes are injected into the routing table. However, it is useful to see all learned routes for troubleshooting purposes.
To view the routing database using the CLI:

```bash
# get router info routing-table database
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
        O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
    E1 - OSPF external type 1, E2 - OSPF external type 2
        i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
        > - selected route, * - FIB route, p - stale info

Routing table for VRF=0
S  * 0.0.0.0/0/0  [1/0] via 172.31.0.1, MPLS
   *> [1/0] via 192.168.2.1, port1
   *> [1/0] via 192.168.122.1, port2
S  * 1.2.3.4/32 [10/0] via 172.16.100.81, VLAN100
C  * 10.10.2.0/24 is directly connected, hub
C  * 10.10.2.1/32 is directly connected, hub
O  * 10.10.10.0/24 [110/101] via 192.168.2.1, port1, 02:10:17
C  * 10.253.240.0/20 is directly connected, wqt.root
S  * 110.2.2.122/32 [22/0] via 2.2.2.2, port2, [3/3]
C  * 172.16.50.0/24 is directly connected, VLAN50
C  * 172.16.60.0/24 is directly connected, VLAN60
C  * 172.16.100.0/24 is directly connected, VLAN100
O  172.31.0.0/30 [110/201] via 192.168.2.1, port1, 00:47:36
C  * 172.31.0.30 is directly connected, MPLS

Selected routes are marked by the > symbol. In the above example, the OSPF route to destination 172.31.0.0/30 is not selected.

Kernel routing table

The kernel routing table makes up the actual Forwarding Information Base (FIB) that used to make forwarding decisions for each packet. The routes here are often referred to as kernel routes. Parts of this table are derived from the routing table that is generated by the routing daemon.

To view the kernel routing table using the CLI:

```bash
# get router info kernel
`tab=254` `vf=0` `scope=0` `type=1` `proto=11` `prio=0` `0.0.0.0/0.0.0.0/0->0.0.0.0/0` `pref=0.0.0.0
   gwy=172.31.0.1 flag=04 hops=0 oif=31(MPLS)
   gwy=192.168.2.1 flag=04 hops=0 oif=3(port1)
   gwy=192.168.122.1 flag=04 hops=0 oif=4(port2)

`tab=254` `vf=0` `scope=0` `type=1` `proto=17` `prio=0` `192.168.122.98/255.255.255.255/0->1.1.1.1/32
   pref=0.0.0.0` `gwy=192.168.122.1 dev=4(port2)

`tab=254` `vf=0` `scope=0` `type=1` `proto=17` `prio=0` `127.31.0.2/255.255.255.255/0->1.1.1.1/32
   pref=0.0.0.0` `gwy=172.31.0.1 dev=31(MPLS)

`tab=254` `vf=0` `scope=0` `type=1` `proto=17` `prio=0` `192.168.2.5/255.255.255.255/0->1.1.1.1/32
   pref=0.0.0.0` `gwy=192.168.2.1 dev=3(port1)

`tab=254` `vf=0` `scope=0` `type=1` `proto=11` `prio=0` `0.0.0.0/0.0.0.0/0->1.2.3.4/32` `pref=0.0.0.0
   gwy=172.16.100.81 dev=20(VLAN100)

`tab=254` `vf=0` `scope=0` `type=1` `proto=17` `prio=0` `192.168.122.98/255.255.255.255/0->8.8.8.8/32
   pref=0.0.0.0` `gwy=192.168.122.1 dev=4(port2)

The kernel routing table entries are:
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tab</td>
<td>Table number: It will either be 254 (unicast) or 255 (multicast).</td>
</tr>
<tr>
<td>vf</td>
<td>Virtual domain of the firewall: It is the VDOM index number. If VDOMs are not enabled, this number is 0.</td>
</tr>
</tbody>
</table>
| type  | Type of routing connection. Valid values include:  
  - 0 - unspecific  
  - 1 - unicast  
  - 2 - local  
  - 3 - broadcast  
  - 4 - anycast  
  - 5 - multicast  
  - 6 - blackhole  
  - 7 - unreachable  
  - 8 - prohibited |
| proto | Type of installation that indicates where the route came from. Valid values include:  
  - 0 - unspecific  
  - 2 - kernel  
  - 11 - ZebOS routing module  
  - 14 - FortiOS  
  - 15 - HA  
  - 16 - authentication based  
  - 17 - HA1 |
| prio  | Priority of the route. Lower priorities are preferred. |
| ->0.0.0.0/0 | The IP address and subnet mask of the destination. |
| (-x.x.x.x/mask) | Preferred next hop along this route. |
| gwy   | Gateway: The address of the gateway this route will use. |
| dev   | Outgoing interface index: This number is associated with the interface for this route. If VDOMs are enabled, the VDOM is also included here. If an interface alias is set for this interface, it is also displayed here. |

**Route cache**

The route cache contains recently used routing entries in a table. It is consulted before the routing table to speed up the route look-up process.

**To view the route cache using the CLI:**

```
# diagnose ip rtcache list  
family=02 tab=254 vrf=0 vf=0 type=01 tos=0 flag=00000200  
0.0.0.0@0-&gt;208.91.113.230@3(port1) gwy=192.168.2.1 prefsr=192.168.2.5
```
The size of the route cache is calculated by the kernel, but can be modified.

To modify the size of the route cache:

```plaintext
config system global
    set max-route-cache-size <number_of_cache_entries>
end
```

**Route look-up**

Route look-up typically occurs twice in the life of a session. Once when the first packet is sent by the originator and once more when the first reply packet is sent from the responder. When a route look-up occurs, the routing information is written to the session table and the route cache. If routing changes occur during the life of a session, additional routing look-ups may occur.

FortiGate performs a route look-up in the following order:

1. Policy-based routes: If a match occurs and the action is to forward, traffic is forwarded based on the policy route.
2. Route Cache: If there are no matches, FortiGate looks for the route in the route cache.
3. Forwarding Information Base, otherwise known as the kernel routing table.
4. If no match occurs, the packet is dropped.

**Searching the routing table**

When there are many routes in your routing table, you can perform a quick search by using the search bar to specify your criteria, or apply filters on the column header to display only certain routes. For example, if you want to only display static routes, you may use "static" as the search term, or filter by the **Type** field with value **Static**.

Route look-up on the other hand provides a utility for you to enter criteria such as **Destination**, **Destination Port**, **Source**, **Protocol** and/or **Source Interface**, in order to determine the route that a packet will take. Once you click **Search**, the corresponding route will be highlighted.

You can also use the CLI for a route look-up. The CLI provides a basic route look-up tool.

**To look-up a route in the CLI:**

```plaintext
# get router info routing-table details 4.4.4.4
Routing table for VRF=0
Routing entry for 0.0.0.0/0
```
Known via "static", distance 1, metric 0, best
* 172.31.0.1, via MPLS distance 0
* 192.168.2.1, via port1 distance 0
* 192.168.122.1, via port2 distance 0

Blackhole routes

Sometimes upon routing table changes, it is not desirable for traffic to be routed to a different gateway. For example, you may have traffic destined for a remote office routed through your IPsec VPN interface. When the VPN is down, traffic will try to re-route to another interface. However, this may not be viable and traffic will instead be routed to your default route through your WAN, which is not desirable. Traffic may also be routed to another VPN, which you do not want. For such scenarios, it is good to define a blackhole route so that traffic is dropped when your desired route is down. Upon reconnection, your desired route is once again added to the routing table and your traffic will resume routing to your desired interface. For this reason, blackhole routes are created when you configure an IPsec VPN using the IPsec wizard.

To create a blackhole route in the GUI:

1. Go to Network > Static Routes.
2. Click Create New. The New Static Route screen appears.
3. Specify a Destination type.
4. Select Blackhole from the Interface field.
5. Type the desired Administrative Distance.
6. Click OK.

Route priority for a Blackhole route can only be configured from the CLI.

Reverse path look-up

Whenever a packet arrives at one of the interfaces on a FortiGate, the FortiGate determines whether the packet was received on a legitimate interface by doing a reverse look-up using the source IP address in the packet header. This protects against IP spoofing attacks. If the FortiGate does not have a route to the source IP address through the interface on which the packet was received, the FortiGate drops the packet as per Reverse Path Forwarding (RPF) check. There are two modes of RPF – feasible path and strict. The default feasible RPF mode checks only for the existence of at least one active route back to the source using the incoming interface. The strict RPF check ensures the best route back to the source is used as the incoming interface.

To configure a strict Reverse Path Forwarding check in the CLI:

```
config system settings
  set strict-src-check enable
end
```
You can remove RPF state checks without needing to enable asymmetric routing by disabling state checks for traffic received on specific interfaces. Disabling state checks makes a FortiGate less secure and should only be done with caution for troubleshooting purposes.

To remove Reverse Path Forwarding checks from the state evaluation process in the CLI:

```
config system interface
    edit <interface_name>
        set src-check disable
    next
end
```

**Asymmetric routing**

Asymmetric routing occurs when request and response packets follow different paths that do not cross the same firewall.

In the following topology, traffic between PC1 and PC2 takes two different paths.

Traffic from PC1 to PC2 goes through the FortiGate, while traffic from PC2 to PC1 does not.

In TCP, if the packets in the request and response directions follow different paths, the FortiGate will block the packets, since the TCP three-way handshake is not established through the FortiGate.

**Scenario 1: PC1 starts a TCP connection with PC2**

1. The TCP SYN is allowed by the FortiGate.
2. The TCP SYN/ACK bypasses the FortiGate.
3. The TCP ACK is blocked by the FortiGate.
4. Subsequent TCP packets are blocked by the FortiGate.

**Scenario 2: PC2 starts a TCP connection with PC1**

1. The TCP SYN bypasses the FortiGate.
2. The TCP SYN/ACK is blocked by the FortiGate.
3. Subsequent TCP packets are blocked by the FortiGate.

In ICMP, consider the following scenarios.

**Scenario 1: PC1 pings PC2**

1. The ICMP request passes through the FortiGate. A session is created.
2. The ICMP reply bypasses the FortiGate, but reaches PC1. The ping is successful.
3. The ICMP request passes through the FortiGate, and it matches the previous session.
4. The ICMP reply bypasses the FortiGate, but it reaches PC1. The ping is successful.
5. Subsequent ICMP requests are allowed by the FortiGate.

Scenario 2: PC2 pings PC1
1. The ICMP request bypasses the FortiGate, but it reaches PC1.
2. The ICMP reply passes through the FortiGate. No session is matched, and the packet is dropped.
3. Subsequent ICMP replies are blocked by the FortiGate.

If an ICMP request does not pass through the FortiGate, but the response passes through the FortiGate, then by default it blocks the packet as invalid.

Permitting asymmetric routing

If required, the FortiGate can be configured to permit asymmetric routing.

To permit asymmetric routing:

```
cfgSystem set asmrte enable
```

This setting should be used only when the asymmetric routing issue cannot be resolved by ensuring both directions of traffic pass through the FortiGate.

When asymmetric routing is enabled and occurs, the FortiGate cannot inspect all traffic. Potentially malicious traffic may pass through and compromise the security of the network.

Asymmetric routing behaves as follows when it is permitted by the FortiGate:

TCP packets

Scenario 1: PC1 starts a TCP connection with PC2
1. The TCP SYN is allowed by the FortiGate. The FortiGate creates a session, checks the firewall policies, and applies the configuration from the matching policy (UTM inspection, NAT, traffic shaping, and so on).
2. The TCP SYN/ACK bypasses the FortiGate.
3. The TCP ACK is allowed by the FortiGate. The packet matches the previously created session.
4. Subsequent TCP packets are allowed by the FortiGate. The packets in the session can also be offloaded when applicable.

Scenario 2: PC2 starts a TCP connection with PC1
1. The TCP SYN bypasses the FortiGate.
2. The TCP SYN/ACK is allowed by the FortiGate. No session is matched. The packet passes to the CPU and is forwarded based on the routing table.
3. The TCP ACK bypasses the FortiGate.
4. Subsequent TCP packets are allowed by the FortiGate. The FortiGate acts as a router that only makes routing decisions. No security inspection is performed.
ICMP packets

Scenario 1: PC1 pings PC2
1. There is no difference from when asymmetric routing is disabled.

Scenario 2: PC2 pings PC1
1. The ICMP request bypasses the FortiGate, but it reaches PC1.
2. The ICMP reply passes through the FortiGate. No session is matched. The packet passes to the CPU and is forwarded based on the routing table.
3. Subsequent ICMP replies are allowed by the FortiGate. The FortiGate acts as a router that only makes routing decisions. No security inspection is performed.

UDP packets

Asymmetric routing does not affect UDP packets. UDP packets are checked by the session table regardless of asymmetric routing. A policy is required to allow UDP.

Routing changes

When routing changes occur, routing look-up may occur on an existing session depending on certain configurations.

Routing changes without SNAT

When a routing change occurs, FortiGate flushes all routing information from the session table and performs new routing look-up for all new packets on arrival by default. You can modify the default behavior using the following commands:

```plaintext
config system interface
  edit <interface>
    set preserve-session-route enable
  next
end
```

By enabling preserve-session-route, the FortiGate marks existing session routing information as persistent. Therefore, routing look-up only occurs on new sessions.

Routing changes with SNAT

When SNAT is enabled, the default behavior is opposite to that of when SNAT is not enabled. After a routing change occurs, sessions with SNAT keep using the same outbound interface as long as the old route is still active. This may be the case if the priority of the static route was changed. You can modify this default behavior using the following commands:

```plaintext
config system global
  set snat-route-change enable
end
```

By enabling snat-route-change, sessions with SNAT will require new route look-up when a routing change occurs. This will apply a new SNAT to the session.
Policy routing allows you to specify an interface to route traffic. This is useful when you need to route certain types of network traffic differently than you would if you were using the routing table. You can use the incoming traffic's protocol, source or destination address, source interface, or port number to determine where to send the traffic.

When a packet arrives, the FortiGate starts at the top of the policy route list and attempts to match the packet with a policy. For a match to be found, the policy must contain enough information to route the packet. At a minimum, this requires the outgoing interface to forward the traffic, and the gateway to route the traffic to. If one or both of these are not specified in the policy route, then the FortiGate searches the routing table to find the best active route that corresponds to the policy route. If no routes are found in the routing table, then the policy route does not match the packet. The FortiGate continues down the policy route list until it reaches the end. If no matches are found, then the FortiGate does a route lookup using the routing table.

Policy routes are sometimes referred to as Policy-based routes (PBR).

Configuring a policy route

In this example, a policy route is configured to send all FTP traffic received at port1 out through port4 and to a next hop router at 172.20.120.23. To route FTP traffic, the protocol is set to TCP (6) and the destination ports are set to 21 (the FTP port).

To configure a policy route in the GUI:

2. Click Create New > Policy Route.
3. Configure the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming interface</td>
<td>port1</td>
</tr>
<tr>
<td>Source Address</td>
<td>0.0.0.0/0.0.0</td>
</tr>
<tr>
<td>Destination Address</td>
<td>0.0.0.0/0.0.0</td>
</tr>
<tr>
<td>Protocol</td>
<td>TCP</td>
</tr>
<tr>
<td>Destination ports</td>
<td>21 - 21</td>
</tr>
<tr>
<td>Type of service</td>
<td>0x00</td>
</tr>
<tr>
<td>Bit Mask</td>
<td>0x00</td>
</tr>
<tr>
<td>Outgoing interface</td>
<td>Enable and select port4</td>
</tr>
<tr>
<td>Gateway address</td>
<td>172.20.120.23</td>
</tr>
</tbody>
</table>
4. Click OK.

To configure a policy route in the CLI:

```plaintext
cfg router policy
  edit 1
    set input-device "port1"
    set src "0.0.0.0/0.0.0.0"
    set dst "0.0.0.0/0.0.0.0"
    set protocol 6
    set start-port 21
    set end-port 21
    set gateway 172.20.120.23
    set output-device "port4"
    set tos 0x00
    set tos-mask 0x00
next
end
```

Moving a policy route

A routing policy is added to the bottom of the table when it is created. Routing policies can be moved to a different location in the table to change the order of preference. In this example, routing policy 3 will be moved before routing policy 2.
To move a policy route in the GUI:

1. Go to **Network > Policy Routes**.
2. In the table, select the policy route.

3. Drag the selected policy route to the desired position.

To move a policy route in the CLI:

```plaintext
config router policy
    move 3 after 1
end
```

**Equal cost multi-path**

Equal cost multi-path (ECMP) is a mechanism that allows a FortiGate to load-balance routed traffic over multiple gateways. Just like routes in a routing table, ECMP is considered after policy routing, so any matching policy routes will take precedence over ECMP.

ECMP pre-requisites are as follows:
- Routes must have the same destination and costs. In the case of static routes, costs include distance and priority
- Routes are sourced from the same routing protocol. Supported protocols include static routing, OSPF, and BGP

**ECMP and SD-WAN implicit rule**

ECMP and SD-WAN implicit rule are essentially similar in the sense that an SD-WAN implicit rule is processed after SD-WAN service rules are processed. See [implicit rule on page 547](#) to learn more.

The following table summarizes the different load-balancing algorithms supported by each:

<table>
<thead>
<tr>
<th>ECMP</th>
<th>SD-WAN</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source-ip-based</td>
<td>Source IP</td>
<td>Traffic is divided equally between the interfaces. Sessions that start at the same source IP address use the same path. This is the default selection.</td>
</tr>
</tbody>
</table>
### ECMP

<table>
<thead>
<tr>
<th>Weight-Based</th>
<th>SD-WAN</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sessions</td>
<td>weight-based</td>
<td>The workload is distributed based on the number of sessions that are connected through the interface. The weight that you assign to each interface is used to calculate the percentage of the total sessions allowed to connect through an interface, and the sessions are distributed to the interfaces accordingly.</td>
</tr>
</tbody>
</table>

| Usage-Based   | Spillover | usage-based | The interface is used until the traffic bandwidth exceeds the ingress and egress thresholds that you set for that interface. Additional traffic is then sent through the next interface member. |

| Source-Destination IP-Based | Traffic is divided equally between the interfaces. Sessions that start at the same source IP address and go to the same destination IP address use the same path. |

| Not Supported | Volume | measured-volume-based | This mode is supported in SD-WAN only. The workload is distributed based on the number of packets that are going through the interface. |

### To configure the ECMP algorithm from the CLI:

- At the VDOM level:
  ```
  config system settings
  set v4-ecmp-mode {source-ip-based* | weight-based | usage-based | source-dest-ip-based}
  end
  ```

- If SD-WAN is enabled, the above option is not available and ECMP is configured under the SD-WAN settings:
  ```
  config system sdwan
  set status enable
  set load-balance-mode {source-ip-based* | weight-based | usage-based | source-dest-ip-based | measured-volume-based}
  end
  ```

For ECMP in IPv6, the mode must also be configured under SD-WAN:

```
# diagnose sys vd list
system fib version=63
list virtual firewall info:
name=root/root index=0 enabled fib_ver=40 use=168 rt_num=46 asym_rt=0 sip_helper=0, sip_nat_trace=1, mc_fwd=0, mc_ttl_nc=0, tpmc_sk_pl=0
ecmp=source-ip-based, ecmp6=source-ip-based asym_rt6=0 rt6_num=55 strict_src_check=0 dns_log=1 ses_num=20 ses6_num=0 pkt_num=19154477
```
To change the number of paths allowed by ECMP:

```
config system settings
    set ecmp-max-paths <number of paths>
end
```

Setting `ecmp-max-paths` to the lowest value of 1 is equivalent to disabling ECMP.

**ECMP configuration examples**

The following examples demonstrate the behavior of ECMP in different scenarios:

- **Example 1:** Default ECMP on page 311
- **Example 2:** Same distance, different priority on page 312
- **Example 3:** Weight-based ECMP on page 312
- **Example 4:** Load-balancing BGP routes on page 313

**Example 1: Default ECMP**

```
config router static
    edit 1
        set gateway 172.16.151.1
        set device "port1"
    next
    edit 2
        set gateway 192.168.2.1
        set device "port2"
    next
end
```

```
# get router info routing-table all
Routing table for VRF=0
S* 0.0.0.0/0 [10/0] via 172.16.151.1, port1
    [10/0] via 192.168.2.1, port2
C 172.16.151.0/24 is directly connected, port1
C 192.168.2.0/24 is directly connected, port2
```

**Result:**

Both routes are added to the routing table and load-balanced based on the source IP.
Example 2: Same distance, different priority

```bash
config router static
  edit 1
    set gateway 172.16.151.1
    set priority 5
    set device "port1"
  next
  edit 2
    set gateway 192.168.2.1
    set device "port2"
  next
end
```

```
# get router info routing-table all
Routing table for VRF=0
S* 0.0.0.0/0 [10/0] via 192.168.2.1, port2
    [10/0] via 172.16.151.1, port1, [5/0]
C 172.16.151.0/24 is directly connected, port1
C 192.168.2.0/24 is directly connected, port2
```

Result:

Both routes are added to the routing table, but traffic is routed to port2 which has a lower priority value with a default of 0.

Example 3: Weight-based ECMP

```bash
config router static
  edit 3
    set dst 10.10.30.0 255.255.255.0
    set weight 80
    set device "vpn2HQ1"
  next
  edit 5
    set dst 10.10.30.0 255.255.255.0
    set weight 20
    set device "vpn2HQ2"
  next
end
```

```
# get router info routing-table all
Routing table for VRF=0
```

```
S 10.10.30.0/24 [10/0] is directly connected, vpn2HQ1, [0/80]
    [10/0] is directly connected, vpn2HQ2, [0/20]
C 172.16.151.0/24 is directly connected, port1
C 192.168.0.0/24 is directly connected, port3
C 192.168.2.0/24 is directly connected, port2
```

Result:

Both routes are added to the routing table, but 80% of the sessions to 10.10.30.0/24 are routed to vpn2HQ1, and 20% are routed to vpn2HQ2.
Example 4: Load-balancing BGP routes

```
config router bgp
    set as 64511
    set router-id 192.168.2.86
    set ebgp-multipath enable
    config neighbor
        edit "192.168.2.84"
            set remote-as 64512
            next
        edit "192.168.2.87"
            set remote-as 64512
            next
    end
end
# get router info routing-table all
Routing table for VRF=0
...
C  172.16.151.0/24 is directly connected, port1
C  192.168.0.0/24 is directly connected, port3
C  192.168.2.0/24 is directly connected, port2
B  192.168.80.0/24 [20/0] via 192.168.2.84, port2, 00:00:33
    [20/0] via 192.168.2.87, port2, 00:00:33
```

Result:

The network 192.168.80.0/24 is advertised by two BGP neighbors. Both routes are added to the routing table, and traffic is load-balanced based on Source IP.

For multiple BGP paths to be added to the routing table, you must enable `ebgp-multipath` for eBGP or `ibgp-multipath` for iBGP. These settings are disabled by default.

Dual internet connections

Dual internet connections, also referred to as dual WAN or redundant internet connections, refers to using two FortiGate interfaces to connect to the Internet. This is generally accomplished with SD-WAN, but this legacy solution provides the means to configure dual WAN without using SD-WAN. You can use dual internet connections in several ways:

- Link redundancy: If one interface goes down, the second interface automatically becomes the main connection.
- Load sharing: This ensures better throughput.
- Use a combination of link redundancy and load sharing.
This section describes the following dual internet connection scenarios:

- **Scenario 1: Link redundancy and no load-sharing on page 314**
- **Scenario 2: Load-sharing and no link redundancy on page 316**
- **Scenario 3: Link redundancy and load-sharing on page 317**

### Scenario 1: Link redundancy and no load-sharing

Link redundancy ensures that if your Internet access is no longer available through a certain port, the FortiGate uses an alternate port to connect to the Internet.

In this scenario, two interfaces, WAN1 and WAN2, are connected to the Internet using two different ISPs. WAN1 is the primary connection. In the event of a failure of WAN1, WAN2 automatically becomes the connection to the Internet. For this configuration to function correctly, you must configure the following settings:

- **Link health monitor on page 314**: To determine when the primary interface (WAN1) is down and when the connection returns.
- **Routing on page 315**: Configure a default route for each interface.
- **Security policies on page 316**: Configure security policies to allow traffic through each interface to the internal network.

### Link health monitor

Adding a link health monitor is required for routing failover traffic. A link health monitor confirms the device interface connectivity by probing a gateway or server at regular intervals to ensure it is online and working. When the server is not accessible, that interface is marked as down.

Set the **interval** (how often to send a ping) and **failtime** (how many lost pings are considered a failure). A smaller interval value and smaller number of lost pings results in faster detection, but creates more traffic on your network.

The link health monitor supports both IPv4 and IPv6, and various other protocols including ping, tcp-echo, udp-echo, http, and twamp.

### To add a link health monitor (IPv4) using the CLI:

```
config system link-monitor
  edit <link-monitor-name>
    set addr-mode ipv4
    set srcintf <interface-name>
    set server <server-IP-address>
    set protocol {ping tcp-echo udp-echo http twamp}
    set gateway-ip <gateway-IP-address>
    set interval <seconds>
    set failtime <retry-attempts>
    set recoverytime <number-of-successful-responses>
    set status enable
  next
end
```
### Network

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>set update-cascade-interface {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>set update-static-route {enable</td>
<td>disable}</td>
</tr>
</tbody>
</table>

#### Routing

You must configure a default route for each interface and indicate your preferred route as follows:

- Specify different distances for the two routes. The lower of the two distance values is declared active and placed in the routing table.

  Or

- Specify the same distance for the two routes, but give a higher priority to the route you prefer by defining a lower value. Both routes will be added to the routing table, but the route with a higher priority will be chosen as the best route.

In the following example, we will use the first method to configure different distances for the two routes. You might not be able to connect to the backup WAN interface because the FortiGate does not route traffic out of the backup interface. The FortiGate performs a reverse path look-up to prevent spoofed traffic. If an entry cannot be found in the routing table that sends the return traffic out through the same interface, the incoming traffic is dropped.

To configure the routing of the two interfaces using the GUI:

1. Go to Network > Static Routes, and click Create New.
2. Enter the following information:

   | Destination | For an IPv4 route, enter a subnet of 0.0.0.0/0.0.0.0. For an IPv6 route, enter a subnet of ::/0. |
   | Interface | Select the primary connection. For example, wan1. |
   | Gateway Address | Enter the gateway address. |
   | Administrative Distance | Leave as the default of 10. |

3. Click OK.
4. Repeat the above steps to set Interface to wan2 and Administrative Distance to 20.

To configure the routing of the two interfaces using the CLI:

```plaintext
config router {static | static6}
edit 1
   set dst 0.0.0.0 0.0.0.0
   set device wan1
   set gateway <gateway_address>
   set distance 10
```
Network

```plaintext
next
edit 2
    set dst 0.0.0.0 0.0.0.0
    set device wan2
    set gateway <gateway_address>
    set distance 20
next
eend
```

Security policies

When you create security policies, you need to configure duplicate policies to ensure that after traffic fails over WAN1, regular traffic is allowed to pass through WAN2, as it did with WAN1. This ensures that failover occurs with minimal effect to users.

Scenario 2: Load-sharing and no link redundancy

Load sharing may be accomplished in a few of the following ways of the many possible ways:

- By defining a preferred route with a lower distance, and specifying policy routes to route certain traffic to the secondary interface.
- By defining routes with same distance values but different priorities, and specifying policy routes to route certain traffic to the secondary interface.
- By defining routes with same distance values and priorities, and use equal-cost multi-path (ECMP) routing to equally distribute traffic between the WAN interfaces.

In our example, we will use the first option for our configuration. In this scenario, because link redundancy is not required, you do not have to configure a link monitor.

Traffic behaviour without a link monitor is as follows:

- If the remote gateway is down but the primary WAN interface of a FortiGate is still up, the FortiGate will continue to route traffic to the primary WAN. This results in traffic interruptions.
- If the primary WAN interface of a FortiGate is down due to physical link issues, the FortiGate will remove routes to it and the secondary WAN routes will become active. Traffic will failover to the secondary WAN.

Routing

Configure routing as you did in Scenario 1: Link redundancy and no load-sharing on page 314 above.

Policy routes

By configuring policy routes, you can redirect specific traffic to the secondary WAN interface. This works in this case because policy routes are checked before static routes. Therefore, even though the static route for the secondary WAN is not in the routing table, traffic can still be routed using the policy route.

In this example, we will create a policy route to route traffic from one address group to the secondary WAN interface.
To configure a policy route from the GUI:

2. Enter the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming interface</td>
<td>Define the source of the traffic. For example, internal.</td>
</tr>
<tr>
<td>Source Address</td>
<td>If we prefer to route traffic only from a group of addresses, define an address or address group, and add here.</td>
</tr>
<tr>
<td>Destination Address</td>
<td>Because we want to route all traffic from the address group here, we do not specify a destination address.</td>
</tr>
<tr>
<td>Protocol</td>
<td>Specify any protocol.</td>
</tr>
<tr>
<td>Action</td>
<td>Forward traffic.</td>
</tr>
<tr>
<td>Outgoing interface</td>
<td>Select the secondary WAN as the outbound interface. For example, wan2.</td>
</tr>
<tr>
<td>Gateway address</td>
<td>Input the gateway address for your secondary WAN.</td>
</tr>
<tr>
<td></td>
<td>Because its default route has a higher distance value and is not added to the routing table, the gateway address must be added here.</td>
</tr>
</tbody>
</table>

3. Click OK.

To configure a policy route from the CLI:

```
config router policy
edit 1
    set input-device "internal"
    set srcaddr "Laptops"
    set gateway <gateway_address>
    set output-device "wan2"
next
end
```

Security policies

Your security policies should allow all traffic from internal to WAN1. Because link redundancy is not needed, you do not need to duplicate all WAN1 policies to WAN2. You will only need to define policies used in your policy route.

Scenario 3: Link redundancy and load-sharing

In this scenario, both the links are available to distribute Internet traffic with the primary WAN being preferred more. Should one of the interfaces fail, the FortiGate will continue to send traffic over the other active interface. The configuration is a combination of both the link redundancy and the load-sharing scenarios. The main difference is that the configured routes have equal distance values, with the route with a higher priority being preferred more. This ensures both routes are active in the routing table, but the route with a higher priority will be the best route.

Link health monitor

Link monitor must be configured for both the primary and the secondary WAN interfaces. This ensures that if the primary or the secondary WAN fails, the corresponding route is removed from the routing table and traffic re-routed to the other
WAN interface.

For configuration details, see sample configurations in Scenario 1: Link redundancy and no load-sharing on page 314.

Routing

Both WAN interfaces must have default routes with the same distance. However, preference is given to the primary WAN by giving it a higher priority.

To configure the routing of the two interfaces using the CLI:

```plaintext
cfg config router {static | static6}
edit 1
   set dst 0.0.0.0 0.0.0.0
   set device wan1
   set gateway <gateway_address>
   set distance 10
   set priority 1
next
edit 2
   set dst 0.0.0.0 0.0.0.0
   set device wan2
   set gateway <gateway_address>
   set distance 10
   set priority 10
next
end
```

Policy routes

The policy routes configuration is very similar to that of the policy routes in Scenario 2: Load-sharing and no link redundancy on page 316, except that the gateway address should not be specified. When a policy route is matched and the gateway address is not specified, the FortiGate looks at the routing table to obtain the gateway. In case the secondary WAN fails, traffic may hit the policy route. Because there is no gateway specified and the route to the secondary WAN is removed by the link monitor, the policy route will by bypassed and traffic will continue through the primary WAN. This ensures that the policy route is not active when the link is down.

Security policies

When you create security policies, you need to configure duplicate policies to ensure that after traffic fails over WAN1, regular traffic is allowed to pass through WAN2, as it was with WAN1. This ensures that failover occurs with minimal effect to users.

Dynamic routing

Dynamic routing protocols attempt to build a map of the network topology to identify the best routes to reach different destinations. Instead of manually defining static routes, which is not scalable, dynamic routing typically involves defining neighbors and peer routers that share their network topology and routing updates with each other. Protocols like distance vector, link state, and path vector are used by popular routing protocols. FortiGate supports RIP, OSPF, BGP,
and IS-IS, which are interoperable with other vendors. When different dynamic routing protocols are used, the administrative distance of each protocol helps the FortiGate decide which route to pick.

Go to System > Feature Visibility and enable Advanced Routing to configure dynamic routing options in the GUI. See Feature visibility on page 2165 for more information.

This section includes:

- RIP on page 320
- OSPF on page 339
- BGP on page 356
- BFD on page 389

To view the routing table and perform route look-ups in the GUI, go to Dashboard > Network and expand the Routing widget.

To view the routing table in the CLI:

```
# get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
    O - OSPF, IA - OSPF inter area
    N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
    E1 - OSPF external type 1, E2 - OSPF external type 2
    i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
    * - candidate default
Routing table for VRF=0
S*  0.0.0.0/0 [5/0] via 192.168.0.1, wan1
C  10.10.10.0/24 is directly connected, internal
C  169.254.2.1/32 is directly connected, Dialup-test
C  172.31.0.0/30 is directly connected, toKVM-MPLS
C  172.31.0.1/32 is directly connected, toKVM-MPLS
C  192.168.0.0/24 is directly connected, wan1
O  192.168.2.24 [110/101] via 10.10.10.11, internal, 00:00:26
S  192.168.20.0/24 [10/0] via 172.31.0.2, toKVM-MPLS
    [10/0] via 10.10.10.11, internal
```
RIP

Routing Information Protocol (RIP) is a distance-vector routing protocol that is intended for small and relatively homogeneous networks. It works well when there are minimal redundant paths and limited hop counts. FortiGate supports RIP version 1 (RFC 1058), RIP version 2 (RFC 2453), and RIPng (RFC 2080).

Basic configuration

To configure the FortiGate to participate in RIP using the most basic configurations in the GUI:

1. Go to Network > RIP.
2. Set the Version.
3. Add the networks that the FortiGate will advertise in and that will participate in RIP.
4. If the interface settings, such as passive interface, authentication, or enabling send/receive updates, must be edited, add the interfaces to the Interface table.
5. Click Apply.

To configure the FortiGate to participate in RIP using the most basic configurations in the CLI:

```
config router rip
  config network
    edit 1
      set prefix <subnet> <netmask>
    next
  end
  config interface
    edit <interface>
      set receive-version 2
      set send-version 2
    next
  end
end
```

Default route injection

Enabling Inject default route (default-information-originate) advertises a default route into the FortiGate's RIP network.

To enable/disable default route injection in the GUI:

1. Go to Network > RIP.
2. Expand the Advanced Options.
3. Enable/disable Inject Default Route.
4. Click OK.

To enable/disable default route injection in the CLI:

```
config router rip
  set default-information-originate {enable | disable}
```
Default metric

The default metric setting sets the default metric for all redistributed routes. If the default metric is set to five, and static routes are redistributed, then static routes have a metric of five. This value can be overridden by setting a specific metric value for a protocol. For example, the static route metric can be set to two, overriding the default metric.

```
config router rip
    set default-metric 5
    config redistribute "static"
        set status enable
        set metric 2
    end
end
```

The default metric is five, but redistributed static routes have a metric of two. So, the default metric is overridden and the metric for redistributed static routes is two.

Timers

RIP uses the update, timeout, and garbage timers to regulate its performance. The default timer settings are effective in most configurations. When customizing the settings, you must ensure that the new settings are compatible with your local routers and access servers.

Go to Network > RIP and expand the Advanced Options to configure the timers in the GUI, or use the CLI:

```
config router rip
    set timeout-timer <seconds>
    set update-timer <seconds>
    set garbage-timer <seconds>
end
```

Update timer

The update timer sets the interval between routing updates. The default value is 30 seconds. Randomness is added to help prevent network congestion due to multiple routers trying to update their neighbors simultaneously. The update timer must be at least three times shorter than the timeout timer.

If there is significant RIP traffic on the network, you can increase the update timer to send fewer updates. You must apply the same increase to all routers on the network to avoid timeouts that degrade your network speed.

Timeout timer

The timeout timer is the maximum amount of time that a reachable route is kept in the routing table since its last update. The default value is 180 seconds. If an update for the route is received before the timeout period elapses, then the timer is reset. The timeout timer should be at least three times longer than the update timer.

If routers are not responding to updates in time, increasing the timeout timer can help. A longer timeout timer results in longer update periods, and the FortiGate could wait a considerable amount of time for all of the timers to expire on an unresponsive route.
Garbage timer

The garbage timer is the amount of time that the FortiGate advertises a route as unreachable before deleting the route from the routing table. The default value is 120 seconds.

If the timer is short, older routes are removed from the routing table more quickly, resulting in a smaller routing table. This can be useful for large networks, or if the network changes frequently.

Authentication and key chain

RIP version 1 (RIPv1) has no authentication. RIP version 2 (RIPv2) uses text passwords or authentication keys to ensure that the routing information exchanged between routers is reliable. For authentication to work, both the sending and receiving routers must be set to use authentication and must be configured with the same password or keys. An authentication key that uses authentication key chains is more secure than a text password because the intervals when the key is valid can be configured.

A key chain is a list of one or more authentication keys that each have send and receive lifetimes. Keys are used to authenticate routing packets only during the keys specified lifetimes. The FortiGate migrates from one key to the next according to the scheduled lifetimes. The sending and receiving routers should have synchronized system dates and times to ensure that both ends are using the same keys at the same times. You can overlap the key lifetimes to make sure that a key is always available, even if there is some difference in the system times.

To configure a text password in the GUI:

1. Go to Network > RIP.
2. In the Interfaces table, click Create New, or edit an existing interface.
3. Enable Authentication and select Text or MD5.
4. Click Change, and enter the password.
5. Configure the remaining settings as needed.
6. Click OK.
7. Click Apply.

To configure a text password in the CLI:

```bash
config router rip
  config interface
    edit <interface>
      set auth-mode {text | md5}
      set auth-string **********
    next
  end
end
```

To configure a key chain with two sequentially valid keys and use it in a RIP interface:

```bash
config router key-chain
  edit rip_key
    config key
      edit 1
        set accept-lifetime 09:00:00 23 02 2020 09:00:00 17 03 2020
        set send-lifetime 09:00:00 23 02 2020 09:00:00 17 03 2020
```
set key-string **********
next
diff 2
set accept-lifetime 09:01:00 17 03 2020 09:00:00 1 04 2020
set send-lifetime 09:01:00 17 03 2020 09:00:00 1 04 2020
set key-string **********
next
next
end
end
config router rip
config interface
edit port1
set auth-keychain "rip_key"
next
end
end

Passive RIP interfaces

By default, an active RIP interface keeps the FortiGate routing table current by periodically asking neighbors for routes and sending out route updates. This can generate a significant amount of extra traffic in a large network.

A passive RIP interface listens to updates from other routers, but does not send out route updates. This can reduce network traffic when there are redundant routers in the network that would always send out essentially the same updates.

This example shows how to configure a passive RIPv2 interface on port1 using MD5 authentication.

To configure a passive RIP interface in the GUI:

1. Go to Network > RIP.
2. In the Interfaces table, click Create New.
3. Set Interface to the required interface.
5. Enable Authentication and set it to MD5.
6. Click Change and enter a password.
7. Set Receive Version to 2.
8. Click OK.

To configure a passive RIP interface in the CLI:

config router rip
config interface
edit port1
set auth-mode md5
set auth-string **********
set receive-version 2
set send-version 2
next
RIP and IPv6

RIP next generation (RIPng) is an extension of RIPv2 that includes support for IPv6. See Basic RIPng example on page 337 and IPv6 tunneling on page 466 for more information.

Basic RIP example

In this example, a medium-sized network is configured using RIPv2.

- Two core routers, RIP Router2 and RIP Router3, connect to the ISP router for two redundant paths to the internet.
- Two other routers, RIP Router1 and RIP Router4, connect to the two core routers and to different local networks.
- The ISP router is using RIP for its connections to the core routers, and redistributes its default route to the network - that is, default route injection is enabled.
- The ISP router uses NAT and has a static route to the internet. None of the other routers use NAT or static routes.

All of the FortiGate routers are configured as shown, using netmask 255.255.255.0. Firewall policies have been configured to allow the required traffic to flow across the interfaces.

</tbody>
</table>

After configuring each router, you can check the status of the connections by viewing the RIP database, RIP interfaces, and routing table. See Verifying the configuration on page 330.

After the network is configured, you can test it to ensure that when network events occur, such as a downed link, routing updates are triggered and converge as expected. See Testing the configuration and routing changes on page 334.

**ISP router**

To configure the ISP Router in the GUI:

1. Go to *Network > RIP*.
2. Set the *Version* to 2.
3. Under *Networks*, add two networks:
   - 172.20.120.0/255.255.255.0
   - 172.20.121.0/255.255.255.0
4. Add the interfaces:
   a. In the *Interfaces* table, click *Create New*.
   b. Set *Interface* to *port2*.
   c. Leave the remaining settings as their default values.
d. Click OK.
e. Repeat these steps for port3.

5. Under Advanced Options, enable Inject Default Route.
   This setting allows the ISP router to share its default 0.0.0.0 routes with other routers in the RIP network.

6. Click Apply.

To configure the ISP Router in the CLI:

```plaintext
config router rip
    set default-information-originate enable
config network
    edit 1
        set prefix 172.20.121.0 255.255.255.0
    next
    edit 2
        set prefix 172.20.120.0 255.255.255.0
    next
end
config interface
    edit "port2"
        set receive-version 2
        set send-version 2
    next
    edit "port3"
        set receive-version 2
        set send-version 2
    next
end
```

Router2 and Router3

Router2 and Router3 RIP configurations have different IP addresses, but are otherwise the same.

To configure Router2 and Router3 in the GUI:

1. Go to Network > RIP.
2. Set the Version to 2.
3. Under Networks, add the IP addresses for each port:

<table>
<thead>
<tr>
<th>Router2</th>
<th>10.12.101.0/255.255.255.0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>10.11.201.0/255.255.255.0</td>
</tr>
<tr>
<td></td>
<td>10.14.201.0/255.255.255.0</td>
</tr>
<tr>
<td></td>
<td>172.20.120.0/255.255.255.0</td>
</tr>
</tbody>
</table>
### Network

<table>
<thead>
<tr>
<th>Router3</th>
<th>10.12.101.0/255.255.255.0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>10.11.202.0/255.255.255.0</td>
</tr>
<tr>
<td></td>
<td>10.14.202.0/255.255.255.0</td>
</tr>
<tr>
<td></td>
<td>172.20.121.0/255.255.255.0</td>
</tr>
</tbody>
</table>

4. **Add the interfaces:**
   a. In the *Interfaces* table, click *Create New*.
   b. Set *Interface* to *port1*.
   c. Leave the remaining settings as their default values.
   d. Click *OK*.
   e. Repeat these steps for *port2*, *port3*, and *port4*.

5. Click *Apply*.

**To configure Router2 in the CLI:**

```bash
config router rip
  config network
    edit 1
      set prefix 10.12.101.0 255.255.255.0
    next
    edit 2
      set prefix 10.11.201.0 255.255.255.0
    next
    edit 3
      set prefix 10.14.201.0 255.255.255.0
    next
    edit 4
      set prefix 172.20.120.0 255.255.255.0
    next
  end
config interface
  edit "port1"
    set receive-version 2
    set send-version 2
  next
  edit "port2"
    set receive-version 2
    set send-version 2
  next
  edit "port3"
    set receive-version 2
    set send-version 2
  next
  edit "port4"
    set receive-version 2
    set send-version 2
  next
  end
end
```
To configure Router3 in the CLI:

```
config router rip
config network
   edit 1
      set prefix 10.12.101.0 255.255.255.0
   next
   edit 2
      set prefix 10.11.202.0 255.255.255.0
   next
   edit 3
      set prefix 10.14.202.0 255.255.255.0
   next
   edit 4
      set prefix 172.20.121.0 255.255.255.0
   next
end
config interface
   edit "port1"
      set receive-version 2
      set send-version 2
   next
   edit "port2"
      set receive-version 2
      set send-version 2
   next
   edit "port3"
      set receive-version 2
      set send-version 2
   next
   edit "port4"
      set receive-version 2
      set send-version 2
   next
end
```

**Router1 and Router4**

Router1 and Router4 RIP configurations have different IP addresses, but are otherwise the same.

To configure Router1 and Router4 in the GUI:

1. Go to Network > RIP.
2. Set the Version to 2.
3. Under Networks, add the IP addresses for each port:

<table>
<thead>
<tr>
<th>Router1</th>
<th>10.11.101.0/255.255.255.0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>10.11.201.0/255.255.255.0</td>
</tr>
<tr>
<td></td>
<td>10.11.202.0/255.255.255.0</td>
</tr>
</tbody>
</table>
Network

<table>
<thead>
<tr>
<th>Router4</th>
<th>10.14.101.0/255.255.255.0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>10.14.201.0/255.255.255.0</td>
</tr>
<tr>
<td></td>
<td>10.14.202.0/255.255.255.0</td>
</tr>
</tbody>
</table>

4. Add the interfaces:
   a. In the Interfaces table, click Create New.
   b. Set Interface to port1.
   c. For port1 only, enable Passive.
   d. Leave the remaining settings as their default values.
   e. Click OK.
   f. Repeat these steps for port2 and port3, making sure that Passive is disabled.

5. Click Apply.

To configure Router1 in the CLI:

```bash
config router rip
config network
   edit 1
      set prefix 10.11.101.0 255.255.255.0
   next
   edit 2
      set prefix 10.11.201.0 255.255.255.0
   next
   edit 3
      set prefix 10.11.202.0 255.255.255.0
   next
end
set passive-interface "port1"
config interface
   edit "port1"
      set receive-version 2
      set send-version 2
   next
   edit "port2"
      set receive-version 2
      set send-version 2
   next
   edit "port3"
      set receive-version 2
      set send-version 2
   next
end
end
```

To configure Router4 in the CLI:

```bash
config router rip
config network
   edit 1
      set prefix 10.14.101.0 255.255.255.0
   next
```
edit 2
  set prefix 10.14.201.0 255.255.255.0
next
edit 3
  set prefix 10.14.202.0 255.255.255.0
next
end
set passive-interface "port1"
config interface
  edit "port1"
    set receive-version 2
    set send-version 2
next
  edit "port2"
    set receive-version 2
    set send-version 2
next
  edit "port3"
    set receive-version 2
    set send-version 2
next
end
end

Verifying the configuration

The interface's names are shown in the debugs. The same commands should also be run on the other routers.

To verify the configuration after the ISP router, Router2, and Route3 have been configured:

This verification can be done after the ISP router, Router2, and Router3 have been configured. Only Router2's debugs are shown.

1. Check the RIP interface information:

```
# get router info rip interface
Router2 is up, line protocol is up
  RIP is not enabled on this interface
ssl.Router2 is up, line protocol is up
  RIP is not enabled on this interface
vdr2link1 is up, line protocol is up
  Routing Protocol: RIP
    Receive RIPv2 packets only
    Send RIPv2 packets only
    Passive interface: Disabled
    Split horizon: Enabled with Poisoned Reversed
    IP interface address:
    172.20.120.102/24
vd12link1 is up, line protocol is up
  Routing Protocol: RIP
    Receive RIPv2 packets only
    Send RIPv2 packets only
    Passive interface: Disabled
    Split horizon: Enabled with Poisoned Reversed
    IP interface address:
    10.11.201.102/24
```
vd42link1 is up, line protocol is up
Routing Protocol: RIP
  Receive RIPv2 packets only
  Send RIPv2 packets only
  Passive interface: Disabled
  Split horizon: Enabled with Poisoned Reversed
  IP interface address: 10.14.201.102/24

vd23link0 is up, line protocol is up
Routing Protocol: RIP
  Receive RIPv2 packets only
  Send RIPv2 packets only
  Passive interface: Disabled
  Split horizon: Enabled with Poisoned Reversed
  IP interface address: 10.12.101.102/24

RIP starts exchanging routes as soon as the networks are added to the Router2 and Router3 configurations because the RIP interfaces are active by default, and start sending and receiving RIP updates when a matching interface on the subnet is found. The interface configuration allows the interface settings to be fine tuned, in this case to specify only RIPv2 support.

2. Check the RIP database:

```
# get router info rip database
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel,
       C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP

Network     Next Hop       Metric From      If       Time
R  0.0.0.0/0   172.20.120.5  2 172.20.120.5  vdr2link1  02:55
Rc 10.11.201.0/24  1    vdr2link1
Rc 10.12.101.0/24  1    vd23link0
Rc 10.14.201.0/24  1    vd42link1
Rc 172.20.120.0/24  1    vdr2link1
R  172.20.121.0/24  10.12.101.103  2 10.12.101.103  vd23link0  02:33
```

3. Check the routing table:

```
# get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
* - candidate default

Routing table for VRF=0
R*  0.0.0.0/0 [120/2] via 172.20.120.5, vdr2link1, 13:37:23
C  10.11.201.0/24 is directly connected, vd12link1
R  10.11.202.0/24 [120/2] via 10.12.101.103, vd23link0, 14:10:01
C  10.12.101.0/24 is directly connected, vd23link0
C  10.14.201.0/24 is directly connected, vd42link1
C  172.20.120.0/24 is directly connected, vdr2link1
R  172.20.121.0/24 [120/2] via 10.12.101.103, vd23link0, 13:20:36
```

Router2 has learned the default gateway from the ISP router, and has learned of other networks from Router3.

4. If firewall policies are correctly configured, the outside network can be reached:
# execute ping-options source 10.11.201.102
# execute ping 8.8.8.8
PING 8.8.8.8 (8.8.8.8): 56 data bytes

To verify the configuration after Router1 and Router4 have also been configured:

This verification can be done after Router1 and Router4 have been configured. Only Router1’s debugs are shown.

1. Check the RIP interface information:

   # get router info rip interface
   Router1 is up, line protocol is up
   RIP is not enabled on this interface
   ssl.Router1 is up, line protocol is up
   RIP is not enabled on this interface
   vd12link0 is up, line protocol is up
   Routing Protocol: RIP
   Receive RIPv2 packets only
   Send RIPv2 packets only
   Passive interface: Disabled
   Split horizon: Enabled with Poisoned Reversed
   IP interface address:
   10.11.201.101/24
   vd13link0 is up, line protocol is up
   Routing Protocol: RIP
   Receive RIPv2 packets only
   Send RIPv2 packets only
   Passive interface: Disabled
   Split horizon: Enabled with Poisoned Reversed
   IP interface address:
   10.11.202.101/24
   LoSales is up, line protocol is up
   Routing Protocol: RIP
   Receive RIPv2 packets only
   Send RIPv2 packets only
   Passive interface: Enabled
   Split horizon: Enabled with Poisoned Reversed
   IP interface address:
   10.11.101.101/24
   127.0.0.1/8

2. Check the RIP database:
Network

# get router info rip database
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel,
C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP

<table>
<thead>
<tr>
<th>Network</th>
<th>Next Hop</th>
<th>Metric From</th>
<th>If</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0.0.0/0</td>
<td>10.11.202.103</td>
<td>3</td>
<td>vd13link0</td>
<td>02:35</td>
</tr>
<tr>
<td>Rc 10.11.101.0/24</td>
<td>1</td>
<td>LoSales</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Rc 10.11.201.0/24</td>
<td>1</td>
<td>LoSales</td>
<td></td>
<td></td>
</tr>
<tr>
<td>R 10.12.101.0/24</td>
<td>10.11.202.103</td>
<td>2</td>
<td>vd13link0</td>
<td>02:35</td>
</tr>
<tr>
<td>R 10.12.102.0/24</td>
<td>10.11.202.103</td>
<td>2</td>
<td>vd13link0</td>
<td>02:35</td>
</tr>
<tr>
<td>R 10.14.101.0/24</td>
<td>10.11.202.103</td>
<td>3</td>
<td>vd13link0</td>
<td>02:35</td>
</tr>
<tr>
<td>R 10.14.201.0/24</td>
<td>10.11.201.102</td>
<td>2</td>
<td>vd13link0</td>
<td>02:30</td>
</tr>
<tr>
<td>R 172.20.120.0/24</td>
<td>10.11.201.102</td>
<td>2</td>
<td>vd13link0</td>
<td>02:30</td>
</tr>
<tr>
<td>R 172.20.121.0/24</td>
<td>10.11.202.103</td>
<td>2</td>
<td>vd13link0</td>
<td>02:35</td>
</tr>
</tbody>
</table>

3. Check the routing table:

# get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
* - candidate default

Routing table for VRF=0
R* 0.0.0.0/0 [120/3] via 10.11.202.103, vd13link0, 00:09:42
C 10.11.101.0/24 is directly connected, LoSales
C 10.11.201.0/24 is directly connected, vd12link0
C 10.11.202.0/24 is directly connected, vd13link0
R 10.12.101.0/24 [120/2] via 10.11.202.103, vd13link0, 00:09:42
R 10.14.101.0/24 [120/3] via 10.11.202.103, vd13link0, 00:09:42
R 10.14.201.0/24 [120/2] via 10.11.201.102, vd12link0, 00:09:42
R 172.20.120.0/24 [120/2] via 10.11.201.102, vd12link0, 00:09:42
R 172.20.121.0/24 [120/2] via 10.11.202.103, vd13link0, 00:09:42

4. If firewall policies are correctly configured, the accounting network and the internet are reachable from the sales network:

# execute ping-options source 10.11.101.101
# execute ping 10.14.101.104
64 bytes from 10.14.101.104: icmp_seq=0 ttl=254 time=0.1 ms
64 bytes from 10.14.101.104: icmp_seq=1 ttl=254 time=0.0 ms
64 bytes from 10.14.101.104: icmp_seq=2 ttl=254 time=0.0 ms
64 bytes from 10.14.101.104: icmp_seq=3 ttl=254 time=0.0 ms
64 bytes from 10.14.101.104: icmp_seq=4 ttl=254 time=0.0 ms
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.0/0.0/0.1 ms

# execute traceroute 10.14.101.104
traceroute to 10.14.101.104 (10.14.101.104), 32 hops max, 3 probe packets per hop, 84 byte packets
  1 10.11.202.103 0.079 ms 0.029 ms 0.013 ms
  2 10.14.101.104 0.043 ms 0.020 ms 0.010 ms
Testing the configuration and routing changes

After the network is configured, test it to ensure that when network events occur, such as a downed link, routing updates are triggered and converge as expected.

In the following examples, we disable certain links to simulate network outages, then verify that routing and connectivity is restored after the updates have converged.

Example 1 - ISP router port3 interface goes down

In this example, a link outage occurs on port3 of the ISP router. Consequently, all routers must use Router2, and not Router3, to reach the internet. Note the RIP database before and after the link failure, and the time taken for the route updates to propagate and return to a functioning state.

Router4's debugs are shown.

Before:

```
# get router info rip database
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel,
       C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP

Network                Next Hop          Metric From         If    Time
R  0.0.0.0/0            10.14.202.103    3 10.14.202.103    vd43link0 02:31
R  10.11.201.0/24       10.14.201.102    2 10.14.201.102    vd42link0 02:47

C  10.14.201.0/24 is directly connected, vd42link0
C  10.14.202.0/24 is directly connected, vd43link0
R  172.20.120.0/24 [120/2] via 10.14.201.102, vd42link0, 02:45:15
R  172.20.121.0/24 [120/2] via 10.14.202.103, vd34link0, 02:45:15

# execute traceroute 8.8.8.8
trace route to 8.8.8.8 (8.8.8.8), 32 hops max, 3 probe packets per hop, 84 byte packets
  1 10.14.202.103 0.187 ms 0.054 ms 0.030 ms
  2 172.20.121.0/24 0.062 ms 0.040 ms 0.025 ms
  3 * * *

After:

- You might see different routes, and the routes might change, while convergence is occurring. During convergence, the metric for your default route increases to 16.

  # get router info rip database
  Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel, C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP
  Network     Next Hop          Metric From   If     Time
  R 0.0.0.0/0  10.14.202.103    16 10.14.202.103 vd43link0 01:50

- After convergence is complete, the RIP database will look similar to the following:

  # get router info rip database
  Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel, C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP
  Network     Next Hop          Metric From   If     Time
  R 0.0.0.0/0  10.14.201.102    3 10.14.201.102 vd42link0 02:53

- The default route should point to Router2, with the same number of hops:

  # get router info routing-table all
  Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
  O - OSPF, IA - OSPF inter area
  N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
  E1 - OSPF external type 1, E2 - OSPF external type 2
  i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
  * - candidate default
  Routing table for VRF=0
  R* 0.0.0.0/0 [120/3] via 10.14.201.102, vd42link0, 00:05:24
  R 10.11.201.0/24 [120/2] via 10.14.201.201, vd42link0, 02:58:39
  C 10.14.101.0/24 is directly connected, LoAccounting
  C 10.14.201.0/24 is directly connected, vd42link0
Example 2- Additional link failures on Router2

In addition to the link failure on the ISP router in example, port1 and port3 on Router2 have also failed. This means that Router4 must go through Router3, Router1, Router2, then the ISP router to reach the internet. Note that, for a period of time, some routes’ metrics increase to 16. If no better routes are found for these networks, then they eventually disappear.

After the convergence completes, the RIP database and routing table on Router4 should resemble the following:

```
# get router info rip database
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel,
       C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP
Network      Next Hop     Metric  From     If         Time
R  0.0.0.0/0      10.14.202.103  5 10.14.202.103 vd43link0 02:54
Rc 10.14.101.0/24  1          vd43link0
Rc 10.14.202.0/24  1          vd43link0
R 172.20.120.0/24  10.14.202.103  4 10.14.202.103 vd43link0 02:54
```

```
# get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default
Routing table for VRF=0
R*  0.0.0.0/0 [120/5] via 10.14.202.103, vd43link0, 00:03:54
R 10.11.201.0/24 [120/3] via 10.14.202.103, vd43link0, 00:03:54
C 10.14.101.0/24 is directly connected, LoAccounting
C 10.14.202.0/24 is directly connected, vd43link0
R 172.20.120.0/24 [120/4] via 10.14.202.103, vd43link0, 00:03:54
```

Reaching the internet on the default gateway now requires five hops from Router4:

```
# execute traceroute 8.8.8.8
traceroute to 8.8.8.8 (8.8.8.8), 32 hops max, 3 probe packets per hop, 84 byte packets
  1 10.14.202.103  0.087 ms  0.026 ms  0.012 ms
  2 10.11.202.101  0.045 ms  0.024 ms  0.025 ms
  3 10.11.201.102  0.048 ms  0.024 ms  0.015 ms
  4 172.20.120.5  0.050 ms  0.028 ms  0.019 ms
  5 * * *
```
**Basic RIPng example**

In this example, a small network is configured with RIP next generation (RIPng). Two FortiGates are connected to the internal network and the ISP, providing some redundancy to help ensure that the internal network can always reach the internet.

The FortiGates are running in NAT mode with VDOMs disabled, and firewall policies have already been configured to allow traffic to flow across the interfaces.

All of the internal computers and other network devices support IPv6 addressing and are running RIPng (where applicable), so no static routing is required. Internal network devices only need to know the FortiGate's internal interface network addresses.

<table>
<thead>
<tr>
<th>Router</th>
<th>Interface (alias)</th>
<th>IPv6 address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router1</td>
<td>port1 (internal)</td>
<td>2002:A0B:6565::0</td>
</tr>
<tr>
<td></td>
<td>port2 (ISP)</td>
<td>2002:AC14:7865::0</td>
</tr>
<tr>
<td>Router2</td>
<td>port1 (internal)</td>
<td>2002:A0B:6666::0</td>
</tr>
<tr>
<td></td>
<td>port2 (ISP)</td>
<td>2002:AC14:7866::0</td>
</tr>
</tbody>
</table>

On each FortiGate, the interfaces are configured first, and then RIPng. No redistribution or authentication is configured.

In the RIPng configuration, only the interface names are required. The ISP router and the other FortiGate are configured as neighbors. Declaring the neighbors reduces the discovery traffic when the routers start. There is no specific command to include a subnet in the RIP broadcast, and RIPng can only be configured using the CLI.

**To configure Router1:**

1. Configure the interfaces:

```
config system interface
edit port1
    set allowaccess ping https ssh
    set type physical
    set description "Internal RnD network"
    set alias "internal"
    config ipv6
        set ip6-address 2002:a0b:6565::/0
    end
end
```
next
edit port2
    set allowaccess ping https ssh
    set type physical
    set description "ISP and Internet"
    set alias "ISP"
    config ipv6
        set ip6-address 2002:ac14:7865::/0
    end
end

2. Configure RIPng:

    config router ripng
    config neighbor
        edit 1
            set ip6 2002:a0b:6566::
            set interface port1
        next
        edit 2
            set ip6 2002:ac14:7805::
            set interface port2
        next
    end
    config interface
        edit port1
        next
        edit port2
        next
    end
end

To configure Router2:

1. Configure the interfaces:

    config system interface
    edit port1
        set allowaccess ping https ssh
        set type physical
        set description "Internal RnD network"
        set alias "internal"
        config ipv6
            set ip6-address 2002:a0b:6566::/0
        end
    next
    edit port2
        set allowaccess ping https ssh
        set type physical
        set description "ISP and Internet"
        set alias "ISP"
        config ipv6
            set ip6-address 2002:ac14:7866::/0
        end
    next
end
2. Configure RIPng:

```plaintext
config router ripng
  config neighbor
    edit 1
      set ip6 2002:a0b:6565::
      set interface port1
    next
    edit 2
      set ip6 2002:ac14:7805::
      set interface port2
    next
  end
  config interface
    edit port1
    next
    edit port2
    next
  end
end
```

**Testing the configuration**

The following commands can be used to check the RIPng information on the FortiGates, and can help track down issues:

**To view the local scope IPv6 addresses used as next-hops by RIPng on the FortiGate:**

```plaintext
# diagnose ipv6 address list
```

**To view IPv6 addresses that are installed in the routing table:**

```plaintext
# diagnose ipv6 route list
```

**To view the IPv6 routing table:**

```plaintext
# get router info6 routing-table
```

This information is similar to the `diagnose ipv6 route list` command, but it is presented in an easier to read format.

**To view the brief output on the RIP information for the interface listed:**

```plaintext
# get router info6 rip interface external
```

This includes information such as, if the interface is up or down, what routing protocol is being used, and whether passive interface or split horizon is enabled.

**OSPF**

Open Shortest Path First (OSPF) is a link state routing protocol that is commonly used in large enterprise networks with L3 switches, routers, and firewalls from multiple vendors. It can quickly detect link failures, and converges network traffic...
Network without networking loops. It also has features to control which routes are propagated, allowing for smaller routing tables, and provides better load balancing on external links when compared to other routing protocols.

To configure OSPF in the GUI, go to Network > OSPF:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router ID</td>
<td>A unique ID to identify your router in the network, typically in the format x.x.x.x.</td>
</tr>
<tr>
<td>Areas</td>
<td>The areas that the router is part of. For each area, define the Area ID, Type, and Authentication method.</td>
</tr>
<tr>
<td>Networks</td>
<td>The networks that OSPF is enabled in, and the area that they belong to.</td>
</tr>
<tr>
<td>Interfaces</td>
<td>OSPF interfaces for transmitting and receiving packets. Configure interface properties, such as Network Type, Cost, Hello interval, and others.</td>
</tr>
<tr>
<td>Advanced Options</td>
<td>Settings for Inject Default Route, Passive Interfaces, and Redistribute. Redistribution can be enabled by protocol and the metric for each protocol can be configured.</td>
</tr>
</tbody>
</table>

This section includes the following topics:

- Basic OSPF example on page 340
- OSPFv3 neighbor authentication on page 351
- OSPF graceful restart upon a topology change on page 353

**Basic OSPF example**

In this example, three FortiGate devices are configured in an OSPF network.

- Router1 is the Designated Router (DR). It has the highest priority and the lowest IP address, to ensure that it becomes the DR.
- Router2 is the Backup Designated Router (BDR). It has a high priority to ensure that it becomes the BDR.
- Router3 is the Autonomous System Border Router (ASBR). It routes all traffic to the ISP BGP router for internet access. It redistributes routes from BGP and advertises a default route to its neighbors. It can allow different types of routes, learned outside of OSPF, to be used in OSPF. Different metrics can be assigned to these routes to make them more or less preferred than regular OSPF routes. Route maps could be used to further control what prefixes are advertised or received from the ISP.
Firewall policies are already configured to allow unfiltered traffic in both directions between all of the connected interfaces.

The interfaces are already configured, and NAT is only used for connections to public networks. The costs for all of the interfaces is left at 0.

The OSPF network belongs to Area 0, and is not connected to any other OSPF networks. All of the routers are part of the backbone 0.0.0.0 area, so no inter-area communications are needed.

Router3 redistributes BGP routes into the OSPF AS and peers with the ISP BGP Router over eBGP. For information about configuring BGP, see BGP on page 356.

The advertised networks - 10.11.101.0, 10.11.102.0, and 10.11.103.0 - are summarized by 10.11.0.0/16. Additional networks are advertised individually by the /24 subnet.

</table>
**Router1**

**To configure Router1 in the GUI:**

1. Go to *Network > OSPF*.
2. Set *Router ID* to *10.11.101.1*.
3. In the *Areas* table, click *Create New* and set the following:

<table>
<thead>
<tr>
<th>Area ID</th>
<th>0.0.0.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Regular</td>
</tr>
<tr>
<td>Authentication</td>
<td>None</td>
</tr>
</tbody>
</table>

4. Click OK.
5. In the *Networks* table, click *Create New* and set the following:

<table>
<thead>
<tr>
<th>Area</th>
<th>0.0.0.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP/Netmask</td>
<td>10.11.0.0 255.255.0.0</td>
</tr>
</tbody>
</table>

6. Click OK.
7. In the *Networks* table, click *Create New* again and set the following:

<table>
<thead>
<tr>
<th>Area</th>
<th>0.0.0.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP/Netmask</td>
<td>192.168.102.0 255.255.255.0</td>
</tr>
</tbody>
</table>

8. Click OK.
9. In the *Interfaces* table, click *Create New* and set the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>Router1-Internal-DR</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>port1</td>
</tr>
<tr>
<td>Cost</td>
<td>0</td>
</tr>
<tr>
<td>Priority</td>
<td>255</td>
</tr>
<tr>
<td>Authentication</td>
<td>None</td>
</tr>
<tr>
<td>Timers</td>
<td>• Hello Interval: 10</td>
</tr>
<tr>
<td></td>
<td>• Dead Interval: 40</td>
</tr>
</tbody>
</table>

10. Click OK.
11. In the *Interfaces* table, click *Create New* again and set the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>Router1-External</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>port2</td>
</tr>
<tr>
<td>Cost</td>
<td>0</td>
</tr>
<tr>
<td>Authentication</td>
<td>None</td>
</tr>
<tr>
<td>Timers</td>
<td>• Hello Interval: 10</td>
</tr>
<tr>
<td></td>
<td>• Dead Interval: 40</td>
</tr>
</tbody>
</table>
To configure Router1 in the CLI:

```bash
config router ospf
    set router-id 10.11.101.1
config area
    edit 0.0.0.0
    next
end
config ospf-interface
    edit "Router1-Internal-DR"
        set interface "port1"
        set priority 255
        set dead-interval 40
        set hello-interval 10
    next
    edit "Router1-External"
        set interface "port2"
        set dead-interval 40
        set hello-interval 10
    next
end
config network
    edit 1
        set prefix 10.11.0.0 255.255.0.0
    next
    edit 2
        set prefix 192.168.102.0 255.255.255.0
    next
end

Router2

To configure Router2 in the GUI:

1. Go to Network > OSPF.
2. Set Router ID to 10.11.101.2.
3. In the Areas table, click Create New and set the following:

<table>
<thead>
<tr>
<th>Area ID</th>
<th>0.0.0.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Regular</td>
</tr>
<tr>
<td>Authentication</td>
<td>None</td>
</tr>
</tbody>
</table>

4. Click OK.
5. In the Networks table, click Create New and set the following:

<table>
<thead>
<tr>
<th>Area</th>
<th>0.0.0.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP/Netmask</td>
<td>10.11.0.0 255.255.0.0</td>
</tr>
</tbody>
</table>
6. Click OK.
7. In the Networks table, click Create New again and set the following:

<table>
<thead>
<tr>
<th>Area</th>
<th>0.0.0.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP/Netmask</td>
<td>192.168.103.0 255.255.255.0</td>
</tr>
</tbody>
</table>

8. Click OK.
9. In the Interfaces table, click Create New and set the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>Router2-Internal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>port1</td>
</tr>
<tr>
<td>Cost</td>
<td>0</td>
</tr>
<tr>
<td>Priority</td>
<td>250</td>
</tr>
<tr>
<td>Authentication</td>
<td>None</td>
</tr>
<tr>
<td>Timers</td>
<td>Hello Interval: 10</td>
</tr>
</tbody>
</table>

10. Click OK.
11. In the Interfaces table, click Create New again and set the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>Router2-External</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>port2</td>
</tr>
<tr>
<td>Cost</td>
<td>0</td>
</tr>
<tr>
<td>Authentication</td>
<td>None</td>
</tr>
<tr>
<td>Timers</td>
<td>Hello Interval: 10</td>
</tr>
</tbody>
</table>

12. Click OK.
13. Click Apply.

**To configure Router2 in the CLI:**

```
config router ospf
  set router-id 10.11.101.1
config area
  edit 0.0.0.0
  next
end
config ospf-interface
  edit "Router2-Internal"
    set interface "port1"
    set priority 250
    set dead-interval 40
    set hello-interval 10
  next
  edit "Router2-External"
    set interface "port2"
```
Router3

To configure Router3 in the GUI:

1. Go to Network > OSPF.
2. Set Router ID to 10.11.103.3.
3. Under Default Settings, set Inject default route to Regular Areas.
   A default route must be present on Router3 to advertise it to other routers.
4. Enable Redistribute BGP and use the default settings.
5. In the Areas table, click Create New and set the following:

<table>
<thead>
<tr>
<th>Area ID</th>
<th>0.0.0.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Regular</td>
</tr>
<tr>
<td>Authentication</td>
<td>None</td>
</tr>
</tbody>
</table>

6. Click OK.
7. In the Networks table, click Create New and set the following:

<table>
<thead>
<tr>
<th>Area</th>
<th>0.0.0.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP/Netmask</td>
<td>10.11.0.0 255.255.0.0</td>
</tr>
</tbody>
</table>

8. Click OK.
9. In the Interfaces table, click Create New and set the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>Router3-Internal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>port1</td>
</tr>
<tr>
<td>Cost</td>
<td>0</td>
</tr>
<tr>
<td>Authentication</td>
<td>None</td>
</tr>
</tbody>
</table>
| Timers              | • Hello Interval: 10  
|                     | • Dead Interval: 40 |

10. Click OK.
11. In the Interfaces table, click Create New again and set the following:

network
set dead-interval 40
set hello-interval 10
next
dconfig network
edit 1
set prefix 10.11.0.0 255.255.0.0
next
dedit 2
set prefix 192.168.103.0 255.255.255.0
next

### Network

<table>
<thead>
<tr>
<th>Name</th>
<th>Router3-Internal2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>port2</td>
</tr>
<tr>
<td>Cost</td>
<td>0</td>
</tr>
<tr>
<td>Authentication</td>
<td>None</td>
</tr>
</tbody>
</table>
| Timers        | • Hello Interval: 10  
                • Dead Interval: 40 |

12. Click OK.
13. Click Apply.

**To configure Router3 in the CLI:**

```bash
config router ospf
    set default-information-originate enable
    set router-id 10.11.103.3
config area
    edit 0.0.0.0
    next
end
config ospf-interface
    edit "Router3-Internal"
    set interface "port1"
    set dead-interval 40
    set hello-interval 10
    next
    edit "Router3-Internal2"
    set interface "port2"
    set dead-interval 40
    set hello-interval 10
    next
end
config network
    edit 1
    set prefix 10.11.0.0 255.255.0.0
    next
end
config redistribute "bgp"
    set status enable
end
```

**To configure BGP on Router3 in the CLI:**

```bash
config router bgp
    set as 64511
    set router-id 1.1.1.1
config neighbor
    edit "172.20.120.5"
    set remote-as 64512
    next
end
config network
```
For more information on configuring BGP, see BGP on page 356.

Testing the configuration

Both the network connectivity and OSPF routing are tested. When a link goes down, routes should converge as expected.

Working state

- Router3:

```
Router3 # get router info ospf neighbor
OSPF process 0, VRF 0:
Neighbor ID   Pri  State   Dead Time   Address   Interface
10.11.101.1   1 Full/Backup 00:00:34   10.11.102.1   port1
10.11.101.2   1 Full/Backup 00:00:38   10.11.103.2   port2
```

Router3 # get router info ospf status
Routing Process "ospf 0" with ID 10.11.103.3
Process uptime is 18 hours 52 minutes
Process bound to VRF default
Conforms to RFC2328, and RFC1583Compatibility flag is disabled
Supports only single TOS(TOS0) routes
Supports opaque LSA
Do not support Restarting

**This router is an ASBR** (injecting external routing information)
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Refresh timer 10 secs
Number of incoming current DD exchange neighbors 0/5
Number of outgoing current DD exchange neighbors 0/5
Number of external LSA 3. Checksum 0x021B78
Number of opaque AS LSA 0. Checksum 0x000000
Number of non-default external LSA 2
External LSA database is unlimited.
Number of LSA originated 16
Number of LSA received 100
Number of areas attached to this router: 1
  Area 0.0.0.0 (BACKBONE)
    Number of interfaces in this area is 2(2)
    Number of fully adjacent neighbors in this area is 2
    Area has no authentication
    SPF algorithm last executed 00:37:36.90 ago
    SPF algorithm executed 13 times
    Number of LSA 6. Checksum 0x03eafa
```

  i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
OSPFv3 neighbor authentication

OSPFv3 neighbor authentication is available for enhanced IPv6 security.

To configure an OSPF6 interface:

```plaintext
config router ospf6
  config ospf6-interface
    edit <name>
      set authentication {none | ah | esp | area}
      set key-rollover-interval <integer>
      set ipsec-auth-alg {md5 | sha1 | sha256 | sha384 | sha512}
      set ipsec-enc-alg {null | des | 3des | aes128 | aes192 | aes256}
      config ipsec-keys
        edit <spi>
          set auth-key <string>
          set enc-key <string>
        next
      end
    end
  next
end
```

To configure an OSPF6 virtual link:

```plaintext
config router ospf6
  config area
    edit <id>
      config virtual-link
        edit <name>
          set authentication {none | ah | esp | area}
          set key-rollover-interval <integer>
          set ipsec-auth-alg {md5 | sha1 | sha256 | sha384 | sha512}
          set ipsec-enc-alg {null | des | 3des | aes128 | aes192 | aes256}
          config ipsec-keys
            edit <spi>
              set auth-key <string>
              set enc-key <string>
            next
          end
        next
      end
    end
end
```
To configure an OSPF6 area:

```plaintext
config router ospf6
  config area
    edit <id>
      set authentication {none | ah | esp}
      set key-rollover-interval <integer>
      set ipsec-auth-alg {md5 | sha1 | sha256 | sha384 | sha512}
      set ipsec-enc-alg {null | des | 3des | aes128 | aes192 | aes256}
    config ipsec-keys
      edit <spi>
        set auth-key <string>
        set enc-key <string>
      next
    next
  end
end
```

### OSPF graceful restart upon a topology change

In OSPF graceful restart mode, the `restart-on-topology-change` option can be used to keep restarting the router in graceful restart mode when a topology change is detected during a restart.

```plaintext
config router ospf
  set restart-on-topology-change {enable | disable}
end
```

OSPFv3 graceful restart mode upon a topology change can be used in OSPF6:

```plaintext
config router ospf6
  set restart-on-topology-change {enable | disable}
end
```

### Example

In this example, a restarting router (one of the FG-300Es in the HA cluster) informs its neighbors using grace LSAs before restarting its OSPF process. When the helper router (the FG-601E) receives the grace LSAs, it enters helper mode to help with the graceful restart until the graceful period expires. It will act as though there are no changes on the restarting router (FG-300E). A generic router simulates a topology change during the restart event.

If `restart-on-topology-change` is enabled on the restarting router, it will not exit the graceful restart mode even when a topology change is detected.

If `restart-on-topology-change` is disabled on the restarting router, it will exit graceful restart mode when a topology change is detected.
To configure the restarting router:

```bash
config router ospf
    set router-id 31.1.1.1
    set restart-mode graceful-restart
    set restart-period 180
    set restart-on-topology-change enable
config area
    edit 0.0.0.0
    next
end
config network
    edit 1
        set prefix 172.16.200.0 255.255.255.0
    next
    edit 2
        set prefix 31.1.1.1 255.255.255.255
    next
end
```

To configure the restarting helper router:

```bash
config router ospf
    set router-id 3.3.3.3
    set restart-mode graceful-restart
config area
    edit 0.0.0.0
    next
end
config network
    edit 1
        set prefix 172.16.200.0 255.255.255.0
    next
    edit 2
        set prefix 3.3.3.3 255.255.255.255
    next
end
```

Testing the configuration

**Topology change with continuing graceful restart enabled:**

When `restart-on-topology-change` is enabled and there is a topology change during the HA OSPF graceful restart, the graceful restart will continue. The routes on the helper router (FG-601E) are still there and no traffic will drop.

```
# get router info ospf neighbor
OSPF process 0, VRF 0:
Neighbor ID Pri State        Dead Time Address          Interface
31.1.1.1  1   Full/DR 00:14:47* 172.16.200.31 port1

# get router info routing-table ospf
Routing table for VRF=0
0 21.21.21.21/32 [110/300] via 172.16.200.31, port1, 00:09:55
```
# get router info ospf neighbor
OSPF process 0, VRF 0:
Neighbor ID   Pri State Dead Time     Address           Interface
31.1.1.1      1 Full/DR 00:14:47* 172.16.200.31 port1

# get router info routing-table ospf
Routing table for VRF=0
O 21.21.21.32 [110/300] via 172.16.200.31, port1, 00:10:17
O 31.1.1.1/32 [110/200] via 172.16.200.31, port1, 00:55:53
O 100.21.1.0/24 [110/200] via 172.16.200.31, port1, 00:13:13

Topology change with continuing graceful restart disabled:

When restart-on-topology-change is disabled and there is a topology change during the HA OSPF graceful restart, the graceful restart will exit. The routes on the helper router (FG-601E) are lost and traffic will drop.

# get router info ospf neighbor
OSPF process 0, VRF 0:
Neighbor ID   Pri State Dead Time     Address           Interface
31.1.1.1      1 Full/DR 00:14:42* 172.16.200.31 port1

FortiOS 7.2.0 Administration Guide
Fortinet Inc.

BGP

Border Gateway Protocol (BGP) is a standardized routing protocol that is used to route traffic across the internet. It exchanges routing information between Autonomous Systems (AS) on the internet and makes routing decisions based on path, network policies, and rule sets. BGP contains two distinct subsets: internal BGP (iBGP) and external BGP (eBGP). iBGP is intended for use within your own networks. eBGP is used to connect different networks together and is the main routing protocol for the internet backbone.

To configure BGP in the GUI, go to Network > BGP:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local AS</td>
<td>The AS number for the local router.</td>
</tr>
<tr>
<td>Router ID</td>
<td>A unique ID to identify your router in the network, typically in the format x.x.x.x.</td>
</tr>
<tr>
<td>Neighbors</td>
<td>The neighbors that the FortiGate will be peering with. Configure the remote router's AS number, any other properties used for peering with the neighbor, and IPv4 and IPv6 filtering.</td>
</tr>
<tr>
<td>Neighbor Groups</td>
<td>The neighbor groups that share the same outbound policy configurations.</td>
</tr>
<tr>
<td>Neighbor Ranges</td>
<td>The source address range of BGP neighbors that will be automatically assigned to a neighbor group.</td>
</tr>
</tbody>
</table>
**Network**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv4 &amp; IPv6 Networks</td>
<td>The networks to be advertised to other BGP routers.</td>
</tr>
<tr>
<td>IPv4 &amp; IPv6 Redistribute</td>
<td>Enable redistribution by protocol. Specify either All routes, or Filter by route map.</td>
</tr>
<tr>
<td>Dampening</td>
<td>Enable route flap dampening to reduce the propagation of flapping routes.</td>
</tr>
<tr>
<td>Graceful Restart</td>
<td>Enable BGP graceful restart, which causes the adjacent routers to keep routes active while the BGP peering is restarted on the FortiGate. This is useful in HA instances when failover occurs.</td>
</tr>
<tr>
<td>Advanced Options</td>
<td>Various advanced settings, such as Local Preference, Distance internal, Keepalive, Holdtime, and others</td>
</tr>
<tr>
<td>Best Path Selection</td>
<td>Configure path selection attributes on this router.</td>
</tr>
</tbody>
</table>

This section includes the following topics:

- Basic BGP example on page 357
- Route filtering with a distribution list on page 366
- Next hop recursive resolution using other BGP routes on page 370
- Next hop recursive resolution using ECMP routes on page 371
- BGP conditional advertisement on page 371
- BGP error handling per RFC 7606 on page 377
- BGP next hop tag-match mode on page 379
- Troubleshooting BGP on page 385

**Basic BGP example**

In this example, BGP is configured on two FortiGate devices. The FortiGates are geographically separated, and form iBGP peering over a VPN connection. FGT_A also forms eBGP peering with ISP2.

FGT_A learns routes from ISP2 and redistributes them to FGT_B while preventing any iBGP routes from being advertised.

The internal networks behind the FortiGates can communicate with each other, and the internal networks behind FGT_B can traverse FGT_A to reach networks that are advertised by ISP2.
FGT_A and FGT_B have static routes to each other through ISP1. ISP1 does not participate in BGP.

The IPsec VPN tunnel between FGT_A and FGT_B is configured with wildcard 0.0.0.0/0 networks for phase2 local and remote selectors. The VPN interfaces have IP addresses already configured and are used for peering between FGT_A and FGT_B.

FGT_A is configured to peer with ISP2 on 10.10.108.86.

The firewall policies between FGT_A and FGT_B are not NATed. The firewall policies egressing on wan2 are NATed.

Configuring iBGP peering

To configure FGT_A to establish iBGP peering with FGT_B in the GUI:

1. Go to Network > BGP.
2. Set Local AS to 64511
3. Set Router ID to 1.1.1.1.
4. In the Neighbors table, click Create New and set the following:
   
<table>
<thead>
<tr>
<th>IP</th>
<th>10.100.201.88</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote AS</td>
<td>64511</td>
</tr>
</tbody>
</table>

5. Click OK.
7. Click Apply.
8. In the CLI, set the interface used as the source IP address of the TCP connection (where the BGP session, TCP/179, is connecting from) for the neighbor (update-source) to FGT_B.

To configure FGT_A to establish iBGP peering with FGT_B in the CLI:

```plaintext
config router bgp
  set as 64511
  set router-id 1.1.1.1
config neighbor
  edit "10.100.201.88"
    set remote-as 64511
    set update-source "toFGTB"
next
end
config network
  edit 1
    set prefix 192.168.86.0 255.255.255.0
next
end
```

To configure FGT_B to establish iBGP peering with FGT_A in the GUI:

1. Go to Network > BGP.
2. Set Local AS to 64511
3. Set Router ID to 2.2.2.2.
4. In the Neighbors table, click Create New and set the following:
To configure FGT_B to establish iBGP peering with FGT_A in the CLI:

```
config router bgp
  set as 64511
  config neighbor
    edit "10.100.201.86"
      set remote-as 64511
      set update-source "toFGTA"
    next
  end
end
config network
  edit 1
    set prefix 192.168.88.0 255.255.255.0
  next
end
```

To check the FGT_A and FGT_B peering:

1. Check the BGP neighbors:
   ```
   # get router info bgp neighbors
   ```
2. Check the networks learned from neighbors:
   ```
   # get router info bgp network
   ```
3. Check that the routes are added to the routing table:
   ```
   # get router info routing-table all
   ```

To see the neighborship status, network, and routing table command outputs for the completed example, see Troubleshooting and debugging on page 362.

**Configuring eBGP peering**

By establishing eBGP peering with ISP2, learned routes will have a distance of 20 and will automatically be propagated to iBGP peers. iBGP peers do not change the next hop when they advertise a route. To make FGT_B receive a route with FGT_A as the next hop, and not ISP 2's network, `Next hop self (next-hop-self)` is enabled for routes advertised to FGT_B.

Additionally, to peer with another router that is multiple hops away, enable `ebg-enforce-multihop` in the neighbor configuration.
In this example, the iBGP routes are automatically advertised to the eBGP neighbor, so a route map is created to deny iBGP routes from being advertised to ISP 2. Prefixes from ISP 2 are advertised to FGT_A and FGT_B, but no prefixes are advertised from FGT_A to ISP 2.

**To configure FGT_A to establish eBGP peering with ISP 2 in the GUI:**

1. Configure a route map to prevent advertisement of iBGP routes to ISP 2:
   a. Go to Network > Routing Objects and click Create New > Route Map.
   b. Set Name to exclude1.
   c. In the Rules table, click Create New.
   d. Set Action to Deny.
   e. Under Other Rule Variables, enable Match origin and set it to IGP.
   f. Click OK.
   g. Click OK.

2. Update the BGP configuration:
   a. Go to Network > BGP.
   b. In the Neighbors table, click Create New and set the following:

<table>
<thead>
<tr>
<th>IP</th>
<th>10.10.102.87</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote AS</td>
<td>64512</td>
</tr>
<tr>
<td>Route map out</td>
<td>exclude1</td>
</tr>
</tbody>
</table>

c. Click OK.

d. In the Neighbors table, edit the previously created entry, 10.100.201.88.

e. Under IPv4 Filtering, select Next hop self.
   f. Click OK.
   g. Click Apply.

**To configure FGT_A to establish eBGP peering with ISP 2 in the CLI:**

1. Configure a route map to prevent advertisement of iBGP routes to ISP 2:

   ```
   config router route-map
   edit "exclude1"
   config rule
   edit 1
   set action deny
   set match-origin igp
   next
   next
   end
   end
   ```

2. Update the BGP configuration:

   ```
   config router bgp
   config neighbor
   edit "10.10.102.87"
   set remote-as 64512
   set route-map-out "exclude1"
   ```
To see the neighbor status, network, and routing table command outputs for the completed example, see Troubleshooting and debugging on page 362.

Firewall policies

On FGT_A configure the following policies:

- Allow the internal subnet to the VPN interface. Do not enable NAT. Enable security profiles as required.
- Allow the VPN interface to the internal subnet. Do not enable NAT. Enable security profiles as required.
- Allow the internal subnet to wan2. Enable NAT and security profiles as required.
- Allow VPN traffic from toFGTA to wan2. Enable NAT and security profiles as required.

On FGT_B configure the following policies:

- Allow the internal subnet to the VPN interface. Do not enable NAT. Enable security profiles as required.
- Allow the VPN interface to the internal subnet. Do not enable NAT. Enable security profiles as required.

To verify that pinging from FGT_B to FGT_A is successful:

```
FGT_B # execute ping-options source 192.168.88.88
FGT_B # execute ping 192.168.86.86
PING 192.168.86.86 (192.168.86.86): 56 data bytes
64 bytes from 192.168.86.86: icmp_seq=0 ttl=255 time=0.5 ms
...--- 192.168.86.86 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.3/0.3/0.5 ms
```

To verify that pinging from FGT_B to a subnet in ISP 2 is successful:

```
FGT_B # execute ping-options source 192.168.88.88
FGT_B # execute ping 172.16.201.87
PING 172.16.201.87 (172.16.201.87): 56 data bytes
64 bytes from 172.16.201.87: icmp_seq=0 ttl=254 time=0.6 ms
...--- 172.16.201.87 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.4/0.4/0.6 ms
```

```
FGT_B # execute traceroute-options source 192.168.88.88
FGT_B # execute traceroute 172.16.201.87
traceroute to 172.16.201.87 (172.16.201.87), 32 hops max, 3 probe packets per hop, 84 byte packets
  1  10.100.201.86  0.315 ms  0.143 ms  0.110 ms
  2  172.16.201.87  0.258 ms  0.144 ms  0.222 ms
```
**Troubleshooting and debugging**

When troubleshooting issues, logically step through the debugs. For example, if peering cannot be established between FGT_A and FGT_B:

1. Verify the basic connectivity between the FGT_A wan1 interface and the FGT_B port1 interface.
2. Verify that the VPN between FGT_A and FGT_B is established.
3. Verify the connectivity between the VPN interfaces.
4. Check the neighborship status on each peer. Use the BGP state to help determine the possible issue, for example:

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Idle</td>
<td>The local FortiGate has not started the BGP process with the neighbor.</td>
</tr>
<tr>
<td></td>
<td>This could be because the eBGP peer is multiple hops away, but multihop is</td>
</tr>
<tr>
<td></td>
<td>not enabled.</td>
</tr>
<tr>
<td>Connect</td>
<td>The local FortiGate has started the BGP process, but has not initiated a</td>
</tr>
<tr>
<td></td>
<td>TCP connection, possibly due to improper routing.</td>
</tr>
<tr>
<td>Active</td>
<td>The local FortiGate has initiated a TCP connection, but there is no response</td>
</tr>
<tr>
<td></td>
<td>This might indicate issues with the delivery or the response from the remote</td>
</tr>
</tbody>
</table>

5. If there are issues establishing the TCP connection, use the command `diagnose sniffer packet any 'tcp and port 179'` to identify the problem at the packet level.

The following outputs show instances where all of the configurations are completed, peering has formed, and routes have been exchanged. The debug output during each configuration step might differ from these outputs. These debug outputs can be used to help identify what might be missing or misconfigured on your device.

**To verify the status of the neighbors:**

```
FGT_A # get router info bgp neighbors
VRF 0 neighbor table:

FGT_B # get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
Route filtering with a distribution list

During BGP operations, routes can be propagated between BGP peers and redistributed from other routing protocols. In some situations, advertising routes from one peer to another might need to be prevented.

The Basic BGP example on page 357 explains using a route map to filter routes that are learned from iBGP to prevent them from propagating to an eBGP peer. In this example, a distribution list is used to prevent certain routes from one peer from being advertised to another peer.

- A company has its own web and email servers in an OSPF area, and needs to advertise routes to these resources to external peers. Users, routers, and other server all reside in the OSPF area.
- The FortiGate acts as the BGP border router, redistributing routes from the company's network to its BGP peers. It is connected to the OSPF area using its DMZ interface.
- Two ISP managed BGP peers in an AS (Peer 1 and Peer 2) are used to access the internet, and routes must not to be advertised from Peer 1 to Peer 2. The manufacturers of these routers, and information about other devices on the external BGP AS, are not known.
- Routes to the BGP peers are redistributed so that external locations can access the web and email servers in the OSPF area. The FortiGate device's external interfaces and the BGP peers are in different ASs, and form eBGP peers.
- Other networking devices must be configured for BGP. The peer routers must be updated with the FortiGate device's BGP information, including IP addresses, AS number, and any specific capabilities that are used, such as
IPv6, graceful restart, BFD, and so on.

- It is assumed that security policies have been configured to allow traffic between the networks and NAT is not used. To tighten security, only the required services should be allowed inbound to the various servers.
- In a real life scenario, public IP addresses would be used in place of private IP addresses.

### Configuring BGP

In this example, Peer 1 routes are blocked from being advertised to Peer 2 using an access list. All incoming routes from Peer 1 are blocked when updates are sent to Peer 2.

Routes learned from OSPF are redistributed into BGP. EBGP multi path is enabled to load-balance traffic between the peers using ECMP. See Equal cost multi-path on page 309 for more information.

### To configure BGP in the GUI:

1. Configure an access list to block Peer 1 routes:
   - a. Go to Network > Routing Objects and click Create New > Access List.
   - b. Set Name to block_peer1.
   - c. In the Rules table, click Create New.
   - d. Set Action to Deny.
   - e. Enable Exact Match and specify the prefix 172.21.111.0 255.255.255.0.
   - f. Click OK.
   - g. Click OK.

2. Configure BGP:
   - a. Go to Network > BGP.
   - b. Set Local AS to 65001
   - c. Set Router ID to 10.11.201.110.
   - d. In the Neighbors table, click Create New and set the following:
     
     | IP          | 172.21.111.5 |
     |-------------|-------------|
     | Remote AS   | 65001       |

   - e. Click OK.
   - f. In the Neighbors table, click Create New again and set the following:
     
     | IP          | 172.22.222.5 |
     |-------------|-------------|
     | Remote AS   | 65001       |
     | Distribute list out | Enable, and select the block_peer1 access list. |

   - g. Click OK.
   - h. Under IPv4 Redistribute, enable OSPF and select ALL.
   - i. Expand Best Path Selection and enable EBGP multi path.
   - j. Click Apply.
To configure BGP in the CLI:

1. Configure an access list to block Peer 1 routes:

   ```
   config router access-list
   edit "block_peer1"
   config rule
   edit 1
   set action deny
   set prefix 172.21.111.0 255.255.255.0
   set exact-match enable
   next
   end
   next
   end
   ```

2. Configure BGP:

   ```
   config router bgp
   set as 65001
   set router-id 10.11.201.110
   set ebgp-multipath enable
   config neighbor
   edit "172.21.111.5"
   set remote-as 65001
   next
   edit "172.22.222.5"
   set distribute-list-out "block_peer1"
   set remote-as 65001
   next
   end
   config redistribute "ospf"
   set status enable
   end
   ```

Configuring OSPF

In this example, all of the traffic is within the one OSPF area, and there are other OSPF routers in the network. When adjacencies are formed, other routers receive the routes advertised from the FortiGate that are redistributed from BGP.

To configure OSPF in the GUI:

1. Go to Network > OSPF.
2. Set Router ID to 10.11.201.110.
3. In the Areas table, click Create New and set the following:

<table>
<thead>
<tr>
<th>Area ID</th>
<th>0.0.0.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Regular</td>
</tr>
<tr>
<td>Authentication</td>
<td>None</td>
</tr>
</tbody>
</table>

4. Click OK.
5. In the Networks table, click Create New and set the following:
6. Click OK.
7. In the Interfaces table, click Create New and set the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>OSPF_dmz_network</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>dmz</td>
</tr>
</tbody>
</table>

8. Click OK.
9. Enable Redistribute BGP and set Metric value to 1.
10. Click Apply.

To configure OSPF in the CLI:

```
config router ospf
    set router-id 10.11.201.110
config area
    edit 0.0.0.0
    next
end
config ospf-interface
    edit "OSPF_dmz_network"
    set interface "dmz"
    next
end
config network
    edit 1
    set prefix 10.11.201.0 255.255.255.0
    next
end
config redistribute "bgp"
    set status enable
    set metric 1
end
```

Testing the configuration

To test this configuration, run the standard connectivity checks, and also make sure that routes are being passed between protocols as expected. Use the following checklist to help verify that the FortiGate is configured successfully:

1. Check that the FortiGate has established peering with BGP Peer 1 and Peer 2:

   # get router info bgp summary
   # get router info bgp neighbors

2. Check that the FortiGate has formed adjacency with OSPF neighbors:

   # get router info ospf status
   # get router info ospf neighbors

3. Check the routing table on the FortiGate to make sure that routes from both OSPF and BGP are included:
4. Check devices in the OSPF network for internet connectivity and to confirm that routes redistributed from BGP are in their routing tables.
5. Check the routing table on Peer 2 to confirm that no routes from Peer 1 are included.
6. Check that the routes from the internal OSPF network are redistributed to Peer 1 and Peer 2.
7. Verify connectivity to the HTTP and email servers.

Next hop recursive resolution using other BGP routes

By default, BGP routes are not considered when a BGP next hop requires recursive resolution. They are considered when `recursive-next-hop` is enabled. Recursive resolution will resolve to one level.

To consider BGP routes for recursive resolution of next hops:

```plaintext
config router bgp
  set recursive-next-hop enable
end
```

Example

To see the change in the routing table when the option is enabled:

1. Check the BGP routing table:

   ```plaintext
   # get router info routing-table bgp
   Routing table for VRF=0
   B   10.100.1.4/30 [200/0] via 10.100.1.14 (recursive is directly connected, R560), 00:02:06
   ```

2. Enable BGP routes for recursive resolution of next hops:

   ```plaintext
   config router bgp
     set recursive-next-hop enable
   end
   ```

3. Check the BGP routing table again:

   ```plaintext
   # get router info routing-table bgp
   Routing table for VRF=0
   B   10.100.1.4/30 [200/0] via 10.100.1.14 (recursive is directly connected, R560), 00:02:15
   B   172.16.203.0/24 [200/0] via 10.100.1.6 (recursive via 10.100.1.14, R560), 00:00:06
   ```

   The second BGP route's next hop is now recursively resolved by another BGP route.
Next hop recursive resolution using ECMP routes

When there are multiple ECMP routes to a BGP next hop, all of them are considered for the next hop recursive resolution. This ensures that the outgoing traffic can be load balanced.

To support multipath, either EGBP or IGBP multipath must be enabled:

```
config router bgp
  set ebgp-multipath enable
  set ibgp-multipath enable
end
```

In this example, there are two static routes. The FortiGate has learned two BGP routes from Router 1 that have the same next hop at 10.100.100.1. The next hop is resolved by the two static routes.

To verify that the routes are added to the BGP routing table:

1. Check the two static routes:

   ```
   # get router info routing-table static
   Routing table for VRF=0
   S    10.100.100.0/24 [10/0] via 172.16.200.55, port9
       [10/0] via 172.16.203.2, agg1
   ```

2. Confirm that both routes are in the BGP routing table:

   ```
   # get router info routing-table bgp
   Routing table for VRF=0
   B    10.100.10.0/24 [20/200] via 10.100.100.1 (recursive via 172.16.200.55, port9),
       00:00:07 (recursive via 172.16.203.2, agg1),
       00:00:07
   00:00:07
   B    10.100.11.0/24 [20/200] via 10.100.100.1 (recursive via 172.16.200.55, port9),
       00:00:07 (recursive via 172.16.203.2, agg1),
       00:00:07
   00:00:07
   ```

BGP conditional advertisement

BGP conditional advertisement allows the router to advertise a route only when certain conditions are met. Multiple conditions can be used together, with conditional route map entries treated as an AND operator, and IPv6 is supported.
**Multiple conditions example**

In this example, the FortiGate only advertises routes to its neighbor 2.2.2.2 if it learns multiple BGP routes defined in its conditional route map entry. All conditionals must be met.

To configure multiple conditions in BGP conditional advertisements:

1. **Configure the IPv4 prefix list:**
   ```
   config router prefix-list
   edit "281"
   config rule
   edit 1
   set prefix 172.28.1.0 255.255.255.0
   unset ge
   unset le
   next
   end
   end
   edit "222"
   config rule
   edit 1
   set prefix 172.22.2.0 255.255.255.0
   unset ge
   unset le
   next
   end
   end
   ```

2. **Configure the community list:**
   ```
   config router community-list
   edit "30:5"
   config rule
   edit 1
   set action permit
   set match "30:5"
   ```

3. **Configure the IPv4 route maps:**
   ```
   config router route-map
   edit "comm1"
   config rule
   edit 1
   set match-community "30:5"
   ```
Network

```
set set-route-tag 15
next
end
next "2224"
  config rule
  edit 1
    set match-ip-address "222"
  next
end
next "2814"
  config rule
  edit 1
    set match-ip-address "281"
  next
end
next
end
```

4. Configure the IPv6 prefix list:

```
config router prefix-list6
edit "adv-222"
  config rule
  edit 1
    set prefix6 2003:172:22:1::/64
    unset ge
    unset le
  next
end
next
edit "list6-2"
  config rule
  edit 1
    set prefix6 2003:172:28:2::/64
    unset ge
    unset le
  next
end
next
```

5. Configure the IPv6 route maps:

```
config router route-map
edit "map-222"
  config rule
  edit 1
    set match-ip6-address "adv-222"
  next
end
next
edit "map-282"
  config rule
  edit 1
    set action deny
```
6. Configure the BGP settings:

```plaintext
cfg router bgp
  config neighbor
    edit "2.2.2.2"
      config conditional-advertise
        edit "2224"
          set condition-routemap "2814" "2224" "comml"
            set condition-type non-exist
        next
      next
    edit "2003::2:2:2:2"
      config conditional-advertise6
        edit "map-222"
          set condition-routemap "map-222" "map-282"
        next
      set route-reflector-client6 enable
next
end
```

To verify the IPv4 conditional advertisements:

```
# get router info bgp neighbors 2.2.2.2
...
  Conditional advertise-map:
    Adv-map 2224root 2814root, cond-state 0-1
    2224root, cond-state 0-1
    commlroot, cond-state 0-0
...
```

In this output, the condition is that the routes in route maps 2814, 2224 and comml do not exist. However, routes for 2814 and 2224 exist, so the conditions are not met.

To verify the IPv6 conditional advertisements:

```
# get router info6 bgp neighbors 2003::2:2:2:2
...
  Conditional advertise-map:
    Adv-map map-222root map-222root, cond-state 1-1
    map-282root, cond-state 1-0
...
```

In this output, the condition is that the routes in route maps map-222 and map-282 exist. However, routes for map-222 exist, but map-282 does not, so the conditions are not met.
To view the conditional route maps:

```bash
# diagnose ip router command show-vrf root show running router bgp
...
neighbor 2.2.2.2 advertise-map 2224root exist-map 2814root
neighbor 2.2.2.2 advertise-map 2224root exist-map 2224root
neighbor 2.2.2.2 advertise-map 2224root exist-map commlroot
...
!
address-family ipv6
neighbor 2003::2:2:2:2 advertise-map map-222root non-exist-map map-222root
neighbor 2003::2:2:2:2 advertise-map map-222root non-exist-map map-282root
!
```

**IPv6 example 1**

In this example, the FortiGate advertises its local network to the secondary router when the primary router is down. The FortiGate detects the primary router is down in the absence of a learned route.

- When the FortiGate learns route 2003:172:28:1::/64 from the primary router, it does not advertise its local route (2003:172:22:1::/64) to the secondary router.
- When the FortiGate does not learn route 2003:17:28:1::/64 from the primary router, advertises its local route (2003:172:22:1::/64) to the secondary router.
- The BGP conditional advertisement condition is set to be true if the condition route map (2003:172:28:1::/64) is not matched (non-exist).

**To configure BGP conditional advertisement with IPv6:**

1. Configure the IPv6 prefix lists:

   ```bash
   config router prefix-list6
   edit "adv-222"
   config rule
   edit 1
   set prefix6 2003:172:22:1::/64
   unset ge
   unset le
   next
   end
   next
   ```
edit "lrn-281"
  config rule
  edit 1
      set prefix6 2003:172:28:1::/64
      unset ge
      unset le
  next
  next
end
end

2. Configure the route maps:

config router route-map
edit "map-221"
  config rule
  edit 1
      set match-ip6-address "adv-222"
  next
end
next
edit "map-281"
  config rule
  edit 1
      set match-ip6-address "lrn-281"
  next
next
end

3. Configure BGP:

config router bgp
  set as 65412
  set router-id 1.1.1.1
  set ibgp-multipath enable
  set network-import-check disable
  set graceful-restart enable
  config neighbor
  edit "2003::2:2:2:2"
      set soft-reconfiguration6 enable
      set remote-as 65412
      set update-source "loopback1"
      config conditional-advertise6
          edit "map-221"
              set condition-routemap "map-281"
              set condition-type non-exist
      next
  next
  edit "2003::3:3:3:3"
      set soft-reconfiguration6 enable
      set remote-as 65412
      set update-source "loopback1"
  next
end
end
In this configuration, if route map map-281 does not exist, then the FortiGate advertises route map map-221 to neighbor 2003::2:2:2.

4. Verify the routing table:

```
# get router info6 routing-table bgp
```

**IPv6 example 2**

With the same IPv6 prefix lists and route maps, when the FortiGate does learn 2003:172:28:1::/64, it advertises local route 2003:172:22:1::/64 to the secondary router. The BGP conditional advertisement condition is set to be true if the condition route map is matched (exist).

**To configure BGP conditional advertisement with IPv6:**

1. Configure BGP:

```
config router bgp
config neighbor
   edit "2003::2:2:2:2"
   config conditional-advertise6
      edit "map-221"
      set condition-routemap "map-281"
      set condition-type exist
   next
next
end
```

2. Verify the routing table:

```
# get router info6 routing-table bgp
```

**BGP error handling per RFC 7606**

The FortiGate uses one of the three approaches to handle malformed attributes in BGP UPDATE messages, in order of decreasing severity:
1. Notification and Session reset
2. Treat-as-withdraw
3. Attribute discard

When a BGP UPDATE message contains multiple malformed attributes, the most severe approach that is triggered by one of the attributes is followed. See RFC 7606 for more information.

The following table lists the BGP attributes, and how FortiGate handles a malformed attribute in the UPDATE message:

<table>
<thead>
<tr>
<th>BGP attribute</th>
<th>Handling</th>
</tr>
</thead>
<tbody>
<tr>
<td>origin</td>
<td>Handled by the treat-as-withdraw approach.</td>
</tr>
<tr>
<td>AS path</td>
<td>Handled by the treat-as-withdraw approach.</td>
</tr>
<tr>
<td>AS 4 path</td>
<td>Handled by the attribute discard approach.</td>
</tr>
<tr>
<td>aggregator</td>
<td>Handled by the attribute discard approach.</td>
</tr>
<tr>
<td>aggregator 4</td>
<td>Handled by the attribute discard approach.</td>
</tr>
<tr>
<td>next-hop</td>
<td>Handled by the treat-as-withdraw approach.</td>
</tr>
<tr>
<td>multiple exit discriminator</td>
<td>Handled by the treat-as-withdraw approach.</td>
</tr>
<tr>
<td>local preference</td>
<td>Handled by the treat-as-withdraw approach.</td>
</tr>
<tr>
<td>atomic aggregate</td>
<td>Handled by the attribute discard approach.</td>
</tr>
<tr>
<td>community</td>
<td>Handled by the treat-as-withdraw approach.</td>
</tr>
<tr>
<td>extended community</td>
<td>Handled by the treat-as-withdraw approach.</td>
</tr>
<tr>
<td>originator</td>
<td>Handled by the treat-as-withdraw approach.</td>
</tr>
<tr>
<td>cluster</td>
<td>Handled by the treat-as-withdraw approach.</td>
</tr>
<tr>
<td>PMSI</td>
<td>Handled by the treat-as-withdraw approach.</td>
</tr>
<tr>
<td>MP reach</td>
<td>Handled by the notification message approach.</td>
</tr>
<tr>
<td>MP unreach</td>
<td>Handled by the notification message approach.</td>
</tr>
<tr>
<td>attribute set</td>
<td>Handled by the treat-as-withdraw approach.</td>
</tr>
<tr>
<td>AIGP</td>
<td>Handled by the treat-as-withdraw approach.</td>
</tr>
<tr>
<td>Unknown</td>
<td>If the BGP flag does not indicate that this is an optional attribute, this malformed attribute is handled by the notification message approach.</td>
</tr>
</tbody>
</table>
This example shows how the ORIGIN attribute can be malformed, and how it is handled.

<table>
<thead>
<tr>
<th>Reason for malformed attribute</th>
<th>Handling</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORIGIN attribute length not one</td>
<td>The prefix will be gone and the BGP session will not be reset.</td>
</tr>
<tr>
<td>ORIGIN attribute value is invalid</td>
<td>The prefix will be gone and the BGP session will not be reset.</td>
</tr>
<tr>
<td>Two ORIGIN attributes with different values</td>
<td>The attributes are ignored, the BGP session will not be reset, and the BGP route will remain.</td>
</tr>
<tr>
<td>ORIGIN attribute is absent</td>
<td>The BGP session will be reset</td>
</tr>
</tbody>
</table>

For example, if the FortiGate receives a malformed UPDATE packet from the neighbor at 27.1.1.124 that has no ORIGIN attribute, the BGP session is reset and the state of the neighbor is shown as `Idle`, the first state of the BGP neighborship connection.

```
# get router info bgp summary
VRF 0 BGP router identifier 27.1.1.125, local AS number 125
BGP table version is 6
1 BGP AS-PATH entries
0 BGP community entries

Neighbor     V   AS  MsgRcvd  MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
3.3.3.3       4  33    0       0       0       0     0       never  Active
27.1.1.124    4  124   94      126     0       0     0       never  Idle

Total number of neighbors 2
```

**BGP next hop tag-match mode**

Tag-match mode can be configured to increase flexibility when controlling how BGP routes' next hops are resolved:

```
config router bgp
  set tag-resolve-mode {disable | preferred | merge}
end
```

| Best-match(disable) | Resolve the BGP route's next hops with best-matched routes. This is the default setting. |
Tag-match **(preferred)**  Resolve the BGP route’s next hops with routes that have the same tag. If there are no results, resolve the next hops with best-matched routes.

Tag-and-best-match **(merge)**  Merge tag-match with best-match if they are using different routes, then let shortcuts hide their parents. The results exclude the next hops of tag-match whose interfaces have appeared in best-match.

In these examples:

- Each spoke has two IPsec tunnels to each hub, and one BGP peer on loopback interface to each hub (route-reflector).
- The loopbacks are exchanged with IKE between the spokes and hubs. They are installed as static routes that are used to provide reachability for establishing BGP neighbors.
- The summary BGP routes from the loopback IP address ranges that originated on the hubs are advertised to the spokes for resolving the BGP next hops on the spokes.
- The spokes’ PC LAN subnets are reflected by the hubs.
- Spoke_1 receives BGP routes (the LAN subnet and loopback IP summary) from Hub_1 with tag 1 and from Hub_2 with tag 2.
- SD-WAN is enabled on Spoke_1, and all of the tunnels are SD-WAN members.

**Example 1: Connection between Hub and Spoke down**

If the connections between Hub_1 and Spoke_2 are down, traffic from PC_3 to PC_4 can still go through Hub_1 because of the best-match resolving on Spoke_1, but packets will be dropped on Hub_1. When tag-match is enabled on Spoke_1, the spoke will resolve the PC_4 LAN route to Hub2, and traffic will be forwarded to Hub_2 and reach its destination.

**To test the tag-match mode:**

1. View the key routes on Spoke_1:

   ```
   Spoke_1(root) # get router info routing-table all
   C 10.0.3.0/24 is directly connected, port4
   B 10.0.4.0/24 [200/0] via 172.31.0.66 [2] (recursive via H1_T11 tunnel 172.31.1.1), 20:09:52
   (recursive via H1_T22 tunnel 10.0.0.2), 20:09:52
   ```
(recursive via H2_T22 tunnel 172.31.1.101), 20:09:52
(recursive via H2_T22 tunnel 10.0.0.4), 20:09:52
B 172.31.0.0/25 [200/0] via 172.31.0.1 (recursive via H1_T11 tunnel 172.31.1.1),
23:25:37
(recursive via H1_T22 tunnel 10.0.0.2), 23:25:37
[200/0] via 172.31.0.2 (recursive via H2_T11 tunnel 172.31.1.101), 23:25:37
(recursive via H2_T22 tunnel 10.0.0.4), 23:25:37
S 172.31.0.1/32 [15/0] via H1_T11 tunnel 172.31.1.1, [1/0]
[15/0] via H1_T22 tunnel 10.0.0.2, [1/0]
S 172.31.0.2/32 [15/0] via H2_T11 tunnel 172.31.1.101, [1/0]
[15/0] via H2_T22 tunnel 10.0.0.4, [1/0]
C 172.31.0.65/32 is directly connected, Loopback0
...

172.31.0.0/25 is the loopback IP summary originated by both Hub_1 and Hub_2. The next hop of the PC_4 LAN route is resolved to Hub_1 (H1_T11, H1_T22) and Hub_2 (H2_T11, H2_T22) based on the loopback IP summary route.

2. When connections between Spoke_2 and Hub_1 fails due to the BGP neighbor, tunnels, or physical ports going down, the PC_4 LAN route can be still resolved to Hub_1 and Hub_2 because the loopback IP summary can still be received from both Hub_1 and Hub_2:

Spoke_1(root) # get router info routing-table all
C 10.0.3.0/24 is directly connected, port4
B 10.0.4.0/24 [200/0] via 172.31.0.66 (recursive via H1_T11 tunnel 172.31.1.1),
00:03:06
(recursive via H1_T22 tunnel 10.0.0.2), 00:03:06
(recursive via H2_T11 tunnel 172.31.1.101), 00:03:06
(recursive via H2_T22 tunnel 10.0.0.4), 00:03:06
B 172.31.0.0/25 [200/0] via 172.31.0.1 (recursive via H1_T11 tunnel 172.31.1.1),
23:55:34
(recursive via H1_T22 tunnel 10.0.0.2), 23:55:34
[200/0] via 172.31.0.2 (recursive via H2_T11 tunnel 172.31.1.101), 23:55:34
(recursive via H2_T22 tunnel 10.0.0.4), 23:55:34
...

3. If traffic sent from PC_3 to PC_4 goes through Hub_1, packets are dropped because there is no PC_4 LAN route on Hub_1:

Spoke_1 (root) # diagnose sniffer packet any 'host 10.0.4.2' 4
interfaces=[any]
filters=[host 10.0.4.2]
11.261264 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
11.261349 H1_T11 out 10.0.3.2 -> 10.0.4.2: icmp: echo request
12.260268 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
12.260291 H1_T11 out 10.0.3.2 -> 10.0.4.2: icmp: echo request

Hub_1 (root) # diagnose sniffer packet any 'host 10.0.4.2' 4
interfaces=[any]
filters=[host 10.0.4.2]
6.966064 EDGE_T1 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
7.965012 EDGE_T1 in 10.0.3.2 -> 10.0.4.2: icmp: echo request

4. If the tag-match mode is set to tag-match (preferred) on Spoke_1, then the PC_4 LAN route can only be resolved to Hub_2 because of tag-match checking:

Spoke_1(root) # get router info routing-table all
C 10.0.3.0/24 is directly connected, port4
B 10.0.4.0/24 [200/0] via 172.31.0.66 tag 2 (recursive via H2_T11 tunnel 172.31.1.101), 00:02:35
(recursive via H2_T22 tunnel 10.0.0.4), 00:02:35
B 172.31.0.0/25 [200/0] via 172.31.0.1 tag 1 (recursive via H1_T11 tunnel 172.31.1.1), 03:18:41
(recursive via H1_T22 tunnel 10.0.0.2), 03:18:41
[200/0] via 172.31.0.2 tag 2 (recursive via H2_T11 tunnel 172.31.1.101),
03:18:41
(recursive via H2_T22 tunnel 10.0.0.4), 03:18:41
...

Spoke_1 (root) # get router info routing-table details 10.0.4.0/24
Routing table for VRF=0
Routing entry for 10.0.4.0/24
Known via "bgp", distance 200, metric 0, best
Last update 00:11 ago
* 172.31.0.66, tag 2 (recursive via H2_T11 tunnel 172.31.1.101), tag-match
(recursive via H2_T22 tunnel 10.0.0.4), tag-match

5. If traffic is again sent from PC_3 to PC_4, it will go through Hub_2 and reach the destination:

Spoke_1 (root) # diagnose sniffer packet any 'host 10.0.4.2' 4
interfaces=[host 10.0.4.2]
7.216948 port4 in 10.0.0.3.2 -> 10.0.4.2: icmp: echo request
7.217035 H2_T11 out 10.0.0.3.2 -> 10.0.4.2: icmp: echo request
7.217682 H2_T11 in 10.0.4.2 -> 10.0.0.3.2: icmp: echo reply
7.217729 port4 out 10.0.4.2 -> 10.0.0.3.2: icmp: echo reply

Example 2: SD-WAN failover when shortcut down

After the shortcut from Spoke_1 to Spoke_2 is established, Spoke_1 will only resolve the PC_4 LAN route to the shortcut, because of best-match resolving, prohibiting SD-WAN failover. When tag-and-best-match is enabled on Spoke_1, the spoke can resolve the PC_4 LAN route to the shortcut and to other alternative tunnels, allowing SD-WAN failover.

To test the tag-and-best-match mode:

1. Unset tag-resolve-mode and resume the connections between Spoke_2 and Hub_1. The routing table on Spoke_1 changes to the initial state:

Spoke_1(root) # get router info routing-table all
C 10.0.3.0/24 is directly connected, port4
B 10.0.4.0/24 [200/0] via 172.31.0.66 [2] (recursive via H1_T11 tunnel 172.31.1.1), 00:01:54
(recursive via H1_T22 tunnel 10.0.0.2), 00:01:54
(recursive via H2_T11 tunnel 172.31.1.101), 00:01:54
(recursive via H2_T22 tunnel 10.0.0.4), 00:01:54
B 172.31.0.0/25 [200/0] via 172.31.0.1 (recursive via H1_T11 tunnel 172.31.1.1), 03:30:35
(recursive via H1_T22 tunnel 10.0.0.2), 03:30:35
[200/0] via 172.31.0.2 (recursive via H2_T11 tunnel 172.31.1.101), 03:30:35
(recursive via H2_T22 tunnel 10.0.0.4), 03:30:35
S 172.31.0.1/32 [15/0] via H1_T11 tunnel 172.31.1.1, [1/0]
[15/0] via H1_T22 tunnel 10.0.0.2, [1/0]

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
2. **Send traffic from PC_3 to PC_4.**
   The shortcut from Spoke_1 to Spoke_2 is established.
   The PC_4 LAN route is only resolved to the shortcut because of best-match resolving. If the shortcut is out of SLA, then the traffic cannot switch over to another, alternative tunnel.

   Spoke_1 (root) # get router info routing-table all
   C 10.0.3.0/24 is directly connected, port4
   B 10.0.4.0/24 [200/0] via 172.31.0.66 [2] (recursive via H1_T11_0 tunnel 10.0.0.4), 00:07:36
   B 172.31.0.0/25 [200/0] via 172.31.0.1 (recursive via H1_T11 tunnel 172.31.1.1), 03:40:12
      (recursive via H1_T22 tunnel 10.0.0.2), 03:40:12
      [200/0] via 172.31.0.2 (recursive via H2_T11 tunnel 172.31.1.101), 03:40:12
      (recursive via H2_T22 tunnel 10.0.0.4), 03:40:12
   S 172.31.0.1/32 [15/0] via H1_T11 tunnel 172.31.1.1, [1/0]
      [15/0] via H1_T22 tunnel 10.0.0.2, [1/0]
   S 172.31.0.2/32 [15/0] via H2_T11 tunnel 172.31.1.101, [1/0]
      [15/0] via H2_T22 tunnel 10.0.0.4, [1/0]
   C 172.31.0.65/32 is directly connected, Loopback0
   S 172.31.0.66/32 [15/0] via H1_T11_0 tunnel 10.0.0.40, [1/0]
   ...

3. **If the tag-match mode is set to tag-and-best-match (merge) on Spoke_1, then the PC_4 LAN route is resolved to the H1_T11_0 shortcut based on best-match resolving, and to H1_T11, H1_T22, H2_T11, H2_T22 based on tag-match resolving. It is then resolved to H1_T11, H1_T22, H2_T11, H2_T22 after letting the shortcut hide its parent tunnel.**

   Spoke_1 (root) # get router info routing-table all
   C 10.0.3.0/24 is directly connected, port4

Troubleshooting BGP

There are some features in BGP that are used to deal with problems that may arise. Typically, the problems with a BGP network that has been configured involve routes going offline frequently. This is called route flap and causes problems for the routers using that route.

Clearing routing table entries

To see if a new route is being properly added to the routing table, you can clear all or some BGP neighbor connections (sessions) using the `execute router clear bgp command`

For example, if you have 10 routes in the BGP routing table and you want to clear the specific route to IP address 10.10.10.1, enter the following CLI command:

```
# execute router clear bgp ip 10.10.10.1
```

To remove all routes for AS number 650001, enter the following CLI command:

```
# execute router clear bgp as 650001
```

Route flap

When routers or hardware along a route go offline and back online that is called a route flap. Flapping is the term that is used if these outages continue, especially if they occur frequently.

Route flap is a problem in BGP because each time a peer or a route goes down, all the peer routers that are connected to that out-of-service router advertise the change in their routing tables. This creates a lot of administration traffic on the network and the same traffic re-occurs when that router comes back online. If the problem is something like a faulty network cable that alternates online and offline every 10 seconds, there could easily be an overwhelming amount of routing updates sent out unnecessarily.
Another possible reason for route flap occurs with multiple FortiGate devices in HA mode. When an HA cluster fails over to the secondary unit, other routers on the network may see the HA cluster as being offline, resulting in route flap. While this doesn't occur often, or more than once at a time, it can still result in an interruption in traffic which is disruptive for network users. The easy solution for this problem is to increase the timers on the HA cluster, such as TTL timers, so they don't expire during the failover process. Also, configuring graceful restart on the HA cluster helps with a smooth failover.

The first method of dealing with route flap is to check your hardware. If a cable is loose or bad, it can easily be replaced and eliminate the problem. If an interface on the router is bad, either avoid using that interface or swap in a functioning router. If the power source is bad on a router, either replace the power supply or use a power conditioning backup power supply. These quick and easy fixes can save you from configuring more complex BGP options. However, if the route flap is from another source, configuring BGP to deal with the outages will ensure your network users uninterrupted service.

Some methods of dealing with route flap in BGP include:

- **Holdtime timer on page 386**
- **Dampening on page 387**
- **Graceful restart on page 387**
- **BFD on page 389**

### Holdtime timer

The first step to troubleshooting a flapping route is the holdtime timer. This timer reduces how frequently a route going down will cause a routing update to be broadcast.

Once activated, the holdtime timer won't allow the FortiGate to accept any changes to that route for the duration of the timer. If the route flaps five times during the timer period, only the first outage will be recognized by the FortiGate. For the duration of the other outages, there won't be changes because the Fortigate is essentially treating this router as down. If the route is still flapping after the timer expires, it will start again.

If the route isn't flapping (for example, if it goes down, comes up, and stays back up) the timer will still count down and the route is ignored for the duration of the timer. In this situation, the route is seen as down longer than it really is but there will be only the one set of route updates. This isn't a problem in normal operation because updates are not frequent.

The potential for a route to be treated as down when it's really up can be viewed as a robustness feature. Typically, you don't want most of your traffic being routed over an unreliable route. So if there's route flap going on, it's best to avoid that route if you can. This is enforced by the holdtime timer.

### How to configure the holdtime timer

There are three different route flapping situations that can occur: the route goes up and down frequently, the route goes down and back up once over a long period of time, or the route goes down and stays down for a long period of time. These can all be handled using the holdtime timer.

For example, your network has two routes that you want to set the timer for. One is your main route (to 10.12.101.4) that all of your Internet traffic goes through, and it can't be down for long if it's down. The second is a low speed connection to a custom network that's used infrequently (to 10.13.101.4). The timer for the main route should be fairly short (for example, 60 seconds). The second route timer can be left at the default, since it's rarely used.

### To configure the BGP holdtime timer:

```plaintext
config router bgp
  config neighbor
    edit 10.12.101.4
      set holdtime-timer 60
```
set keepalive-timer 60
next
edit 10.13.101.4
   set holdtime-timer 180
   set keepalive-timer 60
next
end
end

Dampening

Dampening is a method that's used to limit the amount of network problems due to flapping routes. With dampening, the flapping still occurs but the peer routers pay less and less attention to that route as it flaps more often. One flap doesn't start dampening, but the second flap starts a timer where the router won't use that route because it is considered unstable. If the route flaps again before the timer expires, the timer continues to increase. There's a period of time called the reachability half-life, after which a route flap will be suppressed for only half the time. This half-life comes into effect when a route has been stable for a while but not long enough to clear all the dampening completely. For the flapping route to be included in the routing table again, the suppression time must expire.

If the route flapping was temporary, you can clear the flapping or dampening from the FortiGate device's cache by using one of the execute router clear bgp CLI commands:

# execute router clear bgp dampening {<ip_address> | <ip_address/netmask>}

or

# execute router clear bgp flap-statistics {<ip_address> | <ip_address/netmask>}

For example, to remove route flap dampening information for the 10.10.0.0/16 subnet, enter the following CLI command:

# execute router clear bgp dampening 10.10.0.0/16

To configure BGP route dampening:

config router bgp
   set dampening {enable | disable}
   set dampening-max-suppress-time <minutes_integer>
   set dampening-reachability-half-life <minutes_integer>
   set dampening-reuse <reuse_integer>
   set dampening-route-map <routemap-name_str>
   set dampening-suppress <limit_integer>
   set dampening-unreachability-half-life <minutes_integer>
end

Graceful restart

BGP4 has the capability to gracefully restart.

In some situations, route flap is caused by routers that appear to be offline but the hardware portion of the router (control plane) can continue to function normally. One example of this is when some software is restarting or being upgraded but the hardware can still function normally.

Graceful restart is best used for these situations where routing won't be interrupted, but the router is unresponsive to routing update advertisements. Graceful restart doesn't have to be supported by all routers in a network, but the network will benefit when more routers support it.
FortiGate HA clusters can benefit from graceful restart. When a failover takes place, the HA cluster advertises that it is going offline, and will not appear as a route flap. It will also enable the new HA main unit to come online with an updated and usable routing table. If there is a flap, the HA cluster routing table will be out-of-date.

For example, the FortiGate is one of four BGP routers that send updates to each other. Any of those routers may support graceful starting. When a router plans to go offline, it sends a message to its neighbors stating how long it expects to be offline. This way, its neighboring routers don't remove it from their routing tables. However, if that router isn't back online when expected, the routers will mark it offline. This prevents routing flap and its associated problems.

FortiGate devices support both graceful restart of their own BGP routing software and neighboring BGP routers.

To configure BGP graceful restart:

```bash
config router bgp
  set graceful-restart {disable | enable}
  set graceful-restart-time <seconds_integer>
  set graceful-stalepath-time <seconds_integer>
  set graceful-update-delay <seconds_integer>
config neighbor
  edit 10.12.101.4
    set capability-graceful-restart {enable | disable}
next
end
end
```

Before the restart, the router sends its peers a message to say it's restarting. The peers mark all the restarting router's routes as stale, but they continue to use the routes. The peers assume the router will restart, check its routes, and take care of them, if needed, after the restart is complete. The peers also know what services the restarting router can maintain during its restart. After the router completes the restart, the router sends its peers a message to say it's done restarting.

To restart the router:

```bash
# execute router restart
```

Scheduled time offline

Graceful restart is a means for a router to advertise that it is going to have a scheduled shutdown for a very short period of time. When neighboring routers receive this notice, they will not remove that router from their routing table until after a set time elapses. During that time, if the router comes back online, everything continues to function as normal. If that router remains offline longer than expected, then the neighboring routers will update their routing tables as they assume that the router will be offline for a long time.

The following example demonstrates if you want to configure graceful restart on the FortiGate where you expect the FortiGate to be offline for no more than two minutes, and after three minutes the BGP network should consider the FortiGate to be offline.

To configure graceful restart time settings:

```bash
config router bgp
  set graceful-restart enable
  set graceful-restart-time 120
  set graceful-stalepath-time 180
end
```
Network

BFD

Bidirectional Forwarding Detection (BFD) is a protocol that you can use to quickly locate hardware failures in the network. Routers running BFD communicate with each other and if a timer runs out on a connection then that router is declared down. BFD then communicates this information to the routing protocol and the routing information is updated.

For more information about BFD, see BFD on page 389.

BFD

Bidirectional Forwarding Detection (BFD) is a protocol that you can use to quickly locate hardware failures in the network. Routers running BFD communicate with each other at a negotiated rate. If packets from a BFD-enabled router fail to arrive, that router is declared to be down. BFD communicates this information to the associated routing protocols and the routing information is updated. It helps one way device failure and is used for fast convergence of routing protocols.

BFD can run on an entire FortiGate, selected interfaces, or on a protocol, such as BGP, for all configured interfaces. The configuration hierarchy allows each lower level to override the BFD setting of the upper level. For example, if you enable BFD for an entire FortiGate, you can disable BFD for an interface or for BGP.

---

Echo mode and authentication are not supported for BFD on the FortiGate.

---

BFD can be enabled per device, VDOM, or interface. Once enabled, a BFD neighbor should be defined. Finally, enable BFD on a route or routing protocol.

To configure BFD for an entire FortiGate:

```plaintext
config system settings
    set bfd {enable | disable}
    set bfd-desired-min-tx <ms>
    set bfd-required-min-rx <ms>
    set bfd-detect-mult <multiplier>
    set bfd-dont-enforce-src-port {enable | disable}
end
```

To configure BFD for an interface:

```plaintext
config system interface
    edit <interface-name>
        set bfd {global | enable | disable}
        set bfd-desired-min-tx <ms>
        set bfd-required-min-rx <ms>
        set bfd-detect-mult <multiplier>
next
end
```

To configure BFD neighbors:

```plaintext
config router {bfd | bfd6}
    config neighbor
        edit <IP-address>
```
set interface <interface-name>
  next
end
end

To show BFD neighbors:

# get router {info | info6} bfd neighbor

To show BFD requests:

# get router {info | info6} bfd requests

**BFD and static routes**

BFD for static routes allows you to configure routing failover based on remote path failure detection. BFD removes a static route from the routing table if the FortiGate can't reach the route's destination and returns the route to the routing table if the route's destination is restored.

For example, you can add two static routes with BFD enabled. If one of the routes has a higher priority, all matching traffic uses that route. If BFD determines that the link to the gateway of the route with the higher priority is down, the higher priority route is removed from the routing table and all matching traffic uses the lower priority route. If the link to the gateway for the higher priority route comes back up, BFD adds the route back into the routing table and all matching traffic switches to use the higher priority route.

You can configure BFD for IPv4 and IPv6 static routes.

To configure BFD for static routes:

```
config router {static | static6}
  edit <sequence-number>
    set bfd {enable | disable}
    set device <gateway-out-interface>
  next
end
```

**Example**

The following example demonstrates the configuration of static routes between two FortiGates. There is a host behind FortiGate 2 with an IP address of 1.1.1.1. FortiGate 1 has multiple paths to reach the host.
To configure static routes:

1. Configure FortiGate 1:

   ```
   config system interface
   edit "port1"
   set vdom "root"
   set ip 10.180.6.237 255.255.240.0
   set allowaccess ping
   set bfd enable
   next
   end
   config router bfd
   config neighbor
   edit 10.180.4.136
   set interface "port1"
   next
   end
   end
   ```

2. Configure FortiGate 2:

   ```
   config system interface
   edit "port1"
   set vdom "root"
   set ip 10.180.4.136 255.255.240.0
   set allowaccess ping
   set bfd enable
   next
   end
   config router bfd
   config neighbor
   edit 10.180.6.237
   set interface "port1"
   next
   end
   end
   ```

3. Configure two static routes:

   ```
   config router static
   edit 2
   set dst 1.1.1.1 255.255.255.255
   set gateway 10.180.4.136
   set device "port1"
   set bfd enable
   next
   edit 3
   set dst 1.1.1.1 255.255.255.255
   set gateway 10.180.2.44
   set distance 20
   set device "port1"
   next
   end
   ```

4. Confirm that BFD neighborship is established:
# get router info bfd neighbor
<table>
<thead>
<tr>
<th>OurAddress</th>
<th>NeighAddress</th>
<th>State</th>
<th>Interface</th>
<th>LDesc/RDesc</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.180.6.237</td>
<td>10.180.4.136</td>
<td>UP</td>
<td>port1</td>
<td>1/1</td>
</tr>
</tbody>
</table>

5. Review the active route in the routing table:

# get router info routing-table all
S 1.1.1.1/32 [10/0] via 10.180.4.136, port1
C 10.180.0.0/20 is directly connected, port1

The route with the lower distance is preferred in the routing table.

If port1 on FortiGate 2 goes down or FortiGate 1 is unable to reach 10.180.4.126, the BFD neighborship will go down.

# get router info bfd neighbor
<table>
<thead>
<tr>
<th>OurAddress</th>
<th>NeighAddress</th>
<th>State</th>
<th>Interface</th>
<th>LDesc/RDesc</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.180.6.237</td>
<td>10.180.4.136</td>
<td>DOWN</td>
<td>port1</td>
<td>1/1</td>
</tr>
</tbody>
</table>

With BFD neighborship down, the FortiGate is unable to reach 1.1.1.1/32 through gateway 10.180.4.136. The routing table will be updated so that the route through gateway 10.180.2.44 is active in the routing table.

# get router info routing-table all
S 1.1.1.1/32 [20/0] via 10.180.2.44, port1
C 10.180.0.0/20 is directly connected, port1

BFD removes a static route from the routing table if the FortiGate cannot reach the route's destination. The static route will be returned to the routing table is the route's destination is restored.

**BFD and OSPF**

You can configure BFD for Open Shortest Path First (OSPF) on a FortiGate. FortiGate supports BFD for OSPF for both IPv4 and IPv6. BFD must be configured globally and per interface.

**To configure BFD for OSPF:**

```
config router {ospf | ospf6}
  set bfd {enable | disable}
end
```

**To enable BFD on a specific OSPF interface:**

```
config router {ospf | ospf6}
  set bfd enable
  config {ospf-interface | ospf6-interface}
    edit <ID>
      set bfd {global | enable | disable}
      set area-id <IP address>
    next
  end
end
```

If BFD is configured when OSPF is not, no BFD packets will be sent. When both BFD and OSPF are configured, the neighbors for both will be the same. Use the following commands to confirm that the neighbor IP addresses match:
BFD and BGP

While BGP can detect route failures, BFD can be configured to detect these failures more quickly, which allows for faster responses and improved convergence. This can be balanced with the bandwidth BFD uses in its frequent route checking.

The `config router bgp` commands allow you to set the addresses of the neighbor units that are also running BFD. Both units must be configured with BFD in order to use it.

**To configure BFD for BGP:**

```fortistar
config router bgp
  config neighbor
    edit <neighbor-IP-address>
      set bfd {enable | disable}
    next
  end
end
```

**BFD for Multihop paths**

FortiGate BFD can support neighbors connected over multiple hops. When BFD is down, BGP sessions will be reset and will try to re-establish neighbor connection immediately. See BFD for multihop path for BGP on page 394 for more information.

**To configure BFD for multihop paths:**

```fortistar
config router {bfd | bfd6}
  config multihop-template
    edit <ID>
      set src <IP address/netmask>
      set dst <IP address/netmask>
      set bfd-desired-min-tx <integer>
      set bfd-required-min-rx <integer>
      set bfd-detect-mult <integer>
      set auth-mode {none | md5}
      set md5-key <password>
    next
  end
end
```

**Troubleshooting BFD**

You can troubleshoot BFD using the following commands:

```fortistar
# get router info ospf neighbor
# get router info bfd neighbor
# get router info ospf bfd neighbor
# get router info ospf bfd requests
# diagnose sniffer packet any <filter> <sniffer count>
```
# diagnose debug application bfdd <debug level>
# diagnose debug enable

**BFD for multihop path for BGP**

In BFD, a FortiGate can support neighbors connected over multiple hops. When BFD is down, BGP sessions are reset and will try to immediately re-establish neighbor connections. Previously, BFD was only supported when two routers or FortiGates were directly connected on the same network.

```plaintext
config router {bfd | bfd6}
  config multihop-template
    edit <ID>
      set src <class_IP/netmask>
      set dst <class_IP/netmask>
      set bfd-desired-min-tx <integer>
      set bfd-required-min-rx <integer>
      set bfd-detect-mult <integer>
      set auth-mode {none | md5}
      set md5-key <password>
    next
end
end
```

<table>
<thead>
<tr>
<th>src &lt;class_IP/netmask&gt;</th>
<th>Enter the source prefix.</th>
</tr>
</thead>
<tbody>
<tr>
<td>dst &lt;class_IP/netmask&gt;</td>
<td>Enter the destination prefix.</td>
</tr>
<tr>
<td>bfd-desired-min-tx &lt;integer&gt;</td>
<td>Set the BFD desired minimal transmit interval, in milliseconds (100 - 30000, default = 250).</td>
</tr>
<tr>
<td>bfd-required-min-rx &lt;integer&gt;</td>
<td>Set the BFD required minimal transmit interval, in milliseconds (100 - 30000, default = 250).</td>
</tr>
<tr>
<td>bfd-detect-mult &lt;integer&gt;</td>
<td>Set the BFD detection multiplier (3 - 50, default = 3).</td>
</tr>
<tr>
<td>auth-mode {none</td>
<td>md5}</td>
</tr>
<tr>
<td>md5-key &lt;password&gt;</td>
<td>Enter the password.</td>
</tr>
</tbody>
</table>

**Example**

This example includes IPv4 and IPv6 BFD neighbor configurations. The BFD neighbor is also a BGP neighbor that is in a different AS.
To configure BFD with multihop BGP paths:

1. Enable BFD on all interfaces:
   ```
   config system settings
   set bfd enable
   end
   ```

2. Enable BFD on port1 and ignore the global configuration:
   ```
   config system interface
   edit "port1"
   set bfd enable
   next
   end
   ```

3. Configure the BGP neighbors:
   ```
   config router bgp
   set as 65412
   set router-id 1.1.1.1
   config neighbor
   edit "172.16.201.2"
   set bfd enable
   set ebgp-enforce-multihop enable
   set soft-reconfiguration enable
   set remote-as 65050
   next
   edit "2000:172:16:201::2"
   set bfd enable
   set ebgp-enforce-multihop enable
   set soft-reconfiguration enable
   set remote-as 65050
   next
   end
   ```

4. Configure the IPv4 BFD:
   ```
   config router bfd
   config multihop-template
   edit 1
   set src 172.16.200.0 255.255.255.0
   set dst 172.16.201.0 255.255.255.0
   set auth-mode md5
   set md5-key **********
   next
   end
   ```

5. Configure the IPv6 BFD:
   ```
   config router bfd6
   config multihop-template
   edit 1
   set src 2000:172:16:200::/64
   set dst 2000:172:16:201::/64
   next
   ```
Testing the connection

1. Verify the BFD status for IPv4 and IPv6:

```bash
# get router info bfd requests
BFD Peer Requests:
    client types(ct in 0x): 01=external 02=static
    04=ospf 08=bgp 10=pim-sm
src=172.16.200.1 dst=172.16.201.2 ct=08 ifi=9 type=SM
```

```bash
# get router info bfd neighbor
OurAddress  NeighAddress  State  Interface   LDesc/RDesc
172.16.200.1  172.16.201.2  UP    port1      5/3/M
```

```bash
# get router info6 bfd requests
BFD Peer Requests:
    client types(ct in 0x): 01=external 02=static
    04=ospf 08=bgp 10=pim-sm
```

```bash
# get router info6 bfd neighbor
OurAddress: 2000:172:16:200::1
NeighAddress: 2000:172:16:201::2
State: UP Interface: port1 Desc: 6/4 Multi-hop
```

2. Verify the BGP status and the BGP routing table:

```bash
# get router info bgp summary
VRF 0 BGP router identifier 1.1.1.1, local AS number 65412
BGP table version is 11
3 BGP AS-PATH entries
0 BGP community entries
```

```bash
Neighbor  V  AS  MsgRcvd  MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
172.16.201.2  4  65050  185  187  10  0  0  00:54:20  4
2000:172:16:201::2  4  65050  159  160  10  0  0  00:54:24  4
```

Total number of neighbors 2

```bash
# get router info routing-table bgp
Routing table for VRF=0
B  172.28.1.0/24 [20/0] via 172.16.201.2 (recursive via 172.16.200.4, port1), 00:54:32
B  172.28.2.0/24 [20/0] via 172.16.201.2 (recursive via 172.16.200.4, port1), 00:54:32
B  172.28.5.0/24 [20/0] via 172.16.201.2 (recursive via 172.16.200.4, port1), 00:54:32
B  172.28.6.0/24 [20/0] via 172.16.201.2 (recursive via 172.16.200.4, port1), 00:54:32
```

```bash
# get router info6 bgp summary
VRF 0 BGP router identifier 1.1.1.1, local AS number 65412
BGP table version is 8
3 BGP AS-PATH entries
```
3. Simulate a disruption to the BFD connection. The BFD neighbor is lost:

```
# get router info6 bfd neighbor
OurAddress  NeighAddress  State  Interface   LDesc/RDesc
# get router info6 bfd neighbor
```

4. The BGP neighbor is reset, and the FortiGate attempts to re-establish a connection with the neighbor. The timers are reset once the neighbor connection is re-established:

```
# get router info bgp summary
VRF 0 BGP router identifier 1.1.1.1, local AS number 65412
BGP table version is 12
4 BGP AS-PATH entries
0 BGP community entries
```

```
Neighbor   V   AS MsgRcvd MsgSent TblVer InQ OutQ Up/Down State/PfxRcd
172.16.201.2  4   65050  185  187   7   0   0 00:54:24  3
2000:172:16:201::2  4   65050  159  160   7   0   0 00:54:28  3
```

```
Total number of neighbors 2
```

```
# get router info6 bgp summary
VRF 0 BGP router identifier 1.1.1.1, local AS number 65412
BGP table version is 10
4 BGP AS-PATH entries
0 BGP community entries
```

```
Neighbor   V   AS MsgRcvd MsgSent TblVer InQ OutQ Up/Down State/PfxRcd
172.16.201.2  4   65050  189  192   11  0   0 00:00:11  4
2000:172:16:201::2  4   65050  165  167   12  0   0 00:00:08  4
```

```
Total number of neighbors 2
```

```
# get router info6 bgp summary
VRF 0 BGP router identifier 1.1.1.1, local AS number 65412
BGP table version is 10
4 BGP AS-PATH entries
0 BGP community entries
```

```
Neighbor   V   AS MsgRcvd MsgSent TblVer InQ OutQ Up/Down State/PfxRcd
172.16.201.2  4   65050  189  192   8   0   0 00:00:15  3
2000:172:16:201::2  4   65050  165  167   9   0   0 00:00:12  3
```

```
Total number of neighbors 2
```

```
5. The BGP routes are learned again, and there are new timers in the route tables:
```
```
# get router info routing-table bgp
Routing table for VRF=0
B 172.28.1.0/24 [20/0] via 172.16.201.2 (recursive via 172.16.200.4, port1), 00:00:15
B 172.28.2.0/24 [20/0] via 172.16.201.2 (recursive via 172.16.200.4, port1),
```
Multicast

The following topics include information about multicast:

- Multicast routing and PIM support on page 398
- Configuring multicast forwarding on page 399

Multicast routing and PIM support

Multicasting (also called IP multicasting) consists of using a single multicast source to send data to many receivers. Multicasting can be used to send data to many receivers simultaneously while conserving bandwidth and reducing network traffic. Multicasting can be used for one-way delivery of media streams to multiple receivers and for one-way data transmission for news feeds, financial information, and so on. Many dynamic routing protocols such as RIPv2, OSPF, and EIGRP use multicasting to share hello packets and routing information.

A FortiGate can operate as a Protocol Independent Multicast (PIM) version 2 router. FortiGates support PIM sparse mode (RFC 4601) and PIM dense mode (RFC 3973), and can service multicast servers or receivers on the network segment to which a FortiGate interface is connected. Multicast routing is not supported in transparent mode.

To support PIM communications, the sending and receiving applications, and all connecting PIM routers in between, must be enabled with PIM version 2. PIM can use static routes, RIP, OSPF, or BGP to forward multicast packets to their destinations. To enable source-to-destination packet delivery, sparse mode or dense mode must be enabled on the PIM router interfaces. Sparse mode routers cannot send multicast messages to dense mode routers. If the FortiGate is located between a source and a PIM router, between two PIM routers, or is connected directly to a receiver, you must manually create a multicast policy to pass encapsulated (multicast) packets or decapsulated data (IP traffic) between the source and destination.

PIM domains

A PIM domain is a logical area comprising a number of contiguous networks. The domain contains at least one bootstrap router (BSR), and if sparse mode is enabled, a number of rendezvous points (RPs) and designated routers (DRs). When PIM is enabled, the FortiGate can perform any of these functions at any time as configured.
A PIM domain can be configured in the GUI by going to Network > Multicast, or in the CLI using `config router multicast`. Note that PIM version 2 must be enabled on all participating routers between the source and receivers. Use `config router multicast` to set the global operating parameters.

When PIM is enabled, the FortiGate allocates memory to manage mapping information. The FortiGate communicates with neighboring PIM routers to acquire mapping information and, if required, processes the multicast traffic associated with specific multicast groups.

Instead of sending multiple copies of generated IP traffic to more than one specific IP destination address, PIM-enabled routers encapsulate the data and use a Class D multicast group address (224.0.0.0 to 239.255.255.255) to forward multicast packets to multiple destinations. A single stream of data can be sent because one destination address is used. Client applications receive multicast data by requesting that the traffic destined for a certain multicast group address be delivered to them.

## Configuring multicast forwarding

There is sometimes confusion between the terms forwarding and routing. These two functions should not take place at the same time. Multicast forwarding should be enabled when the FortiGate is in NAT mode and you want to forward multicast packets between multicast routers and receivers. However, this function should not be enabled when the FortiGate itself is operating as a multicast router, or has an applicable routing protocol that uses multicast.

Multicast forwarding is not supported on enhanced MAC VLAN interfaces. To use multicast with enhanced MAC VLAN interfaces, use PIM ([Multicast routing and PIM support on page 398](#)).

There are two steps to configure multicast forwarding:

1. Enabling multicast forwarding on page 399
2. Configuring multicast policies on page 400

### Enabling multicast forwarding

Multicast forwarding is enabled by default. If a FortiGate is operating in transparent mode, adding a multicast policy enables multicast forwarding. In NAT mode you must use the `multicast-forward` setting to enable or disable multicast forwarding.

#### Multicast forwarding in NAT mode

When `multicast-forward` is enabled, the FortiGate forwards any multicast IP packets in which the TTL is 2 or higher to all interfaces and VLAN interfaces, except the receiving interface. The TTL in the IP header will be reduced by 1. Even though the multicast packets are forwarded to all interfaces, you must add multicast policies to allow multicast packets through the FortiGate.

To enable multicast forwarding in NAT mode:

```plaintext
config system settings
  set multicast-forward enable
end
```
**Prevent the TTL for forwarded packets from being changed**

You can use the `multicast-ttl-notchange` option so that the FortiGate does not increase the TTL value for forwarded multicast packets. Use this option only if packets are expiring before reaching the multicast router.

**To prevent the TTL for forwarded packets from being changed:**

```
config system settings
    set multicast-ttl-notchange enable
end
```

**Disable multicast traffic from passing through the FortiGate without a policy check in transparent mode**

In transparent mode, the FortiGate does not forward frames with multicast destination addresses. The FortiGate should not interfere with the multicast traffic used by routing protocols, streaming media, or other multicast communication. To avoid any issues during transmission, you can disable `multicast-skip-policy` and configure multicast security policies.

**To disable multicast traffic from passing through the FortiGate without a policy check in transparent mode:**

```
config system settings
    set multicast-skip-policy disable
end
```

**Configuring multicast policies**

Multicast packets require multicast policies to allow packets to pass from one interface to another. Similar to firewall policies, in a multicast policy you specify the source and destination interfaces, and the allowed address ranges for the source and destination addresses of the packets. You can also use multicast policies to configure source NAT and destination NAT for multicast packets.

Keep the following in mind when configuring multicast policies:

- The matched forwarded (outgoing) IP multicast source IP address is changed to the configured IP address.
- The `snat` setting is optional. Use it when SNAT is needed.

---

IPv4 and IPv6 multicast policies can be configured in the GUI. Go to **System > Feature Visibility**, and enable **Multicast Policy and IPv6**.

---

**Sample basic policy**

In this basic policy, multicast packets received on an interface are flooded unconditionally to all interfaces on the forwarding domain, except the incoming interface.

```
config firewall multicast-policy
    edit 1
        set srcintf "any"
        set dstintf "any"
```
The destination address (dstaddr) is a multicast address object. The all option corresponds to all multicast addresses in the range 224.0.0.0-239.255.255.255.

**Sample policy with specific source and destination interfaces**

This multicast policy only applies to the source port wan1 and the destination port internal.

```fortigate-config
config firewall multicast-policy
edit 1
    set srcintf "wan1"
    set dstintf "internal"
    set srcaddr "all"
    set dstaddr "all"
next
end
```

**Sample policy with specific source address object**

In this policy, packets are allowed to flow from wan1 to internal, and sourced by the address 172.20.120.129, which is represented by the example_addr-1 address object.

```fortigate-config
config firewall multicast-policy
edit 1
    set srcintf "wan1"
    set dstintf "internal"
    set srcaddr "example_addr-1"
    set dstaddr "all"
next
end
```

**Sample detailed policy**

This policy accepts multicast packets that are sent from a PC with IP address 192.168.5.18 to destination address range 239.168.4.0-255. The policy allows the multicast packets to enter the internal interface and then exit the external interface. When the packets leave the external interface, their source address is translated to 192.168.18.10.

```fortigate-config
config firewall address
edit "192.168.5.18"
    set subnet 192.168.5.18 255.255.255.255
next
end
config firewall multicast-address
edit "239.168.4.0"
    set start-ip 239.168.4.0
    set end-ip 239.168.4.255
next
end
config firewall multicast-policy
edit 1
    set srcintf "internal"
end
```
To configure multicast policies in the GUI, enable Multicast Policy in System > Feature Visibility.

**FortiExtender**

There are two configuration modes available on the FortiGate for FortiExtender integration: WAN extension mode and LAN extension mode.

**WAN extension mode**

In WAN extension mode, the FortiExtender works as an extended WAN interface in IP pass-through mode. The FortiGate manages FortiExtender over the CAPWAP protocol in IP pass-through mode, and is integrated into FortiOS as a manageable interface.

Sample configurations in WAN extension mode could include connecting a FortiExtender to two FortiGates in HA active-passive mode, or connecting two FortiExtenders to two FortiGates in HA active-active mode to provide dual active redundancy for wireless WAN access.

For more information, see FortiExtender and FortiGate integration in the FortiExtender (Managed) Administration Guide.

**LAN extension mode**

The LAN extension configuration mode allows FortiExtender to provide remote thin edge connectivity back to the FortiGate over a backhaul connection. A FortiExtender deployed at a remote location will discover the FortiGate access controller (AC) and form an IPsec tunnel (or multiple tunnels when multiple links exist on the FortiExtender) back to the FortiGate. A VXLAN is established over the IPsec tunnels to create an L2 network between the FortiGate and the network behind the remote FortiExtender.
Network

For more information, see FortiExtender as FortiGate LAN extension in the FortiExtender (Managed) Administration Guide.

Adding a FortiExtender

To add a FortiExtender to the FortiGate, create a virtual FortiExtender interface, then add a FortiExtender and assign the interface to the modem. Like other interface types, the FortiExtender interface can be used in static routes, SD-WAN (see Manage dual FortiExtender devices), policies, and other functions.

To create a virtual FortiExtender interface in the GUI:

1. Go to Network > Interfaces and click Create New > FortiExtender.
2. Enter a name for the interface.
3. Configure the remaining settings as needed. See Interface settings on page 137 for more details.
4. Click OK.

To add a FortiExtender in the GUI:

1. Go to Network > FortiExtender and click Create New > Extenders.
2. Enter your FortiExtender's serial number in the Serial number field.
3. Optionally, set an Alias for the FortiExtender.
4. In the State section, enable Authorized.
5. Set Interface to the FortiExtender interface.
6. Configure the remaining setting as required. See the FortiExtender Administration Guide (FGT-Managed) for more information.

![FortiExtender configuration interface]

7. Click OK.

8. In the extenders list, right-click on the FortiExtender and select Diagnostics and Tools to review the modem and SIM status, and other details about the FortiExtender.

**To create a virtual FortiExtender interface in the CLI:**

```bash
config system interfaceedit "fext"
  set vdom "root"
  set mode dhcp
  set allowaccess ping https speed-test
  set type fext-wan
  set estimated-upstream-bandwidth 1000
  set estimated-downstream-bandwidth 500
next
end
```

**To configure the FortiExtender in the CLI:**

```bash
config extender-controller extenderedit "FX211E0000000000"
  set id "FX211E0000000000"
  set authorized enable
  config modem1
    set ifname "fext"
next
end
```

**To verify the modem settings in the CLI:**

```bash
get extender modem-status FX211E0000000000 1
Modem 0:
  physical_port: 2-1.2
  manufacture: Sierra Wireless, Incorporated
  product: Sierra Wireless, Incorporated
  ....
```
Direct IP support for LTE/4G

Direct IP is a public IP address that is assigned to a computing device, which allows the device to directly access the internet.

When an LTE modem is enabled in FortiOS, a DHCP interface is created. As a result, the FortiGate can acquire direct IP (which includes IP, DNS, and gateway) from the LTE network carrier.

Since some LTE modems require users to input the access point name (APN) for the LTE network, the LTE modem configuration allows you to set the APN.

LTE modems can only be enabled by using the CLI.

To enable direct IP support using the CLI:

1. Enable the LTE modem:
   ```
   config system lte-modem
   set status enable
   end
   ```

2. Check that the LTE interface was created:
   ```
   config system interface
   edit "wwan"
   set vdom "root"
   set mode dhcp
   set status down
   set distance 1
   set type physical
   set snmp-index 23
   next
   end
   ```

   Shortly after the LTE modem joins its carrier network, wwan is enabled and granted direct IP:
   ```
   config system interface
   edit wwan
   get
   name : wwan
   ....
   ip : 100.112.75.43 255.255.255.248
   ....
   status : up
   ....
   defaultgw : enable
   DHCP Gateway : 100.112.75.41
   Lease Expires : Thu Feb 21 19:33:27 2019
dns-server-override : enable
   Acquired DNS1 : 184.151.118.254
   Acquired DNS2 : 70.28.245.227
   ....
   ```
PCs can reach the internet via the following firewall policy:

```plaintext
config firewall policy
edit 5
    set name "LTE"
    set srcintf "port9"
    set dstintf "wwan"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set fsso disable
    set nat enable
next
end
```

**Sample LTE interface**

When an LTE modem is enabled, you can view the LTE interface in the GUI and check the acquired IP, DNS, and gateway.

**To view the LTE interface in the GUI:**

1. Go to **Network > Interfaces**.
2. Double-click the LTE interface (wwan) to view the properties.
3. Look in the *Address* section to see the *Obtained IP/Netmask*, *Acquired DNS*, and *Default Gateway*.
4. Click **Return**.

**To configure the firewall policy that uses the LTE interface:**

1. Go to **Policy & Objects > Firewall Policy**.
2. Edit the LTE policy.
3. In the *Outgoing Interface* field, select the interface (wwan in this example).
4. Configure the rest of the policy as needed.
5. Click OK.

Limitations

- Most LTE modems have a preset APN in their SIM card. Therefore, the APN does not need to be set in the FortiOS configuration. In cases where the internet cannot be accessed, consult with your carrier and set the APN in the LTE modem configuration (for example, inet.bell.ca):

  ```
  config system lte-modem
  set status enable
  set apn "inet.bell.ca"
  end
  ```

- Some models, such as the FortiGate 30E-3G4G, have built-in LTE modems. In this scenario, the LTE modem is enabled by default. The firewall policy via the LTE interface is also created by default. Once you plug in a SIM card, your network devices can connect to the internet.

Sample FortiGate 30E-3G4G default configuration:

```
LLDP reception

Device detection can scan LLDP as a source for device identification, but the FortiGate does not read or store the full information. Enabling LLDP reception allows the FortiGate to receive and store LLDP messages, learn about active neighbors, and makes the LLDP information available via the CLI, REST API, and SNMP.

You need to enable device-identification at the interface level, and then lldp-reception can be enabled on three levels: globally, per VDOM, or per interface.

To configure device identification on an interface:

```conf
config system interface
  edit <port>
    set device-identification enable
  next
end
```

To configure LLDP reception globally:

```conf
config system global
  set lldp-reception enable
end
```

To configure LLDP reception per VDOM:

```conf
config system setting
  set lldp-reception enable
end
```

To configure LLDP reception per interface:

```conf
config system interface
  edit <port>
    set lldp-reception enable
  next
end
```

To view the LLDP information in the GUI:

1. Go to Dashboard > Users & Devices.
2. Expand the Device Inventory widget to full screen.
Network

To view the received LLDP information in the CLI:

```bash
# diagnose user device list
  hosts
    vd root/0 44:0a:a0:0a:0a:0a gen 3 req S/2
    created 10290s gen 1 seen 0s port3 gen 1
    ip 172.22.22.22 src lldp
    type 20 'Other Network Device' src lldp id 155 gen 2
    os 'Artist EOS ' version '4.20.4' src lldp id 155
    host 'artist' src lldp
```

To view additional information about LLDP neighbors and ports:

```bash
# diagnose lldprx neighbor {summary | details | clear}
# diagnose lldprx port {details | summary | neighbor | filter}
# diagnose lldprx port neighbor {summary | details}
```

Note that the port index in the output corresponds to the port index from the following command:

```bash
# diagnose netlink interface list port2 port3 | grep index
  if=port2 family=00 type=1 index=4 mtu=1500 link=0 master=0
  if=port3 family=00 type=1 index=5 mtu=1500 link=0 master=0
```

To view the received LLDP information in the REST API:

```json
{
  "http_method":"GET",
  "results":{
    "mac":"90:9c:9c:c9:c9:90",
    "chassis_id":"90:9C:C9:C9:90",
    "port":19,
    "port_id":"port12",
    "port_desc":"port12",
    "system_name":"S124DN3W00000000",
    "system_desc":"FortiSwitch-124D v3.6.6,build0416,180515 (GA)",
    "ttl":120,
    "addresses":[
      {"type":"ipv4",
       "address":"192.168.1.99"
      }
    ],
    "vdom":"root",
  }
}
```
**Virtual routing and forwarding**

Virtual Routing and Forwarding (VRF) is used to divide the FortiGate's routing functionality (layer 3), including interfaces, routes, and forwarding tables, into separate units. Packets are only forwarded between interfaces that have the same VRF.

VDOMs divide the FortiGate into two or more complete and independent virtual units that include all FortiGate functions. VDOMs can be used for routing segmentation, but that should not be the only reason to implement them when a less complex solution (VRFs) can be used. VDOMs also support administration boundaries, but VRFs do not.

Up to 64 VRFs can be configured per VDOM for any device, but only ten VDOMs can be configured by default on a FortiGate (more VDOMs can be configured on larger devices with additional licenses).

- Implementing VRF on page 411
- VRF routing support on page 412
- Route leaking between VRFs with BGP on page 416
- Route leaking between multiple VRFs on page 418
- VRF with IPv6 on page 429
- IBGP and EBGP support in VRF on page 433
Implementing VRF

VRFs are always enabled and, by default, all routing is done in VRF 0. To use additional VRFs, assign a VRF ID to an interface. All routes relating to that interface are isolated to that VRF specific routing table. Interfaces in one VRF cannot reach interfaces in a different VRF.

If some traffic does have to pass between VRFs, route leaking can be used. See Route leaking between VRFs with BGP on page 416.

Enable Advanced Routing in System > Feature Visibility to configure VRFs.

To configure a VRF ID on an interface in the GUI:

1. Go to Network > Interfaces and click Create New > Interface.
2. Enter a value in the VRF ID field.
3. Configure the other settings as needed.
4. Click OK.
5. To add the VRF column in the interface table, click the gear icon, select VRF, and click Apply.
To configure a VRF ID on an interface in the CLI:

```
config system interface
    edit interface42
        ...
        set vrf 14
    next
end
```

VRF routing support

VRF supports static routing, OSPF, and BGP. Other routing protocols require using VDOMs.

![Diagram of network configuration]

BGP

In this example, BGP is used to update the VRF that it is neighbors with.

The hub is configured with two neighbors connected to two interfaces. The branches are configured to match the hub, with branch networks configured to redistribute into BGP.

Policies must be created on the hub and branches to allow traffic between them.

To configure the hub:

```
config router bgp
    set as 65000
    config neighbor
        edit "10.101.101.2"
            set soft-reconfiguration enable
            set interface "port2"
            set remote-as 65101
            set update-source "port2"
        next
        edit "10.102.102.2"
            set soft-reconfiguration enable
            set interface "port3"
            set remote-as 65102
            set update-source "port3"
        next
    end
end
```
To configure branch 101:

```fortios
config router bgp
  set as 65101
  config neighbor
    edit "10.101.101.1"
      set soft-reconfiguration enable
      set interface "port2"
      set remote-as 65000
      set update-source "port2"
    next
  end
  config redistribute connected
    set status enable
  end
end
```

To configure branch 102:

```fortios
config router bgp
  set as 65102
  config neighbor
    edit "10.102.102.1"
      set soft-reconfiguration enable
      set interface "port2"
      set remote-as 65000
      set update-source "port2"
    next
  end
  config redistribute connected
    set status enable
  end
end
```

To verify the BGP neighbors and check the routing table on the hub:

```bash
# get router info bgp summary
BGP router identifier 192.168.0.1, local AS number 65000
BGP table version is 2
2 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS  MsgRcvd  MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
10.101.101.2 4  65101  4     4       2       0     0       00:01:05  3
10.102.102.2 4  65102  3     3       1       0     0

Total number of neighbors 2
```

```bash
# get router info routing-table all
Routing table for VRF=0
Codes (…)
S* 0.0.0.0/0 [10/0] via 192.168.0.254, port1
C 10.101.101.0/24 is directly connected, port2
C 10.102.102.0/24 is directly connected, port3
C 192.168.0.0/24 is directly connected, port1
```
Network

To configure VRF on the hub:

1. Put the interfaces into VRF:

   ```
   config system interface
   edit port2
     set vrf 10
   next
   edit port3
     set vrf 20
   next
   end
   ```

2. Restart the router to reconstruct the routing tables:

   ```
   # execute router restart
   ```

3. Check the routing tables:

   ```
   # get router info routing-table all
   Routing table for VRF=0
   Codes (....)
   S* 0.0.0.0/0 [10/0] via 192.168.0.254, port1
   C 192.168.0.0/24 is directly connected, port1

   Routing table for VRF=10
   C 10.101.101.0/24 is directly connected, port2
   B 192.168.101.0/24 [20/0] via 10.101.101.2, port2, 00:02:25

   Routing table for VRF=20
   C 10.102.102.0/24 is directly connected, port3
   B 192.168.102.0/24 [20/0] via 10.102.102.2, port2, 00:01:50
   ```

4. Check the BGP summary:

   ```
   # get router info bgp summary
   VRF 10 BGP router identifier 10.101.101.1, local AS number 65000
   BGP table version is 1
   2 BGP AS-PATH entries
   0 BGP community entries

   Neighbor   V  AS  MsgRcvd  MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
   10.101.101.2 4  65101    4     4      2       0   0       00:02:05 3

   Total number of neighbors 1

   VRF 10 BGP router identifier 10.101.101.1, local AS number 65000
   BGP table version is 1
   2 BGP AS-PATH entries
   0 BGP community entries

   Neighbor   V  AS  MsgRcvd  MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
   10.102.102.2 4  65102    3     3      1       0   0       00:01:30 3
   ```
Total number of neighbors 1

**OSPF**

OSPF routes in VRFs work the same as BGP: the interface that OSPF is using is added to the VRF.

**To configure the hub:**

1. **Configure OSPF:**
   ```
   config router ospf
     set router-id 1.1.1.1
   config area
     edit 0.0.0.0
     next
   end
   config ospf-interface
     edit Branch101
       set interface "port2"
       set dead-interval 40
       set hello-interval 10
     next
     edit Branch102
       set dead-interval 40
       set hello-interval 10
     next
   end
   config network
     edit 0
       set prefix 10.101.101.0 255.255.255.0
     next
     edit 0
       set prefix 10.102.102.0 255.255.255.0
     next
     edit 0
       set prefix 192.168.1.0 255.255.255.0
     next
   end
   ```

2. **Put the interfaces into VRF:**
   ```
   config system interface
     edit port2
       set vrf 10
     next
     edit port3
       set vrf 20
     next
   end
   ```
To configure branch 101:

```
cfg router ospf
cfg area
    edit 0.0.0.0
    exit
exit
```
```
cfg ospf-interface
    edit HUB
        set interface port2
        set dead-interval 40
        set hello-interval 10
    exit
exit
```
```
cfg network
    edit 0
        set prefix 10.101.101.0 255.255.255.0
    exit
    edit 0
        set prefix 192.168.101.0 255.255.255.0
    exit
exit
```
To check the routing table and OSPF summary:

```
# get router info routing-table ospf
# get router info ospf interface
```

Route leaking between VRFs with BGP

Route leaking allows you to configure communication between VRFs. If route leaking is not configured, then the VRFs are isolated. This example shows route leaking with BGP using virtual inter-VDOM links.

In this example, a hub FortiGate forms BGP neighbors with two branches. It learns the networks 192.168.101.0/24 and 192.168.102.0/24 from the neighbors and separates them into VRF 10 and VRF 20.

To leak the learned routes to each other, an inter-VDOM link (IVL) is formed. An IVL normally bridges two VDOMs, but in this case the links reside on the same VDOM and are used to bridge the two VRFs. NPU links could also be used on models that support it to deliver better performance.

VRF 10 has a leaked route to 192.168.102.0/24 on IVL link-10-20-0, and VRF 20 has a leaked route to 192.168.101.0/24 on IVL link-10-20-1,
To configure route leaking:

1. Configure inter-VDOM links:

```plaintext
config global
cfg system vdom-link
   edit link-10-20-
      next
end
cfg system interface
   edit link-10-20-0
      set vdom "root"
      set vrf 10
      set ip 10.1.1.1/30
      next
   edit link-10-20-1
      set vdom "root"
      set vrf 20
      set ip 10.1.1.2/30
      next
end
```

2. Create prefix lists:
These object define the subnet and mask that are leaked.

```plaintext
config router prefix-list
   edit VRF10_Route
      config rule
         edit 1
            set prefix 192.168.101.0 255.255.255.0
            next
         end
   next
   edit VRF20_Route
      config rule
         edit 1
            set prefix 192.168.102.0 255.255.255.0
            next
         end
   next
end
```

3. Create the route map:
The route map can be used to group one or more prefix lists.

```plaintext
config router route-map
   edit "Leak_from_VRF10_to_VRF20"
      config rule
         edit 1
            set match-ip-address "VRF10_Route"
            next
         end
   next
   edit "Leak_from_VRF20_to_VRF10"
      config rule
         edit 1
```
set match-ip-address "VRF20_Route"
next
end
next
end

4. Configure the VRF leak in BGP, specifying a source VRF, destination VRF, an the route map to use:

```fortigate-config
config router bgp
config vrf
  edit "10"
    config leak-target
      edit "20"
        set route-map "Leak_from_VRF10_to_VRF20"
        set interface "link-10-20-0"
      next
    next
  next
edit "20"
config leak-target
  edit "10"
    set route-map "Leak_from_VRF20_to_VRF10"
    set interface "link-10-20-1"
  next
next
end
end
```

5. Create policies to allow traffic between the VRFs.
   Without a policy permitting traffic on the route between the VRFs, the VRFs are still isolated.

**Route leaking between multiple VRFs**

In this example, routing leaking between three VRFs in a star topology is configured. This allows the solution to be scaled to more VRFs without building full mesh, one-to-one connections between each pair of VRFs. VLAN subinterfaces are created on VDOM links to connect each VRF to the central VRF, allowing routes to be leaked from a VRF to the central VRF, and then to the other VRFs. Static routes are used for route leaking in this example.

For instructions on creating route leaking between two VRFs, see [Route leaking between VRFs with BGP on page 416](#).
In this example, a specific route is leaked from each of the VRFs to each of the other VRFs. VLAN subinterfaces are created based on VDOM links to connect each VRF to the core VRF router.

Multi VDOM mode is enabled so that NP VDOM links can be used. The setup could be configured without enabling multi VDOM mode by manually creating non-NP VDOM links, but this is not recommended as the links are not offloaded to the NPU.

After VDOMs are enabled, all of the configuration is done in the root VDOM.
To configure the FortiGate:

1. Enable multi VDOM mode:
   
   ```
   config system global
   set vdom-mode multi-vdom
   end
   ```

   If the FortiGate has an NP, the VDOM links will be created:
   
   ```
   # show system interface
   config system interface
   ...
   edit "npu0_vlink0"
   set vdom "root"
   set type physical
   next
   edit "npu0_vlink1"
   set vdom "root"
   set type physical
   next
   ...
   end
   ```

   If multi VDOM mode is not used, the VDOM links can be manually created:
   
   ```
   config system vdom-link
   edit <name of vdlink>
   next
   end
   ```

2. Allow interface subnets to use overlapping IP addresses:
   
   ```
   config vdom
   edit root
   config system settings
   set allow-subnet-overlap enable
   end
   ```

3. Configure the inter-connecting VLAN subinterfaces between VRF based on VDOM-LINK:
   
   ```
   config system interface
   edit "vlink0_Vlan_10"
   set vdom "root"
   set vrf 10
   set ip 10.1.1.1 255.255.255.252
   set allowaccess ping https ssh http
   set alias "vlink0_Vlan_10"
   set role lan
   set interface "npu0_vlink0"
   set vlanid 10
   next
   edit "vlink1_Vlan_10"
   set vdom "root"
   set vrf 31
   set ip 10.1.1.2 255.255.255.252
   set allowaccess ping https ssh http
   set alias "vlink1_Vlan_10"
   set role lan
   ```
set interface "npu0_vlink1"
set vlanid 10
next
edit "vlink0_Vlan_11"
    set vdom "root"
    set vrf 11
    set ip 11.1.1.1 255.255.255.252
    set allowaccess ping https ssh http
    set alias "vlink0_Vlan_11"
    set role lan
    set interface "npu0_vlink0"
    set vlanid 11
next
edit "vlink1_Vlan_11"
    set vdom "root"
    set vrf 31
    set ip 11.1.1.2 255.255.255.252
    set allowaccess ping https ssh http
    set alias "vlink1_Vlan_11"
    set role lan
    set interface "npu0_vlink1"
    set vlanid 11
next
edit "vlink0_Vlan_12"
    set vdom "root"
    set vrf 12
    set ip 12.1.1.1 255.255.255.252
    set allowaccess ping https ssh http
    set alias "vlink0_Vlan_12"
    set role lan
    set interface "npu0_vlink0"
    set vlanid 12
next
edit "vlink1_Vlan_12"
    set vdom "root"
    set vrf 31
    set ip 12.1.1.2 255.255.255.252
    set allowaccess ping https ssh http
    set alias "vlink1_Vlan_12"
    set role lan
    set interface "npu0_vlink1"
    set vlanid 12
next
end

4. Configure a zone to allow intrazone traffic between VLANs in the central VRF:

config system zone
    edit "Core-VRF-Router"
        set intrazone allow
        set interface "vlink1_Vlan_10" "vlink1_Vlan_11" "vlink1_Vlan_12"
    next
end

5. Add allow policies for the VRF31 core router:
config firewall policy
  edit 0
    set name "any_to_core_vrf31"
    set srcintf "any"
    set dstintf "Core-VRF-Router"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set logtraffic all
  next
  edit 0
    set name "core_vrf31_to_any"
    set srcintf "Core-VRF-Router"
    set dstintf "any"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set logtraffic all
  next
end

6. Configure VRF10, VRF11, and VRF12 on the Internal and WAN VLAN sub-interfaces:

config system interface
  edit "Internal_VRF10"
    set vdom "Root"
    set vrf 10
    set ip 172.16.10.1 255.255.255.0
    set allowaccess ping https ssh http
    set alias "Internal_VRF10"
    set role lan
    set interface "internal"
    set vlanid 10
  next
  edit "Internal_VRF11"
    set vdom "Root"
    set vrf 11
    set ip 172.16.11.1 255.255.255.0
    set allowaccess ping https ssh http
    set alias "Internal_VRF11"
    set role lan
    set interface "internal"
    set vlanid 11
  next
  edit "Internal_VRF12"
    set vdom "Root"
    set vrf 12
    set ip 172.16.12.1 255.255.255.0
    set allowaccess ping https ssh http
    set alias "Internal_VRF12"
    set role lan
    set interface "internal"
    set vlanid 12
7. Configure static routing and route leaking between each VRF and Core-VRF-Router:

```plaintext
config router static
edit 1
    set dst 172.16.10.0 255.255.255.0
    set gateway 10.1.1.1
    set device "vlink1_Vlan_10"
    set comment "VRF31_Core_Router"
next
edit 2
    set dst 172.16.11.0 255.255.255.0
    set gateway 11.1.1.1
    set device "vlink1_Vlan_11"
    set comment "VRF31_Core_Router"
next
edit 3
    set dst 172.16.12.0 255.255.255.0
    set gateway 12.1.1.1
    set device "vlink1_Vlan_12"
    set comment "VRF31_Core_Router"
next
edit 4
    set dst 172.16.11.0 255.255.255.0
```
In the GUI, go to **Network > Static Routes** to view the static routes:
8. Configure firewall policies for VRF10, VRF11, and VRF12

```bash
config firewall policy
edit 6
set name "VRF10_to_Internet_Policy"
set srcintf "Internal_VRF10"
set dstintf "wan1_VRF10"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set logtraffic all
set nat enable
next
edit 7
set name "VRF10_to_VRF_Leaking_Route"
set srcintf "Internal_VRF10"
set dstintf "vlink0_Vlan_10"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set logtraffic all
next
edit 8
set name "VRF_Leaking_Route_to_VRF10"
set srcintf "vlink0_Vlan_10"
set dstintf "Internal_VRF10"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set logtraffic all
next
edit 9
set name "VRF11_to_Internet_Policy"
set srcintf "Internal_VRF11"
set dstintf "wan1_VRF11"
set srcaddr "all"
```
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set logtraffic all
set nat enable
next
edit 10
set name "VRF11_to_VRF_Leaking_Route"
set srcintf "Internal_VRF11"
set dstintf "vlink0_Vlan_11"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set logtraffic all
next
edit 11
set name "VRF_Leaking_Route_to_VRF11"
set srcintf "vlink0_Vlan_11"
set dstintf "Internal_VRF11"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set logtraffic all
next
edit 12
set name "VRF12_to_Internet_Policy"
set srcintf "Internal_VRF12"
set dstintf "wan1_VRF12"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set logtraffic all
set nat enable
next
edit 13
set name "VRF12_to_VRF_Leaking_Route"
set uuid 92bccf8e-b27b-51eb-3c56-6d5259af6299
set srcintf "Internal_VRF12"
set dstintf "vlink0_Vlan_12"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set logtraffic all
next
edit 14
set name "VRF_Leaking_Route_to_VRF12"
set srcintf "vlink0_Vlan_12"
set dstintf "Internal_VRF12"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set logtraffic all

In the GUI, go to Policy & Objects > Firewall Policy to view the policies.

To check the results:

1. On the FortiGate, check the routing table to see each VRF:

   # get router info routing-table all
   Codes:  K - kernel,  C - connected,  S - static,  R - RIP,  B - BGP
   O - OSPF,  IA - OSPF inter area

VRF with IPv6

IPv6 routes support VRF. Static, connected, OSPF, and BGP routes can be isolated in different VRFs. BGP IPv6 routes can be leaked from one VRF to another.

   config router bgp
   config vrf6
      edit <origin vrf-id>
      config leak-target
         edit <target vrf-id>
         set route-map <route-map>
         set interface <interface>
      next
   next
end
end
end

The origin or target VRF ID is an integer value from 0 - 31.
Using a VRF leak on BGP

In this example, the route 2000:5:5:5::/64 learned from Router 1 is leaked to VRF 20 through the interface vlan552. Conversely, the route 2009:3:3:3::/64 learned from Router 2 is leaked to VRF 10 through interface vlan55.

To configure VRF leaking in BGP:

1. Configure the BGP neighbors:
   ```
   config router bgp
   set as 65412
   config neighbor
   edit "2000:10:100:1::1"
   set activate disable
   set remote-as 20
   set update-source "R150"
   next
   edit "2000:10:100:1::5"
   set activate disable
   set soft-reconfiguration enable
   set interface "R160"
   set remote-as 20
   next
   end
   end
   ```

2. Configure the VLAN interfaces:
   ```
   config system interface
   edit "vlan55"
   set vdom "root"
   set vrf 10
   set ip 55.1.1.1 255.255.255.0
   set device-identification enable
   set role lan
   set snmp-index 51
   config ipv6
   ```
set ip6-address 2000:55::1/64
d
set ip6-address 2000:55::2/64

set interface "npu0_vlink0"
set vlanid 55
next
edit "vlan552"
set vdom "root"

set vrf 20
set ip 55.1.1.2 255.255.255.0
set device-identification enable
set role lan
set snmp-index 53
config ipv6

set ip6-address 2000:55::2/64

d
set interface "npu0_vlink1"
set vlanid 55
next
d

3. Configure the IPv6 prefixes:

config router prefix-list6
edit "1"
config rule
edit 1
set prefix6 2000:5:5:5::/64
unset ge
unset le
next
next
edit "2"
config rule
edit 1
set prefix6 2009:3:3:3::/64
unset ge
unset le
next
next
d

4. Configure the route maps:

config router route-map
edit "from106"
config rule
edit 1
set match-ip6-address "1"
next
next
edit "from206"
config rule
edit 1
set match-ip6-address "2"
5. Configure the IPv6 route leaking (leak route 2000:5:5:5::/64 learned from Router 1 to VRF 20, then leak route 2009:3:3:3::/64 learned from Router 2 to VRF 10):

```bash
config router bgp
  config vrf6
    edit "10"
      config leak-target
        edit "20"
          set route-map "from106"
          set interface "vlan55"
        next
      next
      edit "20"
        config leak-target
          edit "10"
            set route-map "from206"
            set interface "vlan552"
          next
        next
    end
end
end
```

To verify the VRF leaking:

1. Check the routing table before the leak:

```bash
# get router info6 routing-table bgp
Routing table for VRF=10
B 2000:5:5:5::/64 [20/0] via fe00::2000:0000:0000:00, R150, 00:19:45
Routing table for VRF=20
B 2008:3:3:3::/64 [20/0] via fe00::3000:0000:0000:00, R160, 00:18:49
B 2009:3:3:3::/64 [20/0] via fe00::3000:0000:0000:00, R160, 00:18:49
```

2. Check the routing table after the leak:

```bash
# get router info6 routing-table bgp
Routing table for VRF=10
B 2000:5:5:5::/64 [20/0] via fe00::2000:0000:0000:00, R150, 00:25:45
B 2009:3:3:3::/64 [20/0] via fe80::10:0000:0000:4245, vlan55, 00:00:17
Routing table for VRF=20
B 2000:5:5:5::/64 [20/0] via fe80::10:0000:0000:4244, vlan552, 00:00:16
B 2008:3:3:3::/64 [20/0] via fe00::3000:0000:0000:00, R160, 00:24:49
B 2009:3:3:3::/64 [20/0] via fe00::3000:0000:0000:00, R160, 00:24:49
```

Using VRF on a static route

In this example, a VRF is defined on static route 22 so that it will only appear in the VRF 20 routing table.
To configure the VRF on the static route:

```bash
config router static6
  edit 22
    set dst 2010:2:2:2::/64
    set blackhole enable
    set vrf 20
  next
end
```

**IBGP and EBGP support in VRF**

Support is included for internal and external border gateway protocols (IBGP and EBGP) in virtual routing and forwarding (VRF).

FortiGate can establish neighbor connections with other FortiGates or routers, and the learned routes are put into different VRF tables according to the neighbor’s settings.

This example uses the following topology:

- BGP routes learned from the Router1 neighbor are put into vrf10.
- BGP routes learned from the Router2 neighbor are put into vrf20.

**To configure this example:**

```bash
config system interface
  edit port1
    set vrf 10
  next
  edit port2
    set vrf 20
  next
end

config router bgp
  config neighbor
    edit "192.168.1.1"
      set update-source port1
    next
    edit "192.168.2.1"
      set interface port2
    next
```
Results

Using the above topology:

- Both Router1 and Router2 establish OSPF and BGP neighbor with the FortiGate.
- Router1 advertises 10.10.1.0/24 into OSPF and 10.10.2.0/24 into BGP.
- Router2 advertises 20.20.1.0/24 into OSPF and 20.20.2.0/24 into BGP.

When port1 and port2 have not set VRF, all of the routing is in VRF=0:

```
# get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
    N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
    E1 - OSPF external type 1, E2 - OSPF external type 2
    i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
* - candidate default

Routing table for VRF=0
S* 0.0.0.0/0 [5/0] via 10.0.1.254, port9
C  10.0.1.0/24 is directly connected, port9
O  10.10.1.0/24 [110/10] via 192.168.1.1, port1, 00:18:31
B  10.10.2.0/24 [20/200] via 192.168.1.1, port1, 00:01:31
O  20.20.1.0/22 [110/10] via 192.168.2.1, port2, 00:19:05
B  20.20.2.0/24 [20/200] via 192.168.2.1, port2, 00:01:31
C  192.168.1.0/24 is directly connected, port1
C  192.168.2.0/24 is directly connected, port2
```

After VRF is set for BGP, BGP routes are added to the VRF tables along with OSPF and connected routes:

```
# get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
    N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
    E1 - OSPF external type 1, E2 - OSPF external type 2
    i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
* - candidate default

Routing table for VRF=0
S* 0.0.0.0/0 [5/0] via 10.0.1.254, port9
C  10.0.1.0/24 is directly connected, port9

Routing table for VRF=10
O  10.10.1.0/24 [110/10] via 192.168.1.1, port1, 00:18:31
B  10.10.2.0/24 [20/200] via 192.168.1.1, port1, 00:01:31
C  192.168.1.0/24 is directly connected, port1

Routing table for VRF=20
O  20.20.1.0/22 [110/10] via 192.168.2.1, port2, 00:19:05
B  20.20.2.0/24 [20/200] via 192.168.2.1, port2, 00:01:31
C  192.168.2.0/24 is directly connected, port2
BGP neighbor groups

This feature is also supported in the BGP neighbor groups. For example:

```
config router bgp
    config neighbor-group
        edit "FGT"
            set update-source "port1"
        next
    end
    config neighbor-range
        edit 1
            set prefix 172.16.201.0 255.255.255.0
            set neighbor-group "FGT"
        next
    end
end
```

Note that the `set interface` command is not supported.

NetFlow

NetFlow allows you to collect IP network traffic statistics for an interface, and then export those statistics for analysis. NetFlow samplers, that sample every packet, are configured per interface. Full NetFlow is supported through the information maintained in the firewall session.

To configure NetFlow:

```
config system netflow
    set collector-ip <ip>
    set collector-port <port>
    set source-ip <ip>
    set active-flow-timeout <integer>
    set inactive-flow-timeout <integer>
    set template-tx-timeout <integer>
    set template-tx-counter <integer>
end
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collector-ip &lt;ip&gt;</td>
<td>Collector IP address.</td>
</tr>
<tr>
<td>collector-port &lt;port&gt;</td>
<td>NetFlow collector port number (0 - 65535).</td>
</tr>
<tr>
<td>source-ip &lt;ip&gt;</td>
<td>Source IP address, for communication with the NetFlow agent.</td>
</tr>
<tr>
<td>active-flow-timeout &lt;integer&gt;</td>
<td>Timeout to report active flows, in seconds (60 - 3600, default = 1800).</td>
</tr>
<tr>
<td>inactive-flow-timeout &lt;integer&gt;</td>
<td>Timeout for periodic report of finished flows, in seconds (10 - 600, default = 15).</td>
</tr>
<tr>
<td>template-tx-timeout &lt;integer&gt;</td>
<td>Timeout for periodic template flowset transmission, in seconds (60 - 86400, default = 1800).</td>
</tr>
<tr>
<td>template-tx-counter &lt;integer&gt;</td>
<td>Counter of flowset records, before resending a template flowset record (10 - 6000, default = 20).</td>
</tr>
</tbody>
</table>
To configure NetFlow in a specific VDOM:

```
config vdom
  edit <vdom>
    config system vdom-netflow
      set vdom-netflow enable
      set collector-ip <ip>
      set collector-port <port>
      set source-ip <ip>
    end
  next
end
```

To configure a NetFlow sampler on an interface:

```
config system interface
  edit <interface>
    set netflow-sampler {disable | tx | rx | both}
  next
end
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disable the NetFlow protocol on this interface (default).</td>
</tr>
<tr>
<td>tx</td>
<td>Monitor transmitted traffic on this interface.</td>
</tr>
<tr>
<td>rx</td>
<td>Monitor received traffic on this interface.</td>
</tr>
<tr>
<td>both</td>
<td>Monitor transmitted/received traffic on this interface.</td>
</tr>
</tbody>
</table>

**Verification and troubleshooting**

If data are not seen on the NetFlow collector after it has been configured, use the following sniffer commands to verify if the FortiGate and the collector are communicating:

- By collector port:
  ```
  # diagnose sniffer packet 'port <collector-port>' 6 0 a
  ```

- By collector IP address:
  ```
  # diagnose sniffer packet 'host <collector-ip>' 6 0 a
  ```

NetFlow uses the sflow daemon. The current NetFlow configuration can be viewed using test level 3 or 4:

```
# diagnose test application sflowd 3
# diagnose test application sflowd 4
```

NetFlow Cache Stats:
- vdoms=1
- Collectors=1
- Cached_intf=2
- Netflow_enabled_intf=1
- Live_sessions=0
- Session cache max count:71950

**NetFlow templates**

NetFlow uses templates to capture and categorize the data that it collects. FortiOS supports the following NetFlow templates:
<table>
<thead>
<tr>
<th>Name</th>
<th>Template ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STAT_OPTIONS</td>
<td>256</td>
<td>Statistics information about exporter</td>
</tr>
<tr>

NetFlow on FortiExtender and tunnel interfaces

NetFlow sampling is supported on FortiExtender and VPN tunnel interfaces.

VPN tunnel interfaces can be IPsec, IP in IP, or GRE tunnels. NetFlow sampling is supported on both NPU and non-NPU offloaded tunnels.

Examples

In the following examples, a FortiExtender and a VPN tunnel interface are configured with NetFlow sampling.

To configure a FortiExtender interface with NetFlow sampling:

1. Configure a FortiExtender interface with NetFlow sampling enabled for both transmitted and received traffic:

   ```
   config system interface
   edit "fext-211"
   set vdom "root"
   set mode dhcp
   set type fext-wan
   set netflow-sampler both
   set role wan
   set snmp-index 8
   set macaddr 2a:4e:68:a3:f4:6a
   next
   end
   ```

2. Check the NetFlow status and configuration:
Device index 26 is the FortiExtender interface fext-211.

# diagnose test application sflowd 3
===== Netflow Configuration =====
Global collector:172.18.60.80:[2055] source ip: 0.0.0.0 active-timeout(seconds):60 inactive-timeout(seconds):600
___ vdom: root, index=0, is master, collector: disabled (use global config) (mgmt vdom)
|_ col1_ip:172.18.60.80[2055],src_ip:10.6.30.105,seq_num:300,pkts/time to next
template: 18/29
|___ interface:fext-211 sample_direction:both device_index:26 snmp_index:8

3. Check the network interface list:

# diagnose netlink interface list
...
if=fext-211 family=00 type=1 index=26 mtu=1500 link=0 master=0
ref=27 state=start present fw_flags=60000 flags=up broadcast run multicast
...

4. Check the session list for the FortiExtender interface and NetFlow flowset packet:

# diagnose sys session list
session info: proto=1 proto_state=00 duration=1732 expire=59 timeout=0 flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty netflow-origin netflow-reply
statistic(byte/packets/allow_err): org=145572/1733/1 reply=145572/1733/1 tuples=2
tx speed(Bps/kbps): 83/0 rx speed(Bps/kbps): 83/0
origin->sink: org pre->post, reply pre->post dev=5->26/26->5
gw=10.39.252.244/172.16.200.55
hook=pre dir=reply act=dnat 8.8.8.8:61290->10.39.252.243:0(172.16.200.55:61290)
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=0
serial=00001298 tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
no_ofld_reason: non-npu-intf
total session 1

5. The flowset packet can be captured on UDP port 2055 by a packet analyzer, such as Wireshark:
To configure a VPN tunnel interface with NetFlow sampling:

1. Configure a VPN interface with NetFlow sampling enabled for both transmitted and received traffic:

   ```
   config system interface
   edit "A-to-B_vpn"
      set vdom "vdom1"
      set type tunnel
         set netflow-sampler both
         set snmp-index 42
         set interface "port3"
   next
   end
   ```

2. Configure the VPN tunnel:

   ```
   config vpn ipsec phase1-interface
   edit "A-to-B_vpn"
      set interface "port3"
      set peertype any
      set net-device disable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set comments "VPN: A-to-B_vpn [Created by VPN wizard]"
      set wizard-type static-fortigate
      set remote-gw 10.2.2.2
      set psksecret ENC
   next
   end
   ```

   ```
   config vpn ipsec phase2-interface
   edit "A-to-B_vpn"
      set phasename "A-to-B_vpn"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
     aes256gcm chacha20poly1305
      set comments "VPN: A-to-B_vpn [Created by VPN wizard]"
      set src-addr-type name
      set dst-addr-type name
      set src-name "A-to-B_vpn_local"
   ```
set dst-name "A-to-B_vpn_remote"
  next
end

3. Check the NetFlow status and configuration:
   Device index 52 is the VPN interface A-to-B_vpn.

   # diagnose test application sflowd 3
   ===== Netflow Vdom Configuration =====
   Global collector:172.18.60.80:[2055] source ip: 0.0.0.0 active-timeout(seconds):60
   inactive-timeout(seconds):15
   ___ vdom: vdom1, index=1, is master, collector: disabled (use global config) (mgmt vdom)
   |__ coll_ip:172.18.60.80[2055],src_ip:10.1.100.1,seq_num:60,pkts/time to next

   no_ofld_reason: disabled-by-policy
   total session 1

5. The flowset packet can be captured on UDP port 2055 by a packet analyzer, such as Wireshark:
sFlow

sFlow is a method of monitoring the traffic on your network to identify areas on the network that may impact performance and throughput. FortiGate supports sFlow v5. sFlow collector software is available from a number of third-party software vendors. For more information about sFlow, see www.sflow.org.

The packet information that the FortiGate's sFlow agent collects depends on the interface type:

- On an internal interface, when the interface receives packets from devices with private IP addresses, the collected information includes the private IP addresses.
- On an external, or WAN, interface, when the interface receives to route to or from the internet, the collected information includes the IP address of the WAN interface as the source or destination interface, depending on the direction of the traffic. It does not include IP addresses that are NATed on another interface.

sFlow datagrams contain the following information:

- Packet headers, such as MAC, IPv4, and TCP
- Sample process parameters, such as rate and pool
- Input and output ports
- Priority (802.1p and ToS)
- VLAN (802.1Q)
- Source prefixes, destination prefixes, and next hop addresses
- BGP source AS, source peer AS, destination peer AS, communities, and local preference
- User IDs (TACACS, RADIUS) for source and destination
- Interface statistics (RFC 1573, RFC 2233, and RFC 2358)

Configuring sFlow

sFlow can be configured globally, then on traffic VDOMs and individual interfaces.
When configuring sFlow on a VDOM, the collector can be specified, or the collector that is configured globally can be used.

sFlow is supported on some interface types, such as physical, VLAN, and aggregate. It is not supported on virtual interfaces, such as VDOM link, IPsec, GRE, or SSL. When configuring sFlow on an interface, the rate that the agent samples traffic, the direction of that traffic, and the frequency that the agent sends sFlow datagrams to the sFlow collector can be specified. If sFlow is configured on the VDOM that the interface belongs to, the agent sends datagrams to the collector configured for the VDOM. Otherwise, the datagrams are sent to the collector that is configured globally.

Configuring sFlow for an interface disables NP offloading for all traffic on that interface.

**To configure sFlow globally:**

```plaintext
config system sflow
  set collector-ip <ipv4_address>
  set collector-port <port>
  set source-ip <ipv4_address>
  set interface-select-method {auto | sdwan | specify}
  set interface <interface>
end
```

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collector-ip &lt;ipv4_address&gt;</td>
<td>The IPv4 address of the sFlow collector that sFlow agents added to interface (default = 0.0.0.0).</td>
</tr>
<tr>
<td>collector-port &lt;port&gt;</td>
<td>The UDP port number used for sending sFlow datagrams (0 - 65535, default = 6343). Only configured this option if required by the sFlow collector or your network configuration.</td>
</tr>
<tr>
<td>source-ip &lt;ipv4_address&gt;</td>
<td>The source IPv4 address that the sFlow agent used to send datagrams to the collector (default = 0.0.0.0). If this option is not configured, the FortiGate uses the IP address of the interface that it sends the datagram through.</td>
</tr>
<tr>
<td>interface-select-method</td>
<td>How the outgoing interface to reach the server is selected (default = auto).</td>
</tr>
<tr>
<td>interface &lt;interface&gt;</td>
<td>The outgoing interface used to reach the server. This option is only available when interface-select-method is specify.</td>
</tr>
</tbody>
</table>

**To configure sFlow for a VDOM:**

```plaintext
config vdom
  edit <vdom>
    config system vdom-sflow
      set vdom-sflow {enable | disable}
      set collector-ip <ipv4_address>
      set collector-port <port>
      set source-ip <ipv4_address>
      set interface-select-method {auto | sdwan | specify}
      set interface <interface>
    end
next
end
```
Enable/disable the sFlow configuration for the current VDOM (default = disable).

The IPv4 address of the sFlow collector that sFlow agents added to interface (default = 0.0.0.0).

The UDP port number used for sending sFlow datagrams (0 - 65535, default = 6343).

The source IPv4 address that the sFlow agent used to send datagrams to the collector (default = 0.0.0.0).

How the outgoing interface to reach the server is selected (default = auto).

The outgoing interface used to reach the server. This option is only available when `interface-select-method` is `specify`.

### To configure sFlow on an interface:

```
config system interface
  edit <interface>
    set sflow-sampler {enable | disable}
    set sample-rate <integer>
    set polling-interval <integer>
    set sample-direction {tx | rx | both}
  next
end
```

Enable/disable sFlow on this interface (default = disable).

The average number of packets that the agent lets pass before taking a sample (10 - 99999, default = 2000).

Setting a lower rate will sample a higher number of packets, increasing the accuracy or the sampling data, but also increasing the CPU and network bandwidth usage. The default value is recommended.

The amount of time that the agent waits between sending datagrams to the collector, in seconds (1 - 255, default = 20).

Setting a higher value lowers the amount of data that the agent sends across the network, but makes the collector's view of the network less current.

The direction of the traffic that the agent collects (default = both).
Link monitor

The link monitor is a mechanism that allows the FortiGate to probe the status of a detect server in order to determine the health of the link, next hop, or the path to the server. Ping, TCP echo, UDP echo, HTTP, and TWAMP protocols can be used for the probes. Typically, the detect server is set to a stable server several hops away. Multiple servers can also be configured with options to define the protocol and weights for each server.

The link monitor serves several purposes. In the most basic configuration, it can be used to detect failures and remove routes associated with the interface and gateway to prevent traffic from routing out the failed link. More granularity is added in 7.0 that allows only the routes specified in the link monitor to be removed from the routing table. With this benefit, only traffic to specific routing destinations are removed, rather than all routing destinations.

Another enhancement starting in 7.0.1 is an option to toggle between enabling or disabling policy route updates when a link health monitor fails.

The link monitor can also monitor remote servers for HA failover. Using the HA built-in link monitor, it is only able to detect physical link failovers to trigger HA link failover. With the link monitor, remote servers can be used to monitor the health of the path to the server in order to trigger HA failover.

Finally, the link monitor can cascade the failure to other interfaces. When the update-cascade-interface option is enabled, the interface can be configured in conjunction with fail-detect enabled to trigger a link down event on other interfaces.

The following topics provide more information about the link monitor:

- Link monitor with route updates on page 456
- Enable or disable updating policy routes when link health monitor fails on page 458
- Add weight setting on each link health monitor server on page 460
- Dual internet connections on page 313
- SLA link monitoring for dynamic IPsec and SSL VPN tunnels on page 463

Link monitor with route updates

When a link monitor fails, only the routes that are specified in the link monitor are removed from the routing table, instead of all the routes with the same interface and gateway. If no routes are specified, then all of the routes are removed. Only IPv4 routes are supported.

Example

In this example, the FortiGate has several routes to 23.2.2.2/32 and 172.16.202.2/24, and is monitoring the link agg1 by pinging the server at 10.1.100.22. The link monitor uses the gateway 172.16.203.2.
When the link monitor fails, only the routes to the specified subnet using interface `agg1` and gateway 172.16.203.2 are removed.

To configure the link monitor:

```plaintext
config system link-monitor
  edit "22"
    set srcintf "agg1"
    set server "10.1.100.22"
    set gateway-ip 172.16.203.2
    set route "23.2.2.2/32" "172.16.202.0/24"
next
end
```

To check the results:

1. When the link monitor is alive:

   ```plaintext
   # get router info routing-table static
   Routing table for VRF=0
   S* 0.0.0.0/0 [5/0] via 10.100.1.249, port12
   S 10.1.100.0/24 [10/0] via 172.16.203.2, agg1
   S 23.2.2.2/32 [10/0] via 172.16.203.2, agg1
   S 23.2.3.2/32 [10/0] via 172.16.203.2, agg1
   S 172.16.201.0/24 [10/0] via 172.16.200.4, port9
   S 172.16.202.0/24 [10/0] via 172.16.203.2, agg1
   S 172.16.203.0/24 [10/0] via 172.16.200.4, port9
   S 172.16.204.0/24 [10/0] via 172.16.200.4, port9
   S 172.16.205.0/24 [10/0] via 172.16.203.2, agg1
   S 172.16.206.2, vlan100, [100/0]
   ```

2. When the link monitor is dead:

   ```plaintext
   # get router info routing-table static
   Routing table for VRF=0
   S* 0.0.0.0/0 [5/0] via 10.100.1.249, port12
   S 10.1.100.0/24 [10/0] via 172.16.203.2, agg1
   S 23.2.3.2/32 [10/0] via 172.16.203.2, agg1
   S 172.16.201.0/24 [10/0] via 172.16.200.4, port9
   S 172.16.204.0/24 [10/0] via 172.16.200.4, port9
   S 172.16.205.0/24 [10/0] via 172.16.203.2, agg1
   S 172.16.206.2, vlan100, [100/0]
   ```
Enable or disable updating policy routes when link health monitor fails

An option has been added to toggle between enabling or disabling policy route updates when a link health monitor fails. By disabling policy route updates, a link health monitor failure will not cause corresponding policy-based routes to be removed.

```config
config system link-monitor
  edit <name>
    set update-policy-route {enable | disable}
  next
end
```

**Example**

In the following topology, the FortiGate is monitoring the detect server, 10.1.100.22. The FortiGate has a policy-based route to destination 172.16.205.10 using the same gateway (172.16.202.1) and interface (port22). By configuring `update-policy-route disable`, the policy-based route is not removed when the link health monitor detects a failure.

![Topology Diagram]

**To disable updating policy routes when the link health monitor fails:**

1. **Configure the link health monitor:**
   ```config
   config system link-monitor
     edit "test-1"
       set srcintf "port22"
       set server "10.1.100.22"
       set gateway-ip 172.16.202.1
       set failtime 3
       set update-policy-route disable
     next
   end
   ```

2. **Configure the policy route:**
   ```config
   config router policy
     edit 1
       set input-device "port16"
       set dst "172.16.205.10/255.255.255.255"
       set gateway 172.16.202.1
       set output-device "port22"
       set tos 0x14
       set tos-mask 0xff
   ```
3. When the health link monitor status is up, verify that the policy route is active.
   a. Verify the link health monitor status:

   ```
   # diagnose sys link-monitor status
   Link Monitor: test-1, Status: alive, Server num(1), HA state: local(alive), shared (alive)
   Flags=0x1 init, Create time: Fri May 28 15:20:15 2021
   Source interface: port22 (14)
   Gateway: 172.16.202.1
   Interval: 500 ms
   Service-detect: disable
   Diffservcode: 000000
   Class-ID: 0
   Peer: 10.1.100.22(10.1.100.22)
   Source IP(172.16.202.2)
   protocol: ping, state: alive
   Latency(Min/Max/Avg): 0.374/0.625/0.510 ms
   Jitter(Min/Max/Avg): 0.008/0.182/0.074
   Packet lost: 0.000%
   Number of out-of-sequence packets: 0
   Fail Times(0/3)
   Packet sent: 7209, received: 3400, Sequence(sent/rcvd/exp):
   7210/7210/7211
   ```

   b. Verify the policy route list:

   ```
   # diagnose firewall proute list
   list route policy info(vf=root):
   id=1 dscp_tag=0xff 0xff flags=0x0 tos=0x14 tos_mask=0xff protocol=0 sport=0-0 iif=41
   dport=0-65535 oif=14(port22) gwy=172.16.202.1
   source wildcard(1): 0.0.0.0/0.0.0.0
   destination wildcard(1): 172.16.205.10/255.255.255.255
   hit_count=1 last_used=2021-05-27 23:04:33
   ```

4. When the health link monitor status is down, verify that the policy route is active:
   a. Verify the link health monitor status:

   ```
   # diagnose sys link-monitor status
   Link Monitor: test-1, Status: die, Server num(1), HA state: local(die), shared(die)
   Flags=0x9 init log_downgateway, Create time: Fri May 28 15:20:15 2021
   Source interface: port22 (14)
   Gateway: 172.16.202.1
   Interval: 500 ms
   Service-detect: disable
   Diffservcode: 000000
   Class-ID: 0
   Peer: 10.1.100.22(10.1.100.22)
   Source IP(172.16.202.2)
   protocol: ping, state: die
   Packet lost: 11.000%
   Number of out-of-sequence packets: 0
   Recovery times(0/5) Fail Times(0/3)
   ```
Network

Packet sent: 7293, received: 3471, Sequence(sent/rcvd/exp):
7294/7281/7282

b. Verify the policy route list:

```
# diagnose firewall proute list
list route policy info(vf=root):
id=1 dscp_tag=0xff 0xff flags=0x0 tos=0x14 tos_mask=0xff protocol=0 sport=0-0 iif=41
dport=0-65535 oif=14(port22) gwy=172.16.202.1
source wildcard(1): 0.0.0.0/0.0.0.0
destination wildcard(1): 172.16.205.10/255.255.255.255
hit_count=1 last_used=2021-05-27 23:04:33
```

If the update-policy-route setting is enabled, the link health monitor would be down and the policy-based route would be disabled:

```
# diagnose firewall proute list
list route policy info(vf=root):
id=1 dscp_tag=0xff 0xff flags=0x8 disable tos=0x14 tos_mask=0xff protocol=0 sport=0-0
iif=41 dport=0-65535 oif=14(port22) gwy=172.16.202.1
source wildcard(1): 0.0.0.0/0.0.0.0
destination wildcard(1): 172.16.205.10/255.255.255.255
hit_count=1 last_used=2021-05-27 23:04:33
```

Add weight setting on each link health monitor server

Prior to FortiOS 7.0.1, the link health monitor is determined to be dead when all servers are unreachable. Starting in 7.0.1, the link health monitor can configure multiple servers and allow each server to have its own weight setting. When the link health monitor is down, it will trigger static route updates and cascade interface updates if the weight of all dead servers exceeds the monitor's fail weight threshold.

```
config system link-monitor
edit <name>
  set srcintf <interface>
  set server-config {default | individual}
  set fail-weight <integer>
  config server-list
    edit <id>
      set dst <address>
      set weight <integer>
    next
  next
next
```

**server-config**  
Set the server configuration mode:
  - default: all servers share the same attributes.
  - individual: some attributes can be specified for individual servers.

**fail-weight <integer>**  
Threshold weight to trigger link failure alert (0 - 255, default = 0).

**server-list**  
Configure the servers to be monitored by the link monitor.

**dst <address>**  
Enter the IP address of the server to be monitored.

**weight <integer>**  
Weight of the monitor to this destination (0 - 255, default = 0).
Examples

In the following topology, there are two detect servers that connect to the FortiGate through a router: server 1 (10.1.100.22) and server 2 (10.1.100.55).

Alive link health monitor

In this configuration, one server is dead and one server alive. The failed server weight is not over the threshold, so the link health monitor status is alive.

To configure the weight settings on the link health monitor:

1. Configure the link health monitor:

```bash
config system link-monitor
edit "test-1"
  set srcintf "port22"
  set server-config individual
  set gateway-ip 172.16.202.1
  set failtime 3
  set fail-weight 40
config server-list
  edit 1
    set dst "10.1.100.22"
    set weight 60
  next
  edit 2
    set dst "10.1.100.55"
    set weight 30
  next
next
end
```

2. Trigger server 2 to go down. The link monitor is still alive because the fail weight threshold has not been reached.
3. Verify the link health monitor status:

```bash
# diagnose sys link-monitor status test-1
Link Monitor: test-1, Status: alive, Server num(2), HA state: local(alive), shared (alive)
Flags=0x1 init, Create time: Fri Jun 4 17:23:29 2021
Source interface: port22 (14)
Gateway: 172.16.202.1
Interval: 500 ms
Service-detect: disable
Diffservcode: 000000
Class-ID: 0

**Fail-weight (40): not activated**
Peer: 10.1.100.22 (10.1.100.22)
  Source IP (172.16.202.2)
  **protocol: ping, state: alive**
  Latency (Min/Max/Avg): 0.417/0.585/0.530 ms
  Jitter (Min/Max/Avg): 0.007/0.159/0.057
  Packet lost: 0.000%
  Number of out-of-sequence packets: 0
  Fail Times (0/3)
  Packet sent: 239, received: 236, Sequence (sent/rcvd/exp): 240/240/241

Peer: 10.1.100.55 (10.1.100.55)
  Source IP (172.16.202.2)
  **Fail weight 30 applied**
  **protocol: ping, state: dead**
  Packet lost: 100.000%
  Number of out-of-sequence packets: 0
  Recovery times (0/5) Fail Times (1/3)
  Packet sent: 239, received: 3, Sequence (sent/rcvd/exp): 240/4/5
```

**Dead link health monitor**

In this configuration, one server is dead and one server alive. The failed server weight is over the threshold, so the link health monitor status is dead.

**To configure the weight settings on the link health monitor:**

1. **Configure the link health monitor:**

   ```bash
   config system link-monitor
   edit "test-1"
     set srcintf "port22"
     set server-config individual
     set gateway-ip 172.16.202.1
     set failtime 3
     set fail-weight 40
   config server-list
     edit 1
     set dst "10.1.100.22"
     set weight 30
     next
     edit 2
     set dst "10.1.100.55"
   ```
2. Trigger server 2 to go down. The link monitor is dead because the fail weight threshold has been reached.

3. Verify the link health monitor status:

```
# diagnose sys link-monitor status test-1
Link Monitor: test-1, Status: dead, Server num(2), HA state: local(dead), shared(dead)
Flags=0x9 init log_downgateway, Create time: Fri Jun 4 17:23:29 2021
Source interface: port22 (14)
Gateway: 172.16.202.1
Interval: 500 ms
Service-detect: disable
Diffservcode: 000000
Class-ID: 0
Fail-weight (40): activated
Peer: 10.1.100.22(10.1.100.22)
   Source IP(172.16.202.2)
   protocol: ping, state: alive
      Latency(Min/Max/Avg): 0.393/0.610/0.520 ms
      Jitter(Min/Max/Avg): 0.009/0.200/0.095
      Packet lost: 0.000%
      Number of out-of-sequence packets: 0
      Fail Times(0/3)
      Packet sent: 680, received: 677, Sequence(sent/rcvd/exp): 681/681/682
Peer: 10.1.100.55(10.1.100.55)
   Source IP(172.16.202.2)
   Fail weight 50 applied
   protocol: ping, state: dead
      Packet lost: 100.000%
      Number of out-of-sequence packets: 0
      Recovery times(0/5) Fail Times(1/3)
      Packet sent: 680, received: 3, Sequence(sent/rcvd/exp): 681/4/5
```

**SLA link monitoring for dynamic IPsec and SSL VPN tunnels**

The link health monitor settings can measure SLA information of dynamic VPN interfaces, which assign IP addresses to their clients during tunnel establishment. This includes SSL VPN tunnels, IPsec remote access, and IPsec site-to-site tunnels.

---

This feature currently only supports IPv4 and the ICMP monitoring protocol. In the IPsec tunnel settings, `net-device` must be disabled.

```bash
config system link-monitor
   edit <name>
      set server-type {static | dynamic}
   next
end
```
To view the dial-up tunnel statistics:

```
# diagnose sys link-monitor tunnel {name | all} [<tunnel_name>]
```

**Example**

In this example, endpoint users dial up using FortiClient to create IPSec tunnels with the FortiGate and obtain IP addresses. The link monitor on the FortiGate’s dynamic VPN interface detects the path quality to the endpoints.

```
1. Configure the IPsec phase 1 interface:

    config vpn ipsec phase1-interface
    edit "for.Branch"
        set type dynamic
        set interface "port15"
        set mode aggressive
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set dhgrp 5
        set xauth-type auto
        set authusrgrp "vpngroup"
        set assign-ip-from name
        set ipv4-netmask 255.255.255.0
        set dns-mode auto
        set ipv4-split-include "172.16.205.0"
        set ipv4-name "client_range"
        set save-password enable
        set psksecret **********
        set dpd-retryinterval 60
    next
```

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
2. Configure the IPsec phase 2 interface:

```plaintext
config vpn ipsec phase2-interface
   edit "for_Branch_p2"
       set phase1name "for_Branch"
       set proposal aes128-shal aes256-shal aes128-sha256 aes256-sha256 aes128gcm
       set dhgrp 5
   next
end
```

3. Configure the dynamic interface:

```plaintext
config system interface
   edit "for_Branch"
       set vdom "root"
       set ip 10.10.10.254 255.255.255.255
       set type tunnel
       set remote-ip 10.10.10.253 255.255.255.0
       set snmp-index 100
       set interface "port15"
   next
end
```

4. Add the IPsec dial-up tunnel to the link health monitor:

```plaintext
config system link-monitor
   edit "1"
       set srcintf "for_Branch"
       set server-type dynamic
   next
end
```

5. Once endpoint users have connected using FortiClient, verify the tunnel information:

```plaintext
# get vpn ipsec tunnel summary
'for_Branch_0': state=alive, peer=10.10.10.1, create_time=2022-02-08 10:43:11, srcintf=for_Branch, latency=0.162, jitter=0.018, pktloss=0.000%
'for_Branch_1': state=alive, peer=10.10.10.2, create_time=2022-02-08 10:49:24, srcintf=for_Branch, latency=0.266, jitter=0.015, pktloss=0.000%
```

6. Verify the link health monitor status:

```plaintext
# diagnose sys link-monitor tunnel all
for_Branch_0 (1): state=alive, peer=10.10.10.1, create_time=2022-02-08 10:43:11, srcintf=for_Branch, latency=200.177, jitter=0.021, pktloss=0.000%
for_Branch_1 (1): state=alive, peer=10.10.10.2, create_time=2022-02-08 10:49:24, srcintf=for_Branch, latency=200.257, jitter=0.017, pktloss=0.000%
```

7. Manually add 200 ms latency on the path between the FortiGate and FortiClients.
8. Verify the link health monitor status again:

```plaintext
# diagnose sys link-monitor tunnel all
for_Branch_0 (1): state=alive, peer=10.10.10.1, create_time=2022-02-08 10:43:11, srcintf=for_Branch, latency=200.177, jitter=0.021, pktloss=0.000%
for_Branch_1 (1): state=alive, peer=10.10.10.2, create_time=2022-02-08 10:49:24, srcintf=for_Branch, latency=200.257, jitter=0.017, pktloss=0.000%
```
IPv6

The following topics provide information about IPv6:

- IPv6 tunneling on page 466
- IPv6 tunnel inherits MTU based on physical interface on page 468
- Configuring IPv4 over IPv6 DS-Lite service on page 470

IPv6 tunneling

IPv6 tunneling involves tunneling IPv6 packets from an IPv6 network through an IPv4 network to another IPv6 network. This is different than NAT because once the packet reaches its final destination, the true originating address of the sender is still readable. The IPv6 packets are encapsulated within packets with IPv4 headers that carry their IPv6 payload through the IPv4 network. IPv6 tunneling is suitable in networks that have completely transitioned over to IPv6 but need an internet connection, which is still mostly IPv4 addresses.

Both IPv6 tunneling devices, whether they are a host or a network device, must be dual stack compatible. The tunneling process is as follows:

1. The tunnel entry node creates an encapsulating IPv4 header and transmits the encapsulated packet.
2. The tunnel exit node receives the encapsulated packet.
3. The IPv4 header is removed.
4. The IPv6 header is updated and the IPv6 packet is processed.

There are two types of tunnels in IPv6 tunneling, automatic and configured. Automatic tunnels are configured by using IPv4 address information embedded in an IPv6 address. The IPv6 address of the destination host includes information about which IPv4 address the packet should be tunneled to. Configured tunnels are manually configured, and they are used for IPv6 addresses that do not have any embedded IPv4 information. The IPv6 and IPv4 addresses of the tunnel endpoints must be specified.

Tunnel configurations

There are four tunneling configurations available depending on which segment of the path between the endpoints of the session the encapsulation takes place.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network device-to-network device</td>
<td>Dual stack capable devices connected by an IPv4 infrastructure can tunnel IPv6 packets between themselves. The tunnel spans one segment of the path taken by the IPv6 packets.</td>
</tr>
<tr>
<td>Host-to-network device</td>
<td>Dual stack capable hosts can tunnel IPv6 packets to an intermediary IPv6 or IPv4 network device that is reachable through an IPv4 infrastructure. The tunnel spans the first segment of the path taken by the IPv6 packets.</td>
</tr>
<tr>
<td>Host-to-host</td>
<td>Dual stack capable hosts that are interconnected by an IPv4 infrastructure can tunnel IPv6 packets between themselves. The tunnel spans the entire path taken by the IPv6 packets.</td>
</tr>
</tbody>
</table>
Network device-to-host

Dual stack capable network devices can tunnel IPv6 packets to their final destination IPv6 or IPv4 host. The tunnel spans only the last segment of the path taken by the IPv6 packets.

Regardless of whether the tunnel starts at a host or a network device, the node that does the encapsulation needs to maintain soft state information, such as the maximum transmission unit (MTU), about each tunnel in order to process the IPv6 packets.

### 6in4 tunnel

The following tunnel configuration tunnels IPv6 traffic over an IPv4 network. An internal IPv6 interface can be configured under `config system interface`.

![Diagram of 6in4 tunnel configuration]

**To configure an IPv6 tunnel over IPv4:**

```plaintext
config system sit-tunnel
edit <name>
    set source <src_IPv4_address>
    set destination <dst_IPv4_address>
    set interface <src_interface>
    set ip6 <tunnel_IPv6_address>
next
end
```

### 4in6 tunnel

Conversely, the following tunnel configuration tunnels IPv4 traffic over an IPv6 network.

**To configure an IPv4 tunnel over IPv6:**

```plaintext
config system ipv6-tunnel
edit <name>
    set source <src_IPv6_address>
    set destination <dst_IPv6_address>
    set interface <src_interface>
next
end
```

The preceding configurations are not available in transparent mode.
IPv6 tunnel inherits MTU based on physical interface

The MTU of an IPv6 tunnel interface is calculated from the MTU of its parent interface minus headers.

Example

In this topology, FortiGate B and FortiGate D are connected over an IPv6 network. An IPv6 tunnel is formed, and IPv4 can be used over the IPv6 tunnel. The tunnel interface MTU is based on the physical interface MTU minus the IP and TCP headers (40 bytes). On FortiGate B’s physical interface port5, the MTU is set to 1320. The IPv6 tunnel is based on port5, and its MTU value of 1280 is automatically calculated from the MTU value of its physical interface minus the header. The same is true for port3 on FortiGate D.

To verify the MTU for the IPv6 tunnel on FortiGate B:

1. Configure port5:
   ```
   config system interface
   edit "port5"
   set vdom "root"
   set type physical
   set snmp-index 7
   config ipv6
   set ip6-address 2000:172:16:202::1/64
   set ip6-allowaccess ping
   end
   set mtu-override enable
   set mtu 1320
   next
   end
   ```

2. Configure the IPv6 tunnel:
   ```
   config system ipv6-tunnel
   edit "B_2_D"
   set source 2000:172:16:202::1
   set destination 2000:172:16:202::2
   set interface "port5"
   next
   end
   ```

3. Configure the tunnel interface:
   ```
   config system interface
   edit "B_2_D"
   set vdom "root"
   set ip 172.16.210.1 255.255.255.255
   set allowaccess ping https http
   set type tunnel
   ```
set remote-ip 172.16.210.2 255.255.255.255
set snmp-index 33
config ipv6
    set ip6-address 2000:172:16:210::1/64
    set ip6-allowaccess ping
    config ip6-extra-addr
        edit fe80::2222/10
        next
    end
end
set interface "port5"
next
end

4. Verify the interface lists:

    # diagnose netlink interface list port5
    if=port5 family=00 type=1 index=13 mtu=1320 link=0 master=0
    ref=68 state=start present fw_flags=0 flags=up broadcast run multicast
    Qdisc=eq hw_addr:::***:::* broadcast_addr:::***:*:*:*:*:*:
    stat: rxp=1577 txp=1744 rxb=188890 txb=203948 rxe=0 txe=0 rxd=0 txd=0 mc=825 collision=0
    @ time=1631647112
    re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=68

    # diagnose netlink interface list B_2_D
    if=B_2_D family=00 type=769 index=41 mtu=1280 link=0 master=0
    ref=25 state=start present fw_flags=0 flags=up p2p run noarp multicast
    Qdisc=noqueue local=0.0.0.0 remote=0.0.0.0
    stat: rxp=407 txp=417 rxb=66348 txb=65864 rxe=0 txe=61 rxd=0 txd=0 mc=0 collision=60
    @ time=1631647126
    re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=25

To verify the MTU for the IPv6 tunnel on FortiGate D:

1. Configure port3:

    config system interface
    edit "port3"
        set vdom "root"
        set type physical
        set snmp-index 5
        config ipv6
            set ip6-address 2000:172:16:202::2/64
            set ip6-allowaccess ping
        end
        set mtu-override enable
            set mtu 1320
        next
    end
2. Configure the IPv6 tunnel:

```plaintext
config system ipv6-tunnel
   edit "D_2_B"
      set source 2000:172:16:202::2
      set destination 2000:172:16:202::1
      set interface "port3"
   next
end
```

3. Configure the tunnel interface:

```plaintext
config system interface
   edit "D_2_B"
      set vdom "root"
      set ip 172.16.210.2 255.255.255.255
      set allowaccess ping https http
      set type tunnel
      set remote-ip 172.16.210.1 255.255.255.255
      set snmp-index 36
      config ipv6
         set ip6-address 2000:172:16:210::2/64
         set ip6-allowaccess ping
         config ip6-extra-addr
            edit fe80::4424/10
               next
            end
         end
      end
      set interface "port3"
   next
end
```

4. Verify the interface lists:

```plaintext
# diagnose netlink interface list port3
# diagnose netlink interface list D_2_B
```

**Configuring IPv4 over IPv6 DS-Lite service**

IPv4 over IPv6 DS-Lite service can be configured on a virtual network enabler (VNE) tunnel. In addition, VNE tunnel fixed IP mode supports username and password authentication.

```plaintext
config system vne-tunnel
   set status enable
   set mode {map-e | fixed-ip | ds-lite}
   set ipv4-address <IPv4_address>
   set br <IPv6_address or FQDN>
   set http-username <string>
   set http-password <password>
end
```

| mode {map-e | fixed-ip | ds-lite} | Set the VNE tunnel mode: |

DS-Lite allows applications using IPv4 to access the internet with IPv6. DS-Lite is supported by internet providers that do not have enough public IPv4 addresses for their customers, so DS-Lite is used for IPv6 internet connections. When a DS-Lite internet connections is used, the FortiGate encapsulates all data from IPv4 applications into IPv6 packets. The packets are then transmitted to the internet service provider using the IPv6 connection. Next, a dedicated server unpacks the IPv6 packets and forwards the IPv4 data to the actual destination on the internet.

DS-Lite example

In this example, DS-Lite VNE tunnel mode is used between the FortiGate and the BR.

To configure a DS-Lite tunnel between the FortiGate and the BR:

1. Configure the IPv6 interface:

```plaintext
config system interface
edit "wan1"
   set vdom "root"
   set mode dhcp
   set allowaccess ping fgfm
   set type physical
   set role wan
   set snmp-index 1
   config ipv6
      set ip6-allowaccess ping
      set dhcp6-information-request enable
      set autoconf enable
      set unique-autoconf-addr enable
   end
next
end
```
2. Configure the VNE tunnel:

```yaml
config system vne-tunnel
  set status enable
  set interface "wan1"
  set ssl-certificate "Fortinet_Factory"
  set auto-asic-offload enable
  set ipv4-address 192.168.1.99 255.255.255.255
  set br "dgw.xxxxx.jp"
  set mode ds-lite
end
```

3. View the wan1 IPv6 configuration details:

```yaml
config system interface
  edit "wan1"
  config ipv6
    get
      ip6-mode : static
      nd-mode : basic
      ip6-allowaccess : ping
      icmp6-send-redirect : enable
      ra-send-mtu : enable
      ip6-reachable-time : 0
      ip6-retrans-time : 0
      ip6-hop-limit : 0
      dhcp6-information-request: enable
      cli-conn6-status : 1
      vrrp-virtual-mac6 : disable
      vrip6_link_local : ::
      ip6-dns-server-override: enable
      Acquired DNS2 : ::
      ip6-extra-addr:
        ip6-send-adv : disable
        autoconf : enable
        prefix : 2001:f70:2880:xxxx::/64
        preferred-life-time : 942735360
        valid-life-time : 1077411840
        unique-autoconf-addr: enable
        interface-identifier: ::
        dhcp6-relay-service : disable
    end
  next
end
```

4. Verify the IPv6 address list:

```bash
# diagnose ipv6 address list
dev=5 devname=wan1 flag= scope=0 prefix=64 addr=2001:f70:2880:xxxx:xxxx:xxxx:fe39:ccd2
preferred=11525 valid=13325 cstamp=6520 tstamp=6892
dev=5 devname=wan1 flag=P scope=253 prefix=64 addr=fe80::xxxx:xxxx:fe39:ccd2
```
5. Test the tunnel connection by pinging the Google public DNS IPv6 address:

```
# execute ping6 2001:4860:4860::8888
PING 2001:4860:4860::8888 (2001:4860:4860::8888) 56 data bytes
64 bytes from 2001:4860:4860::8888: icmp_seq=1 ttl=114 time=6.89 ms
64 bytes from 2001:4860:4860::8888: icmp_seq=2 ttl=114 time=3.39 ms
64 bytes from 2001:4860:4860::8888: icmp_seq=3 ttl=114 time=3.46 ms
64 bytes from 2001:4860:4860::8888: icmp_seq=4 ttl=114 time=3.34 ms
64 bytes from 2001:4860:4860::8888: icmp_seq=5 ttl=114 time=3.39 ms
--- 2001:4860:4860::8888 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss, time 4079ms
rtt min/avg/max/mdev = 3.340/4.097/6.895/1.400 ms
```

### Fixed IP mode example

In this example, fixed IP VNE tunnel mode with HTTP authentication is used between the FortiGate and the BR.

To configure a fixed IP mode with HTTP authentication between the FortiGate and the BR:

1. **Configure the IPv6 interface:**

   ```
   config system interface
   edit "wan1"
   set vdom "root"
   set mode dhcp
   set allowaccess ping fgfm
   set type physical
   set role wan
   set snmp-index 1
   config ipv6
   set ip6-allowaccess ping
   set dhcp6-information-request enable
   set autoconf enable
   end
   ```

2. **Configure the VNE tunnel:**

   ```
   config system vne-tunnel
   set status enable
   set interface "wan1"
   set ipv4-address 120.51.xxx.xxx1 255.255.255.255
   set br "2001:f60:xxxx:xxxx::1"
   ```
3. Verify the wan1 IPv6 configuration details:

   config system interface
   edit "wan1"
      config ipv6
      get

4. Verify the VNE daemon:

   # diagnose test application vned 1

   vdom: root/0, is master, devname=wan1 link=0 tun=vne.root mode=fixed-ip ssl_
cert=Fortinet_Factory
   end user ipv6 perfix: 2001:f70:2880:xxxx::/64
   config ipv4 perfix: 120.51.xxx.xxx1/255.255.255.255
   config br: 2001:f60:xxxx:xxxx::1
   HTTP username: laptop-
   update url: https://ddnsweb1.ddns.xxxxxx.jp/cgi-bin/ddns_
   api.cgi?d=xxxxxx.v4v6.xxxxx.jp&p=**********
   host: ddnsweb1.ddns.xxxxxx.jp path: /cgi-bin/ddns_
   api.cgi?d=xxxxxx.v4v6.xxxxx.jp&p=**********
   tunnel br: 2001:f60:xxxx:xxxx::1
   tunnel ipv4 addr: 120.51.xxx.xxx1/255.255.255.255
   update result: <H1>DDNS API</H1><HR><H2>*
   routerinfo check : OK</H2><H2>* routerinfo update : OK</H2><H2>* DDNS API update : Success [2022-01-
   18 18:37:58 1642498678]</H2>
   Fixed IP rule client: state=succeed retries=0 interval=0 expiry=0 reply_code=0
   fqdn=2001:f60:xxxx:xxxx::1 num=1 cur=0 ttl=4294967295 expiry=0
   2001:f60:xxxx:xxxx::1
   Fixed IP DDNS client: state=succeed retries=0 interval=10 expiry=0 reply_code=200
   fqdn=ddnsweb1.ddns.xxxxxx.jp num=1 cur=0 ttl=6 expiry=0
   2001:f61:0:2a::18

5. Test the tunnel connection by pinging the Google public DNS IPv4 and IPv6 addresses:

   # execute ping 8.8.8.8
   PING 8.8.8.8 (8.8.8.8): 56 data bytes
   64 bytes from 8.8.8.8: icmp_seq=0 ttl=119 time=3.7 ms
   64 bytes from 8.8.8.8: icmp_seq=1 ttl=119 time=3.6 ms
   64 bytes from 8.8.8.8: icmp_seq=2 ttl=119 time=3.6 ms
   64 bytes from 8.8.8.8: icmp_seq=3 ttl=119 time=3.6 ms
Network

64 bytes from 8.8.8.8: icmp_seq=4 ttl=119 time=3.5 ms
--- 8.8.8.8 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 3.5/3.6/3.7 ms

# execute ping6 2001:4860:4860::8888
PING 2001:4860:4860::8888 (2001:4860:4860::8888) 56 data bytes
64 bytes from 2001:4860:4860::8888: icmp_seq=1 ttl=114 time=6.99 ms
64 bytes from 2001:4860:4860::8888: icmp_seq=2 ttl=114 time=3.61 ms
64 bytes from 2001:4860:4860::8888: icmp_seq=3 ttl=114 time=3.34 ms
64 bytes from 2001:4860:4860::8888: icmp_seq=4 ttl=114 time=3.27 ms
64 bytes from 2001:4860:4860::8888: icmp_seq=5 ttl=114 time=3.75 ms
--- 2001:4860:4860::8888 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss, time 4039ms
rtt min/avg/max/mdev = 3.276/4.195/6.992/1.409 ms

Diagnostics

Administrators can use the Diagnostics page to access the following tools:

<table>
<thead>
<tr>
<th>Capture packet</th>
<th>Captures packet streams in real-time to let you view header and payload information. See Using the packet capture tool on page 475.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug flow</td>
<td>Traces packet flow through FortiOS to help you diagnose and debug issues. See Using the debug flow tool on page 479.</td>
</tr>
</tbody>
</table>

See also Performing a sniffer trace or packet capture on page 2660 and Debugging the packet flow on page 2661.

Using the packet capture tool

Administrators can use the packet capture tool to select a packet and view its header and payload information in real-time. Once completed, packets can be filtered by various fields or through the search bar. The capture can be saved as a PCAP file that you can use with a third-party application, such as Wireshark, for further analysis.

Recent capture criteria is saved after the packet capture, and you can select and use the same criteria again.

For information about running a packet capture in the CLI, see Performing a sniffer trace or packet capture on page 2660.

To use the packet capture tool in the GUI:

1. Go to Network > Diagnostics and select the Packet Capture tab.
2. Optionally, select an Interface (any is the default).
3. Optionally, enable Filters and select a Filtering syntax:
a. **Basic:** enter criteria for the Host, Port, and Protocol number.

![Packet Capture](image1)

b. **Advanced:** enter a string, such as `src host 172.16.200.254 and dst host 172.16.200.1 and dst port 443`.

![Packet Capture](image2)

4. Click *Start capture*. The capture is visible in real-time.
5. While the capture is running, select a packet, then click the Headers or Packet Data tabs to view more information.
6. When the capture is finished, click **Save as pcap**. The PCAP file is automatically downloaded.

7. Optionally, use the **Search** bar or the column headers to filter the results further. The packet capture history is listed under **Recent Capture Criteria** in the right-side of the screen. Clicking the hyperlink will take you back to the main page with the interface and filter settings already populated.
For more granular sniffer output with various verbose settings, use `diagnose sniffer packet <interface> <'filter'> <verbose> <count> <tsformat>`. See Performing a sniffer trace or packet capture on page 2660.

To use recent capture criteria:

1. Go to Network > Diagnostics and select the Packet Capture tab.
2. Under Recent Capture Criteria, click one of the saved capture criteria. The criteria populate the fields.
3. Click Start Capture.

Using the debug flow tool

Administrators can use the debug flow tool to display debug flow output in real-time until it is stopped. The completed output can be filtered by time, message, or function. The output can be exported as a CSV file.

For information about using the debug flow tool in the CLI, see Debugging the packet flow on page 2661.

To run a debug flow:

1. Go to Network > Diagnostics and select the Debug Flow tab.
2. Optionally, enable Filters and select a Filter type:
   a. Basic: filter by IP address, Port, and Protocol, which is the equivalent of:
      - `# diagnose debug flow filter addr <addr/range>`
      - `# diagnose debug flow filter port <port/range>`
      - `# diagnose debug flow filter proto <protocol>`
b. **Advanced**: filter by *Source IP, Source port, Destination IP, Destination port, and Protocol*, which is the equivalent of:

- `# diagnose debug flow filter saddr <addr/range>`
- `# diagnose debug flow filter sport <port/range>`
- `# diagnose debug flow filter daddr <addr/range>`
- `# diagnose debug flow filter dport <port/range>`
- `# diagnose debug flow filter proto <protocol>`

3. Click **Start debug flow**. The debug messages are visible in real-time.
4. When the debug flow is finished (or you click *Stop debug flow*), click *Save as CSV*. The CSV file is automatically downloaded.
The current output can be filtered by *Time* and *Message*. The *Function* field can be added.

5. Hover over the table header and click the gear icon (*Configure Table*).

6. Select *Function* and click *Apply*. The *Function* column is displayed and can be used to filter the output for further analysis.
SD-WAN

The following topics provide information about SD-WAN:

- SD-WAN overview on page 484
- SD-WAN quick start on page 488
- SD-WAN zones on page 498
- Performance SLA on page 507
- SD-WAN rules on page 539
- Advanced routing on page 603
- VPN overlay on page 633
- Advanced configuration on page 690
- SD-WAN cloud on-ramp on page 722
- Troubleshooting SD-WAN on page 744

SD-WAN overview

SD-WAN is a software-defined approach to managing Wide-Area Networks (WAN). It consolidates the physical transport connections, or underlays, and monitors and load-balances traffic across the links. VPN overlay networks can be built on top of the underlays to control traffic across different sites.

Health checks and SD-WAN rules define the expected performance and business priorities, allowing the FortiGate to automatically and intelligently route traffic based on the application, internet service, or health of a particular connection.

WAN security and intelligence can be extended into the LAN by incorporating wired and wireless networks under the same domain. FortiSwitch and FortiAP devices integrate seamlessly with the FortiGate to form the foundation of an SD-Branch.

Some of the key benefits of SD-WAN include:

- Reduced cost with transport independence across MPLS, 4G/5G LTE, and others.
- Reduced complexity with a single vendor and single-pane-of-glass management.
- Improve business application performance thanks to increased availability and agility.
- Optimized user experience and efficiency with SaaS and public cloud applications.

SD-WAN components

SD-WAN can be broken down into three layers:

- Management and orchestration
- Control, data plane, and security
- Network access
The control, data plane, and security layer can only be deployed on a FortiGate. The other two layers can help to scale and enhance the solution. For large deployments, FortiManager and FortiAnalyzer provide the management and orchestration capabilities FortiSwitch and FortiAP provide the components to deploy an SD-Branch.

**SD-WAN designs and architectures**

The core functionalities of Fortinet's SD-WAN solution are built into the FortiGate. Whether the environment contains one FortiGate, or one hundred, you can use SD-WAN by enabling it on the individual FortiGates.

At a basic level, SD-WAN can be deployed on a single device in a single site environment:

At a more advanced level, SD-WAN can be deployed in a multi-site, hub and spoke environment:
At an enterprise or MSSP level, the network can include multiple hubs, possibly across multiple regions:

For more details, see the SD-WAN / SD-Branch Architecture for MSSPs guide.

**SD-WAN designs principles**

The Five-pillar approach, described in the SD-WAN / SD-Branch Architecture for MSSPs guide, is recommended when designing a secure SD-WAN solution.

<table>
<thead>
<tr>
<th>Pillar</th>
<th>Overview</th>
</tr>
</thead>
<tbody>
<tr>
<td>Underlay</td>

</tr>
<tr>
<td>Security</td>
<td>Choose how to protect each of the available paths.</td>
</tr>
<tr>
<td>SD-WAN</td>
<td>Choose the strategy used to pick one of the available paths.</td>
</tr>
</tbody>
</table>

**Underlay**

Determine the WAN links that will be used for the underlay network, such as your broadband link, MPLS, 4G/5G LTE connection, and others.

For each link, determine the bandwidth, quality and reliability (packet loss, latency, and jitter), and cost. Use this information to determine which link to prefer, what type of traffic to send across the each link, and to help you the baselines for health-checks.

**Overlay**

VPN overlays are needed when traffic must travel across multiple sites. These are usually site-to-site IPsec tunnels that interconnect branches, datacenters, and the cloud, forming a hub-and-spoke topology.

The management and maintenance of the tunnels should be considered when determining the overlay network requirements. Manual tunnel configuration might be sufficient in a small environment, but could become unmanageable as the environment size increases. ADVPN can be used to help scale the solution; see ADVPN on page 1532 for more information.

**Routing**

Traditional routing designs manipulate routes to steer traffic to different links. SD-WAN uses traditional routing to build the basic routing table to reach different destinations, but uses SD-WAN rules to steer traffic. This allows the steering to be based on criteria such as destination, internet service, application, route tag, and the health of the link. Routing in an SD-WAN solution is used to identify all possible routes across the underlays and overlays, which the FortiGate balances using ECMP.

In the most basic configuration, static gateways that are configured on an SD-WAN member interface automatically provide the basic routing needed for the FortiGate to balance traffic across the links. As the number of sites and destinations increases, manually maintaining routes to each destination becomes difficult. Using dynamic routing to advertise routes across overlay tunnels should be considered when you have many sites to interconnect.

**Security**

Security involves defining policies for access control and applying the appropriate protection using the FortiGate’s NGFW features. Efficiently grouping SD-WAN members into SD-WAN zones must also be considered. Typically, underlays provide direct internet access and overlays provide remote internet or network access. Grouping the underlays together into one zone, and the overlays into one or more zones could be an effective method.

**SD-WAN**

The SD-WAN pillar is the intelligence that is applied to traffic steering decisions. It is comprised of four primary elements:
- **SD-WAN zones**
  SD-WAN is divided into zones. SD-WAN member interfaces are assigned to zones, and zones are used in policies as source and destination interfaces. You can define multiple zones to group SD-WAN interfaces together, allowing logical groupings for overlay and underlay interfaces. Routing can be configured per zone.
  See [SD-WAN zones on page 498](#).

- **SD-WAN members**
  Also called interfaces, SD-WAN members are the ports and interfaces that are used to run traffic. At least one interface must be configured for SD-WAN to function.
  See [Configuring the SD-WAN interface on page 489](#).

- **Performance SLAs**
  Also called health-checks, performance SLAs are used to monitor member interface link quality, and to detect link failures. When the SLA falls below a configured threshold, the route can be removed, and traffic can be steered to different links in the SD-WAN rule.
  SLA health-checks use active or passive probing:
  - Active probing requires manually defining the server to be probed, and generates consistent probing traffic.
  - Passive probing uses active sessions that are passing through firewall policies used by the related SD-WAN interfaces to derive health measurements. It reduces the amount of configuration, and eliminates probing traffic. See [Passive WAN health measurement on page 518](#) for details.
  See [Performance SLA on page 507](#).

- **SD-WAN rules**
  Also called services, SD-WAN rules control path selection. Specific traffic can be dynamically sent to the best link, or use a specific route.
  Rules control the strategy that the FortiGate uses when selecting the outbound traffic interface, the SLAs that are monitored when selecting the outgoing interface, and the criteria for selecting the traffic that adheres to the rule. When no SD-WAN rules match the traffic, the implicit rule applies.
  See [SD-WAN rules on page 539](#).

### SD-WAN quick start

This section provides an example of how to start using SD-WAN for load balancing and redundancy.

In this example, two ISP internet connections, wan1 (DHCP) and wan2 (static), use SD-WAN to balance traffic between them at 50% each.

![SD-WAN quick start diagram](#)
1. Configuring the SD-WAN interface on page 489
2. Adding a static route on page 490
3. Selecting the implicit SD-WAN algorithm on page 490
4. Configuring firewall policies for SD-WAN on page 491
5. Link monitoring and failover on page 492
6. Results on page 493
7. Configuring SD-WAN in the CLI on page 496

Configuring the SD-WAN interface

First, SD-WAN must be enabled and member interfaces must be selected and added to a zone. The selected FortiGate interfaces can be of any type (physical, aggregate, VLAN, IPsec, and others), but must be removed from any other configurations on the FortiGate.

In this step, two interfaces are configured and added to the default SD-WAN zone (virtual-wan-link) as SD-WAN member interfaces. This example uses a mix of static and dynamic IP addresses; your deployment could also use only one or the other.

Once the SD-WAN members are created and added to a zone, the zone can be used in firewall policies, and the whole SD-WAN can be used in static routes.

To configure SD-WAN members:

1. Configure the wan1 and wan2 interfaces. See Interface settings on page 137 for details.
   a. Set the wan1 interface Addressing mode to DHCP and Distance to 10.

   By default, a DHCP interface has a distance of 5, and a static route has a distance of 10. It is important to account for this when configuring your SD-WAN for 50/50 load balancing by setting the DHCP interface’s distance to 10.

   b. Set the wan2 interface IP/Netmask to 10.100.20.1 255.255.255.0.
2. Go to Network > SD-WAN, select the SD-WAN Zones tab, and click Create New > SD-WAN Member.
3. Set the Interface to wan1.
4. Leave SD-WAN Zone as virtual-wan-link.
5. As wan1 uses DHCP, leave Gateway set to 0.0.0.0.
   If IPv6 visibility is enabled in the GUI, an IPv6 gateway can also be added for each member. See Feature visibility on page 2165 for details.
6. Leave Cost as 0.
   The Cost field is used by the Lowest Cost (SLA) strategy. The link with the lowest cost is chosen to pass traffic. The lowest possible Cost is 0.
7. Set Status to Enable, and click OK.
8. Repeat the above steps for wan2, setting Gateway to the ISP’s gateway: 10.100.20.2.

Adding a static route

You must configure a default route for the SD-WAN. The default gateways for each SD-WAN member interface do not need to be defined in the static routes table. FortiGate will decide what route or routes are preferred using Equal Cost Multi-Path (ECMP) based on distance and priority.

To create a static route for SD-WAN:

1. Go to Network > Static Routes.
2. Click Create New. The New Static Route page opens.
3. Set Destination to Subnet, and leave the IP address and subnet mask as 0.0.0.0/0.0.0.0.
4. In the Interface field select an SD-WAN zone.
5. Ensure that Status is Enabled.
6. Click OK.

Selecting the implicit SD-WAN algorithm

SD-WAN rules define specific routing options to route traffic to an SD-WAN member.
If no routing rules are defined, the default *Implicit* rule is used. It can be configured to use one of five different load balancing algorithms. See *Implicit rule on page 547* for more details and examples.

This example shows four methods to equally balance traffic between the two WAN connections. Go to *Network > SD-WAN*, select the *SD-WAN Rules* tab, and edit the *sd-wan* rule to select the method that is appropriate for your requirements.

- **Source IP** *(CLI command: source-ip-based)*:
  Select this option to balance traffic equally between the SD-WAN members according to a hash algorithm based on the source IP addresses.

- **Session** *(weight-based)*:
  Select this option to balance traffic equally between the SD-WAN members by the session numbers ratio among its members. Use weight 50 for each of the 2 members.

- **Source-Destination IP** *(source-dest-ip-based)*:
  Select this option to balance traffic equally between the SD-WAN members according to a hash algorithm based on the source and destination IP addresses.

- **Volume** *(measured-volume-based)*:
  Select this option to balance traffic equally between the SD-WAN members according to the bandwidth ratio among its members.

**Configuring firewall policies for SD-WAN**

SD-WAN zones can be used in policies as source and destination interfaces. Individual SD-WAN members cannot be used in policies.

You must configure a policy that allows traffic from your organization’s internal network to the SD-WAN zone. Policies configured with the SD-WAN zone apply to all SD-WAN interface members in that zone.

**To create a firewall policy for SD-WAN:**

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*. The *New Policy* page opens.
3. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>Enter a name for the policy.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>internal</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>virtual-wan-link</td>
</tr>
<tr>
<td>Source</td>
<td>all</td>
</tr>
<tr>
<td>Destination</td>
<td>all</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>Firewall / Network Options</td>
<td>Enable NAT and set IP Pool Configuration to Use Outgoing Interface Address.</td>
</tr>
<tr>
<td>Security Profiles</td>
<td>Apply profiles as required.</td>
</tr>
<tr>
<td>Logging Options</td>
<td>Enable Log Allowed Traffic and select All Sessions. This allows you to verify results later.</td>
</tr>
</tbody>
</table>

4. Enable the policy, then click OK.

Link monitoring and failover

Performance SLA link monitoring measures the health of links that are connected to SD-WAN member interfaces by sending probing signals through each link to a server, and then measuring the link quality based on latency, jitter, and packet loss. If a link is broken, the routes on that link are removed and traffic is routed through other links. When the link is working again, the routes are re-enabled. This prevents traffic being sent to a broken link and lost.

In this example, the detection server IP address is 208.91.112.53. A performance SLA is created so that, if ping fails per the metrics defined, the routes to that interface are removed and traffic is detoured to the other interface. The ping protocol is used, but other protocols could also be selected as required.
To configure a performance SLA:

1. Go to Network > SD-WAN, select the Performance SLAs tab, and click Create New.
2. Enter a name for the SLA and set Protocol to Ping.
3. In the Server field, enter the detection server IP address (208.91.112.53 in this example).
4. In the Participants field, select Specify and add wan1 and wan2.

![SD-WAN SLA configuration interface](image)

SLA targets are not required for link monitoring.

5. Configure the required metrics in Link Status.
6. Ensure that Update static route is enabled. This disables static routes for the inactive interface and restores routes on recovery.
7. Click OK.

Results

The following GUI pages show the function of the SD-WAN and can be used to confirm that it is setup and running correctly:

- Interface usage on page 493
- Performance SLA on page 494
- Routing table on page 496
- Firewall policy on page 496

**Interface usage**

Go to Network > SD-WAN and select the SD-WAN Zones tab to review the SD-WAN interfaces’ usage.
SD-WAN

**Bandwidth**

Select *Bandwidth* to view the amount of downloaded and uploaded data for each interface.

![Bandwidth chart]

**Volume**

Select *Volume* to see donut charts of the received and sent bytes on the interfaces.

![Volume chart]

**Sessions**

Select *Sessions* to see a donut chart of the number of active sessions on each interface.

![Sessions chart]

**Performance SLA**

Go to *Network > SD-WAN*, select the *Performance SLAs* tab, and select the SLA from the table (server in this example) to view the packet loss, latency, and jitter on each SD-WAN member in the health check server.
Packet loss

Select *Packet Loss* to see the percentage of packets lost for each member.

Latency

Select *Latency* to see the current latency, in milliseconds, for each member.

Jitter

Select *Jitter* to see the jitter, in milliseconds, for each member.
Routing table

Go to Dashboard > Network, expand the Routing widget, and select Static & Dynamic to review all static and dynamic routes. For more information about the widget, see Static & Dynamic Routing monitor on page 89.

![Routing table](image)

Firewall policy

Go to Policy & Objects > Firewall Policy to review the SD-WAN policy.

![Firewall policy](image)

Configuring SD-WAN in the CLI

This example can be entirely configured using the CLI.

To configure SD-WAN in the CLI:

1. Configure the wan1 and wan2 interfaces:

   ```
   config system interface
   edit "wan1"
   set alias to_ISP1
   set mode dhcp
   set distance 10
   next
   edit "wan2"
   set alias to_ISP2
   set ip 10.100.20.1 255.255.255.0
   next
   end
   ```
2. Enable SD-WAN and add the interfaces as members:

```plaintext
config system sdwan
    set status enable
config members
    edit 1
        set interface "wan1"
    next
    edit 2
        set interface "wan2"
        set gateway 10.100.20.2
    next
end
end
```

If no SD-WAN zone is specified, members are added to the default `virtual-wan-link` zone.

3. Create a static route for SD-WAN:

```plaintext
config router static
    edit 1
        set sdwan-zone "virtual-wan-link"
    next
end
```

4. Select the implicit SD-WAN algorithm:

```plaintext
config system sdwan
    set load-balance-mode {source-ip-based | weight-based | source-dest-ip-based | measured-volume-based}
end
```

5. Create a firewall policy for SD-WAN:

```plaintext
config firewall policy
    edit <policy_id>
        set name <policy_name>
        set srcintf "internal"
        set dstintf "virtual-wan-link"
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
        set utm-status enable
        set ssl-ssh-profile <profile_name>
        set av-profile <profile_name>
        set webfilter-profile <profile_name>
        set dnsfilter-profile <profile_name>
        set emailfilter-profile <profile_name>
        set ips_sensor <sensor_name>
        set application-list <app_list>
        set voip-profile <profile_name>
        set logtraffic all
        set nat enable
```
set status enable
next
end

6. Configure a performance SLA:

config system sdwan
config health-check
edit "server"
    set server "208.91.112.53"
    set update-static-route enable
    set members 1 2
next
end

Results

To view the routing table:

# get router info routing-table all

Routing table for VRF=0
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
* - candidate default

S* 0.0.0.0/0 [1/0] via 172.16.20.2, wan1
    [1/0] via 10.100.20.2, wan2
C 10.100.20.0/24 is directly connected, wan2
C 172.16.20.2/24 is directly connected, wan1
C 192.168.0.0/24 is directly connected, internal

To diagnose the Performance SLA status:

FGT # diagnose sys sdwan health-check
Health Check(server):
Seq(1): state(alive), packet-loss(0.000%) latency(15.247), jitter(5.231) sla_map=0x0
Seq(2): state(alive), packet-loss(0.000%) latency(13.621), jitter(6.905) sla_map=0x0

SD-WAN zones

SD-WAN is divided into zones. SD-WAN member interfaces are assigned to zones, and zones are used in policies, static routes, and SD-WAN rules.

You can define multiple zones to group SD-WAN interfaces together, allowing logical groupings for overlay and underlay interfaces. Zones are used in firewall policies, as source and destination interfaces, to allow for more granular control. SD-WAN members cannot be used directly in policies.
SD-WAN zones and members can both be used in IPv4 and IPv6 static routes to make route configuration more flexible, and in SD-WAN rules to simplify the rule configuration. See Specify an SD-WAN zone in static routes and SD-WAN rules on page 503 for more information.

In the CLI:
- `config system sdwan` has replaced `config system virtual-wan-link`.
- `diagnose sys sdwan` has replaced `diagnose sys virtual-wan-link`.
- When configuring a static route, the `sdwan-zone` variable has replaced the `sdwan` variable.

When the Security Fabric is configured, SD-WAN zones are included in the Security Fabric topology views.

To create an SD-WAN zone in the GUI:

1. Go to **Network > SD-WAN** and select the **SD-WAN Zones** tab.
   The default SD-WAN zones are **virtual-wan-link** and **SASE**.
2. Click **Create New > SD-WAN Zone**.
3. Enter a name for the new zone, such as **vpn-zone**.
4. If SD-WAN members have already been created, add the required members to the zone.
   Members can also be added to the zone after it has been created by editing the zone, or when creating or editing the member.
5. Click OK.

To create an SD-WAN interface member in the GUI:

1. Go to Network > SD-WAN, select the SD-WAN Zones tab, and click Create New > SD-WAN Member.
2. Select an interface. The interface can also be left as none and selected later, or click +VPN to create an IPsec VPN for the SD-WAN member.
3. Select the SD-WAN zone that the member will join. A member can also be moved to a different zone at any time.
4. Set the Gateway, Cost, and Status as required.
5. Click OK.

The interface list at Network > Interfaces shows the SD-WAN zones and their members.
To create a policy using the SD-WAN zone in the GUI:

1. Go to Policy & Objects > Firewall Policy, Policy & Objects > Proxy Policy, or Policy & Objects > Security Policy.
2. Click Create New.
3. Configure the policy settings as needed, selecting an SD-WAN zone or zones for the incoming and/or outgoing interface.

4. Click OK.

To view SD-WAN zones in a Security Fabric topology:

1. Go to Security Fabric > Physical Topology or Security Fabric > Logical Topology. The SD-WAN zones and their members are shown.
To configure SD-WAN in the CLI:

1. **Enable SD-WAN and create a zone:**
   ```
   config system sdwan
   set status enable
   config zone
   edit "vpn-zone"
   next
   end
   end
   ```

2. **Configure SD-WAN members and add them to a zone:**
   ```
   config system sdwan
   config members
   edit 1
   set interface "to_ISP2"
   set zone "vpn-zone"
   next
   edit 2
   set interface "vpn-to-dc"
   set zone "vpn-zone"
   next
   end
   end
   ```

To create a policy using the SD-WAN zone in the CLI:

```
config firewall policy
edit 1
set name sd-wan-1
set srcintf internal
set dstintf vpn-zone
set srcaddr all
set dstaddr all
set action accept
```
set schedule always
set service ALL
set utm-status enable
set logtraffic all
set nat enable
set status enable
next
end

Specify an SD-WAN zone in static routes and SD-WAN rules

SD-WAN zones can be used in IPv4 and IPv6 static routes, and in SD-WAN service rules. This makes route configuration more flexible, and simplifies SD-WAN rule configuration.

To configure an SD-WAN zone in a static route in the GUI:

1. Go to Network > Static Routes
2. Edit an existing static route, or click Create New to create a new route.
3. Set Interface to one or more SD-WAN zones.
4. Configure the remaining settings are required.
5. Click OK.

To configure an SD-WAN zone in a static route in the CLI:

```
config router {static | static6}
  edit 1
    set sdwan-zone <zone> <zone> ...
  next
end
```

To configure an SD-WAN zone in an SD-WAN rule in the GUI:

1. Go to Network > SD-WAN and select the SD-WAN Rules tab
2. Edit an existing rule, or click Create New to create a new rule.
3. In the Zone preference field add one or more SD-WAN zones.
4. Configure the remaining settings are needed.
5. Click OK.

To configure an SD-WAN zone in an SD-WAN rule in the CLI:

```plaintext
config system sdwan
  config service
    edit 1
      set priority-zone <zone>
    next
  end
end
```

Examples

In these two examples, three SD-WAN members are created. Two members, port13 and port15, are in the default zone (virtual-wan-link), and the third member, to_FG_B_root, is in the SASE zone.

Example 1

In this example:

- Two service rules are created. Rule 1 uses the virtual-wan-link zone, and rule 2 uses the SASE zone.
- Two IPv4 static routes are created. The first route uses the virtual-wan-link zone, and the second route uses the SASE zone.
To configure the SD-WAN:

1. Assign port13 and port15 to the `virtual-wan-link` zone and to _FG_B_root to the SASE zone:

   ```
   config system sdwan
   set status enable
   config members
   edit 1
     set interface "port13"
     set zone "virtual-wan-link"
     set gateway 10.100.1.1
   next
   edit 2
     set interface "port15"
     set zone "virtual-wan-link"
     set gateway 10.100.1.5
   next
   edit 3
     set interface "to_FG_B_root"
     set zone "SASE"
   next
   end
   end
   ```

2. Create two service rules, one for each SD-WAN zone:

   ```
   config system sdwan
   config service
   edit 1
     set dst "10.100.20.0"
     set priority-zone "virtual-wan-link"
   next
   edit 2
     set internet-service enable
     set internet-service-name "Fortinet-FortiGuard"
     set priority-zone "SASE"
   next
   end
   end
   ```

3. Configure static routes for each of the SD-WAN zones:

   ```
   config router static
   edit 1
     set distance 1
     set sdwan-zone "virtual-wan-link"
   next
   edit 2
     set dst 172.16.109.0 255.255.255.0
     set distance 1
     set sdwan-zone "SASE"
   next
   end
   ```
To verify the results:

1. Check the service rule 1 diagnostics:

   ```
   # diagnose sys sdwan service 1
   ```

   Service(1): Address Mode(IPV4) flags=0x200 use-shortcut-sla
   Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
   Members(2):
   1: Seq_num(1 port13), alive, selected
   2: Seq_num(2 port15), alive, selected
   Dst address(1):
   10.100.20.0-10.100.20.255

   Both members of the virtual-wan-link zone are selected. In manual mode, the interface members are selected based on the member configuration order. In SLA and priority mode, the order depends on the link status. If all of the link statuses pass, then the members are selected based on the member configuration order.

2. Check the service rule 2 diagnostics:

   ```
   # diagnose sys sdwan service 2
   ```

   Service(2): Address Mode(IPV4) flags=0x200 use-shortcut-sla
   Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
   Members(1):
   1: Seq_num(3 to_FG_B_root), alive, selected
   Dst address(1): Fortinet-FortiGuard(1245324,0,0,0)

   The member of the SASE zone is selected.

3. Review the routing table:

   ```
   # get router info routing-table static
   Routing table for VRF=0
   S* 0.0.0.0/0 [1/0] via 10.100.1.1, port13
       [1/0] via 10.100.1.5, port15
   S 172.16.109.0/24 [1/0] via 172.16.206.2, to_FG_B_root
   ```

   The default gateway has the members from the virtual-wan-link zone, and the route to 172.16.10.9.0/24 has the single member from the SASE zone.

**Example 2**

In this example, two IPv6 static routes are created. The first route uses the virtual-wan-link zone, and the second route uses the SASE zone.

**To configure the SD-WAN:**

1. Configure port13 and port15 with IPv6 addresses and assign them to the virtual-wan-link zone, and assign to_FG_B_root to the SASE zone:

   ```
   config system sdwan
   set status enable
   config members
   edit 1
   set interface "port13"
   set zone "virtual-wan-link"
   set gateway6 2004:10:100::1::1
   ```
set source6 2004:10:100:1::2
next
edit 2
    set interface "port15"
    set zone "virtual-wan-link"
    set gateway6 2004:10:100:1::5
    set source6 2004:10:100:1::6
next
edit 3
    set interface "to_FG_B root"
    set zone "SASE"
next
end
end

2. Configure IPv6 static routes for each of the SD-WAN zones:

   config router static6
   edit 1
       set distance 1
       set sdwan-zone "virtual-wan-link"
   next
   edit 2
       set dst 2003:172:16:109::/64
       set distance 1
       set sdwan-zone "SASE"
   next
end

To verify the results:

1. Review the routing table:

   # get router info6 routing-table static
   Routing table for VRF=0
   S* ::/0 [1/0] via 2004:10:100:1::1, port13, 00:20:51, [1024/0]
       [1/0] via 2004:10:100:1::5, port15, 00:20:51, [1024/0]
   S 2003:172:16:109::/64 [1/0] via ::ac10:ce02, to_FG_B_root, 00:20:51, [1024/0]

   The IPv6 default route includes the members from the virtual-wan-link zone, and the route to 2003:172:16:109::/64 has the single member from the SASE zone.

Performance SLA

The following topics provide instructions on configuring performance SLA:

- Link health monitor on page 508
- Factory default health checks on page 510
- Health check options on page 513
- Link monitoring example on page 515
- SLA targets example on page 516
- Passive WAN health measurement on page 518
Passive health-check measurement by internet service and application on page 523
Health check packet DSCP marker support on page 526
Manual interface speedtest on page 527
Scheduled interface speedtest on page 528
Monitor performance SLA on page 530
SLA monitoring using the REST API on page 533
Mean opinion score calculation and logging in performance SLA health checks on page 537

Link health monitor

Performance SLA link health monitoring measures the health of links that are connected to SD-WAN member interfaces by either sending probing signals through each link to a server, or using session information that is captured on firewall policies (see Passive WAN health measurement on page 518 for information), and measuring the link quality based on latency, jitter, and packet loss. If a link fails all of the health checks, the routes on that link are removed from the SD-WAN link load balancing group, and traffic is routed through other links. When the link is working again the routes are reestablished. This prevents traffic being sent to a broken link and lost.

When an SD-WAN member has multiple health checks configured, all of the checks must fail for the routes on that link to be removed from the SD-WAN link load balancing group.

Two health check servers can be configured to ensure that, if there is a connectivity issue, the interface is at fault and not the server. A server can only be used in one health check.

The FortiGate uses the first server configured in the health check server list to perform the health check. If the first server is unavailable, then the second server is used. The second server continues to be used until it becomes unavailable, and then the FortiGate returns to the first server, if it is available. If both servers are unavailable, then the health check fails.

You can configure the protocol that is used for status checks, including: Ping, HTTP, DNS, TCP echo, UDP echo, two-way active measurement protocol (TWAMP), TCP connect, and FTP. In the GUI, only Ping, HTTP, and DNS are available.

You can view link quality measurements by going to Network > SD-WAN and selecting the Performance SLAs tab. The table shows the default health checks, the health checks that you configured, and information about each health check. The values shown in the Packet Loss, Latency, and Jitter columns are for the health check server that the FortiGate is currently using. The green up arrows indicate that the server is responding, and does not indicate if the health checks are being met. See Results on page 493 for more information.

To configure a link health monitor in the GUI:

1. Go to Network > SD-WAN, select the Performance SLAs tab, and click Create New.
2. Set a Name for the SLA.
3. Set the Protocol that you need to use for status checks: Ping, HTTP, or DNS.
4. Set Server to the IP addresses of up to two servers that all of the SD-WAN members in the performance SLA can reach.
5. Set Participants to All SD-WAN Members, or select Specify to choose specific SD-WAN members.
6. Set Enable probe packets to enable or disable sending probe packets.
7. Configure SLA Target:
   - If the health check is used in an SD-WAN rule that uses Manual or Best Quality strategies, enabling SLA Target is optional. If the health check is used in an SD-WAN rule that uses Lowest Cost (SLA) or Maximum Bandwidth (SLA) strategies, then SLA Target is enabled.
When SLA Target is enabled, configure the following:

- **Latency threshold**: Calculated based on last 30 probes (default = 5ms).
- **Jitter threshold**: Calculated based on last 30 probes (default = 5ms).
- **Packet Loss threshold**: Calculated based on last 100 probes (default = 0%).

8. In the Link Status section configure the following:

- **Check interval**: The interval in which the FortiGate checks the interface, in milliseconds (500 - 3600000, default = 500).
- **Failures before inactive**: The number of failed status checks before the interface shows as inactive (1 - 3600, default = 5). This setting helps prevent flapping, where the system continuously transfers traffic back and forth between links.
- **Restore link after**: The number of successful status checks before the interface shows as active (1 - 3600, default = 5). This setting helps prevent flapping, where the system continuously transfers traffic back and forth between links.

9. In the Actions when Inactive section, enable **Update static route** to disable static routes for inactive interfaces and restore routes when interfaces recover.

10. Click OK.

To configure a link health monitor in the CLI:

```plaintext
config system sdwan
    config health-check
        edit "PingSLA"
            set addr-mode {ipv4 | ipv6}
            set server <server1_IP_address> <server2_IP_address>
            set detect-mode {active | passive | prefer-passive}
            set protocol {ping | tcp-echo | udp-echo | http | twamp | dns | tcp-connect | ftp}
            set ha-priority <integer>
            set probe-timeout <integer>
            set probe-count <integer>
            set probe-packets {enable | disable}
            set interval <integer>
            set failtime <integer>
            set recoverytime <integer>
            set diffservcode <binary>
```
set update-static-route {enable | disable}
set update-cascade-interface {enable | disable}
set sla-fail-log-period <integer>
set sla-pass-log-period <integer>
set threshold-warning-packetloss <integer>
set threshold-alert-packetloss <integer>
set threshold-warning-latency <integer>
set threshold-alert-latency <integer>
set threshold-warning-jitter <integer>
set threshold-alert-jitter <integer>
set members <member_number> ... <member_number>
cfgsla
  edit 1
    set link-cost-factor {latency jitter packet-loss}
    set latency-threshold <integer>
    set jitter-threshold <integer>
    set packetloss-threshold <integer>
  next
next
end
end

Additional settings are available for some of the protocols:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Additional options</th>
</tr>
</thead>
<tbody>
<tr>
<td>http</td>
<td>port &lt;port_number&gt;</td>
</tr>
<tr>

<td>ftp {passive</td>
</tr>
<tr>
<td></td>
<td>ftp-file &lt;path&gt;</td>
</tr>
</tbody>
</table>

For more examples see Health check options on page 513.

Factory default health checks

There are six predefined performance SLA profiles for newly created VDOMs or factory reset FortiGate devices:

- AWS
- System DNS
- FortiGuard
- Gmail
- Google Search
- Office 365

You can view and configure the SLA profiles by going to Network > SD-WAN and selecting the Performance SLAs tab.
After configuring a health check, you will be able to view packet loss, latency, and jitter data for the SLA profiles. If a value is colored red, it means that it failed to meet the SLA requirements.

To configure the performance SLA profiles in the CLI:

```
config system sdwan
  config health-check
    edit "Default_DNS"
      set system-dns enable
      set interval 1000
      set probe-timeout 1000
      set recoverytime 10
    config sla

```

## Health check options

Health checks include several protocols and protocol specific options.

The health check protocol options include:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ping</td>
<td>Use PING to test the link with the server.</td>
</tr>
<tr>
<td>tcp-echo</td>
<td>Use TCP echo to test the link with the server.</td>
</tr>
<tr>
<td>udp-echo</td>
<td>Use UDP echo to test the link with the server.</td>
</tr>
<tr>
<td>http</td>
<td>Use HTTP-GET to test the link with the server.</td>
</tr>
<tr>
<td>twamp</td>
<td>Use TWAMP to test the link with the server.</td>
</tr>
<tr>
<td>dns</td>
<td>Use DNS query to test the link with the server.</td>
</tr>
<tr>
<td></td>
<td>The FortiGate sends a DNS query for an A Record and</td>
</tr>
<tr>
<td></td>
<td>the response matches the expected IP address.</td>
</tr>
<tr>
<td>tcp-connect</td>
<td>Use a full TCP connection to test the link with the</td>
</tr>
<tr>
<td></td>
<td>server.</td>
</tr>
<tr>
<td></td>
<td>The method to measure the quality of the TCP connection can be:</td>
</tr>
<tr>
<td></td>
<td>• half-open: FortiGate sends SYN and gets SYN-ACK. The latency is based on the</td>
</tr>
<tr>
<td></td>
<td>round trip between SYN and SYN-ACK (default).</td>
</tr>
<tr>
<td></td>
<td>• half-close: FortiGate sends FIN and gets FIN-ACK. The latency is based on the</td>
</tr>
<tr>
<td></td>
<td>round trip between FIN and FIN-ACK.</td>
</tr>
<tr>
<td>ftp</td>
<td>Use FTP to test the link with the server.</td>
</tr>
<tr>
<td></td>
<td>The FTP mode can be:</td>
</tr>
<tr>
<td></td>
<td>• passive: The FTP health-check initiates and</td>
</tr>
<tr>
<td></td>
<td>establishes the data connection (default).</td>
</tr>
<tr>
<td></td>
<td>• port: The FTP server initiates and establishes the</td>
</tr>
<tr>
<td></td>
<td>data connection.</td>
</tr>
</tbody>
</table>

SD-WAN health checks can generate traffic that becomes quite high as deployments grow. Please take this into consideration when setting DoS policy thresholds. For details on setting DoS policy thresholds, refer to [DoS policy on page 791](#).

### To use UDP-echo and TCP-echo as health checks:

```plaintext
config system sdwan
   set status enable
config health-check
```
edit "h4_udp1"
  set protocol udp-echo
  set port 7
  set server <server>
next
edit "h4_tcp1"
  set protocol tcp-echo
  set port 7
  set server <server>
next
edit "h6_udp1"
  set addr-mode ipv6
  set server "2032::12"
  set protocol udp-echo
  set port 7
next
end
end

To use DNS as a health check, and define the IP address that the response must match:

config system sdwan
  set status enable
config health-check
  edit "h4_dns1"
    set protocol dns
    set dns-request-domain "ip41.forti2.com"
    set dns-match-ip 1.1.1.1
  next
  edit "h6_dns1"
  set addr-mode ipv6
    set server "2000::15.1.1.4"
  set protocol dns
  set port 53
  set dns-request-domain "ip61.xxx.com"
next
end
end

To use TCP Open (SYN/SYN-ACK) and TCP Close (FIN/FIN-ACK) to verify connections:

config system sdwan
  set status enable
config health-check
  edit "h4_tcpconnect1"
    set protocol tcp-connect
    set port 443
    set quality-measured-method {half-open | half-close}
    set server <server>
next
  edit "h6_tcpconnect1"
    set addr-mode ipv6
    set server "2032::13"
    set protocol tcp-connect
    set port 444
    set quality-measured-method {half-open | half-close}
To use active or passive mode FTP to verify connections:

```
config system sdwan
  set status enable
config health-check
  edit "h4_ftpl"
    set protocol ftp
    set port 21
    set user "root"
    set password **********
    set ftp-mode {passive | port}
    set ftp-file "1.txt"
    set server <server>
next
  edit "h6_ftpl"
    set addr-mode ipv6
    set server "2032::11"
    set protocol ftp
    set port 21
    set user "root"
    set password **********
    set ftp-mode {passive | port}
    set ftp-file "2.txt"
next
end
```

**Link monitoring example**

Performance SLA link monitoring measures the health of links that are connected to SD-WAN member interfaces by sending probing signals through each link to a server and measuring the link quality based on latency, jitter, and packet loss. If a link is broken, the routes on that link are removed, and traffic is routed through other links. When the link is working again, the routes are reenabbled. This prevents traffic being sent to a broken link and lost.

![Link monitoring example diagram](attachment://link_monitoring_example.png)
- Interfaces wan1 and wan2 connect to the internet through separate ISPs
- The detection server IP address is 208.91.114.182

A performance SLA is created so that, if one link fails, its routes are removed and traffic is detoured to the other link.

**To configure a Performance SLA using the GUI:**

1. On the FortiGate, add wan1 and wan2 as SD-WAN members, then add a policy and static route. See [SD-WAN quick start on page 488](#) for details.
2. Go to Network > SD-WAN, select the Performance SLAs tab, and click Create New.
3. Enter a name for the SLA and select a protocol.
4. In the Server field, enter the detection server IP address (208.91.114.182 in this example).
5. In the Participants field, select both wan1 and wan2.
6. Configured the remaining settings as needed, then click OK.

**To configure a Performance SLA using the CLI:**

```
cfg system sdwan
cfg health-check
ed "server"
   set server "208.91.114.182"
   set update-static-route enable
   set members 1 2

nextend
end
```

**To diagnose the Performance SLA status:**

```
# diagnose sys sdwan health-check
Health Check(server):
Seq(1): state(alive), packet-loss(0.000%) latency(15.247), jitter(5.231) sla_map=0x0
Seq(2): state(alive), packet-loss(0.000%) latency(13.621), jitter(6.905) sla_map=0x0
```

**SLA targets example**

SLA targets are a set of constraints that are used in SD-WAN rules to control the paths that traffic take.

The available constraints are:

- **Latency threshold**: Latency for SLA to make decision, in milliseconds (0 - 10000000, default = 5).
- **Jitter threshold**: Jitter for SLA to make decision, in milliseconds (0 - 10000000, default = 5).
- **Packet loss threshold**: Packet loss for SLA to make decision, in percentage (0 - 100, default = 0).
To configure Performance SLA targets using the GUI:

1. On the FortiGate, add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 488 for details.
2. Go to Network > SD-WAN and select the Performance SLAs tab.
3. Create a new Performance SLA or edit an existing one. See Link monitoring example on page 515.
4. Enable SLA Targets and configure the constraints. To add multiple SLA targets, use the CLI.
5. Configured the remaining settings as needed, then click OK.

To configure Performance SLA targets using the CLI:

```bash
config system sdwan
    config health-check
        edit "server"
            set server "208.91.114.182"
            set members 1 2
        config sla
            edit 1
                set link-cost-factor latency jitter packet-loss
                set latency-threshold 10
                set jitter-threshold 10
                set packetloss-threshold 1
            next
            edit 2
                set link-cost-factor latency packet-loss
                set latency-threshold 15
                set packetloss-threshold 2
            next
        end
    end
end
```

The link-cost-factor variable is used to select which constraints are enabled.
Passive WAN health measurement

SD-WAN passive WAN health measurement determines the health check measurements using session information that is captured on firewall policies that have Passive Health Check (passive-wan-health-measurement) enabled. Passive measurements analyze session information that is gathered from various TCP sessions to determine the jitter, latency, and packet loss.

Using passive WAN health measurement reduces the amount of configuration required and decreases the traffic that is produced by health check monitor probes doing active measurements. Passive WAN health measurement analyzes real-life traffic; active WAN health measurement using a detection server might not reflect the real-life traffic.

By default, active WAN health measurement is enabled when a new health check is created. It can be changed to passive or prefer passive:

<table>
<thead>
<tr>
<th>passive</th>
<th>Health is measured using traffic, without probes. No link health monitor needs to be configured.</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefer-passive</td>
<td>Health is measured using traffic when there is traffic, and using probes when there is no traffic. A link health monitor must be configured, see Link health monitor for details.</td>
</tr>
</tbody>
</table>

When passive-wan-health-measurement is enabled, auto-asic-offload will be disabled.

Example

In this example, the FortiGate is configured to load-balance between two WAN interfaces, port15 and port16. A health check is configured in passive mode, and SLA thresholds are set. Passive WAN health measurement is enabled on the SD-WAN policy.

Measurements are taken from YouTube traffic generated by the PC. When latency is introduced to the traffic on port15, the passive health check trigger threshold is exceeded and traffic is rerouted to port16.

To configure the SD-WAN in the GUI:

1. Create the SD-WAN zone:
   a. Go to Network > SD-WAN and select the SD-WAN Zones tab.
   b. Click Create New > SD-WAN Zone.
   c. Enter a name for the zone, such as SD-WAN.
   d. Click OK.
2. Create the SD-WAN members:
a. Go to Network > SD-WAN and select the SD-WAN Zones tab.
b. Click Create New > SD-WAN Member.
c. Set Interface to port15, SD-WAN Zone to SD-WAN, and Gateway set to 172.16.209.2.
d. Click OK.
e. Click Create New > SD-WAN Member again.
f. Set Interface to port16, SD-WAN Zone to SD-WAN, and Gateway set to 172.16.210.2.
g. Click OK.

3. Create a performance SLA:
   a. Go to Network > SD-WAN and select the Performance SLAs tab.
   b. Edit an existing health check, or create a new one.
   c. Set Probe mode to Passive.
   d. Set Participants to Specify and add port15 and port16.
   e. Configure two SLA targets. Note that the second SLA target must be configured in the CLI.
   f. Configure the remaining settings as needed.
   g. Click OK.

The SLA list shows the probe mode in the Detect Server column, if the probe mode is passive or prefer passive.

---

Probe packets can only be disabled in the CLI and when the probe mode is not passive.

---

4. Create SD-WAN rules:
   a. Go to Network > SD-WAN, select the SD-WAN Rules tab, and click Create New.
   b. Configure the first rule:

<table>
<thead>
<tr>
<th>Name</th>
<th>Background_Traffic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source address</td>
<td>172.16.205.0</td>
</tr>
</tbody>
</table>
**Application**  
Click in the field, and in the *Select Entries* pane search for *YouTube* and select all of the entries

**Strategy**  
Maximize Bandwidth (SLA)

**Interface preference**  
port15 and port16

**Required SLA target**  
Passive_Check#2

c. Click OK.
d. Click *Create New* again and configure the second rule:

<table>
<thead>
<tr>
<th>Name</th>
<th>Foreground_Traffic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source address</td>
<td>172.16.205.0</td>
</tr>
<tr>
<td>Address</td>
<td>all</td>
</tr>
<tr>
<td>Protocol number</td>
<td>Specify - 1</td>
</tr>
<tr>
<td>Strategy</td>
<td>Lowest Cost (SLA)</td>
</tr>
<tr>
<td>Interface preference</td>
<td>port15 and port16</td>
</tr>
<tr>
<td>Required SLA target</td>
<td>Passive_Check#1</td>
</tr>
</tbody>
</table>

e. Click OK.

**To configure the firewall policy in the GUI:**

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New.*
2. Configure the policy:

<table>
<thead>
<tr>
<th>Name</th>
<th>SD-WAN-HC-policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>port5</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>SD-WAN</td>
</tr>
<tr>
<td>Source</td>
<td>all</td>
</tr>
<tr>
<td>Destination</td>
<td>all</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>Passive Health Check</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

  *Passive health check can only be enabled in a policy when the outgoing interface is an SD-WAN zone.*

3. Click OK.

**To configure the SD-WAN in the CLI:**

```
config system sdwan
set status enable
```
config zone
    edit "SD-WAN"
    next
end
config members
    edit 1
    set zone "SD-WAN"
    set interface "port15"
    set gateway 172.16.209.2
    next
    edit 2
    set zone "SD-WAN"
    set interface "port16"
    set gateway 172.16.210.2
    next
end
config health-check
    edit "Passive_Check"
        set detect-mode passive
        set members 1 2
config sla
    edit 1
        set latency-threshold 500
        set jitter-threshold 500
        set packetloss-threshold 10
    next
    edit 2
        set latency-threshold 1000
        set jitter-threshold 1000
        set packetloss-threshold 10
    next
end
next
end
config service
    edit 1
        set name "Background_Traffic"
        set mode load-balance
        set src "172.16.205.0"
        set internet-service enable
        set internet-service-app-ctrl 31077 33321 41598 31076 33104 23397 30201 16420
        17396 38569 25564
        config sla
            edit "Passive_Check"
                set id 2
            next
        set priority-member 1 2
        next
        edit 2
            set name "Foreground_Traffic"
            set mode sla
            set src "172.16.205.0"
            set protocol 1
            set dst "all"
        config sla
To configure the firewall policy in the CLI:

```plaintext
to configure the firewall policy in the CLI:

config firewall policy
to configure the firewall policy in the CLI:
```

**Results**

**When both links pass the SLA:**

```
# diagnose sys link-monitor-passive interface
Interface port16 (28):
    Latency 10.000 Jitter 5.000 Packet_loss 0.000% Last_updated Fri Mar 5 10:09:21 2021

Interface port15 (27):
    Latency 60.000 Jitter 0.000% Last_updated Fri Mar 5 10:39:24 2021

# diagnose sys sdwan health-check
Health Check(Passive_Check):
Seq(1 port15): state(alive), packet-loss(0.000%) latency(60.000), jitter(0.750) sla_map=0x3
Seq(2 port16): state(alive), packet-loss(0.000%) latency(10.000), jitter(5.000) sla_map=0x3

# diagnose sys sdwan service 2
Service(2): Address Mode(IPV4) flags=0x200
    Gen(1), TOS(0x0/0x0), Protocol(1: 1->65535), Mode(sla), sla-compare-order
    Members(2):
        1: Seq_num(1 port15), alive, sla(0x1), gid(0), cfg_order(0), cost(0), selected
        2: Seq_num(2 port16), alive, sla(0x1), gid(0), cfg_order(1), cost(0), selected
    Src address(1):
        172.16.205.0-172.16.205.255
    Dst address(1):
        8.8.8.8-8.8.8.8
```
When the latency is increased to 610ms on port15, the SLA is broken and pings are sent on port16:

```
# diagnose sys sdwan health-check
Health Check(Passive_Check):
Seq(1 port15): state(alive), packet-loss(0.000%) latency(610.000), jitter(2.500) sla_map=0x3
Seq(2 port16): state(alive), packet-loss(0.000%) latency(50.000), jitter(21.000) sla_map=0x3

# diagnose sys sdwan service 2

Service(2): Address Mode(IPV4) flags=0x200
   Gen(6), TOS(0x0/0x0), Protocol(1: 1->65535), Mode(sla), sla-compare-order
   Members(2):
      1: Seq_num(2 port16), alive, sla(0x1), gid(1), cfg_order(1), cost(0), selected
      2: Seq_num(1 port15), alive, sla(0x0), gid(2), cfg_order(0), cost(0), selected
   Src address(1):
      172.16.205.0-172.16.205.255
   Dst address(1):
      8.8.8.8-8.8.8.8
```

Passive health-check measurement by internet service and application

Passive health measurement supports passive detection for each internet service and application.

If internet services or applications are defined in an SD-WAN rule with passive health check, SLA information for each service or application will be differentiated and collected. SLA metrics (latency, jitter, and packet loss) on each SD-WAN member in the rule are then calculated based on the relevant internet service's or application's SLA information.

In this example, three SD-WAN rules are created:

- Rule 1: Best quality (latency) using passive SLA for the internet services Alibaba and Amazon.
- Rule 2: Best quality (latency) using passive SLA for the applications Netflix and YouTube.
- Rule 3: Best quality (latency) using passive SLA for all other traffic.

After passive application measurement is enabled for rules one and two, the SLA metric of rule one is the average latency of the internet services Alibaba and Amazon, and the SLA metric of rule two is the average latency of the applications Netflix and YouTube.

To configure the SD-WAN:

1. Configure the SD-WAN members:

   ```
   config system sdwan
   set status enable
   config zone
      edit "virtual-wan-link"
   next
   ```
2. Configure the passive mode health check:

```fortios
config health-check
  edit "Passive_HC"
    set detect-mode passive
    set members 1 2
  next
end
```

3. Configure SD-WAN service rules:

```fortios
config service
  edit 1
    set name "1"
    set mode priority
    set src "172.16.205.0"
    set internet-service enable
    set internet-service-name "Alibaba-Web" "Amazon-Web"
    set health-check "Passive_HC"
    set priority-members 1 2
    set passive-measurement enable //Enable "passive application measurement", it is a new command which is introduced in this project.
  next
  edit 2
    set name "2"
    set mode priority
    set src "172.16.205.0"
    set internet-service enable
    set internet-service-app-ctrl 18155 31077
    set health-check "Passive_HC"
    set priority-members 1 2
    set passive-measurement enable //Enable "passive application measurement"
  next
  edit 3
    set name "3"
    set mode priority
    set dst "all"
    set src "172.16.205.0"
    set health-check "Passive_HC"
    set priority-members 1 2
  next
end
```

4. Configure SD-WAN routes:
config router static
  edit 1
    set distance 1
    set sdwan-zone "virtual-wan-link"
  next
end

5. Configure the firewall policy with passive WAN health measurement enabled:

config firewall policy
  edit 1
    set uuid 972345c6-1595-51ec-66c5-d705d266f712
    set srcintf "port5"
    set dstintf "virtual-wan-link"
    set action accept
    set srcaddr "172.16.205.0"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set passive-wan-health-measurement enable
    set utm-status enable
    set ssl-ssh-profile "certificate-inspection"
    set application-list "g-default"
    set auto-asic-offload disable
  next
end

To verify the results:

1. On the PC, open the browser and visit the internet services and applications.
2. On the FortiGate, check the collected SLA information to confirm that each server or application on the SD-WAN members was measured individually:

   # diagnose sys link-monitor-passive interface

Interface dmz (5):
  Default(0x00000000): latency=3080.0 11:57:54, jitter=5.0 11:58:08, pktloss=0.0 % NA
  Alibaba-Web(0x00690001): latency=30.0 11:30:06, jitter=25.0 11:29:13, pktloss=0.0 % NA
  YouTube(0x00007965): latency=100.0 12:00:35, jitter=2.5 12:00:30, pktloss=0.0 % NA
  Netflix(0x000646eb): latency=10.0 11:31:24, jitter=10.0 11:30:30, pktloss=0.0 % NA
  Amazon-Web(0x00060001): latency=80.0 11:31:52, jitter=35.0 11:32:07, pktloss=0.0 % NA

Interface port15 (27):
  Default(0x00000000): latency=100.0 12:00:42, jitter=0.0 12:00:42, pktloss=0.0 % NA
  Amazon-Web(0x00060001): latency=30.0 11:56:05, jitter=0.0 11:55:21, pktloss=0.0 % NA
  Alibaba-Web(0x00690001): latency=0.0 11:26:08, jitter=35.0 11:27:08, pktloss=0.0 % NA
  YouTube(0x00007965): latency=100.0 11:33:34, jitter=0.0 11:33:50, pktloss=0.0 % NA
3. Verify that the SLA metrics on the members are calculated as expected:

```bash
# diagnose sys sdwan service

Health check packet DSCP marker support

SD-WAN health check probe packets support Differentiated Services Code Point (DSCP) markers for accurate
evaluation of the link performance for high priority applications by upstream devices.

When the SD-WAN health check packet is sent out, the DSCP can be set with a CLI command.
To mark health-check packets with DSCP:

```
config system sdwan
    config health-check
        edit <name>
            set diffservcode <6 bits binary, range 000000-111111>
        next
    end
end
```

**Manual interface speedtest**

An interface speedtest can be manually performed on WAN interfaces in the GUI. The results of the test can be added to the interface’s *Estimated bandwidth*. The estimated upstream and downstream bandwidths can be used in SD-WAN service rules to determine the best link to use when either Maximize Bandwidth or Best Quality strategies are selected.

An SD-WAN Network Monitor license is required to use the speedtest. The *License* widget and the *System > FortiGuard* page show the license status.

To run an interface speedtest in the GUI:

1. Go to *Network > Interfaces*.
2. Edit a WAN interface. The interfaces can be grouped by role using the grouping dropdown on the right side of the toolbar.
3. Click **Execute speed test** in the right pane.

4. When the test completes, click **OK** in the **Confirm** pane to apply the results to the estimated bandwidth. The results can also be applied later by clicking **Apply results to estimated bandwidth**. The speedtest results are used to populate the *Estimated bandwidth* fields.

5. Click **OK**.

---

The FortiGate must be connected to FortiGuard, and able to reach either the AWS or Google speedtest servers.

---

**Scheduled interface speedtest**

The SD-WAN Network Monitor service supports running a speed test based on a schedule. The test results are automatically updated in the *measured-upstream-bandwidth* and *measured-downstream-bandwidth* fields. These fields do not impact the interface inbound bandwidth, outbound bandwidth, estimated upstream bandwidth, or estimated downstream bandwidth settings.

An SD-WAN Network Monitor license is required to use the speedtest. The **License** widget and the System > FortiGuard page show the license status.

When the scheduled speed tests run, it is possible to temporarily bypass the bandwidth limits set on the interface and configure custom maximum or minimum bandwidth limits. These configurations are optional.

```bash
config system speed-test-schedule
edit <interface>
    set schedules <schedule> ...
    set update-inbandwidth enable {enable | disable}
    set update-outbandwidth enable {enable | disable}
    set update-inbandwidth-maximum <integer>
    set update-inbandwidth-minimum <integer>
    set update-outbandwidth-maximum <integer>
    set update-outbandwidth-minimum <integer>
```
In the following example, a speed test is scheduled on port1 at 10:00 AM, and another one at 14:00 PM.

To run a speed test based on a schedule:

1. Configure the recurring schedules:

   ```
   config firewall schedule recurring
   edit "10"
   set start 10:00
   set end 12:00
   set day monday tuesday wednesday thursday friday
   next
   edit "14"
   set start 14:00
   set end 16:00
   set day monday tuesday wednesday thursday friday
   next
   end
   ```

2. Configure the speed test schedule:

   ```
   config system speed-test-schedule
   edit "port1"
   set schedules "10" "14"
   set update-inbandwidth enable
   set update-outbandwidth enable
   set update-inbandwidth-maximum 60000
   set update-inbandwidth-minimum 10000
   set update-outbandwidth-maximum 50000
   set update-outbandwidth-minimum 10000
   next
   end
   ```

3. View the speed test results:

   ```
   config system interface
   edit port1
   ```
Monitor performance SLA

SD-WAN diagnostics can be used to help maintain your SD-WAN solution

Monitoring SD-WAN link quality status

Link quality plays a significant role in link selection for SD-WAN. Investigate any prolonged issues with packet loss, latency, or jitter to ensure that your network does not experience degraded performance or an outage.

You can monitor the link quality status of SD-WAN interface members by going to Network > SD-WAN and selecting the Performance SLAs tab.

The live charts show the packet loss, latency, or jitter for the selected health check. Hover the cursor over a line in the chart to see the specific value for that interface at that specific time.

The table shows information about each health check, including the configured servers, link quality data, and thresholds. The colored arrow indicates the status of the interface when the last status check was performed: green means that the interface was active, and red means that the interface was inactive. Hover the cursor over the arrow for additional information.

Monitoring system event logs

The features adds an SD-WAN daemon function to keep a short, 10 minute history of SLA that can be viewed in the CLI. Performance SLA results related to interface selection, session failover, and other information, can be logged. These logs can then be used for long-term monitoring of traffic issues at remote sites, and for reports and views in FortiAnalyzer.

The time intervals that Performance SLA fail and pass logs are generated in can be configured.
To configure the fail and pass logs' generation time interval:

```plaintext
config system sdwan
  config health-check
    edit "PingSLA"
      set sla-fail-log-period 30
      set sla-pass-log-period 60
    end
  next
end
```

To view the 10 minute Performance SLA link status history:

```
FGDocs # diagnose sys sdwan sla-log PingSLA 1
Timestamp: Fri Sep 4 10:32:37 2020, vdom root, health-check PingSLA, interface: wan2, status: up, latency: 4.455, jitter: 0.430, packet loss: 0.000%.
Timestamp: Fri Sep 4 10:32:37 2020, vdom root, health-check PingSLA, interface: wan2, status: up, latency: 4.461, jitter: 0.436, packet loss: 0.000%.
Timestamp: Fri Sep 4 10:32:38 2020, vdom root, health-check PingSLA, interface: wan2, status: up, latency: 4.488, jitter: 0.415, packet loss: 0.000%.
      ...
Timestamp: Fri Sep 4 10:42:36 2020, vdom root, health-check PingSLA, interface: wan2, status: up, latency: 6.280, jitter: 0.302, packet loss: 0.000%.
Timestamp: Fri Sep 4 10:42:37 2020, vdom root, health-check PingSLA, interface: wan2, status: up, latency: 6.261, jitter: 0.257, packet loss: 0.000%.
Timestamp: Fri Sep 4 10:42:37 2020, vdom root, health-check PingSLA, interface: wan2, status: up, latency: 6.229, jitter: 0.245, packet loss: 0.000%.
```

**SLA pass logs**

The FortiGate generates Performance SLA logs at the specified pass log interval (`sla-pass-log-period`) when SLA passes.

```

In the FortiAnalyzer GUI:
SLA monitoring using the REST API

SLA log information and interface SLA information can be monitored using the REST API. This feature is also be used by FortiManager as part of its detailed SLA monitoring and drill-down features.

Interface log command example:

```json
{
    "http_method": "GET",
    "results": [
        {
            "interface": "port13",
            "logs": [
                {
                    "timestamp": 1547087168,
                    "tx_bandwidth": 3447,
                    "rx_bandwidth": 3457,
                    "bi_bandwidth": 6904,
                    "tx_bytes": 748875,
                    "rx_bytes": 708799,
                    "egress_queue": []
                },
                {
                    "timestamp": 1547087178,
                    "tx_bandwidth": 3364,
                    "rx_bandwidth": 3400,
                    "bi_bandwidth": 6764,
                    "tx_bytes": 753789,
                    "rx_bytes": 712835,
                    "egress_queue": []
                }
            ]
        }
    ]
}
```

...
**SLA log command example:**

```json
{
    "http_method":"GET",
    "results":[
        {
            "name":"ping",
            "interface":"spoke11-p1",
            "logs":[
                {
                    "timestamp":1614813142,

CLI diagnose commands:

# diagnose sys sdwan intf-sla-log port13

# diagnose sys sdwan sla-log ping 1 spoke11-p1_0
   Timestamp: Wed Mar 3 15:35:20 2021, vdom root, health-check ping, interface: spoke11-p1_0, status: up, latency: 0.135, jitter: 0.029, packet loss: 0.000%.

# diagnose sys sdwan sla-log ping 2 spoke12-p1_0
   Timestamp: Wed Mar 3 15:36:08 2021, vdom root, health-check ping, interface: spoke12-p1_0, status: up, latency: 0.095, jitter: 0.010, packet loss: 0.000%.

# diagnose sys sdwan health-check
   Health Check(ping):
     Seq(1 spoke11-p1): state(alive), packet-loss(0.000%) latency(0.156), jitter(0.043) sla_map=0x1
     Seq(1 spoke11-p1_0): state(alive), packet-loss(0.000%) latency(0.128), jitter(0.024) sla_map=0x1
     Seq(2 spoke12-p1): state(alive), packet-loss(0.000%) latency(0.125), jitter(0.028) sla_map=0x1
     Seq(2 spoke12-p1_0): state(alive), packet-loss(0.000%) latency(0.093), jitter(0.008) sla_map=0x1
Mean opinion score calculation and logging in performance SLA health checks

The mean opinion score (MOS) is a method of measuring voice quality using a formula that takes latency, jitter, packet loss, and the codec into account to produce a score from zero to five (0 - 5). The G.711, G.729, and G.722 codecs can be selected in the health check configurations, and an MOS threshold can be entered to indicate the minimum MOS score for the SLA to pass. The maximum MOS score will depend on which codec is used, since each codec has a theoretical maximum limit.

```fortios
config system sdwan
  config health-check
    edit <name>
      set mos-codec {g711 | g729 | g722}
    config sla
      edit <id>
        set link-cost-factor {latency jitter packet-loss mos}
        set mos-threshold <value>
      next
    next
  end
end
```

| mos-codec {g711 | g729 | g722} | Set the VoIP codec to use for the MOS calculation (default = g711). |
|-----------------------------------|---------------------------------------------------------------|
| link-cost-factor {latency jitter packet-loss mos} | Set the criteria to base the link selection on. |
| mos-threshold <value> | Set the minimum MOS for the SLA to be marked as pass (1.0 - 5.0, default = 3.6). |

To configure a health check to calculate the MOS:

```fortios
config system sdwan
  set status enable
  config zone
    edit "virtual-wan-link"
    next
  end
  config members
    edit 1
      set interface "dmz"
      set gateway 172.16.208.2
    next
    edit 2
      set interface "port15"
      set gateway 172.16.209.2
    next
  end
  config health-check
    edit "Test_MOS"
    set server "2.2.2.2"
    set sla-fail-log-period 30
    set sla-pass-log-period 30
    set members 0
    set mos-codec g729
```
SD-WAN

```plaintext
config sla
  edit 1
    set link-cost-factor mos
    set mos-threshold "4.0"
  next
end
next
end
end
```

To use an MOS SLA to steer traffic in an SD-WAN rule:

```plaintext
config system sdwan
  config service
    edit 1
      set name "MOS_traffic_steering"
      set mode sla
      set dst "HQ_LAN"
      set src "Branch_LAN"
  config sla
    edit "Test_MOS"
      set id 1
      next
  end
  set priority-members 0
next
end
end
```

The MOS currently cannot be used to steer traffic when the mode is set to priority.

To verify the MOS calculation results:

1. Verify the health check diagnostics:

   ```plaintext
   # diagnose sys sdwan health-check
   Health Check(Test_MOS): Seq(1 dmz): state(alive), packet-loss(0.000%) latency(0.114), jitter(0.026), mos:4.123, bandwidth-up(999999), bandwidth-dw(999997), bandwidth-bi(1999996) sla_map=0x1
   Seq(2 port15): state(alive), packet-loss(0.000%) latency(0.100), jitter(0.008), mos:4.123, bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
   # diagnose sys sdwan sla-log Test_MOS 1
   Timestamp: Tue Jan 4 11:23:06 2022, vdom root, health-check Test_MOS, interface: dmz, status: up, latency: 0.151, jitter: 0.040, packet loss: 0.000%, mos: 4.123.
   Timestamp: Tue Jan 4 11:23:07 2022, vdom root, health-check Test_MOS, interface: dmz, status: up, latency: 0.149, jitter: 0.041, packet loss: 0.000%, mos: 4.123.
   # diagnose sys sdwan sla-log Test_MOS 2
   Timestamp: Tue Jan 4 11:25:09 2022, vdom root, health-check Test_MOS, interface: port15, status: up, latency: 0.097, jitter: 0.009, packet loss: 0.000%, mos: 4.123.
   Timestamp: Tue Jan 4 11:25:10 2022, vdom root, health-check Test_MOS, interface: port15, status: up, latency: 0.097, jitter: 0.008, packet loss: 0.000%, mos: 4.123.
   ```
2. Change the `mos-codec` to `g722`. The diagnostics will now display different MOS values:

```bash
# diagnose sys sdwan health-check
Health Check (Test_MOS):
Seq1 (dmz): state(alive), packet-loss(0.000%) latency(0.150), jitter(0.031), mos(4.453), bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999996) sla_map=0x1
Seq2 (port15): state(alive), packet-loss(0.000%) latency(0.104), jitter(0.008), mos (4.453), bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999996) sla_map=0x1
```

3. Increase the latency on the link in `port15`. The calculated MOS value will decrease accordingly. In this example, `port15` is out of SLA since its MOS value is now less than the 4.0 minimum:

```bash
# diagnose sys sdwan health-check
Health Check (Test_MOS):
Seq1 (dmz): state(alive), packet-loss(0.000%) latency(0.106), jitter(0.022), mos(4.453), bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999996) sla_map=0x1
Seq2 (port15): state(alive), packet-loss(0.000%) latency(300.119), jitter(0.012), mos (3.905), bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x0
```

Sample logs:

```plaintext
date=2022-01-04 time=11:57:54 eventtime=1641326274876828300 tz="-0800" logid="0113022933" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN SLA notification" eventtype="SLA" healthcheck="Test_MOS" sla_targetid=1 interface="port15" status="up"

**SD-WAN rules**

SD-WAN rules, which are sometimes called *service rules*, identify traffic of interest, and then route the traffic based on a strategy and the condition of the route or *link* between two devices. You can use many strategies to select the outgoing interface and many performance service level agreements (SLAs) to evaluate the link conditions.

Use the following topics to learn about and create SD-WAN rules for your needs:
Overview

SD-WAN rules control how sessions are distributed to SD-WAN members. You can configure SD-WAN rules from the GUI and CLI.

From the GUI, go to Network > SD-WAN > SD-WAN Rules. When creating a new SD-WAN rule, or editing an existing SD-WAN rule, use the Source and Destination sections to identify traffic, and use the Outgoing interfaces section to configure WAN intelligence for routing traffic.

From the CLI, use the following command to configure SD-WAN rules:

```
config system sdwan
  config service
    edit <ID>
    next
```
The following topics describe the fields used to configure SD-WAN rules:

- Fields for identifying traffic on page 541
- Fields for configuring WAN intelligence on page 544
- Additional fields for configuring WAN intelligence on page 546

**Fields for identifying traffic**

This topic describes the fields in an SD-WAN rule used for defining the traffic to which the rule applies. Some fields are available only in the CLI.

SD-WAN rules can identify traffic by source address, destination address, service, and individual or user group matches. SD-WAN rules can also identify traffic by application control (application-aware routing), internet service database (ISDB), BGP route tags, and Differentiated Services Code Point (DSCP) tags.

In the GUI, go to **Network > SD-WAN > SD-WAN Rules**. Click **Create New**, or double-click an existing rule to open it for editing. The **Source** and **Destination** sections are used to identify traffic for the rule:

```
In the CLI, edit the service definition ID number to identify traffic for the rule:

config system sdwan
    config service
        edit <ID>
            <CLI commands from the following tables>
            ...
        end
    end
end
```

The following table describes the fields used for the name, ID, and IP version of the SD-WAN rule:

<table>
<thead>
<tr>
<th>Name, ID, and IP version</th>
<th>CLI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>set name &lt;string&gt;</td>
<td>The name does not need to relate to the traffic being matched, but it is good practice to have intuitive rule names.</td>
</tr>
</tbody>
</table>
### Name, ID, and IP version

<table>
<thead>
<tr>
<th>Field</th>
<th>CLI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>config system sdwan</td>
<td>ID is generated when the rule is created. You can only specify the ID from the CLI.</td>
</tr>
<tr>
<td></td>
<td>config service</td>
<td></td>
</tr>
<tr>

<td><strong>Description</strong></td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------</td>
<td>----------------</td>
</tr>
<tr>
<td><strong>set internet-service-custom</strong>&lt;br/&gt;&lt;name_1&gt; &lt;name_2&gt; ... &lt;name_n&gt;</td>
<td>This applies only to IPv4 rules, and cannot be used in conjunction with an address object.</td>
<td></td>
</tr>
<tr>
<td><strong>set internet-service-custom-group</strong>&lt;br/&gt;&lt;name_1&gt; &lt;name_2&gt; ... &lt;name_n&gt;</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>set internet-service-name</strong>&lt;br/&gt;&lt;name_1&gt; &lt;name_2&gt; ... &lt;name_n&gt;</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>set internet-service-group</strong>&lt;br/&gt;&lt;name_1&gt; &lt;name_2&gt; ... &lt;name_n&gt;</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Application</strong></td>
<td><strong>set internet-service-app-ctrl</strong>&lt;br/&gt;&lt;id_1&gt; &lt;id_2&gt; ... &lt;id_n&gt;</td>
<td>One or more applications or application groups.</td>
</tr>
<tr>
<td></td>
<td><strong>set internet-service-app-ctrl-group</strong>&lt;br/&gt;&lt;name_1&gt; &lt;name_2&gt; ... &lt;name_n&gt;</td>
<td>This applies only to IPv4 rules, and cannot be used in conjunction with an address object.</td>
</tr>
<tr>
<td></td>
<td><strong>set internet-service-app-ctrl-category</strong>&lt;br/&gt;&lt;id_1&gt; &lt;id_2&gt; ... &lt;id_n&gt;</td>
<td>May be used with internet services or service group.</td>
</tr>
<tr>
<td><strong>Route tag (route-tag)</strong></td>
<td><strong>set route-tag</strong>&lt;br/&gt;&lt;integer&gt;</td>
<td>CLI only. This replaces the &lt;b&gt;dst&lt;/b&gt; field (if previously configured) and matches a BGP route tag configured in a route map. See Using BGP tags with SD-WAN rules on page 609.</td>
</tr>
<tr>
<td><strong>TOS mask (tos-mask)</strong></td>
<td><strong>set tos-mask</strong>&lt;br/&gt;&lt;8-bit hex value&gt;</td>
<td>CLI only. In order to leverage type of service (TOS) matching or DSCP matching on the IP header, the SD-WAN rule must specify the bit mask of the byte holding the TOS value. For example, a TOS mask of 0xe0 (11100000) matches the upper 3 bits.</td>
</tr>
<tr>
<td><strong>TOS (tos)</strong></td>
<td><strong>set tos</strong>&lt;br/&gt;&lt;8 bit hex value&gt;</td>
<td>CLI only. The value specified here is matched after the &lt;b&gt;tos-mask&lt;/b&gt; is applied.</td>
</tr>
</tbody>
</table>
### Destination Field CLI Description

For example, the FortiGate receives DSCP values 110000 and 111011. (DSCP is the upper 6 bits of the TOS field – 11000000 and 11101100 respectively). Using the TOS value 0xe0 (11100000), only the second DSCP value is matched.

### Fields for configuring WAN intelligence

This topic describes the fields in an SD-WAN rule used for configuring WAN intelligence, which processes and routes traffic that matches the SD-WAN rule.

In the GUI, go to **Network > SD-WAN > SD-WAN Rules**. Click **Create New**, or double-click an existing rule to open it for editing. The **Outgoing Interfaces** section is used to configure WAN intelligence for the rule:

WAN intelligence is comprised of the following parts:

- **Interface or zone preference on page 544**
- **Strategy on page 545**
- **Performance SLA on page 545**

### Interface or zone preference

By default, the configured order of interfaces and/or zones in a rule are used. Interfaces and zones that are selected first have precedence over interfaces selected second and so on.
You can specify both interfaces and zones. When a zone is specified in the Zone preference field, it is equivalent to selecting each of the contained interface members in the Interface preference section. Interface members in a zone have lower priority than interfaces configured in the Interface preference section.

For example:

- There are 3 interfaces: port1, port2 and port3.
  - Port2 is in Zone1
  - Port1 and port3 belong to the default virtual-wan-link zone.
- An SD-WAN rule is created with Interface preference set to port3 and port1, and Zone preference set to Zone1.

The SD-WAN rule prefers the interfaces in the following order:

1. port3
2. port1
3. port2

You can configure the interface and zone preference in the CLI:

```
config system sdwan
  config service
    edit <ID>
      set priority-members <integer>
      set priority-zone <interface>
    next
  end
end
```

**Strategy**

Strategy dictates how the interface and/or zone order changes as link conditions change. You can use the following strategies:

- **Automatic (auto)**: interfaces are assigned a priority based on quality. See Automatic strategy on page 552.
- **Manual (manual)**: interfaces are manually assigned a priority. See Manual strategy on page 553.
- **Best Quality (priority)**: interfaces are assigned a priority based on the link-cost-factor of the interface. See Best quality strategy on page 554.
- **Lowest cost (SLA) (sla)**: interfaces are assigned a priority based on selected SLA settings. See Lowest cost (SLA) strategy on page 558.
- **Maximize Bandwidth (SLA) (load-balance)**: traffic is distributed among all available links based on the selected load balancing algorithm. See Maximize bandwidth (SLA) strategy on page 561.

**Performance SLA**

The best quality, lowest cost, and maximize bandwidth strategies are the most intelligent modes, and they leverage SLA health checks to provide meaningful metrics for a given link. FortiGate uses the metrics to make intelligent decisions to route traffic.

Automatic and manual strategies have pre-configured logic that do not leverage SLA health checks.
The goal of the performance SLA is to measure the quality of each SD-WAN member link. The following methods can be used to measure the quality of a link:

- **Active measurement**
  - Health-check traffic is sent to a server with a variety of protocols options.
  - The following SLA metrics are measured on this probe traffic:
    - Latency
    - Jitter
    - Packet loss

- **Passive measurement**
  - SLA metrics are measured on real or live traffic, reducing the amount of probe traffic that is sent and received.
  - There is the option (prefer passive) to initiate probe traffic when no live traffic is present.

Performance SLA is utilized by auto, Lowest Cost (SLA), Maximize Bandwidth (SLA), and Best Quality strategies. Lowest Cost (SLA) and Maximize Bandwidth SLA use SLA targets in a pass or fail style to evaluate whether a link is considered for traffic. Best Quality compares a specific metric of the SLA to pick the best result.

Therefore it is integral to select or create an SLA target(s) that relates to the traffic targeted by the rule. It does not make sense to evaluate a public resource, such as YouTube, when the rule matches Azure traffic.

See Performance SLA on page 507 for more details.

**Additional fields for configuring WAN intelligence**

This topic describes the fields in an SD-WAN rule used for configuring WAN intelligence for egress traffic:

- Forward and/or reverse differentiated services code point (DSCP) on page 546
- Default and gateway options on page 547

For information about accessing fields for configuring WAN intelligence, see Fields for configuring WAN intelligence on page 544.

**Forward and/or reverse differentiated services code point (DSCP)**

The FortiGate differentiated services feature can be used to change the DSCP value for all packets accepted by a policy.

The packet's DSCP field for traffic initiating a session (forward) or for reply traffic (reverse) can be changed and enabled in each direction separately by configuring it in the firewall policy using the Forward DSCP and Reverse DSCP fields.

From the CLI:

```
config system sdwan
  config service
    edit <ID>
    ... set dscp-forward enable
    ... next
  end
end

set dscp-forward enable
```

Enable use of forward DSCP tag.
**SD-WAN**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>set dscp-forward-tag 000000</td>
<td>Forward traffic DSCP tag.</td>
</tr>
<tr>
<td>set dscp-reverse enable</td>
<td>Enable use of reverse DSCP tag.</td>
</tr>
<tr>
<td>set dscp-reverse-tag 000000</td>
<td>Reverse traffic DSCP tag.</td>
</tr>
</tbody>
</table>

**Default and gateway options**

Following are additional gateway options that can be set only in the CLI:

```
config system sdwan
    config service
        edit <ID>
            ...
            set default enable
            ...
        next
    end
end
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>set default [enable</td>
<td>disable]</td>
</tr>
<tr>
<td>set gateway [enable</td>
<td>disable]</td>
</tr>
</tbody>
</table>

By default, these settings are set to **disable**.

These two commands help adjust FortiGate route selection by affecting how the FortiGate consults the Forward Information Base (FIB).

In order to decide whether an SD-WAN policy-route can be matched, FortiGate performs the following FIB lookups:

- FIB best match for the destination must return an SD-WAN member.
- FIB route to the destination must exist over the desired SD-WAN member.

When `set default enable` is used with `set gateway enable`, FortiGate bypasses the FIB checks, and instead routes any matching traffic of the SD-WAN rule to the chosen SD-WAN member using the member's configured gateway. SD-WAN members must have a gateway configured.

When `set default disable` is used with `set gateway enable`, FortiGate keeps the first rule in effect but causes the second rule to change to:

- FIB route to the gateway IP address must exist over any interface.

See also [Fields for configuring WAN intelligence on page 544](#).

**Implicit rule**

SD-WAN rules define specific policy routing options to route traffic to an SD-WAN member. When no explicit SD-WAN rules are defined, or if none of the rules are matched, then the default implicit rule is used.

In an SD-WAN configuration, the default route usually points to the SD-WAN interface, so each active member's gateway is added to the routing table's default route. FortiOS uses equal-cost multipath (ECMP) to balance traffic between the interfaces. One of five load balancing algorithms can be selected:
| Source IP <span>(source-ip-based)</span> | Traffic is divided equally between the interfaces, including the SD-WAN interface. Sessions that start at the same source IP address use the same path. This is the default selection. |
| Sessions <span>(weight-based)</span> | The workload is distributing based on the number of sessions that are connected through the interface. The weight that you assign to each interface is used to calculate the percentage of the total sessions that are allowed to connect through an interface, and the sessions are distributed to the interfaces accordingly. Sessions with the same source and destination IP addresses <span>(src-ip and dst-ip)</span> are forwarded to the same path, but are still considered in later session ratio calculations. An interface's weight value cannot be zero. |
| Spillover <span>(usage-based)</span> | The interface is used until the traffic bandwidth exceeds the ingress and egress thresholds that you set for that interface. Additional traffic is then sent through the next SD-WAN interface member. |
| Source-Destination IP <span>(source-dest-ip-based)</span> | Traffic is divided equally between the interfaces. Sessions that start at the same source IP address and go to the same destination IP address use the same path. |
| Volume <span>(measured-volume-based)</span> | The workload is distributing based on the number of packets that are going through the interface. The volume weight that you assign to each interface is used to calculate the percentage of the total bandwidth that is allowed to go through an interface, and the bandwidth is distributed to the interfaces accordingly. An interface's volume value cannot be zero. |

You cannot exclude an interface from participating in load balancing using the implicit rule. If the weight or volume were set to zero in a previous FortiOS version, the value is treated as a one. Interfaces with static routes can be excluded from ECMP if they are configured with a lower priority than other static routes.

**Examples**

The following four examples demonstrate how to use the implicit rules (load-balance mode).
If no SD-WAN zone is specified, members are added to the default virtual-wan-link zone.

**Example 1**

Outgoing traffic is equally balanced between wan1 and wan2, using source-ip-based or source-dest-ip-based mode.

**Using the GUI:**

1. On the FortiGate, enable SD-WAN and add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 488 for details.
2. Go to Network > SD-WAN and select the SD-WAN Rules tab.
3. Edit the sd-wan rule (the last default rule).
4. For the Load Balancing Algorithm, select either Source IP or Source-Destination IP.
5. Click OK.

**Using the CLI:**

1. Enable SD-WAN and add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 488 for details.
2. Set the load balancing algorithm:
   
   **Source IP based:**
   ```
   config system sdwan
   set load-balance-mode source-ip-based
   end
   ```

   **Source-Destination IP based:**
   ```
   config system sdwan
   set load-balance-mode source-dest-ip-based
   end
   ```

Example 2

Outgoing traffic is balanced between wan1 and wan2 with a customized ratio, using weight-based mode: wan1 runs 80% of the sessions, and wan2 runs 20% of the sessions.

Sessions with the same source and destination IP addresses (src-ip and dst-ip) will be forwarded to the same path, but will still be considered in later session ratio calculations.

Using the GUI:

1. Go to Network > SD-WAN and select the SD-WAN Rules tab.
2. Edit the sd-wan rule (the last default rule).
3. For the Load Balancing Algorithm, select Sessions.
4. Enter 80 in the wan1 field, and 20 in the wan2 field.
5. Click OK.

Using the CLI:

```
config system sdwan
    set load-balance-mode weight-based
config members
    edit 1
        set interface "wan1"
        set weight 80
    next
    edit 2
        set interface "wan2"
        set weight 20
    next
end
```

Example 3

Outgoing traffic is balanced between wan1 and wan2 with a customized ratio, using measured-volume-based mode: wan1 runs 80% of the volume, and wan2 runs 20% of the volume.
Using the GUI:

1. Go to Network > SD-WAN and select the SD-WAN Rules tab.
2. Edit the sd-wan rule (the last default rule).
3. For the Load Balancing Algorithm, select Volume.
4. Enter 80 in the wan1 field, and 20 in the wan2 field.
5. Click OK.

Using the CLI:

```fortios
config system sdwan
  set load-balance-mode measured-volume-based
config members
  edit 1
    set interface "wan1"
    set volume-ratio 80
  next
  edit 2
    set interface "wan2"
    set volume-ratio 20
  next
end
end
```

**Example 4**

Load balancing can be used to reduce costs when internet connections are charged at different rates. For example, if wan2 charges based on volume usage and wan1 charges a fixed monthly fee, we can use wan1 at its maximum bandwidth, and use wan2 for overflow.

In this example, wan1’s bandwidth is 10Mbps down and 2Mbps up. Traffic will use wan1 until it reaches its spillover limit, then it will start to use wan2. Note that auto-asic-offload must be disabled in the firewall policy.

Using the GUI:

1. On the FortiGate, enable SD-WAN and add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 488 for details.
2. Go to Network > SD-WAN and select the SD-WAN Rules tab.
3. Edit the sd-wan rule (the last default rule).
4. For the Load Balancing Algorithm, select Spillover.
5. Enter 10000 in the `wan1 Ingress Spillover Threshold` field, and 2000 in the `wan1 Egress Spillover Threshold` field.

6. Click OK.

Using the CLI:

```
config system sdwan
    set load-balance-mode usage-based
config members
    edit 1
        set interface "wan1"
        set spillover-threshold 2000
        set ingress-spillover-threshold 10000
    next
end
```

Automatic strategy

The automatic strategy is a legacy rule that lets you select an outgoing interface based on its performance ranking compared to the other SD-WAN interfaces. This is achieved by applying a performance SLA to rank the interfaces, and then selecting the desired rank.

In this example, you have three SD-WAN interfaces to three different ISPs that all go to the public internet. WAN1 is your highest quality link and should be reserved for business critical traffic. WAN2 and WAN3 are redundant backup links. You noticed one non-critical application is taking up a lot of bandwidth and want to prioritize it to the lowest quality link at any given time.

To configure automatic SD-WAN rules from the CLI:

```
config system sdwan
    config members
        edit 1
            set interface "wan1"
        next
        edit 2
            set interface "wan2"
        next
        edit 3
            set interface "wan3"
        next
```
```plaintext
end
config health-check
    edit "non-critical application"
        set server "noncritical.application.com"
        set members 1 2 3
    config sla
        edit 1
            set latency-threshold 250
            set jitter-threshold 50
            set packetloss-threshold 3
        next
    end
end
config service
    edit 1
        set name "non-critical application"
        set mode auto
        set quality-link 3
        set dst "non-critical-app-address-object"
        set health-check "non-critical application"
    next
end
end
```

The `auto` option is only available in the CLI. If you use the GUI to edit the rule, the `auto` option will be overwritten because you cannot select `auto` in the GUI.

**Manual strategy**

In manual mode, no health checks are used. As a result, the decision making closer resembles logic than intelligence. SD-WAN manual rules are similar to regular policy-based routes, but have the added features of application-aware routing and BGP-tag routing. A manual strategy rule is comprised of the following parts:

- Defining the interfaces to be used
- Ordering the interfaces based on preference

**To configure manual SD-WAN rules from the GUI:**

1. Go to *Network > SD-WAN*.
2. Select the *SD-WAN Rules* tab, and click *Create New*. 
3. Set the following options to create a manual rule:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type a name for the rule.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>(Optional) Specify a Source address and/or User group.</td>
</tr>
<tr>
<td>Destination</td>
<td>Specify the destination using an Address object or an Internet Service or an Application.</td>
</tr>
<tr>
<td>Zone preference</td>
<td>Specify one or more SD-WAN interfaces or zones. The order in which the interfaces or zones are specified determines their priority when the rule is matched.</td>
</tr>
</tbody>
</table>

4. Set the remaining options as desired, and click OK to create the rule.

**To configure manual SD-WAN rules from the CLI:**

```
config system sdwan
config members
  edit 1
    set interface "wan1"
  next
  edit 2
    set interface "wan2"
  next
end
config service
  edit 1
    set name "manual"
    set mode manual
    set priority-members 2 1
    set dst "DC_net"
    set hold-down-time 60
  next
end
end
```

- The command `set mode manual` will not appear in the configuration because it is the default mode.
- The command `set hold-down-time <integer>` is an optional command that controls how long to wait before switching back to the primary interface in the event of a failover.

### Best quality strategy

When using *Best Quality* mode, SD-WAN will choose the best link to forward traffic by comparing the *link-cost-factor*. A link-cost factor is a specific metric of participating link(s) (such as, latency, packet loss, and so on) evaluated against a target that you define (such as a health-check server), for example, the latency of WAN1 and WAN2 to your datacenter. Below is a list of link-cost factors available to you:
### GUI | CLI | Description
---|---|---
Latency | latency | Select a link based on latency.
Jitter | jitter | Select a link based on jitter.
Packet Loss | packet-loss | Select a link based on packet loss.
Downstream | inbandwidth | Select a link based on available bandwidth of incoming traffic.
Upstream | outbandwidth | Select a link based on available bandwidth of outgoing traffic.
Bandwidth | bibandwidth | Select a link based on available bandwidth of bidirectional traffic.
Customized profile | custom-profile-1 | Select link based on customized profile. If selected, set the following weights:
• packet-loss-weight: Coefficient of packet-loss.
• latency-weight: Coefficient of latency.
• jitter-weight: Coefficient of jitter.
• bandwidth-weight: Coefficient of reciprocal of available bidirectional bandwidth.

Although SD-WAN intelligence selects the best quality link according to the selected metric, by default a preference or advantage is given to the first configured SD-WAN member. This default is 10% and may be configured with the CLI command `set link-cost-threshold 10`.

**Example of how `link-cost-threshold` works:**

```plaintext
config system sdwan
    config members
        edit 1
            set interface "wan1"
        next
        edit 2
            set interface "wan2"
        next
    end
    config service
        edit 1
            set name "Best_Quality"
            set mode priority
            set priority-members 2 1
            set dst "DC_net"
            set health-check "DC_HealthCheck"
            set link-cost-factor latency
            set link-cost-threshold 10
        next
    end
end
```

In this example both WAN1 and WAN2 are assumed to have 200ms latency to the health-check server named `DC_HealthCheck`. Because WAN2 is specified before WAN1 in priority-members, SD-WAN parses the two interfaces metric as follows:

- WAN1: 200ms
- WAN2: \(200ms / (1+10\%) = \sim 182ms\)

As a result, WAN2 is selected because the latency is lower.
If the *Downstream* (*inbandwidth*), *Upstream* (*outbandwidth*), or *Bandwidth* (*bibandwidth*) quality criteria is used, the FortiGate uses the upstream and downstream bandwidth values configured on the member interfaces to calculate bandwidth.

The interface bandwidth configuration can be done manually, or the interface speedtest can be used to populate the bandwidth values based on the speedtest results. See *Manual interface speedtest on page 527* for details.

**To manually configure the upstream and downstream interface bandwidth values:**

```config
config system interface
  edit <interface>
    set estimated-upstream-bandwidth <speed in kbps>
    set estimated-downstream-bandwidth <speed in kbps>
  next
end
```

**Example**

In this example, your wan1 and wan2 SD-WAN interfaces connect to two ISPs that both go to the public internet, and you want Gmail services to use the link with the least latency.

**To configure an SD-WAN rule to use Best Quality:**

1. On the FortiGate, add wan1 and wan2 as SD-WAN members, then add a policy and static route. See *SD-WAN quick start on page 488* for details.
2. Create a new Performance SLA named *google*. See *Link monitoring example on page 515*.
3. Go to *Network > SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
4. Enter a name for the rule, such as *gmail*.
5. Configure the following settings:
Priority Rule

Name: gmail

Source
Source address
User group

Destination
Address
Internet Service
Application

Outgoing Interfaces
Select a strategy for how outgoing interfaces will be chosen.
- Manual
- Best Quality
  This interface with the best measured performance is selected.
- Lowest Cost (SLA)
  This interface that meets SLA targets is selected. When there is a tie, the interface with the lowest assigned cost is selected.
- Maximize Bandwidth (SLA)
  Traffic is load balanced among interfaces that meet SLA targets.

Interface preference
Zone preference
Measured SLA
Quality metric
Forward DSCP
Reverse DSCP
Status

Internet Service  Google-Gmail
Strategy  Best Quality
Interface preference  wan1 and wan2
Measured SLA  google (created in step 2).
Quality criteria  Latency

6. Click OK to create the rule.

To configure an SD-WAN rule to use priority:

```bash
config system sdwan
  config health-check
    edit "google"
      set server "google.com"
      set members 1 2
      next
  end
  config service
    edit 1
      set name "gmail"
      set mode priority
      set internet-service enable
      set internet-service-id 65646
      set health-check "google"
```
To diagnose the Performance SLA status:

FGT # diagnose sys sdwan health-check google
Health Check (google):
Seq(1): state(alive), packet-loss(0.000%) latency(14.563), jitter(4.334) sla_map=0x0
Seq(2): state(alive), packet-loss(0.000%) latency(12.633), jitter(6.265) sla_map=0x0

FGT # diagnose sys sdwan service 1
Service(1):

   TOS(0x0/0x0), protocol(0: 1->65535), Mode(priority), link-cost-factor(latency), link-cost-threshold(10), health-check (google) Members:

   1: Seq_num(2), alive, latency: 12.633, selected
   2: Seq_num(1), alive, latency: 14.563, selected

Internet Service: Google-Gmail(65646)

As wan2 has a smaller latency, SD-WAN will put Seq_num(2) on top of Seq_num(1) and wan2 will be used to forward Gmail traffic.

Lowest cost (SLA) strategy

When using Lowest Cost (SLA) mode (sla in the CLI), SD-WAN will choose the lowest cost link that satisfies SLA to forward traffic. The lowest possible cost is 0. If multiple eligible links have the same cost, the Interface preference order will be used to select a link.

In this example, your wan1 and wan2 SD-WAN interfaces connect to two ISPs that both go to the public internet. The cost of wan2 is less than that of wan1. You want to configure Gmail services to use the lowest cost interface, but the link quality must meet a standard of latency: 10ms, and jitter: 5ms.
SD-WAN

To configure an SD-WAN rule to use Lowest Cost (SLA):

1. On the FortiGate, add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 488 for details.
2. Create a new Performance SLA named google that includes an SLA Target with Latency threshold = 10ms and Jitter threshold = 5ms. See Link monitoring example on page 515.
3. Go to Network > SD-WAN, select the SD-WAN Rules tab, and click Create New.
4. Enter a name for the rule, such as gmail.
5. Configure the following settings:

<table>
<thead>
<tr>
<th>Internet Service</th>
<th>Google-Gmail</th>
</tr>
</thead>
<tbody>
<tr>
<td>Strategy</td>
<td>Lowest Cost (SLA)</td>
</tr>
<tr>
<td>Interface preference</td>
<td>wan1 and wan2</td>
</tr>
<tr>
<td>Required SLA target</td>
<td>google (created in step 2).</td>
</tr>
</tbody>
</table>

6. Click OK to create the rule.

To configure an SD-WAN rule to use SLA:

```config
config system sdwan
config members
  edit 1
    set interface "wan1"
    set cost 10
```
next
edit 2
   set interface "wan2"
   set cost 5
next
derm
config health-check
edit "google"
   set server "google.com"
   set members 1 2
   config sla
      edit 1
         set latency-threshold 10
         set jitter-threshold 5
      next
   next
end
derm
config service
edit 1
   set name "gmail"
   set mode sla
   set internet-service enable
   set internet-service-id 65646
   config sla
      edit "google"
         set id 1
      next
   set priority-members 1 2
next
derm

If no SD-WAN zone is specified, members are added to the default virtual-wan-link zone.

The CLI command set minimum-sla-meet-members allows you to specify the number of links that must meet SLA for the rule to take effect. If the number of members is less than the minimum set with this command, the rule will not take effect.

To diagnose the Performance SLA status:

FGT # diagnose sys sdwan health-check google
Health Check(google):
Seq(1): state(alive), packet-loss(0.000%) latency(14.563), jitter(4.334) sla_map=0x0
Seq(2): state(alive), packet-loss(0.000%) latency(12.633), jitter(6.265) sla_map=0x0

FGT # diagnose sys sdwan service 1
Service(1): Address Mode(IPV4) flags=0x0
           TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla)
Internet Service: Google.Gmail(65646)

When both wan1 and wan2 meet the SLA requirements, Gmail traffic will only use wan2. If only wan1 meets the SLA requirements, Gmail traffic will only use wan1, even though it has a higher cost. If neither interface meets the requirements, wan2 will be used.

If both interface had the same cost and both met the SLA requirements, the first link configured in set priority-members would be used.

Maximize bandwidth (SLA) strategy

When using Maximize Bandwidth mode (load-balance in the CLI), SD-WAN will choose all of the links that satisfies SLA to forward traffic based on a load balancing algorithm. The load balancing algorithm, or hash method, can be one of the following:

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>round-robin</td>
<td>All traffic are distributed to selected interfaces in equal portions and circular order. This is the default method, and the only option available when using the GUI.</td>
</tr>
<tr>
<td>source-ip-based</td>
<td>All traffic from a source IP is sent to the same interface.</td>
</tr>
<tr>
<td>source-dest-ip-based</td>
<td>All traffic from a source IP to a destination IP is sent to the same interface.</td>
</tr>
<tr>
<td>inbandwidth</td>
<td>All traffic are distributed to a selected interface with most available bandwidth for incoming traffic.</td>
</tr>
<tr>
<td>outbandwidth</td>
<td>All traffic are distributed to a selected interface with most available bandwidth for outgoing traffic.</td>
</tr>
<tr>
<td>bibandwidth</td>
<td>All traffic are distributed to a selected interface with most available bandwidth for both incoming and outgoing traffic.</td>
</tr>
</tbody>
</table>

When the inbandwidth, outbandwidth, or bibandwidth load balancing algorithm is used, the FortiGate will compare the bandwidth based on the configured upstream and downstream bandwidth values.

The interface speedtest can be used to populate the bandwidth values based on the speedtest results. See Manual interface speedtest on page 527 for details.

To manually configure the upstream and downstream bandwidth values:

```
config system interface
  edit <interface>
    set estimated-upstream-bandwidth <speed in kbps>
    set estimated-downstream-bandwidth <speed in kbps>
  next
end
```

ADVPN is not supported in this mode.
In this example, your wan1 and wan2 SD-WAN interfaces connect to two ISPs that both go to the public internet. You want to configure Gmail services to use both of the interface, but the link quality must meet a standard of latency: 10ms, and jitter: 5ms. This can maximize the bandwidth usage.

To configure an SD-WAN rule to use Maximize Bandwidth (SLA):

1. On the FortiGate, add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 488 for details.
2. Create a new Performance SLA named google that includes an SLA Target 1 with Latency threshold = 10ms and Jitter threshold = 5ms. See Link monitoring example on page 515.
3. Go to Network > SD-WAN, select the SD-WAN Rules tab, and click Create New.
4. Enter a name for the rule, such as gmail.
5. Configure the following settings:
### SD-WAN Field Setting

<table>
<thead>
<tr>
<th>Field</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internet Service</td>
<td>Google-Gmail</td>
</tr>
<tr>
<td>Strategy</td>
<td>Maximize Bandwidth (SLA)</td>
</tr>
<tr>
<td>Interface preference</td>
<td>wan1 and wan2</td>
</tr>
<tr>
<td>Required SLA target</td>
<td>google (created in step 2).</td>
</tr>
</tbody>
</table>

6. Click OK to create the rule.

**To configure an SD-WAN rule to use SLA:**

```
config system sdwan
  config health-check
    edit "google"
      set server "google.com"
      set members 1 2
    config sla
      edit 1
        set latency-threshold 10
        set jitter-threshold 5
      next
      next
    end
  end
config service
  edit 1
    set name "gmail"
    set addr-mode ipv4
    set mode load-balance
    set hash-mode round-robin
    set internet-service enable
    set internet-service-name Google-Gmail
    config sla
      edit "google"
        set id 1
        next
    end
  set priority-members 1 2
  next
end
```

The CLI command `set minimum-sla-meet-members` allows you to specify the number of links that must meet SLA for the rule to take effect. If the number of members is less than the minimum set with this command, the rule will not take effect.

**To diagnose the performance SLA status:**

```
FGT # diagnose sys sdwan health-check google
Health Check (google):
Seq(1): state(alive), packet-loss(0.000%) latency(14.563), jitter(4.334) sla_map=0x0
Seq(2): state(alive), packet-loss(0.000%) latency(12.633), jitter(6.265) sla_map=0x0
```
FGT # diagnose sys sdwan service 1
Service(1): Address Mode(IPV4) flags=0x0
   TOS(0x0/0x0), Protocol(0: 1->65535), Mode(load-balance)
   Members:<<BR>>
      1: Seq_num(1), alive, sla(0x1), num of pass(1), selected
      2: Seq_num(2), alive, sla(0x1), num of pass(1), selected

Internet Service: Google.Gmail(65646)

When both wan1 and wan2 meet the SLA requirements, Gmail traffic will use both wan1 and wan2. If only one of the interfaces meets the SLA requirements, Gmail traffic will only use that interface.

If neither interface meets the requirements but health-check is still alive, then wan1 and wan2 tie. The traffic will try to balance between wan1 and wan2, using both interfaces to forward traffic.

**Use MAC addresses in SD-WAN rules and policy routes**

You can use MAC addresses as the source in SD-WAN rules and policy routes.

The FABRIC_DEVICE address object (a dynamic object that includes the IPs of Security Fabric devices) can be used as a source or destination in SD-WAN rules and policy routes.

The `diagnose ip proute match` command accepts either the IP or MAC address format for the source:

```
diagnose ip proute match <destination> <source> <interface> <protocol> <port>
```

To configure a MAC address as a source for SD-WAN and a policy route:

1. Configure the MAC address:

   ```
   config firewall address
   edit "mac-add"
   set type mac
   set macaddr 70:4c:a5:86:de:56
   next
   end
   ```

2. Configure the policy route:

   ```
   config router policy
   edit 3
   set srcaddr "mac-add"
   set gateway 15.1.1.34
   set output-device ha
   next
   end
   ```

3. Configure the SD-WAN rule:

   ```
   config system sdwan
   config service
   edit 1
   set dst "all"
   set src "mac-add"
   ```
To verify the policy route matching for a MAC address:

```bash
# diagnose ip proute match 3.1.1.34 70:4c:a5:86:de:56 port3 22 6
dst=3.1.1.34 src=0.0.0.0 smac=70:4c:a5:86:de:56 iif=11 protocol=22 dport=6
id=00000003 type=Policy Route
seq-num=3
```

### SD-WAN traffic shaping and QoS

Use a traffic shaper in a firewall shaping policy to control traffic flow. You can use it to control maximum and guaranteed bandwidth, or put certain traffic to one of the three different traffic priorities: high, medium, or low.

An advanced shaping policy can classify traffic into 30 groups. Use a shaping profile to define the percentage of the interface bandwidth that is allocated to each group. Each group of traffic is shaped to the assigned speed limit based on the outgoing bandwidth limit configured on the interface.

For more information, see Traffic shaping on page 918.

### Sample topology

![Sample topology diagram](image)

### Sample configuration

This example shows a typical customer usage where the customer's SD-WAN uses the default zone, and has two member: wan1 and wan2, each set to 10Mb/s.

An overview of the procedures to configure SD-WAN traffic shaping and QoS with SD-WAN includes:

1. Give HTTP/HTTPS traffic high priority and give FTP low priority so that if there are conflicts, FortiGate will forward HTTP/HTTPS traffic first.
2. Even though FTP has low priority, configure FortiGate to give it a 1Mb/s guaranteed bandwidth on each SD-WAN member so that if there is no FTP traffic, other traffic can use all the bandwidth. If there is heavy FTP traffic, it can still be guaranteed a 1Mb/s bandwidth.

3. Traffic going to specific destinations such as a VOIP server uses wan1 to forward, and SD-WAN forwards with an Expedited Forwarding (EF) DSCP tag 101110.

To configure SD-WAN traffic shaping and QoS with SD-WAN in the GUI:

1. On the FortiGate, add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 488.
2. Add a firewall policy with Application Control enabled. See Configuring firewall policies for SD-WAN on page 491.
   a. Enable Guaranteed Bandwidth and set it to 1000 kbps.
   a. Name the traffic shaping policy, for example, HTTP-HTTPS.
   b. Set the following:

<table>
<thead>
<tr>
<th>Source</th>
<th>all</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destination</td>
<td>all</td>
</tr>
<tr>
<td>Service</td>
<td>HTTP and HTTPS</td>
</tr>
<tr>
<td>Outgoing interface</td>
<td>virtual-wan-link</td>
</tr>
<tr>
<td>Shared Shaper</td>
<td>Enable and set to high-priority</td>
</tr>
<tr>
<td>Reverse Shaper</td>
<td>Enable and set to high-priority</td>
</tr>
</tbody>
</table>

   c. Click OK.
5. Go to Policy & Objects > Traffic Shaping, select the Traffic Shaping Policies tab, and click Create New.
   a. Name the traffic shaping policy, for example, FTP.
   b. Set the following:

<table>
<thead>
<tr>
<th>Source</th>
<th>all</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destination</td>
<td>all</td>
</tr>
<tr>
<td>Service</td>
<td>FTP, FTP_GET, and FTP_PUT</td>
</tr>
<tr>
<td>Outgoing interface</td>
<td>virtual-wan-link</td>
</tr>
<tr>
<td>Shared Shaper</td>
<td>Enable and set to low-priority</td>
</tr>
<tr>
<td>Reverse Shaper</td>
<td>Enable and set to low-priority</td>
</tr>
</tbody>
</table>

   c. Click OK
6. Go to Network > SD-WAN, select the SD-WAN Rules tab, and click Create New.
   a. Enter a name for the rule, such as Internet.
   b. In the Destination section, click Address and select the VOIP server that you created in the firewall address.
   d. For Interface preference select wan1.
   e. Click OK.
7. Use CLI commands to modify DSCP settings. See the DSCP CLI commands below.
To configure the firewall policy using the CLI:

```plaintext
config firewall policy
edit 1
  set name "1"
  set srcintf "dmz"
  set dstintf "virtual-wan-link"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set schedule "always"
  set service "ALL"
  set utm-status enable
  set ssl-ssh-profile "certificate-inspection"
  set application-list "default"
  set nat enable
next
end
```

To configure the firewall traffic shaper priority using the CLI:

```plaintext
config firewall shaper traffic-shaper
edit "high-priority"
  set maximum-bandwidth 1048576
  set per-policy enable
next
edit "low-priority"
  set guaranteed-bandwidth 1000
  set maximum-bandwidth 1048576
  set priority low
  set per-policy enable
next
end
```

To configure the firewall traffic shaping policy using the CLI:

```plaintext
config firewall shaping-policy
edit 1
  set name "http-https"
  set service "HTTP" "HTTPS"
  set dstintf "virtual-wan-link"
  set traffic-shaper "high-priority"
  set traffic-shaper-reverse "high-priority"
  set srcaddr "all"
  set dstaddr "all"
next
edit 2
  set name "FTP"
  set service "FTP" "FTP_GET" "FTP_PUT"
  set dstintf "virtual-wan-link"
  set traffic-shaper "low-priority"
  set traffic-shaper-reverse "low-priority"
  set srcaddr "all"
  set dstaddr "all"
next
end
```
To configure SD-WAN traffic shaping and QoS with SD-WAN in the CLI:

```plaintext
cfg system sdwan
  set status enable
cfg members
  edit 1
    set interface "wan1"
    set gateway 172.16.20.2
  next
  edit 2
    set interface "wan2"
    set gateway 10.100.20.2
  next
dn
end
cfg service
  edit 1
    set name "SIP"
    set priority-members 1
    set dst "voip-server"
    set dscp-forward enable
    set dscp-forward-tag 101110
  next
dn
end
```

If no SD-WAN zone is specified, members are added to the default `virtual-wan-link` zone.

To use the `diagnose` command to check if specific traffic is attached to the correct traffic shaper:

```plaintext
# diagnose firewall irope list 100015

policy index=1 uuid_idx=0 action=accept
flag (0):
  shapers: orig=high-priority(2/0/134217728) reply=high-priority(2/0/134217728)
  cos_fwd=0 cos_rev=0
  group=00100015 av=00000000 au=00000000 split=00000000
  host=0 chk_client_info=0x0 app_list=0 ips_view=0
  misc=0 dd_type=0 dd_mode=0
  zone(1): 0 -> zone(2): 36 38
  source(1): 0.0.0.0-255.255.255.255, uuid_idx=6,
  dest(1): 0.0.0.0-255.255.255.255, uuid_idx=6,
  service(2):
    [6:0x0:0/(1,65535)->(80,80)] helper:auto
    [6:0x0:0/(1,65535)->(443,443)] helper:auto

policy index=2 uuid_idx=0 action=accept
flag (0):
  shapers: orig=low-priority(4/128000/134217728) reply=low-priority(4/128000/134217728)
  cos_fwd=0 cos_rev=0
  group=00100015 av=00000000 au=00000000 split=00000000
  host=0 chk_client_info=0x0 app_list=0 ips_view=0
  misc=0 dd_type=0 dd_mode=0
```
To use the diagnose command to check if the correct traffic shaper is applied to the session:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=11 expire=3599 timeout=3600 flags=00000000
sockflag=00000000 sockport=0 av_idx=0 use=5
origin-shaper=low-priority prio=4 guarantee 128000Bps max 1280000Bps traffic 1050Bps drops 0B
reply-shaper=
per_ip_shaper=

SDN dynamic connector addresses in SD-WAN rules

SDN dynamic connector addresses can be used in SD-WAN rules. FortiGate supports both public (AWS, Azure, GCP, OCI, AliCloud) and private (Kubernetes, VMware ESXi and NSX, OpenStack, ACI, Nuage) SDN connectors.

The configuration procedure for all of the supported SDN connector types is the same. This example uses an Azure public SDN connector.

There are four steps to create and use an SDN connector address in an SD-WAN rule:

1. Configure the FortiGate IP address and network gateway so that it can reach the Internet.
2. Create an Azure SDN connector.
3. Create a firewall address to associate with the configured SDN connector.
4. Use the firewall address in an SD-WAN service rule.

To create an Azure SDN connector:

1. Go to Security Fabric > External Connectors.
2. Click Create New.
3. In the Public SDN section, click Microsoft Azure.
4. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>azure1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Enabled</td>
</tr>
<tr>
<td>Update Interval</td>
<td>Use Default</td>
</tr>
<tr>
<td>Server region</td>
<td>Global</td>
</tr>
<tr>
<td>Directory ID</td>
<td>942b80cd-1b14-42a1-8dcf-4b21dece61ba</td>
</tr>
<tr>
<td>Application ID</td>
<td>14dbd5c5-307e-4ea4-8133-68738141feb1</td>
</tr>
<tr>
<td>Client secret</td>
<td>xxxxxx</td>
</tr>
<tr>
<td>Resource path</td>
<td>disabled</td>
</tr>
</tbody>
</table>

5. Click OK.

To create a firewall address to associate with the configured SDN connector:

1. Go to Policy & Objects > Addresses.
2. Click Create New > Address.
3. Enter the following:

<table>
<thead>
<tr>
<th>Category</th>
<th>Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>azure-address</td>
</tr>
<tr>
<td>Type</td>
<td>Dynamic</td>
</tr>
<tr>
<td>Sub Type</td>
<td>Fabric Connector Address</td>
</tr>
<tr>
<td>SDN Connector</td>
<td>azure1</td>
</tr>
<tr>
<td>SDN address type</td>
<td>Private</td>
</tr>
<tr>
<td>Filter</td>
<td>SecurityGroup=edsouza-centos</td>
</tr>
<tr>
<td>Interface</td>
<td>Any</td>
</tr>
</tbody>
</table>

4. Click OK.
To use the firewall address in an SD-WAN service rule:

1. Go to Network > SD-WAN, select the SD-WAN Rules tab, and click Create New.
2. Set the Name to Azure1.
3. For the Destination Address select azure-address.
4. Configure the remaining settings as needed. See SD-WAN rules on page 539 for details.
5. Click OK.

Diagnostics

Use the following CLI commands to check the status of and troubleshoot the connector.

To see the status of the SDN connector:

```bash
# diagnose sys sdn status
SDN Connector   Type   Status    Updating    Last update
azure1           azure   connected  no          n/a
```

To debug the SDN connector to resolve the firewall address:

```bash
# diagnose debug application azd -1
  Debug messages will be on for 30 minutes.

  ...  
  azd sdn connector azure1 start updating IP addresses
  azd checking firewall address object azure-address-1, vd 0
  IP address change, new list:
    10.18.0.4
    10.18.0.12
  ...  
  ...

# diagnose sys sdwan service
Service(2): Address Mode(IPV4) flags=0x0
  TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
  Service role: standalone
  Member sub interface:
    Members:
      1: Seq_num(1), alive, selected
  Dst address:
    10.18.0.4 - 10.18.0.4
    10.18.0.12 - 10.18.0.12
    ... ...
    ...
    ...
```

Application steering using SD-WAN rules

This topic covers how to use application steering in a topology with multiple WAN links. The following examples illustrate how to use different strategies to perform application steering to accommodate different business needs:
Static application steering with a manual strategy on page 573
Dynamic application steering with lowest cost and best quality strategies on page 576

Application matching

To apply application steering, SD-WAN service rules match traffic based on the applications that are in the application signature database. To view the signatures, go to Security Profiles > Application Signatures and select Signature.

![Application Signatures Diagram]

On the first session that passes through, the IPS engine processes the traffic in the application layer to match it to a signature in the application signature database. The first session does not match any SD-WAN rules because the signature has not been recognized yet. When the IPS engine recognizes the application, it records the 3-tuple IP address, protocol, and port in the application control Internet Service ID list. To view the application and corresponding 3-tuple:

```
# diagnose sys sdwan internet-service-app-ctrl-list [app ID]
52.114.142.254
```

The recognized application and 3-tuple stay in the application control list for future matches to occur. If there are no hits on the entry for eight hours, the entry is deleted.

For services with multiple IP addresses, traffic might not match the expected SD-WAN rule because the traffic is destined for an IP address that has no previously been recognized by the FortiGate. The `diagnose sys sdwan internet-service-app-ctrl-list` command can be used to help troubleshoot such situations.

Static application steering with a manual strategy

This example covers a typical usage scenario where the SD-WAN has two members: MPLS and DIA. DIA is primarily used for direct internet access to internet applications, such as Office365, Google applications, Amazon, and Dropbox. MPLS is primarily used for SIP, and works as a backup when DIA is not working.
This example configures all SIP traffic to use MPLS while all other traffic uses DIA. If DIA is not working, the traffic will use MPLS.

To configure an SD-WAN rule to use SIP and DIA in the GUI:

1. Add port1 (DIA) and port2 (MPLS) as SD-WAN members, and configure a static route. See Configuring the SD-WAN interface on page 489 for details.
2. Create a firewall policy with an Application Control profile configured. See Configuring firewall policies for SD-WAN on page 491 for details.
3. Go to Network > SD-WAN, select the SD-WAN Rules tab, and click Create New.
4. Enter a name for the rule, such as SIP.
5. Click the Application field and select the applicable SIP applications from the Select Entries panel.
7. For Interface preference, select MPLS.
8. Click OK.
9. Click Create New to create another rule.
10. Enter a name for the rule, such as Internet.
11. Click the Address field and select all from the panel.
13. For Interface preference, select DIA.
14. Click OK.

To configure the firewall policy using the CLI:

```
config firewall policy
   edit 1
       set name "1"
       set srcintf "dmz"
       set dstintf "virtual-wan-link"
       set srcaddr "all"
       set dstaddr "all"
       set action accept
       set schedule "always"
       set service "ALL"
       set utm-status enable
       set fssso disable
```
To configure an SD-WAN rule to use SIP and DIA using the CLI:

```
set application-list "default"
    set ssl-ssh-profile "certificate-inspection"
    set nat enable
next
end
```

```
To use the diagnose command to check performance SLA status using the CLI:

# diagnose sys sdwan service 1
```

```
Service(1): Address Mode(IPV4) flags=0x0
TOS(0x0/0x0), Protocol (0: 1->65535), Mode (manual)
Members:

1: Seq_num(1), alive, selected
```

```
Internet Service: SIP(4294836224 34640) SIP.Method(4294836225 152305677) SIP.Via.NAT
```

If no SD-WAN zone is specified, members are added to the default `virtual-wan-link` zone.
Dynamic application steering with lowest cost and best quality strategies

In this example, the SD-WAN has three members: two ISPs (DIA_1 and DIA_2) that are used for access to internet applications, and an MPLS link that is used exclusively as a backup for business critical applications.

Business applications, such as Office365, Google, Dropbox, and SIP, use the Lowest Cost (SLA) strategy to provide application steering, and traffic falls back to MPLS only if both ISP1 and ISP2 are down. Non-business applications, such as Facebook and Youtube, use the Best Quality strategy to choose between the ISPs.

To configure the SD-WAN members, static route, and firewall policy in the GUI:

1. Add port1 (DIA_1), port2 (DIA_2), and port3 (MPLS) as SD-WAN members. Set the cost of DIA_1 and DIA_2 to 0, and MPLS to 20. See Configuring the SD-WAN interface on page 489 for details.
2. Configure a static route. See Adding a static route on page 490 for details.
3. Create a firewall policy to allow traffic out on SD-WAN, with an Application Control profile configured. See Configuring firewall policies for SD-WAN on page 491 for details.

To configure the SD-WAN rule and performance SLA checks for business critical application in the GUI:

1. Go to Network > SD-WAN, select the SD-WAN Rules tab, and click Create New.
2. Set the name to BusinessCriticalApps.
   This rule will steer your business critical traffic to the appropriate link based on the Lowest Cost (SLA).
3. Set Source address to all.
4. Under Destination, set Application to your required applications. In this example: Microsoft.Office.365, Microsoft.Office.Online, Google.Docs, Dropbox, and SIP.
5. Under Outgoing Interfaces, select Lowest Cost (SLA).
   The lowest cost is defined in the SD-WAN member interface settings (see Configuring the SD-WAN interface on page 489). The lowest possible cost is 0, which represents the most preferred link. In this example, DIA_1 and DIA_2 both have a cost of 0, while MPLS has a cost of 20 because it is used for backup.
6. In Interface preference, add the interfaces in order of preference when the cost of the links is tied. In this example, DIA_1, DIA_2, then MPLS.
   MPLS will always be chosen last, because it has the highest cost. DIA_1 and DIA_2 have the same cost, so an interface is selected based on their order in the Interface preference list.
7. Set Required SLA target to ensure that only links that pass your SLA target are chosen in this SD-WAN rule:
   a. Click in the Required SLA target field.
   b. In the Select Entries pane, click Create. The New Performance SLA pane opens.
   c. Set Name to BusinessCriticalApps_HC.
      This health check is used for business critical applications in your SD-WAN rule.
   d. Leave Protocol set to Ping, and add up to two servers, such as office.com and google.com.
   e. Set Participants to Specify, and add all three interfaces: DIA_1, DIA_2, and MPLS.
   f. Enable SLA Target.
      The attributes in your target determine the quality of your link. The SLA target of each link is compared when determining which link to use based on the lowest cost. Links that meet the SLA target are preferred over links that fail, and move to the next step of selection based on cost. If no links meet the SLA target, then they all move to the next step.
      In this example, disable Latency threshold and Jitter threshold, and set Packet loss threshold to 1.
   g. Click OK.
   h. Select the new performance SLA to set it as the Required SLA target.
      When multiple SLA targets are added, you can choose which target to use in the SD-WAN rule.
8. Click OK to create the SD-WAN rule.

To configure the SD-WAN rule and performance SLA checks for non-business critical application in the GUI:

1. Go to Network > SD-WAN, select the SD-WAN Rules tab, and click Create New.
2. Set the name to NonBusinessCriticalApps.
   This rule will steer your non-business critical traffic to the appropriate link based on the Best Quality. No SLA target must be met, as the best link is selected based on the configured quality criteria and interface preference order.
3. Set Source address to all.
4. Under Destination, set Application to your required applications. In this example: Facebook, and Youtube.
5. Under Outgoing Interfaces, select Best Quality.
6. In Interface preference, add the interfaces in order of preference.
   By default, a more preferred link has an advantage of 10% over a less preferred link. For example, when latency is used, the preferred link’s calculated latency = real latency / (1+10%).
The preferred link advantage can be customized in the CLI when the mode is **priority** *(Best Quality)* or **auto**:

```plaintext
config system sdwan
  config service
    edit <id>
      set link-cost-threshold <integer>
    next
  end
end
```

7. Create and apply a new performance SLA profile:
   a. Click in the *Measured SLA* field.
   b. In the drop-down list, click **Create**. The *New Performance SLA* pane opens.
   c. Set *Name* to *NonBusinessCritical_HC*. This health check is used for non-business critical applications in your SD-WAN rule.
   d. Leave *Protocol* set to *Ping*, and add up to two servers, such as *youtube.com* and *facebook.com*.
   e. Set *Participants* to *Specify*, and add the DIA_1 and DIA_2 interfaces. In this example, MPLS is not used for non-business critical applications.
   f. Leave *SLA Target* disabled.
   g. Click **OK**.
   h. Select the new performance SLA from the list to set it as the *Measured SLA*.

8. Set *Quality criteria* as required. In this example, *Latency* is selected.
   For bandwidth related criteria, such as *Downstream, Upstream, and Bandwidth* (bi-directional), the selection is based on available bandwidth. An estimated bandwidth should be configured on the interface to provide a baseline, maximum available bandwidth.
9. Click OK to create the SD-WAN rule.

To configure the SD-WAN members, static route, and firewall policy in the CLI:

1. Configure the interfaces:

```plaintext
config system interface
  edit "port1"
    set ip <class_ip>&net_netmask>
    set alias "DIA_1"
    set role wan
  next
  edit "port2"
    set ip <class_ip>&net_netmask>
    set alias "DIA_2"
    set role wan
  next
  edit "port3"
    set ip <class_ip>&net_netmask>
    set alias "MPLS"
    set role wan
  next
end
```

2. Configure the SD-WAN members:

```plaintext
config system sdwan
  set status enable
  config members
```
edit 1
    set interface "port1"
    set gateway 172.16.20.2
next
edit 2
    set interface "port2"
    set gateway 172.17.80.2
next
edit 3
    set interface "port3"
    set gateway 10.100.20.2
    set cost 20
next
end
end

If no SD-WAN zone is specified, members are added to the default virtual-wan-link zone.

3. Configure a static route. See Adding a static route on page 490 for details.
4. Create a firewall policy to allow traffic out on SD-WAN, with an Application Control profile configured. See Configuring firewall policies for SD-WAN on page 491 for details.

To configure the SD-WAN rule and performance SLA checks for business critical application in the CLI:

1. Configure the BusinessCriticalApps_HC health-check:
   config system sdwan
   config health-check
   edit "BusinessCriticalApps_HC"
       set server "office.com" "google.com"
       set members 1 2 3
       config sla
           edit 1
               set link-cost-factor packet-loss
               set packetloss-threshold 1
           next
       end
   end
   end

2. Configure the BusinessCriticalApps service to use Lowest Cost (SLA):
   config system sdwan
   config service
       edit 1
           set name "BusinessCriticalApps"
           set mode sla
           set src "all"
           set internet-service enable
           set internet-service-app-ctrl 17459 16541 33182 16177 34640
           config sla
               edit "BusinessCriticalApps_HC"
                   set id 1
To configure the SD-WAN rule and performance SLA checks for non-business critical application in the CLI:

1. Configure the `nonBusinessCriticalApps_HC` health-check:

```plaintext
config system sdwan
config health-check
  edit "NonBusinessCriticalApps_HC"
    set server "youtube.com" "facebook.com"
    set members 1 2
  next
end
end
```

2. Configure the `NonBusinessCriticalApps` service to use Lowest Cost (SLA):

```plaintext
config system sdwan
config service
  edit 4
    set name "NonBusinessCriticalApps"
    set mode priority
    set src "all"
    set internet-service enable
    set internet-service-app-ctrl 15832 31077
    set health-check "NonBusinessCriticalApps_HC"
    set priority-members 1 2
  next
end
end
```

**Verification**

Check the following GUI pages, and run the following CLI commands to confirm that your traffic is being steered by the SD-WAN rules.
Health checks

To verify the status of each of the health checks in the GUI:

1. Go to Network > SD-WAN, select the Performance SLAs tab, and select each of the health checks from the list.

![SD-WAN Health checks GUI](image)

To verify the status of each of the health checks in the CLI:

```
# diagnose sys sdwan health-check
Health Check(BusinessCritical_HC):
  Seq(1 port1): state(alive), packet-loss(0.000%) latency(12.884), jitter(0.919) sla_map=0x1
  Seq(2 port2): state(alive), packet-loss(0.000%) latency(13.018), jitter(0.723) sla_map=0x1
  Seq(3 port3): state(alive), packet-loss(0.000%) latency(13.018), jitter(0.923) sla_map=0x1
Health Check(NonBusinessCritical_HC):
  Seq(1 port1): state(alive), packet-loss(0.000%) latency(6.888), jitter(0.953) sla_map=0x0
  Seq(2 port2): state(alive), packet-loss(0.000%) latency(6.805), jitter(0.830) sla_map=0x0
```
Rule members and hit count

To verify the active members and hit count of the SD-WAN rule in the GUI:

1. Go to Network > SD-WAN and select the SD-WAN Rules tab.

The interface that is currently selected by the rule has a checkmark next to its name in the Members column. Hover the cursor over the checkmark to open a tooltip that gives the reason why that member is selected. If multiple members are selected, only the highest ranked member is highlighted (unless the mode is Maximize Bandwidth (SLA)).

To verify the active members and hit count of the SD-WAN rule in the CLI:

```
# diagnose sys sdwan service

Service(3): Address Mode(IPV4) flags=0x0
   Gen(13), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
   Members:
      1: Seq_num(1 port1), alive, sla(0x1), cfg_order(0), cost(0), selected
      2: Seq_num(2 port2), alive, sla(0x1), cfg_order(1), cost(0), selected
      3: Seq_num(3 port3), alive, sla(0x1), cfg_order(2), cost(20), selected
   Internet Service: Dropbox(4294836727,0,0,0 17459) Google.Docs(4294836992,0,0,0 16541) Microsoft.Office.365(4294837472,0,0,0 33182) Microsoft.Office.Online(4294837475,0,0,0 16177) SIP(4294837918,0,0,0 34640)
   Src address:
      0.0.0.0-255.255.255.255

Service(4): Address Mode(IPV4) flags=0x0
   Gen(211), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(priority), link-cost-factor(latency), link-cost-threshold(10), heath-check(NonBusinessCritical_HC)
   Members:
      1: Seq_num(1 port1), alive, latency: 5.712, selected
      2: Seq_num(2 port2), alive, latency: 5.511, selected

Applications and sessions

To verify sessions in FortiView:

1. Go to a dashboard and add the FortiView Cloud Applications widget sorted by bytes. See Cloud application view on page 124 for details.
2. Drill down on an application, such as YouTube, then select the Sessions tab.

![YouTube Sessions](image)

To verify applications identified by Application Control in SD-WAN:

```
# diagnose sys sdwan internet-service-app-ctrl-list
```

DSCP tag-based traffic steering in SD-WAN

This document demonstrates the Differentiated Services Code Point (DSCP) tag-based traffic steering in Fortinet secure SD-WAN. You can use this guide as an example to deploy DSCP tag-based traffic steering in Fortinet secure SD-WAN.

DSCP tags are often used to categorize traffic to provide quality of service (QoS). Based on DSCP tags, you can provide SD-WAN traffic steering on an edge device.

In this example, we have two different departments at the Headquarters site - Customer Service and Marketing. Traffic from each of these departments is marked with separate DSCP tags by the core switch, and passes through the core switch to the edge FortiGate. The edge FortiGate reads the DSCP tags and steers traffic to the preferred interface based on the defined SD-WAN rules.
In our example, we consider two types of traffic - social media traffic and VoIP traffic. VoIP traffic from Customer Service is considered to be more important than social media traffic. Each of these traffic types is marked with a DSCP tag by the core switch - VoIP traffic is marked with the DSCP tag of 011100, and social media traffic is marked with the DSCP tag of 001100. The DSCP tagged traffic is then passed on to the edge FortiGate. The edge FortiGate identifies the DSCP tagged traffic and based on the defined SD-WAN rules, the edge FortiGate steers:

- VoIP traffic to the preferred VPN overlay with the least jitter in order to provide the best quality of voice communication with the remote VoIP server (PBX)
- Social media traffic to the preferred Internet link with a lower cost (less expensive and less reliable)

If you are familiar with SD-WAN configurations in FortiOS, you can directly jump to the Configuring SD-WAN rules on page 588 section to learn how to configure the SD-WAN rules to perform traffic steering. Otherwise, you can proceed with all of the following topics to configure the edge FortiGate:

- Configuring IPsec tunnels on page 586
- Configuring SD-WAN zones on page 587
- Configuring firewall policies on page 587
- Configuring Performance SLA test on page 588
- Configuring SD-WAN rules on page 588
- Results on page 591

**Configuring IPsec tunnels**

In our example, we have two interfaces Internet_A (port1) and Internet_B(port5) on which we have configured IPsec tunnels Branch-HQ-A and Branch-HQ-B respectively. To learn how to configure IPsec tunnels, refer to the IPsec VPNs on page 1330 section.

After you have configured the IPsec tunnels, go to VPN > IPsec Tunnels to verify the IPsec tunnels.
Configuring SD-WAN zones

In order for us to steer traffic based on SD-WAN rules, first we need to configure SD-WAN interface members and assign them to SD-WAN zones. For more information about SD-WAN zones, see SD-WAN zones on page 498.

In our example, we created two SD-WAN zones. The virtual-wan-link SD-WAN zone for the underlay traffic passing through the Internet_A(port1) and Internet_B(port5) interfaces, and the Overlay SD-WAN zone for the overlay traffic passing through the Branch-HQ-A and Branch-HQ-B interfaces.

Go to Network > SD-WAN and select the SD-WAN Zones tab to verify the configurations.

In this screenshot, we have configured the Internet_A(port1) and Internet_B(port5) SD-WAN interface members with their Cost values being 0 and 10 respectively. A lower Cost value indicates that this member is the primary interface member, and is preferred more than a member with a higher Cost value when using the Lowest Cost (SLA) strategy.

We also need to configure a static route that points to the SD-WAN interface. For more information static routes, see Adding a static route on page 490.

Configuring firewall policies

Configure firewall policies for both the overlay and underlay traffic. For more information about firewall policies, see Policies on page 759.

In this example, the Overlay-out policy governs the overlay traffic and the SD-WAN-Out policy governs the underlay traffic. The firewall policies are configured accordingly.

Once created, verify the firewall policies by navigating to Policy & Objects > Firewall Policy:
The *Security Profiles* column indicates that the Overlay-out firewall policy for the overlay traffic is set up to not scan any traffic, while the SD-WAN-Out firewall policy is set to scan all web traffic to identify and govern social media traffic as Application Control profile is active.

**Configuring Performance SLA test**

Configure a performance SLA test that will be tied to the SD-WAN interface members we created and assigned to SD-WAN zones. For more information about Performance SLA, see SLA targets example on page 516.

In this example, we created a Performance SLA test Default_DNS with Internet_A (port1) and Internet_B (port5) interface members as participants. We will use the created Performance SLA test to steer all web traffic passing through the underlays other than social media traffic based on the **Lowest Cost (SLA)** strategy.

**Configuring SD-WAN rules**

Configure SD-WAN rules to govern the steering of DSCP tag-based traffic to the appropriate interfaces. Traffic will be steered based on the *Criteria* configured as part of the SD-WAN rules configuration.

In our example, we configured three different SD-WAN rules to govern DSCP tagged traffic. We have one SD-WAN rule each for VoIP traffic, social media traffic (Facebook in this case), and all other web traffic. VoIP traffic is always steered to either of the two overlay SD-WAN zones - *VPN_A_tunnel (Branch-HQ-A)* or *VPN_B_tunnel (Branch-HQ-B)*. Similarly, social media traffic and other web traffic is always steered to either of the two underlay SD-WAN zones - Internet_A (port1) or Internet_B (port5). The interface that is preferred by the system over another depends upon the *Criteria* configured in the SD-WAN rule definition.

We configured the following SD-WAN rules:

- SD-WAN rule for VoIP traffic on page 589
- SD-WAN rule for social media traffic on page 589
- SD-WAN rule for other web traffic on page 590
### SD-WAN rule for VoIP traffic

To configure SD-WAN rule for DSCP tagged VoIP traffic using the CLI:

```plaintext
config sys sdwan
  config service
    edit 5
      set name "VoIP-Steer"
      set mode priority
      set tos 0x70
      set tos-mask 0xf0
      set dst "all"
      set health-check "Default_DNS"
      set link-cost-factor jitter
      set priority-members 4 3
next
end
end

The VoIP-Steer SD-WAN rule configured above governs the DSCP tagged VoIP traffic.

DSCP values commonly are 6-bit binary numbers that are padded with zeros at the end. Therefore, in this example, VoIP traffic with DSCP tag 011100 will become 01110000. This 8-bit binary number 01110000 is represented in its hexadecimal form 0x70 as the tos (Type of Service bit pattern) value. The tos-mask (Type of Service evaluated bits) hexadecimal value of 0xf0 (binary 11110000) is used to check the four most significant bits from the tos value in this case. Hence, the first four bits of the tos (0111) will be used to match the first four bits of the DSCP tag in our policy above. Only the non-zero bit positions are used for comparison and the zero bit positions are ignored from the tos-mask.

We used the Best Quality strategy to define the Criteria to select the preferred interface from the overlay SD-WAN zone. With the Best Quality strategy selected, the interface with the best measured performance is selected. The system prefers the interface with the least Jitter.

For more information about configuring SD-WAN rules with the Best Quality strategy, see Best quality strategy on page 554.

### SD-WAN rule for social media traffic

To configure SD-WAN rule for DSCP tagged social media traffic using the CLI:

```plaintext
FortiGate # config sys sdwan
```
The Facebook-DSCP-steer SD-WAN rule configured above governs the DSCP tagged social media traffic. DSCP values commonly are 6-bit binary numbers that are padded with zeros at the end. Therefore, in this example, social media traffic with DSCP tag 001100 will become 00110000. This 8-bit binary number 00110000 is represented in its hexadecimal form 0x30 as the tos (Type of Service bit pattern) value. The tos-mask (Type of Service evaluated bits) hexadecimal value of 0xf0 (binary 11110000) is used to check the four most significant bits from the tos value in this case. Hence, the first four bits of the tos (0011) will be used to match the first four bits of the DSCP tag in our policy above. Only the non-zero bit positions are used for comparison and the zero bit positions are ignored from the tos-mask.

We used a manual strategy to select the preferred interface from the underlay SD-WAN zone. We manually select the preferred interface as Internet_B(port5) to steer all social media traffic to.

For more information about configuring SD-WAN rules with static application steering with a manual strategy, see Static application steering with a manual strategy on page 573.

**SD-WAN rule for other web traffic**

**To configure SD-WAN rule for all other web traffic using the CLI:**

```plaintext
FortiGate # config sys sdwan
config service
    edit 2
        set name "All-traffic"
        set mode sla
        set dst "all"
        config sla
            edit "Default_DNS"
                set id 1
                next
        end
    end
set priority-members 1 2
end
```
The All-traffic SD-WAN rule configured above governs all other web traffic.

We used the Lowest Cost (SLA) strategy to define the Criteria to select the preferred interface from the underlay SD-WAN zone. With the Lowest Cost (SLA) strategy selected, the interface that meets the defined Performance SLA targets (Default_DNS in our case) is selected. When there is a tie, the interface with the lowest assigned Cost (Internet_A (port1) in our case) is selected.

For more information about configuring SD-WAN rules with the Lowest Cost (SLA) strategy, see Lowest cost (SLA) strategy on page 558.

Once configured, verify your SD-WAN rules by navigating to Network > SD-WAN and selecting the SD-WAN Rules tab.

Results

The following sections show the function of the FortiGate and specifically of secure SD-WAN with respect to DSCP tagged traffic steering, and can be used to confirm that it is setup and running correctly:

- Verifying the DSCP tagged traffic on FortiGate on page 591
- Verifying service rules on page 593
- Verifying traffic steering as per the defined SD-WAN rules on page 594
- Verifying steered traffic leaving the required interface on page 594

Verifying the DSCP tagged traffic on FortiGate

To verify the incoming DSCP tagged traffic, we used packet sniffing and converting the sniffed traffic to a desired format. For more information about packet sniffing, see Using the FortiOS built-in packet sniffer on the Fortinet Knowledge Base.
For VoIP traffic that is marked with DSCP tag 0x70:

```bash
# diagnose sniffer packet any '(ip and ip[1] & 0xfc == 0x70)' 6 0 1
```

We used the open-source packet analyzer Wireshark to verify that VoIP traffic is tagged with the 0x70 DSCP tag.

For web traffic marked with DSCP tag 0x30:

```bash
# diagnose sniffer packet any '(ip and ip[1] & 0xfc == 0x30)' 6 0 1
```

We used the open-source packet analyzer Wireshark to verify that web traffic is tagged with the 0x30 DSCP tag.
Verifying service rules

The following CLI commands show the appropriate DSCP tags and the corresponding interfaces selected by the SD-WAN rules to steer traffic:

```
# diagnose sys sdwan service
```

Service(5): Address Mode (IPV4) flags=0x0
Gen(1), TOS(0x70/0xf0), Protocol(0: 1->65535), Mode (manual)
Members:
  1: Seq_num(4 Branch-HQ-B), alive, selected
Dst address:
  0.0.0.0-255.255.255.255

Service(3): Address Mode (IPV4) flags=0x0
Gen(1), TOS(0x30/0xf0), Protocol(0: 1->65535), Mode (manual)
Members:
  1: Seq_num(2 port5), alive, selected
Dst address:
  0.0.0.0-255.255.255.255

Service(2): Address Mode (IPV4) flags=0x0
SD-WAN

Verifying traffic steering as per the defined SD-WAN rules

Go to Network > SD-WAN and select the SD-WAN Rules tab to review the Hit Count on the appropriate SD-WAN interfaces.

Verifying steered traffic leaving the required interface

Go to Dashboard > Top Policies to confirm that web traffic (port 443) flows through the right underlay interface members, and VoIP traffic flows through the right overlay interface member.

Web traffic leaves either Interface_A(port1) or Interface_B(port5):

VoIP traffic leaves the preferred VPN_B_Tunnel(Branch-HQ-B) interface:
ECMP support for the longest match in SD-WAN rule matching

The longest match SD-WAN rule can match ECMP best routes. The rule will select the egress ports on ECMP specific routes, and not the less specific routes, to transport traffic.

The service mode determines which egress port on the ECMP specific routes is selected to forward traffic:

- **Manual** *(manual)*: The first configured alive port is selected.
- **Best Quality** *(priority)*: The best quality port is selected.
- **Lowest Cost** *(sla)*: The first configured or lower cost port in SLA is selected.

**Example**

By default, SD-WAN selects the outgoing interface from all of the links that have valid routes to the destination. In some cases, it is required that only the links that have the best (or longest match) routes (single or ECMP) to the destination are considered.

In this example, four SD-WAN members in two zones are configured. The remote PC (PC_2 - 10.1.100.22) is accessible on port15 and port16, even though there are valid routes for all of the SD-WAN members. A single SD-WAN service rule is configured that allows traffic to balanced between all four of the members, but only chooses between port15 and port16 for the specific 10.1.100.22 address.

A performance SLA health check is configured to monitor 10.1.100.2. An SD-WAN service rule in Lowest Cost (SLA) mode is configured to select the best interface to steer the traffic. In the rule, the method of selecting a member if more than one meets the SLA *(tie-break)* is configured to select members that meet the SLA and match the longest prefix in the routing table *(fib-best-match)*. If there are multiple ECMP routes with the same destination, the FortiGate will take the longest (or best) match in the routing table, and choose from those interface members.
To configure the SD-WAN:

```bash
config system sdwan
  config zone
    edit "virtual-wan-link"
    next
    edit "z1"
    next
  end
  config members
    edit 1
    set interface "port1"
    set gateway 172.16.200.2
    next
    edit 2
    set interface "dmz"
    set gateway 172.16.208.2
    next
    edit 3
    set interface "port15"
    set zone "z1"
    set gateway 172.16.209.2
    next
    edit 4
    set interface "port16"
    set zone "z1"
    set gateway 172.16.210.2
    next
  end
  config health-check
    edit "1"
    set server "10.1.100.2"
    set members 0
    config sla
      edit 1
      next
    end
  next
end
config service
  edit 1
  set name "1"
  set mode sla
  set dst "all"
  set src "172.16.205.0"
  config sla
    edit "1"
    set id 1
    next
  end
  set priority-members 1 2 3 4
  set tie-break fib-best-match
next
end
```
To check the results:

1. The debug shows the SD-WAN service rule. All of the members meet SLA, and because no specific costs are attached to the members, the egress interface is selected based on the interface priority order that is configured in the rule:

   ```
   FGT_A (root) # diagnose sys sdwan service
   
   Service(1): Address Mode(IPV4) flags=0x200 use-shortcut-sla
   Gen(4), TOS(0x0/0x0), Protocol(0:1->65535), Mode(sla), sla-compare-order
   Members(4):
   1: Seq_num(1 port1), alive, sla(0x1), gid(0), cfg_order(0), cost(0), selected
   2: Seq_num(2 dmz), alive, sla(0x1), gid(0), cfg_order(1), cost(0), selected
   3: Seq_num(3 port15), alive, sla(0x1), gid(0), cfg_order(2), cost(0), selected
   4: Seq_num(4 port16), alive, sla(0x1), gid(0), cfg_order(3), cost(0), selected
   
   Source address(1):
   172.16.205.0-172.16.205.255
   Dst address(1):
   0.0.0.0-255.255.255.255
   
   Service 1:
   ```

2. The routing table shows that there are ECMP default routes on all of the members, and ECMP specific (or best) routes only on port15 and port16:

   ```
   FGT_A (root) # get router info routing-table static
   
   Routing table for VRF=0
   S* 0.0.0.0/0 [1/0] via 172.16.200.2, port1
   [1/0] via 172.16.208.2, dmz
   [1/0] via 172.16.209.2, port15
   S 10.1.100.22/32 [10/0] via 172.16.209.2, port15
   
   Because tie-break is set to fib-best-match, the first configured member from port15 and port16 is selected to forward traffic to PC_2. For all other traffic, the first configured member from all four of the interfaces is selected to forward traffic.

3. On PC-1, generate traffic to PC-2:

   ```
   ping 10.1.100.22
   ```

4. On FGT_A, sniff for traffic sent to PC_2:

   ```
   # diagnose sniffer packet any 'host 10.1.100.22' 4
   interfaces=[any]
   filters=[host 10.1.100.22]
   
   2.831299 port5 in 172.16.205.11 -> 10.1.100.22: icmp: echo request
   2.831400 port15 out 172.16.205.11 -> 10.1.100.22: icmp: echo request
   ```

   Traffic is leaving on port15, the first configured member from port15 and port16.

**Override quality comparisons in SD-WAN longest match rule matching**

In SD-WAN rules, the longest match routes will override the quality comparisons when all of the specific routes are out of SLA.

With this feature in an SD-WAN rule:
• **Lowest Cost (sla):** Even though all of the egress ports on specific routes (longest matched routes) are out of SLA, the SD-WAN rule still selects the first configured or lower-cost port from the egress ports to forward traffic.

• **Best Quality (priority):** Even though the egress ports on specific routes (longest matched routes) have worse quality that all other ports on less specific routes, the SD-WAN rule still selects the best quality port from the ports on specific routes to forward traffic.

This feature avoids a situation where, if the members on specific routes (longest matched routes) are out of SLA or have worse quality, the traffic might be forwarded to the wrong members in SLA (higher quality) on the default or aggregate routes.

**Example**

In this example, four SD-WAN members in two zones are configured. The remote PC (PC_2 - 10.1.100.22) is accessible on port15 and port16, even though there are valid routes for all of the SD-WAN members. A single SD-WAN service rule is configured that allows traffic to be balanced between all four of the members, but only chooses between port15 and port16 for the specific 10.1.100.22 address. If neither port15 nor port16 meet the SLAs, traffic will be forwarded on one of these interfaces, instead of on port1 or dmz.

A performance SLA health check is configured to monitor 10.1.100.2. An SD-WAN service rule in Lowest Cost (SLA) mode is configured to select the best interface to steer the traffic. In the rule, the method of selecting a member if more than one meets the SLA (tie-break) is configured to select members that meet the SLA and match the longest prefix in the routing table (`fib-best-match`). If there are multiple ECMP routes with the same destination, the FortiGate will take the longest (or best) match in the routing table, and choose from those interface members.

**To configure the SD-WAN:**

```
config system sdwan
  config zone
    edit "virtual-wan-link"
    next
    edit "z1"
    next
  end
  config members
    edit 1
      set interface "port1"
      set gateway 172.16.200.2
    next
    edit 2
      set interface "dmz"
      set gateway 172.16.208.2
    next
    edit 3
```
To check the results:

1. The debug shows the SD-WAN service rule. Both port15 and port16 are up, but out of SLA:

   FGT_A (root) # diagnose sys sdwan service
   Service(1): Address Mode(IPV4) flags=0x200 use-shortcut-sla
   Gen(3), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
   Members(4):
   1: Seq_num(1 port1), alive, sla(0x1), gid(0), cfg_order(0), cost(0), selected
   2: Seq_num(2 dmz), alive, sla(0x1), gid(0), cfg_order(1), cost(0), selected
   3: Seq_num(3 port15), alive, sla(0x0), gid(0), cfg_order(2), cost(0), selected
   4: Seq_num(4 port16), alive, sla(0x0), gid(0), cfg_order(3), cost(0), selected
   Src address(1):
   172.16.205.0-172.16.205.255
   Dst address(1):
   0.0.0.0-255.255.255.255
2. The routing table shows that there are ECMP default routes on all of the members, and ECMP specific (or best) routes only on port15 and port16:

FGT_A (root) # get router info routing-table static
Routing table for VRF=0
S* 0.0.0.0/0 [1/0] via 172.16.200.2, port1
     [1/0] via 172.16.208.2, dmz
     [1/0] via 172.16.209.2, port15
S  10.1.100.22/32 [10/0] via 172.16.209.2, port15

Because tie-break is set to fib-best-match, even though both port15 and port16 are out of SLA, the first configured member of the two (port15) is selected to forward traffic to PC_2. For all other traffic, the first configured member from all of the interfaces that are in SLA is selected to forward traffic (port1).

3. On PC-1, generate traffic to PC-2:

    ping 10.1.100.22

4. On FGT_A, sniff for traffic sent to PC_2:

    # diagnose sniffer packet any 'host 10.1.100.22' 4
    interfaces=[any]
    filters=[host 10.1.100.22]
    2.831299 port5 in 172.16.205.11 -> 10.1.100.22: icmp: echo request
    2.831400 port15 out 172.16.205.11 -> 10.1.100.22: icmp: echo request

   Traffic is leaving on port15, the first configured member from port15 and port16, even though both are out of SLA.

Use an application category as an SD-WAN rule destination

An application category can be selected as an SD-WAN service rule destination criterion. Previously, only application groups or individual applications could be selected.

config system sdwan
    config service
        edit <id>
            set internet-service enable
            set internet-service-app-ctrl-category <id_1> <id_2> ... <id_n>
        next
    end
end

To view the detected application categories details based on category ID, use diagnose sys sdwan internet-service-app-ctrl-category-list <id>.

Example

In this example, traffic steering is applied to traffic detected as video/audio (category ID 5) or email (category ID 21) and applies the lowest cost (SLA) strategy to this traffic. When costs are tied, the priority goes to member 1, dmz.
To configure application categories as an SD-WAN rule destination:

1. Configure the SD-WAN settings:

   ```bash
   config system sdwan
   set status enable
   config zone
   edit "virtual-wan-link"
   next
   end
   config members
   edit 1
   set interface "dmz"
   set gateway 172.16.208.2
   next
   edit 2
   set interface "vlan100"
   set gateway 172.16.206.2
   next
   end
   config health-check
   edit "1"
   set server "8.8.8.8"
   set protocol dns
   set members 0
   config sla
   edit 1
   next
   end
   end
   ```

2. Configure the SD-WAN rule to use application categories 5 and 21:

   ```bash
   config system sdwan
   config service
   edit 1
   set name "1"
   set mode sla
   set src "172.16.205.0"
   set internet-service enable
   set internet-service-app-ctrl-category 5 21
   config sla
   edit "1"
   set id 1
   next
   end
   set priority-members 1 2
   ```
3. Configure the firewall policy:

```fortios```
config firewall policy
  edit 1
    set srcintf "port5"
    set dstintf "virtual-wan-link"
    set action accept
    set srcaddr 172.16.205.0
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "certificate-inspection"
    set application-list "g-default"
  next
end
```fortios```

4. Verify that the traffic is sent over dmz:

```fortios```
# diagnose firewall proute list
list route policy info(vf=root):
  id=2133590017(0x7f2c0001) vwl_service=1(1) vwl_mbr_seq=1 2 dscp_tag=0xff 0xff flags=0x0
tos=0x00 tos_mask=0x00 protocol=0 sport=0-65535 iif=0 dport=1-65535 path(2) oif=5(dmz)
oif=95(vlan100)
  source(1): 172.16.205.0-172.16.205.255
destination wildcard(1): 0.0.0.0/0.0.0.0
  internet service(2): (null) (0,5,0,0,0) (null) (0,21,0,0,0)
hit_count=469 last_used=2021-12-15 15:06:05
```fortios```

5. View some videos and emails on the PC, then verify the detected application details for each category:

```fortios```
# diagnose sys sdwan internet-service-app-ctrl-category-list 5
YouTube(31077 4294838537): 209.52.146.205 6 443 Wed Dec 15 15:37:19 2021
# diagnose sys sdwan internet-service-app-ctrl-category-list 21
```fortios```

6. Verify that the captured email traffic is sent over dmz:

```fortios```
# diagnose sniffer packet any 'host 172.217.14.197' 4
interfaces=[any]
filters=[host 172.217.14.197]
5.079814 dmz out 172.16.205.100.60592 -> 172.217.14.197.443: psh 2961561240 ack
2277134591
```fortios```

7. Edit the SD-WAN rule so that dmz has a higher cost and vlan100 is preferred.

8. Verify that the traffic is now sent over vlan100:

```fortios```
# diagnose firewall proute list
list route policy info(vf=root):
  id=2134048769(0x7f4233001) vwl_service=1(1) vwl_mbr_seq=2 1 dscp_tag=0xff 0xff flags=0x0
tos=0x00 tos_mask=0x00 protocol=0 sport=0-65535 iif=0 dport=1-65535 path(2) oif=5(dmz)
```fortios```
source(1): 172.16.205.0-172.16.205.255
destination wildcard(1): 0.0.0.0/0.0.0.0
internet service(2): (null) (0,5,0,0) (null) (0,21,0,0,0)
hit_count=635 last_used=2021-12-15 15:55:43

# diagnose sniffer packet any 'host 172.217.14.197' 4
interfaces=[any]
filters=[host 172.217.14.197]
304.625168 vlan100 in 172.16.205.100.60592 -> 172.217.14.197.443: psh 2961572711 ack 2277139565

**Advanced routing**

The following topics provide instructions on SD-WAN advanced routing:

- Local out traffic on page 603
- Using BGP tags with SD-WAN rules on page 609
- BGP multiple path support on page 612
- Controlling traffic with BGP route mapping and service rules on page 614
- Applying BGP route-map to multiple BGP neighbors on page 621
- Using multiple members per SD-WAN neighbor configuration on page 627

**Local out traffic**

Local out, or self-originating, traffic is traffic that originates from the FortiGate going to external servers and services. The traffic can be from Syslog, FortiAnalyzer logging, FortiGuard services, remote authentication, and others.

By default, local out traffic relies on routing table lookups to determine the egress interface that is used to initiate the connection. However, many types of local out traffic support selecting the egress interface based on SD-WAN or manually specified interfaces. When manually specifying the egress interface, the source IP address can also be manually configured.

Go to Network > Local Out Routing to configure the available types of local out traffic. Some types of traffic can only be configured in the CLI.

---

By default Local Out Routing is not visible in the GUI. Go to System > Feature Visibility to enable it. See Feature visibility on page 2165 for more information.

---

When VDOMs are enabled, the following entries are available on the local out routing page:

<table>
<thead>
<tr>
<th>Global view</th>
<th>VDOM view</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>External Resources</strong></td>
<td><strong>LDAP Servers</strong></td>
</tr>
<tr>
<td>AWS_IP_Blacklist</td>
<td>ldap</td>
</tr>
<tr>
<td>AWS_Malware_Hash</td>
<td>Log</td>
</tr>
</tbody>
</table>
If a service is disabled, it is grayed out. To enable it, select the service and click Enable Service. If a service is enabled, there is a Local Out Setting button in the gutter of that service's edit page to directly configure the local-out settings.

**Examples**

**To configure DNS local-out routing:**

1. Go to Network > Local Out Routing and double-click System DNS.
2. For Outgoing interface, select one of the following:
   - **Auto**: Select the outgoing interface automatically based on the routing table.
   - **SD-WAN**: Select the outgoing interface using the configured SD-WAN interfaces and rules.
   - **Specify**: Select the outgoing interface from the dropdown.
   - **Use Interface IP**: Use the primary IP, which cannot be configured by the user.
   - **Manually**: Selected an IP from the list, if the selected interface has multiple IPs configured.
3. If Specify is selected, select a setting for Source IP:
4. Click OK.
To edit local-out settings from a RADIUS server entry:

1. Go to User & Authentication > RADIUS Servers and double-click an entry to edit it.
2. Click Local Out Setting.

The Edit Local Out Setting pane opens.

3. Configure the settings for Outgoing interface and Source IP.

4. Click OK.

To edit multiple entries concurrently:

1. Go to Network > Local Out Routing.
2. If applicable, select IPv4 or IPv6. IPv4+IPv6 does not support multi-select.
3. Click Multi-Select Mode. All of the local out settings that can be edited concurrently are shown.
4. Select the specific entries, or click Select All to select all of the entries.
5. Click *Edit* and configure the local out settings as required.

6. Click *OK*.

7. Click *Exit Multi-Select Mode* to return to the normal view.

### Configuring local out routing in the CLI

Some local out routing settings can only be configured using the CLI.

**PING**

IPv4 and IPv6 pings can be configured to use SD-WAN rules:

```
execute ping-options use-sdwan {yes | no}
execute ping6-options use-sdwan {yes | no}
```

**Traceroute**

IPv4 traceroute can be configured to use SD-WAN rules:

```
execute traceroute-options use-sdwan {yes | no}
```

**Central management**

Central management traffic can use SD-WAN rules or a specific interface:

```
config system central-management
  set interface-select-method {auto | sdwan | specify}
  set interface <interface>
end
```

**NTP server**

NTP server traffic can use SD-WAN rules or a specific interface:

```
config system ntp
  config ntpserver
    edit <id>
      set interface-select-method {auto | sdwan | specify}
```
set interface <interface>
next
end

DHCP proxy

DHCP proxy traffic can use SD-WAN rules or a specific interface:

config system settings
    set dhcp-proxy-interface-select-method {auto | sdwan | specify}
    set dhcp-proxy-interface <interface>
end

| dhcp-proxy-interface-select-method {auto | sdwan | specify} | Select the interface selection method: |
|--------------------------------------------------------|---------------------------------------|
|                                                         | • auto: Set the outgoing interface automatically (default). |
|                                                         | • sdwan: Set the interface by SD-WAN or policy routing rules. |
|                                                         | • specify: Set the interface manually. |
| dhcp-proxy-interface <interface>                        | Specify the outgoing interface. This option is only available and must be configured when interface-select-method is specify. |

DHCP relay

DHCP relay traffic can use SD-WAN rules or a specific interface:

config system interface
    edit <interface>
        set dhcp-relay-interface-select-method {auto | sdwan | specify}
        set dhcp-relay-interface <interface>
    next
end

| dhcp-relay-interface-select-method {auto | sdwan | specify} | Select the interface selection method: |
|--------------------------------------------------------|---------------------------------------|
|                                                         | • auto: Set the outgoing interface automatically (default). |
|                                                         | • sdwan: Set the interface by SD-WAN or policy routing rules. |
|                                                         | • specify: Set the interface manually. |
| dhcp-relay-interface <interface>                        | Specify the outgoing interface. This option is only available and must be configured when interface-select-method is specify. |

CA and local certificate renewal with SCEP

Certificate renewal with SCEP traffic can use SD-WAN rules or a specific interface:

config vpn certificate setting
    set interface-select-method {auto | sdwan | specify}
    set interface <interface>
end

IPS TLS protocol active probing

TLS active probing can use SD-WAN rules or a specific interface:
config ips global
    config tls-active-probe
        set interface-selection-method {auto | sdwan | specify}
        set interface <interface>
        set vdom <VDOM>
        set source-ip <IPv4 address>
        set source-ip6 <IPv6 address>
    end
end

**interface-select-method {auto | sdwan | specify}**
- Select the interface selection method:
  - auto: Set the outgoing interface automatically (default).
  - sdwan: Set the interface by SD-WAN or policy routing rules.
  - specify: Set the interface manually.

**interface <interface>**
- Specify the outgoing interface. This option is only available and must be configured when `interface-select-method` is `specify`.

**vdom <VDOM>**
- Specify the VDOM. This option is only available and must be configured when `interface-select-method` is `sdwan` or `specify`.

**source-ip <IPv4 address>**
- Specify the source IPv4 address. This option is only available and must be configured when `interface-select-method` is `sdwan` or `specify`.

**source-ip6 <IPv6 address>**
- Specify the source IPv6 address. This option is only available and must be configured when `interface-select-method` is `sdwan` or `specify`.

**Netflow and sflow**

Netflow and sflow can use SD-WAN rules or a specific interface:

config system {netflow | sflow | vdom-netflow | vdom-sflow}
    set interface-select-method {auto | sdwan | specify}
    set interface <interface>
end

**interface-select-method {auto | sdwan | specify}**
- Select the interface selection method:
  - auto: Set the outgoing interface automatically (default).
  - sdwan: Set the interface by SD-WAN or policy routing rules.
  - specify: Set the interface manually.

**interface <interface>**
- Specify the outgoing interface. This option is only available and must be configured when `interface-select-method` is `specify`. 
Using BGP tags with SD-WAN rules

SD-WAN rules can use Border Gateway Protocol (BGP) learned routes as dynamic destinations.

In this example, a customer has two ISP connections, wan1 and wan2. wan1 is used primarily for direct access to internet applications, and wan2 is used primarily for traffic to the customer's data center.

The customer could create an SD-WAN rule using the data center's IP address range as the destination to force that traffic to use wan2, but the data center's IP range is not static. Instead, a BGP tag can be used.

For this example, wan2's BGP neighbor advertises the data center's network range with a community number of 30:5.

This example assumes that SD-WAN is enabled on the FortiGate, wan1 and wan2 are added as SD-WAN members in the virtual-wan-link SD-WAN zone, and a policy and static route have been created. See SD-WAN quick start on page 488 for details.

FortiOS supports IPv4 and IPv6 route tags.

To configure BGP tags with SD-WAN rules:

1. Configure the community list:

   ```
   config router community-list
   edit "30:5"
   config rule
   edit 1
   set action permit
   set match "30:5"
   next
   end
   next
   end
   ```

2. Configure the route map:

   ```
   config router route-map
   edit "comm1"
   config rule
   edit 1
   set match-community "30:5"
   set set-route-tag 15
   next
   ```
3. Configure BGP:

```plaintext
config router bgp
set as xxxxx
set router-id xxxx
config neighbor
edit "10.100.20.2"
  set soft-reconfiguration enable
  set remote-as xxxxx
  set route-map-in "comm1"
next
end
end
```

4. Configure a firewall policy:

```plaintext
config firewall policy
edit 1
  set name "1"
  set srcintf "dmz"
  set dstintf "virtual-wan-link"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set schedule "always"
  set service "ALL"
  set nat enable
next
end
```

5. Edit the SD-WAN configuration:

```plaintext
config system sdwan
set status enable
config members
  edit 1
    set interface "wan1"
    set gateway 172.16.20.2
next
  edit 2
    set interface "wan2"
next
end
config service
  edit 1
    set name "DataCenter"
    set mode manual
    set route-tag 15
    set priority-members 2
next
end
```
Troubleshooting BGP tags with SD-WAN rules

Check the network community

Use the `get router info bgp network` command to check the network community:

```
# get router info bgp network
BGP table version is 5, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network Next Hop Metric LocPrf Weight RouteTag Path

**Check dynamic BGP addresses**

Use the `get router info route-map-address` command to check dynamic BGP addresses:

```
# get router info route-map-address
Extend-tag: 15, interface(wan2:16)
  10.100.11.0/255.255.255.0
```

**Check dynamic BGP addresses used in policy routes**

Use the `diagnose firewall proute list` command to check dynamic BGP addresses used in policy routes:

```
# diagnose firewall proute list
list route policy info(vf=root):

id=4278779905 vwl_service=1(DataCenter) flags=0x0 tos=0x00 tos_mask=0x00 protocol=0 sport=0:65535 iif=0 dport=1-65535 oif=16
source wildcard(1): 0.0.0.0/0.0.0.0
destination wildcard(1): 10.100.11.0/255.255.255.0
```

**BGP multiple path support**

BGP supports multiple paths, allowing an ADVPN to advertise multiple paths. This allows BGP to extend and keep additional network paths according to RFC 7911.

In this example, Spoke1 and Spoke2 each have four VPN tunnels that are connected to the Hub with ADVPN. The Spoke-Hub has established four BGP neighbors on all four tunnels.

![Diagram of BGP multiple path support](image)

Spoke 1 and Spoke 2 can learn four different routes from each other.

**To configure the hub:**

```
config router bgp
  set as 65505
  set router-id 11.11.11.11
  set ibgp-multipath enable
  set additional-path enable
```
To configure a spoke:

```
config router bgp
  set as 65505
  set router-id 2.2.2.2
  set ibgp-multipath enable
  set additional-path enable
  set additional-path-select 4
  config neighbor
    edit "10.10.100.254"
      set soft-reconfiguration enable
      set remote-as 65505
      set additional-path both
      set adv-additional-path 4
    next
    edit "10.10.200.254"
      set soft-reconfiguration enable
      set remote-as 65505
      set additional-path both
      set adv-additional-path 4
    next
    edit "10.10.203.254"
      set soft-reconfiguration enable
      set remote-as 65505
      set additional-path both
      set adv-additional-path 4
    next
    edit "10.10.204.254"
      set soft-reconfiguration enable
      set remote-as 65505
      set additional-path both
      set adv-additional-path 4
    next
```
To view the BGP routing table on a spoke:

Spoke1 # get router info routing-table bgp
Routing table for VRF=0

B* 0.0.0.0/0 [200/0] via 10.10.200.254, vd2-2, 03:57:26
[200/0] via 10.10.203.254, vd2-3, 03:57:26

[200/0] via 10.10.100.3, vd2-1, 03:57:26

Controlling traffic with BGP route mapping and service rules

SD-WAN allows you to select different outbound WAN links based on performance SLAs. It is important that BGP neighbors are aware of these settings, and changes to them.

BGP can adapt to changes in SD-WAN link SLAs in the following ways:

- Applying different route-maps based on the SD-WAN's health checks. For example, different BGP community strings can be advertised to BGP neighbors when SLAs are not met.
- Traffic can be selectively forwarded based on the active BGP neighbor. If the SD-WAN service's role matches the active SD-WAN neighbor, the service is enabled. If there is no match, then the service is disabled.
Example

In this topology, a branch FortiGate has two SD-WAN gateways serving as the primary and secondary gateways. The gateways reside in different datacenters, but have a full mesh network between them.

This example shows how route-maps and service rules are selected based on performance SLAs and the member that is currently active. Traffic flows through the primary gateway unless the neighbor's health check is outside of its SLA. If that happens, traffic routes to the secondary gateway.

BGP NBR1 is the primary neighbor and BGP NBR2 is the secondary neighbor.

The branch FortiGate's wan1 and wan2 interfaces are members of the SD-WAN. When the SD-WAN neighbor status is primary, it will advertise community 20:1 to BGP NBR1 and 20:5 to BGP NBR2. When the SD-WAN neighbor status is secondary, it will advertise 20:5 to BGP NBR1 and 20:2 to BGP NBR2.

Only one of the primary or secondary neighbors can be active at one time. The SD-WAN neighbor status is used to decide which neighbor is selected:

- **Primary**: The primary neighbor takes precedence if its SLAs are met.
- **Secondary**: If the primary neighbor's SLAs are not met, the secondary neighbor becomes active if its SLAs are met.
- **Standalone**: If neither the primary or secondary neighbor's SLAs are met, the SD-WAN neighbor status becomes standalone.

Route map

SD-WAN is configured to let BGP advertise different communities when the SLA status changes. When the SLA is missed, it triggers BGP to advertise a different community to its BGP neighbor based on its route-map. The BGP neighbors can use the received community string to select the best path to reach the branch.

To configure BGP route-maps and neighbors:

1. Configure an access for the routes to be matched:

```plaintext
config router access-list  
edit "net192"  
config rule  
edit 1  
set prefix 192.168.20.0 255.255.255.0  
next
```
2. Configure the primary neighbor’s preferred route-map:

```plaintext
config router route-map
edit "comm1"
config rule
edit 1
    set match-ip-address "net192"
    set set-community "20:1"
next
next
end
end
```

3. Configure the secondary neighbor’s preferred route-map:

```plaintext
config router route-map
edit "comm2"
config rule
edit 1
    set match-ip-address "net192"
    set set-community "20:2"
next
next
end
end
```

4. Configure the failed route-map:

```plaintext
config router route-map
edit "comm5"
config rule
edit 1
    set match-ip-address "net192"
    set set-community "20:5"
next
next
end
end
```

5. Configure BGP neighbors:

```plaintext
config router bgp
    set as 65412
    set router-id 1.1.1.1
    set ibgp-multipath enable
config neighbor
    edit "10.100.1.1"
        set soft-reconfiguration enable
        set remote-as 20
        set route-map-out "comm5"
        set route-map-out-preferable "comm1"
    next
    edit "10.100.1.5"
        set soft-reconfiguration enable
        set remote-as 20
```
When SLAs are met, route-map-out-preferable is used. When SLAs are missed, route-map-out is used.

To configure SD-WAN:

1. Configure the SD-WAN members:

```plaintext
config system sdwan
  set status enable
  config members
    edit 1
      set interface "port1"
    next
    edit 2
      set interface "port2"
    next
  end
end
```

2. Configure health checks for each member:

```plaintext
config system sdwan
  config health-check
    edit "ping"
      set server "10.100.2.22"
      set members 1
      config sla
        edit 1
          set link-cost-factor packet-loss
          set packetloss-threshold 1
        next
      end
    next
    edit "ping2"
      set server "10.100.2.23"
      set members 2
      config sla
        edit 1
          set link-cost-factor packet-loss
          set packetloss-threshold 1
        next
      end
    next
end
```

3. Configure the SD-WAN neighbors and assign them a role and the health checks used to determine if the neighbor meets the SLA:

SD-WAN neighbors can only be configured in the CLI.

```plaintext
config system sdwan
  config neighbor
    edit "10.100.1.1"
```
Service rules

Create SD-WAN service rules to direct traffic to the primary neighbor when its SLAs are met, and to the secondary neighbor when the primary neighbor's SLAs are missed.

To configure the SD-WAN service rules:

```plaintext
config system sdwan
  config service
    edit 1
      set name "Primary-Out"
      set role primary
      set dst "all"
      set src "all"
      set priority-members 1
    next
    edit 2
      set name "Secondary-Out"
      set role secondary
      set dst "all"
      set src "all"
      set priority-members 2
    next
  end
end
```

If neither the primary nor secondary neighbors are active, the SD-WAN neighbor status becomes standalone. Only service rules with `standalone-action` enabled will continue to pass traffic. This option is disabled by default.

Verification

To verify when the primary neighbor is passing traffic:

1. Verify the health check status:

   FortiGate-Branch # diagnose sys sdwan health-check
   Health Check (ping):
     Seq(1 port1): state(alive), packet-loss(0.000%) latency(0.569), jitter(0.061) sla_
SD-WAN

map=0x1
Health Check (ping2):
Seq(2 port2): state(alive), packet-loss(0.000%) latency(3.916), jitter(2.373) sla_map=0x1

2. Verify SD-WAN neighbor status:
FortiGate/Branch # diagnose sys sdwan neighbor
SD-WAN neighbor status: hold-down(disable), hold-down-time(0), hold_boot_time(0)
  Selected role (primary) last Secondary_select_time/current_time in seconds 0/572
Neighbor(10.100.1.1): member(1) role(primary)
    Health-check(ping:1) sla-pass selected alive
Neighbor(10.100.1.15): member(2) role(secondary)
    Health-check(ping2:1) sla-pass alive

3. Verify service rules status:
FortiGate/Branch # diagnose sys sdwan service
Service(1): Address Mode(IPV4) flags=0x0
  Gen(3), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
    Service role: primary
    Members:
      1: Seq_num(1 port1), alive, selected
      Src address:
      0.0.0.0-255.255.255.255

    Dst address:
      0.0.0.0-255.255.255.255

Service(2): Address Mode(IPV4) flags=0x0
  Gen(6), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
  Service role: secondary, disabled by unselected.
  Members:
    1: Seq_num(2 port2), alive, selected
    Src address:
    0.0.0.0-255.255.255.255

    Dst address:
    0.0.0.0-255.255.255.255

4. Verify neighbor routers:
   a. Primary neighbor router:
     FGT-NBR1 # get router info bgp network 192.168.20.0
     BGP routing table entry for 192.168.20.0/24
     Paths: (1 available, best #1, table Default-IP-Routing-Table)
     Not advertised to any peer
     64512
     10.100.1.2 from 10.100.1.2 (192.168.122.98)
     Origin IGP metric 0, localpref 100, valid, external, best
     Community: 20:1
     Last update: Thu Apr 30 13:41:40 2020

   b. Secondary neighbor router:
     FGT-NBR2 # get router info bgp network 192.168.20.0
     VRF 0 BGP routing table entry for 192.168.20.0/24
     Paths: (1 available, best #1, table Default-IP-Routing-Table)
Not advertised to any peer
Original VRF 0
64512
10.100.1.6 from 10.100.1.6 (192.168.122.98)
   Origin IGP metric 0, localpref 100, valid, external, best
   Community: 20:5
   Last update: Thu Apr 30 13:41:39 2020

To verify when the secondary neighbor is passing traffic:

1. Verify the health check status:
   FortiGate-Branch # diagnose sys sdwan health-check
   Health Check(ping):
   Seq(1 port1): state(dead), packet-loss(54.000%) sla_map=0x0
   Health Check(ping2):
   Seq(2 port2): state(alive), packet-loss(0.000%) latency(4.339), jitter(3.701) sla_map=0x1

2. Verify SD-WAN neighbor status:
   FortiGate-Branch # diagnose sys sdwan neighbor
   SD-WAN neighbor status: hold-down(disable), hold-down-time(0), hold_boot_time(0)
   Selected role(secondary) last_secondary_select_time/current_time in seconds
   936/936
   Neighbor(10.100.1.1): member(1) role(primary)
   Health-check(ping:1) sla-fail dead
   Neighbor(10.100.1.5): member(2) role(secondary)
   Health-check(ping2:1) sla-pass selected alive

3. Verify service rules status:
   FortiGate-Branch # diagnose sys sdwan service
   Service(1): Address Mode(IPV4) flags=0x0
       Gen(4), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
   Service role: primary, disabled by unselected.
   Members:
       1: Seq_num(1 port1), alive, selected
   Src address:
       0.0.0.0-255.255.255.255
   Dst address:
       0.0.0.0-255.255.255.255
   Service(2): Address Mode(IPV4) flags=0x0
       Gen(7), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
   Service role: secondary
   Members:
       1: Seq_num(2 port2), alive, selected
   Src address:
       0.0.0.0-255.255.255.255
   Dst address:
       0.0.0.0-255.255.255.255
4. Verify neighbor routers:

a. Primary neighbor router:

FGT-NBR1 # get router info bgp network 192.168.20.0

Applying BGP route-map to multiple BGP neighbors

Controlling traffic with BGP route mapping and service rules explained how BGP can apply different route-maps to the primary and secondary SD-WAN neighbors based on SLA health checks.

In this example, SD-WAN neighbors that are not bound to primary and secondary roles are configured.

The FortiGate has multiple SD-WAN links and has formed BGP neighbors with both ISPs.

ISP1 is used primarily for outbound traffic, and has an SD-WAN service rule using the lowest cost algorithm applied to it. When SLAs for ISP1 are not met, it will fail over to the MPLS line.

Inbound traffic is allowed by both WAN links, with each WAN advertising a community string when SLAs are met. When SLAs are not met, the WAN links advertise a different community string.

This example uses two SD-WAN links. The topology can be expanded to include more links as needed.
To configure BGP route-maps and neighbors:

1. Configure an access list for routes to be matched:

   ```
   config router access-list
   edit "net192"
   config rule
   edit 1
      set prefix 192.168.20.0 255.255.255.0
   next
   next
   end
   ```

2. Configure route-maps for neighbor ISP1:

   ```
   config router route-map
   edit "comml"
   config rule
   edit 1
      set match-ip-address "net192"
      set set-community "64511:1"
   next
   next
   edit "comm-fail1"
   config rule
   edit 1
      set match-ip-address "net192"
      set set-community "64511:5"
   next
   next
   end
   ```

3. Configure route-maps for neighbor ISP2:

   ```
   config router route-map
   edit "comm2"
   config rule
   edit 1
      set match-ip-address "net192"
      set set-community "64522:1"
   next
   next
   edit "comm-fail2"
   config rule
   edit 1
      set match-ip-address "net192"
      set set-community "64522:5"
   next
   next
   end
   ```
4. Configure the BGP neighbors:

```fortigateconfig
config router bgp
  set as 64512
  set keepalive-timer 1
  set holdtime-timer 3
config neighbor
  edit "192.168.2.1"
    set soft-reconfiguration enable
    set remote-as 64511
    set route-map-out "comm-fail1"
    set route-map-out-preferable "comm1"
  next
  edit "172.31.0.1"
    set soft-reconfiguration enable
    set remote-as 64522
    set route-map-out "comm-fail2"
    set route-map-out-preferable "comm2"
  next
end
config network
  edit 1
    set prefix 192.168.20.0 255.255.255.0
  next
end
```

When SLAs are met, route-map-out-preferable is used. When SLAs are missed, route-map-out is used.

To configure SD-WAN:

1. Configure the SD-WAN members:

```fortigateconfig
config system sdwan
  set status enable
config members
  edit 1
    set interface "port1"
    set gateway 192.168.2.1
  next
  edit 2
    set interface "MPLS"
    set cost 20
  next
end
```

2. Configure the health checks that must be met:

```fortigateconfig
config system sdwan
  config health-check
    edit "pingserver"
      set server "8.8.8.8"
      set members 2 1
      config sla
        edit 1
          set link-cost-factor packet-loss
          set packetloss-threshold 2
```
3. Configure the SD-WAN neighbors and assign them a role and the health checks used to determine if the neighbor meets the SLA:

When no role is defined, the default role, standalone, is used.

```plaintext
config system sdwan
  config neighbor
    edit "192.168.2.1"
      set member 1
      set health-check "pingserver"
      set sla-id 1
    next
    edit "172.31.0.1"
      set member 2
      set health-check "pingserver"
      set sla-id 1
    next
  end
end
```

**Service rules**

Create SD-WAN service rules to direct traffic to the SD-WAN links based on the lowest cost algorithm. The same SLA health check and criteria that are used for the SD-WAN neighbor are used for this SD-WAN service rule.

When no roles are defined in the service rule, the default role, standalone, is used.

**To configure the SD-WAN service rule:**

```plaintext
config system sdwan
  config service
    edit 1
      set name "OutboundAll"
      set mode sla
      set dst "all"
      set src "all"
      config sla
        edit "pingserver"
          set id 1
        next
        set priority-members 1 2
      next
    end
  end
end
```
Verification

To verify that when both SLAs are met, port1 is selected due to its lower cost:

1. Verify the health check status:

   FortiGate/Branch # diagnose sys sdwan health-check
   Health check(pingserver):
   Seq(2 MPLS): state(alive), packet-loss(0.000%) latency(24.709), jitter(14.996) sla_map=0x1
   Seq(1 port1): state(alive), packet-loss(0.000%) latency(28.771), jitter(14.840) sla_map=0x1

2. Verify SD-WAN neighbor status:

   FortiGate/Branch # diagnose sys sdwan neighbor
   Neighbor(192.168.2.1): member(1) role(standalone)
     Health-check(pingserver:1) sla-pass selected alive
   Neighbor(172.31.0.1): member(2) role(standalone)
     Health-check(pingserver:1) sla-pass selected alive

3. Verify service rules status:

   Because the service role is standalone, it matches both neighbors. The mode (SLA) determines that port1 is lower cost.

   FortiGate/Branch # diagnose sys sdwan service

   Service(1): Address Mode(IPV4) flags=0x0
   Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
   Service role: standalone
   Members:
   1: Seq_num(1 port1), alive, sla(0x1), cfg_order(0), cost(0), selected
   2: Seq_num(2 MPLS), alive, sla(0x1), cfg_order(1), cost(20), selected
   Src address:
   0.0.0.0-255.255.255.255
   Dst address:
   0.0.0.0-255.255.255.255

4. Verify neighbor routers:

   a. Primary neighbor router:

      FGT-NBR1 # get router info bgp network 192.168.20.0
      BGP routing table entry for 192.168.20.0/24
      Paths: (1 available, best #1, table Default-IP-Routing-Table)
      Not advertised to any peer
      64512
      192.168.2.5 from 192.168.2.5 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 64511:1
      Last update: Thu Apr 30 23:59:05 2020

   b. Secondary neighbor router:

      FGT-NBR2 # get router info bgp network 192.168.20.0
      VRF 0 BGP routing table entry for 192.168.20.0/24
      Paths: (1 available, best #1, table Default-IP-Routing-Table)
      Not advertised to any peer
      Original VRF 0
To verify that when neighbor ISP1 misses SLAs, MPLS is selected and BGP advertises a different community string for ISP1:

1. Verify the health check status:

FortiGate-Branch # diagnose sys sdwan health-check
Health Check(pingserver):
Seq(2 MPLS): state(alive), packet-loss(0.000%) latency(25.637), jitter(17.820) sla_map=0x1
Seq(port1): state(dead), packet-loss(16.000%) sla_map=0x0

2. Verify SD-WAN neighbor status:

FortiGate-Branch # diagnose sys sdwan neighbor
Neighbor(192.168.2.1): member(1) role(standalone)
   Health-check(pingserver:1) sla-fail dead
Neighbor(172.31.0.1): member(2) role(standalone)
   Health-check(pingserver:1) sla-pass selected alive

3. Verify service rules status:

As SLA failed for neighbor ISP1, MPLS is preferred.

FortiGate-Branch # diagnose sys sdwan service
Service(1): Address Mode(IPV4) flags=0x0
   Gen(3), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
   Service role: standalone
   Members:
      1: Seq_num(2 MPLS), alive, sla(0x1), cfg_order(1), cost(20), selected
      2: Seq_num(port1), dead, sla(0x0), cfg_order(0), cost(0)
   Src address:
      0.0.0.0-255.255.255.255
   Dst address:
      0.0.0.0-255.255.255.255

4. Verify neighbor routers:

   The community received on ISP1 is updated.

   a. Primary neighbor router:

     FGT-NBR1 # get router info bgp network 192.168.20.0
     BGP routing table entry for 192.168.20.0/24
     Paths: (1 available, best #1, table Default-IP-Routing-Table)
     Not advertised to any peer
     64512
     192.168.2.5 from 192.168.2.5 (192.168.122.98)
     Origin IGP metric 0, localpref 100, valid, external, best
     Community: 64511:5
     Last update: Fri May 1 00:33:26 2020
b. Secondary neighbor router:

```bash
FGT-NBR2 # get router info bgp network 192.168.20.0
VRF 0 BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
   Not advertised to any peer
   Original VRF 0
   64512
   172.31.0.2 from 172.31.0.2 (192.168.122.98)
   Origin IGP metric 0, localpref 100, valid, external, best
   Community: 64522:1
   Last update: Fri May 1 00:22:42 2020
```

### Using multiple members per SD-WAN neighbor configuration

SD-WAN BGP neighbor configurations are used to define the SLA health check in which an SD-WAN member must meet to qualify as being up. When the SD-WAN member meets the SLA threshold, the FortiGate will apply the route map defined in the BGP neighbor's `route-map-out-preferable` option. If the SD-WAN member fails to meet the SLA, the FortiGate will apply the route map defined in the BGP neighbor's `route-map-out` option instead. This allows the FortiGate to advertise the health of the SD-WAN member to its BGP neighbor by advertising different community strings based on its SLA status.

For more information, refer to the following BGP examples: Controlling traffic with BGP route mapping and service rules on page 614 and Applying BGP route-map to multiple BGP neighbors on page 621.

Selecting multiple SD-WAN members allows the SD-WAN neighbor feature to support topologies where there are multiple SD-WAN overlays and/or underlays to a neighbor. The `minimum-sla-meet-members` option is used to configure the minimum number of members that must be in an SLA per neighbor for the preferable route map to be used.

```bash
config system sdwan
config neighbor
   edit <ip>
      set member {<seq-num_1>} [<seq-num_2>] ... [<seq-num_n>] member {<seq-num_1>}
      set minimum-sla-meet-members <integer>
      set next member {<seq-num_1>}
      [<seq-num_2>] ... [<seq-num_n>]
   end
end
```

<table>
<thead>
<tr>
<th>Enter the member sequence number list. Multiple members can be defined.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>minimum-sla-meet-members &lt;integer&gt;</code> Set the minimum number of members that meet SLA when the neighbor is preferred (1 - 255, default = 1).</td>
</tr>
<tr>
<td>• If the number of in SLA members is less than the <code>minimum-sla-meet-members</code> value, the default route map will be used.</td>
</tr>
<tr>
<td>• If the number of in SLA members is equal or larger than the <code>minimum-sla-meet-members</code> value, the preferable route map will be used.</td>
</tr>
</tbody>
</table>
Example

In the following example, the spoke FortiGate has four tunnels: two tunnels to Hub_1 and two tunnels to Hub_2. The spoke has two BGP neighbors: one to Hub_1 and one to Hub_2. BGP neighbors are established on loopback IPs.

The SD-WAN neighbor plus `route-map-out-preferable` configuration is deployed on the spoke to achieve the following:

- If any tunnel to Hub_1 or Hub_2 is in SLA, the preferable route map will be applied on the BGP neighbor to Hub_1 or Hub_2.
- If both tunnels to Hub_1 or Hub_2 are out of SLA, the default route map will be applied on the BGP neighbor to Hub_1 or Hub_2.

The preferable route map and default route map are used to set different custom BGP communities as the spoke advertises its LAN routes to the hub. Each hub can translate communities into different BGP MED or AS prepends and signal them to the external peers to manipulate inbound traffic, thereby routing traffic to the spoke only when the SLAs are met on at least one of two VPN overlays. In this example, community string 10:1 signals to the neighbor that SLAs are met, and 10:2 signals that SLAs are not met.

To configure the BGP route maps and neighbors:

1. Configure an access list of prefixes to be matched:

   ```
   config router access-list
   edit "net10"
   config rule
   edit 1
   set prefix 10.0.3.0 255.255.255.0
   next
   end
   next
   end
   ```
2. Configure route maps for neighbors in SLA (preferable) and out of SLA (default):

```config
config router route-map
edit "in_sla"
config rule
edit 1
  set match-ip-address "net10"
  set set-community "10:1"
next
next
edit "out_sla"
config rule
edit 1
  set match-ip-address "net10"
  set set-community "10:2"
next
next
end
end
```

3. Configure the BGP neighbors:

```config
config router bgp
set router-id 172.31.0.65
config neighbor
  edit "172.31.0.1"
    set route-map-out "out_sla"
    set route-map-out-preferable "in_sla"
    set update-source "Loopback0"
  next
  edit "172.31.0.2"
    set route-map-out "out_sla"
    set route-map-out-preferable "in_sla"
    set update-source "Loopback0"
  next
end
config network
  edit 1
    set prefix 10.0.3.0 255.255.255.0
  next
end
end
```

To configure SD-WAN:

1. Configure the SD-WAN members:

```config
config system sdwan
set status enable
config members
  edit 1
    set interface "H1_T11"
    set source 172.31.0.65
  next
  edit 4
    set interface "H1_T22"
```
set source 172.31.0.65
next
edit 6
   set interface "H2_T11"
   set source 172.31.0.65
next
edit 9
   set interface "H2_T22"
   set source 172.31.0.65
next
end
end

2. Configure the health check that must be met:

    config system sdwan
    config health-check
    edit "HUB"
       set server "172.31.100.100"
       set members 0
       config sla
          edit 1
             set link-cost-factor latency
             set latency-threshold 100
          next
       next
    end
end

3. Configure the SD-WAN neighbors:

    config system sdwan
    config neighbor
       edit "172.31.0.1"
          set member 1 4
          set health-check "HUB"
          set sla-id 1
          set minimum-sla-meet-members 1
       next
       edit "172.31.0.2"
          set member 6 9
          set health-check "HUB"
          set sla-id 1
          set minimum-sla-meet-members 1
       next
end
end

To verify that when two members to Hub_1/Hub_2 are in SLA, the preferable route map is be applied on BGP neighbors to Hub_1/Hub_2:

Branch1_A_FGT (root) # diagnose sys sdwan health-check
Health Check(HUB):
Seq(1 H1_T11): state(alive), packet-loss(0.000%) latency(0.209), jitter(0.017), mos(4.404), bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
Seq(4 H1_T22): state(alive), packet-loss(0.000%) latency(0.171), jitter(0.004), mos(4.404), bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x1
Seq(6 H2_T11): state(alive), packet-loss(0.000%) latency(0.175), jitter(0.014), mos(4.404), bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999997) sla_map=0x1
Seq(9 H2_T22): state(alive), packet-loss(0.000%) latency(0.176), jitter(0.019), mos(4.404), bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x1

# diagnose sys sdwan neighbor
Neighbor(172.31.0.1): member(1 4 )role(standalone)  
  Health-check(HUB:1) sla-pass selected alive
Neighbor(172.31.0.2): member(6 9 )role(standalone)  
  Health-check(HUB:1) sla-pass selected alive

On Hub_1 and Hub_2, the expected communities have been attached into the spoke's LAN route:

Hub_1_FGT (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65) 
      Origin IGP metric 0, localpref 100, valid, internal, best 
      Community: 10:1 
      Last update: Wed Dec 29 22:38:29 2021

Hub_2_FGT (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65) 
      Origin IGP metric 0, localpref 100, valid, internal, best 
      Community: 10:1 

If one member for each neighbor becomes out of SLA, the preferable route map is still applied:

Branch1_A_FGT (root) # diagnose sys sdwan health-check
Health Check(HUB):
Seq(1 H1_T11): state(alive), packet-loss(0.000%) latency(120.207), jitter(0.018), mos (4.338), bandwidth-up(999999), bandwidth-dw(999997), bandwidth-bi(1999996) sla_map=0x0 
Seq(4 H1_T22): state(alive), packet-loss(0.000%) latency(0.182), jitter(0.008), mos(4.404), bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x1
Seq(6 H2_T11): state(alive), packet-loss(0.000%) latency(120.102), jitter(0.009), mos (4.404), bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x0 
Seq(9 H2_T22): state(alive), packet-loss(0.000%) latency(0.176), jitter(0.009), mos(4.404), bandwidth-up(999999), bandwidth-dw(999997), bandwidth-bi(1999996) sla_map=0x1

# diagnose sys sdwan neighbor
Neighbor(172.31.0.1): member(1 4 )role(standalone)  
  Health-check(HUB:1) sla-pass selected alive
Neighbor(172.31.0.2): member(6 9 )role(standalone)  
  Health-check(HUB:1) sla-pass selected alive

Hub_1_FGT (root) # get router info bgp network 10.0.3.0/24

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
VPN overlay

The following topics provide instructions on SD-WAN VPN overlays:

- ADVPN and shortcut paths on page 633
- SD-WAN monitor on ADVPN shortcuts on page 646
- Hold down time to support SD-WAN service strategies on page 647
- SD-WAN integration with OCVPN on page 649
- Adaptive Forward Error Correction on page 656
- Dual VPN tunnel wizard on page 660
- Duplicate packets on other zone members on page 661
- Duplicate packets based on SD-WAN rules on page 664
- Speed tests run from the hub to the spokes in dial-up IPsec tunnels on page 665
- Interface based QoS on individual child tunnels based on speed test results on page 672
- Use SSL VPN interfaces in zones on page 675
- SD-WAN in large scale deployments on page 679

ADVPN and shortcut paths

This topic provides an example of how to use SD-WAN and ADVPN together.

ADVPN (Auto Discovery VPN) is an IPsec technology that allows a traditional hub-and-spoke VPN’s spokes to establish dynamic, on-demand, direct tunnels between each other to avoid routing through the topology’s hub device. The primary advantage is that it provides full meshing capabilities to a standard hub-and-spoke topology. This greatly reduces the provisioning effort for full spoke-to-spoke low delay reachability, and addresses the scalability issues associated with very large fully meshed VPN networks.

If a customer's head office and branch offices all have two or more internet connections, they can build a dual-hub ADVPN network. Combined with SD-WAN technology, the customer can load-balance traffic to other offices on multiple dynamic tunnels, control specific traffic using specific connections, or choose better performance connections dynamically.

SD-WAN load-balance mode rules (or services) do not support ADVPN members. Other modes’ rules, such as SLA and priority, support ADVPN members.

This topic covers three parts:

1. Configure dual-hub ADVPN with multiple branches.
2. Configure BGP to exchange routing information among hubs and spokes.
3. Configure SD-WAN on spoke to do load-balancing and control traffic.
A typical ADVPN configuration with SD-WAN usually has two hubs, and each spoke connects to two ISPs and establishes VPN tunnels with both hubs.

This example shows a hub-and-spoke configuration using two hubs and one spoke:

- Hub1 and Hub2 both use wan1 to connect to the ISPs and port10 to connect to internal network.
- Spoke1 uses wan1 to connect to ISP1 and wan2 to connect to ISP2.
- wan1 sets up VPN to hub1.
- wan2 sets up VPN to hub2.

The SD-WAN is configured on the spoke. It uses the two VPN interfaces as members and two rules to control traffic to headquarters or other spokes using ADVPN VPN interfaces. You can create more rules if required.

For this example:

- Use SD-WAN member 1 (via ISP1) and its dynamic shortcuts for financial department traffic if member 1 meets SLA requirements. If it doesn’t meet SLA requirements, it will use SD-WAN member 2 (via ISP2).
- Use SD-WAN member 2 (via ISP2) and its dynamic shortcuts for engineering department traffic.
- Load balance other traffic going to hubs and other spokes between these two members.
- Set up all other traffic to go with their original ISP connection. All other traffic does not go through SD-WAN.
- Set up basic network configuration to let all hubs and spokes connect to their ISPs and the Internet.

</tbody>
</table>

The GUI does not support some ADVPN related options, such as auto-discovery-sender, auto-discovery-receiver, auto-discovery-forwarder, and IBGP neighbor-group setting, so this example only provides CLI configuration commands.

**Hub1 sample configuration**

**To configure the IPsec phase1 and phase2 interface:**

```bash
config vpn ipsec phase1-interface
  edit "hub-phase1"
    set type dynamic
    set interface "wan1"
    set peer-type any
    set net-device disable
    set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-sha1
    set add-route disable
    set dpd on-idle
    set auto-discovery-sender enable
    set psksecret sample
    set dpd-retryinterval 5
  next
end
config vpn ipsec phase2-interface
  edit "hub-phase2"
    set phasename "hub-phase1"
    set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-sha256
  next
end
```
When net-device is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The tunnel-search option is removed in FortiOS 7.0.0 and later.

**To configure the VPN interface and BGP:**

```plaintext
config system interface
   edit "hub-phase1"
      set ip 10.10.100.254 255.255.255.255
      set remote-ip 10.10.100.253 255.255.255.0
   next
end
config router bgp
   set as 65505
config neighbor-group
   edit "advpn"
      set link-down-failover enable
      set remote-as 65505
      set route-reflector-client enable
   next
end
config neighbor-range
   edit 1
      set prefix 10.10.100.0 255.255.255.0
      set neighbor-group "advpn"
   next
end
config network
   edit 1
      set prefix 172.16.101.0 255.255.255.0
   next
   edit 2
      set prefix 11.11.11.0 255.255.255.0
   next
end
```

**To configure the firewall policy:**

```plaintext
config firewall policy
   edit 1
      set name "spoke2hub"
      set srcintf "hub-phase1"
      set dstintf "port10"
      set srcaddr "spoke_subnets"
      set dstaddr "hub_subnets"
      set action accept
      set schedule "always"
      set service "ALL"
      set comments "allow traffic from spokes to headquarter"
   next
   edit 2
      set name "spoke2spoke"
      set srcintf "hub-phase1"
```
set dstintf "hub-phase1"
set srcaddr "spoke_subnets"
set dstaddr "spoke_subnets"
set action accept
set schedule "always"
set service "ALL"
set comments "allow traffic from spokes to spokes"
next
edit 3
set name "internal2spoke"
set srcintf "port10"
set dstintf "hub-phase1"
set srcaddr "hub_subnets"
set dstaddr "spoke_subnets"
set action accept
set schedule "always"
set service "ALL"
set comments "allow traffic from headquarter to spokes"
next
end

**Hub2 sample configuration**

Hub2 configuration is the same as hub1 except the wan1 IP address, VPN interface IP address, and BGP neighbor-range prefix.

**To configure the IPsec phase1 and phase2 interface:**

```bash
config vpn ipsec phase1-interface
   edit "hub-phase1"
       set type dynamic
       set interface "wan1"
       set peertype any
       set net-device disable
       set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-shal aes256-shal 3des-shal
       set add-route disable
       set dpd on-idle
       set auto-discovery-sender enable
       set psksecret sample
       set dpd-retryinterval 5
next
end
config vpn ipsec phase2-interface
   edit "hub-phase2"
       set phasename "hub-phase1"
       set proposal aes128-shal aes256-shal 3des-shal aes128-sha256 aes256-sha256 3des-sha256
next
end
```

**To configure the VPN interface and BGP:**

```bash
config system interface
   edit "hub-phase1"
```
set ip 10.10.200.254 255.255.255.255
set remote-ip 10.10.200.253 255.255.255.0
next
end
config router bgp
set as 65505
config neighbor-group
edit "advpn"
   set link-down-failover enable
   set remote-as 65505
   set route-reflector-client enable
next
end
config neighbor-range
edit 1
   set prefix 10.10.200.0 255.255.255.0
   set neighbor-group "advpn"
next
end
config network
edit 1
   set prefix 172.16.101.0 255.255.255.0
next
edit 2
   set prefix 11.11.11.0 255.255.255.0
next
end
end

To configure the firewall policy:

config firewall policy
edit 1
   set name "spoke2hub"
   set srcintf "hub-phase1"
   set dstintf "port10"
   set srcaddr "spoke_subnets"
   set dstaddr "hub_subnets"
   set action accept
   set schedule "always"
   set service "ALL"
   set comments "allow traffic from spokes to headquarter"
next
edit 2
   set name "spoke2spoke"
   set srcintf "hub-phase1"
   set dstintf "hub-phase1"
   set srcaddr "spoke_subnets"
   set dstaddr "spoke_subnets"
   set action accept
   set schedule "always"
   set service "ALL"
   set comments "allow traffic from spokes to spokes"
next
edit 3
   set name "internal2spoke"
set srcintf "port10"
set dstintf "hub-phase1"
set srcaddr "hub_subnets"
set dstaddr "spoke_subnets"
set action accept
set schedule "always"
set service "ALL"
set comments "allow traffic from headquarter to spokes"

next
derm

**Spoke1 sample configuration**

To configure the IPsec phase1 and phase2 interface:

```
config vpn ipsec phase1-interface
  edit "spoke1-phase1"
    set interface "wan1"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-shal aes256-shal
    set add-route disable
    set dpd on-idle
    set auto-discovery-receiver enable
    set remote-gw 11.1.1.11
    set psksecret sample
    set dpd-retryinterval 5
  next

  edit "spoke1-2-phase1"
    set interface "wan2"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-shal aes256-shal
    set add-route disable
    set dpd on-idle
    set auto-discovery-receiver enable
    set remote-gw 11.1.2.11
    set psksecret sample
    set dpd-retryinterval 5
  next

config vpn ipsec phase2-interface
  edit "spoke1-phase2"
    set phasename "spoke1-phase1"
    set proposal aes128-shal aes256-shal aes128-sha256 aes256-sha256 aes128gcm aes256gcm
    set chacha20poly1305
    set auto-negotiate enable
  next

  edit "spoke1-2-phase2"
    set phasename "spoke1-2-phase1"
    set proposal aes128-shal aes256-shal aes128-sha256 aes256-sha256 aes128gcm aes256gcm
    set chacha20poly1305
    set auto-negotiate enable
  next
end
```
To configure the VPN interface and BGP:

```plaintext
cfg sys int
edit "spoke1-phase1"
    set ip 10.10.100.2 255.255.255.255
    set remote-ip 10.10.100.254 255.255.255.0
next
edit "spoke1-2-phase1"
    set ip 10.10.200.2 255.255.255.255
    set remote-ip 10.10.200.254 255.255.255.0
next
end

cfg router bgp
    set as 65505

cfg neighbor
    edit "10.10.100.254"
        set advertisement-interval 1
        set link-down-failover enable
        set remote-as 65505
next
edit "10.10.200.254"
    set advertisement-interval 1
    set link-down-failover enable
    set remote-as 65505
next
end

cfg net
    edit 1
        set prefix 10.1.100.0 255.255.255.0
next
end

global

To configure SD-WAN:

```plaintext
cfg sys sdwan
    set status enable

cfg members
    edit 1
        set interface "spoke1-phase1"
next
    edit 2
        set interface "spoke1-2-phase1"
next
end

cfg health-check
    edit "ping"
        set server "11.11.11.11"
        set members 1 2
        config sla
            edit 1
                set latency-threshold 200
                set jitter-threshold 50
                set packetloss-threshold 5
            next
        end
```
If no SD-WAN zone is specified, members are added to the default virtual-wan-link zone.

To configure the firewall policy:

```
config firewall policy
  edit 1
    set name "outbound_advpn"
    set srcintf "internal"
    set dstintf "virtual-wan-link"
    set srcaddr "spoke_subnets"
    set dstaddr "spoke_subnets" "hub_subnets"
    set action accept
    set schedule "always"
    set service "ALL"
    set comments "allow internal traffic going out to headquarter and other spokes"
  next
edit 2
  set name "inbound_advpn"
  set srcintf "virtual-wan-link"
  set dstintf "internal"
  set srcaddr "spoke_subnets" "hub_subnets"
  set dstaddr "spoke_subnets"
  set action accept
  set schedule "always"
  set service "ALL"
  set comments "allow headquarter and other spokes traffic coming in"
next
end
```
Troubleshooting ADVPN and shortcut paths

Before spoke vs spoke shortcut VPN is established

Use the following CLI commands to check status before spoke vs spoke shortcut VPN is established.

```
# get router info bgp summary
BGP router identifier 2.2.2.2, local AS number 65505
BGP table version is 13
3 BGP AS-PATH entries
0 BGP community entries
```

SD-WAN monitor on ADVPN shortcuts

SD-WAN monitors ADVPN shortcut link quality by dynamically creating link monitors for each ADVPN link. The dynamic
link monitor on the spoke will use ICMP probes and the IP address of the gateway as the monitored server. These ICMP
probes will not be counted as actual user traffic that keeps the spoke-to-spoke tunnel alive.

- - - Static tunnels
------- Dynamic tunnels (shortcuts)

- When no shortcut is established:

  # diagnose sys sdwan health-check
  Health Check (ping):
  Seq(1 tunnel-1): state (alive), packet-loss (0.000%) latency (0.038), jitter (0.006) sla
  map=0x3
  Seq(2 tunnel-2): state (alive), packet-loss (0.000%) latency (0.035), jitter (0.004) sla
  map=0x3
• When one shortcut is established:
  
  ```
  # diagnose sys sdwan health-check
  Health Check(ping):
  Seq(1 tunnel-1): state(alive), packet-loss(0.000%) latency(0.039), jitter(0.003) sla_map=0x3
  Seq(1 tunnel-1_0): state(alive), packet-loss(0.000%) latency(0.060), jitter(0.023) sla_map=0x3
  Seq(2 tunnel-2): state(alive), packet-loss(0.000%) latency(0.035), jitter(0.002) sla_map=0x3
  ```

• When more than one shortcut is established:
  
  ```
  # diagnose sys sdwan health-check
  Health Check(ping):
  Seq(1 tunnel-1): state(alive), packet-loss(0.000%) latency(0.036), jitter(0.004) sla_map=0x3
  Seq(1 tunnel-1_0): state(alive), packet-loss(0.000%) latency(0.041), jitter(0.009) sla_map=0x3
  Seq(2 tunnel-2): state(alive), packet-loss(0.000%) latency(0.030), jitter(0.005) sla_map=0x3
  Seq(2 tunnel-2_0): state(alive), packet-loss(0.000%) latency(0.031), jitter(0.004) sla_map=0x3
  ```

**Hold down time to support SD-WAN service strategies**

In a hub and spoke SD-WAN topology with shortcuts created over ADVPN, a downed or recovered shortcut can affect which member is selected by an SD-WAN service strategy. When a downed shortcut tunnel recovers and the shortcut is added back into the service strategy, the shortcut is held at a low priority until the hold down time has elapsed.

By default, the hold down time is zero seconds. It can be set to 0 - 10000000 seconds.

**To configure the hold down time:**

```
config system sdwan
  config service
    edit 1
      set hold-down-time <integer>
    next
  end
end
```

**Example**

In this example, the hold down time is set to 15 seconds, and then the SD-WAN service is looked at before and after the hold down elapses after a downed shortcut recovers.
To configure the hold down time:

```bash
config system sdwan
  config service
    edit 1
      set hold-down-time 15
    next
  end
end
```

To view which SD-WAN member is selected before and after the hold down time elapses:

Before the hold down time has elapsed:

```bash
# diagnose sys sdwan service
Service(1): Address Mode(IPV4) flags=0x200
  Gen(34), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(priority), link-cost-factor(packet-loss), link-cost-threshold(0), heath-check(ping)
Hold down time(15) seconds, Hold start at 2003 second, now 2010
  Member sub interface(4):
    1: seq_num(1), interface(vd2-1):
       1: vd2-1_0(86)
    3: seq_num(2), interface(vd2-2):
       1: vd2-2_0(88)

  Members(4):
    1: Seq_num(1 vd2-1), alive, packet loss: 27.000%, selected
    2: Seq_num(2 vd2-2_0), alive, packet loss: 0.000%, selected
    3: Seq_num(2 vd2-2), alive, packet loss: 0.000%, selected
    4: Seq_num(1 vd2-1_0), alive, packet loss: 61.000%, selected
  Dst address(1):
    33.1.1.101-33.1.1.200
```

After the hold down time has elapsed:

```bash
# diagnose sys sdwan service
Service(1): Address Mode(IPV4) flags=0x200
  Gen(35), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(priority), link-cost-factor(packet-loss), link-cost-threshold(0), heath-check(ping)
Hold down time(15) seconds, Hold start at 2018 second, now 2019
```
SD-WAN integration with OCVPN

OCVPN has the capability to enable SD-WAN in order to dynamically add its tunnel interfaces as SD-WAN members. Users can configure SD-WAN health checks and service rules to direct traffic over the OCVPN tunnels.

The following example uses a dual hub and spoke topology. Each hub and spoke has two WAN link connections to the ISP. The spokes generate two IPsec tunnels to each hub (four tunnels in total). BGP neighbors are established over each tunnel and routes from the hubs and other spokes learned from all neighbors, which forms an ECMP scenario. All tunnels are placed as SD-WAN members, so traffic can be distributed across tunnels based on the configured SD-WAN service rules.

To integrate SD-WAN with OCVPN in the GUI:

1. Configure the primary hub:
   a. Go to VPN > Overlay Controller VPN and set the Status to Enable.
   b. For Role, select Primary Hub.
c. Enter the WAN interfaces (port15 and port16) and tunnel IP allocation block (10.254.0.0/16).

The WAN interface is position sensitive, meaning a tunnel will be created with the first position interface on the hub to the first position interface on the spoke, and so on. In this example, FGT_A (primary hub) will create two tunnels with FGT_C (spoke):
- FGT_A port15 ==> FGT_C internal1
- FGT_A port16 ==> FGT_C internal2

d. Enable Auto-discovery shortcuts.

e. Enable Add OCVVPN tunnels to SD-WAN. The IPsec tunnels will be added automatically to the SD-WAN members if SD-WAN is enabled.

2. Configure the overlays on the primary hub:

a. In the Overlays section, click Create New.

b. Enter a name and add the local interface (port2). Note the overlay is either based on local subnets or local interfaces, but not both.

By default, inter-overlay traffic is not enabled. Toggle Allow traffic from other overlays to enable it.

c. Click OK and repeat these steps to create the second overlay (loop1).

d. Click Apply.

3. Configure the secondary hub with the same settings as the primary hub.

4. Configure the spoke:

a. Go to VPN > Overlay Controller VPN and set the Status to Enable.

b. For Role, select Spoke.

c. Enter the WAN interfaces (internal1 and internal2).

d. Enable Auto-discovery shortcuts.

e. Enable Add OCVVPN tunnels to SD-WAN. The IPsec tunnels will be added automatically to the SD-WAN members if SD-WAN is enabled.

f. Configure the overlays.

The overlay names on the spokes must match the names on the hub for the traffic to be allowed through the same overlay.

g. Click Apply.
5. Configure the other spoke with the same settings.
6. On a spoke, go to Network > SD-WAN and select the SD-WAN Zones tab to view the configuration generated by OCVPN.

Firewall policies will be automatically generated by OCVPN between the local interfaces and the SD-WAN interface. Each policy will define the proper local and remote networks for its source and destination addresses.

To integrate SD-WAN with OCVPN in the CLI:

1. Configure the primary hub:
   ```
   config vpn ocvpn
   set role primary-hub
   set sdwan enable
   set wan-interface "port15" "port16"
   set ip-allocation-block 10.254.0.0 255.255.0.0
   config overlays
   edit "overlay1"
   config subnets
   edit 1
   set type interface
   set interface "port2"
   next
   next
   edit "overlay2"
   config subnets
   edit 1
   set type interface
   set interface "loop1"
   next
   next
   end
   end
   ```
2. Configure the secondary hub with the same settings as the primary hub.
3. Configure the spoke:
   ```
   config vpn ocvpn
   set status enable
   set sdwan enable
   set wan-interface "internal1" "internal2"
   config overlays
   edit "overlay1"
   config subnets
   ```
4. Configure the other spoke with the same settings.

5. Configure SD-WAN:

```
edit 1
    set type interface
    set interface "wan2"
next
end
next
edit "overlay2"
    config subnets
    edit 1
        set type interface
        set interface "loop1"
next
end
next
end
```

Firewall policies will be automatically generated by OCVPN between the local interfaces and the SD-WAN interface. Each policy will define the proper local and remote networks for its source and destination addresses.

If no SD-WAN zone is specified, members are added to the default virtual-wan-link zone.

To verify the integration is working after the ADVPN shortcut is triggered:

1. Check the routing table on the spoke:

```
FGT_C # get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
    O - OSPF, IA - OSPF inter area
    N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
    E1 - OSPF external type 1, E2 - OSPF external type 2
    i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
```
* - candidate default

3. Check the SD-WAN state:

```bash
FGT_C # diagnose sys sdwan health-check
Health Check(Defalut_DNS):
Health Check(Default_Office_365):
Health Check(Default_Gmail):
Health Check(Default.AWS):
Health Check(Default_Google Search):
Health Check(Default_FortiGuard):
Health Check(ocvpn):
  Seq(1_OCVPN2-0a): state(alive), packet-loss(0.000%) latency(0.364), jitter(0.028) sla_map=0x0
  Seq(2_OCVPN2-0b): state(alive), packet-loss(0.000%) latency(0.287), jitter(0.026) sla_map=0x0
  Seq(3_OCVPN2-la): state(dead), packet-loss(100.000%) sla_map=0x0
  Seq(4_OCVPN2-lb): state(dead), packet-loss(100.000%) sla_map=0x0
  Seq(4_OCVPN2-lb_0): state(alive), packet-loss(0.000%) latency(0.289), jitter(0.029) sla_map=0x0
```

Adaptive Forward Error Correction

Forward Error Correction (FEC) is used to control and correct errors in data transmission by sending redundant data across the VPN in anticipation of dropped packets occurring during transit. The mechanism sends out x number of redundant packets for every y number of base packets.

Adaptive FEC considers link conditions and dynamically adjusts the FEC packet ratio:

- The FEC base and redundant packet relationship is dynamically adjusted based on changes to the network SLA metrics defined in the SD-WAN SLA health checks. For example, when there is no or low packet loss in the network, FEC can work on a low redundant level sending only one redundant packet for every 10 base packets. As packet loss increases, the number of redundant packets sent can rise accordingly.
- FEC can be applied only to streams that are sensitive to packet loss. For example, policies that allow the UDP based VoIP protocol can enable FEC, while TCP based traffic policies do not. This reduces unnecessary bandwidth consumption by FEC.
- Because FEC does not support NPU offloading, the ability to specify streams and policies that do not require FEC allows those traffic to be offloaded. This means that all traffic suffers a performance impact.

In this example, an IPsec tunnel is configured between two FortiGates that both have FEC enabled. The tunnel is an SD-WAN zone, and an SLA health-check is used to monitor the quality of the VPN overlay. The intention is to apply FEC to UDP traffic that is passing through the VPN overlay, while allowing all other traffic to pass through without FEC. An FEC profile is configured to adaptively increase redundant levels if the link quality exceeds a 10% packet loss threshold, or the bandwidth exceeds 950 Mbps.

The DMZ interface and IPsec tunnel vd1-p1 are SD-WAN members. FEC is enabled on vd1-p1, and health-check works on vd1-p1.
To configure the FortiGates:

1. On both FortiGates, enable FEC and NPU offloading on the IPsec tunnel vd1-p1:

   ```
   config vpn ipsec phase1-interface
   edit "vd1-p1"
   set npu-offload enable
   set fec-egress enable
   set fec-ingress enable
   next
   end
   ```

2. On FortiGate A, configure SD-WAN:

   The VPN overlay member (vd1-p1) must be included in the health-check and configured as the higher priority member in the SD-WAN rule.

   ```
   config system sdwan
   set status enable
   config zone
   edit "virtual-wan-link"
   next
   end
   config members
   edit 1
   set interface "dmz"
   set gateway 172.16.208.2
   next
   edit 2
   set interface "vd1-p1"
   next
   end
   config health-check
   edit "1"
   set server "2.2.2.2"
   set members 2
   config sla
   edit 1
   next
   end
   end
   config service
   edit 1
   set name "1"
   set dst "all"
   set src "172.16.205.0"
   set priority-members 2 1
   ```
3. On FortiGate A, create a policy to specify performing FEC on UDP traffic, and a policy for other traffic:

```plaintext
config firewall policy
  edit 1
    set srcintf "port5"
    set dstintf "virtual-wan-link"
    set action accept
    set srcaddr "172.16.205.0"
    set dstaddr "all"
    set schedule "always"
    set service "ALL_UDP"
    set fec enable
  next
  edit 2
    set srcintf "any"
    set dstintf "any"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
  next
end
```

4. On FortiGate A, configure FEC mapping to bind network SLA metrics and FEC base and redundant packets:

```plaintext
config vpn ipsec fec
  edit "m1"
  config mappings
    edit 1
      set base 8
      set redundant 2
      set packet-loss-threshold 10
    next
    edit 2
      set base 9
      set redundant 3
      set bandwidth-up-threshold 950000
    next
  end
end
```

The mappings are matched from top to bottom: packet loss loss greater than 10% with eight base and two redundant packets, and then uploading bandwidth greater than 950 Mbps with nine base and three redundant packets.

5. On FortiGate A, apply the FEC mappings on vd1-p1:

```plaintext
config vpn ipsec phasel-interface
  edit "vd1-p1"
    set fec-health-check "1"
    set fec-mapping-profile "m1"
    set fec-base 10
    set fec-redundant 1
```
The FEC base and redundant values are used when the link quality has not exceeded the limits specified in the FEC profile mapping. If `fec-codec` is set to `xor` the base and redundant packet values will not be updated.

To verify the results:

1. **Send TCP and UDP traffic from PC1 to PC2, then check the sessions on FortiGate A:**

   To verify the results:

   ```
   # diagnose sys session list
   session info: proto=6 proto_state=01 duration=12 expire=3587 timeout=3600 flags=00000000
   socktype=0 sockport=0 av_idx=0 use=3

   npu_state=0x504000
   
   no_ofld_reason: non-npu-intf
   ```

   Non-FEC protected TCP traffic is offloaded, while FEC protected UDP traffic is not offloaded

2. **On FortiGate A, check the health-check result and the corresponding FEC base and redundant packets:**
# diagnose sys sdwan health-check
Health Check(1):
Seq(2 vd1-p1): state(alive), packet-loss(0.000%) latency(0.168), jitter(0.021),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x1

Because bandwidth-up is more than 950000kbps, base and redundant are set to 9 and 3:

# diagnose vpn tunnel fec vd1-p1
egress:
  enabled=1 base=9 redundant=3 codec=0 timeout=10(ms)
  encode=6621 encode_timeout=6621 encode_fail=0
tx_data=6880 tx parity=18601
ingress:
  enabled=1 timeout=50(ms)
fasm_cnt=0 fasm_full=0
ipsec_fec_chk_fail=0 complete=0
rx_data=0 rx parity=0
recover=0 recover_timeout=0 recover_fail=0
rx=0 rx fail=0

3. Make packet loss more than 10%, then check the health-check result and the corresponding FEC base and redundant packets again:

# diagnose sys sdwan health-check
Health Check(1):
Seq(2 vd1-p1): state(alive), packet-loss(15.000%) latency(0.168), jitter(0.017),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x0

Because packet loss is more than 10%, entry one in FEC mapping is first matched, and base and redundant are set to 8 and 2:

# diagnose vpn tunnel fec vd1-p1
egress:
  enabled=1 base=8 redundant=2 codec=0 timeout=10(ms)
  encode=6670 encode_timeout=6670 encode_fail=0
tx_data=6976 tx parity=18748
ingress:
  enabled=1 timeout=50(ms)
fasm_cnt=0 fasm_full=0
ipsec_fec_chk_fail=0 complete=0
rx_data=0 rx parity=0
recover=0 recover_timeout=0 recover_fail=0
rx=0 rx fail=0

**Dual VPN tunnel wizard**

This wizard is used to automatically set up multiple VPN tunnels to the same destination over multiple outgoing interfaces. This includes automatically configuring IPsec, routing, and firewall settings, avoiding cumbersome and error-prone configuration steps.
To create a new SD-WAN VPN interface using the tunnel wizard:

1. Go to Network > SD-WAN, select the SD-WAN Zones tab, and click Create New > SD-WAN Member.
2. In the Interface drop-down, click +VPN. The Create IPsec VPN for SD-WAN members pane opens.
3. Enter the required information, then click Next.
4. Review the settings then click Create.
5. Click Close to return to the SD-WAN page.
   The newly created VPN interface will be highlighted in the Interface drop-down list.
6. Select the VPN interface to add it as an SD-WAN member, then click OK.

**Duplicate packets on other zone members**

When duplication rules are used, packets are duplicated on other good links within the SD-WAN zone and de-duplicated on the destination FortiGate. Use force mode to force duplication on other links within the SD-WAN zone, or use on-demand mode to trigger duplication only when SLA fails on the selected member.

The duplication rule is configured in the CLI by using the `config duplication` command. The following options can be configured:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcaddr</td>
<td>Source address or address group names.</td>
</tr>
<tr>
<td>dstaddr</td>
<td>Destination address or address group names.</td>
</tr>
<tr>
<td>srcaddr6</td>
<td>Source IPv6 address or IPv6 address group names.</td>
</tr>
<tr>
<td>dstaddr6</td>
<td>Destination IPv6 address or IPv6 address group names.</td>
</tr>
<tr>
<td>srcintf</td>
<td>Incoming (ingress) interfaces or zones.</td>
</tr>
<tr>
<td>dstintf</td>
<td>Outgoing (egress) interfaces or zones.</td>
</tr>
<tr>
<td>service</td>
<td>Service and service group names.</td>
</tr>
<tr>
<td>packet-duplication</td>
<td>Configure packet duplication method.</td>
</tr>
<tr>
<td></td>
<td>• disable: Disable packet duplication (default).</td>
</tr>
<tr>
<td></td>
<td>• force: Duplicate packets across all interface members of the SD-WAN zone.</td>
</tr>
<tr>
<td></td>
<td>• on-demand: Duplicate packets across all interface members of the SD-WAN</td>
</tr>
<tr>
<td></td>
<td>zone based on the link quality.</td>
</tr>
<tr>
<td>packet-de-duplication</td>
<td>Enable/disable discarding of packets that have been duplicated (default =</td>
</tr>
<tr>
<td></td>
<td>disable).</td>
</tr>
</tbody>
</table>

The `duplication-max-num <integer>` option under `config system sdwan` is the maximum number of interface members that a packet is duplicated on in the SD-WAN zone (2 - 4, default = 2). If this value is set to 3, the original packet plus two more copies are created. If there are three member interfaces in the SD-WAN zone and the `duplication-max-num` is set to 2, the packet duplication follows the configuration order, so the packets are duplicated on the second member.

**Example**

The packet duplication feature works best in a spoke-spoke or hub-and-spoke topology. In this example, a hub-and-spoke ADVPN topology is used. Before shortcuts are established, Hub 1 forwards the duplicate packets from Spoke 1 to Spoke 2. Once shortcuts are established, Hub 1 is transparent, and duplicate packets are exchanged directly between the spokes.

![Diagram of SD-WAN topology](image-url)
To configure packet duplication between Spoke 1 and Spoke 2:

1. Configure Spoke 1:

   ```
   config system sdwan
   set status enable
   config zone
   edit "virtual-wan-link"
   next
   edit "sdwanzone_v4"
   next
   end
   config members
   edit 1
   set interface "t1"
   set zone "sdwanzone_v4"
   next
   edit 4
   set interface "t21"
   set zone "sdwanzone_v4"
   next
   edit 2
   set interface "t2"
   set zone "sdwanzone_v4"
   next
   end
   config health-check
   edit "h1"
   set server "10.34.1.1"
   set interval 1000
   set failtime 10
   set members 1 2
   config sla
   edit 1
   set packetloss-threshold 40
   next
   end
   end
   config duplication
   edit 1
   set srcaddr "all"
   set dstaddr "all"
   set srcintf "port1"
   set dstintf "sdwanzone_v4"
   set service "ALL"
   set packet-duplication force
   set packet-de-duplication enable
   next
   end
   ```

2. Configure Spoke 2 with similar settings.
Duplicate packets based on SD-WAN rules

SD-WAN duplication rules can specify SD-WAN service rules to trigger packet duplication. This allows the duplication to occur based on an SD-WAN rule instead of the source, destination, and service parameters in the duplication rule.

1. Packets can be forced to duplicate to all members of the same SD-WAN zone. See Duplicate packets on other zone members on page 661 for details.
   For example, in Spoke 1 set packet-duplication to force so that when a client sends a packet to the server, it is duplicated to all members of the same zone as long as its health check is alive. If a members health check is dead, then the member is removed from the SD-WAN duplication zone.

2. Packets can be duplicated to other members of the SD-WAN zone on-demand only when the condition of the link is not good enough.
   Set packet-duplication to on-demand. If sla-match-service is disabled, when all the SLAs of the member exceed threshold (sla_map=0), the packet is duplicated. But when the SLAs are within threshold (sla_map!=0), the packet is not duplicated.
   If sla-match-service is enabled, then only the SLA health checks and targets used in the service rule need to exceed threshold in order to trigger packet duplication.

3. Packets can be duplicated to all members of the same SD-WAN zone when the traffic matches one or more regular SD-WAN service rules.

   The following example shows the third type of packet duplication.

   ![SD-WAN Diagram](image)

   In this example, SD-WAN is configured with three members: vpn1, vpn2, and vpn3. Service rule 1 controls all traffic from 10.100.20.0/24 to 172.16.100.0/24 using member 1.

   To send a duplicate of the traffic that matches service rule 1 using member 2, members 1 and 2 are added to the same SD-WAN zone, and a duplication rule is configured with service-id set to 1.

   **To send a duplicate of the traffic that matches service rule 1 using member 2:**

   ```
   config system sdwan
   set status enable
   config zone
   edit "virtual-wan-link"
   next
   edit "zone2"
   ```
next
end
config members
  edit 1
    set interface "vpn1"
  next
  edit 2
    set interface "vpn2"
  next
  edit 3
    set interface "vpn3"
    set zone "zone2"
  next
end
config service
  edit 1
    set dst "172.16.100.0"
    set src "10.100.20.0"
    set priority-members 1
  next
end
config duplication
  edit 1
    set service-id 1
    set packet-duplication force
  next
end
end

Speed tests run from the hub to the spokes in dial-up IPsec tunnels

In a hub and spoke SD-WAN topology that uses dial-up VPN overlays, QoS can be applied on individual tunnels based on the measured bandwidth between the hub and spokes. The FortiGate can use the built in speed test to dynamically populate the egress bandwidth to individual dial-up tunnels from the hub.

SD-WAN members on a spoke can switch routes when the speed test is running from the hub to the spoke. The speed test results can be cached for reuse when a tunnel comes back after going down.

CLI commands

Allow upload speed tests to be run from the hub to spokes on demand for dial-up IPsec tunnel:

```fortios
config system speed-test-schedule
  edit <interface>
    set dynamic-server {enable | disable}
  next
end
```

<table>
<thead>
<tr>
<th><code>&lt;interface&gt;</code></th>
<th>The dial-up IPsec tunnel interface on the hub.</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic-server {enable</td>
<td>disable}</td>
</tr>
</tbody>
</table>
To limit the maximum and minimum bandwidth used in the speed test, enable \texttt{set update-inbandwidth} and \texttt{set update-outbandwidth}. See \texttt{Scheduled interface speedtest} on page 528 for more information.

\begin{verbatim}
config system global
    set speedtest-server {enable | disable}
end
速度测试服务器 \texttt{(enable | disable)}

Enable/disable the speed test server on the spoke (default = disable). This setting must be enabled on spoke FortiGates. This enables iPerf in server mode, which listens on the default iPerf TCP port 5201.

Allow an SD-WAN member on the spoke to switch routes when it is on speed test from the hub to spokes:

\begin{verbatim}
config system sdwan
    set speedtest-bypass-routing {enable | disable}
    config neighbor
        edit <bgp neighbor>
            set mode speedtest
        next
    end
end
速度测试绕行路由 \texttt{(enable | disable)}

Enable/disable bypass routing when doing a speed test on an SD-WAN member (default = disable).

Use the speed test to select the neighbor.

Manually run uploading speed test on the physical interfaces of each tunnel of an dial-up IPsec interface:

\begin{verbatim}
execute speed-test-dynamic <interface> <tunnel_name> '<y'/'n'> <max-out> <min-out>
\end{verbatim}

\begin{itemize}
    \item \texttt{<interface>} IPsec phase1 interface name.
    \item \texttt{<tunnel_name>} The tunnel name, or \texttt{all} for all tunnels.
    \item \texttt{'<y'/'n'>} Apply the result to the tunnels’ shaper or not.
    \item \texttt{<max-out>} The maximum speed used in a speed test, in kbps.
    \item \texttt{<min-out>} The minimum speed used in a speed test, in kbps.
\end{itemize}

Manually run a non-blocking uploading speed test:

\begin{verbatim}
diagnose netlink interface speed-test-tunnel <interface> <tunnel_name>
\end{verbatim}
**Debug and test commands:**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>diagnose debug application speedtest &lt;int&gt;</code></td>
<td>Enable debug of the speed test module in the forticron daemon.</td>
</tr>
<tr>
<td><code>diagnose debug application speedtestd &lt;int&gt;</code></td>
<td>Enable debug of the speed test server daemon.</td>
</tr>
<tr>
<td><code>diagnose test application forticron 9</code></td>
<td>List the scheduled speed tests.</td>
</tr>
<tr>
<td><code>diagnose test application forticron 10</code></td>
<td>Show the cached speed test results.</td>
</tr>
<tr>
<td><code>diagnose test application forticron 11</code></td>
<td>Write the cached speed test results to disk.</td>
</tr>
<tr>
<td><code>diagnose test application forticron 12</code></td>
<td>Load the speed test results from disk.</td>
</tr>
<tr>
<td><code>diagnose test application forticron 99</code></td>
<td>Cancel all pending speed tests.</td>
</tr>
</tbody>
</table>

**Example**

In this example, the hub is configured as a VPN dial-up server and both of the spokes are connected to the hub. It is assumed that the VPN configuration is already done, with a dynamic gateway type and kernel device creation (`net_device`) disabled. Only one SD-WAN interface is used, so there is only one VPN overlay member in the SD-WAN zone. Multiple WAN interfaces and VPN overlays could be used.

The VPN interfaces and IP addresses are:

<table>
<thead>
<tr>
<th>FortiGate</th>
<th>Interface</th>
<th>IP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>FGT_A (Hub)</td>
<td>hub-phase1</td>
<td>10.10.100.254</td>
</tr>
<tr>
<td>FGT_B (Spoke)</td>
<td>spoke11-p1</td>
<td>10.10.100.2</td>
</tr>
<tr>
<td>FGT_D (Spoke)</td>
<td>spoke21-p1</td>
<td>10.10.100.3</td>
</tr>
</tbody>
</table>

A recurring speed test is configured that runs on the hub over the dial-up interfaces. The speed tests are performed over the underlay interface from the hub to the spoke. Each spoke is configured to operate as a speed test server and to allow the speed test to run on its underlay interface. The spokes establish BGP peering with the hub over the VPN interface, and advertises its loopback network to the hub. The specific configuration is only shown for FGT_B.
When the speed test is running, routing through the VPN overlay can be bypassed, and route maps are used to filter the routes that are advertised to peers. The spoke's route map does not advertise any routes to the peer, forcing the hub to use others paths to reach the spoke's network.

When no speed tests are running, the spoke's route map allows its network to be advertised on the hub.

When the speed test is complete, the measured egress bandwidth is dynamically applied to the VPN tunnel on the hub, and the result is cached for future use, in case the tunnel is disconnected and reconnected again.

**To configure the hub FortiGate (FGT_A):**

1. **Configure a shaping profile:**
   ```
   config firewall shaping-profile
   edit "profile_1"
   config shaping-entries
   edit 1
   set class-id 2
   set priority low
   set guaranteed-bandwidth-percentage 10
   set maximum-bandwidth-percentage 10
   next
   end
   ```
   ```
   set default-class-id 2
   next
   end
   ```

   Three classes are used in the profile for low, medium, and high priority traffic. Each class is assigned a guaranteed and maximum bandwidth as a percentage of the measured bandwidth from the speed test.

2. **Use the shaping profile in the interface:**
   ```
   config system interface
   edit "hub-phase1"
   set egress-shaping-profile "profile_1"
   next
   end
   ```

3. **Configure a schedule to use for the speed tests:**
   ```
   config firewall schedule recurring
   edit "speedtest_recurring"
   set start 01:00
   set end 23:00
   set day monday tuesday wednesday thursday friday saturday
   next
   end
   ```

4. **Configure the speed test schedule:**
   ```
   config system speed-test-schedule
   edit "hub-phase1"
   set schedules "speedtest_recurring"
   set dynamic-server enable
   next
   end
   ```
To configure the spoke FortiGates (FGT_B and FGT_D):

1. Enable the speed test daemon:

   ```
   config system global
   set speedtest-server enable
   end
   ```

2. Allow speed tests on the interface:

   ```
   config system interface
   edit "port1"
   append allowaccess speed-test
   next
   end
   ```

3. Configure SD-WAN with bypass routing enabled for speed tests on member spoke11-p1:

   ```
   config system sdwan
   set speedtest-bypass-routing enable
   config members
   edit 1
   set interface "spoke11-p1"
   next
   end
   config neighbor
   edit "10.10.100.254"
   set member 1
   set mode speedtest
   next
   end
   ```

4. Configure BGP routing:

   ```
   config router route-map
   edit "No_Speed-Test"
   config rule
   edit 1
   set action permit
   next
   next
   end
   next
   edit "Start_Speed-Test"
   config rule
   edit 1
   set action deny
   next
   next
   end
   ```

   ```
   config router bgp
   set as 65412
   config neighbor
   edit "10.10.100.254"
   set remote-as 65412
   set route-map-out "Start_Speed-Test"
   set route-map-out-preferable "No_Speed-Test"
   ```
To manually run the speed test:

# execute speed-test-dynamic hub-phase1 all y 1000 100
Start testing the speed of each tunnel of hub-phase1
[6400d9] hub-phase1_0: physical_intf=port1, local_ip=172.16.200.1, server_ip=172.16.200.2
Wait for test 6400d9 to finish...
Speed-test result for test ID 6400d9:
  Completed
  measured upload bandwidth is 1002 kbps
  measured time Sun Jun 20 15:56:34 2021

The tested out-bandwidth is more than the set maximum accepted value 1000. Will update the tunnel's shaper by the set update-outbandwidth-maximum.
Apply shaping profile 'profile_1' with bandwidth 1000 to tunnel hub-phase1_0 of interface hub-phase1
[6400e0] hub-phase1_1: physical_intf=port1, local_ip=172.16.200.1, server_ip=172.16.200.4
Wait for test 6400e0 to finish...
Speed-test result for test ID 6400e0:
  Completed
  measured upload bandwidth is 1002 kbps
  measured time Sun Jun 20 15:56:39 2021

The tested out-bandwidth is more than the set maximum accepted value 1000. Will update the tunnel's shaper by the set update-outbandwidth-maximum.
Apply shaping profile 'profile_1' with bandwidth 1000 to tunnel hub-phase1_1 of interface hub-phase1

# diagnose netlink interface speed-test-tunnel hub-phase1 all
send speed test request for tunnel 'hub-phase1_0' of 'hub-phase1': 172.16.200.1 -> 172.16.200.2
send speed test request for tunnel 'hub-phase1_1' of 'hub-phase1': 172.16.200.1 -> 172.16.200.4

Results

1. Before the speed test starts, FGT_A can receive the route from FGT_B by BGP:

   # get router info routing-table bgp
   Routing table for VRF=0
   B 2.2.2.32 [200/0] via 10.10.100.2 (recursive via 172.16.200.2, hub-phase1), 00:00:10
   B 10.1.100.0/24 [200/0] via 10.10.100.2 (recursive via 172.16.200.2, hub-phase1), 00:00:10

2. At the scheduled time, the speed test starts for the hub-phase1 interface from hub to spoke:
# diagnose test application forticron 9
Speed test schedules:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Server</th>
<th>Update</th>
<th>Up/Down-limit (kbps)</th>
<th>Days</th>
</tr>
</thead>
<tbody>
<tr>
<td>H:M</td>
<td>TOS</td>
<td>Schedule</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

-----------------------------------------------

hub-phase1  dynamic  111111
14:41 0x00  speedtest_recurring
Active schedules:

64002f: hub-phase1(port1) 172.16.200.2  hub-phase1_1
64002e: hub-phase1(port1) 172.16.200.4  hub-phase1_0

The `diagnose` command can be used on both the hub and spokes to check the speed test execution.

3. While the speed test is running, FGT_A does not receive the route from FGT_B by BGP:

```
# get router info routing-table bgp
Routing table for VRF=0
```

4. Speed tests results can be dynamically applied to the dial-up tunnel for egress traffic shaping:

```
# diagnose vpn tunnel list
-----------------------------------------------
name=hub-phase1_0  ver=2  serial=c 172.16.200.1:0->172.16.200.4:0  tun_id=172.16.200.4  dst_net=1500  dpd-link=on  remote_location=0.0.0.0  weight=1
... egress traffic control:
  bandwidth=737210(kbps)  lock_hit=0  default_class=2  n_active_class=3
  class-id=2  allocated-bandwidth=73720(kbps)  guaranteed-bandwidth=73720(kbps)
    max-bandwidth=73720(kbps)  current-bandwidth=0(kbps)
    priority=low  forwarded_bytes=52
    dropped_packets=0  dropped_bytes=0
  class-id=3  allocated-bandwidth=221163(kbps)  guaranteed-bandwidth=221162(kbps)
    max-bandwidth=294883(kbps)  current-bandwidth=0(kbps)
    priority=medium  forwarded_bytes=0
    dropped_packets=0  dropped_bytes=0
  class-id=4  allocated-bandwidth=442325(kbps)  guaranteed-bandwidth=147441(kbps)
    max-bandwidth=442325(kbps)  current-bandwidth=0(kbps)
    priority=high  forwarded_bytes=0
    dropped_packets=0  dropped_bytes=0
-----------------------------------------------
name=hub-phase1_1  ver=2  serial=d 172.16.200.1:0->172.16.200.2:0  tun_id=172.16.200.2  dst_net=1500  dpd-link=on  remote_location=0.0.0.0  weight=1
... egress traffic control:
  bandwidth=726813(kbps)  lock_hit=0  default_class=2  n_active_class=3
  class-id=2  allocated-bandwidth=72681(kbps)  guaranteed-bandwidth=72681(kbps)
    max-bandwidth=72681(kbps)  current-bandwidth=0(kbps)
    priority=low  forwarded_bytes=123
    dropped_packets=0  dropped_bytes=0
  class-id=3  allocated-bandwidth=218044(kbps)  guaranteed-bandwidth=218043(kbps)
    max-bandwidth=290725(kbps)  current-bandwidth=0(kbps)
```

FortiOS 7.2.0 Administration Guide

Fortinet Inc.
5. Speed test results can be cached, indexed, and written to disk:

```bash
# diagnose test application forticron 10
Speed test results:
1: vdom=root, phaselntf=hub-phasel, peer-id='spokell-pl', bandwidth=737210, last_log=1624226603
2: vdom=root, phaselntf=hub-phasel, peer-id='spoke2l-pl', bandwidth=726813, last_log=1624226614
# diagnose test application forticron 11
Write 2 logs to disk.
# diagnose test application forticron 12
load 2 results.
```

Disable then reenable the IPsec VPN tunnel and the cached speed test results can be applied to the tunnel again:

```bash
# diagnose vpn tunnel list
name=hub-phasel_0 ver=2 serial=c 172.16.200.1:0->172.16.200.4:0 tun_id=172.16.200.4 dst_mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
... egress traffic control:
  bandwidth=737210 (kbps) lock_hit=0 default_class=2 n_active_class=3
# diagnose vpn tunnel list
name=hub-phasel_1 ver=2 serial=d 172.16.200.1:0->172.16.200.2:0 tun_id=172.16.200.2 dst_mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
... egress traffic control:
  bandwidth=726813 (kbps) lock_hit=0 default_class=2 n_active_class=3
```

### Interface based QoS on individual child tunnels based on speed test results

In a hub and spoke SD-WAN topology that uses dial-up VPN overlays, QoS can be applied on individual tunnels based on the measured bandwidth between the hub and spokes. The FortiGate can use the built in speed test to dynamically populate the egress bandwidth to individual dial-up tunnels from the hub.

A bandwidth limit, derived from the speed test, and a traffic shaping profile can be applied on the dial-up IPsec tunnel interface on the hub. A class ID and percentage based QoS settings can be applied to individual child tunnels using a traffic shaping policy and profile.

### CLI commands

If the interface is an IPsec dial-up server, then egress shaping profile type can only be set to `policing`; it cannot be set to `queuing`:

```bash
config firewall shaping-profile
edit <profile-name>
```

---

SD-WAN

<table>
<thead>
<tr>
<th>priority</th>
<th>forwarded_bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>medium</td>
<td>0</td>
</tr>
<tr>
<td>dropped_packets</td>
<td>0</td>
</tr>
<tr>
<td>dropped_bytes</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

</tr>
<tr>
<td>dropped_bytes</td>
<td>0</td>
</tr>
</tbody>
</table>

---

FortiOS 7.2.0 Administration Guide
Fortinet Inc. 672
set type policing
next
end

The outbandwidth value is dynamically obtained from the speed test results for each individual child tunnel, and should not be set manually:

```
config system interface
  edit <dialup-server-phasel-name>
    set egress-shaping-profile <profile-name>
      set outbandwidth <bandwidth>
  next
end
```

### Example

In this example, the hub is configured as a VPN dial-up server and both of the spokes are connected to the hub. It is assumed that the VPN configuration is already done, with a dynamic gateway type and kernel device creation (*net-device*) disabled. Only one SD-WAN interface is used, so there is only one VPN overlay member in the SD-WAN zone. Multiple WAN interfaces and VPN overlays could be used.

The VPN interfaces and IP addresses are:

<table>
<thead>
<tr>
<th>FortiGate</th>
<th>Interface</th>
<th>IP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>FGT_A (Hub)</td>
<td>hub-phase1</td>
<td>10.10.100.254</td>
</tr>
<tr>
<td>FGT_B (Spoke)</td>
<td>spoke11-p1</td>
<td>10.10.100.2</td>
</tr>
<tr>
<td>FGT_D (Spoke)</td>
<td>spoke21-p1</td>
<td>10.10.100.3</td>
</tr>
</tbody>
</table>

The hub VPN has two child tunnels, one to each spoke.

The speed test configuration is shown in *Speed tests run from the hub to the spokes in dial-up IPsec tunnels on page 665*. This example shows applying a shaping profile to the hub’s tunnel interface in order to apply interface based traffic shaping to the child tunnels.

A traffic shaping policy is used to match and assign traffic to the classes in the shaping profile.

**To configure the hub FortiGate (FGT_A) and check the results:**

1. Configure the hub FortiGate (FGT_A) as in *Speed tests run from the hub to the spokes in dial-up IPsec tunnels on page 665*.  
2. Configure the shaping profile:

```plaintext
config firewall shaping-profile
   edit "profile_1"
      config shaping-entries
         edit 1
            set class-id 2
            set priority low
            set guaranteed-bandwidth-percentage 10
            set maximum-bandwidth-percentage 10
         next
         edit 2
            set class-id 3
            set priority medium
            set guaranteed-bandwidth-percentage 30
            set maximum-bandwidth-percentage 40
         next
         edit 3
            set class-id 4
            set priority high
            set guaranteed-bandwidth-percentage 20
            set maximum-bandwidth-percentage 60
         next
      end
   end
```

3. Configure a traffic shaping policy:

```plaintext
config firewall shaping-policy
   edit 2
      set service "ALL"
      set schedule "always"
      set dstintf "hub-phase1"
      set class-id 3
      set srcaddr "all"
      set dstaddr "all"
   next
end
```

In this example, all traffic through the hub-phase1 interface is put into class ID 3. Class IDs an be assigned based on your traffic requirements.

4. At the schedules time, the speed test will start for the hub-phase1 interface from the hub to the spokes. The speed test results can then be dynamically applied on individual child tunnels as egress traffic shaping, and the class ID percentage based QoS settings is applicable on them as templates.

```plaintext
# diagnose vpn tunnel list
---------------------------------------
name=hub-phase1_0 ver=2 serial=c 172.16.200.1:0->172.16.200.4:0 tun_id=172.16.200.4 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
... egress traffic control:
   bandwidth=737210(kbps) lock_hit=0 default_class=2 n_active_class=3
class-id=2 allocated-bandwidth=73720(kbps) guaranteed-
bandwidth=73720(kbps)
   max-bandwidth=73720 (kbps) current-bandwidth=0(kbps)
```
SD-WAN

priority=low forwarded_bytes=52
 dropped_packets=0 dropped_bytes=0
class-id=3 allocated-bandwidth=221163(kbps) guaranteed-
bandwidth=221162(kbps)
 max-bandwidth=294883(kbps) current-bandwidth=0(kbps)
priority=medium forwarded_bytes=0
dropped_packets=0 dropped_bytes=0
class-id=4 allocated-bandwidth=442325(kbps) guaranteed-
bandwidth=147441(kbps)
 max-bandwidth=442325(kbps) current-bandwidth=0(kbps)
priority=high forwarded_bytes=0
dropped_packets=0 dropped_bytes=0

---------------------------------------------------------------------
name=hub-phase1_1 ver=2 serial=d 172.16.200.1:0->172.16.200.2:0 tun_id=172.16.200.2 dst_mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1 ... 

egress traffic control:

 bandwidth=726813(kbps) lock_hit=0 default_class=2 n_active_class=3
class-id=2 allocated-bandwidth=72681(kbps) guaranteed-
bandwidth=72681(kbps)
 max-bandwidth=72681(kbps) current-bandwidth=0(kbps)
priority=low forwarded_bytes=123
dropped_packets=0 dropped_bytes=0
class-id=3 allocated-bandwidth=218044(kbps) guaranteed-
bandwidth=218043(kbps)
 max-bandwidth=290725(kbps) current-bandwidth=0(kbps)
priority=medium forwarded_bytes=0
dropped_packets=0 dropped_bytes=0
class-id=4 allocated-bandwidth=436087(kbps) guaranteed-
bandwidth=145362(kbps)
 max-bandwidth=436087(kbps) current-bandwidth=0(kbps)
priority=high forwarded_bytes=0
dropped_packets=0 dropped_bytes=0

The guaranteed and maximum bandwidths equal 10% of the speed test result, as expected.

Use SSL VPN interfaces in zones

SSL VPN interfaces can be used in zones, simplifying firewall policy configuration in some scenarios.

Example

In this example, a zone is created that includes a physical interface (port4) and an SSL VPN interface. The zone is used as the source interface in a firewall policy. PC1 is used for regular access with a firewall policy, and PC2 uses the SSL VPN for access.
To create a zone that includes the port4 and ssl.root interfaces in the GUI:

1. Go to Network > Interfaces and click Create New > Zone.
2. Set the name of the zone, such as zone_sslvpn_and_port4.
3. Add port4 and ssl.root to the Interface members.
4. Click OK.

To configure SSL VPN settings in the GUI:

1. Go to VPN > SSL-VPN Settings.
2. Set Listen on Interface(s) to port2.
3. Set Listen on Port to 1443.
4. Configure the remaining settings as required.
5. Click Apply.
To configure a firewall policy with the zone as the source interface in the GUI:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Set the policy name, such as policy_to_sslvpn_tunnel.
3. Set Incoming Interface to zone_sslvpn_and_port4.
4. Set Outgoing Interface to port1.
5. Configure the remaining settings as required.

6. Click OK.

To configure the zone, SSL VPN, and policy in the CLI:

1. Create a zone that includes the port4 and ssl.root interfaces:

   ```
   config system zone
   edit "zone_sslvpn_and_port4"
     set interface "port4" "ssl.root"
   next
   end
   ```

2. Configure SSL VPN settings with port2 as the source interface:

   ```
   config vpn ssl settings
   set servercert "fgt_gui_automation"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
   set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPV6_ADDR1"
   set dns-server1 8.8.8.8
   set dns-server2 8.8.4.4
   set port 1443
   set source-interface "port2"
   set source-address "all"
   set source-address6 "all"
   set default-portal "web-access"
   end
   ```

3. Configure a firewall policy with the zone as the source interface:

   ```
   config firewall policy
   edit 2
     set name "policy_to_sslvpn_tunnel"
     set srcintf "zone_sslvpn_and_port4"
     set dstintf "port1"
   ```
To test the configuration:

1. On PC1, open a browser and try to access the server at 172.16.200.44. You are redirected to the authentication page.

   ![Authentication Required](image1)

   **Authentication Required**
   Please enter your username and password to continue.
   Username:  
   Password:  
   Continue

2. Enter the **Username** and **Password**, then click **Continue**.
   You are redirected back to the server.

3. On PC2, access the SSL VPN web portal.

   ![Please Login](image2)

4. Enter the **Username** and **Password**, then click **Login**.
5. Access the server using the bookmark.

SD-WAN in large scale deployments

Phase 2 selectors can be used to inject IKE routes on the ADVPN shortcut tunnel. When configuration method (mode-cfg) is enabled in IPsec phase 1 configuration, enabling mode-cfg-allow-client-selector allows custom phase 2 selectors to be configured. By also enabling the addition of a route to the peer destination selector (add-route) in the phase 1 configuration, IKE routes based on the phase 2 selectors can be injected. This means that routes do not need to be reflected on the hub to propagate them between spokes, avoiding possible BGP daemon process load issues and improving network scalability in a large-scale ADVPN network.

Route map rules can apply priorities to BGP routes. On the hub, priorities can be set in a route map’s rules, and the route map can be applied on BGP routes. This allows the hub to mark the preferred path learned from the spokes with a higher priority, instead of using multiple SD-WAN policy routes on the hub. When a preferred outbound route map (route-map-out-preferable) is also configured in an SD-WAN neighbor on the spoke, deploying SD-WAN rules on the hub to steer traffic from the hub to a spoke is unnecessary.

SD-WAN members’ local cost can be exchanged on the ADVPN shortcut tunnel so that spokes can use the remote cost as tiebreak to select a preferred shortcut. If multiple shortcuts originate from the same member to different members on the same remote spoke, then the remote cost on the shortcuts is used as the tiebreak to decide which shortcut is preferred.

In this example, SD-WAN is configured on an ADVPN network with a BGP neighbor per overlay.

Instead of reflecting BGP routes with the route-reflector on the hub, when the shortcuts are triggered, IKE routes on the shortcuts are directly injected based on the configured phase 2 selectors to allow routes to be exchanged between spokes.
Routes between the hub and the spokes are exchanged by BGP, and the spokes use the default route to send spoke-to-spoke traffic to the hub and trigger the shortcuts.

Instead of configuring SD-WAN rules on the hub, different priorities are configured on the BGP routes by matching different BGP communities to steer traffic from the hub to the spokes.

**To configure Spoke 1:**

1. **Configure phase 1:**

   ```
   config vpn ipsec phasel-interface
   edit "spoke11-p1"
   ... set ike-version 2
   set net-device enable
   set add-route enable
   set mode-cfg enable
   set auto-discovery-receiver enable
   set mode-cfg-allow-client-selector enable
   ... next
   edit "spoke12-p1"
   ... set ike-version 2
   set net-device enable
   set add-route enable
   set mode-cfg enable
   set auto-discovery-receiver enable
   set mode-cfg-allow-client-selector enable
   next
   end
   ```

2. **Configure phase 2:**

   ```
   config vpn ipsec phase2-interface
   edit "spoke11-p2"
   ... set src-name "LAN_Net"
   set dst-name "all"
   next
   edit "spoke12-p2"
   ... set src-name "LAN_Net"
   set dst-name "all"
   next
   end
   ```

3. **Configure an address group:**

   Spoke 1 uses LAN subnet 10.1-3.100.0/24.

   ```
   config firewall addrgrp
   edit "LAN_Net"
   set member "10.1.100.0" "10.2.100.0" "10.3.100.0"
   next
   end
   ```

4. **Configure route maps:**
- If overlay 1 to the hub is in SLA, attach "65000:1" to the BGP routes advertised to the hub over overlay 1.
- If overlay 2 to the hub is in SLA, attach "65000:2" to the BGP routes advertised to the hub over overlay 2.
- If any overlay to the hub is out of SLA, attach "65000:9999" to the BGP routes advertised to the hub over any overlay.

```plaintext
config router route-map
   edit "HUB_CARRIER1"
      config rule
         edit 1
            set set-community "65000:1"
            ...
         next
      end
   ...
next
edit "HUB_CARRIER2"
config rule
   edit 1
      set set-community "65000:2"
      ...
   next
   ...
next
edit "HUB_BAD"
config rule
   edit 1
      set set-community "65000:9999"
      ...
   next
end
...
next
eend
```

5. Configure BGP and SD-WAN members and neighbors:

```plaintext
config router bgp
   set as 65412
config neighbor
   edit "10.10.15.253"
      set remote-as 65412
      set route-map-out "HUB_BAD"
      set route-map-out-preferable "HUB_CARRIER1"
      ...
   next
   edit "10.10.16.253"
      set remote-as 65412
      set route-map-out "HUB_BAD"
      set route-map-out-preferable "HUB_CARRIER2"
      ...
   next
end
config system sdwan
config members
```
edit 1
   set interface "spoke11-p1"
nextedit 2
   set interface "spoke12-p1"
nextend

cfg neighbor
edit "10.10.15.253"
   set member 1
   set health-check "1"
   set sla-id 1
nextedit "10.10.16.253"
   set member 2
   set health-check "11"
   set sla-id 1
nextend

To configure Spoke 2:

1. Configure phase 1:

   config vpn ipsec phase1-interface
      edit "spoke21-p1"
         ...
         set ike-version 2
         set net-device enable
         set add-route enable
         set mode-cfg enable
         set auto-discovery-receiver enable
         set mode-cfg-allow-client-selector enable
         ...
nextedit "spoke22-p1"
         ...
         set ike-version 2
         set net-device enable
         set add-route enable
         set mode-cfg enable
         set auto-discovery-receiver enable
         set mode-cfg-allow-client-selector enable
nextend

2. Configure phase 2:

   config vpn ipsec phase2-interface
      edit "spoke21-p2"
         ...
         set src-name "LAN_Net"
         set dst-name "all"
nextedit "spoke22-p2"
         ...
3. Configure an address group:
Spoke 2 uses LAN subnet 192.168.5-7.0/24.

```
set src-name "LAN_Net"
set dst-name "all"
next
derm
```

4. Configure route maps:
- If overlay 1 to the hub is in SLA, attach "65000:1" to the BGP routes advertised to the hub over overlay 1.
- If overlay 2 to the hub is in SLA, attach "65000:2" to the BGP routes advertised to the hub over overlay 2.
- If any overlay to the hub is out of SLA, attach "65000:9999" to the BGP routes advertised to the hub over any overlay.

```
config router route-map
  edit "HUB_CARRIER1"
    config rule
      edit 1
        set set-community "65000:1"
        ...
next
...
next
edit "HUB_CARRIER2"
    config rule
      edit 1
        set set-community "65000:2"
        ...
next
...
next
edit "HUB_BAD"
    config rule
      edit 1
        set set-community "65000:9999"
        ...
next
...
next
derm
```

5. Configure BGP and SD-WAN members and neighbors:

```
config router bgp
  set as 65412
config neighbor
  edit "10.10.15.253"
    set remote-as 65412
```
To configure the hub:

1. Configure the route maps:
   - Set the priority to 100 for routes with community 65000:1, indicating that they are in SLA for overlay 1.
   - Set the priority to 200 for routes with community 65000:2, indicating that they are in SLA for overlay 2.
   - Set the priority to 9999 for routes with community 65000:9999, indicating that they are out of SLA for any overlay.

   ```
   config router route-map
   edit "Set Pri"
   config rule
   edit 1
   set match-community "comm_65000:1"
   set set-priority 100
   next
   edit 2
   set match-community "comm_65000:2"
   set set-priority 200
   ```
2. Configure BGP:

```plaintext
config router bgp
  set as 65412
config neighbor-group
  edit "advpn"
    set remote-as 65412
    set route-map-in "Set_Pri"
    ...
  next
  edit "advpn2"
    set remote-as 65412
    set route-map-in "Set_Pri"
    ...
next
config neighbor-range
  edit 1
    set prefix 10.10.15.0 255.255.255.0
    set neighbor-group "advpn"
  next
  edit 2
    set prefix 10.10.16.0 255.255.255.0
    set neighbor-group "advpn2"
next
end

to test the configuration:
1. Check the routing tables on the spokes:

Spoke 1:
```
spoke-1 (root) # get router info routing-table all
  B*  0.0.0.0/0 [200/0] via 10.10.15.253 (recursive is directly connected, spoke11-p1), 00:01:17, [1/0] // default route to hub
  [200/0] via 10.10.16.253 (recursive is directly connected, spoke12-p1), 00:01:17, [1/0]
  B  9.0.0.0/24 [200/0] via 10.10.15.253 (recursive is directly connected, spoke11-p1), 00:01:17, [1/0] // route to the server behind hub
  [200/0] via 10.10.16.253 (recursive is directly connected, spoke12-p1), 00:01:17, [1/0]
  C  10.1.100.0/24 is directly connected, port2 // route to PC 1
  C  10.10.15.0/24 is directly connected, spoke11-p1 // overlay 1
  C  10.10.15.1/32 is directly connected, spoke11-p1
  C  10.10.16.0/24 is directly connected, spoke12-p1 // overlay 2
  C  10.10.16.1/32 is directly connected, spoke12-p1
```
2. Send traffic from PC 1 to PC 2 and trigger the shortcut:
The IKE routes on the shortcut are directly injected based on the phase 2 selectors, and spoke-to-spoke traffic then
goes directly through the shortcut instead of going through the hub.

Spoke 1:

```
spoke-1 (root) # get router info routing-table static
S 192.168.5.0/24 [15/0] via spoke11-p1_0 tunnel 172.16.200.4 vrf 0, [1/0]  
S 192.168.6.0/24 [15/0] via spoke11-p1_0 tunnel 172.16.200.4 vrf 0, [1/0]  
S 192.168.7.0/24 [15/0] via spoke11-p1_0 tunnel 172.16.200.4 vrf 0, [1/0]  

spoke-1 (root) # diagnose sniffer packet any 'host 192.168.5.44' 4  
filters=[host 192.168.5.44]  
1.446306 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request  
1.446327 spoke11-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request  
1.446521 spoke11-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply  
1.446536 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
```

Spoke 2:

```
spoke-2 (root) # get router info routing-table static
S 10.1.100.0/24 [15/0] via spoke21-p1_0 tunnel 10.10.15.1 vrf 0, [1/0]  
S 10.2.100.0/24 [15/0] via spoke21-p1_0 tunnel 10.10.15.1 vrf 0, [1/0]  
S 10.3.100.0/24 [15/0] via spoke21-p1_0 tunnel 10.10.15.1 vrf 0, [1/0]  
```

3. Confirm that the overlays are in SLA on the spokes:

Spoke 1:

```
spoke-1 (root) # diagnose sys sdwan neighbor  
Neighbor(10.10.15.253): member(1)role(standalone)  
  Health-check(1:1) sla-pass selected alive  
Neighbor(10.10.16.253): member(2)role(standalone)  
  Health-check(1:1) sla-pass selected alive
```

Spoke 2:

```
spoke-2 (root) # diagnose sys sdwan neighbor  
Neighbor(10.10.15.253): member(1)role(standalone)  
  Health-check(1:1) sla-pass selected alive  
Neighbor(10.10.16.253): member(2)role(standalone)  
  Health-check(2:1) sla-pass selected alive
```
4. On the hub, check that the routes received from the spokes have the expected priorities:

```plaintext
hub (root) # diagnose ip route list | grep proto=11
```
```
tab=254 vf=0 scope=0 type=1 proto=11 prio=100 0.0.0.0/0/0.0.0.0/0->10.1.100.0/24
pref=0.0.0.0 gwy=10.10.15.1 dev=101(hub-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=200 0.0.0.0/0/0.0.0.0/0->10.1.100.0/24
pref=0.0.0.0 gwy=10.10.16.1 dev=102(hub2-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=100 0.0.0.0/0/0.0.0.0/0->192.168.5.0/24
pref=0.0.0.0 gwy=10.10.15.2 dev=101(hub-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=200 0.0.0.0/0/0.0.0.0/0->192.168.5.0/24
pref=0.0.0.0 gwy=10.10.16.2 dev=102(hub2-phase1)
```

The priority set by the hub’s route map is based on the community string received from the spoke. The route with a lower priority value is selected, so traffic to Spoke 1 goes out on the hub-phase1 tunnel:

```plaintext
hub (root) # diagnose sniffer packet any 'host 9.0.0.2' 4 interfaces=[any]
filters=[host 9.0.0.2]
2.735456 R190 in 9.0.0.2 -> 10.1.100.22: icmp: echo request
2.735508 hub-phase1 out 9.0.0.2 -> 10.1.100.22: icmp: echo request
2.735813 hub-phase1 in 10.1.100.22 -> 9.0.0.2: icmp: echo reply
2.735854 R190 out 10.1.100.22 -> 9.0.0.2: icmp: echo reply

5. If overlay 1 goes out of SLA, the priorities of the routes on the hub are updated and traffic from the hub to Spoke 1 goes through overlay 2:

**Spoke 1:**
```
spoke-1 (root) # diagnose sys sdwan neighbor
Neighbor(10.10.15.253): member(1) role(standalone)
   Health-check(1:1) sla-fail alive
```
```
Neighbor(10.10.16.253): member(2) role(standalone)
   Health-check(11:1) sla-pass selected alive
```

**Spoke 2:**
```
spoke-2 (root) # diagnose sys sdwan neighbor
Neighbor(10.10.15.253): member(1) role(standalone)
   Health-check(1:1) sla-fail alive
```
```
Neighbor(10.10.16.253): member(2) role(standalone)
   Health-check(11:1) sla-pass selected alive
```

**Hub:**
```
hub (root) # diagnose ip route list | grep proto=11
```
```
tab=254 vf=0 scope=0 type=1 proto=11 prio=200 0.0.0.0/0/0.0.0.0/0->10.1.100.0/24
pref=0.0.0.0 gwy=10.10.15.1 dev=101(hub2-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=9999 0.0.0.0/0/0.0.0.0/0->10.1.100.0/24
pref=0.0.0.0 gwy=10.10.16.1 dev=102(hub2-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=200 0.0.0.0/0/0.0.0.0/0->192.168.5.0/24
pref=0.0.0.0 gwy=10.10.15.2 dev=101(hub-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=9999 0.0.0.0/0/0.0.0.0/0->192.168.5.0/24
pref=0.0.0.0 gwy=10.10.16.2 dev=102(hub2-phase1)
```
```
hub (root) # diagnose sniffer packet any 'host 9.0.0.2' 4 interfaces=[any]
filters=[host 9.0.0.2]
3.550181 R190 in 9.0.0.2 -> 10.1.100.22: icmp: echo request
3.550234 hub2-phase1 out 9.0.0.2 -> 10.1.100.22: icmp: echo request
```
3.550713 hub2-phase1 in 10.1.100.22 -> 9.0.0.2: icmp: echo reply
3.550735 R190 out 10.1.100.22 -> 9.0.0.2: icmp: echo reply

6. Trigger shortcuts between Spoke 1 and Spoke 2:
   - Shortcuts spoke11-p1_1 and spoke11-p1_0 originate from spoke11-p1.
   - spoke11-p1_1 corresponds to spoke21-p1_0 on Spoke 2.
   - spoke11-p1_0 corresponds to spoke22-p1_0 on Spoke 2.

Spoke 1:
spoke-1 (root) # diagnose sys sdwan service

Service(1): Address Mode (IPV4) flags=0x200 use-shortcut-sla
  Tie break: cfg
  Gen(12), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-number
  Service role: standalone
  Member sub interface(4):
  3: seq_num(1), interface(spoke11-p1):
     1: spoke11-p1_0(75)
     2: spoke11-p1_1(76)
  Members(4):
     1: Seq_num(1 spoke11-p1_1, alive, sla(0x1), gid(0), remote cost(100), cfg_order(0), local cost(0), selected
     2: Seq_num(1 spoke11-p1_0, alive, sla(0x1), gid(0), remote cost(200), cfg_order(0), local cost(0), selected
     3: Seq_num(1 spoke11-p1, alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
     4: Seq_num(2 spoke12-p1), alive, sla(0x2), gid(0), cfg_order(1), local cost(0), selected

Src address(1):
   10.1.100.0-10.1.100.255

Dst address(1):
   0.0.0.0-255.255.255.255

Spoke 2:
spoke-2 (root) # diagnose sys sdwan service

Service(1): Address Mode (IPV4) flags=0x200 use-shortcut-sla
  Tie break: cfg
  Gen(9), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-number
  Service role: standalone
  Member sub interface(4):
  2: seq_num(1), interface(spoke21-p1):
     1: spoke21-p1_0(68)
  4: seq_num(2), interface(spoke22-p1):
     1: spoke22-p1_0(67)
  Members(4):
     1: Seq_num(1 spoke21-p1_0, alive, sla(0x1), gid(0), cfg_order(0), local cost(100), selected
     2: Seq_num(1 spoke21-p1, alive, sla(0x1), gid(0), cfg_order(0), local cost(100), selected
     3: Seq_num(2 spoke22-p1_0, alive, sla(0x2), gid(0), cfg_order(1), local cost(200), selected
     4: Seq_num(2 spoke22-p1), alive, sla(0x2), gid(0), cfg_order(1), local cost(200), selected
Src address(1):
   192.168.5.0-192.168.5.255

Dst address(1):
   0.0.0.0-255.255.255.255

7. On Spoke 2, increase the cost of spoke21-p1_0 to 300.

   spoke-2 (root) # config system sdwan
   config members
   edit 1
      set interface "spoke21-p1"
         set cost 300
   next
   end
   end

The new cost is learned by the spoke11-p1_1 shortcut on Spoke 1, and that shortcut is no longer preferred due to its higher remote cost:

Spoke 1:

   spoke-1 (root) # diagnose sys sdwan service

   Service(1): Address Mode (IPV4) flags=0x200 use-shortcut-sla
   Tie break: cfg
      Gen(13), TOS(0x0/0x0), Protocol (0: 1->65535), Mode(sla), sla-compare-number
   Service role: standalone

Advanced configuration

The following topics provide instructions on SD-WAN advanced configuration:

- SD-WAN with FGCP HA on page 690
- Configuring SD-WAN in an HA cluster using internal hardware switches on page 697
- SD-WAN configuration portability on page 701
- SD-WAN segmentation over a single overlay on page 707

See also Packet distribution for aggregate static IPsec tunnels in SD-WAN on page 1489.

SD-WAN with FGCP HA

This example shows how to convert a standalone FortiGate SD-WAN solution to a FGCP HA cluster with full-mesh WAN set up. This configuration allows you to load balance your internet traffic between multiple ISP links. It also provides redundancy for your internet connection if your primary ISP is unavailable, or if one of the FortiGates in the HA cluster fails.

This example assumes that a standalone FortiGate has already been configured for SD-WAN by following the SD-WAN quick start on page 488.
**Standalone FortiGate:**

The following devices are required to convert the topology to HA:

- A second FortiGate that is the same model running the same firmware version.
- Two switches for connecting each FortiGate's WAN interface to the corresponding ISP modem.

**Before you begin:**

- Ensure that the licenses and subscriptions on both HA members match.
- Ensure that there are one or more ports reserved for HA heartbeat.
- Ensure you have physical access to both HA members.

---

**FGCP HA cluster:**

Enabling HA and re-cabling the WAN interfaces will cause network interruptions. This procedure should be performed during a maintenance window.
**Configuring the standalone FortiGate for HA**

After running the following commands, the FortiGate negotiates to establish an HA cluster. You might temporarily lose connectivity with the FortiGate as FGCP negotiations take place and the MAC addresses of the FortiGate interfaces are changed to HA virtual MAC addresses.

This configurations sets the HA mode to active-passive.

The ha1 and ha2 interfaces are configured as the heartbeat interfaces, with priorities set to 200 and 100 respectively. Setting different priorities for the heartbeat interfaces is a best practice, but is not required.

If you have more than one cluster on the same network, each cluster should have a different group ID. Changing the group ID changes the cluster interface's virtual MAC addresses. If the group IP causes a MAC address conflict on your network, select a different group ID.

Enabling override and increasing the device priority means that this FortiGate always becomes the primary unit.

**To configure the standalone FortiGate for HA in the GUI:**

1. Go to System > Settings and change the Host name so that the FortiGate can be easily identified as the primary unit.
2. Go to System > HA and configure the following options:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Active-Passive</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device priority</td>
<td>250</td>
</tr>
<tr>
<td>Group name</td>
<td>My-cluster</td>
</tr>
<tr>
<td>Password</td>
<td>&lt;password&gt;</td>
</tr>
<tr>
<td>Heartbeat interfaces</td>
<td>ha1 and ha2</td>
</tr>
</tbody>
</table>
| Heartbeat Interface Priority | port2 (ha1): 200  
                           | port3 (ha2): 100 |

 Override and the group ID can only be configured from the CLI.
3. Click OK.
Connectivity with the FortiGate will temporarily be lost.

To configure the standalone FortiGate for HA in the CLI:

1. Change the host name so that the FortiGate can be easily identified:
   
   ```
   config system global
   set hostname primary_FG
   end
   ```

2. Configure HA:
   
   ```
   config system ha
   set mode a-p
   set group-id 100
   set group-name My-cluster
   set password <password>
   set priority 250
   set override enable
   set hbdev ha1 200 ha2 100
   end
   ```

   If HA mode does not start after running the above steps, ensure that none of the FortiGate's interfaces use DHCP or PPPoE addressing.

Configuring the secondary FortiGate for HA

The secondary FortiGate must be the same model and running the same firmware version as the primary FortiGate. The HA settings are the same as for the primary unit, except the secondary device has a lower priority and override is not enabled.
It is best practice to reset the FortiGate to factory default settings prior to configuring HA. This reduces the chance of synchronization problems.

```
# execute factoryreset
This operation will reset the system to factory default!
Do you want to continue? (y/n) y
```

This is unnecessary if the device is new from the factory.

**To configure the secondary FortiGate for HA in the GUI:**

1. Go to System > Settings and change the Host name so that the FortiGate can be easily identified as the backup unit.
2. Go to System > HA and configure the options the same as for the primary FortiGate, except with a lower priority:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Active-Passive</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device priority</td>
<td>128</td>
</tr>
<tr>
<td>Group name</td>
<td>My-cluster</td>
</tr>
<tr>
<td>Password</td>
<td>&lt;password&gt;</td>
</tr>
<tr>
<td>Heartbeat interfaces</td>
<td>ha1 and ha2</td>
</tr>
<tr>
<td>Heartbeat Interface Priority</td>
<td>port2 (ha1): 200</td>
</tr>
<tr>
<td></td>
<td>port3 (ha2): 100</td>
</tr>
</tbody>
</table>

3. Click OK.

**To configure the secondary FortiGate for HA in the CLI:**

1. Change the host name so that the secondary FortiGate can be easily identified:

   ```
   config system global
   set hostname secondary_FG
   end
   ```

2. Configure HA:

   ```
   config system ha
   set mode a-p
   set group-id 100
   set group-name My-cluster
   set password <password>
   set priority 128
   set hbdev ha1 200 ha2 100
   end
   ```

**Connecting the heartbeat interfaces between the FortiGates**

**To connect and check the heartbeat interfaces:**

1. Connect the heartbeat interfaces ha1 and ha2 between the primary and secondary FortiGate.
   a. An HA primary device is selected. Because the primary FortiGate has a higher priority and override enabled, it assumes the role of HA primary.
b. The secondary FortiGate synchronizes its configuration from the primary device.

diagnose sys ha checksum cluster

is_master = 1, is_root_master = 1
dumpconfig
 global: 2b e9 81 38 c2 9d 4f db b7 0e 1f 49 42 c6 le fb
 root: af a6 48 c5 c2 9a 8b 81 a5 03 fb 27 e9 ae 01 6a
 all: 89 1f 63 77 48 8a 30 ee 57 06 ca eb 71 e6 8e ad

dumpconfig
 global: 2b e9 81 38 c2 9d 4f db b7 0e 1f 49 42 c6 le fb
 root: af a6 48 c5 c2 9a 8b 81 a5 03 fb 27 e9 ae 01 6a
 all: 89 1f 63 77 48 8a 30 ee 57 06 ca eb 71 e6 8e ad

If all of the cluster members have identical checksums, then their configurations are synchronized. If the checksums are not the same, wait for a few minutes, then repeat the command. Some parts of the configuration might take a significant amount of time to synchronize (tens of minutes).

Connecting other traffic interfaces

After the device configurations are synchronized, you can connect the rest of the traffic interfaces. Making these connections will disrupt traffic as cables are disconnected and reconnected.

Switches must be used between the cluster and the ISPs, and between the cluster and the internal network, as shown in the topology diagram.

Checking cluster operations

The HA Status dashboard widget shows the synchronization status. Hover over the host names of each FortiGate in the widget to verify that they are synchronized and have the same checksum.

To view more information about the cluster status, including the number of sessions passing through the cluster members, go to System > HA.

See Check HA synchronization status on page 2046 for more information.
Results

1. Browse the internet on a computer in the internal network.
2. Go to Network > SD-WAN and select the SD-WAN Zones tab to see the bandwidth, volume, and sessions for traffic on the SD-WAN interfaces. See Results on page 493 for details.
3. Go to Dashboard > Network, and expand the SD-WAN widget to see information about each interface, such as the number of sessions and the bit rate.

Testing HA failover

All traffic should currently be flowing through the primary FortiGate. If it becomes unavailable, traffic fails over to the secondary FortiGate. When the primary FortiGate rejoins the cluster, the secondary FortiGate continues to operate as the primary FortiGate.

To test this, ping a reliable IP address from a computer in the internal network, and then power off the primary FortiGate. There will be a momentary pause in the ping results until traffic diverts to the backup FortiGate, allowing the ping traffic to continue:

```
64 bytes from 184.25.76.114: icmp_seq=69 ttl=52 time=8.719 ms\n64 bytes from 184.25.76.114: icmp_seq=70 ttl=52 time=8.822 ms\n64 bytes from 184.25.76.114: icmp_seq=74 ttl=52 time=8.901 ms\nRequest timeout for icmp_seq 75\n64 bytes from 184.25.76.114: icmp_seq=76 ttl=52 time=8.860 ms\n64 bytes from 184.25.76.114: icmp_seq=77 ttl=52 time=9.174 ms\n64 bytes from 184.25.76.114: icmp_seq=83 ttl=52 time=8.639 ms
```

If you are using port monitoring, you can also unplug the primary FortiGate's internet facing interface to test failover.

After the secondary FortiGate becomes the primary, you can log into the cluster using the same IP address as before the fail over. If the primary FortiGate is powered off, you will be logged into the backup FortiGate. Check the host name to verify what device you have logged into. The FortiGate continues to operate in HA mode, and if you restart the primary FortiGate, it will rejoin the cluster and act as the backup FortiGate. Traffic is not disrupted when the restarted FortiGate rejoins the cluster.

You can also use the CLI to force an HA failover. See Force HA failover for testing and demonstrations on page 2071 for information.

Testing ISP failover

To test a failover of the redundant internet configuration, you need to simulate a failed internet connection to one of the ports. You can do this by disconnecting power from the wan1 switch, or by disconnecting the wan1 interfaces of both FortiGates from ISP1.

After disconnecting, verify that users still have internet access.
- Go to Dashboard > Network, and expand the SD-WAN widget. The Upload and Download columns for wan1 show that traffic is not going through that interface.

<table>
<thead>
<tr>
<th>Interface</th>
<th>Status</th>
<th>Upload</th>
<th>Download</th>
</tr>
</thead>
<tbody>
<tr>
<td>wan1</td>
<td></td>
<td>0 bps</td>
<td>0 bps</td>
</tr>
<tr>
<td>wan2</td>
<td></td>
<td>2.97 kbps</td>
<td>6.76 kbps</td>
</tr>
</tbody>
</table>

- Go to Network > SD-WAN and select the SD-WAN Zones tab. The Bandwidth, Volume, and Sessions tabs show that traffic is entirely diverted to wan2.

Users on the network should not notice the wan1 failure. If you are using the wan1 gateway IP address to connect to the administrator dashboard, it will appear as though you are still connecting through wan1.

After verifying a successful failover, reestablish the connection to ISP1.

**Configuring SD-WAN in an HA cluster using internal hardware switches**

In this SD-WAN configuration, two FortiGates in an active-passive (A-P) HA pair are used to provide hardware redundancy. Instead of using external switches to provide a mesh network connection to the ISP routers, the FortiGates use their built-in hardware switches to connect to the ISP routers.

Only FortiGate models that have hardware switches can be used for this solution. Ports in a software switch are not in a forwarding state when a FortiGate is acting as a secondary device in a A-P cluster.
In this topology:
- Two hardware switches are created, HD_SW1 and HD_SW2.
- HD_SW1 is used to connect to ISP 1 Router and includes the internal1 and internal2 ports.
- HD_SW2 is used to connect to ISP 2 Router and includes the internal3 and internal4 ports.
- Another interface on each device is used as the HA heartbeat interface, connecting the two FortiGates in HA.

The FortiGates create two hardware switches to connect to ISP 1 and ISP2. When FGT_A is the primary device, it reaches ISP 1 on internal1 in HD_SW1 and ISP 2 on internal4 in HD_SW2. When FGT_B is the primary device, it reaches ISP 1 on internal2 in HD_SW1 and ISP 2 on internal3 on HD_SW2.

**HA failover**

This is not a standard HA configuration with external switches. In the case of a device failure, one of the ISPs will no longer be available because the switch that is connected to it will be down.

For example, if FGT_A loses power, HA failover will occur and FGT_B will become the primary unit. Its connection to internal2 on HD_SW1 will also be down, so it will be unable to connect to ISP 1. Its SD-WAN SLAs will be broken, and traffic will only be routed through ISP 2.

A link on a hardware switch cannot be monitored in HA monitor, so it is impossible to perform link failure when a port in either of the hardware switches fails. Performing a link failure is unnecessary in this configuration though, because any link failure on the hardware switch will be experienced by both cluster members. SD-WAN SLA health checks should be used to monitor the health of each ISP.

**Failure on a hardware switch or ISP router**

If a hardware switch or switch interface is down, or the ISP router is down, the SD-WAN can detect the broken SLA and continue routing to the other ISP.

For example, if FGT_A is the primary unit, and ISP 2 Router becomes unreachable, the SLA health checks on SD-WAN will detect the broken SLA and cause traffic to stop routing to ISP 2.

**Configuration**

**To configure the HA A-P cluster with internal hardware switches:**

1. Configure two FortiGates with internal switches in an A-P HA cluster (follow the steps in HA active-passive cluster setup on page 2037), starting by connecting the heartbeat interface.
2. When the HA cluster is up, connect to the primary FortiGate’s GUI.
3. Remove the existing interface members from the default hardware switch:
   a. Go to Network > Interfaces.
   b. In the LAN section, double-click the internal interface to edit it.
   c. In Interface Members, remove all of the interfaces
4. Configure the hardware switch interfaces for the two ISPs:
   a. Go to Network > Interfaces and click Create New > Interface.
   b. Enter a name (HD_SW1).
   c. Set Type to Hardware Switch.
   d. In Interface Members, add two interfaces (internal1 and internal2).
   e. Set IP/Netmask to 192.168.1.2/24.
   f. Configure the remaining settings as needed.
   g. Click OK.
   h. Repeat these steps to create a second hardware switch interface (HD_SW2) with two interface members
(internal3 and internal4) and IP/Netmask set to 192.168.3.2/24.

To connect the devices as shown in the topology:

1. Connect the incoming interface to the internal switch on both FortiGates.
2. On FGT_A, connect internal1 of HD_SW1 to ISP 1 Router.
3. On FGT_B, connect internal3 of HD_SW2 to ISP 2 Router.
4. For HD_SW1, connect FGT_A internal2 directly to FGT_B internal2.
5. For HD_SW2, connect FGT_A internal4 directly to FGT_B internal4.

To configure SD-WAN:

The primary FortiGate makes all the SD-WAN decisions.

1. On the primary FortiGate, go to Network > SD-WAN, select the SD-WAN Zones tab, and click Create New > SD-WAN Member.
2. In the Interface dropdown, select HD_SW1.
3. Leave SD-WAN Zone set to virtual-wan-link.
4. Enter the Gateway address 192.168.1.1.
5. Click OK.
6. Repeat these steps to add the second interface (HD_SW2) with the gateway 192.168.3.1.
7. Click Apply.
8. Create a health check:
   a. Go to Network > SD-WAN, select the Performance SLA tab, and click Create New.
   b. Set Name to GW_HC.
   c. Set Protocol to Ping and Servers to 8.8.8.8.
   d. Set Participants to All SD-WAN Members.
   e. Enable SLA Target and leave the default values.
   f. Click OK.

9. Create SD-WAN rules as needed. The SLA health check can be used to determine when the ISP connections are in or out of SLA, and to failover accordingly.

SD-WAN configuration portability

When configuring SD-WAN, adding interfaces to members is optional.

This allows the SD-WAN to be configured without associating any interfaces to SD-WAN members. It also allows a configuration to be copied directly from one device to another, without requiring the devices to have interfaces with the same names.

After the configuration is created, add interfaces to the members make it functional.
Example 1

In this example, we create a template with two SD-WAN members configured without assigned interfaces that are used in a performance SLA and SD-WAN rule. The template can be used to configure new devices, as in Example 2 on page 705. Interfaces are then assigned to the members, and the configuration becomes active.

To create the SD-WAN members in the GUI:

1. Go to Network > SD-WAN, select the SD-WAN Zones tab, and click Create New > SD-WAN Member.
2. Leave all the settings set to their default values and click OK.
3. Repeat the above steps to create a second member.

The empty members are listed on the SD-WAN Zones tab.

The members are disabled until interfaces are configured, but can still be used in performance SLAs and SD-WAN rules.

To create a performance SLA in the GUI:

1. Go to Network > SD-WAN and select the Performance SLAs tab.
2. Click Create New.
3. Configure the performance SLA, specifying the empty members as participants.

4. Click OK.

To create an SD-WAN rule in the GUI:

1. Go to Network > SD-WAN, select the SD-WAN Rules tab, and click Create New.
2. Configure the rule, adding both members to the Interface preference field:

3. Click OK.

To assign interfaces to the SD-WAN members in the GUI:

1. Go to Network > SD-WAN and select the SD-WAN Zones tab.
2. Edit the first member
3. Set *Interface* to an actual interface.

4. Click OK.
5. Repeat the above steps to assign an interface to the second member.

To configure the SD-WAN in the CLI:

1. Create SD-WAN members:

   ```
   config system sdwan
   set status enable
   config members
   edit 1
   next
   edit 2
   next
   end
   end
   ```

2. Create a health check (performance SLA):

   ```
   config system sdwan
   config health-check
   edit "office"
   set server "office365.com"
   set protocol http
   set sla-fail-log-period 300
   set sla-pass-log-period 300
   set members 2 1
   config sla
   edit 1
   set latency-threshold 300
   set jitter-threshold 200
   next
   edit 2
   set link-cost-factor latency
   set latency-threshold 20
   next
   end
   next
   end
   ```

3. Create a service (rule):

   ```
   config system sdwan
   config service
   edit 3
   set name "Office365"
   ```
set mode sla
set internet-service enable
set internet-service-app-ctrl 33182
config sla
edit "office"
   set id 2
   next
end
set priority-members 1 2
next
end
end

The SD-WAN configuration can now be used in as a template for new spokes, as in Example 2 on page 705.

To assign interfaces to the SD-WAN members in the CLI:

```plaintext
config system sdwan
config members
edit 1
   set interface "OCVPN4-0.0"
next
edit 2
   set interface "OCVPN4-0.1"
next
end
end
```

If no SD-WAN zone is specified, members are added to the default virtual-wan-link zone.

---

**Example 2**

In this example, the configuration from Example 1 is copied onto a new FortiGate.

**Using the CLI console and the GUI**

**To copy the SD-WAN configuration from the original FortiGate:**

1. Optionally, change the console screen paging setting. See Screen paging on page 37 for details.
2. Open the CLI console.
3. If necessary, click Clear console to empty the console.
4. Enter the following command:
   ```plaintext
   show system sdwan
   ```
5. Either click Download and open the file in a text editor, or click Copy to clipboard and paste the content into a text editor.
6. Edit the CLI configuration as necessary. For example, the first line that shows the `show` command should be deleted, and the default health checks can be removed.

7. If required, save the CLI configuration as a text file.

**To paste the SD-WAN configuration onto a new FortiGate:**

1. Copy the SD-WAN configuration from the text editor.
2. On the new FortiGate, open the CLI console.
3. Press Ctrl + v to paste the CLI commands.
4. In necessary, press Enter to apply the last `end` command.
   The SD-WAN configuration is copied to the new FortiGate.
   If the interfaces do not exist, the SD-WAN members are created without interfaces, and are disabled until interfaces are configured.

**To assign interfaces to the SD-WAN members:**

1. Go to Network > SD-WAN and select the SD-WAN Zones tab.
2. Edit the first member
3. Set Interface to an actual interface.
4. Click OK.
5. Repeat the above steps to assign an interface to the second member.

**Using a terminal emulator**

The following instructions use PuTTY. The steps may vary in other terminal emulators.

**To copy the SD-WAN configuration from the original FortiGate:**

1. Connect to the FortiGate. See Connecting to the CLI on page 29 for details.
2. Enter the following command:
   ```
   show system sdwan
   ```
3. Select the output, press Ctrl + c to copy it, and then paste it into a text editor.
4. Edit the CLI configuration as necessary. For example, the default health checks can be removed.
5. If required, save the CLI configuration as a text file.
To paste the SD-WAN configuration onto a new FortiGate:

1. Connect to the new FortiGate. See Connecting to the CLI on page 29 for details.
2. Copy the SD-WAN configuration from the text editor.
3. Right-click to paste the SD-WAN configuration.
4. In necessary, press Enter to apply the last end command.
   The SD-WAN configuration is copied to the new FortiGate.
   If the interfaces do not exist, the SD-WAN members are created without interfaces, and are disabled until interfaces are configured.

To assign interfaces to the SD-WAN members in the CLI:

```plaintext
config system sdwan
  config members
    edit 1
      set interface "_OCVPN4-0.0"
    next
    edit 2
      set interface "_OCVPN4-0.1"
    next
  end
end
```

If no SD-WAN zone is specified, members are added to the default virtual-wan-link zone.

SD-WAN segmentation over a single overlay

SD-WAN, VPN, and BGP configurations support L3 VPN segmentation over a single overlay. In these configurations, a hub and spoke SD-WAN deployment requires that branch sites, or spokes, are able to accommodate multiple companies or departments, and each company's subnet is separated by a different VRF. A subnet on one VRF cannot communicate with a subnet on another VRF between different branches, but can communicate with the same VRF.

SD-WAN options

VRF-aware SD-WAN health checks

SD-WAN on the originating spoke can tag the health check probes with the correct VRF when transmitting to a multi-VRF tunnel. The hub can then forward the probes to the correct health check server in the same VRF as the hub.

```plaintext
config system sdwan
  config health-check
    edit <name>
      set vrf <vrf id>
      set source <address>
    next
  end
end
```
SD-WAN

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf &lt;vrf id&gt;</td>
<td>Virtual Routing Forwarding ID.</td>
</tr>
<tr>
<td>source &lt;address&gt;</td>
<td>Source IP address used in the health-check packet to the server.</td>
</tr>
</tbody>
</table>

**Overlay stickiness**

When a hub has multiple overlays, traffic received on one overlay should egress on the same overlay when possible. The `service-sla-tie-break` option ensures overlay stickiness. In SD-WAN service rules, options are available to ensure that traffic received in a zone stays in that zone.

```plaintext
config system sdwan
  config zone
    edit <name>
      set service-sla-tie-break input-device
    next
  end
config service
  edit <id>
    set input-zone <zone>
    set tie-break input-device
  next
end
```

- **service-sla-tie-break**
  - Members that meet the SLA are selected by matching the input device.
- **input-zone <zone>**
  - Source input-zone name.
- **tie-break input-device**
  - Members that meet the SLA are selected by matching the input device.

**IPsec options**

**Configurable rate limit for shortcut offers sent by the hub**

By default, the hub sends a shortcut offer to a spoke every five seconds. If the hub continues to send offers that keep failing, and there are a large number of spokes, this can cause a high load on the hub. This setting makes the interval between shortcut offers configurable.

```plaintext
config vpn ipsec phase1-interface
  edit <name>
    set auto-discovery-offer-interval <interval>
  next
end
```

- **auto-discovery-offer-interval <interval>**
  - Interval between shortcut offer messages, in seconds (1 - 300, default = 5).

**Segmentation over a single overlay**

Segmentation requires that VRF info is encapsulated within the IPsec VPN tunnel. This setting enables multi-VRF IPSEC tunnels.
config vpn ipsec phase1-interface
  edit <name>
    set encapsulation vpn-id-ipip
  next
end

encapsulation vpn-id-ipip  VPN ID with IPIP encapsulation.

VPN configuration for BGP

The role of a VRF can be specified, along with other VRF details. Up to 64 VRFs can be configured per VDOM for any device.

config router bgp
  config vrf
    edit <vrf>
      set role {standalone | ce | pe}
      set rd <string>
      set export-rt <route_target>
      set import-rt <route_target>
      set import-route-map <route_map>
      config leak-target
        edit <vrf>
          set route-map <route-map>
          set interface <interface>
        next
        next
      end
    end
  end

role {standalone | ce | pe}  VRF role: standalone, customer edge (CE), or provider edge (PE).
rd <string>  Route Distinguisher: AA|AA:NN. This option is only available when the role is CE.
export-rt <route_target>  List of export route target. This option is only available when the role is CE.
import-rt <route_target>  List of import route target. This option is only available when the role is CE.
import-route-map <route_map>  Import route map. This option is only available when the role is CE.
route-map <route-map>  Route map of VRF leaking.
interface <interface>  Interface that is used to leak routes to the target VRF.

In FortiOS 7.0, config vrf was config vrf-leak, and config leak-target was config target.
Display BGP routes by VRF and neighbor

```plaintext
# diagnose ip router bgp set-filter vrf <vrf>
# diagnose ip router bgp set-filter neighbor <neighbor address>
# diagnose ip router bgp set-filter reset
# execute router clear bgp vpnv4 unicast soft {in | out}
# get router info filter show
# get router info filter vrf {vrf | all}
```

Examples

In example 1, multiple companies (or departments of a company) share the ADVPN. Company A and company B each have two branches in two different locations. Company A's branches (A-1 and A-2) can talk to each other using the VPN shortcut, but not to company B's branches (B-1 and B-2). Likewise, company B's branches can talk to each other using the VPN shortcut, but not to company A's branches. Traffic can share the tunnels and shortcuts, but cannot be mixed up.

Example 2 shows that performance SLA health checks can be sent from a spoke's VRF to the loopback on the hub that is in the same VRF.

Example 3 shows that when traffic is ingress on the hub on one overlay, it will preferably egress on the same overlay.

Example 1

In this example, two spokes each have two tunnels to the hub.

- Each spoke has two VRFs behind it that can use the same IP address or subnets.
- The computers in VRF1 behind spoke 1 can talk to the computers in VRF1 behind spoke 2, but not to any of the computers in the VRF2s behind either spoke.
- The computers in VRF2 behind spoke 1 can talk to the computers in VRF2 behind spoke 2, but not to any of the computers in the VRF1s behind either spoke.
To configure the hub:

```bash
config router bgp
    set as 65505
    set router-id 11.11.11.11
    set ibgp-multipath enable
    set additional-path enable
    set additional-path-vpnv4 enable
    set cluster-id 11.12.13.14
    set additional-path-select 3
    config neighbor-group
        edit "gr1"
            set capability-graceful-restart enable
            set capability-default-originate enable
            set next-hop-self-rr enable
            set soft-reconfiguration-vpnv4 enable
            set remote-as 65505
            set additional-path both
            set additional-path-vpnv4 both
            set adv-additional-path 3
            set route-reflector-client enable
            set route-reflector-client-vpnv4 enable
        next
        edit "gr2"
            set capability-graceful-restart enable
            set capability-default-originate enable
            set next-hop-self-rr enable
            set soft-reconfiguration-vpnv4 enable
            set remote-as 65505
            set additional-path both
            set additional-path-vpnv4 both
            set adv-additional-path 3
            set route-reflector-client enable
            set route-reflector-client-vpnv4 enable
        next
    end

To check the spoke 1 routes:

# get router info routing-table bgp
Routing table for VRF=0

Routing table for VRF=1
B V 33.1.1.0/24 [200/0] via 10.10.100.3 [2] (recursive via vd2-1 tunnel 11.1.1.11 vrf 0), 04:42:57, [1/0]  [200/0] via 10.10.200.3 [2] (recursive is directly connected, vd2-2_0), 04:42:57, [1/0]

Routing table for VRF=2
B V 33.1.1.0/24 [200/0] via 10.10.100.3 [2] (recursive via vd2-1 tunnel 11.1.1.11 vrf 0), 04:42:56, [1/0]  [200/0] via 10.10.200.3 [2] (recursive is directly connected, vd2-2_0), 04:42:56, [1/0]

VRF1 routes:

# get router info filter vrf 1
# get router info routing-table bgp
Routing table for VRF=1
B V 33.1.1.0/24 [200/0] via 10.10.100.3 [2] (recursive via vd2-1 tunnel 11.1.1.11 vrf 0), 04:44:11, [1/0]
To test the configuration on shortcut 1:

1. From VRF1 of spoke 1 ping VRF1 of spoke 2 and from VRF2 of spoke 1 ping VRF2 spoke 2. Both VRF1 and VRF2 source and destination IP addresses are the same, so you can see how the traffic is isolated.

2. Check sessions on spoke 1:

The output `vd=<vdom ID>:<VRF ID>` indicates that sessions are created in and stay in the corresponding VRFs.

- User at 22.1.1.22 in VRF1 on spoke 1 ping 33.1.1.33 in VRF1 on spoke2:

```bash
# diagnose sys session list
session info: proto=1 proto_state=00 duration=21 expire=42 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3

no_ofld_reason: disabled-by-policy
```

Example 2

In this example, SLA health checks are sent from a spoke's VRF to the loopback on the hub that is in the same VRF.
To configure the health check:

```fortigate
config system sdwan
    config health-check
        edit "1"
            set server "11.11.22.11"
            set vrf 1
            set source 22.1.1.2
            set members 1 2
        config sla
            edit 1
                set latency-threshold 200
                set jitter-threshold 50
            next
        next
    end
end
```

To check the health check status:

```fortigate
# diagnose sys sdwan health-check status 1
Health Check(1):
Seq(1 vd2-1): state(alive), packet-loss(0.000%) latency(0.023), jitter(0.002), mos(4.404),
bandwidth-up(0), bandwidth-dw(0), bandwidth-bi(0) sla_map=0x1
Seq(2 vd2-2): state(alive), packet-loss(0.000%) latency(0.022), jitter(0.002), mos(4.404),
bandwidth-up(0), bandwidth-dw(0), bandwidth-bi(0) sla_map=0x1
```

**Example 3**

In this example, when traffic from spoke 1 arrives at the hub on tunnel 1, it will egress the hub on tunnel 1 to go to other spokes. If traffic arrives on tunnel 2, it will egress on tunnel 2, and not tunnel 1.

To configure SD-WAN on the hub:

```fortigate
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
            set service-sla-tie-break input-device
        next
    end
    config members
        edit 1
            set interface "p1"
        next
        edit 2
            set interface "p2"
        next
    end
    config health-check
        edit "1"
            set server "22.1.1.2"
            set members 1 2
    config sla
```
To verify that traffic stays in the same overlay on ingress and egress on the hub:

1. Confirm that the SD-WAN service rule has Tie break set to input-device so that, when SLAs are met on all of the members, traffic prefers to egress on the same member as the input device:

   ```
   # diagnose sys sdwan service
   ``

   ```
   Service(1): Address Mode(IPV4) flags=0x200 use-shortcut-sla
   Tie break: input-device
   Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
   Members(2):
     1: Seq_num(1 p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
     2: Seq_num(2 p2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
   Dst address(1):
     0.0.0.0-255.255.255.255
   ```

2. Use `diagnose sniffer packet` commands to verify that traffic ingress and egress are on the same overlay.

SD-WAN cloud on-ramp

In this example, you configure a connection to a new cloud deployment that has some remote servers. SD-WAN is used to steer traffic through the required overlay tunnel.

The on-premise FortiGate has two internet connections, each with a single VPN connection. The two VPN gateways are configured on the cloud for redundancy, one terminating at the FortiGate-VM, and the other at the native AWS VPN Gateway.

This example uses AWS as the Infrastructure as a Service (IaaS) provider, but the same configuration can also apply to other services. A full mesh VPN setup is not shown, but can be added later if required.
To connect to the servers that are behind the cloud FortiGate-VM, virtual IP addresses (VIPs) are configured on port2 to map to the servers:

- VPN traffic terminating on port1 is routed to the VIP on port2 to access the web servers.
- VPN traffic terminating on the VPN gateway accesses the VIPs on port2 directly.

There are four major steps to configure this setup:

1. Configuring the VPN overlay between the HQ FortiGate and cloud FortiGate-VM on page 723
2. Configuring the VPN overlay between the HQ FortiGate and AWS native VPN gateway on page 728
3. Configuring the VIP to access the remote servers on page 731
4. Configuring the SD-WAN to steer traffic between the overlays on page 734

After the configuration is complete, verify the traffic to ensure that the configuration is working as expected, see Verifying the traffic on page 738.

Configuring the VPN overlay between the HQ FortiGate and cloud FortiGate-VM

Configure the cloud FortiGate-VM

To create an address for the VPN gateway:

1. Go to Policy & Objects > Addresses and click Create New > Address.
2. Set Name to local_subnet_10_0_2_0.
3. Set IP/Netmask to 10.0.2.0/24.
4. Click OK.
To configure a custom IPsec VPN:

1. Go to VPN > IPsec Wizard.
2. Set Name to Core_Dialup.
3. Set Template type to Custom.

![VPN Creation Wizard](image)

4. Click Next.
5. Configure Network settings:
   - Remote Gateway: Dialup User
   - Interface: port1
   - NAT Traversal: Enable

6. Configure Authentication settings:
   - Method: Pre-shared Key
   - Pre-shared Key: Enter the pre-shared key.
   - Version: 1
   - Mode: Aggressive
     This setting allows the peer ID to be specified.
   - Accept Types: Specific peer ID
   - Peer ID: IaaS
     The other end of the tunnel needs to have its local ID set to IaaS.

![Authentication](image)

7. Leave the default Phase 1 Proposal settings and disable XAUTH.
8. Configure the *Phase 2 Selector* settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>Ent_Core</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local Address</td>
<td>Named Address - <em>local_subnet_10_0_2_0</em></td>
</tr>
<tr>
<td>Remote Address</td>
<td>Named Address - <em>all</em></td>
</tr>
</tbody>
</table>

This setting allows traffic originating from both the remote subnet 10.100.88.0 and the health checks from the VPN interface on the remote FortiGate. For increased security, each subnet can be specified individually.

9. Click OK.

**To configure remote and local tunnel IP addresses:**

1. Go to *Network > Interfaces* and edit the *Core.Dialup* interface under *port1*.
2. Set *IP* to *172.16.200.1*.
3. Set *Remote IP/Netmask* to *172.16.200.2 255.255.255.0*. This is where remote health check traffic will come from.
4. Enable *Administrative access* for HTTPS, PING, and SSH.

5. Click OK.

**To configure a route to the remote subnet through the tunnel:**

1. Go to *Network > Static Routes* and click *Create New*.
2. Set *Destination* to *Subnet* and enter the IP address and netmask: 10.100.88.0/255.255.255.0.
3. Set *Interface* to *Core.Dialup*.

4. Click OK.
To configure a firewall policy to allow traffic from the tunnel to port2:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>Core_Dialup-to-port2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>Core_Dialup</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>port2</td>
</tr>
<tr>
<td>Source</td>
<td>all</td>
</tr>
<tr>
<td>Destination</td>
<td>local_subnet_10_0_2_0</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
</tbody>
</table>

3. Configure the remaining settings as required.
4. Click OK.

Configure the HQ FortiGate

To create an address for the VPN gateway:

1. Go to Policy & Objects > Addresses and click Create New > Address.
2. Set Name to remote_subnet_10_0_2_0.
3. Set IP/Netmask to 10.0.2.0/24.
4. Click OK.

To configure a custom IPsec VPN:

1. Go to VPN > IPsec Wizard.
2. Set Name to FGT_AWS_Tun.
3. Set Template type to Custom.
4. Click Next.
5. Configure Network settings:
Remote Gateway | Static IP Address
---|---
IP Address | 100.21.29.17
Interface | port5
NAT Traversal | Enable

6. Configure Authentication settings:

<table>
<thead>
<tr>
<th>Method</th>
<th>Pre-shared Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pre-shared Key</td>
<td>Enter the pre-shared key.</td>
</tr>
<tr>
<td>Version</td>
<td>1</td>
</tr>
<tr>
<td>Mode</td>
<td>Aggressive</td>
</tr>
<tr>
<td>Accept Types</td>
<td>Any peer ID</td>
</tr>
</tbody>
</table>

7. Leave the default Phase 1 Proposal settings, except set Local ID to IaaS.
8. Disable XAUTH.
9. Configure the Phase 2 Selector settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>FGT_AWS_Tun</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local Address</td>
<td>Named Address - all</td>
</tr>
<tr>
<td></td>
<td>This setting allows traffic originating from both the local subnet 10.100.88.0 and the health checks from the VPN interface. For increased security, each subnet can be specified individually.</td>
</tr>
<tr>
<td>Remote Address</td>
<td>Named Address - remote_subnet_10_0_2_0</td>
</tr>
</tbody>
</table>

10. Click OK.

To configure local and remote tunnel IP addresses:

1. Go to Network > Interfaces and edit the FGT_AWS_Tun interface under port5.
2. Set IP to 172.16.200.2.
3. Set Remote IP/Netmask to 172.16.200.1 255.255.255.0.
4. Enable Administrative access for HTTPS, PING, and SSH.
5. Click OK.

Routing is defined when creating the SD-WAN interface. The firewall policy is created after the SD-WAN interface is defined.
Configuring the VPN overlay between the HQ FortiGate and AWS native VPN gateway

This example uses static routing. It is assumed that the AWS VPN Gateway is already configured, and that proper routing is applied on the corresponding subnet.

Verify the AWS configuration

See Creating routing tables and associate subnets in the AWS Administration Guide for configuration details.

To check the AWS configuration:

1. Go to Virtual Private Network (VPN) > Customer Gateways to confirm that the customer gateway defines the FortiGate IP address as its Gateway IP address, in this case 34.66.121.231.

2. Go to Virtual Private Network (VPN) > Virtual Private Gateways to confirm that a virtual private gateway (VPG) has been created. In this case it is attached to the Cloud_onRamp VPC that contains the FortiGate and servers.

3. Go to Virtual Private Network (VPN) > Site-to-Site VPN Connections to confirm that site-to-site VPN connections have been created and attached to the customer gateway and virtual private gateway.
   If Routing Options is Static, the IP prefix of the remote subnet on the HQ FortiGate (10.100.88.0) is entered here.

AWS site-to-site VPN always creates two VPN tunnels for redundancy. In this example, only Tunnel 1 is used.

4. Click Download Configuration to download the FortiGate’s tunnel configurations. The configuration can be referred to when configuring the FortiGate VPN.
5. The new VPG is attached to your VPC, but to successfully route traffic to the VPG, proper routing must be defined. Go to Virtual Private Cloud > Subnets, select the Cloud-OnRamp-VPN, and select the Route Table tab to verify that there are at least two routes to send traffic over the VPG.

- 169.254.0.0/24 defines the tunnel IP address. Health check traffic originating from the FortiGate will come from this IP range.
- 10.100.0.0/16 defines the remote subnet from the HQ FortiGate.
- Both routes point to the just created VPG vgw-04xxxx.

6. On the cloud FortiGate-VM EC2 instances, ensure that port1 and port2 both have Source/Dest. Check set to false. This allows the FortiGate to accept and route traffic to and from a different network.
If you launched the instance from the AWS marketplace, this setting defaults to true.

**Configure routing to the VPG on the cloud FortiGate-VM**

**To configure routing to the VPG on the cloud FortiGate-VM:**

1. Go to Network > Static Routes and click Create New.
2. Set Destination to Subnet and enter the IP address and netmask: 10.100.88.0/255.255.255.0.
3. Set Gateway Address to Specify and enter 10.0.2.1.
4. Set Interface to port2.
   The new route must have the same Administrative Distance as the route that was created for traffic through the Core_Dialup tunnel to ensure that both routes are added to the routing table (see To configure a route to the remote subnet through the tunnel).
   The Gateway Address is arbitrarily set to 10.0.2.1. The VPG does not have an IP address, but the address defined here allows the FortiGate to route traffic out of port2, while AWS routes the traffic based on its routing table.

5. Click OK.

6. Go to Network > Static Routes to view the configured static routes:

   ![Static Routes Table]

7. If Optimal dashboards is selected, go to Dashboard > Network and expand the Routing widget to view the routing table.
   If Comprehensive dashboards is selected, go to Dashboard > Routing Monitor and select Static & Dynamic in the widget toolbar to view the routing table:

   ![Routing Table]

**Configure IPsec VPN on the HQ FortiGate**

**To configure a custom IPsec VPN:**

1. Go to VPN > IPsec Wizard.
2. Set Name to AWS_VPG.
3. Set Template type to Custom.
4. Click Next.
5. Configure Network settings:

<table>
<thead>
<tr>
<th>Remote Gateway</th>
<th>Static IP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>34.210.19.225</td>
</tr>
<tr>
<td>This address is taken from the downloaded AWS configuration file.</td>
<td></td>
</tr>
<tr>
<td>Interface</td>
<td>port1</td>
</tr>
<tr>
<td>NAT Traversal</td>
<td>Enable</td>
</tr>
</tbody>
</table>

6. Configure Authentication settings:

<table>
<thead>
<tr>
<th>Method</th>
<th>Pre-shared Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pre-shared Key</td>
<td>Enter the pre-shared key.</td>
</tr>
<tr>
<td>Version</td>
<td>1</td>
</tr>
<tr>
<td>Mode</td>
<td>Main</td>
</tr>
</tbody>
</table>

7. Configure the Phase 1 Proposal settings using information from the downloaded AWS configuration file.
8. Disable XAUTH.
9. Configure the Phase 2 Selector settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>AWS_VPG</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local Address</td>
<td>Named Address - all</td>
</tr>
<tr>
<td></td>
<td>This setting allows traffic originating from both the local subnet 10.100.88.0 and the health checks from the VPN interface. For increased security, each subnet can be specified individually.</td>
</tr>
<tr>
<td>Remote Address</td>
<td>Named Address - remote_subnet_10_0_2_0</td>
</tr>
</tbody>
</table>

10. Click OK.

To configure local and remote tunnel IP addresses:

1. Go to Network > Interfaces and edit the AWS_VPG interface under port1.
2. Set IP to 169.254.55.154.
4. Enable Administrative access for HTTPS and PING.
5. Click OK.

Routing is defined when creating the SD-WAN interface. The firewall policy is created after the SD-WAN interface is defined.

Configuring the VIP to access the remote servers

VIPs, interface IP addresses, and policies are created on the cloud FortiGate-VM to allow access to the remote servers.

To configure additional private IPs on AWS for the FortiGate VIP:

1. On the FortiGate EC2 instance, edit the Elastic Network Interface that corresponds to port2. In this example, Network Interface eth1.
2. Go to Actions > Manage IP Addresses.
3. Add two private IP address in the 10.0.2.0/24 subnet.
   These address will be used in the VIPs on the FortiGate. This ensures that traffic to these IP addresses is routed to the FortiGate by AWS.
4. Click Yes, Update.

To configure VIPs on the cloud FortiGate-VM:

1. Go to Policy & Objects > Virtual IPs and click Create New > Virtual IP.
2. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>VIP-HTTP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>port2</td>
</tr>
<tr>
<td>External IP address/range</td>
<td>10.0.2.20</td>
</tr>
<tr>
<td>Map to IPv4 address/range</td>
<td>10.0.3.33</td>
</tr>
</tbody>
</table>

3. Click OK.
4. Create a second VIP for the FTP server with the following settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>VIP-FTP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>port2</td>
</tr>
<tr>
<td>External IP address/range</td>
<td>10.0.2.21</td>
</tr>
<tr>
<td>Map to IPv4 address/range</td>
<td>10.0.3.44</td>
</tr>
</tbody>
</table>

To configure firewall policies to allow traffic from port2 to port3:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>To-WebServer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>port2</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>port3</td>
</tr>
<tr>
<td>Source</td>
<td>all</td>
</tr>
<tr>
<td>Destination</td>
<td>VIP-HTTP</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

3. Configure the remaining settings as required.
4. Click OK.
5. Create a second policy for the FTP VIP with the following settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>To-FTP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>port2</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>port3</td>
</tr>
<tr>
<td>Source</td>
<td>all</td>
</tr>
<tr>
<td>Destination</td>
<td>VIP-FTP</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
</tbody>
</table>
SD-WAN

NAT Enabled

6. Click OK.

Configuring the SD-WAN to steer traffic between the overlays

Configure the HQ FortiGate to use two overlay tunnels for SD-WAN, steering HTTPS and HTTP traffic through the FGT_AWS_Tun tunnel, and SSH and FTP through the AWS_VPG tunnel.

1. Add SD-WAN member interfaces
2. Configure a route to the remote network
3. Configure firewall policies
4. Configure a health check
5. Configure SD-WAN rules

To add SD-WAN member interfaces:

1. Go to Network > SD-WAN, select the SD-WAN Zones tab, and click Create New > SD-WAN Member.
2. Set Interface to AWS_VPG then click OK.

3. Click Create New > SD-WAN Member again.
4. Set Interface to FGT_AWS_Tun.
5. Set Gateway to 172.16.200.1.
6. Click OK.

To configure a route to the remote network 10.0.2.0/24:

1. Go to Network > Static Routes and click Create New.
2. Set Destination to Subnet and enter the IP address and netmask: 10.0.2.0/255.255.255.0.
3. Set Interface to virtual-wan-link.
4. Click OK.

Individual routes to each tunnel are automatically added to the routing table with the same distance:

To configure firewall policies to allow traffic from the internal subnet to SD-WAN:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>ISFW-to-IaaS</th>
</tr>
</thead>
</table>
### Configuration Settings:

<table>
<thead>
<tr>
<th><strong>Incoming Interface</strong></th>
<th>port3</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Outgoing Interface</strong></td>
<td>virtual-wan-link</td>
</tr>
<tr>
<td><strong>Source</strong></td>
<td>all</td>
</tr>
<tr>
<td><strong>Destination</strong></td>
<td>all</td>
</tr>
<tr>
<td><strong>Schedule</strong></td>
<td>always</td>
</tr>
<tr>
<td><strong>Service</strong></td>
<td>ALL</td>
</tr>
<tr>
<td><strong>Action</strong></td>
<td>ACCEPT</td>
</tr>
<tr>
<td><strong>NAT</strong></td>
<td>Enabled</td>
</tr>
</tbody>
</table>

3. Configure the remaining settings as required.

4. Click OK.

Once the firewall policies are configured, the VPN tunnels should come up when there is traffic.

---

### To Configure a Health Check to Monitor the Status of the Tunnels:

As you are accessing the servers on the 10.0.2.0/24 subnet, it is preferable to use the FortiGate port2 interface as the ping server for detection. This ensures that, if the gateway is not reachable in either tunnel, its routes are brought down and traffic continues on the other tunnel.

1. Go to Network > SD-WAN, select the Performance SLAs tab, and click Create New.

2. Configure the following:

   - **Name**: ping_AWS_Gateway
   - **Protocol**: Ping
   - **Server**: 10.0.2.10
   - **Participants**: Specify Add AWS_VPG and FGT_AWS_Tun as participants.

3. Click OK.
Health check probes originate from the VPN interface’s IP address. This is why the phase2 selectors are configured with Local Address set to all.

To configure SD-WAN rules to steer traffic:

HTTPS and HTTP traffic is steered to the FGT_AWS_Tun tunnel, and SSH and FTP traffic is steered to the AWS_VPG tunnel. The Manual algorithm is used in this example.

1. Go to Network > SD-WAN, select the SD-WAN Rules tab, and click Create New.
2. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>http-to-FGT_AWS_Tun</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Address</td>
<td>all</td>
</tr>
<tr>
<td>Address</td>
<td>remote_subnet_10_0_2_0</td>
</tr>
<tr>
<td>Protocol</td>
<td>TCP</td>
</tr>
<tr>
<td>Port range</td>
<td>80 - 80</td>
</tr>
<tr>
<td>Outgoing Interfaces</td>
<td>Manual</td>
</tr>
<tr>
<td>Interface preference</td>
<td>FGT_AWS_Tun</td>
</tr>
</tbody>
</table>

3. Click OK.
4. Create other SD-WAN rules as required:
Verifying the traffic

To verify that pings are sent across the IPsec VPN tunnels

- On the HQ FortiGate, run the following CLI command:

```bash
# diagnose sniffer packet any 'host 10.0.2.10' 4 0 1 interfaces=[any]
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.0.2.10]
pcap_snapshot: snaplen raised from 0 to 262144
2021-06-05 11:35:14.822600 AWS_VPG out 169.254.55.154 -> 10.0.2.10: icmp: echo request
2021-06-05 11:35:14.822789 FGT_AWS_Tun out 172.16.200.2 -> 10.0.2.10: icmp: echo request
```

- On the cloud FortiGate-VM, run the following CLI command:

```bash
# diagnose sniffer packet any 'host 10.0.2.10' 4 0 1 interfaces=[any]
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.0.2.10]
pcap_snapshot: snaplen raised from 0 to 262144
2021-06-05 11:37:57.176329 port2 in 169.254.55.154 - 10.0.2.10: icmp: echo request
2021-06-05 11:37:57.176363 port2 out 10.0.2.10 - 169.254.55.154: icmp: echo reply
2021-06-05 11:37:57.176505 Core_Dialup in 172.16.200.2 - 10.0.2.10: icmp: echo request
2021-06-05 11:37:57.176514 Core_Dialup out 10.0.2.10 - 172.16.200.2: icmp: echo reply
```

To verify the SLA health checks on the HQ FortiGate:

1. Go to Network > SD-WAN, select the Performance SLAs tab, select Packet Loss, and click the ping_AWS_Gateway SLA:

2. Run the following CLI command:

```bash
# diagnose sys sdwan health-check
...
Seq(1 AWS_VPG): state(alive), packet-loss(0.000%) latency(56.221), jitter(0.290) sla_map=0x0
Seq(2 FGT_AWS_Tun): state(alive), packet-loss(0.000%) latency(55.039), jitter(0.223) sla_map=0x0
```
To verify service rules:

1. Go to Network > SD-WAN and select the SD-WAN Rules tab:

   ![SD-WAN Rules tab](image)

2. Run the following CLI command:

   ```
   # diagnose sys sdwan service
   
   Service(1): Address Mode(IPV4) flags=0x0  
   Gen(1), TOS(0x0/0x0), Protocol(6: 80->80), Mode(manual)

   Dst address:  
   10.0.2.21-10.0.2.21
   ```
To verify that sessions are going to the correct tunnel:

1. Run the following CLI command to verify that HTTPS and HTTP traffic destined for the Web server at 10.0.2.20 uses FGT_AWS_Tun:

```
# diagnose sys session filter dst 10.0.2.20
# diagnose sys session list
```

```
session info: proto=6 proto_state=11 duration=2 expire=3597 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=4

To simulate an issue on an overlay VPN tunnel:

On the cloud FortiGate-VM, disable the firewall policy allowing Core_Dialup to port2.

1. Health-checks through the FGT_AWS_Tun tunnel fail:
   a. Go to Network > SD-WAN, select the Performance SLAs tab, select Packet Loss, and click the ping_AWS_Gateway SLA:
b. Run the following CLI command:

```bash
# diagnose sys sdwan health-check
...
Seq(1 AWS_VPG): state(alive), packet-loss(0.000%) latency(52.746), jitter(0.713) sla_map=0x0
Seq(2 FGT_AWS_Tun): state(dead), packet-loss(19.000%) sla_map=0x0
```

2. Service rules show that the member is down:

a. Go to Network > SD-WAN and select the SD-WAN Rules tab:

b. Run the following CLI command:

```bash
# diagnose sys sdwan service

Service(1): Address Mode(IPV4) flags=0x0
  Gen(2), TOS(0x0/0x0), Protocol(6: 80->80), Mode(manual)
Members:
  1: Seq_num(2 FGT_AWS_Tun), dead
  Src address:
    0.0.0.0-255.255.255.255
  Dst address:
    10.0.2.0-10.0.2.255

Service(2): Address Mode(IPV4) flags=0x0
  Gen(1), TOS(0x0/0x0), Protocol(6: 22->22), Mode(manual)

      Dst address: 10.0.2.21-10.0.2.21

3. Sessions are redirected to the working tunnel:
   a. Run the following CLI command:

   ```
   # diagnose sys session list
   ```

   session info: proto=6 proto_state=11 duration=3 expire=3596 timeout=3600
   flags=00000000 socktype=0 sockport=0 av_idx=0 use=4

total session 2

4. Routes to the FGT_AWS_Tun tunnel are removed:
   a. If Optimal dashboards is selected, go to Dashboard > Network and expand the Routing widget to view the routing table.

   If Comprehensive dashboards is selected, go to Dashboard > Routing Monitor and select Static & Dynamic in the widget toolbar to view the routing table:

   ![Routing Table Screenshot]

   b. Run the following CLI command:

   ```
   # get router info routing-table all
   Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
          O - OSPF, IA - OSPF inter area
          N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
          E1 - OSPF external type 1, E2 - OSPF external type 2
          i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
          * - candidate default
   
   Routing table for VRF=0
   S* 0.0.0.0/0 [1/0] via 10.100.64.254, port1
       [1/0] via 10.100.65.254, port5
   S 10.0.2.0/24 [1/0] via 169.254.55.153, AWS_VPG
   C 10.0.10.0/24 is directly connected, Branch-HQ-A
   C 10.0.10.1/32 is directly connected, Branch-HQ-A
   ...
   ```

Troubleshooting SD-WAN

The following topics provide instructions on SD-WAN troubleshooting:

- Tracking SD-WAN sessions on page 745
- Understanding SD-WAN related logs on page 745
- SD-WAN related diagnose commands on page 748
- SD-WAN bandwidth monitoring service on page 752
- Using SNMP to monitor health check on page 755
Tracking SD-WAN sessions

You can check the destination interface in Dashboard > FortiView Sessions in order to see which port the traffic is being forwarded to.

The example below demonstrates a source-based load-balance between two SD-WAN members:

- If the source IP address is an **even** number, it will go to **port13**.
- If the source IP address is an **odd** number, it will go to **port12**.

![FortiView Sessions interface](image)

Understanding SD-WAN related logs

This topic lists the SD-WAN related logs and explains when the logs will be triggered.

**Health-check detects a failure:**

- When health-check detects a failure, it will record a log:

  1: date=2021-04-20 time=17:06:31 eventtime=1618963591590008160 tz="-0700"
  logid="0100022921" type="event" subtype="system" level="critical" vd="root"
  logdesc="Routing information changed" name="test" interface="R150" status="down"
  msg="Static route on interface R150 may be removed by health-check test. Route:
  (10.100.1.2->10.100.2.22 ping-down)"

- When health-check detects a recovery, it will record a log:

  2: date=2021-04-20 time=17:11:46 eventtime=1618963591590008160 tz="-0700"
  logid="0100022921" type="event" subtype="system" level="critical" vd="root"
  logdesc="Routing information changed" name="test" interface="R150" status="up"
  msg="Static route on interface R150 may be added by health-check test. Route:
  (10.100.1.2->10.100.2.22 ping-up)"

**Health-check has an SLA target and detects SLA qualification changes:**

- When health-check has an SLA target and detects SLA changes, and changes to fail:

  1: date=2021-04-20 time=21:32:33 eventtime=161897955388763760 tz="-0700"
  logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root"
  logdesc="SDWAN status" eventtype="Health Check" healthcheck="test" slatargetid=1 oldvalue="2"
  newvalue="1" msg="Number of pass member changed."
SD-WAN calculates a link’s session/bandwidth over/under its ratio and stops/resumes traffic:

- When SD-WAN calculates a link’s session/bandwidth over its configured ratio and stops forwarding traffic:

  1: date=2021-04-20 time=21:55:14 eventtime=1618980914728863220 tz="-0700"
  logid=0113022924 type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN volume status" eventtype="Volume" interface="R160" member="2" msg="Member enters into conservative status with limited ability to receive new sessions for too much traffic."

- When SD-WAN calculates a link’s session/bandwidth according to its ratio and resumes forwarding traffic:

  2: date=2021-04-20 time=22:12:52 eventtime=1618981972698753360 tz="-0700"
  logid=0113022924 type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN volume status" eventtype="Volume" interface="R160" member="2" msg="Member resume normal status to receive new sessions for internal adjustment"

The SLA mode service rule’s SLA qualified member changes:

- When the SLA mode service rule’s SLA qualified member changes. In this example R150 fails the SLA check, but is still alive:

  1: date=2021-04-20 time=22:40:46 eventtime=1618983646428803040 tz="-0700"
  logid=0113022923 type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status" eventtype="Service" serviceid=1 service="test" seq="2,1" msg="Service prioritized by SLA will be redirected in sequence order."

- When the SLA mode service rule’s SLA qualified member changes. In this example R150 changes from fail to pass:

  2: date=2021-04-20 time=22:41:51 eventtime=1618983711679827920 tz="-0700"
  logid=0113022923 type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status" eventtype="Service" serviceid=1 service="test" seq="1,2" msg="Service prioritized by SLA will be redirected in sequence order."

The priority mode service rule member’s link status changes:

- When priority mode service rule member’s link status changes. In this example R150 changes to better than R160, and both are still alive:

  1: date=2021-04-20 time=22:56:55 eventtime=1618984615708804760 tz="-0700"
  logid=0113022923 type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status" eventtype="Service" serviceid=1 service="test" metric="packet-loss" seq="2,1" msg="Service prioritized by performance metric will be redirected in sequence order."
• When priority mode service rule member's link status changes. In this example R160 changes to better than R150, and both are still alive:

2: date=2021-04-20 time=22:56:58 eventtime=1618984618278852140 tz="-0700" logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status" eventtype="Service" serviceid=1 service="test" metric="packet-loss" seq="1,2" msg="Service prioritized by performance metric will be redirected in sequence order."

SD-WAN member is used in service and it fails the health-check:

• When SD-WAN member fails the health-check, it will stop forwarding traffic:

1: date=2021-04-20 time=23:04:32 eventtime=1618985072898756700 tz="-0700" logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status" eventtype="Service" interface="R150" member="1" serviceid=1 service="test" gateway=10.100.1.1 msg="Member link is unreachable or miss threshold. Stop forwarding traffic."

• When SD-WAN member passes the health-check again, it will resume forwarding logs:

2: date=2021-04-20 time=23:06:08 eventtime=1618985168018789600 tz="-0700" logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status" eventtype="Service" interface="R150" member="1" serviceid=1 service="test" gateway=10.100.1.1 msg="Member link is available. Start forwarding traffic."

Load-balance mode service rule's SLA qualified member changes:

• When load-balance mode service rule's SLA qualified member changes. In this example R150 changes to not meet SLA:

1: date=2021-04-20 time=23:10:24 eventtime=1618985425048820800 tz="-0700" logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status" eventtype="Service" serviceid=1 service="test" member="2(R160)" msg="Service will be load balanced among members with available routing."

• When load-balance mode service rule's SLA qualified member changes. In this example R150 changes to meet SLA:

2: date=2021-04-20 time=23:11:34 eventtime=1618985494478807100 tz="-0700" logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status" eventtype="Service" serviceid=1 service="test" member="2(R160),1(R150)" msg="Service will be load balanced among members with available routing."

SLA link status logs, generated with interval sla-fail-log-period or sla-pass-log-period:

• When SLA fails, SLA link status logs will be generated with interval sla-fail-log-period:

1: date=2021-04-20 time=23:18:10 eventtime=1618985890469018260 tz="-0700" logid="0113022925" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN SLA information" eventtype="SLA" healthcheck="test" slatargetid=1 interface="R150" status="up" latency="0.061" jitter="0.004" packetloss="2.000%" inbandwidthavailable="0kbps" outbandwidthavailable="200.00Mbps" bibandwidthavailable="200.00Mbps" inbandwidthused="1kbps" outbandwidthused="1kbps" bibandwidthused="2kbps" slamap="0x0" metric="packetloss" msg="Health Check SLA status. SLA failed due to being over the performance metric threshold."
SD-WAN related diagnose commands

This topic lists the SD-WAN related diagnose commands and related output.

To check SD-WAN health-check status:

FGT # diagnose sys sdwan health-check
Health Check (server):
Seq(1 R150): state(alive), packet-loss(0.000%) latency(0.110), jitter(0.024) sla_map=0x0
Seq(2 R160): state(alive), packet-loss(0.000%) latency(0.068), jitter(0.009) sla_map=0x0

FGT # diagnose sys sdwan health-check
Health Check (ping):
Seq(1 R150): state(alive), packet-loss(0.000%) latency(0.100), jitter(0.017) sla_map=0x0
Seq(2 R160): state(dead), packet-loss(100.000%) sla_map=0x0

FGT # diagnose sys sdwan health-check google
Health Check (google):
Seq(1 R150): state(alive), packet-loss(0.000%) latency(0.081), jitter(0.019) sla_map=0x0
Seq(2 R160): state(alive), packet-loss(0.000%) latency(0.060), jitter(0.004) sla_map=0x0

To check SD-WAN member status:

- When SD-WAN load-balance mode is source-ip-based/source-dest-ip-based.

  FGT # diagnose sys sdwan member
  Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024, weight: 0
  Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024, weight: 0

- When SD-WAN load-balance mode is weight-based.

  FGT # diagnose sys sdwan member
  Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024, weight: 33
  Session count: 15
  Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024, weight: 66
  Session count: 1

- When SD-WAN load-balance mode is measured-volume-based.
  - Both members are under volume and still have room:

    FGT # diagnose sys sdwan member
    Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 33  
Config volume ratio: 33, last reading: 218067B, volume room 33MB  
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024, weight: 66  
Config volume ratio: 66, last reading: 202317B, volume room 66MB

- Some members are overloaded and some still have room:

  FGT # diagnose sys sdwan member  
  Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024, weight: 0  
  Config volume ratio: 33, last reading: 1287767633B, overload volume 517MB  
  Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024, weight: 63  
  Config volume ratio: 66, last reading: 1686997898B, volume room 63MB

- When SD-WAN load balance mode is usage-based/spillover:

  FGT # diagnose sys sdwan member  
  Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024, weight: 255  
  Egress-spillover-threshold: 400kbit/s, ingress-spillover-threshold: 300kbit/s  
  Egress-overbps=0, ingress-overbps=0  
  Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024, weight: 254  
  Egress-spillover-threshold: 0kbit/s, ingress-spillover-threshold: 0kbit/s  
  Egress-overbps=0, ingress-overbps=0

- When member has reached limit and spillover occurs:

  FGT # diagnose sys sdwan member  
  Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024, weight: 255  
  Egress-spillover-threshold: 400kbit/s, ingress-spillover-threshold: 300kbit/s  
  Egress-overbps=0, ingress-overbps=0  
  Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024, weight: 254  
  Egress-spillover-threshold: 0kbit/s, ingress-spillover-threshold: 0kbit/s  
  Egress-overbps=0, ingress-overbps=0

- You can also use the `diagnose netlink dstmac list` command to check if you are over the limit.

  FGT # diagnose netlink dstmac list R150  
  dev=R150 mac=00:00:00:00:00:00 vwl rx_tcp_mss=0 tx_tcp_mss=0 egress_overspill_threshold=50000 egress_bytes=100982 egress_over_bps=1 ingress_overspill_threshold=37500 ingress_bytes=40 ingress_over_bps=0 sampler_rate=0 vwl_zone_id=1 intf_qua=0

To check SD-WAN service rules status:

- **Manual mode service rules.**

  FGT # diagnose sys sdwan service  
  Service(1): Address Mode(IPV4) flags=0x200  
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)  
  Members(2):  
  1: Seq_num(1 R150), alive, selected  
  2: Seq_num(2 R160), alive, selected
Dst address(1):
  10.100.21.0-10.100.21.255

- **Auto mode service rules.**

  ```
  FGT # diagnose sys sdwan service
  Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(auto), link-cost-factor(latency),
  link-cost-threshold(10), health-check(ping)
  Members(2):
    1: Seq_num(2 R160), alive, latency: 0.066, selected
    2: Seq_num(1 R150), alive, latency: 0.093
  Dst address(1):
    10.100.21.0-10.100.21.255
  ```

- **Priority mode service rules.**

  ```
  FGT # diagnose sys sdwan service
  Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(priority), link-cost-factor
  (latency), link-cost-threshold(10), health-check(ping)
  Members(2):
    1: Seq_num(2 R160), alive, latency: 0.059, selected
    2: Seq_num(1 R150), alive, latency: 0.077, selected
  Dst address(1):
    10.100.21.0-10.100.21.255
  ```

- **Load-balance mode service rules.**

  ```
  FGT # diagnose sys sdwan service
  Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(load-balance hash-mode=round-robin)
  Members(2):
    1: Seq_num(1 R150), alive, sla(0x1), gid(2), num of pass(1), selected
    2: Seq_num(2 R160), alive, sla(0x1), gid(2), num of pass(1), selected
  Dst address(1):
    10.100.21.0-10.100.21.255
  ```

- **SLA mode service rules.**

  ```
  FGT # diagnose sys sdwan service
  Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Members(2):
    1: Seq_num(1 R150), alive, sla(0x1), gid(0), cfg_order(0), cost(0), selected
    2: Seq_num(2 R160), alive, sla(0x1), gid(0), cfg_order(1), cost(0), selected
  Dst address(1):
    10.100.21.0-10.100.21.255
  ```

To check interface logs from the past 15 minutes:

```
FGT (root) # diagnose sys sdwan intf-sla-log R150
Timestamp: Wed Apr 21 16:58:27 2021, used inbandwidth: 655bps, used outbandwidth:

SD-WAN bandwidth monitoring service

The bandwidth measuring tool is used to detect true upload and download speeds. Bandwidth tests can be run on demand or automated using a script, and can be useful when configuring SD-WAN SLA and rules to balance SD-WAN traffic.

The speed test tool requires a valid SD-WAN Bandwidth Monitoring Service license.
The speed test tool is compatible with iperf3.6 with SSL support. It can test the upload bandwidth to the FortiGate Cloud speed test service. It can initiate the server connection and send download requests to the server. The tool can be run up to 10 times a day.

FortiGate downloads the speed test server list. The list expires after 24 hours. One of the speed test servers is selected, based on user input. The speed test runs, testing upload and download speeds. The test results are shown in the command terminal.

**To download the speed test server list:**

```bash
# execute speed-test-server download
Download completed.
```

**To check the speed test server list:**

```bash
# execute speed-test-server list
AWS_West valid
  Host: 34.210.67.183 5204 fortinet
  Host: 34.210.67.183 5205 fortinet
  Host: 34.210.67.183 5206 fortinet
  Host: 34.210.67.183 5207 fortinet
Google_West valid
  Host: 35.197.55.210 5204 fortinet
  Host: 35.197.55.210 5205 fortinet
  Host: 35.197.55.210 5206 fortinet

  Host: 35.197.18.234 5206 fortinet
  Host: 35.197.18.234 5207 fortinet
```

**To run the speed test:**

You can run the speed test without specifying a server. The system will automatically choose one server from the list and run the speed test.

```bash
# execute speed-test auto
The license is valid to run speed test.
Speed test quota for 2/1 is 9
current vdom=root
Run in uploading mode.
Connecting to host 35.230.2.124, port 5206
[ 16] local 172.16.78.185 port 2475 connected to 35.230.2.124 port 5206
[ ID] Interval Transfer Bitrate Retr Cwnd
[ 16] 0.00-1.01 sec 11.0 MBytes 91.4 Mbits/sec 0 486 KBytes
[ 16] 1.01-2.00 sec 11.6 MBytes 98.4 Mbits/sec 0 790 KBytes
[ 16] 2.00-3.01 sec 11.0 MBytes 91.6 Mbits/sec 15 543 KBytes
[ 16] 3.01-4.01 sec 11.2 MBytes 94.2 Mbits/sec 1 421 KBytes
[ 16] 4.01-5.01 sec 11.2 MBytes 93.5 Mbits/sec 0 461 KBytes
- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -

```
### Speed Test Results

**Speed Test Done.**
Run in reverse downloading mode!

**Connecting to host 35.230.2.124, port 5206**
Reverse mode, remote host 35.230.2.124 is sending

<table>
<thead>
<tr>
<th>ID</th>
<th>Interval</th>
<th>Transfer</th>
<th>Bitrate</th>
</tr>
</thead>
<tbody>
<tr>
<td>16</td>
<td>0.00-5.01 sec</td>
<td>56.1 MBytes</td>

</tr>
<tr>
<td>16</td>
<td>0.00-5.06 sec</td>
<td>55.8 MBytes</td>
<td>92.6 Mbits/sec</td>
</tr>
</tbody>
</table>

**speed test Done**

To run the speed test on a server farm or data center:

```
# execute speed-test auto AWS_West
The license is valid to run speed test.
Speed test quota for 2/1 is 8
current vdom=root
Run in uploading mode.
Connecting to host 34.210.67.183, port 5205
```

To run the speed test on a local interface when there are multiple valid routes:

```
# execute speed-test port1 Google_West
The license is valid to run speed test.
Speed test quota for 2/1 is 6
bind to local ip 172.16.78.202
current vdom=root
Specified interface port1 does not comply with default outgoing interface port2 in routing table!
Force to use the specified interface!
Run in uploading mode.
Connecting to host 35.197.18.234, port 5205
```

speed test Done.

To add a script to run a speed test automatically once every 24 hours:

```bash
config system auto-script
  edit "speedtest"
    set interval 86400
    set repeat 0
    set start auto
    set script "
execute speed-test-server download
execute speed-test"
  next
end

To view the results of the speed test script:

execute auto-script result speedtest
```

Using SNMP to monitor health check

You can monitor SD-WAN health check related statistics using SNMP. The MIB file can be downloaded by going to System > SNMP and clicking Download FortiGate MIB File.

The following OIDs can be monitored:

<table>
<thead>
<tr>
<th>Name</th>
<th>OID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fgVWLHealthCheckLinkNumber</td>
<td>.1.3.6.1.4.1.12356.101.4.9.1</td>
<td>The number of health check links in fgVWLHealthCheckLinkTable</td>
</tr>
<tr>
<td>fgVWLHealthCheckLinkTable</td>
<td>.1.3.6.1.4.1.12356.101.4.9.2</td>
<td>SD-WAN health check statistics table. This table has a dependent expansion</td>
</tr>
<tr>
<td></td>
<td></td>
<td>relationship with fgVdTable. Only health checks with a configured member</td>
</tr>
<tr>
<td></td>
<td></td>
<td>link are present in this table.</td>
</tr>
<tr>
<td>Name</td>
<td>OID</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>fgVWLHealthCheckLinkTableEntry</td>
<td>.1.3.6.1.4.1.12356.101.4.9.2.1.1</td>
<td>SD-WAN health check statistics on a virtual domain.</td>
</tr>
<tr>
<td>fgVWLHealthCheckLinkID</td>
<td>.1.3.6.1.4.1.12356.101.4.9.2.1.1.1</td>
<td>SD-WAN health check link ID. Only health checks with configured member link are present in this table. Virtual-wan-link health check link IDs are only unique within a virtual domain.</td>
</tr>
<tr>
<td>fgVWLHealthCheckLinkName</td>

## Example

This example shows a SD-WAN health check configuration and its collected statistics.

**To configure the SD-WAN health check:**

```plaintext
config system sdwan
    set status enable
config zone
    edit "virtual-wan-link"
        next
end
config members
    edit 1
        set interface "port1"
        set gateway 192.168.2.1
    next
    edit 2
        set interface "MPLS"
        set zone "SD-Zone2"
        set cost 20
    next
    edit 3
        set interface "port2"
    next
end
config health-check
    edit "pingserver"
        set server "8.8.8.8"
        set sla-fail-log-period 10
        set sla-pass-log-period 20
        set members 2 1 3
    config sla
        edit 1
            set link-cost-factor jitter packet-loss
            set packetloss-threshold 2
        next
    next
```
The collected statistics:

Policy and Objects

This section contains topics on configuring policies and traffic shaping:

- Policies on page 759
- Objects on page 868
- Protocol options on page 916
- Traffic shaping on page 918
- Zero Trust Network Access on page 970

Policies

The firewall policy is the axis around which most features of the FortiGate revolve. Many firewall settings end up relating to or being associated with the firewall policies and the traffic they govern. Any traffic going through a FortiGate has to be associated with a policy. These policies are essentially discrete compartmentalized sets of instructions that control the traffic flow going through the firewall. These instructions control where the traffic goes, how it is processed, if it is processed, and whether or not it is allowed to pass through the FortiGate.

When the firewall receives a connection packet, it analyzes the source address, destination address, and service (by port number). It also registers the incoming interface, the outgoing interface it needs to use, and the time of day. Using this information, the FortiGate firewall attempts to locate a security policy that matches the packet. If a policy matches the parameters, then the FortiGate takes the required action for that policy. If it is Accept, the traffic is allowed to proceed to the next step. If the action is Deny or a match cannot be found, the traffic is not allowed to proceed.

The two basic actions at the initial connection are either Accept or Deny:

- If the action is Accept, the policy permits communication sessions. There may be other packet processing instructions, such as requiring authentication to use the policy or restrictions on the source and destination of the traffic.
- If the action is Deny, the policy blocks communication sessions, and you can optionally log the denied traffic. If no security policy matches the traffic, the packets are dropped. A Deny security policy is needed when it is required to log the denied traffic, also called violation traffic.

One other action can be associated with the policy:

- **IPsec**: this is an Accept action that is specifically for IPsec VPNs.

| 🧠 | Each field in a firewall policy that accepts multiple inputs, such as srcaddr and dstaddr, can accept as many inputs as there are unique objects created. The maximum number of objects depends on the model. See the Maximum Values Table for more details. |

The following topics provide information on the available types of policies and configuration instructions:

- Firewall policy on page 760
- NGFW policy on page 773
- Local-in policy on page 789
Firewall policy

The firewall policy is the axis around which most of the other features of the FortiGate firewall revolve. A large portion of the settings in the firewall at some point will end up relating to or being associated with the firewall policies and the traffic that they govern. Any traffic going through a FortiGate unit has to be associated with a policy. These policies are essentially discrete compartmentalized sets of instructions that control the traffic flow going through the firewall. These instructions control where the traffic goes, how it's processed, if it's processed, and even whether or not it's allowed to pass through the FortiGate.

The following topics provide information on the firewall policy and configuration:

- Firewall policy parameters on page 760
- Configurations in the GUI on page 761
- Configurations in the CLI on page 766
- Policy views on page 771
- Policy lookup on page 773

Firewall policy parameters

For traffic to flow through the FortiGate firewall, there must be a policy that matches its parameters:

- Incoming interface(s)
- Outgoing interface(s)
- Source address(es)
- User(s) identity
- Destination address(es)
- Internet service(s)
- Schedule
- Service

Traffic parameters are checked against the configured policies for a match. If the parameters do not match any configured policies, the traffic is denied.

Traffic flow initiated from each direction requires a policy, that is, if sessions can be initiated from both directions, each direction requires a policy.

Just because packets can go from point A to point B on port X does not mean that the traffic can flow from point B to point A on port X. A policy must be configured for each direction.

When designing a policy, there is often reference to the traffic flow, but most communication is two-way so trying to determine the direction of the flow might be confusing. If traffic is HTTP web traffic, the user sends a request to the
website, but most of the traffic flow will be coming from the website to the user or in both directions? For the purposes of determining the direction for a policy, the important factor is the direction of the initiating communication. The user is sending a request to the website, so this is the initial communication; the website is responding so the traffic is from the user's network to the Internet.

FortiOS does not perform a reverse-path check on reply traffic that matches an allowed session based on the IP tuple. The request traffic can be sent on one interface and the reply traffic could return on another interface.

**Configurations in the GUI**

Firewall policies can be created in the GUI by configuring the necessary parameters.

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Incoming interface(s)</strong></td>
<td>This is the interface or interfaces by which the traffic is first connected to the FortiGate unit. The exception being traffic that FortiGate generates itself. This is not limited to the physical Ethernet ports found on the device. The incoming interface can also be a logical or virtual interface such as a VPN tunnel, a Virtual WAN link, or a wireless interface.</td>
</tr>
<tr>
<td><strong>Outgoing interface(s)</strong></td>
<td>This is the interface or interfaces used by traffic leaving a port once it has been processed by the firewall. Similar to incoming interfaces, it is not limited to only physical interfaces.</td>
</tr>
<tr>
<td><strong>Source address(es)</strong></td>
<td>The addresses that a policy can receive traffic from can be wide open or tightly controlled. For a public web server that the world at large should be able to access, the best choice will be <em>all</em>. If the destination is a private web server that only the branch offices of a company should be able to access, or a list of internal computers that are the only ones allowed to access an external resource, then a group of preconfigured addresses is the better strategy.</td>
</tr>
<tr>
<td><strong>User(s) identity</strong></td>
<td>This parameter is based on a user identity that can be from a number of authentication authorities. It will be an account or group that has been set up in advance that can be selected from the drop down menu. The exception to this is the feature that allows the importing of LDAP Users. When the feature is used, a small wizard window will appear to guide the user through the setup. The caveat is that the LDAP server object in the <em>User &amp; Authentication &gt; LDAP Servers</em> section has to be already configured to allow the use of this import feature.</td>
</tr>
<tr>
<td><strong>Destination address(es)</strong></td>
<td>In the same way that the source address may need to be limited, the destination address can be used as a traffic filter. When the traffic is destined for internal resources, the specific address of the resource can be defined to better protect the other resources on the network. One of the specialized destination address options is to use a Virtual IP address. If the destination address doesn’t need to be internal, you can define policies that are only for connecting to specific addresses on the Internet.</td>
</tr>
<tr>
<td><strong>Internet service(s)</strong></td>
<td>In this context, an Internet service is a combination of one or more addresses and one or more services associated with a service found on the Internet such as an update service for software.</td>
</tr>
</tbody>
</table>
Schedule

The time frame that is applied to the policy. This can be something as simple as a time range that the sessions are allowed to start, such as between 8:00 am and 5:00 pm. Something more complex like business hours that include a break for lunch and time of the session’s initiation may need a schedule group because it will require multiple time ranges to make up the schedule.

Service

The services chosen represent the TCP/IP suite port numbers that will most commonly be used to transport the named protocols or groups of protocols. This is different than Application Control which looks more closely at the packets to determine the actual protocol used to create them.

A case where either side can initiate the communication, like between two internal interfaces on the FortiGate unit, would be a more likely situation to require a policy for each direction.

Enabling advanced policy options in the GUI

Advanced policy options can be enabled so that you can configure the options in the GUI.

To enable advanced policy options:

```
config system settings
   set gui-advanced-policy enable
end
```

Advanced policy options are now available when creating or editing a policy in the GUI:

To enable configuring TCP sessions without SYN:

```
config system settings
   set tcp-session-without-syn enable
end
```

TCP sessions without SYN can now be configured when creating or editing a policy in the GUI:
Add Policy change summary and Policy expiration to Workflow Management

Two options, Policy change summary and Policy expiration, are included in Workflow Management. Policy change summary enforces an audit trail for changes to firewall policies. Policy expiration allows administrators to set a date for the firewall policy to be disabled.

There are three states for the Policy change summary:
- **Disable**: users will not be prompted to add a summary when editing a policy.
- **Required**: the Policy change summary will be enabled and will require users to add a summary when editing or creating a firewall policy.
- **Optional**: the Policy change summary will be enabled but users can leave the summary empty, if preferred, when editing or creating a firewall policy.

There are three states for Policy expiration:
- **Disable**: the firewall policy will not expire. This is the default setting for Policy expiration.
- **Default**: the firewall policy will expire after the default number of days.
- **Specify**: the firewall policy will expire at a set date and time.

The default value for Policy expiration is 30 days. This number can be changed in the CLI or in System > Settings in the GUI to any value between zero and 365 days. If the default value is set to zero, the Default state will disable the Policy expiration.

To configure the firewall policy change summary and default expiration in the GUI:

1. Go to System > Feature Visibility.
2. Enable Workflow Management.
3. Click Apply.
4. Go to System > Settings.
5. In the Workflow Management section, set Policy change summary to Required. Policies expire by default is enabled by default with an Expire after value of 30.
To configure firewall policy expiration in the GUI:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Name the policy and configure the necessary parameters.
3. Set Policy expiration to Specify. The Expiration date fields appears with the current date and time.
4. Select the date and time for the policy to expire from the Expiration date fields.
5. Click OK. The Workflow Management - Summarize Changes pane opens.
Policy and Objects

6. In the Change summary field, enter details about the changes made to the policy. These details can be referred to later for auditing purposes.

7. Click OK.

To configure the firewall policy change summary in the CLI:

```
config system settings
    set gui-enforce-change-summary {disable | require | optional}
end
```

To configure the policy expiration default value in the CLI:

```
config system settings
    set default-policy-expiry-days <integer>
end
```

To configure firewall policy expiration in the CLI:

```
config firewall policy
    edit <id>
        set policy-expiry {enable | disable}
        set policy-expiry-date <YYYY-MM-DD HH:MM:SS>
    next
end
```

Policy change summaries are used to track changes made to a firewall policy. The Audit trail allow users to review the policy change summaries, including the date and time of the change and which user made the change.

To review the audit trail in the GUI:

1. Go to Policy & Objects > Firewall Policy.
2. Select the policy you want to review and click Edit.
3. In the right-side banner, click Audit Trail. The Audit trail for Firewall Policy pane opens and displays the policy change summaries for the selected policy.

4. Select an entry to review the details of the change made.
5. When you are done reviewing the Audit Trail, click Close.
6. Click Cancel to exit the Edit Policy page.

**Configurations in the CLI**

Firewall policies can be created in the CLI by configuring the necessary parameters. See Configurations in the GUI on page 761 for more information on the various parameters.
Policy and Objects

<table>
<thead>

</tbody>
</table>

Firewall anti-replay option per policy

When the global anti-replay option is disabled, the FortiGate does not check TCP flags in packets. The per policy anti-replay option overrides the global setting. This allows you to control whether or not TCP flags are checked per policy.

To enable the anti-replay option so TCP flags are checked using the CLI:

```config firewall policy
edit 1
  set name "policyid-1"
  set srcintf "wan2"
  set dstintf "wan1"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set schedule "always"
  set service "ALL"
  set anti-replay enable
  set logtraffic all
  set nat enable
next
end
```

Deny matching with a policy with a virtual IP applied

Preventing hosts with specific source addresses from accessing a server behind the FortiGate may be required in some cases. For this scenario, you should have previously configured a firewall policy with a virtual IP (VIP) object applied to it.
Policy and Objects

to allow such access. See Destination NAT on page 816 for details.

When denying traffic destined for a typical firewall policy without a VIP applied, you would simply configure a new firewall policy with an action of deny and with specific source addresses above the firewall policy that you want to prevent these hosts from accessing. However, the FortiGate matches firewall policies with VIPs applied differently than typical firewall policies. Policies with VIPs applied have priority over typical firewall policies.

Therefore, to block specific source traffic destined for a firewall policy specified with an action of accept and with a VIP applied, you should configure set match-vip enable on the firewall policy with a deny action that has been configured to match traffic before the firewall policy with the VIP applied.

If the policy action is set to accept, match-vip cannot be enabled.

To block VIP traffic in a deny policy:

```
cfg firewall policy
  ed 1
    set name "deny-policy-1"
    set srcintf "wan1"
    set dstintf "lan1"
    set srcaddr "src-hosts-to-deny-access"
    set dstaddr "all"
    set action "deny"
    set schedule "always"
    set service "all"
    set match-vip enable
  next
  ed 2
    set name "vip-policy-1"
    set srcintf "wan1"
    set dstintf "lan1"
    set srcaddr "all"
    set dstaddr "vip-object-1"
    set action "accept"
    set schedule "always"
    set service "ALL"
  next
end
```

Alternatively, to block access to a firewall policy with a VIP applied, you can configure a new VIP object configured with set src-filter <range>. Configure a new firewall policy with a deny action and with this new VIP applied, and then configure this policy to match traffic before the firewall policy with the same VIP applied with an action of accept. In this case, the firewall policy can simply have set match-vip disable, which is the default setting in a new firewall policy.

To specify a VIP with source addresses specified with a deny policy:

```
cfg firewall vip
  ed "vip-with-srcaddr-to-deny"
    set extip "10.1.100.199"
    set extintf "wan1"
    set mappedip "172.16.200.55"
```
```
set src-filter "1.1.1.1/24"
next
end
```

```
config firewall policy
edit 3
set name "deny-policy-3"
set srcintf "wan1"
set dstintf "lan1"
set srcaddr "all"
set dstaddr "vip-with-srcaddr-to-deny"
set action "deny"
set match-vip disable
set schedule "always"
set service "ALL"
next
edit 2
set name "vip-policy-1"
set srcintf "wan1"
set dstintf "lan1"
set srcaddr "all"
set dstaddr "vip-object-1"
set action "accept"
set match-vip disable
set schedule "always"
set service "ALL"
next
end
```

**Hardware acceleration**

Hardware acceleration is supported on select FortiGate devices and is enabled by default on all firewall policies to ensure optimal performance when processing network traffic traversing the FortiGate. See the Hardware Acceleration Reference Manual for details.

Typically, hardware acceleration on a specific firewall policy is disabled for one of two purposes:

- To allow CLI commands such as the packet sniffer and debug flow to display all traffic matching the policy since traffic offloaded by SPU hardware on a FortiGate device is not visible by those CLI tools.
- To troubleshoot any possible issues arising by using hardware acceleration.

**To disable hardware acceleration in an IPv4 firewall policy:**

```
config firewall policy
edit 1
    set auto-asic-offload disable
next
end
```

**To disable hardware acceleration in an IPv6 firewall policy:**

```
config firewall policy6
edit 1
    set auto-asic-offload disable
next
end
```
To disable hardware acceleration in a multicast firewall policy:

```bash
config firewall multicast-policy
    edit 1
        set auto-asic-offload disable
    next
end
```

**TCP Maximum Segment Size (MSS)**

The TCP maximum segment size (MSS) is the maximum amount of data that can be sent in a TCP segment. The MSS is the MTU size of the interface minus the 20 byte IP header and 20 byte TCP header. By reducing the TCP MSS, you can effectively reduce the MTU size of the packet.

The TCP MSS can be configured in a firewall policy, or directly on an interface. See Interface MTU packet size on page 150 for details on configuring TCP MSS directly on an interface.

To configure TCP MSS in a firewall policy:

```bash
config firewall policy
    edit <policy ID>
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.10.10.6"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set tcp-mss-sender 1448
        set tcp-mss-receiver 1448
    next
end
```

**Adjusting session time-to-live (TTL)**

A session is a communication channel between two devices or applications across the network. Sessions allow FortiOS to inspect and act on a sequential group of packets in a session all at once instead of inspecting each packet individually. Each session has an entry in the session table that includes important information about the session.

The session time-to-live (TTL) parameter determines how long a session of a particular protocol such as TCP, UDP, or ICMP remains in the session table. To ensure proper operation of some devices or applications, the session TTL parameter may need to be increased or decreased to allow sessions to remain active in the session table for a longer or shorter duration, respectively.

To configure a modified session TTL in a firewall policy:

```bash
config firewall policy
    edit <policy ID>
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.10.10.6"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set session-ttl 1800
```
Policy and Objects

The session TTL can be set to zero or never to ensure a session never times out. See No session timeout on page 860 for details.

Session TTL should only be set to zero or never after careful consideration of:

- The connected device’s or application’s requirements for sessions to always stay alive
- The expectation that a connected device or application will use the same session determined by traffic using a fixed source port, fixed destination port, fixed source IP address, and fixed destination IP address.

When session TTL is set to zero or never, then sessions will not be cleared from the session table or expire after a specified time unless the CLI commands `diagnose system session filter <filter>` and `diagnose system session clear` are used. If this setting is used in the case when traffic through a firewall policy can generate numerous unique sessions, then this may have unintended consequences to the FortiGate’s memory usage and performance due to the session table constantly growing and not clearing out idle sessions.

To disable session TTL in a firewall policy:

```
config firewall policy
edit <policy ID>
  set srcintf "internal"
  set dstintf "wan1"
  set srcaddr "10.10.10.6"
  set dstaddr "all"
  set schedule "always"
  set service "ALL"
  set session-ttl never
next
end
```

Policy views

In Policy & Objects policy list pages, there are two policy views: Interface Pair View and By Sequence view.

Interface Pair View displays the policies in the order that they are checked for matching traffic, grouped by the pairs of incoming and outgoing interfaces in collapsible sections.
Policy and Objects

By Sequence displays policies in the order that they are checked for matching traffic without any grouping.

The default display is Interface Pair View. You can switch between the two views except if any or multiple interfaces are applied in the policy. The FortiGate automatically changes the view on the policy list page to By Sequence whenever there is a policy containing any or multiple interfaces as the Source or Destination interface. If the Interface Pair View is grayed out, it is likely that one or more policies have used the any or multiple interfaces.

You can export the current view to CSV and JSON formats by clicking Export and selecting CSV or JSON. The file is automatically downloaded.
Policy lookup

Firewall policy lookup is based on the `Source_interfaces/Protocol(Source_Address)/Destination_Address` that matches the `source-port` and `dst-port` of the protocol. Use this tool to find out which policy matches specific traffic from a number of policies. After completing the lookup, the matching firewall policy is highlighted on the policy list page.

The `Policy Lookup` tool has the following requirements:

- Transparent mode does not support policy lookup function.
- When executing the policy lookup, you need to confirm whether the relevant route required for the policy work already exists.

Sample configuration

This example uses the TCP protocol to show how policy lookup works:

1. On a `Policy & Objects` policy list page, click `Policy Lookup` and enter the traffic parameters.

2. Click Search to display the policy lookup results.

NGFW policy

Profile-based next-generation firewall (NGFW) mode is the traditional mode where you create a profile (antivirus, web filter, and so on) and then apply the profile to a policy.

In policy-based NGFW mode, you allow applications and URL categories to be used directly in security policies, without requiring web filter or application control profiles. However, it is possible to select and apply web filter URL categories and groups.
In policy-based mode:

- Central NAT is always enabled. If no Central SNAT policy exists, you must create one. See Central SNAT on page 807 for more information.
- Pre-match rules are defined separately from security policies, and define broader rules, such as SSL inspection and user authentication.
- The IPsec wizard is not supported.

If your FortiGate operates in NAT mode, rather than enabling source NAT in individual NGFW policies, go to Policy & Objects > Central SNAT and add source NAT policies that apply to all matching traffic. In many cases, you may only need one SNAT policy for each interface pair.

The NGFW mode is set per VDOM, and it is only available when the VDOM inspection mode is flow-based. You can operate your entire FortiGate or individual VDOMs in NGFW policy mode. The application default port can be set as a service port in the NGFW mode using the default-app-port-as-service option.

In NGFW mode, administrators can configure a security policy in learn mode to monitor traffic. See Learn mode in security policies in NGFW mode on page 785 for more information.

---

Switching from profile-based to policy-based mode converts your policies to policy-based. To avoid issues, you could create a new VDOM for the policy-based mode. We recommend backing up your configuration before switching modes. See Configuration backups on page 65 for information.

---

### Enabling policy-based NGFW mode

**To enable policy-based NGFW mode without VDOMs in the GUI:**

1. Go to System > Settings.
2. In NGFW Mode, select Policy-based.
3. Click Apply.

**To enable policy-based NGFW mode with VDOMs in the GUI:**

1. Go to System > VDOM.
2. Double-click a VDOM to edit the settings.
3. In NGFW Mode, select Policy-based.
4. Click OK.

**To enable policy-based NGFW mode without VDOMs in the CLI:**

```bash
config system settings
    set ngfw-mode policy-based
end
```

**To enable policy-based NGFW mode with VDOMs in the CLI:**

```bash
config vdom
    edit <vdom>
        config system settings
            set ngfw-mode policy-based
```
Security and SSL Inspection & Authentication policies

Security policies work with SSL Inspection & Authentication policies to inspect traffic. To allow traffic from a specific user or user group, both Security and SSL Inspection & Authentication policies must be configured. A default SSL Inspection & Authentication policy with the certificate-inspection SSL Inspection profile is preconfigured. Traffic will match the SSL Inspection & Authentication policy first. If the traffic is allowed, packets are sent to the IPS engine for application, URL category, user, and user group match, and then, if enabled, UTM inspection (antivirus, IPS, DLP, and email filter) is performed.

SSL Inspection & Authentication policies are used to pre-match traffic before sending the packets to the IPS engine:

- There are no schedule or action options; traffic matching the policy is always redirected to the IPS engine.
- SSL inspection, formerly configured in the VDOM settings, is configured in an SSL Inspection & Authentication policy.
- Users and user groups that require authentication must be configured in an SSL Inspection & Authentication policy.

Security policies work with SSL Inspection & Authentication policies to inspect traffic:

- Applications and URL categories can be configured directly in the policy.
- Users and user groups that require authentication must also be configured in a security policy.
- The available actions are Accept or Deny.
- The Service option can be used to enforce the standard port for the selected applications.
- UTM inspection is configured in a security policy.
To configure policies for Facebook and Gmail access in the CLI:

1. Configure an SSL Inspection & Authentication policy:

```plaintext
config firewall policy
  edit 1
    set name "Policy-1"
    set srcintf "port18"
    set dstintf "port17"
    set srcaddr "all"
    set dstaddr "all"
    set service "ALL"
    set ssl-ssh-profile "new-deep-inspection"
  set groups "Dev" "HR" "QA" "SYS"
next
end
```

2. Configure security policies:

```plaintext
config firewall security-policy
  edit 2
    set name "allow-QA-Facebook"
    set srcintf "port18"
    set dstintf "port17"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set application 15832
    set groups "Dev" "QA"
next
  edit 4
    set name "allow-QA-Email"
    set srcintf "port18"
    set dstintf "port17"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
```
Policy and Objects

set url-category 23
set groups "QA"
end

Logs

In the application control and web filter logs, securityid maps to the security policy ID.

Application control log:

date=2019-06-17 time=16:35:47 logid="1059028704" type="utm" subtype="app-ctrl"

Other NGFW policy-based mode options

You can combine Application Control and Web Filter in the same NGFW mode policy.
The following security profiles can be used in NGFW policy-based mode:

- AntiVirus
- Web Filter
- Intrusion Prevention
- File Filter
- Email Filter

Logging can also be enabled in security policies.

**Inspection mode per policy**

Inspection mode is configured on a per-policy basis in NGFW mode. This gives you more flexibility when setting up different policies.

When configuring a firewall policy, you can select a *Flow-based* or *Proxy-based* Inspection Mode. The default setting is *Flow-based*.

**To configure inspection mode in a policy:**

1. Go to Policy & Objects > Firewall Policy.
2. Create a new policy, or edit an existing policy.
3. Configure the policy as needed.

   a. If you change the Inspection Mode to *Proxy-based*, the Proxy HTTP(S) traffic option displays.

   ![Diagram](image1)

   b. In the Security Profiles section, if no security profiles are enabled, the default SSL Inspection is *no-inspection*.

   c. In the Security Profiles section, if you enable any security profile, the SSL Inspection changes to certificate-inspection.

   ![Diagram](image2)
To see the inspection mode changes using the CLI:

```
config firewall policy
edit 1
  set srcintf "wan2"
  set dstintf "wan1"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set schedule "always"
  set service "ALL"
  set inspection-mode proxy
  set nat enable
next
end
```

To see the HTTP and SSH policy redirect settings when inspection mode is set to proxy using the CLI:

```
config firewall policy
edit 1
  set srcintf "wan2"
  set dstintf "wan1"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set schedule "always"
  set service "ALL"
  set inspection-mode proxy
  set http-policy-redirect enable
  set ssh-policy-redirect enable
  set nat enable
next
end
```

To see the default SSL-SSH policy set to no inspection using the CLI:

```
config firewall policy
edit 1
  show fu | grep ssl-ssh-profile
  set ssl-ssh-profile "no-inspection"
next
end
```

**NGFW policy mode application default service**

In NGFW policy-based mode, the application default service enforces applications running only on their default service port. The applications specified in the policy are monitored, and if traffic is detected from a nonstandard port, it is blocked, and a log entry is recorded with a *port-violation* event type.

If you are not using the default ports, and need to pick specific services, select *Specify* to select the required services.

**Example**

In this example, the standard port is enforced for HTTPS traffic using the HTTP.AUDIO application.
First, an SSL Inspection & Authentication policy is created to traffic pre-match, and then a security policy is created to allow the HTTP.Audio application when using the default port. Fetching an MP3 file from an HTTP server using port 443 is allowed, but is blocked when using a nonstandard port, such as 8443.

**To enforce the HTTP.Audio application using the default port in the GUI:**

1. Create a new SSL Inspection & Authentication policy, or use the default policy.
2. Go to Policy & Objects > Security Policy, and click Create New.
3. Enter a name for the policy, such as allow_HTTP.Audio.
4. Configure the ports as needed.
5. Set Service to App Default.
6. In the Application field, select HTTP.Audio.
7. Set the Action to Accept.
8. Click OK.

**To enforce the HTTP.Audio application using the default port in the CLI:**

1. Create a firewall policy:

   ```
   config firewall policy
   edit 1
   set name "consolidated_all"
   set srcintf "port13"
   set dstintf "port14"
   set srcaddr "all"
   set dstaddr "all"
   set service "ALL"
   set ssl-ssh-profile "new-deep-inspection"
   next
   end
   ```

2. Create a security policy:

   ```
   config firewall security-policy
   edit 1
   ```
set name "allow_HTTP.Audio"
set srcintf "port13"
set dstintf "port14"
set srcaddr "all"
set enforce-default-app-port enable
set action accept
set schedule "always"
set logtraffic all
set application 15879
next
end

Logs

The application logs show logs with an event type of port-violation for traffic on port 8443 that is blocked, and an event type of signature for traffic on port 443 that is allowed.

Blocked:

2: date=2019-06-18 time=16:15:40 logid="1060028736" type="utm" subtype="app-ctrl" eventtype="port-violation" level="warning" vd="vd1" eventtime=1560899740218875746 tz="-0700" appid=15879 srcip=10.1.100.22 dstip=172.16.200.216 srcport=52680 dstport=8443 srcintf="port13" srcintfrole="undefined" dstintf="port14" dstintfrole="undefined" proto=6 service="HTTPS" direction="incoming" policyid=1 sessionid=5041 appcat="Video/Audio" app="HTTP.Audio" action="block" hostname="172.16.200.216" incidentserialno=1906780850 url="/app_data/story.mp3" securityid=2 msg="Video/Audio: HTTP.Audio," apprisk="elevated"

Allowed:

1: date=2019-06-18 time=16:15:49 logid="1059028704" type="utm" subtype="app-ctrl" eventtype="signature" level="information" vd="vd1" eventtime=1560899749258579372 tz="-0700" appid=15879 srcip=10.1.100.22 dstip=172.16.200.216 srcport=54527 dstport=443 srcintf="port13" srcintfrole="undefined" dstintf="port14" dstintfrole="undefined" proto=6 service="HTTPS" direction="incoming" policyid=1 sessionid=5064 appcat="Video/Audio" app="HTTP.Audio" action="pass" hostname="172.16.200.216" incidentserialno=1139663486 url="/app_data/story.mp3" securityid=2 msg="Video/Audio: HTTP.Audio," apprisk="elevated"

Add option to set application default port as a service port

The default-app-port-as-service option can be used in NGFW mode to set the application default port as a service port. This allows applications to match the policy and be blocked immediately the first time that traffic hits the firewall. When this option is enabled, the NGFW policy aggregates the ports used by the applications in the policy and performs a pre-match on the traffic.

config system settings
  set default-app-port-as-service {enable | disable}
end

This option can be configured on a per-VDOM level.

This setting is enabled by default on new installations. When upgrading, the setting is disabled to retain the previous behavior.
To configure the application default port as service port:

1. Configure the VDOM settings:
   ```
   config system settings
   set vdom-type traffic
   set opmode nat
   set ngfw-mode policy-based
   set block-land-attack disable
   set default-app-port-as-service enable
   set application-bandwidth-tracking disable
   end
   ```

2. Configure the NGFW policy:
   ```
   config firewall security-policy
   edit 1
   set name "test"
   set srcintf "port2"
   set dstintf "port1"
   set srcaddr "all"
   set dstaddr "all"
   set internet-service-src disable
   set enforce-default-service-port enable
   set action accept
   next
   end
   ```

Sample logs

The following logging behavior occurs in NGFW mode with `default-app-port-as-service` enabled, traffic that does not match the default port is blocked immediately. Only a traffic log is generated.

Log with SSH and FTP traffic:

```
1: date=2022-02-24 time=11:16:36 eventtime=1645730197145603994 tz="-0800"
logid="0000000013" type="traffic" subtype="forward" level="notice" vd="vd1"
srcip=10.1.100.12 srcport=40402 srcintf="port2" srcintfrole="undefined"
dstip=172.16.200.55 dstport=21 dstintf="port1" dstintfrole="undefined"
srccountry="Reserved" dstcountry="Reserved" sessionid=6811 proto=6 action="deny"
policyid=0 policytype="security-policy" poluuuid="7ed35582-95a2-51ec-0d21-4093cb91e67b"
policyname="Default" centrlnatid=1 service="FTP" transdisp="snat" transip=172.16.200.4
transport=40402 duration=10 sentbyte=0 rcvdbyte=0 sentpkt=0 rcvdpkt=0 appcat="unscanned"
```

Log with SSH and FTP traffic with port 2121:

```
1: date=2022-02-24 time=11:19:20 eventtime=1645730360685614031 tz="-0800"
logid="0000000013" type="traffic" subtype="forward" level="notice" vd="vd1"
srcip=10.1.100.12 srcport=41362 srcintf="port2" srcintfrole="undefined"
dstip=172.16.200.55 dstport=2121 dstintf="port1" dstintfrole="undefined"
srccountry="Reserved" dstcountry="Reserved" sessionid=7213 proto=6 action="deny"
policyid=0 policytype="security-policy" poluuuid="7ed35582-95a2-51ec-0d21-4093cb91e67b"
policyname="Default" centrlnatid=1 service="tcp/2121" transdisp="snat"
```
Policy and Objects

transip=172.16.200.4 transport=41362 duration=9 sentbyte=60 rcvdbyte=0 sentpkt=1 rcvdpkt=0 appcat="unscanned"

- When default-app-port-as-service is disabled and enforce-default-app-port is enabled, traffic that does not match the default port is not blocked immediately. Application and traffic logs are generated.

Traffic log with SSH and FTP traffic:

1: date=2022-02-24 time=11:21:51 eventtime=1645730511325606916 tz="-0800" logid="0000000013" type="traffic" subtype="forward" level="notice" vd="vd1" srcip=10.1.100.12 srsrcport=40408 srcsintf="port2" srcsintfrole="undefined" dstip=172.16.200.55 dstport=21 dstsintf="port1" dstsintfrole="undefined" srccountry="Reserved" dstcountry="Reserved" sessionid=7522 proto=6 action="deny" policyid=0 policytype="security-policy" poluuuid="7ed35582-95a2-51ec-0d21-4093cb91e67b" policyname="Default" centralnatid=1 service="FTP" transdisp="snat" transip=172.16.200.4 transport=40408 duration=14 sentbyte=164 rcvdbyte=171 sentpkt=3 rcvdpkt=2 appid=15896 appcat="Network.Service" app="FTP" apprisk="elevated" utmaction="block" countapp=1 utmref=65501-0

Application log with SSH and FTP traffic:

Traffic log with SSH and FTP traffic with port 2121:

1: date=2022-02-24 time=11:24:25 eventtime=1645730665235613912 tz="-0800" logid="0000000013" type="traffic" subtype="forward" level="notice" vd="vd1" srcip=10.1.100.12 srsrcport=41366 srcsintf="port2" srcsintfrole="undefined" dstip=172.16.200.55 dstport=2121 dstsintfrole="undefined" srccountry="Reserved" dstcountry="Reserved" sessionid=7876 proto=6 action="deny" policyid=0 policytype="security-policy" poluuuid="7ed35582-95a2-51ec-0d21-4093cb91e67b" policyname="Default" centralnatid=1 service="tcp/2121" transdisp="snat" transip=172.16.200.4 transport=41366 duration=11 sentbyte=112 rcvdbyte=171 sentpkt=2 rcvdpkt=2 appid=15896 appcat="Network.Service" app="FTP" apprisk="elevated" utmaction="block" countapp=1 utmref=65500-0

Application log with SSH and FTP traffic with port 2121:

2: date=2022-02-24 time=11:24:16 eventtime=1645730656426052412 tz="-0800" logid="1060028736" type="utm" subtype="app-ctrl" eventtype="port-violation" level="warning" vd="vd1" appid=15896 srcip=10.1.100.12 srccountry="Reserved" dstip=172.16.200.55 dstcountry="Reserved" srsrcport=41366 dstport=2121 dstsintfrole="undefined" dstsintfrole="undefined" proto=6 service="FTP" direction="outgoing" policyid=0 sessionid=7876 action="block" appcat="Network.Service" app="FTP" incidentserialno=188744241 msg="Network.Service: FTP, non-default port used: 2121" apprisk="elevated"
Application logging in NGFW policy mode

In NGFW policy mode, if an application, application category, or application group is selected on a security policy, and traffic logging is set to UTM or All, then application control logs will be generated. In addition, when a signature is set to the ACCEPT action under a security policy, all corresponding child signatures will be assessed and logged as well.

Under NGFW, with `default-app-port-as-service` enabled, enable APP Default. The traffic which doesn’t match the default port will be blocked immediately, and there is only traffic log generated.

Under NGFW, with `default-app-port-as-service` disabled, enable APP Default. The traffic which doesn’t match the default port will not be blocked immediately, and there is app and traffic logs generated.

To verify application logging:

1. Go to Policy & Objects > Security Policy and configure a new policy for YouTube.
2. Set Action to ACCEPT and Log Allowed Traffic to Security Events.

3. Configure the remaining settings as required, then click OK.
4. On a client system, play some YouTube videos.
5. On FortiOS, go to Log & Report > Security Events and view the Application Control logs.

There are logs not only for YouTube, but also for `YouTube_Video.Play`, `YouTube_Video.Access`, and so on, as verified from the Application Name column.
Learn mode in security policies in NGFW mode

In NGFW mode, administrators can configure a security policy in learn mode to monitor traffic that passes through the source and destination interfaces. The learn mode uses a special prefix in the policy mode and profile fields in traffic and UTM logs for use by FortiAnalyzer and the Policy Analyzer Management Extension Application (MEA) that is available with FortiManager.

When enabled on FortiManager, Policy Analyzer MEA works with security policies in learning mode to analyze logs sent from a managed FortiGate to FortiAnalyzer. Based on the analyzed traffic, FortiManager administrators can choose to automatically create a policy in FortiManager for the managed FortiGate. For more information about Policy Analyzer MEA, see the Policy Analyzer Administration Guide.

The following limitations apply when learn mode is enabled in a security policy:

- Only interfaces with device-identification enable can be used as source interfaces in a security policy with learning mode enabled.
- Incoming and outgoing interfaces do not support any.
- Internet service is not supported.
- NAT46 and NAT64 are not supported.
- Users and groups are not supported.
- Some negate options are not supported.

To enable learn mode in the GUI:

1. Enable policy-based NGFW mode:
   a. Go to System > Settings.
   b. Set the NGFW Mode to Policy-based and click Apply.
2. Go to Policy & Objects > Security Policy, and open a security policy for editing.
3. Set the Policy Mode to Learn Mode.
4. Select an *Incoming Interface*.
5. Select an *Outgoing Interface*.
6. (Optional) Type a comment in the *Comments box*.
7. Toggle on *Enable this policy*.
8. Click *OK* to save the security policy.

**To enable learn mode in the CLI:**

1. Enable policy-based NGFW mode:

```plaintext
config system settings
    set ngfw-mode policy-based
end
```

2. Enable learn mode in a security policy:

```plaintext
config firewall security-policy
    edit <id>
        set learning-mode enable
    next
end
```

**To view learn mode fields in logs in the CLI:**

1. Filter and view fields in traffic logs:

```plaintext
# execute log filter category 0
# execute log display

1 logs found.
1 logs returned.
```

```
1: date=2022-03-21 time=10:21:11 eventtime=1647883271150012188 tz=-0700 logid=0000000013 type=traffic subtype=forward level=notice vd=root srcip=10.1.100.41 srcport=43296 srcintf=port24 srcintfrole=undefined dstip=172.16.200.55 dstport=80 dstintf=port17 dstintfrole=wan srccountry=Reserved dstcountry=Reserved sessionid=33934 policyid=99 policytype=security-policy poluuid=6e3f7f54-a932-51ec-73ba-8282cfd0b73c policymode=learn action=accept countweb=1 countav=1 countips=3 countapp=1 crscore=50 craction=2 srchwvendor=VMware devtype=Computer osname=Debian mastersrcmac=00:0c:29:b5:92:8d srcmac=00:0c:29:b5:92:8d srcserver=0 utmref=65534-0

Local-in policy

While security profiles control traffic flowing through the FortiGate, local-in policies control inbound traffic that is going to a FortiGate interface.

Administrative access traffic (HTTPS, PING, SSH, and others) can be controlled by allowing or denying the service in the interface settings. Trusted hosts can be configured under an administrator to restrict the hosts that can access the administrative service.

Local-in policies allow administrators to granularly define the source and destination addresses, interface, and services. Traffic destined for the FortiGate interface specified in the policy that meets the other criteria is subject to the policies action.

Local-in policies can be used to restrict administrative access or other services, such as VPN, that can be specified as services. You can define source addresses or address groups to restrict access from. For example, by using a geographic type address you can restrict a certain geographic set of IP addresses from accessing the FortiGate.

By default, no local-in policies are defined, so there are no restrictions on local-in traffic.

Local-in policies can only be created or edited in the CLI. You can view the existing local-in policies in the GUI by enabling it in System > Feature Visibility under the Additional Features section. This page does not list the custom local-in policies.

To configure a local-in policy using the CLI:

```
config firewall (local-in-policy | local-in-policy6)
  edit <policy_number>
    set intf <interface>
    set srcaddr <source_address> [source_address] ...
    set dstaddr <destination_address> [destination_address] ...
    set action {accept | deny}
    set service <service_name> [service_name] ...
    set schedule <schedule_name>
    set comments <string>
  next
end
```

For example, to prevent the source subnet 10.10.10.0/24 from pinging port1, but allow administrative access for PING on port1:

```
config firewall address
  edit "10.10.10.0"
    set subnet 10.10.10.0 255.255.255.0
  next
end
```
Policy and Objects

config firewall local-in-policy
  edit 1
    set intf "port1"
    set srcaddr "10.10.10.0"
    set dstaddr "all"
    set service "PING"
    set schedule "always"
  next
end

To test the configuration:
1. From the PC at 10.10.10.12, start a continuous ping to port1:
   ping 192.168.2.5 -t
2. On the FortiGate, enable debug flow:
   # diagnose debug flow filter addr 10.10.10.12
   # diagnose debug flow filter proto 1
   # diagnose debug enable
   # diagnose debug flow trace start 10
3. The output of the debug flow shows that traffic is dropped by local-in policy 1:
   # id=20085 trace_id=1 func=print_pkt_detail line=5746 msg="vd-root:0 received a packet (proto=1, 10.10.10.12:1->192.168.2.5:2048) from port1. type=8, code=0, id=1, seq=128."
   id=20085 trace_id=1 func=init_ip_session_common line=5918 msg="allocate a new session-0017c5ad"
   id=20085 trace_id=1 func=vf_ip_route_input_common line=2615 msg="find a route: flag=800000 gw=192.168.2.5 via root"
   id=20085 trace_id=1 func=fw_local_in_handler line=474 msg="iprobe_in_check() check failed on policy 1, drop"

Additional options

To disable or re-enable the local-in policy, use the set status {enable | disable} command.

To dedicate the interface as an HA management interface, use the set ha-mgmt-intf-only enable command.

TTL policies

You can configure a time-to-live (TTL) policy to block attack traffic with high TTLs. This feature only applies to local-in traffic and does not apply to traffic passing through the FortiGate. You can use srcintf to set the interface that the local-in traffic hits. See config firewall ttl-policy.

To configure a TTL policy using the CLI:

config firewall ttl-policy
  edit <id>
    set status {enable | disable}
    set action {accept | deny}
    set srcintf <interface>
    set srcaddr <source_address> [source_address] ...
    set service <service_name> [service_name] ...
    set schedule <schedule_name>
set ttl <value/range>
next
end

**DoS policy**

A Denial of Service (DoS) policy examines network traffic arriving at a FortiGate interface for anomalous patterns, which usually indicates an attack.

A denial of service occurs when an attacking system starts an abnormally large number of sessions with a target system. The large number of sessions slows down or disables the target system, preventing legitimate users from using it.

DoS policies are checked before security policies, preventing attacks from triggering more resource intensive security protection and slowing down the FortiGate.

**DoS anomalies**

Predefined sensors are setup for specific anomalous traffic patterns. New DoS anomalies cannot be added by the user.

The predefined anomalies that can be used in DoS policies are:

<table>
<thead>
<tr>
<th>Anomaly</th>
<th>Description</th>
<th>Recommended Threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td>tcp_syn_flood</td>
<td>If the SYN packet rate of new TCP connections, including retransmission, to one destination IP address exceeds the configured threshold value, the action is executed.</td>
<td>2000 packets per second.</td>
</tr>
<tr>
<td>tcp_port_scan</td>
<td>If the SYN packet rate of new TCP connections, including retransmission, from one source IP address exceeds the configured threshold value, the action is executed.</td>
<td>1000 packets per second.</td>
</tr>
<tr>
<td>tcp_src_session</td>
<td>If the number of concurrent TCP connections from one source IP address exceeds the configured threshold value, the action is executed.</td>
<td>5000 concurrent sessions.</td>
</tr>
<tr>
<td>tcp_dst_session</td>
<td>If the number of concurrent TCP connections to one destination IP address exceeds the configured threshold value, the action is executed.</td>
<td>5000 concurrent sessions.</td>
</tr>
<tr>
<td>udp_flood</td>
<td>If the UDP traffic to one destination IP address exceeds the configured threshold value, the action is executed.</td>
<td>2000 packets per second.</td>
</tr>
<tr>
<td>udp_scan</td>
<td>If the UDP sessions setup rate originating from one source IP address exceeds the configured threshold value, the action is executed.</td>
<td>2000 sessions per second.</td>
</tr>
<tr>
<td>udp_src_session</td>
<td>If the number of concurrent UDP connections from one source IP address exceeds the configured threshold value, the action is executed.</td>
<td>5000 concurrent sessions.</td>
</tr>
<tr>
<td>udp_dst_session</td>
<td>If the number of concurrent UDP connections to one destination IP address exceeds the configured threshold value, the action is executed.</td>
<td>5000 concurrent sessions.</td>
</tr>
<tr>
<td>Anomaly</td>
<td>Description</td>
<td>Recommended Threshold</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>icmp_flood</td>
<td>If the number of ICMP packets sent to one destination IP address exceeds the configured threshold value, the action is executed.</td>
<td>250 packets per second</td>
</tr>
<tr>
<td>icmp_sweep</td>
<td>If the ICMP sessions setup rate originating from one source IP address exceeds the configured threshold value, the action is executed.</td>
<td>100 sessions per second</td>
</tr>
<tr>
<td>icmp_src_session</td>
<td>If the number of concurrent ICMP connections from one source IP address exceeds the configured threshold value, the action is executed.</td>
<td>300 concurrent sessions</td>
</tr>
<tr>
<td>icmp_dst_session</td>
<td>If the number of concurrent ICMP connections to one destination IP address exceeds the configured threshold value, the action is executed.</td>
<td>1000 concurrent sessions</td>
</tr>
<tr>
<td>ip_src_session</td>
<td>If the number of concurrent IP connections from one source IP address exceeds the configured threshold value, the action is executed.</td>
<td>5000 concurrent sessions</td>
</tr>
<tr>
<td>ip_dst_session</td>
<td>If the number of concurrent IP connections to one destination IP address exceeds the configured threshold value, the action is executed.</td>
<td>5000 concurrent sessions</td>
</tr>
<tr>
<td>sctp_flood</td>
<td>If the number of SCTP packets sent to one destination IP address exceeds the configured threshold value, the action is executed.</td>
<td>2000 packets per second</td>
</tr>
<tr>
<td>sctp_scan</td>
<td>If the number of SCTP sessions originating from one source IP address exceeds the configured threshold value, the action is executed.</td>
<td>1000 packets per second</td>
</tr>
<tr>
<td>sctp_src_session</td>
<td>If the number of concurrent SCTP connections from one source IP address exceeds the configured threshold value, the action is executed.</td>
<td>5000 concurrent sessions</td>
</tr>
<tr>
<td>sctp_dst_session</td>
<td>If the number of concurrent SCTP connections to one destination IP address exceeds the configured threshold value, the action is executed.</td>
<td>5000 concurrent sessions</td>
</tr>
</tbody>
</table>

For thresholds based on the number of concurrent sessions, blocking the anomaly will not allow more than the number of concurrent sessions to be set as the threshold.

For example, if the period for a particular anomaly is 60 seconds, such as those where the threshold is measured in concurrent sessions, after the 60 second timer has expired the number of allowed sessions that match the anomaly criteria is reset to zero. This means that, if you allow 10 sessions through before blocking, after the 60 seconds has elapsed, another 10 sessions will be allowed. The attrition of sessions from expiration should keep the allowed sessions from reaching the maximum.

For rate based thresholds, where the threshold is measured in packets per second, the Block action prevents anomalous traffic from overwhelming the firewall in two ways:
Policy and Objects

- **continuous**: Block packets once an anomaly is detected, and continue to block packets while the rate is above the threshold. This is the default setting.
- **periodical**: After an anomaly is detected, allow the configured number of packets per second.

For example, if a DoS policy is configured to block icmp_flood with a threshold of 10pps, and a continuous ping is started at a rate of 20pps for 1000 packets:

- In continuous mode, the first 10 packets are passed before the DoS sensor if triggered, and then the remaining 990 packets are blocked.
- In periodical mode, 10 packets are allowed to pass per second, so 500 packets are blocked in the 50 seconds during which the ping is occurring.

The actual numbers of passed and blocked packets may not be exact, as fluctuations in the rates can occur, but the numbers should be close to the defined threshold.

---

**To configure the block action for rate based anomaly sensors:**

```
config ips global
  set anomaly-mode {continuous | periodical}
end
```

---

**DoS policies**

A DoS policy can be configured to use one or more anomalies.

**To configure a DoS policy in the GUI:**

1. Go to `Policy & Objects > IPv4 DoS Policy` or `Policy & Objects > IPv6 DoS Policy` and click `Create New`. If the option is not visible, enable `DoS Policy` in `Feature Visibility`. See [Feature visibility on page 2165](#) for details.
2. Configure the following:

<table>
<thead>
<tr>
<th><strong>Name</strong></th>
<th>Enter a name for the policy.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Incoming Interface</strong></td>
<td>Enter the interface that the policy applies to.</td>
</tr>
<tr>
<td><strong>Source Address</strong></td>
<td>Enter the source address.</td>
</tr>
<tr>
<td><strong>Destination Address</strong></td>
<td>Enter the destination address. This is the address that the traffic is addressed to. In this case, it must be an address that is associated with the firewall interface. For example, it could be an interface address, a secondary IP address, or the address assigned to a VIP address.</td>
</tr>
<tr>
<td><strong>Service</strong></td>
<td>Select the services or service groups. The ALL service can be used or, to optimize the firewall resources, only the services that will be answered on an interface can be used.</td>
</tr>
</tbody>
</table>

**L3 Anomalies**

**L4 Anomalies**

Configure the anomalies:

- **Logging**: Enable/disable logging for specific anomalies or all of them. Anomalous traffic will be logged when the action is *Block or Monitor*.
- **Action**: Select the action to take when the threshold is reached:
  - **Disable**: Do not scan for the anomaly.
  - **Block**: Block the anomalous traffic.
  - **Monitor**: Allow the anomalous traffic, but record a log message if logging is enabled.
- **Threshold**: The number of detected instances that triggers the anomaly action.

| **Comments** | Optionally, enter a comment. |

3. Enable the policy, then click OK.

The quarantine option is only available in the CLI. See Quarantine on page 795 for information.

---

**To configure a DoS policy in the GUI:**

```bash
config firewall DoS-policy
edit 1
  set name "Flood"
  set interface "port1"
  set srcaddr "all"
  set dstaddr "all"
  set service "ALL"
config anomaly
  edit "icmp_flood"
  set status enable
  set log enable
  set action block
  set quarantine attacker
  set quarantine-expiry 1d1h1m
```
```
set quarantine-log enable
set threshold 100
```

**name <string>**  
Enter a name for the policy.

**interface <string>**  
Enter the interface that the policy applies to.

**srcaddr <string>**  
Enter the source address.

**dstaddr <string>**  
Enter the destination address.  
This is the address that the traffic is addressed to. In this case, it must be an  
address that is associated with the firewall interface. For example, it could be an  
interface address, a secondary IP address, or the address assigned to a VIP  
address.

**service <string>**  
Enter the services or service groups.  
The **ALL** service can used or, to optimize the firewall resources, only the services  
that will be answered on an interface can be used.

**status {enable | disable}**  
Enable/disable this anomaly.

**log {enable | disable}**  
Enable/disable anomaly logging. When enabled, a log is generated whenever the  
anomaly action is triggered, regardless of which action is configured.

**action {pass | block}**  
Set the action to take when the threshold is reached:  
- **pass**: Allow traffic, but record a log message if logging is enabled.  
- **block**: Block traffic if this anomaly is found.

**quarantine {none | attacker}**  
Set the quarantine method (see Quarantine on page 795):  
- **none**: Disable quarantine.  
- **attacker**: Block all traffic from the attacker's IP address, and add the  
  attacker's IP address to the banned user list.

**quarantine-expiry <###d##h##m>**  
Set the duration of the quarantine, in days, hours, and minutes (###d##h##m)  
(1m - 364d23h59m, default = 5m). This option is available if quarantine is set  
attacker.

**quarantine-log {enable | disable}**  
Enable/disable quarantine logging (default = disable). This option is available if  
quarantine is set attacker.

**threshold <integer>**  
The number of detected instances - packets per second or concurrent session  
number - that triggers the anomaly action.

---

**Quarantine**

Quarantine is used to block any further traffic from a source IP address that is considered a malicious actor or a source of  
traffic that is dangerous to the network. Traffic from the source IP address is blocked for the duration of the quarantine,  
and the source IP address is added to the banned user list.

The banned user list is kept in the kernel, and used by Antivirus, Data Leak Prevention (DLP), DoS, and Intrusion  
Prevention System (IPS). Any policies that use any of these features will block traffic from the attacker's IP address.
To view the quarantined user list:

```
# diagnose user quarantine list
src-ip-addr  created       expires       cause
```

Troubleshooting DoS attacks

The best way to troubleshoot DoS attacks is with Anomaly logs and IPS anomaly debug messages.

To test an icmp_flood attack:

1. From the Attacker, launch an icmp_flood with 50pps lasting for 3000 packets.
2. On the FortiGate, configure continuous mode and create a DoS policy with an icmp_flood threshold of 30pps:

   ```
   config firewall DoS-policy
   edit 1
   set name icmpFlood
   set interface "port1"
   set srcaddr "all"
   set dstaddr "all"
   set service "ALL"
   config anomaly
   edit "icmp_flood"
   set status enable
   set log enable
   set action block
   set threshold 30
   next
   end
   next
   end
   ```

3. Configure the debugging filter:

   ```
   # diagnose ips anomaly config
   DoS sensors in kernel vd 0:
   DoS id 1 proxy 0
   0 tcp_syn_flood status 0 log 0 nac 0 action 0 threshold 2000
   ... 7 udp_dst_session status 0 log 0 nac 0 action 0 threshold 5000
   8 icmp_flood status 1 log 1 nac 0 action 7 threshold 30
   9 icmp_sweep status 0 log 0 nac 0 action 0 threshold 100
   ...
   total # DoS sensors: 1.
   ```
# diagnose ips anomaly filter id 8

4. Launch the icmp_flood from a Linux machine. This example uses Nmap:

   $ sudo nping --icmp --rate 50 -c 3000 192.168.2.50
   SENT (0.0522s) ICMP [192.168.2.205 > 192.168.2.50 Echo request {type=8/code=0} id=8597
   seq=1] IP [ttl=64 id=47459 iplen=28 ]

   Max rtt: 11.096ms | Min rtt: 0.028ms | Avg rtt: 1.665ms
   Raw packets sent: 3000 (84.000KB) | Rcvd: 30 (840B) | Lost: 2970 (99.00%)
   Nping done: 1 IP address pinged in 60.35 seconds

5. During the attack, check the anomaly list on the FortiGate:

   $ diagnose ips anomaly list
   list nids meter:
   id=icmp_flood       ip=192.168.2.50 dos_id=1 exp=998 pps=46 freq=50

   total # of nids meters: 1.

<table>
<thead>
<tr>
<th>id=icmp_flood</th>
<th>The anomaly name.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip=192.168.2.50</td>
<td>The IP address of the host that triggered the anomaly. It can be either the client or the server. For icmp_flood, the IP address is the destination IP address. For icmp_sweep, it would be the source IP address.</td>
</tr>
<tr>
<td>dos_id=1</td>
<td>The DoS policy ID.</td>
</tr>
<tr>
<td>exp=998</td>
<td>The time to be expired, in jiffies (one jiffy = 0.01 seconds).</td>
</tr>
<tr>
<td>pps=46</td>
<td>The number of packets that had been received when the diagnose command was executed.</td>
</tr>
</tbody>
</table>
   | freq=50         | For session based anomalies, freq is the number of sessions. For packet rate based anomalies (flood, scan):
       * In continuous mode: freq is the greater of pps, or the number of packets received in the last second.
       * In periodic mode: freq is the pps. |

6. Go to Log & Report > Security Events and download the Anomaly logs:

   date=2020-11-20 time=14:38:39 eventtime=16059119824184594 tz="-0800"
   logid="0720018433" type="utm" subtype="anomaly" eventtype="anomaly" level="alert"
   vd="root" severity="critical" srcip=192.168.2.205 srcrcountry="Reserved" dstip=192.168.2.50 srcintf="port1" srcintfrole="undefined" sessionid=0 action="clear_session" proto=1 service="PING" count=1307 attack=icmp_flood icmpid="0x2195" icmptype="0x08" icmpcode="0x00" attackid=16777316 policyid=1 policytype="DoS-policy"
   ref="http://www.fortinet.com/ids/VID16777316" msg="anomaly: icmp_flood, 31 > threshold 30, repeats 28 times" crscore=50 craction=4096 crlevel="critical"

   date=2020-11-20 time=14:39:09 eventtime=16059119826224056 tz="-0800"
   logid="0720018433" type="utm" subtype="anomaly" eventtype="anomaly" level="alert"
   vd="root" severity="critical" srcip=192.168.2.205 srcrcountry="Reserved" dstip=192.168.2.50 srcintf="port1" srcintfrole="undefined" sessionid=0 action="clear_session" proto=1 service="PING" count=1497 attack=icmp_flood icmpid="0x2195" icmptype="0x08" icmpcode="0x00" attackid=16777316 policyid=1 policytype="DoS-policy"
Analysis

In the first log message:

| msg="anomaly: icmp_flood, 31 > threshold 30" | At the beginning of the attack, a log is recorded when the threshold of 30pps is broken. |
| repeats 28 times | The number of packets that has exceeded the threshold since the last time a log was recorded. |
| srcip=192.168.2.205 | The source and destination IP addresses of the attack. |
| dstip=192.168.2.50 | action="clear_session" |
| equivalent to block. |
| If action was set to monitor and logging was enabled, this would be action="detected". |

In the second log message:

- Because it is an ongoing attack, the FortiGate generates one log message for multiple packets every 30 seconds.
- It will not generate a log message if:
  - The same attack ID happened more than once in a five second period, or
  - The same attack ID happened more than once in a 30 second period and the actions are the same and have the same source and destination IP addresses.

| msg="anomaly: icmp_flood, 50 > threshold 30" | In the second before the log was recorded, 50 packets were detected, exceeding the configured threshold. |
| repeats 1497 times | The number of packets that has exceeded the threshold since the last time a log was recorded |

Access control lists

An access control list (ACL) is a granular, targeted blocklist that is used to block IPv4 and IPv6 packets on a specified interface based on the criteria configured in the ACL policy.

On FortiGate models with ports that are connected through an internal switch fabric with TCAM capabilities, ACL processing is offloaded to the switch fabric and does not use CPU resources. VLAN interfaces that are based on physical switch fabric interfaces are also supported. Interfaces that are connected through an internal switch fabric usually have names prefixed with port or lan, such as port1 or lan2; other interfaces are not supported.

The packets will be processed by the CPU when offloading is disabled or not possible, such as when a port on a supported model does not connect to the internal fabric switch.

ACL is supported on the following FortiGate models:

- 100D, 100E, 100EF, 101E
- 140D, 140D-POE, 140E, 140E-POE
- 1500D, 1500DT
Policy and Objects

- 3000D, 3100D, 3200D, 3700D
- All 300E and larger E-series models
- All 100F and larger F-series models

Example

To block all IPv4 and IPv6 telnet traffic from port2 to Company_Servers:

```
config firewall acl
   edit 1
      set interface "port2"
      set srcaddr "all"
      set dstaddr "Company_Servers"
      set service "TELNET"
   next
end
config firewall acl6
   edit 1
      set interface "port2"
      set srcaddr "all"
      set dstaddr "Company_Servers_v6"
      set service "TELNET"
   next
end
```

Diagnose commands

To check the number of packets dropped by an ACL:

```
# diagnose firewall acl counter
ACL id 1 dropped 0 packets
# diagnose firewall acl counter6
ACL id 2 dropped 0 packets
```

To clear the packet drop counters:

```
# diagnose firewall acl clearcounter
# diagnose firewall acl clearcounter6
```

Interface policies

Interface policies are implemented before the security policies and are only flow-based. They are configured in the CLI.

This feature allows you to attach a set of IPS policies with the interface instead of the forwarding path, so packets can be delivered to IPS before entering the firewall. This feature is used for following IPS deployments:

- One-Arm: By defining interface policies with IPS and DoS anomaly checks and enabling sniff-mode on the interface, the interface can be used for one-arm IDS.
- IPv6 IPS: IPS inspection can be enabled through interface IPv6 policy.
- Scan traffic that is destined to the FortiGate.
- Scan and log traffic that are silently dropped or flooded by Firewall or Multicast traffic.

IPS sensors can be assigned to an interface policy. Both incoming and outgoing packets are inspected by IPS sensor (signature).

**To configure an interface policy:**

```plaintext
config firewall interface-policy
edit 1
    set status enable
    set comments 'test interface policy #1'
    set logtraffic utm
    set interface "port2"
    set srcaddr all
    set dstaddr all
    set service "ALL"
    set application-list-status disable
    set ips-sensor-status disable
    set dsri disable
    set av-profile-status enable
    set av-profile default
    set webfilter-profile-status disable
next
end
```

**Source NAT**

The following topics provide instructions on configuring policies with source NAT:

- Static SNAT on page 800
- Dynamic SNAT on page 801
- Central SNAT on page 807
- Configuring an IPv6 SNAT policy on page 812
- SNAT policies with virtual wire pairs on page 814

**Static SNAT**

Network Address Translation (NAT) is the process that enables a single device such as a router or firewall to act as an agent between the Internet or Public Network and a local or private network. This agent acts in real time to translate the source or destination IP address of a client or server on the network interface. For the source IP translation, this enables a single public address to represent a significantly larger number of private addresses. For the destination IP translation, the firewall can translate a public destination address to a private address. So we don't have to configure a real public IP address for the server deployed in a private network.

We can subdivide NAT into two types: source NAT (SNAT) and destination NAT (DNAT). This topic is about SNAT. We support three NAT working modes: static SNAT, dynamic SNAT, and central SNAT.
In static SNAT all internal IP addresses are always mapped to the same public IP address. This is a port address translation, Since we have 60416 available port numbers, this one public IP address can handle the conversion of 60,416 internal IP addresses.

<table>

FortiGate firewall configurations commonly use the Outgoing Interface address.

**Sample configuration**

The following example of static SNAT uses an internal network with subnet 10.1.100.0/24 (vlan20) and an external/ISP network with subnet 172.16.200.0/24 (vlan30).

When the clients in internal network need to access the servers in external network, We need to translate IP addresses from 10.1.100.0/24 to an IP address 172.16.200.0/24, In this example, we implement static SNAT by creating a firewall policy.

**To configure static NAT:**

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Configure the required policy parameters.
3. Enable NAT and select Use Outgoing Interface Address. For packets that match this policy, its source IP address is translated to the IP address of the outgoing interface.
4. If needed, enable Preserve Source Port to keep the same source port for services that expect traffic to come from a specific source port. Disable Preserve Source Port to allow more than one connection through the firewall for that service.

5. Click OK.

**Dynamic SNAT**

Dynamic SNAT maps the private IP addresses to the first available public address from a pool of addresses. In the FortiGate firewall, this can be done by using IP pools. IP pools is a mechanism that allows sessions leaving the FortiGate firewall to use NAT. An IP pool defines a single IP address or a range of IP addresses to be used as the source address for the duration of the session. These assigned addresses are used instead of the IP address assigned to that FortiGate interface.
**IP pool types**

FortiGate uses four types of IPv4 IP pools. This topic focuses on some of the differences between them.

**Overload**

This type of IP pool is similar to static SNAT mode. We need to define an external IP range that contains one or more IP addresses. When there is only one IP address it is almost the same as static SNAT, the outgoing interface address is used. When it contains multiple IP addresses, it is equivalent to an extended mode of static SNAT.

For instance, if we define an overload type IP pool with two external IP addresses (172.16.200.1—172.16.200.2), since there are 60,416 available port numbers per IP, this IP pool can handle 60,416*2 internal IP addresses.

<table>
<thead>
<tr>
<th>Original Source IP</th>
<th>Original Source Port</th>
<th>Translated Source IP</th>
<th>Translated Source Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.1.100.1</td>
<td>11110</td>
<td>172.16.200.1</td>
<td>5117</td>
</tr>
<tr>
<td>10.1.100.2</td>
<td>11111</td>
<td>172.16.200.1</td>
<td>5118</td>
</tr>
<tr>
<td>.....</td>
<td>.....</td>
<td>172.16.200.1</td>
<td>.....</td>
</tr>
<tr>
<td>.....</td>
<td>.....</td>
<td>172.16.200.1</td>
<td>65533</td>
</tr>
<tr>
<td>.....</td>
<td>.....</td>
<td>172.16.200.2</td>
<td>5117</td>
</tr>
<tr>
<td>.....</td>
<td>.....</td>
<td>172.16.200.2</td>
<td>65533</td>
</tr>
</tbody>
</table>

The mapped IP address can be calculated from the source IP address. The index number of the address in the pool is the remainder of the source IP address, in decimal, divided by the number addresses in the pool.

To calculate the decimal value of the source IP address, either use an online calculator, or use the following equation:

\[ a.b.c.d = a \times (256)^3 + b \times (256)^2 + c \times (256) + d \]

For example:

\[ 192.168.0.1 = 192 \times (256)^3 + 168 \times (256)^2 + 0 \times (256) + 1 = 3232235521 \]

If there is one IP pool, where:

- \( P_1 \) = the first address in the IP pool
- \( R_1 \) = the number of IP addresses in the IP pool
- \( X \) = the source IP address as a decimal number
- \( Y \) = the mapped IP address

Then the equation to determine the mapped address is:

\[ Y = P_1 + X \mod R_1 \]

For example:

<table>
<thead>
<tr>
<th>IP pool</th>
<th>Source IP address</th>
</tr>
</thead>
<tbody>
<tr>
<td>172.26.73.20 to 172.26.73.90</td>
<td>192.168.1.200</td>
</tr>
</tbody>
</table>

1. Convert the source IP address to a decimal number:

\[ 192 \times (256)^3 + 168 \times (256)^2 + 1 \times (256) + 200 = 3232235976 \]

2. Determine the number of IP addresses in the pool:

\[ 172.26.73.90 - 172.26.73.20 = 71 \]
3. Find the remainder of the source IP address divided by the number of addresses in the pool:
   \[ 3232235976 \mod 71 = 26 \]

4. Add the remainder to the first IP address in the pool:
   \[ 172.26.73.20 + 26 = 172.26.73.46 \]

So, the mapped IP address is \textbf{172.26.73.46}.

If there are multiple IP pools, the calculation is similar to when there is only one pool.

If there are two IP pools, where:
- \( P_1 \) = the first address in the first IP pool
- \( P_2 \) = the first address in the second IP pool
- \( R_1 \) = the number of IP addresses in the first IP pool
- \( R_2 \) = the number of IP addresses in the second IP pool
- \( X \) = the source IP address as a decimal number
- \( Y \) = the mapped IP address

Then the equations to determine the mapped address are:

- If \( X \mod (R_1 + R_2) \geq R_1 \), then \( Y = P_2 + X \mod R_2 \)
- If \( X \mod (R_1 + R_2) < R_1 \), then \( Y = P_1 + X \mod R_1 \)

For example:

<table>
<thead>
<tr>
<th>IP pools</th>
<th>Source IP address</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool01: 172.26.73.20 to 172.26.73.90</td>
<td>192.168.1.200</td>
</tr>
<tr>
<td>pool02: 172.26.75.50 to 172.26.75.150</td>
<td></td>
</tr>
</tbody>
</table>

1. Convert the source IP address to a decimal number:
   \[ 192 \times (256)^2 + 168 \times (256)^2 + 1 \times (256) + 200 = 3232235976 \]

2. Determine the total number of IP addresses in the pools:
   \[ (172.26.73.90 - 172.26.73.20) + (172.26.75.50 - 172.26.75.150) = 71 + 101 = 172 \]

3. Find the remainder of the source IP address divided by the number of addresses in the pools:
   \[ 3232235976 \mod 172 = 108 \]

4. The remainder is greater than the number of addresses in pool01, so the address is selected from pool02 and the remainder is recalculated based only on pool02:
   \[ 3232235976 \mod 101 = 40 \]

5. Add the new remainder to the first IP address in pool02:
   \[ 172.26.75.50 + 40 = 172.26.75.90 \]

So, the mapped IP address is \textbf{172.26.75.90}.

**One-to-one**

This type of IP pool means that the internal IP address and the external (translated) IP address match one-to-one. The port address translation (PAT) is disabled when using this type of IP pool. For example, if we define a one-to-one type IP pool with two external IP addresses (172.16.200.1 - 172.16.200.2), this IP pool only can handle two internal IP addresses.
Fixed port range

For the overload and one-to-one IP pool types, we do not need to define the internal IP range. For the fixed port range type of IP pool, we can define both internal IP range and external IP range. Since each external IP address and the number of available port numbers is a specific number, if the number of internal IP addresses is also determined, we can calculate the port range for each address translation combination. So we call this type fixed port range. This type of IP pool is a type of port address translation (PAT).

For instance, if we define one external IP address (172.16.200.1) and ten internal IP addresses (10.1.100.1-10.1.100.10), we have translation IP+Port combination like following table:

<table>
<thead>
<tr>
<th>Original Source IP</th>
<th>Original Source Port</th>
<th>Translated Source IP</th>
<th>Translated Source Port Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.1.100.1</td>
<td>..</td>
<td>172.16.200.1</td>
<td>5117–11157</td>
</tr>
<tr>
<td>10.1.100.2</td>
<td>..</td>
<td>172.16.200.1</td>
<td>11158–17100</td>
</tr>
<tr>
<td>10.1.100.3</td>
<td>..</td>
<td>172.16.200.1</td>
<td>..</td>
</tr>
<tr>
<td>10.1.100.4</td>
<td>..</td>
<td>172.16.200.1</td>
<td>..</td>
</tr>
<tr>
<td>10.1.100.5</td>
<td>..</td>
<td>172.16.200.1</td>
<td>..</td>
</tr>
<tr>
<td>10.1.100.6</td>
<td>..</td>
<td>172.16.200.1</td>
<td>..</td>
</tr>
<tr>
<td>10.1.100.7</td>
<td>..</td>
<td>172.16.200.1</td>
<td>..</td>
</tr>
<tr>
<td>10.1.100.8</td>
<td>..</td>
<td>172.16.200.1</td>
<td>..</td>
</tr>
<tr>
<td>10.1.100.9</td>
<td>..</td>
<td>172.16.200.1</td>
<td>53445–59465</td>
</tr>
<tr>
<td>10.1.100.10</td>
<td>..</td>
<td>172.16.200.1</td>
<td>59466–65525</td>
</tr>
</tbody>
</table>

Port block allocation

This type of IP pool is also a type of port address translation (PAT). It gives users a more flexible way to control the way external IPs and ports are allocated. Users need to define Block Size/Block Per User and external IP range. Block Size means how many ports each Block contains. Block per User means how many blocks each user (internal IP) can use.

The following is a simple example:

- **External IP Range**: 172.16.200.1—172.16.200.1
- **Block Size**: 128
- **Block Per User**: 8

Result:

- **Total-PBAs**: 472 (60416/128)
- **Maximum ports can be used per User (Internal IP Address)**: 1024 (128*8)
- **How many Internal IP can be handled**: 59 (60416/1024 or 472/8)

Sample configuration

To configure overload IP pool in the GUI:

1. In Policy & Objects > IP Pools, click Create New.
2. Select IPv4 Pool and then select Overload.
3. Enter the external IP range separated by a hyphen (172.16.200.1-172.16.200.1).

4. Click OK.

To configure overload IP pool in the CLI:

```
config firewall ippool
    edit "Overload-ippool"
        set startip 172.16.200.1
        set endip 172.16.200.1
    next
end
```

To configure one-to-one IP pool using the GUI:

1. In Policy & Objects > IP Pools, click Create New.
2. Select IPv4 Pool and then select One-to-One.
3. Enter the external IP range separated by a hyphen (172.16.200.1-172.16.200.2).

4. Click OK.

To configure one-to-one IP pool in the CLI:

```
config firewall ippool
    edit "One-to-One-ippool"
        set type one-to-one
```

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
To configure fixed port range IP pool in the GUI:

1. In Policy & Objects > IP Pools, click Create New.
2. Select IPv4 Pool and then select Fixed Port Range.
4. Enter the internal IP range separated by a hyphen 10.1.100.1-10.1.100.10.
5. Click OK.

To configure fixed port range IP pool in the CLI:

```
config firewall ippool
edit "FPR-ippool"
  set type fixed-port-range
  set startip 172.16.200.1
  set endip 172.16.200.1
  set source-startip 10.1.100.1
  set source-endip 10.1.100.10
next
end
```

To configure port block allocation IP pool in the GUI:

1. In Policy & Objects > IP Pools, click Create New.
2. Select IPv4 Pool and then select Port Block Allocation.
3. Enter the external IP range separated by a hyphen 172.16.200.1-172.16.200.1).

4. Click OK.

To configure port block allocation IP pool in the CLI:

```plaintext
config firewall ippool
  edit PBA-ippool
    set type port-block-allocation
    set startip 172.16.200.1
    set endip 172.16.200.1
    set block-size 128
    set num-blocks-per-user 8
  next
end
```

Central SNAT

The central SNAT table enables you to define and control (with more granularity) the address translation performed by FortiGate. With the NAT table, you can define the rules for the source address or address group, and which IP pool the destination address uses.

FortiGate reads the NAT rules from the top down until it hits a matching rule for the incoming address. This enables you to create multiple NAT policies that dictate which IP pool is used based on source address, destination address, and source port. NAT policies can be rearranged within the policy list. NAT policies are applied to network traffic after a security policy.

The central SNAT table allows you to create, edit, delete, and clone central SNAT entries.

Central SNAT notes

- The central NAT feature is not enabled by default.
- If central NAT is enabled, the NAT option under IPv4 policies is skipped and SNAT must be done via `central-snat-map`. The firewall policy list and dialog boxes have messages and redirection links to show this information.
- If NGFW mode is policy-based, then it is assumed that central NAT (specifically SNAT) is enabled implicitly.
Sample configuration

To enable central SNAT from the GUI:

1. In System > Settings, under System Operations Settings, enable Central SNAT.
2. Click Apply.

To enable or disable central SNAT using the CLI:

```plaintext
config system settings
    set central-nat {enable | disable}
end
```

When central NAT is enabled, Policy & Objects displays the Central SNAT section.

The Central SNAT policy has many options:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Specify whether you are performing SNAT on IPv4 or IPv6. This option only appears when IPv6 is enabled under Feature Visibility.</td>
</tr>
<tr>
<td>Incoming Interface</td>
<td>Specify one or more interfaces for the ingress traffic.</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>Specify one or more interfaces for the egress traffic.</td>
</tr>
<tr>
<td>Source Address</td>
<td>Specify the address or address group of the source.</td>
</tr>
<tr>
<td>Destination Address</td>
<td>Specify the address or address group of the destination.</td>
</tr>
<tr>
<td>NAT</td>
<td>Enable or disable to perform NAT. When disabled, no source address translation will occur.</td>
</tr>
<tr>
<td>IP Pool Configuration</td>
<td>Use outgoing interface address:</td>
</tr>
<tr>
<td></td>
<td>• Use the address of the outgoing interfaces as source address.</td>
</tr>
<tr>
<td></td>
<td>Use Dynamic IP Pool:</td>
</tr>
<tr>
<td></td>
<td>• Choose an IP Pool to perform source NAT.</td>
</tr>
<tr>
<td>Protocol</td>
<td>Choose from any, TCP, UDP, SCTP, or specify the protocol number to match. For example, for ICMP, click specify with the protocol number 1.</td>
</tr>
<tr>
<td>Explicit port mapping</td>
<td>Enable in order to match this NAT policy only when the following ports are a match:</td>
</tr>
<tr>
<td></td>
<td>• Choose an original source port from one to 65535. NAT'd port will be chosen by the FortiGate based on the IP Pool configuration.</td>
</tr>
<tr>
<td></td>
<td>Explicit port mapping cannot apply to some protocols which do not use ports, such as ICMP. When enabling a NAT policy which uses Explicit port mapping, always consider that ICMP traffic will not match this policy.</td>
</tr>
<tr>
<td></td>
<td>When using IP Pools, only the Overload type IP Pool allows Explicit port mapping. When Explicit port mapping is applied, you must define an original source port range and a translated sort port range. The source port will map one to one with the translated port.</td>
</tr>
<tr>
<td></td>
<td>Refer to Dynamic SNAT to understand how each IP Pool type works.</td>
</tr>
</tbody>
</table>
Policy and Objects

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comments</td>
<td>Enter comments for this NAT policy.</td>
</tr>
<tr>
<td>Enable this policy</td>
<td>Enable or disable this policy.</td>
</tr>
</tbody>
</table>

To configure central SNAT using the CLI:

```plaintext
cfg firewall central-snat-map
edit <policyID number>
  set status {enable|disable}
  set orig-addr <valid address object preconfigured on the FortiGate>
  set srcintf <name of interface on the FortiGate>
  set dst-addr <valid address object preconfigured on the FortiGate>
  set dstintf <name of interface on the FortiGate>
  set protocol <integer for protocol number>
  set orig-port <integer for original port number>
  set nat-port <integer for translated port number>
  set comments <string>
next
end
```

**Example one**

Apply SNAT to all traffic from port2 to port3.

To configure from the CLI:

```plaintext
cfg firewall central-snat-map
  edit 1
    set srcintf "port3"
    set dstintf "port2"
    set orig-addr "all"
    set dst-addr "all"
next
end
```

**Example two**

Apply an IP Pool to all traffic from port3 to port2 that are TCP. NAT all other traffic using the outgoing interface IP.

To configure from the CLI:

```plaintext
cfg firewall ippool
  edit "Overload-IPPOOL"
    set startip 192.168.2.201
    set endip 192.168.2.202
next
end
cfg firewall central-snat-map
  edit 1
    set srcintf "port3"
    set dstintf "port2"
    set orig-addr "all"
    set dst-addr "all"
```
Policy and Objects

```
set protocol 6
set nat-ippool "Overload-IPPOOL"
next
edit 2
  set srcintf "port3"
  set dstintf "port2"
  set orig-addr "all"
  set dst-addr "all"
next
end
```

To collect session table output from the CLI:

diagnose sys session list

The TCP session (protocol 6) is NAT’d with Overload-IPPOOL to 192.168.2.201:

```
session info: proto=6 proto_state=05 duration=14 expire=0 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=860/7/1 reply=555/8/1 tuples=2
  tx speed(Bps/kbps): 60/0 rx speed(Bps/kbps): 38/0
origin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=pre dir=org act=snat 192.168.0.10:49531->23.57.57.114:443 (192.168.2.201:61776)
hook=pre dir=reply act=dnat 23.57.57.114:443->192.168.2.201:61776 (192.168.0.10:49531)
prom/before,after) 0/(0,0), 0/(0,0)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0

sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

A UDP session (protocol 17) is NAT’d to the outgoing interface IP address 192.168.2.86:

```
session info: proto=17 proto_state=01 duration=16 expire=163 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ helper=dns-udp vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=59/1/1 reply=187/1/1 tuples=2
  tx speed(Bps/kbps): 3/0 rx speed(Bps/kbps): 11/0
origin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=pre dir=org act=snat 192.168.0.10:52177->4.2.2.1:53 (192.168.2.86:61770)
hook=pre dir=reply act=dnat 4.2.2.1:53->192.168.2.86:61770 (192.168.0.10:52177)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=00011061 tos=ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```
Example three

Apply an IP Pool to all traffic from port3 to port2 that have a specific original port range, mapping the ports to the same NAT'd port range. Nat all other traffic using the outgoing interface IP.

To configure from the CLI:

```
config firewall central-snat-map
edit 1
    set srcintf "port3"
    set dstintf "port2"
    set orig-addr "all"
    set dst-addr "all"
    set orig-port 50000-65535
    set nat-ippool "Overload-IPPOOL"
    set nat-port 50000-65535
next
edit 2
    set srcintf "port3"
    set dstintf "port2"
    set orig-addr "all"
    set dst-addr "all"
next
end
```

To collect session table output from the CLI:

```
diagnose sys session list
```

Traffic with original port in the range between 50000-65535 will be NAT'd with the Overload type IP Pool. The mapped port is in the same port range:

```
session info: proto=17 proto_state=01 duration=3 expire=176 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ helper=dns-udp vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=71/1/1 reply=123/1/1 tuples=2
tx speed(Bps/kbps): 23/0 rx speed(Bps/kbps): 40/0
origin->sink: org pre->post, reply pre->post dev=9->6/6->9 qwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:52540->4.2.2.1:53(192.168.2.201:52540)
hook=pre dir=reply act=dnat 4.2.2.1:53->192.168.2.201:52540(192.168.0.10:52540)
dst_mac=d9:05:6f:12:34
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=00011399 tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwd=n/a
npu_state=0x040000
```

Traffic with original port outside the range of 50000-65535 will be NAT'd to the outgoing interface IP:

```
session info: proto=6 proto_state=01 duration=3 expire=3597 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
```
per_ip_shaper=

Configuring an IPv6 SNAT policy

IPv4 and IPv6 central SNAT maps are displayed in the same table.

To configure an IPv6 policy with central SNAT in the GUI:

1. Enable central SNAT:
   a. In the Global VDOM, go to System > VDOM.
   b. Select a VDOM and click Edit. The Edit Virtual Domain Settings pane opens.
   c. Enable Central SNAT.
d. Click OK.

2. In the VDOM with central SNAT enabled (FG-traffic in this example), go to Policy & Objects > Central SNAT and click Create New.

3. Configure the policy settings:
   a. For Type, select IPv6.
   b. Enter the interface, address, and IP pool information.
   c. Configure the remaining settings as needed.

   d. Click OK.

The matching SNAT traffic will be handled by the IPv6 central SNAT map.

To configure an IPv6 policy with central SNAT in the CLI:

1. Enable central SNAT:

   ```
   config vdom
   edit FG-traffic
   config system settings
   set central-nat enable
   end
   next
   end
   ```

2. Create an IPv6 central SNAT policy:

   ```
   config vdom
   edit FG-traffic
   config firewall central-snat-map
   ```
### Policy and Objects

```fortios-config
edit 2
   set type ipv6
   set srcintf "wan2"
   set dstintf "wan1"
   set orig-addr6 "all"
   set dst-addr6 "all"
   set nat-ippool6 "test-ippool6-1"
next
end
next
end
```

3. Verify the SNAT traffic:

```fortios-config
(FG-traffic) # diagnose sniffer packet any icmp6 4
interfaces=[any]
filters=[icmp6]
^C
8 packets received by filter
0 packets dropped by kernel
```

### SNAT policies with virtual wire pairs

Source NAT (SNAT) can be configured in IPv4 and IPv6 policies with virtual wire pair (VWP) interfaces, and between VWP interfaces when central NAT is enabled.

**To configure a policy using SNAT and a VWP interface when central NAT is disabled:**

1. Create the VWP interface:

   ```fortios-config
   config system virtual-wire-pair
      edit "test-vw-1"
         set member "port1" "port4"
      next
   end
   ```

2. Create the IP pool. The IP pool must have a different subnet than the VWP peers.

   ```fortios-config
   config firewall ippool
      edit "vwp-pool-1"
         set startip 172.16.222.99
         set endip 172.16.222.100
      next
   end
   ```

3. Configure the firewall policy:

   ```fortios-config
   config firewall policy
      edit 88
   ```
Policy and Objects

```
set srcintf "port4"
set dstintf "port1"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set logtraffic all
set nat enable
set ippool enable
set poolname "vwp-pool-1"
```

```
next
end
```

4. Verify the IP pool functions as expected and traffic passes through:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
23.438095 port4 in 172.16.200.11 -> 172.16.200.156: icmp: echo request
23.438126 port1 out 172.16.222.100 -> 172.16.200.156: icmp: echo request
23.438492 port1 in 172.16.200.156 -> 172.16.222.100: icmp: echo reply
24.439305 port4 out 172.16.200.11 -> 172.16.200.156: icmp: echo request
24.439319 port1 out 172.16.222.100 -> 172.16.200.156: icmp: echo request
24.439684 port1 in 172.16.200.156 -> 172.16.222.100: icmp: echo reply
24.439692 port4 out 172.16.200.156 -> 172.16.200.11: icmp: echo reply
```

8 packets received by filter  
0 packets dropped by kernel

To configure a SNAT between VWP interfaces when central NAT is enabled:

1. Enable central NAT:

```
config system settings
    set central-nat enable
end
```

2. Create the VWP interface:

```
config system virtual-wire-pair
    edit "test-vw-1"
        set member "port1" "port4"
    next
end
```

3. Create the IP pool. The IP pool must have a different subnet than the VWP peers.

```
config firewall ippool
    edit "vwp-pool-1"
        set startip 172.16.222.99
        set endip 172.16.222.100
    next
end
```
4. Configure the SNAT policy:
   
   ```
   config firewall central-snat-map
   edit 2
   set srcintf "port4"
   set dstintf "port1"
   set orig-addr "all"
   set dst-addr "all"
   set nat-ippool "vwp-pool-1"
   next
   end
   ```

5. Configure the firewall policy:

   ```
   config firewall policy
   edit 90
   set srcintf "port4"
   set dstintf "port1"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set logtraffic all
   next
   end
   ```

**Destination NAT**

The following topics provide instructions on configuring policies with destination NAT:

- [Static virtual IPs on page 816](#)
- [Virtual IP with services on page 819](#)
- [Virtual IPs with port forwarding on page 820](#)
- [Virtual server load balance on page 822](#)

**Static virtual IPs**

Static Virtual IPs (VIP) are used to map external IP addresses to internal IP addresses. This is also called destination NAT, where a packet's destination is being NAT'd, or mapped, to a different address.

Static VIPs are commonly used to map public IP addresses to resources behind the FortiGate that use private IP addresses. A static one-to-one VIP is when the entire port range is mapped. A port forwarding VIP is when the mapping is configured on a specific port or port range.

Some of the VIP configuration options are:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VIP Type</td>
<td>• IPv4 (config firewall vip) - The source and destination are both IPv4.</td>
</tr>
<tr>
<td></td>
<td>• IPv6 (config firewall vip6) - The source and destination are both IPv6.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> IPv6 is only available when IPv6 is enabled in the Feature Visibility.</td>
</tr>
<tr>
<td>Setting</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Interface (ext intf)</td>
<td>The external interface that the firewall policy source interface must match. For example, if the external interface is port1, then the VIP can be used in a policy from port1 to port3, but not in a policy from port2 to port3.</td>
</tr>
<tr>
<td></td>
<td>If the external interface is any, then the VIP can be used in any firewall policy.</td>
</tr>
</tbody>
</table>
| Type (type)             | - Static NAT - Use an external IP address or address range.  
- FQDN - Use an external IP or FQDN address.  
- load-balance (CLI only) - Load balance traffic.  
- server-load-balance - Load balance traffic across multiple servers. SSL processing can be offloaded to the FortiGate. This type of VIP is configure from Policy & Objects > Virtual Servers.  
- dns-translation (CLI only) - DNS translation.  
- access-proxy - Used for ZTNA. See ZTNA HTTPS access proxy example on page 989 for details.                                                     |
| External IP address/range (ext ip) | In a static NAT VIP, the external IP address is the IP address that the FortiGate listens for traffic on.  
When the external interface is not any, 0.0.0.0 can be used to make the external IP address equivalent to the external interface’s IP address.  
The external IP address is also used to perform SNAT for the mapped server when the server outbound traffic with a destination interface that matches the external interface. The firewall policy must also have NAT enabled. |
<p>| IPv4 address/range (mapped ip) | The IPv4 address or range that the internal resource is being mapped to.                                                                                                                                   |
| IPv6 address/range (ipv6-mapped) | The IPv6 address or range that the internal resource is being mapped to.                                                                                                                                    |
| srcintf-filter (CLI only) | Listen for traffic to the external IP address only on the specified interface. While the external interface restricts the policies where the VIP can be used, it does not restrict listening to only the external interface. To restrict listening to only a specific interface, srcintf-filter must be configured. |
| nat-source-vip (CLI only) | Force all of the traffic from the mapped server to perform SNAT with the external IP address, regardless of the destination interface. If srcintf-filter is defined, then nat-source-vip only forces SNAT to be performed when the destination matches the srcintf-filter interface. In both cases, the firewall policy must have NAT enabled. |
| arp-reply (CLI only) | Enable/disable responding to ARP requests on the external IP address (default = enable).                                                                                                                  |
| Source address (src-filter) | Restrict the source IP address, address range, or subnet that is allowed to access the VIP.                                                                                                               |
| Services (service)      | Set the services that are allowed to be mapped.                                                                                                                                                    |
| Port Forwarding (portforward) | Enable port forwarding to specify the port (mappedport) to map to.                                                                                                                                   |</p>
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If no services are configured, you can configure the protocol (protocol) to use when forwarding packets, the external service port range (extport) to be mapped to a port range on the destination network, and the mapped port range (mappedport and ipv6-mappedport) on the destination network.</td>
<td></td>
</tr>
</tbody>
</table>

**Port Mapping Type**

- One to one - Each external service port is mapped to one port. A range is allowed, but the number of ports should be the same.
- Many to Many - The port mapping can be one to one, one to many, or many to one. There are no restrictions on how many external ports must map to internal ports.

**Sample configuration**

To create a virtual IP in the GUI:

1. In Policy & Objects > Virtual IPs and click Create New > Virtual IP.
2. Select a VIP Type based on the IP versions used.
3. Enter a unique name for the virtual IP.
4. Enter values for the external IP address/range and map to IPv4/IPv6 address/range fields.

```plaintext
config firewall vip
edit "Internal_WebServer"
set extip 10.1.100.199
set extintf "any"
set mappedip "172.16.200.55"
commit
```

To create a virtual IP in the CLI:
To apply a virtual IP to policy in the CLI:

```plaintext
config firewall policy
  edit 8
    set name "Example_Virtual_IP_in_Policy"
    set srcintf "wan2"
    set dstintf "internal"
    set srcaddr "all"
    set dstaddr "Internal_WebServer"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
  next
end
```

**Virtual IP with services**

Virtual IP with services is a more flexible virtual IP mode. This mode allows users to define services to a single port number mapping.

This topic shows how to use virtual IP with services enabled. This example has one public external IP address. We map TCP ports 8080, 8081, and 8082 to an internal WebServer TCP port 80. This allows remote connections to communicate with a server behind the firewall.

**Sample configuration**

**To create a virtual IP with services in the GUI:**

1. In *Policy & Objects > Virtual IPs* and click *Create New > Virtual IP*.
2. Set *VIP Type* to *IPv4*.
3. Enter a unique name for the virtual IP and fill in the other fields.
4. Configure the fields in the *Network* section. For example:
   - Set *Interface* to *any*.
   - Set *External IP Address/Range* to *10.1.100.199*.
   - Set *Mapped IP Address/Range* to *172.16.200.55*.
5. Enable *Optional Filters* and then enable *Services*.
6. In the *Services* field click + to display the *Services* pane.
7. In the *Services* pane select *TCP_8080*, *TCP_8081*, and *TCP_8082*.
8. Enable *Port Forwarding* and set *Map to IPv4 port* to *80*. 
9. Click OK.

To see the results:

1. Apply the above virtual IP to the firewall policy.
2. The results are:
   - Access 10.1.100.199:8080 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
   - Access 10.1.100.199:8081 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
   - Access 10.1.100.199:8082 from external network and FortiGate maps to 172.16.200.55:80 in internal network.

To create a virtual IP with services in the CLI:

```bash
config firewall vip
edit "WebServer_VIP_Services"
   set service "TCP_8080" "TCP_8081" "TCP_8082"
   set extip 10.1.100.199
   set extintf "any"
   set portforward enable
   set mappedip "172.16.200.55"
   set mappedport 80
next
end
```

**Virtual IPs with port forwarding**

If you need to hide the internal server port number or need to map several internal servers to the same public IP address, enable port-forwarding for Virtual IP.
This topic shows how to use virtual IPs to configure port forwarding on a FortiGate unit. This example has one public external IP address. We map TCP ports 8080, 8081, and 8082 to different internal WebServers’ TCP port 80. This allows remote connections to communicate with a server behind the firewall.

**Sample configuration**

**To create a virtual IP with port forwarding in the GUI:**

1. In Policy & Objects > Virtual IPs.
2. Click Create New and select Virtual IP.
3. For VIP Type, select IPv4.
4. Enter a unique name for the virtual IP and fill in the other fields.
5. Configure the fields in the Network section. For example:
   - Set Interface to any.
   - Set External IP Address/Range to 10.1.100.199.
   - Set Mapped IP Address/Range to 172.16.200.55.
7. Enable Port Forwarding.
8. Configure the fields in the Port Forwarding section. For example:
   - Set Protocol to TCP.
   - Set External Service Port to 8080.
   - Set Map to IPv4 port to 80.
9. Click OK.
10. Follow the above steps to create two additional virtual IPs.
    a. For one virtual IP:
       - Use a different Mapped IP Address/Range, for example, 172.16.200.56.
       - Set External Service Port to 8081.
- Use the same *Map to IPv4* port number: 80.

  b. For the other virtual IP:
  - Use a different *Mapped IP Address/Range*, for example, 172.16.200.57.
  - Set *External Service Port* to 8082.
  - Use the same *Map to IPv4* port number: 80.

11. Create a *Virtual IP Group* and put the above three virtual IPs into that group.

![Virtual IP Group](image)

To see the results:

1. Apply the above virtual IP to the Firewall policy.
2. The results are:
   - Access 10.1.100.199:8080 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
   - Access 10.1.100.199:8081 from external network and FortiGate maps to 172.16.200.56:80 in internal network.
   - Access 10.1.100.199:8082 from external network and FortiGate maps to 172.16.200.57:80 in internal network

**Virtual server load balance**

This topic shows a special virtual IP type: virtual server. Use this type of VIP to implement server load balancing.

The FortiOS server load balancing contains all the features of a server load balancing solution. You can balance traffic across multiple backend servers based on multiple load balancing schedules including:

- Static (failover)
- Round robin
- Weighted (to account for different sized servers or based on the health and performance of the server including round trip time and number of connections)

The load balancer supports HTTP, HTTPS, IMAPS, POP3S, SMTPS, SSL/TLS, and generic TCP/UDP and IP protocols. Session persistence is supported based on the SSL session ID based on an injected HTTP cookie, or based on the HTTP or HTTPS host. SSL/TLS load balancing includes protection from protocol downgrade attacks. Server load balancing is supported on most FortiGate devices and includes up to 10,000 virtual servers on high end systems.
SSL/TLS offloading

FortiGate SSL/TLS offloading is designed for the proliferation of SSL/TLS applications. The key exchange and encryption/decryption tasks are offloaded to the FortiGate unit where they are accelerated using FortiASIC technology which provides significantly more performance than a standard server or load balancer. This frees up valuable resources on the server farm to give better response to business operations. Server load balancing offloads most SSL/TLS versions including SSL 3.0, TLS 1.0, and TLS 1.2, and supports full mode or half mode SSL offloading with DH key sizes up to 4096 bits.

FortiGate SSL offloading allows the application payload to be inspected before it reaches your servers. This prevents intrusion attempts, blocks viruses, stops unwanted applications, and prevents data leakage. SSL/TLS content inspection supports TLS versions 1.0, 1.1, and 1.2 and SSL versions 1.0, 1.1, 1.2, and 3.0.

Virtual server requirements

When creating a new virtual server, you must configure the following options:

- Virtual Server Type.
- Load Balancing Methods.
- Health check monitoring (optional).
- Session persistence (optional).
- Virtual Server IP (External IP Address).
- Virtual Server Port (External Port).
- Real Servers (Mapped IP Address & Port).

Virtual server types

Select the protocol to be load balanced by the virtual server. If you select a general protocol such as IP, TCP, or UDP, the virtual server load balances all IP, TCP, or UDP sessions. If you select specific protocols such as HTTP, HTTPS, or SSL, you can apply additional server load balancing features such as Persistence and HTTP Multiplexing.
<table>
<thead>
<tr>
<th>Protocol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP</td>
<td>Select HTTP to load balance only HTTP sessions with the destination port number that matches the Virtual Server Port setting. Change Virtual Server Port to match the destination port of the sessions to be load balanced (usually port 80 for HTTP sessions). You can enable HTTP Multiplexing. You can also set Persistence to HTTP Cookie to enable cookie-based persistence.</td>
</tr>
<tr>
<td>HTTPS</td>
<td>Select HTTPS to load balance only HTTPS sessions with the destination port number that matches the Virtual Server Port setting. Change Virtual Server Port to match the destination port of the sessions to be load balanced (usually port 443 for HTTPS sessions). You can enable HTTP Multiplexing. You can also set Persistence to HTTP Cookie to enable cookie-based persistence, or you can set Persistence to SSL Session ID.</td>
</tr>
<tr>
<td>IMAPS</td>
<td>Select IMAPS to load balance only IMAPS sessions with the destination port number that matches the Virtual Server Port setting. Change Virtual Server Port to match the destination port of the sessions to be load balanced (usually port 993 for IMAPS sessions). You can also set Persistence to SSL Session ID.</td>
</tr>
<tr>
<td>POP3S</td>
<td>Select POP3S to load balance only POP3S sessions with the destination port number that matches the Virtual Server Port setting. Change Virtual Server Port to match the destination port of the sessions to be load balanced (usually port 995 for POP3S sessions). You can also set Persistence to SSL Session ID.</td>
</tr>
<tr>
<td>SMTPS</td>
<td>Select SMTPS to load balance only SMTPS sessions with the destination port number that matches the Virtual Server Port setting. Change Virtual Server Port to match the destination port of the sessions to be load balanced (usually port 465 for SMTPS sessions). You can also set Persistence to SSL Session ID.</td>
</tr>
<tr>
<td>SSL</td>
<td>Select SSL to load balance only SSL sessions with the destination port number that matches the Virtual Server Port setting. Change Virtual Server Port to match the destination port of the sessions to be load balanced. You can also set Persistence to SSL Session ID.</td>
</tr>
<tr>
<td>TCP</td>
<td>Select TCP to load balance only TCP sessions with the destination port number that matches the Virtual Server Port setting. Change Virtual Server Port to match the destination port of the sessions to be load balanced.</td>
</tr>
<tr>
<td>UDP</td>
<td>Select UDP to load balance only UDP sessions with the destination port number that matches the Virtual Server Port setting. Change Virtual Server Port to match the destination port of the sessions to be load balanced.</td>
</tr>
<tr>
<td>IP</td>
<td>Select IP to load balance all sessions accepted by the security policy that contains this virtual server.</td>
</tr>
</tbody>
</table>

**Load balancing methods**

The load balancing method defines how sessions are load balanced to real servers.

All load balancing methods do not send traffic to real servers that are down or not responding. FortiGate can only determine if a real server is not responding by using a health check monitor. You should always add at least one health check monitor to a virtual server or to real servers; otherwise load balancing might try to distribute sessions to real servers that are not functioning.
<table>
<thead>
<tr>
<th>Load Balancing Method</th>
<th>Description</th>
</tr>

<tr>
<td><strong>Static</strong></td>
<td>The traffic load is statically spread evenly across all real servers. Sessions are not assigned according to how busy individual real servers are. This load balancing method provides some persistence because all sessions from the same source address always go to the same real server. Because the distribution is stateless, so if a real server is added, removed, or goes up or down, the distribution is changed and persistence might be lost.</td>
</tr>
<tr>
<td><strong>Round Robin</strong></td>
<td>Directs new requests to the next real server. This method treats all real servers as equals regardless of response time or the number of connections. This method does not direct requests to real servers that are down or non-responsive.</td>
</tr>
<tr>
<td><strong>Weighted</strong></td>
<td>Real servers with a higher weight value receive a larger percentage of connections. Set the real server weight when adding a real server.</td>
</tr>
<tr>
<td><strong>Least Session</strong></td>
<td>Directs requests to the real server that has the least number of current connections. This method works best in environments where the real servers or other equipment you are load balancing all have similar capabilities. This load balancing method uses the FortiGate session table to track the number of sessions being processed by each real server. The FortiGate unit cannot detect the number of sessions actually being processed by a real server.</td>
</tr>
<tr>
<td><strong>Least RTT</strong></td>
<td>Directs sessions to the real server with the lowest round trip time. The round trip time is determined by a ping health check monitor. The default is 0 if no ping health check monitors are added to the virtual server.</td>
</tr>
<tr>
<td><strong>First Alive</strong></td>
<td>Directs sessions to the first live real server. This load balancing schedule provides real server failover protection by sending all sessions to the first live real server. If a real server fails, all sessions are sent to the next live real server. Sessions are not distributed to all real servers so all sessions are processed by the first real server only.</td>
</tr>
<tr>
<td><strong>HTTP Host</strong></td>
<td>Load balances HTTP host connections across multiple real servers using the host’s HTTP header to guide the connection to the correct real server.</td>
</tr>
</tbody>
</table>

**Health check monitoring**

In the FortiGate GUI, you can configure health check monitoring so that the FortiGate unit can verify that real servers are able respond to network connection attempts. If a real server responds to connection attempts, the load balancer continues to send sessions to it. If a real server stops responding to connection attempts, the load balancer assumes that the server is down and does not send sessions to it. The health check monitor configuration determines how the load balancer tests real servers. You can use a single health check monitor for multiple load balancing configurations. You can configure TCP, HTTP, DNS, and ping health check monitors. You usually set the health check monitor to use the same protocol as the traffic being load balanced to it. For example, for an HTTP load balancing configuration, you would normally use an HTTP health check monitor.

**Session persistence**

Use persistence to ensure a user is connected to the same real server every time the user makes an HTTP, HTTPS, or SSL request that is part of the same user session. For example, if you are load balancing HTTP and HTTPS sessions to a collection of eCommerce web servers, when users make a purchase, they will be starting multiple sessions as they navigate the eCommerce site. In most cases, all the sessions started by this user during one eCommerce session should be processed by the same real server. Typically, the HTTP protocol keeps track of these related sessions using cookies. HTTP cookie persistence ensure all sessions that are part of the same user session are processed by the same real server.
When you configure persistence, the FortiGate unit load balances a new session to a real server according to the load balance method. If the session has an HTTP cookie or an SSL session ID, the FortiGate unit sends all subsequent sessions with the same HTTP cookie or SSL session ID to the same real server.

**Real servers**

Add real servers to a load balancing virtual server to provide information the virtual server requires to send sessions to the server. A real server configuration includes the IP address of the real server and port number the real server receives sessions on. The FortiGate unit sends sessions to the real server’s IP address using the destination port number in the real server configuration.

When configuring a real server, you can also specify the weight (if the load balance method is set to Weighted) and you can limit the maximum number of open connections between the FortiGate unit and the real server. If the maximum number of connections is reached for the real server, the FortiGate unit automatically switches all further connection requests to other real servers until the connection number drops below the limit. Setting *Maximum Connections* to 0 means that the FortiGate unit does not limit the number of connections to the real server.

**Sample of HTTP load balancing to three real web servers**

This example describes the steps to configure the load balancing configuration below. In this configuration, a FortiGate unit is load balancing HTTP traffic from the Internet to three HTTP servers on the internal network. HTTP sessions are accepted at the wan1 interface with destination IP address 172.20.120.121 on TCP port 8080, and forwarded from the internal interface to the web servers. When forwarded, the destination address of the session is translated to the IP address of one of the web servers.

This load balancing configuration also includes session persistence using HTTP cookies, round-robin load balancing, and TCP health monitoring for the real servers. Ping health monitoring consists of the FortiGate unit using ICMP ping to ensure the web servers can respond to network traffic.
General steps:

1. Create a health check monitor.
   A ping health check monitor causes the FortiGate to ping the real servers every 10 seconds. If one of the servers does not respond within 2 seconds, the FortiGate unit will retry the ping 3 times before assuming that the HTTP server is not responding.

2. Create a load balance virtual server with three real servers.

3. Add the load balancing virtual server to a policy as the destination address.

To see the virtual servers and health check monitors options in the GUI, Load Balance must be selected in Feature Visibility > Additional Features. See Feature visibility on page 2165 on page 1 for details.

Configure a load balancing virtual server in the GUI

To create a health check monitor:

1. Go to Policy & Objects > Health Check.
2. Click Create New.
3. Set the following:
   - Name to Ping-mon-1
   - Type to Ping
   - Interval to 10 seconds
   - Timeout to 2 seconds
   - Retry to 3 attempt(s)

4. Click OK.

To create a virtual server:

1. Go to Policy & Objects > Virtual Servers.
2. Click Create New.
3. Set the following:
   - Name to Vserver-HTTP-1
   - Type to HTTP
   - Interface to wan1
   - Virtual Server IP to 172.20.120.121
   - Virtual Server Port to 8080
4. In the Real Servers table, click Create New.
5. Set the following for the first real server:
   - Type to IP
   - IP Address to 10.31.101.30
   - Port to 80
   - Max Connections to 0
   - Mode to Active

6. Click OK. Configure two more real servers with IP addresses 10.31.101.40 and 10.31.101.50, and the same settings as the first real server.
7. Click OK.
To create a security policy that includes the load balance virtual server as the destination address:

1. Go to Policy & Objects > Firewall Policy.
2. Click Create New.
3. Set the Inspection Mode to Proxy-based. The new virtual server will not be available if the inspection mode is Flow-based.
4. Set the following:
   - Name to LB-policy
   - Incoming Interface to wan1
   - Outgoing Interface to internal
   - Source to all
   - Destination to Vserver-HTTP-1
   - Schedule to always
   - Service to ALL
   - Action to ACCEPT
5. Enable NAT and set IP Pool Configuration to Use Outgoing Interface Address.
6. Enable AntiVirus and select an antivirus profile.
7. Click OK.
Configure a load balancing virtual server in the CLI

To configure HTTP load balancing to three real web servers in the CLI:

1. Create a health check monitor:

```plaintext
config firewall ldb-monitor
    edit "Ping-mon-1"
      set type ping
      set interval 10
      set timeout 2
      set retry 3
    next
end
```

2. Create a virtual server:

```plaintext
config firewall vip
    edit "Vserver-HTTP-1"
      set type server-load-balance
      set extip 172.20.120.121
      set extintf "any"
      set server-type http
      set monitor "Ping-mon-1"
      set ldb-method round-robin
      set persistence http-cookie
      set extport 8080
    config realservers
      edit 1
        set type ip
        set ip 10.31.101.30
        set port 80
      next
      edit 2
        set type ip
        set ip 10.31.101.40
        set port 80
      next
      edit 3
        set type ip
        set ip 10.31.101.50
        set port 80
      next
    end
next
end
```

3. Add the load balancing virtual server to a policy as the destination address:

```plaintext
config firewall policy
    edit 2
      set name "LB-policy"
      set inspection-mode proxy
      set srcintf "wan1"
      set dstintf "internal"
      set srcaddr "all"
      set dstaddr "Vserver-HTTP-1"
      set action accept
```
set schedule "always"
set service "ALL"
set utm-status enable
set ssl-ssh-profile "certificate-inspection"
set av-profile "default"
set fsso disable
set nat enable
next
end

Results

Traffic accessing 172.20.120.121:8080 is forwarded in turn to the three real servers.

If the access request has an http-cookie, FortiGate forwards the access to the corresponding real server according to the cookie.

Examples and policy actions

The following topics provide examples and instructions on policy actions:

- NAT64 policy and DNS64 (DNS proxy) on page 831
- NAT46 policy on page 836
- NAT46 and NAT64 policy and routing configurations on page 839
- Mirroring SSL traffic in policies on page 850
- Recognize anycast addresses in geo-IP blocking on page 852
- Matching GeoIP by registered and physical location on page 853
- HTTP to HTTPS redirect for load balancing on page 855
- Use Active Directory objects directly in policies on page 856
- No session timeout on page 860
- MAP-E support on page 861
- Seven-day rolling counter for policy hit counters on page 865
- Cisco Security Group Tag as policy matching criteria on page 866

**NAT64 policy and DNS64 (DNS proxy)**

NAT64 policy translates IPv6 addresses to IPv4 addresses so that a client on an IPv6 network can communicate transparently with a server on an IPv4 network.

NAT64 policy is usually implemented in combination with the DNS proxy called DNS64. DNS64 synthesizes AAAA records from A records and is used to synthesize IPv6 addresses for hosts that only have IPv4 addresses. DNS proxy and DNS64 are interchangeable terms.
Policy and Objects

Sample topology

In this example, a host on the internal IPv6 network communicates with ControlPC.qa.fortinet.com that only has IPv4 address on the Internet. Central NAT is disabled.

1. The host on the internal network does a DNS lookup for ControlPC.qa.fortinet.com by sending a DNS query for an AAAA record for ControlPC.qa.fortinet.com.
2. The DNS query is intercepted by the FortiGate DNS proxy. The DNS proxy performs an A-record query for ControlPC.qa.fortinet.com and gets back an RRSet containing a single A record with the IPv4 address 172.16.200.55.
3. The DNS proxy then synthesizes an AAAA record. The IPv6 address in the AAAA record begins with the configured NAT64 prefix in the upper 96 bits and the received IPv4 address in the lower 32 bits. By default, the resulting IPv6 address is 64:ff9b::172.16.200.55.
4. The host on the internal network receives the synthetic AAAA record and sends a packet to the destination address 64:ff9b::172.16.200.55.
5. The packet is routed to the FortiGate internal interface (port10) where it is accepted by the NAT64 security policy.
6. The FortiGate translates the destination address of the packets from IPv6 address 64:ff9b::172.16.200.55 to IPv4 address 172.16.200.55 and translates the source address of the packets to 172.16.200.200 (or another address in the IP pool range) and forwards the packets out the port9 interface to the Internet.

Sample configuration

To configure a NAT64 policy with DNS64 in the GUI:

1. Enable IPv6 and DNS database:
   a. Go to System > Feature Visibility.
   b. In the Core Features section, enable IPv6.
   c. In the Additional Features section, enable DNS Database.
   d. Click Apply.
2. Enable DNS proxy on the IPv6 interface:
   a. Go to Network > DNS Servers.
   b. In the DNS Service on Interface table, click Create New.
   c. For Interface, select port10.
   d. For Mode, select Forward to System DNS.
   e. Click OK.
3. Configure the IPv6 DHCP server:
   a. Go to Network > Interfaces and edit port10.
   b. Enable DHCPv6 Server and enter the following:
IPv6 subnet | 2001:db8:1::/64
---|---
DNS service | Specify
DNS server 1 | 2001:db8:1::10

c. Click OK.

4. Configure the IPv6 VIP for the destination IPv6 addresses:
These are all of the IPv6 addresses that the FortiGate DNS proxy synthesizes when an IPv6 device performs a DNS query that resolves to an IPv4 Address. In this example, the synthesized IPv6 address in theAAAA record begins with the configured NAT64 prefix in the upper 96 bits, so the VIP is for all the IPv6 addresses that begin with 64:ff9b.
   a. Go to Policy & Objects > Virtual IPs and click Create New > Virtual IP.
   b. Enter the following:
      | VIP type | IPv6
      | Name | vip6
      | Eternal IP address/range | 64:ff9b::-64:ff9b::ffff:ffff
      | Map to IPv4 address/range | Use Embedded
   c. Click OK.

5. Configure the IPv6 firewall address for the internal network:
   a. Click Create New > Address.
   b. Enter the following:
      | Category | IPv6 Address
      | Name | internal-net6
      | Type | IPv6 Subnet
      | IP/Netmask | 2001:db8:1::/48
   c. Click OK.

6. Configure the IP pool containing the IPv4 address that is used as the source address of the packets exiting port9:
   a. Go to Policy & Objects > IP Pools and click Create New.
   b. Enter the following:
      | IP Pool Type | IPv4 Pool
      | Name | exit-pool4
      | Type | Overload
      | External IP address/range | 172.16.200.200-172.16.200.207
      | NAT64 | Enable

   *External IP address/range must start and end on the boundaries of a valid subnet. For example, 172.16.200.0-172.16.200.7 and 172.16.200.16-172.16.200.31 are a valid subnets (/29 and /28 respectively).*
c. Click OK.

7. Configure the NAT64 policy:
   a. Go to Policy & Objects > Firewall Policy and click Create New.
   b. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>policy64-1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>port10</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>port9</td>
</tr>
<tr>
<td>Source</td>
<td>internal-net6</td>
</tr>
<tr>
<td>Destination</td>
<td>vip6</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>NAT64</td>
</tr>
<tr>
<td>IP Pool Configuration</td>
<td>exit-pool4</td>
</tr>
</tbody>
</table>

c. Click OK.

To configure a NAT64 policy with DNS64 in the CLI:

1. Enable IPv6 and DNS database:
   ```
   config system global
   set gui-ipv6 enable
   end
   config system settings
   set gui-dns-database enable
   end
   ```

2. Enable DNS proxy on the IPv6 interface:
   ```
   config system dns-server
   edit "port10"
   set mode forward-only
   next
   end
   ```

3. Configure the IPv6 DHCP server:
   ```
   config system dhcp6 server
   edit 1
   set subnet 2001:db8:1::/64
   set interface "port10"
   set dns-server1 2001:db8:1::10
   next
   end
   ```

4. Configure the IPv6 VIP for the destination IPv6 addresses:
config firewall vip6
  edit "vip6"
    set extip 64:ff9b::64:ff9b::ffff:ffff
    set embedded-ipv4-address enable
  next
end

5. Configure the IPv6 firewall address for the internal network:

config firewall address6
  edit "internal-net6"
    set ip6 2001:db8:1::/48
  next
end

6. Configure the IP pool containing the IPv4 address that is used as the source address of the packets exiting port9:

config firewall ippool
  edit "exit-pool4"
    set startip 172.16.200.200
    set endip 172.16.200.207
    set nat64 enable
  next
end

7. Configure the NAT64 policy:

config firewall policy
  edit 1
    set name "policy64-1"
    set srcintf "port10"
    set dstintf "port9"
    set action accept
    set nat64 enable
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 internal-net6
    set dstaddr6 vip6
    set schedule "always"
    set service "ALL"
    set ippool enable
    set poolname "exit-pool4"
  next
end

To enable DNS64 and related settings using the CLI:

Enabling DNS64 means that all IPv6 traffic received by the current VDOM can be subject to NAT64 if the source and destination address matches an NAT64 security policy.

By default, the setting always-synthesize-aaaa-record is enabled. If you disable this setting, the DNS proxy (DNS64) will attempt to find an AAAA records for queries to domain names and therefore resolve the host names to IPv6 addresses. If the DNS proxy cannot find an AAAA record, it synthesizes one by adding the NAT64 prefix to the A record.
config system dns64
    set status {enable | disable}
    set dns64-prefix <ipv6-prefix>
        set always-synthesize-aaaa-record {enable | disable}
end

By default, the `dns64-prefix` is 64:ff9b::/96.

### NAT46 policy

NAT46 refers to the mechanism that allows IPv4 addressed hosts to communicate with IPv6 hosts. Without such a mechanism, IPv4 environments cannot connect to IPv6 networks.

### Sample topology

In this example, an IPv4 client tries to connect to an IPv6 server. A VIP is configured on FortiGate to map the server IPv6 IP address 2000:172:16:200::55 to an IPv4 address 10.1.100.55. On the other side, an IPv6 IP pool is configured and the source address of packets from client are changed to the defined IPv6 address. In this setup, the client PC can access the server by using IP address 10.1.100.55.

### Sample configuration

To configure NAT46 in the GUI:

1. **Enable IPv6:**
   a. Go to **System > Feature Visibility**.
   b. In the **Core Features** section, enable **IPv6**.
   c. Click **Apply**.
2. **Configure the VIP:**
   a. Go to **Policy & Objects > Virtual IPs and click **Create New > Virtual IP**.  
   b. Enter the following:

<table>
<thead>
<tr>
<th><strong>VIP type</strong></th>
<th>IPv4</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>vip46_server</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>port2</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Static NAT</td>
</tr>
<tr>
<td><strong>External IP address/range</strong></td>
<td>10.1.100.55</td>
</tr>
<tr>
<td><strong>Map to IPv6 address/range</strong></td>
<td>2000:172:16:200::55</td>
</tr>
</tbody>
</table>

c. Click **OK**.
3. Configure the IPv6 IP pool:
   a. Go to Policy & Objects > IP Pools and click Create New.
   b. Enter the following:

<table>
<thead>
<tr>
<th>IP Pool Type</th>
<th>IPv6 Pool</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>client_external</td>
</tr>
<tr>
<td>NAT46</td>
<td>Enable</td>
</tr>
</tbody>
</table>
   c. Click OK.

4. Configure the firewall policy:
   a. Go to Policy & Objects > Firewall Policy and click Create New.
   b. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>policy46-1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>port10</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>port9</td>
</tr>
<tr>
<td>Source</td>
<td>all</td>
</tr>
<tr>
<td>Destination</td>
<td>vip46_server</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>NAT</td>
<td>NAT46</td>
</tr>
<tr>
<td>IP Pool Configuration</td>
<td>client_external</td>
</tr>
</tbody>
</table>
   c. Configure the other settings as needed.
   d. Click OK.

To configure NAT46 in the CLI:

1. Enable IPv6:
   ```
cfg system global
   set gui-ipv6 enable
   end
   ```

2. Configure the VIP:
   ```
cfg firewall vip
   edit "vip46_server"
   set extip 10.1.100.55
   set nat44 disable
   set nat46 enable
   set extintf "port2"
   set ipv6-mappedip 2000:172:16:200::55
   ```
3. Configure the IPv6 IP pool:

```plaintext
config firewall ippool6
edit "client_external"
    set startip 2000:172:16:201::
    set endip 2000:172:16:201::7
    set nat46 enable
next
end
```

4. Configure the firewall policy:

```plaintext
config firewall policy
edit 2
    set name "policy46-1"
    set srcintf "port10"
    set dstintf "port9"
    set action accept
    set nat46 enable
    set srcaddr "all"
    set dstaddr "vip46_server"
    set srcaddr6 "all"
    set dstaddr6 "all"
    set schedule "always"
    set service "ALL"
    set logtraffic all
    set auto-asic-offload disable
    set ippool enable
    set poolname6 "client_external"
next
end
```

Sample troubleshooting

To trace the flow and troubleshoot:

```plaintext
# diagnose debug flow filter saddr 10.1.100.11
# diagnose debug flow show function-name enable
# diagnose debug flow show iprope enable
# diagnose debug flow trace iprope start 5
```

```
id=20085 trace_id=1 func=print_pkt_detail line=5401 msg="vd-root:0 received a packet (proto=1, 10.1.100.11:27592->10.1.100.55:2048) from port10. type=8, code=0, id=27592, seq=1."
```

```
id=20085 trace_id=1 func=init_ip_session_common line=5561 msg="allocate a new session-000003b9"
```

```
id=20085 trace_id=1 func=iprope_dnat_check line=4948 msg="in-[port10], out-[]"
id=20085 trace_id=1 func=iprope_dnat_tree_check line=822 msg="len=1"
```
NAT46 and NAT64 policy and routing configurations

Multiple NAT46 and NAT64 related objects are consolidated into regular objects. A per-VDOM virtual interface, naf.<vdom>, is automatically added to process NAT46/NAT64 traffic. The features include:

- **vip46 and vip64 settings are consolidated in vip and vip6 configurations.**
- **policy46 and policy64 settings are consolidated in firewall policy settings.**
- **nat46&nat64 are included in firewall policy settings.**
- **ippool and ippool6 support NAT46 and NAT64 (when enabled, the IP pool should match a subnet).**
- **Central SNAT supports NAT46 and NAT64.**
- **add-nat46:route in ippool6 and add-nat64:route in ippool are enabled by default. The FortiGate generates a static route that matches the IP range in ippool6 or ippool for the naf tunnel interface.**

**Automatic processing of the naf tunnel interface is not supported in security policies.**

To configure NAT46/NAT64 translation, use the standard vip/vip6 setting, apply it in a firewall policy, enable NAT46/NAT64, and enter the IP pool to complete the configuration.
The external IP address cannot be the same as the external interface IP address.

**Examples**

IPv6 must be enabled to configure these examples. In the GUI, so go to System > Feature Visibility and enable IPv6. In the CLI, enter the following:

```bash
config system global
    set gui-ipv6 enable
end
```

### NAT46 policy

In this example, a client PC is using IPv4 and an IPv4 VIP to access a server that is using IPv6. The FortiGate uses NAT46 to translate the request from IPv4 to IPv6 using the virtual interface naf.root. An ippool6 is applied so that the request is SNATed to the ippool6 address (2000:172:16:200::1 - 2000:172:16:101::1).

**To create a NAT46 policy in the GUI:**

1. **Configure the VIP:**
   a. Go to Policy & Objects > Virtual IPs and click Create New > VIP.
   b. Enter the following:

<table>
<thead>
<tr>
<th>VIP type</th>
<th>IPv4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>test-vip46-1</td>
</tr>
<tr>
<td>Interface</td>
<td>To_vlan20</td>
</tr>
<tr>
<td>Type</td>
<td>Static NAT</td>
</tr>
<tr>
<td>External IP address/range</td>
<td>10.1.100.150</td>
</tr>
<tr>
<td>Map to IPv6 address/range</td>
<td>2000:172:16:200::156</td>
</tr>
</tbody>
</table>
2. Configure the IPv6 pool:
   a. Go to Policy & Objects > IP Pools and click Create New.
   b. Enter the following:

<table>
<thead>
<tr>
<th>IP Pool Type</th>
<th>IPv6 Pool</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>test-ippool6-1</td>
</tr>
<tr>
<td>NAT46</td>
<td>Enable</td>
</tr>
</tbody>
</table>

   c. Click OK.

3. Configure the firewall policy:
   a. Go to Policy & Objects > Firewall Policy and click Create New or edit an existing policy.
   b. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>policy46-1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>To_vlan20</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>To_vlan30</td>
</tr>
<tr>
<td>Source</td>
<td>all</td>
</tr>
<tr>
<td>Destination</td>

</tr>
</tbody>
</table>

c. Configure the other settings as needed.

d. Click OK.

**To create a NAT46 policy in the CLI:**

1. **Configure the VIP:**
   ```
   config firewall vip
   edit "test-vip46-1"
       set extsip 10.1.100.150
       set nat44 disable
       set nat46 enable
       set extintf "port24"
       set arp-reply enable
       set ipv6-mappedip 2000:172:16:200::156
   next
   end
   ```

2. **Configure the IPv6 pool:**
   ```
   config firewall ippool6
   edit "test-ippool6-1"
       set startip 2000:172:16:101::1
       set endip 2000:172:16:101::1
       set nat46 enable
       set add-nat46-route enable
   ```
3. Configure the firewall policy:

```plaintext
config firewall policy
edit 2
set name "policy46-1"
set srcintf "port24"
set dstintf "port17"
set action accept
set nat46 enable
set srcaddr "all"
set dstaddr "test-vip46-1"
set srcaddr6 "all"
set dstaddr6 "all"
set schedule "always"
set service "ALL"
set logtraffic all
set auto-asic-offload disable
set ippool enable
set poolname6 "test-ippool6-1"
next
end
```

To verify the traffic and session tables:

1. Verify the traffic by the sniffer packets:

```plaintext
(rroot) # diagnose sniffer packet any 'icmp or icmp6' 4
interfaces=[any]
filters=[icmp or icmp6]
2.593302 port24 in 10.1.100.41 -> 10.1.100.150: icmp: echo request
2.593344 naf.root out 10.1.100.41 -> 10.1.100.150: icmp: echo request
2.593790 naf.root in 10.1.100.150 -> 10.1.100.41: icmp: echo reply
2.593804 port24 out 10.1.100.150 -> 10.1.100.41: icmp: echo reply
11 packets received by filter
0 packets dropped by kernel
```

2. Verify the session tables for IPv4 and IPv6:

```plaintext
(rroot) # diagnose sys session list
session info: proto=1 proto_state=00 duration=2 expire=59 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3

no_ofld_reason: disabled-by-policy
total session 1

The IPv4 session is between the incoming physical interface port24 and naf.root. The IPv6 session is between the naf.root and the outgoing physical interface port17.

NAT64 policy

In this example, a client PC is using IPv6 and an IPv6 VIP to access a server that is using IPv4. The FortiGate uses NAT64 to translate the request from IPv6 to IPv4 using the virtual interface naf.root. An ippool is applied so that the request is SNATed to the ippool address (172.16.101.2 - 172.16.101.3).

An embedded VIP64 object is used in this configuration so a specific IPv4 mapped IP does not need to be set. The lower 32 bits of the external IPv6 address are used to map to the IPv4 address. Only an IPv6 prefix is defined. In this example, the IPv6 prefix is 2001:10:1:100::; so the IPv6 address 2001:10:1:100::ac10:c89c will be translated to 172.16.200.156.
To create a NAT64 policy in the GUI:

1. Configure the VIP:
   a. Go to Policy & Objects > Virtual IPs and click Create New > VIP.
   b. Enter the following:

<table>
<thead>
<tr>
<th>VIP type</th>
<th>IPv6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>test-vip64-1</td>
</tr>
<tr>
<td>External IP address/range</td>
<td>2000:10:1:100::150</td>
</tr>
<tr>
<td>Map to IPv4 address/range</td>
<td>Specify: 172.16.200.156</td>
</tr>
</tbody>
</table>

   c. Click OK.

2. Configure the VIP with the embedded IPv4 address enabled:
   a. Go to Policy & Objects > Virtual IPs and click Create New > VIP.
   b. Enter the following:

<table>
<thead>
<tr>
<th>VIP type</th>
<th>IPv6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>test-vip64-2</td>
</tr>
<tr>
<td>External IP address/range</td>
<td>2001:10:1:100::-2001:10:1:100::ffff:ffff</td>
</tr>
<tr>
<td>Map to IPv4 address/range</td>
<td>Use Embedded</td>
</tr>
</tbody>
</table>
3. Configure the IP pool:
   a. Go to Policy & Objects > IP Pools and click Create New.
   b. Enter the following:

<table>
<thead>
<tr>
<th>IP Pool Type</th>
<th>IPv4 Pool</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>test-ippool4-1</td>
</tr>
<tr>
<td>Type</td>
<td>Overload</td>
</tr>
<tr>
<td>External IP address/range</td>
<td>172.16.101.2-172.16.101.3</td>
</tr>
<tr>
<td>NAT64</td>
<td>Enable</td>
</tr>
</tbody>
</table>

   c. Click OK.

4. Configure the firewall policy:
   a. Go to Policy & Objects > Firewall Policy and click Create New or edit an existing policy.
   b. Enter the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>policy64-1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>To_vlan20</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>To_vlan30</td>
</tr>
<tr>
<td>Source</td>
<td>all</td>
</tr>
<tr>
<td>Destination</td>
<td>test-vip64-1</td>
</tr>
<tr>
<td></td>
<td>test-vip64-2</td>
</tr>
</tbody>
</table>
Schedule | always  
--- | ---  
Service | ALL  
Action | ACCEPT  
NAT | NAT64  
IP Pool Configuration | test-ippool4-1  

d. Configure the other settings as needed.

e. Click OK.

To create a NAT64 policy in the CLI:

1. Configure the VIP:
   ```
   config firewall vip6  
   edit "test-vip64-1"  
   set extip 2000:10:1:100::150  
   set nat66 disable  
   set nat64 enable  
   set ipv4-mappedip 172.16.200.156  
   next  
   end
   ```

2. Configure the VIP with the embedded IPv4 address enabled:
   ```
   config firewall vip6  
   edit "test-vip64-2"  
   set nat66 disable  
   set nat64 enable  
   set embedded-ipv4-address enable
   ```
3. Configure the IP pool:

```plaintext
config firewall ippool
  edit "test-ippool4-1"
  set startip 172.16.101.2
  set endip 172.16.101.3
  set nat64 enable
  set add-nat64-route enable
next
end
```

4. Configure the firewall policy:

```plaintext
config firewall policy
  edit 1
  set name "policy64-1"
  set srcintf "port24"
  set dstintf "port17"
  set action accept
  set nat64 enable
  set srcaddr "all"
  set dstaddr "all"
  set srcaddr6 "all"
  set dstaddr6 "all"
  set dstaddr6 "test-vip64-1" "test-vip64-2"
  set schedule "always"
  set service "ALL"
  set logtraffic all
  set auto-asic-offload disable
  set ippool enable
  set poolname "test-ippool4-1"
next
end
```

To verify the traffic and session tables:

1. Verify the VIP64 traffic by the sniffer packets:

```plaintext
(root) # diagnose sniffer packet any 'icmp or icmp6' 4
  interfaces=[any]
  filters=[icmp or icmp6]
  20.578854 port17 out 172.16.101.2 -> 172.16.200.156: icmp: echo request
  20.579083 port17 in 172.16.200.156 -> 172.16.101.2: icmp: echo reply
11 packets received by filter
0 packets dropped by kernel
```
2. Verify the session tables for IPv6 and IPv4:

```
(root) # diagnose sys session6 list
session6 info: proto=58 proto_state=00 duration=5 expire=56 timeout=0 flags=00000000
sockport=0 socktype=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
```

```
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty
statistic(bytes/packets/allow_err): org=312/3/0 reply=312/3/0 tuples=2
tx speed(Bps/kbps): 55/0 rx speed(Bps/kbps): 55/0
origin->sink: org pre->post, reply pre->post dev=24->53/53->24
```

```
peer=172.16.101.2:45392->172.16.101.2:45392->172.16.200.156:8 naf=1

```

```
rpdb_link_id = 00000000 ngfwid=n/a
```

```
npu_state=0x040001 no_offload
no_ofld_reason: disabled-by-policy
```

```
total session 1
```

The IPv6 session is between the incoming physical interface port24 and naf.root. The IPv4 session is between the naf.root and the outgoing physical interface port17.

3. Verify the embedded VIP64 traffic by the sniffer packets:

```
(root) # diagnose sniffer packet any 'icmp or icmp6' 4
```

```
interfaces=[any]
filters=['icmp or icmp6']
```
MIRRORS SSL TRAFFIC IN POLICIES

SSL mirroring allows the FortiGate to decrypt and mirror traffic to a designated port. A new decrypted traffic mirror profile can be applied to IPv4, IPv6, and explicit proxy firewall policies in both flow and proxy mode. Full SSL inspection must be used in the policy for the traffic mirroring to occur.

SSL inspection is automatically enabled when you enable a security profile on the policy configuration page.

To configure SSL mirroring in a policy in the GUI:

1. Go to Policy & Objects > Firewall Policy.
2. Create a new policy, or edit an existing one.
3. Configure the interfaces, sources, and other required information.
4. In the Security Profiles section, for SSL Inspection, select deep-inspection, or another profile that uses Full SSL Inspection.
5. Enable *Decrypted Traffic Mirror*. The terms of use agreement opens.

6. Click *Agree* to accept the terms.

7. In the drop-down list, select a decrypted traffic mirror, or click *Create* to create a new one. In this example, a new decrypted traffic mirror is created using the port3 interface.

8. Click *OK* to save the policy.

To configure SSL mirroring in proxy mode in the CLI:

1. Create the decrypted traffic mirror profile:
   ```
   config firewall decrypted-traffic-mirror
   edit SSL-to-port3
   set dstmac ff:ff:ff:ff:ff:ff
   set traffic-type ssl
   set traffic-source client
   set interface port3
   next
   end
   ```

2. Configure the policy to enable SSL traffic mirroring:
   ```
   config firewall policy
   edit 1
   set name "mirror-policy"
   set srcintf "port1"
   set dstintf "port2"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set nat enable
   ```

Recognize anycast addresses in geo-IP blocking

An anycast IP can be advertised from multiple locations and the router selects a path based on latency, distance, cost, number of hops, and so on. This technique is widely used by providers to route users to the closest server. Since the IP is hosted in multiple geographic locations, there is no way to specify one single location to that IP.

Anycast IP address ranges can be bypassed in geo-IP blocking. The ISDB contains a list of confirmed anycast IP ranges that can be used for this purpose.
When the source or destination is set to `geoip`, you can enable the `geoip-anycast` option. Once enabled, IPs where the anycast option is set to 1 in `geoip_db` are bypassed in country matching and blocking.

You can only use the CLI to configure this feature.

To enable the geoip-anycast option using the CLI:

```plaintext
cfg firewall policy
e1
  set name "policyid-1"
  set srcintf "wan2"
  set dstintf "wan1"
  set srcaddr "all"
  set dstaddr "test-geoip-CAN_1"
  set action accept
  set schedule "always"
  set service "ALL"
  set geoip-anycast enable
  set logtraffic all
  set nat enable
  next
end
```

To check the geoip-anycast option for an IP address using the CLI:

```plaintext
diagnose geoip ip2country 1.0.0.1
  1.0.0.1 - Australia, is anycast ip
```

The anycast IP is 1.0.0.1.

Matching GeoIP by registered and physical location

IP addresses have both a physical and registered location in the geography IP database. Sometimes these two locations are different. The `geoip-match` command allows users to match an IPv4 address in a firewall policy to its physical or registered location when a GeoIP is used as a source or destination address. IPv6 policies currently support geography address objects but do not support `geoip-match`.

In the following example, the physical location of 220.243.219.10 is CA (Canada), the registered location is CN (China), and it is not an anycast IP.

To configure GeoIP matching based on registered location:

1. Create a firewall policy to match the IP:

   ```plaintext
cfg firewall policy
e1
  set name "policy_id_1"
  set srcintf "wan2"
  set dstintf "wan1"
  set srcaddr "all"
```

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
set dstaddr "test-geoip-CA"
set action accept
set schedule "always"
set service "ALL"
set geoip-match registered-location
set logtraffic all
set auto-asic-offload disable
set nat enable
next
end

Since CA is applied as a destination address and registered location IP matching is enabled, if the destination IP of the traffic is 220.243.219.10, then the traffic will be blocked because the registered location is CN.

2. Verify that the policy is blocking traffic from the IP address:

# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
5.383798 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
6.381982 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
7.382608 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
^C
3 packets received by filter
0 packets dropped by kernel

To configure GeoIP matching based on physical location:

1. Create a firewall policy to match the IP:

config firewall policy
edit 1
set name "policy_id_1"
set srcintf "wan2"
set dstintf "wan1"
set srcaddr "all"
set dstaddr "test-geoip-CA"
set action accept
set schedule "always"
set service "ALL"
set geoip-match physical-location
set logtraffic all
set auto-asic-offload disable
set nat enable
next
end

Since CA is applied as a destination address and physical location IP matching is enabled, if the destination IP of the traffic is 220.243.219.10, then the traffic will pass through.

2. Verify that the policy is allowing traffic from the IP address:

# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
5.273985 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
5.274176 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
6.274426 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
6.274438 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
HTTP to HTTPS redirect for load balancing

You can configure a virtual server with HTTP to HTTPS redirect enabled. When enabled, a virtual server can convert a client's HTTP requests to HTTPS requests. Through this mandatory conversion, HTTP traffic is converted to HTTPS traffic. This conversion improves the security of the user network.

You can only enable this feature by using the CLI. After you enable this feature, traffic flows as follows:

- When FortiGate receives an HTTP request for an external IP, such as 10.1.100.201 in the following example, FortiGate sends an HTTP 303 response back to the original client and redirects HTTP to HTTPS, instead of forwarding the HTTP request to the real backend servers.
- The client browser restarts the TCP session to HTTPS.
- The HTTPS session comes to the FortiGate where a matching firewall policy allows the HTTPS traffic and establishes a secure SSL connection, and then forwards the request to the real backend servers.

To configure virtual server with HTTPS redirect enabled:

1. Create a virtual server with server-type set to http:

```plaintext
config firewall vip
edit "virtual-server-http"
   set type server-load-balance
   set extip 10.1.100.201
   set extintf "wan2"
   set server-type http
   set ldb-method round-robin
   set extport 80
config realservers
   edit 1
       set ip 172.16.200.44
       set port 80
   next
   edit 2
       set ip 172.16.200.55
       set port 80
   next
end
```

2. Create a virtual server with server-type set to https and with the same external IP address:

```plaintext
config firewall vip
edit "virtual-server-https"
   set type server-load-balance
   set extip 10.1.100.201
   set extintf "wan2"
   set server-type https
   set ldb-method round-robin
   set extport 443
config realservers
   edit 1 set ip 172.16.200.44
```
set port 443
next
edit 2
    set ip 172.16.200.55
    set port 443
next
end
set ssl-certificate "Fortinet_CA_SSL"
next
end

3. Enable the http-redirect option for the virtual server with server-type set to http:
config firewall vip
    edit "virtual-server-http"
        set http-redirect enable
    next
end

4. Add the two virtual servers to a policy:
config firewall policy
    edit 9
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "virtual-server-http" "virtual-server-https"
        set action accept
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end

Use Active Directory objects directly in policies

Active Directory (AD) groups can be used directly in identity-based firewall policies. You do not need to add remote AD groups to local FSSO groups before using them in policies.

FortiGate administrators can define how often group information is updated from AD LDAP servers.

To retrieve and use AD user groups in policies:

1. Set the FSSO Collector Agent AD access mode on page 856
2. Add an LDAP server on page 857
3. Create the FSSO collector that updates the AD user groups list on page 858
4. Use the AD user groups in a policy on page 859

Set the FSSO Collector Agent AD access mode

To use this feature, you must set FSSO Collector Agent to Advanced AD access mode. If the FSSO Collector Agent is running in the default mode, FortiGate cannot correctly match user group memberships.
Add an LDAP server

To add an LDAP server in the GUI:

1. Go to User & Authentication > LDAP Servers.
2. Click Create New.
3. Configure the settings as needed.

4. If secure communication over TLS is supported by the remote AD LDAP server:
   a. Enable Secure Connection.
   b. Select the protocol.
   c. Select the certificate from the CA that issued the AD LDAP server certificate.
   If the protocol is LDAPS, the port will automatically change to 636.

5. Click OK.

To add an LDAP server in the CLI:

```bash
cfg user ldap
   edit "AD-ldap"
      set server "10.1.100.131"
```
```plaintext
set cnid "cn"
set dn "dc=fortinet-fsso,dc=com"
set type regular
set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
set password Xxxxxxxxxxxxxxxxxxxxxxxxxx
next
end
```

**Create the FSSO collector that updates the AD user groups list**

**To create an FSSO agent connector in the GUI:**

1. Go to Security Fabric > External Connectors.
2. Click Create New.
3. In the Endpoint/Identity section, click FSSO Agent on Windows AD.
4. Fill in the Name
5. Set the Primary FSSO Agent to the IP address of the FSSO Collector Agent, and enter its password.
6. Set the User Group Source to Local.
7. Set the LDAP Server to the just created AD-ldap server.
8. Enable Proactively Retrieve from LDAP Server.
9. Set the Search Filter to `(&(objectClass=group)(cn=group*))`.
   
   The default search filter retrieves all groups, including Microsoft system groups. In this example, the filter is configured to retrieve group1, group2, etc, and not groups like grp199.
   
   The filter syntax is not automatically checked; if it is incorrect, the FortiGate might not retrieve any groups.
10. Set the Interval (minutes) to configure how often the FortiGate contacts the remote AD LDAP server to update the group information.

11. Click OK.
12. To view the AD user groups that are retrieved by the FSSO agent, hover the cursor over the group icon on the fabric.
To create an FSSO agent connector in the CLI:

```
config user fss
  edit "ad-advanced"
    set server "10.1.100.131"
    set password XXXXXXXXXXXXX
    set ldap-server "AD-ldap"
    set ldap-poll enable
    set ldap-poll-interval 2
    set ldap-poll-filter "((objectClass=group)(cn=group*))"
next
end
```

You can view the retrieved AD user groups with the `show user adgrp` command.

**Use the AD user groups in a policy**

The AD user groups retrieved by the FortiGate can be used directly in firewall policies.
No session timeout

To allow clients to permanently connect with legacy medical applications and systems that do not have keepalive or auto-reconnect features, the session timeout can be set to never for firewall services, policies, and VDOMs.

The options to disable session timeout are hidden in the CLI.

To set the session TTL value of a custom service to never:

```
config firewall service custom
  edit "tcp_23"
    set tcp-portrange 23
    set session-ttl never
  next
end
```

To set the session TTL value of a policy to never:

```
config firewall policy
  edit 201
    set srcintf "wan1"
    set dstintf "wan2"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "TCP_8080"
    set logtraffic disable
    set session-ttl never
    set nat enable
  next
end
```

To set the session TTL value of a VDOM to never:

```
config system session-ttl
  set default never
  config port
    edit 1
      set protocol 6
      set timeout never
      set start-port 8080
      set end-port 8080
    next
  end
end
```

To view a session list with the timeout set to never:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=9 expire=never timeout=never flags=00000000
sockflag=00000000 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
```
MAP-E support

On a customer edge (CE) FortiGate, an IPv4-over-IPv6 (MAP-E) tunnel can be created between the FortiGate and the border relay (BR) operating in an IPv6 network. A tunnel interface is created between the FortiGate and BR, which can be applied to firewall policies and IPsec VPN.

To configure a MAP-E tunnel between the FortiGate and the BR:

1. Configure fixed IP mode.
   a. Configure IPv6 on the interface:

      ```
      config system interface
      edit "wan1"
      config ipv6
      set autoconf enable
      set unique-autoconf-addr enable
      set interface-identifier ::6f:6clf:3400:0
      ```
The interface-identifier is an IPv6 address. Its last 64-bit will be kept and the rest will be cleared automatically. It will combine with the IPv6 prefix it gets from the IPv6 router to generate the IPv6 address of the interface.

By default, unique-autoconf-addr is disabled. It must be enabled so it can handle IPv6 prefix changing.

b. Configure the VNE tunnel:

```plaintext
config system vne-tunnel
  set status enable
  set interface "wan1"
  set mode fixed-ip
  set ipv4-address 10.10.81.81 255.255.255.0
  set br 2001:160::82
end
```

Initial sequence overview of VNE tunnel under fixed IP mode:

Once the IPv6 address of the FortiGate changes, the tunnel will be down because the BR does not know the FortiGate’s new IPv6 address. The FortiGate uses update-url to update the new IPv6 address to the provisioning server. The provisioning server updates the FortiGate’s IPv6 address to the BR so the VNE tunnel can be re-established.

Communication sequence overview of re-establishing VNE tunnel:
2. Configure the VNE tunnel to use MAP-E mode:

```plaintext
config system vne-tunnel
  set status enable
  set interface 'wan1'
  set ssl-certificate "Fortinet_Factory"
  set bmr-hostname ********
  set auto-asic-offload enable
  set mode map-e
end
```

Initial sequence overview of VNE tunnel under MAP-E mode:
The FortiGate sends a MAP rule request to the MAP distribution server once the IPv6 address is configured on the FortiGate by RS/RA. Next, the FortiGate will send an AAAA query to get the IPv6 address of the MAP distribution server. After sending the BMR request to the MAP distribution server, the FortiGate will get the IPv4 address, port set, BR IPv6 address, and hostname of the address resolution server from the BMR reply. The VNE tunnel between the FortiGate and BR is now established.

The address resolution server is actually a dynamic DNS. The hostname is used for the FortiGate to maintain an IPv6 address when it changes.

The FortiGate updates the DDNS server with its IPv6 address whenever it updates, which in turn provides the update to the MAP distribution server and BR so they know how to resolve the FortiGate by hostname.

Once the VNE tunnel is established, a tunnel interface is created (vne.root), and an IPv4-over-IPv6 tunnel is set up between the FortiGate and BR. The route, firewall policy, and DNS server can now be configured to let the traffic go through the VNE tunnel and the and protect the end-user. The VNE tunnel can also be used in IPsec phase 1.

3. Configure the route:

```plaintext
config router static
  edit 1
    set device "vne.root"
  next
end
```

4. Configure the firewall policy:

```plaintext
config firewall policy
  edit 111
    set name "ff"
    set srcintf "port2"
    set dstintf "vne.root"
```
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set utm-status enable
set ssl-ssh-profile "certificate-inspection"
set av-profile "default"
set nat enable
next
end

5. Configure the DNS server:

    config system dns-server
    edit "port2"
    next
    end

### Seven-day rolling counter for policy hit counters

Instead of storing a single number for the hit count and byte count collected since the inception of each policy, seven numbers for the last seven days and an active counter for the current day are stored. The past seven-day hit count is displayed in the policy list and policy pages. A seven-day bar chart shows statistics on each policy page. This feature is currently supported in firewall and multicast policies, but not security policies.

**To view the rolling counter information in the GUI:**

1. Go to Policy & Objects > Firewall Policy or Policy & Objects > Multicast Policy.
2. Select a policy and hover over the Bytes, Packets, or Hit Count values to view the tooltip with the corresponding traffic statistics and bar graph (this example uses firewall policies).

3. Click Edit. The policy traffic statistics appear in the right-hand side of the page.
4. Use the dropdowns to filter the bar graph data by counter (Bytes, Packets, or Hit Count) and policy type (IPv4, IPv6, or IPv4 + IPv6).

5. Optionally, click Clear Counters to delete the traffic statistics for the policy.
6. Click OK.

To view the rolling counter information in the CLI:

```
# diagnose firewall iprope show 100004 2
idx=2 pkts/bytes=14709/18777329 asic_pkts/asic_bytes=8087/10413737 nturbo_pkts/nturbo_bytes=8087/10413737 flag=0x0 hit count:19 (4 7 0 1 1 3 3 0)  
  first:2021-03-02 17:09:00 last:2021-03-08 17:23:40  
  established session count:0  
  first est:2021-03-02 17:11:20 last est:2021-03-08 17:23:40

# diagnose firewall iprope6 show 100004 2
idx=2 pkts/bytes=15698/19307164 asic_pkts/asic_bytes=7006/8578911 nturbo_pkts/nturbo_bytes=7006/8578911 flag=0x0 hit count:19 (4 7 0 1 3 2 2 0)  
  first:2021-03-02 17:10:32 last:2021-03-08 17:23:33  
  established session count:0  
  first est:2021-03-02 17:11:43 last est:2021-03-08 17:23:33
```

**Cisco Security Group Tag as policy matching criteria**

The FortiGate can read the Cisco Security Group Tag (SGT) in Ethernet frames, and use them as matching criteria in firewall policies. A policy can match based on the presence of an SGT, or the detection of a specific ID or IDs.

When a packet with a SGT passes through and a session is established, the `ext_header_type=0xc5:0xc5` flag is included in the session table.

This feature is available in flow mode policies for virtual wire pair policies or policies in transparent mode VDOMs.
To configure a firewall policy to detect SGTs in Ethernet frames:

```
config firewall policy
  edit 1
    set sgt-check {enable | disable}
    set sgt <ID numbers>
  next
end
```

**Examples**

In these examples, port2 and port5 are in a virtual wire pair. Firewall policies are created that pass traffic with SGTs with a specific ID number, any ID number, or either of two specific ID numbers.

To configure the virtual wire pair:

```
config system virtual-wire-pair
  edit "test-vwp-1"
    set member "port5" "port2"
    set wildcard-vlan enable
  next
end
```

To configure a firewall policy to match frames that have an SGT with ID 20 and allow them through:

```
config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port5"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set sgt-check enable
    set sgt 20
  next
end
```

To configure a firewall policy to match frames that have an SGT with any ID:

```
config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port5"
    set action accept
    set srcaddr "all"
```
To configure a firewall policy to match frames that have the SGT with IDs 20 or 21:

```plaintext
config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port5"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set sgt-check enable
    set sgt 20 21
next
end
```

To check the session list:

```plaintext
# diagnose sys session list

session info: proto=6 proto_state=01 duration=10 expire=3593 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3

```

Objects

The following topics provide information about objects:
Policy and Objects

- Address group exclusions on page 869
- MAC addressed-based policies on page 870
- ISDB well-known MAC address list on page 872
- Dynamic policy — fabric devices on page 873
- FSSO dynamic address subtype on page 875
- ClearPass integration for dynamic address objects on page 879
- Group address objects synchronized from FortiManager on page 882
- Using wildcard FQDN addresses in firewall policies on page 884
- Configure FQDN-based VIPs on page 886
- IPv6 geography-based addresses on page 887
- Array structure for address objects on page 889
- IPv6 MAC addresses and usage in firewall policies on page 891
- FortiNAC tag dynamic address on page 893
- Allow empty address groups on page 896
- Remove overlap check for VIPs on page 896
- VIP groups on page 897
- Internet Services on page 898

Address group exclusions

Specific IP addresses or ranges can be subtracted from the address group with the *Exclude Members* setting in IPv4 address groups.

This feature is only supported for IPv4 address groups, and only for addresses with a Type of *IP Range* or *Subnet*.

To exclude addresses from an address group using the GUI:

1. Go to *Policy & Objects > Addresses*.
2. Create a new address group, or edit an existing address group.
3. Enable *Exclude Members* and click the + to add entries.
4. Configure the other settings as needed.
5. Click *OK*.
The excluded members are listed in the *Exclude Members* column.

To exclude addresses from an address group using the CLI:

```bash
config firewall addrgrp
edit <address group>
    set exclude enable
    set exclude-member <address> <address> ...
next
end
```

**MAC addressed-based policies**

MAC addresses can be added to the following IPv4 policies:

- Firewall
- Virtual wire pair
- ACL
- Central SNAT
- DoS

A MAC address is a link layer-based address type and it cannot be forwarded across different IP segments. In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range.

FortiOS only supports the MAC address type as source address for policies in NAT mode VDOM. When you use the MAC address type in a policy as source address in NAT mode VDOM, IP address translation (NAT) is still performed according to the rules defined in the policy. The MAC address type only works for source address matching. It does not have any association with NAT actions.

For policies in transparent mode or the virtual wire pair interface, you can use the MAC address type as source or destination address.

**To configure a MAC address using the GUI:**

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
2. Enter a name.
3. For *Category*, select *Address*.
4. For *Type*, select *Device (MAC Address)*.
5. Enter the MAC address.

6. Click OK.

7. Go to Policy & Objects > Firewall Policy to apply the address type to a policy in NAT mode VDOM:
   a. For Source, select the MAC address you just configured.
   b. For Destination, select an address.

   In NAT mode VDOM, this address type cannot be used as destination address.

   c. Configure the other settings as needed.
   d. Click OK.

To configure a MAC address using the CLI:

1. Create a new MAC address:

   ```
   config firewall address
   edit "test-mac-addr1"
     set type mac
     set macaddr 00:0c:29:41:98:88
   next
   end
   ```

2. Apply the address type to a policy. In transparent mode or the virtual wire pair interface, this address type can be mixed with other address types in the policy:

   ```
   config firewall policy
   edit 1
     set srcintf "port2"
     set dstintf "port1"
     set srcaddr "test-mac-addr1" "10-1-100-42"
     set dstaddr "all"
     set action accept
     set schedule "always"
     set service "ALL"
     set logtraffic all
   ```
set nat enable
next
end

**ISDB well-known MAC address list**

The Internet Service Database (ISDB) includes well-known vendor MAC address range lists. The lists can only be used for source MAC addresses in IPv4 policies, and include the vendor name and the MAC address ranges that the vendor belongs to.

**To view the vendor list:**

```plaintext
# diagnose vendor-mac id
Please input Vendor MAC ID.
ID: 1 name: "Asus"
ID: 2 name: "Acer"
ID: 3 name: "Amazon"
ID: 4 name: "Apple"
ID: 5 name: "Xiaomi"
ID: 6 name: "Blackberry"
ID: 7 name: "Canon"
ID: 8 name: "Cisco"
ID: 9 name: "Linksys"
ID: 10 name: "D-Link"
ID: 11 name: "Dell"
ID: 12 name: "Ericsson"
ID: 13 name: "LG"
ID: 14 name: "Fujitsu"
ID: 15 name: "Fitbit"
ID: 16 name: "Fortinet"
ID: 17 name: "OPPO"
ID: 18 name: "Hitachi"
ID: 19 name: "HTC"
ID: 20 name: "Huawei"
ID: 21 name: "HP"
ID: 22 name: "IBM"
ID: 23 name: "Juniper"
ID: 24 name: "Lenovo"
ID: 25 name: "Microsoft"
ID: 26 name: "Motorola"
ID: 27 name: "Netgear"
ID: 28 name: "Nokia"
ID: 29 name: "Nintendo"
ID: 30 name: "PaloAltoNetworks"
ID: 31 name: "Polycom"
ID: 32 name: "Samsung"
ID: 33 name: "Sharp"
ID: 34 name: "Sony"
ID: 35 name: "Toshiba"
ID: 36 name: "VMware"
ID: 37 name: "Vivo"
ID: 38 name: "ZyXel"
ID: 39 name: "ZTE"
```
To view the MAC address ranges for a vendor:

```
# diagnose vendor-mac id 16
Vendor MAC: 16(Fortinet)
Version: 0000700021
Timestamp: 201908081432
Number of MAC ranges: 6
00:09:0f:00:00:00 - 00:09:0f:ff:ff:ff
04:d5:90:00:00:00 - 04:d5:90:ff:ff:ff
08:5b:0e:00:00:00 - 08:5b:0e:ff:ff:ff
70:4c:a5:00:00:00 - 70:4c:a5:ff:ff:ff
90:6c:ac:00:00:00 - 90:6c:ac:ff:ff:ff
e8:1c:ba:00:00:00 - e8:1c:ba:ff:ff:ff
```

To query the vendor of a specific MAC address or range:

```
# diagnose vendor-mac match 00:09:0f:ff:ff:ff 48
Vendor MAC: 16(Fortinet), matched num: 1
```

To use the vendor ID in a firewall policy:

```
config firewall policy
    edit 9
        set name "policy_id_9"
        set uuid 6150cf30-308d-51e9-a7a3-bcbd05d61f93
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set vendor-mac 36 16
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
next
end
```

Only packets whose source MAC address belong to Fortinet or VMware are passed by the policy.

Dynamic policy — fabric devices

The dynamic address group represents the configured IP addresses of all Fortinet devices connected to the Security Fabric. It currently includes FortiManager, FortiAnalyzer, FortiClient EMS, FortiMail, FortiAP(s), and FortiSwitch(es). Like other dynamic address groups for fabric connectors, it can be used as an IPv4 address in firewall policies and objects.

The list of firewall addresses includes a default address object called FABRIC_DEVICE. You can apply the FABRIC_DEVICE object to the following types of policies:

- Firewall policy, including virtual wire pairs, NAT 46, and NAT 64 (IPv4 only)
- IPv4 shaping policy
- IPv4 ACL policy
You cannot apply the **FABRIC_DEVICE** object to the following types of policies:

- IPv4 explicit proxy policy

You also cannot use the **FABRIC_DEVICE** object with the following settings:

- Custom extension on *internet-service*
- Exclusion of *addrgrp*

Initially the **FABRIC_DEVICE** object does not have an address value. The address value is populated dynamically as things change. As a result, you cannot edit the **FABRIC_DEVICE** object, add any addresses to the object, or remove any addresses from the object. The *Edit Address* pane in the GUI only has a *Return* button because the object is read-only:

The **FABRICDEVICE** object address values are populated based on:

- FortiAnalyzer IP (from the *Fabric Settings* pane)
- FortiManager IP (from the *Fabric Settings* pane)
- FortiMail IP (from the *Fabric Settings* pane)
- FortiClient EMS IP (from the *Fabric Settings* pane)
- FortiAP IPs (from the *FortiAP Setup* pane or DHCP)
- FortiSwitch IPs (from the *FortiSwitch Setup* page or DHCP)

**To apply the FABRIC_DEVICE object to a firewall policy using the GUI:**

1. Go to *Policy & Objects > Firewall Policy*.
2. Create a new policy or edit an existing policy.
3. For the *Destination* field, select **FABRIC_DEVICE** from the list of address entries.
4. Configure the rest of the policy as needed.
5. Click OK.

**To apply the FABRICDEVICE object to a firewall policy using the CLI:**

```plaintext
config firewall address
edit "FABRIC_DEVICE"
   set type ipmask
   set comment "IPv4 addresses of Fabric Devices."
   set visibility enable
```
set associated-interface ''
set color 0
set allow-routing disable
set subnet 0.0.0.0 0.0.0.0
next
end
config firewall policy
edit 1
  set srcintf "port2"
  set dstintf "port1"
  set srcaddr "all"
  set dstaddr "FABRICDEVICE"
  set action accept
  set schedule "always"
  set service "ALL"
  set utm-status enable
  set fsso disable
  set nat enable
next
end

Diagnose command

You can use the diagnose command to list IP addresses of Fortinet devices that are configured in the Security Fabric.

To run the diagnose command using the CLI:

(root) # diagnose firewall sf-addresses list

FabricDevices: 172.18.64.48
FortiAnalyzer: 172.18.60.25
FortiSandbox: 172.18.52.154
FortiManager: 172.18.28.31
FortiClientEMS: 172.18.62.6
FortiAP:
FortiSwitch:
FortiAP/SW-DHCP:

FSSO dynamic address subtype

The Fortinet Single Sign-On (FSSO) dynamic firewall address subtype can be used in policies that support dynamic address types. The FortiGate will update the dynamic address used in firewall policies based on the source IP information for the authenticated FSSO users.

It can also be used with FSSO group information that is forwarded by ClearPass Policy Manager (CPPM) via FortiManager, and other FSSO groups provided by the FSSO collector agent or FortiNAC.

To configure FSSO dynamic addresses with CPPM and FortiManager in the GUI:

1. Create the dynamic address object:
   a. Go to Policy & Objects &gt; Addresses, and click Create New &gt; Address.
   b. For Type, select Dynamic.
c. For Sub Type, select Fortinet Single Sign-On (FSSO). The Select Entries pane opens and displays all available FSSO groups.

d. Select one or more groups.

e. Click OK to save the configuration.

![Image of Configure FSSO groups]

In the address table, there will be an error message for the address you just created (Unresolved dynamic address: fsso). This is expected because there are currently no authenticated FSSO users (based on source IP) in the local FSSO user list.

2. Add the dynamic address object to a firewall policy:
   a. Go to Policy & Objects > Firewall Policy.
   b. Create a new policy or edit an existing policy.
   c. For Source, add the dynamic FSSO address object you just created.
   d. Configure the rest of the policy as needed.
   e. Click OK to save your changes.

![Image of Configure firewall policy]

3. Test the authentication to add a source IP address to the FSSO user list:
   a. Log in as user and use CPPM for user authentication to connect to an external web server. After successful authentication, CPPM forwards the user name, source IP address, and group membership to the FortiGate via FortiManager.
   b. Go to Monitor > Firewall User Monitor to view the user name (fsso1) and IP address.

![Image of Firewall User Monitor]

c. Go to Policy & Objects > Addresses to view the updated address table. The error message no longer appears.
d. Hover over the dynamic FSSO address to view the IP address (*fsso resolves to: 10.1.100.185*).

To verify user traffic in the GUI:

   Details for the user *fsso1* are visible in the traffic log:

   ![Traffic Log Example]

   - If another user is authenticated by CPPM, then the dynamic address *fsso* entry in the address table will be updated. The IP address for user *fsso2 (10.1.100.188)* is now visible:

   ![Address Table Example]

2. Go to FortiView > Sources to verify that the users were able to successfully pass the firewall policy.

   ![Source Table Example]

   If a user logs off and CPPM receives log off confirmation, then CPPS updates the FortiGate FSSO user list via FortiManager. The user IP address is deleted from the dynamic FSSO address, and the user is no longer be able to pass the firewall policy.
To configure FSSO dynamic addresses with CPPM and FortiManager in the CLI:

1. Create the dynamic address object:

```plaintext
cfg firewall address
edit "fsso"
    set type dynamic
    set sub-type fsso
    set fsso-group "cp_test_FSSOROLE"
next
end
```

2. Add the dynamic address object to a policy:

```plaintext
cfg firewall policy
edit 1
    set name "pol1"
    set srcintf "port2"
    set dstintf "port3"
    set srcaddr "fsso"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set logtraffic all
    set fsso disable
    set nat enable
next
end
```

To verify user traffic in the CLI:

1. Check the FSSO user list:

```plaintext
diagnose debug authd fsso list
----FSSO logons----
IP: 10.1.100.185 User: fsso1 Groups: cp_test_FSSOROLE Workstation: MemberOf: FSSO-CPPM cp_test_FSSOROLE
Total number of logons listed: 1, filtered: 0
----end of FSSO logons----
```

2. Check the authenticated firewall users list:

```plaintext
diagnose firewall auth list
10.1.100.185, fsso1
type: fsso, id: 0, duration: 2928, idled: 2928
server: FortiManager
packets: in 0 out 0, bytes: in 0 out 0
group_id: 2 33554433
group_name: FSSO-CPPM cp_test_FSSOROLE
----- 1 listed, 0 filtered ------

After user traffic passes through the firewall, the nu

```plaintext
diagnose firewall auth list
10.1.100.185, fsso1
type: fsso, id: 0, duration: 3802, idled: 143
server: FortiManager
packets: in 1629 out 1817, bytes: in 2203319 out 133312
```
Policy and Objects

```
group_id: 23354433

group_name: FSSO-CPPM cp_test_FSSOROLE

1 listed, 0 filtered
```

ClearPass integration for dynamic address objects

ClearPass Policy Manager (CPPM) can gather information about the statuses of network hosts, for example, the latest patches or virus infections. Based on this information, CPPM send the IP addresses and current states, such as Healthy or Infected, to the FortiGate.

On the FortiGate, the IP addresses received from CPPM are added to a dynamic firewall address with the `clearpass-spt` subtype. This address can be used in any policy that supports dynamic addresses, such as Firewall or SSL-VPN policies.

In this example, you create two dynamic IP addresses that are used in two firewall policies (deny and allow). One policy allows traffic (host state = Healthy), and the other denies traffic (host state = Infected). When CPPM sends the information, the IP addresses are assigned according to their host state: Healthy or Infected.

You can then verify that traffic from the Infected host is denied access by the deny policy, and traffic from the Healthy host is allowed access by the allow policy.

Create a REST API administrator

A REST API administrator is required to generate an authorization token for REST API messages, and to limit hosts that can send REST API messages to the FortiGate.

To create a REST API administrator in the GUI:

1. Go to System > Administrators.
2. Click Create New > REST API Admin.
3. Configure the Username and other information as needed.
5. In the Trusted Hosts field, enter 10.1.100.0/24.

```
New REST API Admin

Username: cpl-back
Comments: 0/255
Administrator profile: clearpass
PKI Group: 
CORS Allow Origin: 

Restrict login to trusted hosts

Trusted Hosts: 10.1.100.0/24

OK Cancel
```

For this example, an administrator profile called `clearpass` was created with full read/write access. See Administrator profiles on page 1951 for details.

6. Click OK.
   The New API key pane opens.
The API key is the REST API authorization token that is used in REST API messages sent by CPPM to the FortiGate.

7. Copy the API key to a secure location. A new key can be generated if this one is lost or compromised.
8. Click Close.

**To create a REST API administrator in the CLI:**

```bash
config system api-user
   edit "cpi-back"
      set accprofile "clearpass"
      config trusthost
         edit 1
            set ipv4-trusthost 10.1.100.0 255.255.255.0
         next
      end
   end
execute api-user generate-key cp-api
   New API key: 0f1HxGHh9r9p74k7qgfHNH40p51bjs
   NOTE: The bearer of this API key will be granted all access privileges assigned to the api-user cp-api.
```

**Create dynamic IP addresses with the clearpass subtype**

Two dynamic IP addresses are required, one for the allow policy, and the other for the deny policy.

**To create the dynamic IP addresses:**

```bash
config firewall address
   edit "cppm"
      set type dynamic
      set sub-type clearpass-spt
      set clearpass-spt healthy
      set comment ''
      set visibility enable
      set associated-interface ''
      set color 0
   next
   edit "cppm-deny"
      set type dynamic
```
Create firewall policies

Two firewall policies are required, one to accept traffic (cppm-allow), and the other to deny traffic (cppm-deny).

To create the firewall policies in the GUI:

1. Go to Policy & Objects > Firewall Policy.
2. Configure the allow policy:
   a. Click Create New.
   b. Enter a name for the policy.
   c. Set Source set to cppm.
   d. Set Action to ACCEPT.
   e. Configure the remaining settings as needed.
   f. Click OK.
3. Configure the deny policy:
   a. Click Create New.
   b. Enter a name for the policy.
   c. Set Source set to cppm-deny.
   d. Set Action to DENY.
   e. Configure the remaining settings as needed.
   f. Click OK.

To create the firewall policies in the CLI:

```
config firewall address
edit "cppm"
   set type dynamic
   set sub-type clearpass-spt
   set clearpass-spt healthy
   set comment ''
   set visibility enable
   set associated-interface ''
   set color 0
next
edit "cppm-deny"
   set type dynamic
   set sub-type clearpass-spt
   set clearpass-spt infected
   set comment ''
   set visibility enable
   set associated-interface ''
   set color 0
```
Policy and Objects

Verification

Go to Log & Report > Forward Traffic to review traffic logs and ensure that traffic is allowed or denied as expected.

To verify that FortiGate addresses are assigned correctly, enter the following:

```bash
# diagnose firewall dynamic list
List all dynamic addresses:
cppm-deny: ID(141)
  ADDR(10.1.100.188)

cppm: ID(176)
  ADDR(10.1.100.185)
  ADDR(10.1.100.186)
```

Group address objects synchronized from FortiManager

Address objects from external connectors that are learned by FortiManager are synchronized to FortiGate. These objects can be grouped together with the FortiGate CLI to simplify selecting connector objects in the FortiGate GUI. Multiple groups can be created.

This option is only available for objects that are synchronized from FortiManager.

To add an object to a connector group:

```bash
config user adgrp
  edit <object_name>
    set server-name "FortiManager"
    set connector-source <group_name>
next
end
```

Example

In this example, objects learned by the FortiManager from an Aruba ClearPass device are synchronized to the FortiGate. Some of the objects are then added to a group called ClearPass to make them easier to find in the object list when creating a firewall policy.

Prior to being grouped, the synchronized objects are listed under the FortiManager heading in the object lists.
To add some of the objects to a group:

```plaintext
config user adgrp
  edit "cp_test_FSSOROLE"
    set server-name "FortiManager"
    set connector-source "ClearPass"
  next
  edit "cp_test_[AirGroup v2]"
    set server-name "FortiManager"
    set connector-source "ClearPass"
  next
end
```

The objects are now listed under the *ClearPass* heading.
Using wildcard FQDN addresses in firewall policies

You can use wildcard FQDN addresses in firewall policies. IPv4, IPv6, ACL, local, shaping, NAT64, NAT46, and NGFW policy types support wildcard FQDN addresses.

For wildcard FQDN addresses to work, the FortiGate should allow DNS traffic to pass through.

Initially, the wildcard FQDN object is empty and contains no addresses. When the client tries to resolve a FQDN address, the FortiGate will analyze the DNS response. The IP address(es) contained in the answer section of the DNS response will be added to the corresponding wildcard FQDN object. It is therefore necessary to have the DNS session-helpers defined in the `config system session-helper` setting.

Since FortiGate must analyze the DNS response, it does not work with DNS over HTTPS.

In FortiOS 7.0 and later, FortiGate supports DNS over TLS. It is possible to analyze DNS responses sent over DoT, as long as there is a firewall policy that allows the DNS traffic from the client and is configured with a DNS filter that supports DoT. For information on configuring this, see DNS inspection with DoT and DoH on page 1186.

When the wildcard FQDN gets the resolved IP addresses, FortiOS loads the addresses into the firewall policy for traffic matching.

The FortiGate will keep the IP addresses in the FQDN object table as long as the DNS entry itself has not expired. Once it expires, the IP address is removed from the wildcard FQDN object until another query is made. At any given time, a single wildcard FQDN object may have up to 1000 IP addresses.

The DNS expiry TTL value is set by the authoritative name server for that DNS record. If the TTL for a specific DNS record is very short and you would like to cache the IP address longer, then you can extend it with the CLI. See To extend the TTL for a DNS record in the CLI: on page 886

For more information, see FQDN address firewall object type.

Wildcard FQDN IPs are synchronized to other autoscale members whenever a peer learns of a wildcard FQDN address.

To create a wildcard FQDN using the GUI:

1. Go to Policy & Objects > Addresses and click Create New > Address.
2. Specify a Name.
3. For Type, select FQDN.
4. For **FQDN**, enter a wildcard FQDN address, for example, `*.fortinet.com`.

![Configuration Interface](image)

5. Click **OK**.

**To use a wildcard FQDN in a firewall policy using the GUI:**

1. Go to **Policy & Objects > Firewall Policy** and click **Create New**.
2. For **Destination**, select the wildcard FQDN.
3. Configure the rest of the policy as needed.
4. Click **OK**.

**To create a wildcard FQDN using the CLI:**

```plaintext
config firewall address
  edit "test-wildcardfqdn-1"
    set type fqdn
    set fqdn "*.fortinet.com"
  next
end
```

**To use wildcard FQDN in a firewall policy using the CLI:**

```plaintext
config firewall policy
  edit 2
    set srcintf "port3"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "test-wildcardfqdn-1"
    set action accept
    set schedule "always"
    set service "ALL"
    set auto-asic-offload disable
    set nat enable
  next
end
```

**To use the diagnose command to list resolved IP addresses of wildcard FQDN objects:**

```bash
# diagnose firewall fqdn list
List all FQDN:
```
Policy and Objects

*fortinet.com: ID(48) ADDR(96.45.36.159) ADDR(192.168.100.161) ADDR(65.39.139.161)

Alternatively:

```
# diagnose test application dnsproxy 6
worker idx: 0
vfid=0 name=*fortinet.com ver=IPv4 min_ttl=3266:0, cache_ttl=0 , slot=-1, num=3, wildcard=1
  96.45.36.159 (ttl=68862:68311:68311) 192.168.100.161 (ttl=3600:3146:3146)
  65.39.139.161
(ttl=3600:3481:3481)
```

To use the diagnose command for firewall policies which use wildcard FQDN:

```
# diagnose firewall iprope list 100004
...
destination fqdn or dynamic address (1):*fortinet.com ID(48) uuid_idx=57 ADDR
  (208.91.114.104) ADDR(208.91.114.142) ADDR(173.243.137.143) ADDR(65.104.9.196) ADDR
  (96.45.36.210)
...
```

To extend the TTL for a DNS record in the CLI:

```
In this the example the set cache-ttl value has been extended to 3600 seconds.
config firewall address
  edit "fortinet.com"
    set type fqdn
    set fqdn "www.fortinet.com"
    set cache-ttl 3600
  next
end
```

Configure FQDN-based VIPs

In public cloud environments, sometimes it is necessary to map a VIP to an FQDN address.

To configure an FQDN-based VIP in the GUI:

1. Go to Policy & Objects > Virtual IPs and click Create New > Virtual IP.
2. Enter a name for the VIP.
3. Select an interface.
4. For Type, select FQDN.
5. For External, select IP and enter the external IP address.
6. For Mapped address, select an FQDN address.

For Mapped address, select an FQDN address.

7. Click OK.

To configure an FQDN-based VIP in the CLI:

```
config firewall vip
  edit "FQDN-vip-1"
    set type fqn
    set extip 10.2.2.199
    set extintf "any"
    set mapped-addr "destination"
next
end
```

IPv6 geography-based addresses

IPv6 geography-based addresses can be created and applied to IPv6 firewall policies.

IPv6 geography-based addresses do not support geoip-override or geoip-anycast.
To create an IPv6 geography-based address in the GUI:

1. Go to Policy and Objects > Addresses.
2. Click Create New > Address.
3. Set Category to IPv6 Address.
4. Enter a name for the address.
5. Set Type to IPv6 Geography.
6. Select the Country/Region from the list.
7. Optionally, enter comments.
8. Click OK.

To use the IPv6 geography address in a policy:

1. Go to Policy & Objects > Firewall Policy.
2. Edit an existing policy, or create a new one, using the IPv6 geography address as the Source or Destination Address.
3. In the policy list, hover over the address to view details.

To configure an IPv6 geography-based address in the CLI:

1. Create an IPv6 geography-based address:

   config firewall address6  
   edit "test-ipv6-geoip"  
   set type geography  
   set color 6  
   set comment "IPv6 Geography address"  
   set country "CA"  
   next  
   end

2. Use the IPv6 geography-based address in a policy:

   config firewall policy  
   edit 1  
   set name "test-policy6-1"  
   set srcintf "port6"  
   set dstintf "port5"  
   set srcaddr6 "all"  
   set dstaddr6 "test-ipv6-geoip"  
   set action accept  
   set schedule "always"  
   set service "ALL"  
   set nat enable  
   next  
   end

Array structure for address objects

Some address objects logically belong to the same device, such as two IPs from the same computer. These address objects can be grouped into an address folder, which is an exclusive list of address objects that do not appear in other address groups or folders.

In the CLI, the folder type can be set after the member list is already populated. If the member list contains an incompatible entry, then the setting will be discarded when the next/end command is issued. If the folder type is set before the member list is populated, then the possible member entry list will be filtered according to the selected type.
To create an address folder in the GUI:

1. Go to Policy & Objects > Addresses.
2. Click Create New > Address Group and enter a name.
3. For Type, select Folder.
4. For Members, click the + to add the addresses. Address folders and groups are exclusive, so the Select Entries window filters out address objects that are a member of an existing group or folder.

5. Click OK.
6. In the address table, expand the Address Group section to view the folder (dev1-addr-comb). The expandable folder view shows the address folder's child objects:

<table>
<thead>
<tr>
<th></th>
<th>Safe-network1-devices</th>
<th>Address Group (Folder)</th>
<th>2 entries</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>dev1-addr-comb</td>
<td>Address Group (Folder)</td>
<td>3 entries</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>dev1-IP-nic1</td>
<td>Subnet</td>
<td>192.168.1.25/32</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>dev1-IP-nic2</td>
<td>Subnet</td>
<td>192.168.1.122/32</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>dev1-mac</td>
<td>Device (MAC Address)</td>
<td>00:0a:95:9d:68:16</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>dev2-addr-comb</td>
<td>Address Group (Folder)</td>
<td>4 entries</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>dev2-IP-nic1</td>
<td>Subnet</td>
<td>192.168.1.101/32</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>dev2-IP-nic2</td>
<td>Subnet</td>
<td>192.168.1.102/32</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>dev2-IP-nic3</td>
<td>Subnet</td>
<td>192.168.1.103/32</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>dev2-mac</td>
<td>Device (MAC Address)</td>
<td>11:5b:12:2c:87:02</td>
<td>1</td>
</tr>
</tbody>
</table>

To configure an address folder in the CLI:

```bash
config firewall addrgrp
edit "safe-network1-devices"
  set type folder
  set member "dev1-addr-comb" "dev2-addr-comb"
  set comment ''
  set exclude disable
  set color 13
next
end
config firewall addrgrp
edit "dev1-addr-comb"
  set type folder
  set member "dev1-IP-nic1" "dev1-IP-nic2" "dev1-mac"
```
IPv6 MAC addresses and usage in firewall policies

Users can define IPv6 MAC addresses that can be applied to the following policies:

- Firewall
- Virtual wire pair
- ACL/DoS
- Central NAT
- NAT64
- Local-in

In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range. In this example, a firewall policy is configured in a NAT mode VDOM with the IPv6 MAC address as a source address.

IPv6 MAC addresses cannot be used as destination addresses in VDOMs when in NAT operation mode.

To configure IPv6 MAC addresses in a policy in the GUI:

1. Create the MAC address:
   a. Go to Policy & Objects > Addresses and click Create New > Address.
   b. For Category, select IPv6 Address.
   c. Enter an address name.
   d. For Type, select Device (MAC Address).
Policy and Objects

e. Enter the MAC address.

f. Click OK.

2. Configure the policy:
   a. Go to Policy & Objects > Firewall Policy and click Create New.
   b. For Source, select the IPv6 MAC address object.
   c. Configure the other settings as needed.
   d. Click OK.

To configure IPv6 MAC addresses in a policy in the CLI:

1. Create the MAC address:

   ```
   config firewall address6
   edit "test-ipv6-mac-addr-1"
      set type mac
      set macaddr 00:0c:29:b5:92:8d
   next
   end
   ```

2. Configure the policy:

   ```
   config firewall policy
   edit 2
      set srcintf "wan2"
      set dstintf "wan1"
      set srcaddr "all"
      set dstaddr "all"
      set srcaddr6 "test-ipv6-mac-addr-1" "2000-10-1-100-0"
      set dstaddr6 "all"
      set action accept
      set schedule "always"
      set service "ALL"
      set logtraffic all
      set auto-asic-offload disable
      set nat enable
   next
   end
   ```
FortiNAC tag dynamic address

The FortiNAC tag dynamic firewall address type is used to store the device IP, FortiNAC firewall tags, and FortiNAC group information sent from FortiNAC by the REST API when user logon and logoff events are registered.

In the following example, the user connecting to the network will be required to first log on to the FortiNAC. When the login succeeds, the logon information is synchronized to the FortiGate using the REST API. The FortiGate updates the dynamic firewall address object with the user and IP information of the user device. This firewall address is used in firewall policies to dynamically allow network access for authenticated users, thereby allowing SSO for the end user.

This example assumes the following:

- The FortiGate is the Security Fabric root device (refer to Configuring the root FortiGate and downstream FortiGates on page 2210 for more information).
- The FortiNAC is running version 9.2.2 (or later), and it is connected to the Security Fabric (refer to Configuring FortiNAC on page 2252 for more information).
- Firewall tags and groups have been assigned in FortiNAC to the registered FortiGate (refer to Virtualized Devices for more information). Unlike firewall tags, which are simple labels that can be configured on FortiNAC, firewall groups can be local, built-in, user-defined, or remote user groups imported from a remote server used for user authentication. Only groups that the user of the current logon event belongs to are sent to the FortiGate. Firewall tags are sent for all user authentication.

To use a FortiNAC tag dynamic firewall address in a policy:

1. Trigger two user logon events on the FortiNAC.
2. In FortiOS, go to Policy & Objects > Addresses, and expand the FortiNAC Tag (IP Address) section to view the newly created dynamic firewall address objects. The dynamic firewall addresses matching the current user logon status on FortiNAC have the current IP address of user devices. The addresses without matching user logons are marked with a red exclamation mark (!).
3. Go to Policy & Objects > Firewall Policy and click Create New or edit an existing policy. FortiNAC tag dynamic firewall address an be used as source or destination addresses.

4. Configure the settings as needed, then click OK. In this policy, traffic can only pass if it originates from any of the mapped IP addresses (10.1.100.184 and 10.1.100.185); other traffic cannot pass.
5. Hover over the address in the policy, then in the tooltip, click View Matched Addresses.

6. Have one of the users log off from the FortiNAC.

7. In FortiOS, go to Policy & Objects > Addresses and verify the FortiNAC Tag addresses. A user logged off from 10.1.100.184, so now only 10.1.100.185 is mapped to the dynamic firewall objects.

All firewall policies using those objects are automatically updated.

8. Go to Policy & Objects > Firewall Policy. Hover over the address in the policy, then in the tooltip, click View Matched Addresses.

The firewall policy was automatically updated so that traffic from 10.1.100.184 can no longer pass, and only traffic from 10.1.100.185 can pass.
Allow empty address groups

Address groups with no members can be configured in the GUI, CLI, and through the API. In previous versions of FortiOS, error messages appear for empty address groups and they cannot be configured.

To create an empty address group in the GUI:

1. Go to Policy & Objects > Addresses and click Create New > Address Group.
2. Enter a name.
3. Click OK. The This field is required. error is not displayed under the Members field.

To create an empty address group in the CLI:

```bash
config firewall addrgrp
ten edit "test-empty-addrgrp4-1"
nextend
```

No error message is returned in the console.

Remove overlap check for VIPs

There is no overlap check for VIPs, so there are no constraints when configuring multiple VIPs with the same external interface and IP. A new security rating report alerts users of any VIP overlaps.

To configure two VIPs with the same external interface and IP:

```bash
config firewall vip
ten edit "test-vip44-1"
  set extip 10.1.100.154
  set mappedip "172.16.200.156"
  set extintf "port24"
nexten edit "test-vip44-1_clone"
  set extip 10.1.100.154
  set mappedip "172.16.200.156"
  set extintf "port24"
  set src-filter 10.1.100.11
nexten end
```
No error message appears regarding the overlapping VIPs.

To view the security rating report:

2. Expand the Failed section. The Virtual IP Overlap results show an overlap (test-vip44-1 and test-vip44-1_clone) on the root FortiGate.

VIP groups

Virtual IP addresses (VIPs) can be organized into groups. This is useful in scenarios where there are multiple VIPs that are used together in firewall policies. If the VIP group members change, or a group member's settings change (such as the IP address, port, or port mapping type), then those changes are automatically updated in the corresponding firewall policies.

The following table summarizes which VIP types are allowed and not allowed to be members of a VIP group:

<table>
<thead>
<tr>
<th>Group type</th>
<th>VIP types allowed as members</th>
<th>VIP types not allowed as members</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv4</td>
<td>• Static NAT</td>
<td>• Access proxy</td>
</tr>
<tr>
<td></td>
<td>• Load balance</td>
<td>• Server load balance</td>
</tr>
<tr>
<td></td>
<td>• DNS translation</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• FQDN</td>
<td></td>
</tr>
<tr>
<td>IPv6</td>
<td>• Static NAT</td>
<td>• Access proxy</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Server load balance</td>
</tr>
</tbody>
</table>

Different VIP types can be added to the same group.
To configure a VIP group in the GUI:

1. Go to Policy & Objects > Virtual IPs and click Create New > Virtual IP Group.
2. Set the Type to IPv4 or IPv6.
3. Enter a name.
4. Optionally, enter additional information in the Comments field.
5. For IPv4 groups, select the Interface. Select a specific interface if all of the VIPs are on the same interface; otherwise, select any.
6. Click the + in the Members field and select the members to add to the group.
7. Click OK.

To configure an IPv4 VIP group in the CLI:

```plaintext
config firewall vipgrp
  edit <name>
    set interface <name>
    set member <vip1> <vip2> ...
  next
end
```

To configure an IPv6 VIP group in the CLI:

```plaintext
config firewall vipgrp6
  edit <name>
    set member <vip1> <vip2> ...
  next
end
```

Internet Services

The following topics provide instructions on configuring policies with Internet Service:

- Using Internet Service in policy on page 898
- Using custom Internet Service in policy on page 900
- Using extension Internet Service in policy on page 902
- Global IP address information database on page 904
- IP reputation filtering on page 906
- Internet service groups in policies on page 908
- Allow creation of ISDB objects with regional information on page 912
- Internet service customization on page 914
- Look up IP address information from the Internet Service Database page on page 915

Using Internet Service in policy

This topic shows how to apply a predefined Internet Service entry into a policy.

The Internet Service Database is a comprehensive public IP address database that combines IP address range, IP owner, service port number, and IP security credibility. The data comes from the FortiGuard service system. Information is regularly added to this database, for example, geographic location, IP reputation, popularity & DNS, and so on. All this
information helps users define Internet security more effectively. You can use the contents of the database as criteria for inclusion or exclusion in a policy.

From FortiOS version 5.6, Internet Service is included in the firewall policy. It can be applied to a policy only as a destination object. From version 6.0, Internet Service can be applied both as source and destination objects in a policy. You can also apply Internet Services to shaping policy.

There are three types of Internet Services you can apply to a firewall policy:

- Predefined Internet Services
- Custom Internet Services
- Extension Internet Services

**Sample configuration**

To apply a predefined Internet Service entry to a policy using the GUI:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Click in the Destination field.
3. In the Select Entries pane, click Internet Service and select Google-Gmail.
4. Configure the remaining fields as needed.
5. Click OK.

To apply a predefined Internet Service entry to a policy in the CLI:

In the CLI, enable the `internet-service` first and then use its ID to apply the policy.

This example uses Google Gmail and its ID is 65646. Each Internet Service has a unique ID.

```
config firewall policy
  edit 9
    set name "Internet Service in Policy"
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
    set internet-service enable
    set internet-service-id 65646
    set action accept
    set schedule "always"
    set utm-status enable
    set av-profile "g-default"
```
set ssl-ssh-profile "certificate-inspection"
set nat enable
next
end

To diagnose an Internet Service entry in the CLI:

# diagnose internet-service id-summary 65646
Version: 0000600096
Timestamp: 201902111802
Total number of IP ranges: 444727
Number of Groups: 7
Group(0), Singularity(20), Number of IP ranges(142740)
Group(1), Singularity(19), Number of IP ranges(1210)
Group(2), Singularity(16), Number of IP ranges(241)
Group(3), Singularity(15), Number of IP ranges(38723)
Group(4), Singularity(10), Number of IP ranges(142586)
Group(5), Singularity(8), Number of IP ranges(5336)
Group(6), Singularity(6), Number of IP ranges(113891)
Internet Service: 65646(Google.Gmail)
Number of IP range: 60
Number of IP numbers: 322845
Singularity: 15
Reputation: 5(Known and verified safe sites such as Gmail, Amazon, eBay, etc.)
Icon Id: 510
Second Level Domain: 53(gmail.com)
Direction: dst
Data source: isdb

Result

Because the IP and services related to Google Gmail on the Internet are included in this Internet Service (65646), all traffic to Google Gmail is forwarded by this policy.

Using custom Internet Service in policy

Custom Internet Services can be created and used in firewall policies.

When creating a custom Internet Service, you must set following elements:

- IP or IP ranges
- Protocol number
- Port or port ranges
- Reputation

You must use CLI to create a custom Internet Service, except for geographic based services (see Allow creation of ISDB objects with regional information on page 912).

CLI syntax

config firewall internet-service-custom
   edit <name>
      set comment <comment>
      set reputation {1 | 2 | 3 | 4 | 5}
config entry
  edit <ID>
    set protocol <protocol #>
    set dst <object_name>
  config port-range
    edit <ID>
      set start-port <port #>
      set end-port <port #>
    next
  next
end
end

Sample configuration

To configure a custom Internet Service:

cfg firewall internet-service-custom
  edit "test-isdb-1"
    set comment "Test Custom Internet Service"
    set reputation 4
  config entry
    edit 1
      set protocol 6
      config port-range
        edit 1
          set start-port 80
          set end-port 443
        next
      end
    set dst "10-1-100-0"
  next
  edit 2
    set protocol 6
    config port-range
      edit 1
        set start-port 80
        set end-port 80
      next
    end
    set dst "172-16-200-0"
  next
end

To apply a custom Internet Service into a policy:

cfg firewall policy
  edit 1
    set name "Internet Service in Policy"
    set srcintf "wan2"
    set dstintf "wan1"
Policy and Objects

```
set srcaddr "all"
set internet-service enable
set internet-service-id 65646
set internet-service-custom "test-isdb-1"
set action accept
set schedule "always"
set utm-status enable
set av-profile "g-default"
set ssl-ssh-profile "certificate-inspection"
set nat enable
next
end
```

**Result**

In addition to the IP address, IP address ranges, and services allowed by Google.Gmail, this policy also allows the traffic which access to 10.1.100.0/24 and TCP/80-443 and 172.16.200.0/24 and TCP/80.

**Using extension Internet Service in policy**

Extension Internet Service lets you add custom or remove existing IP address and port ranges to an existing predefined Internet Service entries. Using an extension type Internet Service is actually editing a predefined type Internet Service entry and adding IP address and port ranges to it.

When creating an extension Internet Service and adding custom ranges, you must set following elements:

- IP or IP ranges
- Protocol number
- Port or port ranges

You must use CLI to add custom IP address and port entries into a predefined Internet Service.

You must use GUI to remove entries from a predefined Internet Service.

**Custom extension Internet Service CLI syntax**

```
config firewall internet-service-extension
edit <ID #>
   set comment <comment>
   config entry
      edit <ID #>
         set protocol <number #>
         set dst <object_name>
         config port-range
            edit <ID #>
               set start-port <number #>
               set end-port <number #>
            next
         end
      next
   end
end
```

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
Sample configuration

To configure an extension Internet Service in the CLI:

```sh
config firewall internet-service-extension
  edit 65646
    set comment "Test Extension Internet Service 65646"
    config entry
      edit 1
        set protocol 6
        config port-range
          edit 1
            set start-port 80
            set end-port 443
          next
        end
      next
      set dst "172-16-200-0"
    next
    edit 2
      set protocol 17
      config port-range
        edit 1
          set start-port 53
          set end-port 53
        next
      set dst "10-1-100-0"
    next
  next
end
```

To remove IP address and port entries from an existing Internet Service in the GUI:

1. Go to Policy & Objects > Internet Service Database.
2. Search for Google-Gmail.
3. Select Google-Gmail and click Edit.
4. In the gutter, click View/Edit Entries.
5. Select the IP entry that you need to remove and click Disable.

6. Click Return twice.
To remove IP address and port entries from an existing Internet Service in the CLI:

```
config firewall internet-service-extension
  edit 65646
    config disable-entry
      edit 1
        set protocol 17
        config port-range
          edit 1
            next
          end
        config ip-range
          edit 1
            set start-ip 142.250.191.165
            set end-ip 142.250.191.165
            next
          end
        next
      end
    end
end
```

To apply an extension Internet Service into policy in the CLI:

```
config firewall policy
  edit 9
    set name "Internet Service in Policy"
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
    set internet-service enable
    set internet-service-id 65646
    set action accept
    set schedule "always"
    set utm-status enable
    set av-profile "g-default"
    set ssl-ssh-profile "certificate-inspection"
    set nat enable
  next
end
```

**Result**

In addition to the IP addresses, IP address ranges, and services allowed by Google.Gmail, this policy also allows the traffic which accesses 10.1.100.0/24 and UDP/53 and 172.16.200.0/24 and TCP/80-443. At the same time, the traffic that accesses 2.20.183.160 is dropped because this IP address and port is disabled from Google.Gmail.

**Global IP address information database**

The Internet Service and IP Reputation databases download details about public IP address, including: ownership, known services, geographic location, blocklisting information, and more. The details are available in drilldown information, tooltips, and other mechanisms in the FortiView and other pages.
The global IP address database is an integrated database containing all public IP addresses, and is implemented in the Internet Service Database.

To view the owner of the IP address:

(global) # get firewall internet-service-owner ?
  id  Internet Service owner ID.
  1 Google
  2 Facebook
  3 Apple
  4 Yahoo
  ...... 
  115 Cybozu
  116 VNC

To check for any known service running on an IP address:

(global) # diagnose internet-service info FG-traffic 6 80 8.8.8.8
  Internet Service: 65537(Google.Web)

To check GeoIP location and blocklist information:

(global) # diagnose internet-service id 65537 | grep 8.8.8.8
  8.8.8.8-8.8.8.8 geo_id(11337) block list(0x0) proto(6) port(80 443)
  8.8.8.8-8.8.8.8 geo_id(11337) block list(0x0) proto(17) port(443)

To check a known malicious server:

(global) # diagnose internet-service id-summary 3080383
  Version: 0000600096
  Timestamp: 201902111802
  Total number of IP ranges: 444727
  Number of Groups: 7
  Group(0), Singularity(20), Number of IP ranges(142740)
  Group(1), Singularity(19), Number of IP ranges(1210)
  Group(2), Singularity(16), Number of IP ranges(241)
  Group(3), Singularity(15), Number of IP ranges(38723)
  Group(4), Singularity(10), Number of IP ranges(142586)
  Group(5), Singularity(8), Number of IP ranges(5336)
  Group(6), Singularity(6), Number of IP ranges(113891)
  Internet Service: 3080383(Botnet.C&C.Server)
  Number of IP range: 111486
  Number of IP numbers: 111486
  Singularity: 20
  Reputation: 1(Known malicious sites related to botnet servers, phishing sites, etc.)
  Icon Id: 591
  Second Level Domain: 1(other)
  Direction: dst
  Data source: irdb

To check questionable usage:

(global) # diagnose internet-service id-summary 2818238
  Version: 0000600096
Policy and Objects

Timestamp: 201902111802
Total number of IP ranges: 444727
Number of Groups: 7
Group(0), Singularity(20), Number of IP ranges(142740)
Group(1), Singularity(19), Number of IP ranges(1210)

Data source: irdb

IP reputation filtering

There are currently five reputation levels in the Internet Service Database (ISDB), and custom reputation levels can be defined in a custom internet service. You can configure firewall policies to filter traffic according to the desired reputation level. If the reputation level of either the source or destination IP address is equal to or greater than the level set in the policy, then the packet is forwarded, otherwise, the packet is dropped.

The five default reputation levels are:

1. Known malicious sites, such as phishing sites or sites related to botnet servers
2. High risk services sites, such as TOR, proxy, and P2P
3. Unverified sites

4. Reputable social media sites, such as Facebook and Twitter

5. Known and verified safe sites, such as Gmail, Amazon, and eBay

The default minimum reputation level in a policy is zero, meaning that the reputation filter is disabled.

For IP addresses that are not included in the ISDB, the default reputation level is three.

The default reputation direction is destination.

**Example 1**

Packets from the source IP address with reputation levels three, four, or five will be forwarded by this policy.

**To set the reputation level and direction in a policy using the CLI:**

```
config firewall policy
edit 1
  set srcintf "wan2"
  set dstintf "port1"
  set srcaddr "all"
  set dstaddr "all"
  set reputation-minimum 3
  set reputation-direction source
  set action accept
  set schedule "always"
  set service "ALL"
  set logtraffic all
  set auto-asic-offload disable
  set nat enable
next
end
```

Packets from the source IP address with reputation levels three, four, or five will be forwarded by this policy.

**Example 2**

This policy allows only outbound FTP traffic, if the destination server has a minimum reputation of 4.

**To set the reputation level and direction in a policy using the CLI:**

```
cfg firewall policy
edit 1
  set srcintf "port1"
  set dstintf "wan2"
  set srcaddr "all"
  set dstaddr "all"
  set reputation-minimum 4
  set reputation-direction destination
  set action accept
```
Policy and Objects

set schedule "always"
set service "FTP"
set logtraffic all
set auto-asic-offload disable
set nat enable
next
d

Internet service groups in policies

This feature provides support for Internet Service Groups in traffic shaping and firewall policies. Service groups can be used as the source and destination of the policy. Internet Service Groups are used as criteria to match traffic; the shaper will be applied when the traffic matches.

To use a group as a destination, `internet-service` must be enabled. To use a group as a source, `internet-service-src` must be enabled.

The following CLI variables are available in the `firewall policy` and `firewall shaping-policy` commands:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>internet-service-group &lt;string&gt;</td>
<td>Internet Service group name.</td>
</tr>
<tr>
<td>internet-service-custom-group &lt;string&gt;</td>
<td>Custom Internet Service group name.</td>
</tr>
<tr>
<td>internet-service-src-group &lt;string&gt;</td>
<td>Internet Service source group name.</td>
</tr>
<tr>
<td>internet-service-src-custom-group &lt;string&gt;</td>
<td>Custom Internet Service source group name.</td>
</tr>
</tbody>
</table>

Examples

The following examples use the below topology.

![Topology Diagram]

Example 1

In this example, the PC is allowed to access Google, so all Google services are put into an Internet Service Group.

To configure access to Google services using an Internet Service Group using the CLI:

1. Create a Service Group:
   
   ```
   config firewall internet-service-group
   edit "Google_Group"
   set direction destination
   ```
### Policy and Objects

```plaintext
next
end
```

2. Create a firewall policy to allow access to all Google Services from the PC:

```plaintext
cfg firewall policy
edit 1
    set name "PC to Google"
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "all"
    set internet-service enable
    set internet-service-group "Google_Group"
    set action accept
    set schedule "always"
    set fsso disable
    set nat enable
next
end
```

**To configure access to Google services using an Internet Service Group in the GUI:**

1. On the FortiGate, create a Service Group using the CLI.
2. Go to Policy & Objects > Firewall Policy, and create a new policy.
3. Set the Destination as the just created Internet Service Group.
4. Configure the remaining options, then click OK.
5. Go to Policy & Objects > Firewall Policy and hover over the group to view a list of its members.

Example 2

In this example, two office FTP servers are put into an Internet Custom Service Group, and the PC connection to the FTP servers is limited to 1Mbps.

To put two FTP servers into a custom service group and limit the PC connection speed to them in the CLI:

1. Create custom internet services for the internal FTP servers:

```plaintext
config firewall internet-service-custom
edit "FTP_PM"
   config entry
e   edit 1
      config port-range
e   edit 1
      set start-port 21
      set end-port 21
      next
   end
   set dst "PM_Server"
   next
end
next
edit "FTP_QA"
   config entry
e   edit 1
      config port-range
e   edit 1
      set start-port 21
      set end-port 21
      next
   end
   set dst "QA_Server"
   next
end
```
2. Create a custom internet server group and add the just created custom internet services to it:

```plaintext
config firewall internet-service-custom-group
edit "Internal_FTP"
    set member "FTP_QA" "FTP_PM"
next
end
```

3. Create a traffic shaper to limit the maximum bandwidth:

```plaintext
config firewall shaper traffic-shaper
edit "Internal_FTP_Limit_1Mbps"
    set guaranteed-bandwidth 500
    set maximum-bandwidth 1000
    set priority medium
next
end
```

4. Create a firewall shaping policy to limit the speed from the PC to the internal FTP servers:

```plaintext
config firewall shaping-policy
edit 1
    set name "For Internal FTP"
    set internet-service enable
    set internet-service-custom-group "Internal_FTP"
    set dstintf "port1"
    set traffic-shaper "Internal_FTP_Limit_1Mbps"
    set traffic-shaper-reverse "Internal_FTP_Limit_1Mbps"
    set srcaddr "PC"
next
end
```

To put two FTP servers into a custom service group and limit the PC connection speed to the in the GUI:

1. Create custom internet services for the internal FTP servers using the CLI.
2. Create a custom internet server group and add the just created custom internet services to it using the CLI.
3. Create a traffic shaper to limit the maximum bandwidth:
   a. Go to Policy & Objects > Traffic Shaping, select the Traffic Shapers tab, and click Create New.
   b. Enter a Name for the shaper, such as Internal_FTP_Limit_1Mbps.
   c. Set the Traffic Priority to Medium.
   d. Enable Max Bandwidth and set it to 1000.
   e. Enable Guaranteed Bandwidth and set it to 500.
   f. Click OK.
4. Create a firewall shaping policy to limit the speed from the PC to the internal FTP servers:
   a. Go to Policy & Objects > Traffic Shaping, select the Traffic Shaping Policy tab, and click Create New.
   b. Set the Destination to the just created custom internet service group, and apply the just create traffic shaper.
Configure the remaining options as shown, then click OK.

Allow creation of ISDB objects with regional information

Geographic-based Internet Service Database (ISDB) objects allow users to define a country, region, and city. These objects can be used in firewall policies for more granular control over the location of the parent ISDB object. ISDB objects are now referenced in policies by name instead of ID.

To apply a location-based ISDB object to a policy in the GUI:

1. Create the ISDB object:
   a. Go to Policy & Objects > Internet Service Database and click Create New > Geographic Based Internet Service.
   b. Configure the settings as required.
   c. Click OK.

2. View the IP ranges in the location-based internet service:
   a. Go to Policy & Objects > Internet Service Database.
   b. In the table, hover over the object created in step 1 and click View/Edit Entries. The list of IPs is displayed:
c. Click Return.

3. Add the ISDB object to a policy:
   a. Go to Policy & Objects > Firewall Policy and create a new policy or edit an existing one.
   b. For Destination, click Internet Service and select the ISDB object created in step 1.
   c. Configure the other settings as needed.
   d. Click OK.

To apply a location-based ISDB object to a policy in the CLI:

1. Create the ISDB object:

```
config firewall internet-service-name
edit "test-location-isdb-1"
   set type location
   set internet-service-id 65536
   set country-id 840
   set region-id 283
   set city-id 23352
next
end
```

2. View the IP ranges in the location-based internet service:

```
# diagnose internet-service id 65536 | grep "country(840) region(283) city(23352)"
96.45.33.73-96.45.33.73 country(840) region(283) city(23352) blocklist(0x0) reputation(4), domain(5) popularity(0) botnet(0) proto(6) port(1-65535)
96.45.33.73-96.45.33.73 country(840) region(283) city(23352) blocklist(0x0) reputation(4), domain(5) popularity(0) botnet(0) proto(17) port(1-65535)
198.94.221.56-198.94.221.56 country(840) region(283) city(23352) blocklist(0x0) reputation(4), domain(5) popularity(4) botnet(0) proto(6) port(1-65535)
198.94.221.56-198.94.221.56 country(840) region(283) city(23352) blocklist(0x0) reputation(4), domain(5) popularity(4) botnet(0) proto(17) port(1-65535)
```
3. Add the ISDB object to a policy:

```
config firewall policy
edit 3
    set name "PC to Google"
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "PC"
    set internet-service enable
    set internet-service-name "test-location-isdb-1"
    set action accept
    set schedule "always"
    set logtraffic all
    set logtraffic-start enable
    set auto-asic-offload disable
    set nat enable
next
end
```

**Internet service customization**

Internet Service Database (ISDB) entries can be tuned for their environments by adding custom ports and port ranges, as well as port mapping.

**To add a custom port range:**

```
config firewall internet-service-addition
edit 65646
    set comment "Add custom port-range:tcp/8080-8090 into 65646"
config entry
    edit 1
        set protocol 6
        config port-range
            edit 1
                set start-port 8080
                set end-port 8090
next
end
end
```

Warning: Configuration will only be applied after rebooting or using the 'execute internet-service refresh' command.

**To verify that the change was applied:**

```
# diagnose internet-service info FG-traffic 6 8080 2.20.183.160
Internet Service: 65646(Google.Gmail)
```

**To configure additional port mapping:**

```
config firewall internet-service-append
    set match-port 10
```
set append-port 20
end

Warning: Configuration will only be applied after rebooting or using the 'execute internet-service refresh' command.

Look up IP address information from the Internet Service Database page

The IP Address Lookup button allows users to look up IP address information from the Internet Service Database and GeoIP Database. Returned IP address information includes the reverse IP address/domain lookup, location, reputation, and other internet service information.

To look up IP address information:

1. Go to Policy & Objects > Internet Service Database.
2. Click IP Address Lookup. The IP Address Lookup pane opens.
3. In the IP Address Query field, enter the IP address and press Enter.

Results of an IP address from the Internet Service Database:

Results of an IP address from the GeoIP Database:

Results of an IPv6 address from the GeoIP Database:
4. Click Close.

Protocol options

Firewall policies contain a Protocol Options field that defines the parameters for handling protocol-specific traffic. Multiple protocol options profiles can be configured in FortiOS since the requirements may differ between policies. A single protocol options profile is applied per policy, but the profile can be used in multiple policies.

To create a protocol options profile, go to Policy & Objects > Protocol Options. The following settings can be configured.

Log oversized files

Enable this option to log the occurrence of oversized files being processed. This does not change how they are processed. It only allows the FortiGate to log that they were either blocked or allowed through.

It is common practice to allow larger files through without antivirus processing. Monitor the logs for the frequency of oversized file processing to determine whether or not to alter the settings for treating oversized files. The threshold setting for oversized files and emails is located in the Common Options section.

RPC over HTTP

This protocol is used by Microsoft Exchange Servers to perform virus scanning on emails that use RPC over HTTP.

Protocol port mapping

To optimize the FortiGate’s resources, the mapping and inspection of the following protocols can be enabled or disabled:

- HTTP
- SMTP
- POP3
- IMAP
- FTP
- NNTP
- MAPI
- DNS
- CIFS

Each protocol has a default TCP port. The ports can be modified to inspect any port with flowing traffic. The packet headers indicate which protocol generated the packet.
Common options

The *Comfort Clients* and *Block Oversized File/Email* options apply to multiple protocols.

**Comfort clients**

When proxy-based antivirus scanning is enabled, the FortiGate buffers files as they are downloaded. Once the entire file is captured, the FortiGate begins scanning the file. The user must wait during the buffering and scanning procedure. After the scan is completed and if no infection is found, the file is sent to the next step in the process flow. If the file is large, this part of the process can take some time. In some cases, enough time that some users may get impatient and cancel the download.

The *Comfort Clients* option mitigates this potential issue by feeding a trickle of data while waiting for the scan to complete. The user is aware that processing is taking place, and that there has not been a failure in the transmission. The slow transfer rate continues until the antivirus scan is complete. The transfer will proceed at full speed once the file is scanned successfully and does not contain any viruses.

If there is evidence of an infection, the FortiGate caches the URL and drops the connection. The client does not receive any notification of what happened because the download to the client has already started. Instead, the download stops and the user is left with a partially downloaded file. If the user tries to download the same file again within a short period of time, the cached URL is matched and the download is blocked. A notification is displayed that the download was blocked. The number of URLs in the cache is limited by the size of the cache.

Client comforting is available for HTTP and FTP traffic. If the FortiGate supports SSL content scanning and inspection, client comforting can be configured for HTTPS and FTPS traffic.

Buffering the entire file allows the FortiGate to eliminate the danger of missing an infection due to fragmentation because the file is reassembled before examination. This buffering is performed whenever the *Comfort Clients* option is disabled.

Client comforting can send unscanned and potentially infected content to the client, so only enable this option if you are prepared to accept this risk. Keeping the client comforting interval high and the amount low will reduce the amount of potentially infected data that is downloaded.

**Block oversized files and emails**

This option is related to antivirus scanning. The FortiGate has a finite amount of resources to buffer and scan a file. If a large file (such as an ISO image or video file) is downloaded, this could overwhelm or exceed the FortiGate’s memory, especially if other large files are being downloaded at the same time.

A threshold is assigned to identify an oversize file or email. The default is 10 MB. The range varies per model, and the minimum is 1 MB. Any file or email over this threshold will not be processed by policies applying the antivirus security profile.

If the FortiGate enters conserve mode on a regular basis, lowering the threshold can lessen the impact of processing the files on memory. This can increase risk, even though malware is more likely to be in smaller files.
Web options

The Chunked Bypass option applies to traffic containing web protocols.

Chunked bypass

Chunked bypass is a mechanism in HTTP 1.1 that allows a web server to start sending chunks of dynamically generated output in response to a request before actually knowing the actual size of the content. For dynamically generated content, enabling chunked bypass speeds up the initial response to HTTP requests, but the content is not held in the proxy as an entire file before proceeding.

Email options

The Allow Fragmented Messages and Append Signature (SMTP) options apply to email protocols.

Allow fragmented messages

The specifications of RFC 2046 allow for the breaking up of emails and sending the fragments in parallel to be rebuilt and read at the other end by the mail server. It was originally designed to increase the performance over slower connections where larger email messages were involved. Feasibility of using this function depends on the mail configuration. Outside of Microsoft Outlook, not many email clients are set up to break up messages like this. The drawback of this feature is that if malware is broken up between multiple fragments of the message, there is a risk that it will not be detected by some antivirus configurations because all the code may not be present at the same time to identify the malware.

Append signature

This option adds a plain text email signature to SMTP email messages as they pass through the FortiGate. The message maximum is 1023 characters.

This feature works best in an environment where there is some standardization of what goes into the senders' personal signatures so that there is no duplication or contradiction of information. For example:

- This email should not be forwarded without prior approval.
- Please consider the environment before printing this email.
- For questions regarding purchasing our products, please call ...

Traffic shaping

A FortiGate provides quality of service (QoS) by applying bandwidth limits and prioritization to network traffic. Traffic shaping is one technique used by the FortiGate to provide QoS. A basic approach to traffic shaping is to prioritize higher priority traffic over lower priority traffic during periods of traffic congestion. This provides a stabilizing effect for important traffic while throttling less important traffic.

The FortiGate can be configured to deliver traffic shaping with policing or traffic shaping with queuing. The general difference between the two is as follows:
Policy and Objects

<table>
<thead>
<tr>
<th>Technique</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traffic shaping with policing</td>
<td>When traffic exceeds the configured bandwidth limits, traffic is dropped.</td>
</tr>
<tr>
<td>Traffic shaping with queuing</td>
<td>When traffic exceeds the configured bandwidth limits, traffic is delayed for transport until bandwidth frees up. Traffic may be dropped if the queues are full.</td>
</tr>
</tbody>
</table>

Policing and queuing can both prioritize traffic and deliver guaranteed bandwidth and maximum bandwidth by setting bandwidth limits. The implementation differs though, since queuing uses queues, and policing does not. In queuing, before a packet egresses an interface, it is first enqueued to a queue using an algorithm such as RED or FIFO. The kernel dequeues the packet based on the HTB algorithm before sending it out. In policing, traffic simply drops if it is over the allocated bandwidth.

The following topics provide information about configuring traffic shaping:

- Traffic shaping policies on page 921
- Traffic shaping profiles on page 925
- Traffic shapers on page 935
- Global traffic prioritization on page 947
- DSCP matching and DSCP marking on page 950
- Examples on page 954

### Configuration methods

There are different methods to configure traffic shaping on the FortiGate. The following table lists the methods and their capabilities in order of preference. If all three methods are configured, the first will be preferred over the second, which is preferred over the third.

<table>
<thead>
<tr>
<th>Method</th>
<th>Traffic prioritization</th>
<th>Policing</th>
<th>Queuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traffic shaping profile*</td>
<td>Yes</td>
<td>Yes, based on percentage of outbandwidth</td>
<td>Yes</td>
</tr>
<tr>
<td>Traffic shaper</td>
<td>Yes</td>
<td>Yes, based on rate</td>
<td>No</td>
</tr>
<tr>
<td>Global traffic prioritization</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

*Traffic shaping profiles are configured as either policing or queuing types. Queuing allows for additional options when configuring a shaping class entry.

The features of each method’s implementation are slightly different. The following is a brief summary of the traffic policing features and the approach each method takes.

### Traffic prioritization

The FortiGate can place packets into different priority levels in order to prioritize certain traffic over others.
<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traffic shaping profile</td>
<td>Traffic is placed into classes. A total of 30 classes are available. For each class, traffic can be configured into five priority levels.</td>
</tr>
<tr>
<td>Traffic shaper</td>
<td>Traffic can be prioritized into the high (2), medium (3), or low (4) levels. When traffic is below the guaranteed bandwidth of the shaper, the traffic is automatically applied the critical level (1).</td>
</tr>
<tr>
<td>Global traffic prioritization</td>
<td>Traffic is prioritized into high (2), medium (3), or low (4) based on ToS (type of service) or DSCP.</td>
</tr>
</tbody>
</table>

**Guaranteed and maximum bandwidth limits**

The general purpose for configuring guaranteed bandwidth is to allocate a certain proportion of the total outbound bandwidth to guarantee transport for a certain type of traffic. This is configured and handled differently in each method.

A traffic shaping profile, when applied to an interface’s egress shaping profile, can be configured to use up to 100% of the interface’s configured bandwidth between all the classes. It does not matter what priority is configured in each class. The guaranteed bandwidth is always honored.

Traffic shapers, however, do not have a hard limit on the guaranteed bandwidth. Administrators need to be aware how much guaranteed bandwidth has been allocated to all their traffic shapers, so that they do not exceed the total outbound bandwidth of an interface. Traffic under the guaranteed bandwidth of a traffic shaper is given a priority of one. If the total traffic with priority one exceeds the total outbound bandwidth, traffic can be dropped.

The maximum bandwidth limit caps the maximum bandwidth that can be used. This is configured as a percentage of the outbound bandwidth in a traffic shaping profile. It is configured as a rate for traffic shapers.

**Configuring outbound bandwidth**

Traffic shaping is generally configured for egress traffic leaving the FortiGate. Therefore, it is necessary for the interface outbound bandwidth to be defined for traffic prioritization to take place in all of the traffic shaping configuration methods. Interface outbound bandwidth is also needed when defining the guaranteed and maximum bandwidth in a traffic shaping profile.

For traffic shapers, configuring outbound bandwidth is not necessary to apply maximum bandwidth limits; however, outbound bandwidth is necessary for guaranteed bandwidth. Traffic under the guaranteed bandwidth limit on a traffic shaper is given priority 1. If outbound bandwidth is not configured, traffic prioritization does not take place and the priority is meaningless.

**Traffic shaping policy**

Traffic shaping profiles and traffic shapers are methods of policing traffic. Traffic shaping policies are used to map traffic to a traffic shaper or assign them to a class.

A traffic shaping policy is a rule that matches traffic based on certain IP header fields and/or upper layer criteria. For example, it can match traffic based on source and destination IP, service, application, and URL category. One common use case is to match traffic based on the ToS or DS (differentiated services) field in the IP header. This allows Type of Service or Differentiated Services (DiffServ) tags to be read from traffic from a downstream device and prioritized accordingly on the FortiGate.
DSCP matching and DSCP marking

DSCP matching and DSCP marking can be performed on a firewall shaping policy and a regular firewall policy. DSCP matching is used to match DSCP tags from ingress traffic, and DSCP marking is used to change the DSCP tag on egress traffic.

In a firewall shaping policy and regular firewall policy, use the tos and tos-mask fields to perform DSCP matching. Use the diffserv-forward and diffserv-reverse fields to perform DSCP marking.

Traffic shaping policies

As mentioned in Traffic shaping on page 918, traffic shaping starts with the traffic shaping policy. Traffic shaping policies are used to map traffic to a traffic shaper or assign them to a class. Traffic is then shaped by the shaper or the shaping profile that is applied on an interface.
Traffic can also be shaped by applying traffic shapers directly on a firewall policy. However, this legacy approach can only be configured from the CLI, and is not a preferred method for applying traffic shaping. As the number of firewall policies increases, managing shaping on each individual policy becomes increasingly difficult. For the same reason, it is also not recommended to mix the legacy approach with traffic shaping policies to avoid the added complexity.

**Overview**

A traffic shaping policy is a rule that matches traffic based on certain IP header fields and/or upper layer criteria. When traffic hits the firewall, the FortiGate will first look up a firewall policy, and then match a shaping policy. The matching traffic will apply a traffic shaper, class ID, or assign a DSCP DiffServ tag to the outgoing traffic.
The traffic shaping policies must be placed in the correct order in the traffic shaping policy list page to obtain the desired results. Policies are matched from top-down, so the traffic shaping policies should be arranged in a sequence that places the more granular policies above general policies.

The policy can be configured by going to Policy & Objects > Traffic Shaping and selecting the Traffic Shaping Policies tab. If the menu does not display the traffic shaping settings, go to System > Feature Visibility and enable Traffic Shaping.

### Configuring traffic shaping policies

A traffic shaping policy can be split into two parts:

- Options used to match the traffic
- Options used to apply actions to the matched traffic

In the GUI, the options are configured in the If Traffic Matches and Then sections. In the CLI, all options are configured under `config firewall shaping-policy`. Some options can only be configured from the CLI.

The following options can be configured for traffic matching criteria:

<table>
<thead>
<tr>
<th>GUI option</th>
<th>CLI option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Source</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Address</td>
<td>set srcaddr &lt;address_object&gt;</td>
<td>Select the address object to match the source IP.</td>
</tr>
<tr>
<td>User</td>
<td>set users &lt;user_object&gt;</td>
<td>Select the user object to match the user authenticated for the session.</td>
</tr>
<tr>
<td>Internet Service</td>
<td>set internet-service-src enable</td>
<td>Select the internet service to match the source of the incoming traffic. Internet service currently cannot be used with source address.</td>
</tr>
<tr>
<td></td>
<td>set internet-service-src-name &lt;name&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>set internet-service-src-group &lt;group&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>set internet-service-src-custom &lt;custom&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>set internet-service-src-custom-group &lt;custom_group&gt;</td>
<td></td>
</tr>
<tr>
<td><strong>Destination</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Address</td>
<td>set dstaddr &lt;address_object&gt;</td>
<td>Select the address object to match the destination IP.</td>
</tr>
<tr>
<td>Internet Service</td>
<td>set internet-service enable</td>
<td>Select the internet service to match the destination of the incoming traffic. Internet service currently cannot be used with destination address and service.</td>
</tr>
<tr>
<td></td>
<td>set internet-service-name &lt;name&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>set internet-service-group &lt;group&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>set internet-service-custom &lt;custom&gt;</td>
<td></td>
</tr>
<tr>
<td>GUI option</td>
<td>CLI option</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Policy</strong></td>
<td>set internet-service-custom-group &lt;custom_group&gt;</td>
<td>Enable to select a schedule (one-time, recurring, or group).</td>
</tr>
<tr>
<td><strong>Objects</strong></td>
<td>set schedule &lt;schedule&gt;</td>
<td>Select the service or service group for the traffic.</td>
</tr>
<tr>
<td><strong>Schedule</strong></td>
<td>set service &lt;service&gt;</td>
<td>Application control must be enabled in the related firewall policy to learn the application of the traffic.</td>
</tr>
<tr>
<td><strong>Service</strong></td>
<td>set application &lt;application&gt;</td>
<td>Select the application to match the traffic.</td>
</tr>
<tr>
<td><strong>Application</strong></td>
<td>set app-category &lt;category&gt;</td>
<td>Select the application category to match the traffic.</td>
</tr>
<tr>
<td><strong>Category</strong></td>
<td>set app-group &lt;groups&gt;</td>
<td>Select the application group to match the traffic.</td>
</tr>
<tr>
<td><strong>Group</strong></td>
<td>set url-category &lt;category&gt;</td>
<td>Select the URL category to match the URL of the traffic. A web filter profile must be enabled in the related firewall policy to know the URL of the traffic (see Web filter on page 1124).</td>
</tr>
<tr>
<td><strong>URL Category</strong></td>
<td>set tos-mask &lt;hexadecimal_mask&gt; set tos &lt;value&gt; set tos-negate {enable</td>
<td>disable}</td>
</tr>
</tbody>
</table>

The following options can be configured for actions to apply to the matched traffic:

<table>
<thead>
<tr>
<th>GUI option</th>
<th>CLI option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Outgoing interface</strong></td>
<td>set dstintf &lt;interface&gt;</td>
<td>Select the destination interface that the traffic shaping applies to (required).</td>
</tr>
<tr>
<td><strong>Apply shaper</strong></td>
<td>set traffic-shaper &lt;shaper&gt;</td>
<td>Select the shared shaper to be applied to traffic in the ingress-to-egress direction. For example, on traffic that egresses on the wan interface, the shaper is applied to upload or outbound traffic.</td>
</tr>
<tr>
<td>GUI option</td>
<td>CLI option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Reverse shaper</td>
<td>set traffic-shaper-reverse &lt;shaper&gt;</td>
<td>Select the reverse shaper to be applied to traffic in the egress-to-ingress direction. For example, on traffic that egresses on the wan interface, the shaper is applied to download or inbound traffic.</td>
</tr>
<tr>
<td>Per-IP shaper</td>
<td>set per-ip-shaper &lt;shaper&gt;</td>
<td>Select the per-IP shaper. Per-IP shapers affect downloads and uploads. The allotted bandwidth applies to each individual IP. In a shared shaper, the allotted bandwidth applies to all IPs.</td>
</tr>
</tbody>
</table>

Assign shaping class ID

<table>
<thead>
<tr>
<th>Traffic shaping class ID</th>
<th>set class-id &lt;class&gt;</th>
<th>Set the class ID to apply the matching traffic. Class IDs are further prioritized within a traffic shaping profile and applied to an interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>n/a</td>
<td>set diffserv-forward {enable</td>
<td>disable}</td>
</tr>
</tbody>
</table>

Traffic shapers and class IDs can be applied at the same time when configuring traffic shaping policies. However, to reduce the complexity, it is recommended to use one method over the other.

The following topics include examples with traffic shaping policies:
- Interface-based traffic shaping profile on page 954
- Shared traffic shaper on page 935
- Per-IP traffic shaper on page 940

Traffic shaping profiles

As mentioned in Traffic shaping on page 918, the three main methods of configuring traffic shaping are:
- Traffic shaping profiles
- Traffic shapers
- Global traffic prioritization

A traffic shaping profile allows traffic shaping to be configured with policing or queuing. Up to 30 classes can be defined, with prioritization and bandwidth limits configured for each class. When queuing is enabled, metrics can be configured for traffic queuing in each class.
Traffic shaping with policing

At the most basic level, policing involves traffic prioritization and bandwidth limits. Traffic prioritization helps categorize traffic into different priority levels: low, medium, high, critical, and top. When bandwidth is limited, traffic with higher priority levels will take precedence over lower priority traffic. Traffic with lower priority levels that exceeds available bandwidth will be dropped. These levels are only applicable in the context of traffic shaping profiles and should not be confused with global traffic prioritization levels.

Bandwidth limits define the guaranteed and maximum bandwidth allotted to each traffic class. These limits are configured as a percentage of the outbound bandwidth, which is the outbound bandwidth configured on an interface.

Guaranteed bandwidth limits guarantee the minimum bandwidth that is allotted to a given class of traffic. The sum of all guaranteed bandwidth of all classes within a traffic shaping profile cannot exceed 100%. However, the sum of all guaranteed bandwidth does not need to add up to 100%. The guaranteed bandwidth is always respected, even if one class has lower priority than another.

Maximum bandwidth limits define the maximum percentage of the outbound bandwidth that a traffic class can use up. This value often will be 100%, given that when there is no other traffic going through other classes, you would want to fully utilize the bandwidth of the outbound link. Traffic throughput exceeding the maximum bandwidth will be dropped.

The following diagram illustrates ingress traffic and how the FortiGate assigns classes and bandwidth to each class.

When comparing traffic shaping profiles and traffic shapers, it is important to remember that guaranteed and maximum bandwidth in a traffic shaping profile is a percentage of the outbound bandwidth, while guaranteed and maximum bandwidth in a traffic shaper is a rate (Kbps, Mbps, and so on). As long as the outbound bandwidth is true to its measurement, the bandwidth usage should not exceed the available bandwidth of a link when using a traffic shaping profile.

Congestion occurs when actual traffic surpasses the outbound bandwidth limit. At this point, traffic prioritization helps determine which traffic will be prioritized over others. First, the guaranteed bandwidth limit is allocated for each class. The left over bandwidth is allocated to traffic classes based on priority. The traffic classes with the highest priority can use as much of the remaining bandwidth as needed. Then, the remaining bandwidth can be allocated to classes at the next priority level, and so forth.

To see examples of applied traffic prioritization and bandwidth limits, see the debugs in Verifying that the traffic is being shaped on page 930.
**Traffic shaping with queuing**

When traffic congestion occurs and if there is no queuing, then the excess packets are dropped. With queuing, when traffic exceeds the configured bandwidth limits, the traffic is delayed for transport until bandwidth frees up. Traffic may still be dropped if the queues are full.

In queuing, before a packet egresses an interface, it is first enqueued using an algorithm, such as random early detection (RED) or first in, first out (FIFO). The kernel then dequeues the packet based on the HTB algorithm before sending it out. Queuing can be configured per shaping profile, and it can be customized per class.

The following diagram shows how traffic policing differs from traffic queuing by comparing the bandwidth limit, projected bandwidth utilization, and actual bandwidth utilization.

![Traffic shaping with policing](image1)

![Traffic shaping with queuing](image2)

For more information about traffic shaping with queuing, see Traffic shaping with queuing using a traffic shaping profile on page 931.

**Configuring traffic shaping profiles**

The main steps to configure traffic shaping are:

1. Configure the traffic shaping policy, and assign matched traffic to a class (see Traffic shaping policies on page 921).
2. Configure the traffic shaping profile and apply traffic bandwidth, prioritization and/or queuing per class.
3. Configure the interface outbandwidth and apply an egress shaping profile to the interface.

**Configuring the traffic shaping profile**

A traffic shaping profile consists of the class ID and the settings per class ID. It also defines the type of traffic shaping to apply (policing or queuing) and the default class ID for traffic that does not match any traffic shaping policies.

A class can be configured in the GUI as part of a traffic shaping profile or policy. In the CLI, a traffic class must be defined before it can be assigned within a traffic shaping profile. Class IDs range from 2 - 31, and they can be reused between different traffic shaping profiles.

When configuring a traffic shaping profile, the settings can be defined per class.

The following options can be configured for traffic shaping classes:

<table>
<thead>
<tr>
<th>GUI option</th>
<th>CLI option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>set default-class-id &lt;class-id&gt;</td>
<td>Set the default class ID. Each profile must have one default class ID. The default class ID can be changed at any time.</td>
</tr>
</tbody>
</table>
## Policy and Objects

<table>
<thead>
<tr>
<th>GUI option</th>
<th>CLI option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traffic shaping class ID</td>
<td>set class-id &lt;integer&gt;</td>
<td>Set the class ID (2 - 31).</td>
</tr>
<tr>
<td>Guaranteed bandwidth</td>
<td>set guaranteed-bandwidth-percentage &lt;integer&gt;</td>
<td>Set the percentage of the outbandwidth that will be guaranteed for the class ID.</td>
</tr>
<tr>
<td>Maximum bandwidth</td>
<td>set maximum-bandwidth-percentage &lt;integer&gt;</td>
<td>Set the percentage of the outbandwidth that will be the maximum bandwidth for the class ID.</td>
</tr>
<tr>
<td>Priority</td>
<td>set priority {top</td>
<td>critical</td>
</tr>
</tbody>
</table>

### To configure a traffic shaping profile in the GUI:

1. Go to **Policy & Objects > Traffic Shaping**, select the **Traffic Shaping Profiles** tab, and click **Create New**.
2. Enter the profile name, and optionally enter a comment.
3. In the **Traffic Shaping Classes** section, click **Create New**.
4. Configure the traffic shaping class ID settings (**Traffic shaping class ID, Guaranteed bandwidth, Maximum bandwidth, and Priority**).
5. Click **OK**.
6. Create more shaping classes as needed (the total guaranteed bandwidth of all classes cannot exceed 100%).
7. Click **OK**.

### To configure a traffic shaping profile in the CLI:

1. Configure the shaping class:
   ```
   config firewall traffic-class
   edit <integer>
   set class-name <string>
   next
   end
   ```

2. Configure the shaping profile:
   ```
   config firewall shaping-profile
   edit <name>
   set type {policing | queuing}
   set default-class-id <class-id>
   config shaping-entries
   edit <id>
   set class-id <integer>
   set priority {top | critical | high | medium | low}
   set guaranteed-bandwidth-percentage <integer>
   set maximum-bandwidth-percentage <integer>
   next
   end
   ```
Configuring the interface outbandwidth

There are two settings that must be configured on an interface that has traffic shaping applied to egressing traffic: a traffic shaping profile must be assigned, and the outbound bandwidth must be configured.

Since traffic shaping is often configured on the WAN interface for egressing traffic, the outbound bandwidth is effectively the upstream bandwidth allowed by your ISP. On the FortiGate, it is possible to perform a speed test on interfaces are assigned a WAN role assigned (see Manual interface speedtest on page 527). The speed test performs measurements against public cloud servers, and provides an accurate measurement of the upstream bandwidth. After the test is complete, the results can be used to populate the Outbound bandwidth field.

To configure traffic shaping on an interface:

1. Go to Network > Interfaces and double-click an interface to edit it.
2. For interfaces assigned a WAN role, in the right-side of the screen, click Execute speed test.
3. When the test completes, click OK in the Confirm pane to apply the results to the estimated bandwidth. The speed test results are populated in the Estimated bandwidth fields for kbps Upstream and kbps Downstream.
4. In the Traffic Shaping section, enable Outbound shaping profile and select a profile.
5. Enable Outbound bandwidth and copy the kbps Upstream value from the speed test, or enter a custom value.
6. Click OK.
Verifying that the traffic is being shaped

In this example, three traffic classes are defined in the traffic shaping profile assigned to port1. The outbandwidth configured on port1 is 1000 Kbps. Each class has an allocated-bandwidth, guaranteed-bandwidth, max-bandwidth, and current-bandwidth value.

- The guaranteed-bandwidth and max-bandwidth are rates that are converted from the percentage of outbandwidth configured for each class. For example, class-id 2 has 10% guaranteed-bandwidth, equivalent to 100 Kbps, and 100% max-bandwidth equivalent to 1000 Kbps.
- The allocated-bandwidth displays the real-time bandwidth allocation for the traffic class based on all available factors. This value changes as traffic demand changes.
- The current-bandwidth displays the real-time bandwidth usage detected for the traffic class.

To verify that traffic is being shaped by the traffic shaping profile:

1. Enable debug flow to view the live traffic as it matches a traffic shaping policy:

   ```
   # diagnose debug flow show function-name enable
   # diagnose debug flow show iprope enable
   # diagnose debug flow filter <filters>
   # diagnose debug flow trace start <repeat_number>
   # diagnose debug enable
   ```

   The `iprope_shaping_check` function outputs the shaping policy matched for any given traffic:

   ```
   ...
   id=20085 trace_id=21 func=iprope_shaping_check line=934 msg="in-[port3], out-[port1], skb_flags=02000000, vid-0"
   id=20085 trace_id=21 func=__iprope_check line=2277 msg="gnum-100015, check-fffffffffa002a8fe"
   id=20085 trace_id=21 func=__iprope_check_one_policy line=2029 msg="checked gnum-100015 policy-3, ret-matched, act-accept"
   id=20085 trace_id=21 func=__iprope_check_one_policy line=2247 msg="policy-3 is matched, act-accept"
   id=20085 trace_id=21 func=__iprope_check_one_policy line=2294 msg="gnum-100015 check result: ret-matched, act-accept, flag-00000000, flag2-00000000"
   ```

2. Display the session list:

   ```
   # diagnose sys session filter <filters>
   # diagnose sys session list
   ```

   Sessions that match a shaping policy will display `class_id` and `shaping_policy_id` fields:

   ```
   ...
   session info: proto=6 proto_state=05 duration=32 expire=0 timeout=3600 flags=00000000 socktype=0 sockport=0 av_idx=0 use=4
   origin-shaper= reply-shaper= per_ip_shaper=
   class_id=4 shaping_policy_id=3 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
   ```

3. Display the interface statistics:

   ```
   # diagnose netlink interface list port1
   if=port1 family=00 type=1 index=3 mtu=1500 link=0 master=0
   ref=95 state=start present fw_flags=2001b800 flags=up broadcast run allmulti multicast Qdisc=pfifo_fast hw_addr=52:54:00:7e:a6 broadcast_addr=ff:ff:ff:ff:ff:ff
   inbandwidth=10000 (kbps) total_bytes=2098887K drop_bytes=7854K
   ```
egress traffic control:

- **class-id=2**
  - bandwidth=1000 (kbps)
  - lock_hit=241
  - default_class=3
  - n_active_class=3
  - allocated_bandwidth=140 (kbps)

- refcnt=95

If the debug output does not display egress traffic control by class and displays them by priority, it is likely that global traffic prioritization is configured. The global traffic prioritization settings must be disabled to view the preceding debug output (see Global traffic prioritization on page 947).

**Traffic shaping with queuing using a traffic shaping profile**

You can use the weighted random early detection (WRED) queuing function within traffic shaping.

This topic includes two parts:

- Traffic shaping with queuing on page 931
- Burst control in queuing mode on page 932

You cannot configure or view WRED in the GUI; you must use the CLI.

**WRED is not supported when traffic is offloaded to an NPU.**

**Traffic shaping with queuing**

Traffic shaping has a queuing option. Use this option to fine-tune the queue by setting the profile queue size or performing random early drop (RED) according to queue usage.

This example shows setting the profile queue size limit to 5 so that the queue can contain a maximum of five packets and more packets are dropped.

**To set the profile queue size limit:**

```
config firewall shaping-profile
edit "profile"
```
This example shows performing RED according to queue usage by setting `red-probability`, `min`, and `max`. Setting `red-probability` to 10 means start to drop packets when queue usage reaches the `min` setting. When queue usage reaches the `max` setting, drop 10% of the packets.

- Level 1: when queue is less than `min` packets, drop 0% of packets.
- Level 2: when queue reaches `min` packets, start to drop packets.
- Level 3: when queue usage is between `min` and `max` packets, drop 0–10% of packets by proportion.
- Level 4: when queue (average queue size) is more than `max` packets, drop 100% of packets.

To set RED according to queue usage:

```
config firewall shaping-profile
  edit "profile"
    set type queuing
    set default-class-id 31
  config shaping-entries
    edit 31
      set class-id 31
      set guaranteed-bandwidth-percentage 5
      set maximum-bandwidth-percentage 10
      set red-probability 10 <range from 0 to 20; default: 0 no drop>
      set min 100 <range from 3 to 3000>
      set max 300 <range from 3 to 3000>
    next
  next
next
end
```

To troubleshoot this function, use the following diagnose commands:

```
diagnose netlink intf-class list <intf>
diagnose netlink intf-qdisc list <intf>
```

**Burst control in queuing mode**

In a hierarchical token bucket (HTB) algorithm, each traffic class has buckets to allow a burst of traffic. The maximum burst is determined by the bucket size `burst` (for guaranteed bandwidth) and `cburst` (for maximum bandwidth). The shaping profile has `burst-in-msec` and `cburst-in-msec` parameters for each shaping entry (`class id`) to control the bucket size.

This example uses the outbandwidth of the interface as 1 Mbps and the maximum bandwidth of class is 50%.

\[
\text{burst} = \text{burst-in-msec} \times \text{guaranteed bandwidth} = 100 \text{ ms} \times 1 \text{ Mbps} \times 50\% = 50000 \text{ b} = 6250 \text{ B}
\]
Policy and Objects

cburst = cburst-in-msec \times \text{maximum bandwidth} = 200 \text{ ms} \times 1 \text{ Mbps} \times 50\% = 100000 \text{ b} = 12500 \text{ B}

The following example sets burst-in-msec to 100 and cburst-in-msec to 200.

**To set burst control in queuing mode:**

```
config firewall shaping-profile
edit "profile"
    set type queuing
    set default-class-id 31
config shaping-entries
edit 31
    set class-id 31
    set guaranteed-bandwidth-percentage 5
    set maximum-bandwidth-percentage 50
    set burst-in-msec 100 <range from 0 to 2000>
    set cburst-in-msec 200 <range from 0 to 2000>
next
end
next
end
```

**Example**

**Enabling RED for FTP traffic from QA**

This example shows how to enable RED for FTP traffic from QA. This example sets a maximum of 10% of the packets to be dropped when queue usage reaches the maximum value.

**To configure the firewall address:**

```
config firewall address
edit QA_team
    set subnet 10.1.100.0/24
next
end
```

**To set the shaping policy to classify traffic into different class IDs:**

```
config firewall shaping-policy
edit 1
    set service HTTPS HTTP
    set dstintf port1
    set srcaddr QA_team
    set dstaddr all
    set class-id 10
next
edit 2
    set service FTP
    set dstintf port1
    set srcaddr QA_team
    set dstaddr all
    set class-id 20
next
end
```
To set the shaping policy to define the speed of each class ID:

```
config firewall shaping-profile
edit QA_team_profile
   set type queuing
   set default-class-id 30
   config shaping-entries
      edit 1
         set class-id 10
         set guaranteed-bandwidth-percentage 50
         set maximum-bandwidth-percentage 100
      next
      edit 2
         set class-id 20
         set guaranteed-bandwidth-percentage 30
         set maximum-bandwidth-percentage 60
         set red-probability 10
      next
      edit 3
         set class-id 30
         set guaranteed-bandwidth-percentage 20
         set maximum-bandwidth-percentage 50
      next
   end
end
```

To apply the shaping policy to the interface:

```
config sys interface
edit port1
   set outbandwidth 10000
   set egress-shaping-profile QA_team_profile
next
end
```

To use diagnose commands to troubleshoot:

```
# diagnose netlink intf-class list port1

Traffic shapers

The following topics provide more information about traffic shapers:

- Shared traffic shaper on page 935
- Per-IP traffic shaper on page 940
- Changing traffic shaper bandwidth unit of measurement on page 943
- Multi-stage DSCP marking and class ID in traffic shapers on page 943
- Adding traffic shapers to multicast policies on page 945

Shared traffic shaper

Shared traffic shaper is used in a firewall shaping policy to indicate the priority and guaranteed and maximum bandwidth for a specified type of traffic use.

The maximum bandwidth indicates the largest amount of traffic allowed when using the policy. You can set the maximum bandwidth to a value between 1 and 16776000 Kbps. The GUI displays an error if any value outside this range is used. If you want to allow unlimited bandwidth, use the CLI to enter a value of 0.

The guaranteed bandwidth ensures that there is a consistent reserved bandwidth available. When setting the guaranteed bandwidth, ensure that the value is significantly less than the interface's bandwidth capacity. Otherwise, the interface will allow very little or no other traffic to pass through, potentially causing unwanted latency.

In a shared traffic shaper, the administrator can prioritize certain traffic as high, medium, or low. FortiOS provides bandwidth to low priority connections only when high priority connections do not need the bandwidth. For example, you
should assign a high traffic priority to a policy for connecting a secure web server that needs to support e-commerce traffic. You should assign less important services a low priority.

When you configure a shared traffic shaper, you can apply bandwidth shaping per policy or for all policies. By default, a shared traffic shaper applies traffic shaping evenly to all policies that use the shared traffic shaper.

When configuring a per-policy traffic shaper, FortiOS applies the traffic shaping rules defined for each security policy individually. For example, if a per-policy traffic shaper is configured with a maximum bandwidth of 1000 Kbps, any security policies that have that traffic shaper enabled get 1000 Kbps of bandwidth each.

If a traffic shaper for all policies is configured with a maximum bandwidth of 1000 Kbps, all policies share the 1000 Kbps on a first-come, first-served basis.

The configuration is as follows:

```
config firewall shaper traffic-shaper
  edit "traffic_shaper_name"
    set per-policy enable
  next
end
```

The shared traffic shaper selected in the traffic shaping policy affects traffic in the direction defined in the policy. For example, if the source port is LAN and the destination is WAN1, the traffic shaping affects the flow in this direction only, affecting the outbound traffic's upload speed. You can define the traffic shaper for the policy in the opposite direction (reverse shaper) to affect the inbound traffic's download speed. In this example, that would be from WAN1 to LAN.

Only traffic through forward traffic shapers will be included in FortiView; reverse and per-IP shapers are not included.

Traffic shapers can be added to a multicast policy when multicast routing is enabled.

The following example shows how to apply different speeds to different types of service. The example configures two shared traffic shapers to use in two firewall shaping policies. One policy guarantees a speed of 10 Mbps for VoIP traffic. The other policy guarantees a speed of 1 Mbps for other traffic. In the example, FortiOS communicates with a PC using port10 and the Internet using port9.

To configure shared traffic shapers in the GUI:

1. Create a firewall policy:
   a. Go to Policy & Objects > Firewall Policy and click Create New.
   b. Set the Name to Internet Access.
   c. Set the Incoming Interface to port10.
   d. Set the Outgoing Interface to port9.
   e. Set the Source and Destination to all.
   f. Set the Schedule to always.
   g. Set the Service to ALL.
   h. Click OK.

2. Create the shared traffic shapers:
   a. Go to Policy & Objects > Traffic Shaping, select the Traffic Shapers tab, and click Create New.
   b. Set the Name to 10Mbps. This shaper is for VoIP traffic.
   c. Set the Traffic Priority to High.
   d. Enable Max Bandwidth and enter 20000.
Policy and Objects

e. Enable Guaranteed Bandwidth and enter 10000.

f. Click OK.

g. Repeat the above steps to create another traffic shaper named 1Mbps with the Traffic Priority set to Low, the Max Bandwidth set to 10000, and the Guaranteed Bandwidth set to 1000.

3. Create a firewall shaping policy:
   b. Set the Name to VoIP_10Mbps_High. This policy is for VoIP traffic.
   c. Set the Source and Destination to all.
   d. Set the Service to all VoIP services.
   e. Set the Outgoing Interface to port9.
   f. Enable Shared shaper and select 10Mbps.
   g. Enable Reverse shaper and select 10Mbps.
   h. Click OK.
   i. Repeat the above steps to create another firewall shaping policy named Other_1Mbps_Low for other traffic, with the Source and Destination set to all, Service set to ALL, Outgoing Interface set to port9, and Shared shaper and Reverse shaper set to 1Mbps.

To configure shared traffic shapers in the CLI:

1. Create a firewall policy:
   ```plaintext
   config firewall policy
   edit 1
   set name "Internet Access"
   set srcintf "port10"
   set dstintf "port9"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set fsso disable
   set nat enable
   next
   end
   ```

2. Create the shared traffic shapers:
   ```plaintext
   config firewall shaper traffic-shaper
   ```

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
Policy and Objects

edit "10Mbps"
    set guaranteed-bandwidth 10000
    set maximum-bandwidth 20000
next
edit "1Mbps"
    set guaranteed-bandwidth 1000
    set maximum-bandwidth 10000
    set priority low
next
end

3. Create a firewall shaping policy:
config firewall shaping-policy
edit 1
    set name "VOIP_10Mbps_High"
    set service "H323" "IRC" "MS-SQL" "MYSQL" "RTSP" "SCCP" "SIP" "SIP-MSNmessenger"
    set dstintf "port9"
    set traffic-shaper "10Mbps"
    set traffic-shaper-reverse "10Mbps"
    set srcaddr "all"
    set dstaddr "all"
next
edit 2
    set name "Other_1Mbps_Low"
    set service "ALL"
    set dstintf "port9"
    set traffic-shaper "1Mbps"
    set traffic-shaper-reverse "1Mbps"
    set srcaddr "all"
    set dstaddr "all"
next
end

To troubleshoot shared traffic shapers:

1. Check if specific traffic is attached to the correct traffic shaper. The example output shows the traffic attached to the 10Mbps and 1Mbps shapers:

   # diagnose firewall iprope list 100015
   policy index=1 uuid_idx=0 action=accept
   flag (0):
   shapers: orig=10Mbps (2/1280000/2560000)
   cos_fwd=0 cos_rev=0
   group=00100015 av=00000000 au=00000000 split=00000000
   host=4 chk_client_info=0x0 app_list=0 ips_view=0
   misc=0 dd_type=0 dd_mode=0
   zone(1): 0 -> zone(1): 38
   source(1): 0.0.0.0-255.255.255.255, uuid_idx=0,
   dest(1): 0.0.0.0-255.255.255.255, uuid_idx=0,
   service(15):
   [6:0x0:0/(1,65535)->(1720,1720)] helper:auto
   [6:0x0:0/(1,65535)->(1503,1503)] helper:auto
   [17:0x0:0/(1,65535)->(1719,1719)] helper:auto
   [6:0x0:0/(1,65535)->(6660,6669)] helper:auto
   [6:0x0:0/(1,65535)->(1433,1433)] helper:auto
   [6:0x0:0/(1,65535)->(1434,1434)] helper:auto
   [6:0x0:0/(1,65535)->(3306,3306)] helper:auto
   [6:0x0:0/(1,65535)->(554,554)] helper:auto
2. Check if the correct traffic shaper is applied to the session. The example output shows that the 1Mbps shaper is applied to the session:

```
# diagnose sys session list
```

```
name             10Mbps
maximum-bandwidth 2500 KB/sec
guaranteed-bandwidth 1250 KB/sec
```

```
total session 1
```

```
```

3. Check the statuses of shared traffic shapers:

```
# diagnose firewall shaper traffic-shaper list
```

```
name 10Mbps
maximum-bandwidth 2500 KB/sec
```

```
guaranteed-bandwidth 1250 KB/sec
```

```
current-bandwidth 0 B/sec
priority 2
tos ff
```

```
packets dropped 0
```
Policy and Objects

bytes dropped 0

name 1Mbps
maximum-bandwidth 1250 KB/sec
guaranteed-bandwidth 125 KB/sec
current-bandwidth 0 B/sec
priority 4
tos ff
packets dropped 0
bytes dropped 0

**Per-IP traffic shaper**

With per-IP traffic shaping, you can limit each IP address's behavior to avoid a situation where one user uses all of the available bandwidth. In addition to controlling the maximum bandwidth used per IP address, you can also define the maximum number of concurrent sessions for an IP address. For example, if you apply a per-IP shaper of 1 Mbps to your entire network, FortiOS allocates each user/IP address 1 Mbps of bandwidth. Even if the network consists of a single user, FortiOS allocates them 1 Mbps. If there are ten users, each user gets 1 Mbps of bandwidth, totaling 10 Mbps of outgoing traffic.

For shared shapers, all users share the set guaranteed and maximum bandwidths. For example, if you set a shared shaper for all PCs using an FTP service to 10 Mbps, all users uploading to the FTP server share the 10 Mbps.

Shared shapers affect upload speed. If you want to limit the download speed from the FTP server in the example, you must configure the shared shaper as a reverse shaper. Per-IP shapers apply the speed limit on both upload and download operations. Only traffic through forward traffic shapers will be included in FortiView; reverse and per-IP shapers are not included.

The following example shows how to apply a per-IP shaper to a traffic shaping policy. This shaper assigns each user a maximum bandwidth of 1 Mbps and allows each user to have a maximum of ten concurrent connections to the FTP server. In the example, FortiOS communicates with users using port10 and the FTP server using port9.

**To configure a per-IP traffic shaper in the GUI:**

1. Create a firewall policy:
   a. Go to **Policy & Objects > IPv4 Policy** and click **Create New**.
   b. Set the **Name** to **FTP Access**.
   c. Set the **Incoming Interface** to **port10**.
   d. Set the **Outgoing Interface** to **port9**.
   e. Set the **Source** to **all**.
   f. Set the **Destination** to **FTP_Server**.
   g. Set the **Schedule** to **always**.
   h. Set the **Service** to **ALL**.
   i. Click **OK**.

2. Create the per-IP traffic shaper:
   a. Go to **Policy & Objects > Traffic Shaping**, select the **Traffic Shapers** tab, and click **Create New**.
   b. Set **Type** to **Per IP Shaper**.
   c. Enter the **Name (FTP_Max_1M)**. This shaper is for VoIP traffic.
   d. Enable **Max Bandwidth** and enter **1000**.
   e. Enable **Max Concurrent Connections** and enter **10**. This means that each user can have up to ten concurrent connections to the FTP server.
f. Click OK.

3. Create a firewall shaping policy:
   b. Enter the Name (FTP speed 1M).
   c. Set the Source to the addresses and users that require access to the FTP server.
   d. Set the Destination to FTP_Server.
   e. Set the Service to ALL.
   f. Set the Outgoing Interface to port9.
   g. Enable Per-IP shaper and select FTP_Max_1M.
   h. Click OK.

To configure a per-IP traffic shaper in the CLI:

1. Create a firewall policy:
   ```
   config firewall policy
   edit 1
   set name "FTP Access"
   set srcintf "port10"
   set dstintf "port9"
   set srcaddr "all"
   set dstaddr "FTP_Server"
   set action accept
   set schedule "always"
   set service "ALL"
   set fsso disable
   set nat enable
   next
   end
   ```

2. Create the per-IP traffic shaper:
   ```
   config firewall shaper per-ip-shaper
   edit "FTP_Max_1M"
   set max-bandwidth 1000
   set max-concurrent-session 10
   next
   end
   ```

3. Create a firewall shaping policy:
   ```
   config firewall shaping-policy
   edit 1
   ```
To troubleshoot per-IP traffic shapers:

1. Check if specific traffic is attached to the correct traffic shaper. The example output shows the traffic attached to the FTP_Max_1M shaper:

   ```
   # diagnose firewall iprope list 100015
   policy index=3 uuid_idx=0 action=accept
   flag (0):
   shapers: per-ip=FTP_Max_1M
   cos_fwd=0 cos_rev=0
   group=00100015 av=00000000 au=00000000 split=00000000
   host=2 chk_client_info=0x0 app_list=0 ips_view=0
   misc=0 dd_type=0 dd_mode=0
   zone(1): 0 -> zone(1): 38
   source(3): 10.1.100.11-10.1.100.11, uuid_idx=30, 10.1.100.143-10.1.100.143, uuid_idx=32,
   10.1.100.22-10.1.100.22, uuid_idx=31,
   dest(1): 172.16.200.55-172.16.200.55, uuid_idx=89,
   service(1):
   [0:0x0:0/(0,65535)->(0,65535)] helper:auto
   ```

2. Check if the correct traffic shaper is applied to the session. The example output shows that the FTP_Max_1M shaper is applied to the session:

   ```
   # diagnose sys session list
   session info: proto=6 proto_state=01 duration=36 expire=3567 timeout=3600 flags=00000000
   sockflag=00000000 sockport=0 av_idx=0 use=4
   origin-shaper=
   reply-shaper=
   per_ip_shaper=FTP_Max_1M
   class_id=0 shaping_policy_id=3 ha_id=0 policy_dir=0 tunnel=/ helper=ftp vlan_cos=0/255
   state=may_dirty ip npu npd mif route_preserve
   statistic(bytes/packets/allow_err): org=506/9/1 reply=416/6/1 tuples=2
   tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
   orgin->sink: org pre->post, reply pre->post dev=39->38/38->39 gwy=172.16.200.55/0.0.0.0
   hook=pre dir=reply act=dnat 172.16.200.55:21->172.16.200.1:58275(10.1.100.11:58275)
   pos/(before,after) 0/(0,0), 0/(0,0)
   misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=2
   serial=0000211a tos=ff/ff app_list=0 app=0 url_cat=0
   sdwan_mbr_seq=0 sdwan_service_id=0
   rpd_link_id = 00000000
   dd_type=0 dd_mode=0
   npu_info: flag=0x00/0x00, offload=0/0, ips_offload=0/0, epid=0/0, ipid=0/0,
   vlan=0x0000/0x0000
   vlfid=0/0, vtag_in=0x0000/0x0000 in_npu=0/0, out_npu=0/0, fwd_en=0/0, qid=0/0
   no_ofld_reason: offload-denied helper
   ```

3. Check the statuses of per-IP traffic shapers. The output should resemble the following:

   ```
   # diagnose firewall shaper per-ip-shaper list
   name FTP_Max_1M
   ```
Policy and Objects

- maximum-bandwidth 125 KB/sec
- maximum-concurrent-session 10
- tos ff/ff
- packets dropped 0
- bytes dropped 0
- addr=10.1.100.11 status: bps=0 ses=3

Changing traffic shaper bandwidth unit of measurement

Bandwidth speeds are measured in kilobits per second (Kbps), and bytes that are sent and received are measured in megabytes (MB). In some cases, this can cause confusion depending on whether your ISP uses kilobits per second (Kbps), kilobytes per second (KBps), megabits per second (Mbps), or gigabits per second (Gbps).

You can change the unit of measurement for traffic shapers in the CLI.

To change the bandwidth unit of measurement for a shared traffic shaper:

```
config firewall shaper traffic-shaper
  edit <traffic_shaper_name>
    set bandwidth-unit {kbps | mbps | gbps}
  next
end
```

To change the bandwidth unit of measurement for a per-IP traffic shaper:

```
config firewall shaper per-ip-shaper
  edit <traffic_shaper_name>
    set bandwidth-unit {kbps | mbps | gbps}
  next
end
```

Multi-stage DSCP marking and class ID in traffic shapers

Traffic shapers have a multi-stage method so that packets are marked with a different differentiated services code point (DSCP) and class id at different traffic speeds. Marking packets with a different DSCP code is for the next hop to classify the packets. The FortiGate benefits by marking packets with a different class id. Combined with the egress interface shaping profile, the FortiGate can handle the traffic differently according to its class id.

<table>
<thead>
<tr>
<th>Rule</th>
<th>DSCP code</th>
<th>Class ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>speed &lt; guarantee bandwidth</td>
<td>differcode</td>
<td>class id in shaping policy</td>
</tr>
<tr>
<td>guarantee bandwidth &lt; speed &lt; exceed bandwidth</td>
<td>exceed-dscp</td>
<td>exceed-class-id</td>
</tr>
<tr>
<td>exceed bandwidth &lt; speed</td>
<td>maximum-dscp</td>
<td>exceed-class-id</td>
</tr>
</tbody>
</table>

This example sets the following parameters:

- When the current bandwidth is less than 50 Kbps, mark packets with differcode 100000 and set class id to 10.
- When the current bandwidth is between 50 Kbps and 100 Kbps, mark packets with exceed-dscp 111000 and set exceed-class-id to 20.
Policy and Objects

- When the current bandwidth is more than 100 Kbps, mark packets with maximum-dscp 111111 and set exceed-class-id to 20.

To set multi-stage DSCP marking and class ID in a traffic shaper:

```plaintext
config firewall shaper traffic-shaper
  edit "50k-100k-150k"
    set guaranteed-bandwidth 50
    set maximum-bandwidth 150
    set diffserv enable
    set dscp-marking-method multi-stage
    set exceed-bandwidth 100
    set exceed-dscp 110000
    set exceed-class-id 20
    set maximum-dscp 111111
    set diffservcode 100000
  next
end

config firewall shaping-policy
  edit 1
    set service "ALL"
    set dstintf PORT2
    set srcaddr "all"
    set dstaddr "all"
    set class-id 10
  next
end
```

Traffic shapers also have an overhead option that defines the per-packet size overhead used in rate computation.

To set the traffic shaper overhead option:

```plaintext
config firewall shaper traffic-shaper
  edit "testing"
    set guaranteed-bandwidth 50
    set maximum-bandwidth 150
    set overhead 14 <range from 0 to 100>
  next
end
```

Example

This example shows how to mark QA traffic with a different DSCP according to real-time traffic speed.

To configure the firewall address:

```plaintext
config firewall address
  edit QA_team
    set subnet 10.1.100.0/24
  next
end
```
To configure the firewall shaper traffic shaper:

```sh
config firewall shaper traffic-shaper
edit "500k-1000k-1500k"
   set guaranteed-bandwidth 500
   set maximum-bandwidth 1500
   set diffserv enable
   set dscp-marking-method multi-stage
   set exceed-bandwidth 1000
   set exceed-dscp 111000
   set maximum-dscp 111111
   set diffservcode 100000
next
end

config firewall shaping-policy
edit QA_team
   set service "ALL"
   set dstintf port1
   set traffic-shaper "500k-1000k-1500k"
   set traffic-shaper-reverse "500k-1000k-1500k"
   set srcaddr "QA_team"
   set dstaddr "all"
next
end
```

Adding traffic shapers to multicast policies

When multicast routing is enabled, a traffic shaper can be added to a multicast policy.

*Only a shared traffic shaper with the per-policy option disabled can be used. This is the default state of the per-policy option. The auto-asic-offload option must also be disabled on the multicast policy.*

---

Example

In this example, a traffic shaper is applied to the multicast policy. A multicast flow sender sends the multicast data stream. The shaper attached to the multicast session is checked, and the shaping of the data stream is confirmed in the multicast session.
To apply traffic shaping to a multicast policy:

1. Enable multicast routing on the VDOM:

   ```
   config router multicast
   set multicast-routing enable
   config pim-sm-global
   config rp-address
   edit 1
   set ip-address 10.1.100.10
   next
   end
   config interface
   edit "wan2"
   set pim-mode sparse-mode
   next
   edit "wan1"
   set pim-mode sparse-mode
   next
   end
   ```

2. Create a traffic shaper:

   ```
   config firewall shaper traffic-shaper
   edit "shaper128kbps-high"
   set guaranteed-bandwidth 128
   set maximum-bandwidth 128
   set per-policy disable
   set diffserv enable
   set diffservcode 010101
   next
   end
   ```

3. Apply the traffic shaper to the multicast policy and disable NPU offloading:

   ```
   config firewall multicast-policy
   edit 1
   set name "test_multicast-policy"
   set logtraffic enable
   set srcintf "wan2"
   set dstintf "wan1"
   set srcaddr "all"
   set dstaddr "all"
   set snat enable
   set auto-asic-offload disable
   set traffic-shaper "shaper128kbps-high"
   next
   end
   ```

4. Check the shaper and DSCP in the multicast session:

   ```
   # diagnose sys mcast-session list
   session info: id=26 vf=0 proto=17 10.1.100.41.35537->230.0.0.1.7878
   used=2 path=1 duration=118 expire=179 indev=18 pkts=119 bytes=64260
   state=00000000;
   session-npu-info: ipid/vlifid=0/0 vlanid/vtag_in=0/0 in_npuid=0 tae_index=0 qid=0
   ```
Global traffic prioritization

Global traffic prioritization allows your traffic to be prioritized as high (2), medium (3), or low (4) based on ToS (type of service) or DSCP. When using ToS-based priority, integers 0 to 15 can be used, which correspond to the definitions of the ToS field values in RFC 1349. When using DSCP, values 0 to 63 can be used, which correspond to the six bits in the DSCP value.

The outbandwidth must be defined in order for global prioritization to take effect. When the outbandwidth is defined on an interface without an applied egress-shaping-profile, the interface has a total of five priority levels:

<table>
<thead>
<tr>
<th>Priority level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Top</td>
</tr>
<tr>
<td>1</td>
<td>Critical</td>
</tr>
<tr>
<td>2</td>
<td>High</td>
</tr>
<tr>
<td>3</td>
<td>Medium</td>
</tr>
<tr>
<td>4</td>
<td>Low</td>
</tr>
</tbody>
</table>

Priority level 0 is reserved for administrative and local out traffic. Priority level 1 is used for traffic that is below guaranteed bandwidth when using a traffic shaper.

Traffic shaper and traffic shaping profile configurations take precedence over global traffic prioritization.

CLI commands

The following commands are used to configure the prioritization either by ToS or DSCP.

To configure the traffic prioritization type and level:

```conf
config system global
  set traffic-priority {tos | dscp}
  set traffic-priority-level {high | medium | low}
end
```

To configure the ToS-based priority table:

```conf
config system tos-based-priority
  edit <id>
    set tos <0-15>
    set priority {high | medium | low}
```
To configure the DSCP-based priority table:

    config system dscp-based-priority
    edit <id>
        set ds <0-63>
        set priority (high | medium | low)
    next
end

To configure the interface outbandwidth:

    config system interface
    edit <name>
        set outbandwidth <bandwidth in kbps>
    next
end

Example

In the following configuration, packets with DSCP markings of 1 are prioritized as high, and packets with DSCP markings of 2 are prioritized as medium. All the other traffic is prioritized as low. The outbandwidth on interface port3 is set to 1000 kbps.

To configure DSCP-based traffic prioritization:

1. Configure DSCP-based prioritization in the global settings:

    config system global
        set traffic-priority dscp
        set traffic-priority-level low
    end

2. Configure the DSCP-based priority table:

    config system dscp-based-priority
    edit 1
        set ds 1
        set priority high
    next
    edit 2
        set ds 2
        set priority medium
    next
end

3. Configure the outbandwidth on port3:

    config system interface
    edit "port3"
        set outbandwidth 1000
    next
end
Verifying the traffic prioritization

When traffic exceeds the outbandwidth of 1000 kbps, traffic prioritization will take effect. Since the form of traffic shaping applied here is policing, excess packets above the outbandwidth are dropped.

In scenario 1, approximately 300 kbps of high priority traffic and 300 kbps of medium priority traffic passes through the FortiGate on port3.

To debug the bandwidth allocation:

```
# diagnose netlink interface list port3
if=port3 family=00 type=1 index=5 mtu=1500 link=0 master=0
ref=35 state=start present fw_flags=3800 flags=up broadcast run allmulti multicast
Qdisc=pfifo_fast hw_addr=52:54:00:fb:81:0c broadcast_addr=ff:ff:ff:ff:ff:
outbandwidth=1000 (kbps)
    priority=0 allocated-bandwidth=0(kbps) total_bytes=9311K drop_
bytes=197K
    priority=1 allocated-bandwidth=0(kbps) total_bytes=0 drop_bytes=0
priority=2 allocated-bandwidth=354(kbps) total_bytes=20407K drop_
bytes=48K
    priority=3 allocated-bandwidth=354(kbps) total_bytes=7093K drop_
bytes=1262K
    priority=4 allocated-bandwidth=290(kbps) total_bytes=266018K drop_
bytes=7743K
stat: rxp=15450901 txp=25933756 rxb=5456860515 txb=17257309292 rxe=0 txe=0 rxd=0 txd=0 mc=0
collision=0 @ time=1629439926
re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=35
```

High priority (2) traffic is allocated 354 kbps of bandwidth. Medium priority (3) traffic is also allocated 354 kbps of bandwidth. The remaining bandwidth is allocated to low priority (4) traffic.

In scenario 2, approximately 400 kbps of high priority traffic and 800 kbps of medium priority traffic passes through the FortiGate on port3.

To debug the bandwidth allocation:

```
# diagnose netlink interface list port3
if=port3 family=00 type=1 index=5 mtu=1500 link=0 master=0
ref=36 state=start present fw_flags=3800 flags=up broadcast run allmulti multicast
Qdisc=pfifo_fast hw_addr=52:54:00:fb:81:0c broadcast_addr=ff:ff:ff:ff:ff:
outbandwidth=1000 (kbps)
    priority=0 allocated-bandwidth=7(kbps) total_bytes=9981K drop_
bytes=240K
    priority=1 allocated-bandwidth=0(kbps) total_bytes=0 drop_bytes=0
priority=2 allocated-bandwidth=425(kbps) total_bytes=31478K drop_
bytes=101K
    priority=3 allocated-bandwidth=567(kbps) total_bytes=12056K drop_
bytes=1984K
    priority=4 allocated-bandwidth=290(kbps) total_bytes=266795K drop_
bytes=7771K
stat: rxp=15461740 txp=25950805 rxb=5459688950 txb=17273940560 rxe=0 txe=0 rxd=0 txd=0 mc=0
collision=0 @ time=1629440553
re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
```
Policy and Objects

High priority (2) traffic is allocated 425 kbps of bandwidth. Medium priority (3) traffic is allocated 567 kbps of bandwidth. Since the total bandwidth required exceeds 1000 kbps, the remaining medium priority (3) traffic is dropped. In comparing the successive debug outputs, the drop_bytes counter for medium priority (3) traffic gets bigger.

DSCP matching and DSCP marking

This feature has three parts:
- DSCP matching in firewall policies
- DSCP matching in firewall shaping policies
- DSCP marking in firewall shaping policies

DSCP matching in firewall policies

Traffic is allowed or blocked according to the Differentiated Services Code Point (DSCP) values in the incoming packets. The following CLI variables are available in the config firewall policy command:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tos-mask &lt;mask_value&gt;</td>
<td>Non-zero bit positions are used for comparison. Zero bit positions are ignored (default = 0x00). This variable replaces the dscp-match variable.</td>
</tr>
<tr>
<td>tos &lt;tos_value&gt;</td>
<td>Type of Service (ToC) value that is used for comparison (default = 0x00). This variable is only available when tos-mask is not zero. This variable replaces the dscp-value variable.</td>
</tr>
<tr>
<td>tos-negate {enable</td>
<td>disable}</td>
</tr>
</tbody>
</table>

DSCP matching in firewall shaping policies

Shaping is applied to the session or not according to the DSCP values in the incoming packets. The same logic and commands as in firewall policies are used.

DSCP marking in firewall shaping policies

Traffic is allowed or blocked according to the DSCP values in the incoming packets. DSCP marking in firewall shaping policies uses the same logic and commands as in firewall policy and traffic-shaper.

When DSCP marking on firewall shaper traffic-shaper, firewall shaping-policy, and firewall policy all apply to the same session, shaping-policy overrides policy, and shaper traffic-shaper overrides both shaping-policy and policy.

The following CLI variables in config firewall policy are used to mark the packets:
Policy and Objects

diffserv-forward {enable | disable}  
Enable/disable changing a packet's DiffServ values to the value specified in diffservcode-forward (default = disable).

diffservcode-forward <dscp_value>  
The value that packet's DiffServ is set to (default = 000000). This variable is only available when diffserv-forward is enabled.

diffserv-reverse {enable | disable}  
Enable/disable changing a packet's reverse (reply) DiffServ values to the value specified in diffservcode-rev (default = disable).

diffservcode-rev <dscp_value>  
The value that packet's reverse (reply) DiffServ is set to (default = 000000). This variable is only available when diffserv-rev is enabled.

Examples

Example 1

FortiGate A marks traffic from the sales and QA teams with different DSCP values. FortiGate B does DSCP matching, allowing only the sales team to access the database.

1. Configure FortiGate A:

   config firewall policy
   edit 1
      set srcintf "port2"
      set dstintf "port3"
      set srcaddr "QA"
      set dstaddr "all"
      set action accept
      set schedule "always"
      set service "ALL"
      set diffserv-forward enable
      set diffservcode-forward 110000
      set nat enable
   next
   edit 5
      set srcintf "port2"
      set dstintf "port3"
      set srcaddr "Sales"
      set dstaddr "all"
      set action accept
      set schedule "always"
      set service "ALL"
      set diffserv-forward enable
      set diffservcode-forward 111011
      set nat enable
2. Configure FortiGate B:

```plaintext
config firewall policy
edit 2
    set srcintf "port3"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "Database"
    set action accept
    set schedule "always"
    set service "ALL"
    set tos-mask 0xf0
    set tos 0xe0
    set fsso disable
    set nat enable
next
end
```

**Example 2**

FortiGate A marks traffic from the sales and QA teams with different DSCP values. FortiGate B uses a firewall shaping policy to do the DSCP matching, limiting the connection speed of the sales team to the database to 10MB/s.

1. Configure FortiGate A:

```plaintext
config firewall policy
edit 1
    set srcintf "port2"
    set dstintf "port3"
    set srcaddr "QA"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set diffserv-forward enable
    set diffservcode-forward 110000
    set nat enable
next
edit 5
    set srcintf "port2"
    set dstintf "port3"
    set srcaddr "Sales"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set diffserv-forward enable
    set diffservcode-forward 111011
    set nat enable
next
end
```
2. Configure FortiGate B:

```plaintext
config firewall policy
  edit 2
  set srcintf "port3"
  set dstintf "port1"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set schedule "always"
  set service "ALL"
  set nat enable
next
end
config firewall shaper traffic-shaper
  edit "10MB/s"
  set guaranteed-bandwidth 60000
  set maximum-bandwidth 80000
next
end
config firewall shaping-policy
  edit 1
  set service "ALL"
  set dstintf "port1"
  # set tos-mask 0xf0
  set tos 0xe0
  set traffic-shaper "10MB/s"
  set srcaddr "all"
  set dstaddr "all"
next
end
```

Example 3

FortiGate A has a traffic shaping policy to mark traffic from the QA team with a DSCP value of 100000, while reverse traffic is marked with 000011.

1. Configure FortiGate A:

```plaintext
config firewall shaping-policy
  edit 1
  set name "QA Team 50MB"
  set service "ALL"
  set dstintf "port3"
  set traffic-shaper "50MB/s"
  set traffic-shaper-reverse "50MB/s"
  set diffserv-forward enable
  set diffserv-reverse enable
  set srcaddr "QA"
  set dstaddr "all"
  set diffservcode-forward 100000
  set diffservcode-rev 000011
next
end
```
Examples

This section includes the following traffic shaping configuration examples:

- Interface-based traffic shaping profile on page 954
- Interface-based traffic shaping with NP acceleration on page 962
- QoS assignment and rate limiting for FortiSwitch quarantined VLANs on page 963
- Ingress traffic shaping profile on page 964

Interface-based traffic shaping profile

A traffic shaping policy can be used for interface-based traffic shaping by organizing traffic into 30 class IDs. The shaping profile defines the percentage of the interface bandwidth that is allocated to each class. Each traffic class ID is shaped to the assigned speed according to the outgoing bandwidth limit configured to the interface.

Traffic classification

A shaping policy classifies traffic and organizes it into different class IDs, based on matching criteria. For traffic matching a criterion, you can choose to put it into 30 different shaping classes, identified by class ID 2 to 31.

You must select an outgoing interface for the traffic. The shaping policy is only applied when the traffic goes to one of the selected outgoing interfaces.

<table>
<thead>
<tr>
<th>Criterion</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>• Address: match the source address of the traffic to the selected address or address group.</td>
</tr>
<tr>
<td></td>
<td>• User: use the user credentials of the traffic to match the selected user or user group. At least one address, address group, or internet service must also be selected.</td>
</tr>
<tr>
<td></td>
<td>• Internet service: match the traffic to the selected internet service. Internet services cannot be used if addresses or address or groups are used.</td>
</tr>
<tr>
<td>Destination</td>
<td>• Address: match the destination address of the traffic to the selected address or address group.</td>
</tr>
<tr>
<td></td>
<td>• Internet service: match the traffic to the selected internet service. Internet services cannot be used if addresses or address or groups are used.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Match the current date and time to the selected schedule. You can select a one-time schedule, recurring schedule, or schedule group. This setting is optional.</td>
</tr>
<tr>
<td>Service</td>
<td>Match the service of the traffic to the selected service or service group.</td>
</tr>
<tr>
<td>Application</td>
<td>Match the application of the traffic to the selected application, application category, or application group.</td>
</tr>
<tr>
<td></td>
<td>Application control must be enabled in the related firewall policy to know the application of the traffic. See Application control on page 1182 for more information.</td>
</tr>
<tr>
<td>URL category</td>
<td>Match the URL of the traffic to the selected URL category. Web filter must be enabled in the related firewall policy to know the URL of the traffic. See Web filter on page 1124 for more information.</td>
</tr>
</tbody>
</table>
When multiple items are selected in one criterion, it is considered a match when traffic matches any one of them.

Traffic prioritization

Shaping profiles define how different shaping classes of traffic are prioritized. For each class, you can define three prioritization strategies: guaranteed bandwidth, maximum bandwidth, and priority.

For each shaping profile, a default shaping class must be defined. Traffic is prioritized based on the default shaping group in the following two circumstances:

- All traffic to the outgoing interface that does not match to any shaping policy
- Traffic with a shaping group that is not defined in a shaping profile

<table>
<thead>
<tr>
<th>Prioritization strategy</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Guaranteed bandwidth</td>
<td>The percentage of the link speed that is reserved for the shaping group. The total guaranteed bandwidth for all shaping groups cannot exceed 100%.</td>
</tr>
<tr>
<td>Maximum bandwidth</td>
<td>The maximum percentage of the link speed that the shaping group can use.</td>
</tr>
<tr>
<td>Priority</td>
<td>The shaping class priority: top, critical, high, medium, or low. When groups are competing for bandwidth on the interface, the group with the higher priority wins.</td>
</tr>
</tbody>
</table>

Applying a shaping profile to an interface

Traffic shaping is accomplished by configuring the outgoing bandwidth and outgoing shaping profile on an interface. The shaping profile uses the outgoing bandwidth of the interface as the maximum link speed, and it only works when the outgoing bandwidth is configured.

This example shows how to apply interface-based traffic shaping to web and file accessing traffic according to a schedule:

- The link speed of the wan1 interface is 10 Mb/s.
- File access can use up to 2 Mb/s from 8:00 AM to 6:00 PM.
- Web access can use 8 Mb/s from 8:00 AM to 6:00 PM.
Putting the traffic into shaping classes

To create a recurring schedule in the GUI:

1. Go to Policy & Objects > Schedules.
2. Click Create New > Schedule.
3. Configure a recurring schedule called Day_Hours for everyday from 8:00 AM to 6:00 PM.
4. Click OK.

To create a traffic shaping policy and class ID for the web accessing traffic in the GUI:

2. Enter a name for the policy, such as web_access_day_hours.
3. Enable Schedule and select the schedule you just created.
4. Set Service to web accessing services, such as HTTP and HTTPS.
5. Set Action to Assign Shaping Class ID, and Outgoing interface to wan1.
6. Click the Traffic shaping class ID drop down then click Create.
7. Enter an integer value for the ID (3) and a description for the Name, such as Web Access.
8. Click OK.
9. Select the class ID you just created for Traffic shaping class ID.

10. Configure the remaining settings as required.
11. Click OK.

To create a traffic shaping policy and class ID for the file accessing traffic in the GUI:

2. Enter a name for the policy, such as file_access_day_hours.
3. Enable Schedule and select the schedule you just created.
4. Set Service to file accessing services, such as ASF3, FTP and SMB.
5. Set Action to Assign Shaping Class ID, and Outgoing interface to wan1.
6. Click the Traffic shaping class ID drop down then click Create.
7. Enter an integer value for the ID (4) and a description for the Name, such as File Access.
8. Click OK.
9. Select the class ID you just created for Traffic shaping class ID.

10. Configure the remaining settings as required.
11. Click OK.

To put the traffic into shaping classes in the CLI:

1. Create a recurring schedule:

   ```
   config firewall schedule recurring
   edit "Day_Hours"
   set start 08:00
   set end 18:00
   set day sunday monday tuesday wednesday thursday friday saturday
   next
   end
   ```

2. Create the traffic class IDs:

   ```
   config firewall traffic-class
   edit 3
   set class-name "Web Access"
   ```
3. Create the web and file accessing traffic shaping policies:

```python
config firewall shaping-policy
    edit 2
        set name "web_access_day_hours"
        set comment "Limit web accessing traffic to 8Mb/s in day time"
        set service "HTTP" "HTTPS"
        set schedule "Day_Hours"
        set dstintf "wan1"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
    edit 3
        set name "file_access_day_hours"
        set comment "Limit file accessing traffic to 2Mb/s during the day"
        set service "AFS3" "FTP" "FTP_GET" "FTP_PUT" "NFS" "SAMBA" "SMB" "TFTP"
        set schedule "Day_Hours"
        set dstintf "wan1"
        set class-id 4
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

**Allocating bandwidth to the shaping classes**

A traffic shaping profile defines the guaranteed and maximum bandwidths each class receives. In this example, file access can use up to 2 Mb/s and web access can use 8 Mb/s from 8:00 AM to 6:00 PM.

**To create a traffic shaping profile using the GUI:**

1. Go to Policy & Objects > Traffic Shaping, select the Traffic Shaping Profiles tab, and click Create New.
2. Enter a name for the profile, such as Day_Hours_Profile.
3. Configure a default traffic shaping class:
   - This class has a high priority, meaning that when the other classes have reached their guaranteed bandwidths, this default class will use the rest of the available bandwidth.
   a. In the Traffic Shaping Classes table click Create New.
   b. Click the Traffic shaping class ID drop down then click Create.
   c. Enter a name for the class, such as Default Access.
   d. Click OK.
   e. Select the class ID you just created for Traffic shaping class ID.
Policy and Objects

f. Configure the following settings, then click OK:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Guaranteed bandwidth</td>
<td>30</td>
</tr>
<tr>
<td>Maximum bandwidth</td>
<td>100</td>
</tr>
<tr>
<td>Priority</td>
<td>High</td>
</tr>
</tbody>
</table>

4. Configure a web accessing traffic shaping class:
When other types of traffic are competing for bandwidth, this class is guaranteed to 6 Mb/s, or 60% of the bandwidth.

a. In the Traffic Shaping Classes table click Create New.
b. Configure the following settings, then click OK:

<table>
<thead>
<tr>
<th>Traffic shaping class ID</th>
<th>Web Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Guaranteed bandwidth</td>
<td>60</td>
</tr>
<tr>
<td>Maximum bandwidth</td>
<td>80</td>
</tr>
<tr>
<td>Priority</td>
<td>Medium</td>
</tr>
</tbody>
</table>

5. Configure a file accessing traffic shaping class:
When other types of traffic are competing for bandwidth, this group is guaranteed to 1 Mb/s, or 10% of the bandwidth.

a. In the Traffic Shaping Classes table click Create New.
b. Configure the following settings, then click OK:

<table>
<thead>
<tr>
<th>Traffic shaping class ID</th>
<th>File Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Guaranteed bandwidth</td>
<td>10</td>
</tr>
<tr>
<td>Maximum bandwidth</td>
<td>20</td>
</tr>
<tr>
<td>Priority</td>
<td>Medium</td>
</tr>
</tbody>
</table>
6. Click OK.

To create a traffic shaping profile using the CLI:

```
config firewall shaping-profile
edit "Day_Hours_Profile"
  set default-class-id 2
config shaping-entries
  edit 1
    set class-id 2
    set guaranteed-bandwidth-percentage 30
    set maximum-bandwidth-percentage 100
    next
  edit 2
    set class-id 3
    set priority medium
    set guaranteed-bandwidth-percentage 60
    set maximum-bandwidth-percentage 80
    next
  edit 3
    set class-id 4
```
Defining the available bandwidth on an interface

In this example, the link speed of the wan1 interface is 10 Mb/s.

To set the bandwidth of the wan1 interface in the GUI:

1. Go to Network > Interfaces.
2. Edit the wan1 interface.
3. Under Traffic Shaping, enable Outbound shaping profile and select the profile that you just created, Day_Hours_Profile.
4. Enable Outbound Bandwidth and set it to 10000 Kbps.
5. Click OK.

To set the bandwidth of the wan1 interface in the CLI:

```text
config system interface
  edit "wan1"
    set egress-shaping-profile "Day_Hours_Profile"
    set outbandwidth 10000
  end
next
end
```

Diagnose commands

To check that the specific traffic is put into the correct shaping group or class ID:

```
# diagnose firewall i propane list 100015
```

```text
  set priority medium
  set guaranteed-bandwidth-percentage 10
  set maximum-bandwidth-percentage 20
  next
  end
  next
  end
```
To check the speed limit for each class ID on an interface:

```
# diagnose netlink interface list wan1
```

**Interface-based traffic shaping with NP acceleration**

Interface-based traffic shaping with NP acceleration is supported on some devices.

An administrator configures the WAN interface’s maximum outbound bandwidth and, based on that, creates a traffic shaping profile with a percentage based shaper. This allows for proper QoS and traffic shaping. VLAN interfaces are not supported.

- This feature is supported on FortiGate 600E, 500E, and 300E models.

To configure interface-based traffic shaping:

1. Enable NPU offloading when doing interface-based traffic shaping according to the egress-shaping-profile:

   ```
   config system npu
   set intf-shaping-offload enable
   end
   ```

2. Configure shaping profiles:

   ```
   config firewall shaping-profile
   edit "sdwan"
   set default-class-id 4
   config shaping-entries
   edit 1
   set class-id 4
   set guaranteed-bandwidth-percentage 3
   set maximum-bandwidth-percentage 5
   next
   edit 2
   set class-id 3
   set priority medium
   set guaranteed-bandwidth-percentage 50
   set maximum-bandwidth-percentage 100
   next
   edit 3
   set class-id 2
   set priority low
   set guaranteed-bandwidth-percentage 1
   set maximum-bandwidth-percentage 5
   next
   end
   ```

The class number is limited to 16.
3. Configure a traffic shaper and shaping policy:

```javascript
config firewall shaper traffic-shaper
    edit "Transactional"
        set priority medium
    next
end

config firewall shaping-policy
    edit 1
        set service "ALL"
        set dstintf "any"
        set traffic-shaper "Transactional"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

4. Apply the egress shaping profile on the interface:

```javascript
config system interface
    edit "port2"
        set vdom "root"
        set ip 10.1.100.23 255.255.255.0
        set allowaccess ping
        set type physical
        set outbandwidth 500
        set egress-shaping-profile "sdwan"
        set snmp-index 4
    next
end
```

5. Configure a firewall policy:

```javascript
config firewall policy
    edit 3
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
end
```

### QoS assignment and rate limiting for FortiSwitch quarantined VLANs

When devices are quarantined, they are isolated from the rest of the network. However, they can still impact the network if not controlled beyond isolation. A quarantined host, which offers heavy traffic, could congest the network and create a DOS-style reduction in service to authorized hosts.

Within the quarantined VLAN, two restrictions are available within the network:
Policy and Objects

- Traffic policing (also known as rate limiting)
- QoS (Quality of Service) assignment (also known as priority assignment)

Each quarantined host's traffic can be subject to rate limiting and priority adjustment. This reduces the impact that any quarantined host can have on authorized traffic on the network.

To configure QoS assignment and rate limiting for quarantined VLANs:

1. Configure a traffic policy, or use the default "quarantine" policy:

   ```
   config switch-controller traffic-policy
   edit "quarantine"
   set description "Rate control for quarantined traffic"
   set guaranteed-bandwidth 163840
   set guaranteed-burst 8192
   set maximum-burst 163840
   set cos-queue 0
   next
   end
   ```

2. Configure an interface:

   ```
   config system interface
   edit "qtn.aggr1"
   set vdom "root"
   set ip 10.254.254.254 255.255.255.0
   set description "Quarantine VLAN"
   set security-mode captive-portal
   set replacemsg-override-group "auth-intf-qtn.aggr1"
   set device-identification enable
   set snmp-index 30
   set switch-controller-access-vlan enable
   set switch-controller-traffic-policy "quarantine"
   set color 6
   set interface "aggr1"
   set vlanid 4093
   next
   end
   ```

   By default, `switch-controller-traffic-policy` is empty. You need to apply the necessary traffic policy (not only limited to "quarantine").

Ingress traffic shaping profile

A traffic shaping profile can be applied to an interface for traffic in the ingress direction. Similar to an egress traffic shaping profile, the guaranteed bandwidth and priority of the profile will be respected when an interface receives inbound traffic. When congestion occurs, any remaining bandwidth will be allotted to classes based on priority.

Ingress traffic shaping does not support NPU offloading.
Example

In this example, the port2 interface has a total inbound bandwidth of 100 Mbps. Traffic from certain clients to certain servers are assigned different classes.

IPv6 traffic from any client PCs to server PCs is assigned class 5.

For each class, the priority, guaranteed bandwidth, and maximum bandwidth are as follows:

<table>
<thead>
<tr>
<th>Class</th>
<th>Priority</th>
<th>Guaranteed bandwidth</th>
<th>Maximum bandwidth</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Low</td>
<td>10%</td>
<td>60%</td>
</tr>
<tr>
<td>3</td>
<td>High</td>
<td>20%</td>
<td>100%</td>
</tr>
<tr>
<td>4</td>
<td>High</td>
<td>30%</td>
<td>100%</td>
</tr>
<tr>
<td>5</td>
<td>Medium</td>
<td>10%</td>
<td>50%</td>
</tr>
</tbody>
</table>

Bandwidth will first be allotted to each class according to its guaranteed bandwidth. Then remaining available bandwidth will be allotted to class 3 and 4 first based on their priority. The allocation will be proportional to their guaranteed bandwidth ratio.

To configure ingress traffic shaping:

1. Configure the client and server addresses:

```plaintext
config firewall address
  edit "pc1"
    set subnet 10.1.100.11 255.255.255.255
next
edit "pc2"
    set subnet 10.1.100.22 255.255.255.255
next
edit "pc4"
    set subnet 172.16.200.44 255.255.255.255
next
edit "pc5"
    set subnet 172.16.200.55 255.255.255.255
next
end
```
2. Configure the class IDs:

```fortigate-config
config firewall traffic-class
edit 2
  set class-name "class2"
next
edit 3
  set class-name "class3"
next
edit 4
  set class-name "class4"
next
edit 4
  set class-name "class5"
next
end
```

3. Configure traffic shaping policies to assign classes to each group of traffic.

a. Configure a policy to assign traffic from PC1 to PC4 in class 2:

```fortigate-config
config firewall shaping-policy
edit 1
  set name "shaping policy 1"
  set service "ALL"
  set dstintf "wan1"
  set class-id 2
  set srcaddr "pc1"
  set dstaddr "pc4"
next
end
```

b. Configure a policy to assign traffic from PC2 to PC4 in class 3:

```fortigate-config
config firewall shaping-policy
edit 2
  set name "shaping policy 2"
  set service "ALL"
  set dstintf "wan1"
  set class-id 3
  set srcaddr "pc2"
  set dstaddr "pc4"
next
end
```

c. Configure a policy to assign traffic from PC2 to PC5 in class 4:

```fortigate-config
config firewall shaping-policy
edit 3
  set name "shaping policy 3"
  set service "ALL"
  set dstintf "wan1"
  set class-id 4
  set srcaddr "pc2"
  set dstaddr "pc5"
next
end
```
d. Configure a policy to assign all IPv6 traffic to class 5:

```fortigateconfig
config firewall shaping-policy
edit 4
    set name "shaping policy 4"
    set ip-version 6
    set service "ALL"
    set dstintf "wan1"
    set class-id 5
    set srcaddr6 "all"
    set dstaddr6 "all"
next
end
```

4. Configure a shaping profile to set the priority, and the guaranteed and maximum bandwidth percentages for each class:

```fortigateconfig
config firewall shaping-profile
edit "ingShapeProfile"
    set default-class-id 2
config shaping-entries
edit 2
    set class-id 2
    set priority low
    set guaranteed-bandwidth-percentage 10
    set maximum-bandwidth-percentage 60
next
edit 3
    set class-id 3
    set guaranteed-bandwidth-percentage 20
    set maximum-bandwidth-percentage 100
next
edit 4
    set class-id 4
    set guaranteed-bandwidth-percentage 30
    set maximum-bandwidth-percentage 100
next
edit 5
    set class-id 5
    set priority medium
    set guaranteed-bandwidth-percentage 10
    set maximum-bandwidth-percentage 50
next
end
```

5. Configure the inbandwidth and apply the ingress shaping profile on port2:

```fortigateconfig
config system interface
edit "port2"
    set ip 10.1.100.1 255.255.255.0
    set inbandwidth 100000
    set ingress-shaping-profile "ingShapeProfile"
config ipv6
    set ip6-address 2000:10:1:100::1/64
end
```
next
end

Inbandwidth must be configured for traffic shaping to take effect.

6. Configure a firewall policy to allow traffic to go through. Since traffic shaping is for inbound traffic on port2, the policy is defined from port2 to wan1:

```plaintext
cfg firewall policy
ed 2
    set srcintf "port2"
    set dstintf "wan1"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "all"
    set dstaddr6 "all"
    set schedule "always"
    set service "ALL"
    set logtraffic all
    set auto-asic-offload disable
    set nat enable
next
end
```

NPU must be disabled by configuring `set auto-asic-offload disable`.

**Verifying that the traffic is being shaped**

In each of the following cases, the server PCs (PC4 and PC5) are configured as iPerf servers. The client PCs (PC1 and PC2) are configured as iPerf clients. The client sends traffic to the server from the client to server direction, triggering inbound traffic shaping on the port2 interface. The inbound bandwidth on port2 is 100 Mbps.

**Case 1: single stream, PC1 to PC4**

Traffic is sent from PC1 to PC4. There is no other traffic. Traffic is marked with class ID 2 and allocated the maximum bandwidth 60 Mbps (60%).

```
# diagnose netlink interface list port2
if=port2 family=00 type=1 index=20 mtu=1500 link=0 master=0
ref=25 state=start present fw_flags=3800 flags=up broadcast run multicast
Qdisc=mq hw_addr=70:4c:a5:7d:d4:95 broadcast_addr=ff:ff:ff:ff:ff:ff
ingress traffic control:
    class-id=2 allocated-bandwidth=60000 (kbps)  guaranteed-bandwidth=10000 (kbps)
    max-bandwidth=60000 (kbps)     current-bandwidth=60002 (kbps)
    priority=low   forwarded_bytes=58157K
    dropped_packets=94K   dropped_bytes=125385K
    class-id=5 allocated-bandwidth=1000 (kbps)  guaranteed-bandwidth=1000 (kbps)
    max-bandwidth=50000 (kbps)  current-bandwidth=0 (kbps)
    priority=medium forwarded_bytes=0
    dropped_packets=0 dropped_bytes=0
    class-id=3 allocated-bandwidth=15000 (kbps) guaranteed-bandwidth=20000 (kbps)

misc  rxc=0  txc=0
input_type=0  state=3  arp_entry=0  refcnt=25

Case 2: dual stream, PC1 to PC4, PC2 to PC4

Traffic is sent from both PC1 and PC2 to PC4. PC1 to PC4 traffic is marked with class ID 2 and low priority, and PC2 to PC4 traffic is marked with class ID 3 and high priority. Both class 2 and 3 will be allocated their guaranteed bandwidth first, using up 10% and 20% respectively. The remaining available bandwidth is used by class 3 since it has a higher priority. Class 2 uses around 10 Mbps, and class 3 uses around 90 Mbps.

*# diagnose netlink interface list port2*

Case 3: multiple streams

Multiple streams of traffic are sent at the same time:
PC1 to PC4 traffic is assigned class 2 with low priority, and a guaranteed bandwidth of 10 Mbps.
PC2 to PC4 traffic is assigned class 3 with high priority, and a guaranteed bandwidth of 20 Mbps.
PC2 to PC5 traffic is assigned class 4 with high priority, and a guaranteed bandwidth of 30 Mbps.

All classes will be allocated their guaranteed bandwidth first, using up 10 Mbps, 20 Mbps, and 30 Mbps respectively. The remaining available bandwidth (40 Mbps) is shared by class 3 and class 4 based on their guaranteed bandwidth ratio of 20:30.

- Class 3’s share of the remaining 40 Mbps traffic = $40 \times \frac{20}{(20 + 30)} = 16$ Mbps
- Class 4’s share of the remaining 40 Mbps traffic = $40 \times \frac{30}{(20 + 30)} = 24$ Mbps

Each class is allocated roughly the following bandwidth:

- Class 2: 10 Mbps
- Class 3: 20 Mbps + 16 Mbps = 36 Mbps
- Class 4: 30 Mbps + 24 Mbps = 54 Mbps

Zero Trust Network Access introduction

Zero Trust Network Access (ZTNA) is an access control method that uses client device identification, authentication, and Zero Trust tags to provide role-based application access. It gives administrators the flexibility to manage network access for On-net local users and Off-net remote users. Access to applications is granted only after device verification, authenticating the user’s identity, authorizing the user, and then performing context based posture checks using Zero Trust tags.

Traditionally, a user and a device have different sets of rules for on-net access and off-net VPN access to company resources. With a distributed workforce and access that spans company networks, data centers, and cloud, managing the rules can become complex. User experience is also affected when multiple VPNs are needed to get to various resources. ZTNA can improve this experience.

ZTNA access proxy and IP/MAC based access control

- ZTNA access proxy allows users to securely access resources through an SSL encrypted access proxy. This simplifies remote access by eliminating the use of VPNs.
- IP/MAC based access control combines IP/MAC with uses ZTNA tags for identification and security posture check to implement role-based zero trust access.
ZTNA telemetry, tags, and policy enforcement

When On-net and Off-net FortiClient endpoints register to FortiClient EMS, device information, log on user information, and security posture are all shared over ZTNA telemetry with the EMS server. Clients also make a certificate signing request to obtain a client certificate from the EMS that is acting as the ZTNA Certificate Authority (CA).

Based on the client information, EMS applies matching Zero Trust tagging rules to tag the clients. These tags, and the client certificate information, are synchronized with the FortiGate in real-time. This allows the FortiGate to verify the client's identity using the client certificate, and grant access based on the ZTNA tags applied in the ZTNA rule.

For more information, see Establish device identity and trust context with FortiClient EMS on page 982.

Access proxy

The FortiGate access proxy can proxy HTTP, SSH, RDP, SMB, FTP, and other TCP traffic over secure connections with the client. This enables seamless access from the client to the protected servers, without needing to form IPsec or SSL VPN tunnels.
**HTTPS access proxy**

The FortiGate HTTPS access proxy works as a reverse proxy for the HTTP server. When a client connects to a webpage hosted by the protected server, the address resolves to the FortiGate’s access proxy VIP. The FortiGate proxies the connection and takes steps to authenticate the user. It prompts the user for their certificate on the browser, and verifies this against the ZTNA endpoint record that is synchronized from the EMS. If an authentication scheme, such as SAML authentication, is configured, the client is redirected to a captive portal for sign-on. If this passes, traffic is allowed based on the ZTNA rules, and the FortiGate returns the webpage to the client.

For example configurations, see ZTNA HTTPS access proxy example on page 989, ZTNA HTTPS access proxy with basic authentication example on page 996, and ZTNA proxy access with SAML authentication example on page 1014.

**TCP forwarding access proxy (TFAP)**

The TCP forwarding access proxy works as a special type of HTTPS reverse proxy. Instead of proxying traffic to a web server, TCP traffic is tunneled between the client and the access proxy over HTTPS, and forwarded to the protected resource. The FortiClient endpoint configures the ZTNA connection by pointing to the proxy gateway, and then specifying the destination host that it wants to reach. An HTTPS connection is made to the FortiGate's access proxy VIP, where the client certificate is verified and access is granted based on the ZTNA rules. TCP traffic is forwarded from the FortiGate to the protected resource, and an end to end connection is established. To reduce overhead, you can disable access proxy encryption on the client, as some TCP protocols, like RDP, are already secure. The TCP forwarding access proxy supports UTM scanning and deep inspection for HTTP, HTTPS, SMTP, SMTPS, IMAP, IMAPS, POP3, POP3S, SMB, and CIFS.

For an example configuration, see ZTNA TCP forwarding access proxy example on page 1003.

**SSH access proxy**

The SSH access proxy provides some benefits to proxying SSH connections over TFAP, including allowing SSH deep inspection, performing optional SSH host-key validation, and allowing one time user authentication to authenticate the ZTNA SSH access proxy connection and SSH server connection.

For an example configuration, see ZTNA SSH access proxy example on page 1030.

**Basic ZTNA configuration components**

The basic components that are require to configure ZTNA access proxy the FortiGate are:

1. FortiClient EMS fabric connector and ZTNA tags.
2. FortiClient EMS running version 7.0.0 or later or FortiClient EMS Cloud.
3. FortiClient running 7.0.0 or later.
4. ZTNA server
5. ZTNA rule
6. (Optional) User authentication
7. (Optional) HA configurations

For configuration details, see Basic ZTNA configuration on page 974.
Basic ZTNA configuration

To deploy a ZTNA access proxy, configure the following components on the FortiGate:

1. Configure a FortiClient EMS connector on page 974
2. Configure a ZTNA server on page 976
3. Configure a ZTNA rule on page 979
4. Optional authentication on page 980
5. Optional HA configurations on page 981

To configure ZTNA in the GUI, go to System > Feature Visibility and enable Zero Trust Network Access.

Configure a FortiClient EMS connector

To add an on-premise FortiClient EMS server in the GUI:

2. Click Create New and click FortiClient EMS.
3. Enter a name for the connector and the IP address or FQDN of the EMS.
4. Click OK.
5. A window appears to verify the EMS server certificate. Click Accept.
   See FortiClient EMS for more information.

To add an on-premise FortiClient EMS server in the CLI:

```bash
config endpoint-control fctems
   edit <name>
      set server <server IP or domain>
   next
end
```

To add FortiClient EMS Cloud in the GUI:

2. Double-click FortiClient EMS to open it for editing.
3. Set Type to FortiClient EMS Cloud.
4. Enter a name for the connector.
5. Click OK. A window appears to verify the EMS server certificate.
6. Click Accept.
   See FortiClient EMS for more information.

To add FortiClient EMS Cloud in the CLI:

```bash
config endpoint-control fctems
   edit <name>
```
set fortinetone-cloud-authentication enable
set certificate <string>
next
done

**ZTNA tags**

After the FortiGate connects to the FortiClient EMS, it automatically synchronizes ZTNA tags. ZTNA tags are generated from tagging rules configured on the FortiClient EMS. These tagging rules are based on various posture checks that can be applied on the endpoints. See [Endpoint Posture Check Reference](#).

**To view the synchronized ZTNA tags in the GUI:**

1. Go to *Policy & Objects > ZTNA* and select the *ZTNA Tags* tab.
2. Hover the cursor over a tag name to view more information about the tag, such as its resolved addresses.

![ZTNA Tags GUI](image)

**To create a ZTNA tag group in the GUI:**

1. Go to *Policy & Objects > ZTNA* and select the *ZTNA Tags* tab.
2. Click *Create New Group*.
3. Enter a name for the group and select the group members.

![Create New Group](image)
4. Click OK.

To view the synchronized ZTNA tags in the CLI:

```
# diagnose firewall dynamic address
# diagnose firewall dynamic list
```

To create a ZTNA tag group in the CLI:

```
config firewall addrgrp
edit <group name>
    set category ztna-ems-tag
    set member <members>
next
end
```

Configure a ZTNA server

To configure a ZTNA server, define the access proxy VIP and the real servers that clients will connect to. The access proxy VIP is the FortiGate ZTNA gateway that clients make HTTPS connections to. The service/server mappings define the virtual host matching rules and the real server mappings of the HTTPS requests.

To create a ZTNA server for HTTPS access proxy in the GUI:

1. Go to Policy & Objects > ZTNA and select the ZTNA Servers tab.
2. Click Create New.
3. Enter a name for the server.
4. Select an external interface, enter the external IP address, and select the external port that the clients will connect to.
5. Select the Default certificate. Clients will be presented with this certificate when they connect to the access proxy VIP.
6. Add server mapping:
   a. In the Service/server mapping table, click Create New.
   b. Set Service to HTTPS.
   c. Set Virtual Host to Any Host or Specify.
      - Any Host: Any request that resolves to the access proxy VIP will be mapped to your real servers. For example, if both www.example1.com and www.example2.com resolve to the VIP, then both requests are mapped to your real servers.
      - Specify: Enter the name or IP address of the host that the request must match. For example, if www.example1.com is entered as the host, then only requests to www.example1.com will match.
   d. Configure the path as needed.
      The path can be matched by substring, wildcard, or regular expression. For example, if the virtual host is specified as www.example1.com, and the path substring is map1, then www.example1/map1 will be matched.
   e. If multiple servers will be configured, enable Load balancing and select an algorithm.
   f. Add a server:
      i. In the Servers table, click Create New.
      ii. Enter the server IP address and port number.
      iii. Set the server status.
iv. Click OK.
v. Add more servers as needed.
g. Click OK.
h. Add more server mappings as needed.

7. Click OK.

To create a ZTNA server and access proxy VIP in the CLI:

1. Configure an access proxy VIP:

```fortigate
config firewall vip
edit <name>
   set type access-proxy
   set extip <external IP>
   set extintf <external interface>
   set server-type { https | ssh }
   set extport <external port>
   set ssl-certificate <certificate>
next
end
```

2. If the virtual host is specified, configure the virtual host:

```fortigate
config firewall access-proxy-virtual-host
edit <auto generated when configured from GUI>
   set ssl-certificate <certificate>
   set host <host name or IP>
   set host-type { sub-string | wildcard }
next
end
```

3. Configure the server and path mapping:

```fortigate
config firewall access-proxy
edit <name>
   set vip <vip name>
   set client-cert { enable | disable }
   set empty-cert-action { accept | block }
   set log-blocked-traffic { enable | disable }
config api-gateway
   edit 1
      set url-map <mapped path>
      set service { http | https | tcp-forwarding | samlsp }
      set virtual-host <name of virtual-host if specified>
      set url-map-type { sub-string | wildcard | regex }
   config realservers
      edit 1
         set addr-type ip
         set ip <ip of real server>
         set port <port>
         set status { active | standby | disable }
         set health-check { enable | disable }
next
end
set ldb-method static
set persistence none
```

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
Configure a ZTNA rule

A ZTNA rule is a proxy policy used to enforce access control. ZTNA tags or tag groups can be defined to enforce zero trust role based access. Security profiles can be configured to protect this traffic.

To configure a ZTNA rule in the GUI:
1. Go to Policy & Objects > ZTNA and select the ZTNA Rules tab.
2. Click Create New.
3. Enter a name for the rule.
4. Select an Incoming Interface and Source.
5. Add the ZTNA tags or tag groups that are allowed access. If multiple tags are included, select the Match ZTNA Tags method, Any or All.
6. Select the ZTNA Server.
7. Select the Destination.
8. Configure the remaining options as needed.
9. Click OK.

To configure a ZTNA rule in the CLI:

```
config firewall proxy-policy
edit 1
   set name <ZTNA rule name>
   set proxy access-proxy
   set access-proxy <access proxy>
```
Policy and Objects

set srcintf <interface>
set srcaddr "all"
set transparent {enable | disable}
set dstaddr "all"
set ztna-ems-tag <ZTNA tag(s)>
set ztna-tags-match-logic {or | and}
set action accept
set schedule "always"
set logtraffic all
set poolname <ip_pool>
set utm-status enable
set ssl-ssh-profile <inspection profile>
next
end

The transparent and poolname settings cannot be enabled at the same time. Use one setting at a time when configuring ZTNA rules.

Optional authentication

To configure authentication to the access proxy, you must configure an authentication scheme and authentication rule in the GUI or CLI. They are used to authenticate proxy-based policies, similar to configuring authentication for explicit and transparent proxy.

The authentication scheme defines the method of authentication that is applied. For ZTNA, basic HTTP and SAML methods are supported. Each method has additional settings to define the data source to check against. For example, with basic HTTP authentication, a user database can reference an LDAP server, RADIUS server, local database, or other supported authentication servers that the user is authenticated against.

The authentication rule defines the proxy sources and destinations that require authentication, and which authentication scheme to apply. For ZTNA, active authentication method is supported. The active authentication method references a scheme where users are actively prompted for authentication, like with basic authentication.

After the authentication rule triggers the method to authenticate the user, a successful authentication returns the groups that the user belongs to. In the ZTNA rule and proxy policy you can define a user or user group as the allowed source. Only users that match that user or group are allowed through the proxy policy.

To configure a basic authentication scheme:

config authentication scheme
   edit <name>
      set method basic
      set user-database <auth server>
   next
end

To configure an authentication rule:

config authentication rule
   edit <name>
      set status enable
      set protocol http
To apply a user group to a ZTNA rule in the GUI:

1. Go to Policy & Objects > ZTNA and select the ZTNA Rules tab.
2. Edit an existing rule, or click Create New to create a new rule.
3. Click in the Source field, select the User tab, and select the users and user groups that will be allowed access.
4. Configure the remaining settings as required.
5. Click OK.

To apply a user group to a ZTNA rule in the CLI:

```fortigateconfig
config firewall proxy-policy
edit <policy ID>
    set name <ZTNA rule name>
    set proxy access-proxy
    set access-proxy <access proxy>
    set srcintf <interface>
    set srcaddr "all"
    set dstaddr "all"
    set ztna-ems-tag <ZTNA tags>
    set ztna-tags-match-logic {or | and}
    set action accept
    set schedule "always"
    set logtraffic all
    set groups <user group>
    set utm-status enable
    set ssl-ssh-profile <inspection profile>
next
end
```

The authentication rule and scheme defines the method used to authenticate users. With basic HTTP authentication, a sign in prompt is shown after the client certificate prompt. After the authentication passes, the returned groups that the user is a member of are checked against the user groups that are defined in the ZTNA rule. If a group matches, then the user is allowed access after passing a posture check.

For basic setup information, see ZTNA HTTPS access proxy with basic authentication example on page 996.

For advanced setup information, see ZTNA proxy access with SAML authentication example on page 1014 and ZTNA access proxy with SAML and MFA using FortiAuthenticator example on page 1037.

Optional HA configurations

User information and TLS sessions are synchronized between HA members for ZTNA proxy sessions. When a failover occurs, the new primary unit will continue allowing sessions from the logged in users without asking for the client certificate and re-authentication again.
There are no special configurations for HA. Refer to HA active-passive cluster setup on page 2037 and HA active-active cluster setup on page 2039 to configure your HA cluster.

Establish device identity and trust context with FortiClient EMS

How device identity is established through client certificates, and how device trust context is established between FortiClient, FortiClient EMS, and the FortiGate, are integral to ZTNA.

Device roles

FortiClient

FortiClient endpoints provide the following information to FortiClient EMS when they register to the EMS:

- Device information (network details, operating system, model, and others)
- Logged on user information
- Security posture (On-net/Off-net, antivirus software, vulnerability status, and others)

It also requests and obtains a client device certificate from the EMS ZTNA Certificate Authority (CA) when it registers to FortiClient EMS. The client uses this certificate to identify itself to the FortiGate.

FortiClient EMS

FortiClient EMS issues and signs the client certificate with the FortiClient UID, certificate serial number, and EMS serial number. The certificate is then synchronized to the FortiGate. EMS also shares its EMS ZTNA CA certificate with the FortiGate, so that the FortiGate can use it to authenticate the clients.

FortiClient EMS uses zero trust tagging rules to tag endpoints based on the information that it has on each endpoint. The tags are also shared with the FortiGate. See Endpoint Posture Check Reference for a list of the endpoint posture checks that EMS can perform.
Each ZTNA tag creates two firewall addresses in all VDOMs on a FortiGate. One firewall address is the IP address, and the other firewall address is the MAC address. Because each FortiGate model has a global limit and a per-VDOM limit for the maximum number of supported firewall addresses, the FortiGate model determines the maximum number of ZTNA tags allowable by that unit, which is the maximum number of firewall address divided by two. For each FortiGate model's limit, see the Maximum Values table.

**FortiGate**

The FortiGate maintains a continuous connection to the EMS server to synchronize endpoint device information, including primarily:

- FortiClient UID
- Client certificate SN
- EMS SN
- Device credentials (user/domain)
- Network details (IP and MAC address and routing to the FortiGate)

When a device's information changes, such as when a client moves from on-net to off-net, or their security posture changes, EMS is updated with the new device information and then updates the FortiGate. The FortiGate's WAD daemon can use this information when processing ZTNA traffic. If an endpoint's security posture change causes it to no longer match the ZTNA rule criteria on an existing session, then the session is terminated.

**Certificate management on FortiClient EMS**

FortiClient EMS has a `default_ZTNARootCA` certificate generated by default that the ZTNA CA uses to sign CSRs from the FortiClient endpoints. Clicking the refresh button revokes and updates the root CA, forcing updates to the FortiGate and FortiClient endpoints by generating new certificates for each client.
Do not confuse the EMS CA certificate (ZTNA) with the SSL certificate. The latter is the server certificate that is used by EMS for HTTPS access and fabric connectivity to the EMS server.

EMS can also manage individual client certificates. To revoke the current client certificate that is used by the endpoint: go to **Endpoint > All Endpoints**, select the client, and click **Action > Revoke Client Certificate**.

---

**Locating and viewing the client certificate on an endpoint**

In Windows, FortiClient automatically installs certificates into the certificate store. The certificate information in the store, such as certificate UID and SN, should match the information on EMS and the FortiGate.

To locate certificates on other operating systems, consult the vendor documentation.

To locate the client certificate and EMS ZTNA CA certificate on a Windows PC:

1. In the Windows search box, enter *user certificate* and click **Manage user certificates** from the results.

2. In the certificate manager, go to **Certificates - Current User > Personal > Certificates** and find the certificate that is issued by the FortiClient EMS.
3. Right-click on it and select Properties.
4. The General tab shows the client certificate UID and the issue and expiry dates. The Details tab show the certificate SN.

5. Go to the Certificate Path tab to see the full certificate chain.
6. Select the root CA and click View Certificate to view the details about the EMS ZTNA CA certificate.

Verifying that the client information is synchronized to the FortiGate

The following diagnose commands help to verify the presence of matching endpoint record, and information such as the client UID, client certificate SN, and EMS certificate SN on the FortiGate. If any of the information is missing or incomplete, client certificate authentication might fail because the corresponding endpoint entry is not found. More in-depth diagnosis would be needed to determine the reason for the missing records.
Policy and Objects

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td># diagnose endpoint record list &lt;ip&gt;</td>
<td>Show the endpoint record list. Optionally, filter by the endpoint IP address.</td>

online records: 1; offline records: 0; quarantined records: 0
```

SSL certificate based authentication

A client certificate is obtained when an endpoint registers to EMS. FortiClient automatically submits a CSR request and the FortiClient EMS signs and returns the client certificate. This certificate is stored in the operating system's certificate store for subsequent connections. The endpoint information is synchronized between the FortiGate and FortiClient EMS.
When an endpoint disconnects or is unregistered from EMS, its certificate is removed from the certificate store and revoked on EMS. The endpoint obtains a certificate again when it reconnected the EMS.

By default, client certificate authentication is enabled on the access proxy, so when the HTTPS request is received the FortiGate’s WAD process challenges the client to identify itself with its certificate. The FortiGate makes a decision based on the following possibilities:

1. If the client responds with the correct certificate that the client UID and certificate SN can be extracted from:
   - If the client UID and certificate SN match the record on the FortiGate, the client is allowed to continue with the ZTNA proxy rule processing.
   - If the client UID and certificate SN do not match the record on the FortiGate, the client is blocked from further ZTNA proxy rule processing.

2. If the client cancels and responds with an empty client certificate:
   - If empty-cert-action is set to accept, the client is allowed to continue with ZTNA proxy rule processing.
   - If empty-cert-action is set to block, the client is blocked from further ZTNA proxy rule processing.

To configure the client certificate actions:

```
config firewall access-proxy
  edit <name>
    set client-cert {enable | disable}
    set empty-cert-action {accept | block}
  next
end
```

**Example**

In this example, a client connects to qa.fortinet.com and is prompted for a client certificate.

- client-cert is set to enable, and empty-cert-action is set to block.
- The ZTNA server is configured, and a ZTNA rule is set to allow this client.
- The domain resolves to the FortiGate access proxy VIP.

**Scenario 1:**

When prompted for the client certificate, the client clicks OK and provides a valid certificate that is verified by the FortiGate.

![Image of client certificate prompt](image-url)
Result:

The client passes SSL certificate authentication and is allowed to access the website.

Scenario 2:

When prompted for the client certificate, the client clicks Cancel, resulting in an empty certificate response to the access proxy.

Result:

Because the certificate response is empty and empty-cert-action is set to block, the WAD daemon blocks the connection.

Currently, the Microsoft Edge, Google Chrome, and Safari browsers are supported by ZTNA.

ZTNA configuration examples

This section includes the following ZTNA configuration examples:

- ZTNA HTTPS access proxy example on page 989
- ZTNA HTTPS access proxy with basic authentication example on page 996
- ZTNA TCP forwarding access proxy example on page 1003
- ZTNA TCP forwarding access proxy without encryption example on page 1009
- ZTNA proxy access with SAML authentication example on page 1014
- ZTNA IP MAC based access control example on page 1018
- ZTNA IPv6 examples on page 1024
- ZTNA SSH access proxy example on page 1030
- ZTNA access proxy with SAML and MFA using FortiAuthenticator example on page 1037
- ZTNA access proxy with SSL VPN web portal example on page 1049
- Posture check verification for active ZTNA proxy session examples on page 1054
- ZTNA TCP forwarding access proxy with FQDN example on page 1060
- ZTNA session-based form authentication on page 1063
ZTNA HTTPS access proxy example

In this example, an HTTPS access proxy is configured to demonstrate its function as a reverse proxy on behalf of the web server it is protecting. It verifies user identity, device identity, and trust context, before granting access to the protected source.

This example shows access control that allows or denies traffic based on ZTNA tags. Traffic is allowed when the FortiClient endpoint is tagged as Low risk, and denied when the endpoint is tagged with Malicious-File-Detected.

This example assumes that the FortiGate EMS fabric connector is already successfully connected.

To configure ZTNA in the GUI, go to System > Feature Visibility and enable Zero Trust Network Access.

To configure a Zero Trust tagging rule on the FortiClient EMS:

1. Log in to the FortiClient EMS.
2. Go to Zero Trust Tags > Zero Trust Tagging Rules, and click Add.
3. In the Name field, enter Malicious-File-Detected.
4. In the Tag Endpoint As dropdown list, select Malicious-File-Detected.
   EMS uses this tag to dynamically group together endpoints that satisfy the rule, as well as any other rules that are configured to use this tag.
5. Click Add Rule then configure the rule:
   a. For OS, select Windows.
   b. From the Rule Type dropdown list, select File and click the + button.
   c. Enter a file name, such as C:\virus.txt.
   d. Click Save.
6. Click Save.
To configure a ZTNA server for HTTPS access proxy in the GUI:

1. Go to Policy & Objects > ZTNA and select the ZTNA Servers tab.
2. Click Create New.
3. Set Name to WIN2K16-P1.
4. Configure the network settings:
   a. Set External interface to port1.
   b. Set External IP to 192.168.2.86.
   c. Set External port to 8443.
5. Select the Default certificate. Clients will be presented with this certificate when they connect to the access proxy VIP.
6. Add server mapping:
   a. In the Service/server mapping table, click Create New.
   b. Set Service to HTTPS.
   c. Set Virtual Host to Any Host.
   d. Configure the path as needed. For example, to map to winserver.fgdocs.com/fortigate, enter /fortigate.
   e. Add a server:
      i. In the Servers table, click Create New.
      ii. Set IP to 192.168.20.6.
      iii. Set Port to 443.
      iv. Click OK.
f. Click OK.

7. Click OK.

To configure ZTNA rules to allow and deny traffic based on ZTNA tags in the GUI:

1. Go to Policy & Objects > ZTNA and select the ZTNA Rules tab.
2. Create a rule to deny traffic:
   a. Click Create New.
   b. Set Name to ZTNA-Deny-malicious.
   c. Set Incoming Interface to port1.
   d. Set Source to all.
   e. Add the ZTNA tag Malicious-File-Detected.
      This tag is dynamically retrieved from EMS when you first created the Zero Trust Tagging Rule.
   f. Select the ZTNA server WIN2K16-P1.
   g. Set Action to DENY.
   h. Enable Log Violation Traffic.
   i. Click OK.

3. Create a rule to allow traffic:
   a. Click Create New.
   b. Set Name to proxy-WIN2K16-P1.
c. Set *Incoming Interface to port1.*

d. Set *Source to all.* This can also be set to specific IP addresses to only allow those addresses to connect to this HTTPS access proxy.

e. Add the ZTNA tag *Low.*

f. Select the ZTNA server *WIN2K16-P1.*

g. Configure the remaining options as needed.

h. Click OK.

4. On the ZTNA rules list, make sure that the deny rule (*ZTNA-Deny-malicious*) is above the allow rule (*proxy-WIN2K16-P1*).

To configure HTTPS access in the CLI:

1. Configure the access proxy VIP:

```plaintext
config firewall vip
   edit "WIN2K16-P1"
      set type access-proxy
      set extip 192.168.2.86
      set extintf "port1"
      set server-type https
      set extport 8443
      set ssl-certificate "Fortinet_SSL"
   next
end
```

2. Configure the server and path mapping:

```plaintext
config firewall access-proxy
   edit "WIN2K16-P1"
      set vip "WIN2K16-P1"
      set client-cert enable
      set log-blocked-traffic enable
      config api-gateway
         edit 1
            config realservers
               edit 1
                  set ip 192.168.20.6
               next
            end
         end
      end
end
```

3. Configure ZTNA rules:

```plaintext
config firewall proxy-policy
   edit 3
      set name "ZTNA-Deny-malicious"
      set proxy access-proxy
      set access-proxy "WIN2K16-P1"
      set srcintf "port1"
      set srcaddr "all"
      set dstaddr "all"
      set ztna-ems-tag "FCTEMS000109188_Malicious-File-Detected"
```
set schedule "always"
set logtraffic all
next
edit 2
set name "proxy-WIN2K16-P1"
set proxy access-proxy
set access-proxy "WIN2K16-P1"
set srcintf "port1"
set srcaddr "all"
set dstaddr "all"
set ztna-ems-tag "FCTEMS0000109188_Low"
set action accept
set schedule "always"
set logtraffic all
next
der

Testing the remote access to the HTTPS access proxy

After FortiClient EMS and FortiGate are configured, the HTTPS access proxy remote connection can be tested.

Access allowed:

1. On the remote Windows PC, open FortiClient.
2. On the Zero Trust Telemetry tab, make sure that you are connected to the EMS server.
3. Open a browser and enter the address of the server and the access port. When entering the FQDN, make sure that the DNS can resolve the address to the IP address of the FortiGate. In this example, winserver.fgdocs.com resolves to 192.168.2.86.
4. The browser prompts for the client certificate to use. Select the EMS signed certificate, then click OK.

The certificate is in the User Configuration store, under Personal > Certificates. The details show the SN of the certificate, which matches the record on the FortiClient EMS and the FortiGate.
5. The client is verified by the FortiGate to authenticate your identity.
6. The FortiGate matches your security posture by verifying your ZTNA tag and matching the corresponding ZTNA rule, and you are allowed access to the web server.

**Access denied:**

1. On the remote Windows PC, trigger the Zero Trust Tagging Rule by creating the file in C:\virus.txt.
2. Open a browser and enter the address http://winserver.fgdocs.com:8443.
3. The client is verified by the FortiGate to authenticate your identity.
4. FortiGate checks your security posture. Because EMS has tagged the PC with the *Malicious-File-Detected* tag, it matches the *ZTNA-Deny-malicious* rule.
5. You are denied access to the web server.
Logs and debugging

Access allowed:

# diagnose endpoint record list

ZTNA HTTPS access proxy with basic authentication example

This example expands on the previous example (ZTNA HTTPS access proxy example on page 989), adding LDAP authentication to the ZTNA rule. Users are allowed based on passing the client certificate authentication check, user authentication, and security posture check.

Users that are in the AD security group ALLOWED-VPN are allowed access to the access proxy. Users that are not part of this security group are not allowed access.
This example assumes that the FortiGate EMS fabric connector is already successfully connected.

LDAP/Active Directory Users and Groups:

- Domain: KLHOME.local
- Users (Groups):
  - radCurtis (Domain Users, ALLOWED-VPN)
  - radKeith (Domain Users)

To configure a secure connection to the LDAP server in the GUI:

1. Go to User & Authentication > LDAP Servers and click Create New.
2. Configure the following settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>WIN2K16-KLHOME-LDAPS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server IP/Name</td>
<td>192.168.20.6</td>
</tr>
<tr>
<td>Server Port</td>
<td>636</td>
</tr>
<tr>
<td>Common Name Identifier</td>
<td>sAMAccountName</td>
</tr>
<tr>
<td>Distinguished Name</td>
<td>dc=KLHOME,dc=local</td>
</tr>
<tr>
<td>Exchange server</td>
<td>Disabled</td>
</tr>
<tr>
<td>Bind Type</td>
<td>Regular</td>
</tr>
<tr>
<td></td>
<td>Enter the Username and Password for LDAP binding and lookup.</td>
</tr>
<tr>
<td>Secure Connection</td>
<td>Enabled</td>
</tr>
<tr>
<td></td>
<td>Set Protocol to LDAPS</td>
</tr>
<tr>
<td></td>
<td>Enable Certificate and select the CA certificate to validate the server certificate.</td>
</tr>
<tr>
<td>Server identity check</td>
<td>Optionally, enable to verify the domain name or IP address against the server certificate.</td>
</tr>
</tbody>
</table>
3. Click Test Connectivity to verify the connection to the server.
4. Click OK.

To configure a secure connection to the LDAP server in the CLI:

```plaintext
config user ldap
    edit "WIN2K16-KLHOME-LDAPS"
        set server "192.168.20.6"
        set cnid "sAMAccountName"
        set dn "dc=KLHOME,dc=local"
        set type regular
        set username "KLHOME\Administrator"
        set password <password>
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

To configure a remote user group from the LDAP server in the GUI:

1. Go to User & Authentication > User Groups and click Create New.
2. Set the name to KLHOME-ALLOWED-VPN.
3. Set Type to Firewall.
4. In the Remote Groups table click Add:
   a. Set Remote Server to WIN2K16-KLHOME-LDAPS.
   b. Locate the ALLOWED-VPN group, right-click on it, and click Add Selected.
   c. Click OK.
5. Click OK.

To configure a remote user group from the LDAP server in the CLI:

```bash
config user group
  edit "KLHOME-ALLOWED-VPN"
    set member "WIN2K16-KLHOME-LDAPS"
  config match
    edit 1
      set server-name "WIN2K16-KLHOME-LDAPS"
      set group-name "CN=ALLOWED-VPN,DC=KLHOME,DC=local"
    next
  next
end
```

**Authentication scheme and rules**

After the LDAP server and user group have been configured, an authentication scheme and rule must be configured.

To configure authentication schemes and rules in the GUI, go to System > Feature Visibility and enable Explicit Proxy.

**Authentication scheme**

The authentication scheme defines the method of authentication that is applied. In this example, basic HTTP authentication is used so that users are prompted for a username and password the first time that they connect to a website through the HTTPS access proxy.

**To configure an authentication scheme in the GUI:**

1. Go to Policy & Objects > Authentication Rules and click Create New > Authentication Scheme.
2. Set the name to ZTNA-Auth-scheme.
3. Set Method to Basic.
4. Set User database to Other and select WIN2K16-KLHOME-LDAPS as the LDAP server.
5. Click OK.
To configure an authentication scheme in the CLI:

```plaintext
config authentication scheme
  edit "ZTNA-Auth-scheme"
    set method basic
    set user-database "WIN2K16-KLHOME-LDAPS"
  next
end
```

**Authentication rule**

The authentication rule defines the proxy sources and destination that require authentication, and what authentication scheme is applied. In this example, active authentication through the basic HTTP prompt is used and applied to all sources.

To configure an authentication rule in the GUI:

2. Set the name to ZTNA-Auth-rule.
3. Set Source Address to all.
4. Set Protocol to HTTP.
5. Enable Authentication Scheme and select ZTNA-Auth-scheme.
6. Click OK.

To configure an authentication rule in the CLI:

```plaintext
config authentication rule
  edit "ZTNA-Auth-rule"
    set srcaddr "all"
    set active-auth-method "ZTNA-Auth-scheme"
  next
end
```

**Applying the user group to a ZTNA rule**

A user or user group must be applied to the ZTNA rule that you need to control user access to. The authenticated user from the authentication scheme and rule must match the user or user group in the ZTNA rule.

In this example, the user group is applied to the two ZTNA rules that were configured in ZTNA HTTPS access proxy example on page 989.

To apply a user group to the ZTNA rules in the GUI:

1. Go to Policy & Objects > ZTNA and select the ZTNA Rules tab.
2. Edit the ZTNA-Deny-malicious rule.
3. Click in the Source field, select the User tab, select the KLHOME-ALLOWED-VPN group, then click Close.
4. Click OK.
5. Edit the proxy-WIN2K16-P1 rule.
6. Click in the Source field, select the User tab, select the KLHOME-ALLOWED-VPN group, then click Close.
7. Click OK.
Policy and Objects

To apply a user group to the ZTNA rules in the CLI:

```
config firewall proxy-policy
  edit 3
    set name "ZTNA-Deny-malicious"
    set proxy access-proxy
    set access-proxy "WIN2K16-P1"
    set srcintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set ztna-ems-tag "FCTEMS0000109188_Malicious-File-Detected"
    set schedule "always"
    set logtraffic all
    set groups "KLHOME-ALLOWED-VPN"
  next
  edit 2
    set name "proxy-WIN2K16-P1"
    set proxy access-proxy
    set access-proxy "WIN2K16-P1"
    set srcintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set ztna-ems-tag "FCTEMS0000109188_Low"
    set action accept
    set schedule "always"
    set logtraffic all
    set groups "KLHOME-ALLOWED-VPN"
  next
end
```

Testing remote access to the HTTPS access proxy with user authentication

Scenario 1: access allowed - user radCurtis

1. On a remote Windows PC, open the FortiClient app, select the Zero Trust Telemetry tab, and confirm that you are connected to the EMS server.

2. In a browser, enter the address of the server and the access port.
   If entering an FQDN, make sure that DNS can resolve the address to the IP address of the FortiGate. In this example, `winserver.fgdocs.com` resolves to `192.168.2.86`.

3. When the browser asks for the client certificate to use, select the EMS signed certificate, then click OK.
   The client certificate is verified by the FortiGate to authenticate your identity.

4. When prompted, enter the username `radCurtis` and the password, and click Sign in.
   As `radCurtis` is a member of the `ALLOWED-VPN` group in Active Directory, it will match the `KLHOME-ALLOWED-VPN` user group. After the user authentication passes, the FortiGate performs a posture check on the ZTNA group. When that passes, you are allowed access to the website.

Verifying the results

```
# diagnose firewall auth list
10.10.10.20, radCurtis
    type: fw, id: 0, duration: 13, idled: 13
```
Policy and Objects

expire: 587, allow-idle: 600
packets: in 0 out 0, bytes: in 0 out 0
group_id: 8 16777220
group_name: KLHOME-ALLOWED-VPN grp_16777220

# diagnose test application fcnacd 7
ZTNA Cache:
-uid P4F3263AE6E54777A6509A8FCCDF9284: { "tags": [ "all_registered_clients", "Low" ], "user_name": "keith", "client_cert_sn": "6C7433E8E2CEDEB49B6C3C3C03677A3521EA4486", "ems_sn": "FCTEMS0000109188" }

The user_name is the windows log in username learned by FortiClient. It might not match the username used in firewall user authentication.

# execute log display

1: date=2021-04-13 time=00:11:56 eventtime=1618297916023667886 tz="-0700" logid="0000000010" type="traffic" subtype="forward" level="notice" vd="root" srcip=10.10.10.20 srcport=51513 srcintf="port1" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved" dstip=192.168.20.6 dstport=443 dstintfrole="undefined" sessionid=2319197 srcuuid=2d8e1736-8ec6-51eb-885c-009bdf9c31d7 dstuuid=5445be2e-5d7b-51ea-e2c3-ae6b7855c52f service="HTTPS" wanoptapptype="web-proxy" proto=6 action="accept" policyid=2 policytype="proxy-policy" poluuid="5aba29de-8ec6-51eb-698f-25b59d5bf852" duration=10 user="radCurtis" group="KLHOME-ALLOWED-VPN" authserver="WIN2K16-KLHOME-LDAPS" wanin=104573 rcvdbyte=104573 wanout=2364 lanin=3538 sentbyte=3538 lanout=104445 appcat="unscanned"

Scenario 2: access denied – user radKeith

1. If scenario 1 has just been tested, log in to the FortiGate and deauthenticate the user:
   a. Go to Dashboard > Users & Devices and expand the Firewall Users widget.
   b. Right-click on the user radKeith and select deauthenticate.
2. On a remote Windows PC, open the FortiClient app, select the Zero Trust Telemetry tab, and confirm that you are connected to the EMS server.
3. In a browser, enter the address winserver.fgdocs.com.
4. When the browser asks for the client certificate to use, select the EMS signed certificate, then click OK. This option might not appear if you have already selected the certificate when testing scenario 1.
   The client certificate is verified by the FortiGate to authenticate your identity.
5. When prompted, enter the username radKeith and the password, and click Sign in.
   As radKeith is not a member of the ALLOWED-VPN group in Active Directory, it will not match the KLHOME-ALLOWED-VPN user group. Because no other policies are matched, this user is implicitly denied

Verifying the results

Go to Dashboard > Users & Devices, expand the Firewall Users widget, and confirm that user radKeith is listed, but no applicable user group is returned.

# execute log display

1: date=2021-04-13 time=12:29:21 eventtime=161834216182542277 tz="-0700" logid="0000000013" type="traffic" subtype="forward" level="notice" vd="root" srcip=10.10.10.20 srcport=52571
Policy and Objects

**ZTNA TCP forwarding access proxy example**

In this example, a TCP forwarding access proxy (TFAP) is configured to demonstrate an HTTPS reverse proxy that forwards TCP traffic to the designated resource. The access proxy tunnels TCP traffic between the client and the FortiGate over HTTPS, and forwards the TCP traffic to the protected resource. It verifies user identity, device identity, and trust context, before granting access to the protected source.

By default, encryption is disabled on FortiClient ZTNA rules, as this reduces overhead for end to end protocols that are already secure. For insecure end to end protocols, enable encryption.

RDP (Remote Desktop Protocol) and SMB (Server Message Block) protocol access are configured to one server, and SSH access to the other server.

FortiClient (Windows) must be running 7.0.3 or later to detect SMB.

This example assumes that the FortiGate EMS fabric connector is already successfully connected.

**To configure the ZTNA server for TCP access proxy in the GUI:**

1. Go to Policy & Objects > ZTNA and select the ZTNA Servers tab.
2. Click Create New.
3. Set Name to ZTNA-tcp-server.
4. Configure the network settings:
   a. Set External interface to port3.
   b. Set External IP to 10.0.3.11.
   c. Set External port to 8443.

5. Select the Default certificate. Clients will be presented with this certificate when they connect to the access proxy VIP.

6. Add server mapping:
   a. In the Service/server mapping table, click Create New.
   b. Set Service to TCP Forwarding.
   c. Add a server:
      i. In the Servers table, click Create New.
      ii. Create a new address for the FortiAnalyzer server at 10.88.0.2 and use it as the address.
      iii. Set Port to 22.
      iv. Click OK.
   d. Add another server:
      i. In the Servers table, click Create New.
      ii. Create a new address for the winserver at 10.88.0.1 and use it as the address.
      iii. Set Port to 445, 3389 to correspond to SMB and RDP.
      iv. Click OK.
   e. Click OK.

7. Click OK.

To configure the ZTNA rule to allow traffic to the TCP access proxy in the GUI:

1. Go to Policy & Objects > ZTNA, select the ZTNA Rules tab, and click Create New.
2. Set Name to ZTNA_remote.
3. Set Incoming Interface to port3.
4. Set Source to all.
5. Select the ZTNA server ZTNA-tcp-server.
6. Configure the remaining options as needed.
7. Click OK.

To configure the access proxy VIP in the CLI:

```plaintext
config firewall vip
edit "ZTNA-tcp-server"
   set type access-proxy
   set extip 10.0.3.11
   set extintf "port3"
   set server-type https
   set extport 8443
   set ssl-certificate "Fortinet_SSL"
next
end
```
To configure the server addresses in the CLI:

```bash
config firewall address
edit "FAZ"
    set subnet 10.88.0.2 255.255.255.255
next
edit "winserver"
    set subnet 10.88.0.1 255.255.255.255
next
end
```

To configure access proxy server mappings in the CLI:

```bash
config firewall access-proxy
edit "ZTNA-tcp-server"
    set vip "ZTNA-tcp-server"
    set client-cert enable
    config api-gateway
        edit 1
            set service tcp-forwarding
        config realservers
            edit 1
                set address "FAZ"
                set mappedport 22
            next
        edit 2
            set address "winserver"
            set mappedport 445 3389
        next
        next
end
```

The mapped port (mappedport) restricts the mapping to the specified port or port range. If mappedport is not specified, then any port will be matched.

To configure a ZTNA rule (proxy policy) in the CLI:

```bash
config firewall proxy-policy
edit 0
    set name "ZTNA_remote"
    set proxy access-proxy
    set access-proxy "ZTNA-tcp-server"
    set srcintf "port3"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set utm-status enable
    set ssl-ssh-profile "certificate-inspection"
    set logtraffic all
next
end
```
Test the connection to the access proxy

Before connecting, users must have a ZTNA connection rule in FortiClient.

ZTNA TCP forwarding rules can be provisioned from the EMS server. See Provisioning ZTNA TCP forwarding rules via EMS for details.

To create a ZTNA rule in FortiClient:

1. On the ZTNA Connection Rules tab, click Add Rule.
2. Set Rule Name to SSH-FAZ.
3. Set Destination Host to 10.88.0.2:22. This is the real IP address and port of the server.
4. Set Proxy Gateway to 10.0.3.11:8443. This is the access proxy address and port that are configured on the FortiGate.
5. Enable Encryption. This option determines whether or not the Client to FortiGate access proxy connection is encrypted in HTTPS.
6. Click Create.
7. Create a second rule with the following settings:
   - Rule Name: RDP_winserver
   - Destination Host: 10.88.0.1:3389
   - Proxy Gateway: 10.0.3.11:8443
   - Encryption: Enabled
8. Create a third rule with the following settings:

- **Rule Name**: SMB_winserver
- **Destination Host**: 10.88.0.1:445
- **Proxy Gateway**: 10.0.3.11:8443
- **Encryption**: Enabled

After creating the ZTNA connection rules, you can SSH, RDP, and SMB directly to the server IP address and port.

**ZTNA TCP forwarding access proxy without encryption example**

TCP forwarding access proxy supports communication between the client and the access proxy without SSL/TLS encryption. The connection still begins with a TLS handshake. The client uses the HTTP 101 response to switch protocols and remove the HTTPS stack. Further end to end communication between the client and server are encapsulated in the specified TCP port, but not encrypted by the access proxy. This improves performance by reducing the overhead of encrypting an already secured underlying protocol, such as RDP, SSH, or FTPS. Users should still enable the encryption option for end to end protocols that are insecure.

In this example, the encryption option to access the web server on HTTP/8080 is disabled to show that traffic for an insecure connection protocol can be viewed in plain text in a protocol analyzer (such as Wireshark). In a real life application, the encryption option should be used for an insecure protocol.

![Diagram of ZTNA TCP forwarding access proxy](image)

**To configure the ZTNA server for TCP access proxy in the GUI:**

1. Go to Policy & Objects > ZTNA and select the ZTNA Servers tab.
2. Click Create New.
3. Set Name to ZTNA-tcp-server.
4. Configure the network settings:
   a. Set External interface to port3.
   b. Set External IP to 10.0.3.11.
   c. Set External port to 8443.
5. Select the Default certificate. Clients will be presented with this certificate when they connect to the access proxy VIP.
6. Add server mapping:
   a. In the Service/server mapping table, click Create New.
   b. Set Service to TCP Forwarding.
Policy and Objects

c. Add a server:
   i. In the Servers table, click Create New.
   ii. Create a new address for the winserver at 10.88.0.1 and use it as the address.
   iii. Click OK.
d. Click OK.

7. Click OK.

To configure the ZTNA rule to allow traffic to the TCP access proxy in the GUI:

1. Go to Policy & Objects > ZTNA and select the ZTNA Rules tab.
2. Click Create New.
3. Set Name to ZTNA-TCP.
4. Set Incoming Interface to port3.
5. Set Source to all.
6. Select the ZTNA server ZTNA-tcp-server.
7. Configure the remaining options as needed.
8. Click OK.

To configure the access proxy VIP in the CLI:

```plaintext
config firewall vip
  edit "ZTNA-tcp-proxy"
    set type access-proxy
    set extip 10.0.3.11
    set extintf "port3"
    set server-type https
    set extport 443
    set ssl-certificate "Fortinet_SSL"
next
end
```

To configure the server addresses in the CLI:

```plaintext
config firewall address
  edit "winserver"
    set subnet 10.88.0.1 255.255.255.255
next
end
```

To configure access proxy server mappings in the CLI:

```plaintext
config firewall access-proxy
  edit "ZTNA-tcp-server"
    set vip "ZTNA-tcp-server"
    set client-cert enable
    config api-gateway
      edit 1
        set service tcp-forwarding
    config realservers
      edit 2
        set address "winserver"
```
The mapped port (mappedport) is not specified so that it will map any ports that are defined in FortiClient’s ZTNA connection rule.

To configure a ZTNA rule (proxy policy in the CLI):

```bash
config firewall proxy-policy
edit 0
  set name "ZTNA-TCP"
  set proxy access-proxy
  set access-proxy "ZTNA-tcp-server"
  set srcintf "port3"
  set srcaddr "all"
  set dstaddr "all"
  set action accept
  set schedule "always"
  set logtraffic all
next
end
```

Test the connection to the access proxy

Before connecting, users must have a ZTNA connection rule in FortiClient.

---

ZTNA TCP forwarding rules can be provisioned from the EMS server. See Provisioning ZTNA TCP forwarding rules via EMS for details.

---

To create a ZTNA rule in FortiOS:

1. Go to the ZTNA Connection Rules tab and click Add Rule.
2. Set Rule Name to Webserver HTTP.
3. Set Destination Host to 10.88.0.1:8080. This is the real IP address and port of the server.
4. Set Proxy Gateway to 10.0.3.11:443. This is the access proxy address and port that are configured on the FortiGate.
5. Disable Encryption. This option determines whether or not the Client to FortiGate access proxy connection is encrypted in HTTPS.
6. Click Create.

After creating the ZTNA connection rule, open a browser and access the web page at http://10.88.0.1:8080.

Logs and debugs

1. The forward traffic log will show a log similar to this:

27: date=2021-07-13 time=13:05:00 eventtime=1626206700290129558 tz=-0700 logid=00000000024 type=traffic subtype=forward level=notice vd=root srcip=10.0.3.2 srcport=61409 srcintf="port3" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved" dstip=10.88.0.1 dstport=8080 dstintf="root" dstintfrole="undefined" sessionid=46959 service="tcp/8080" proto=6 action="accept" policyid=3 policytype="proxy-policy" poluuid="fe0e1ae8-bdf9-51eb-b86f-c5e2adb934b3" policynname="ZTNA-TCP" duration=114 wanin=38471 rcvddbyte=38471 wanout=775 lanin=2450 sentbyte=2450 lanout=40643 appcat="unscanned"

2. Use the following WAD debugs to can capture the details about the connection as seen by the FortiGate WAD daemon. Notice that the HTTP request has tls=0, indicating that the proxy connection between the client and access proxy is not encrypted.
Policy and Objects

# diagnose wad debug enable category all
# diagnose wad debug enable level verbose
# diagnose debug enable

[I][p:224][s:46086][r:16777237] wad_dump_http_request 2542
hreq=0x7f20bdaf5950 Received request from client: 10.0.3.2:62067

GET /tcp?address=10.88.0.1&port=8080&tls=0 HTTP/1.1
Host: 10.0.3.11:443
User-Agent: Forticlient
Accept: */*
Cookie: Authorization: Basic ...

After reviewing the details, disable or reset the debugs:

# diagnose debug reset

3. On the client PC, perform a packet capture to review the traffic flow between the client (10.0.3.2) and the access proxy (10.0.3.11) in detail. While the traffic is encapsulated in port 443, the underlying HTTP/8080 requests and traffic are decoded as clear text.

Packet capture of traffic between 10.0.3.2:60824<->10.0.3.11:443:

Traffic stream:

ZTNA proxy access with SAML authentication example

In this example, an HTTPS access proxy is configured, and SAML authentication is applied to authenticate the client. The FortiGate acts as the SAML SP and a SAML authenticator serves as the IdP. In addition to verifying the user and device identity with the client certificate, the user is also authorized based on user credentials to establish a trust context before granting access to the protected resource.

This example assumes that the FortiGate EMS fabric connector is already successfully connected.
To configure the access proxy VIP:

```plaintext
config firewall vip
  edit "ZTNA_server01"
    set type access-proxy
    set extip 172.18.62.32
    set extintf "any"
    set server-type https
    set extport 7831
    set ssl-certificate "Fortinet_CA_SSL"
  next
end
```

To configure access proxy server mappings:

```plaintext
config firewall access-proxy
  edit "ZTNA_server01"
    set vip "ZTNA_server01"
    set client-cert enable
    config api-gateway
      edit 1
        set service https
        config realservers
          edit 1
            set ip 172.18.62.25
            set port 443
        next
      end
    next
end
```

To configure a SAML server:

```plaintext
config user saml
  edit "saml_ztna"
    set cert "Fortinet_CA_SSL"
    set entity-id "https://fgt9.myqalab.local:7831/samlap"
    set idp-entity-id "http://MYQALAB.LOCAL/adfs/services/trust"
    set idp-single-sign-on-url "https://myqalab.local/adfs/ls"
    set idp-single-sign-out-url "https://myqalab.local/adfs/is"
    set idp-cert "REMOTE_Cert_4"
    set digest-method sha256
    set adfs-claim enable
    set user-claim-type upn
    set group-claim-type group-sid
  next
end
```
Policy and Objects

To map the SAML server into an access proxy configuration:

```plaintext
cfg firewall access-proxy
   edit "ZTNA_server01"
      config api-gateway
         edit 3
            set service samlsp
            set saml-server "saml_ztna"
         next
      next
   next
end
```

To configure an LDAP server and an LDAP server group to verify user groups:

```plaintext
cfg user ldap
   edit "ldap-10.1.100.198"
      set server "10.1.100.198"
      set cnid "cn"
      set dn "dc=myqalab,dc=local"
      set type regular
      set username "cn=fosqa1,cn=users,dc=myqalab,dc=local"
      set password **********
      set group-search-base "dc=myqalab,dc=local"
   next
end

cfg user group
   edit "ldap-group-saml"
      set member "ldap-10.1.100.198"
   next
end
```

To configure the authentication rule and scheme to match the new SAML server:

```plaintext
cfg authentication rule
   edit "saml_ztna"
      set srcintf "port10"
      set srcaddr "all"
      set ip-based disable
      set active-auth-method "saml_ztna"
      set web-auth-cookie enable
   next
end

cfg authentication scheme
   edit "saml_ztna"
      set method saml
      set saml-server "saml_ztna"
      set saml-timeout 30
      set user-database "ldap-10.1.100.198"
   next
end
```
To enable user group authentication in an access-proxy type firewall proxy-policy:

```bash
config firewall proxy-policy
edit 6
    set name "ZTNA_remote"
    set proxy access-proxy
    set access-proxy "ZTNA_server01"
    set srcintf "any"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set groups "ldap-group-saml"
    set utm-status enable
    set ssl-ssh-profile "certificate-inspection"
next
end
```

**Testing the connection**

**To test the connection:**

1. On a client PC, try to access the webpage through the HTTPS access proxy. For example, go to http://172.18.62.32:7831 in a browser.
2. The client PC is prompted for a client certificate. After the certificate is validated, you are redirected to a SAML login portal.

![SAML login portal](image)

3. Enter your user credentials. The SAML server authenticates and sends a SAML assertion response message to the FortiGate.
4. The FortiGate queries the LDAP server for the user group, and then verifies the user group against the groups or groups defined in the proxy policy.
5. The user is proxied to the webpage on the real web server.
Logs and debugs

Use the following command to check the user information after the user has been authenticated:

```
# diagnose wad user list
ID: 7, VDOM: vdom1, IPv4: 10.1.100.143
  user name : test1@MYQALAB.local
  worker : 0
  duration : 124

ZTNA IP MAC based access control example

In this example, firewall policies are configured that use ZTNA tags to control access between on-net devices and an internal web server. This mode does not require the use of the access proxy, and only uses ZTNA tags for access control. Traffic is passed when the FortiClient endpoint is tagged as Low risk only. Traffic is denied when the FortiClient endpoint is tagged with Malicious-File-Detected.
This example assumes that the FortiGate EMS fabric connector is already successfully connected.

To configure ZTNA in the GUI, go to System > Feature Visibility and enable Zero Trust Network Access.

To configure a Zero Trust tagging rule on the FortiClient EMS:

1. Log in to the FortiClient EMS.
2. Go to Zero Trust Tags > Zero Trust Tagging Rules, and click Add.
3. In the Name field, enter Malicious-File-Detected.
4. In the Tag Endpoint As dropdown list, select Malicious-File-Detected.
   EMS uses this tag to dynamically group together endpoints that satisfy the rule, as well as any other rules that are configured to use this tag.
5. Click Add Rule then configure the rule:
   a. For OS, select Windows.
   b. From the Rule Type dropdown list, select File and click the + button.
   c. Enter a file name, such as C:\virus.txt.
   d. Click Save.
6. Click Save.

To configure a firewall policy with IP/MAC based access control to deny traffic in the GUI:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Set Name to block-internal-malicious-access.
3. Set Incoming Interface to default.35.
4. Set Outgoing Interface to port3.
5. Set Source to all.
6. Set IP/MAC Based Access Control to the Malicious-File-Detected tag.
7. Set Destination to all.
8. Set Service to ALL.
9. Set Action to DENY.
10. Enable Log Violation Traffic.
11. Configuring the remaining settings as needed.
12. Click OK.

To configure a firewall policy with IP/MAC based access control to allow access in the GUI:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Set Name to allow-internal-access.
3. Set Incoming Interface to default.35.
4. Set Outgoing Interface to port3.
5. Set Source to all.
6. Set IP/MAC Based Access Control to the Low tag.
7. Set Destination to all.
8. Set Service to ALL.
9. Set Action to ACCEPT.
10. Enable Log Allowed Traffic and set it to All Sessions.
11. Configuring the remaining settings as needed.
12. Click OK.

To configure firewall policies with IP/MAC based access control to block and allow access in the CLI:

cfg firewall policy
  edit 29
Policy and Objects

set name "block-internal-malicious-access"
set srcintf "default.35"
set dstintf "port3"
set srcaddr "all"
set dstaddr "all"
set ztna-status enable
set ztna-ems-tag "FCTEMS0000109188_Malicious-File-Detected"
set schedule "always"
set service "ALL"
set logtraffic all
next

edit 30
set name "allow-internal-access"
set srcintf "default.35"
set dstintf "port3"
set srcaddr "all"
set dstaddr "all"
set ztna-status enable
set ztna-ems-tag "FCTEMS0000109188_Low"
set action accept
set schedule "always"
set service "ALL"
set inspection-mode proxy
set logtraffic all
set nat enable
next
end

Testing the access to the web server from the on-net client endpoint

Access allowed:

1. On the remote Windows PC, open FortiClient.
2. On the Zero Trust Telemetry tab, make sure that you are connected to the EMS server.
3. Open a browser and enter the address of the server.
4. The FortiGate matches your security posture by verifying your ZTNA tag and matching the corresponding allow-internal-access firewall policy, and you are allowed access to the web server.
Access denied:

1. On the remote Windows PC, trigger the Zero Trust Tagging Rule by creating the file in C:\virus.txt.
2. Open a browser and enter the address of the server.
3. FortiGate checks your security posture. Because EMS has tagged the PC with the *Malicious-File-Detected* tag, it matches the *block-internal-malicious-access* firewall policy.
4. You are denied access to the web server.

Logs and debugs

IPTV6 examples

IPv6 can be configured in ZTNA in several scenarios:

- IPv6 Client — IPv6 Access Proxy — IPv6 Server
- IPv6 Client — IPv6 Access Proxy — IPv4 Server
Policy and Objects

- IPv4 Client — IPv4 Access Proxy — IPv6 Server

These examples show the basic configuration for each scenario. It is assumed that the EMS fabric connector is already successfully connected.

Example 1: IPv6 Client — IPv6 Access Proxy — IPv6 Server

To configure the FortiGate:

1. Configure the IPv6 access proxy VIP:

   ```
   config firewall vip6
       edit "zv6"
           set type access-proxy
           set server-type https
           set extport 6443
           set ssl-certificate "cert"
       next
   end
   ```

2. Configure a virtual host:

   ```
   config firewall access-proxy-virtual-host
       edit "vhost_ipv6"
           set ssl-certificate "cert"
           set host "qa6.test.com"
       next
   end
   ```

   The client uses this address to connect to the access proxy.

3. Configure an IPv6 access proxy and IPv6 api-gateway, apply the VIP6 and virtual host to it, and assign an IPv6 address to the realserver:

   ```
   config firewall access-proxy6
       edit "zs6"
           set vip "zv6"
   ```
To test the configuration:

3. After device certificate verification, the browser will open up the webpage on the IPv6 real server.
4. In the Forward Traffic Log, the following log is available:
Example 2: IPv6 Client — IPv6 Access Proxy — IPv4 Server

To configure the FortiGate:

1. Configure the IPv6 access proxy VIP:

   ```fortigate
   config firewall vip6
   edit "zv6"
      set type access-proxy
      set server-type https
      set extport 6443
      set ssl-certificate "cert"
   next
   end
   ```

2. Configure a virtual host:

   ```fortigate
   config firewall access-proxy-virtual-host
   edit "vhost_ipv6"
      set ssl-certificate "cert"
      set host "qa6.test.com"
   next
   end
   ```

   The client uses this address to connect to the access proxy.

3. Configure an IPv6 access proxy and IPv6 api-gateway, apply the VIP6 and virtual host to it, and assign an IPv4 address to the realserver:

   ```fortigate
   config firewall access-proxy6
   edit "zs6"
      set vip "zv6"
      config api-gateway6
         edit 1
            set virtual-host "vhost_ipv6"
            config realservers
               edit 1
                  set ip 172.16.200.209
               next
            next
         next
      end
   end
   ```

4. Apply the IPv6 access proxy to a proxy policy:
To test the configuration:

3. After device certificate verification, the browser will open up the webpage on the IPv4 real server.
4. In the Forward Traffic Log, the following log is available:

```
2: date=2021-06-25 time=13:46:54 eventtime=1624654014129553521 tz="-0700" logid="00000000024" type="traffic" subtype="forward" level="notice" vd="root" srcip=2000:10:1:100::214 srcport=60530 srcintf="port2" srcintfrole="undefined" dstcountry="Reserved" srccountry="Reserved" dstip=172.16.200.209 dstport=443 dstintf="root" dstintfrole="undefined" sessionid=219 service="HTTPS" proto=6 action="accept" policyid=1 policytype="proxy-policy" poluuid="7afdac8c-d5db-51eb-dfc6-67bb8e4bdfc" polycategory="ztna_rule" duration=5 wanin=2028 rcvdbyte=2028 wanout=1321 lanin=1236 sentbyte=1236 lanout=947 appcat="unscanned" utmaaction="allow" countweb=1 utmref=65443-14
```
Example 3: IPv4 Client — IPv4 Access Proxy — IPv6 Server

To configure the FortiGate:

1. Configure the IPv4 access proxy VIP:

   ```
   config firewall vip
   edit "zv4"
       set type access-proxy
       set extip 172.18.62.66
       set extintf "any"
       set server-type https
       set extport 4443
       set ssl-certificate "cert"
   next
   end
   ```

2. Configure a virtual host:

   ```
   config firewall access-proxy-virtual-host
   edit "vhost_ipv4"
       set ssl-certificate "cert"
       set host "qa.test.com"
   next
   end
   ```

   The client uses this address to connect to the access proxy.

3. Configure an IPv4 access proxy and IPv6 api-gateway, apply the VIP and virtual host to it, and assign an IPv6 address to the realserver:

   ```
   config firewall access-proxy
   edit "zs4"
       set vip "zv4"
   config api-gateway6
   edit 1
       set virtual-host "vhost_ipv4"
   config realservers
   edit 1
   next
   next
   next
   end
   end
   ```

4. Apply the IPv4 access proxy to a proxy policy:

   ```
   config firewall proxy-policy
   edit 1
       set name "ztnta_rule"
       set proxy access-proxy
       set access-proxy "zs4"
       set srcintf "port2"
       set srcaddr "all"
       set dstaddr "all"
       set action accept
       set schedule "always"
   ```
set logtraffic all
set srcaddr6 "all"
set dstaddr6 "all"
set utm-status enable
set ssl-ssh-profile "custom-deep-inspection"
set webfilter-profile "monitor-all"
next
end

5. Apply the IPv4 VIP to a firewall policy:

config firewall policy
edit 4
set name "ZTNA"
set srcintf "port2"
set dstintf "any"
set action accept
set srcaddr "all"
set dstaddr "zv4"
set schedule "always"
set service "ALL"
set inspection-mode proxy
set logtraffic all
set nat enable
next
end

To test the configuration:

1. On an IPv4 client, ensure that the address qa6.test.com resolves to the IPv4 VIP address of 172.18.62.66.
3. After device certificate verification, the browser will open up the webpage on the IPv6 real server.
4. In the Forward Traffic Log, the following log is available:

```
1: date=2021-06-25 time=13:52:30 eventtime=1624654350689576485 tz="-0700"

lanin=569 sentbyte=569 lanout=3040 appcat="unscanned" utmaction="allow" countweb=1
utmref=65443-28
```

ZTNA SSH access proxy example

ZTNA can be configured with SSH access proxy to provide a seamless SSH connection to the server.

Advantages of using an SSH access proxy instead of a TCP forwarding access proxy include:

- Establishing device trust context with user identity and device identity checks.
- Applying SSH deep inspection to the traffic through the SSH related profile.
- Performing optional SSH host-key validation of the server.
• Using one-time user authentication to authenticate the ZTNA SSH access proxy connection and the SSH server connection.

Perform SSH host-key validation of the server

To act as a reverse proxy for the SSH server, the FortiGate must perform SSH host-key validation to verify the identity of the SSH server. The FortiGate does this by storing the public key of the SSH server in its SSH host-key configurations. When a connection is made to the SSH server, if the public key matches one that is used by the server, then the connection is established. If there is no match, then the connection fails.

One-time user authentication

SSH access proxy allows user authentication to occur between the client and the access proxy, while using the same user credentials to authenticate with the SSH server. The following illustrates how this works:

1. The remote endpoint registers to FortiClient EMS and receives the client certificate.
2. The remote endpoint tries to connect to the SSH access proxy. It must use the same username that is later used for access proxy authentication.
3. The FortiGate challenges the endpoint with device identity validation.
4. The remote endpoint provides the EMS issued certificate for device identification.
5. The FortiGate challenges the endpoint with user authentication. For example, this could be done with basic or SAML authentication.
6. The users enters their credentials on the remote endpoint.
7. The FortiGate authenticates the user and collects the username.
8. Using the FortiGate's CA or the customer's CA certificate, the FortiGate signs an SSH certificate and embeds the username in its principal.
9. The FortiGate attempts to connect to the SSH server using the certificate authentication.
10. The SSH server verifies the authenticity of the certificate, and matches the username principal against its authorized_keys file.
11. If the username matches a record in the file, then the SSH connection is established. If no match is found, then the SSH connection fails.
**Example**

In this example, an SSH connection is established using SSH access proxy with host-key validation and one-time authentication.

- The SSH server is a Linux based server that uses sshd to provide remote access.
- For SSH host-key validation, the public key of the SSH server has been imported into the FortiGate.
- For one-time authentication using certificate authentication:
  - The SSH server must allow certificate authentication.
  - The SSH server must have the proper entry in its authorized_keys file that contains the user principal and the FortiGate CA's public key.
  - The entry is present in the user directory corresponding to the user that is trying to log in.

**To pre-configure the Linux SSH server:**

1. Collect the public key used for host-key validation:
   a. Locate the public key files in the SSH server:

   ```bash
   $ ls -la /etc/ssh/*.pub
   -rw-r--r-- 1 root root 186 Mar 29 2020 /etc/ssh/ssh_host_ecdsa_key.pub
   -rw-r--r-- 1 root root 106 Mar 29 2020 /etc/ssh/ssh_host_ed25519_key.pub
   -rw-r--r-- 1 root 406 Mar 29 2020 /etc/ssh/ssh_host_rsa_key.pub
   ``

   b. Choose the publish key file based on the hash type (in this case, ECDSA), and show it's content:

   ```bash
   $ cat /etc/ssh/ssh_host_ecdsa_key.pub
   ecdsa-sha2-nistp256 AAAAE2*********IpEik=
   ```

   This key will be used when configuring the FortiGate.

2. Retrieve the FortiGate CA’s public key from the FortiGate:

   ```bash
   # show full firewall ssh local-ca Fortinet_SSH_CA
   config firewall ssh local-ca
   edit "Fortinet_SSH_CA"
   set password ENC <hidden password>
   set private-key "------BEGIN OPENSSH PRIVATE KEY------
   <hidden private key>
   ------END OPENSSH PRIVATE KEY------"
   set public-key "ssh-rsa AAAAB3*********JLX1xj3"
   set source built-in
   next
   end
   ``

3. On the Linux server, enable the SSH service to use the authorized_keys file:
   a. Locate and edit the `/etc/ssh/sshd_config` file.
   b. Ensure that the `AuthorizedKeysFile` line is uncommented, for example:

   ```bash
   AuthorizedKeysFile .ssh/authorized_keys .ssh/authorized_keys2
   ```

4. Allow remote SSH log in with certificate authentication and principal name:
   a. Log in to the SSH server using the account that will be granted remote SSH access (in this example: `radCurtis`):
   b. Locate the account’s authorized_keys file in the `~/.ssh` directory:

   ```bash
   $ ls -la ~/.ssh
   total 12
   ```
c. If the directory and file do not exist, create the directory:

```
$ mkdir ~/.ssh
```

d. Create an entry containing the following keywords and add them to the authorized_keys file:

```
echo 'cert-authority,principals="radCurtis" ssh-rsa AAAAB3**********JLXlxj3' >> authorized_keys
```

Where:

- `cert-authority` - indicates that this entry is used in certificate authentication by validating the certificate using the public key provided in this entry.
- `principals="radCurtis"` - indicates the user that must match with the username embedded in the SSH certificate.
- `ssh-rsa AAAAB3**********JLXlxj3` - indicates the FortiGate CA’s public key that is used to validate the SSH certificate.

5. Restart the sshd service:

```
$ sudo systemctl stop sshd
$ sudo systemctl start sshd
```

The SSH server can now accept SSH connection from `radCurtis@<server IP>`, where the SSH certificate used by the FortiGate to log in contains `radCurtis` embedded as a principal.

When a user connects from a SSH client using `<username>@<server IP>`, sshd will locate the `authorized_keys` file in the directory `/home/<username>/.ssh/authorized_keys`. If the `authorized_keys` is not in that directory, authentication will fail on the SSH server side.

If you suspect that authentication is failing on the SSH server, use the following commands to manually start sshd in debug mode to troubleshoot:

```
$ sudo systemctl stop sshd
$ /usr/sbin/sshd -ddd -p 22
```

To configure the FortiGate:

1. Configure a new VIP to allow access to the SSH access proxy over 192.168.2.87:443:

```
config firewall vip
  edit "ZTNA_SSH"
  set type access-proxy
  set extip 192.168.2.87
  set extintf "any"
  set server-type https
  set export 443
  set ssl-certificate "Fortinet_CA_SSL"
  next
end
```

2. Configure the address object for the SSH server:
Policy and Objects

3. Configure the host-key that will be used to authenticate the SSH server. The public-key was retrieved when pre-configure the Linux SSH server (step 1b).

```config firewall address
edit "SSH_server"
   set subnet 192.168.20.1 255.255.255.255
next
end
```

4. Configure the access proxy SSH client certificate:
A CA certificate is assigned to sign the SSH certificate that will be used in the SSH authentication. The SSH certificate will have the username embedded in the certificate principal.

```config firewall ssh host-key
edit "ed25519"
   set type ECDSA
   set usage access-proxy
   set public-key "AAAAE2**********IpEk="
next
end
```

5. Configure the access-proxy server setting:

```config firewall access-proxy
edit "ZTNA_SSH"
   set vip "ZTNA_SSH"
   set client-cert enable
   config api-gateway
      edit 1
      set url-map "tcp"
      set service tcp-forwarding
      config realservers
         edit 1
         set address "SSH_server"
         set type ssh
         set ssh-client-cert "ssh-access-proxy"
         set ssh-host-key-validation enable
         set ssh-host-key "ed25519"
next
next
next
end
```

6. Configure the RADIUS setting, user setting, and user group to apply user authentication to the access proxy connection using RADIUS:

```config user radius
edit "Win2k16-Radius"
   set server "192.168.20.6"
```
set secret ENC <secret>
next
d
c
config user local
dt edit "radCurtis"
set type radius
set radius-server "Win2k16-RADIUS"
next
d
c
config user group
dt edit "radius_group"
set member "radCurtis" "Win2k16-RADIUS"
next
d
7. **Create the authentication scheme and rule to perform the authentication:**

config authentication scheme
dt edit "basic_auth"
set method basic
set user-database "Win2k16-RADIUS"
next
d
c
config authentication rule
dt edit "ztna-basic"
set srcaddr "all"
set ip-based disable
set active-auth-method "basic_auth"
set web-auth-cookie enable
next
d
8. **Configure the ZTNA rule to allow traffic to the SSH server, and apply user authentication, posture check, and a security profile where necessary:**

config firewall proxy-policy
dt edit 5
dt set name "SSH-proxy"
dt set proxy access-proxy
set access-proxy "ZTNA_SSH"
dt set srcintf "port1"
dt set srcaddr "all"
dt set dstaddr "all"
dt set ztma-ems-tag "FC7EMS8821001056_emsl38_av_tag"
dt set action accept
set schedule "always"
set groups "radius_group"
dt set utm-status enable
set ssl-ssh-profile "custom-deep-inspection"
next
d
To check the results:

1. On the remote client, open FortiClient, go to the Zero Trust Telemetry tab, and make sure that it is connected to the EMS server.
2. Go to the ZTNA Connection Rules tab and click Add Rule.
3. Configure the rule, then click Create:

<table>
<thead>
<tr>
<th><strong>Rule Name</strong></th>
<th>SSH-Linux</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Destination Host</strong></td>
<td>192.168.20.1:22</td>
</tr>
<tr>
<td><strong>Proxy Gateway</strong></td>
<td>192.168.2.87:443</td>
</tr>
<tr>
<td><strong>Mode</strong></td>
<td>Transparent</td>
</tr>
<tr>
<td><strong>Encryption</strong></td>
<td>Disabled (recommended)</td>
</tr>
</tbody>
</table>

When Encryption is disabled, the connection between the client and FortiGate access proxy is not encapsulated in HTTPS after the client and FortiGate connection is established. This allows for less overhead, because SSH is already a secure connection. This option is available in FortiClient 7.0.1 and later releases.

4. Open an SSH client, such as PuTTY, and make an SSH connection to radCurtis@192.168.20.1 on port 22.

5. After device authentication is performed and passes in the background, FortiClient prompts the user to sign in. Enter the username, radCurtis, and password, then click Sign in.

After successful user authentication, the SSH connection is established without an additional log in.

6. On the FortiGate, check the logged in user:
   a. Go to Dashboard > Users & Devices and expand the Firewall Users widget.
   b. Check the WAD proxy user list:

```
# diagnose wad user list
ID: 2, VDOM: root, IPv4: 10.10.10.25
user name : radCurtis
worker    : 0
duration  : 614
auth_type : Session
auth_method: Basic
pol_id    : 5
```
7. The successful connection is logged in the forward traffic logs after the SSH connection has disconnected:

```bash
# execute log display
25 logs found.
10 logs returned.
```

```
l: date=2021-08-11 time=17:59:56 eventtime=162872999610159120 tz="-0700" logid="0000000024" type="traffic" subtype="forward" level="notice" vd="root" srcip=10.10.10.25 srcport=50627 srcintf="port1" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved" dstip=192.168.20.1 dstport=22 dstintfrole="undefined" sessionid=1926338 srcuuid="5445be2e-5d7b-51ea-e2c3-ae6b7855c52f" service="SSH" proto=6 action="accept" policyid=5 policytype="proxy-policy" policyuid="16fb5550-e976-51eb-e76c-d45e96da5dc" policynname="SSH-proxy" duration=67 user="radCurtis" group="radius_group" authserver="Win2k16-RADIUS" wanin=3681 wanout=3132 lanin=3403 sentbyte=3403 lanout=5699 appcat="unscanned"
```

**ZTNA access proxy with SAML and MFA using FortiAuthenticator example**

ZTNA access proxy supports device verification using device certificates that are issued by EMS. To authenticate users, administrators can use either basic or SAML authentication. An advantage of SAML authentication is that multi-factor authentication (MFA) can be provided by the SAML Identity Provider (IdP).

In these examples, a FortiAuthenticator is used as the IdP, and MFA is applied to user authentication for remote users accessing the web, RDP, and SSH resources over the ZTNA access proxy. It is assumed that the FortiGate EMS fabric connector has already been successfully connected.

- Configuring the FortiAuthenticator on page 1038
- Configuring the FortiGate SAML settings on page 1040
- Example 1 - Applying SAML and MFA to ZTNA HTTPS access proxy on page 1043
- Example 2 - Applying SAML and MFA to a ZTNA TCP forwarding access proxy for RDP connections on page 1045
- Example 3 - Applying SAML and MFA to a ZTNA SSH access proxy on page 1047

DNS resolutions:
The FortiAuthenticator (FAC) integrates with Active Directory (AD) on the Windows Domain Controller, which is also acting as the EMS server. Users are synchronized from the AD to the FAC, and remote users are configured with token-based authentication. SAML authentication is configured on the FortiGate, pointing to the FAC as the SAML IdP. The SAML server is applied to the ZTNA access proxy authentication scheme and rule, to provide the foundation for applying user authentication on individual ZTNA rules.

**Configuring the FortiAuthenticator**

First configure the FortiAuthenticator to synchronize users from AD using LDAP, apply MFA to individual remote users, and be the IdP.

**To create a remote authentication server pointing to the Windows AD:**

1. Go to *Authentication > Remote Auth. Servers > LDAP* and click *Create New.*
2. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>AD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary server name / IP</td>
<td>10.100.88.5</td>
</tr>
<tr>
<td>Port</td>
<td>389 (or another port if using LDAPS)</td>
</tr>
<tr>
<td>Based distinguished name</td>
<td>DC=FORTI-ARBUTUS,DC=LOCAL</td>
</tr>
<tr>
<td>Bind type</td>
<td>Regular</td>
</tr>
<tr>
<td>Username</td>
<td>&lt;user account used for LDAP bind&gt;</td>
</tr>
<tr>
<td>Password</td>
<td>&lt;password of user&gt;</td>
</tr>
<tr>
<td>User object class</td>
<td>person (default)</td>
</tr>
<tr>
<td>Username attribute</td>
<td>sAMAccountName (default)</td>
</tr>
<tr>
<td>Group object class</td>
<td>group (default)</td>
</tr>
<tr>
<td>Obtain group membership</td>
<td>Group attribute</td>
</tr>
<tr>
<td>from</td>
<td></td>
</tr>
<tr>
<td>Group membership attribute</td>
<td>memberOf (default)</td>
</tr>
<tr>
<td>Secure connection</td>
<td>Enable if using LDAPS or STARTTLS</td>
</tr>
</tbody>
</table>

3. Click *OK.*
4. In the *Remote LDAP Users* section click *Go.*
5. Select the users to import then click *OK.*
6. Click *OK.*

For more details, see LDAP in the FortiAuthenticator Administration Guide.
To configure a remote LDAP user to use MFA:

1. Go to Authentication > User Management > Remote Users, and edit a user.
2. Enable Token-based authentication then select the method of token code delivery.
   For this example, select FortiToken > Mobile, select the Token from the drop-down list, and set the Activation delivery method to email.
3. In the User Information section, add the email address that will be used for the FortiToken activation.
4. Click OK.
   An activation email is sent to the user that they can use to install the token to their FortiToken Mobile app.
   For more details, see Remote users in the FortiAuthenticator Administration Guide.

To configure SAML IdP:

1. Go to Authentication > SAML IdP > General and enable Enable SAML Identity Provider portal.
2. The Server address is the device FQDN or IP address (configured in the System Information widget at System > Dashboard > Status). In this example, it is fac.fortidemo.fortinet.com.
3. Set Username input format to username@realm.
4. Click Add a realm in the Realms table:
   a. Set Realm to the just created LDAP realm (AD).
   b. Optionally, enable Filter and select the required users groups. In this example, Customer Support and Marketing are configured.
5. Set Default IdP certificate to the certificate that will be used in the HTTPS connection to the IdP portal.
6. Click OK.
7. Go to Authentication > SAML IdP > Service Providers, and click Create New to create a service provider (SP) for the FortiGate SP.
8. Configure the following, which must match what will be configured on the FortiGate:

<table>
<thead>
<tr>
<th>SP name</th>
<th>Enterprise Core</th>
</tr>
</thead>
<tbody>
<tr>
<td>IdP prefix</td>
<td>ztna</td>
</tr>
<tr>
<td>Server certificate</td>
<td>Same certificate as the default IdP certificate used in SAML IdP &gt; General</td>
</tr>
<tr>
<td>SP entity ID</td>
<td><a href="https://entcore.fortidemo.fortinet.com:20443/ztna/saml/metadata/">https://entcore.fortidemo.fortinet.com:20443/ztna/saml/metadata/</a></td>
</tr>
<tr>
<td>SP ACS (login) URL</td>
<td><a href="https://entcore.fortidemo.fortinet.com:20443/ztna/saml/login/">https://entcore.fortidemo.fortinet.com:20443/ztna/saml/login/</a></td>
</tr>
<tr>
<td>SP SLS (logout) URL</td>
<td><a href="https://entcore.fortidemo.fortinet.com:20443/ztna/saml/logout/">https://entcore.fortidemo.fortinet.com:20443/ztna/saml/logout/</a></td>
</tr>
<tr>
<td>Participate in single logout</td>
<td>Enable</td>
</tr>
</tbody>
</table>

Where the SP entity ID, SP ACS (login) URL, and SP SLS (logout) URL break down as follows:
- `entcore.fortidemo.fortinet.com` - The FQDN that resolves to the FortiGate SP.
- `20443` - The port that is used to map to the FortiGate's SAML SP service.
- `/ztna/saml` - The custom, user defined fields.
- `/metadata, /login, and /logout` - The standard convention used to identify the SP entity, log in portal, and log out portal.
9. Click OK.
10. Edit the just created SP object and, under SAML Attribute, click Create New.
11. Set SAML attribute to the username and set User attribute to Username, then click OK.
12. Click OK.

For more details, see Configuring SAML settings in the SAML Interoperability Guide.

**Configuring the FortiGate SAML settings**

On the FortiGate, a SAML user is used to define the SAML SP and IdP settings. This user is then applied to the ZTNA proxy using an authentication scheme, rule, and settings. A ZTNA server is then created to allow access to the SAML SP server so that end users can reach the FortiGate SP’s captive portal. The SAML user must then be added to a ZTNA rule to trigger authentication when accessing the ZTNA access proxy.

**To create a new SAML user/server:**

1. Create the SAML user object:

```
config user saml
  edit "su-ztna"
    set cert "FortiDemo"
    set entity-id "https://entcore.fortidemo.fortinet.com:20443/ztna/saml/metadata/"
    set single-sign-on-url "https://entcore.fortidemo.fortinet.com:20443/ztna/saml/login/"
    set single-logout-url "https://entcore.fortidemo.fortinet.com:20443/ztna/saml/logout/
    set idp-entity-id "http://fac.fortidemo.fortinet.com/saml-idp/ztna/metadata/"
    set idp-single-sign-on-url "https://fac.fortidemo.fortinet.com/saml-idp/ztna/login/"
    set idp-single-logout-url "https://fac.fortidemo.fortinet.com/saml-idp/ztna/logout/"
    set idp-cert "REMOTE_Cert_1"
    set user-name "username"
    set digest-method sha1
  next
end
```

Where:

- The FortiDemo certificate is a local certificate that is used to sign SAML messages that are exchanged between the client and the FortiGate SP. In this example, it is used to sign *entcore.fortidemo.fortinet.com*.
- The REMOTE_Cert_1 certificate is a remote certificate that is used to identify the IdP. In this example, *fac.fortidemo.fortinet.com*.
- The URLs used in the SAML user settings are the same as the ones defined on the FortiAuthenticator.

2. Add the SAML user object to a new user group:

```
config user group
  edit "ztna-users"
    set member "su-ztna"
  next
end
```
To apply the SAML server to proxy authentication:

1. Apply the SAML server to an authentication scheme:

   config authentication scheme
   edit "saml-scheme"
   set method saml
   set saml-server "su-ztna"
   next
   end

2. Apply the authentication scheme to an authentication rule:

   config authentication rule
   edit "saml-rule"
   set srcintf "any"
   set srcaddr "all"
   set ip-based disable
   set active-auth-method "saml-scheme"
   set web-auth-cookie enable
   next
   end

3. Configure the active authentication scheme, and a captive portal to serve the log in page for the SAML requests:

   config firewall address
   edit "entcore.fortidemo.fortinet.com"
   set type fqdn
   set fqdn "entcore.fortidemo.fortinet.com"
   next
   end

   config authentication setting
   set active-auth-scheme "saml-scheme"
   set captive-portal "entcore.fortidemo.fortinet.com"
   end

To configure a ZTNA access proxy to allow SAML authentication requests to the SP:

1. Configure the ZTNA server:
   a. Go to Policy & Objects > ZTNA, select the ZTNA Servers tab, and click Create New.
   b. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>ZTNA-access</th>
</tr>
</thead>
<tbody>
<tr>
<td>External interface</td>
<td>Any</td>
</tr>
<tr>
<td>External IP</td>
<td>10.100.64.201</td>
</tr>
<tr>
<td>External port</td>
<td>20443</td>
</tr>
<tr>
<td>SAML</td>
<td>Enabled</td>
</tr>
<tr>
<td>SAML SSO Server</td>
<td>su-ztna</td>
</tr>
<tr>
<td>Default certificate</td>
<td>FortiDemo</td>
</tr>
</tbody>
</table>

   c. Click OK.

2. Define the ZTNA rule to allow access to the ZTNA server:
Policy and Objects

a. Go to Policy & Objects > ZTNA, select the ZTNA Rules tab, and click Create New.
b. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>ZTNA-Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source (Address)</td>
<td>all</td>
</tr>
<tr>
<td>Source (User)</td>
<td>ztna-users</td>
</tr>
<tr>
<td>ZTNA Server</td>
<td>ZTNA-access</td>
</tr>
<tr>
<td>Action</td>
<td>Accept</td>
</tr>
</tbody>
</table>

c. Click OK.

to configure a VIP and a firewall policy to forward IdP authentication traffic to the FortiAuthenticator:

Remote clients connect to the FortiAuthenticator IdP behind the FortiGate using a VIP. In this example, users connect to the FQDN fac.fortidemo.fortinet.com that resolves to the VIP’s external IP address.

1. Configure the VIP to forward traffic to the FortiAuthenticator:
   a. Go to Policy & Objects > Virtual IPs and click Create New > Virtual IP.
   b. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>FortiAuthenticator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Any</td>
</tr>
<tr>
<td>External IP address</td>
<td>10.100.64.103</td>
</tr>
<tr>
<td>Map to &gt; IPv4 address/range</td>
<td>10.100.88.9</td>
</tr>
<tr>
<td>Port Forwarding</td>
<td>Enabled</td>
</tr>
<tr>
<td>Protocol</td>
<td>TCP</td>
</tr>
<tr>
<td>External service port</td>
<td>443</td>
</tr>
<tr>
<td>Map to IPv4 port</td>
<td>443</td>
</tr>
</tbody>
</table>

c. Click OK.

2. Configure a firewall policy to allow VIP:
   a. Go to Policy & Objects > Firewall Policy and click Create New.
b. Configure the following:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>WAN to FAC</td>
</tr>
<tr>
<td>ZTNA</td>
<td>Disabled</td>
</tr>
<tr>
<td>Incoming Interface</td>
<td>Any</td>
</tr>
<tr>
<td>Outgoing Interface</td>
<td>Any</td>
</tr>
<tr>
<td>Source</td>
<td>All</td>
</tr>
<tr>
<td>ZTNA Server</td>
<td>FortiAuthenticator</td>
</tr>
<tr>
<td>Schedule</td>
<td>always</td>
</tr>
<tr>
<td>Service</td>
<td>ALL</td>
</tr>
<tr>
<td>Action</td>
<td>Accept</td>
</tr>
<tr>
<td>NAT</td>
<td>disabled</td>
</tr>
</tbody>
</table>

c. Click OK.

Example 1 - Applying SAML and MFA to ZTNA HTTPS access proxy

In this HTTPS access proxy example, two real servers are implemented with round robin load balancing performed between them. The HTTPS access proxy is configured on the same ZTNA server as was configured in the authentication step. The same ZTNA rule and firewall policy also apply.

To configure the ZTNA server for HTTPS access proxy with load balancing:

1. Go to Policy & Objects > ZTNA and select the ZTNA Servers tab.
2. Edit the ZTNA-access server.
3. In the Service/server mapping table, click Create New:
   a. Set Service to HTTPS.
   b. Set Virtual Host to Any Host.
   c. In the Servers table click Create New:
      i. Set IP to 10.100.77.200
      ii. Set Port to 443
      iii. Set Status to Active.
      iv. Click OK.
   d. Create a second server with IP 10.100.77.202.
   e. Click OK.
4. Enable Load balancing, and select the Round Robin algorithm.
5. Click OK.

Testing and verification:

From the remote endpoint, user John Locus attempts to connect to the Finance server over ZTNA:

1. On the remote Windows computer, open FortiClient and register to the EMS server.
2. Open a browser and attempt to connect to the web server at https://ztna.fortidemo.fortinet.com:20443.
3. Device authentication prompts the user for their device certificate. Select the certificate issued by EMS and click OK.

4. FortiGate receives the SAML request and redirects the user to the IdP login screen. Enter the username and password for John Locus and click Login.

5. A second prompt opens asking for the Token Code. Enter the code then click Verify.

6. The FortiAuthenticator IdP verifies the login, then sends the SAML assertion back to the user.

7. The browser redirects the assertion to the FortiGate SP, which decides if the user is allowed access.

8. On a successful log in, FortiGate redirects the user to the web page that they are trying to access.

Logs and debugs:

On the FortiGate, a successful connection can be seen in Log & Report > Forward Traffic log, or by using the CLI:

```
# execute log filter category 0
# execute log filter field srcip 10.100.66.103
# execute log display ...
1: date=2021-08-25 time=23:34:15 eventtime=1629959656098675227 tz="-0700" logid="0000000024"
type="traffic" subtype="forward" level="notice" vd="root" srcip=10.100.66.103 srcport=51341
srcintf="port1" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved"
dstip=10.100.77.202 dstport=443 dstintf="root" dstintfrole="undefined" sessionid=3396047

rcvbyte=2837 wanout=1546 lanin=1576 sentbyte=1576 lanout=1033 appcat="unscanned"
...
```
Log number four shows that the session was first allowed through the ZTNA firewall policy. Log numbers one and two show the traffic allowed through the ZTNA proxy-policy over two successive sessions. Note that they have different destination IP addresses (dstip), indicating that ZTNA was performing server load balancing.

Use the following command to show if the FortiGate's WAD process has an active record of the SAML user login:

```
# diagnose wad user list
```

```
ID:  6,  VDOM: root,  IPv4: 10.100.66.103
  user name  : johnlocus
  worker     : 0
  duration   : 611
  auth_type  : Session
  auth_method: SAML
  pol_id     : 1
  g_id       : 3
  user_based : 0
  expire     : 283
LAN:
  bytes_in=38016  bytes_out=16166
WAN:
  bytes_in=12422  bytes_out=7217
```

**Example 2 - Applying SAML and MFA to a ZTNA TCP forwarding access proxy for RDP connections**

In this TCP forwarding access proxy example, RDP connections are allowed to be forwarded to the Windows/EMS server. Traffic to TCP/3389 is allowed through the ZTNA proxy.

**To configure the ZTNA server for TCP forwarding on TCP/3389:**

1. Create a firewall address for the Windows/EMS server:
   a. Go to **Policy & Objects > Addresses and click Create New > Address**.
   b. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>EMS-Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Subnet</td>
</tr>
<tr>
<td>IP/Netmask</td>
<td>10.100.88.5/32</td>
</tr>
<tr>
<td>Interface</td>
<td>any</td>
</tr>
</tbody>
</table>

   c. Click OK.

2. Go to **Policy & Objects > ZTNA and select the ZTNA Servers tab**.
3. Edit the ZTNA-access server.
4. In the **Service/server mapping** table, click **Create New**:
   a. Set **Service** to **TCP Forwarding**.
   b. In the **Servers** table click **Create New**:
Policy and Objects

i. Set Address to EMS-Server.
ii. Set Ports to 3389.
iii. Click OK.
c. Click OK.

5. Click OK.

Testing and verification:

On the remote endpoint, manually configure ZTNA connection rules to forward RDP traffic to the ZTNA access proxy. The rules can also be pushed from the EMS server; for details see Provisioning ZTNA TCP forwarding rules via EMS.

Configure the ZTNA connection rule:
1. On the remote Windows computer, open FortiClient.
2. Register to the EMS server.
3. On the ZTNA Connection Rules tab, click Add Rule to add a TCP forwarding rule.
4. Configure the following:

<table>
<thead>
<tr>
<th>Rule Name</th>
<th>RDP-server</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destination Host</td>
<td>10.100.88.5:3389</td>
</tr>
<tr>
<td>Proxy Gateway</td>
<td>ztna.fortidemo.fortinet.com:20443</td>
</tr>
<tr>
<td>Mode</td>
<td>Transparent</td>
</tr>
<tr>
<td>Encryption</td>
<td>Disabled</td>
</tr>
</tbody>
</table>

*Encryption can be enabled or disabled. When it is disabled, the client to access proxy connection is not encrypted in HTTPS. Because RDP is encrypted by default, disabling Encryption does not reduce security.*

5. Click Create.

Connect over RDP:
1. On the remote PC, open a new RDP connection.
2. Enter the IP address 10.100.588.5. By default, RDP session use port 3389.
   When the connection to the ZTNA access proxy is established, FortiGate will redirect the SAML login request to the FortiAuthenticator IdP.
   A FortiClient prompt will open with the FortiAuthenticator login screen.
3. Enter the username and password then click Login.
4. A second prompt opens asking for the Token Code. Enter the code from your FortiToken app, then click Verify.
5. FortiAuthenticator verifies the token code, determines if the login is successful, then sends the SAML assertion back to the client.
6. The client redirects the response back to the FortiGate SP.
7. If the log in was successful, the user can now log on to the RDP session.

Logs and debugs:

On the FortiGate, a successful connection can be seen in Log & Report > Forward Traffic log, or by using the CLI:
Policy and Objects

# execute log filter category 0
# execute log filter field srcip 10.100.66.103
# execute log display
...
3: date=2021-08-25 time=23:05:52 eventtime=162995792227222222 tz="-0700" logid="0000000024" type="traffic" subtype="forward" level="notice" vd="root" srcip=10.100.66.103 srcport=59980 srcintf="port1" srcintfrole="wan" dstcountry="Reserved" dstcountry="Defined" dstip=3389 dstport=3389 dstintfrole="undefined" sessionid=3349083 srcuuid="d8dd134a-0517-51ec-2ff0-3032b84564e7" service="RDP" proto=6 action="accept" policyid=1 policytype="proxy-policy" poluuid="256bb090-0518-51ec-431-5d3cc0baa72b" policymname="ZTNA-Rule" duration=8 user="johnlocus" group="ztna-users" wanin=0 rcvdbyte=0 wanout=0 lanin=1444 sentbyte=1444 lanout=665 appcat="unscanned"

4: date=2021-08-25 time=23:05:49 eventtime=162995792227222222 tz="-0700" logid="0000000024" type="traffic" subtype="forward" level="notice" vd="root" srcip=10.100.66.103 srcport=59982 srcintf="port1" srcintfrole="wan" dstcountry="Reserved" dstcountry="Defined" dstip=443 dstport=20443 dstintfrole="undefined" sessionid=3349102 srcuuid="d8dd134a-0517-51ec-2ff0-3032b84564e7" service="tcp/20443" proto=6 action="accept" policyid=41 policytype="policy" poluuid="256db090-0518-51ec-76a-18df00b82d3" policymname="ZTNA Policy" duration=5 user="johnlocus" authserver="su-ztna" wanin=0 rcvdbyte=0 wanout=0 lanin=14237 sentbyte=14237 lanout=1032 appcat="unscanned"

Use the following command to show if the FortiGate's WAD process has an active record of the SAML user login:

# diagnose wad user list

ID: 6, VDOM: root, IPv4: 10.100.66.103
user name : johnlocus
worker : 0
duration : 611
auth_type : Session
auth_method : SAML
pol_id : 1
poluuid : "256db090-0518-51ec-76a-18df00b82d3"
g_id : 3
user_based : 0
expire : no
LAN:
  bytes_in=51471 bytes_out=233862
WAN:
  bytes_in=211247 bytes_out=24410

Example 3 - Applying SAML and MFA to a ZTNA SSH access proxy

In this SSH access proxy example, SSH connections can be forwarded to the web server.

To configure the ZTNA server for SSH access proxy:

1. Create a firewall address for the web server:
   a. Go to Policy & Objects > Addresses and click Create New > Address.
   b. Configure the following:

<table>
<thead>
<tr>
<th>Name</th>
<th>Web-Server1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Subnet</td>
</tr>
</tbody>
</table>

FortiOS 7.2.0 Administration Guide
Fortinet Inc.
**Policy and Objects**

<table>
<thead>
<tr>
<th>IP/Netmask</th>
<th>10.100.77.101/32</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>any</td>
</tr>
</tbody>
</table>

c. Click OK.

2. Go to *Policy & Objects > ZTNA* and select the *ZTNA Servers* tab.
3. Edit the ZTNA-access server.
4. In the *Service/server mapping* table, edit the *TCP Forwarding* entry:
   a. In the *Servers* table click *Create New*:
      i. Set *Address* to *Web-Server1*.
      ii. Set *Ports* to 22.
      iii. Optionally, enable *Additional SSH Options* to configure other SSH options as needed.
      iv. Click OK.
   b. Click OK.
5. Click OK.

**Testing and verification:**

On the remote endpoint, manually configure ZTNA connection rules to forward SSH traffic to the ZTNA access proxy. The rules can also be pushed from the EMS server; for details see Provisioning ZTNA TCP forwarding rules via EMS.

**Configure the ZTNA connection rule:**

1. On the remote Windows computer, open FortiClient.
2. Register to the EMS server.
3. On the *ZTNA Connection Rules* tab, click *Add Rule* to add a TCP forwarding rule.
4. Configure the following:

<table>
<thead>
<tr>
<th>Rule Name</th>
<th>SSH-webserver</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Destination Host</strong></td>
<td>10.100.77.101:22</td>
</tr>
<tr>
<td><strong>Proxy Gateway</strong></td>
<td>ztna.fortidemo.fortinet.com:20443</td>
</tr>
<tr>
<td><strong>Mode</strong></td>
<td>Transparent</td>
</tr>
<tr>
<td><strong>Encryption</strong></td>
<td>Disabled</td>
</tr>
</tbody>
</table>

5. Click *Create*.

**Connect over SSH:**

1. On the remote PC, open a new SSH connection.
2. Enter the host root@10.100.77.101 on port 22.
   - When the connection to the ZTNA access proxy is established, FortiGate will redirect the SAML login request to the FortiAuthenticator IdP.
   - A FortiClient prompt will open with the FortiAuthenticator login screen.
3. Enter the username and password then click *Login*.
4. A second prompt opens asking for the *Token Code*. Enter the code from your FortiToken app, then click *Verify*.
5. FortiAuthenticator verifies the token code, determines if the login is successful, then sends the SAML assertion back to the client.
6. The client redirects the response back to the FortiGate SP.
7. If the log in was successful, the user can now log on to the SSH session.

Logs and debugs:

On the FortiGate, a successful connection can be seen in Log & Report > Forward Traffic log, or by using the CLI:

```
# execute log filter category 0
# execute log filter field srcip 10.100.66.103
# execute log display
...
2: date=2021-08-25 time=23:20:03 eventtime=1629958804116962686 tz="-0700" logid="0000000024" type="traffic" subtype="forward" level="notice" vd="root" srcintf="port1" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved" dstip="10.100.77.101" dstport=22 dstintf="root" dstintfrole="undefined" sessionid=3372964 srcuid=d8dd134a-0517-51ec-2ff0-3032b84564e7 service="SSH" proto=6 action="accept" policyid=1 policytype="proxy-policy" poluuid="256bb090-0518-51ec-f431-5dccc0baa725b" policyname="ZTNA-Rule" duration=1 user="johnlocus" group="ztna-users" wanin=39 rcvdbyte=39 wanout=0 lanin=1444 sentbyte=1444 lanout=726 appcat="unscanned"
```

Use the following command to show if the FortiGate's WAD process has an active record of the SAML user login:

```
# diagnose wad user list

ID: 6, VDOM: root, IPv4: 10.100.66.103
  user name : johnlocus
  worker : 0
  duration : 192
  auth_type : Session
  auth_method : SAML
    pol_id : 1
    g_id : 3
    user_based : 0
    expire : 475
LAN:
  bytes_in=19647 bytes_out=10063
WAN:
  bytes_in=2886 bytes_out=1860
```

### ZTNA access proxy with SSL VPN web portal example

SSL VPN web portals can be defined in ZTNA access proxy settings. The ZTNA access proxy handles the access control processes (client certificate authentication, posture check, user authentication and authorization), and establishes the HTTPS connection between the end user and the access proxy. Then, it forwards the user to the web portal where they can use predefined bookmarks to access TCP based services like HTTPS, RDP, VNC, FTP, SFTP, SSH, Telnet, and SMB. Existing SSL VPN portal configurations can be used.
Policy and Objects

The web portal service can only be configured in the CLI.

Example

In this example, a remote client connects to the ZTNA access proxy and completes the client certificate check. If successful, the remaining access control procedures are automatically completed, and the user is forwarded to the web portal. The web portal is configured with predefined bookmarks that connect to internal servers and external websites. The user can access any resource that is defined in the bookmarks to create an end-to-end connection.

To configure the SSL VPN web portal:

1. Go to VPN > SSL-VPN Portals and click Create New.
2. Enter the name, test_ssl.
3. Disable Tunnel Mode.
4. Enable Web Mode.
5. Create the bookmarks:
   a. Under Predefined Bookmarks, click Create New.
   b. Enter the name of the service.
   c. Select the service Type.
   d. Enter the URL to access the service.
   e. Click OK.
   f. Repeat these steps to create other bookmarks.
6. Click OK.

To configure the ZTNA access proxy:

1. Configure a VIP for the ZTNA access proxy. The ssl-certificate can be replaced with a server certificate:

   ```
   config firewall vip
   edit "ztna_webportal"
   set type access-proxy
   set extip 172.18.62.68
   set extintf "any"
   ```
Policy and Objects

```
set server-type https
set extport 4443
set ssl-certificate "*.test.com"
next
end

2. Configure the virtual host to be used to connect to the ZTNA access proxy. The host should resolve to the VIP’s address:

```
config firewall access-proxy-virtual-host
edit "webportal"
set ssl-certificate "*.test.com"
set host "web.test.com"
next
end
```

3. Configure the ZTNA access proxy to be in web portal mode:

```
config firewall access-proxy
edit "ztna_webportal"
set vip "ztna_webportal"
set client-cert enable
config api-gateway
edit 1
set url-map "/webportal"
set service web-portal
set virtual-host "webportal"
set ssl-vpn-web-portal "test_ssl"
next
next
end
```

4. Apply the access proxy to a proxy policy (specify the ZTNA tags as needed):

```
config firewall proxy-policy
edit 1
set name "ztna_rule"
set proxy access-proxy
set access-proxy "ztna_webportal"
set srcintf "any"
set srcaddr "all"
set dstaddr "all"
set ztna-ems-tag "FCTEMS8821000000_High"
set action accept
set schedule "always"
set logtraffic all
set srcaddr6 "all"
set dstaddr6 "all"
set utm-status enable
set profile-type group
set profile-group "profile group1"
set logtraffic-start enable
next
end
```

The SSL VPN bookmarks are learned by the WAD daemon and are ready to use.
5. Verify the bookmarks:

```plaintext
# diagnose test app wad 351
[bookmark: (portal/group/name=test_ssl/gui-bookmarks/2nd HTTP)]:
  type :1
  url  :http://httpbin.org
  host :
  folder:
  domain:
  port :0

[bookmark: (portal/group/name=test_ssl/gui-bookmarks/FTP)]:
  type :4
  url :
  host :
  folder:172.16.200.215
  domain:
  port :0

[bookmark: (portal/group/name=test_ssl/gui-bookmarks/HTTPS-fortinet)]:
  type :1
  url  :https://www.fortinet.com
  host :
  folder:
  domain:
  port :0

[bookmark: (portal/group/name=test_ssl/gui-bookmarks/RDP)]:
  type :9
  url :
  host :172.18.62.213
  folder:
  domain:
  port :3389
```

To test the connection:

1. From the client browser, go to https://web.test.com:4443/webportal to access the ZTNA access proxy web portal.
2. Once the client passes the certificate check, posture check, and access is granted, the user is redirected to the web portal. The list of predefined bookmarks appears.

3. Click a bookmark, such as HTTPS-fortinet. The website opens.

4. From the web portal, click another bookmark, such as SSH. The page opens with the credential login screen to access the server.
Posture check verification for active ZTNA proxy session examples

Endpoint posture changes trigger active ZTNA proxy sessions to be re-verified and terminated if the endpoint is no longer compliant with the ZTNA policy.

The FortiGate monitors changes to the endpoint tags that are updated by EMS with the fnacd process. When a change is detected, the endpoint's active ZTNA sessions must match the ZTNA policy again before data can pass.

Changes to the ZTNA policy, such as changing the ZTNA tag matching logic, will also trigger re-verification of the client device against the policy.

The remote endpoint accesses the RDP server through the TCP forwarding access proxy. The proxy is managed by the FortiClient EMS server, which has a ZTNA tagging rule that assigns the AV-enabled tag to endpoints that have Windows antivirus enabled, and the Low risk host tag to endpoints that are low risk.

These examples assume that the FortiGate EMS fabric connector has already connected successfully, and a ZTNA server named WIN2K16-P1-RDP that forwards traffic to the RDP server has been configured.

**Example 1 - The ZTNA tag status changes on the endpoint**

In this example, a ZTNA rule is configured to allow access for endpoints that have the AV-enabled tag. After an RDP session is established, Windows antivirus is disabled on the remote endpoint. The FortiGate re-verifies the session and the active RDP session is removed from the FortiGate session table, causing the RDP session to be disconnected.
To configure the ZTNA rule in the GUI:

1. Go to Policy & Objects > ZTNA, select the ZTNA Rules tab, and click Create New.
2. Set Name to TCP-forward-WIN2K16.
3. Set Incoming Interface to port1.
4. Set Source to all.
5. In ZTNA Tag add AV-enabled
6. In ZTNA Server add WIN2K16-P1-RDP.
7. Set Destination to all.
8. Set Action to ACCEPT.
9. Configure the remaining options as needed.
10. Click OK.

To configure the ZTNA rule in the CLI:

cfg Firewall proxy-policy
  edit 4
    set name "TCP-forward-WIN2K16"
    set proxy access-proxy
    set access-proxy "WIN2K16-P1-RDP"
    set srcintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set ztna-ems-tag "FCTEMS0000109188_AV-enabled"
    set action accept
    set schedule "always"
    set logtraffic all
  next
end

To test the example:

1. On the remote endpoint, open FortiClient.
2. On the Zero Trust Telemetry tab, make sure that you are connected to the EMS server.
3. Add a ZTNA rule:
   a. On the ZTNA Connection Rules tab, click Add Rule.
   b. Configure the ZTNA rule:

<table>
<thead>
<tr>
<th>Rule Name</th>
<th>RDP-WIN2K16</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destination Host</td>
<td>192.168.20.6:3389</td>
</tr>
<tr>
<td>Proxy Gateway</td>
<td>192.168.2.86:443</td>
</tr>
<tr>
<td>Encryption</td>
<td>Disabled</td>
</tr>
</tbody>
</table>

c. Click Create.
4. Ensure that the endpoint has Windows antivirus enabled.
5. Open an RDP session to connect to the RDP server at 192.168.20.6.
6. After a successful connection, on the FortiGate:
a. The endpoint is detected and marked with the AV-enabled tag:

```
# diagnose test application fcnacd 7
```

ZTNA Cache V2:
Entry #1:
- UID: F4F3263AE54777A6509A8FCCDF9284

```
   d. The ZTNA log indicates that traffic is denied:
      ```
      # execute log filter category 21
      # execute log display
      6: date=2021-10-18 time=11:31:45 eventtime=1634581905530840484 tz="-0700"
      logid="2101060510" type="utm" subtype="ztna" eventtype="ztna-policy-match"
      level="warning" vd="root" msg="Connection is blocked due to unable to match a proxy-policy"
policyid=4 sessionid=3083 srcip=10.10.10.25 dstip=192.168.20.6 srcport=60668
Example 2 - The ZTNA rule tag checking logic changes

In this example, a ZTNA rule is configured to allow access to endpoints that have at least one of the AV-enabled or Low ZTNA tags. A remote user who has Windows antivirus disabled, but is low risk, successfully establishes an RDP session over the ZTNA access proxy. An administrator changes the ZTNA rule’s tag matching logic from Any to All, causing the RDP session to be disconnected.

To configure the ZTNA rule in the GUI:

1. Go to Policy & Objects > ZTNA, select the ZTNA Rules tab.
2. Edit the TCP-forward-WIN2K16 rule.
3. In ZTNA Tag, add Low.
4. Ensure that Match ZTNA Tags is set to Any.
5. Click OK.

To configure the ZTNA rule in the CLI:

```bash
config firewall proxy-policy
edit 4
    set name "TCP-forward-WIN2K16"
    set proxy access-proxy
    set access-proxy "WIN2K16-P1-RDP"
    set srcintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set ztna-ems-tag "FCTEMS0000109188_AV-enabled" "FCTEMS0000109188_Low"
    set ztna-tags-match-logic or
    set action accept
    set schedule "always"
    set logtraffic all
next
end
```

To test the example:

1. On the remote Windows PC, disable antivirus protection.
2. Open an RDP session to connect to the RDP server at 192.168.20.6.
3. After a successful connection, on the FortiGate:
   a. The endpoint is detected and marked with the Low tag, but not the AV-enabled tag:

   ```bash
   #诊断测试应用 fcnacd 7
   ZTNA Cache V2:
   Entry #1:
   - UID: F4F3263AE8E54777A6509A8FCCDF9284
   ```

c. The forward traffic log indicates that traffic is allowed:

# execute log filter category 0 
# execute log display 

... 
1: date=2021-10-18 time=12:46:01 eventtime=1634586361077487880 tz="-0700" 
logid="0000000024" type="traffic" subtype="forward" level="notice" notice="vd" root= 
srcip=10.10.10.25 srcport=55140 srcintf="port1" srcintfrole="wan" 
dstcountry="Reserved" srccountry="Reserved" dstip=192.168.20.6 dstport=3389 
dstintf="root" dstintfrole="undefined" sessionid=12542 srcuuid="5445be2e-5d7b-51ea-e2c3-ae6b7855c52f" service="RDP" proto=6 action="accept" policyid=4 
policytype="proxy-policy" poluuid="ce8f82d0-8fb3-51eb-0a17-5e6a6a51ff27" 
policyname="TCP-forward-WIN2K16" duration=138 wanin=140349 rcvdbyte=140349 
wanout=47118 lanin=48799 sentbyte=48799 lanout=142521 appcat="unscanned"

4. On the FortiGate, edit the ZTNA rule TCP-forward-WIN2K16:
   • In the GUI, set Match ZTNA Tags to All.
   • In the CLI, set ztna-tags-match-logic to and.

5. Due to the ZTNA rule update, the FortiGate re-verifies the session, and the RDP session is disconnected:
a. The previous session is removed:

```
# diagnose sys session filter dst 192.168.2.86
# diagnose sys session filter src 10.10.10.25
# diagnose sys session list
total session 0
```

b. The ZTNA log indicates that traffic is denied:

```
# execute log filter category 21
# execute log display
1: date=2021-10-18 time=12:53:57 eventtime=1634586837921889075 tz="-0700"
logid="2101060510" type="utm" subtype="ztna" eventtype="ztna-policy-match"
level="warning" vd="root" msg="Connection is blocked due to unable to match a proxy-policy" policyid=0 sessionid=13865 srcip=10.10.10.25 dstip=192.168.2.86 srcport=55162 dstport=443 srcintf="port1" srcintfrole="wan" dstintf="root" dstintfrole="undefined"

```

**ZTNA TCP forwarding access proxy with FQDN example**

When defining ZTNA connection rules on FortiClient for TCP forwarding, it is sometimes desirable to configure the destination host address as an FQDN address instead of an IP address. Since the real servers are often servers in the corporate network, this layer of obfuscation prevents internal IPs from easily leaking to the public, and also makes the destination more easily recognizable by the end users.

One obstacle to overcome is getting remote hosts to resolve an internal FQDN that is typically only resolvable by an internal DNS in the corporate network. This can be solved with the following:

1. When an FQDN address is added as a destination host in a ZTNA connection rule, FortiClient creates a virtual IP for this FQDN address and adds this to the computer’s host file (Windows). The same is true when a ZTNA connection rule entry is pushed from EMS.
2. The virtual IP mapped to the FQDN address is not the real address of the server. It allows applications to resolve the FQDN address to this virtual IP. FortiClient listens to any traffic destined for it and forwards the traffic using the TCP forwarding URL with FQDN to the ZTNA access proxy.
3. The FortiGate access proxy will resolve the FQDN using the internal DNS on the corporate network, matching the traffic to the ZTNA real server configuration with the same domain and address.
4. If a valid ZTNA real server entry is found, traffic is forwarded to the real server.

**Example**

In this example, two servers in the internal network are added to the FortiGate access proxy for TCP forwarding. The remote client configures two ZTNA connection rules, with the destination host field pointing to the FQDN addresses of the internal servers. These FQDN addresses are configured in the FortiGate’s DNS database so they can be resolved by the FortiGate. It is recommended to use an internal DNS server for production environments.
This example assumes that the FortiGate EMS Fabric connector is already successfully connected.

This feature requires a minimum FortiClient and FortiClient EMS version of 7.0.3.

To configure the TCP forwarding access proxy:

1. Go to Policy & Objects > ZTNA and select the ZTNA Servers tab.
2. Click Create New.
3. Set Name to ZTNA_S1.
4. Configure the network settings:
   a. Set External interface to any.
   b. Set External IP to 172.18.62.32.
   c. Set External port to 443.
5. Select the Default certificate. Clients will be presented with this certificate when they connect to the access proxy VIP.
6. Add server mapping:
   a. In the Service/server mapping table, click Create New.
   b. For Service, select TCP Forwarding.
   c. Add a server:
      i. In the Servers table, click Create New.
      ii. Create a new FQDN address for the HTTPS server at s27.qa.fortinet.com, then click OK.
      iii. Apply the new address object as the address for the new server.
      iv. Click OK.
   d. Add another server using the same steps for s29.qa.fortinet.com.
7. Click OK. Now that the ZTNA server is complete, the domain settings must be configured in the CLI to map domains to the real servers.

To map domains to the real servers:

```
config firewall access-proxy
edit "ZTNA_S1"
   set vip "ZTNA_S1"
   set client-cert enable
   config api-gateway
```
To configure the ZTNA rule:

1. Go to Policy & Objects > ZTNA and select the ZTNA Rules tab.
2. Click Create New.
3. Set Name to ZTNA_TCP.
4. Set Incoming Interface to port2.
5. Set Source to all.
6. Select the ZTNA server ZTNA_S1.
7. Configure the remaining options as needed.
8. Click OK.

To configure the DNS entries for each server:

1. Enable the DNS database visibility:
   a. Go to System > Feature Visibility.
   b. Enable DNS Database.
   c. Click Apply.
2. Go to Network > DNS Servers. Under DNS Database, click Create New.
3. Set DNS Zone to ZTNA.
4. Set Domain Name to qa.fortinet.com.
5. Add the DNS entries:
   a. Under DNS Entries, click Create New.
   b. Set Hostname to s27.
   c. Set IP Address to the HTTPS server address.
   d. Click OK.
   e. Add another DNS entry using the same steps for the s29.qa.fortinet.com HTTP server.
6. Click OK.

Testing the connection to the access proxy

Before connecting, users must have a ZTNA connection rule in FortiClient.
To create the ZTNA rules in FortiClient and connect:

1. From the ZTNA Connection Rules tab, click Add Rule.
2. Create a rule for the HTTPS server:
   a. Set Rule Name to server27.
   b. Set Destination Host to s27.qa.fortinet.com:443.
   c. Set Proxy Gateway to 172.18.62.32:443.
   d. Disable Encryption.
   e. Click Create.
3. Create a rule for the HTTP server:
   a. Set Rule Name to server29.
   b. Set Destination Host to s29.qa.fortinet.com:80.
   c. Set Proxy Gateway to 172.18.62.32:443.
   d. Disable Encryption.
   e. Click Create.
4. Upon creating the ZTNA rules, two new entries are added to the Windows PC’s host file in folder C:\Windows\System32\drivers\etc. View the file, and observe the new entries for the virtual IP and FQDN pairing for each ZTNA connection rule.

   # ----- FORTICLIENT ZTNA VIP START -----  
   10.235.0.1 s27.qa.fortinet.com  
   10.235.0.2 s29.qa.fortinet.com  
   # ----- FORTICLIENT ZTNA VIP END -----  

5. The Windows PC now resolves the FQDNs to the virtual IPs, and FortiClient will listen to the traffic to these IPs and forward them to the TCP access proxy.
6. Have the remote user connect to the HTTPS and HTTP servers on a browser. After device verification, the user is able to successfully connect to the remote servers.

**ZTNA session-based form authentication**

Session-based form authentication for ZTNA allows users to log in through an authentication portal with support for multi-factor authentication (MFA). This added advantage over the basic type authentication method allows FortiToken MFA to be applied directly to FortiGate users. FortiToken MFA can be applied to local users or remote users. Session-based form authentication can also be applied to explicit and transparent web proxies.

**Example**

In this example, the FortiGate is configured with a ZTNA HTTPS access proxy to protect access to the web server. It uses session-based form authentication with cookies and auth-portal enabled. It connects to the internal Windows Active Directory using LDAPS for user authentication, and assigns FortiToken MFA to individual users.
Policy and Objects

This example assumes that the FortiGate EMS Fabric connector is already successfully connected.

**To configure the LDAP server:**

1. Go to *User & Authentication > LDAP Servers* and click *Create New*.
2. Configure the following settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>LDAP-fortiad</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server IP/Name</td>
<td>10.88.0.1</td>
</tr>
<tr>
<td>Server Port</td>
<td>389</td>
</tr>
<tr>
<td>Common Name Identifier</td>
<td>sAMAccountName</td>
</tr>
<tr>
<td>Distinguished Name</td>
<td>dc=fortiad,dc=info</td>
</tr>
<tr>
<td>Exchange server</td>
<td>Disable this setting.</td>
</tr>
<tr>
<td>Bind Type</td>
<td>Regular</td>
</tr>
<tr>
<td></td>
<td>Enter the Username and Password for LDAP binding and lookup.</td>
</tr>
<tr>
<td>Secure Connection</td>
<td>Enable and set the Protocol to LDAPS.</td>
</tr>
<tr>
<td>Certificate</td>
<td>Enable and select the CA certificate to validate the server certificate.</td>
</tr>
<tr>
<td>Server identity check</td>
<td>Optionally, enable to verify the domain name or IP address against the server certificate.</td>
</tr>
</tbody>
</table>

3. Click *Test Connectivity* to verify the connection to the server.
4. Click *OK*.

**To configure a user with FortiToken MFA:**

1. Go to *User & Authentication > User Definition* and click *Create New*.
2. Set *User Type* to *Remote LDAP User* and click *Next*.
3. Set *LDAP Server* to *LDAP-fortiad* and click *Next*.
4. For *Remote Users*, right-click on a user from the list under the corresponding OU and click *Add Selected*. In this example, the user *tsmith* under the *Marketing OU* is selected.
5. Click *Submit*. 
6. Double-click the new user, *tsmith*, to edit the settings.
7. Enable Two-factor Authentication. Select either FortiToken Cloud or FortiToken. In this example, FortiToken is selected with a mobile FortiToken available on this FortiGate.
8. Enter an *Email Address* for the user to get a token activation notification.
9. Click OK.

**To configure a user group:**

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Enter the name of the group, *FortiAD-MFA-group*.
3. Set *Type* to *Firewall*.
4. Click the + in the *Members* field and add the user, *tsmith*.
5. Click OK.

**To configure the authentication scheme:**

1. Go to *Policy & Objects > Authentication Rules* and click *Create New > Authentication Scheme*.
2. Enter the name, *ZTNA-Auth-scheme*.
3. Set *Method* to *Form-based*.
4. Set *User database* to *Other* and select the *LDAP-fortiad* LDAP server.
5. Enable Two-factor authentication.
6. Click OK.

**To configure the authentication rule:**

```
config authentication rule
  edit "ztna_form_rule"
    set srcaddr "all"
    set ip-based disable
    set active-auth-method "ZTNA-Auth-scheme"
    set web-auth-cookie enable
next
end
```

*By disabling ip-based, the rule is session-based, so web authentication cookies must be enabled.*

**To configure the ZTNA basic server settings in the GUI:**

Configuring the ZTNA server requires some settings that can only be configured in the CLI. The basic settings are configured in the GUI first, then the advanced CLI-only configurations are added after.

1. Go to *Policy & Objects > ZTNA* and select the ZTNA Servers tab.
2. Click *Create New*.
3. Enter the server name, *ZTNA_S1*.
4. Configure the network settings:
Policy and Objects

5. Select the Default certificate. Clients will be presented with this certificate when they connect to the access proxy VIP. In this example, the custom certificate, `ztna-wildcard` is selected.

6. Add server mapping:
   a. In the Service/server mapping table, click Create New.
   b. Set Service to HTTPS.
   c. Set Virtual Host to Any Host.
   d. Configure the path as needed.
   e. Add a server:
      i. In the Servers table, click Create New.
      ii. Set IP to 10.88.0.3.
      iii. Set Port to 9443.
      iv. Click OK to complete the server settings.
   f. Click OK to complete the HTTPS service mapping.

7. Click OK.

To configure the advanced authentication settings in the CLI:

The following steps are required to create a virtual host and to enable the authentication portal.

1. Create an access proxy virtual host that points to the ZTNA access proxy. The FQDN of the host must be able to resolve to the external address 10.0.3.10. The client will be redirected to this page for form authentication:

   ```
   config firewall access-proxy-virtual-host
   edit "auth-portal-vhost"
     set ssl-certificate "ztna-wildcard"
     set host "authportal.ztnademo.com"
   next
   end
   ```

2. Enable auth-portal on the access proxy and point it to the virtual host:

   ```
   config firewall access-proxy
   edit "ZTNA_S1"
     set auth-portal enable
     set auth-virtual-host "auth-portal-vhost"
   next
   ```

When `auth-virtual-host` is configured in the access proxy, it acts as a single sign-on (SSO) point. This means users will be authenticated once when accessing any domains or services in ZTNA_S1.

When `auth-virtual-host` is not configured, users will be re-authenticated for each domain or service in ZTNA_S1.
To apply the authentication to the ZTNA rule:

1. Go to Policy & Objects > ZTNA and select the ZTNA Rules tab.
2. Click Create New.
3. Enter the name, ZTNA_R1.
4. Set Incoming Interface to port3.
5. Set Source to all. This can also be set to specific IP addresses to only allow those addresses to connect to this HTTPS access proxy.
6. Click the + in the Source and from the User tab, select the FortiAD-MFA-group user group.
7. Click the + in the ZTNA Tag field and select the Low tag.
8. Set ZTNA Server to ZTNA_S1.
9. Set Destination to Webserver1, which is an address object for 10.88.0.3/32.
10. Configure the remaining options as needed.
11. Click OK.

Testing the connection

To test the remote access to the HTTPS access proxy with user authentication:

1. On the remote Windows PC, open FortiClient.
2. From the Zero Trust Telemetry tab, make sure that you are connected to the EMS server.
3. Open a browser and enter the address or FQDN of the server and the access port. In this example, https://webserver.ztnademo.com:9443 resolves to https://10.0.3.10:9443.
4. The browser prompts for the client certificate to use. Select the EMS signed certificate, then click OK.
5. The client is verified by the FortiGate to authenticate your identity.
6. Form authentication redirects you to the captive portal defined by the auth-virtual-host, authportal.ztnademo.com:9443. Enter your user credentials and FortiToken code.
7. After the user authentication passes, the FortiGate performs a posture check on the endpoint. When the posture check passes, you are allowed access to the website.

To verify the logs:

1. Verify the logged in users in the WAD daemon:

   ```
   # diagnose wad user list
   ID: 2, VDOM: root, IPv4: 10.0.3.2
   user name : tsmith
   worker : 1
   duration : 42
   auth_type : Session
   auth_method : Form
   pol_id : 1
   g_id : 4
   user_based : 0
   expire : no
   LAN:
   bytes_in=5117 bytes_out=302717
   WAN:
   bytes_in=304915 bytes_out=4407
   ```

2. Verify the endpoint information:

   ```
   # diagnose endpoint record list
   Record #1:
   IP Address = 10.0.3.2
   MAC Address = 02:09:0f:00:03:03
   MAC list = 02:09:0f:00:04:03;02:09:0f:00:03:03;
   VDOM = (-1)
   EMS serial number: FCTEMS8822000000
   Client cert SN: 5BDEE2D7B7FCA460D9CEC67B6F4D1FA33E3D281A
   ```
Public IP address: 67.249.72.215
Quarantined: no
Online status: online
Registration status: registered
On-net status: on-net
Gateway Interface:
FortiClient version: 7.0.2
AVDB version: 1.0
FortiClient app signature version: 13.364
FortiClient vulnerability scan engine version: 2.31
FortiClient UID: 9A016B5A6E914B42AD4168C066EB04CA
Host Name: WIN10-01
OS Type: WIN64
Host Description:
Domain: fortiad.info
Last Login User: tsmith

Number of Routes: (0)
online records: 1; offline records: 0; quarantined records: 0

3. Verify the detected tags on the endpoint:

    # diagnose test app fcnacd 7
    ZTNA Cache V2:
    Entry #1:
    - UID: 9A016B5A6E914B42AD4168C066EB04CA
    - EMS SN: FCCTEMS88020010000
    - Domain: fortiad.info
    - User: tsmith
    - Owner:
    - Certificate SN: 5BDEE2D7FCA46D9CEC67BBBFA33E3D281A
    - online: true
    - Tags (2):
      -- Tag (#0): all_registered_clients
      -- Tag (#1): Low
    "ls_idx_mask = 0x00000001,

4. Verify the ZTNA logs.
   - In the GUI, go to Log & Report > ZTNA Traffic.
   - In the CLI:

    # execute log filter category 0
    # execute log filter field subtype ztna
    # execute log display
    17 logs found.
    10 logs returned.

    1: date=2022-05-19 time=13:04:41 eventtime=1652990680922903215 tz="-0700"

Migrating from SSL VPN to ZTNA

ZTNA can be used to replace VPN-based teleworking solutions to enhance the user experience and to increase security. A typical teleworking configuration may utilize SSL VPN tunnel or web portal mode with LDAP user authentication. Common objects defined for this setup can be reused when migrating to ZTNA, such as the remote LDAP server, user group, and address objects.

SSL VPN teleworking scenarios

SSL VPN tunnel mode access with LDAP user authentication

Remote users that are in the ALLOWED-VPN active directory group have access to a specific web server when they connect through the SSL VPN tunnel. The FortiGate enables split tunneling to the web server so that only traffic to that destination is routed through the tunnel. The web server hosts internal websites that are only accessible by employees.

SSL VPN web mode access with LDAP user authentication

Remote users that are in the ALLOWED-VPN active directory group have access to a specific web server when they connect through the SSL VPN web portal. The web server hosts internal websites that are only accessible by employees. The pre-defined bookmark to the internal website is the only site that allows remote access.

Common configurations

This section includes configurations for common objects used in the SSL VPN configuration that can be reused in the ZTNA deployment:

- LDAP server
- User group
- Firewall address for protected server
LDAP server

To configure an LDAP server:

```fortigate
config user ldap
  edit "WIN2K16-KLHOME-LDAPS"
    set server "192.168.20.6"
    set server-identity-check disable
    set cnid "sAMAccountName"
    set dn "dc=KLHOME,dc=local"
    set type regular
    set username "KLHOME\\Administrator"
    set password **********
    set secure ldaps
    set ca-cert "CA_Cert_1"
    set port 636
  next
end
```

User group

To configure the user group:

```fortigate
config user group
  edit "KLHOME-ALLOWED-VPN"
    set member "WIN2K16-KLHOME-LDAPS"
    config match
      edit 1
        set server-name "WIN2K16-KLHOME-LDAPS"
        set group-name "CN=ALLOWED-VPN,DC=KLHOME,DC=local"
      next
    next
next
end
```

Firewall address for protected server

Firewall addresses can be reused in the server settings for TCP forwarding configurations.

To configure the firewall address:

```fortigate
config firewall address
  edit "winserver"
    set subnet 192.168.20.6 255.255.255.255
  next
end
```

Migrating to ZTNA

The preceding simple SSL VPN tunnel and web mode teleworking solutions can be migrated to ZTNA configurations, providing device authentication using client certificates and additional security posture checks.
Instead of connecting to the SSL VPN tunnel or web portal, the remote user connects to the HTTPS access proxy that forwards traffic to the web server after authentication and security posture checks are completed. This provides granular control over who can access the web resource using role-based access control. It also gives the user transparent access to the website using only their browser.

Migrating to ZTNA includes the following steps:

1. Connecting to FortiClient EMS
2. Configuring ZTNA tags on FortiClient EMS
3. Configuring a VIP to allow remote users access to FortiClient EMS
4. Configuring the ZTNA server
5. Configuring the authentication scheme and rule
6. Configuring the ZTNA rules

**Connecting to FortiClient EMS**

The first step to configure ZTNA is to connect to and authorize a FortiClient EMS using the EMS connector. There are different ways to connect to an on-premise FortiClient EMS server and a FortiClient EMS Cloud. Refer to the first step of Configure a FortiClient EMS connector on page 974 for instructions.

**Configuring ZTNA tags on FortiClient EMS**

ZTNA tags and tagging rules define security posture checks that connecting devices must pass before they are allowed to access protected resources and applications. In the following example, a Zero Trust tagging rule is configured to detect if a virus file exists on an endpoint.

**To configure a Zero Trust tagging rule on the FortiClient EMS:**

1. Log in to the FortiClient EMS.
2. Go to Zero Trust Tags > Zero Trust Tagging Rules, and click Add.
3. In the Name field, enter Malicious-File-Detected.
4. In the Tag Endpoint As dropdown list, select Malicious-File-Detected.
   EMS uses this tag to dynamically group together endpoints that satisfy the rule, as well as any other rules that are configured to use this tag.
5. Click Add Rule then configure the rule:
   a. For OS, select Windows.
   b. From the Rule Type dropdown list, select *File* and click the + button.
   c. Enter a file name, such as C:\virus.txt.
   d. Click Save.
6. Click Save.

Configuring a VIP to allow remote users access to FortiClient EMS

A ZTNA solution requires users to be registered and connected to the FortiClient EMS server. When an EMS server is behind the FortiGate, a VIP needs to be defined to allow remote users access to register to the FortiClient EMS. The only port required to be forwarded is TCP/8013. This VIP also needs to be applied in a firewall policy to allow this traffic.

To configure a VIP to allow traffic to the EMS server:

1. Go to Policy & Objects > Virtual IPs and click Create New > Virtual IP.
2. Set Name to VIP-EMS.
3. Configure the VIP settings:
   a. Set Interface to port1.
   b. Set External IP address/range to 192.168.2.5.
   c. Set Map to to 192.168.20.10.
   d. Enable Port Forwarding.
   e. Set External service port to 8013.
   f. Set Map to IPv4 port to 8013.
4. Click OK.

To configure the firewall policy:

1. Go to Policy & Objects > Firewall Policy and click Create New.
2. Set Name to ZTNA-VIP.
3. Configure the policy settings:
   a. Set Incoming Interface to port1.
   b. Set Outgoing Interface to port3.
   c. Set Source to all.
   d. Set Destination to VIP-EMS.
   e. For Service, select an option that is for TCP/8013.
   f. Disable NAT.
   g. Configure the remaining options as needed.
4. Click OK.
Configuring the ZTNA server

The ZTNA server defines the external IP and port used for the FortiGate access proxy. It also defines the protected resources that can be accessed through the HTTPS access proxy or TCP forwarding access proxy. The following configuration defines a HTTPS access proxy for accessing the web server on 192.168.20.6.

To configure a ZTNA server for HTTPS access proxy:

1. Go to Policy & Objects > ZTNA and select the ZTNA Servers tab.
2. Click Create New.
3. Set Name to WIN2K16-P1.
4. Configure the network settings:
   a. Set External interface to port1.
   b. Set External IP to 192.168.2.86.
   c. Set External port to 8443.
5. Select the Default certificate. Clients will be presented with this certificate when they connect to the access proxy VIP.
6. Add server mapping:
   a. In the Service/server mapping table, click Create New.
   b. Set Service to HTTPS.
   c. Set Virtual Host to Any Host.
   d. Configure the path as needed. For example, to map to winserver.fgdocs.com/fortigate, enter /fortigate.
   e. Add a server:
      i. In the Servers table, click Create New.
      ii. Set IP to 192.168.20.6.
      iii. Set Port to 443.
      iv. Click OK.
f. Click OK.

7. Click OK.

**Configuring the authentication scheme and rule**

The authentication scheme defines the authentication method that is applied. In this example, basic HTTP authentication is used so that users are prompted for a username and password the first time that they connect to a website through the HTTPS access proxy. The LDAP server defined for the SSL VPN configurations can be reused here.

**To configure an authentication scheme:**

1. Go to Policy & Objects > Authentication Rules and click Create New > Authentication Scheme.
2. Set the name to ZTNA-Auth-scheme.
3. Set Method to Basic.
4. Set User database to Other and select WIN2K16-KLHOME-LDAPS as the LDAP server.
5. Click OK.

The authentication rule defines the proxy sources and destination that require authentication, and what authentication scheme is applied. In this example, active authentication through the basic HTTP prompt is used and applied to all sources.

**To configure an authentication rule:**

2. Set the name to ZTNA-Auth-rule.
3. Set Source Address to all.
4. Set Protocol to HTTP.
5. Enable Authentication Scheme and select ZTNA-Auth-scheme.
6. Click OK.

**Configuring the ZTNA rules**

A user or user group must be applied to the ZTNA rule used to control user access. The authenticated user from the authentication scheme and rule must match the user or user group in the ZTNA rule. The user group, KLHOME-
ALLOWED-VPN, defined in the SSL VPN configurations is reused in this example. The ZTNA tag, Malicious-File-Detected, is used to define a rule to deny access when the connecting device has the malicious file detected.

To configure ZTNA rules to allow and deny traffic based on ZTNA tags:

1. Go to Policy & Objects > ZTNA and select the ZTNA Rules tab.
2. Create a rule to deny traffic:
   a. Click Create New.
   b. Set Name to ZTNA-Deny-malicious.
   c. Set Incoming Interface to port1.
   d. Set Source to all, then click the + and from the User tab, select the KLHOME-ALLOWED-VPN group.
   e. Add the ZTNA tag Malicious-File-Detected. This tag is dynamically retrieved from EMS when the Zero Trust tagging rule is first created.
   f. Select the ZTNA server WIN2K16-P1.
   g. Set Action to DENY.
   h. Enable Log Violation Traffic.
   i. Click OK.
3. Create a rule to allow traffic:
   a. Click Create New.
   b. Set Name to proxy-WIN2K16-P1.
   c. Set Incoming Interface to port1.
   d. Set Source to all, then click the + and from the User tab, select the KLHOME-ALLOWED-VPN group. The Source can also be set to specific IP addresses to only allow those addresses to connect to this HTTPS access proxy.
   e. Add the ZTNA tag Low.
   f. Select the ZTNA server WIN2K16-P1.
   g. Set Action to ACCEPT.
   h. Configure the remaining options as needed.
   i. Click OK.
4. In the ZTNA Rules list, make sure that the deny rule (ZTNA-Deny-malicious) is above the allow rule (proxy-WIN2K16-P1).
Testing the connection

Once ZTNA is configured, connect to the FortiGate access proxy using an endpoint that is registered to EMS. The user should be prompted for their device certificate, username, and password the first time they connect. Once they have authenticated and they pass the security posture checks, they will be allowed to access the website.

See ZTNA HTTPS access proxy example on page 989 and ZTNA HTTPS access proxy with basic authentication example on page 996 for sample verifications and results.

Disabling the SSL VPN

Once testing is complete and the ZTNA servers and policies are configured, the users can be migrated to using ZTNA. Use the following checklist to verify if the remote users are ready to migrate:

1. The users have installed a supported FortiClient version and have installed the ZTNA module.
2. The endpoints can register to FortiClient EMS.
3. If using a TCP forwarding access proxy, ensure that ZTNA rules are either pushed from FortiClient EMS, or the users know how to configure them manually.

Next, SSL VPN access can be disabled in a phased approach by disabling SSL VPN firewall policies that allow access to resources that are accessible using ZTNA.

Once all applications and resources have been migrated, the SSL VPN can be disabled entirely by going to VPN > SSL-VPN Settings, and deselecting the Enable SSL-VPN toggle.

ZTNA scalability support for up to 50 thousand concurrent endpoints

ZTNA scalability supports up to 50 thousand concurrent endpoints. Communication between FortiOS and FortiClient EMS has efficient queries that request incremental updates. Retrieved device information can be written to the FortiClient NAC daemon cache.

FortiOS can receive tag information from the EMS common tags API. This feature requires FortiClient EMS 7.0.3 or later.

To use the common tags API capability:

1. Enable the common tags API when connecting the EMS:

   ```
   config endpoint-control fctems
   edit "local.ems"
   set server "10.6.30.213"
   set capabilities fabric-auth silent-approval websocket websocket-malware push-ca-certs common-tags-api
   next
   end
   ```

2. The FortiGate uses the new APIs to obtain device information from the EMS:

   ```
   [ec_ems_context_submit_work:414] Call submitted successfully.
   obj-id: 11, desc: REST API to get updates of tag endpoints., entry:
   ```
api/v1/report/fct/tags.
[ec_ems_context_submit_work:414] Call submitted successfully.
  obj-id: 12, desc: REST API to get updates of tags associated with FCT UID., entry:
api/v1/report/fct/uid_tags.
[ec_ez_worker_process:334] Processing call for obj-id: 11, entry:
"api/v1/report/fct/tags"
[ec_ez_worker_process:441] Call completed successfully.
  obj-id: 11, desc: "REST API to get updates of tag endpoints.", entry:
"api/v1/report/fct/uid_tags".
[ec_ez_worker_process:334] Processing call for obj-id: 12, entry:
"api/v1/report/fct/uid_tags"
[ec_ez_worker_process:334] Processing call for obj-id: 12, entry:
"api/v1/report/fct/uid_tags"
[ec_ez_worker_process:334] Processing call for obj-id: 12, entry:
"api/v1/report/fct/uid_tags"
[ec_ez_worker_process:334] Processing call for obj-id: 12, entry:
"api/v1/report/fct/uid_tags"
[ec_ez_worker_process:334] Processing call for obj-id: 12, entry:
"api/v1/report/fct/uid_tags"
[ec_ez_worker_process:441] Call completed successfully.
  obj-id: 12, desc: "REST API to get updates of tags associated with FCT UID.", entry:
"api/v1/report/fct/uid_tags".

3. Confirm that the device information from the EMS is written to the FortiClient NAC daemon cache:

   # diagnose endpoint record list

   ...
     Avatar source: OS
     Phone number:
     Number of Routes: (1)
     Gateway Route #0:
       - IP:10.1.91.6, MAC: 4f:8d:c2:73:dd:fe, Indirect: no
       - Interface:port2, VFID:1, SN: FG5H1E599999999
     online records: 37174; offline records: 0; quarantined records: 0; out-of-sync records: 0

4. Use the tags that are pulled from the EMS in a firewall address:

   config firewall address
     edit "FCTEMS8888888888_ZT_AD_MGMT"
     set type dynamic
     set sub-type ems-tag
     set obj-tag "ZT_AD_MGMT"
     set tag-type "zero_trust"
next
end

5. **Check the tags' resolved IP and MAC addresses:**

```
# diagnose firewall fqdn getinfo-ip FCTEMS8888888888_ZT_AD_MGMT
getinfo FCTEMS8888888888_ZT_AD_MGMT id:114 generation:106 count:187 data_len:6160 flag 0
# diagnose firewall fqdn getinfo-mac MAC_FCTEMS8888888888_ZT_AD_MGMT
getinfo MAC_FCTEMS8888888888_ZT_AD_MGMT id:163 generation:105 count:371 data_len:2226 flag 0
# diagnose firewall dynamic address FCTEMS8888888888_ZT_AD_MGMT
CMDB name: FCTEMS8888888888_ZT_AD_MGMT
TAG name: ZT_AD_MGMT
FCTEMS8888888888_ZT_AD_MGMT: ID(114)
    ADDR(10.1.10.4)
    ADDR(10.1.99.195)
Total IP dynamic range blocks: 190.
Total IP dynamic addresses: 281.
# diagnose firewall dynamic address MAC_FCTEMS8888888888_ZT_AD_MGMT
CMDB name: MAC_FCTEMS8888888888_ZT_AD_MGMT
TAG name: ZT_AD_MGMT
MAC_FCTEMS8888888888_ZT_AD_MGMT: ID(163)
    MAC(52:f1:9d:06:1c:db)
    MAC(4b:77:2b:db:82:15)
    MAC(df:6e:9e:d9:04:1e)
Total MAC dynamic addresses: 393.
```

**ZTNA troubleshooting and debugging**

The following debug commands can be used to troubleshoot ZTNA issues:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td># diagnose endpoint fctems test-connectivity &lt;EMS&gt;</td>
<td>Verify FortiGate to FortiClient EMS connectivity.</td>
</tr>
<tr>
<td># execute fctems verify &lt;EMS&gt;</td>
<td>Verify the FortiClient EMS's certificate.</td>
</tr>
<tr>
<td># diagnose test application fcnacd 2</td>
<td>Dump the EMS connectivity information.</td>
</tr>
<tr>
<td># diagnose debug app fcnacd -1</td>
<td>Run real-time FortiClient NAC daemon debugs.</td>
</tr>
<tr>
<td># diagnose debug enable</td>
<td>Run real-time FortiClient NAC daemon debugs.</td>
</tr>
<tr>
<td># diagnose endpoint record list &lt;ip&gt;</td>
<td>Show the endpoint record list. Optionally, filter by the endpoint IP address.</td>
</tr>
<tr>
<td># diagnose endpoint lls-comm send ztna find-uid &lt;uid&gt;</td>
<td>Query endpoints by client UID.</td>
</tr>
<tr>
<td># diagnose endpoint lls-comm send ztna find-ip-vdom &lt;ip&gt; &lt;vdom&gt;</td>
<td>Query endpoints by the client IP-VDOM pair.</td>
</tr>
<tr>
<td># diagnose wad dev query-by uid &lt;uid&gt;</td>
<td>Query from WAD diagnose command by UID.</td>
</tr>
</tbody>
</table>
## Command Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td># diagnose wad dev query-by ipv4 &lt;ip&gt;</td>
<td>Query from WAD diagnose command by IP address.</td>
</tr>
<tr>
<td># diagnose firewall dynamic list</td>
<td>List EMS ZTNA tags and all dynamic IP and MAC addresses.</td>
</tr>
<tr>
<td># diagnose test application fcnacd 7</td>
<td>Check the FortiClient NAC daemon ZTNA and route cache.</td>
</tr>
<tr>
<td># diagnose test application fcnacd 8</td>
<td></td>
</tr>
<tr>
<td># diagnose wad worker policy list</td>
<td>Display statistics associated with access proxy rules.</td>
</tr>
<tr>
<td># diagnose wad debug enable category all</td>
<td>Run real-time WAD debugs.</td>
</tr>
<tr>
<td># diagnose wad debug enable level verbose</td>
<td></td>
</tr>
<tr>
<td># diagnose debug enable</td>
<td></td>
</tr>
<tr>
<td># diagnose debug reset</td>
<td>Reset debugs when completed</td>
</tr>
</tbody>
</table>

The WAD daemon handles proxy related processing. The FortiClient NAC daemon (fcnacd) handles FortiGate to EMS connectivity.

### Troubleshooting usage and output

1. Verify the FortiGate to EMS connectivity and EMS certificate:
   ```
   # diagnose endpoint fctems test-connectivity WIN10-EMS
   Connection test was successful:
   # execute fctems verify WIN10-EMS
   Server certificate already verified.
   # diagnose test application fcnacd 2
   EMS context status:
   FortiClient EMS number 1:
       name: WIN10-EMS confirmed: yes
       fetched-serial-number: FCTEMS0000109188
   Websocket status: connected
   ```

2. If fcnacd does not report the proper status, run real-time fcnacd debugs:
   ```
   # diagnose debug app fcnacd -l
   # diagnose debug enable
   ```

3. Verify the following information about an endpoint:
   - Network information
   - Registration information
   - Client certificate information
   - Device information
   - Vulnerability status
   - Relative position with the FortiGate
# diagnose endpoint record list 10.6.30.214
Record #1:

- **IP Address**: 10.6.30.214
- **MAC Address**: 00:0c:29:ba:1e:61
- **MAC list**: 00:0c:29:ba:1e:61;00:0c:29:ba:1e:6b
- **VDOM**: root (0)
- **EMS serial number**: FCTEMS8821001322
- **Client cert SN**: 17FF6595600A1AF53B87627AB4EBEDD032593E64
- **Quarantined**: no
- **Online status**: online
- **Registration status**: registered
- **Gateway Interface**: port2
- **FortiClient version**: 7.0.0
- **AVDB version**: 84.778
- **FortiClient app signature version**: 18.43
- **FortiClient vulnerability scan engine version**: 2.30
- **FortiClient UID**: 5FCFA3ECDE4D478C911D9232EC9299FD
- **Host Name**: ADPC

```
Number of Routes: (1)
  Gateway Route #0:
    - IP:10.1.100.214, MAC: 00:0c:29:ba:1e:6b, Indirect: no
    - Interface:port2, VFID:0, SN: FG5H1E5819902474
```

4. **Query the endpoint information, include ZTNA tags, by UID or IP address:***

```
# diagnose endpoint lls-comm send ztna find-uid 5FCFA3ECDE4D478C911D9232EC9299FD
UID: 5FCFA3ECDE4D478C911D9232EC9299FD
  status code:ok
  Domain: qa.wangd.com
  User: user1
  Cert SN:17FF6595600A1AF53B87627AB4EBEDD032593E64
  EMS SN: FCTEMS8821001322
  Routes(1):
    - route[0]: IP=10.1.100.214, VDom=root
  Tags(3):
    - tag[0]: name=ZT_OS_WIN
    - tag[1]: name=all_registered_clients
    - tag[2]: name=Medium

# diagnose endpoint lls-comm send ztna find-ip-vdom 10.1.100.214 root
UID: 5FCFA3ECDE4D478C911D9232EC9299FD
  status code:ok
  Domain: qa.wangd.com
  User: user1
  Cert SN:17FF6595600A1AF53B87627AB4EBEDD032593E64
  EMS SN: FCTEMS8821001322
  Routes(1):
    - route[0]: IP=10.1.100.214, VDom=root
  Tags(3):
    - tag[0]: name=ZT_OS_WIN
    - tag[1]: name=all_registered_clients
    - tag[2]: name=Medium
```

5. **Query endpoint information from WAD by UID or IP address:**
Policy and Objects

# diagnose wad dev query-by uid 5FCFA3ECE4D478C911D9232EC9299FD
Attr of type=0, length=32, value(ascii)=5FCFA3ECE4D478C911D9232EC9299FD
Attr of type=4, length=30, value(ascii)=MAC_FCTEMS821001322_ZT_OS_WIN
Attr of type=4, length=26, value(ascii)=MAC_FCTEMS821001322_ZT_OS_WIN
Attr of type=4, length=43, value(ascii)=MAC_FCTEMS821001322_all_registered_clients
Attr of type=4, length=39, value(ascii)=FCTEMS821001322_all_registered_clients
Attr of type=4, length=27, value(ascii)=MAC_FCTEMS821001322_Medium
Attr of type=4, length=23, value(ascii)=FCTEMS821001322_Medium
Attr of type=5, length=18, value(ascii)=FOSQA@qa.wangd.com
Attr of type=6, length=40, value(ascii)=17FF6595600A1AF53B87627AB4EBEDD032593E64

# diagnose wad dev query-by ipv4 10.1.100.214
Attr of type=0, length=32, value(ascii)=5FCFA3ECE4D478C911D9232EC9299FD
Attr of type=4, length=30, value(ascii)=MAC_FCTEMS821001322_ZT_OS_WIN
Attr of type=4, length=26, value(ascii)=MAC_FCTEMS821001322_ZT_OS_WIN
Attr of type=4, length=43, value(ascii)=MAC_FCTEMS821001322_all_registered_clients
Attr of type=4, length=39, value(ascii)=FCTEMS821001322_all_registered_clients
Attr of type=4, length=27, value(ascii)=MAC_FCTEMS821001322_Medium
Attr of type=4, length=23, value(ascii)=FCTEMS821001322_Medium
Attr of type=5, length=18, value(ascii)=FOSQA@qa.wangd.com
Attr of type=6, length=40, value(ascii)=17FF6595600A1AF53B87627AB4EBEDD032593E64

6. List all the dynamic ZTNA IP and MAC addresses learned from EMS:

    # diagnose firewall dynamic list
List all dynamic addresses:
FCTEMS0000109188_all_registered_clients: ID(51)
   ADDR(172.17.194.209)
   ADDR(192.168.40.8)
...
FCTEMS0000109188_Low: ID(78)
   ADDR(172.17.194.209)
   ADDR(192.168.40.8)
...
FCTEMS0000109188_Malicious-File-Detected: ID(190)
   ADDR(172.17.194.209)
   ADDR(192.168.40.8)
...

7. Check the FortiClient NAC daemon ZTNA and route cache:

    # diagnose test application daemon fcnacd 7
ZTNA Cache:
-uid 5FCFA3ECE4D478C911D9232EC9299FD: { "tags": [ "ZT_OS_WIN", "all_registered_clients", "Medium" ], "domain": "qa.wangd.com", "user_name": "user1", "client_cert_sn": "17FF6595600A1AF53B87627AB4EBEDD032593E64", "owner": "FOSQA@qa.wangd.com", "gateway_route_list": [ { "gateway_info": [ "fgt_sn": "FG5H1E5819902474", "interface": "port2", "vdom": "root" ], "route_info": [ { "ip": "10.1.100.214", "mac": "00-0c-29-ba-1e-6b", "route_type": "direct" } ] } ], "ems_sn": "FCTEMS821001322" }

    # diagnose test application daemon fcnacd 8
IP-VFID Cache:
IP: 10.1.100.206, vfid: 0, uid: 3DED29B5438641E9888F2DCBD29BD21
IP: 10.1.100.214, vfid: 0, uid: 5FCFA3ECE4D478C911D9232EC9299FD

8. Troubleshoot WAD with real-time debugs to understand how the proxy handled a client request:

    # diagnose wad debug enable category all
    # diagnose wad debug enable level verbose
# diagnose debug enable

[0x7fd7a46bb60] Received request from client: 10.10.10.20:56312

Always reset the debugs after using them:

```bash
# diagnose debug reset
```
Security Profiles

This section contains information about configuring FortiGate security features, including:

- Inspection modes on page 1085
- Antivirus on page 1090
- Web filter on page 1124
- Filtering based on YouTube channel on page 1163
- DNS filter on page 1166
- Application control on page 1192
- Intrusion prevention on page 1205
- File filter on page 1227
- Email filter on page 1234
- Data leak prevention on page 1248
- VoIP solutions on page 1261
- ICAP on page 1284
- Web application firewall on page 1293
- SSL & SSH Inspection on page 1296
- Custom signatures on page 1310
- Overrides on page 1319

If you are unable to view a security profile feature, go to System > Feature Visibility to enable it.

Inspection modes

FortiOS supports flow-based and proxy-based inspection in firewall policies. You can select the inspection mode when configuring a policy.

Flow-based inspection takes a snapshot of content packets and uses pattern matching to identify security threats in the content.

Proxy-based inspection reconstructs content that passes through the FortiGate and inspects the content for security threats.

Certain security profiles allows users to display flow-based or proxy-based feature sets.

This following topics provide information about inspection modes for various security profile features:

- Flow mode inspection (default mode) on page 1086
- Proxy mode inspection on page 1086
- Inspection mode feature comparison on page 1088
Flow mode inspection (default mode)

When a firewall policy's inspection mode is set to flow, traffic flowing through the policy will not be buffered by the FortiGate. Unlike proxy mode, the content payload passing through the policy will be inspected on a packet by packet basis with the very last packet held by the FortiGate until the scan returns a verdict. If a violation is detected in the traffic, a reset packet is issued to the receiver, which terminates the connection, and prevents the payload from being sent successfully.

Flow-based inspection identifies and blocks security threats in real time as they are identified. All applicable flow-based security modules are applied simultaneously in one single pass, using Direct Filter Approach (DFA) pattern matching to identify possible attacks or threats. Pattern matching is offloaded and accelerated by CP8 or CP9 processors.

Flow-based inspection typically requires lower processing resources than proxy-based inspection and does not change packets, unless a threat is found and packets are blocked.

Use case

It is recommended to apply flow inspection to policies that prioritize traffic throughput, such as allowing connections to a streaming or file server.

For example, you have an application server that accepts connections from users for a daily quiz show app, HQ. Each HQ session sees 500,000+ participants, and speed is very important because participants have less than 10 seconds to answer the quiz show questions.

Proxy mode inspection

When a firewall policy's inspection mode is set to proxy, traffic flowing through the policy will be buffered by the FortiGate for inspection. This means that the packets for a file, email message, or web page will be held by the FortiGate until the entire payload is inspected for violations (virus, spam, or malicious web links). After FortiOS finishes the inspection, the payload is either released to the destination (if the traffic is clean) or dropped and replaced with a replacement message (if the traffic contains violations).

To optimize inspection, the policy can be configured to block or ignore files or messages that exceed a certain size. To prevent the receiving end user from timing out, you can apply client comforting. This allows small portions of the payload to be sent while it is undergoing inspection.

Proxy mode provides the most thorough inspection of the traffic; however, its thoroughness sacrifices performance, making its throughput slower than that of a flow mode policy. Under normal traffic circumstances, the throughput difference between a proxy-based and flow-based policy is not significant.
**Use case 1**

Your organization deals with sensitive data on a regular basis and a data leak would significantly harm your business. At the same time, you wish to protect your employees from malicious content, such as viruses and phishing emails, which could be used to gain access to your network and the sensitive data on your systems.

In this scenario, a proxy inspection policy is recommended to prioritize network security. You want traffic inspection to be as thorough as possible to avoid any data leaks from exiting the LAN and any malicious content from entering it. The policy would include antivirus, DLP, web, and email filters all operating in proxy mode.

**Use case 2**

You have a corporate mail server in your domain that is used by your employees for everyday business activities. You want to protect your employees from phishing emails and viruses. At the same time, you want to also protect your web servers from external attacks.

In this scenario, a proxy inspection policy is recommended to prioritize the safety of employee emails. Applying the antivirus and email filter in this mode allows you to filter out any malware and spam emails received by the mail servers via SMTP or MAPI. An IPS sensor would be used to prevent DOS attacks on the mail servers.
Inspection mode feature comparison

The following table shows which UTM profile can be configured on a flow mode or proxy mode inspection policy.

Some UTM profiles are hidden in the GUI and can only be configured using the CLI. To configure profiles in a firewall policy in CLI, enable the `utm-status` setting.

Some profiles might have feature differences between flow-based and proxy-based Inspection. From the GUI and CLI, you can set the Feature set option to be Flow-based or Proxy-based to display only the settings for that mode.

*File-size filtering only works if file size is present in the protocol exchange.

Antivirus

FortiOS offers the unique ability to implement both flow-based and proxy-based antivirus concurrently, depending on the traffic type, users, and locations. Flow-based antivirus offers higher throughput performance.

FortiOS includes two preloaded antivirus profiles:
- `default`
- `wifi-default`

You can customize these profiles, or you can create your own to inspect certain protocols, remove viruses, analyze suspicious files with FortiSandbox, and apply botnet protection to network traffic. Once configured, you can add the antivirus profile to a firewall policy.

This functionality requires a subscription to FortiGuard Antivirus.

The following topics provide information about antivirus profiles:
- Proxy mode stream-based scanning on page 1092
- Databases on page 1095
- Content disarm and reconstruction on page 1096
- FortiGuard outbreak prevention on page 1098
- External malware block list on page 1100
- Malware threat feed from EMS on page 1103
- Checking flow antivirus statistics on page 1106
- CIFS support on page 1108
- Using FortiSandbox post-transfer scanning with antivirus on page 1113
- Using FortiSandbox inline scanning with antivirus on page 1115
- Using FortiENDR inline scanning with antivirus on page 1121

**Protocol comparison between antivirus inspection modes**

The following table indicates which protocols can be inspected by the designated antivirus scan modes.

<table>
<thead>
<tr>
<th>Protocol</th>

</tr>
</tbody>
</table>

* Proxy mode antivirus inspection on CIFS protocol has the following limitations:
  - Cannot detect infections within some archive files.
  - Cannot detect oversized files.

**Other antivirus differences between inspection modes**

Starting from 6.4.0, the scan mode option is no longer available for flow-based AV.

This means that AV no longer exclusively uses the default or legacy scan modes when handling traffic on flow-based firewall policies. Instead, AV in flow-based policies uses a hybrid of the two scan modes. Flow AV may use a pre-filtering database for malware detection in some circumstances as opposed to the full AV signature database in others. The scan method is determined by the IPS engine algorithm that is based on the type of file being scanned. When handling oversized files in flow-based AV, the action can either be pass (default) or block. When the action is pass, IPS appends to-be-scan data into the AV scan buffer. If the appended file size exceeds the oversize-limit that is defined in the protocol option profile, then the AV session is cleared and the file is bypassed from AV scanning.

In contrast, proxy mode maintains the scan mode option, which can be toggled between default or legacy mode. In default mode, the WAD daemon receives the file and then decides if it can do an in-process scan of the file in simple AV configuration scenarios. If the file is in an oversized archive that is supported by the stream-based decompressor, then it is sent to stream-based scan for best effort inspection. Stream-based scan decompresses and scans the entire archive without archiving the file. If the file is not supported by stream-based scan, then it is buffered and then sent to the scanunit daemon for inspection on content that is under the oversize limit.

In legacy mode, stream-based scanning is disabled, so oversized archive files and files that cannot be handled by WAD in-process scan are buffered and sent to the scanunit daemon for processing.

**AI-based malware detection**

The AV Engine AI malware detection model integrates into regular AV scanning to help detect potentially malicious Windows Portable Executables (PEs) in order to mitigate zero-day attacks. Previously, this type of detection was handled by heuristics that analyzed file behavior. With AV Engine AI, the module is trained by FortiGuard AV against many malware samples to identify file features that make up the malware. The AV Engine AI package can be downloaded by FortiOS via FortiGuard on devices with an active AV subscription. The machine-learning-
Security Profiles

detection setting is enabled by default at a per-VDOM level. Files detected by the AV Engine AI are identified with the W32/Al.Pallas.Suspicious virus signature.

To configure machine learning-based malware detection:

```plaintext
config antivirus settings
    set machine-learning-detection {enable | monitor | disable}
end
```

Proxy mode stream-based scanning

In proxy mode, AV scanning is processed as follows:

1. File arrives in WAD for processing
2. Can the file be scanned by in-process scan?
   - Yes: default
   - No: Scan mode?
     - Legacy
     - Is AV engine AI scan enabled?
       - Yes: Is the file type supported?
         - Yes: Stream-based scan
         - No: Is the file supported by stream-based scan?
           - Yes: Is the file an oversized archive file?
             - Yes: Scanunit scan
             - No: WAD in-process scan
           - No: WAD in-process scan
     - No: WAD in-process scan
Can the file be scanned by in-process scan?

- This is determined by the WAD daemon.
- In-process scan can be used for simple AV configurations to quickly scan a file without handing it off to another process.
- The following, more complex feature sets cannot be processed by in-process scan:
  - AV engine AI scan
  - DLP
  - Quarantine
  - FortiGuard outbreak prevention and external block list
  - Content disarm

Scan mode?

- To configure the scan mode:
  
  ```batch
  config antivirus profile
  edit <name>
  set feature-set proxy
  set scan-mode {default | legacy}
  next
  end
  ```

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Enable stream-based scanning (default).</td>
</tr>
<tr>
<td>legacy</td>
<td>Disable stream-based scanning.</td>
</tr>
</tbody>
</table>

Is AV engine AI scan enabled?

- When enabled, supported files (such as EXE, PDF, and MS Office) are forwarded to the scanunit scan.
- AV engine AI scan is enabled by default. To disable it:
  
  ```batch
  config antivirus settings
  set machine-learning-detection disable
  end
  ```

Is the file supported by stream-based scan?

- Stream-based scan supports the following archive file types: ZIP, GZIP, BZIP2, TAR, and ISO (ISO 9660).
- In FortiOS 7.0, stream-based scan is supported in HTTP(S), FTP(S), and SCP/SFTP.
- In FortiOS 6.4 and 6.2, stream-based scan is only supported in HTTP(S).
- Stream-based scan does not support HTTP POST.
- Stream-based scan is not supported when the following features are enabled:
  - DLP
  - Quarantine
  - FortiGuard outbreak prevention and external block list
  - Content Disarm
- If a file is not supported, it is buffered and sent to scanunit for scanning.
Is the file an oversized archive file?

- An oversized archive file is a compressed file that is oversized according to the following setting:

```plaintext
config firewall profile-protocol-options
edit <profile>
    config <protocol>
        set oversize-limit <size>
    end
next
end
```

- If the file is not oversized, it is buffered and sent to scanunit for scanning.

Notes

Stream-based scans:

- Are performed with no oversize limits on a best effort basis.
- Can inspect the contents of large archive files without buffering the entire file.
- Decompress and scan the entire archive.

Legacy scan mode:

- Used to disable stream-based scanning for troubleshooting purposes.
- Limited by the oversize and uncompressed-oversize limits:

```plaintext
config firewall profile-protocol-options
edit <profile>
    config <protocol>
        set oversize-limit <size>
        set uncompressed-oversize-limit <size>
    end
next
end
```

TCP windows

Some file transfer applications can negotiate large TCP windows. For example, WinSCP can negotiate an initial TCP window size of about 2 GB.

The TCP window options can be used to prevent overly large initial TCP window sizes, helping avoid channel flow control issues. It allows stream-based scan's flow control to limit peers from sending data that exceeds a policy's configured oversize limit.

To configure TCP window size options:

```plaintext
config firewall profile-protocol-options
edit <string>
    config {ftp | ssh}
        set stream-based-uncompressed-limit <integer>
        set tcp-window-type {system | static | dynamic}
        set tcp-window-size <integer>
        set tcp-window-minimum <integer>
        set tcp-window-maximum <integer>
```
Security Profiles

end
next
eend

| (ftp | ssh) | • ftp: Configure FTP protocol options.  
• ssh: Configure SFTP and SCP protocol options. |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>stream-based-uncompressed-limit &lt;integer&gt;</td>
<td>The maximum stream-based uncompressed data size that will be scanned, in MB (default = 0 (unlimited)). Stream-based uncompression used only under certain conditions.).</td>
</tr>
</tbody>
</table>
| tcp-window-type {system | static | dynamic} | The TCP window type to use for this protocol.  
• system: Use the system default TCP window size for this protocol (default).  
• static: Manually specify the TCP window size.  
• dynamic: Vary the TCP window size based on available memory within the limits configured in tcp-window-minimum and tcp-window-maximum. |
| tcp-window-size <integer> | The TCP static window size (65536 - 33554432, default = 262144). This option is only available when tcp-window-type is static. |
| tcp-window-minimum <integer> | The minimum TCP dynamic window size (65536 - 1048576, default = 131072). This option is only available when tcp-window-type is dynamic. |
| tcp-window-maximum <integer> | The maximum TCP dynamic window size (1048576 - 33554432, default = 8388608). This option is only available when tcp-window-type is dynamic. |

Databases

The antivirus scanning engine uses a virus signatures database to record the unique attributes of each infection. The antivirus scan searches for these signatures and when one is discovered, the FortiGate determines if the file is infected and takes action.

All FortiGates have the normal antivirus signature database. Some models have additional databases that you can use. The database you use depends on your network and security needs, and on your FortiGate model.

The extended virus definitions database is the default setting and provides comprehensive antivirus protection. Low-end FortiGate models cannot support the extreme database. The FortiGate 300D is the lowest model that supports the extreme database. All VMs support the extreme database. The use-extreme-db setting is only available on models that support the extreme database.

**Extended**

This is the default setting. This database includes currently spreading viruses, as determined by the FortiGuard Global Security Research Team, plus recent viruses that are no longer active. These viruses may have been spreading within the last year but have since nearly or completely disappeared.

**Extreme**

This includes the extended database, plus a large collection of zoo viruses. These are viruses that have not spread in a long time and are largely dormant. Some zoo viruses might rely on operating systems and hardware that are no longer widely used.
To change the antivirus database:

config antivirus settings
  set use-extreme-db {enable | disable}
end

Content disarm and reconstruction

Content disarm and reconstruction (CDR) allows the FortiGate to sanitize Microsoft Office documents and PDF files (including those that are in ZIP archives) by removing active content, such as hyperlinks, embedded media, JavaScript, macros, and so on from the files (disarm) without affecting the integrity of its textual content (reconstruction). It allows network administrators to protect their users from malicious document files.

Files processed by CDR can be stored locally for quarantine on FortiAnalyzer, FortiSandbox, or FortiGate models with a hard disk. The original copies can also be obtained in the event of a false positive.

CDR is supported on HTTP, SMTP, POP3, and IMAP. Note that SMTP splice and client-comfort mode are not supported. CDR does not support flow-based inspection modes.

Sample topology

In this example, the a Microsoft Office document with an embedded hyperlink (that redirects to an external website) is sent to the receiver. When the user receives the file, the hyperlink in the document is deactivated.

To configure CDR:

1. Go to Security Profiles > AntiVirus.
2. Edit an antivirus profile, or create a new one.
3. Under APT Protection Options, enable Content Disarm and Reconstruction.

![Image of APT Protection Options]

4. Select a quarantine location from the available options:

<table>
<thead>
<tr>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FortiSandbox</td>
<td>Saves the original document file to a connected FortiSandbox.</td>
</tr>
<tr>
<td>File Quarantine</td>
<td>Saves the original document file to disk (if possible) or a connected FortiAnalyzer based on the FortiGate log settings (config log fortianalyzer setting).</td>
</tr>
<tr>
<td>Discard</td>
<td>The default setting, which discards the original document file.</td>
</tr>
</tbody>
</table>

5. Click OK.

To edit the CDR detection parameters:

By default, stripping of all active Microsoft Office and PDF content types are enabled. In this example, stripping macros in Microsoft Office documents will be disabled.

```bash
config antivirus profile
edit av
  config content-disarm
    set office-macro disable
    set detect-only {enable | disable}
    set cover-page {enable | disable}
  end
next
end
```

Where:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>detect-only</td>
<td>Only detect disarmable files, do not alter content. Disabled by default.</td>
</tr>
<tr>
<td>cover-page</td>
<td>Attach a cover page to the file's content when the file has been processed by CDR. Enabled by default.</td>
</tr>
</tbody>
</table>
FortiGuard outbreak prevention

FortiGuard Virus Outbreak Protection Service (VOS) allows the FortiGate antivirus database to be subsidized with third-party malware hash signatures curated by FortiGuard. The hash signatures are obtained from FortiGuard's Global Threat Intelligence database. The antivirus database queries FortiGuard with the hash of a scanned file. If FortiGuard returns a match, the scanned file is deemed to be malicious. Enabling the AV engine scan is not required to use this feature.

FortiGuard VOS can be used in both proxy-based and flow-based policy inspections across all supported protocols.

The FortiGate must be registered with a valid FortiGuard outbreak prevention license.

To verify FortiGuard antivirus license information:

1. Go to System > FortiGuard and locate the Outbreak Prevention section in the table.

2. See the instructions in the video, How to Purchase or Renew FortiGuard Services, if required.

To enable FortiGuard outbreak prevention:

1. Go to Security Profiles > AntiVirus.
2. Edit an antivirus profile, or create a new one.
4. Click OK.

To verify FortiGuard antivirus license information:

```
# diagnose debug rating
Locale       : english

Service      : Web-filter
Status       : Enable
License      : Contract

Service      : Antispam

External malware block list

The external malware block list allows users to add their own malware signatures in the form of MD5, SHA1, and SHA256 hashes. The FortiGate's antivirus database retrieves an external malware hash list from a remote server and polls the hash list every n minutes for updates. Enabling the AV engine scan is not required to use this feature.

The external malware block list can be used in both proxy-based and flow-based policy inspections, but it is not supported in AV quick scan mode.

Note that using different types of hashes simultaneously may slow down the performance of malware scanning. It is recommended to use one type of hash.

To create the external block list:

1. Create the malware hash list.
   The malware hash list follows a strict format in order for its contents to be valid. Malware hash signature entries must be separated into each line. A valid signature needs to follow this format:

   # MD5 Entry with hash description
   aa67243f746e5d76f68ec809355ec234  md5_sample1

   # SHA1 Entry with hash description
   a57983cb39e25ab80d7d3dc05695dd0ee0e49766  sha1_sample2

   # SHA256 Entry with hash description
   ae9bc04c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379  sha256_sample1

   # Entry without hash description
   0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521

   # Invalid entries
   7688499dc71b932feb126347289c0b8a_md5_sample2
   7614e98badca10b5e2d08f8664c519b7a906fbd5180ea5d04a82fce9796a4b87sha256_sample3

2. Configure the external malware block list source:
   a. Go to Security Fabric > External Connectors and click Create New.
   b. Click Malware Hash.
   c. Configure the settings as needed. The URI must point to the malware hash list on the remote server.
   d. Click OK.
3. To view entries inside the malware block list on the External Connectors page, hover over the malware hash card and click View Entries.

To configure antivirus to use an external block list in the GUI:

1. Go to Security Profiles > AntiVirus and edit the antivirus profile.
2. In the Virus Outbreak Prevention section, enable Use external malware block list and click Specify.
3. Click the + in the field and select a threat feed.
4. Optionally, enable Quarantine.

5. Configure the other settings as needed.

6. Click OK.

To configure antivirus to use an external block list in the CLI:

```
config antivirus profile
  edit "Demo"
    set feature-set proxy
    set mobile-malware-db enable
    config http
      set av-scan disable
      set outbreak-prevention block
      set external-blocklist block
      set quarantine enable
      set emulator enable
      set content-disarm disable
    end
  config ftp
    set av-scan disable
    set outbreak-prevention block
    set external-blocklist block
    set quarantine enable
    set emulator enable
  end
  config imap
    set av-scan monitor
    set outbreak-prevention block
    set external-blocklist block
    set quarantine enable
    set emulator enable
    set executables default
end
```
Security Profiles

```plaintext

set outbreak-prevention-archive-scan enable
set external-blocklist-enable-all disable
set external-blocklist "malhash1"
set av-virus-log enable
set av-block-log enable
set extended-log disable
set scan-mode default
```
Security Profiles

next
end

The quarantine setting is configured in each protocol (set quarantine). The malware threat feed is also specified (set external-blocklist-enable-all disable) to the threat connector, malhash1(set external-blocklist "malhash1").

To verify the scanunit daemon updated itself with the external hashes:

```
# diagnose sys scanunit malware-list list
md5 'aa67243f746e5d76f68ec809355ec24' profile 'malhash1' description 'md5_sample1'
sha1 'a57983cb39e25ab80d7d3dc05695dd0ee0e49766' profile 'malhash1' description 'sha1_sample2'
sha256 '0289b0d967cb7b1fbl451339c7b9818a621903090e020366ab415c549212521' profile 'malhash1'
sha256 'ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379' profile 'malhash1'
```

Malware threat feed from EMS

A FortiGate can pull malware threat feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. This feature is supported in proxy and flow mode.

If an external malware blocklist and the FortiGuard outbreak prevention database are also enabled in the antivirus profile, the checking order is: AV local database, EMS threat feed, external malware blocklist, FortiGuard outbreak prevention database. If the EMS threat feed and external malware blocklist contain the same hash value, then the EMS infection will be reported if both of them are blocked.

To configure an EMS threat feed in an antivirus profile in the GUI:

1. Enable the EMS threat feed:
   a. Go to Security Fabric > Fabric Connectors and double-click the FortiClient EMS card.
   b. Enable EMS Threat Feed.
c. Configure the other settings if needed (see Configuring FortiClient EMS on page 2236 for more details).

d. Click OK.

2. Create the antivirus profile:
   a. Go to Security Profiles > AntiVirus and click Create New.
   b. In the Virus Outbreak Prevention section, enable Use EMS threat feed.
   c. Configure the other settings as needed.

d. Click OK.
To configure an EMS threat feed in an antivirus profile in the CLI:

1. Enable the EMS threat feed:

   ```
   config endpoint-control fctems
   edit "WIN10-EMS"
   set fortinetone-cloud-authentication disable
   set server "192.168.20.10"
   set https-port 443
   set source-ip 0.0.0.0
   set pull-sysinfo enable
   set pull-vulnerabilities enable
   set pull-avatars enable
   set pull-tags enable
   set pull-malware-hash enable
   unset capabilities
   set call-timeout 30
   set websocket-override disable
   next
   end
   ```

2. Create the antivirus profile:

   ```
   config antivirus profile
   edit "av"
   config http
   set av-scan block
   end
   config ftp
   set av-scan block
   end
   config imap
   set av-scan block
   end
   config pop3
   set av-scan block
   end
   config smtp
   set av-scan block
   end
   config cifs
   set av-scan block
   end
   set external-blocklist-enable-all enable
   set ems-threat-feed enable
   next
   end
   ```

Sample log

```
# execute log filter category utm-virus
# execute log display

1: date=2021-03-19 time=16:06:46 eventtime=1616195207055607417 tz="-0700" logid="0208008217" type="utm" subtype="virus" eventtype="ems-threat-feed" level="notice" vd="vd1" policyid=1 msg="Detected by EMS threat feed." action="monitored" service="HTTPS" sessionid=1005 srcip=10.1.100.24 dstip=172.16.200.214 srcport=54674 dstport=443 srcintf="port2" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" proto=6 direction="incoming"
```
Checking flow antivirus statistics

Two CLI commands are used for the antivirus statistics:

- diagnose ips av stats show
- diagnose ips av stats clear

SNMP uses an API to get the antivirus statistics.

To check flow antivirus statistics:

1. Create an antivirus profile:

   ```
   config antivirus profile
   edit "av-test"
   config http
   set av-scan monitor
   end
   config ftp
   set av-scan block
   set quarantine enable
   end
   next
   end
   ```

2. Enable the profile in a firewall policy:

   ```
   config firewall policy
   edit 1
   set name "policy1"
   set srcintf "port2"
   set dstintf "port1"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set utm-status enable
   set fsso disable
   set av-profile "av-test"
   set ssl-ssh-profile "custom-deep-inspection"
   ```
3. On the client PC, download the EICAR Standard Anti-Virus Test File via HTTP.

4. Check the antivirus statistics on the FortiGate. Since the action is set to monitor for HTTP, HTTP virus detected increases by 1:

```
# diagnose ips av stats show
AV stats:
HTTP virus detected: 1
HTTP virus blocked: 0
SMTP virus detected: 0
SMTP virus blocked: 0
POP3 virus detected: 0
POP3 virus blocked: 0
IMAP virus detected: 0
IMAP virus blocked: 0
NNTP virus detected: 0
NNTP virus blocked: 0
FTP virus detected: 0
FTP virus blocked: 0
SMB virus detected: 0
SMB virus blocked: 0
```

5. On the client PC, download the EICAR file via FTP.

6. Check the antivirus statistics on the FortiGate. Since quarantine is enabled for FTP, FTP virus detected and FTP virus blocked increase by 1:

```
# diagnose ips av stats show
AV stats:
HTTP virus detected: 1
HTTP virus blocked: 0
SMTP virus detected: 0
SMTP virus blocked: 0
POP3 virus detected: 0
POP3 virus blocked: 0
IMAP virus detected: 0
IMAP virus blocked: 0
NNTP virus detected: 0
NNTP virus blocked: 0
FTP virus detected: 1
FTP virus blocked: 1
SMB virus detected: 0
SMB virus blocked: 0
```

7. Check the antivirus statistics using an SNMP walk:

```
root:~# snmpwalk -c public -v 1 10.1.100.6 1.3.6.1.4.1.12356.101.8.2.1.1
iso.3.6.1.4.1.12356.101.8.2.1.1.1.1.1 = Counter32: 2 (fgAvVirusDetected)
iso.3.6.1.4.1.12356.101.8.2.1.1.1.2.1 = Counter32: 1 (fgAvVirusBlocked)
iso.3.6.1.4.1.12356.101.8.2.1.1.1.3.1 = Counter32: 1 (fgAvHTTPVirusDetected)
iso.3.6.1.4.1.12356.101.8.2.1.1.1.4.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.5.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.6.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.7.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.8.1 = Counter32: 0
```
Configure diagonal (fgAvFTPVirusBlocked)
Configure diagonal (fgAvFTPVirusDetected)

Optionally, set the antivirus statistics to zero:

# diagnose ips av stats clear

**CIFS support**

Antivirus scanning on Common Internet File System (CIFS) traffic is supported in flow-based and proxy-based inspection. The file filter profile handles the configuration of file filtering on CIFS. The antivirus profile handles the antivirus configuration for CIFS scanning.

File filtering for CIFS is performed by inspecting the first 4 KB of the file to identify the file’s magic number. If a match occurs, CIFS file filtering prevents the CIFS command that contains that file from running. The file filter functions differently for un-encrypted and encrypted CIFS traffic:

- For un-encrypted CIFS traffic, the standalone file filter works in flow and proxy mode.
- For encrypted CIFS traffic, the CIFS profile must be enabled in the firewall policy because the SMB server’s credential settings are still be configured in CIFS profile. Using the standalone file filter only works in proxy mode.

For a CIFS profile to be available for assignment in a policy, the policy must use proxy inspection mode. See Proxy mode inspection on page 1086 for details. Note that in proxy inspection mode, special condition archive files (encrypted, corrupted, mailbomb, and so on) marked by the antivirus engine are blocked automatically.

Messages that are compressed with LZNT1, LZ77, and LZ77+Huffman algorithms can be scanned in proxy mode.

**Configure file-type filtering and antivirus scanning on CIFS traffic**

To configure file-type filtering and antivirus scanning on CIFS traffic:

1. Configure a CIFS domain controller on page 1108
2. Configure a CIFS profile on page 1109
3. Configure an antivirus profile on page 1111

**Configure a CIFS domain controller**

The domain controller must be configured when CIFS traffic is encrypted. The configuration tells the FortiGate the network location of the domain controller and the superuser credentials.
To configure the CIFS domain controller:

```fortigate
config user domain-controller
  edit "SERVER_NAME"
    set hostname "host"
    set domain-name "EXAMPLE.COM"
    set username "admin-super"
    set password ********
    set ip 172.16.201.40
  next
end
```

**Configure a CIFS profile**

To create a CIFS profile, configure the server credential type and create a file filter profile.

**Set the CIFS server credential type**

The CIFS server credential type can be `none`, `credential-replication`, or `credential-keytab`.

- **none**
  
  The CIFS profile assumes the CIFS traffic is unencrypted. This is the default value.
  ```fortigate
  config firewall profile-protocol-options
    edit "cifs"
      config cifs
        set server-credential-type none
      end
  next
end
```

- **credential-replication**
  
  To decrypt CIFS traffic, FortiOS obtains the session key from the domain controller by logging in to the superuser account. The domain controller must be configured.
  ```fortigate
  config firewall profile-protocol-options
    edit "cifs"
      config cifs
        set server-credential-type credential-replication
        set domain-controller "SERVER_NAME"
      end
  next
end
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domain-controller</td>
<td>The previously configured domain to decrypt CIFS traffic for.</td>
</tr>
<tr>
<td>credential-keytab</td>
<td>To decrypt CIFS traffic, FortiOS uses a series of keytab values. This method is used when the SMB connection is authenticated by Kerberos. Keytab entries must be configured, and are stored in FortiOS in plaintext.</td>
</tr>
</tbody>
</table>
Security Profiles

```
config firewall profile-protocol-options
  edit "cifs"
  config cifs
    set server-credential-type credential-keytab
    config server-keytab
      edit "keytab1"
        set keytab
          "BQIAABFAAEC0VYQU1QTEUuQ09NAAdleGFtcGxlAAAAAVUmAlwBABIAILdV5P6NXT8RrTvapcMJQxDYCjRQiD0Bzxh

</table>

Configure CIFS file filtering

Multiple rules can be added to a file filter profile. See File filter on page 1227.

To configure a file filter for CIFS traffic:

```
config file-filter profile
  edit "cifs"
    set comment "block zip files on unencrypted cifs traffic"
    set feature-set flow
    set replacemsg-group ''
    set log enable
    config rules
      edit "rule1"
        set protocol cifs
        set action block
        set direction any
        set password-protected any
        set file-type zip
        next
      end
    end
end
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment &lt;string&gt;</td>
<td>A brief comment describing the entry.</td>
</tr>
<tr>
<td>feature-set {flow</td>
<td>proxy}</td>

</tr>
<tr>
<td>file-type &lt;file_type&gt;</td>
<td>The file types to be matched. See Supported file types on page 1232 for details.</td>
</tr>
</tbody>
</table>

### Configure an antivirus profile

The antivirus profile handles the antivirus configuration for CIFS scanning.

**To configure an antivirus profile:**

```
config antivirus profile
   edit "av"
      ...
      config cifs
         set av-scan {disable | block | monitor}
         set outbreak-prevention {disable | block | monitor}
         set external-blocklist {disable | block | monitor}
         set quarantine {enable | disable}
         set archive-block {encrypted corrupted partiallycorrupted multipart nested mailbomb fileslimit timeout unhandled}
         set archive-log {encrypted corrupted partiallycorrupted multipart nested mailbomb fileslimit timeout unhandled}
         set emulator {enable | disable}
      end
   next
end
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>av-scan</td>
<td>Enable antivirus scan service:</td>
</tr>
<tr>
<td></td>
<td>* disable: Disable (default).</td>
</tr>
<tr>
<td></td>
<td>* block: Block the virus infected files.</td>
</tr>
<tr>
<td></td>
<td>* monitor: Log the virus infected files.</td>
</tr>
<tr>
<td>outbreak-prevention {disable</td>
<td>block</td>
</tr>
<tr>
<td></td>
<td>* disable: Disable (default).</td>
</tr>
<tr>
<td></td>
<td>* block: Block the matched files.</td>
</tr>
<tr>
<td></td>
<td>* monitor: Log the matched files.</td>
</tr>
<tr>
<td>external-blocklist {disable</td>
<td>block</td>
</tr>
<tr>
<td></td>
<td>* disable: Disable (default).</td>
</tr>
<tr>
<td></td>
<td>* block: Block the matched files.</td>
</tr>

### Log samples

File-type detection events generated by CIFS profiles are logged in the `utm-cifs` log category. Antivirus detection over the CIFS protocol generates logs in the `utm-virus` category. See the FortiOS Log Message Reference for more information.

#### Logs generated by CIFS profile file filter:

```
date=2019-03-28 time=10:39:19 logid="1800063001" type="utm" subtype="cifs" eventtype="cifs-filefilter" level="notice" vd="vdom1" eventtime=1553794757 msg="File was detected by file filter." direction="incoming" action="passthrough" service="CIFS" srcip=10.1.100.11 dstip=172.16.200.44 srcport=33372 dstport=445 srcintf="wan2" srcintfrole="wan" dstintf="wan1" dstintfrole="wan" policyid=1 proto=16 profile="cifs" filesize="1154" filename="virus\test.png" filtername="2" filetype="png"
```

```

Using FortiSandbox post-transfer scanning with antivirus

Antivirus profiles can submit potential zero-day viruses to FortiSandbox for inspection. Based on FortiSandbox's analysis, the FortiGate can supplement its own antivirus database with FortiSandbox's threat intelligence to detect files determined as malicious or suspicious. This augments the FortiGate antivirus with zero-day detection.

FortiSandbox can be used with antivirus in both proxy-based and flow-based inspection modes. The FortiGate first examines the file for any known viruses. When a match is found, the file is tagged as known malware. If no match is found, the files are forwarded to FortiSandbox using the following options:

- **All Supported Files**: all files matching the file types defined in the scan profile of the FortiSandbox are forwarded.
- **Suspicious Files Only**: files classified by the antivirus as having any possibility of active content are forwarded to FortiSandbox. When using FortiGate Cloud Sandbox, we recommend selecting this option due to its submission limits.
- **None**: files are not forwarded to FortiSandbox.

For more information, see Configuring Sandboxing on page 2230.
To enable FortiSandbox inspection in an antivirus profile:

1. Go to Security Profiles > AntiVirus.
2. Create, edit, or clone an antivirus profile.
3. In the APT Protection Options section, set Send Files to FortiSandbox for Inspection to either Suspicious Files Only or All Supported Files.
4. Optionally, for Do not submit files matching types, click the + to exclude certain file types from being sent to FortiSandbox.
5. Optionally, for Do not submit files matching file name patterns, click the + to enter a wildcard pattern to exclude files from being sent to FortiSandbox.

6. Enable Use FortiSandbox Database.
7. Click OK.

FortiGate diagnostics

To view the detection count:

```bash
# diagnose test application quarantined 7
Total: 0
Statistics:
  vfid: 0, detected: 2, clean: 1252, risk_low: 6, risk_med: 2, risk_high: 1, limit_reached:0
```

To verify the address is configured correctly:

```bash
# diagnose test application quarantined 1
... 
fortisandbox-fsb1 is enabled: analytics, realtime=yes, taskfull=no
addr=172.18.52.154/514, source-ip=0.0.0.0, keep-alive=no. ssl_opt=3, hmac_alg=0
... 
```
To run the diagnostics for real-time debugging:

```
# diagnose debug application quarantined -1
# diagnose debug enable
```

To check the FortiGate Cloud server status:

```
# diagnose test application forticldd 3
...  
  Active APTSrvr status: up
```

To view FortiGate Cloud Sandbox submission statistics for advanced debugging:

```
# diagnose test application quarantined 2
```

**FortiSandbox diagnostics**

To run the OFTP debug for advanced debugging:

```
# diagnose-debug device <client serial number>
```

**Using FortiSandbox inline scanning with antivirus**

FortiSandbox inline scanning can be used in proxy inspection mode. When inline scanning is enabled, the client’s file is held while it is sent to FortiSandbox for inspection. During this time, the FortiGate may apply client comforting (see Protocol options on page 916). For example, leaking a certain amount of bytes at a certain time interval to the client. Once a verdict is returned, the appropriate action (allow or block) is performed on the held file. If there is an error connecting to the FortiSandbox or a timeout on the FortiSandbox scanning the file within the default 50 seconds, the file can be passed, logged, or blocked based on FortiGate’s configuration.

Inline scanning requires a FortiSandbox appliance running version 4.2 or later, and the FortiSandbox must be reachable by port 4443. This feature is not supported on FortiSandbox Cloud or FortiGate Cloud Sandbox. See Understanding Inline Block feature in the FortiSandbox Best Practices for more information.

---

FortiSandbox inline scanning is disabled by default. FortiSandbox inline scanning is best used in conjunction with AV engine scanning since there is a higher rate of detection by using both at the same time.

---

To enable FortiSandbox inline scanning:

```
config system fortisandbox
  set status enable
  set inline-scan {enable | disable}
  set server <fortisandbox_server_ip>
end

To configure the FortiSandbox scanning options in an antivirus profile:

```
config antivirus profile
  edit <name>
```
set fortisandbox-mode {inline | analytics-suspicious | analytics-everything}
set fortisandbox-error-action {ignore | log-only | block}
set fortisandbox-timeout-action {ignore | log-only | block}

Basic configuration

This example assumes that Inline Block Policy is already enabled in FortiSandbox for the FortiGate with selected risk levels (see FortiGate devices in the FortiSandbox Administration Guide for more information). The inline block policy in this example blocks all risk levels: malicious, high risk, medium risk, and low risk.
To configure FortiSandbox inline scanning in the GUI:

1. Enable FortiSandbox inline scanning globally:

   ```bash
   config system fortisandbox
   set status enable
   set inline-scan enable
   set server "172.18.70.76"
   end
   ```

2. Configure the antivirus profile:
   a. Go to Security Profiles > AntiVirus and click Create New.
   b. Set the Feature set to Proxy-based.
   c. Enable the protocols to inspect.
   d. Enable AntiVirus scan and set it to Block.
   e. Enable Send files to FortiSandbox for inspection and set the Action to Block. The Scan strategy appears as Inline because it was configured in the CLI.
f. Click OK.

**To configure FortiSandbox inline scanning in the CLI:**

1. Enable FortiSandbox inline scanning globally:
   
   ```
   config system fortisandbox
   set status enable
   set inline-scan enable
   set server "172.18.70.76"
   end
   ```

2. Configure the antivirus profile:
   
   ```
   config antivirus profile
   edit "Inline_scan_demo"
   set feature-set proxy
   set fortisandbox-mode inline
   config http
   set av-scan block
   set fortisandbox block
   end
   config ftp
   set av-scan block
   set fortisandbox block
   end
   config imap
   set av-scan block
   set fortisandbox block
   ```
Security Profiles

end
config pop3
  set av-scan block
  set fortisandbox block
end
config smtp
  set av-scan block
  set fortisandbox block
end
config mapi
  set av-scan block
  set fortisandbox block
end
config cifs
  set av-scan block
  set fortisandbox block
end
config ssh
  set av-scan block
  set fortisandbox block
end
next
end

To verify that infected files are blocked inline:

1. On a client, open a web browser and download an infected file.
2. The file is held while being scanned by FortiSandbox. Once FortiSandbox determines that file’s risk level is not tolerated by the inline block policy, the FortiGate drops the connection and displays a replacement message that the file cannot be downloaded.

![High Security Alert]

3. In FortiOS, view the antivirus log.
   - In the GUI, go to Log & Report > Security Events and click the AntiVirus card.
   - In the CLI:

```
  # execute log filter category 2
  # execute log display
  1 logs found.
  1 logs returned.

  1: date=2022-03-23 time=16:19:37 eventtime=1648077577156255080 tz="-0700"
```
logid="0210008232" type="utm" subtype="virus" eventtype="fortisandbox" level="warning" vd="vdom1" policyid=1 poluuuid="9170ca3e-aade-51ec-772b-1d31f135fe26" policytype="policy" msg="Blocked by FortiSandbox." action="blocked" service="HTTP" sessionid=10545 srcip=10.1.100.181 dstip=172.16.200.184 srcport=37046 dstport=80 srccountry="Reserved" dstcountry="Reserved" srcintf="port1" srcintfrole="undefined" dstintf="port9" dstintfrole="undefined" srcuuid="5b426c60-aade-51ec-f020-b3d334ba18d3" dstuuid="5b426c60-aade-51ec-f020-b3d334ba18d3" proto=6 direction="incoming" filename="skip_vm.vXE" quarskip="File-was-not-quarantined" virus="Trojan" viruscat="Unknown" dtype="fortisandbox" ref="http://www.fortinet.com/ve?vn=Trojan" virusid=0 url="http://172.16.200.184/sandbox/inline/skip_vm.vXE" profile="Inline_scan_demo" agent="curl/7.68.0" httpmethod="GET" analyticssubmit="false" fsaaction="deny" fsaseverity="high-risk" fsaverdict="block" fsafileid=0 fsafiletype="exe" crscore=50 craction=2 crlevel="critical"

**Configuration with FortiSandbox scanning error and timeout actions**

In this example, the HTTP protocol settings for av-scan and fortisandbox in the AV profile are both set to block. All files traversing HTTP in this configuration are scanned by the AV engine first, and then by FortiSandbox inline scanning for further file analysis. Based on the FortiSandbox results, FortiOS will take the appropriate action.

Files can be blocked if they contain a scan error or timeout. The scan timeout is configured in FortiSandbox and set to 50 seconds. If the file scan takes longer than 50 seconds, FortiSandbox returns a timeout to the FortiGate, and file is dropped with the current configuration. If a user tries to download the same file again, the cached result is provided by FortiSandbox to the FortiGate based on the previous file scan.

This example assumes FortiSandbox inline scanning has been configured globally. The FortiGate will block the file if there is an inline scanning error or timeout.

To configure the antivirus profile to block files if there is an inline scanning error or timeout:

```plaintext
config antivirus profile
  edit "av"
    set feature-set proxy
    set fortisandbox-mode inline
  config http
    set av-scan block
    set fortisandbox block
  end
  set fortisandbox-error-action block
  set fortisandbox-timeout-action block
next
end
```

If the administrator decides to take more risk and scan all files traversing HTTP, but log or ignore an inline scanning error or timeout, the profile is modified as follows:

```plaintext
config antivirus profile
  edit "av"
    set fortisandbox-error-action {log-only | ignore}
    set fortisandbox-timeout-action {log-only | ignore}
next
end
```
The AV engine is still used first, followed by FortiSandbox inline scanning. The FortiGate will log or ignore the file if there is an inline scanning error or timeout, and the file is allowed to pass through.

Using FortiNDR inline scanning with antivirus

FortiNDR (formerly FortiAI) can be used with antivirus profiles in proxy inspection mode (flow mode is currently not supported). FortiNDR inspects high-risk files and issues a verdict to the firewall based on how close the file features match those of malware. When enabled, FortiNDR can log, block, ignore, or monitor (allow) the file based on the verdict.

Traffic is blocked when verdict is infected/risky
Traffic containing an unidentified file passes through FortiGate
Traffic is passed when verdict is clean

A licensed FortiNDR appliance with version 1.5.1 or later is required to use this feature.

To configure FortiNDR inline inspection with an AV profile:

1. Configure FortiNDR to join a Security Fabric in FortiOS (see Configuring FortiNDR on page 2257).
2. In the FortiNDR CLI, enable inline inspection:
   ```
   config system fortindr
   set status enable
   end
   ```
3. Configure an AV profile in FortiOS to use inline inspection and block detected infections:
   ```
   config antivirus profile
   edit "av"
   set feature-set proxy
   config http
   ```
Security Profiles

```fortran
set fortindr block
end
config ftp
  set fortindr block
end
config imap
  set fortindr block
end
config pop3
  set fortindr block
end
config smtp
  set fortindr block
end
config mapi
  set fortindr block
end
config nntp
  set fortindr block
end
config cifs
  set fortindr block
end
config ssh
  set fortindr block
end
next
end
```

4. Add the AV profile to a firewall policy. When potential infections are blocked by FortiNDR inline inspection, a replacement message appears (see Replacement messages on page 2136 for more information). An infection blocked over HTTP looks similar to the following:

![Sample log](http://www.fortinet.com/ve?utm_medium%3Demail&utm_source=FortiNDR&utm_campaign=FortiNDR-
"action="monitored" service="HTTP" sessionid=13312 srcip=10.1.100.221 dstip=172.16.200.224 srcport=50792 dstport=80 srcintf="wan2" srcintfrole="wan" dstintfrole="wan" proto=6 direction="incoming"

**Sample log**

```
date=2021-04-29 time=15:12:07 eventtime=16197327633022960 tz="-0700" logid=0209008221 type="utm" subtype="virus" eventtype="fortindr" level="notice" vd="vd01" policyid=1 msg="Detected by FortiNDR." action="monitored" service="HTTP" sessionid=13312 srcip=10.1.100.221 dstip=172.16.200.224 srcport=50792 dstport=80 srcintf="wan2" srcintfrole="wan" dstintfrole="wan" proto=6 direction="incoming"
```
FortiNDR inline inspection with other AV inspection methods

The following inspection logic applies when FortiNDR inline inspection is enabled simultaneously with other AV inspection methods. The AV engine inspection and its verdict always takes precedence because of performance. The actual behavior depends on which inspected protocol is used.

HTTP, FTP, SSH, and CIFS protocols:

1. AV engine scan; AV database and FortiSandbox database (if applicable).
   a. FortiNDR inline inspection occurs simultaneously.
2. AV engine machine learning detection for WinPE PUPs (potentially unwanted programs).
   a. FortiNDR inline inspection occurs simultaneously.
3. Outbreak prevention and external hash list resources.
   a. FortiNDR inline inspection occurs simultaneously.

If any AV inspection method returns an infected verdict, the FortiNDR inspection is aborted.

POP3, IMAP, SMTP, NNTP, and MAPI protocols:

1. AV engine scan; AV database and FortiSandbox database (if applicable).
2. AV engine machine learning detection for WinPE PUPs (potentially unwanted programs).
   a. FortiNDR inline inspection occurs simultaneously.
3. Outbreak prevention and external hash list resources.
   a. FortiNDR inline inspection occurs simultaneously.

In an AV profile, use `set fortindr-error-action {log-only | block | ignore}` to configure the action to take if FortiNDR encounters an error.

Accepted file types

The following file types are sent to FortiNDR for inline inspection:

<table>
<thead>
<tr>
<th>File Type</th>
<th>File Type</th>
<th>File Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>7Z</td>
<td>HTML</td>
<td>RTF</td>
</tr>
<tr>
<td>ARJ</td>
<td>JS</td>
<td>TAR</td>
</tr>
<tr>
<td>BZIP</td>
<td>LZH</td>
<td>VBA</td>
</tr>
<tr>
<td>BZIP2</td>
<td>LZW</td>
<td>VBS</td>
</tr>
<tr>
<td>CAB</td>
<td></td>
<td>WinPE (EXE)</td>
</tr>
</tbody>
</table>
## Web filter

Web filtering restricts or controls user access to web resources and can be applied to firewall policies using either policy-based or profile-based NGFW mode.

In FortiOS, there are three main components of web filtering:

- Web content filter: blocks web pages containing words or patterns that you specify.
- URL filter: uses URLs and URL patterns to block or exempt web pages from specific sources, or block malicious URLs discovered by FortiSandbox.
- FortiGuard Web Filtering service: provides many additional categories you can use to filter web traffic.

These components interact with each other to provide maximum control over what users on your network can view and protect your network from many internet content threats.

Web filters are applied in the following order:

1. URL filter
2. FortiGuard Web Filtering
3. Web content filter
4. Web script filter
5. Antivirus scanning

FortiOS includes three preloaded web filter profiles:

- **default**
- **monitor-all** (monitors and logs all URLs visited, flow-based)
- **wifi-default** (default configuration for offloading WiFi traffic)

You can customize these profiles, or you can create your own to manage network user access.

---

Some features of this functionality require a subscription to FortiGuard Web Filtering.

---

The following topics provide information about web filters:

- URL filter on page 1125
- FortiGuard filter on page 1130
- Credential phishing prevention on page 1136
- Additional antiphishing settings on page 1139
- Usage quota on page 1142
- Web content filter on page 1144
- Advanced filters 1 on page 1147

<table>
<thead>
<tr>
<th>ELF</th>
<th>MS Office documents (XML and non-XML)</th>
<th>XZ</th>
</tr>
</thead>
<tbody>
<tr>
<td>GZIP</td>
<td>PDF</td>
<td>ZIP</td>
</tr>
</tbody>
</table>
URL filter

The URL filter uses specific URLs with patterns containing text and regular expressions so the FortiGate can process the traffic based on the filter action (exempt, block, allow, monitor) and web pages that match the criteria. Once a URL filter is configured, it can be applied to a firewall policy.

The following filter types are available:

<table>
<thead>
<tr>
<th>URL filter type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simple</td>
<td>The FortiGate tries to strictly match the full context. For example, if you enter <a href="http://www.facebook.com">www.facebook.com</a> in the URL field, it only matches traffic with <a href="http://www.facebook.com">www.facebook.com</a>. It won't match facebook.com or message.facebook.com. When the FortiGate finds a match, it performs the selected URL action.</td>
</tr>
<tr>
<td>Regular expression/wildcard</td>
<td>The FortiGate tries to match the pattern based on the rules of regular expressions or wildcards. For example, if you enter <em>fa</em> in the URL field, it matches all the content that has fa such as <a href="http://www.facebook.com">www.facebook.com</a>, message.facebook.com, fast.com, and so on. When the FortiGate finds a match, it performs the selected URL action.</td>
</tr>
</tbody>
</table>

For more information, see the URL Filter expressions technical note in the Knowledge Base.

The following actions are available:

<table>
<thead>
<tr>
<th>URL filter action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exempt</td>
<td>The traffic is allowed to bypass the remaining FortiGuard web filters, web content filters, web script filters, antivirus scanning, and DLP proxy operations.</td>
</tr>
<tr>
<td>Block</td>
<td>The FortiGate denies or blocks attempts to access any URL that matches the URL pattern. A replacement message is displayed.</td>
</tr>
<tr>
<td>Allow</td>
<td>The traffic is passed to the remaining FortiGuard web filters, web content filters, web script filters, antivirus proxy operations, and DLP proxy operations. If the URL does not appear in the URL list, the traffic is permitted.</td>
</tr>
<tr>
<td>Monitor</td>
<td>The traffic is processed the same way as the Allow action. For the Monitor action, a log message is generated each time a matching traffic pattern is established.</td>
</tr>
</tbody>
</table>

In the following example, a URL filter will be created to block the facebook.com URL using a wildcard.
Configuring a URL filter in the GUI

To create a URL filter for Facebook:

1. Go to Security Profiles > Web Filter and click Create New, or edit an existing profile.
2. In the Static URL Filter section, enable URL Filter.
4. For URL, enter *facebook.com, for Type, select Wildcard, and for Action, select Block.

5. Click OK. The entry appears in the table.

6. Configure the other settings as needed.
7. Click OK.

To apply the web filter profile to a firewall policy:

1. Go to Policy & Objects > Firewall Policy.
2. Edit a policy, or create a new one.
3. In the Security Profiles section, enable Web Filter and select the profile you created.
4. Configure the other settings as needed.
5. Click OK.
Configuring a URL filter in the CLI

To create a URL filter for Facebook:

```
config webfilter urlfilter
   edit 1
      set name "webfilter"
      config entries
         edit 1
            set url "*facebook.com"
            set type wildcard
            set action block
         next
      next
end
```

To apply the URL filter to a web filter profile:

```
config webfilter profile
   edit "webfilter"
      config web
         set urlfilter-table 1
      end
      config ftgd-wf
         ...
      end
next
end
```

To apply the web filter profile to a firewall policy:

```
config firewall policy
   edit 1
      set name "WF"
      set srcintf "wan2"
      set dstintf "wan1"
      set srcaddr "all"
      set dstaddr "all"
      set action accept
      set schedule "always"
      set service "ALL"
      set utm-status enable
      set inspection-mode proxy
      set logtraffic all
      set webfilter-profile "webfilter"
      set profile-protocol-options "protocol"
      set ssl-ssh-profile "protocols"
      set nat enable
   next
end
```
Verifying the URL filter results

Verify the URL filter results by going to a blocked website. For example, when you go to the Facebook website, the replacement message appears:

FortiGuard Intrusion Prevention - Access Blocked

Web Page Blocked

The page you have requested has been blocked because the URL is banned.

<table>
<thead>
<tr>
<th>URL</th>
<th><a href="https://www.facebook.com">https://www.facebook.com</a></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Request Blocked</td>
</tr>
<tr>
<td>Username</td>
<td>[redacted]</td>
</tr>
<tr>
<td>Group Name</td>
<td>[redacted]</td>
</tr>
<tr>
<td>URL Source</td>
<td>Local URLfilter Block</td>
</tr>
</tbody>
</table>

To customize the URL web page blocked message:

1. Go to System > Replacement Messages.
2. In the HTTP section, select URL Block Page and click Edit.
3. Edit the HTML to customize the message.

To check web filter logs in the GUI:

2. Click the Web Filter card name.
3. If there are a lot of log entries, click Add Filter and select Event Type > urlfilter to display logs generated by the URL filter.
To check web filter logs in the CLI:

```bash
# execute log filter utm-webfilter
# execute log display
```

```
1: date=2019-04-22 time=11:48:43 logid=0315012544 type=utm subtype=webfilter
eventtype=urlfilter level=warning vd=vdom1 eventtime=1555958923322174610
urlfilteridx=0 urllsource="Local URLfilter Block" policyid=1 sessionid=649063
srcip=10.1.200.15 srclport=50472 srcintf="wan2" srcintfrole="wan" dstip=157.240.18.35
dstport=443 dstintf="wan1" dstintfrole="wan" proto=6 service="HTTPS"
hostname="www.facebook.com" profile="webfilter" action="blocked" reqtype="direct" url="/"
sentbyte=1171 rcvdbyte=141 direction="outgoing" msg="URL was blocked because it is in the URL filter list" crscore=30
craction=8 crlevel="high"
```

**FortiGuard filter**

The FortiGuard filter enhances the web filter features by sorting billions of web pages into a wide range of categories that users can allow or block.

The FortiGuard Web Filtering service includes over 45 million individual website ratings that apply to more than two billion pages. When the FortiGuard filter is enabled in a web filter profile and applied to firewall policies, if a request for a web page appears in traffic controlled by one of the firewall policies, the URL is sent to the nearest FortiGuard server. The URL category or rating is returned. If the category is blocked, the FortiGate shows a replacement message in place of the requested page. If the category is not blocked, the page request is sent to the requested URL as normal.

To use this service, you must have a valid FortiGuard license.

The following actions are available:

<table>
<thead>
<tr>
<th>FortiGuard web filter action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow</td>
<td>Permit access to the sites in the category.</td>
</tr>
<tr>
<td>Monitor</td>
<td>Permit and log access to sites in the category. User quotas can be enabled for this option (see Usage quota on page 1142).</td>
</tr>
<tr>
<td>Block</td>
<td>Prevent access to the sites in the category. Users trying to access a blocked site see a replacement message indicating the site is blocked.</td>
</tr>
<tr>
<td>Warning</td>
<td>Display a message to the user allowing them to continue if they choose.</td>
</tr>
<tr>
<td>Authenticate</td>
<td>Require the user to authenticate with the FortiGate before allowing access to the category or category group.</td>
</tr>
<tr>
<td>Disable</td>
<td>Remove the category from the from the web filter profile. This option is only available for local or remote categories from the right-click menu.</td>
</tr>
</tbody>
</table>

**FortiGuard web filter categories**

FortiGuard has many web filter categories, including two local categories and a special remote category. Refer to the following table for more information:
Security Profiles

### FortiGuard web filter category

<table>
<thead>
<tr>
<th>Category</th>
<th>Where to find more information</th>
</tr>
</thead>
<tbody>
<tr>
<td>All URL categories</td>
<td>See Web Filter Categories.</td>
</tr>
<tr>
<td>Local categories</td>
<td>See Web rating override on page 1320.</td>
</tr>
<tr>
<td>Remote category</td>
<td>See Threat feeds on page 2506.</td>
</tr>
</tbody>
</table>

The priority of categories is local category > external category > FortiGuard built-in category. If a URL is configured as a local category, it only follows the behavior of the local category and not the external or FortiGuard built-in category.

### Blocking a web category

The following example shows how to block a website based on its category. The information and computer security category (category 52) will be blocked.

**To block a category in the GUI:**

1. Go to Security Profiles > Web Filter and click Create New, or edit an existing profile.
2. In the FortiGuard category based filter section, select Information and Computer Security, then click Block.

![Web Filter Profile](image)

3. Configure the remaining settings as needed.
4. Click OK.

**To block a category in the CLI:**

```
config webfilter profile
edit "webfilter"
    config ftgd-wf
        unset options
```
To verify that the category is blocked:

1. Go to a website that belongs to the blocked category, such as www.fortinet.com.
   The page should be blocked and display a replacement message.

To view the log of a blocked website in the GUI:

2. Click the Web Filter card name.
3. Select an entry with blocked in the Action column and click Details.

To view the log of a blocked website in the CLI:

```
# execute log filter category utm-webfilter
# execute log display
```

```
1: date=2019-04-22 time=13:46:25 logid="0316013056" type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="vdom1" eventtime=1555965984972459609 policyid=1
```

```
dstip=54.183.57.55 dstport=80 dstintf="wan1" dstintfrole="wan" proto=6 service="HTTP" hostname="www.fortinet.com" profile="webfilter" action="blocked" reqtype="direct" url="/" sentbyte=386 rcvdbyte=0 direction="outgoing" msg="URL belongs to a denied category in policy" method="domain" cat=52 catdesc="Information Technology"

Allowing users to override blocked categories

There is an option to allow users with valid credentials to override blocked categories.

To allow users to override blocked categories in the GUI:

1. Go to Security Profiles > Web Filter and click Create New, or edit an existing profile.
2. Enable Allow users to override blocked categories.
3. Enter information in the following fields:
   - Groups that can override
   - Profile name
   - Switch applies to
   - Switch Duration
4. Configure the other settings as needed.

5. Click OK.

To allow users to override blocked categories in the CLI:

```bash
config webfilter profile  
   edit "webfilter"  
       set ovrd-perm bannedword-override urlfilter-override fortiguard-wf-override contenttype-check-override  
   config override  
       set ovrd-user-group "radius_group"  
   config webfilter  
end  
config ftgd-wf  
   unset options  
end  
next  
end
```
Issuing a warning on a web category

The following example shows how to issue a warning when a user visits a website in a specific category (information and computer security, category 52).

To configure a warning for a category in the GUI:

1. Go to Security Profiles > Web Filter and click Create New, or edit an existing profile.
2. In the FortiGuard category based filter section, select Information and Computer Security, then click Warning.
3. Set the Warning Interval, then click OK.
   The warning interval is the amount of time until the warning appears again after the user proceeds past it.

4. Configure the remaining settings as needed.
5. Click OK.

To configure a warning for a category in the CLI:

```
config webfilter profile
  edit "webfilter"
  config ftgd-wf
  unset options
  config filters
    edit 1
      set category 52
      set action warning
      next
    end
  end
  next
end
```
To verify that the warning works:

1. Go to a website that belongs to the category, such as www.fortinet.com.
2. On the warning page, click **Proceed or Go Back**.

Authenticate a web category

The following example shows how to authenticate a website based on its category (information and computer security, category 52).

To authenticate a category in the GUI:

1. Go to *Security Profiles* > *Web Filter* and edit or create a new web filter profile.
2. In the FortiGuard category based filter section, select *Information and Computer Security*, then click **Authenticate**.
3. Set the **Warning Interval** and select one or more user groups, then click **OK**.
4. Configure the remaining settings as needed.
5. Click **OK**.

To authenticate a category in the CLI:

```bash
config webfilter profile
  edit "webfilter"
    config ftgd-wf
      unset options
      config filters
        edit 1
          set category 52
          set action authenticate
          set auth-usr-grp "local_group"
          next
        end
      end
    end
  end
end
```
To verify that you have configured authentication:

1. Go to a website that belongs to the category, such as www.fortinet.com.
2. On the warning page, click Proceed.
3. Enter the username and password for the configured user group, then click Continue.

Customizing the replacement message page

When the category action is Block, Warning, or Authenticate, you can customize the replacement message page that a user sees.

To customize the replacement message page:

1. Go to Security Profiles > Web Filter and edit or create a new web filter profile.
2. In the FortiGuard category based filter section, right-click on a category and select Customize.
3. Select a Replacement Message Group. See Replacement message groups on page 2139 for details.
4. Optionally, click Edit FortiGuard Block Page or Edit FortiGuard Warning Page to make modifications.
5. Click Save.
6. Configure the remaining settings as needed.
7. Click OK.

Credential phishing prevention

When credential phishing prevention is enabled, the FortiGate scans for corporate credentials submitted to external websites and compares them to sensitive credentials stored in the corporate domain controller. Based on the configured antiphishing rules in proxy mode web filter profiles, the FortiGate will block the URL or alert the user if the credentials match ones that are stored on the corporate domain controller.

- The corporate domain controller must be configured in the domain controller.
- Credentials can be matched based on sAMAccountName, user principal name (UPN), or down-level logon name.
The antiphishing profile defines the corporate domain controller, antiphishing check option, default action if no rules match, antiphishing status, and so on.

Inspection entries in the profile define what action occurs when the submission request matches the specified FortiGuard categories.

The profile scans for pre-defined and custom username and password fields in the HTTP request, such as username, auth, and password. You can evaluate custom fields by configuring custom patterns.

The URL filter defines individual URLs that the antiphish action (block or log) is applied to when the URL submission request matches.

Web-based URL filter actions and FortiGuard category-based filtering have higher priority than antiphishing URL filter actions and FortiGuard filtering:

- If a request is blocked by the web-based URL filter or FortiGuard filter, there is no further antiphishing scanning. Antiphishing scanning only happens after the web-based URL files and FortiGuard filters allow the traffic.
- If a submission matches an entry in the URL filter table that has an antiphishing action, the defined action is taken. No further FortiGuard category-based rules are applied.
- Like firewall rules, the URL filter table and FortiGuard category-based antiphishing rules use a top-down priority. The rule that matches first is the one that is used.

In this example, URLs that match FortiGuard category 37 (social networking) will be blocked and other categories will be logged.

**To configure credential phishing prevention:**

1. Configure the corporate domain controller:

   ```
   config user domain-controller
   edit "win2016"
   edit win2016
   set hostname "win2016"
   set domain-name "corpserver.local"
   set username "Administrator"
   set password **********
   set ip <server_ip>
   next
   end
   ```

   The hostname and the domain-name are case sensitive.

2. Configure the antiphishing profile, which includes the FortiGuard category rule:

   ```
   config webfilter profile
   edit <profile-name>
   set feature-set proxy
   ...
   config web
   ...
   end
   config antiphish
   set status enable
   set domain-controller "win2016"
   ```
set default-action block
set check-uri enable
set check-basic-auth enable
set max-body-len 65536

config inspection-entries
  edit "inspect-37"
    set fortiguard-category 37
    set action block
  next
  edit "inspect-others"
    set fortiguard-category all
    set action log
  next
end

config custom-patterns
  edit "customer-name"
    set category username
  next
  edit "customer-passwd"
    set category password
  next
end

... 

set web-antiphishing-log enable
next
end

- check-uri enables support for scanning HTTP GET URI parameters.
- check-basic-auth enables support for scanning the HTTP basic authentication field.

3. Configure the URL filter to scan specific URLs. The antiphish action is added to the URL filter table entry, and the URL filter is applied to the web filter profile:

config webfilter urlfilter
  edit 1
    set name "antiphish-table"
  config entries
    edit 1
      set url "www.example.com"
      set type simple
      set antiphish-action block
      set status enable
      set referrer-host ''
    next
  end
next
config webfilter profile
  edit "<profile-name>"
    config web
      set urlfilter-table 1
  end
... 
end
4. Optionally, define custom patterns to scan fields other than the built-in username and password keywords:

```plaintext
config webfilter profile
  edit "<profile-name>"
  config custom-patterns
    edit "customer-name"
      set category username
      next
    edit "customer-passwd"
      set category password
      next
  end
  next
end
```

**Additional antiphishing settings**

The following settings are available for antiphishing:

- **Enable DNS service lookup in the domain controller** so that the domain controller IP does not need to be configured. The DNS server will resolve the domain controller IP.
- **Specify a source IP or port for the fetching domain controller.**
- **Use an LDAP server as a credential source** (only the OpenLDAP server is supported).
- **Block or log valid usernames regardless of password match.**
- **Use literal custom patterns type for username and password.**
- **Active Directory Lightweight Directory Services (AD LDS) support**

**Configuration examples**

To enable DNS service lookup:

```plaintext
config user domain-controller
  edit "win2016"
    set ad-mode ds
    set dns-srv-lookup enable
    set hostname "win2016"
    set username "replicate"
    set password *********
    set domain-name "SMB2016.LAB"
  next
end
```

To specify the source IP and port for the fetching domain controller:

```plaintext
config user domain-controller
  edit "win2016"
    set ad-mode ds
    set hostname "win2016"
    set username "replicate"
    set password *********
    set ip-address 172.18.52.188
    set source-ip-address 172.16.100.1
```
Security Profiles

set source-port 2000
set domain-name "SMB2016.LAB"

next
derm

to use an LDAP server as a credential store:

1. Configure the LDAP server:

   config user ldap
   edit "openldap"
   set server "172.18.60.214"
   set cnid "cn"
   set dn "dc=qafsso,dc=com"
   set type regular
   set username "cn=Manager,dc=qafsso,dc=com"
   set password **********
   set antiphish enable
   set password-attr "userPassword"
   next
derm

tern the web filter profile:

   config webfilter profile
   edit "webfilter"
   set feature-set proxy
   config ftgd-wf
   unset options
   config filters
   edit 1
   set action block
   next
derm
   config antiphish
   set status enable
   config inspection-entries
   edit "cat34"
   set fortiguard-category 34
   set action block
   next
derm
   set authentication ldap
   set ldap "openldap"
derm
   next
derm
   set log-all-url enable
derm

To configure username-only credential matching:

   config webfilter profile
   edit "webfilter"
   set feature-set proxy
   config ftgd-wf
To configure different custom pattern types for usernames and passwords:

```bash
config webfilter profile
  edit "qwer"
    set type literal
  next
  edit "[0-6]Dat*"
  next
  edit "dauw9"
    set category password
    set type literal
  next
  edit "[0-5]foo[1-4]"
    set category password
  next
end
set domain-controller "win2016"
end
set log-all-url enable
next
end
```
In this example, the `qwer` and `dauw9` entries use the literal type, while `[0-6]Dat*` and `[0-5]foo[1-4]` use the default regex type.

**To configure Active Directory in LDS mode:**

```plaintext
config user domain-controller
  edit "win2016adlds"
    set hostname "win2016adlds"
    set username "foo"
    set password **********
    set ip-address 192.168.10.9
    set domain-name "adlds.local"
    set ad-mode lds
    set adlds-dn "CN=adlds1part1,DC=ADLDS,DC=COM"
    set adlds-ip-address 192.168.10.9
    set adlds-port 3890
next
end
```

**Usage quota**

In addition to using category and classification blocks and overrides to limit user access to URLs, you can set a daily quota by category, category group, or classification. Quotas allow access for a specified length of time or a specific bandwidth, and are calculated separately for each user. Quotas are reset daily at midnight.

Quotas can be set for the **Monitor**, **Warning**, or **Authenticate** actions. Once the quota is reached, the traffic is blocked and the replacement message page displays.

---

**Quotas are only available in proxy-based inspection mode.**

---

**Configuring a quota**

The following example shows how to set a time quota for the education category (category 30).

**To configure a quota in the GUI:**

1. Go to **Security Profiles > Web Filter** and click **Create New**, or edit an existing profile.
2. For **Feature set**, select **Proxy-based**.
3. In the **FortiGuard category based filter** section, scroll to the **General Interest - Personal** and click the + to expand the section.
4. Select *Education*, then click *Monitor.*

5. In the *Category Usage Quota* section, click *Create New.* The *New/Edit Quota* pane opens.

6. In the *Category* field, select *Education.*

7. For the *Quota Type*, select *Time* and set the *Total quota* to 5 minutes.

8. Click *OK.* The entry appears in the table.

9. Configure the other settings as needed.

10. Click *OK.*

**To configure a quota in the CLI:**

```bash
config webfilter profile
edit "webfilter"
    config ftgd-wf
        unset options
        config filters
```
edit 1
   set category 30
next
derm quota
   edit 1
   set category 30
   set type time
   set duration 5m
next
derm
\n\nTo verify the quota usage:

1. Go to a website that belongs to the education category, such as https://www.harvard.edu/. You can view websites in that category at the moment.
2. In FortiOS, go to Dashboard > FortiGuard Quota Monitor to check the used and remaining time.

   Category Usage Quota
   \n   | User     | 10.1.100.11 |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Web Filter Profile</td>
<td>webfilter</td>
</tr>
<tr>
<td>Category</td>
<td>Used Quota</td>
</tr>
<tr>
<td>Education</td>
<td>1 second(s)</td>
</tr>
</tbody>
</table>

3. When the quota reaches its limit, traffic is blocked and the replacement page displays.

   Web content filter

   You can control access to web content by blocking webpages containing specific words or patterns. This helps to prevent access to pages with questionable material. You can specify words, phrases, patterns, wildcards, and regular expressions to match content on webpages. You can use multiple web content filter lists and select the best one for each web filter profile. The maximum number of web content patterns in a list is 5000.

   When configuring a web content filter list, the following patterns are available:
Use this setting to block or exempt one word or text strings of up to 80 characters. You can also use wildcard symbols such as ? or * to represent one or more characters. For example, a wildcard expression fort*.com matches fortinet.com and fortiguard.com. The * represents any character appearing any number of times.

<table>
<thead>
<tr>
<th>Web content pattern type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wildcard</td>
<td>Use this setting to block or exempt patterns of regular expressions that use some of the same symbols as wildcard expressions, but for different purposes. In regular expressions, * represents the character before the symbol. For example, forti*.com matches fortii.com but not fortinet.com or fortiiice.com. In this case, the symbol * represents i appearing any number of times.</td>
</tr>
</tbody>
</table>

**Content evaluation**

The web content filter scans the content of every webpage that is accepted by a firewall policy. The system administrator can specify banned words and phrases and attach a numerical value (or score) to the importance of those words and phrases. When the web content filter scan detects banned content, it adds the scores of banned words and phrases found on that page. If the sum is higher than a threshold set in the web filter profile, the FortiGate blocks the page.

The default score for web content filter is 10 and the default threshold is 10. This means that by default, a webpage is blocked by a single match. These settings can only be configured in the CLI.

Banned words or phrases are evaluated according to the following rules:

- The score for each word or phrase is counted only once, even if that word or phrase appears many times in the webpage.
- The score for any word in a phrase without quotation marks is counted.
- The score for a phrase in quotation marks is counted only if it appears exactly as written.

The following table is an example of how rules are applied to the webpage contents. For example, a webpage contains only this sentence:

*The score for each word or phrase is counted only once, even if that word or phrase appears many times in the webpage.*

<table>
<thead>
<tr>
<th>Banned pattern</th>
<th>Assigned score</th>
<th>Score added to the sum for the entire page</th>
<th>Threshold score</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>word</td>
<td>20</td>
<td>20</td>
<td>20</td>
<td>Appears twice but is only counted once. The webpage is blocked.</td>
</tr>
<tr>
<td>word phrase</td>
<td>20</td>
<td>40</td>
<td>20</td>
<td>Each word appears twice but is only counted once, giving a total score of 40. The webpage is blocked.</td>
</tr>
<tr>
<td>word sentence</td>
<td>20</td>
<td>20</td>
<td>20</td>
<td><em>word appears twice and sentence does not appear, but since any word in a phrase without quotation marks is counted, the score for this pattern is 20. The webpage is blocked.</em></td>
</tr>
<tr>
<td>Banned pattern</td>
<td>Assigned score</td>
<td>Score added to the sum for the entire page</td>
<td>Threshold score</td>
<td>Comment</td>
</tr>
<tr>
<td>-------------------------</td>
<td>----------------</td>
<td>--------------------------------------------</td>
<td>----------------</td>
<td>--------------------------------------------------------------------------</td>
</tr>
<tr>
<td>&quot;word sentence&quot;</td>
<td>20</td>
<td>0</td>
<td>20</td>
<td>This phrase does not appear exactly as written. The webpage is allowed.</td>
</tr>
<tr>
<td>&quot;word or phrase&quot;</td>
<td>20</td>
<td>20</td>
<td>20</td>
<td>This phrase appears twice but is only counted once. The webpage is blocked.</td>
</tr>
</tbody>
</table>

To configure a web content filter in the GUI:

1. Go to Security Profiles > Web Filter and click Create New, or edit an existing profile.
2. In the Static URL Filter section, enable Content Filter.
3. Click Create New. The New Web Content Filter pane opens.
4. Configure the following settings:
   - Pattern Type: Regular Expression
   - Pattern: fortinet
   - Language: Western
   - Action: Block
   - Status: Enable
5. Click OK. The entry appears in the table.
6. Configure the other settings as needed.
7. Click OK.
To configure a web content filter in the CLI:

1. Create the content (banned word) table:

```
config webfilter content
   edit 1
       set name "webfilter"
   config entries
       edit "fortinet"
           set pattern-type regexp
           set status enable
           set lang western
           set score 10
           set action block
       next
   next
end
```

2. Apply the content table to the web filter profile:

```
config webfilter profile
   edit "webfilter"
   config web
       set bword-threshold 10
       set bword-table 1
   end
   config ftgd-wf
       unset options
   end
next
end
```

To verify the content filter:

1. Go to a website with the word fortinet, such as www.fortinet.com.
   The website is blocked and a replacement page displays:

```
The URL you requested has been blocked
```

Advanced filters 1

This topic gives examples of the following advanced filter features:

- Block malicious URLs discovered by FortiSandbox on page 1148
- Allow websites when a rating error occurs on page 1148
- Rate URLs by domain and IP address on page 1149
- Block invalid URLs on page 1149
Security Profiles

Block malicious URLs discovered by FortiSandbox

This setting blocks malicious URLs that FortiSandbox finds. Your FortiGate must be connected to a registered FortiSandbox.

For information on configuring FortiSandbox, see Using FortiSandbox post-transfer scanning with antivirus on page 1113 and Using FortiSandbox inline scanning with antivirus on page 1115.

To block malicious URLs discovered by FortiSandbox in the GUI:

1. Go to Security Profiles > Web Filter and click Create New, or edit an existing profile.
2. In the Static URL Filter section, enable Block malicious URLs discovered by FortiSandbox.
3. Click OK.

To block malicious URLs discovered by FortiSandbox in the CLI:

```fortios
config webfilter profile
   edit "webfilter"
   config web
      set blocklist enable
   end
   next
end
```

Allow websites when a rating error occurs

If you do not have a FortiGuard license, but you have enabled services that need a FortiGuard license (such as FortiGuard filter), then you will get a rating error message.

Use this setting to allow access to websites that return a rating error from the FortiGuard Web Filter service.

To allow websites with rating errors in the GUI:

1. Go to Security Profiles > Web Filter and click Create New, or edit an existing profile.
2. In the Rating Options section, enable Allow websites when a rating error occurs.
3. Click OK.

To allow websites with rating errors in the CLI:

```fortios
config webfilter profile
   edit "webfilter"
   config ftgd-wf
      set options error-allow
   end
   next
end
```
Rate URLs by domain and IP address

If you enable this setting, in addition to only sending domain information to FortiGuard for rating, the FortiGate always sends both the URL domain name and the TCP/IP packet's IP address (except for private IP addresses) to FortiGuard for the rating.

The FortiGuard server might return a different category of IP address and URL domain. If they are different, the FortiGate uses the rating weight of the IP address or domain name to determine the rating result and decision. This rating weight is hard-coded in FortiOS.

For example, if we use a spoof IP of Google as www.irs.gov, the FortiGate will send both the IP address and domain name to FortiGuard to get the rating. We get two different ratings: one is the search engine and portals that belong to the Google IP, the second is the government and legal organizations that belongs to www.irs.gov. Because the search engine and portals rating has a higher weight than government and legal organizations, the traffic is rated as search engine and portals.

To rate URLs by domain and IP address in the GUI:

1. Go to Security Profiles > Web Filter and click Create New, or edit an existing profile.
2. In the Rating Options section, enable Rate URLs by domain and IP address.
3. Click OK.

To rate URLs by domain and IP address in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            set options rate-server-ip
        end
    next
end
```

Block invalid URLs

Use this setting to block websites when their SSL certificate CN field does not contain a valid domain name.

This option also blocks URLs that contains spaces. If there is a space in the URL, it must be written as %20 in the URL path.

To block invalid URLs in the GUI:

1. Go to Security Profiles > Web Filter and click Create New, or edit an existing profile.
2. In the Static URL Filter section, enable Block invalid URLs.
3. Click OK.
To block invalid URLs in the CLI:

```
config webfilter profile
  edit "webfilter"
    set options block-invalid-url
  next
end
```

Advanced filters 2

This topic gives examples of the following advanced filter features:

- Safe search on page 1150
- Restrict YouTube access on page 1151
- Log all search keywords on page 1152
- Restrict Google account usage to specific domains on page 1152
- HTTP POST action on page 1153
- Remove Java applets, ActiveX, and cookies on page 1153

These advanced filters are only available in proxy-based inspection mode.

Safe search

This setting applies to popular search sites and prevents explicit websites and images from appearing in search results.

The supported search sites are:

- Google
- Yahoo
- Bing
- Yandex

To enable safe search in the GUI:

1. Go to Security Profiles > Web Filter and click Create New, or edit an existing profile.
2. In the Search Engines section, enable Enforce ‘Safe Search’ on Google, Yahoo!, Bing, Yandex.
3. Click OK.
To enable safe search in the CLI:

```plaintext
config webfilter profile
  edit "webfilter"
  config web
    set safe-search url header
  end
next
end
```

**Restrict YouTube access**

The *Restrict YouTube access* setting in the video filter profile adds the HTTP header `YouTube-Restrict: Strict` or `YouTube-Restrict: Moderate` into the HTTP request when enabled. When YouTube reads this header, it applies the appropriate content restriction based on the selected mode. YouTube Restricted Mode is an optional setting that filters out potentially mature videos while leaving a large number of videos still available (see *Restrict YouTube content available to users* and *Manage your organization's YouTube settings* for more information). Google defines the restricted YouTube access modes as follows:

- **Strict Restricted YouTube access**: this setting is the most restrictive. Strict Restricted Mode does not block all videos, but works as a filter to screen out many videos based on an automated system, while leaving some videos still available for viewing.
- **Moderate Restricted YouTube access**: this setting is similar to Strict Restricted Mode but makes a much larger collection of videos available.

**To restrict YouTube access in the GUI:**

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Restrict YouTube Access* and select either *Strict* or *Moderate*.

![Web Filter Profile](image)

3. Click *OK*.

**To restrict YouTube access in the CLI:**

```plaintext
config webfilter profile
  edit <name>
  config web
    set youtube-restrict {none | strict | moderate}
  end
next
end
```

**Vimeo access**

The file filter profile includes a setting to restrict Vimeo access, which can only be configured in the CLI.
Security Profiles

To restrict Vimeo access:

```bash
config webfilter profile
  edit <name>
    config web
      set vimeo-restrict {7 | 134}
    end
  next
end
```

| vimeo-restrict {7 | 134} | Set the Vimeo restriction: |
|-------------------------|----------------------------|
| 7:                      | do not show mature content |
| 134:                    | do not show unrated and mature content |

Log all search keywords

Use this setting to log all search phrases.

To enable logging search keywords in the GUI:

1. Go to Security Profiles > Web Filter and click Create New, or edit an existing profile.
2. In the Search Engines section, enable Log all search keywords.
3. Click OK.

To enable logging search keywords in the CLI:

```bash
config webfilter profile
  edit "webfilter"
    config web
      set log-search enable
    end
  next
end
```

Restrict Google account usage to specific domains

Use this setting to block access to certain Google accounts and services, while allowing access to accounts with domains in the exception list.

To enable Google account restriction:

1. Go to Security Profiles > Web Filter and click Create New, or edit an existing profile.
2. In the Proxy Options section, enable Restrict Google account usage to specific domains.
3. Click the + and enter the domains that Google can access, such as www.fortinet.com.

4. Click OK.

When you try to use Google services like Gmail, only traffic from the domain of www.fortinet.com can go through. Traffic from other domains is blocked.

**HTTP POST action**

Use this setting to select the action to take with HTTP POST traffic. HTTP POST is the command used by the browser when you send information, such as a completed form or a file you are uploading to a web server. The action options are allow or block. The default is allow.

**To configure HTTP POST in the GUI:**

1. Go to Security Profiles > Web Filter and click Create New, or edit an existing profile.
2. In the Proxy Options section, for HTTP POST Action, select Allow or Block.
3. Click OK.

**To configure HTTP POST in the CLI:**

```
config webfilter profile
  edit "webfilter"
    set post-action {normal | block}
  config ftgd-wf
    unset options
  end
next
end
```

**Remove Java applets, ActiveX, and cookies**

Web filter profiles have settings to filter Java applets, ActiveX, and cookies from web traffic. Note that if these filters are enabled, websites using Java applets, ActiveX, and cookies might not function properly.

**To enable these filters in the GUI:**

1. Go to Security Profiles > Web Filter and click Create New, or edit an existing profile, and go to the Proxy Options section.
2. In the Proxy Options section, enabled the filters you want to use: Remove Java Applets, Remove ActiveX, or Remove Cookies.

To enable these filters in the CLI:

```bash
config webfilter profile
    edit "webfilter"
        set options {activexfilter cookiefilter javafilter}
        config ftgd-wf
            unset options
        end
    next
end
```

Web filter statistics

FortiOS provides diagnostics commands to view web filter statistics reports, which are either proxy-based or flow-based. The commands are available in both VDOM and global command lines.

Proxy-based web filter statistics report

Use the `diagnose wad filter vd {<VDOM> | global}` command to filter for per-VDOM or global statistics reports.

In the following example, there are two VDOMs (root and vdom1) using proxy-based policies that have web filter profiles enabled.

To view per-VDOM statistics reports:

```
(global) # diagnose wad filter vd root
Drop unknown session is enabled.

(global) # diagnose wad stats filter list
filtering of vdom root
dlp          = 0
content-type = 0
urls:
    examined = 6
    allowed  = 3
    blocked  = 0
    logged   = 0
    overridden = 0
```
Flow-based web filter statistics report

Use the `diagnose webfilter stats list {<VDOM> | global}` command to check the flow-based web filter statistics.

In the following example, the VDOM is using flow-based policies that have web filter profiles enabled.

To view web filter statistics:

```bash
# diagnose webfilter stats list root
Proxy/flow URL filter stats:
  request: 9474
  blocked: 8606
  allowed: 868
  overridden: 0
  logged: 8606
  pending: 0
```

URL certificate blocklist

As increasing numbers of malware have started to use SSL to attempt to bypass IPS, maintaining a fingerprint-based certificate blocklist is useful to block botnet communication that relies on SSL.

This feature adds a dynamic package that is distributed by FortiGuard and is part of the Web Filtering service. It is enabled by default for SSL/SSH profiles, and can be configured using the following CLI commands:

```bash
config vdom
  edit <vdom>
    config firewall ssl-ssh-profile
      edit "certificate-inspection"
```
Websense Integrated Services Protocol

Websense Integrated Services Protocol (WISP) servers can be used server, which allows the FortiGate to send traffic to the third-party web filtering service for rating and approval checking.

When WISP is enabled, the FortiGate maintains a pool of TCP connections to the WISP server. The TCP connections are used to forward HTTP request information and log information to the WISP server and receive policy decisions.

When a WISP server is used in a web filter profile, in flow or proxy mode, the following web filter scanning priority sequence is used:

1. Local URL filter
2. Websense web filtering service
3. FortiGuard web filtering service

The following example uses a WISP server configured in a flow mode web filter profile.

To use a WISP server in flow mode:

1. Configure the WISP servers:

```plaintext
config web-proxy wisp
edit "wisp1"
set server-ip 10.2.3.4
next
edit "wisp2"
set server-ip 10.2.3.5
next
edit "wisp3"
set server-ip 192.168.1.2
next
edit "wisp4"
set server-ip 192.168.3.4
next
end
```

2. Configure the web filter profile:

```plaintext
config webfilter profile
edit "webfilter_flowbase"
set feature-set flow
config ftgd-wf
unset options
config filters
edit 64
set category 64
set action block
```
Inspecting HTTP3 traffic

HTTP/3 traffic can be inspected on the FortiGate in flow mode inspection.

When using Chrome, the browser may switch the HTTP/3 connection to HTTP/2 when deep inspection is applied, due to its sensitivity to delays caused by deep inspection.

Example

In this example, a web filter profile is created to block the words *Welcome to aioquic*, which appear in a website that uses HTTP/3.

To block content in HTTP/3 traffic:

1. Configure the web filter banned word table:

   ```
   config webfilter content
   edit 1
   set name "aioquic"
   config entries
   edit "Welcome to aioquic"
   set status enable
   next
   end
   end
   ```

2. Apply the banned word table in the web filter profile:
3. Configure the firewall policy:

```plaintext
config firewall policy
edit 1
set utm-status enable
set ssl-ssh-profile "deep-inspection"
set webfilter-profile "flow-webfilter"
set logtraffic all
set nat enable
next
end
```

4. Access the website using a supported HTTP/3 client, such as Chrome or Firefox. The website is blocked by the FortiGate.

---

**Video filter**

With the video filter profile, you can filter YouTube videos based on FortiGuard categories or by channel ID for a more granular override of a single channel, user, or video. The video filter profile is currently supported in proxy-based policies and requires SSL deep inspection. The FortiGuard Video filtering service is based on a valid FortiGuard web filter license.

The following topics provide information about video filters:

- Filtering based on FortiGuard categories on page 1159
- Filtering based on YouTube channel on page 1163
Filtering based on FortiGuard categories

Video filtering is only proxy-based and uses the WAD daemon to inspect the video in four phases:

1. When the WAD receives a video query from a client, it extracts the video ID (vid) and tries to check the category and channel from the local cache.
2. If there is no match from the local cache, it connects to the FortiGuard video rating server to query the video category.
3. If the FortiGuard rating fails, it uses the videofilter.youtube-key to communicate with the Google API server to get its category and channel ID. This is the API query setting and it requires the user’s own YouTube API key string. This configuration is optional.
4. If all steps fail to match the video, the WAD calls on the IPS engine to match the video ID and channel ID from the application signature database.

The FortiGuard anycast service must be enabled to use this feature.

In the following example, a new video filter profile is created to block the Knowledge category.

In the firewall policy settings, the default application control profile is recommended because it blocks QUIC traffic. Many Google services use the QUIC protocol on UDP/443. By blocking QUIC, YouTube will use standard HTTPS TCP/443 connections.

To configure a video filter based on FortiGuard categories in the GUI:

1. Create the video filter profile:
   a. Go to Security Profiles > Video Filter and click Create New.
   b. Enter a name (category_filter).
   c. In the FortiGuard Category Based Filter section, set the Knowledge category Action to Block.
   d. Click OK.
2. Create the firewall policy:
   a. Enter the following:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Incoming Interface</strong></td>
<td>port2</td>
</tr>
<tr>
<td><strong>Outgoing Interface</strong></td>
<td>port1</td>
</tr>
<tr>
<td><strong>Source</strong></td>
<td>All</td>
</tr>
<tr>
<td><strong>Destination</strong></td>
<td>All</td>
</tr>
<tr>
<td><strong>Service</strong></td>
<td>All</td>
</tr>
<tr>
<td><strong>Inspection Mode</strong></td>
<td>Proxy-based</td>
</tr>
<tr>
<td><strong>NAT</strong></td>
<td>Enable</td>
</tr>
<tr>
<td><strong>Video Filter</strong></td>
<td>Enable and select category_filter</td>
</tr>
<tr>
<td><strong>Application Control</strong></td>
<td>Enable and select default</td>
</tr>
<tr>
<td><strong>SSL Inspection</strong></td>
<td>deep-inspection</td>
</tr>
<tr>
<td><strong>Log Allowed Traffic</strong></td>
<td>All Sessions</td>
</tr>
</tbody>
</table>

   b. Configure the other settings as needed and click OK.

To configure a video filter based on FortiGuard categories in the CLI:

1. Create the video filter profile:
   ```
   config videofilter profile
   edit "category_filter"
   config fortiguard-category
   edit 5
   set action block
   set category-id 4
   set log enable
   next
   next
   end
   end
   ```

2. Create the firewall policy:
   ```
   config firewall policy
   edit 10
   set name "client_yt_v4"
   set srcintf "port2"
   set dstintf "port1"
   set srcaddr "all"
   set dstaddr "all"
   set action accept
   set schedule "always"
   set service "ALL"
   set utm-status enable
   set inspection-mode proxy
   set ssl-ssh-profile "deep-inspection"
   set application-list "default"
   ```
set videofilter-profile "category_filter"
  set logtraffic all
  set nat enable
  next
end

To configure the YouTube API key (optional):

cfg videofilter youtube-key
  edit 1
    set key ********
    set status enable
  next
end

Verifying that the video is blocked

When a user browses to YouTube and selects a video based in the Knowledge category, a replacement message will appear. This replacement message says the URL is blocked, and displays the URL of the YouTube video. On the FortiGate, verify the forward traffic and web filter logs.

Sample forward traffic log

2: date=2021-04-27 time=15:27:13 eventtime=16195624334288 tz="-0700" logid="0000000013" type="traffic" subtype="forward" level="notice" vd="vd1" srcip=10.1.100.11 srcport=60628 srcintf="port2" srcintfrole="undefined" dstip=172.217.3.206 dstport=443 dstintf="port1" dstintfrole="undefined" srccountry="Reserved" dstcountry="United States" sessionid=8230 proto=6 action="client-rst" policyid=10 policytype="policy" poluuid="a5e991ba-a799-51eb-4efe-ce32b9f70b75" policymain="client_yt_v4" service="HTTPS" trandisp="snat" transip=172.16.200.1 transport=60628 duration=95 sentbyte=3546 rcvbyte=21653 sentpkt=24 rcvdpkt=34 appcat="unscanned" wanin=2152 wanout=2290 lanin=2000 lanout=2000 utmaction="block" countweb=3 utmref=65532-0

Sample web filter log

1: date=2021-04-27 time=15:25:37 eventtime=1619562338128550236 tz="-0700" logid="0347013664" type="utm" subtype="webfilter" eventtype="videofilter-category" level="warning" vd="vd1" msg="Video category is blocked." policyid=10 sessionid=8230 srcip=10.1.100.11 dstip=172.217.3.206 srcport=60628 dstport=443 srcintf="port2" srcintfrole="undefined" dstintfrole="undefined" proto=6 service="HTTPS" action="block"
  videoinfosource="Cache" profile="category_filter" videoid="EAyo3_zJj5c" videocategoryid=4 hostname="www.youtube.com" url="https://www.youtube.com/watch?v=EAyo3_zJj5c"

Troubleshooting and debugging

To verify if the FortiGuard video filtering license is valid:

# get system fortiguard
  fortiguard-anycast : enable
  fortiguard-anycast-source: debug
  protocol : https
  port : 443
webfilter-license : Contract
webfilter-expiration: Fri Dec 13 2030

videofilter-license : Contract
videofilter-expiration: Fri Dec 13 2030

The videofilter license should be synchronized with the webfilter license.

To verify the WAD worker is running:

```shell
# diagnose test app wad 1000
Process [0]: WAD manager type=manager(0) pid=232 diagnosis=yes.
Process [1]: type=worker(2) index=0 pid=294 state=running
diagnosis=no debug=enable valgrind=supported/disabled
```

To display and debug video filter cache:

```shell
# diagnose test app wad ?
....
321: Display Video Filter Cache stats.
322: Reset Video Filter Cache stats.
323: Flush Video Filter Cache entries.
324: Display Video Filter module stats.
325: Request category list from Youtube API.
326: Display FTGD agent module stats.
327: Reset FTGD agent module stats.
328: Toggle Video Filter Cache Check.
329: Toggle Video Filter FTGD Query.
330: Toggle Video Filter API Check.
```

To enable real-time WAD debugs:

```shell
# diagnose wad debug enable level verbose
# diagnose wad debug enable category video
# diagnose debug enable
```

Sample output

```
[p:274][s:8754][r:186] wad_http_req_exec_video_filter_check(167): hreq=0x7f1184f288e0, check video filter check videofilter

ctx=0x7f118502d1f8
```
Filtering based on YouTube channel

Video filtering can be configured to filter specific YouTube channels. When a video matches a YouTube channel, the video will take the corresponding action of allow, monitor, or block. Video filtering is only supported in proxy-based inspection mode, and deep inspection must be enabled in the firewall policy.

By default, when the FortiGuard category-based filter and YouTube channel override are used together, a video will be blocked if it matches either category or YouTube channel and the action is set to block.

Identifying the YouTube channel ID

The following table lists how to identify the YouTube channel ID based on different YouTube video URLs formats:

<table>
<thead>
<tr>
<th>Video URL</th>
<th>Channel ID</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://www.youtube.com/channel/">www.youtube.com/channel/</a>&lt;channel-id&gt;</td>
<td>&lt;channel-id&gt; indicates the ID for the channel.</td>
</tr>
<tr>
<td><a href="http://www.youtube.com/user/">www.youtube.com/user/</a>&lt;user-id&gt;</td>
<td>Open the page source and locate:</td>
</tr>
<tr>
<td></td>
<td>&lt;meta itemprop=&quot;channelId&quot; content=&quot;&lt;channel-id&quot;&gt;&quot;</td>
</tr>
<tr>
<td></td>
<td>&lt;channel-id&gt; indicates the channel ID for the user page.</td>
</tr>
<tr>
<td><a href="http://www.youtube.com/watch?v=">www.youtube.com/watch?v=</a>&lt;string&gt;</td>
<td>Open the page source and locate:</td>
</tr>
<tr>
<td></td>
<td>&lt;meta itemprop=&quot;channelId&quot; content=&quot;&lt;channel-id&quot;&gt;&quot;</td>
</tr>
<tr>
<td></td>
<td>&lt;channel-id&gt; indicates the channel ID for the video.</td>
</tr>
</tbody>
</table>
Security Profiles

In a YouTube channel filter profile, the default action is set to monitor when there is no match. Logging is also disabled by default.

```
config videofilter youtube-channel-filter
  edit <id>
    set default-action {block | monitor | allow}
    set log {enable | disable}
  next
end
```

**Example**

In the following example, the Fortinet YouTube channel ID (UCJHo4AuVomwMRzgkA5DQEOA) is blocked, and the video filter is applied to a policy.

To configure a video filter based on a YouTube channel in the GUI:

1. Go to Security Profiles > Video Filter and click Create New.
2. In the Channel override list section, click Create New. The New Channel Override Entry pane opens.
   a. Enter the Channel ID (UCJHo4AuVomwMRzgkA5DQEOA) and for Action, select Block.

   ![New Channel Override Entry](image)

   b. Click OK.
3. Click OK.
4. Create the firewall policy:
   a. Go to Policy & Objects > Firewall Policy and click Create New.
   b. For Inspection Mode, select Proxy-based.
   c. Enable Video Filter and select the profile you created.
Security Profiles

d. For SSL Inspection, select deep-inspection.

e. Configure the other settings as needed and click OK.

To configure a video filter based on a YouTube channel in the CLI:

1. Create the channel filter:

```bash
config videofilter youtube-channel-filter
   edit 1
      set name "channel_filter"
      set default-action monitor
      set log enable
      config entries
         edit 1
            set action block
            set channel-id "UCJHo4AuVomwMRzgkA5DQEOA"
      next
   next
end
```

2. Create the video filter profile:

```bash
config videofilter profile
   edit "channel_filter"
      set youtube-channel-filter 1
   next
end
```

3. Create the firewall policy:

```bash
config firewall policy
   edit 1
      set name "video-filter"
      set srcintf "port2"
      set dstintf "port1"
      set srcaddr "all"
      set dstaddr "all"
      set action accept
      set schedule "always"
```
Security Profiles

set service "ALL"
set utm-status enable
set inspection-mode proxy
set ssl-ssh-profile "deep-inspection"
set videofilter-profile "channel_filter"
set nat disable
next
end

DNS filter

You can apply DNS category filtering to control user access to web resources. You can customize the default profile, or create your own to manage network user access and apply it to a firewall policy, or you can add it to a DNS server on a FortiGate interface. For more information about configuring DNS, see DNS on page 202.

DNS filtering has the following features:

- FortiGuard Filtering: filters the DNS request based on the FortiGuard domain rating.
- Botnet C&C domain blocking: blocks the DNS request for the known botnet C&C domains.
- External dynamic category domain filtering: allows you to define your own domain category.
- DNS safe search: enforces Google, Bing, and YouTube safe addresses for parental controls.
- Local domain filtering: allows you to define your own domain list to block or allow.
- External IP block list: allows you to define an IP block list to block resolved IPs that match this list.
- DNS translation: maps the resolved result to another IP that you define.

Some DNS filter features require a subscription to FortiGuard Web Filtering.

DNS filtering connects to the FortiGuard secure DNS server over anycast by default. For more information about this configuration, see DNS over TLS and HTTPS on page 214.

The IPS engine handles the DNS filter in flow mode policies and queries the FortiGuard web filter server for FortiGuard categories. In proxy mode, the DNS proxy daemon handles the DNS filter and queries the FortiGuard SDNS server for FortiGuard categories. When a DNS filter profile is enabled in `config system dns-server`, the DNS proxy daemon handles the traffic.

DNS filter profiles cannot be used in firewall policies when the FortiGate is in NGFW policy-based mode; see NGFW policy on page 773 for more information. They can be used in the DNS server; see FortiGate DNS server on page 206 for more information.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 1168), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 1185).
DNS filter behavior in proxy mode

In cases where the DNS proxy daemon handles the DNS filter (described in the preceding section) and if DNS caching is enabled (this is the default setting), then the FortiGate will respond to subsequent DNS queries using the result in the DNS cache and will not forward these queries to a real DNS server.

There are two options to disable this behavior:

- Disable DNS caching globally.
- Remove the DNS filter profile from the proxy mode firewall policy or from the DNS server configured on a FortiGate interface.

To disable DNS caching globally:

```
config system dns
  set dns-cache-limit 0
end
```

There will be a performance impact to DNS queries since each query will not be cached, and will be forwarded to a real DNS server.

FortiGuard DNS rating service

DNS over TLS connections to the FortiGuard secure DNS server is supported. The CLI options are only available when `fortiguard-anycast` is enabled. DNS filtering connects to the FortiGuard secure DNS server over anycast by default.

To configure DoT to the secure DNS server in the CLI:

```
config system fortiguard
  set fortiguard-anycast enable
  set fortiguard-anycast-source fortinet
  set anycast-dns-server-ip 0.0.0.0
  set anycast-dns-server-port 853
end
```

The following topics provide information about DNS filters:

- Configuring a DNS filter profile on page 1168
- FortiGuard category-based DNS domain filtering on page 1170
- Botnet C&C domain blocking on page 1173
- DNS safe search on page 1177
- Local domain filter on page 1179
- DNS translation on page 1182
- Applying DNS filter to FortiGate DNS server on page 1185
- DNS inspection with DoT and DoH on page 1186
- Troubleshooting for DNS filter on page 1190
Configuring a DNS filter profile

Once a DNS filter is configured, it can be applied to a firewall policy. This example scans DNS traffic traversing the FortiGate.

When a FortiGate DNS server has been configured, refer to the steps in Applying DNS filter to FortiGate DNS server on page 1185.

To configure DNS Filter profile in the GUI:

1. Go to Security Profiles > DNS Filter and click Create New, or edit an existing profile.
2. Configure the settings as needed.

3. Click OK.

To create or configure DNS Filter profile in the CLI:

```
config dnsfilter profile
   edit "demo"
      set comment ''
      config domain-filter
         unset domain-filter-table
      end
   config ftgd-dns
      set options error-allow
      config filters
         edit 2
            set category 2
            set action monitor
         next
         edit 7
            set category 7
            set action block
         next
      ...
```
edit 22
    set category 0
    set action monitor
next
end
end
set log-all-domain enable
set sdns-ftgd-err-log enable
set sdns-domain-log enable
set block-action redirect
set block-botnet enable
set safe-search enable
set redirect-portal 93.184.216.34
set youtube-restrict strict
next
end

To apply DNS Filter profile to the policy in the GUI:

1. Go to Policy & Objects > Firewall Policy and click Create New, or edit an existing policy.
2. In the Security Profiles section, enable DNS Filter and select the DNS filter.

3. Configure the other settings as needed.
4. Click OK.

To apply DNS Filter profile to the policy in the CLI:

config firewall policy
    edit 1
        set name "Demo"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set logtraffic all
        set fsso disable
Security Profiles

set dnsfilter-profile "demo"
set profile-protocol-options "default"
set ssl-ssh-profile "deep-inspection"
set nat enable
next
dnsfilter-profile: "demo"
end

DNS filter behavior in proxy mode

In cases where the DNS proxy daemon handles the DNS filter (described in DNS filter on page 1166) and if DNS caching is enabled (this is the default setting), then the FortiGate will respond to subsequent DNS queries using the result in the DNS cache and will not forward these queries to a real DNS server.

There are two options to disable this behavior:

- Disable DNS caching globally.
- Remove the DNS filter profile from the proxy mode firewall policy or from the DNS server configured on a FortiGate interface.

To disable DNS caching globally:

```plaintext
config system dns
set dns-cache-limit 0
end
```

There will be a performance impact to DNS queries since each query will not be cached, and will be forwarded to a real DNS server.

FortiGuard category-based DNS domain filtering

You can use the FortiGuard category-based DNS domain filter to inspect DNS traffic. This makes use of FortiGuard's continuously updated domain rating database for more reliable protection.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 1168), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 1185).

The FortiGate must have a FortiGuard Web Filter license to use the FortiGuard category-based filter.

To configure FortiGuard category-based DNS domain filtering in the GUI:

1. Go to Security Profiles > DNS Filter and click Create New, or edit an existing profile.
2. Enable FortiGuard Category Based Filter.
3. Select the category and then select Allow, Monitor, or Redirect to Block Portal for that category.
4. In the Options section, select a setting for Redirect Portal IP. Select either Use FortiGuard Default (208.91.112.55) or click Specify and enter another portal IP. The FortiGate will use the portal IP to replace the resolved IP in the DNS
response packet.

5. Click OK.

To configure FortiGuard category-based DNS domain filtering in the CLI:

```
config dnsfilter profile
  edit "demo"
    set comment '
  config domain-filter
    unset domain-filter-table
  end
  config ftgd-dns
    set options error-allow
  config filters
    edit 2
      set category 2
      set action monitor
      next
    edit 7
      set category 7
      set action monitor
      next
    ...
    edit 22
      set category 0
      set action monitor
      set log-all-domain enable
      set sdns-ftgd-err-log enable
      set sdns-domain-log enable
      set block-action {redirect | block}
      set block-botnet enable
```
set safe-search enable
set redirect-portal 93.184.216.34
set youtube-restrict strict
next
end

Verifying the logs

From your internal network PC, use a command line tool, such as dig or nslookup, to do a DNS query for some domains. For example:

#dig www.example.com
;; -->>HEADER<<- opcode: QUERY; status: NOERROR; id: 61252
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 13; ADDITIONAL: 11

;; QUESTION SECTION:
;; www.example.com. IN A

;; ANSWER SECTION:
www.example.com. 17164 IN A 93.184.216.34

;; AUTHORITY SECTION:

To check the DNS filter log in the GUI:

2. Click the DNS Query card name. There are logs for the DNS traffic that just passed through the FortiGate with the FortiGuard rating for the domain name.

To check the DNS filter log in the CLI:

```
# execute log filter category utm-dns

# execute log display
2 logs found.
2 logs returned.
```

1: date=2019-04-05 time=09:39:34 logid="1501054802" type="utm" subtype="dns" eventtype="dns-response" level="notice" vd="vdom1" eventtime=1554482373 policyid=1 sessionid=50868 srcip=10.1.100.18 srport=34308 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16 dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="demo" xid=17647 qname="www.example.com" qtype="A" qtypeval=1 qclass="IN" ipaddr="93.184.216.34" msg="Domain is monitored" action="pass" cat=52 catdesc="Information Technology"

Botnet C&C domain blocking

FortiGuard Service continually updates the botnet C&C domain list. The botnet C&C domain blocking feature can block the botnet website access at the DNS name resolving stage. This provides additional protection for your network.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 1168), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 1185).

To configure botnet C&C domain blocking in the GUI:

1. Go to Security Profiles > DNS Filter and click Create New, or edit an existing profile.
2. Enable Redirect botnet C&C requests to Block Portal.
3. Optionally, click the botnet package link. The Botnet C&C Domain Definitions pane opens, which displays the latest list.
4. Configure the other settings as needed.
5. Click OK.

To configure botnet C&C domain blocking in the CLI:

```plaintext
config dnsfilter profile
  edit "demo"
    set comment ''
    config domain-filter
      unset domain-filter-table
    end
  config ftgd-dns
    set options error-allow
    config filters
      ...
    end
  end
  set log-all-domain enable
  set sdns-ftgd-err-log enable
  set sdns-domain-log enable
  set block-action block
  set block-botnet enable
  set safe-search enable
  set redirect-portal 208.91.112.55
  set youtube-restrict strict
next
end
```

Verifying the logs

Select a botnet domain from that list. From your internal network PC, use a command line tool, such as `dig` or `nslookup`, to send a DNS query to traverse the FortiGate. For example:
The botnet domain query was blocked and redirected to the portal IP (208.91.112.55).

To check the DNS filter log in the GUI:

2. Click the DNS Query card name to view the DNS query blocked as a botnet domain.

To check the DNS filter log in the CLI:

(vdom1) # execute log filter category utm-dns

(vdom1) # execute log display
2 logs found.
2 logs returned.

1: date=2019-04-04 time=16:43:59 logid="1501054601" type="utm" subtype="dns" eventtype="dns-response" level="warning" vd="vdom1" eventtime=1554421439 policyid=1 sessionid=14135 srcip=10.1.100.18 srcport=57447 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16 dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="demo" xid=24339 qname="canind.co" qtype="A" qtypeval=1 qclass="IN" msg="Domain was blocked by dns botnet C&C" action="redirect" botnetdomain="canind.co"

2: date=2019-04-04 time=16:43:59 logid="1500054000" type="utm" subtype="dns" eventtype="dns-query" level="information" vd="vdom1" eventtime=1554421439 policyid=1 sessionid=14135 srcip=10.1.100.18 srcport=57447 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16 dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="demo" xid=24339 qname="canind.co" qtype="A" qtypeval=1 qclass="IN"

Botnet C&C IPDB blocking

FortiOS also maintains a botnet C&C IP address database (IPDB). If a DNS query response IP address (resolved IP address) matches an entry inside the botnet IPDB, this DNS query is blocked by the DNS filter botnet C&C.

To view the botnet IPDB list in the CLI:

(global) # diagnose sys botnet list 9000 10
9000. proto=TCP ip=103.228.28.166, port=80, rule_id=7630075, name_id=3, hits=0
9001. proto=TCP ip=5.9.32.166, port=481, rule_id=4146631, name_id=7, hits=0
9002. proto=TCP ip=91.89.44.166, port=80, rule_id=48, name_id=96, hits=0
9003. proto=TCP ip=46.211.46.166, port=80, rule_id=48, name_id=96, hits=0
9004. proto=TCP ip=77.52.52.166, port=80, rule_id=48, name_id=96, hits=0
9005. proto=TCP ip=98.25.53.166, port=80, rule_id=48, name_id=96, hits=0
9006. proto=TCP ip=70.120.67.166, port=80, rule_id=48, name_id=96, hits=0
9007. proto=TCP ip=85.253.77.166, port=80, rule_id=48, name_id=96, hits=0
9008. proto=TCP ip=193.106.81.166, port=80, rule_id=48, name_id=96, hits=0
9009. proto=TCP ip=58.13.84.166, port=80, rule_id=48, name_id=96, hits=0

Select an IP address from the IPDB list and use a reverse lookup service to find its corresponding domain name. From your internal network PC, use a command line tool, such as `dig` or `nslookup`, to query this domain and verify that it is blocked by the DNS filter botnet C&C. For example:

```
# dig cpe-98-25-53-166.sc.res.rr.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 35135
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; cpe-98-25-53-166.sc.res.rr.com. IN A

;; ANSWER SECTION:
cpe-98-25-53-166.sc.res.rr.com. 60 IN A 208.91.112.55
```

Since the resolved IP address matches the botnet IPDB, the query was blocked and redirected to the portal IP (208.91.112.55).

To check the DNS filter log in the GUI:

1. Go to Log & Report > DNS Query to view the DNS query blocked by botnet C&C IPDB.

<table>
<thead>
<tr>
<th>Date/Time</th>
<th>Sub Type</th>
<th>Source</th>
<th>Domain Name</th>
<th>Query Type</th>
<th>Policy</th>
<th>Message</th>

<td>A</td>
<td>1</td>
<td>Domain was blocked by dns botnet C&amp;C</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To check the DNS filter log in the CLI:

```
(global) # execute log filter category utm-dns
2 logs found.
2 logs returned.

1: date=2019-04-05 time=11:06:48 logid="1501054600" type="utm" subtype="dns" eventtype="dns-response" level="warning" vd="vdom1" eventtime=1554487606 policyid=1 sessionid=55232 srcip=10.1.100.18 srccport=60510 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16 dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="demo" xid=16265 qname="cpe-98-25-53-166.sc.res.rr.com" qtype="A" qtypeval=1 qclass="IN" ipaddr="93.184.216.34" msg="Domain was blocked by dns botnet C&C" action="redirect" botnetip=98.25.53.166
```

```
2: date=2019-04-05 time=11:06:48 logid="1500054000" type="utm" subtype="dns" eventtype="dns-query" level="information" vd="vdom1" eventtime=1554487606 policyid=1 sessionid=55232
```
To check botnet activity:

1. Go to Dashboard > Status and locate the Botnet Activity widget.

2. If you do not see the widget, click Add Widget, and add the Botnet Activity widget.

DNS safe search

The DNS safe search option helps avoid explicit and inappropriate results in the Google, Bing, and YouTube search engines. The FortiGate responds with content filtered by the search engine.

For individual search engine safe search specifications, refer to the documentation for Google, Bing, and YouTube.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 1168), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 1185).

To configure safe search in the GUI:

1. Go to Security Profiles > DNS Filter and click Create New, or edit an existing profile.
2. Enable Enforce ‘Safe search’ on Google, Bing, YouTube.
3. For Restrict YouTube Access, click Strict or Moderate.
4. Configure the other settings as needed.
5. Click OK.

To configure safe search in the CLI:

```
config dnsfilter profile
edit "demo"
```
config ftgd-dns
  set options error-allow
  config filters
    edit 2
      set category 2
      next
      ...
    end
  end
  set log-all-domain enable
  set block-botnet enable
  set safe-search enable
  set youtube-restrict strict
  next
end

Verifying the logs

From your internal network PC, use a command line tool, such as dig or nslookup, and perform a DNS query on www.bing.com. For example:

```bash
# dig www.bing.com
;; -<<HEADER<<- opcode: QUERY; status: NOERROR; id: 46568
;; Flags: qr rd ra; QUERY: 1; ANSWER: 2; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:

;; ANSWER SECTION:
www.bing.com. 103 IN A
strict.bing.com. 103 IN CNAME strict.bing.com

;; Received 67 B
;; Time 2019-04-05 14:34:52 PDT
;; From 172.16.95.16@53(UDP) in 196.0 ms
```

The DNS query for www.bing.com returns with a CNAME strict.bing.com, and an A record for the CNAME. The user's web browser then connects to this address with the same search engine UI, but any explicit content search is filtered out.

To check the DNS filter log in the GUI:

2. Click the DNS Query card name.

The DNS filter log in FortiOS shows a message of DNS Safe Search enforced.

To check the DNS filter log in the CLI:

```bash
# execute log filter category utm-dns
# execute log display
2 logs found.
2 logs returned.
```
Local domain filter

In addition to the FortiGuard category-based domain filter, you can define a local static domain filter to allow or block specific domains.

In a DNS filter profile, the local domain filter has a higher priority than FortiGuard category-based domain filter. DNS queries are scanned and matched first with the local domain filter. If an entry matches and the local filter action is set to block, then that DNS query is blocked and redirected.

If the local domain filter list has no match, then the FortiGuard category-based domain filter is used. If a DNS query domain name rating belongs to the block category, the query is blocked and redirected. If the FortiGuard category-based filter has no match, then the original resolved IP address is returned to the client DNS resolver.

If the local domain filter action is set to allow and an entry matches, it will skip the FortiGuard category-based domain filter and directly return to the client DNS resolver. If the local domain filter action is set to monitor and an entry matches, it will go to the FortiGuard category-based domain filter for scanning and matching.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 1168), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 1185).

To configure the local domain filter in the GUI:

1. Go to Security Profiles > DNS Filter and click Create New, or edit an existing profile.
2. In the Static Domain Filter section, enable Domain Filter.
3. Click Create New. The Create Domain Filter pane opens.
4. Enter a domain, and select a Type and Action. This example has three filters:

<table>
<thead>
<tr>
<th>Domain</th>
<th>Type</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://www.fortinet.com">www.fortinet.com</a></td>
<td>Simple</td>
<td>Allow</td>
</tr>
<tr>
<td>*.example.com</td>
<td>Wildcard</td>
<td>Redirect to Block Portal</td>
</tr>
<tr>
<td>google</td>
<td>Reg. Expression</td>
<td>Monitor</td>
</tr>
</tbody>
</table>
5. Click OK. The entry appears in the table.

6. Configure the other settings as needed.

7. Click OK.

**To configure the local domain filter in the CLI:**

```plaintext
config dnsfilter domain-filter
  edit 1
    set name "demo"
    set comment ''
    config entries
      edit 1
        set domain "www.fortinet.com"
        set type simple
        set action allow
        set status enable
        next
      edit 2
        set domain "*.example.com"
        set type wildcard
        set action block
        set status enable
        next
      edit 3
        set domain "google"
        set type regex
        set action monitor
        set status enable
      next
    end
next
end
```
Wildcard entries are converted to regular expressions by FortiOS. As a result, wildcards will match any suffix, as long as there is a word boundary following the search term.

For example:

```
config entries
  edit 1
    set domain "*.host"
    set type wildcard
  next
end
```

Will match `wp36.host` and `wp36.host.pressdns.com`, but not `wp36.host123.pressdns.com`.

To avoid this, use an explicit regular expression search string:

```
config entries
  edit 1
  set domain "^.*\\.host$"
  set type regexp
  next
end
```

To check the DNS filter log in the GUI:

2. Click the DNS Query card name.

<table>
<thead>
<tr>
<th>Date/Time</th>
<th>Sub Type</th>
<th>Source</th>
<th>Domain Name</th>
<th>Query Type</th>
<th>Policy</th>
<th>Message</th>
<th>Domain Filter List</th>
<th>Category</th>
<th>Category Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2019/04/05 15:37:06</td>
<td>dns</td>
<td>10.1.100.18</td>
<td><a href="http://www.google.com">www.google.com</a></td>
<td>A</td>
<td>1</td>
<td>Domain belongs to a denied category in policy</td>
<td>41</td>
<td>Search Engines and Portals</td>
<td></td>
</tr>
<tr>
<td>2019/04/05 15:37:06</td>
<td>dns</td>
<td>10.1.100.18</td>
<td><a href="http://www.google.com">www.google.com</a></td>
<td>A</td>
<td>1</td>
<td>Domain was blocked because it is in the domain-filter list: demo</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Since the local domain filter for `google` is set to monitor, it is blocked by the FortiGuard category-based domain filter because the policy action is deny.

To check the DNS filter log in the CLI:

```
# execute log filter category utm-dns
# execute log display
```

```
7: date=2019-04-05 time=15:37:06 logid="1501054803" type="utm" subtype="dns" eventtype="dns-response" level="warning" vd="vdom1" eventtime=1554503826 policyid=1 sessionid=69132 srcip=10.1.100.18 srcport=49832 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16 dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="demo" xid=4612 qname="www.google.com" qtype="A" qtypeval=1 qclass="IN" ipaddr="208.91.112.55" msg="Domain belongs to a denied category in policy" action="redirect" cat=41 catdesc="Search Engines and Portals"
```

```
8: date=2019-04-05 time=15:37:06 logid="1500054000" type="utm" subtype="dns" eventtype="dns-query" level="information" vd="vdom1" eventtime=1554503826 policyid=1 sessionid=69132 srcip=10.1.100.18 srcport=49832 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16```

**DNS translation**

This setting allows you to translate a DNS resolved IP address to another IP address you specify on a per-policy basis.

For example, website A has a public address of 1.2.3.4. However, when your internal network users visit this website, you want them to connect to the internal host 192.168.3.4. You can use DNS translation to translate the DNS resolved address 1.2.3.4 to 192.168.3.4. Reverse use of DNS translation is also applicable. For example, if you want a public DNS query of your internal server to get a public IP address, then you can translate a DNS resolved private IP to a public IP address.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 1168), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 1185).

**Sample configuration**

This configuration forces the DNS filter profile to translate 93.184.216.34 (www.example.com) to 192.168.3.4. When internal network users perform a DNS query for www.example.com, they do not get the original www.example.com IP address of 93.184.216.34. Instead, it is replaced with 192.168.3.4.

To configure DNS translation in the GUI:

1. Go to Security Profiles > DNS Filter and click Create New, or edit an existing profile.
2. In the Static Domain Filter section, enable DNS Translation.
3. Click *Create New*. The *New DNS Translation* pane opens.

4. Enter the *Original Destination* (the domain's original IP address), the *Translated Destination* IP address, and the *Network Mask*.

5. Click *OK*. The entry appears in the table.

6. Configure the other settings as needed.

7. Click *OK*.

To configure DNS translation in the CLI:

```
config dnsfilter profile
  edit "demo"
    set comment ''
    ...  
  config dns-translation
    edit 1
      set src 93.184.216.34
      set dst 192.168.3.4
      set netmask 255.255.255.255
    next
  end
  set redirect-portal 0.0.0.0
  set redirect-portal6 ::
  set youtube-restrict strict
next
end
```
To check DNS translation using a command line tool before DNS translation:

```bash
# dig www.example.com
;; -->>HEADER<<- opcode: QUERY; status: NOERROR; id: 27030
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.example.com.

;; ANSWER SECTION:
www.example.com. 33946 IN A 93.184.216.34

;; AUTHORITY SECTION:

;; From 172.16.95.16@53(UDP) in 0.5 ms

DNS translation network mask

The following is an example of DNS translation that uses a network mask:

To configure DNS translation in the CLI:

```bash
config dns-translation
edit 1
    set src 93.184.216.34
    set dst 1.2.3.4
    set netmask 255.255.224.0
next
end
```
To check DNS translation using a command line tool after DNS translation:

# dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 6736
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.example.com.

;; ANSWER SECTION:
www.example.com. 29322 IN A 1.2.24.34

;; AUTHORITY SECTION:
example.com. 13954 IN NS a.iana-servers.net.
example.com. 13954 IN NS b.iana-servers.net.

;; Received 97 B
;; Time 2019-04-08 12:04:30 PDT
;; From 172.16.95.16@53(UDP) in 2.0 ms

The binary arithmetic to convert 93.184.216.34 to 1.2.3.4 with the subnet mask is as follows:

1. AND src(Original IP) with negative netmask (93.184.216.34 & ~255.255.224.0):

   01011101.10111000.11011000.00100010 93.184.216.34
   00000000.00000000.00000000.00000000 ~255.255.224.0
   ----------------------------------------------- &
   00000000.00000000.00000000.00000000 0.0.24.34

2. AND dst(Translated IP) with netmask:

   00000001.00000010.00000011.00000100 1.2.3.4
   11111111.11111111.11110000.00000000 255.255.224.0
   ----------------------------------------------- &
   00000001.00000010.00000000.00000000 1.2.0.0

3. Final step 2 bitwise-OR 3:

   00000000.00000000.00011000.00100010 0.0.24.34
   00000001.00000010.00000000.00000000 1.2.0.0
   ----------------------------------------------- |
   00000001.00000010.00011000.00100010 1.2.24.34

Applying DNS filter to FortiGate DNS server

You can configure a FortiGate as a DNS server in your network. When you enable DNS service on a specific interface, the FortiGate will listen for DNS service on that interface.

Depending on the configuration, DNS service works in three modes: Recursive, Non-Recursive, or Forward to System DNS (server). For details on how to configure the FortiGate as a DNS server and configure the DNS database, see FortiGate DNS server on page 206.

You can apply a DNS filter profile to Recursive and Forward to System DNS mode. This is the same as the FortiGate working as a transparent DNS proxy for DNS relay traffic.
To configure DNS service in the GUI:

1. Go to Network > DNS Servers (if this option is not available, go to System > Feature Visibility and enable DNS Database).
2. In the DNS Service on Interface section, click Create New and select an Interface from the dropdown.
3. For Mode, select Forward to System DNS.
4. Enable DNS Filter and select a profile from the dropdown.
5. Click OK.

To configure DNS service in the CLI:

```
config system dns-server
  edit "port10"
    set mode forward-only
    set dnsfilter-profile "demo"
  next
end
```

To check DNS service with a DNS filter profile using a command line tool:

In this example, port10 is enabled as a DNS service with the DNS filter profile demo. The IP address of port10 is 10.1.100.5, and the DNS filter profile is configured to block category 52 (information technology). From your internal network PC, use a command line tool, such as dig or nslookup, to perform a DNS query. For example:

```
# dig @10.1.100.5 www.fortinet.com
;;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 52809
;;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.fortinet.com. IN A

;; ANSWER SECTION:
www.fortinet.com. 60 IN A 208.91.112.55

;; Received 50 B
;; Time 2019-04-08 14:36:34 PDT
;; From 10.1.100.5@53(UDP) in 13.6 ms
```

The relay DNS traffic was filtered based on the DNS filter profile configuration. It was blocked and redirected to the portal IP (208.91.112.55).

DNS inspection with DoT and DoH

DNS over TLS (DoT) and DNS over HTTPS (DoH) are supported in DNS inspection. Prior to 7.0, DoT and DoH traffic silently passes through the DNS proxy. In 7.0, the WAD is able to handle DoT and DoH, and redirect DNS queries to the
Security Profiles

DNS proxy for further inspection.

In the following examples, the FortiGate inspects DNS queries made over DoT and DoH to a Cloudflare DNS server. The DNS filter profile blocks the education category.

To configure DNS inspection of DoT and DoH queries in the GUI:

1. Configure the SSL-SSH profile:
   a. Go to Security Profiles > SSL/SSH Inspection and click Create New.
   b. Set Inspection method to Full SSL Inspection. DoT and DoH can only be inspected using doing deep inspection.
   c. In the Protocol Port Mapping section, enable DNS over TLS.
d. Configure the other settings as needed.
e. Click OK.

2. Configure the DNS filter profile:
   a. Go to Security Profiles > DNS Filter and click Create New.
   b. Enable Redirect botnet C&C requests to Block Portal.
   c. Enable FortiGuard Category Based Filter and set the Action for the Education category to Redirect to Block Portal.
   d. Configure the other settings as needed.
   e. Click OK.

3. Configure the firewall policy:
   a. Go to Policy & Objects > Firewall Policy and click Create New.
   b. Enable DNS Filter and select the profile you created.
   c. For SSL Inspection, select the profile you created.
   d. Configure the other settings as needed.
   e. Click OK.

To configure DNS inspection of DoT and DoH queries in the CLI:

1. Configure the SSL-SSH profile:

```bash
config firewall ssl-ssh-profile
edit "ssl"
   config dot
      set status deep-inspection
      set client-certificate bypass
      set unsupported-ssl-cipher allow
      set unsupported-ssl-negotiation allow
      set expired-server-cert block
      set revoked-server-cert block
      set untrusted-server-cert allow
      set cert-validation-timeout allow
      set cert-validation-failure block
   end
next
end
```

2. Configure the DNS filter profile:

```bash
config dnsfilter profile
edit "dnsfilter"
   config ftgd-dns
      config filters
         edit 1
            set category 30
            set action block
         next
      end
   set block-botnet enable
next
end
```
3. Configure the firewall policy:

```plaintext
config firewall policy
edit 1
    set srcintf "port1"
    set dstintf "port3"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set profile-protocol-options "protocol"
    set ssl-ssh-profile "ssl"
    set webfilter-profile "webfilter"
    set dnsfilter-profile "dnsfilter"
    set nat enable
next
end
```

**Testing the connection**

**To query DNS over TLS:**

1. Send a DNS query over TLS to the Cloudflare server 1.1.1.1 (this example uses `kdig` on an Ubuntu client). The `www.ubc.ca` domain belongs to the education category:

```plaintext
~$ kdig -d @1.1.1.1 +tls-ca +tls-host=cloudflare-dns.com www.ubc.ca
;; DEBUG: Querying for owner(www.ubc.ca.), class(1), type(1), server(1.1.1.1), port (853), protocol(TCP)
;; DEBUG: TLS, imported 128 system certificates
;; DEBUG: TLS, received certificate hierarchy:
;; DEBUG: #1, C=US,ST=California,L=San Francisco,O=Cloudflare, Inc.,CN=cloudflare-dns.com
;; DEBUG: SHA-256 PIN: elpYcnCs9ZtkQBI4+cb2QzZcy015UI9jMkSvVtTad0=
;; DEBUG: #2, C=US,ST=California,L=Sunnyvale,O=Fortinet,OU=Certificate Authority,CN=FG3H1E5818903681,EMAIL=support@fortinet.com
;; DEBUG: SHA-256 PIN: s48VtdOD1NZfAG2g/92hMLhitU51qsP9pkHAUTJE+f4=
;; DEBUG: TLS, skipping certificate PIN check
;; DEBUG: TLS, The certificate is trusted.
;; TLS session (TLS1.3)-(ECDHE-SECP256R1)-(ECDSA-SECP256R1-SHA256)-(AES-256-GCM)
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 56850
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.ubc.ca. IN A

;; ANSWER SECTION:
www.ubc.ca. 60 IN A 208.91.112.55

;; Received 44 B
;; Time 2021-03-12 06:53:37 UTC
;; From 1.1.1.10853(TCP) in 6.0 ms
```
In this query, the FortiGate inspects the DNS query to the Cloudflare DNS server. It replaces the result with the IP of the FortiGuard block page, which successfully blocks the query.

To query DNS over HTTPS:

1. In your browser, enable DNS over HTTPS.
2. Go to www.ubc.ca. The website is redirected to the block page.

Troubleshooting for DNS filter

If you have trouble with the DNS filter profile in your policy, start with the following troubleshooting steps:

- Check the connection between the FortiGate and FortiGuard DNS rating server (SDNS server).
- Check that the FortiGate has a valid FortiGuard web filter license.
- Check the FortiGate DNS filter configuration.

Checking the connection between the FortiGate and FortiGuard SDNS server

You need to ensure the FortiGate can connect to the FortiGuard SDNS server. By default, the FortiGate uses UDP port 53 to connect to the SDNS server.

To check the connection between the FortiGate and SDNS server:

1. Verify the FortiGuard SDNS server information:

   ```
   # diagnose test application dnsproxy 3
   ...
   FDG_SERVER:208.91.112.220:53
   FGD_CATEGORY_VERSION:8
   SERVER_LDB: gid=6f00, tz=-420, error_allow=0
   FGD_REDIR:208.91.112.55
   ```

   The SDNS server IP address might be different depending on location (in this example, it is 208.91.112.220:53).

2. In the management VDOM, check the communication between the FortiGate and the SDNS server:

   ```
   #execute ping 208.91.112.220
   ```

3. Optionally, you can check the communication using a PC on the internal network (this example uses dig).
   a. Disable the DNS filter profile so that it does not affect your connection check.
   b. Ping your ISP or a public DNS service provider's DNS server, for example, Google's public DNS server of 8.8.8.8:

      ```
      #dig @8.8.8.8 www.fortinet.com
      ```

      Or, specify the SDNS server as a DNS server:

      ```
      #dig @208.91.112.220 www.fortinet.com
      ```
c. Verify that you can get a domain www.fortinet.com A record from the DNS server. This shows that the UDP port 53 connection path is not blocked.

```bash
# dig @8.8.8.8 www.fortinet.com
;; -->>HEADER<<-- opcode: QUERY; status: NOERROR; id: 35121
;; Flags: qr rd ra; QUERY: 1; ANSWER: 3; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
www.fortinet.com. IN A

;; ANSWER SECTION:
fortinet-prod4-858839915.us-west-1.elb.amazonaws.com. 51 IN A 52.8.142.247
fortinet-prod4-858839915.us-west-1.elb.amazonaws.com. 51 IN A 13.56.55.78

;; Received 129 B
;; Time 2019-04-29 14:13:18 PDT
;; From 8.8.8.8@53(UDP) in 13.2 ms
```

Checking the FortiGuard DNS rating service license

The FortiGuard DNS rating service shares the license with the FortiGuard web filter, so you must have a valid web filter license for the DNS rating service to work. While the license is shared, the DNS rating service uses a separate connection mechanism from the web filter rating.

To check the DNS rating service license in the CLI:

1. View the DNS settings:

   ```bash
   # diagnose test application dnsproxy 3
   ```

2. Look for the `FGD_DNS_SERVICE_LICENSE` line and check that the license has not expired:

   ```plaintext
   FGD_DNS_SERVICE_LICENSE:
   server=208.91.112.220:53, expiry=2022-10-03, expired=0, type=2
   ```

3. Check the `sdns-server` lines to show the functioning servers:

   ```plaintext
   sdns-server:208.91.112.220:53 tz=-480 tls=0 req=0 to=0 res=0 rt=4 ready=1 timer=0
   probe=0 failure=0 last_failed=0
   ```

Checking the FortiGate DNS filter profile configuration

To check the DNS filter profile configuration:

1. In FortiOS, create a local domain filter and set the Action to Redirect to Block Portal (see Local domain filter on page 1179).

2. Apply this DNS filter profile to the policy.

3. From the client PC, perform a DNS query on this domain. If you get the profile’s redirected portal address, this means that the DNS filter profile works as expected.
Additional troubleshooting

Use `diagnose test application dnsproxy <test level>` to troubleshoot further DNS proxy information, where:

<table>
<thead>
<tr>
<th>Test level</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Clear DNS cache</td>
</tr>
<tr>
<td>2</td>
<td>Show statistics</td>
</tr>
<tr>
<td>3</td>
<td>Dump DNS setting</td>
</tr>
<tr>
<td>4</td>
<td>Reload FQDN</td>
</tr>
<tr>
<td>5</td>
<td>Requery FQDN</td>
</tr>
<tr>
<td>6</td>
<td>Dump FQDN</td>
</tr>
<tr>
<td>7</td>
<td>Dump DNS cache</td>
</tr>
<tr>

</tr>
<tr>
<td>99</td>
<td>Restart the dnsproxy worker</td>
</tr>
</tbody>
</table>

To debug DNS proxy details:

```
#diagnose debug application dnsproxy -1
#diagnose debug {enable | disable}
```

Application control

FortiGates can recognize network traffic generated by a large number of applications. Application control sensors specify what action to take with the application traffic. Application control uses IPS protocol decoders that can analyze network traffic to detect application traffic, even if the traffic uses non-standard ports or protocols. Application control supports traffic detection using the HTTP protocol (versions 1.0, 1.1, and 2.0).
FortiOS includes three preloaded application sensors:

- *default* (monitors all applications)
- *wifi-default* (default configuration for offloading WiFi traffic)
- *block-high-risk*

You can customize these sensors, or you can create your own to log and manage the applications on your network.

Once configured, you can add the application sensor to a firewall policy.

---

This functionality requires a subscription to FortiGuard Application Control.

---

The following topics provide information about application control:

- Basic category filters and overrides on page 1193
- Excluding signatures in application control profiles on page 1196
- Port enforcement check on page 1198
- Protocol enforcement on page 1199
- SSL-based application detection over decrypted traffic in a sandwich topology on page 1201
- Matching multiple parameters on application control signatures on page 1202
- Application signature dissector for DNP3 on page 1204

## Basic category filters and overrides

Once you have created an application sensor, you can define the applications that you want to control. You can add applications and filters using categories, application overrides, and/or filter overrides with designated actions (monitor, allow, block, or quarantine).

### Configuring category filters

Categories allow you to choose groups of signatures based on a category type. Applications belonging to the category trigger the action that is set for the category. For a list of application control categories, refer to the FortiGuard Labs website.
To configure category filters in the GUI:

1. Go to Security Profiles > Application Control and click Create New, or edit an existing sensor.
2. Under Categories, click the icon next to the category name to set the action or view the application signatures.

3. Click OK.

To configure category filters in the CLI:

```bash
config application list
    edit <name>
        config entries
            edit <id>
                set category <id>
                set action {pass | block | reset}
                set log {enable | disable}
            next
        end
    next
end
```

Configuring application and filter overrides

Multiple application signatures can be added for one sensor with a designated action. Filters can be added based on behavior, application category, popularity, protocol, risk, technology, or vendor subtypes.

To configure overrides in the GUI:

1. Go to Security Profiles > Application Control and click Create New, or edit an existing sensor.
2. In the Application and Filter Overrides table, click Create New.
3. Add an application:
   a. For Type, select Application.
   b. Select an Action from the dropdown.
   c. In the Search box, enter an application name and press Enter.
   d. In the search results, select desired the applications (you can select multiple applications) and click Add Selected.
Security Profiles

4. Add a filter:
   a. In the Application and Filter Overrides table, click Create New.
   b. For Type, select Filter.
   c. Select an Action from the dropdown.
   d. In the Filter field, click the +. The Select Entries pane opens, and you can search based on filter subtypes. This example has excessive bandwidth (under behavior) and game (under application category).

5. Click OK.
To configure overrides in the CLI:

```plaintext
config application list
  edit <name>
    config entries
      edit <id>
        set protocols <integer>
        set risk <integer>
        set vendor <id>
        set technology <id>
        set behavior <id>
        set popularity <integer>
        set action {pass | block | reset}
        set log {enable | disable}
      next
    next
  next
end
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>protocols &lt;integer&gt;</td>
<td>Application protocol filter (0 - 47, or all).</td>
</tr>
<tr>
<td>risk &lt;integer&gt;</td>
<td>Risk or impact of allowing traffic from this application to occur (1 - 5; low (1), elevated (2), medium (3), high (4), and critical (5)).</td>
</tr>
<tr>
<td>vendor &lt;id&gt;</td>
<td>Application vendor filter (0 - 25, or all).</td>
</tr>
</tbody>
</table>
| technology <id> | Application technology filter:  
  - all  
  - 0 (network-protocol)  
  - 1 (browser-based)  
  - 2 (client-server)  
  - 4 (peer-to-peer) |
| behavior <id> | Application behavior filter:  
  - all  
  - 2 (botnet)  
  - 3 (evasive)  
  - 5 (excessive bandwidth)  
  - 6 (tunneling)  
  - 9 (cloud) |
| popularity <integer> | Application popularity filter (1 - 5, from least to most popular). |
| action {pass | block | reset} | Pass/block traffic or reset the connection for traffic from this application (default = block). |
| log {enable | disable} | Enable/disable logging for this application list (default = enable). |

### Excluding signatures in application control profiles

In an application control list, the exclusion option allows users to specify a list of applications they wish to exclude from an entry filtered by category, technology, or others. By excluding the signature, the application is no longer processed on...
the entry in which it is excluded, but may match subsequent entries that exist.

**To configure signature exclusion:**

```plaintext
config application list
  edit <name>
    config entries
      edit <id>
        set category <id>
        set exclusion <application id>
        set action {pass | block | reset}
      next
    end
  next
end
```

**Sample configurations**

In the following example, category 23 (social media) is blocked in the entries, and signature 34527 (Instagram) is excluded from this entry. Traffic to Instagram will pass because the signature is removed from entry 1 and the action of other-application-action is set to pass.

**To configure signature exclusion:**

```plaintext
config application list
  edit "test"
    set other-application-action pass
    set unknown-application-action pass
    set other-application-log enable
    set unknown-application-log enable
    config entries
      edit 1
        set category 23
        set exclusion 34527
        set action block
      next
    next
end
```

In the following example, entry 1 is configured so that category 23 (social media) is set to pass and signature 34527 (Instagram) is excluded. In entry 2, application 34527 (Instagram) is blocked, so the traffic to Instagram will be blocked, even though it is excluded in entry 1. Traffic to other signatures in category 23, such as Facebook, will still pass.

**To configure signature exclusion:**

```plaintext
config application list
  edit "test"
    set other-application-action pass
    set unknown-application-action pass
    set other-application-log enable
    set unknown-application-log enable
    config entries
      edit 1
```
Security Profiles

set category 23
set exclusion 34527
set action pass
next
edit 2
set application 34527
set action block
next
next
end
end

In the following example, an explicit proxy is behind the FortiGate with an excluded signature for 107347980 (Proxy.HTTP) and category 6 (proxy) is set to block. The client will allow normal proxy traffic to pass, but it will discard all proxy application traffic (such as KProxy, Tor, and so on).

To configure signature exclusion:

config application list
edit "test"
   set other-application-action pass
   set unknown-application-action pass
   set other-application-log enable
   set unknown-application-log enable
   config entries
      edit 1
      set category 6
      set exclusion 107347980
      set action block
   next
next
end

Port enforcement check

Most networking applications run on specific ports. For example, SSH runs on port 22, and Facebook runs on ports 80 and 443.

If the default network service is enabled in the application control profile, a port enforcement check is done at the application profile level, and any detected application signatures running on the non-standard TCP/IP port are blocked. This means that each allowed application runs on its default port.

To configure port enforcement check:

config application list
edit <name>
   set enforce-default-app-port enable
   config entries
      edit 1
      set application 15896
      set action pass
   next
end
For example, when applying this application control sensor, FTP traffic (application 15896) with the standard port (port 21) is allowed, while the non-standard port (port 2121) is blocked.

**Protocol enforcement**

Protocol enforcement allows you to configure networking services (e.g. FTP, HTTP, HTTPS) on known ports (e.g. 21, 80, 443). For protocols that are not allowlisted under select ports, the IPS engine performs the violation action to block, allow, or monitor that traffic.

This feature can be used in the following scenarios:

- When one protocol dissector confirms the service of network traffic, protocol enforcement can check whether the confirmed service is allowlisted under the server port. If it is not allowlisted, the traffic is considered a violation and IPS can take the action specified in the configuration (block or monitor it).
- When there is no confirmed service for the network traffic, the traffic is considered a service violation if IPS dissectors rule out all of the services enforced under its server port.

In an applicable profile, a default network service list can be created to associate well known ports with accepted services.

In the following example, an application sensor is configured to enforce HTTP on port 80 (block), and DNS on port 53 (monitor).

**To configure protocol enforcement in the GUI:**

1. Go to Security Profiles > Application Control.
2. Create a new application sensor or edit an existing one.
   - Enforcement entries can be created, edited, or deleted to configure network services on certain ports and determine the violation action.
5. Configure the entry for HTTP:
   a. For Port, enter 80.
   b. For Enforced protocols, select HTTP.
   c. For Violation action, select Block.
Security Profiles

6. Configure the entry for DNS:
   a. Click Create New, then for Port, enter 53.
   b. For Enforced protocols, select DNS.
   c. For Violation action, select Monitor.
   d. Click OK.

The entries are displayed in the table.

7. Click OK.

To configure protocol enforcement in the CLI:

```
config application list
  edit "protocol-GUI"
    set other-application-log enable
    set control-default-network-services enable
  config default-network-services
    edit 1
```
SSL-based application detection over decrypted traffic in a sandwich topology

When a FortiGate is sandwiched between SSL encryption and decryption devices, the FortiGate can process the decrypted traffic that passes between those devices. This feature adds support for decrypted traffic in application control. In some pre-defined signatures, the signature is pre-marked with the `require_ssl_di` tag. The `force-inclusion-ssl-di-sigs` option under application list allows users to control the inspection of dissected traffic. When this option is enabled, the IPS engine forces the pre-marked SSL-based signatures to be applied to the decrypted traffic of the respective applications. In the following topology, SSL Proxy 1 handles the client connection and SSL Proxy 2 handles the server connection, leaving the content unencrypted as traffic passes through the FortiGate.

To configure SSL-based application detection over decrypted traffic:

```
config application list
  edit "test"
    set force-inclusion-ssl-di-sigs {enable | disable}
  end
end
```

Example pre-marked SSL-based signature:

```
F-SBID(--vuln_id 15722; --attack_id 42985; --name "Facebook_Chat"; --group im; --protocol tcp; --default_action pass; --revision 4446; --app_cat 23; --vendor 3; --technology 1; --behavior 9; --pop 4; --risk 2; --language "Multiple"; --weight 20; --depend-on 15832; --depend-on 38468; --require_ssl_di "Yes"; --casi 1; --casi 8; --parent 15832; --app_port TCP/443; --severity info; --status hidden; --service http; --flow from_client; --pattern "/pull?"; --context uri; --no_case; --pattern ".facebook.com"; --context host; --no_case; --tag set,Tag.Facebook.Pull; --tag quiet; --scan-range 10m,all; --date 20190301; )
```
All signatures that include the require_ssl_di tag are pre-defined and cannot be customized.

Matching multiple parameters on application control signatures

Application control signatures that support parameters (such as SCADA protocols) can have multiple parameters grouped together and matched at the same time. Multiple application parameter groups can be added to an override. Traffic will be flagged if it matches at least one parameter group.

This example uses the Modbus_Func05.Write.Single.Coil.Validation signature. This is an industrial signature, so ensure that no signatures are excluded:

```plaintext
config ips global
    set exclude-signatures none
end
```

To configure an application sensor with multiple parameters in the GUI:

1. Go to Security Profiles > Application Control and click Create New, or edit an existing sensor.
2. In the Application and Filter Overrides table, click Create New.
5. Click the Selected tab. In the Application Parameters section, click Create New.

6. Edit the parameter values as needed.

7. Click OK.

8. Add more signatures if needed.

9. Click OK.

To configure an application sensor with multiple parameters in the CLI:

```
config application list
  edit "test"
    set other-application-log enable
  config entries
    edit 1
```
set application 48885
config parameters
    edit 1
        config members
            edit 1
                set name "UnitID"
                set value "0:255"
            next
            edit 2
                set name "Address"
                set value "0:65535"
            next

Application signature dissector for DNP3

The DNP3 application signature dissector supports detecting DNP3 traffic that is encapsulated by the RealPort protocol (Net.CX). DNP3 is used in industrial solutions over serial ports, USB ports, printers, and so on. RealPort encapsulation allows transportation of the underlying protocols over TCP/IP. The FortiGate industrial signatures must be enabled to use RealPort.DNP3 signatures:

    config ips global
        set exclude-signatures none
    end

IPS engine version 7.0015 and later supports RealPort.DNP3 dissectors.

Intrusion prevention

Intrusion Prevention System (IPS) detects network attacks and prevents threats from compromising the network, including protected devices. IPS can be in the form of a standalone appliance, or part of the feature set of a Next Generation Firewall (NGFW), such as FortiGate. IPS utilizes signatures, protocol decoders, heuristics (or behavioral monitoring), threat intelligence (such as FortiGuard Labs), and advanced threat detection in order to prevent exploitation of known and unknown zero-day threats. FortiGate IPS is even capable of performing deep packet inspection to scan encrypted payloads in order to detect and prevent threats from attackers.

Networks and devices are often exploited through vulnerabilities. Software vulnerabilities are one such example where a bug or inherent weakness in the code provides attackers an opportunity to gain access to the software. More severe vulnerabilities allow unauthorized access, data leakage, and execution of malicious code. Exploitation of these vulnerabilities can cause damage to the machine and infect others. While the best solution is to patch vulnerabilities as soon as patches are available, IPS signatures offer a solution to detect and block exploitation of many vulnerabilities before they enter the network.

IPS signatures

Fortinet’s solution combines industry-leading threat intelligence from FortiGuard Labs with the FortiGate NGFW to identify the latest threats and prevent them from entering your network. IPS signatures are one such method for delivering the latest protection. FortiGuard Labs uses AI and Machine Learning (ML) to analyze billions of events every day. The FortiGuard Labs research team also proactively performs threat research to discover new vulnerabilities and exploitation, and produces signatures to identify such threats. These IPS signatures are delivered to each FortiGate daily, so that the IPS engine is armed with the latest databases to match the latest threats.

IPS sensors

A FortiGate IPS sensor is a collection of IPS signatures and filters that define the scope of what the IPS engine will scan when the IPS sensor is applied. An IPS sensor can have multiple sets of signatures and/or filters. A set of IPS signatures consists of manually selected signatures, while a set of IPS filters consists of filters based on signature attributes like target, severity, protocol, OS, and application. Each signature has predefined attributes and an action, such as block, allow, monitor (pass), quarantine, and reset. It is also possible to create custom IPS signatures to apply to an IPS sensor.

From the Security Profiles > Intrusion Prevention pane, you can create new IPS sensors and view a list of predefined sensors.

FortiOS includes the following predefined IPS sensors with associated predefined signatures:

<table>
<thead>
<tr>
<th>Predefined IPS sensors</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all_default</td>
<td>Filters all predefined signatures, and sets action to the signature’s default action.</td>
</tr>
<tr>
<td>all_default_pass</td>
<td>Filters all predefined signatures, and sets action to pass/monitor.</td>
</tr>
</tbody>
</table>
### Security Profiles

<table>
<thead>
<tr>
<th>Predefined IPS sensors</th>
<th>Description</th>

<tr>
<td>wifi-default</td>
<td>Filters all predefined signatures with severity of Critical/High/Medium. Sets action to signature’s default action. Used in profile for offloading WiFi traffic.</td>
</tr>
</tbody>
</table>

### DDoS attacks

Besides protecting against threats and exploitation of vulnerabilities, the IPS engine is also responsible for mitigating Denial of Service (DoS) attacks where attackers attempt to bring a service down by flooding the target with traffic from distributed systems. Using anomaly-based defense, FortiGate can detect a variety of L3 and L4 anomalies and take action against these attacks. This can be configured under IPv4 and IPv6 DoS Policies, which is discussed in detail under DoS policy on page 791.

This section contains the following topics:

- Signature-based defense on page 1206
- IPS configuration options on page 1210

This section also provides the following examples about IPS sensors:

- IPS signature filter options on page 1214
- IPS with botnet C&C IP blocking on page 1218
- IPS signatures for the industrial security service on page 1222
- IPS sensor for IEC 61850 MMS protocol on page 1223
- SCTP filtering capabilities on page 1225

### Signature-based defense

Signature-based defense is used against known attacks or vulnerability exploits. These often involve an attacker attempting to gain access to your network. The attacker must communicate with the host in an attempt to gain access, and this communication includes commands or sequences of commands and variables. The IPS signatures include these command sequences, allowing the FortiGate unit to detect and stop the attack.

This section describes the following components used in signature-based defense:

- IPS signatures on page 1207
- Protocol decoders on page 1207
- IPS engine on page 1207
IPS signatures

IPS signatures are the basis of signature-based intrusion prevention. Every attack can be reduced to a particular string of commands or a sequence of commands and variables. Signatures include this information, and FortiGate uses the information to detect and stop attacks.

Signatures also include characteristics about the attack they describe. These characteristics include the network protocol associated with the attack, the vulnerable operating system, and the vulnerable application.

To view the complete list of signatures, go to Security Profiles > IPS Signatures. The list of signatures includes predefined and custom signatures. You can hover over the name of the IPS signature to display a pop-up window that includes an ID number. You can click the ID number to display the FortiGuard page.

Protocol decoders

Before examining network traffic for attacks, the IPS engine uses protocol decoders to identify each protocol appearing in the traffic. Attacks are protocol-specific, so your FortiGate unit conserves resources by looking for attacks only in the protocols used to transmit them. For example, the FortiGate unit will only examine HTTP traffic for the presence of a signature describing an HTTP attack.

IPS engine

Once the protocol decoders separate the network traffic by protocol, the IPS engine examines the network traffic for the attack signatures by using IPS sensors.

IPS sensors

The IPS engine does not examine network traffic for all signatures. The IPS engine examines network traffic for signatures specified in IPS sensors. You must first create an IPS sensor, and then you can specify what signatures the IPS sensor will use. You can add individual signatures to IPS sensors, or you can add filters to IPS sensors, and the filters automatically include the applicable signatures.

To view IPS sensors, go to Security Profiles > Intrusion Prevention. To create a new sensor, click Create New.
An IPS sensor is composed of IPS signatures and filters. Under IPS Signatures and Filters, click Create New to create a set of IPS signatures or a set of IPS filters.

You can create IPS sensors for specific types of traffic, and then select the IPS sensors in firewall policies designed to handle the same type of traffic. For example, you can specify all of the web-server related signatures in an IPS sensor, and select the IPS sensor in a firewall policy that controls all traffic to and from a web server that is protected by the FortiGate unit.

The FortiGuard Service periodically adds new predefined signatures to counter new threats. New predefined signatures are automatically included in IPS sensors that are configured to use filters when the new signatures match existing filter specifications. For example, if you have an IPS sensor with a filter that includes all signatures for the Windows operating system, your filter will automatically incorporate new Windows signatures that the FortiGuard Service adds to the database.

IPS signature and filter entries are checked from top down. When a signature is found in a set of signatures or filters, the action defined for the signature is taken.

**IPS filters**

IPS sensors can contain one or more IPS filters. A filter is a collection of signature attributes that you specify. The signatures that have all of the attributes specified in a filter are included in the IPS filter.

Following are the attribute groups:

- Target
- Severity
- Protocol
Security Profiles

- OS
- Application

Starting in FortiOS 6.4.2, you can also filter by CVE ID or CVE pattern by using the CLI. See FortiOS 6.4 New Features > IPS signature filter options.

When selecting multiple attributes within the same group, the selections are combined by using a logical OR. When selecting multiple attributes between attribute groups, each attribute group is combined by using a logical AND.

Once you select filters in the GUI, the filtered list of IPS signatures are displayed. Adjust your filters accordingly to construct a suitable list for your needs.

For example, if your FortiGate unit protects a Linux server running the Apache web server software, you could create a new filter to protect it. By setting OS filter attribute to Linux, and the filter attribute Application to Apache, the filter will include only the signatures that apply to both Linux and Apache. If you wanted to scan for all the Linux signatures and all the Apache signatures, you would create two filters, one for each.

To view the filters in an IPS sensor, go to Security Profiles > Intrusion Prevention, select the IPS sensor, and click Edit.

Custom and predefined signature entries

Signature entries allow you to add individual, custom or predefined IPS signatures to an IPS sensor. If you need only one signature, or you want to manually select multiple signatures that don’t fall into the criteria for an IPS filter, adding a signature entry to an IPS sensor is the easiest way. Signature entries are also the only way to include custom signatures in an IPS sensor.

To select an individual signature, click a signature, and select Add Selected. The signature moves to the Selected list.

To select multiple signatures, use the Search bar to perform a keyword search, and then click Add All Results to move all entries to the Selected list.

Overriding the default action

Each IPS signature comes with a default action such as Block and Pass. In some scenarios, you may want to override this action. You can override a set of IPS filter or signatures. By default, a set of IPS filter or signatures has an action of Default, which applies a signature’s default action when the signature is matched. By changing the action, you can override the setting for all signatures within the filter or signature set.
Security Profiles

Policies

You must select an IPS sensor in a security policy or an interface policy to apply the IPS sensor to traffic. An IPS sensor that it not selected in a policy is not applied to network traffic.

IPS configuration options

Besides configuring an IPS filter or selecting IPS signatures for an IPS sensor, you can configure additional IPS options for each sensor or globally for all sensors. This topic introduces the following available configuration options:

- Malicious URL database for drive-by exploits detection on page 1210
- IPS signature rate count threshold on page 1210
- Botnet C&C on page 1211
- Hardware acceleration for flow-based security profiles (NTurbo and IPSA) on page 1211
- Extended IPS database on page 1212
- IPS engine-count on page 1212
- Industrial signature database on page 1212
- Fail-open on page 1213
- IPS buffer size on page 1213
- Session count accuracy on page 1213
- Protocol decoders on page 1213

Malicious URL database for drive-by exploits detection

This feature uses a local malicious URL database on the FortiGate to assist in detection of drive-by exploits, such as adware that allows automatic downloading of a malicious file when a page loads without the user's detection. The database contains all malicious URLs active in the last one month, and all drive-by exploit URLs active in the last three months. The number of URLs controlled are in the one million range.

This feature can be enabled from a IPS Sensor in the GUI by going to Security Profiles > Intrusion Prevention and editing or creating an IPS Sensor. Then enable Block malicious URLs.

From the CLI:

```
config ips sensor
  edit <profile>
    set block-malicious-url [enable | disable]
  next
end
```

Blocking malicious URLs is not supported on some FortiGate models, such as FortiGate 51E, 50E, or 30E.

IPS signature rate count threshold

You can use the IPS signature rate-based settings to specify a rate count threshold that must be met before the signature is triggered. A rate count threshold provides a more controlled recording of attack activity. For example, if
multiple login attempts produce a failed result over a short period of time, then an alert would be sent and traffic might be blocked, which is a more manageable response than sending an alert every time a login fails.

This can be configured from the GUI by going to Security Profiles > Intrusion Prevention. Create or edit an IPS sensor. Within the sensor, edit the IPS signatures and filters. Only IPS signatures have the rate-based settings option. IPS filters do not.

Some settings are only available from CLI.

The syntax for this configuration is as follows:

```
config ips sensor
    edit default
        config entries
            edit <Filter ID number>
                set rule <*id>
                    set rate-count <integer between 1 - 65535>
                    set rate-duration <integer between 1 - 65535>

The value of the rate-duration is an integer for the time in seconds.

set rate-mode <continuous | periodical>

The rate-mode refers to how the count threshold is met.

If the setting is "continuous", and the action is set to block, the action is engaged as soon as the rate-count is reached. For example, if the count is 10, the traffic would be blocked as soon as the signature is triggered 10 times.

If the setting is "periodical", the FortiGate allows up to the value of the rate-count incidents where the signature is triggered during the rate-duration. For example, if the rate count is 100 and the duration is 60, the signature would need to be triggered 100 times in 60 seconds for the action to be engaged.

set rate-track <dest-ip | dhcp-client-mac | dns-domain | none | src-ip>

This setting allows the tracking of one of the protocol fields within the packet.

**Botnet C&C**

See IPS with botnet C&C IP blocking on page 1218.

**Hardware acceleration for flow-based security profiles (NTurbo and IPSA)**

Some FortiGate models support a feature call NTurbo that can offload flow-based firewall sessions to network processors. See also Hardware Acceleration > NTurbo offloads flow-based processing. For IPSA enhanced pattern matching, see Hardware Acceleration > IPSA offloads flow-based advanced pattern matching.

Some FortiGate models also support offloading enhanced pattern matching for flow-based security profiles to CP8 or CP9 content processors. You can use the following command to configure NTurbo and IPSA:

```
config ips global
    set np-accel-mode {none | basic}
    set cp-accel-mode {none | basic | advanced}
end
```

If the np-accel-mode option is available, your FortiGate supports NTurbo. The none option disables NTurbo, and basic (the default) enables NTurbo.
If the `cp-accel-mode` option is available, your FortiGate supports IPSA. The `none` option disables IPSA, and `basic` enables basic IPSA, and `advanced` enables enhanced IPSA, which can offload more types of pattern matching than basic IPSA. The `advanced` option is only available on FortiGate models with two or more CP8 processors, or one or more CP9 processors.

**Extended IPS database**

Some models have access to an extended IPS Database. Because the extended database may affect FortiGate performance, the extended database package may be disabled by default on some models, such as desktop models. You can only enable the extended IPS database by using the CLI.

```
config ips global
   set database extended
end
```

FortiGate models with the CP9 SPU receive the IPS full extended database, and the other physical FortiGate models receive a slim version of the extended database. The slim-extended database is a smaller version of the full extended database that contains top active IPS signatures. It is designed for customers who prefer performance.

Customers with non-CP9 SPU models need to upgrade to a CP9 SPU model (physical FortiGate) in order to get full IPS signature coverage. All FortiGate models 200 (E and F) and higher have a CP9 SPU.

See [Determining the content processor in your FortiGate unit](#) in the FortiOS Hardware Acceleration Guide to check if your device has a CP9 SPU.

**IPS engine-count**

FortiGate units with multiple processors can run one or more IPS engine concurrently. The engine-count CLI command allows you to specify how many IPS engines to use at the same time:

```
config ips global
   set engine-count <int>
end
```

The recommended and default setting is 0, which allows the FortiGate unit to determine the optimum number of IPS engines.

**Industrial signature database**

Industrial signatures are defined to protect Industrial Control Systems (ICS), Operational Technology (OT) and SCADA systems, which are critical infrastructure used by manufacturing industries. These signatures are enabled by default, but can be configured by using the following CLI:

```
config ips global
   set exclude-signatures {none* | industrial}
end
```
**Fail-open**

A fail-open scenario is triggered when IPS raw socket buffer is full. Therefore IPS engine has no space in memory to create more sessions and needs to decide whether to drop the sessions or bypass the sessions without inspection.

```plaintext
config ips global
  set fail-open {enable | disable}
end
```

The default setting is `disable`, so sessions are dropped by IPS engine when the system enters fail-open mode. When enabled, the IPS engine fails open, and it affects all protocols inspected by FortiOS IPS protocol decoders, including but not limited to HTTP, HTTPS, FTP, SMTP, POP3, IMAP, and so on. When the IPS engine fails open, traffic continues to flow without IPS scanning.

Sessions offloaded to Nturbo do not support fail-open. When Nturbo data path is overloaded, traffic is dropped regardless of fail-open setting.

**IPS buffer size**

If system enters fail-open mode frequently, it is possible to increase the IPS socket buffer size to allow more data buffering, which reduces the chances of overloading the IPS engine. You can set the size of the IPS buffer.

```plaintext
config ips global
  set socket-size <int>
end
```

The default socket size and maximum configurable value varies by model. In short, socket-size determines how much data the kernel passes to the IPS engine each time the engine samples packets.

Take caution when modifying the default value. If the socket-size is too large, the higher memory used by the IPS engine may cause the system to enter conserve mode more frequently. If set too low, the system may enter IPS fail-open mode too frequently.

**Session count accuracy**

The IPS engine can track the number of open session in two ways. An accurate count uses more resources than a less accurate heuristic count.

```plaintext
config ips global
  set session-limit-mode {accurate | heuristic}
end
```

The default is `heuristic`.

**Protocol decoders**

The FortiGate Intrusion Prevention system uses protocol decoders to identify the abnormal traffic patterns that do not meet the protocol requirements and standards. For example, the HTTP decoder monitors traffic to identify any HTTP
Security Profiles

packets that do not meet the HTTP protocol standards.

To change the ports a decoder examines, you must use the CLI. In this example, the ports examined by the DNS decoder are changed from the default 53 to 100, 200, and 300.

```plaintext
config ips decoder dns_decoder
    config parameter "port_list"
    set value "100,200,300"
end
end
```

You cannot assign specific ports to decoders that are set to auto by default. These decoders can detect their traffic on any port. Specifying individual ports is not necessary.

**IPS signature filter options**

IPS signature filter options include hold time, CVE pattern, and IPS sensor attributes.

**Hold time**

The hold time option allows you to set the amount of time that signatures are held after a FortiGuard IPS signature update per VDOM. During the holding period, the signature's mode is monitor. The new signatures are enabled after the hold time to avoid false positives.

The hold time can be from 0 days and 0 hours (default) up to 7 days, in the format ##d##h.

**To configure the amount of time to hold and monitor IPS signatures:**

```plaintext
config system ips
    set signature-hold-time 3d12h
    set override-signature-hold-by-id enable
end
```

When a signature that is on hold is matched, the log will include the message `signature is on hold`.

```plaintext
date=2010-07-06 time=00:00:57 logid="0419016384" type="utm" subtype="ips" severity="info" srcip=10.1.100.22 srcountry="Reserved" dstip=172.16.200.55 srcintf="port13" dstintf="undefined" sessionid=3620 action="detected" proto=6 service="HTTP" policyid=1 attack="Eicar.Virus.Test.File" srcport=52170 dstport=80 hostname="172.16.200.55" url="/virus/eicar" direction="incoming" attackid=29844 profile="test" ref="http://www.fortinet.com/ids/VID29844" incidentserialno=25165825 msg="file_transfer: Eicar.Virus.Test.File, (signature is on hold)"
```

**To view signatures being held by rule ID 29844 on the VDOM:**

```plaintext
# diagnose ips signature on-hold vd1 29844
Rule: 29844, attack_id: 58886, last updated: 20170411
Rule: 29844, attack_id: 59517, last updated: 20170411
Rule: 29844, attack_id: 60105, last updated: 20170411
...
To view all help signatures on the VDOM:

```
# diagnose ips on-hold vd1
Rule: 17541, attack_id: 20899, last updated: 20140423
Rule: 17557, attack_id: 20934, last updated: 20140423
Rule: 17559, attack_id: 20932, last updated: 20140423
Rule: 17560, attack_id: 20933, last updated: 20140423
Rule: 17562, attack_id: 20928, last updated: 20170908
Rule: 17677, attack_id: 21187, last updated: 20171106
Rule: 17713, attack_id: 43756, last updated: 20140424
Rule: 17759, attack_id: 21298, last updated: 20140423
...
```

**Viewing on hold information in the GUI**

On hold signatures are grayed out in the GUI with an hourglass icon beside the signature name. A tooltip displays the on hold expiry and other details.

On the **Security Profiles > IPS Signatures** page, for example, the `Adobe.Reader.Annots.api.setProps.Use.After.Free` signature is on hold. Hover over the grayed-out entry to view the tooltip, which includes the action and hold time expiry.

On this page, all on hold signatures are displayed as on hold regardless of whether `override-signature-hold-by-id` is enabled.

![Screenshot of GUI showing on hold signatures]

The same tooltip is available on the **Edit IPS Sensor (Security Profiles > Intrusion Prevention)** page when creating or editing the IPS signatures. In the **Add Signatures** pane when the **Type** is **Signature**, signatures on hold are only displayed as on hold if `override-signature-hold-by-id` is enabled.

![Screenshot of Edit IPS Sensor page]

You can still use on hold signatures in an IPS sensor profile; however, the profile will not block matching traffic. It will monitor it instead (logging in effect) until the on hold time expires.
CVE pattern

The CVE pattern option allows you to filter IPS signatures based on CVE IDs or with a CVE wildcard, ensuring that any signatures tagged with that CVE are automatically included.

To configure CVE patterns for CVE-2010-0177 and all CVE-2017 CVEs:

```
config ips sensor
    edit "cve"
        set comment "cve"
    config entries
        edit 1
            set cve "cve-2010-0177"
            set status enable
            set log-packet enable
            set action block
        next
        edit 2
            set cve "cve-2017"
            set action reset
        next
    end
next
end
```

For example, the CVE of the IPS signature `Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution` is CVE-2010-0177. This matches the CVE filter in the IPS sensor, so traffic is blocked and logged:

```
date=2020-07-13 time=15:44:56 logid="0419016384" type="utm" subtype="ips"
eventtype="signature" level="alert" vd="vd1" eventtime=1594593896666145871 tz="-0700"
severity="critical" srcip=10.1.100.22 srccountry="Reserved" dstip=172.16.200.55
srcintf="port2" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined"
sessionid=1638 action="dropped" proto=6 service="HTTPS" policyid=1
hostname="172.16.200.55" url="/Mozilla" direction="incoming" attackid=20853 profile="sensor-1"
ref="http://www.fortinet.com/ids/VID20853" incidentserialno=124780667 msg="web_client:
crlevel="critical"
```

IPS sensor attributes

When configuring IPS sensor profiles, IPS signatures can be filtered based on the attributes: default status, default action, vulnerability type, and the last update date. When monitoring the specific, filtered signatures, logs are not generated for other, irrelevant signatures.

This avoids generating a lot of false positives due to many signatures having the pass action, which is never logged.

To configure filters in an IPS sensor profile:

```
config ips sensor
    edit "test_default"
    config entries
        edit 1
            set default-action pass
```
set default-status enable
set vuln-type 12
set last-modified before 2020/02/02
next
end
next
end

| default-action {pass | block | all}             | Filter by signatures' default actions (default = all). |
|-------------------|-------------------------------------------------------|
| default-status {enable | disable | all}         | Filter by signatures' default statuses (default = all). |
| vuln-type <integer> ... <integer> | Filter by signatures' vulnerability types. |
| last-modified {before | after | between} <date> [end-date] | Filter by signatures' last modified date (default = before 00/00/00). The date format is yyyy/mm/dd. The year range is 2001 - 2050. |

When the IPS profile is used in a firewall profile and then the EICAR virus test file signature is triggered, the signature matches the values set in the filter and logs are generated:

```
1: date=2022-02-15 time=14:07:03 eventtime=1644962823303491048 tz="-0800" logid="0419016384" type="utm" subtype="ips" eventtype="signature" level="alert" vd="vd1" severity="info" srcip=10.1.100.11 srccountry="Reserved" dstip=172.16.200.55 dstcountry="Reserved" srcintf="port38" srcintfrole="undefined" dstintf="port37" dstintfrole="undefined" sessionid=1171 action="detected" proto=6 service="HTTP" policyid=1 ppoluid="623d2d28-8ea7-51ec-00ef-7549685a77c2" policytype="policy" attack="Eicar.Virus.Test.File" srcrevport=47230 dstport=80 hostname="172.16.200.55" url="/virus/eicar" direction="incoming" attackid=29844 profile="test_default" ref="http://www.fortinet.com/ids/VID29844" incidentserialno=103809025 msg="file_transfer: Eicar.Virus.Test.File"

IPS with botnet C&C IP blocking

The Botnet C&C section consolidates multiple botnet options in the IPS profile. This allows you to enable botnet blocking across all traffic that matches the policy by configuring one setting in the GUI, or by the `scan-botnet-connections` option in the CLI.

**To configure botnet C&C IP blocking in the GUI:**

1. Go to Security Profiles > Intrusion Prevention, and click Create New to create a new IPS sensor, or double-click an existing IPS sensor to open it for editing.
2. Navigate to the Botnet C&C section.
3. For Scan Outgoing Connections to Botnet Sites, select Block or Monitor.
4. Configure the other settings as needed.
5. Click OK to save the IPS sensor.
6. Add the IPS sensor to a firewall policy. The IPS engine will scan outgoing connections to botnet sites. If you access a botnet IP address, an IPS log is generated for this attack.
7. Go to Log & Report > Security Events and click the Intrusion Prevention card to view the log.

**To configure botnet C&C IP blocking in the CLI:**

```
config ips sensor
  edit "Demo"
    set scan-botnet-connections {disable | block | monitor}
  next
end
```

The `scan-botnet-connections` option is no longer available in the following CLI commands:

- `config firewall policy`
- `config firewall interface-policy`
- `config firewall proxy-policy`
- `config firewall sniffer`
Sample log

```
# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.
```

```
1: date=2022-04-28 time=16:18:34 eventtime=1651187914585406621 tz="-0700" logid="0422016400" type="utm" subtype="ips" eventtype="botnet" level="warning" vd="vd1" msg="Botnet C&CC Communication." severity="critical" srcip=10.1.100.11 srccountry="Reserved" dstip=2.58.149.169 srcintf="port13" srcintfrole="undefined" dstintfrole="undefined" sessionid=894198 action="dropped" srcport=41798 dstport=80 proto=6 service="HTTP" policyid=1 profile="sensor-1" directions="outgoing" attack="Loki" attackid=7630239 ref="http://www.fortinet.com/be?bid=7630239" crscore=50 craction=4 crlevel="critical"
```

**Botnet IPs and domains lists**

To view botnet IPs and domains lists:

1. Go to System > FortiGuard.
2. Expand License Information > Intrusion Prevention to view Botnet IPs and Botnet Domains information.
3. Click View List for more details.
Botnet C&C domain blocking

To block connections to botnet domains:

1. Go to Security Profiles > DNS Filter, and click Create New, or double-click an existing filter to open it for editing.
2. Enable Redirect botnet C&C requests to Block Portal.

3. Configure the other settings as needed.
4. Click OK.
5. Add the filter profile to a firewall policy.

Botnet C&C URL blocking

To block malicious URLs:

1. Go to Security Profiles > Intrusion Prevention, and click Create New, or double-click an existing filter to open it for editing.
2. Enable Block malicious URLs.

3. Configure the other settings as needed.
4. Click OK.
5. Add the sensor to a firewall policy.

**Botnet C&C signature blocking**

**To add IPS signatures to a sensor:**

1. Go to Security Profiles > Intrusion Prevention, and click Create New, or double-click an existing sensor to open it for editing.
2. In the IPS Signatures and Filters section, click Create New. A list of available signatures appears.
3. For Type, select Signature. Select the signatures you want to include from the list.
4. Configure the other settings as needed.
5. Click *Add Selected*.

6. Click OK to add the IPS signatures to the IPS sensor.

7. Click OK to save the IPS sensor.

8. Add the sensor to a firewall policy to detect or block attacks that match the IPS signatures.

### IPS signatures for the industrial security service

The FortiGuard Industrial Security Service (ISS) includes both application control and intrusion prevention signatures for industrial applications and protocols. The industrial database attack definitions are only updated if the FortiGate has a valid ISS license and an IPS security profile is used in a policy.

By default, industrial signatures are excluded from the signature lists in the GUI.

**To verify that the FortiGate has a valid ISS license:**

1. Go to *System > FortiGuard*.
2. In the *License Information* table, check the license status of *Industrial DB*.
3. Expand the *Industrial DB* entry to see the current *Industrial Attack Definitions* version.

**To force the industrial DB attack definitions to update:**

1. Optionally, create an IPS profile:
   a. Go to *Security Profiles > Intrusion Prevention* and click *Create New*.
   b. Enter a name for the profile.
   c. In the *IPS Signatures and Filters* table click *Create New*.
   d. Click OK.
   e. Click OK.
2. Use the IPS profile in a policy:
   a. Go to Policy & Objects > Firewall Policy.
   b. Edit an existing policy, or click Create New to create a new policy.
   c. Under Security Profiles, enable IPS and select an IPS profile.
   d. Configure the remaining settings as needed, then click OK.
3. Go to System > FortiGuard and either click Update Licenses & Definitions Now, or wait for the next automatic update. The update could take a few minutes.
4. Refresh the page, then check the Industrial Attack Definitions version to confirm that they have been updated.

To make ISS IPS and application control signatures available in the GUI:

```plaintext
config ips global
   set exclude-signatures none
end
```

To view the signatures in the GUI:

1. Go to Security Profiles > Application Signatures and search for industrial to find signatures that identify industrial protocols.
2. Go to Security Profiles > IPS Signatures to find signatures that detect networks attacks that target industrial assets.

**IPS sensor for IEC 61850 MMS protocol**

IEC 61850 is a SCADA protocol whose services are mapped to a number of protocols, including MMS services. MMS/ICCP detection is supported in IPS. The purpose of the MMS dissectors is to identify every IEC 61850 service to distinguish different MMS/ICCP messages. IPS engine 6.0.12 and later support MMS dissectors.

The following scenarios are also supported:

- Multiple MMS PDUs are transferred in one TCP payload, and the IPS engine identifies individuals.
- An MMS message is split over multiple TCP segments, where MMS runs over COTP segments.
- ICCP/TASE.2 that also uses MMS transport (ISO transport over TCP for ICCP) is detected.
Security Profiles

Industrial signatures must be enabled in the global IPS settings to receive MMS/ICCP signatures. By default, industrial signatures are excluded.

```
config ips global
    set exclude-signatures none
end
```

Below are some industrial signatures for MMS/ICCP messages that can be detected by the IPS engine. This is not an exhaustive list.

- MMS_GetNameList.Request
- MMS_GetNamedVariableListAttributes.Request
- MMS_GetVariableAccessAttributes.Request
- MMS_Identify.Request
- MMS_Initiate.Request
- MMS_Read.Request
- MMS_Reset.Request
- ICCP_Transfer.Reporting
- ICCP_Create.Dataset
- ICCP_Abort
- ICCP_Start.Transfer.DSTransferSet
- ICCP_Get.Dataset.Element.Values
- ICCP_Get.Next.DSTransfer.Set.Value
- ICCP_Delete.Dataset
- ICCP_Start.Transfer.IMTransferSet

**Diagnose command**

The COTP dissector adds support for identifying every MMS PDU, and let the IPS engine separate them, like the Modbus and IEC-104 services for example.

```
# diagnose ips debug enable all
# diagnose debug enable
```
Security Profiles

[284@78]ips_l7_dsct_processor: serial=8142 create: cotp
[284@78]ips_l7_dsct_processor: serial=8142 create: iec104
[284@78]ips_l7_dsct_processor: serial=8142 create: modbus

Log samples

MMS dissectors can be triggered, and MMS/ICCP signatures can be monitored and logged.

SCTP filtering capabilities

A Stream Control Transmission Protocol (SCTP) dissector and Payload Protocol Identifier (PPID) filter can be used to either terminate the SCTP session, or replace the offending data chunk with zeros to keep the client and server sequence numbers synchronized. The SCTP filter action can also pass the data chunk.

SCTP client

SCTP server

FortiGate

To configure and test an SCTP filter:

1. Configure an SCTP filter profile that uses the reset action:

   config scpf-filter profile
   edit "sctp"
   set comment "Demo profile"
   config ppid-filters
   edit 1
     set ppid 112233
     set action reset
     set comment "test chunk"
   next
   end
2. Use the SCTP filter profile in a firewall policy:

```config firewall policy
edit 1
    set name "1"
    set srcintf "port38"
    set dstintf "port37"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "new-deep-inspection"
    set scpt-filter-profile "sctp"
    set logtraffic all
next
end
```

3. On the SCTP client, confirm that the connection works and send a data chunk with PPID 112233.

4. The IPS engine detects the data chunk. The PPID matches the PPID filter, and the filter action is reset, so the data chunk is not received on the server, and the session is terminated.
5. Change the filter action to replace:

```plaintext
config sctp-filter profile
edit "sctp"
config ppid-filters
edit 1
  set action replace
next
end
end
```

6. Resend the data chunk.

7. The IPS engine detects the data chunk. The PPID matches the PPID filter, and the filter action is replace, so the data chunk is replaced with zeros.

---

**File filter**

The file filter can be applied directly to firewall policies and supports various traffic protocols in proxy or flow mode.
<table>
<thead>
<tr>
<th>Protocol</th>
<th>Proxy mode</th>
<th>Flow mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>CIFS</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>FTP</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>HTTP</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>IMAP</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>MAPI</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>

<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>SMTP</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>SSH</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Prior to FortiOS 6.4.1, file filter was embedded in the web filter, email filter, SSH inspection, and CIFS profiles.

To configure a file filter in the GUI:

1. Configure the filter profile:
   a. Go to Security Profiles > File Filter and click Create New.
   b. Select a Feature set.
   c. In the Rules table, click Create New.
   d. Configure the settings as required.
   e. Click OK to save the rule.
Security Profiles

f. Optionally, create more rules.

g. Click OK to save the filter profile.

2. Apply the filter to a policy:
   a. Go to Policy & Objects > Firewall Policy and edit an existing policy or create a new one.
   b. In the Security Profiles section, enable File Filter.
   c. Select the filter from the dropdown box.

   d. Configure the other settings as needed.
   e. Click OK.

To configure a file filter in the CLI:

1. Configure the file filter profile:

   ```
   config file-filter profile
   edit "test"
      set comment ''
      set feature-set flow
      set replacemsg-group ''
      set log enable
      set scan-archive-contents enable
   config rules
      edit "r2"
         set comment ''
   ```
Security Profiles

set protocol http ftp smtp imap pop3 cifs
set action block
set direction outgoing
set password-protected any
set file-type "sis" "tar" "tiff" "torrent" "upx" "uue" "wav" "wma" "xar" "xz" "zip"

next
edit "r1"
set comment ''
set protocol http ftp smtp imap pop3 cifs
set action log-only
set direction any
set password-protected any
set file-type ".net" "7z" "activemime" "arj" "aspack" "avi" "base64" "bat" "binhex" "bmp" "bzip" "bzip2"
next
edit "r3"
set comment ''
set protocol http ftp smtp imap pop3
set action block
set direction any
set password-protected any
set file-type "binhex"
next
end
end

2. Apply the filter to a policy:

config firewall policy
edit 1
set name "filefilter-policy"
set srcintf "port10"
set dstintf "port9"
set srcaddr "all"
set dstaddr "all"
set srcaddr6 "all"
set dstaddr6 "all"
set action accept
set schedule "always"
set service "ALL"
set utm-status enable
set profile-protocol-options "protocol"
set ssl-ssh-profile "protocols"
set file-filter-profile "test"
set auto-asic-offload disable
set np-acceleration disable
set nat enable
next
end

Logs

Go to Log & Report > Security Events and select the File Filter card to view the file filter logs.

Supported file types

File filter allows the FortiGate to block files passing through based on file type based on the file's meta data only, and not on file size or file content. A DLP profile must be configured to block files based on size or content, such as SSN numbers, credit card numbers, or regexp.

The following file types are supported in file filter and DLP profiles:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.net</td>
<td>Match .NET files</td>
</tr>
<tr>
<td>7z</td>
<td>Match 7-Zip files</td>
</tr>
<tr>
<td>activemime</td>
<td>Match ActiveMime files</td>
</tr>
<tr>
<td>arj</td>
<td>Match ARJ compressed files</td>
</tr>
<tr>
<td>aspack</td>
<td>Match ASPack files</td>
</tr>
<tr>
<td>avi</td>
<td>Match AVI files</td>
</tr>
<tr>
<td>base64</td>

</tr>
</tbody>
</table>

* This file type is only available in DLP profiles.
Email filter

Email filters can be configured to perform spam detection and filtering. You can customize the default profile, or create your own and apply it to a firewall policy.

Two kinds of filtering can be defined in a single profile, and they will act independent of one another.

Filter options can be organized according to the source of the decision:

- **Local options**: the FortiGate qualifies the email based on local conditions, such as block/allowlists, banned words, or DNS checks using FortiGuard Antispam.
- **FortiGuard-based options**: the FortiGate qualifies the email based on the score or verdict returned from FortiGuard Antispam.
- **Third-party options**: the FortiGate qualifies the email based on information from a third-party source (like an ORB list).

Local and FortiGuard block/allowlists can be enabled and combined in a single profile. When combined, the local block/allowlist has a higher priority than the FortiGuard block list during a decision making process. For example, if a client IP address is blocklisted in the FortiGuard server, but you want to override this decision and allow the IP to pass through the filter, you can define the IP address or subnet in a local block/allowlist with the clear action. Because the information coming from the local list has a higher priority than the FortiGuard service, the email will be considered clean.

Some features of this functionality require a subscription to FortiGuard Antispam.

Protocol comparison between email filter inspection modes

The following table indicates which email filters are supported by their designated inspection modes.

<table>
<thead>
<tr>
<th></th>
<th>SMTP</th>
<th>POP3</th>
<th>IMAP</th>
<th>MAPI</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>

<td>No</td>
</tr>
</tbody>
</table>

The following topics provide information about email filter profiles:

- Local-based filters on page 1235
- FortiGuard-based filters on page 1242
- Third-party-based filters on page 1244
- Filtering order on page 1244
- Protocols and actions on page 1246
- Configuring webmail filtering on page 1247
Local-based filters

There are six types of local spam filters:

- HELO DNS lookup
- Return email DNS check
- Block/allow list
- Banned words
- Trusted IP addresses
- MIME header

* These filters can only be configured in the CLI.

By default, HELO DNS and return email DNS checks are done before the block/allow list check. In some situations, such as when configuring a block/allow list to clear an email from performing further filtering, configure the following to give precedence to the block/allow list:

```
config emailfilter profile
edit <name>
    config smtp
        set local-override enable
    next
end
end
```

HELO DNS lookup

Whenever a client opens an SMTP session with a server, the client sends a HELO command with the client domain name. The FortiGate takes the domain name specified by the client in the HELO and performs a DNS lookup to determine if the domain exists. If the lookup fails, the FortiGate determines that any emails delivered during the SMTP session are spam. The HELO DNS lookup is only available for SMTP traffic.

Return email DNS check

The FortiGate performs a DNS lookup on the return field. If no such record exists, the email is treated as spam. When return email DNS checking is enabled, the FortiGate takes the domain in the reply-to email address and reply-to domain, and checks the DNS servers to see if there is an A or MX record for the domain. If the domain does not exist, the FortiGate treats the email as spam.

Block/allow list

Block/allow lists can be made from emails or IP subnets to forbid or allow them to send or receive emails. The following table summarizes the configurable options in a block/allow list.
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Pattern</th>
<th>Action</th>
</tr>
</thead>
</table>
| IP/Netmask and IPv6/Netmask   | The FortiGate compares the IP address of the client delivering the email to the addresses in the IP address block/allow list specified in the email filter profile. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry against all delivered email. By default the hdrip setting under config smtp is disabled. If enabled, the FortiGate checks all the IP addresses in the header of SMTP email against the specified IP address block/allow list. | The filter is an IP address with a subnet mask. | • Mark as Reject: the email is dropped before reaching its destination.  
• Mark as Spam: the email is allowed through, but it will be tagged with an indicator marking the email as spam.  
• Mark as Clear: the email is allowed to go through to its destination on the assumption that it is not spam. |
| Recipient Address            | The FortiGate compares the sender email address to the contents of the RCPT TO envelope header and To: mail header to the specified pattern. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry. | | • Wildcard: the filter is an email address with a wildcard symbol in place of the variable characters (such as *:example.com or fred@*.com).  
• Regular Expression: the filter is a regular expression. For example, ^\[_.a-z0-9-]+\[_.a-z0-9-]+\]@ (example|xmple|examp). (com|org|net) can be used to filter based on a number of email domain name combinations. |
| Sender Address                | The FortiGate compares the sender email address to the contents of the MAIL FROM envelope header, From: mail header, and Sender: mail header to the specified pattern. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry. | | • Mark as Spam: the email is allowed through, but it will be tagged with an indicator marking the email as spam.  
• Mark as Clear: the email is allowed to go through to its destination on the assumption that it is not spam. |
| Subject                       | The FortiGate compares the sender email address to the contents of the Subject: mail header to the specified pattern. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry. | | |

* This type is only supported in proxy mode.
Banned words

When banned word checking is enabled, the FortiGate examines emails for words that appear in the banned word list specified in the email filter profile.

The banned word pattern can be either wildcard or Perl regular expression, which could include part of a word, a whole word, a phrase, multiple words, or multiple phrases.

Each time the banned word filter detects a pattern in an email, it adds the pattern score to the sum of scores for the message. The score is set when creating a new pattern to block content (set score). Higher scores indicate more offensive content. If the total score of the discovered banned words in the email exceeds the threshold value set in the email filter profile, then the FortiGate treats the email as spam. The score for each pattern is counted only once, even if that pattern appears many times in the email. The default score for banned word patterns is 10, and the default threshold in the email filter is 10. This means that by default, an email message is blocked by a single match.

For example, if the FortiGate scans an email containing only this sentence: “The score for each word or phrase is counted only once, even if that word or phrase appears many times in the email message.” and the banned word list contains the following patterns:

<table>
<thead>
<tr>
<th>Banned word pattern</th>
<th>Pattern type</th>
<th>Assigned score</th>
<th>Score added to sum for entire page</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>word</td>
<td>Wildcard</td>
<td>20</td>
<td>20</td>
<td>The pattern appears twice, but it is counted once.</td>
</tr>
<tr>
<td>word phrase</td>
<td>Wildcard</td>
<td>20</td>
<td>0</td>
<td>Both words appear in the email, but they do not appear together as specified in the pattern. There are no matches.</td>
</tr>
<tr>
<td>word*phrase</td>
<td>Wildcard</td>
<td>20</td>
<td>20</td>
<td>A match occurs as long as “word” appears before “phrase” regardless of what is in between them. The pattern appears twice, but it is counted once.</td>
</tr>
<tr>
<td>mail*age</td>
<td>Wildcard</td>
<td>20</td>
<td>20</td>
<td>This pattern is a match because “email message” appears in the email.</td>
</tr>
</tbody>
</table>

The email would be treated as spam if the banned word threshold is set to 60 or less.

To apply a banned word filter to an email filter profile:

1. Configure the banned words list:

   ```
   config emailfilter bword
   edit 1
   set name "banned"
   config entries
   edit 23
   set pattern-type {wildcard | regexp}
   set pattern <string>
   set score <1 - 99999>
   next
   end
   ```
2. Configure the email filter profile:

```fortigate-config
config emailfilter profile
edit "myBannedWordsProfile"
set spam-filtering enable
set options bannedword
set spam-bword-threshold <0 - 2147483647>
set spam-bword-table 23
next
end
```

Once a banned word list is configured in the CLI and applied to an email filter profile, some settings can be edited in the GUI for that particular email filter profile. A banned word profile can be selected, and its Threshold (spam-bword-threshold) can be edited.

## Trusted IP addresses

When the FortiGate creates a list of trusted IP addresses, any incoming email traffic from these IP address is exempt from having IP-based checks, such as DNSBL, RBL, FortiGuard Antispam service, or locally-defined IP block lists.

If the FortiGate sits behind a company's mail transfer units, it may be unnecessary to check email IP addresses because they are internal and trusted. In this case, only external IP addresses would be checked. In some cases, external IP addresses may be added to the list if they are known to not be spam sources.

### To configure a trusted IP address list:

1. Define the IP address list:

```fortigate-config
config emailfilter iptrust
edit 1
set name "trustedIP"
config entries
edit 33
set addr-type {ipv4 | ipv6}
set ipv4-subnet <IPv4_classnet>
set ipv6-subnet <IPv6_network>
next
end
next
end
```

2. Add the list to the email filter profile:

```fortigate-config
config emailfilter profile
edit "email_filter_profile"
set spam-iptrust-table 1
next
end
```
**MIME header**

This feature filters by the MIME header.

**To configure a MIME header check:**

1. Define the header content:

   ```
   config emailfilter mheader
   edit 100
   set name "mheader"
   config entries
   edit 1
   set flagname <string>
   set fieldbody <string>
   set pattern-type {wildcard | regexp}
   set action {spam | clear}
   next
   end
   next
   end
   ``

2. Add the header to the email filter profile:

   ```
   config emailfilter profile
   edit "email_filter_profile"
   set options spamhdrcheck
   set spam-mheader-table 100
   next
   end
   ``

**Configuring a local-based email filter**

**To configure a local-based email filter in the GUI:**

1. Configure the email filter profile:
   a. Go to Security Profiles > Email Filter and click Create New, or edit an existing profile.
   b. Select a Feature set (Proxy-based is used in this example) and enable Enable spam detection and filtering.
   c. In the Local Spam Filtering section, enable the desired filters (HELO DNS Lookup, Return Email DNS Check, Block/Allow List).
   d. In the Block/Allow List table, click Create New. The Create Anti-Spam Block/Allow List Entry pane opens.
   e. Set the Type to IP/Netmask and enter an IP/Netmask.
f. Select an Action.

![Create Anti-Spam Block/Allow List Entry](image)

Click OK to save the block/allow list.

![New Email Filter Profile](image)

h. Click OK save the email filter profile.

2. Configure the firewall policy:
   a. Go to Policy & Objects > Firewall Policy and click Create New, or edit an existing policy.
   b. Set the inspection-mode to Proxy-based.
Security Profiles

c. Enable the Email Filter option and select the previously created profile.

d. Set SSL Inspection to a profile that has deep SSL inspection enabled. Deep inspection is required to filter SMTP, POP3, IMAP, or any SSL/TLS encapsulated protocol.

e. Configure the other settings as needed.

f. Click OK.

To configure a local-based email filter in the CLI:

1. Configure a block/allow list:

   ```
   config emailfilter block-allow-list
   edit 1
   set name "myBAL"
   config entries
   edit 1
   set status enable
   set type ip
   set action spam
   set addr-type ipv4
   set ip4-subnet 10.1.100.0 255.255.255.0
   next
   end
   next
   end
   ```

2. Configure an email filter profile:

   ```
   config emailfilter profile
   edit "myLocalEmailFilter"
   set spam-filtering enable
   set options spambal spamhelodns spamraddrdns
   config smtp
   set action tag
   end
   set spam-bal-table 1
   next
   end
   ```
3. Use the profile in a firewall policy:

```plaintext
cfg firewall policy
edit 1
    set inspection-mode proxy
    set ssl-ssh-profile "deep-inspection"
    set emailfilter-profile "myLocalEmailFilter"
next
end
```

### FortiGuard-based filters

The FortiGate consults FortiGuard servers to help identify spammer IP address or emails, known phishing URLs, known spam URLs, known spam email checksums, and others. For more information, refer to the [FortiGuard](http://www.fortiguard.com) website.

There are five FortiGuard spam filtering options:

- IP address check
- URL check
- Detect phishing URLs in email (requires URL check to be enabled)
- Email checksum check
- Spam submission

#### IP address check

The FortiGate queries the FortiGuard Antispam service to determine if the IP address of the client delivering the email is in the block list. If there is a match, the FortiGate treats delivered emails as spam.

#### URL check

The FortiGate submits all URLs that appear in the email body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL block list, the FortiGate treats the email as spam.

#### Detect phishing URLs in email

The FortiGate submits all URL hyperlinks that appear in the email body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL phishing list, the FortiGate removes the hyperlink from the message. The URL remains in place, but it is no longer a clickable hyperlink.

#### Email checksum check

The FortiGate submits a checksum of each email to the FortiGuard service for checking. If a checksum exists in the FortiGuard checksum block list, the FortiGate treats the email as spam.
Spam submission

Spam submission is a way to inform the FortiGuard Antispam service of non-spam messages incorrectly marked as spam. When enabled, the FortiGate adds a link to the end of every email marked as spam. Click the link to notify the FortiGuard Antispam service if an email is marked incorrectly.

Configuring FortiGuard filters

To configure FortiGuard filters in the GUI:

1. Go to Security Profiles > Email Filter and click Create New.
2. Enable Enable spam detection and filtering.
3. In the FortiGuard Spam Filtering Spam Filtering section, enable the following as needed:
   - IP Address Check
   - URL Check
   - Detect Phishing URLs in Email
   - Email Checksum Check
   - Spam Submission
4. Click OK.

To configure FortiGuard filters in the CLI:

```
config emailfilter profile
  edit <name>
    set spam-filtering enable
    set options spamfsip spamfsurl spamfsphish spamfschecksum spamfssubmit
  next
end
```
Security Profiles

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spamfsip</td>
<td>Check email IP addresses</td>
</tr>
<tr>
<td>spamfsurl</td>
<td>Check email content URLs</td>
</tr>
<tr>
<td>spamfsphish</td>
<td>Check email content phishing URLs</td>
</tr>
<tr>
<td>spamfschksum</td>
<td>Check email checksums</td>
</tr>
<tr>
<td>spamfssubmit</td>
<td>Add FortiGuard Antispam spam submission text</td>
</tr>
</tbody>
</table>

Third-party-based filters

In addition to local and FortiGuard filters, FortiOS can leverage third-party sources, which are known as DNS-based blackhole lists (DNSBL) or Open Relay Behavior-modification Systems (ORBS). These are maintained lists of IP addresses that have been identified as associated with spamming.

The following example demonstrates how to configure a DNSBL. The `config emailfilter dnsbl` command is used to configure either DNSBL or ORBS.

To configure a DNSBL:

1. Define the server to get the DNSBL list from:
   ```
   config emailfilter dnsbl
   edit 100
   set name "dnsbl"
   config entries
     edit 1
     set status enable
     set server <IP address or server name>
     set action {reject | spam}
   next
   next
   end
   ```

2. Add the DNSBL list to an email filter profile:
   ```
   config emailfilter profile
   edit "email_filter_profile"
     set options spamrbl
     set spam-rbl-table 100
   next
   end
   ```

Filtering order

The FortiGate checks for spam using various filtering techniques. The filtering order used by the FortiGate depends on which mail protocol is used.
Filters requiring a query to a server and a reply (FortiGuard Antispam service and DNSBL/ORDBL) are run simultaneously. To avoid delays, queries are sent while other filters are running. The first reply to trigger a spam action takes effect as soon as the reply is received.

Each spam filter passes the email to the next if no matches or problems are found. If the action in the filter is Mark as Spam, the FortiGate tags the email as spam according to the settings in the email filter profile. If the action in the filter is Mark as Reject, the email session is dropped. If the action in the filter is Mark as Clear, the email is exempt from any remaining filters. For SMTP and SMTPS, if the action is Discard, the email is discarded or dropped.

### SMTP and SMTPS spam filtering order

The FortiGate scans SMTP and SMTPS email for spam in a specific order, which depends on whether or not the local override feature is enabled. This feature is disabled by default, but enabling it gives priority to local spam filters.

You can enable local override (set local-override) in an email filter profile to override SMTP or SMTPS remote checks, which includes checks for IP RBL, IP FortiGuard AntiSpam, and HELO DNS with the locally defined antispam block and/or allow lists.

---

**SMTPS spam filtering is available on FortiGates that support SSL content scanning and inspection.**

---

**To configure local override of an antispam filter:**

```plaintext
config emailfilter profile
    edit <name>
        set spam-filtering enable
        set options spambal spamfsip spamfsurl spamhelodns spamfsphish
        config smtp
            set local-override {enable | disable}
        end
    end
next
```

<table>
<thead>
<tr>
<th>Local override disabled</th>
<th>Local override enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. HELO DNS lookup, last hop IP check against ORDBL</td>
<td>1. Last hop IP checks local block/allow list</td>
</tr>
<tr>
<td>2. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, FortiGuard IP address check, phishing URLs detection</td>
<td>2. Envelope address checks local block/allow list</td>
</tr>
<tr>
<td>3. Last hop IP checks local block/allow list</td>
<td>3. Headers IPs local block/allow list, MIME header checks based on local list of patterns (mheader)</td>
</tr>
<tr>
<td>4. Envelope address checks local block/allow list</td>
<td>4. Headers email address local block/allow list</td>
</tr>
<tr>
<td>5. Headers IPs local block/allow list</td>
<td>5. Banned words (subject first, then body) based on local list of patterns (bword)</td>
</tr>
<tr>
<td>6. Headers email address local block/allow list, MIME header checks based on local list of patterns (mheader)</td>
<td>6. HELO DNS lookup, last hop IP check against ORDBL</td>
</tr>
<tr>
<td>7. Banned words (subject first, then body) based on local block/allow list (bword)</td>
<td>7. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, FortiGuard IP address check, phishing URLs detection</td>
</tr>
</tbody>
</table>
Security Profiles

**IMAP, IMAPS, POP3, and POP3S spam filtering order**

The FortiGate scans IMAP, IMAPS, POP3, and POP3S email for spam in the following order:

1. MIME headers check, email address block/allow list check
2. Banned word check on email subject
3. IP block/allow list check
4. Banned word check on email body
5. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, DNSBL and ORDBL checks

IMAPS and POP3S spam filtering are available on FortiGates that support SSL content scanning and inspection.

**Protocols and actions**

In an email filter profile, there are options to configure settings for SMTP, POP3, IMAP, and MAPI protocols. For each protocol, you can set an action to either discard (block), tag, or pass the log for that protocol. The action options vary per protocol. For the tag action, the spam email can be tagged with configured text in the subject or header.

MAPI is only configurable in the CLI and with the proxy feature set.

**To configure protocols in an email filer:**

```plaintext
config emailfilter profile
  edit <name>
    set feature-set {flow | proxy}
    set spam-filtering enable
    set options {bannedword spambal spamfsip spamfssubmit spamfschksum spamfsurl spamhelodns spamraddrdns spamrbl spamhdrcheck spamfsphish}
    config smtp
      set log-all {enable | disable}
      set action {pass | tag | discard}
      set tag-type {subject | header | spaminfo}
      set tag-msg <string>
      set hdrip {enable | disable}
      set local-override {enable | disable}
    end
    config imap
      set log-all {enable | disable}
      set action {pass | tag}
      set tag-type {subject | header | spaminfo}
      set tag-msg <string>
    end
    config pop3
      set log-all {enable | disable}
      set action {pass | tag}
```

### Security Profiles

```plaintext
set tag-type {subject | header | spaminfo}
set tag-msg <string>
end
cfg mapi
    set log-all {enable | disable}
    set action {pass | discard}
end
next
```

#### Configuring webmail filtering

You can configure an email filter to detect and log emails sent by Gmail and Hotmail. These interfaces do not use standard email protocols (SMTP, POP3, or IMAP) and use HTTPS instead. However, you can still configure the email filter to detect emails that pass through the FortiGate.

The FortiGate only detects and logs the emails, it does not discard or tag them.

---

The following options are available:

- **bannedword**: content block.
- **spambal**: block/allow list.
- **spamfsip**: email IP address FortiGuard antispam block list check.
- **spamfssubmit**: add FortiGuard antispam spam submission text.
- **spamfschksum**: email checksum FortiGuard antispam check.
- **spamfsurl**: email content URL FortiGuard antispam check.
- **spamhelodns**: email HELO/EHLO domain DNS check.
- **spamraddrdns**: email return address DNS check.
- **spamrbl**: email DNSBL and ORBL check.
- **spamhdrcheck**: email MIME header check.
- **spamfsphish**: email content phishing URL FortiGuard antispam check.

The following options are available:

- **lbannedword**: content block.
- **spambal**: block/allow list.
- **spamfsip**: email IP address FortiGuard antispam block list check.
- **spamfssubmit**: add FortiGuard antispam spam submission text.
- **spamfschksum**: email checksum FortiGuard antispam check.
- **spamfsurl**: email content URL FortiGuard antispam check.
- **spamhelodns**: email HELO/EHLO domain DNS check.
- **spamraddrdns**: email return address DNS check.
- **spamrbl**: email DNSBL and ORBL check.
- **spamhdrcheck**: email MIME header check.
- **spamfsphish**: email content phishing URL FortiGuard antispam check.
Security Profiles

To configure webmail filtering:

```bash
cfg emailfilter profile
  edit <name>
    set spam-filtering enable
  end
config msn-hotmail
  set log-all enable
end
config gmail
  set log-all enable
end
```

data leak prevention

The FortiGate data leak prevention (DLP) system prevents sensitive data from leaving or entering your network by archiving some or all of the content that passes through the FortiGate. DLP archiving is configured per filter, which allows a single profile to archive only the required data. There are two forms of DLP archiving:

- **Summary only**: a summary of all the activity detected by the profile is recorded. For example, when an email message is detected, the sender, recipient, message subject, and total size are recorded. When a user accesses a web browser, every URL that they visit is recorded.
- **Full**: detailed records of all the activity detected by the profile is recorded. For example, when an email message is detected, the message itself, including any attachments, is recorded. When a user accesses a web browser, every page that they visit is archived.

You can configure the DLP archiving protocol in the DLP profile (see `config dlp profile`). You can customize the default DLP profile or create your own by adding individual filters based on:

- Data types (keyword, regex, hex, credit card, social security number, or custom)
- Dictionaries
- Sensors
- File patterns
- Known files using DLP fingerprinting
- Known files using DLP watermarking

Once configured, you can apply the DLP profile to a firewall policy. Data matching defined sensitive data patterns is blocked, logged, or allowed when it passes through the FortiGate. DLP can only be configured in the CLI.

Filters are ordered, but there is no precedence between the possible actions.
**Protocol comparison between DLP inspection modes**

The following table indicates which protocols can be inspected by DLP based on the specified inspection modes.

<table>
<thead>
<tr>
<th></th>
<th>HTTP</th>
<th>FTP</th>
<th>IMAP</th>
<th>POP3</th>
<th>SMTP</th>
<th>NNTP</th>
<th>MAPI</th>
<th>CIFS</th>
<th>SFTP/SCP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy</td>
<td>Yes</td>
<td>Yes</td>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Logging and blocking files by file name**

Sometimes, file names are not accurately recorded in DLP logs, even though the files are blocked correctly based on the DLP profile. This is particularly apparent on cloud-based services, such as Google Drive or SharePoint.

For HTTP file uploads, some cloud services use proprietary encodings and APIs to transfer files and exchange metadata, instead of standard HTTP mechanisms, requiring custom handling of the proprietary API. If a cloud service changes the API without notice, the custom handling becomes outdated and file names might not be logged properly. Due to this, special consideration must be taken when using DLP to block files by file pattern. To block a specific file type, it is better to block by file type, and not by file name pattern.

The following topics provide information about DLP:

- Basic DLP settings on page 1249
- DLP fingerprinting on page 1256

**Basic DLP settings**

DLP settings can be configured for data types, dictionaries, sensors, file patterns, and profiles. This topic includes three examples that incorporate several DLP settings.

- Block HTTPS upload traffic that includes credit card or social security number (SSN) information.
- Log FTP upload traffic with a specific pattern.
- Block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB.

**DLP data type**

This configuration includes five pre-defined data types to match for keyword, regex, hex, credit card, and social security number (SSN). Custom data types can be added.

```plaintext
config dlp data-type
  edit "keyword"
    set pattern "built-in"
  next
  edit "regex"
    set pattern "built-in"
  next
  edit "hex"
    set pattern "built-in"
  next
  edit "credit-card"
```
Security Profiles

set pattern "\\b([2-6]{1}\d\{3\})[- ]?\d\{4\}[- ]?\d\{2\}[- ]?\d\{2\}[- ]?\d\{2,4\}\b"
set verify "built-in"
set look-back 20
set transform "\\b\\1[- ]?\\2[- ]?\\3[- ]?\\4[- ]?\\5\b"
next
edit "ssn-us"
set pattern "\\b\\d\{3\}-(\\d\{2\})-(\\d\{4\})\b"
set verify "(?<!-)\\b(?!666|000|9\d\{2\})\\d\{3\}-(?!00)\\d\{2\}-(?!04)\\d\{4\}\\b(?!-)"
set look-back 12
set transform "\\b\\1-\\2-\\3\b"
next
end

To add a custom DLP data type:

config dlp data-type
edit <name>
    set pattern <string>
    set verify <string>
    set transform <string>
next
end

<table>
<thead>
<tr>
<th>pattern &lt;string&gt;</th>
<th>Enter a regular expression pattern string without a look around.</th>
</tr>
</thead>
<tbody>
<tr>
<td>verify &lt;string&gt;</td>
<td>Enter a regular expression pattern string used to verify the data type.</td>
</tr>
<tr>
<td>transform &lt;string&gt;</td>
<td>Enter the template to transform user input to a pattern using the capture group from pattern.</td>
</tr>
</tbody>
</table>

DLP dictionary

A DLP dictionary is a collection of data type entries.

To configure a DLP dictionary:

config dlp dictionary
edit <name>
    config entries
edit 1
        set type {credit-card | hex | keyword | regex | ssn-us}
        set pattern <string>
        set repeat {enable | disable}
        set status {enable | disable}
next
next
end

DLP sensor

A DLP sensor defines which dictionary to check. It counts the number of dictionary matches to trigger the sensor.
To configure a DLP sensor:

```plaintext
cfg dlp sensor
  edit <name>
    set match-type {match-all | match-any | match-eval}
    set eval <string>
  config entries
    edit <id>
      set dictionary <dlp_dictionary>
      set count <integer>
      set status {enable | disable}
    next
  next
end
```

DLP file pattern

A DLP file pattern can block, allow, log, or quarantine a file based on the specified file type in the file filter list (see Supported file types on page 1232).

To configure a DLP file pattern:

```plaintext
cfg dlp filepattern
  edit <id>
    set name <name>
  config entries
    edit <name>
      set filter-type {type | pattern}
      set file-type <file_type>
    next
  next
end
```

DLP profile

A DLP profile allows for filtering by size and file type. DLP profiles can be applied in firewall policies.

To configure a DLP profile:

```plaintext
cfg dlp profile
  edit <name>
    set feature-set {flow | proxy}
  config rule
    edit <id>
      set proto <protocol> <protocol> ...
      set sensor <dlp_sensor>
      set action {allow | log-only | block | quarantine-ip}
    next
  next
end
```
Example 1

This configuration will block HTTPS upload traffic that includes credit card or social security number (SSN) information. The pre-defined data types for credit-card and ssn-us are used in the dictionary.

To block HTTPS upload traffic that includes credit card or SSN information:

1. Configure the DLP dictionary:

```plaintext
config dlp dictionary
edit "dic-case1-cc-ssn"
config entries
edit 1
    set type "credit-card"
next
edit 2
    set type "ssn-us"
next
end
next
end
```

2. Configure the DLP sensor:

```plaintext
config dlp sensor
edit "sensor-case1-cc-ssn"
config entries
edit 1
    set dictionary "dic-case1-cc-ssn"
next
next
end
```

3. Configure the DLP profile:

```plaintext
config dlp profile
edit "profile-case1-cc-ssn"
config rule
edit 1
    set proto http-post
    set sensor "sensor-case1-cc-ssn"
    set action block
next
next
end
```

4. Add the DLP profile to a firewall policy:

```plaintext
config firewall policy
edit 1
    set srcintf "port2"
    set dstintf "port1"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "all"
```
Security Profiles

```
set dstaddr6 "all"
set schedule "always"
set service "ALL"
set utm-status enable
set inspection-mode proxy
set ssl-ssh-profile "custom-deep-inspection"
set dlp-profile "profile-case1-cc-ssn"
set logtraffic all
set nat enable
```

When a credit card or SSN is included in HTTP POST traffic, a replacement message appears because it is blocked. A DLP log is generated.

**Sample log**

```
5: date=2022-02-15 time=09:49:04 eventtime=1644947344512841971 tz="-0800" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" filteridx=1
dlpextra="sensor-case1-ssn" filtertype="rule" filtercat="file" severity="medium"
policyid=1 poluuid="905fb604-7ed4-51ec-0853-79e498591bf8" policytype="policy" sessionid=9290

hostname="dlptest.com" url="https://dlptest.com/https-post/" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML, like Gecko) file" filename="item_meta[6]" filesize=19
profile="profile-case1-ssn"
```

**Example 2**

This configuration will log FTP upload traffic with the following patterns:

- keyword = demo
- regex = demo(regex){1,5}
- hex = e6b58be8af95

The dictionary entries have repeat match enabled. The DLP sensor is set so this is repeated five times.

**To log FTP upload traffic that has specific keyword, regex, and hex patterns repeated for five times:**

1. Configure the DLP dictionary:

   ```
   config dlp dictionary
   edit "dic-case2-keyword-regex-hex"
   config entries
   edit 1
   set type "keyword"
   set pattern "demo"
   set repeat enable
   next
   edit 2
   set type "regex"
   set pattern "demo(regex){1,5}"
   ```
Security Profiles

set repeat enable
next
edit 3
    set type "hex"
    set pattern "e6b58be8af95"
    set repeat enable
next
end
next
end

2. Configure the DLP sensor:

    config dlp sensor
    edit "sensor-case2-keyword-regex-hex"
        config entries
            edit 1
                set dictionary "dic-case2-keyword-regex-hex"
                set count 5
            next
        next
    end

3. Configure the DLP profile:

    config dlp profile
    edit "profile-case2-keyword-regex-hex"
        config rule
            edit 1
                set proto ftp
                set sensor "sensor-case2-keyword-regex-hex"
                set action log-only
            next
        next
    end

4. Add the DLP profile to a firewall policy:

    config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "custom-deep-inspection"
        set dlp-profile "profile-case2-keyword-regex-hex"
        set logtraffic all
        set nat enable
5. Upload a Word document that contains "demo, demo, demo, demoregexregex," using FTP.

A DLP log is generated after the FTP traffic passes.

Sample log

3: date=2022-02-15 time=10:42:34 eventtime=1644950554735620032 tz="-0800" logid="0954024577" type="utm" subtype="dlp" eventtype="dlp" level="notice" vd="root" filteridx=1 dlprextra="sensor-case2-keyword-regexp-hex " filtertype="rule" filtercat="file" severity="medium" policyid=1 poluuid="905fb604-7ed4-51ec-0853-79e498591bf8" policytype="policy" sessionid=10551 epoch=64494633 eventid=0 srcip=10.1.100.106 srcport=55647 srccountry="Reserved" srcintf="port2" srcintfrole="undefined" srcuuid="358d0f56-7ed4-51ec-50f7-a5e4525a641d" dstip=35.163.228.146 dstport=1048 dstcountry="United States" dstintf="port1" dstintfrole="undefined" dstuuid="358d0f56-7ed4-51ec-50f7-a5e4525a641d" proto=6 service="FTP" filetype="msofficex" direction="outgoing" action="log-only" filename="dlp-test.docx" filesize=11627 infectedfilename="word/document.xml" infectedfilesize=2448 infectedfiletype="html" infectedfilelevel=1

Example 3

This configuration will block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB.

To block HTTPS download of EXE files and log downloads larger than 500 KB:

1. Configure the DLP file pattern:

```plaintext
config dlp filepattern
edit 3
set name "case3-exe"
config entries
edit "exe"
set filter-type type
set file-type exe
next
next
end
```

2. Configure the DLP profile:

```plaintext
config dlp profile
edit "profile-case3-type-size"
config rule
edit 1
set proto http-get
set filter-by none
set file-type 3
set action block
next
edit 2
set proto http-get
set filter-by none
```
Security Profiles

set file-size 500
set action log-only
next
end
next
end

3. Add the DLP profile to a firewall policy:
config firewall policy
edit 1
set srcintf "port2"
set dstintf "port1"
set action accept
set srcaddr "all"
set dstaddr "all"
set srcaddr6 "all"
set dstaddr6 "all"
set schedule "always"
set service "ALL"
set utm-status enable
set inspection-mode proxy
set ssl-ssh-profile "custom-deep-inspection"
set dlp-profile "profile-case3-type-size"
set logtraffic all
set nat enable
next
end

4. Download an EXE file using HTTPS. The download is blocked, a replacement message appears, and a DLP log is generated.

Sample log
