# Overview

The information in this document provides guidance for configuring the Check Point firewall to be managed by FortiNAC. This document details the items that must be configured.

Note: As much information as possible about the integration of this device with FortiNAC is provided. However, the hardware vendor may have made modifications to the device's firmware that invalidate portions of this document. If having problems configuring the device, contact the vendor for additional support.

## What it Does

The following features operate independently of each other. Both can be configured, if desired.

### **L3 (ARP) Information Collection**

The Check Point firewall can also be used to collect L3 (ARP) information for network visibility.

### **Syslog Management**

When FortiNAC receives an incoming security syslog event from a Check Point firewall, FortiNAC generates a security event. That security event can trigger a security alarm allowing FortiNAC to take action on the associated host, such as disabling the host or marking it at risk. See [Security incidents](#) in the Administration Guide for more information.

**Click on the desired feature to proceed:**

[L3 \(ARP\) Information Collection](#)

[Syslog Management](#)

# L3 (ARP) Information Collection

## How it Works

FortiNAC collects IP address to MAC address information by reading the Checkpoint's ARP cache regularly. For details, see [L3 polling](#) in the Administration Guide.

## Check Point Requirements

- SNMP community or account

## Procedure

1. In the FortiNAC Administration UI, navigate to **Network > Inventory**.
2. Add the Checkpoint using the management interface IP address. See [Add or modify a device](#) in the Administration Guide for instructions. Include the following:
  - **SNMP Settings:** SNMP v1 or v3 credentials used for device discovery and ARP collection/L3 polling

## Related KB Articles:

[Options for Devices Unable to Be Modeled in Topology](#)

3. Once added, enable L3 Polling. Right click on the model in the left panel and select **Group Membership**.
4. Check the box next to **L3 Polling (IP→MAC)** and click **OK**.
5. Click the **Polling** tab.
  - a. Check the box next to **L3 (IP→MAC) Polling**.
  - b. Click **Save**.

Once the Checkpoint is discovered, IP address information should populate the adapter records.

# Syslog Management

## How it Works

Automated response by FortiNAC to security events sent by the firewall is achieved through the following steps:

1. Firewall sends a security syslog event to FortiNAC.
2. FortiNAC parses the information based on pre-defined security event parsers stored in FortiNAC's database. See [Security event parsers](#) in the Administration Guide for more information.
3. FortiNAC generates a security event that can contain any or all of the fields included in the message.
4. FortiNAC attempts to identify the host that is the target of the event. This is done by resolving the source IP address in the message to a MAC address in FortiNAC's database through L3 Polling.
  - a. If the IP address is not able to be resolved, the event is held in memory until an associated host can be found.
  - b. Once an associated host is found, the event is printed and searchable under **Logs > Security Incidents > Events** of the Administration UI. See [Security events](#) in the Administration Guide for more information.
5. If the Security Event is mapped to a Security Alarm, FortiNAC takes action based on the alarm configuration. The actions taken can range from sending an email to isolating the offending host. See [Security alarms](#) in the Administration Guide for more information.

## Requirements

- FortiNAC
  - Endpoint License level PRO

## **Step 1: Configure Check Point**

Add FortiNAC as a Syslog server. Use the eth0 management IP address. Refer to the Check Point documentation to configure the Check Point Gateway to enable logging of the specific Events (e.g., Anti-Malware, New Anti-Virus, etc.).

## Step 2: Add Check Point as a Pingable Device in FortiNAC

1. Navigate to **Network > Inventory**.
2. Right-click and select **Add a Pingable Device** to add the Check Point to FortiNAC. The Physical Address (MAC) is required when creating pingable devices if the IP to MAC cannot be resolved when the ARP tables are read.
3. Configure using the table below. For instructions, see [Add or modify a pingable device](#) in the Administration Guide.

### Element Tab Field Definitions

Some fields listed display only when modifying an existing pingable device or when viewing the device properties.

<b>Container</b>	Container in the Inventory tree where this device is stored.
<b>Name</b>	Name of the device. Enter Check Point.
<b>IP Address</b>	IP address of the Check Point.
<b>Physical Address</b>	The MAC address of the Check Point. Appears in the view only when the device is a pingable.
<b>Device Type</b>	Select <b>IPS/IDS</b> .
<b>Incoming Events</b>	Select <b>Security Events</b> , and then select <b>Check Point</b> .
<b>SSO Agent</b>	Select <b>Not Applicable</b> .
<b>Role</b>	The Role for this device. Available roles appear in the drop-down list.
<b>Description</b>	Description of the device entered by the Administrator.
<b>Note</b>	User specified notes about the device.
<b>Contact Status Polling</b>	Enable or disable contact status polling for the selected device.

### Step 3: Create “Catch All” Security Rule

Create a "Catch All" security rule to enable logging of security events from a Check Point device. No security alarms are generated. Used to view all events that are being sent to FortiNAC.

#### Create “Catch All” Security Rule Trigger

1. Select **Logs > Security Incidents**.
2. Select **Triggers**.
3. Click **Add** or select an existing trigger and click **Modify**.
4. Click in the **Name** field and enter a name for this security trigger (such as “Checkpoint Catch All”).

Frequency	Vendor	Type	Sub Type	Threat ID	Description	Severity	Prefer Destination Address	Number of Custom Fields
No records found.								

5. Under Security Filters, click the **Add** button
6. For the “Catch All” trigger, add a filter with **Vendor: CheckPoint**.

Name	Value
No records found.	

7. Click **OK** to save filter.

**Add Security Trigger**

Name:

Time Limit:

Filter Match:

Security Filters							
Frequency	Vendor	Type	Sub Type	Threat ID	Description	Severity	Prefer
	CheckPoint						No

8. Click **OK** to save Trigger.

For more details on these views, see [Add a trigger](#) and [Add or modify filters](#) in the Administration Guide.

### **Add “All Hosts” User/Host Profile**

Create a profile to apply to all hosts.

1. Select **Policy & Objects > User/Host Profiles**.
2. Click the **Add** button.
3. Click in the Name field and enter **All Hosts**.
4. Leave all other fields at default. Click **OK** to continue.

**Add User/Host Profile**

Name:

Where (Location):

Who/What by Group:

Who/What by Attribute:

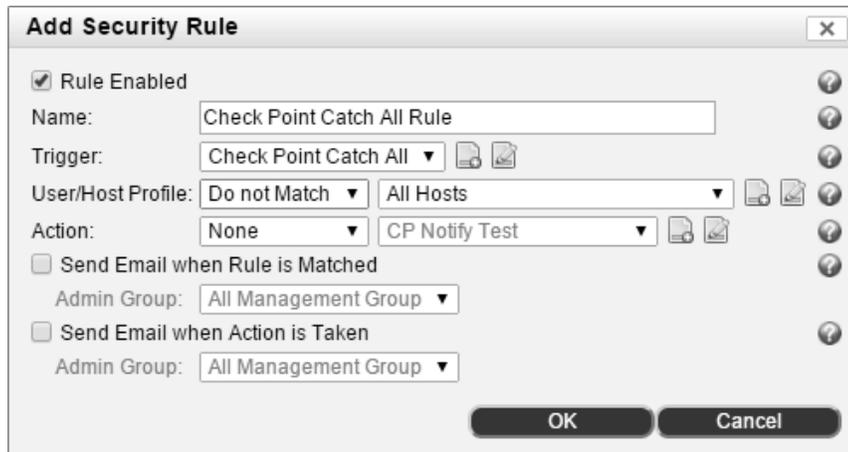

When:

Note:

## Create “Catch All” Security Rule

Create a “Catch All” Security Rule and associate the “Catch All” trigger.

1. Select **Logs > Security Incidents**.
2. Select **Rules**.
3. Click **Add**.

4. Click in the **Name** field and enter a name for this security rule.
5. Select the “Catch All” trigger from the drop down menu.
6. Select **Does Not Match** and **All Hosts** from the User/Host Profile drop-down lists. This enables Security Event Triggers but disables Security Alarms.
7. Click **OK** to save.

## **Step 4: Generate and Evaluate Security Events**

1. Create conditions that generate events from the Check Point so they can be evaluated.
2. Under **Logs > Security Incidents**, select **Events**.
3. Review the security events received. Use these security events as a starting point to filter on specific fields in order to create the appropriate security filters for security event triggers.

An event rule can be created from this view based upon a received event. For details on this view, see [Security events](#) in the Administration Guide.

## Step 5: Configure Security Rule

Create security alarms for these security events. Once alarms are created, admin and/or users can be notified, and take the primary action, secondary action, etc.

1. Define a security trigger that consists of one or many security filters and optional time limit/frequency. See [Add a Trigger](#).
2. Define a security action that consists of one or many activities to be executed once a trigger is satisfied. Each activity consists of a primary task and an optional secondary task that can be executed after a period of time. See [Add or modify an action](#).
3. Add the security rule.
  - a. Select the security trigger created in the previous step.
  - b. Define hosts to which the security rule applies (see [User/host profiles](#) in the Administration Guide).
  - c. Select the security action created in the previous step.
  - d. Notify administrators/users.

For details, see [Add or modify a rule](#) in the Administration Guide.

## Validate

1. Connect a host to the network.
2. Reproduce a condition on the host to trigger the firewall to send a security event.
3. Verify the event is generated in FortiNAC by navigating to **Logs > Security Incidents > Events** and clicking the **Update** button.
4. If alarm is also configured, verify the alarm was generated by clicking **Alarms** and clicking the **Update** button.
5. If an action was configured, verify the action executed.

If any of the above do not work as expected, refer to the [Troubleshooting](#) section of this document.

# Troubleshooting

## Related KB Articles

Refer to the applicable KB article(s):

## Debugging

Use the following KB article to gather the appropriate logs using the debugs below.

[Gather logs for debugging and troubleshooting](#)

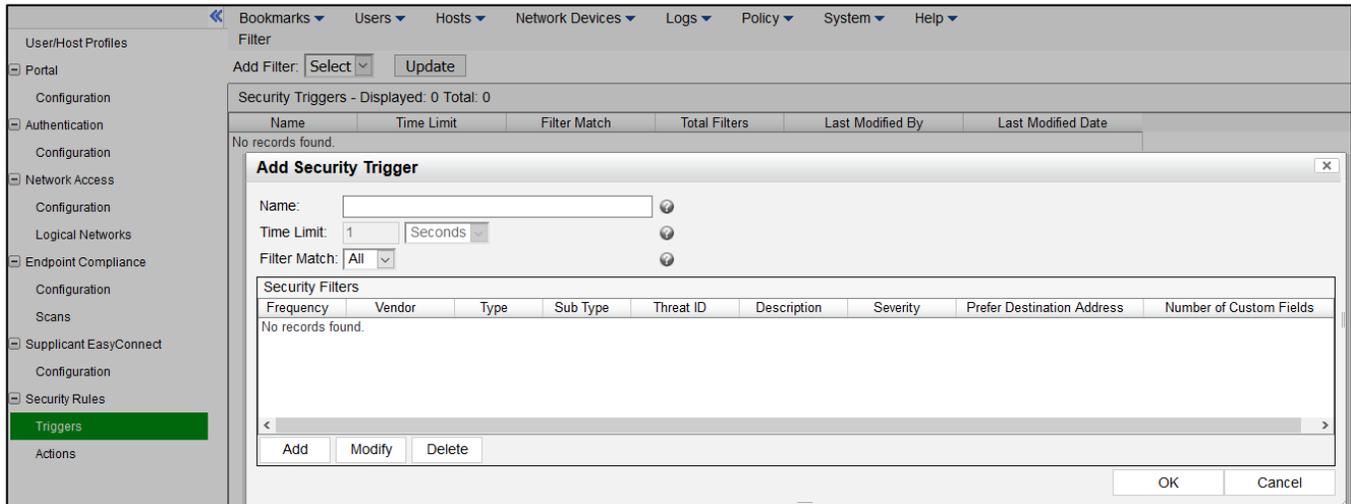

**Note:** Debugs disable automatically upon restart of FortiNAC control and management processes.

Function	Syntax	Log File
Syslog activity	<code>nacdebug -name SyslogServer true</code>	<code>/bsc/logs/output.master</code>
Security Event syslog parsing	<code>nacdebug -name SecurityEventManager true</code>	<code>/bsc/logs/output.master</code>
SNMP activity	<code>nacdebug -name SnmpV1 true</code>	<code>/bsc/logs/output.master</code>
Disable debug	<code>nacdebug -name &lt;debug name&gt; false</code>	N/A

# Appendix

## Add or Modify a Security Rule Trigger

1. Select **Policy > Policy Configuration**.
2. In the menu on the left expand **Security Rules**.
3. Click **Triggers**.
4. Click **Add** or select an existing trigger and click **Modify**.
5. Click in the **Name** field and enter a name for this security trigger.

6. Use the table of field definitions below to enter the security trigger information.

### Add Security Rule Trigger - Field Definitions

<b>Name</b>	A name for this security trigger.
<b>Time Limit</b>	The amount of time within which the incoming events must occur before satisfying the trigger.
<b>Filter Match</b>	Select whether any size subset of the security filters must be matched in order to satisfy the trigger.
<b>Frequency</b>	The number of times the security event must occur from the vendor in order to satisfy the trigger.
<b>Vendor</b>	The name of the vendor that is sending the security event.
<b>Type</b>	Specifies the type of security event.
<b>Sub Type</b>	Specifies the subtype of security event.
<b>Threat ID</b>	A unique identifying code supplied by the vendor for the specific type of threat or event that occurred.
<b>Description</b>	A textual description supplied by the security appliance of the event.
<b>Severity</b>	The range within which the threat level must be defined in order to satisfy the trigger. See <a href="#">Security Event Severity Level Mappings</a> .
<b>Number of Custom Fields</b>	The number of custom fields that were added to the filter.
<b>Add button</b>	Click to add a filter.
<b>Modify button</b>	Click to modify a selected filter.
<b>Delete button</b>	Click to delete a selected filter.
<b>Not currently in use/In use by</b>	Indicates whether the action is in use, and the number of rules currently associated with the action.

7. To create a Security Filter for the Security Trigger, under **Security Filters**, click the **Add** button.

8. Use the table of field definitions below to enter the Security Filter information. Click **OK** to save.

### Security Filters – Field Definitions

<b>Frequency</b>	The number of times the security event must occur from the vendor in order to satisfy the trigger.
<b>Vendor</b>	The name of the vendor that is sending the security event. Select <b>Check Point</b> .
<b>Type</b>	Specifies the type of security event.
<b>Sub Type</b>	Specifies the subtype of security event.
<b>Threat ID</b>	The code generated by the vendor for the security event threat level.
<b>Description</b>	Additional details about the security event.
<b>Severity Range</b>	The range within which the threat level must be defined in order to satisfy the trigger.
<b>Custom Fields</b>	The custom fields that were added to the filter. Click <b>Add</b> to add a custom field. Click <b>Modify</b> to modify a selected field. Click <b>Delete</b> to delete a selected field.

### Add a Custom Field

## Security Event Severity Level Mappings

Each vendor defines its own severity levels for syslog messages. These severity levels are normalized within FortiNAC to provide additional filtering options for incoming security events. The following table provides severity level mappings between the vendor and FortiNAC.

Check Point Vendor Severity Level	FortiNAC Severity Level
1	1
2	2
3	3
4	4
5	5
6	6
7	7
8	8
9	9
10	10
